目录

口头交流

精准医学研究协作组

Disrupted Functional Connectivity of Emotion Regulation Network in Major Depressive Disorder and Its Association with Symptom Improvement: A Multi-site Resting-state Functional MRI Study....71
单、双相抑郁发作患者肠道微生物组-血清代谢组的整合分析....71
Novel Loci Associated with Electroconvulsive Therapy Response in Patients with Schizophrenia: A Genomewide Association Study....72
Multi-omics Reveal Microbial Determinants Impacting The Treatment Outcome of Antidepressants in Major Depressive Disorder....72
利用深度学习方法对双相障碍患者的转相模式进行识别与预测....73
Second-Generation Antipsychotics and Sexual Dysfunction: A Pharmacovigilance-Pharmacodynamic Study....73

继续教育协作组

肠道真菌菌群失调对精神分裂症发病的影响....74
抑郁症工作记忆损害相关异常神经振荡调节....74
伴与不伴强迫症状双相抑郁障碍患者的脑功能网络拓扑属性比较研究....75
抑郁症海马亚区体积的全基因组关联分析研究....75

抑郁障碍研究协作组

抑郁症患者主观和客观认知差异及对社会功能影响分析....76
单相抑郁障碍的抑制控制网络 low-gamma 频段效能连接研究....76
伴自杀风险单双相抑郁患者认知加工特征的眼动研究....77
Histological Disruption of Microstructural Covariance Network in Atypical Depression....77
环状 RNA 结合多模态脑影像在抑郁症诊断和早期疗效预测中的价值及作用机制初探....78
线粒体基因在抑郁症患者外周血中表达上调并与抗抑郁疗效有关....78
生物皮肤电势特征用于区分抑郁症、双相抑郁及健康对照的判别研究....79
基于全息希尔伯特谱探究无抽搐电休克治疗(MECT)后抑郁症患者脑电图变化....79
Intermediary Roles of Prospective Memory and Retrospective Memory in The Comorbidity of Depression and Pain....80
思维反刍的纵向研究：跨诊断的情感障碍内表征....80
运动辅助疗法对抑郁障碍患者自主神经功能的影响....81

生物精神病学组

Fluoxetine-loaded Tetrahedral DNA Nanostructures Facilitate Early-onset Anti-depressive Effects Via Modulating Hippocampal Neurogenesis and Neuroplasticity....82
精神分裂症 NMDAR 抗体水平及其与临床特征和治疗应答的关联....82
精神病临床高危和首发患者错误监控缺陷的脑电低频振荡机制研究....83
Association between Ambient Particulate Matters and Anhedonia Among Patients with Depression....83
Association between Serum Lipids and Rapid Weight Gain in First-episode Schizophrenia....84
Adverse Childhood Experiences Are Associated with Psychiatric Problems and Intelligence in Adolescents From The ABCD Study....84
Cognitive Heterogeneity and Structure Enriched Functional Networks Topological Deviations in Major Depressive Disorder....85
CBS 蛋白调控 H2S 影响 GPX4 和 SLC7A11 表达缓解胶质细胞铁死亡发挥抗抑郁症的分子机制研究....85
NOD2 受体在 LPS 介导的抑郁行为中的作用研究....86

双相障碍研究协作组

Construction and Validation of A Clinical Predictive Model for Prenatal Depression and Its Influencing Factors Using Nomograms....87
Analysis of Telomere Length and The Relationship with Neurocognitive Functions in Euthymic Bipolar Disorder: A Cross-sectional Pilot Study....87
Efficacy and Tolerability of FDA-approved Atypical Antipsychotics for Acute Bipolar Depression: A Systematic Review and Network Meta-analysis....87
Regional Gene Transcriptional Signatures within Dysfunctional Brain Networks in Major Depressive Disorder with High Suicidality....88
双相情感障碍及其未患病一级亲属反应抑制的冲动性和神经相关性：一项脑磁图研究....88
建立并验证一项住院抑郁障碍患者的转相预测模型： 基于真实世界电子病历数据的回顾性队列研究....89
双相障碍灰质体积及大脑功能活动一致性与电压门控钙离子通道 CACNA1G 基因的关联研究....89
Prevalence and Risk Factors for Non-suicidal Self-injury Among Patients with Bipolar Disorder：a Multicenter Study

Across China 90
Functional Genomic Analysis Delineates Regulatory Mechanisms of GWAS-identified Bipolar Disorder Risk Variants 90
基于静息态全脑 beta 频段初步寻找可早期识别抑郁转双相的风险脑区 91
Exploration of Individualized Treatment Strategies for Depression with Atypical Features in IDoT-AFD: Implications for Clinical Practice 91
Local and Large-scale Resting-state Oscillatory Dysfunctions for Early Antidepressant Response Prediction in Major Depressive Disorder 92
经颅磁刺激下脑网络动态变化 92
Personality Traits Play A Vital Role in The Pathway From Social Isolation and Loneliness To Depression: A Mendelian Randomization Study 93
电休克疗法降低难治性抑郁症患者的星形胶质细胞活化和炎症水平-基于血浆星形胶质细胞外囊泡的证据 93
Circadian Rhythm Disorder Symptoms in MDD Correlate with Circadian Gene Polymorphisms 94
A Dynamic Process Model of Bipolar Disorder States Switching Based on The Salience Network 94
Study on The Construction of A Peripheral Blood Expression Profile Diagnostic Model for Bipolar Disorder Depressive Episode Based on Deep Learning Methods 95
CACNA1C 基因多态性与重度抑郁障碍转躁的关联研究 95
中国双相情感障碍伴混合特征的诊断及相关因素分析：一项多中心调查研究 96
Association of Peripheral Inflammation with Disrupted Brain Functional Network Topology in Bipolar Disorder 96

儿童精神病学组

Effect of Repeated Intravenous Esketamine on Adolescents with Major Depressive Disorder and Suicidal Ideation: A Randomized Active-Placebo-Controlled Trial 97
基于同卵双生子样本研究肠道菌群对孤独症谱系障碍严重程度的影响机制 97
儿童期虐待经历对于青少年人群非自杀性自伤行为的影响 97
人格特征预测未治疗青少年抑郁症患者的抗抑郁药治疗反应：一项为期 8 周、开放标签、灵活剂量的研究 98
Natural Language-inspired Analysis of Motion Sequences for Early Diagnosis of Autism Spectrum Disorder 98
儿童和成人 ADHD 视觉空间注意相关脑功能异常的差异 99
Maresin-1 Improves LPS-induced Depressive-like Behavior by Inhibiting Hippocampal Microglial Activation 99
炎症细胞因子辅助诊断精神分裂症、抑郁障碍及双相情感障碍的效能研究 100
Childhood Maltreatment and Adolescent Eating Disorders: A Moderated Mediation Model of Social Anxiety and Physical Activity 100
结合全基因组及深度学习技术解析 ADHD 药物治疗反应遗传机制 101
Cross-Cultural Generalizability of The First Year Inventory for Early ASD Screening in China 101
神经发育障碍儿童共同的异常生物运动感知 102
High Dynamic Functional Connectivity of Sensorimotor Cortices Associated with Restricted, Repetitive Behavior in Children with Autism Spectrum Disorder 102
自然场景中眼动注视模式在孤独症谱系障碍早期辅助诊断中的应用 102
PCBI 干预对孤独症谱系障碍儿童父母回应性的影响 103
基于两阶段渐进式特征优化的孤独症谱系障碍脑影像结构特征分析 103
儿童注意缺陷多动障碍静息态脑功能网络拓扑属性及药物疗效:一项 fNIRS 研究 104
Predicting Pragmatics in Preschool Children with Autism Spectrum Disorder Based on Structural Covariance Networks by Performing Machine Learning Prediction-based Methods 104
Frequency of Depression and Correlates Among Chinese Children and Adolescents Living in Poor Areas under The Background of Targeted Poverty Alleviation: Results of A Survey in Weining County 105
突发公共卫生事件视域下青少年健康素养评价量表编制及在初中生中应用的信效度分析 105
Dynamic Network Characteristics of Adolescents with Major Depressive Disorder: Attention Network Mediates The Association between Anhedonia and Attentional Deficit 106
Relationships Among Premonitory Urge, Tics, and Quality of Life in Drug-naive Children with Tic Disorders: A Mediation Analysis of A Chinese Sample 106
Development, Reliability and Validity of Sensory Phenomenon Assessment Scale (SPAS): A New Tool for Assessment of Tic-associated Sensations 107
Identification of Suicidality in Adolescent Major Depressive Disorder Patients Using SMRI: A Machine Learning Approach. 107
Sex- and Age-dependent Alterations in White Matter Diffusivity Among Children and Adolescents with Social Anxiety Disorder. 108
基于情绪调节能力构建的成人 ADHD 分类模型及其临床特征探索 108
忧郁型和非忧郁型抑郁症患者大脑半球间/半球内的功能连通性的不对称性损害 109
首发青少年抑郁症患者伴非自杀性自伤的神经电生理特点对不良预后的预测作用 109
多模态磁共振结合深度学习算法预测哌甲酯治疗 ADHD 疗效 110
基于体积的形态学测量对青少年抑郁症患者的大脑皮层异常的研究 110

Association between School Bullying and Premenstrual Disorders in Girls : A Cross-sectional Study From The Adolescence Mental Health Promotion Cohort 110
Behavioral Intervention Alone Versus Behavioral Intervention Plus Oxytocin Nasal Spray for Treating Social Communication Deficits in Autism Spectrum Disorder: A Randomized Placebo-controlled Clinical Trial..... 111
Impulsivity Mediates The Association between Childhood Maltreatment and Suicidal Behaviors Among Left-behind Children and Adolescents in China 111
儿童青少年抑郁障碍住院患者成年早期结局的随访研究 112
ABC Family Gene Polymorphisms and Processing Speed Interact To Influence Depression Severity..... 112
高精度经颅直流电刺激对伴或不伴感觉处理异常的孤独症谱系儿童社交障碍的改善作用差异研究 113
Therapeutic Efficacy of Sulforaphane in Autism Spectrum Disorders and Its Association with Gut Microbiota: Animal Model and Human Longitudinal Studies 113
12 周哌甲酯/托莫西汀治疗对注意缺陷多动障碍儿童反应抑制能力的效果研究：来自 fNIRS 的证据 114
基于半结构化互动视频中观察到的非典型面部表情特征标记作为孤独症谱系障碍（ASD）评估标志物的分析 114
SSRIs 药物治疗前后的 SII 和 NLR 对青少年抑郁症患者自伤行为的预测价值 115
综合医院精神心理研究协作组
Psychological Status and Multimodal Magnetic Resonance Imaging Study of Patients with Functional Anorectal Pain 116
Association of Sleep Timing with All-cause and Cardiovascular Mortality: The Sleep Heart Health Study and Osteoporotic Fractures in Men Study 116
Differential Responses From The Left Postcentral Gyrus, Right Middle Frontal Gyrus, and Precuneus To Meal Ingestion in Patients with Functional Dyspepsia 117
Internet Addiction Exposure Increases Risk of Suicide Attempts in Chinese Adolescents: A Prospective Cohort Study 117
Group Interpersonal Psychotherapy for Generalized Anxiety Disorder (IPT-G-GAD) in China: Development and Adaption 117
Internet Gaming Addiction Among Children and Adolescents with Non-suicidal Self-Injury: A Network Perspective .. 118
精神分裂症研究协作组
Inhibitory Effects of Liquiritin, A Natural Compound, Against Antipsychotic-induced Hyperprolactinemia Via Modulation of Dopamine D2 Receptors 119
Weight Changes Following Treatment with Aripiprazole, Risperidone and Olanzapine: A 12-month Study of First-episode Schizophrenia Patients in China..... 119
Different Levels of Prepulse Inhibition in Patients with First-episode Schizophrenia, Bipolar Disorder, and Major Depressive Disorder 119
Effect of Transcranial Direct Current Stimulation Combined with Cognitive Training When Targeting Posterior Parietal Cortex Vs Dorsolateral Prefrontal Cortex on Working Memory in Schizophrenia: A Randomized Clinical Trial 120
Impairment of Olfactory Identification Ability in Ultra-High Risk for Psychosis and Drug-naive First Episode Schizophrenia..... 120
Initial Drug Attitude As A Prediction of Medication Adherence in First-episode Schizophrenic Patients: A 1-year Prospective Study in China 121
The Association between Different Symptom Groups of Schizophrenia and Retinal Structures 121
听声识别精神分裂症：融合不同情绪和特征的语音判别分析 122
早发型精神分裂症的免疫基因组学和免疫细胞特征分析 122
Neuroanatomical Abnormalities in Individuals at Early Stage of Schizophrenia: Relationship with Neurometabolites and Clinical Symptoms 122
CBT 研究协作组
Early Enhancement Effect of Low-frequency Repetitive Transcranial Magnetic Stimulation on Cognitive Behavioral Therapy in Patients with Panic Disorder..... 123
Functional Connectivity of Goal-directed System on Efficacy of Cognitive Behavior Therapy for Obsessive-Compulsive Disorder..... 124
预防自杀的认知行为治疗在自杀未遂抑郁症患者中的随访对照研究 124
社交焦虑障碍认知行为治疗技术专家共识的德尔菲法研究 125
体现认知行为治疗中核心治疗元素之间相互影响的成语筛选与调查研究 125
社交隔离、孤独感增加糖尿病相关痴呆发生风险：一项队列研究 125
Panic Disorder Caused by Childhood Traumatic Experiences Is Associated with NOS1AP DNA Methylation and Precentral Gyrus Function..... 126
线上强化 CBT-I 治疗对慢性失眠障碍合并抑郁和/或焦虑症状的疗效研究 126
焦虑障碍研究协作组 127
不同亚型的焦虑障碍患者述情困难水平比较 127
Characteristics and Economic Burden of Patients with Somatoform Disorders in Chinese General Hospitals: A Multicenter Cross-sectional Study..... 127

A Projection From Ventral Hippocampus To Basolateral Amygdala Is Involved in The Destabilization of Remote Fear Memory....128
基于多模态数据和深度学习的焦虑障碍多亚型辅助诊断分型....128
Transcriptome-neuroimaging Correlation Analysis Reveals Genes and Biological Processes Associated with Cortical Thickness in Obsessive-compulsive Disorder....129
Depression and Anxiety Symptoms Associated with Internet Addiction and Non-suicidal Self-injury in Chinese Adolescent Students - A Network Analysis....129
强迫症患者在模糊情景下决策行为的脑网络研究....130
生活事件对青少年焦虑的影响：自我和谐和社会支持的链式中介作用....130
Longitudinal Study Tracking Cerebellar-cerebral Functional Connectivity in Patients with Obsessive-compulsive Disorder....130
坦度螺酮 不同剂量治疗广泛性焦虑障碍对代谢指标的影响：一项多中心 RCT 的事后分析....131
Association of Polymorphisms in Hypocretin (Orexin) Receptor 1 and Plasma Hypocretin: Treatment Response Prediction in Major Depressive Depression....131
Network Analysis Reveals Disrupted Functional Connectivity and Topology Properties in Panic Disorders....132
Efficacy and Safety of Transcranial Direct Current Stimulation (tDCS) on Cognitive Function in Chronic Schizophrenia with Tardive Dyskinesia (TD): A Randomized, Double-blind, Sham-controlled, Clinical Trial....132

老年精神病学组

农村地区首诊阿尔茨海默症的治疗情况分析....133
知情者报告的认知下降可预测主观认知下降（SCD）的纵向转归: 一项 7 年的随访研究....133
阿尔茨海默病和轻度认知功能障碍血浆 pNFL、P-tau181 及视网膜变化相关研究....134
脑脊液 β 淀粉样蛋白 42 和 NLRP3 与麻痹性痴呆患者认知功能障碍、精神行为症状及预后的相关性分析....134
青少年和成年早期重性抑郁障碍患者脑白质完整性异常的比较研究....135
基于 A/T(N)研究框架靶向 Aβ 和 tau 蛋白 PET 与阿尔茨海默病的诊断和鉴别....135
轻度认知障碍患者昼夜活动节律的静息态脑功能研究....135
轻度认知障碍患者决策反馈加工神经活动特征....136
Diminished Activation of Excitatory Neurons in The Prelimbic Cortex Leads To Impaired Working Memory Capacity in Mice.....136
Efficacy and Safety of Computerized Cognitive Training Added To SSRIs in Late-life Depression with Cognitive Impairment: A 12-Week, Randomized Controlled Study....137
抑郁和焦虑在中国老年人关节炎与早期认知功能下降关系中的作用：链式中介作用....137
语言训练对轻度阿尔茨海默病总体认知功能和执行功能的作用效果分析....137

进食障碍研究协作组

Nicotine Decreases Pain Behaviors and Nerve Regeneration Via The A7 Nicotinic Acetylcholine Receptor in Two Rat Nerve Injury Models....138
Study on Intestinal Flora Characteristics and Metabolomic Analysis in Children and Adolescents with First Untreated Obsessive-compulsive Disorder....138
进食障碍患者临床表现的性别差异....139
The Predictive Role of Frontoparietal Network in Clinical Symptoms and Treatment Response in Anorexia Nervosa..139
中国暴食障碍诊疗专家共识....140
Transcranial Direct Current Stimulation Modulates EEG Microstates in Obsessive-Compulsive Disorder....140
阈下抑郁对肥胖和病态肥胖人群认知功能损伤的影响研究....141
基于网络的认知行为疗法治疗成人暴食谱系障碍疗效的荟萃分析....141
进食障碍患者注意偏向及抑制控制的事件相关电位研究....141
消化科门诊患者的进食障碍风险评估....142

精神康复协作组

The Relationship between The Self-stigma and The Quality of Life in Long-term Hospitalized Patients with Schizophrenia: A Cross-sectional Study....143
Aberrant Metabolism of The Gut Microbiota Mediates Tryptophan-Associated Cognitive Impairment in Drug-na?ve, First Episode Schizophrenia Patients....143
基于人工智能的音视频特征模型在抑郁症识别中的应用....143
高频 rTMS 调节 Sigma-1 受体和神经元活动增强应激后食蟹猴认知功能的研究....144

民族心理与精神医学学组

The Prevalence of Mental Disorders in Inner Mongolia Autonomous Region, China: A Cross-sectional Epidemiological Study....145
Association of Insulin Signaling Pathway Gene Polymorphism and Brain Function with Clinical and Cognitive Feature of Early-onset Obsessive-compulsive Disorder....145
动力性人际治疗对抑郁症患者心智化功能的改善作用及其与抑郁症状变化的关系：一项多中心随机对照研究146

Sex-specific Associations of Childhood Maltreatment with Social Cognition in Chinese Han First-episode, Drug-naive Major Depressive Disorder 146
首发未用药精神分裂症患者血浆补体系统异常与皮层厚度下降、逻辑记忆功能受损的关联研究 147
Abnormal Interhemispheric Functional Cooperation in Schizophrenia Follows The Neurotransmitter Profiles 147
东亚及欧洲人群抑郁症的共遗传研究 147
四川省高校少数民族学生心理健康状况和相关影响因素的研究 148

Objective The emotion regulation network (ERN) in brain systems provides a framework for understanding the neuropathology of affective disorders. Although previous neuroimaging studies have demonstrated that functional aberrations within the ERN are associated with the clinical symptoms of major depressive disorder (MDD), whether the ERN in patients with MDD shows abnormal functional connectivity (FC) remains unclear owing to the lack of large samples.

Methods To address this issue, we obtained a large functional magnetic resonance imaging dataset from 709 patients with MDD and 725 healthy controls (HC) recruited across five sites. Using a seed-based FC approach, we first compared the group difference in resting-state FC of the 14 ERN seeds between participants with and without MDD. Further, an 8-week antidepressant monotherapy (45 MDD patients) data was used to evaluate the relationship between the aforementioned abnormal functional interactions within the ERN and the efficacy prediction of antidepressants.

Results Compared with the controls, the MDD patients showed significantly increased FC between the bilateral angular gyrus and bilateral middle temporal gyrus as well as the bilateral occipital areas, the bilateral subgenual anterior cingulate cortex and right thalamus as well as the calcarine cortex, and the left ventrolateral prefrontal cortex and right thalamus. We also observed significantly decreased FC between the bilateral amygdala and middle frontal gyrus as well as the bilateral superior temporal gyrus in the MDD group compared to the HC group. Correlation results showed that these aberrant FC in the ERN were negatively correlated with the reduction rate of the Hamilton Rating Scale for depression (HAMD) among MDD patients.

Conclusion The present study illustrated widespread aberrant FC of the ERN in MDD with large-sample, multi-site datasets. These results might extend our understanding of the neurobiological underpinnings underlying emotional regulation deficits in MDD.

单、双相抑郁发作患者肠道微生物组-血清代谢组的整合分析

王雨静 安翠霞*

河北医科大学第一医院精神卫生中心

目的 对单相抑郁及双相抑郁患者的肠道微生物组和血清代谢组进行整合分析，探索单、双相抑郁发作的差异客观生物标记物。

方法 收集 2021 年 5 月—2022 年 10 月就诊于河北医科大学第一医院处于抑郁发作的重性抑郁障碍(MDD 组，n=38）及双相障碍(BD 组，n=44）患者，共 82 例。收集一般人口学资料，完成汉密尔顿抑郁量表-24 项、汉密尔顿焦虑量表、数字符号转换测验、数字广度测验、连线测验 A 评估。收集患者的粪便及血液样本，基于 16S rRNA 和超高效液相色谱与质谱联用技

术进行肠道微生物组和非靶向血清代谢组学检测。

结果 1.关于 α 多样性，两组间 Chao1、ACE 和 Observed species 指数差异存在统计学意义（均 P＜0.05）；关于 β 多样性，两组差异存在统计学差异（P＜0.05）。BD 组和 MDD 组之间存在 17 个显著差异菌群（P＜0.05；LDA＞3.8）。在属水平上，BD 组双歧杆菌属、g__Prevotella_7、g__un_f_Muribaculaceae 丰度较高，副萨特氏菌属丰度较低，发现 4 个差异菌属联合诊断 AUC 为 0.925。2.筛选出 50 种内源性差异代谢物(VIP＞1)，前 10 个差异代谢物中，有 8 个代谢物的 AUC 大于 0.7，分别是腺苷、甘油磷脂胆碱、苯丙氨酸、1-羟基-2-萘甲酸、次黄嘌呤、乳酸、牛磺酸、异柠檬酸（AUC=0.818、0.737、0.889、0.770、0.720、0．760、0.730、0.715）。3.双歧杆菌属与乳酸、牛磺酸等代谢物呈正相关（r=0.458，P＜0.01、r=0.355，P＜0.05）。

结论 本研究发现肠道微生物及血清代谢物能够有效的区分单、双相抑郁患者，找出了显著不同的 17 种肠道菌群及 50 种内源性血清代谢物；此外 4 个菌属联合及 8 个血清代谢物具有鉴别诊断单、双相抑郁的潜在价值，部分差异菌属及代谢物可能与疾病的临床症状有相关性，且肠道微生物与血清代谢物之间可能存在互相影响。

结论 本研究发现肠道微生物及血清代谢物能够有效的区分单、双相抑郁患者，找出了显著不同的 17 种肠道菌群及 50 种内源性血清代谢物；此外 4 个菌属联合及 8 个血清代谢物具有鉴别诊断单、双相抑郁的潜在价值，且肠道微生物与血清代谢物之间可能存在互相影响。

Novel Loci Associated with Electroconvulsive Therapy Response in Patients with Schizophrenia: A Genomewide Association Study

Tingting Wang[1], Bao-Zhu Yang[2], Shuangshuang Feng[1], Kezhi Liu[1], Bo Xiang[1]
1.西南医科大学附属医院精神科
2.耶鲁大学医学院精神科

Objective : Electroconvulsive therapy (ECT) reduces schizophrenic symptoms and prevents relapse, but treatment response is variable. Little is known about the genetic basis of ECT's treatment efficacy for schizophrenia. To identify genomic loci and pathways associated with the ECT treatment efficacy and to predict the ECT treatment response using the polygenic risk score (PRS) derived from our genomewide association study (GWAS) on the ECT treatment efficacy.

Methods We designed a GWAS approach and recruited 515 schizophrenia patients who underwent ECT in psychiatric hospitals (348 for the discovery of GWAS, 137 for replication and prediction of treatment efficacy, and 90 (30 new plused and 60 previous samples) for plasma protein analysis. Symptoms before and after ECT were accessed using the positive and negative syndrome scale (PANSS), and four reduction ratings of the symptom changes were defined. Plasma protein analysis for the identified candidate genes was conducted. Genetic loci, tissues/cell types, and the biological pathways associated with ECT and prediction of treatment efficacy using polygenic risk scores (PRS).

Result We identified three genomewide significant (GWS) single nucleotide polymorphisms, rs199850886 (p=1.98×10-8), rs5851619 (p=1.32×10-8), and rs67506437 (p=3.17×10-8) for two PANSS reduction rates, which map to the upstream of RFPL2 (ret finger protein-like 2), on TRAT1 (T cell receptor associated transmembrane adaptor 1) and on SSNA1 (SS nuclear autoantigen 1), respectively. We also obtained two GWS gene-based genes KIAA1107 (aka. BTBD8 (BTB domain containing 8), p= 1.75×10-7) and SLC5A1 (solute carrier family 5 member 1, p= 8.37×10-7) for the positive symptom reduction rate (PANSS-PRR). The Purkinje cell and microglia were associated with PANSS-PRR (p＜5×10-3), inhibitory neuron to PANSS total score reduction rate (PANSS-TRR) (p＜5×10-3), Purkinje cell and macrophage to general symptoms reduction rate (PANSS-GRR) (p＜5×10-3). We found four pathways to PANSS-TRR, including transferrin endocytosis and recycling, iron uptake and transport, activation of matrix metalloproteinases, and Vpu-mediated degradation of CD4. The expression of △RFPL2 (before-after ECT) in the plasma and PANSS-PRR are significantly correlated (r=0.24, p=0.028). PRS significantly predicted the ECT response for above 80% PANSS-TRR (area under curve 0.691, p =0.036) and less than 50% PANSS-PRR (area under the curve 0.612, p=0.049) in another137 independent schizophrenics.

Conclusions We identified promising candidate genes, cell types, tissues, and biological pathways related to the ECT treatment efficacy. The identified SNPs are effective in predicting ECT's therapeutic effects. These findings enhance our comprehension of the mechanisms behind ECT responses and may guide ECT selection for patients with schizophrenia.

Objective To explore the effect of escitalopram, an antidepressant, on the gut microbe's composition and function in patients with MDD and to preliminarily elucidate the possible mechanisms of antidepressant drugs mediated by gut microbes.

Methods A multi-omics study was undertaken involving 110 MDD patients treated with escitalopram (ESC) for a period of 12 weeks. This study was conducted within a cohort and compared to a reference group of 166 healthy individuals. All the stool samples were subjected to shotgun metagenomic sequencing and non-targeted metabolomics. Meanwhile, the plasma samples were also subjected to non-targeted metabolomics.

Results It was found that ESC ameliorated abnormal blood metabolism by upregulating MDD-depleted amino acids and downregulating MDD-enriched fatty acids. On the other hand, the use of ESC showed a relatively weak inhibitory effect on the gut microbiota, leading to a reduction in microbial richness and functions. Machine learning-based multi-omics integrative analysis revealed that gut microbiota contributed to the changes in plasma metabolites and was associated with several amino acids such as tryptophan and its gut microbiota-derived metabolite, indole-3-propionic acid (I3PA). Notably, a significant correlation was observed between the baseline microbial richness and clinical remission at week 12. Compared to non-remitters, individuals who achieved remission had a higher baseline microbial richness, a lower dysbiosis score, and a more complex and well-organized community structure and bacterial networks within their microbiota. These findings indicate a more resilient microbiota community in remitters. Furthermore, we also demonstrated that it was not the composition of the gut microbiota itself, but rather the presence of sporulation genes at baseline that could predict the likelihood of clinical remission following ESC treatment. The predictive model based on these genes revealed an area under the curve (AUC) performance metric of 0.71.

Conclusion This study provides valuable insights into the role of the gut microbiota in the mechanism of ESC treatment efficacy for patients with MDD. The findings represent a significant advancement in understanding the intricate relationship among antidepressants, gut microbiota, and the blood metabolome. Additionally, this study offers a microbiota-centered perspective that can potentially improve antidepressant efficacy in clinical practice. By shedding light on the interplay between these factors, this research contributes to our broader understanding of the complex mechanisms underlying the treatment of MDD and opens new avenues for optimizing therapeutic approaches.

利用深度学习方法对双相障碍患者的转相模式进行识别与预测

冯筱扬 马燕桃 张于亚楠 孙瑶瑶 卢喆 廖云丹 康哲维 于欣* 岳伟华*
北京大学第六医院

目的 双相障碍是一类容易被误诊为抑郁障碍，复发率高，预后不佳，患者依从性差的精神疾患。其症状通常包括抑郁发作和（轻）躁狂发作。患者多因为抑郁障碍首发就诊，因此误诊率较高，对精准用药有一定影响。本研究通过 MDCC 等评估工具结合深度学习方法对患者的临床症状进行分析，从而在时间序列上实现对患者转相模式的识别与预测，为早期识别和精准医疗打下基础。

方法 本研究纳入在北大六院双相障碍管理平台心镜 APP 上进行线上随访并在线下诊断确诊为双相障碍的患者 792 名。患者自愿加入科学研究随访后，通过 M.I.N.I.评估确定为双相障碍患者，同时患者自愿在心镜 APP 进行线上随访评估 YMRS、HAMD、MDCC 等量表。根据 YMRS、HAMD 是否达到诊断标准，将患者某个时间点上状态分为平稳、抑郁、躁狂、混合四个相位。通过数次的随访和评估，获得患者相位转变的模式，接着利用 transformer 等深度学习算法对患者进行学习和建模，最后结合 MDCC 对患者数个时间以后的分数进行预测，并根据分数给出预测标签的结果。

结果 不考虑时间序列的情况下，对患者的下一个相位进行识别，预测准确率可以达到 97%。对于患者连续四个相位的识别，即对患者的转相模式进行十六分类任务的预测，准确率达到 91%。对患者的时间序列进行精准预测，对于 90 天后患者相位的预测因其状态而有所区别。从别的状态转到平稳相的准确率高达 85%，对于患者转至混合相的准确率为 67%，对转至抑郁相的准确率为 33%，转至躁狂相则因缺乏验证集数据而无法确定是否准确。

结论 利用 transformer 等深度学习模型和 MDCC、YMRS、HAMD 等评估工具，可以对双相障碍的发病模式进行一定程度的识别，并在未来一段时间上进行预测。随着随访队列的扩大，该模型准确率可以进一步提高，提前预警患者的发作状态，为探索双相障碍的转相机制、并进行精准医疗早期干预打下基础。

Second-Generation Antipsychotics and Sexual Dysfunction: A Pharmacovigilance-Pharmacodynamic Study

程渝[1] 陈由骏[2] 牟凡[1] 王婉莹[1] 钱瑞仪[1] 禹顺英[1]
1.上海交通大学医学院附属精神卫生中心
2.上海交通大学医学院

Objective There is a growing recognition of the as-

sociation between sexual dysfunction(SD) and antipsychotic treatment; however, the risk for SD secondary to specific antipsychotics has not been extensively studied. We aimed to employ a pharmacovigilance-pharmacodynamic approach to examine the safety signals of second-generation antipsychotics (SGAs) concerning reported SD, as well as to investigate the potential receptor mechanisms involved.

Methods The FAERS database monitors post-marketing drug safety, collecting information on adverse events (AEs) associated with various drugs. This study focused on nine SGAs: amisulpride, aripiprazole, clozapine, lurasidone, olanzapine, paliperidone, quetiapine, risperidone, and ziprasidone. SD and relevant AEs were screened using MedDRA terminology from Q1 of 2004 to the Q3 of 2022. Moreover, data were analyzed separately for hypersexuality, hyposexuality, erectile dysfunction, and ejaculatory dysfunction to clarify the risk of sexual side effects associated with each drug. Disproportionality analysis was performed to identify associations between examined drugs and SD events. Results were presented as reporting odds ratios (RORs) and information component (IC). Significance was determined by lower limits of 95% CI for ROR and IC exceeding 1, with a minimum of three reported AEs per drug. Linear regressions explored associations between significant RORs and receptor occupancy, which were calculated from in vitro binding profiles.

Results In this study, a total of 41,886,918 reports were identified from the FAERS database, with 5854 cases exposed to targeted SGAs. The mean patient age was 34.8 years. Males had a higher prevalence of sexual dysfunction (69.8% vs. 21.6% in females, with 8.7% unspecified). About 60% of adverse event reports originated from the United States, with 2.3% remaining unspecified. Safety signal analysis indicated that all examined drugs, except amisulpride, were significantly associated with sexual dysfunction. The largest effect size in this estimation was observed for compulsive sexual behavior with aripiprazole (ROR 849.65, ROR025 713.70; IC 7.57, IC025 6.36), followed by psychosexual disorder with aripiprazole (ROR 141.14, ROR025 107.72; IC025 6.49, IC025 4.95), and psychosexual disorder with paliperidone (ROR 101.96, ROR025 70.48; IC 6.45, IC025 4.46). Additionally, aripiprazole exhibited the most significant correlation with hypersexuality (ROR 87.12), while paliperidone showed the most vital signals for hyposexuality (ROR 6.88), erectile dysfunction(ROR 8.23), and ejaculatory dysfunction (ROR11.99). Regression analysis revealed significant effects for receptor occupation of D2 and D3 receptors on ROR.

Conclusion Our results suggest a safety signal of SGAs for reporting SD-related AEs, and the dopamine receptor occupation may contribute to potential mechanisms. Further research is warranted to explore the causality of these associations and the clear mechanisms.

肠道真菌菌群失调对精神分裂症发病的影响

袁秀霞 孙尧 庞礼娟 李雪 宋学勤*
郑州大学第一附属医院

目的 探讨多基因风险评分（PRS）和肠道真菌的交互作用对 SCH 发病的影响。

方法 本研究为横断面研究，选取就诊于郑州大学第一附属医院精神科的首发未用药 SCH 患者作为病例组，选取经过广告招募及来医院体检的健康人群作为对照组，研究对象选取时间为 2017 年 10 月至 2019 年 10 月之间。采用 18S 核糖体 RNA（rRNA）测序平台检测肠道真菌水平。通过 logistic 回归模型探讨肠道真菌菌群失调（MD）指数、α 多样性指数和 PRS 与 SCH 发病风险的关系。

结果 本研究共纳入了 137 例首发未用药 SCH 患者（男 62 例，女 75 例）和 76 名健康对照者（男 31 例，女 45 例）。患者组年龄为（22.5?7.5）岁，对照组年龄为（22.8?2.3）岁。PRS 是 SCH 发病的危险因素（OR=1.111, 95%CI=1.036~1.178, P=0.002）。肠道真菌 MD 指数升高是 SCH 的危险因素 （OR=1.200, 95% CI=1.124~1.281, P＜0.001） 。真菌 α 多样性 Shannon 指数（OR=0.813, 95% CI=0.755-~0.874, P＜0.001）和 Simpson 指数（OR=0.218, 95% CI=0.091~0.523, P＜0.001）升高是 SCH 的保护因素。关键菌曲霉菌属丰度增加是 SCH 的保护因素（OR=0.928, 95% CI=0.864~0.996, P=0.040）。曲霉菌属丰度和认知功能领域中的工作记忆（r=0.280, P= 0.001），词语学习（r=0.253, P=0.003）、推理和问题解决（r=0.191, P=0.028）呈正相关。

结论 肠道真菌 α 多样性和曲霉菌属是 SCH 的保护性因素。

抑郁症工作记忆损害相关异常神经振荡调节

王旭苗[1] 崔青[1] 邹浩文[2] 姚志剑[1]
1.南京脑科医院
2.南京大学医学院

目的 探究抑郁症工作记忆认知表现特征及其相关神经振荡调节过程。

方法 招募 52 名抑郁症患者（抑郁组）和 42 名健康受试者（对照组），完成 N-back 工作记忆任务状态脑电图扫描，同日使用汉密尔顿抑郁量表（HAMD-17）、汉密尔顿焦虑量表（HAMA）对受试者进行评估。根据样本特征，使用双样本 t 检验、卡方检验比较两组间一般人口学资料及 HAMD-17、HAMA 得分；将年龄、受教育年限作为协变量，使用协方差分析比较两组间 0-back、2-back 任务反应时、正确率差异；使用协方

差分析比较两组间工作记忆编码期及维持操作期额叶、顶叶 theta 振荡，枕叶 alpha、gamma 振荡相对能量值，并将所得差异脑区异常振荡相对能量与任务正确率、反应时进行 pearson 偏相关分析。

结果 两组间性别，年龄、受教育年限均不存在显著差异。抑郁症患者组 HAMD-17（t=23.773，P=0.000）、HAMA 得分（t=16.134，P=0.000）均显著高于健康对照组。工作记忆任务表现方面，两组间 0-back 正确率、反应时不存在显著差异，抑郁症组在难度较高的 2-back 正确率（F= 1.189，P= 0.008）、反应时（F=4.304，P=0.021）均显著低于对照组。较对照组相比，抑郁症组 2-back 工作记忆编码期额叶 theta（均数±标准差：患者组：1.186±0.732，对照组：2.000±1.027，F=5.212，P=0.025）、顶叶 theta 振荡（均数±标准差：患者组：0.746±0.714，对照组：1.667±0.811，F=12.325，P=0.001）相对能量显著降低（FDR 校正），且与 2-back 反应时（额叶：r=-0.347，P=0.016、顶叶：r=-0.388，P=0.006）呈显著负相关关系。

结论 抑郁症患者工作记忆更新功能受损，工作记忆编码期异常降低的额叶 theta 振荡活动可能是其损害相关的潜在神经电生理改变，这为客观的临床认知评估提供初步线索。临床治疗手段对其异常神经振荡活动的调节，为进一步寻找潜在的治疗疗效生物标记物提供可能。

伴与不伴强迫症状双相抑郁障碍患者的脑功能网络拓扑属性比较研究

钟舒明 杨梓彬 陈观茂 赖顺凯 张一靓 王颖 贾艳滨*

暨南大学附属第一医院(广州华侨医院)

目的 研究基于图论的网络拓扑属性分析方法比较伴与不伴强迫症状（Obsessive Compulsive Symptoms, OCS）双相抑郁障碍患者的脑网络全局属性和节点属性的异同，从脑网络层面探究伴强迫症状双相抑郁障碍的神经生物学机制。

方法 研究纳入 53 例未用药伴强迫症状双相抑郁患者（OCS 组），37 例未用药不伴强迫症状双相抑郁患者（NOCS 组）以及 50 例健康对照（HC 组）。采用 MRI 扫描获取静息态功能像（resting-state functional MRI, rs-fMRI），应用基于 Matlab 平台的 SPM12、CAT12 以及 DPABI 工具包对影像数据进行预处理，利用 GRETNA 软件构建功能网络并应用图论分析方法分别计算小世界属性等网络拓扑属性指标。最后，用存在组间差异的网络指标作为分类特征值，利用支持向量机（Support Vector Machine, SVM）机器学习分类模型对 OCS 组、NOCS 组和 HC 组分别进行两两之间的分类。

结果 在节点属性上，OCS 组的节点中心度在右侧颞横回高于 HC 组，OCS 组的节点效率在右侧颞横回高于 HC 组，NOCS 组的节点效率在小脑蚓部低于 OCS 组和 HC 组；OCS 组的介数中心度在左侧额下回低于 HC 组，OCS 组的介数中心度在小脑蚓部低于 NOCS 组和 HC 组。SVM 分类显示：当使用各节点属性组合作为分类特征时，在 OCS、NOCS 和 HC 三组分类中均能获得较好的分类效果。其中，在 OCS 组与 NOCS 组分类时，组合特征分类性能 AUC = 0.7986，准确度 76.74%，敏感度 70.59%，特异度 83.17%；OCS 与 HC，组合特征分类性能 AUC = 0.6308，准确度 75.49%，敏感度 64.00%，特异度 61.54%；NOCS 与 HC，组合特征分类效能 AUC＝0.7718，准确度 73.81%，敏感度 90.00%，特异度 58.82%。

结论 在节点属性上，左侧额下回、左侧枕上回、右侧罗兰迪克岛盖、右侧颞横回，以及小脑等脑区表现出异常，且这些异常改变在伴强迫症状组中更显著，其中左侧额下回的介数中心度、右侧颞横回的节点中心度、节点效率与强迫症状的严重程度相关。此外，SVM 机器分类学习模型显示各节点属性（节点中心度、节点效率、介数中心度）多特征融合作为分类具有一定的疾病诊断能力。

抑郁症海马亚区体积的全基因组关联分析研究

奚康[1] 张擎[2] 程宇琪[1] 李明[3]

1.昆明医科大学第一附属医院

2.宁波大学医学院

3.中国科学院昆明动物研究所

目的 大量研究报道了抑郁症（MDD）中的海马体积异常并发现不同海马亚区功能存在差异。既往在健康人群中针对海马总体积的遗传学研究取得了诸多发现，但 MDD 患者的海马不同亚区的详细遗传机制及调控基因尚不清楚。因此，本研究希望比较首发未服药 MDD 患者与健康对照的海马亚区体积，结合全基因组关联分析（GWAS）探索 MDD 患者海马亚区体积的遗传基础；利用多基因风险评分（PRS）研究 MDD 的遗传风险是否影响抑郁症患者特定海马亚区体积的变化。

方法 依据纳入、排除标准，收集在昆明医科大学第一附属医院门诊或住院部就诊的 18 至 60 岁 MDD 患者人口学信息、量表测评及磁共振扫描，获取 3D-T1 结构磁共振数据，利用 Freesurfer 6.0 软件获得所有被试海马亚区体积数据，进行一般线性模型评估抑郁症患者与健康人相比海马各亚区体积的变化。提取被试者外周血获取基因组 DNA 和单核苷酸多态性（SNP）基因型信息，以海马亚区体积为表型，性别、年龄和前 5 个主成分作为协变量，使用 PLINK 进行线性回归的 GWAS 分析。使用 PRSice 软件进行多基因风险评分分析。使用 ANNOVAR 软件对 GWAS 结果进行位点功能注释，寻找 SNP 位点对应的基因。

结果 1.MDD 首发未服药患者与健康对照的海马亚区体积的组间比较未见明显差异。2.在 MDD 患者海马亚区体积的 GWAS 分析中，我们观察到 145 个表型

显著位点，其中有 33 个位点在多个亚区中显著，独立显著位点 89 个，相关海马亚区包括左侧齿状回、左侧海马伞、右侧分子层、右侧下托。3.MDD 患者的 SNPs 位点注释得到的 44 个基因富集到 8 个 KEGG 通路中，包括辅因子的生物合成通路、半乳糖代谢通路、淀粉和蔗糖代谢通路、戊糖和葡萄糖醛酸盐相互转化通路、癌症的转录失调通路、糖核苷酸的生物合成、铁死亡、ABC 转运蛋白通路。4.根据 PRS 结果，我们观察到目标数据集可以显著预测 MDD 以下海马亚区体积的改变：双侧下托、CA1、旁下托、分子层、齿状回、CA4、右侧海马尾、左侧海马裂、HATA。

结论 1. MDD 患者多个海马亚区体积（尤其齿状回、海马伞、分子层、下托）均受遗传因素影响，相关的 SNPs 与多种生物学通路相关，包括糖代谢、转录失调、铁死亡、蛋白转运相关通路。2.抑郁症基于多基因的风险评分对患者海马亚区体积的变化有影响，提示了海马亚区遗传-环境交互作用在抑郁症发病机制中的潜在作用

3.北京大学中国卫生发展研究中心

目的 比较抑郁症患者主观认知症状与客观认知功能之间的差异，并分析差异的方向及程度对患者社会功能的影响。

方法 在中国 15 家医院门诊连续入组抑郁发作患者 447 名，采集患者的一般人口学、病史等资料，使用汉密尔顿抑郁量表 17 项（HAMD-17）、席汉残疾量表分别评估患者的抑郁症状及社会功能，使用认知功能缺陷自评问卷（PDQ-D）和数字符号转换测验（DSST）分别评估患者的主观认知症状和客观认知功能。使用主观和客观认知结果之间的差异评分将患者分为自我评价好组和自我评价差组，比较两组之间的一般人口学、临床特征的组间差异。使用 Logistic 回归分析影响患者自评认知功能较差的特征，并使用广义线性方程分析自评认知功能较差对于社会功能的影响。

结果 根据差异性评分将患者分为自我评价好组（195 例）与自我评价差组（252 例），两组患者在年龄，性别，受教育程度，疾病总体严重程度，社会功能等指标之间存在显著差异（P<0.05），并且对差异分组有显著影响。构建广义线性模型，SDS 总分作为因变量，纳入包括主客观差异，一般人口学指标，现病史及疾病严重程度等指标作为自变量，结果显示，认知差异评分与社会功能有显著关联(P=0.033),自我评估好组的社会功能 SDS 评分显著高于自我评估差组的抑郁症患者。

结论 抑郁症患者存在显著的主客观认知症状和功能的差异，这种差异性与一般人口学，疾病特征有显著关联，并对患者的社会功能损伤有显著影响，即高估认知功能的患者的社会功能较好，而低估认知功能的患者的社会功能损伤更严重。本研究结果的机制可能来自于抑郁症患者的注意负性偏向，基于此，能够为基于认知评估差异开展针对性干预，进而促进患者疾病改善和社会功能恢复提供线索。

单相抑郁障碍的抑制控制网络 low-gamma 频段效能连接研究

韩颖琳[1] 花玲玲[2] 杜易珊[2] 夏逸[2] 史家波[2] 姚志剑[2,3]
1.南京医科大学附属脑科医院精神三科
2.南京医科大学附属脑科医院心境障碍科
3.东南大学生物科学与医学工程学院

目的 low-gamma 频段与工作记忆等认知任务密切相关，本研究探讨在 G/NG 任务态下抑郁症患者的抑制控制网络 low-gamma 频段效能连接差异，以及异常功能连接值与患者临床特征的相关性，以其寻找识别患者抑制行为障碍发生可能的生物学标记。

方法 招募 2015 年 1 月至 2023 年 04 月在南京医科大学附属脑科医院住院的 50 例单相抑郁症患者，以及周围地区的性别、年龄、受教育程度相匹配的 48 例健康对照者。两组受试者执行 go/nogo 任务进行脑磁图信号采集。提取所有受试执行 nogo 任务—抑制行为的信号，采用进行预处理与源重建。根据研究假设，选取右额下回-前运动辅助区（pre-supplementary motor area，preSMA）-左初级运动皮层（primary motor cortex area，M1）三个脑区作为感兴趣区，以 low-gamma（30-50Hz）波为感兴趣频段，提取 0-900ms 的时间序列，利用格兰杰因果模型（Granger causal model，GCM）计算各感兴趣脑区之间的效能连接值。把有统计学差异的功能连接分别与患者组的 HAMD17 总分、阻滞因子分、发作次数、总病程进行皮尔森相关分析。本实验脑磁影像数据结果用 matlab2012b 软件进行处理，全部数据结果用 SPSS24.0 软件进行统计分析。

结果 1）双样本 t 检验示，与正常对照组相比，抑郁症患者在 NG 任务下执行抑制行为时，preSMA-左 M1（P=0.021，FDR 校正）、右 IFG-preSMA（P=0.014，过 FDR 校正）存在效能连接异常，显著下降。 2）相关分析示，抑郁症患者在 low-gamma 频段的 preSMA-左 M1，右 IFG-preSMA 效能连接与 HAMD17 总分（r=-0.412，P=0.017）、发病次数（r=-0.614，P=0.021）和认知因子分（r=-0.698，P=0.017）均呈正相关。

结论 在 Nogo 任务下，抑郁症患者的抑制控制网络活动异常，尤其是右 IFG-preSMA-左 M1 通路效能连接较正常对照组减弱。这些提示抑郁症患者抑制控制功能损害的特异性变化，本研究进一步发现抑郁症患者的功能连接与 HAMD17 总分、发病次数和阻滞分子分呈负相关，提示这条功能连接与患者临床疾病严重程度等临床特征相关，提示该通路效能连接异常或可作为区分抑郁症与正常组的影像学指标。

伴自杀风险单双相抑郁患者认知加工特征的眼动研究

李昊伦[1,2] 李凌江[1] 张燕[1]
1.中南大学湘雅二医院
2.南京脑科医院

目的 1.通过眼动技术探索伴有自杀风险的单、双相抑郁患者的认知加工特征；2.整合动态眼动指标与临床自评指标，验证经典的自杀认知加工理论。

方法 1.建立具有自杀主题的自由视图(free-viewing)眼动任务范式(同时呈现自杀、消极、积极、中性的情绪刺激)，记录并观测被试在多重情绪效价矩阵下的视觉偏好及眼动反应。研究入组 76 名有自杀未遂史的抑郁患者（SA），66 名无自杀风险的对照组抑郁患者（ND）和 105 名健康被试(HC)，通过方差分析、时程分析等方法比较认知加工早期和后期的眼动反应和动态认知等变化；2.利用结构方程建模(Structural Equation Modeling)，结合自杀意念、绝望感、自杀行为等临床指标和眼动指标，对自杀认知理论进行模型验证性分析。

结果 1.与无自杀抑郁患者和健康对照组相比，有自杀未遂史的抑郁患者(SA)在认知早期和后期都表现出对自杀刺激的注意偏倚，表现为更多的早期（473ms vs 405ms）和整体注视时长(6061ms vs 3959ms)。两组抑郁被试(SA, ND)在对自杀图片的首注视点分布占比、首注视点潜伏期和解离潜伏期上并无明显差别，敏感性分析结果提示研究被试的人口学、临床等因素对自杀注意偏倚无明显混淆效应；2.基于自杀认知理论建立的结构方程模型(SEM)拟合程度整体良好，模型中所有路径系数均显著($p<0.05$)。

结论 1.伴有自杀风险的单、双相抑郁患者对自杀信息的认知偏倚发生在其信息加工的中-后阶段，这可能与精细认知加工过程有关；2.眼动指标和临床数据为自杀认知理论提供了客观的“生物-心理”依据，验证了该理论在实际临床样本及综合评价指标中的有效性，并揭示了绝望感、自杀认知偏倚、自杀认知固着等认知易感因素在自杀发生发展中的关键作用。

Histological Disruption of Microstructural Covariance Network in Atypical Depression

Huifeng Zhang[1], Rubai Zhou[1], Wenxian Lu[1], Ye Wu[2], Daihui Peng[1]
1.Division of Mood Disorders, Shanghai Mental Health Center, Shanghai Jiao Tong University School of Medicine, Shanghai, China
2.School of Computer Science and Technology, Nanjing University of Science and Technology, Nanjing, China

Objective The symptom heterogeneity of major depression, in conjunction with etiological heterogeneity, is hindering progress toward patient-specific treatment strategies and course trajectories. Compared to non-atypical depression, atypical depression (AD) showed more severe, recurrent, and lengthy depression episodes, as well as high rate of psychiatric comorbidities and obesity-related metabolic syndrome. It has thus become crucial to disentangling MDD heterogeneity and gain a better understanding of endophenotypes for AD.

Methods The diffusion MRI (dMRI) images were acquired from 50 AD patients, 97 non-AD patients, and 50 healthy controls (HCs). Then, we used a diffusion MRI-based soma and neurite density imaging, namley intra-soma volume fraction index and intra-neurite volume fraction index, that unveil histological features of brain cyto- and myelo-architecture, and performed microstructural co-

variance network to reflect the triggering effect of neuropathological epicenters (i.e., core hubs).

Results Microstructural covariance network reveal abnormal cortico-limbic interactions, especially mPFC-striatum pathway, in both intra-soma volume fraction and intra-neurite volume fraction among AD patients, non-AD patients, and HCs. For post-hoc analysis, compared with non-AD patients, AD patients showed attenuated intra-soma volume fraction in R.caudal anterior cingulate. Furthermore, these microstrutural morphological features in epicenters were significantly correlated with atypical features scores.

Conclusion Incorporating a biophysical diffusion modeling in dMRI methods to map the histological properties of histological features of brain cyto- and myelo-architecture in vivo, and specifically the triggering effect of mPFC-striatum pathway in whole brain disconnections, would have important effects for our understanding of atypical and non-atypical depression.

关键字：atypical depression; diffusion magnetic resonance imaging; non-invasive soma and neurite density imaging; microstructural covariance network.

环状 RNA 结合多模态脑影像在抑郁症诊断和早期疗效预测中的价值及作用机制初探

陈刚[1,2] 居敏姿[3] 姜文颢[2] 孙太鹏[1,2] 蒋丽华[1] 袁勇贵[2]

1.淮安市第三人民医院
2.东南大学附属中大医院
3.东南大学医学院

目的 通过发现队列筛选出抑郁症（MDD）和健康对照（HC）之间差异表达的 circRNA；分析 circRNA 对 MDD 患者多模态脑影像的影响以及二者结合在 MDD 诊断和早期疗效预测中的价值。

方法 6 例 MDD 和 6 例 HC 用于 RNA 高通量测序，15 例 MDD 和 15 例 HC 用于测序结果的验证；差异表达的 circRNAs 在另一个包括 86 例 MDD 和 53 例 HC 的独立验证队列再次进行验证。对患者的脑影像指标进行了主成分分析（PCA），共获得 8 个主成分因子。通过典型相关分析（CCA）分析 circRNA 组与主成分因子组之间的相关关系；采用交互作用和中介分析探讨 circRNA 在脑影像特征和 MDD 临床变量关系中的作用。

结果 发现队列共筛选出 3 个差异表达的 circRNA；在独立验证队列中进行验证发现：MDD 患者血浆的 circATF7IP（Z=6.18，P<0.001）、circPARN（Z=4.48，P<0.001）、circZBTB25（Z=6.35，P<0.001）显著升高。脑结构的主成分因子与 circATF7IP 以及 circZBTB25 显著正相关；脑网络因子与 circATF7IP 显著正相关而脑功能因子与 circPARN 显著负相关。原始的多模态脑影像特征联合 circRNA 联合后对 MDD 诊断的 AUC 达到了 0.988，敏感性 89.5%，特异性 100%；对早期疗效均预测的 AUC 为 0.867，敏感性为 84.2%，特异性为 81.2%。进一步采用 PCA 提取的脑影像因子联合 circRNA 的预测结果仍表现稳定，对 MDD 诊断的 AUC 为 0.98，敏感性为 93.0%，特异性为 96.2%，对早期疗效均预测的 AUC 为 0.812，敏感性为 72.5%，特异性为 82.4%。circZBTB25、circPARN 与疾病的交互作用共同调节 MDD 患者的皮质结构。circRARN 对网络间功能连接（FC）与抑郁严重程度、网络间 FC 与 2 周后快感缺水平的关系中都起到中介调节作用；其次，circRARN 还对脑功能改变与抑郁严重程度、脑功能改变与 2 周后快感缺水平之间的关系起到中介调节作用。

结论 多模态脑影像特征和 circRNA 联合后对 MDD 的诊断和早期疗效均具有较好的预测效能；circRNA 可以通过调节大脑的结构和功能影响 MDD 的发生和发展。

线粒体基因在抑郁症患者外周血中表达上调并与抗抑郁疗效有关

曾端 李华芳*
上海市精神卫生中心

目的 线粒体功能障碍与单胺、炎症、神经可塑性等相互作用，被认为是 MDD 的基础。“线粒体稳态失衡假说”在抑郁发生机制中引起了越来越多的关注，该假说认为抑郁症是一种线粒体能量代谢疾病，可能与抑郁症患者大脑能量代谢异常有关，而在早期阶段逆转线粒体功能障碍可能为治疗干预提供新目标。虽然有越来越多的证据表明线粒体生物能学和 MDD 有关，但目前还未有明确的线粒体表型或生物标记物作为指导，需进一步研究明确治疗靶点。

方法 选择 GSE98793（128 例 MDD vs. 64 例对照）、GSE146446（96 例度洛西汀 8 周治疗前后）芯片数据集作为主要研究对象。从 MitoProteome 及 A Human MitoCarta3.0 在线数据库中下载线粒体相关基因（MRG），共 1902 个基因。利用 R 语言中的 limma 包、samr 包对 MDD 及健康对照、8 周治疗前后分别进行差异基因表达分析。使用在线工具 DAVID 对基因进行 GO term 及 KEGG 通路分析。将 2 个数据库差异基因与线粒体基因取交集，并采用 Lasso 回归筛选与 MDD 及抗抑郁疗效最相关的差异 MRG，并计算线粒体基因评分来构建疾病的判别模型。

结果 抑郁病例-对照组间共有 3078 个基因，与线粒体基因取交集后共发现 253 个 MRG。GO term 分析发现差异 MRG 主要富集在 ATP 结合、核糖体结构成分等。KEGG 通路分析发现 MRG 主要富集在代谢途径、活性氧等通路。度洛西汀有效组共 2469 个 8 周治疗前后差异基因，与 253 个线粒体相关基因取交集后共发现 21 个 MRG，LASSO 回归筛选出 7 个与抑郁症及抗抑郁疗效最相关的候选 MRG，并通过构建线粒体评分模型来判别 MDD-对照及度洛西汀治疗有效-无效的预测模型。结果发现线粒体评分在 MDD 患者全

血中显著升高,8 周治疗后线粒体评分降低,判别 MDD 和对照组的曲线下面积（AUC）为 0.730（95%CI 0.658-0.802）。将样本按 3:7 比例进行内部验证，发现线粒体评分仍能判别两组，并在其他数据库中 GSE19738（全血: 33 MDDvs. 34 对照）进行验证，发现线粒体评分判别 MDD 和对照组的 AUC 为 0.734。

结论 线粒体基因评分在抑郁症患者外周血中明显升高，8 周抗抑郁治疗后降低，可能作为抑郁症及抗抑郁疗效的外周诊疗标志物。

生物皮肤电势特征用于区分抑郁症、双相抑郁及健康对照的判别研究

吕海龙[1] 黄辉敏[2] 何佳栋[3] 洪万初[4] 邵嘉敏[1] 朱健峰[4] 朱盛[4] 李宇波[3] 胡少华[1,2]
1.浙江大学医学院附属第一医院
2.温州医科大学精神医学学院
3.浙江大学
4.瑞安市第五人民医院

目的 研究抑郁症、双相情感障碍（抑郁发作）等患者在不同类型情绪刺激任务下皮肤电势的差异，明确依据任务态下皮肤电势特征区分患者与健康对照的准确率，并探索皮肤电势特征与个体氧化应激指标、激素水平、免疫因子等生物学指标的相关性。

方法 本研究入组双相情感障碍抑郁相患者（BPD）77 例，抑郁症患者（MDD）53 例和健康志愿者（HC）79 例。所有受试者需完成一般人口学、临床资料、量表评估以及认知功能测试。此外，病例组根据意愿完成氧化应激指标等生物学指标采集。同时，设计自由观看范式(a)、正负情绪范式(b)、语义刺激范式(c)、情景干预范式(d)、情绪诱发范式(e)、语境刺激范式（f）等 6 种不同类型的情绪刺激任务范式，采集所有被试任务状态下的左手部皮肤电势数据。采用 SPSS 软件进行一般资料组间分析，采用 R 语言进行相关性分析，采用 Python3.1 软件基于支持向量机作为最佳判别模型，在 BPD 患者、MDD 患者以及健康对照进行探索性疾病分类判别。

结果 1.BPD 患者、MDD 患者在任务范式 a、b、c、d、e 中均被检测出皮肤电势差异。其中，在范式 a、b、c、d 中皮肤电势特征值表现为 HC＜BPD＜MDD，且抑郁症与健康对照之间存在显著差异（p＜0.05）；而在范式 e 中，皮肤电势特征值表现为 MDD＜BPD＜HC，且抑郁症与健康对照之间存在显著差异（p＜0.05）。2.基于 SVM 的判别模型，依据所有范式下的皮肤电势特征，区分 MDD 与 HC 的准确率为 78%，敏感度为 74%，特异度为 82%；基于 SVM 的三分类判别模型，区分 BPD 患者、MDD 患者、健康对照的准确率为 59%，敏感度为 59%，特异度 79%。3. 在多个任务范式（b、c、e、f）中，BPD 患者的皮肤电势时频域特征值均与氧化应激指标前白蛋白呈正相关（P ＜0.05）；在多个任务（a、b、e、f）中，MDD 患者的皮肤电势时频域特征值均与氧化应激指标尿酸、间接胆红素、直接胆红素、白蛋白、前白蛋白等呈正相关（P ＜0.05）。

结论 1.在 6 个情绪刺激任务中，与健康对照比较，MDD 患者、BPD 患者均存在左手部皮肤电势差异，且与机体氧化应激水平如尿酸、前白蛋白等水平相关。 2.基于皮肤电势的预测模型可以依据任务态皮肤电势特征区分 BPD 患者、MDD 患者、健康对照，提示皮肤电势可能是情感障碍潜在的生物学标记物。

基于全息希尔伯特谱探究无抽搐电休克治疗(MECT)后抑郁症患者脑电图变化

丁楷模[1] 岳壮[2] 袁维帅[3] 朱俊[1] 张丹伟[1] 李国海[1] 李素霞[2]
1.镇江市精神卫生中心
2.北京大学
3.自然资源部第一海洋研究所

目的 本研究基于全息希尔伯特谱分析方法（HHSA）量化脑电，评估抑郁症患者经无抽搐电休克治疗（MECT）后静息态脑电图（RS-EEG）的变化，探讨 MECT 的脑电机制。

方法 在本研究中，共纳入 63 名接受 5-8 次 MECT 治疗的抑郁症患者（男 19 例、女 43 例，平均年龄(37.50±6.36)）。采用汉密尔顿抑郁量表（HAMD-24）、汉密尔顿焦虑量表（HAMA）评估 MECT 治疗前、每次 MECT 治疗后、随访期抑郁焦虑严重程度变化。采用 EGI（128 导盐水电极）记录患者 MECT 治疗前、每次 MECT 治疗后、随访期的静息态脑电图。按国际 10-20 电极分布系统，取匹配的 27 个脑电电极数据进行预处理，取 150s 闭眼数据，计算全息希尔伯特谱（Holo-Hilbert?spectral，高维频率谱，包括载波频率 FM 和调幅频率 AM）。将 MECT 治疗前脑电的全息希尔伯特谱分别与每次 MECT 治疗后、每次随访时的脑电全息希尔伯特谱，做配对 T 检验；将全部实验期间脑电的全息希尔伯特谱感兴趣区域（Region of Interest，包括通道、AM 频率范围、FM 频率范围）与汉密尔顿焦虑量表、抑郁量表做皮尔逊相关性分析。

结果 （1）与 MECT 治疗前基线相比，随着 MECT 治疗次数的增加，抑郁患者脑电的全息希尔伯特谱低频（AM 1/128~4Hz,FM 1/2~8Hz）能量显著升高，高频（AM 1/16~32Hz,FM 8~64Hz）能量显著下降，其中第一次 MECT 治疗后低频显著升高脑区为左右中央区，高频显著降低脑区为前额叶区，随 ECT 次数增加，显著改变的脑区向全脑区域发展；（2）与 MECT 治疗前基线相比，MECT 治疗结束后，随着随访时间的推移，脑电低频能量升高、高频能量下降的效应在不断减小（即低频能量回落，高频能量回升），随访至 3 个月后基本消失；（3）汉密尔顿抑郁量表（HAMD-24）、汉密尔顿焦虑量表（ HAMA）与脑电的全息希尔伯特谱低

频能量显著负相关，与高频能量显著正相关。

结论 MECT 治疗升高脑电全息希尔伯特谱低频能量，降低高频能量，且患者症状与低频能量负相关，与高频能量正相关；全息希尔伯特谱量化脑电图有助于评估 MECT 治疗效果，辅助临床疗效评估。

关键字：抑郁症，无抽搐电休克治疗（MECT），静息态脑电图（RS-EEG），全息希尔伯特谱分析方法（HHSA）

Intermediary Roles of Prospective Memory and Retrospective Memory in The Comorbidity of Depression and Pain

高桦[1] 夏清荣[1] 张许来[1] 陈苑苑[1] 闫军伟[1] 郜见亮[1] 张楼凤[1] 张劼[1] 王克明[1] 李超[1] 鞠培俊[2] 朱翠珍[1]
1.合肥市精神病医院
2.上海市精神卫生中心

Objective The treatment of patients who suffer from depression and physical pain remains a major challenge because of the complex interplay between maladaptive cognition with the affective and physical aspects of pain. However, the exact cognitive mechanisms involved in the maintenance and reinforcement of depression and pain-related disability are unclear. Prospective memory (PM) and retrospective memory (RM) are negatively affected by many psychotic diseases and their complications in patients with major depressive disorder (MDD) and chronic pain (CP) are still unknown.

Methods A total of 124 participants were included in this study and divided into three groups: comorbidity group (patients with depression and chronic pain, n = 40), depression group (patients with depression but without chronic pain, n = 42), and healthy controls (n = 42). The grouping method is described in the fifth edition of Diagnostic and Statistical Manual of Mental Disorders and the International Association for the Study of Pain. The Hamilton Depression Rating Scale-24 (HAMD-24) and Beck Depression Inventory-II (BDI-II) were used in evaluating the severity of depression, and the Pain intensity numerical rating scale and Montreal Cognitive Assessment-Basic Section were used in assessing pain intensity and global cognitive function, respectively. Short-Form McGill Pain Questionnaire-2-Chinese was used in estimating pain-related features. Lastly, the Prospective and Retrospective memory questionnaire was used in evaluating memory failure in everyday life.

Results The impairments of PM and RM remarkably differed among the three groups ($F = 7.221$, $P \leq 0.001$; $F = 7.221$, $P \leq 0.001$) and were severe in the comorbidity group. Spearman correlation analysis revealed positive correlation between the PM with continuous pain and neuropathic pain ($R = 0.431$, $P \leq 0.01$; $R = 0.253$, $P = 0.022$), and RM was positively correlated with continuous pain and neuropathic pain ($R = 0.415$, $P \leq 0.01$; $R = 0.247$, $P = 0.025$). Regression analysis indicated that a significant positive relationship between total neuropathic pain and BDI total score ($\beta = 0.300$, $t = 2.889$, $P = 0.005$), and negative effects were associated with marital status ($\beta = ?0.312$, $t = ?2.977$, $P = 0.004$). In addition, a significant positive relationship was found between affective descriptors and total BDI score ($\beta = 0.594$, $t = 6.600$, $P \leq 0.001$). An examination of the mediator pathways revealed the indirect role of PM（Indirect effect: 0.144, 95%CI：0.009 to 0.358） and RM （Indirect effect: 0.186, 95%CI：0.022 to 0.434）in patients with comorbid MDD and CP. Overall, we clearly demonstrated that PM and RM can serve as predictive factors for these patients.

Conclusion Patients with comorbid MDD and CP are presented with more PM and RM impairments than patients with MDD but without CP. PM and RM are possibly mediating factors that affect the etiology of comorbid MDD and CP.

关键字：depression, chronic pain, comorbidity, prospective memory, retrospective memory

思维反刍的纵向研究：跨诊断的情感障碍内表征

张倩倩 赵小天 覃雅琦 柳进* 张燕*
中南大学湘雅二医院

目的 通过纵向研究设计，在多种情感障碍间验证思维反刍的跨诊断意义，并通过比较多种情感障碍达到临床缓解后思维反刍的变化，来进一步探究其跨诊断意义和状态独立性特征。

方法 本研究为纵向队列研究，样本来源于中南大学湘雅二医院精神障碍门诊，数据收集时间为 2020.9.13 至 2022.08.01，共计纳入重性抑郁障碍、双相情感障碍、强迫障碍、广泛性焦虑障碍及健康被试 433 人。采用反刍反应量表(RRS)、汉密尔顿抑郁评定量表(HAMD)、汉密尔顿焦虑评定量表(HAMA)、耶鲁布朗（Y-BOCS）和杨氏躁狂量表（YMRS）对重性抑郁障碍、双相情感障碍、强迫障碍、广泛性焦虑患者进行各疾病主要症状和结局指标发作期和缓解期的测量和比较，从而探究思维反刍在不同情感障碍间的得分差异及其与各疾病主要症状间关系。

结果 通过进行情感障碍与健康被试、情感障碍组间比较发现，思维反刍总分（RRS-total）、强迫思考（RRS-brooding）及反省深思(RRS-reflection)在各疾病组基线分布无差异（$P>0.05$），仅双相情感障碍躁狂发作状态下 RRS-total 和 RRS-brooding 均值稍低于其他疾病组，但仍高于健康被试（$P<0.001$）。治疗 8 周后，除躁狂发作组，思维反刍各因子得分均值在不同疾病组间分布无显著差异，且均高于健康被试，提示思维反刍在多种情感障碍中存在跨诊断意义（<0.001）。进一步将各疾病组分为缓解组和未缓解组进行亚组分析发现，思维反刍在各疾病主要临床症状达到缓解后仍存在 8 周 RRS-total、RRS-brooding 和 RRS-reflection 得分显著高于健康被试，提示思维反刍具有与诊断类别无关的状态独立性。

结论 综上，无论是发作期还是缓解期，思维反刍在多种情感障碍间的严重程度无显著差异，是具有跨诊断意义的临床表征；随着原有疾病治疗的变化，思维反刍的严重程度表现出与情感障碍主要症状缓解不一致的特点，是多种情感障碍共同的内表征，具有状态独立性。

关键字：思维反刍，情感障碍疾病，跨诊断，状态独立性

运动辅助疗法对抑郁障碍患者自主神经功能的影响

夏叶 张函 胡彩虹 杨渊*
华中科技大学附属同济医院

目的 在标准抗抑郁药物治疗基础上，探索规定剂量的轻中度有氧运动辅助疗法对抑郁障碍患者自主神经功能的影响。

方法 本研究为一项随机对照干预试验。于 2020 年 12 月至 2022 年 10 月在同济医院焦虑抑郁专科门诊，纳入符合 DSM-V 抑郁障碍诊断标准的轻中度抑郁障碍患者。纳入的 96 例受试者以随机化方式按照 1:1 比例分为运动组（48 例）和对照组（48 例）。所有受试者均予以 150mg 剂量的文拉法辛进行药物治疗，同时运动组再加以规定剂量的有氧运动（150 min/周、3~5 次/周、心率达到最大心率（220 次/min-年龄）的 64%~76%）辅助治疗。采用 24 小时长程动态心电图（Holter）、动态血压（BPM）及瞳孔对光反射检测运动组和对照组受试者在基线和治疗 3 个月后的自主神经功能状况。数据分析使用 SPSS 25.0 进行，采用协方差分析对干预后两组间差异进行统计分析，以 $P<0.05$ 认为差异具有统计学意义。

结果 运动组和对照组分别有 36 例、32 例受试者完成了 3 个月的干预治疗。（1）在符合研究方案分析（PP）中，运动组与对照组在心率变异性（HRV）频域指标的总功率（F=6.986，P=0.011）、高频功率（F=7.205，P=0.010）、低高频比值（F=7.845，P=0.007）、规一化低频功率（F=7.524，P=0.009）、规一化高频功率（F=6.889，P=0.012）上的差异均显示出了显著统计学意义，运动组 HRV 水平相比对照组显著更高。但在意向性分析（ITT）中，HRV 及 BPM 指标在运动组与对照组之间的差异均未显示出统计学意义。（2）在 PP 分析和 ITT 分析中，瞳孔对光反射指标在运动组与对照组之间的差异未显示出统计学意义。但在 PP 分析中，运动组相比对照组的 PD1（5.09±0.18 vs. 5.05±0.22）、PD10（3.91±0.15 vs. 3.64±0.19）、PD100（3.05±0.11 vs. 2.71±0.14）和瞳孔收缩速度（0.48±0.02 vs. 0.44±0.02）均值更高，瞳孔舒张速度（0.37±0.02 vs. 0.40±0.03）均值更低，两组间的均值显示出了一定的差异倾向。

结论 本研究规定剂量的有氧运动干预下，能够调节抑郁障碍患者的自主神经功能，提高 HRV 水平，使副交感神经活动更高、交感神经活动降低。

Objective The delayed-onset effects of antidepressants may increase the risk of suicide in patients before they take effect. Accumulating evidence shows that the restriction of the blood-brain barrier(BBB), the inhibition of hippocampal neurogenesis, and the reduction in neuroplasticity play vital roles in the delayed. This study uses tetrahedral DNA nanostructures (TDNs) as a drug delivery system that can effectively promote the proliferation of neural stem cells and penetrate the BBB. By combining with classical antidepressant fluoxetine (FLX) to construct a nanoscale complex (TDNs&FLX), which can exert anti-depressive effects at the early stage of treatment on mice chronic depression model.

Methods Firstly, we used multiple methods to characterize the successful fabrication of TDNs&FLX complex. Secondly, we constructed chronic unpredictable stress (CUS) induced mice depression model and divided them into five different group. Then we applied two stage treatment and compared their anti-depressive effects in several behavioral tests such as weight change, sucrose preference(SPT), open field test(OFT), tail suspension test (TST), and forced swim test (FST). Furthermore, we prepared bromodeoxyuridine(BrdU)-labeled and Golgi-stained hippocampal brain slices to evaluate neurogenesis and neuroplasticity. Finally, we collected hippocampal tissue and perform RNA sequencing to elaborate potential molecular biological changes.

Results We verify that TDNs&FLX is successfully loaded by several characterization techniques. We also find that TDNs&FLX was well-distributed in brain tissue through in vivo imaging system. Besides, we observe no abnormal pathological changes in the H&E-stained major organs, confirming its relative biological safety. The subsequent behavioral tests demonstrate TDNs&FLX exert therapeutic effects in SPT,OFT,TST and FST compared with Case-Vehicle and all p value <0.05). Moreover, BrdU-labeled brain slices immunofluorescence and Golgi-staining suggest statistical significance (p<0.05) between Case-TDNs&FLX and Case-Vehicle indicate promotion of neural precursor cells and enhancement of dendritic complexity and dendritic spine density. Additionally, RNA-seq and downstream enrichment analysis show the core genes and related pathway mainly involve in neurogenesis, neuroplasticity, and neuropeptide signal.

Conclusion In this study, we synthesized a nanoscale complex TDNs&FLX which can increase newborn neural precursor cells and repair neuroplasticity while exerting early therapeutic effects. Pure TDNs lack long-lasting therapeutic benefits, and free FLX resulted in delay therapeutic outcomes. These findings propose a new way to modify classic antidepressants with new-style nucleic acid nanonanomaterials and advance DNA-based nanomedicine development for depression.

精神分裂症 NMDAR 抗体水平及其与临床特征和治疗应答的关联

仝景慧 陈闻锦 周衍芳 谭云龙*
北京大学回龙观临床医学院，北京回龙观医院

目的 精神分裂症（SCZ）是一种高度复杂性和异质性、病理生理机制未明、约 30%患者治疗应答欠佳的重性精神障碍。N-甲基-D-天冬氨酸受体（NMDAR）抗体因其独特的自身免疫特性以及对 NMDAR 的可逆性影响可能介导了 SCZ 的发病以及治疗应答。由于 NMDAR 对白质轴突髓鞘化和信号转导至关重要，我们推测质白质完整性受损可能在 NMDAR 抗体与 SCZ 治疗抵抗的关系中发挥作用。

方法 本研究分为两部分，第一部分纳入首发 SCZ（FES）患者 110 例，健康对照（HC）50 例。测定血清 NMDAR 抗体水平以及患者组的精神病理症状（PANSS）和认知功能（MCCB），比较 NMDAR 抗体水平的组间差异以及 NMDAR 抗体与精神病理症状、认知功能的相关性。第二部分纳入 TRS 患者 50 例、NTRS 患者 45 例、健康对照 90 例，检测血清 NMDAR 抗体水平和白质弥散张量成像各向异性分数（FA）以及区域脆弱性指数（RVI）。比较三组间的 NMDAR 抗体水平及白质 FA 值、RVI 值，并进一步做相关性分析。

结果 1.FES 组的血清 NMDAR 抗体水平显著高于 HC 组（P=0.002）。在 FES 组，血清 NMDAR 抗体水平与 PANSS 阳性症状分量表分（r=0.25，P=0.016）、阴性症状分量表分（r=0.29，P=0.007）和 PANSS 总分（r=0.29，P=0.006）显著正相关；与 MCCB 的信息处理速度（r=-0.39，P<0.001）、工作记忆（r=-0.36，P<0.001）、言语学习和记忆维度得分（r=-0.37，P<0.001）以及 MCCB 总分（r=-0.38，P<0.001）显著负相关。2. 血清 NMDAR 抗体水平在 TRS 组最高，显著高于 NTRS 组（P=0.02）以及 HC 组（P<0.001）。全脑白质平均 FA 值在 TRS 组最低，白质 RVI 值在 TRS 组最高。在 TRS 组，血清 NMDAR 抗体水平与全脑白质平均 FA 显著负相关（r=-0.37，P=0.03），与区域白质束的相关性在胼胝体膝部最强（r=-0.50，P=0.0021），与白质 RVI 显著正相关（r=0.36，P=0.04）。相反，上述相关性在 NTRS

组均不显著。

结论 本研究提示NMDAR抗体可能在SCZ的发病以及治疗机制中发挥至关重要的作用，强调了SCZ患者白质微结构损伤的潜在NMDAR机制，这可能导致他们对抗精神病药物的治疗抵抗性。

精神病临床高危和首发患者错误监控缺陷的脑电低频振荡机制研究

洪祥飞 徐丽华 唐莺莹 唐晓晨 胡业刚 钱镇颖 魏燕燕 崔慧茹 张天宏 李春波 王继军*
上海交通大学医学院附属精神卫生中心

目的 错误监控功能受损是精神分裂症的一项重要认知缺陷。研究表明，处于精神病发病前驱期的临床高危人群和精神病首发患者已表现出错误监控功能缺陷，然而其内在神经机制仍不明确。基于健康人群的研究提示，脑电低频delta（2-4 Hz）和theta（4-8 Hz）节律振荡可能与错误监控的神经机制有关。本研究通过分析精神病临床高危被试和首发患者在错误监控过程中的脑电低频振荡能量，探讨从精神病前驱期至首次发作期错误监控缺陷的脑电低频振荡机制。

方法 本研究纳入49名健康对照、32名精神病首发患者和68名临床高危被试，采用阳性与阴性症状量表评定高危和首发患者的症状严重程度。记录被试在一项修改版Flanker任务中的64通道头皮脑电信号，采用时频分析方法计算正确和错误反应试次诱发的脑电delta和theta振荡能量。将受试者的年龄和教育年限作为协变量，利用混合设计方差分析考察正确和错误反应试次以及三组被试间的脑电低频振荡能量差异。

结果 （1）脑电delta频段：与正确反应试次相比，错误反应试次诱发的delta能量显著上升（p=0.032），且与受试者分组具有显著交互作用（p=0.003）；后续分析表明，与健康对照相比，错误和正确试次之间的能量差值在高危（p=0.005）和首发患者中显著下降（p=0.001），但高危和首发患者间无显著差异（p>0.4）。（2）脑电theta频段：与正确反应试次相比，错误反应试次诱发的theta能量显著上升（p=0.004），且无显著组间差异（p>0.8）或交互作用（p>0.5）。（3）相关性分析：在整个样本中（包括高危与首发患者），脑电delta频段能量与阴性症状（r=-0.21，p=0.034）和冲动症状（r=-0.21，p=0.034）评分之间具有显著负相关，说明阴性和冲动症状越明显的患者，其脑电delta频段能量越低。

结论 本研究首次揭示了错误监控过程中脑电低频振荡能量从精神病前驱期至首次发作期的变化特征。与健康对照相比，高危和首发患者在错误监控过程中的脑电delta振荡能量显著下降，而theta振荡能量并无显著衰退。高危和首发患者脑电delta振荡能量下降可能与其错误监控缺陷以及冲动攻击性的神经机制有关。

2.Hefei Fourth People's Hospital
3.Anhui Mental Health Center
4.Department of Maternal, Child & Adolescent Health, School of Public Health, Anhui Medical University

Objective Recent studies have linked ambient air pollution to depression. Anhedonia is a core symptom of depression which severely impacts on prognosis. The present study aims to investigate the association of PM2.5 and PM10 exposure with anhedonia in depressed patients.

Methods A total of 538 patients with depression who were hospitalized at the Fourth People's Hospital of Hefei between June 2017 and December 2021 were included. We estimated ambient particulate matters exposure, including PM2.5 and PM10, using a satellite-based spatiotemporal model at a resolution of 1 km2. The revised Physical Anhedonia Scale (RPAS) and the revised Social Anhedonia Scale (RSAS) were evaluated. The association of ambient particulate matters and anhedonia was examined using multiple linear regression models, adjusted for potential confounders.

Results We observed that exposure to PM2.5 were significantly associated with increased RSAS score and RPAS score, with the major effect in the 12-month exposure window (β = 1.238, 95%CI: 0.353, 2.123) and 18-month exposure window (β = 1.888, 95%CI: 0.699, 3.078) respectively. Meanwhile, PM10 levels was also significantly associated with increased RSAS score and RPAS score, with the major effect in the 18-month exposure window (β = 1.220, 95%CI: 0.439, 2) and 3-month exposure window (β = 1.602, 95%CI: 0.062, 3.143) respectively. Subgroup analysis showed that both PM2.5 and PM10 were significantly associated with anhedonia in females, patients < 40 years old, low family income group, and those who had a higher educational level.

Conclusion Our study suggests that long-term PM2.5 and PM10 exposure are associated with more severe anhedonia in patients with depression. These associations were different in subgroup by age, gender, family income and educational level.

4.Institute of Mental Health, Fudan University
5.Shanghai Key Laboratory of Psychotic Disorders, Shanghai Mental Health Center, Shanghai Jiao Tong University School of Medicine

Objective Individuals with schizophrenia have a lower than average life expectancy, largely due to the high prevalence of cardiometabolic comorbidities. There is an unmet public health need to identify schizophrenia patients who have a high risk of rapid antipsychotic-induced weight gain (AIWG) and determine the lipid profile and potential lipid biomarkers of AIWG.

Methods This study was a randomized controlled trial in China based on the sequential multiple-assignment randomized trials to compare antipsychotic treatments (SMART-CAT). All patients were randomly assigned to olanzapine, risperidone, perphenazine, amisulpride or aripiprazole for 8 weeks. Here, we applied untargeted lipidomics absolute-quantitative analysis at baseline and after 8 weeks of antipsychotic treatment in 80 patients. To evaluate the effects of AIWG on lipid profile, 25 patients with ≥7% weight changes (weight gain, WG) and 28 patients with <3% weight changes (weight stable, WS) were investigated, separately.

Results We found that baseline CerP(d40:3) and PC(20:1/22:6) were positively associated with weight change at follow-up (r>0.4, pFDR<0.05). In addition, the independent signatures CerP(d40:3) and PC(20:1/22:6) were predictive of rapid weight gain in individuals with schizophrenia, with an area under the receiver operating characteristic curve (AUROC) of 0.76 (95% CI: 0.63-0.90), and 0.75 (95% CI: 0.62-0.88), respectively. Compared with baseline, levels of 48 differential lipid metabolites (fold change > 1.2, VIP> 1 and pFDR < 0.05) were significantly higher in the WG group. Interestingly, no differential lipid metabolites were identified in the WS group. The LASSO regression model identified 18 AIWG lipid signatures, including 2 ChEs, 1DG, 12PCs, 1PG, 1PI, and 1SM, with the ChE(16:1) contributing the most. Furthermore, the level changes of ChE(16:1) were positively associated with weight change（r=0.67，pFDR<0.05）.

Conclusion Collectively, these data suggest that lipid profile may serve as predictors of rapid weight gain in schizophrenia and provide useful markers for AIWG intervention.

Adverse Childhood Experiences Are Associated with Psychiatric Problems and Intelligence in Adolescents From The ABCD Study

张梦婷 王强* 谢敏
四川大学华西医院

Objective This study aimed to investigate the relationship between adverse childhood experiences(ACEs) and psychiatric problems and intelligence in adolescents and explore if brain volume in region of interest mediates the association of ACEs with intelligence.[Methods]We analyzed reports of 10,572 children of 10–11 years old from the Adolescent Brain Cognitive Development (ABCD) datasets in order to study the relationship between ACEs and psychiatric problems and intelligence in adolescents. Multiple linear regression analyses were used to examine associations between ACEs, intelligence, sleep disorders and brain volume in region of interest. The associations between ACEs and putamen volume and IQ were examined using spearman correlation analysis. Logistic Regression analyses were conducted to examine the associations between different levels of ACEs and Child behavior checklist(CBCL), reports of internalizing problems, externalizing problems, total problems, depressive problems, anxiety disorder, somatic problems, ADHD, oppositional de?ant problems, conduct problems, sluggish cognitive tempo, obsessive-compulsive problems and stress problems. Five levels of ACEs were created: none, exposure to one ACE, exposure to two ACEs, exposure to three ACEs, exposure to four or more ACEs. The mediation analysis was conducted using the chain mediation model to explore the potential mediatory role of total putamen volume on full scale of IQ(FSIQ).

Results The results showed that ACEs were negatively and significantly related to sleep quality and neurocognition, especially for FSIQ (β=-0.025, R?=7.26, p < 0.001). Left and right putamen volume explained 29.55 and 33.60% of the total variance in ACEs by multiple linear regression analysis. Logistic regression analysis showed that the CBCL score was strongly associated with ACEs in each scale, and the association was stronger as ACEs number increased. Moreover, the association between ACEs and FSIQ was partly mediated by total putamen volume (proportion explained 7.49%).

Conclusion ACEs are associated with the development of mental health problems and lower scores on intelligence in adolescents. And the more ACEs, the stronger this correlation manifests. The effect of ACEs on intelligence may be mediated by the volume of the putamen. Implementing empirically supported policies and interventions that target ACEs may promote the mental health and intellectual development of children and adolescents.

Cognitive Heterogeneity and Structure Enriched Functional Networks Topological Deviations in Major Depressive Disorder

Yushun Yan Yu Wang Haochen Gong Huanhuan Fan Min Wang Ningdan Fan Yue Du Xiao Yang Jinxue Wei Xiaohong Ma*
Mental health center and laboratory of psychiatry, West China Hospital of Sichuan University

Objective Major depressive disorder (MDD) with cognitive impairments is common, but the heterogeneity in cognitive functions impedes the exploration of underlying biological deviations. The current research aims to identify possible cognitive dimensions of MDD and provide insight into topographic properties of dimension-specific brain networks.

Methods This was a case-control, cross-sectional study. Data were collected from Dec 17, 2013 to Oct 30, 2019 and analyzed from Jun 14, 2022 to Mar 28, 2023. Patients with MDD were recruited from the West China Hospital and healthy controls (HCs) were recruited from community. Participants were Han Chinese individuals aged between 18 to 65 years. Patients were suffering through current major depressive episode with 17-item Hamilton Depression Rating Scale more than 17 scores and unmedicated for at least two weeks. An automatic cognitive battery was employed and multimodal magnetic resonance images were acquired. A semi-supervised machine learning approach was applied to cluster dimensions of MDD with cognitive homogeneity. Individual difference structure co-variance network and probabilistic tractography white fiber network of brain cortex which was parcellated into 360 regions according to Human Connectome Project-Multimodal Parcellation atlas were constructed, and were aligned with corresponding sparse simplex functional network. Consequently, structure enriched functional networks (i.e., SFNGM and SFNWM) were generated. Global (i.e., global efficiency, assortativity, hierarchy, and synchronization) and nodal (i.e., local efficiency, shortest path length, clustering coefficient, degree centrality, and betweenness centrality) topographic metrics were calculated to investigate topological deviations between dimensions.

Results In MDD group, 103 (52.02%; mean [standard deviation, SD] age, 29.0 [9.65] years; female, 80 [77.7%]) patients were clustered into dimension 1 which presented widespread cognitive impairments while 95 (47.98%; mean [SD] age, 29.4 [9.70] years; female, 52 [54.7%]) were assigned into dimension 2 which presented cognitive preservations compared with 279 healthy controls (mean [SD] age, 27.2 [10.30] years; female, 177 [63.4%]). Regard mass-univariates comparisons, only synchronization of SFNGM among global metrics presented significant difference between dimensions (F = 7.230, P = 0.008), while all nodal metrics showed statistically similarity after false discovery rate correction. However, for multi-variates pattern analysis, all nodal topological metrics except betweenness of SFNWM (AUC = 0.629) exhibited better performances (AUCs range 0.736 to 0.967) in elastic net regression models, while all global metrics did not (AUCs < 0.615).

Conclusion Two distinct cognitive dimensions of MDD were detected. Nodal topographic properties of individual multimodal brain network integrating the whole brain regions facilitates the differentiation of dimensions.

CBS 蛋白调控 H2S 影响 GPX4 和 SLC7A11 表达缓解胶质细胞铁死亡发挥抗抑郁症的分子机制研究

吴晓朋* 熊建文 万齐根
江西省精神病医院

目的 抑郁症是一种常见的心理疾病，是以持久的心境低落为主要特征，同时伴有认知功能障碍、躯体症状，甚至有自杀企图或行为，严重者还可出现幻觉、妄想症等精神病症状[1]。随着社会经济的发展和生活节奏的加快，抑郁症发病率越来越高。世界卫生组织预测，截至目前，抑郁症已成为危害人类身心健康的第二大类疾病，仅次于冠心病。此外，抑郁症是造成全球非致命性健康损失的首要因素，其危害受到社会各界的广泛关注[3]。目前，该病发病机制仍不明确，多种因素均参与了抑郁症的发生、发展。临床尚缺乏有效的治疗手段。有研究证实内源性硫化氢（H2S）参与了多种神经系统疾病的发生、发展，而胱硫醚合成酶（Cystathionine beta-synthase，CBS）是细胞在同型半胱氨酸转化为半胱氨酸的过程中产生内源性 H2S 的主要限速酶之一。CBS 在精神疾病中的报道较少，因此再探究。本项目通过建立抑郁症小鼠及相关细胞，旨在从整体动物水平和细胞水平阐明 CBS 在抑郁症发展过程中的作用及其分子机制，为临床防治抑郁症提供新的思路及可借鉴的经验。

方法 募集抑郁症患者和年龄相当的健康者，各≥25 名，采取外周血，分离血清；临床水平研究 CBS 蛋白及 H2S 水平与抑郁症的相关性。以大鼠小胶质细胞为研究对象，细胞水平探究 CBS 蛋白调控 H2S 影响 GPX4 和 SLC7A11 表达缓解胶质细胞铁死亡的分子机制以及动物水平探究 CBS 蛋白调控 H2S 影响 GPX4 和 SLC7A11 表达调控铁死亡的发挥治疗抑郁症的潜在作用。

结果 发现 NaHS 确实能够减轻小鼠的抑郁样和焦虑样行为，主要通过减少铁沉积和氧化应激，增加 GPX4 和 SLC7A11 的表达，从而缓解小鼠的铁死亡水平。提出假说：CBS 蛋白调控 H2S 影响 GPX4 和 SLC7A11 表达，从而缓解胶质细胞铁死亡发挥抗抑郁症的作用。

结论 1、从临床水平，确证 CBS 蛋白及 H2S 水平与抑郁症的相关性；2、从细胞水平，阐明 CBS 蛋白调控 H2S 影响 GPX4 和 SLC7A11 表达缓解胶质细胞

铁死亡的分子机制；3、从动物水平探究 CBS 蛋白调控 H2S 影响 GPX4 和 SLC7A11 表达调控铁死亡治疗抑郁症的潜在作用。

NOD2 受体在 LPS 介导的抑郁行为中的作用研究

惠文宇[1,2] 董子青[1] 刘彤[1] 王云鹏[1,2] 马现仓[1]
1.西安交通大学第一附属医院心理卫生科
2.西安交通大学第一附属医院脑科学研究中心

目的 神经炎症与抑郁症的发生发展密切相关。NOD2 是一种胞浆内模式识别受体，被细菌肽聚糖中的胞壁酰二肽（MDP）激活后可介导炎症反应。在小鼠脑中，肠菌来源的 MDP 可激活下丘脑抑制性神经元 NOD2 受体，调节小鼠的摄食和体温。脂多糖（LPS）是革兰氏阴性细菌细胞壁的主要成分，作为一种促炎细胞因子诱导剂，可用于动物神经炎症和抑郁样行为模型的建立，但是在 LPS 介导的抑郁样行为中，NOD2 的作用尚未得到证实。

方法 本研究采用基因背景为 C57BL/6J 的 8 周龄雄性 NOD2-/-小鼠和野生型小鼠，采用糖水偏好、悬尾实验、新奇抑制摄食、旷场实验和高架十字迷宫实验评估焦虑、抑郁样行为。在此基础上，随机将两组小鼠分为对照组和建模组，分别为 WT+ Saline 组、WT+ LPS 组、NOD2-/- + Saline 组和 NOD2-/- + LPS 组，小鼠腹腔注射生理盐水(10 ml/kg)或 LPS (0.5 mg/kg)，持续 21 天，采用糖水偏好实验、悬尾实验、新奇抑制摄食实验、旷场实验和高架十字迷宫实验评估焦虑、抑郁样行为。

结果 与野生型小鼠比，NOD2-/-小鼠自主活动能力无异常，未出现焦虑、抑郁样行为改变。LPS 干预后，与 WT + Saline 组相比，WT + LPS 组在旷场实验和高架十字迷宫实验中自主活动能力无显著改变，进入中心区域时间显著降低，在糖水实验中糖水偏好指数显著下降，在悬尾实验中不动时间显著增加，在新奇抑制摄食实验中摄食前驱期轻微升高，表明慢性低剂量 LPS 干预野生型小鼠可以诱导出现抑郁样行为。与 WT + LPS 组相比，NOD2-/- + LPS 组糖水偏好指数显著升高，在悬尾实验中不动时间显著减少，在新奇抑制摄食实验中摄食前驱期显著下降，表明 NOD2 敲除鼠对慢性低剂量 LPS 造成的抑郁样行为具有显著的保护作用。同时 NOD2-/- + LPS 组比 WT + LPS 组在旷场实验中进入中心区域时间显著升高，在高架十字迷宫实验中进入中心区域时间也有轻微升高，表明 NOD2 敲除鼠对慢性低剂量 LPS 造成的焦虑样行为具有显著的保护作用。

结论 NOD2 可能参与慢性炎症状态诱导的焦虑、抑郁样行为的发生发展，然而 NOD2 是否通过“脑-肠轴”机制调控了前额叶皮层及海马神经元可塑性改变仍须进一步研究。

Construction and Validation of A Clinical Predictive Model for Prenatal Depression and Its Influencing Factors Using Nomograms

杨勇* 俞人婕
苏州市广济医院

Objective Antenatal depression is the most significant emotional issue for pregnant women during pregnancy, with a higher incidence compared to postpartum depression. LASSO regression analysis can identify the most important predictive factors more accurately and effectively through variable selection techniques. The aim of this study is to explore the factors that contribute to antenatal depression in pregnant women, construct a calibrated line plot model, and validate it to assess its accuracy and reliability as a predictive tool.

Methods Among the 3694 pregnant women, 473 (12.8%) had antenatal depression. LASSO regression selected important factors affecting antenatal depression, including T scores on the Eysenck Personality Questionnaire (EPQ) N scale, negative coping scores on the Trait Coping Style Questionnaire (TCSQ), and total score on the Generalized Anxiety Disorder-7 (GAD-7) screening questionnaire. The calibrated line plot model constructed from these three factors had an area under the ROC curve of 0.885 (95% CI: 0.869-0.902) and 0.868 (95% CI: 0.827-0.909) in the training set and validation set, respectively, indicating good performance. After calibration using calibration plots and Hosmer-Lemeshow tests, we found that the model had good discriminative ability and precision, and DCA validated its clinical utility.

Results Among the 3694 pregnant women, 473 (12.8%) had antenatal depression. LASSO regression selected important factors affecting antenatal depression, including T scores on the Eysenck Personality Questionnaire (EPQ) N scale, negative coping scores on the Trait Coping Style Questionnaire (TCSQ), and total score on the Generalized Anxiety Disorder-7 (GAD-7) screening questionnaire. The calibrated line plot model constructed from these three factors had an area under the ROC curve of 0.885 (95% CI: 0.869-0.902) and 0.868 (95% CI: 0.827-0.909) in the training set and validation set, respectively, indicating good performance. After calibration using calibration plots and Hosmer-Lemeshow tests, we found that the model had good discriminative ability and precision, and DCA validated its clinical utility.

Conclusion The incidence of antenatal depression in pregnant women is relatively high, and the main influencing factors include T scores on the EPQ N scale, negative coping scores on the TCSQ, and GAD-7 scores. The diagnostic prediction model we have established is helpful for early identification of prenatal depression and provides a basis for early prevention.

Analysis of Telomere Length and The Relationship with Neurocognitive Functions in Euthymic Bipolar Disorder: A Cross-sectional Pilot Study

杨曦* 蔡璐瑶 万超
深圳市康宁医院

Objective Telomere shortening has been considered a potential biological marker related to disease susceptibility and aging in psychiatric disorders. However, the relationship between telomere length and bipolar disorder (BD-I and BD-II) is uncertain. Moreover, whether telomere shortening is an independent factor of cognitive impairment in BD patients is still inconclusive.

Methods We explore telomere length and cognitive function in patients with bipolar disorder and the relationship between them. We enrolled three groups (35 patients with euthymic BD-I, 18 with euthymic BD-II, and 37 healthy controls). Telomere length was measured by fluorescent quantitative polymerase chain reaction (q-PCR), and cognitive function was evaluated by the MATRICS Consensus Cognitive Battery (MCCB). SPSS 24.0 was used for statistical analysis.

Results The telomere length of euthymic patients with BD-I and BD-II was shorter than that of healthy controls. Telomere length was not significantly different between BD-I and BD-II. Patients with BD-I and BD-II showed poor cognitive function compared to healthy controls. In the three groups, no correlation was detected with telomere length or cognitive function. The duration of illness (DI) was negatively correlated with reasoning and problem solving in BD-I. Nevertheless, the duration of untreated illness (DUI) showed a negative correlation with visual learning performance.

Conclusion This study provides preliminary evidence that shortened telomere length is a potential biomarker for BD-I and BD-II. However, the cognitive deficit in BD has no correlation with shortened telomere length.

Efficacy and Tolerability of FDA-approved Atypical Antipsychotics for Acute Bipolar Depression: A Systematic Review and Network Meta-analysis

Shaoli Li Chenyue Xu Shaohua Hu Jianbo Lai*
浙江大学医学院附属第一医院

Objective To compare the efficacy and tolerability of the US Food and Drug Administration (FDA) approved atypical antipsychotics (AAPs) for patients with acute bipolar depression, using a Bayesian network meta-analysis.

Methods Randomized controlled trials of five AAPs, cariprazine, lumateperone, lurasidone, olanzapine, and quetiapine, for bipolar depression, were included. Efficacy assessments included rates of response (≥ 50% improvement in Montgomery-Asberg Depression Rating

Scale, MADRS) and remission (MADRS ≤12 or ≤10 at endpoint). Tolerability outcomes included all-cause discontinuation and discontinuation due to adverse events, adverse events (rates of somnolence, headache, and nausea), and metabolic outcomes (rates of ≥ 7% weight gain, change in total cholesterol, triglycerides, and glucose). Changes from baseline or odds ratios (OR) with 95% credible intervals (95% CrI) were evaluated.

Results Sixteen random controlled trials with 7234 patients met the inclusion criteria of the systematic literature review. For response rate, all five AAPs were more efficacious than the placebo (range of OR 1.45–2.08). For remission rate, cariprazine, lurasidone, olanzapine, and quetiapine had significantly higher remission rates compared with placebo (range of OR 1.43–2.00). In terms of tolerability, olanzapine was associated with significantly lower odds of all-cause discontinuation compared with placebo (OR: 0.68, 95% CrI: 0.50-0.96), while lumateperone, lurasidone, olanzapine, and quetiapine were similar to placebo. Quetiapine was associated with higher odds of discontinuation due to adverse events than placebo (OR: 2.38, 95% CrI: 1.41-5.00). Compared with placebo, lumateperone (OR: 4.17, 95% CrI: 1.92-12.50), olanzapine (OR: 2.78, 95% CrI: 1.61-5.26), quetiapine (OR: 4.76, 95%CrI: 3.33-7.14) had higher odds of somnolence, and lumateperone was associated with higher odds than lurasidone (OR: 2.86, 95% CrI: 1.06-12.50). The rate of headache was similar across all agents. Cariprazine had higher odds of nausea than placebo (OR: 2.86, 95% CrI: 1.52-6.67), olanzapine (OR: 3.45, 95% CrI: 1.20-14.29), and quetiapine (OR: 3.85, 95% CrI: 1.75-11.11). Lumateperone had a lower rate of ≥ 7% weight gain than placebo and other treatments (all OR: 0.00), while cariprazine (OR: 2.56, 95% CrI: 1.14-10.00), olanzapine (OR: 33.33, 95% CrI: 12.50-100.00), and quetiapine (OR: 2.94, 95% CrI: 1.72-5.88) were associated with higher odds compared with placebo and there was no significant difference between lurasidone and placebo. Olanzapine was associated with a significantly higher change from the baseline of total cholesterol and triglycerides than the placebo.

Conclusion All FDA-approved AAPs were more efficacious than placebo for adults with acute bipolar depression, while their tolerability, adverse events, and metabolism outcomes are variable. These findings inform individualized prescriptions of AAPs for acute bipolar depression in clinical practice.

Background Suicide, a prevalent global cause of mortality and morbidity, manifests a pronounced heritability, with Major depressive disorder (MDD) contributing significantly. Yet, the present landscape of suicide risk assessment heavily hinges on subjective self-reporting and intention, posing inherent limitations. Accordingly, an imperious demand arises within the clinical realm for an objective and efficacious tool to evaluate and prognosticate the vulnerability to suicide in MDD patients.

Method Gene expression profiles available in the Allen Human Brain Atlas were leveraged to partition brain networks dependent on regional gene transcriptional signatures. Concurrently, a cohort comprising 182 individuals diagnosed with MDD (86 with suicide attempt (SA) and 96 without SA) and 102 healthy controls (HC) was recruited. An ensemble learning model was constructed on the repartitioned brain networks utilizing resting-state functional connectivity to distinguish SA from MDD. Subsequently, virtual lesion analysis was applied to pinpoint most dysfunctional brain network in MDD patients with high suicide risk.

Results We unveiled functional aberrations in Clusters 2 and 3 (mainly involving in paralimbic and cognitive control areas) in MDD as compared to HC. A marked dysfunction of Cluster 1 (primarily in occipital cortex), whose resting-state functional abnormality (RSFA) scores correlated with suicide risk, was revealed in SA group. Subsequently, exploratory experiments uncovered correlations between the expression levels of two suicide risk genes, GABRG2 and GRIN2A, and the average RSFA scores of Cluster 1 within SA group, respectively. Moreover, both GABRG2 and GRIN2A were found within the gene sets associated with Cluster 1.

Conclusion In this study, we presented a detailed neurobiological elucidation for the possible causes of the aberrant imaging phenotypes manifested in SA, revealing new insights from both micro and macro perspectives. Furthermore, our model serves as a valuable tool for clinicians, enabling them to effectively evaluate and diagnose patients with high suicide risk.

双相情感障碍及其未患病一级亲属反应抑制的冲动性和神经相关性：一项脑磁图研究

夏逸[1] 王晓芹[1] 尤为[1] 杜易珊[1] 汤浩[1] 卢青[2] 姚志剑[1,2]
1.南京医科大学附属脑科医院心境障碍科
2.东南大学生物医学工程

目的 反应抑制是双相情感障碍的核心认知障碍，导致双相情感障碍患者冲动性的增加。然而，双相情感障碍反应抑制受损和冲动的神经机制之间的关系目前

尚不清楚。遗传上易患的双相情感障碍个体提供了一种识别内表型的方法。

方法 患者来自于 2010 年到 2020 南京医科大学附属脑科医院心境障碍科住院诊断为重性抑郁障碍正处于抑郁发作的患者。亲属是确诊双相情感障碍患者的一级亲属。健康人招募于社区。最终，39 名双相情感障碍患者、22 名双相情感障碍患者的未患病一级亲属和 36 名健康对照在脑磁图扫描中进行了 GO/NO-GO 任务。所有受试者还完成了 Barratt 冲动量表的评估。

结果 与健康对照组相比，双相情感障碍组 beta 能量降低，右额下回潜伏期延长，峰值频率增加，前辅助运动区 beta 能量降低，右额下回到前辅助运动区的连接性降低。在双相情感障碍患者的未患病一级亲属组，前辅助运动区 beta 能量降低，右额下回潜伏期延长。双相情感障碍患者运动冲动增强与右额下回 beta 振荡活动异常改变及右额下回到前辅助运动区的功能连接减弱有关。

结论 右额下回活动下降和在前额叶控制网络中的主导作用受损可能是双相情感障碍反应抑制功能障碍的神经病理基础，从而导致双相情感障碍运动冲动增加。此外，我们的发现指出，测量右额下回功能障碍可以作为一种潜在的手段来识别具有向双相情感障碍疾病表达转化的遗传高危个体。

建立并验证一项住院抑郁障碍患者的转相预测模型： 基于真实世界电子病历数据的回顾性队列研究

阳璐[1] 陈俊[1] 方贻儒[2]
1.上海交通大学附属精神卫生中心
2.上海交通大学附属瑞金医院

目的 由于缺乏客观生物学标记物，早期识别双相障碍（bipolar disorder，BD）一直是精神医学领域亟待解决的难题。现行诊断系统仍依赖于描述性临床观察，约一半的 BD 患者首次发作为抑郁发作，故其早期容易被误诊为抑郁症（major depressive disorder，MDD）。超过 20%的 MDD 患者未来将出现躁狂/轻躁狂发作，从而变更诊断为 BD，其中住院 MDD 患者未来发生转相的风险高达 40%。BD 的误诊将导致患者病情迁延恶化，影响其长期预后。本研究旨在建立并验证一项住院 MDD 患者的转相预测模型。

方法 纳入 2008 年 1 月 1 日至 2021 年 10 月 1 日在上海市精神卫生中心住院的 MDD 患者（ICD-10 诊断代码：F32.x、F33.x），年龄为 10-90 岁，既往未有双相障碍（F30.x，F31.x）或精神分裂症（F20.x）诊断。使用 LASSO-Cox 方法及向后选择建立住院 MDD 患者转相预测模型。使用 bootstrap 重抽样进行模型内部验证，并使用 2014 年 1 月 1 日至 2019 年 5 月 31 日在青岛市精神卫生中心住院的 MDD 患者进行模型外部验证。

结果 研究共纳入 2788 例住院 MDD 患者建立预测模型，模型在训练集中具有较好区分度（C 指数=0.721，95%CI：0.677-0.764）和校准度（校准斜率=0.990，95%CI：0.809-1.171）。经过重校准后，预测模型在外部验证集（n=2574）中取得较好区分度（C 指数=0.703，95%CI：0.676-0.730）和校准度（模型总体校准斜率=0.992，95%CI：0.872-1.112）。模型共纳入 12 个变量：男性、处方心境稳定剂、存在精神病性症状、较高水平的 FT4、较高水平的 PCT、较高水平的 BASO%、每日饮酒与转相风险升高显著相关。高龄、存在脑器质性疾病史、较高水平的 ALB、较高水平的 TSH 与较低的转相风险显著相关。

结论 本研究建立了一项住院 MDD 患者的转相预测模型，该模型可作为临床辅助决策工具，计算 MDD 个体未来的转相风险并指导制定个性化干预方案，从而提升医疗质量并改善患者预后。

双相障碍灰质体积及大脑功能活动一致性与电压门控钙离子通道 CACNA1G 基因的关联研究

杨倩[1] 张蒙蒙[1] 张雅敏[2] 魏巍[2] 李涛[2] 李名立[1]
1.四川大学华西医院心理卫生中心
2.浙江大学医学院附属精神卫生中心（杭州市第七人民医院）

目的 探索双相障碍（Bipolar Disorder，BD）与健康对照（Health Control，HC）间大脑结构和功能的差异，以及 T 型-VGCC 基因 CACNA1G rs757415 多态性与 BD 大脑结构及功能交互作用的神经环路，明确该基因位点多态性影响 BD 患者的神经环路结构与功能改变特征。

方法 纳入 173 名 BD 受试者和 207 名 HC 受试者，采集受试者的一般资料、临床量表评分、全血标本，使用 3.0T 磁共振扫描仪采集受试者大脑结构及功能数据。应用 Matlab、SPM、DPARSF 等软件分析得到所有受试者大脑灰质体积（GMV）、大脑功能活动局部一致性（ReHo）图谱。应用 imLDRTM 法，检测受试者 CACNA1G rs757415 位点的等位基因多态性。控制年龄、性别、受教育年限及大脑体积等协变量，分析两组受试者 GMV、ReHo 的差异，以 voxel 水平 P<0.005，cluster 水平（FDR 校正）P<0.05 定为有统计学差异的脑区。在 SPM12 上采用 full factor 方法分析诊断与基因型对 GMV、ReHo 的交互作用，以 volex 水平 P<0.01，cluster 水平（FDR 校正）P<0.05 为有统计学差异的脑区。

结果 与 HC 组相比，BD 组灰质体积降低的脑区位于双侧梭状回、双侧前扣带回和扣带旁回、双侧内侧额上回、双侧小脑前叶及后叶、双侧海马旁回、左侧颞上回、左侧楔前叶、右侧岛叶；未发现灰质体积增大脑区。BD 组大脑功能活动 ReHo 降低的脑区位于双侧额

上回、双侧颞上回、双侧壳核、右侧枕上回、左侧前扣带回及旁扣带回、左侧角回、左侧岛叶等脑区；ReHo增强的脑区位于双侧丘脑、双侧海马、双侧楔前叶、左侧枕上回、左侧海马旁回。诊断与 CACNA1G rs757415 对灰质体积存在交互作用的脑区位于—右侧海马旁回-梭状回-小脑山顶。正常对照组，风险等位基因携带者该脑区大脑灰质体积较非风险等位基因携带者减小，但 BD 患者组，该风险等位基因携带者的大脑灰质体积较非风险等位基因携带者增大。

结论 与 HC 组相比，BD 患者大脑结构与功能既有降低的脑区又有增高的脑区，且主要在额颞叶-扣带回-梭状回-岛叶-小脑-基底节-边缘系统等认知情绪环路上。CACNA1G rs757415 基因可能主要通过影响 BD 患者右侧小脑、右侧海马旁回、右侧梭状回的灰质体积参与了双相情感障碍的发病。

Objective Non-suicidal self-injury (NSSI) is a serious problem among patients with bipolar disorder. Previous studies have shown that about 52% of patients with bipolar disorder had engaged in NSSI at least once, and NSSI was also an important predictor of future suicide attempts in adolescents. However, few studies focused on the risk factors and prevalence of NSSI among patients with bipolar disorder in China. The purpose of this study was to investigate the prevalence of NSSI and its risk factors in bipolar disorder patients in China, so as to provide some reference for the prevention of NSSI in clinic.

Methods The NSSI behaviors were identified using the Ottawa Self-injury Inventory (Chinese version). Mini International Neuropsychiatric Interview (Hypo?) Manic Episode with Mixed Features?DSM?5 Module (MINI?M, Chinese version) was used to evaluate suicidal ideation. Chinese version of the Clinically Useful Depression Outcome Scale supplemented with questions for the DSM-5 mixed features specifier (Chinese CUDOS-M) was used to distinguish the mixed features of bipolar disorder. Social-demographic characteristics and clinical characteristics between NSSI group and Non-NSSI group were compared by using Chi-squared tests. In addition, we included in the binary logistic regression models those factors that showed a statistically significant difference(P?

Functional Genomic Analysis Delineates Regulatory Mechanisms of GWAS-identified Bipolar Disorder Risk Variants

陈蕊[1] 罗雄剑[2]

1.中国科学院昆明动物研究所
2.东南大学生命健康高等研究院

Objective Genome-wide association studies (GWASs) have identified multiple risk loci for bipolar disorder (BD). However, pinpointing functional (or causal) variants in the reported risk loci and elucidating their regulatory mechanisms remain challenging.

Methods We first integrated chromatin immunoprecipitation–sequencing (ChIP-Seq) data from human brain tissues (or neuronal cell lines) and position weight matrix (PWM) data to identify functional single nucleotide polymorphisms (SNPs). Then, we verified the regulatory effects of these transcription factor (TF) binding-disrupting SNPs (hereafter referred to as “functional SNPs”) through a series of experiments, including reporter gene assays, allele-specific expression (ASE) analysis, TF knockdown, CRISPR/Cas9-mediated genome editing, expression quantitative trait loci (eQTL) analysis. Finally, we overexpressed PACS1 (whose expression was most significantly associated with the identified functional SNPs rs10896081 and rs3862386) in mouse primary cortical neurons to investigate if PACS1 affects dendritic spine density.

Results We identified 16 functional SNPs (in 9 risk loci); these functional SNPs disrupted the binding of 7 TFs, for example, CTCF and REST binding was frequently disrupted. We then identified the potential target genes whose

expression in the human brain was regulated by these functional SNPs through eQTL analysis. Of note, we showed dysregulation of some target genes of the identified TF binding-disrupting SNPs in BD patients compared with controls, and overexpression of PACS1 reduced the density of dendritic spines, revealing the possible biological mechanisms of these functional SNPs in BD.

Conclusion Our study identifies functional SNPs in some reported risk loci and sheds light on the regulatory mechanisms of BD risk variants. Further functional characterization and mechanistic studies of these functional SNPs and candidate genes will help to elucidate BD pathogenesis and develop new therapeutic approaches and drugs.

基于静息态全脑 beta 频段初步寻找可早期识别抑郁转双相的风险脑区

花玲玲[1] 杜易珊[1] 夏逸[1] 何晨[1] 尤为[1] 汤浩[1] 史家波[1] 卢青[2] 姚志剑[1]
1.南京脑科医院
2.东南大学

目的 临床上多数双相情感障碍（Bipolar Disorder, BP）以抑郁首发，导致 BD 患者临床治疗效果欠佳，病程迁延，给患者和家庭带来沉重负担。因此，从早期抑郁发作中尽早预测双相障碍是有效避免误诊的重要手段。本研究通过回顾性对抑郁症患者进行随访，对转相和未转相患者进行分析，试图从神经电生理角度寻找可以早期识别 BD 的生物学指标。

方法 本实验共入组 58 例健康对照者（Healthy Control, HC），入组南京脑科医院 2012-2020 年期间 143 例住院患者，MDD 88 例，BD64 例，BD 组分为抑郁转相(ctBD,26 例) 和双相组（rBD,38 例）。所有入组受试者均通过脑磁图技术来记录 5 分钟的睁眼静息态活动。脑磁图数据基于 fieldtrip 平台进行处理，进行滤波、去除伪迹、溯源等处理，提取静息态 beta 能量（13-30Hz）进行频谱分析，运用 Cluster-based permutations 的非参数统计方法进行统计分析。

结果 在 sensor 水平上，三组 beta 频段（13-20 Hz）在顶枕叶 sensor 上差异具有统计学意义，在随后的两两比较中发现顶枕叶 beta 能量在 HC 组、MDD 组、rBD 组、ctBD 组中呈现逐渐增强趋势（P<0.05，corrected）。在溯源分析中发现三组间差异除了来源于顶枕叶、小脑等脑区，也来自于背外侧前额叶、杏仁核、海马、纹状体（尾状核、壳核）、扣带回等脑区。与 HC 组相比，ctBD 组和 rBD 组主要表现为前额叶-边缘-纹状体-小脑等脑区的 beta 能量增强，而 MDD 组在这些脑区差异无明显统计学意义。rBD 组与 MDD 组相比，beta 能量差异表现为更为广泛的前额叶-边缘（杏仁核）-皮层下（苍白球、壳核）-小脑等脑区的差异。ctBD 分别 和 rBD、MDD 组相比，beta 能量差异主要集中在枕叶、楔前叶、矩状沟、舌回等皮层。

结论 本研究未发现 MDD 在前额叶-边缘-纹状体-小脑环路存在 beta 频段损害，但在 ctBD 和 rBD 中均发现损害，且在 rBD 患者中 beta 能量损害更重，提示该环路在 beta 频段可较好区分单双相抑郁障碍。此外，顶枕叶相关脑区在 beta 频段可有助于早期识别双相情感障碍，但目前本研究结果仍需进一步结合临床特征和分类模型进行验证。

Exploration of Individualized Treatment Strategies for Depression with Atypical Features in IDoT-AFD: Implications for Clinical Practice

周儒白 张慧凤 卢文仙 陈嘉烨 许腾欢 吴百川 叶巾眉 丁蕾 蔡亦韵 粟幼嵩 彭代辉*
上海市精神卫生中心

Objective Major depressive disorder (MDD) with atypical features, namely depression with atypical features (AFD), is one of the most common clinical specifiers of MDD, closely associated with bipolar disorder (BD). AFD is regarded as a bridge between MDD and BD or even a variant of BD-II. The Study of Individualized Diagnosis and Treatment for Depression with Atypical Features (iDoT-AFD) is a multicenter, prospective study consisting of a 12-week randomized controlled trial (RCT) and a continued follow-up until 4 years or reaching the study endpoint. The primary objective of the iDoT-AFD study is to find out the individualized treatment strategies for patients with AFD during acute phase.

Methods Patients with AFD were randomly allocated (1:1:1:1) to one of the four treatment groups including 'single application of selective serotonin reuptake inhibitor (SSRI) or serotonin-noradrenaline reuptake inhibitor (SNRI)', 'SSRI/SNRI combined with mood stabilizer', 'SSRI/SNRI combined with quetiapine (≥ 150mg/d)', or 'treatment as usual (TAU)', and then followed up at the end of 2nd week, 4th week, 8th week, 12th week to evaluate the effectiveness of different treatments. Clinical remission was defined as total scores less than or equal to 7 on the Hamilton's Depression Scale with 24 items (HAMD-24) or total scores less than or equal to 5 on the Quick Inventory of Depressive Symptomatology (self-report) with 16 items (QIDS-SR16). Treatment response was defined as a ≥50% decrease from the baseline HAMD-24. Comparisons of the effectiveness were performed between TAU group and each of the other three groups.

Results A total of 102 patients with AFD were recruited. No difference of treatment effectiveness was found at the end of 12th week, while remission rates (self-reporting) and response rates revealed significant group differences at the end of 4th week, 14.3% / 41.7% (SSRI/SNRI), 25%/ 34.6% (SSRI/SNRI and mood stabilizer), 40%/ 57.9% (SSRI/SNRI and quetiapine), and 47.6%/ 71.4% (TAU) at the end of 4th week. Subthreshold

hypomanic symptoms were not different among 4 groups, while they are significantly different after 12-week treatment with SSRI/SNRI > SSRI/SNRI and mood stabilizer > TAU > SSRI/SNRI and quetiapine pattern. The treatment compliance was significantly different among the four groups with 92% (SSRI/SNRI), 66% (SSRI/SNRI and mood stabilizer), 63% (SSRI/SNRI and quetiapine), and 100% (TAU). Also, significant difference was revealed on the drop-out rate with 17% (SSRI/SNRI), 42% (SSRI/SNRI and mood stabilizer), 0% (SSRI/SNRI and quetiapine), and 16.7% (TAU).

Conclusion The RCT part of the iDoT-AFD study indicate that SSRI/SNRI combined with quetiapine has advantages in the self-reporting clinical remission and treatment response at the end of 4th week. This kind of treatment also has superiority of reduce subthreshold hypomanic symptoms, and has excellent drop-out rate.

Local and Large-scale Resting-state Oscillatory Dysfunctions for Early Antidepressant Response Prediction in Major Depressive Disorder

田水[1,3] 王强[2] 陈志璐[3] 姚志剑[3]
1.南京医科大学第一附属医院
2.南京市鼓楼医院
3.南京医科大学附属脑科医院

Objective Magnetoencephalography (MEG) could explore and resolve brain signals with realistic temporal resolution to investigate the underlying electrophysiology of major depressive disorder (MDD) and the treatment efficacy. Here, we explore whether neuro-electrophysiological features of MDD at baseline can be used as a neural marker to predict their early antidepressant response.

Methods Sixty-six medication-free patients with MDD and 48 controls were enrolled and underwent resting-state MEG scans. Hamilton Rating Score for Depression (HRSD-17) was assessed at baseline and after pharmacotherapy for 2 weeks. We measured local and large-scale resting-state oscillatory dysfunctions with a data-driven model using the Fitting Oscillations & One-Over F algorithm. Then, we quantified band-limited regional power and functional connectivity between brain regions.

Results After 2 weeks follow-up, 31 patients showed early response (ER) to pharmacotherapy, which were defined as at least 50% reduction of severity of in HAMD-17. Twenty-one patients did not. We observed decreased regional periodic power in patients with MDD comparing to controls. However, patients with ER demonstrated that functional couplings across brain regions were increased in both alpha and beta band, which were significantly correlated with severity of depressive symptoms after treatment. Receiver operating characteristic curves (ROC) confirmed predictive ability of baseline large-scale functional connectivity for early antidepressant efficacy (AUC=0.9969).

Conclusion The current study revealed the electrophysiological dysfunctions of local neural oscillatory involved in depression and highlighted the identification ability of large-scale couplings biomarkers in early antidepressant response prediction.

3.东南大学儿童发展与学习科学教育部重点实验室

目的 本文基于静息态 EEG 信号，研究重复经颅磁刺激(rTMS)后脑网络的动态变化情况以及寻找相关的脑网络指标。

方法 首先在 EEG 信道层面使用微状态研究方法寻找健康受试者表征经颅磁刺激后的脑网络动态变化指标。提取得到微状态的时间动态参数平均持续时间长度(DurationMean)。而后使用重复方差测量探究真假刺激作用下脑网络动态变化情况差异。通过潜变量增长模型确定 rTMS 后脑网络波动情况和行为学指标变化量二者的初始水平和增长率之间的相关性。而后使用 Louvain 社区发现算法对受试者基于微状态拓扑图进行社区分类。并使用统计分析研究不同社区人群的脑电指标 DurationMean 和 0-back 反应时(RT0)指标之间的相关性。

结果 通过微状态方法获得受试者的组间微状态模板以及每位受试者的微状态模板，本实验的微状态模板的平均全局解释方差达到了 74%。经过统计分析，DurationMean 在 rTMS 作用后表现出了显著的增长。并且真刺激组存在一个刺激后参数指标显著上升然后逐渐回落的趋势，这一趋势与假刺激组的趋势之间的差异具有统计学意义。通过 Louvain 社区发现算法，将受试者分为对微状态效应较为敏感的人群和较为不敏感的人群。不敏感人群的 DurationMean 的增长值在刺激后的五个时间点的参数分布围绕在零值附近，而敏感社区的受试者相对不敏感组的受试者的 DurationMean 增长较为明显。并且经过重复方差分析，分组因子与时间因子对 DurationMean 存在交互作用。将两组受试者的脑电指标和行为指标进行相关性分析，两组人群的指标均表现出了关联性，其中敏感人群的 DurationMean 增长值与 RT0 变化值为负相关。

结论 以上结论表现了 DurationMean 能体现受试者的脑电神经网络稳定性，并且根据结果说明了 rTMS 提升了脑网络的稳定性，并且这个效应持续在刺激结束后数个小时。而后结合行为学指标和脑电进行分，可以得出脑电指标 DurationMean 的增长和行为学指标 RT0 的变化之间存在一定的关联性。并且不同的人群

对于 rTMS 作用的敏感性存在一定的差异，并且这种差异会持续到后续的数个小时。基于此，可以得到受试者的脑电微状态指标可以有效的鉴别对经颅磁刺激的敏感性，为经颅磁刺激的应用提供了一定的参考价值。

4.上海市交通大学瑞金医院

Objective Social isolation, loneliness, and Personality traits have all been linked to depression, while it is unclear which one plays the most important role in the pathophysiology of depression and whether modifiable risk variables influence the causative consequences.

Methods We extracted genetic variants associated with social isolation, loneliness, personality traits, and depression from the Psychiatric Genomics Consortium (69,500 individuals) as well as from the UK Biobank (1,292,620 individuals). Then, we assessed the relationship between loneliness, social isolation, personality traits(agreeableness, conscientiousness, openness, extraversion and neuroticism), and depression separately using a 2-sample Mendelian randomization(MR) method. Moreover, the causal association between five personality traits and social isolation, loneliness was explored using bidirectional MR analysis. Subsequently, a multivariate Mendelian randomization method was used to separately examine the effect of personality traits or loneliness, social isolation on depression after moderating for another factor. Alternatively, mediating role analysis was used to explore the mediating role of social isolation, loneliness, and personality traits on depression.

Results In a 2-sample MR analysis, genetically predicted the elevated levels of social isolation, loneliness (β = 0.188, 95% confidence interval [CI] 0.109-0.268, P = 3.594e-06), and neuroticism (β = 0.017, 95% CI 0.015-0.019, P = 5.006e-53) were significantly associated with higher levels of depression. The 2-sample MR evidence suggests a significant causal association between social isolation, loneliness, and neuroticism(β = 7.319, 95% CI 6.137-8.501, P = 6.700e-34). Interestingly, a significant causal association between neuroticism and social isolation, loneliness was also found in the inverse 2-sample MR analysis(β = 0.051, 95% CI 0.048-0.055, P = 3.259e-153). Multivariate MR analysis showed that a convincing causal association between neuroticism and depression levels remained under the regulation of social isolation, loneliness(β = 0.014, 95% CI 0.009-0.019, P = 9.583e-09), while no causal association was found between social isolation, loneliness and depression levels after neuroticism was regulated(P = 1.430e-01). Mediation analysis showed that the proportion of mediation for the indirect effect of social isolation and loneliness on depression mediated by neuroticism was 10.2%. In contrast, only 0.3% of the indirect effects for the mediation of the indirect effect of neuroticism on depression mediated by social isolation, loneliness.

Conclusion Our findings provide evidence that higher levels of social isolation, loneliness have an impact on increased levels of depression and that neuroticism in turn play an important mediating role between the two.

电休克疗法降低难治性抑郁症患者的星形胶质细胞活化和炎症水平-基于血浆星形胶质细胞外囊泡的证据

徐淑娴 谢新晖 刘忠纯*
武汉大学人民医院

目的 抑郁症的发病机制至今仍未研究透彻，许多因素都会导致抑郁症，近几年抑郁症的炎症假说受到了越来越多的关注。许多临床研究发现抑郁症患者外周血炎症因子升高，而使用抗炎药物也会在某种程度上缓解抑郁症状。由于抑郁症也是脑部疾病，外周的病变可能无法直接反应中枢的病变，星形胶质细胞可以分泌炎症因子，与抑郁症的发病关系密切，但因为伦理、技术等各方面的限制，我们很难从活体内直接获悉中枢神经炎症的情况。近 10 年细胞外囊泡（EVs）和中枢神经系统来源的 EVs 提取技术领域的进展为我们提供了对人体进行脑活检的可能性，由于 EVs 可以穿过血脑屏障并在外周被检测到，它们也成为神经精神疾病最具潜力的生物标志物。本研究利用从血浆中分离的星形胶质细胞外囊泡（ADEVs）探讨抑郁症的神经炎症假说，以及探索电休克疗法（ECT）在对抑郁症患者的潜在抗炎作用。

方法 招募 40 名治疗难治性抑郁症（TRD）患者和 35 名匹配的健康对照组（HC）进行基线调查，其中 34 名 TRD 患者完成了 ECT 后的访视，在基线和末次 ECT 后对被试进行临床量表评估及血样收集。采集血样后获得血浆，并从血浆分离和验证 ADEVs，之后测量 ADEVs 中的一个 EV 标记物 CD81、两个星形胶质细胞标记物（GFAP 和 S100β）以及 9 个炎症标志物的蛋白浓度作为研究的主要分析结果。此外，还对被试的临床特征和 ADEV 蛋白水平之间的相关性进行了探索性分析。

结果 基线时 TRD 组的 CD81、GFAP 和 S100β 水平显著高于 HC 组。TRD 组的炎症标志物 IFN-γ、IL-1β、IL-4、IL-6、TNF-α、IL-10 和 IL-17A 也显著高于 HC 组。经过多次 ECT 治疗后，CD81、GFAP 和 S100β 水平显著降低，IFN-γ 和 IL-4 水平也显著降低。此外，CD81、GFAP、S100β 和炎症细胞因子水平较高与更严重的抑郁症状和较差的认知功能相关。

结论 本研究通过 ADEVs 的研究支持了抑郁症的星形胶质细胞活化和神经炎症假说，此外 ECT 可能通过抑制这种星形胶质细胞的活化发挥抗炎作用。

Circadian Rhythm Disorder Symptoms in MDD Correlate with Circadian Gene Polymorphisms

黄秦特 王凡 吕洞宾 王嫩媞 魏喆懿 陈依明 徐初琛 洪武*
上海市精神卫生中心

Objective Major depressive disorder（MDD） is related to circadian deregulations. Meanwhile, the rhythmic cell-autonomous expression of clock genes generates circadian rhythms. We hypothesized that circadian clock genes NPAS2 and NR1D1 would be associated with circadian rhythm disorder symptoms of Major depressive disorder(MDD).

Methods 257 Subjects with MDD and 273 control subjects participated in this case-control study, the Hamilton rating scale for depression(HAMD), Morningness-eveningness Questionnaire(MEQ), and Pittsburgh sleep quality index(PSQI) were obtained in all subjects. Genotypes of single nucleotide polymorphisms (SNPs) of NPAS2 and NR1D1 were determined by the PCR and MassArray SNP sequencing analysis.

Results In our study, no SNPs yielded a positive association with MDD.In haplotype analysis, the A-T haplotype of rs3811561-rs1053096 and the A-A haplotype of rs3811561-rs1374324 of NPAS2 appeared to have a protective effect against MDD(p=0.0459, p=0.0341). But the result did not remain significant after permutation test corrections. In the association analysis of genotype and symptoms of circadian rhythm disorder. When the genotype of rs1562313 of the NPAS2 gene is CT, the sleep quality of patients tends to be better(p=0.039). The patients with rs3811561 CC genotype of NPAS2 are less likely to be evening type(p=0.030, OR=0.427), and patients with rs1811399 AA genotype of NPAS2 appear to have a higher possibility to be evening type(p=0.015, OR=1.942).

Conclusion The polymorphisms of NPAS2 might be associated with circadian rhythm disorder symptoms of MDD.

A Dynamic Process Model of Bipolar Disorder States Switching Based on The Salience Network

钟元[1] 张归[1] 吴云[1] 王荣[1] 王纯[2] 肖茜[3] 苏林雁[4] 卢光明[5]

5.南京大学医学院附属金陵医院医学影像科

Objective Bipolar disorder (BD) is a highly burdensome and refractory mental disorder, affecting individuals, families, and society. The treatment challenge in BD lies in the ease with which patients transition from depressive to manic or from manic to depressive state, with the frequency of these alternating cycles often indicating the severity of the illness. However, treatment targeting the depressive state often carries the risk of inducing manic state, and vice versa. Therefore, reducing the frequency of states switching in BD patients and gradually achieving a stable state are crucial for effective treatment. Previous clinical researches have identified numerous potential factors influencing BD states switching. However, the process of BD states switching remains unclear. The purpose of this study is to propose a dynamic process model of BD states switching in order to further understand the treatment, patterns of occurrence and development, and pathophysiological mechanisms of BD.

Methods The factors influencing BD states switching have been categorized into four groups: genetics, external events, neurotransmitters, and functions interactions among brain networks. The pathways of BD states switching were analyzed and discussed within the framework of "psychological-physiological-neural" interactions.

Results The results of the model demonstrate the crucial role of the salience network (SN) in the process of BD states switching. The anterior insula (AI) detects information from internal sensations and external stimuli, which is then transmitted to the anterior cingulate cortex (ACC) and ultimately reaches the sensorimotor network (SMN). Simultaneously, the amygdala detects external stimuli and, along with the ventral tegmental area (VTA), transmits 5-HT signals to the SMN through the ACC. The thalamus receives external events and dopamine signals from the substantia nigra (SuN) and VTA, influencing the function of the motor system. The signals from the SuN and VTA also reach the frontal lobe, affecting the cognitive system. Additionally, the AI's detection of salience influences the regulation of the SN in switching between the default mode network (DMN) and the central executive network (CEN). Genetic factors modulate an individual's sensitivity to internal and external signals and the production of neurotransmitters during this process. Positive internal and external stimuli can trigger manic state in BD via these pathways, while the reverse leads to depressive state. As external events dominate multiple pathways, they are considered triggers for BD states switching.

Conclusion In conclusion, we have proposed a dynamic process model of BD states switching based on the SN within the framework of "psychological-physiological-neural". This model describes the pathways involved in BD states switching and contributes to a better understanding of the treatment, occurrence, development patterns, and pathophysiological mechanisms of BD.

Study on The Construction of A Peripheral Blood Expression Profile Diagnostic Model for Bipolar Disorder Depressive Episode Based on Deep Learning Methods

王相文[1] 孙平[2]
1.济宁医学院
2.青岛市精神卫生中心

Objective The aim of this study is to analyze gene expression profile data of patients with bipolar disorder depressive episode in the GEO database using bioinformatics methods, identify differentially expressed genes, and construct a machine learning-based diagnosis model. Through this study, we hope to find the biological characteristics of bipolar disorder depressive episode and provide new insights for the diagnosis and treatment of bipolar disorder depressive episode.

Methods Data source and preprocessing: The gene expression profile dataset GSE23848 was selected from the GEO database for human bipolar disorder depressive episode patients and healthy controls. Original data underwent quality control, background correction, normalization, and Z-score standardization to address experimental bias, batch effects, and data dimensionality. Differential gene expression analysis: DESeq2 package analyzed gene expression differences between patients and controls. Significance level was set as adjusted $p < 0.05$, $|logFC| > 1.3$, with multiple test correction. Differentially expressed genes were identified. Construction of diagnosis model: To simplify the model and enhance prediction, feature selection was used to screen differentially expressed genes. Random forest screened feature genes, and a three-layer feedforward neural network was constructed using Keras framework under TensorFlow. Binary cross-entropy and Adam were used as loss function and optimizer, respectively. The dataset was divided into 20% validation and 80% training sets. Evaluation indicators included accuracy, sensitivity, specificity, and AUC. The optimal diagnosis model was selected based on these indicators.

Results A total of 1180 genes with significant differential expression were found between patients with bipolar disorder depressive episode and the control group. These differentially expressed genes may be closely related to the pathogenesis of bipolar disorder depressive episode. Through feature selection, 61 differentially expressed genes with high classification ability were screened, and 1-61 genes were subjected to cyclic random forest classification to determine the ideal mtry value, and finally mtry value of 23 was selected. Then, the 23 genes were included in the deep learning model for training. The parameters of the final model in the validation set were: accuracy: 0.82 ± 0.11, sensitivity: 0.79 ± 0.14, specificity: 0.86 ± 0.10, AUC: 0.91 ± 0.07.

Conclusion This study identified some genes related to the differential expression of gene expression profiles in patients with bipolar disorder depressive episode and constructed a machine learning-based diagnosis model for bipolar disorder depressive episode, which has high accuracy and discrimination ability. This research provides new insights for the diagnosis and treatment of bipolar disorder depressive episode and serves as a reference for the application of bioinformatics methods in disease diagnosis.

CACNA1C 基因多态性与重度抑郁障碍转躁的关联研究

沈甜[1,2] 陈子木[1] 陈磊[1] 袁勇贵[1] 徐治[1]
1.东南大学附属中大医院
2.北京大学第六医院

目的 重度抑郁障碍（MDD）和双相情感障碍（BD）是两种与严重社会功能损伤有关的常见情感障碍。BD 由于早期被误诊为 MDD 而导致接受不适当的药物治疗，增加社会负担，因此研究影响 MDD 向 BD 的转化的潜在生物标志物十分重要。钙离子通道相关的 CACNA1C 的多个基因多态性位点与 BD 密切相关，，本研究旨在探究 CACNA1C 的基因多态性与重度抑郁障碍转躁的关联性。

方法 本研究共纳入 500 名诊断为 MDD 的患者，随访 5 年，并用自制问卷进行半结构式访谈并根据随访结果将受试者分为 MDD 组和 BD 组，在入组时使用 HAMD-17 评估抑郁症状严重程度以及收集外周血，使用 SPSS 对两组患者的临床特征进行分析，对基因 CACNA1C 的单核苷酸多态性进行检测，采用 Unphased 3.1.7 软件包分析单个 SNP 位点的基因型频率、等位基因频率及单倍型与转躁的关联性，采用 Mplus8.0 软件包分析基因 CACNA1C 的多态性在 HAMD 量表中睡眠分项三项总得分与转躁之间是否存在中介效应。

结果 共随访成功 299 名 MDD 患者，其中有 38 人修改诊断为 BD，转躁率为 12.7%。研究发现性别、年龄、首次发病年龄、家族史、精神病性症状在 MDD 组和 BD 组之间存在显著差异。同时研究还发现基因 CACNA1C 的位点 rs2239128 的 TT 基因型频率 (X2=5.667，P=0.048)在两组间存在明显差异；通过单倍型的关联分析发现，基因 CACNA1C 的 rs215976-rs215992 位点构成的 C-C 单倍型 (X2=6.726，P=0.032)在两组之间存在显著差异，中介分析未发现基因 CACNA1C 的多态性在 HAMD 量表中睡眠分项三项总得分与转躁之间存在中介效应。

结论 本研究表明，基因 CACNA1C 单个位点的多态性以及单倍型可能与 MDD 转躁相关，同时发现了首次发病年龄、家族史、精神病性症状等影响转躁的临床危险因素，对临床诊断抑郁症转躁具有一定的指导意义。

目的 在中国，很少有全面的研究来调查双相情感障碍伴混合特征的患者，所以对该疾病的认识也不完整。本研究旨在探讨双相情感障碍伴混合特征患者的临床表现及影响因素，从而增加临床医生对该疾病的认识和诊治。

方法 这是一项横断面多中心研究，我们招募了1060 名符合双相 I 型障碍(BD-I)或双相II障碍(BD-II)DSM-5 诊断标准的参与者。所有参与者均来自中国16 个城市的 20 家三级甲等医院，研究时间为 2021 年11 月至 2022 年 5 月，包括住院和门诊患者。所有参与者的临床表现以百分比计算，表示占本研究中 BD 患者总数的比例。双相情感障碍患者是否伴有混合特征是根据其在躁狂或轻躁狂发作期间 MINI 评分≥2 分，或者在重度抑郁症发作期间 CUSDO-M 评分≥7 分。数据分析基于一般线性混合模型。

结果 双相情感障碍伴混合特征的患者躁狂/轻躁狂发作时最常见的临床表现是显著的烦躁不安或抑郁情绪(52.7%)，而重度抑郁发作时最常见的表现为精力增加(16.7%)或话多(17.5%)。在相关因素方面，BD-I 和 BD-II 均有 1 个变量有统计学意义:是否曾住过院(P=0.013[BD-I], P=0.005[BD-II])。

结论 双相情感障碍伴混合特征的躁狂/轻躁狂发作最常见的临床表现是核心症状——显著的烦躁不安或抑郁情绪，而双相情感障碍伴混合特征的重度抑郁发作患者中，情感高涨并不是最常见的临床表现。有无住院史是双相情感障碍伴或不伴混合特征的相关因素。

Association of Peripheral Inflammation with Disrupted Brain Functional Network Topology in Bipolar Disorder

汤桂贤 陈观茂 王颖*
暨南大学附属第一医院(广州华侨医院)

Objective Increasing evidences show that inflammation might be involved in bipolar disorder (BD), but the association between abnormal brain function and inflammation in BD patients is still unclear. In this study, we tried to explore the disrupted brain functional network topology, peripheral cytokines and their correlations to demonstrate the role of inflammation in brain functional network topology in BD.

Methods In this study, 53 BD patients and 47 healthy controls (HCs) underwent resting-state magnetic resonance imaging scans. Graph theory analysis was performed to investigate the topological properties of whole-brain functional connectome at both global and nodal levels. Serum levels of interleukin-4 (IL-4), interleukin-6 (IL-6) interleukin-8 (IL-8), interleukin-10 (IL-10), and tumor necrosis factor-α (TNF-α) were measured in all participants. Correlations between topological properties, clinical variables and cytokines levels in BD were calculated. Furthermore, mediation analysis was employed to determine whether inflammatory cytokines affect depressive symptoms by affecting brain network properties.

Results Patients with BD showed significantly greater normalized characteristic path length (λ), and marginally greater characteristic path length (Lp) and lower global efficiency (Eglo). Furthermore, the BD group showed lower nodal degree centrality (Degi) in the bilateral lingual gyrus, and lower nodal efficiency (Enodal) in the bilateral lingual gyrus, right postcentral gyrus, right superior frontal gyrus (SFG), and the left middle temporal pole (MTP). Besides, IL-4, IL-6, IL-8, IL-10 levels were higher in BD than HCs. Correlation analyses revealed that elevated levels of IL-10 were correlated with the greater Lp and lower Eglo, and elevated levels of IL-8 was correlated with the greater λ. Furthermore, the Enodal in the left MTP was negatively correlated with IL-4 and IL-8 levels in BD. Moreover, the Enodal of the left MTP mediated the effect of IL-4 levels on the 24-item HDRS scores.

Conclusion Our study provided preliminary evidence of the association between disrupted brain functional network topology and neuroinflammation in BD. The current study demonstrated disrupted topological organization in the whole brain and regional connectivity was associated with inflammatory cytokines of the IL-4, IL-8 and IL-10 levels in BD. Moreover, our results indicated that higher IL-4 levels and impaired regional connectivity in the temporal pole may be associated with the severer depressive symptoms in BD.

Effect of Repeated Intravenous Esketamine on Adolescents with Major Depressive Disorder and Suicidal Ideation: A Randomized Active-Placebo-Controlled Trial

周燕玲* 蓝晓凤 王成瑜 宁玉萍
广州医科大学附属脑科医院

Objective Suicide is a major cause of death in adolescents with limited treatment options. Ketamine and its enantiomers have shown rapid antisuicidal effects in adults with major depressive disorder (MDD), but their efficacy in adolescents is unknown. We conducted an active, placebo-controlled trial of intravenous esketamine's safety and efficacy in this population.

Methods A total of 54 adolescents (aged 13-18) with MDD and suicidal ideation were included from an inpatient setting and randomly assigned (1:1) to receive three infusions of esketamine (0.25 mg/kg) or midazolam (0.045 mg/kg) over 5 days, with routine inpatient care and treatment. Changes from baseline to 24 hours after the final infusion (Day 6) in the scores of the Columbia Suicide Severity Rating Scale (C-SSRS) Ideation and Intensity (primary outcome) and Montgomery–?sberg Depression Rating Scale (MADRS, key secondary outcome) were analyzed using linear mixed models. Additionally, the 4-week clinical treatment response was a key secondary outcome.

Results The mean changes in C-SSRS Ideation and Intensity scores from baseline to Day 6 were significantly greater in the esketamine group than in the midazolam group (Ideation, -2.6 [SD=2.0] vs. -1.7 [SD=2.2], P=0.007; Intensity, -10.6 [SD=8.4] vs. -5.0 [SD=7.4], P=0.002), and the changes in MADRS scores from baseline to Day 6 were significantly greater in the esketamine group than in the midazolam group (-15.3 [SD=11.2] vs. -8.8 [SD=9.4], P=0.004). The rates of antisuicidal and antidepressant responses at 4 weeks posttreatment were 69.2% and 61.5% after esketamine, and 52.5% and 52.5% after midazolam, respectively. The most common adverse events in the esketamine group were nausea, dissociation, dry mouth, sedation, headache and dizziness.

Conclusion These preliminary findings indicate that three-dose intravenous esketamine, added to routine inpatient care and treatment, was an effective and well-tolerated therapy for treating adolescents with MDD and suicidal ideation.

基于同卵双生子样本研究肠道菌群对孤独症谱系障碍严重程度的影响机制

黄懿钖[1] 李春燕[3] 李赟[2] 柯晓燕[2]
1.南京医科大学附属儿童医院
2.南京医科大学附属脑科医院
3.南京大学医学院附属鼓楼医院

目的 分析肠道微生物群作为非共享环境因素对孤独症谱系障碍（Autism Spectrum Disorder,ASD）临床表现严重程度的影响，进一步探索脑肠轴功能失调与孤独症谱系障碍的病理生理基础。

方法 招募 2015 年 08 月至 2022 年 07 月期间在南京脑科医院儿童心理卫生研究中心门诊就诊的 2-6 岁，符合 DSM-5 中有关 ASD 的诊断标准，并经过卵型鉴定的 ASD 同卵双生子 19 对，利用孤独症评定量表（Childhood Autism Rating Scale, CARS）对其症状严重程度进行评估，根据 ASD 临床严重程度不同进行分组，其中，每对 ASD 同卵双生子中 CARS 评分较高的为双生子 H，评分较低的为双生子 L；双生子 H 组成 MZCo-ASD-H 组，双生子 L 组成 MZCo-ASD-L 组。同时，采集 MZCo-ASD-H 组、MZCo-ASD-L 组共 38 例 ASD 儿童的粪便样本，提取粪便细菌微生物 DNA，使用 16SrDNA 测序技术分析两组肠道菌群的构成和分布特征；采用 LEfSe 分析，进一步比较两组间的肠道菌群差异，发现 MZCo-ASD -H 组具有显著性差异的细菌生物标志物；使用 PICRSt2 MetaCyc 数据库预测其代谢通路。

结果 分析 MZCo-ASD-H 组和 MZCo-ASD -L 组的肠道菌群结构特征,其组间 α 多样性比较差异均无统计学意义（P>0.05），β 多样性 PLS-DA 分析显示 MZCo-ASD -H 组和 MZCo-ASD-L 组的肠道菌群构成具有显著性差异；根据可操作分类单元的分类,不同症状严重程度的孤独症同卵双生子的肠道菌群菌落结构在门、科水平存在明显差异，MZCo-ASD-H 组较 MZCo-ASD-L 组变形杆菌门相对丰度显著降低（P<0.05），而瘤胃球菌科相对丰度显著增加（P<0.05）；LEfSe 分析研究显示，MZCo-ASD-H 组肠道菌群主要的细菌生物标志物为魏斯氏菌属、明串球菌科、假单胞菌目、卟啉单胞菌属； METACYC 代谢通路分析显示，MZCo-ASD-H 组肌醇代谢功能丰度低于 MZCo-ASD-L 组（P<0.05）。

结论 肠道微生物作为非共享环境因素可能参与了 ASD 症状严重程度改变的发生发展。

儿童期虐待经历对于青少年人群非自杀性自伤行为的影响

何玉琼 崔夕龙 杨听雨 张雅茹 罗学荣*
中南大学湘雅二医院

目的 探讨儿童期虐待经历对于青少年人群非自杀性自伤行为（non-suicidal self-injury, NSSI）的影响。

方法 我们的分别在湖南省内两所中学的中学生人群中展开了儿童期虐待经历和 NSSI 的调查。此外，我们在中南大学湘雅二医院门诊及住院部展开了青少年抑郁症患者的儿童期虐待经历和 NSSI 的调查，并在学校收集健康青少年作为对照。通过 logistic 回归分析

以及相关分析分别探索儿童期虐待经历对非临床患者、临床患者的 NSSI 的影响。

结果 在非临床样本中，我们一共收集了 3518 名中学生的调查数据。儿童期的情感虐待经历（相对于没有情感虐待经历）（OR=6.587）、躯体虐待（相对于没有躯体虐待经历）（OR=4.204）、情感忽视（OR=2.103）（相对于没有情感忽视经历）是青少年 NSSI 的危险因素。儿童期的情感虐待相对于没有情感虐待经历）（OR=6.189）、躯体虐待（相对于没有躯体虐待经历）（OR=5.265）、情感忽视情感忽视（OR=2.103）（OR=3.030）是青少年重复 NSSI 危险因素。基于临床样本的对比研究，伴 NSSI 的抑郁症青少年患者在儿童期虐待问卷上不同的情感虐待、情感忽视、躯体虐待、躯体忽视等亚量表的得分均高于不伴 NSSI 的青少年抑郁症患者、以及健康对照组，并且三组间的两两比较的差异均显著(p 均＜0.001)。在伴 NSSI 的抑郁症患者组内，相关分析显示过去 6 个月的 NSSI 严重程度与情感虐待（r=0.383，p＜0.001）、躯体虐待（r=0.307，p＜0.001）、情感忽视（r=0.430，p＜0.001）、躯体忽视（r=0.307，p＜0.001）呈正相关。过去 12 个月的 NSSI 严重程度与情感虐待（r=0.429，p＜0.001）、躯体虐待（r=0.364，p＜0.001）、情感忽视（r=0.400，p＜0.001）、躯体忽视（r=0.332，p＜0.001）呈正相关，与过去 6 个月的 NSSI 的严重程度呈正相关（r=0.898，p＜0.001）。

结论 儿童期的虐待经历对于普通健康青少年人群、青少年抑郁症患者的 NSSI 均有不同程度的影响。这提示我们，对于儿童期早期虐待经历的干预可能可以预防青少年患者产生 NSSI。

人格特征预测未治疗青少年抑郁症患者的抗抑郁药治疗反应：一项为期 8 周、开放标签、灵活剂量的研究

冉柳毅[1] 刘心怡[1] 王我[1] 邱海棠[2] 况利[2]
1.重庆医科大学附属大学城医院
2.重庆医科大学附属第一医院

目的 既往研究发现人格特征是成人抑郁症患者抗抑郁药治疗反应的有效预测因素之一。然而，人格特质与青少年抑郁症抗抑郁药治疗反应的关系尚不清楚。本研究的目的是探索人格特质与 SSRIs 治疗反应的关系，以青少年抑郁症为研究样本，重点关注短期疗效反应。并且，进一步探索人格特质和临床特征在抗抑郁药治疗反应中的预测价值。

方法 本研究共招募了 197 例未治疗的青少年抑郁症患者，最终 82 名患者完成了为期 8 周的 SSRIs（氟西汀或舍曲林）单药治疗。采用修订版大五人格量表评估患者基线的人格特征。17 项汉密尔顿抑郁评定量表和儿童抑郁评定量表-修订版评估基线和第 8 周的抑郁症状严重程度，根据 2 个量表的平均减分率为主要疗效评估指标。Logistic 回归探索人格维度和抗抑郁药治疗反应之间的关系。ROC 曲线评估人格子维度和临床特征在预测治疗反应方面的准确度。

结果 （1）青少年抑郁症组的基线神经质得分高于青少年健康对照组(p< 0.001)，外向性得分(p< 0.001)、开放性得分(p< 0.01)、宜人性得分(p< 0.001)和责任感得分(p< 0.001)低于青少年对照。（2）在治疗 8 周时，治疗有效组的基线外向性评分低于治疗无效组（p= 0.021）；logistic 回归分析显示，基线外向性评分与抗抑郁药治疗反应相关(OR= 1.022, p= 0.018)，在校正了具有差异趋势的变量(OR= 1.104, p= 0.038) 或所有潜在混杂变量(OR= 1.139, p= 0.019)，外向性评分仍与治疗反应相关；基线低外向性评分组的 8 周治疗有效率（55%）显著高于高外向性评分组（30.6%），差异有统计学意义（$\chi2$= 4.608, p= 0.032）。（3）病程、外向性-合群和宜人性-信任的组合模型在预测青少年抑郁症抗抑郁药治疗反应中具有一定的准确度（AUC = 0.763，敏感性为 79.4%，特异性为 68.7%）；在这个模型中，低得分组的 8 周治疗有效率（64.3%）显著高于高得分组（17.5%）（$\chi2$= 18.477, p< 0.001）。

结论 青少年抑郁症患者具有显著不同的人格特征。外向性人格特征可能与青少年抑郁症抗抑郁药的短期治疗反应有关，在使用抗抑郁药治疗前有必要对患者进行人格特征的筛查。本研究结论仍需大样本和长期治疗随访的验证。

关键字：人格特征;青少年抑郁症;预测治疗反应；SSRI

Natural Language-inspired Analysis of Motion Sequences for Early Diagnosis of Autism Spectrum Disorder

关陆阳[1] 张子一[1] 王菲[1] 李锦卉[2] 黄安琪[2] 王永露[1] 高天舒[1] 朱清峣[1] 柯晓燕[1,2]

Objective Natural language and motor skills serve as crucial avenues for human communication and self-expression, necessitating adherence to well-defined rules and constraints. Linguistic systems demand compliance with grammatical, semantic, and pragmatic principles, whereas motor functions mandate observance of muscular, skeletal, and anatomical limitations. Moreover, both language and movement unfold sequentially over time, warranting precise execution. Nevertheless, Autism Spectrum Disorder (ASD) is characterized by developmental delays or atypical developmental trajectories in both linguistic and motor domains, indicating that individuals with ASD may diverge from these established norms. Consequently, this investigation endeavors to scrutinize the action sequences in ASD by drawing from the attributes of natural language, with the objective of uncovering potential ASD markers and facilitating early diagnostic efforts.

Methods This study recruited 160 ASD individuals

aged 18-36 months, 45 individuals with atypical development, and 30 typically developing children at the outpatient clinic of Nanjing Medical University Affiliated Brain Hospital. The standardized behavior observation room was used to track and detect the participants' action behaviors, and computer vision technology was used to digitize the action behaviors. In the data analysis section, the K-nearest neighbor algorithm was used to extract key frames from videos, deep learning algorithm was used to recognize human keypoints, and natural language algorithms were used to extract features and classify ASD children's action behaviors.

Results The overall three-class accuracy rate was 77.5%. Among them, the classifier performed well in the typical development category, with sensitivity and specificity of 0.85 and 0.98, respectively. It also performed well in the ASD category, with sensitivity and specificity of 0.98 and 0.88, respectively. However, the classification performance in the atypical development category needs further improvement, with sensitivity and specificity of only 0.07 and 0.8, respectively. In the interpretable analysis, the Euclidean distance between the head and the toy, the Euclidean distance between the shoulder and the hand, and the Euclidean distance between the head and the upper limb were considered important distinguishing features.

Conclusion This study found that the classifier performed well in the typical development and ASD categories, with high sensitivity and specificity. However, the classification performance in the atypical development category needs further improvement. These results provide new methods and ideas for the early diagnosis of ASD. In the future, further research and improvement of the classifier's design and algorithm can increase its classification accuracy and reliability, providing more scientific and accurate support for the early diagnosis and treatment of ASD.

3.杭州师范大学

目的 既往研究发现 ADHD 患者认知功能异常在儿童期和成人期可能有不同神经基础，如认知抑制相关神经活动在发育中表现出脑区间差异。成人 ADHD 患者能有效利用额叶进行认知加工，而儿童 ADHD 患者认知加工相关脑区并不具有特异性且常常激活不足。本研究针对 ADHD 患者视觉空间注意能力异常有关脑活动在儿童期和成人期的差异性进行探讨。

方法 研究纳入 44 名儿童 ADHD（平均年龄 11 岁），36 名儿童健康对照（平均年龄 11 岁），29 名成人 ADHD（平均年龄 26 岁）和 37 名成人健康对照（平均年龄 25 岁），所有被试均在磁共振扫描中完成注意选择（任务 A）和注意抑制（任务 B）的视觉空间注意任务。对任务诱发的全脑激活，通过两因素方差分析（[患病情况：ADHD vs. HC]×[年龄段：儿童 vs. 成人]），在两个任务中分别分析患病情况和年龄段的交互效应。使用偏相关分析，在控制性别、年龄和智商后，分析具有交互效应的局部脑区神经活动强度与任务行为表现和临床量表评分的相关性。全脑分析多重比较通过 GFR 校正，$Z>3.1$, 团块水平 $p<0.05$。相关分析采用双尾检验，当 $p<0.05$ 时认为相关有统计学意义。

结果 （1）任务行为表现方面，儿童 ADHD 比儿童健康对照正确率更低，而成人 ADHD 比成人健康对照正确反应时更慢。神经活动方面，（2）在注意选择任务中：儿童 ADHD 患者左侧罗兰迪克岛盖区及左侧楔前叶功能异常减弱；儿童 ADHD 患者左侧舌回功能异常增强，且左侧舌回神经活动越强、多动冲动症状越严重；成人 ADHD 患者左侧舌回功能异常减弱，在成人健康对照中左侧舌回神经活动越强、任务正确率越高。（3）在注意抑制任务中：儿童 ADHD 患者左侧梭状回、左侧楔前叶、左侧辅助运动区、右侧枕下回和右侧颞上回功能异常减弱，且左侧辅助运动区活动越弱、任务反应时越长；成人 ADHD 患者右侧枕下回和右侧颞上回功能异常增强。

结论 ADHD 患者在儿童期和成人期均表现出视觉空间注意受损。在进行视觉空间注意加工时，ADHD 患者在儿童期可能既有额叶、也有枕叶脑区功能活动的异常，而成人期可能仅表现为枕叶脑区神经活动异常、而额叶活动功能正常。研究提示 ADHD 患者认知功能异常的神经基础随着生长发育发生动态变化，可为选择疾病转归与预后的评估指标提供依据。

3.重庆医科大学附属大学城医院

Objective Maresin-1 is an antiphlogistic agonist synthesized by macrophages from docosahexaenoic acid (DHA). It has both anti-inflammatory and pro-inflammatory properties and has been found to enhance neuroprotection and cognitive function. However, there is limited knowledge of its effects on depression and the potential mechanism remains unclear. In this study, the effects of Maresin-1 on lipopolysaccharide (LPS)-induced depressive symptoms and neuroinflammation were investigated

in mice and the possible cellular and molecular mechanisms were further clarified.

Methods 90 mice were randomly divided into groups, namely, the control group（n=30）, the LPS (1 mg/kg) + NS group (LPS+NS)(n=30), and the LPS (1 mg/kg) + MaR1 (5 μg/kg) (LPS+MaR1) (n=30)group. Mice in the control group were injected intraperitoneally with 10 mL/kg normal saline (NS) while mice in the other groups received intraperitoneal injections of the above materials. Twenty-four hours after injection, the three groups of mice underwent behavioral tests, including the tail-suspension test (TST), the open-field test (OFT), and the sugar-preference test (SPT). Additionally, the mice in each group were euthanized to collect brain tissue samples.

Results Maresin-1 reduced the standardized uptake value (SUV) of [18 F] DPA-714 in brain regions associated with depression (e.g., hippocampus and pre-frontal cortex), while immunofluorescence of hippocampal and indicated that Maresin-1 inhibited microglial activation reducing the expression of the pro-inflammatory cytokine IL-1β and NLRP3. The RNA sequencing of mouse hippocampi showed that genes expressed differentially between Maresin-1-treated and LPS-treated tissue were associated with tight connections between cells and the stress-activated MAPK cascade negative regulatory pathways.

Conclusion MaR1 was found to have anti-inflammatory effects and is effective for investigating the potential cellular and molecular mechanisms of LPS-induced depressive-like behaviors in a multi-modal and multi-dimensional manner. This study provides a reference and methods for the anti-inflammatory treatment of depressive-like behaviors.

2.中国科学院心理研究所院心理健康重点实验室

目的 研究表明精神分裂症、抑郁障碍、双相情感障碍与炎症过程相关，但炎症细胞因子对这三种疾病的诊断效能和预测能力尚无研究。本研究旨在探讨血清当中多种炎症细胞因子因子水平是否可作为此三种疾病的诊断生物学指标及鉴别诊断生物学指标。

方法 选取在院治疗的 8-17 岁的 367 例儿童青少年患者，其中精神分裂症患者 83 例、抑郁症患者 152 例、双相情感障碍患者 131 例，年龄性别匹配的健康对照者 101 例。采用阳性和阴性症状量表、汉密尔顿抑郁量表、杨氏躁狂量表分别对其症状进行评估。检测各组血清当中 IFN-y、IL-1beta、IL-2、IL-4、IL-6、IL-10、IL-12P40、IL-12P70、IL-21、TGF-beta1 水平。每种疾病与对照组之间控制年龄及性别之后进行逻辑回归分析，同时每 2 种疾病之间也做了回归分析。

结果 10 种炎症细胞因子联合用于预测精神分裂症的阳性预测率为 74%，用于预测抑郁症的阳性预测率为 74%，用于预测双相情感障碍的阳性预测率为 67%。在三种疾病两两配对进行鉴别诊断时抑郁障碍及双相情感障碍的平均判别准确率为 55%及 58%，精神分裂症与抑郁障碍的平均判别准确率分别是 66%及 73%，精神分裂症与双相情感障碍的平均判别准确率分别是 66%及 72%。

结论 与健康对照组相比，多种炎症细胞因子联合可用于识别不同疾病，但在不同精神疾病之间的鉴别效应欠佳，特别是抑郁障碍与双相情感障碍，提示这两种疾病炎症反应可能相似。炎症细胞因子有望成为青少年精神分裂症、抑郁障碍、双相情感障碍的潜在筛查或诊断生物标志物。

Childhood Maltreatment and Adolescent Eating Disorders: A Moderated Mediation Model of Social Anxiety and Physical Activity

Sihong Li Xuerong Luo* Yanmei Shen*
中南大学湘雅二医院

Objective Childhood maltreatment (CM) is considered a high-risk adolescent eating disorder (ED) factor. However, less is known regarding the underlying processes between CM and ED. This study aims to investigate (a) the mediating role of social anxiety(SA)in the association between CM and ED, and (b) the moderating role the physical activity in the relationship between CM and adolescent ED.

Methods This model was examined with 848 students from a middle school in grade7-8 in Changsha with a longitudinal design; the participants completed measurements regarding childhood maltreatment (Childhood Trauma Questionnaire) at baseline and completed measurements regarding social anxiety (The Social Anxiety Scale-Adolescents), physical activity, and eating disorder(The Eating Attitudes Test) at 6-month follow-up.

Results The correlation analyses indicated that emotional abuse (EA) and Social Avoidance and Distress that is more general or pervasive (SAD-G) were significantly positively associated with adolescent ED. Mediation analyses revealed that the paths from EA to SAD-G, from SAD-G to ED, and from EA to ED were significant. Moderated mediation further indicated that physical activities(PA) moderated the indirect effects of EA on ED through SAD-G and moderated the effects of EA on SAD-G.

Conclusions This study provides valuable evidence by revealing the mediating role of SAD-G and the moderating role of PA between CM and ED, which indicate that SA may be a vital factor for people who suffered from CM

and ED. Furthermore, the role of PA should be addressed in preventing and treating ED.

目的 药物是注意缺陷/多动障碍（ADHD）的主要治疗方式。尽管哌甲酯（MPH）和托莫西汀（ATX）在 ADHD 的疗效已经得到广泛证实，但目前仍无有效手段预测药物反应。本研究旨在结合全基因组关联研究和深度学习方法，来阐明与治疗反应相关的遗传机制，为个体化治疗提供依据。

方法 共有 241 名 ADHD 患者接受了为期 8-12 周的药物治疗（MPH 组 161 人；ATX 组 80 人）。基因分型通过 Affymetrix 6.0 芯片完成。本研究使用注意缺陷多动障碍评定量表（ADHD-RS）得分变化的百分比（%）作为结局变量进行了全基因组关联分析。本研究建立了深度学习模型来预测治疗反应，包括深度卷积模型、长短时记忆网络、全连接网络。并比较了深度学习模型与支持向量回归和随机森林的预测效果。此外，为确保结果的可重复性和模型的可靠性，我们额外采用了 64 个通过 InfiniumPsychArray-24 芯片进行分型的样本作为独立的重复及测试数据集。我们计算了每个单核苷酸位点对于预测模型的贡献，以此来确定相关位点。

结果 基因组关联研究（GWAS）发现了 2 个显著的单核苷酸多态性（SNP）（rs2000900，P=3.31E-09；rs10880574，P=2.39E-09），涉及两个在脑中表达的基因：MYO5B 和 TMEM117，主要在神经系统及消化系统中表达。卷积神经网络表现出了较好的预测效能，在训练集中均方误差小于 0.043，验证误差为 0.012，独立测试集中误差为 0.081。对模型贡献最大的 SNP 位于 ADHD 相关基因 NKAIN2 内，该基因还与肠道菌群、体重指数相关。富集分析显示，前 300 个 SNP 与物质依赖等表型相关。

结论 本研究结合基因组关联研究和深度学习技术，揭示了与 ADHD 人群对于药物的反应的新基因，包括与 ADHD、精神疾病及消化系统疾病相关的基因。

Cross-Cultural Generalizability of The First Year Inventory for Early ASD Screening in China

张子一 王菲 关陆阳 朱清峣 高天舒 王永露 姜肖茹 柯晓燕*
南京脑科医院

Objective Early identification of Autism spectrum disorder (ASD) is challenging due to limitations in existing screening measures. The First Year Inventory 2.0 (FYI 2.0) is a Level 1 screening tool designed to assess ASD risk in 12-month-old infants, and has been adapted and modified by researchers in various countries, considering sample characteristics. This study aims to investigate the feasibility and clinical implications of the FYI-Chinese version in both community and high-risk samples within the context of China.

Methods The study participants consisted of two groups: a Low-risk group (LR group) comprising 519 individuals recruited from four community health care centers in Nanjing, and a High-risk group (HR group) consisting of 53 siblings of individuals diagnosed with ASD from the Nanjing Medical University ASD Siblings Cohort. Participants in the HR group underwent assessments using the Chinese version of the Gesell Developmental Schedules, the Autism Diagnostic Observation Schedule - Toddler Module (ADOS-T), and the Communication and Symbolic Behavior Scales Developmental Profile Infant-Toddler Checklist (CSDS-ITC). Our objectives include analyzing response distributions, establishing specific scoring norms for Chinese infants, examining construct validity, exploring the association between parental reports and clinician evaluations of ASD risk, and developing more effective cutoff scores for the HR siblings.

Results The Cronbach's alpha across the 61 questions were 0.81. The CFA results yielded a less-than-ideal fit of the model to the data. Employing the UK risk score assignment, the 95th percentile total risk score equaled 31.00 and were higher than those of the American (17.75). The US risk score assignment was rendered inapplicable, prompting us to transpose the probabilistic data in our sample into risk points adhering to the same scoring system as the standard FYI 2.0. According to the reversed risk points, this total score ranged from 0-23, and the 95th percentile score equaled 13. The HR group did not exhibit significantly lower total scores compared to the LR group. The Pearson correlation coefficient revealed significant associations between the FYI 2.0 and both the CSBS DP-ITC and ADOS-T.

Conclusion These findings provide compelling evidence regarding the applicability and validity of the Chinese version of the FYI. The observed discrepancy in cross-cultural response distribution suggests that Chinese parents may possess different understandings of certain questions and exhibit preferences for particular answers compared to their American counterparts. It is imperative to establish modified scoring criteria tailored to the Chinese sample. There was no discernible difference in the 95% cutoff point between the High-risk and Low-risk groups. This discrepancy indicates that parents of ASD siblings may exhibit a heightened assessment of infants' social development.

4.北京脑科学与类脑研究中心

目的 感知生物运动（BM）对人类的生存和社会互动至关重要。BM 感知被认为是社会认知的标志之一。已有研究发现孤独症谱系障碍（ASD）和注意缺陷多动障碍（ADHD）儿童有着相似的异常 BM 感知。但没有研究比较二者的 BM 感知损伤的差异。本研究通过行为学范式，比较典型发育（TD）和不同神经发育障碍儿童的 BM 感知能力的异同。

方法 本研究招募了 TD（n＝33）、ASD（n＝14）、ADHD（n＝40）以及 ASD 共患 ADHD（n＝32）四组儿童。我们测试了四组儿童在 BM 探测和方向判别两种任务表现。在此基础上，采用社会反应量表(SRS)评估儿童的社交能力并探究 SRS 得分与 BM 感知的关系。

结果 在 BM 探测任务中，我们发现四组儿童的表现有显著差异（$p < 0.001$），事后比较发现与 TD 儿童相比，三组神经发育障碍儿童表现较差 (所有 $p < 0.05$)，三组神经发育儿童的表现之间没有差异（所有 $p > 0.05$）。BM 探测任务的正确率与 SRR 分数呈显著负相关（$r = -0.253$，$p = 0.005$）。同样在 BM 方向判别任务中，四组儿童的表现有显著差异（$p < 0.001$），事后比较发现与 TD 儿童相比，三组神经发育障碍儿童表现较差 (所有 $p < 0.05$)，三组神经发育儿童的表现之间没有差异（所有 $p > 0.05$），BM 方向判别任务表现与 SRR 分数呈显著负相关（$r = -0.276$，$p = 0.002$）。

结论 我们发现不同神经发育障碍儿童有共同的 BM 感知损伤。此外，个体感知 BM 信息的能力能预测其社交能力。本研究揭示 BM 感知受损可能成为神经发育障碍潜在的生物学标志物，神经发育障碍儿童可能存在共同的社会信息加工损伤机制。

High Dynamic Functional Connectivity of Sensorimotor Cortices Associated with Restricted, Repetitive Behavior in Children with Autism Spectrum Disorder

郑翔宇[1] 田俊斌[1] 卜暄[2] 张慧[3] 董迪[4] 曹庆久[1] 贺永[2] 杨莉[1]
1.北京大学第六医院
2.北京师范大学
3.北京航空航天大学
4.中国科学院大学

Objective Restricted, repetitive behavior (RRB) is a pattern of purposeless behavior that displays little variation in form and interferes with appropriate behavior, which is a core feature of autism spectrum disorder (ASD), and these behaviors can be classified into different subtypes based on their characteristics. Understanding the neural mechanisms underlying RRBs and its subtypes can provide insights into the neurobiology of ASD and inform the development of targeted interventions. In this study, we aimed to investigate the association between time-varying brain functional connectivity with RRBs and subtypes.

Methods A total of 93 children with ASD and 110 children with typical development (TD) were enrolled in the study, available from the Autism Brain Imaging Data Exchange database (ABIDE). Sliding-window approach was used to estimate dynamic functional connectivity variation (dFCV) defined as the standard deviation of functional connectivity for the participants. RRB behavior was assessed by the Autism Diagnostic Interview-Revised (ADI-R). Support vector machine (SVM) classifier was used to find RRB related brain regions. Linear regession was used to found the machnism of RRB subtypes. In addition, neural activity was separated into different states by the K-means algorithm, and the potential neuropsychological associations were found in each state by meta-analytic decoding. The relationship between different neural activity states and RRB was assessed by a linear SVM regression model.

Results Compared with TDs, individuals with ASD had increased dFCV in the whole brain and networks. DFCV in sensorymotor areas can be used to predict RRB with 87.1% accuracy by SVM classifier, mainly including primary somatosensory cortex (S1), primary motor cortex (M1), somatosensory association cortex (SA), premotor cortices, putamen, insula, cerebellum. DFCV in M1 and cerebellum was related to restricted or circumscribed interests (CI) scores (Beta=0.526, p=0.008); the dFCV in SA and insula was related to insistence on sameness (IS) scores (Beta=0.526, p=0.015); the dFCV in pars orbitalis and cerebellum was related to repetitive sensory and motor behaviors (RSMB) (Beta=0.438, p=0.024). Brain activity can be clustered into different states, the states can be used to predict the severity of RRB (R2=0.360, RMSE =2.570), with state 4 occurring most frequently in ASD group, which were related to the sensory terms.

Conclusion Instable neurol activity across the brain, particularly in the sensorimotor cortices may be an underlying mechanism of RRB in ASD. Brain dynamic activity states especially that related to sensory processing could be used to predict the severity of RRB.

目的 孤独谱系障碍（Autism Spectrum Disorder, ASD）是一种神经发育障碍，从生命早期起病，延续终生。全球范围内 ASD 的发病率逐年上升，已经成为亟待重视的公共卫生问题。感知觉异常被认为是 ASD 的核心特征。视觉注意是感知觉的一个重要方面，ASD 人群往往对各种视觉刺激表现出非典型的视觉注意。已有多项眼动追踪研究发现 ASD 人群与健康人群之间存在显著的视觉注意差异。因此，本研究旨在使用眼动追踪技术，通过呈现包含自然场景、建筑物、人物的图像刺激，探索 ASD 的视觉注意特征，从眼动追踪数据中提取可区分 ASD 儿童和健康对照的指标，建立 ASD 的早期诊断辅助模型。

方法 本研究纳入 ASD 儿童 12 例（年龄 2-6 周岁；男：女=9：3）、健康对照 14 例（年龄 2-6 周岁；男：女=7：7）。基于眼球追踪技术收集的眼动数据，即被试者观看图像时的注视点序列，使用深度神经网络计算被试者是否患有 ASD 的概率。具体而言，首先将图像使用卷积神经网络 ResNet 提取图像特征，根据注视点序列依次取出每个注视点对应位置的图像特征组成图像特征序列，再将其输入至循环神经网络 LSTM 中提取其中的时序特征，最后使用一层全连接层以及 Sigmoid 函数计算该样本患有 ASD 的概率，得到某个被试者观看的所有图像的概率后将其进行平均作为该被试者患有 ASD 的概率。

结果 使用留一法进行 26 折交叉验证，该模型总体的准确率为 0.846，识别 ASD 患者的准确率（即灵敏度）为 0.667，识别健康儿童的准确率（即特异性）为 1.000，ROC 曲线下的面积 AUC 为 0.952，结果表明该模型可以根据眼动数据有效地诊断 ASD。

结论 本研究使用眼动追踪技术，验证了 ASD 儿童的视觉注意特点与正常对照有显著差异，通过分析眼动追踪数据，可以有效区分 ASD 与健康对照，这标志着在临床实践中使用眼动追踪技术早期筛查和诊断 ASD 迈出了更大一步。

PCBI 干预对孤独症谱系障碍儿童父母回应性的影响

王菲[1] 关陆阳[1] 李锦卉[2] 黄安琪[2] 张子一[1] 封敏[1] 肖湘[1] 傅俊俐[1] 柯晓燕[1,2]
1.南京医科大学附属脑科医院儿童心理卫生研究中心
2.南京大学医学院附属南京脑科医院

目的 孤独症谱系障碍（autism spectrum disorder, ASD）是一种神经发育障碍，以社交沟通障碍、兴趣狭隘、行为重复刻板为主要特征，严重影响儿童社会功能和生活质量。以游戏为基础促进交流与行为的干预（play-based communication and behavior intervention, PCBI）作为一种超早期干预方法，具有早期介入、父母参与、游戏为基础以及强调自然环境等优势。然而，目前对于这种干预方法的有效性及其对父母回应性的影响的研究还相对有限。因此，本研究旨在比较 PCBI 超早期干预和 ABA 干预对 ASD 儿童疗效的差异，并探究 PCBI 超早期干预对父母回应性的作用。

方法 本研究采用非随机对照比较设计，招募了 60 名被诊断为 ASD 的儿童，其中 30 名接受 PCBI 超早期干预，另外 30 名接受 ABA 干预。使用孤独症评估量表（CARS）评估了儿童在入组前和干预结束后的症状严重程度。此外，通过编码干预前后亲子游戏视频评估 PCBI 超早期干预对父母回应性的作用。使用混合设计重复测量方差分析比较两组干预方法对症状改善的整体效果以及两者之间是否存在显著差异。

结果 研究发现，PCBI 超早期干预组和 ABA 干预组在整体上对 ASD 儿童的症状改善效果没有显著差异（$F=2.921$，$P=0.093$）。然而，时间的主效应表明整个干预过程对改善儿童的症状具有显著的效果（$F=14.318$，$P<0.01$）。此外，组别和时间之间的交互作用的非显著性表明两种干预方法在不同时间点上的效果没有显著差异（$F=0.875$，$P=0.354$）。经过 PCBI 超早期干预，父母在与儿童的亲子游戏中更频繁地参与到与儿童的游戏中，并展现更多积极回应（$P<0.05$）。此外，研究发现在入组前的基线时，父母的积极回应比率与干预结束后儿童的 CARS 分数呈负相关（$\beta=-0.38$，$P<0.05$），而父母的未回应比率与干预结束后儿童的 CARS 分数呈正相关（$\beta=0.411$，$P<0.05$）。校正年龄和性别后，研究结果显示这些相关性仍然具有显著性。

结论 本研究结果表明，PCBI 超早期干预和 ABA 干预对 ASD 儿童的改善效果相似，且 PCBI 超早期干预对父母回应性产生了积极的影响。这些发现强调了 PCBI 超早期干预在 ASD 儿童疗效和父母回应性中的重要作用，同时也为临床实践和干预策略的选择提供了有益的参考。

目的 孤独症谱系障碍（Autism spectrum disorder，

ASD）病因复杂。既往研究发现 ASD 患者与典型发育对照（typically developing，TD）相比存在广泛脑解剖学差异，但差异区域报道不一致。目前机器学习已成为探索 ASD 生物标志物的重要手段，但面临将特征数量最小化的关键问题。本研究使用基于 LASSO 和线性核 SVM 的两阶段渐进式特征优化方法，探索对 ASD 与 TD 分类最具贡献度的脑结构特征。

方法 本研究纳入符合 DSM-5 诊断标准的 201 名 ASD 患者及年龄、性别匹配的 218 名典型发育对照（TD）。所有被试采集 3D T1 序列，通过 FreeSurfer 软件进行颅骨剥离，偏场校正、配准和分割等，使用 Aparc 模板提取灰质体积、厚度、表面积和表面曲率、Aseg 模板测量深部核体积、海马亚分区模板计算海马亚结构体积，共 392 个脑结构特征。使用基于 LASSO 和线性核 SVM 的两阶段渐进式特征优化进行特征筛选：第一阶段，使用 5 折交叉验证及最小绝对收缩和选择算子（LASSO）进行粗筛选，保留被选中 4 次以上的特征以确保筛选结果的稳定性。第二阶段，使用线性核的支持向量机（SVM）进行特征进一步筛选，在 5 折交叉验证基础上，计算每个特征在每一折中的贡献度排序并将其平均，按照平均排序从高到低的顺序逐个将特征纳入 SVM 模型，直到加入新的特征不再提高 SVM 的性能，得到筛选特征集合。

结果 将特征按平均贡献排序逐个添加到 SVM 中后平均 AUC 自 0.75 逐渐增加，随着新增特征的贡献逐渐减小，平均 AUC 趋于收敛，最终收敛至 0.87。在 392 个特征中，共 9 个保留在收敛时的模型中，对 ASD 与 TD 分类贡献度最高：右苍白球体积，左岛叶皮层体积，左岛叶皮层厚度，左伏隔核体积，左丘脑体积，右海马下托体积，右前扣带回皮层厚度，右前扣带回皮层表面积，左眶额皮质皮层表面积。

结论 基于 LASSO 和线性核 SVM 的两阶段渐进方法能够有效进行 ASD 与 TD 分类特征优化。皮层下脑结构特征对 ASD 与 TD 分类具有突出贡献，对 ASD 与 TD 分类贡献最高的特征脑区与奖赏系统相关脑区高度重叠，提示皮层下结构可能在 ASD 病因及发病机制中具有重要作用。

儿童注意缺陷多动障碍静息态脑功能网络拓扑属性及药物疗效:一项 fNIRS 研究

刘泽腾 黄金巧 陆元圆 黄春香*
中南大学湘雅二医院

目的 注意缺陷多动障碍（ADHD）是儿童期一种常见的慢性神经发育障碍，本研究拟结合功能性近红外光谱技术（fNIRS）和基于图论的复杂脑网络分析方法探讨 ADHD 儿童静息态脑功能网络拓扑属性，及药物治疗后脑功能网络的改善情况。

方法 2022 年 6 月-2023 年 1 月于中南大学湘雅二医院纳入 32 名 ADHD 儿童为实验组，长沙市某小学招募健康儿童 15 名为对照组（HC），经过 12 周药物治疗（哌甲酯或者托莫西汀）的 ADHD 儿童 15 名为药物治疗组（PT），使用量表 SNAP-IV（父母版）和 PSQ（父母版）评估核心症状,利用功能性近红外光谱仪采集被试全脑静息态血氧数据。应用软件 SPSS 23.0，Matlab2013b ，GRETNA、Homer2 工具包统计比较 ADHD 组和 HC 组，ADHD 组和 PT 组脑功能网络结果。

结果 （1）ADHD 组与 HC 组静息态脑功能网络比较示，小世界网络属性、全局效率差异有统计学意义（$p<0.05$），表明 ADHD 组小世界属性和全局效率下降；（2）经过 12 周药物治疗后，ADHD 组与 PT 组比较结果示，全局效率差异有统计学意义（$p<0.05$），表明 PT 组全局效率趋于正常。

结论 基于 fNIRS 和图论方法构建的静息态脑功能网络中，ADHD 患儿具有异常的小世界网络属性，药物治疗后，脑网络拓扑属性趋于正常稳定。静息态脑功能网络拓扑属性可能作为 ADHD 儿童诊断及治疗的潜在神经标志物。考虑到本研究样本量较少，属于探索性发现，对于往后研究者关于 ADHD 神经影像研究有一定的借鉴意义。

Predicting Pragmatics in Preschool Children with Autism Spectrum Disorder Based on Structural Covariance Networks by Performing Machine Learning Prediction-based Methods

钱璐[1,2] 丁宁[1] 孙贝[1] 李赟[1] 高慧云[1] 肖湘[1] 肖婷[1] 柯晓燕[1]
1.南京脑科医院
2.无锡市精神卫生中心

Objective Pragmatics refers to the use of spoken language to effectively convey messages across diverse social communication contexts, which is frequently demonstrated to be a key component of the difficulties with far-reaching influences exhibited by children diagnosed with autism spectrum disorder (ASD). Growing evidence indicates that autism spectrum disorder (ASD) is a neuropsychological disconnection condition, structural magnetic resonance imaging studies have helped advance our understanding of its brain networks underlying specific symptoms. However, there has been little previous work using prediction frameworks to elucidate pragmatics underpinnings based on structural connectivity (SC) in ASD.

Methods In this study, totally 92 children with ASD and 52 age- and gender- matched healthy controls (HCs) completed the parent-reported measure of pragmatics-the Chinese version of Language Use Inventory (LUI). Meanwhile, cortical thickness, surface area and volume of each brain region calculated by Freesurfer were used to construct the structural covariance networks (SCNs), and structural connectivity (SC) matrices were derived from

the SCNs. Then, network-based statistic-Predict (NBS-Predict) was used to demonstrate dysconnected subnetwork associated with ASD. Nest, we combined connectome-based predictive modeling (CPM) approach and NBS-Predict to predict pragmatic skills by SC from the SCNs in the ASD group.

Results NBS-Predict identified the subnetwork associated with ASD comprised 55 lowered connections among 32 brain regions ($p = 0.01$) with the highest classification accuracy of 73.7% (95% CI: 0.733~0.741), and the right superior temporal gyrus were found to be a dysconnected region with the greatest extent, while subnetwork associated with ASD comprised 69 enhanced connections among 37 brain regions ($p = 0.01$) with the highest classification accuracy of 74.5 % (95% CI: 0.740~0.750), and the right insula gyrus was found to be a dysconnected region with the greatest extent. CPM showed that the optimal correlation coefficient between the predicted pragmatic scores and the actual scores of the ASD group was 0.306 ($p < 0.001$), totally 23 edges were negatively correlated with the total scores of the LUI-Mandarin ($p = 0.03$). NBS-Predict showed that the optimal correlation coefficient between the predicted pragmatic scores and the actual scores was 0.265 (95% CI：0.239~0.252). Moreover, CPM and NBS-Predict consistently revealed the pragmatic skills of the ASD group were associated with the morphological covariation among the left posterior cingulate gyrus, left posterior superior temporal gyrus, and bilateral transverse temporal gyrus.

Conclusion Morphological covariation among the left posterior cingulate gyrus, left posterior superior temporal gyrus, and bilateral transverse temporal gyrus was closely involved in the pragmatics function in preschool children with ASD.

Frequency of Depression and Correlates Among Chinese Children and Adolescents Living in Poor Areas under The Background of Targeted Poverty Alleviation: Results of A Survey in Weining County

袁晓菲 胡婷婷 周娇娇 陈旭*
首都医科大学附属北京安定医院，国家精神心理疾病临床医学中心，精神疾病诊断与治疗北京市重点实验室

Objective There is a lack of epidemiological data on depressive morbidity in children and adolescents in rural China. This study determines the frequency and correlates of depression among children and adolescents to offer useful insights for family education and government policy-making in rural China.

Methods A cross-sectional online survey was conducted between April 20 to May 10, 2022. Depression was assessed using the Center for Epidemiologic Studies Depression Scale (CES-D), and the correlative factors of depression were analyzed.

Results In this study, 23180 children and adolescents were enrolled (median (range) age: 12 (9–18) years); of them, 8,261 (35.6%) suffered from depression with a CES-D score of > 15. The onset of depression was significantly related to age, grade, gender, parental absence, attending key schools or classes, presence of moderate or severe internet addiction (IA), school record, social relationships, parental occupation, and education status. Furthermore, female gender (OR = 1.175; 95% CI: 1.108–1.247; $p < 0.001$), junior middle school (OR = 1.487; 95% CI: 1.380–1.601; $p < 0.001$), parental absence (OR = 1.272; 95% CI: 1.183–1.367; $p < 0.001$), attending key schools (OR = 1.221; 95% CI: 1.120–1.332; $p < 0.001$), attending key classes (OR = 1.099; 95% CI: 1.001–1.207; $p = 0.048$), and presence of moderate or above IA (OR = 13.593; 95% CI: 12.028–15.361; $p < 0.001$) were the most prominent independent factors for depression.

Conclusion Depression is very common among Chinese children and adolescents living in poor areas of Weining County. Older age, higher school grade, female gender, parental absence, attending key schools or classes, and the presence of moderate to severe IA are some important factors that may dictate the occurrence of depression in these children and adolescents.

突发公共卫生事件视域下青少年健康素养评价量表编制及在初中生中应用的信效度分析

王舟[1] 高婷叶[1] 李光建[1] 周洁[1] 孔亚萍[1] 范桂红[1] 卞茜[2] 张兴[3] 赵世俊[4]
1.常州市德安医院精神心理科
2.上海交通大学医学院附属精神卫生中心,上海市疾病预防控制精神卫生分中心
3.常州市疾病预防控制中心结防所
4.江苏省常州市高级中学心理咨询室

目的 编制突发公共卫生事件视域下青少年健康素养评价量表（Adolescent Health Literacy Evaluation Scale under Public Health Emergencies，AHLES-PHE）及其在初中生中应用的信效度检测。

方法 结合突发公共卫生事件及青少年健康素养特点形成 AHLES-PHE 初始版，经两轮 Delphi 专家征询形成 AHLES-PHE 专家版，对 1729 名初中生中进行测试，通过项目分析和因子分析(结构效度)形成 AHLES-PHE 正式版。AHLES-PHE 正式版内容效度用专家法和敏感性分析评估，检测其与日常健康信息素养自评问卷（Everyday health information literacy，EHIL）关联效度，计算内部一致性信度、奇偶分半信度及重测信度。

结果 （1）项目分析：AHLES-PHE 专家版各条目得分与总分的相关系数在 0.420~0.722 之间（$P<0.01$），

决断值 CR 在 10.140~66.980 之间（P<0.01）。（2）效度分析：探索性因子分析得出 45 条目和 8 因子的 AHLES-PHE 正式版，8 因子可解释总变异的 61.30%，验证性因子分析模型拟合指标为 X2/df=3.325、RMSEA=0.052、GFI=0.853、CFI=0.912、TLI=0.904、NFI=0.880；敏感性分析 Cronbach's α 系数范围为 0.957~0.958 之间，AHLES-PHE 正式版总分与 EHIL 总分相关系数 r 值为 0.340（P<0.01）。（3）信度分析：AHLES-PHE 正式版总量表的内部一致性 Cronbach's α 系数、分半信度 Spearman-Brown 系数分别为 0.958 和 0.975，总量表的重测信度 ICC 值为 0.753（P<0.01）。

结论 该研究编制的 AHLES-PHE 正式版具有较好的信度、结构效度及内容效度，与 EHIL 关联效度一般，该量表在突发公共卫生事件视域下对初中生健康素养评测有一定的适用性。

Dynamic Network Characteristics of Adolescents with Major Depressive Disorder: Attention Network Mediates The Association between Anhedonia and Attentional Deficit

Yujiao Wen Hong Li Dan Qiao Tian Ren Lei lei Gaizhi Li Chunxia Yang Yifan Xu Min Han Zhifen Liu*
Department of Psychiatry, The First Hospital of Shanxi Medical University, Taiyuan, China

Objective Adolescents with major depressive disorder (MDD) is highly heterogeneous, and attention-deficit is a critical symptom, which impaired the social functioning of patients. However, the neural network relevant psychopathologic mechanism was not elucidated. Therefore, we aimed to explore the dynamic neural network activity of attention-deficit and the relationship with the clinical outcome.

Methods We studied 188 adolescents (12-23 years) with major depressive disorder(MDD) who were treated with SSRIs for 8 weeks and 94 healthy controls who had high-quality resting-state EEG and fMRI data as a part of the adolescent with MDD Cohort. Combining psychophysics, electroencephalography (EEG), and functional magnetic resonance imaging (fMRI) techniques, we aimed to inform the dynamic network features by investigated EEG microstate characteristics and related network temporal features in adolescents with MDD.

Results At baseline, microstate analysis demonstrated that the frequency of microstate C in the adolescents with MDD were decreased compared to the health controls, while the duration and coverage of microstate D was increased in the MDD. Mediation analysis revealed that the transition probability from microstate C to microstate D mediated the anhedonia and attention deficit in the patient group. The resting fMRI results showed that the temporal variability of dorsal attention network (DAN) was significantly weaker in MDD than that in healthy controls, whereas the temporal frequencies were comparable between the two groups. Importantly, temporal variability of DAN mediates the relationship between anhedonia and attention deficit in the patient group. After acute-stage treatment, the remitters ameliorated in microstates C and D compared with treatment failures. For resting-state fMRI data, temporal variability of DAN was significantly higher in remitters than in treatment failures.

Conclusion Our findings elucidated the dynamic neural network characteristics revelant acute-stage treatment efficacy in the adolescents with MDD, which were significantly associated with the anhedonia and the cognitive impairments. The study enriched the understandings of the neural mechanism underlying the attention deficit in adolecents MDD, and provided the novel clinical biomarkers.

Relationships Among Premonitory Urge, Tics, and Quality of Life in Drug-naive Children with Tic Disorders: A Mediation Analysis of A Chinese Sample

王贤斌 徐会 李彦霖 胡淑锦 杨凯 张文炎 蒋忠良 李瑛* 崔永华*
首都医科大学附属北京儿童医院

Objective Premonitory urge (PU) is a common sensory phenomenon in patients with tic disorder (TD). The quality of life is an important issue for the recovery of patients with tic disorders. However, the relationship among PU, severity of tic and quality of life was unclear. The aim of this study is to explore the association among these three variables.

Methods Clinical data, including the Yale Global Tic Severity Scale (YGTSS), Premonitory Urge to Tic Scale (PUTS), and Tourette-Quality of Life Scale (GTS-QOL), were collected from drug-naive TD patients aged 6-16. Based on the PUTS values, the subjects were divided into two groups: the PU group (PUTS > 12) and the NPU group (PUTS ≤ 12). Logistic regression was employed to explore the contribution of age and gender to the presence or absence of PU in TD patients. Correlation analysis was performed using Spearman's correlation and partial correlation. Lastly, mediation analysis was conducted to explore the relationship among the severity of PU, the severity of tics and their components, quality of life, and various influencing factors.

Results A total of 1204 drug-naive TD patients were enrolled in our study, with 911 subjects in the PU group and 293 in the NPU group. By Kolmogorov-Smirnov test, except for cognitive factor score of GTS-QOL (p = 0.422) and Physical factor score of GTS-QOL (p = 0.099), age, YGTSS, GTS-QOL total score and each factor score were statistically different (p<0.05) between PU and NPU groups. The Chi-square test of sex and comorbidity (pure tic or not) between 2 groups did not show a significant difference (p = 0.228 for sex, and p =

0.267 for comorbidity). Logistic regression analysis found that age (OR = 1.127, p = 0.001) were significant predictors for the presence of PU. All of pairwise Spearman correlation analysis for selected clinical variables were significant (p<0.05). Impairment of tic could not act as a mediator (p>0.05) of the effect of PU on quality of life and its various factors. Vocal tic did not act as a mediator (p>0.05) of the effect of PU on the cognitive factor of quality of life, but could act as a mediator of the effect of PU on quality of life and its other factors (p<0.05). Motor tic can act as a mediator (p<0.05) of the effect of PU on quality of life and its factors.

Conclusion The incidence of PU in tic disorder increased with age, which was a risk factor predicting higher tic severity and worse life quality. Motor tic and vocal tic but not impairment of tic can act as a mediator of the effect of PU on quality of life. Future development of therapies targeting PU, motor tics, or vocal tics may be effective in improving quality of life in TD

Development, Reliability and Validity of Sensory Phenomenon Assessment Scale (SPAS): A New Tool for Assessment of Tic-associated Sensations

王贤斌 李彦霖 于丽萍 张文炎 蒋忠良 杨凯 李瑛* 崔永华*
首都医科大学附属北京儿童医院

Objective Premonitory urge (PU) is a common sensory symptom in patients with tic disorder (TD). However, the current assessment tools cannot comprehensively and accurately evaluate PU in the whole age group. We will attempt to develop a new scale to evaluate PU more accurately and comprehensively, and to test its reliability and validity.

Methods The final version of Sensory Phenomenon Assessment Scale (SPAS) would be developed after reviewing of literatures, semi-structured interviews for patients and expert consultation. Then, hundreds of TD children and adolescents would be interviewed by psychiatrist to fill in the SPAS, Yale Global Tic Severity Scale (YGTSS), Premonitory Urge for Tics Scale (PUTS) and Children's Yale-Brown Obsessive-Compulsive Scale (CY-BOCS). The Cronbach's alpha coefficient and Spearman-Brown coefficient of the SPAS would be calculated to evaluate the reliability and split-half reliability, respectively. A random sample of 40% would be selected to retest the SPAS one month later to calculate the test-retest reliability. The correlation coefficients between the SPAS and the three scales YGTSS, PUTS and CY-BOCS would be calculated to verify the criterion validity, and an exploratory factor analysis was performed. Finally, according to PUTS, we would explore the cut-off values of normal and abnormal SPAS.

Results We developed the sensory phenomena scale, including two parts: symptom list and severity. The second part of severity included one dimension of five items, including number, frequency, tension, transformation and functional impairment. A total of 279 TS children and adolescents with (n = 223) and without (n = 56) PU were finished these 4 scales. Cronbach's alpha coefficient, Spearman-Brown coefficient and test-retest reliability was 0.863, 0.879 and 0.987 separately. For validity, Correlation analysis between PUTS and SPAS, YGTSS and SPAS, CY-BOCS and SPAS were 0.688 (p<0.01), 0.265 (p<0.01) 0.052 (p>0.05). A total of 5 items of SPAS belonged to one dimension, each item had a factor loading greater than 0.6. The receiver operating characteristic curve (ROC) of SPAS was made according to PUTS score to classify patients with or without PU. The area under the curve (AUC) was 0.808, and the maximum Youden index corresponding to the SPAS value was 3.5.

Conclusion After testing, the reliability and validity of SPAS were accepted, which met the requirements of scale development. After clinical practice, the sensory phenomena scale constructed in this study can comprehensively evaluate the severity of PU in children and adolescents aged 6-17 years with TD.

Identification of Suicidality in Adolescent Major Depressive Disorder Patients Using SMRI: A Machine Learning Approach.

洪素 况利* 徐小明 黄倩 邓霏 李雪 李夏颖
重庆医科大学附属第一医院精神科，CSP 综合医院精神心理研究协作组

Objective Suicidal behavior is a major concern for patients who suffer from major depressive disorder (MDD), especially among adolescents and young adults. Machine learning models with the capability of suicide risk identification at an individual level could improve suicide prevention among high-risk patient population.

Methods A cross-sectional assessment was conducted on a sample of 66 adolescents/young adults diagnosed with MDD. The structural T1-weighted MRI scan of each subject was processed using the FreeSurfer software. The classification model was conducted using the Support Vector Machine - Recursive Feature Elimination (SVM-RFE) algorithm to distinguish suicide attempters and patients with suicidal ideation but without attempts.

Results The SVM model was able to correctly identify suicide attempters and patients with suicidal ideation but without attempts with a cross-validated prediction balanced accuracy of 78.59%, the sensitivity was 73.17% and the specificity was 84.0%. The positive predictive value of suicide attempt was 88.24%, and the negative predictive value was 65.63%. Right lateral orbitofrontal thickness, left caudal anterior cingulate thickness, left fusiform thickness, left temporal pole volume, right rostral anterior cingulate volume, left lateral orbitofrontal thickness, left posterior cingulate thickness, right pars orbitalis thickness,

right posterior cingulate thickness, and left medial orbitofrontal thickness were the 10 top-ranked classifiers for suicide attempt.

Conclusion The findings indicated that structural MRI data can be useful for the classification of suicide risk. The algorithm developed in current study may lead to identify suicide attempt risk among MDD patients.

Sex- and Age-dependent Alterations in White Matter Diffusivity Among Children and Adolescents with Social Anxiety Disorder

Yufeng Xia[1], Xiaochen Zhang[1], Wenjing Liu[1], Zhen Liu[1], Yue Ding[1], Zhishan Hu[1], Zhi Yang[1,2], Wenhong Cheng[1,3]
1.上海市精神卫生中心
2.首都医科大学附属北京安定医院
3.上海市第一人民医院

Objective Social anxiety disorder (SAD) is associated with significantly impaired social functioning, but the underlying neurobiological mechanisms remain unclear. Abnormal brain anatomy in patients with SAD was previously reported. There are considerable sex differences in the incidence and severity of SAD, coupled with the early onset of SAD when the brain is undergoing critical neurodevelopmental changes, but possible sex- and age-dependent alterations in brain anatomy have rarely been explored. As a pioneer, our lab previously reported various sex- and age-dependent alterations in gray and white matter volume among pediatric patients with SAD. In this study, we aimed to address the sex- and age-dependent alterations in the white matter morphology among this diagnostic group.

Methods This study included 144 participants, who and whose parents gave written consent to the protocol approved by the Ethics Committee at Shanghai Mental Health Center. Among the participants, 76 (44 female; age: 9.1 to 17.8) were confirmed as clinically normal and 68 (45 female; age: 9.3 to 17.7) were diagnosed to have social anxiety disorder as their primary diagnosis by professional pediatric psychiatrists, with sex and age matched. For all the participants, high-resolution T1- and diffusion-weighted images were acquired on a Siemens 3.0-Tesla magnetic resonance scanner. White matter morphology was quantified by conventional diffusion tensor imaging measures, including fractional anisotropy (FA), mean diffusivity (MD), axial diffusivity (AD), and radial diffusivity (RD). We applied a voxel-based analysis for each type of parameter maps via statistical parametric mapping with cluster-level corrections for multi-comparisons.

Results We observed significant sex- and age-dependent alterations in the white matter diffusivity, including AD, RD, and MD, at the exterior of bilateral cerebella, but no significant alterations in the FA across the brain. For male children and adolescents, white matter diffusivity was not correlated with age among clinically normal individuals; however, higher age corresponded with more declined white matter diffusivity among patients with SAD. For female children and adolescents, higher age corresponded with more declined white matter diffusivity among clinically normal individuals, but with more increased white matter diffusivity among patients with SAD.

Conclusion We discovered white matter diffusivity alterations focally at the exterior of the cerebellum among pediatric patients with SAD. Importantly, these alterations were modulated by sex and age. These findings suggest that for male and female pediatric patients with SAD, the critical neurodevelopmental period of the transition from childhood to adolescence was differentially characterized by age-dependent brain alterations.

基于情绪调节能力构建的成人 ADHD 分类模型及其临床特征探索

刘倩溶[1,2] 岳鑫鑫[1,2] 高媛[1,2] 潘美蓉[1,2] 赵梦婕[1,2] 司飞飞[1,2] 董敏[1,2] 李海梅[1,2] 王玉凤[1,2] 钱秋谨[1,2] 刘璐[1,2]

1.北京大学第六医院/精神卫生研究所
2.国家卫生健康委员会精神卫生学重点实验室（北京大学），国家精神心理疾病临床医学研究中心（北京大学第六医院）

目的 情绪调节能力缺陷在精神障碍群体中广泛存在，且与多种精神病理症状密切相关。注意缺陷多动障碍（ADHD）成人存在显著的情绪失调（Emotional Dysregulation，ED），然而目前尚缺乏研究对成人 ADHD 情绪调节能力的特征进行细致刻画。本研究基于情绪调节能力对混合人群（成人 ADHD 及成人对照）构建分类模型，并进一步比较不同分类在 ADHD 核心症状、情绪失调症状等临床特征的差异。

方法 纳入符合 DSM-5 诊断标准的 ADHD 成人 303 例，以及成人健康对照（HC）164 名。采用情绪调节困难量表（DERS）、情绪调节问卷（ERQ）评估情绪调节能力；ADHD 症状量表评估核心症状、执行功能行为评定量表成人版“情绪控制”因子分评估 ED。使用潜在剖面分析（Latent Profile Analysis, LPA），以 ERQ 和 DERS 评估的八个情绪调节能力因子（认知重评、表达抑制、情绪接受、策略使用、冲动控制、情绪知觉、目标行为、情绪理解）作为预测项，对混合样本进行分类。进一步对新分类模型进行内部验证，选择支持向量机算法对分类模型进行十次五折交叉验证。最后，在最佳模型的基础上，采用协方差分析对不同分类的临床核心症状及情绪失调症状进行比较，探索其外部效度。

结果 LPA 显示四分类为最佳模型（AIC=9032.422，BIC=9210.715，LMR=0.0052，BLRT<0.001），分别为：适应性策略高调节能力（LP1，31.9%）、适应性策略中等调节能力（LP2，26.8%）、非适应性策略中等调节能力（LP3，29.0%）和非适应性策略低调节能力（LP4，12.3%）。比较四分类间的诊断

分布，发现 HC 主要集中在 LP1（70.7%），ADHD 主要集中在 LP3（42.9%），LP4 仅包含 ADHD 个体。内部验证结果发现线性支持向量机的准确率最高为 97.4%。五折交叉验证的结果提示，各个分类的真阳性率均在 90%以上；在假阴性率方面，LP4 最高为 8.6%，LP3 最低为 1.5%；各个分类的阳性预测值均在 90%以上；十次五折交叉验证结果仍提示模型仍具有较好的稳定性。协方差分析显示，ADHD 核心症状与情绪失调在各分类间差异有显著意义。

结论 基于情绪调节能力构建的四分类模型具有很好的内部及外部效度，该结果有助于阐释 ADHD 情绪失调的异质性，并有望为未来开展针对性干预提供依据。

忧郁型和非忧郁型抑郁症患者大脑半球间/半球内的功能连通性的不对称性损害

张雅茹 崔夕龙* 罗学荣*
中南大学湘雅二医院

目的 重度抑郁症（MDD）患者中普遍存在忧郁特征。忧郁 MDD 往往被认为是更严重的疾病形式和更高的自杀风险。大脑不对称性的改变被认为与各种神经病理学有关。抑郁症患者可能存在不对称性的损害。大脑不对称性可以通过半球间/半球内的功能连接来测量。然而在忧郁组和非忧郁 MDD 患者中，半球间/半球内 FC 在多大程度上导致了大脑不对称的破坏，这仍然是未知的。其次，目前尚不清楚这种不对称性的改变能否作为区分忧郁组和非忧郁 MDD 患者的内在表型。

方法 通过湘雅第二医院精神科门诊招募了 31 例忧郁 MDD 患者和 33 例年龄在 18-45 岁的非忧郁 MDD 患者，从社区中招募了 32 名年龄和性别匹配的健康对照组。采集以上被试的静息态功能磁共振（functional magnetic resonance, fMRI）数据。进一步分析患者和健康对照的不对称性指数(parameter of asymmetry, PAS)以及 PAS 值与临床症状的相关性。

结果 与非忧郁的 MDD 相比，忧郁 MDD 组右侧额中回和左侧小脑 IX 的 PAS 减少。忧郁 MDD 组左侧脑岛 PAS 值与汉密尔顿抑郁量表(HAMD)总分呈显著负相关($r = -0.402, p = 0.025$)。左侧小脑 IX 区的 PAS 值与 HAMD 总分($r = -0.395, p = 0.028$)和短暂快乐体验量表(TEPS)的情境完善($r = -0.401, p = 0.028$)呈负相关。支持向量机结果显示，左侧小脑 IX 的 PAS 值能够区分忧郁症组和非忧郁症组，灵敏度为 80.65%，特异度为 57.14%，准确率为 71.19%。同时，右侧额叶中回 PAS 值区分这两组的敏感性为 67.74%，特异度为 75.00%，准确率为 69.49%。而这两个脑区 PAS 值联合用于区分患者组的灵敏度、特异度和准确率分别为 74.19%、82.14%和 77.97%。

结论 忧郁组和非忧郁 MDD 患者的大脑都发生了功能不对称的改变，这种功能不对称性可能参与 MDD 的病理生理学改变。

首发青少年抑郁症患者伴非自杀性自伤的神经电生理特点对不良预后的预测作用

马伶丽[1] 周冬冬[2] 彭薪宇[1] 胡锦辉[2] 赵琳[1] 况利[1,2]
1.重庆医科大学附属第一医院
2.重庆医科大学附属大学城医院

目的 反复进行 NSSI 行为的抑郁症患者是向自杀行为发展的高风险亚群，而 NSSI 在青少年人群中呈现爆发性的高患病率。因此，针对青少年抑郁症人群中反复进行 NSSI 行为的亚群研究，在识别和预测抑郁症人群中的自杀高风险具有重要的意义。NSSI 和自杀行为的前期研究提示两者的发生存在共同的认知环节——反应抑制功能缺陷，从神经发育角度看来对后期危险行为的成因对后期的危险行为有较强的预测性。电生理指标中的 P300 成分的特征指标可以对反应抑制功能缺陷进行量化评估，是反映 NSSI 发生发展过程中重要的生理指标。

方法 研究共分为横断面研究和纵向研究两个方面。横断面研究纳入 MDD 受试者共 124 例，根据其伴随行为分为三个亚组：MDD 组、MDD+NSSI 组、MDD+SA 组，并设置匹配的健康对照（HC 组），将横断面四组的 P300 指标数据进行分析比较。以 MDD+NSSI 患者为观察对象进行纵向队列研究，共纳入 57 例。以持续口服舍曲林为治疗方式，在治疗前、治疗后第 4 周、治疗后第 8 周、治疗后第 12 周、治疗后第 24 周为随访时间点。比较不同预后的 MDD+NSSI 青少年患者在基线状态和治疗过程中的脑电指标变化，并找到基线状态下，不同的脑电变化特征对治疗预后的预测作用。

结果 在伴有 NSSI 行为的青少年抑郁症人群中，基线状态的 P300 成分进行时频分析，其 theta 频段能量特点，有对不良预后的预测作用。预后良好组的基线 P3d 振幅与 theta 能量值均与横断面 MDD+NSSI 组保持在相同水平（$p>0.05$）；预后不良组的基线 P3d 振幅与横断面 MDD+NSSI 组保持在相同水平，而 theta 能量值与 MDD+SA 组保持在相同水平（$p>0.05$）。其基线状态的 theta 能量值对不良预后的预测 ROC 曲线下面积为 0.72。

结论 基线状态下，在伴有 NSSI 行为的青少年抑郁症患者中若出现类似于横断面中 MDD+SA 人群的时频指标特征性改变，对其预后有一定的预测作用：基线状态下，对自伤线索存在负性情绪应激的青少年抑郁症人群在后续治疗过程中预后较好，随着治疗，该类人群的 NSSI 行为频率也会逐渐下降；基线状态下，对自伤线索不存在负性情绪应激的青少年抑郁症人群在后续治疗过程中预后较差，该类人群的 NSSI 行为不会随着治疗而逐渐减少。

多模态磁共振结合深度学习算法预测哌甲酯治疗 ADHD 疗效

傅朝[1] 李少贤[2] 单译瑾[3] 毕胜晗[2] 曹庆久[1] 李淑宇[2] 杨莉[1]
1.北京大学第六医院/精神卫生研究所，国家精神心理疾病临床医学研究中心（北京大学第六医院），国家卫生健康委员会精神卫生学重点实验室 （北京大学）
2.北京师范大学认知神经科学与学习国家重点实验室
3.北京航空航天大学

目的 哌甲酯是临床治疗注意缺陷多动障碍（Attention deficit/hyperactivity disorder, ADHD）的一线药物，总体能有效改善患者的临床症状，但仍对 30%左右的 ADHD 患者无效。寻找哌甲酯治疗 ADHD 疗效的可靠生物学标记物预测方法有助于使患者得到精准有效治疗，减少不必要的副反应，提高治疗依从性，改善患者结局。神经影像学技术已广泛应用于神经精神疾病的发病机制及临床研究中，以深度学习为代表的基于数据驱动的分类方法能够捕捉复杂抽象的高阶特征，具有较好的分类性能，本研究将使用 ADHD 患者治疗前的神经影像学数据结合深度学习算法，预测哌甲酯治疗 ADHD 儿童青少年 12 周后的疗效。

方法 本研究共纳入了 61 例 ADHD 儿童青少年患者，在治疗前使用 ADHD 症状评定量表（ADHD-RS）评估其症状严重程度，以及进行磁共振扫描，成像序列包括结构磁共振（T1），静息态功能磁共振（rs-fMRI）和弥散张量成像（DTI）。对所有入组患者进行标准的哌甲酯剂量滴定，滴定至最佳剂量后维持治疗，12 周后使用 ADHD-RS 评估其症状，以症状减分率≥40%为有显著疗效的标准将患者对哌甲酯的反应分为有效和无效。将患者治疗前的 T1，rs-fMRI 以及 DTI 数据预处理后，进行初步的特征提取，包括不同脑区的结构特征，脑区之间的静态与动态功能连接及其图论特征，对上述特征使用主成分分析进行降维，将降维后的特征通过多层感知机对药物疗效进行分类。

结果 哌甲酯治疗 12 周之后，ADHD 患者的 ADHD-RS 症状评分显著降低，其中 44%的患者有显著疗效。结合深度学习算法，使用治疗前多模态神经影像学数据特征对哌甲酯治疗 ADHD 疗效进行预测，将样本以 4：1 的比例分为训练集和测试集，结果发现，在训练集中的准确率为 0.92，测试集中准确率达到 0.85，其中，结构特征和功能连接矩阵在预测中起到了较为重要的作用。

结论 本研究使用多模态磁共振数据结合深度学习算法对哌甲酯治疗 ADHD 疗效进行预测，结果显示在训练集和测试集中都有较高的准确率。

基于体积的形态学测量对青少年抑郁症患者的大脑皮层异常的研究

李雪[1,2] 邓霏[2] 张小柳[1] 郁仁强[1] 况利[1,2]
1.重庆医科大学附属第一医院
2.重庆医科大学附属大学城大学城医院

目的 探究青少年重度抑郁症患者皮层体积特征，探究重度抑郁症患者与认知过程和面部情绪识别有关的大脑区域的形态测量是否发生改变。

方法 于重庆医科大学附属第一医院门诊收集青少年重度抑郁症患者 66 例和与患者组年龄、性别、受教育程度相匹配的右利手健康对照组 39 例。在 MRI 扫描当天使用 17 项汉密尔顿抑郁量表(HAMD-17)测量被试抑郁症的严重程度。所有磁共振图像均采用 GE 3T GE Signa HDxt 扫描仪。我们在 DPABISurf 中进行图像处理和统计分析，评估 MDD 患者和对照组之间的大脑皮层体积差异。我们采用双样本 t 检验来研究抑郁症患者的皮层体积变化。将年龄和性别作为线性回归模型的协变量。初始体素阈值设置为 $p < 0.001$。使用无阈值的团块增强处理(TFCE)方法进行多重比较矫正，每个半球的显著性阈值为 $q < 0.025$。在得到具有显著性差异的核团后，我们进一步提取了青少年 MDD 患者和健康对照的核团内的平均皮层厚度，并进行与临床评分（即量表评分和病程）的皮尔逊相关分析，以检验测量值与临床信息之间的关系。最后，我们将得到的两组的平均皮层厚度进行受试者工作特征曲线（ROC）分析，以验证我们得到的皮层体积差异能够区分重度 MDD 患者及健康对照。

结果 与正常健康对照相比，青少年重度抑郁症患者在背侧视觉通路（V3B）及早期视觉皮层（V2）的皮层体积显著降低；而在初级运动皮层的皮层体积显著增高（M1）。

结论 在人脑中，从混乱的背景中整合轮廓需要一种循环机制，V1、V2、V3B 参与了这个过程，抑郁症患者可能存在轮廓整合障碍，从而导致注意力下降；所以，视觉皮层也和认知过程比如信息整合、轮廓整合、面部情绪识别障碍等相关。初级运动皮层（M1, primary motor cortex） 通过独特的、特定的皮层途径来协调与神经性疼痛有关的感觉和厌恶情绪成分，以此达到缓解疼痛的目的。本实验 M1 皮层的体积降低可能提示 MDD 患者对疼痛抑制增强，进而导致自伤等行为的发生。

Association between School Bullying and Premenstrual Disorders in Girls : A Cross-sectional Study From The Adolescence Mental Health Promotion Cohort

廖晓 李雨辰 万晓钰 张伟*
四川大学华西医院

Objective School bullying is a pervasive problem that occurs in an educational setting among adolescents. Bullying victims have a higher odds of experiencing a range of adverse psychological outcomes. Previous studies have illustrated that school bullying was associated with premenstrual disorders (PMDs) in adulthood. Thus, leveraging cross-sectional data from a large cohort of students aged 10-19 years in China, we aimed to examine the association between school bullying and PMDs in adolescents.

Methods We conducted a cross-sectional analysis among 10,042 menstruating girls from the Adolescence Mental Health Promotion Cohort, assessed for PMDs with the Calendar of Premenstrual Experiences (COPE) and school bullying with Delaware Bullying Victimization Scale-Student (DBVS-S). Multivariable logistic regression was used to examine the associations between school bullying and PMDs, including premenstrual syndrome (PMS) and premenstrual dysphoric disorder (PMDD).

Results At a mean age of 15.0 years (standard deviation (SD) 1.77), 2145 (21%) girls met the criteria of a probable PMD, including 1557 (16%) for PMS and 588 (6%) for PMDD. Compared to girls without any bullying experience, bullied girls had a higher odd of PMDs (OR 3.15, 95% CI 2.75 - 3.60). The association was most pronounced for verbal bullying (OR 3.18, 95% CI 2.76 - 3.68), followed by relational bullying (OR 3.24, 95% CI 2.72 - 3.84), cyberbullying (OR 3.00, 95% CI 2.26 - 3.99), and physical bullying (OR 2.45, 95% CI 1.93 - 3.09). A stronger association of any bullying was observed for PMDD than for PMS and among girls without psychiatric comorbidities than those with.

Conclusion Our findings suggested that school bullying, particularly verbal and relational bullying, is positively associated with PMDs in adolescent girls. Efforts to prevent school bullying are needed to reduce the risk of multiple adverse health outcomes, including PMDs.

Behavioral Intervention Alone Versus Behavioral Intervention Plus Oxytocin Nasal Spray for Treating Social Communication Deficits in Autism Spectrum Disorder: A Randomized Placebo-controlled Clinical Trial

Xu Chen Fanchao Meng Yin Tian Tianyi Chang Jia Chang Yi Zheng*
National Clinical Research Center for Mental Disorders & Beijing Key Laboratory of Mental Disorders, Beijing Anding Hospital, Capital Medical University

Objective To examine the short-term efficacy and safety of oxytocin nasal spray in treating social communication deficits in ASD.

Methods In this randomized, double-blind, placebo-controlled clinical trial, a total of 80 children with ASD (aged 6–12 years) were enrolled and received placebo treatment for 1 week. The participants (n = 68) who showed a reduction of less than 10% in the results of the social responsiveness scale (SRS) were randomized to receive behavioral intervention plus placebo (n = 34) or oxytocin nasal spray (n = 33, 24 IU per day) for 6 weeks. Social communication deficits and safety profiles were evaluated at baseline and 6 weeks.

Results The full analysis set, per protocol set, and safety set included 67, 60, and 67 children, respectively. At 6 weeks, the oxytocin group exhibited significantly greater changes in the SRS scores than the placebo group (25.2 ± 0.5 vs. 7.1 ± 0.5, $p < 0.001$). Both the placebo and oxytocin groups showed good treatment adherence for medication (100% for both groups) and behavioral intervention (89.5% vs. 90.3%, $p > 0.05$). No severe adverse events were recorded.

Conclusion Behavioral intervention in combination with oxytocin nasal spray demonstrated preliminary efficacy in improving social communication deficits in children with ASD, with good treatment adherence and safety.

Impulsivity Mediates The Association between Childhood Maltreatment and Suicidal Behaviors Among Left-behind Children and Adolescents in China

Rushuang Zeng[1,2,3], Jing Miao[1,2,3], Xiufeng Xu[1,2,3], Hailiang Ran[4], Yusan Che[4], Die Fang[4], Yuanyuan Xiao[4], Jin Lu[1,2,3]
1.Department of Psychiatry, First Affiliated Hospital of Kunming Medical University
2.Yunnan Clinical Research Center for Mental Disorders
3.Mental Health Institute of Yunnan
4.School of Public Health, Kunming Medical University.

Objective The purpose of the study was to investigate the detection rate and distribution of suicidal behaviors and childhood maltreatment among left-behind children and adolescents in a county of Yunnan Province and analyze the social-psychological factors assosicated with suicidal behaviors among left-behind children and adolescents;Reseach on the assosication between childhood maltreatment and suicidal behaviors and whether impulsivity exist mediating role here; and provide valuable evidences and insights for relevant departments to formulate suicide prevention and intervention measures for left-behind children and adolescents.

Methods In a county in Yunnan Province, a two-stage random cluster sampling method was used to investigate the left-behind children and adolescents aged 10 to 18 (excluding 18) in school. Single / multivariate logistic regression was used to assess the relationship between childhood maltreatment, impulsivity and suicide-related behaviors in left-behind children. And further explore the mediating role of impulsivity in the interaction between childhood abuse and suicide-related behaviors.

Results A total of 5188 participants (response rate:

96.09%) completed the survey and were included in the final analysis. The mean age of all the included participants was 13.58±1.96 years.The detection rate of suicidal ideation was 33.62%. The detection rate of the suicide plan was 20.62%. The attempt suicide detection rate was 9.56%.4057 students had any of the five dimensions(emotional abuse, physical abuse, sexual abuse, emotional neglect, physical neglect)with a detection rate of 78.20%.Left-behind children and adolescents who had experienced any childhood abuse and had the impulse to act were more likely to experience suicidal ideation, suicide plans, and suicide attempts.Students who experienced any childhood maltreatment (OR=2.56, 95%CI: 1.82,3.59), students with motor impulsiveness (OR=1.73, 95%CI: 1.46,2.06) and non-planning impulsiveness (OR=1.38, 95%CI: 1.03,1.86) were more likely to have suicide plans. Impulsivity played a partial mediator between physical neglect and suicidal ideation, including 9.78%.Some mediated between physical neglect and suicide planning, including 20.21%.Some mediated between physical neglect and suicide attempts, including 14.77%.It partially mediated between childhood abuse and suicidal ideation, suicide planning, and impulsivity did mediated between childhood abuse and suicide attempts.

Conclusion The survey shows that among left-behind children and adolescents, impulsivity plays a partial intermediary role between any childhood abuse and suicidal ideation and suicide plan. Schools and relevant education departments should formulate different intervention strategies for impulsive students in formulating suicide prevention and intervention measures.

儿童青少年抑郁障碍住院患者成年早期结局的随访研究

于辉 敦玥 徐晨阳 来庆娟 曹庆久*
北京大学第六医院

目的 探索住院儿童青少年抑郁障碍患者成年早期的预后及影响预后的相关因素。

方法 本研究为回顾性队列研究，筛选 2009 年 1 月至 2015 年 10 月期间在北京大学第六医院儿童病房住院治疗的全部儿童青少年抑郁障碍患者，采用自编信息采集量表对儿童青少年抑郁障碍患者的住院病历进行回顾，并进行 5-11 年的随访调查。使用简明国际神经精神访谈量表（M.I.N.I.）和大体功能评定量表（GAF）对随访时患者的精神症状、临床诊断及社会功能进行评估。采用描述性统计分析患者的基线情况、临床结局等，采用相关分析探讨影响预后的相关因素。全部数据使用 SPSS 21 进行统计分析，显著性水平取双侧检验，检验水准 α=0.05。

结果 共入组 124 例患者,随访成功 83 例（66.9%），其中 2 例（2.4%）随访时已经死亡，1 例为自杀，1 例因躯体疾病死亡。平均随访年限（7.4±1.8）年，随访时年龄中位数为 22 岁。在随访时间点 86.4%的患者诊断未变，诊断改变的 11 例患者中有 10 例诊断为双相情感障碍，1 例诊断为心境（情感）障碍及人格障碍。在随访时间点有 33.3%患者仍在用药，停药年限中位数为 5.7 年。有 19.5%（15/81）患者完全不能参与有用的社会活动，包括全职、兼职及上学，24.7%的患者经济独立，57.1%的患者最高学历为大学本科。按照 GAF 评分标准：基本正常、轻度异常、中度异常、重度异常、极重度异常的患者分别占 64.2%、21%、13.6%及 1.2%。随访时 BMI 与性别相关（$p<0.05$）。患者的社会功能、受教育水平在性别、是否有发病诱因、家族史、既往史、是否为独生子女、居住地类型、城乡情况、性格、出院疗效上的差异均无统计学意义（均 $p>0.05$）。12 岁前起病及 12 岁后起病患者在最高学历、能够参加社会有用的活动、BMI 及远期社会功能上的差异均无统计学意义（均 $p>0.05$）。

结论 儿童青少年住院抑郁障碍患者，在成年早期有较好的诊断稳定性（86.4%），大部分（80%以上）患者能够外出参与有用的社会活动、社会功能保持良好；64.9%以上的患者获得大专及以上学历，一半以上的患者与家庭及朋友关系良好，按照中国标准，超重及肥胖的患者比例为 14%，低于全国一般人群水平（37.7%），本研究说明儿童青少年抑郁障碍住院患者的预后较好。随访时 BMI 与性别相关（$p<0.05$），未发现与社会功能、受教育水平等预

ABC Family Gene Polymorphisms and Processing Speed Interact To Influence Depression Severity

Meijiang Jin[1], Lei Ji[2], Maojia Ran[1], Yan Bi[2], Hang Zhang[1], Yuanmei Tao[1], Hanmei Xu[1], Shoukang Zou[1], Hong Zhang[1], Tao Yu[2], Li Yin[1]
1.Psychological Center, West China Hospital, Sichuan University, Chengdu, Sichuan 610041, China
2.Bio-X Institutes, Key Laboratory for the Genetics of Developmental and Neuropsychiatric Disorders, Shanghai Jiao Tong University, 1954 Huashan Road, Shanghai 200030, China

Objective The ABC family encodes ATP-binding cassette proteins, which are mainly expressed in the blood-brain barrier and mitochondrial inner membrane and are involved in the transport of various substances. Therefore, 7 SNPs in ABCB1 (rs28401781, rs4148739, rs3747802) and ABCB6 (rs1109866, rs1109867, rs3731885, rs3755047) were included in this study to explore the association of ABC family gene polymorphisms with depression. In addition this study further included cognitive data to explore its association with depression.

Methods The study included 1493 healthy controls (12-65 years, 917 females (61.4%)) and 805 depressed patients (12-65 years, 476 females (59.1%)) who were not

receiving antidepressant treatment or who received treatment for a total duration of no more than 2 weeks. Of these depressed patients, 477 completed cognitive tests. Allele frequencies and genotypic differences between healthy controls and depressed patients were compared for each SNP. Differences in cognitive function across genotypes were compared, and an interaction analysis of cognitive function with genotype was performed to explore the relationship with depression severity.

Results The rs1109866 (X2 = 8.224, p = 0.004; X2 = 9.819, p = 0.007), rs1109867 (X2 = 7.346, p = 0.007; X2 = 9.153, p = 0.010), rs3731885 (X2 = 4.821, p = 0.028; X2 = 8.689, p = 0.013) and rs3755047 (X2 = 5.347, p = 0.021; X2 = 7.403, p = 0.025) loci showed significant differences in gene frequency and genotype frequency between depressed patients and healthy controls, but only the results for the rs1109866 and rs1109867 loci remained significant after adjustment. In addition, rs28401781 (t=2.781, p=0.006, p.adj=0.042) and rs4148739 (t=3.067, p=0.003, p.adj=0.021) were associated with the number of TOH test errors. In addition we found that both rs1109866 and rs1109867 interacted with Trail Making Test results to influence depression severity at baseline in depressed patients.

Conclusion ABC family gene polymorphisms are associated with depression and cognitive function, and ABC family gene polymorphisms interact with cognitive processing speed to influence depression severity.

高精度经颅直流电刺激对伴或不伴感觉处理异常的孤独症谱系儿童社交障碍的改善作用差异研究

王永露 柯晓燕* 焦公凯* 方慧*
南京医科大学附属脑科医院儿童心理卫生研究中心

目的 半数以上的孤独症谱系障碍(Autism Spectrum Disorder, ASD)儿童在感知觉或感统方面存在异常或失调，其严重影响患儿的沟通及社交，本研究旨在探索高精度经颅直流电刺激对伴或不伴感觉处理异常的孤独症谱系儿童社交障碍的改善作用差异。

方法 本研究是一项随机双盲假对照试验，最终共纳入 72 名 4-12 岁 ASD 儿童参加试验，基于《儿童感觉统合能力发展评定量表》（Children Sensory Integration Rating Scale, CSIRS）评估情况分为感统正常组、感统失调组及对照组，均以左侧背外侧前额叶皮层（F3）为中心阳极进行真或伪高精度 5 通道经颅直流电刺激(High-definition transcranial Direct Current Stimulation, HD-tDCS)，设置电流为 2 mA，连续直流电，每次刺激 20 min，每周 5 次，连续 3 周，共计 14 次。在 HD-tDCS 治疗前 1 周内和最后一次治疗后 1 周内通过社交反应量表(SRS)评估被试社交功能。对于经 HD-tDCS 真刺激组干预后的 4-8 岁 ASD 儿童资料进行事后分析，共纳入 51 名 ASD 儿童，基于《感觉讯息处理及自我调节功能检核表》（Sensory Processing and Self-Regulation Checklist, SPSRC）分为触觉反应不足、触觉反应过于强烈及触觉正常组，对比组间疗效差异。

结果 与伪刺激组相比，F3 中心阳极真刺激组 SRS 量表得分显著减少；与感统失调组相比，干预前后感统正常组在社交知觉（t=5.032, p＜0.000）和社交行为方式（t=3.085, p=0.004）维度的显著变化有统计学意义。触觉反应不足及触觉正常组在社交知觉、社交认知、社交沟通、社交行为方式及 SRS 量表总分上在 HD-tDCS 干预前后得分对比中均展现出显著变化。触觉反应过于强烈组仅社交沟通（t=2.385, p=0.022）治疗后减分存在统计学意义。

结论 HD-tDCS 在改善社交障碍症状方面，感统正常、触觉反应正常或者不足的 ASD 儿童表现出更大的潜力，社交障碍与感统失调、感知觉异常可能存在起协同作用的共同通路，尤其是神经递质及脑网络层面。感觉统合训练联合 tDCS 较单一康复训练或者物理干预疗效可能更好。

关键字：孤独症谱系障碍(Autism Spectrum Disorder, ASD)；高精度 5 通道经颅直流电刺激(High-definition transcranial Direct Current Stimulation, HD-tDCS)；感知觉异常；感统失调；社交障碍。

Therapeutic Efficacy of Sulforaphane in Autism Spectrum Disorders and Its Association with Gut Microbiota: Animal Model and Human Longitudinal Studies

杨洁贤 贺理 戴思 郑慧慧 崔夕龙 欧建君* 张晓洁*
中南大学湘雅二医院

Objective Sulforaphane (SFN) is an isothiocyanate derived from its glucosinolate precursor, glucoraphanin, as found in broccoli, mostly in the sprouts, partially inactivated by cooking. Recently, many clinical studies reported the improvements on clinical symptoms in treatment of ASD patients treated by SFN. Besides, SFN has been found to improve several diseases by regulating gut microbiota (GM), while the effect of GM on SFN for autism spectrum disorders (ASD) has not been studied. Therefore, this study aims to reveal the role of SFN in the treatment of ASD in children and its potential relationship with intestinal flora through both clinical and animal studies, and to provide new insights into the treatment and pathogenesis of ASD.

Methods To investigate the therapeutic effect of SFN treatment on childhood ASD and its potential relationship with intestinal flora, we constructed a younger age ASD animal model using lipopolysaccharide injection in pregnant rats and evaluated the therapeutic effect of SFN and investigate the potential role of intestinal flora by three-chamber social test and 16S rRNA sequencing, respectively. Meanwhile, we also conducted a longitudinal study to investigate the therapeutic effects of SFN on childhood ASD by recruiting patients aged 4-7 years with ASD

and to explore the potential relationship between the therapeutic effects of SFN and intestinal flora.

Results SFN significantly improved social behavior in ASD-like rats as well as autism symptoms in ASD patients. Although GM changes were similar for both ASD-like rats and ASD patients, such as consistent changes in order Bacillales, family Staphylococcaceae and genus Staphylococcus, the responses and effects of GM on SFN were highly variable in the two studies. The gut microbiota composition was significantly altered in SFN-treated ASD-like rats, whereas this alteration was not evident in ASD patients after 12 weeks of SFN treatment. Correlation analysis showed that order Pasteurellales, Corvnebacteriales, family Pasteurellaceae, Neisseriaceae and genus Prevotella Haemophilus and Neisseria were associated with enhanced social behavior in rats, while Bacteroidetes (from the phylum to the order Bacteroidales), family Prevotellaceae, family Hyphomicrobiaceae and genus Chelativorans, unidentified Peptococcaceae and Devosia were associated with improved ASD symptoms in ASD patients.

Conclusion These data demonstrate that SFN treatment alleviates social deficits in gestational-LPS induced ASD-like rat model and pediatric autism patients, and the improvements associated with gut microbiota. These data indicated that SFN, as a potential intervention targeting the gut microbiota, could provide a novel avenue for preventing and treating ASD.

12 周哌甲酯/托莫西汀治疗对注意缺陷多动障碍儿童反应抑制能力的效果研究：来自 fNIRS 的证据

刘泽腾 黄金巧 陆元圆 黄春香*
中南大学湘雅二医院

目的 基于功能性近红外光谱技术（fNIRS），在 Go/No go 范式条件下探讨注意缺陷多动障碍（ADHD）儿童的反应抑制能力及相应脑区血流动力学反应，经过12周哌甲酯或者托莫西汀治疗后脑区激活改善情况。

方法 2022 年 6 月-2023 年 1 月于中南大学湘雅二医院纳入 25 名 ADHD 儿童，长沙市某小学招募健康儿童（HC）20 名，经过 12 周药物治疗的 ADHD 儿童（PT）15 名，使用量表 SNAP-IV（父母版）、PSQ（父母版）、BRIEF-P（父母版）评估核心症状和执行功能水平，利用 fNIRS 采集全脑 Go/No go 任务态血氧数据。软件 SPSS 23.0、NisSpark、Matlab2013b 用于统计分析。

结果 （1）ADHD 组和 HC 组两组结果比较显示，BRIEF-P 抑制因子分差异有高度统计学意义（$p<0.001$），即 ADHD 组反应抑制能力受损程度更高；Go/No go 模块正确率、反应时间差异有统计意义（$p=0.023$、$p=0.040$），即 ADHD 组对图片刺激的正确反应次数低于健康儿童，反应时间长于健康儿童；通道 19（$t=-3.448$，$p^*=0.022$），20（$t=-3.501$，$p^*=0.022$），32（$t=-3.506$，$p^*=0.022$）氧合血红蛋白浓度差值的差异有统计学意义，表明 ADHD 组通道 19，20 和 32 激活程度更弱。（2）相关性分析结果示，BRIEF-P 量表的抑制因子分与 Go/No go 模块反应时间呈现正相关（$r=1.000$，$p<0.001$）；BRIEF-P 量表的抑制因子分与通道 20 的 β 值为负相关（$r=-0.440$，$p=0.028$）；Go/No go 模块反应时间与通道 20 的 β 值为负相关（$r=-0.440$，$p=0.028$）。（3）ADHD 组和 PT 组比较结果示，通道 13（$t=-3.728$，$p^*=0.034$）差异有统计学意义，表明 PT 组通道 13 激活更强。

结论 ADHD 儿童存在着明显的反应抑制能力缺陷，表现为大脑双侧额极区皮层，右侧背外侧前额叶皮层激活程度减弱；经药物治疗后，右侧额极区皮层，背外侧前额叶皮层激活程度较前增强。

基于半结构化互动视频中观察到的非典型面部表情特征标记作为孤独症谱系障碍（ASD）评估标志物的分析

金衍[2] 马增慧[2] 程建宏[2] 唐晓明[2] 许涤沙[2] 李雪[1] 郭延庆[1] 刘靖[1]
1.北京大学第六医院，北京大学精神卫生研究所，国家卫生健康委员会精神卫生学重点实验室（北京大学），国家精神心理疾病临床医学研究中心（北京大学第六医院）
2.ALSO 研究院，ALSOLIFE

目的 探索并验证采用基于视频行为特征的孤独症谱系筛查系统标记的面部表情(Facial expression)特征是否能够有效区分孤独症谱系障碍(Autism spetrum disorder, ASD)儿童和典型发育(ypical developing,TD)儿童，并探讨儿童面部表情特征与社交能力之间的关系。

方法 入组 158 名 1-6 岁的 ASD 儿童和年龄性别相匹配的 158 名 TD 儿童，采用基于视频行为特征的孤独症谱系筛查系统，基于五个不同的半结构化互动活动的短视频对所有被试的面部表情特征进行标记，包括:面部表情的总次数、恰当的面部表情的总次数、恰当的面部表情的次数占面部表情总次数的比例、基础面部表情的次数、非基础面部表情的次数、非基础面部表情的次数占面部表情总次数的比例和面部表情的丰富度（记为 FE1-FE7)。使用非参数检验比较两组的评定结果，以二元逻辑回归方法确定与组别差异相关的指标，以逐步逻回归方法筛选与 ASD 相关的重要面部表情特征并建立预测模型，使用 Bootstrap 内部重采样、校准曲线和 Hosmer-Lemeshow、ROC 和 AUC 曲线评价模型。使用对数趋势线探索分布趋势。使用孤独症儿童行为评定量表（ABC）和丹佛发育筛查测试（DDST）评估儿童的社会和交流能力，通过 Pearson 相关系数检验各指标与社交能力间的的关联性及显著程度。

结果 FE1、FE2、FE3、FE4、FE7 在五项活动中均显示出 ASD 组和 TD 组之间具有统计学意义的差异（经过矫正的 Ps<0.001，Z=4.344-7.307），并与两组间的诊断差异显著相关（OR=0.17-0.632，95%CI：0.104-0.545，0.278-0.732，Ps<0.05），AUCs=0.345-0.738，与社会和交流能力显著相关（rs=|0.217-0.359|，Ps<0.01）。FE5 和 FE6 未通过信度检验，但对数趋势线显示了它们存在区分 ASD 和 TD 的潜力。基于上述 5 个面部表情特征的分类模型将 AUC 提高到 0.78（95%CI：0.726-0.828），并通过了校准验证（$\chi2$=5.473，P=0.706）。

结论 使用孤独症筛查系统、基于半结构化互动活动行为视频标记的五个面部表情特征与儿童的社交能力显著相关，其组合具有较有效的区分 ASD 儿童和 TD 儿童的能力。

SSRIs 药物治疗前后的 SII 和 NLR 对青少年抑郁症患者自伤行为的预测价值

高峥[1] 李雪[1] 张琦[1] 张才溢[1,2]
1.徐州医科大学
2.徐州医科大学附属徐州东方医院

目的 探讨青少年抑郁症患者在接受 SSRIs 药物治疗前后，其系统免疫炎症指数(systemic immune-inflammation index，SII）和中性粒细胞-淋巴细胞比值（neutrophil-to-lymphocyte ratio，NLR）在预测自伤行为方面的价值。

方法 招募 104 名符合 DSM-5 抑郁发作诊断标准的青少年。于治疗前和治疗 2 周后采集血液样本，并计算 SII 和 NLR。并采用童年创伤问卷、情绪调节量表进行问卷调查，以评估患者童年创伤经历和认知重评水平。采用 wilcoxon 符号秩检验比较患者治疗前后血液学参数的差异。采用 Mann-Whitney 检验评估接受 SSRIs 药物治疗前后，有无自伤行为青少年间的 SII 和 NLR 差异性。并绘制受试者工作特征(ROC)曲线，分析基线时 SII、NLR 及与童年创伤的交互项在预测青少年抑郁症患者是否有自伤行为的价值。

结果 （1）与基线时的 SII 和 NLR 相比，药物治疗 2 周后 SII 和 NLR 值均显著降低（z=-2.71，z=-2.61，p<0.01）。（2）有自伤史的基线 SII 和 NLR 明显高于无自伤史者（z=2.93，z=2.08，p<0.01）。而 SSRIs 药物治疗两周后，SII 和 NLR 在两者间的差异性不显著（p>0.05）。（3）青少年抑郁症患者的童年创伤与是否存在自伤行为存在显著正相关（r=0.34，p<0.01）；情绪调节策略认知重评与是否存在自伤行为存在显著负相关（r=-0.24，p<0.01）。（4） 基线 SII 预测青少年自伤行为的最佳截断值为 346.21（AUC=0.69，95%CI=0.58-0.79，p<0.01）。基线 NLR 预测青少年自伤行为的最佳截断值为 1.44（AUC=0.63，95%CI=0.52-0.75，p<0.05）。基线 SII 与童年创伤的交互项预测青少年自伤行为的最佳截断值为 16700.56（AUC=0.77，95%CI=0.68-0.85，p<0.01）。

结论 高 SII 和 NLR 值可能与抑郁症青少年的自伤行为有关。此外，基线 SII 与童年创伤之间的交互作用似乎比单独的 SII 或 NLR 更能预测自伤行为。

Psychological Status and Multimodal Magnetic Resonance Imaging Study of Patients with Functional Anorectal Pain

万昱[1] 范明峰[2] 王帅[2] 尹万斌[2] 周聪[1,3]
1.School of Mental Health, Jining Medical University
2.Department of Anorectal Surgery, Affiliated Hospital of Jining Medical University
3.Department of Psychology, Affiliated Hospital of Jining Medical University

Objective Functional anorectal pain (FAP) is a specific type of rectal pain characterized by persistent pain sensations in the anal and rectal regions, despite the absence of apparent structural or organic abnormalities. This study aims to investigate the differences in anxiety and depression between FAP patients and healthy controls (HC), and analyze changes in whole-brain gray matter volume, diffusion structures, and spontaneous brain activity in patients with FAP using multimodal magnetic resonance imaging (MRI) techniques.

Methods A cross-sectional study design was employed, involving 27 FAP patients from the Affiliated Hospital of Jining Medical University and 25 HC. Anxiety and depression symptoms were assessed using the Hamilton Depression and Anxiety Rating Scales. Voxel-based morphometry (VBM) was used to analyze whole-brain gray matter volume differences between the two groups. Tract-based spatial statistics (TBSS) were applied to analyze various DTI parameters (fractional anisotropy [FA], mean diffusivity [MD], axial diffusivity [AD], radial diffusivity [RD]). Additionally, regional homogeneity (ReHo) and amplitude of low-frequency fluctuations (ALFF) values were calculated using the DPABI toolbox and SPM12 software to investigate spontaneous neural activity alterations between the two groups. Group differences in imaging metrics were assessed using a two-sample t-test with age and gender as covariates.

Results (1) Anxiety and depression scores were significantly higher in the FAP group than in the HC group. (2) VBM analysis revealed increased gray matter volume in bilateral fusiform, right parahippocampal, bilateral inferior temporal gyrus, and decreased gray matter volume in left orbital middle frontal gyrus, left calcarine, left middle occipital gyrus, right insular inferior frontal gyrus, left middle temporal gyrus, left triangular inferior frontal gyrus, right middle occipital gyrus and right dorsal lateral frontal gyrus in the FAP group compared to the HC group. (3)TBSS analysis showed significantly decreased FA values in one cluster in the right superior longitudinal fasciculus, one cluster in the forceps minor, five clusters in the left superior longitudinal fasciculus, one cluster in the anterior thalamic radiation in FAP group compared to the HC group. (4) Compared to the HC group, the FAP group exhibited increased ALFF values in the right cerebellum area and increased ReHo values in the right middle frontal gyrus.

Conclusion This study revealed significantly higher levels of anxiety and depression symptoms in FAP patients compared to healthy controls. Alterations in gray matter volume, white matter integrity, and spontaneous neural activity in specific brain regions of FAP patients were identified. These findings provide insights into the neurophysiological mechanisms underlying FAP and offer potential neuroimaging biomarkers for its diagnosis and treatment.

关键字：functional anorectal pain; anxiety; depression; brain imaging; functional magnetic resonance imaging

Association of Sleep Timing with All-cause and Cardiovascular Mortality: The Sleep Heart Health Study and Osteoporotic Fractures in Men Study

范雅娟 闫斌 马现仓*
西安交通大学第一附属医院

Objective : The importance of sleep in maintaining body health and preventing diseases cannot be ignored. The purpose of this study was to investigate the association of sleep timing (including bedtime, wake-up time, and sleep midpoint) with all-cause and cardiovascular disease-related (CVD) mortality.

Methods All participants were screened from two cohort studies: the Sleeping Heart Health Study (SHHS, 2250 males, 2574 females, age 63.9±11.1 years) following for 10.7 years and the Osteoporotic Fractures in Men Study (MrOS, 2658 males, age 76.3±5.5) following for 10.4 years. The sleep information of the participants was obtained based on the sleep questionnaires they filled out during the baseline period. The bedtime was divided into 10:00 PM and before, 10:01-12:00 AM, 12:00 AM and later, and wake up time was divided into 8:00 AM and later, 6:01-8:00 AM, 6:00 AM and earlier in this study. The association between sleep timing and mortality was examined using cox proportional hazards regression analysis adjusting for potential confounders.

Results At the end of follow-up, 23.2% of people in the SHHS cohort died, including 7% from cardiovascular disease, compared with 55% in the MroS cohort, of which CVD accounted for 19%. Multivariate cox regression analysis showed that sleeping at > 12:00 AM was independent associated with increased all-cause mortality [SHHS: hazard ratio (HR) 1.54(1.28-1.85), P<0.001; MrOS: HR 1.27(1.021.59), P=0.033] and CVD mortality [SHHS: 1.71(1.25-2.36), P=0.001; MrOS: 1.26(0.86-1.87), P=0.238]. In SHHS study, waking up later than 8 AM and sleep midpoint after 4 AM were also associated with increased all-cause and CVD mortality. However, these associations were less clear in MrOS study.

Conclusions Going to bed late (>12:00 AM) and waking up late on weekdays (>8:00 AM) independently increased all-cause and CVD mortality. This finding underscores the importance of proper bedtime and wake-up time for maintaining health and reducing mortality.

Differential Responses From The Left Postcentral Gyrus, Right Middle Frontal Gyrus, and Precuneus To Meal Ingestion in Patients with Functional Dyspepsia

陈一萍* 王彩花
浙江大学医学院附属第二医院

Objective Functional dyspepsia (FD) is most often a meal-induced syndrome. Studies using resting-state functional magnetic resonance imaging (rs-fMRI) reported abnormal connectivity in areas related to pain processing in FD. However, only a few studies have attempted to determine how meal ingestion affects the brain's working patterns. Through rs-fMRI, this study observed how meal ingestion affected brain regions related to visceral hypersensitivity and emotional response networks in FD patients.

Methods A total of 30 FD patients and 32 healthy controls (HC) were enrolled and underwent clinical investigations. Rs-fMRI was performed twice after a 4-h fast and 50 min after a meal. The mean functional connectivity strength (FCS) values were extracted from brain regions with significant differences to show the trend of changes related to meal ingestion after FCS analyses.

Results Depression, anxiety, sleep disturbances, and weight loss were more common in FD patients ($P \leq 0.001$). Compared with HCs (corrected cluster P- value < 0.05), FD patients had significantly higher FCS in the right middle frontal gyrus before meals and higher meal-induced FCS in the left postcentral gyrus. HCs had greater meal-induced activation in the right precuneus and anterior cingulate cortex. FD patients had a decreasing trend in the right inferior frontal gyrus compared to the increasing trend in HCs. We only found anxiety to be negatively correlated with FCS in the right inferior frontal gyrus in FD ($r = ?0.459$, $p = 0.048$, uncorrected).

Conclusion In this study, we discovered that FD patients have different perceptual and emotional responses to food intake in defined brain areas, providing promising impetus for understanding pathogenic brain mechanisms in FD.

Internet Addiction Exposure Increases Risk of Suicide Attempts in Chinese Adolescents: A Prospective Cohort Study

Sihong Li jiansong zhou*
中南大学湘雅二医院

Objective Background: Suicide is one of the most important global public health issues in adolescents, while internet addiction is reported to be associated with a higher rate of suicide attempts in this population. However, few longitudinal study was performed to explore the relationship between internet addiction and suicide attempts in adolescent. Thus, this study aims to explore the relationship between internet addiction exposure and suicide attempts.

Methods A total of 848 students were enrolled in this study, all participants were asked to complete a questionnaire from November to December in 2020, and a 6-month follow-up. The demographic variables were collected by a self-designed questionnaire, depression - anxiety - stress scale(DASS-21) was used to evaluate the status of depression, anxiety, stress. Revise Chinese internet addiction scale(CIAS-R) was used to estimate the symptoms of Internet addiction. $\chi 2$ test and ANOVA was employed to compare group difference and cox regression analysis was used to examine the association between internet addiction and suicide attempts.

Results We found that adolescents with internet addiction are more likely to be an ethnic minority and experience stress, anxiety, and depression. Besides, internet addiction exposure was associated with a significantly increased risk of suicide attempts.

Conclusion nternet addiction exposure was associated with an increased risk of suicide attempts, and this finding highlights the importance of addressing internet addiction symptoms among Chinese adolescents to better prevent suicidal behaviors.

Group Interpersonal Psychotherapy for Generalized Anxiety Disorder (IPT-G-GAD) in China: Development and Adaption

孙霞 [1] 张露佳 [2] 潘艳 [1] 倪开济 [1,2] 季陈凤 [1] 周千 [1], Scott Stuart[3] 骆艳丽 [1]
1.上海交通大学医学院附属仁济医院
2.上海童创未来医疗管理有限公司
3.University of Southern California, Dept of Psychiatry, Los Angeles, California, USA

Objective Generalized anxiety disorder (GAD) is a common and disabling psychiatric disorder which negatively impairs patients' quality of life. Studies suggest that inadequate consideration of interpersonal problems may contribute to the poor treatment response in psychotherapy for GAD. Interpersonal psychotherapy (IPT) is an evidence-based psychosocial intervention that focuses on symptoms by improving interpersonal functioning, and research demonstrates that IPT is efficacious in treating social anxiety and panic disorders. The present study conducted a pilot testing and explored subsequent modification of a model of Group Interpersonal Psychotherapy for Generalized Anxiety Disorder in China.

Methods Initial group-IPT treatment handbook for

Chinese GAD patients was developed by reviewing the literature and referencing treatment manuals. Two pilot IPT groups were conducted in Renji Hospital (Shanghai) from January 2021 to June 2021. Each group treatment consisted of eleven patients and two certified IPT Community-Based therapists who were supervised by a certified IPT supervisor. Participants between the ages of 18 to 65 were eligible if they were: 1) diagnosed with GAD according to Diagnostic and Statistical Manual of Mental Disorders, 5th Edition (DSM-5) criteria (American Psychiatric Association, 2013); 2) were experiencing their first episode of GAD; 3) had not been treated with antidepressant or anti-anxiety medication; 4) had not received Interpersonal Psychotherapy. Exclusion criteria included: 1) any mental illness diagnosis other than GAD; 2) suicidality; 3) current or previous history of alcohol, drug addiction. Anxiety and depression symptoms were measured using the 7- item Generalized Anxiety Disorder Questionnaire (GAD-7).

Results A total of 79 subjects were screened for the study. Twelve were excluded and two declined. The remaining 67 subjects were randomized to receive either sertraline and psychoeducation (n=31) or sertraline and group IPT (n=36). Dropout rates were 8.33% in the sertraline plus group IPT, versus 19.36% for sertraline plus psychoeducation group. The GAD-7 scores dropped from intake scores of 13.97 and 13.54 (sertraline plus group IPT and sertraline plus psychoeducation group, respectively), scores were 7.58 and 9.84 at week one, and were 5.81 and 6.88 at week 2. Scores on the GAD-7 were 4.71 and 4.88 at week 4, while 4.16 and 4.38 at week 8.

Conclusion This project was undertaken to develop and adapt the IPT for Groups protocol for work with generalized anxiety disorder patients in China and to collect preliminary data on its benefits. This is the first study to evaluate Group IPT for treatment of GAD; it is also one of the first IPT outcome studies conducted in China. Based on the data we collected, we now have an adapted protocol for Group IPT for GAD.

Internet Gaming Addiction Among Children and Adolescents with Non-suicidal Self-Injury: A Network Perspective

杨源 马延启 周睿 戢婷 侯彩兰*
广东省人民医院

Objective : Internet gaming addiction is a growing global concern and mental health burden. Currently, no study has examined Internet gaming addiction among individuals with non-suicidal self-injury (NSSI). This study aims to examine the epidemiology, correlates, and network structure of Internet gaming addiction among children and adolescents with NSSI in China.

Methods This was a cross-sectional study conducted in Guangdong Mental Health Center, China, from Dec 2019 to Dec 2021. The 13-item Chinese Internet gaming addiction scale, SAS, SDS, and UCLA loneliness scale were adopted to evaluate patient's internet gaming addiction, anxiety, depression and loneliness. Univariate analyses, multivariate logistic regression, and network analysis were conducted.

Results A total of 110 children and adolescents with NSSI behaviors participated in the study, and 45 (40.9%) of them reported Internet gaming addiction. Multivariate logistic regression analysis revealed that male participants (OR = 6.047, P = 0.001) and those living on campus (OR = 2.677, P = 0.039) were more likely to suffer from Internet gaming addiction. Network analysis revealed that item1 ('Always thinking about online games when not playing'), item6 ('Clearly aware of the dangers of online games but fail to stop'), and item3 ('Moody / anxious / agitated / angry while not playing') were core symptoms for the identification of Internet gaming addiction, while item9 ('loss of interest'), and item13 ('deceiving') were the least influential symptoms in the network.

Conclusions Internet gaming addiction was prevalent among children and adolescents with NSSI. 'Preoccupation', 'Unsuccessful attempts to control playing', and 'Withdrawal' were of key importance for identifying Internet gaming addiction. Ongoing clinical care and targeted interventions to address these symptoms (e.g., strengthening self-control) may be important for reducing the risk of Internet gaming addiction in children and adolescents with NSSI.

Inhibitory Effects of Liquiritin, A Natural Compound, Against Antipsychotic-induced Hyperprolactinemia Via Modulation of Dopamine D2 Receptors

张志洋 王传跃*
首都医科大学附属北京安定医院

Objective Chinese liquorice (Glycyrrhiza uralensis, radix glycyrrhizae) is a commonly used herb in traditional Chinese medicine that may reduce antipsychotic-induced hyperprolactinemia. A component in the extract of Chinese liquorice is the flavone, liquiritin. This study investigated the effects of liquiritin on antihyperprolactinemia and its mechanisms of action, in vitro and in a rat model.

Methods The in vivo model of hyperprolactinemia was induced by sulpiride, a selective D2 and D3 antagonist, in Sprague Dawley rats. Model rats were administered daily intragastric liquiritin (10, 20, and 40 mg/kg) for 14 days; bromocriptine served as the positive control. The serum was collected and the pituitary gland was harvested. In vitro experiments utilized cultured MMQ rat prolactinoma cells, an exemplary in vitro model for hyperprolactinemia, to determine whether liquiritin targeted dopamine D2 receptors (D2R); small interfering RNA was used to knock down the endogenous D2R transcript. The concentration of prolactin in serum and culture medium were determined by radioimmunoassay. The pituitary gland and MMQ cells were analyzed by western blot and reverse transcription-polymerase chain reaction for cellular prolactin synthesis and the expression of mRNA.

Results Liquiritin significantly suppressed elevated serum prolactin, produced by chronic administration of sulpiride in rats, and reduced the expression of prolactin mRNA in the rat pituitary. Liquiritin also inhibited the release of prolactin from MMQ cells in a dose-dependent manner. The in vivo and in vitro effects of liquiritin were similar to that of bromocriptine. The inhibitory effect of liquiritin on the release of prolactin is completely abolished by the knockdown of D2R.

Conclusion These results indicate that liquiritin inhibits prolactin release by modulating the D2R. Liquiritin, a novel therapeutic agent, has promising potential for the treatment of antipsychotic-induced hyperprolactinemia.

关键字：liquiritin, hyperprolactinemia, D2R, RNAi.

Weight Changes Following Treatment with Aripiprazole, Risperidone and Olanzapine: A 12-month Study of First-episode Schizophrenia Patients in China

周天航 蒲城城 黄泽韬 高天奇 周恩鹏 郑月 张丹 黄冰洁 程章 石川 于欣*
北京大学第六医院

Objective This study aimed to assess weight changes following antipsychotic treatment in first-episode schizophrenia (FES) patients and make a comparison of aripiprazole, risperidone and olanzapine. Predictors for long-term clinically relevant weight gain (CRW, ≥7%) were examined.

Methods We carried out a second analysis of data from the Chinese First-Episode Schizophrenia Trial. Repeated measures general linear model (GLM) statistics were used to compare body weight at each follow-up point (month of 1, 2, 3, 6, 9and 12). Logistic regression models were constructed to evaluate possible predictors for CRW.

Results Body weight increased with an average rate of 0.93 % per month, with the fastest growth rate occurring in first 3 months. CRW was observed in 79 % of patients. Participants from olanzapine group showed significantly higher weight gain than risperidone group and aripiprazole group. Repeated measures GLM revealed a significant main effect of time ($p < 0.001$) and a significant time*group interaction was revealed ($p < 0.001$), while the between-subject group effect was not statistically significant ($p = 0.272$). Multivariate logistic regression model showed that with smaller baseline BMI (OR = 1.33, $p < 0.001$), with a family history of mental disorder (OR = 5.08, $p = 0.004$), receiving olanzapine (OR = 2.35, $p = 0.001$), and CRW at the first-month (OR = 4.29, $p = 0.032$) were independent predictors for the first-year CRW.

Conclusion Antipsychotics are associated with a clinically significant weight gain in FES patients, which occurs mostly in first 3 months. Aripiprazole might not be an ideal choice in terms of long-term metabolic side-effects. Early and close metabolic monitoring should accompany antipsychotic prescription.

Different Levels of Prepulse Inhibition in Patients with First-episode Schizophrenia, Bipolar Disorder, and Major Depressive Disorder

Yue Sun[1], Qijing Bo[1], Zhen Mao[1], Qing Tian[1], Fang Dong[1], Liang Li[2], Chuanyue Wang[1]
1.Beijing Anding Hospital, Capital Medical University
2.Peking University

Objective The present study aims to preliminarily explored the PPI deficits of the acoustic startle reflex in patients with FES, BD, and MDD, and the difference of deficiency extent among these disorders. Furthermore, a preliminary analysis was conducted to determine the sensitivity and specificity of the effect size of PPI deficits to differentiate FES, BD, and MDD from HC.

Methods Patients with FES, BD, or MDD, and healthy controls (HC) (n = 53, 30, 25, and 82, respectively) were tested using perceived spatial co-location and separation PPI paradigms (PSC-PPI, PSS-PPI), in which the leading ear given background noise was the same or different from the ear receiving the prepulse stimulus, respectively.

Results Using the PSS-PPI paradigm, the PPI levels of the 4 groups, from small to large, were FES, BD, MDD, and HC. Relative to the HC, the PPI deficits in the FES groups were significant ($P < 0.001$), but the PPIs were similar between BD and HC, and between MDD and HC. ROC curve analysis showed that the PSS-PPI (AUC = 0.73, $P < 0.001$) and the Latency (AUC = 0.72, $P < 0.001$) were significant for differentiating the FES and BD from the HC respectively.

Conclusion The level of PPI was lowest in patients with FES, followed by BD, MDD and HC. PSS-PPI is a more sensitive paradigm than PSC-PPI, and could significantly differentiate between FES and HC, with a large effect size. The latency had differentiating value of BD from HC. This result may provide a basis for further research on biological indicators that can assist differential diagnoses in psychosis.

Effect of Transcranial Direct Current Stimulation Combined with Cognitive Training When Targeting Posterior Parietal Cortex Vs Dorsolateral Prefrontal Cortex on Working Memory in Schizophrenia: A Randomized Clinical Trial

Wenpeng Hou[1], Qi Wang[2], Hang Li[1], Fang Dong[1], Qijing Bo[1], Fuchun Zhou[1], Anning Li[1], Liang Zhang[1], Zhenzhu Chen[1], Zhimin Wang[1], Xianbin Li[1], Chuanyue Wang[1]
1.Beijing Key Laboratory of Mental Disorders, National Clinical Research Center for Mental Disorders & National Center for Mental Disorders, Beijing Anding Hospital, Capital Medical University, Beijing, China; Advanced Innovation Center for Human Brain Protection, Capital Medical University, Beijing, China.
2.Fengtai Mental Health Center, Beijing, China.

Objective Working memory impairment are linked to irregularities in the dorsolateral prefrontal cortex (DLPFC) and the posterior parietal cortex (PPC), the aim of this study was to compare the efficacy of tDCS coupled with working memory training when distinctly targeting DLPFC or PPC for working memory deficits in schizophrenia.

Methods This randomized, double-blind clinical trial was conducted from September 2021 to May 2023 at a hospital in Beijing, China. A total of 60 clinically stable patients with schizophrenia, scoring 30-50 on the spatial span test of the MATRICS Consensus Cognitive Battery (MCCB) were included. Participants were randomly allocated into active DLPFC, active PPC, or sham stimulation. Ten sessions of tDCS were conducted twice daily for five days, in conjunction with N-back training. Participants were followed up to week 2. The primary outcome was change in the spatial span test score at week 1. Secondary outcomes included changes in scores of color delay-estimation task, and other cognitive tasks.

Results Among the 60 patients enrolled, 34 (57%) were female, the mean (SD) age was 33.2 (7.4) years, 54 (90%) completed the evaluation at week 1, and 52 (87%) at week 2. The active PPC group demonstrated a significantly greater improvement in spatial span test score at week 1 in comparison to the active DLPFC group ($P = .01$, Cohen's $d = .94$). Furthermore, the active PPC group exhibited an augmentation in color delay-estimation task capacity at week 1 relative to the active DLPFC group ($P = .03$, Cohen's $d = .80$), with this effect sustained at week 2 ($P = .01$, Cohen's $d = .93$). The active PPC group also showed increased color delay-estimation task capacity compared to the sham stimulation group at week 2 ($P = .02$, Cohen's $d = -.82$). There were no significant differences among the three groups in other cognitive tasks. No serious adverse events were reported.

Conclusion The findings from this study suggest that tDCS targeting PPC rather than DLPFC during concurrent working memory training may precisely improve working memory in schizophrenia, meriting further investigation.

Impairment of Olfactory Identification Ability in Ultra-High Risk for Psychosis and Drug-naive First Episode Schizophrenia

欧阳丽君 袁柳 马晓倩 范乐佳 贺莹*
中南大学湘雅二医院

Objective ：Olfactory discrimination dysfunction has been described in patients with psychotic disorders. And These changes have also been observed in individuals with clinical or genetic high risk, suggesting Olfactory discrimination dysfunction may be the potential risk factor for developing psychosis. So, the purpose of our study is to explore the difference in olfactory discrimination ability in the prosal stage and early stage of psychosis and to explore the potential risk factor of developed psychosis.

Methods ：Olfactory identification and cognitive function were compared in 88 Ultra-high -risk (UHR) individuals, 111 Drug-na?ve first-episode schizophrenia (FES), 81 Genetic high-risk (GHR) individuals, and 110 healthy controls (HC). Besides Olfactory identification and cognitive function were compared among UHR individuals who later transitioned to psychosis (UHR-T; n = 58) and those who did not transition (UHR-NT; n = 30).

Results ：Olfactory Stick Identification Test for Japanese (OSIT-J) scores were decreased in patients FEP group compared to (UHR & GHR), Compared to HC, FES patients, and UHR showed significant defects in olfactory identification, but there were no differences in olfactory identification dysfunction between the GHR and HC group. Moreover, There was a significant impairment in olfactory identification ability in the UHR-T group that later developed schizophrenia spectrum disorder compared to the UHR-NT group.

Conclusion ：In conclusion, These findings suggest

that impairment of olfactory identification exists in the early stage of psychosis, and olfactory identification dysfunction may be a potential marker of transition to schizophrenia.

Initial Drug Attitude As A Prediction of Medication Adherence in First-episode Schizophrenic Patients: A 1-year Prospective Study in China

Nan Dai[2], Bingjie Huang[1], Tianqi Gao[1], Yue Zheng[1], Chuan Shi[1], Chengcheng Pu[1], Xin Yu[1]
1.北京大学第六医院
2.昆明医科大学第一附属医院

Objective We investigated the association of drug attitude (measured by the Drug Attitude Inventory, DAI-10) with the adherence at six time points (baseline, weeks 4, 8, 12, 26, and 39 weeks) during 1-year treatment. The possible factors associated with drug attitude toward medications (measured by DAI-10) at the interested time point were also studied.

Methods The analyzed data derived from a 1-year randomized, open-labeled clinical trial in China. Demographics, psychopathology, social functioning, and attitude toward drugs (measured by DAI-10) were collected at baseline, weeks 4, 8, 12, 26, 39 and 52. The association of drug attitude (measured by DAI-10) with the adherence at the six time points were calculated using the Mann Whitney U test. The optimal cut-off point of DAI-10 was then suggested using a Receiver-Operating-Characteristic-(ROC-) analysis. A cox-regression was conducted to further investigate the association of DAI-10 with discontinuation controlling for potentially confounding effects. We used multiple regression analysis to test the possible factors associated with DAI-10.

Results Among six time points, Only DAI-10 total score at baseline indicated a significant difference (p=0.004) between completed and discontinued groups. Females and Baseline DAI-10 total score more than -1 were indicated as independent protective factors for discontinuation in the following one-year antipsychotic drug treatments. At baseline, the severity of the disease (CGI-s) and insight were shown to be associated with DAI-10 total scores.

Conclusion Attitude towards antipsychotic drugs at the beginning of the treatment were shown a crucial role in predicting discontinuation during the treatment.

The Association between Different Symptom Groups of Schizophrenia and Retinal Structures

徐淑莉[1,2]
1.空军军医大学第一附属医院
2.天津市精神卫生中心

Objective 1. Investigate the impairments of retinal structure in the Han patients with schizophrenia and enrich the database of the study on the impairments of the retinal structure of schizophrenia. 2. Investigate the changes of the macula and optic nerve fiber layer between in schizophrenic patients. 3. Investigate the impairments of retinal macular thickness and optic nerve fiber layer thickness in the negative and positive symptom groups of schizophrenia. 4. Investigate the relationship between the negative and positive symptom groups and retinal thickness.

Methods 50 patients with schizoprenia were included. Considering the positive factor and negative factor components in PANSS scale, the patients were classified according to the main symptom groups, 26 patients were collected in the negative symptom group and 24 patients were raised in the positive symptom group. Meanwhile, 33 healthy controls matched with age and gender of schizophrenia group were recruited from hospital staff and adult medical students by using SCI-D NP version evaluation by professional psychiatrists. The age, sex, education level, geographical coordinates, course, first age, medication status, family history and other demographic data and clinical data were collected. SANS was used in the negative schizophrenia symptom group; SAPS was used in the positive symptom group. The scanning information of the eyes were collected by using the Zeiss optical coherence scanner 4000 system (OCT). SPSS 24.0 (Chicago, IL) software was used to analyze the basic data and OCT data of the subjects. The chi square test was used for the comparison of the counting data, the normal test for the measurement data, the independent sample t-test was used for the comparison of the normal distribution data, the single factor variance analysis was used among the groups, and the correlation analysis was used to analyse the relation of the two variables.

Results 1. The central macular thickness of schizophrenia patients was thinner [(238.64 μ m ± 20.31 μ m) vs. (248.86 μ m ± 17.23 μ m), P = 0.002]. 2. The central macular thickness of the negative symptoms group was thinner [(237.46 μ m ± 23.09 μ m) vs. (248.86 μ m ± 17.23 μ m), P = 0.002], and that of the positive symptoms group was thinner [(239.92 μ m ± 16.95 μ m) vs. (248.86 μ m ± 17.23 μ m), P = 0.002]. The macular in inferior quadrant area of the negative symptoms group tended to be thinner than positive group [(309.94 μ m ± 21.97 μ m) vs. (313.27 μ m ± 13.19 μ m), P = 0.059]. 3. The correlation coefficient between the SANS score and retinal thickness was not statistically significant; the correlation coefficient between the SAPS score and retinal thickness was not statistically significant.

Conclusion The retinal thickness in schizophrenia became thinner in the central area of the macula. The retinal impairments were more serious in patients with negative symptoms.

听声识别精神分裂症：融合不同情绪和特征的语音判别分析

黄杰 赵艳丽 田占霄 屈威 杜霞 张洁 谭云龙 王志仁 谭淑平*
北京回龙观医院

目的 精神分裂症作为一种异质性的精神障碍，快速准确的诊断仍然是一个巨大的挑战。基于语音的精神分裂症判别分析展示了巨大的潜力。然而性别，年龄和受教育程度等人口学信息以及不同的情绪状态都可能影响判别模型的性能。因此在本研究中，构建了一个基于深度学习的精神分裂症语音判别模型，探索在融合个体信息和不同情绪刺激后精神分裂症的诊断正确率是否有提升。

方法 我们招募了 156 名精神分裂症患者和 74 名健康对照，完成不同情绪刺激的固定文本阅读任务并录音。构建卷积神经网络以融合人口学信息和梅尔频谱系数，应用于语音判别分析得到融合不同特征的结果。将不同情绪刺激的结果加权集成得到情绪融合结果。分析了不同情绪刺激和不同特征融合对精神分裂症诊断准确性的影响。

结果 结果表明，中性情绪刺激的判别分析结果优于正性和负性；融合不同特征后模型准确率明显提高；整合不同的情绪刺激和融合不同特征，提高了敏感性和特异性。最佳判别模型的总体分类准确率为 91.7%，灵敏度为 94.9%，特异性为 85.1%，ROC 为 0.963。

结论 在中性情绪刺激下，精神分裂症患者与健康对照者的言语差异较大，更有助于精神分裂症的判别分析。融合情绪，人口学信息和梅尔频谱系数可以在模型中提供个体差异信息，提高精神分裂症诊断的准确性。我们的研究结合了深度学习和语音分析，为提高精神分裂症的精准诊断提供了方法验证，并展现了在精神分裂症中使用语音分析的潜力。

早发型精神分裂症的免疫基因组学和免疫细胞特征分析

陈姿 李玉雪 高耀 杜鑫哲 刘莎* 曹晓华*
山西医科大学第一医院

目的 早发型精神分裂症（early-onset schizophrenia，EOS）是指发病年龄<18 周岁的一类精神分裂症。与成人精神分裂症患者相比较，EOS 患者遗传负荷较高，受环境因素影响小，以 EOS 患者为研究对象有助于精神分裂症遗传因素和发病机制的研究。许多新研究发现精神分裂症的基因位点集中在免疫系统相关基因。本研究旨在分析 EOS 的免疫基因组学特征及免疫细胞特征，进一步从免疫组学揭示 EOS 发病机制。

方法 RNA-seq 测序数据来自山西医科大学第一医院招募的参与者，包含 19 个 EOS 患者及 18 个健康对照（HC）外周血液中的全基因组 mRNA 表达。经 R 软件包 limma 筛选差异表达基因（DEGs），并进行加权基因共表达网络分析（WGCNA）筛选模块基因，且通过 Immport 数据库下载免疫相关基因 1793 个，经 Venn 图取三者交集为 EOS 免疫相关 DEGs。进而通过随机森林（RF）算法和支持向量机（SVM）算法筛选关键基因，并构建 ROC 曲线评估其诊断效能。同时使用 CIBERSORT 进行免疫浸润分析探索 EOS 患者中免疫细胞的浸润丰度，并探寻关键基因与免疫细胞之间的关联。

结果 RNA-seq 测序数据共鉴定出 1826 个 DEGs，其中 1266 个上调，560 个下调。WGCNA 筛选出两个关键模块和 222 个模块基因。Immport 数据库下载免疫相关基因 1793 个，取三者交集的 24 个基因为 EOS 免疫相关 DEGs。通过随机森林（RF）算法和支持向量机（SVM）算法交集筛选出 6 个关键基因：CCL8、PSMD1、AVPR1B、SEMG1、TLR3、F2R。建立关键基因的 ROC 曲线 AUC 值均>0.7，均具有良好的诊断效能。 免疫浸润结果显示：与健康对照相比，EOS 患者静息肥大细胞、静息 CD4+记忆 T 细胞的细胞比例显著增加，激活肥大细胞、中性粒细胞、激活 CD4+记忆 T 细胞的细胞比例显著降低。相关性分析结果显示：部分关键基因与免疫细胞具有显著的相关性。

结论 本研究通过筛选 DEGs 和 WGCNA 筛选出与 EOS 相关的差异基因,并与免疫相关基因取交集获得 EOS 患者中差异性表达的免疫相关基因。进一步筛选出 6 个关键基因，并验证其均有较高的诊断效能。免疫浸润分析揭示了 EOS 患者中存在部分免疫细胞的差异性表达，并发现部分关键基因与其之间具有一定的相关性，这为探索 EOS 的发病机制和诊断提供了新的见解。

关键字：早发精神分裂症

Neuroanatomical Abnormalities in Individuals at Early Stage of Schizophrenia: Relationship with Neurometabolites and Clinical Symptoms

王玉珏 欧阳丽君 袁柳 范乐佳* 马晓倩*
中南大学湘雅二医院

Objective The presence of brain structural and metabolite abnormalities has been observed in the early stages of schizophrenia or prior to disease onset, and these abnormalities may demonstrate progressive changes. However, the relationship between these two factors has rarely been studied. The aim of the present study was to explore the association between cortical abnormalities, metabolite levels, and clinical symptoms in clinical groups.

Methods We recruited a total of 51 drug-naive first-episode schizophrenia (FES) patients, 51 healthy controls (HC), and 51 individuals at ultra-high risk for psychosis (UHR), among whom 20 UHR individuals converted to psychosis (UHR-C) within a two-year period. T1-weighted

images and 1H-MRS data were acquired for all subjects at baseline. Voxel-based morphometry and surface-based morphometry analysis were separately used to measure grey matter volume (GMV) and cortical thickness (CT). Metabolite concentrations, including phosphocholine (Cho) and glutamate + glutathione (Glx), were also measured concurrently. We performed one-way analysis of variance (ANOVA) and assessed the effect of group membership (UHR-C, UHR unconverted to psychosis [UHR-NC], FES, HC). Pearson correlation analysis was conducted to evaluate the associations between these indicators in the UHR subgroups.

Results The UHR-C group exhibited significantly thicker CT in the right lateral occipital (rLO) cortex ($F(3,149)=4.418$, $p=0.005$) compared to the other three groups, and the right medial orbito-frontal (rMOF) cortex ($F(3,149)=7.273$, $p<0.001$) compared to the FES and HC groups. A significant CT reduction was observed in the FES group in the right fusiform cortex ($F(3,149)=4.846$, $p=0.003$) compared to the UHR-C and HC groups. No significant differences in metabolite levels and GMV were found among any of the groups ($p>0.05$). In the UHR-C group, CT in the rMOF was positively correlated with general symptoms ($r=0.603$, $p=0.005$) and Cho levels in the mPFC ($r=0.586$, $p=0.008$). Cho levels were also positively correlated with general symptoms ($r=0.657$, $p=0.002$). Furthermore, Glx levels were negatively correlated with disorganized symptoms ($r=-0.493$, $p=0.005$) in the UHR-NC group.

Conclusion The observed altered CT in the frontal-occipital area in the UHR-C group suggests its involvement in the onset of the disease. The thickened CT in the UHR-C group is associated with a disturbance in brain metabolite levels and may represent a compensatory effect. This compensatory effect exists prior to disease onset but may become exhaustive as the disease progresses due to potential neurotoxic effects. The findings of this multimodal brain imaging study provide valuable insights into understanding premorbid brain structural changes in patients with schizophrenia and the neural substrate underlying the altered neural activity associated with the disease.

Early Enhancement Effect of Low-frequency Repetitive Transcranial Magnetic Stimulation on Cognitive Behavioral Therapy in Patients with Panic Disorder

杨祥云* 王鹏翀 孟丽敏
首都医科大学附属北京安定医院

Objective Cognitive behavioural therapy (CBT) is the first-line treatment for panic disorder (PD). However, some patients still have poor response to CBT, especially in the early stage of treatment. Thus, to find a new method to enhance the early effect of CBT is necessary. Current research aimed to verify whether low-frequency repetitive transcranial magnetic stimulation (l-rTMS) may enhancement the effect of CBT for PD patients in the early stage.

Methods PD patients were recruited and randomly assigned to the experimental group and the control group using a random number table. The patient of experimental group received CBT combined with true l-rTMS, and the control group received CBT combined with pseudo l-rTMS. Both groups received 12 sessions of CBT and 20 times of l-rTMS intervention in the first month of CBT. The target of l-rTMS stimulation was the left dorsolateral prefrontal cortex, the stimulation time was 30 minutes, and the frequency was five times once week. The patients' panic symptoms, anxiety, and social function were assessed with the Panic Disorder Severity Scale (PDSS), HAMA, and PSP at 7 timepoints.

Results A total of 50 patients with panic disorder were recruited and randomly assigned to the experimental group and the control group with 25 cases each. A total of 10 cases fell out of the two groups. The IPP analysis method was used to analyze the general demographic data and clinical characteristics of 40 patients who completed the treatment. It was found that there were no statistically significant differences between the two groups in terms of age, sex, course of disease, education, severity of panic disorder, anxiety, depression, personal and social functions ($P>0.05$). The PDSS and HAMA scores significantly reduced after intervention in both groups. The PSP score significantly increased after intervention in both groups. The difference of PDSS, HAMA, and PSP scores between the two groups at different time points (0,2, 4, 6, 8, 10 and 12 weekends) was compared by repeated measurement analysis of variance. It was found that there were statistical differences on PSSS and HAMA between groups, time points and interaction effects ($p<0.05$). Further post-mortem analysis: inter-group univariate analysis of variance found that there was a statistically significant difference in the total PDSS score and HAMA score between the two groups at the end of the 2nd, 4th, 6th and 12th weeks, and the PDSS score of the study group was lower than that of the control group; Intra-group paired t-test showed that the scores of PDSS in the two groups at the end of 2, 4, 6, 8 and 12 weeks were lower than the baseline. There was not significant difference on PSP between groups, time points and interaction.

Conclusion The effect of l-rTMS real stimulation combined with CBT in the treatment of panic disorder is better than that of l-rTMS false stimulation combined with CBT, which can significantly improve panic symptoms at the early stage.

Functional Connectivity of Goal-directed System on Efficacy of Cognitive Behavior Therapy for Obsessive-Compulsive Disorder

Haocheng Chena[2], Huan Zhang[1], Wangyue Li[2], Xuedi Zhang[2], Zhihan Xu[2], Zhongqi Wang[2], Wenjing Jiang[2], Na Liu[1], Ning Zhang[2]
1.Department of Medical Psychology, The Affiliated Brain Hospital of Nanjing Medical University, Nanjing, Jiangsu, China;
2.The Affiliated Brain Hospital of Nanjing Medical University, Nanjing, Jiangsu, China

Objective This study aims to investigate the association between baseline functional connectivity of brain regions related to goal-directed and habitual-learning, and the efficacy of exposure and response prevention therapy in individuals with obsessive-compulsive disorder (OCD). Also, the study aims to examine whether treatment response differs among patients with different disease duration and ages of onset.

Methods 35 OCD Patients were divided into two groups based on treatment response (Nrespond=18, Nnonrespond=17) after undergoing 8 weeks 16 sessions (twice a week) of cognitive behavior therapy including exposure and response prevention therapy. Further subgroup analysis was conducted based on disease duration (Nshort = 17, Nlong= 18) and age of onset (Nadolescent = 14, Nadult = 21), and data from symptom rating scales were collected prior to treatment, at week 4, and at week 8. We selected a total of 32 regions of interest (ROIs) that are relevant to goal-directed and habitual-learning processes for the collection of resting-state ROI-ROI functional connectivity data. Using repeated-measures linear mixed-effects models, we investigated the differences in baseline brain activity within the goal-directed network, habitual-learning network, and goal-habit network among different groups, including the treatment response group, duration of illness group, and age of onset group. Additionally, we examined the relationship between these differences in baseline brain activity and changes in Yale-Brown Obsessive Compulsive Scale scores.

Results Cognitive behavior therapy(including exposure and response prevention) resulted in varying degrees of improvement in OCD symptoms among patients. In the respond group, the smaller baseline levels of goal-directed brain regions, including the frontal lobe cortex and anterior cingulate cortex were associated with more significant symptom improvements. The decrease of functional connectivity of fear extinction-related brain regions in the goal-directed brain regions (anterior cingulate cortex and ventromedial prefrontal cortex) is accompanied by a decrease in Y-BOCS scores as treatment progresses. Additionally, in the groups of duration of illness and age of onset, Enhanced functional connectivity within and between default networks, highlight networks, and FPN networks contributes to the efficacy of cognitive behavioral therapy. Finally, most baseline functional connections showed significant differences compared to matched healthy controls.

Conclusion This study suggest that goal-directed system may influence the efficacy of exposure and response prevention therapy by participating in goal selection, maintenance, and emotion regulation. Furthermore, we found that disease duration and age of onset may affect treatment outcomes by modulating functional connectivity between goal-directed and habitual-learning brain regions.

预防自杀的认知行为治疗在自杀未遂抑郁症患者中的随访对照研究

张春苗 李献云* 徐若愚 徐恩瑶 张房昉 聂明海
北京回龙观医院

目的 探讨预防自杀的认知行为治疗治疗自杀未遂抑郁症患者的疗效。

方法 纳入 2021 年 9 月至 2022 年 8 月北京回龙观医院住院的自杀未遂抑郁症患者 112 例，采取随机数字表区组随机化法将患者分为干预组和对照组，干预组给予 12 次预防自杀的认知行为治疗，对照组给予支持性心理治疗，分别在干预前中后和干预结束后 1 个月（第 0、4、8、12 周末），采用 Beck 自杀意念评估量表（Beck scale for suicide Ideation-Chinese version,BSI-CV）和病人健康问卷抑郁量表（Patient Health Questionnaire depression scale,PHQ -9）评估患者自杀意念、自杀倾向和抑郁症状的变化。采用重复测量方差分析进行干预效果的分析。

结果 ①自杀意念：组别和时间交互作用不显著（F=0.509，P=0.677）。自第 8 周起，干预组自杀意念总分低于对照组（P＜0.001）；随时间变化两组患者第 4、8、12 周时的自杀意念总分均低于基线，第 8、12 周时总分均低于第 4 周（均为 P＜0.01）。②自杀倾向：组别和时间交互作用不显著（F=2.564，P=0.059）。两组患者的自杀倾向在各个时点的组间差异无统计学意义（F=0.001，P=0.975）；随时间变化两组患者第 4、8、12 周时自杀倾向总分均低于基线（P＜0.05），对照组干预后第 12 周时总分低于第 4 周（P＜0.01），其他时点之间差异无统计学意义（P>0.05）。③抑郁症状：组别和时间交互作用显著（F=3.843，P=0.012）。自第 4 周起，干预组抑郁得分低于对照组（P＜0.05）；随时间变化两组患者第 4、8、12 周时得分均低于基线，第 8、12 周时得分均低于第 4 周（均为 P＜0.01）。

结论 预防自杀的认知行为治疗对自杀未遂抑郁

症患者的抑郁症状的影响自干预第 4 周开始就显示出优越性；对自杀意念的效果自第 8 周始优于对照组，而对自杀倾向干预效果不明显。由于自杀倾向的跟踪需要一个长期过程，尚需进一步研究追踪预防自杀的认知行为治疗对自杀未遂抑郁症患者的长期效果。

社交焦虑障碍认知行为治疗技术专家共识的德尔菲法研究

刘萌萌 罗佳 李占江*
首都医科大学附属北京安定医院

目的 本研究拟用德尔菲法（Delphi）调查社交焦虑障碍(Social anxiety disorder，SAD) 认知行为治疗（Cognitive Behavioral Therapy, CBT）技术在国内的应用情况，形成专家共识，为进一步规范 CBT 技术奠定基础。

方法 复习国内外关于社交焦虑障碍 CBT 技术的研究文献及书籍，筛选出 49 项 CBT 技术并制定专家咨询表，发放至国内符合遴选标准的 26 名 CBT 专家。从使用频率、治疗效果贡献程度和来访者接受度三个维度对各技术进行评估，共进行两轮专家咨询。计算专家积极性、专家权威系数、专家意见的集中程度和协调程度等统计指标，并根据各技术的综合秩次进行重要性大小排序。

结果 两轮专家咨询的积极性为 100%，专家权威系数分别为 0.96，0.95。技术各维度评分的肯德尔协调系数范围 0.31-0.51（$p<0.01$）。综合排序前五位的技术分别为建立治疗联盟、心理教育、识别自动思维、微观案例概念化、资料收集。而综合排序靠后，但国外研究已证实其有效性的技术，包括意象重构、录像反馈、现场暴露、想象暴露、正念呼吸和身体扫描。

结论 专家评分一致性较高且推荐使用的技术如下，第一，支持性的基本技术如，建立治疗联盟，心理教育、微观案例概念化等；第二，认知技术如识别自动思维，行为实验，可替代性思维等；第三，聚焦症状的行为技术如问题解决、社交技能训练、角色扮演等。总之，多数社交焦虑障碍 CBT 技术的专家评价一致性较高，且适宜性良好，但仍有部分社交焦虑障碍 CBT 的高阶技术在中国文化背景下的应用有待进一步探究。

体现认知行为治疗中核心治疗元素之间相互影响的成语筛选与调查研究

许敬仁[1] 杨华[1] 林晨辰[2] 张宁[1] 柳娜[1] 马辉[1] 裴涛[2] 胡鸣宇[1]
1.南京医科大学附属脑科医院
2.南京师范大学

目的 筛选出能体现认知行为治疗（Cognitive behavior therapy，CBT）四大核心治疗元素（认知、情绪、行为和生理反应）之间相互影响的成语，并在此基础上确定可尝试应用于 CBT 本土化实践的成语。

方法 研究一：体现认知行为治疗核心治疗元素间相互影响的成语筛选研究 以商务印书馆出版的《新华成语词典》（第 2 版）作为筛选工具，采用三轮人工筛选法。首先，根据成语筛选标准，由两位接受过系统 CBT 培训的临床心理学硕士研究生对成语词典中的成语逐一进行独立筛选。然后，由一位具有 10 年 CBT 治疗经验的资深 CBT 治疗师审定并与两位研究生讨论，确定符合标准的成语。最后，将确定的初筛成语交由四位 CBT 专家（CBT 培训师和督导师）审定，再经全体讨论后，最终确定能体现 CBT 中认知、情绪、行为和生理反应相互影响的成语。 研究二：入选成语在大学生中的调查研究 以研究一筛选出的成语为基础编制《关于成语理解程度的调查问卷》，并在 1685 名不同专业和高校大学生中进行抽样调查，进一步确定可作为 CBT 治疗工具尝试应用于 CBT 实践的成语。

结果 研究一：体现认知行为治疗核心治疗元素间相互影响的成语筛选研究《新华成语词典》（第 2 版）中，体现认知影响情绪的成语 13 个；体现情绪影响认知的成语 5 个；体现认知影响行为的成语 42 个；体现行为影响认知的成语 1 个；体现认知影响生理反应的成语 6 个；体现情绪影响行为的成语 24 个；体现行为影响情绪的成语 1 个；体现情绪影响生理反应的成语 61 个；体现行为影响生理反应的成语 1 个；体现生理反应影响行为的成语 4 个；未发现生理反应影响认知和情绪的成语。 研究二：入选成语在大学生中的调查研究 推荐“知足常乐”、“风声鹤唳”、“分道扬镳”、“冷暖自知”、“寝食不安”、“不堪回首”、“不寒而栗”、“嗷嗷待哺”等 86 个成语可作为 CBT 治疗工具应用于本土化实践，其中体现认知影响影响情绪的成语 8 个，体现情绪影响认知的成语 4 个，体现认知影响行为的成语 23 个，体现行为影响认知的成语 1 个，体现认知影响生理反应的成语 3 个，体现情绪影响行为的成语 12 个，体现情绪影响生理反应的成语 34 个，体现生理反应影响行为的成语 1 个。

结论 中国成语中的确存在着诸多能体现 CBT 四大核心治疗元素（认知、情绪、行为和生理反应）之间相互影响的成语，并推荐 86 个成语作为 CBT 治疗工具。

社交隔离、孤独感增加糖尿病相关痴呆发生风险：一项队列研究

聂雨[1] 何芷萱[2] 梁燕[1] 刘亚平[1] 张继辉[1]
1.广州医科大学附属脑科医院
2.暨南大学医学院

目的 2 型糖尿病患者易受到社交隔离与孤独感的影响，而社会心理因素很可能与痴呆发生有关。然而，我们仍不清楚社交隔离与孤独感是否与 T2DM 患者的痴呆发生风险相关。我们假设社交隔离和孤独感与 2 型糖尿病患者的新发痴呆相关，且两者分别由不同的因素介导。

方法 我们从英国生物样本数据库纳入了 24,986 名基线时患有 2 型糖尿病的参与者(平均年龄：60.0±6.9 岁，中位随访时间：12.0 年)。通过问卷调查评估他们的社交隔离和孤独感。新发痴呆病例通过医院记录和死亡登记系统进行确认。

结果 校正人口统计学因素后，社交隔离和孤独感与 2 型糖尿病患者新发痴呆风险增加相关；然而，在完全校正的模型中，这些关联显著减弱。健康行为主要解释了社交隔离与痴呆的关联，心理因素主要解释了孤独感与痴呆的关联。痴呆多基因风险评分或 APOE ε4 等位基因的携带状态显著影响了社交隔离或孤独感与痴呆发生的关联。

结论 社交隔离和孤独感与 2 型糖尿病患者的新发痴呆相关，并分别通过不同的中间途径介导。本研究结果有助于我们进一步了解不良社会因素对 2 型糖尿病患者认知结局的不利影响，并为降低 2 型糖尿病患者的痴呆风险提供了一个有前景的靶点。

Panic Disorder Caused by Childhood Traumatic Experiences Is Associated with NOS1AP DNA Methylation and Precentral Gyrus Function

肖斟[1,4] 赵丽萍[1] 徐华桢[1] 周其冈[3] 王纯[1,2]
1.南京医科大学附属脑科医院
2.南京医科大学 CBT 研究所
3.南京医科大学药学院
4.泰州市第五人民医院

Objective To explore whether childhood traumatic experiences are associated with NOS1AP DNA methylation modification as well as brain function in patients with PD.

Methods 32 subjects with PD and 22 healthy people as control group were recruited. History of childhood traumatic experiences were reviewed by the Childhood Trauma Questionnaire (CTQ). Then, peripheral blood was collected from all participants for DNA methylation test. Next, the Amplitude of Low Frequency Fluctuation(ALFF) values of precentral gyrus were extracted from the patients' functional Magnetic Resonance imaging(fMRI)data. Finally, the correlation of DNA methylation, CTQ scores and ALFF values were analyzed respectively. Animal experiments were designed to test NOS1AP protein expression in the precentral gyrus with immunofluorescence histochemistry(IHC)and Western Blot (WB). To mimic childhood traumatic experiences, mice were treated with chronic restraint stress (CRS) for 21 days. Elevated plus maze (EPM) and open field test (OFT) were used to determine whether the mice showed anxiety-like behavior.

Results Peripheral blood sample showed one of the three fragments of the NOS1AP gene which were extracted from PD patients differed significantly from healthy people in the level of DNA methylation. And we found that the CG13 locus is less methylated than normal controls. The level of methylation at the CG13 locus was significantly correlated with patients' precentral gyrus ALFF values and somatic abuse scores on the CTQ scale. The CRS mice model showed obvious anxiety-like behavior compared to the control group. WB and IHC showed significant upregulation of NOS1AP protein expression in frontal cortex in CRS mice.

Conclusion Our results suggested that childhood traumatic experiences can influence NOS1AP DNA methylation levels and precentral gyrus function. The pattern of behavior change on brain function may be related to the upregulation of NOS1AP in the precentral gyrus.

线上强化 CBT-I 治疗对慢性失眠障碍合并抑郁和/或焦虑症状的疗效研究

居易 苑成梅* 赵亚婷 葛方梅 张洁 罗鑫 邱祎人 王勇*
上海市精神卫生中心

目的 失眠认知行为治疗已被广泛验证可有效改善失眠，但存在治疗师资源有限、费用高昂等限制。网络技术的发展使得更高效的医学行为治疗成为可能，线上 CBT-I 干预应运而生，其有着成本低、访问方便和标准化等一系列优点，并且对失眠的疗效也被国内外不少研究证实，但线上 CBT-I 对失眠共病情绪问题的疗效研究较少。因此本研究旨在将失眠障碍及其合并的焦虑抑郁症状作为一个整体考虑，针对慢性失眠合并抑郁和/或焦虑症状的患者，开发出线上强化 CBT-I 疗法，探索其对失眠及其合并症状的可行性及长短期疗效。

方法 研究纳入 83 例慢性失眠障碍合并抑郁和/或焦虑症状的患者，按照 1：2 随机分配至线上心理教育对照组和线上强化 CBT-I 干预组，在基线、干预后 35 天和 6 个月评估 PSQI, HAMA, HAMD, ISI 和 DBAS 量表。

结果 干预组治疗前后 PSQI 得分（15.2 vs 8.8, p=0.007）、ISI 总分（19.7 vs 12.5, p=0.001）、 睡眠潜伏期（97.1 vs 32.8, p<0.001）均显著下降（P＜0.01），睡眠效率（61.5% vs 78.7%, p=0.002）、睡眠时长（5.1 vs 6.3, p=0.002）、DBAS 总分（34.6 vs 43.2, p<0.001）显著增加，且 6 个月后改善效果仍显著。而对照组 6 个月后睡眠效率、睡眠潜伏期及睡眠信念改善均不显著。此外，干预组治疗后的 PSQI（41.4% vs 21.8%, p=0.002），HAMD（47.7% vs 26.33%, p=0.016）及 HAMA 减分率

（51.0% vs 32.8%, p<0.001）均显著高于对照组，且 6 个月后仍显著。

结论 线上强化 CBT-I 治疗可以有效改善共病患者的失眠及情绪状况，且有着持续作用，这一标准化和规范化的程序提供了稳定的治疗质量，为失眠共病抑郁和/或焦虑问题的患者提供了便捷有效的治疗。

不同亚型的焦虑障碍患者述情困难水平比较

苏珊珊 蒋文晖 王书婷 徐觅真 王振 徐一峰 仇剑崟*

上海市精神卫生中心

目的 述情障碍是多种精神障碍和心身疾病的发病高危因素，可能会影响到患者的治疗疗效。焦虑障碍分为不同亚型，本研究目的是探究首发未用药的不同亚型焦虑障碍患者的述情困难水平有无差异。

方法 在精神专科门诊收集符合ICD-11中焦虑障碍（包含广泛性焦虑障碍、惊恐障碍、社交焦虑障碍、场所恐惧症、特定恐惧症、分离性障碍、选择性缄默症等）诊断标准的患者，要求首发、未用药，对符合入组标准的患者在用药前进行基线评估，包含人口统计学资料收集，汉密尔顿焦虑量表（HAMA）及多伦多述情障碍量表（TAS-20）评估。

结果 我们在门诊共收集到471例焦虑障碍患者，294 例广泛性焦虑障碍、110 例惊恐障碍、49 例社交焦虑障碍、12 例场所恐惧症、6 例特定恐惧症。受试者平均年龄为 34 岁，平均受教育年限为 15 年；入组受试者以女性为主，64.17%为女性，35.83%为男性；51.47%为未婚，43.32%为已婚。研究发现不同的焦虑障碍亚型述情障碍量表得分差异不显著。

结论 焦虑障碍女性患病率高于男性，精神专科门诊最常见的焦虑障碍亚型是广泛性焦虑障碍。不同亚型的焦虑障碍患者均存在一定的述情困难且程度上无明显差异。

关键字：焦虑障碍，不同亚型，述情困难

Characteristics and Economic Burden of Patients with Somatoform Disorders in Chinese General Hospitals: A Multicenter Cross-sectional Study

杨祥云 王鹏翀 杨丽娟 李占江*

首都医科大学附属北京安定医院

Objective This study aimed to early screen patients with SFD when they visited general hospitals using a new Chinese questionnaire and explore the characteristics and economic burden of these patients.

Methods Patients (n=1497) from the outpatient department of neurology, cardiology and gastroenterology of three large general hospitals were included. Participants were screened using a newly developed questionnaire, the Self-screening Questionnaire for Somatic Symptoms (SQSS), to identify the patients with SFD (total SQSS score ≥ 29 points). We compared the demographics and clinical information of patients with and without SFD. Logistic regression was used to explore potential factors related to medical expenses, visits to doctors and sick leave days taken.

Results The frequency of detection of patients with SFD was 17.03%. There were significant differences in employment, doctor visits, symptom duration, medical expenses, sick leave days, PHQ-15 scores, and PHQ-9 scores between patients with SFD and without SFD. General non-specific somatic symptoms were frequently present in patients with SFD. Several potential factors were associated with higher medical expenses, repeated doctor visits, and sick leave days taken in the regression analysis.

Conclusion The findings indicate that patients with SFD are common in general hospitals, and their direct and indirect economic burden is higher than that of non-SFD patients, which indicates that more screening effort should be made to this group to early identify their problems. Certain characteristics were identified among patients with SFD and several factors were associated with negative consequences of SFD, all of which might be prevented by developing a preventive intervention program to reduce the economic burden of the patients.

A Projection From Ventral Hippocampus To Basolateral Amygdala Is Involved in The Destabilization of Remote Fear Memory

韩盈[1] 时杰[1] 陆林[1,2]
1.北京大学中国药物依赖性研究所
2.北京大学第六医院

Objective Fear response often occurs after reactivation of fear memories by exposure to unconditioned stimulus (UCS) or fear-associated conditioned stimuli (CSs). Fear memories that were reactivated by fear-associated CSs undergo reconsolidation and interfering with this reconsolidation inhibit subsequent fear response. Our previous study demonstrated the efficacy of a novel UCS-based memory reconsolidation interference procedure for inhibiting nicotine craving induced by exposure to diverse nicotine-associated CSs and nicotine itself. In present study we intend to investigate the neural circuits underlying the destabilization after UCS-based retrieval.

Methods Brain activity was assessed by c-fos immunofluorescence after CS or UCS retrieval 1 d or 14 d after fear conditioning. Designer receptors exclusively activated by designer drugs (DREADDs), neural circuit tracing, fiber photometry and pharmacological interventions were used to explore the involvement of ventral hippocampus (vHipp) and basolateral amygdala (BLA) in the reconsolidation of recent and remote fear memory.

Results We found that CS and UCS retrieval induce different patterns of brain region activation and this pattern change with time. Both CS and UCS retrieval 1 d after learning induced the activation of prelimbic cortex (PrL), dorsal hippocampus and BLA. Fourteen days after conditioning, CS retrieval activated PrL and infralimbic cortex, while UCS retrieval activated PrL, vHipp, BLA and central amygdala. The projection from vHipp to BLA was also selectively activated by UCS retrieval. Propranolol microinjections into the BLA or anisomycin microinjections into the vHipp disrupted the UCS retrieval-mediated reconsolidation of remote fear memory, and this memory impairment effects persisted for at least two weeks with no recovery after reminder shock. Moreover, inactivation of vHipp, but not PrL projections to BLA by DREADDs after UCS retrieval impaired remote fear memory.

Conclusion Our results suggest that a projection from ventral hippocampus to basolateral amygdala may be involved in UCS retrieval-induced reconsolidation of remote fear memory.

关键字：UCS retrieval; fear memory; reconsolidation; vHipp; BLA

基于多模态数据和深度学习的焦虑障碍多亚型辅助诊断分型

高远[1] 倪华庆[1] 汤一彬[1] 王晓彤[1] 王纯[2]
1.河海大学信息科学与工程学院
2.南京医科大学附属脑科医院

目的 本研究旨在采用深度学习方法，根据低频振幅（ALFF）、局部一致性（ReHo）以及脑灰质体积（VBM）的多模态数据提取脑网络信号并建模，对焦虑障碍（AD）亚型患者进行分类，同时发现与疾病相关的生物标志物。

方法 招募符合DSM-5诊断标准的广泛性焦虑症（GAD）患者48名、惊恐障碍（PD）患者51名、社交焦虑障碍（SAD）患者25名、特定恐惧症（SP）患者55名以及健康对照组（HC）108名，被试样本共计287个。采集其静息态影像数据，计算ALFF、ReHo、VBM指标，获取连接梯度数据（Connectome Gradient Data）。随后，引入基于自编码网络的二元假设模型对数据进行AD和HC的分型。若测试数据标签被预测为AD，则该测试数据进入AD亚型多元假设模型的分类框架，进行亚类的区分。随后，我们在高准确率的亚型分类基础上，采用多元方差分析进行了亚类间显著生物标志物提取。具体而言，对三个多模态数据为线索，构建脑区间的相关性矩阵，生成连接梯度数据。同时，对该数据采用现有基于自编码网络的二分假设分类方法进行AD患者与HC分类。在亚型分类框架中，则采用多元假设模型对其分类，即对测试数据标签分别做四种亚型（GAD、PD、SAD、SP）假设。在不同假设下，将训练数据和测试数据一起作用于基于多分类的特征选择方法（如基于多分类的支持向量机—特征消除方法，multi-class SVM-RFE），挑选出训练数据的典型脑梯度特征，随后送入自编码网络提取高级特征。最后，根据不同假设所提取高级特征进行亚型分类。提取生物标志物时，我们聚焦于亚型分类正确假设下提取的连接梯度数据所对应的脑区，并基于多模态数据进行多元方差分析，得到与疾病相关的显著脑区，以此作为生物标志物。

结果 在留一法（LOOCV）测试中，该深度学习框架对 AD 亚型分类的准确率为 97.9%，实现了高准确率的亚型分类目标。提取的显著生物标志物则集中于有限个脑区，包括眶部额下回、额中回、脑岛、杏仁核、楔前叶等。这些脑区都与情绪控制、奖惩机制存在强相关性，并与现有 AD 及其亚型的脑区发病机制有较好的印证关系。

结论 研究表明，采用多模态数据和深度学习方法可高精度地对 AD 亚型进行分类，并能提取辨别性脑区作为生物标志。其有助于深入理解 AD 亚型间差异，并为个体化治疗提供指导。

Transcriptome-neuroimaging Correlation Analysis Reveals Genes and Biological Processes Associated with Cortical Thickness in Obsessive-compulsive Disorder

章达 胡晓* 关承斌*
南京脑科医院

Objective Obsessive-compulsive disorder (OCD) is a debilitating psychiatric condition characterized by enduring and intrusive thoughts and repetitive compulsions. Previous studies have reported modifications in the thickness of the cerebral cortex in individuals with OCD. The objective of this study is to investigate the patterns of cortical thickness alterations in patients with OCD and elucidate the potential biological mechanisms underlying these changes.

Methods We conducted an analysis of cortical abnormalities in adults with OCD using data from the ENIGMA Obsessive-Compulsive Disorder Working Group. The study encompassed a total of 1488 patients diagnosed with OCD and 1436 healthy controls derived from the ENIGMA dataset. Furthermore, we performed validation utilizing an independent sample consisting of 45 OCD patients and 40 controls. Cortical thickness disparities between the OCD patients and healthy controls were examined, with a specific emphasis on identified cerebral regions. To gain insight into the biological mechanisms underpinning the observed cortical thickness differences, a functional enrichment analysis was conducted. This analysis entailed identifying biological processes, molecular functions, and cellular components associated with the differentially expressed genes within the regions exhibiting modified cortical thickness.

Results The analysis unveiled significant disparities in cortical thickness in specific cerebral regions of OCD patients compared to healthy controls. Specifically, noteworthy alterations were observed in the inferior parietal cortex bilaterally. The functional enrichment analysis of the differentially expressed genes within these regions highlighted substantial enrichment in various biological processes, including the aspartate family amino acid metabolic process, long-chain fatty acid metabolic process, and purine ribonucleotide metabolic process. Additionally, there was enrichment in molecular functions related to ATPase activity coupled with transmembrane movement of substances, as well as enrichment in cellular components such as the peroxisomal part and dynactin complex.

Conclusion Our findings provide compelling evidence for modifications in cortical thickness in the superior and inferior parietal cortices of individuals with OCD, indicating the involvement of these specific cerebral regions in the pathophysiology of OCD. The functional enrichment analysis suggests that dysregulation of biological processes related to metabolism and cellular functions, particularly involving peroxisomal and dynactin complex components, may contribute to the pathology of OCD. These results contribute to a deeper comprehension of the neurobiological basis of OCD and may have implications for the development of targeted therapeutic interventions for this psychiatric disorder.

Depression and Anxiety Symptoms Associated with Internet Addiction and Non-suicidal Self-injury in Chinese Adolescent Students - A Network Analysis

马墨涵 肖楚曼 欧雯雯 杨雨萌 陈雅菲 柯纯溪 柳进 刘帮杉 李云静 杨思齐 陆怡梅 李亮 吕冠仪 赵小天 覃雅琦 黎晓澍 鞠玉朦 张燕*
中南大学湘雅二医院

Objective Non-suicidal self-injury (NSSI) and Internet addiction (IA) are adolescent maladaptive behaviors that are receiving increasing attention and exerting a significant impact on both adolescent development and public health, and depressive and anxiety symptoms are two of the most associated risk factors of NSSI and IA. This study aimed to use network analysis to explore the association and causal relationships between NSSI, IA, and depression-anxiety symptoms.

Methods A total of 1799 adolescents aged 12-16 completed self-report questionnaires. We conducted a conditional dependence test on NSSI and IA controlling for depression and anxiety, and constructed a partial correlation network and a direct acyclic graph incorporating NSSI, IA, nine depressive symptoms (from PHQ-9), and seven anxiety symptoms (from GAD-7).

Results Results suggested that there was no significant correlation between NSSI and IA after controlling for depression ($P = 0.25$) and anxiety ($P = 0.14$) symptoms. IA was mainly associated with Anxiety symptoms, and NSSI was associated with both anxiety and depressive symptoms. Suicidal ideation and afraid were causally related to NSSI, and restlessness was causally related to IA.

Conclusion This study suggests that NSSI and IA are conditionally independent of depression and anxiety. Specific symptoms including suicidal ideation, afraid, and restlessness are the key intervention targets of NSSI and IA

behaviors.

强迫症患者在模糊情景下决策行为的脑网络研究

贾云涵 谢民耀 袁方正 汪晋仪 黄彦源 欧阳梦媛 丁晖 柳娜* 张宁
南京脑科医院

目的 强迫症是以闯入性、反复出现的想法和行为为主要临床表现的慢性精神疾病，其患者通常表现出执行功能的障碍。目前对强迫症执行功能的研究表明，强迫症有抑制控制缺陷（即冲动特质）、决策缺陷以及强化学习能力失调的特点，但三者之间的关系尚不明确，其神经影像机制仍需探讨。

方法 本研究纳入 25 名强迫症患者（OCD 组）与 27 名性别、年龄和受教育年限均匹配的健康志愿者（HC 组）作为研究对象，使用 Y-BOCS、BIS-11、BAI 和 BDI 量表进行临床信息评估，使用爱荷华博弈任务(IGT)进行决策功能评估，使用 fMRI 和独立成分分析(ICA)进行神经影响机制的评估。

结果 OCD 组和 HC 组在人口学信息上没有显著差异，但表现出注意冲动、Y-BOCS、BAI 和 BDI 得分的差异。在 IGT 中，不同被试的在不同阶段的净得分有显著差异。OCD 组的净得分在第二阶段显著低于第四阶段，HC 组的第一阶段的净得分显著低于第三阶段、第五阶段的净得分。为避免概率因素的影响，本研究进一步探究了被试在选项选择之间的差异，相比 HC 组，OCD 组的被试更偏向不利选项，OCD 组在五个阶段中的选项没有显著变化，而 HC 组随着实验阶段的进行，选择有利选项的次数显著升高。其次， ICA 结果显示，相比 HC 组，OCD 组的默认模式网络（DMN）内部和 DMN 与额顶网络（FPN）之间的功能连接更弱；网络内比较显示视觉网络内成分和躯体运动网络内成分功能连接在 HC 组中均显著强于 OCD 组。最后，DMN 内部功能连接与选项计分正相关(r=0.29)，与 Y-BOCS (r=?0.43)、BAI (r=?0.31)、BDI 得分(r=?0.33)负相关；DMN 与 FPN 功能连接与选项计分正相关(r=0.51)，与 Y-BOCS (r=?0.41)、BDI 得分 (r=?0.30)负相关。同时，Y-BOCS、DMN 与 FPN 功能连接以及 IGT 选项计分存在显著中介效应，其中 Y-BOCS 分数为自变量，选项计分为因变量，DMN 与 FPN 的功能连接为中介变量。

结论 强迫症患者存在一定程度的冲动特质，主要表现为注意冲动；强迫症患者模糊情景下的决策存在缺陷，不能从负面的失败反馈中获得经验进行调整，是强化学习功能的失调；强迫症患者的 DMN 内部功能连接以及 DMN 和 FPN 功能连接异常，可能与强迫症强化学习功能的失调有关。

生活事件对青少年焦虑的影响：自我和谐和社会支持的链式中介作用

黄薛冰* 王玉璐 岳晶丽
北京大学第六医院，北京大学精神卫生研究所，国家卫生健康委员会精神卫生学重点实验室（北京大学），国家精神心理疾病临床医学研究中心（北京大学第六医院）

目的 我国青少年的焦虑障碍发病率为 15~25%，青少年处于心理发育、社会发展的关键时期，面对多重压力，关注青少年的心理健康尤为重要。研究发现，生活事件与焦虑之间并不是简单的线性关系，往往受到个体心理特质和外界环境的影响。本研究旨在探究青少年生活事件、自我和谐、社会支持与焦虑的关系，试图揭示自我和谐及社会支持在青少年生活事件和焦虑之间的作用机制。

方法 本研究采用青少年生活事件量表（Adolescent Self-Rating Life Events Check List，ASLEC）、自我和谐量表(Self Consistency and Congruence，SCCS)、社会支持量表(Social Support Rate Scale，SSRS)和广泛性焦虑障碍量表（Generalized Anxiety Disorder，GAD-7）对青少年进行横断面调查，采用 SPSS20.0 及 Mplus7.0 进行数据统计。

结果 本研究共纳入 570 名青少年，青少年生活事件与自我和谐、焦虑显著正相关（r＝0.359， r＝0.286，均 p＜0.01），与社会支持显著负相关（r＝-0.243， p＜0.01）；自我和谐与社会支持显著负相关（r＝-0.434，p＜0.01），与焦虑显著正相关（r＝0.433，p＜0.01）；社会支持与焦虑显著负相关（r＝-0.299，p＜0.01）。生活事件对焦虑影响的中介效应主要通过三种途径实现，即生活事件→自我和谐→焦虑；生活事件→社会支持→焦虑以及生活事件→自我和谐→社会支持→焦虑，三种途径的中介效应占比分别为 39.328%、4.442%和 6.176%，效应量分别为 0.0363、0.0041 和 0.0057。

结论 生活事件不仅直接影响青少年焦虑，还通过自我和谐和社会支持的链式中介作用间接影响青少年焦虑。可以通过改善自我和谐、增强社会支持来降低青少年的焦虑，促进青少年的心理健康。

Center for Mental Disorders, and National Center for Mental Disorders, The Second Xiangya Hospital of Central South University, Changsha 410011, Hunan, China.
2.Department of Radiology, The Second Xiangya Hospital of Central South University, Changsha, Hunan 410011, China.
3.Department of Radiology, Tianjin Medical University General Hospital, Tianjin, China.
4.Department of Psychiatry, The Third People's Hospital of Foshan, Foshan 528000, Guangdong, China.
5.Department of Psychiatry, Qiqihar Medical University, Qiqihar, Heilongjiang 161006, China.

Objective The role of cerebellar-cerebral functional connectivity (FC) in obsessive-compulsive disorder (OCD) and its trajectory after pharmacotherapy, as well as its potential as a prognostic biomarker, are unclear.

Methods This study involved 37 drug-naive patients with OCD and 37 healthy controls (HCs). All participants underwent a functional magnetic resonance imaging (fMRI) scan at baseline. Subsequently, OCD patients received paroxetine treatment for four weeks and underwent another scan after treatment. Seed-based FC analyses were performed to examine differences in cerebellar-cerebral FC between patients with OCD and HCs, and between patients with OCD before and after treatment. Support vector regression (SVR) was performed to predict treatment response. Correlation analysis was used to explore the association between cerebellar-cerebral FC and clinical data.

Results Compared to HCs, patients with OCD exhibited reduced cerebellar-cerebral FC in executive, affective-limbic, and sensorimotor networks. Following treatment, patients showed partial clinical improvement and partial restoration of the previously decreased cerebellar-cerebral FCs. Abnormal cerebellar-cerebral FC at baseline was negatively correlated with the severity of compulsions ($r = -0.472$, $p = 0.004$) and social functional impairment ($r = -0.494$, $p = 0.002$). Changes in cerebellar-cerebral FC were linked to changes in cognitive function ($r = -0.440$, $p = 0.024$). SVR analyses based on abnormal cerebellar-cerebral FC showed significant correlations between predicted and actual treatment response ($p < 0.001$).

Conclusion Our findings suggest that cerebellar-cerebral FC plays a crucial role in the neuropsychological mechanisms underlying OCD and its pharmacological treatment. Furthermore, cerebellar-cerebral FC could serve as a potential prognostic biomarker for OCD.

坦度螺酮 不同剂量治疗广泛性焦虑障碍对代谢指标的影响：一项多中心 RCT 的事后分析

宇淑涵 邵春红* 诸索宇 王志阳
复旦大学附属华山医院

目的 探究坦度螺酮常规剂量（30 mg/d）和强化剂量（60 mg/d）在治疗 GAD 患者过程中对体重、BMI、血糖的影响。

方法 本研究是一项多中心、随机、平行对照临床试验（的事后分析。患者通过中心分层、区组随机化方法、1:1 比例进入常规治疗组（30 mg 组）和强化治疗组（60 mg 组）。患者在基线、第 1、2、4、6 周末接受访视，期间检测了患者的体重、BMI；在基线及治疗第 6 周末对患者的空腹血糖也进行检测。

结果 60 mg 组的基线体重高于 30 mg 组，两组在 BM、空腹血糖基线水平均无显著差异。治疗的 6w，60 mg 组的体重始终高于 30 mg 组（all $P > 0.05$），与基线特征保持一致。两组相较基线的体重改变量在各个随访时间点上均是轻微的，在第六周时 60 mg 组，与 30 mg 组没有显著性差异（$P = 0.903$）。以基线值作为协变量分析显示，60 mg 组与 30 mg 组的体重变化值在各时间点仍无显著差异；60 mg 组在治疗的第二周开始，BMI 水平低于 30 mg 组（$P<0.05$），两组在各个时间点较基线的 BMI 变化量均较轻微，且组间无显著差异（all $P > 0.05$); 60 mg 与 30 mg 组的空腹血糖无显著差异（ $P = 0.106$），与基线特征保持一致。

结论 坦度螺酮 60mg 与 30mg 短期治疗 GAD 患者时，对于体重、BMI、空腹血糖无显著影响，且高剂量并未增加体重或 BMI 上升或空腹血糖受损的风险。

关键字：广泛性焦虑障碍；坦度螺酮；体重；血糖；BMI

Association of Polymorphisms in Hypocretin (Orexin) Receptor 1 and Plasma Hypocretin: Treatment Response Prediction in Major Depressive Depression

黄满丽[1,2] 金康裕[1,2] 周瑞[3] 陈冰[1,2] 王政[1,2] 路静[1,2]
1.浙江大学医学院附属第一医院精神卫生科
2.浙江省精神障碍诊疗和防治技术重点实验室
3.浙江大学医学院附属第二医院核医学科、医学 PET 中心

Objective Genetic antecedents to depression may also contribute to biological involvement in its origin, devolution and clinical response. Hypocretins (orexins), excitatory neuropeptides generated within the hypothalamic region, regulate sleep, wakefulness, feeding behavior and energy metabolism. Clinical and preclinical studies suggested a potential link between hypocretin and depression.

Methods We divided major depressive disorder (MDD) patients into two groups according to the plasma hypocretin-1changes after 8-week escitalopram treatment: Hypocretin Increase group (Hypocretin-Inc) and Hypocretin Decrease (Hypocretin-Dec) group. Briefly, first, we explored changes in peripheral hypocretin-1 levels in patients with MDD before and after antidepressant treatment. Second, cognitive function and hypocretin-related SNPs were measured, leading to a more in-depth understanding of the pathogenesis of MDD. Third, we established the model by icv hypocretin-1 into the lateral ven-

tricle and observed the effect of hypocretin-1 on the metabolism of different brain regions using micoPET-CT. Finally, we attempted to elucidate the mechanism of its role in cerebral glucose metabolism.

Results Hypocretin-Dec groups showed better HAMD, HAMA, and cognitive function than the Hypocretin-Inc group. hypocretin or CUMS, Suvorexant (dual hypocretin receptor antagonist) could reverse the changeover the depression, anxiety and cognitive repairment from CUMS. And Hypocretin receptor 1(HCRTR1) single nucleotide polymorphism (rs2271933) differs between these two groups, indicating that HCRTR1 mutations underlie the etiology of clinical outcomes. Plasma Hypocretin-1 was positively correlated with HAMD and HAMA scores, and negatively correlated with the overall composite score of MCCB and verbal learning. 18F-FDG uptake decreased in the hippocampus of intracerebroventricular injection (icv) of hypocretin which mimics the hippocampus' 18F-FDG uptake of CUMS rats. Glucose-related molecular mRNA changes after icv.

Conclusion The hypocretinergic system related to the clinical outcomes included changes in core symptom severity and cognitive functioning from pre- to post-treatment. HCRTR1 mutations underlie the etiology of depression and cognitive repairment, and the hypocretinergic system regulates glucose metabolism and participates in the pathogenesis of depression and cognition from depression. Changes in plasma hypocretin and HCRTR1 polymorphisms could be the predictor for the depressive clinical outcome and cognitive recovery. Selective Hypocretin receptor antagonism takes advantage of these properties to develop depression therapeutics.

Network Analysis Reveals Disrupted Functional Connectivity and Topology Properties in Panic Disorders

游林林* 孙太鹏 陈刚 徐微 江晨光 姜文颢* 袁勇贵*
东南大学附属中大医院

Objective Panic disorder (PD) is a common disabling condition characterized by recurrent and unexpected panic attacks, accompanied by anticipatory anxiety and fear avoidance. Neuroimaging studies have indicated that emotional and behavioral impairments correlated with anxiety disorder are correlated with abnormalities of functional connectivity (FC) among brain regions and networks. However, we know little about the functional dysconnectivity including brain region nodes and modular brain networks, and the change of topological property brain networks in PD.

Methods We used the whole brain FC, modular networks, and graph-theory analysis to investigate an extensive network-level pathophysiological profile in PD patients. We collect functional MRI data from 82 PD and 97 healthy controls (HCs). Intrinsic FC between each pair of 160 regions, 6 intro- network and 15 inter networks were analyzed to distinguish patients from controls. We then explored the global and local properties of networks.

Results The whole brain FC analysis revealed several abnormal connectivity profiles including frontolimbic (frontal cortex, and insula), sensory and perceptual processing areas (occipital and posterior cingulate cortices (PCC)), and cerebellum. PD patients had lower FC of intra- insula, and other FC (frontal cortex-PCC, frontal cortex- cerebellum, and PCC-occipital cortex) were higher than HCs. PD subjects were characterized by 3 connectomic feature (within sensorimotor network (SMN), SMN and occipital network (OCN), OCN-cerebellum) of lower connectivity in modular network compared to HCs. At the global perspective, decreased small-worldness, global efficiency (Eg), normalized clustering coefficient, and increased characteristic path length (Lp) were detected in PD patients using graph-theory analysis. Moreover, positive correlations were found between the AUC of Lp and anxiety symptoms severity. At the local perspective, our findings revealed lower nodal efficiency (Ne) in the right mid insula, and both the AUC of Ne in insula and the FC of intra- insula were negatively associated with PD symptoms.

Conclusion Our findings emphasize the disorganization of topological among functional brain network and the important role of the insula, which provides new information and perspective for exploring the neural physiopathology in PD patients.

Efficacy and Safety of Transcranial Direct Current Stimulation (tDCS) on Cognitive Function in Chronic Schizophrenia with Tardive Dyskinesia (TD): A Randomized, Double-blind, Sham-controlled, Clinical Trial

周玥[1,2] 杜向东[1]
1.苏州市广济医院
2.徐州医科大学

Objective Previous studies have shown that transcranial direct current stimulation(tDCS) led to an improvement of cognitive function in patinets with schizophrenia, but rare study has explored the effect of tDCS on long-term hospitalized chronic schizophrenia with tardive dyskinesia(TD). The present research explored if cognitive function in patients with long-term hospitalized chronic schizophrenia with TD could be improved through tDCS.

Methods This study is a randomized, double-blind, sham-controlled clinical trial. Of the 52 patients, 14 dropped out and 38 completed the experiment. Thirty-eight patients on stable treatment regimens were randomly assigned to receive active tDCS(n=21) or sham stimulation(n=17) on weekdays of the first, third, and fifth weeks of treatment. Patients performed the Pattern Recognition Memory(PRM) and the Intra/Extradimensional Set Shift (IED) from the Cambridge Neuropsychological Test Automated Battery at baseline, at the 3-week of tDCS treatment

(week3), and the end of tDCS treatment (week5). Clinical symptoms were also measured at the baseline and the fifth week using the Scale for the Assessment of Negative Symptoms (SANS) and the Positive and Negative Syndrome Scale (PANSS).Side effects of tDCS were assessed with an experimenter-administered open-ended questionnaire during the whole experiment.

Results There were no significant differences in PRM and IED performance metrics, SANS total score and PANSS total score between active and sham tDCS groups at the end of the 5-wk treatment period (all P > 0.05).Furthermore, it was significant difference in the adverse effects of the tingling sensation between the two groups (P<0.05), but there was no significant difference in other side effects (P>0.05).

Conclusion According to these findings, there is no evidence in support of the use of anodal stimulationover the left dorsolateral prefrontal cortex an approach for improving cognitive function in patients with long-term hospitalized chronic schizophrenia with TD.

农村地区首诊阿尔茨海默症的治疗情况分析

赵岩* 赵俊来
河南省尉氏县蔡庄镇瑶台精神病防治所

目的 随着人口老龄化的加剧，老年痴呆症在社会中受到广泛关注。然而，农村地区的阿尔茨海默症识别率和重视率仍然偏低。本研究旨在通过分析农村地区阿尔茨海默症首次治疗情况，了解农村地区群众对阿尔茨海默症的认识，为社会健康教育和社区防治提供依据。

方法 本研究选取了 2021 年 5 月至 2023 年 5 月期间在我诊所门诊诊断为阿尔茨海默症的56位首发首治患者作为研究对象。通过医疗记录和病历资料，收集患者的首诊症状和首次治疗时间等相关信息。使用统计方法对收集到的数据进行分析，计算首诊症状的比例，并对农村地区老年痴呆症首次治疗时间进行描述性统计。

结果 本研究分析了56位农村地区阿尔茨海默症首发首治患者的数据。结果显示，45%的患者首诊症状为精神症状，表现为行为异常、情绪波动,、幻觉、妄想等；38%的患者首诊症状为记忆力减退，表现为遗忘、迷失方向等。而其他症状，如运动障碍、语言障碍等的比例较低。

结论 在农村地区的阿尔茨海默症患者中，精神症状是首诊症状的主要类型，其次是记忆力减退。这可能与农村地区的社会文化背景、缺乏对该疾病的了解和认识和医疗资源有限有关。为了改善农村地区老年痴呆症的识别和治疗情况，需要加强对农村地区阿尔茨海默症的宣传，提高群众对老年痴呆症的认识和重视程度，以便早期诊断和治疗。

知情者报告的认知下降可预测主观认知下降（SCD）的纵向转归：一项 7 年的随访研究

刘园园 李伟 苏宁 洪波 肖世富* 岳玲*
上海市精神卫生中心

目的 通过 7 年的随访队列研究来确定知情者报告的记忆衰退(IMD)在主观认知下降(SCD)老年人中的纵向预测价值。

方法 90 例 SCD 纳入研究。对基线的研究对象分为有知情者报告认知下降的 SCD（+ IMD）组和无知情者报告认知下降的 SCD（-MID）组。然后，进行 7 年认知随访，并诊断，使用 Logit 回归模型来确定基线知情者报告的认知下降是否可以预测 7 年随访的结果(稳定或进展)。

结果 37 例 SCD 受试者存在知情者报告的认知下降。在基线时，+IMD 组比 -IMD 组表现出更多的抑郁症状(p＝0.016)。在控制年龄，性别，教育年限和

抑郁状态后，+ IMD 组的认知功能，如北京版蒙特利尔认知评估(MoCA) ，数字广度前瞻测试(DST-F) ，视觉匹配和推理(VMR)和韦氏成人智力量表-图片完成(WAIS-PC)评分显着低于-IMD 组。在 7 年的随访中，54.0% (20/37)的 + IMD 参与者转为轻度认知障碍或痴呆，22.6% (12/53)的-IMD 参与者转为 MCI。在控制基线抑郁状态和认知功能后，+ IMD 组的简易精神状态检查(MMSE)、 MoCA 和言语流畅性(VFT)的随访评分显著低于-IMD 组。此外，在控制年龄，性别，教育年限，血管风险因素及基线 30 项老年抑郁量表(GDS-30)和认知测试评分后，+IMD 组的 MMSE、听觉词汇学习测验(AVLT)延迟回忆项目的下降幅度更大(OR = 3.361,95%置信区间[CI]1.138-9.925，p = 0.028)，+ IMD 组更有可能在 7 年的随访中进展为认知障碍。

结论 + IMD 组的参与者认知能力较差，未来更有可能转变为认知障碍。我们的长期随访研究证实了知情者对 SCD 认知变化的重要性，这可以帮助临床医生重视知情者报告，识别随着时间的推移有认知衰退风险的个体。

阿尔茨海默病和轻度认知功能障碍血浆 pNFL、P-tau181 及视网膜变化相关研究

何晓雪 姜红燕* 李燕 刘芮君 李葆罗 沈宗霖
昆明医科大学第一附属医院

目的 阿尔茨海默病(Alzheimer Disease , AD)早期诊断、治疗十分困难。血浆标记物检测技术的提高使得其成为辅助诊断 AD 的一种方便、可靠的手段。神经丝轻链 （NFL）与磷酸化 Tau 181 蛋白（P-tau181）是有潜力生物标志物。AD 大脑病理改变可以通过视网膜体现，成为一种新的生物标志物。本文旨在研究轻度认知功能障碍（MCI）、 AD 和正常对照组间血浆 pNFL 水平、P-tau181 水平及视网膜厚度、血管密度的差异，探索血浆标记物检测结合眼底检查能否更加准确的协助诊断。

方法 本研究为病例对照研究。自昆明医科大学第一附属医院精神科门诊、住院部收集 MCI 和 AD 患者，正常对照组来自社区。采用简明精神状态检查量表、蒙特利尔认知评估量表评估认知水平。采用 Simoa 方法检测 pNFL、P-tau181 水平；眼底检查：光学相关断层扫描及光学相关断层扫描血管成像。受试者分为三组，轻度认知功能障碍组、阿尔茨海默组、正常对照组。比较三组的血液标记物水平、认知功能、视网膜厚度、血管密度的差异。统计使用 SPSS 25.0。采用卡方检验、单因素 ANOVA、K 个独立样本 T 检验，ROC 曲线评价各种检查诊断 AD 的准确性。

结果 共收集 143 例受试者，MCI44 例、AD55 例、对照 44 例。血浆检测分析结果：MCI 组 pNFL 水平较正常对照组高，MCI、AD 组无显著差异。MCI 组 P-tau181 水平较正常对照组高，AD 组较 MCI 组高；pNFL（AUC=0.712）、P-tau181（AUC=0.763）水平均可协助诊断 AD，二者联合眼底检查更加准确（AUC=0.784），联合认知量表、眼底检查更加精准（AUC=0.983）。

结论 P-tau181 水平升高可以区分 MCI 与 AD。pNFL 水平及 P-tau181 水平变化是认知功能下降的独立危险因素。pNFL、P-tau181 水平联合眼底视网膜厚度协助诊断 AD 更加精准。

脑脊液 β 淀粉样蛋白 42 和 NLRP3 与麻痹性痴呆患者认知功能障碍、精神行为症状及预后的相关性分析

曹媛媛[1] 黄剑[2] 石川[2]
1.昌平区北郊医院
2.北京大学第六医院

目的 分析脑脊液 β 淀粉样蛋白 42（Aβ-42）和核苷酸结合寡聚结构样受体蛋白 3（NLRP3）与麻痹性痴呆（GPI）患者认知功能障碍、精神行为症状及预后的相关性。

方法 选取 2020 年 1 月-2021 年 9 月本院收治的 78 例 GPI 患者为研究对象（研究组），另选取同时期本院收治的 58 例手术行腰椎麻醉的非神经系统疾病患者为对照组。检测两组患者脑脊液 Aβ-42、NLRP3 水平，同时分别采用蒙特利尔认知检查量表（MoCA）、神经精神量表问卷（NPI）评估两组患者认知功能与精神行为症状。采用 Person 相关性分析分析脑脊液 Aβ-42、NLRP3 水平与 MoCA、NPI 水平的相关性。

结果 研究组脑脊液 Aβ-42 水平低于对照组（P<0.05），NLRP3 水平高于对照组（P<0.05）。研究组 MoCA 水平低于对照组（P<0.05），NPI 水平高于对照组（P<0.05）。Person 相关性分析显示，脑脊液 Aβ-42 水平与 MoCA 水平呈正相关（r=-0.583，P<0.05）；脑脊液 Aβ-42 水平与 NPI 水平呈负相关（r=0.562，P<0.05）；脑脊液 NLRP3 水平与 MoCA 水平呈负相关（r=-0.574，P<0.05）；脑脊液 NLRP3 水平与 NPI 水平呈正相关（r=0.557，P<0.05）。预后不良组患者反复多次驱梅治疗占比，脑脊液 NLRP3 水平、NPI 评分高于预后良好组（P<0.05）。预后不良组患者脑脊液 Aβ-42 水平、MoCA 评分低于预后良好组（P<0.05）。Logistic 回归分析显示，治疗情况、Aβ-42、NLRP3、MoCA、NPI 水平均是影响 GPI 患者预后不良的危险因素（P<0.05）。脑脊液 Aβ-42、NLRP3 单独及联合预测 GPI 患者预后不良的灵敏度分别为 84.12%、85.63%、90.35%，AUC 分别为 0.743、0.769、0.841，特异度分别为 66.72%、63.85%、62.48%。

结论 脑脊液 Aβ-42 与 NLRP3 水平在 GPI 患者体内表达异常，与 GPI 患者认知功能障碍、精神行为症状关系密切，可在一定程度上作为评估 GPI 患者预后的预测价值，且两者联合检测效能更高。

青少年和成年早期重性抑郁障碍患者脑白质完整性异常的比较研究

张曦 孔令韬*
中国医科大学附属第一医院

目的 重性抑郁障碍（Major Depressive Disorder，MDD）是以心境低落、兴趣减退、快感缺失为核心症状的一种重性精神疾病，大多数 MDD 患者在青少年和成年早期首次发病。本研究使用脑磁共振弥散张量成像技术结合临床心理测评数据，进行青少年和成年早期 MDD 患者大脑白质完整性差异的比较和研究，探索研究青少年和成年早期 MDD 患者大脑白质异常改变的相同点和差异，寻找可能存在的青少年重性抑郁障碍脑白质改变特异性标志。

方法 本研究纳入年龄为 13-24 岁的 168 名研究对象，其中 13-17 岁的青少年 MDD 患者（adolescent MDD，adMDD）44 名，与之匹配的青少年健康对照（adolescent Healthy control，adHC）37 名；18-24 岁的成年早期 MDD（early adult MDD，eaMDD）患者 46 名与之匹配的成年早期健康对照（eaHC）41 名。采集人口学资料、使用儿童与青少年精神障碍半定式诊断检查手册（K-SADS-PL）确定 adMDD 组诊断，结构式临床会谈(SCID)确定 eaMDD 组诊断。研究对象通过汉密尔顿抑郁量表、汉密尔顿焦虑量表量化临床症状。进行磁共振扫描以获得脑白质完整性影像数据，指标使用各向异性分数（FA）。扫描完成后对研究对象进行至少三个月的电话随访。对收集到的人口学资料和临床症状测评结果进行统计分析，对白质脑影像进行预处理，对影像进行统计分析，进行 GRF 校正，定位存在统计学差异的脑簇，对差异脑簇进行白质脑区定位，对差异的脑区进行提值，提取的 FA 值参与之后的相关分析。对异常脑区提取的 FA 值和临床症状评分以年龄、性别作为控制变量进行偏相关分析。

结果 1.与 adHC 相比，adMDD 在左侧外囊、左侧上纵束和左侧前放射冠白质 FA 值增加（P＜0.05）。2.与 eaHC 相比，eaMDD 全脑白质未发现 FA 值显著差异。3.偏相关分析显示 adMDD 患者的左侧外囊白质 FA 值与 HAMA 评分呈正相关关系（r=0.400，P=0.016）。

结论 1.青少年重性抑郁障碍患者在左侧外囊、左侧上纵束和左侧前放射冠白质完整性有显著异常改变。2.成年早期重性抑郁障碍患者脑白质完整性无显著异常变化。3.青少年重性抑郁障碍患者左侧外囊白质完整性的变化与焦虑症状的严重程度有关。4. 青少年和成年早期重性抑郁障碍患者存在不同的脑白质完整性改变。

关键字：重性抑郁障碍；白质完整性；神经影像学；焦虑症状；弥散张量成像。

基于 A/T(N)研究框架靶向 Aβ 和 tau 蛋白 PET 与阿尔茨海默病的诊断和鉴别

王烨 于恩彦*
浙江省肿瘤医院

阿尔茨海默病（Alzheimer’s disease，AD）是老年人最常见的神经退行性疾病,其主要病理是神经细胞外 β 淀粉样蛋白（amyloid β-protein, Aβ）沉积和细胞内 tau 蛋白的过度磷酸化。本文简要阐述 AD 与非 AD 的病理过程，并介绍目前已临床应用的 3 种靶向 Aβ（18F-flutemetamol、18F-florbetapir 和 18F-florbetaben）和 1 种靶向 tau 蛋白（18F-flortaucipir）的正电子发射计算机断层（positron emission tomography,PET）显影剂，以及与二代显影剂的比较，探讨按照 A/T(N)研究框架联合靶向 Aβ 和 tau 蛋白 PET 检测在 AD 中的诊断应用，以及与路易体痴呆(Dementia with lewy bodies, DLB)、额颞叶痴呆(Frontotemporal dementia, FTD)和帕金森病痴呆(Parkinson’s disease dementia, PDD)等常见神经退行性疾病的鉴别。认为联合开展靶向 Aβ 和 tau 蛋白 PET 检测有助于分析 AD 的病理机制，能够提高 AD 的诊断效率和准确性。

轻度认知障碍患者昼夜活动节律的静息态脑功能研究

杨铭枫 宁玉萍*
广州医科大学附属脑科医院

目的 轻度认知障碍（MCI）是正常衰老和痴呆的过渡状态，MCI 患者是罹患阿尔茨海默病（AD）的高风险人群，认知障碍具有高患病率、高致残率、高社会经济负担，低就诊率的特点，目前仍无根治的药物，防治的重点在于对危险因素的早识别、早干预以延缓或降低 MCI 向 AD 的转化。昼夜节律紊乱是 MCI 发生发展的高危因素，既往研究发现 MCI 及 AD 患者存在松果体（PG）的萎缩，动物模型中发现节律中枢（视交叉上核，SCN）的破坏，但其脑功能受损模式仍未知，探索 MCI 患者 SCN 及 PG 的静息态脑功能改变有助于理解昼夜节律紊乱与认知障碍的关系，为寻找诊疗靶点提供理论支持。

方法 纳入 31 名 MCI 及 35 名正常对照（NC），要求其连续 7 天佩戴腕表式体动仪、采集人口学及临床信息、完成神经心理评估及磁共振扫描。对比 MCI 与 NC 的静息态脑功能指标、采用相关及回归分析探索昼夜活动节律、认知功能、静息态脑功能之间的相关性。

结果 与 NC 相比，MCI 患者 SCN 及 PG 的功能连接（FC）发生改变，包括降低的 FC：左侧 SCN 与

前扣带回、双侧 SCN 与中央前回的 FC；升高的 FC：右侧 SCN 与后扣带回、海马、枕上回、枕中回的 FC 和 PG 与额中回、前扣带回、岛叶、额下回眶部的 FC。SCN 及 PG 的静息态脑功能与节律及认知功能相关，回归分析发现与节律平均值、视空间和语言功能关系最密切的是右侧 SCN 与海马的 FC；与节律的日间稳定性最密切的是右侧 SCN 与枕中回、中央前回的 FC；与节律的相对振幅最密切的是右侧 SCN 的分数低频振幅（fALFF）；与总体认知和执行功能最密切的是左侧 SCN 与前扣带回的 FC、与记忆力最密切的是左侧 SCN 与前扣带回的 FC、PG 的局部一致性（Reho）及其与额中回的 FC、与注意力最密切的是 PG 与额中回的 FC。

结论 MCI 患者 SCN、PG 静息态 FC 存在异常并与昼夜活动节律及认知功能相关，提示 SCN、PG 跨脑区的交互异常可能是 MCI 患者节律紊乱的脑功能基础。

轻度认知障碍患者决策反馈加工神经活动特征

张莽[1,2] 张莹[1,2,3] 王露菀[1,2] 王婧[1,2] 于欣[1,2] 王华丽[1,2]
1.北京大学第六医院（精神卫生研究所）
2.痴呆诊治转化医学研究北京市重点实验室
3.首都医科大学附属北京安定医院

目的 本研究旨在考察 MCI 患者组在风险决策和模糊决策时决策反馈加工过程相关的神经活动特征。

方法 纳入 19 名 MCI 患者和 20 名年龄、性别和教育水平相匹配的健康对照（Healthy control，HC）。所有受试者均采用计算机版神经心理测验（CNCB）评估神经认知功能，并采集了骰子游戏任务（Game of dice task，GDT）和爱荷华博弈任务（Iowa gambling task，IGT）下的脑电图（EEG）信号。通过分析任务态下奖赏正波（Reward positivity，RewP）评价反馈加工过程的动机特征，反馈 P3（Feedback-P3，fb-P3）评价认知资源分配特征，反应时评价信息处理速度，事件相关振荡（Event related oscillation，ERO）评价决策反馈后的信息整合和行为调节能力。

结果 在 GDT 任务中，MCI 组的 RewP（$p = 0.022$）和 fb-P3（$p = 0.045$）振幅低于 HC 组，反馈的幅度和效价调节 RewP（ $p = 0.008$；$p = 0.017$）和 fb-P3（$p < 0.001$；$p < 0.001$）的幅值。在 IGT 任务中，同样发现 MCI 组与 HC 组相比存在较低的 RewP 和 fb-P3 幅值（$p = 0.07$；$p = 0.010$），反馈幅度和效价调节 RewP 的幅值（$p = 0.002$；$p = 0.020$），RewP（$\Delta M = 1.95$?V, $p < 0.001$；$\Delta M = -1.04$?V, $p < 0.001$）和 fb-P3（$\Delta M = 2.33$?V, $p < 0.001$；$\Delta M = -2.52$?V, $p < 0.001$）效价效应在不同反馈幅度之间相反。此外，反应时结果表明 MCI 组比 HC 组需要更长的时间做出模糊决策（$p = 0.041$）。ERO 结果显示 MCI 组 delta 功率在两种决策任务中均低于 HC 组（GDT： $p = 0.045$；IGT：$p = 0.011$），而 theta 功率无组间差异（$p > 0.100$）。

结论 本研究发现 MCI 患者在风险决策和模糊决策的反馈评估阶段存在神经活动的减弱，提示其决策反馈加工过程可能存在动机、认知资源分配以及信息整合和行为调节能力的异常。

5.首都医科大学

Objective Working memory capacity (WMC) impairment is an early sign of Alzheimer's disease (AD), but the underlying mechanisms remain unclear. Clarifying how WMC is affected will help us better understand the pathological mechanism of AD.

Methods We used the olfactory working memory capacity (OWMC) paradigm to evaluate WMC in 3-month-old 5XFAD (an animal model of AD [TG]) mice. Immunofluorescence staining of the prefrontal cortex (PFC) was performed to detect the number of FOS-positive (FOS+) neurons, calmodulin-dependent protein kinase II-positive (CaMKII+) neurons, and glutamate decarboxylase-positive (GAD+) neurons in the prelimbic cortex (PrL) and infralimbic cortex (IL). A chemogenetic method was then used to modulate the inhibition and activation of excitatory neurons in the PrL of WT and 5XFAD mice and to measure the memory capacity of mice.

Results WMC was significantly diminished in 5XFAD mice compared to littermate WT mice. Neuronal activation of the PrL, but not the IL, was attenuated in 5XFAD mice performing the OWMC task. Subsequently, the FOS+ neurons were co-localized with both CaMKII+ neurons and GAD+ neurons. The results showed that the activation of excitatory neurons in the PrL was correlated with WMC in mice. Our results further demonstrate that the chemogenetic inhibition of PrL excitatory neurons resulted in reduced WMC in WT mice, while the chemogenetic activation of PrL excitatory neurons improved the WMC of 5XFAD mice.

Conclusion The diminished activation of PrL excitatory neurons in 5XFAD mice during task performance is associated with reduced WMC, and activation modulation of excitatory neurons by chemogenetic methods can improve memory capacity impairment in 5XFAD mice. These findings may provide a new direction for exploring AD therapeutic approaches.

Efficacy and Safety of Computerized Cognitive Training Added To SSRIs in Late-life Depression with Cognitive Impairment: A 12-Week, Randomized Controlled Study

汪晓 张庆娥*
北京安定医院

Objective This randomized, open-label study compared the therapeutic effects of computerized cognitive training (CCT) combined with Selective serotonin reuptake inhibitors (SSRIs) in late-life depression(LLD) patients with cognitive impairment.

Methods Study data were collected from May 5, 2021, to April 21, 2023. Outpatients who met diagnostic criteria for major depressive disorder according to DSM-V criteria that had a total score on the 17-item Hamilton Depression Rating Scale (HAMD-17) ≥ 18 and Montreal Cognitive Assessment scale (MOCA) < 0.001) in both groups, while MMRM analysis revealed a significantly greater reduction in cognitive function (ADAS-cog total score) from baseline to outcome in the CCT and SSRIs group compared to the SSRIs and blank control [(F (1,115) =13.65, least-squares mean difference [95% CI]: ?2.77 [?3.73, ?1.81], p<0.001)]. Depression symptom improvement on the HAMD-17 was greatest for the CCT and SSRIs group compared to the control group, and the difference was statistically significant. [MMRM, estimated mean difference (SE) between groups ?3.59 [?5.02, ?2.15], p < 0.001]. The baseline-to-week-8 least-squares mean change of the HAMA scores, NPI scores were greater in the CCT and SSRIs group than in the control group (all P < 0.05). The most frequent TEAEs in both groups were dry mouth, somnolence, and constipation. There was no significant difference in the incidence of adverse events between the two groups.

Conclusion CCT combined with SSRIs was efficacious and well tolerated in LLD with cognitive impairment.

关键字：late-life depression; cognitive function; computerized cognitive training; SSRIs

抑郁和焦虑在中国老年人关节炎与早期认知功能下降关系中的作用：链式中介作用

何泳怡 王诗镔* 侯彩兰 贾福军
广东省人民医院

目的 关节炎是一种常见慢性病。关节炎与早期认知功能下降存在一定的关联。心理健康可能在其中起着重要作用，但潜在的机制仍不清楚。本研究探讨抑郁和焦虑在中国老年人关节炎与早期认知功能下降关系中的作用。

方法 从 2021 年 10-12 月收集的广东省居民心理健康调查基线数据中选取 65 岁以上的老年人。排除数据缺失的问卷及自我报告患有神经系统疾病的受试者。收集其人口学资料、生活习惯和慢性病患病情况。采用痴呆筛查表（AD-8）、患者健康问卷抑郁量表（PHQ-9）和广泛性焦虑障碍量表（GAD-7）评估早期认知功能下降、抑郁和焦虑症状。在控制潜在混杂因素后，采用分层 Logistic 回归模型估计与关节炎与早期认知功能下降的关系。采用链式中介模型来研究抑郁和焦虑是否在关节炎与早期认知功能下降中起中介作用。

结果 共有 3781 名老年人纳入本研究，关节炎的自我报告率为 12.8%，早期认知下降的发生率为 16.19%。在单因素分析中，老年人的早期认知功能下降与关节炎、抑郁症状、焦虑症状、年龄、婚姻状况、收入、饮茶习惯、目前吸烟、共患其他慢性病存在关联（p< 0.05）。分层 Logistic 回归结果显示，控制人口学资料和生活习惯后，自我报告关节炎的老年人的早期认知功能下降发生率边缘显著地高于对照组（OR=1.279 ，95%CI: 0.998~1.638，p=0.051）。进一步控制焦虑和抑郁后，老年人关节炎和早期认知功能下降不存在关联（OR=1.194 ，95%CI: 0.927~1.539， p= 0.170）。链式中介作用表明，抑郁症状、焦虑症状在关节炎和早期认知下降的关系之间起部分中介作用，链式中介作用显著（βa=0.025, 95% CI: 0.008~0.028; βb=0.019, 95% CI: 0.005~0.038）。

结论 关节炎可能是老年人早期认知下降的一个危险因素。老年人的关节炎既能直接影响早期认知下降，也能通过抑郁和焦虑症状间接影响早期认知水平。为提高老年关节炎患者的预后及生活质量，临床上需要及时地对高风险患者的心理健康水平进行筛查及干预。

语言训练对轻度阿尔茨海默病总体认知功能和执行功能的作用效果分析

孙祝平 吴宇洁*
上海市长宁区精神卫生中心

目的 研究语言训练对轻度阿尔茨海默病（AD）总体认知功能和执行功能的作用效果。

方法 选择 2020 年 5 月到 2023 年 1 月在我院接受治疗的 AD 患者 99 例作为观察对象，按随机数表法分成古汉语组 33 例，英语组 33 例，以及现代文组 33 例。为古汉语组实施古汉语的高强度执行控制训练，为英语组实施英语的低强度执行控制训练，为现代文组实施现代文的无执行控制训练。各组均治疗 3 个月，分别在治疗前、治疗 4 周后，以及治疗 3 个月后对患者进行认知功能评价。对比各组 MMSE 评分，WCST 评分，ADAS-cog 评分，QOL-AD 评分，语言流畅性评分，数字广度评分。

结果 治疗 4 周及治疗 3 个月后，各组的 MMSE 评分较治疗前均明显升高，且古汉语组和英语组的 MMSE 评分均分别高于现代文组，而古汉语组又高于英语组，差异均有统计学意义（P＜0.05）。同时，各组

的 QOL-AD 评分较治疗前均明显升高，且古汉语组和英语组的 QOL-AD 评分较现代文组均明显更高，而古汉语组又较英语组明显更高，差异有统计学意义（P＜0.05）。治疗 4 周及治疗 3 个月后，各组的 ADAS-cog 评分及 WCST 评分错误应答分值和持续性错误分值较治疗前均明显降低，而语言流畅性评分、数字广度评分、WCST 评分完成分类分值较治疗前均明显升高，差异有统计学意义（P＜0.05）。治疗 3 个月后，古汉语组和英语组的 ADAS-cog 评分及 WCST 评分错误应答分值和持续性错误分值较现代文组均明显更低，而语言流畅性评分、数字广度评分、WCST 评分完成分类分值较现代文组均明显更高，差异有统计学意义（P＜0.05）。治疗 3 个月后，古汉语组的 ADAS-cog 评分及 WCST 评分错误应答分值和持续性错误分值较英语组明显更低，而语言流畅性评分、数字广度评分、WCST 评分完成分类分值较英语组明显更高，差异有统计学意义（P＜0.05）。

结论 语言训练对轻度阿尔茨海默病总体认知功能和执行功能的作用效果较好，且以选择古汉语为最佳，英语次之，现代文效果相对较弱，值得临床关注。

Nicotine Decreases Pain Behaviors and Nerve Regeneration Via The A7 Nicotinic Acetylcholine Receptor in Two Rat Nerve Injury Models

方烨红 廖艳辉*
浙江大学医学院附属邵逸夫医院

Objective Neuropathic pain is stubborn and associated with peripheral nerve regeneration process. Nicotine has been found to reduce pain but whether it is involved in the regulation of nerve regeneration and the underlying mechanism are unknown.

Methods The rat chronic constriction injury (CCI) model and tibial nerve crush model were used in this study. Western blotting and/or immunofluorescent staining were applied to detect growth associated protein 43 (GAP43) and IBA1. The selective α7 nicotinic acetylcholine receptor (nAChR) blocker, methyllycaconitine (MLA) was intraperitoneal administrated to assess the behavioral and molecular mechanism of nicotine in analgesia.

Results nicotine reduced anatomical measures of regeneration as well as expression of regeneration marker growth associated protein 43 (GAP43). In the tibial nerve crush model, nicotine treatment significantly suppressed GAP43 expression and functional reinnervation as measured by myelinated action potential and electromyography of gastrocnemius. In both models, nicotine treatment reduced macrophage density in the sensory ganglia and peripheral nerve. These effects of nicotine were reversed by the selective α7 nicotinic acetylcholine receptor (nAChR) blocker, methyllycaconitine. In addition, nicotine significantly elevated expression of PTEN (the phosphatase and tensin homolog deleted on chromosome 10), a key player in both regeneration and pain. Pharmacological interference of PTEN could regulate GAP43 expression, pain related behaviors and macrophage infiltration in nicotine-treated nerve crush model.

Conclusion Our results reveal that nicotine and its α7-nAChR regulate both peripheral nerve regeneration process and pain though PTEN and downstream inflammation-related pathway.

Study on Intestinal Flora Characteristics and Metabolomic Analysis in Children and Adolescents with First Untreated Obsessive-compulsive Disorder

代佳利[1,2] 朱刚[1]
1.中国医科大学附属第一医院
2.大庆市第三医院

Objective Numbers of adult patients with obses-

sive-compulsive disorder (OCD) start from children or adolescents, so early identification and intervention become the key to control the disease. However, its etiology has not been fully clarified. This study sought to explore the relationship between the pathogenesis and gut microbiota in children and adolescents with OCD.

Methods Multi-omics combined analysis of the gut microbiota in first-episode children and adolescents with OCD was performed. Stool samples were collected from 49 first-episode untreated children and adolescents with OCD and 42 age - and sex-matched healthy controls (HC), and all subjects were evaluated for clinical parameters. A total of 91 samples were analyzed by 16S rRNA sequencing and metabonomic based on UHPLS-MS. Correlation analysis was conducted between metagomic sequencing results and clinical parameters to explore the relationship between intestinal flora and OCD symptoms and the possible functional pathways involved in the pathogenesis.Fecal samples from 19 OCD and 18 HC subjects were analyzed by Illumina HiSeq sequencing platform using metagenomic high-throughput sequencing method. Association analysis was performed on metagenomic and metabonomics analysis data to clarify the association between differential flora and differential metabolites.

Results 1. The diversity index of intestinal flora in patients with OCD was significantly decreased (obs, P<0.001; chao1, P<0.001; ACE, P<0.001; shannon, P<0.001; simpson, P<0.05; good, P<0.001), and the microbial interaction network was significantly weaker than that in HC group. 2. The relative abundance ratio (F/B) of Firmicutes /Bacteroidetes in OCD group was significantly lower (P<0.001). 3. The abundance of butyrate-producing bacteria such as Romboutsia (q<0.01), Mitsuokella (q<0.01), and Terrasporobacter (q<0.01) in the intestine of patients with OCD decreased significantly. 4. The random forest model identified 30 specific bacteria as markers, and the AUC between OCD patients and HC was 0.9011. 5. There is a correlation between the changes of clinical parameters in OCD group and the abundance of specific bacteria in intestinal flora. 6. A total of 43 endogenous differential metabolites were screened out in OCD-HC group, and there was a correlation between the differential metabolites and the differential flora (P<0.05). 7. The relative contents of Neopterin and Sepiapterin, the intermediate products of folate biosynthesis, were significantly higher in OCD group (P<0.05); Glucocorticoids and corticosterones significantly decreased in regulating lipolysis in adipocytes and prion diseases (P<0.05).

Conclusion Gut microbiata of children and adolescents with OCD were disordered at phylum, genus and species level, and the diversity of flora was significantly reduced. The OCD and HC groups had distinctive intestinal flora. Several gene functional and metabolic pathways of intestinal flora in OCD patients are destroyed.

进食障碍患者临床表现的性别差异

郑理匀 陈超 张大荣 李雪霓 孔庆梅* 司天梅
北京大学第六医院

目的 探究进食障碍（ED）患者身体质量指数（BMI）、行为症状及心理特征等方面的性别差异。

方法 以门诊及住院诊治的 ED 患者为研究对象，纳入 986 名 ED 患者，其中男性 54 名，女性 932 名。使用进食障碍问卷（EDQ）及进食障碍调查量表（EDI-1）进行评估。在经过倾向性评分匹配消除年龄、学历的差异后，对比不同性别 ED 患者在 BMI、行为症状以及心理特征方面的差异。采用分层回归分析探究可能影响男性及女性患者罹患神经性厌食（AN）的因素。

结果 （1）男性 ED 患者的最高、最低、期望 BMI 均高于女性，在 BN 及 EDNOS 中，男性期望与目前 BMI 的差值（分别为 0.36±0.63 kg/m2、0.21±0.62 kg/m2）与女性（分别为-2.43±0.37 kg/m2、-1.80±0.49 kg/m2）相比具有显著差异。（2）男性 ED 患者较女性使用泻药行为的比例更小、频率更低，且其限制进食行为的频率更低，选择减少主食作为节食方式的比例更小。（3）男性 ED 患者报告了更少的增重恐惧、体重/体型对自尊自信的影响以及与暴食发作相关的失控感和痛苦感。（4）男性患者 EDI-1 总分和对瘦的追求、内省因子分低于女性，且 EDI-1 总分的性别差异不随诊断亚型的变化而变化。（5）在 ED 患者中进行的 Logistics 回归分析发现，对身体不满因子得分和目前 BMI 与罹患 AN 负关联；成熟恐惧因子得分与罹患 AN 正关联，在女性 ED 患者中的分析结果与男女合并分析结果一致，而在男性 ED 患者中仅发现目前 BMI 与罹患 AN 负关联。

结论 （1）男性患者的瘦身动机更弱，暴食相关的心理特征更不明显。（2）基于 EDI-1 评估的男性患者症状严重程度可能更轻。（3）影响男性患者罹患 AN 的行为及心理因素可能与女性不同。

The Predictive Role of Frontoparietal Network in Clinical Symptoms and Treatment Response in Anorexia Nervosa

Qianqian He Hui Zheng Ling Yue Qing Kang Cheng Lian Yan Chen Lei Guo Zhen Wang Jue Chen*
上海市精神卫生中心

Objective Anorexia nervosa (AN) is an eating disorder characterized by severe dietary restriction, misperceptions of body shape and weight, fear of weight gain, combined with some emotional problems. AN has been characterized as an over-control disorder with increased resting-state functional connectivity (RSFC) in the frontoparietal control network (FPCN). However, there has been limited exploration of neuroimaging biomarkers for predicting treatment response in AN. The study aimed to

investigate the role of FPCN in predicting clinical symptoms and treatment response in AN patients.

Methods Seventy-nine female AN patients who had not received prior treatment and forty matched healthy controls (HCs) were recruited for this study. All participants completed the Questionnaire Version of the Eating Disorders Examination (version 6.0) to assess the severity of AN. Additionally, RSFC data were obtained from all participants at baseline. AN patients then underwent outpatient treatment for four and twelve weeks, during which time their clinical symptoms were evaluated using the same measures as at baseline.

Results After controlling for depression and anxiety symptoms, the AN group still exhibited increased RSFC in the right posterior parietal cortex (PPC) and dlPFC compared to HCs. Moreover, RSFC in the PPC to inferior frontal gyrus (IFG) was found to be an important predictor or tend to be an important predictor for the clinical symptoms after controlling for age, and treatment response of AN after controlling for age, age of onset and BMI.

Conclusion Alterations in RSFC of FPCN may provide a possible neural marker to assist in predicting clinical symptoms and treatment response in AN patients, providing new insight into the pathogenesis of AN and allowing for early prevention and treatment.

3.华西医院心理卫生中心心身医学和临床心理部
4.北京大学第六医院心身科
5.南京脑科医院医学心理科
6.北京大学第六医院门诊部
7.青岛和睦家心理健康中心

目的 暴食障碍是以反复发作性暴食为主要特征的一类进食障碍。暴食患者存在反复冲动的暴食行为，导致多种躯体问题，并共病多种精神障碍，需引起重视。然而，目前在中国，对于暴食障碍不能早期识别和诊治，导致病程迁延。因此，在中华医学会心身医学分会进食障碍协作学组的组织下，由 9 名精神科医学专家组，基于循证医学证据、国内外指南与专家共识、专家经验等制定本专家共识，以期提高国内专业人员对暴食症的识别和诊治水平。

方法 在中华医学会心身医学分会进食障碍协作组的组织下，由 9 名精神科医学专家组成了制定《中国暴食障碍诊疗专家共识》的专家组，进行线上调研和讨论，纳入本共识的临床问题以及目前诊疗方法的归纳总结。专家组以“eating disorders”、“binge eating disorder”、“psychotherapy”、“pharmacological treatment” “depression”、“bipoloar disorder”、“anxiety”、“fluoxetine”为关键词，系统检索了国内外主要数据库。检索时间为建库至 2023-03-30，限定语种为英文或中文。检索、精筛后获得相关文献和国内外权威指南共识共 42 篇。专家组结合相关文献总结，提出本共识和推荐建议。

结果 结合检索整理的国际权威指南共识结果，共识撰写专家组从定义、流行病学、临床特征何评估、诊断与鉴别诊断、治疗原则与方法、需特殊关注的人群等几个方面对暴食障碍的特点及诊治进行了全面阐述及推荐建议。

结论 目前 BED 的发病机制仍未明了，对其发病机制有待进一步深入了解。已开发的治疗方案，如心理治疗、药物治疗、行为减重治疗以及多种治疗方式相结合的模式被证明有效，且仍不断有新的治疗方法出现。但暴食障碍自 DSM-5 中才被单独列出，目前研究结论存在研究时间较短，样本量较小等问题，还有待进行更长时间和更大样本量的研究来验证已有结论。

Transcranial Direct Current Stimulation Modulates EEG Microstates in Obsessive-Compulsive Disorder

程佳月[1] 王杨[1] 唐莺莹[1] 林梁俊[2] 高见[1] 王振[1]
1.上海交通大学医学院附属精神卫生中心
2.苏州市广济医院

Objective Transcranial direct current stimulation (tDCS) could potentially serve as a safe, accessible, promising therapeutic approach for obsessive-compulsive disorder (OCD). The objective of this study was to evaluate the effect tDCS on electroencephalography (EEG) microstates and identify potential biomarker to predict the efficacy.

Methods A total of 24 individuals diagnosed with OCD underwent ten sessions of tDCS, while 27 healthy individuals were included as controls. The microstates A, B, C, and D were extracted both before and following tDCS. Comparative analysis of microstate metrics was performed between the OCD group and the healthy control group, as well as within the OCD group before and after tDCS. Multiple linear regression was conducted to detect potential biomarkers of tDCS.

Results In comparison to the healthy control group, individuals with OCD exhibited significantly reduced duration and coverage of microstate A ($t = -0.530$, $p = 0.015$), which demonstrated a significant increase towards healthy levels following tDCS ($t = -0.196$, $p = 0.039$). Moreover, the occurrence of microstate D was found to be higher in the OCD group compared to the healthy controls ($t = 2.549$, $p = 0.014$). The transition between microstate A and C was significantly different between OCD and healthy control groups (from microstate A to C: $t = -2.862$, $p = 0.006$, from microstate C to A: $t = -2.399$, $p = 0.020$), which was no

longer observed following tDCS. Multiple linear regression revealed that the duration of microstate C could predict OCD symptom improvement following tDCS (R2 = 0.622, p = 0.001).

Conclusion The results of this work showed the aberrant of large-scale EEG brain network that could be modulated by tDCS. Notably, the duration of EEG microstate

阈下抑郁对肥胖和病态肥胖人群认知功能损伤的影响研究

张一靓 吕思慧 钟舒明 赖顺凯 杨华 王存川 贾艳滨*
暨南大学附属第一医院(广州华侨医院)

目的 探讨阈下抑郁对肥胖和病态肥胖人群的认知功能的影响，并分析肥胖及阈下抑郁与认知功能的相关性。

方法 本研究纳入 35 例肥胖组被试者，37 例病态肥胖组被试者，以及 43 例正常对照患者，采用认知功能成套测验—共识版（MATRICS Consensus Cognitive Battery，MCCB）评估 3 组人群的 7 个领域的认知功能；同时评估 3 组 研究对象的情绪分数 ，抑郁分数，将患者分为伴阈下抑郁的肥胖组（Complicated with Subthreshold depression，CSD）和不伴阈下抑郁的肥胖组（Not Complicated with Subthreshold Depression，NCSD）。统计分析这 3 组人群 的认知功能的差异，并分析肥胖和阈下抑郁与认知功能的相关性。

结果 肥胖组和病态肥胖组的工作记忆[（47.76±1.765）&（45.56±1.780）与（55.49±2.242）]分数均低于 HC 组（58.35±8.437）（P<0.05）；NCSD 组、CSD 组和 HC 组的信息处理速度、注意警觉性、工作记忆、词语学习、推理和问题解决、社会认知、总体综合认知领域存在统计学差异（p<0.05）。谁？体重指数（Body Mass Index，BMI）与信息处理速度、注意警觉性、推理和问题解决、总体综合分数呈负相关（P＜0.01）；谁？阈下抑郁的 HAMD 分数与信息处理速度、词语学习、工作记忆、推理和问题解决、注意/警觉性、社会认知、总体综合分数领域均存在负相关（p＜0.01）。

结论 肥胖人群存在工作记忆和推理和问题解决领域的认知功能损伤，随着肥胖人群的 BMI 值升高，出现认知损伤和阈下抑郁的风险越高，且伴有阈下抑郁的肥胖人群的认知功能损伤更为显著。

基于网络的认知行为疗法治疗成人暴食谱系障碍疗效的荟萃分析

钟佳男 李晓白*
中国医科大学附属第一医院

目的 基于网络的认知行为疗法（internet-based cognitive behavioral therapy，iCBT）是近年来较新的心理治疗施行方式，已有许多研究尝试探究此疗法对暴食谱系障碍的临床疗效，但各研究结果尚存在不一致性，本文对现有的相关文献进行荟萃分析，以评价其临床应用价值。

方法 系统地检索 Pubmed、Embase、Web of Science、Cochrane Library、PsycINFO 英文数据库以及中国知网、万方、CBM 中文数据库，将所有已发表的随机对照试验进行筛选、收集并汇总，检索日期截止至 2022 年 10 月。对纳入文献进行质量评价，然后将检索到文献的数据通过 Revman5.4 软件进行合并统计分析，获得加权平均差（Weighted Mean Difference，WMD）、标准化均数差（Standardized Mean Difference，SMD）或相对危险度（Relative Risk，RR），及各自的 95%置信区间。

结果 最终纳入 10 篇符合纳入标准的随机对照试验，共计 1931 例暴食谱系障碍患者。统计结果显示，iCBT 对暴食谱系障碍患者的暴食相关临床症状改善更显著（即 EDE-Q 总分减少更显著，WMD=-0.83，95%CI[-1.07,-0.59]，P<0.00001），客观暴食发作次数（Objective Binge Episodes，OBEs）减少更明显（WMD=-6.48，95%CI[-10.38，-2.59]，P=0.001），与对照组结果相比具有统计学意义。我们还发现 iCBT 对抑郁（SMD=-0.40，95%CI[-0.59，-0.21]，P<0.0001）、焦虑（SMD=-0.24，95%CI[-0.45，-0.04]，P<0.02）、自尊（WMD=2.76，95%CI[1.44，4.09]，P<0.0001）等方面都有不同程度的改善作用，但治疗脱落率与对照组之间差异具有统计学意义（RR=2.03，95%CI[1.46，2.83]，P<0.0001）。

结论 iCBT 对改善暴食谱系障碍患者的典型临床症状有明显的效果，并且能缓解抑郁、焦虑情绪，提高自尊。

进食障碍患者注意偏向及抑制控制的事件相关电位研究

郑理匀 朱琳琳 杨晶菁 司天梅 孔庆梅*
北京大学第六医院

目的 通过回顾进食障碍患者注意偏向及抑制控制两方面的事件相关电位研究，探究进食障碍患者认知异常背后的神经认知机制。

方法 使用主题词“进食障碍（英文主题词：eating disorder）”和“事件相关电位（英文主题词：event-related potential）”为基本条件，设计检索式分别检索中国知网、中国生物医学文献数据库、万方数据库、PubMed 数据库、Embase 数据库，汇总并剔除重复文献后，获得 138 篇待筛文献，通过阅读标题、摘要、全文或引文并结合纳排标准，最终纳入 15 篇文献进行分析。

结果 10 篇研究通过被动浏览范式诱发的事件相关电位探究了进食障碍患者的注意偏向特点，发现与正常人群相比，患者在被动浏览范式中被食物、体型线索诱发出了振幅更高的 P200 及 EPN、P300 及 LPP。5 篇研究通过被动浏览、Go/No-go 或 Stop-signal 范式所诱发的事件相关电位探究了进食障碍患者的抑制控制特点，发现进食障碍患者在不同的范式中诱发产生了振幅或潜伏期异常的 N200 及 P300。

结论 进食障碍患者存在注意偏向以及抑制控制方面的异常，并具有相应的事件相关电位特征。此类异常特征可能为疾病的跨诊断分类提供神经电生理方面的机制依据，并为针对进食障碍患者的相关疗法，如注意偏向修正训练或者抑制控制训练等提供疗效评估手段。

消化科门诊患者的进食障碍风险评估

刘怡梦[1,2,3] 陈绍奇[3] 余莉琼[4] 王葵[1,2] 杨红[5] 陈珏[6]
1.中国科学院心理健康重点实验室，中国科学院心理研究所，北京 100101
2.中国科学院大学，北京 100049
3.中国人民解放军 63820 部队医院，绵阳 621000
4.江油市第二人民医院，绵阳 621701
5.北京协和医院，北京 100005
6.上海交通大学医学院附属精神卫生中心，上海 200030

目的 进食障碍（eating disorder，ED）患者常存在消化道症状。不少患者在确诊前会去消化科门诊就诊，甚至出现患者长时间在消化科治疗而延误进食障碍诊疗的状况。本研究旨在调查消化科门诊患者的进食障碍风险，并探讨该风险与性别、年龄和负面情绪的关系，为进食障碍的及时诊断和治疗提供参考。

方法 本研究的被试选取自中国人民解放军 63820 部队医院消化科门诊患者。由于进食障碍多发于青春期和成年早期，因此研究只考虑年龄为 16 岁至 50 岁之间的患者，符合条件的患者有 463 名，其中有 256 名患者愿意参加本研究，并最终完成了问卷，删除没有认真填写的问卷，最后留存 200 名患者（男女比例 1：1）的数据。该研究通过了中科院心理研究所和解放军 63820 部队医院的伦理审核，所有参与研究的患者填写了知情同意，自愿参与本研究。 自评问卷内容包括基本信息（性别、年龄、婚姻状况等），进食障碍症状（EDE-Q 量表）和负性情绪（DASS-21 量表）。

结果 按照 DSM-5 标准，9.5%的患者有进食障碍患病风险；女患者进食障碍的患病风险为 16%，要显著高于男性患者（3%）。75%具有进食障碍风险的女性患者年龄在 30 岁以下。此外，本研究还发现负面情绪会增加进食障碍风险，OR=1.072（95%CI：1.033-1.112）。

结论 消化科门诊患者存在较高的进食障碍风险，尤其是 30 以下的女性患者。且负面情绪会增加进食障碍风险。

The Relationship between The Self-stigma and The Quality of Life in Long-term Hospitalized Patients with Schizophrenia: A Cross-sectional Study

柴佳宝 [1] 刘福权 [2] 邓虎 [1] 胡娜 [1] 黄文倩 [1] 王红 [1] 崔永华 [3] 刘琳 [1] 李瑛 [3]
1.北京回龙观医院 北京大学回龙观临床医学院
2.北京积水潭医院
3.国家儿童医学中心 首都医科大学附属北京儿童医院

Objective Self-stigma of mental illness refers to the phenomenon where individuals with mental disorders internalize the negative stereotypes and prejudices associated with mental illness prevalent in society, and apply these stereotypes to themselves. This self-stigma often leads patients to feel ashamed, inferior, and guilty about their condition, perceiving themselves as defective or unworthy of acceptance. To explore the impact of self-stigma on the quality of life of patients with schizophrenia, and which factors affect the quality of life through self-stigma as a mediator.

Methods This study adopted a cross-sectional design and randomly selected 170 hospitalized patients with schizophrenia for evaluation. The assessment tools included the Positive and Negative Syndrome Scale (PANSS), Self-Esteem Inventory (SEI), Connor-Davidson Resilience Scale (CD-RISC), Internalized Stigma of Mental Illness Scale (ISMI), Schizophrenia Quality of Life Scale (SQLS), Coping Questionnaire for Schizophrenia Patients (CQSP), Social Support Rating Scale (SSRS), and Temporal Experience of Pleasure Scale (TEPS). Correlation analysis, regression analysis, and mediation analysis were used to test the correlation and mediation effects.

Results Self-shame has a significant impact on quality of life (T = 8.13, p = 0.00). Self-esteem (T = -2.11, p = 0.04) and coping strategies, specifically problem-solving (T = -2.58, p = 0.01) and avoidance (T = 4.65, p = 0.00), have a greater impact on self-shame. When self-shame is used as a mediator, the problem-solving factor in coping strategies has an indirect effect on quality of life, which is significant (AB = -0.16, P = 0.02), while the avoidance factor in coping strategies has a direct effect on quality of life, which is significant (C' = 0.54, p < 0.001), and an indirect effect, which is also significant (AB = 0.25, p < 0.001).

Conclusion Self-stigma has a significant impact on the quality of life. Clinical work to improve the quality of life of patients with schizophrenia should focus on self-stigma and factors that affect self-stigma, especially self-esteem and coping strategies.

关键字：schizophrenia, self-stigma, quality of life, self-esteem, coping strategies

Aberrant Metabolism of The Gut Microbiota Mediates Tryptophan-Associated Cognitive Impairment in Drug-na?ve, First Episode Schizophrenia Patients

袁秀霞 李雪 庞礼娟 孙尧 宋学勤*
郑州大学第一附属医院

Objective Cognitive impairments in patients with schizophrenia (SCZ) are associated with poor functional outcomes. The microbiome–gut–brain axis is related to brain health and cognition.

Methods Here, we present a half-year follow-up study involving metabolomics and metagenomics, from 210 first-episode, drug-na?ve SCZ patients and 159 healthy controls (HCs). We collected biological samples at baseline (all participants) and 6 months after risperidone treatment (SCZ patients). Cognitive function was assessed using the MATRICS Consensus Cognitive Battery (MCCB).

Results The differential metabolites and microbial markers are associated with metabolic pathways involving amino and fatty acids. Follow-up study revealed that metabolites N-acetyl-serotonin (NAS) and stearic acid (SDA) and microbial species from the genera Blautia spp. and Ruminococcus spp. were associated with cognitive function in SCZ patients. These microbial species expressed genes that regulate tryptophan metabolism. Faecal microbiota transplantation resulted in higher colonic levels of microtoxin (lipopolysaccharides and purlisin), proinflammatory cytokines and tryptophan-related genes in mice receiving microbiota from SCZ patients, suggesting that the intestinal microbiota and metabolome interact and converge on inflammation and tryptophan metabolism.

Conclusion Future research on genome-microbiome-metabolite interactions is warranted to advance our understanding of the role of NAS and SDA in the cognitive impairments of SCZ and to explore novel interventions.

基于人工智能的音视频特征模型在抑郁症识别中的应用

徐晨阳 石川*
北京大学第六医院

目的 随着人工智能技术的发展，表情识别技术和声音检测技术在抑郁障碍的识别中得到了越来越广泛的应用，数字医疗的发展也为精神疾病的诊断带来了新的方向。抑郁症患者人群与正常人群在语音特征及面部表情方面存在差异，而目前广泛使用的数据集多来自国外，本研究将针对中国人群建立广泛实用的抑郁症音视频数据集；同时既往研究多采用定式任务或临床访谈中的音视频数据，本研究将创新性地使用人机交互访谈中产生的语音及表情数据，探讨人机交互中基于语音特征/面部表情的模型识别抑郁患者的有效性。

方法 纳入 80 例抑郁患者及 40 例健康对照组，在处理音频数据时，我们筛选出人机交互数据中 10 秒以上且有声的片段，提取 25 类声学特征进行数据分析，采用经典的支持向量机（Support Vector Machine）作为基本分类模型；处理视频数据时，我们采用了经预训练的端到端的层次化深度学习框架，用于处理长时间高冗余度、可边长度的视频。具体而言，所采用的层次模型使用 3D 卷积神经网络来进行局部时空模式探索，以及一个基于冗余感知的自注意力机制用于问题级别的全局特征聚合，使用 5 折交叉验证（5-fold cross validation）计算模型的平均准确率。

结果 本研究纳入的抑郁组和对照组年龄匹配，人机交互中基于语音特征的模型区分抑郁患者的准确率为 82.42%；基于面部表情特征的模型区分抑郁患者的准确率为 70.24%。

结论 本研究提供了一种使用人机交互过程中产生的音视频数据识别抑郁症的新方法，其中使用语音特征的模型性能优于面部表情特征。这表明，声学特征及面部表情可能成为抑郁症新的客观指标，且人机交互可以成为有效的数据获取方式。未来我们将进一步扩大样本量，并采用外部验证的方式评估模型的性能。

高频 rTMS 调节 Sigma-1 受体和神经元活动增强应激后食蟹猴认知功能的研究

黄颖 温盛霖*
中山大学附属第五医院

目的 通过对应激后食蟹猴进行高频重复经颅磁刺激（ rTMS）干预，探索高频 rTMS 增强认知功能的机制，包括高频 rTMS 对 Sigma-1 受体（ σ1R）水平的影响以及不同 rTMS 方案对神经元电活动的作用。

方法 选择非人灵长类动物（NHP）作为研究对象，应用手指迷宫测试评估认知功能；利用正电子发射计算机断层显像（PET）手段评检测 σ1R 在大脑中的变化；采用颅内电极记录不同 rTMS 方案诱发神经元电活动的变化。

结果 （1）训练结束后，猴子成功完成学习测试；猴子在学习测试后的第一个月和第二个月手指迷宫测试的成功率没有明显变化，而第四个月成功率显著下降（$P<0.05$）。（2）应激开始后，食蟹猴血浆皮质醇水平明显升高（$P<0.05$），并且在应激结束后一个月仍维持在较高水平；应激两个月后，手指迷宫记忆测试的成功率明显下降（$P<0.05$），随着应激时间延长下降趋势逐渐增加，rTMS 干预后成功率明显提高（$P<0.05$）；应激三个月后食蟹猴对糖水的偏好程度明显下降（$P<0.05$），rTMS 干预后一个月偏好程度明显增加（$P<0.05$）；在应激期间猴子出现拔毛、咬伤和过度手淫症状，在应激结束后一个月仍没有恢复，经过高频 rTMS 干预后上述症状明显缓解。（3）评估 NHP 应激后和干预后脑内 σ1R 的变化。在应激后，多数脑区(+)-[18F]TZ3108 的摄取量明显下降（$P<0.05$），其中枕叶下降最明显，其次为顶叶、脑桥、额叶、丘脑、中脑、尾状核、颞叶。干预后大多数脑区 BPND 值升高， 但只有脑桥有统计学意义（$P<0.05$）。在认知功能改善明显的猴子中， rTMS 靶区、左侧额叶和顶叶脑皮层、左侧额叶脑白质中 σ1R 水平明显升高（$P<0.05$）。（4）在 10Hz rTMS 方案下，多数神经元发放率增加，少数发放率降低或无明显变化；在 1Hz rTMS 方案下，发放率受到抑制的神经元比例较 10Hz 增加，多数神经元发放率增加。

结论 食蟹猴应激后出现了认知功能下降，高频 rTMS 可以改善认知功能损伤；认知功能受损可能与 σ1R 下降相关；高频 rTMS 可能通过调节刺激靶区、同侧额叶和顶叶皮层、同侧额叶白质中 σ1R 而增强认知功能；rTMS 诱发神经元发放率增加可能是改善认知功能的原因。

The Prevalence of Mental Disorders in Inner Mongolia Autonomous Region, China: A Cross-sectional Epidemiological Study

王瑞琪[1] 隋晓杰[2] 黄悦勤[3] 李强[4] 于东升[1] 吕东升[1]
1.内蒙古自治区精神卫生中心(内蒙古自治区脑科医院、内蒙古自治区第三医院)
2.内蒙古自治区卫生健康委
3.北京大学第六医院，北京大学精神卫生研究所，国家卫生健康委员会精神卫生重点实验室（北京大学），国家精神心理疾病临床医学研究中心（北京大学第六医院）
4.北京大学中国社会科学调查中心

Objective Inner Mongolia Autonomous Region, located in the northern frontier of China, was one of the multi-ethnic settlements. Mental health resources were short and unevenly distributed. So far, the epidemiological investigation of mental disorders in the whole region had not been reported. To understand the prevalence and distribution of various mental disorders in Inner Mongolia

Methods This study is a cross-sectional survey, using the multistage stratified sampling method with unequal probability. The sample population of our survey was randomly distributed in 11 cities, 41 counties or districts , 246 villages or communities, and 22942 household addresses in Inner Mongolia。14164 qualified samples were selected, and 12625 respondents actually participated in the survey, with a response rate of 89.13%. The survey was conducted in two stages. The tools in the first stage include the Composite International Diagnostic Interview 3.0 (CIDI), and the tools in the second stage include the Structured Clinical Interview for DSM?IV Axis I disorders (SCID) , the Community Screening Instrument for dementia from the 10/66 dementia diagnostic package, and the Geriatric Mental State Examination(GMS). Two-stage investigation uses data verification aiming at internal logic among items, ratio of "don't know" or "refuse to answer", outliers of data and rationality of interview time, and telephone verification and recording verification aiming at irregular behavior of interviewers. We weighted the data to adjust the sampling, non-response, post-event stratification and extreme value of dependent variable.

Results Among the five major mental disorders, including mood disorder, anxiety disorder, substance-use disorders, Impulse-control disorders and eating disorder, the weighted 12-month prevalence rate of mood disorder was the highest (8.71%), followed by anxiety disorder (4.64%), substance use disorder (4.42%), intermittent explosive disorder (1.10%) and eating disorder (0.03%). The weighted lifetime prevalence rate of schizophrenia and other psychotic diseases was 0.68%, and the weighted lifetime prevalence rate of dementia in people aged 65 and above was 7.82%. The 12-month prevalence rates of mood disorder, anxiety disorder, substance use disorder and eating disorder have gender differences. The 12-month prevalence rates of anxiety disorder and senile dementia are different in different regions. There are age differences in 12-month prevalence of mood disorders. There are ethnic differences in 12-month prevalence rate of dementia.

Conclusion Depression and dementia weresevere in our district. There were gender and age differences in various mental disorders. The government should pay more attention to the psychological problems of women, the elderly and other focus groups and control men's unhealthy lifestyles such as smoking and drinking. Because of ethnic integration, there is no obvious difference in prevalence rate between Han and Mongolian.

关键字：cross-sectional investigation；prevalence；mental disorders

Association of Insulin Signaling Pathway Gene Polymorphism and Brain Function with Clinical and Cognitive Feature of Early-onset Obsessive-compulsive Disorder

Hui Ding Min yaoxie Jinyi Wang Mengyuan Ouyang Yanyuan Huang Fangzheng Yuan Yunhan Jia Xuedi Zhang Na Liu* Ning Zhang*
南京脑科医院

Objective More and more studies had focused on the metabolic disorders related to Obsessive Compulsive Disorder (OCD), especially OCD and glucose and lipid metabolism. Studies have shown that OCD was closely related to central insulin signaling pathway, and both of them were closely related to neurodevelopmental disorders. Based on the gene-brain-clinic/cognitive multi-model, this study aims to explore the gene polymorphisms of central insulin signaling pathway and resting-state functional brain imaging changes in early-onset obsessive-compulsive disorder (EO-OCD) from the neurodevelopmental perspective . Meanwhile, we also explore how these genetic imaging changes effects on clinical and cognitive impairment of EO-OCD.

Methods A total of 108 EO-OCD and 105 healthy controls(HC) were recruited. A total of 12 SNPs in 11 genes related to central insulin signaling pathway were genotyped by molecular testing technology, and the genetic model was established by SNPSTATS software. Brain resting-state functional magnetic resonance imaging (rs-fMRI) data were collected from 69 EO-OCD. The difference of amplitude of low frequency vibration (ALFF) between EO-OCD and HC was compared, and the difference brain regions were used as regions of interest/seeds(ROIs). The ROIs were to analyze the effect of A allele on the whole brain functional connectivity (FC) of EO-OCD patients with or without A allele. The MATRICS Consensus Cognitive Battery (MCCB) was used to evaluate 76 EO-OCD patients and 49 HC, and a mediating effect model between gene-imaging-clinical characteristics and cognition was established.

Results RACGAP1 rs297941 is associated with EO-OCD. In EO-OCD patients, ALFF values were increased and brain activity was enhanced in the right precu-

neus of the A allele compared with the GG genotype. However, the ALFF values of the right supramarginal gyrus and the postcentral gyrus were decreased, and the brain activity was weakened. FC was enhanced between the right superior temporal gyrus and the left and right supplementary motor areas, between the right cerebellum and the left angular gyrus of the inferior parietal border, and between the left angular gyrus and the right cerebellum in the A allele carriers. The mediating effect model showed that ALFF in the right postcentral gyrus had a mediating effect between rs297941 polymorphism and cognitive fluency score. The FC from the left angular gyrus to the right cerebellum had a mediating effect between rs297941 polymorphism and cognitive processing speed score. ALFF in the right supramarginal gyrus has a mediating effect between rs297941 polymorphism and Y-bocs thinking scores and total scores.

Conclusion RACGAP1 rs297941 was associated with EO-OCD. The EO-OCD group showed distinct brain activity in the left precuneus, right precuneus, right supramargonic gyrus, right cerebellum, left angular gyrus, right postcentral gyrus and right superior parietal gyrus. Carriers of the A allele had altered spontaneous

动力性人际治疗对抑郁症患者心智化功能的改善作用及其与抑郁症状变化的关系：一项多中心随机对照研究

姚佳宇 郑子蔚 蒋文晖 王媛 仇剑崟*
上海市精神卫生中心

目的 抑郁症（MDD）是一种常见的心境障碍，常伴有心智化功能受损。动力性人际治疗（DIT）是一种关注 MDD 患者心智化功能的短程、手册化治疗，已被证明能有效改善 MDD 患者的抑郁症状。本研究考察 DIT 对 MDD 患者心智化功能的改善作用及其与抑郁症状变化的关系。

方法 212 名 MDD 患者被随机分配到 DIT+药物治疗组（DIT: n=116）和单纯药物治疗组（ADM: n=96），接受 16 周的治疗。通过汉密尔顿抑郁量表（HAMD）和反思功能问卷（RFQ）分别评估抑郁症状和心智化功能。依据意向性分析原则，采用混合线性模型比较不同治疗方式对患者抑郁症状和心智化功能的改善作用，并进一步分析 DIT 组患者心智化功能的变化与抑郁症状变化的关系。

结果 对 HAMD 的分析发现，组别×时间的交互作用显著（F(5,786.42)=5.196, p<0.001），DIT 组在 2 周、8 周、12 周和 16 周的分数均低于 ADM 组（p<0.05）；对 RFQ 的分析发现，确定性维度（RFQ-C）组别×时间的交互作用边缘显著（F(1,135.25)=3.852, p=0.052），治疗前两组间无显著差异（p=0.283），但治疗后 DIT 组的分数显著高于 ADM 组（p=0.004），且仅 DIT 组治疗前后的 RFQ-C 得到改善（p<0.001）。不确定性维度（RFQ-U）组别×时间的交互作用显著（F(1,143.31)=7.558, p=0.007），治疗前两组间无显著差异（p=0.270），但治疗后 DIT 组的分数显著低于 ADM 组（p<0.001），且仅 DIT 组治疗前后的 RFQ-U 得到改善（p<0.001）；对 DIT 组进行相关分析显示，RFQ-U 与 HAMD 变化显著相关（r=0.332, p=0.007），RFQ-U 与 HAMD 变化显著相关（r=0.332, p=0.007），RFQ-C 与 HAMD 变化边缘显著相关（r=-0.206, p=0.097），RFQ-C 与 HAMD 变化边缘显著相关（r=-0.206, p=0.097）。进一步比较 DIT 治疗有反应者与无反应者治疗前后 RFQ 的变化，发现仅有反应者的 RFQ-C（t=-4.350, p<0.001）与 RFQ-U（t=2.865, p=0.006）在治疗后有显著改善。

结论 DIT 联合药物治疗对 MDD 患者具有有效性，能有效改善心智化功能，抑郁症状变化与心智化功能改善有关。

Sex-specific Associations of Childhood Maltreatment with Social Cognition in Chinese Han First-episode, Drug-naive Major Depressive Disorder

刘渊 李洁*
天津市安定医院

Objective Childhood maltreatment (CM) has been linked to social cognition deficits in major depressive disorder (MDD), but little is known about sex-specific effects. This study aimed to investigate the sex-specific associations of CM with social cognition in first-episode drug-naive patients with MDD.

Methods A total of 251 Han Chinese participants, comprising 117 first-episode drug-na?ve MDD patients and 134 healthy controls (HCs), were recruited and assessed for demographic and clinical characteristics. All participants completed the Childhood Trauma Questionnaire (CTQ), Toronto Alexithymia Scale (TAS-20), Interpersonal Reactivity Index–C (IRI), and Facial Emotion Recognition Test. Partial correlation analysis was used to explore the sex-specific association of CM with social cognition.

Results Our findings revealed significant differences in the associations of CM with social cognition between males and females in both HCs and MDD patients. Moreover, in comparison to HCs, the associations of CM with social cognition displayed distinct and even contrasting sex-specific patterns in MDD patients. Remarkably, these opposing associations of CM with social cognition exhibited both similar and different sex-specific patterns among MDD patients. Specifically, male MDD patients exhibited unique imbalanced associations between emotional neglect and alexithymia, while both female and male MDD patients shared imbalanced associations of childhood abuse with empathy.

Conclusion These results emphasize the importance of considering the sex-specific impacts of CM on

social cognition in MDD and highlight the need for personalized interventions and treatments for MDD patients with a history of CM.

首发未用药精神分裂症患者血浆补体系统异常与皮层厚度下降、逻辑记忆功能受损的关联研究

余华 倪培艳 李涛*
杭州市第七人民医院

目的 精神分裂症是常见的、会严重影响患者的社会功能，并对个人和家庭带来严重疾病负担的重性精神疾病。越来越多的证据表明，感染和免疫功能异常与精神分裂症的发生发展密切相关。有关补体蛋白是否在精神分裂症患者中存在异常，仍缺乏系统研究。更进一步，补体系统在重性精神疾病中与大脑病理生理机制的关系我们仍然知之甚少。

方法 本研究通过采用人类补体蛋白 2-免疫学复合分析法测定了补体成分 1q（complement component 1q, C1q），补体成分 3（complement component 3，C3），补体成分 3b（complement component 3b, C3b）， 补体成分 4（complement component 4，C4），因子 B（factor B，FB）、因子 H（factor H， FH）和丙哌啶(properdin)的血浆补体蛋白浓度。采用阳性和阴性症状量表（Positive and Negative Symptom Scale, PANSS）评估患者的症状严重程度。我们还通过韦氏成人智力测试，CANTAB 来测量所有参与者的认知功能。使用 3.0T Phillips 磁共振仪采集了所有被试的结构相磁共振数据。我们的研究分为两个部分进行，第一部分探索了首发未用药精神分裂症患者血浆补体系统与正常对照相比是否存在异常。第二部分探索了异常补体系统与异常皮层厚度、认知功能缺陷的关系。

结果 我们的主要研究结果如下：1）首发未用药精神分裂症患者与对照组相比，患者经 10 倍对数转化后的血浆补体成分 C1q、C4、因子 B、因子 H 和丙哌啶水平显著高于对照组。2）在首发精神分裂症患者中，血浆 C4 和因子 H 水平与左侧初级感觉运动区皮层厚度呈显著负相关，而在正常受试者中血浆 C4 水平与左侧前额叶皮层厚度呈正相关。同时，在所有被试和首发精神分裂症患者中，我们发现逻辑记忆分数分别与补体成分 3 和补体成分 4 呈负相关。

结论 本研究结果为精神分裂症炎症反应异常假说机制提供了初步的临床证据，为精神分裂症炎症反应可能导致异常皮层厚度改变、认知功能下降（逻辑记忆损害）提供了重要依据。

Abnormal Interhemispheric Functional Cooperation in Schizophrenia Follows The Neurotransmitter Profiles

张薇 何孔亮*
合肥市第四人民医院

Objective Interhemispheric cooperation is one of the most prominent functional architectures of the human brain. Interhemispheric cooperation deficits have been reported in patients with schizophrenia (SCZ) using increasingly powerful neurobehavioral and neuroimaging measures. However, these methods rely in part on the assumption of anatomic symmetry between hemispheres. In the present study, we explored interhemispheric cooperation deficits in SCZ using a newly developed index Connectivity between Functionally Homotopic voxels (CFH) which is unbiased by hemispheric asymmetry.

Method Eighty-six SCZ patients and 86 age- and sex-matched healthy controls (HCs) were recruited. Multimodal magnetic resonance imaging was conducted on all subjects and whole-brain CFH maps were constructed for comparison between groups. We also examined the correlations of CFH values differing between SCZ and HC groups with various neurotransmitter receptor and transporter densities.

Result Schizophrenia patients exhibited significantly lower CFH values in the frontal lobes, left postcentral gyrus, and right inferior temporal gyrus, and significantly greater CFH values in the right caudate nucleus compared to HCs. Moreover, CFH values differing in patients were significantly correlated with positive symptom score and illness duration. Functional connectivity within frontal lobes was significantly reduced at the voxel cluster level compared to healthy subjects. Finally, the CFH abnormal map of schizophrenia patients was spatially associated with the densities of dopamine D1 and D2 receptor, F-DOPA, dopamine transporter, serotonin transporter, and acetylcholine transporter.

Conclusions Regional abnormalities in interhemispheric cooperation may contribute to the clinical symptoms of schizophrenia. Further, these CFH abnormalities may be associated with dysfunction in neurotransmitter systems strongly implicated in schizophrenia.

东亚及欧洲人群抑郁症的共遗传研究

龚骞 刘忠纯*
武汉大学人民医院精神卫生中心

目的 通过比较不同人群之间遗传变异的共同点和差异，确定是否存在特定的遗传风险因素在不同人群中的共同作用，鉴定与抑郁症相关的共同遗传变异位点。判断是否有民族特异性的遗传风险因素，探索种族/民族间抑郁症患病率差异的遗传基础，开发针对不

同人群的抑郁症预防和治疗策略提供指导，以及为跨文化精神健康服务的发展提供支持。

方法 利用来自东亚和欧洲人群的独立的全基因组关联研究抑郁症表型结果，先通过 LDSC 计算两者整体的连锁不平衡程度，再应用新的统计遗传学方法（MiXeR 和联合假阳性率发现率分析），研究具有混合效应方向的遗传重叠。之后确定欧洲与亚洲人群共同相关的基因座，并对其进行功能注释，将其映射到推定的基因组中。

结果 LDSC 结果显示东亚和欧洲人群有一定的遗传相关性，MiXeR 和联合假阳性绿分析显示，两者之间存在基因位点的重叠，并有证据表明在独立样本中存在一致的遗传效应。确定欧洲和东亚人群之间共同相关的基因座。这些基因座可能与抑郁症的发病有关，并且在不同人群之间共享一定的遗传风险。对共同相关的基因座进行功能注释和基因组映射，发现这些基因座与神经发育有关。

结论 东亚及欧洲人群抑郁症的无论是从连锁不平衡还是从共享的遗传变异位点角度都存在很强的共遗传，这些位点可是解释了跨民族的抑郁症发生的机制，以及解释不同人群之间的抑郁症患病率差异，为跨文化精神健康研究和干预提供重要的信息和指导。

四川省高校少数民族学生心理健康状况和相关影响因素的研究

邓忠越[1,2] 王聪[1,2] 蔡佳[1,2] 慕云菲[1,2] 王瑜[1,2] 冉茂盛[1,2]

1.四川大学华西医院心理卫生中心，中国，四川成都 610041

2.四川大学华西医院精神医学研究室，中国，四川成都 610041

目的 旨在探索中国高校少数民族学生心理健康问题负担和影响因素。

方法 新冠疫情解封后，于 2022 年-12 月 14 日~2023 年 2 月 28 日，通过问卷星调查四川省内高校(包括大学、大专、中专)在校学生的心理健康状况。收集包括人口社会学、经济、家庭、心理压力等资料，心理健康状况用一般健康问卷(GHQ-12)、广泛性焦虑量表（GAD-7)、抑郁自评量表(PHQ-9)和创伤后应激障碍(PTSD)评估量表(PCL-5)测量。多因素逻辑回归分析探索影响学生心理健康的因素。

结果 23102 名学生参与了调查，共有 22602(97.8%)例有效问卷。学生中位数年纪 19(13-26)岁，女性 14302(63.3%)名；少数名族共计 2526(11.2%)名，彝族 1184(5.2%)，藏族 804(3.6%)，羌族 133(0.6%)，其他民族学生合计 405(1.8%)。少数民族学生中 236(11.2%)有一般健康问题，853(33.8%)有焦虑，1022(40.5%)有抑郁，917(36.3%)有 PTSD 症状，均高于在汉族学生中的比例。与汉族相比，少数民族学生在一般健康问题(aOR 0.95, [95% CI, 0.81-1.11])和抑郁症状(aOR 1.08,[95% CI, 0.99-1.19])的风险无显著差异；但彝族和其他少数民族学生出现焦虑(彝族: aOR 1.14,[95% CI，1.0 -1.31]；其他少数民族:aOR 1.32,[95% CI, 1.07-1.64])和 PTSD 症状(彝族:aOR 1.24,[95% CI, 1.09-1.41]; 其他少数民族:aOR 1.37,[95% CI, 1.10-1.70])的风险显著增加。不论民族，同性性取向、贫困、父母单身、抽烟、喝酒、已婚、感染新冠、被隔离、疫情出行压力、担忧疫情影响家庭经济，均会增加学生出现一般健康问题、焦虑、抑郁、PTSD 症状的风险。学业压力对一般健康是保护性因素，但会增加焦虑、抑郁、PTSD 症状的风险。相较于权威型，父母教养方式为其他类型的学生出现心理健康问题的风险增高，忽视型风险最大。

结论 疫情解封后学生心理健康问题仍不容忽视，少数民族有与汉族学生不同的影响因素。应开展纵向研究，探索少数民族学生心理健康问题的变化趋势，研究制定符合需求的、有文化适应性的心理健康政策和干预服务，提高学生心理健康。

Associations of Adverse Childhood Experiences with Depressive Disorders in Later Life: Results From The China Mental Health Survey

尹慧芳 李金浩 李明慧 侯筱菲 颜国利 徐广明*
天津市安定医院

Objective It is unknown the relationship between adverse childhood experiences (ACEs) and depressive disorders among Chinese older adults, although many studies have documented the association between ACEs and depressive symptoms across the life span. This study aims to examine the association of ACEs with depressive disorders among older adults in China.

Methods This study used data from the China Mental Health Survey (CMHS), which is the first nationally representative survey of community-based adult mental disorders and mental health services conducted in China from 2013 to 2015. Depressive disorders were diagnosed using the Chinese version of the Composite International Diagnostic Interview-3.0 (CIDI). Finally, 2317 individuals aged 60 years or over were included in the CMHS. Logistic regression models were established to assess the associations between ACEs and depressive disorders.

Results This study proved ACEs increased the risk to have past-year depressive disorders in older adults. Individuals who experienced ACEs (compared to no ACE exposure) were more likely to experience past-year depressive disorders (OR=1.718, 95% CI=1.051-2.808). After adjustment for age, sex, marital status, employment status, education, rural or urban residence, region, and physical diseases, the association between ACEs and past-year depressive disorders were still significant(OR=1.718, 95%CI=1.051-2.808). There was a significant effect of neglect on depressive disorders in males (OR=3.510, 95% CI=1.471-8.373) rather than in fenmales; However, family violence had a significant effect on depressive disorders in females（OR=3.942，95%CI=1.378-11.275 rather than in ,males.

Conclusion ACEs were associated with increased risk for past-year depressive disorders in older adults. ACEs had long-term negative impact on the mental health of Chinese adults in their later life.

山东省 65 岁以上老年人痴呆现状调查

胡丽丽* 王延祜 李奇
山东省精神卫生中心

目的 了解全省 65 岁以上老年人痴呆患病现状，为推动老年人常见心理问题早筛早诊早治工作提供参考依据。

方法 采用分层多阶段随机抽样方法，在全省选取 39 个县（市、区），58 个街（镇），167 个居（村）委员会，每个居（村）委员会至少调查 35 名 65 岁以上老年人，样本量为 5600 人。与调查对象签订知情同意书后，由经过培训的社区卫生服务中心人员采用 AD8 问卷、简版社区痴呆筛查表（CSI-D）进行筛查。对筛查出的所有阳性样本及同比例或 15%（两者取高者）的阴性复查样本由精神科医师进行疾病诊断。

结果 1.本次调查共收回问卷 6538 份，男性 44.77 %，女性占 55.23%。65 岁以上老年人痴呆的阳性率为 25.24%，患病率粗率为 6.78%。2.在不同特征居民老年痴呆阳性率的对比中，男性老年痴呆阳性率（21.01%）低于女性老年痴呆阳性率（28.66%），其原因可能为女性的寿命高于男性，痴呆发病后女性比男性的存活时间更长。随着年龄的增加，老年痴呆的阳性率逐渐增高。65-69 岁人群的阳性率（20.55%）最低，80 岁及以上居民的老年痴呆阳性率（35.03%）最高，70-79 岁人群中阳性人数有 886 人（26.27%）。高中及以上学历老年痴呆阳性率最低（15.24%），其次是初中学历（20.85%）和小学学历（22.95%）的人群，不识字或识字很少的人群老年痴呆阳性率最高（30.70%）。受教育程度低的人群患老年痴呆的风险性增高，教育功能会提高人群的认知能力，可以在一定程度上降低和推迟老年痴呆的发生。未婚老年人的阳性率高于已婚老年人，分别为 29.41%、23.02%，既往研究表明丧偶、独居的老年人其老年痴呆发生率要远高于一般老年人，其获得的社会支持较少。农民老年痴呆阳性率（27.11%）高于其他人群，其他职业的人群参与社会活动和与人交往的频率可能要高于农村人群，其外部活动的多样性以及活动时间会在一定程度上减缓和降低老年痴呆的发生。

结论 山东省 65 岁以上老年人老年痴呆患病率稍高于全国平均水平（5.6%）。老年痴呆筛查阳性率与年龄、性别、文化程度和婚姻情况密切相关。建议在社会心理服务体系建设中，推动老年期痴呆早期、定期、规范筛查，并积极开展“医院-社区-家庭”一体化的社区综合防治。不断开展健康宣教工作，提高居民心理健康素养，逐步形成关注老年痴呆、关爱老年人的社会氛围

关键字：老年痴呆、筛查、现状调查

The Global Burden of Six Psychiatric Disorders and Health Inequality From 1990 To 2019

Nanxi Li[1], Junjian Mo[2], Sihao Chen[1], Wei Wei[1], Tao Li[1]
1.Affiliated Mental Health Centre & Hangzhou Seventh People's Hospital
2.Department of Hematology, The Fifth Affiliated Hospital, Sun Yat-sen University

Objective The aim of this study is to characterize the burden of six psychiatric disorders, including depressive disorders (DD), bipolar disorder (BD), schizophrenia (SCZ), anxiety disorder (AD), autism spectrum disorders (ASD), and attention-deficit/hyperactivity disorder (ADHD), and to investigate cross-country inequalities

across different levels of socio-demographic development.

Methods The disability-adjusted life years (DALYs) estimates for the six psychiatric disorders, along with their 95% confidence intervals (CI), were obtained from the Global Burden of Disease Study. Age-standardized DALYs rates (ASDR) were calculated for 204 countries. To evaluate the distributional inequalities in the burden of these mental disorders, we employed the slope index of inequality and concentration index, which are two standard metrics of absolute and relative gradient inequality recommended by the World Health Organizations.

Results There were also significant disparities in the global DALYs rates of the six psychiatric disorders by age and gender, and there was notable heterogeneity in the ASDR across 204 countries in 2019. Furthermore, the Slope Index of Inequality also revealed a shift from 93.5 (95% CI: 22.0 to 165.1) in 1990 to 131.9 (95% CI: 64.2 to 199.6) in 2019 for DD, from 97.7 (95% CI: 77.5 to 117.8) in 1990 to 95.7 (95% CI: 73.9 to 117.5) in 2019 for BD, from 119.4 (95% CI: 109.4 to 129.4) in 1990 to 131.8 (95% CI: 122.0 to 141.6) in 2019 for SCZ, from 157.0 (95% CI: 122.7 to 191.2) in 1990 to 156.3 (95% CI: 119.5 to 193.1) in 2019 for AD, from 6.2 (95% CI: 2.2 to 10.2) in 1990 to 4.7 (95% CI: 0.4 to 9.0) in 2019 for ASD, from 7.0 (95% CI: 5.1 to 9.0) in 1990 to 2.7 (95% CI: 0.9 to 4.6) in 2019 for ADHD. The concentration index also indicated 39.0 (95% CI: 30.8 to 47.3) in 1990 and 41.4 (95% CI: 33.3 to 49.4) in 2019 for DD, 41.8 (95% CI: 34.0 to 49.5) in 1990 and 39.8 (95% CI: 32.0 to 47.6) in 2019 for BD, 42.8 (95% CI: 34.8 to 50.8) in 1990 and 43.2 (95% CI: 35.3 to 51.2) in 2019 for SCZ, 41.8 (95% CI: 33.9 to 49.7) in 1990 and 41.6 (95% CI: 33.8 to 49.5) in 2019 for AD, 40.3 (95% CI: 32.4 to 48.3) in 1990 and 39.7 (95% CI: 32.0 to 47.5) in 2019 for ASD, 44.4 (95% CI: 36.4 to 52.5) in 1990 and 44.0 (95% CI: 36.2 to 51.8) in 2019 for ADHD.

Conclusion There is a significant heterogeneity in ASDR across countries, as well as in the age and sex distribution of the global DALYs rate among the DD, BD, SCZ, AD, ASD and ADHD. Countries with high level of socio-demographic development bore a disproportionately greater burden of these psychiatric disorders, and the degree of inequality between these countries and those with high levels of socio-demographic development has exacerbated over time.

The Association between Various Dimensions of Sleep Parameters and Mental Health: A Large Cross-sectional Study of 13554 Chinese Students

王鲜*
郑州大学公共卫生学院

Objective We aimed to investigate the association between multiple sleep variables and mental health among Chinese students aged 9–22.

Methods We stratified the included 13,554 students by educational levels. Sleep parameters contained sleep duration on school days and weekends, napping time, chronotype and social jetlag (SJL), which were calculated via questionnaires. Individual psychological well-being and distress were assessed by Warwick-Edinburgh mental Well-being scale and the Kessler Psychological Distress Scale 10 respectively. The multiple linear and binary logistic regression were applied to analyze the association of sleep with mental health.

Results Short sleep on school days showed significantly positive association with psychological problems. While among senior high school students, we found reverse result that sleeping less might negatively associated with more severe distress (7-8 h: aOR = 0.67, 95% CI: 0.46, 0.97). The association of sleep duration with mental health was attenuated a lot on weekends. The chronotype was significantly related with mental health in primary and junior high school: intermediate chronotype (vs late chronotype) was associated with greater wellbeing (β = 1.03, 95% CI: 0.09, 1.96; β = 1.89, 95% CI: 0.81, 2.97) and less distress (aOR = 0.78, 95% CI: 0.60, 1.00; aOR = 0.73, 95% CI: 0.58, 0.91). The relationship between SJL, napping duration and psychological health problems were also observed in some educational levels.

Conclusion Sleep deprivation on school days, late chronotype and SJL were positively associated with worse mental health in our study, which differed among various educational stages.

Correlation Analysis of Depressed Patients with Borderline Personality Traits and Non-suicidal Self-injure Behavior

Wangni Chen Ting yuan Yuwen Pan Yuan Lu Jie Zhang*
广州医科大学附属脑科医院

Objective Adolescent with psychiatric disorders and non-suicidal self-injure behavior are a serious public health problem. Fewer studies have explored the relationship between borderline personality traits and non-suicidal self-injure behaviour in patients with depressive disorders. This paper focuses on the prevalence of non-suicidal self-injure behaviour in adolescents with depressive disorders and compares the clinical characteristics of adolescents with depressive disorders with and without borderline personality disorder traits.

Methods This cross-sectional study included 391 patients aged 13-25 years, including 297 (76.0%) females, who visited at the Brain Hospital of Guangzhou Medical University from January 2022 to May 2023, and included patients with a diagnosis of unipolar or bipolar depression based on the diagnostic criteria called ICD-10. Self-assessment and unstructured interviews were used to assess patients' depressive symptoms, borderline personality traits, negative adolescent life events and non-suicidal self-injure behavior using the Hamilton Depression Inventory

(HAMD-17), Borderline Symptom List-23 (BSL-23), Adolescent Life Events Questionnaire and Non-Suicidal Self-injure Brief Assessment Tool respectively. Data were analyzed using SPSS23 software with t-tests or non-parametric tests for continuous variables based on normality, chi-square tests for categorical variables, and multivariate logistic regression to explore risk factors for non-suicidal self-injure behavior.

Results A total of approximately 60.35% (236/391) of patients with depressive disorders were found to exhibit non-suicidal self-injure behaviour. Patients with non-suicidal self-injure behaviour were more likely to be female (X2=21.66,P<0.001), younger (t=5.182,P<0.001), to have a previous history of suicide (t=22.119,P<0.001) and to have more severe depressive symptoms (t=-3.699,P<0.001) than those without non-suicidal self-injure behaviour. Borderline personality traits were more obvious(t=-7.187,P< 0.001) and negative life events were more frequent in adolescents (t=-2.585,P=0.01). After adjusting for confounding variables, multivariate logistic regression found that female (OR=3.088, 95%CL 1.787-5.337,P<0.001), previous suicidal history (P=0.005), and borderline traits (OR=1.033,95%CL1.017-1.045,P<0.001) independently influenced depressed patients' non-suicidal self-injure behaviour.

Conclusion The prevalence of non-suicidal self-injure behaviour was higher among adolescents with depressive disorders, and females, previous suicidal history, negative adolescent life events, borderline traits, and depression levels were strongly associated with non-suicidal self-injure behaviour. However, the relationship between borderline personality traits and non-suicidal self-injure behaviour was more significant after adjusting for population characteristics.Further research is needed to explore the relationship between life events, borderline traits and NNSI.

关键字：adolescent, depression ,BPD, non-suicidal self-injure behavior, adolescent life events.

Exploring Influencing Factors and Differences of Suicidal Ideation and Suicide Attempts Among Depressed Adolescents Based on Decision Tree Model

周勇杰[1] 刘佳瑶[2] 王旸[2]
1.康宁医院
2.深圳大学

Objective Suicide has been recognized by the World Health Organization as a major global public health issue. Depressed adolescents with abnormal psychological conditions are more prone to experiencing suicidal health problems. To effectively prevent suicide behavior, it is crucial to further enhance our understanding of suicide. Therefore, we explored the influencing factors of suicidal behavior among depressed adolescents in different stages of suicide, comparing the similarities and differences between suicidal ideation and suicide attempts.

Methods A multicenter survey was conducted in 14 tertiary hospitals' psychiatric departments across nine provinces in China. A total of 2,343 depressed adolescents aged 12-18 years were recruited through convenience sampling. We utilized a decision tree classification model, incorporating 31 factors encompassing participants' suicidal behavior. All factors are categorized into demographic characteristics, psychological traits, and social stressors. The importance of each factor was measured using Gini coefficients.

Results Among the 2,343 participants, valid data from 2,300 completed surveys were collected after excluding cases with unanswered suicide-related questions. The model demonstrated a good fit with high accuracy (SI=0.86, SA=0.85 and F-Score (SI=0.85, SA=0.83). The predictive importance of each factor varied between groups with suicidal ideation and with suicide attempts. The most significant influencing factor in both groups was depression (16.7% for suicidal ideation, 19.8% for suicide attempts). However, factors such as perceived academic stress, level of hopelessness, and age were more closely associated with suicidal ideation (7.2%, 9.1%, 7.1%) than suicide attempts (1.6%, 5.0%, 3.2%). Factors related to the current atypical school status, duration of education, and the extent of perceived loneliness due to external abandonment were relatively more important in the suicide attempt stage (10.10%, 8.6%, 7.4%) compared to suicidal ideation (3.5%, 2.6%, 2.3%).

Conclusion Individual risk factors, such as depression and stress, significantly influence suicidal behavior of depressed adolescents and exert a greater impact on suicide ideation than suicide attempt. While the social and environmental context where individuals exist, including education and social connectedness, has a larger impact on suicide attempts among depressed adolescents.

Human Resources Available To Provide Treatment and Social Welfare Services To Mentally Ill Individuals in Mainland China: A Scoping Review

Meng Sun[1], Hongling Zhou[1], Yue Li[1], Jiali Wang[1], Wenjuan Yang[1], Yi Gong[1], Jiahuan Xu[1], Jiawen Zhang[1], Xinhu Yang[1], Marlys Bueber[2], Michael R, Phillips[2,3], Liang Zhou[1]
1.Department of Social Psychiatry, the Affiliated Brain Hospital of Guangzhou Medical University, Guangzhou, China
2.Shanghai Mental Health Centre, Shanghai Jiao Tong University School of Medicine, Shanghai, China
3.Departments of Psychiatry and Epidemiology, Columbia University, New York, NY, USA

Objective Mental health professionals in various institutions in mainland China provide treatment and social support services to individuals with mental disorders. Over the last 20 years of rapid urbanisation, the numbers, type, distribution, and qualifications of these professionals have

changed dramatically. However, there has been no systematic attempt to collect information about this transformation in the human resources available to provide mental health services—information that needs to be regularly updated to improve the country's coordination of these services.

Methods This scoping review compiles current details on China's mental health workforce and identifies critical gaps in available research and reporting. We systematically reviewed all relevant studies and reports published between 1 January 2000 and 30 June 2021 in six databases (Web of Science, Pubmed, CNKI, Wanfang, the National Science and Technology Library of China, and the State Council Policy Document Database of China) and one website (the National Health Commission of the People's Republic of China). We also reviewed yearbooks about provincial health services available on the websites of provincial Health Commissions from 2000 through 2020.

Results We identified 82 reports from 69 studies and two relevant government reports. From 2000 to 2020, the number of psychiatrists in the country increased by 139%, and the number of psychiatric nurses increased by 340%. However, the much higher number of mental health professionals per 100,000 population and the better quality of training of mental health professionals in urban, eastern provinces compared to rural, western provinces remained unchanged over the 20 years. Progress has been made in standardising the training of psychiatrists, but there are no standardised training programs for psychiatric nurses, clinical psychologists, or psychiatric social workers.

Conclusion Future research needs to address several issues that limit the effectiveness of policies aimed at increasing the size, quality and equitable distribution of China's mental health workforce: 1) limited data available about the numbers and training of mental health professionals in many provinces, 2) absence of data about mental health-related training of non-psychiatric medical professionals and non-medical personnel (including teachers, police, family members, and others) who provide essential monitoring and supportive care to those with mental illness, and 3) failure to formally assess the outcomes of the training programs.

兴奋-抑制神经递质失衡在迟发性运动障碍临床识别和发生机制中的作用

于婷* 谭云龙
北京回龙观医院

目的 迟发性运动障碍(TD)是精神科最为棘手、致残性最高，且目前仍无有效治疗手段的药物不良反应。其发病机制未明，既往研究提示，兴奋-抑制性神经递质失衡，在其病理生理机制中作用关键。本研究通过检测细胞内外，皮质-纹状体-白质通路，谷氨酸-GABA 系统功能。为 TD 机制的认识提供新证据，为临床诊断及治疗评价提供生物学指标。

方法 1：以伴有 TD 的精神分裂症患者(TD 组)50 例，性别、年龄、受教育年限、利手、病程及抗精神病药相匹配的不伴有 TD 的精神分裂症患者（NT 组）50 例和健康对照(HC 组)50 例为研究对象。采集前扣带回谷氨酸和 GABA 磁共振波谱，通过异常不自主运动量表(AIMS)评估 TD 严重程度 2：采集上述三组被试静息态功能磁共振成像，进行全脑局部一致性(ReHo)分析，对运动环路做静息状态功能连接(rsFC)分析。3：检测白质区域易损伤指数(RVI)作为认知缺陷预测指标，采集认知功能成套测验(MCCB)。4：应用 Freesurfer 及 VBM 计算脑皮质体积、厚度、表面积。比较组间差异，分析各指标间相关关系。

结果 1：TD 组谷氨酸最高(243.35 ± 379.76 ppm)，NT 组最低(44.51 ± 118.09 ppm)，HC 组居中(191.37 ± 296.89 ppm)。TD 组 GABA(15.00 ± 15.65 ppm)明显低于，NT 组(25.15 ± 30.16 ppm)和 HC 组(25.13 ± 24.58 ppm)(图 1)。TD 组 GABA 浓度与 AIMS(颈肩髋)有正相关趋势。2：疾病组 ReHo 减低(图 2)；TD 组比 NT 组 ReHo 增加(图 3)；TD 组 ReHo 与 AIMS 相关。疾病组运动环路 rsFC 减低(图 4)；TD 组比 NT 组 rsFC 减低(图 5)；TD 组 rsFC 与 AIMS 负相关(图 6)。3：TD 组 RVI 最高，NT 组次之，均显著高于 HC 组。NT 组 RVI 与言语流畅性和加工速度负相关，而 TD 组不存在这种相关性。4：TD 组左中央前上沟皮质体积、表面积仍较非 TD 组大；TD 组 AIMS 总分与左中央前上沟皮质体积正相关。灰质体积示 NT 组和 TD 组广泛减小，额叶更明显；TD 组比 NT 组脑干等增大，楔叶、舌回减小(图 7)。TD 组灰质体积与 AIMS 正相关(图 8)。

结论 TD 影响皮质-纹状体-白质通路微结构，兴奋-抑制性神经递质失衡与 TD 患病风险的增高可能有关。

关键字：磁共振成像，神经细胞内，脑代谢，异常不自主运动

Prevalence of and Factors Associated with Overweight and Obesity in Patients with Severe Mental Disorders in Shenzhen: Results From The Urban Chinese Population

Xiaodong Peng* Wei Shan Zhijian Zhou Guojun Wang
Shenzhen Kangning Hospital

Objective The objective was to analyze the prevalence of overweight and obesity in patients with SMDs and the factors associated with their sociodemographic and disease characteristics in a cross-sectional population-based study.

Methods This analysis examined the prevalence of overweight and obesity in 14,868 managed SMD patients in an urban area of Shenzhen city based on data from the health information monitoring system in 2020. Sociodemographic and physiological characteristics of overweight and obesity in SMD patients were described. Multivariate logistic regression models were used to identify the factors associated with the prevalence of overweight and obesity

in patients with SMDs.

Results Records of 14,868 participants were included for analysis. The prevalence of overweight and obesity in patients with SMDs in this study was 32.6% and 16.1%, respectively. In multivariate analysis, married status, Shenzhen household registration, management durations of 5-10 years and >10 years, participation in family physician services, taking clozapine or aripiprazole, FPG>6.1 mmol/L, hypertension, TC≥5.2 mmol/L, TG≥1.7 mmol/L, and more frequent follow-ups in the past year were associated with higher odds of overweight and obesity. Compared to their respective reference categories, living with parents, spouse and children, taking risperidone, aripiprazole, amisulpride and perphenazine, FPG>6.1 mmol/L, hypertension, TC≥5.2 mmol/L, TG≥1.7 mmol/L, and more frequent follow-ups in the past year were associated with higher odds of obesity.

Conclusion We observed a high prevalence of overweight and obesity in patients with SMDs in this study. The findings highlight the need for integrated management of overweight and obesity risk factors among patients with SMDs.

广东省青年人抑郁、焦虑与不良生活方式的关联性研究

王诗镔[1] 唐志滔[2]
1.广东省精神卫生中心，广东省人民医院，广东省医学科学院
2.吉林大学公共卫生学院

目的 调查广东省青年人抑郁、焦虑症状的流行情况，分析抑郁、焦虑与不良生活方式的关联性，为青年人群心身健康问题的防治策略和干预措施提供证据。

方法 利用 2022 年开展的“广东省居民心理健康素养调查”的数据，采用多阶段分层随机抽样法于省内 21 个地市抽取 18-44 岁的青年居民作为研究对象，共纳入有效样本 28789 例。抑郁和焦虑症状分别采用患者健康问卷抑郁症状群量表（PHQ-9）和广泛性焦虑障碍量表（GAD-7）评估，纳入 8 种不良生活方式因素，包括吸烟、饮酒、非规律一日三餐、不锻炼、屏幕时间过长、久坐行为、非正常体重（BMI 过高/过低）、失眠。协变量纳入社会人口学特征、慢性病数、心理健康素养。基于复杂加权统计，分析广东省青年人抑郁、焦虑症状的流行情况，采用 Rao-Scott χ 2 检验分析各因素与抑郁、焦虑的关联性；使用二阶聚类法，对各不良生活方式因素进行聚类分析；采用多因素 Logistics 回归，通过三种不良生活方式组合（模型 1：代入各个不良生活方式因素；模型 2：代入不良生活方式总数；模型 3：代入各个不良生活方式类别），分析其与抑郁、焦虑的关联性。

结果 广东省青年人群抑郁、焦虑症状检出率分别为 28.0%和 19.5%。其中，81.6%的青年同时存在 1-4 种不良生活方式。通过二阶聚类法，得出 8 个类别，依据各类别组成概率，命名为健康生活组（10.0%）、不锻炼-屏幕时间过长-吸烟-饮酒组（19.0%）、不锻炼-久坐行为-屏幕时间过长组（13.0%）、不锻炼-屏幕时间过长-失眠组（14.9%）、不锻炼组（9.8%）、不锻炼-屏幕时间过长-非规律一日三餐组（17.8%）、非正常体重-不锻炼-屏幕时间过长组（6.%）、不锻炼-屏幕时间过长组（9.5%）。多因素 Logistics 分析发现，非规律一日三餐、不锻炼、屏幕时间过长、久坐行为、失眠是抑郁的危险因素；饮酒、非规律一日三餐、不锻炼、屏幕时间过长、久坐行为、失眠是焦虑的危险因素；不良生活方式越多，抑郁、焦虑的风险越大；不锻炼-屏幕时间过长-失眠组和不锻炼-屏幕时间过长-非规律一日三餐组患抑郁、焦虑的风险较大，且远大于单个不良生活方式因素的风险。

结论 广东省青年人群的抑郁、焦虑症状发生率较高，不良生活方式流行程度较高，呈簇集特征，需健康促进相关专业人员关注不良生活方式的聚集作用和联合作用对心理健康的威胁，加强心身健康教育。

The Impact of Childhood Trauma on Emotional Distress and The Mediating Role of Sense of Coherence Among College Students in China

Ningdan Fan[1,2], Huanhuan Fan[1,2], Yushun Yan[1,2], Xiao Yang[1,2], Min Wang[1,2], Yikai Dou[1,2], Ruiqing Luo[1,3], Yu Wang[1,2], Rongjun Ni[1,2], Jinxue Wei[1,2], Wanqiu Yang[4,5], Xiaohong Ma[1,2]
1.Mental health center and laboratory of psychiatry, West China Hospital of Sichuan University,, Chengdu, China.
2.Huaxi Brain Research Center, West China Hospital of Sichuan University, Chengdu, China.
3.Chongqing Mental Health Center.
4.School of Ethnology and Sociology, Yunnan University, Kunming, China.
5.School of medicine, Yunnan University, Kunming, China.

Objective Childhood trauma is strongly linked to emotional distress. However, there has been limited investigation into the relationship between childhood trauma and emotional distress. This study attempted to examine the relationship among childhood trauma, sense of coherence (SOC) and mental health, and further explore the moderating role of SOC in college students.

Methods This cross-sectional study focused on Chinese undergraduate college students who were administrated online questionnaires consisting the childhood trauma questionnaire(CTQ), SOC scale, Patient Health Questionnaire 9(PHQ-9) and Generalized Anxiety Disorder Questionnaire(GAD-7). T tests were used to assess the statistical significance of sample characteristics. Path analysis and structural equation modeling(SEM) were employed to examine the relationships among the variables in the hypothesized model. Moderation analysis was conducted to explore the impact of SOC on the relationship

between CTQ and GAD-7/PHQ-9, where CTQ served as the independent variable and GAD-7/PHQ-9 as the dependent variable. Logistic regression analysis was utilized to explore the relationship between mental health problems, SOC, and other potential causes.

Results A total of 2307 Chinese college students (1044 female, 1263 male) participated in this study. In this study, female have higher SOC than male(T=-4.089, P<0.001). Female have better comprehensibility(T=-4.933, P<0.001） than male. Secondly, the study indicated that college students who have experienced childhood trauma have a higher proportion of anxiety(14.95%) and depression(32.44%) compared to those who have not experienced childhood trauma (anxiety: 4.99%; depression: 14.02%). In logistic regression analysis, women were not at higher risk of developing mental health problems than men(OR, 0.928; 95%CI: 0.757 to 1.137), younger college students,especially freshmen, were at increased risk of developing depression(OR, 0.617; 95%CI: 0.480 to 0.792) or anxiety(OR, 0.587; 95%CI: 0.406 to 0.847) than older college students, and participants with low SOC were more likely to have symptoms of anxiety or depression than people with high SOC (OR＜0.001).The results showed that SOC had negative moderating effects on the relationship between CTQ on GAD-7 (standard β = -0.45, P<0.001) and PHQ-9 (standard β = -0.467, P<0.001).

Conclusion Childhood trauma has been linked to an increased risk of emotional distress among college students. This study also revealed that SOC plays a negative moderating role in this process, broadering implications for mitigating emotional distress and enhancing trauma and distress adjustment. Additionally, these findings highlight the need for future research to explore the mechanisms underlying the development of depression and anxiety among college students, with a particular focus on understanding the roles of various influencing factors at psychological and social levels.

Preventing Post-discharge Suicides in Psychiatric Patients: Insights From Patients, Lay Healthcare Supporters, and Mental Health Professionals - A Qualitative Analysis

付甜甜[1] 刘慧铭[2] 陈畅[2] 张斌[2] 陈冠婕[2] 白渊翰[2] 李菁华[1] 侯丰苏[2]
1.中山大学公共卫生学院
2.深圳市精神卫生中心/深圳市康宁医院

Objective Discharged psychiatric patients are at higher risk of suicide due to various risk factors in their lives compared to the general population. However, specific problems and needs of these patients after discharge remain unclear. This study aims to qualitatively investigate the problems and needs from the perspectives of patients, their lay health supporters (LHSs), and mental health professionals (MPs), to offer guidance for reducing post-discharge suicide.

Methods This study is part of a larger implementation study based on Shenzhen Kangning Hospital (SKH) in Shenzhen, Guangdong, China. Under the community-based participatory research framework, we recruited discharged psychiatric patients, their LHSs, and MPs as a collaborative community team, and we conducted individual in-depth interviews for patients and LSHs and focus group interviews withs MPs. We utilized a thematic analysis approach to identify sub-themes and themes from interviews through systematically coding and condensing the data.

Results A total of 45 participants were recruited for interviews, comprising 17 patients, 8 LHSs, and 20 MPs. We conducted 25 individual in-depth interviews and 3 focus group interviews. Through the interviews, we identified three themes of post-discharge problems: problems related to self, family-related problems, societal and community-related problems. We also identified four themes related to reducing post-discharge suicide: proactive self-management, multifunctional relatives, multifunctional MP group, and a warm society. The tangible support from LHSs and emotional support from MPs are strongly emphasized. Follow-up interventions were identified as the most significant way to addressing these unmet needs. Instrumental support from the community and a caring and non-discriminatory environment for individuals with mental disorders are essential for reducing suicide risk.

Conclusion Establishing an integrated mental health care service network that connects psychiatric patients, LHSs, and MPs cross community and societal sectors, with patient-centered follow-up care at its core, is a practical approach to better address patients' needs and reduce post-discharge suicide.

Characteristics and Associated Factors of Psychotic-like Experiences in Remission: A Cross-sectional Study Among College Students in China

杨欣湖 黎玥 周洪玲 孙梦 周亮*
广州医科大学附属脑科医院

Objective Psychotic-like experiences (PLEs) are common and associated with potential poor mental health among adolescents. Although the associated factors of PLEs have been widely explored in previous research, the characteristics and associated factors of remission PLEs remain unclear. Therefore, the aim of this proposed cross-sectional study is to describe the characteristics of those who reported remitted PLEs through comparing them with non-PLEs and current PLEs in a large sample of college students in five domains: demographics, lifestyle, psychosocial factors, lifetime affective symptoms and sleep problems.

Methods A total of 4,208 college students completed an online self-report questionnaire between October and December 2020. The 15-item positive subscale of the community assessment of psychic experiences (CAPE-P15) was used to assess non-PLEs, remission and current PLEs. Multivariate logistic regression models were used to examine associations between remission PLEs and a range of factors from demographic, lifestyle, psychosocial factors, lifetime affective symptoms and sleep problems.

Results Three developmental trajectories of PLEs were observed: non-PLEs (47.27% of the sample), remission PLEs (40.42%) and current PLEs (12.31%). The factor values of the remission group were almost in between non-PLEs and current PLEs. Recent adverse life events, resilience, depressive/anxiety symptoms and early wakening are shared associated factors for the promotion of the remission of PLEs and prevention of the onset of PLEs; social support is the specific associated factor for the promotion of the remission of PLEs; sex, age, chronic physical illness, alcohol intake, childhood trauma and waking up easily at night are specific associated factors for the remission of PLEs in comparison to the non-PLEs group.

Conclusion To our knowledge, this is the first study to explore associated factors for the remission of PLEs from multiple domains (including socio-demographic, lifestyle, psychosocial factors, lifetime affective symptoms and sleep problems). We found almost all the measures among the remission group were consistent between the current PLEs group and non-PLE group. These findings suggest that remission PLEs are a vital and unique developmental trajectory and provide preliminary targets for the development of precision prevention and intervention for adolescents at risk of mental health problems. Further investigation may shed light on the causality of the relationship between remission PLEs and these associated factors.

Development and Validation of A Predictive Model for Readmission of Major Depressive Disorder Patients with Negative Attempts

郝新梅 孙平*
青岛市精神卫生中心

Objective A chronic disease known as major depressive disorder (MDD) is characterized by a significant probability of relapse. The study aimed to investigate the factors associated with the occurrence of readmission in first-hospitalized MDD patients with negative attempts to build a predictive model eventually.? [Methods]The study enrolled 3977 MDD patients. By reviewing the patient visit records in the hospital information system (HIS), biochemical parameters, demographic characteristics, clinical course, symptom characteristics, family history, concomitant somatic disorders, and tobacco and alcohol habits were acquired. The data were randomly split into a training set and a validation set in R software. Statistical descriptions and univariate logistic regression analysis were performed on the training set. The multivariate logistic analysis incorporated factors that were linked to the outcome in univariate analysis to create a stepwise regression model (with a p threshold <0.2). Then visualize it with Nomogram. In the next step to evaluate the model, we successively evaluated the model with the training set and validation set data in three directions from the discrimination, calibration, and clinical decision curve analysis, respectively.

Results (1) There was a significant difference in the incidence of readmission between first-hospitalized MDD patients with negative attempts and those without negative attempts; (2) Length of stay, course of the disease, somatic symptoms, psychosis symptoms, anxiety symptoms, alcohol/tobacco dependence, family history of psychiatric disease, continued use of antidepressants combined with antipsychotics or not after discharge, and TBIL were included in these variables to build a predictive model in R software called “model. step”; (3) The AUCROC was 0.783 for the training set and 0.778 for the validation set. The Hosmer-Lemesho (H-L) test for calibration was P = 0.3521 for the training set and P = 0.8497 for the validation set.

Conclusion In conclusion, the study showed that the incidence of readmission was significantly higher in first-hospitalized MDD patients with negative attempts than in first-hospitalized MDD patients without negative attempts. The model built by these factors has acceptable discrimination, and calibration and also has certain clinical applicability. For better clinical applicability and a better prognosis for MDD patients, the model still has to be further tuned after many validations in several centers.

Altered Relationship between Functional Connectivity and Fiber- Bundle Structure in High-functioning Adults with Autism Spectrum Disorder

董强利[1] 郑炜豪[2] 张燕[3] 鞠玉朦[3]
1.兰州大学第二医院
2.兰州大学
3.中南大学湘雅二医院

Objective Autism spectrum disorder (ASD) is a pervasive neurodevelopmental disorder characterized by abnormalities in structure and function of the brain. However, the impact of ASD on the relationship between fiber-bundle microstructures and functional connectivity (FC), particularly how they are coupled, remains unclear.

Methods Here, we examined structural and functional images of 26 high-functioning adult males with ASD and 26 typically developing controls (TDCs) that were matched for age, gender, and full-scale IQ. We utilized fixel-based analysis to extract microstructural information from fiber tracts, which was then used to predict FC using

a multilinear model.

Results Our results revealed that the structure-function relationships in both ASD and TDC cohorts were strongly aligned in the primary cortex but decoupled in the high-order cortex, and the ASD patients exhibited reduced structure-function relationships throughout the cortex compared to the TDCs. Furthermore, we observed that the disrupted relationships in ASD were primarily driven by alterations in FC rather than fiber-bundle microstructures. The structure-function relationships in the left superior parietal cortex, right precentral and inferior temporal cortices, and bilateral insula could predict individual differences in clinical symptoms of ASD patients.

Conclusion These findings underscore the significance of altered relationships between fiber-bundle microstructures and FC in the etiology of ASD.

关键字：autism spectrum disorder (ASD); magnetic resonance imaging (MRI); structure-function relationships; fiber-bundle microstructures; functional connectivity

Revealing The Potential Causality of Suicidal Ideation and Psychopathic Symptoms Among Survivors 10 Years after The Wenchuan Earthquake Using Network Analysis

马紫娟 王东方 范方*
华师大学校医院大学城门诊部

Objective Little is known about which psychopathic symptom is most associated with suicidal ideation and their potential causal relationship among earthquake survivors. Using a 10-year large cohort of Chinese adolescents exposed to the Wenchuan earthquake, this study aimed to identify the most critical psychopathic symptoms linked to suicidal ideation and to examine the potential causality between the above variable.

Methods A total of 684 survivors who completed surveys at 6 months and 10 years post-earthquake and had one or above psychopathic symptoms were included in the analyses. Socio-demographic, post-traumatic stress symptoms, depressive symptoms, and suicidal ideation were measured at 6 months and/or 10 years post-earthquake. A gaussian graphical model (GGM) network, a flow network of suicidal ideation, and a directed acyclic graphs (DAG) network were performed based on R version 4.1.3.

Results The GGM network revealed that"Depressed mood" had the highest EI value. The flow network showed that nine symptoms were directly associated with suicidal ideation, especially "Negative beliefs - Suicidal ideation" with the highest edge weight value (0.28), followed by "Depressed mood - Suicidal ideation (the edge weight value = 0.24)". In addition, the DAG network revealed that anhedonia could affect "Depressed mood", which further lead to "Suicidal ideation", and finally trigger "Negative beliefs".

Conclusion The pathway of "Anhedonia → Depressed mood → Suicidal ideation" was a crucial psychopathic mechanism of suicidal ideation. It informs that intervening in anhedonia and depressed mood among earthquake-exposed survivors is necessary to potentially decrease the risk of future suicidal ideation.

Changes of Suicide Rate and Risk Factors for Non-psychiatric Inpatients During Hospitalization in General Hospital

Jiayi Liao[1], Robert Rosenheck[2], Bin Sun[1], Jingwen Liu[1], Yizhong Shen[3], Shuai Yuan[1], Yarong Ma[1], Jie Zhang[1], Rong Zhang[4], Lijiao Zheng[5], Hanwei Chen[5], Huiqiang Feng[6], Hongbo, He[1]
1.Department of Psychosomatic Medicine, The Affiliated Brain Hospital of Guangzhou Medical University, Guangzhou, China
2.Department of Psychiatry, Yale School of Medicine, New Haven, CT, USA
3.The Third People's Hospital of Zhuhai, Zhuhai, China
4.Guangdong Second Rongjun Hospital, Foshan, China
5.Guangzhou Panyu Central Hospital, Guangzhou, China
6.Health Commission of Guangdong Province, Guangzhou, China

Objective Currently, there remains a dearth of research on suicide among non-psychiatric inpatients in general hospitals. It is fundamental to identify the suicide risk of non-psychiatric inpatients. We investigated the suicide risk, suicide risk factors and mental health status of non-psychiatric inpatients in general hospital, with the aim of developing assessment methods preventive interventions to reduce the occurrence of suicidal behavior among general hospital patients.

Methods A prospective study was conducted at a tertiary general hospital with 1385 inpatient beds in Guangzhou, Guangdong Province, China. On-line assessment of mental health status and suicide was completed at admission and discharge. We assessed depression, anxiety, insomnia and suicide via the Patient Health Questionnaire-9, Generalized Anxiety Disorder-7, Athens Insomnia Scale and Columbia Suicide Severity Rating Scale. Binary logistics regression was used to examined the risk factors of suicide.

Results From April 1, 2021 and January 31, 2022, 3685 inpatients admitted to 24 non-psychiatric departments who finished assessment both at admission and discharge were consecutively enrolled in the study. Most inpatients were young and middle-aged, low education, low-income families, short hospital stay, and form the department of internal medicine and surgery. The detection rates of depression, anxiety and insomnia were 14.6%, 9.0% and 17.8%, respectively. There were 2.7% of inpatients at a suicide risk. Binary logistics regression demonstrated that the inpatients with anxiety were at higher risk of suicide.

Conclusion The comorbidity of physical illnesses and mental health problems, including depression, anxiety, insomnia, and suicide among non-psychiatric patients in general hospital was common. Medical staff in general

hospitals should be trained to improve their ability to identify mental disorders and high-risk individuals for suicide, provide timely interventions and effectively reduce the suicide risk of patients.

Exploring Bullying Experiences and Self-Harm Among High School Students Using Network Analysis

王佳丽 [1,2] 龚艺 [2] 徐嘉欢 [2] 张嘉雯 [2] 钟少玲 [2] 孙梦 [2] 苏敬华 [2] 周亮 [2]
1.中南大学湘雅公共卫生学院
2.广州医科大学附属脑科医院

Objective Given the increasing prevalence and potentially fatal outcome of self-harm among adolescents, exploring correlates associated with self-harm is urgent. Bullying is extremely prevalent among adolescents and is associated with an elevated risk of self-harm and suicide. Most previous research has employed regression analyses to demonstrate the independent association between bullying and self-harm after controlling demographics. However, the mechanism between bullying experiences and self-harm has less been investigated. This study used network analysis to delineate the relationship between self-harm, bullied experience, and other correlates of self-harm in a population-based sample of adolescents.

Methods A cross-sectional study was conducted among 3535 Chinese adolescents at middle and high schools aged 12-19. Self-harm was assessed using the question, "During the past 12 months, have you ever hurt yourself on purpose?" Bullying was measured according to the frequency of bullying experiences in the last month. Binary logistic regression was used to analyze the independent correlates of self-harm. In addition, network analysis was employed to examine the interplay between self-harm, bullying, and other correlates, including being left-behind, parents' marital status, academic pressure, feeling of insecurity to school, social support, loneliness, sleep quality, and depressive symptoms.

Results Among 3535 adolescents, 50.6% were girls, with a mean age of 15.55 (1.58) years. The 12-month prevalence of self-harm among the adolescent sample was 8.0%. 41.0% of adolescents reported being bullied in the past month. Bullying victimization was significantly associated with self-harm, adjusting for other correlates (OR= 2.16, 95%CI: 1.58-2.95, P<0.001). The estimated network consisted of ten nodes and twenty-nine non-zero edges and showed a significant relationship between bullying and self-harm in the adolescent sample. Depressive symptoms, loneliness, and self-ham were central factors in the network model. The edge weights indicated that self-harm was significantly associated with all measured correlates. The strongest association was with depressive symptoms, followed by being left-behind, bullying, and loneliness. Bullying was significantly associated with most correlates of self-harm, including loneliness, depressive symptoms, feeling of insecurity to school, and social support.

Conclusion Our findings suggest that self-harm prevention should focus more on adolescents who have experienced bullying. Parents, health professionals, and educational staff should routinely evaluate adolescents' experiences with bullying and provide timely support. School-based cooperative approaches for reducing bullying behaviors are also needed. Besides, future interventions for self-harm should comprehensively consider the interplay of various factors.

4.东南大学生物科学与医学工程学院

目的 目前青少年网络游戏成瘾和情绪障碍共病情况普遍，并且多以非自杀性自伤行为为主要表现形式，严重影响青少年的社会功能，成为了当前世界性公共卫生难题。冲动性高是网络游戏成瘾是常见的临床危害特征，与抑制控制损害密切相关。对于网络游戏成瘾和非自杀性自伤行为之间的因果关系尚不清楚，尤其是网络游戏成瘾作用于青少年非自杀性自伤行为的相关机制尚无明确证据。因此，本研究探索抑制控制功能在网络游戏成瘾和非自杀性自伤之间的中介作用，为两者共病的防治提供依据。

方法 采用网络成瘾测评量表、Barratt 冲动量表及与抑制控制相关的部分认知功能测验，包括连线测验 A(Trail Making Test A, TMT-A)，符号编码(Symbol Coding, SC)，神经心理评估成套测验迷宫测验(Neuropsychological Assessment Battery-Mazes, Mazes)于 2020 年 1 月到 2023 年 5 月共有 1002 名 14-20 岁的青少年抑郁患者在住院期间进行评估研究。用 SPSS24.0 软件进行统计分析。

结果 相关分析结果显示，网络成瘾、非自杀性自伤评估、抑制控制损害均呈正相关，相关系数为 0.401～0.699（均 P＜0.01）。结构方程模型分析结果显示，抑制控制损害在青少年网络成瘾和非自杀性自伤间起完全中介作用，中介效应模型拟合较好（$\chi2$ /df = 3.587, CFI = 0.911, TFI = 0.921, RMSEA = 0.072, SRMR = 0.028）。抑制控制功能损害可正向预测非自杀性自伤程度（r= 0.52, P< 0. 001），采用偏差校正百分位 Bootstrap 进行中介效应检验, 抑制控制损害在网络游戏成瘾与青少年非自杀性自伤的中介效应 95%的区间为[0.10, 0.71], 中介效果量为 41.38%, 中介作用显著。

结论 青少年网络成瘾对非自杀性自伤有一定预测作用，通过抑制控制损害发挥间接作用。

Difference in Relationship of Peer Victimization and Mental Health in Vocational School Students by Genders : A Network Analysis

王俊 唐劲松*
浙江大学医学院附属邵逸夫医院

Objective We sought to explore the interconnection of peer victimization, depression, anxiety, wellbeing and mental resilience across genders and find the key symptoms related to peer victimization respectively in male and female vocational school students.

Methods A total of 4929 students from vocational school were included. The Multidimensional Peer Victimization Scale (MPVS) was used to measure peer victimization, the nine-item Patient Health Questionnaire (PHQ-9), the seven-item Generalized Anxiety Disorder Scale (GAD-7), the Warwick-Edinburgh Mental Well-being Scale (WEMWBS), and the 10-item Connor-Davidson Resilience Scale (CD-RISC-10) were used to measure mental health including anxiety and depressive symptoms, well-being and mental resilience. Network analysis was used to explore the interconnection of peer victimization and mental health respectively by genders. Central symptoms were identified via centrality indices.

Results Suicide thought and depressed mood were the most central nodes of the network respectively in male and female students. Also, chronic depressed mood played important role in the network in both male and female students.

Conclusion Suicide thought was the key symptom related to peer victimization in male vocational school students however depressed mood in female students. Screening and curbing suicide thought and depressed mood is likely to protect students suffering peer victimization from further harm.

关键字：peer victimization , anxiety, depression, gender difference

Hypoconnectivity within The Orbitofrontal-striatal-thalamic Network in Patients with Obsessive-compulsive Disorder without Depression.

李康宁[1] 李洵[2] 曹玉萍[1] 杨垣[1]
1.中南大学湘雅二医院
2.南华附一医院

Objective Alterations in the functional connectivity within and between orbitofrontal-striatal-thalamic (OST), cingulo-opercular network (CON), and default mode network (DMN) network are widely detected to explore the pathogenesis in obsessive-compulsive disorder (OCD). Comorbid mood disorders co-occur commonly with OCD, and work is needed to assess the connectivity of these functional connectivity networks in patients with OCD without a mood disorder.

Methods Fifty-four OCD patients with no depression and 42 healthy controls aged 18-51 were compared in this study. Resting-state fMRI was used to compare the functional connectivity within and between the DMN, CON, and OST networks. The regions of interest (ROIs) for DMN and CON were selected from previous categorizations. ROIs for striatal and thalamic in OST are chosen from papers of Di Martino et al. and Fitzgerald et al. Others were selected from the Harvard-Oxford atlas as distributed with FSL.

Results The average Y-BOCS score in the OCD group was 20.15 (7.13). There were no differences in mean age, gender percentage, education, or FD between the two groups (Ps > .05). Significant differences could be seen in the connectivity within the OST network (F=6.84, p=.011, FDR adjusted p=0.044). Additionally, connectivity within the OST network was more less in the OCD group (M=.30) than that in the HC group (M=.34, SD=.12). There were no significant differences in the other networks (within DMN, within CON, OST-CON, OST-DMN, DMN-CON) (all FDR adjusted p > .050).

Conclusion Hypoconnectivity in OST is a characteristic of OCD without psychiatric comorbidity, suggesting that previous reports of altered functioning of this network in individuals with OCD were not due to comorbid mood disorders.

人牙髓干细胞改善慢性不可预知温和刺激模型小鼠的抑郁样行为及认知功能的研究

张煜晖 刘忠纯*
武汉大学人民医院精神卫生中心

目的 抑郁症是一种常见的精神障碍，其对人类健康的威胁越来越受到研究者们的重视。大量研究表明，异常的神经元功能、过度激活的小胶质细胞和过度的神经炎症反应与抑郁症的发作有关。 目前在神经科学领域，干细胞疗法被用于研究多种神经退行性疾病及神经损伤性疾病。人牙髓干细胞（hDPSC）位于牙髓的血管周围壁龛内，被认为起源于迁移的颅神经嵴（CNC）细胞，同时可以高度表达多种神经生物标志物。多项实验表明牙髓干细胞可以通过诱导分化为神经系统细胞和分泌细胞因子的作用促进神经修复，减少神经炎症，以保护和滋养受损神经微环境中的神经元。然而，牙髓干细胞在治疗抑郁症等精神疾病中的作用还未得到充分研究。

方法 制备慢性不可预知温和刺激（CUMS）抑郁模型是通过将实验动物随机暴露于各种低强度的社会和环境刺激下，持续 7 周实现。随后进行脑立体定位注射，将 1μL 的人牙髓干细胞（1*10^5/ml）双侧注射到腹侧海马内。动物抑郁样行为及认知功能通过开放矿场实验（OFT）、蔗糖偏好实验（SPT）、悬尾实验（TST）和 Morris 水迷宫实验（MWM）等动物行为学实验评估。

结果 慢性不可预知温和刺激诱导小鼠抑郁样行为及认知功能损伤，使小鼠 OFT 的中心区域时间减少，TST 的不动时间增加，SPT 中蔗糖偏好降低，以及 MWM 中规定时间内通过水面平台的次数减少。海马注射人牙髓干细胞的实验组小鼠相比于假手术组，OFT 的中心区域时间增加，TST 的不动时间减少，SPT 中蔗糖偏好升高，以及 MWM 中规定时间内通过水面平台的次数增多。但相比于对照组，两组的 OFT 运动总距离均有降低。

结论 我们的研究结果揭示了人牙髓干细胞可以一定程度上逆转 CUMS 造成的小鼠抑郁样行为，并挽救认知功能损害。此外，也为应用干细胞疗法治疗抑郁症等精神疾病的机制研究提供了实验支持。

Gender Differences of Neurometabolic and Neuroendocrine Alternations and Its Lateralization in Adolescents with Major Depression

宋小东 贾艳滨*
暨南大学附属第一医院

Objective : H protons magnetic resonance spectroscopy (1H-MRS) has been used to detect the biochemical metabolism changes in major depressive disorder (MDD). While, the current research on the mechanism of gender-related adolescent depression is still insufficient. Lateralization study can better reflect the characteristic changes of brain function in patients with depression. The study foucus on the neurometabolic and neuroendocrine alternations , so as to find gender-related differences in endocrine alternations and brain metabolism in patients with depression.

Methods : A total of 121 adolescents with MDD(43 with male, and 78 with female) were recruited in this study. Bilateral metabolite levels of the prefrontal cortex (PFC), anterior cingulated cortex (ACC), lenticular nucleus (LN) of basal ganglia, thalamus and cerebellum were obtained by 1H-MRS at 3.0 T, and then the ratios of N-acetyl aspartate (NAA) and cholinecontaining compounds (Cho) to creatine (Cr) were determined, respectively. Finally, we calculated the LI values of various brain regions to compare the lateralization characteristics of brain metabolism in patients with depression.

Results : 121 adolescent MDD participants were enrolled in our study. Significant differences in endocrine indices were observed in TT4 (t= -2.718, p =0.008), ACTH (z = -2.943, p = 0.004) between male and female MDD patients. Relative to the male MDD patients, female MDD patients exhibited higher TT4 level, but lower ACTH level in the blood. Significant differences in cerebellum NAA/Cr and Cho/Cr ratios were observed in the Cho/Cr ratios in the left cerebellum(t = 2.656, p = 0.009) between the two groups. Female MDD patients showed significantly lower Cho/Cr ratios in left cerebellum than male patients. Correlation analysis shows there was a significant positive correlation between TT4 and Cho/Cr ratios in the left cerebellum in male adolescents (r = 0.391, p = 0.01). Comparison of the LI of the PWM, ACC, BG,and cerebellum in the female group to the standard value (Standard value = 1.0) showed a higher LI in the Cho/Cr ratio in the thalamus((t = 3.029,p = 0.003) , and a higher LI in the NAA/Cr ratio in the BG of female group, at a confidence level of p < 0.05(t = 3.182,p = 002).

Conclusion : Depressed adolescents have characteristic endocrine and brain metabolic pathogenesis related to sex. Female depressed adolescents exhibited higher TT4 level, but lower ACTH level than male ones, and female adolescents patients showed significantly lower Cho/Cr ratios in left cerebellum than male patients. For male patients, there was a significant positive correlation between TT4 and Cho/Cr ratios in the left cerebellum. Higher LI of the Cho/Cr ratio in the thalamusand and higher LI of the NAA/Cr ratio in the BG seems to be a metabolic trait specific to female.

The Role of O-GlcNAcylation in Mood Disorders and Comorbid Metabolic Syndrome

朱维莉[1] 丁增波[1] 杨东锜[1] 李素霞[1] 时杰[1] 陆林[2]
1.北京大学中国药物依赖性研究所
2.北京大学第六医院

Objective Mood disorders including major depressive disorder and anxiety are the leading cause of disability worldwide and place a substantial economic burden on society. O-GlcNAcylation, a dynamic posttranslational modification, acts as both a metabolism regulator and a stress sensor. Although the relevant underlying biological mechanisms are still lacking, mood disorders have been closely associated with several metabolic abnormalities such as high rates of obesity and metabolic syndrome. Therefore, the current study aims to examine whether O-GlcNAcylation is involved in mood disorders and comorbid metabolic syndrome and to better characterise the O-GlcNAcylation site associated with this relationship.

Methods C57BL/6 mice aged 8 weeks were randomly divided into normal diet (chow) group and high fat diet (HFD) group. Transcriptome-wide association was used to analyze the correlation between O-GlcNAcylation associated proteins and body weight, depressive- and anxiety-like behavioral phenotypes. Additionally, blood, adipose tissue and hypothalamic paraventricular nucleus (PVN) of mice were collected. Furthermore, Western blot was used to detect O-GlcNAcylation, O- GlcNAc transferase (OGT) and O-GlcNAcase (OGA). Moreover, chow and HFD mice were treated with OGA inhibitor PUGNAc by stereotactic injection into PVN to observe the effects of inhibition of OGA on depressive- and anxiety-like behavior. Subsequently, the effects of OGA inhibitor were verified and the O-GlcNAcylation site transcription factor FoxO1 in PVN were also identified. The expression of FoxO1 and phospho-Foxo1 in the PVN was detected. Finally, chow and HFD mice were given FoxO1 transcription activity inhibitor AS1842856 to observe the effects of inhibition of FoxO1 on depressive- and anxiety-like behaviors.

Results Transcriptome-wide association showed that OGA expression in hypothalamus was positively correlated with behavioural deficits. OGT expression was negatively correlated with body weight, depressive- and anxiety-like behaviors of mice. While FoxO1 was positively correlated with these behavioral phenotypes. In addition, the O-GlcNAcylation in PVN of HFD mice at 8 weeks was decreased, and the OGA was increased simultaneously. Moreover, inhibition of OGA prevented the HFD-induced depressive- and anxiety-like behaviors, as well as significantly improved the long-term HFD caused O-GlcNAcylation and increase the expression of phospho-FoxO1. Finally, total-FoxO1 was increased and phospho-FoxO1 was decreased in PVN of HFD mice, and inhibition of FoxO1 transcription could prevent depressive- and anxiety-like behaviors induced by chronic HFD treatment.

Conclusion The current findings reveal that targeting the metabolic function through O-GlcNAcylation and

the key downstream site might give us a better understanding of the underlying mechanisms of mood disorders comorbid metabolic syndrome and provide preventive strategies and improved treatments.

基于倾向性评分匹配法探讨 COVID-19 疫情对青少年学生非自杀性自伤行为的影响

周烈[1,2]
1.长江大学精神卫生研究所
2.荆州市精神卫生中心

目的 了解 COVID-19 疫情对荆州市学生的非自杀性自伤行为的影响及相关因素。

方法 2021 年 6 月-2022 年 1 月，采用冉茂盛整编《青少年学生心理健康状况调查问卷》用方便整群抽样对学生调查。回收 16025 份问卷，有效问卷 12507 份，有效率 78.04%。是否自伤作为因变量，性别、年龄、独生子女作为混淆变量进行 1:2 倾向性评分匹配后，采用单因素分析和二元 logistic 回归模型，使用 R 软件中的 scale 函数对数据进行了标准化和中心化处理，prcomp 函数进行主成分分析，计算各主成分得分加权和，乘以其对应的标准差，得出疫情指数。使用 mediate 函数进行中介分析并进行 bootstrap 检验。

结果 共完成 7275 例匹配，其中 NSSI 2425 例。单因素分析显示，青少年学生在焦虑、抑郁、社会支持、疫情造成心理压力、是否隔离、自己或家属是否有以下情况（感染 / 疑似感染 / 密切 接触 / 服务志愿者）、家庭组成、疫情前后家庭经济、疫情前后家庭关系、疫情前后朋友关系、疫情对学习的影响程度、疫情后学习是否恢复、疫情后生活秩序是否恢复、疫情后生活是否恢复、自我学业满意度上 NSSI 检出率差异均有统计学意义。二元 logistic 结果显示，危险因素有抑郁(OR=1.084)、焦虑(OR=1.143)、自己或家属有感染 / 疑似感染 / 密切 接触 / 服务志愿者情况(OR=1.228)、母亲受高等教育(OR=1.336)、父亲职业为企业与公司职员(OR=1.300)、非核心家庭及主干家庭(OR=1.213)、疫情前后家庭关系恶化(OR=1.526)、疫情后学习未恢复(OR=1.166)、自我学业满意度一般(OR=1.265)或不满意(OR=1.409)。此外，疫情指数对焦虑和抑郁具有显著的正向影响，而对社会支持具有显著的负向影响。焦虑得分、抑郁得分和疫情指数都与 NSSI 呈正相关关系。在中介分析中，焦虑、抑郁在疫情指数对 NSSI 影响中起到了中介作用，中介效应占总效应的 52.5%(B = 0.0142) 、60.3% (B = 0.01633)；而社会支持起到了负向中介作用 23.2% (B = 0.00628)。

结论 青少年学生在疫情期间存在焦虑、抑郁和社会支持不足的问题，疫情对学生的心理和生活产生了显著的影响，要重视青少年学生的心理健康问题和社会支持，同时，也需要关注家庭和社会的支持和帮助。

中国内地心理援助热线设置情况

吴霞民[1] 赵苗苗[2] 马宁[1] 白羽[1] 陈润滋[1] 陆林[1]
1.北京大学第六医院，北京大学精神卫生研究所，国家卫生健康委员会精神卫生学重点实验室（北京大学），国家精神心理疾病临床医学研究中心（北京大学第六医院）
2.上海交通大学医学院附属精神卫生中心，上海交通大学中国医院发展研究院心理健康管理研究所

目的 心理援助热线是一种受众面广、行之有效、相对方便实用的心理服务途径，成为向公众提供心理危机干预、心理健康教育、心理咨询的重要途径，在处理心理应激和预防心理行为问题方面发挥着重要作用。本研究旨在了解中国内地当前心理援助热线设置和服务开展情况，为政府相关部门进一步完善心理援助热线建设提供参考依据。

方法 国家精神卫生项目办公室编制心理援助热线设置情况调查表，2022 年 31 个省（自治区、直辖市）精神卫生项目办每月上报热线服务号码、服务时间、坐席数、热线咨询员数、接听量，采用描述性统计、Kruskal Wallis 检验对热线设置和服务情况进行分析。

结果 截至 2022 年底，中国内地 31 省（自治区、直辖市）以公立精神卫生医疗机构和精防机构为主的心理援助热线 650 条，7 天*24 小时全时段的服务热线占 68.3%，热线坐席 1288 个，热线咨询员 8152 人。2022 年每条热线接听量平均为 1668 次，东部地区热线接听量高于中西部地区（H=6.159,P<0.05），省级热线接听量高于市级和区县级（H=30.417,P<0.01）。

结论 心理援助热线是公众寻求心理健康服务的适宜形式之一，得到了较高利用。下一步应整合资源，优化热线号码，不断加强宣传，强化队伍建设，加强热线服务的规范性，更好地满足公众的需要。

Lifetime Help-seeking and Delays after First Onset of Mood Disorders and Anxiety Disorders in The China Mental Health Survey

Shaoling Zhong[1], Xiaofei Hou[2], Chao Ma[3], Dengzheng Dai[3], Zhaorui Liu[3], Liang Zhou[1], Yueqin Huang[3]
1.广州医科大学附属脑科医院
2.天津市安定医院
3.北京市第六医院

Objective Utilization of mental health services after disorder onset is low and delayed among individuals with common mental disorders, despite high disease burdens and available effective treatments. This study aims to examine failure and delays in help-seeking and associated

factors among individuals with lifetime disorder of mood disorders and/or anxiety disorders in China.

Methods We used data from the China Mental Health Survey (CMHS), a nationally representative epidemiological survey of mental disorders, including 32 522 participants aged 18 years and older across 31 provinces. We assessed lifetime mental disorders, age of onset, and help-seeking behaviour, using the Composite International Diagnostic Interview (CIDI). Logistic and Cox regression analyses were used to examine the correlates of sociodemographic and clinical factors with lifetime help-seeking and delays to initial health care.

Results We identified 3075 patients with any lifetime disorder, and 521 (16.9%, 95% CI: 15.6-18.3%) have sought some type of services (mental health speciality, general medical, human services, and complementary and alternative medicine). The median delays to initial health care were 1 (IQR: 0-7), 5 (IQR: 1-10), and 10 (IQR: 0-29) years for depressive disorders, bipolar disorders, and anxiety disorders. comorbidity, age of onset, and family history were associated with lifetime help-seeking, although the pattern varied between disorder classes.

Conclusion Failure and delays in help-seeking are common in China. Developing national strategies to expand effective coverage of mental health services, as well as improving mental health literacy and screening for common mental disorders would be beneficial to increase help-seeking and fill the treatment gap.

关键字：help-seeking behaviour; treatment gap; depression; anxiety; bipolar disorder

Delayed Dopaminergic Projection From Ventral Tegmental Area To Prelimbic Cortex Modulates Remote Memory Retrieval

曹露 袁凯 陆林*
北京大学第六医院

Objective Studies have shown that there is a late consolidation phenomenon, which exists in 12-24 hours after the acquisition of fear memory, and specially mediates the long-term maintenance of fear memory. However, the specific neurobiological mechanism of this process is still unclear. The medical prefrontal cortex (mPFC) is one of the most important brain regions for storage of long-term and remote memory. Recent studies have shown that its early activity after the acquisition of fear memoriy plays an important role in the expression of remote memory. However, it is not clear whether the mPFC is also existed in late consolidation and how it mediates the long-term storage and maintenance of memory.

Methods The study used a rat fear conditioning model and combined with immunofluorescence, pharmacological intervention, electrophysiological recordings and chemical genetics to investigate the specific neurobiological mechanism at the cellular, molecular and circuit levels of late activation in mPFC and the role of this process in the retrieval of remote fear memory.

Results After fear memory training, the expression of c-fos and the excitatory synaptic tramission in prelimbic cortex (PrL) was significantly increased in the early and delayed activation; in addition, the activated neurons were mainly combined by excitatory neurons in the early and delayed activation. (2) After contextual fear memory training, the injection of protein synthesis inhibitor anisomycin into PrL during the early activation of PrL could specifically decrease the expression of recent fear memory, but had no effect on remote memory. However, after contextual fear memory training, the injection of protein synthesis inhibitor anisomycin could specifically decrease the expression of remote fear memory, but had no effect on recent memory. (3) After contextual fear memory training, the injection of D1/5 antagonist SCH into PrL during the delayed activation, which could specifically reduce the expression of remote fear memory, but had no effect on recent fear memory; in addition, the microinjection of D1/5 agonist SKF into PrL during the delayed activation could promote the expression of remote fear memory, but had no effect on recent fear meory. (4) PrL received dopaminergic projections from VTA; After contextual fear memory training, the antagonist of D1/5 SCH could block the increasing effect on spontaneous excitatory postsynaptic currents in the pyramidal neurons in PrL during the delayed activation. The projection of VTA to PrL was both sufficient and necessary for delayed activation of PrL.

Conclusion Concluding the above results, there were protein synthesis-dependent early and delayed activation phenomenon in the PrL brain region. In addition, dopamine D1/5 receptors mediated the dopaminewhich played an important role in the delayed activation of PrL and mediated the expression of remote fear memory.

关键字：Remote fear memory, Prelimbic cortex, Late consolidation, Dopaminergic system, Ventral Tegmental Area.

社会支持对社区严重精神障碍患者的疾病病耻感、精神症状和社会功能影响的纵向研究

范云歌[1] 马宁[2] 白羽[2] 陈润滋[2] 张五芳[2]
1.华南师范大学心理学院
2.北京大学第六医院，北京大学精神卫生研究所，国家卫生健康委员会精神卫生学重点实验室（北京大学），国家精神心理疾病临床医学研究中心（北京大学第六医院），北京 100191

目的 本研究探讨社会支持对社区严重精神障碍（精神分裂症或双相情感障碍）患者的疾病病耻感、精神病性症状和社会功能的影响及其作用路径。

方法 采用纵向研究的方法，选取 312 位处于社区康复阶段的严重精神障碍患者，分别在基线（T1）和 6 个月（T2）时对患者进行评估。在 T1 时，分别采用社会支持评定量表（SSRS）、病耻感感受调查表(ISMI)、阳性与阴性症状量表（PANSS）、个人与社会表现量表（PSP）对患者的社会支持水平、病耻感、精神病性症状和社会功能进行评估。在 T2 时，对患者的病耻感、精神病性症状和社会功能进行随访评估。采用

分层多元回归方法检验T1社会支持水平对T2病耻感、T2 精神病性症状和 T2 社会功能的预测作用；并检验病耻感在社会支持与患者精神病性症状之间的中介作用，及病耻感和精神病性症状在社会支持与患者社会功能之间的中介作用。

结果 （1）T1 社会支持水平越高，在 T2 时患者的病耻感越低（β = -0.11, p = 0.031），精神症状得分越低（β = -0.19, p < 0.001），社会功能越好（β = 0.13, p = 0.010）；（2）T2 时的病耻感在 T1 社会支持对 T2 精神症状的预测作用中起中介作用（间接效应：β = -0.04, 95% CI [-0.07, -0.02]），即 T1 时较低的社会支持水平可通过增加患者的病耻感，从而引起其精神症状的恶化；（3）T2 时的病耻感和精神症状在 T1 社会支持对 T2 社会功能的预测作用中起链式中介作用，其中路径 1（T1 社会支持→T2 病耻感→T2 社会功能）的间接效应不显著（β = -0.01, 95% CI [-0.04, 0.01]），路径 2（T1 社会支持→T2 精神症状→T2 社会功能）的间接效应显著（β = 0.07, 95% CI [0.02, 0.12]），路径 3（T1 社会支持→T2 病耻感→T2 精神症状→T2 社会功能）的间接效应显著（β = 0.02, 95% CI [0.01, 0.04]），即 T1 时较低的社会支持水平可通过增加患者的病耻感，引起其精神病性症状的恶化，从而进一步降低其社会功能。

结论 提高处于社区康复阶段的严重精神障碍患者的社会支持水平有助于降低其病耻感，从而进一步改善其长期的精神病性症状和社会功能。为促进患者的长期康复，有必要对其提供多角度全方位的社会支持服务，以改善患者的预后。

基于客观语音特征的青少年失眠的识别和预测研究

Runxi Pang Yang Wang Keyin Zhou Xiao Xu Fei Wang*
南京脑科医院

目的 本研究旨在探索与青少年失眠、抑郁、失眠伴抑郁的不同亚型青少年患者的临床症状和语音声学特征差异，将客观指标应用于辅助临床区分不同亚型的青少年患者。

方法 研究对象为江苏省泰州、宜兴和射阳三个地区参与心理健康筛查项目的 11427 名年龄在 10-18 岁的青少年，进行临床量表评估和语音采集。采用 SPSS 26.0 软件进行统计分析，通过对性别、年级和经济发展水平进行卡方检验，检验人口学特征是否存在差异。针对健康组、失眠组、抑郁组和失眠伴抑郁组的样本，使用独立样本 Kruskal-Wallis test（K-W 检验）分析四组间的语音特征差异。

结果 健康组、失眠组、抑郁组和失眠伴抑郁组的样本在人口学特征无显著差异。在症状差异分析中，根据青少年情绪状态-抑郁分量表，健康组与失眠组的抑郁症状分数显著低于抑郁组和失眠伴抑郁组；青少年情绪状态-焦虑分量表，失眠伴抑郁组的焦虑症状分数显著高于健康组、失眠组、抑郁组；青少年情绪状态-压力分量表，健康组与失眠组的抑郁症状分数显著低于抑郁组和失眠伴抑郁组；根据青少年失眠量表，健康组与抑郁组的抑郁症状分数显著低于失眠组和失眠伴抑郁组。在语音差异分析中，共振峰特征、梅尔倒谱系数和有效语音段在健康组中表现最高，失眠组共振峰特征值低于健康组，抑郁组和失眠伴抑郁组共振峰特征值最低；频率特征在健康组中普遍表现最高，在失眠组和失眠伴抑郁组频率特征值低于健康组，在抑郁组中表现最低；时域特征在健康组中普遍表现最高，在失眠组和抑郁组中时域特征低于健康组，在失眠伴抑郁组表现最低。

结论 失眠、抑郁、失眠伴抑郁的不同亚型青少年患者存在临床症状的表现，提示失眠可能是抑郁的初期症状，而语音声学特征中的共振峰、梅尔倒谱系数、有效语音段、频率和时域特征可以作为客观的声学指标进一步区分失眠、抑郁、失眠伴抑郁的不同亚型青少年患者，为青少年失眠和抑郁的早期识别和干预提供了重要的研究证据。

The Familial Transmission of Suicide and Non-suicidal Self-injury in Different Income Levels in Town

于梅[2] 李雪梅[1] 陈润森[2] 周新雨[1]
1.重庆医科大学附属第一医院 精神科
2.清华大学万科公共卫生与健康学院

Objective The familial transmissions of suicide and non-suicidal self-injury were discovered before. However, whether the transmissions could be different in different income levels and the influential factors needs to be discovered. Our study aims to investigate the questions.

Methods Data from 13988 pairs of parents' and children's reports in the town of Chongqing in China were analyzed. The children's age was between 7 to 12 years old. There were six income levels that categorized into < ￥2000, ￥2000-￥3999, ￥4000-￥5999, ￥6000-￥9999, ￥10000-￥19999, >￥20000. The children's depression symptom was measured by the Center for Epidemiological Studies Depression Scale for Children (CES-DC) while the anxiety symptom was measured by the Screen for Child Anxiety Related Emotional Disorders (SCARED).

Results The familial transmission of suicide was significant in all income levels except the highest level while the familial transmission of NSSI was significant in all income levels except the lowest level. Besides, the suicide transmission was significant in female children but not in male children, in fathers with low education level but not with high education level, and when the time spent with father was long but not short in the low-income level. In the low- and high-income levels, the suicide and NSSI transmission occurred mainly in male children, in mothers

with high education and when the time spent with mother was long. Moreover, the suicide and NSSI transmissions were totally or partly through children's depression and anxiety.

Conclusion In the low-income level, the suicide transmission might be influenced more by the lack of materials instead of parents' parenting through children's depression and anxiety. In the high-income level, the suicide and NSSI transmissions were mainly influenced by mothers and for male children partly through children's negative mood. In the medium income level, the suicide and NSSI transmissions were mainly from parents and partly through children's negative mood.

Objective Major depressive disorder (MDD) is the most prevalent form of depression and is becoming a great challenge for public health and medical practice. Although first-line antidepressants offer therapeutic benefit, about 35% of depressed patients are not adequately treated, creating a large unmet medical need. The study assessed the efficacy and safety of ansofaxine (LY03005), a potential triple reuptake inhibitor of serotonin, norepinephrine and dopamine, in adults with MDD.

Methods This multicenter, double-blind, randomized, placebo-controlled phase 3 clinical trial was conducted in China and patients with MDD according to the Diagnostic and Statistical Manual of Mental Disorders 5th edition were included. After screening, patients were randomly assigned (1:1:1) to ansofaxine 80 mg/day, ansofaxine 160 mg/day, or placebo groups. The primary efficacy endpoint was the MADRS total score change from baseline to the end of week 8. Safety indexes include adverse events, vital signs, physical examinations, laboratory tests, 12-lead electrocardiograms (ECG) and evaluation of suicide tendency and sexual function. This study was registered at ClinicalTrials.gov (No. NCT04853407).

Results A total of 691 patients were screened from December 2018 to December 2020. Among them, 558 patients were randomized and took the study drug as the following: ansofaxine 80 mg (n = 187), ansofaxine 160 mg (n = 186) and placebo (n = 185). Significant differences were found in mean changes in MADRS total scores at week 8 in the two ansofaxine groups (80 mg, -20.0; 160 mg, -19.9) vs. placebo (-14.6; p <0.0001). All doses of ansofaxine were generally well-tolerated. Treatment-emergent adverse events (TEAEs) were reported by 137 (74.46%) patients in ansofaxine 80 mg group, 144 (78.26%) patients in ansofaxine 160 mg and 125 (67.93%) patients in placebo group. The incidence of treatment-related adverse events (TRAEs) were 59.2% (109 patients, 233 events), 65.22% (120 patients, 296 events) in the 80, 160 mg ansofaxine groups and 45.11% (83 patients, 170 events) in the placebo group.

Conclusion The initial results of this trial indicate that ansofaxine (80, 160 mg per day) were effective and safe in the treatment of adult MDD patients.

精神专科医院新冠疫情前后医院感染特征比较

潘轶竹* 罗凤琪 丁卉 宋琳楠 甄雪洋
首都医科大学附属北京安定医院

目的 比较新冠疫情前后精神专科医院患者医院感染特征，探究新冠疫情对精神专科医院医院感染发生的影响。

方法 通过医院感染预警系统回顾性调查选取2019年1月1日-2022年12月31日期间北京市某精神专科医院医院感染患者信息，划分2019年医院感染患者为新冠疫情发生前组，2020-2022年医院感染患者为新冠疫情发生后组，应用《医院感染病例调查表》收

集患者信息，比较分析新冠疫情前后精神专科医院患者医院感染发病率及感染特征差异。

结果 共调查出院患者38611例,医院感染951例，其中男性540例，女性411例;2019-2022年各年医院感染率依次为1.71%、3.15%、2.76%、2.35%；男性医院感染率依次为2.31%、4.45%、4.17%、3.33%，女性医院感染率依次为1.29%、2.23%、1.92%、1.69%。各年医院感染率男性高于女性、65岁及以上者高于65岁以下者、住院日＞90天者高于90天以下者（P＜0.05）；2019年的年度医院感染率、≤18岁及18-65岁组患者医院感染率、住院日＜30天及30-60天组患者医院感染率低于2020-2022年各年（P＜0.05），2022年的年度医院感染率、18-65岁组及≥65岁组、住院日＜30天组的患者医院感染率低于2020年（P＜0.05）。

结论 精神专科医院受建筑布局、患者特点、管理方式影响，在突发传染病疫情防控中存在短板与局限性，新冠疫情后医院感染率高于疫情前。强化疫情防控及医院感染控制措施对精神专科医院院感防控有积极作用，疫情后第三年医院感染率低于疫情后第一年。男性、高龄及住院日长是医院感染率发生的高危因素，在院感防控中应多加关注。

新冠疫情解封后不同学习阶段学生的心理健康现状及其影响因素的研究

蔡佳 王聪 慕云菲 邓忠越 冉茂盛*
四川大学华西医院

目的 本研究旨在探索新冠疫情限制解除后，青少年和青年学生的心理健康状况（如抑郁、焦虑、创伤后应激障碍（PTSD）、失眠）及其影响因素。

方法 于2022年12月14日-2023年2月28日在四川省162所学校(初中、高中和大学)的90118名学生中实施调查，主要采用“问卷星”的方式进行线上问卷自评。包括三部分，第一部分包括基本信息、与疫情相关的信息等；第二部分包括心理健康相关问卷，如患者健康问卷(PHQ-9)、广泛性焦虑量表(GAD-7)、DSM-5创伤后应激障碍量表（PCL-5）、失眠严重程度指数（ISI）和社会支持量表（SSRS）；第三部分包括不良行为相关问卷，如网络成瘾量表（IAT）、自杀行为、校园欺凌行为以及网络欺凌行为问卷等。参与者分为三组:初中生组、高中生组和大学生组。首先使用方差分析对三组的人口资料和量表资料进行比较分析。其次，将人口资料、分组及上述除PHQ-9及GAD-7以外的所有量表资料作为自变量，分别以是否存在抑郁症状（PHQ-9≥5：存在抑郁症状），是否存在焦虑症状（GAD-7≥5：存在焦虑症状）为因变量，分析三组参与者患抑郁或焦虑的风险。最后，使用二元逻辑回归分别对三组的抑郁症状和焦虑症状进行了危险因素分析。

结果 三组学生抑郁症状、焦虑症状和PTSD的患病率仍然较高，均与疫情封控时相当。三组中，高中组学生出现抑郁症状、焦虑症状、PTSD、失眠和自杀观念（终身）的比率最高。与初中组学生相比，高中组学生出现抑郁症状的概率增加了79.8%，大学组学生增加了45.5%；高中组学生出现焦虑症状的概率增加了76.7%，大学组学生增加了39.5%。对于所有学生，抑郁和焦虑症状增加的危险因素包括：学业成绩不理想、自杀观念（终身）、有精神障碍史、以及较高得分的IAT、ISI、网络欺凌行为量表和校园欺凌行为量表，而较高水平的社会支持则降低抑郁和焦虑症状的风险。此外，三组学生还分别存在特殊、不同的影响抑郁和焦虑症状的因素。

结论 新冠疫情解封后，不同学习阶段的学生仍然存在不可忽视的心理健康问题。政府卫生健康部门、教育部门以及学校应特别、长期关注青少年和青年学生，特别是高中生的心理健康。应综合考虑不同学习阶段学生的心理健康状况的特点，以及心理健康相同和不同的影响因素，制定和发展有针对性的健康政策和社会心理服务干预措施。

Effect of Targeted Memory Reactivation During Sleep on Memory Performance in Old Adults

Yongbo Zheng[1,2], Le Shi[1], Lin Lu[1,2]
1.Peking University Sixth Hospital
2.Peking-Tsinghua Center for Life Sciences and PKU-IDG/McGovern Institute for Brain Research

Objective The cognitive ability of the elderly declines at different speeds with aging, among which the hippocampus-dependent memory decline is the most significant. Improving the memory performance of the elderly is the key to promote their quality of life. This study intends to detect the memory performance of the elderly by giving them auditory cues exposure during non-rapid eye movement stage 2 sleep.

Methods We recruited healthy subjects aged between 55 and 75 years in our study. During the learning stage, subjects need to learn two different kinds of pictures, one of which is directly associated with auditory cues and the other is indirectly associated with auditory cues. Subjects in sleep group were arranged to take a nap, and the auditory cues were given when polysomnography showed that they were entered the non-rapid eye movement stage 2 sleep; in the meantime, the subjects in wake group stayed awake and were given the same auditory cues. All of the subjects were told to remain awake after the intervention completed, followed by the recognition test of the pictures directly and indirectly associated with the auditory cues. The recognition level of pictures directly and indirectly associated with auditory cues was evaluated by the relative accuracy index.

Results Exposure to auditory cues during non-rapid eye movement stage 2 sleep could improve the relative accuracy index for recognition of pictures indirectly associated with auditory cues in sleep group. However, there was no significant improvement in the relative accuracy index

for recognition of pictures directly associated with auditory cues. In addition, auditory cues exposure during sleep increased power spectrum and power spectral density of slow wave oscillation and fast spindle in frontal region and central region.

Conclusion This study mainly found that auditory cues exposure during non-rapid eye movement stage 2 sleep can improve the memory performance of the elderly, which may be related to the increase of the power spectrum of slow wave oscillation and fast spindle wave in the elderly during the sleep.

Mental Health Literacy of Urban and Rural Residents in Guangdong Province

何小燕[1,2] 谭文艳[2] 黄卓慧[2] 计樱莹[1] 王诗镔[2]
1.无锡市精神卫生中心
2.广东省人民医院

Objective ：Mental health literacy refers to people's ability to use a combination of mental health knowledge, skills, and attitudes to maintain and promote mental health. A high level of mental health literacy helps identify mental illness early, reduces stigma, and provides effective support and treatment, thereby improving the mental health of individuals and the public.As the largest economic province in China, Guangdong province is not yet aware of the level of mental health literacy of its residents. Therefore, the aim of this study is to assess the level of mental health literacy of urban and rural residents in Guangdong province and its related influencing factors.

Methods ：Stratified multi-stage random sampling method was used to select 51774 urban and rural permanent residents aged 18 years and above，and the National Mental Health Literacy Questionnaire(NMHLQ)was used to conduct household survey.The NMHLQ included knowledge judgment,self-assessment and case study．The total score of knowledge judgment≥80 points，the total score of self-assessment≥24 points，and the total score of cases ≥28 points were considered to be the standard of mental health literacy.Descriptive statistics were estimated using the Complex Samples Package for the composition ratios, means, and prevalence of the population with different characteristics. The distribution of different sociodemographic characteristics of the study population and the comparison of the prevalence of chronic diseases were determined using the Rao-Scott $\chi 2$ test.

Results :The mental health literacy attainment rate of urban residents in Guangdong Province is 13.6%, and that of rural areas is 8.6%.Urban residents scored higher than rural areas in mental health knowledge, mental health awareness, mental illness recognition, and overcoming stigma, while they scored lower in positive mindset, access to mental health knowledge, and attitude toward seeking help from psychological professionals were lower than those in rural areas.Logistic regression analysis showed that women, brain workers, years of education >12, high income, regular diet, non-smoking and non-drinking were protective factors for mental health literacy.

Conclusion :The mental health literacy level of urban and rural residents in Guangdong Province is low, and its mental health literacy level is closely related to the existence of demographic characteristics and living habits.

The Effect of Systematic Couple Group Therapy on Families with Depressed Juveniles: A Polit Trial

孟天骄 钱英 王玉璐 高兵玲 岳晶丽* 唐登华
北京大学第六医院

Objective To explore the short-term efficacy of 5-week systemic couples group therapy on families with children and adolescents diagnosed with depression.

Methods Twelve families with children and adolescents diagnosed with depressive disorder and parents with a communication problem and current dyadic adjustment score (DAS) below 95 were enrolled. Before and after the treatment, the indicators of parental communication are measured by Conflict and Problem-solving Scale (CPS), Communication Pattern Questionnaire (CPQ), The Primary Communication Inventory (PCI) and communication frequency scale. Dyadic Adjustment Scale (DAS) and Quality of Marriage Index (QMI) are used to measure marital quality. Children Perceived Inter-Parental Conflict (CPIC) and Children's Depression Inventory (CDI) are used to measure their perceived parental conflicts and depression symptoms.

Results For parents, there is significant improvement in overall communication satisfaction and constructive communication indicators (including mutual constructive communication pattern and cooperative communication strategy). It also shows significantly lower mean scores for destructive communication indicators (including demand-avoidance communication pattern and mutual avoidance communication pattern; destructive communication strategies including verbal aggression, physical aggression, child involvement, stalemate and avoidance-capitulation, etc.). The frequency of communication between couples was significantly increased. The subjective marital satisfaction and marital adjustment of couples were significantly improved. For the children and adolescents, they perceive significantly lower conflict intensity, lower conflict frequency and higher conflict resolution degree from the parents. Their coping efficacy was also significantly increased. The improvement of children's depression symptoms was significantly positively correlated with the improvement of parents' communication quality and marriage quality. Although the depression scores of the children show a declining trend (from 29.58±11.62 before treatment to 25.17±14.64 after treatment），no significant improvement was detected.

Conclusion Systemic couples group therapy shows

positive effects on families with children and adolescents diagnosed with depression. After the treatment, parental communication and marital quality are significantly improved. Children and adolescents perceive significantly lower levels of parental conflicts. The greater the improvement of parents' communication quality and marital quality, the greater the alleviation of children's depression symptoms. While there is a declining trend in children and adolescents' depressive symptoms, no significant improvement is detected.

基于潜类别分析的学业目标及归因风格对心理健康影响研究

虞越男 朱玥 王菲*
南京脑科医院

目的 学业在大学生生活中占有重要地位，不同的学业目标和归因风格与情绪变化密切相关。本研究的目标是基于学业目标和归因风格确定高校学生学业相关亚型，探讨不同亚型学生的心理健康、学业成绩间的差异。此外，本研究还将基于不同的学业相关亚型识别心理问题高危亚型及学业成绩对不同亚型的心理健康的中介调节模式。

方法 2022 年 9 月（T1）至 2023 年 3 月（T2）进行为期 6 个月的纵向研究，4907 名来自同一所高校的新生完成 2 次心理健康评估。在首次评估阶段完成成就目标定向量表与多维多向归因量表，并进行潜在类别分析。此外，本研究还收集了新生第一学期学业成绩。使用单因素方差分析比较不同亚型学生抑郁、焦虑、失眠和压力差异。使用二元逻辑回归比较不同亚型学生随学业增长其抑郁、焦虑、失眠和压力症状加重的风险。使用单因素方差分析对不同亚型学生学业成绩进行比较，并采用中介分析探究学业成绩在学生亚型的抑郁、焦虑、失眠和压力增长中的调节作用。

结果 本研究提取三组不同的学业相关亚型，即低学业目标型（n=282）、高学业目标自我实现型（n=2695）和高学业目标他人标准型（n=1930）。在新生入学时(T1)和第一学期结束后(T2)，高学业目标他人标准型学生在抑郁、焦虑、失眠和压力症状高于其他两组亚型。低学业目标型成绩低于其他两组亚型，高学业目标两组间成绩则无差异。随着学业的增加，高学业目标他人标准型与高学业目标自我实现型学生相比，更易出现抑郁（OR 1.72，95%CI 1.35-2.19）、焦虑（OR 2.33，95%CI 1.78-3.04）、失眠（OR 2.21，95%CI 1.29-2.35）、异常压力（OR 1.74，95%CI 1.68-2.92）。高学业目标他人标准型与低学业目标型的学生相比，更易存在焦虑（OR 2.08，95%CI 1.10-2.96）、异常压力（OR 2.61，95%CI 1.32-5.16）。学业成绩在高学业目标两组学生产生心理问题的过程中其部分或完全中介作用。

结论 持有高学业目标依赖于通过他人的标准来展示自己能力的学生，即高学业目标他人标准型，尽管在学业成绩上较优秀，但随学年增加和学业加重，其也越容易出现心理问题。并且，良好的学业成绩并没有改善心理健康问题的出现。高校新生可通过早期的心理健康教育树立更加完善的学业价值观，用以预防心理健康问题发生发展。

公共卫生事件下大规模集会医疗保障人员心理干预研究

孟祥博*
北京市延庆区医院（北京大学第三医院延庆医院）

目的 了解北京冬奥会期间医疗保障人员的心理健康状况，从人口学特征、社会支持和应对方式等方面探究心理健康的影响因素。针对焦虑、抑郁等症状对处于“红码区”的人员给予积极心理学方法的干预，探究这种干预方法的疗效。

方法 第一部分：采用方便抽样的方法于 2022 年 2 月-2022 年 3 月，选取参加北京冬奥会医疗保障的人员共 300 名，其中“红码区”人员 150 人，“绿码区”人员 150 人。通过“问卷星”在线发放心理健康测评工具，包含人口学变量、7 项广泛性焦虑障碍量表、9 条目患者健康问卷、领悟社会支持量表和简易应对方式量表，对 300 名医疗保障人员进行心理健康状况调查，以抑郁症状、焦虑症状等阳性检出率作为结局指标，采用线性回归分析探究影响心理健康的因素。 第二部分：依据积极心理学理论，建立三级心理干预模型，一级干预：全员预防性干预。二级干预为焦虑和/或抑郁评分在中度以上的医疗保障人员进行的干预。三级干预是为那些有更严重心理健康问题的人启动应急反应机制，将人员转介至精神卫生专业人员诊断和治疗。采用三级干预模型，对处于“红码区”的 150 名人员根据心理健康状况调查进行相应的心理干预，4 周后对这些人员再次进行心理健康评估，评估内容同干预前。运用配对样本 T 检验、重复测量方差分析和卡方检验等统计学方法分析，探究积极心理学干预的疗效。

结果 第一部分研究共纳入 300 名受试者，总体阳性检出率分别为：检出焦虑症状共 177 人，检出率 59%；检出有抑郁症状共 210 人，检出率 70%；采取消极应对方式共 65 人，检出率 21.7%。线性回归分析显示：性别、日工作时长、是否接诊阳性病例、社会支持、积极应对方式和消极应对方式为焦虑的影响因素；学历、日工作时长、是否接诊阳性病例、社会支持、积极应对方式和消极应对方式为抑郁的影响因素。第二部分研究结果显示，干预后 GAD-7、PHQ-9 和消极应对总分均有明显降低（p 均<0.01；Cohen's d 值分别为 1.93、2.31、1.73），干预后积极应对得分有所上升（p<0.01，Cohen's d 值=-1.46）。

结论 在参加北京冬奥会医疗保障的人员普遍存在一定的心理健康困扰，主要表现为抑郁情绪、焦虑情绪。性别、学历、是否接诊阳性病例、每日工作时长、

社会支持、积极应对和消极应对为抑郁情绪、焦虑情绪的影响因素。积极心理学干预能显著改善焦虑、抑郁情绪，提升积极应对水平。

Common Structural Signature Alterations in Chronic Ketamine Users and Chronic Methamphetamine Users

孙云开 廖艳辉*
浙江大学医学院附属邵逸夫医院

Objective Altered cortical thickness in chronic ketamine users and chronic methamphetamine users have been found, respectively. However, the core vulnerabilities cross substance use disorders remain unknown. The current study aimed to detect if chronic ketamine users and chronic methamphetamine users shared similar impaired in brain structural properties and if the shared structural signatures can classify cross two substance use disorders.

Methods T1-weighted magnetic resonance imaging (MRI) data from 99 chronic ketamine users, 139 chronic methamphetamine users and 105 health control were analyzed by using FreeSurfer software. A general linear model was applied to compared cortical thickness, surface area and subcortical volume between different substance use disorders and health control, respectively. Machine learning algorithms based on co-varying brain regions were used to identify addiction disorders from healthy control.

Results We found that chronic ketamine users showed widely reduced cortical thickness compared with healthy control, while chronic methamphetamine users also exhibited widely reduced brain cortical thickness. In total, chronic ketamine users and chronic methamphetamine users shared similar pattern in cortical thickness, surface area and subcortical volume. Based on co-vary abnormal brain cortical thickness, the support vector machine model using structural features of one addiction disorder can classify the other disorder with the accuracy for identifying chronic ketamine users of 74.23% and the accuracy for identifying chronic methamphetamine users of 71.94%.

Conclusion Our results show substantial similarities in sMRI phenotypes between two substance use disorders and suggest that the cortical in co-varying brain regions are a transdiagnostic neuroimaging biomarkers to predict addiction abusers.

Causal Relationship between Substance Use and Insomnia: A Bidirectional Mendelian Randomization Study

郭垒 苏杭 陈天真 杜江 江海峰 赵敏*
上海交通大学医学院附属精神卫生中心

Objective : Insomnia is a significant factor that affects both physical and mental health and may increase the risk of various mental disorders, causing a considerable

burden on mental health. Substance use, particularly tobacco and alcohol use, is a significant health issue affecting the Chinese population. Previous studies have suggested a correlation between substance use, such as tobacco and alcohol, and the occurrence of insomnia, and insomnia may further aggravate substance use problems. However, the causal relationship between the two is still unclear. This study aimed to use a bidirectional Mendelian randomization approach to explore the causal relationship between substance use and insomnia.

Methods The Mendelian randomization (MR) method used genome-wide association study (GWAS) summary data to study the causal relationship between exposure and outcome. Bidirectional MR tested the bidirectional effects of the two factors and determined the bidirectional causal relationship between the two factors. This study used GWAS data on alcohol addiction (N = 6514), weekly alcohol consumption (N = 335394), smoking initiation (N = 607291), daily smoking quantity (N = 249752), and two insomnia traits (N = 462341; N = 336965) to conduct bidirectional MR analysis and confirmed the robustness of the analysis using sensitivity analysis.

Results The bidirectional MR results indicated that weekly alcohol consumption (IVW: P = 0.017, b = 0.063; Weighted median: P = 0.025, b = 0.048) and smoking initiation (IVW: P = 0.008, b = 0.036; Weighted median: P = 0.04, b = 0.023) had promoting effects on insomnia. However, although IVW suggested that insomnia had an effect on alcohol addiction (P = 0.036) and daily smoking quantity (P = 0.016), sensitivity analysis using methods such as Weighted median and Weighted mode did not support this.

Conclusions This study, through bidirectional MR analysis, found that tobacco use and alcohol consumption have a promoting effect on insomnia, which is consistent with previous reports. However, this study's results do not support the speculation that insomnia itself promotes alcohol and tobacco use. Insomnia caused by alcohol and tobacco use may be related to the neural excitability and awakening function abnormalities caused by substance use, and patients with insomnia may be less likely to seek relief through tobacco and alcohol. This study reveals the potential causal relationship between substance use and insomnia through Mendelian randomization analysis based on large-scale GWAS data, providing new evidence for clinical diagnosis and treatment. Future large-scale cohort studies are needed to further explore the causal relationship between substance use and insomnia.

关键字：Mendelian randomization; tobacco use; alcohol use; insomnia

下丘脑室旁核及其脑区微环路在可卡因诱导的条件性味觉厌恶中的作用

张力博[1] 张钟玉[1] 张桂鹏[1] 黄恩泽[1] 陈文茜[1] 陈玟君[1] 薛言学[1] 陆林[1,2] 时杰[1]
1.北京大学中国药物依赖性研究所
2.北京大学第六医院/北京大学精神卫生研究所

目的 药物成瘾是一种危害严重的脑疾病，目前药物成瘾的研究多集中于成瘾性药物奖赏效应所形成的关联性记忆，对其产生的厌恶性关联记忆如条件性味觉厌恶（CTA）等的关注较少，关于参与药物成瘾厌恶性记忆的脑区及其神经机制尚不清楚。因此，本研究旨在探索可卡因厌恶性记忆产生的机制，为进一步理解药物成瘾记忆形成的机制提供理论基础。

方法 （1）动物禁水 24 h 后进行 7 天的饮水适应期，第 8 天给予动物新颖味觉溶液 30 min，并在 30 min 后腹腔注射可卡因（30 mg/kg）或对照溶剂（1 ml/kg），第 9 天恢复饮水 30 min，第 10 天进行 CTA 测试；（2）免疫荧光染色检测可卡因 CTA 形成过程中各脑区 Fos 蛋白表达及其在目标脑区内与特异神经元类型标志物的共标情况；（3）全细胞膜片钳技术检测可卡因 CTA 形成后，目标脑区中特异神经元类型的突触传递变化；（4）化学遗传学和光遗传学手段对目标脑区及其特异神经元类型的活性进行调控。

结果 （1）多种新颖味觉与可卡因的关联均可引起不同种属动物对该味觉溶液产生厌恶反应，且单次关联即可引起动物饮用量的显著降低；（2）可卡因引起小鼠多个脑区内 Fos 蛋白表达增加，但下丘脑室旁核（PVN）内 Fos 蛋白表达在 CTA 关联后进一步增多，使用化学遗传学抑制或激活 PVN 脑活性均可阻止小鼠 CTA 的形成。此外，特异性标记并激活 PVN 印迹神经元也可诱导出小鼠的味觉厌恶；（3）CTA 关联可引起小鼠 PVN 脑区的 Fos+神经元与促肾上腺皮质激素释放因子（CRF）神经元的共标率增加，同时引起 Fos+神经元与催产素（OXT）神经元共标率下降。可卡因 CTA 形成后，PVN CRF 神经元的自发型兴奋性突触后电流（sEPSC）和自发型抑制性突触后电流（sIPSC）均没有变化，而 PVN OXT 神经元 sEPSC 的频率下降，其 sEPSC 的振幅及 sIPSC 则没有改变；（4）化学遗传学或光遗传学手段激活 PVN OXT 神经元可抑制小鼠 CTA 的形成，化学遗传学抑制其活性则可增强可卡因 CTA；（5）化学遗传学手段抑制 PVN CRF 神经元也可阻止小鼠 CTA 的形成，而化学遗传学或光遗传学激活 PVN CRF 神经元则对可卡因 CTA 没有影响。

结论 本研究探讨了 PVN 脑区及其不同神经元类型参与可卡因 CTA 形成的机制，为理解药物成瘾记忆提供了新的视角和神经生物学基础。

A Joint Study of Whole Exome Sequencing and Functional MRI Analysis in Methamphetamine Use Disorder

罗丹 沈聃琳 汤乔 来铭枫 徐佳军 李静*
四川大学华西医院

Objective Methamphetamine use disorder (MUD) is a worldwide public mental problem influenced by both environmental and genetic factors. Genetic studies of MUD have focused on common variants and have been

constrained by the heterogeneity of clinical symptoms.

Methods We sequenced the exome of 91 cases and 51 controls of Han Chinese ancestry and scanned their brain. Burden tests of rare variants were performed first to explore the association between genes/pathways and MUD. Secondly, parallel Independent Component Analysis was conducted to investigate genetic underpinnings of brain function changes of MUD.

Results One gene (SPATA21, p=8.66×10-3) and four pathways (ABC-type xenobiotic transporter activity, p=1.14×10-4; methyltransferase complex, p=1.78×10-5; histone methyltransferase complex, p=3.48×10-5; ABC transporters, p=1.76×10-4) achieved significance separately in burden test and GO/KEGG pathway analysis. In addition, we identified one pair of imaging-genetic components of significant correlation (r = -0.525, p<0.001). The genetic component enriched in four pathways, namely dynein intermediate chain binding (p=7.90×10-4), dynein light intermediate chain binding (p=3.69×10-4), minus-end-directed microtubule motor activity (p=2.06×10-4), and axonemal dynein complex (p=3.18×10-4). Changes of brain function mediated the effects of genetic variants on MUD in cases.

Conclusion Both rare variants analysis and imaging-genetic analysis found evidence corresponding with the adverse neural development and defective synaptic plasticity hypotheses of MUD. The mediation of brain functional changes indicates that genetic component may act on MUD through changing brain activity.

Neural Mechanism Underlying Altered Activity in The Anterior Cingulate Cortex During Methamphetamine Cue-Induced Reinstatement

吴旻青[1] 周文华[2] 赵敏[1]
1.上海市精神卫生中心
2.宁波市康宁医院

Objective To reveal the precise role of anterior cingulate cortex (ACC) in methamphetamine cue-induced reinstatement and its circuitry mechanism in regulating relapse-related behaviors.

Methods Adult male Sprague-Dawley rats were trained using a fixed-ratio schedule to establish stable methamphetamine (METH) self-administration behavior. After two weeks of home-cage abstinence, brains were harvested following extinction or cue-induced reinstatement sessions. c-Fos immunoreactivity were measured among multiple brain regions. We tested the effects of inhibitory (hM4Di) and excitatory (hM3Dq) designer receptors exclusively activated by designer drugs (DREADDs) in ACC on METH self-administration and different forms of reinstatement tests. We also investigated the effect of ACC pyramidal neurons modulation on METH-induced cognitive impairment using a novel-object recognition task. Fluoro-Gold based retrograde tracing was employed to identify potential upstream nuclei involved in ACC regulation.

Results Compared to the control group without cues, subjects exposed to conditioned cues exhibited significantly higher levels of c-Fos immunoreactivity in the anterior cingulate cortex (ACC), prelimbic cortex, infralimbic cortex, claustrum, and basal lateral amygdala. Notably, both the claustrum and ACC neurons consistently demonstrated activation during METH self-administration and cue-induced reinstatement sessions. Chemogenetic activation of ACC pyramidal neurons enhanced cue-induced drug seeking, while inhibition of the ACC mitigated cognitive impairments during METH withdrawal. Furthermore, the increased expression of c-Fos in the ACC-projecting claustrum neurons suggests their involvement in regulating METH cue-induced reinstatement.

Conclusion The ACC plays a crucial role in METH relapse-related behaviors, as its activation promotes cue-induced reinstatement, while inhibiting the ACC alleviates cognitive impairments during withdrawal. The claustrum may be involved in regulating the ACC excitability to modulate METH reward and cue-induced reinstatement.

2.Anhui Psychiatric Center, Anhui Medical University, Hefei 238000, China
3.Anhui Medical University, Hefei 238000, China
4.School of Mental Health and Psychological Sciences, Anhui Medical University, Hefei 238000, China.
5.Huzhou Third Municipal Hospital, Huzhou University, Huzhou, 313000, China.

Objective The role of age of onset in the development of alcohol use disorders remains unclear. We thus retrospectively investigated a large-scale cohort to explore the effect of age of onset on the course of alcohol use disorders.

Methods In this study, a total of 14,357 inpatients with alcohol use disorders were recruited over a 7-year time span, and after applying rigorous data criteria, 2,176 inpatients were ultimately included in the statistical analysis. Patients were divided into three age subgroups according to their age of onset, which were early adult onset(EAO), middle adult onset(MAO) and late adult onset(LAO).

Results The proportion of recurrence was statistically different in the subgroups with different age of onset (X2=9.819, df=3, P=0.007), the Bonferroni post hoc test suggested a higher proportion of recurrence in the EAO than that in the MAO subgroup (66.1% vs 59.5%, P<0.05).

We then performed a Binary logistic regression. Taking patients in the EAO subgroup as a reference, patients with MAO had a lower risk of recurrence (OR=0.75, 95%CI=0.63-0.90, P=0.002), however, the risk of recurrence in the LAO subgroup was not statistically different from the EAO (OR=0.78, 95%CI=0.54-1.11, P=0.17). Subsequently, a survival analysis for recurrence within one year was performed. There were statistically differences in Kaplan-Meier method estimates of the probability of disease-free survival (DFS) at day 365 between the three age of onset subgroups (33.9%, 40.5%, 39.7%, respectively; P=0.03). Specifically, post hoc tests suggested that DFS was lower in the EAO subgroup than in the other two groups (median DFS=197, 95%CI=172.10-221.90, P=0.012). Finally, we follow-up all patients for 5 years for cerebral atrophy onset, and the results suggest that the incidence of cerebral atrophy during the follow-up period was lower in the EAO subgroup than that in the other two subgroups (OR=1.42, 95%CI=1.19-1.70, P<0.001; OR=1.62, 95%CI=1.14-2.31, P=0.007, respectively), but this difference was no longer statistically significant after controlling for the age factor (both P>0.05).

Conclusion This is the first large sample size study to explore the influence of age of onset on alcohol use disorders in a Chinese population. Our study found that alcohol use disorders with onset in early adult are associated with more recurrences. These findings will help explore risk factors for alcohol use disorders and provide preliminary evidence for clinical development of prevention strategies.

丘脑前内侧核到基底外侧杏仁核的神经投射在尼古丁成瘾中的作用

顾腾宇 董菁 王鑫宇 张晶 刘剑锋*
武汉科技大学

目的 药物成瘾是一种反复发作的慢性脑病，主要表现为对成瘾药物的精神依赖。尼古丁作为烟草依赖最相关的成分，主要通过激活大脑自然奖赏系统中的烟碱乙酰胆碱系统，启动其奖赏效应。既往研究表明，基底外侧杏仁核（BLA）与丘脑前核参与调控记忆、认知、成瘾行为。然而，丘脑前核的亚区之一丘脑前内侧核（IAM）是否与基底外侧杏仁核之间存在神经投射，这一神经投射是否参与尼古丁成瘾行为及其具体机制，尚未有研究报道。本研究采用大鼠条件位置偏好模型（conditioned place preference, CPP），探究丘脑前内侧核至基底外侧杏仁核的神经投射是否参与调节尼古丁成瘾行为及其环路机制。

方法 采用无偏倚设计和三室训练箱构建尼古丁 CPP 模型，在进行尼古丁训练和消退后给予应激或低剂量尼古丁进行点燃。通过大鼠脑立体定位注射技术，在大鼠基底外侧杏仁核双边注射逆行示踪病毒，确认丘脑前内侧核到基底外侧杏仁核的神经投射。在大鼠基底外侧杏仁核双边注射逆行示踪病毒，结合免疫荧光染色检测尼古丁 CPP 点燃时各脑区 cFos 表达及其在目标脑区内与相关病毒表达的共标情况。运用光遗传学技术调控 IAM→BLA 神经投射并观察其对大鼠尼古丁成瘾行为的影响。

结果 确认 IAM 和 BLA 脑区之间存在投射；利用光遗传学技术抑制 IAM→BLA 神经投射发现大鼠尼古丁 CPP 点燃时的 CPP 得分明显上升，即对 IAM→BLA 投射的抑制能促进低剂量尼古丁诱导的雄性大鼠的点燃；相对的用光遗传激活 IAM→BLA 神经投射则可以抑制低剂量尼古丁诱导的雄性大鼠的点燃。

结论 光遗传学调控 IAM→BLA 神经投射可双向调节药物诱导的尼古丁 CPP 点燃，说明该神经环路可能在尼古丁成瘾及复吸中发挥重要作用。

海洛因稳定戒断者的执行功能和前瞻记忆状况—基于眼动追踪和 E-Prime 任务的研究

赵伟[1] 李叶刚[2] 宋莉[2] 魏侠[2] 胡林娜[2] 焦东亮[1]
1.蚌埠医学院精神卫生学院
2.蚌埠市第四人民医院

目的 美沙酮替代治疗后，海洛因使用障碍（Heroin Use Disorder, HUD）患者的复吸率仍然很高，对医疗护理工作带来了重大挑战。成瘾所致认知控制缺陷是 HUD 患者复吸的重要内因并且可能长期表现。对此，本研究旨在探究长期戒断后，海洛因稳定戒断者的执行功能和前瞻记忆等相关认知控制表现。

方法 这项病例对照研究纳入了 63 名接受美沙酮维持治疗一年以上的戒断后稳定期 HUD 患者，以及基线资料相匹配的 31 名健康对照组。其中 HUD 患者根据既往是否海洛因复吸划分为复吸组（n＝41）和非复吸组（n = 22）。对于各组执行功能的评估，主要包括执行功能量表和眼动追踪任务；对于前瞻记忆的评估，使用前瞻回溯记忆量表以及基于 E-Prime 的前瞻记忆任务。

结果 （1）海洛因复吸组在执行功能量表各因子及总分、反向眼跳幅度、反向眼跳速度表现上显著差于非复吸组及健康对照组（P＜0.05），而非复吸组与健康对照组差异无统计学意义（P＞0.05）；（2）海洛因复吸组与非复吸组在眼跳错误率上显著高于健康对照组（P ＜ 0.05）；（3）海洛因复吸组与非复吸组在前瞻记忆量表得分以及前瞻记忆任务上与健康对照组差异无统计学意义（P＞0.05）；（4）相关分析结果显示，反向眼跳幅度和速度得分与执行功能得分呈负相关（r＜0，P＜0.05）；（5）逐步回归分析结果显示，以反向眼跳幅度和速度作为因变量，执行功能的转换与自我监控因子进入回归方程；（6）受试者工作特征（Receiver Operating Characteristic，ROC）曲线结果显示，对于 HUD 患者复吸筛查，眼动追踪任务显示较高的敏感性，而执行功能量表显示较高的特异性。

结论 （1）在戒断后稳定期， HUD 患者中仍然存在执行功能损害和较高的眼跳错误率，但前瞻记忆没有表现出显著损害；（2）反向眼跳幅度和速度对于 HUD 患者的复吸倾向表现出较高的筛查价值，执行功能的转换与自我监控能力可能是其重要影响因素；（3）对 HUD 患者开展执行功能评估并结合反向眼跳幅度和速度，显示了较高的筛查特异性和敏感度，有望成为识别 HUD 患者早期复吸倾向新的筛查指标。

乳酸及胶质细胞—神经元间乳酸转运在可卡因潜伏心理渴求中的作用及机制

陈玟君[1] 张艳[1] 梁洁[1] 张钟玉[1] 张力博[1] 黄恩泽[1] 张桂鹏[1] 陆林[1,2] 韩盈[1] 时杰[1]
1.北京大学中国药物依赖性研究所
2.北京大学第六医院/北京大学精神卫生研究所

目的 药物成瘾是一种慢性复发性脑疾病，其最为核心且难以解决的问题是戒断后存在的潜伏心理渴求及由此导致的复吸行为。乳酸参与了长期记忆的形成及奖赏记忆的再巩固，但其是否参与药物相关线索诱导的潜伏心理渴求尚不明确。本研究旨在探讨中央杏仁核（CeA）中乳酸及胶质细胞与神经元之间的乳酸转运在可卡因潜伏心理渴求中的作用及其机制，以期为降低戒断后心理渴求和临床防复吸治疗方法的探索提供新的理论依据。

方法 （1）大鼠经历可卡因自身给药训练后，于戒断第 1 天或第 30 天测试前在 CeA 注射糖原磷酸化抑制剂（DAB），观察对潜伏心理渴求的影响。（2）利用膜片钳技术探究 DAB 灌注后 CeA 中神经元自发兴奋性突触后电流（sEPSC）的变化。（3）给药前在 CeA 注射乳酸，观察能否恢复潜伏心理渴求，并采用蛋白免疫印迹分析（WB）检测突触可塑性相关蛋白的变化。（4）采用 WB 检测戒断第 1 天和第 30 天乳酸转运体（MCT1/2/4）在 CeA 中表达水平的变化。（5）于可卡因戒断后第 1 或 30 天在 CeA 注射 MCT2-ODN 或戒断后第 3 天给予 AAV-hSyn-shMCT2RNA 以敲降 MCT2，观察对潜伏心理渴求、GluA1/2/3 蛋白水平以及 CeA 神经元 sEPSC 的影响。（6）于可卡因戒断后第 1 或 30 天在 CeA 注射 MCT4-ODN 或戒断后第 3 天给予 AAV-GFaABC1D-shMCT4RNA 以敲降 MCT4，观察对上述指标的影响。（7）第 30 天给予 MCT2-ODN 或 MCT4-ODN 前注射乳酸，观察能否恢复潜伏心理渴求。

结果 （1）戒断第 1 天或第 30 天 CeA 注射 DAB 可显著降低戒断第 30 天时可卡因相关线索诱导的渴求。（2）对戒断第 30 天大鼠的脑片进行 DAB 灌注后，CeA 脑区中 sEPSC 的频率显著降低，幅度无明显改变。（3）提前给予乳酸可恢复被 DAB 破坏的潜伏心理渴求以及突触可塑性相关蛋白的表达。（4）和戒断第 1 天相比，CeA 中 MCT2 和 MCT4 在可卡因戒断第 30 天时的表达增加。（5）敲降 MCT2 或 MCT4 均可抑制潜伏心理渴求，降低戒断第 30 天 CeA 中 GluA1/2/3 的水平及神经元 sEPSC 的频率。

结论 本研究发现了乳酸以及胶质细胞与神经元之间的乳酸转运在可卡因潜伏心理渴求过程中的重要作用，抑制中央杏仁核中的乳酸生成及乳酸转运能降低戒断期可卡因相关线索诱导的心理渴求，为治疗药物成瘾和预防复吸提供新的研究方向。

Amygdala Astrocytes Modulate The Erasure of Drug Addiction Memory

李雪 吴宪文 丁增波 薛言学*
北京大学医学部

Objective Addictive substances, as unconditioned stimuli, induce changes in brain circuits associated with reward, cognition, and emotional states, potentially integrating into the memory system to form pathological addictive memories. In clinical practice, memory extinction is commonly employed to suppress addictive memories. However, their efficacy is limited. Recent studies have shown that astrocytes, in addition to their supportive and nutritive roles for neurons, also play a crucial role in synaptic plasticity, suggesting their potential involvement in addictive memory. Therefore, this study aims to elucidate the role of astrocytes in the extinction of drug addiction memory and investigate the underlying neurobiological mechanisms.

Methods The self-administration of cocaine was used as an animal model for addictive memory. A combination of techniques, including immunoblotting, immunofluorescence, brain slice patch-clamp recordings, and Golgi staining, were employed to explore the role of astrocytes and synaptic plasticity mechanisms in the extinction of addictive memory.

Results (1) In the drug-priming test following self-administration extinction training, the intensity of cocaine craving in rats was associated with co-labeling of astrocytes in the basolateral amygdala (BLA) region with addictive engram. (2) Chemogenetic inhibition of astrocyte activity combined with extinction training effectively facilitated the elimination of cocaine addiction memory and reduced psychological craving. Electrophysiological results showed a significant increase in the AMPA/NMDA ratio, and Golgi staining revealed a significant increase in mushroom-like dendritic spines in the BLA region during this process. Conversely, chemogenetic activation of astrocyte activity produced opposite effects, suggesting that astrocyte activity influences synaptic plasticity during the erasure of addictive memory. (3) Further western blot analysis revealed a significant increase in microtubule stability in the BLA region of rats with effectively inhibited drug addiction memory, indicating the involvement of microtubule proteins in the erasure of addictive memory. (4) Single-cell sequencing analysis of rats with different levels of cocaine craving demonstrated that astrocytes in the BLA region were associated with addictive relapse behaviors

and microtubule protein stability. (5) Enhancing microtubule protein stability with the drug EPOB, in combination with extinction training, increased the number of mushroom-like dendritic spines in the BLA region, accompanied by a significant increase in the AMPA/NMDA ratio. (6) Further investigation revealed the reversible effect of astrocyte activation on the extinction of addictive memory following the increased microtubule protein stability induced by EPOB.

Conclusion This study demonstrates that intervening in astrocyte activity, in combination with extinction training, may promote the erasure of addictive memory by reshaping synap

Functional Connectivity Changes in The Resting-state of The Amygdala in Alcohol-dependent Patients with Depression

孙丰伟 杨梅* 贾晓健*
济宁医学院精神卫生学院，深圳市精神卫生中心/深圳市康宁医院

Objective Differences in the functional connectivity of the amygdala in alcohol-dependent patients with or without depression were compared based on resting-state functional magnetic resonance imaging to explore the characteristics of functional connectivity changes in alcohol-dependent patients with depression.

Methods A total of 60 alcohol-dependent patients and 31 healthy controls were included in the study. Based on the Patients Health Questionnaire-9 scores, alcohol-dependent patients were classified into alcohol-dependent patients with depression and alcohol-dependent patients without depression. Three groups of resting-state functional magnetic resonance imaging data were collected and the whole brain functional connectivity was calculated using the amygdala as the region of interest. Voxel-based ANCOVA analysis was performed for functional connectivity on the three groups. Post hoc t-tests between the two groups were performed using the least significant difference correction method. The results are corrected for the Gaussian random field multiplicity comparison. In addition, the relationship between values of functional connectivity in statistically significant brain regions and alcohol dependence scale and Patients Health Questionnaire-9 score was explored.

Results Compared with alcohol-dependent patients without depression, alcohol-dependent patients with depression had reduced functional connectivity between the right amygdala and the left middle temporal gyrus. Compared with healthy controls, the functional connectivity of the right amygdala with left superior temporal gyrus, the right superior temporal gyrus and the right caudate nucleus was reduced in the alcohol-dependent patients with depression, and the functional connectivity of the left amygdala with the left and right superior temporal gyrus was reduced. Compared with healthy controls, the functional connectivity of the right amygdala with left superior temporal gyrus and right insula was reduced in the alcohol-dependent patients without depression. There was no significant correlation between the values of functional connectivity in statistically significant brain regions and the scores of alcohol dependence scale and Patients Health Questionnaire-9.

Conclusion The functional connectivity between the right amygdala and the left superior temporal gyrus is altered in alcohol-dependent patients, and the functional connectivity changes between the amygdala and the temporal lobe is more extensive in alcohol-dependent patients with depression, which may be a key neural mechanism for alcohol dependence comorbid depression.

关键字：alcohol dependence; amygdala; depression; functional connectivity; resting-state functional magnetic resonance imaging; temporal gyrus.

基于虚拟现实的线索暴露治疗对酒依赖患者心理渴求及生理反应的影响

张俊俊 王传升*
新乡医学院第二附属医院

目的 探讨基于虚拟现实的线索暴露治疗是否能够降低酒依赖患者线索暴露时的心理渴求及生理反应，为酒依赖的治疗提供新的治疗手段。

方法 选取 2022 年 5 月-10 月在新乡医学院第二附属医院住院治疗的 44 例男性酒依赖患者，在完成急性戒断治疗后对酒依赖患者进行一次基于虚拟现实的线索暴露（评估），记录其暴露前后心理渴求、心率、皮电、呼吸的变化情况。采用随机数字表法将其随机分为研究组（n=23）和对照组（n=21）。对照组仅接受常规临床治疗，研究组在常规临床治疗的基础上另加 8 次基于虚拟现实的线索暴露治疗（治疗），每周 3 次（间隔 1 日），共 8 次。完成治疗后再次对酒依赖患者进行一次基于虚拟现实的线索暴露（评估），记录其暴露前后心理渴求、心率、皮电、呼吸的变化。比较治疗前后酒依赖患者线索暴露时的心理渴求及生理反应情况。

结果 两组患者的年龄、受教育年限、累计饮酒时间、成瘾时间以及日饮酒量比较，差异无统计学意义（P＞0.05）；治疗前，两组患者线索暴露前后心理渴求、心率、皮电、呼吸的变化值比较，差异无统计学意义（P>0.05）；治疗后，研究组线索暴露前后心理渴求、心率的变化值较对照组明显降低，差异有统计学意义（P<0.05），皮电、呼吸的变化值与对照组比较，差异无统计学意义（P>0.05）；治疗后，研究组线索暴露前后心理渴求、心率的变化值较治疗前明显降低，差异有统计学意义（P<0.05），皮电、呼吸的变化值较治疗前无明显变化，差异无统计学意义（P>0.05）；治疗后，对照组线索暴露前后心理渴求、心率、皮电、呼吸的变化值较治疗前无明显变化，差异无统计学意义（P>0.05）。

结论 基于虚拟现实的线索暴露治疗可以降低酒依赖患者线索暴露时的心理渴求及生理反应。

The Input of Paraventricular Nucleus of Thalamus To Nucleus Accumbens Modulates Alcohol Dependence Formation Via Aversion Processing

赵小溪 胡阿倩 向小军*
中南大学湘雅二医院

Objective The objectives of this study are to examine the impact of the PVT-NAc neural pathway on the formation of alcohol-induced conditioned place preference (CPP) and conditioned place aversion (CPA) by modulating aversive responses. Additionally, we aim to investigate the changes in PVT-NAc neuronal activity during the process.

Methods Male C57BL/6 mice were subjected to stereotaxic surgery to receive targeted injections of viral vectors in PVT and NAc regions expressing either activated or inhibitory DREADDS (Designer Receptor Exclusively Activated by Designer Drugs). Following a recovery period of at least 2 weeks, the mice underwent conditioning procedures involving exposure to ethanol (2 g/kg) to induce CPA (Experiment 1) or CPP (Experiments 2). Prior to the training sessions, all experimental groups in Experiment 1 and Experiment 2 received injections of CNO (0.2 ml/20g) to activate or inhibit the PVT-NAc pathway. CPA and CPP scores were assessed through two separate testing sessions conducted after the completion of training. Subsequently, the neuronal activity of PVT-NAc neurons was measured.

Results The chemogenetic inhibition of the PVT-NAc pathway in mice led to a significant reduction in the expression of alcohol-induced CPA. Moreover, the analysis of PVT-NAc neurons C-fos expression levels showed significantly higher activation in mice exhibiting higher CPA scores (Experiment 1). Conversely, the activation of the PVT-NAc pathway significantly inhibited the formation of alcohol-induced CPP in mice (Experiments 2).

Conclusion The present results demonstrate that inhibiting the PVT-NAc pathway reduces the aversive effects of alcohol, while activating this pathway attenuates the rewarding properties of alcohol in mice. By modulating the neural circuitry involved in alcohol aversion and reward, interventions aimed at the PVT-NAc pathway may help mitigate the negative consequences associated with alcohol consumption. These findings suggest that targeting the PVT-NAc pathway could hold promise as a therapeutic approach for the treatment of alcohol use disorders.

Neurobiology of Addictive Memory Retrieval: Focusing on The Medial Prefrontal Cortex

Sai Shi Min Zhao*
Shanghai Mental Health Center, Shanghai Jiao Tong University School of Medicine, 600 South Wan Ping Road, Shanghai 200030, China

Objective Substance use patterns that are maladaptive cause serious social problems. Developing a pathological addiction memory is a result of repeated exposure to addictive drugs and drug-related cues. A memory retrieval process is triggered by an internal or external cue that induces memory imprinting expression. Recent research on addiction-related memory processes suggests that the retrieval of addictive memory can induce relapse, while multiple retrievals (ie, extinction training following brief cue-elicited memory retrieval) can attenuate the ability of cues to elicit learned behaviors. Therefore, it is important to understand the process of addictive memory retrieval.

Methods We conducted a systematic review of literature on cue induced-memory retrieval in three databases. We extracted data from studies meeting our inclusion criteria, which related to substance craving induced by cue and data based on addictive memory retrieval and medial prefrontal cortex (mPFC).

Results We reviewed 312 research outputs. A total of 42 articles meeting the inclusion criteria were found. mPFC serve a pivotal role in regulating learning and memory for addiction. Different ensembles of mPFC response to discrete cue-elicited memory retrieval. Glutamatergic projections from the mPFC to subcortical regions (ie, NAc and VTA) contribute to addictive memory retrieval and induce substance craving. Cortical inhibitory neurons contact each other to form a network of inhibitory synaptic connections. Inhibitory neurons play a role in encoding in valence processing through regulating the activity of excitatory neurons. In addition, specific ensembles may act as a memory switch to modulate memory retrieval for addiction.

Conclusion mPFC is implicated in processing addictive memory retrieval, including responding to cue and encoding valence while the mechanisms of mPFC regulating in addictive memory retrieval is still not well understood. The present review summarizes current evidence about mPFC as a key region in sensory-guided, valence-driven relapse behavior.

孤啡肽受体激动剂 Ro 64-6198 对大鼠海洛因奖赏和复吸的影响

陈杉珊 王方敏 周漪颖 刘慧珍 周文华*
宁波市康宁医院

目的 海洛因作为传统毒品，相较新型毒品其具备更强的成瘾性、毒害性、依赖性。当前海洛因成瘾人数绝对占比依然较高，长期使用海洛因导致的强迫性反复药物寻求和使用及复吸问题仍然棘手。本研究旨在探究孤啡肽（nociceptin，NOP）受体激动剂对于大鼠海洛因成瘾奖赏和复吸行为的影响。

方法 建立海洛因自身给药成瘾大鼠模型，利用动物行为学方法观察并分析 NOP 受体激动剂 Ro 64-6198 及联合 NOP 受体拮抗剂 SB-612111 对于大鼠海洛因奖赏及复吸行为的影响。SD 雄性大鼠在固定比率（FR=1）程序下注射剂量为（0.05 mg/kg，0.2 g/L）海洛因进行自身给药训练，每天 4 h，连续 10 d，建立稳定的海洛因自身给药模型，在第 11 天将大鼠随机分为 4 组，分别腹腔注射生理盐水，0.3，1，3mg/kg NOP 受体激动剂 Ro 64-6198，进行奖赏测试。随后置于饲养笼内自然戒断 14 d，在第 15 天进行环境线索（CC）诱导的大鼠海洛因复吸测试；消退 1 天后，在戒断的第 17 天进行条件性线索（CS）诱导的大鼠海洛因复吸测试；消退 1 天后，在戒断的第 19 天，大鼠腹腔注射相同剂量的生理盐水或 0.25mg/kg 海洛因随后进行条件性线索（CS）诱导的大鼠海洛因复吸测试；消退 1 天后，在戒断的第 21 天，大鼠腹腔注射相同剂量的生理盐水或 1.25mg/kg 育亨宾随后进行环境线索（CC）诱导的大鼠海洛因复吸测试。

结果 大鼠海洛因自身给药训练 10 d，建立了稳定的自身给药行为。不同浓度 NOP 受体激动剂 Ro 64-6198 对于大鼠海洛因奖赏行为具有呈一定剂量依赖性的抑制作用，且在 3mg/kg 呈现出显著性的降低【F(3,16)=2.858, P=0.070】。1 和 3mg/kg NOP 受体激动剂 Ro 64-6198 能抑制四种诱导条件下大鼠海洛因复吸行为，且 1mg/kg NOP 受体激动剂 Ro 64-6198 的抑制作用最显著【F(3,16)=6.734, P=0.004】，当联合 1mg/kg NOP 受体拮抗剂 SB-612111 时可实现 NOP 受体激动剂 Ro 64-6198 抑制作用的逆转 (P=0.028)。

结论 NOP 受体激动剂 Ro 64-6198 抑制大鼠海洛因奖赏行为和复吸行为，NOP 受体拮抗剂可以阻断 NOP 受体激动剂的抑制作用，结果提示 NOP 受体激动剂可能对治疗海洛因成瘾和复吸具有治疗潜

The Resting-state Functional Connectivity Changes in The Right Anterior Cingulate Cortex of Chronic Ketamine Users

Jun Zhong Fengchun Wu Huawang Wu Hongbo He Zhaohua Zhang Ni Fan*
广州医科大学附属脑科医院

Objective Ketamine abuse has become a significant concern due to its widespread recreational use and its potential neurotoxic effects on the brain. Chronic ketamine users (CKUs) often experience cognitive impairments, but the underlying neural mechanisms are not well understood. This study aimed to investigate the resting-state functional connectivity (FC) changes in the right anterior cingulate cortex (ACC) of CKUs and their relationship with cognitive performance. The selection of the right ACC for investigation was based on its strong involvement in drug addiction, as supported by previous studies.

Methods Resting-state functional magnetic resonance imaging (fMRI) data were collected from CKUs and healthy controls (HCs). The MATRICS Consensus Cognitive Battery (MCCB) was used to assess cognitive function.

Results 28 CKUs and 30 healthy controls were recruited. Group-level comparisons revealed that CKUs exhibited increased functional connectivity between the right ACC and the right postcentral gyrus compared to HCs.A positive correlation was observed between right ACC-right postcentral gyrus functional connectivity and reasoning and problem-solving score of MCCB. However, no significant correlation was found between functional connectivity and ketamine use characteristics in CKUs.

Conclusion Our study revealed enhanced functional connectivity between the right ACC and the right postcentral gyrus in CKUs. This enhanced functional connectivity may indicate functional compensation for cognitive deficits in CKUs, especially for reasoning and problem-solving impairments in CKUs.

关键字：Ketamine, Chronic ketamine use, Cognitive impairments, Right anterior cingulate cortex, Functional connectivity.

Disrupted White Matter Structural Networks in Individuals with Alcohol Dependence

曹海玲[1] 郭万军[2]
1.四川大学华西医院
2.浙江大学医学院附属精神卫生中心(杭州市第七人民医院)

Objective Previous diffusion tensor imaging (DTI) studies have demonstrated widespread white matter microstructure damage in patients with alcoholism. However, very little is known about the alterations in the topological architecture of white matter structural networks in alcohol dependence (AD). This study aimed to explore the alterations in the topological architecture of white matter structural networks in AD.

Methods : A total of 67 AD inpatients during early abstinence and 69 healthy controls were included in this study. The graph theoretical analysis method was applied to investigate the topological organization of the white matter structural networks, including global and local topological parameters, and network-based statistics were applied to identify structural connectivity alterations.

Results : Both the patient and control groups showed small-world properties in white matter structural networks. However, compared to controls, AD patients exhibited abnormal global network properties characterized by increased small-worldness, normalized clustering coefficient, clustering coefficient, and shortest path length; and decreased global efficiency and local efficiency. Further analyses revealed decreased nodal efficiency and degree centrality in AD patients mainly located in the default mode network (DMN), including the precuneus (PCUN), anterior cingulate and paracingulate gyrus (ACG), median cingulate and paracingulate gyrus (DCG), posterior cingulate gyrus (PCG), and medial part of the superior frontal

gyrus (SFGmed). Furthermore, based on NBS approaches, patients displayed weaker subnetwork connectivity mainly located in the region of the DMN. Additionally, altered network metrics were correlated with Intelligence Quotient (IQ) scores and Global Assessment Function (GAF) scores.

Conclusion : Our results may reveal the disruption of whole-brain white matter structural networks in AD individuals. The alterations in brain white matter structural networks may provide new insights for understanding the pathophysiological mechanisms of AD and facilitating the development of therapeutic and prevention strategies.

Dampened Diurnal Oscillation of The Gut Microbiota in Alcohol Dependence Patients with Sleep Disturbance

赵康卿[1] 胡令明[1] 倪照军[1] 李祥雪[1] 覃颖[2] 于周龙[1] 王忠[1] 刘燕菁[2] 赵静雯[2] 彭雯涓[2] 时杰[3] 陆林[1] 孙洪强[1]

1.Peking University Sixth Hospital, Peking University Institute of Mental Health, NHC Key Laboratory of Mental Health (Peking University), National Clinical Research Center for Mental Disorders (Peking University Sixth Hospital), Beijing, 100191, China.

2.The Second People's Hospital of Guizhou Province, Guizhou, 550004, China.

3.National Institute on Drug Dependence and Beijing Key Laboratory of Drug Dependence, Peking University, Beijing, China.

Objective Both alcohol dependence (AD) and sleep disturbance may render alteration of the gut microbiota, which may further disrupt the circadian rhythmicity of gut microbiota and the host. However, the gut microbiota composition and rhythmicity has rarely been studied in the AD patients with sleep disturbance. Herein, we elucidated changes of gut flora and diurnal oscillation of gut microbiota in AD patients with sleep disturbance.

Methods Thirty-two AD patients and 20 healthy subjects were included in this study. Fecal samples at 7:00 AM, 11:00 AM, 3:00 PM, and 7:00 PM were collected from each subject; 16S rDNA sequencing was conducted. Furthermore, AD patients were sub-grouped into the AD patients with sleep disturbance (ADwSD) group and the AD patients without sleep (ADw/oSD) disturbance for further analyses.

Results PSQI scores were lower in AD patients, compared with healthy subjects ($p < 0.001$); The ADwSD group showed higher levels of anxiety, depression and withdrawal than the ADw/oSD group (all $p < 0.05$). The gut microbiota in the ADwSD group differed from that of the ADw/oSD group ($p < 0.05$); At different taxonomic levels, bacterial abundance differed between the ADwSD and ADw/oSD groups, e.g., Cyanobacteria and Pseudomonadales (all $p < 0.05$). The gut microbiota in the ADw/oSD exhibited robust diurnal oscillation ($p < 0.05$), which were statistically insignificant in the ADwSD group.

Conclusion AD patients with sleep disturbance exert altered profiles of the gut microbiota in composition, function and diurnal oscillation, which may provide novel perspectives into the mechanism of sleep disturbance in AD.

Peripheral Biomarkers To Differentiate Bipolar Depression From Major Depressive Disorder: A Real-world Retrospective Study

Nan Lyu[1], Han Wang[1], Qian Zhao[1], Bingbing Fu[1], Jinhong Li[1], Ziqi Yue[2], Juan Huang[1], Fan Yang[1], Hao Liu[1], Ling Zhang[1], Rena Li[1]
1.Beijing Key Laboratory of Mental Disorders, National Clinical Research Center for Mental Disorders & National Center for Mental Disorders, Beijing Anding Hospital, Capital Medical University, Beijing, 100088，China
2.National Center for Cardiovascular Diseases and Fuwai Hospital, Beijing, 100037, China.

Bipolar depression (BPD) is often misdiagnosed as a major depressive disorder (MDD) in clinical practice, which may be attributed to a lack of robust biomarkers indicative of differentiated diagnosis. This study analysed the differences in various hormones and inflammatory markers to explore peripheral biomarkers that differentiate BPD from MDD patients. Propensity score matching (PSM) was used to control for the effect of potential confounders in the MDD and BPD groups. A total of 2,048 BPD and MDD patients were included. A panel of blood tests was performed to determine the levels of sex hormones, stress hormones, and immune-related indicators. A receiver operating characteristic (ROC) curve was used to analyse the potential biomarkers for differentiating BPD from MDD. Compared to patients with MDD, BPD patients expressed a longer duration of illness, more hospitalisations within five years, and an earlier age of onset, along with fewer comorbid psychotic symptoms. In terms of biochemical parameters, MDD patients presented higher IgA and IgM levels, while BPD patients featured more elevated neutrophil and monocyte counts. ROC analysis suggested that combined biological indicators and clinical features could moderately distinguish between BPD and MDD. In addition, different biological features exist in BPD and MDD patients of different ages and sexes. Differential peripheral biological parameters were observed between BPD and MDD, which manifested between sexes and ages. A combined diagnostic model that integrates clinical characteristics and biochemical indicators has a moderate accuracy in distinguishing BPD from MDD.

冰毒成瘾者肠道菌群特征的性别差异研究

刘林梓 汤艳清*
中国医科大学附属第一医院

目的 冰毒是我国范围内最广泛使用的精神活性物质，冰毒成瘾（MUD）为社会带来了严重的公共卫生负担。最近有证据显示，肠道菌群可能参与了 MUD 的过程。来自肠道细菌的脂多糖可能进入循环血液，激活大脑中的小胶质细胞，从而减少戒断后对冰毒的渴望。在人类研究中，也有项研究表明男性 MUD 患者的肠道菌群与健康对照（HC）相比存在显著差异。然而，既往证据均基于男性受试者，而性别已被证实会影响冰毒成瘾及戒断过程。女性患者罹患神经精神并发症的风险更高、且更有可能在治疗干预中获益。本研究旨在确定全性别人群中 MUD 患者和 HC 之间的肠道菌群差异，并探索 MUD 患者的性别特异性特征。

方法 本研究纳入戒断后 MUD 患者及 HC 各 50 名（女性各 20 名），签署知情同意书后采集受试者人口学资料（性别、年龄、BMI 等）、临床信息（毒品使用信息、消化道症状、戒断症状）并应用 T 检验/卡方检验进行组间比较及组内（不同性别）比较。同时采集受试者粪便样本进行 16S rDNA 测序以分析受试者肠道微生物群。

结果 MUD 患者与 HC 在性别、年龄、BMI 上未见显著差异。与 HC 相比，MUD 患者微生物群在 alpha 多样性 Chao1、Shannon 指数上未见显著差异；在基于 Bray-Curtis 距离的 beta 多样性上存在显著差异（PERMANOVA, $p = 0.035$）。在物种组成上，MUD 患者肠道微生物群存在厚壁菌门、变形菌门的富集，以及拟杆菌门、放线菌门的减少。MUD 患者中，不同性别患者的病程未见显著差异，且不同性别 MUD 患者与同性别 HC 相比，微生物群整体改变与前述结果一致。在物种水平上，女性人群中，MUD 患者肠道微生物群中拟杆菌属、Prevotella_9 属出现显著降低，而在男性人群中则未观察到此改变。

结论 MUD 患者和 HC 之间的肠道菌群差异在整体水平（如多样性、菌门水平）上呈现跨性别的一致变化，在属水平上，拟杆菌属、Prevotella_9 属的降低是女性 MUD 患者的性别特异性改变。

Altered Reward Circuit Function Moderate The Relationship between Childhood Maltreatment and Depression Severity in Adolescents

Weicheng Li Zhibo Hu Chengyu Wang Xiaofeng Lan Min Zhang Fan Zhang Zerui You Yanxiang Ye Haiyan Liu Yanling Zhou* Yuping Ning*
Affiliated Brain Hospital of Guangzhou Medical University

Objective The role of childhood maltreatment (CM) is believed to be crucial in the aberrant function of reward circuit in adolescent-onset major depressive disorder (AO-MDD). Nevertheless, the impact of abnormalities in the GP-based reward circuit on the association between CM and the severity of AO-MDD remains largely unknown.

Methods The GP-based resting-state functional connectivity (RSFC) was analyzed in a sample of 75 patients with AO-MDD and 80 healthy controls in order to identify potential abnormalities in the GP-based reward

circuit in AO-MDD patients. Furthermore, we investigated the possible associations between aberrant GP-based reward circuit functioning, CM and its subtypes (namely, childhood abuse and childhood neglect), as well as the severity of AO-MDD.

Results Compared to the healthy control group, patients with AO-MDD demonstrated a reduction in RSFC between the left posterior GP and the right dorsomedial prefrontal cortex (DMPFC). Our moderation analysis revealed that the abnormal RSFC between the posterior GP and DMPFC had a moderating effect on the relationship between CM and the severity of AO-MDD. Furthermore, upon further interaction decomposition, we observed a positive correlation between CM and AO-MDD severity exclusively in patients with AO-MDD who exhibited lower RSFC between the posterior GP and DMPFC. For AO-MDD patients with higher RSFC between posterior GP and DMPFC, the relationship between CM and AO-MDD severity was not discernible.

Conclusion Our findings underscore the crucial role of anomalies in the reward circuit in AO-MDD and furnish novel leads for probing the relationship among CM, malfunctioning of the reward circuit, and AO-MDD.

Differential Associations between Working Memory Impairment and Gray Matter Volume Changes in Remitted Schizophrenia and Bipolar Disorder Patients

孙婷 汤艳清*
中国医科大学附属第一医院

Objective : Cognitive deficits are frequently observed in individuals with remitted schizophrenia (SZ) and bipolar disorder (BD), persisting even during periods of symptom remission and impacting patients' social functioning and recovery. The underlying mechanisms of these impairments, potentially related to alterations in gray matter volumes (GMV), remain unclear. This study aimed to investigate whether the association between working memory impairment and GMV changes differs between remitted SZ and BD patients, providing insights into the neurobiological underpinnings of these conditions.

Methods A total of 137 adult participants, including 46 remitted SZ patients, 35 remitted BD patients, and 56 age-, sex-, and education-matched healthy controls (HC), were enrolled. All participants completed spatial span and digital sequence tests, along with structural magnetic resonance imaging scans. Image data were preprocessed and analyzed using VBM8, SPM8, and Dpabi software packages in MATLAB. Demographic data, cognitive test scores, and correlations between cognitive performance and GMV were analyzed using SPSS.

Results 1. Both remitted SZ and BD patients exhibited significantly lower test scores on the spatial span ($p < 0.001$) and digital sequence tests ($p < 0.001$) compared to HC. 2. GMV reductions were observed in remitted SZ and BD patients compared to HC ($p < 0.001$), particularly in the insula, superior temporal pole, amygdala, anterior cingulate gyrus, and frontal cortex (superior gyrus, middle gyrus, inferior tegmental gyrus, and orbitofrontal gyrus). 3. No significant correlations were found between GMV and cognitive test scores in remitted SZ patients ($p > 0.05$). 4. In remitted BD patients, the spatial span and digital sequence tests showed significant correlations with GMV changes in the right insula, amygdala, superior temporal pole, medial superior frontal gyrus, and dorsolateral superior frontal gyrus ($r = 0.390$, $p = 0.025$; $r = 0.554$, $p = 0.001$).

Conclusion Both remitted SZ and BD patients exhibit working memory impairments; however, only BD patients show associations with GMV changes. These findings suggest that the underlying pathophysiological mechanisms of cognitive impairments in these two disorders may differ in terms of gray matter volume alterations.

基于 RhoA/ROCK 信号通路探讨类惊恐发作对大鼠血管内皮损伤的影响

礼希曦 阿地拉,阿布力孜 汤艳清*
中国医科大学附属第一医院

目的 本研究利用动物模型观察惊恐发作对血管内皮功能、结构的影响及 RhoA/ROCK 信号通路在其中的作用以及氟西汀对血管内皮细胞的保护作用。

方法 将电极植入大鼠背侧中脑导水管周围灰质（Dorsolateral periaqueductal gray dPAG）上，对大鼠 dPAG 脑区进行电刺激以激发大鼠跑或跳跃行为作为惊恐发作模型。实验 1：以人群中惊恐发作持续时间（5-20 分钟）为参考，27 只大鼠随机分为 3 组：电刺激 dPAG 5 分钟组、10 分钟组、15 分钟组，结束后测定内皮依赖性血管舒张功能。实验 2：45 只大鼠随机分为 5 组：空白组、假手术组、电刺激组、电刺激+普萘洛尔（β 肾上腺受体阻滞剂）组、电刺激+法舒地尔（ROCK 抑制剂）组，每组 9 只。依据实验 1 结果中引起血管内皮损伤的电刺激时间为实验 2 电刺激时间。实验 3：将 30 只大鼠随机分为 3 组： 假手术组、电刺激组、电刺激+氟西汀组,每组 10 只。假手术组及电刺激组连续腹腔注射生理盐水 21 天；电刺激+氟西汀组连续腹腔注射氟西汀 21 天；给药前及第 21 天给药后 30 分钟均测定逃逸阈值并在第 21 天行大鼠 dPAG 电刺激，结束后取材。实验 2 结束后对各组血压、心率、血清去甲肾上腺素水平及 RhoA/ROCK 信号通路相关蛋白进行检测。实验 2 及实验 3 测血管内皮依赖性舒张功能、血管组织 eNOS、内皮素-1、血清炎症因子及氧化应激等相关指标进行比较。

结果 电刺激 dPAG 15 分钟使大鼠血压、心率、血清去甲肾上腺素水平升高、血管组织 RhoA/ROCK 信号通路被激活、血管内皮细胞脱落、血管内皮依赖性舒

张功能减低、血管组织 eNOS 及 p-eNOS 表达降低、内皮素-1 表达升高,同时观察到电刺激组大鼠血清炎症因子水平升高、氧化-抗氧化失衡。应用普萘洛尔及法舒地尔后血管内皮功能障碍、血清炎症因子水平、氧化应激得到改善。同样，氟西汀慢性给药后,模型大鼠血管内皮损伤、血清炎症因子水平 IL-6、hs-CRP 及氧化应激得到改善。

结论 电刺激大鼠诱发类惊恐发作 15 分钟可致血管内皮损伤，机制之一可能是类惊恐发作引起交感神经兴奋，诱发模型大鼠炎症因子、氧化应激水平升高，进而激活 RhoA/ROCK 信号通路，且氟西汀在抗惊恐发作同时可预防血管内皮损伤，其机制可能通过降低全身炎症及氧化应激水平起到保护血管内皮细胞的作用。

A Study of Cognitive Function in Adolescent with Melancholic Major Depressive Disorder Based on FNIRS

梁秀梅 乔丹 任田 温宇娇 徐一凡 马璐 李琪琪 李改智 刘志芬*
山西医科大学第一医院

Objective To observe the characteristics of cognitive impairment and corresponding cerebral hemodynamics in adolescent melancholic MDD, and to elucidate the relationship between cognitive impairment and depressive symptoms in the group.

Methods Fifty-seven and 44 adolescent patients with MDD with or without melancholic feature (MDD-MEL/nMEL) and 58 healthy controls (HCs) were recruited. We used the repeatable battery for the assessment of neuropsychological status (RBANS) measuring neurocognitive function, and used functional near infrared spectroscopy (fNIRS) monitoring cerebral hemodynamic changes, described by β value. And we compared RBANS scores and β value among three groups. Subsequently, according to the HAMD reduction rate at 8 weeks, patients with MDD-MEL were divided into response group (n=24) and non-response group (n=15). Then we analyzed the neurocognitive test and frontotemporal cerebral blood flow changes in the two groups during follow-up.

Results (I) Neurocognitive function: There were no significant differences between the adolescent with MDD-MEL and MDD-nMEL in RBANS scores (all $p > 0.05$). But the absolute scores of immediate memory, attention, delayed memory and total scores in the adolescent with MDD-MEL were lower than those in the MDD-nMEL, and both lower than those in the HCs. Besides, there were time effects on total score of RBANS ($F=27.335$, $p < 0.001$), immediate memory ($F=17.833$, $p < 0.001$), verbal function ($F=5.263$, $p = 0.032$), and delayed memory ($F=7.669$, $p = 0.011$) between the MDD-MEL responders and non-responders. And there was a significant difference in immediate memory between the response and the non-response ($F = 20.336$, $p < 0.001$). （II）Frontotemporal cerebral hemodynamics: HBO concentration of cerebral blood flow in the adolescent with MDD-MEL was significantly lower than that in the MDD-nMEL in eight channels (channels 10, 16, 20, 25, 27, 37, 41, 45) ($p < 0.05$, Bonferroni correction). Besides, there was no temporal effect on β values between the responding and the non-responding group ($p > 0.05$). The main effect was not significant and there was no interaction.

Conclusion Adolescents with MDD-MEL may have more severe cognitive impairment, and the cerebral hemodynamics of the medial prefrontal cortex may be significantly decreased. Cognitive impairment in adolescents with MDD-MEL is associated with poor prognosis of the disease.

Gender Effects on Differentiating Patients with Major Depressive Disorder From Bipolar Disorder in Depressive State: A FMRI Study with Follow-up

Wen Liu Xiaowei Jiang Yide Xin Zijing Deng Yu Xie Yifang Zhou Yifan Wu Qikun Su Lingtao Kong Feng Wu Yanqing Tang*
中国医科大学附属第一医院

Background Bipolar disorder (BD) is difficult to discriminate from major depressive disorder (MDD) before the appearance of mania or hypomania. This study was designed to identify whether patients with MDD and those who converted to BD are distinguishable using dynamic amplitude low-frequency fluctuations (dALFF) and describe the gender effects on the identification of the two disorders.

Methods : We compared the dALFF values of 35 BD patients who converted from MDD during the 2-year follow-up, 99 MDD patients, and 130 healthy controls (HCs) using two-way ANOVA. Pearson's correlation was used to compare dALFF in dysfunctional brain regions and clinical characteristics.

Results : A main effect of diagnosis was discovered in the frontal and occipital gyrus. For the main effect of gender, both the left middle occipital gyrus and the medial part of the superior frontal gyrus had higher dALFF values in males compared to females. An interaction of gender and diagnosis effect was observed in the right precentral gyrus. Male MDD patients exhibited a higher dALFF value than male BD patients. Additionally, we discovered a higher dALFF value in females than in males in BD patients. WCST scores were positively associated with dALFF values in the frontal and occipital gyrus in MDD patients. Meanwhile, dALFF values in the occipital gyrus positively correlated with WCST in female MDD patients only.

Conclusions Our study is the first to find that BD and MDD can be differentiated at an early stage, and gender effects on the disorders should be taken into consideration.

5.Psychosocial Research Center, University of Melbourne,
6.North Western Mental Health
7.华南理工大学

Objective The consequences and impact of violent behavior in schizophrenia are often serious, and identification of risk factors is of great importance to achieve early identification and effective management.

Methods This follow-up study sampled adult patients with schizophrenia in primary mental health care in a rural area of southern China, in which 491 participants completed a comprehensive questionnaire at baseline and the 2-year follow-up. Sociodemographic, clinical and psychological assessment data were collected from all participants. Paired sample T-Tests and the McNemar Test were performed to examine changes over the follow-up period. Generalized Estimating Equations (GEE) were used to analyze the risk factors for violent behavior.

Results The results showed that about two in five community-dwelling patients with schizophrenia reported violent behavior in the past year. At follow-up, participants were significantly less employed, had more times of hospitalization, more psychotropic medication, and severer depressive symptoms, but had better health-related quality of life than at baseline. Use of clozapine and better insight into medication decreased the possibility of violent behavior, while more severe positive symptoms, insomnia, as well as use of second-generation antipsychotics other than clozapine, antidepressants and mood stabilizers increased the possibility of violent behavior.

Conclusion Risk evaluation, prevention and management of violence in patients with schizophrenia are demanded in primary mental health care.

Relationship between Covid-pandemic Anxiety and Sleep Disorder with Menstrual Disorders Among Female Medical Workers

孙文喜[1] 夏丽萍[1] 季彩芳[1] 魏倩倩[1] 张军[1] 何丝迪[1] 王旭芹[1] 沈雪琴[2] 张晓斌[1] 李传威[1]

1.苏州市广济医院
2.南京医科大学附属江苏盛泽医院

Objective It has been more than 2 years since the 2019 novel coronavirus disease (COVID-19) pandemic destabilized the world, adversely affecting not only physical health, but also mental health. During this time, frontline medical workers were at a greater health risk, especially female medical workers. Changes or abnormalities in the menstrual cycle—an important indicator of women's health—may jeopardize female reproductive functioning. Considering that emotional health and sleep status may be related to the menstrual cycle, this study aimed to investigate the association between menstrual cycle changes, anxiety, sleep dysfunction, and other factors among female medical workers during the COVID-19 pandemic.

Methods A cross-sectional survey was conducted by distributing online questionnaires to female medical workers in China from February to May 2022. The study included 160 women aged 18–45 years old. The questionnaires covered data related to the participants' sociodemographic characteristics, medical and reproductive history, and lifestyle. The Rating Scale for Clinical Manifestations of Menopathy (SCMM), Self-Rating Anxiety Scale (SAS), and Sleep Dysfunction Rating Scale (SDRS) were utilized. Data were analyzed using chi-square tests, t-tests, and linear regression analysis.

Results A total of 160 female medical staff were randomly selected in this research, of whom seven scored less than 3 points, 85 scored 3-11 points, and 68 scored more than 11 points on the total score of the SCMM. Compared to pre-pandemic scores, scores of dizziness and tinnitus were significantly higher during the COVID-19 pandemic. Scores corresponding to the following clinical symptoms were also higher during the pandemic: Menopathy, including hypaphrodisia, dim complexion, abnormal urination, languidness, dim menstruation, thin menstruation, dysmenorrhea, and empty or saggy lower abdomen ($p<0.05$). However, pre-pandemic scores of vaginal bleeding quantity were significantly higher than those found during the COVID-19 pandemic ($p<0.05$). Scores of vaginal bleeding quantity were significantly lower in cabin hospitals than other types of hospitals, and a similar finding was observed for vaginal bleeding duration (all $p<0.05$). Moreover, the findings of the univariable and multivariable linear regression analysis revealed a link between consistent exercise, the underlying illness, the SDRS score, the SAS score, and the total score of SCMM ($p<0.05$).

Conclusion In this study, we found that menstruation in female medical workers was affected by the COVID-19 pandemic. Furthermore, regular exercise and good physical condition were protective factors, while anxiety and insomnia were risk factors for menstrual abnormalities.

Association between Dietary Patterns and Premenstrual Disorders: A Cross-sectional Analysis of College Students in China

李雨辰* 石心怡 吕东昊
四川大学华西医院

Objective Premenstrual disorders (PMDs) are prevalent among women of reproductive age and have negative impacts on their physical and mental well-being. While previous studies have explored the role of dietary factors in the development of PMDs, limited evidence exists regarding the associations between dietary patterns and PMDs, particularly in Asian populations.

Methods This cross-sectional study involved young female adults recruited from the Care of Premenstrual Emotion (COPE) prospective cohort study in China. PMDs were assessed using the Calendar of Premenstrual Experiences, and the consumption frequency of 12 common food groups was evaluated using a Food Frequency Questionnaire. Principal component analysis was utilized to extract dietary patterns, and standardized dietary pattern scores were calculated and transformed into quintiles. Multivariate regressions, adjusted for potential confounders, were conducted to investigate the associations between PMDs, food groups, and dietary patterns. Sensitivity analyses were stratified by place of origin and coexistence of depression or anxiety. Furthermore, the associations of a specific dietary pattern, identified as associated with PMDs, with PMD subtypes of different onset time and severity were explored.

Results The study included 1382 participants (mean age= 20.0 [standard deviation 1.41]), of whom 337 (24.4%) reported having PMDs. Three dietary patterns were identified and named based on regional food preferences: Traditional North China Diet (characterized by high consumption of wheat, other staple foods, fish/seafood, and preserved vegetables), Traditional South China Diet (characterized by high consumption of rice, red meat, and poultry), and Lacto-ovo Vegetarian Diet (characterized by high consumption of fresh vegetables, fruits, and dairy products). The Traditional South China Diet showed an association with a decreased incidence of PMDs (OR=0.88[95% Confidence interval 0.78–1.00]; P for trend=0.035). No significant differences were observed in the associations between the Traditional South China Diet and different PMD subtypes.

Conclusion Adherence to the Traditional South China Diet may be beneficial in the early prevention and management of PMDs and their symptoms.

The Prominent Role of The Amygdala-hippocampal Circuit in Premenstrual Syndrome and Premenstrual Dysphoric Disorder: Evidence From Multimodal Neuroimaging

龙镜亦*
武汉市精神病院

Objective Premenstrual syndrome (PMS) or premenstrual dysphoric disorder (PMDD) usually presents with mild to moderate emotional and physical symptoms that affect patients' routine work, social activities, and family lives. However, their pathogenesis and the up-downstream regulating mechanisms are still unclear. Hence, we conducted this research to further reveal the role of the amygdala-hippocampal circuit in PMS and PMDD.

Methods We summarized findings of PMS and PMDD related to the amygdala and hippocampal by retrospect literature over the past decades.

Results First, structural and functional alterations of the amygdala in PMS and PMDD were closely associated with emotional regulation. Sufficient evidence suggests that fluctuations in sex hormones may be a pivotal factor in brain structural remodeling. Additionally, several studies verified that estrogen concentrations significantly influenced the severity of symptoms and brain activity. Currently, generally agreed that damage to the amygdala may lead to aberrations in top-down inhibition processes in the limbic system, which involves the core pathological mechanism of PMS and PMDD. Furthermore, numerous human and animal studies have confirmed that estrogen can modify the hippocampus's structure, metabolism, and function. The estradiol level positively correlated with the hippocampus's connectivity, volume, and white matter integrity in healthy females. Inversely, patients exhibit different alterations in grey matter density, functional activity, and connectivity in the hippocampus. Indeed, ovarian gonadal hormones could pass through the blood-brain barrier and subsequently affect mood and behavioral patterns by regulating the amygdala-hippocampal circuit. Sex hormones can profoundly affect the HPA axis and neurotransmitters such as serotonin, dopaminergic, and GABA. Besides, in healthy females, harmonious covariations existed between the metabolism, structure, and function of the amygdala-hippocampal circuit and ovarian gonadal hormone levels during the menstrual cycle. Nevertheless, various inappropriate manifestations and remodeling of metabolic, structural, and functional systems have occurred in PMS and PMDD. Why the amygdala-hippocampal circuit are the most susceptible region in PMS and PMDD? In brief, there are extensive distributions of estradiol and progesterone receptors in the limbic system, and these receptors are the most densely concentrated in the neurons and glial cells of the amygdala and hippocampus. These neurotransmitters, ovarian hormones, and their receptors are crucial factors in inducing structural and functional abnormalities in the amygdala and hippocampal, which can trigger relevant symptoms.

Conclusion The amygdala-hippocampus circuit is the most vulnerable area in PMS and PMDD. Therefore,

we should pay attention to this circuit for further guiding the individualized identification, classification, and treatment.

A Sex-specific Interaction between Family Function and The PCDH9 Rs9540720 Polymorphism—A Novel Risk Factor for The Development of Major Depressive Disorder in Chinese Freshmen

秦岩 胡书章 牛四方 慕福芹 郑艺 刘传新* 刘燕*
济宁医学院精神卫生学院

Objective According to previous studies, family functioning has been associated with major depressive disorder. Then, the interaction between family functioning and PCDH9 rs9540720 gene polymorphism on major depressive disorder remains to be investigated.

Methods Blood samples were provided by 4866 (69.76%) of the 6985 respondents who completed follow-up and were genotyped for PCDH9 rs9540720 using the QIAamp96DNA QIAcube HT kit. The comprehensive international diagnostic interview (CIDI-3.0) was used to assess major depressive disorder. Family functioning was assessed using the Family Assessment Device (FAD).

Results The prevalence of MDD was 2.36% (95% CI: 1.96%-2.83%). After adjusting for covariates, the AA genotype of PCDH9 rs 9540720 showed a protective effect (P<0.05) in the total sample (OR=0.49, 95% CI:0.24-0.90) and in the female sample (OR=0.44, 95% CI:0.18-0.94); Affective Responsiveness in family function showed a risk effect in the total sample (OR=1.72, 95% CI:1.10-2.72) showed a risk effect, while in females Affective Responsiveness (OR=1.77, 95% CI:1.02-3.09) showed a risk effect in the female sample (P<0.05). In men neither genetics nor environment had a significant effect (P>0.05). After controlling for covariates, the interaction of genes (rs 9540720) and environment (general function) showed a risk effect in the total sample (OR=6.97,95% CI:1.17-41.13) and in the female sample (OR=8.46, 95% CI:1.01-72.84). Specifically, rs9540720 AA genotype carriers in the total and female samples were observed to be at higher risk of MDD development when family functioning was poor.

Conclusion The risk of MDD in college freshmen, especially in women, is influenced by a combination of genes (PCDH9 rs9540720) and environment (family functioning). Focusing on unhealthy family functioning and MDD susceptibility genotypes could help screen college students for major depressive disorder.

Incidence and Factors Associated with Suicidal Behavior in Patients with First Hospitalization for Major Depression Disorder：a Large Sample Cross-sectional Study

马骏 王高华*
武汉大学人民医院精神科

Objective Suicidal behavior (SB) and major depressive disorder (MDD) stand as prominent worldwide public health issues, with MDD being among the leading causes of SB. Therefore, this study's objective was to determine the prevalence of SB and its related factors among first-time hospitalized MDD patients in China and to develop predictive models for SB in this population.

Methods A total of 981 patients with MDD who were hospitalized for the first time were recruited for this study. Sociodemographic and general clinical data of the included patients were collected, and common metabolic parameters and thyroid function were extracted. Depressive symptoms, anxiety symptoms and psychotic symptoms and severity of illness were assessed using the Hamilton Depression Assessment Scale (HAMD), the Hamilton Anxiety Assessment Scale (HAMA) and the Positive Symptom Subscale (PSS) of Positive and Negative Syndrome Scale (PANSS), and the Clinical Global Impression Scale - Severity of Illness (CGI-SI), respectively.

Results Our study revealed a 13.46% prevalence of SB among MDD patients hospitalized for the first time. The clinical subgroup with SB displayed more severe psychopathological and psychological symptoms and worse metabolic outcomes than the group non-SB. PSS score, HAMA score, CGI-SI score, triglyceride (TC) levels, waist circumference (WC), and diastolic blood pressure (DBP) emerged as independent risk factors for SB. The combination of PSS, HAMA, and CGI-SI scores demonstrated excellent discriminatory capabilities regarding MDD patients with and without SB.

Conclusion The prevalence of SB is high among first-hospitalized MDD patients, and the severity of clinical symptoms and multiple metabolic parameters are risk factors for SB. We determined that the PSS, HAMA, and CGI-SI can jointly discriminate well between the target group for combined SB.

中国
3.苏州广济医院

目的 精神分裂症与暴力密切相关，但机制不明。本研究旨在探索伴暴力犯罪行为精神分裂症患者的临床特征、静息态前额叶区域功能连接特征及可能的多基因遗传风险特征，并基于临床特征-前额叶功能连接-多基因风险评分，采用机器学习方法构建精神分裂症患者的暴力分类模型。

方法 本研究采用病例对照研究设计，以伴暴力犯罪行为精神分裂症患者为暴力组，既往从无攻击他人行为的精神分裂症患者为非暴力组。最终纳入暴力组 134 例，非暴力组 141 例。采集了受试者的社会人口学及临床资料及静息状态下的近红外功能成像前额叶功能连接及多基因风险评分（SCZ-PRS）数据。基于临床特征、前额叶功能连接及 SCZ-PRS 多维度因素采用逻辑回归、随机森林及朴素贝叶斯三种机器学习的方法建立精神分裂症患者的暴力分类模型。

结果 1.暴力组患者存在男性比例高、文化程度低、未治期长，首发年龄大、精神病态评分更高等特点（P<0.05）。 2.在前额叶功能连接特征上，暴力组在额极-右侧三角部（PFC-TRI.R）（P=0.041）、右侧背外侧前额皮层-右侧三角部（DLPFC.R-TRI.R）（P=0.028）、右侧三角部-右侧前运动和辅助运动皮层（TRI.R-PMSMC.R）（P=0.016）及右侧三角部-左侧前运动和辅助运动皮层（TRI.R-PMSMC.L）（P=0.048）之间的 FC 均低于非暴力组，而双侧前运动和辅助运动皮层之间的 FC 则高于非暴力组（P<0.001）。关联分析结果显示，在暴力组中，FCPMSMC.R -PMSMC.L 与精神病态（PCL:SV）反社会因子呈正相关（r=0.172，P=0.048）。3.SCZ-PRS 相关分析的结果显示，在伴暴力犯罪行为精神分裂症患者中，SCZ-PRS 与 FCPMSMC.R-PMSMC.L 呈正相关（P=0.002-0.029），但未发现 SCZ-PRS 与暴力风险相关的临床指标之间存在明显的相关性。4.基于临床特征、静息态前额叶脑区功能连接及 SCZ-PRS 多维度数据构建的机器学习模型中，使用随机森林模型对暴力组与非暴力组进行分类的效果最好，其准确性达 0.942，灵敏度为 0.985、特异度为 0.895。

结论 1.前额叶中负责语言管理的右侧三角部的枢纽功能异常及负责复杂运动控制及认知控制的前运动及辅助运动皮层连接的异常激活均可能与精神分裂症的暴力相关。2.精神分裂症的多基因遗传风险可能通过

2001-2022 年我国精神卫生政策文本分析及优化建议

高霞[1] 朱瑞轩[2] 石元洪[1] 杨杨[1] 董丽平[1] 童萍[1] 孙亭[1]
1.江苏省苏北人民医院
2.大连医科大学公共卫生学院

目的 探讨近20年精神卫生政策制定存在的问题并提出改进意见。

方法 本文收集整理 2001-2022 年我国精神卫生的 22 份政策文本，从政策类型、发文数量、政策效力级别及制定部门、政策工具等方面进行分析。

结果 2001 年至 2022 年 22 年间共有 22 份相关政策法规颁布实施，精神卫生政策发文呈周期性波动趋势。精神卫生政策类型多样，表现为法律、条例、指导意见、工作规划、纲要、通知等 6 种形式。政策类型以地方性的“条例”为主，共有 14 部，占所有政策文本的 63.7% 以上；而“指导意见”“工作规划”等数量较低，一共只有 7 份，占政策文本的 31.8% 。22 份现行有效的精神卫生政策文件中国家和地方层面皆有：国家层面的相关政策有 8 份：法律一部、国务院规范性文件 2 部、党内法规制度 3 部、部门工作文件 2 份；地方层面精神卫生条例有 14 部，其中省级地方性法规 8 部、设区的市地方性法规 6 部。环境型政策工具占比最高，共 566 条，高达 63.3%，供给型政策工具 220 条，占 25.2%，而需求型政策工具 109 条占 11.5%。其中，供给型政策工具中，组织管理占比达 9.2%，而财政投入占比较低，仅占 1.5%；环境型政策工具中，标准规范占比最高 19.8%，其次是权益保障占比 19%；而需求型政策工具中试点示范最低，仅占 0.8%，健康教育占比较高，达 6.9%。

结论 我国精神卫生政策类型权威性高，但地域性差异大；政策制定的不连续，发文数量偏少；国家对精神卫生工作关注不够，地方政府缺乏精神卫生工作实施细则；政策工具使用不当，需求型政策工具相对匮乏。建议增强政策的权威性与约束力，提高政策的操作性；强化人、财、物等方面的保障，增强政策的连续性；加强政府不同部门之间的合作，形成协同合作机制；合理运用政策工具，完善精神卫生政策体系。

伴暴力犯罪行为精神分裂症患者的面部情绪识别特征研究

张兰兰[1] 古宇[2] 郭慧娟[2] 黄颖[2] 王纪智[2] 赵熠鑫[2] 周建松[2] 王小平[2]
1.苏州市广济医院
2.中南大学湘雅二医院

目的 本研究拟探讨伴暴力犯罪行为的精神分裂症患者面部情绪识别功能特征及其与疾病症状之间的关系。

方法 本研究采用病例对照研究设计，以伴暴力犯罪行为精神分裂症患者（涉凶杀及故意伤害罪，经鉴定为无刑事责任能力）为暴力组，既往从无攻击他人致轻伤及以上级别的精神分裂症患者为非暴力组。招募时对两组患者的年龄和性别进行匹配，采集受试者的社会人口学资料，使用阳性和阴性症状量表（PANSS）

评估受试者的疾病症状，采用面部情绪识别任务（包含悲伤、愤怒、恐惧等 6 种情绪图片）评估两组患者的面部情绪识别功能。使用独立样本 t 检验和协方差分析方法比较两组的面部情绪识别得分，使用偏相关分析探讨有差异的情绪识别得分与PANSS各症状量表评分之间的关系。

结果 本研究共招募 391 例精神分裂症患者，其中暴力组 238 例，非暴力组 153 例。暴力组阴性症状量表评分低于非暴力组，在阳性症状和一般精神病理症状量表评分中，两组无明显差异。暴力组患者的面部情绪识别得分排序为：快乐＞中性＞悲伤＞恐惧＞厌恶＞愤怒；非暴力组患者的厌恶情绪识别得分高于恐惧情绪，其余得分情况与暴力组类似。暴力组患者在悲伤（7.26±2.06 vs 6.82±2.35，P＜0.05）、恐惧（7.02±2.40 vs 6.72±2.46，P＜0.05）、快乐（8.96±1.72 vs 8.33±2.25，P＜0.001）和中性（8.47±2.01 vs 7.90±2.31，P＜0.001）四个维度的得分均高于非暴力组；两组在愤怒和厌恶情绪识别得分上未见明显差异。暴力组患者的恐惧、快乐和中性情绪识别得分与 PANSS 阳性症状、阴性症状及一般精神病理症状评分均呈负相关，悲伤情绪识别得分与PANSS阴性症状及一般精神病理症状评分呈负相关。

结论 伴暴力犯罪行为和不伴暴力犯罪行为的精神分裂症患者可能存在相似的面部情绪识别缺陷；伴暴力犯罪行为的精神分裂症患者对部分面部情绪的。

快速眼动期睡眠对恐惧记忆泛化的抑制作用及其神经影像机制

邸天琪[1] 刘王玥[1] 郑恩雨[1] 陆林[1,2] 孙艳[1] 时杰[1]
1.北京大学中国药物依赖性研究所
2.北京大学第六医院

目的 恐惧记忆泛化是生物长期进化过程中表现出的适应性反应。过度泛化是对安全刺激与危险刺激间差异辨别能力的减弱,无法区分与危险线索相似度高的泛化刺激，从而引起不适当的焦虑样症状以及相关精神疾病（如创伤后应激障碍、惊恐障碍、广泛性焦虑障碍等）。睡眠在恐惧记忆的泛化中起到重要作用，其中快速眼动睡眠与创伤后应激障碍在内的过度泛化相关精神疾病的发展、维持和恶化关联密切。然而，快速眼动睡眠与恐惧记忆泛化之间的关联缺少研究证据。本研究的目的旨在明确快速眼动睡眠与恐惧记忆泛化的关联及相关神经影像机制。

方法 通过分夜睡眠限制范式（前半夜/后半夜睡眠限制）干预快速眼动期睡眠时间及占比（前半夜以非快动眼睡眠为主，后半夜以快动眼睡眠为主），探究快速眼睡眠能否特异性抑制恐惧记忆泛化。在 118 名受试者随机分为早期睡眠组（快速眼动睡眠占比少，ES，N=40）、晚期睡眠组（快速眼动睡眠占比多,LS，N=39）、整夜睡眠对照组（TS，N=39）。实验流程包括睡前恐惧记忆习得、醒后近期-恐惧记忆泛化测试、一周后远期-恐惧记忆泛化测试。在上述泛化测试中，均同步采集任务态影像学数据和行为学数据（主观恐惧评级、客观皮肤电导反应），通过一般线性模型分析三组被试在加工泛化刺激线索时脑功能的变化。

结果 ES 组的恐惧泛化程度显著高于 LS 与 TS 组，快速眼动睡眠占比与恐惧记忆泛化程度呈显著负相关，但并不影响恐惧记忆的表达。核磁结果发现，ES 组在近期处理泛化刺激时前额叶、枕中回、顶下小叶、楔前叶、舌回的激活程度显著低于其他两组（PFWE<0.05）；并且，ES 组在一周后处理泛化刺激时，前额叶、楔前叶等脑区的激活程度仍然显著低于其他两组。

结论 快速眼动睡眠有助于抑制恐惧记忆的泛化，可能与其参与了前额叶、顶下小叶、楔前叶等脑区的情绪与记忆整合功能有关。本研究发现为临床治疗非适应性恐惧泛化相关疾病提供新思路。

全蛋白质组关联研究发现失眠症新型易感基因 CAMLG

王帅 刘传新 郁昊*
济宁医学院

目的 失眠症是常见的复杂疾病，遗传因素在其发病中起重要作用。全基因组关联研究(GWAS)鉴定出多个失眠症易感基因。然而，易感位点如何参与失眠风险机制尚不完全清楚。通过整合多组学数据，如基因组学、蛋白质组学和转录组学数据等，有望解释易感基因参与失眠症的发病机制，进而为失眠症的发病机制提供重要线索。

方法 本研究利用英国生物银行 UK biobank 的失眠症全基因组关联研究结果(N=386,988)、人脑蛋白质组(N=376)数据以及人脑转录组学(N=888)数据，开展全蛋白质组和全转录组关联研究。采用孟德尔随机化分析和共定位分析筛选易感基因与失眠症的因果关系。利用独立的蛋白质组学(N=152)和转录组数据对结果进行验证。针对筛选出的新失眠易感基因 CAMLG 进行功能验证。

结果 全蛋白质组关联研究鉴定出 5 个失眠易感基因，包括 ADO, LXN, STAU1, CAMLG 和 GFM1，它们通过各自顺式调节机制影响其脑中的蛋白水平，孟德尔随机化分析和共定位分析结果表明上述基因与失眠症存在显著因果关系。基于独立的人脑蛋白质组学数据集(N=152)的验证结果表明，ADO, LXN, CAMLG 和 GFM1 基因与失眠症显著关联。全转录组关联研究结果表明，LXN, CAMLG 和 GFM1 基因在 mRNA 水平与失眠症显著关联。基因表达区域及细胞类型的分析表明，LXN, CAMLG 和 GFM1 基因在与失眠相关的大脑区域富集表达，包括兴奋性神经元、星形胶质细胞和少突胶质细胞前体细胞。随后，本研究选取新发现的失眠症新型易感基因 CAMLG 开展功能分析，结果表明 CAMLG 敲低可通过促进 GABRG2 蛋白降解降低 GABRG2 水平。CAMLG 的缺乏促进了 GABRG2 在细胞质晚期内体中的定位，表明 CAMLG 通过核内体-溶酶体途径部分调控 GABRG2 的降解。结果提示 CAMLG 下调促进 GABRG2 在神经元中的加速降解可能是导致抑制性神经元功能异常并诱发失眠症状的原因。

结论 全蛋白质组关联研究发现 LXN, CAMLG 和 GFM1 为失眠症易感基因，为失眠症的机制和治疗研究提供了潜力的治疗靶点。

失眠障碍患者睡眠觉醒周期蓝斑功能与负性情绪的相关性研究

卢盼盼[1] 郭誉鹏[1] 邵岩[1] 邹广源[2] 陈洁[1] 高雪娇[1] 刘佳怡[2] 姚萍[3] 周蜀钦[2] 徐静[2] 高家红[2,4] 邹启红[2] 孙洪强[1]

1.北京大学第六医院
2.北京大学前沿交叉学科研究院磁共振成像研究中心
3.内蒙古自治区精神卫生中心
4.北京大学 IDG 麦戈文脑科学研究所

目的 失眠障碍（insomnia disorder，ID）是最常见的睡眠障碍，患者常伴发包括焦虑和抑郁症状在内的负性情绪。然而，ID 相关负性情绪的神经生物学机制仍未知。既往研究证实蓝斑是情绪调控的关键脑区，其同时也参与了睡眠觉醒调控。本研究旨在探索 ID 患者睡眠觉醒周期蓝斑与全脑功能连接的变化情况，及其与主观睡眠质量、焦虑和抑郁症状的关系。

方法 本研究纳入符合 DSM-5 诊断标准的 37 例 ID 患者及年龄、性别和受教育年限匹配的 30 名健康受试者。所有受试者首先完成一般人口学资料采集、匹兹堡睡眠质量指数量表、抑郁自评量表、焦虑自评量表的评估，佩戴腕式体外活动仪并记录两周睡眠日记，随后经历连续两晚的多导睡眠监测，并在一周后在北京大学磁共振研究中心接受同步脑电-功能磁共振成像（Electroencephalogram-functional magnetic resonance imaging, EEG-fMRI）扫描，以收集整个睡眠觉醒周期的脑电和脑影像数据。选择蓝斑作为种子点，计算其与全脑的功能连接。通过混合线性效应模型计算基于种子点的功能连接的组与睡眠时相交互作用。随后运用 Spearman 相关性分析探索蓝斑脑功能与匹兹堡睡眠质量指数、抑郁自评量表得分、焦虑自评量表得分之间的相关性。

结果 蓝斑与全脑功能连接的分析结果显示，右顶叶、左颞叶、左岛叶和边缘叶存在组与睡眠时相的交互作用。与健康对照组相比，ID 患者在非快速眼动睡眠 2 期和非快速眼动睡眠 3 期蓝斑与边缘叶的功能连接显著增强。在混合样本中，非快速眼动睡眠 2 期蓝斑与边缘叶的功能连接与抑郁自评量表得分（$r=0.337$，$p=0.019$）和匹兹堡睡眠质量指数评分（$r=0.401$，$p=0.003$）呈显著正相关。

结论 非快速眼动睡眠 2 期睡眠期间蓝斑与边缘叶神经环路的异常调控可能是 ID 伴发抑郁情绪的潜在神经生物学机制。

4.Department of Psychiatry and Behavioral Sciences, University of Crete, Heraklion, Crete, Greece
5.Sleep Medicine Center, Mental Health Center, West China Hospital, Sichuan University, Chengdu, China

Objective Insomnia with objective short sleep duration (ISSD) has been associated with higher risk of cardiometabolic morbidity. In this study, we examined the association between ISSD, also based on subjective sleep duration, with incident hypertension in the Sleep Heart Health Study (SHHS).

Methods We analyzed data from 1413 participants free of hypertension or sleep apnea at baseline from the SHHS with a median follow-up duration of 5.1 years. Insomnia symptoms were defined based on difficulty falling asleep, difficulty returning to sleep, early morning awakening, or sleeping pill use more than half days in a month. Objective short sleep duration was defined as polysomnography-measured total sleep time

Food Insecurity is Associated With The Prevalence of Insomnia: Findings from The Longitudinal Ageing Study in India (Lasi)

冷思琪 唐向东*
四川大学华西医院

Objective Whether food insecurity (FI), a social determinant of health, is associated with insomnia in the older generation is uncertain. This study explored the relationship between FI and insomnia among older Indians.

Methods Data from the Longitudinal Ageing Study in India (LASI) wave 1 (2017-2018). Older adults (≥ 60 years) completing FI and insomnia surveys were recruited. FI was indicated by the lack of assesses to enough food in the past year. Insomnia was determined by the presence of any of three symptoms ≥ 5 times/week: difficulty in initiating sleep (DIS), difficulty in maintaining sleep (DMS), or early morning awakening (EMA). The association between FI and insomnia was assessed by multivariable logistic regression adjusted for potential covariates. The interactions in subgroups of age, sex, drinking, smoking, economic status, and living arrangement were also evaluated.

Results 31186 participants met the entry criteria. Overall prevalence was 7.24% for FI and 11.40% for insomnia. In the fully adjusted model, food insecurity was correlated with insomnia (OR 1.49; 95% CI 1.31-1.70) and was related to DIS, DMS, and EMA (OR 1.38; 95% CI 1.18-1.62, OR 1.46; 95% CI 1.25-1.71, and OR 1.43; 95% CI 1.23-1.88, respectively). A significant interaction effect by age categories was observed between FI and insomnia (p = 0.046). Positive relationships were observed in all age categories, and the magnitude of association was slightly increased with age (OR 1.36; 95% CI 1.14-1.61 in 60-70 years, OR 1.53; 95% CI 1.21-1.92 in 70-80 years, OR 2.20; 95% CI 1.54-3.14 in ≥ 80 years).

Conclusion FI was associated with a higher prevalence of insomnia among older Indians. Our findings elicit concern for public health policies, programs, and practices to address FI, which is imperative to ensure the health and well-being of the older population.

虚拟现实技术辅助治疗慢性失眠有效性及安全性的随机对照研究

赵琳琳 谭立文*
中南大学湘雅二医院

目的 探讨虚拟现实技术（VR）对慢性失眠患者辅助治疗的有效性和安全性。

方法 招募慢性失眠患者 116 例，采用随机数字表法分为试验组（VR+常规治疗，n=58）和对照组（普通动画+常规治疗，n=58），为期 2 周，共完成 8-10 次 VR 治疗，治疗后随访 4 周。在治疗前、治疗 2 周末、治疗结束后 2 周、治疗结束后 4 周分别采用失眠严重程度指数（Insomnia Severity Index，ISI）、匹兹堡睡眠质量指数（Pittsburgh Sleep Quality Index，PSQI）、抑郁自评量表（Self-rating Depression Scale，SDS）和焦虑自评量表（Self-rating Anxiety Scale，SAS）评估 2 组受试者的主观睡眠情况和抑郁焦虑严重程度，采集连续 24 小时的体动记录仪数据，用于分析总睡眠时间、入睡潜伏期、睡眠效率和入睡后觉醒（WASO）时间等睡眠-觉醒节律参数。重复测量方差分析比较 2 组各时间点组内变化差异，卡方检验或 Fisher 确切概率法比较 2 组有效率及不良反应率等。

结果 试验组和对照组在不同时点的 ISI 总分（F=52.339，P<0.01）和 PSQI 总分（F=41.212，P<0.01）差异均有统计学意义。试验组治疗 2 周末和治疗结束后 2 周的 PSQI 总分显著低于对照组（均 P<0.05），治疗 2 周末 PSQI 较治疗前的改善值显著高于对照组（P=0.0051）。以 ISI 减分率作为有效性评价指标，2 组在治疗 2 周末、治疗结束后 2 周和治疗结束后 4 周的有效率差值[95% CI]分别为 27.67% [13.94%, 41.40%]、23.77%[8.72%, 38.81%]、16.34%[3.51%, 29.17%]，不同时点 2 组有效率差异均有统计学意义，试验组均优于对照组。试验组治疗 2 周末的 SDS 总分、SAS 总分均显著低于对照组（均 P<0.05）。体动记录仪数据分析显示，试验组在治疗 2 周末的睡眠效率显著高于对照组（P=0.0243），且治疗结束后 4 周的总睡眠时间较治疗前的改善值显著高于对照组（P=0.0201）。2 组各项不良事件的发生率差异均无统计学意义且无严重不良事件发生。

结论 VR 对慢性失眠患者的睡眠、情绪具有较好的辅助改善作用，安全性较好，可作为慢性失眠治疗的一种增效策略。

创伤后应激障碍发病与韧性的结构相似性网络及全脑基因表达关联研究

袁敏兰 李论 朱鸿儒 张伟*
四川大学华西医院

目的 创伤后应激障碍（post-traumatic stress disorder, PTSD）是一种慢性精神障碍，历了重大创伤事件的人群中有约 30%的个体会罹患 PTSD，而经历了创伤暴露未患病者（trauma-exposed control, TEC）的神经改变可能是创伤个体韧性的关键。研究表明 PTSD 患者和 TEC 个体均存在多个脑区的结构异常，然而不同区域之间的结构相似性网络（morphometric similarity network, MSN）异常仍然不清楚。MSN 的改变可能与不同脑区的基因共表达模式变化有关。本研究旨在探究 PTSD 和 TEC 的 MSN 改变，以及其与全脑基因表达的关联，为进一步理解 PTSD 的发病机制和找到潜在干预靶点提供参考。

方法 本研究样本来自汶川地震重灾区的地震幸存者，其中 PTSD 患者 63 例，TEC 66 例。另招募未经历地震的健康志愿者（HC）52 例。使用 3.0 T MRI 成像系统获取所有受试者头部 T1 加权图像。将大脑划分为 308 个区域，对每例受试者进行皮层重建并提取形态学指标用于构建 MSN。采用一般线性模型计算 PTSD 与 HC，TEC 与 HC 的区域 MSN 差异性。利用 AHBA 数据库中汇总的健康人全脑基因表达数据，采用偏最小二乘回归（PLS）建立全脑区域 MSN 改变与基因表达的关联，找到与区域 MSN 关联最强的基因，并进行基因进行功能富集分析。

结果 PTSD 患者和 TEC 相比于 HC 均出现左侧中央前回 MSN 升高、右侧额中回喙部 MSN 减低，TEC 出现特异性左侧下顶叶、海马旁回等脑区 MSN 升高以及左侧枕叶、右内侧眶额回等脑区 MSN 减低。与 PTSD 患者全脑 MSN 变化显著相关的基因有 3367 个，与 TEC 全脑 MSN 变化显著相关的基因 4380 个（标准化系数 Z<-3 或>3，pFDR < 0.005）。在这些基因中，PTSD 与 TEC 的 Jaccard 相似系数为 0.71，TEC 中有 28.06%的特异性表达基因，PTSD 中仅 2.31%的特异性表达基因。基因富集分析显示小分子分解代谢过程、膜组织、突触信号传递调控等功能存在富集。

结论 本研究将区域 MSN 表型异常与基因表水平进行关联，有助于理解重大创伤后 PTSD 发病与韧性的微观分子功能与宏观脑结构改变的调控机制。

抑郁症患者血清细胞因子水平及其与症状和代谢指标的相关性

贾敏* 马青艳 范雅娟 高成阁 马现仓 王崴*
西安交通大学第一附属医院

目的 抑郁症是一种包含情绪、认知和躯体三维度症状的常见精神疾病。既往研究证实外周细胞因子可以通过血脑屏障进入中枢，引发中枢炎症级联反应，介导抑郁的发生。代谢综合征（metabolic syndrome，MetS）主要表现为肥胖、糖脂异常和高血压，荟萃分析表明抑郁症和 MetS 之间存在双向关联，队列研究显示抑郁症患者发生 MetS 风险是健康人的 1.5 倍，抑郁症和 MetS 都可被认为是“低度炎性状态”，细胞因子在其中发挥重要作用。本研究通过检测抑郁症患者血清中细胞因子，分析其与代谢指标及抑郁症状的相关性。

方法 收集抑郁症患者 108 例作为病例组，招募健康对照 47 例作为对照组，测定两组血清中细胞因子 IL-4、IL-6、IL-10、IFN-γ 及 TNF-α 水平；使用相关性分析的方法分析抑郁症患者血清中细胞因子水平与症状及代谢相关指标的关系，代谢指标包括 BMI、TBC、CRE、BUN、UA、TG、CHOl、LDL、HDL、GLU 及 HbA1c。

结果 （1）共收集受试者 155 例，其中病例组 108 例，对照组 47 例。病例组和对照组的年龄、性别、吸烟状况、BMI 的差异无统计学意义（P>0.05）。（2）两组血清细胞因子检测发现，病例组血清中 IL-4、IFN-γ 及 TNF-α 水平低于对照组，IL-6 和 IL-10 水平高于对照组，差异有统计学意义。（3）在病例组中，相关性分析发现 HAMA 总分与 IFN-γ 和 TNF-α 水平呈正相关，未发现 HAMD 总分与细胞因子水平相关；IL-6 水平与 TG、CHOl 及 LDL 呈正相关；IL-10 水平与 CHOl 水平呈正相关；病例组 TNF-α 水平与 CRE 水平呈负相关；未发现其他细胞因子与代谢指标之间的相关性。

结论 抑郁症患者存在免疫功能异常，这种免疫功能的紊乱与抑郁症患者伴随出现的代谢异常有一定关联。

关键字：抑郁症，细胞因子，症状，代谢指标

Susceptibility Or Resilience To Childhood Maltreatment Is Related To Hippocampal Subfield Volumes in Major Depressive Disorder Versus Healthy Populations

Qianyi Luo Yingying Du Huiqin Nie Yurong Zou Juran Chen Yuhong Li Hongjun Peng*
广州医科大学附属脑科医院

Objective Childhood maltreatment (CM) has profound effects on patients with major depressive disorder (MDD) and healthy populations. Numerous studies have linked CM to morphological abnormalities in brain areas responsible for cognitive and emotional processing, such as the hippocampus. However, the hippocampus is not a homogeneous structure but comprises several subfields, and the impact of CM on the morphology of these subfields has not been fully elucidated. In this study, we aimed to investigate whether abnormalities in hippocampal subfield volumes exist in MDD patients and healthy controls (HCs)

and whether such alterations are related to CM.

Methods We employed an advanced automated hippocampal segmentation procedure to measure the hippocampal subfields volumes in MDD patients with CM (n=48), MDD patients without CM (n=30), HCs with CM (n=57), and HCs without CM (n=46).

Results Our analysis has revealed reduced volumes of several hippocampal subfields, such as cornu ammonis (CA), subiculum, molecular layer, and hippocampal body in HCs with CM. In addition, decreased volume in the hippocampus amygdala-transition-area subregion was found in MDD patients with CM. Furthermore, moderation analysis has demonstrated that the altered CA4 subfield volume moderated the relationship between CM and depression severity. Additionally, HCs with CM showed an increase in volume in the right CA3 and amygdala-transition-area subfields, compared to MDD patients with CM, suggesting that increased volume in hippocampal subfields may serve as a potential mechanism of resilience.

Conclusion Collectively, our findings corroborate the notion that CM exerts a significant impact on the morphology of hippocampal subfields, manifesting in both MDD patients and healthy individuals.

基于质子磁共振波谱成像技术探索青少年双相抑郁患者非自杀性自伤神经代谢改变

王丞基[1] 曲源[2] 张丞[1] 佟钙玉[1] 唐潇潇[1] 曼则热姆·乃比[1] 邹韶红[1]
1.新疆维吾尔自治区人民医院临床心理科
2.新疆维吾尔自治区人民医院放射影像中心

目的 借助氢质子磁共振波谱（1H Magnetic Resonance Spectroscopy,1H-MRS）成像技术探讨青少年双相抑郁患者非自杀性自伤行为与腹内侧前额叶（Ventromedial Prefrontal Cortex,vmPFC）各代谢物之间的关系。

方法 本研究分析了伴或不伴 NSSI 的青少年双相抑郁患者的神经代谢差异。收集了 40 例在 1 个月内未接受药物治疗的青少年双相抑郁患者，根据他们有无 NSSI 行为，分为有 NSSI 组（21 例）和无 NSSI 组（19 例）。使用 1H-MRS 检测所有患者的腹内侧前额叶脑生化代谢物比值。

结果 有 NSSI 青少年双相抑郁患者 vmPFC 的 NAA/Cr 低于无 NSSI 青少年双相抑郁患者，有 NSSI 青少年双相抑郁患者 vmPFC 的 Cho/Cr 和 HAMD 评分有显著正相关性。研究结果表明，有 NSSI 的青少年双相抑郁患者 vmPFC 中 NAA 代谢水平降低，此外，有 NSSI 行为的青少年双相抑郁患者 vmPFC 的 Cho 水平可能与更严重的抑郁情绪有关。

结论 我们的研究指出，青少年双相抑郁患者 NSSI 行为可能与 vmPFC 神经元功能障碍有关，此外膜磷脂分解代谢水平异常可能与更严重的抑郁情绪有关，本研究为青少年双相抑郁患者 NSSI 行为的病理生理机制提供了参考。

一线消防人员重大救援后应激相关心理反应及其影响因素研究

周瀛 李卫晖*
中南大学湘雅二医院

目的 调查参与特别重大事故救援的一线消防人员的创伤后应激障碍、抑郁、焦虑症状，同时探究不同因素对于消防人员的 PTSD 的影响，为参与救援行动的一线消防人员制定针对常见精神障碍的干预措施提供理论依据。

方法 研究对象：295 名参与了湖南省某突发特别重大事故抢险救援行动的一线消防人员。研究时点：（1）重大救援前 1 年、发生后 2 周调查消防人员的抑郁、焦虑症状，共回收了 259 份有效问卷；（2）发生后 2 周、发生后 3 月随访了消防人员的 PTSD 症状，共回收了 274 份有效问卷。研究工具：抑郁自评量表、焦虑自评量表、创伤后应激障碍检查表等量表。统计学方法：描述性分析、单因素分析、配对 T 检验比较事故前后抑郁、焦虑的发生率及其症状变化；多重非参数检验分析了 PTSD 症状在人口学变量、职业背景变量类别的差异，以及不同时期、不同岗位的消防人员 PTSD 症状差异，二元 logic 回归分析探究创伤暴露程度、人口学、职业背景、心理弹性、社会支持因素对于消防人员 PTSD 症状发展的潜在影响。

结果 重大救援事件发生之后消防人员抑郁症状发生率从 55.6%下降至 39%，焦虑症状发生率从 2.7%上升到 4.6%，PTSD 症状的发生率为 7.7%；重大救援事件后消防人员的抑郁症状，包括性兴趣/自尊丧失症状、忧虑/焦虑心境、躯体化症状较救援前存在统计学差异；消防人员的焦虑症状，如运动性紧张以及混合症状较救援前存在统计学差异；消防人员的 PTSD 症状在受教育程度、工作年限、心理弹性上存在统计学差异；消防人员的 PTSD 症状，如负性认知及情绪症状在创伤暴露后 2 周与暴露后 3 月之间存在统计学差异；不同岗位的消防人员抑郁、焦虑症状无差异，PTSD 症状存在统计学差异；消防人员 PTSD 症状的严重程度与创伤暴露程度有关。

结论 （1）参与此重大救援的一线消防人员抑郁症状发生率较高于其他研究，焦虑症状发生率相较其他研究低。总体而言，此研究中一线消防人员的抑郁症状较焦虑症状突出；（2）创伤暴露后 3 月较之 2 周，PTSD 症状发生率较高、症状较前有所加重，本次研究中 PTSD 发生率总体低于其他研究。（3）一线消防人员的创伤暴露程度是导致 PTSD 症状严重程度的独立风险因素，受教育程度、工作年限、心理弹性可能是影响 PTSD 症状的因素。

含利托那韦成分的抗病毒药物与精神科常用药物相互作用的药学建议

果伟 张玲 郭小兵 王刚*
首都医科大学附属北京安定医院

目的 利托那韦是抗逆转录病毒药，常与其他抗病毒药组成复方制剂（如奈玛特韦/利托那韦、洛匹那韦/利托那韦、先诺特韦/利托那韦等）。利托那韦是多种代谢酶的抑制剂或诱导剂，与精神科药物联用时存在复杂的药物-药物相互作用。尽管药品说明书、国内外文献提供了药物联用建议，但临床实践时仍存在国内外药物品种不同、推荐意见不一致或无法实施等不足。

方法 为此，中国药理学会药源性疾病专委会药源性精神疾病学组和首都医科大学附属北京安定医院联合发起，组织医学和药学专家，在对国内外相关综述、共识、指南和数据库文献梳理的基础上，结合我国药品现状和临床实践制订了《含利托那韦成分的抗病毒药物与精神科常用药物相互作用的药学建议》（简称建议）。

结果 首先，分别为精神疾病患者因病情需要新增含利托那韦成分抗病毒药物治疗，和正在服用含利托那韦成分抗病毒药物治疗的患者需新增精神科药物治疗制定了各自的决策路径。其次，将含利托那韦成分的抗病毒药物与国内常用精神科药物联用的相互作用风险分为 4 级，并对每个风险等级中的精神科药物进行了详细的说明，包括相互作用机制，精神科药物浓度变化、药学建议和文献依据。最后，还对含利托那韦成分的抗病毒药物在初始服药和停用时的注意事项，以及联合用药过程中，精神科药物减停的注意事项进行了阐述。

结论 本建议归纳了含利托那韦成分的抗病毒药物与国内常用精神科药物联合使用的药学建议，可为临床实践提供参考。

关键字：利托那韦，药物-药物相互作用，治疗药物监测。

生命不同阶段多重应激对代谢综合征的影响

李娜 王岚 王学义*
河北医科大学第一医院精神卫生中心

目的 探讨生命不同阶段（胎儿期、童年期和成年期）多重应激对代谢综合征发生率的影响。

方法 在 2013-2014 年间调查开滦矿业集团工人，以胎儿期是否暴露于地震作为胎儿期创伤性事件，采用儿童期创伤问卷（Childhood Trauma Questionnaire，CTQ）和生活事件量表（life event scale，LES）分别评估儿童期创伤和成年期生活事件。收集所有受试者一般人口学资料，如性别、年龄、出生日期、家庭收入、受教育情况、吸烟及饮酒史等。进行体格检查，如测量腰围、臀围、身高和体重等。留取血液样本进行血糖、血脂等检查。胎儿期地震暴露组为 1976 年 7 月 29 日至 1977 年 4 月 28 日出生，在胎儿期经历地震；胎儿期非暴露组为 1977 年 7 月 29 日至 1978 年 4 月 28 日出生，地震至少 1 年后出生，胎儿期未遭受地震应激。将 CTQ≥26 分定义为存在儿童期创伤，将 LES≥32 分定义为存在成年期生活事件。将所有受试者根据生命不同阶段遭受创伤性事件的情况分为4组：无应激组、1 个应激组、2 个应激组和 3 个应激组，比较 4 组代谢综合征的发生率。计量资料以?x± s 表示，多组间比较采用单因素方差分析；计数资料用百分率表示，采用 χ2 检验进行组间比较；采用多因素 logistics 回归分析进行代谢综合征的影响因素分析。

结果 最终有 626 人纳入统计分析，其中无应激组 29 人、1 个应激组 249 人、2 个应激组 275 人和 3 个应激组 73 人。 4 组间代谢综合征的发生率比较存在统计学差异（χ2=21.981，P＜0.001），随着遭受创伤时期数量增加代谢综合征发生率增加，分别是 1 个应激组 17.3%，2 个应激组 20.0%，3 个应激组 42.5%。多因素 logistics 回归分析显示，在胎儿期、童年期和成年期均遭受创伤性事件是代谢综合征的独立风险因素（OR=3.134, 95%CI=1.042, 9.429）。吸烟能增加代谢综合征的患病风险（OR=1.809, 95%CI=1.40, 2.871）。

结论 生命不同阶段遭受多重创伤性事件会增加代谢综合征的患病风险。吸烟是代谢综合征的患病的风险因素。

首发抑郁症患者治疗前后肠道菌群及短链脂肪酸的特征性分析

宇淑涵 安翠霞*
河北医科大学第一医院精神卫生中心

目的 探索首发抑郁症患者治疗前后肠道菌群结构及肠道代谢产物短链脂肪酸（SCFAs）差异。

方法 本研究纳入 2021 年 5 月 1 日至 2021 年 11 月 1 日就诊于河北医科大学第一医院精神科门诊的首发抑郁症患者（MDD）组 45 例，同时进行招募健康志愿者（CG）组 22 例。所有受试者由精神科医师进行临床资料采集，对受试者进行汉密尔顿抑郁量表（HAMD）、汉密尔顿焦虑量表（HAMA）、躯体化症状自评量表（SSS）、连线测验 A（TMT-A）、反刍思维问卷（RRS）。并收集受试者的粪便样本，并对粪便样本提取 DNA，进行 16S rRNA 肠道菌群基因检测，采集静脉血进行短链脂肪酸检测。其中 21 名抑郁症患者在抗抑郁治疗 1 个月后再次进行量表评估、菌群检测及血液检测。比较抑郁症患者与健康对照组、抑郁症患者治疗前后在临床参数、肠道菌群菌群结构、血清 SCFAs 的差异性。

结果 MDD 组与 HC 组的肠道 β 多样性有显著差

异，MDD 组 Akkermansia 菌、 Megamonas 菌、Lachnospira 菌、Prevotellaceae 菌、Subdoligranulum 菌、Blautia 菌、Streptococcus 菌、Dialister 菌减少，MDD 组血液异戊酸（Z=2.95, P=0.003）、乙酸（Z=2.92, P=0.004）含量增加。抑郁症组治疗前后各量表得分比较均有明显统计学意义（HAMA, t=8.22, P＜0.05; HAMD, t=11.04, P＜0.05; SSS, Z=5.72, P＜0.05; TMT-A, z=4.61, P＜0.05; RRS, Z=5.85, P＜0.05）。抑郁症组治疗前后肠道菌群 α 多样性及 β 多样性无明显差异。治疗后肠道 Odoribacter 菌（P=0.04）及血液异戊酸（P=0.03）减少。

结论 首发抑郁患者与健康对照组在肠道菌群多样性和结构上发生显著差异。首发抑郁症患者治疗 4 周后症状改善，治疗后肠道多样性和结构上没有发生显著差异，血清 SCFAs 中异戊酸减少。

关键字：首发抑郁症；肠道菌群；SCFAs

嗅觉特征联合神经心理学测试对轻度认知障碍的诊断价值

霍雅欣 安翠霞*
河北医科大学第一医院精神卫生中心

目的 探讨嗅觉特征联合神经心理学测试对轻度认知障碍（mild cognitive impairment，MCI）的诊断价值。

方法 2021 年 4 月至 2021 年 10 月在石家庄裕华区及邢台入组社区老年人 MCI 者 70 例，NC 组 236 例。利用中国科学院开发的中国人群的嗅觉识别测验（CSIT）嗅棒采集受试者嗅觉识别功能，通过神经心理学测试了解患者的认知功能状况，并通过武汉赛维尔生物科技有限公司的 ELISA 方法对受试者血浆生物标志物（Aβ40、Aβ42、p-tau217）进行检测，利用 SPSS 26.0 和 MedCalc20.027 对数据进行统计分析，通过受试者工作曲线比较嗅觉特征、嗅觉特征结合波士顿命名（Boston Naming Test ，BNT）或血浆生物标志物、波士顿命名结合血浆生物标志物对 MCI 识别的准确率、敏感度及特异度。

结果 与对照组相比，在嗅觉特征中，MCI 组的识别准确率低，组间差异有统计学意义（P<0.05）；在认知测试中，MCI 组的得分更低。与单独嗅觉特征相比，嗅觉特征结合 BNT 的组合在识别 MCI 中的敏感性较高（75.0%）、特异性较高（73.8%），ROC 曲线下面积为 0.788；嗅觉特征结合血浆 Aβ40 对于识别 MCI 的敏感性降低（51.8%）、特异性提高（83.5%），ROC 曲线下面积为 0.709；与单独 BNT 相比，BNT 结合血浆生物标志物 Aβ40 对 MCI 识别敏感性降低（61.1%）、特异性（84.6%）提高，ROC 曲线下面积为 0.770。

结论 对于社区可疑 MCI 的筛查可以采用嗅觉特征结合 BNT 的认知测试，并且 BNT 结合血浆 Aβ40 也可以提高识别 MCI 的特异度，这些组合可能在筛查 MCI 可疑人群方面具有潜在应用价值。但嗅觉特征联合血浆生物标志物的组合对 MCI 的预测作用需要进一步的研究。

中性粒细胞与淋巴细胞比值等指数在双相抑郁与单相抑郁诊断中的价值评估

谢婷婷 王育梅*
河北医科大学第一医院精神卫生中心

目的 研究表明心境障碍的病理机制可能与免疫激活有关。中性粒细胞与淋巴细胞比值（Neutrophil To Lymphocyte Ratio, NLR）等免疫细胞比率指数常被作为研究双相障碍和抑郁症外周炎症标志物。比较分析在发作中双相障碍患者不同状态和单相抑郁症中这些炎症标记物的表现，进一步分析炎症标记物对在双相抑郁与单相抑郁诊断中的价值评估，为治疗心境障碍提供更好指导。

方法 本研究为回顾性研究，纳入河北医科大学第一医院 2022 年 1 月到 2022 年 12 月内住院的患者，共计 404 名，将总样本分为四组（BD 躁狂 175 例、BD 抑郁症 85 例、BD 混合 42 例、单相抑郁 102 例）。从住院数据库中检索中性粒细胞、单核细胞、淋巴细胞和血小板、血脂、hsCRP 等数据。并利用这些参数计算了 NLR 等指数。二元 logistic 回归来探讨炎症标记物对双相抑郁与单相抑郁之间的相关性，并利用 ROC 曲线来判断上述炎症标记物对双相抑郁与单相抑郁诊断中的价值评估。

结果 与单相抑郁组相比，双相躁狂和抑郁患者的 hsCRP、白细胞及 NLR 等免疫细胞比率水平较高（P<0.05）。在四组患者当中，BD 躁狂患者炎症激活指数最高。多因素 logistic 回归发现 NLR[OR=1.836，95%CI（1.169-2.884），P=0.008]、hsCRP[OR=1.209，95%CI（1.008-1.454），P=0.040]是 BD 抑郁发生的危险因素，此外，使用 NLR、hsCRP 指标绘制 ROC 曲线评估诊断单双相抑郁的价值，其曲线下面积分别为 0.641、0.637，并将此两指标组合诊断，发现 NLR+hsCRP 曲线下面积为 0.709。

结论 验证了炎症在心境障碍病理机制中的重要性，其中 NLR 及 hsCRP 等指标在单双相抑郁之间的鉴别诊断中有一定价值，且 NLR+hsCRP 指标组合诊断价值优于单个指标 NLR 及 hsCRP。

关键字：双相障碍；抑郁症；炎症；中性粒细胞；淋巴细胞

精神障碍住院患者高尿酸血症的患病率及尿酸与年龄的关系：一项横断面研究

杨国栋 郎甲然 周爽 冯玥 陈亚欣 任会鹏*
河北医科大学第一医院精神卫生中心

目的 本研究旨在评价精神疾病住院患者高尿酸血症的发生率及血清尿酸与年龄的关系。

方法 选取 2021 年 12 月至 2022 年 1 月，在河北医科大学第一医院精神科住院患者 1761 名（665 名男性和 1096 名女性）。通过调取患者的住院病历信息进行横断面研究。根据年龄将参与者分为三组，包括未成年组（17 岁及以下）、青年组（18-45 岁）、中老年组（45 岁及以上）。选取患者的姓名、性别、年龄、身高、体重等基本信息，以及甘油三酯、胆固醇、肌酐、尿酸等生化指标，分析高尿酸血症（hyperuricemia，HUA）的患病率以及这些指标与患者高尿酸血症的关系。采用 Kruskal-Wallis 检验、卡方检验和多元线性 logistic 回归法验证住院精神病患者的 SUA 水平和年龄，并通过平滑曲线拟合探究血清尿酸（serum uric acid，SUA）与年龄之间的关系。

结果 HUA 的估计患病率为 35.4%。与 45 岁及以上人群相比，17 岁及以下人群的 HUA 患病率显著更高（分别为 40.5%和 24.9%，P < 0.001）。未调整混杂因素的情况下，17 岁及以下与 HUA 相关（OR 2.06;95%CI 1.57-2.71）。进一步调整潜在混杂因素，17 岁及以下仍与 HUA 显著相关（调整后 OR 6.85;95%CI 4.79-9.80）。此外，男性患者与女性患者相比，年龄与 HUA 之间的关联更强。SUA 与年龄，体重指数，甘油三酯，总胆固醇，血压不成正比。

结论 平滑曲线拟合表明 SUA 与年龄之间存在非线性关系。年龄是精神疾病住院患者 SUA 的保护因素。

关键字：高尿酸血症；尿酸；年龄；精神病患者；精神病

短链脂肪酸介导炎症反应改善 CUMS 诱导的抑郁和焦虑样行为

郑亚昕 韩文娟 安翠霞*
河北医科大学第一医院精神卫生中心

目的 肠道微生物群在抑郁症的发病过程中发挥着重要作用，短链脂肪酸（SCFAs）是肠道微生物最主要的代谢产物，具有抗炎特性。越来越多的证据表明炎症是抑郁症发病的关键致病因素，toll 样受体 4 (Toll-like receptor 4, TLR4)在机体面临应激或损伤时会被激活并增强促炎细胞因子的表达，持续的压力和释放的促炎细胞因子会导致慢性神经炎症。本研究探讨 SCFAs 干预是否通过调控 TLR4/MyD88/NF-κB 炎症通路产生抗抑郁作用。

方法 本研究针对 C57BL/6 J 小鼠进行慢性不可预测轻度应激（Chronic unpredictable mild stress, CUMS）通过蔗糖偏好实验（SPT）、强迫游泳实验（FST）和旷场实验（OFT）进行评估，利用 16S rRNA 基因序列分析小鼠的肠道微生物群；采用免疫荧光染色和 Western blot 方法分别分析海马组织中星形胶质细胞和 TLR4/MyD88/NF-κB 炎症通路的活化情况。

结果 SCFAs 可显著改善 CUMS 诱导的抑郁和焦虑样行为 SPT (F(2,15)=10.912, P=0.001), FST (F(2,15)=10.912, P=0.001), OFT 中心时间 (F(2,15)=12.599, P=0.001) of the OFT ；各组的粪便微生物组成有差异，在科水平，CUMS-SCFAs 组 Rikenellaceaee 与 Bacteroidaceae 相对丰度增加，Clostridia_UCG-014 相对丰度降低；在属水平，Clostridia_UCG-014 和 Prevotella 相对丰度降低，Alistipes 相对丰度增加；此外 SCFAs 可抑制海马区 GFAP 阳性星形胶质细胞的活化(F(2,6)=16.565, P=0.004)，并降低 TLR4/MyD88/NF-κB 通路的表达 TLR4 (F(2,6)=70.588, P<0.001), MYD88(F(2,6)=174.388, P<0.001), NF-κB(F(2,6)=14.40, P=0.005)。

结论 研究结果表明，SCFAs 改善了小鼠的抑郁和焦虑样行为，同时改变了粪便微生物组成及中枢炎症水平。我们发现了 SCFAs 的抗抑郁作用以及可能的作用机制。

关键字：抑郁症；短链脂肪酸；炎症；肠道微生物群

代谢相关疾病与轻度认知损害的相关性研究

黄桉琦 王岚*
河北医科大学第一医院精神卫生中心

目的 探讨代谢相关疾病与轻度认知损害（MCI）的相关性，尝试从代谢炎症角度探索 MCI 的风险因素，为可能的阿尔茨海默病（AD）患者在 MCI 阶段甚至更早的时期做出干预治疗及预防提供理论依据。

方法 本研究纳入了河北省石家庄及邢台市的社区老年人 219 人，其中存在代谢相关疾病（高血压、高血脂、2 型糖尿病）患者 145 人，及健康对照者 74 人，统一标准测量身高、体重及腹围，采用蒙特利尔认知评估量表（Montreal Cognitive Assessment，MoCA）等评估两组的认知功能情况，使用 ELISA 方法对血浆中 Aβ40、Aβ42、P-tau217、炎症因子 ILβ-1、IL-6、TNF-α 水平进行定量分析。使用基于 SPSS 26.0 软件对上述量表得分及血液样本等数据分析组间差异并探究轻度认知损害的风险因素。

结果 1.代谢相关疾病组与健康对照组的 AD 生物标记物和炎症因子的差异存在统计学意义，其中代谢相关疾病组 ILβ-1（H=4259.50，P=0.013）、IL-6（H=4341.00，P=0.021）、Aβ40（H=3372.50，P＜0.001）高于健康对照组，TNF-α（H=4232.50，P=0.011）、Aβ42/Aβ40（H=3493.00，P＜0.001）、Aβ42（H=3938.50，P=0.001）低于健康对照组，其余指标组间差异无统计学意义（P>0.05）。2.代谢相关疾病组与健康对照组 MCI 的构成比（χ2 =7.397，P=0.007）、腹围（H=2543.00，P＜0.001）和身体质量指数（BMI）（H=2863.50，P=0.012）均高于健康对照组，组间差异均有统计学意义。3.将是否为 MCI 作为因变量，性别、年龄、文化程度、腹围、BMI、是否代谢相关疾病、上述血液指标作为自变量纳入回归分析，结果表明，仅腹围是 MCI 的危险因素（OR=1.130，95%CI=1.040-1.227，P=0.004），相对于文盲，小学、初中是 MCI 的保护因素（OR=0.124、0.185，

95%CI=0.023-0.656、0.043-0.802，P=0.014、0.024）。

结论 腹围是 MCI 的风险因素，应对代谢相关疾病人群检测认知功能水平，并积极控制腹围，预防认知损害。

关键字：代谢相关疾病；轻度认知损害；身体质量指数；腹围；Aβ40；Aβ42；P-tau217；炎症因子

经历儿童期虐待事件的青少年发生自杀的风险增加：边缘型人格特征和近期负性生活事件的中介作用

赵天宇 王学义*
河北医科大学第一医院精神卫生中心

目的 既往研究认为儿童期虐待可能会引起情绪调节、身份认同和人际关系这三种能力的降低，以上均导致了青少年群体自杀风险的增加。基于生物心理社会模型，我们认为边缘型人格特征和近期负性生活事件可能是童年期创伤和自杀风险之间的联系的中介。然而，关于儿童期虐待经历导致青少年发生自杀行为的机制性研究相对较少，本研究旨在探讨边缘型人格特征和近期负性生活事件的中介作用。

方法 本研究于 2021 年 4 月至 2022 年 12 月纳入 12 至 18 岁的青少年受试者共 246 人，其中 137 人被诊断患有当前的精神障碍，109 人是健康对照。采用童年期创伤问卷、贝克自杀意念量表、青少年生活事件量表、青少年自我伤害行为问卷、巴瑞特冲动人格问卷和情绪调节困难量表评估受试者临床特征。根据温忠麟推荐的中介效应检验的偏差校正非参数百分位 Bootstrap 方法，应用 SPSS 宏程序 PROCESS 的 model6 进行序列中介效应检验。首先将自变量、因变量和中介变量进行标准化处理，然后在控制年龄和性别的条件下，重复取样 5000 次，计算 95%的置信区间。

结果 我们的研究结果表明，儿童期虐待显著预测自杀（β=0.48）；儿童期虐待预测边缘型人格特征（β=0.17）；儿童期虐待预测近期负性生活事件（β=0.17），边缘型人格特征预测近期负性生活事件（β=0.11）；儿童期虐待、边缘型人格特征和近期负性生活事件同时纳入回归方程时，儿童期虐待对自杀的直接预测显著（β=0.30），边缘型人格特征正向预测自伤（β=0.20），近期负性生活事件正向预测自伤（β=0.21）。中介效应分析表明：边缘型人格特征和近期负性生活事件在儿童期虐待和自杀之间起中介作用，中介效应值为 0.18，占儿童期虐待对自杀的总效应（0.48）的 37.5%。

结论 儿童期虐待会增加自杀的风险，并且这种效应是通过边缘型人格特征和近期负性生活事件的共同作用形成的，对此进行有针对性的干预可能会降低青少年的自杀风险。

关键字：儿童期虐待；自杀；青少年；边缘型人格特征；近期负性生活事件

胎儿期经历地震应激和抑郁症状对成年男性脑网络拓扑属性的影响

刘不凡 王学义*
河北医科大学第一医院精神卫生中心

目的 探讨胎儿期经历地震应激及抑郁情绪对成年男性脑网络拓扑属性的影响。

方法 于 2014 年 2 月至 2015 年 7 月于唐山调查胎儿期经历地震应激的男性受试者共 956 名，筛选符合各分组条件受试者共 34 名，分为应激抑郁组(n=8)、应激健康组(n=15)、健康对照组（n=11）。采用汉密尔顿抑郁量表（Hamilton depression scale，HAMD）评估抑郁症状的严重程度，并行脑静息态功能磁共振成像扫描（resting-state functional magnetic resonance imaging，rs-fMRI），使用图论方法分析三组受试者的脑网络拓扑属性，并对三组大脑网络聚类系数、特征路径长度、标准特征路径长度、小世界属性值、全局效率及局部效率进行比较。

结果 与健康对照组相比，应激抑郁组聚类系数、特征路径长度、全局效率显著下降(均 P<0.05)；应激健康组特征路径长度、全局效率显著下降(均 P<0.05)。与健康对照组相比，应激抑郁组受试者内侧额上回（p＜0.001，t=-2.631）节点介数下降，颞下回（p＜0.001，t=3.203）节点介数增加；后扣带回（p＜0.001，t=-2.209）节点度中心性下降，颞上回（p＜0.001，t=3.505）、眶部额上回（p＜0.001，t=2.641）度中心性增加；缘上回节点效率下降（p＜0.001，t=-4.515）。应激健康组较健康对照组中央后回（p＜0.001，t=-2.133）节点介数下降，背外侧额上回（p＜0.001，t=-2.226）节点效率下降。应激抑郁组较应激健康组海马（p＜0.001，t=-2.158）节点度中心性下降。

结论 产前地震应激和抑郁情绪与成年男性脑网络功能改变有关，且产前地震应激较抑郁情绪对脑网络功能的影响明显，两者联合作用对成年男性脑网络功能的影响尤为显著。

Correlation Between Behavioral Impairment and Peripheral Blood Biomarkers in Patients with Mild Cognitive Impairment

Wei Liang Lan Wang Cuixia An*
Mental Health Center, The First Hospital of Hebei Medical University

Objective Mild behavioral impairment (MBI) in non-demented elderly adults may be influenced by early Alzheimer's disease (AD) pathology. We examined the prevalence of mild behavioral impairment (MBI) in healthy older adults (HOA) and individuals with mild cognitive impairment (MCI), and the association between

MBI and plasma biomarkers of Alzheimer's disease (AD).

Methods A total of 241 subjects (136 HOA and 105 MCI) were enrolled in the Yuhua District of Shijiazhuang City, Hebei Province, in China. The MBI Symptom Checklist was employed for assessment and diagnosis of MBI. Fasting venous blood was collected from 70 patients (32 HOA, 38 MCI), and Aβ40, Aβ42, and P-Tau217 levels were measured using enzyme-linked immunosorbent assay.

Results The prevalence of clinically related MBI in HOA and MCI groups was 4.4% and 15.3%, respectively ($\chi2$=7.262, P=0.007), especially in terms of decreased motivation, impulse dyscontrol (highest detection rate), and social inappropriateness (P<0.05), but there were no differences in emotional dysregulation and abnormal perception or thought content (lowest detection rate) (P>0.05). Additionally, no significant difference in total MBI incidence and MBI subdomains between genders was observed. MBI total score was correlated with Aβ42 and P-Tau217 (r=-0.392, P=0.029; r=-0.403, P=0.025), but not with Aβ40 or Aβ42/40 ratio. Among the subdomains, impulsivity domains were correlated with Aβ42 (r=-0.401, P=0.025).

Conclusion Both MCI and HOA demonstrated a higher prevalence of MBI, with impulse control behavior being the most common. MBI not only serves as an independent risk factor for cognitive decline but is also associated with AD biomarkers.

应激易感小鼠肠道菌群与短链脂肪酸和炎症水平的差异

韩文娟 郑亚昕 安翠霞*
河北医科大学第一医院精神卫生中心

目的 长期暴露在慢性应激下，抑郁的发生率会增加。然而，慢性应激只会引起一部分个体患病风险增加。目前认为炎症是一种促进应激易感性的机制。本研究探讨经历慢性不可预测轻度应激（CUMS）易感组小鼠与抵抗组小鼠的肠道菌群、肠道菌群代谢产物短链脂肪酸（Short chain fatty acids, SCFAs）及体内炎症水平差异。

方法 本研究针对 C57BL/6 J 小鼠进行 CUMS，通过蔗糖偏好实验（SPT）、强迫游泳实验（FST）和旷场实验（OFT）进行评估，根据焦虑和抑郁行为学测试结果分为 CUMS 易感组与 CUMS 抵抗组，采用 16S rRNA 基因序列分析小鼠的肠道微生物群，采用液相色谱和气相色谱质谱法检测粪便中 SCFAs；采用 ELISA 和 Western blot 方法分析海马组织中炎症因子及 TLR4/MyD88/NF-κB 炎症通路的活化情况。

结果 CUMS 易感小鼠表现出更严重的抑郁和焦虑症状（SPT, F(2,12)=18.761, P<0.001; FST, F(2,12)=3.889, P<0.05;），α 多样性显著差异，海马中白细胞介素 (IL)-1β （F(2,9)=4.588, P=0.039) 和 TLR4/MYD88/NF-κB 炎症通路组分表达升高（TLR4(F(2,6)=47.623, P<0.001), MYD88(F(2,6)=41.982, P<0.001), NF-κB(F(2,6)=18.294, P=0.003)）。CUMS 抵抗组小鼠粪便中的 SCFA 水平明显高于对照组小鼠(乙酸 (F(2,9)=8.135, P=0.010), 丙酸 (F(2,9)=3.342, P=0.082), 丁酸 (F(2,9)=12.589, P=0.002), 戊酸 (F(2,9)=25.922, P<0.001), 异丁酸 (F(2,9)=28.953, P<0.001), 异戊酸 (F(2,9)=24.252, P<0.001)。

结论 暴露于 CUMS 压力下的小鼠并不总是表现出抑郁和焦虑的症状。CUMS 易感组小鼠肠道菌群多样性和 MYD88、NF-κB、TLR4 蛋白水平均高于 CUMS 抵抗组。CUMS 抵抗组的 SCFA 水平明显高于 CUMS 易感组。肠道菌群和 SCFAs 改变可能是提高慢性应激后恢复能力的途径。

CLOCK 基因多态性与双相障碍、精神分裂症易感性的 Meta 分析

孙亚麒 吴俊峰 赵雅萱 王育梅*
河北医科大学第一医院精神卫生中心

目的 探讨昼夜节律时钟基因 CLOCK 多态性与双相障碍、精神分裂症易感性的关系。

方法 通过计算机检索 PubMed、Embase 和 Scopus 数据库，查找建库至 2022 年 9 月有关 CLOCK 基因与双相障碍、精神分裂症易感性关系的研究文献。使用关键词“single nucleotide polymorphism”或“polymorphism”、“SNP”，以及“bipolar disorder”、“schizophrenia”、“clock”来筛选文章并提取数据。通过 Stata17.0 进行统计学分析，卡方检验计算 CLOCK 基因的分布与哈代温伯格定律（Hardy Weinberg Equilibrium, HWE）检验，采用 95% CI 合并 OR 检验评估 CLOCK 基因多态性与双相障碍、精神分裂症发病风险之间的关联强度，依次比较等位基因模型、显性模型、隐性模型。

结果 共检索文献 529 篇文献，最终纳入 7 篇，包括一项高加索人种研究（病例组 121 例和对照组 121 例）和 6 项蒙古利亚人种研究（病例组 1,695 例和对照组 2,896 例）。其中双相障碍有关的 SNP 为 rs3736544[隐性模型(OR=1.10,95%CI=0.64～1.87,P= 0.706)，显性模型(OR=1.14,95%CI=0.70～1.88,P=0.099)和等位基因模型 (OR=1.07,95%CI=0.85 ～ 1.35,P=0.158)] 和 rs1801260[隐性模型 (OR=1.06,95%CI=0.59 ～ 1.91,P= 0.392)，显性模型(OR=0.84,95%CI=0.68～1.04,P=0.257) 和等位基因模型 (OR=1.15,95%CI=0.95 ～ 1.39,P=0.213)]，与精神分裂症有关的 SNP 为 rs1801260[隐性模型 (OR=0.29,95%CI=0.03 ～ 2.48,P= 0.004)，显性模型 (OR=0.64,95%CI=0.32 ～ 1.27,P ＜ 0.001)和等位基因模型(OR=0.63,95%CI=0.32～1.27, P ＜0.001)]。昼夜节律时钟基因 CLOCK 多态性与双相障碍、精神分裂症易感性之间的相关性在各基因模型

中无统计学意义。

结论 昼夜节律时钟基因 CLOCK 基因多态性与双相障碍、精神分裂症发病风险之间的相关性较弱，需要纳入更多高质量的研究进行进一步分析。

关键字：昼夜节律；时钟基因；基因多态性；双相障碍；精神分裂症；Meta 分析

轻度认知障碍患者在双重任务行走中的姿势改变

王雪萌 安翠霞*
河北医科大学第一医院精神卫生中心

目的 比较轻度认知障碍（mild cognitive impairment,MCI）患者与认知正常老年人在行走过程中的姿势特征，分析 MCI 患者在行为运动学上的标志性改变，并探讨姿势与认知功能的关联。

方法 在 2022 年 2 月-2022 年 3 月的邢台老年认知筛查队列中纳入 54 例 MCI 患者及 56 例认知正常老年人。要求所有受试者完成双重任务行走（即在平坦地面上行走的同时进行 100 连续减 7 的计算任务），并接受神经心理评估。使用 OpenPose 系统提取人体 25 个关键点的坐标，分析了在双重任务行走过程中 13 个关节之间的相对距离与 10 个关节角度的变化。使用斯皮尔曼相关性分析对姿势特征与蒙特利尔认知评估量表（ MoCA)子量表的关系进行分析，采用受试者工作特征曲线（ROC）分析评估姿势特征识别 MCI 患者的能力。

结果 与认知完整组相比，MCI 患者在垂直方向上双手之间运动距离的变异程度更大（Z=-3.211, P=0.001）；在水平方向上，左腿向外侧的摆动幅度更大（Z=-1.967, P=0.049），右侧髋关节的活动范围更小（t=2.058, P=0.042），左侧膝关节的伸展程度更小（Z=-2.667, P=0.008）。这四种姿势特征都与视空间功能相关：视空间子量表得分越低，双手垂直运动距离的变异程度越大（r=-0.257,P=0.007），左腿向外侧摆动幅度更大（ r=0.263,P=0.0067 ），右侧髋关节的活动范围（ r=0.204,P=0.032 ）及左侧膝关节的伸展程度（r=0.266,P=0.005）更小。根据 ROC 分析显示：在双重任务中，双手的运动特征在 MCI 识别中表现出较好的判别能力（AUC=0.678，P=0.001），敏感度为 64.8%，特异性为 64.3%；其次为左膝特征（AUC=0.647，P=0.008）、左腿特征（AUC=0.609，P=0.049）。联合三个指标对 MCI 的识别能力最好（AUC=0.730，P＜0.001），敏感度及特异度均得到了提高（敏感度为 66.7%，特异性为 76.8%）。

结论 轻度认知障碍患者在双重任务行走中表现出独特的姿势特征。这些特征与视空间功能明显相关，并为 MCI 的早期识别提供了新的思路与客观证据。

新型冠状病毒感染导致医护人员返岗压力及影响因素分析

闫乐婷 申晶晶 刘秀娟 张亚兴 金圭星 赵媛媛*
河北医科大学第一医院精神卫生中心

目的 探讨新型冠状病毒感染后医护人员返岗压力及相关影响因素。

方法 本研究选取 2022 年 11 月至 2023 年 1 月感染新冠病毒的河北医科大学第一医院医疗工作人员 131 例作为研究对象，调查工具采用自制一般情况调查表、焦虑自评量表（SAS）、抑郁自评量表(SDS)。应用 SPSS25.0 软件对数据进行统计学分析。计数资料使用例数和百分率描述，计量资料以 M(P25,P75) 表示。在本次分析中根据数据的特性主要运用卡方检验和秩和检验分析。

结果 本次参与调查的 131 例医护人员中医师所占比例为 44%，护士所占比例为 58%。医护人员中 58% 在感染新冠症状好转后立即返岗。在新冠感染后医务人员投入工作精力显著低于感染前（?2 =15.54，P =0.019）；女性医护人员的焦虑水平显著高于男性（Z =-3.516,P <0.001），女性医护人员的抑郁水平显著高于男性（Z =-3.162,P =0.002）；博士及以上学历者的焦虑水平显著高于本科（Z =11.059,P =0.011），其余学历组别之间焦虑抑郁症状无明显差异；与家人居住者焦虑水平显著高于独居人员（Z =-2.047，P =0.041）；因担心传染给家人而产生返岗焦虑的医护人员的抑郁水平明显高于因其他原因而产生返岗焦虑的医护人员（Z =-2.628，P=0.009）；存在返岗焦虑的医护人员感染前投入的工作精力明显少于不存在返岗焦虑的医护人员（?2=14.318，P <0.001）；存在返岗焦虑的医护人员与不存在返岗焦虑的医护人员相比，所认为的合理返岗时间不同（?2=8.298，P =0.029），不存在返岗焦虑的医护人员对返岗更积极；对返岗、在岗存在焦虑的医护人员出现中重度抑郁的比例显著高于对返岗、在岗不存在焦虑的医护人员（?2 =8.017，P =0.022）。

结论 医护人员面对疫情容易产生焦虑抑郁情绪，尤其是女性，以及与家人共同生活的医护人员。对返岗产生焦虑的主要来源主要是担心传染给家人及对合理返岗时间存在异议，而且这种对返岗的焦虑会影响工作精力并带来抑郁情绪。所以医院应设置合理的返岗时间并关注对医护家属的传染问题，从而减少医护人员对返岗的焦虑，维护医护人员的工作精力和心理健康。

伴焦虑症状的儿童青少年抑郁症患者主观时间知觉的改变

王卓言 许银珠 刘颖 于鲁璐*
河北医科大学第一医院精神卫生中心

目的 时间知觉是人脑对时间的感知能力。研究发现，时间知觉受性别、年龄、情绪、疾病等相关因素的影响。目前关于抑郁症患者时间感知变化的研究结论并不一致，本研究通过评估儿童青少年抑郁症患者主观时间知觉及焦虑抑郁得分，旨在讨论其主观时间知觉的改变以及伴焦虑症状对儿童青少年抑郁症患者的主观时间知觉影响。

方法 收集河北医科大学第一医院精神科的66例ICD-10诊断为抑郁症患者（平均年龄15.42岁）和石家庄一中、石家庄栾城区第二中学以及栾城区职业技术教育中心招募的66例健康对照组（平均年龄15.80岁）的一般信息，采用主观时间知觉量表（包括“时间压力”、“时间扩张”、“时间隐喻快速”、“时间隐喻慢速”四个维度）评估被试的主观时间认知，选用汉密尔顿抑郁量表评估患者的抑郁症状，选用广泛性焦虑障碍量表筛查焦虑症状。采用 t 检验和秩和检验比较抑郁组和健康对照组的主观时间知觉得分，伴或不伴有焦虑症状以及不同焦虑程度的抑郁症患者主观时间知觉得分，采用 Spearman 相关分析探究抑郁症患者中有无焦虑症状及焦虑症状的严重程度和时间知觉是否相关，以 $P < 0.05$ 认为有统计学意义。

结果 1、抑郁组在时间扩张和时间隐喻慢速得分高于健康对照组（$P<0.05$），时间压力得分高于对照组（$P=0.126$），在时间隐喻快速得分低于对照组（$P=0.022$）。2、抑郁组中，GAD-7得分和主观时间知觉各维度均成正相关（$P<0.05$），HAMD得分与时间扩张、时间隐喻慢速成正相关（$P<0.05$）。3、抑郁组中65%的患者伴有焦虑症状，伴焦虑症状组在时间压力、时间扩张和时间隐喻：慢速的得分高于不伴焦虑症状组（$P<0.05$）。4、焦虑程度越高，在时间压力、时间扩张的得分越高（$P<0.05$），多重比较时发现，重度焦虑组在时间压力得分高于无焦虑组（$P=0.001$），重度焦虑组在时间扩张得分高于轻度焦虑组（$P=0.042$）。

结论 与健康对照组相比，抑郁组患者的主观时间知觉发生改变。患有抑郁症的儿童青少年患者的时间感知改变表现为时间变慢。伴焦虑症状的抑郁症患者更容易感受到时间变快，主观体验到时间压力，同时伴焦虑症状也进一步加重患者的时间变慢的体验。上述时间知觉体验的变化可能涉及相关脑区结构的改变，未来需进一步研究以探讨其具体机制。

疫情期间青少年精神障碍患者休学情况及家庭影响因素分析

柳亚楠 高明龙*
河北医科大学第一医院精神卫生中心

目的 探讨疫情期间因精神心理疾病休学的青少年患者疾病分布情况，并分析家庭因素对其可能产生的影响。

方法 筛选2021年1月至2022年12月期间于河北医科大学第一医院精神卫生中心门诊就诊的青少年患者。填写一般情况调查表，采用汉密尔顿焦虑量表（HAMA）、汉密尔顿抑郁量表（HAMD）、焦虑自评量表（SAS）、抑郁自评量表（SDS）评估患者焦虑抑郁的严重程度；采用中学生心理健康量表、社会适应性自评问卷、自尊量表、青少年生活事件量表、中学生人际关系测量、家庭环境测评量表（FES-CV）、父母教养方式评价量表（EMBU）评估休学青少年患者适应能力、人际交往能力、应激相关因素及家庭因素。

结果 共筛选150名休学的青少年患者，包括抑郁障碍（n=107）、焦虑障碍（n=13）、双相情感障碍（n=4）、适应障碍（n=11）、强迫障碍（n=6）、精神分裂症（n=6）、注意缺陷与多动障碍（n=2）、孤独症（n=1）。结果显示，抑郁障碍患者占有比例为71.3%，占休学青少年患者的绝大部分。分析年龄、性别、教育阶段、目前治疗、是否存在NSSI行为是否会影响患者焦虑抑郁的程度，分析家庭环境、父母教养方式与中学生心理健康、社会适应性、自尊、青少年生活事件、人际关系的相关性。结果显示，性别（$p=0.028$）、有无NSSI行为（$p=0.034$）、FES-CV矛盾性（$p<0.001$）可以显著影响HAMA分数。性别（$p=0.003$）、有无NSSI行为（$p=0.002$）、FES-CV矛盾性（$p<0.001$）可以显著影响HAMD分数。性别（$p=0.004$）、有无NSSI行为（$p=0.020$）、FES-CV矛盾性（$p=0.007$）可以显著影响SAS分数。性别（$p=0.014$）、有无NSSI行为（$p=0.006$）、FES-CV矛盾性（$p=0.010$）可以显著影响SDS分数。FES-CV组织性可以显著影响社会适应性（$p=0.033$）、人际关系（$p=0.042$）。FES-CV矛盾性可以显著影响青少年生活事件中的受惩罚（$p=0.005$）、健康适应（$p=0.002$）。父母教养方式与患者焦虑抑郁程度、社会适应性、自尊、人际关系无明显相关关系。

结论 疫情期间，家庭环境对休学学生心理健康的影响较大，组织性和矛盾性影响更为明显。日常生活中，父母应注意营造良好的家庭环境，促进儿童、青少年等学生心理的健康发展。

抑郁症患者血清胃饥饿素水平以及光照治疗效果的初步探索性研究

卢文婷 王学义*
河北医科大学第一医院精神卫生中心

目的 胃饥饿素是一种调节食欲的激素，在情绪调节中也发挥作用。目前关于胃饥饿素与抑郁症之间的关系仍有争议，光照疗法是治疗抑郁症的一种物理治疗，其机制可能是通过眼-脑激素调节通路调节胃饥饿素分泌进而缓解抑郁症状。本研究旨在调查抑郁症患者血清胃饥饿素水平，探索光照治疗的疗效及对胃饥饿素水平的影响。

方法 筛查2021年9月至2022年12月在河北医科大学第一医院精神卫生中心住院的抑郁症患者，采用随机数字表法随机分为光疗组（光照治疗+药物组，

n=30）、单纯药物组（n=30），同时在查体中心招募健康对照组（n=30），治疗 1 周。光照治疗采用光疗室的方式，光照强度为 10000lux，于清晨 7:30 至 8:00 进行 30 分钟光照，连续治疗 7 天。在治疗前及治疗第 1 周末，采用 17 项汉密尔顿抑郁量表(Hamilton depression scale, HAMD17)和汉密尔顿焦虑量表(Hamilton anxiety scale, HAMA)评定患者的临床症状，比较 3 组基线及治疗后光疗组和单纯药物组的有效率和缓解率，同时留取患者血液标本用于检测胃饥饿素水平。采用 $\chi 2$ 检验和重复测量方差分析进行统计比较。采用独立样本 t 检验比较光疗组及单纯药物组在治疗 1 周末各量表总分、因子分减分率及胃饥饿素水平的差异。

结果 治疗前光疗组及单纯药物组 HAMD、HAMA 总分以及胃饥饿素水平均高于健康对照组（F=63.467/60.043，P＜0.001）。光疗组在治疗 1 周末 HAMD 及 HAMA 评分显著低于单纯药物组（F=4.973/5.352，P=0.033/0.027）；光疗组在治疗 1 周末胃饥饿素水平与健康对照组无明显差异，单纯药物组胃饥饿素水平仍明显高于健康对照组（F=4.186,P=0.20）。

结论 以光疗室的方式进行光照治疗能显著改善抑郁症患者的抑郁、焦虑情绪，抑郁症患者胃饥饿素水平升高，光照治疗后胃饥饿素水平趋于正常，胃饥饿素水平的变化可能是光照治疗改善患者抑郁症状的相关机制之一。

关键字：光照治疗；光疗室；抑郁症；胃饥饿素；机制探索

某高校医学生网络使用现状及影响因素调查分析

靳娜 王学义*
河北医科大学第一医院精神卫生中心

目的 调查高校医学生网络使用现状及相关的影响因素。

方法 采用互联网自评问卷方式，于 2021 年 10 月 11 日-2021 年 11 月 7 日，对河北省某医学院校 7201 名医学生进行网络使用现状的调查。采用中文版网络成瘾量表（the Internet Addiction Test，IAT）、匹兹堡睡眠量表（PSQI）、焦虑自评量表（SAS）、抑郁自评量表（SDS）评估网络使用状况、睡眠、焦虑、抑郁情绪，并收集人口学一般资料。根据 IAT 量表评分界定无网络成瘾组、疑似成瘾组和成瘾组，比较组间网络使用状况并分析网络成瘾影响的相关因素。

结果 筛查出存在网络使用问题的学生（IAT≥40 分）共 1788 例（24.8%），其中疑似成瘾者 1721 例（23.9%），成瘾者 67 例（0.9%）。R×C 卡方检验分析显示：三组中家庭教养方式、经历校园欺凌、学习压力、人际关系不良、睡眠质量差、焦虑、抑郁情绪在无网络成瘾组、疑似成瘾组、成瘾组之间差异具有统计学意义（P＜0.001），日常体育锻炼、内向性格在疑似成瘾和成瘾组与无网络成瘾组之间差异具有统计学意义（P＜0.001）。三组在性别、年级、婚恋情况、吸烟、饮酒无统计学差异（P＞0.05）。多元 Logistic 回归分析显示：焦虑和抑郁情绪是网络成瘾的主要影响因素（P＜0.001，OR=4.866，6.038）；人际关系不良、溺爱型家庭、睡眠质量差、校园欺凌、日常体育锻炼也是网络成瘾的影响因素（P＜0.05，OR=4.023、3.147、2.168、1.938、0.386）。

结论 医学生网络使用问题检出率 24.8%，焦虑和抑郁情绪是网络成瘾的主要危险因素，日常体育锻炼是网络成瘾的保护因素。

深部经颅磁刺激治疗抑郁症的疗效及脑影像学变化

许月航 王学义*
河北医科大学第一医院精神卫生中心

目的 探讨抑郁症患者经过深部经颅磁刺激治疗（deep transcranial magnetic stimulation，dTMS）后大脑静息态影像学变化及其与患者焦虑抑郁及自杀意念症状的关系。

方法 本研究为前瞻性研究，研究对象为 2022 年 9 月-2022 年 11 月在河北医科大学第一医院精神卫生中心门诊或住院入组的抑郁症患者（n=5），所有患者在治疗前及 20 次 dTMS 治疗后均进行临床资料评估（包括汉密尔顿焦虑量表（Hamilton anxiety scale，HAMA）、汉密尔顿抑郁量表（Hamilton depression scale，HAMD）和贝克自杀意念量表（Beck scale for suicide ideation-Chinese version，BSI-CV)）和磁共振扫描。纳入年龄、性别匹配的健康对照组 5 例行磁共振扫描。使用美国西门子公司 3.0T 磁共振成像系统完成受试者影像数据的采集。计算大脑内每个体素与其周围相邻体素在时间序列上的一致性，得出该体素的肯德尔和谐系数（ReHo 值），以差异脑区为种子点计算患者治疗前后种子点与全脑的功能连接值。用 MATLAB2018b 平台 SPM 所带统计分析软件对抑郁组和健康对照组的 ReHo 值进行独立样本检验，再对抑郁症患者 dTMS 治疗前后的 ReHo 值及功能连接值进行配对样本 t 检验。结果采用 FWE 校正（体素水平 P＜0.001，簇水平 P＜0.05，双侧检验）。

结果 深部经颅磁刺激治疗后，抑郁症患者 HAMA 总分、精神焦虑因子分和躯体焦虑因子分较前显著降低，HAMD 总分、焦虑/躯体化因子分、认知因子分和迟滞因子分较前显著降低，贝克自杀意念量表得分也较前显著降低（均 P＜0.05）。与健康对照组相比，抑郁症患者右背外侧额上回、右前扣带回 ReHo 值明显升高，左距状裂周围皮层、右枕上回 ReHo 值明显降低（P＜0.05，FWE 校正）。深部经颅磁刺激治疗后，患者右背外侧额上回 ReHo 值降低（t=-32.98，P＜0.05）。以右背外侧额上回为感兴趣区，20 次深部经颅磁刺激治疗后，右背外侧额上回与左中央后回功能连接增强

（t=13.25，k=22，x=-54,y=-12,z=36）。

结论 dTMS 治疗后患者右背外侧额上回 ReHo 值降低、右背外侧额上回与左中央后回功能连接增强，可能与 dTMS 抗焦虑、抗抑郁以及降低自杀意念相关。

关键字：dTMS；抑郁症；自杀意念；功能连接；reho

内源性大麻素基因多态性与抑郁障碍临床症状的相关性研究

许银珠 卢文婷 程月红 王学义 于鲁璐*
河北医科大学第一医院精神卫生中心

目的 探讨应激与内源性大麻素单核苷酸多态性（SNP）对抑郁障碍及其临床特征的影响。

方法 2021 年 11 月-2022 年 6 月在河北医科大学第一医院精神卫生中心纳入抑郁组 100 例以及对照组 55 例，调查被试者的应激因素，包括家庭教育方式，评估童年期创伤问卷、生活事件量表、压力知觉量表。对于评估抑郁障碍的临床特征，采用 HAMD、HAMA、PSQI 及贝克自杀意念问卷中文版。应激—内源性大麻素 SNPs—抑郁障碍发病之间的相关性采用 logistic 回归分析。将 100 例抑郁组的抑郁障碍临床特征进行深层分析，应激—内源性大麻素 SNPs—抑郁障碍临床特征之间的相关性采用回归模型的协方差分析。

结果 压力知觉（OR=22.749，95%CI=7.525～68.774，P＜0.001）、家庭教育方式（OR=23.246，95%CI =1.293～8.152，P = 0.012）与抑郁障碍存在关联性。CNR2 rs2501432 TT 基因型（OR=4.447，95%CI =1.155～17.124，P＝0.030）、FAAH rs324420 AA 基因型（OR=11.929，95%CI =1.003～142.335，P = 0.049）与抑郁障碍发病相关。将 100 例抑郁组的抑郁障碍临床特征进行深层分析。CNR1 rs1049393 TT 型为 HAMA 分值的保护性因素（F =4.650，P = 0.002），FAAH rs324420 对 HAMA 分值的危险因素（F =4.566，P = 0.013）。CNR1 rs2023239、CNR1 rs7766029、CNR1 rs7766029、CNR2 rs2501432 与压力知觉以协同作用的方式对 PSQI 分值产生影响。

结论 CNR2 rs2501432 TT 型、FAAH rs324420 AA 型为抑郁障碍的危险因素 CNR1 rs1049393 CC 型、FAAH rs324420 AA 型为抑郁障碍焦虑程度的危险因素。CNR1 rs104939 CC 型是压力知觉与非民主型家庭方式背景下抑郁障碍的保护因素。压力知觉与 CNR1 rs104939、CNR1 rs2023239、CNR1 rs7766029、CNR2 rs2501432 以协同作用的方式对抑郁障碍的睡眠质量产生影响。

内源性大麻素外周 AEA、2-AG 水平与抑郁障碍临床症状的相关性

许银珠 卢文婷 程月红 王学义 于鲁璐*
河北医科大学第一医院精神卫生中心

目的 初步探索外周内源性大麻素 AEA、2-AG 水平与抑郁障碍临床症状的相关性。

方法 纳入 2021 年 11 月-2022 年 6 月在河北医科大学第一医院精神卫生中心门诊就诊及住院治疗的抑郁障碍患者。健康对照组均为招募的志愿者，其性别、年龄、受教育程度与病例组相匹配。评估抑郁障碍的临床特征，采用汉密尔顿抑郁量表（Hamilton Depression Scale, HAMD）、汉密尔顿焦虑量表（Hamilton Depressive Scale, HAMA）、匹兹堡睡眠质量指数（Pittsburgh sleep quality index, PSQI）及贝克自杀意念问卷中文版。比较抑郁组与对照组外周 AEA、2-AG 水平；采用 Spearman 相关分析，探索抑郁组外周 AEA、2-AG 水平与抑郁障碍临床特征的相关性；采用 kruskal-wallis 秩和检验（H-检验），分析内源性大麻素基因多态性与外周 AEA、2-AG 水平的相关性。

结果 抑郁组较对照组外周 AEA（14.70±3.46 vs 292.01±21.77，P＜0.001）、2-AG（105.77±21.90 vs 2081±355.48，P＜0.001）水平显著下降。在抑郁组中，AEA 水平与 HAMA 分值呈负相关（r = -0.241，P = 0.016）。AEA 与 HAMD 分值（r＝-0.166，P＝0.099）、PSQI 分值（r＝-0.139，P＝0.169）、自杀意念（r＝0.073，P = 0.470）未见相关性。2-AG 与 HAMD 分值（r = -0.069，P＝0.493）、HAMA 分值（r＝-0.159，P＝0.113）、PSQI 分值（r = -0.086，P = 0.396）、自杀意念（r = -0.094，P = 0.350）未见相关性。

结论 外周 AEA、2-AG 水平的下降与抑郁障碍相关。在抑郁障碍人群中，AEA 水平的与焦虑症状的严重程度呈负相关。检测外周 AEA、2-AG 水平的变化可能有助于识别抑郁障碍及其临床特征。

正念减压对乳腺癌患者及其照顾者负性情绪的对照研究和机制探讨

郎甲然 赵洪猛 杨国栋 陈亚欣 冯玥 任会鹏*
河北医科大学第一医院精神卫生中心

目的 本研究将在心理治疗师的指导下，进行标准化 MBSR（mindfulness based stress reduction）对乳腺癌患者及其照顾者负性情绪的研究，并且评估机制。这项随机对照研究将通过分析干预前后的负性情绪相关量表来评估 MBSR 的疗效。此外，本研究还将评估细胞因子和端粒酶水平，以探索 MBSR 的生物学机制。

方法 研究于 2022 年 6 月开始至 2023 年 12 月结束，主要实施单位为河北医科大学第一医院和天津肿瘤医院，这项随机对照试验将以 1：1 的比例随机将符合纳入标准的 60 对乳腺癌患者及其照顾者的二元组分为 MBSR 组和 NMBSR(non- mindfulness based stress reduction)组。MBSR 组参与者接受为期 8 周的正念减

压治疗，而 NMBSR 组参与者仅接受健康教育。主要结果将包括对癌症复发恐惧量表、匹兹堡睡眠量表、医院焦虑抑郁量表、五因素正念觉知量表等量表。次要结果将包括血清细胞因子 IL-6（interleukin-6）、IL-10（interleukin-10）、IFN-γ（Interferon-γ）和 TNF-α（Tumor Necrosis Factor-α）的浓度，血清端粒酶活性（Telomerase activity，TA），以及白细胞端粒长度（Telomere length，TL）的测定。采用 SPSS 25.0 软件、GraphPad Prism 8 软件进行数据分析，符合正态分布的计量资料描述为均值±标准差，组间比较采用 t 检验、非正态分布计量资料描述为中位数（四分位数间距），组间比较采用非参数检验（Wilcoxon 秩和检验）、计数资料采用 χ2 检验，相关性分析采用 Pearson 相关分析。

结果 后期的研究正在进行中，前期的结果显示，乳腺癌和照料者二元组在干预组与对照组相比，干预组患者的生活质量和焦虑抑郁有显着改善，端粒酶活性较对照组更高。与对照组相比，干预组的照顾者的焦虑抑郁有所改善（P＜0.05）。

结论 MBSR 是一种无风险、操作灵活、成本效益高的干预措施，会改善癌症患者的负性情绪。这项研究中描述的随机对照试验将测试这种非药物干预是否可以减少乳腺癌患者的负性情绪，提供一种有效的非药物治疗方式改善肿瘤患者的负性情绪。

经皮颅-耳电刺激对不同程度抑郁症患者的疗效及安全性评估

李天舒 金圭星*
河北医科大学第一医院精神卫生中心

目的 经皮颅-耳电刺激（TECAS）作为一种联合耳迷走神经刺激和经皮三叉神经刺激的新治疗方法，与单纯药物治疗对照，评估其对不同程度抑郁症患者的疗效及安全性。

方法 所有参与者来自河北医科大学第一医院就诊的患者，筛查 165 人，最终共纳入 135 名患者，其中研究组为在家接受早晚 2 次 30 分钟的 TECAS 治疗（n=68），对照组为服用草酸艾司西酞普兰片（n=67），剂量为 5-20mg/天，两组疗程共 8 周。主要指标是蒙哥马利抑郁量表（MADRS）的减分值、生活质量量表（SF-36）的评分及不良反应记录表，次要指标包括汉密尔顿抑郁量表（HAMD）及汉密尔顿焦虑量表（HAMA）。

结果 研究组失访 5 人、症状好转拒绝继续治疗 2 人及治疗无效出组 1 人，最终完成治疗及评估 60 人。对照组失访 4 人、因副作用拒绝治疗 3 人及症状好转拒绝继续治疗 2 人，最终完成治疗及评估 58 人。在轻中度患者中，研究组第 4 周 VT 得分小于对照组（Z＝-2.328，P＝0.020），第 8 周 RP（Z＝-2.168，P＝0.030）、GH（Z＝-2.045，P＝0.041）及 VT（Z＝-2.296，P＝0.022）得分小于对照组，其余结果均无统计学差异（P＞0.05）。在重度患者中，研究组在第 2 周（Z＝-2.590，P＝0.010）、第 4 周（Z＝-3.552，P＜0.0001）及第 8 周（Z＝-4.002，P＜0.001）MADRS 减分值高于对照组；第 2 周（Z＝-2.269，P＝0.023）、第 4 周（Z＝-3.882，P＜0.001）及第 8 周（t＝6.147，P＜0.001）HAMD 减分值高于对照组；第 4 周（t＝2.033，P＝0.047）及第 8 周（t＝3.475，P＝0.001）HAMA 减分值高于对照组；第 4 周（t＝2.395，P＝0.020）及第 8 周（t＝3.807，P＜0.001）精神焦虑因子减分值高于对照组；第 2 周（Z＝-2.320，P＝0.020）及第 8 周（t＝2.309，P＝0.025）躯体焦虑因子减分值高于对照组。不良反应中，研究组[14（23.3）]较对照组[25（43.1）]低且具有统计学意义（X2＝5.209，P＝0.022）。

结论 TECAS 对不同程度的抑郁症患者均具有较佳的疗效，尤其是重度抑郁症患者疗效及安全性均优于草酸艾司西酞普兰，可以作为治疗不同程度抑郁症患者的新疗法。

关键字：抑郁症；经皮颅耳电刺激；疗效；安全性；重度抑郁

SuPAR 在经历童年创伤的青少年抑郁障碍患者中的水平及早期预测价值

李娜 申晶晶 张亚兴 姚书婧 金圭星*
河北医科大学第一医院精神卫生中心

目的 探讨童年创伤对青少年抑郁障碍患者可溶性尿激酶型纤溶酶原激活物受体（Soluble Urokinase Plasminogen Activator Receptor, suPAR）水平的影响及分析 suPAR 在经历童年创伤的青少年抑郁障碍患者中的早期预测价值。

方法 根据 DSM-5 抑郁障碍的诊断标准，患者均来自 2021 年 8 月至 2022 年 11 月在河北医科大学第一医院精神卫生中心住院的青少年抑郁障碍患者（12-18 岁）共 117 例，根据 CTQ 分为创伤组和非创伤组。采用 HAMD-17 评估抑郁症状严重程度。以 ELSIA 方法检测血浆 suPAR 水平及血清 hs-CRP 水平。流式细胞术测定血浆 12 项细胞因子水平。采用 ROC 曲线分析 suPAR 对经历童年创伤的青少年抑郁障碍患者的早期预测价值。

结果 本研究纳入创伤组 88 例（75.2%），非创伤组 29 例（24.8%）。两组在亲子关系、精神症状方面有差异（P<0.05）。与非创伤组相比，创伤组的 HAMD-17 得分更高（P＜0.05），suPAR、IL-2、IL-4、IL-1β 水平更高（P＜0.05）。Spearman 分析显示 suPAR 与 CTQ（r=0.211，P=0.023）、情感虐待（r=0.223，P=0.016）、情感忽视（r=0.218，P=0.018）、躯体虐待（r=0.210，P=0.023）、HAMD-17（r=0.329，P＜0.001）呈正相关性。ROC 曲线分析显示，suPAR、IL-2、IL-4 和 IL-1β 预测经历童年创伤的青少年抑郁障碍患者的曲线下面积(AUC)分别为 0.687、0.651、0.642、0.659，当 suPAR 的临界值为 4.74ng/ml 时，其敏感度为 86.4%，但特异度为 41.4%。

结论 1.青少年抑郁障碍患者中童年创伤的检出

率较高。经历童年创伤的患者亲子关系更差，精神症状突出，抑郁症状更严重；suPAR、IL-2、IL-4、IL-1β 水平更高。suPAR 与情感虐待、情感忽视、躯体虐待有关。2.suPAR 在经历童年创伤的青少年抑郁障碍患者中有一定的早期预测价值。

关键字：青少年；抑郁障碍；童年创伤；suPAR

早期与晚期轻度认知障碍患者静息态 ALFF 值改变与诊断

耿皓 安翠霞*
河北医科大学第一医院精神卫生中心

目的 比较正常对照组（Normal Control, NC）、早期轻度认知障碍（Early mild cognitive impairment, EMCI）、晚期轻度认知障碍（Late mild cognitive impairment, LMCI）三组患者不同脑区低频波动振幅（Amplitude of Low Frequency Fluctuation, ALFF）值，找出差异脑区，为 MCI 的进一步细分提供影像学依据。

方法 收集阿尔茨海默病神经影像学倡议（Alzheimer's Disease Neuroimaging Initiative, AD） 3 阶段病人，EMCI 患者男 15 例，女 12 例；LMCI 患者男 4 例，女 6 例；NC 组男 14 例，女 15 例。均行常规磁共振成像（Magnetic Resonance Imaging, MRI）检测，排除脑外伤等疾病，Hachinski 缺血指数量表（HIS）分数高于 4 分。行血氧依赖静息态核磁共振（BOLD-fMRI）检查。完成 MMSE、MoCA 等量表测评。对差异脑区进行统计提取 ALFF 值，分析相关性。

结果 1.NC 组、EMCI 组、LMCI 组在年龄、性别方面没有统计学差异(P＞0.05)，受教育程度存有统计学差异（P＜0.05），Rey 听觉语言学习测试（RAVLT），阿尔茨海默病评定量表-认知量表（ADAS-cog），功能活动问卷（FAQ），存在统计学差异（H=6.99、7.30、8.06，P＜0.05）；2.NC 组和 EMCI 组对比，颞上回区域存在统计学差异（P＜0.05），ALFF 值呈下降趋势；NC 组和 LMCI 组对比，多重校正后，楔前叶区域存在统计学差异（P＜0.05），ALFF 值呈上升趋势；EMCI 组和 LMCI 组对比，中央前回及枕中回存在统计学差异（P＜0.05），ALFF 呈上升趋势；3.三组人群 RAVLT_learning 量表在枕中回呈现出统计学差异（r=-0.27，P＜0.05）；4.用单一脑区对 NC、EMCI、LMCI 进行诊断，未见统计学差异（P＞0.05）。将差异脑区联合后进行诊断，未见统计学差异（P＞0.05）。

结论 三组人群存在差异脑区、量表，ALFF 值在诊断方面未见统计学差异，但仍有作为潜在诊断指标的潜力。

儿童青少年双相情感障碍相关静息态脑功能磁共振成像研究的荟萃分析

辛晓 王育梅*
河北医科大学第一医院精神卫生中心

目的 大量静息态功能磁共振成像（resting-state functional magnetic resonance imaging, rs-fMRI）研究揭示了儿童青少年双相情感障碍（pediatric bipolar disorder, PBD）患者自发神经活动异常的脑区，但结果并不一致。本研究对既往 PBD 患者的 rs-fMRI 研究进行 Meta 分析，探索 PBD 相对一致的活动异常的脑区，揭示 PBD 潜在的生物学机制。

方法 检索自建库至 2022 年 12 月，Pubmed 、Embase、Web of science、中国知网、万方和维普数据库，对 PBD 脑功能改变的文献并加以筛选，提取相关数据并进行纽卡斯尔-渥太华量表（newcastle-ottawa scale, NOS）质量评估，将提取的脑影像学数据使用激活似然估计法（activation likelihood estimation, ALE）进行 Meta 分析。最后，将 ALE 的输出结果整合到 Mango 软件中进行脑成像处理。

结果 共检索 1519 篇文献，最终纳入 8 篇文献，NOS 文献质量评价量表评分为 6~7 分，提示文献质量较好。采用激活似然估计法发现 PBD 患者较 HCs，右侧海马旁回，左侧尾核活动增强（体素分别为 536 mm3、400mm3，P<0.05），其中右侧海马旁回被激活的可能最大，左侧楔前叶[布罗德曼分区 7（BA7）]，左侧扣带回（BA24），左侧梭状回（BA19），右侧楔前叶（BA7）活动减弱（体素分别是 2880 mm3、600 mm3、496 mm3、448mm3，P<0.05），其中左侧楔前叶被激活的可能性最大。

结论 通过 ALE 元分析发现，PBD 患者较为一致的活动异常的脑区是右侧海马旁回和左楔前叶，这为我们从神经影像学角度探寻 PBD 患者潜在生物标志物提供了重要线索。

室内光照辅助治疗抑郁症的疗效与安全性的初步研究

任若佳 王学义*
河北医科大学第一医院精神卫生中心

目的 探讨室内光照辅助治疗抑郁症的临床疗效与安全性。

方法 筛查 2021 年 9 月至 2022 年 12 月在河北医科大学第一医院精神卫生中心住院的抑郁症患者，采用随机数字表法随机分为试验组（光照治疗+药物组，n=40）和对照组（单纯药物组，n=40），治疗 2 周，治疗后继续随访 2 周。光照治疗采用室内光照的方式，光照强度为 10000lux，于清晨 7:30 至 8:00 进行 30 分钟光照治疗，连续治疗 14 天。在治疗第 1、2 周末及治疗结束后随访第 1、2 周末，采用 17 项汉密尔顿抑

郁量表（Hamilton Depression Scale, HAMD17）和汉密尔顿焦虑量表（Hamilton Anxiety Scale, HAMA）评定患者的临床症状，比较 2 组有效率和治愈率。采用 χ2 检验和重复测量方差分析进行统计比较。采用非参数检验比较 2 组在治疗 1 周末各量表总分及因子分减分率的差异。脱落病例资料均按照末次结转法（Last Observation Carried Forward, LOCF）进行缺失值处理后纳入统计学分析。

结果 试验组与对照组在治疗 1 周末及 2 周末两组的有效率差异有统计学意义（P=0.005、P=0.015）；两组的治愈率在治疗第 1、2 周末，治疗后随访第 1、2 周末差异均无统计学意义（均 P>0.05）。治疗 1 周末时 HAMD17 中除体重因子之外，2 组其他因子分和总分的减分率差异均有统计学意义（均 P<0.05）；2 组的 HAMA 总分及各因子分减分率在治疗 1 周末时差异有统计学意义（均 P<0.05）。在整个观察期间，HAMD17 评分时间与组别之间存在交互效应（F=9.662，P<0.05），简单效应分析显示试验组治疗前、治疗 1 周末、2 周末及治疗后随访 1 周末、2 周末时的 HAMD17 评分下降显著优于对照组（均 P<0.05）。试验组在接受 2 周的室内光照治疗期间无严重不良事件发生，无躁狂或轻躁狂发作，观察试验组患者光照治疗前后对眼睛的影响，结果显示眼前节照相检查结果均无异常，视力也无下降。

结论 室内光照治疗方式能显著改善抑郁症患者的抑郁、焦虑情绪，对认知及睡眠等反面也有积极影响，起效迅速且安全性较好，可作为抑郁症的一种无创性辅助治疗方法。

关键字：光照治疗，室内光照，抑郁症，快速起效，安全性

太极运动对老年人认知功能及嗅觉识别功能的影响研究

李伟 宋美*
河北医科大学第一医院精神卫生中心

目的 探讨太极运动对老年人认知功能及嗅觉识别功能的影响。

方法 2021 年 4 月-10 月在石家庄市裕华区招募老年人 272 例，2022 年 2 月-3 月于邢台市王其和太极协会招募老年人 291 例，其中 46 人因年龄小于 55 岁被排除在外。将入组老人分为太极组(TC, n=249)和无运动组(NE, n=258)，太极组进一步分为 3 年及 3 年以下组(TC-1, n=86)和 3 年以上组(TC-2, n=163)，分别对 3 组老人进行认知功能评估；包括蒙特利尔认知评估量表(MoCA) 、简易智能精神状态量表(MMSE) 、临床痴呆评定量表(CDR) 、日常生活能力量表(ADL)以及波士顿命名测试(BNT)，并采用中国人群嗅觉识别测试棒(CSIT)进行嗅觉识别功能检查。

结果 TC-1 组、TC-2 组 MMSE 得分均高于 NE 组(t=2.748，P=0.006；t=2.417，P=0.016)；TC-2 组 MoCA 得分高于 NE 组(t=2.141，P=0.033)；TC-2 组 BNT 得分高于 NE 组、TC-1 组(H=14.497，P＜0.001)；TC-2 组 MoCA 视空间得分优于 TC-1 组(H=7.630，P＜0.05)；TC-2 注意、延迟回忆得分均优于 NE 组(H=8.561，P＜0.05；H=12.222，P＜0.05)；TC-1 组抽象得分低于 NE 组、TC-2 组(H=9.299，P＜0.05)；TC-2 组 ADL 得分低于 NE 组(H=10.261，P＜0.05)；而在 CDR 得分上，TC-1、TC-2 组显著低于 NE 组(H=12.734，P＜0.001)；与 TC-2 组相比，TC-1 组更容易患嗅觉识别障碍(OR =2.844，Z2=4.251，P=0.039)。

结论 1. 参加 3 年以上太极运动的老年人认知功能优于参加太极运动 3 年及 3 年以下老年人或平时不规律参加运动的老人。2. 参加 3 年以上太极运动的老年人嗅觉识别功能优于参加太极运动 3 年及 3 年以下老年人。

关键字：太极运动， 认知功能， 嗅觉识别功能, CSIT 评分

青少年抑郁障碍伴 NSSI 患者与冲动性、血清非酶性抗氧化物之间的相关性研究

周婉玉 李幼东*
河北医科大学第一医院精神卫生中心

目的 本研究旨在探讨冲动性及血清非酶性抗氧化物可否作为青少年抑郁障碍伴非自杀性自伤（Non-suicidal self-injury, NSSI）的相关因素；同时探究在青少年抑郁障碍伴 NSSI 患者中，成瘾特征与冲动性及血清非酶性抗氧化物之间的关系。

方法 1. 纳入青少年抑郁障碍患者 126 例，将 72 例伴 NSSI 的青少年抑郁障碍患者作为实验组，54 例不伴 NSSI 的青少年抑郁障碍患者作为对照组，所有患者收集一般人口学资料。 2.使用 Barratt 冲动量表、汉密尔顿抑郁量表及汉密尔顿焦虑量表评估两组患者的冲动性、抑郁及焦虑情况。渥太华自伤量表评估伴 NSSI 的青少年抑郁障碍患者的自伤情况。由全自动生化分析仪检测生化指标中白蛋白、尿酸和总胆红素的水平。

结果 1.两组中，伴 NSSI 组的年龄较低（P＜0.05），饮酒史占比较高（P＜0.05）；2.两组冲动性比较，伴 NSSI 组的 Barratt 冲动量表的总分及运动冲动性的评分较高（P＜0.05）；3.两组血清非酶性抗氧化物水平，伴 NSSI 组的血清白蛋白及总胆红素水平较低（P＜0.05）；4.进行二元 Logistic 回归，运动冲动性（OR＝1.096, 95%CI: 1.018 - 1.179），白蛋白（OR = 0.704, 95%CI: 0.584 - 0.848），总胆红素（OR = 0.841, 95%CI: 0.735 - 0.962）为青少年抑郁障碍发生 NSSI 的风险因素；5.ROC 曲线发现，运动冲动性、白蛋白及总胆红素可作为青少年抑郁障碍发生 NSSI 的预测指标（AUC > 0.7, P < 0.05）；6.分析渥太华自伤量表，近 1 月自伤大于 1 次患者，其初始自伤年龄较低（P＜0.05），抵制自伤的动力越差（P＜0.05），成瘾特征总分较高（P＜0.05）；7.相关性分析发现，成瘾特征与运动冲动性及自伤时，这种冲动感觉是舒适呈正相关（P＜0.05）。

结论 1. 白蛋白、总胆红素及运动冲动性可作为青少年抑郁障碍发生 NSSI 行为相关风险因素。 2. 在青少年抑郁障碍伴 NSSI 患者中，运动冲动性得分越高，自伤时冲动感觉越舒适，其成瘾特征总分越高。

关键字：青少年抑郁障碍，非自杀性自伤，冲动性，血清非酶性抗氧化物，成瘾特征

生物信息学探索 m6A 修饰在重性抑郁障碍发生及亚型分类中的作用

刘政 李幼东*
河北医科大学第一医院精神卫生中心

目的 通过生物信息学探索 m6A 修饰在 MDD 发生中的作用，为 MDD 诊断和治疗提供新的思路。

方法 1.在NCBI-GEO 数据库中检索确定了 MDD 和健康人群的外周血样本基因数据集 GSE98793、GSE32280 和 GSE38206。基于生物信息学的方法进行 m6A 调控因子表达的差异分析。2.通过残差的比较选择最适合筛选核心 m6A 调控因子的机器学习模型，使用机器学习模型和诺谟图模型筛选核心 m6A 调控因子，通过核心 m6A 调控因子构建能区分 MDD 和健康人群的分类模型和预测模型，并用验证集进行验证。3.通过生物信息学的方法筛选 MDD 和健康人群的差异表达基因，之后使用 LASSO 算法筛选出 MDD 关键基因。利用 STRING 数据库和 PPI 网络识别与核心 m6A 调控因子相关的 MDD 关键基因。4.利用单一样本基因集合富集分析进行免疫浸润的差异比较以及 m6A 调控因子与 MDD 免疫浸润的相关性确定。5.应用共识聚类的方法对核心 m6A 调控因子介导的 m6A 修饰进行了亚型聚类分析，并对不同的 m6A 修饰亚型进行了免疫浸润及生物学通路的分析。

结果 1.在 MDD 与健康人群的外周血样本中存在 4 种差异的 m6A 调控因子，其中 HNRNPC 在 MDD 患者中低表达，IGFBP3、YTHDC2 和 YTHDF3 在 MDD 患者中的高表达；2.采用随机森林和诺谟图模型筛选出 HNRNPC、IGFBP3、YTHDC2 和 YTHDF3 为核心 m6A 调控因子，并可以区分 MDD 和健康人群以及预测 MDD 的发生；3.通过 LASSO 算法对 40 个差异基因进行筛选，共得到 12 个 MDD 关键基因。识别出 1 个 MDD 关键基因（IARS）与核心 m6A 调控因子相关，表明 m6A 修饰可能通过介导 IARS 在 MDD 的发生发展中发挥作用；4.与健康人群相比，免疫浸润中的调节性 T 细胞在 MDD 中增加，另外嗜酸性粒细胞与 4 种核心 m6A 调控因子相关性最高；5.在 MDD 中，基于 4 种核心 m6A 调控因子筛选出两种不同 m6A 修饰亚型：集群 A 和集群 B。这两种亚型在免疫浸润程度和生物通路存在显著差异。

结论 本研究发现了参与 MDD 发生、亚型分类的 4 种核心 m6A 调控因子，并且免疫浸润参与了 MDD 不同亚型的靶向治疗，为 MDD 发生和治疗提供新的思路。

关键字：重性抑郁障碍，m6A 修饰，共识聚类，免疫浸润

强光治疗改善抑郁症睡眠问题的对照研究

杨丽 王学义*
河北医科大学第一医院精神卫生中心

目的 抑郁症是一种严重的精神疾病，往往伴随睡眠问题，睡眠问题会严重影响患者的抑郁情绪。目前对睡眠的改善主要以药物治疗和心理治疗为主，但疗效有限。近年来，光照治疗在改善抑郁症患者睡眠问题方面被寄予厚望。本文旨在探讨强光治疗广泛应用于伴有睡眠问题的抑郁症的治疗前景。

方法 2021 年 10 月至 2022 年 11 月从河北医科大学第一医院精神卫生中心纳入符合《简明国际神经精神障碍访谈检查》（M.I.N.I.5.0）中抑郁发作诊断的患者 46 例，按照随机数字表法 1:1 分为单纯药物组（N=30 例）及强光治疗组（N=30 例），单纯药物组只接受抗抑郁药治疗，强光治疗组接受抗抑郁药治疗的同时给予光照治疗，光照治疗采用光疗室的方式，光照强度为 10000lux，于清晨 7:30 至 8:00 进行 30 分钟光照治疗，连续治疗 14 天。基线及 2 周末均采用匹兹堡睡眠质量指数（Pittsburgh sleep quality index, PSQI）评估睡眠情况。

结果 基线时单纯药物组和强光治疗组在 PSQI 总分及主观睡眠质量、入睡时间、睡眠时间、睡眠效率、睡眠紊乱、催眠药物、日间功能紊乱等因子分无统计学差异（P>0.05）。治疗 2 周后，强光治疗组在 PSQI 总分及入睡时间、睡眠时间因子分减分率较单纯药物组更高（P<0.05），其余差异治疗无统计学意义（P＞0.05）。

结论 抗抑郁药联合强光治疗对抑郁症患者入睡时间、睡眠维持时间的改善比单纯抗抑郁药治疗效果更好，可以作为辅助改善抑郁症患者睡眠问题的一种无创性物理疗法。

关键字：抑郁症；强光治疗；睡眠问题

血清 NfL 及炎症因子在阿尔兹海默病早期识别中的作用研究

敬欣阳 安翠霞*
河北医科大学第一医院精神卫生中心

目的 既往研究发现血液神经丝轻链（Neuroflament light，NfL）与认知功能的评估存在关联，认知功能的下降与较高的循环炎症水平有关，但尚不清楚血液 NfL 的含量与炎症因子及认知功能之间的内在联系。所以本研究的目的是探究血清 NfL 和炎症因子在早期识别阿尔兹海默病中的作用，探究血清 NfL 和炎症因子之间的关系。

方法 河北医科大学第一医院精神卫生中心研究员自 2021 年 4 月-2022 年 2 月从社区招募 157 名 55 岁

及以上的受试者，将其按认知功能分为三组。由受过培训的精神科医师对受试者行认知评估并采集血清样本，通过采用酶联免疫吸附试验（enzyme linked immunosorbent assay，ELISA）检测神经丝轻链、炎症因子及其他阿尔兹海默病（Alzheimer's disease，AD）病理学指标浓度，分析认知功能、NfL、炎症因子及其他 AD 病理学指标的相关性，并探寻其识别轻度认知功能障碍（Mild Cognitive Impairment，MCI）的能力。计数资料的比较采用卡方检验。对受试者各种认知测查量表及血液指标浓度进行特征曲线（receiver operating characteristic，ROC）分析，计算曲线下面积（area under the curve，AUC），以灵敏度和特异度评估诊断性能。

结果 1.MCI 人群血清 NfL 的水平较健康对照组上升（F=7.582，P=0.023）；2.血清 NfL 的含量与炎症因子 IL-1β 及 IL-6 及 Aβ40 均存在正相关，相关系数分别为 0.471、0.269、0.386；3.血清 NfL 与 p-tau217 和波士顿命名试验联合后能明显提高预测 MCI 的准确率，AUC 分别为 0.687 和 0.742，但血清 NfL 与炎症因子结合对提高预测 MCI 的准确率并无作用。

结论 血清 NfL 的含量与认知及炎症因子存在关系，能够帮助早期识别 MCI 人群，与 BNT 或 p-tau217 结合后能提高预测准确率。说明 NfL 有希望成为早期识别阿尔兹海默病外周血生物标志物，为阿尔兹海默病的治疗提供新理念。

医学生的自杀意念及相关因素

黄凡凡 王学义*
河北医科大学第一医院精神卫生中心

目的 自杀意念(SI，Suicide ideation)可以看作是发生自杀行为的一个前兆。本研究的主要目的是评估医学生自杀意念的严重程度，并探讨其相关因素。

方法 选取河北省某医学院校在校大学生 7176 人，采用网络自评问卷进行横断面研究；使用自编一般人口学问卷收集年龄、性别、家庭教养方式、是否留守儿童、个性特征等社会人口学资料；使用童年期创伤问卷简表(CTQ-SF)、青少年自我评定生活事件清单(ASLEC)、贝壳自杀意念量表(BSSI)和心理弹性量表(CD-RISC)进行评估。采用单因素方差分析和二元 logistic 回归分析医学生自杀意念的相关因素。

结果 终生自杀意念检出率为 13.4%，一周自杀意念检出率为 6.2%。专制型家庭教养方式(OR=1.55，P<0.001)、饮酒(OR=1.70，P<0.001)、内向(OR=1.20，P<0.05)、失恋(OR=1.73，P<0.05)、独生子(OR=1.24，P<0.01)、躯体疾病(OR=1.47，P<0.01)、童年期创伤经历(OR =1.03，P<0.001)、负性生活事件(OR=1.01，P<0.001) 是终生自杀意念的危险因素；专制型家庭教养方式 (OR=1.29，P<0.05)、内向(OR=1.29，P<0.05)、童年期创伤经历(OR=1.04，P<0.01)、负性生活事件(OR=1.01，P<0.001) 是一周自杀意念的危险因素；良好的心理弹性(OR=0.96、0.96，均 P<0.001)是终生自杀意念和一周自杀意念的保护因素；精神科就诊(OR=1.67、1.51，均 P<0.05)以及心理咨询经历(OR=1.94、1.77，均 P<0.001)是终生自杀意念和一周自杀意念的预警因素。

结论 专制型家庭教养方式、饮酒、内向性格、失恋、独生子、有躯体疾病、童年期创伤经历、有较多负性生活事件经历的医学生更易产生自杀意念；良好的心理弹性有助于减少自杀意念；对有精神科就诊和心理咨询经历的医学生应当提供更多的关注。

关键字：医学生；自杀意念；检出率；相关因素

精神分裂症患者血浆奥氮平及其主要代谢产物 N-去甲奥氮平浓度与代谢参数的关系

安会梅* 齐思远 杨甫德
北京回龙观医院

目的 奥氮平是治疗精神分裂症常用的非典型性抗精神病药物之一，与其他抗精神病药物相比，它具有的疗效佳，锥体外系不良反应发生率较低等优点，但具有代谢异常发生率高的缺点。因此医生在使用奥氮平时需要权衡利弊。本研究将在接受奥氮平治疗的精神分裂症患者中考察奥氮平及其主要代谢产物 N-去甲奥氮平稳态血浆浓度与代谢参数之间的关系，为临床精准用药提供依据。

方法 本研究入组了 352 例接受奥氮平治疗的精神分裂症住院患者，诊断依据为 DSM-V。采用高效液相-串联质谱（HPLC-MS/MS）方法检测奥氮平及其主要代谢产物 N-去甲奥氮平稳态血浆浓度；同时收集其常规生化检测中与代谢相关的参数，包括胰岛素、 葡萄糖、总胆固醇（TC）、甘油三酯（TG）、高密度脂蛋白胆固醇 (HDL-c)、低密度脂蛋白胆固醇(LDL-c)、C 反应蛋白（CRP）和同型半胱氨酸水平；统计分析这些代谢相关的参数与血浆奥氮平及其主要代谢产物 N-去甲奥氮平稳态血浆浓度之间的关系。

结果 在接受奥氮平治疗的住院精神分裂症患者中，较低的血浆 N-去甲奥氮平浓度与高的葡萄糖、TG 水平以及胰岛素抵抗（HOMA-IR）相关，而较高的血浆奥氮平浓度与较高的 CRP 和同型半胱氨酸水平相关。

结论 这些结果表明氮平及其主要代谢产物 N-去甲奥氮平可能对奥氮平引起的糖脂代谢异常有不同的影响，N-去甲奥氮平可能平衡奥氮平诱导的胰岛素抵抗以及糖脂代谢异常。该研究结果提示在接受奥氮平治疗的精神分裂症患者中对奥氮平及其主要代谢产物 N-去甲奥氮平进行治疗药物监测以及定期检测各种代谢参数有重要的临床意义。

关键字：精神分裂症，治疗药物监测，奥氮平，N-去甲基奥氮平，代谢异常

使用支持向量机识别误诊的双相障碍患者：基

于确诊情感障碍的功能磁共振进行特征选择

姜晓薇[1] 曹磷[2] 黎超[1] 嘉林那[1] 荆怡[3] 蔡巍[3] 赵文晖[1] 孙琦坤[1] 吴枫[1] 孔令韬[1] 汤艳清[1]
1.中国医科大学附属第一医院
2.加拿大阿尔伯塔大学
3.东软智能医疗研究院

目的 重性抑郁障碍（major depressive disorder, MDD）和双相障碍（bipolar disorder, BD）是两种致残、致死率较高的情感障碍，由于 MDD 和 BD 临床症状相似，缺乏客观生物标记物，缺乏对患者的跟踪随访，鉴别两种疾病的病理生理机制不明等原因，两种疾病的鉴别一直是临床上亟待解决的问题。由于鉴别困难导致的治疗不当、预后不良等问题给患者、家庭乃至全社会带来沉重负担。本研究旨在建立 MDD-BD 鉴别模型，并将此模型用于识别转躁患者，以明确两种情感障碍早期鉴别的影像学机制，并提示哪些 MDD 患者存在潜在转躁风险。

方法 基线采集 92 名 MDD 患者和 48 名 BD 患者的静息态功能磁共振数据，之后对 MDD 患者进行 2 年以上随访。随访后，MDD 患者中有 23 名患者确诊为转躁患者。之后使用支持向量机分类器基于 48 名 BD 和 50 名 MDD 的功能连接（functional connectivity, FC）数据建立 MDD-BD 分类器，并将该分类器在新的数据集（23 名转躁患者和 19 名 MDD）进行测试。

结果 MDD-BD 分类器识别转躁患者的准确率为 81%（敏感度=82.6%，特异度=79%，AUC=74.6%）。特征选择结果表明皮质-边缘神经环路的脑区对分类贡献最大。此外，BD 患者和转躁患者在该神经环路的所有脑区 FC 值无统计学差异（$p>0.05$），而 BD 患者和转躁患者在该神经环路的大部分脑区（左侧中央后回、左侧额中回、右侧额中回、左侧枕中回、左侧中央前回、左侧顶下回、左侧颞下回）均表现出与 MDD 之间的统计学差异（$p<0.05$）。FC 值与抑郁、焦虑、躁狂/轻躁狂症状评分无相关关系（FDR 校正）。

结论 BD 可能在皮质-边缘神经环路存在一些素质性的因素，不受疾病发作状态影响；基于这些素质性的影像特征，可以通过诊断明确的 BD 建立模型预测早期 BD 的发生。

关键字：重性抑郁障碍，双相障碍，转躁患者，功能磁共振，支持向量机

芍药甘草汤治疗精神分裂症患者高泌乳素血症的随机对照研究

李然然* 王忠宝 马家树
山东省精神卫生中心

目的 大多数抗精神病药物都是多巴胺 D2 受体拮抗剂，高催乳素血症是抗精神病药物治疗中常见的副作用。而高催乳素血症往往会导致患者出现性功能障碍。目前的研究发现芍药甘草汤能显著改善多巴胺 D2 受体和多巴胺转运体的功能，可以抑制催乳素的分泌，但是对患者用药期间出现的性功能障碍的疗效尚不明确。评价芍药甘草汤治疗高催乳素血症的疗效与安全性，及其对性功能障碍的影响。

方法 在山东省精神卫生中心的住院及门诊患者中，根据入组标准招募 62 名精神分裂症患者。将其随机分成两组，实验组（采用芍药甘草汤干预治疗）和对照组，进行为期 8 周的随机对照研究。在基线期和治疗后的第 4 周、8 周对两组患者进行性激素检查，采用阳性与阴性症状量表 PANSS、治疗副反应量表 TESS 评估患者的精神症状和不良反应。在基线期和 8 周末时采用亚利桑那性体验量表 ASEX 评估患者的性功能变化。

结果 1. 实验组入组 32 例。对照组入组 30 例。两组患者基线时的年龄，病程，性别，受教育年限无显著差异（$p>0.05$）。 2.在入组时，两组抗精神病药物治疗方案无显著差异（$p>0.05$）。在整个研究期间，患者的抗精神病方案保持不变。联合苯海索和苯二氮卓类药物治疗锥体外系反应和失眠。 3.采用广义估计方程分析显示，基线时两组之间的催乳素水平无显著差异（$p>0.05$）。在第 4 周、第 8 周末，对照组催乳素血清浓度水平均显著高于实验组（$p<0.05$）。在第 4 周、第 8 周末，实验组血清催乳素水平与基线相比无显著差异（$p>0.05$），对照组血清催乳素水平均显著高于基线（$p<0.05$）。两组之间的雌二醇、睾酮、孕酮、卵泡刺激素和促黄体生成素的血清浓度水平在基线、4 周末和 8 周末时均无显著差异（$p>0.05$）。 4.采用协方差分析比较两组间 ASEX 评分的差异。基线期两组之间的 ASEX 总分无显著差异（$p>0.05$）。第 8 周末，实验组的 ASEX 总分显著低于对照组（$p<0.05$）。对每个条目单独分析，第 8 周时，实验组在性冲动、性唤起、阴道润滑(女性)/阴茎勃起(男性)得分明显低于对照组，差异具有统计学意义（$p<0.05$）；两组间在性高潮能力）和性满意度上得分比较没有显著差异（$p>0.05$）。 5.第 8 周时，两组 TESS 评分无显著差异（$p>0.05$））。 6.治疗前后两组间 PANSS 评分无显著差异（$p>0.05$）。

结论 芍药甘草汤不能显著降低抗精神病药物引起的

关键字：高催乳素血症、抗精神病药物、芍药甘草汤、精神分裂症、性功能障碍

二甲双胍通过抑制 SREBP 及其下游靶基因改善奥氮平引起的代谢异常

李然然* 马家树 崔翠翠 苏现彪 郑云哨 白录东
山东省精神卫生中心

目的 奥氮平是一种广泛应用于精神障碍临床治疗的非典型抗精神病药物，常导致脂质代谢紊乱。最近的研究表明，二甲双胍可以改善抗精神病药物引起的脂质代谢异常，但其潜在机制尚不清楚。SREBP 转录因子在调节细胞胆固醇和脂肪酸生物合成中起着至关重要的作用。本研究旨在探讨二甲双胍是否通过调节

SREBP 及其下游靶基因改善奥氮平诱导的代谢异常，为开发新型靶向药物提供理论依据和科学依据。

方法 招募首发或半年内未服用抗精神病药物的精神分裂症患者 60 例，性别不限，年龄：18-60 岁。阳性和阴性症状量表评分（PANSS）≥60 分，临床总体印象量表（CGI）≥4 分，血脂、体重、血压、血糖等均在正常范围内。随机分为两组，分别给予奥氮平与奥氮平+二甲双胍药物治疗。分别在研究基线、4 周、8 周采集空腹血，检测血脂四项（ LDL、HDL、TG、TC）、空腹血糖，检测患者治疗前后外周血中 SREBP mRNA，及 下游靶基因 HMGCS1、HMGCR、SCD、FASN mRNA 表达水平。

结果 (1)脂质代谢指标:第 4 周末，奥氮平组(n=11)与奥氮平加二甲双胍组(n=11) TC、LDL 水平比较，差异有统计学意义($P < 0.05$)，第 8 周比较，差异无统计学意义(图 1)。(2)SREBP 及下游靶基因 mRNA 表达水平:第 8 周末，奥氮平组患者外周血浆中 SREBP 及其下游靶基因 mRNA 表达量升高(n=5)，奥氮平+二甲双胍组降低(n=5) ($P < 0.05$)。两组间表达量差异有统计学意义($P < 0.05$)(图 2)。

结论 二甲双胍治疗 4 周可有效改善奥氮平所致精神分裂症患者 TC 和 LDL 水平升高。这种改善可能是通过 SREBP 及其下游靶基因介导的。

关键字：精神分裂症；奥氮平；二甲双胍；血脂代谢；SREBP

调节激肽原 L 的 miRNA 基因多态性与精神分裂症易感性相关:一项初步的人群的研究

金梦迪 杨名家 谢梦桐 薛凤玉 艾立哲 李昕蔚 卢庆幸 宋海燈 俞琼*
吉林大学公共卫生学院流行病学与生物统计学教研室

目的 miR-SNP 是一种影响 miRNA 基因、miRNA 结合位点或 miRNA 生物发生的功能性单核苷酸多态性(SNP)。本研究旨在探讨调节激肽原 L 蛋白的 miRNAs 基因多态性与精神分裂症(SCZ)之间的关系。

方法 采用生物信息学方法预测调控激肽原 L 蛋白的 miRNAs 基因多态性位点。采用 imLDR 多 SNP 分型技术检测 513 例精神分裂症患者和 509 例对照者的 rss56103835、rs6513496、rs651349 和 rs2986407 基因多态性。随后在 SNPstats 计算的最优遗传模型下评估 miR-SNP 变异与 SCZ 易感性和 SCZ 患者症状的关联。使用广义多因子降维(GMDR)和 logistic 回归计算 miR-SNP 相互作用。最后本研究利用 PsychENCODE 基因表达数据集进一步探索 SNP 在人脑中的时空表达模式，分析 miR-SNP 定位基因在生命早期大脑不同区域中的表达变化。探讨其在 SCZ 的发生发展及其症状中的可能作用。

结果 研究发现，在显性模型下 has-miR-323b rs56103835 与精神分裂症的相关性有统计学意义。基因-基因互作结果显示，三因子模型(rss56103835 /rs2986407 /rs2155248)效果最好，但尚不能认为与 SCZ 显著相关。rs2986407 基因型为 CC 或 CT 的 SCZ 患者比 TT 患者更容易出现幻听。 基因时空表达模式分析显示，MIR1343 在出生后 150 天内显著下降，纹状体区 MIR1343 下降最为显著。随后，小脑皮层的 MIR1343 水平持续上升。MIR323B 在出生后的前 100 天显著下降，杏仁核区域除外，随后在新皮层和小脑皮层中呈持续上升趋势。

结论 我们的数据显示，hsa-miR-323b-rs56103835 从 C 到 T 的突变与精神分裂症的易感性相关。hsa-miR-1343-rs2986407 从 T 突变为 C 增加了 SCZ 患者幻听的风险。MIR323B 和 MIR1343 在早期大脑发育中可能发挥重要作用。

Specific Timing of Slow Oscillation-spindle Coupling During Sleep Is Essential for Reprocessing of Negative Emotional Memories

赛力克[1] 祝喜梅[2] 李鹏[2] 邓佳慧[2] 陆林[2]
1.北京大学
2.北京大学第六医院

Objective Neuronal activities during memory encoding in the awake are often reprocessed during subsequent sleep, particularly especially non-rapid eye movement sleep. However, the time window and mechanism of this process remains largely unknown. Here, we aimed to capture the time window of negative emotional memory reprocessing during sleep and to explore the effect of sleep-specific oscillations in this process.

Methods This study used a balanced crossover design. 56 healthy people (17?25 years, right-handed) were enrolled (four females, mean age = 22.05 ± 1.41 years). Memory performance was evaluand by the recognition test after sleep. We used a semi-positive definite programming-based Support Vector Machine (SVM) classifier, which enables automatic learning to generate optimal kernel functions, and thus classification optimization.

Results We found a generalized pattern of memory reprocessing that preferentially processed negative emotional memories rather than neutral memories. This process was accompanied by increased negative emotional memory-specific slow oscillations (SO) spindle coupling in 2nd sleep cycles. The density of SO-spindle coupling can predict the delayed recognition performance. Moreover, the recall of negative emotional memories was significantly reduced after the inhibition of SO-spindle coupling by transcranial alternating current stimulation in 2nd sleep cycles.

Conclusion Our findings indicate that negative emotional memories are preferentially processed in the 2nd sleep cycle, and SO-spindle coupling plays an important role.

关键字：SO-spindle coupling, memory reprocessing, 2nd sleep cycles, negative emotional memory

全基因组关联分析揭示与电休克治疗精神分裂症疗效有关的共表达模块

谷晓楚[1] 向波[2] 吴静[1] 徐晓文[1]
1.苏州市广济医院
2.西南医科大学

目的 电休克疗法（modified elctroconvulsive therapy, MECT）用于精神分裂症治疗具有起效快、有效率高的优点，然而其作用机制仍未完全阐明。为进一步探索前期发现的包含 425 个基因的外周血基因共表达模块与精神分裂症患者电休克治疗（modified elctroconvulsive therapy, MECT）之间的关联，本研究采用全基因组关联研究（Genome-Wide Association Studies，GWAS）的方法，分析模块中基因的多基因风险分数（polygenic risk score, PRS）与 PANSS 减分率的关联。

方法 本研究共纳入 255 例精神分裂症患者，所有患者均接受了两周 6 次的 MECT。在治疗前后分别进行阳性与阴性症状量表(Positive and Negative Syndrome Scale, PANSS)评估来评价 MECT 的疗效。提取所有患者的外周血 DNA，采用博奥晶典精准医疗研究芯片进行全基因组分型。经过质控，共有 489,294 个 SNP 及 247 位患者数据纳入进一步研究。采用 PRSice-2 软件对模块中 425 个基因的 PRS 与 PANSS 进行回归分析。

结果 255 位患者平均年率 38.8±12.4 岁，平均病程 10.9±9.7 年。治疗前 PANSS 总分、阳性量表分、阴性量表分、一般精神病理量表分均显著高于治疗后（P<0.001）。前期发现的共表达模块中的 425 个基因的多基因风险分数（polygenic risk score, PRS）与 PANSS 减分率显著相关（B = 35.59, P= 0.021）。

结论 该模块中的基因常见变异与 MECT 的疗效有关，可能可以用于预测 MECT 的疗效及进一步阐明 MECT 治疗精神分裂症的机制。

Inter-Linking The Brain Transcriptome and GWAS Risk Variants Revealed Neural Circuits Prognostic of Nicotine Use Severity

Bo Xiang[1], Tingting Wang[1], Bao-Zhu Yang[2]
1.西南医科大学附属医院精神科
2.耶鲁大学医学院精神科

Background Genome-wide association studies (GWAS) have identified many risk variants for smoking-related traits, but the neural bases of these risk variants remain unclear. Here, we focused on human brain transcriptomes and genetic effects of cigarettes per day (CPD) to investigate the neurogenetic mechanisms of why some people smoke more.

Methods We constructed whole-brain and intramodular region-specific coexpression networks using BrainSpan's transcriptomes and the GWAS-identified risk variants of CPD derived by the U.K. Biobank (N=128,434). We confirmed the associations between CPD and the gene sets in the region-specific subnetworks using an independent cohort (N=118,549) and conducted bioinformatic analyses.

Results Eight brain-region-specific coexpression subnetworks were identified in association with CPD (p-values<0.01): amygdala, hippocampus, medial prefrontal cortex (MPFC), orbitofrontal cortex (OPFC), dorsolateral prefrontal cortex, striatum, mediodorsal nucleus of the thalamus (MDTHAL), and primary motor cortex (M1C). The gene sets in the eight subnetworks were associated with CPD (adjusted p-values=0.0499~1.01×10-10). We identified three hub proteins encoded by GRIN2A (glutamate-receptor-ionotropic-NMDA-subunit-2A) in the amygdala, PMCA2 (plasma-membrane-Ca2+-ATPase-2) in the hippocampus, MPFC, OPFC, striatum, and MDTHAL, and SV2B (synaptic-vesicle-glycoprotein-2B) in M1C. Intriguingly, the pancreatic secretion pathway appeared in all the significant protein interaction subnetworks, suggesting pleiotropic effects between pancreatic diseases and cigarette smoking.

Conclusions To our knowledge, we present the first study linking brain transcriptomes and GWAS risk variants to identify brain-region-specific networks enriched for CPD. The three hub proteins are encoded by genes implicated in stress response, drug memory, calcium homeostasis, and inhibitory control. The findings provide new evidence of the neurogenetic underpinnings of smoking severity.

血浆氧化甾醇在早发性精神分裂症患者中性别特异性变化

孙作厘 闫俊娟 吴元珍 王海霞 郑毅 李人*
首都医科大学附属北京安定医院

目的 ：氧化甾醇是胆固醇的含氧代谢产物，参与发育、细胞信号传导和突触功能，这些生理过程受损可能是在精神分裂症的重要发病机制。氧化甾醇种类多样，根据其羟化酶的不同生成多种氧化甾醇。其中，24（S）-羟基胆固醇（24S-OHC，主要脑型氧化甾醇）和 27 羟基胆固醇（27-OHC，来自外周系统的主要氧化甾醇）的血浆水平可以在一定程度上代表脑-外周系统胆固醇稳态。本课题组前期研究提示首发精神分裂症患者血浆 24S-OHC 显著增加，但 27-OHC 水平降低，与精神病性症状存在显著关联，这种变化在精神分裂症临床超高危患者中就已经出现。本研究的目的是探索氧化甾醇与早发性精神分裂症（EOS）患者临床特征的潜在联系。

方法 本研究分为两个部分，首先招募 142 名健康受试者，观察氧化甾醇随年龄的特征性变化。其次，

招募了 71 名 EOS 患者来探索氧化甾醇在 EOS 中的作用。采集受试者外周血，采用液相色谱-串联质谱法检测氧化甾醇的水平。

结果 首先，我们证明了在 1 至 41 岁的 EOS 患者和健康个体中，胆固醇稳态的年龄依赖性变化。24S-OHC 水平随着年龄增长显著降低，在 0-3 岁降低最为显著；而 27-OHC 水平相对稳定，在中青年时期随着年龄增长有增加的趋；。这种氧化甾醇随年龄的变化无性别差异。另一方面，我们发现 EOS 患者血浆 27-OHC 的性别特异性表达，男性的 27-OHC 水平高于女性。我们还发现，EOS 患者的 24S-OHC/27-OHC 比值与阴性症状呈正相关。此外，尽管女性患者的阳性症状比男性更为突出，但男性和女性患者在 27-OHC 和 PANSS 评分之间表现出相反的关联趋势，尤其是在阳性评分方面。

结论 虽然脑氧化甾醇已被报道可能作为治疗精神分裂症干预的靶点，我们的研究证明胆固醇稳态，特别是脑和外周氧化甾醇可能在 EOS 中发挥性别特异性作用。

重性抑郁发作反刍思维相关的静息脑磁频谱与功能连接特征

汤浩[1] 熊婷婷[1] 史家波[1] 陈瑜[1] 张思启[2] 卢青[2] 姚志剑[1,2]
1.南京医科大学附属脑科医院心境障碍科
2.东南大学生物科学与医学工程学院

目的 对于抑郁症和双相障碍患者来说，反刍思维是重性抑郁发作期的重要临床特征之一。反刍思维的脑电生理机制尚不明确，尤其缺乏重性抑郁发作患者相关的临床研究。本研究旨在探究重性抑郁发作反刍思维相关的静息脑磁频谱和功能连接特征。

方法 纳入 95 例处于重性抑郁发作期的抑郁症（n = 40）及双相障碍（n = 55）患者，以及 52 例健康对照，进行脑磁图（Magnetoencephalography, MEG）静息态扫描，同时完善其人口学、临床资料以及反刍思维量表（Rumination Response Scale, RRS）的评估。患者组与健康对照组进行各脑区各频段频谱功率及相干性（Coherence）的组间比较，两组间存在显著差异的脑区能量及功能连接与反刍思维量表得分进行偏相关分析（控制年抑郁症状、焦虑症状、年龄等因素），得出与反刍思维相关的局部脑区能量及功能连接。

结果 1）频谱分析显示重性抑郁发作患者组在双侧额叶、右颞叶 theta 频段能量显著弱于健康对照组，而右额叶、双侧颞叶和左顶叶 beta 频段能量显著高于健康对照组。Spearman 非参数偏相关显示患者组左前额 theta 频段能量与 RRS 呈显著负相关（r = -0.321, P= 0.005）；3）在 gamma 频段，患者组左额_左颞、左额_右颞功能连接显著高于健康对照组，右额_左顶功能连接显著低于健康对照组。其中，左额_左颞（r = 0.325, P = 0.001）及左额_右颞（r = 0.338, P = 0.001）功能连接均与反刍思维总分显著正相关。

结论 重性抑郁发作时静息 MEG 能量及脑区交互的异常主要累及前额叶和双侧颞叶，左额 theta 功率下降以及左额对双颞区在 gamma 频段功能连接增强与反刍思维有关，这反映了重性抑郁发作“自上而下”控制效能的降低，额颞区功能紊乱可能是重性抑郁发作反刍思维的神经电生理基础。

精神分裂症持续性幻听的功能网络研究

邵续 唐劲松*
浙江大学医学院附属邵逸夫医院精神卫生科

目的 在伴持续性幻听的精神分裂症患者中构建功能像拓扑网络，探究持续性幻听的功能网络特征。

方法 本研究纳入 90 名伴持续性幻听的精神分裂症患者（pAH 组）、55 名不伴幻听的精神分裂症患者（non-pAH 组）及 83 名性别和年龄匹配的健康受试者（HC 组）。本研究收集受试者的一般临床资料，进行临床评估，并采集静息态功能像磁共振数据，基于 Dosenbach160 模板构建功能像拓扑网络，探究三组受试者结构网络全局属性及局部属性的差异，在 pAH 组探究拓扑属性与临床症状的相关性。

结果 与 HC 组相比，两组患者特征路径长度升高，全局效率及局部效率下降；左侧颞顶联合区的介中心性下降，右侧小脑下部的度中心性升高，额颞顶枕及岛叶区域的节点聚类系数、节点效率及节点局部效率下降；感觉运动网络、枕叶网络模块内的连接强度以及额顶网络-枕叶网络模块之间的连接强度下降，顶叶、岛叶、丘脑及小脑区域的节点参与系数升高；两组患者均存在功能连接下降的子网络，而 pAH 组全脑累及范围更广泛。与其他两组分别相比，pAH 组左侧前额叶前部和右侧楔前叶的节点效率下降，辅助运动区的节点局部效率下降。pAH 组左侧前额叶前部的节点效率与 PANSS 阳性量表分正相关，左侧岛叶中部的度中心性与 PANSS-GPS 得分及 PANSS 总分负相关，右侧额叶的参与系数与 PANSS P3 条目分正相关。

结论 幻听及非幻听患者均表现出网络整合能力及信息传递效率下降、全脑广泛节点的信息传输能力下降、网络模块化紊乱、全脑广泛的功能连接下降。幻听患者的局部属性与临床症状相关，且仅幻听患者表现出左侧前额叶前部、右侧楔前叶、辅助运动区的信息传递能力下降。本研究为探索持续性幻听的机制提供了宝贵证据，为临床早期识别及靶向干预提供了理论基础。

精神分裂症持续性幻听的因果结构协变网络研究

邵续 唐劲松*
浙江大学医学院附属邵逸夫医院精神卫生科

目的 幻听是精神分裂症核心的阳性症状之一，25-30%的患者经过两种抗精神病药物治疗后仍遭受幻听的困扰，持续超过一年可被定义为持续性幻听。幻听极大损害患者的生活质量，造成沉重的社会与经济负担，但其神经病理机制尚不明确。本研究旨在伴持续性幻听的精神分裂症患者中构建因果结构协变网络，探究持续性幻听相关的灰质体积渐进病变模式。

方法 本研究纳入90名伴持续性幻听的精神分裂症患者（pAH 组）、55 名不伴幻听的精神分裂症患者（non-pAH 组）及 83 名性别和年龄匹配的健康受试者（HC 组）。本研究收集受试者的一般临床资料，进行临床评估，并采集 3D T1 结构像磁共振数据，在 pAH 组构建因果结构协变网络，探究全脑灰质体积萎缩的渐进式模式及起源点，探究起源点与其他区域之间的因果效应传递模式。

结果 随着幻听程度的加重，灰质体积萎缩从丘脑逐渐累及至额叶、颞叶、海马、小脑等区域。在因果结构协变网络中，丘脑是因果起源点，右侧岛盖部额下回、双侧中央后回、左侧丘脑、右侧额中回是中转节点，额颞顶枕、边缘系统、小脑等区域是目标节点。丘脑灰质体积改变的影响经由中转节点传递至目标节点，形成丘脑-皮层-小脑的因果环路。

结论 幻听患者的灰质体积改变呈现出渐进模式，丘脑是病变的起源点，因果效应经由额顶区域传递至其他皮层区域及小脑。本研究为探索持续性幻听的机制提供了宝贵证据，为临床早期识别及靶向干预提供了理论基础。

尼古丁对精神分裂症认知功能和海马 Glx 的影响

陈珊珊 尤子凡 王梁梁 孙云开 李锦光 何张鉴 张廷开 廖艳辉 唐劲松*
浙江大学医学院附属邵逸夫医院

目的 精神分裂症是一种严重的慢性精神疾病，主要症状包括幻觉、妄想、情感淡漠和社交活动退缩等，并常伴有不同程度的认知功能障碍。临床研究发现，精神分裂症患者吸烟率可高达 79%，远超正常人群和其他精神障碍患者。有研究提示精神分裂症患者可能通过吸烟获得某些“益处”，然而当前相关研究结果并不一致。氢质子磁共振波谱成像（1H-MRS）作为无创性测量大脑中代谢物水平的成像方法被广泛利用。本课题采用 1H-MRS 技术开展 RCT 研究，探究尼古丁对精神分裂症患者认知功能和海马谷氨酰胺复合物（Glx）的影响。

方法 纳入不吸烟精神分裂症患者进行随机分组。试验组使用尼古丁贴片（14mg/片/天），安慰剂组使用外观类似的安慰剂贴片（1 片/天）。收集所有受试者的人口学信息，在基线和干预 2 周后均采用重复性成套神经心理状态测验（RBANS）量表评估精神分裂症患者的认知功能以及完成海马 1H-MRS 波谱。分析比较两组干预后认知功能和海马 Glx 水平的变化。将试验组干预后认知功能变化和 Glx 变化进行偏相关分析。

结果 尼古丁贴片干预 2 周后，试验组患者的即刻记忆得分、言语功能得分、注意力得分和 RBANS 总分均显著上升，试验组患者左侧海马的 Glx 水平较基线均显著下降，上述结果均通过 FDR 校正。试验组患者干预后 Glx 水平变化和注意力得分变化呈正相关，未通过 FDR 校正。

结论 短期尼古丁干预有助于改善不吸烟精神分裂症患者的认知功能（即刻记忆、言语功能和注意力）；不吸烟精神分裂症患者经尼古丁短期干预后，海马的 Glx 水平降低，这种改变可能在相应的认知功能改善中发挥一定作用。

Sex Differences in The Association of Treatment-resistant Schizophrenia and Serum Interleukin-6 Levels

贺静琦 唐劲松*
浙江大学医学院附属邵逸夫医院

Objective Low-grade inflammation and altered inflammatory markers have been observed in treatment-resistant schizophrenia (TRS). Interleukin-6 (IL-6) is one of the pro-inflammatory cytokines linked with TRS and receives increasing attention. Previous studies showed that patients with TRS might have higher IL-6 levels compared with healthy individuals and treatment-responsive patients. Besides, emerging evidence has suggested that there are sex differences in the associations between IL-6 levels and various illnesses, including chronic hepatitis C, metabolic syndrome, etc.; however, there is limited study on TRS. In this present study, we aimed to compare the serum IL-6 levels of TRS and partially responsive schizophrenia (PRS) and explore potential sex differences in the association of TRS and IL-6 levels.

Methods The study population consisted of a total of 90 patients with schizophrenia: 64 TRS patients (45.3% males and 54.7% females) and 26 PRS patients (46.2% males and 53.8% females). We measured serum IL-6 levels using enzyme-linked immunosorbent assay (ELISA) and analyzed them separately by gender, controlling for confounders (age, education, medication, body mass index, and PANSS scores) rigorously.

Results The results showed that patients with TRS had higher serum IL-6 levels than patients with PRS ($p = 0.002$). In females, IL-6 levels increased significantly in

the TRS group compared with the PRS group (p = 0.005). And a positive correlation tendency was observed between IL-6 levels and PANSS general sub-scores (r = 0.31, p = 0.039), although this correlation was not significant after correcting for multiple comparisons. Whereas, there were no differences in IL-6 levels between the TRS and PRS (p = 0.124) in males.

Conclusion Our findings provided evidence supporting the hypothesis that the inflammatory response system (IRS) may play a role in the pathogenesis of TRS in a sex-dependent manner. In addition, sex differences in the immune dysfunction of individuals with schizophrenia cannot be neglected, and inflammation in male and female TRS should be discussed separately.

Multiple Serum Anti-glutamate Receptor Antibody Levels in Clozapine-treated/naive Patients with Treatment Resistant Schizophrenia

贺静琦 唐劲松*
浙江大学医学院附属邵逸夫医院

Objective Glutamatergic function deficits have been associated with the pathogenesis of treatment-resistant schizophrenia (TRS), while the effects of clozapine on the glutamate system may contribute to its superior efficacy. In recent years, evidence emerged supporting the involvement of immune processes and increased prevalence of antineuronal antibodies in TRS. In this present study, we aimed to investigate multiple anti-glutamate receptor antibody levels in TRS and explored the effects of clozapine on these antibody levels.

Methods We measured and compared multiple anti-glutamate receptor (NMDAR, AMPAR, mGlur3, mGluR5) antibody levels among clozapine-treated patients with TRS (TRS-C, n=37), clozapine-na?ve patients with TRS (TRS-nC, n=39), and patients with nTRS (NTRS, n=35), using enzyme linked immunosorbent assay (ELISA). Severity of clinical symptoms was evaluated with Positive and Negative Symptom Scale (PANSS). Cognitive function was assessed using the MATRICS Consensus Cognitive Battery (MCCB).

Results The four glutamate receptor antibody levels in the TRS-nC were higher than those in the NTRS (p < 0.001). The anti-mGluR3 antibody levels in the TRS-C were similar to those in the NTRS (p = 0.233), and the other three antibody levels were between the NTRS and the TRS-nC. However, in all three groups, no significant associations were found between antibody levels and symptom severity or cognitive function.

Conclusion Our findings suggest that both glutamatergic function deficits and immune processes may play a role in the pathogenesis of TRS. The effect of clozapine targeting anti-glutamate receptor antibody levels may be an element of its pharmacology that contribute to its therapeutic effects.

Identification and Functional Analysis of Circulating Extrachromosomal Circular DNA in Schizophrenia Implicate Its Negative Effect on The Disorder

陈珊珊 唐劲松*
浙江大学医学院附属邵逸夫医院

Objective Despite the remarkable advances in the genetics of schizophrenia (SCZ) in recent years, identifying the specific genetic biomarkers of SCZ has been challenging. Extrachromosomal circular DNAs (eccDNAs) are circular DNA molecules derived and free from linear chromosomes, which can carry functional DNA elements and disturb gene expression and regulation. Here, we explored the presence of circulating eccDNA in the plasma of chronic SCZ and compared their eccDNA profiles against that of the healthy controls.

Methods 211 differential eccDNAs carrying genic segments (eccGene), including eccTAOK2, eccDNMT3B, eccSIRT5, eccJAG1 and so on, were identified in 10 chronic SCZ patients, whereas only 26 specific eccGenes were found in the 17 healthy people.

Results Human phenotype ontology enrichment analysis upon the 211 SCZ-specific eccGenes showed that six of them were enriched in the phenotype of progressive intellectual disability (FDR < 0.05). Among the SCZ-specific eccGenes, functional assays of two artificial eccDNAs carrying TAOK2-intronic sequence showed that they attenuated the TAOK2 mRNA expression in both U-251MG and SH-SY5Y cell lines, which the function was further confirmed by the dual-luciferase reporter gene assay. In addition, RNA-seq analysis showed that introduction of the artificial eccTAOK2 in U-251MG cells resulted in dysfunction of the immune-related biological processes.

Conclusion Together, these results suggest that circulating eccDNAs have negative effects on SCZ and underscore its potential role as a valuable noninvasive biomarker for the diagnosis and monitoring of the disorder.

关键字：schizophrenia；eccDNAs；negative effects

Exosome and Exosomal Contents in Schizophrenia

张廷开 唐劲松*
浙江大学医学院附属邵逸夫医院

Objective Schizophrenia (SCZ) is a severe neuropsychiatric disorder with high heredity and complex pathophysiology. Recently, increasing studies have focused on the role of exosomes in SCZ due to accumulating knowledge in biological function of exosome. Here, we review recent research advances on the association of exosomes and SCZ.

Methods We searched the literature for nearly 5 years with schizophrenia and exosome as keywords on Pubmed, and found 11 relative articles.

Results It was reported that miR-137 and miR-206 upregulated in blood exosome in schizophrenia patients, and exosome-derived miR-223 increased in postmortem orbitofrontal cortex (OFC). A study of plasma exosome circRNAs in SCZ patients identified 44 differentially expressed circRNAs compared to matched healthy controls, including 38 upregulated, 6 downregulated and 8 novel circRNAs. In another study, researchers found that the expressions of two lncRNAs, MIAT and PVT1, in serum exosomes of SCZ patients without medication were significantly different from those of healthy controls, and that 1-month risperidone treatment could affect the expression of MIAT and PVT1. A series of proteins related to mitochondria, including Mitofusin 2 (MFN2), cyclophilin D (CYPD) and syntaphilin (SNPH) are reported significantly changed in both astrocyte-derived EVs (ADEVs) and neuron-derived EVs (NDEVs) in individuals with first episode psychosis (FEP). A recent study examined the levels of exosomal Aβ and tau in SCZ and found that the level of astrocyte-derived exosomal Aβ42 protein was increased in SCZ patients compared to healthy controls. Moreover, the level of P-T181-tau protein in astrocyte-derived exosome was also increased in SCZ patients and was associated with worse executive function. Ranganathan found that the level of glial fibrillary acidic protein (GFAP), a marker of astrocytic pathology, was higher in plasma exosomes of SCZ patients compared to healthy controls, while the expression of α-II-Spectrin was significantly lower. A multicenter metabolomics study identified 25 blood exosome-derived metabolites that were significantly different in SCZ, and these metabolites were found to be enriched in two pathways: glycerophospholipid metabolites and the biosynthesis of phenylalanine, tyrosine, and tryptophan. Another study found decreased levels of the insulin upstream signaling transduction protein pS312-IRS-1 in blood exosome of drug-na?ve first-episode schizophrenia.

Conclusion Exosomes have the potential to serve as biomarkers for the diagnosis of SCZ. Components of exosomes, including nucleotides such as miRNA, circRNA, and lncRNA, as well as proteins and metabolites, have been shown to be differentially expressed in SCZ in various studies. These findings indicate some underlying mechanisms to SCZ including the neuroinflammation hypothesis, neurodevelopment aberrance, abnormal mitochondria function and oxidative stress and glutamate receptors dysfunction.

Neural Variability in Three Major Psychiatric Disorders

魏巍[1] 邓丽红[1] 乔春霞[2], Pak C Sham[3], Lena Palaniyappan[4] 李涛[1]
1.杭州市第七人民医院浙江大学医学院附属精神卫生中心
2.四川大学华西医院
3.香港大学
4.麦吉尔大学

Objective Across the major psychiatric disorders (MPDs), a shared disruption in brain physiology is suspected. Here we investigate the neural variability at rest, a well-established behavior-relevant marker of brain function, and probe its basis in gene expression and neurotransmitter receptor profiles across the MPDs.

Methods We recruited 219 healthy controls and 279 patients with schizophrenia, major depressive disorder, or bipolar disorders (manic or depressive state). The standard deviation of blood oxygenation level-dependent signal (SDBOLD) obtained from resting-state fMRI was used to characterize neural variability. Transdiagnostic disruptions in SDBOLD patterns and their relationships with clinical symptoms and cognitive functions were tested by partial least-squares correlation. Moving beyond the clinical sample, spatial correlations between the observed patterns of SDBOLD disruption and postmortem gene expressions, Neurosynth meta-analytic cognitive functions, and neurotransmitter receptor profiles were estimated.

Results Two transdiagnostic patterns of disrupted SDBOLD were discovered. Pattern 1 is exhibited in all diagnostic groups and is most pronounced in schizophrenia, characterized by higher SDBOLD in the language/auditory networks but lower SDBOLD in the default mode/sensorimotor networks. In comparison, pattern 2 is only exhibited in unipolar and bipolar depression, characterized by higher SDBOLD in the default mode/salience networks but lower SDBOLD in the sensorimotor network. The expression of pattern 1 related to the severity of clinical symptoms and cognitive deficits across MPDs. The two disrupted patterns had distinct spatial correlations with gene expressions (e.g., neuronal projections / cellular processes), meta-analytic cognitive functions (e.g., language/memory), and neurotransmitter receptor expression profiles (e.g., D2/serotonin/opioid receptors).

Conclusion In conclusion, neural variability is a potential transdiagnostic biomarker of MPDs with a substantial amount of its spatial distribution explained by gene expressions and neurotransmitter receptor profiles. The pathophysiology of MPDs can be traced through the measures of neural variability at rest, with varying clinical-cognitive profiles arising from differential spatial patterns of aberrant variability.

剪切波弹性成像在精神病长期服药患者肝脏弹性评估中的应用价值

刘海花[1] 陈文翔[1] 凌菁[1] 成欣蕊[1] 段婷慧[1] 於子扬[2]
1.苏州市广济医院
2.苏大附属第二医院

目的 探讨剪切波弹性成像（SWE）在精神病长期服药患者肝脏弹性评估中的应用价值。

方法 选取 2018 年 7 月~2019 年 7 月我院收治的 90 例精神分裂症长期服药患者，均进行 SWE 检查和肝穿刺病理活检，分 析比较患者肝纤维化情况、一般资料、影响患者肝纤维化的多因素以及各指标对患者的评估价值。

结果 经肝穿刺病理活检，90 例患者肝纤维化显著 52 例（57.78%）、非显著 38 例（42.22%）；肝纤维化显著组肝纤 维化-4 因子指数（FIB-4）、谷草转氨酶/血小板比率指数（APRI）及杨氏模量值高于非显著组（P 均＜0.05）； FIB-4、APRI 及杨氏模量值是精神病长期服药患者肝纤维化程度的危险因素（P 均＜0.05）；FIB-4、APRI、杨氏 模量值及联合对 FIB-4、APRI 及杨氏模量值的 AUC 为 0.719、0.659、0.928、0.940，杨氏模量值及联合的特异度 高于 FIB-4、APRI（P 均＜0.05）。

结论 SWE 检查可有效评估精神病长期服药患者肝纤维化程度，杨氏模量值在患者的肝脏弹性评估中具有临床应用价 值。

首发精神分裂症患者治疗前后镜像同伦功能连接值 与临床疗效相关性的研究

刘霞[1] 李则挚[2] 周智凤[1] 侯刚强[1] 江文涛[1] 周勇杰[1]
1.深圳市康宁医院
2.广东三九脑科医院

目的 镜像同伦功能连接（the voxel-mirrored homotopic connectivity, VMHC）可部分反映大脑在静息状态下，两侧大脑半球之间神经元功能连接活动的强弱。本研究目的在于探索首发精神分裂症患者在治疗前 VMHC 是否存在显著异常的脑区，以及这些脑区治疗前后 VMHC 值与患者临床症状、认知功能变化的相关性。

方法 选取符合 DSM-IV 诊断标准的 43 名首发精神分裂症患者（first episode schizophrenia group，FESZ 组），和 30 名年龄、性别相匹配的健康对照（HC 组），使用 PANSS 量表评估患者临床症状，并使用 MATRICS 共识认知成套测验（MCCB）进行认知功能评估。4 周药物治疗后，再次测评患者临床症状及认知功能。治疗前后患者均采集 T1、BOLD 数据，使用 DPABI 工具包计算治疗前 FESZ 组和 HC 组 VMHC 值并进行统计分析，以阳性脑区作为感兴趣区（ROI），提取这些 ROI 治疗前后 VMHC 值，以性别、年龄做协变量，采用偏相关分析与 PANSS、MCCB 各指标做相关性分析研究。

结果 FESZ 组和 HC 组 VMHC 统计结果显示，VMHC 显著增强的脑区为双侧扣带回中部（Cingulated M），显著降低的脑区为双侧小脑后叶和前额叶部分脑区（$p<0.01$, FDR 校正）。治疗前后的偏相关分析结果显示，扣带回中部的 VMHC 值在治疗前后的降分率与 PANSS 阳性量表的减分率呈显著正相关（R=0.851，P<0.0001）；与 MCCB 中数字序列 T 分的加分率呈显著正相关（R=0.627，P=0.016）；与 MCCB 中符号编码 T 分的加分率呈显著正相关（R=0.497，P=0.05）。

结论 FESZ 治疗前，扣带回中部 VMHC 显著增强，部分前额叶和小脑后叶 VMHC 显著降低，说明 FESZ 静息状态下，双侧大脑半球之间的功能连接失衡，前后脑出现减弱，大脑中部出现增强。治疗后，扣带回中部 VMHC 值显著降低，且与部分量表的变化存在正相关，提示治疗后扣带回中部 VMHC 值减弱与治疗效果正相关。VMHC 值是一个具有较高特异性的评价指标，治疗前后各脑区 VMHC 值的变化，尤其是扣带回中部 VMHC 值的变化在评价临床疗效中的应用价值值得深入探讨。

关键字：镜像同伦功能连接（the voxel-mirrored homotopic connectivity, VMHC）；首发精神分裂症；MATRICS 共识认知成套测验（MCCB）；扣带回中部

抑郁障碍及高危亲属身体成分的性别差异研究

周慧[1,2] 陆小兵[1] 李则挚[1]
1.广州医科大学附属脑科医院
2.宝安区石岩人民医院

目的 通过生物电阻抗分析法观察首发抑郁障碍（FE-MDD）、高危亲属（FDR）与健康受试者（HC）不同性别的身体成分差异，探讨重性抑郁障碍（MDD）患者身体成分的特点。

方法 本研究收集 140 名首次发作以及从未治疗过的诊断为 MDD 的门诊患者，根；同期选取健康志愿者为对照组（n=134）,以及随机选取 MDD 患者的父母或者儿女为一高危亲属（n=112）。收集一般资料以及采用身体成分分析仪进行身体成分测量。

结果 高危亲属体脂百分比高于健康受试者，相位角及矿物质低于健康受试者，女性中首发患者体脂百分比、内脏脂肪显著高于健康受试者；高位亲属的矿物质低于对照组。相位角（OR: 0.286,Cl:0.157~0.52）是抑郁障碍的保护因素，在女性中内脏脂肪（OR：1.019,95%，Cl:1.004~1.034）是郁障碍的危险因素；矿物质（OR: 0.099,Cl:0.023~0.433）是抑郁障碍的保护因素。

结论 首发抑郁障碍及高危亲属身体成分较健康受试者均会出现一定程度的变化，且存在性别差异，内脏脂肪面积、体脂百分比、矿物质及相位角可能是 MDD 的影响因素之一，因此在临床上应该对抑郁障碍患者以及高危亲属早期进行身体成分监测，为早期干预提供重要依据。

Decreased Resting-state Neural Signal in The

Left Angular Gyrus As A Potential Neuroimaging Biomarker of Schizophrenia: An Amplitude of Low-frequency Fluctuation and Support Vector Machine Analysis

高玉军 王高华*
武汉大学人民医院

Objective Schizophrenia (SCH) is primarily diagnosed based on specific clinical symptoms, with the lack of any objective SCH-related biomarkers often resulting in patient misdiagnosis and the underdiagnosis of this condition. This study was developed to assess the utility of amplitude of lowfrequency fluctuation (ALFF) values analyzed via support vector machine (SVM) methods as a means of diagnosing SCH.

Methods In total, 131 SCH patients and 128 age- and gender-matched healthy control (HC) individuals underwent resting-state functional magnetic resonance imaging (rs-fMRI), with the resultant data then being analyzed using ALFF values and SVM methods.

Results Relative to HC individuals, patients with SCH exhibited ALFF reductions in the left angular gyrus (AG), fusiform gyrus, anterior cingulate cortex (ACC), right cerebellum, bilateral middle temporal gyrus (MTG), and precuneus (PCu) regions. No SCH patient brain regions exhibited significant increases in ALFF relative to HC individuals. SVM results indicated that reductions in ALFF values in the bilateral PCu can be used to effectively differentiate between SCH patients and HCs with respective accuracy, sensitivity, and specificity values of 73.36, 91.60, and 54.69%.

Conclusion These data indicate that SCH patients may exhibit characteristic reductions in regional brain activity, with decreased ALFF values of the bilateral PCu potentially offering value as a candidate biomarker capable of distinguishing between SCH patients and HCs.

Efficacy of Individualized Repetitive Transcranial Magnetic Stimulation Treatment for Depression: A Systematic Review and Meta-analysis

Jing Jin[1], Yun Wang[1], Yuan Zhou[1,2], Gang Wang[1]
1.The National Clinical Research Center for Mental Disorders & Beijing Key Laboratory of Mental Disorders, Beijing Anding Hospital & the Advanced Innovation Center for Human Brain Protection, Capital Medical University
2.CAS Key Laboratory of Behavioral Science, Institute of Psychology; Department of Psychology, University of Chinese Academy of Sciences

Objective There are increasing studies on individualized repetitive transcranial magnetic stimulation (rTMS) strategies for the treatment of major depressive disorder (MDD), which include individualized target and individualized frequency/timing. However, it remains unknown whether these individualized rTMS strategies are effective, and more importantly, whether they are superior to stand rTMS in treating depression. This systematic review and meta-analysis aim to provide a comprehensive overview of the existing individualized methods for treating MDD, with a focus on their clinical use and efficacy.

Methods We conducted a systematic search in PubMed, EMBASE, and the Cochrane Library for randomized controlled trials (RCTs) that focused on individualized rTMS treatment for depression. Two authors independently conduct article selections, data extraction, and bias risk evaluation. Meta-analysis was conducted to compare the symptom severity difference of post-rTMS with 1) individualized targeting compared to the sham group or standard group; and 2) individualized frequency/timing compared to the sham group or standard group. Additionally, meta-regression analysis was conducted to investigate the influence of pulse numbers on effect size. We also discussed improvements in cognition and adverse effects of individualized rTMS.

Results A total of 14 RCTs were included in the meta-analysis, with 11 RCTs focused on individualized targeting strategy and 3 RCTs on individualized frequency/timing. The pooled effect size of the meta-analysis indicated that individualized targeting rTMS had an antidepressant outcome (SMD = -0.64, 95%CI: [-0.92, -0.35], $p < 0.001$) compared to the sham group. The total number of pulses had a significant influence on the effect size ($R2 = 56.42\%$, $p = 0.035$), indicating that the efficacy of the individualized rTMS target increased with an increasing total number of pulses. Moreover, individualized rTMS targeting had a superior antidepressant outcome (SMD = -0.38, 95%CI: [-0.75, -0], $p = 0.049$) compared to the standard group. Individualized frequency/timing rTMS was found to be antidepressant efficacious (SMD = -0.37, 95%CI: [-0.69, -0.05], $p = 0.025$) compared to the sham group, but not superior (SMD = -0.35, 95%CI: [-0.95, 0.24], $p = 0.25$) compared to the standard group. Four RCTs reported cognitive functioning outcomes after individualized targeting rTMS treatment, with two supporting a significant improvement and the rest finding no difference between the individualized targeting rTMS and the sham group. The most commonly reported adverse effect was headache, with a higher incidence in the individualized group (26/261) compared to the sham group (12/161) and standard group (2/57).

Conclusion This study provides the first quantitative synthesis demonstrating the antidepressant efficacy of individualized rTMS, with individualized targeting rTMS showing promise for MDD treatment.

SOD 和 HsCRP 与残留阴性症状精神分裂症患者萝卜硫素疗效的关系

曾剑飞[1,2] 陆小兵[1] 李则挚[1]
1.广州医科大学附属脑科医院营养与代谢精神心理科
2.深圳市康宁医院

目的 越来越多的证据表明，氧化应激和免疫炎症过程与精神分裂症的阴性症状相关。萝卜硫素(Sulforaphane, SFN)除具有较强的抗氧化和抗炎活性外，还可改善精神分裂症患者的认知功能。探讨 SFN 对阴性症状精神分裂症患者的疗效及对超氧化物歧化酶(superoxide dismutase, SOD)和炎症标志物高敏 c 反应蛋白(high-sensitivity C-reactive protein, HsCRP)水平的影响。

方法 共纳入45例处于稳定期以阴性症状为主的精神分裂症患者。入组患者在原治疗基础上加用 SFN 片，剂量为 90mg /d，共治疗 24 周。在基线、12 周和 24 周时，我们对参与者进行了访谈并评估了其医疗状况。采用阳性与阴性症状量表(PANSS)减分率评价各组治疗效果，采用副反应量表(TESS)评价不良反应，并检测 SOD、HsCRP 等指标。

结果 PANSS 阴性分量表评分显著降低($P < 0.001$)， SOD 活性显著升高($P<0.001$)， HsCRP 显著升高($P<0.05$)。PANSS 阴性分量表减分率有效组 HsCRP 改善显著($P<0.05$)。

结论 SFN 可能作为一种潜在的辅助干预措施，安全地改善精神分裂症的阴性症状。降低 HsCRP 水平的抗炎作用是 SFN 改善精神分裂症患者阴性症状的可能机制。

首发未服药精神分裂症患者肠道微生物组特征改变

陶诗婉 吴雨璐 肖立玲 王强*
四川大学华西医院

目的 肠道微生物与精神分裂症的病因学研究已然受到广泛关注，已有一系列高水平关联研究表明精神分裂症患者的肠道菌群组成会发生变化，然而，引发这些变化的因素却很难确定。有研究指出，细菌以外的肠道微生物的作用应得到重点关注。肠道病毒组数量极其庞大，在塑造肠道菌群群落组成，以及调节肠道菌群代谢、进化和适应性方面发挥重要作用。本研究将探索肠道病毒组在肠道菌群与精神分裂症发病关联中的调控作用。

方法 本研究从四川大学华西医院心理中心招募首发未服药的精神分裂症患者和地域来源及性别、年龄等人口学特征相似或相近的健康对照共 95 例，精分患者的诊断符合 DSM-5 中相应的诊断标准。样本采集包括一般人口学信息和粪便样本采集等。对粪便样本进行肠道微生物（病毒和细菌）宏基因组测序。探索各个样本在不同分类水平（界、门、纲、目、科、属、种）上含有何种病毒/菌群及其相对丰度，并进行群落结构的分析（α 和 β 多样性分析）。采用偏最小二乘判别分析挑选对分组贡献较大的差异微生物，在此基础上探索分类学的疾病特异性病毒-细菌组跨界相关性（Trans-kingdom correlation），将性别、BMI 等因素作为协变量构建偏相关网络。

结果 研究共招募 95 名被试（48 名患者和 47 名健康对照）。对于肠道菌群，两组间 α 多样性在各水平上无显著差异，在科、属、种水平上组间 β 多样性存在显著差异；对于肠道病毒组，两组间 α 多样性在目、科两水平上存在显著差异，在目、属、种水平上组间 β 多样性存在显著差异。判别分析共鉴定出 9 种对组间差异贡献较大的病毒和 28 种细菌。跨界偏相关网络分析表明精神分裂症组和健康对照组的病毒-细菌关联模式存在较大差异。

结论 本研究结果表明，除肠道菌群以外，肠道病毒也显示出与精神分裂症的发病相关。在精分患者和健康对照中肠道病毒与肠道菌群的关联模式差异将促进我们对肠道微生物群如何影响精神分裂症的发生的理解，也为发现潜在的、便于临床转化的可干预靶点（饮食结构指导、联用抗生素、补充益生元等方案）提供了前期基础。

关键字：肠道微生物，精神分裂症

非典型抗精神病药治疗后血清催乳素的预测模型

李艳歌*
郑州大学第一附属医院

目的 高催乳素血症（hyperprolactinemia, HPRL）是部分非典型抗精神病药常见的不良反应之一，可引起女性月经量少、周期延长、闭经、溢乳以及男性性功能障碍等症状。在需长期服药的患者中血清催乳素备受关注，本研究应用定量药理学的方法建立用药后血清催乳素的预测模型。

方法 收集 528 例精神科病房 2018 年 1 月 1 日-2022 年 12 月 30 日服用单种非典型抗精神病药治疗且至少有两次血清催乳素检测结果的患者，整理人口学、非典型抗精神病药物种类、剂量、用药时间、血清催乳素水平、HPRL 相关症状、减轻 HPRL 的药物等数据，采用非线性混合效应模型的方法建立血清催乳素随用药时间变化的 Emax 模型。

结果 528 例建模患者年龄 42.08±15.67（14～75）岁，女性 51%，98%为汉族。依据用药种类不同，更易出现 HPRL 的：氨磺必利（5%）、利培酮（25.6%）、帕利哌酮（9.5%）、奥氮平（23.4%）、氯氮平组（14%），上述各组血清催乳素用药后变化较快，且规律类似，43 天左右达血清催乳素峰值。阿立哌唑（14%）、喹硫平（6.5%）、齐拉西酮组（2%）血清催乳素升高不明显。模型诊断图、可视化预测检验图说明模型的准确性和预测能力较好。

结论 服用易引起 HPRL 的非典型抗精神病药 1 月内血清催乳素升高最快，1 月半左右达峰，适宜在该

阶段临床监测催乳素并适当干预，防止因 HPRL 停药。

Objective Suicidal ideation is a substantial clinical challenge in treatment resistant depression (TRD). Recent work demonstrated promising antidepressant effects in TRD patents with no or mild suicidal ideation using a specific Transcranial Magnetic Stimulation (TMS) protocol termed intermittent theta burst stimulation (iTBS). To reduce the financial and time burden of TMS therapy, intensive (accelerated) treatment schedules have been developed involving higher dosing and multiple sessions per day. Recent protocol modifications provided a striking advance in terms antidepressant clinical efficacy. More specifically, known as Stanford Neuromodulation Therapy (SNT), demonstrated promising outcomes with 64.3% response rate at four-week follow-up. In addition to iTBS, continuous TBS (cTBS) delivered to the right DLPFC has also demonstrated therapeutic efficacy in TRD patients. Compared to iTBS, cTBS is more often used to manage anxiety symptoms, and it is noteworthy that anxiety demonstrates a moderate covariance with suicidal risks. Here, we examined the clinical effects of accelerated schedules of iTBS and continuous TBS (cTBS) in patients with moderate to severe suicidal ideation.

Methods TRD patients (n=44) with moderate to severe suicidal ideation were randomized to receive treatment with either accelerated iTBS or cTBS. These were delivered in ten daily TBS sessions (1800 pulses/session) for five consecutive days (total 90,000 pulses). Neuronavigation was employed to target accelerated iTBS and cTBS to the left and right dorsolateral prefrontal cortex (DLPFC) respectively. Clinical assessments were performed at baseline, post treatment, two weeks and four weeks post intervention.

Results Accelerated cTBS and iTBS led to substantial and comparable antidepressant effects at treatment end-point, and at 2- and 4-week follow-up (response rates, cTBS= 54.54%, 50.00%, 54.54%; iTBS= 59.09%, 54.54%, 54.54%). Critically, accelerated cTBS was superior to iTBS in the management of suicidal ideation (mean effect of group, PBonferroni = 0.04) and anxiety symptoms (interaction effect, PBonferroni = 0.01 at post-treatment). During the 4-week follow-up, 72.73% of the patients in the accelerated cTBS group achieved remission of suicidal ideation, compared to 31.82% in the accelerated iTBS group (Pcorrected = 0.007). At 4-week follow-up (week 5), the response rates of depression were comparable in the two groups (RatecTBS = 54.54%, RateiTBS = 54.54%, Pcorrected = 1.000). In terms of anxiety, the accelerated cTBS group demonstrated a better response rate than the accelerated iTBS group (RatecTBS = 81.82%, RateiTBS = 50%, Pcorrected = 0.026).

Conclusion These findings provide the first evidence that accelerated schedules of left-DLPFC iTBS and right-DLPFC cTBS are comparably effective in managing antidepressant symptoms and indicate that right-DLPFC cTBS is superior in reducing suicidal ideation and anxiety symptoms.

基于群体药代动力学模型探索氨磺必利在特殊人群中的个体化给药方案

黄善情 尚德为*
广州医科大学附属脑科医院

目的 基于中国精神障碍患者氨磺必利群体药代动力学模型，年龄作为显著影响氨磺必利清除率的因素，研究特殊年龄人群的个体化给药方案，为临床给药提供技术指导。

方法 基于前期建立的氨磺必利群体药代动力学模型，对 13~18 岁（青少年）和 65~69 岁（老年人）特殊年龄段人群进行仿真在 50-1200mg/d 剂量下的血药浓度范围。

结果 当青少年服药剂量小于 300 mg·d-1，氨磺必利血药浓度低于 AGNP 指南推荐有效浓度范围下限（100 ng·mL-1）当给药剂量大于 800 mg·d-1，氨磺必利平均血药浓度大于 320 ng·mL-1；给药剂量增加至 1200 mg·d-1，青少年氨磺必利血药浓度均不会超 600 ng·mL-1。当老年人服药剂量在 100~300 mg·d-1，氨磺必利平均血药浓度在 AGNP 指南推荐的有效浓度范围内（100~320 ng·mL-1）；当老年人服药剂量超过 600 mg·d-1 血药浓度超过实验室警戒浓度（640 ng·mL-1）。

结论 青少年如果期望获得有效治疗浓度需加大给药剂量且氨磺必利用于青春期精神分裂症的资料有限，通常是不建议青春期至 18 岁的青少年使用氨磺必利，老年人给药剂量超过 600 mg·d-1，需密切监测氨磺必利血药浓度。

基于脑电微状态 k-mers 的词袋模型对重度抑郁症进行分类的机器学习研究

周东东 王我 况利*
重庆市重庆医科大学附属大学城医院

目的 脑电微状态类似于自然语言中的字符，由几个微状态组成的短片段(k-mers)类似于单词，而微状态序列则类似于自然语言。我们的目的在于探究微状态 k-mers 是否可以作为重度抑郁症的神经生物标记，以及能否在个体水平识别重度抑郁症。

方法 我们使用词袋模型来处理微状态序列，使用 k 范围为 1 到 10 的 k-mer 作为单词计算词频（TF），并将考虑或不考虑逆文档频率(IDF)的 TF 作为特征。本研究包含两个独立的重度抑郁症数据集。我们分别对数据集 1(27 名患者和 26 名对照)和数据集 2(34 名患者和 30 名对照)进行嵌套交叉验证，然后在一个数据集上进行训练，在另一个数据集上进行测试，反之亦然。计算敏感度、特异度以及 AUC 等指标评估机器学习性能。

结果 在数据集 1 中，使用 4-mers 的 TF 作为特征的 L1 正则化模型的 AUC 为 81.5%，在数据集 2 中，使用 9-mers 的 TF 作为特征的 L1 正则化模型的 AUC 达到 88.9%。当使用数据集 1 作为训练集时，使用 9-mers 的 TF- IDF 作为特征的 L2 正则化模型预测数据集 2 的最佳 AUC 为 74.1%；而数据集 2 作为训练集时，8-mers 的 TF 作为特征的 L1 正则化模型预测数据集 1 的最佳 AUC 为 70.2%。

结论 我们的研究提示微状态 k-mers 可作为重度抑郁症的神经生物标记物，并能在个体水平识别重度抑郁症患者。本研究结果将有助于推动使用自然语言处理技术进一步探索微状态序列在神经精神疾病精准诊疗中的价值。

基于智商作为代理表型的精神分裂症异质性分析

任虹燕[1] 尹美钰[5] 魏巍[4,5] 王强[1] 邓伟[4] 马小红[1] 赵连生[1] 李晓晶[4], Pak Sham[3] 李明[5] 李世武[5] 李涛[4]
1.四川大学华西医院心理卫生中心
2.香港大学李嘉诚医学院精神病学系
3.浙江大学医学院附属精神卫生中心 （杭州市第七人民医院）
4.中科院昆明动物所

背景 精神分裂症（Schizophrenia，SCZ）是一种由不同症候群组成的，异质性高，病因未明重性精神障碍；既往大量的研究提示无论以哪种临床症候群表现为主的精神分裂症患者均存在不同类型的认知缺陷。利用认知指标作为代理表型对精神分裂症进行基于生物学基础的再分类成为一种切实可行的研究方式。目的 探索基于智商作为代理表型是否可以为揭示精神分裂症的病理生理机制以及再分类提供重要证据。

方法 本研究运用一种新的代理表型方法（Proxy-phenotype method, PPM），利用当前最新地全基因组关联分析（Genome-wide association study, GWAS）结果以及基于生物信息学算法的转录组关联分析（Transcriptomic association study，TWAS）寻找与智商（Intelligence, IT）以及精神分裂症相关联的，在背侧前额叶（Dorsal lateral prefrontal cortex, DLPFC）表达的智商代理基因（IT-proxy genes）；并运用表达预测算法对独立样本 DLPFC 区域的 IT-proxy genes 进行预测以及新的亚型寻找；后利用不同纬度的，包括认知、影像以及纵向临床量表在内的数据对新的亚型进行特征定义。最后结合小鼠神经元生长对上述基因进行生物功能的探索。

结果 联合 GWAS 和 TWAS 的 PPM 方法发现 10 个基因在 DLPFC 的表达存在与智商以及 SCZ 的显著关联；在一组包括 155 名首发未服药的精神分裂症患者以及 189 名匹配的正常对照的独立样本中我们对上述 10 个 IT-proxy genes 在 DLPFC 进行表达预测以及组间比较，结果提示上述基因在 DLPFC 的表达存在显著的组间差异并可以利用上述 10 个基因的表达矩阵在患者组侦测到 4 个亚型；进一步对 4 种亚型进行特征定义发现 4 种亚型在工作记忆存在显著的组间差异；在颞极、枕额叶、顶内沟以及前额叶的灰质体积存在组间差异，其差异在上述脑区组成的结构网络中更为突出；纵向临床大体功能量表提示其中 1 组亚型相比较于其他 3 组亚型存在显著的预后不良；小鼠神经元生长研究提示上述基因可以显著的促进神经元，特别是其结构中树突棘的生长。

结论 由多种认知模块组成地智商作为代理表型可以有效识别精神分裂症的异质并进行亚型的侦测，这些亚型为疾病精准诊疗提供重要证据。

Genetic Correlation and Overlap between Suicidal Behaviors and Mental Health Conditions

黄蕴琪 王强*
四川大学华西医院

Objective To investigate the genetic association between mental disorders and nonfatal suicide attempts (SA), which occur far more frequently and are a major source of disability and social and economic burden.

Methods We used genome-wide association summary statistics from individuals with European ancestry from the Psychiatric Genomics Consortium (schizophrenia [SCZ], major depressive disorder [MDD], bipolar disorder [BD], anxiety disorder [ANX] and post-traumatic stress disorder [PTSD]), International Suicide Genetics Consortium (SA), and Million Veterans Program (opioid use disorder [OUD] and alcohol use disorder [AUD]). We estimated genome-wide and regional genetic correlation, and

cortical gene expression of each phenotype. Shared loci were identified and mapped to genes, which were further tested for functional enrichment.

Results We observed positive genome-wide genetic correlations between mental disorders and SA (range 0·26–0·86, rgSA-MDD=0.86, p=2.5E-123, rgSA-BD=0.26, p=1.33E-07). After conditioning SA data with major mental disorders, genome-wide genetic correlations between SA and most mental disorders remained positively significant (range 0·08–0·42, rgSA-MDD=0.42, p=2.08E-11, rgSA-SCZ=0.04, p=1.29E-27). When zooming into local regions, seven (SA-BD) to 81 (SA-ANX) shared loci were identified for pairs involving SA and one of those mental disorders. Cortical gene expression analysis indicated YOD1 as the only shared cis-eQTL gene for multiple phenotype pairs (FDR = 0.021). However, enrichment analysis did not yield significant results.

Conclusion This study underscores the urgent need to address the genetic architecture of suicide behaviors, among individuals with or without major mental disorders.

Load-dependent Inverted U-shaped Connectivity of The Default Mode Network in Schizophrenia During A Working Memory Task: Evidence From A Replication FMRI Study

王斐文 刘哲宁 阳洁*
中南大学湘雅二医院

Objective Working memory (WM) deficit is associated with aberrant brain connectome degree distribution in schizophrenia. However, the brain neural mechanism underlying the degree redistribution pattern in schizophrenia is still uncertain.

Methods We examined the functional connectome degree distribution in 81 schizophrenias and 77 healthy controls (HCs) across different WM loads during an nback task. We tested associations between the altered degree distribution and clinical symptoms and conducted functional connectivity analyses to investigate the neural mechanism underlying altered degree distribution. These analyses were repeated in another independent dataset of 96 subjects. Machine-learning analysis was employed to study the ability of the degree distribution pattern of one dataset to discriminate patients from controls in the second dataset.

Results Patients showed a decreased centrality in the dPCC (dorsal posterior cingulate cortex) for the '2back vs. 0back' contrast compared with HCs. The dPCC centrality pattern across all WM loads fitted the 'inverted U-shape' with a left shift of this pattern in patients. This reduced centrality correlated with severity of delusions and related to its reduced functional connectivity with dorsal precuneus. These results were replicated in the second independent dataset, and the machine-learning analyses achieved 0.71 accuracy.

Conclusion Schizophrenia is characterized by a load-dependent reduction of centrality in dPCC, and it relates to the severity of delusions. We raise the possibility that restoring dPCC centrality in the presence of cognitive demands may have a therapeutic effect on persistent delusions in schizophrenia.

CYP2C19 基因多态性与艾司西酞普兰治疗药物监测的临床应用分析

曾环思 钟彩妮* 蒋家兵 王裕锋 钟易霖 彭陈陈
深圳市康宁医院

目的 探讨细胞色素 P450 2C19（CYP2C19）基因多态性及其他影响因素与艾司西酞普兰血药浓度相关性，为治疗药物监测（TDM）临床应用提供参考。

方法 回顾性收集我院 2020 年 1 月-2022 年 12 月使用艾司西酞普兰住院患者的 TDM 结果及年龄、性别、肝功能、合并用药及 CYP2C19 基因多态性等临床资料，分析 CYP2C19 基因多态性及其他影响因素对艾司西酞普兰血药浓度影响。

结果 93 例中国汉族抑郁住院患者中，CYP2C19*2、*3 及*17 等位基因突变率分别为：33.33%、5.91%和 0.54%，基因型分布符合中国汉族人群的遗传平衡定律。超快代谢型（UM）（*1/*17）、广泛代谢型（EM）（*1/*1）、中间代谢型（IM）（*1/*2、*1/*3）和慢代谢型（PM）（*2/*2、*2/*3）的艾司西酞普兰校正血药浓度（CDR）分别为 104.16，（92.42±9.41），（137.15±11.95）和（185.59±22.28）(ng·mL-1)/(mg·kg-1)。与 EM 组比较，PM 患者艾司西酞普兰的血药浓度增加 93.17%，IM 患者增加 44.73%（P< 0. 05）。多元线性回归显示，CDR、是否 PM 和是否 IM 是影响艾司西酞普兰血药浓度的主要因素（R2=0.417，P< 0. 001），模型可解释 41.7%的艾司西酞普兰血药浓度的变化。

结论 中国汉族抑郁患者中 CYP2C19*2、*3 基因多态性与艾司西酞普兰血药浓度有关，PM 患者应根据血药浓度进行剂量调整。

Study of The Functional Network Characteristics of Mood Disorder And Its Association with Clinical Symptom Dimensions

李丹 吴航 关霖 刘歆怡 徐劲节 杨帆 周晶晶 刘瑞 周媛 王刚*
首都医科大学附属北京安定医院

Objective Major depressive disorder (MDD) and bipolar disorder (BD) are two closely related types of mood disorders. According to the DSM-5, patients with

major depressive disorder and bipolar disorder can be further classified into depression with mixed features (MMF) and bipolar disorder with mixed features (BMF). The purpose of this study is to explore the abnormal patterns of different large-scale functional brain networks in MDD, BD, MMF and BMF patients and to find brain networks related to depressive and manic symptoms in the mood disorder spectrum.

Methods In this study, patients with MDD, BD, MMF, BMF and healthy controls (HC) was collected, resting fMRI scans were completed, the severity of depressive and manic symptoms of patients group was assessed by the Hamilton Depression Rating Scale and the Young Mania Rating Scale, respectively. Based on the functional connectivity matrix of each subject, the brain network related to depressive and manic symptoms was separately identified in the patient group using the network-based statistics (NBS) method. Pearson correlation was used to calculate the relationship between the averaged functional connectivity within the two brain networks and the severity of clinical symptoms. One-way analysis of variance was used to compare the difference in functional connectivity of brain networks related to different symptoms in subtypes of patients and HC. For networks with significant main effects, post-hoc tests were performed to compare between group differences.

Results A total of 168 participants were included in analysis, including 42 MDD, 30 BD, 27 MMF, 27 BMF, and 42 HC. Two within-network functional connectivity and 7 between-network functional connectivity were significant among different groups, and the patients group generally showed significantly higher functional connectivity than the HC. The brain network related to depressive symptoms included 82 functional connectivity ($r=0.66$, $P<0.05$). The brain network related to manic symptoms comprised 87 functional connections ($r=0.59$, $P<0.05$). In the brain network corresponding to manic symptoms, BD MMF and BMF exhibited significantly higher averaged functional connectivity than HC, and BMF showed significantly higher averaged functional connectivity than MDD. In the brain network corresponding to depressive symptoms, there were no significant group differences.

Conclusion This study demonstrated that patients with MDD, BD, MMF, BMF exhibit abnormal brain network connectivity patterns relative to HC, and may be influenced by a common factor. From the viewpoint of the entire mood disorder spectrum patients, depressive and manic symptoms can be characterized by different brain networks. The findings of this study contribute to further understanding of abnormal brain function patterns in patients with different subtypes of mood disorders and provide support for the search of relationships between clinical symptoms and neuroimaging features.

2.Department of Clinical Medicine，Chongqing Medical and Pharmaceutical College

3.Department of Neurology, The First Affiliated Hospital of Chongqing Medical University

Objective The objective of this study was to understand Major depressive disorder (MDD) better, a complicated mental disorder marked by high relapse rates and low treatment response. By analyzing the transcriptome expression profiles in the peripheral blood of MDD patients, the study intended to identify potential biomarkers of MDD.

Methods The study selected and preprocessed GSE98793. The technique of Gene Set Enrichment Analysis (GSEA) was applied to choose the MDD-related pathways. A range of analytical methods, including gene differential analysis, weighted gene co-expression network analysis (WGCNA), and LASSO regression, was used to recognize hub genes associated acutely with MDD. Based on the gene expression profiling of the entire sample (MDD/control:64/64), this study preliminarily constructed the immune infiltration landscape in patients and identified immune cells significantly associated with MDD. Machine learning (ML) was used to create risk prediction models to diagnose MDD, and the diagnostic efficacy was evaluated based on the receiver operating characteristic curve (ROC) and the area under the curve (AUC).

Results The study discovered 15 essential genes significantly associated with MDD. The CIBERSORT analysis revealed that the proportions of naive CD4+ T-cells, activated memory CD4+ T-Cells, monocytes, CD8+ T-cells, and resting memory CD4+ T-cells were all related to MDD. Using machine learning techniques, six MDD risk prediction models were constructed. The optimum model was the random forest, with the AUC in the test set being 0.86.

Conclusion In conclusion, creating diverse machine learning models utilizing these biomarkers may contribute to more accurate MDD diagnosis. The outcomes underline the importance of using these biomarker data to enhance the understanding, detection, and treatment response predictions for MDD.

吸烟对精神分裂症临床表现和脑形态的影响

陈珊珊 孙云开 尤子凡 李锦光 何张鉴 张廷开 廖艳辉 唐劲松*

浙江大学医学院附属邵逸夫医院

目的 精神分裂症是一种严重的慢性精神疾病，主要症状包括幻觉、妄想、情感淡漠和社交活动退缩等，以及出现不同程度的认知功能障碍。临床研究发现，精神分裂症患者吸烟率可高达 79%，该现象受到学界广泛关注。既往有研究提示，吸烟精神分裂症患者的脑形态可能存在异常。本研究通过对比吸烟和不吸烟精神分裂症患者临床表现和脑形态的差异，探究吸烟精神分裂症患者临床表现和脑形态的特点。

方法 纳入吸烟精神分裂症患者、不吸烟精神分裂症患者和健康对照。收集所有受试者的人口学信息，采用阳性和阴性症状量表（PANSS）、9 项患者健康问卷（PHQ-9）、7 项广泛性焦虑障碍量表（GAD-7）和重复性成套神经心理状态测验（RBANS）量表评估精神分裂症患者的临床表现，其中吸烟患者需完成吸烟情况评估。所有受试者完成高分辨 3D-T1 加权结构像数据采集。比较吸烟和不吸烟精神分裂症患者临床表现的差异。比较三组受试者的皮层厚度、表面积、皮层下结构体积和海马亚区体积的差异。将组间比较有显著差异的脑结构指标与临床表现进行偏相关分析。

结果 吸烟精神分裂症患者的 PHQ-9 得分显著低于不吸烟精神分裂症患者（p=0.013），通过 FDR 校正。吸烟精神分裂症患者的注意力得分较不吸烟精神分裂症患者低（p=0.026），未通过 FDR 校正。吸烟精神分裂症患者的吸烟情况和临床表现无相关性(p 均>0.05)。吸烟精神分裂症患者右外侧眶额叶（p=0.048）和右颞横回（p=0.043）的皮层厚度较不吸烟精神分裂症患者低，未通过 FDR 校正。吸烟精神分裂症患者海马亚区-右侧海马伞体积较不吸烟精神分裂症患者更小（p=0.011），未通过 FDR 校正。

结论 吸烟精神分裂症患者可能表现出更轻的抑郁症状，注意力有受损的趋势；吸烟精神分裂症患者右外侧眶额叶和右颞横回的皮层厚度呈现更低的趋势，海马亚区-右侧海马伞的体积呈现下降更明显的趋势。

尼古丁对精神分裂症认知功能和海马 NAA 水平的影响

陈珊珊 王梁梁 尤子凡 李锦光 何张鉴 张廷开 廖艳辉 唐劲松 *
浙江大学医学院附属邵逸夫医院

目的 精神分裂症是一种严重的慢性精神疾病，主要症状包括幻觉、妄想、情感淡漠和社交活动退缩等，认知功能障碍正是该疾病核心症状之一。临床研究发现，精神分裂症患者吸烟率高，远超正常人群和其他精神障碍患者，进一步研究提示精神分裂症患者吸烟行为可能是自我给药帮助缓解症状，然而当前相关研究结果并不一致。氢质子磁共振波谱成像（1H-MRS）作为无创性测量大脑中代谢物水平的成像方法被广泛利用。本课题采用 1H-MRS 技术开展 RCT 研究，探究尼古丁对精神分裂症患者认知功能和海马 N-乙酰天门冬氨酸（NAA）的影响。

方法 纳入不吸烟精神分裂症患者进行随机分组。试验组使用尼古丁贴片（14mg/片/天），安慰剂组使用外观类似的安慰剂贴片（1 片/天）。收集所有受试者的人口学信息，在基线和干预 2 周后均采用重复性成套神经心理状态测验（RBANS）量表评估精神分裂症患者的认知功能以及完成海马 1H-MRS 波谱。分析比较两组干预后认知功能和海马 NAA 水平的变化。将试验组干预后认知功能变化和 NAA 变化进行偏相关分析。

结果 尼古丁贴片干预 2 周后，试验组患者的即刻记忆得分、言语功能得分、注意力得分和 RBANS 总分均显著上升，试验组患者左侧海马的 NAA 水平较基线均显著下降，上述结果均通过 FDR 校正。试验组患者干预后 NAA 水平变化和注意力得分变化呈正相关，未通过 FDR 校正。

结论 短期尼古丁干预有助于改善不吸烟精神分裂症患者的认知功能（即刻记忆、言语功能和注意力）；不吸烟精神分裂症患者经尼古丁短期干预后，海马的 NAA 水平降低，这种改变可能在相应的认知功能改善中发挥一定作用。

关键字：精神分裂症；尼古丁；NAA；认知功能；磁共振成像

Identification of Male Schizophrenia Patients Using Brain Morphology Based on Machine Learning Algorithms

余涛 张许来*
合肥市精神病医院

Objective A fast diagnosis of schizophrenia is crucial to prescription of an appropriate antipsychotic in the early stage which is able to make treatment more efficient. Current diagnosis of schizophrenia is carried out based on doctors' judgment through observing behaviors and psychiatric symptoms of patients. However, in many cases, the diagnosis is not highly reliable, due to clinician subjectivity, patient heterogeneity and nomenclature inadequacy, leading to diagnosis of schizophrenia in the early stages being still considered a challenging task.

Methods A total of 78 male subjects composed of 60 patients with schizophrenia who met the Diagnostic and Statistical Manual of Mental Disorders-5 and 18 healthy controls participated in this study. The Least absolute shrinkage and selection operator (LASSO) was applied to select the important features from several brain morphological indexes including cortical volume (CV), cortical thickness (CT) and cortical surface area (CSA) as input features for classification. The establishment and evaluation of models were conducted in R software. The entire data was randomly divided into training (70%) and testing sets (30%). The training set was used for developing models, and the testing set for assessing the performance of models. Four commonly used machine learning algorithms including GLM, RF, KNN, SVM were tested for classifier selection process. Performance of classification models

was evaluated with the area under receiver operating characteristic curves (AUC) and balanced accuracy.

Results There were no significant differences in age and whole brain volume between patients with schizophrenia and healthy controls. The important features were selected by LASSO, including banks of superior temporal sulcus (bankssts), cuneus, inferior temporal, isthmus cingulate, lateral occipital, lingual, paracentral, parsopercularis, superior frontal, temporal pole, and insula region. After the important features were selected using LASSO, we compared differences in them between groups. Patients with schizophrenia showed reductions in left bankssts area, left inferior temporal area, left lateral occipital area and left superior frontal volume as well as increased cortical thickness in left lingual, right cuneus and lateral occipital regions, compared with healthy controls. RF outperformed other machine learning algorithms and achieved the better classification performance with an AUC of 0.886. Subsequently, CV, CT and CSA were used for development of classification models using the RF algorithm, respectively. Among three brain morphological features, CT performed best and its AUC and balanced accuracy reached 0.605.

Conclusion In this study, we found structural abnormality in some brain regions primarily involved in temporal and frontal lobes in schizophrenia patients. Compared with other algorithms, RF showed better performance in discriminating male schizophrenia patients from healthy controls.

基于质谱技术的抑郁症代谢组学研究进展

刘明霞 贺毅 孙作厘* 杨健*
首都医科大学附属北京安定医院

目的 重性抑郁障碍（Major depressive disorder，MDD）是一种以显著而持久的心境低落为主要临床特征的精神疾病。MDD 病因复杂，其发病机制尚未完全阐明。基于质谱的代谢组学可以在代谢水平上为 MDD 的预后、治疗反应和相关生物标志物提供新的见解。

方法 我们在 Web of Science 和 PubMed 数据库中使用了“depression”以及“metabonomics”等关键词检索相关文章，根据需要选取近五年发表的英文研究。

结果 MDD 的质谱代谢组学研究常用的方法有液相色谱-质谱联用（Liquid chromatography–mass spectrometry，LC-MS）、气相色谱-质谱联用（Gas chromatography-mass spectrometry，GC-MS）、超流体临界色谱-质谱联用（Supercritical fluid chromatography-mass spectrometry，SFC-MS）以及质子转移反应质谱（Proton-transfer reaction mass spectrometry，PTR-MS），常见的代谢组学平台包括靶向代谢组学（Targeted metabolomics）、非靶向代谢组学（Untargeted metabolomics）以及拟靶向代谢组学（Pseudotargeted metabolomics），关注较多的代谢物可分为氨基酸类代谢、脂质类代谢以及肠道微生物相关的代谢物等，此外中药类、益生菌类以及常见抗抑郁合成药治疗前后代谢物的变化也是研究的重点内容。

结论 随着质谱代谢组学检测技术的发展，代谢组学在 MDD 研究中的作用凸显。代谢组学挖掘出大量 MDD 生物标志物及其代谢途径信息，然而这些信息在 MDD 发展中所起的作用尚未完全阐明，如何利用这些数据来提高 MDD 的诊断、治疗和预后仍不清楚。未来，多种质谱技术和代谢组学平台的整合开发以及与其它领域技术的联合应用将为 MDD 的深入研究提供更准确和完整的信息。

基于列线图的氨磺必利停药风险预测模型建立与验证

陈彬彬* 徐象珍 吕海燕
厦门市仙岳医院

目的 抗精神病药物的连续治疗是防止和延缓精神症状复发的有效手段，本研究调查了精神病院治疗期间使用抗精神病药氨磺必利的停药情况，探讨停药的风险因素，并构建风险预测模型，为临床用药决策提供依据。

方法 回顾性分析 2019 年 1 月至 2021 年 3 月使用氨磺必利的患者资料，获取相关资料及实验室检测指标、临床疗效总体改善情况及不良反应发生情况，并通过 1 年随访整理氨磺必利的停药情况。采用 t 检验和单因素方差分析评估氨磺必利血药浓度与临床疗效和不良反应的关系。将所有患者作为训练集，使用重复抽样 1000 次的 bootstrap 方法进行验证。使用 Lasso 生存分析初步筛选的潜在风险预测因子，接着使用多因素 cox 生存分析模型将选定的风险预测因子进一步纳入多变量生存分析。基于最终模型确定氨磺必利停药预测模型的风险因素，构建列线图用于预测服用氨磺必利用 6 个月及 12 个月的停药风险。使用一致性指数（C 指数）、校准曲线、决策曲线分析（DCA）进行模型的区分度、校准度和临床实用度验证，构建列线图。本研究使用 R 软件 4.1.2 版本进行统计分析和作图。$P<0.05$ 为差异具有统计学意义。

结果 共纳入了 172 例患者，随访 1 年后 45.3% 的患者停止使用氨磺必利。氨磺必利使用时间中位数 14 个月，停药组中中位数为 5 个月，未停药组中中位数为 16 个月。Cox 回归结果发现氨磺必利停药风险和性别、是否共病高脂血症和氨磺必利的血药浓度显著相关。合并高脂血症的患者，其停药风险比未发生高脂血的患者高 3.7 倍。氨磺必利血药浓度每增加 100 ng/ml 患者出现停药的可能性增加 1.135 倍，而当浓度达到 800 ng/ml 时，其停药风险增加将近 2 倍。氨磺必利停药风险诺莫图的 C 指数为 0.713，校准曲线显示 6 个月、12 个月和 18 个月的停药风险预测结果与实际结果一致性强。

结论 本研究虽未发现氨磺必利药物浓度与疗效和不良反应有明显相关性，但是发现药物浓度对预后

的判断具有一定的意义。针对有高脂血症的女性患者，药物浓度越高，其治疗结局不佳停药的风险越高，这提示我们可以提前做出用药决策并定期监测血药浓度和血脂水平。本研究根据血药浓度、合并症和临床疗效绘制的列线图，可以用于预测精神分裂症患者使用氨磺必利的停药风险，辅助用药决策的制定。

关键字：氨磺必利；停药；列线图；血药浓度

内源性大麻素在抑郁动物模型中的变化规律及其与糖皮质激素含量的相关性

任思宇 杨健*
首都医科大学附属北京安定医院

目的 检测内源性大麻素花生四烯乙醇胺(AEA)及 2-花生四烯酸甘油(2-AG)在抑郁模型动物体内的含量变化，分析其与经典应激/抑郁生化指标糖皮质激素(CORT)含量的相关性，从而为进一步探讨内源性大麻素系统在抑郁症中发挥的作用及意义奠定基础，二者相互辅助以使抑郁相关的生化检测更具有可信度。

方法 选用 260-280g 成年 SD 大鼠,分为对照组、模型组。对照组不做其他处理。抑郁组接受为期 7 天，每天连续 4 小时的束缚，后进行 3 天的获得性无助实验，分为两天的训练期及一天的测试期。以 10 天为一周期，两周期的应激造模结束后，采用糖水偏好实验、旷场实验和强迫游泳对实验 SD 大鼠进行行为学检测。采用 UPLC-MC 测定束缚应激结合获得性无助应激造模的抑郁 SD 大鼠的血清内 AEA、2-AG 及 CORT 的相对含量。

结果 获得性无助实验结合慢性束缚应激可使 SD 大鼠出现抑郁样行为，抑郁大鼠血清 2-AG 相较于正常大鼠有显著降低，AEA 有升高趋势，CORT 显著升高。其中 CORT 含量与 2-AG 具有显著负相关性($p = 0.0051^{**}$, $r = ?.646$)，AEA 含量与 CORT($p > 0.05$, $r = .071$)及 2-AG($p > 0.05$, $r = -.031$)均无显著相关性。

结论 内源性大麻素信号失调可能与负性情绪状态和应激反应增多等抑郁状态的出现有关。2-AG 表达水平明显低于对照组，其含量变化稳定，可作为除皮质酮外的一种抑郁样状态生化检测指标。CORT 含量与 2-AG 具有显著负相关性，可与糖皮质激素作为同时反映抑郁状态的检测指标。

关键字：抑郁；内源性大麻素；AEA；2-AG

Seizures Induced by Atypical Antipsychotics: A Real World Study From 2004 To 2022 Based on The FAERS Database

Xue Zhao [1], Youjun Chen[2], Yu Cheng[2], Huafang Li[1,3,4], Shunying Yu[1]
1.Shanghai Mental Health Center, Shanghai Jiao Tong University School of Medicine, Shanghai, China
2.Shanghai Jiao Tong University School of Medicine, Shanghai, China
3.Shanghai clinical research center for mental health
4. Shanghai key laboratory of psychotic disorders

Objective The atypical antipsychotics were reported to be associated with seizures, however, few large, long-term and real-world studies about atypical antipsychotic-associated seizures have been conducted. This pharmacovigilance study aimed to characterize the potential association between sezures and atypical antipsychotic using the FDA Adverse Event Reporting System (FAERS) data.

Methods Data from the first quarter of 2004 to the third quarter of 2022 in FAERS database were downloaded for disproportionality analysis. The Medical Dictionary for Regulatory Activities (MedDRA) was used to identify adverse events including seizures. Disproportionality was estimated using reporting odds ratios (ROR) corresponding 95% confidence intervals (CIs) and information component (IC) along with 95% CIs.

Results Between the first quarter of 2004 to the third quarter of 2022, 41886918 AE reports were submitted to FAERS. A total of 6436 cases were utilized in IC and ROR calculations commonly used the atypical antipsychotics, and three or more reported cases the adverse events related to seizures. A significant disproportionality signal (ROR025>1) was seen with all 8 atypical antipsychotics (including clozapine, quetiapine, olanzapine, aripiprazole, risperidone, lurasidone, paliperidone and ziprasidone). Among the 8 atypical antipsychotics, clozapine and quetiapine performed widest spectrum of seizures related events with 15 PTs associated with seuzures, followed by olanzapine (N = 11) and aripiprazole (N = 9). In this estimation about every drug, the largest effect size was observed for “alcoholic seizure” with clozapine (ROR=19.94, ROR025=7.13; IC=0.38, IC025=-1.39), “convulsive threshold lowered” with quetiapine (ROR=12.74, ROR025=8.26 2; IC=0.31, IC025=-0.41), “convulsion neonatal” with olanzapin (ROR=9.26, ROR025=5.71; IC=0.35, IC025=-0.47), “convulsive threshold lowered” with aripiprazole (ROR=7.52, ROR025=3.87; IC=0.41, IC025=-0.73), “convulsive threshold lowered” with ziprasidone (ROR=18.47, ROR025=6.88; IC=0.38, IC025=-1.39), “hyponatraemic seizure” with risperidone (ROR=8.21, ROR025=3.64; IC=0.42, IC025=-0.99), “seizure like phenomena” with lurasidone (ROR=10.22, ROR025=5.30; IC=0.36, IC025=-0.78), and “atonic seizures” with paliperidone (ROR=6.36, ROR025=2.63; IC=0.48, IC025=-1.08).

Conclusion The atypical antipsychotics may increase the risk of seizures in varying degrees, findings of this study warrants further pharmacovigilance data and clinical causality assessment.

Using A New Algorithm for Diagnosing Major Depression Based on Multidimensional Clinical Indicators

蒋超楠 黄满丽*
浙江大学医学院附属第一医院

Objective Major depressive disorder (MDD) is a prevalent mental illness that significantly impairs physical and psychosocial functioning. Accurate diagnosis is crucial for early treatment of MDD. Recent research suggests that machine learning (ML) can successfully classify individuals by detecting and monitoring biomarkers. However, most current diagnostic models for depression use only single-dimensional data. Therefore, a new deep learning algorithm based on multidimensional clinical indicators was developed to diagnose MDD.

Methods In this study, we recruited 100 patients with MDD and 100 healthy individuals. Depressive symptoms were assessed using the Hamilton Depression Rating Scale 17. We measured plasma levels of interleukin-6, interleukin-1β, tumor necrosis factor-α, mature brain-derived neurotrophic factor, tissue plasminogen activator, precursor of brain-derived neurotrophic factor, Tyrosine Kinase receptor B, and hypocretin-1. Among them, 95 participants (46 patients and 49 age-gender matched healthy controls) underwent MRI scans. We analyzed correlations between the indicators to determine variables significantly related to depressive symptoms, plasma cytokine levels, and gray matter volume. To further objectively differentiate depressed patients from healthy controls, we used these biological indicators as features to develop a novel method based on Graph Convolution Network. We then compared this method to 9 traditional machine learning approaches, We reported the results of 3-fold cross-validation during the classification process. To prevent overfitting, we designed a data augmentation strategy that added Gaussian noise during the training and testing procedures.

Results By combining the plasma cytokine levels and neuroimaging indicators, our model achieved an accuracy and F1 score of 91.36% and 92.43%, respectively, which were 2.47% and 1.67% higher than those of the random forest method without data augmentation. After data augmentation, the accuracy and F1 score reached 95.06% and 95.43%, respectively.

Conclusion This study is the first to develop a new model that utilizes non-traditional machine learning algorithms to integrate plasma cytokine levels and neuroimaging indicators for distinguishing between MDD and HC. Compared to a combination of single-dimensional multi-indicators, the multi-dimensional multi-indicator approach used in our model demonstrated higher accuracy in distinguishing MDD patients from HC subjects. Therefore, attributes of different natures can be utilized to improve the diagnostic performance of the model.

Gut Bacteroides in Common Psychiatric Disorders

Zhiyu Li Jian Yang*
The National Clinical Research Center for Mental Disorders & Beijing Key Laboratory of Mental Disorders, Beijing Anding Hospital, Capital Medical University, Beijing, 100088, China.

Objective To review the role of Bacteroides in common psychiatric disorders and their related mechanism mediated by microbiota-gut-brain (MGB) axis.

Methods The literature yielded a total of 242 articles regarding the role of Bacteroides in psychiatric diseases covering the period 2013 to 2023 by database search.

Results A significant elevation of Bacteroides level was found in major depressive disorder (MDD) patient compared with healthy controls (HCs). Bacteroides were also targeted for antidepressant regulation, such as sertraline and fluoxetine. A latest study has found that Bacteroides fragilis, Bacteroides uniformis and Bacteroides caccae could induce depressive-like symptoms in antibiotic-treated mice, but Bacteroides ovatus not. Evidence indicated that the level of Bacteroides increased significantly in bipolar disorder (BD) patients. At the specie level, an elevation of Bacteroides barnesiae and Bacteroides togonis, and a reduction of Bacteroides helcogenes were observed in BD patients compared with HCs. Some schizophrenia (SCZ)-focused clinical trials revealed a lower Bacteroides level in patients relative to HCs. Bacteroides were proved to be lower in SCZ patients with aggression and correlated negatively with aggressive behaviors. A relatively higher level of Bacteroides has been reported in the autism spectrum disorder (ASD) children. At the specie level, a significant increase was observed in the level of Bacteroides plebeius, Bacteroides intestinalis and Bacteroides faecis, while the level of Bacteroides fragilis, Bacteroides caccae, Bacteroides intestinihominis, Bacteroides ovatus, Bacteroides stercoris and Bacteroides dorei decreased in children with ASD compared to the controls. Inserra et al. found Bacteroides were higher in animals with decreased anxiety-like behavior.Bacteroides uniformis CECT 7771, Bacteroides thetaiotaomicron and Bacteroides fragilis were proved to ameliorate anxiety?like behavior in mice. Based on the strong correlation between Bacteroides and psychiatric disorders, we describe possible mechanisms by which Bacteroides mediates the regulation of psychiatric disorders. These mechanisms rely mainly on the MGB axis including neurotransmitters (GABA and 5-HT) and microbiota-derived metabolites (SCFAs metabolism and tryptophan metabolism). Currently, the mechanism of Bacteroides in psychiatric disorders has limited to the results of correlation analysis. Thus, it is mandatory to conduct in vivo and in vitro experiments to clarify the action mechanisms of Bacteroides in psychiatric disorders.

Conclusion This review raises important issues regarding the role that Bacteroides play in common psychiatric disorders, which can be used as diagnostic markers or therapeutic targets for psychiatric disorders in the future.

长程间歇性 θ 脉冲刺激模式治疗重性抑郁障碍

快感缺失的疗效分析及脑电机制研究

张睿彧 杨军 张克让 杨春霞 孙宁*
山西医科大学第一医院

目的 快感缺失是重性抑郁障碍（MDD）的核心症状之一，也是疗效差的预测因子，在充分药物及心理治疗后仍有部分患者有残留，寻找有效的治疗方法十分必要。经颅磁刺激可直接作用于奖赏环路调节神经兴奋性以改善快感缺失症状。本研究探讨长程间歇性θ脉冲刺激模式（piTBS）干预 MDD 快感缺失的疗效，并对其脑电机制进行初步探索。

方法 本研究将患者分为联合干预组（A 组）和药物组（B 组），A 组给予 piTBS 治疗和药物治疗（SSRIs），B 组仅给予药物治疗（SSRIs），在治疗前、2 周、4 周、8 周分别进行 HAMD-24 项量表、SHAPS 量表、YMRS 量表评估，在治疗前和 8 周采集静息态脑电数据。

结果 1.疗效研究结果：①2 周及 4 周时两组间治疗有效率有显著差异（2 周：A 组 52%，B 组 24%，P=0.039＜0.05，4 周：A 组 74%，B 组 44%，P=0.027＜0.05）。②2 周及 4 周时两组间 SHAPS 量表减分率有显著差异（2 周：A 组 25.41±16.37，B 组 14.00±22.90，P=0.043＜0.05；4 周：A 组 35.97±15.17，B 组 24.14±25.73，P=0.047＜0.05）。③两组在各评估节点的 YMRS 总分均＜5 分，研究期间没有患者出现躁狂/轻躁狂症状增加。2.脑电功率谱结果：①A 组治疗前后存在差异的电极点有：δ 频段：C3、CP3、F4、CP2、PO4；θ 频段：C3、CP3、AF8、CP2；α 频段：F3、C3、C5、CP2；β 频段：F4；γ 频段：F4、P6。②B 组治疗前后 δ 频段在 F1、FC1、Fz、FCz 电极点存在差异。③两组患者 8 周脑电功率谱对比发现存在差异的电极点有：δ 频段：AF7、AF8、Fz、F1、F7、F8、FCz、FC1、FT7、C6、T7、T8、TP8；θ 频段：AF7、AF8、Fz、F7、FC1、FT7；α 频段：AF7、F7、F8、FCz、FC1、FT7、C6、T7、P5、P6；β 频段：AF7、F7、FC1、FC6、FT7、C6、T7；γ 频段：FT7、CP3。

结论 1.piTBS 模式联合药物干预抗抑郁治疗效果明显，且可以快速改善抑郁障碍快感缺失症状。2.piTBS 模式主要通过改变患者前额叶、左侧额叶、右侧顶叶及右侧枕叶的活动来改善抑郁症状及快感缺失症状。

难治性精神分裂症的皮层厚度及个体化结构协变网络研究

王俊 唐劲松*
浙江大学医学院附属邵逸夫医院

目的 难治性精神分裂症（Treatment resistant schizophrenia，TRS）对药物治疗效果不佳，具有沉重的疾病负担。既往研究已经发现了精神分裂症表现出了以额颞叶为主的灰质形态学改变，然而关于 TRS 形态学属性的特异性变化仍不清楚。另一方面，基于组水平的结构脑网络研究被广泛应用于探究精神分裂症患者的脑网络属性改变，而基于个体水平探究 TRS 脑网络属性的研究还未存在。因此本研究采用形态学分析和个体化结构协变网络方法，探究 TRS 皮层厚度及结构协变网络属性的改变。

方法 （1）本研究采集了 52 例难治性精神分裂症、34 例精神分裂症治疗有效者（Treatment Responder, TR）以及 84 例健康对照（Healthy control, HC）的 3D T1 结构加权像。我们通过 FreeSurfer 软件测量了 68 个皮层区域的皮层厚度。使用一般线性模型比较三组间皮层厚度的差异。（2）基于皮层厚度，构建个体化脑结构协变网络，基于图论分析，采用方差分析比较三组人群结构协变网络全局及局部属性的差异。（3）采用相关分析方法，在 TRS 患者中，探索其临床特征与其特异性改变的形态及拓扑学指标之间的关系。

结果 （1）形态学研究显示：在皮层厚度方面：与 HC 组相比，TRS 组与 TR 组均表现出以额颞叶为主的皮层厚度下降，其中 TRS 组（53/68）较 TR 组（22/68）皮层厚度下降更为广泛（P＜0.05, FDR 校正）。与 HC 和 TR 组分别相比，TRS 组的双侧梭状回、双侧脑岛、左侧颞中回、左额下回岛盖部及右后扣带回的皮层厚度的显著降低（P<0.05, FDR 校正）；其中 TR 的左侧颞中回皮层厚度也显著低于 HC（P<0.05, FDR 校正）。（2）结构协变网络研究显示：与 HC 组比，TRS 组具有更低的聚类系数及局部效率，其中，男性较女性患者具有更低的聚类系数及局部效率。（3）相关分析显示：在 TRS 组中，患者左侧颞中回的皮层厚度与 PANSS 总分呈负相关（r=-0.328，uncorrected P=0.017）。

结论 TRS 患者较 TR 患者表现出更广泛的灰质损害，尤其以额颞叶为主；同时 TRS 患者存在特异性区域的皮层厚度减少，分别位于梭状回、脑岛、左额下回岛盖部、左侧颞中回及及右后扣带回。TRS 患者具有更低的聚类，局部效率。表明 TRS 患者可能存在大脑局部处理信息能力的下降。

The Differences of Neuroendocrine Abnormalities between Major Depressive Disorder and Bipolar Disorder in Adolescents and Adults

尹捷 张剑昭 贾艳滨*
暨南大学附属第一医院(广州华侨医院)

Objective While patients with major depression disorder (MDD) and bipolar disorder (BD) often exhibit neuroendocrine abnormal alterations, there is a lack of studies directly comparing the neuroendocrine differences between MDD and BD patients in different age groups. The study aims to examine the relationship of neuroendo-

crine pathways with mood disorders by comparing the differences in measures of neuroendocrine function between untreated first consultation patients with MDD and BD in adolescents and adults.

Methods A sample of 280 MDD and 187 BD was recruited, which was divided into MDD adolescents, BD adolescents, MDD adults and BD adults according to age. Adrenocorticotropic hormone(ACTH), cortisol(COR), testosterone(T) and prolactin (PRL) were measured for all patients. Analysis of covariance (ANCOVA) was used to assess the differences of neuroendocrine abnormalities between MDD and BD groups, and the occurrences of abnormal hormone secretion in MDD and BD groups were compared by chi-square test. Spearman correlation analysis was used to analyze the correlation between all hormone indicators, total scores of HAMD, total scores of HAMA and total scores of YMRS.

Results ANCOVA showed that serum levels of COR(F=7.999, p=0.005) and T(F=5.719, p=0.018) were higher in adolescent patients with MDD than in adolescent patients with BD, and serum level of ACTH(F=4.552, P=0.034) was higher in adult patients with MDD than in adults patients with BD. X2 tests demonstrated that the incidences of increased COR(X2=4.804, p=0.028) and T(X2=5.957, p=0.015) were significantly higher in MDD adolescents than in BD adolescents. Spearman correlation analysis showed that T was negatively and significantly correlated with the HAMD total score both in MDD adolescents and BD adolescents.

Conclusion Our findings indicated that the dysfunction of neuroendocrine Hypothalamic–Pituitary–Adrenal (HPA) axis differs between MDD and BD patients in both adolescent and adult groups. And T could be used as markers for severity and symptoms of adolescent patients with MDD.

斯皮诺素通过调节 HPA 轴拮抗慢性束缚应激大鼠焦虑行为

吴桐 李成冲*
齐齐哈尔医学院精神卫生学院

目的 慢性压力应激会导致广泛性焦虑。斯皮诺素是酸枣仁中黄酮类主要成分，具有镇静催眠、抗焦虑作用。本研究旨在探讨斯皮诺素对慢性束缚应激大鼠焦虑行为的拮抗作用及其机制

方法 50 只 SD 大鼠随机分为空白组、模型组、斯皮诺素高、低剂量组(15 mg/kg/d)、(5 mg/kg/d）和阳性对照组(Dzp)（3.6 mg/kg/d）,除空白组外，其余各组大鼠采用慢性束缚应激复制焦虑模型，每天束缚 3h，连续 21 d。从第 11 天开始，每天束缚结束后 0.5 h，空白组和模型组灌胃给予蒸馏水，给药组灌胃给予相应药物，连续 10d。通过高架十字迷宫实验和旷场实验观察大鼠行为学的变化。采用 ELISA 检测血浆皮质酮（CORT）水平，以及终纹床核（BNST）和下丘脑两个脑区谷氨酸/γ-氨基丁酸（Glu/GABA）、去甲肾上腺素(NE)和促肾上腺皮质激素释放激素（CRF）水平。采用 qPCR 及 Western blot 测定 BNST 和下丘脑匀浆中糖皮质激素受体 GR 及 cAMP 应答元件结合蛋白（CREB）表达水平

结果 行为学结果显示，相较于 Con 组，Mol 组在旷场中央区的活动距离、滞留时间（P＜0.001）及在高架十字迷宫中开臂进入次数百分比、滞留时间百分比（P ＜ 0.05）均显著降低，SPI 给药能显着增加旷场中央区的活动距离和滞留时间（P =0.024）及在高架十字迷宫中开臂进入次数百分比（P＜0.05）和滞留时间百分比。Elisa 结果显示，Mol 组相较于 Con 组，血浆 CORT 显着上升,（P=0.019），而 SPI 给药能有效抑制 CORT 升高(PSPI-L=0.032, PSPI-H=0.005)。Mol 组 BNST 区 Glu/GABA 比例升高(P=0.014)，BNST 区和下丘脑区 NE 水平升高，SPI 给药能显著降低 Glu/GABA 比例及 NE 和 CRF 水平，且呈剂量依赖趋势。qPCR 和 western blot 显示，慢性束缚能增加 BNST 区和下丘脑区 GR 基因表达水平和 GR、CREB 磷酸化水平，而 SPI 给药能抑制因束缚所致 GR 表达的增加和 GR 和 CREB 磷酸化水平。

结论 Spi 可改善慢性束缚应激所致大鼠焦虑症，其作用机制可能与调控 HPA 轴表达，降低大脑终纹床核和下丘脑的 GR 表达，继而抑制血浆中 CORT 浓度升高有关，同时，Spi 对 HPA 的调控作用可能通过 GR-CREB 信号传导通路所介导。

未服药强迫症患者脑区表面积增大与动态功能改变

丁志鹏 丁振宁 杨旭 齐家乐 秦晓青 李成冲*
齐齐哈尔医学院精神卫生学院

目的 根据以往的研究，已经发现强迫症患者的大脑区域存在结构和功能上的异常。然而，对于未经药物治疗的强迫症患者来说，关于大脑区域结构变化与静息状态下动态功能连接（dFC）变化之间的关联，仍存在不确定性。

方法 对 48 例未接受药物治疗的强迫症患者和 39 例健康对照组进行了 T1 加权磁共振成像和静息状态功能磁共振成像。研究的主要目标是比较强迫症患者和健康对照组在皮层面积方面的差异。随后，以皮层面积异常的脑区作为种子进行 dFC 分析，并使用偏相关分析探索强迫症患者的皮层面积和 dFC 变化与临床信息之间的关系。最后，应用逻辑斯蒂回归分析检测是否可以使用多模态成像数据的变化来区分强迫症患者和健康对照组

结果 强迫症的人在左侧背侧视觉流区和左侧楔前叶视觉区的表面积有所扩大，而与右侧岛叶中部的 dFC 在左侧背侧视觉流区有所降低，同样，左侧楔前叶视觉区与右侧颞顶枕交界区 1 的 dFC 也有所降低。皮层表面积和 dFC 值的变化都能用来区分强迫症患者

和健康对照组，这种区分的准确性为0.9，敏感性为0.91，特异性为 0.87

结论 在静息状态下，左侧背侧视觉流区和左侧楔前叶视觉区皮层表面积的扩大以及动态功能连接的变化，可能构成了强迫症病理生理过程的一个重要部分

关键字：强迫症 磁共振成像

Attention Avoidance To Alcohol-related Stimuli in Alcohol-dependent Patients with A Treatment Period of 3–5 Years: Evidence From ERP

李成冲[1] 丛威亮[2] 于增艳[1]
1.齐齐哈尔医学院
2.齐齐哈尔医学院附属第三医院

Objective Alcohol dependence symbol (ADS) refers to a recurrent, chronic encephalopathy caused by prolonged, high-dose alcohol abuse that leads to central nervous system intoxication, characterized by mental and physical dependence on alcohol. The clinical manifestations include compulsive drinking experiences, increased tolerance to alcohol, and withdrawal syndrome after stopping drinking, including tremors, transient hallucinations, and seizures, which seriously affect patients' The clinical manifestations include compulsive drinking experiences, increased tolerance to alcohol, and withdrawal syndrome after stopping drinking, including tremors, transient hallucinations, and seizures, which seriously affect patients' ability to learn and live. This study aimed to examine the attentional bias for alcohol-related stimuli of the patients.

Methods The cue-target paradigm was used to examine the attentional bias towards alcohol-related stimuli and neutral stimuli in patients with a treatment period of 3–5 years. In the cue-target, alcohol-related stimuli refer to a glass filled with alcohol, while neutral stimuli refer to an empty glass. During the experiment, the EEG of patients would be recorded. The early PD (80–150 ms), PD (150–250 ms) and the CDAP (400–750 ms) were adopted to reflect the patient's neural activity.

Results For behavioral results, compared to reaction time (RT) for consistent conditions of the cue-target (471 ms), the RT was significant shorter for inconsistent conditions of the cue-targe (439 ms) [t (8) = 3.684, p = .006, d = 2.604]. The ERP results as follows, for early PD time window, alcohol-related stimuli induced a more positive ERP wave amplitude on the contralateral (.055 μV) side than on the ipsilateral side (-1.098 μV) [t (8) = 3.234, p = .012, d = 2.287]; For PD time window, alcohol-related stimuli also induced a more positive ERP wave amplitude on the contralateral (.132 μV) side than on the ipsilateral side (-.964 μV) [t (8) = 3.398, p = .009, d = 2.402]; For CDAP time window, The same pattern was be found, -.6 for contralateral side and -1.53 for ipsilateral side, respectively [t (8) = 2.389, p = .044, d = 1.689].

Conclusion These results suggest that patients with treatment period of 3–5 years showed attentional avoidance of alcohol-related stimuli in the early stage of attention. Patients actively and consistently suppressed alcohol-related stimuli.

Personality Traits As Predictors for Treatment Response of Selective Serotonin Reuptake Inhibitors Among Unmedicated Obsessive-Compulsive Disorder： A 12-weeks Retrospective Longitudinal Study

张剑昭[1] 王振[2] 贾艳滨[1]
1.暨南大学附属第一医院精神科
2.上海交通大学医学院附属精神卫生中心

Objective As first-line treatment for obsessive-compulsive disorder (OCD), selective serotonin reuptake inhibitors (SSRIs) have yet to achieve a satisfactory therapeutic effect. Even after standard treatment with SSRIs, there are still 40%~60% of OCD patients having residual chronic symptoms. Recent studies have shown that personality traits could be the potential source of the heterogeneity in the OCD treatment outcomes. Therefore, we further investigated the predictive effect of personality traits for the response to SSRIs among OCD patients.

Methods A total 61 unmedicated OCD patients and 35 healthy controls (HC) were enrolled in this 12-weeks retrospectively study. The personality traits were assessed at baseline using Eysenck Personality Questionnaire (EPQ) in the both two groups. The scores of Yale-Brown Obsessive Compulsive Scale (Y-BOCS) were used to evaluated the severity of OCD symptoms in the 0, 2, 4, 8 and 12 week of monotherapy with SSRIs, respectively. The treatment responses were set as the primary outcomes according to the reduction rate of Y-BOCS (response: ≥25%; marked response: ≥50%).

Results Compared with HC, OCD individuals showed significantly higher scores of Neuroticism trait. Correlation analyses revealed the association between Psychoticism traits and disease duration. It was also found that disease duration and family history were closely related to obsessive thoughts and total score of Y-BOCS. Results from 12-weeks follow-up suggested that 80.33% OCD patients represented a response to SSRIs treatment, while only 44.26% OCD patients showed a marked response. Subsequent multivariate Cox proportional analyses indicated that both Neuroticism and Extraversion traits could predict a response (slight improvement) to SSRIs, and only Extraversion trait heralded a marked response (dramatic improvement).

Conclusion Our study found that Neuroticism and Extraversion traits could affect the response of OCD patients to monotherapy of SSRIs to various degrees. The finding of the present study indicated that personality traits may develop the susceptibility of OCD and could also predicated the outcomes of SSRIs treatment.

伴忧郁特征未服药抑郁症患者的结构影像学及分子特征

袁丽锦[1] 储召松[1] 陈娴俞[1] 和梦馨[1] 鲁毅[3] 许秀峰[1,2] 沈宗霖[1,2]
1.昆明医科大学第一附属医院精神科
2.云南省精神疾病临床研究中心
3.昆明医科大学第一附属医院影像科

目的 忧郁型抑郁症是重度抑郁症中常见亚型。忧郁型抑郁症很难治疗，因为其背后的神经生物学基础我们知之甚少。因此，本研究将基于体素的形态测量分析与神经递质系统衍生图谱信息相结合，探索忧郁型抑郁症患者是否存在灰质的结构变化以及这些变化背后的分子基础。

方法 招募 137 名未服药重度抑郁症患者和 75 名健康对照者进行结构性磁共振成像，并采用基于体素的形态测量分析对成像结果进行了分析。然后根据蒙哥马利-艾斯伯格抑郁评定量表和汉密尔顿抑郁评定量表上的得分，将患者分为忧郁型抑郁症和非忧郁型抑郁症两个亚组。接下来，分析组间灰质体积变化与神经递质受体或转运体密度分布之间的空间相关性。

结果 与健康对照者相比，非忧郁型抑郁症患者的双侧海马、双侧丘脑、右侧杏仁核和右侧后扣带回/楔前叶的灰质体积方面显著减小。与非忧郁型抑郁症患者相比，忧郁型抑郁症患者的双侧后扣带回/楔前叶和外侧枕叶皮层的灰质体积显著减小。非忧郁型抑郁症患者和健康对照者之间的灰质体积无显著差异。其中，左外侧枕叶皮层、右外侧枕叶皮层和双侧后扣带回/楔前叶的灰质体积与疾病的严重程度没有关系。此外，与健康对照者相比，由忧郁型抑郁症导致的灰质体积的变化在空间上与 5-羟色胺转运体、大麻素受体和 μ-阿片受体有关。与非抑郁型抑郁症患者相比，忧郁型抑郁症导致的灰质体积的变化在空间上与囊泡乙酰胆碱转运体有关。

结论 本研究发现抑郁症亚型患者的大脑灰质体积有异常改变，此外，还发现了一系列的神经递质受体可能与这些改变有关。本研究结果可能提供了对抑郁症亚型结构异常的分子机制的更全面的理解，并有可能为开发新的治疗策略提供新线索。

Carbamazepine Induced Adverse Drug Reactions: A Simple, Economical Detection To Identify Patients Carrying The HLA-B*15:02 Allele Using PCR-RFLP Method

周旋*
合肥市精神病医院

Objective HLA-B*15:02 allele is strongly associated with Carbamazepine-induced SJS/TEN in subjects of Han Chinese. In this study, we developed a novel PCR-RFLP approach to detect the HLA-B*15:02 mutation in high effectiveness.

Methods rs2844682 and rs3909184 have been previously suggested as tag SNVs for HLA-B*15:02. For rs3909184, A 1221bp fragment was amplified by PCR, digested with Pml I restriction endonuclease and separated by 2.5% agarose gel electrophoresis for PCR-RFLP analysis. For rs2844682, we constructed the EcoR I restriction site by site-directed mutagenesis using overlapping PCR and amplified a 1077bp fragment, then digested with EcoR I restriction endonuclease and separated by 2.5% agarose gel electrophoresis for PCR-RFLP analysis.

Results It was verified by pyrosequencing that HLA-B*15:02 genotype could be detected by PCR-RFLP method, and the process was simple, accurate and economical.

Conclusion We developed a sensitive, simple and economical approach to detect HLA-B*15:02 genotype, and can be the preferred new method when genotyping another SNP site.

关键字：Carbamazepine, PCR-RFLP, overlapping PCR, site-directed mutagenesis, HLA-B*15:02, single nucleotide polymorphism

负性生活事件对儿童青少年抑郁症患者 AHR 甲基化水平和抑郁严重程度的影响

周盈 傅一笑*
重庆医科大学

目的 抑郁症是常见的精神疾病之一，是全球残疾的主要原因，其病因复杂，遗传和环境在发病过程中起重要作用。越来越多的研究集中于抑郁症的表观遗传学机制，其中 DNA 甲基化是最常见的表观遗传修饰。儿童青少年抑郁症病程比成人更长，首发年龄更小，复发率及自杀风险更高。本课题组前期已在儿少抑郁症患者与正常对照组间发现 AHR 甲基化水平存在差异，因此本研究拟进一步探讨儿少抑郁症的环境因素与 AHR 甲基化、抑郁严重程度的相关性，旨在从表观遗传学解释儿少抑郁症的发病机制。

方法 于重庆医科大学附属第一医院精神科门诊纳入 10-19 岁诊断为首发重性抑郁障碍的患者 36 例，详细评估入组者贝克抑郁量表，青少年生活事件量表，采集静脉血。对外周血 AHR DNA 甲基化水平、青少年生活事件量表、贝克抑郁量表、进行偏相关分析，评估 AHR DNA 甲基化是否与青少年生活事件和抑郁严重程度之间存在显著关联。

结果 青少年生活事件量表与 AHR_13、AHR_14 甲基化水平存在相关性，控制了体重、年龄、身高、性别等混杂因素过后，人际关系、学习压力与 AHR DNA

甲基化无显著相关性（p＞0.05）；受惩罚和 AHR_13_214 甲基化水平正相关（p＜0.05，r=0.390）；丧失和 AHR_13_61 甲基化水平负相关（p＜0.05，r=0.-0.409），和 AHR_14_101 甲基化水平正相关（p＜0.05，r=0.0.377）；健康适应和 AHR_13_90 甲基化水平正相关（p＜0.05，r=0.520）；其他和 AHR_13_90 正相关（p＜0.05，r=0.402），和 AHR_13_214 正相关（p＜0.05，r=0.390），和 AHR_14_197 负相关（p＜0.05，r=-0.368）。贝克抑郁量表得分与人际关系（p＜0.05，r=0.628）、学习压力（p＜0.05，r=0.572）、受惩罚（p＜0.05，r=0.688）、丧失（p＜0.05，r=0.371）、健康适应（p＜0.05，r=0.625）、其他（p＜0.05，r=0.764）均正相关；与 AHR 甲基化水平无显著相关性（p＞0.05）。

结论 青少年抑郁症严重程度与负性生活事件密切相关，提示负性生活事件可能为抑郁症发病的关键因素。且负性生活事件与 AHR 部分位点甲基化水平相关，说明环境因素可能通过影响 AHR 甲基化位点介导青少年抑郁症的发生。

关键字：DNA 甲基化，抑郁症，儿童青少年，负性生活事件

自我关怀在父母教养方式与青少年抑郁发生中的中介效应研究

周盈 王文靖 傅一笑*
重庆医科大学

目的 了解青少年抑郁症患者父母教养方式、自我关怀水平和抑郁水平的现状，分析其在性别、年级、居住地等因素上的差异；探讨青少年抑郁症患者父母教养方式、自我关怀和抑郁之间的关系，验证自我关怀的中介作用。

方法 纳入符合精神障碍诊断与统计手册第 5 版（DSM-5）抑郁症诊断标准的门诊及住院的青少年抑郁症患者 282 例，性别、年龄、年级、居住地、独生情况相匹配的正常对照 200 例。采用贝克抑郁自评量表（BDI）、父母教养方式量表（EMBU）和自我关怀量表（SCS）进行测量。

结果 （1）病例组和对照组在贝克抑郁得分、自我关怀各维度及自我关怀总分存在显著差异（t=-11.725~16.586，P＜0.05）；病例组和对照组除父母亲偏爱被试因子外，在父母教养方式其余各因子得分存在显著差异（t=-6.877~9.562，P＜0.05）。（2）不同性别青少年抑郁症患者贝克抑郁得分、自我关怀总分及自我友善、自我批判维度得分存在显著差异(t=-2.981~2.331，P<0.05)。（3）青少年抑郁症患者的父母教养方式各因子得分均与贝克抑郁得分显著相关（r=-0.470~0.382，P<0.05），其自我关怀总分和自我关怀各维度得分均与贝克抑郁得分显著相关（r=-0.569~0..586，P<0.05）。（4）父亲情感温暖、理解能够显著的负向预测贝克抑郁得分（β=-0.356，P<0.05），父亲惩罚、严厉和母亲惩罚、严厉能够显著的正向预测贝克抑郁得分（β=0.182，P<0.05；β=0.157，P<0.05）；自我关怀总分能显著的负向预测贝克抑郁得分（β=-0.569，P<0.05）。（5）自我关怀在父亲情感温暖、理解因子（F1）和贝克抑郁评分之间存在部分中介作用，中介效应占总效应的 20.00%；自我关怀在父亲惩罚、严厉因子（F2）和抑郁评分之间存在部分中介作用，中介效应占总效应的 32.92%；自我关怀在母亲惩罚、严厉因子（M4）和抑郁评分之间存在部分中介作用，中介效应占总效应的 40.88%。

结论 青少年抑郁症患者的父母教养方式和自我关怀对抑郁有重要影响，父母教养方式可以通过影响青少年抑郁症患者的自我关怀水平来影响抑郁水平。鼓励父母采用积极恰当的教养方式，有助于培养青少年更多的自我关怀，降低青少年抑郁症患者的抑郁情绪。

关键字：青少年，抑郁症，父母教养方式，自我关怀

Building A Novel Self-iterative Clinical Pharmacist Intervention Model in Psychiatric Hospital: Application and Evaluation

吴剑虹 沈远*
江南大学附属精神卫生中心

Objective Clinical pharmacist intervention (CPI) in psychiatric hospital has not been popularized in China. This study aimed to construct a real-time dynamic self-iterative CPI model in The Affiliated Mental Health Center of Jiangnan University and evaluate its effect.

Methods We focused on the running data in 2021 and 2022. The number of interventions, intervention types and intervention strategies after the model were evaluated.

Results In 2021 and 2022, a total of 443 cases were reported and among them, 271 CPI cases were identified during ward rounds by physicians, pharmacists and nurses (61.17%). The proportion of CPI through ward rounds and information system gradually decreased while intervention through other ways increased. Meanwhile, there are various of CPI types including adverse reactions (26.86 %), blood concentration (13.32%), drug usage and dosage (10.61%) and among them, adverse reactions are the focus of pharmacists' attention. Besides, the intervention strategies of pharmacists mainly concentrated in medication change (18.74 %), medication discontinuation (15.58 %) and dose reduction (12.19 %). New pharmaceutical technologies such as therapeutic drug monitoring and drug gene detection help pharmacists accelerate CPI time and increase the credibility of medication recommendations. In addition, self-iteration mechanism can continuously optimize the model operation.

Conclusion Overall, the CPI model established in this study effectively promote pharmacist intervention and accelerate pharmaceutical transformation.

关键字：clinical pharmacist intervention model, psychiatric hospital, drug gene detection, self-iteration

基于机器学习分类算法的拉莫三嗪血清稳态浓度达标预测

郭徵豪 张孜 尚德为*
广州医科大学附属脑科医院

目的 本研究通过应用 4 种机器学习算法（XGBoost、LightGBM、Catboost、随机森林），以癫痫患者的人口统计学资料和用药方案为基础，建立 LTG 血药浓度达标预测模型，协助临床判断不同患者 LTG 稳态浓度能否达到治疗窗，为临床个体化给药方案的制定提供一定的参考。

方法 通过病历系统和检验系统收集患者的临床资料、合并用药情况和拉莫三嗪血药浓度数据，使用 Juypter notebook 对数据进行预处理。采用 KNN 算法对缺失值进行插补，对连续型变量进行归一化处理，分类型变量进行独热编码。以 AGNP 共识指南中拉莫三嗪治疗窗作为达标标准。将数据集按 7：3 随机分为训练集和测试集，分别用于模型建立和模型验证。以五折交叉验证法减少模型过拟合，贝叶斯优化算法调整参数得到最佳模型。采用混淆矩阵图、准确性、精确率、召回率、F1 值和 AUC 来评估模型的预测性能。

结果 总共收集到277例符合标准的患者的资料，通过 XGBoost、LightGBM、Catboost、随机森林 4 种算法成功建立预测模型，4 个模型均能较好的预测拉莫三嗪稳态浓度的达标情况，准确性、精确率、召回率、F1 值和 AUC 均>0.8。其中随机森林算法的预测能力最好，准确性、精确率、召回率、F1 值和 AUC 均>0.87。

结论 本研究建立的 4 个预测模型能够较好的判断患者接受拉莫三嗪治疗后血清浓度达到治疗窗的情况，可促进临床对治疗效果的评估，为个体化用药提供参考。

CYP3A4 基因多态性对精神分裂症患者齐拉西酮血药浓度的影响

钟彩妮 曾环思* 蒋家兵 王裕锋 钟易霖 彭陈陈
深圳市康宁医院

目的 研究细胞色素 P450 酶 3A4（CYP3A4）基因多态性对精神分裂症患者齐拉西酮血药浓度的影响。

方法 纳入70例精神分裂症患者使用齐拉西酮治疗，采用聚合酶链反应-限制性内切片段长度多态性法（PCR-RFLP）测定 CYP3A4 基因分型，高效液相色谱串联质谱法（LC-MS/MS）测定齐拉西酮稳态谷浓度，单因素方差分析比较组间血药浓度的差异，多元线性回归分析协变量性别、年龄、体重、剂量、合并用药、基因分型与血药浓度的相关性。

结果 70 例患者 CYP3A4 基因 *1G 和*18B 等位基因突变频率为 25.71%和 1.43%，齐拉西酮血药浓度为（100.35± 82.66）ng·mL-1，C/D 为（1.23± 0.73）ng·mL-1·mg-1·d； 男性组与女性组、＜30 岁组与≥30 岁、单一用药组与合并用药组、CYP3A4 *18B AA 组与 AG 组，组间血药浓度和 C/D 差异无统计学意义（P> 0.05）。CYP3A4 *1G 不同基因型分组的 C/D，CC 组为（1.17±0.62）ng·mL-1·mg-1·d，CT 组为（1.12±0.69）ng·mL-1·mg-1·d，TT 组为（2.44±1.02）ng·mL-1·mg-1·d，经组内两两比较，TT 组齐拉西酮 C/D 较 CT 组高，差异有统计学意义（P< 0. 05）；多元线性回归分析调整后 R2=0.503（P< 0. 001），剂量与血药浓度存在显著正相关，CYP3A4 *1G TT 型患者的血药浓度较 CC 型患者高 35.40%（P< 0. 05）。

结论 CYP3A4 基因多态性可影响齐拉西酮血药浓度，结合基因多态性和血药浓度能更好的实现个体化用药。

关键字：齐拉西酮；CYP3A4；基因多态性；血药浓度

Multi-level Genomic Analysis of Autism Tendency in Adult

陈碧清[1] 朱子建[2]
1.江苏省中医院
2.陕西师范大学

Objective Autism is a generalized developmental disorder that originated from infancy, characterized by disorder in social communication, abnormal communication and stereotyped behavior.Autism not only happen in children, but also could be harmful in adults. Although it may not meet the clinical diagnostic criteria, people with high autism tendency are more likely to develop autism in the future. At present, autism is believed to be a polygenic genetic disease.

Methods We have enrolled 700 and 1513 healthy adult volunteers in two cohorts. Their peripheral blood were collected, withgenomic DNAextracted and detected by Illumina Zhonghua-8 gene chips. Detected SNPs were then imputed with IMPUTE2 software. Meanwhile, their autistic tendencyscores were quantified by the China Adult Autism Scale, with demographic data collected. Genome-wide association study was performed at SNP, gene and pathway levels.Meta-analysis was performed.

Results The autistic tendency ranged between 5 and 33 points, with an average of 19.2 points, conforming to a normal distribution. Gender was significantly correlated with autism tendency, so was included in the analysis as a confounding factor. SNP level association analysis found 5 and 1 SNPs achieved genome-wide significancein the two cohorts separately, but were not verified in the other cohort. Gene level analysis found one gene ANKRD16 was significant after multiple correction in the cohort of 1513 people. Gene level meta-analysis found GPD2 was significant after correction.Pathway analysis found FEEDER PATHWAY reached corrected significance.

Conclusion Since it is hard to recruit large number of autism patients for a solid GWAS, conducting genomic

analysis in healthy people with autism tendency might be an alternative with advantage of larger sample size and more potential targets for medical interference.

关键字：autism tendency, GWAS, adult, multi-level

功能异常脑区和 TPH2 甲基化相互作用与抑郁症关联研究

谈婷婷[1,2] 袁勇贵[1] 徐治[1]
1.东南大学附属中大医院
2.苏州市广济医院

目的 抑郁症 (MDD) 是全球常见的精神疾病之一。我们将探讨 rs-fMRI 结合 TPH2 基因甲基化水平之间相互作用与 MDD 发生的关联性。

方法 本研究共纳入 300 例 MDD 患者和 100 例健康对照 (HCs)，其中 101 例 MDD 和 64 例 HCs 扫描 MRI。本研究使用 MATLAB(2014a)的 RESTplus 软件分析 rs-fMRI 资料，分别使用了低频振幅（ALFF）、区域一致性（ReHo）和分数低频振幅（fALFF）探讨脑区局部自发性的神经活动，并进行功能连接（FC）的分析。分析扫描 MRI 的 MDD 患者组和 HCs 组之间的一般资料和脑区异常活动值，通过广义线性模型分析 rs-fMRI 发现的脑区异常的活动和 TPH2 甲基化水平相互作用与 MDD 发生的关联性。最后使用 R 语言进行错误发现率（FDR）多重检验校正。

结果 本研究纳入 291 例 MDD 患者和 100 例 HCs。Rs-fMRI 分析显示：在 MDD 组和 HCs 之间，右侧扣带回、右侧颞上回（STG）和左侧舌回的 ALFF 存在明显差异性（$p<0.05$）；右侧颞中回（Middle temporal gyrus, MTG）、左侧颞上回、左侧楔叶和左侧枕中回（MOG）的 ReHo 存在明显差异性（$p<0.05$）；以上述结果作为 ROIs 进一步分析 MDD 和 HCs 之间的 FC 差异性，发现左侧前扣带回与右侧扣带回的 FC、右侧 STG 与右侧颞下回（ITG）的 FC、右侧 STG 与左侧 STG、右侧 STG 与右侧额上回（SFG）的 FC 和右侧 STG 与左侧枕下回（IOG）以及右侧 MTG 与右侧 MOG 的 FC 具有差异性（$p<0.05$）；研究进一步发现 MDD 和 HCs 之间右侧 STG 的 ALFF 活动与 TPH2-5-203 甲基化、左侧舌回的 ALFF 活动与 TPH2-9-178 甲基化相互作用与 MDD 的发生存在关联性（$p=0.004$；$p=0.048$）；右侧 MTG 的 ReHo 活动水平与 TPH2-5-203 甲基化与 MDD 的发生存在关联性以及右侧 STG 与左侧 IOG 之间的功能连接与 TPH2-9-178 甲基化的相互作用与 MDD 的发生相关（$p=0.018$；$p=0.021$）。

结论 本研究表明 MDD 患者相较于 HCs，额上回、颞叶、枕中回、枕下回、舌回及楔叶的功能活动存在异常，而右侧颞上回、颞中回、左侧舌回和枕下回的功能活动与 TPH2 甲基化相互作用与 MDD 的发生存在关联，这提示着上述两者的联合有助于及早发现 MDD

关键字：抑郁症，静息态功能磁共振，DNA 甲基化，TPH2

抗抑郁药效与靶向测序基因的多基因风险评分的相关性研究

邵永琪 蔡雨凡 唐海平 徐治*
东南大学附属中大医院

目的 重性抑郁障碍（MDD）是临床上常见的一类精神障碍性疾病。目前临床上治疗 MDD 主要以药物为主，但抗抑郁疗效个体差异很大，约有 2/3 的 MDD 患者在初始抗抑郁治疗后未能达到症状缓解。近年来，全基因组关联研究已经发现了多个基因组区域的遗传变异影响抗抑郁药效的易感性。本研究旨在从抑郁症患者靶向外显子测序层面上探究靶向外显子测序基因的多基因风险评分(PRS)与抗抑郁药效的关联。

方法 本研究使用日本生物银行的东亚人 GWAS summary 数据作为 PRS 计算的 Base 集，招募 1000 名 MDD 患者，将其 1309 个基因的靶向外显子测序结果作为 PRS 计算的 target 集，利用 PLink 1.9 软件计算精神分裂症表型 PRS、抑郁症表型 PRS。以 MDD 患者治疗前和治疗后 2 周汉密尔顿抑郁症 17 项评分（HAMD-17）的减分率作为评价抗抑郁药疗效的指标。同时纳入 MDD 患者治疗前儿童期创伤、家庭环境、生活事件、社会支持、多伦多述情障碍、快感缺失、贝克自杀意念量表以评估 MDD 患者的临床症状和心理特征。采用 Spearman 相关性分析、多元线性回归统计等方法进行分析。

结果 根据 PRS 既往相关研究，选定在 0.001、0.05、0.1、0.2、0.3、0.4、0.5 七个阈值下分别计算并得到相关表型的 PRS，并利用所得到的 PRS 进行后续分析。相关性分析结果显示：0.05 阈值下的精神分裂症表型 PRS 与 HAMD-17 两周减分率呈负相关（$P<0.05$），而 7 个阈值下抑郁症表型 PRS 均与 HAMD-2 周减分率未见显著相关性（$P>0.05$）。多元逐步回归分析结果显示：纳入精神分裂症 PRS 的模型 1 中，家庭环境-知识性、生活事件-一年内负性事件值、社会支持-主观支持、0.1 阈值下精神分裂症 PRS、多伦多述情障碍-总分是 MDD 患者抗抑郁药疗效的影响因素（$P<0.05$）。纳入抑郁症 PRS 的模型 2 中，家庭环境-知识性、生活事件-一年内负性事件值、社会支持-主观支持、0.1 阈值下抑郁症 PRS、多伦多述情障碍、家庭环境-组织性是 MDD 患者抗抑郁药疗效的影响因素（$P<0.05$）。

结论 多基因风险评分可以在一定程度上反应遗传变异在抗抑郁药效差异中的易感性，0.05 阈值下的精神分裂症表型 PRS 与 HAMD-17 两周减分率存在相关性，并且 0.1 阈值下的精神分裂症或抑郁症表型 PRS、临床症状及心理特征与抗抑郁药效有关。

利用临床心理特征、遗传变量构建抗抑郁药效预测模型

蔡雨凡 邵永琪 唐海平 徐治*
东南大学附属中大医院

目的 抑郁症是一种常见的精神疾病，对患者身心健康造成了严重影响。现有的抗抑郁药物在治疗效果上存在很大差异，因此如何预测抗抑郁药物的治疗反应具有重要的临床价值。抗抑郁药效受遗传因素影响，抑郁症患者的临床和心理特征被认为是预测治疗反应的可能因素。本研究将进行靶向外显子基因测序，利用机器学习方法将基因单核苷酸多态性（SNPs）、临床特征和心理特征结合生成预测模型，提高预测抗抑郁药效的准确度，为临床治疗提供一定的参考。

方法 本研究共招募了1000名首发或未服药大于2周的抑郁症患者，接受单一抗抑郁药治疗8周。在基线期和治疗后第2、4周时采用17项汉密尔顿抑郁量表（HAMD-17）评估患者抑郁症状严重程度及其变化。观察患者4周时的治疗效果，标准为HAMD-17减分率＜50%为无效，HAMD-17减分率≥50%为有效。在基线期收集患者的一般人口学资料、临床特征（包括Beck自杀意念量表、快感缺失量表、多伦多述情障碍量表）和心理特征（社会支持量表、家庭环境量表、童年创伤经历量表，生活事件量表），基于KEGG通路数据库，围绕MDD病因假说和发病机制以及抗抑郁作用相关通路共筛选1309个候选基因，通过Illumina MiSeq平台完成测序，使用PLINK软件筛选高质量SNP，剔除缺失率大于20%、最小基因频率低于5%的SNP标记。最终纳入845名患者、65个特征变量构建数据集。将数据集划分为训练集（N=591）和测试集（N=254），对训练集做数据预处理，递归消除法筛选出59个特征，基于随机森林算法构建4周抗抑郁药效预测模型。利用网格搜索进行超参数优化，比较纳入不同特征变量组合后模型的预测效果，记录测试集的准确率、召回率和F1值等评估指标。

结果 对于接受4周抗抑郁药治疗的患者，仅纳入一般人口学资料和临床特征的疗效预测模型训练集和测试集的准确率为79.9%、54.4%，增加心理变量后模型准确率为79.9%、56.1%，增加遗传变量后模型准确率为80.4%、58%，同时纳入心理、遗传变量后模型准确率为99.7%、76.8%。

结论 通过对比不同特征变量组合下模型的预测性能，发现将遗传因素、心理特征和临床特征组合起来能够进一步提高模型的预测能力，为临床用药决策的制定提供了一定的参考价值。

辅助分子伴侣 FKBP51 对糖皮质激素受体的调节及其与抑郁症的关系

余思烨 王高华*
武汉大学人民医院

目的 据世界卫生组织统计，全球约有3.5亿抑郁症患者，预计到2030年，抑郁症将上升至世界疾病负担首位[1]。多年以来，人们不断探索抑郁症的病因和发病机制，但直到现在仍未完全阐明。在抑郁症的众多发病机制中，神经内分泌失调是一个重要因素，而糖皮质激素受体（glucocorticoid receptor , GR）的研究较为深入，故本篇摘要将探讨辅助分子伴侣FKBP51对GR活性的影响及其与抑郁症的关系，以期为抑郁症的防治提供新线索

方法 计算机检索Pubmed、中国知网、Embase、万方数据库中发表的关于FKBP51和GR及其与抑郁症的相关研究，检索时限为2017年1月1日到2022年12月31日。中文主题检索词为“抑郁症”、“糖皮质激素”，英文主题检索词为（“FKBP5/FKBP51”）、（“glucocorticoid receptor/GR”）、（“depressi*”）。Pubmed检索策略：((depressi*) AND (FKBP5 OR FKBP51)) AND (GR OR glucocorticoid receptor) AND (2017:2022[pdat])

结果 正常情况下当机体出现应激反应时，自主神经系统和HPA轴将被激活，GR通过负反馈调节抑制亢进的HPA轴，使其恢复到正常水平，辅助分子伴侣FKBP51在这一过程中将协助GR进行核转位，故FKBP51表达量的高低将影响GR的信号转导过程，进而对机体的应激反应产生影响。随着时代的发展，人们发现FKBP5基因的单核苷酸多态性与FKBP51的表达水平、抑郁症发病风险以及机体对抗抑郁药物的反应有关。近些年来，研究人员们发现除了环境因素和FKBP5的单核苷酸多态性以外，表观遗传改变与二者一起增加抑郁症的易感性。目前众多研究显示慢性应激可致FKBP5甲基化程度降低，而DNA甲基化程度又与FKBP51的表达呈负相关，当FKBP51表达失衡时，GR信号转导过程将发生改变，最终将导致HPA轴持续性功能失调，抑郁症易感性增加

结论 综上所述，辅助分子伴侣FKBP51通过在GR的信号转导过程中发挥重要作用进而与抑郁症密切相关。随着人们对GR和FKBP51研究的不断深入，相信在不久的将来选择性FKBP51抑制剂将在抑郁症治疗中大放异彩

关键字：辅助分子伴侣、FKBP51、糖皮质激素受体、抑郁症

The Effects of Gender, Age, Dose Regimen and Co-medication on Amisulpride Serum Concentration Based on Therapeutic Drug Monitoring

王裕锋 蒋家兵 曾环思 彭陈陈*
深圳市康宁医院

Objective This study aims to illuminate the impact of age, gender, dose regimen and co-medication to amisulpride serum concentration.

Methods The effects of gender, age, dose regimen, and co-medication on amisulpride serum concentrations and dose-corrected serum concentrations (C/D ratios) on 158 in-patients treated with amisulpride were investigated.

Results The results showed that the median amisulpride serum drug concentration and the median amisulpride C/D ratio in female patients were significantly higher than that in male patients. (P = 0.004 and 0.002, respectively) The C/D ratios in patients over 60 years old was significantly higher than that in younger (P = 0.005). At different dose regimen, namely, once daily (QD) or twice daily (BID), there were significant differences in amisulpride concentration and C/D ratios (both P < 0.001). However, further study showed that there was no difference when the dose was same. When compared with high dose (400 mg/d) and lower dose (800 mg/d), there were significant differences in C/D ratios (P < 0.001). Interestingly, the median C/D ratios decreased with daily dose increased. Furthermore, the serum concentration increased linearly with the daily dose (r = 0.46, P < 0.001). The amisulpride C/D ratios have no differences between coadministration with clozapine and amisulpride monotherapy (P = 0.703); coadministration with Fluphenazine and Eszopiclone, the amisulpride C/D ratios would decrease in different degrees (P = 0.021 and 0.005, respectively); while Coadministration with valproic acid, the serum concentration of amisulpride would increase (P = 0.021).

Conclusion The results of this retrospective analysis will be helpful to provide patients with a more personalized amisulpride regimen.

关键字：Amisulpride, Serum concentration, C/D ratios, Co-medication

Association Between Electroconvulsive Therapy and Depressive Disorder: Bibliometric Analysis and Global Trends

蔡海鹏 杜若南 杨可冰 李伟 王志仁*
北京回龙观医院

Objective Depressive disorder is a chronic mental illness that is vulnerable to relapse, imposes a huge economic burden on society and patients, and is a major global public health problem. Depressive disorders are characterized by depressed mood, decreased energy and interest, and suicidal ideation and behavior in severe cases. They can be treated through pharmacotherapy and psychotherapy or physical treatments such as electroconvulsive therapy (ECT). In patients with suicidal ideation, behavior, or refractory depressive disorder ECT has a faster onset of action and better efficacy than pharmacotherapy. This study used bibliometric and visual analyses to map the current state of global research on ECT for depressive disorder and to predict future research trends in this area.

Methods A literature search was performed for studies on ECT and depressive disorder in the Web of Science Core Collection (WoSCC) database. All studies considered for this paper were published between 2012 and 2021. Bibliometric and co-occurrence analyses were performed using the CiteSpace software.

Results In total, 2184 publications were retrieved. The number of publications on ECT and depressive disorder have been increasing since 2012, with China being a emerging hub with a growing influence in the field. Zafiris J. Daskalakis is the top author in terms of number of publications, and The Journal of ECT is not only the most published journal but also the most co-cited journal in the field. Co-occurrence analysis showed that electroconvulsive therapy, treatment-resistant depression, bipolar disorder, hippocampus, efficacy, and electrode placement are current research hotspots. Molecular biomarkers, neuroimaging predictors, and late-life depression will become research hotspots in the future.

Conclusion Our analysis made it possible to observe an important growth of the field since 2012, to identify key scientific actors in this growth and to predict hot topics for future research.

抗精神病药物对首发精神分裂症患者大脑结构及功能的影响

侯灵芝[1] 李海锦[1] 张悦[1] 王佳卉[1] 刘怡彤[1] 吴启今[1] 李红[1] 李彩[2] 成军[1]
1.郑州大学第一附属医院精神医学科
2.郑州大学第一附属医院药学部

目的 探讨首发未服药精神分裂症患者治疗前后与健康对照者大脑结构及功能差异。

方法 纳入 36 例首首发未服药精神分裂症患者（患者组）及年龄、性别、教育年限相匹配的 25 名健康对照（对照组），进行静息态脑功能磁共振（rest fMRI）扫描，对患者组进行阳性阴性症状量表 (PANSS)评分后，抗精神病药物干预治疗 12 周，再次采用 fMRI 检测脑功能活动情况及 PANSS 评分，并进行比较。

结果 与对照者相比，首发未服药精神分裂症患者颞下回、颞上回、右侧楔前叶、右中央前回、左侧中央沟盖、右侧颞叶、额上回、内侧额回、左侧尾状核，右侧楔叶、左侧顶上回、右侧补充运动区、右侧额下回三角部、右侧额中回、右侧颞中回、左侧脑岛、右侧中央旁小叶脑区存在局部活性异常（P＜0.05），提示这些脑区的异常与精神分裂症的疾病易感性有关。且经抗精神病药物治疗 12 周后，额上回、右侧叶、右侧楔前叶、右中央前回、左侧沟盖、左侧顶上回的活性异常有所改善（P＜0.05）。其中患者中央沟盖、左侧顶上回的大脑自发活动特征的改变与临床症状的改善相关（P＜0.05）。

结论 首发未服药精神分裂症患者与健康对照组比较有多个脑区功能活动异常，药物治疗后有所改善。

Changes in Peripheral Blood Levels of NLR, MLR, RLR, and SII in Patients with Depression

Lingzhi Hou[1], Haijin Li[1], Yue Zhang[1], Jiahui Wang[1], Yitong Liu[1], Qijin Wu[1], Jun Cheng[1], Cai Li[2], Hong Li[1]
1.Department of Psychiatry, The First Affiliated Hospital of Zhengzhou University
2.Department of Pharmacy, The First Affiliated Hospital of Zhengzhou University

Objective To explore the application value of peripheral blood neutrophil to lymphocyte ratio (NLR), monocyte to lymphocyte ratio (MLR), platelet-to-lymphocyte ratio (PLR) and systemic immune-inflammatory index (SII) in depressive disorder.

Methods A total of 190 patients with major depression (MDD group) and age- and gender-matched 100 healthy controls (HC group) admitted to our hospital from January 2023 to June 2023 were collected. We analyzed the participants' platelet (PLT), neutrophil (NEU), lymphocyte (LYM), and monocyte (MON) counts, compared the differences in NLR, MLR, PLR and SII, and explored the relationships between depression and these indicators.

Results There were significant differences in MON, MLR and SII among the there groups（F=52.561,52.104,18.670, both P＜0.01). The MON, MLR and SII of MDD group was significantly higher than that of HC group, and the difference was statistically significant (both P＜0.01).

Conclusion Increased MON, MLR and SII, as signs of inflammatory response, may be biological indictors of depressive disorders.

关键字：depression, neutrophil-to-lymphocyte ratio (NLR), monocyte-to-lymphocyte ratio (MLR), platelet-to-lymphocyte ratio (PLR), systemic immune-inflammation index (SII)

The Influence of Genetic and Environmental Factors on Adolescent Anxiety: A Twin Study

王芳易[1] 傅一笑[2]
1.重庆医科大学
2.重庆医科大学附属第一医院

Objective Anxiety is a common psychological problem among adolescents and has become the focus of public attention in China, but little was known about the etiology of anxiety in Chinese adolescents. This study explored the influence of genetic and environmental factors on adolescent anxiety. Sex differences were also examined.

Methods Anxiety is a common psychological problem among adolescents and has become the focus of public attention in China, but little was known about the etiology of anxiety in Chinese adolescents. This study explored the influence of genetic and environmental factors on adolescent anxiety. Sex differences were also examined.

Results The effects of A and E on adolescent anxiety were 0.34 (95% CI=0.12-0.53) and 0.66 (95% CI:0.47-0.89), respectively. Adolescent anxiety was significantly positively correlated with peer relations (r =0.138, P<0.05) and negatively correlated with prosocial behavior (r =0.045, P

喹硫平在中国精神分裂症及情感性障碍患者的群体药代动力学及其影响因素的研究

刘威*
苏州市广济医院

目的 喹硫平是一种二苯并硫氮杂?类非典型抗精神病药物，目前已经被广泛应用于精神分裂症及双相情感障碍的临床治疗。本研究通过用非线性混合效应模型（NONMEM）方法建立喹硫平在中国精神分裂症及情感性障碍患者中的群体药代动力学（PPK）模型并研究其影响因素。

方法 回顾性的收集 304 例患者的 485 份血药浓度数据及临床资料，血药浓度为临床常规血药浓度监测采集的稳态谷浓度。采用 NONMEM 软件通过一级吸收和消除的单室模型建立了中国精神分裂症及情感性障碍患者的喹硫平速释片群体药代动力学模型，药动学参数用含个体间和个体内变异交互作用的一阶条件估算法计算，考察了生理因素（包括年龄、体重、性别等）以及实验室检查（胆红素、总蛋白、白蛋白、ALT、AST、γ-GTP、血肌酐等）对喹硫平药动学的影响。采用拟合优度诊断图、自举法（bootstrap）和正态化预测分布误差法（NPDE）进行模型评估。

结果 最终模型中喹硫平的表观清除率（CL/F）和表观分布容积（V/F）的群体典型值分别为 83 L/h 和 1350 L。协变量分析结果显示年龄对喹硫平的 CL/F 具有显著性影响，建立的最终模型 CL/F 参数公式如下：CL/F（L/h）= 83 × (AGE /43.1)-0.301。CL/F 的个体间变异和残差变异分别为 20.8%和 11.1%。最终模型评估显示该模型具有良好的稳定性和可靠性。

结论 本研究为首次在中国精神分裂症及情感性障碍患者中开展的喹硫平的群体药代动力学研究本研究，并考察了多种因素对喹硫平 PK 参数的影响，结果表明年龄是影响喹硫平清除率的重要因素。患者年龄的增加可以导致喹硫平药物清除率的非线性减少，该研究可为临床制定喹硫平个体化给药方案提供依据。

A Population Pharmacokinetic Analysis of Amisulpiride in Adult Chinese Patients with Schizophrenia：Impact of Creatinine Clearance Rate

刘威*
苏州市广济医院

Objective Amisulpride, as an antipsychotic, signif-

icantly exceeded the therapeutic reference range in a considerable percentage of the serum concentrations of Chinese patients, thus it is necessary to investigate its pharmacokinetic effects in different populations. The purpose of this study was to establish and validate a population pharmacokinetic (PPK) model of amisulpiride in Chinese adult schizophrenia patients, and to investigate the effects of covariates on the pharmacokinetic parameters of amisulpiride.

Methods 168 serum concentrations of 88 patients were collected from routine clinical monitoring in this retrospective study. Covariates were recorded which including demographic parameters (gender, age, weight), biological characteristics (serum creatinine, creatinine clearance) and co-medications. The PPK model of amisulpride was established by a nonlinear mixed effects modeling (NONMEM) approach. To evaluate the final model, goodness-of-fit (GOF) plots, bootstrapping validation (1000 runs), and normalized prediction distribution error (NPDE) were carried out.

Results A one-compartment model with first-order absorption and elimination was developed, the population estimate of the apparent clearance (CL/F) and apparent volume of distribution (V/F) was 32.6 L/h and 391 L, respectively. We found that creatinine clearance rate was a significant covariate affecting the clearance of amisulpride in this study. The established model was as follows: CL/F= 32.6(CLcr/114.3)0.485 (L/h). Evaluation by GOF plots, bootstrap and NPDE proved that the final model was reliable. Comparison of identified PK parameters in Chinese patients with previous PPK analysis in Caucasian patients indicated that the CL/F of amisulpride was similar, while the V/F was lower compared with Caucasian patients, which may lead to relevant differences in amisulpride serum concentrations during steady state.

Conclusion Ceatinine clearance was found to be an important covariate affecting the apparent clearance of amisulpiride for the first time. The study illustrated differences in PK parameters between Chinese and Caucasian patients. A PPK model of amisulpride in Chinese schizophrenic patients was successfully established by NONMEM and may offer a powerful approach for individualizing doses and therapeutic drug monitoring.

青少年抑郁症全基因组甲基化分析及候选基因甲基化水平横纵向对比和相关性研究

夏晓迪 易立 傅一笑*
重庆医科大学附属第一医院

目的 本研究旨在探讨环境因素可能通过改变基因位点甲基化水平介导青少年抑郁症的发生发展，以期为寻找青少年抑郁症诊治的客观生物标记物提供新思路。

方法 采用 850k 甲基化芯片检测 3 对同卵不同抑郁表型青少年双生子外周血甲基化，并通过基因本体富集分析、京都基因与基因组百科全书分析、蛋白相互作用分析获得候选基因。进一步采用多重 PCR 结合 MethylTarget 技术定量检测 10 例药物干预治疗前后青少年抑郁症患者，14 例青少年抑郁症患者，18 例健康对照组外周血候选基因位点的甲基化水平。最后将差异基因位点甲基化水平与抑郁严重程度、童年创伤进行相关性分析。

结果 850k 甲基化芯片共检测到 57 个不同甲基化水平的基因，其中 NOS1、ARHGEF12、GRID2 等基因甲基化水平较高，AHR、RFX7、ZCCHC11 等基因甲基化水平较低。进一步在横断面研究中发现青少年抑郁患者外周血 AHR_13 203、AHR_14 127 甲基化水平高于健康对照组，AHR_14 71 甲基化水平低于健康对照组。在控制年龄、体重指数等变量后，发现童年创伤总分与贝克抑郁量表得分，AHR_13 203，AHR_14 127 显著正相关，与 AHR_13 153 负相关。进一步研究发现 AHR_13 203 位与情感虐待、性虐待、情感忽视正相关，AHR_14 127 与情感虐待、躯体虐待、性虐待正相关。纵向干预研究中发现 AHR_13 67 和 AHR_14 154 甲基化水平在干预后下降，AHR_14 106 和 AHR_14 180 甲基化水平在干预后升高。在控制年龄、体重指数等变量后发现汉密尔顿抑郁得分与 AHR_13 67 正相关、与 AHR_14 106 负相关（所有统计检验均采用双侧，$p < 0.05$ 为有统计学意义，$r > \pm 0.3$ 为有相关性）。

结论 同卵不同抑郁表型双生子之间 850k 甲基化芯片结果存在差异，其中 AHR 不同片段和位点的甲基化水平在青少年抑郁症患者及药物治疗干预前后均显著存在差异且部分位点与童年创伤有关。提示 AHR 部分位点的甲基化水平变化可能成为青少年抑郁症诊治的关键生物标记物。

血小板计数对精神分裂症患者服用抗精神病药物后临床症状和代谢指标变化的预测作用研究

郑炀昊 张雅敏 李涛* 中国抗精神病药物基因组学联盟
杭州市第七人民医院

目的 （1）分析精神分裂症（SZ）患者血小板计数（PLT）与临床症状、代谢指标是否相关？（2）服用抗精神病药物 6 周后，患者 PLT 如何变化，7 个不同药物治疗组是否有差异？（3）基线血小板计数对 SZ 患者疗效及代谢变化是否有预测作用，以及预测作用是否独立于白细胞计数、代谢指标？

方法 在这项随机临床试验中，我们将 2985 例 SZ 住院患者随机分配到 5 种非典型抗精神病药物组和 2 种典型抗精神病药物组中的一组，并分别在基线、第 2 周、第 4 周、第 6 周时进行随访，评估临床症状、测量代谢指标、血常规和生化。采用重复测量方差分析检验 PLT 随时间的变化是否有统计学意义；采用潜伏生长曲线模型（LGM）来拟合阳性和阴性综合征量表

（PANSS）评分、代谢指标的纵向变化趋势；并通过结构方程拟合 PLT 和其他血液指标、代谢指标对临床疗效和代谢指标纵向变化的预测作用。

结果 共有 2596 例患者完成随访，基线 PLT 与白细胞总数、身体质量指数、总胆固醇和低密度脂蛋白呈正相关（FDR q<0.05），与 PANSS 评分无相关。经过 6 周治疗，阿立哌唑和齐拉西酮组患者 PLT 显著增加。结构方程中，基线 PLT 能与白细胞计数、代谢指标一起预测抗精神病药物治疗后的阴性症状改善，PLT 较低的患者，阴性症状改善越明显，但不能预测阳性症状。

结论 SZ 患者 PLT 与白细胞总数、血脂等代谢指标正相关，但不能预测其用药后的纵向变化。PLT 与临床症状不相关，但是可以作为患者阴性症状改善的预测指标，其机制有待进一步研究。

关键字：精神分裂症；阴性症状；血小板计数；白细胞总数；脂代谢

Integration of Multi-omics Summary Data Reveals The Role of N6-methyladenosine in Neuropsychiatric Disorders

刘付超 罗凌雪 庞滔 郑浩浩 常素华*
北京大学第六医院

Objective In this study, we utilized multi-omics summary data to explore the relationship among m6A-QTLs and other multi-molecular phenotypes and seven neuropsychiatric diseases.

Methods We integrated multi-omics data and genome-wide association study summary data of seven neuropsychiatric diseases to analyze diseases-related m6A site and the association between m6A and gene/protein by using transcriptome-wide association study tool and Summary-data-based Mendelian randomization.

Results We firstly identified 86 m6A sites associated with seven neuropsychiatric diseases. Subsequently, we identified 7881 associations of m6A sites and gene expressions and 916 out of the m6A - gene associations were between the 82 disease-related m6A sites and 606 genes. We further identified 58 out of the genes were disease-related by performing transcriptome-wide association study. Finally, we integrated these results and obtained 81 associations linking m6A - disease, m6A - gene and gene - disease, suggesting potential pathogenic mechanisms in which m6A influences disease through the regulation of gene expression. In addition, we also analyzed the effect of gene expression on m6A, the post-transcription effect of m6A on protein, and related association with diseases as well.

Conclusion Our study provide new insights into the genetic component of m6A in neuropsychiatric disorders and offer promising targets for further mechanistic investigations and the development of new therapeutics.

Application of Physiologically Based Pharmacokinetic (PBPK) Model To Predict The Pharmacokinetic Changes of Aripiprazole Combined with Risperidone

牟凡 黄志伟 程渝 禹顺英*
上海交通大学医学院附属精神卫生中心

Objective The objective of this study was to investigate the pharmacokinetic changes of aripiprazole caused by various influencing factors when it was co-administered with risperidone through PBPK models, so as to provide clinicians with valuable references for formulating an optimal dosage regimen.

Methods The initial PBPK models of aripiprazole and risperidone were developed by gathering basic physicochemical parameters and parameters related to absorption, distribution, metabolism, and excretion from literature and pharmacology databases. Then, by combining the inhibitory parameters, the enzymatic kinetic parameters of different CYP2D6 genotypes as well as the changes in anatomical and physiological parameters when liver function is damaged, the corresponding PBPK models were further established to predict common pharmacokinetic changes caused by these influencing factors. Finally, based on the simulation of PBPK models, this study put forward dosage optimization recommendations for situations where risks may exist.

Results The simulations of PBPK model revealed that co-administration of risperidone did not result in significant changes in the exposure level of aripiprazole. However, the CYP2D6 genotype was found to have a significant impact on the exposure level of aripiprazole, with the addition of risperidone not increasing the variability among individuals with different genotypes. For individuals with CYP2D6 intermediate metabolizer (IM) genotype, a dose reduction of approximately 14% is recommended for aripiprazole. Likewise, individuals with CYP2D6 poor metabolizer (PM) genotype should receive a greater reduction of approximately 28% in aripiprazole dosage. Furthermore, in patients with mild liver damage, a dose reduction of approximately 11% is advised when aripiprazole is combined with risperidone. However, when patients with mild liver damage have CYP2D6 genotypes of IM and PM, aripiprazole doses should be further reduced to 61% and 51%, respectively.

Conclusion The PBPK models demonstrated that the co-administration of aripiprazole and risperidone would not significantly impact the plasma concentration of aripiprazole, and there was no increased risk of drug-drug interaction due to CYP2D6 genetic polymorphism. However, in patients with mild hepatic damage, co-administration of the two drugs can lead to an increase in the exposure level of aripiprazole. Therefore, it is crucial to appropriately reduce the dose of aripiprazole to mitigate potential risks, particularly when the patient has CYP2D6 IM or PM genotype.

基于神经影像和机器学习的以耳针疗法为基础的 taVNS 治疗妊娠期及产后抑郁症的疗效预判研究

张雨桐[1] 李卫晖[2] 张悦欣[2]
1.中南大学湘雅一医院
2.中南大学湘雅二医院精神科

目的 基于神经影像和人工智能机器学习，研究以中医学针灸耳针疗法为基础的经皮耳穴-迷走神经电刺激（ta vagus nerve stimulation，taVNS）治疗妊娠期及产后抑郁症的疗效预判。

方法 临床常用的抑郁症药物治疗只有约 40%的患者在初始治疗后获得缓解，且存在着程度不一的副作用、药物依赖以及停药后复发等不足之处。而对于孕产妇而言，抑郁症没有绝对安全有效的治疗方法。因此，临床迫切需要开发新的有效、简便、安全的补充替代疗法，taVNS 治疗抑郁症成为可深入研究的问题。采用机器学习及脑影像技术，建立人工智能癫痫预测模型，以及电休克疗法（Electroconvulsive Therapy,ECT）治疗抑郁症的疗效预测支持向量机（Support Vector Machines,SVM）模型。 基于临床已有 taVNS 物理治疗效果及影像组学和机器学习的新进展，并与中医学结合，在前期研究基础上，进行前瞻性临床试验，获得临床疗效、脑形态、静息态脑区局部功能以及全脑网络等多维度数据，采用机器学习方法，分析及提取疗效预测相关的影像学标记物，综合多种统计算法，建立 taVNS 治疗妊娠期及产后抑郁症的疗效预测模型，在临床实践中验证和提高该预测模型的效能。 （1)通过前瞻性临床研究，收集 taVNS 抗抑郁临床病例，汇总既往研究成果，通过影像组学和机器学习方法，识别出适宜人群的相关系列影像学标记物。（2）优化机器学习参数，融合多维度数据，建立 taVNS 治疗抑郁症的疗效预测模型，并测试其稳定性。（3）通过前瞻性临床研究，将预测的疗效和实际疗效交叉验证，以评估疗效预测模型准确性，优化参数，提高效能。

结果 通过研究为筛查 taVNS 适宜的孕产妇抑郁症人群提供新方法，从而实现精准治疗，为临床广泛开展新技术经皮耳穴-迷走神经刺激技术治疗抑郁症打下科学基础，为其它针刺类似特色技术临床应用提供新的研究范式。

结论 将人工智能运用于影像组学构建辅助疾病诊断和疗效预测模型等方面研究具有较好的基础及广阔的应用前景。借助这一手段对 taVNS 治疗妊娠期及产后抑郁症进一步研究，将促进 taVNS 技术从基础研究推广到临床应用。

Chronic Restraint Stress–induced Depression?like Behavior Is Mediated by Upregulation of Melanopsin Expression in C57BL/6 Mice Retina

傅迎美[1] 董一港[2] 郭晓云[1] 刘红梅[1] 徐青青[1] 袁瑞雪[1] 宁爱玲[1] 洪武[1] 彭延敏[1] 禹顺英[1]
1.上海市精神卫生中心
2.华东师范大学

Objective : Depression is associated with circadian disturbances in which melanopsin was a key mechanism. Further studies have demonstrated that melanopsin gene variations are associated with some depressive disorders and aberrant light can impair mood through melanopsin-expressing retinal ganglion cells (mRGCs). The goal of this study was to explore the direct relationship between depression and melanopsin

Methods Adult C57BL/6 male mice were physically restrained for 16 h in a 50-ml polypropylene centrifuge tube and all behavioral tests were performed after CRS treatment. Western blot analysis and immunofuorescence were used to detect melanopsin expression in the retina of C57BL/6 mice. And we observed the change of the electrophysiological function and release of glutamate of mRGCs

Results The melanopsin expression upregulate in mRGCs of chronic restraint stress (CRS)-treating mice which exhibit depression-like behavior. The frequency of blue light-induced action potentials and light-induced glutamate release medi ated by melanopsin also increase signifcantly. This change of melanopsin is mediated by the CRS-induced glucocorticoid

Conclusion CRS may induce the depression-like behavior in mice via glucocorticoid-melanopsin pathway. Our fndings provide a novel mechanistic link between CRS-induced depression and melanopsin in mice.

关键字：Chronic restraint stress, Depression, Melanopsin, mRGCs, Glucocorticoid

Abnormal Neural Responses in Three Phases of Reward Processing in Individuals with Major Depressive Disorder: A Task-fMRI Study

吴艳坤[1] 苏允爱[1] 朱琳琳[1] 李继涛[1] 李科[2] 司天梅[1]
1.北京大学第六医院
2.战略支援部队特色医学中心

Objective Anhedonia is a diagnostic hallmark of major depressive disorder (MDD). Mounting evidence suggests that anhedonia in MDD is associated with aberrant reward processing. Reward processing includes three phases: reward anticipation, outcome consumption and choice evaluation. However, few studies have simultaneously investigated the neural responses in the three phases of reward processing.

Methods By using a roulette task, neural responses during reward anticipation, outcome monitoring and choice evaluation were assessed in 89 unmedicated patients with MDD and 35 healthy controls (HC).

Results Relative to the HC, individuals with MDD showed exaggerated brain activity in the medial superior frontal gyrus (SFG) during the reward anticipation, blunted activation in the striatum, including the nucleus accumbens (NAc) and caudate, and medial prefrontal cortex during the outcome consumption, and blunted activation in the SFG during the choice evaluation.

Conclusion These findings hint at a convergent impairment in the frontostriatal circuit during the three phases of reward processing. The hypoactivation in the NAc parallels current evidence on a central role for the NAc in consummatory pleasure. The dissociation between the SFG activity of reward anticipation and choice evaluation may represent a divergent pathophysiology for anticipatory and consummatory anhedonia.

本科医学生学习精神病学前后对其态度的变化及影响因素

陈诗婕[1] 邓奇坚[2,3] 蒲唯丹[4] 欧阳萱[2] 陶好娟[2] 马晓倩[2] 吴国伟[2]
1.中南大学湘雅医学院
2.中南大学湘雅二医院精神卫生研究所，中国精神心理疾病临床医学研究中心
3.中南大学医院管理处
4.中南大学湘雅三医院临床心理科

目的 探究本科医学生学习精神病学理论课及见习课前后对精神病学态度的变化及其影响因素，探索整合翻转课堂教学和微课教学方式的效果。

方法 采用方便抽样，对中南大学湘雅医学院的152名医学本科生进行问卷调查。被调查者经过为期半年的精神病学理论学习和见习培训，收到有效问卷149份，有效率98.0%。精神医学16人（10.74%），临床医学71人（47.65%），麻醉学29人（19.46%），预防医学33人（22.15%）。所用教材为人民卫生出版社出版的第8版《精神病学》。

结果 经过系统的学习，与基线期相比，经过学习后的医学生ATP总分显著增高（P<0.001）。除精神医学专业外，临床医学（P=0.003）、预防医学（P=0.005）、麻醉学（P=0.013）的学生经过系统学习后，ATP总分均有显著提高。进一步对比具体的条目，发现以下6个条目的分数有显著提升。共情能力总分和培训前的ATP-30总分存在显著正相关的关系，即共情能力越强，培训前的ATP-30总分越高。

结论 在本研究中，我们详细阐述了本科医学生学习精神病学理论课及见习课前后对精神病学态度的变化，以及推测了可能的影响因素。我们发现共情能力越强的学生，在未接受系统教育前对于精神病学的态度越积极。在经过精神病学理论和见习课程的系统学习后，不同专业的医学生ATP-30分数均有显著提升，且相较于其他国家的平均分数，此次受访学生ATP-30分数普遍较高。其中有六个条目的内容有显著提升，是需要靠见习才能了解的知识，凸显了见习的重要性。本研究采用微课结合翻转课堂教学法，取得良好成效，期望为国内其他院校的精神病学临床见习带教提供参考，进一步促进精神医学专业的临床见习带教水平，共同为培养生物-心理-社会医学模式下全面发展的高素质医学人才做出贡献。

5.安徽省精神卫生中心

目的 神经精神科生物节律评估访谈(BRIAN)量表用于神经精神科临床评估生物节律，该量表从睡眠、活动、社会节律、饮食习惯四个维度较为全面的评估生物节律，本研究检验中文版神经精神科生物节律评估访谈(BRIAN-C)量表在抑郁症患者中的信度及效度。

方法 采用BRIAN-C量表、16项抑郁症状快速评估量表（Brief 16-Item Quick Inventory of Depressive Symptomatology Self-Report,QIDS-SR16）、广泛性焦虑量表(7-item generalized anxiety disorder scale,GAD-7)、6项生活质量问卷(6-item Quality of life short form,SF-6)对122例抑郁症患者及122例对照进行施测，分别采用鉴别力指数D、相关性分析评价条目的区分度、同

质性，采用 Cronbach's α 系数、Spearman-Brown 系数、组内相关系数（ICC）、重测相关系数评价信度，分别采用验证性因素分析、相关性分析、ROC 曲线评价结构效度、校标效度、预测效度。

结果 纳入研究组和对照组各 122 例。BRIAN-C 量表条目同质性分析均显示有统计学差异（p<0.05），相关系数 r 在 0.359-0.852 之间；Cronbach′s α 系数为 0.911，Spearman-Brown 系数为 0.807；ICC 为 0.639(95%CI: 0.375~0.729)、重测相关系数 r 为 0.432(p=0.001)；验证性因素分析显示拟合度指标为：χ2/df=1.937，GFI =0.822，CFI =0.877，TLI=0.855，RMSEA=0.088；BRIAN-C 得分与 QIDS-SR16、GAD-7、SF-6 得分均呈显著相关性（p<0.05），相关系数 r 分别为 0.735、0.462、-0.692；ROC 曲线显示区分抑郁症与对照的 AUC 为 0.939（95% CI: 0.909～0.970，P＜0.05），29 分是最佳临界值，其对应的灵敏度为 0.861，特异度为 0.926。

结论 中文版 BRIAN 具有良好的信效度，相对于国内现有的评估工具，本量表能够较为全面、简洁、准确的评估抑郁症患者的生物节律,可以在抑郁症患者当中推广使用。

首发早发性和晚发性抑郁症患者静息态功能磁共振低频振幅的研究

阎锐[1,2] 王晓芹[1] 孙浩[1,2] 刘海燕[1] 陈瑜[1] 史家波[1] 崔青[1] 卢青[3] 姚志剑[1,2,3]
1.南京医科大学附属脑科医院心境障碍科
2.南京大学医学院
3.东南大学生物医学工程

目的 既往研究发现不同年龄段发病的抑郁症有不同的临床特征，发病年龄 18 岁以前的早发抑郁症（Early onset depression，EOD）较发病年龄在 45 岁以后晚发抑郁症（Later onset depression，LOD）有较高的阳性家族史、自杀风险和较高的转躁风险，同时研究发现存在不同的脑影像学特征。本研究旨在探讨首发早发性抑郁症和晚发性抑郁症脑静息态低频振幅（amplitude of low frequency fluctuation，ALFF）特征。

方法 招募来自南京医科大学附属脑科医院符合 DSM5 抑郁症诊断标准的首发患者。按照起病年龄，分为 18 岁以前的早发抑郁症 40 名，45 岁以后起病的晚发抑郁症抑郁症 50 名，同时招募 70 名年龄、性别、受教育年限匹配的健康对照。将 3 组受试进行 3.0T 静息态功能磁共振扫描，计算灰质体积（gray matter，GM）和 ALFF。为去除年龄的影响，将灰质总体积和年龄为协变量计算三组 ALFF 差异，首先进行单因素方差分析，高斯随机场法（Gaussian random field，GRF）校正，其次在三组比较差异有统计学意义的基础上，进行 hoc t 检验，对每两组 ALFF 进行两两比较，继续使用 GRF 校正。

结果 三组被试在双侧颞下回、右颞上回、左矩状回、左枕下回、右舌回、左额上回、左直回、右额下回、右枕中回、左丘脑、双侧楔前叶、右缘上回、左楔叶、右侧辅助运动区、左侧顶下回、左侧中央后回、左中央前回（单体素 p<0.001，连续体素值 K≥35，GRF 校正后 p<0.05）。在方差分析基础上进行两两事后独立样本 t 检验，与 LOD 组相比，EOD 组在右舌回、左枕下回、左额上回、左中央前叶 ALFF 值增高，左直回、右颞上回、左颞下回 ALFF 值下降（单体素 p<0.001，连续体素值 K≥17，GRF 校正后 p<0.05）。

结论 首发 LOD 与 EOD 患者存在不同的静息态脑活动特征。右舌回、左枕下回、左额上回、左中央前叶、左直回、右颞上回和左颞下回的脑局部能量活动特征可能和 LOD 与 EOD 的发病机制有关。

精神科住院医师规范化培训 OSCE 采用标准化病人和真实病人的结果比较

宋美 安翠霞*
河北医科大学第一医院精神卫生中心

目的 客观结构化临床考试（Objective Structure Clinical Examination, OSCE）又称为多站式临床考试，它要求学生在特定的时间内通过多个模拟临床情境的“考站”，完成一系列的临床任务，是评估住院医师岗位胜任力的客观测评形式。自 2022 年起，按照河北省卫生与健康委员会的要求，住院医师规范化培训结业技能考试 OSCE 采用真实的临床病人，本研究将探讨采用真实病人（real patient, RP）的 OSCE 与既往 SP 相比，学员对考核的满意度与考核结果的比较。探讨在精神科住院医师规范化培训 OSCE 采用标准化病人和真实病人考试结果的差异。

方法 选择河北医科大学第一医院 2018 级、2019 级精神科住院医师规范化培训学员 38 名，其中 2018 级学员采用 SP 考核（SP 组），2019 级学员采用 RP 考核（RP 组），SP 组参加了 2020 年年度 OSCE 技能考核，RP 组参加了 2021 年年度 OSCE 技能考核，采用“五站式”包括（1）辅助检查及影像学解读、（2）临床技能、（3）临床思维、（4）神经系统检查或临床沟通、（5）心肺复苏。每站考核采用满分 100 分的原始得分作为评价指标，满意度采用自制的 OSCE 考核满意度文件，比较两次考核的结果和学员满意度。

结果 满意度调查结果显示 SP 组在“我觉得病人很配合”条目选择“非常同意”、“同意”的学员比例明显高于 RP 组（P<0.05）OSCE 考核结果方面，2 组在临床技能、临床思维、临床沟通、神经系统查体、心肺复苏五站的考核成绩无明显差异。

结论 在 OSCE 中采用 RP 可能导致学员主观感觉考核难度增加，但采用 SP 还是 RP 均不会影响学员的考核结果。

精神分裂症与双相 I 型障碍的近红外脑功能成像研究

李娟* 惠娟 代海月 穆俊林
新乡医学院第二附属医院

目的 精神分裂症（schizophrenia，SP）和双相 I 型障碍（bipolar disorder-I）都是常见的重性精神障碍，因为临床表现等诸多相似性，二者鉴别有一定困难。SP 和 BP-I 在言语流畅性表现有差异，比较二者在言语流畅性任务（verbal fluency task，VFT）下前额叶皮质（prefrontal cortex，PFC）的激活模式，可能有助于二者的诊断与鉴别诊断。功能性近红外光谱技术（functional near infrared spectroscopy，fNIRS）可以反映 PFC 在认知任务下的脑血流的变化，近年来被用作精神障碍的辅助诊断。

方法 2020 年 3 月至 2021 年 9 月收集新乡医学院第二附属医院住院的 SP 和 BP-I 躁狂发作患者，同期从社区招募健康志愿者（healthy controls，HC）。分别采用阴性和阳性症状量表、杨氏躁狂量表、健康生活 9 项问卷和蒙特利尔认知评估量表对患者组的精神症状和认知功能进行评估。采用 52 通道的 fNIRS，测量三组人群在 3 种 VFT（语义 VFT 和两种语音 VFT）期间前额叶氧合血红蛋白（oxyhemoglobin，HbO2）及脱氧血红蛋白（reduced hemoglobin，HbR）相对浓度变化的特征，比较任务间及组间的激活差异。将有差异的变量纳入模型分析，建立可用于疾病分类的模型。

结果 最后共纳入 SP 组 60 例、BP-I 组 42 例和 HC 组 44 例。SP 和 BP-I 在语义和语音 VFT 下的产词数均低于 HC，但是语义流畅性缺陷更明显。SP 和 HC 在语义 VFT 期间前额叶的激活比语音 VFT 期间更广。SP 在语义和语音 VFT 期间均存在前额叶低激活，而 BP-I 仅在语义 VFT 期间表现前额叶低激活。综合各组在语义 VFT 下 HbO2 与 HbR 的激活情况，SP 以双侧背外侧、腹外侧前额叶低激活为主，BP-I 双侧颞上回及右侧额叶低激活为主。采用 Logistics 回归分析和神经网络分析对 SP 和 BP-I 分别进行分类建模，模型对 SP 和 HC 的分类正确率在 80%左右，对 BP-I 和 HC 的分类正确率在 74%左右。

结论 SP 和 BP-I 语义言语流畅性缺陷更明显。汉语中，语义 VFT 涉及的神经元活动更广泛，对前额叶激活更敏感。SP 的前额叶功能缺陷广泛，尤以双侧背外侧和腹外侧前额叶皮质为主，BP-I 的前额缺陷以右侧额叶及双侧颞上回为主。

4.天津市安定医院

Objective A seizure duration longer than 15 s has been applied to define the treatment seizure for Magnetic seizure therapy (MST), which is modified from electroconvulsive therapy (ECT) without much validation. Our objective was to investigate whether this seizure duration was suitable for MST treating schizophrenia.

Methods Thirty-five and thirty-three inpatients with schizophrenia were included to receive ten sessions of MST and ECT respectively. The clinical symptom was assessed using Positive and Negative Symptom Scale (PANSS) at baseline and 4-week follow-up. EEG was monitored during each MST or ECT treatment using bifrontal electrodes.

Results The proportion of participants achieved the 15 s threshold were only 28.6 % in the MST group, without differences between responders and non-responders. For patients receiving MST, the average EEG seizure duration was correlated with the percentage of PANSS reduction ($t(33) = 2.53$, $p = 0.016$, uncorrected; $t(33) = 2.02$, $p = 0.053$, corrected with clinical characteristics). The average EEG seizure duration predicted the clinical response at a trend level ($Z = 1.73$, $p = 0.085$) with an optimal cut-off of 11.3 s. All patients in the ECT group achieved the 15 s threshold, however, their average EEG seizure duration was uncorrelated with clinical improvement.

Conclusion Adequate length of EEG seizure may be essential for the antipsychotic effect of MST, though affected by various clinical and technical factors. Our findings suggested a shorter duration of seizure was more suitable for MST compared to ECT when treating patients with schizophrenia.

Role of GDNF in Aberrant Activity within DMN Subsystems During Rumination in Major Depressive Disorder

贾凤南 汤臻 李荣华 付晓倩 柳艳松* 杜向东*
苏州市广济医院

Background The neurotrophic hypothesis might play a role in major depressive disorder (MDD), but it remains unclear the relationship between glial cell line-derived neurotrophic factor (GDNF) and brain activity in patients with MDD. In this study, we focused on the altera-

tions of activity of default mode network (DMN) subsystem, level of GDNF and rumination to investigate the role of GDNF in MDD.

Methods Here, individuals with MDD (n = 33) and healthy controls (n = 33) completed a rumination state task during a magnetic resonance imaging (MRI) scan, in which they were induced into a continuous, active rumination state. The fALFF (fALFF) was calculated to characterize spontaneous brain activity of DMN. Serum levels of GDNF were measured in all participants. Correlation between fALFF values and GDNF levels as well as rumination in MDD was calculated.

Results Compared with the HCs, MDD patients showed decreased GDNF levels. MDD patients showed a significant decreased activity in the DMN DMPFC subsystem during rumination as well as inversed activity during distraction state (t = -2.727, p = 0.008; t = 2.649, p = 0.011, respectively), and increased activity in MTL subsystem during rumination in MDD patients (t = 2.610, p = 0.011). Moreover, abnormal activity in the DMN DMPFC subsystem during rumination were positively correlated with the GDNF (r = 0.406, p = 0.019) levels and negatively related to brooding scores (r = -0.456, p = 0.009) in MDD. However, the activity of DMN MTL subsystem was positively correlated with the brooding scores(r = 0.408, p = 0.018).

Conclusions Our findings demonstrate that GDNF levels are associated with impaired activity of DMN subsystems in MDD patients and was associated with rumination symptom, suggesting that GDNF might play a crucial role in brain functional abnormalities in MDD.

抗抑郁药物治疗前后抑郁症患者在自我面孔识别任务下的脑激活变化

范泽斌 刘哲宁 赵璇 汤世雄 陶好娟*
中南大学湘雅二医院

目的 自我面孔识别是自我参照认知的重要组成部分，研究发现自我面孔识别与情感状态密切相关。然而，抗抑郁治疗前的抑郁发作期和治疗后抑郁缓解或部分缓解期的抑郁症患者自我面孔识别相关脑区的激活是否存在变化仍未知。本研究基于自我面孔识别任务采用功能磁共振成像技术比较成人抑郁症患者抗抑郁治疗前的抑郁发作期和治疗后抑郁缓解或部分缓解期的脑激活变化。

方法 成人抑郁发作组(n=59)（符合精神障碍诊断与统计手册(SCID-5)重性抑郁障碍的诊断标准,且HAMD-17≥17 分)，成人抑郁缓解/部分缓解状态组(n=33)（符合精神障碍诊断与统计手册(SCID-5)重性抑郁障碍的诊断标准，目前为完全缓解或部分缓解，且HAMD 介于 0-15 分)和健康对照组(n=36)在任务态功能磁共振扫描过程中进行自我面孔识别任务。自我面孔识别任务范式采用 Block 设计，包括的图像有自我中性面孔，他人中性面孔，他人厌恶面孔，空白背景图。统计分析基于 MATLAB 的 spm 软件进行多因素方差分析 3 组（抑郁发作状态组，抑郁缓解/部分缓解状态组，正常组）× 3 刺激水平（自我中性面孔 vs 空白背景图，自我中性面孔 vs 他人中性面孔，自我中性面孔 vs 他人厌恶面孔）的脑激活信号值变化的比较分析。

结果 多因素方差分析显示诊断分组与任务刺激水平在左侧枕叶、左侧梭状回存在显著交互作用。在自我中性面孔 vs 空白背景图的任务刺激水平下，诊断分组的简单效应显示，与健康对照组相比，抑郁发作状态组与抑郁缓解/部分缓解状态组在双侧枕叶、双侧梭状回脑区的脑激活均存在显著性降低，抑郁发作状态组与抑郁缓解/部分缓解状态组之间没有显著性差异。在自我中性面孔 vs 他人中性面孔的任务刺激水平下，诊断分组的简单效应显示，与抑郁缓解/部分缓解状态组和正常对照组相比，抑郁发作状态组在右侧额下回、右侧岛叶存在显著的脑激活下降，而抑郁缓解/部分缓解状态组与正常对照组之间的脑激活无显著性差异。

结论 自我面孔识别任务下，成人抑郁症患者在治疗前后均存在视觉皮层、梭状回的脑激活下降；抗抑郁药物治疗可改善抑郁症患者右侧额下回、右侧岛叶的脑激活。研究结果提示，视觉皮层、梭状回脑激活下降可能与抑郁症自我参照认知异常的神经病理基础有关，是抑郁症神经影像学异常的素质标记；抑郁症患者右侧额下回、右侧岛叶的脑激活下降可能是抑郁症的神经影像状态标记。

关键字：抑郁症； 任务态功能磁共振成像；自我面孔识别； 梭状回；视觉皮层

结节性硬化复合体基因多态性与精神分裂症的关联研究

高可润[1,2] 傅迎美[2] 李华芳[2] 禹顺英[2]
1.杭州市第七人民医院
2.上海市精神卫生中心

目的 哺乳动物雷帕霉素靶蛋白信号通路调控蛋白翻译，参与细胞生长、增殖，与突触可塑性密切相关，结节性硬化复合体 1（Tuberous Sclerosis complex，TSC1）和 TSC2 是该通路中的重要调节因子，本研究探讨 TSC1、TSC2 基因多态性与精神分裂症的关系。

方法 纳入 933 例精神分裂症患者和 1339 例健康对照，用 SNaPshot 技术对 TSC1、TSC2 基因的标签 SNP 进行基因分型，比较病例组和对照组间的等位基因、基因型的分布频率有无差异。用 SYBR Green 实时定量 PCR 检测 53 例精神分裂症患者和 53 例健康对照外周血中 TSC1、TSC2 的 mRNA 表达水平。

结果 精神分裂症患者组 TSC2 基因 rs2074969-A 等位基因的频率低于健康对照组（13.1% vs 16.0%，P=0.006，OR=0.79，95%CI：0.67-0.94），经 Bonferroni 校正后差异有显著性（校正 P=0.006×6=0.036<0.05）。rs2074969-A 等位基因携带患者（AG+AA）的 TSC2 基因的 mRNA 表达量显著低于 GG 基因型患者（P=0.004）。

结论 rs2074969（TSC2）基因多态与 TSC2 基因

表达及精神分裂症患病风险有关。

关键字：精神分裂症 结节性硬化复合体 单核苷酸多态性 关联研究 基因表达

Relationship between Implicit and Explicit Memory and Childhood Traumatic Experiences of First-degree Relatives in Patients with Obsessive-compulsive Disorder

徐海琴 钟慧* 莫大明 陈彬彬
合肥市第四人民医院

Objective To explore the correlation between childhood trauma characteristics of first-degree relatives (father or mother) of patients with obsessive-compulsive disorder (OCD) and implicit、 explicit memory.

Methods Sixty OCD patients and their first-degree relatives were included. Childhood trauma experience was assessed using the childhood Trauma questionnaire-short form (CTQ-SF).The Yale-Brown scale for obsessive-compulsive symptoms (Y-BOCS) evaluates the severity of compulsive symptoms in patients. The childhood trauma questionnaire-short form (CTQ-SF) assessed the childhood traumatic experiences of first-degree relatives (father or mother).The adult attachment scale (AAS) assesses the type of attachment of a first-degree relative (father or mother). Word perception speed test task and word recognition task were used to test the response time and accuracy of implicit memory and explicit memory. SPSS 22.0 was used for statistical analysis to compare the correlation between obsessive-compulsive symptoms, implicit memory, explicit memory and childhood trauma characteristics of first-degree relatives in patients with obsessive-compulsive disorder.

Results The accuracy of implicit memory response in OCD patients was negatively correlated with the scores of physical neglect [(9.18±2.801)] and physical abuse [(6.05±1.707)] of first-degree relatives (father or mother) [(r=-0.260, $p < 0.05$); (r= -0.417, $p < 0.01$)]. The obsessive-thinking [(11.08±4.784)] score of OCD patients was negatively correlated with the dependency subscale score of first-degree relatives (paternal or maternal) AAS [(19.07±3.568)] [(r=-0.318, $P < 0.05$)].

Conclusion The accuracy of implicit memory response in patients with obsessive-compulsive disorder is related to childhood traumatic experiences of first-degree relatives (father or mother), especially physical abuse and neglect of first-degree relatives (father or mother).

关键字：obsessive-compulsive disorder，implicit and explicit memory，childhood traumatic experiences

血清泌乳素对老年精神分裂症患者骨密度影响的相关研究

汪西莹* 隋毓秀 陈丽君 任方芳 王沛弟
南京医科大学附属脑科医院 精神三科

目的 本研究拟收集老年精神分裂症患者，充分纳入和骨质疏松相关因素，尤其患者用药情况，拟探讨高泌乳素血症对老年精神分裂症患者骨密度的影响，并进一步探索抗精神病药物与其相关的因素，以指导临床用药。

方法 将南京脑科医院精神科≥60 岁且已完善骨密度测定以及泌乳素测定的精神分裂症患者作为研究对象，入组标准： 符合国际疾病分类精神与行为障碍（ICD-10）中精神分裂症诊断标准；排除标准：家族中无遗传性骨代谢系统疾病史； 进食障碍、酒精滥用或依赖；长期服用糖皮质激素、维生素 D、降钙素、二磷酸盐、钙剂等药物者；长期卧床或乘坐轮椅。HPRL(hyperprolactinemia ）诊断标准：女性血清（PRL)>25ng/ml，男性血清 PRL≥20ng/ml。将研究对象中 PRL 水平满足诊断标准则诊断为 HPRL。将满足 HPRL 诊断标准的老年精神分裂症患者（n=31）归为 HPRL 组；将不满足 HPRL 诊断标准的老年精神分裂症患者（n=33）归为对照组。使用 SPSS 22.0 对数据进行统计分析。采用方差分析比较高泌乳素血症组和正常泌乳素组精神分裂症患者之间骨密度的差异；采用单因素回归分析和多元逐步线性回归分析探索骨密度可能的影响因素。

结果 实验组 BMD 与 BMI 呈正相关，与年龄、PRL 呈负相关。多因素线性回归分析显示，年龄、BMI、HPRL 是影响 BMD 的独立相关因素，且骨密度和催乳素水平显著负相关(P〈0.05)。

结论 高泌乳素血症是抗精神病药物的常见不良反应，可降低老年精神分裂症患者骨密度。抗精神病药所引起的高泌乳素血症与骨密度减少、骨质疏松症的发生有关。在老年精神分裂症患者使用抗精神病药物治疗的同时，需注意泌乳素、骨密度检测，必要时采用降泌乳素及改善骨质疏松等对症治疗。

关键字：高泌乳素；老年精神分裂症患者；骨密度；骨质疏松

抑郁症患者自杀意念和自杀未遂的大脑局部一致性差异：一项基于静息态功能磁共振的研究

吴涵 王雪 王雯 金文青 姜玮 杨春林 任艳萍* 马辛* 李人*
首都医科大学附属北京安定医院

目的 自杀包括自杀意念、自杀未遂和自杀死亡。自杀多发生在抑郁症患者中，因此确定抑郁症患者自杀意念和行为相关风险的生物标志物是降低自杀死亡率的关键。

方法 本研究依据抑郁症患者入组前两周内有无自杀未遂行为和意念分为自杀未遂组（Suicidal attempts，SA）、自杀意念组（Suicidal ideation，SI）和疾病对照组（Depression control，DC），并招募与研究组年龄等相匹配的健康对照组（Health control，HC 组）。

使用汉密尔顿抑郁量表（Hamilton Depression Scale，HAMD-17）、自杀意念量表（Scale for Suicide Ideation，SSI）评估患者抑郁和自杀症状。对静息态功能磁共振图像进行局部一致性（Regional homogeneity，ReHo）分析，并采用置换检验（Permutation Test，PT）随机重复 5000 次，结合无阈值族群增强（Threshold-Free Cluster Enhancement，TFCE）的方法进行多重比较校正。并与临床心理评估量表评分进行相关性分析。

结果 纳入 SA 组 30 例、SI 组 33 例、DC 组 41 例、HC 组 36 例。四组被试在年龄、性别、受教育年限和药物使用等方面均无统计学差异。DC、SI 和 SA 组三组在 HAMD-17 总分（F=46.015，P＜0.001）、认知障碍因子（F=132.374，P＜0.001）、阻滞因子（F=32.971，P＜0.001）、睡眠障碍因子（F=9.026，P＜0.001）组间比较存在统计学差异。SA 组 SSI 总分显著高于 SI 组（t=-5.370，P＜0.001）。ReHo 结果显示，四组在右侧岛叶及颞横回（F=12.311，P＜0.05）、左侧中央后回（F=8.353，P＜0.05）、右侧中央后回的 ReHo 值（F=7.543，P＜0.05）、左侧中央后回及顶下缘角回（F=9.592，P＜0.05）存在显著差异。SA 仅在右侧中央后回的 ReHo 值较 SI 显著降低并存在统计学差异（P＜0.05）。SA 组右侧中央后回的 ReHo 值与 SSI 评分呈负相关（r=-0.745，P＜0.001）。

结论 抑郁症自杀未遂与意念和无自杀症状的抑郁症相比在右侧中央后回的局部一致性减弱，这可能是区别抑郁症自杀未遂和意念的潜在生物学标志物。

关键字：抑郁症，自杀意念，自杀未遂，静息态功能磁共振，局部一致性（Regional homogeneity，ReHo）

功能近红外脑成像应用于儿童精神障碍性疾病的研究进展

邵小骏 朱刚*
中国医科大学附属第一医院

目的 儿童精神障碍性疾病发病率及疾病负担逐渐升高。常见儿童精神障碍性疾病除了精神分裂症、抑郁障碍、焦虑障碍等同时常见于成年人的精神疾病以外，还包括一些特发于儿童期者，如注意缺陷多动障碍、孤独症谱系障碍等。儿童精神障碍性疾病因识别率低、治愈率低给患儿、家庭及整个社会带来了严重负担。现阶段儿童精神障碍性疾病病因和发病机制迄今不明确，症状缺乏特异性，诊断一致性较低，给患儿早期诊断和规范化干预工作带来极大的困难。功能近红外脑成像是一种非侵入性、无痛的新兴的神经成像技术，广泛应用于神经病学与精神病学的辅助诊断等领域，如抑郁症、脑卒中等疾病。近年来，不少学者已经将其应用于儿童精神障碍性疾病(如注意力缺陷多动障碍、孤独症谱系障碍)的研究。本综述以期为儿童精神障碍性疾病患者辅助诊断提供依据。

方法 本综述基于近年来国内外相关临床指南，结合近年来国内外对功能近红外脑成像在儿童精神障碍性疾病中的研究做一系统综述，总结功能近红外脑成像应用于儿童精神障碍性疾病的研究进展。

结果 功能近红外脑成像应用对儿童精神障碍性疾病早期识别、诊断、评估、治疗、疗效评估及预后预测提供依据有重大意义，可作为一种安全的新兴得技术供临床选择，但必须是遵守安全指南的前提下且结合患者具体情况。

结论 功能近红外脑成像可进一步研究儿童精神障碍性疾病与脑机制之间的关系，并用于指导和优化临床治疗及后续康复方案，同时应根据患者症状加以不同的有针对性的临床应用。

谷氨酸通路基因与快感缺失症状的关联研究

黄欣欣[1] 易正辉[2]
1.南京脑科医院
2.上海交通大学医学院附属精神卫生中心

目的 快感缺失是精神分裂症（schizophrenia，SZ）阴性症状的主要症状，同时也是重型抑郁障碍（major depression disorders，MDD）的核心症状。目前其发生机制仍不清楚，谷氨酸能系统可能参与快感缺失的病理生理机制。本研究探讨快感缺失症状与 N-甲基 D-天冬氨酸受体（N-methyl D-aspartate receptor，NMDAR）通路基因的关联。

方法 纳入 279 例 SZ 患者，236 例 MDD 患者及 236 例健康对照（healthy control，HC）。采用时间性愉快体验量表中文版（Temporal Experience of Pleasure Scale, TEPS），Chapman 社会快感缺失量表（The Chapman Revised Social Anhedonia Scale，CSAS）和躯体快感缺失量表（The Chapman Revised Physical Anhedonia Scale，CPAS）评估愉快体验能力。选取 NMDAR 通路的 NOS1AP，GSK3B，DAOA，DISC1 及 GRIN2A 基因的 17 个 SNP 位点进行基因分型，采用广义多因子降维法（generalized multifactor dimensionality reduction，GMDR）（version 1.0）分析基因交互作用对快感缺失症状的影响。

结果 SZ 与 MDD 患者的期待性和即时性愉悦体验显著低于 HC，MDD 患者期待性愉快体验显著低于 SZ 患者，而 SZ 与 MDD 两组间在即时性愉快体验上无显著差异。GMDR 分析发现由 DAOA-rs3916965 与 DISC1-rs821577 组成的 2 位点模型对 SZ 患者总体愉悦体验能力具有预测作用；由 NOS1AP-rs1858232 和 GRIN2A-rs1014531 组成的 2 位点模型可以预测 MDD 患者期待性愉悦体验；SZ 和 MDD 高风险组愉快体验能力显著低于低风险组。

结论 NMDAR 通路基因-基因交互作用可能参与快感缺失症状的发生。

关键字：精神分裂症；重性抑郁障碍；快感缺失；NMDAR 通路基因

Retinal Structure and Function As Potential Biological Markers in Major Depressive Disorder: A Scoping Review

段莉[1,2] 姜萍[2] 王琳[2] 朱刚[1]
1.中国医科大学附属第一医院
2.承德医学院

Objective Anatomically and developmentally, the retina is considered to be an extension of the central nervous system and has the opportunity to break through the bottleneck in psychiatry medicine research as a specific biomarker. This article summarizes the related studies on retinal structure or function as potential biomarkers of major depressive disorder (MDD), to clarify the pathophysiological mechanisms of MDD and provide theoretical references for developing or improving objective examination methods.

Methods We searched PubMed, Embase, APA PsycInfo, Web of Science, Ovid, ProQuest, CNKI, Wanfang Database, CBM, VIP, and other databases based on the scoping review methodology framework up to June 2023. Two researchers independently screened the literature and summarized the application status of objective instruments for retinal in MDD patients as well as the correlations between the retina markers and MDD.

Results A total of 19 articles were eligible, including 14 case-control studies, 1 cohort study, 1 longitudinal study, 1 cross-sectional study, and 2 systematic reviews. Twelve studies analyzed the correlation between the markers of MDD and retinal structures such as central macular thickness, and nerve fiber layer thickness measured by OCT. Seven studies examined retinal function based on visual electrophysiology such as electroretinogram and visual evoked potential. The results showed that retinal function could be used as a potential biomarker for MDD even in the early stage of the disease risk trajectory. Some studies also used mixed applications of multiple examination tools.

Conclusion The characteristics of the retinal structure have been confirmed to be associated with MDD, but it is prone to dynamic changes with age stratification, different medication types, and disease severity. There are few studies on retinal function characteristics as potential biomarkers of MDD, especially lack of the safe, unified, and standardized examination methods. Future studies should explore the feasibility of combining retinal structure and function as MDD biomarkers deeply, and find out the optimal combination of various tools.

The Therapeutic Effect and Mechanism of Repetitive Transcranial Magnetic Stimulation on Children with ADHD Dyslexia：A Protocol

段莉[1,2] 田春生[1,3] 王琳[2] 朱刚[1]
1.中国医科大学附属第一医院
2.承德医学院
3.沈阳市精神卫生中心

Objective Evidences have demonstrated that 20%-40% of children with attention deficit hyperactivity (ADHD) suffer from dyslexia simultaneously, which seriously reduces their ability in reading, writing and language expression, resulting in a decline in their overall academic performance, and psychosocial problems. Repetitive transcranial magnetic stimulation (rTMS), as a safe and effective physical therapy, have been widely used in improving symptoms of attention and behavior in patients with ADHD, but there are only few reports on the clinical efficacy of dyslexia.

Methods This study was designed to observe the improvement of dyslexia in ADHD children before and after rTMS treatment, and explore its mechanism through the changes of N400 brain evoked potential waveforms. It aimed to provide feasible guarantee for further expanding the application of rTMS in the field of children's mental health and the effective development of precision treatment for dyslexia in children with ADHD.

Results Overall, 30 patients with ADHD and 30 healthy children will be recruited into case and control groups in this study. Prior to the commencement of treatment, the SNAP-IV, Dyslexia Checklist for Chinese Children (DCCC) and Chinese Reading Skill Diagnostic Test (CRSDT) will be used as assessment tools to evaluate clinical symptoms and reading ability. Over a 4-week period, patients and health controls will receive the true rTMS and pseudo rTMS respectively, and SNAP-IV, DCCC and CRSDT will be applied to evaluate the effects before treatment (baseline) and after treatment. Moreover, the event-related potential N400 waveform of the case group will be collected before and after treatment.

Conclusion This study will analyze the applicability and effectiveness of rTMS in ADHD children with dyslexia by horizontally comparing the improvement of reading ability in case group and control group, as well as longitudinally comparing the improvement of clinical symptoms and reading ability of the participants in case group. Additionally, the mechanism of the action of rTMS in the treatment of dyslexia was also explored by further analysis of N400 waveform changes.

A Decision Tree Model for Detecting High-risk Factors of Sleep Disorder Among Community-dwelling Elderly Residents From PCHSIs

段莉[1,2] 朱刚[1]
1.中国医科大学附属第一医院
2.承德医学院

Objective Difficulties with sleep and disruptions to circadian rhythms in the elderly population are getting

worse and significant as the global population ages. However, caregivers in aged families and professions in medical institutions are more likely to confront patients with sleep disorder, but lack effective methods/tools to identify risk factors and formulate intervention measures.

Methods Overall, 656 participants were enrolled from 6 primary community health services institutions (PCHSIs). After implementing descriptive statistics, t-test and bivariate logistic regression analyses, the model of sleep disorders among the elderly community-dwelling residents were built employing decision tree method.

Results In total, 35.52% (233/656) participants from PCHSIs have been screened with sleep disorders. There were seven risk factors (sex, negative life events, psychological resilience, irrational belief, personality, satisfaction with the income and frequency of physical activity participation) with fewer branches were used in this decision tree model. The sensitivity, specificity, positive predictive value, negative predictive value, and area under the curve (AUC) for detecting sleep disorder among the elderly community-dwelling residents were78.46%, 63.64%, 80.95%, 60.00%, 0.769 (95% CI: 0.731-0.808), respectively.

Conclusion Findings further indicate that sleep disorder has become a significant problem among the elderly population. Subjects with high risk of sleep disorders had significantly higher level of negative life events, irrational belief, but lower satisfaction with the income, psychological resilience and less physical activity. This simple decision tree model will help the elderly and their caregivers assessing the risk of sleep disorder easily and formulate targeted and effective intervention measures.

Age of Onset for Major Depressive Disorder and Its Association with Symptomatology and Metabolism

何嘉丽 黄东 钟舒明 赖顺凯 宋小东 贾艳滨*
暨南大学附属第一医院(广州华侨医院)

Objective Few studies have investigated the effect of age of onset (AOO) on clinical features of patients with Major depressive disorder (MDD) and explore its potential influencing factors. Therefore, our study compared the clinical features, endocrine metabolism and neurometabolism of MDD patients with different AOO, and explored the underlying mechanisms for AOO of MDD.

Methods In present study, 200 drug-na?ve patients with MDD, aged between 18 and 60, were included and divided into three groups according to AOO: the adolescence onset group (AO, age 10-17, n=55), the early adulthood onset group (EAO, age 18-29, n=79), the late adulthood onset group (LAO, age 30-60, n=66). After recruitment, all participants were evaluated to record their clinical features. Peripheral blood was collected to detect thyroid function and trace elements of all patients. Additionally, all subjects underwent protons magnetic resonance spectroscopy (1H-MRS) to collect neurometabolic ratios of N-acetyl aspartate (NAA) and choline-containing compounds (Cho) to creatine (Cr) in prefrontal cortex (PFC) and thalamus. Finally, differences of metabolite levels were calculated and multivariate analysis was adopted to explore the influencing factors for AOO of MDD.

Results In terms of symptom dimension, except for the somatization of anxiety (p=0.049), there were no significant differences between the three AOO groups in the remaining six factors scores of 24-item Hamilton Depression Rating Scale (HDRS-24), but severity of depression was higher in LAO patients than in EAO patients. AO patients with MDD showed more depressive episodes, longer duration of illness, and a greater incidence of suicidal ideation (all $p<0.05$). Both AO and EAO patients showed elevated triiodothyronine level than LAO (all $p<0.001$), while only EAO showed higher thyroid stimulating hormone than LAO (p=0.045). In addition, LAO patients exhibited lower phosphorus levels and higher ceruloplasmin levels compared to the other two groups (all $p<0.001$), while EAO was higher than LAO in the comparison of blood zinc level (p=0.011). In the aspect of neurometabolic levels, the NAA/Cr ratio of AO and EAO groups in right PFC and bilateral thalamus were higher than that in LAO group ($p<0.001$, p=0.002, $p<0.001$). Furthermore, serum phosphorus, zinc, ceruloplasmin levels and the NAA/Cr ratio of right PFC were closely related to AOO, which may affect the AOO of patients with MDD (all $p<0.05$).

Conclusion MDD patients with earlier AOO showed more complex clinical features such as more depressive episodes, longer duration of illness, and a greater incidence of suicidal ideation, while those with later AOO showed more metabolic disturbances in terms of thyroid function, microelement and neurometabolism. What's more, altered serum trace elements levels and neurometabolic abnormalities in right PFC may be important factors affecting the AOO of MDD patients.

关键字：major depressive disorder; age of onset; thyroid hormone; microelement; neurometabolism

A Controlled Study of The Rehabilitation Effects of Online Mindfulness Interventions in Patients with Anxiety Disorder with Or without Somatization Symptoms at Home During COVID-19

武雅学[1] 张海敏[2] 裴杨[2] 李艳丽[1]
1.北京回龙观医院
2.北京觉心健康科技有限公司

Objective During community lockdown to prevent the COVID-19, patients with anxiety disorders are unable to seek medical attention in a timely manner and are overly worried about the epidemic, resulting in increased anxiety and somatic symptoms. Mindfulness-application-experts have developed a Online-Mindfulness Based Intervention for Anxiety (EMBIA). The objective of this study was to compare the effects of EMBIA on anxiety disorders with

or without somatization symptoms.

Methods The 800 subjects in this study were recruited and provided EMBIA during 2021-2022. Inclusion criteria: ①Meet the DSM-5 diagnostic criteria for anxiety disorders; ②Age 18-65 years old; ③ High school and above education level; ④No psychiatric drugs were used in the 8 weeks prior to the intervention. Exclusion criteria: ①accompanied by psychotic symptoms or personality disorders; ②history of mental disorders that meet the diagnostic criteria for other disorders in the DSM-5; ③Have serious physical diseases and are in an unstable period; ④ Have alcohol, drug or Internet addiction. The EMBIA intervention lasts for 10 weeks and consists of 2 hours session each, as well as approximately 20-30 minutes practise a day after class. GAD-7, PHQ-9 and PHQ-15 were used to evaluate anxiety, depression and somatization before and after the intervention. The amount of intervention was counted, such as the number of classes and exercises after class, etc.

Results Finally, 800 subjects in 673 to complete all 10 weeks intervention. There were 125 males (18.6%) and 548 females (81.4%). The age mean±standard was 46.63±9.99 year. Before and after intervention, the GAD-7 scores were 10.78±3.97 and 5.68±3.79 (t value 29.78, P=0.000), and the PHQ-9 scores were 9.01±4.60 and 5.52±3.87 (t value 17.29, P=0.000), respectively. P=0.000) and PHQ-15 scores were 11.06±4.72 and 7.50±4.40, respectively (t value 19.41, P=0.000). Before and after the intervention, anxiety improved in 219 (32.5%), and cured in 285 (42.3%). A paired t-test was performed between 224 subjects with PHQ-15 score ≤9 and 147 subjects with PHQ-15 score ≥15 was found that both groups of subjects had improved GAD-7, and there was no significant difference(t=-0.553, p=0.581). Pearson correlation test was conducted between The Times of class and The Times of after-class practice punching and the score reduction rate of the three psychological indicators. It was found that The Times of class had no correlation with the score reduction rate of the three indicators of GAD-7, PHQ-9 and PHQ-15, but the number of after-class practice punching was correlated with the score reduction rate of GAD-7.

Conclusion EMBIA courses can be helpful for people with anxiety disorders who are not taking medication. Improvements in anxiety disorders were similar regardless of whether somatization symptoms were present. The frequency of practice after class was positively correlated with the improvement of anxiety.

Whole-exome Sequencing in A Multiplex Bipolar Disorder Family Identifies TIMELESS As A Risk Gene

Binli Shang Runxu Yang Lei Dong Kun Lian Kang Xi Chengyi Zhang Xufeng Xu Yuqi Cheng*
昆明医科大学第一附属医院

Objective Bipolar disorder (BD) is a common, complex, and heritable psychiatric disorder characterized by episodes of severe mood swings. The contribution of both common and rare risk variants to the genetic architecture of BD has been documented in whole exome and whole genome sequencing approaches. Genome-wide association studies have identified multiple variants that can contribute to the disease, but few of these risk variants or genes can be repeated and their mechanisms are not completely clear. Less work has been undertaken to assess the contribution of rare variants in the development of this complex disorder. Due to the high heterogeneity and segregation of BD between different families, there is an urgent need to identify highly penetrant rare variants through multiply affected family. In this study, we aimed at identification of rare, penetrant risk variants utilizing whole exome sequencing (WES) in a three-generation Chinese family with multiple members affected with BD.

Methods WES was performed on a density Chinese BD family with four individuals affected BD and three healthy family members. The analyses focused on i) the identification of rare, damaging variation, and ii) the molecular function in which these rare variants play a role using several in silico prediction tools. Sanger sequencing was conducted to confirm the segregation. Finally, protein structure was performed to evaluate the effect of the detected variants.

Results Filtered data from WES according to the candidate variants prioritized strategy, combined with in silico analyses, we revealed two novel rare and potentially damaging frameshift variants (rs574933916, rs531096022) in the gene TIMELESS. Sanger sequencing validated the segregation. The two variants were shared by four affected individuals but were absent in unaffected members. These two insertion variants were located in an evolutionary conserved position and predicted to be damaging to protein coding by different prediction tools. TIMELESS plays an important role in the DNA replication and genome stability and in the regulation of the circadian clock.

Conclusion This study provides an insight of how multiplex affected family used to identify rare variants on risk for disease. The novel rare variants identified in TIMELESS further deepen our understanding of mutation spectrum and provide additional evidence to the role of TIMELESS in causation of BD. Future work in larger samples is needed to fully investigate the role of the TIMELESS in BD.

产前抑郁筛查量表的编制与初步验证

向静 朱刚*
中国医科大学附属第一医院

目的 编制产前抑郁筛查量表（prenatal depression screening scale,PDSS）用于产前抑郁的筛查，为临床及科研提供更好的测评产前抑郁的工具；初步验证产前

抑郁筛查量表，探索影响孕妇产前抑郁的因素。

方法 (1）以 DSM-5 和 ICD-11 中抑郁障碍诊断标准以及各类抑郁自评量表为理论基础，检索大量产前抑郁相关文献，并与孕妇进行结构化访谈，建立条目池。(2）专家咨询后，根据专家意见进行条目的删减和修改。(3）在产科门诊选取孕妇进行预调查，对问卷的用词采取了通俗化处理，并进一步删除不适宜孕妇回答的条目，初步形成量表。(4）采用方便抽样的方法在产科门诊进行正式调查。(5）用 SPSS 和 Amos 对量表做统计学分析，最终正式确定量表。(6）采用一般情况调查量表、PDSS、EPDS、Beck、PHQ-9、HAMD 对孕妇进行调查，探讨影响 PDSS 得分因素，并绘制各量表 ROC 曲线，比较 AUC，结合临床实践，选出最适宜孕妇群体的抑郁评价量表。

结果 (1)专家咨询：积极度为 100%，Cr 为 0.810。（2）经过各种条目分析以及探索性因子分析，各条目因子负荷量均大于 0.4，总体累计方差贡献率为 65.408%。量表总克隆巴赫 α 系数为 0.924，重测信度为 0.880，分半信度为 0.873，信度良好。验证性因子分析显示 x/df=1.461，RMSEA=0.064，CFI=0.920，GFI=0.869，TLI=0.901，IFI=0.923，拟合指标均达标。（3）以患者的一般情况为自变量，PDSS 总分作为因变量，分别做单因素方差分析。统计学上有显著性差异的是“家庭月收入”、“个人收入”、“计划妊娠及期待值”、“妊娠期间合并症/并发症”、“抑郁症病史”、“经前烦躁史”、“分娩医疗保险”、“痛经史”。(4）ROC 曲线分析中 EPDS 曲线下面积为 0.864，PHQ-9 为 0.871,Beck 为 0.907，PDSS 为 0.877。

结论 （1）编制《产前抑郁筛查量表》符合量表编制基本流程，信效度均达标，可以用于产前抑郁的筛查。(2）孕妇在妊娠期间多感到思维没有以前敏捷、易怒、易焦虑、睡眠质量下降。(3）经济水平、妊娠期间合并症/并发症、抑郁症病史、经前烦躁史、痛经史是产前抑郁的影响因素。(4）与 EPDS、HAMD、PHQ-9、Beck 相比，本量表更适用于孕妇产前抑郁筛查。

基于网络的产前正念干预对围产期女性产后抑郁预防的有效性研究

何佳莉 朱刚*
中国医科大学附属第一医院

目的 本研究初步建立一套基于互联网的产前正念干预方案，并探讨该干预方案对产后抑郁的预防效果，以期降低围产期女性罹患产后抑郁的风险，也为产后抑郁的防治奠定理论基础。

方法 选取 2021 年 12 月-2022 年 10 月在中国医科大学附属第一医院产科门诊进行常规产检、自愿接受干预的孕晚期女性作为研究对象，采用随机数表法将其随机分入干预组和对照组，两组各 50 例。对照组接受常规产检和健康教育，干预组在对照组的基础上接受基于网络的产前正念干预措施。在干预开始之前和产后 4 周采用 EPDS、GAD-7、PSS、PSQI、FFMQ 分别评估两组研究对象产后抑郁、焦虑、知觉压力、睡眠质量和正念水平等方面的变化情况。

结果 干预前后，干预组和对照组在健康情况调查表、EPDS、GAD-7、PSS、PSQI、FFMQ 中得分的差异均没有统计学意义（P＞0.05），而实施干预后干预组 FFMQ 总分明显高于对照组（P＜0.05），说明干预组正念水平较对照组有显著改善；干预组新发 8 例（19.0%），对照组新发 20 例（44.4%），比较两组发病率具有统计学意义（P＜0.05），干预前后干预组 EPDS 得分比较差异有统计学意义（P＜0.05），而对照组无明显统计学差别（P＞0.05），表明干预组抑郁水平明显改善；干预组 GAD-7 得分比较差异有统计学意义（P＜0.05），而对照组没有明显的统计学差别（P＞0.05），说明通过实施正念干预，干预组焦虑水平显著改善；干预前后 PSS 得分比较差异均有统计学意义（P＜0.05），说明干预组知觉压力水平较对照组有明显改变；两组干预前后 PSQI 得分比较差异均无统计学意义（P＞0.05），提示正念干预对孕妇产后睡眠质量没有显著改善；干预组在 4 周干预后 FFMQ 总分及描述、觉知地行动维度差异具有统计学意义（P＜0.05），观察、不判断、不行动维度没有明显改变，而对照组 FFMQ 总分及各个维度均未有显著变化（P＞0.05），表明经正念情绪管理干预后，干预组孕妇正念水平有明显提高，以描述和觉知地行动维度为主。

结论 本研究发现基于网络的产前正念干预对于改善产后焦虑、知觉压力、以及提升正念水平有积极作用，提示临床心理健康教育可以通过实施产前正念干预措施，从而帮助围产期女性预防产后抑郁的发生和产后负性情绪的出现

关键字：围产期；产后抑郁；正念干预

经颅磁刺激治疗伴快感缺失抑郁症患者的功能近红外脑成像研究

褚江敏 程宇琪* 李欣儒 董蕾 奚康
昆明医科大学第一附属医院

目的 抑郁症是以情绪低落为主要表现的疾病，快感缺失作为抑郁症的核心症状之一。爆发式丛状刺激(TBS)是经颅磁刺激治疗的新型治疗模式，因其刺激时间短、可多次重复治疗等优势逐渐成为新的治疗方案。本研究采用双侧 TBS（biTBS：左侧 iTBS 治疗，右侧 cTBS 治疗）分别作用于背外侧前额叶及眶额叶两个不同位点对抑郁症快感缺失患者进行治疗，观察 biTBS 治疗患者快感缺失及其他抑郁症状的疗效，对比不同靶点对于快感缺失和其他抑郁症状是否存在疗效差异，使用近红外脑功能检测对比治疗前后抑郁患者前额叶激活程度的改变。

方法 收集昆明医科大学第一附属医院精神科就诊的抑郁症伴快感缺失患者，将他们分为三组进行 biTBS 治疗，第一组以左右背外侧前额叶为靶点（DLPFC 组)；第二组以左右眶额叶为靶点（OFC 组)；

第三组以左右眶额皮层为靶点的伪 TBS 治疗（shamOFC 组）。收集与抑郁组患者相匹配的健康对照组（HC 组）。所有抑郁组患者治疗前、治疗第 5 天和治疗结束分别进行 17 项汉密尔顿抑郁量表、斯奈思-汉密尔顿快感量表评估患者疾病严重程度。在治疗前中后期分别使用近红外脑功能检测评估患者在语言流畅度任务（VFT）下前额叶的血红蛋白的浓度及分布。

结果 1.OFC 组和 DLPFC 组治疗后 HAMD 及 SHAPS 评分均低于 shamOFC 组差异有统计学意义（P＜0.05），DLPFC 组与 OFC 组治疗后分数无明显差异（P＞0.05），随着治疗时间的延长 HAMD 分数都存在不同程度的减低（P＜0.05）。2.近红外检测结果显示基线时 MDD 组与 HC 组相比，MDD 组的前额叶氧合动力曲线整体偏低平，OFC 组和 DLPFC 组经过 biTBS 治疗后右侧的氧合动力曲线较较治疗前明显降低，双侧前额叶较治疗前激活减弱，其中右侧更明显。

结论 1.相较于假刺激组，biTBS 辅助药物治疗对 MDD 患者的抑郁症状和快感缺失的治疗有效，OFC 组与 DLPFC 组疗效相近，可作为一个潜在治疗靶点。2.VFT 任务下抑郁患者在抑郁发作期间与健康对照相比存在广泛的双侧前额叶激活程度减低。3.biTBS 可能会造成双侧前额叶的激活程度下降，抑郁症状的改善可能和右侧 DLPFC 的部分脑区的氧合血红蛋白浓度呈负相关。

首次躁狂发作和首次抑郁发作患者血清甲状腺激素水平的比较

杜健[1] 郑月[2] 陈丽君[1] 隋毓秀[1]
1.南京脑科医院
2.北京大学第六医院

目的 探究首发躁狂患者和首发抑郁障碍患者外周学甲状腺激素水平差异，及其与疾病的相关性。

方法 纳入 2022 年 8 月——2022 年 10 月于南京脑科医院精神科住院患者，其中首发躁狂患者 30 例（既往无抑郁发作史）和首发抑郁患者 33 例（既往无躁狂发作）的数据进行回顾性分析。卡方检验被用于比较首次发作的双相情感障碍和首次发作的抑郁障碍患者的性别、是否吸烟和是否饮酒的差异；独立样本 t 检验被用于比较两组患者的年龄、BMI、血清 TT3，TT4，FT3，FT4，水平的差异；Mann-Whitney U 被用于比较两组患者的血清 TSH 水平的差异；以血清 TT3，TT4，FT3，FT4，TSH 为因变量，通过二元逻辑回归探究入组被试的诊断和甲状腺激素水平的相关性。

结果 本研究共入组 63 名被试，所有被试甲状腺激素水平均在临床界定的正常范围内且无甲状腺相关疾病。两组基本资料比较中，性别（?2=0.09，df=1，p=0.923）、吸烟史（?2=0.55，df=1，p=0.458）和饮酒史（?2=3.508，df=1，p=0.061）无显著差异。两组的年龄（t=0.86, df=53, p=0.395）、BMI（t=1.10, df=61, p=0.277）也无统计学差异。两组间血清 TT3（t=0.305, df=61, p=0.761），TT4（t=-2.76, df=61, p=0.783），FT3（t=0.387, df=61, p=0.700）无明显差异。但相比于首发抑郁患者（M±SD=16.22±2.61），血清 FT4 表达水平（t=4.627, df=61, p<0.001）在首发躁狂组（M±SD=20.03±3.86）明显更高, Bonferroni 校正（p=0.05/10）后两组间的差异仍然显著；相比于首次发作的抑郁障碍组（M±SD=2.19±1.14），TSH（Z=-2.11, p=0.035）在首发躁狂组（M±SD=1.70±1.08）明显更低, 但 p 值未能通过 Bonferroni 校正（p=0.05/10）。二元逻辑回归显示两组患者的疾病诊断和血清 FT4（B=-0.44，df=1，p<0.001）显著相关，而与 TT3，TT4 和 TSH 无关。

结论 本研究结果表明，首发抑郁患者 FT4 水平明显低于首发躁狂患者，并且首发抑郁和首发躁狂诊断和血清 FT4 表达水平密切相关。

运动后 beta 反弹减弱反映重性抑郁障碍患者的精神运动改变：一项脑磁图研究

夏逸[1] 崔青[1] 阎锐[1] 卢青[2] 姚志剑[1,2]
1.南京医科大学附属脑科医院心境障碍科
2.东南大学生物医学工程

目的 精神运动改变是重性抑郁障碍患者的常见症状。初级运动皮质在精神运动改变的机制中起着至关重要的作用。既往研究发现运动异常患者的感觉运动皮层运动后 beta 反弹改变。然而，重性抑郁障碍患者运动后 beta 反弹的变化尚不清楚。本研究旨在探讨重性抑郁障碍患者精神运动改变与运动后 beta 反弹的关系。

方法 共计 132 名受试者包括 65 名健康对照和 67 名重性抑郁障碍患者。患者来自于 2010 年到 2020 南京医科大学附属脑科医院心境障碍科住院诊断为重性抑郁障碍正处于抑郁发作的患者。健康人招募于社区。在脑磁图扫描期间，所有参与者都完成了一项简单的右手视觉运动任务。采用时频分析方法，在源重建水平测量左侧初级运动皮质的运动后 beta 反弹。采用阻滞因子得分和神经认知功能测验，包括数字符号转换测验、连线测验 A 式和言语流利性测验，来评估精神运动表现。采用皮尔逊相关分析评估运动后 beta 反弹与精神运动改变之间的关系。

结果 在所有三项神经认知测试中，患者组的神经认知表现都比对照组差。与对照组相比，患者的运动后 beta 反弹降低。在患者组中，运动后 beta 反弹降低与阻滞因子分呈负相关。此外，运动后 beta 反弹和数字符号转换测验得分之间存在正相关，与言语流利性测验得分呈负相关。

结论 我们的发现提示，初级运动皮质中运动后 beta 反弹的减弱可能是重性抑郁障碍精神运动改变的原因之一，可能与临床精神运动症状和认知功能障碍有关。

精神科专业住院医师规范化培训中如何进行分阶段及分层递进培养

梁雪梅* 孙伟东 李欣 张笑然
齐齐哈尔医学院第四附属医院

目的 在日趋完善的住院医师规范化培训计划中，分阶段及分层递进式教学模式充分体现“以学生为主体，以教师为主导”的教学原则，为了更好的进行精神医学的人才培养，探讨分阶段及分层递进教学模式在精神科住院医师规范化培训中的应用进行本研究。

方法 通过计算机检索中国知网（CNKI）、万方数据知识服务平台等数据库，检索时间为 2010 至 2023 年 6 月，检索词为“分层递进”、“分阶段递进”、“精神科”、“住院医师规范化培训”，纳入有效参考文献 35 篇。结合各基地住院医师规范化培训过程中分阶段及分层递进培养的一系列方案和措施，以齐齐哈尔医学院附属第二医院精神科专业基地实践经验为例，紧扣住培“两个标准”，围绕精神科住培教学过程中如何开展分阶段及分层递进的教学模式进行了总结及深入思考。

结果 在住培教学过程中进行分阶段及分层递进教学是各专业基地目前积极推广应用的教学模式，部分基地积极探索在轮转培训计划、培训课程、教学活动、带教和考核等各个环节实施分层递进，不断优化以临床胜任力为导向的住院医师规范化培训模式，逐步提高和完善住院医师的临床胜任力。此种教学模式能科学、有效地提高住院医师培训质量。但在精神科专业基地目前尚无单独针对此种教学模式的探讨及报道，且精神科住培方面的文章数量非常少。

结论 只有因地制宜、因人施教才能取得更好的培训效果，通过分层递进的培养模式能调动学员的学习自主性，加深对学科的认识，从浅到深，从简单到复杂，层层递进地让学员树立临床自信，强化临床思维，巩固临床知识，完善医患沟通。通过以胜任力为导向的分层递进教学，对提高规范化培训质量和水平，具有积极促进作用。本文通过分析其他专业基地的教学经验及结合精神科专业基地教学实践，总结了目前精神科住培过程中从按年级进行分阶段培养方案及在实际教学课程设置、教学目标及要求、轮转科室具体教学活动、带教及考核等多方面分层培养模式进行总结。为能够培养具备六大核心胜任力的优秀精神科医师提供参考依据，以期为全国各家精神科住培基地提供借鉴。

Atypical Antipsychotics Resulting in Self-perceived Hot: A Case Report

孙林远[1] 高阳[2] 苏斌[2] 李名立[1]
1.四川大学华西医院
2.克拉玛依市人民医院

Objective Atypical antipsychotics have complex pharmacological properties. In addition to blocking 5-HT2A and D2 receptors, they also act on other neurotransmitters, such as noradrenaline transporter, M1, M3, H1, α1-adrenergic and α2-adrenergic. Blockade of α1 receptor can lead to adverse cardiovascular reactions such as orthostatic hypotension, dizziness, and sleepines. This paper reports a case of self-perceived hot caused by taking atypical antipsychotic drugs, in order to get clinical attention.

Methods A 31-year-old Han male has been diagnosed with schizophrenia for 6 years due to auditory hallucinations, persecutional delusions, and relational delusions. The patient was hospitalized after the initial onset of the disease. After taking olanzapine 20mg/d, auditory hallucinations and delusions gradually disappeared, but he had irritable temper and felt hot without fever. After discharge, the patient adhered to medication for 6 months and partially recovered his social function. But he discontinued treatment for felt hot. 8 months later, his symptoms relapsed and was hospitalized for a second time, and the drug was adjusted to risperidone 2mg twice a day. The psychotic symptoms were improved, but he still felt hot even lead to poor sleep at night. After discharge, he took medicine regularly under the supervision of their family members and could keep working outside the hospital for 1 years. But he secretly discontinued the medication due to the discomfort of feeling hot again. He relapsed again for the third time, drug adjustment for paliperidone 3mg/d and clozapine 25mg/d. He complained of hot and irritability, and asked to take a cold bath.

Results Aripiprazole 25mg/d and clozapine 25mg/d were prescribed to him. Three days later, the patient was happy that the self-perceived hot disappeared and the mood was no longer irritable. During follow-up after discharge for 6 months, self-conscious hot did not recur and psychotic symptoms were well controlled.

Conclusion To our knowledge, this is the first report of self-perceived hot in patients with atypical antipsychotics. Atypical antipsychotic medications have complex pharmacologic mechanisms, and a review of this patient's history reveals that all previous antipsychotic medications antagonize the α1-adrenergic receptor, which leads to telangiectasis, and this may have been the cause of his felling of fever with normal temperature. Aripiprazole and amisulpride have no α1-adrenergic receptor antagonism, and the absence of fever after switching to aripiprazole supports this finding. This case suggests that when a patient with schizophrenia who is under treatment reports adverse effects of abnormal somatosensory, the antipsychotic medication used by the patient should be reviewed, and a change of medication may be considered to avoid this adverse effect and improve the patient's adherence to treatment.

情感忽视和情绪智力对青少年抑郁症非自杀性自伤行为的影响：有调节的中介模型

严舒雅[1] 冉杭林[2] 罗艳鸽[3] 钟舒明[1] 贾艳滨[1]
1.暨南大学附属第一医院(广州华侨医院)
2.重庆医科大学
3.中山大学附属第八医院

目的 探索情感忽视和情绪智力对青少年抑郁症患者非自杀性自伤行为的影响，以及抑郁症状和情绪智力在其中的有调节的中介作用。

方法 纳入174例符合DSM-5诊断标准的青少年抑郁症患者（10-18岁），采用童年创伤问卷(Childhood Trauma Questionnaire, CTQ)、抑郁自评量表(Self-rating Depression Scale, SDS)、青少年自我伤害问卷、情绪智力问卷(Emotional Intelligence Scale, EIS)分别评估患者的情感忽视、抑郁症状、非自杀性自伤行为(Non-suicidal Self-injury, NSSI)和情绪智力。使用皮尔逊相关或斯皮尔曼相关对各量表得分之间的关系进行探查；使用 Hayes 编制的 PROCESS 宏程序进行有调节的中介模型分析；使用简单斜率分析进一步探讨情绪智力如何调节抑郁症状和NSSI的关系。

结果 NSSI的检出率为55.2%（96/174）。情感忽视与 NSSI 呈显著正相关(r=0.40, p<0.001)；情感忽视显著正向预测抑郁症状 (β=0.93, p<0.001)，抑郁症状显著正向预测 NSSI (β=1.01, p<0.001)；情绪智力和抑郁症状的交互项显著负向预测 NSSI(β=-0.03, p<0.001)。简单斜率分析显示，低情绪智力者的抑郁症状对NSSI的预测作用(β=1.58, p<0.001)大于高情绪智力者的抑郁症状对 NSSI 的预测作用(β=0.44, p=0.02)。

结论 青少年抑郁症患者的抑郁症状在情感忽视与NSSI之间起完全中介作用，情绪智力调节了中介模型的后半路径，在抑郁症状对NSSI的影响中起调节作用，随着情绪智力水平的降低，青少年抑郁症患者的抑郁症状严重程度对NSSI的预测作用越来越强。

艾司氯胺酮激活Nrf2抑制炎症反应发挥快速抗抑郁作用

马欣旭 陈海霞 彭正午 王化宁 蔡敏*
西京医院

目的 探讨艾司氯胺酮对LPS所诱导的抑郁样行为的影响及可能机制。

方法 采用脂多糖（LPS）腹腔注射构建诱导抑郁样行为。将40只C57BL/6J小鼠随机分为对照组（Con）、模型+生理盐水组（LPS+Sal）、模型+艾司氯胺酮治疗组（LPS+Es-Ket）和模型+艾司氯胺酮+Nrf2信号通路抑制剂组（LPS+Es-Ket+ML385），每组10只。LPS+Sal组、LPS+Es-Ket组和LPS+Es-Ket+ML385组连续5天腹腔注射LPS（1mg/kg）进行造模，Con组仅注射生理盐水。造模结束后，Con组和LPS+Sal组小鼠均接受10?L/g生理盐水，LPS+Es-Ket组和LPS+Es-Ket+ML385组接受10mg/kg艾司氯胺酮腹腔注射，随后LPS+Es-Ket+ML385组立即接受30 mg/kgML385腹腔注射，24h后依次进行旷场实验、新奇抑制摄食实验、悬尾实验检测各组小鼠抑郁样行为。随后，处死小鼠，分离出前额叶皮层和海马组织，通过Western Blot检测小鼠前额叶皮层和海马组织中Nrf2、IL-1β、TNF-α和iNOS的表达情况。

结果 1.较Con组，LPS+Sal组和LPS+Es-Ket+ML385组旷场运动总距离、中心区运动距离、进入中心区次数、中心区停留时间比均显著降低（P均<0.05）、进食潜伏期和悬尾不动时间增加（P均<0.05）；较LPS+Sal组和LPS+Es-Ket+ML385组，LPS+Es-Ket组旷场运动总距离、中心区运动距离、进入中心区次数、中心区停留时间比均显著增加（P均<0.05）、进食潜伏期和悬尾不动时间减少（P均<0.05）；Con组与LPS+Es-Ket组各行为学指标均无统计学差异（P均＞0.05）。2.较Con组，LPS+Sal组和LPS+Es-Ket+ML385组前额叶皮层和海马组织中Nrf2分子表达下降，IL-1β、TNF-α和iNOS分子表达上调（P均<0.05），LPS+Es-Ket组前额叶皮层和海马组织中Nrf2表达较LPS+Saline组增加，IL-1β、TNF-α和iNOS分子表达下降（P<0.05），Con组与LPS+Es-Ket组上述分子表达均无差异（P>0.05）。

结论 艾司氯胺酮可快速改善LPS所导致的小鼠抑郁样行为，其抗抑郁作用会受到Nrf2通路抑制剂的影响。

马来酸氟伏沙明对伴胃肠道症状的儿童青少年强迫症患者疗效及其肠道菌群的影响研究

代佳利[1,2] 朱刚[1]
1.中国医科大学附属第一医院
2.大庆市第三医院

目的 明确伴胃肠道症状的首发未用药儿童青少年强迫症患者肠道菌群的整体结构特征。探究伴胃肠道症状的儿童青少年强迫症患者经马来酸氟伏沙明治疗的临床疗效与安全性。比较伴胃肠道症状的儿童青少年强迫症患者经马来酸氟伏沙明治疗前后肠道菌群变化情况，并寻找出显著差异菌群及其与临床疗效之间的相关性。

方法 1、将2022年1月～2023年1月于本院心理科就诊的30例伴胃肠道症状的儿童青少年强迫症患者作为研究对象，对所有受试者进行相关临床量表的评定，并留取粪便样本。2、给予伴胃肠道症状的首发未用药儿童青少年强迫症患者马来酸氟伏沙明足量治疗12周，于治疗4、8、12周后复测CY-BOCS、HAMD、HAMA、GSRS、TESS以及CGI，完成随访后再次收集粪便样本，并对治疗前后的样本进行16SrRNA测序。

3、通过比较治疗前后患者肠道菌群变化情况以及强迫、焦虑、抑郁等临床症状的严重程度，明确马来酸氟伏沙明对伴胃肠道症状的儿童青少年强迫症患者的临床疗效与安全性，并进一步探讨该药物对伴胃肠道症状的儿童青少年强迫症患者肠道菌群的影响。

结果 1、经马来酸氟伏沙明治疗 12 周后伴胃肠道症状的 OCD 患者（OCD12W）胃肠道症状明显减轻（P < 0.05）。2、 OCD12W 组患者肠道菌群各多样性指数均显著升高（obs，P < 0.05；chao1，P < 0.05；ACE，P < 0.05；shannon，P < 0.05；simpson，P < 0.05）。2、OCD12W 组厚壁菌门 / 拟杆菌门的相对丰度比值（F/B）显著升高（P < 0.001）。3、OCD12W 组患者肠道瘤胃球菌属（Ruminococcus，q＜0.01）、大肠埃希菌-志贺氏菌属（Escherichia-shigella，q＜0.01）等与胃肠道症状相关的菌属的相对丰度显著升高。4、OCD 组各临床参数的变化与肠道菌群中特定细菌的丰度改变之间存在相关性（P＜0.05）。

结论 1、经 12 周马来酸氟伏沙明治疗，首发未用药儿童青少年 OCD 患者胃肠道症状明显改善，肠道菌群多样性显著升高。2、首发未用药儿童青少年 OCD 患者肠道稳态被破坏与瘤胃球菌属（Ruminococcus）等与胃肠道症状密切相关的菌属相对丰度显著降低有关。3、首发未用药儿童青少年 OCD 患者各临床参数的变化与肠道菌群特定物种的丰度改变之间存在关联。

基于高通量测序方法的儿童青少年强迫症患者肠道菌群特征分析

代佳利[1,2] 朱刚[1]
1.中国医科大学附属第一医院
2.大庆市第三医院

目的 强迫症（obsessive compulsive disorder，OCD）是一种病因未明的致残性精神障碍，其发生发展过程与肠道菌群的关联尚未被完全阐明。本研究旨在通过 16SrRNA 测序和宏基因组学联合分析的方法，为首发未用药儿童青少年强迫症患者是否存在肠道菌群功能紊乱提供直接证据，同时寻找强迫症的潜在生物标志物。

方法 1、本研究首先收集了 49 例首发未用药儿童青少年强迫症患者（OCD）和 42 例年龄、性别与之匹配的健康对照者（HC）的粪便样本，同时对受试者进行随访及各临床参数的评估。2、采用 16S rRNA 测序的方法对 49 例强迫症组（OCD 组）和 42 例健康对照组（HC 组）的粪便样本进行分析。3、利用宏基因组学高通量测序方法基于 Illumina HiSeq 测序平台对 19 例 OCD 及 18 例 HC 受试者的粪便样本进行分析。

结果 1、OCD 患者肠道菌群各多样性指数均显著降低（P < 0.001），同时其微生物互作网络明显弱于 HC 组。2、OCD 组厚壁菌门 / 拟杆菌门的相对丰度比值（F/B）显著降低（P < 0.001）。3、OCD 患者肠道罗姆布茨菌属（Romboutsia，q ＜ 0.01）、光冈菌属（Mitsuokella，q＜0.01）、土孢杆菌属（Terrisporobacter，q＜0.01）等产丁酸盐菌的丰度显著降低。4、随机森林模型识别 30 个特异性菌属作为生物标记物，OCD 组和 HC 组之间的 AUC 为 0.9011。5、OCD 组各临床参数的变化与肠道菌群中特定细菌的丰度改变之间存在相关性（P＜0.05）。

结论 1、首发未用药儿童青少年 OCD 患者肠道菌群的多样性显著降低，且微生物互作网络存在明显缺陷。2、首发未用药儿童青少年 OCD 患者肠道稳态被破坏与罗姆布茨菌属（Romboutsia）等产丁酸盐细菌的相对丰度显著降低有关。3、OCD 组和 HC 组可通过以包特氏菌属（Bordetella）为主的特异性肠道菌群生物标记物进行区分。

五羟色胺再摄取抑制剂对首发未用药儿童青少年强迫症患者肠道菌群的影响

代佳利[1,2] 朱刚[1]
1.中国医科大学附属第一医院
2.大庆市第三医院

目的 强迫症（OCD）是一种以反复持久出现的强迫观念和（或）强迫行为为基本特征的慢性致残性精神障碍。本研究旨在通过 16S rRNA 测序、宏基因组学和代谢组学多组学联合分析的方法，探讨 SSRIs 治疗对首发未用药儿童青少年 OCD 患者肠道菌群结构和功能的影响，为 OCD 的早期诊断和疗效预测提供重要的理论基础。

方法 本研究首先收集了 26 例首发未用药儿童青少年 OCD 患者，对受试者进行随访及各临床参数的评估，并留取粪便样本。利用 16S rRNA 扩增子测序技术、宏基因组高通量测序，并基于超高效液相色谱系统-质谱联用（UHPLS-MS）技术采用代谢组学的方法对 26 例经过 12 周 SSRIs 药物干预的 OCD 患者（OCD12W）肠道菌群粪便样本进行多组学分析，探讨治疗前后（OCD0W-OCD12W）肠道菌群变化特征，并寻找与疗效相关的特异性菌群标记物和可能涉及到的代谢通路。

结果 1、药物干预后强迫症组（OCD12W）肠道菌群各多样性指数与干预前组（OCD0W）相比均无显著性差异（P＞0.05）。2、随机森林模型在治疗有效组（Respond）和无效组（Nonrespond）患者中识别了 13 个特异性菌属作为微生物标志物，其 AUC 为 0.8274。3、OCD0W-OCD12W 组共筛选出 63 个差异代谢物，其中叶酸合成通路（Folate Biosynthesis）的中间产物新喋呤（Neopterin）和墨蝶呤（Sepiapterin）在 OCD12W 组的相对含量显著降低（P <0.05）；延胡索酸（Fumarate）、2-氧代异戊酸（2-oxoisovalerate）、3-脱氢奎尼酸（3-dehydroquinic acid，DHQ）等参与氨基酸生

物合成通路的代谢物显著升高（P <0.05）。

结论 1、短期 SSRIs 治疗可以改善儿童青少年 OCD 患者临床症状，但不能显著改变其肠道菌群的组成和结构。2、OCD 患者对药物干预的疗效也可以通过以丛生放线菌属（Actinospica）为主的特异性生物标记物模型进行预测。3、OCD 患者肠道菌群代谢产物表达存在紊乱，并造成相关代谢通路功能异常，药物治疗可部分恢复。

Anti-Myelin Oligodendrocyte Glycoprotein Antibody-Associated Meningitis with Psychotic Symptoms

Xiaofei Cheng[1], Qian Yang[1], Zhewei Su[1], Linyuan Sun[1], Mei Wang[1,2], Mingli Li[1,2]
1.West China Hospital, Sichuan University
2.Sichuan Clinical Medical Research Center for Mental Disorders

Objective The current study aims to discuss the possible relationship between anti-Myelin Oligodendrocyte Glycoprotein (MOG) antibody-associated meningitis and psychotic symptoms based on a case report.

Methods We report one case of a 31-year-old female presented with headache, fever, thinking rupture, and dissociative amnesia. We summarize all test results of the patient, combining the diagnosis, treatment and clinical effect, to find out the relationship between MOGAD and psychotic symptoms.

Results The patient was diagnosed with viral encephalitis and treated with antiviral therapy for 7 days after lumbar puncture in a local hospital, with the CSF nucleated leukocyte count of 17 × 106/L (reference range: 0–8 × 106/L). She regained consciousness; however, developing new symptoms of splitting of thought and dissociative amnesia. So lumbar puncture was performed again. CSF analysis showed the nucleated leukocyte count decreased to 2 × 106/L. Only pachymeningeal enhancement was observed on T2-weighted FLAIR MRI after gadolinium enhancement, with a disorganized alpha rhythm on EEG. She was treated with sufficient antiviral and anti-psychotics, totally recovered from dissociative amnesia but was discharged for unsatisfactory remission of splitting of thought. This time, anti-MOG IgG antibodies were found in her serum, with a titer of 1:10 (reference range: negative). Thus, she was diagnosed with anti-MOG antibody-associated meningitis and treated with intravenous methylprednisolone therapy. Finally, she recovered totally during the subsequent visit after two weeks. Enhanced MRI showed reduction in pachymeningeal enhancement in the third-month of follow-up.

Conclusion There might be relationship between MOG and psychosis. Firstly, psychotic symptoms may be the main manifestation of anti-MOG antibody-associated meningitis. Secondly, it implied the importance of immunotherapy in the treatment of anti-MOG antibody-associated encephalitis or meningitis with psychotic symptoms. Thirdly, the patient showed pachymeningeal enhancement instead of brain parenchymal lesions. Due to the atypical clinical features and CSF/MRI changes, this rare kind of MOGAD must be considered especially when the patient presents with fever, headache, and mental disorders with meningitis-like image changes. In conclusion, our findings prove the complexity of the clinical manifestations of anti-MOG antibody-associated diseases in patients with psychotic symptoms as the primary or main symptom. Thus, this report may expand our understanding of autoimmune psychosis.

双相障碍灰质体积和功能连接与电压门控钙离子通道 CACNB2 基因的关联研究

程晓菲[1] 杨倩[1] 张雅敏[2] 魏巍[2] 李名立[1] 李涛[2]
1.四川大学华西医院心理卫生中心
2.浙江大学医学院附属精神卫生中心(杭州市第七人民医院)

目的 探索双相障碍（Bipolar Disorder，BD）与健康对照（Health Control，HC）间大脑灰质体积和功能连接的差异，以及电压门控钙离子通道基因 CACNB2 rs11013860 多态性与双相障碍交互作用的大脑灰质体积及大脑功能连接的脑区。

方法 纳入 173 名 BD 患者和 207 名 HC，采集其一般信息、外周血、临床量表评分，通过磁共振成像（MRI）进行大脑结构及功能的检测，用 imLDRTM 法检测 CACNB2 rs11013860 基因多态性。通过 MATLAB2019a、DPABI 等软件对脑影像进行预处理；控制年龄、性别、受教育年限及大脑体积等协变量，分析两组受试者脑灰质体积(grey matter volume，GMV)、功能连接指标度中心（Degree Centrality，DC）的差异；应用 SPM12 分析诊断与 rs11013860 基因型对 GMV、DC 的交互作用。将 volex 水平 P<0.005，cluster 水平（FDR 校正）P<0.05 定义为有统计学差异。

结果 与 HC 组相比，BD 组双侧梭状回/前扣带回/扣带旁回/内侧额上回/眶内侧额上回/舌回/小脑前后叶、海马旁回、左侧颞上回/楔前叶/小脑坡、右侧岛叶等脑区 GMV 降低。BD 组双侧前扣带回/扣带旁回/额上回/颞上回/颞中回/枕上回等脑区 DC 降低；双侧额中回/额下回三角部/楔前叶/丘脑/尾状核/海马、左颞中回/角回/颞上回/后扣带回等 DC 增强。 与非风险等位基因携带者 CC 组相比，CACNB2 rs11013860 的风险等位基因纯合子携带者 AA 组左侧距状裂、双侧舌回/楔叶等脑区的 GMV 减小。未发现 rs11013860 基因对 DC 有影响。右侧小脑前叶/小脑后叶/小脑坡/小脑山顶/海马旁回/舌回的 GMV 存在诊断与 rs11013860 基因的交互效应。患者组表现为风险等位基因携带者纯合子组（AA 组）大脑灰质体积较非风险等位基因携带者

（CC 组）增大；正常对照表现为风险等位基因携带者（AA、AC 组）大脑灰质体积较非风险等位基因携带者减少。

结论 本研究发现 BD 与 HC 组间的灰质体积和功能连接均存在差异，主要集中于小脑、扣带回、额/颞上回、海马、楔前叶等情绪环路上；CACNB2 rs11013860 基因可能通过影响右侧小脑/海马旁回/舌回等脑区的灰质体积导致 BD 的发生。

免疫炎症与奖赏功能在青少年抑郁障碍中的研究进展

姚珂珂 叶兰仙*
兰州大学第二医院

目的 青少年抑郁障碍是一种严重且越来越常见的精神疾病，存在显著的痛苦和功能障碍，与成年后的精神疾病及心理社会功能障碍发生密切相关，已成为当今重大的公共卫生问题之一。目前抑郁障碍的具体病理机制尚未明确，近年来，奖赏-炎症整合模型被提出，研究发现免疫炎症系统和奖赏系统在抑郁障碍中双向关联相互作用，本文就免疫炎症与奖赏功能在青少年抑郁障碍中的相互作用研究进展作一综述，为青少年抑郁障碍的精准干预及治疗提供新的方向。

方法 综述近 5 年青少年抑郁障碍免疫炎症及奖赏功能相关的研究进展，总结二者之间的相互作用机制和影响因素。

结果 目前，免疫-炎症假说已成为抑郁障碍病理机制研究的热点之一，免疫炎症是抑郁障碍潜在的重要促发因素，主要通过影响大脑奖赏相关的神经回路及神经递质与奖赏功能相互作用。白介素-6（interleukin-6,IL-6）、肿瘤坏死因子（tumor necrosis factor,TNF）、C-反应蛋白（C-reactive,CRP）等细胞因子及炎症蛋白通过影响奖赏相关脑区、改变腹侧纹状体的多巴胺释放和激活犬尿氨酸等途径导致奖赏反应性和目标导向行为的降低，对青少年抑郁障碍不同方面的动机行为造成损害。除此之外，童年逆境、近期压力可调节免疫炎症与奖赏功能在青少年抑郁障碍中的相互作用。

结论 免疫炎症和奖赏功能相互作用可能是青少年抑郁障碍的重要发病机制，为未来青少年抑郁障碍发病机制研究及有效的干预治疗提供理论依据。

住院医师规范化培训学员心理健康评定量表编制

罗佳荟[1] 杨伶俐[2] 刘芳[1] 于嘉乐[1] 包凌博[1]
1.昆明医科大学第一附属医院精神科
2.昆明医科大学第一附属医院科教处

目的 编制《住培学员心理健康评定量表》并检验其信效度，为中国住培学员心理健康研究提供有效且具有针对性的测评工具，使住培学员心理健康水平客观化。

方法 在文献综述、半结构化访谈的基础上，基于心理健康的概念框架和前人编制的心理健康量表构建《住培学员心理健康评定量表》的结构与量表条目池。于 2021 年 9 月采用 Delphi 专家咨询法对量表条目进行定性评价，根据专家对条目的重要性和适用性的评分以及意见，对量表条目进行修改。于 2021 年 11 月采用方便整群抽样选取云南省昆明市某住培基地进行调查，共回收 386 份有效问卷，采用极端组比较、题目与总分相关、探索性因子分析等方法。于 2022 年 9 月对云南省昆明市两个住培基地发放正式版量表进行调查，共回收有效问卷 650 份。采用内部一致性系数、分半信度、效标效度、验证性因子分析等方法对量表性能进行评价。

结果 初次发放共回收 386 份问卷，对量表条目进行定量评价及筛选，结果显示《住培学员心理健康评定量表》由 6 个维度（压力知觉与应对、躯体症状、临床工作失误、支持网络、培训满意度、情绪行为反应）共 41 个条目组成，6 个维度方差累积贡献率达到 63.818%。再次发放共回收 650 份问卷，以进行量表的性能评价，总量表的 Cronbach's α 系数为 0.954，分半信度为 0.887；各维度 Cronbach's α 系数为 0.835～0.935，分半信度为 0.782～0.867，由此可见量表的信度良好。验证性因子分析显示，$\chi 2/df = 2.108$（$P < 0.001$），GFI ＝0.901，AGFI＝0.876，NFI＝0.930，RFI ＝0.917，CFI＝0.962，RMSEA＝0.041，模型拟合优度较好，表明该量表结构效度良好。

结论 《住培学员心理健康评定量表》基本满足量表编制要求，信效度良好，可以作为住培学员心理健康水平的评估工具。

精神疾病中情感迟钝的研究进展

张裕裕 蔡敏 唐乃龙 吕润欣 张遥迟 雷蕾 王化宁*
空军军医大学西京医院(空军军医大学第一附属医院)

目的 情感迟钝（emotional blunting）表现为高级和细腻情感的逐渐丧失、缺乏亲情友爱，严重者可使患者的生活质量下降及所承担的社会责任减少。情感迟钝可见于精神分裂症、抑郁障碍、双相情感障碍、创伤后应激障碍、痴呆等多种精神疾病中，尽管逐渐引起研究者的注意，但临床的认识及相关研究空白较大。情感淡漠（apathy）指对周围事物漠不关心，缺乏对外界刺激相应的情感反应，常与意志减退相伴。我们阅读文献后发现一些研究者将淡漠与情感迟钝交替使用，且描述的情感损伤的症状相似。本文综述了情感迟钝在各疾病中的相关研究，介绍了情感迟钝症状的评估工具

及治疗方式，以期为该症状提供更全面的了解认识，并为临床治疗提供参考。

方法 通过检索知网（情感迟钝）OR（淡漠）OR（淡漠综合征），Pubmed (((((emotional blunting) OR (emotional adverse effects)) OR (apathy syndrome)) OR (emotional* numb*)) OR (interpersonal adverse effects)) OR (cognitive blunting) 等进行整理分析和总结，检索式为主题和关键词，检索时间为 2000 年 1 月直今。

结果 现有针对情感迟钝这类情感反应降低的症状研究，大多将情感迟钝与淡漠两个术语随意使用，但是一项因素分析指出情感迟钝和淡漠是精神病性障碍阴性症状维度中的两个不同因素，也有研究者认为情感迟钝是淡漠症状的基础，除此之外还有一部分研究者认为淡漠是情感迟钝的一部分；多种疾病提示情感迟钝与认知障碍有关，因此这类症状是情感问题还是认知问题，仍需进一步的研究论证；目前尚无公认的情感迟钝的测量工具，在临床上使用多种评估工具进行评估，测量结果难免会存在差异；对于情感迟钝的治疗主要考虑减少用药剂量，更换不同类型的药物，及使用多巴胺能或抗胆碱酯酶等药物，但是会存在病情反复及加重的风险。

结论 目前缺少公认统一的针对情感迟钝症状的测量工具，对于不同疾病出现的情感迟钝症状，其治疗方式也需要我们临床医生的关注，以此来判断病情严重程度、规范并促进基于评估的临床诊断与治疗，以期针对症状为患者提供更好的治疗；未来仍需结合潜在的神经生物学基础和功能性神经成像技术进一步解析机制。

实施性科学在抑郁症中的运用进展

何雨茹[1] 方贻儒[2] 陈俊[1]
1.上海交通大学医学院附属精神卫生中心
2.上海交通大学附属瑞金医院

目的 抑郁症是最常见的精神障碍之一，其高致病、高复发、高致残的特征会对患者造成极大的疾病负担，亟待更有效且具成本效益的干预措施。近年来许多研究聚焦于抑郁症的基础研究，但可惜的是，其可能的病因和发病机制仍然未明。据估计，基础研究的成果平均需花费 17 年才有可能进入临床实践。实施性研究就此应运而生，其是针对政策和干预措施的实施过程，及影响这些过程的情境因素的科学研究，可以弥补最佳证据与临床运用之间的鸿沟，促进研究结果和基于循证的证据在日常实践中的系统吸收以提高卫生服务的质量和有效性。实施性科学比传统临床研究更广泛，不仅关注患者，还关注医疗服务提供者、组织和政策层面，需要跨学科的合作。总的来说，实施性科学是寻找“实施”有效干预措施的影响因素，弥补循证证据与临床实践之间鸿沟的科学。针对抑郁症的实施性研究正在蓬勃发展，但临床对其的意识仍然很局限，此综述旨在填补这一信息鸿沟，以促进实施性科学在临床中的应用。

方法 计算机检索 PubMed，收集使用实施性科学原理针对抑郁症的研究。检索时间为建库至 2022 年 11 月 1 日。英文检索词包括“major depressive disorder”，“depression”，“implementation science”，“implementation research”，“diffusion”等。

结果 实施性研究主要包括两个阶段。第一阶段通常会确定待解决问题的干预措施及其必要性。通常会通过形成性研究来明确政策或干预的必要性，其中包括现况调查，采用定性、定量或混合方法对实施者、潜在受众和其他利益相关方进行调查。第二阶段是在第一阶段的基础上，确定了干预措施和支持因素后，设计全面可靠的实验方案和试点研究，以确定是否可以通过对照试验或其他方法将干预措施推广到更大的环境，评估干预措施的临床有效性和实施性指标（可及性、可接受度、适合性、采纳性、可行性和保真度等）。

结论 这一类旨在促进基于循证的干预在临床的实施，弥补最佳证据和临床运用之间鸿沟的研究即为实施性研究。本综述将介绍实施性科学的定义及其在抑郁症中的运用进展，实施性科学如何推进高质量证据在真实世界的实施，并呼吁在抑郁症及其他精神障碍领域中更广泛地使用实施性科学，扩大有效干预措施的实施。

2.联勤保障部队第九〇四医院

目的 抑郁症是我国最常见的精神障碍之一，其认知功能障碍影响着患者的预后和生活质量，也与抑郁症高复发率有关，给个人、家庭和社会带来了沉重的负担。因此，改善抑郁症患者认知功能至关重要。重复经颅磁刺激（Repetitive transcranial magnetic stimulation，rTMS）是无创脑刺激技术的一种，广泛用于抑郁症的治疗，但对抑郁症患者认知功能障碍的疗效尚未得出统一结论。本文旨在探究 rTMS 对抑郁症患者的认知功能障碍的疗效，并分析其治疗相关机制及安全性，进一步归纳精准、个体化 rTMS 治疗抑郁症认知障碍的最新进展，为下步开展相关临床工作和科研工作提供理论借鉴。

方法 通过计算机检索 PubMed、Web of Science、中国知网（CNKI）、万方数据知识服务平台等数据库，检索时间为建库至 2023 年 1 月，中文检索词包括“rTMS”、“抑郁症”、“认知”，英文检索词包括“depression”、“rTMS”、“cognitive”。文献纳入标准：文献内容涉及 rTMS 治疗抑郁症患者对认知功能的影响，文献排除标准： 与本文主题无关联的文献、质量较差的文

献等。最终纳入文献 33 篇。

结果 通过回顾相关文献，可见 rTMS 与改善抑郁症患者工作记忆、执行功能、注意力和信息处理速度等认知功能有关，但并非所有研究都观察到认知的变化。毕竟磁脉冲波形、线圈的形状和方向、刺激的强度、间隔和频率等不同的刺激参数，不同的刺激部位，以及不同的认知任务，都会影响研究的结果。年龄也可能是 rTMS 治疗抑郁症认知功能障碍效果的独立影响因素，老年人群认知改善的潜力可能更大，因为年轻患者的认知功能可能显示出天花板效应，但其抗抑郁疗效与年龄可能并无相关联系。

结论 总之，rTMS 可以改善抑郁症患者的认知功能障碍部分维度，有治疗抑郁症患者认知功能障碍的潜力，且不依赖其抗抑郁作用，也无认知副作用，未来可能成为一种恢复抑郁症患者认知功能的代偿治疗模式。近些年个体化的精准 rTMS 抗抑郁疗效得到了验证，但对抑郁症认知功能障碍疗效尚缺乏相关研究，未来需结合影像学探索基于个体化的精准 rTMS 最佳方案，改善抑郁症患者认知功能障碍，提高其生活质量，帮助其更好的回归社会。

Sex Differences of Glutamate, GABA and BDNF in Patients with Major Depressive Disorder

Aichen Tang Rena Li* Gang Wang*
The National Clinical Research Center for Mental Disorders & Beijing Key Laboratory of Mental Disorders of Mental Disorders, Beijing Anding Hospital, Capital Medical University

Objective Women are about twice as likely as are men to develop depression during their lifetime. There is a lack of attention to sex in clinical diagnosis and treatment, mainly due to the unclear mechanism of sex differences in major depressive disorder (MDD). This article reviews the sex differences in glutamate (Glu), γ-aminobutyric acid (GABA) and brain-derived neurotrophic factors (BDNF) in MDD patients in order to better understand the pathogenesis of depression.

Results 1 Sex differences in glutamatergic system There were significant sex differences in Glu metabolism in human. The medial prefrontal cortex (mPFC) Glu levels are sensitive to ovarian hormone fluctuations and women seem to exhibit higher levels of Glu compared to men in the striatum, cerebellum, the sensorimotor cortex and anterior cingulate cortex (ACC) in normal volunteers. In female MDD patients, the concentration of Glu in the mPFC was positively correlated with the HAMA score. And the expression of glutamate transporter genes and glutamate receptor subtypes in female was higher than in male in the dorsolateral prefrontal cortex (DLPFC). Different from DLPFC region, levels of Glx (Glu and Gln mixture) and Glu in ACC were declined in female MDD patients. This may indicate that the changes in different brain regions are sex-specific, but the study sample size is small and needs to be confirmed in a larger population in the future. 2 Sex differences in GABA The subtype of GABA neurons, SST neurons, has sex differences in patients with MDD. The defect of SST gene expression in ACC and subgenus prefrontal cortex (sgPFC) is greater in women. Decreased expression of SST gene and protein in amygdala after death was limited to female with MDD. In addition, the effect of ovarian steroid fluctuations on GABA and GABA receptors also linked to the increased risk of depression in women. For example, higher levels isoprogesterone during pregnancy and sharply reduction at birth are leading to an overall decline in GABA function. In general, fluctuations in female GABA transmission may increase depression sensitivity. 3 Sex differences in BDNF There was no significant sex difference in serum BDNF concentration in normal healthy people. In MDD, only female MDD patients had significantly lower serum BDNF protein levels. A significant positive correlation between baseline BDNF and disease severity was detected in women. At present, whether the level of BDNF in MDD patients has sex difference is still controversia. Confirming the sex difference of BDNF in MDD patients and exploring its molecular pathways are expected to bring new targets for the precise treatment of depression in addition to serotonin and glutamate-related neurotransmitters.

Conclusion On the whole, the levels of Glu, GABA and BDNF in patients with depression have significant sex differences. This may help to develop drugs that efficiently regulate the binding of related transmitters and specific receptors in women.

关键字：major depression, neurotransmitters, glutamate, GABA, BDNF, sex differences

ITBS 对 CPZ 诱导的脱髓鞘小鼠抑郁样行为及海马髓鞘相关分子表达的影响

王艺霖 彭正午* 蔡敏 马欣旭 王化宁*
西京医院

目的 探讨 iTBS 对双环己酮草酰二腙(CPZ)诱导的脱髓鞘小鼠抑郁样行为及海马髓鞘碱性蛋白（MBP）、少突胶质细胞转录因子 2(Olig2)、环腺苷酸-磷酸二酯酶（CNPase）的影响。

方法 选取 C57BL/6 雄性小鼠 32 只，随机分为对照组（Con 组）、对照+iTBS 治疗组（Con+iTBS 组）、CPZ 造模组（CPZ 组），CPZ+iTBS 治疗组（CPZ+iTBS 组），每组 8 只。Con 组及 Con+iTBS 组均给予正常饲料喂养 6 周，CPZ 组及 CPZ+iTBS 组均给予 0.2% (质量分数) CPZ 的混合饲料饲喂养 6 周，诱导脱髓鞘小鼠模型，造模结束后，照预先设定的参数对 Con+iTBS 组及 CPZ+iTBS 组进行 iTBS 治疗，治疗十天，实验期间观察记录小鼠体质量的变化。随后通过糖水偏好实验和悬尾实验评估小鼠抑郁样行为。随后处死并分离出小鼠的海马组织，通过 western blot 检测小鼠海马组织中的 MBP、Olig2、CNPase 的表达情况。

结果 1.相较于 Con 组，CPZ 组小鼠的个体质量显著降低（$P<0.05$），Con+iTBS 组及 CPZ+iTBS 组并

无显著性差异。2.相较于 Con 组，CPZ 组小鼠悬尾不动时间减少（P<0.05），糖水偏好指数减少（P<0.05）；较 CPZ 组，CPZ+iTBS 的悬尾不动时间增加（P<0.05），糖水偏好指数增加（P<0.05）；Con 组与 CPZ+iTBS 的各组行为学指标并无显著性差异。3.相较于 Con 组，CPZ 组小鼠海马组织中的 MBP、Olig2 和 CNPase 分子表达下降；较 CPZ 组，CPZ+iTBS 的组小鼠海马组织中的 MBP、Olig2 和 CNPase 分子表达上调（P<0.05），Con 组与 CPZ+iTBS 组上述分子表达均无显著性差异。

结论 iTBS 可能通过上调 CPZ 诱导的脱髓鞘小鼠海马组织中的 MBP、Olig2、CNPase 的表达水平，进而改善其抑郁样行为。

关键字：iTBS；抑郁样行为；髓鞘损伤；海马

Comparison in Clinical Efficacy about Continuing, Reducing, Increasing, Switching, Or Stopping Antidepressant Medications in Patients with Depressive Disorders Who Are Clinically Stable: A Systematic Review and Network Meta-analysis

潘子怡[1] 张浩楠[1] 李炳桦[1] 黄卓悦[1] 陈俊[1] 方贻儒[1,2]
1.上海交通大学医学院附属精神卫生中心
2.上海交通大学附属瑞金医院

Objective In the management of depression, achieving and maintaining remission during the stabilization phase is crucial for preventing relapse and improving the overall quality of life for patients. However, current evidence-based guidelines lack clear indications for different maintenance treatment strategies, including continuing the antidepressant at standard doses recommended for acute treatment, reducing the current antidepressant dose, increasing the dose, switching to another antidepressant, or even discontinuing the medication. The purpose of our study is to compare the effectiveness of these treatment strategies.

Methods We conducted a comprehensive search of databases including MEDLINE, EMBASE, PsycInfo, Central, Cinahl, Web of Science, and PubMed to obtain published and registered randomized controlled trials (RCTs) from inception to December 4, 2022. RCTs meeting the following criteria were included in the analysis: (1) participants aged ≥18 years; (2) diagnosed with depressive disorder; (3) achieved clinical stability; (4) compared at least two of the five strategies; (5) recorded rates of relapse; (6) sample size > 30 and follow-up ≥ 6 weeks. We simultaneously excluded RCTs that recruited individuals with "treatment-resistant" characteristics. Data extraction and quality assessment were independently performed by two reviewers. For each outcome and comparison, we conducted standard fixed-effects pairwise and network meta-analyses(NMAs) within a frequentist framework using the Stata (version 17) network packages. Subgroup analyses were performed to assess the moderating effect on depression relapse rates based on factors such as gender, country, type of medication, follow-up period, severity, and disease staging.

Results 24 records (involving 6,055 individuals) were included for analysis. All continuation strategies were significantly more effective in preventing relapse compared to stopping antidepressants. Specifically, continuing (OR 0.38, 95% CI 0.33-0.44), reducing (OR 0.37, 0.23-0.59), increasing (OR 0.40, 0.23-0.69), and switching (OR 0.50, 0.34-0.72) demonstrated significant efficacy. There were no statistically significant differences among the four continuation strategies. The ranking of efficacy showed that reducing was slightly superior to continuing, followed by increasing and switching, with stopping showing the lowest efficacy.

Conclusion Our systematic review and network meta-analysis indicate that among stable-phase patients with depression, all continuation strategies are significantly more effective compared to stopping medication. Additionally, reduction is superior to continuation at standard dosage. Our research findings support the update of clinical guidelines, emphasizing that reduction and continuation during the maintenance treatment phase yield the best overall efficacy in preventing relapse while reducing economic costs.

睡眠障碍患者临床特征的性别差异-基于多导睡眠监测的研究

王秋棠 郑磊磊 林铮*
浙江大学医学院附属第二医院

目的 本研究采用多导睡眠监测（PSG）对不同性别患者的睡眠特征进行分析，发现睡眠障碍患者临床特征的性别差异，分析睡眠障碍对男女患者情绪、认知功能的影响，以期为临床精准治疗提供依据。

方法 本研究共纳入来自浙江大学医学院附属第二医院精神科 2021.01 至 2022.12 期间 185 名睡眠障碍住院患者。研究采用匹兹堡睡眠量表(PSQI) 、汉密尔顿焦虑量表 (HAMA) 、汉密尔顿抑郁量表-17 项 (HAMD-17) 、简明智能精神状态检查 (MMSE) 、数字广度测验 (DST) 以及数字符号问卷(DSST) 对患者的睡眠及情绪、认知功能进行评估。采用多导睡眠脑电记录仪对患者进行标准的睡眠监测。我们使用 EXCEL 数据库管理数据，采用 SPSS 26.0 软件对数据进行统计分析。 计量资料采用 ANOVA 方差分析、各指标间的关系采用 SPEARMAN 相关分析，检验标准：α=0.05 双侧检验。

结果 MMSE 与 N3 期、REM 期呈正相关；DST 与 N3 期呈正相关，与 N2 期呈负相关；DSST 与总睡眠时间、睡眠效率、N3 期、REM 期呈正相关，与 N2 期呈负相关，（P＜0.05）。 男、女睡眠障碍患者的呼吸暂停低通气指数 (AHI) 与身体质量指数 (BMI) 呈正相关（P＜0.05）。进一步的分层分析以身体质量指数 (BMI) 为协变量进行协方差分析，以 BMI =22 分组，高 BMI 组比低 BMI 组的 AHI 高，同时以 BMI 为协变

量，男性 AHI 患者显著高于女性（P＜0.05）。

结论 1、PSG 睡眠结构分析发现：男性睡眠障碍患者的 N1 期时长和占比均高于女性患者，提示男性睡眠障碍患者较女性睡眠障碍患者浅睡眠延长更显著。2、男性、女性睡眠障碍患者焦虑程度越高，总睡眠时间、深睡眠时间、REM 期时间越短，提示睡眠障碍患者焦虑程度越高睡眠质量越差。3、女性睡眠障碍患者较男性患者抑郁症状更明显，女性患者较男性患者主观感受不良更显著。4、男性、女性睡眠障碍患者均存在执行功能下降，与 REM 潜伏期、N2 期、N3 期以及 REM 期有关。5、睡眠呼吸暂停低通气情况与男、女性的体重增高有关，在排除体重影响因素后，男性 AHI 仍高于女性。

高强度高频重复经颅磁刺激对伴有自杀意念的青少年抑郁症患者的疗效及对唾液皮质醇的影响

丁鹏锦 杨丽霞*
贵州医科大学附属医院

目的 比较高强度高频重复经颅磁刺激（aTMS）与标准高频重复经颅磁刺激（rTMS）对青少年抑郁症患者抑郁症状和自杀意念的疗效差异。同时，分析 aTMS 对患者唾液皮质醇浓度变化的影响，并探讨治疗前后唾液皮质醇浓度与抑郁程度和自杀意念的相关性。

方法 选取我院精神科伴有自杀意念的青少年抑郁发作患者分为高强度组 27 例和标准组 30 例，其中高强度组男性 7 名，女性 20 名，标准组男性 7 名，女性 23 名。高强度组每日接受两次 rTMS 治疗，4000 脉冲/日，连续治疗 7 天，共 28000 个刺激。标准组每日接受一次 rTMS 治疗，2000 脉冲/日，连续治疗 14 天，共 28000 个刺激。分别在治疗前（T1）以及治疗后第一周末（T2）、第二周末（T3）、第四周末（T4）进行汉密尔顿抑郁量表-24 项（HAMD）、自杀意念量表（SSI）、临床疗效总评量表严重程度分量表 (CGI-SI) 评定，以及测定各时点次日早晨 8：00 患者唾液皮质醇浓度。同时，观察并记录治疗期间可能与经颅磁刺激治疗有关的不良反应。

结果 两组患者在基线 T1 期的 HAMD、SSI、CGI-SI 量表总分及唾液皮质醇浓度无显著差异(P＞0.05)。经过治疗后，两组在 T4 期的 HAMD、SSI、CGI-SI 量表总分及唾液皮质醇浓度较同组 T1 期均有不同程度下降(P＜0.05)。高强度组 T4 期总显效率为 77.8%，标准组 T4 期总显效率为 53.3%，两组显效率无显著性差异（P＞0.05）。与标准组同期比较，高强度组在 T2 期 SSI 总分下降更明显（P＜0.05）。两组在 T4 期 HAMD、SSI、CGI-SI 量表总分及唾液皮质醇浓度比较均无显著差异(P＞0.05)。两组患者 T1 期唾液皮质醇浓度与 HAMD 评分呈正相关（P＜0.01）

结论 1.aTMS 治疗相比标准 rTMS 治疗在对青少年抑郁症患者自杀意念程度的改善具有更加快速起效的优势，其疗效在治疗第 1 周末可见。2.aTMS 治疗可以改善青少年抑郁症患者的抑郁症状及自杀意念，其在治疗第 4 周的疗效及安全性等同于标准 rTMS 治疗。3.两种 TMS 治疗均可以降低青少年抑郁症患者的唾液皮质醇水平。4.青少年抑郁症患者唾液皮质醇水平与抑郁程度及自杀意念呈正相关。

关键字：高强度高频重复经颅磁刺激；青少年；抑郁症；自杀意念；唾液皮质醇

重性精神障碍家庭照顾者焦虑抑郁情绪及护理负担的现状调查及其影响因素研究

陈君霞 吴小立*
中山大学附属第三医院

目的 本研究通过对重性精神障碍家庭照顾者的焦虑抑郁情绪和护理负担水平以及对精神疾病相关知识的掌握程度开展现况调查，分析该特定人群中出现焦虑抑郁情绪和护理负担的影响因素，为后续家庭干预措施的制定提供理论基础和应用指导。

方法 本研究共纳入 290 对重性精神障碍患者及其照顾者，采用广泛性焦虑障碍量表（GAD-7）、抑郁症筛查量表（PHQ-9）、Zarit 护理者负担量表（ZBI）、家庭调查问卷、家庭应对问卷以及疾病知识和应对技巧调查问卷等量表分别评估照顾者的焦虑、抑郁、护理负担、情绪表达水平、采取的应对策略以及对疾病知识的掌握程度。

结果 1.30.1%、26.3%及 45.8%照顾者分别检查出焦虑（GAD-7≥5）、抑郁（PHQ-9≥5）和护理负担（ZBI≥21）。2.多因素 logistic 回归分析结果显示：1）护理负担（OR=1.06）、未受过正规教育（OR=0.50）是照顾者出现焦虑情绪的危险因素；2）护理负担（OR=1.05）、对患者持批评态度（OR=1.09）、首次住院治疗（OR=3.33）、再次住院间隔时间超过 2 年以上（OR=3.55）是照顾者出现抑郁情绪的危险因素；3）对患者持批评（OR=1.12）或情绪过度参与（OR=1.23）态度、倾向于采取以情绪为主导的应对策略（OR=1.19）；以及长期照顾者（OR=4.12）均是患者出现护理负担加重的危险因素。3.照顾者对患者持有批评、情绪过度参与的态度与患者既往是否出现自杀行为密切相关（P 值≤0.001）；患者角度所感知到的家庭环境与患者的疾病相关因素（包括近 2 年内有无再次住院、既往是否出现自杀、自伤行为以及近 30 天内是否出现危机事件、近 1 周的病情严重程度等）均存在统计学差异（P<0.05）。4.照顾者有关家庭日常相处以及应对疾病相关危机事件等方面知识的掌握程度与其焦虑抑郁情绪、护理负担呈负相关（P<0.001）。

结论 1.重性精神障碍照顾者的焦虑抑郁情绪检出率高于一般人群；护理负担可作为预测其焦虑抑郁情绪的危险因素。2.照顾者出现焦虑抑郁情绪和护理负担的危险因素包括未接受过正规教育、长期照护者、持批评或情绪过度参与的态度对待患者、采取以情绪为

主导的应对策略、患者为首次住院治疗或再次住院治疗间隔超过 2 年以上。3.比起照顾者的情绪表达水平，从患者角度所感知的家庭环境对于预测患者疾病预后的效果不可忽略。

喀什地区精神分裂症患者合并代谢综合征的现状调查及其认知功能的研究

戴璐 吴小立*
中山大学附属第三医院

目的 研究喀什地区精神分裂症合并代谢综合征的患病率、影响因素及患者的认知功能特征和影响因素。

方法 入组符合 ICD-10 精神分裂症诊断标准的患者 1428 名，收集其人口学信息及临床资料，参考我国代谢综合征的诊断标准，将受试者分为高风险组、临界组、代谢综合征组，计算喀什地区精神分裂症患者代谢综合征的患病率，探索患者合并代谢综合征的影响因素；用 MoCA 量表评估患者的认知功能，阐明共病代谢综合征精神分裂症患者的认知功能特征及其影响因素。

结果 （1）喀什地区精神分裂症患者代谢综合征患病率为 28.5%；（2）合并不同代谢综合征风险的 3 个组别的精神分裂症患者，在年龄、病程、BMI 方面的差异具有统计学意义（P<0.05）；（3）合并代谢综合征的精神分裂症患者中，腹型肥胖的患病率最高（73.4%）；男性患者腹型肥胖、高血糖、高血压、低 HDL-C 的患病率高于女性（P<0.05）；（4）喀什地区精神分裂症患者共病代谢综合征可能受性别、年龄、受教育年限、病程、BMI 影响（P<0.05），经二元 logistic 回归分析，最终有统计学意义的变量为性别、年龄、BMI（P<0.05）；（5）精神分裂症患者 MoCA 得分低于正常，合并不同代谢综合征风险的 3 个组别在视空间与执行功能方面的得分差异有统计学意义（P<0.05），男性患者视觉感知能力更好，女性患者语言能力更好，其差异有统计学意义（P<0.05），不同性别患者整体认知功能的差别无统计学意义（P＞0.05）；（6）在合并代谢综合征的精神分裂症患者认知功能的相关分析中发现：年龄、病程、TG、舒张压、PANSS 各项评分及总分与 MoCA 各项及其总分呈负相关（P<0.05），受教育年限与之呈正相关（P<0.05），经多元线性回归分析，最终有统计学意义的变量为病程、受教育年限、TG、PANSS-N 评分、PANSS-G 评分及总分（P<0.05）。

结论 （1）喀什地区精神分裂症患者代谢综合征的患病率为 28.5%；（2）喀什地区精神分裂症患者共病代谢综合征的危险因素为男性、高龄、高 BMI；（3）喀什地区精神分裂症患者认知功能均受损，随着合并代谢综合征诊断项目数的增多，患者的认知功能明显减退，视空间与执行功能显著受损；（4）共病代谢综合征的精神分裂症患者整体认知功能的保护因素为受教育年限，危险因素为长病程、高 TG、阴性症状及一般精神病理症状明显。

求同存异促进精神科封闭式病房患者和谐相处探讨

朱建立[1,2] 胡静[1] 杜宝国[1] 王传升[2] 职晓燕[2]
1.广东省中山市第三人民医院
2.河南省精神卫生中心

目的 探讨求同存异促进精神科封闭式病房患者和谐相处的作用。

方法 把某精神科封闭式病区的患者，随机分为干预组（39 人）及对照组（38 人）。后续新入科患者按抽签法随机分配入组。干预组接受心理干预，把求同存异贯彻病区日常活动中：1、树立求同存异理念，定期召开座谈会，号召求同存异，相互理解，相互包容，鼓励患者体验变化，分享感受；2、增强自主性，每个病室选举寝室长一名，负责协调解决病室内部矛盾及上报工作；3、增加归属感，商议各自病室的名称，比如“康复驿站”、“望柳居”或者“快乐家园”等；4、满足自我实现的需要，建立奖惩制度，对每周选举出来的优秀病室、先进个人、文明标兵及进步最大患者（医务人员及患者均参与投票），给以奖励。对照组按照病区常规方式管理。每周 1 次、连续 8 周对 2 组患者的感受（主要借鉴马斯洛需要层次理论，调查患者在安全需要、尊重的需要及归属和爱的需要是否得到满足；交往互动是否有影响）进行定性研究，并评价效果。干预组总计入组 105 人，对照组总计入组 96 人。

结果 1、在安全的需要、归属和爱的需要、尊重的需要、自我实现的需要方面，干预组患者主观体验较好。2、干预组患者交往互动受到求同存异影响，主观感受较积极。3、各病种患者中，酒依赖患者改善最突出，干预前酒依赖患者普遍对其它疾病诊断的患者存在歧视排斥；干预后，多数酒依赖患者认为大家都是治疗精神心理问题的，都应该被尊重，不应歧视别人。4、干预组患者从求同存异理念中受益，暴力事件减少，住院满意度提高明显，对照组患者也希望加入干预组。

结论 求同存异可以改善精神科封闭式病房患者的人际互动方式，提高其积极感受，减少暴力事件的发生，促进病区和谐。

关键字：求同存异； 精神科封闭式病房； 和谐相处

An Exploration of Transcultural Adaptation of Interpersonal Psychotherapy in China

赵光菊 李卫晖*
中南大学湘雅二医院

Objective In recent years, interpersonal psychotherapy (IPT), which originated from the Western cultural background, has attracted the attention of many countries, including China. However, due to its cultural sensitivity, adaptation of IPT to different cultural environment is necessary for the practical and effective application.

Methods Based on the course evaluation of an IPT training program, this paper discusses the cultural adaptation of IPT in Chinese context,focusing on the Chinese characteristics in the IPT Problem Areas (Interpersonal Disputes, Role Transition, Grief and Loss).85 Chinese occupational psychotherapists and psychiatrists,etc were systematically trained in IPT, and their perspectives on the cultural adaptation of IPT in Chinese settings were investigated and described.

Results The trainees had a positive attitude towards the acceptance of IPT by Chinese physicians and patients.There are many cultural customs with Chinese characteristics in the four IPT Problem Areas, involving funeral culture, collectivism, male chauvinism, confucianism, left-behind children, hierarchical relations and so on.

Conclusion IPT is still applicable in Chinese cultural environment, but Chinese traditional values and history have formed Chinese group characteristics of interpersonal relationships and role conflicts, therapists need to consider these in the practice of psychotherapy, and more work is needed for the targeted adjustment rules.

前额叶 Alpha 节律在左右半球的不对称性与抑郁症严重程度的关系

刘家钰*
大连市第七人民医院

目的 通过对抑郁症患者前额叶 alpha 节律的对称性进行量化研究，考察神经电生理指标与抑郁症之间的关系，以及基线状态抑郁症患者前额叶 alpha 节律在左右半球的不对称程度，检验 FAA 指标与抑郁症严重程度的相关性。

方法 选取 60 例抑郁症患者，使用汉密尔顿抑郁量表和汉密尔顿焦虑量表评估病情的严重程度，使用抑郁自评量表来评估患者的整体病情。对所有研究对象予脑电图检查。数据采集结束后，提取 8-13 Hz 范围的 alpha 节律能量，提取 F3 和 F4 两个导联 Alpha 能量均值，计算出 FAA 的值。使用 SPSS 进行统计分析，对于服从正态分布的计量资料以（?±s）表示，计数资料以例数表示。正态计量资料使用 t 检验、方差分析。对于不服从正态分布的计量资料以中位数和四分位间距（M（p25，p75））表示，使用秩和检验进行差异性分析。相关性分析使用回归分析，P＜0.05 差异有统计学意义。

结果 1.患者左侧 alpha 波信号功率（F3）显著高于右侧 alpha 波信号功率（F4）。其中不同的婚姻状况、各个年龄组、病程组、不同的文化程度的患者以及有无家族史患者的 F3 均显著高于 F4 的值，女性患者的 F3 也显著高于 F4，但男性患者的 F3 和 F4 的值之间的差异无统计学意义。2.FAA 的值在不同的年龄、婚姻状况、发病病程、文化程度以及是否有家族史的患者中均无显著的差异性，男性患者的 FAA 的值明显高于女性。3.FAA 的值与 HAMD 的评分呈负相关的关系；轻中度抑郁组 FAA 的值显著高于重度抑郁 FAA 的值。4.FAA 与 HAMD 各类因子分数之间的关系如下：FAA 与焦虑/躯体化、认识障碍、阻滞、睡眠障碍、绝望感这 5 类因子的评分呈明显的相关性，与体重和日夜变化这两类因子的评分无明显的相关性。5.HAMA 与 HAMD 评分之间呈明显的正相关的关系。6.FAA 与 HAMA 的评分之间呈负相关的关系。

结论 ：我们的结果表明抑郁症的严重程度与前额叶 alpha 节律在左右半球的不对称性呈显著的正相关的关系，虽然这一机制还未得到阐明，但我们的研究表明抑郁症的严重程度与前额叶 alpha 节律的不对称性有相关性，这种不对称性可能会为抑郁症的病情评估提供一定的客观依据，进一步可能会为抑郁症的治疗疗效提供客观的评价指标，及时评估抗抑郁药物是否起效，对调整治疗药物、提前预测治疗效果提供重要参考。

Brain Structural Alterations and Cognitive Dysfunction in Lung Cancer Patients without Brain Metastasis

张大福 杨润许 尚彬丽 孙朵 程宇琪*
昆明医科大学第一附属医院

Objective To explore the relationship between cognitive function and brain structure in non-brain metastasis lung cancer (LC) and healthy controls (HC).

Methods 75 chemotherapy drug-na?ve LCs without brain metastasis and 29 HCs matched with age, sex and education were evaluated by cognitive assessment and structural MRI, including cortical thickness, surface area and subcortical structure volume, and evaluated the relationships between these parameters.

Results Compared with HCs, the volume of twelve subcortical structures showed smaller in advanced lung cancer patients (aLCs) ($p < 0.05$). The cortical thickness of one brain region and the surface area of five regions decreased in aLCs ($p < 0.05$). In early lung cancer patients (eLCs), the cortical thickness of three regions increased. Compared with eLCs, the aLCs showed a decrease in cortical thickness and surface area ($p < 0.05$). The function of visuospatial/executive and delayed-recall was impaired in aLCs, which became more obvious with the progress of the disease, and was positively correlated with several cerebral cortex thickness, surface area and subcortical structure volume ($p < 0.05$).

Conclusion Brain structural alterations and cognitive dysfunction can be found in aLC patients independent of metastasis. On the other hand, because all the patients did not receive any chemotherapy, these abnormalities identified in aLC, but not in eLC, were more likely the results of the disease rather than the chemotherapy.

自我厌恶对大学生非自杀性自伤行为的影响：生命意义感的中介效应

罗煜婷[1,2] 邱紫璇[2] 王尚[2] 汪雨菡[2] 黄晶[3] 陶好娟[1]
1.中南大学湘雅二医院
2.中南大学湘雅医学院
3.中南大学人文学院

目的 探索自我厌恶与非自杀性自伤行为（NSSI）的关系，以及孤独感、生命意义感和社会联结在两者关系间的中介作用。

方法 采用自我厌恶量表中文版(the Chinese version of self-disgust scale, SDS-C)，社会联结量表修订版(Social Connectedness Scale-Revised，SCS-R) 、生命意义感量表(Meaning in Life Questionnaire, MLQ)、孤独感量表（UCLA Loneliness Scale Version 3）和渥太华自伤量表（Ottawa Self-Injury Inventory，OSI）中文修订版对 657 名在校大学生及硕士研究生进行线上调查。采用 SPSS26.0 和 PROCESS4.1 进行数据处理。

结果 （1）大学生中 NSSI 的检出率是 15.98%。自我厌恶、社会联结、生命意义感和孤独感在有 NSSI 组和无 NSSI 组间有显著差异(p<0.001)：有 NSSI 组的自我厌恶、孤独感显著高于无 NSSI 组，而社会联结、生命意义感显著低于无 NSSI 组。（2）自我厌恶、孤独感、生命意义感、社会联结和大学生 NSSI 之间存在显著的两两相关。（3）路径（自我厌恶-NSSI）的总效应显著，自我厌恶对 NSSI 的直接预测效应显著。（4）自我厌恶会通过生命意义感的中介作用对 NSSI 产生显著的负向影响，具有遮掩效应。（5）孤独感和社会联结在自我厌恶与 NSSI 两者关系间的中介作用不显著。

结论 自我厌恶可以显著预测 NSSI，生命意义感是自我厌恶与 NSSI 之间的中介变量。本研究为深入了解非自杀性自伤行为的心理相关机制提供了新的视角，提示在大学生的心理健康服务中通过增加生命意义感或许可为有效管理 NSSI 提供实践依据。

机器人辅助导航的加速经颅磁刺激治疗抑郁症的临床疗效

代海月*
河南省新乡市新乡医学院第二附属医院

目的 本研究比较机器人辅助导航的加速经颅磁刺激（aTMS）治疗中重度抑郁症的安全性、耐受性及临床疗效，并进一步探索其对认知功能的影响，为临床治疗抑郁症提供新的方案参考。

方法 招募新乡医学院第二附属医院门诊及住院的中重度抑郁症患者 24 例，在经颅磁治疗前后进行量表评估、认知评估及功能性近红外光谱（fNIRS）检查，共有 16 例完成全部的治疗及相应的评估检查。所有患者使用基于面部特征识别的智能导航经颅磁机器定位于左侧背外侧前额叶（L-DLPFC）靶点进行治疗，每日治疗两次，两次间隔 4-6 小时，每次治疗持续 30 分钟，共计 3000 脉冲，连续治疗 10 天。在治疗前后完成近红外检查，记录言语流畅性任务（VFT）下的组词个数，并对任务过程中氧合血红蛋白（oxy-Hb）激活的变化进行统计分析，在治疗前、治疗 10 次后、治疗 20 次结束后采用汉密尔顿抑郁量表（HAMD-17）、汉密尔顿焦虑量表（HAMA）、贝克抑郁量表（BDI）、贝克焦虑量表（BAI）及蒙特利尔认知评估量表（MoCA）评估患者的抑郁、焦虑症状及认知功能，以 HAMD-17 量表的减分率作为疗效的主要结果指标。使用相应的统计方法比较患者治疗前后的症状改善及认知功能的变化。

结果 （1）对治疗前后患者量表评估的减分率进行分析，结果发现治疗后各量表减分率下降明显，有 68.75%的患者 HAMD 减分率超过 50%，有 37.5%的患者治疗后达到缓解水平。 （2）患者治疗前后在 VFT 任务中的语音流畅性任务（LFT）中的组词数差异无统计学意义（P=0.129）；而在语义流畅性任务（CFT）中，患者治疗前后的组词数差异有统计学意义（P=0.002）。在 LFT 任务下，治疗前后患者在 2 个通道（左侧 2 个，ch40，ch42）的[oxy-Hb]激活存在统计学差异（t=2.501-2.577，见图 2）。然而当 FDR 设置为 0.05 时，差异无统计学意义。

结论 基于面部特征识别的加速经颅磁刺激治疗中重重度抑郁症患者是安全有效且耐受良好的，对认知功能也有一定的改善作用，但仍需大样本的随机对照研究进一步验证本结果。

Elevated Plasma Levels of Mature BDNF in Major Depressive Disorder Patients with Higher Suicidal Ideation.

郦海媚 赵苗苗 许毅 黄满丽*
浙江大学医学院附属第一医院

Objective Several evidences showed signaling through brain-derived neurotrophic factor (BDNF) and its receptor, tropomycin receptor kinase B (TrkB) as well as inflammation play a crucial part in the pathophysiology of depression. The purpose of our study was to evaluate plasma levels of BDNF-TrkB signaling, inflammatory factors in major depressive disorder (MDD) patients and assess their associations with clinical performance.

Methods This study recruited a total sample of 83 MDD patients and 93 healthy controls (CON). All of the participants were tested with Hamilton depression scale (HAMD), Beck Scale for suicide ideation, and the NEO-Five Factor Inventory scales. The plasma level of selected BDNF-TrkB signaling (mature BDNF: mBDNF, precursor BDNF: proBDNF, tyrosine kinase B: TrkB, tissue plasminogen activator: tPA) and selected inflammatory factors (IL-1??, IL-6, TNF-?? were measured using enzyme-linked immunosorbent assay (ELISA). Further, we performed correlation analysis to indicate the relationship between plasma level of the factors and clinical characteristics.

Results Higher level of mBDNF and lower Openness were observed in MDD patients with higher suicidal ideation than patients with lower suicidal ideation. ii) In MDD patients, mBDNF is positively correlated with sum score of Beck Scale for suicide ideation (BSS). iii) The levels of mBDNF, tPA, IL-1?? , IL-6 were significantly higher in all MDD subjects compared to healthy controls. While the levels of trkB, proBDNF were lower in MDD subjects.

Conclusion The limitations of our research may partly arise from the relatively small sample size and this study was cross-sectional, thereby limiting causal inference. Our study provides novel insights regarding the potential role of mBDNF in the neurobiology of the association of depression and suicidal ideation and the relationship among BDNF-TrkB signaling, inflammatory factors and clinical characteristics in MDD, especially.

关键字：BDNF-TrkB signaling, inflammatory factors, suicidal ideation, Beck Scale, major depressive disorder

抑郁障碍研究协作组

CRP 与特定抑郁症状有关：来自 NHANES 的 5 个独立样本的网络分析结果

林靖宇[1] 黄海明[2] 司天梅[3] 陈林[1] 陈景旭[1] 苏允爱[3]
1.北京大学回龙观临床医学院，北京回龙观医院

目的 抑郁症是一种异质性很强的常见精神疾病，不同的抑郁症状背后其生物机制可能有所不同。既往研究证据提示，抑郁症的植物神经系统症状，如疲乏、食欲、睡眠等症状，以及情感症状中的快感缺失，都与免疫-炎症系统密切相关。 然而，炎症与特定的抑郁症状之间的关系仍不清楚。

方法 本研究的数据来源于美国国家健康和营养调查研究（National Health and Nutrition Examination Survey, NHANES），纳入了同时评估了抑郁症状和 C-反应蛋白 (C-Reactive Protein, CRP)的 5 个数据集，为 2005-2006 年、2007-2008 年、2009-2010 年、2015-2016 年和 2017-2020 年的 NHANES 数据。NHANES 是美国具有全国代表性的社区样本，旨在调查受试者的营养状况和身心健康。 研究使用患者健康问卷（Patient Health Questionnaire-9, PHQ-9）来评估抑郁症状，并使用网络分析来评估 CRP 与抑郁症状的关系。

结果 在 5 个 NHANES 独立样本中，共纳入了 24932 名受试者。相关性分析发现，CRP 与所有抑郁症状密切相关 ($r = 0.02\text{-}0.08$, P 值均 < 0.01)，尤其是疲乏($r = 0.08$, $P < 0.001$)和食欲改变($r = 0.08$, $P < 0.001$)。在 5 个独立样本的网络分析中，均一致地发现疲乏与 CRP 密切相关。至少在 2 个样本的网络分析中，快感缺乏、睡眠问题和食欲变化与 CRP 相关，但这些抑郁症症状并非在所有五个样本中都与 CRP 相关。此外，本研究还发现，与其他症状相比，快感缺失、 疲乏、睡眠问题和食欲改变间的联系更为紧密。

结论 本研究提示炎症对抑郁症状的影响是特异的而非普遍的，并发现了 CRP 与疲乏稳定的联系，这为识别抑郁症的炎性亚型提供了理论依据，有利于进一步优化抑郁症个体化抗炎治疗策略；此外，本研究从炎症与抑郁症状网络的角度，发现了 CRP、疲乏、快感缺失、睡眠问题和食欲改变的紧密联系，进一步证实了抑郁症的病态行为（Sickness Behavior）理论假说。

关键字：抑郁症；炎症；CRP；疲乏；网络分析

The Effect of The Method of Emotional Regulation with Music on Emotional Self-care in Front-line Medical Staff

赵鑫[1] 赵莹莹[1] 唐瑶瑶[2] 陈洛婷[3] 苏琳[4]

Objective To investigate the effect of Emotional Regulation with Music on the emotional self-care of front-line medical staff during the COVID-19 pandemic

Methods 31 frontline medical staff from nine provinces in China were recruited as subjects from April 2020 to June 2021. The method of Emotional Regulation with Music (ER) developed from Guided Imagery and Music (GIM) was used as an intervention with the client by qualified music therapists trained in this method. Each client received four sessions of ER intervention online. The visual analogue scale (VAS) was used as a measuring tool to evaluate the subjects' emotional state at baseline and after the intervention, also the clients were asked to complete the relevant questionnaires. A t-test was used for statistical analysis to compare the differences in scale scores before and after the intervention.

Results A total of 31 frontline medical personnel, 28 females and 3 males, with a mean age of 34.52±8.18 years, were included. The results showed a statistically significant decrease in VAS scale scores (7.42±1.82) after the intervention using the ER method compared to the scores at baseline (5.52±2.13) (t=-5.33, p=0.000). The results of the questionnaire showed that 86% of the subjects indicated that they had learned the Emotional Regulation with Music and 77% indicated that the method was very effective in regulating their emotions. 92% of the subjects indicated that they were willing to continue using the method for emotion regulation in their lives.

Conclusion The method of ER can effectively improve emotional self-care in frontline medical staff. The subjects can be aware of and accept their current emotional state during the session of the therapy, choose music that can help them regulate their emotions in the company of the therapist, and can take care of their emotions and improve their mood state in the present moment. It can also help the subjects to make a song list for themselves for daily use and self-care, which is worth promoting among front-line medical staff.

3.北京市残疾人服务示范中心

Objective Supportive Music and Imagery (SMI) therapy is a psychotherapy method that uses Music and Imagery as the carrier to help patients focus on their own internal positive resources. It may be helpful to relieve the depressive symptoms of patients. The purpose of this study was to explore the effectiveness of SMI therapy in the treatment of depression.

Methods A total of 29 outpatients who met the diagnostic criteria of depression based on DSM-IV were treated with SMI therapy besides routine antidepressant treatment once a week for 3 months, with a total of 12 times of SMI therapy. DSM-IV, Hamilton Depression scale (HAMD-17), fatigue rating scale (FAI), Newfoundland Memorial University Happiness scale (MUNSH), 16-item Depression self-rating scale (QIDS-SR16) and CGIS score were evaluated at baseline. To compare the changes in mood, fatigue and happiness of patients before and after treatment, QIDS-SR16 was performed from the end of the first week to the 12th week, and FAI and HAMD17 were evaluated at the end of the 2nd, 4th, 6th, 8th, 10th and 12th weeks, and MUNSH was also evaluated at the 12th week.

Results Owning to only completed the baseline data or the first interview, 5 subjects were excluded, and the remaining 24 subjects were included in the analysis. The results of mixed effect ANOVA model showed that within 12 weeks, there were significant differences between the score of each follow-up time and baseline in HAMD17 ($P < 0.0001$), FAI ($P < 0.0001$), and QIDS-SR16 ($P < 0.0001$). The difference between the score of MUNSH at baseline and the 12th week was tested by paired t-test, and the result was statistically significant ($P < 0.05$). Among the 24 subjects included in the analysis, 20 subjects achieved early improvement at the beginning of the second weekend (HAMD-17 score reduction rate ≥ 20%), and the early improvement rate was 83.3%. At the end of the 12th weekend, 20 subjects respond to therapy (HAMD-17 score ≥ 50%), with a respond rate of 83.3%. At the end of the 12th week, 18 subjects were clinically remission (HAMD-17 score ≤ 7), and the remission rate was 75.0%.

Conclusion The depression, anxiety and fatigue symptom of the patients improved continuously within 12 weeks. The combination of SMI therapy has high early improvement rate and clinical remission rate in patients with depression. In the future study we can increase the control group, and further explore the efficacy of SMI in depression.

2.南京大学医学院
3.东南大学生物医学工程

目的 既往研究发现不同年龄段发病的抑郁症有

不同的临床特征，且发现 30 岁前和 30 岁后起病的成年抑郁症患者脑局部一致性（regional homogeneity，ReHo）特征存在差异，但发病年龄 18 岁以前的早发抑郁症（Early onset depression，EOD）较发病年龄在 45 岁以后晚发抑郁症（Later onset depression，LOD）的局部协调性不清楚。本研究旨在探讨首发早发性和晚发性抑郁症患者静息态脑局部一致性（regional homogeneity，ReHo）特征，为不同年龄段抑郁症发病研究脑影像学机制提供依据。

方法 招募来自南京医科大学附属脑科医院符合 DSM5 抑郁症诊断标准的首发患者。按照起病年龄，分为 18 岁以前的早发抑郁症 40 名，45 岁以后起病的晚发抑郁症抑郁症 50 名，同时招募 70 名年龄、性别、受教育年限匹配的健康对照。将 3 组受试进行 3.0T 静息态功能磁共振扫描，计算灰质体积（gray matter，GM）和 ReHo 值。为去除年龄的影响，将灰质总体积和年龄为协变量计算三组 ReHo 值差异，首先进行单因素方差分析，高斯随机场法（Gaussian random field，GRF）校正，其次在三组比较差异有统计学意义的基础上，使用 GRF 矫正方法进行 hoc t 检验，对每两组 ReHo 值进行两两比较。

结果 三组受试在左额上回、双侧颞上回、右枕中回、右海马旁回、左中央前回、左缘上回脑区 ReHo 值存在差异（单体素 $p<0.001$，连续体素值 $K\geq64$，GRF 校正后 $p<0.05$）。在方差分析基础上进行两两事后独立样本 t 检验，与 LOD 组相比，EOD 组右枕中回和左额上回 ReHo 值增高，双侧颞上回和右直回 ReHo 值下降（单体素 $p<0.001$，连续体素值 $K\geq22$，GRF 校正后 $p<0.05$）。

结论 首发 LOD 与 EOD 患者存在不同的静息态脑活动特征。右枕中回、左额上回、双侧颞上回和右直回的脑局部协调性下降可能和 LOD 与 EOD 的发病机制有关。

5.Department of Psychiatry, Qiqihar Medical University, Qiqihar, Heilongjiang 161006, China.

Objective The trajectory of voxel-mirrored homotopic connectivity (VMHC) values after medical treatment in obsessive-compulsive disorder (OCD) and its value in diagnosis remain unclear. This study aimed to investigate the pathophysiological mechanism of OCD, as well as biomarkers for diagnosis and prediction of pharmacological efficacy.

Methods Thirty-four drug-naive patients with OCD and 36 healthy controls (HCs) underwent magnetic resonance imaging. The patients were scanned again after a 4-week treatment with paroxetine. The acquired data were subjected to VMHC, support vector machine (SVM), support vector regression (SVR), and correlation analyses.

Results Compared with HCs, patients with OCD exhibited significantly lower VMHC values in the bilateral superior parietal lobule (SPL), postcentral gyrus (PoCG), and calcarine cortex (CC), and the VMHC values in the PoCG were positively correlated with cognitive function. After treatment, the patients showed increased VHMC values in the bilateral posterior cingulate cortex/precuneus (PCC/PCu) with the improvement of symptoms. SVM results indicated that the combined VMHC values in the SPL and PoCG could differentiate patients with OCD with an accuracy of 90%. SVR results showed that the VMHC values in the PoCG at baseline could aid to predict a reduction in the scores of OCD scales.

Conclusion This study revealed that SPL, PoCG, and CC participate in the pathophysiological mechanism of OCD while PoCG and PCC/PCu participate in the pharmacological mechanism. The VMHC values in the SPL and PoCG are potential biomarkers for diagnosis and those in the PoCG are a potential predictive biomarker of the treatment effects in OCD.

抑郁障碍患者的脑电微状态改变及其与认知功能的关联

田晴[1] 范玉[1] 张晓斌[1] 贾秋放[1] 王传跃[2]
1.苏州市广济医院
2.首都医科大学附属北京安定医院

目的 脑电（EEG）微状态分析是利用多通道 EEG 信号全局拓扑结构评估脑功能网络的方法，而异常的网络功能与某些精神障碍相关。因微状态具有丰富的时间信息，可为识别 EEG 特征提供强大的工具。已有研究显示抑郁障碍患者的静息态脑电微状态存在异常，然而其与抑郁障碍的认知功能关联较少被研究。本研究旨在探索抑郁障碍患者的脑电微状态改变及其与认知功能的关联。

方法 在本研究中，共纳入 24 名抑郁障碍患者（患者组）和 32 名健康人群（对照组）。通过可重复的成套神经心理状态测量（RBANS）采集神经认知数据，

并采用汉密尔顿抑郁量表（HAMD）、汉密尔顿焦虑量表（HAMA）评估被试者的临床特征。通过对静息态脑电拓扑结构被分为 4 个标准类型：A、B、C、D。两组人口学数据采用独立样本 t 检验和卡方检验，认知及微状态指标采用协方差分析（受教育程度为控制变量）。采用 Pearson 相关置换检验探索微状态指标与认知功能的相关性。

结果 1、人口学资料、临床特征、认知功能结果：患者组与对照组年龄、性别匹配无显著差异，受教育程度差异具有统计学意义，故将受教育程度纳为控制变量。神经认知结果无显著差异。 2、在微状态持续时间上，与对照组相比，患者组微状态 C 显著升高（F=6.02, P=0.017）,微状态 D 显著降低（F=19.2，P<0.001）；在微状态出现频率上，患者组微状态显著升高（F=6.2，P=0.016），微状态 D 显著降低（F=5.8，P=0.020）；在微状态覆盖范围上，患者组微状态 C 显著升高（F=10.8，P=0.002），微状态 D 显著降低（F=9.4，P=0.003）；在微状态转换概率上，患者组微状态 A to C 升高、A to D 降低（P=0.018；P=0.002），微状态 B to C 升高（P=0.005），微状态 C to A、C to B 升高（P=0.024；P=0.004），微状态 D to A 降低（P=0.003）。以上 P 值均经过 FDR 校正。 3、Pearson 相关分析置换检验结果显示，微状态 C to B 的转换概率与视觉空间结构呈正相关（r=0.41，P=0.049）。

结论 相较于健康人群，抑郁障碍患者在微状态 C 和微状态 D 的差异具有统计学意义，同时微状态 C to B 的转换概率与视觉空间结构成正相关，可能有助于客观评估相关认知功能。

抑郁障碍疗效与心率变异性关联的前瞻性队列研究

刘志鹏 伍海林 胡静 郭中孟*
江西省精神病医院

目的 研究抗抑郁药物五羟色胺再摄取抑制剂（SSRIs）治疗抑郁障碍的疗效与心率变异性（HRV）参数的相关性。

方法 本研究采用前瞻性队列研究，招募符合诊断标准的抑郁障碍患者 395 名，口服一线抗抑郁药物 SSRIs 治疗。分别在基线与治疗 1 个月后使用汉密尔顿抑郁量表（HAMD）评定抑郁的严重程度，并进行短程心率变异性检查，时域指标包括：①总的 R-R 间期标准差(SDNN)；②相邻 RR 间期的均方根(RMSSD)；频阈指标包括: ① 低频功率 (LF)；②高频功率(HF)；④ 低频功率/高频功率比率（LF/HF）。研究组为治疗有效组，以 HAMD 评分减分率≥50%；对照组为治疗无效组，以 HAMD 评分减分率＜50%。

结果 受试者完成研究 369 例，其中舍曲林 94 例、艾司西酞普兰 85 例、西酞普兰 33 例、氟西汀 101 例、帕罗西汀 35 例、氟伏沙明 21 例。研究组和对照组在年龄、性别、体质指数、每周运动时间比较无统计学差异治疗（P>0.05)。其中研究组 192 例（52%），对照组 177 例（48%）。研究组和对照组之间 SDNN，RMSSD 和 LF/HF 比值无统计学差异（P>0.05)，而 LF 和 HF 均有显著差异（p<0.001)。相关性分析显示：所有抑郁障碍治疗 HAMD 减分后有更高的的心率变异性。LF，HF，LF/HF 比率与 HAMD 评分呈负相关。

结论 研究显示：抑郁障碍的心率变异性与症状严重程度变化相关，提示心率变异性参数可能作为抑郁障碍的生物学诊断标志物。抗抑郁药物疗效不佳的患者有更低的心率变异性，较低的心率变异性可能作为抗抑郁药物治疗疗效欠佳的预测因素。

关键字：抑郁障碍、疗效、心率变异性、前瞻性队列研究

不同抑郁程度患者抑郁、焦虑水平及认知功能的相关分析

朱小林[1] 祖孟兰[2] 谭淑平[1]
1.北京回龙观医院
2.河北承德医学院

目的 既往研究发现抑郁症与认知障碍之间存在密切的关系。一方面，抑郁症患者常出现认知障碍的症状，他们常会出现记忆力减退、注意力不集中、决策力下降等症状。另一方面，长期遭受压力的个体，可能会因为适应能力下降而导致认知障碍的出现，而这些认知障碍有可能会进一步引发抑郁症的发生。本研究旨在探讨不同抑郁程度患者其抑郁情绪与认知功能、睡眠、焦虑的关系。

方法 选择 2021 年 3 月到 2023 年 6 月北京某医院门诊收治的 820 例主诉有抑郁情绪的患者为研究对象，所有患者均接受患者健康问卷抑郁症状群量表（PHQ-9）、广泛性焦虑量表（GAD-7）、失眠严重指数问卷（ISI）和符号编码测验（SC）。将患者按抑郁评估结果分为三组：无抑郁组（PHQ-9 < 5 分，n = 201）、轻中度抑郁组(5 ≤ PHQ-9 < 14 分, n = 329)、重度抑郁组(PHQ-9≥15 分，n=290)。比较三组被试的抑郁、焦虑水平和睡眠质量，以及抑郁情绪与认知功能的关系。

结果 单因素方差分析发现，三组被试年龄差异显著，无抑郁组、轻中度抑郁组患者的年龄均高于重度抑郁组 (均 P＜0.05)。卡方检验发现，三组被试性别差异显著，重度抑郁组中女性较多，差异具有统计学意义(P＜0.01)。把年龄、性别作为协变量，进行单变量方差分析发现，重度抑郁组患者的抑郁、焦虑、失眠严重指数显著高于轻中度组和无抑郁组(均 P < 0.001)，轻中度组的抑郁、焦虑、失眠严重指数高于无抑郁组(均 P ＜0.001)；在数字符号编码测验上，重度抑郁组患者完成数和正确数显著低于轻中度抑郁组和无抑郁组 (P < 0.001)，轻中度抑郁组和无抑郁组差异不显著。另外，Spearman 相关分析也发现，抑郁情绪与焦虑、失眠呈显著正相关(均 P＜0.001)，与数字符号编码任务中的完成数、正确数呈显著负相关(均 P＜0.001)。

结论 抑郁症患者的抑郁水平与其焦虑、失眠和

认知功能密切相关。重度抑郁患者常伴发焦虑、失眠及认知功能的下降。抑郁程度越高，认知功能损伤越严重。

关键字：抑郁；认知功能；焦虑；失眠

针对瑜伽治疗重症抑郁症的有效性的一篇系统性综述和荟萃分析

吴宇飞 杨建立*
天津市天津医科大学总医院临床心理科

目的 瑜伽是一种结合了身体和精神锻炼的方法，根据文献报道，瑜伽对于重度抑郁症的辅助治疗是有效和可接受的。本研究旨在进一步探索瑜伽对重度抑郁症患者疗效的证据。

方法 对 PubMed, Embase, Cochrane Library, PsycINFO, SinoMed, CNKI，万方和 VIP 数据库等数据库以确定好的检索式进行了检索，检索的文章日期是从数据库建立到 2022 年 10 月 13 日。筛选出符合纳入标准的瑜伽治疗重度抑郁症患者的随机对照试验后，我们采用 RoB2.0 和 GRADE 质量评级对文献质量进行评价。抑郁症状的改善以贝克抑郁量表(BDI)、汉密尔顿抑郁评定量表(HAMD)或其他量表作为主要结局指标；焦虑症状的改善以汉密尔顿焦虑量表(HAMA)和状态-特质焦虑量表(STAI)作为次要结局指标。采用 95% CI 时的 RR 和 Cohen's d 作为效应大小估计，p 值小于 0.05 表示有统计学意义。除此之外，我们采用 Q 和 I2 评估异质性大小，并且根据研究来源地区（亚洲组和美洲组）、干预类型（瑜伽治疗组和瑜伽辅助药物治疗组）、干预持续时间（以治疗时间 8 周为分界点，小于八周为短程治疗组，大于八周为长程治疗组）、干预频率（以干预频率每周 4 次为分界点，干预频率少于每周 4 次为低频干预组，干预频率超过每周 4 次为高频干预组）进行了亚组分析以及敏感性分析去探讨异质性的来源。

结果 一共有 34 项 RCT 研究纳入研究，其中包括治疗组 1269 例患者和对照组 1072 例患者，48.4%为女性。与对照组相比，BDI-II 结果显示瑜伽对抑郁症状的改善有中等效果,HAMD 结果显示瑜伽对抑郁症状严重程度有中度改善，通过 STAI 的结果可以得出结论，瑜伽对改善焦虑水平的影响较小。以研究地区分组的亚组分析结果显示，来自亚洲的研究比来自美洲的研究的异质性更小且在改善抑郁症状方面有中度的积极效果；以干预类型分组的亚组分析结果显示，瑜伽辅助药物治疗组比瑜伽治疗组在改善抑郁症状方面效果更显著；以干预持续时间分组的亚组分析结果显示，短程治疗组比长程治疗组在改善抑郁症状方面效果更显著；以干预频率分组的亚组分析结果显示，高频干预组比低频干预组在改善抑郁症状方面效果更显著。 所纳入的文献中的瑜伽治疗组在治疗期间均无不良事件发生。

结论 瑜伽可以改善重度抑郁症患者的抑郁症状和焦虑，并且具有安全性和广泛的患者接受度。

关键字：重度抑郁症；抑郁；焦虑；瑜伽；系统综述

Effects of GABA A Receptor Gene Variation on Anxious Depression Mediated by Amygdala Subregion Network

乔娟[1] 陶诗婉[2] 孙雨荣[3] 史家波[2] 陈瑜[2] 田水[3] 姚志剑[2] 卢青[3]
1.徐州市东方人民医院
2.南京脑科医院
3.东南大学

Objective This study aimed to use genetic imaging analysis to investigate the imaging feature of GABA A polymorphism, especially in the amygdala subregions network. We used an imaging genetic approach to investigate the polygenic effects of the GABA A receptor on the amygdala network in anxious depression (AD).

Methods 182 patients diagnosed with MDD and 64 healthy controls (HC) were recruited. We genotyped the GABA A receptor gene polymorphism and underwent resting state fMRI scan in all subjects. Correlation analysis was employed to explore the relationship between the multilocus genetic profile scores (MGPS) of GABA A receptor, amygdala subregion network functional connectivity and clinical feature in anxious depression patients. The mediation analysis was employed to evaluate the brain function between the GABA A receptor MGPS and the clinical feature in MDD patients.

Results Compared with NAD, the AD patients showed decreased effects in GABA A receptor MGPS. AD patients showed a negative correlation between MGPS and the FC of right CM and right MFG. Then exploring the correlation of abnormal brain function and clinical feature, we found that there was a negative correlation between the FC (right CM and right MFG) and the anxiety/somatic factors. More importantly, right CM and right MFG connectivity mediates the association between GABA A receptor MGPS and anxiety/somatic traits in MDD patients.

Conclusion Our findings suggest that the GABA A receptor multilocus genetic profile makes a considerable contribution to the amygdala network dysfunction and the anxiety/somatic factor in patients with anxious depression. The abnormal amygdala network mediated the susceptibility of GABA A receptors to clinical features in anxious depression patients.

3.南京市第一医院

Objective Major depressive disorder (MDD), a common mental disorder worldwide, frequently coexists with various physical illnesses, and recent studies have shown an increased prevalence of subclinical hypothyroidism (SHypo) among MDD patients. However, the neural mechanisms shared and unique to these disorders and the associated alterations in brain function remain largely unknown. This study investigated the potential brain function mechanisms underlying comorbid MDD and SHypo.

Methods Thirty MDD patients (non-comorbid group), 30 MDD patients comorbid with SHypo (comorbid group), 26 patients with SHypo, and 30 healthy controls were recruited for resting-state functional magnetic resonance imaging (rs-fMRI). We used regional homogeneity (ReHo) to examine differences in internal cerebral activity across the four groups.

Results Compared with the non-comorbid group, the comorbid group exhibited significantly higher ReHo values in the right orbital part of the middle frontal gyrus (ORBmid) and bilateral middle frontal gyrus; decreased ReHo values in the right middle temporal gyrus, right thalamus, and right superior temporal gyrus, and right insula. Within the comorbid group, serum TSH levels were negatively associated with the ReHo values of the right insula; the ReHo values of the right Insula were negatively associated with the retardation factor score; the ReHo values of the right ORBmid were positively correlated with the anxiety/somatization factor scores.

Conclusion These findings provide valuable clues for exploring the shared neural mechanisms between MDD and SHypo and have important implications for understanding the pathophysiological mechanisms of the comorbidity of the two disorders.

C 反应蛋白、血清叶酸与急性期抑郁症患者自杀意念、行为的关系

黄娟* 吕楠 付冰冰 赵茜
首都医科大学附属北京安定医院

目的 本研究通过使用医院信息系统的电子健康记录数据，了解和探讨急性期抑郁障碍患者自杀意念、行为与 C 反应蛋白、血清叶酸水平间的关系，为预防自杀提供生物学参考指标。

方法 本研究为描述性、回顾性研究，利用基于医院信息系统(hospital information system, HIS)的电子健康记录(electronic health record，EHR)提取患者的临床资料，研 究 C 反应蛋白、血清叶酸与急性期抑郁障碍患者自杀意念、行为的关系。研究将纳入 2019 年 1 月 1 日至 2020 年 12 月 31 日在首都医科大学附属北京安定医院住院及急诊留观治疗的抑郁症患者。依据入组时是否伴有自杀意念、自杀，将其分为抑郁症伴自杀意念、自杀行为组及不伴自杀意念或行为组。比较两组人口学信息、疾病特征及入院后首次的 C 反应蛋白与血清叶酸水平，后将其纳入二元 logistic 回归分析，探索影响自杀意念、行为的独立影响因素。

结果 共纳入 1775 例，其中抑郁症伴自杀意念、自杀行为组 957 例（53.9%），两组 C 反应蛋白差异无统计学意义（$\chi2=0.517$，$P=0.472$）,血清叶酸差异有统计学意义（$\chi2=8.378$，$P<0.004$）。将年龄、性别、吸烟、饮酒史、目前有无工作、婚姻情况、文化程度、有无家族史、病程时长、发病年龄、本次发作精神病症状 CRP 有无异常、血清叶酸有无异常带入到二元 logistic 回归分析，结果显示饮酒（$P<0.05$，OR=1.935，95% CI=1.001-3.741）、未婚（$P<0.05$，OR=0.472，95% CI=0.272-0.820）、高的 C 反应蛋白(＞0.1mg/dL)（$P<0.001$，OR=2.632，95% CI=1.657-4.182）是影响抑郁症患者出现自杀意念、自杀行为的独立危险因素。

结论 C 反应蛋白影响抑郁症患者的自杀意念、行为，临床诊疗上应予以重视。未来需进一步探索抑郁症伴自杀意念、行为者生物学指标上不同，为临床医生提供更精准、复合的参考标准。

关键字：C 反应蛋白;血清叶酸;抑郁症患者自杀意念、行为

Effects of Fluoxetine and Es-ketamine on Depressive Behavior and Expression of Inflammation Related Genes in Mice with Chronic Various Stress

周翠红 马欣旭 陈海霞 陈怡环 赵洁玉 彭正午 王化宁 蔡敏*
西京医院

Background and Objective The inflammatory response might be an important component of the pathogenesis of depression. We explored the effect of fluoxetine and esketamine on depression-, anxiety-like behavior and inflammation-related gene expression in chronic various stress (CVS) mice.

Materials and methods 32 C57BL/6J mice were randomly assigned to the four groups: Control, CVS+Sal, CVS+Flx, CVS+es-Ket. Mice in Control were treated by nothing as comparison. The mice in CVS+Sal, CVS+Flx, CVS+es-Ket were treated by CVS modeling for consecutive 21 days. And then, mice were injected with saline (10 μL/g), fluoxetine (20 mg/kg) or es-ketamine (15 mg/kg) for seven days respectively after CVS. Subsequently, all mice were subjected to open field test, novelty suppressed feeding test, tail suspension test, forced swimming test, and elevated plus maze test to observe the depression and anxiety-like behaviors. Then the mice were sacrificed and plasma were extracted for Elisa test, including IL-1β, IL-6, IL-8, IL-17A, IL-33, TNF-α, IL-4, IL-9, IL-10, IL-24, IL-

24, IL-37, IFN-β, CXCL12 and Arg-1.

Results Compared with the other three groups, CVS group exhibited significant depression- and anxiety-like behaviors, including decreased total open-field motor distance, prolonged feeding latency, immobility time in tail suspension test and forced swimming test. The time to enter the central area of the open field and elevated open arms were also decreased. Additionally, the level of IL-1β, IL-6, IL-8, IL-17A, TNFα, IL-4, IL-9, IL-24, IL-24, IL-37, IFN-β, CXCL12 were increased significantly, while IL-10, IL-33 decreased significantly, and Arg-1 levels showed a downward trend in CVS group. Furthermore, the depression- and anxiety-like behaviors in CVS mice can be reversed effectively by es-ketamine and fluoxetine, evidenced by increased the total distance of open field test, shortened the feeding latency, decreased the immobility time in tail suspension test and forced swimming decreased, the elevated time to enter the central area of the open field increased and elevated open arms in CVS+Flx and the CVS+es-Ket groups. In addition, es-ketamine and fluoxetine improved the level of inflammatory factors in CVS group. It's apparent that the level of IL-1β, IL-6, IL-8, IL-17A, TNF-α, IL-4, IL-9, IL-24, IL-24, IL-37, IFN-β, CXCL12 were significantly decreased, while IL-10, IL-33 were greatly increased and Arg-1 were relieved in plasm of CVS+Flx and CVS+es-Ket groups.

Conclusion Both es-ketamine and fluoxetine can alleviate depression- and anxiety-like behaviors in CVS mice by reducing the level of inflammatory factors and increasing the level of anti-inflammatory factors, it's worth noting that es-ketamine has a faster onset time.

关键字：es-ketamine; fluoxetine; chronic variable stress; inflammatory factors

首发焦虑性抑郁症静息态功能磁共振局部一致性研究

赵鹏[1] 王强[1] 阎锐[2] 王心仪[3] 卢青[3] 姚志剑[2]
1.南京市鼓楼医院
2.南京脑科医院
3.东南大学生物科学与医学工程学院

目的 探究首发焦虑性抑郁症患者及非焦虑性抑郁症患者静息状态时的局部脑的活动差异，以期阐明焦虑性抑郁症的神经基础。

方法 在南京大学医学院附属鼓楼医院及南京医科大学附属脑科医院招募门诊就诊或住院的符合DSM-5 抑郁发作诊断标准的首发未经治疗的抑郁症患者 98 例，17 项汉密尔顿抑郁量表（HAMD17）总分≥17 分。定义 HAMD 焦虑躯体化因子分≥7 分为焦虑性抑郁症，HAMD 焦虑躯体化因子分<7 分非焦虑性抑郁症。将患者分为焦虑性抑郁症组（60 例），和非焦虑性抑郁组（38 例）。同时招募 60 名年龄、性别、教育年限均匹配的健康对照。所有受试入组时签署知情同意书，予 HAMD17 量表评估，评估当天进行 3.0T 静息态功能磁共振扫描，在 Matlab 平台上使用 Data Processing Assistant for Resting-State fMRI（DPARSF）软件对磁共振数据进行预处理并计算局部一致性（ReHo）值。统计分析由 Resting-State fMRI Data Analysis Toolkit（REST）软件完成，先对三组受试脑区 ReHo 值进行方差分析，在方差分析差异脑区的基础上再进行两两独立样本 t 检验，将两组患者差异的脑区与病程、HAMD 总分及因子分进行相关分析。

结果 三组受试 ReHo 值差异有统计学意义的脑区包括左侧颞下回（ITG）、左侧颞中回（MTG）、右侧 MTG、右侧颞上回（STG）及右侧小脑脚 2 区（单个体素 $p<0.001$，连续体素数 $K>26$，Alphasim 矫正后 $p<0.05$）。与非焦虑性抑郁组相比，焦虑性抑郁症组左侧 ITG、左侧 MTG 及右侧 STG 的 ReHo 值显著降低（单个体素 $p<0.001$，连续体素数 $K>3$，Alphasim 矫正后 $p<0.05$）；与健康对照组相比，焦虑性抑郁症组右侧小脑脚 2 区及右侧小脑 9 区 ReHo 值显著降低（单个体素 $p<0.001$，连续体素数 $K>3$，Alphasim 矫正后 $p<0.05$）。焦虑性抑郁症组左侧 ITG、左侧 MTG 及右侧 STG 的 ReHo 值与 HAMD-17 总分、HAMD 因子分、HAMA 总分及病程无显著相关性（$p>0.05$）。

结论 左侧 ITG、左侧 MTG 及右侧 STG 的 ReHo 值降低是焦虑性抑郁区别于非焦虑性抑郁症的特征功能改变，可能参与了抑郁症焦虑症状的神经基础。

2.复旦大学附属华山医院
3.杨浦区精神卫生中心

目的 了解安非他酮对抑郁症患者快感缺失的疗效，以及对快感缺失不同成分(动机与愉悦、表达)疗效的差异。

方法 本研究根据 ICD-10 诊断标准，应用 SHAPS 量表筛选出服药 8-12 周后仍存在快感缺失的门诊患者（SHAPS 分值≥3），随机分为对照组和研究组。对照组维持 SSRIs 类药治疗，研究组在 SSRIs 类药物的基础上联合安非他酮 300mg/天治疗。在基线期、4 周、8 周、12 周共 4 个时点使用 YMRS、HAMD-17、HAMA、CAINS、SHAPS 进行评估。一共有 62 例患者完成了为期 12 周的随访，其中 30 例对照组，32 例研究组。

结果 基线期，两组患者在性别、年龄、受教育年限、总病程、YMRS、HAMD-17、HAMA、CAINS 总分、CAINS 动机与愉悦、CAINS 表达、SHAPS 无统计学差异。随访 12 周，重复测量方差分析结果显示：CAINS 动机与愉悦上 Ftime=4.753，P=0.005，时间的主效应显著，Ftime*group=4.622，P=0.006，时间与组别的交互效应显著，基线期（F=0.648，P=0.424）、4 周

（F=0.027，P=0.869）、8 周（F=4.892，P=0.031）、12 周（F=4.915，P=0.030），提示提示从第 8 周开始两组间动机与愉悦改善程度开始出现差异，研究组改善明显。CAINS 表达上 Ftime=19.687，P<0.001，时间的主效应显著，Ftime*group=5.074，P=0.002，时间与组别的交互效应显著，基线期（F=2.894，P=0.094）、4 周（F=1.574，P=0.214）、8 周（F=1.729，P=0.193）、12 周（F=2.373，P=0.129），提示在 4 个评估时间点上两组间的表达缺损无统计学差异。在 CAINS 总分上，Ftime=9.470，P<0.001，时间的主效应显著，Ftime*group=5.806，P=0.002，时间与组别的交互效应显著，基线期（F=0.390，P=0.535）、4 周（F=0.249，P=0.620）、8 周（F=5.193，P=0.026）、12 周（F=5.827，P=0.019），提示从第 8 周开始两组间快感缺失改善程度开始出现差异，研究组改善明显。

结论 安非他酮可以改善抑郁症患者的快感缺失。对于动机与愉悦维度改善明显、但对于表达维度改善不明显。

关键字：抑郁症；快感缺失；CAINS

Major Depressive Disorder Is Associated with The Mitochondrial ND1 T3394C Mutation in Two Han Chinese Families

敬攀[1] 禹海航[1] 张晓斌[2]
1.宁波市康宁医院
2.苏州市广济医院

Objective The purpose of this study was to investigate the possible relationship between mitochondrial ND1 T3394C mutation and Major depressive disorder (MDD).

Methods Clinical data were collected from two pedigrees, and detailed mitochondrial genomes were conducted for the two proband members. Resultant variants were evaluated for evolutionary conservation, allelic frequencies, and structural and functional consequences. Detailed mitochondrial whole genome analysis phylogenetic analysis and haplotype analysis were performed on probands.

Results In this study, we report the clinical, genetic and molecular characterization of two Chinese families with MDD. There were variable ages of onset and severity in depression among these families. These Chinese families exhibited extremely low penetrances of MDD. Sequence analyses of mitochondrial genomes from these pedigrees revealed homoplasmic T3394C (Y30H) mutation. The polymorphism is located at a highly conserved tyrosine at position 30 of ND1 and distinct mtDNA polymorphisms originating from haplogroups M9a3 and M9a.

Conclusion This observation of the T3394C mutation in two genetically unrelated individuals who suffer from depression strongly suggests that this mutation might play a role in the development of MDD. However, there was an absence of functionally significant mtDNA mutations in these two Chinese pedigrees carrying the T3394C mutation. It is therefore possible for nuclear modifier gene(s) or environmental factor(s) to play a role in the phenotypic expression of the MDD-associated T3394C mutation.

7.北京大学第六医院（精神卫生研究所），国家精神心理疾病临床医学研究中心（北京大学第六医院）
8.山东第一医科大学附属省立医院全科医学科

目的 探究我国糖尿病前期人群的抑郁症状与其糖尿病发病风险的关联。

方法 本研究的数据来源于中国健康与养老追踪调查 2011-2018 年随访数据。糖尿病前期的定义为糖化血红蛋白范围为 5.7%-6.4%，或空腹血糖水平范围为 5.6-6.9mmol/L。抑郁症状的定义是流调中心抑郁量表（Center for Epidemiologic Studies Depression，CES-D）得分 10 分及以上。糖尿病的定义为 2013、2015、2018 年研究对象自报被医生诊断为糖尿病或者正在服用降糖药物。采用 Cox 比例风险回归模型分析糖尿病前期患者的抑郁症状与其糖尿病发病风险的关联。

结果 共纳入 3956 名 45 岁以上的糖尿病前期患者，平均随访时间为 6.28 年，随访期间首次记录的糖尿病病例共 458 名。调整潜在混杂因素后，与无抑郁症状者相比，有抑郁症状的研究对象的糖尿病风险比（hazard ratio, HR）为 1.31（95%CI：1.07-1.59）。通过亚组分析发现，在女性、更年轻的研究对象、中等体力个体、血脂正常个体、血压正常个体中，抑郁症状与糖尿病的发病风险之间的关联更强。

结论 抑郁症状可增加糖尿病前期患者转化为的糖尿病风险。研究结果提示应重视糖尿病前期患者人群的抑郁症状，将为糖尿病的有效防治提供科学依据。

Evidence of N-linked Glycosylation in Microglia Participated in Depression Based on Pre-clinical Data

杨瑶 李媛 和申 彭代辉*

上海市精神卫生中心

Objective Neuroimmune plays an important role in depression in humans and depressive-like behaviors in mice. According to our previous work, N-linked glycosylation (NLG) might contribute to depressive mice and the neuroinflammation mechanism of major depression disorder (MDD). Additionally, microglia is the main executor of neuroimmune function in the central nervous system. Thus, targeting NLG in microglia of the chronic unpredictable mild stress (CUMS) mouse in this study might offer evidence supporting a potential strategy for MDD.

Methods The CUMS mouse model was established according to the protocol of PaulWillner (Neurobiology of Stress, 2017). According to our previous data, NLG-related genes (especially B4galt1) were found altered in depressive-like mice. Thus, tunicamycin (TU, the inhibitor of NLG), was injected with a candidate concentration as a therapeutic method for depressive-like mice. Immunofluorescence (IF) was used to identify the expression level of B4galt1. The cell counting data were double-blind.

Results (1) Our depressive behavior results showed that the TU injection reduced the immobility time of CUMS mice in the tail suspension test, a despairing degree for rodents. (2) The B4galt1 is expressed on microglia, and neurons, but not on the astrocyte. (3) In CUMS group, the expression level of B4galt1 was increased in microglia, not in neurons.

Conclusion These findings indicate that NLG is associated with MDD, and suggest that therapeutically targeting NLG might be an effective strategy for depressive mice.

反刍思维是伴非自杀性自伤抑郁症患者的危险因素

鲍慈青[1] 沈阿姿[1] 施开宇[1] 邹浩文[1] 张乔阳[1] 何晨[1] 孙浩[1] 史家波[1] 姚志剑[1,2]

1.南京医科大学附属脑科医院心境障碍科

2.南京大学医学院

目的 非自杀性自伤行为(Non-suicidal self-injury, NSSI)是严重危害公共健康危害的行为。有证据表明反刍思维可能与自非自杀性自伤行为呈正相关。对于两者关系的性质，尤其是在重度抑郁症患者中，仍然存在分歧。这项研究旨在确定反刍思维是否是非自杀性自伤的危险因素。

方法 以 2022 年 8 月～2022 年 11 月于南京医科大学附属脑科医院情感障碍科住院的 132 例重度抑郁障碍患者为研究对象，根据一系列临床评估，所有参与者被分为两组：伴非自杀性自伤的 MDD 组（n=70）和不伴非自杀性自伤的 MDD 组（n=62）。采用渥太华自伤问卷评估自伤行为，反刍思维量表评估反刍思维（症状反刍、强迫思考、反省深思）。采用二元 logistic 回归分析来评估反刍思维总分及因子分与非自杀性自伤之间的关系。

结果 伴非自杀性自伤的 MDD 组的患者的整体的反刍思维和症状反刍因子都显著高于不伴非自杀性自伤的 MDD 组患者（p=0.03；p=0.008）。此外，尽管没有统计学差异，但在强迫思考和反省深思两个因子中，伴非自杀性自伤的 MDD 组比不伴非自杀性自伤的 MDD 组呈现较高的分数。在控制了年龄、当前的抑郁和焦虑症状以及教育年限后，就因子分而言，具有较高症状反刍的患者更有可能报告非自杀性自伤 [OR（95%CI）=1.352（1.098 1.665），P=0.006]。此外，具有较高强迫冥想的 MDD 患者也更可能报告非自杀性自伤 [OR（95%CI）=1.686（1.164 2.441），P=0.005]。

结论 这些结果表明，反刍思维尤其是症状反刍和强迫冥想可能是非自杀性自伤的一个危险因素。未来的研究应该探索这种关联的潜在机制，以及可能减少非自杀性自伤特定反刍思维的干预措施。

重性抑郁障碍伴快感缺失症状的相关功能紊乱与自杀意念的关系：基于脑网络分析

王晓芹[1] 夏逸[1] 阎锐[1,2] 王欢[3] 孙浩[1,2] 黄映红[1,2] 史家波[1] 卢青[3] 姚志剑[1,2,3]

1.南京医科大学附属脑科医院心境障碍科

2.南京大学医学院

3.东南大学生物科学与医学工程学院

目的 一些流行病学研究和心理学模型提示，重性抑郁障碍伴有快感缺失症状与高自杀意念相关。本研究旨在探究重性抑郁障碍伴快感缺失症状患者异常的功能连接网络及其内部的拓扑特性与自杀意念的关系。

方法 选择 2021 年 1 月到 2023 年 3 月南京医科大学附属脑科医院心境障碍科住院诊断为重性抑郁障碍正处于抑郁发作的患者。共纳入 273 例重性抑郁障碍患者和150名健康对照者，进行静息态磁共振扫描。使用斯奈思-汉密尔顿快感量表将抑郁患者分为高快感缺失 144 人，低快感缺失 129 人。首先，以 AAL3 为模板计算全脑的功能连接值，基于网络的统计方法，计算与快感缺失相关的脑功能网络异常。然后，将差异网络进一步使用图论分析，探究与快感缺失症状相关脑功能网络内的拓扑结构异常。此外，我们使用贝克自杀意念量表对每例患者的自杀意念进行了量化。使用中介分析的统计方法评估了快感缺失症状评分是否可以中介快感缺失相关网络指标与自杀意念之间的关系。

结果 基于网络的统计分析结果显示，伴高快感缺失症状患者在部分额叶-边缘相关网络功能连接异常增加，包括额叶皮质、纹状体、前扣带回皮质和杏仁核等 19 个脑区作为网络节点。对此网络进一步图论分析表明，快感缺失相关的网络表现出明显的全局和局部拓扑结构紊乱，如：显著降低的 gamma 和 lambda 值，

伏隔核节点局部效率显著下降。此外，快感缺失症状评分可以中介快感缺失相关网络指标(网络平均功能连接值、gamma 和伏隔核节点局部效率)与自杀意念之间的关系。

结论 本研究发现，重性抑郁障碍伴快感缺失患者存在脑功能网络及其内部拓扑结构异常。更重要的是，重性抑郁障碍患者存在额叶-边缘相关网络紊乱会通过快感缺失症状导致自杀意念，揭示了快感缺失导致自杀意念的潜在神经机制。

基于网络统计的抑郁症情绪处理早期阶段大脑功能连接的动态变化

杜易珊[1] 花玲玲[1] 夏逸[1] 史家波[1] 姚志剑[1,2] 卢青[2]
1.南京医科大学附属脑科医院心境障碍科
2.东南大学生物科学与医学工程学院

目的 抑郁症患者存在负性情绪偏向，但其情绪识别早期阶段大脑动态加工的神经机制仍不清楚。本研究旨在探究抑郁症患者负性面孔加工时皮层和皮层下脑区交互作用随时间和频段变化的动态特征，以期发现抑郁症情绪加工早期阶段异常的神经机制，寻找可以早期识别抑郁症的神经电生理标记。

方法 入组南京脑科医院抑郁症住院患者 108 例和 64 例相匹配的健康对照者，利用脑磁图技术（加拿大，CTF275）检测被试在识别负性情绪面孔时的脑磁活动。以 AAL90 为标准模板计算全脑功能连接。以 100ms 为时间窗长，步长 50ms，分别计算 400ms 内 alpha、beta 和 gamma 频段的脑区功能连接。用基于网络的统计方法计算两组之间的大脑功能连接差异。

结果 相对于健康人，抑郁症患者在识别负性面孔时，在 0-100ms, gamma 波段功能连接下降，主要分布在以角回、扣带回、额叶、楔叶为主的默认网络。在 150-250ms, beta 波段功能连接减弱，主要分布在情绪网络。在 200-300ms，alpha 波段功能连接下降，主要分布在枕上回为主的视觉区域。200-300ms alpha 波段的功能连接减弱与连线测试 A 分数呈正相关（r= 0.290,P= 0.035），150-250ms beta 波段的功能连接减弱与 HAMD-17 项分数呈负相关（r= -0.231, P= 0.016），与总病程呈正相关（r= 0.230, P= 0.016）。

结论 抑郁症患者情绪处理早期阶段的不同时间段内，脑区间的动态交互作用不同于健康人，主要表现在与默认网络、情绪网络和视觉网络相关的脑区交互间的功能连接异常下降，这种异常与疾病严重程度有关。提示抑郁症患者在情绪加工早期阶段便出现异常，这可能是抑郁症患者出现负性情绪偏向的早期神经机制之一，为抑郁症诊断的神经标记物提供基础。

伴非自杀性自伤成年早期抑郁症患者磁共振脑白质研究

黄映红[1,2] 阎锐[1] 孙浩[1,2] 王晓芹[1] 夏秋栋[1] 陈志璐[1] 史家波[1] 卢青[3] 姚志剑[1,2]
1.南京医科大学附属脑科医院心境障碍科
2.南京大学医学院
3.东南大学生物科学与医学工程学院

目的 近年来，伴非自杀性自伤（non-suicidal self-injury, NSSI）抑郁症的研究受到了广泛重视。NSSI 被认为是预测自杀的因子之一，是一种常见的抑郁症伴随症状。伴 NSSI 抑郁症患者的治疗效果更差，自杀风险更高，更易复发且预后更差。但伴 NSSI 抑郁症的神经机制尚不明确。本研究旨在探讨在伴 NSSI 的抑郁症患者中的脑白质影像学特征。

方法 本研究招募了南京脑科医院精神科从 2020 年 7 月至 2022 年 10 月入院的 18-30 岁的抑郁症患者。根据是否伴有 NSSI，抑郁症患者被分成伴 NSSI 的抑郁症组（MDD/NSSI），和不伴 NSSI 的抑郁症组（sMDD）。一共纳入 54 名 MDD/NSSI 患者和 68 名 sMDD 患者及 66 名年龄、性别、受教育年限匹配的健康被试。对入组被试进行脑磁共振成像扫描，将采集的 DTI 数据预处理后，继续使用 PANDA 软件计算全脑白质 FA 值，并使用 SPSS 软件对结果进行统计分析。

结果 与 sMDD 组相比，MDD/NSSI 组左额枕下束、左钩束、左绦带白质 FA 值异常。与 HC 组相比，MDD/NSSI 组在小脑中角、右小脑上角、左小脑上角、右大脑角、右扣带回、左扣带回均存在异常。与 HC 组相比，sMDD 组在胼胝体、左小脑上角、右大脑角、左矢状层、左外囊、右海马扣带回、右界嵴、左额枕下束、左钩束均存在异常（p<0.05，bonferroni 校正）。

结论 伴 NSSI 的抑郁症与不伴 NSSI 的抑郁症之间在脑白质各向异性值上存在差异，提示 NSSI 可能导致特征性的脑白质结构改变。

3.东南大学生物科学与医学工程学院

背景 与环境背景不相称的情绪低落是抑郁症（Major depressive disorder，MDD）的核心症状，由负性认知框架介导，表现为大脑对情绪信息加工中晚期编码过程的异常。心脑交互（Heart-brain interaction，HBI）与个体情绪联系密切。MDD 患者负性情绪面孔信息加工异常，且在情绪信息加工过程中 HBI 模式也

存在异常。在健康者中，HBI 的电生理能量模式可调节大脑负性情绪面孔信息加工。尚未知 MDD 异常的负性情绪面孔信息加工是否与 HBI 有关。本部分基于《情绪面孔刺激任务》，对大脑情绪信息加工的事件相关电位晚期正成份（Late Positive Potentials, LPPs）以及心跳诱发电位（Heart-evoked potentials, HEPs）特征进行分析，探讨 MDD 患者 HBI 对情绪面孔信息加工功能的影响。

方法 选取符合 DSM-IV诊断标准的 MDD 患者 27 例以及 27 名健康对照者（HC）作为研究对象。记录被试者执行《情绪面孔刺激任务》时的心电与脑电数据；分析每次情绪面孔图片刺激前的 HEPs 与不同情绪面孔图片刺激后 LPPs 特征并进行溯源分析；结合临床特征，应用回归分析建立预测模型，探讨 HEPs 与 LPPs 之间的关系。

结果 MDD 组与 HC 组人口学资料比较差异无统计学意义（均 $p>0.05$）。MDD 组在情绪面孔刺激前右额顶叶（F2，F4，F6，FC2，FC4）的 HEPs 波幅低于 HC 组（均 $p<0.05$），正/中/负性情绪面孔刺激后 MDD 组左额叶及右顶枕叶 LPPs 平均波幅较 HC 组降低（均 $p<0.05$）；溯源分析显示 MDD 组异常的 HEPs 与前扣带回（Anterior cingulate cortex，ACC）激活度降低相关，负性情绪面孔刺激下异常的 LPPs 与 ACC 的激活度降低、右脑岛的激活度增高相关；MDD 组异常的 HEPs 波幅仅预测负性情绪面孔刺激下异常的 LPPs。

结论 MDD 患者 HBI 电生理能量模式异常，对负性情绪面孔信息晚期编码产生影响；ACC 及右脑岛功能异常是 MDD 患者异常 HBI 电生理能量模式影响大脑负性情绪面孔信息加工的时空特性的神经基础。

抑郁症伴焦虑症状患者认知功能损害特点研究

盛俊领[1] 孙浩[2] 周红亮[1] 花玲玲[1] 杜易珊[1] 夏逸[1] 王晓芹[1] 史家波[1] 姚志剑[1,2]
1.南京医科大学附属脑科医院心境障碍科
2.南京大学医学院

背景 ：伴有焦虑症状的抑郁症患者非常常见，一般症状更重预后不良，并且伴有广泛的认知功能的损害，但抑郁症伴焦虑症状对特定认知领域的影响尚存在争议。

方法 对 169 名抑郁症伴焦虑症状患者、77 名抑郁症不伴焦虑患者以及 108 名健康人进行四个维度的认知评估，评估的项目如下：连线测试 B（TMT-B ）、数字广度测试 （DSB） 、威斯康辛卡片分类测试（WCST）、语言流利性测试（VFT）衡量执行功能，连线测试 A（TMT-A）衡量注意力，Wechsler 记忆量表修订版 （WMS-R） 的逻辑记忆 （LM） 和图形记忆（FM）用来衡量记忆，数字符号替换测试（DSST）来衡量处理速度。所有抑郁伴焦虑和不伴焦虑组完成 17 项汉密尔顿抑郁量表（HAMD17）和汉密尔顿焦虑量表（HAMA）。抑郁伴焦虑被定义为 HAMA 总分>14 分。采用协方差分析和回归模型分析，以评估抑郁伴焦虑症状患者的认知功能的特定损害。

结果 抑郁伴焦虑和不伴焦虑组与健康对照相比，在认知的四个维度均发现有显著损害（p 均<0.05），在抑郁症伴焦虑组中，控制了年龄、性别和教育年限后发现，HAMA 总分对执行功能有贡献（R2 =0.221，p=0.037），HAMA 中的躯体性焦虑分对处理速度有贡献（R2 =0.327， p=0.045），控制了抑郁的严重程度之后，HAMA 总分对执行功能仍有贡献（R2 =0.221，p=0.036），HAMA 躯体性焦虑对处理速度也同样有贡献（R2 =0.352， p=0.018）；在抑郁伴焦虑组中 HAMD 总分对处理速度也是有贡献的（R2 =0.330， p=0.028），但是在单纯焦虑组中 HAMD 对处理速度没有贡献。

结论 我们的研究表明单纯抑郁症和抑郁症伴焦虑的患者在认知功能方面与健康人在认知的各个方面都是有显著差异的，但是抑郁症中的焦虑症状可能会引起执行功能的损害，躯体性焦虑可能会引起处理速度的损害，消除抑郁症的严重程度的影响后，依然成立。

伴/不伴忧郁特征抑郁症喜悦表情刺激下眶额回时频能量差异研究

张乔阳[1,2] 花玲玲[1] 杜易珊[1] 鲍慈青[1] 沈阿姿[1] 施开宇[1] 何晨[1] 孙浩[1] 史家波[1] 姚志剑[1]
1.南京医科大学附属脑科医院心境障碍科
2.南京医科大学附属常州第二人民医院

背景 ：眶额叶皮层过度激活在重度抑郁症患者奖赏功能障碍中起着核心作用。伴忧郁特征亚型具有高度的异质性，病理生理机制主要与奖赏功能失调有关。然而，眶额叶皮层活动在伴忧郁特征亚型中的改变仍不清楚。 目的 研究在喜悦面孔刺激下，伴忧郁特征抑郁症患者眶额叶皮层活动的改变，及与忧郁特征维度的关系。

方法 纳入伴忧郁特征抑郁症患者 18 例、不伴忧郁特征抑郁症患者 21 例及健康志愿者 22 例，进行喜悦表情刺激下的脑磁图扫描。利用时间频率分析方法，通过聚类置换检验比较三组喜悦表情刺激后 0-500ms，频率段为 4-80HZ 下眶额叶皮层的时频能量。使用内源性汉密顿抑郁量表（Hamilton Endogenomorphy Scale）评估患者的忧郁特征维度，采用偏相关分析探索患者组眶额叶皮层时频能量与忧郁特征维度的关联。

结果 在刺激任务的中后期，alpha 和 beta 频段内，伴忧郁特征组眶额叶时频能量均显著高于不伴忧郁特征组和健康对照组，而不伴忧郁特征组与健康对照组之间无显著性差异。控制年龄、性别、教育水平后，患者组 beta 频段眶额叶皮层时频能量与忧郁特征维度总分呈正相关（$pr=0.355, p<0.05$），alpha 频段眶额叶皮层时频能量与忧郁特征维度无相关性（$pr=0.217, p>0.05$）。

结论 我们的研究结果表明，伴和不伴忧郁特征抑郁症患者喜悦表情刺激下的眶额回激活程度不同。眶额回 beta 频段时频能量增加可能是伴忧郁特征亚型独特的神经生物学特征。

Sex Differences in Prevalence and Clinical Correlates of Suicide Attempts in First-episode and Drug-naive Patients with Anxious Depression in A Chinese Han Population: A Large-scale Cross-sectional Study

Guoshuai Luo Hongyun Ma Shuo Wang Daliang Sun*
Department of Geriatric Psychiatry, Tianjin Anding Hospital

Objective Depression and anxiety disorders have a high co-morbidity rate. Previous research has focused on risk factors for anxiety depression (AD). However, fewer studies have examined sex differences in the prevalence of suicide attempts among AD patients. This study aimed to explore sex differences in suicide attempts and risk factors in patients with AD.

Methods This study recruited 1380 first episode and drug-na?ve patients with AD. Sociodemographic and clinical characteristics were measured using a self-administered demographic questionnaire. In addition, the Hamilton Depression Scale (HAMD), Hamilton Anxiety Inventory (HAMA), and positive subscale of the Positive and Negative Syndrome Scale (PANSS) were used to assess patients' clinical symptoms. We also measured the patient's blood glucose, lipids, blood pressure, and thyroid axis hormone levels. Chi-square tests and t-tests were used to account for differences between groups. A two-way ANOVA was used to explore group differences in sex and suicide attempts (with or without suicide attempts). A binary logistic regression analysis assessed the risk factors for suicide attempts in male and female patients.

Results There were no sex differences in the prevalence of suicide attempts in patients with FEDN anxious depression (male: 22.9% vs. female: 25.0%, P = 0.428). Compared with male AD patients, female patients were older and had a higher age of onset (P < 0.0001, Bonferroni corrected P < 0.05/15 = 0.003). Two-way ANOVA analysis showed that suicide attempts had a significant effect on illness duration, HAMD score, HAMD score, PANSS positive score, TSH levels, TgAb levels, TC levels, HDL-C levels, and LDL-C levels (all P < 0.005). Furthermore, HAMA score and TPOAb were associated with the times of suicide attempts in both male and female patients with AD, while HAMD score was related to the times of suicide attempts in female AD only. In addition, binary logistic regression analysis showed that HAMA score, TSH levels, and TPOAb levels significantly predicted suicide attempts in both male and female patients with AD, while HAMD score significantly predicted suicide attempts in female patients with AD only.

Conclusion There were no sex differences in the prevalence of suicide attempts in FEDN patients with AD. The severity of anxiety and higher levels of TSH and TPOAb were risk factors for suicide attempts in both male and female patients with AD, whereas the severity of depression was only associated with suicide attempts in females.

U-shaped Association between Triglyceride Glucose-body Mass Index and Suicide Attempts in Chinese Patients with First-episode Drug-na?ve Major Depressive Disorder

刘军军[1] 杜向东[2]
1.南京梅山医院
2.苏州广济医院

Objective Triglyceride glucose-body mass index (TyG-BMI) has been suggested as an alternative indicator of insulin resistance (IR). However, the relationship between TyG-BMI and suicide attempts (SA) remains unclear. The aim of this study was to examine the association between TyG-BMI and SA in Chinese patients with first-episode drug-na?ve (FEDN) major depressive disorder (MDD).

Methods From September 2016 to December 2018, 1718 FEDN MDD patients aged 34.9 ± 12.4 years were enrolled in this cross-sectional study from the First Hospital of Shanxi Medical University (Taiyuan, Shanxi Province, China). A multivariable logistic regression analysis was used to estimate the association between TyG-BMI and the risk of SA. Threshold effects were examined by a two-piecewise linear regression model. Interaction and stratified analyses were performed based on sex, education, marital status, comorbid anxiety, and psychotic symptoms.

Results After adjusting for confounders, multivariate binary logistic regression analysis revealed that the association between TyG-BMI and SA was not significant (OR = 1.00, 95% CI: 1.00–1.01, P=0.10). However, smoothing plots showed a nonlinear relationship between TyG-BMI and SA, with the inflection point of TyG-BMI being 210. The effect sizes and the confidence intervals on the left and right sides of the inflection point were 0.99 (0.97-0.999, P= 0.03) and 1.01 (95%CI: 1.00 to 1.05, P< 0.001), respectively.

Conclusion A U-shaped relationship between TyG-BMI and SA in FEDN MDD patients was found, with the lowest risk of SA at a TyG-BMI of 210, indicating that both the lower and higher TyG-BMI levels may lead to an increased risk of SA.

基于代谢组学的抑郁障碍相关标志物探索：一项病例对照研究

王丽娜[1,2] 马蔼丽[3] 乔冬冬[1]
1.山东省精神卫生中心
2.山东师范大学心理学院
3.济宁医学院

目的 抑郁障碍(Major Depressive Disorder, MDD)发病机制复杂。代谢组学（Metabolomics）可通过对机体内源性小分子代谢物及其涉及的代谢通路进行分析从而探究代谢物与机体生理病理变化之间的相互关系。本研究通过比较抑郁障碍患者与健康人的血清代谢产物及相关代谢途径的差异，结合差异代谢物的生物学功能，为抑郁障碍的发病机制提供新的理论基础及标记可能的生物标志物。

方法 （1）纳入符合 ICD-10 诊断标准的抑郁障碍患者和与之匹配的健康对照者各 80 名。（2）采用 Seriomics 一步法（MTBE-甲醇-水三相溶剂体系）提取受试者血清中极性亲水的代谢物组分和疏水的非极性代谢物组分（脂质），并采用超高效液相色谱-高分辨质谱法（UPLC-HRMS）非靶向代谢组学技术进行检测。（3）通过主成分分析、正交偏最小二乘法-判别分析（OPLS-DA）明确两组代谢物之间的差异。以 VIP> 1.0 且 P<0.05 为标准筛选差异代谢物。（4）应用 KEGG (Kyoto Encyclopedia of Genes and Genomes)数据库采用过表达分析方法进行通路富集分析，得到与差异代谢物相关的重要代谢途径。

结果 （1）本研究最终确定了 33 种差异代谢产物。与正常对照组相比，代谢产物羟基二十碳四烯酸、羟基十八碳二烯酸、L-谷氨酸等水平显著升高，代谢产物 N2 甲基鸟苷、血叶啉、牛磺鹅去氧胆酸、血清素等水平显著降低。进一步筛选显示，氨基酸中的血清素、L-谷氨酸和 L-天冬氨酸、不饱和脂肪酸中的花生四烯酸和甘油磷脂中的溶血磷脂酰胆碱与抑郁障碍显著相关。（2）具有显著差异的代谢途径主要涉及苯丙氨酸、酪氨酸和色氨酸的代谢、氨酰基 tRNA 的代谢、丙氨酸、天冬氨酸和谷氨酸的代谢、精氨酸的代谢、缬氨酸、亮氨酸和异亮氨酸降解代谢等。结合代谢途径的生物学效应，表明苯丙氨酸、酪氨酸和色氨酸代谢以及精氨酸代谢途径与抑郁障碍显著相关。

结论 抑郁障碍存在显著的代谢物和代谢通路异常。其中，苯丙氨酸、酪氨酸和色氨酸代谢以及精氨酸代谢通路中代谢物水平的改变可能是抑郁障碍的生物标志物。

基于真实世界证据探索伴自杀意念或行为的抑郁症患者的临床特征、治疗特点及疾病负担

王瀚 吕楠 黄娟 付冰冰 张玲 赵茜*
首都医科大学附属北京安定医院

目的 利用真实世界数据探讨精神专科医院中伴自杀意念或行为的抑郁症患者的临床特征、治疗特点以及疾病负担。

方法 本研究为描述性、回顾性研究，利用基于 HIS 系统的电子健康记录提取患者的临床资料。研究纳入 2013 年 1 月 1 日至 2020 年 12 月 31 日在首都医科大学附属北京安定医院住院及急诊留观治疗的抑郁症患者。依据入组时是否伴有自杀意念和（或）自杀行为，将入组患者分为抑郁症伴自杀意念组，抑郁症伴自杀行为组及抑郁症阳性对照组。在数据库中提取并比较三组患者入院治疗过程中的治疗特点，一般人口学信息、临床资料、治疗情况及疾病负担，并在患者出院后 1 年的观察期内研究患者的复燃与复发的情况。

结果 研究发现伴自杀意念及行为的抑郁症患者在人口学特征（如年轻、女性、无业）和临床特征（如起病年龄早、伴有精神病性症状、存在起病诱因）等方面与抑郁症阳性对照组患者相比存在显著差异。在疾病负担方面，伴自杀意念或行为的抑郁症患者常需要多次住院，每次住院需要花费更多的费用，提示此类患者的疾病负担更重。在治疗方面，有超过 30%的患者需要经过 4 轮以上的治疗，超过 90%的患者单独或联合使用抗抑郁药，其中 SSRIs 抗抑郁药最常使用。无论在治疗初期还是在出院时，伴自杀意念或行为的抑郁症患者的治疗方案更复杂。其在治疗过程中合并 ECT 治疗的比例更高，随着治疗轮次的增加，合并使用抗精神病药及心境稳定剂的比例在逐步增加。在出院后半年内，伴自杀意念或行为的抑郁症患者更容易出现疾病复燃。

结论 伴自杀意念或行为的抑郁症患者具有独特的人口学及临床特征，其治疗方案更复杂、疾病负担更重且更容易出现疾病复燃。

3.南京医科大学附属脑科医院精神科
4.南京大学医学院，南京脑科医院

Objective Antidepressant treatment effects are strongly heritable and have substantial effects on brain function and structure, but the underlying mechanisms are still poorly understood. In this research, we aimed to evaluate the factors of single nucleotide polymorphisms (SNPs) and hierarchical brain structural and functional networks that were associated with antidepressant treatment. Moreover, we further explored the correlations and mediation

pattern among “brain structure-brain function-gene” in major depressive disorder (MDD).

Methods We analysed 405 SNPs and rich club/feeder/local connections of hierarchical structural and functional networks with three-way parallel independent component analysis in 179 MDD patients. The group-discriminative independent components of the three modalities between responders and non-responders of antidepressant treatment were identified. Pearson correlations and mediation analysis were further utilized to investigate the associations among SNPs and connections of the structural and functional networks.

Results Notably, correlations with antidepressant treatment outcomes were found in structural, functional and SNP modalities simultaneously. The features of group-discriminative independent components included the shared feeder connections of hub regions with the inferior frontal orbital gyrus and amygdala in structural and functional modalities and genes enriched in circadian rhythmic processes and dopaminergic synapse pathways. The structural feeder network displayed close correlations with SNPs and the functional feeder network. Furthermore, the structural feeder network could mediate the association between SNPs and the functional feeder network, implying that genetic variants might influence brain function by affecting brain structure in MDD.

Conclusion These findings provide potential biomarkers for antidepressant therapy and provide a better grasp of the associations among SNPs and hierarchical structural and functional networks in MDD.

抑郁症发展轨迹对自杀意念的影响研究

廖宇华[1,2] 张慧敏[1] 刘熠锋[1] 郭蓝[2] 王婉馨[2] 韩雪[1] 李陵江[3] 范北方[1] 卢次勇[2]
1.深圳市南山区慢性病防治院
2.中山大学公共卫生学院
3.中南大学湘雅二医院

目的 抑郁症患者的抑郁症状发展轨迹具有异质性及长期稳定性，不同的抑郁症状发展轨迹对自杀意念可产生不同程度的影响，有效识别抑郁症的发展轨迹是为受影响的个体提供及时有效治疗方法和干预措施的基础。

方法 本研究基于 DCC 队列（Depression Cohort of China）中抑郁症患者开展前瞻性队列研究，基线调查后（T1），于 4 周（T2）、8 周（T3）、12 周（T4）及 24 周（T5）开展随访，采用潜类别轨迹模型（Latent Class Trajectory Models， LCTM）识别抑郁症异质性发展轨迹。采用多项 Logistic 回归模型发现异质性轨迹的危险因素。以自杀意念为结局，采用生存分析方法探索抑郁症异质性发展轨迹对自杀意念的影响。

结果 研究共纳入抑郁症患者 904 人，经 LCTM 模型拟合总体样本可分为无应答组 171 人（18.92%），起效未缓解组 539 人（59.62%）及缓解组 194 人（21.46%）。无应答组与缓解组相比，有较高的基线抑郁症状评分（PHQ-9：AOR=1.12,95%CI=1.05-1.19）、躯体疼痛症状（SSI: AOR=1.05,95%CI=1.01-1.09）为无应答的危险因素，较好的心理弹性（CD-RISC：AOR=0.97,95%CI=0.96-0.99）为保护因素。起效未缓解组与缓解组相比，较高的基线抑郁症状评分（PHQ-9：AOR=1.10,95%CI=1.04-1.16）、人口学信息中未婚/离异丧偶、躯体疼痛症状（SSI 疼痛：AOR=1.05,95%CI=1.00-1.09）以及自杀意念（BSSI：AOR=1.05,95%CI=1.02-1.08）为起效未缓解组的危险因素。队列中基线无自杀意念的抑郁症患者 208 人，经 Cox 回归发现无应答组及起效未缓解组是缓解组自杀意念风险的 15.44 倍（95%CI=5.89-40.44）及 5.37 倍（95%CI=2.25-12.81）。抑郁症状是独立且唯一的风险因素。

结论 抑郁症病程发展可表现为治疗无应答、治疗起效但未缓解及治疗缓解三种类型，无应答及起效未缓解是抑郁症自杀意念发生的独立且唯一的风险因素。定期开展抑郁症状的随访监测，发现影响症状发展的危险因素，有针对性地开展预防措施，对抑郁症的预防及治疗具有重要意义。

罗伊适应模式心理护理对心境障碍抑郁发作患者生活质量及满意度的影响

潘蒙 王立娜*
天津市安定医院

目的 为了探究在心境障碍抑郁发作患者的临床护理干预中，罗伊适应模式心理护理对患者生活质量及满意度的影响。

方法 此次纳入实验研究的对象均为 2021 年 4 月至 2022 年 4 月我院收入的心境障碍抑郁发作患者 90 例，按照患者的入组时间，采用数字标记方式，将其分成对照组（常规护理）与研究组（罗伊适应模式心理护理），分别收入患者 45 例，比较两组患者的生活质量各项评分、抑郁焦虑情况、满意度等指标。

结果 护理前，比较两组患者的生活质量评分，组间对比结果缺少差异性，P＞0.05；护理后，研究组精神健康、总体健康、社会功能、精力、生理职能、身体疼痛、情感职能、生理功能等内容评分结果均明显高于对照组，差异有统计学意义（P＜0.05）。护理前，比较两组患者 SDS 评分与 SAS 评分，组间对比结果缺少差异性，P＞0.05；护理后，研究组 SDS 评分为（33.14±1.19）分、SAS 评分为（31.11±1.57）分；对照组 SDS 评分为（44.28±3.37）分、SAS 评分为（42.38±3.52）分，干预组均明显低于对照组，差异有统计学意义（P＜0.05）。研究组护理满意度为 95.56%，对照组为 77.78%，研究组明显高于对照组，差异有统计学意义（P＜0.05）。

结论 对于心境障碍抑郁发作患者而言，有效的护理干预措施是非常重要的，罗伊适应模式心理护理是一种先进的护理干预措施，能够对患者的心理状态

做出有效干预，能够有效缓解患者的心理焦虑抑郁问题，使患者更好地面对生活，促进生活质量的不断提升，而且还会对护理服务工作更加满意，在临床护理中应推广使用范围。

首发重性抑郁症患者肠道菌群组成及与胃肠道症状的相关性

刘鹏鸿 张克让*
山西医科大学第一医院

目的 在本研究中，我们旨在探索首发未治疗的 MDD 患者肠道菌群的特征及其与炎症标志物和胃肠道症状的相关性，为 MDD 的治疗提供理论依据。

方法 收集符合入排标准的 91 例首发未服药的 MDD 患者和 105 名健康对照者（Healthy Controls，HCs)。采用 16S rRNA 测序技术和生物信息学分析评估粪便菌群组成。采用酶联免疫吸附试验(Enzyme Linked Immunosorbent Assay，ELISA)检测外周血超敏 c 反应蛋白(hs-CRP)、白细胞介素-1β（IL-1β）、白细胞介素-6（IL-6）、白细胞介素-10（IL-10）和肿瘤坏死因子-α（TNF-α）; 采用胃肠症状评定量表(Gastrointestinal Symptom Rating Scale， GSRS)和汉密尔顿抑郁量表（Hamilton Depression Scale， HAMD）分别评估胃肠道症状和抑郁症状的严重程度。

结果 所有的 MDD 患者都伴有胃肠道症状，食欲下降、早饱感、恶心呕吐的发生率均高于 70%。与 HCs 相比，MDD 患者外周血中 hs-CRP 水平明显升高 ($P < 0.05$) ；肠道菌群分析显示两组受试者肠道菌群 α 多样性（Simpson 指数和 Pielous 均匀度指数）和 β 多样性存在明显差异($P < 0.05$) 。 LEfSe 分析发现，在属的水平上，MDD 组具有较高的地嗜皮菌属、异斯卡多维亚菌属、双歧杆菌属、布洛特菌属、钩丝菌属、红长菌属、马赛菌属、嗜血杆菌属、Candidatus_Xiphinematobacter 和 Chthoniobacter，较低的拟杆菌属、副拟杆菌属、SMB53、厌氧菌属、梭菌属、毛梭菌属、罗斯氏菌属、 粪杆菌属、瘤胃球菌属、小杆菌属、考拉杆菌属和萨特氏菌属。相关性分析发现罗斯氏菌属、萨特氏菌属、副拟杆菌属的相对丰度与 hs-CRP、HAMD-17、GSRS 总分及部分条目呈负相关 ($P < 0.05$)。

结论 MDD 患者肠道菌群紊乱，外周血 hs-CRP 升高。MDD 患者改变的肠道菌群与 hs-CRP、抑郁症状和胃肠道症状密切相关。

Gut Microbiota Characteristics and Its Immunoregulatory Role in Inflammatory Depression：joint Clinical and Animal Data

刘鹏鸿 刘志芬 孙宁 张克让*
山西医科大学第一医院

Objective Previous studies have reported that inflammatory depression is a treatment-resistant depression subtype associated with specific symptoms and biological abnormalities and gut microbiota may be the source of low-grade inflammation. But the gut microbiota features and its roles of immunoregulation in this subtype of depression remains uncertain. we propose that TLR-4/NF-κB and NLRP3 inflammasome signalling pathway activated by disordered gut microbiota could contribute to intestinal and central inflammation in inflammatory depression.

Methods To test this hypothesis we performed studies in both human and mice. Gut microbiota composition in stool, inflammation factor and SCFAs in plasma, inflammatory and permeability marker in intestinal mucosa were analyzed in inflammatory depression patients. Then we performed fecal microbiota transplantation (FMT) and probiotic supplement to determine whether the behavioral phenotypes were linked with disturbed gut microbiota in inflammatory depression.

Results Compared to HCs, depressive patients have decreased SCFA-producing bacteria, higher hs-CRP and lower SCFAs in plasma, decreased intestinal barrier, enhanced inflammatory markers. Compared with non-inflammatory depression and HCs, the relative abundance of Bacteroides was significantly higher and Clostridium was lower in inflammatory depression patients. Further, we identify the SCFA-producing species and butanoate metabolism abnormal in inflammatory depression by shotgun metagenomic sequencing. After FMT, gut microbiota of inflammatory depression increased the inflammatory factors such as TLR-4, NLRP3 (intestinal mucosa), hs-CRP (plasma), TLR-4, NF-κB, NLRP3, Caspase-1, IL-1β and iba-1 (brain) and intestinal mucosal permeability in recipient mice with depressive and anxiety-like behaviors. Clostridium butyricum treatment can normalize the gut microbiota, repair “gut leak”, decrease the peripheral and central inflammatory factors and have an antidepressant-like effect in the mouse model of inflammatory depression.

Conclusion This study suggest that inflammatory depression had increased pro-inflammatory genera and decreased SCFAs producing genera. The gut microbiota-derived inflammatory processes are involved in pathology of inflammatory depression and TLR-4/NF-κB and NLRP3 inflammasome signalling pathway, at least in part, mediate this interaction.

Forebrain and Liver Differential MRNA Expression Profiling of Chronic Unpredictable Mild Stress Induced Mice Base on Transcriptome Sequencing

吴晓慧 陈俊 方贻儒*
上海市精神卫生中心

Objective Based on the evidence from the World Health Organization, depression is one of the top five leading causes of global burden of disease, as well as an important cause of suicidal behavior. The prefrontal cortex and hippocampus are two major divisions of the forebrain. Dysfunction in both of them plays an important role in depression. Besides, as the largest internal organ in the human body, liver and depression are related in several ways, including inflammation and energy metabolism. Over the decades, depressive-like animal models provide chances to explore potential mechanism of this disease. In the current study, we aimed to compare the gene expression profile of both the central nervous system and peripheral immune-related organ in the chronic unpredictable mild stress (CUMS) mice with their controls, expecting to figure out the key molecular profiles and signaling pathways involved in potential pathogenesis of depression.

Methods In total, 40 male C57BL/6 mice aged 6-8 weeks were grouped into the CUMS group (n=25) and the control (CT) group (n=15), which were housed under standard condition, with five mice per cage. We conducted a 6-week CUMS model, with various mild stressors exposures including tail pinch (2 min), food deprivation (24 h), water deprivation (24 h), damp sawdust (24 h), cage tilting of 45° (24 h), noise (2 h), body restraint (3 h), ice-water swimming (5 min) and 45℃ housing (30 min). After all the stimulus, behavioral measurements were performed on both CUMS and CT mice, including the sucrose preference test (SPT), the forced- swimming test (FST), the tail suspension test (TST) and the open-field test (OFT). Then tissues of prefrontal cortex, hippocampus and liver of 6 mice from each group were dissected for tanscriptome sequencing and bioinformation analysis.

Results After the 6-weeks CUMS modeling, the weight of the CUMS mice showed a significant decreasing. The CUMS mice exhibited lower sucrose preference, more immobility time in both FST and TST, while the total distance in OFT of the two groups displayed no statistically significant difference. There were 64 genes up regulated and 88 down regulated genes in prefrontal cortex of CUMS mice compared to CT mice. The function of the up regulated genes mainly enriched in the domain of cholesterol metabolism. In comparison with the CT mice, there were 126 up regulated genes, which were enriched in steroid metabolic process, and 359 down regulated genes in CUMS mice. As for the tissue of liver, the CUMS mice showed 115 up regulated genes and

Conclusion Based on the combination of transcriptome sequencing, our results suggested that genes involved in cholesterol metabolism and immune response process are affected most significantly after CUMS in mice. These findings provide opportunities to further dissect the mechanism underlying metabolism and inflammation perceived threat in conditions of depression and revealing potential therapeutic targets for depression.

Objective Deficits in facial emotional intensity recognition have been associated with social cognition in patients with major depression. The study examined multiple event-related potential (ERP) components in patients with major depression and investigated the relationships between ERPs, social cognition, and clinical features.

Methods Thirty-one patients met DSM-IV diagnosis of depression and 31 healthy participants completed the emotion intensity recognition task (EIRT), while ERPs were recorded. Data on ERP components (P100, N170, P200, and P300) were analyzed.

Results The behavioral results showed that patients with major depression performed worse on EIRT, including all six categories of emotions (sadness, disgust, happiness, surprise, anger, and fear), compared to healthy participants. The ERP results showed that patients with major depression exhibited higher P100 amplitudes for sad and happy faces than healthy participants; P300 amplitudes induced by sad and surprise faces were also higher than in healthy participants, mainly in the central and temporal lobes. A positive correlation was found between sadness intensity scores and P100 amplitudes in patients with major depression.

Conclusion Patients with major depression are biased in their identification of facial expressions indicating emotional intensity. Specifically, they have emotional biases in the early and late stages of cognitive processing, mainly in the form of sensitivity to sad stimuli. It may lead to a persistent rumination of sadness that is detrimental to the remission of depression. Additionally, patients with major depression devote different amounts of cognitive resources for different intensities of sad faces during the preconscious stage of cognitive processing. The more intense their perception of sadness, the more cognitive resources they devote. Therefore, the assessment of the intensity of facial expressions is an important research topic, with clinical implications on social cognitive function in patients with major depression.

3.Department of Clinical Psychology, The Affiliated Hospital of Jiangnan University

Objective Suicide prevention for major depressive disorder (MDD) is a worldwide challenge, especially for suicide attempt (SA). This study aimed to verify and complement suicide attempts biomarkers of MDD with a recent suicide attempt sample.

Methods This study included 189 participants (60 healthy controls; 47 MDD patients with non-suicide (MDD-NSs); 40 MDD patients with suicide ideation (MDD-SIs); 42 MDD patients with SA (MDD-SAs)).MDD patients with an acute SA time was determined to be within one week since the last SA. SUICIDALITY Part in MINI was applied to evaluate suicidality. Based on previous studies, absolute powers in 14 frequency bands were extracted from subject's resting-state electroencephalography data and compared within four groups. The relationship among suicidality, the number of SA, and powers in significant frequency bands were investigated.

Results MDD-SIs had increased powers in delta, theta, alpha, and beta band on the right frontocentral sites compared to MDD-NSs, while MDD-SAs had decreased powers in delta, beta, and gamma bands on widely right frontocentral and parietooccipital sites compared to MDD-SIs. Beta 1 power was the lowest in MDD-SAs and was modulated by the number of SA. The correlation between suicidality and beta 1 power was negative in MDD-SAs and positive in MDD-SIs.

Conclusion Reduced Beta 1 (12 - 15 Hertz) power could be essential in promoting suicidal behavior in MDD. Research on recent suicide attempt samples contributes to a better understanding of suicide mechanisms and preventing suicidal behavior in MDD.

关键字：suicide attempt, suicide ideation, beta1 absolute power, electroencephalogram, major depressive disorder

天津市成年人群自杀意念危险因素调查

潘鹏 张燕 王立娜 徐广明*
天津市安定医院

目的 描述天津市成年人群终生自杀意念的发生率及其特征，并分析其危险因素，为自杀预防提供科学依据

方法 数据来源于天津市精神障碍流行病学调查。采用分层多阶段整群随机抽样，每户家庭随机抽取一位半年内居住满 3 个月的 18 岁及以上成年人作为调查对象。现场调查分两阶段：筛查阶段，采用一般健康问卷（GHQ-12）及 8 个精神障碍扫描问题作为筛查工具，根据筛查结果把调查对象划分为精神障碍低危、中危和高危 3 个等级，共 11748 名受访者完成筛查，使用健康相关生活质量问卷、匹兹堡睡眠问卷评估其生活质量、睡眠质量；诊断访谈阶段，在低危、中危、高危 3 组中分别抽取 10%、40%、100%共 4563 人进行 DSM-IV-TR 轴I障碍临床定式检查及哥伦比亚自杀意念的评估。最后对数据进行加权调整，并运用 SPSS. 23 对数据进行整理和分析。单因素分析时，自杀意念发生率在不同组间比较采用 $\chi 2$ 检验，多因素分析危险因素时采用 logistic 回归分析，$P<0.05$ 时差异有统计学意义

结果 1.完成两阶段调查的受访者共 4438 人（97.3%），503 人存在终生自杀意念，调整后终生自杀意念的发生率为 5.00%（95%CI: 4.36%～5.64%） 2.自杀意念 logistic 回归分析结果显示：女性（OR= 2.45，95%CI：1.80~3.33）、有宗教信仰（OR= 2.66，95%CI：1.72~4.09）、因躯体疾病住过院（OR=1.62，95%CI：1.19~2.20）、存在精神障碍诊断（OR=4.34，95%CI：3.17~5.93）、主观经济状况差（OR=1.89，95%CI：1.38~2.60）、GHQ≥4 分（OR=2.41，95%CI：1.73~3.36）、PSQI＞7 分（OR=1.80，95%CI：1.19~2.73）等因素为自杀意念的危险因素

结论 1.天津市成年人群终生自杀意念的发生率与我国其他地区的研究结果相近，但低于其他大部分国家和地区的研究结果 2.女性、有宗教信仰、因躯体疾病住过院、存在精神障碍诊断、主观经济状况差、GHQ≥4 分、PSQI＞7 分是天津市成年人群终生自杀意念的危险因素

关键字：自杀意念 危险因素 流行病学 天津市

Orbitofrontal Cortex-hippocampus Potentiation Mediates Relief for Depression: A Randomized Double-bl

黎兴兴[1] 韩思竹[1] 魏硕池[1] 赵迪[2] 丁锦君[2] 徐永明[1] 于畅[1] 陈赞[1] 周东升[1] 袁逖飞[2]

2.上海市精神卫生中心

目的 It has been 15 years since the FDA approved repetitive transcranial magnetic stimulation (rTMS) targeting the dorsolateral prefrontal cortex (DLPFC) for clinical depression treatment. Yet, the underlying mechanisms for rTMS-induced depression relief are not fully elucidated.

方法 This study analyzes TMS-electroencephalogram (EEG) data from 64 healthy control (HC) subjects and 53 patients with major depressive disorder (MDD) before and after rTMS treatment.

结果 Prior to treatment, patients with MDD have lower activity in the DLPFC, the hippocampus (HPC), the orbitofrontal cortex (OFC), and DLPFC-OFC connectivity compared with HCs. Following active rTMS treatment, patients with MDD show a significant increase in the DLPFC, HPC, and OFC. Notably, the increase in HPC activity is associated explicitly with ameliorating depressive symptoms but not anxiety or sleep quality.

结论 The orbitofrontal-hippocampal pathway plays a crucial role in mediating depression relief following rTMS

The Relationship between Theta Power, Theta Asymmetry and The Effect of Escitalopram in The Treatment of Depression

Min Gao[2], Wenhua Sang[1], Kun Mi[1], Jiancong Liu[1], Yudong Liu[1], Wenge Zhen[1], Bang An[2]
1.Hebei Mental Health Center
2.Xianyang Central Hospital

Objective Only about one-third of depressed patients respond to initial antidepressants treatment. Therefore, it is crucial to find effective predictors of antidepressants. The purpose of our study was to learn the relationship between EEG theta power, theta asymmetry and the efficacy of escitalopram.

Methods The study included 34 patients with depression. Before and after each patient's course of treatment, EEG data was gathered. Both the Hamilton Anxiety Scale (HAMA) and the 17-item Hamilton Depression Scale (HAMD-17) were evaluated simultaneously. The natural logarithm of right frontal theta power minus left frontal theta power was used to calculate inter-electrode theta asymmetry (AT).

Results First, our study found no statistically significant difference between intra-electrode theta power and inter-electrode AT before and after treatment ($P \geq 0.05$). When we later looked at the data regarding treatment effects, the findings revealed that patients ($n = 9$) who did not respond to treatment had lower baseline theta power at C4 [6.190 (2.000, 12.990) vs 15.800 (7.255, 22.330), $z = -2.166$, $P = 0.030$]. The two groups had no difference in other electrodes ($P \geq 0.05$). The AT of C3/C4 in non-responders ($n = 9$) were lower [0.012 (0.795) vs 0.733 (0.539), $t = -3.224$, $P = 0.005$]. However, there was no difference in inter-electrode AT between the two groups in F3/F4 and F7/F8 ($P \geq 0.05$). We finally show that the theta power at C4 was negatively correlated with HAMD scores before treatment ($r = -0.346$, $P = 0.045$).

Conclusion Our findings determined that increased theta power and positive asymmetry in the right frontal-central area correlate with favorable escitalopram treatment, providing a basis for finding predictive markers for antidepressants.

Role of Baseline Resting-state Functional Connectivity of The Nucleus Accumbens Subregions in Antidepressant Treatment in Major Depressive Disorder

王赟[1] 周晶晶[1] 陈熊鹰[1] 刘瑞[1] 张志芳[1] 冯媛[1] 周媛[2] 王刚[1]
1.首都医科大学附属北京安定医院
2.中国科学院心理研究所

Objective The nucleus accumbens (NAc) plays a crucial role in the pathophysiology of major depressive disorder (MDD), and abnormal resting-state functional connectivity (rsFC) of NAc subregions has been found in MDD. However, it is unclear whether the altered rsFC of NAc subregions can predict efficiency of antidepressant treatment, and whether antidepressants can normalize the altered rsFC of NAc subregions in MDD.

Methods We collected resting-state functional magnetic resonance imaging (fMRI) data from 46 unmedicated MDD patients at baseline and after 12 weeks of escitalopram treatment. We also collected fMRI data from 58 healthy controls (HCs). The left and right NAc core-like and shell-like subregions were selected as seed regions for rsFC analyses. We examined group differences in rsFC of NAc subregions between the MDD and HCs cross-sectionally at baseline. We then longitudinally examined whether the altered rsFC at baseline was associated with treatment efficiency, indicated by change in depression severity after 12-week treatment. Lastly, we investigated whether antidepressant treatment normalized the altered rsFC of NAc subregions in MDD.

Results Compared with the HC group, decreased rsFC of NAc subregions with the middle cingulate cortex (MCC) was observed in MDD patients at baseline. In the MDD group, the rsFC of the NAc subregions with the MCC at baseline was negatively correlated with the reduction of depressive symptoms. In addition, the rsFC of the NAc subregions with the MCC was increased after 12-week antidepressant treatment in the MDD group.

Conclusion The present findings suggest that the functional alteration of the NAc subregions with the MCC in MDD patients may serve as a potential biomarker for antidepressant treatment efficiency, and the dysfunction of the frontal-striatal circuit may be a key target for MDD treatment.

首发未用药抑郁症患者精神病性症状与临床特点、脂质代谢的关系

王闻慧[1] 张向阳[2]
1.天津市安定医院
2.中国科学院大学心理学系

目的 本研究分析首发未用药重度抑郁障碍（MDD）患者的一般人口学资料及临床特征，探究不同起病年龄组 MDD 伴有精神病性症状(PD)的风险因素。

方法 在山西医科大学第一临床医学院精神科门诊招募首发未用药 MDD 患者，评估工具包括:一般情况调查表、既往躯体疾病与精神科疾病史、临床信息记录、以及汉密尔顿抑郁量表（HAMD）、汉密尔顿焦虑量表（HAMA）、阳性和阴性症状量表（PANSS）等。根据发病年龄分为早发组和晚发组，以再根据是否伴有精神病性症状分组，对组间人口学资料及临床特征进行比较；分层分析 MDD 伴有精神病性症状的风险因素。

结果 晚发组比早发组有更长的未治期(DUP)(5.69±4.158 vs 8.01±5.698, P＜0.001)、更多比例的 PD(14.6% vs 8.3%, P＜0.001)。与伴有精神病性症状（NPD）组相比，PD 组的受教育程度更低(P=0.004)、BMI 更高(24.33±1.926 vs 24.66±1.897，P=0.027)。无论在早发组还是晚发组，与 NPD 组相比，PD 组存在更多的自杀行为史(16.7% vs 51.5%, P＜0.001)、更多的共病重度焦虑比例(5.3% vs 71.3%, P＜0.001)、更高的 HAMD 评分(29.9±2.700 vs 33.87±2.630, P＜0.001)。Logistic 回归分析发现，共病重度焦虑、更高的 HAMD 评分是不同发病年龄组 MDD 患者 PD 的独立危险因素，而 TG 在 EAO 组 MDD 患者中是 PD 风险因素。

结论 MDD 早发组与晚发组伴有精神病性症状的影响因素可能不同，共病重度焦虑、更高的 HAMD 评分是不同发病年龄组 MDD 患者 PD 的独立危险因素，而 TG 在 EAO 组 MDD 患者中是 PD 风险因素。

首发未用药重度抑郁症患者外周血细胞因子与自杀意念相关性的研究

田雪* 董叶青 李美娟 张楚浩 李洁
天津市安定医院

目的 长期以来，人们认为异常的细胞因子水平与抑郁症和自杀有关。然而，不同的细胞因子与自杀之间的相关性仍有争议。本研究旨在探讨哪些细胞因子与首发未用药重度抑郁障碍患者的近一周自杀意念的风险存在关联。

方法 在 2021 年 1 月至 2022 年 7 月期间，从天津市安定医院招募 88 名中国汉族首发未用药的重度抑郁障碍患者。使用标准化问卷记录人口统计学特征，采用 Bio-plex 法测定 27 种细胞因子的浓度，贝克自杀意念量表用于评估最近一周的自杀意念，汉密尔顿抑郁评定量表和汉密尔顿焦虑评定量表用于评估抑郁和焦虑症状。单因素和多因素逻辑回归模型被用来评估细胞因子和自杀意念风险之间的关联并根据年龄、性别、婚姻状况、教育水平、吸烟状况和 BMI 进行了分层分析和交互分析。

结果 在 88 名首发未用药的重度抑郁障碍患者中，有 42 名参与者（47.7%）在最近一周有自杀意念。参与者的平均年龄是 30.1 岁（标准差 9.3，范围是 16-52 岁）。参与者中 31 人（35.2%）是男性，53 人（61.6%）是单身，37 人（44.6%）受过高等教育，64 人（72.7%）不吸烟。参与者的平均 BMI 为 23.5kg/㎡（标准差 5.5，范围 14.11-49.54）。单因素逻辑回归分析显示，白细胞介素-2 （IL-2）和血管内皮生长因子（VEGF）的水平与近一周自杀意念的风险有关联的趋势（IL-2：OR：1.276，95CI：0.994~1.637, P=0.056；VEGF：OR：1.004，95CI：1~1.008, P=0.060）。多因素逻辑回归分析显示，即使调整了性别、年龄、婚姻状况、教育、吸烟、BMI、HAMD 和 HAMA 评分，外周血 IL-2 水平升高仍与自杀意念风险增加相关。IL-2 水平每升高 1pg/ml，患者出现自杀意念的风险增加 32.7%（OR：1.327，95CI：1.009~1.746, P=0.043）。分层分析显示，自杀意念的风险与 IL-2 水平之间的关联与多因素逻辑回归分析中的关联是一致的。交互分析未发现明显交互作用（P for interaction＞0.05）。

结论 重度抑郁障碍患者的自杀意念风险与外周血 IL-2 的水平正相关，外周血 IL-2 水平升高，患者近一周出现自杀意念的风险显著增加。

关键字：白细胞介素-2，自杀意念，重度抑郁障碍，首发，未用药，分层分析

抑郁症快感缺失患者海马及其亚区灰质体积改变的磁共振研究

吴聪冲 陆邵佳*
浙江大学医学院附属第一医院

目的 研究伴有和不伴有快感缺失的重度抑郁症患者海马及其亚区灰质体积的变化，分析抑郁症快感缺失症状和海马亚区结构改变的相关性，探索抑郁症快感缺失的相关病理机制。

方法 研究纳入首发或复发三个月未用药的重度抑郁症门诊患者 70 例，并根据抑郁症诊断标准以及 Snaith-Hamilton 快感量表评估结果将抑郁症患者分为伴有快感缺失特征组（n=30）和不伴有快感缺失特征组(n=40)。同期间纳入性别、年龄匹配的 43 名健康受试者为对照组。所有的参与者均接受临床病史的采集和头颅磁共振扫描，并采用 FreeSurfer 6.0 程序进行海马亚区分割，计算得到海马各亚区的灰质体积。我们通过方差分析比较三组临床特征和海马及其亚区体积的差异，并使用相关分析来探讨海马亚区体积与临床特征之间的关系。

结果 ANOVA 显示三组受试者主要在左侧海马头部，包括左侧 CA1 区、颗粒细胞层-分子层-齿状回区（GC-ML-DG）和分子层区（ML）的头部灰质体积上存在显著差异。随后，两两比较显示，与健康对照组相比，两组抑郁症患者左侧海马头部灰质体积均显著下降。同时，研究发现，与健康对照组相比，仅伴有快感缺失的抑郁症患者在左侧 CA1 区、GC-ML-DG 区和 ML 区头部的灰质体积存在显著的减小；不伴有快感缺失的抑郁症患者与健康对照组在海马各个亚区灰质体积上均无显著差异。在抑郁症患者中进行相关分析显示，海马亚区体积与临床特征之间无显著相关性。

结论 本研究以快感缺失为切入点，发现伴快感缺失的抑郁症患者表现出独特的海马亚区体积减小，主要包括左侧海马 CA1 区和齿状回的体积下降；推测抑郁症快感缺失症状可能与海马特殊亚区结构改变密切相关，为抑郁症快感缺失的神经病理机制提供新证据。

3.中国科学院心理研究所行为科学重点实验室
4.中国科学院大学心理学系
5.山东省戴庄医院

Objective Previous neuroimaging studies have revealed the effects of antidepressant treatment on large-scale brain networks, but whether it has different effects on first-episode and recurrent major depressive disorder (MDD) remains unclear.

Methods Resting-state functional magnetic resonance imaging data were collected from 25 first-episode drug na?ve MDD patients, 16 recurrent MDD patients, and 42 healthy controls separately at baseline and after 12-week follow-up. The patients with MDD were administrated with escitalopram treatment for 12 weeks. The large-scale brain networks were constructed by using the human Brainnetome Atlas.

Results Results showed that the decreased functional connectivity between subcortical network (SCN) and ventral attention network (VAN) in recurrent MDD patients increased after 12-week follow-up, and restored to normal. The functional connectivity within frontoparietal network (FPN) in recurrent MDD patients presented same change patterns. However, no significant changes were found in first-episode MDD patients. The functional connectivity in SCN and default mode network (DMN) were decreased in first-episode and recurrent MDD patients during the treatment. In all MDD patients, the change of functional connectivity within FPN was negatively correlated with the change of 16-item Quick Inventory of Depressive Symptomatology score, and the functional connectivity between SCN and VAN at baseline was negatively correlated with the reduction rate of 17-item Hamilton Depression Rating Scale score.

Conclusion In short, the functional connectivity between SCN and VAN, and within FPN may be biomarkers of antidepressant treatment, and it mainly have effects on recurrent MDD patients. The decreased functional connectivity in SCN and DMN may reminder the abnormal characteristics of MDD. These findings could deepen our understanding of the mechanism of antidepressants, and could provide a theoretical basis for realizing individualized precise treatment for MDD in future.

基于 GEO 数据库的抑郁症核心 mRNA 筛选及联合调控网络的构建

齐涵 王琰 周晶晶 刘瑞 闫芳*
首都医科大学附属北京安定医院

目的 本研究旨在利用公共数据库中抑郁症表达谱芯片通过共表达网络分析对 mRNAs 的相互作用进行深入挖掘，筛选出核心 mRNAs，并进行初步的功能探索，为阐明抑郁症的调控机制提供研究思路。

方法 以 GEO（Gene Expression Omnibus）数据库中抑郁症相关基因表达谱芯片结果作为数据来源，经过数据标准化、差异性分析后筛选得到抑郁症和健康对照间差异表达的 mRNAs 作为候选位点。利用 R 软件“WGCNA”程序包进行候选 mRNAs 的共表达网络分析，得到核心 mRNAs 位点；利用“clusterProfiler”程序包中的“enrichGO”和“enrichKEGG”进行 GO 富集和 KEGG 通路分析。通过 miRDB 数据库预测可调控核心 mRNA 的 miRNA（microRNA）位点，形成 miRNA-mRNA 关系对。Cytoscape 3.4.0 进行网络的可视化。

结果 以 GSE98793 作为数据来源，共纳入抑郁症患者 64 例，健康对照 64 例。差异性分析共发现 11 个基因的 FDR 校正 P 值<0.05，48 个基因的 FDR 校正 P 值<0.1，其中 24 个基因在 MDD 组高表达，另 24 个在 MDD 组低表达。进一步扩大筛选范围，选择 P<0.05 的 5459 个基因开展 WGCNA 分析。样本聚类未识别异常样本。以 power=7 作为软阈值，WGCNA 共鉴定出 14 个基因模块，其中 magenta 模块与基因表达具有正相关关系（Cor=0.32,P=0.015）,purple 模块与基因表达具有负相关关系（Cor=-0.28,P=0.047）。Purple 模块共包括 51 个基因位点，6 个位点的关联性较强：HDGF, MPP1, FOXO3B, RHD, TPM1, ALAS2。Magenta 模块共包括 57 个基因位点，5 个基因位点关联较强：LOC339988, KLRD1, TARP, YME1L1, TRDV3。

结论 本研究利用 WGCNA 深入挖掘 GEO 数据库中的表达谱芯片数据，得到 9 个核心 mRNAs 位点，从分子功能、生物通路和转录调控的角度对核心 mRNAs 进行初步的功能探索，构建抑郁症核心 mRNA-miRNA 联合调控网络，为抑郁症调控机制的探索提供新的思路。

Association of Different Duration of Untreated Illness with Thyroid Function in First-episode and Drug Naive Major Depressive Disorder Patients with Comorbid Overweight Or Obesity

Yufang Zhou[1], Shengwei Wu[1], Xiangyang Zhang [2]
1.Department of Integrated Chinese and Western Medicine, The Affifiliated Brain Hospital of Guangzhou Medical University
2.Key Laboratory of Mental Health, Institute of Psychology, Chinese Academy of Sciences

Objective : Abnormal thyroid function and overweight or obesity are common comorbidities in patients with major depression disorder (MDD). Long-term duration of untreated illness (DUI) has been reported to lead to poorer outcomes in MDD patients. However, there are fewer studies on DUI, major depressive disorder comorbid with overweight or obesity , and thyroid function abnormalities. The objective of this study was to investigate the relationship between DUI and thyroid function in first-episode and drug na?ve (FEDN) MDD patients with comorbid overweight or obesity, which received little systemic investigation.

Methods This cross-sectional study recruited 1026 outpatients with FEND MDD. Enrolled patients were divided into two group according to the median DUI: < 0.001). Further linear regression analysis showed that DUI was associated with TSH elevation (B=1.003，P=0.000), and HAMD, TC, LDL-C played a partial mediating role（all P =0.000）.

Conclusion Our results show that the longer DUI of FEDN MDD patients not only has a more negative impact on depression itself, but also has a more negative impact on endocrine and metabolic functions, such as thyroid function and lipid metabolism.

Serum-derived Exosomes of Patients with Depression with Increased MiR-96-5p Inhibits Neuronal Differentiation by Targeting RAC1

Shengwei Wu[1], Zewei Chen[1], Zhengzheng Xuan[2], Yufang Zhou[1], Chubing Zou[1], Youtian Wang[1], Junrong Ye[3], Pinge Zhao[1], Aixiang Xiao[3], Lin Yu[4], Jianxiong Guo[1]
1.Department of Integrated Chinese and Western Medicine, The Affifiliated Brain Hospital of Guangzhou Medical University
2.Guangdong Provincial Hospital of Traditional Chinese Medicine
3.Department of Nursing Administration, The Affifiliated Brain Hospital of Guangzhou Medical
4.The Affifiliated TCM Hospital of Guangzhou Medical University

Objective Exosomes are associated with neuronal differentiation in mental diseases such as depression. The study aimed to explore the effects of exosomes on neuronal differentiation and molecular mechanisms.

Methods We isolated the exosomes from the serum of patients with depression and healthy control. The characteristics were identified using transmission electron microscopy, nanoparticle tracking analysis, and western blot. All-trans retinoic acid-treated SH-SY5Y cells were used to establish the differentiation model. Exosomes from depression co-cultured with RA-treated cells, miR-96-5p mimic was transfected, and PMA was used to activate RAC1. Neuronal differentiation indexes were detected by a microscope, real-time PCR, western blot, and immunofluorescence assay. The targeting relationship was assessed by bioinformatic analysis and luciferase reporter assay.

Results The results showed that exosomes inhibited differentiation and neurite length, downregulated SYP, upregulated Nestin, and reduced SYP positive cells. MiR-96-5p was highly expressed in the exosomes of depression. Overexpression of miR-96-5p inhibited RA-induced neuronal differentiation. RAC1 is a miR-96-5p target. Activation of RAC1 reversed the effects on neuronal differentiation induced by miR-96-5p. Additionally, downregulation of miR-96-5p attenuated depression-like behaviors induced by CUMS, improved hippocampal neuron injury, and promoted hippocampal neuron differentiation.

Conclusion In conclusion, serum-derived exosomes from depression suppressed neuronal differentiation by the miR-96-5p/RAC1 axis, and miR-96-5p promoted depression. The findings suggested that regulating the secretion of exosomes and miR-96-5p expression may be a new approach for depression therapy.

抑郁症患者时间感知差异与认知功能之间关系

刘攀琪[1] 郭华[2] 马瑞华[1] 刘思佳[1] 石晶[1] 赵科[3] 谭云龙[1] 杨甫德[1] 王志仁[1]
1.北京回龙观医院，北京大学回龙观临床医学院，北京
2.驻马店精神病院,河南
3.中国科学院心理研究所,脑与认知科学国家重点实验室，北京

目的 通过时间二分法探索抑郁症患者和健康人在时间感知上的差异，以及探索抑郁症患者时间感知差异与认知功能之间的关系。

方法 符合入排标准的 30 名抑郁症患者（抑郁症组）与 20 名健康对照者（对照组）通过时间二分法评估时间感知的改变，即研究对象根据训练阶段所感知到的“长”、“短”两种时距，从而对给定的时距（400ms-1600ms）做出“长”或“短”的判断，完成时间二分任务。采用汉密尔顿抑郁量表-17 项来评估抑郁症患者的抑郁程度，采用认知功能评价表(MCCB)评估所有受试者的认知功能。

结果 抑郁症组在 400ms 和 600ms 时距下判断为“长”的比例多于对照组（P＜0.05）；在 800ms、1000ms、

1200ms 与 1400ms 时，抑郁症组和对照组判断为“长”的比例没有显著性差异（P＞0.05）；但在 1600ms 的时距下，抑郁症组判断为“长”的比例少于对照组（P＜0.05）。抑郁症组的时间二分点小于对照组（P＜0.05）；抑郁症组的差别阈限与韦伯比率均大于对照组（P＜0.05）。抑郁症组的 MCCB 总分低于对照组（P＜0.05）。抑郁组的差别阈限与韦伯比率与 MCCB 总分均呈现负相关（P＜0.05）。

结论 与对照组相比，抑郁症组将短时距判断为长的比例增加，表明抑郁症患者可能高估了短时距；抑郁症患者的时间感知的敏感性可能也有所下降。抑郁症患者的时间感知能力可能受其认知的影响，认知得分越高的抑郁症患者的时间敏感性越高。

Abnormalities of Somatomotor Network in Patients with Major Depressive Disorder and Their Siblings

李峰 张志芳 薄奇静 王传跃*
首都医科大学附属北京安定医院

Objective Major depressive disorder (MDD) is a common and serious psychiatric disorder. Degree Centrality (DC), an index which can reflect its funcional connection in the brain network.has been widely used to explore etiology and pathophysiology of MDD. However, differences between patients with MDD and their siblings in DC values are largely unknown.

Methods This study obtained resting-state functional magnetic resonance imaging (MRI) data from 102 patients with MDD, 71 healthy controls and 35 siblings. First, by using ANOVA, we examined differences among three groups in DC values. Then, we defined the diffenent brain regions among the three groups as seed point, and calculate their functional connections (FC) with the whole brain.

Results As for DC and FC values, there were significant group differences in one-way ANOVA analyses, respectively. For DC values, Post hoc test showed that the differences among three group is in middle frontal gyrus (cluster size = 17 voxels, peak level PFWE-corr = 0.008; peak voxel MNI coordinate: x = -3, y = -27, z = 60, F = 5.77), and in right precentral(cluster size = 7 voxels, peak level PFWE-corr = 0.035; peak voxel MNI coordinate: x = 42, y = -9, z = 57, F = 15.87), As for FC values, there were significant group differences too. Post hoc test showed that compared with the patients with MDD, siblings showed higher DC values in right postcentral (cluster size = 3 voxels, peak level PFWE-corr = 0.039; peak voxel MNI coordinate: x = 39, y = -33, z = 63, F =15.79).

Conclusion The difference among patients with MDD,healthy controls and siblings in somatomoter network mainly, and may relate to the neural mechanisms of its disease.

A Clinical Prediction Models Based on Brain Fractional Anisotropy Distinguish Unipolar Depression From Bipolar Depression

Ruihua Ma[1], Yuhan Tong[2], Hua Guo[3], Fude Yang[1], Siyan Zan[1], Ruonan Du[1], Sijia Liu[1], Yang Luo[1], Yingna Li[1], Jing Shi[1], Xuan Wang[1], Yunlong Tan[1], Shuping Tan[1], Baopeng Tian[1], Zhiren Wang[1]
1.Beijing Huilongguan Hospital
2.Fuxing Hospital Affiliated to Capital Medical University
3.Zhumadian Psychiatric Hospital

Objective To develop a clinical prediction model based on brain fractional anisotropy for distinguishing unipolar depression from bipolar depression.

Methods 239 patients (146 unipolar depression and 93 bipolar depression) who met the diagnostic criteria of DSM-5 were collected from Zhumadian Second People’s hospital and Beijing Huilongguan hospital, and randomly divided into training and validation sets in the ratio of 7:3. Multivariate analysis of variance (MANOVA) was used to compare the difference of FA between UD and BD in the training set, and logistic regression was used to build the model classifier. Then, the performance of the model was tested using the validation set.

Results In the training set, UD differed from BD in the integrity of multiple white matter fiber tracts of the brain. Compared to UD patients, BD patients had a younger age at first, a smaller proportion of smoking, higher white matter fiber integrity in the body of corpus callosum and right inferior cerebellar peduncle, and lower white matter fiber integrity in column and body of fornix and left medial lemniscus. Furthermore, based on these six differential variables, Nomograms and models were developed to distinguish UD from BD, with well-fitting calibration curves. Patients who had a nomogram score of less than 220 were considered to have a high probability of BD. Conversely, a diagnosis of UD is more likely. In addition, the values of the area under the curve are 0.756 and 0.657 in the training and validation cohorts, respectively, with sensitivity of 0.786 and 0.794, and specificity of 0.672 and 0.526 for the training and validation cohorts, respectively.

Conclusion A model based on brain fractional anisotropy can distinguish UD from BD, and provide a basis for clinical treatment options for both disorders.

氟西汀联合舒肝解郁胶囊对抑郁症心率变异性的影响

王莹*
丽水市二院

目的 研究氟西汀联合舒肝解郁胶囊对抑郁症心

率变异性(HRV)的影响。

方法 选择本院 2021 年 9 月到 2022 年 1 月 108 例抑郁症患者作为研究对象，按随机数字表法均分为对照组和研究组。对照组采取盐酸氟西汀胶囊治疗，研究组在对照组的基础上联合舒肝解郁胶囊治疗。比较两组的汉密尔顿抑郁量表(HAMD)，汉密尔顿焦虑量表(HAMA)，匹兹堡睡眠质量指数(PSQI)，HRV[正常窦性 R-R 间期的标准差(SDNN)、低频率值(LF)、高频率值(HF)、LF/HF 比值]，临床疗效，不良反应。

结果 结果 对照组治疗 6 周后的 HAMD、PSQI 显著高于研究组，差异均有统计学意义(P<0.05)；两组治疗 6 周后的 HAMA 比较，差异无统计学意义(P>0.05)。对照组治疗 6 周后的 SDNN、LF、HF、LF/HF 显著低于研究组，差异均有统计学意义(P<0.05)。对照组总有效率 81.48%，显著低于研究组总有效率 94.44%，差异有统计学意义(P<0.05)。对照组不良反应率 9.26%与研究组不良反应率 7.41%比较，差异无统计学意义(P>0.05)。

结论 氟西汀联合舒肝解郁胶囊治疗，可在不增加不良反应的基础上，显著降低抑郁程度，改善患者的睡眠质量和心率变异性。

Bridge Symptoms between Parenting Styles and Proximal Psychological Risk Factors Associated with Adolescent Suicidal Thoughts: A Network Analysis

欧雯雯* 杨雨萌 陈雅菲 李云静 李亮 陆依梅 黄梅 马墨涵 吕冠仪 赵小天 杨思琦 覃雅琪 鞠玉朦* 张燕*
中南大学湘雅二医院

Objective :Parenting styles and the associated proximal psychological factors are suggested to increase suicidal risks in adolescents. However, how the two factors interact and confer risks on the emergence of adolescent suicidal thoughts remains unclear. Herein, we used a network approach to investigate their interrelationship and explore whether the network properties predict adolescent suicidal thoughts.

Methods :Self-report questionnaires were completed by 1171 students aged 12-16. Network analyses were performed by Gaussian graphical models estimating the adolescent psychosocial network structure of parenting styles and psychological variables including depression, anxiety, affective lability, rumination, and resilience. Furthermore, we re-examined the network by adding a variable measuring active suicidal thoughts. Moreover, we conducted linear regressions to examine the predictive utility of bridge symptoms for adolescent suicidal thoughts.

Results :Resilience, Afraid, Rumination, Concentration, and affective lability (Anger) had the highest bridge strengths in the adolescent psychosocial network. Among the identified bridge symptoms, Resilience was negatively correlated with active suicidal thoughts (regularized edge weights = -0.181, bootstrapped 95% CIs: [-0.043, -0.155]), whereas affective lability (from Anxiety to Depression, Anger), Rumination, and Afraid were positively correlated with active suicidal thoughts, with edge weights (bootstrapped 95% CIs) ranging from 0.057 (0.001, 0.112) to 0.081(0.026, 0.136). Regression analysis showed that bridge strength was significantly correlated with active suicidal thoughts (R2 = 0.432, P = 0.001).

Conclusion :Negative parenting styles may drive and maintain suicidal thoughts by modifying the key proximal psychological variables. Our findings highlight the important role of bridge symptoms, which may serve as potential intervention targets for preventing adolescent suicide.

Common and Specific Patterns of Dynamic Functional Connectivity Variability of Thalamo-cortical Circuitry in Bipolar and Major Depressive Disorders

Fengmei Lu Wei Luo Yue Yu Xiao Cai Linna Fu Shuai Yuan Juan Huang Yajun Zhang Jing Xie Zongling He*
The Clinical Hospital of Chengdu Brain Science Institute, MOE Key Lab for Neuroinformation, University of Electronic Science and Technology of China, Chengdu, 611731, PR China

Objectives : Evidence has indicated abnormalities of thalamo-cortical functional connectivity (FC) in bipolar disorder during a depressive episode (BDD) and major depressive disorder (MDD). However, the dynamic FC (dFC) within this system is poorly understood. This study aims to provide more precise thalamic subregions to explore the disrupted thalamo-cortical dFC patterns between BDD and MDD.

Methods A total of 250 subjects including 95 MDD patients, 58 BDD patients and 97 healthy controls (HCs) were recruited. We defined 16 seeds of the thalamus according to the the Human Brainnetome Atlas. To identify the dFC variability, a sliding-window dFC approach was applied with the Dynamic Brain Connectome (DynamicBC) toolbox. Correlation analysis was performed between altered dFC variability and clinical data. Further, classification analysis with a linear support vector machine model was conducted.

Results No significant differences are found in term of age, gender, education level, handedness, mean FD, and the variance of FD among the three groups. Compared with healthy controls (HCs), both patients revealed increased dFC variability between thalamus subregions with hippocampus (HIP), angular gyrus and caudate, and only BDD showed increased dFC variability of the thalamus with superior frontal gyrus (SFG), HIP, insula, middle cingulate gyrus and postcentral gyrus. Compared with MDD and HCs, only BDD exhibited enhanced dFC variability of the thalamus with SFG and superior temporal gyrus. Further,

the number of depressive episodes in MDD was significantly positively associated with altered dFC variability. Finally, the disrupted dFC variability could distinguish BDD from MDD with 83.44% classification accuracy.

Conclusions BDD and MDD shared common disrupted dFC variability in the thalamo-limbic and striatal-thalamic circuitries, whereas BDD exhibited more extensive and broader aberrant dFC variability, which may facilitate distinguish between these two mood disorders.

Two-week RTMS-induced Brain Activity Changes in Adolescents with Depression Measured by FMRI

Fengmei Lu Wei Luo Yue Yu Xiao Cai Linna Fu Shuai Yuan Juan Huang Yajun Zhang Jing Xie Zongling He*
The Clinical Hospital of Chengdu Brain Science Institute, MOE Key Lab for Neuroinformation, University of Electronic Science and Technology of China, Chengdu, 611731, PR China

Objectives : Repetitive transcranial magnetic stimulation (rTMS) to the left dorsolateral prefrontal cortex (L-DLPFC) is commonly used clinically for the treatment of major depressive disorder (MDD). The neuroimaging biomarkers and mechanisms of rTMS are still not completely understood. This study aimed to explore the functional neuroimaging changes induced by rTMS on adolescents with MDD.

Methods A total of 10 sessions of rTMS was administrated to the L-DLPFC at 110% resting motor threshold and 10-Hz frequency in thirteen adolescents with MDD once a day for two weeks. Stimulus trains were 5 seconds with an inter-train intervals of 55 seconds, treatment session was lasted for 20 minutes and consisted of 1000 pulses. All of them were scanned with resting-state functional magnetic resonance imaging at baseline and after rTMS treatment. Patient's depression and anxiety severity were measured by using the Hamilton Depression Rating Scale (HAMD-24) and the 14-item Hamilton Anxiety Scale (HAMA) at baseline (pre-rTMS) and at the end of the two weeks of rTMS treatment (post-rTMS) prior to the MRI scan. The regional homogeneity (ReHo), amplitude of low frequency fluctuation (ALFF), and the subgenual anterior cingulate cortex (sgACC)-based functional connectivity (FC) were computed to be served as neuroimaging indicators. The correlation between changes in the sgACC-based FC and the improvement of depressive symptoms was also analyzed.

Results The two subgroups (pre-rTMS and post-rTMS) did not differ significantly in mean FD. After rTMS treatment, the total HAMD scores and HAMA scores were significantly reduced, and ReHo and ALFF were significantly increased in the L-DLPFC, left medial prefrontal cortex, bilateral medial orbital frontal cortex, and the left ACC. While ReHo and ALFF were decreased mainly in the left middle occipital gyrus, right middle cingulate cortex (MCC), bilateral calcarine, left cunus and left superior occipital gyrus. Further, the FCs between the left sgACC and the L-DLPFC, right IFGoper, left MCC, left precuneus, bilateral post-central gyrus, left supplementary motor area and left superior marginal gyrus were enhanced after rTMS treatment. Moreover, the changes of the left sgACC-left MCC FC were associated with improvement in depressive symptoms in the early improvers.

Conclusions This study showed that two-week rTMS intervention in adolescents with MDD is associated with changes in brain neuroimaging activities and sgACC-based FC, and change of sgACC-MCC FC is related with improvement in depressive symptoms in the early improvers. The findings may provide a basic neural biomarkers and substrates for rTMS clinical trials.

HTR2A Rs3125-负性生活事件交互作用与抑郁障碍自杀未遂的关联分析

庞剑月 王一萍 滕慧敏 罗蕊 李恒芬*
郑州大学第一附属医院

目的 越来越多的研究支持遗传和环境因素在抑郁障碍和自杀未遂中起到重要作用，但相关的基因和环境因素尚不明确。本研究将从 HTR2A、NOS1 基因多态性和幼年创伤史、负性生活事件的基因-基因/环境交互作用来探讨抑郁障碍自杀未遂的发病机制。

方法 我们于 2009 年 11 月-2017 年 5 月收集 852 例抑郁障碍患者，根据有无自杀未遂史分为自杀未遂组（SA 组，n=334）和无自杀未遂组（NSA 组，n=518），并招募健康对照 716 名，收集入组对象的人口学信息及临床特征，包括年龄、性别、婚姻、幼年创伤史、精神病家族史、负性生活事件、情绪低落、兴趣减退、精力缺乏、自责自罪、认知三联征、晨重晚轻等 19 个变量，并采用 Sequenom 质谱分析技术检测 HTR2A（rs1328683、rs17068986、rs3125）和 NOS1（rs1123425、rs2682826、rs3741476、rs527590、rs7959232）8 个标签单核苷酸多态性（（tagging single nucleotide polymorphisms，tagSNPs）。GMDR 软件用于分析基因-基因/环境因素的交互作用。

结果 比较 SA 组和 NSA 组患者之间人口学信息及临床特征发现，6 个变量（负性生活事件、精力缺乏、体重下降、自责自罪、认知三联征及晨重晚轻）在两组之间有统计学差异（P<0.05）；比较三组之间的 8 个 tagSNPs 发现：HTR2A rs17068986、rs3125 和 NOS1 rs527590、rs7959232 在三组之间有统计学差异（P<0.05），经 Bonferroni 法校正后未发现与抑郁障碍自杀未遂相关的 tagSNPs；logistic 回归分析发现，负性生活事件、自责自罪、认知三联征与抑郁障碍患者的自杀未遂有关联。将 rs17068986、rs3125、 rs527590、rs7959232、幼年创伤史、负性生活事件纳入 GMDR 软

件进行基因-基因/环境交互作用发现：rs3125 与负性生活事件构成的二阶模型为最优模型，测试精确度为0.5779.

结论 本研究提供了 HTR2A rs3125 与负性生活事件的联合导致抑郁障碍自杀未遂风险的依据，加深了我们对抑郁障碍自杀未遂发病机制的理解。

4.Shanghai Key Laboratory of Psychotic disorders
5.Mental Health Branch, China Hospital Development Institute

Objective The aim of this paper was to investigate the efficacy of internet interpersonal social rhythm (iIPSRT) for Major depressive disorder (MDD).

Methods In this 8-week, randomized, single-blind, controlled study, a total of 120 MDD patients were randomly assigned to the iIPSRT or internet general psychoeducation(iGP). The iIPSRT was conducted according to a manual developed specifically for this study. Subjects in two groups received 45 minutes of iIPSRT or iGP from Monday to Friday and lasted for eight weeks. Both groups were combined with antidepressant medication. The participants' depressive symptoms, anxiety symptoms, interpersonal relationships, social function and biological rhythms were assessed using 17-item Hamilton Depression Scale (HAMD-17), Hamilton Anxiety Scale (HAMA), Interpersonal Comprehensive Diagnostic Scale (ICDS), Sheehan Disability Scale (SDS), Morning and Evening Questionnaire (MEQ) at baseline and 8th week.

Results Compared with iGP, iIPSRT alleviated the HAMD total score, anxiety/somatization subscore, weight subscore, cognitive disturbance subscore, retardation subscore, sleep disturbance subscore in MDD patients (F = 190.94, p Bonferroni < 0.001; F = 83.13, p Bonferroni < 0.001; F = 4.15, p Bonferroni = 0.048; F = 65.42, p Bonferroni < 0.001; F = 53.15, p Bonferroni < 0.001; F = 67.76, p Bonferroni < 0.001, respectively). Furthermore, iIPSRT relieved HAMA total score, somatic anxiety subscore, psychogenic anxiety subscore(F = 142.97, p Bonferroni < 0.001; F = 111.06, p Bonferroni < 0.001; F = 128.04, p Bonferroni < 0.001), as well as ICDS total score, conversation subscore, making friends subscore, manners subscore , and work/school subscore, social life subscore, family life subscore, days underproductive subscore ((F = 17.38, p Bonferroni < 0.001; F = 14.61, p Bonferroni < 0.001; F = 10.97, p Bonferroni = 0.001; F = 11.74, p Bonferroni = 0.001; (F = 4.85, p Bonferroni = 0.031; F = 16.29, p Bonferroni < 0.001; F = 12.11, p Bonferroni = 0.001; F = 8.3, p Bonferroni = 0.005).

Conclusion This study demonstrated that iIPSRT helped MDD patients improve clinical symptoms including depressive symptoms, anxiety symptoms, interpersonal problem, and social function in MDD patients.

3.The First Affiliated Hospital of Guangzhou University of Chinese Medicine, Guangzhou, China
4.The Second Affiliated Hospital of Hunan University of Chinese Medicine，Changsha, China
5.Guangzhou Hospital of Integrated Chinese and Western medicine, Guangzhou, China

Objective To explore the interhemispheric information synergy ability of the brain in major depressive disorder (MDD) patients by applying the voxel-mirrored homotopic connectivity (VMHC) method and further explore the potential clinical diagnostic value of VMHC metric by a machine learning approach.

Methods 52 healthy controls and 48 first-episode MDD patients were recruited in the study. We performed neuropsychological tests and resting-state fMRI scanning on all subjects. The VMHC values of the symmetrical interhemispheric voxels in the whole brain were calculated. The VMHC alterations were compared between two groups, and the relationship between VMHC value and clinical variables was analyzed. Then, abnormal brain regions were selected as features to conduct the classification model by using the support vector machine (SVM) approach.

Results Compared to the healthy controls, MDD patients exhibited decreased VMHC values in the bilateral middle frontal gyrus, fusiform gyrus, medial superior frontal gyrus and precentral gyrus. Furthermore, the VMHC values of the bilateral middle frontal gyrus and fusiform gyrus were all positively correlated with the total Hamilton Depression Scale (HAMD). Moreover, SVM analysis displayed that a combination of all clusters demonstrated the highest area under the curve (AUC) of 0.87 with an accuracy of 86.17%, sensitivity of 76.74%, and specificity of 94.12%, respectively.

Conclusion MDD patients had reduced functional connectivity in the bilateral middle frontal gyrus, fusiform

gyrus, medial superior frontal gyrus and precentral gyrus, which may be related to depressive symptoms. The abnormality in these brain regions could represent potential imaging markers to distinguish MDD patients from healthy controls.

视听整合持续操作测试对抑郁症患者认知功能障碍的测试初探

黄召江*
深圳市精神卫生中心/深圳市康宁医院

目的 认知功能障碍也是抑郁症主要的临床表现之一。应用视听整合连续操作测试（IVA-CPT）评估抑郁症患者的认知功能障碍的特点；以及评估抑郁症患者心理健康状况与 IVA-CPT 各指标的相关性。

方法 采取病例对照研究。对就诊于深圳市康宁医院门诊的成年抑郁症患者 105 例，对照组 54 例，应用 IVA-CPT、马萨诸塞州综合医院认知及躯体功能量表(CPFQ)、9 项患者健康问卷量表（PHQ-9）、7 项广泛性焦虑障碍量表（GAD-7）、90 项症状清单（SCL-90）评估其认知功能和心理健康状况。

结果 （1）病例组 IVA-CPT 测试指标：综合注意商数，听觉注意商数，听觉警觉性，听觉集中性，听觉速度，视觉注意商数，视觉警觉性，视觉集中性，视觉速度，综合反应控制商数，听觉反应控制商数，听觉谨慎性，听觉一致性，视觉反应控制商数，视觉谨慎性及视觉一致性商数均低于对照组（P<0.001）；病例组 CPFQ 量表各因子分均高于对照组（P<0.001）；（2）抑郁症患者伴焦虑症状与不伴焦虑症状在 IVA-CPT 测验商数上无统计学差异（P>0.05）；在 CPFQ 量表上有统计学差异（P<0.05）；（3）IVA-CPT 测试指标与 HAMD、PHQ-9、CPFQ 呈显著负相关（P<0.01）；（4）抑郁症患者的心理健康状况 SCL-90 总分与 CPFQ 呈显著正相关（P<0.01）；与 IVA-CPT 呈负相关（P<0.05）；（5）Logistic 回归分析结果提示：CPFQ 总分、SCL-90 总分是促进抑郁症的 发生（OR=1.42，P=0.021；OR=1.15，P=0.007）；教育程度、综合注意商数、综合反应控制商数是阻碍抑郁症的发生（OR=0.08，P=0.038；OR=0.81，P=0.019；OR=0.93，P=0.039）。

结论 （1）通过 IVA-CPT，了解抑郁症患者的视听操作任务执行能力及注意缺陷。抑郁症患者主要表现在视听觉警觉性、集中性差、对刺激的反应速度较慢；视听觉对刺激反应的谨慎程度不够以及维持任务的能力欠佳；（2）本研究提示 IVA-CPT 对认知功能检测具有较好的效果，对抑郁症患者的认知功能缺陷有较好的辅助诊断价值；（3）认知功能受损及躯体症状严重、心理健康状况低、综合注意力减退、综合反应控制能力低是抑郁症的危险因素。

Quantitative Proteomics Combine Independent PRM Analysis Revealed The Mitochondrial and Synaptic Mechanism of Norisoboldine for Its Antidepressant Effects

Weijing Kan[1], Lei Li[1], Feng Yang[3], Tengfei Ji[2], Gang Wang[1], Jing Du[1]
1.首都医科大学附属北京安定医院
2.中国医学科学院北京协和医院
3.首都医科大学附属北京天坛医院

Objective Major depressive disorder (MDD) is a common disease affecting 300 million people worldwide. The existing drugs are ineffective for approximately half of patients, so we tested Norisoboldine (NOR) as a novel antidepressant drug and performed proteomic analysis to study the mechanisms.

Methods Normal C57 mice and chronic social defeat stress (CSDS) mice were treated with various concentrations of NOR and the antidepressant effects were determined by tail suspension, sucrose preference and forced swimming tests. The experimental animals were divided into normal control (CON), CSDS, NOR treated (NOR) and imipramine treated (IMI) groups and the proteins of prefrontal cortex were extracted for quantitative proteomic analysis. The bioinformatics analysis was performed to determine GO enrichment of the relevant differential proteins and protein-protein interaction network.

Results We found that norisoboldine (NOR) showed an antidepressant efficacy in the chronic social defeat stress (CSDS) depression model in the tail suspension, forced swimming, and sucrose consumption tests. We utilized the drug-treated CSDS mice paradigm to segregate and gain differential protein cohorts of CSDS versus CON(CSDSCON), imipramine (IMI) -treated versus CSDS(IMICSDS), and NOR-treated versus CSDS(NORCSDS) from the prefrontal cortex. These proteomics data were first analyzed by ANOVA with p

抑郁症亚型的脑功能网络差异及其与社会认知的关联研究

卢文仙 张慧凤 周儒白 彭代辉*
上海交通大学医学院附属精神卫生中心

目的 抑郁症（major depressive disorder，MDD）的临床表现和病因的异质性限制了我们对该疾病的深入理解，因此推动了对 MDD 亚型的研究。伴非典型特征的抑郁症（atypical depression，AD）是一种常见的 MDD 亚型，具有心境反应性、明显的体重增加或食欲增加、睡眠增加、灌铅样麻痹和人际拒绝敏感的特征。与此同时，社会认知障碍是导致 MDD 患者痛苦和预

后不良的因素之一。本研究的目标是探究 AD 亚型患者与不伴非典型特征抑郁症（non-atypical depression, non-AD）患者在脑功能影像方面是否存在差异，并探索其与社会认知的关联性，以深化对该亚型的理解，并为抑郁症的个体化诊疗提供参考。

方法 自 2019 年 8 月至 2022 年 9 月，满足招募标准并通过影像质量控制的 54 名 AD，100 名 non-AD，和 44 名健康对照被纳入研究。所有参与者在静息状态下接受了 3T 磁共振扫描，获取了 3D 结构像和功能像。经过预处理，我们构建了三组数据的全脑静息态功能网络，并进行了基于网络的统计分析（Network-based statistic，NBS）。此外，对具有显著差异的脑功能连接和社会认知进行了偏向关分析，以探究抑郁症患者社会认知受损的脑功能基础。

结果 全脑功能网络连接分析显示，在丘脑-小脑子网络中，AD 组、non-AD 组和健康对照组之间存在显著差异（p-FDR < 0.05）。该子网络包含了多个丘脑核团与小脑蚓部以及小脑半球亚区之间的功能连接。对该网络内的功能连接进行两两比较后发现，AD 组的小脑蚓 4/5 区与丘脑左腹外侧核以及左后外侧核之间的功能连接值显著低于其他两组（$p < 0.05$）。偏向关分析结果显示，该子网络内的功能连接与抑郁严重程度、非典型症状和社会认知显著相关（$p < 0.05$）。

结论 本研究发现丘脑-小脑子网络在 AD、non-AD 和健康对照组之间存在差异，并观察到其与社会认知之间的关联。研究结果提示，丘脑与小脑之间的协同功能改变可能参与了 MDD 及其亚型社会认知障碍的发生和发展。这些发现有助于进一步理解 AD 亚型和抑郁症社会认知障碍的病理生理学基础，并为抑郁症的脑影像学研究提供了新的视角。

低频重复经颅磁刺激辅助治疗伴不同特征抑郁症的对照研究

潘惠 杨忠*
常熟市第三人民医院

目的 探讨在原有抗抑郁药基础上联合右侧背外侧前额叶皮质（DLPFC）低频重复经颅磁刺激（rTMS）对伴不同特征抑郁症的疗效和安全性差异

方法 将 80 例符合 DSM-5 伴焦虑痛苦特征、伴忧郁特征或伴非典型特征相关诊断标准且经足量足疗程抗抑郁药治疗后仍应答不佳，即 17 项汉密尔顿抑郁量表（HAMD-17）总分减分率＜50%的抑郁症患者分成三组，在保持原有抗抑郁药治疗方案不变的前提下，各自联合右侧 DLPFC 低频 rTMS 连续治疗 6 周。分别在基线期和治疗后第 2、4、6 周末采用自杀意念自评量表(SIOSS)和 HAMD-17 评估疗效，?采用治疗中出现的副作用量表（TESS）评估安全性

结果 （1）从治疗第 2 周末起，伴焦虑痛苦特征组 HAMD-17 总分、SIOSS 总分较基线期均降低（P<0.01）。（2）从治疗第 4 周末起，伴忧郁特征组及伴非典型特征组 HAMD-17 总分、SIOSS 总分较各自基线期均降低（P<0.05 或 P<0.01）。（3）从治疗第 2 周末起，伴焦虑痛苦特征组 HAMD-17 总分、SIOSS 总分较伴忧郁特征组及伴非典型特征组均降低（P<0.05 或 P<0.01）。（4）三组间治疗期间出现的主要不良反应差异无统计学意义（P>0.05）

结论 抗抑郁药联合右侧 DLPFC 低频 rTMS 能在一定程度上安全有效地治疗伴不同特征的抑郁症状，特别是对伴焦虑痛苦特征的抑郁症患者起效时间更短且疗效更优

关键字：右侧背外侧前额叶皮质低频重复经颅磁刺激；伴不同特征的抑郁症；抗抑郁药治疗应答不佳

巴戟天寡糖通过调节 SIRT1/PGC-1α 线粒体生物合成通路改善 CUMS 高血压大鼠抑郁样行为和认知功能障碍

高维[1] 郭蓉娟[2]
1.清华大学玉泉医院
2.北京中医药大学东方医院

目的 观察慢性不可预见性温和应激（CUMS）下高盐饮食高血压大鼠的行为学变化，基于线粒体能量代谢障碍假说探讨其病理机制及巴戟天寡糖的干预机理。

方法 采用盐敏感高血压（Dahl/SS）大鼠，使用 CUMS 联合 8%NaCl 高盐饮食制备高血压合并抑郁大鼠模型，随机分为高盐对照组、CUMS 组、巴戟天寡糖组、西酞普兰组，每组 6 只。在造模第 0、12 周进行模型评价，测量血压，采用糖水消耗实验、旷场实验评价抑郁样行为，新物体识别实验评价记忆能力，透射电镜观察大鼠海马区线粒体形态，ELISA 法检测检测海马组织内神经递质包括去甲肾上腺素（NE）、5-羟色氨酸（5-HT）的含量，Western-blot 检测 SIRT1/PGC-1α 线粒体生物合成通路相关蛋白表达。

结果 应激第 12 周，给药 6 周后，与高盐对照组相比，CUMS 组收缩压、舒张压上升（P<0.01），糖水偏爱率减少（P<0.01），旷场实验静止时间增加（P<0.05），新物体识别实验分辨指数下降（P<0.01）。与 CUMS 组相比，巴戟天寡糖组收缩压下降（P<0.05），巴戟天寡糖组和西酞普兰组糖水偏爱率增加（P<0.01），旷场实验静止时间增加（P<0.01），新物体识别实验分辨指数增加（P<0.01）。电镜下观察各组海马区神经元和突触内均可见不同程度的线粒体数目减少和形态异常，但 CUMS 组线粒体肿胀最严重，可见明显的内嵴溶解消失，基质疏松，空泡变性。检测海马组织发现与高盐对照组相比，CUMS 组 5-HT、NE 含量下降（P<0.05），SIRT1 含量明显下降（P<0.01）。和 CUMS 组相比，巴戟天寡糖组 5-HT（P<0.05）、NE（P<0.01）含量上升，SIRT1、PGC-1α 含量均上升（P<0.05），西酞普兰组 5-HT 含量上升（P<0.05），SIRT1 含量上升（P<0.05）。

结论 CUMS 可以使高血压大鼠出现明显的抑郁

样行为和认知功能下降，血压增长更快，加剧脑内神经元和突触内线粒体损伤，导致脑组织内 5-HT、NE 含量明显下降，而巴戟天寡糖可以减少慢性应激下高血压大鼠收缩压的增加，减少抑郁样行为，提升认知功能，这可能与其上调 SIRT1-PGC-1α 线粒体生物合成通路相关蛋白含量，保护神经元和突触内的线粒体，进而提升脑组织内 5-HT、NE 含量有关。进一步验证了抑郁症线粒体能量代谢障碍假说。

关键字：抑郁，高血压，巴戟天寡糖，线粒体能量代谢障碍，SIRT1-PGC-1α 通路

中国孕早期女性的抑郁症状与感知压力之间的关系

秦雪梅[1] 徐抒音[1] 马墨涵[1] 范幸[2] 聂雪晴[2] 李凌江[1] 张燕[1] 刘帮杉[1]
1.中南大学湘雅二医院
2.长沙市妇幼保健院

目的 孕早期女性的抑郁症状较为常见，严重时将影响其自身、伴侣及子代的身心健康。本研究旨在探索中国孕早期女性的抑郁症状与感知压力之间的关系，从而为采取进一步的预防、干预措施提供参考依据。

方法 本研究采用方便取样的方法，对长沙市妇幼保健院 224 名孕早期女性（Total Pregnant Women, PW-T）采用爱丁堡产后抑郁量表（Edinburgh Postnatal Depression Scale, EPDS）和 10 项感知压力量表简体中文版（Simplified Chinese version of the 10-item Perceived Stress Scale, SCPSS-10）自评抑郁症状和感知压力。在本研究中，将 EPDS ≥ 10 分定义为伴抑郁症状孕妇（Pregnant Women with Depressive Symptoms, PW-DS）组，共 40 例；EPDS ≤ 9 分为健康孕妇（Healthy Pregnant Women, PW-HC）组，共 184 例。使用 Spearman 偏相关分析和二元逻辑回归分析探究抑郁症状与感知压力之间的关系。

结果 本研究中，17.9%孕早期女性有明显的抑郁症状。协方差分析结果显示，PW-DS 组 SCPSS-10 得分明显高于 PW-HC 组（F=72.709, P＜0.001）。Spearman 偏相关分析结果显示，PW-T 组中 EPDS 总分与 SCPSS-10 总分呈强相关（r=0.628；P＜0.001）。逻辑回归分析显示，受教育年限和 SCPSS-10 总分对抑郁症状有显著意义（Odds Ratio, OR = 0.797 和 1.549；P＜0.05）。

结论 中国孕早期女性抑郁症状的发生率较高，较低的受教育年限和较高的感知压力与抑郁风险增加有关，提示临床上应在孕早期女性中针对受教育年限较低者和感知压力较高者积极开展抑郁症状筛查和干预。同时，改善孕早期女性对压力的思考方式也可能有助于维护其围产期心理健康。

5.National Institute for Health Research Biomedical Research Centre (BRC), Guy's and St Thomas' NHS Foundation Trust and King's College London, London, United Kingdom

Objective The problem of suicide has become increasingly common in individuals with major depressive disorder (MDD). Transcranial direct current stimulation (tDCS) is an effective treatment for MDD with 2 milliamperes (mA) for at least thirty minutes per day for two weeks. This study aims to investigate the efficacy of daily duration-doubled tDCS as an adjunctive intervention for rapidly reducing suicidal ideation and improving depression in MDD patients.

Methods In this double-blind, randomized, sham-controlled study, 76 MDD patients with suicidal ideation are randomly assigned to either active (n=38) or sham (n=38) tDCS group. The anode and cathode are placed over the scalp areas corresponding to left and right dorsolateral prefrontal cortex (DLPFC), respectively, and each stimulation lasts for 60 minutes. The primary outcome is defined as change of Beck Scale for Suicide Ideation (BSI) after 5 and 10 sessions. The change of other clinical assessments, blood biomarkers related to suicidal ideation and depressive sumptoms are defined as secondary outcomes. Blood biomarkers related to suicidal ideation are collected at baseline and after 10 sessions.

Discussion This study suggest the adjunctive duration-doubled tDCS might be a novel method to rapidly reduce suicidal ideation and improve depressive symptom. The variation of biomarkers could be potential predictive models of suicide risk.

Trial registration The trial protocol is registered with ClinicalTrials.gov under protocol registration number NCT05555927. Registered on September 25, 2022.

关键字： Transcranial direct current stimulation (tDCS), Major depressive disorder (MDD), Suicidal ideation, Randomized controlled trial (RCT)

Higher Efficiency of Left Superor Frontal Gyrus

and The Symptom Features of Major Depressive Disorder

Objective Major depressive disorder (MDD) patients with anhedonia tend to have a poor prognosis. The underlying imaging basis for anhedonia in MDD remains largely unknown. The relationship between nodal properties and anhedonia in MDD patients need to be further investigated. Herein, this study aims to explore differences of cerebral functional node characteristics in MDD patients with severe anhedonia (MDD-SA) and MDD patients with mild anhedonia (MDD-MA) before and after the antidepressant treatment.

Methods Ninety participants with current MDD were recruited in this study. 24-Item Hamilton Depression Scale(HAMD-24) and Snaith-Hamilton Pleasure Scale (SHAPS) were used to assess the severity of depression and anhedonia at baseline and the end of 6- months treatment. The MDD patients who scored above the 25th percentile on the SHAPS were assigned to an MDD-SA group (n=19), while those who scored below the 25th percentile were assigned to an MDD-MA group (n=18). All patients in the 2 groups received antidepressant treatment. Functional magnetic resonance imaging (fMRI) images of all the patients were collected at baseline and the end of 6-months treatment. Graph theory was applied to analyze the patients cerebral functional nodal characteristics, which were measured by efficiency (ei) and degree (ki).

Results Repeated measures 2-factor ANCOVA showed significant main effects on group on the ei and ki values of left superior frontal gyrus (LSFG) (P=0.003 and P=0.008, respectively), and on the ei and ki values of left medial orbital-frontal gyrus (LMOFG) (P=0.004 and P=0.008, respectively). Compared with the MDD-MA group, the significantly higher ei and ki values of the LSFG (P=0.015 and P=0.021, respectively), and the significantly higher ei and ki values of the LMOFG (P=0.015 and P=0.037, respectively) were observed in the MDD-SA group at baseline. Meanwhile, higher SHAPS scores could result in higher ei and ki values of LSFG (P=0.019 and P=0.026, respectively), and higher ei value of LMOFG (P=0.040) at baseline; higher SHAPS scores could result in higher ei values of LSFG (P=0.049) at the end of 6-months treatment. The multiple linear regression analysis revealed that sex were negatively correlated with the ei and ki values of LSFG (r= ?0.014, P=0.004; r=?1. 153, P=0.001, respectively).

Conclusion There are obvious differences in nodal properties between the MDD-SA and the MDD-MA patients, such as the high ei of LSFG in the MDD-SA patients, which may be associated with the severity of anhedonia. These nodal properties could be potential biomarkers for the prognosis of MDD. The increased ei and ki values in the LSFG of MDD- SA patients may underlie a compensatory mechanism or protective mechanism. The mechanism may be an important component of the pathological mechanism of MDD-SA. Sex of MDD may affect the nodal properties of LSFG at baseline and the end of 6-months treatment.

单、双相抑郁障碍患者效应连接的异同性研究

张志芳 杨帆 周媛 张玲 王刚*
首都医科大学附属北京安定医院

目的 比较静息状态下单、双相抑郁障碍患者在默认网络、执行控制网络和突显网络内及网络间效应连接的异同性。

方法 纳入单相抑郁障碍患者 83 例，双相抑郁障碍患者 59 例及对照组 61 例，采集所有受试者的静息态 fMRI 数据及 T1 结构像数据。首先将静息态 fMRI 数据进行预处理，然后采用独立成分分析的方法得到组水平上的感兴趣脑区 11 个，最后提取感兴趣脑区的时间序列，采用基于频谱的动态因果模型分析方法，比较单、双相抑郁障碍患者在默认网络、执行控制网络和突显网络内及网络间效应连接共同的及差异性的异常特征。

结果 （1）人口学及临床资料的比较：三组之间在年龄、性别、受教育程度和平均帧位移上的差异无统计学意义（P＞0.05），但在汉密尔顿抑郁量表 17 项、汉密尔顿焦虑量表、杨氏躁狂量表总分上的差异有统计学意义（P＜0.001）。事后比较发现，单、双相抑郁障碍患者的汉密尔顿抑郁量表 17 项、汉密尔顿焦虑量表总分均高于对照组，但单、双相抑郁障碍患者之间的差异无统计学意义；双相抑郁障碍患者的杨氏躁狂量表总分显著高于单相抑郁障碍患者和对照组，但单相抑郁障碍患者与对照组之间的差异无统计学意义。（2）效应连接的比较：①与对照组相比，双相抑郁障碍患者在突显网络的网络内兴奋性效应升高（Pp=1.00）。单相抑郁障碍患者在执行控制网络、突显网络的网络内兴奋性效应升高（Pp 分别为 0.95 和 1.00），默认网络的网络内兴奋性效应降低（Pp=0.99），从执行控制网络到默认网络的网络间兴奋性效应升高（Pp=0.99），从突显网络到默认网络的网络间抑制性效应升高（Pp=1.00），从默认网络到突显网络的网络间兴奋性效应降低（Pp=1.00）。②与单相抑郁障碍患者相比，双相抑郁障碍患者在执行控制网络的网络内兴奋性效应降低（Pp=1.00），从突显网络到默认网络的网络间抑制性效应降低（Pp=0.99），从执行控制网络和默认网络到突显网络的网络间兴奋性效应升高（Pp 分别为 0.95

和 0.98）。

结论 突显网络的网络内兴奋性效应升高是单、双相抑郁障碍患者共同的异常特征，两患者组间效应连接的差异主要表现在网络间的效应连接上。这些结果的发现加深了我们对单、双相抑郁障碍患者内在神经机制的理解，为寻找两种疾病客观神经生物学标记提供了影像学证据。

Efficacy of Repetitive Transcranial Magnetic Stimulation and Agomelatine on Sleep Quality and Biomarkers of Adult Patients with Mild To Moderate Depressive Disorder

濮正平 林勇* 郭子雷
嘉兴学院附属精神卫生中心

Objective Mild to moderate depressive disorder (DD), which accounts for much larger patient population, has been largely neglected in previous studies exploring the sleep quality of DD patients; in addition, most of these patients had comorbid insomnia. Thus, this study aimed to explore the effect of repetitive transcranial magnetic stimulation (rTMS) and agomelatine on sleep quality of adult patients with mild to moderate DD.

Methods 100 participants were randomly divided into high-frequency rTMS group and sham rTMS group (n = 50 each). All patients were administered agomelatine simultaneously. Hamilton Depression Scale-17 Items (HAMD- 17), Pittsburgh Sleep Index (PSQI), and polysomnography were used to evaluate the efficacy. Serum norepi- nephrine (NE), 5-hydroxytryptamine, brain-derived neurotrophic factor (BDNF), and melatonin were also determined.

Results The HAMD-17 and PSQI scores in high-frequency rTMS group were lower than those in sham rTMS group at the 4th and 8th weekend after treatment ($P < 0.05$). Post-treatment total sleep time, sleep efficiency, and N3 percentage in high-frequency rTMS group were better than those in sham rTMS group ($P < 0.05$); while post- treatment sleep latency, awakening time, micro-awakening times, and N1 percentage were significantly less than those in sham rTMS group ($P < 0.01$). Post-treatment serum levels of NE and BDNF in high-frequency rTMS group were higher than those in sham rTMS group ($P < 0.05$).

Conclusion The combination of high-frequency rTMS and agomelatine is effective in the treatment of mild to moderate DD, which can improve the sleep quality and increase the levels of some neurotransmitters and neurotrophic factors.

首发抑郁症影响因素的巢式病例对照研究

张慧敏[1] 廖宇华[1] 刘熠锋[1] 郭蓝[2] 王婉馨[2] 范北方[1] 李凌江[3] 韩雪[1] 卢次勇[2]
1.深圳市南山区慢性病防治院
2.中山大学公共卫生学院
3.中南大学湘雅二医院精神卫生研究所

目的 阈下抑郁症状是抑郁症发病的重要风险指标，被视为抑郁症前期。基于阈下抑郁症状人群探索首发抑郁症的影响因素，可为抑郁症的病因学和早期预防提供重要依据。

方法 2019 年 1 月-2020 年 12 月在深圳市南山区初级卫生保健机构中采用 PHQ-9 量表进行抑郁症状筛查，以 PHQ-9≥5 分人群归类为阈下抑郁症状并组成研究队列进行定期随访（每 6 月一次）。在队列 1 年随访期内，由社区初级保健机构转诊至精神专科进行诊断评估，以在精神专科门诊确诊的首发抑郁症患者为病例组，以未患抑郁症的研究对象为对照组。按照性别（相同）、 年龄（±3）进行 1:2 匹配，开展巢式病例对照研究。应用自主开发手机应用程序进行问卷调查，收集流行病学相关信息，应用二分类条件 Logistic 回归模型分析首发抑郁症的影响因素。

结果 本研究依托深圳市精神卫生资源，链接初级卫生保健机构与精神专科，纳入 34 家初级卫生保健机构开展阈下抑郁症状筛查，完成有效筛查 4288 例，筛查出有阈下抑郁症状者 3285 人，在一年随访期内，经转诊通道至精神科确诊并纳入病例组 192 人，匹配对照组 384 人。结果显示，越多的焦虑症状（AOR=1.13，95%CI=1.07-1.20）、失眠症状（AOR=1.06，95%CI=1.01-1.11）、应激性生活事件（AOR=1.16，95%CI=1.05-1.51）可增加抑郁症的发生风险。较高的主观幸福感（AOR=0.93， 95%CI=0.87-0.98）可降低发生抑郁症的风险，是抑郁症的保护因素。

结论 在阈下抑郁症状人群中，较多的焦虑症状、失眠症状、应激性生活事件均是首发抑郁症的危险因素；较高的幸福感是首发抑郁症的保护因素。 在阈下抑郁症状人群中，要着重对焦虑症状、失眠症状、应激性生活事件及主观幸福感进行评估，采取有针对性的措施减少焦虑症状、失眠症状，提升主观幸福感。

基于定量蛋白质组学探讨灵芝酸 A 抗抑郁的作用机制

徐劲节 阚伟京 王威 王刚 杜静*
首都医科大学附属北京安定医院

目的 灵芝酸 A（GA）是灵芝中主要的生物活性成分，本研究主要探讨 GA 在抑郁症治疗中的潜力及其可能的作用机制。

方法 ①将 C57BL/6J 小鼠随机分为对照组（CON）、慢性社会挫败应激诱导的抑郁模型组（CSDS）、灵芝酸 A 组（GA）和丙咪嗪组（IMI）。通过 CSDS 建立抑郁症模型，GA 组小鼠接受连续 5 天的 GA（2.5mg/kg）注射，IMI 组小鼠接受连续注射 5 天的 IMI（10mg/kg）注射。通过旷场实验、悬尾实验及强迫游泳实验评估小鼠行为学的变化，进而判断其抗抑郁效果。②从实验小鼠的前额叶皮层提取蛋白质，进行 LC-MS/MS 分析，以鉴定和定量蛋白质。③筛选出所有 ANOVA 分析中 p 值<0.05 的差异蛋白质进行后续分析，并进行 Kmeans 聚类分析。④使用生物信息学工具，进行蛋白质 GO 富集分析和 PPI 网络分析。⑤对于筛选出的关键蛋白质或通路，进行 PRM 验证。

结果 ①在 CSDS 模型中，小鼠经过连续 10 天的社会攻击后，表现出明显的抑郁样行为。然而，经过 GA 处理后，小鼠的抑郁症状明显改善，GA 的抗抑郁效果与阳性对照药物 IMI 相当。②CSDS 和 CON（CSDSCON）组、GA 和 CSDS（GACSDS）组、IMI 和 CSDS（IMICSDS）组中的蛋白质表达存在显著差异，分别得到 305、949、289 个差异蛋白。其中，GACSDS-CSDSCON 组、GACSDS-IMICSDS 组分别有 132、118 个共同差异蛋白。③通过 ANOVA 差异蛋白表达聚类分析，我们将差异蛋白分为多个簇。其中，簇 1、簇 3、簇 5 的蛋白表达变化与情绪变化一致，这些蛋白簇在 GO 分类分析中显示出富集在与线粒体代谢、神经突触的结构和功能、RNA 处理、以及蛋白质和肽的合成、运输和定位的蛋白质类别。④对 GACSDS-IMICSDS 组和 GACSDS-CSDSCON 组的共同差异蛋白进行 GO 分析和 PPI 分析，发现与线粒体和突触功能相关的蛋白质明显富集。⑤PRM 分析发现，与神经突触相关的蛋白质（Carmil1、Dcx、Tprkb、Erbb4、Fam3c、Rnf112、Atxn3、Ppp1r2）和与线粒体相关的蛋白质（Bnip1、Apoh、Acbd5、Tubgcp4、Nup37、Naa30、Mrpl42）的表达发生了明显变化。

结论 本研究初步揭示了灵芝酸 A 的潜在抗抑郁作用，其作用机制可能涉及神经突触以及线粒体相关功能。

Association between Work Stress, Insomnia, and Depression Among Medical Staff During The Outbreak of COVID-19: A Moderating Mediating Model

陈颜 蒋敏 廖宇华 孙雪蝶 李燕薇 韩雪*
南山区慢病院

Objective The objective of the study was to investigate the relationship between work stress, insomnia, and depression among medical staff, and the moderating role of weekly working hours between work stress and insomnia.

Methods A cross-sectional survey was conducted among 1165 participants, 631 (54.2%) male and 534 (45.8%) female, with a mean age of 35.49±10.64, from February to April 2021 during the COVID-19 pandemic in Shenzhen, China. Work stress, insomnia, and depression were measured using the Self-Reported Work Stress Scale (SWSS), Insomnia Severity Index (ISI), and Patient Health Questionnaire 9 (PHQ-9), respectively. The significance of the mediating and moderating effect was calculated using a bootstrap approach with SPSS PROCESS macro.

Results Work stress was significantly associated with depression (β=0.45, $p < 0.001$). Insomnia partly mediated the relationship between work stress and depression (β=0.58, $p < 0.001$). Besides, weekly working hours moderated the relationship between work stress and insomnia. Medical staff who are prone to insomnia are more likely to have severe symptoms of depression when exposed to work stress, for those with longer working hours (＞40 hours/week) particularly.

Conclusion The findings found that insomnia played a mediating role in the association between work stress and depression, and moderated the role of weekly working hours on the path between work stress and insomnia. This finding necessitates the importance of developing skills, and interventions to improve medical staff's sleep and work reorganization, to enhance their emotional health.

Selective Structural and Functional Indicators in Nonsuicidal Self-injury Adolescents with Major Depression Disorder

Hong Li[1,2], Gaizhi Li[1,2], Dan Qiao[1,2], Yifan Xu[1,2], Yujiao Wen[1,2], Zhifen Liu[1,2]
1.Department of Psychiatry, The First Hospital of Shanxi Medical University, Taiyuan, China.
2.2Shanxi Key Laboratory of Artificial Intelligence Assisted Diagnosis and Treatment for Mental Disorder, The First Hospital of Shanxi Medical University, Taiyuan, China.

Objective Nonsuicidal self-injury (NSSI) is one of the most frequent and persistent behavioral characteristics following adolescents with major depressive disorder (MDD). It is suggested that NSSI behavior is associated with the deficits of structural and functional characteristics of adolescents with MDD, which contribute to potentially poor recovery and even suicide behavior. There is a need to elucidate the behavior-specific neural mechanisms of NSSI in adolescent MDD to inform the development of relevant therapeutic targets based on these markers in intervention studies.

Methods To address this issue, we collected 119 first-episode drug-na?ve MDD patients and 43 healthy controls. Adolescents with MDD were divided into two groups based on whether they had NSSI behavior (81 for MDD with NSSI behavior and 38 for MDD with none-NSSI behavior). Combining psychophysics and magnetic resonance imaging (MRI), we quantified the differences

accounting for emotional symptoms (i.e., depression and anxiety), NSSI behavior as well as the structural and functional features between MMD patients and healthy controls.

Results We found that (1) structural MRI analyses showed that the gray matter volume of the middle frontal cortex (MFC) in MDD with none-NSSI behavior was significantly smaller than that in the healthy controls, and the gray matter volume of the superior frontal cortex (SFC) in MDD with NSSI was significantly smaller than that in the healthy controls. Correlation analysis showed that the gray matter volume of the SFC was significantly negatively correlated with the NSSI behavior (qualified by the NSSI Diary Card) in MDD adolescents. (2) at resting state, we compared groups in network coherence of subdivisions of the frontoparietal network (FPN), default mode network (DMN), and salience network (SN). Depressed adolescents with NSSI had lower coherence in the FPN (i.e., SFC and precuneous) compared to those without NSSI and healthy controls.

Conclusion Our findings demonstrated that the structural and functional deficits in the depressed adolescents with NSSI behavior, which were highly correlated with the their NSSI behavior. Therefore, this study strengthened our understanding of the pathogenesis of depressed adolescents with NSSI, which might contribute to tailoring a personalized method for treating the patients.

Prevalence and Clinical Correlates of Suicide Attempts in First Episode, Never Treated Major Depressive Disorder Patients with Comorbid Autoimmune

周亚男 罗银利 袁宁*
湖南省第二人民医院

Objective Autoimmune thyroiditis (AIT) is closely associated with major depressive disorder (MDD). However, its association with suicide attempts (SA) in this population remains unexplored. The study aimed to assess the prevalence and correlates of SA in first-episode drug-na?ve (FEDN) MDD patients with AIT.

Methods We recruited 1718 FEDN MDD outpatients and assessed depressive, anxiety, and psychotic symptoms by the Hamilton Rating Scale for Depression (HAMD), the Hamilton Rating Scale for Anxiety, and the Positive and Negative Syndrome Subscale positive subscale, respectively. The serum levels of free triiodothyronine, free thyroxine, thyroid stimulating hormone (TSH), anti-thyroglobulin, thyroid peroxidases antibody (TPOAb), and several other metabolic parameters were assessed. Multiple logistic regression model was applied to identify the correlates of SA in AIT MDD patients. The Area Under the Curve (AUC) was used to test the performance of this model.

Results The prevalence of SA was higher in AIT patients than in non-AIT patients (34% vs 14%, p<0.001). The presence of AIT independently doubled the risk of SA (OR, 1.88, 95%CI, 1.42-2.50, p<0.001). Anxiety (OR, 3.09, 95%CI, 1.76-5.42, p<0.001), HAMD score (OR, 1.19, 95%CI, 1.09-1.31, p<0.001), TPOAb (OR, 1.002, 95%CI, 1.001-1.002, p<0.001), and TSH (OR, 1.20, 95%CI, 1.10-1.32, p<0.001) were independently associated with SA in MDD patients with AIT.

Conclusion The combination of the four variables well distinguished SA patients from non-SA patients (AUC value:0.80). Taken together, AIT was closely associated with SA. Regular thyroid examination may help detect SA in MDD patients.

关键字：Autoimmune thyroiditis; Major depressive disorder; Suicidal attempts; Anxiety

Clinical Correlates, Lipid Metabolic Parameters and Thyroid Hormones Are Associated with Abnormal Glucose Metabolism in First-episode and Drug-na?ve Major Depressive Disorder Patients with Suicide Attempts: A Large Cross-sectional Study

陈士望[1] 李申[1] 李洁[1] 张向阳[2]
1.天津市安定医院
2.中国科学院

Objective Those factors associated with glucose disturbances in major depressive disorder (MDD) patients with comorbid suicide attempts remains unclear. To the best of our knowledge, this is the first study with a large sample size to examine risk factors for glucose disturbances, including clinically relevant factors, lipid metabolic parameters, and thyroid hormone levels in first-episode drug-na?ve (FEDN) MDD patients with comorbid suicide attempts.

Methods A total of 1718 FEDN MDD patients were enrolled. The Hamilton Depression Scale (HAMD), Hamilton Anxiety Scale (HAMA), and Positive and Negative Syndrome Scale (PANSS) were used to assess the clinical symptoms of the patients. Fasting blood glucose, metabolic parameters and thyroid hormone levels were measured.

Results The prevalence of glucose disturbances was 24% in MDD patients with comorbid suicide attempts, which was 1.88 times higher than that in MDD patients without suicide attempts (11%). Among MDD patients with comorbid suicide attempters, those with comorbid glucose metabolism disorders had higher HAMA, HAMD and PANSS positive subscale scores, and higher levels of TC, TG, thyroid stimulating hormone (TSH), HDL-C, LDL-C, and thyroid peroxidases antibody (TPOAb) compared with those without glucose metabolism disorders. The combination of HAMA score, HAMD score, PANSS positive subscale score and TSH distinguished between patients with and without glucose disturbances.

Conclusion Our findings suggest a high prevalence of glucose disturbances in FEDN MDD patients with

comorbid suicide attempts. Several clinical correlates, lipid metabolism parameters, and thyroid hormone function are associated with glucose disturbances in MDD patients with comorbid suicide attempts.

The Association of Clinical Correlates and Metabolic Parameters with Subclinical Hypothyroidism in First-episode and Drug-naive Patients with Major Depressive Disorder Comorbid with Glucose Disturbances: A Large Cross-sectional Study

陈士望[1] 张宾[1] 李申[1] 李洁[1] 张向阳[2]
1.天津市安定医院
2.中国科学院

Objective The factors associated with subclinical hypothyroidism (SCH) in major depressive disorder (MDD) patients with comorbid glucose disturbances remains unclear. To the best of our knowledge, this is the first study with a large sample size to examine risk factors of SCH in first-episode drug-na?ve (FEDN) MDD patients with comorbid glucose disturbances, including clinically relevant factors, metabolic parameters, and thyroid hormone levels.

Methods A total of 1718 FEDN MDD patients were enrolled. The Hamilton Depression Scale (HAMD), Hamilton Anxiety Scale (HAMA), and Positive and Negative Syndrome Scale (PANSS) were used to assess the clinical symptoms of patients. Fasting blood glucose, metabolic parameters and thyroid hormone levels were measured.

Results The prevalence of SCH in MDD patients with comorbid glucose disturbances was 85.04%, which was 2.43 times higher than in MDD patients without glucose disturbances (56.94%). HAMD and HAMA scores, as well as TSH, TPOAb and PANSS positive symptoms scores were higher in patients with severe SCH compared to those with mild SCH in combination with glucose disturbances (all $p<0.001$). TgAb, TC, Systolic and Diastolic blood pressure were all higher in patients with severe SCH than in those with mild SCH. In addition, HAMD score, HAMA score, Psychotic positive score, Diastolic BP, and TC were independently associated with the TSH levels in MDD patients with comorbid glucose disturbances.

Conclusion Our results suggest a high prevalence of SCH in MDD patients with comorbid glucose disturbances. Several clinically relevant factors and metabolic parameters have an impact on SCH in MDD patients with comorbid glucose disturbances.

Cognitive Function of MDD Links with GABA-related Pathways : A Comprehensive Analysis Based on GWAS Study

许吉怡 张玲 王刚* 杜静*
首都医科大学附属北京安定医院

Objective Cognitive dysfunction symptoms cannot be ignored during the treatment of Major Depressive Disorder (MDD) , but the pathogenesis of cognitive dysfunction in MDD is still unclear. Recently, a Genome Wide Association Study (GWAS)，aiming to figure out the the phenotypic and genetic relationship between cognitive function and MDD, which enrolled four large European cohorts in a total of 3510 MDD cases and 6057 controls identified a set of significantly interacting single nucleotide polymorphisms (SNPs) between MDD and cognitive domains of executive function, processing speed, and global cognition. In order to further explore whether GABAergic system participated in the pathogenesis of cognitive dysfunction in MDD, we conducted a further analysis based on this GWAS study.

Methods The risk genes base on the GWAS study were collected, and then genes of GABA-related pathways were confirmed via Pathcards database (https://pathcards.genecards.org/). Then, the construction of the PPI network analysis was performed by an online tool, the Search Tool for the Retrieval of Interacting Genes/Proteins (STRING; https://string-db.org/). The criteria of the PPI network included a confidence score ≥ 0.4 and a maximum number of interactions$\leq$5.The active interaction sources included text mining, experiments, databases, coexpression, neighborhood, gene fusion, and corecurrence.

Results 57 risk genes of MDD cognitive dysfunction symptoms and genes of 4 GABA-related pathways, GABA receptor signaling, Degradation of GABA, GABAB receptor activation, mBDNF and proBDNF regulation of GABA neurotransmission, were exhibited from the analysis. 20 risk genes were connected with those GABA-related pathways and 9 genes, ARFGEF1, CPXM1, CWC25, FOXO1, MYBL1, NKX2-3, SGK3, SYT4, and VCPIP1, were connected with all those 4 GABA-related pathways. Further studies are warranted to determine the molecular mechanisms.

Conclusion This study presented a genetic hint that GABA-related pathways linked with cognitive functions of MDD, which provided a further evidence for the involvement of GABAergic system in the pathogenesis and treatment of cognitive impairment in depression.

Volume Changes of The Subcortical Limbic Structures in Major Depressive Disorder Patients with and without Anhedonia

穆庆丽 陆邵佳*
浙江大学医学院附属第一医院

Objective Anhedonia is a core feature of major depressive disorder (MDD) and the limbic system has been indicated to be associated with anhedonia in MDD due to its crucial role within the reward circuit. However, the relationship between different regions of the limbic system and MDD, particularly anhedonic symptoms, remains unclear. Therefore, the purpose of this study was to investigate volume changes of various parts of the subcortical limbic (ScL) system in MDD with and without anhedonia.

Methods A total of 120 individuals, including 30 MDD patients with anhedonia, 43 MDD patients without anhedonia, and 47 healthy controls (HCs) were enrolled in this study. All subjects underwent structural magnetic resonance imaging scans. After that, ScL system segmentation was performed using the FreeSurfer pipeline ScLimbic. Analysis of covariance (ANCOVA) was performed to identify brain regions with significant volume differences among three groups, and then, post hoc tests were calculated for inter-group comparisons. Finally, correlations between volumes of different parts of the ScL and clinical characteristics in MDD patients were further analyzed.

Results The ANCOVA revealed significant volume differences of the ScL system among three groups in the bilateral fornix (Fx), and the right basal forebrain (BF). As compared with HCs, both groups of MDD patients showed decreased volume in the right Fx, meanwhile, MDD patients with anhedonia further exhibited volume reductions in the left Fx and right BF. However, no significant difference was found between MDD patients with and without anhedonia. No significant association was observed between subregion volumes of the ScL system and clinical features in MDD.

Conclusion The present findings demonstrated that the two groups of MDD patients exhibited segregated brain structural alterations in the ScL system and volume loss of the ScL system is fairly extensive in MDD patients with anhedonia.

The Differential Orbitofrontal Activity and Connectivity between Atypical and Typical Major Depressive Disorder

郭志鹏* 廖旦 刘春红
首都医科大学附属北京中医医院

Objective Atypical major depressive disorder (MDD) is a distinct subtype of MDD, characterized by increased appetite and/or weight gain, oversleeping, leaden paralysis, and interpersonal rejection sensitivity. Delineating different neural circuits associated with atypical MDD and typical MDD would better inform clinical personalized interventions.

Methods Using resting-state functional magnetic resonance imaging (fMRI), we investigated both intra-regional and inter-regional synchronization in 55 patients with atypical MDD, 51 patients with typical MDD, and 49 healthy controls (HCs) with age, sex, and educational level matched in both MDD subtypes. The voxel-level regional homogeneity (ReHo) and functional connectivity (FC) analyses were conducted to characterize atypical and typical MDD. Support vector machine (SVM) approaches were applied to examine the validity of the findings in distinguishing the two types of MDD.

Results Increased ReHo values in the right lateral orbitofrontal cortex (OFC) and their corresponding FC between the right lateral OFC and right dorsolateral prefrontal cortex (dlPFC), and FC between the right striatum with left OFC were identified in atypical MDD patients compared to typical MDD patients and HCs. The ReHo in right lateral OFC and the significant FCs found above were significantly correlated with body mass index (BMI) across all MDD subjects. The connectivity of the right striatum and left OFC is positively correlated with the retardation scores in the atypical MDD group. Finally, using the ReHo of the right lateral OFC as a feature, we achieved 71.68% accuracy and 0.75 area under curve to differentiate atypical MDD from typical MDD.

Conclusion Our findings showed that atypical MDD might be associated with altered OFC activity and connectivity. Furthermore, our findings also highlight the key role of lateral OFC in atypical MDD, which may provide valuable information for future personalized interventions.

Clinical Correlates of Autoimmune Thyroiditis and Non-autoimmune Hypothyroidism in Treatment-naive Patients with Major Depressive Disorder

Wu Siqi[1,2], Wang Haitao[2], Du Xiangdong[1]
1.Suzhou Guangji Hospital
2.North China University of Science and Technology

Objective Thyroid autoimmunity is a potentially critical factor that is often neglected in the association between subclinical hypothyroidism (SCH) and depressive disorders. This study aimed to investigate the clinical correlates of autoimmune thyroiditis (AIT) and non-autoimmune hypothyroidism (NAIH) in treatment-na?ve patients with major depressive disorder (MDD).

Methods Using a cross-sectional design, we recruited a total of 1718 outpatients with treatment-na?ve MDD. Demographic and relevant clinical information including duration of MDD, severity of depression and anxiety, psychotic symptoms, suicide attempts, thyroid function parameters, etc. were collected. According to thyroid function parameters, patients were classified as AIT, NAIH, latent Hashimoto's thyroiditis (LH) and euthyroidism (ET).

Results Patients with SCH (including AIT and NAIH) had older age at onset, and were more likely to have psychotic symptoms compared to those with ET. Multiple

linear regression analysis showed that SCH was associated with duration of MDD and HAMD scores. Logistic regression analysis showed that the odds of having more severe anxiety and metabolic syndrome were greater among patients with SCH compared to those with ET. The odds of having suicide attempts were greater among patients with AIT than among those with ET.

Conclusion Our findings suggested that AIT and NAIH were associated with duration of MDD, HAMD scores, severity of anxiety, and metabolic syndrome. However, only AIT in SCH was associated with suicide attempts.

关键字：Major depressive disorder Autoimmune thyroiditis Subclinical hypothyroidism Non-autoimmune hypothyroidism Suicide attempts

The Interactions between Childhood Adversities and Stressful Life Events Were Associated with Depressive Symptoms Among UK Biobank Participants

马千淑 谢敏 王强*
四川大学华西医院

Objective To examine the contributions of moderation and mediation by adult stressful life events (SLEs) to the association between childhood adversity and late-life depressive symptoms.

Methods We conducted a retrospective cohort study using data from adult participants in the UK Biobank baseline survey (2006-2010) and online follow-up mental health survey (2016-2017). Childhood adversities contained five dimensions, including physical neglect, emotional neglect, sexual abuse, physical abuse, and emotional abuse, which were assessed retrospectively through the online follow-up survey (2016). SLEs were assessed during the baseline survey (2006-2010). The outcome was the total score of the PHQ-9 scale in the online follow-up survey. Linear regression models were performed to explore the association of childhood adversities and SLE with depression symptoms and their moderation effects on depression. Mediation analyses were carried out to explore the mediating role of SLEs between childhood adversities and depressive symptoms.

Results A total of 150978 participants aged 38 to 72 years were included. Among the cohort, the average age was 55.91 (SD 7.74) years, 43.7% were male, and 89,395 (59.2%) and 63,894 (42.32%) reported childhood adversities and stressful life events, respectively. We found that childhood adversities significantly increased the effects of SLEs on depressive symptoms ($\beta = 0.0079$, $P = 3.25 \times 10$-22). The results of mediation analyses revealed that SLEs significantly mediated the association between childhood adversities and depressive symptoms by 3.98%.

Conclusion Our study identified important interactions between childhood adversities and adult SLEs on depressive symptoms and showed that the adult SLEs may modify the associations between childhood adversities and depressive symptoms. These findings may provide more reliable evidence for subsequent pathogenesis studies of depression.

抑郁症患者情绪面孔处理网络效应连接的改变

生芳睿[1] 王赟[1] 冯媛[1] 张玲[1] 周媛[2] 王刚[1]
1.首都医科大学附属北京安定医院
2.中国科学院心理研究所

目的 重性抑郁障碍（major depressive disorder, MDD）患者存在情绪加工异常以及情绪面孔处理网络关键脑区（如前额叶、杏仁核及视觉皮层）的功能连接异常。但是，处理情绪面孔时这些关键脑区之间功能交互的方向性即效应连接是如何改变的，仍不清楚。本研究旨在探讨未服药 MDD 患者在情绪面孔加工过程中，腹内侧前额叶（vmPFC）、背外侧前额叶（dlPFC）、杏仁核及梭状回面孔区（FFA）之间效应连接的改变，为阐明 MDD 患者情绪面孔加工受损的神经机制以及发现潜在的用于 MDD 诊断的生物标志物提供进一步证据。

方法 纳入符合美国精神疾病诊断与统计手册第五版（DSM-V）抑郁发作诊断的患者 48 例，年龄、性别、受教育程度均匹配的健康被试 44 例。所有受试在核磁扫描过程中完成情绪面孔配对任务，同时记录反应时和准确率。采用能够揭示脑区之间因果关系的动态因果模型（dynamic causal modeling, DCM）研究 MDD 患者情绪面孔加工过程的异常。根据前人研究，选取个体化后的 vmPFC、双侧 dlPFC、双侧杏仁核和双侧 FFA 作为每个被试的感兴趣脑区，构建 DCM；通过参数经验贝叶斯比较 MDD 患者与健康对照之间的效应连接差异，并基于组间差异连接，通过留一交叉验证对疾病分类诊断进行预测。

结果 DCM 分析发现，与健康对照相比，MDD 患者存在以下异常：1）右侧 dlPFC、右侧杏仁核与右侧 FFA 脑区的自连接减弱，提示这些脑区自抑制减弱、兴奋性增强；2）右侧杏仁核到双侧 dlPFC、右侧 FFA 以及左侧杏仁核之间的效应连接增强，提示以右侧杏仁核为主的右侧情绪面孔处理网络存在异常的效应连接；3）左侧 dlPFC 到左侧 FFA 和 vmPFC 的效应连接减弱，左侧杏仁核到左侧 FFA 效应连接增强，提示左侧情绪面孔处理网络存在多样的效应连接异常模式。进一步，我们发现存在组间差异的上述连接可以有效预测 MDD 患者的诊断分类（$r=0.2$, $p=0.039$）。

结论 在情绪面孔加工过程中，抑郁症患者情绪面孔处理网络表现出复杂的异常模式，部分结果证实了既往研究结果，即证实了以右侧情绪面孔处理网络在 MDD 情绪面孔加工中的作用，同时也发现 MDD 患者左侧情绪面孔处理网络效应连接异常。这些研究发现有助于增进对 MDD 受损的神经机制的理解，也提示情绪面孔处理网络效应连接有潜力作为辅助 MDD 诊断的客观生物标志物。

Clinical and Preclinical Evaluation of MiR-144-5p As A Key Target for Major Depressive Disorder

吴晓东[1] 张雨龙[1] 王萍[1] 任振华[2] 刘寰忠[1]
1.安徽医科大学附属巢湖医院
2.安徽医科大学

Objective Neuronal abnormalities are closely associated with major depressive disorder (MDD). Available evidence suggests a role for microRNAs (miRNAs) in regulating the expression of genes involved in MDD. Hence, miRNAs that can be potential therapeutic targets need to be identified.

Methods A mouse model of chronic unpredictable stress (CUS) was used to evaluate the function of miRNAs in MDD. miR-144-5p was screened from the hippocampi of CUS mice based on sequencing results. Adenovirus-associated vector were used to overexpress or knockdown miR-144-5p in mice. BpV(pic) and LY294002 were used to determine the relationship between miR-144-5p target genes PTEN and TLR4 in neuronal impairment caused by miR-144-5p deficiency. Western blotting, immunofluorescence, ELISA immunosorbent assay, and Golgi staining were used to detect neuronal abnormalities. Serum samples from healthy individuals and patients with MDD were used to detect miR-144-5p levels in the serum and serum exosomes using qRT-PCR.

Results miR-144-5p expression was significantly decreased within the hippocampal dentate gyrus (DG) of CUS mice. Upregulation of miR-144-5p in the DG ameliorated depression-like behavior in CUS mice and attenuated neuronal abnormalities by directly targeting PTEN and TLR4 expression. Furthermore, miR-144-5p knockdown in normal mice led to depression-like behavior via inducing neuronal abnormalities, including abnormal neurogenesis, neuronal apoptosis, altered synaptic plasticity, and neuroinflammation. miR-144-5p deficiency-mediated neuronal impairment was mediated by PI3K/Akt/FoxO1 signaling. Furthermore, miR-144-5p levels were downregulated in the sera of patients with MDD and associated with depressive symptoms. Consistently, serum exosome-derived miR-144-5p levels were decreased in patients with MDD.

Conclusion miR-144-5p plays a vital role in regulating neuronal abnormalities in depression. Our findings provide translational evidence that miR-144-5p is a new potential therapeutic target for MDD.

Identification of 7 Mitochondria-related Genes As Diagnostic Biomarkers of MDD and Their Correlation with Immune Infiltration: New Insights From Bioinformatics Analysis

刘小兰* 武勇 李明星*
武汉市精神卫生中心

Objective Major depressive disorder (MDD) is one of the most prevalent and debilitating psychiatric disorders. It becomes more recognized that mitochondrial dysfunction contributes to the pathophysiology of depression. However, little research has systematically investigated the mitochondria-related biomarkers for MDD diagnosis. This study aimed to develop a novel diagnostic gene signature in MDD based on mitochondria-related genes.

Methods We identified the differentially expressed mitochondrial-related genes (DeMRGs) by combing the gene expression data of the GEO database with mitochondria-related gene lists obtained from the MitoCarta3.0 database. Next, three kinds of machine-learning algorithms were used to screen characteristic DeMRGs. Then, we constructed a multivariable diagnostic model based on these characteristic genes and evaluated the diagnostic ability of this model. Subsequently, the immune landscape of infiltrated immune cells between MDD patients and controls was evaluated by CIBERSORT. Using consensus clustering analysis, we divided MDD patients into different clusters based on the characteristic DeMRGs expression patterns. Finally, the variations in immune cell infiltration between different clusters, and the correlation between characteristic DeMRGs and immune cell infiltration were analyzed.

Results Seven characteristic genes, including PMPCB, MRPS28, LYRM2, MGST1, COX20, PTPMT1, and STX17, were identified from the 31 DeMRGs. Based on the seven characteristic genes, we successfully constructed a diagnostic model which had relatively good diagnostic performance and potential application in the clinical diagnosis of MDD. In addition, our results also imply an intimate and comprehensive association between the characteristic DeMRGs and immune infiltrating cells.

Conclusion A novel mitochondria-related gene signature with a good diagnostic performance and a relationship with immune microenvironment were identified in major depressive disorder.

Hefei 238000, China
3.Anhui Medical University, Hefei 238000, China
4.School of Mental Health and Psychological Sciences, Anhui Medical University, Hefei 238000, China

Objective Age of onset influences the prognosis of many diseases and even serves as potential driver. But in Major Depressive Disorder, there is no consensus regarding the effect of age of onset on the course.

Methods In this study, a total of 38,671 inpatients were surveyed over 16 years, and 6,113 inpatients were eventually included in the statistical analysis after applying rigorous data criteria.

Results In the subset of first hospitalization(n=4884), the differences in the length of stay between several age of onset groups were statistically significant(F=56.852, df1=3, df2=4880, P<0.001, ω2=0.033). Similarly, this difference was also significant in the subset of relapse hospitalization(n=1229, F=5.985, df1=3, df2=1225, P<0.001, ω2=0.012). The Bonferroni post hoc test suggested a longer length of stay in the adolescent onset group(P<0.001). In the adolescent-onset group, the proportion with 2 or more relapses within one year was higher than those without relapses(6.7% Vs 2.7%, X2=12.685, df=6, P < 0.001). Logistic regression suggests that patients with adolescent onset are at higher risk for 2 or more relapses within one year(B=0.881, OR=2.41, 95%CI 1.37-4.23, P=0.002).

Conclusion This is the first large sample size study to examine age at onset and risk of relapse at the individual level in a Chinese population. Our study found that adolescent onset is more susceptible to the chronicity of MDD. These findings will contribute to the accurate typing of MDD, as well as customized individualized prevention and treatment options.

Correlation Analysis of Gut Microbiota and Short-chain Fatty Acid Characteristics in Major Depressive Disorder

高明雪 刘鹏鸿 杨春霞 刘志芬 张克让 孙宁*
山西医科大学第一医院

Objective Major depressive disorder (MDD) is a psychiatric disorder that has a serious impact on human physical and mental health. Previous studies have shown that imbalance of gut microbiota is closely related to the occurrence and development of MDD, and gut microbiota may cause MDD by influencing short-chain fatty acid (SCFA). Therefore, this study analyzed the gut microbiota and SCFA levels in patients with MDD to explore the relationship between them, aiming to provide a theoretical basis for the early identification, prevention and prognosis of MDD.

Methods In this study, eighty-two first-episode, drug-naive patients with MDD and ninety-one healthy subjects were recruited, and general demographic data of the subjects were collected. The Gastrointestinal Symptom Rating Scale (GSRS) was used to measure the severity of gastrointestinal symptom. We used 16S rRNA gene sequencing to detect the sequences of the intestinal flora of the two groups. The levels of SCFAs in plasma were measured by gas chromatography-mass spectrometry (GC-MS). We compared the differences in intestinal flora and SCFAs, between the two groups of subjects, and analyzed the correlation between the above indicators.

Results Patients with MDD differed from healthy controls significantly in education, total scores of HAMD-24, total scores of HAMA, score of GSRS and smoking. Further, there were significant differences between the two groups in frequency of drinking sugary drinks or eating desserts and defecation frequency(P<0.05). The fecal microbiome from MDD patients showed a significant decrease in α-diversity, as measured by Chao1, Faith's PD, Shannon, Simpson, Pielou's evenness and number of observed species. Meanwhile, there were differences in β-diversity between the two groups. LEfSe analysis identified 37 characteristic bacterial strains that were significantly different between the two groups (LDA > 3), of these, 15 enriched in patients with major depressive disorder. The genus Blautia, genus Bifidobacterium, genus Megamonas, genus Streptococcus were significantly enriched taxa in the patient group. The levels of propionic acid (P＜0.01) and butyric acid (P＜0.01) were found to be significantly decreased in depressed patients compared to controls, the level of isovaleric acid was not significantly different between the two groups (P = 0.645).Correlation analysis revealed positive correlations between genus Blautia and total scores of HAMD-24 and total scores of HAMA, but negative correlations with the level of propionic acid (P < 0.05). The levels of propionic acid and butyric acid were found that negative correlations with genus Bifidobacterium (P < 0.01).

Conclusion Patients with MDD had lower propionic acid and butyric acid level in peripheral blood, and changed in the composition of the intestinal flora compared to the healthy population. Dysbiosis could be a new therapeutic target and prognostic tool for the treatment of patients with MDD.

时间相关语音特征在单双相抑郁患者中的差异性分析

李楠茜* 丰雷 王刚
首都医科大学附属北京安定医院

目的 探究单相抑郁和双相抑郁患者的时间相关语音特征是否存在差异，以及与抑郁症状水平间的相关性。

方法 研究纳入经 MINI 诊断的中重度抑郁发作（HAMD-17 总分＞17 分）的单相抑郁患者 74 例、双

相抑郁患者 85 例，全部受试者无影响发声及阅读的躯体疾病。研究在安静环境下，采集受试者朗读固定文字材料时的音频数据，分析受试者音频中朗读时长、说话时长以及停顿时长三个时间相关的语音特征。使用 T 检验、回归分析的方法进行统计分析。

结果 单相抑郁和双相抑郁组受试者的性别、年龄、文化程度分布，无组间差异（P＞0.05）。研究分析朗读时长、说话时长以及停顿时长三个时间相关语音特征，在两组受试者间未见统计学显著性差异（P=0.851、0.266、0.641），由于上述语音特征被认为与抑郁症状水平有关，研究分析发现，疾病类别与抑郁症状水平的交互效应对两组受试者朗读时长特征的影响具有统计学显著性（P=0.049），而对说话时长和停顿时长特征的影响并不显著（P=0.793、0.059）。研究进一步展开亚组分析的结果提示，单相抑郁组和双相抑郁患者组的朗读时长特征，在中度抑郁亚组（P=0.377）或重度抑郁亚组（P=0.783）中并不存在统计显著性组间差异。

结论 时间相关语音特征在中重度抑郁发作的单双相抑郁患者中，并未发现显著性差异。

首复发抑郁障碍疗效相关静息态脑电功率谱分析

郭梦 雷蕾 孙宁 杨春霞 张克让*
山西医科大学第一医院

目的 抑郁障碍发病率逐年上升，较高的复发率导致其治疗复杂化，增加了社会和经济负担。所以对首发抑郁障碍患者的疗效检测及预防复发显得尤为关键，研究发现首发抑郁障碍患者脑电图存在特征性静息态脑电功率谱，在治疗方面研究结果也不尽相同，由此推测首/复发抑郁障碍患者之间可能也存在差异特征，因此我们拟通过研究首/复发抑郁障碍患者及其在疗效方面的静息态脑电功率谱差异，为抑郁障碍的诊治及预防复发提供客观的神经电生理指标。

方法 本研究依据纳入及排除标准收集 2019 年 1 月-2021 年 1 月抑郁障碍住院患者 292 例，其中首次抑郁发作（First Depressive Episode , FDE）组 144 例，复发性抑郁障碍（Recurrent Depressive Disorder , RDD）组 148 例（抑郁发作次数≥2 次）。收集其治疗前一般人口学资料、16 导静息态脑电图、HAMD-24；治疗 2 周后 HAMD-24。用 MATLAB 软件对所有脑电资料进行预处理及功率谱计算，对 FDE 与 RDD 组各频段脑电功率谱进行统计分析比较，探索首/复发抑郁障碍患者脑电功率谱的差异特征；根据治疗前后量表减分将 FDE 患者分为治疗有效组（116 例）与未显效组（28 例）、RDD 分为治疗有效组（99 例）与未显效组（49 例），对两组中疗效相关亚组的各频段脑电功率谱进行差异比较，探索抑郁障碍患者疗效相关的脑电功率谱特征。人口学和临床资料采用单因素方差分析、卡方检验及独立样本 t 检验进行比较，使用 SPSS26.0 软件进行统计分析。

结果 首发和复发抑郁障碍患者脑电功率谱在 beta 频段 C4 电极点存在差异（p<0.010），在 delta、theta、alpha、gamma 无明显差异（p>0.010）。FDE 患者治疗有效组与未显效组脑电功率谱在 gamma 频段电极点 F3 、F4 、C3、O2、P3 、P4 、T6 、FP2、F7 处存在差异，在 delta、theta、beta、alpha 无明显差异。RDD 患者治疗有效组与未显效组脑电功率谱在 delta、theta、alpha、beta、gamma 频段均无明显差异。

结论 Beta 频段 C4 电极点处脑电功率谱差异可能反应首/复发抑郁障碍患者的差异。Gamma 频段的 F3、F4、C3、O2、P3、P4、T6、FP2、F7 电极点处脑电功率谱差异可能反应不同首发抑郁障碍患者的疗效。

Volumetric Alterations of The Hippocampal Subfields in Major Depressive Disorder with and without Suicidal Ideation

Yuwei Xu[1,2], Dong Cui[3], Yang Zhao[1,2,4], Congchong Wu[1,2], Qingli Mu[1,2], Zhe Fang[1,2], Shaohua Hu[1], Manli Huang[1], Shaojia Lu[1]
1.Department of Psychiatry, The First Affiliated Hospital, Zhejiang University School of Medicine, Key Laboratory of Mental Disorder's Management of Zhejiang Province, Zhejiang Engineering Center for Mathematical Mental Health, Hangzhou, Zhejiang, China
2.Faculty of Clinical Medicine, Zhejiang University School of Medicine, Hangzhou, Zhejiang, China
3.Department of Radiology, Shandong First Medical University & Shandong Academy of Medical Sciences, Tai'an, Shandong, China
4.Department of Clinical Psychology, The Fifth Peoples' Hospital of Lin'an District, Hangzhou, Zhejiang, China

Objective Major depressive disorder (MDD) frequently co-occurs with suicidal ideation (SI). Prior research suggested that MDD patients who experienced suicidal attempts (SA) exhibited smaller hippocampal volume than those without SA. The hippocampus consists of several subfields that are histologically and functionally unique respectively. However, few studies have explored the link between suicide and volumetric changes of the hippocampal subfields in MDD.

Methods A total of 92 participants, including 24 MDD patients with SI (MDD-SI), 30 MDD patients without SI (MDD-nSI), and 38 healthy controls (HCs) were recruited in this study. High-resolution structural magnetic resonance images (MRI) were obtained and analyzed by using the automated hippocampal substructure module in Free Surfer 6.0. Analyses of variance (ANOVA) were performed to obtain hippocampal subfields with significant differences among three groups and then post hoc tests were calculated for inter-group comparisons. Correlation analyses were performed to investigate associations be-

tween hippocampal subfield volumes and clinical characteristics

Results The ANOVA revealed significant volumetric differences of the hippocampal subfields among three groups in the bilateral cornu ammonis (CA) 1 head, CA4, granule cell layer of the dentate gyrus (GC-ML-DG), molecular layer (ML), the right hippocampus-amygdala transition area (HATA), and the right subiculum (Sub) body. Relative to HCs, both groups of MDD showed decreased volumes in the CA1 head, CA4, GC-ML-DG head, ML head, and whole hippocampal head of the left hippocampus, the right HATA, and bilateral whole hippocampal body and whole hippocampus. Meanwhile, the MDD-SI group further exhibited diminished volume in the CA1 head, GC-ML-DG head, ML head, CA4 body, Sub body, and whole hippocampal head of the right hippocampus, as well as bilateral GC-ML-DG body and ML body. Additionally, the MDD-SI group also showed decreased volumes in the right GC-ML-DG body, ML body, and Sub body when comparing to MDD-nSI group. However, no significant association was observed between hippocampal subfield volumes and clinical features in MDD.

Conclusion The present findings suggested that SI in MDD might be attributed to subfield abnormalities in the subiculum and DG-dominant circuit of the right hippocampus.

Reliability and Validity of The Chinese Brief Cognitive Test (C-BCT) in Patients with MDD

范安豫阳 王巍巍 张玲 周晶晶 朱雪泉 刘瑞 王刚*
首都医科大学附属北京安定医院

Objective Cognitive impairment is a significant clinical feature of Major Depressive Disorder (MDD), and evaluating cognitive function can help with treatment prediction and prognosis. Subjective cognitive evaluation in MDD patients has been extensively researched, but the results often do not align with objective evaluation. Objective cognitive testing tools evaluate only a limited number of cognitive dimensions, and most cognitive batteries are either time-consuming or lack normative data in China. However, the Chinese Brief Cognitive Test (C-BCT) is a brief cognitive battery that has normative data in China and is less time-consuming. The purpose of this study is to explore and analyze the reliability and validity of the electronic version of the C-BCT for evaluating cognitive impairment in patients with Major Depressive Disorder.

Methods A total of 133 outpatients and inpatients who met the diagnostic criteria for Major Depressive Disorder in the DSM-5 were administered the C-BCT. The participants also completed the Chinese version of the MATRICS Consensus Cognitive Battery (MCCB), the 17-item Hamilton Depression Rating Scale (HAMD-17), and the Hamilton Anxiety Rating Scale (HAMA). Nineteen patients underwent a retest with the C-BCT after one week.

Results Analysis of the C-BCT items showed significant differences between each sub-test's high and low score groups (t=4.114-8.446, P<0.001). The homogeneity test indicated that the correlation coefficient (r) between each sub-test and the total score was greater than 0.4. The overall correlation between C-BCT and MCCB was strong (r=0.743, P<0.01).None of HAMD-17, HAMA, and the factors representing psychotic symptoms in BPRS were related to cognitive performance (P>0.05). The number of hospitalizations due to depression was negatively correlated with the total score and scores for the Trail Making Test, Digit Span Test, and Symbol Coding Test (r=-0.278, P=0.001; r=-0.216, P=0.013; r=-0.259, P=0.003; r=-0.240, P=0.005, respectively). The age of onset of current depression episode was negatively correlated with Digit Span Test (r=-0.219, P=0.011). Disease duration was negatively correlated with Digit Span Test (r=0.185, P=0.033).

Conclusion C-BCT has good reliability and validity for assessing the cognitive level of patients with depression. Patients with higher education levels perform better overall, with faster processing speed, attention, working memory, and executive function. Employed patients have better processing speed than unemployed patients. The severity of depression, as measured by HAMD-17, HAMA, and BPRS factors representing psychotic symptoms, is not related to cognitive performance. The longitudinal clinical features of patients' illnesses (longer disease duration, more previous hospitalizations, older age at onset of this episode, longer time from first episode to first treatment) all represent poor cognitive performance.

伏硫西汀在神经突密度正常的重性抑郁障碍患者中恢复 mGLUR5 可用性

刘帮杉[1] 邓傲骞[1] 董楚宁[1] 张倩倩[1] 陈文涛[1] 周廉博[1] 欧雯雯[1] 柳进[1] 王小平[1] 黄艺耘[2] 鞠玉朦[1] 王云华[1] 马晓伟[1] 张燕[1]
1.中南大学湘雅二医院
2.耶鲁大学 PET 中心

目的 临床前研究指出，代谢型谷氨酸受体 5（mGluR5）是重性抑郁障碍(MDD)的潜在治疗靶点。我们通过纵向[18F]FPEB-PET-NODDI 研究旨在探讨：(1) 伏硫西汀能否通过恢复 MDD 患者 mGLUR5 可用性来发挥抗抑郁作用。(2) 伏硫西汀恢复 mGluR5 可用性的效果是否依赖于正常神经突密度。

方法 我们从门诊随机招募了 25 名 MDD 患者和 21 名健康对照，其中 13 名患者完整接受了为期八周的伏硫西汀治疗并完成了随访。通过[18F]FPEB-PET 扫描和神经突取向分散和密度成像 (NODDI) 分别评估了基线与 8 周随访 mGluR5 可用性和神经突密度指数 (NDI)。我们使用 HAM-D 量表评估抑郁症状严重程度，并以 7 分作为划界将患者分为缓解者（n=6）和非缓解者（n=7）。

结果 在基线时，与健康对照组相比，MDD 患者大部分脑区 mGluR5 可用性降低。治疗后，在缓解者的前额叶和海马区域观察到 mGluR5 可用性显著增加，而在非缓解者中未观察到此现象。基线神经突密度指数（NDI）影响伏硫西汀治疗在背外侧前额叶(dlPFC)(P=0.022)、腹内侧前额叶(vmPFC)(P=0.024)和海马(P=0.021)中提高 mGluR5 可用性的效果。

结论 年轻成年 MDD 患者 mGluR5 可用性较低，伏硫西汀能够通过恢复 MDD 患者 mGLUR5 可用性来发挥抗抑郁作用，但治疗效果依赖于相对正常的神经突密度。

单次亚麻醉剂量氯胺酮/艾司氯胺酮静脉点滴快速治疗抑郁新技术研发与临床转化应用

胡永东* 王东 房捷欣 王恩聪 马可 李雨微
首都医科大学附属北京朝阳医院

目的 为解决目前抗抑郁治疗这两大关键局限：①抗抑郁剂起效延迟，无法快速缓解抑郁伴发的急性自杀风险；②20%-30%患者属于难治性抑郁。我们团队开展了“单次亚麻醉剂量氯胺酮/艾司氯胺酮静脉点滴快速治疗抑郁新技术”研发与临床转化应用。

方法 我们从 2013 年起，历时 10 年，开展“单次亚麻醉剂量氯胺酮/艾司氯胺酮静脉点滴快速治疗抑郁新技术”研发与与临床转化应用项目。2013 年起我们团队启动了国内首个氯胺酮治疗抑郁障碍的临床研究，代表性论文 2016 年发表在 Psychological Medicine，精神科 I 区杂志，影响因子 5.8 分，被引次数：96 次(截止 2023 年 4 月)。我们的代表性论文被中华精神科杂志在学术动态专栏介绍、被 Nature Reviews 杂志（影响因子 57 分）引用，肯定了我们研究的创新性，评价我们是国际首次采用：单次氯胺酮合并常规抗抑郁剂治疗抑郁障碍的有效性研究，这标志着我国在氯胺酮快速治疗抑郁障碍临床研究方面达到国际先进水平。该成果于 2020 年获批专利一项，2018、2020 年在北京朝阳医院获批 2 个新技术临床准入批件，2019 年中国医学论坛报对我们首例新技术开展进行了报道。2020 年获得朝阳医院 2019 年度技术创新奖二等奖。2021 年获得 2020 年度北京医学科技奖三等奖。2022 年荣获 2022 年第三届首都医学创新与转化成国展示与科技评价活动（优秀项目组）三等奖！

结果 该新技术在临床转化应用中总计完成 39 例，其中 24 例氯胺酮、15 例艾司氯胺酮。本新技术快速起效、总体上治疗 4 小时有效率达到 70%；临床治愈率显著提高， 4 周内总体临床治愈率（以任何一个时点 MADRS≤10 分为临床治愈标准）达到 83%，远远高于目前 30%-40%的临床治愈率。

结论 “单次亚麻醉剂量氯胺酮/艾司氯胺酮静脉点滴快速治疗抑郁新技术”具有快速、显著地缓解严重抑郁障碍伴发的急性自杀风险，它能在治疗后 2 小时就快速缓解自杀风险，同时能快速、显著地提高难治性抑郁治愈率。具有值得期待的临床应用前景。

Prevalence and Associated Factors of Obesity in Patients with Major Depressive Disorder at Different Age of Onset

刘小恩*
天津市安定医院

Objective Major depressive disorder (MDD) and obesity are two serious public health problems. Although there have been several research on both, there have few studies on differences in obesity among MDD patients at different ages of onset. The aim of this study was to assess prevalence and correlates of obesity in MDD patients at different ages of onset.

Methods A total of 1718 first-episode drug-naive MDD patients were recruited. MDD patients were divided into early adulthood onset (EAO, =45 years) subgroups according to their age of onset. We assessed patients' symptoms using the 17-item Hamilton Depression Rating Scale (HAMD-17), the Hamilton Anxiety Scale (HAMA), and Positive and Negative Syndrome Scale (PANSS) positive subscale. We evaluated baseline parameters such as: body mass index (BMI), systolic and diastolic blood, and the hematological biochemical parameters, with the aim to investigate whether the parameters could be associated with an increased risk of weight gain.

Results The percentage of overweight and obesity patients with MDD in EAO group was 54.4% and 4.1%, respectively, and the percentage of overweight and obesity patients with MDD in MAO group was 60.4% and 2.8%, respectively. MDD patients with MAO had a longer disease duration and higher HAMD score, HAMA score, PANSS positive subscale score, as well as thyroid stimulating hormone (TSH), anti-thyroglobulin (TgAb), fasting blood glucose (FBG), total cholesterol (TC), low-density lipoprotein cholesterol (LDL-C), systolic and diastolic blood pressures (SBP and DBP) levels. However, there was no significant difference in BMI between the two groups. In the EAO group, statistically significant differences were found among normal weight group, overweight group and obesity group in duration of illness, age of onset, TSH, TgAb, thyroid peroxidase antibody (TPOAb), free thyroxine (FT4), TC, triglycerides (TG), SBP and DBP. The TSH, TgTb and SBP were the risk factors for weight gain. In the MAO group, statistically significant differences were found among normal weight group, overweight group and obesity group in TSH and FBG. The two indicators were the risk factors for weight gain.

Conclusion There were no significant differences in the weight of MDD patients at different age of onset, while the risk factors for weight gain were different.

Association between Psychotic Symptoms and Abnormal Lipid Metabolism in Young, Drug-Na?ve Patients with First-Episode Major Depressive Disorder

李泊萱[1] 张向阳[2,3]
1.Tianjin Anding Hospital, Tianjin, China
2.CAS Key Laboratory of Mental Health, Institute of Psychology, Chinese Academy of Sciences, Beijing, China
3.Department of Psychology, University of Chinese Academy of Sciences, Beijing, China

Objective Major depressive disorder (MDD) patients exhibit abnormalities in lipid metabolism, but the relationship between these abnormalities and the risk of psychotic symptoms remains uncertain. This study aimed to compare lipid metabolism disorders in young patients with psychotic major depressive disorder (PMD) and non-psychotic major depressive disorder (NPMD), explore risk factors for symptom onset, and provide important implications for therapeutic intervention.

Methods A total of 1047 outpatients with first-episode and drug-na?ve (FEDN) MDD, presenting abnormal lipid metabolism, were enrolled in this study. Sociodemographic information, clinical data, and lipid parameters were collected. The Hamilton Depression Rating Scale assessed depressive symptoms, while the positive symptom subscale of the Positive and Negative Syndrome Scale evaluated psychotic symptoms.

Results Compared to the NPMD group, the PMD group exhibited higher total cholesterol (TC) levels (5.73±1.12 mmol/L vs. 5.38±1.07 mmol/L, t=-3.150, P=0.002). Logistic regression analysis revealed a significant association between psychotic symptoms and TC levels in MDD patients with abnormal lipid metabolism (OR=1.330, 95% CI=1.055-1.678, P=0.016).

Conclusion This study demonstrates that PMD patients have elevated TC levels. Regular evaluation of blood lipid levels is crucial for preventing psychotic symptoms in young individuals with MDD. Furthermore, the findings highlight the potential of serological markers in assessing the risk of psychotic symptoms in early-stage MDD patients.

IL-1ra Treatment Prevents Chronic Social Defeat Stress-induced Depression-like Behaviors and Glutamatergic Dysfunction Via The Upregulation of CREB-BDNF

3.武汉市传染病医院
4.武汉大学中南医院

Objective Proinflammatory cytokines IL-1β has been proposed to be a key mediator in the pathophysiology of mood-related disorders. However, the IL-1 receptor antagonist (IL-1ra) is a natural antagonist of IL-1 and plays a key role in the regulation of IL-1-mediated inflammation, the effects of IL-1ra in stress-induced depression has not been well elucidated.

Methods Chronic social defeat stress (CSDS) and lipopolysaccharide (LPS) were used to investigate the effects of IL-1ra. ELISA kit and qPCR were used to detect IL-1ra levels. Golgi staining and electrophysiological recordings were used to investigate glutamatergic neurotransmission in the hippocampus. Immunofluorescence and western blotting were used to analyze CREB-BDNF pathway and synaptic proteins.

Results Serum levels of IL-1ra increased significantly in two animal models of depression, and there was a significant correlation between serum IL-1ra levels and depression-like behaviors. Both CSDS and LPS induced the imbalance of IL-1ra and IL-1β in the hippocampus. Furthermore, chronic intracerebroventricular (i.c.v.) infusion of IL-1ra not only blocked CSDS-induced depression-like behaviors, but also alleviated CSDS-induced decrease in dendritic spine density and impairments in AMPARs-mediated neurotransmission. Finally, IL-1ra treatment produces antidepressant-like effects through the activation of CREB-BDNF in the hippocampus.

Conclusion Our study suggests that the imbalance of IL-1ra and IL-1β reduces the expression of the CREB-BDNF pathway in the hippocampus, which dysregulates AMPARs-mediated neurotransmission, ultimately leading to depression-like behaviors. IL-1ra could be a new potential candidate for the treatment of mood disorders.

川金解郁汤对慢性应激诱导抑郁大鼠模型的神经保护作用

郑欣宇[1,2] 肖江[1,2] 孙文[1,2] 周绍明[1,2] 肖剑英[1,2] 刘芳[1,2] 杨萍[1,2]
1.湖南省脑科医院
2.CSP 抑郁障碍研究协作组

目的 研究川金解郁汤对慢性不可预知性应激诱导的抑郁大鼠模型的神经保护作用。

方法 48 只成年雄性健康 SD 大鼠，随机选取对照组 12 只，其余大鼠建立 CUMS 抑郁模型。将建模成功后大鼠随机分成 3 组：CUMS 组、氟西汀组和川金解郁汤组；通过旷场实验、糖水偏爱实验，测定大鼠抑郁水平；RT-PCR 检测脑源性神经营养因子、酪氨酸蛋白激酶受体 B、环磷酸腺苷反应元件结合蛋白 mRNA 在海马齿状回的表达量，免疫荧光检测 BDNF 与神经元核心抗原的表达，Westernblotting 检测胶质纤维酸性蛋白水平。

结果 造模后，CUMS 组、氟西汀组、川金解郁

汤组的糖水消耗、糖水偏爱、垂直运动及水平运动结果明显低于对照组（P＜0.01）；干预后，CUMS 组以上指标低于对照组（P＜0.01），氟西汀组与川金解郁汤组以上指标均高于 CUMS 组（P＜0.01 或＜0.05），但低于对照组（P＜0.01 或＜0.05）。RT-PCR 结果显示，与对照组相比，CUMS 组、氟西汀组、川金解郁汤组的 BDNF、Trkb、CREB mRNA 均显著降低（P＜0.01）。与 CUMS 组相比，氟西汀组与川金解郁汤组的上述指标均显著升高（P＜0.01）。免疫荧光结果显示，与对照组相比，CUMS 组的 BDNF、NeuN 表达量都显著下降（P＜0.01）；与 CUMS 组相比，氟西汀组、川金解郁汤组以上指标升高（P＜0.01 或 P＜0.05），且川金解郁汤所有指标及氟西汀组 NeuN 表达量低于对照组（P＜0.01 或 P＜0.05）。大鼠海马齿状回 GFAP 蛋白结果显示，与对照组相比，CUMS 组的 GFAP 蛋白表达下降（P＜0.01）。与 CUMS 组相比，氟西汀组 GFAP 蛋白表达升高（P＜0.05）。

结论 川金解郁汤可改善大鼠抑郁行为学指标，提高海马齿状回 BDNF、TrkB、CREB 及 NeuN 表达。提示川金解郁汤可能通过 BDNF/TrkB/CREB 通路发挥神经保护作用改善 CUMS 大鼠的抑郁症状。

Plasma Apo-E Mediated Suicidality and Corticospinal Tract Abnormalities in Patients with Major Depressive Disorder

雷小霞 张晨*
上海市精神卫生中心

Objective This study aims to explore the link between Apo-E, brain white matter, and suicide in patients with major depressive disorder (MDD) to investigate the potential neuroimmune mechanisms of Apo-E that may lead to suicide.

Methods Thirty-nine patients with MDD (22 patients with suicidality) and 57 age, sex, and education-matched healthy controls (HCs) participated in this study, provided plasma Apo-E samples, and underwent diffusion tensor imaging (DTI) scans. Plasma Apo-E levels and white matter microstructure were analyzed among the MDD with suicidality, MDD without suicidality, and HC groups using analysis of variance (ANOVA) with post-hoc Bonferroni correction and tract-based spatial statistics (TBSS) with threshold-free cluster enhancement (TFCE) correction. Mediation analysis investigated the relationship between Apo-E, brain white matter, and suicidality in MDD.

Results The MDD with suicidality subgroup showed significantly higher total depressive and suicide scores, a longer disease course, and lower plasma Apo-E levels than the nonsuicide MDD subgroup. TBSS analyses revealed that the MDD nonsuicide subgroup showed significantly increased mean diffusivity (MD) in the left corticospinal tract and the body of the left corpus callosum, as well as significantly increased axial diffusivity (AD) in the left anterior corona radiata and the right posterior thalamic radiation, compared to the MDD with suicidality subgroup. The main finding was that the increased MD of the left corticospinal tract contributed to the elevated suicide score, with Apo-E mediating the effect.

Conclusion Apo-E's mediating role between the left corticospinal tract and the suicide factor reveals the neuroimmune mechanism of suicide in MDD.

关键字：Major depressive disorder, Apo-E, suicidality, tract-based spatial statistics, mediation analysis

老年性耳聋认知储备失调影响阈下抑郁的静息态脑电网络机制研究

高敏倩[1,2] 杨海弟[2] 贾艳滨[1]
1.暨南大学附属第一医院(广州华侨医院)
2.中山大学附属第二医院

目的 采用静息态脑电 EEG 明确老年性耳聋认知储备失调对抑郁情绪影响的中枢网络机制。

方法 对老年性耳聋伴阈下抑郁患者（n=12）、老年性耳聋不伴抑郁症状患者（n=18）进行听力学评估（纯音测听）、认知功能评估（蒙特利尔认知评估量表 MoCA 量表）、抑郁症状评估（汉密顿抑郁量表 HAMD-24）、睡眠质量评估（PSQI）、静息态脑电 EEG，并分别进行静息态脑电 EEG 的分析，包括溯源分析、功能连接、聚类系数、特征路径长度。

结果 老年性耳聋伴阈下抑郁组的平均 HAMD-24 为 10.50±2.39 分，老年性耳聋不伴抑郁症状组的平均 HAMD-24 为 3.72±1.67 分（t=9.15，P=0.000）。老年性耳聋伴阈下抑郁组的 MoCA 为 19.05±3.94 分，老年性耳聋不伴抑郁症状组的 MoCA 为 22.50±2.57 分（t=-2.53，P=0.017）。老年性耳聋伴阈下抑郁组的 PSQI 为 12.58±3.06 分，老年性耳聋不伴抑郁症状组的 PSQI 为 8.83±3.71 分（t=2.90，P=0.007）。两组间的平均 HAMD-24、MoCA、PSQI 差异均具有统计学意义（P＜0.05），其中老年性耳聋不伴抑郁症状组的命名能力、延迟回忆能力明显高于老年性耳聋伴阈下抑郁组。相比起老年性耳聋不伴抑郁组，全脑溯源分析提示老年性耳聋伴阈下抑郁组的梭状回及枕叶明显激活。不同频段在不同皮层间也出现了异常激活：包括后扣带回及边缘叶（Delta 波）、海马旁回及边缘叶（Theta 波）、前扣带回及边缘叶（Alpha 波）、额上回及额叶（Beta 波）、颞下回及边缘叶（Gamma 波）。老年性耳聋伴阈下抑郁组患者不同频段均出现异常增多的功能连接，尤其是高频段（P＜0.05）。老年性耳聋伴阈下抑郁组的聚类系数、全局效率、局部效率异常增强，特征路径长度明显下降（P＜0.05）。

结论 老年性耳聋伴阈下抑郁患者的睡眠质量和认知功能均下降，脑功能连接及脑网络异常激活，更容易出现认知储备失调。

关键字：阈下抑郁；老年性耳聋；静息态脑电；认知储备失调

Effects of Gender and BMI Index on The Pharmacokinetics of Fluvoxamine: A Population Pharmacokinetic Model in Chinese Psychiatric Patients

杨烨 张孜 戴丽静 郭徵豪 甘桐营 卢浩扬 倪晓佳 张明 尚德为 温预关*
广州医科大学附属脑科医院

Objective To establish a population pharmacokinetic model of fluvoxamine in Chinese psychiatric patients, quantitatively investigate the covariates affecting the pharmacokinetics of fluvoxamine, and compare and analyze the plasma concentration with the treatment window of fluvoxamine through the simulation of blood drug concentration through covariates, so as to provide a reference for the individualized use of clinical fluvoxamine.

Methods Retrospectively collected the data of patients who received therapeutic drug monitoring for fluvoxamine from May 2020 to October 2022 in Brain Hospital Affiliated to Guangzhou Medical University, including demographic data, combined medication and liver and kidney function indicators. nonlinear mixed-effects modeling (NONMEM) was used to establish a population pharmacokinetic （PPK）model of fluvoxamine，using a goodness-of-fit plot, normalized prediction distribution error, and bootstrapping method (1000 times) to validate the model , and using simulation to quantify the effect of covariates on the pharmacokinetics of fluvoxamine

Results A first-order conditional estimation with interaction (FOCE I) was used to describe the PFK model of fluvoxamine，The PPK model included 583 fluvoxamine plasma concentration data from 131 patients, Final model founded that Gender and body mass index (BMI) were significant covariates in apparent clearance of fluvoxamine (CL/F). The final model is CL/F=71.7×[1+0.0466×(BMI-21.16)]×(1-0.203×SEX) (female: SEX=1, male: SEX=0). Fluvoxamine (CL/F) was positively correlated with BMI index, and fluvoxamine CL/F in women was significantly lower than that in men. The model-based simulation results showed that the recommended max dose of fluvoxamine may reach up to 200mg/d for patients with low BMI index (BMI=14), 300 mg/d for those with normal BMI index (BMI=21), and 400 mg/d for those with high BMI index (BMI: 30~42), respectively.

Conclusion A population pharmacokinetic model of fluvoxamine was successfully established for Chinese groups, and sex and BMI index were found to be covariates affecting the individual differences of patients with mental disorders in China, and the maximum dose was recommended for different BMI populations.

关键字：Fluvoxamine; Population pharmacokinetics; Therapeutic drug monitoring; Dosage selection

以创伤为中心的认知行为疗法（TF-CBT）对儿童青少年创伤后应激障碍疗效的荟萃分析

孙一帆 李晓白*
中国医科大学附属第一医院

目的 作为一种手册化心理治疗方法，目前已有一定数量的研究探究了以创伤为中心的认知行为疗法（Trauma-focused cognitive behavioral therapy ，TF-CBT）对于儿童青少年创伤后应激障碍（post-traumatic stress disorder ，PTSD）的疗效，但各个研究结果之间不一致性尚存。因此，本研究应用系统文献检索以及荟萃分析方法，通过与非积极对照措施相比较，进一步评价该疗法的疗效和依从性。

方法 从 Pubmed、Embase、Cochrane Library、PsycINFO、web of science 数据库中检索 2022 年 11 月 31 日之前关于 TF-CBT 治疗儿童青少年 PTSD 的相关随机对照试验。按照预先设定好的纳入排除标准进一步筛选符合标准的研究，随后对纳入研究进行质量评价并提取所需要的数据和信息, 通过 Review Manager 5.4 软件完成统计分析得出结果。最后，通过 Stata17.0 软件完成 Egger's 检验对主要结果的发表偏倚进行定量检测。

结果 本研究共纳入 14 篇随机对照试验，总计 2007 例受试者。结果显示，TF-CBT 对于儿童青少年 PTSD 的总体疗效显著优于非积极对照措施（SMD＝-0.95，95%CI＝[-1.24，-0.66]，P＜0.00001）。随后关于侵入、回避、警觉性增高这三个亚症状群以及抑郁和焦虑症状的疗效比较结果也同样支持 TF-CBT 的显著治疗优势（侵入：SMD＝-0.53，95%CI＝[-0.72，-0.34]，P＜0.00001。回避：SMD＝-0.53，95%CI＝[-0.70，-0.37]，P＜0.00001。警觉性增高：SMD＝-0.64，95%CI＝[-1.00，-0.28]，P=0.008。抑郁：SMD＝-0.45，95%CI＝[-0.61，-0.30]，P＜0.00001。焦虑：SMD＝-0.31，95%CI＝[-0.48，-0.15]，P=0.0001）。 关于依从性，TF-CBT 与所有非积极对照措施相比， 合并效应量结果未见统计学差异（RR＝1.08, 95%CI＝[0.81, 1.42] , P =0.60）。

结论 TF-CBT 可显著改善儿童青少年创伤后应激障碍患者的典型临床症状，并能在一定程度上缓解他们的抑郁和焦虑情绪。

关键字：认知行为疗法；儿童青少年；创伤后应激障碍；荟萃分析

抗抑郁药物疗效与胆固醇代谢及奖赏环路的相关性研究

曲天宇[1] 张玲[1] 孙作厘[1] 周媛[2] 刘瑞[1] 王刚[1]
1.首都医科大学附属北京安定医院，国家精神疾病医学中心，国家精神心理疾病临床医学研究中心，精神疾病诊断与治疗北京市重点实验室，100088 北京市西城区德外安康胡同 5 号
2.中国科学院心理研究所

目的 验证 24S-OHC 与抑郁症状变化的关系；检验 24S-OHC 与前额叶皮质-缰核功能连接的关系；探索 24S-OHC、27-OHC 与奖赏环路功能连接的关系。

方法 纳入 2018 年 7 月至 2022 年 4 月就诊于北京安定医院门诊的抑郁症患者。抑郁症患者在入组前至少 14 天内未服用任何抗抑郁药物，并接受单一抗抑郁药艾司西酞普兰治疗 12 周，在治疗前后进行随访，采用 HAMD-17 量表评估抑郁症状，并采集血液样本。采用液相色谱-质谱联用的方法检测抑郁症患者治疗前后血浆 24S-OHC、27-OHC 水平。对部分患者采用静息态 fMRI 检查评估奖赏环路的功能连接状况。纳入与患者年龄和性别匹配的健康对照，采集外周血进行血浆羟基胆固醇水平检测和静息态 fMRI 检查。基于 SPSS24.0，分别采用 T 检验、卡方检验、非参数检验等方法分析抑郁症患者羟基胆固醇代谢和腹内侧前额叶皮质-缰核（vmPFC-Hb）功能连接与健康对照的差异及治疗前后的变化；基于 MATLAB R2018b 软件选取奖赏环路内部感兴趣功能连接；采用相关性分析方法，探索血浆羟基胆固醇水平、功能连接及抗抑郁疗效之间的相关性。

结果 本研究共纳入 96 例抑郁症患者和 96 例健康对照，在基线期均完成血样采集，其中 58 例抑郁症患者和 56 例健康对照完成基线 fMRI 扫描；在 12 周急性期治疗结束后，84 例患者完成了随访，其中 60 例患者检测了血浆羟基胆固醇水平，41 例患者完成了 fMRI 扫描。研究发现：（1）抑郁症患者治疗前后 24S-OHC 水平降低且与 HAMD-17 减分正相关，治疗有效组 24S-OHC 在治疗后显著降低，而 27-OHC 未发现与疗效的相关性；（2）抑郁症患者治疗前后 vmPFC-Hb 的功能连接变化与 HAMD-17 减分和 24S-OHC、27-OHC 变化没有显著的相关性；（3）抑郁症患者治疗前后腹内侧前额叶皮质-左侧丘脑（vmPFC-LT）的功能连接变化与 27-OHC 的变化显著负相关。

结论 抑郁症患者存在 24S-OHC 代谢异常及 vmPFC-LT、vmPFC-left Hb 功能改变。24S-OHC 与抗抑郁疗效有关，且患者症状的改善与 24S-OHC 的变化正相关；此外，治疗后患者 vmPFC-LT 功能连接与 27-OHC 的变化负相关。这说明，胆固醇代谢、奖赏环路均参与到抑郁症进程中，并存在一定的相互关系，但相关机制仍需要进一步探索。

2.东南大学医学院
3.东南大学计算机学院
4.连云港第四人民医院

目的 本研究结合机器学习的分析方法，建立基于静息态脑功能影像学和 P11 基因 DNA 甲基化的多维数据的特征模型，以预测抑郁症患者抗抑郁药治疗的早期疗效。

方法 纳入符合《精神障碍诊断与统计手册》第 4 版（DSM-IV）修订版诊断标准的抑郁症患者 98 例。根据抗抑郁药治疗 2 周后 HAMD-17 项量表评分的减分率是否≥50%，将患者分为有效组 51 例，无效组 47 例。在基线期，利用 Illumina HiSeq 平台检测外周血标本中 P11 基因 74 个 CpG 位点的甲基化水平；通过静息态功能磁共振（rs-fMRI）技术检测 116 个脑区的低频振幅（ALFF）、局部一致性（ReHo）和各脑区间静息态功能连接（FC）特征，利用最小绝对收缩和选择算子（LASSO）分析方法，对数据进行特征降维和特征选择。以筛选后的 P11 基因 DNA 甲基化指标、脑功能指标、临床特征的不同组合为特征，采用 4 种典型的机器学习方法建立径向核支持向量机（SVM）、随机森林（RF）、朴素贝叶斯（NB）和 logistic 回归（LR）的疗效预测模型。采用了留一交叉验证法，应用受试者工作特征曲线下面积（AUC）来评估预测模型的性能。

结果 基于 ALFF、ReHo、FC、P11 基因 DNA 甲基化和临床特征的多维特征组成的 SVM 模型表现最优，其预测准确率为 95.92%，AUC 为 0.9967，优于 RF、NB 和 LR 模型。基于 rs-fMRI、DNA 甲基化和临床特征的多维数据集的预测准确性，高于仅基于 rs-fMRI 和临床特征，或仅基于 DNA 甲基化和临床特征的预测准确性。

结论 结合脑功能影像、DNA 甲基化和临床特征的多维特征可以预测抑郁症抗抑郁药治疗的早期疗效。

性激素结合球蛋白与重度抑郁症之间的因果关系：双相孟德尔随机化研究

杜志强 孙逸凡 郭帅熠 周勤 蒋颖 沈远 周振和 朱浩浩*
无锡市精神卫生中心

目的 本研究运用两样本孟德尔随机化(mendelian randomization,MR)研究来探讨性激素结合球蛋白与重度抑郁症之间的因果关系。

方法 本研究使用了欧洲人群的全基因组关联分析（Genome-wide Association Study，GWAS）数据。我们使用了包含 214989 例女性性激素结合球蛋白样本，185221 例男性性激素结合球蛋白样本以及 500199 例重度抑郁症样本的数据，通过孟德尔随机化研究，使用了倒数方差加权法（inverse variance weighted, IVW）、Weighted median、Weighted mode 和 MR Egger 等方法来评估性激素结合球蛋白与重度抑郁症之间的双向因果关系。

结果 女性性激素结合球蛋白与重度抑郁症之间

存在因果关系，这种关系是正相关的。使用 Weighted median 方法，优势比（Odds Ratio，OR）为 1.056（95%CI：1.005-1.109，P=0.031）。使用 Weighted mode 方法，优势比为 1.067（95%CI：1.012-1.126，P=0.021）。这表明，女性性激素结合球蛋白水平越高，患有重度抑郁症的风险就越高。与此同时，男性性激素结合球蛋白对重度抑郁症的影响并不显著，P 值大于 0.05，无统计学意义。然而，重度抑郁症与男性性激素结合球蛋白之间存在因果关系，这种关系是负相关的。使用倒数方差加权法，优势比为 0.954（95%CI：0.916-0.993，P=0.023）。这表明，男性患有重度抑郁症，可能会导致性激素结合球蛋白的水平降低。

结论 女性性激素结合球蛋白与重度抑郁症发生风险呈正相关，这表明女性 SHBG 水平越高，重度抑郁症发生风险越高；而重度抑郁症与男性性激素结合球蛋白呈负相关，这表明重度抑郁症会导致男性 SHBG 水平降低。这为我们提供了新的思路，女性应加强性激素结合球蛋白的监测，以降低重度抑郁症的发生；同时对于男性重度抑郁症患者，我们建议监测性激素结合球蛋白，这可能对于预防和治疗男性重度抑郁症具有重要意义。我们的发现为进一步阐明性激素结合球蛋白与抑郁症之间的关系，为临床治疗提供了新的思考方向和潜在靶点。

关键字：性激素结合球蛋白；重度抑郁症；因果关系；孟德尔随机化；全基因组关联分析

首发和复发重度抑郁症患者脑干容积的改变

陈越 陆邵佳*
浙江大学医学院附属第一医院

目的 迄今为止，对首发抑郁和复发抑郁患者的脑干形态学变化的神经影像学研究有限。本研究旨在研究脑干区域的体积变化与发作次数和疾病持续时间的关系。

方法 共有 111 人接受了 T1 加权结构磁共振成像扫描，包括 36 名首发抑郁患者、25 名复发抑郁患者和 50 名健康对照组。使用贝叶斯分割算法来分析每个脑干区域的体积，包括延髓、脑桥、中脑和小脑上脚，以及整个脑干体积。运用方差分析比较三组之间脑区体积差异，并两两进行组间比较。随后相关分析以确定区域体积和临床特征之间的关联。

结果 方差分析显示，三组患者的脑干体积在脑桥、中脑、小脑上脚和整个脑干中存在明显差异（F=3.996~5.886，矫正后 P=0.015~0.028）。与健康对照相比，两组抑郁患者的脑桥和整个脑干的体积都减少了（P=0.002~0.034），然而，只有首发抑郁组显示中脑的体积明显减少（P=0.003）。特别的是，复发组与首发组（p=0.021）和健康对照（p=0.008）相比，小脑上脚体积明显减少。相关分析显示，小脑上脚体积与抑郁患者的发作次数（r=-0.36，p<0.01）和病程（r=-0.28，p=0.035）呈负相关。

结论 本研究结果提供了涉及抑郁症的脑干容积减少的病理生理学证据，特别是小脑上脚的容积减少可能代表抑郁复发的神经生物学标志。需要进一步的研究来证实我们的观察，加深我们对抑郁症复发的神经机制的理解。

忧郁型抑郁症和焦虑型抑郁症的肠道菌群物种组成及代谢通路差异

程荟菱 张玲*
首都医科大学附属北京安定医院

目的 探究忧郁型抑郁症和焦虑型抑郁症的肠道菌群组成特征及功能代谢的改变。

方法 选取 2017 年 2 月至 2019 年 7 月就诊于首都医科大学附属北京安定医院门诊及病房的抑郁症患者 215 例，从中筛选出符合忧郁组患者 23 例，焦虑组患者 43 例，同时符合忧郁型抑郁症和焦虑型抑郁症诊断（共病组）患者 45 例。采用 16S 测序及宏基因组测序方法，对不同抑郁亚型的肠道菌群多样性、物种组成及功能通路进行分析，并建立基于随机森林的分类方法识别肠道菌群作为不同抑郁亚型的生物标志物。临床数据均采用 SPSS Statistics 26.0 进行统计学分析，对年龄、病程、量表分值等计量资料采用方差分析或秩和检验，对性别等计数资料比较采用卡方检验。另外，使用 R 语言对肠道菌群进行分析，3 组比较采用 Kruskal–Wallis 检验，并使用 Benjamini - Hochberg 对 P 值进行校正，P 值（校正）＜0. 05 为差异有统计学意义。肠道菌群之间或肠道菌群与临床数据的相关性分析用 Pearson 相关分析(正态分布)或 Spearman 相关分析(非正态分布)。

结果 1、焦虑组与忧郁组在 Alpha 多样性指标的差异有统计学意义。2、3 组抑郁亚型的肠道菌群组成有明显差异，其中，焦虑组和忧郁组之间存在较多的差异菌群。忧郁组在毛螺菌科、草酸杆菌科、粪杆菌属、罗氏菌属、毛螺菌属、梭状链杆菌属、芽殖菌属、拟杆菌属、草酸杆菌属、霍尔德曼菌属、食蔗糖梭状链杆菌、伶俐粪球菌、普氏栖粪杆菌、挑剔真杆菌的丰度表达增加，而焦虑组中龋齿罗氏菌、口腔放线菌、变异链球菌的丰富上调。另外，相较于焦虑组，共病组在毛螺菌科、多尔氏菌属、芽殖菌属、伶俐粪球菌富集。3、在代谢通路上，焦虑组富集的通路较少，忧郁组在泛酸和辅酶 A 生物合成、聚酮糖单元生物合成等生物合成途径相对富集，而共病组在 ABC 转运蛋白、糖、多元醇、脂质转运系统富集。4、在功能模块层面，焦虑组中富集的功能模块较少，忧郁组在醋酸盐合成、甘油三酯降解及一氧化氮合成等功能模块富集，而共病组在谷氨酸降解等模块富集。

结论 不同抑郁亚型的肠道菌群组成和功能代谢方面存在明显差异。忧郁型抑郁症中产丁酸菌和孢子形成菌显著富集，焦虑组中口腔菌显著富集而丁酸菌明显减少，另外，共病组中肠道菌群的组成并非是忧郁

组与焦虑组的菌群总和，而具有自身的独特性。此外，肠道菌群还可能通过功能代谢来影响抑郁亚型。

关键字：忧郁型抑郁症、焦虑型抑郁症、肠道菌群、功能代谢

Does Baseline Functioning Predict Treatment Outcomes In First-episode, Drug-na?ve Patients With Major Depressive Disorder?

焦清艳 张健 孙霞 张勇*
天津市安定医院

Objective Major depressive disorder (MDD) is associated with worse functioning. We aims to examine the association between baseline functioning and treatment outcome and to highlight the predictors of treatment outcome in MDD with first-episode, drug-na?ve (FED) patients.

Methods Ninety FED patients were recruited consecutively and evaluated using the 17-item Hamilton Depression Rating Scale (HDRS-17), the 14-item Hamilton Anxiety Scale (HAMA-14), the Functioning Assessment Short Test (FAST) and the MATRICS Consensus Cognitive Battery (MCCB) both at baseline and week 8.

Results Eighty-four FED patients completed final assessments. Our findings showed FED remitters had significantly lower scores of baseline HDRS-17 compared with non-remitters [24.1(4.8) vs 28.9 (5.2), t = -4.34, p< 0.001]. Further, FED remitters had significantly lower scores in autonomy [2.5 (2.0) vs 3.7 (2.4), t = -2.48, p = 0.015], but higher T scores in CPT compared with FED non-remitters [45.0 (11.1) vs 39.0 (11.4), t = 2.41, p = 0.018]. We also found treatment outcomes associated significantly with total FAST and most MCCB domain scores, even after controlling for baseline HDRS-17, HAMA-14 and demographic variables (p's < 0.05). Additionally, Cognitive domain, BACS-SC, occupational domain, BVMT-R and MSCEI may predict treatment response, while baseline HDRS-17, CPT and autonomy domain may predict remission in FED patients (p's < 0.05).

Conclusions This study firstly demonstrated a significant association between functioning and treatment outcomes in FED patients. Further, better baseline cognitive functioning, occupational functioning, less severe depression and greater self-management in particular contribute to treatment outcomes of FED patients.

The Up-to-down Dynamic Change Trajectory of Regional Gray Matter Volume after Electroconvulsive Therapy in Depression: A Systematic Review of Structural MRI Studies

Xiuli Wang[1], Bochao Cheng[2]
1.the Fourth People's Hospital of Chengdu
2.West China Second University Hospital of Sichuan University

Objective : Neuroimaging research has indicated gray matter volume (GMV) changes in the cortical-subcortical regions after electroconvulsive therapy (ECT) in depression, with considerable inconsistency across different time points among studies. By synthesizing longitudinal structural MRI studies before and after an index ECT course, this review aimed to explore longitudinal regional GMV changes induced by ECT, the association of these changes with depressive symptomatology and ECT-related parameters, and pre-treatment neurobiomarker predictive of response to ECT in depression.

Methods After a systematic database research on PubMed, Embase, Web of Science and Cochrane Library, a systematic review was conducted to investigate the longitudinal (short-term, long-term and medium-term) GMV changes in the cortical-subcortical regions after an ECT-index series in patients with current depressive episodes by synthesizing longitudinal structural MRI (T1-weighted imaging) studies.

Results Thirty-four studies meeting the inclusion criteria were included in this review. Short-term GMV increases were observed in the ACC, temporal regions, bilateral hippocampi and amygdala, and striatum within 14 days after an index ECT course compared to pretreatment values in depression in overwhelming studies. Bidirectional (increase or no change) long-term GMV changes were observed over 2 weeks after an index ECT course in depression, together with inconclusive intermediate effects from 2 weeks to more than 2 weeks after an index ECT course. Across different time points after an index ECT course the regional GMV changes were not necessarily linked to the alterations/improvement of depressive symptoms in depression in most studies included. The ECT-induced GMV changes might be specifically observed in the stimulated hemisphere(s), with tending to not be significantly affected by the number of ECT sessions. The pretreatment small bilateral hippocampus and partial hippocampal subfields may be a predictive biomarker for antidepressant response to ECT in depression. Pretreatment ACC, bilateral hippocampus and partial hippocampal subfields, and amygdala may be predictive biomarkers for antidepressant response to ECT in depression.

Conclusions This review suggested up- and down dynamic neurobiological trajectory of regional GMV changes in the cortico-limbic regions mainly in ACC, temporal, hippocampus and amygdala regions and striatum over time after an index ECT course in patients with depression, with an inconclusive association between these GMV changes and the improvement of depressive symptoms after ECT sessions. The ECT-induced neurobiological effects may be ipsilateral to the stimulated side(s) in depression. The pretreatment small bilateral hippocampus and partial hippocampal subfields may be an early predictor of clinical response to ECT in depression.

Neural Substrate of Anhedonia in Major Depressive Disorder.

Robin Shao* Xuanhao Zhao Kangguang Lin*
广州医科大学附属脑科医院

Objective As a core symptom of Major Depressive Disorder (MDD), anhedonia is closely associated with functional abnormalities in the brain reward system. However, existing findings on functional activation differences during reward anticipation, processing and learning between MDD patients and healthy controls (HCs) are inconsistent. Therefore, this study conducted a quantitative synthesis of past findings in this field.

Methods Whole-brain voxel-based fMRI meta-analyses were conducted to identify brain regions exhibiting different reward-based functional activations in MDD patients compared to HCs. A total of 18 studies were included, with 11 studies related to reward anticipation, and 8 studies related to reward processing and learning analysis respectively. Jack-knife sensitivity and subgroup analyses were performed to test robustness of findings. Overlapping analysis was conducted to reveal regions which showed group differences in activity across multiple reward functions.

Results During reward anticipation, MDD patients demonstrated higher activities in the right cuneus, and lower activities in the bilateral visual cortex and lateral prefrontal cortex (LPFC), and the right thalamus compared to HCs. During reward processing, MDD patients displayed higher activities in the left temporal cortex, and decreased activities in the right caudate nucleus/nucleus accumbens, LPFC and dorsomedial prefrontal cortex (DMPFC) than controls. During reward learning, MDD patients exhibited higher activities in the bilateral cerebellum and left visual cortex, and decreased activities in the bilateral dorsal LPFC, caudate, left putamen, right thalamus, parahippocampal gyrus and visual cortex. A subset of the significant results was replicated in jack-knife and subgroup analyses, such as the lower orbitofrontal cortex activities to reward anticipation, and the higher left temporal activities to reward processing, in MDD patients compared HCs. Overlapping analysis revealed lower right thalamus activities in MDD patients to both reward anticipation and learning, and lower right caudate activities in MDD patients to both reward processing and learning.

Conclusion Our findings suggest that across different reward functions, MDD patients exhibited lower activities in prefrontal, striatal and limbic circuitries, but higher activities in regions implicated in visual and semantic processing, compared to controls. The hypoactivation in the thalamus and caudate, which are important components of the frontostriatal circuitries, may be key neural substrates underlying MDD-related anhedonia across reward functions.

最后通牒博弈任务中抑郁症患者规范适应的神经基础

高连禄[1,2] 金悦宁[1,2] 王赟[3] 何毓文[4] 张玲[3] 王刚[3] 周媛[1,2,3]
1.中国科学院心理研究所
2.中国科学院大学心理学系
3.首都医科大学附属北京安定医院
4.澳门大学

目的 抑郁症是一种常见的精神障碍，患者表现出持续而严重的社会功能受损。社会认知是决定社会功能的重要因素。越来越多研究者开始关注抑郁症的社会认知障碍。社会规范是适用于人际交往的行为准则，人们可以识别违反社会规范的行为并针对性地做出行为反应，体现出社会规范适应性。从社会规范适应角度来研究抑郁症的社会认知，为抑郁症研究提供了新思路。

方法 本研究从北京安定医院纳入了 52 名抑郁症患者（男/女：14/38，平均年龄 28.29 岁），通过广告招募了 49 名健康对照（男/女：20/29，平均年龄 26.92 岁）。所有被试作为回应者在磁共振数据扫描的同时完成了单次、匿名的最后通牒博弈任务。行为学数据分析除比较接受率的组间差异外，本研究参考既往健康被试的行为建模研究，进行了模型构建和模型选择，基于最优模型比较组间学习率等模型参数的差异，并提取最优模型中每个被试的学习率和规范预期偏差参数（norm prediction error, norm PE；即本轮任务中实际得到的金钱比例和当前的公平规范的差值）用于后续分析。影像学数据分析采用参数分析方法，获得受 norm PE 调节的脑区，分析其与学习率的关联；进一步提取显著关联脑区的参数分析值，使用 SPSS 宏程序 PROCESS 进行中介分析，探索脑功能活动是否介导了被试类型和学习率的关系。

结果 行为学数据分析发现，抑郁症患者在最后通牒博弈中的决策行为存在异常，表现为抑郁症患者的接受率显著低于健康对照($p < 0.001$)。进一步计算建模分析发现，抑郁症患者公平规范学习率显著低于健康对照（89% 最大密度区间: [-0.10, -0.02]）。脑功能影像学分析发现，内侧前额叶皮层、双侧额中回、右侧顶下小叶、左侧额下回、左侧前脑岛的脑活动受 norm PE 调节的程度与学习率负相关；中介分析发现，内侧前额叶皮层、左侧额中回、右侧顶下小叶和左侧前脑岛受 norm PE 调节的程度在被试类型和被试学习率间起中介作用。

结论 本研究通过计算建模分析揭示了抑郁症患者存在规范适应不良（学习率降低），同时揭示了内侧前额叶皮层、左侧额中回、右侧顶下小叶和左侧前脑岛等受规范预期偏差调节的脑功能活动在抑郁症患者公平规范适应不良中所起的作用。这些研究发现加深了对抑郁症患者社会功能不良的理解，为发展抑郁症患者社会功能的干预和康复措施提供了理论基础。

累积生态风险对青少年抑郁症患者抑郁症状的影响：未来期望的中介作用

江李梅[1] 侯雅婷[2] 孙俊伟[1,2,3]
1.山西医科大学人文社会科学学院
2.山西医科大学精神卫生学院
3.太原市精神病医院

目的 根据人类发展的生物生态学理论，青少年在发展过程中会受到家庭、学校、同伴等环境的影响，增加个体消极发展结果的特征被称为"生态风险因素"。研究发现环境中风险因素的累积效应，即风险因素累积越多会加重对个体的消极影响。青春期是发展的关键阶段，但同时也是抑郁症的高发阶段。因此本研究旨在探究累积生态风险对青少年抑郁症患者抑郁症状的影响，为暴露在多重风险环境中的青少年抑郁症患者的治疗及干预提供参考依据。

方法 纳入151名符合ICD-10诊断标准的抑郁障碍青少年（13~18 岁），以及 172 名健康对照青少年（13~18 岁）。采用以往研究中使用的累积生态风险问卷评估青少年抑郁障碍患者风险暴露；采用青少年未来期望量表评估青少年对特定事件在未来发生的可能性信念；使用抑郁自评量表评估抑郁症状。采用SPSS22.0进行统计分析，通过独立样本t检验、Pearson相关分析等方法探讨累积生态风险与抑郁症状的关系，采用 PROCESS 程序检验累积生态风险通过未来期望进而影响抑郁症状的中介效应。

结果 （1）临床青少年抑郁症患者累积生态风险暴露水平（115.66±23.89）显著高于健康对照青少年（98.68±24.96），p＜0. 001；临床青少年抑郁症患者的未来期望量表得分（43.52±14.77）显著低于健康对照青少年（51.65±16.37），p＜0.001；(2)累积生态风险与临床青少年抑郁症患者抑郁症状呈显著正相关（r=0.603，p＜0.01），与未来期望呈显著负相关（r=-0.478，p＜0.01）；未来期望与临床青少年抑郁症患者抑郁症状呈显著负相关（r=-0.578，p＜0.01）；（3）累积生态风险对临床青少年抑郁症患者抑郁症状有直接预测作用(β=0.423, p＜0.001）；青少年未来期望在累积生态风险对临床青少年抑郁症患者抑郁症状的影响中起中介作用，中介效应为 0.180，其 95% Bootstrap CI 为（0.109~0.261），占总效应的 29.85%。

结论 累积生态风险对青少年抑郁症患者抑郁水平具有预测作用，青少年未来期望在累积生态风险与青少年抑郁症患者抑郁症状间起部分中介作用。青少年抑郁症患者抑郁的治疗干预可通过提升积极未来期望从而减少抑郁症状。

关键字：累积生态风险；青少年；抑郁症；未来期望

青少年未来期望与抑郁症状的关系：多群组分析

江李梅[1] 孙俊伟[1,2]
1.山西医科大学人文社会科学学院
2.太原市精神病医院

目的 调查青少年未来期望、心理弹性与抑郁症状之间的关系，探究青少年未来期望与抑郁症状间的中介作用机制及临床青少年抑郁障碍患者与健康青少年的机制差异。

方法 纳入 92 名符合 ICD-10 诊断标准的抑郁障碍青少年（13~18 岁），以及 98 名健康对照青少年（13~18 岁）。使用青少年未来期望量表、中文版简版心理弹性量表以及抑郁自评量表评估抑郁症状。通过组间比较、相关分析等方法，探讨青少年未来期望与抑郁症状的关系以及采用 AMOS 构建中介模型以阐释青少年未来期望影响心理弹性进而导致抑郁症状的机制，并采用多群组分析阐释临床青少年抑郁障碍患者与健康青少年在未来期望影响心理弹性进而导致抑郁症状机制中的差异。

结果 （1）临床抑郁障碍青少年的未来期望量表及心理弹性水平得分显著低于健康对照青少年，P＜0.001；（2）相关分析显示，未来期望与抑郁症状呈显著负相关，与心理弹性存在显著正相关，心理弹性与抑郁症状呈显著负相关，P＜0.001。进一步中介模型表明，青少年未来期望对抑郁症状有显著负向作用；心理弹性能够部分中介青少年未来期望与抑郁症状的关系，占总效应的 30.74%；进一步多群组分析发现，相比健康青少年，青少年未来期望对临床青少年抑郁障碍患者的心理弹性预测作用较强。

结论 未来期望对临床青少年抑郁障碍患者和健康青少年的抑郁症状具有预测作用；心理弹性在未来期望与抑郁之间起中介作用；相较于健康青少年，临床青少年抑郁症患者未来期望对心理弹性的正向预测作用更强。认知免疫可能是抑郁症患者低心理弹性维持低期望的机制。干预认知免疫过程可作为心理治疗的目的，帮助临床青少年抑郁障碍患者从积极体验中获益进而提高心理弹性缓解抑郁症状。

伴有认知缺陷抑郁症患者的自杀意念和行为：中文版哥伦比亚自杀严重程度评定量表的验证和应用

纪雨佳 刘兴昌 郑舒琼 钟权 郑荣欣 黄今 尹红蕾*
南方医院

目的 本研究旨在验证中文版哥伦比亚自杀严重程度评定量表（C-SSRS）的信度和效度，并分析重度抑郁症患者（MDD）的自杀意念及行为与认知缺陷之间的关系。

方法 一项单中心队列研究招募了 456 名抑郁症患者以及 108 名健康对照。所有抑郁症患者都在基线

时完成了量表评估及神经认知测试，并进行了 3 个月的随访。探讨了 C-SSRS 的可靠性、有效性和对未来 SA 的预测。验证性因素分析验证了其结构。430 名抑郁症患者通过聚类分析并与健康对照比较分为轻度认知受损组（N=390）和严重认知受损组（N=40）。二元逻辑回归被用于分析自杀评分与认知受损程度的关系。

结果 与其他自杀意念和行为评估量表相比，中国 C-SSRS 具有良好的收敛效度和区分效度，在识别自杀行为方面具有较高的敏感性和特异性。自杀意念（SI）分量表随时间变化敏感。意念强度子量表表现出很强的内部一致性（Cronbach's alpha= 0.884/0.821）。SI 严重程度评分是后续自杀行为的最强预测指标（OR：2.663，95%CI：1.063，6.671）。较高的一生中最差点 C-SSRS 总分（OR：1.033，95% CI：1.008，1.058）、SI 严重程度评分（OR：1.281，95% CI：1.002，1.637）和 SI 强度评分（OR：1.066，95% CI：1.011，1.123）与严重认知障碍显著相关。单个 C-SSRS 项目的持续时间和制止因素也与认知障碍有关。

结论 中文版 C-SSRS 是抑郁症患者自杀意念和行为可靠和有效的评估工具。MDD 患者的自杀意念与认知功能障碍有关。这些发现为抑郁症患者的自杀预防提供了参考。

伏硫西汀治疗抑郁症患者前后脑功能差异的研究

宋正粉[1] 刘纪洲[1] 金梦云[1] 袁丽锦[1] 储召松[1] 鲁毅[2] 许秀峰[1] 沈宗霖[1]
1.昆明医科大学第一附属医院精神科
2.昆明医科大学第一附属医院医学影像科

目的 通过对比分析伏硫西汀治疗前后抑郁症患者的症状和动静态功能影 像学变化情况，以期为 MDD 患者的发病机制及抗抑郁药治疗的治疗机制提供影 像学参考依据。

方法 入组抑郁症患者 39 例，健康对照 24 例，收集一般人口学资料、汉密 尔顿抑郁量表 17 项（17-item Hamilton Depression Scale，HAMD-17）评分、重复性成套神经心理状态测验（ repeatable battery for the assessment of neuropsychological status，RBANS）评分、fMRI 等。抑郁症组予伏硫西汀单药治疗 12 周后再次收集 HAMD-17 评分、RBANS 评分和 fMRI 数据。首先计算全脑 的 fALFF 脑图，然后以 fALFF 存在有统计学差异的脑区作为感兴趣区（region of interest，ROI），进行 ROI 与全脑的静息态功能连接（resting-state functional connectivity，rsFC）和 ROI 与全脑的动态功能连接（dynamic functional connectivity， dFC）分析。此外研究还独立选择海马作为 ROI，分别进行了左右海马喙侧和尾 侧 4 个亚区与全脑的 dFC 分析，进一步探究海马及其亚区与 MDD 发病及药物 治疗机制的关系。

结果 1.抑郁症患者基线期与健康对照组比较，左小脑脚 1、左距状皮层、左颞上回、左/右内侧额上回、右楔前叶脑功能存在异常，经过伏硫西汀治疗 12 周后，HAMD-17 总分较基线期明显下降，左颞上回与额顶网络（左中央前回/中 央后回、右中央旁小叶、左楔前叶）的功能连接发生改变。 2. 抑郁症患者基线期与健康对照组比较，右喙侧海马与左额下回三角部 dFC 变异性减弱，异常脑区 dFC 值与 RBANS 总分及因子分、HAMD-17 总分均无显 著相关性。

结论 1.小脑、距状皮层（枕叶）、颞叶、额叶、楔前叶等脑区功能异常可 能是 MDD 发病的病理机制，伏硫西汀可能通过调整颞叶与额顶网络的功能连接来发挥抗抑郁作用。2. 右喙侧海马与左额下回三角部异常功能连接可能是独立于症状和病程的反 应 MDD 发病机制的神经影像学指标。

Exploring Mechanisms of ZDXS001 Prescription Against Major Depressive Disorder Based on Network Pharmacology and Experimental Verification

陈颖[1,2] 岳莹莹[1,2] 袁勇贵[1,2]
1.东南大学附属中大医院
2.东南大学医学院

Objective To investigate the effect of ZDXS001 on depression-like behavior induced by chronic unpredictability mild stimulation (CUMS) in rats, and explore the anti-depressant mechanism of ZDXS001 formula, so as to provide theoretical basis for the disclosure of its pharmacological effects and clinical application.

Methods 1.CUMS group rats were treated with different antidepressants for 2 weeks after 42 days of modeling. Behavioral evaluation were conducted on the 7th, 42nd and 56th days. 2.This experiment analyzed its potential antidepressant molecular mechanism through network pharmacology and validated the potential pathway and target of ZDXS001 in the treatment of depression by using 4D-DIA proteomics technology. 3.The antidepressant pathway of ZDXS001 was verified by molecular biological techniques.

Results 1.After two weeks of treatment with ZDXS001 formula, the behavior experiments and body weight was improved ($P < 0.05$). 2.Network pharmacological results showed that 206 active compounds of ZDXS001 formula were screened from TCMSP and other databases; 3336 differentially expressed genes of depression were screened.The compound-target complex network showed that the most active compounds in ZDXS001 were kaempferol, quercetin, β-sitosterol and luteolin. Protein-protein interaction analysis on the STRING platform showed that the key target genes of ZDXS001 were CREB1, MAPK1, MAPK14, etc.The results of GO and KEGG analysis showed that the anti-depressant function of the active ingredient in ZDXS001 formula included the

response to lipopolysaccharide and extracellular stimulation, and the main pathways included MAPK pathway and IL-17.3.The results of hippocampal proteomics showed that compared with the model group, a total of 172 proteins in hippocampal rats in the ZDXS001 treatment group had significant changes, among which 61 proteins showed increased expression and 111 proteins showed decreased expression. Bioinformatics analysis of differential proteins showed that the functions of selected differential proteins were mainly in MAPK pathway and nerve regeneration.4.The effect of ZDXS001 on antidepressant was closely related to nerve regeneration through Nissl staining and immunofluorescence experiments.

Conclusion 1. CUMS can induce depression-like phenotype in rats, and ZDXS001 formula can play an antidepressant role. 2. ZDXS001 may play an antidepressant role by regulating MAPK signaling pathway to improve depression-like behavior.

伴或不伴焦虑症状的青少年抑郁症认知功能状况及其与自杀意念的相关性研究

米文芳 董强利* 张兰*
兰州大学第二医院

目的 探讨伴或不伴焦虑症状的青少年抑郁症患者的抑郁、焦虑、认知功能及自杀意念状况，同时了解认知功能与自杀意念之间的相关性，以期为青少年抑郁症的预防和治疗提供有价值的参考。

方法 选取 2022.7.-2023.2.就诊于兰州大学第二医院心理卫生科青少年抑郁症患者 60 例，年龄 12-18 岁之间。首先根据 HAMD-17 中焦虑躯体化因子是否≥7 分将患者分为焦虑性抑郁症组和非焦虑性抑郁症组，两组各 30 例。然后使用 HAMD-17、HAMA、BSI-CV、MoCA 对两组患者的焦虑症状、抑郁症状、自杀意念及认知功能进行量化评估。最后，将收集到的所有数据运用 t 检验、U 检验、Spearman 相关性分析等方法进行统计学分析，最终得出相关结论。

结果 最终入组患者共 60 例，两组各 30 例。研究发现，(1)焦虑性抑郁症组和非焦虑性抑郁症组的一般资料（年龄、性别、民族、户籍、优势手、是否为独生子女、年级及受教育年限）差异无统计学意义；两组间 HAMD-17（30.83±5.491vs21.40±5.165，t=5.771，P＜0.01）、HAMA（30.22±9.254vs18.55±7.626，t=4.469，P＜0.01）和BSI-CV的量化评分（22(19;30)vs18(0;23)，Z=2.905，P=0.004）差异均存在统计学意义（P＜0.05）；两组间 MoCA 评分（25(21;26)vs23(22;25)，Z=-0.895，P=0.371）差异无统计学意义。（2）对焦虑性抑郁症组各量表之间的相关性分析后发现：抑郁焦虑症状与自杀意念之间存在显著正相关，相关性中等偏强（rs=0.617/0.744，P=0.000）；认知功能与焦虑（rs=0.040，P=0.797）及抑郁症状（rs=0.038，P=0.811）之间不存在相关性；认知功能与自杀意念之间存在显著负相关，相关性中等（rs=-0.507，P=0.032）。

结论 （1）伴焦虑症状的青少年抑郁症比不伴有焦虑症状的青少年抑郁症的焦虑、抑郁症状更严重，自杀意念更强;（2）未得出有效证据证明伴焦虑症状的青少年抑郁症与不伴焦虑症状的青少年抑郁症之间认知功能存在差异;（3）青少年抑郁症患者的焦虑和抑郁症状与自杀意念呈正相关，当患者焦虑或抑郁症状越严重，其自杀意念越强；认知功能与自杀意念则呈负相关，当患者认知功能越低，则其自杀意念越强。

抑郁症患者奖赏期待和奖惩反馈加工存在异常关联：一项事件相关电位研究

孙逸凡 王军 周振和*
南京医科大学，无锡市精神卫生中心

目的 基于与奖赏期待及奖惩反馈相关脑电活动指标，探索抑郁障碍患者快感缺失症状的特征与神经相关性。

方法 在无锡市精神卫生中心招募符合DSM-5中重性抑郁症的诊断标准患者为研究组（MDD），在周边社区招募从无精神障碍病史及家族史的健康人群作为对照（HC），且均排除脑外伤、癫痫、严重躯体疾病、妊娠及哺乳期妇女等情形。采用汉密尔顿抑郁量表 HAMD 评定被试抑郁症状严重程度，采用时间性快感体验量表 TEPS 反映被试快感缺失感受的程度，使用 E-prime3.0 编制改良猜门范式，在被试完成该范式时同步记录其脑电活动，比较两组在不同条件下刺激前负波 SPN 与反馈相关负波 FRN 的差异。

结果 共有 35 名 MDD 和 31 名 HC 的数据通过质控，两组在年龄、性别构成、利手性等一般人口学资料上无统计学差异（均 p＞0.05），MDD 组 HAMD 总分高于 HC 组（均 p<0.05），而 TEPS 总分及因子分均低于 HC 组（均 p<0.05）。混合设计 ANOVA 显示，SPN 波幅的组别主效应显著（p=0.045），HC 组大于 MDD 组；输赢主效应显著（p=0.019），赢钱大于输钱；组别×输赢的交互作用均不显著；HC 组的 FRN 差异波（输减赢）波幅大于 MDD 组（p=0.015），混合设计 ANOVA 显示组别、输赢的主效应均显著（分别 p<0.001、p=0.033），且组别×输赢的交互作用显著（p=0.015），简单效应分析表明 HC 组输比赢的 FRN 波幅更大（p<0.001），且赢钱条件下 FRN 波幅 HC 组大于 MDD 组（p=0.015）。Pearson 相关分析显示，MDD 组 FRN 差异波波幅和 HAMD 总分呈正相关（r =0.392, p =0.020），输钱后 SPN 波幅和 TEPS 消费因子呈正相关（r =0.357, p =0.035）；HC 组的 SPN 与 FRN 间无明显相关性，而 MDD 组输钱后 SPN 波幅与输和赢条件下 FRN 波幅（分别 r =0.416, p =0.013; r =0.476, p =0.004）均显著正相关。

结论 本研究表明，MDD 患者存在对奖赏反馈敏感性降低以及对奖惩反馈期待均减弱，前者与抑郁严

重程度有关，但两者与量表评估的相关性并不明显；此外，在健康人群中无相关性的两种快感缺失相关脑电成分在患者组出现了正相关，提示罹患抑郁障碍可能使奖赏期待与奖惩反馈神经加工产生了异常“连接”，这为后续相关研究提供了新的线索。

Epidemiological Characteristics of Mood Disorders in Adolescents and The Effect of Sertraline on Their Metabolic Level

曲衍衍 周振和*
无锡市精神卫生中心

Objective To explore the epidemiological characteristics of mood disorders in adolescents and analyze the effects of sertraline on adolescents' metabolic level.

Methods A total of 88 adolescents aged 11-18 who received treatment in Wuxi Mental Health Center from January 2018 to August 2021 were selected as the observation group, while 80 healthy students aged 14-18 were selected as the control group. Logistic regression analysis model was established to analyze the influencing factors of adolescents' mood disorders. Paired sample T test was used to analyze related metabolic indexes before and 24 weeks treatment with sertraline in the observation group, while partial correlation analysis was used to analyze the relationship between different doses of sertraline and changes in related metabolic indexes.

Results Logistic regression analysis model showed that single parent family, family history, childhood stress/surgery, online games were risk factors for emotional disorders in adolescents (P<0.05). The levels of WBC and PLT were significantly decreased, while the levels of TC, ALT, AST and PRL were significantly increased with the treatment of sertraline (P<0.05). Partial correlation analysis showed that the reduction rate of PLT increased with the increase of sertraline dosage (P<0.05), while the rise rate of ALT, AST and PRL increased with the increase of sertraline dose (P<0.05).

Conclusion Single parent family, family history, childhood stress/surgery, online games were risk factors for mood disorders in adolescents. Sertraline can significantly decrease WBC and PLT, and increase TC, ALT, AST and PRL levels.

合肥市抑郁症发病与季节气象要素变化的关联分析

谢思思[1] 杜洋[1] 吴静[2] 王涛[3]
1.合肥市第四人民医院
2.安徽理工大学
3.安徽省气象公共服务中心

目的 抑郁症是全球常见的精神健康障碍，其发病与环境因素密切相关。然而，有关气象因素对抑郁症发病的影响尚未充分阐明。本研究旨在探讨安徽省合肥市的气象因素与抑郁症发病之间的关系。建立抑郁症发病的简易气象风险等级，为合肥市抑郁症的防治提供部分参考。

方法 ：收集于 2016 年 1 月 1 日～2019 年 12 月 31 日期间合肥市第四人民医院门诊就诊的合肥市本地抑郁症患者资料和同期气象要素资料，对其进行 Pearson 相关及多元线性回归模型分析，总结季节气象要素对抑郁症发病的影响。

结果 合肥市抑郁症门诊就诊人次在秋季偏多，以 10 月为全年最高值，就诊人次与气温日较差、日照时长、风速在每日和逐月变化上呈正相关，与降水量在每日变化上呈负相关，差异具有统计学意义（P＜0.05）；多元线性回归分析表明：月平均气温日较差越大、平均相对湿度越高，月就诊人次越多。抑郁症易发的气象条件是：大雨天气、气温日较差较大、风速较大、日照较长。

结论 合肥市抑郁症发病存在季节性特点，气温日较差、日照时长、风速、降水量影响抑郁症发病。这一研究结果有助于制定抑郁症的预防和治疗策略，优化医疗资源分配，并促进社会心理健康服务。

抑郁症与老年人听力丧失的遗传相关性研究

王玥 郁昊*
济宁医学院精神卫生学院

目的 抑郁症和老年听力丧失同为复杂性疾病，遗传因素在两者发病中起到重要作用。既往流行病学和临床观察性研究结果表明，抑郁症和老年人听力丧失之间共病率高，两者存在显著关联。然而，目前对两者的共同患病因素尚不完全清楚。本研究基于抑郁症和老年听力丧失的全基因组关联研究数据（GWAS），采用多种遗传相关分析方法探讨抑郁症与老年听力丧失之间的共同遗传基础。

方法 首先，本研究利用抑郁症（n=500，199）和老年人听力丧失（n=723，266）的 GWAS 数据，采用全基因组遗传相关分析方法（连锁不平衡回归分析[LDSC]和遗传协方差分析[GNOVA]）的方法，检验两者的全基因组遗传相关性。其次，本研究利用局部遗传相关分析方法（LAVA），探讨两者在基于连锁不平衡划分的遗传区域的遗传相关性。最后，本研究利用条件错误发现率（condFDR）和联合错误发现率（conjFDR）分析方法，鉴定与两者同时相关的遗传变异位点，并利用用 FUMA 数据库开展遗传变异位点的功能注释和通路富集分析。

结果 首先，全基因组遗传相关分析发现，抑郁症和老年人听力丧失存在显著遗传相关性。其次，局部遗

传相关分析结果表明，基因组中的 5 个遗传区域范围内，抑郁症和老年人听力丧失存在显著相关。最后，条件错误发现率分析结果发现，9 个与抑郁症显著关联的易感位点和 79 个老年人听力丧失显著关联的易感位点；联合错误发现率发现 7 个同时与抑郁症和老年人听力丧失显著关联的易感位点。基于 FUMA 数据库的功能注释结果表明，7 个两者共同的易感位点位于遗传表达调控区域，影响附近基因表达水平。通路富集分析结果表明，与两者同时关联的易感基因富集于“检测参与感觉的化学刺激"（detection of chemical stimulus involved in sensory perception）、"感觉知觉"（sensory perception）、"G 蛋白偶联受体活性"（G protein-coupled receptor activity）等多个通路，提示易感基因参与两种疾病的生物学通路。

结论 本研究鉴定出抑郁症和老年人听力丧失的遗传关联，为研究两者的遗传基础提供重要线索，并为未来研究针对这两种疾病的治疗策略提供科学基础。

嗅觉评估在抑郁障碍患者的临床应用研究

张凤晓 王仕俊 栾树鑫*
吉林大学第一医院

目的 研究发现，嗅觉与抑郁之间存在联系，尤其随着气味识别能力的提高，抑郁患者的症状有所减轻。正常情况下，气味等嗅觉信息从嗅球传递到初级嗅觉皮层，包括内嗅皮质区等；再进一步投射到次级嗅觉皮层等。本文主要通过研究嗅觉识别、内嗅皮质体积与抑郁患者的关系，探讨嗅觉评估在识别抑郁患者的作用；同时，抑郁诊断我们主要基于临床表现；因此，我们寻求客观的检查手段为抑郁患者的诊断及治疗提供新思路。

方法 取 2022 年 01 月至 2023 年 04 月就诊于门诊符合入组标准的抑郁障碍患者 35 例（注：7≤患者汉密尔顿抑郁量表 17 项评分≤24；未曾服用过抗抑郁药物），与之相匹配的正常对照组 33 例。首先，需要收集入组人群的一般临床资料，再者给予应用宾夕法尼亚大学嗅觉识别测验（University of Pennsylvania Smell Identification Test, UPSIT）和头磁共振（Magnetic Resonance Imaging, MRI）影像中内嗅区皮质（Entorhinal Cortex, EC）体积（mm3）主观或客观评估嗅觉功能。应用 ITK-SNAP 3.8 软件在 sMRI 序列中冠状位手工逐层勾画双侧 EC 作为感兴趣区域，自动计算出相应的体积。分析嗅觉评估在两组的差别，以及嗅觉评估识别抑郁的效能。使用 SPSS 26.0 软件统计数据与分析。

结果 （1）正常对照组与抑郁障碍组的 UPSIT 评分均值分别为（19.61±5.83）和（16.17±7.74）（P<0.05），即正常对照组>抑郁障碍组。（2）正常对照组与抑郁障碍组的 EC 体积均值分别为（1709.42±421.72）和（1421.63±685.74）（P<0.05），即正常对照组>抑郁障碍组。？（3）两组间 UPSIT 评分与 EC 体积相关，且呈正相关（r=0.55；P<0.05），即 EC 体积随 UPSIT 评分升高而增加；（4）UPSIT 评分、EC 体积及 UPSIT 评分联合 EC 体积对区分曲线下面积分别为 0.645、0.669、0.665；敏感性与特异性分别为：93.9%与 42.9%、90.9%与 51.4%、87.9%与 57.1%。？

结论 （1）UPSIT、EC 在抑郁障碍患者中可出现相应的评分或体积的下降，抑郁患者的嗅觉功能有所降低。（2）EC 体积、UPSIT 联合 EC 体积可更好的用于抑郁障碍的诊断。

关键字：抑郁障碍、嗅觉功能、气味识别，内嗅皮质体积

电休克治疗联合药物对抑郁症患者复发以及认知功能的影响：一项为期 5 年的随访研究

姚姣 杜洋 季益富*
合肥市第四人民医院

目的 探讨电休克疗法（ECT）合并药物与单纯药物对抑郁症患者复发以及认知功能的影响。

方法 选取 2018 年 1 月至 2018 年 12 月于安徽省精神卫生中心就诊的 324 名抑郁症患者为研究对象，于 2023 年 6 月结束随访，根据有无行电休克治疗分为研究组（n=117）和对照组（n=207），在 ECT 前和 ECT5 年后，两组患者均完成一般情况调差表、蒙特利尔认知评估量表（MoCA）、自杀意念量表（SSI）、匹兹堡睡眠质量指数（PSQI）、汉密尔顿抑郁量表（HAMD）以及汉密尔顿焦虑量表（HAMA）的评定，采用独立样本 t 检验进行 2 组间差异性检验。

结果 治疗前，两组 MoCA、SSI、PSQI、HAMD、HAMA 评分上无明显差异（均 P>0.05）。治疗后，研究组在 MoCA 总分、视觉空间与执行功能、注意功能、延迟记忆功能、定向功能等 4 个维度上得分均低于对照组，差异具有统计学意义（均 P＜0.05）；研究组在 HAMD、HAMA、SSI、PSQI 得分上均低于对照组，差异具有统计学意义（均 P＜0.05）；研究组认知障碍发生率（85.47%，100/117）高于对照组认知障碍发生率（51.69%，107/207）；研究组复发率（37.61%，44/117）低于对照组（72.95%，151/207）。

结论 与单独使用药物治疗相比，ECT 治疗抑郁患者疗效显著，降低抑郁症的复发率，对认知有一定损害。

关键字：抑郁症；电休克疗法；认知；复发

中国常见皮肤病患者中抑郁焦虑的未治疗情况调查分析：一项横断面研究

唐陶然[1,2,3] 王汨[1,3] 李宏[2] 杨淞淳[3] 张成成[4] 林文锐[3] 柯昕辰[3] 张汉伊[3] 粟娟[3] 朱诗林[2]
1.中南大学湘雅一医院临床心理中心
2.湖南省中医学院附属二医院

3.中南大学湘雅一医院皮肤科
4.中南大学公共卫生学院

目的 本研究旨在分析常见皮肤病患者的心理需求被忽视的现状和原因。

方法 研究通过在线平台发放电子问卷，收集了患者自我报告的人口学、临床和心理学资料，主要结果指标包括抑郁（9-item Patient Health Questionnaire,PHQ-9）与焦虑（Generalized Anxiety Disorder-7, GAD-7）。采取多因素回归分析寻求心理治疗行为的影响因素及未治疗原因。

结果 共调查 1010 名患者。273 名（27.0%）患者有心理干预的必要（PHQ-9≥10 分和或 GAD-7≥8 分，或已接受心理治疗），但没有接受心理治疗。在多因素回归模型中，收入（OR=0.80，95%CI：0.65-0.99）、皮肤病病程（OR=0.68，95%CI：0.49-0.95）和因为皮肤病出现的自杀意念（OR=2.10，95%CI：1.14-3.87）是寻求心理治疗的影响因素。895 名（88.6%）未接受心理治疗的皮肤病患者中，是否存在心理干预必要与未接受心理治疗的原因相关，包括不知道可以或在哪寻求心理帮助，担心心理治疗的副作用，皮肤病严重时未及时寻求心理治疗，以及目前未因皮肤病产生心理困扰。

结论 本研究调查了皮肤病患者对心理干预的需求现状以及需求未得到满足的原因。患者对皮肤病导致的心理问题存在困扰但缺乏应有的认知，心理健康服务往往没有得到充分利用。

关键字：抑郁，焦虑，皮肤病，心理治疗，网络调查

伴有自杀意念的抑郁症患者犬尿氨酸代谢的随访研究

吴百川 陈嘉烨 赵冬梅 金峰 李华 蔡亦蕴 张慧凤 彭代辉 沈婷*
上海交通大学医学院附属精神卫生中心

目的 在抑郁症患者和自杀未遂患者中都有犬尿氨酸代谢通路异常的报道，但是结论并不一致且缺乏随访数据。本研究旨在探讨伴有自杀意念的抑郁症患者犬尿氨酸代谢通路是否存在异常，及其与临床症状的动态关系。

方法 根据 DSM-5 诊断标准纳入 68 名抑郁症患者及 72 名年龄、性别平均水平匹配的健康对照，进行量表评估（汉密尔顿抑郁量表，HAMD；汉密尔顿焦虑量表，HAMA；贝克自杀意念量表，BSI）及空腹静脉血采集。对其中 41 名伴有自杀意念的抑郁症患者进行随访，在第 2 周、第 4 周末重复量表评估及空腹静脉血采集。使用超高效液相色谱-三重四极杆质谱联用仪测定血浆中犬尿氨酸代谢物的水平。对血液学指标对数转化后进行 Z-score 标准化，对不同代谢物的多重比较使用 FDR（False Discovery Rate）校正。采用独立样本 t 检验、Mann-Whitney U 检验进行组间比较；采用 Spearman 相关分析基线犬尿氨酸代谢物与量表评分之间的关系；采用线性混合效应模型分析随访过程中犬尿氨酸代谢物与量表评分的关系。

结果 抑郁症患者的外周吡啶甲酸（PIC）（0.39 ± 0.87 vs -0.23 ± 1.09，t = 3.68），3-羟基犬尿氨酸与犬尿氨酸的比值（3-HK/KYN）（0.38 ± 0.85 vs -0.09 ± 1.01，t = 2.94）以及 3-HK（0.31 ± 0.81 vs 0.14 ± 1.04，t = 2.77）低于健康对照（P < 0.05）。在伴或不伴自杀意念的抑郁症患者之间，未发现犬尿氨酸代谢物之间的差异。在抑郁症患者中，HAMD、HAMA 评分均与血浆 3-HK（HAMD: r = 0.37；HAMA: r = 0.30）和 3-HK/KYN（HAMD: r = 0.35；HAMA: r = 0.28）水平呈正相关（P < 0.05）。纳入年龄、性别因素后，对随访数据的量表评分与犬尿氨酸代谢物水平建立线性混合效应模型，结果显示 HAMA 评分在随访过程中对 3-HK/KYN 的影响具有统计学意义（B = 0.04，t = 2.46，P < 0.05）。

结论 抑郁症患者存在犬尿氨酸代谢通路异常，3-HK 与 3-HK/KYN 可能与抑郁症患者的抑郁、焦虑水平存在关联，并且在伴有自杀意念的抑郁症患者中，犬尿氨酸-3-单加氧酶的活性可能与焦虑水平存在关联。

关键字：抑郁症；犬尿氨酸；自杀；焦虑

伴有和不伴有躯体症状的抑郁症患者前扣带回亚区静息态功能连接的特异性改变

刘婷婷[1] 乔娟[2]
1.徐州医科大学
2.徐州市东方人民医院

目的 探讨躯体性抑郁症患者前扣带回亚区功能连接的特异性改变，进一步理解躯体性抑郁症发生的神经影像学基础。

方法 分析 38 例伴有躯体症状的抑郁症（Somatic Depression，SD）患者、33 例不伴有躯体症状的抑郁症(Non-Somatic Depression，NSD)患者和 30 例健康对照组(Healthy control，HC)。采用 24 项汉密尔顿抑郁评定量表(24-item Hamilton Depression Rating Scale，HAMD-24)评估抑郁症患者抑郁程度，采用抑郁和躯体症状量表（Depression and Somatic Symptoms Scale ，DSSS）评估抑郁症患者躯体症状严重程度。同时使用静息态功能磁共振分析前扣带回亚区（膝前区前扣带回 pgACC、膝下区前扣带回 sgACC、胼胝体上方前扣带回 supACC）的功能连接，通过相关分析评估有特异性改变的前扣带回亚区、躯体症状和抑郁症状之间可能的关联。

结果 伴有躯体症状的患者组（SD）HAMD 总分显著高于不伴有躯体症状的抑郁症组（NSD）($p<0.001$)。SD 患者组 DSSS 总分显著高于 NSD 患者组 ($p<0.001$)。三组间单因素方差分析，膝下区前扣带回(sgACC)与双侧豆状核、右侧膝前区前扣带回（pgACC）与左侧颞上回的功能连接（functional connectivity，FC）有显著性差异(AlphaSim 校正，体素水平 $p<0.001$，团块水平 $p<0.05$)。采用独立样本 T 检验：与 NSD 组相比，SD

组左侧 sgACC 与左侧海马 FC 增强，右侧 pgACC 与左侧颞上回 FC 增强 (AlphaSim 校正，体素水平 p <0.001，团块水平 p<0.05)；与 HC 组相比，SD 组右侧 sgACC 与右侧豆状核 FC 增强 (AlphaSim 校正，体素水平 p <0.001，团块水平 p<0.05)。关联分析发现 SD 患者组 HAMD 评分与左侧 sgACC 和左侧海马的 FC 值呈负相关（经 Bonferroni 校正，r=-0.618，p<0.05）、与右侧 sgACC 和右侧豆状核 FC 值呈负相关（经 Bonferroni 校正，r=-0.529，p<0.05）。

结论 与 NSD 组相比，SD 组存在特异性前扣带回亚区功能连接的改变，这些改变可能是躯体性抑郁发生的神经病理学基础。

The Short-term Effects of MECT on Adolescent Depression May Diminish over Time——an Observational Study

陈开超 杜莲*
重庆医科大学附属第一医院精神科

Objective To address the short-term and long-term effects of MECT on adolescent depression, seek to determine the optimal number of MECT sessions and the relationship between the effects of MECT and family function.

Methods Sixty-six adolescent inpatients with major depressive disorder (MDD) who had received MECT were recruited. We assessed severity of illness with the Hamilton Depression Rating Scale-24 (HAMD-24) at T0 (before MECT), T1 (after MECT completion) and T2 (days or months after MECT completion). We further compared the scores (T0, T1, T2) and calculated the reduction rate of HAMD. We considered patients with a reduction rate of ≥50% as valid group, those between 25% and 50% as partially valid group, and those with <25% as invalid group. We compared the HAMD change values caused after each MECT compared to before each therapy in these 3 subgroups. Then, we further observed the trend of HAMD changes during the 0-9th MECT sessions. Additionally, we explored the correlation of FAD scores with MECT efficacy.

Results Upon immediate completion of MECT, 39 patients (59.1%) showed a notable response(reduction rate was ≥50%), termed 'short-term effects'. For those patients who underwent the T2 time point assessment, 'long-term effects' were seen in only 8 patients (21.1%). HAMD scores at T1 and T2 were both significantly reduced in comparison to T0 scores (non-parametric test, P < 0.01).ANOVA indicated there were no significant differences in HAMD scores at baseline and T2 among the three subgroups. However, at T1, the HAMD score of the effective group was significantly lower than that of the partially effective group and the ineffective group (F=43.89, p<0.001). We found that the three subgroups showed different trends in HAMD. The valid group maintained the relatively lowest HAMD score level after each MECT session. After the sixth session, the overall reduction rate of the effective group began to be ≥50% compared to the baseline(t=15.834, p<0.001), while the other two groups did not reach the effective standard from beginning to end. Pearson's correlation analysis revealed no substantial association between scores across the FAD's seven dimensions and variations in HAMD Scores (T0-T1, T0-T2). Nevertheless, a significant positive correlation was identified between the general functional dimension scores in the FAD and HAMD scores at T0 (r?=0?.41, p?

Research on The Mechanism of Insula-related Genetic Factors That Regulate Major Depressive Disorder

陈凡 周振和*
无锡市精神卫生中心

Objective This study aimed to explore the differential expression of insula-related genes in peripheral blood of patients with Major Depressive Disorder (MDD), and to analyze the mechanism of insula-related genetic factors regulating MDD based on bioinformatics and molecular biology. This study provides new insights into important biological pathways in the occurrence and development of MDD.

Methods (1) The gene expression profile data of peripheral blood and insula tissue samples of MDD patients and healthy controls were collected from GEO database based on bioinformatics, and Differentially Expressed Genes (DEGs) were screened out, and receiver operating characteristic (ROC) curves were further constructed to analyze the accuracy of these genes in diagnosing MDD. (2) Peripheral blood samples of MDD patients who met the diagnostic criteria of the Diagnostic and Statistical Manual of Mental Disorders-5th Edition (DSM-5) were collected, and RT-qPCR experiments were performed to validate Hub genes. (3) C57 mice were randomly divided into three groups, including blank control group, Hub gene knockout group and Hub gene knockout+fluoxetine (10mg/kg) group, with 10 males in each group. The effects of Hub gene on depression-like behavior in mice were observed by open field experiment, tail suspension experiment and sugar water preference experiment, and the molecular mechanism of depression regulated by genetic factors related to insula was further studied by means of serum corticosterone level, RT-qPCR, Western blot and immunocytochemistry et al.

Results (1) In the GSE102556 and GSE182183 datasets, a total of 6 genes significantly expressed in the insula and blood in depression were screened: HIST1H4D, LRIT3, GYPC, ALOX15, SPATC1L, PLVAP, among which the Area Under Curve (AUC) of LRIT3 and HIST1H4D was greater than 0.9, showing good diagnostic accuracy. (2) RT-qPCR analysis showed that the expression level of LRIT3 in peripheral blood of MDD patients

was significantly lower than that of healthy controls (P<0.05). (3) Compared with the blank control group, the LRIT3 knockout mice showed significantly decreased movement distance in open field test, prolonged immobility time in tail suspension test, decreased sucrose preference and increased serum corticosterone level. Further studies showed that these effects were associated with regulation of the CGMP-PKG signaling pathway.

Conclusion (1) Insula-related genes are involved in the regulation of MDD. (2) Insula-related genes LRIT3 and HIST1H4D are differentially expressed in peripheral blood of MDD patients. The genes have the potential to become biological markers for the diagnosis of MDD in the future. (3) LRIT3 knockout could induce depression-like behavior in mice, which might be related to CGMP-PKG signaling pathway.

Abnormal Changes of Dynamic Topological Characteristics in Patients with Major Depressive Disorder

周玥[1,2] 朱益辉[2] 叶宏庭[2] 姜文颢[1,2] 张羽博[1,2] 孔佑勇[2] 袁勇贵[1,2]
1.东南大学附属中大医院
2.东南大学

Objective Most studies have detected abnormalities of static topological characteristics in major depressive disorder (MDD). However, whether dynamic alternations in brain topology are influenced by MDD remains unknown. This study was aimed to explore abnormal changes of dynamic topological characteristics between patients with MDD and NCs.

Methods A sample of 830 MDD patients and 771 NCs was used from 16 sites. An approach was proposed to capture the dynamic topological characteristics with sliding-window and graph theory for a large data sample from the REST-meta-MDD project.

Results It was shown that patients with MDD were characterized by decreased nodal efficiency of the left orbitofrontal cortex. The temporal variability of topological characteristics was focused on the left opercular part of Inferior frontal gyrus, and the right part of middle frontal gyrus, inferior parietal gyrus, precuneus and thalamus.

Conclusion This study explored the dynamic brain topological aberrances in MDD, with nodal topological changes observed. Some of the brain regions were reported associated with emotion regulation, especially the cortex of frontal and parietal lobes and thalamus. The interesting findings has the high potential to help enhance the understanding on the neural mechanisms of MDD. The overall results highlight that altered temporal variability of topological characteristics, which provide novel insights into the role of topological network characteristics in patients with MDD.

Prevalence and Risk Factors of Osteoporosis in Chinese Inpatients with Major Depressive Disorder — A Cross-sectional Study Based on Quantitative CT

黄朋举[1] 王文斌[1] 王玲[2] 于爱红[1]
1.首都医科大学附属北京安定医院
2.首都医科大学附属北京积水潭医院

Objective The relationship between major depression disorder (MDD) and osteoporosis remains controversial. We aimed to report the prevalence of osteoporosis in inpatients with MDD in China and explore the risk factors for osteoporosis in MDD patients.

Methods 306 inpatients with MDD and 604 healthy physical examination people were included in this study. The lumbar volumetric bone mineral density (vBMD) of the study subjects was measured by quantitative computed tomography (QCT). And vBMD <0.05). But there were no statistically significant differences in gender distribution, average disease duration, the proportion of smokers, diabetes, and hyperlipidemia between the two groups (p>0.05).

Conclusion The prevalence of osteoporosis in inpatients with MDD over the age of 40 in China was higher than that of healthy people; MDD may be a risk factor for osteoporosis; The decrease of BMD in patients with MDD is related to aging, low education level, and hypertension.

关键字：major depressive disorder, osteoporosis, quantitative computed tomography, prevalence

抗抑郁剂对抑郁症患者凝血功能的影响

朱自馨 袁勇贵*
东南大学附属中大医院

目的 探讨抑郁症患者在院发生下肢静脉血栓的发生率及相关危险因素，比较不同种类的抗抑郁剂对抑郁症患者凝血功能的影响。

方法 第一部分：回顾性研究：纳入东南大学附属中大医院心身医学科 2015-2020 年在院确诊下肢静脉血栓的抑郁症患者共 33 例，按年龄及性别随机匹配同一时间段内的未发生静脉血栓的抑郁症患者共 198 例，收集两组的临床资料，分析抑郁症患者发生静脉血栓的危险因素。第二部分：抑郁症患者静脉血栓形成发生率的 Meta 分析：检索 PubMed、Web of science、Cochrane Library、CNKI 和万方数据库，收集建库至今有关抑郁症患者合并下肢静脉血栓发生率的研究，采用 STATA 14.0 软件进行 Meta 分析。第三部分：前瞻性研究：选取符合纳入标准的 2021-10 至 2022-07 在东南大学附属中大医院心身医学科住院的抑郁症患者共 200 例，

根据入院后有无发现下肢静脉血栓形成分为血栓组和非血栓组，比较其两组间的差异；根据在院使用抗抑郁剂的种类分为 SSRIs 组，SNRIs 组，伏硫西汀组和联合用药组，分别比较各组治疗前后凝血相关指标的变化。

结果 第一部分：回顾性研究发现年龄与抑郁症患者下肢静脉血栓形成之间显著相关，静脉血栓发生率最高的年龄段在 71-80 岁。在凝血相关指标上，ATIII、FDP 和 DD 均高于非血栓组。第二部分：Meta 分析结果表明抑郁症患者在院诊断静脉血栓形成的发生率为 0.9%。第三部分：前瞻性研究发现年龄、性别、SRRS 得分、TT、FDP 和 DD 为抑郁症患者下肢静脉血栓形成的潜在危险因素。对不同种类的抗抑郁剂进行亚组分类后发现，SSRIs 组治疗前后发生变化的凝血相关指标数量最多，FIB, APTT, DD, ESR, TT, ATIII 和 FDP。SNRIs 组和联合用药组的 APTT, DD 和 ATIII 在治疗前后发生的变化有显著性差异。

结论 静脉血栓形成在抑郁症患者中的发生率显著高于普通人群。抑郁症与静脉血栓形成显著相关，高龄、运动迟滞以及血液中低 FDP 和高 DD 水平都可能会增加抑郁症患者静脉血栓形成的风险。使用不同种类的抗抑郁剂治疗后，SSRIs 类药物对患者凝血功能的影响最大，可能会增加静脉血栓形成的风险。

A Proteomic Molecular Mechanistic Study on The Improvement of Depression-like Behavior in CSDS Depressed Mice by Hernandezine

李磊[1] 阚伟京[1] 王刚[1] 吉腾飞[2] 杜静[1]
1.首都医科大学附属北京安定医院
2.中国医学科学院北京协和医院

Objective To investigate the protein expression changes and cellular molecular functional mechanisms of hernandezine (HER) during the improvement of depressive-like behavior in chronic social defeat stress (CSDS) mice.

Methods After CSDS modeling procedure, C57 mice were screened for depression with sucrose preference test(SPT). The experimental animals were divided into normal control (CON), CSDS, hernandezine treated (HER) and imipramine treated (IMI) groups, and the antidepressant effects were observed by tail suspension, sucrose preference and forced swimming tests after drug treatment. The proteins were extracted from the prefrontal cortex of the brain for quantitative proteomic analysis. The bioinformatics analysis were performed to determine GO enrichment of the relevant differential proteins and protein-protein interaction network.

Results A total of 6467 proteins were detected by quantitative proteomics, and differential protein groups derived from CSDS compared with CON (CSDS-CON), imipramine (IMI) treatment compared with CSDS (IMI-CSDS), and HER treatment compared with CSDS (HER-CSDS) were obtained, and these protein expression changes were first analyzed by analysis of variance (ANOVA, $P < 0.05$) to obtain protein clusters with consistent trends in change clusters, in which protein level trends in protein cluster 3 were similar to those of altered mood, and protein cluster 3 was found to be enriched in mitochondrial and synaptic-related functions and localization. Further GO enrichment of common proteins in HER-CSDS/IMI-CSDS group and HER-CSDS/CSDS-CON group supported the ANOVA results. We analyzed the common protein groups of HER-CSDS/IMI-CSDS and HER-CSDS/CSDS-CON using PPI and found enrichment of proteins related to mitochondrial and synaptic functions. Protein-protein interaction network analysis of differential proteins revealed that many differential proteins were primarily enriched in regulating synaptic and mitochondrial function. Hernandezine treatment altered synaptic and mitochondrial function-related protein synthesis, resulting in improved depression-like behavior, suggesting that synaptic and mitochondrial function-related proteins play an important role in the treatment of depression.

Conclusion Hernandezine ameliorates depression-like behavior in CSDS mice by regulating the expression levels of mitochondrial and synaptic-related proteins. In conclusion, the current proteomic studies of the prefrontal cortex provide a specific and common molecular basis for the therapeutic mechanism of hernandezine that underlies the pathophysiology and treatment of CSDS-induced depression.

重性抑郁障碍患者自杀意念与解释偏向的相关研究

谢静 傅琳娜 何宗岭*
成都市第四人民医院

目的 探讨重性抑郁障碍（Major Depressive Disorder，MDD）患者自杀意念与消极解释偏向的相关性。

方法 根据本研究的纳入及排除标准，于成都市第四人民医院睡眠医学中心纳入及招募 105 名受试者。使用一般人口学问卷收集受试者的基本信息，精神障碍诊断和统计手册第五版(DSM-5)用于诊断 MDD，抑郁症症状快速自评量表（QIDS-SR）评估受试者抑郁情绪，广泛性焦虑量表（GAD-7）评估受试者焦虑情绪，贝克自杀意念量表(BSI-CV)评估受试者自杀意念。自主改编的解释偏向测试软件评估受试者解释偏向，包括自我/他人即时消极解释偏向、自我/他人延时消极解释偏向 4 个部分。采用卡方检验、独立样本 t 检验或秩和检验、多元方差分析对一般人口学特征、临床症状、解释偏向等进行组间比较。使用多元线性回归分析 MDD 患者自杀意念与解释偏向的关系。

结果 1、本研究入组 MDD 患者 63 例，其中女性 45 例（71.40%），平均年龄 24.17±11.30 岁，受教育年限 12.52（6.00，15.00）年。正常对照组 42 名，其中女性 33 人（78.57%），平均年龄 26.48±4.46 岁，受教

育年限 15.00（12.00，16.00）年。与正常对照组相比，MDD 组受教育水平更低（p＜0.001），QIDS、GAD-7、自杀意念强度评分显著更高（p＜0.001）。两组年龄（p=0.212）、性别（p＝0.412）无统计学差异。 2、解释偏向结果采用多元方差分析，校正性别、年龄、受教育年限后，与正常对照组相比，MMD 组自我即时消极解释偏向（p=0.011）、自我延时消极解释偏向（p＜0.001）、他人延时消极解释偏向（p＜0.001）更偏向于消极。两组他人即时消极解释偏向无统计学差异。 3、多元线性回归分析控制了性别、年龄、教育年限等因素，发现自杀意念风险强度与自我延时消极解释偏向分数（β=0.378，p=0.002）、QIDS 分数（β=0.533，p＜0.001）呈正相关关系；自杀意念风险强度与年龄（β=-0.237，p=0.025）呈负相关关系。

结论 1、与正常组相比，MDD 患者存在显著的消极解释偏向，且 MDD 患者的自杀意念随自我延时消极解释偏向的分值升高而升高。2、自我延时消极解释偏向可能是介导 MDD 患者自杀意念的潜在机制之一。

LHPP 介导的溶酶体酸化在抑郁症中的作用机制

李晶[1] 许琪[2]
1.首都医科大学附属北京安定医院
2.中国医学科学院基础医学研究所

目的 抑郁症是以持续性的情绪低落、兴趣缺失和动机减退为主要临床症状的疾病，具有高复发率、高致残率、高自杀率的特征，已经成为危害我国人口健康的第一大精神疾病。抑郁症神经发生发病假说认为抑郁症患者脑中海马神经发生不足，海马体积萎缩是抑郁症发生的重要原因，促进神经发生是抗抑郁的重要治疗靶点。管腔酸化是指在质子泵的主要作用和其他转运体的共同作用下，通过逆电势梯度转运氢离子等阳离子，造成细胞或细胞器内腔产生一种酸性环境的过程。真核细胞中目前没有发现使用无机焦磷酸盐(PPi) 水解释放的能量直接驱动管腔酸化的现象。前期全基因组关联研究表明，LHPP 的无机焦磷酸酶功能在很大程度上可能与抑郁症有关。

方法 首先在遗传学层面：前期遗传学发现的信号位点位于 LHPP 基因内含子，故通过对编码区重测序找寻真正的致病位点。其次在分子生物学层面，从 LHPP 无机焦磷酸酶活性、表达分布及亚细胞定位情况和分子功能等三个方面来进行研究。在动物模型层面，建立三种 LHPP 基因缺陷动物模型——全身敲除小鼠、星形胶质细胞特异性敲除小鼠和重测序测得突变位点的点突变小鼠，探究 LHPP 与抑郁症发病、抑郁表型间的关系；

结果 本研究发现 LHPP 的功能和其在抑郁症发病中可能的作用机制。在遗传学层面，鉴别出三个影响 LHPP 无机焦磷酸酶活性的错义突变位点，是抑郁症的保护性位点。细胞学实验证实 LHPP 部分定位于星形胶质细胞的溶酶体膜上，与 V 型 ATP 酶的 ATP6V0D1 亚基相互作用，通过其焦磷酸水解酶活性水解焦磷酸促进质子跨膜转运。在氧化应激压力下 LHPP 基因敲除会损害溶酶体降解活性，影响了溶酶体对底物蛋白 CEBPβ 的降解过程，转录因子 CEBPβ 积累增多，导致其下游一组在体外和体内均能促进海马神经发生的趋化因子表达和释放增加。在动物模型层面，发现 LHPP 的缺失在 CUMS 压力下具有抗抑郁表型。

结论 LHPP 功能缺失可能会导致溶酶体 pH 稳态机制失调和降解功能障碍。从而使 LHPP 敲除组星形胶质细胞在压力下的转录因子 CEBPβ 高于对照组，并释放更多的趋化因子。释放增加的趋化因子具有促进神经发生的作用，进而产生抗抑郁表型。

SSRI 类抗抑郁药延迟起效机制及预测研究

卞奥 肖凡 孔鑫媛 方舒琳 季欣蕾 王湘*
中南大学湘雅二医院医学心理中心

目的 SSRI 类抗抑郁药作为一线抗抑郁药物，其起效时间较慢一直是困扰临床工作者的一大难题，但对于相关机制目前尚未取得共识。“认知神经心理假说”在生物学假说的基础上纳入了更多与病因学相关的心理社会因素与药物疗效关联的证据，提出了可完整解释抗抑郁药物延迟起效的理论框架。本研究将基于首发重性抑郁障碍（MDD）的纵向队列研究，结合认知心理评估方法与静息态脑电技术，筛选可预测抗抑郁疗效的认知心理特征及脑电客观标记物，验证认知神经心理理论并构建多模态融合的临床预测模型。

方法 69 名首发未服药 MDD 患者与 36 名正常对照，均完成临床、负性加工偏向、社会环境信息的评估，采集静息态脑电并提取各脑区 alpha 偏侧化与前额叶 theta cordance 特征。使用 SSRI 抗抑郁药物（艾司西酞普兰或舍曲林）治疗 8 周后，再次完成临床症状与心理社会因素评估，并根据 8 周相对基线时汉密尔顿抑郁量表减分率，将 MDD 患者分为治疗应答组（MDD_R,39 人）或治疗无应答组（MDD_NR,30 人）。通过基线数据的组间比较与相关分析，筛选可预测抗抑郁药物应答的认知心理特征以及脑电客观标记物，并对认知神经心理理论进行验证。进一步建立多模态机器学习模型，检验其在预测 SSRI 类抗抑郁药疗效方面的临床应用价值。

结果 MDD 患者基线测量的社会支持水平、临床症状、负性加工偏向特征均与 HC 存在显著差异（p < 0.001），中央区 alpha 偏侧化差异显著（p < 0.05）。8 周药物治疗后，MDD 两组在临床症状与负性加工偏向特征方面均有改善（p < 0.05），并且 MDD_R 改善程度高于 MDD_NR（p < 0.05）。相关分析发现 MDD 群体在治疗前的负性认知加工偏向与顶区 alpha 偏侧化负相关显著（p < 0.05），神经质人格与中央区及中央

-顶叶联合区 alpha 偏侧化负相关显著（p< 0.05）。结合以上显著特征构建的多模态机器学习模型表现较优（正确率 75%，特异度 83%）。

结论 本研究支持了认知神经心理假说对 SSRI 类抗抑郁药物疗效机制的假说。基于机器学习方法构建的多模态临床预测模型可有效预测首发 MDD 患者 8 周 SSRI 类抗抑郁药物治疗疗效。（本研究得到国家自然科学基金 31671144 资助）

美金刚干预对大鼠抑郁样行为的影响及可能机制

金雪娇 宋景贵*
河南省精神病院

目的 本研究通过观察经美金刚治疗后 CUMS 大鼠抑郁样行为的变化，评估美金刚的抗抑郁作用，并且使用蛋白质组学、免疫组化等研究方法，探究美金刚抗抑郁的可能机制，为美金刚临床治疗抑郁症提供理论依据。

方法 1.模型的建立及分组：①建立 CUMS 大鼠模型，采用旷场实验、蔗糖水偏好实验、强迫游泳实验、Y 迷宫实验综合分析评估对照组、CUMS＋生理盐水组、CUMS＋SSRIs 组及 CUMS+美金刚组大鼠的抑郁状态及认知功能；②对照组、CUMS＋生理盐水组、CUMS＋SSRIs 组及 CUMS+美金刚组分别进行对应的给药处理，动物行为学实验比较不同组大鼠的抑郁状态，探究美金刚的抗抑郁作用。2.实验指标检测①本实验主要采用糖水偏好实验以及强迫游泳实验进行抑郁状态的评定，以判断美金刚是否可以改善 CUMS 大鼠的抑郁状态。②谷氨酸检测：末次行为学结束后对全部大鼠进行快速心尖采血，检测对照组、CUMS＋生理盐水组、CUMS＋SSRIs 组及 CUMS+美金刚组大鼠的谷氨酸含量变化，验证谷氨酸功能失调在抑郁症发病中的作用；③免疫组织化学：经免疫组织化学染色后显微镜下观察海马区和皮质区星形胶质细胞形态变化，评估各组大鼠海马区神经细胞活化情况；④蛋白水平检测：Western Blot 定量检测对照组，CUMS＋生理盐水组，CUMS＋SSRIs 组及 CUMS+美金刚组，大鼠海马区和皮质区、mTOR 信号通路蛋白的表达情况。

结果 采用糖水偏好实验以及强迫游泳实验评估大鼠的抑郁样行为以及美金刚改善抑郁样行为的作用，结果显示：在糖水偏好实验中，经过 4 周 CUMS 造模后，CUMS＋生理盐水组较对照组蔗糖偏好百分比下降，具有统计学意义（p＜0.05），通过使用美金刚治疗后大鼠的蔗糖偏好百分比上升具有统计学意义（p＜0.05）；强迫游泳实验中 CUMS＋生理盐水组较对照组不动时间百分比上升有统计学差异（p＜0.05），经过美金刚治疗后不动时间百分比明显下降（p＜0.05）。使用 Western Blot 对大鼠海马区相关蛋白进行检测，发现 CUMS＋生理盐水组的 mTOR 及其通路蛋白表达水平下降（p＜0.05），美金刚治疗后这一变化得到了逆转（p＜0.05）。

结论 1.美金刚能改善 CUMS 大鼠的抑郁样行为。2.美金刚可能通过影响 mTOR 的表达水平，进而调节 PI3K/AKT 通路，改善大鼠的抑郁样行为。

关键字：抑郁样行为，美金刚，谷氨酸

Dissecting The Effect of Perceived Social Support on Problematic Smartphone Use in Adolescents with Depression

周勇杰* 弓建 汪艳妮
深圳康宁医院

Background Social support could protects individuals by buffering the negative effects of psychological and behavioral risk factors. However, results from some studies contradicted to the above understanding in effect of perceived social support (PSS) on problematic smartphone use (PSU). Therefore, this study dissected the effect of PSS on PSU by dividing PSS into three parts in adolescents with depression, and whether this effect was mediated by loneliness to find the reason of the contradiction.

Methods The data was from baseline data of the cohort study of Chinese Adolescent Depression Cohort (CADC) aged from 12 to 18 years old. Path analysis was adopted to examine the relationship between PSS and PSU, as well as the indirect effect of loneliness.

Results A total of 2343 adolescents with depression were included. PSS negatively predicted PSU through loneliness. But PSS directly and positively predicted PSU. PSS were divided into three aspects according to the source of it. PSS from family, friends and significant others negatively predicted PSU through loneliness. Family support directly and negatively predicted PSU. However, friends support and significant others support directly and positively predicted PSU.

Conclusion High family support decreased PSU, while high friends support and significant others support increased PSU. Friends support and significant others support had greater effect on PSU than family support. It explained why some studies, including this one got conclusion that was contrary to the general understanding. The findings suggested that we should develop the family support, such as promoting parent-child communication to decrease PSU. Given that friends support could increase PSU, we should guide adolescents with depression to handle friends support correctly, such as paying more attention to real-life interactions with friends rather than online interactions.

The Effect of TAAR1 Deficiency on Mitochondrial Function and Immune Inflammation in The MPFC

张献强 李继涛 司天梅 苏允爱*
北京大学第六医院

Objective Trace amine-associated receptor 1 (TAAR1) is a G protein-coupled receptor expressed in vertebrate brain, which interacts with glutamate and monoaminergic neurotransmitters in the key brain regions such as medial prefrontal cortex (mPFC), represents a novel therapeutic target for mental disorders. Although it is known that TAAR1 has a coordinated control effect on monoaminergic system and plays a significant physiological role in the modulation of central nervous system function, the molecular and signal pathway investigations are to date very scarce. This study aims to explore the gene expression profile in the mPFC of TAAR1 knockout (KO) mice, and conduct bioinformatics analysis of differentially expressed genes (DEGs) to obtain specific biological processes and target genes related to TAAR1, so as to provide more ideas for the research of TAAR1 in mental diseases.

Methods In this study, we constructed TAAR1 knockout mice, evaluated the behavioral characteristics of mice including anxiety-like, depression-like, and cognitive behaviors, screened DEGs in mPFC using RNA sequencing (RNA-seq), and analyzed them using the Gene Ontology (GO) annotation and Kyoto Encyclopedia of Genes and Genomes (KEGG) annotations. In addition, several significant differential genes and alterations involved in immune inflammation were further identified.

Results The findings of this study revealed that TAAR1 knockout can damage the cognitive performance of mice but has no impact on their anxiety- and depressive-like behavior. As observed by principal component analysis, the RNA-seq gene expression profiles in the mPFC of WT and KO mice were different, with 592 genes showing significant differences, of which 516 genes were up-regulated and 76 genes were down-regulated. The GO enrichment analysis of DEGs highlighted functions involved in regulation of small molecule metabolic process, ATP biosynthesis and metabolism, glycolysis, mitochondrial depolarization and membrane potential, amine transport, synaptic signal release, memory and NMDA selective glutamate receptor complex. Furthermore, KEGG pathway enrichment analysis suggested that these DEGs were mainly related to oxidative phosphorylation, ribosome, and degenerative diseases of the central system, cancer and addiction. Additionally, the DEGs involved in mitochondrial function, immune inflammation, and synaptic signaling were identified using RT-PCR.

Conclusion The RNA-seq, combined with bioinformatics analysis, showed that knockout of TAAR1 gene in the mPFC of mice altered the expression of various genes involved in a wide spectrum of biological function, which may be involved in the regulation of cognitive function in mice.

关键字：TAAR1, cognitive function, mitochondria, immune inflammation

The Predictive Value of C-reactive Protein for Malignant Catatonia in Acutely Ill Psychiatric Disorders

韩天[1] 张绮航[1] 殷晓琳[1] 申昊天[1] 何笑笑[2] 周福春[1] 王传跃[1]
1.首都医科大学附属北京安定医院
2.北京大学第六医院

Objective Preliminary data have suggested that increased C-reactive protein (CRP) level is independently associated with catatonic features. Malignant catatonia (MC) is characterized by excitement, stupor, catalepsyor, fever and autonomic instability. MC is clinically similar to neuroleptic malignant syndrome (NMS), and both can lead to life-threatening medical conditions. This study examined the predictive value of high serum CRP in this “catatonia to NMS” conversion and explored other potential risk factors.

Methods Acutely admitted psychiatric patients were screened for the catatonia at a tertiary psychiatric hospital and the catatonic patients were followed through the acute phase. The Bush–Francis Catatonia Rating Scale (BFCRS) was used to assess the severity of catatonic symptoms, and diagnosis of catatonia was determined by the diagnostic and statistical manual of mental disorders, fifth edition (DSM-5). Baseline serum hs-CRP levels were determine with the enzyme-linked immunosorbent assay. Serum levels of creatine kinase (CK) was also determined. Typical (or atypical) MC and NMS were diagnosed based on criteria described in previous literature.

Results Fifty-one patients with catatonia were subsequently identified among 509 acutely admitted inpatients. Typical (5/51) or atypical (6/51) features of MC were present in the catatonic patients (21.6%) during acute phase treatment (2.2% for the whole sample). Six of them were exposed to antipsychotics and thereby diagnosed as typical NMS (2/51) and atypical NMS (4/51). Baseline higher serum hs-CRP levels significantly predicted subsequent features of MC. No NMS conversion was noted in the non-catatonic patients or catatonic patients with normal serum hs-CRP level. The primary trigger of MNS was the discontinuation of antipsychotics. All NMS cases responded to electroconvulsive therapy (ECT). Serum CK levels rose and fell in tandem with the severity of catatonic symptoms.

Conclusion MC is not uncommon in psychiatric patients during acute phase treatment, which warrants more clinical attention. Catatonic patients with a high level of serum hs-CRP are more likely to progress to MC or NMS (when exposed to antipsychotics).

双相躁狂患者初级和高级奖赏环路静息态功能连接的研究

石晶[1] 郭华[2] 王志仁[1] 谭淑平[1] 杨甫德[1] 谭云龙[1]
1.北京回龙观医院
2.驻马店市精神病医院

目的 越来越多的证据提示奖赏环路的功能异常可能在情感障碍的发病机制中发挥作用。奖赏能够分为初级奖赏和高级奖赏。初级奖赏常常直接与生存和繁殖有关，比如食物和性，而高级奖赏一般对于维持体内平衡不是必不可少的，它只有在较低级别的奖赏（包括金钱或权利）的学习中获得价值。初级奖赏和高级奖赏所涉及的脑区是不同的。先前有研究报道，精神分裂症患者在初级和高级奖赏相关的神经回路都出现异常，而在 BD 患者中，只有与高级奖赏相关的神经回路异常，有关于其在初级奖赏相关的神经回路的研究报道较少。因此本研究考察，双相躁狂患者在初级和高级奖赏环路静息态功能连接的异常模式。

方法 纳入 41 例双相躁狂患者与 39 名正常对照。使用 Young 躁狂量表，汉密尔顿焦虑量表，汉密尔顿抑郁量表评估患者症状严重程度；所有被试使用 GE HDXT 3.0 T 磁共振扫描仪完成数据采集，基于 MatLab2015b 平台，应用 DPARSF 软件对静息态 fMRI 数据进行预处理，用 REST 软件提取 HarvardOxford 模板中的眶额皮层、左右丘脑、尾状核、壳核、伏隔核、海马、杏仁核为感兴趣区，用 DPARSF 软件计算感兴趣的功能连接（FC），用 SPSS20.0 进行统计分析，比较组间差异，采用 Bonferroni 对多重比较进行校正，P<0.05 时对比组之间的差异有统计学意义。

结果 （1）与对照组相比，双相躁狂组在眶额皮质与左侧纹状体的 FC 值显著降低（P<0.05）；（2）与对照组相比，双相躁狂组在眶额叶皮质与右侧纹状体的 FC 值显著增加（P<0.05）；（3）与对照组相比，双相躁狂组在眶额皮层与右侧杏仁核的 FC 值显著增加（P<0.05）；（4）在双相躁狂组中，FC 值与 Young 躁狂量表的得分呈正相关（P<0.05）。

结论 双相躁狂患者高级奖赏环路功能连接可能存在异常，这种异常改变可能与患者的症状有关。

关键字：双相躁狂；奖赏环路；初级；高级

RTMS Ameliorates Depressive-like Behaviors and Regulates The Gut Microbiome and Medium- and Long-chain Fatty Acids in Mice Exposed To Chronic Unpredictable Mild Stress

周翠红 陈怡环 王化宁 彭正午*
西京医院

Objective Repetitive transcranial magnetic stimulation (rTMS) is a clinically useful therapy for depression. However, the effects of rTMS on the metabolism of fatty acids (FAs) and the composition of gut microbiota in depression are not well established.

Methods Mice received rTMS (15 Hz, 1.26T) for seven consecutive days after exposure to chronic unpredictable mild stress (CUMS). The subsequent depressive-like behaviors, the composition of gut microbiota of stool samples, as well as medium- and long-chain fatty acids (MLCFAs) in the plasma, prefrontal cortex (PFC) and hippocampus (HPC) were evaluated.

Results CUMS induced remarkable changes in gut microbiotas and fatty acids, specifically in community diversity of gut microbiotas and PUFAs in the brain. 15 Hz rTMS treatment alleviates depressive-like behaviors and partially normalized CUMS induced alterations of microbiotas and MLCFAs, especially the abundance of Cyanobacteria, Actinobacteriota, and levels of polyunsaturated fatty acids (PUFAs) in the hippocampus and PFC.

Conclusion These findings revealed that the modulation of gut microbiotas and PUFAs metabolism might partly contribute to the antidepressant effect of rTMS.

关键字：rTMS; CUMS; gut microbiota; medium- and long-chain fatty acids

Aberrant Single-subject Morphological Cortical Networks in First Episode Schizophrenia

范丰梅[1] 谭淑平[1] 罗真真[2] 袁敬轩[2] 王志仁[1] 范宏振[1] 杨甫德[1] 谭云龙[1] 王金辉[2]

Objective Disruptions of morphological covariance networks at group level are widely reported in schizophrenia. However, schizophrenia-related alterations in individualized morphological networks are not well established. Here we separately used four cortical surface mesh-based indices (cortical thickness, CT; fractal dimension, FD; gyrification index, GI; sulcal depth, SD) to construct single-subject morphological brain networks for patients with first episode schizophrenia (FES) and healthy controls (HCs) from three sites.

Methods The study included a total of 203 patients with FES (95 M/108 F, average age = 24.7±5.6 years) and 131 normal controls (73 M/58 F, average age = 27.8±6.0 years). We constructed four types of single-subject morphological brain networks for each structural MRI image. Then we calculated network parameter and performed statistical analysis, including between-group differences in graph-based network parameters, interregional morphological similarities, relationships between MRI-based measures and clinical and neuropsychological variables.

Results Compared with the healthy controls, decreased interregional morphological similarities were found in all types of networks in the FES patients whereas increases were observed only in the FD and SD networks (P < 0.05, corrected). The altered connections were mainly involved in regions of visual, control, somatomotor, frontoparietal and default mode networks. Further graph-based analysis revealed that the global network organization was

intact while nodal centrality was altered in the patients as characterized by decreased nodal degree and efficiency in the left PGs Area V6A and increased nodal efficiency in left Area STGa for the CT networks, decreased nodal degree and efficiency in the left Posterior Insular Area 2 for the FD networks, and decreased nodal betweenness in the left Area 52 for the SD networks ($P < 0.05$, corrected). Interestingly, the altered morphological connections not only accounted for positive symptoms, negative symptoms and cognitive dysfunction of the patients but also exhibited high sensitivities and specificities for distinguishing the patients from controls.

Conclusion Altogether, our findings indicate that FES is accompanied by characteristic disruptions in different types of single-subject morphological brain networks, which provide novel insights into neurobiological mechanisms underlying schizophrenia and may serve as potential biomarkers for the disease.

Objective Machine learning approaches such as neural networks (NN) have great potential in discovering correlations and differences between patients with bipolar disorder (BD) and healthy controls (HC). In this study, we aim to design a high-performance NN classifier to classify patients and HC.

Methods Resting-state functional magnetic resonance imaging (rs-fMRI) of 91 subjects was utilized, including 52 BD patients and 39 HC. A functional connectivity matrix was created using correlations between the mean time series of 400 brain regions generated by dictionary learning, and then was vectorized as input features for classification. Ten-fold cross-validation was performed to compare a three-layer NN with linear-SVM classifier and SVM with radial basis function (RBF-SVM). Finally, a leave-one-region-out strategy was introduced, which retrained the classifier with one brain region removed in turn, and the top two regions causing the most performance decrease were considered to contribute most to the classifier.

Results The proposed NN achieved a mean accuracy of 93.45±7.31%, with a sensitivity of 96.33±7.37% and specificity of 88.83±20.55%. The top two important brain regions for the classification performance were selected, with eight Talairach labels including bilateral regions of inferior frontal gyrus, middle frontal gyrus, superior frontal gyrus, lentiform nucleus, and right regions of middle temporal gyrus, superior temporal gyrus, extra-nuclear, sub-gyral.

Conclusion Neural networks model is significantly superior to classic machine learning classification models on BD diagnosis. The brain regions found by the leave-one-region-out method play a crucial part in diagnosing BD, indicating the great importance of these regions in BD classification.

双相障碍抑郁发作共病边缘型人格患者的血浆皮质醇水平及甲状腺功能分析

李媛媛[1] 杨永涛[2] 王艳华[1] 崔伟[1] 崔利军[1]
1.河北省精神卫生中心
2.珠海市慢性病防治站

目的 研究双相障碍抑郁发作共病边缘型人格患者的血浆皮质醇水平及甲状腺功能水平，为临床工作提供决策参考。

方法 97 例住院双相障碍抑郁发作患者，符合DSM-5双相障碍目前为抑郁发作的诊断标准，用DSM-IV-TR 轴 II 障碍临床定式检查中边缘型人格障碍的诊断条目进行评定，分为共病边缘型人格组（42 例）和不共病边缘型人格组（55 例）。采用汉密尔顿抑郁量表、汉密尔顿焦虑量表、32 项轻躁狂症状清单评估，于入院次日清晨空腹采集静脉血，用全自动生化分析仪测定血浆皮质醇及甲状腺功能.

结果 43.30%双相障碍抑郁发作共病边缘型人格，女性、学生多见，发病年龄为 16.00±4.79 岁，小于不共病边缘型人格的25.95±11.49岁（$z=4.599$；$p<0.001$），双相II型患者中 80.95%共病边缘型人格，高于双相I型的 36.36%（2=19.185；$p<0.001$）。共病边缘型人格患者的 FT4 为 0.67±0.23ng/dl，低于不共病边缘型人格患者的 1.51±0.67ng/dl（$z=2.079$；$p=0.038$），共病边缘型人格患者的 COR 为 14.86±7.19ug/dl，低于不共病边缘型人格患者的 1.60±1.02ug/dl（$z=2.843$；$p=0.004$）。二项 Logistic 回归分析显示：年龄（OR=0.931）、有自伤自杀（OR=4.806）、血浆皮质醇水平（OR=0.909）、双相II型（OR=3.128）是双相障碍抑郁发作共病边缘型人格的相关因素。

结论 低血浆皮质醇水平与双相障碍抑郁发作共病边缘性人格相关，低 FT4 可能与自杀自伤关联更紧密，进一步影响边缘性人格的发生。

阿戈美拉汀片联合盐酸帕罗西汀对抑郁伴失眠患者 SOD、BDNF 水平的影响

徐卫国[1] 李莎[1] 王慧[1] 李纪迎[2] 周倩[1] 胡学福[1]
1.1.宁夏回族自治区宁安医院（宁夏精神卫生中心），宁夏 银川 750021
2. 2.山东市精神卫生中心，山东 济南 205514

目的 探讨阿戈美拉汀片联合盐酸帕罗西汀对抑郁伴失眠患者超氧化物歧化酶（SOD）、脑源性神经营养因子（BDNF）水平的影响。

方法 选取宁夏精神卫生中心 2021 年 10 月到 2022 年 9 月期间诊断抑郁伴失眠的住院患者 120 例，分为对照组 60 例和实验组 60 例。在使用盐酸帕罗西汀进行常规抗抑郁治疗的基础上，实验组和对照组分别联合阿戈美拉汀、右佐匹克隆进行 8 周治疗。使用汉密顿抑郁量表（HAMD）评定患者抑郁程度；匹兹堡睡眠质量指数（PSQI）评定患者睡眠质量；酶联免疫吸附试验法检测褪黑素、SOD、BDNF 水平；电化学发光免疫法检测去甲肾上腺素（NE）、多巴胺（DA）、5-羟色胺（5-HT）水平。对比两组治疗后临床症状改善程度及各递质水平变化。

结果 治疗前，两组 HAMD 评分水平及 PSQI 评分水平对比，差异无统计学差异（P>0.05），治疗后，两组数值均有所下降，差异有统计学差异（P<0.05），且实验组较对照组的 HAMD、PSQI 水平降低更明显；治疗前，两组 SOD、BDNF、褪黑素水平对比，差异无统计学意义（P>0.05），治疗后，两组 SOD、BDNF、褪黑素水平均得到一定程度升高，升高程度则是观察组 SOD、BDNF、褪黑素水平高于对照组，差异有统计学差异（P<0.05）；治疗前，两组 NE、DA、5-TH 水平对比，差异无统计学差异（P>0.05），治疗后，两组 NE、DA、5-TH 水平均得到一定程度升高，升高程度则是观察组 NE、DA、5-TH 水平高于对照组差异具有统计学差异（P<0.05）。在 8 周的治疗过程中，两组均有患者出现不良反应，但症状有些自行消失，有些给予对症处理后好转，病例均未退组。两组总不良反应率差异无统计学差异（P>0.05）。

结论 盐酸帕罗西汀联合阿戈美拉汀片治疗抑郁伴失眠患者，可显著改善患者抑郁程度和睡眠质量，升高褪黑素水平，抑制氧化应激状态，上调 BDNF 水平，改善患者神经递质水平。本研究存在不足之处：未对其作用机制深入探究，结果可能具有一定的局限性。

Integrated Untargeted Fecal Metabolomics and Gut Microbiota Strategy for Screening Potential Biomarkers Associated with Schizophrenia

刘向来* 韩天明 姚乾坤
海南省安宁医院

Objective To develop early objective laboratory diagnostic biomarkers to screen different subtypes of patients, and to implement targeted prevention and precision medicine to reduce the risk of SZ and improve patients' quality of life.

Methods Untargeted metabolomics and 16S rDNA sequencing were used to analyze the differences in metabolites and gut microflora among 28 patients with two types of schizophrenia and 11 healthy subjects.

Results The metabolome and sequencing data could effectively discriminate among paranoid schizophrenia patients, undifferentiated schizophrenia patients and healthy controls. We obtained 65 metabolites and 76 microorganisms with significant changes, and fecal metabolite composition was significantly correlated with the differential genera (|r|>0.5), indicating that there was a regulatory relationship between the gut microbiota and the host metabolites. The gut microbiome, as an objective and measurable index, showed good diagnostic value for distinguishing schizophrenia patients from healthy people, especially with a combination of several differential microorganisms, which had the best diagnostic effect (AUC>0.9).

Conclusion Our results are conducive to understanding the complicated metabolic changes in SZ patients and providing valuable information for the clinical diagnosis of SZ.

2.Research Center for Learning Science, Southeast University

Objective Depressive rumination in bipolar disorder is well documented. Recent neuroimaging studies highlight the role of the default mode network (DMN) in rumination in depressed and healthy individuals. However, few studies have evaluated DMN activity in bipolar disorder rumination. This study aimed to examine the associations between rumination and the activity of DMN subsystems in BD patients and determine whether brooding and reflection are related to separate subnetwork activities.

Methods Forty-four depressed bipolar I disorder (BD-I) patients and forty-six healthy controls (HC) underwent resting-state magnetoencephalography (MEG). Two core hubs of the DMN, the posterior cingulate cortex (PCC) and anterior medial prefrontal cortex (amPFC), together with the dorsal medial prefrontal cortex (dmPFC) and the medial temporal lobe (MTL) subsystems, were identified as the regions of interest. The power envelope method was used to determine the alpha band's cross-subsystem functional connectivity (FC). After comparing the rumination and DMN FC between the groups, Spearman partial correlation analysis was performed to evaluate the relationship between aberrant FC and rumination in BD-I patients.

Results BD-I patients demonstrated more global rumination, including higher subcomponent scores of

brooding and reflection. In addition, the alpha frequency FC of the PCC-dmPFC and dmPFC-MTL subsystems within the DMN was dramatically increased in the BD-I group. The former was strongly associated with reflection, whereas the latter was related to brooding.

Conclusion The findings suggest that the reflection and brooding components of rumination are selectively related to the alpha frequency FC of the PCC-dmPFC and dmPFC-MTL subsystems, respectively. These associations highlight the significance of DMN activities in rumination among BD-I patients and have implications for future rumination interventions.

Association between Stereopsis Deficits and Cognitive Impairments in Patients with Bipolar Disorder

庄楠楠 朱振华 殷旭圆 侯文龙 蔡源 贾宁宁 惠李*
苏州市广济医院

Objective Cognitive and sensory deficits were considered a core feature of bipolar disorder (BD). However, no studies have investigated stereopsis integrity, cognition and their associations in BD patients. Thus, the aim of this study was to investigate stereopsis integrity, cognition and their associations in BD patients.

Methods 256 BD patients and 134 healthy controls (HCs) were included in this study. The stereoacuity and cognition were assessed using the Titmus Stereopsis Test and RBANS.

Results There were significant differences in all RBANS scores and lg seconds of arc between two groups (all, $P < 0.0001$). The percentage of BD with correct stereopsis detection was significantly reduced in 400, 200, 140, 100, 80, 60, 50, 40 seconds of arc compared with HCs (all, $P < 0.05$). Both of spearman correlation and stepwise multivariate regression analyses showed the negative correlation of log seconds of arc with the RBANS total score, subscores of immediate memory and attention (all, $P < 0.05$) rather than psychiatric symptoms' scores (all, P ? 0.05) in patients. The stereopsis, all RBANS scores and their combinations exhibited the AUC of 0.706, 0.866 and 0.871 in discriminating between two groups (sensitivity/specificity: 0.641/0.709, 0.809/0.796, and 0.845/0.778), respectively.

Conclusion Our results confirmed significant cognitive and stereopsis deficits as well as the stereopsis correlations with immediate memory and attention rather than psychiatric symptoms, which further suggested that stereopsis and cognition may share common neural circuits. Moreover, the stereovision combined with cognition may be considered an important marker of early screening and prediction of BD.

Association between Increased Serum TNF-α Levels and Immediate Memory Impairment in Patients with Major Depressive Disorder

惠李* 叶刚 汤臻 朱振华 殷旭圆 侯文龙 蔡源 贾宁宁 陈茹凤
苏州市广济医院

Objective Cognitive impairment of major depressive disorder (MDD) may arise from neuroinflammation mediated by cytokines. Thus, this study examined whether altered serum tumor necrosis factor alpha (TNF-α) levels were associated with different cognitive domains of MDD.

Methods 60 MDD patients and 60 healthy controls were recruited. Cognition and serum TNF-a were assessed using the Repetitive Battery for the Assessment of Neuropsychological Status (RBANS) and flow cytometry, respectively.

Results After adjusting for covariates, all RBANS scores were lower in MDD patients than in healthy controls ($P < 0.001$), and log10TNF-α levels were higher in MDD patients than in healthy controls ($P = 0.006$). Log10TNF-a levels were correlated with immediate memory scores in MDD patients after adjusting for confounding factors ($r = -0.35$, $P = 0.009$), but not in healthy controls ($r = -0.02$, $P = 0.90$). Further stepwise multivariate regression analysis showed the association of log10TNF-α with immediate memory scores in MDD patients ($\beta = -14.58$, $t = -4.14$, $P < 0.001$), but not in healthy controls ($\beta = -0.02$, $t = -0.14$, $P = 0.89$).

Conclusion Our data suggested that elevated serum TNF-α levels were implicated in the pathogenesis and immediate memory impairment of MDD.

关键字：TNF-α; major depressive disorder; immediate memory; association

Global Brain Connectivity in Adolescent Depression with Subthreshold Manic Symptoms and The Relations with Processing Speed

张晓菲 成小芳 陈建山 孙加琪 李伟明 毛議苗 刘雨彤 陈蕾 曾炫霖 李烜 叶碧瑜 杨婵娟 曹莉萍*
广州医科大学附属脑科医院

Objective Bipolar disorder (BD) is a sevrious chornic multifactorial disorder that associated with dysfunctional resting-state brain function presenting with cognitive impairment. However, it is still not known whether the abnormal functional connectivity occurs and predict cognitive functioning before preceding full-blown episodes. .

Methods We analysis 149 adolescent depression from baseline data of the sBEAD cohort (Symptomatic trajectory and Biomarkers of Early Adolescent Depression, ID ChicTR2100049066), including 72 adolescent depression with subthreshold manic symptoms (SubMD) ,77 adolescent depression without subthreshold manic symptoms

(nSubMD) and 69 healthy adolescents (HCs). All of participants were scanned resting-state functional magnetic resonance imaging (rs-fMRI) and examined the processing speed domain of cognitive function. For each individual, voxel-based graph theory analysis of whole-brain functional network connectivity GBC map was calculated.

Results Compared to nSubMD, the SubMD group showed lower GBC values in the right medial superior frontal gyrus (SFGmed.R) and right supplymentary motor area(SMA.R),while SubMD group additionally showed higher GBC values in left postcental gyrus (PoCG.L), right precuneus (PCUN.R). Compared to HCs, the nSubMD group showed significantly higher GBC value both in right of medial superior frontal gyrus /supplymentary motor area and right of inferior temporal gyrus. While, in the SubMD group, we observed that lower GBC values in the right dorsolateral of superior frontal gyrus and left middle orbitofrontal gyrus and higher GBC values in right Inferior temporal gyrus and right Precuneus and left Postcental Gyrus, relatived to HCs group. Compared to HCs group, SubMD group showed lower TMT-A scores.YMRS scores were statistically significant higher in SubMD group compared tonSubMD group. Further, GBC values in SFGmed.R was positive correlated with and TMT-A scores.What's more, ROC analysis demonstrated that these aberrant hub-like regions and the Composite index of these regions may play roles in differentiating SubMD from nSubMD.

Conclusion Our results indicate that aberrant connectivity patterns in SFGmed.R, PoCG.L and PCUN.R hub-like regions, may be characteristic of early neurological damage in bipolar disorder. and global dysconnectivity across these regions could be a stable biomarker for identification the prodromal phrase of BD.

精神障碍患者感染新型冠状病毒后对抗精神病药物血药浓度的影响

杨蕊[1] 万瑾凌[2] 皮晨岐[3] 王添慧[3] 朱雪泉[1] 周双桨[3]
1.北京安定医院
2.张家口市沙岭子医院
3.北京回龙观医院

目的 探究精神障碍患者感染新型冠状病毒（SARS-CoV-2）对抗精神病药物血药浓度的影响，并为精神卫生工作者提供针对感染 SARS-CoV-2 后精神障碍患者的抗精神病药物治疗策略和管理建议。

方法 收集并分析 2022 年 12 月 12 日至 2023 年 1 月 11 日在某三级医院住院期间感染新型冠状病毒的精神障碍患者的人口学资料，精神疾病相关临床资料，感染 SARS-CoV-2 后相关症状、体征及血液学指标，精神障碍患者在感染 SARS-CoV-2 前后的抗精神病药物的血药浓度。

结果 本研究共纳入 326 名 18-85 岁的精神障碍患者（精神分裂症、双相情感障碍、其他精神障碍）进行分析。对比患者在感染 SARS-CoV-2 前后抗精神病药物血药浓度的变化，其中氯氮平、阿立哌唑、喹硫平、奥氮平、利培酮、帕利哌酮血药浓度均在 SARS-CoV-2 感染后有不同程度的升高。Logistic 回归分析显示，感染 SARS-CoV-2 前的抗精神病药物血药浓度水平及抗精神病药物种类与血药浓度高于神经精神药理学与药物精神病学协会（AGNP）推荐范围有显著关联；感染 SARS-CoV-2 前抗精神病药物血药浓度水平、性别及抗精神病药物种类与患者是否进行主要抗精神病药物剂量调整有显著关联。

结论 本研究覆盖了多种抗精神病药物浓度与感染 SARS-CoV-2 之间的关系：氯氮平、阿立哌唑、喹硫平、奥氮平、利培酮、帕利哌酮这些临床中常用的抗精神病药物的血药浓度均在精神障碍患者感染 SARS-CoV-2 后有不同程度的升高，这对于精神障碍患者在感染 SARS-CoV-2 后的抗精神病药物的使用方面具有重要的指导作用。

关键字：精神障碍；新型冠状病毒；抗精神病药物；血药浓度

血清谷氨酸和神经营养因子水平与氯氮平疗效的关系

姜祥智*
青岛市精神卫生中心

目的 探讨血清谷氨酸和神经营养因子水平与氯氮平疗效的关系。

方法 44 例难治性精神分裂症病人逐渐减少原有抗精神病用量至停用，同时氯氮平从小剂量开始添加，根据病人病情，大约使用 4 周时间达到氯氮平稳定治疗量（300mg/d-600mg/d），后继续观察时间 12 周，以 PANSS 减分率≥20%为症状缓解。治疗过程中不合并应用其他抗精神病药物，但可根据实际情况合用小剂量苯二氮卓类药物及苯海索、普萘洛尔对症治疗。于氯氮平稳定治疗量时采用 PANSS 量表评估病情，同时采集空腹静脉血 5ml，经 3000r/min,4℃离心 10 分钟分离血清，置于-80℃冰箱保存备用，使用酶联免疫吸附测定（ELISA）分析样品的血清神经生长因子（NGF），脑源性神经营养因子(BDNF)、胶质细胞衍生的神经营养因子（GDNF）和血管内皮生长因子（VEGF）水平。

结果 缓解组 PANSS 评分、阳性症状评分、阴性症状评分和一般病理症状评分显著低于未缓解组，差异有统计学意义（t=2.74-5.21，P＜0.01）；缓解组血清谷氨酸和 BDNF 水平显著高于未缓解组，差异有统计学意义（t=13.48，P＜0.01；t=2.16，P＜0.05）。

结论 血清谷氨酸和 BDNF 水平与氯氮平疗效呈正相关。

Circulating T-cell Subsets Discrepancy Between

Bipolar Disorder and Major Depressive Disorder During Mood Episodes: A Naturalistic, Retrospective Study of 1015 Cases

Shaoli Li Shaohua Hu* Jianbo Lai*
浙江大学医学院附属第一医院

Objective We aimed to investigate whether peripheral T-cell subsets could be a biomarker to distinguish major depressive disorder (MDD) and bipolar disorder (BD).

Methods Medical records of hospitalized patients in the Department of Psychiatry, the First Affiliated Hospital, Zhejiang University School of Medicine, from January 2015 to September 2020 with a discharge diagnosis of MDD or BD were reviewed. Patients who underwent peripheral blood examination of T-cell subtype proportions, including CD3+, CD4+, CD8+ T-cell, and natural killer cells, were enrolled. The Chi-square test, t-test, or one-way analysis of variance was used to analyze group differences. Demographic profiles and T-cell data were used to construct a random forest classifier-based diagnostic model.

Results Totally, 98 cases of BD mania, 459 cases of BD depression (BD-D), and 458 cases of MDD were included. There were significant differences in the proportions of CD3+, CD4+, CD8+ T-cell, and natural killer cells among the three groups. Compared with MDD, the BD-D group showed higher CD8+ but lower CD4+ T-cell and a significantly lower ratio of CD4+ and CD8+ proportions. The random forest model achieved an area under the curve of 0.77 (95% confidence interval: 0.71-0.83) to distinguish BD-D from MDD patients.

Conclusion These findings imply that BD and MDD patients may harbor different T-cell inflammatory patterns, which could be a potential diagnostic biomarker for mood disorders.

GLP-1RA 在精神分裂症患者抗精神病药源性肥胖中的应用

李雪 袁秀霞 庞礼娟 宋学勤*
郑州大学第一附属医院

目的 临床广泛应用的二代抗精神病药物在较好的改善患者精神症状的同时，也带来了不可小觑的代谢副反应。大量研究提示糖脂代谢异常是肥胖、糖尿病和其他代谢综合征的主要原因。胰高糖素样肽-1 受体激动剂（GLP-1RA）是近年来的新型降糖药，在调节血糖同时改善胰岛素抵抗、显著减少体脂，在改善糖脂代谢异常中起着重要作用。

方法 本研究纳入精神分裂症患者出现抗精神病药源性肥胖患者 60 例，随机分为两组，一组为实验组（20 例），在常规抗精神病药物治疗基础上加用临床广泛应用的 GLP-1RA，利拉鲁肽，按 0.6-1.2-1.8 模式逐渐加量至 1.8mg/d；另一组为空白对照，仅仅继续服用常规抗精神病药物。对基线，治疗 1 月，3 月分别进行一般资料的收集，PANSS 量表、副反应量表的评测，并留取实验组及对照组受试者外周血 15ml，用于代谢指标（空腹血糖，空腹胰岛素，甘油三酯，总胆固醇，低密度脂蛋白胆固醇，高密度脂蛋白胆固醇等）的检测。

结果 基线水平，实验组和对照组一般资料差异无统计学意义（p＞0.05）。治疗 1 月后，实验组血糖明显低于对照组，血脂差异无统计学意义；治疗 3 月后，实验组血糖，血脂等代谢指标均明显低于对照组。纵向比较，实验组治疗 1 月、3 月，BMI，代谢指标均明显下降，且 PANSS 量表以及副反应量表均无差异。

结论 GLP-1RA 短期应用可以降低精神分裂症患者抗精神病药源性肥胖时的体重，血糖和血脂，未增加不良反应。更长时间的随访有助于验证本研究的结论并为抗精神病药源性肥胖的治疗提供一定的依据。

关键字：GLP-1RA，精神分裂症，抗精神病药物，药源性肥胖，糖脂代谢

青春期慢性应激影响情感相关行为及少突胶质细胞——应激相关精神障碍的胶质发病假说

张瀚迪* 陈欢 康哲维 刘雪晴 梁玥汐 温轩 方泽漫
汕头大学精神卫生中心

目的 本研究探索青春期慢性应激经历对情感相关行为以及不同脑区的少突胶质细胞（OLs）及髓鞘的影响。

方法 实验一，探索慢性社交挫败应激（CSDS）对小鼠行为和 OLs 的短期影响。4 周龄雄性 C57BL/6J 小鼠随机分为应激组（CSDS 组，N＝12）与对照组（CTL 组，N＝12）。应激结束后，进行行为学试验评估小鼠的行为变化，取脑组织进行免疫组织化学及免疫荧光染色，检测不同脑区增殖及 Ols 标志物。实验二：探索 CSDS 对小鼠行为和 OLs 的长期影响，以及经历青春期 CSDS 的成年期小鼠再次经历阈下应激（Subthreshold stress, SS）的行为变化。4 周龄雄性 C57BL/6J 小鼠随机分为双重应激组（CSDS+SS 组，N＝12），单纯早年应激组（CSDS+CTL 组，N＝12），单纯成年后阈下应激组（CTL+SS 组，N＝8），空白对照组（CTL+CTL 组，N＝8）。CSDS+SS 组小鼠在接受连续 10 天的 CSDS 后，进行 3 周的恢复性饲养，随后接受阈下应激。CSDS+CTL 组小鼠和 CTL+SS 组小鼠分别只接受慢性社交挫败应激和阈下应激，空白对对照组小鼠不进行任何应激。在阈下应激结束 1 天后，对所有小鼠进行行为学试验，取脑组织进行免疫荧光染色检测 Ols 相关标志物。

结果 实验一：（1）CSDS 组小鼠在社交试验中表现出社交回避行为；（2）CSDS 组小鼠 mPFC 区 EdU 阳性增殖细胞、EdU 与 Olig2 双阳性 OLs、EdU 与 NG2 双阳性 OPC、EdU 与 APC 双阳性成熟 OLs 数量降低；（3）杏仁核脑区新生及已存在的 Ols 细胞无显著改变。实验二：（1）社交试验中，CSDS+SS 组小鼠与 CTL+SS

组小鼠相比，社交比下降。当靶为 C57 时，CSDS+SS 组小鼠与 CSDS+CTL 或 CTL+SS 组小鼠相比，接近行为减少；当靶为 CD-1 时，CSDS+SS 组小鼠与 CSDS+CTL 组相比，接近行为减少。（2）与 CTL+CTL 组相比，CSDS+CTL 组、CTL+SS 组和 CSDS+SS 组小鼠 mPFC 和 NAc 区新生及已存在的 OLs 数量无显著改变。

结论 青春期慢性社交挫败应激可使小鼠产生社交回避和恐惧行为，并增加个体对于应激的易感性。青春早慢性社交挫败应激短期内抑制少突胶质细胞系细胞的增殖与分化。

Strain-level Structure of Gut Microbiome Showed Potential Association with Cognitive Function in Major Depressive Disorder: A Pilot Study

董再全 况伟宏*
四川大学华西医院

Objective : To explore the effect of gut microbiota on cognitive function in major depressive disorder (MDD) and its possible mechanisms

Methods We enrolled 57 patients with MDD and 30 healthy controls (HCs) and used 16S rRNA gene sequencing analysis and Shotgun metagenomic sequencing analysis to determine gut microbial composition.

Results The richness and diversity of gut microbiota in patients with MDD were the same as those in HCs, but there were differences in the abundance of Bifidobacterium and Blautia. Compared with HCs, two strains (bin_32 and bin_55) were significantly increased and one stain (bin_31) was significantly decreased in patients with MDD based on the strain-level meta-analysis. Time to complete the Stroop-C had significant negative correlations with bin_31 and bin_32. Bin_55 had significant negative correlations with time to complete the Stroop-C, time to complete the Stroop-CW, and repeated animal words in 60 s but significant positive correlations with correct answers in 120 s on the Stroop-CW.

Conclusions Finally, based on the strain-level analysis, we found that gut microbiota may be associated with the pathogenesis of MDD and may have potential effects on cognitive function.

TRPV1 基因甲基化和依恋类型对抑郁症影响的研究

徐德峰 王明真 王淼 毕晓姣 王丽娜 乔冬冬*
山东省精神卫生中心

目的 抑郁症（MDD）病因机制复杂，多种环境因素、遗传因素及二者相互作用在其中发挥重要作用。本研究旨在从表观遗传学角度探讨 TRPV1 基因甲基化和依恋类型与 MDD 的关系，以期为 MDD 病因机制研究提供理论基础。

方法 病例组纳入 16-65 岁，符合 DSM-IV 诊断标准抑郁症患者 80 例，性别不限；同时纳入健康对照 80 名，年龄、性别与病例组相匹配。采用 Illumina Infinium Methylation EPIC Bead Chip 850K 甲基化芯片进行基因甲基化检测。依恋类型采用成人依恋量表（AAS）进行评估，分为安全型、先占型、淡漠型、恐惧型 4 种。统计分析在 SPSS 26.0 软件中进行，采用独立样本 t 检验进行组间基因甲基化水平比较；采用二项 logistic 回归分析基因甲基化水平、依恋类型对 MDD 发病风险的影响；采用 logistic 回归和 ROC 曲线探索性分析基因甲基化水平、依恋类型对 MDD 发病风险的预测价值，以曲线下面积、敏感度、特异度为评价预测价值的指标。P<0.05 为差异具有统计学意义。

结果 两组在性别、年龄的分布上没有显著统计学差异（P 均＞0.05）。TRPV1 基因 11 个 cg 位点(cg26537098、cg26754159、cg00734682、cg18768260、cg20723599、cg23750361、cg11106060、cg09451903、cg00302076、 cg11157771、cg07760800)甲基化程度在病例组中显著高于对照组(P<0.001)，且均与 MDD 存在相关（P 均<0.05）；安全型依恋、先占型依恋、恐惧型依恋在两组间存在显著差异(P 均<0.05)，且与 MDD 存在强相关 (r=-0.341，P<0.01)；而冷漠型依恋在二者间差异不显著。多因素 logistic 回归分析结果示：不安全型依恋以及 TRPV1 基因 cg26537098、cg20723599、cg11106060 三个位点的高甲基化水平是 MDD 的独立危险因素（OR=1.62~7.25，P＜0.05），曲线下面积（AUC）为 0.838（95%CI：0.776~0.899，P＜0.001）。

结论 TRPV1 基因甲基化水平和依恋类型与 MDD 相关，能够增加 MDD 的发病风险，TRPV1 基因甲基化水平联合不安全依恋类型能够预测 MDD 的发病。

关键字：抑郁症，TRPV1 基因，DNA 甲基化，依恋类型

抑郁症患者嗅觉功能与竞争性干扰抑制的队列研究

朱云程[1,3] 王芳[2]
1.上海市虹口区精神卫生中心
2.上海市杨浦区精神卫生中心
3.上海大学医学院精神卫生临床研究中心

目的 探寻抑郁症嗅觉功能、竞争性干扰抑制功能治疗前后的变化，并初步探索嗅觉功能与竞争性干扰抑制功能、情绪严重程度之间的相关性。

方法 选取符合 ICD-10 诊断标准中抑郁症患者

48 例，选取 33 名性别、年龄、受教育程度与病例组相匹配的健康人群作为对照组，应用汉密尔顿抑郁量表（HAMD-17）、汉密尔顿焦虑量表（HAMA）、基于中国人群的嗅觉命名测验、情绪 Stroop 任务来评估抑郁、焦虑情绪的严重程度、嗅觉功能水平及情绪干扰下 Stroop 各项任务的平均反应时间，并通过平均反应时间/正确率(mean reaction time/accuracy rate ,ΔMRT）得到校正后的各项任务的平均反应时间。抑郁症组及健康对照组均分别于治疗前（基线）、治疗后 3 月(随访)完成 2 次以上所有项目的评估。采用 SPSS 17.0 软件对研究所得的数据进行统计分析，运用多重线性回归分析年龄、教育年限、HAMD-17、HAMA、ΔMRT 与嗅觉功能的相关性。

结果 抑郁症组相较于健康对照组嗅觉功能水平[7 (6,8) vs. 9 (8,9)]、嗅觉的自我评估[3 (3,4) vs. 4 (3,5)]均更差、竞争性干扰抑制各项任务的平均反应时间更长，但随着情绪状态的恢复（治疗后 3 月），嗅觉功能水平及自我评估均可得到恢复，但竞争性干扰抑制功能中的平均反应时间仍维持较健康对照组更长的反应时长。基线水平上多重线性回归分析显示年龄及、负性一致（NEG-C）的 ΔMRT 与抑郁症患者嗅觉功能缺陷有关，其回归模型具有统计学意义（F=11.89，P<0.001），因变量嗅觉测试总分变异的 31.7%可由年龄、ΔMRT（NEG-C）来解释（R 2=0.346，校正 R 2=0.317）。回归方程 Y(^)=10.676-0.063×年龄-0.002×ΔMRT（NEG-C）。

结论 抑郁症患者在接受治疗前其嗅觉功能的缺陷可能与年龄、负性一致的平均反应时间（毫秒）有关，未发现其与抑郁、焦虑情绪严重程度有明确相关性。而随着抑郁情绪的恢复，嗅觉功能缺陷亦能随之恢复，提示嗅觉功能可能是反应脑功能水平的一个状态指标。相较于情绪、嗅觉功能，竞争干扰性抑制功能尤其负性一致的平均反应时间恢复所需要的时间更长，提示可能与疾病的转归预后有关，当然，这一点需要更大的样本量及更长的随访时间来验证。

关键字：抑郁症；嗅觉功能；竞争性干扰抑制；反应时间

Discrimination of First-onset Patients with Bipolar Disorder Or Major Depressive Disorder by Screened Biochemical Parameters Modeling

朱云程 [1,3] 方贻儒 [2,3]
1.上海市虹口区精神卫生中心
2.上海市精神卫生中心
3.上海大学医学院精神卫生临床研究中心

Objective There are theoretical hypotheses about different levels of oxidative stress damage in mood disorders. We screened out eight biochemical indicators based on oxidative stress, for further verification in first-onset patients with bipolar disorder (BD) or major depressive disorder (MDD).

Methods We extracted 224 first-onset patients (BD=93 and MDD=131) from the overall sample database of 4647 candidates. Eight clinical biochemical parameters were tested, including direct bilirubin (DBIL), indirect bilirubin (IDBIL), uric acid (UA), lactate dehydrogenase (LDH), thyroid stimulating hormone (TSH), free triiodothyronine (FT3), prealbumin and progesterone. The above parameters enter the hierarchical multiple linear regression model for analysis.

Results When compared to MDD, the BD group showed decreased prealbumin and elevated UA, LDH, and FT3 in males while decreased prealbumin and DBIL and elevated IDBIL, LDH, FT3 and progesterone in females (p's < .05). We observed the area under the curve (AUC) of the predictive model to distinguish between BD and MDD to be .894 among men and .897 among women.

Conclusion This result elucidates the validity of these biomarkers for identifying first-episode patients with BD or MDD. The discrimination was satisfactory, with good diagnostic accuracy for both gender subgroups.

关键字：bipolar disorder; major depressive disorder; biological markers; first onset

经历慢性负性应激的抑郁症患者中 HPA 轴功能和海马多模态脑影像学特征研究

张丽丽 [1] 栗克清 [1] 张云淑 [1] 伊琦忠 [2]
1.河北省精神卫生中心
2.新疆医科大学第一附属医院

目的 筛查经历慢性负性应激的抑郁症在海马脑影像学、HPA 轴功能的特征。

方法 纳入经历慢性负性应激的抑郁症组 34 例，非经历慢性负性应激的抑郁症组 31 例，健康对照组 30 例。采集受试者的静息态磁共振影像，提取并处理海马结构像和功能像数据，对海马进行亚区分割，采用 ANCOVA 对经历慢性负性应激的抑郁症、非经历慢性负性应激的抑郁症、健康对照三组间海马及亚区体积、海马与全脑体素功能连接（FC）、海马亚区间功能连接（FC）的差异进行分析；采用酶联免疫吸附检测技术对血浆中的 ACTH、CORT 的表达水平进行检测，比较三组间的表达差异；并进行海马差异性结构和功能连接指标和 HPA 轴功能间的相关分析。

结果 （1）和非经历慢性负性应激的抑郁症组相比，经历慢性负性应激的抑郁症组中右侧海马颗粒细胞层-分子层-齿状回头部体积（P=0.03）和右侧海马角 CA3 区头部体积（P=0.02）增加；右侧额上回和双侧海马的功能连接值（P＜0.001）、右侧额下回三角部和双侧海马的功能连接值（P＜0.001）增强；前下托和海马角 CA1 区的功能连接值（P=0.003）降低。（2）ACTH（P＜0.0001）和 CORT（P=0.004）的表达水平在经历慢性负性应激的抑郁症组和非经历慢性负性应激的抑郁症组间存在统计学差异。（3）在非经历慢性负性应激的抑郁症组中，发现前下托和海马角 CA1 的功能连接值与 ACTH 呈正相关（r=0.43，P=0.03）。

结论 经历慢性负性应激的抑郁症在海马亚区结

构和功能连接、HPA 轴功能方面均和非经历慢性负性应激的抑郁症存在差异；由于慢性负性应激的作用可能造成 HPA 轴和海马功能间的关系变得更为复杂。经历慢性负性应激的抑郁症可能作为一种潜在的抑郁亚型有不同的发病机制。

关键字：抑郁症;慢性应激;海马;HPA 轴功能

慢性稳定期精神分裂症血清 IFN-γ，IL-6，BDNF 浓度水平与其阴性症状及认知功能相关性研究

陈鹏 张庆榕 高滢 陈静 朱宏亮 患李* 张晓斌*
苏州市广济医院

目的 探讨慢性稳定期精神分裂症患者血清 IFN-γ，IL-6，BDNF 水平及其与阴性症状及认知功能的相关性。

方法 纳入 2016 年 8 月至 2021 年 10 月就诊的慢性稳定期精神分裂症患者 75 例(患者组,男 48 例,女 27 例),健康对照 42 名(对照组,男 20 例,女 22 例)。血清 IFN-γ（TH1），IL-6（TH2），BDNF 水平采用酶联免疫吸附技术测定;使用 PANSS 评定患者相关临床症状。PANSS 中 N1，N3，N6，G7，G13 总分为情绪表达减少评分，N2，N4，G16 总分为动机缺乏评分，RBANS 评估认知功能。采用 SPSS 22.0 进行统计分析。两组比较采用独立样本 t 检验及非参数检验, 患者组 IFN-γ，IL-6，BDNF 与临床变量关系以（BMI，教育年限，年龄，抗精神病药物剂量，性别）作为协变量进行偏相关分析。

结果 患者组视觉空间结构评分，即刻记忆评分，语言评分，注意力评分，延迟记忆评分，认知总分评分均低于对照组（P 均＜0.05）。患者组和对照组血清 IL-6 水平[8.32（3.87，14.31）pg/ml vs 1.99（1.43，2.58）pg/ml，Z=-6.105，P=0.031]，TNF-a 水平[1.37（0.77，2.88）pg/ml vs 0.765（0.36，1.055）pg/ml，Z=-4.21，P=0.031]，BDNF 水平[(18555.57±8776.32)pg/ml vs (12473.22±3963.88)pg/ml，t=5.139，P＜0.001]。患者组阴性症状中的动机缺乏症状与视觉空间结构（r=0.301，P=0.011）存在正相关。患者组 IL-6 水平与其即刻记忆（r=0.245，P=0.041）、视觉空间结构（r=0.242，P=0.044），延迟记忆（r=0.258，P=0.031），认知总分（r=0.245，P=0.004）均存在正相关。慢性精神分裂症 TNF-a 水平与即刻记忆（r=0.271，P=0.023）正相关。

结论 慢性精神分裂症患者存在神经炎症，神经营养不足。其部分阴性症状可能影响其认知功能。TH1，TH2 相关细胞因子很可能参与慢性精神分裂症部分认知功能损害，且均参与即刻记忆的损害。

高通量测序分析氟西汀对抑郁大鼠肠道菌群的影响

董慧*
江苏省扬州五台山医院

目的 肠道菌群假说认为“肠道菌群—肠—脑”轴功能障碍是抑郁症的主要病理基础，其异常可能是抑郁症的直接诱因和潜在影响因素。氟西汀(FLX)是一种选择性 5-羟色胺再摄取抑制剂，为一线抗抑郁药物。本研究通过对细菌 16SrRNA 基因 V4 可变区测序来分析抑郁模型大鼠肠道菌群特征，评价 FLX 对肠道菌群结构的影响和调控。

方法 慢性不可预见性温和刺激（CUMS）结合孤养构建抑郁大鼠模型，FLX 进行干预，糖水偏好实验、行为学测试等评估建模及 FLX 抗抑郁情况。利用 Illumina MiSeq 技术对各实验组大鼠肠道微生物 16SrRNA 基因 V4 可变区进行测序，揭示肠道菌群的结构组成。Qiime 软件分析各实验组肠道微生物群落结构 α 和 β 多样性。

结果 与正常大鼠相比，抑郁模型大鼠肠道微生物群落丰富度未发生明显改变，微生物群落多样性显著减少。优势菌群中厚壁菌门相对丰度显著增加，拟杆菌门、变形菌门、放线菌门相对丰度减少。模型组肠道菌群 shannon 指数显著下降、simpson 指数下降。FLX 能够缓解大鼠的抑郁样行为，显著降低抑郁大鼠肠道微生物群落的 β 多样性。

结论 CUMS 结合孤养引起大鼠抑郁样行为的同时也影响了肠道菌群的结构，乳酸菌科 (杆菌类，厚壁菌门)的相对丰度增加是抑郁大鼠肠道微生物变化的特征标志，可能与机体自我保护机制有关。FLX 能够缓解大鼠的抑郁样行为，显著降低抑郁大鼠肠道微生物群落的 β 多样性。说明抗抑郁药物能够调节微生物-肠-脑轴的机制，与其抗抑郁作用具有相关性。

血浆 IFN-γ 水平与急性期精神分裂症患者临床症状的相关性研究

李美娟 仇玉莹 罗国帅 李洁*
天津市安定医院

目的 干扰素 γ（interferon-gamma, IFN-γ）是机体重要的细胞因子，能够调节人体免疫水平，具有抗病毒，抗肿瘤等作用。精神分裂症患者存在不同程度的免疫炎症改变，但目前关于 IFN-γ 与精神分裂症临床症状的关联研究较少，且无一致性结论。本研究旨在通过较大样本的临床研究，探索未用药精神分裂症患者临床症状与外周血 IFN-γ 水平的关联。

方法 本研究纳入了 137 名未用药的急性期精神分裂症患者（依据 DSM-5 诊断）和 67 名健康对照，采集所有参与者的空腹外周静脉血并使用 ELISA 方法（试剂盒来自于酶免公司）检测 IFN-γ 的浓度，同时对所有患者进行临床症状评估，使用阳性与阴性症状量表（Positive and Negative Syndrome Scale，PANSS），

分析时使用 PNASS 5 因子模型。结果：（1）精神分裂症患者的外周血 IFN-γ 浓度（317(239,440) ng/L）显著低于健康对照（941(739,2120) ng/L），差异具有统计学意义（秩和检验，p<0.001）；支持分析使用单变量协方差，控制性别，年龄和体重指数，结果显示两组间 IFN-γ 浓度存在统计学差异（p<0.001）。（2）在精神分裂症患者中，IFN-γ 浓度与阳性症状（p=0.026）和激越症状（p=0.042）负相关（偏相关；控制性别，年龄以体重指数），进一步的分析显示上述相关性仅在女性患者中存在（N=87）。

结论 急性期精神分裂症患者外周血 IFN-γ 浓度显著低于健康对照，IFN-γ 浓度越低，阳性症状和激越症状越严重，尤其在女性患者中。

关键字：IFN-γ；精神分裂症；急性期；阳性症状

血浆 NGAL 水平对未用药精神分裂症患者认知功能的影响

李美娟 仇玉莹 李洁*
天津市安定医院

目的 中性粒细胞明胶酶相关脂质运载蛋白（neutrophil gelatinase-associated lipocalin，NGAL）是人脂质运载蛋白家族成员，由中性粒细胞等多种组织细胞分泌，与机体的免疫应答等多种功能有关，目前研究发现外周血以及脑脊液 NGAL 浓度与阿尔茨海默病性痴呆患者的认知功能密切相关，但缺乏 NGAL 在精神分裂症认知功能中的研究，本研究旨在探索外周血中 NGAL 水平与未用药精神分裂症患者认知功能的关联。

方法 本研究纳入了 137 名未用药的精神分裂症患者和 67 名健康对照，对所有参与者进行中国版 MATRICS 认知成套测验（Measurements and Treatment Research to Improve Cognition in Schizophrenia (MATRICS) Consensus Cognitive Battery，MCCB）并将量表得分进行年龄，性别和受教育水平矫正，同时采集所有参与者的空腹外周静脉血并使用 ELISA 方法（试剂盒来自于酶免公司）检测 NGAL 的浓度。

结果 （1）在 MCCB 的九项认知测试中，精神分裂症患者的认知功能均显著低于健康对照，差异具有统计学意义（独立样本 t 检验，所有 p 值均< 0.001）。（2）精神分裂症患者的外周血 NGAL 浓度（13.16±8.06 ng/L）显著低于健康对照（16.32±6.66 ng/L），差异具有统计学意义（秩和检验，p<0.001）。（3）在精神分裂症患者中，NGAL 浓度与空间广度（p=0.018）和简易视觉空间记忆测验得分（p=0.005）正相关（多元线性回归，以认知得分为因变量，以 NGAL 浓度和体重指数为自变量）；而在健康对照中，NGAL 浓度与持续操作测验-相同配对得分负相关（p=0.047）。

结论 精神分裂症患者存在显著且广泛的认知功能损害，外周血 NGAL 浓度与认知功能的关联在患者和对照人群中展示出不同的作用模式，本研究是首次探索外周血 NGAL 与精神分裂症认知损害的关联研究，仍需要更多深入的研究来阐释两者的关联。

Multimodal Neuromarkers in Depression Via Cognition-guided MRI Fusion

Xiao Yang[1], Shile Qi[2], Min Wang[1], Liansheng Zhao[1], Jinxue Wei[1], Qiang Wang[1], Tao Li[1], Jing Sui[3], Xiaohong Ma[1]
1.Mental health center and psychiatric laboratory, West China Hospital of Sichuan University
2.College of Computer Science and Technology, Nanjing University of Aeronautics and Astronautics
3.State Key Laboratory of Cognitive Neuroscience and Learning, Beijing Normal University

Objective : Major depressive disorder (MDD) often results in cognitive impairments, which can have a significant impact on patients' quality of life. However, the mechanisms underlying cognitive deficits in MDD remains unclear.

Methods A total of 131 MDD patients and 145 healthy controls (HC) were included. Neurocognitive function was assessed using the Cambridge Automated Neuropsychological Test Battery (CANTAB), which includes five tests: Rapid Visual Information Processing (RVP), Delayed Matching to Sample (DMS), Pattern Recognition Memory (PRM), Intra/Extra-Dimensional Set Shift (IED), and Spatial Working Memory (SWM). Structural magnetic resonance imaging (MRI) and resting-state functional MRI data were collected. The severity of individual illnesses was evaluated using the Hamilton Depression Rating Scale (HAMD). Two years later, the Social Disability Screening Schedule (SDSS) was used to evaluate their social functioning. FSL and DPARSF were used to analyze the data, ALFF and GMV were extracted as representative neuroimaging features for fusion analysis. Multivariate canonical correlation analysis with reference and joint independent component analysis (MCCAR+jICA) techniques were used to guide the fusion of GMV and ALFF, using five cognitive scores (sustained attention, visual recognition memory, pattern recognition memory, executive function, and working memory as references. The aims of the study were as following: (1) identifying multimodal imaging biomarkers related to multiple cognitive domains in MDD; (2) comparing the similarity and differences of the identified multimodal brain networks across cognitive dimensions and determining the specific neural markers of a particular cognitive dimension, and verifying the stability of the MRI data fusion analysis results in a restricted age cohort; and (3) using the identified multimodal components between MDD and HC to identify predictive biomarkers of social functioning through a linear regression model.

Results This study identified a multimodal frontal-insular-parietal network associated with sustained attention, and the abnormal changes in this network were related to social functioning status of MDD in two-year fol-

low-up MDDs (N=131). Analysis of multimodal data fusion components guided by different cognitive dimensions found that ALFF function consistently decreased in the right temporal-parietal-hippocampal circuit, while structure features was more sensitive to differences between cognitive dimensions. Furthermore, the consistent ALFF functional changes across the five cognitive dimensions were closely related to the individuals' symptom severity.

Conclusion This study identified multiple multimodal neuroimaging biomarkers related to neurocognition, which may help develop new and more effective treatment strategies targeting cognitive impairments and social functioning in MDD patients.

首发精神分裂症患者和双相情感障碍患者血浆磷酸化 Tau181 与静息态脑功能活动的相关性研究

余华[1] 梦捷[2] 雷鹏[2] 李涛[1]
1.杭州市第七人民医院
2.四川大学华西医院

目的 精神分裂症、双相情感障碍（BD）和抑郁障碍（MDD）与阿尔茨海默病（Alzheimer's disease, AD）的发生风险增加相关。而血浆 P-tau181 浓度和 Aβ42/Aβ40 比值在青年重型精神疾病患者中是否与 AD 具有相同的变化趋势有待进一步探讨。 低频震荡振幅分数（fALFF）已被用于研究各种神经退行性疾病，与对照组相比，AD 患者梭状回、双侧海马/海马旁区的 fALFF 增加。然而，作者尚未发现有研究探讨上述三种重型精神疾病中默认网络功能连接、fALFF 与血浆 AD 生物标志物之间的关系。

方法 我们从住院和门诊收集 95 例首发精神分裂症（FES）患者、107 例 BD 患者、77 例 MDD 患者和 187 例健康对照。我们分别研究了各组患者 AD 血浆生物标志物（Tau、P-tau181、Aβ40、Aβ42、Aβ42/Aβ40 ??ratio），并探讨了这些血浆生物标志物与默认网络功能连接以及基于全脑的 fALFF 之间的关系。我们还进行了组间比较，以探索与血浆生物标志物相关的神经影像生物标志物是否存在显著的组间差异。

结果 首发精神分裂症患者血浆 P-tau181 浓度在正常范围内，而 BD 和 MDD 患者血浆 P-tau181 浓度明显高于健康对照组。与对照组相比，精 FES 组和 BD 患者组 Aβ40 和 Aβ42 升高，Aβ42/Aβ40 比值降低（Table 1）。在 BD 受试者中，P-tau181 水平升高与 DMN 完整性（后扣带皮层与双侧顶下小叶静息态功能连接）下降有关，尤其是该网络的后部（图 1）。FES 组血浆 P-tau181 与舌回 fALFF 值及双侧舌回功能连接呈正相关（图 2）。在 MDD 和对照中，我们未发现血浆生物标志物与 DMN 完整性和 fALFF 值之间存在任何显著相关性。在 BD 组中，我们发现 PCC 和右顶下小叶之间的 rs-FC 与 TMT-B 时间呈负相关（表 2）。

结论 我们的研究结果表明，在 FES 和 BD 患者中，血浆 P-tau181 和静息态功能活动之间的关联脑区与 AD 受损的大脑区域高度重合，特别是默认模式网络的后部，以及视觉感知区域。我们的结果可能提示严重精神疾病患者大脑中存在神经元纤维缠结与 β 淀粉样变性。

Childhood Abuse Influences Clinical Features of Major Depressive Disorder by Modulating The Functional Network of The Right Amygdala Subregions

Suzhen Chen[1], Yingying Yin[1], Yuqun Zhang[2], Wenhao Jiang[1], Zhenghua Hou[1], Yonggui Yuan[1]
1.Department of Psychosomatics, ZhongDa Hospital, School of Medicine, Southeast University
2.School of Nursing, Nanjing University of Chinese Medicine

Objective Childhood trauma and the amygdala play important roles in major depressive disorder (MDD) mechanisms. However, the neurobiological mechanism among them remains unclear. We aimed to explore the relationship among the amygdala subregion's abnormal functional connectivity (FC), clinical features, and childhood trauma in MDD.

Methods We obtained resting-state functional magnetic resonance imaging (fMRI) in 115 MDD patients and 91 well-matched healthy controls (HC). Amygdala subregions were defined according to the Human Brainnetome Atlas. The case vs. control difference in FCs was extracted. The mediation between the detected abnormal FCs and clinical features were analyzed.

Results Compared with HC subjects, only the right amygdala subregions, namely the right medial amygdala (mAmyg.R) and the right lateral amygdala (lAmyg.R), showed a significant decrease in whole-brain FC in MDD patients (PFDR<0.01). Only childhood abuse experiences were significantly associated with amygdala subregions connectivity and clinical features in MDD patients. Additionally, The FCs between the right medial amygdala and extensive frontal, temporal, and subcortical regions mediated between the early life abuses and disease onset or treatment outcome.

Conclusion The findings indicate that the abnormal connectivity of the right amygdala subregions is involved in MDD's pathogenesis and clinical characteristics.

Objective Childhood emotional neglect (EN) is a risk factor for abnormal brain development, neurocognitive impairment, and subsequent major depressive disorder (MDD), while social support is a protective factor. However, the exact links among them remain unclear. This study aimed to investigate the mediating factors between EN and MDD and whether combining multi-indicator could help diagnose MDD.

Methods Regional homogeneity (ReHo) of spontaneous brain activity and clinical features were compared between 33 MDD patients and 36 healthy controls (HC). Mediation analysis was employed to explore whether social support or ReHo mediates the association between EN and MDD. The linear discriminant analysis model was constructed with EN, social support, and ReHo, and applied to distinguish MDD from HC in both primary and replication cohorts.

Results Compared with HC, MDD patients experienced severer EN and poorer social support, and exhibited lower ReHo in the left middle occipital gyrus and bilateral postcentral gyrus, and higher ReHo in right cerebellum crus1. EN could affect MDD directly and indirectly through ReHo in these discrepant brain regions and social support. Combining ReHo values of these four distinct brain regions, EN, and objective support could classify MDD patients from HC, and the 10-fold cross-validation accuracy within-study replication and in the independent cohort was 83.78%±1.49% and 82.72%±2.22%, respectively.

Conclusion These findings suggested that childhood EN, social support, and emotional-related regions' ReHo were associated with risks of MDD, providing new insights into the pathological mechanisms underlying MDD. Combining EN, objective support, and ReHo of spontaneous brain activity could help diagnose MDD.

3.苏州市广济医院

Objective Accumulating evidence has indicated that oxidative stress (OS) and matrix metalloproteinase-9 (MMP-9) may contribute to the mechanism of schizophrenia. In the present study, we aimed to evaluate the associations of OS parameters and MMP-9 levels with psychopathological symptoms in male chronic schizophrenia patients.

Methods Plasma hydrogen peroxide (H2O2), malondialdehyde (MDA), superoxide dismutase (SOD), catalase (CAT), glutathione peroxidase (GSH-Px), serum matrix metalloproteinase-9 (MMP-9), and tissue inhibitors of metalloproteinases-1 (TIMP-1) levels were assayed in 80 male patients with chronic schizophrenia, composed of 31 treatment resistant schizophrenia (TRS) and 49 chronic stable schizophrenia patients, and 80 matched healthy controls. Schizophrenia symptoms were assessed by the Positive and Negative Syndrome Scale (PANSS).

Results Our results demonstrated that levels of antioxidant enzymes, SOD, GSH-Px, H2O2, and MDA were significantly decreased, whereas CAT and MMP-9 levels were increased in patients with schizophrenia, when compared with healthy controls. In schizophrenia patients, correlation analyses showed that H2O2 levels were significantly and positively correlated with PANSS positive scores, CAT and MDA levels were significant negatively correlated with PANSS negative scores and PANSS total scores, and MDA levels were significantly positively correlated with MMP-9 levels (all $P < 0.05$). However, we did not find that MMP-9 played an interaction role between OS parameters and PANSS total scores and subscales scores (all $P > 0.05$). Furthermore, plasma CAT activities were independent risk predictors for TRS.

Conclusion Our results showed that alterations of plasma OS parameters in male patients with chronic schizophrenia were associated with psychopathology and MMP-9. Moreover, CAT levels may have an independent predictive value for TRS.

精神病性障碍早期视空间认知缺陷特征及皮层干预靶点

崔慧茹 唐晓晨 徐丽华 钱禛颖 朱田园 唐莺莹 李春波 王继军*
上海交通大学医学院附属精神卫生中心

目的 针对精神分裂症认知功能缺陷的难治性现状，课题组策略：一是前移治疗窗口早干预，选择早期患者为干预对象，包括精神病临床高危综合征（CHR）和首发精神分裂症（FES）；二是针对性选择与精神病发作密切关联的特定认知领域，基于相关病理性脑神经环路进行精准干预。本研究选择与精神病发作密切相关的视空间认知功能，基于其病理性神经环路、采用重复经颅磁刺激（rTMS）进行个体化精准干预研究。

方法 使用随机双盲安慰剂对照的研究设计，纳入 CHR 和 FES 患者作为干预对象，随机分为 rTMS 真刺激组和伪刺激组。基于视空间认知功能缺陷的病理性神经环路“顶叶-海马回路”，根据每个被试的海马-下顶叶的局部最大功能连接确定皮层干预靶点，采用 20Hz 高频 rTMS 干预左下顶叶、进行个体化精准干预 2 天 10 个疗程，并在干预前后采集神经影像学数据，明确 rTMS 对视空间认知功能的干预疗效、探索 rTMS 疗效的生物学机制。

结果 110 例患者随机分为 rTMS 真伪刺激两各组 55 例，两组患者在人口学及临床学特征方面匹配；真刺激组 52 例和伪刺激组 47 例患者完成了 rTMS 干预及干预前后的认知功能评估，结果显示 rTMS 精准干预左下顶叶对视空间认知功能的效应优于伪刺激对照组，时间和组别交互作用显著（$F=6.873$，$p=0.01$）；真刺激组 48 例和伪刺激组 38 例患者完成了 rTMS 干预、干预前后的认知功能评估及干预前后的神经影像扫描，使用多变量距离矩阵回归（MDMR）算法分析发现视空间认知功能与双侧角回脑区活动显著相关；分别以双侧角回为感兴趣种子点，进行与全脑体素的功能连接分析：右侧角回与左侧枕叶、右侧眶额、右侧额下回、右侧额上回之间的功能连接与认知分数存在显著负向关联；对上述四组功能连接在干预前后的变化值与认知变化值进行相关分析，真刺激组存在右侧角回与左侧枕叶的功能连接变化与认知变化之间存在显著负相关（$r=-0.31$, $p=0.04$），提示 rTMS 干预机制与降低右侧角回与左侧枕叶的功能连接有关。

结论 研究确定了能有效改善视空间认知缺陷的 rTMS 皮层干预靶点，具有临床转化价值和理论研究意义。

3.苏州大学

Objective In this study, the hypothesis that the blood serum levels of the five serum neuropeptides in chronic stable schizophrenia patients (CSS), treatment-resistant schizophrenia patients (TRS) and healthy controls (HC) would be related to cognitive functions was investigated.

Methods In this study, three groups were assessed: 48 CSS and 29 TRS (case groups) who were hospitalised in the regional psychiatric hospitals (i.e. Lianyungang Fourth People's Hospital) and 53 HC (control group). All participants above were enrolled. the blood serum levels of α-MSH, β-Endorphin (BE), Neurotensin (NT), Oxytocin (OT), and Substance.P (S.P) were measured. Psychiatric symptoms in schizophrenia patients were assessed with the Positive and Negative Syndrome Scale (PANSS). The cognitive ability of SZ and HC was measured with the Repeatable Battery for the Assessment of Neuropsychological Status (RBANS) Chinese version.

Results TRS had significantly higher PANSS total and subscale scores than CSS patients (all $P<0.05$). SCZ performed worse than HC in total score and all subscales of the RBANS (all $P<0.05$). The levels of the above five serum neuropeptides were significantly higher in SCZ than in HC (all $P<0.05$). The levels of OT ($F=3.363$, $P=0.003$) and S.P ($F=2.753$, $P=0.011$) were significantly higher in CSS than in TRS patients. The α-MSH levels in TRS patients was significantly and negatively correlated with the language score of RBANS ($r=-0.398$, $P=0.032$). However, the BE levels ($r=0.294$, $P=0.043$) and NT levels ($r=0.288$, $P=0.047$) in CSS patients were significantly and positively correlated with the visuospatial/constructiona score of RBANS. Moreover, the NT levels were significantly and positively correlated with the BE levels ($r=0.870$, $P=0.000$) in the CSS patients, and the interaction effect of the NT and BE levels was positively associated with the visuospatial/constructiona score of RBANS ($r=0.299$, $P=0.039$).

Conclusion Our results that the lower cognitive levels and higher serum neuropeptides levels in male patients with chronic SCZ suggest that abnormally increased serum neuropeptide levels may be associated with the physiology of SCZ, and it may cause cognitive impairment and psychiatric symptoms, especially in patients with TRS.

精神分裂症患者眼动异常及其与认知功能障碍的关系

王肖依 王莹 吴仁容 赵靖平*
中南大学湘雅二医院

目的 精神分裂症患者同时存在认知功能受损和眼动异常，但它们之间的联系目前仍未阐明。在本研究中，我们探索了认知功能与眼动之间的关系。

方法 本研究中共纳入精神分裂症被试 97 例、健康对照 82 例。所有被试均完成人口学资料的采集，同时还包括 2 个眼动任务测试（注视稳定性、李萨如平滑眼追踪），以及认知功能测试（使用 MCCB 工具测试，包括 7 个测试覆盖 5 个认知领域）。其中，眼动任务中注释稳定性测验包括简单模式和干扰模式，李萨如平滑眼追踪包括低速、高速和复杂背景 3 个模式。

结果 精神分裂症患者在信息处理速度、工作记忆、词语学习、视觉学习、问题解决和推理 5 个认知领域评分均较健康对照组显著下降（$p<0.001$）。同时，精神分裂症患者较健康对照在眼动测验中存在广泛的眼动异常（$p<0.05$）。在精神分裂症患者中，眼动异常与认知功能障碍的关系主要存在与视觉学习领域与注

释稳定性的干扰模式（包括注视点个数、注视时长、眼跳幅度、眼跳距离，其中注视时长为正相关，其余均为负相关）和李萨如平滑眼追踪 3 个模式的垂直位置差（均为负相关）。

结论 本研究中探索了精神分裂症患者的眼动测量视觉探索和认知功能之间的关系。患者在视觉领域的功能受损与眼动测量之间存在显著的联系，表明视觉学习功能受损越严重，患者在视觉探索任务中表现越差。

Association between Body Mass Index and Suicide Attempts in Chinese Patients with First-episode Drug-na?ve Major Depressive Disorder

刘军军[1] 杜向东[2]
1.上海梅山医院
2.苏州市广济医院

Objective In patients with major depressive disorder (MDD), the relationship between body mass index (BMI) and risk of suicide attempts (SA) remains unclear, and findings are controversial. The aim of this study was to investigate the relationship between BMI and SA in a Chinese population with first-episode drug-na?ve (FEDN) MDD.

Methods A total of 1718 patients with FEDN MDD were enrolled in this cross-sectional study. Their socio-demographic characteristics as well as anthropometric data were collected. The 17-item Hamilton Rating Scale (HAMD-17) and Hamilton Anxiety Scale (HAMA) were used to assess the severity of depression and anxiety symptoms in all participants. Thyroid hormones, lipid profile, and fasting blood glucose (FBG) were measured. A history of suicide attempts was verified based on medical records and interviews with patients and their family members. Multiple logistic regression analysis was used to estimate the association between BMI and the risk of SA. Threshold effects were examined by a two-piecewise logistic regression model.

Results Multiple logistic regression analysis showed that BMI was independently and negatively correlated with SA (OR = 0.91, 95%CI: 0.85 to 0.98, P = 0.014) in patients with FEDN MDD after adjusting for covariates. Smoothing plots also revealed a non-linear (L-shaped) relationship between BMI and SA, and a two-piecewise logistic regression model was used to calculate the inflection point of BMI as 22.1 kg/m2. On the left of the inflection point, a negative association between BMI and SA was detected (OR = 0.54, 95%CI: 0.42 to 0.70, P< 0.001), while no significant association was observed on the right side of the inflection point (OR = 1.01, 95%CI: 0.93 to 1.10, P = 0.750).

Conclusion Our results suggest that lower BMI is associated with a higher risk of SA in Chinese patients with FEDN MDD, especially in those with BMI below 22.1 kg/m2.

关键字：Key words: association, suicide attempt, major depressive disorder, non-linear relationship

有自残行为和无自残行为的双相障碍患者认知功能的差异研究

胡茂林[1] 贺振祥[1] 杜隆彬[1] 殷淑娴[2] 董黎[2] 宗小芬[1]
1.武汉大学人民医院
2.孝感市康复医院

目的 研究表明双相情感障碍有自残行为和无自残行为的人在临床症状以及认知功能等多方面存在差异，但既往研究尚未有一致性结论。本研究采用他评与自评量表以及认知功能评估表 MCCB 来对两类患者进行症状及认知功能评

方法 250 名受试者（有自残行为的双相障碍患者 85 人，没有自残行为的双相患者 52 人和正常对照组 113 人）完成了一组关于病情严重的他评（HAMD、HAMA、BPRS 和 YMRS）和自评量表（PHQ-9，SHAPS，GAD-7，匹兹堡睡眠量表，失眠严重程度量表，大五人格量表，CTQ,人际关系量表，功能失调态度量表，MDQ，社会支持量表）以及认知功能的评估。采用 t 检验、非参数检验、方差分析等统计学方法来评估比较人口学资料、患者的症状严重程度和认知功能差异。

结果 与对照组相比，双相自残组在 PHQ-9、GAD-7、匹兹堡睡眠量表、失眠严重程度、CTQ、人际关系、功能失调态度、MDQ 评分较高（P<0.05)；在 SHAPS、大五人格、社会支持、部分认知功能（BACS SC、NAB Mazes、MSCEIT ME、CPT-IP）上评分明显较低（P<0.05）；在 HVLT、BVMT 上无明显差异（P>0.05)。与对照组相比，双相非自残组在 PHQ-9、GAD-7、匹兹堡睡眠、失眠严重程度、CTQ、人际关系、功能失调态度量表评分较高（P<0.05)；在 SHAPS、大五人格、部分认知功能（BACS SC、HVLT、NAB Mazes、BVMT、CPT-IP）上评分较低（P<0.05）；在社会支持、MSCEIT ME 上无明显差异（P>0.05)。与双相非自残组相比，双相自残组在 PHQ-9、GAD-7、人际关系、功能失调态度、HAMD、HAMA，认知功能 BVMT 上评分较高（P<0.05）；在 SHAPS、社会支持、YMRS 上评分较低（P<0.05）；在匹兹堡睡眠、失眠严重程度、大五人格、CTQ、MDQ、BPRS，认知功能（TMT-A、TMT-B、BACS SC、HVLT、NAB Mazes、BVMT、MSCEIT ME、CPT-IP）上无明显差异（P>0.05）。

结论 与对照组相比，双相障碍患者存在认知功能损害。有自残行为的双相障碍患者其快感缺失程度和抑郁程度比无自残行为的双相障碍患者要高，并且其认知功能的损害相较于无自残行为的双相障碍患者更严重。社会支持差的双相患者自残行为发生率高。

光照联合经颅磁刺激治疗抑郁症快速起效的探索性研究

李坤[3] 邓伟[2]
1.杭州市第七人民医院
2.山东省戴庄医院

目的 抑郁症是一种发病率高、自杀率高的精神疾病，目前临床药物治疗起效慢、疗效有限。因此，本研究结合临床治疗的重大需求，针对无创神经调控如何产生协同效应的科学问题，探索光照联合经颅磁刺激（Transcranial magnetic stimulation, TMS）快速起效治疗抑郁症，以及在不同 TMS 靶点的疗效差异。

方法 采用随机单盲对照的研究设计，纳入100例抑郁症受试者，随机分为四组，包括药物组（对照组）、药物+光照组、药物+光照+TMS（前额叶）组、药物+光照+TMS（枕叶）组。临床治疗方案为：光照治疗采用 10000 Lux 强度的白光，每次 30 分钟；TMS 治疗在光照治疗前 20 分钟内，采用间歇性 θ 频段爆发式脉冲刺激模式，根据组别不同靶点分别为左侧背外侧前额叶和左侧枕叶，每次 1200 个脉冲；抗抑郁药物使用限制为选择性5-羟色胺再摄取抑制剂；干预疗程为5天，每天 1 次。主要结局指标为有效率，定义为汉密尔顿抑郁量表（Hamilton Depression Scale, HAMD）减分率≥50%。

结果 药物+光照+TMS（枕叶）组、药物+光照+TMS（前额叶）组、药物+光照组、药物组四组间的有效率具有统计学差异，分别为 66.7%、66.7%、40%、33.3%；缓解率具有统计学差异，分别为 45.8%、41.7%、8.0%、8.3%。通过协方差分析，四组干预后 HAMD 评分（F = 3.917, P = 0.011）、汉密尔顿焦虑量表躯体性焦虑因子分（F = 2.878, P = 0.040）、贝克自杀意念量表评分（F = 3.639, P = 0.016）、自杀意念强度因子分（F = 4.071, P = 0.009）、自杀风险因子分（F = 3.639, P = 0.016）、斯奈思—汉密尔顿快感量表总分（F = 3.293, P = 0.024）、交往/感觉因子分（F = 2.808, P = 0.044）、兴趣/饮食因子（F = 3.539, P = 0.018）分存在统计学差异。枕叶联合治疗组和前额叶联合治疗组在改善抑郁症状、自杀严重度、快感缺失症状方面均优于药物组，其中药物+光照+TMS（枕叶）组在改善焦虑上优于药物+光照组。

结论 研究发现枕叶联合治疗组和前额叶联合治疗组两种神经调控方式都能够在短期内快速起效，有效改善了快感缺失症状。

关键字：抑郁症；光照治疗；经颅磁刺激；快速起效

鱼油补充治疗对抑郁症患者骨转化标志物的影响：一项双盲随机对照研究

汪露[1] 金坤[2] 滕紫薇[2] 唐慧[2] 王菲菲[1] 董芳[1] 陈晋东[2]
1.首都医科大学附属北京安定医院
2.中南大学湘雅二医院

目的 探讨首诊未用药抑郁症患者骨转化标志物的变化，并进一步探索鱼油辅助治疗对抑郁症患者骨转化标志物的影响。

方法 横断面研究中纳入 139 名首诊未用药抑郁症患者和 55 名健康对照。采用 Mann-Whitney U Test 对抑郁症组和对照组的骨转化标志物包括：β-胶原特殊序列（β-Cross Laps，CTX）、降钙素（thyrocalcitonin，hCT）、骨钙素（osteocalcin，OC）、甲状旁腺激素（parathyroid hormone，PTH）以及 I 型原胶原 N 端前肽（Type I procollagen N-terminal pre-peptide，PINP）进行比较。随访研究为 n-3 多不饱和脂肪酸（n-3 poly-unsaturated fatty acids, n-3 PUFAs）辅助文拉法辛治疗抑郁症的随机双盲安慰剂对照临床试验。横断面研究中有 72 名首诊未用药抑郁症患者参与临床试验，采用随机数字表法将受试者分为安慰剂组和鱼油组。分别在基线、治疗后 4 周以及治疗后 12 周进行随访评估。本研究为该临床试验的二次分析，采用广义估计方程（generalized estimating equation，GEE）来分析骨转化标志物在治疗前后的变化。

结果 首诊未用药抑郁症患者血清的 PINP 水平跟健康对照相比较显著升高（z=2.233，p=0.026）。分别在基线和治疗后12周对安慰剂组和鱼油组的骨转化指标进行组间比较，发现鱼油组和安慰剂组 CTX（Wald χ2=4.848，p=0.028）、OC（Wald χ2=6.178，p=0.013）和 PINP（Wald χ2=3.759，p=0.053）的组间差异具有统计学意义。分别在安慰剂组和鱼油组对不同随访时点的骨转化指标进行重复测量时间比较，发现 CTX（Wald χ2=7.188，p=0.007）的差异具有统计学意义。进一步进行简单效应分析后发现，治疗后 12 周的安慰剂组与鱼油组的 OC 及 PINP 水平存在统计学差异，鱼油组均高于安慰剂组（P＜0.05）；而在安慰剂组中，治疗后 12 周 CTX 和 OC 水平与基线相比较均降低（P＜0.05）。

结论 首诊未用药抑郁症患者骨形成标志物增加，文拉法辛抗抑郁治疗能同时降低抑郁症患者的骨吸收和骨形成标志物，而 n-3 PUFAs 辅助治疗能升高骨形成标志物。

关键字：抑郁障碍；n-3 多不饱和脂肪酸；骨转化标志物；骨形成；骨吸收。

Prediction of The Antipsychotic Efficacy by Polygenetic Risk Scores Based on Therapeutic-response Related Brain Indices

Zhe Lu Weihua Yue*
Peking University Sixth Hospital, Peking University Institute of Mental Health

Objective Polygenic risk scores (PRS) and some neuroimaging biomarkers have been proved related to schizophrenia. In this study, we aimed to predict the antipsychotic efficacy by combination of neuroimaging and genetic factors.

Methods A total of 2674 patients with schizophrenia were included, 2298 of which from CAPOC cohort were enrolled as discovery cohort, and the remained 376 patients were set as validation cohort (286 from CAPEC cohort and 87 from the Xinxiang cohort). We firstly conducted the GWAS with PANSS reduction rate as phenotype in the discovery cohort. Then the Mendelian randomization studies were conducted to detect therapeutic-response related brain indices, with 3144 brain imaging phenotypes (summary data from GWASs of brain imaging phenotypes in UK Biobank) as exposure and antipsychotic efficacy (summary data from the GWAS result in CAPOC cohort) as outcome. Next, the PRSs based on GWASs of therapeutic-response related brain indices were calculated. Finally, we compared the PRSs between treatment response (TR) group and Non-TR group.

Results Seven therapeutic-response related brain indices were found, including volume of grey matter in left supracalcarine cortex (ubm-a-118, P_FDR = 0.027), volume of grey matter in left cuneal cortex (ubm-a-88, P_FDR = 0.029), mean L3 in medial lemniscus (right) on FA skeleton (ubm-a-445, P_FDR = 0.037), volume of grey matter in right lateral occipital cortex, superior division (ubm-a-69, P_FDR = 0.037), functional connectivity of bilateral anterior cuneus and bilateral angular gyrus (ubm-a-2323, P_FDR = 0.037), volume of grey matter in right central opercular cortex (ubm-a-109, P_FDR = 0.042), and mean thickness of posteriorcingulate in the right hemisphere (ubm-a-3053, P_FDR = 0.046). In discovery cohort, the difference of PRS based on ubm-a-109 was significant between early-TR group and Non-early-TR group (P = 0.043). We also detected the differences of the PRSs in first-episode patients and recurrent patients separately. In first-episode patients, the PRS based on ubm-a-88 was significant between early-TR group and Non-early-TR group (P = 0.047), and the PRS based on ubm-a-445 was significant between TR group and Non-TR group (P = 0.046). In recurrent patients, the PRS based on ubm-a-109 was significant between early-TR group and Non-early-TR group (P = 0.011), which was in consistent with the result in whole sample, and the PRS based on ubm-a-3053 was significant between TR group and Non-TR group (P = 0.048). As for CAPEC cohort, the PRS based on ubm-a-109 was significant between early-TR group and Non-early-TR group (P = 0.032) in first-episode patients. As for Xinxiang cohort, the PRSs based on ubm-a-109 (P = 0.012) and ubm-a-445 (P = 0.037) were significant between TR group and Non-TR group.

Conclusion The potential clinical utility of these findings warrants further investigation of these effects in patients receiving single medication.

What Somatization Symptoms in Patients with Digestive Disease Could Be Signs of The Risk of Anxiety and Depression

Yan Xu[1], Yue Zhao[2,4], Qiong Lian[4], Haiyan Zeng[3], Xinli Chia[2,4]
1.十堰市人民医院
2.深圳大学
3.深圳大学总医院
4.广东省精神卫生中心

Objective :Anxiety and depression symptoms are highly prevalent in patients with digestive diseases.Comorbidity emotional problem can exacerbate physical suffering and exert direct impacts on life quality of patients with physical disease.Solving these problems depends on the physician's awareness of anxiety and depression.Some symptoms of emotional problem are expressed through somatization which increase the difficulty to be diagnosed. The current study aimed to explore the interaction pattern between somatization and emotional problem from a symptom perspective, hoping to identify characteristic symptoms from anxiety and depression in patiens with digestive diseases and help physicians improve the ability to diagnose physical -mental Comorbidity.

Method This study investigated the interaction relationship between somatization and anxiety and depression in a sample of Chinese patients diagnosed with chronic digestive disease at Shiyan First Hospital in Hubei province (N = 960, 56.6% females; M age = 36.9, SD age = 9.7, range: 18-63) using network analysis. The Symptom Checklist-90 was used to assess somatization, anxiety, and depression. Graph Gaussian Model was utilized to estimate the regularized correlation network structure.

Results It revealed that anxiety symptoms “feeling so restless that couldn’t sit still” and “feeling that familiar things are strange or unreal” and depression symptoms “feeling of being trapped or caught” were central symptoms within their symptom communities.Somatization symptom “a lump in the throat” was the key symptom to activate anxiety or depression symptoms. Meanwhile, somatization symptoms “trouble getting in the breath” and “numbness or tingling in parts of the body” were important somatization symptoms correlated with central anxiety symptoms, and “heavy feelings in arms or legs” and “soreness of muscles” were highly connected with central depression symptoms.

Conclusion These findings provided a novel perspective on what somatization symptoms should be considered for the detection of anxiety or depression in digestive patients.

精神病临床高危与首发患者错误监控缺陷通过解体症状与临床自知力对社会功能的间接影响

徐丽华 洪祥飞 唐莺莹 崔慧茹 魏燕燕 钱禛颖 唐晓晨 胡业刚 张天宏 王继军*
上海市南汇区精神卫生中心

目的 社会功能对维持心理健康至关重要。社会

功能缺陷是独立于精神分裂症患者临床状态的长期显著特征，也是精神病临床高危被试转化的风险因素。错误监控在人们适应社会生活中起着关键作用，研究表明错误监控功能缺陷可能是孤独症患儿社会功能缺陷的基础。本研究旨在观察错误监控功能（由错误相关负波（ERN）的振幅大小表示）对精神病临床高危与首发临床队列的社会功能的直接（DE）和间接影响（IDE）。

方法 本研究招募 100 例临床队列被试（包括精神病临床高危与首发患者）和 49 例健康对照，记录他们在一项 Flanker-Go/NoGo 任务中的头皮脑电信号，检测 ERN 幅值。临床评估采用阳性和阴性综合征量表（PANSS）、自知力评估量表（SAI）和总体功能的社会和角色量表。使用 R 软件的“lavaan”包进行路径分析。

结果 与健康对照组相比较，临床队列组的 ERN 负向幅值显著减小（F1, 145=19.58, p<0.001，partial ?2 = 0.12, 95%CI: 0.04–0.22）。相关分析表明，ERN 幅值、PANSS 的解体症状因子、临床自知力总分、社会功能之间存在显著相关关系（p<0.05）。然而，路径分析结果显示 ERN 对当前社会功能的直接影响不显著（DE:?0.071, p=0.341），但通过 PANSS 的解体症状因子（IDE: -0.139, p=0.009）与临床自知力总分（IDE: -0.085, p=0.041）对社会功能有间接影响。

结论 本研究首次借助事件相关电位挖掘从精神病前驱期至精神病首发阶段社会功能缺陷的脑电生理机制，以期为早期改善患者社会功能、降低精神病高危群体的转化率提供靶向干预措施。研究表明错误监控功能与社会功能相关显著，但患者的解体症状与自知力水平在其中发挥着完全中介效应，提示针对错误监控功能的溯源脑区进行靶向干预，也许能改善患者的解体症状并提高患者的自知力，进而提高患者的社会功能。

童年期创伤、BDNF 水平与首发精神分裂症认知功能、大脑皮层厚度的相关性研究

王蕾蕾 周衍芳 黄隽超 谭云龙*
北京回龙观医院

目的 探究童年期创伤与首发精神分裂症患者的 BDNF 水平、认知功能、大脑皮层厚度之间的相关性

方法 本课题采用病例对照研究的方法。入组符合《美国精神障碍诊断与统计手册第 4 版》（DSM-IV）诊断标准的首发 SCZ 患者，采用童年期创伤问卷（CTQ）评估童年期创伤经历、阳性和阴性症状量表（PANSS）评估患者的精神病理症状；应用 MCCB 评估认知功能水平，并对符合条件的研究对象进行 MAGNETOM Prisma 3.0T 磁共振扫描测量大脑皮层厚度；采用酶联免疫吸附法测定血浆 BDNF 浓度。共有首发 SCZ 患者 124 例及性别、年龄与之匹配的健康对照 103 例完成认知功能评估和核磁共振成像扫描，纳入此研究分析。比较认知功能、大脑皮层厚度的组间差异，并采用偏相关分析探究首发 SCZ 患者的童年期创伤、BDNF 水平、差异脑区皮层厚度、认知功能之间的相关性，根据相关分析结果，采用中介效应模型探讨童年期创伤、大脑皮层厚度、认知功能之间的关系。

结果 2. 首发 SCZ 患者的 MCCB 总分及各个维度得分显著低于健康对照组（均 P<0.007）。与健康对照相比，首发 SCZ 患者的左右侧大脑皮层平均厚度及多个脑区的皮层厚度显著降低（均 P<0.00034）。首发 SCZ 患者皮层厚度异常与童年期创伤、认知功能存在相关性。经 Bonferroni 多重校正后只有情感忽视与右侧梭状回皮层厚度仍存在显著的负相关性（r=-0.29，P=0.001）。经校正后左侧梭状回皮层厚度（r=0.33，P=2.244×10-4）和言语学习和记忆、右侧枕颞侧沟皮层厚度（r=0.29，P=0.001）与加工速度以及右侧梭状回皮层厚度与言语学习和记忆（r=0.33，P=2.131×10-4）、加工速度（r=0.30，P=0.001）、MCCB 总分（r=0.30，P=0.001）仍存在显著的正相关性。BDNF 水平与首发 SCZ 患者的认知功能、大脑皮层厚度均没有相关性。中介效应分析表明，右侧梭状回皮层厚度在情感忽视和 MCCB 总分、言语学习和记忆中起到中介作用。

结论 年期创伤与首发 SCZ 患者的认知缺陷、大脑皮层厚度变薄有关，BDNF 水平与这两者均无显著的相关性。大脑皮层厚度能够影响首发 SCZ 患者的认知功能。右侧梭状回皮层厚度变薄在情感忽视和认知缺陷，尤其是言语学习和记忆受损中起到中介效应。

基于加权基因共表达网络分析的抑郁症患者转录组学研究

王敏 杨潇 马小红*
四川大学华西医院

目的 抑郁症（Major Depressive Disorder, MDD）是全球致残的主要原因之一，然而 MDD 的病因机制尚不清楚。既往研究显示多种基因在共表达网络中的相互作用可能参与了 MDD 的病理生理过程。

方法 本研究纳入 137 例 MDD 患者，和年龄、性别、体重指数匹配的健康对照 131 例。检测外周静脉的血转录组学指标，使用加权基因共表达网络分析（weighted gene co-expression network analysis，WGCNA）识别与 MDD 疾病相关的模块，使用京都基因与基因组百科全书（Kyoto Encyclopedia of Genesand Genomes, KEGG）和基因本体论（Gene Ontology, GO）两个数据库对差异的模块进行功能富集，同时寻找关键（Hubgene, Hub）基因。差异指标经过 FDR 多重比较校正，q<0.05 表示差异具有统计学意义。

结果 经质控后纳入 10769 个基因进行分析。WGCNA 共识别出 3 个与 MDD 相关的模块，分别是黄色模块包含 1183 个基因（r=0.21, P=0.0006），绿色模块包含 858 个基因（r=-0.17, P=0.005），淡绿色模块包含 51 个基因（r=0.18, P=0.003）。经 GO 和 KEGG 富

集分析，黄色模块主要富集到 SAPK 信号通路、 PRR 信号通路、Toll 样受体信号通路、IL-6 产生过程、Notch 信号通路、NF-κB 信号通路、Th17 细胞分化、疱疹病毒感染等炎症免疫过程相关通路等。绿色模块主要富集到 RNA 代谢、线粒体基因表达、细胞呼吸等生物调控相关过程，以及帕金森病、亨廷顿病、非酒精性脂肪肝、糖尿病性心肌病等神经退行性疾病和代谢性疾病相关的通路。黄色模块识别出 3 个 Hub 基因，分别是 KPNB1、 KPNA4、PSEN1，绿色模块识别出 5 个 Hub 基因，分别是 RPS15A、RPS21、 RPL27A、RPL5 和 RPL7A。

结论 MDD 患者的炎症、免疫、神经发育与凋亡相关的基因在转录过程中存在异常表达，KPNB1、KPNA4、PSEN1、RPS15A、RPS21、 RPL27A、RPL5 和 RPL7A 是与 MDD 相关的 Hub 基因，可能参与 MDD 的发生发展。

抗炎药治疗重度抑郁症的疗效和可接受性研究：一项系统综述和网络荟萃分析

杜玥 窦翊愷 杨潇 王瑜 王敏 马小红*
四川大学华西医院心理卫生中心

目的 虽然抗炎药物被认为具有潜在的抗抑郁作用，但仍缺乏比较不同抗炎药物抗抑郁作用的充分证据。近年来，抗炎药物的抗抑郁作用受到广泛关注，新的试验不断更新证据。我们使用最新证据进行网络荟萃分析（NMA），比较不同抗炎药物对重度抑郁症的影响。

方法 我们检索了 PubMed、Embase、Web of Science 、 Cochrane Review 、 Cochrane Trial 和 ClinialTrails.gov 数据库，并筛选符合条件的随机临床试验。研究纳入了包含 ω-3 脂肪酸、非甾体抗炎药（NSAIDs）、吡格列酮、米诺环素、N-乙酰半胱氨酸（NACs）、他汀类药物、皮质类固醇和单克隆抗体在内的抗炎药物。本荟萃分析的主要结果指标是疗效和可接受性，次要结果指标是缓解率和因副作用而退出试验的比率。我们计算了比值比（OR）和 95%置信区间（95%-CI）。本研究计划已在 PROSPERO（CRD42023422004）注册。

结果 共纳入 48 项研究。在疗效方面，抗炎药物（OR=2.04，95% CI：1.41-2.97，p=0.0002）与安慰剂相比表现出显著的抗抑郁作用。亚组分析显示，吡格列酮（OR=28.50，95% CI：3.16-257.44，p=0.003）、NACs（OR=1.97，95% CI：1.06-3.65，p=0.03）、皮质类固醇（OR=9.92，95% CI：1.08-91.47，p=0.04）和他汀类药物（OR=4.41，95% CI：1.33-14.60，p=0.02）优于安慰剂。根据累积排名曲线下面积（SUCRA）值，吡格列酮（SUCRA 值=93.3）是对 MDD 患者抑郁症状最有效的抗炎药物。在可接受性方面，抗炎药物与安慰剂相似（OR=0.91， 95% CI：0.74-1.11， p=0.35），NSAIDs（SUCRA 值=81.6）具有最佳可接受性。此外，在敏感性分析中，他汀类（OR=4.41，95% CI：1.33-14.60）表现出稳定的抗抑郁作用。

结论 抗炎药物表现出显著的抗抑郁作用和良好的可接受性。吡格列酮比其他药物更有效。NSAIDs 具有最佳的可接受性。然而，由于纳入研究数量和异质性的限制，上述结果必须谨慎解释。

Cognitive Benefits and Side Effects of Buspirone: A Systematic Review and Meta-Analysis

杜玥 杨潇 王敏 王瑜 樊宁丹 马小红*
四川大学华西心理卫生中心

Objective Cognitive impairment is a common symptom of various diseases, yet effective treatment methods remain elusive. Buspirone, a 5-hydroxytryptamine 1A (5-HT1A) receptor agonist, is believed to have potential cognitive benefits. However, no studies have explored the potential benefits and overall effects of buspirone on different cognitive domains, as well as its potential side effects. To address this gap, we conducted a systematic review and meta-analysis to investigate the potential cognitive benefits of buspirone in different domains, while also examining the possibility of side effects.

Methods We searched the PubMed, Embase, Web of Science, Cochrane Review, Cochrane Trial and ClinialTrails.gov databases and screened for eligible randomized clinical trials. The primary outcome measures of this meta-analysis were cognitive benefits and side effects (adverse events), and the secondary outcome measures were acceptability and dropout rate due to side effects. We used effect size and 95% confidence interval (95% CI) to present the continue results and used odds ratio (OR) and 95% CI to present the binary results.

Results total of 16 studies were included. In terms of cognitive benefits, buspirone (g=0.20, 95%CI: 0.06-0.34) showed significant cognitive benefits compared to placebo. Subgroup analysis showed that visual learning and memory (g=0.49, 95%CI: 0.21-0.78), logical reasoning (g=0.42, 95%CI: 0.14-0.71), and attention (g=0.37, 95%CI: 0.13-0.61) were superior to placebo. Buspirone showed higher rate of dizziness (OR=4.66, 95%CI: 2.07-10.47) than placebo. Meanwhile, there was no significant difference in acceptability (OR=1.11, 95% CI: 0.75-1.64) and dropout rates due to adverse events (OR=1.65, 95% CI: 0.77–3.52) between buspirone and placebo.

Conclusion In summary, we found that buspirone demonstrated significant cognitive benefits compared to placebo, particularly in the domains of visual learning and memory, logical reasoning, and attention. However, buspirone can cause side effects such as dizziness, constipation, and gastric distress. Nevertheless, there was no difference in acceptability and dropout rate due to adverse events between buspirone and placebo.

关键字：Buspirone, cognitive benefits, side effects

Plasma Exosomal CircRNA-miRNA-mRNA Network Construction and Its Diagnostic Efficacy Identification in First-episode Schizophrenia

杜鑫哲[1] 胡晓东[1] 高耀[1] 李忻蓉[1] 徐勇[2] 刘莎[1]
1.山西医科大学第一医院
2.太原市中心医院

Objective The exosomal of circRNA-miRNA-mRNA networks in first episode schizophrenia (FOS) have not reported yet. We constructed exosomal circRNA-miRNA-mRNA networks, and their diagnostic efficiency was examined in FOS.

Methods The expression level of exosomal circRNA, miRNA and mRNA derived from 10 FOS patients and 10 healthy controls (HC) was determined by high throughput sequencing. CircRNA-miRNA-mRNA networks was constructed based on differently expressed (DE)- circRNAs, miRNAs and mRNAs. Then 3 circRNA-miRNA-mRNA were selected for subsequent research. Expression level were validated using quantitative real-time (qRT)-PCR in 32 FOS and 31 HC. Finally, Receiver operating characteristic (ROC) analysis and correlations analysis were performed.

Results There were 26,194 DE-circRNA, 26 DE-miRNA, 2637 DE-mRNA in plasma exosome in FOS patients. Then the circRNA-miRNA-mRNA network consisting of 9 circRNA, 6 miRNA and 16 mRNA, were constructed. 3 network (chr15:93496587-93499879+ -- hsa-miR-20b-5p – ANKH, chr7:40037093-40087476+ -- hsa-miR-22-3p--C5orf24, chr19:17883266-17883550+ -- hsa-miR-502-3p -- B4GALT5) were selected for subsequent research. The expression level of 9 genes in validation data were consistent with results of the high-throughput sequencing. The AUC of the circRNA-miRNA-mRNA network was higher than circRNA, miRNA or mRNA alone in plasma exosome, and the AUC of mRNAs in plasma exosome was higher than mRNAs in peripheral blood. The expression level of chr15:93496587-93499879+, chr7:40037093-40087476+, hsa-miR-22-3p and B4GALT5 were correlated with the PANSS score.

Conclusion The exosomal circRNA-miRNA-mRNA in FOS were constructed, and they had the potential to be used as a biomarker for FOS.

抑郁症患者存在多个血常规炎性指标异常

朱晓昱 李然 谭云龙*
北京回龙观医院

目的 大量证据表明，免疫异常和炎症可能在抑郁症的病理生理学中发挥重要作用。本研究以血常规中中性粒细胞与淋巴细胞比值（NLR）、单核细胞与淋巴细胞比值（MLR）、血小板与淋巴细胞比值（PLR）和全身免疫炎症指数（SII）为炎症标志物，探讨炎症与抑郁之间的关系。

方法 本研究纳入 239 例抑郁症患者和 241 例健康对照者的全血细胞分析数据，进行横断面研究。抑郁症患者进一步按照诊断名称被分为三个亚组：伴有精神病症状的重度抑郁发作组、不伴有精神病症状的重度抑郁发作组和中度抑郁发作组。我们分析了参与者的中性粒细胞（NEU）、淋巴细胞（LYM）、单核细胞（MON）和血小板（PLT）计数，计算并比较了 NLR、MLR、PLR 和 SII 在各组之间的差异，并探讨了抑郁与这些炎性指标之间的关系。

结果 PLT、MON、NEU、MLR 和 SII 在抑郁症患者和对照组之间存在显著差异。三个抑郁症患者组的 MON 和 MLR 均显著高于正常对照组。两个重度抑郁发作患者组的 SII 显著高于正常对照组，中度抑郁发作组中的 SII 相比正常对照组呈增加趋势，但不显著。抑郁症患者各个亚组之间无显著差异。

结论 MON、MLR 和 SII 升高可作为抑郁症炎症反应的标志。这些指标在三组不同程度、不同临床特征的抑郁症患者亚组之间没有差异，意味着其不受临床症状和疾病阶段影响，可能是抑郁症的生物学指标。

3.广州市中西医结合医院

Objective A growing body of evidence showed that corticostriatolimic system dysfunctions were linked to suicide behaviors in individuals with major depressive disorder （MDD). However, the neurobiological mechanism that makes depressed youths more vulnerable to suicide is poorly understood. Therefore, this study aimed to investigate the functional connectivity pattern in depressed adolescents with prior suicide attempts.

Methods A total of 115 depressed adolescents with and without prior suicide attempts (SA) and 35 age-, education-, and gender-matched healthy controls underwent resting-state functional imaging (R-fMRI) scans. The dynamic FCS (dFCS) variability and static FCS (sFCS) metrics were measured.

Results We found that the dFCS variability of the major depressive disorder with suicide attempts (MDD-SA) group was higher than that of the major depressive disorder

without suicide attempts (MDD-NSA) group in the right caudate nucleus/pallidum, right anterior cingulate gyrus and left medial superior frontal gyrus, and the MDD-SA group showed higher sFCS values in the bilateral cuneus . dFCS variability of the left medial superior frontal gyrus and right anterior cingulate gyrus was significantly correlated with the SI intensity rating scores. Combining the altered dFCS and sFCS metrics could improve the classification performance for discriminating MDD-SA from MDD-NSA (area under the curve: 0.780).

Conclusion Our findings suggest that abnormal connectivity patterns in multiple brain regions involving cognition and emotion control, and self-referential processing are associated with the increasing risk of vulnerability to a suicide attempt in depressed adolescents. Furthermore, FCS could serve as a sensitive biomarker for revealing the neurobiological mechanisms underlying suicidal vulnerability.

2.Mental health center and laboratory of psychiatry, West China Hospital of Sichuan University, 610041, Chengdu, China.

Objective The main objective of the present study was to assess differences in cerebral blood flow using functional near-infrared spectroscopy (fNIRS) between patients with Major Depressive Disorder (MDD) who exhibit varying levels of anhedonia compared with healthy individuals.

Methods A total of 122 MDD patients and 39 age- and gender-matched healthy controls (HC) were recruited in this study. We measured frontal haemodynamic responses to a verbal fluency task (VFT) using a 48-channel fNIRS imaging device, while levels of anhedonia and severity of depression were assessed by using the Dimensional Anhedonia Rating Scale (DARS) and the Hamilton Depression-17 (HAMD-17) separately. A latent profile analysis was performed to establish profile-dependant differences in subtypes of anhedonia based on the participants' responses to DARS in MDD group.

Results MDD patients were identified and classified as low-level (43%) and high-level (57%) of anhedonia. Compared to healthy controls, only MDD patients with high-level had bilaterally lower oxyhaemoglobin responses to the VFT tasks in the dorsolateral prefrontal cortex (DLPFC), orbitofrontal and frontopolar area. HAMD-17 total scores were associated with high-level of anhedonia in MDD patient compared to low-level.

Conclusion This study identified two distinct subtypes of anhedonia in individuals with MDD and showed that higher levels of anhedonia were associated with greater depression severity and impaired functioning of the prefrontal cortex. These findings suggest that interventions targeting anhedonia may be the most effective approach for clinicians seeking to improve MDD patients' outcomes.

Altered Wavelet-based Amplitude in Cortical-striatal-limbic Predicting Clinical Effects: An 8-week Follow-up in Unmedicated Patients with Schizophrenia

Shuzhan Gao[1], Yunkai Sun[2], Jinsong Tang[2], Xijia Xu[1]
1.Department of Psychiatry, the Affiliated Brain Hospital of Nanjing Medical University, Nanjing, China, 210029
2.Department of Psychiatry, Sir Run Run Shaw Hospital, School of Medicine, Zhejiang University, Hangzhou, China, 310016

Objective The current paper aimed to explore alternations of brain regional neural activity associated with the patients with schizophrenia after 8-week of treatment using wavelet-based amplitude of low frequency fluctuation (wavelet-based ALFF) and whether these treatment-associated brain regional activity can predict the clinical effects.

Methods 43 unmedicated schizophrenia patients and 53 healthy controls matched with age were included. Wavelet-based ALFF for schizophrenia patients at baseline and 8-week follow-up as well as healthy controls at baseline were measured. Correlation analysis and elastic net were used to detect the relationship between local neural activities and clinical characteristics.

Results Compared with healthy controls, wavelet-based ALFF values of right olfactory, bilateral caudate were increased, left middle frontal gyrus, left inferior frontal gyrus opercularis, right supramarginal, right inferior frontal triangularis/opercularis were decreased in patients at baseline. After treatment, wavelet-based ALFF in bilateral caudate, left putamen, right middle cingulum and right inferior frontal gyrus opercularis were increased, right precentral/postcentral was still decreased in patients. Compared with patients at baseline, wavelet-based ALFF values of left putamen in patients after treatment were increased. Correlation analyses showed bilateral caudate and right precentral/postcentral associated with social cognition. The wavelet-based ALFF values of combined with all abnormal regions at baseline could predict the score of attention/vigilance, working memory, verbal learning, visual learning, reasoning, and problem solving, social cognition, overall composite of cognition, and positive symptoms by elastic net.

Conclusion Altered wavelet-based amplitude in cortical-striatal-limbic might predict clinical effects after

8-week treatment in unmedicated patients with schizophrenia.

广泛性焦虑障碍、创伤后应激障碍和社交焦虑障碍存在共有和疾病特有的形态相似性网络改变

谭桂凤 袁敏兰 朱鸿儒 张伟*
四川大学华西医院

目的 广泛性焦虑障碍 (generalized anxiety disorder，GAD)、创伤后应激障碍 (posttraumatic stress disorder， PTSD) 和社交焦虑障碍 (social anxiety disorder ，SAD)之间高度共病，且症状存在重叠，这促进了对疾病共有的和特异性的神经生物学研究。形态相似性网络(morphometric similarity network，MSN)可以在个体水平分析大脑宏观结构和微观结构的形态特征。本研究旨在探究 GAD、PTSD 和 SAD 之间共有和疾病特有的 MSN。

方法 本研究采集 34 名 GAD 患者、63 名 PTSD 患者、36 名 SAD 患者和 52 名健康对照者（health controls，HC）的 T1 加权（T1-Weighted, T1w)成像数据，提取 308 个脑区域的 7 个形态特征为每个受试者构建 MSN。随后使用协方差分析和事后检验来比较 MSN 的组间差异。此外，我们还比较了区域 MSN 在 GAD、PTSD、SAD 和 HC 之间的差异。最后，我们分析了 MSN 与临床特征之间的关系。

结果 基于 T1w 影像学的形态特征，构建 308?308MSN 矩阵，并确定 GAD、PTSD、SAD 和 HC 中个体的 MSN。根据协方差分析，4 组被试的 MSN 在 5 条边上存在显著差异：左颞上回和右中央前回之间，左中央前回和右楔叶_part1/part2 之间，右额中回和右颞上回之间，以及左楔叶_part1 和右顶下小叶（FDR 矫正后，$p < 0.01$）。事后分析显示，与 SAD 和 HC 相比，GAD 和 PTSD 两组患者在左颞上回和右中央前回之间的形态相似性（morphometric similarity，MS）增加，在左中央前回和右楔叶_part1/part2 之间以及右额中回和右颞上回之间的 MS 减少。与 GAD、PTSD 和 HC 相比，SAD 组患者右额中回和右颞上回之间以及左楔叶和右顶下小叶之间的 MS 增加。此外，在区域 MSN 分析中，与 SAD 相比，GAD 在左中央前回的区域 MSN 增加。与 HC 和 SAD 相比，PTSD 中发现左中央前回区域 MSN 增加。在偏相关分析中，PTSD 组左颞上回和右中央前回之间的 MS 值与汉密尔顿焦虑评分呈轻度正相关。

结论 GAD、PTSD 和 SAD 之间的 MSN 存在共有和疾病特有的改变，这对疾病的鉴别诊断和特有的靶向干预具有重要意义。

Influencing Factors and Correlation Analysis of Cognitive Function and Cerebral Cortex Thickness in Patients with Schizophrenia

周衍芳 黄隽超 张苹 谭淑平 王志仁 谭云龙*
北京回龙观医院

Objective Cognitive impairment is one of the core characteristics of schizophrenia. Cortical thickness is a quantitative indicator of the density, cell structure, and arrangement of neuronal and glial cells, synaptic spines, and passing axons. Our research objective was to compare the differences of cognition and cortical thickness in patients with schizophrenia and healthy controls, and to explore their associations in the two groups.

Methods One hundred and sixty-seven patients who met the ICD-10 diagnostic criteria for schizophrenia and 72 age- and gender- matched healthy controls were enrolled in the study. The MATRICS Consensus Cognitive Battery (MCCB) in Chinese version was used to assess cognitive function of all subjects. Cerebral cortical thickness was measured by structural magnetic resonance imaging (sMRI). Group differences of cognitive function and cerebral cortical thickness as well as their relationships were explored.

Results Age, gender, and education years were matched between schizophrenia patients and healthy controls (Ps>0.05). The total score of MCCB in patients was significantly lower than that in the control group [(44.25±9.89) vs. (58.24±7.81), t=-10.19，P<0.001]. The scores of the seven cognitive dimensions in the patient group were significantly lower than those in the control group (Ps<0.001). Multiple linear regression analysis using the total MCCB score of the patient group as the dependent variable showed that education level (β=0.42, t=-5.70, P<0.001) was a significant influencing factor of cognitive function, while age, gender, chlorpromazine equivalents, age of onset or the course of disease was not significantly correlated with the MCCB total score (Ps>0.05). The average cerebral cortical thickness in the schizophrenia group was significantly lower than that in healthy controls [(2.51±0.09) mm vs. (2.58±0.08) mm, t=-5.19, P<0.001]. Multiple linear regression analysis using the average cortical thickness of the patients group as the dependent variable showed that the course of the disease (β=-0.46, t=-5.94, P<0.001) and chlorpromazine equivalent (β=-0.21, t=-2.67, P=0.008) were significant influencing factors, while age, gender, education level or the age of onset were not significantly correlated with the average thickness of the cerebral cortex (Ps>0.05). In patients with schizophrenia, the average cortical thickness was positively related to the total score of MCCB (r=0.21, P=0.026) and positively correlated with working memory (r=0.22, P=0.018), while these correlations were not significant in the control group (Ps>0.05).

Conclusion In patients with schizophrenia, education level was a protective factor for cognitive function, and the course of disease and chlorpromazine equivalents

were adverse influencing factors of cerebral cortical thickness. The decrease of average cerebral cortical thickness was associated with cognitive dysfunction in patients with schizophrenia.

青春期前后网络游戏对认知能力影响的差异

刘攀琪 陈海滔 洪江月 王静函 刘华清 谭淑平*
北京大学回龙观临床医学院，北京回龙观医院

目的 网络游戏是很常见的休闲娱乐方式，但长时间使用互联网和游戏导致网络成瘾或游戏障碍在儿童、青少年群体中发病率显著升高。探索网络游戏对儿童、青少年认知的影响也越来越重要。本研究旨在探索网络游戏对进入青春期与未进入青春期的儿童、青少年认知能力影响的差异。

方法 共有 2640 名 6-18 岁青少年通过线上招募参加本研究。本研究收集了参与者过去半年内每周参与网络游戏的时间、年龄、性别、家庭基本状况等信息。使用数字符号转换测试(DSST)和威斯康星卡片分类测试(WCST)来评估神经认知功能，采用语音情绪识别测试来评估社会认知功能,以及使用长处与困难问卷来测量参与者的心理健康状况。采用具有交互作用项的多元线性回归模型来探索网络游戏时长对认知功能的影响在进入青春期与未进入青春期的儿童、青少年之间的差异。

结果 研究发现网络游戏时长与青春期的儿童、青少年认知存在显著相关，同时对于是否进入青春期的孩子带来的影响是存在差异的。在分析网络游戏时长对于 DSST、语音情绪识别、同伴关系问题，以及亲社会行为方面的影响时，是否进入青春期与网络游戏时长之间均存在交互效应。具体分析显示，在进入青春期的孩子中网络游戏时长对各方面认知的影响：DSST($\beta = 0.080$，$P = 0.002$)；语音情绪识别($\beta = -0.047$，$P = 0.002$)；同伴关系问题($\beta = 0.025$， $P < 0.001$)和亲社会行为($\beta = 0.023$, $P < 0.001$)。对于未进入青春期的孩子网络游戏时长对于各方面认知的影响：DSST($\beta = -0.103$， $P = 0.109$)；语音情绪识别($\beta = -0.155$，$P < 0.001$)；同伴关系问题($\beta = 0.066$ ，$P < 0.001$)和亲社会行为($\beta = 0.079$，$P < 0.001$)。

结论 网络游戏对于儿童、青少年的多方面认知功能均存在显著影响，但对于不同阶段（是否进入青春期）的儿童、青少年带来的影响是存在差异的。结果表明对于未进入青春期的青少年，网络游戏对认知能力的消极影响程度大于进入青春期的青少年。本研究提示对于未进入青春期的儿童、青少年更应该加强网络游戏的管理，针对青少年的网络游戏问题需要根据是否进入青春期给出不同的指导建议。

稳定期精神分裂症患者童年创伤与元认知功能间的关系

方文梅[1] 孔慧[1] 叶玲飞[1] 王悦[1] 朱道民[1] 董毅[2]
1.安徽医科大学附属心理医院，安徽省精神卫生中心，合肥市第四人民医院，安徽省精神心理疾病临床医学研究中心
2.安徽省芜湖安定精神病医院

目的 精神分裂症是一组表现有认知功能缺陷的精神疾病，包括神经认知功能、社会认知功能以及元认知功能的缺陷。患者早年经历创伤性事件较多，研究证据表明童年创伤经历对精神分裂症患者神经认知功能和社会认知功能均具有负性影响。元认知是指个体在进行信息加工的同时，能够理解自己和他人的心理状态并作出相应行为反应的一种能力。然而，关于精神分裂症患者童年创伤与元认知功能间的关系研究较少，有研究显示两者间呈现一种正性关联。本研究试图探讨稳定期精神分裂症患者童年创伤水平与元认知功能间的关系。

方法 选取安徽省精神卫生中心住院和门诊的稳定期精神分裂症患者 81 例。采用童年创伤问卷(childhood trauma questionnaire, CTQ)评估精神分裂症患者的童年创伤经历，包括情感虐待(EA)、躯体虐待(PA)、性虐待 (SA)、情感忽视 (EN)和躯体忽视(PN) 5 个分量表。通过印第安精神疾病访谈(the indiana Psychiatric illness interview，IPII)，采用修订版元认知量表(MAS—A)对精神分裂症患者元认知功能进行评估，包括自我反省（S）、理解他人（O）、去中心化（D）、控制（M）4 个因子。同时采用阳性和阴性症状量表（PANSS）对精神分裂症患者症状作评估。分析患者童年创伤水平与元认知功能间的关系。

结果 Spearman 相关分析显示，患者 CTQ 的躯体虐待分与 MAS-A 的理解他人分和去中心化分呈正相关（$r=0.219$、$P<0.05$，$r=0.234$、$P<0.05$），具有统计学意义。控制年龄、性别、受教育年限、病程和 PANSS 评分后，CTQ 的躯体虐待分与 MAS-A 的去中心化分间的相关性仍存在（$r=0.251$，$P=0.035$），与理解他人分间的相关性不再具有统计学意义，而与控制分呈负相关（$r=-0.266$，$P=0.025$），具有统计学意义。

结论 精神分裂症患者早年躯体虐待经历与元认知间的正性关联，与一些研究的结果一致，这种关联性可能反应了创伤-元认知-内省间的复杂性，以及可能其他重要的影响因素的作用，这一点值得进一步深入研究。

关键字：稳定期精神分裂症；童年创伤；元认知

精神疾病患者言语流畅性任务下前额叶激活特征的近红外光谱成像研究

阳雨露 孟雅婧*
四川大学华西医院

目的 应用功能性近红外光谱成像（fNIRS）探讨抑郁障碍（D）、焦虑障碍（AD）、双相情感障碍（BP）和精神分裂症（SCH）患者言语流畅性任务（VFT）下前额叶激活的特征。

方法 于四川大学华西医院门诊和住院部招募符合《精神障碍诊断与统计手册（第 5 版）》诊断标准的 39 例 SCH 患者、205 例 D 患者、212 例 AD 患者以及 77 例 SCH 患者，使用 fNIRS 监测他们在 VFT 任务下前额叶血流动力学变化，使用症状自评量表（SCL-90）评估患者的临床症状。比较不同病种的患者平均氧合血红蛋白（HbO）浓度差异及 VFT 任务开始后 2~7 秒 HbO 的斜率（初始斜率）的差异，使用偏相关分析平均 HbO 浓度和初始斜率与临床症状之间的相关性。结果均通过 FDR 校正，P＜0.05。

结果 在四组患者中，D 组在通道 4（Z=2.828，P=0.028），通道 6（Z=2.912，P=0.022）（主要位于额极区和眶额叶），AD 患者在通道 4（Z=3.154，P=0.010）、通道 5（Z=3.021，P=0.015）、通道 6（Z=2.980，P=0.017）（主要位于额极区和眶额叶）的平均 HbO 浓度与所有通道平均 HbO 浓度（Z=2.881，P=0.024）高于 SCH 患者。D 组与 BP 组（Z=2.691，P=0.039）在右侧额极区、额叶下回和眶额区 （通道 3）的初始斜率差异有统计学意义。对于 BP 患者，SCL-90 的敌对因子得分与通道 4（r=-0.505，P=0.004）、通道 6（r=-0.390，P=0.004）、通道 15（r=-0.546，P=0.002）、通道 16（r=-0.550，P=0.002）的平均 HbO 浓度（主要位于额极区和眶额叶、布洛卡区的岛盖部、上外额叶皮层）和所有通道的平均 HbO 浓度（r=-0.491，P=0.006）呈负相关。

结论 SCH 患者在额极区和眶额叶的激活较 D 和 AD 患者更低，D 患者在右侧额极区、额下回和眶额叶的初始激活斜率高于 BP 患者。在额极区和眶额叶、布洛卡区的岛盖部、上外额叶皮层的激活越少，BP 患者越易怒敌对。本实验为使用 fNIRS-VFT 范式来进一步鉴别诊断不同精神疾病做出了有益的贡献。

首发精神分裂症患者 IRS/CIRS-BCL2 机制及与认知功能障碍的相关性探索

勾梦壮 陈闻锦 谭云龙*
北京大学回龙观临床医学院 北京回龙观医院

目的 脑白质对神经炎症敏感，可出现脱髓鞘和少突胶质细胞损伤凋亡等变化。免疫炎症反应系统和代偿性免疫调节反应系统（IRS/CIRS）是探索免疫失衡在精神分裂症（SCZ）病理生理机制中作用的新假说，其与 SCZ 脑白质变化和认知损伤的关系尚未阐明。本研究旨在首发精神分裂症患者（FEPS）中，探索 IRS/CIRS 表达特征及其与脑白质完整性（FA）的关系；进一步分析 IRS/CIRS 与抗凋亡分子 BCL2 的关系，探索 IRS/CIRS-凋亡（BCL2）及 microRNA 调控机制与认知功能损伤的关系。

方法 纳入 DSM-IV 诊断标准的首发 SCZ 患者（FEPS 组，n=133），及年龄和性别相匹配的健康对照（HCs 组，n=56）。ELISA 检测被试血浆中 16 种细胞因子的表达水平，计算 IRS/CIRS 值；DTI 计算白质 FA；ELISA 检测血浆中 BCL2 的表达水平，qPCR 检测全血 BCL2mRNA 及上游调控分子 miR-181b-5p 表达水平；分析它们的组间差异及与 IRS/CIRS 的相关性。中介模型探索 IRS/CIRS、BCL2mRNA 和 miR-181b-5p 的关系。MCCB 评估被试认知功能，探索 IRS/CIRS-凋亡机制与认知损伤的关系。

结果 FEPS 组 IRS/CIRS 显著高于 HCs 组（P<0.001），脑白质平均 FA 显著降低（P=0.032），二者负相关（P=0.029）；BCL2mRNA 和蛋白表达水平显著下调（P=0.002 和 0.023），与 IRS/CIRS 负相关（P=0.029 和 0.030）；miR-181b-5p 与 BCL2mRNA 表达水平负相关（P<0.001），与 IRS/CIRS 正相关（P=0.026）；miR-181b-5p 在 IRS/CIRS 对 BCL2mRNA 调控中起显著中介作用。FEPS 组工作记忆与 BCL2mRNA 表达水平正相关（P=0.001），与 miR-181b-5p 表达水平负相关（P=0.005），BCL2mRNA 在 miR-181b-5p 与工作记忆的负相关中起显著中介作用。

结论 FEPS 存在 IRS/CIRS 免疫失衡，与白质完整性下降相关，提示疾病早期白质可能受到失衡的免疫细胞因子影响。其机制可能是 IRS/CIRS-BCL2 代表的炎症-凋亡通路通过参与少突胶质细胞凋亡，促进白质完整性下降。miR-181b-5p 在其中起中介作用，与工作记忆降低相关。

关键字：精神分裂症，IRS/CIRS，白质，BCL2，miR-181b-5p，认知功能

DNMT1 SNPs (rs2114724 and Rs2228611) Associated with Positive Symptoms in Chinese Patients with Schizophrenia

平军娇[1] 万静[1] 黄彩英[1] 余金鸣[1] 罗佳丽[1] 邢志强[1] 罗兴光[2] 杜宝国[1] 蒋廷云[1] 章杰[1]
1.中山市第三人民医院

Objective Schizophrenia is a serious mental disorder with complex clinical manifestations, while its pathophysiological mechanism is not fully understood. Accumulated evidence suggested the alteration in epigenetic pathway was associated with clinical features and brain dysfunctions in schizophrenia. DNA methyltransferases (DNMTs), a key enzyme for DNA methylation, are related to the development of schizophrenia, whereas the current research evidence are not sufficient. The aim of study will explore the effects of gene polymorphisms of DNMTs on the susceptibility and symptoms of schizophrenia.

Methods The study was case-control study designed and employed the Diagnostic and Statistical Manual of Mental Disorders-Fifth Edition (DSM-5) as the diagnostic standard.134 hospitalized patients with schizophrenia in the Third People's Hospital of Zhongshan City

from January 2018 to April 2020 (Case group) as well as 64 healthy controls (Control group) from the same region were involved. Single nucleotide polymorphisms (SNPs) of DNMT1 genes (r s2114724 and rs 2228611) and DNMT3B genes (rs 2424932, rs 1569686, rs 6119954 and rs 2424908) were determined with Massarray. Linkage disequilibrium analysis and haplotype analysis were performed, and genotype and allele frequencies were compared. The severity of clinical symptoms was assessed by the Positive and Negative Syndrome Scale (PANSS). The correlation between DNMT1 genes (rs 2114724 and rs 2228611) and DNMT3B genes (rs2424932, rs1569686, rs6119954 and rs2424908) and clinical features was analyzed.

Results There were no significant differences in genotype, allele frequency and haplotype of DNMT1 genes (rs 2114724 and rs 2228611) and DNMT3B genes (rs 2424932, rs 1569686, rs 6119954 and rs 2424908) between the case and healthy control group. There were significant differences in the PANSS total positive symptom scores, P3 (Hallucinatory behavior), P6 (Suspicious/persecution), G7 (Motor retardation), and G15 (Preoccupation) in patients with different DNMT1 gene rs 2114724 and rs 2228611 genotypes. The linkage disequilibrium analysis of gene polymorphic loci revealed that rs 2114724-rs 2228611 was complete linkage disequilibrium, and rs 1569686-rs 2424908, rs 2424932-rs 1569696 and rs 2424932-rs 2424908 were strongly linkage disequilibrium.

Conclusion The polymorphisms alteration in genetic pathway may associated with development of specific clinical features in schizophrenia.

6.Guangdong Engineering Technology Research Center for Translational Medicine of Mental Disorders, Guangzhou, China

Objective Cognitive impairment is common and cause poor clinical outcomes in patients with LLD. Functional abnormalities of the habenula in patients with depression has been demonstrated by increasing studies, and habenula is involved in cognitive processing. However, whether patients with LLD exhibited disrupted habenular functional connectivity (FC), and whether the habenular FC mediates the relationship between depressive symptoms and cognitive impairment remains unclear.

Methods One hundred twenty-seven patients with LLD and 75 healthy controls were recruited. The static and dynamic FC between habenula and the whole brain was calculated, and its relationships with depressive symptoms and cognitive impairment were explored by correlation and mediation analyses.

Results In patients with LLD, the more severe depressive symptoms (higher GDS score and retardation score of HAMD) was a mediator of the cognitive impairment (verbal fluency and working memory). Compared with the controls, patients with LLD exhibited decreased static FC between right habenula and bilateral inferior frontal gyrus (IFG), and there was no significant difference in dynamic FC between the two groups. Additionally, the decreased static FC between right habenula and IFG was associated with more severe depressive symptoms and cognitive impairment (language, memory and visuospatial skills). Lastly, the static FC between right habenula and left IFG partially mediated the relationship between depressive symptoms and cognitive impairment (verbal fluency and working memory).

Conclusion Patients with LLD exhibited decreased static FC between the habenula and IFG, and this decreased static FC was involved in the underlying neural substrate connecting depressive symptoms and cognitive impairment.

Effects of MC1R and BIN1 Gene Polymorphisms on Chinese Patients with Alzheimer's Disease and Mild Cognitive Impairment

李晓月[1] 张凯[2]

1.芜湖市第四人民医院

2.巢湖市第一人民医院

Objective Alzheimer’s disease (AD) and Mild cognitive impairment (MCI) are complex diseases influenced by genetic polymorphisms. The most recognized genetic polymorphism is currently the APOEε4 allele. In recent years, MCIR and BIN1 have been shown to be involved in the formation of pathological substances in neurodegenerative diseases. Therefore, the main objective of this study was to investigate whether MC1R and BIN1 polymorphic genes are associated with the development of AD and MCI and the synergistic role of these two genes in the disease with APOE.

Methods A total of 134 AD patients (57 males), 416

MCI patients (180 males) and 509 healthy controls (249 males) were collected. DNA was extracted using a Tiangen DNA isolation kit for genetic analysis. TaqMan SNP genotyping analysis and an ABI PRISM 7900 sequence detection system (Applied Biosystems) equipped with SDS2.1 software were used to analyze the selected SNPs of the genes.Statistical analysis was performed using SPSS 24,0 and State software.

Results We then analyzed the BIN1 rs7561528 gene polymorphisms and the results are shown in Table 3. It was found that there were differences in BIN1 genotype frequencies between the MCI and HC groups ($\chi2$=7.79, df=2, P=0.020), with higher GG genotype frequencies (81.60% VS. 73.74%) and lower AG genotype frequencies (17.16% VS. 24.44%) in the MCI group. Subsequently, our results stratifying APOEε4 carrier status showed that the GG genotype was higher in the MCI patient group compared to the HC group (87.50% VS. 65.38%), while both the AG genotype and AA genotype frequencies were lower than in the HC group (10.71% VS. 29.49%; 1.79% VS. 5.13%). The two groups differed in genotype distribution ($\chi2$=8.42, df=2, P=0.015). After correction for age and education, APOEε4+ was a risk factor for AD (OR=1.73, P=0.036) and BIN1 was a protective factor for the occurrence of AD (OR=0.22, P＜0.001). APOEε4+ remained a risk factor for AD in the AD patient group compared to the MCI patient group, and the risk was even elevated compared to the HC group (OR=2.21 VS. OR=1.73). The BIN1 rs7561528 G allele was a protective factor for AD compared to MCI (OR=0.26, P＜0.05). In MCI patients, there is synergy between MC1R AG genotype and APOEε4 (OR=0.41, 95%CI=0.18-0.95, P=0.037), BIN1 GG genotype and APOEε4 (OR=2.71, 95%CI=1.02-7.25, P=0.046).

Conclusion Our study investigated the association of MC1R and BIN1 polymorphic genes with MCI and AD susceptibility and their interactions with APOEε4 genes. The current findings suggest that carriers of the rs7561528 GG genotype of the BIN1 gene polymorphism are at significantly higher risk of MCI than the AG genotype. In addition, the AG genotype of MC1Rrs2228479 and the BIN1rs7561528 GG genotype both interacted with the APOEε4 allele in MCI patients. We also found that the APOEε4 allele was present as a risk factor in AD patients, while BIN1rs7561528 G allele was a protective allele for AD. The future should focus on exploring.

数字运动对精神分裂症神经认知功能的影响

王德权 邓伟*
杭州市第七人民医院

目的 精神分裂症是一种慢性的且严重的精神障碍，影响着全世界 2000 万人。精神分裂症认知症状严重影响患者的社会功能，但药物治疗疗效差。数字运动是一种同时存在认知刺激和身体刺激的新型运动形式。目前数字运动对精神分裂症神经认知功能的影响尚不清楚。故本研究的目的为探索数字运动对精神分裂症神经认知功能的影响。

方法 本研究共纳入 64 例精神分裂症患者，将他们随机分为干预组和对照组。干预组接受 8 周的数字运动干预和药物治疗，对照组接受 8 周药物治疗。采用 MCCB 认知成套测验评估神经认知功能，阳性和阴性症状量表评估临床症状。干预组和对照组两组患者分别在治疗第 0 周、第 4 周和第 8 周，采集 MCCB 数据；在治疗第 0 周和第 8 周，采集临床症状数据。干预组为期 8 周的数字运动的运动处方包含两个阶段，第 1 周为第一阶段适应期和第 2-8 周的第二阶段训练期。第一阶段适应期频率为 2 次/周，约 45 分钟/次，强度为低强度-中等强度，运动类型为有氧运动和抗阻运动，低难度系数，运动软件为健身环大冒险和舞力全开；第二阶段训练期频率为 3 次/周，约 60 分钟/次，运动强度为中等强度-高强度，运动的类型不变，中等难度系数，运动软件不变。本研究采用独立样本 T 检验、Mann-Whitney U 检验或 Kolmogorov-Smirnov 检验方法比较治疗前干预组和对照组基线认知功能、临床症状差异。采用双因素重复测量方差分析方法分析数字运动对精神分裂症神经认知功能、临床症状的影响。

结果 第一，本研究发现干预组和对照组的精神分裂症患者基线神经认知功能、临床症状无统计学差异（P>0.05）。第二，数字运动干预 4 周后两组精神分裂症患者神经认知功能仍无统计学差异（P>0.05）。第三，数字运动干预 8 周后干预组抑郁因子分(P=0.001)显著低于对照组，且干预组的言语记忆和学习能力（P=0.035）、推理及问题解决能力（P=0.009）和视觉记忆和学习能力（P=0.043）显著高于对照组。

结论 为期 8 周的数字运动能有效提升精神分裂症患者的言语记忆和学习能力、推理及问题解决能力、视觉记忆和学习能力三个维度的神经认知功能，同时能改善精神分裂症患者的情绪症状。本研究的结果为未来数字运动处方应用于临床精神分裂症神经认知症状的治疗提供证据支持。

The Medial Prefrontal Cortex CRHR1 in Excitatory Neurons Mediate Cognitive Deficits Induced by Early-life Stress in Adolescent Mice

马玉努 李继涛 司天梅*
北京大学第六医院（精神卫生研究所）；国家精神心理疾病临床医学研究中心，卫计委（原卫生部）精神卫生学重点实验室（北京大学）

Objective Adolescence is a critical period for neurodevelopment and marks the onset of several psychiatric disorders. Recent evidence suggests that early-life stress, a critical risk factor for psychiatric disorders, may exert adverse effects via CRH-CRHR1 system and neuronal activity in medial prefrontal cortex (mPFC) in adolescent rodents. This study aims to examine whether and how the

two systems interact to mediate early-life stress-induced negative effects.

Methods Early-life stress (ELS) paradigm (limited nesting and bedding material) was established in male mice during postnatal day (PND) 2-9. At PND35, we examined the effects of ELS on PFC-dependent cognitive behaviors and neural activation (using immediate early gene c-fos immunostaining) in mPFC. We then blocked CRHR1 systematically or knocked down CRHR1 in mPFC to investigate the involvement of CRH-CRHR1 system in ELS-induced cognitive dysfunction and mPFC neuronal activity in adolescent mice. Finally, using DREADDs techniques, we specifically manipulated CamKIIa+ neuron (a marker of excitatory neuron) activity in mPFC to examine whether stress-induced cognitive deficits could be reversed.

Results (1) Early-life stress impaired temporal order memory (TOM) and spatial working memory in adolescent mice. (2) Immediate early gene c-fos immunostaining revealed that ELS mice had fewer CamkIIa+ and PV+ neurons activated during the TOM test. (3) Systemic administration of antalarmin, an antagonist of CRHR1, or mPFC CRHR1 knockdown restored ELS-induced cognitive deficits and PV+ and CamkIIa+ neuron dysfunction in adolescent mice. (4) Crhr1 mRNA is mainly expressed in the CamKIIa+ neurons (not inhibitory neurons) in mPFC. (5) Chemogenetic activation of CamKIIa+ neurons in mPFC successfully restored cognitive deficits induced by early-life stress.

Conclusion These findings suggest that mPFC CRHR1 and excitatory neuron activity mediates ELS-induced cognitive deficits in adolescent male mice. These neurobiological mechanisms provide novel perspectives for the early treatment and prevention of stress-related mental diseases such as depression.

The Relationship between Alterations in Plasma Metabolites and Treatment Responses in Antipsychotic-Na?ve Female Patients with Schizophrenia

王小丽 谢筠 马宏筠 李洁*
天津市安定医院

Objective The biological mechanisms underlying schizophrenia have not fully been investigated in female patients. This study aimed to explore the relationship between alterations in plasma metabolites and treatment responses amongst antipsychotic-na?ve female patients with schizophrenia.

Methods A total of 38 antipsychotic-na?ve female schizophrenia patients (ANS) and 19 healthy female controls (HC) were recruited. Plasma samples were obtained from all participants, and targeted metabolomics were measured with FIA-MS/MS and LC-MS/MS. The positive and negative syndrome scale (PANSS) was used to assess the severity of psychotic symptoms before and after eight weeks of treatment. Receiver operator characteristics (ROC) curves were used to predict diagnostic and therapeutic responses.

Results A total of 186 metabolites passed quality control procedures and were used in statistical analysis to identify potential biomarkers. Before treatment, the ANS patients had lower levels of γ -Aminobutyric Acid (GABA) ($P = 0.002$) and higher levels of Cholesteryl esters (CE) (20:3) ($P = 0.004$), Cholic Acid (CA) ($P = 0.004$) and Glycocholic Acid (GCA) ($P = 0.034$) compared to the HCs. These four differential metabonomic markers were synthesized into a combinatorial biomarker panel. This panel significantly distinguished ANS from HC (area under curve (AUC) = 0.891, $P < 0.001$). Moreover, this biomarker panel was able to effectively predict therapeutic responses (AUC = 0.774, $P = 0.025$).

Conclusion Our results suggest that plasma CE (20:3), CA, GCA, and GABA levels may be used as potential biomarkers for diagnosing and predicting antipsychotic efficacy amongst female schizophrenia patients.

An Epigenetic Clock To Assess The Differential Neurodevelopmental Trajectories and Prevalence of Three Major Psychiatric Disorders

赵存友* 吴晓蕙
南方医科大学医学遗传学教研室；精神健康研究教育部重点实验室；粤港澳大湾区脑科学研究中心

Objective Few studies have quantitatively described the common and distinct aspects of the neurodevelopmental trajectories of schizophrenia (SZ), bipolar disorder (BD) and major depressive disorder (MD). Therefore, there is an urgent need for a multiplatform epigenetic clock based specifically on human blood and brain tissues to assess deviations in neurodevelopmental trajectories in patients with three major psychiatric disorders.

Methods Based on 31 publicly available datasets measured on Illumina 27K (27K), Illumina 450K (450K), or Illumina EPIC (850K) array platforms from patients with SZ, BD or MD and unaffected controls, this study used a combination of elastic net and sure independence screening algorithms to develop a new epigenetic clock specific to human blood and brain tissues, then evaluated epigenetic age acceleration from blood and brain tissues of patients with three major psychiatric disorders.

Results The Blood?Brain Clock achieves high performance in predicting blood and brain DNAm age and estimates that the three major psychiatric disorders have differential trend variations of epigenetic age acceleration. Epigenetic age acceleration in both blood and brain tissues showed a decrease in SZ but an increase in BD and MD relative to controls. Blood precedes brain tissue in exhibiting distinguishable alterations in epigenetic age acceleration across three major psychiatric disorders. Moreover, most of the disease-associated differentially methylated DNAm probes that were shared across SZ, BD and MD displayed opposite alteration patterns between SZ and

BD/MD but similar patterns between BD and MD. BD and MD were also indistinguishable from each other but significantly distinguishable from SZ in neuropsychiatric disorder classification models constructed with random forest classifiers.

Conclusion The different trends identified in epigenetic age acceleration across three major psychiatric disorders in this study added substantial value to understanding offsets in their neurodevelopmental trajectories. These distinguishable alterations in epigenetic age acceleration observed in peripheral system prior to brain tissue facilitate early diagnosis of disorders and has the potential to evaluate the risk of various disorders.

Aβ25-35 损伤致 PC12 细胞自噬功能动态变化的研究

方斌斌* 周振和* 张岳春
无锡市精神卫生中心

目的 分别通过β淀粉样蛋白（amyloid beta-protein，Aβ）损伤 PC12 细胞建立阿尔茨海默病（Alzheimer's disease，AD）细胞模型，体外模拟 AD 病理过程，探讨 Aβ损伤 PC12 细胞后细胞自噬功能的变化，为研究 AD 细胞的自噬提供理论基础。

方法 大鼠肾上腺髓质嗜铬瘤分化细胞株 PC12 细胞经 Aβ25-35 损伤处理后，MTT 检测各组细胞活力；Annexin V?FITC/PI 双染色荧光显微镜及流式细胞仪检测各组细胞凋亡情况；DCFH?DA 探针荧光显微镜及流式细胞仪测定细胞内活性氧（reactive oxygen species，ROS）水平；免疫印迹法检测自噬相关蛋白、凋亡相关蛋白和 AD 相关蛋白的水平。

结果 与对照组相比，不同浓度的 Aβ25-35 作用 PC12 细胞 6、8、12、24、48 h 后，细胞活力呈剂量和时间依赖性下降，差异有统计学意义。Aβ25-35 损伤持续一定时间后细胞内 ROS 水平升高，两者损伤后细胞凋亡增加，抗凋亡蛋白 Bcl?2 表达量降低、凋亡蛋白 Cleaved?caspase?3 蛋白表达升高且 BACE1、PS1 蛋白表达异常增加。

结论 Aβ25-35 诱导的细胞自噬呈剂量和时间依赖性，可以作为 AD 早期阶段的研究指标；在一定的浓度范围内，Aβ25-35 诱导细胞自噬的同时不增加细胞毒性，不增加细胞凋亡，为干预 AD 发生发展的最佳阶段。

关键字：阿尔茨海默病；Aβ25-35；PC12 细胞；自噬

阿戈美拉汀对抑郁障碍快感缺失症状改善效果的随机对照研究

赵淼[1] 寻广磊[1,2]
1.山东省精神卫生中心（山东大学附属精神卫生中心）
2.中华医学会精神医学分会生物精神病学组

目的 评价阿戈美拉汀治疗抑郁障碍的疗效及对快感缺失症状的改善效果。

方法 入组 2020 年 2 月至 2022 年 8 月山东省精神卫生中心门诊收治的 120 例抑郁障碍患者作为研究对象,以随机数字表法分为 2 组。研究组 58 例予以阿戈美拉汀（25mg/片）治疗，起始睡前口服 1 片，2 周后加量至 50mg/日；对照组 62 例予以艾司西酞普兰（10mg/片）治疗，起始早饭后口服半片，1 周内滴定至 10mg/日，根据治疗反应及患者耐受性进行剂量调整，最大剂量为 20mg/日。在基线、3 周末、6 周末使用汉密尔顿抑郁-17 项量表（HAMD-17）评估病情严重程度，使用斯奈思-汉密尔顿快感量表中文版（SHAPS）评估快感缺失症状严重程度。使用 SPSS 25.0 对数据录入分析。计数资料的率比较使用卡方检验。正态分布的计量资料采用（x±s)表示，两组间 HAMD-17、SHAPS 评分的比较使用独立样本 t 检验。

结果 共有 97 例患者完成随访，其中研究组 48 例，对照组 49 例，23 例患者测量基线数据后失访。两组患者一般资料匹配，有可比性。基线期，研究组 HAMD-17 评分为 27.44±2.10 分，SHAPS 评分为 37.96±3.20 分。对照组 HAMD-17 评分为 28.02±2.18 分，SHAPS 评分为 37.29±3.35 分。两组间 HAMD-17、SHAPS 评分差异无统计学意义（P＞0.05）。3 周末，研究组 HAMD-17 评分为 21.60±2.74 分，对照组为 21.33±2.59 分，两组间 HAMD-17 评分差异无统计学意义（P＞0.05）。研究组 SHAPS 评分为 29.46±3.17 分，对照组为 31.35±3.13 分，差异有统计学意义（P＜0.05）。两组内 HAMD-17 和 SHAPS 评分均较基线期有所降低，差异均有统计学意义（P＜0.05）。6 周末，研究组 HAMD-17 评分为 17.10±3.88 分，对照组为 16.22±3.69 分，两组间 HAMD-17 评分差异无统计学意义（P＞0.05）。研究组 SHAPS 评分为 24.92±2.55 分，对照组为 26.63±2.16 分，差异有统计学意义（P＜0.05）。两组内 HAMD-17 和 SHAPS 评分均较基线期有所降低，差异均有统计学意义（P＜0.05）。

结论 阿戈美拉汀与艾司西酞普兰治疗抑郁障碍患者的疗效相当，但阿戈美拉汀改善抑郁障碍患者快感缺失症状的效果优于艾司西酞普兰。

关键字：阿戈美拉汀；艾司西酞普兰；抑郁障碍；快感缺失

注射 Erastin 建立大鼠急性抑郁模型的行为学评价及铁死亡和炎症相关分子的检测

徐文倩*
武汉大学人民医院

目的 向海马内注射铁死亡诱导剂 Erastin 建立大鼠急性抑郁模型，检测 Erastin 对大鼠抑郁样行为的影响，检测海马铁死亡相关蛋白及炎症因子的表达改变。

方法 40只6周龄健康雄性Sprague-Dawley（SD）大鼠按照随机数字法分为PBS组、Erastin低剂量（EL）组、Erastin 中剂量（EM）组、Erastin 高剂量（EH）组、脂多糖（LPS）组共5组，每组8只大鼠。采用脑立体定位技术向各组大鼠海马注射相应药物后于第 4 天开始进行体重及行为学检测，行为学测试包括糖水偏好实验（SPT）、开放旷场试验（OFT）、强迫游泳实验（FST）和高架十字迷宫实验(EPM)，观察大鼠的抑郁及焦虑样行为。采用 Western Blot 技术和 RT-PCR 技术检测海马铁死亡相关蛋白，包括谷胱甘肽过氧化物酶 4（GPX4）、环氧化酶 2（COX2）、铁蛋白重链 1（FTH1）、长链酯酰辅酶 A 合成酶 4（ACSL4）、溶质载体家族 7 成员 11（SLC7A11），以及促炎因子，包括白介素 6（IL-6）、白介素 1β（IL-1β）和肿瘤坏死因子-α（TNF-α）的表达。采用 GraphPad Prism 8.0 软件进行统计分析及作图，多组间比较采用单因素方差分析，进一步两两比较使用 LSD 法。

结果 （1）体重及行为学检测结果：在注射药物前，各组大鼠体重和行为学检测结果的差异无统计学意义；与 PBS 组相比，注射 Erastin 后，EM（400 ng/μl）组大鼠表现出更明显的焦虑及抑郁样行为，包括体重减轻，糖水偏好率降低，强迫游泳不动时间及高架闭合臂时间增加，旷场中心区停留时间及高架开放臂时间减少。（2）铁死亡相关蛋白的表达：与 PBS 组相比，注射 Erastin 后大鼠海马中 FTH1、GPX4 和 SLC7A11 的 mRNA 水平和蛋白表达降低，COX2 和 ACSL4 的 mRNA 水平和蛋白表达升高。（3）促炎因子的表达：与 PBS 组相比，注射 Erastin 后大鼠海马组织中促炎因子 TNF-α、IL-1β 和 IL-6 的 mRNA 和蛋白质表达升高。

结论 本研究发现 Erastin 可诱导大鼠焦虑抑郁样行为，然而 Erastin 剂量过高或过低均不能很好地诱导大鼠抑郁样行为，因此本文中找到了 Erastin 的最佳剂量为 2?g，并发现了海马中铁死亡相关蛋白及神经炎症相关因子的变化。

关键字：抑郁症；Erastin；铁死亡；神经炎症

N-乙酰半胱氨酸对铜腙短期暴露导致的小鼠工作记忆和神经生物学变化的影响

张琳*
苏州市广济医院

目的 为观察抗氧化剂 N-乙酰半胱氨酸（N-acetylcysteine，NAC）对 CPZ 暴露导致的动物行为和神经生物学改变的作用，并探讨其作用机制。NAC 已经用于精神分裂症的辅助治疗，我们假设该药可能通过抗氧化和抗炎机制减轻脑白质损伤，改善动物行为。

方法 行为学实验（顺序为旷场实验-社交行为实验-Y-迷宫实验），做酶联免疫吸附试验检测促炎细胞因子 IL-1β 和 TNF-α 的浓度，免疫组织化学及免疫荧光方法检测小鼠脑组织少突胶质细胞（GST-Pi 阳性细胞）、髓鞘碱性蛋白（myelin basic protein，MBP）及小胶质细胞(Iba-1 阳性细胞)的变化。

结果 1.1. CPZ 暴露 10 天损害小鼠的空间工作记忆，不影响小鼠的自发活动、探索能力及社交活动。不同剂量的 NAC 对 CPZ 引起的空间工作记忆损害有改善作用。 1.2. CPZ 暴露 10 天可引起脑组织和肝脏组织 T-SOD 降低及 MDA 升高，不同剂量的 NAC 可以缓解 CPZ 引起的这些变化。提示 NAC 通过抗氧化作用能缓解 CPZ 起的氧化应激损伤。 1.3. CPZ 暴露 10 天，小胶质细胞活化导致数目增多，脑内炎性细胞因子 IL-1β、TNF-α 含量增多，不同剂量的 NAC 可以缓解神经炎症反应。 1.4. CPZ 暴露 10 天，少突胶质细胞数目减少，不同剂量的 NAC 可以减轻 CPZ 引起的这种变化，NAC 有保护 OLs 的作用，但是各组之间 MBP 水平没有明显差别。

结论 CPZ 暴露可以通过氧化应激损伤和神经炎症引起少突胶质细胞的减少，从而影响大脑的高级神经活动，使动物的行为发生改变。NAC 可以减轻氧化应激损伤和神经炎症，进而保护 OLs，缓解动物行为学的异常。以上研究结果表明，CPZ 暴露 10 天的小鼠可能作为精神分裂症前驱期的动物模型，脑白质损伤可由氧化应激和神经炎症介导，可能是精神分裂症的发病机制之一，NAC 可以作为精神分裂症动物模型的保护性药物。

伴自杀意念青少年抑郁障碍患者认知功能损害特点及相关性研究

吴蕾 杨建中*
昆明医科大学第二附属医院

目的 在青少年抑郁障碍患者的自杀风险因素中，自杀意念很常见，继而在自杀意念驱动下导致青少年抑郁障碍发生自杀风险也随之急剧升高，已严重影响青少年的成长发展及社会心理功能。本研究拟比较伴/不伴自杀意念的青少年抑郁障碍患者相关因素：抑郁、焦虑严重程度、认知障碍、冲动、快感缺乏及神经电生理检测来探讨伴自杀意念青少年抑郁障碍患者的认知功能损害特点。

方法 收集青少年抑郁障碍患者，同时招募与入组患者组相匹配的对照组（HC 组 21 例）。根据贝克自杀意念量表 (BSI-CV)将青少年抑郁障碍患者分成伴自杀意念 MDD 组(SI 组 40 例)和不伴自杀意念 MDD 组(NSI 组 36 例)；采用 HAMD-24、HAMA-14、SHAPS、BIS-II 分别评估三组的抑郁、焦虑严重程度、快感缺乏及冲动性。采用心理学范式情绪 Go/No-Go 任务及获得的 ERP 成分(N2、P3)来评估三组的认知功能。通过 SPSS26.0 进行统计分析。

结果 1.三组被试在一般资料上相匹配，具有可比性；2.三组被试两两比较：SI 组、NSI 组 HAMD-24 总分、认知障碍因子分、HAMA-14 总分、SHAPS、 BIS-II 得分明显高于 HC 组(均 $P<0.05$)，且 SI 组 HAMD-24 总分、认知障碍因子分、HAMA-14 总分、SHAPS、

BIS-II 得分高于 NSI 组(均 P<0.05)；3.在情绪 Go/No Go 任务中，在 Go 反应时:SI 组、NSI 组在三种情绪图片下反应时均长于HC组；4.在情绪Go/No Go任务中，相比于中性和正性面孔、SI 组在负性面孔会引起更大的 P3 波幅；5.SI 组负性情绪面孔下 No-Go P3 波幅与 HAMD-24 总分、认知障碍因子分、HAMA-14 总分、BIS-II 显著负相关(r=-0.325、-0.319、-0.391、-0.362，P <0.01)；6.Logistic 回归分析结果显示：抑郁、焦虑、认知障碍的严重程度及负性面孔下 No-Go P3 波幅偏低是青少年抑郁障碍患者自杀意念的危险因素。

结论 伴自杀意念青少年抑郁障碍患者的焦虑、抑郁更严重、且快感缺乏明显，易冲动，认知损害更明显。他们在负性情绪下抑制控制损害明显，且负性情绪下抑制控制损害与焦虑、抑郁、认知障碍严重程度、易冲动密切相关。抑郁、焦虑、认知障碍以及负性面孔下抑制控制缺陷明显是青少年抑郁障碍患者自杀意念的危险因素。

关键字：青少年；抑郁障碍； 自杀意念；抑制控制；冲动性；快感缺乏；

中西医结合治疗对社区抑郁障碍患者疗效、安全性及依从性的随机对照研究

丁楠[1] 简佳[2] 孙萌萌[2] 郑云哨[2] 崔开艳[2] 杨丽敏[2] 王汝展[2] 寻广磊[2,3]
1.济宁医学院精神卫生学院
2.山东省精神卫生中心
3.中华医学会精神医学分会生物精神病学组

目的 本研究根据中药治疗、西药治疗和中西医结合治疗的有效性、安全性，以及患者对治疗的依从性，探讨中西医结合治疗社区抑郁障碍患者的有效方案。

方法 本研究研究对象来自于山东省 9 个地区 27 个区县级精神专科医院门诊就诊的抑郁障碍患者，符合 ICD-10 抑郁障碍诊断标准。共纳入 310 例社区抑郁障碍患者被随机分为西药组、中药组和中西医结合组，分别接受单用艾司西酞普兰或度洛西汀、单用舒肝解郁胶囊和联合使用舒肝解郁胶囊和艾司西酞普兰或度洛西汀，治疗 8 个月。第一阶段结束（8 周末）进行疗效判定，对第一阶段单药治疗效果不佳的患者采用中西医结合治疗（舒肝解郁胶囊联合艾司西酞普兰或度洛西汀），对第一阶段中西医结合治疗效果不佳的患者进行西药剂量优化并加强依从性管理，对第一阶段治疗有效的患者继续原治疗方案。在基线、4、8、12、16、24 及 32 周末使用蒙哥马利-阿斯伯格抑郁评定量表（MADRS）、汉密尔顿抑郁量表（HAMD）、汉密尔顿焦虑量表（HAMA），评估病情；通过 Morisky 服药依从性问卷（MMAS-8）、计算脱落率，评估依从性；使用副反应量表（TESS）、不良事件记录表评估安全性。

结果 1.三组第一阶段（8 周末）的治疗结局有显著差异（P<0.001）。其中，中西医结合组与西药组、中药组的疗效差异显著（P=0.002；P=0.001），中西医结合组的治愈率及有效率更高。2.中西医结合组 MADRS、HAMD 及 HAMA 量表总分在三阶段整体变化上，与西药组及中药组相比有显著差异（P<0.05），中西医结合组量表评分下降更快，更快趋近于 0。3.西药组中年龄大的患者较年龄小的患者 HAMD 减分率低（P<0.05），中西医结合组中年龄大的患者的 HAMD 减分率较西药组高（P<0.05）。4.中西医结合组与脱落率成负相关，首次发病、无诱因起病、病程、未婚、学历越低及接受治疗时间越长与患者脱落率成正相关。三组间不良反应发生率和 TESS 分值差异均不显著。

结论 1.中西医结合治疗社区抑郁障碍患者较单用西药后合并中药或者单用中药后合并西药的疗效好，可以较快控制疾病症状，更早的使病情平稳，具有更高的依从性，安全性好。2.本研究发现中西医结合治疗对老年抑郁障碍患者具有更好的疗效，说明在社区实施中西医结合治疗有独特的优势。

伞型花内酯改善慢性应激大鼠抑郁样行为的机制研究

张丽媛 宋学勤*
郑州大学第一附属医院

目的 伞型花内酯（Umb）具有多种药理特性，如抗氧化、抗炎、抗糖尿病和抗肿瘤作用。然而，其潜在抗抑郁作用报道较少。本研究旨在探讨 Umb 对慢性应激大鼠模型抑郁样行为的改善作用机制。

方法 采用慢性应激建立大鼠抑郁症模型：75 只 SD 大鼠随机分为 5 组(n=15)：对照组、模型组(CUMS)、CUMS + Flu(20mg/kg)组、CUMS +Umb (20mg/kg) 组、CUMS + Umb (40mg/kg)组。除对照组大鼠外，其它大鼠均暴露于CUMS 3 周后，分别接受对应的药物治疗。从第四周开始，大鼠灌胃伞型花内酯或氟西汀，每天一次。最后一次给药 4h 后进行行为学测试。评价大鼠的行为学、生化指标、分子蛋白表达等。所有数据均以平均值±标准差表示。结果采用 SPSS17.0 (SPSSInc.，USA) 进行方差分析(ANOVA),并且使用 Tukey 法进行事后检验。P 值小于 0.05 为差异有统计学意义。

结果 Umb(20,40mg/kg)显著改善抑郁样行为，包括糖水偏好、悬尾不动时间(TST)和强迫游泳时间(FST)，同时显著降低细胞因子水平。机制方面，发现 Umb 显著升高海马 SIRT1 蛋白表达，显著抑制 HMGB1/NF-κB 通路蛋白表达。

结论 综上所述，Umb 能显著改善慢性应激大鼠抑郁样行为，其机制与调控 SIRT1 和 HMGB1/NF-κB 蛋白信号相关。

关键字：伞型花内酯，慢性不可预测的轻度应激(CUMS)，HMGB1/NF-κB，SIRT1

肠道菌群及其相关抗氧化物在精神分裂症中的作用研究

王舒颖 宋学勤*
郑州大学第一附属医院

目的 观察首发未用药 SCZ 患者和健康对照人群中肠道菌群分布和抗氧化物水平的差异；观察肠道菌群、抗氧化物与 SCZ 发病的关系；探讨 SCZ 患者中肠道菌群和抗氧化物的可能作用。

方法 入组对象为 2019 年 10 月至 2022 年 3 月我院精神医学科住院的首发未用药 SCZ 患者，并通过广告招募健康对照（HC）人群。入组当天完善受试者基本信息。使用阳性与阴性症状量表（PANSS）评估 SCZ 组精神症状的严重程度。使用汉化版的认知功能成套测验（MCCB）评估所有受试者的认知功能。在入组次日清晨收集所有受试者的空腹血液样本和粪便样本。SCZ 患者接受利培酮单药治疗 24 周后，于门诊随访，并评估 PANSS 和 MCCB 量表。

结果 与 HC 组相比，SCZ 组的信息处理速度、注意/警觉、工作记忆、词语学习、视觉学习和社会认知领域评分均显著低于 HC 组（P 均<0.05）。推理和问题 解决评分未见统计学差异（P>0.05）。 3. SCZ 组肠道菌群的改变和抗氧化物水平的变化：与 HC 组相比，SCZ 组的肠道菌群 α 多样性中的 shannon 指数和 simpson 指数显著降低（P 均<0.05）。SCZ 组梭状芽胞杆菌属、琥珀酸弧菌属的相对丰度显著升高，双歧杆菌属、小杆菌属、另枝菌属、厌氧肠球菌属、链球菌属的相对丰度均显著降低（P 均<0.05）。SCZ 组的 TBIL、IBIL 水平显著升高，SOD 显著降低（P 均<0.05）。基于差异肠道菌群和抗氧化物指标构建 SCZ 诊断模型：经过统计学筛选，以厌氧肠球菌属、链球菌属、IBIL 和 SOD 建立 SCZ 辅助诊断模型，准确率达 79%，敏感度 79%，特异度 80%，工作特征曲线（ROC）曲线下面积达 0.87。该模型效能优于单用肠道菌群或单用抗氧化物建立的诊断模型。

结论 首发未用药 SCZ 患者体内存在肠道菌群的失调和抗氧化物水平的改变；厌氧肠球菌属、链球菌属、IBIL 和 SOD 或许可以作为 SCZ 的诊断标记物；

肠道菌群及抗氧化物在精神分裂症症状中的作用研究

王舒颖 宋学勤*
郑州大学第一附属医院

目的 观察肠道菌群、抗氧化物与精神分裂症（SCZ）症状和疗效的关系； 探讨 SCZ 患者中肠道菌群和抗氧化物的可能作用。

方法 入组对象为 2019 年 10 月至 2022 年 3 月我院精神医学科住院的首发未用药 SCZ 患者，并通过广告招募健康对照（HC）人群。入组当天完善受试者基本信息。使用阳性与阴性症状量表（PANSS）评估 SCZ 组精神症状的严重程度。使用汉化版的认知功能成套测验（MCCB）评估所有受试者的认知功能。在入组次日清晨收集所有受试者的空腹血液样本和粪便样本。SCZ 患者接受利培酮单药治疗 24 周后，于门诊随访，并评估 PANSS 和 MCCB 量表。

结果 在 SCZ 组中，小杆菌属相对丰度与视觉学习领域正相关（r=0.234，P=0.021），琥珀酸弧菌属相对丰度与工作记忆领域负相关（r=-0.348，P=0.002），链球菌属与视觉学习领域正相关（r=0.203，P=0.046）。IBIL 与工作记忆领域负相关（r=-0.247，P=0.028）。 6. 琥珀酸弧菌属相对丰度和 IBIL 对认知功能中的工作记忆领域的预测具有统计学意义（b=-0.273，t=-3.831P<0.001； b=-0.192，t=-2.411，P=0.018），方程具有统计学意义（ P<0.001），决定系数（调整 R2 值）为 0.191，自变量之 间不具有多重共线性。基线时期 SCZ 患者的另枝菌属相对丰度和 24 周利培酮治疗后的 PANSS 阴性症状分（N24）负相关（r=-0.228，P=0.046）。基线时期 SCZ 患者的 UA 水平分别与治疗后的 N24 和 PANSS 总分（T24）正相（ r=0.258，P=0.024；r=0.288，P=0.011），基线时期 SCZ 患者的 TBIL 和 IBIL 水平分别与治疗后的 PANSS 阳性症状分（P24）正相关。基线时期 SCZ 患者的另枝菌属相对丰度和 UA 水平对治疗后患者的阴性症状的预测有统计学差异。

结论 在首发未用药 SCZ 患者中，琥珀酸弧菌属的相对丰度和 IBIL 水平可能是认知功能中工作记忆领域的危险因素；基线时期 SCZ 患者的另枝菌属的相对丰度可能是阴性症状疗效的保护因素，基线时期 SCZ 患者的的 UA 水平可能是阴性症状疗效的危险因素。

关键字：精神分裂症，疗效，肠道菌群，抗氧化物

重型抑郁障碍左侧颞极颞上回的结构-功能耦合与视觉记忆关联的破坏

王瑜 韦锦学 张子健 杨潇 马小红*
四川大学华西医院

目的 脑功能连接模式受到结构连接的限制，结构-功能（SC-FC）耦合有助于衡量二者之间的关系。先前研究表明，SC-FC 耦合的改变与多种精神障碍有关，尤其是灰质网络能揭示与解剖组织改变相关的不同和稳定表型。然而，传统的 SC-FC 耦合指标只考虑全局和整体脑的相关性，忽略了区域特性。最近开发的区域特异性 SC-FC 耦合算法在精神障碍研究中显示出潜在应用价值。

方法 在本研究中，我们构建 115 例重型抑郁障碍（MDD）患者和 134 例健康对照者（HCs）之间的灰质结构连接和功能连接网络，并计算和比较 MDD 和 HC 间的区域特异性 SC-FC 耦合。采用计算机化的剑桥神经认知测试自动化电池（CANTAB）来评估被试的

神经认知功能，比较 MDD 和 HC 的组间差异。同时分析临床特征、神经认知功能和区域特异性 SC-FC 耦合之间的相关性。

结果 相对于 HCs，MDD 患者左侧眶部额下回（Frontal_Inf_Orb_L）和右侧枕下回（Occiptal_Inf_R）的 SC-FC 耦合显著增加，而左侧颞极颞上回（Temporal_Pole_Sup_L）和右侧颞极颞中回（Temporal_Pole_Mid_R）的 SC-FC 耦合显著降低。Temporal_Pole_Sup_L 的 SC-FC 耦合与 MDD 患者的 PRM 延迟任务的正确率呈正相关，但在 HCs 中没有呈现相关性。

结论 本研究表明，MDD 患者左侧颞极颞上回的 SC-FC 解耦以及左侧颞极颞上回的 SC-FC 耦合与神经认知功能之间的异常关联可能参与了 MDD 的病理生理过程。

关键字：重型抑郁障碍，结构-功能耦合，左侧颞极颞上回，视觉记忆

首发精神分裂症患者脑白质微结构与认知损害的关联研究

贾茹飞 宋学勤*
郑州大学第一附属医院

目的 观察首发精神分裂症患者用药之前脑白质微结构和认知功能的损害情况。探讨首发精神分裂症患者脑白质微结构与认知功能损害的关联。

方法 入组对象为从 2019 年 10 月至 2022 年 10 月就诊于郑州大学第一附属医院精神科的首发未用药精神分裂症（SCZ）患者，以及通过广告招募的健康对照组。采用 MATRICS 成套认知功能量表（MCCB）评估所有入组对象的认知功能。使用美国 GE 公司的 Discovery 750 3.0T 磁共振扫描仪采集所有受试者的 DTI 序列。采用 PANDA 软件处理 DTI 数据，获取每个被试每条白质纤维束的部分各向异性（FA）、轴向扩散率（AD）以及径向扩散率（RD）指标。采用 SPSS 26.0 统计软件分析数据。计量资料组间比较采用独立样本 t 检验，相关性分析采用 Pearson 相关。DTI 参数差异性分析结果采用 FDR 方法进行多重检验校正。差异有统计学意义以双侧 P<0.05 来表示。

结果 研究最终纳入 54 例首发未用药 SCZ 患者和 70 例健康对照进行分析。患者组在认知功能七大领域评分均明显低于健康对照组，差异有统计学意义（均 P<0.05）。患者组胼胝体辐射线枕部 FA 值低于对照组，差异有统计学意义（P<0.05，FDR 校正）；右侧下纵束 AD 值、左侧上纵束 AD 值、左侧钩束 RD 值高于对照组，差异有统计学意义（P<0.05, FDR 校正）。患者组胼胝体辐射线枕部 FA 值和和社会认知正相关（r=0.275，P=0.044）；右侧下纵束 AD 值和信息处理速度、注意及警觉性、社会认知负相关（r=-0.369，P=0.006；r=-0.274，P=0.045；r=-0.337，P=0.013）；左侧上纵束 AD 值和信息处理速度、注意及警觉性、社会认知负相关（r=-0.352，P=0.009；r=-0.276，P=0.043；r=-0.426，P=0.001）；左侧钩束 RD 值和注意及警觉性、社会认知负相关（r=-0.412，P=0.002；r=-0.401，P=0.003）。

结论 首发未用药精神分裂症患者存在脑白质微结构改变。 精神分裂症患者 FA 值、AD 值、RD 值均与认知功能相关，异常的脑白质微结构可能参与了认知功能损害。

精神分裂症患者细胞色素 P450 酶 CYP2D6 基因多态性对阿立哌唑治疗效应的影响

李小龙*
呼伦贝尔市第三人民医院（呼伦贝尔市精神卫生中心）

目的 为确保阿立哌唑在精神分裂症患者治疗中的有效运用，检测患者细胞色素 P450 酶 CYP2D6 基因多态性，分析其对阿立哌唑治疗效应的影响。

方法 选取我院的 300 例精神分裂症患者，均在 2018 年 8 月~2020 年 9 月入院，入选的患者均接受了 28 天的阿立哌唑治疗，期间不运用其他任何药物。采取 DP-TOF 飞行时间质谱检测系统，检测入选患者 CYP2D6 exon I C/T 188 位点（以下称为“此研究目标位点”）的基因多态性。对比不同基因型患者的血药浓度与剂量比、治疗有效率（分别在治疗后第 14 天、第 28 天统计）。

结果 在血药浓度两次统计中，血药浓度从高到低依次排列是：C/C＞C/T＞T/T（P＜0.05）。在治疗有效率上，第 14 天时各基因型患者对比不存在显著差异（P＞0.05），在第 28 天，治疗有效率从高到低依次排列是：C/T＞C/C＞T/T（P＜0.05）。

结论 在精神分裂症患者采用阿立哌唑治疗的过程中，细胞色素 P450 酶 CYP2D6 基因多态性会对该药物的效果产生影响，临床应当根据患者的不同基因型调整用药剂量或者用药方案。

腹侧被盖区 mTORC1 对抑郁和焦虑样行为的调控作用研究

郑子腾[1,2] 杨璐[1,2] 张兰兰[1] 崔明湖[1] 郭明[1,2]
1.滨州医学院附属医院心理科
2.滨州医学院附属医院医学研究中心

目的 抑郁症和焦虑症是常见的精神障碍，共病率高且严重影响患者的社会功能和生活质量。这两种疾病是神经精神科学领域研究的难点问题，虽然提出了单胺递质异常等假说，但仍不能确切地解释其发病机制，同时药物治疗也存在有效率低、起效慢和副作用多等问题。新冠疫情大流行期间抑郁症和焦虑症的发病率大大增加，使人们认识到疾病预防、诊断和治疗的

重要性，阐明抑郁症和焦虑症的发病机制、寻找新的有效靶点是迫在眉睫的任务。腹侧被盖区（VTA）是情绪调控的重要脑区，多巴胺神经元在其中发挥重要作用。我们的前期研究发现敲除多巴胺神经元中 mTOR 基因的转基因小鼠抑郁和焦虑样行为增加。mTOR 通过与不同蛋白形成复合物激活不同的下游信号通路，为进一步探究 mTOR 影响抑郁和焦虑样行为的机制，我们考察了 VTA 中 mTOR 复合物 1（mTORC1）对焦虑和抑郁行为的影响。

方法 Raptor 是 mTORC1 的重要组成蛋白，我们应用 Cre-loxp 系统和脑立体定位技术在 Raptorflox/flox 小鼠 VTA 注射 AAV-CAG-Cre-ZsGreen 特异性敲除 VTA 脑区的 raptor 基因，对照组小鼠注射 AAV-CAG-ZsGreen。病毒注射 3 周后对小鼠进行嗅尿实验（FUST）、悬尾实验（TST）、高架十字迷宫（EPM）和明暗箱实验（LDB）行为学检测，考察小鼠抑郁和焦虑样行为。行为学实验结束后用免疫荧光成像和 real-time RT-PCR 实验检测病毒表达和基因敲除水平。

结果 VTA 特异性敲除 Raptor 基因后，小鼠在 FUST 和 TST 实验中表现出抑郁样行为增加，在 EPM 和 LDB 实验中表现出焦虑样行为增加。Real-time RT-PCR 实验结果显示病毒注射可以有效降低 VTA 脑区 raptor 的 mRNA 表达水平。

结论 特异性敲除 VTA 的 raptor 基因可以增加小鼠抑郁和焦虑样行为，提示 VTA 的 mTORC1 具有调控情绪行为的作用。

目的 通过对 APOE 基因、抑郁症与氧化应激相关机制的研究进行综述，为未来探究 APOE 基因通过氧化应激途径对抑郁症产生影响具体研究提供参考。

方法 载脂蛋白 E 是一种多态性蛋白，其合成受到载脂蛋白 E 基因调控。近年来，随着对载脂蛋白 E 基因与神经退行性疾病相关性的不断研究，关于载脂蛋白 E 基因与抑郁症存在关联的研究越来越多。氧化应激指机体自由基的积累和清除，它是抑郁症重要发病机制之一，这种氧化应激与 APOE 基因多态性也存在一定联系，本文将对 APOE 基因、抑郁症与氧化应激相关机制的研究进行综述。

结果 APOE-?4 等位基因的个体可能因为小胶质细胞的数量显著降低，从而导致 Aβ 蛋白的纤维沉积在线粒体，造成线粒体的损伤，产生大量的活性氧和活性氮，同时，在 APOE-?4 等位基因携带者的 CAT 和 GSH-Px 等抗氧化酶活性降低，活性氧和活性氮的清除下降，进而与细胞生物膜上相关的酶、膜受体上的多不饱和脂肪酸核酸和侧链以及磷脂等大分子物质脂质发生过氧化反应，形成脂质过氧化产物 MDA，且 APOE-?4 等位基因的个体蛋白质中缺少两个关键的半胱氨酸残基，脂质过氧化所产生的物质 4-HN 含量上升，脂质过氧化物进一步堆积，导致机体细胞膜渗透性、蛋白质发生改变，从而产生神经毒性，影响抑郁症的发生和发展，也可抑制海马神经前体细胞的增殖，对抑郁症患者的记忆和认知功能产生负性影响。

结论 APOE 基因可能通过氧化应激途径对抑郁症的发生、发展及认知功能产生影响。

2.承德医学院
3.北京航空航天大学

目的 精神分裂症和衰老与认知缺陷有关，视觉和言语工作记忆表现的明显下降说明了这一点。作为一种非语言、非视觉和独特的工作记忆子系统，振动触觉工作记忆（vibrotactile working memory, vtWM）在加强信息处理、缓解和康复有视觉和听觉障碍的人方面起着关键作用。然而，在精神分裂症患者和老年人中，对 vtWM 的认知处理和能力的调查仍然很少。

方法 在这项研究中，我们进行了三个实验来比较四组人的 vtWM 表现：健康的青少年（Young）、健康的老年人（Old）、青少年精神分裂症患者（young patients with schizophrenia, SCZ-Young）、老年的精神分裂症患者（older patients with schizophrenia, SCZ-Old）。此外，使用磁共振波谱（1H-MRS）检验了青少年与老年精神分裂症患者中 N-乙酰天门冬氨酸化合物（N-acetylaspartate compounds, NAAc）的代谢物水平。

结果 结果显示，Old、SCZ-Young 和 SCZ-Old 的 vtWM 表现都明显受损。最关键的是，老年精神分裂症组的损伤最为严重，这体现在 SCZ-Old 组的小指表现和对最后一个项目的回忆更差。此外，排序任务显示，SCZ-Young 组的执行控制功能和 vtWM 的相对工作记忆能力退化程度低于 SCZ-Old 组。而 MRS 结果显示，SCZ-Young 组的前扣带皮层（anterior cingulate cortex, ACC）的 NAAc 水平明显高于 SCZ-Old 组。

结论 这些结果表明，老年精神分裂症患者在触觉和频率信息处理方面受到的损害比年轻患者和健康老年人更大。而且，年轻的精神分裂症患者在 vtWM 处理方面的恶化程度较小，特别是在较高的振动触觉工作记忆负荷下。因此，早期评估和干预可能对治疗精神分裂症的认知障碍及其预后结局有好处。

4.镇江市精神卫生中心

目的 精神分裂症的阴性症状缺乏有效的治疗手段。现有的重复经颅磁刺激（repetitive transcranial magnetic stimulation，rTMS）常选用背外侧前额叶皮层作为干预靶点来治疗阴性症状，但该方案的总体疗效有限且个体差异性大。影像学研究表明精神分裂症的眶额皮层出现结构和功能的异常，且与阴性症状密切相关。本研究旨在探索 rTMS 干预眶额皮层对首发精神分裂症的临床疗效，并采用经颅磁刺激诱发的脑电（TMS evoked potentials，TEPs）来探讨其潜在的电生理机制。

方法 本研究采用随机、双盲、伪刺激对照的实验设计。我们在哈尔滨市第一专科医院入组 100 例首发精神分裂症患者，将其随机分成真刺激组和伪刺激组。患者接受连续 20 天的低频 1Hz 重复经颅刺激治疗，干预靶点为右侧眶额皮层，干预强度为 110%的静息态运动阈值。我们在基线阶段及治疗结束后采集了患者的阳性和阴性症状量表（PANSS）及经颅磁刺激诱发的脑电信号。对于 TEPs 信号，我们采用半球间信号传播指数来量化被试大脑左、右半球同源位置处的半球间抑制效应。采用双因素混合设计的方差分析来比较 rTMS 干预前后临床症状和电生理指标的变化，采用皮尔逊相关分析来探索临床改善和电生理改变之间的关系。

结果 基线阶段，真刺激组和伪刺激组的人口统计学资料、临床症状等无差异。rTMS 治疗前后，PANSS 总分的时间效应显著，组别和时间的交互效应显著。进一步的后验分析表明，真刺激组患者的临床症状（尤其是阴性症状和一般精神病理症状）的改善显著优于伪刺激组。TEP 结果表明，患者的半球间信号传播指数具有区域特异性，仅在刺激靶点周围表现出明显的半球间抑制效应。半球间信号传播指数在基线阶段与阴性症状显著正相关。在 rTMS 真刺激组中，基线阶段的半球间信号传播指数与阴性症状的改善显著相关；治疗前后半球间信号传播指数的改变与阴性症状的改善显著相关；而在伪刺激组中不存在这种相关性。

结论 连续 20 天的 1Hz 低频 rTMS 干预眶额皮层可显著改善首发精神分裂症患者的阴性症状。半球间抑制效应的改善是 rTMS 治疗阴性症状的潜在机制。这些结果为精神分裂症的物理治疗及潜在的神经电生理机制提供了新的证据和循证支持。

免疫衰老相关 T 细胞表型及白质异常在精神分裂症伴迟发性运动障碍患者中的关系研究

李娜 谭云龙*
北京回龙观医院

目的 精神分裂症患者较普通人群寿命减少约 20-25 年，且年龄是迟发性运动障碍（tardive dyskinesia，TD）最重要的危险因素之一。过早或加速衰老、免疫功能障碍在伴有 TD 的精神分裂症患者的病理机制中发挥重要作用。T 细胞亚群相对比例失调是免疫衰老最重要的表型且与大脑结构异常密切相关。本研究旨在探索免疫衰老相关 T 细胞表型及白质异常在伴有 TD 的精神分裂症患者发病机制中的作用。

方法 本研究共纳入符合入组标准的精神分裂症患者共 108 例，其中 TD 患者 50 例，非 TD（NTD）患者 58 例，健康对照 (healthy control，HC) 58 例，收集一般人口学资料、临床资料（性别、年龄、教育程度、起病年龄、总病程、当前用药情况等），采用阳性与阴性症状量表（Positive and Negative Syndrome，PANSS）评估临床症状，采用异常不自主运动量表(Abnormal Involuntary Movement Scale，AIMS)评估 TD 的严重程度。用流式细胞术定量检测幼稚 (CD45RA+)、记忆 (CD45RO+)、凋亡 (CD95+) 标志物阳性的 CD4+ 和 CD8+ T 细胞百分比及 IFN-γ、IL-6、IL-1β 和 TNF-α 等细胞因子在衰老表型阳性 T 细胞中的表达情况。使用 MRI 成像分析，计算皮质下灰质体积及白质纤维束的分数各项异性（fractional anisotropy，FA）。使用 SPSS 进行单因素方差分析、皮尔逊相关分析、多元线性回归分析等进行组间比较及各指标相互关系的探讨，以性别、年龄、教育程度及颅内总体积（针对影像数据）等作为协变量。

结果 1）与 NTD 和 HC 相比，TD 患者中 CD8+CD45RO+CD95+ T 细胞亚群的数量较高，并且与外周-中枢交界组织脉络丛的体积相关。2）CD8+CD45RO+CD95+ T 细胞中的 INF-γ 表达量、穹窿/终纹的 FA 值和苍白球体积与口面型 TD 的严重程度相关，而额枕下束、扣带束和上纵束的 FA 值与四肢-躯干型 TD 的严重程度相关。

结论 免疫衰老相关 T 细胞表型与大脑结构异常的相互关联在 TD 的发病机制中发挥重要作用，且免疫衰老标志物及白质异常进一步佐证了口面型及四肢-躯干型 TD 的发病机制不同，为将来针对免疫衰老、白质异常的精准靶向治疗不同类型的 TD 提供了理论依据。

亨廷顿舞蹈病 HTT 基因 CAG 三核苷酸重复次数在精神分裂症迟发性运动障碍患者的表达研究

李娜 谭云龙*

北京回龙观医院

目的 伴有迟发性运动障碍（Tardive dyskinesia，TD）的精神分裂症临床表型与亨廷顿舞蹈病（Huntington's disease，HD）有诸多相似之处，包括运动过度、精神症状和认知功能下降等。先前的研究假设这两种疾病背景下的运动障碍可能源于相同的遗传倾向，即导致亨廷顿舞蹈病的 HTT 基因 CAG 三核苷酸重复扩增可能同样在 TD 病理机制中发挥重要作用，然而亨廷顿蛋白（huntingtin，HTT）基因胞嘧啶-腺嘌呤-鸟嘌呤（cytosine–adenine–guanine，CAG）三核苷酸重复序列的作用尚未在 TD 中得到充分探索，基于上述内容本研究探讨 HTT 基因 CAG 重复次数能否解释 HD 与 TD 之间的临床表型相似性。

方法 从 2021-2022 年共纳入符合入组标准的精神分裂症患者共 362 例，其中 TD 患者 165 例，非 TD（NTD）患者 197 例，收集一般人口学资料、临床资料（性别、年龄、教育程度、起病年龄、总病程、当前用药情况等），采用阳性与阴性症状量表（Positive and Negative Syndrome，PANSS）评估临床症状，采用异常不自主运动量表(Abnormal Involuntary Movement Scale, AIMS)评估 TD 的严重程度。通过聚合酶链反应（polymerase chain reaction，PCR）定量检测 2 组患者 HTT 基因的 CAG 重复长度。

结果 1）HTT 基因 CAG 重复长度在 TD 和 NTD 患者中没有差异 ($p = 0.752$)，2）CAG 重复长度与 PANSS 评分或 AIMS 评分不相关性均不显著（$ps > 0.05$）。

结论 我们的研究结果并不支持 HTT 基因的 CAG 重复序列扩增在 TD 机制中的发挥作用，需要更多神经生物学和遗传学研究来阐明 TD 和 HD 之间的相似性。

Inflammatory Disequilibrium and Lateral Ventricular Enlargement in Treatment-Resistant Schizophrenia

陈闻锦 勾梦壮 谭云龙*
北京回龙观医院北京大学回龙观临床医学院

Objective Treatment-resistant schizophrenia (TRS) patient respond poorly to antipsychotics. Inflammatory imbalance involving pro- and anti-inflammatory cytokines may play an important role in the mechanism of antipsychotic-medication response. This study aimed to investigate immune imbalance and how the latter relates to clinical manifestations in patients with TRS. The level of net inflammation was estimated by evaluating the immune-inflammatory response system and compensatory immune-regulatory reflex system (IRS/CIRS) in 52 patients with TRS, 47 with non-TRS, and 56 sex and age matched healthy controls.

Methods The immune biomarkers mainly included macrophagic M1, T helper, Th-1, Th-2, Th-17, and T regulatory cytokines and receptors. Plasma cytokine levels were measured using enzyme-linked immunosorbent assay. Psychopathology was assessed using the Positive and Negative Syndrome Scale (PANSS). Subcortical volumes were quantified using a 3-T Prisma Magnetic Resonance Imaging scanner.

Results The results showed that (1) patients with TRS were characterized by activated pro-inflammatory cytokines and relatively insufficient anti-inflammatory cytokines, with an elevated IRS/CIRS ratio indicating a new homeostatic immune setpoint; (2) IRS/CIRS ratio was positively correlated with larger lateral ventricle volume and higher PANSS score in patients with TRS.

Conclusion Our findings highlighted the inflammatory disequilibrium as a potential pathophysiological process of TRS.

4.Dongzhimen Hospital, Beijing University of Chinese Medicine

Objective Psychogenic erectile dysfunction (pED) has been associated with cognitive declines. While increasing neuroimaging studies have demonstrated abnormalities of cerebral structural changes in pED, the association between altered white matter (WM) structural network and cognitive impairments remains unclear. Hence, this study aimed to explore the association between WM structural network connectivity and cognitive performance in patients with pED.

Methods Forty pED patients and 33 healthy controls (HCs) were recruited to perform cognitive assessments, and diffusion tensor imaging scans. We firstly constructed the WM structural network and applied the machine learning method to identify the important features. Then, we examined group differences in cognitive assessments, WM structural network connectivity within the identified features, and associations between altered WM structural network connectivity and cognitive scores in pED patients.

Results From 26896 features of DTI data, 24 important features were identified by K-Nearest Neighbor classification with a satisfactory accuracy (78%). Compared with HCs, we found that pED patients showed higher fractional anisotropy (FA) values between left transverse temporal sulcus and left supramarginal gyrus, and lower FA values between left suborbital sulcus and left para-hippocampal part of the medial occipito-temporal gyrus in pED patients. Furthermore, the increased FA between left transverse temporal sulcus and left supramarginal gyrus was observed to be negatively associated with impaired delayed memory.

Conclusion Overall, our findings provide new insights into WM network alterations associated with impaired cognitive functions in pED, which may unravel the potential neural mechanisms underlying the cognitive impairments of pED patients.

目的 观察精神分裂症（Schizophrenia, SZ）患者的局部自发脑活动变化及其与临床症状和认知功能的相关性，探究用于疗效预测的生物标志物。

方法 本研究共纳入 104 例 SZ 患者和 86 例健康受试者（Healthy Control, HC）。SZ 组受试者在基线和第二代抗精神病药治疗 8 周末进行功能磁共振扫描，HC 组受试者在基线时扫描。使用低频振幅（Amplitude of Low-frequency Fluctuation, ALFF）、局部一致性（Regional Homogeneity, ReHo）和度中心性评估受试者局部自发脑功能活动。采用阳性与阴性症状量表（Positive and Negative Syndrome Scale, PANSS）和认知功能成套测验评估患者的临床症状及认知功能。比较 SZ 患者和 HC 的差异以及治疗前后的变化，探究与临床量表变化的相关性。根据 PANSS 减分率，将 SZ 组受试者分为 SZ 有效组和 SZ 无效组，比较两亚组治疗前后指标的变化，进一步探究是否与疗效相关。

结果 1. 和 HC 相比，SZ 患者 ALFF 和 ReHo 的变化存在重叠脑区，在颞下回、额下回、小脑增高，在梭状回和楔前叶降低。2. 和治疗前相比，治疗后 SZ 组患者的 ALFF 在右背外侧额上回增高，在双侧枕中回、左侧中央旁小叶、左侧舌回、右侧中央前回降低。ReHo 在右内侧额上回增高，在左侧枕中回和左侧中央后回降低。3. 在 SZ 两个亚组的分析中，仅在 SZ 有效组中发现右内侧额上回的 ReHo 值增加。4. SZ 组患者右背外侧额上回 ALFF 值的增加与焦虑抑郁因子评分的降低呈正相关（r=0.347, P=0.001），与连线测验评分的降低呈正相关（r=0.272, P=0.012）；右内侧额上回 ReHo 值的增加与阴性因子评分的降低呈负相关（r=-0.255, P=0.019）；左侧中央后回 ReHo 值的降低与符号编码评分的增加呈正相关（r=0.306, P=0.005）。

结论 1. SZ 患者许多脑区的功能活动和 HC 存在差异，表现出广泛的局部脑功能异常。2. 治疗过程中，SZ 患者部分脑区的局部自发脑功能活动发生变化，且右背外侧额上回、右内侧额上回、左侧中央后回的变化与阴性症状、焦虑抑郁症状或信息处理速度的改善相关。3. 右内侧额上回的局部自发脑活动变化可能可以评估症状改善程度，以预测疗效。

抑郁障碍患者临床特征与黑皮质素系统基因组关联分析

许月 杨建中*
昆明医科大学第二附属医院

目的 探讨抑郁障碍患者快感缺失、食欲变化特征及 BMI 值与黑皮质素系统因 POMC、CART、AgRP、NPY、MC3R、MC4R、PCSK1、PCSK2 候选基因的多态性位点相关性。

方法 选取 2016 年 01 月至 2022 年 11 月在昆明医科大学第二附属医院符合 ICD-10 抑郁障碍诊断标准的 1093 例抑郁障碍患者，收集一般资料并根据 ICD-10 诊断标准进行结构化访谈评估患者快感缺失及食欲变化特征。入组对象均抽取外周静脉血 5ml，采用微阵列 SNP 分型技术进行全基因组关联研究，筛选出黑皮质素系统 POMC、CART、AgRP、NPY、MC3R、MC4R、PCSK1、PCSK2 基因的全部单核苷酸多态性位点，进一步探讨抑郁障碍的快感缺失、食欲变化、BMI 值等临床表型与黑皮质素系统候选基因的相关性。

结果 1.本研究入组的 1093 例抑郁障碍患者中，男性抑郁障碍患者占 31.11%，女性占 69.89%，平均年龄 33.25±17.50 岁。2.存在快感缺失特征占 85.18%，存自杀观念的 585 例中 91.62%存在快感缺失特征；存快感缺失者 HAMD 总分、焦虑/躯体化、认知障碍、日夜变化、阻滞、 绝望感因子分在两组间存在统计学差异。食欲变化占 63.59%，正常占 36.41%；BMI 值提示正常占 60.93%。3.黑皮质素系统候选基因 114 个 SNP 位点与抑郁障碍患者的快感缺失特征存在相关性，其中存在 CART rs281126（A）等位基因变异的患者可能存在更高快感缺失特征风险；159 个 SNP 食欲变化存在相关性，其中 PCSK2 rs2206452、rs2424074、

rs1015776、rs2424066、rs1361510、rs1417559、rs1417560达到较显著水平（P<5.0x10-5），且均为抑郁障碍患者可能产生食欲变化的危险因素。有 114 个 SNP 位点与 BMI 值存在相关性。

结论 1.抑郁障碍患者存快感缺失特征比例较高，抑郁程度更重食欲减退更明显。2. 黑皮质素系统候选基因多态性位点与抑郁患者的临床特征存在相关性。3. 黑皮质素系统中部分基因的多态性位点的等位基因变异可能与更高快感缺失特征的风险，更高的食欲变化风险特征及 BMI 值变化相关且为抑郁障碍 患者出现该临床特征的危险因素。

Identification of VIPR2 Rare and Common Variants in The Chinese Han Population with Schizophrenia

殷嘉浚[1] 周娟[2] 方芳[1] 俞水[1] 王军[1] 袁建民[1] 周振和[1]

1.无锡市精神卫生中心
2.山东省肿瘤医院

Objective Schizophrenia is a severe and chronic psychiatric disorder with hereditary risk up to 80% as previous studies indicated. Several researches have demonstrated a significant association between schizophrenia and microduplications that overlap the vasoactive intestinal peptide receptor 2 gene (VIPR2).

Methods To further investigate potential causal VIPR2 gene variants, all exons and un-translated portions of the VIPR2 gene were sequenced using amplicon targeted resequencing in 1804 Chinese Han patients with schizophrenia and 996 healthy counterparts in the present study.

Results Nineteen rare non-synonymous mutations and 1 frameshift deletion was identified for schizophrenia, among which 5 variants have never been reported so far. Frequencies of rare non synonymous mutations were significantly different between the two groups. Specifically, the non synonymous mutation rs78564798 (Pallele = 0.006) as well as two rare variations in the VIPR2 gene's introns (rs372544903, Pallele = 0.026 and a novel mutation, chr7:159034078, GRCh38, Pallele = 0.048) were significantly associated with schizophrenia.

Conclusion Our findings add new evidence that the functional and probable causative variants of VIPR2 gene may play an important role in susceptibility to schizophrenia. Further studies on validations of VIPR2's function in the etiology of schizophrenia are warranted.

关键字：VIPR2 gene, schizophrenia, amplicon targeted resequencing, association study, causative variants

精神分裂症患者血浆 MMP9 水平升高与抗精神病药物治疗效果差和右侧颞上回白质体积下降相关

李晓静[1,2] 王秀娟[1] 杨勇锋[1,2] 岳伟华[3] 吕路线[1,2] 李文强[1,2]

1.新乡医学院第二附属医院，河南省精神病医院
2.河南省生物精神病学重点实验室
3.北京大学精神卫生研究所

目的 抗精神病药物治疗是精神分裂症（schizophrenia, SCZ）治疗的主要手段，然而有大约三分之一的 SCZ 患者抗精神病药物治疗无效或效果差。在临床治疗前期识别出这类患者将有助于进行个体化治疗以改善疗效。氧化还原失衡和免疫炎症失调与 SCZ 病因病理密切相关，并且会影响疾病的治疗效果。基质金属蛋白酶 9（matrix metalloproteinase 9, MMP9）是介导氧化应激和炎症之间相互作用的一个关键分子，因此 MMP9 可能是预测 SCZ 患者疗效的潜在生物标记物。此外，有研究发现 MMP9 的升高也与认知障碍和白质损伤相关。在本研究中我们探讨了 SCZ 患者血浆 MMP9 浓度与抗精神病药物反应、临床症状和大脑结构的关系。

方法 本研究共纳入 129 名健康对照和 124 名 SCZ 患者。SCZ 患者在经过 8 周的抗精神病治疗后，根据 PANSS 减分率是否≥50%，将其分为疗效好组（n=49）和疗效差组（n=75）。在健康对照组，我们采集了基线期血液样本；在 SCZ 患者组，进行了基线期和治疗 8 周这两个时间点的血液样本采集、PANSS 评估、MCCB 评估、磁共振数据采集。此外，我们采用 ELISA 的方法检测血液样本中 MMP9 的含量，并基于 Brainnetome 图谱的 246 个分区，从患者的磁共振图像中提取了区域白质体积。

结果 与健康对照组相比，疗效差组患者血浆 MMP9 水平在基线期明显升高，并与右侧颞上回白质体积和认知症状呈负相关；相反，疗效好组患者和健康对照组之间的血浆 MMP9 无差异，血浆 MMP9 与认知症状或白质体积也无相关性。此外，SCZ 患者基线期血浆 MMP9 水平与 PANSS 减分率呈负相关，二元 Logistic 回归结果也显示 SCZ 患者基线期 MMP9 水平是影响疗效的一个重要因素。

结论 血浆 MMP9 升高与 SCZ 患者抗精神病药物疗效差、白质缺损和认知障碍有关,可能是指导个性化治疗的潜在生物标志物。

稳定期精神分裂症患者元认知能力与快感体验能力的相关性分析

孔慧 董毅 方文梅 方靓 王悦 叶玲飞 朱道民*
安徽医科大学附属心理医院，合肥市第四人民医院，安徽省精神卫生中心

目的 近年来，精神分裂症患者的元认知及相关的认知功能缺陷受到了广泛的关注，大量研究表明，精神分裂症患者存在广泛的元认知障碍，快感缺失作为精神分裂症的主要核心症状，与认知功能损伤的关系密切，目前关于精神分裂症患者快感缺失与元认知能力间的关系的研究较少。本研究旨在讨论精神分裂症患者元认知能力与快感体验能力之间的相关性。

方法 选择 2022 年 12 月-2023 年 6 月期间在安徽省精神卫生中心住院及门诊治疗的符合 ICD-10 诊断标准的稳定期精神分裂症患者作为研究对象（81 例）。通过印第安纳精神疾病访谈(IPII)，采用修订版元认知量表（MAS-A）对精神分裂症患者元认知能力进行评估，包括自我反省（S）、理解他人想法（O）、去中心化（D）、控制（M）四个因子。采用时间快感体验量表（TEPS)、躯体快感缺失量表（RPAS）以及社会快感缺失量表（RPAS）评估患者的快感体验能力，其中 TEPS 包括预期快感、完成快感两个分量表。采用 Pearson 相关分析、Spearman 相关性分析进行数据处理。

结果 D 分与 TEPS 总分及完成快感分(r=0.266、0.303，P<0．05)均呈正相关，具有统计学意义；MAS-A 总分与 TEPS 总分和完成快感分(r=0.238，P<0．05、r=0.254，P<0．05)均呈正相关，具有统计学意义。以性别分组分别进行相关性分析，结果显示在女性患者中，MAS-A 总分 、S 分、O 分、D 分、M 分(r=0.461、0.330、0.413、0.382、0.441，P<0．05)与 TEPS 总分呈正相关，均具有统计学意义。MAS-A 总分、S 分、O 分、D 分、M 分(r=0.531、0.421、0.480、0.444、0.451，P<0．05)与完成快感分也呈正相关，均具有统计学意义。而这些相关性在男性患者中均不存在。女性的 MAS-A 总分、S 分、O 分以及 M 分(r=-0.383、-0.382、-0.341、-0.379，P<0．05)与社会快感缺失量表分均呈负相关,这些相关性在男性患者中同样也不存在。

结论 稳定期精神分裂症患者元认知能力与快感体验能力正性相关，提示元认知的完整性可能会影响对时间快感、躯体以及社会快感的体验，且在女性患者中尤为明显，值得进一步研究讨论。

稳定期精神分裂症患者元认知功能与依恋关系的相关性分析

叶玲飞 方文梅 方靓 孔慧 王悦 董毅 朱道民*
安徽医科大学附属心理医院，合肥市第四人民医院，安徽省精神卫生中心

目的 精神分裂症是一组具有广泛认知损害的重性精神疾病。元认知作为认知活动的核心，是指个体在进行信息加工的同时，能够理解自己和他人的心理状态并做出相应行为反应的一种能力。研究显示精神分裂症患者存在广泛的元认知障碍，且这种元认知缺陷可能与童年创伤、不安全依恋有关。目前关于精神分裂症依恋关系与元认知功能之间的研究甚少，本研究旨在探讨稳定期精神分裂症患者依恋关系与元认知功能的相关性。

方法 选取在安徽省精神卫生中心住院和门诊治疗的符合 ICD-10 诊断标准的稳定期的精神分裂症患者作为研究对象，共纳入 80 名患者，根据性别分组，其中女性组 35 例、男性组 45 例；采用亲密关系体验-关系结构量表（Experiences in Close Relationships-Relationship Structures scale,ECR-RS）评估稳定期精神分裂症患者的多种依恋关系，包括依恋回避、依恋焦虑两个维度；分为母亲依恋（ECR-RS-1）、父亲依恋（ECR-RS-2）、恋人依恋（ECR-RS-3）、挚友依恋（ECR-RS-4）四个领域。采用印第安纳精神疾病访谈（the indiana Psychiatric illness interview,IPII）及修订版元认知评估量表（MAS-A）对患者元认知功能进行评估，包括自我反省（S）、理解他人（0）、去中心化（D）、控制（M）4 个因子。采用独立样本 T 检验比较男性组与女性组元认知功能及亲密关系体验-关系结构量表之间的差异，通过偏相关分析探讨稳定期精神分裂症患者依恋关系与元认知功能间的关系。

结果 独立样本 T 检验发现女性患者组的元认知总分及元认知 D 分高于男性患者组，差异具有统计学意义(t=-1.989,P=0.05;t=-3.62,P=0.001)，亲密关系体验-关系结构量表各项得分在两组间差异均无统计学意义。控制混杂因素对精神分裂症患者的依恋关系及元认知功能进行偏相关分析，结果显示恋人依恋（ECR-RS-3）领域的依恋回避与元认知的总分、元认知 D 分及元认知 M 分结果呈负相关(r=-0.266,P<0.05；r=-0.250,P<0.05；r=-0.292,P<0.05)。

结论 稳定期精神分裂症患者异性亲密关系越好，患者对自我和他人的认知理解能力及应对社会困境的功能可能就越好。

伴 NSSI 的首发抑郁症患者 rTMS 治疗临床疗效及其磁共振波谱分析研究

任一铭 杨建中*
昆明医科大学第二附属医院

目的 1.通过磁共振波谱技术探究伴有非自杀性自伤行为(NSSI)的抑郁症患者大脑内侧前额叶皮层 γ-氨基丁酸(GABA)与谷氨(GLU)的含量及其与抑郁症状及 NSSI 行为的关联性。2.探究伴有 NSSI 行为的抑郁症患者在重复经颅磁刺激治疗后，抑郁症状、NSSI 行为的变化、mPFC 的 GABA 与 GLU 含量的变化,以及抑郁症状、NSSI 行为变化与 GABA、GLU 含量变化的关联性。

方法 纳入了 103 例伴有 NSSI 行为的首发抑郁障碍患者，采用汉密尔顿抑郁量表、抑郁自评量表、非自杀性自伤行为与功能量表评定患者的抑郁症状以及 NSSI 行为的严重程度；之后进行 MRS 检查并对 MRS 数据进行采集与后处理，测得患者大脑 mPFC 内 GABA

及 GLU 的含量；分析患者的抑郁症状以及 NSSI 行为的严重程度与大脑 mPFC 内 GABA 及 GLU 含量的关联性。在此基础上将其中 35 名患者随机分为研究组和对照组进行为期 10 天的治疗，两组均给予常规抗抑郁药物治疗，前者在使用抗抑郁药治疗的同时联合使用 rTMS 疗法。在治疗后再次进行 HAMD、SDS、ANSSIQ 量表的评定并行 MRS 检查.

结果 治疗后，研究组患者 mPFC 内的 GABA 升高，GLU 含量降低，HAMD、SDS、ANSSIQ 得分均降低.对照组患者 mPFC 内的 GABA 与 GLU 含量在治疗前后无明显差异,HAMD、SDS、ANSSIQ 得分均降低.研究组患者 HAMD、SDS、ANSSIQ 得分低于对照组，mPFC 内的 GABA 含量高于对照组，GLU 含量低于对照组.研究组患者治疗前后 GABA 的变化量与 HAMD、SDS、ANSSIQ 三种量表的减分呈负相关关系,GLU 的变化量与 HAMD、SDS、ANSSIQ 三种量表的减分呈正相关关系.多重线性回归分析结果显示，在治疗前后量表评分变化量 dHAMD、dSDS、dANSSIQ 三个自变量中：dHAMD 对 dGABA 有负效应，对 dGLU 有正效应；dANSSIQ 对 dGLU 有正效应；dSDS 被剔除未进入回归方程。

结论 伴有 NSSI 行为的抑郁症患者大脑 mPFC 内 GABA 及 GLU 含量与其抑郁症状及 NSSI 行为的严重程度有关。低频 rTMS 治疗作用于右侧 DLPFC 可以用于伴有 NSSI 行为的抑郁症患者的治疗，在治疗后患者的抑郁症状减轻，且自伤意念减轻、自伤行为减少。这些改变可能与治疗期间大脑 mPFC 内 GABA 含量的升高和 GLU 含量的减少有关联性.

抗精神病药源性肥胖患者认知功能的进一步损害机制

张筱蕴 宋学勤
郑州大学第一附属医院

目的 第二代非典型抗精神病药物（AAPDS）是治疗精神分裂症和其他精神病的常用药物。抗精神病药物的应用会引起一些代谢不良反应，如肥胖、血脂异常、血糖异常和胰岛素抵抗等。其中最常见的副作用是体重增加，长期服用 AAPDS 会使至少 50%的患者体重增加至少 5kg，不良反应的发生，不仅会影响患者的身心健康，而且会在原有疾病造成的认知功能损害的基础上，引起认知功能的进一步累加，表现为学习、记忆功能等的下降，严重降低患者的依从性。

方法 纳入我院首发未用药精神分裂症患者组 70 例，健康对照组 50 例，两组基线人口学资料无明显差异。对首发精神分裂症患者组给予利培酮治疗，动态观察两组 BMI、炎症因子和认知的关系。

结果 研究发现首发未用药精神分裂症患者信息处理速度(SOP)、注意与警觉（AV）、工作记忆(WM)、视觉记忆(BVMT)、推理和问题解决(RPS)评分等都明显低于正常对照组，血清炎症因子 IL-1β 、IL-6 和 TNF-α 在治疗前明显高于健康对照组。治疗后半年随着体重的增加，炎症因子 IL-1β 、IL-6 和 TNF-α 水平升高。治疗半年后，体重增加组认知功能领域中信息处理速度(SOP)、工作记忆(WM)、视觉记忆(BVMT)、推理和问题解决(RPS)评分明显低于体重无明显增加组。

结论 首发精神分裂症患者存在多个认知功能领域的损害，同时提示精神分裂症存在免疫系统激活。而应用抗精神病药物后引起的药源性肥胖可能是一种慢性低度炎症。药源性肥胖导致增多的游离脂肪酸通过激活小胶质细胞的 NF-KB 通路和改变小胶质细胞的激活状态，产生更高水平的炎症因子。炎症因子通过正反馈，进一步激活 NF-KB 通路，引起神经炎症的级联放大，损伤海马突触可塑性和 LTP 的明显减弱，从而影响认知功能。促炎因子状态的改变和肥胖存在一定的相关性，随着体重的增加，炎症因子也发生一些动态变化，同时利培酮所致的体重增加可能对认知功能产生进一步的负面影响。

关键字：抗精神病药物；利培酮；药源性肥胖；认知；免疫；小胶质细胞

阿尔茨海默病性患者激越症状的发生与左侧杏仁核体积与有关

洪波[1] 郭茜[1] 丁燕[2] 杨阳[1] 陈剑华[1] 岳玲[1]
1.上海市精神卫生中心
2.上海市闵行区精神卫生中心

目的 阿尔茨海默病（AD）伴发的精神行为症状(BPSD)给患者及家属带来了严重的疾病负担，其中激越症状是造成照料者痛苦的主要原因，也是导致送入医疗机构的主要原因。激越症状的出现可能和某些关键脑区的结构改变有关。因此，本研究通过分析 AD 患者脑结构的改变与激越症状的关系，探索影响激越症状的关键脑区。

方法 本研究以上海市精神卫生中心门诊或住院的 AD 患者为研究对象，收集基线期一般人口学资料，使用简易精神状态量表（MMSE）评估其认知功能，痴呆评定量表（CDR）评估其痴呆严重程度，神经精神问卷（NPI）评估其精神行为症状，进行 3D T1 结构像磁共振扫描并使用 Freesurfer 6.0 软件分割脑区。以 NPI 量表中激越/攻击性的分数是否≥1 分，分为激越组和非激越组，比较两组间关键脑区的结构变化。

结果 通过门诊及病房收集符合 ICD-10 诊断标准的 AD 患者 66 例，其中激越组 34 例，非激越组 32 例。两组间年龄、性别、受教育年限均无统计学差异。激越组的 MMSE 总分低于非激越组（11.35±7.04 vs15.35±7.03，p=0.012），NPI 总分（37.70±21.99 vs18.43±18.60，p<0.001）及 CDR 分数（2.28±0.69 vs1.73±0.73，p=0.001）均高于非激越组，差异存在统计学意义。激越组左侧杏仁核体积略高于非激越组（968.55±303.00 vs942.05±241.36，p=0.09），两组间右

侧杏仁核及双侧海马体积均无统计学差异。Logistic 多因素回归发现，左侧杏仁核体积较大（p=0.045）和 CDR 分数较高（p=0.007）是 AD 患者出现激越症状的主要危险因素。

结论 AD 患者出现激越症状可能与左侧杏仁核结构改变有关。

关键字：阿尔茨海默病 激越 杏仁核 脑结构

氧化三甲胺及其前体在精神分裂症伴发代谢综合征患者中的差异分析

罗超[1,2] 李宁宁[1] 丁燕莉[1] 陈剑华[1]
1.上海交通大学医学院附属精神卫生中心
2.复杂基质样本生物分析湖南省重点实验室

目的 分析长期住院精神分裂症伴随或不伴随代谢综合征患者血浆中氧化三甲胺及其前体代谢物的差异，为发现新的生物标志物提供依据。

方法 在本院病房中招募长期住院的精神分裂症患者，根据中华医学会 2020 年的代谢综合征诊断标准分为伴发代谢综合征组（M 组）和不伴发代谢综合征组（N 组）；再招募性别、年龄与精神分裂症患者匹配的健康对照组（H 组）。采用 UPLC-MS 的方法检测各组人群血浆中氧化三甲胺（TMAO）、三甲胺（TMA）、甜菜碱（TCJ）、肉碱（RJ）和胆碱（DJ）水平。

结果 本研究共纳入 210 名受试者，其中 M 组 79 人，N 组 71 人，H 组 60 人。三组受试者年龄、性别无统计学差异。相较于 N 组和 H 组，M 组受试者体重、BMI、腰围、血压、空腹血糖、甘油三酯水平和调节代谢紊乱药物使用百分比较高，而高密度脂蛋白水平较低；M 组与 N 组相比，病程、抗精神病药物使用种类无统计学差异。单因素方差分析发现，M 组和 N 组 TMAO 水平较 H 组升高（P 均< 0.001）；DJ 水平在三组之间无显著性差异；M 组和 N 组 TCJ 水平较 H 组降低（P < 0.001, = 0.001）；M 组和 N 组 RJ 水平均低于较 H 组（P 均< 0.001），但 M 组高于 N 组（P = 0.037）；N 组 TMA 水平低于 H 组和 M 组（P 均< 0.001）。男性 TMAO 水平较低，而 DJ、TCJ 和 TMA 水平较女性高（P 均< 0.05）。由于样本中男性比例较大，故男性 TMAO 及其前体代谢物的水平与总体趋势相近；女性各组间 TMAO 水平未见显著差异，M 组 DJ 水平显著增高（P 均< 0.05）。

结论 TMAO 水平在精神分裂症患者中升高，其中伴发代谢综合征患者中的水平更高，有潜力成为预测精神分裂症伴发代谢综合征的生物标志物。

关键字：精神分裂症；代谢综合征；氧化三甲胺；靶向代谢组

Association of Impaired Cortical Inhibition and Clinical Outcomes in Patients at Clinical High Risk for Psychosis

吴观福 徐丽华 朱田园 钱禛颖 孔盖 崔慧茹 张天宏 王继军 唐莺莹*
上海交通大学医学院附属精神卫生中心

Objective Cortical inhibition (CI) could be in-vivo measured using single-pulse or paired-pulse transcranial magnetic stimulation (TMS). Impaired CI has been observed in patients with schizophrenia and at clinical high-risk for psychosis (CHR). However, it remains unclear whether CI impairments could predict the clinical outcomes of CHR, i.e., the risk of converting to schizophrenia.

Methods We recruited 55 CHR patients, 35 patients with first-episode schizophrenia (FES), and 35 healthy controls (HC). 83.6% of CHR patients and 85.7% of FES patients were drug-naive. We measured the cortical inhibition function of the left primary motor cortex using TMS by three CI indexes, GABAA-mediated short-interval cortical inhibition (SICI), GABAB-mediated cortical silent period (CSP), and glutamate-mediated intra-cortical facilitation (ICF). We used MATRICS Consensus Cognitive Battery to test all subjects' neurocognitive performance. CHR patients were followed-up within 2 years and were divided into CHR converters (CHR-C) and CHR non-converters (CHR-NC) according to their clinical and functional assessments during the follow-up.

Results There was a significant between-group difference for CSP. CSP was longer in CHR-C (Bonferroni adjusted P = 0.047) and FES group (Bonferroni adjusted P = 0.033) than HC, while CSP was comparable between CHR-NC and HC (Bonferroni adjusted P = 0.455). In CHR, CSP was negatively related to their performances in verbal learning task (r = -0.282, P = 0.039), visuospatial memory task (r = -0.277, P = 0.042), and maze task (r = -0.379, P = 0.005). There was no significant between-group difference for either SICI or ICF.

Conclusion The prolonged CSP was selectively observed in CHR patients who later converted to schizophrenia, suggesting that impaired GABAB-mediated cortical inhibition could be related to the full-blown onset of schizophrenia and may be a potential biomarker for predicting the individual conversion risk.

Comparing The Efficacies of Transcranial Magnetic Stimulation Treatments by Different Targeting Methods in Major Depressive Disorder: A Network Meta-analysis

王思睿[1] 孔盖[1] 吴观福[1] 崔慧茹[1] 钱禛颖[1] 徐丽华[1] 魏宇梅[1] 王俊杰[2] 黄晶晶[1] 王继军[1,3,4] 李惠[1] 唐莺莹[1]
1.上海交通大学附属精神卫生中心
2.苏州市广济医院
3.上海交通大学类脑智能应用与技术中心
4.中国科学院脑科学与智能技术卓越创新中心

Objective To compare the efficacies of three different transcranial magnetic stimulation (TMS) targeting methods, "5 cm" method, F3 method, and neuronavigational method, over the left dorsolateral prefrontal cortex (DLPFC) for patients with major depressive disorder (MDD) by performing a network meta-analysis (NMA).

Methods We included all randomized controlled trials (RCTs) comparing efficacies between active TMS treatment by any one or more of the three targeting methods and sham TMS treatment or between TMS treatments by any two or three of above targeting methods. Participants included were diagnosed with MDD with no limitation to age, gender or nationality. The primary outcomes are the reduction scores in the Hamilton Depression Rating Scale (HDRS) compared with baseline. We used the dropout rate and incidence of adverse events to represent the acceptability of TMS treatment as secondary outcomes. Standardized mean differences (SMD) were computed for continuous outcome data and summary odds ratios (ORs) were used for binary data. The surface under the cumulative ranking curve (SUCRA) was generated to rank the efficacies and acceptability of different targeting methods. We assessed heterogeneity by using the I2 statistic and used node-splitting method to access the local inconsistency. The risk of bias was assessed with the Cochrane risk of the bias assessment tool. We created funnel plots to explore possible small-study and publication biases.

Results Of 1228 references, 42 RCTs were included. The result of NMA of efficacy showed the comparison between efficacy of "5 cm" method and sham treatment was statistically significant. Same result also found in the comparison between neuronavigational method and sham treatment. The SUCRA showed, in terms of efficacy, neuronavigational method may be the most efficacious targeting method (86.4%), followed by the F3 method (56.1%), "5 cm" method (54.8%), and sham treatment (2.7%). In terms of dropout rate, the result of NMA showed no statistically significance among groups. In terms of incidence of adverse events, 23 trials which included in analysis mostly reported headache and discomfort at scalp. The result of NMA showed "5 cm" method had higher incidence of adverse events than sham treatment, other comparisons were not statistically significant. The SUCRA showed sham treatment may have the lowest incidence of adverse events. The results of the node splitting method showed good consistency. The funnel plots of efficacy and acceptability had good symmetry, indicating a higher quality of inclusion in the study and a lower possibility of publication bias.

Conclusion Neuronavigational method is probably the most efficacious targeting method comparing to traditional targeting methods. Few differences were found in acceptability between the different targeting methods and sham treatment. Patients may experience more adverse events during real stimulation, but most of them were not drop out.

不同刺激电量 MECT 治疗精神障碍患者的疗效分析

刘二月* 王海华 施皑皑
上海市浦东新区南汇精神卫生中心

目的 探究不同刺激电量对 MECT 治疗精神障碍患者疗效的影响

方法 选取本院精神科于 2022 年 2 月至 2023 年 2 月收治的 75 例精神障碍患者作为研究对象，并按照刺激电量不同随机均分为 3 组（低电量组、中电量组、高电量组）。对比三组的治疗总有效率、不良反应发生率、精神状况、刺激电量影响因素等指标。

结果 治疗前，三组 CGI-S 评分无显著差异（P>0.05）。治疗后，三组 CGI-S 评分均明显降低。与低电量、中电量组相比，高电量组的 CGI-S 评分下降更显著（P<0.05）。低电量、中电量、高电量组治疗精神障碍的总有效率分别为 64.00%、76.00%、88.00%。与低电量组、中电量组相比，高电量组的治疗总有效率显著上升（P<0.05）；低电量、中电量、高电量组治疗精神障碍的不良反应总发生率分别为 4.00%、12.00%、28.00%。与低电量组、中电量组相比，高电量组主要在头疼、其他肌肉疼、短期记忆力下降等方面的不良反应显著增加（均 P<0.05）；治疗前，三组的 HAMD、PANSS、WAIS 及 WMS 评分比较，均无显著差异（均 P>0.05）。治疗后，与低电量、中电量组相比，高电量组患者的 HAMD、PANSS、BRMS、WMS 评分均呈显著下降趋势（均 P<0.05），WAIS 评分差异不显著（P>0.05）；男性、年龄较大、精神分裂症是所需电量高的预测因素。

结论 不同刺激电量 MECT 治疗精神障碍患者的疗效不同。增加刺激电量能够显著提升患者的临床疗效，改善患者抑郁、冲动、妄想等精神状况，但会增加短期不良反应，特别是疼痛、记忆力下降等临床表现的发生，因此在对患者采取 MECT 治疗时，应对刺激电量进行严格控制。

睡眠时相延迟型强迫症患者的脑代谢磁共振波谱及反应抑制功能研究

王健[1,2] 郑会蓉[1,2]
1.南方医科大学附属广东省人民医院（广东省医学科学院）广东省精神卫生中心
2.华南理工大学医学院

目的 本研究旨在探讨强迫症患者丘脑神经代谢物水平、反应抑制功能及睡眠时相延迟之间的关联性，进一步理解强迫症的发病机制。

方法 本研究应用磁共振波谱测量 41 名强迫症患者和 22 名健康对照的丘脑静息态和功能态神经递质水

平，检测前和检测中采用 Go-Nogo 任务进行反应抑制功能测量。所有参与者收集一般临床资料及七天的睡眠日记记录，应用多导睡眠脑电记录仪进行夜间睡眠监测(PSG)。采用匹兹堡睡眠质量指数量表(PSQI)评估主观睡眠质量；清晨型-夜晚型问卷(MEQ)评估睡眠时型；耶鲁布朗强迫症严重程度量表(Y-BOCS)评估强迫症状严重程度；汉密尔顿抑郁量表(HAMD)评估抑郁程度；汉密尔顿焦虑量表(HAMA)评估焦虑程度。

结果 与健康对照相比，强迫症患者丘脑静息态 N-乙酰天门冬氨酸(NAA)水平显著升高(p=0.021)；Go 任务正确率显著降低(p=0.017)；Nogo 任务错误率显著增加(p＜0.001)；Nogo 任务错误反应时显著延长(p=0.001)；快速动眼(REM)睡眠潜伏期显著延长(p=0.005)；PSQI 评分更高(p＜0.001)。研究发现强迫症患者中 48.78%(20/41)的患者存在 DSPD，伴有或不伴 DSPD 的强迫症患者丘脑静息态 NAA 水平均高于健康对照(p=0.047, p=0.049)，但组间差异无统计学意义(p=0.973)；伴有 DSPD 的强迫症患者丘脑功能态肌酸(Cr)水平高于不伴 DSPD 的患者 (p=0.038)，同时强迫思维(Obsession)评分更高(p=0.029)。与健康对照及不伴 DSPD 的强迫症患者相比，伴有 DSPD 的强迫症患者 Nogo 任务错误率显著增加(p<0.001, p<0.001)，Nogo 任务错误反应时更长(p=0.010, p=0.021)。伴有 DSPD 的强迫症 PSQI 评分显著高于健康对照和不伴 DSPD 的强迫症患者(p<0.001, p=0.008)。OCD 患者全样本分析发现强迫思维评分与 PSQI 存在正相关(r=0.358, p=0.022)，与 MEQ 评分存在负相关(r=-0.516, p=0.005)。回归分析显示，MEQ 评分

结论 强迫症患者丘脑神经代谢物异常及抑制功能损害与睡眠时相延迟有关。关键脑区的神经代谢物异常和更严重的反应抑制损伤可能构成强迫症睡眠时相延迟的神经生物学基础。

关键字：强迫症；睡眠时相；反应抑制；神经代谢物

Caspase-1 Affects Chronic Restraint Stress-induced Depression-like Behaviors by Modifying GABAergic Dysfunction in The Hippocampus

李明星[1] 孙雪娇[2] 王宗琴[1] 李毅[1]
1.武汉市精神卫生中心
2.武汉大学中南医院

Objective Major depression disorder (MDD) is one of the most common psychiatric disorders and one of the leading causes of disability in worldwide. Both inflammation and GABAergic dysfunction have been implicated in the pathophysiology of MDD. Caspase-1, a classic inflammatory caspase, regulates AMPARs-mediated glutamatergic neurotransmission. However, the role of caspase-1 in chronic stress-induced GABAergic dysfunction remains largely unknown.

Methods Depressive-like behaviors were induced by chronic restraint stress (CRS) in adult male mice. Genetic and pharmacological approaches were used to investigate the role of caspase-1-mediated neuroinflammation on the GABAergic neurotransmission in the hippocampus. Miniature inhibitory postsynaptic currents (mIPSCs) were recorded by whole-cell patch-clamp techniques. Surface protein was extracted by a biotin kit, and the expression of protein was detected by western blotting. Intrahippocampal microinjection of the adeno-associated virus was carried out using a stereotaxic instrument and followed by behavioral tests.

Results In this study, we found that serum and hippocampal caspase-1-IL-1β levels increased significantly in chronic restraint stress (CRS) mice, and a significant negative correlation occurred between levels of caspase-1 and depression-like behaviors. Furthermore, CRS significantly decreased GAD67 mRNA levels and GABAergic neurotransmission accompanied by the reduction of GABA concentration, reduced the amplitude and frequency of mIPSCs inhibitory postsynaptic currents (mIPSCs) and the decreased surface expression of GABAARs γ2 subunit in the hippocampus. Genetic deficiency of caspase-1 not only blocked CRS-induced depression-like behaviors, but also alleviated CRS-induced impairments in GABAergic neurotransmission. Finally, reexpression of caspase-1 in the hippocampus of Caspase-1-/- mice increased susceptibility to stress-induced anxiety- and depression-like behaviors through inhibiting GAD67 expression and GABAAR-mediated synaptic transmission.

Conclusion Our study suggests that CRS dysregulates GABAergic neurotransmission via increasing the levels of caspase-1-mediated neuroinflammation in the hippocampus, ultimately leading to depression-like behaviors. This work illustrates that targeting caspase-1 may provide potential therapeutic benefits to stress-related GABAergic dysfunction in the pathogenesis of MDD.

关键字：CRS; caspase-1; hippocampus; GAD67; GABAergic dysfunction; mIPSCs.

Changes of Structural Functional Connectivity Coupling and Its Correlations with Cognitive Function in Patients with Major Depressive Disorder

廖启蒙 张子健 杨潇 韦锦学 王敏 窦恺翊 杜玥 马小红*
四川大学华西医院心理卫生中心

Objective Previous neuroimaging studies have reported structural and functional brain abnormalities in major depressive disorder (MDD). In this study, we aimed to explore whether the coherence of structural-functional networks was affected by disease and investigate its correlation with clinical manifestations.

Methods The severity of symptoms and cognitive function of 121 MDD patients and 139 healthy controls were assessed using HAMD-17, HAMA-14 and the Cambridge cognitive function test (CANTAB), respectively. Imaging data, including diffusion tensor imaging (DTI),

T1 structural MRI, and resting-state functional MRI, were measured to constructed whole-brain networks. Spearman correlation coefficients were calculated as coupling coefficients. Double-weight median correlation was used to investigate the correlations between differences in brain networks and the clinical assessments.

Results The percentage of total correct response to DMS and the percentage of delayed correct response to PRM decreased in MDD patients compared with controls. Compared with the HC group, KLS-FC coupling between the parietal lobe and subcortical area, FA-FC coupling coefficient between the temporal lobe and parietal lobe, and FN-FC coupling coefficient in the frontal lobe decreased in the MDD group. Several correlations between brain network connectivity and clinical manifestations were identified

Conclusion The structural functional coupling ability in patients with depression was significantly lower than that in healthy subjects, and the abnormalities in structural-functional coupling were related to clinical characterization. These findings may help to deepen our understanding of the pathophysiological mechanisms of depression and provide new ideas for the diagnosis and treatment of depression.

Multimodal Neuroimaging Network Associated with Executive Function in Adolescent MDD Patients Via Cognition-guided MRI Fusion

廖启蒙 刘艺林 窦愷翊 杜玥 王敏 韦锦学 赵连生 杨潇* 马小红*
Mental health center and laboratory of psychiatry, West China Hospital of Sichuan University, 610041, Chengdu, China

Objective Adolescents are a high-risk population for major depressive disorder (MDD). Previous studies have reported structural and functional brain abnormalities associated with cognitive dysfunction in MDD. Besides, the exposure to childhood maltreatment is also a potential factor for impaired cognition. This study aimed to identify the multimodal co-varying brain network related to executive function and their relationship with childhood maltreatment.

Methods A total of 24 MDD patients and 43 healthy controls (HCs) were included and completed the 17-item Hamilton Depression Scale (HAMD-17), 14-item Hamilton Rating Scale for Anxiety (HAMA-14), the Childhood Trauma Questionnaire (CTQ) and the Intra-Extra Dimensional Set Shift Task (IED). Multimodal neuroimaging data, including amplitude of low-frequency fluctuations (ALFF) from resting-state functional MRI (rs-fMRI) and gray matter volume (GMV) from structural MRI (sMRI) were combined together with executive using a supervised fusion method. The potential pairwise relationship between identified neuroimaging pattern, cognitive function and childhood maltreatment were analyzed using moderating effect model.

Results The MDD group showed more total errors than the HCs after controlling for age and education year. Their performance on IED task were related to score of HAMA and CTQ. We discovered an executive function-related brain pattern featured with lower ALFF and GMV loadings in MDD patients. The GMV loadings of identified brain network had a negative moderating effect on the relationship between CTQ score and poor performance in IED task.

Conclusion These findings may help to deepen our understanding of the pathophysiological mechanisms of cognitive dysfunction in adolescent depression, and provide new ideas for its accurate diagnosis and treatment.

关键字：adolescent MDD, executive function, magnetic resonance imaging, supervised multimodal fusion, moderating effect

童年逆境与成年精神分裂症患者攻击性

彭兴[1,2] 张秀军[1] 周福春[2] 王传跃[2] 王琪[2] 王菲菲[2] 侯文鹏[2] 丁玉深[2] 王逍遥[2] 江启彤[2] 周艳[2]
1.华北理工大学公共卫生学院
2.首都医科大学附属北京安定医院

目的 考察成人精神分裂症患者的童年创伤流行率并探讨生活逆境（童年创伤和欺凌）与患者的攻击性行为的关系。

方法 使用童年创伤问卷(Childhood Trauma Questionnaire-Short Form, CTQ-SF)、成人欺凌问卷(Bullying Scale for Adults, BSA)（中文版）及 Buss 和 Perry 攻击问卷（Buss-Perry Aggression Questionnaire, AQ-CV），招募首都医科大学附属安定医院门诊以及病房符合 DSM-5 诊断的成年精神分裂症患者 391 名，社会招募在性别、年龄以及受教育程度等人口学资料匹配的健康对照 410 名。

结果 1.童年创伤流行率：健康对照：16.59%；精神分裂症：53.20%。2.精神分裂症患者在童年创伤总分及各个维度、成人欺凌总分（13.87±13.61 VS 3.10±5.39，t=14.92，p＜0.001, 95%CI: 9.35~12.18）及各个维度分、攻击总分、躯体攻击、言语攻击、愤怒、敌意及指向自我攻击等维度的分数均高于健康对照，且差异具备统计学意义(p 值均小于 0.001，95%CI：0.27~13.42)；3.进一步分析精神分裂症个体的攻击性：在躯体性攻击维度，存在童年创伤的两组精神分裂症患者的攻击性无显著性差异(p=0.075，95%CI：-0.15~3.09)；在其他维度，存在童年创伤的精神分裂症个体的攻击性均高于不存在童年创伤的精神分裂症个体（p 值均小于 0.001，95%CI：0.57~15.96，其中言语攻击维度 p=0.001, 95%CI: 0.57~2.40）。4.将欺凌作为协变量，上述两组患者间的攻击性差异仍显著 (66.03±27.08 VS 55.14±20.53)，F(1,389)=18.07, p＜0.001；且欺凌对攻击性的独立贡献也是显著的 F(1,389)=10.79, p=0.001,

偏 η2=0.027，95%CI：3.16~12.58，R2adj=0.136。

结论 1.精神分裂症群体的攻击性较健康被试高，并且首次发现存在童年创伤精神分裂症个体的攻击性较不存在童年创伤精神分裂症个体的攻击性高；2.较健康对照，精神分裂症个体在成年后更容易遭受欺凌，并且对患者发病后的攻击行为具有独立的贡献。

关键字：童年创伤；欺凌；攻击性；精神分裂症；

难治性强迫障碍的脑代谢磁共振波谱及抑制功能研究

罗国伟[1] 肖雨晴[1,2] 黄诃桂[1,2] 郑会蓉[1]
1.广东省人民医院
2.南方医科大学

目的 研究难治性强迫障碍抑制控制神经环路中抑制功能程度、各神经代谢物水平、症状亚型与睡眠-觉醒节律紊乱的相互关联，及与健康对照神经环路基础的异同，进一步理解强迫障碍及不同亚型的发病机制。

方法 对入组 26 例难治性强迫障碍患者和 27 例健康对照者进行一般资料收集和临床症状评估，并采用 3-Tesla Philips Ingenia 设备进行全脑磁共振成像和磁共振波谱单体素扫描。感兴趣区放置在前扣带回。记录扫描过程中 go-nogo 任务的反应时长和反应错误率。经质量筛选，有效的磁共振波谱数据共 90 例，其中包括难治性强迫障碍患者静息态波谱 23 例和功能态波谱 23 例，健康对照者静息态波谱 22 例和功能态波谱 22 例。最后对磁共振波谱进行定量分析，获取前扣带回各神经代谢物的绝对浓度值并进行统计学分析。

结果 难治性强迫障碍组与健康对照组在静息态和功能态磁共振波谱的谷氨酸、谷氨酰胺复合物、肌醇、胆碱、肌酸和 N-酰基天门冬氨酸+ N-酰基天门冬氨酸浓度未见统计学差异(P＞0.05)。将难治性强迫障碍患者根据临床症状分为强迫思维组(n=7)与强迫行为组(n=16)，在静息态磁共振波谱中，强迫思维组的前扣带回谷氨酸浓度显著低于强迫行为组(P＜0.05)。将难治性强迫障碍患者以是否伴有睡眠时相延迟进行分组，分为伴有睡眠时相延迟组(n=13)和不伴有睡眠时相延迟组(n=10)，在功能态磁共振波谱中，伴有睡眠时相延迟组的谷氨酸和谷氨酸酰胺复合物浓度高于不伴睡眠时相延迟组(P＜0.05)。从 go-nogo 任务结果来看，难治性强迫障碍组按键选择的错误率明显升高(P＜0.05)。在分组探索中发现，伴有睡眠时相延迟的强迫障碍患者错误率最高，其次是不伴睡眠延迟的强迫障碍患者，最后是健康对照。

结论 初步结果提示强迫思维、强迫行为或是否伴有睡眠时相延迟可能代表了与前扣带回谷氨酸浓度水平独特相关的强迫亚型，为强迫障碍的神经病理机制提供了新的证据和方向。本研究也从神经认知功能的角度验证了难治性强迫障碍患者存在抑制功能损害，伴有睡眠时相延迟的强迫障碍患者抑制功能受损严重。

关键字：难治性强迫障碍；抑制控制；谷氨酸；睡眠时相；功能态磁共振波谱

童年期创伤对成年抑郁症患者杏仁核及 BDNF 表达水平的影响

郭文韬[1,2] 张丽丽[1] 栗克清[1] 李冰[1] 张云淑[1]
1.河北省第六人民医院(河北省精神卫生中心)
2.河北大学

目的 1．比较伴童年期创伤组、不伴童年期创伤组、健康对照组三组人群杏仁核的结构和功能，进一步揭示伴童年期创伤抑郁症中杏仁核可能参与的发病机制。 2．比较伴童年期创伤组、不伴童年期创伤组、健康对照组三组人群脑源性神经营养因子（Brain-Derived Neurotrophic Factor，BDNF）及其 mRNA 表达的差异，进一步揭示童年期创伤对成年抑郁症患者 BDNF 表达的影响。 3．结合环境因素、脑影像学、遗传学等综合因素，筛查相关特异性指标，探讨经历童年期创伤抑郁症可能的发病机制。

方法 本研究共纳入 94 例受试者，其中伴童年期创伤组 30 例，不伴童年期创伤组 34 例，健康对照组 30 例。采用汉密尔顿抑郁量表 17 项（Hamilton Depression Scale，HAMD-17）、童年期创伤问卷评估受试者抑郁症状严重程度及童年期创伤程度。应用 GE Signa 3.0 T 核磁共振成像系统，采集高分辨率 3D T1 像结构数据，用于杏仁核体积测定。采集静息态磁共振数据，用于杏仁核与其他脑区功能连接的分析。提取外周血浆及血细胞，用酶联免疫吸附测定法（Enzyme Linked Immunosorbent Assay，ELISA）检测外周 BDNF 水平，应用实时荧光定量聚合酶链式反应法（Quantitative Real-time Polymerase Chain Reaction，RT-qPCR）检测 BDNF mRNA 表达水平。

结果 1．三组受试者杏仁核体积及各亚区体积差异无统计学意义。2．三组受试者杏仁核与全脑功能连接分析后发现 5 个有显著差异的脑区，分别是右侧舌回、右侧额上回、右侧岛盖部额下回、右侧楔叶和右侧额中回。

结论 本研究结果显示杏仁核与右侧舌回、右侧额上回、右侧岛盖部额下回、右侧楔叶和右侧额中回的功能连接增强可能参与了抑郁症的发病。杏仁核与右侧舌回、右侧额中回的功能连接增强可能是伴童年期创伤抑郁症的发病机制之一，且杏仁核与右侧额中回、右侧舌回的功能连接能够部分中介童年期创伤和抑郁情绪之间的关系。伴童年期创伤抑郁症患者 BDNF mRNA 的表达水平和杏仁核与右侧舌回的功能连接存在相关性，但未发现 BDNF mRNA 表达水平和杏仁核与右侧舌叶的功能连接存在中介效应。

Identification of Key Biomarkers and Immune

Infiltration in Early-onset Schizophrenia by Comprehensive Bioinformatics Analysis

4.Department of Psychiatry, Taiyuan Central Hospital of Shanxi Medical University,
5.Department of Mental Health, Shanxi Medical University

Objective To identify the key biomarkers in early-onset schizophrenia (EOS) and explore their potential immune infiltration mechanism.

Methods The whole blood of 19 patients with early-onset SCZ (EOS) and 18 healthy controls (HC) were sequenced. Firstly, the differentially expressed genes (DEGs) between EOS patients and healthy controls were screened by "limma" R software package. Combined weighted gene coexpression network analysis (WGCNA) and LASSO algorithm to screen key genes. The expression abundance of 24 kinds of immune cells was predicted by ImmuCellAI website, and the correlation between potential biomarkers and different immune cells was further analyzed. Finally, the selected key immune genes were verified, including functional enrichment, ROC analysis and so on.

Results We finally screened seven differential immunity related genes: AKAP7, BARD1, CHCHD2, PXMP4, UNC5C, SLC35F3. Immune infiltration analysis showed that the proportion of B cells and CD4-naive cells increased significantly in EOS group. By analyzing the correlation between differential immune related genes and immune cells, we found that there was a strong correlation between AKAP7, BARD1 and B cells. Our results suggest that AKAP7 and BARD1 may serve as key biomarkers of EOS, and their underlying immune mechanisms may be involved in B-cell disorders.

Conclusion In this study, we screened out the potential immune biomarkers of EOS: AKAP7 and BARD1, we found that B-cell disorder may be involved in its occurrence and development.

肠道 Lachnoclostridium 菌属丰度及相关炎症指标与首发精神分裂症的关联研究

赵心怡 袁秀霞 张丽媛 宋学勤*
郑州大学第一附属医院

目的 探讨肠道 Lachnoclostridium 菌属丰度及炎症指标与首发精神分裂症（SCZ）的关联。

方法 选取 2020-2022 年就诊于郑州大学第一附属医院精神医学科的首发未用药 SCZ 患者（SCZ 组）和同一时期的健康对照者（HC 组）各 87 例，在基线时测量 hsCRP、SOD.1 和 ESR 水平及肠道菌群中 Lachnoclostridium 菌属的丰度。用阳性和阴性症状量表（PANSS）评估 SCZ 患者的临床症状，认知功能成套测验（MCCB）评估 SCZ 组和 HC 组的认知功能。SCZ 组接受 24 周利培酮治疗后，复测上述指标。

结果 （1）基线时 SCZ 组的 SOD.1 水平低于 HC 组（t=-6.888，P＜0.001），Lachnoclostridium 丰度高于 HC 组（t=-2.654，P=0.009）；（2）在基线时的 87 名首发 SCZ 患者中，hsCRP 水平与 PANSS 评分的 G 评分正相关（r=0.222，P=0.039），SOD.1 水平与认知能力正相关（r=0.298，P=0.005），ESR 与 SoP.AGT、SC.AGT 负相关（r=-0.230 、 -0.313 ， P 均 ＜ 0.05 ），Lachnoclostridium 丰度与部分认知评分呈负相关；（3）在 24 周利培酮治疗后，首发 SCZ 患者的 SOD.1 水平显著升高（t=-2.071，P=0.045），ESR 显著降低（t=2.211，P=0.033），PANSS 评分显著降低，认知功能显著改善；（4）24 周随访数据的 39 名首发 SCZ 患者中，基线 Lachnoclostridium 丰度与基线及 24 周的认知功能呈负相关。24 周的 Lachnoclostridium 丰度与 PANSS 评分正相关；与认知功能呈负相关。基线时的 ESR 水平与认知功能正相关。24 周的治疗前后，ESR 的增加量（cESR）与 cSoP.AGT、cWM.AGT 负相关。（5）基线时 Lachnoclostridium 的丰度与 24 周的 ESR（r=0.453，P=0.004）正相关，与 24 周的 MCCB 总分（r=-0.344，P=0.032）负相关，基线 Lachnoclostridium 丰度对于 24 周的 MCCB 总分有预测价值。

结论 促炎菌属 Lachnoclostridium 及炎症指标随病情变化，在精神分裂症的发病及缓解中起了一定的作用。

肠道菌群相关的脂肪酸和维生素吸收与首发精神分裂症关联研究

赵心怡 宋学勤*
郑州大学第一附属医院

目的 探讨精神分裂症（SCZ）的微生物-肠-脑轴标记。

方法 采用 16s rRNA 测序技术检测人粪便样本、小鼠粪便样本和肠内容物的微生物组成。采用非靶向和靶向代谢组学检测人粪便样本、小鼠肠组织和脑组织代谢物水平。采用 PANSS 评估精神症状严重程度。

结果 （1）血清代谢组学分析发现，首发 SCZ 患者和健康对照之间的差异代谢物富集分析 TOP1 的是脂肪酸代谢、TOP2 是维生素的吸收和代谢，其中脂肪酸中的十八碳四烯酸和维生素中的叶酸与认知功能显著正相关（p<0.05）；（2）肠道菌群结果显示：首发 SCZ 患者多样性发生改变（p<0.05），首发 SCZ 患者布劳特

氏菌属（Blautia）、类芽胞杆菌属（Parabacteroides）降低，艰难梭菌（Clostridioides）升高和普氏梭杆菌（Flavonifractor）升高。菌群功能分析显示，这些差异菌主要与脂肪酸代谢、维生素的吸收相关；（3）将 SCZ 患者菌群和对照组菌群分别转移给抗生素处理过的 SCZ 组小鼠和 HC 组小鼠，发现 SCZ 菌群特征在小鼠肠内容物中得到复现。对 SCZ 组小鼠和 HC 小鼠肠组织差异代谢物进行富集分析发现，近端肠组织主要与脂肪酸的吸收有关（TOP5），远端肠组织主要与氨基酸的代谢有关（TOP5）。脑组织的结果也显示，SCZ 小鼠和对照小鼠脑组织前额叶皮质、海马、小脑、纹状体的差异代谢物主要与脂肪酸和维生素的吸收、代谢（TOP5）有关。

结论 SCZ 患者存在肠道菌群失调，肠道菌群可能是通过影响脂肪酸和微生物的吸收和代谢，进而影响大脑参与 SCZ 的发病。

关键字：精神分裂症；脂肪酸；维生素；肠道菌群；代谢组学

首发未用药精神分裂症患者的肠道真菌结构失调

赵心怡 袁秀霞 宋学勤*
郑州大学第一附属医院

目的 精神分裂症患者体内存在菌群失调的现象，本研究的目的是探究首发精神分裂症患者体内真菌结构的改变以及真菌-细菌之间的关联网络。

方法 招募了 205 名首发精神分裂症患者和 125 名健康对照者，分别用 16S 和 18S rRNA 基因扩增子测序分析了他们肠道的细菌和真菌组成。采用 Spearman 检验和距离相关分析进行真菌-细菌的相关网络分析。我们还计算了相对网络连通性，它代表了网络中交互(边)和分类群(节点)中相关性显著的比例。

结果 与健康对照相比，精神分裂症患者真菌 α 多样性较低。此外，精神分裂症患者和健康对照之间存在 29 种不同的真菌标记物。与健康对照相比，精神分裂症患者的真菌与细菌的 α 多样性比值也显著降低（$p < 0.001$）。在风险预测模型中，我们观察到细菌和真菌联合标志物比单独的细菌标志物具有更高的准确性（AUC = 0.847 vs AUC = 0.739；$p = 0.043$）。健康对照的真菌-细菌相关网络比精神分裂症患者更密集，且相邻节点数量多($p < 0.05$)。此外，精神分裂症患者 Purpureocillium 丰度的增加与更严重的精神症状和更差的认知功能相关($p < 0.05$)。

结论 本研究表明，首发精神分裂症患者的真菌-细菌相关网络与健康对照相比被削弱和破坏，这可能与他们的临床表现有关。未来对真菌-细菌相关网络的研究将有助于我们进一步了解真菌群在精神分裂症病因学中的作用，并有助于发现新的干预方法。

4.河北省第六人民医院
5.沈阳市精神卫生中心
6.哈尔滨市第一专科医院
7.绵阳市第三医院
8.自贡市精神卫生中心
9.上海市精神卫生中心

目的 精神分裂症和精神发育迟滞都被包括在神经发育障碍的连续谱中，DNA 甲基化的改变对于神经发育障碍的疾病发生过程至关重要。家系研究有助于消除遗传背景的差异对表观遗传学研究结果的影响，并有助于筛选与神经发育障碍真正相关的差异甲基化位置（DMPs）及区域（DMRs）。

方法 本研究招募了 4 个包含同卵双胞胎个体的家系。每个家系中的双胞胎个体均患有神经发育障碍（精神分裂症、精神发育迟滞或二者共病）。对每个家系的所有样本进行全基因组 DNA 甲基化分析，以期能确定家系中神经发育障碍患者和未受影响个体之间的 DMPs 和 DMRs，并其所注释的基因进行进一步的功能和通路富集分析。

结果 对 4 个家系进行综合分析，结果提示 2 个显著的 DMPs 均注释到基因 CYP2E1。在家系 1 中，有 1476 个 DMPs 注释到到 880 个基因，并且识别出 162 个与 153 个基因重叠的 DMRs。我们的研究结果表明，FYN，STAT3，RAC1 和 NR4A2 甲基化水平的改变与精神分裂症和精神发育迟滞的发生有关。富集分析结果提示神经发育和免疫系统可能参与精神分裂症和精神发育迟滞的发生。

结论 DNA 甲基化的改变可能通过影响神经发育和免疫系统，从而参与神经发育障碍的疾病发展。

不同部位间歇性 θ 脉冲式经颅磁刺激对精神分裂症阴性症状的疗效

占燕[1,2] 张素贞[3] 金建红[2] 张红[2] 秦金梅[2] 吴宇杰[2] 李晨虎[2] 卓恺明[3] 刘登堂[3] 占归来[2] 骆艳丽[1]
1.上海交通大学医学院附属仁济医院
2.上海市徐汇区精神卫生中心
3.上海交通大学附属精神卫生中心

目的 1、评价间歇性θ脉冲式经颅磁刺激（intermitted Theta Burst Stimulation，iTBS）干预左侧或双侧前额叶背外侧（dorsalateral prefrontal cortex，DLPFC）治疗精神分裂症阴性症状的疗效及安全性； 2、探索iTBS干预对精神分裂症阴性症状的疗效是否存在性别差异。

方法 纳入90例以阴性症状为主的精神分裂症患者（PANSS 阴性症状量表分≥15 分，且 N1～N7 项目中至少有 1 项评分≥4 分）。按随机数字表法分为双侧DLPFC 真刺激组（A 组，30 例），左侧 DLPFC 真刺激/右侧 DLPFC 伪刺激组（B 组，30 例），或双侧 DLPFC 伪刺激组（C 组，30 例）。三组均在药物治疗方案不变的基础上使用 iTBS 干预，干预时间为 4 周（1 次/日，5 次/周，周末休息），共治疗 20 次。在基线及治疗第 4 周末，采用阳性与阴性症状量表（PANSS），阴性症状量表（SANS），临床疗效总评量表（CGI）及卡尔加里精神分裂症抑郁量表（CDSS）评定精神症状及其严重程度。以 SANS 减分及减分率为主要评估指标，锥体外系副反应量表（SAS）及不良事件为次要评估指标。

结果 1、三组基线 SANS 总分和 PANSS 阴性症状分差异均无统计学意义（p>0.05）。治疗第 4 周末，不同 rTMS 干预方案 SANS 总分减分及减分率差异均存在统计学意义（F=7.295，p=0.001；F=7.219，p=0.001）。双侧 DLPFC 真刺激组及左侧 DLPFC 真刺激组 SANS 总分减分及减分率均显著高于伪刺激组，左侧 DLPFC 真刺激组和双侧 DLPFC 真刺激组间 SANS 总分减分及减分率均无统计学差异。在干预过程中均无主观报告不良反应，三组干预前后 SAS 评分均无统计学差异。2、SANS 减分及减分率的组别和性别之间存在显著交互作用（p<0.05）。男性患者：双侧 DLPFC 真刺激组 SANS 减分显著高于左侧 DLPFC 真刺激组及伪刺激组，双侧 DLPFC 真刺激组 SANS 减分率显著高于伪刺激组；女性患者：仅左侧 DLPFC 真刺激组 SANS 减分及减分率均显著高于伪刺激组。

结论 应用 iTBS 干预左侧或双侧 DLPFC 治疗精神分裂症患者阴性症状安全有效，男性患者干预双侧 DLPFC、女性患者干预左侧 DLPFC 更能显著改善阴性症状。

关键字：精神分裂症 阴性症状 经颅磁刺激 前额叶背外侧

精神分裂症患者肠道菌群、细胞因子及静息态脑功能的关联性研究

夏晓伟 魏钦令*
中山大学附属第三医院

目的 探讨肠道菌群、细胞因子及静息态脑功能在精神分裂症发病中的作用以及三者间的关系，进一步明确精神分裂症发病机制，为建立疾病诊断的生物学指标及寻找治疗的新视角提供理论依据。

方法 纳入 31 例未用药精神分裂症患者(Schizophrenia ,SZ)，同期招募年龄、性别、受教育年限相匹配的 39 例健康对照(Health Control, HC)。所有参与者都进行粪便微生物宏基因组高通量测序分析、ELISA 法测定血清细胞因子（IL6、IL4、IL1β、IL2、IL17、IL23、IL10、IL12、TNFα 和 TGFβ1）水平和使用静息态功能核磁共振成像系统(resting-state Functional Magnetic Resonance Imaging, rs-fMRI)获取功能影像数据计算 fALFF、ReHo、基于种子点的功能连接以及网络拓扑特性。在 SZ 组将组间差异肠道菌种、细胞因子和 rs-fMRI 指标两两之间进行相关分析，显著相关的变量纳入中介模型进行中介分析。

结果 1.SZ 组和 HC 组之间 α 和 β 多样性存在差异。与 HC 相比，SZ 组有 21 个菌种相对丰度有差异。2.差异肠道菌种与右壳核 fALFF 值、右壳核及右内侧额上回功能连接、左侧缘上回的节点度中心度有相关性。3.外周抗炎细胞因子与抗炎肠道菌种呈正相关，与促炎肠道菌种呈负相关。外周抗炎细胞因子与右壳核 fALFF 值呈正相关，外周促炎细胞因子与内侧额上回功能连接呈正相关、与左侧缘上回节点特性呈负相关。4.中介分析发现，在 SZ 组，Bacteroides thetaiotaomicron 通过 IL1β 水平增加及 IL2、IL10 水平减少影响右壳核 fALFF 值变化；Alistipes finegoldii 通过 IL2 水平减少影响右壳核 fALFF 值变化；Veillonella parvula 通过 IL1β 水平增加影响右壳核 fALFF 值变化；Parabacteroides johnsonii 通过 IL10 水平减少影响右壳核-颞下回功能连接强度。

结论 1．SZ 患者肠道菌群多样性降低,促炎菌增加，而抗炎菌减少。2．SZ 患者富集的促炎菌与特定脑区自发活动、内在功能连接和网络拓扑特性相关。3. SZ 患者细胞因子与促炎或抗炎肠道菌种及特定脑区静息态脑功能相关。4. SZ 患者细胞因子在肠道菌群与静息态脑功能之间的关系中起到中介作用。

关键字：精神分裂症；肠道菌群；细胞因子；静息态功能磁共振成像

6759 例精神障碍患者抗核抗体检测分析

蔡金泰 杨梦心 许莹 何咏茵 林裕龙 刘海英*
广州医科大学附属脑科医院

目的 分析精神障碍患者中抗核抗体（ANA）阳性检出情况及其临床意义。

方法 选取 2020 年 6 月-2022 年 5 月期间就诊并执行抗核抗体谱检测（线性免疫印迹法）的精神障碍患者，结合临床资料回顾分析 ANA 检测结果。

结果 6759 例患者中 458 例 ANA 阳性（6.8%），女性患者阳性率高于男性（7.5% vs. 5.8%, P＜0.05）。458 例 ANA 阳性中，以抗 Ro52（2.4%）为多见，抗 SSB（1.1%）、抗 AMA M2（1.1%）次之；患者疾病分布，以精神分裂症（99 例，21.6%）、抑郁症（82 例，17.9%）、双相情感障碍（36 例，7.9%）为主。抗 Ro52、抗 SSA、抗 SSB 等干燥综合征相关抗体阳性的患者主要表现为精神分裂症 47 例（20.7%）、抑郁发作 42 例（18.5%）、焦虑障碍 19 例（8.4%）、双相情感障碍 16

例（7.0%）等；AMA-M2 阳性患者常见于精神分裂症（22.5%）、阿尔兹海默症（12.7%）、抑郁（11.3%）、双相情感障碍（9.9%）等；抗 PO、抗 Sm、抗 nRNP、抗 dsDNA 等系统性红斑狼疮相关 ANA 多见于抑郁（27.5%）和精神分裂症（19.6%）。32 例 ANA 阳性者患有自身免疫性疾病，包括 19 例系统性红斑狼疮、9 例自身免疫性脑炎、3 例干燥综合征（其中 1 例合并自身免疫性溶血性贫血）、1 例免疫性肠炎。

结论 ANA 在精神障碍患者中存在一定的阳性检出率，多见于精神分裂症和抑郁症；抗核抗体谱筛查在早期诊断精神障碍合并或继发于自身免疫病的患者中有重要价值。

氯氮平等抗精神病药物对精神分裂症等患者短程心率变异性的影响

黄利芬* 韦朝阳 覃青华 梁霏 杨照奎
广西壮族自治区脑科医院

目的 探讨氯氮平、奥氮平等抗精神病药物对精神分裂症等患者短程心率变异性的影响。

方法 单用氯氮平、奥氮平、利培酮、阿立哌唑、齐拉西酮药物，氯氮平分别与利培酮、阿立哌唑、齐拉西酮合用治疗的患者（简称合用药组）共 6 组，用常规十二导心电图技术对各组治疗前、治疗后的2周末、4 周末的短程（5 分钟）心率变异性各参数进行检测分析。

结果 收集了 106 名患者，①平均心率:氯氮平组 2 周末起,合用药组 4 周末均增快(P< 0.05)。② 最高与最低心率的差值:氯氮平、奥氮平及合用药组 2 周末起，阿立哌唑 4 周末显著缩小(P< 0.01)。③ SDNN 值：氯氮平、奥氮平、合用药组 2 周末起呈降低趋势（P< 0.05）。阿立哌唑组 4 周末显著降低（P< 0.01）。④ RMSSD 值：氯氮平组 2 周末起，奥氮平、阿立哌唑组和合用药组于 4 周末降低（P< 0.05）。⑤ PNN50 值：氯氮平、阿立哌唑、齐拉西酮组 4 周末，合用药组 2 周末起均异常（P< 0.05）。

结论 服用氯氮平等药后，患者心率变异各指标呈降低等异常，说明氯氮平等抗精神病药物对自主神经功能、迷走神经活性降低等有损害，以氯氮平及合用药最明显，利培酮相对安全。

关键字：短程心率变异性；精神分裂症；氯氮平；抗精神病药；联合用药

团体心理治疗对精神分裂症患者认知功能影响的研究进展

李昌英* 甄蕾 沈君
青海省第三人民医院

目的 精神分裂症是一种严重的精神障碍，且多伴随对认知功能的影响，目前临床中治疗阳性和阴性症状有良好的疗效，而对认知障碍的治疗收效甚微。大量来自基础和临床的研究证据表明团体心理治疗能显著改善精神分裂症患者的认知功能。因此，现就对团体心理治疗改善认知功能的潜在机制进行详细阐述，以期为今后深入研究和干预精神分裂症认知障碍提供参考。

方法 通过从精神分裂症认知障碍的发病机制、精神分裂症认知障碍的临床表现、精神分裂症认知障碍的治疗手段、团体心理治疗对精神分裂症认知功能的影响几个方面分别论述。

结果 精神分裂症是精神疾病中较为严重的类型，在发病后会表现出一系列行为、认知、思维、情感上的功能障碍，根据大数据统计显示该病症高发群体在青壮年时期，病因较为复杂，且与个人客观因素间存在着密切联系。当前我国正处于经济高速发展阶段，和 20 世纪末期相比生活节奏、工作压力、学习压力等均快速增加，而这也是导致精神分裂症发病率逐年升高的重要诱因。一旦发病不仅会对患者个人造成生理和心理上的影响，还会进一步对家庭、社会产生不同程度的危害。临床单纯以抗精神类药物治疗时虽然可以在一定程度上缓解临床症状，但如未采取有效的心理干预手段，则有较高概率引起患者抗拒治疗和复发的情况，甚至可能出现加剧异常情绪状态的可能，影响最终预后效果，也会给患者带来更多伤害。现阶段国内精神疾病的医疗技术正在逐渐提升和完善，并且临床医学对患者人文关怀的关注度也在随之提升，绝大多数医生开始转变自身的认知，开始摒弃单一药物治疗理念，更多地开始运用药物治疗和心理治疗结合的综合干预方案，根据患者病情实际情况采取针对性的措施，以确保其心理状态的保持和角色功能的恢复。心理治疗对精神分裂症稳定期患者的恢复有着积极、正面的促进作用，其主要是由于当患者病情稳定后，其认知功能逐步恢复正常，开始对自身疾病状态进行审视，基于原有对精神分裂症的不了解，从而出现自卑、恐惧、紧张等负面情绪，如外界存在不良刺激源，则会进一步增加病情复发的概率，甚至出现自残行为。

结论 团体心理治疗对提高精神分裂症患者的认知功能有积极影响，在改善患者的认知功能、精神状态、社会功能、自尊心理、自我和谐情况等方面均有明显的效果。但具体的作用机制还有待进一步深入研究。

基于 AMPK/mTOR 探讨奥氮平致小鼠肝脏原代细胞糖/脂代谢紊乱的机制研究

闫鹏月[1,2,3] 韩枫[1,2,3] 杨勇锋[1,2,3] 吕路线[1,2,3] 邵明龙[1,2,3] 李文强[1,2,3]
1.新乡医学院第二附属医院，河南省精神病医院
2.河南省生物精神病学重点实验室
3.河南省精神神经医学国际联合实验室

目的 利用细胞实验模拟研究奥氮平所致的精神疾病患者超重/肥胖、糖脂代谢紊乱这些代谢性副作用的发病机理，进而探索以 AMPK/mTOR 相关通路作为靶标在治疗奥氮平所致的代谢副作用中的干预潜力。

方法 分离提取小鼠肝脏原代细胞，在体外分别以 0、10、25、50、100 μM/L 的奥氮平药物剂量处理细胞，在作用 24 h 之后，利用油红 O 染色方法检测细胞内脂质积累水平，通过 Western blot 方法检测关键分子 mTOR 和 AMPK 及其磷酸化 p-mTOR Ser2448、p-AMPK Thr 172 的蛋白表达水平。

结果 mTOR 及其磷酸化形式 p-mTOR 在 25nm-50nm 浓度的奥氮平处理下出现了明显的升高趋势，同时 p-AMPK 在 5-25nm 浓度奥氮平处理下出现了显著降低结果，而油红 O 染色结果也证实了奥氮平致脂质积累且呈现剂量依赖性，同时在 25nm 到 50nm 浓度处理时肝脏细胞脂肪积累较多。

结论 奥氮平可能通过增加脂肪酸合成相关蛋白 mTOR 及降低分解代谢相关的 AMPK 导致肝脏细胞脂质积累，AMPK 及 mTOR 在奥氮平诱导的肝脏细胞糖、脂代谢中起到关键的作用，这将为临床干预奥氮平致代谢综合征提供新的见解。

利用代谢组学分析鉴定可用于首发精神分裂症诊断和监测抗精神病药物单药治疗的潜在血浆生物标志物

程淑敏 刘亚 宋盟 吕路线 李文强*
河南省精神病院

目的 精神分裂症（schizophrenia，SCZ）是一种病因复杂的严重精神障碍。目前临床上 SCZ 的诊断主要依赖于对患者临床症状的主观识别，缺乏可靠的分子诊断工具，容易发生误诊和漏诊。代谢组学是“组学”的最新领域，通过对生物样品中低分子量代谢物的全面研究发现有效的分子标记物，从而客观可靠地诊断 SCZ 和预测疗效。

方法 1.本研究共纳入 43 例首发未用药 SCZ 患者和 29 例健康对照（HC）。所有入组患者均接受利培酮或奥氮平单药治疗 4-6 周。在基线期、治疗后 4 周和 6 周后评定 PANSS 量表。使用液相色谱-质谱联用仪（LC-MS）对 HC 和首发 SCZ 患者在急性期用药前后的血浆样本进行全面的代谢组学分析。2.使用 SPSS 13.0、Progenesis QI 以及 MetaboAnalyst 5.0 进行统计分析。人口学资料和临床资料进行正态性检验，用 Mann-WhitneyU 检验分析非正态分布的数据；用 Student t 检验分析正态分布的数据；用 Chi-Squared 检验分析分类变等方法；所有多重比较的数据均经过了 FDR 矫正。

结果 1.10 种脂质代谢产物和 27 种可溶性小分子被鉴定为是与 SCZ 诊断和治疗相关的潜在生物标志物。这些代谢产物在 SCZ 中显著减少，治疗后脂质和硫酸盐显著增加；其中有 4 种代谢物与 PANSS 总分呈显著正相关。2.α-十八碳二烯酸、磷脂酰胆碱（PC）（16:0/18:1(11Z)）、1-甲基烟酰胺、磷脂酰乙醇胺（PE）（20:2(11Z, 14Z)/18:2(9Z, 12Z)，硫酸盐和 L-色氨酸组成的生物标志物组可以用来区分 SCZ 和 HC，该标记物组的 ROC 曲线下面积（AUC）是 0.972，说明该预测模型具有良好的判别能力。 3.C16 鞘氨醇、γ-亚麻酸、亚油酸、PC(16:0/18:1(11Z))、PE(20:2(11Z, 14Z)/18:2(9Z, 12Z))和硫酸盐的生物标志物组在区分 SCZ 药物治疗前后方面具有良好的分类性能（AUC=0.905）。

结论 SCZ 患者的脂质代谢、含硫生物分子的合成和硫酸化修饰、色氨酸代谢、抗炎和抗氧化系统以及不饱和脂肪酸的生物合成紊乱；这些代谢紊乱可通过抗精神病药物治疗部分恢复正常。本研究中确定的生物标志物组可以为 SCZ 的客观诊断和疗效预测提供线索。

线粒体功能障碍与精神分裂症临床表征的相关性

王冠玉 苏玺* 李文强 杨勇锋 吕路线
新乡医学院第二附属医院

目的 精神分裂症（Schizophrenia，SZ）病理机制不明。线粒体功能障碍可能在 SZ 的发病过程中扮演重要角色。线粒体 DNA 拷贝数是衡量线粒体功能的重要指标。本研究旨在通过分析 SZ 患者基线期和治疗 8 周后的外周血线粒体 DNA 拷贝数变化及其与临床症状及疗效的关联，进而明确线粒体功能障碍在 SZ 发生发展中的作用。

方法 本研究通过新乡医学院第二附属医院伦理委员会的批准，所有入组人群已签署知情同意书。根据 DSM-IV 中 SZ 临床诊断标准纳入首发或复发未经系统治疗的 SZ 患者，收集基础资料，分别在基线期和治疗 8 周后使用精神分裂症认知功能成套测验（MATRICS Consensus Cognitive Battery，MCCB）和阳性与阴性症状量表（Positive and Negative Syndrome Scale，PANSS）评估患者的认知功能状况和临床精神症状，同时采集外周血样本。此外，纳入与 SZ 患者年龄、性别相匹配的健康人群，并收集基础信息和外周血样本。采用实时荧光定量 PCR 技术检测研究对象外周血白细胞线粒体 DNA 拷贝数。采用 GraphPad 8.0.2 软件和 SPSS 20.0 软件进行数据分析，运用配对的的 t 检验比较 SZ 患者与健康对照的外周血线粒体 DNA 拷贝数，运用偏相关分析比较分析 SZ 患者线粒体 DNA 拷贝数与其临床表征及疗效的相关性。

结果 1.与健康对照组相比，SZ 患者的外周血线粒体 DNA 拷贝数显著下降（$P<0.05$），治疗 8 周后 SZ 患者的线粒体 DNA 拷贝数又显著回升（$P<0.05$），该变化在男性患者中更明显。2.SZ 患者的基线期线粒体

DNA 拷贝数与认知功能（符号编码测验、空间广度测试、视觉记忆测验和神经认知总分）显著正相关（P<0.05），尤其以男性为主。3.SZ 患者的基线期线粒体 DNA 拷贝数与女性的认知功能的改善（连线测验、迷宫测验、范畴流畅测验、持续操作测验和神经认知总分）显著负相关（P<0.05）。

结论 1. 线粒体 DNA 拷贝数与患者认知功能存在相关性；2. 线粒体 DNA 拷贝数能有效预测女性患者认知功能的改善；3.线粒体功能障碍可能参与精神分裂症的发生发展。

关键字：精神分裂症；线粒体功能障碍；认知障碍

孕期母体免疫激活所致子代谷氨酸 NMDA 能系统和 GABA 能系统失衡的相关研究

朱涵育[1,2] 张燕[1,2] 杨勇锋[1,2] 李文强[1,2] 吕路线[1,2]
1.新乡医学院第二附属医院，河南省精神病医院
2.河南省生物精神病学重点实验室

目的 孕早期注射聚肌胞苷酸（polyinsinic acid-polycytidylic acid, Poly I:C）构建母体免疫激活致子代精神分裂症大鼠模型，观察该模型引起的谷氨酸 NMDA 能系统和 GABA 能系统紊乱情况。

方法 选取孕 9.5 天 SD 大鼠尾静脉注射 10mg/kg Poly I:C (n=10)和等体积的 0.9%无菌生理盐水(n=10)。模型组和对照组子代在 21 日龄时离乳分笼，选取雄鼠作为研究对象，在成年期对大鼠进行 Y 迷宫等行为学检测。采用气相色谱-质谱连用分析方法（GC-MS）检测模型大鼠成年期脑脊液中神经递质浓度。采用蛋白质免疫印迹（Western Blot, WB）技术检测两组大鼠在成年期海马和额叶两个脑区中 NMDA 受体主要亚型的表达情况。采用 WB 技术检测两组大鼠在成年期海马脑区中精神分裂症的 GABA 能神经系统相关分子和易感基因的表达情况；采用免疫荧光技术检测两组大鼠在成年期海马脑区中 GABA 能神经系统关键分子 PV 的表达情况。 用均数±标准差来表示计量资料。采用独立样本 t 检验比较不相关的两组样本，采用非参数检验中的两独立样本检验分析两组非正态分布的样本数据，使用 SPSS26.0 软件对各组实验结果统计学分析，检验结果 P < 0.05 可认为有统计学差异，使用 GraphPad Prime9 进行绘图。

结果 1．大鼠脑组织中 GABA、5-HT 以及谷氨酰胺含量显著降低（P 均<0.05）。2．成年期大鼠的海马 NMDAR2A，额叶 NMDAR1、NMDAR2A、NMDAR2B 蛋白水平均增加。此外，PSD95 在额叶显著上调表达。NMDA 受体的高表达与在开放臂和新异臂的探索成负相关（P 均<0.05）。3．模型大鼠 GABA 的易感基因表达在海马区 NRG1-ErbB4 通路损伤，NRG1 以及下游 ErbB4 及其磷酸化蛋白的含量均显著降低（P 均<0.05）。4．GABA 合成的关键酶 GAD65 和 GAD67 的 mRNA 和蛋白水平无显著异常；囊泡运输的关键分子 VGAT 的检测提示递质的转运无异常。PV 免疫荧光染色发现模型组大鼠海马 DG 区域 PV 阳性细胞数显著降低（P 均<0.05）。

结论 孕早期母体免疫激活子代在成年期表现出明显的谷氨酸能系统功能亢进和 GABA 能系统缺陷，谷氨酸能系统功能亢进与认知损伤有关联。谷氨酸能系统和 GABA 能系统失衡可能是引起精神分裂症发生的重要病理基础。

3.National Clinical Research Center for Mental Disorders (Peking University Sixth Hospital)
4.PKU-IDG/McGovern Institute for Brain Research, Peking University
5.Chinese Institute for Brain Research

Objective Psychiatric disorders pose a serious burden to global public health. However, the range of available drugs for psychiatric disorders is limited. The brain-gut axis connects inflammatory bowel disease and psychiatric disorders. There are also some comorbidities between inflammatory bowel disease (IBD) and psychiatric disorders. Thus, investigating the effect of intestinal anti-inflammatory drug targets on psychiatric disorders may provide new insights for the treatment or prevention of psychiatric disorders.

Methods We performed two-sample Mendelian randomization (MR) to assess the causal effects of intestinal anti-inflammatory drug targets on psychiatric disorders, and explore the mediating effect of gut microbiota. The colocalization analysis was used to enhance the evidence of MR. We used summary data from existing expression quantitative trait loci (eQTL) and protein QTL in brain and public genome-wide association studies of disease. The statistics on attention deficit hyperactivity disorder, autism spectrum disorder, bipolar disorder (BD), major depressive disorder, obsessive-compulsive disorder (OCD) and schizophrenia included 55,374; 46,351; 413,466; 500,199; 33,925; 130,644 individuals, respectively.

Results We found the causal evidence between expression of the TPMT in amygdala and the risk of BD (odds ratio [OR] = 0.93; 95% credible interval [CI], 0.89 to 0.97), and the result remained consistent when protein QTL and sigmoid colon eQTL as exposure. Colocalization analysis identified a shared genetic variant (rs11751561) between TPMT gene expression and BD with posterior probability of 61.6%. Interestingly, the causal effect was

masked by the increased gut microbiota abundance of genus roseburia (effect proportion = 10.05%). We also found higher expression of the ACAT1 was associated with lower risk of OCD (OR= 0.62; 95% CI, 0.48 to 0.81), but the posterior probability less than 0.1%.

Conclusion The findings indicate TPMT may be a protective gene for the risk of BD, which protective effect is masked by intestinal genus roseburia. These results provide new targets for the treatment of psychiatric disorders and suggested caution in the use of drugs. Extensive suggestive associations identified between the TPMT or ACAT1 expressed in the brain and different psychiatric disorders prompt that more attention should be paid to TPMT and ACAT1 in the future development of new drugs.

PDIA3 与精神分裂症的相关研究

范晓云* 苏玺 李文强 杨勇锋 吕路线*
河南省精神病院

目的 精神分裂症(SZ)患者表现出明显的免疫异常，然而，探索其在 SZ 诊断中的临床应用的研究是有限的。在数据库 PGC3、Immport 发现 PDIA3 是一个之前未报到过的精神分裂症风险基因，本研究将从临床和动物层面研究 PDIA3 与精神分裂症的联系。

方法 1.入组汉族 18-55 岁的受试者，采集 SZ 血浆样本，采用阳性和阴性综合征量表（PANSS）和 MATRICS 公认认知成套测验（MCCB）评估 SZ 患者基线和 8 周临床症状，并采集结构磁共振数据，同时收集健康对照（HC）血浆样本，最终分析共纳入 89 例 SZ 和 57 例 HC。 2.采用 ELISA 方法检测血浆 PDIA3 水平，分析 SZ 患者与 HC 血浆 PDIA3 水平有无差异，以及治疗后情况，采用偏相关分析，对血浆 PDIA3 与 PANSS、MCCB、MRI 进行相关性分析，所有抗精神病药物剂量转换为氯丙嗪当量，以年龄、教育年限、病程和氯丙嗪当量为协变量，使用 FDR 方法对影像数据进行多重比较校正。 3.C57BL/6J 正常小鼠，随机分为对照组和干预组，分别腹腔注射 DMSO 或 20mg/kg PDIA3 抑制剂 LOC14，之后进行行为学检测、在体电生理检测以及新鲜取材检测 PDIA3 表达变化。 4.采用统计软件 SPSS 26.0，独立样本 t 检验、配对 t 检验以及偏相关方法进行统计分析，P＜0.05 代表差异具有统计学意义。

结果 1.SZ 患者治疗 8 周后血浆 PDIA3 水平与基线期相比显著降低，与正常人群无差异。 2.PDIA3 含量与符号编码得分正相关，PDIA3 含量变化量与符号编码得分变化量存在负相关，即治疗 8 周后 PDIA3 变化量越大而认知症状改善越差，即治疗用药使 SZ 认知症状改善不明显，也是目前临床治疗效果不理想的原因之一，男性 8 周后 PDIA3 水平与扣带回和杏仁核脑区白质密度正相关。 与对照组相比，干预组小鼠在高架十字迷宫中进入开放臂的次数和距离均减少；在新物体识别实验中接触新物体的次数和时间均减少，存在焦虑以及记忆、认知功能受损，干预组小鼠功率谱具有更高水平，脑组织 PDIA3 表达降低，证明 LOC14 药物起效。

结论 PDIA3 参与精神分裂症的病理机制，PDIA3 低表达是导致正常小鼠焦虑和认知障碍的重要原因

关键字：精神分裂症、风险基因、PDIA3、PANSS、MCCB、

塞来昔布辅助治疗对精神分裂症患者精神病理学、代谢和炎症的影响

于洪岩 史晗 杨勇锋 王秀娟 陈祎 康宁 刘青 张露文 邵明龙 宋盟 张燕 李文强 吕路线 苏玺* 刘须振
新乡医学院第二附属医院

目的 探讨塞来昔布辅助治疗精神分裂症（SZ）的有效性和安全性，促进其临床应用。

方法 本研究进行一项为期六周的随机、双盲、安慰剂对照研究；研究纳入 100 例首发 SZ 患者，随机分为安慰剂组和塞来昔布辅助治疗组，在基线和 6 周进行精神病症状、糖脂代谢指标、心血管指标、炎症细胞因子以及不良反应的评估。

结果 塞来昔布辅助治疗组 SZ 患者的 PANSS 阳性评分、体重、BMI 指数、腰围、总胆固醇、甘油三酯均显著低于安慰剂组。安慰剂组患者，基线期肿瘤坏死因子-α（TNF-α）和白介素 4（IL-4）水平分别与 6 周时的体重和血糖水平呈负相关，6 周时干扰素-γ（IFN-γ）水平与低密度脂蛋白水平呈负相关；塞来昔布辅助治疗组该相关性消失。基线期 TNF-α 水平和 IL-4 水平分别与 PANSS 阴性评分和 PANSS 总分正相关。此外，基线期 IL-4 水平与 6 周 PANSS 总分及阴性症状呈正相关，与 PANSS 变化率呈负相关，基线期 TNF-α 水平与 PANSS 变化率呈正相关；而类似相关性在塞来昔布辅助治疗组均无发现。塞来昔布辅助治疗没有严重的心血管不良反应。

结论 塞来昔布辅助治疗可改善 SZ 阳性症状，并改善药物治疗诱导的代谢风险，是安全有效的 SCZ 辅助治疗药物。炎症状态与 SZ 病理和疗效相关，塞来昔布通过改善炎症状态发挥作用。此外，基线 IL-4 水平可能是预后不良的一个指标。

Autophagy Flux, Cognitive Deficits and Depressive Symptoms in Parkinson's Disease

李研哲 杨鹤超 李申* 李洁*
天津市安定医院

Objective Depressive symptoms are common in

Parkinson's disease (PD). The relationships between autophagy with PD or depression have been documented. However, no studies explored the role of autophagy markers associated with depressive symptoms in PD. Our study aimed to investigate the relationships between autophagy flux, cognitive impairments and depressive symptoms in PD patients.

Methods A total of 163 PD patients aged 50-80 years were recruited. The autophagy markers (LC3-I, LC3-IIand P62) and glycolipid parameters were measured. Depressive symptoms, cognitive impairments, and motor function were assessed using the Hamilton Depression Rating Scale-17 (HAMD-17), the Montreal Cognitive Assessment (MoCA), and the Movement Disorders Society Unified Parkinson's Rating Scale Part III (MDS-UPDRS-III), respectively.

Results There were no significant differences between depressed and non-depressed PD patients for LC3-I, LC3-II, LC3-II/LC3-I and P62. After controlling confounding variables, LC3-II/LC3-Ishowed an independent relationship with depressive symptoms in PD patients (Beta = 10.082, t = 2.483, p = 0.014). Moreover, in depressive PD patients, P62 was associated with MoCA score (Beta = -0.002, t = -2.380, p = 0.020); Further, P62 was related to naming ability; in addition, P62 was an independent contributor to delayed recall (Beta = -0.001, t = -2.452, p = 0.017).

Conclusion LC3-II/LC3-I was related to depressive symptoms in PD patients. In depressive PD patients, P62 was associated with cognitive function, especially naming ability and delayed recall.

Altered Brain Regional Homogeneity Is Associated with Cognitive Dysfunction in First-episode Drug-naive Major Depressive Disorder: A Resting-state FMRI Study

倪苏琳 Shuzhan Gao Chenxi Ling Jing Jiang Fan Wu Ting Peng Jing Sun Ning Zhang* Xijia Xu*
南京脑科医院

Objective Our study aimed to explore the abnormal spontaneous brain activity by regional homogeneity (ReHo) and their association with cognitive function to understand the neuropathology of MDD.

Methods ReHo was used to investigate brain activities of 60 patients with first-episode drug-naive MDD and 60 healthy controls (HCs). Partial correlation analysis was conducted on altered ReHo values and the severity of symptoms and cognitive deficits. Moreover, support vector machine analysis was used to evaluate the accuracy of abnormal ReHo values in distinguishing patients with MDD from HCs.

Results Compared with HCs, patients with MDD showed significantly increased ReHo values in the right cerebellum crus2 and right thalamus and decreased ReHo values in the right angular gyrus (AG) and right precuneus (PCUN). The ReHo value in right cerebellum crus2 and right AG were positively associated with working memory and visual learning, respectively. Furthermore, the combination of ReHo values in the right cerebellum crus2 and right PCUN discriminated the patients with MDD from HCs with specificity, sensitivity, and accuracy of 0.9688, 0.6250, and 0.90, respectively.

Conclusion Our study revealed the pathophysiology mechanism of cognitive deficits in MDD may be related to abnormal spontaneous brain activity. What’s more, the combination of ReHo values in the right cerebellum crus2 and right PCUN can be used to discriminate patients with MDD from HCs effectively.

关键字：major depressive disorder, cognitive dysfunction, regional homogeneity, support vector machine

Altered Sensorimotor Network Function in Treatment-Na?ve Patients with First-Episode Major Depressive Disorder

Sulin Ni Shuzhan Gao Tian Chen Chenxi Ling Fan Wu Ting Peng Jing Jiang Jing Sun Ning Zhang* Xijia Xu*
南京脑科医院

Objective Major depressive disorder (MDD) is an incapacitating psychiatric condition typified by recurring episodes of negative emotional and cognitive deficits, and its etiology remains uncertain.

Methods In this study, we enrolled 60 patients with drug-naive first-episode MDD and 60 healthy controls to investigate the potential neurobiological mechanisms underlying the clinical features of MDD. Specifically, we utilized the Measurement and Treatment Research to Improve Cognition in Schizophrenia Consensus Cognitive Battery to assess cognitive function and fractional amplitude of low-frequency fluctuation (fALFF) and measure spontaneous brain activity in resting-state functional magnetic resonance imaging. We then compared the differences in fALFF values between the two groups to identify the potential biomarkers of MDD.

Results Compared with those of healthy controls, patients with MDD showed significantly decreased fALFF values in the somatosensory–motor network (SMN), including the right precentral gyrus/postcentral gyrus, right superior parietal lobule (SPL), and left supplementary motor area (SMA), and increased fALFF values in the right medial prefrontal cortex. Furthermore, correlation analysis suggested that the verbal learning deficits in patients with MDD are related to abnormal brain activity in the left SMA at rest. Lastly, support vector machine analysis showed that the fALFF values of the right SPL and left SMA exhibited high accuracy in differentiating MDD patients from healthy controls.

Conclusion Our findings suggested that reduced local activity in the SMN is a potential neurobiological basis of the clinical features of MDD and a potential biomarker for diagnosing and treating this disorder.

function, fractional amplitude of low-frequency fluctuation, support vector machine, somatosensory-motor network

肠道真菌失调与慢性精神分裂症严重程度相关

孙尧 袁秀霞 李雪 庞礼娟 宋学勤*
郑州大学第一附属医院

目的 精神分裂症（SCZ）是一种慢性重型精神疾病，常引起社会功能衰退，预后不良。但病因尚未阐明，课题组前期研究发现肠道真菌失调与 SCZ 发病相关。本研究探讨真菌菌群改变和代谢紊乱与慢性 SCZ 发病的关系。

方法 选择符合 DSM-V 诊断标准且反复发作大于三次、病程大于五年的精神分裂症患者 110 例作为患者组，另选取同期体检健康的 85 例健康对照者作为对照组。通过内源转录间隔区（ITS）检测患者组和对照组肠道真菌菌群组成，采用阳性和阴性症状量表（PANSS）评定患者精神症状严重程度，使用 Spearman 相关性分析研究真菌菌群改变与精神症状之间的关系。

结果 本研究发现慢性 SCZ 患者肠道真菌菌群组成改变，属于 Ascomycota 的物种显著升高，属于 Basidiomycota 的物种显著降低，α 多样性指数显示 SCZ 患者物种多样性指数 ace 指数、Shannon 指数和系统发育多样性（PD）指数显著低于对照组。β 多样性分析显示通过菌群组成能够显著区分患者组和对照组，PERMANOVA 分析显示组间差异大于组内差异，提示通过微生物进行分组有意义。相关性分析显示：Metschnikowiaceae 科与 SCZ 患者 PANSS 评分显著正相关；Candida 属与 PANSS 兴奋性因子负相关，与 PANSS 抑郁性因子正相关；lodderomyces 属与阴性症状负相关；种水平上 Clavispora_lusitaniae 与 PANSS 无组织因子分负相关；Lodderomyces_elongisporus 与 PANSS 阴性症状分负相关；Picha_fermenants 与 PANSS 总分，一般病理分和阴性症状因子分显著正相关。

结论 慢性精神分裂症患者肠道存在真菌菌群失调，且相关真菌菌群落水平与精神症状显著相关。

早期自噬对母婴分离后大鼠认知功能的影响

熊樱 王惠玲*
湖北省人民医院

目的 探讨早期自噬对母婴分离诱导的类精神分裂症样模型大鼠认知功能的影响，以及羟氯喹对大鼠认知功能的作用和机制。

方法 实验采用雄性 Wistar 大鼠，在 PND9 母婴分离 24h 制作类精神分裂症样模型[1]。实验分组为 CON 组、MS 组、MS+CQ 组、CON+CQ 组。分别于 PND10 取材，采用 HE 染色、免疫荧光染色、锇铀铅染色投射电镜、蛋白印迹分析等方法检测母婴分离后 PND10 天自噬相关蛋白的表达。在 PND60 天使用旷场实验、新物体实验、三箱社交实验、巴恩斯迷宫实验、前脉冲抑制实验等验证母婴分离后模型构建成功与否，以及认知功能检测。

结果 研究结果表明：母婴分离后幼鼠海马组织电镜下自噬泡增加、自噬相关蛋白 LC3II 表达增加、P62 蛋白表达下降、LC3 免疫荧光染色发现母婴分离幼鼠分离 24 小时后海马 CA1 区神经元自噬相关蛋白 LC3 蛋白表达较正常组增加。但是在使用 2mg/kg 羟氯喹在 PND9 预处理后，显著抑制了 LC3I 到 LC3II 的转化、增加了 P62 的表达含量，降低了 Beclin-1 的表达，抑制自噬的发生。在成年期巴恩斯迷宫与新物体识别实验中，MS+CQ 组的认知功能明显高于 MS 组认知功能，MS+CQ 组在旷场实验中的焦虑行为也有明显改善，不自主运动无明显差异。前脉冲抑制与三箱社交实验无明显差异。

结论 母婴分离 24h 后过度 CA1 区发生过度自噬激活，抑制早期自噬激活可以改善母婴分离后成年期的认知功能障碍。羟氯喹早期预处理抑制自噬可以对精神分裂症认知功能具有保护作用。

关键字：母婴分离、自噬、羟氯喹

Interplay of Genetic Factors, Circulating Metabolites, and Gut Microbiota Underlying The Influence of Personality on Ulcerative Colitis Predisposition

陈碧清* 袁晓敏
江苏省中医院

Objective The relationship between personality and gastrointestinal diseases has been attracting attention in recent years. High negative affectivity and social inhibition personality has been related to subsequent disease exacerbation and depression symptoms in ulcerative colitis (UC). However, the influence of individual personality traits on susceptibility, progression, and prognosis of UC has not been touched, and the underlying molecular mechanism is unclear.

Methods Here in this study, Cohort 1 enrolled 81 patients with active UC and 61 healthy people. Their gut microbiota were analyzed using 16S rRNA sequencing, and their serum samples were measured by non-targeted metabolomics. Cohort 2 recruited 378 healthy people, with their genomic DNA measured by Illumina Zhonghua-8 gene chips. A multi-level genome-wide association study was performed on cohort 2. Big Five personality questionnaire was adopted to evaluate the personality characteristics for all subjects.

Results Compared with healthy people, patients with active UC have higher agreeableness and lower openness. In patients with UC, the scores of agreeableness, conscientiousness, and extraversion are negatively correlated with depression and anxiety levels, while neuroticism is positively correlated with depression and anxiety levels.

Openness was associated with lower disease activity but unrelated with depression and anxiety. The five personality types had their specific gut microbiota composition, metabolome, and related genes. In patients with UC, Aggregatibacter was associated with lower openness. Lactococcus was related to higher agreeableness. Patients with UC and higher neuroticism harbored less Prevotellaceae. Patients with more active UC and higher conscientiousness harbored less Odoribacter. Openness was associated with lower hypoxanthine, taurine, andsphosine-1-phosphate levels. Agreeableness was negatively correlated with the levels of decanoyl-L-carnitine, diphenhydramine, glycochenodeoxycholate, and taurine. Neuroticism is positively related to D-quinovose levels and negatively related to L-kynurenine levels, and involved dysfunction of tryptophan metabolism, suggesting its relationship with UC associated mood disorders. In healthy people, genes such as NMNAT2, WT1, YY1, OR51E2, SLC25A29, and SGOL2 were significantly associated with more than two types of personality traits. Three genes, namely BCAS3, ZNF333, and MTUS2, were associated with both agreeableness and openness, indicating their role in the relationship between personality and UC.

Conclusion In summary, personality traits play an inescapable but not well studied role in UC development. A set of specific genetic factors, bacteria and circulating metabolites may build a bridge between them. This study suggests a possibility of including personality characteristics in the early screening of UC.

精神分裂谱系患者前瞻记忆的认知加工缺陷研究

李航[1,2] 周福春[1,2] 王传跃[1,2]
1.首都医科大学附属北京安定医院，国家精神心理疾病临床医学研究中心，精神疾病诊断与治疗北京市重点实验室，北京脑重大疾病研究院精神分裂症研究所，北京 100088
2.人脑保护高精尖创新中心，首都医科大学，100069

目的 前瞻记忆（PM）缺陷是精神分裂症患者的常见认知损害，与患者的临床和功能结局密切相关，但既往使用基于临床场景的工具（生态效度良好）无法揭示其认知加工过程。本研究拟在匹配生态效度的基础上，通过线索非聚焦眼动追踪范式考察精神分裂症谱系障碍患者 PM 受损的认知加工过程，并探讨其与基础神经认知功能缺陷的关系。

方法 （1）实验 1 中，纳入符合 DSM-5 精神分裂症谱系障碍诊断标准的患者（SSD）和健康对照，通过生态效度良好的中文版剑桥前瞻性记忆测试进行筛选，使两组在社会人口学资料和基于事件的 PM 分数上匹配，纳入 SSD 和健康对照各 32 例，通过眼动追踪实验对比两组的 PM 正确率和策略监控能力（干扰词注视次数），并采用中文版 MCCB 评估被试的神经认知功能，阳性与阴性症状量表（PANSS）评估患者症状严重程度。（2）实验 2 中，再纳入 31 例 SSD 患者扩大样本量，分析 SSD 患者眼动 PM 正确率、策略监控能力与 MCCB 各维度认知功能和临床症状之间的关系。

结果 （1）实验 1 中，SSD 患者在实验室 PM 正确率、策略监控和 MCCB 多个维度上显著差于健康对照（均为 P<0.05）；通过协方差分析控制了策略监控和 MCCB 总分后，PM 正确率在两组间差异消失（F(1,60)=1.748, P=0.191）。（2）实验 2 中，在 SSD 患者组相关性分析显示，其 PM 正确率与工作记忆（r=0.27，P=0.31）、注意力/警觉（r=0.398，P=0.01）和 PANSS 总分（r=-0.33，P=0.009）呈显著相关性。SSD 组干扰词注视次数与视觉学习（r=0.33，P=0.008）及 PANSS 总分（r=-0.32，P=0.01）呈显著相关。回归分析显示 PANSS 总分（β=-0.007，P=0.049）和视觉学习（β=0.011，P=0.04）是策略监控能力的预测变量（R?=0.143）。

结论 （1）本研究首次通过眼动追踪实验室范式证实，PM 缺陷是 SSD 患者的原发性认知缺陷，策略监控是其关键认知加工缺陷环节。（2）相比于基于临床的 PM 评估（生态效度良好），眼动追踪能更为敏感的揭示 SSD 患者的 PM 认知加工过程。精神症状总体严重度和视觉学习能力是独立预测 SSD 患者策略监控能力的变量。

经颅交流电刺激对精神分裂症患者幻听的疗效：一项随机、双盲、对照临床试验

呼如芯*
天津市安定医院

目的 经颅交流电刺激(tACS , transcranial alternating current stimulation)是一种非侵入性脑刺激手段。其原理是通过给定交流电从头皮传递到作用的神经元。tACS 被认为是通过同步脑波震荡进而诱导长期的突触的可塑性进而调节大脑的认知功能。十多年来，它已被用于不同的领域，如中风、帕金森病和脑损伤等神经系统疾病，然而目前它在精神病学临床研究中应用较少。本研究旨在通过一项随机、双盲、对照的临床试验，来探索经颅交流电刺激对用药精神分裂症患者幻听等临床症状的疗效作用。

方法 本研究纳入了 50 名精神分裂症患者（依据 DSM-5 诊断），将他们随机分配到两组，对照组每天接受 20 分钟的假刺激、tACS 组接受 40 赫兹 2 毫安的 tACS 治疗，每周五天，连续四周。在基线、第 2 周、第 4 周和第 6 周对患者进行临床症状评估，使用精神症状评定量表（PSYRATS）评定幻听症状的改善，作为主要测量结果。阳性和阴性综合征量表（PANSS）被用作次要测量结果。

结果 （1）PANSS 量表显示在两组之间没有明显差异，无统计学意义。（2）对 PSYRAT 量表上的幻听

得分分析显示两组之间有不同趋势，tACS 组相对于对照组对幻听症状有更好的治疗效果。

结论 虽然 tACS 组的幻听评分相对对照组而言只有很小的改善，但这种改善是有意义的。仍需要更大的样本量和更深入的研究来进一步探讨 tACS 在治疗精神分裂症幻听症状的疗效。

关键字：经颅交流电刺激，精神分裂症，幻听

正念干预对于康复期精神分裂症患者面孔情绪识别和生活质量的作用研究

仵琼* 宋学勤
郑州大学第一附属医院

目的 （1）观察正念干预后康复期精神分裂症患者正念水平、面孔情绪识别和生活质量的变化；（2）探讨康复期精神分裂症患者正念水平、面孔情绪识别和生活质量的关联及正念干预的影响。

方法 以河南省郑州市某精神专科医院封闭病区符合纳入标准的 70 名康复期精神分裂症患者为研究被试，收集患者的一般情况，并根据性别和年龄进行分层随机分组形成实验组（35 人）和对照组（35 人）。在常规护理和药物治疗的基础上，实验组接受 8 周的正念干预，而对照组接受 8 周的工娱治疗。最终完成实验的有 62 名(实验组 32 人、对照组 30 人)。在干预前后使用正念五因素量表（FFMQ）、精神分裂症生活质量量表中文版（SQLS）、和行为学实验分别评估患者正念水平、生活质量水平和面孔情绪识别能力。采用 SPSS 21.0 软件，使用卡方检验、t 检验、非参数检验等统计方法处理和分析数据，同时，借助 PROCESS3.0 插件进行 Bootstrap 法调节效应分析。

结果 （1）实验组和对照组在年龄、性别、病程、受教育程度上无显著差异（p>0.05），具有可比性。（2）干预前，实验组和对照组在 FFMQ 总分及观察、描述、有觉知地行动、不判断、不反应五个子维度、SQLS 总分及心理社会、精力动机、症状副反应三个子维度上无显著差异，而干预后两组在以上维度差异均显著。（3）实验组干预前后各维度差异明显，而对照组干预前后各维度变化不明显。（4）干预前后实验组变量相关分析发现，干预前，正念水平、生活质量、面孔情绪识别之间显著相关，正念水平和生活质量得分呈显著负相关，与面孔情绪识别正确率呈显著正相关，生活质量得分与面孔情绪识别正确率之间呈显著负相关。干预后，正念水平和面孔情绪识别呈显著正相关，而生活质量与正念水平、面孔情绪识别无明显相关关系。（5）干预前对实验组数据进行回归分析显示：正念水平在面孔情绪识别和生活质量之间起调节作用，而干预后这种作用不显著。

结论 （1）正念干预可以有效提升康复期精神分裂症患者的正念水平和面孔情绪识别能力，改善患者的生活质量，有利于精神分裂症患者康复。（2）康复期精神分裂症患者正念水平、面孔情绪识别和生活质量之间存在显著正相关关系，并且正念干预后这些相关关系发生变化。

关键字：精神分裂症；正念训练；面孔情绪识别；生活质量

SSRIs Compared To TCAs Improve Social Perception in Major Depressive Disorders: A Pilot, Open-label, 12-week Study

周振和* 徐洪 王军
无锡市精神卫生中心

Objective To investigate whether selective serotonin reuptake inhibitors (SSRIs) or tricyclic antidepressants (TCAs) can improve social cognitive impairment in major depressive disorder (MDD) patients.

Methods Sixty patients who met the Diagnostic and Statistical Manual of Mental Disorders-5 diagnostic criteria for MDD were allocated to a selective serotonin reuptake inhibitor (SSRI) treatment group (SSRITG, n=30) or a tricyclic antidepressant (TCA) treatment group (TCATG, n=30). Thirty healthy individuals were recruited to serve as the controls. The Emotion Intensity Recognition Task (EIRT) and the Interpersonal Perception Task-15 (IPT-15) were measured at baseline and then after 4 and 12 weeks of treatment with SSRIs or TCAs.

Results Both SSRIs and TCAs decreased the Hamilton Depression Scale scores. At baseline, the total scores and five factor scores of the IPT-15 and the total scores and six factor scores of the EIRT were significantly lower in the SSRITG and TCATG groups than those of the controls. A repeated measures analysis of variance revealed a significant main effect of time period (baseline, 4 weeks, and 12 weeks) for the IPT-15 scores and EIRT scores and significant interactions for time period × group (SSRITG and TCATG). A multivariate analysis of variance showed no significant differences between the SSRITG and TCATG on IPT-15scores and EIRT scores at 4 weeks, but there were significant differences between these two groups at 12 weeks.

Conclusions MDD patients have impairments in social cognitive function, which might be improved by SSRIs.

青春早期慢性社交挫败应激对 C57BL/6J 小鼠行为及补体 C3/C3a 水平的影响

刘雪晴 梁玥汐 温轩 方泽漫 张瀚迪*
汕头大学精神卫生中心

目的 青春期经历负性事件的个体罹患情感障碍、创伤后应激障等精神障碍的风险显著增高，但其潜在机制仍有待阐明。我们通过构建青春期慢性应激动物

模型探究青春期负性经历对个体社交及情感相关行为的影响及潜在的生物学机制。

方法 4 周龄的 C57 小鼠连续 10 天的社交挫败应激，应激结束后通过蔗糖偏好实验、旷场实验、社交互动实验和强迫游泳实验评估小鼠的社交及情感相关行为改变，采用酶联免疫吸附试验检测小鼠循环和中枢的补体表达水平，免疫荧光实验检测小鼠中枢小胶质细胞变化。

结果 在蔗糖偏好实验中，应激组蔗糖偏好水平显著降低（$p<0.05$）。在旷场实验中，应激组小鼠的总路程（$p<0.05$），中央区路程（$p<0.05$），中央区路程/总路程比值（$p<0.05$）均显著降低。在社交互动实验中，对照组与陌生 CD1 小鼠的接近时间显著高于新奇物体（空笼子）的接近时间（$p<0.001$），相反，应激组与 CD1 小鼠接近时间显著低于新奇物体（空笼子）的接近时间（$p<0.05$），应激组在角落区的时间（$p<0.001$）、逃跑行为（$p<0.001$）显著增高。在强迫游泳实验中，应激组和对照组在后 4min 中的不动时间无统计学差异。酶联免疫吸附实验表明应激结束后应激组循环补体蛋白 C3 以及 C3a 水平无统计学差异，前额叶补体蛋白 C3a 水平显著降低（$p<0.05$）。免疫荧光实验表明应激组前额叶小胶质细胞(IBA1+CD45-)的数量显著增加($P<0.05$)。

结论 青春早期慢性社交挫败应激导致的抑郁焦虑样行为改变以及前额叶补体蛋白 C3a 和小胶质细胞的变化可能是精神障碍易感性的机制之一。

关键字：抑郁障碍、生命早年应激、补体 C3/C3a、小胶质细胞、慢性社交挫败

反复睡眠剥夺伴短暂休息对大鼠疲劳样行 为和 TGF-β1 表达的影响

吴映如 张瀚迪*
汕头大学精神卫生中心

目的 慢性疲劳综合征 (chronic fatigue syndrome/CFS) 是一种病因不明，以慢性疲劳为主要特征，涉及多系统功能障碍的综合征。抑炎因子转化生长因子 β1 (transforming growing factor β1/TGF-β1) 可能与 CFS 病理机制相关。本研究利用反复睡眠剥夺伴短暂休息诱导的疲劳动物模型，探讨 TGF-β1 在疲劳综合征发病中的作用。

方法 我们使用了 22 只 6 周龄雄性 SD 大鼠，随机分为对照组和疲劳组。造模前 1 天进行基线负重游泳实验。在进行 10 天的反复睡眠剥夺伴短暂休息的疲劳负载造模后，两组大鼠进行尾静脉采血 (负载结束后第 1 天、第 4 天) 和行为学检测 (负载结束后第 1、2、4 天行旷场实验和负重游泳实验，负载结束后第 3 天行 Y 迷宫实验) 。在负载结束后第 5 天处死，取脑组织用于检测 TGF-β1。

结果 (1) 与正常对照组相比，反复睡眠剥夺伴短暂休息 10 天造成大鼠体重显著降低；(2) 疲劳组大鼠在造模期间休息时的总睡眠时间呈波动式变化，于第 3 天和第 9 天达到高峰；(3) 疲劳负载前和结束后第 1 天，两组负重游泳时间无显著差异，疲劳组大鼠负载结束后第 2 天、第 4 天负重游泳时间与正常对照组相比显著增加；(4) 旷场实验结果显示与正常对照组相比，负载结束后第 1 天疲劳组大鼠中央区距离/总距离比值显著增加，负载结束后第 4 天疲劳组大鼠中央区距离/总距离、进入中央区时间显著增加；(5) Y 迷宫实验结果显示与正常对照组相比，疲劳组大鼠自发转换率显著降低，总入臂次数无显著差异；(6) 负载结束后第 1 天和第 4 天，疲劳组大鼠外周血 TGF-β1 水平与对照组无显著差异；(7) 疲劳组大鼠前额叶 TGF-β1 表达显著高于对照组，纹状体 TGF-β1 表达无显著差异。

结论 上述结果表明，反复睡眠剥夺伴短暂休息的疲劳模型可诱导大鼠出现以认知功能损害为主要表现的疲劳样行为改变，其前额叶抑炎细胞因子 TGF-β1 表达增加可能与精神疲劳的病理机制密切相关。

关键字：慢性疲劳综合征，精神疲劳，细胞因子，TGF-β1

脑脊液梅毒抗体 TRUST 与化学发光检测对神经梅毒的临床诊断价值

许莹 何咏茵 何咏茵 杨梦心 刘海英 *
广州医科大学附属脑科医院

目的 探讨脑脊液梅毒（TP）抗体甲苯胺红不加热试验（TRUST）及化学发光法检测 TP-IgG 对神经梅毒的诊断价值。

方法 选取广州医科大学附属脑科医院 2020 年 6 月至 2022 年 5 月两年间收治的 145 例有神经系统症状的梅毒患者，分析脑脊液与血清 TRUST、TP-IgG 结果，比较评估对神经梅毒的诊断效能。

结果 145 例梅毒患者，确诊神经梅毒 64 例，非神经梅毒 63 例，但神经系统症状不能确定梅毒感染引起的患者（随访组）18 例。26 例（40.6%）神经梅毒患者脑脊液白细胞≥10×106/L，55 例（85.9%）总蛋白量＞500mg/L，异常比例均高于非神经梅毒患者（$P<0.001$）；非神经梅毒组中白细胞升高、总蛋白升高者各为 7.9%、30.2%。56 例（87.5%）神经梅毒确诊者脑脊液 TRUST 阳性（滴度中位数为 1:2）。非神经梅毒组患者脑脊液的 TRUST（3 例，4.7%）与 TP-IgG（38 例，60.3%）阳性率均要明显低于神经梅毒组（$P<0.05$）。18 例随访患者脑脊液 TRUST 均为阴性，但 TP-IgG 均为阳性，常规无异常。145 例患者脑脊液 TP-IgG 水平与其自身 TRUST 滴度呈正相关（$r=0.669$, $P<0.001$）。神经梅毒确诊者血清 TRUST 与 TP-IgG 均为阳性，血清 TRUST 滴度、TP-IgG 中位数分别为 1:32、23.8±2.8，均要高于脑脊液抗体水平（$Z=-8.46$,$P<0.01$；$Z=-3.31$,$P=0.01$），尤以 TRUST 滴度升高显著，几乎 16 倍于脑脊液。确诊患者脑脊液 TRUST 治疗前后滴度明显降低（4.3±4.5 vs. 2.8±3.5；$Z=-2.11$，$P=0.035$）,而脑脊液 TP-IgG 治疗前后水平则无统计学差异（$Z=-0.87$,$P=0.061$）。脑脊液 TRUST 诊断的灵敏度与特异性

分别为 88.9%、95.2%，阳性预测值为 94.9%，阴性预测值为 95.2%；TP-IgG 灵敏度高达 100%，但特异性仅有 39.7%，阳性预测值为 62.7%，阴性预测值为 100%；两项指标联合检测敏感性与特异性分别为 88.9%、97.1%。

结论 脑脊液 TRUST 检测对神经梅毒诊断敏感性不足，可作为疗效监测的指标，联合 TRUST 及化学发光法检测 TP-IgG 未能提高神经梅毒的诊断率，但是脑脊液 TP-IgG 阴性可排除神经梅毒诊断。

萝卜硫素治疗孤独症的有效性与血浆磷脂代谢机制的研究

戴思 林晶晶 沈屹东 欧建君*
中南大学湘雅二医院

目的 本研究旨在探索萝卜硫素治疗孤独症谱系障碍（Autism Spectrum Disorder，ASD）的分子机制，寻找与疗效相关的生物学标志物并构建疗效预测模型，以指导萝卜硫素在 ASD 中的临床应用。

方法 本研究基于课题组前期12周的萝卜硫素治疗 ASD 的随机、双盲、安慰剂对照试验。采用《OSU 孤独症评定量表—DSM-IV》（OSU Autism Rating Scale—DSM-IV，OARS-4）量表在基线、治疗第 4、8 和 12 周时评估萝卜硫素组和安慰剂组的 ASD 临床症状变化，利用广义线性混合模型比较 OARS-4 量表得分在组别和时间上的差异。在基线和治疗终点时采集患者血浆样本，利用超高效液相色谱—高分辨质谱法进行非靶向代谢组学的检测。将得到的血浆代谢物相对定量标准化数值使用方差分析-成分分析法筛选两组的差异代谢物，并进行代谢通路富集分析。通过 Spearman 相关分析，寻找与萝卜硫素治疗疗效显著相关的差异代谢物，再将萝卜硫素治疗有效组和无效组中这些代谢物进行 Fisher 判别分析，以筛选出具有疗效预测的生物标志物。

结果 本研究共采集了 40 名 ASD 儿童血浆样本进行代谢组学研究。12 周药物干预后，萝卜硫素组的临床症状得到显著改善（$P<0.05$），并有 201 种代谢物与安慰剂组存在显著差异，主要显著富集于甘油磷脂代谢和初级胆汁酸的生物合成通路（$P<0.01$）。牛磺酸、磷脂酰丝氨酸和溶血磷脂酰丝氨酸与 ASD 患者症状变化呈显著正相关（$P<0.05$），而溶血磷脂酰乙醇胺、鞘磷脂类和甘油三酯类代谢物与症状变化呈显著负相关（$P<0.05$）。其中，鞘磷脂 SM（d35:1）和牛磺酸进入了 Fisher 判别分析模型（$P<0.01$），该模型预测萝卜硫素疗效的正确率为 84.6%。

结论 萝卜硫素治疗 ASD 疗效的分子机制可能与细胞膜磷脂代谢有关，鞘磷脂 SM（d35:1）和牛磺酸可成为萝卜硫素治疗 ASD 疗效预测的生物标志物。

中国华南地区某精神专科医院碳青霉烯耐药肺炎克雷伯菌感染的危险因素及流行病学分析

岳磊 刘海英*
广州医科大学附属脑科医院

目的 研究碳青霉烯耐药的肺炎克雷伯菌(CRKP)感染在中国华南地区某精神疾病专科医院的危险因素和流行病学特征。

方法 选取 2021 年 7 月至 2022 年 6 月一年间内感染肺炎克雷伯菌的住院患者共 107 例，并按照对碳青霉烯类抗生素的耐药性分为耐药组（CRKP）和敏感组（CSKP）。对 CRKP 和 CSKP 组患者进行单因素统计学分析和多因素 logistic 回归分析。同时，本研究还从临床分离菌株的抗生素耐药性、标本来源以及碳青霉烯耐药基因型分布等方面对 CRKP 在该医院的流行病学特征进行分析。

结果 CRKP 感染的独立危险因素为抗真菌药物暴露(OR:11.750, 95%CI: 1.236-111.706)，消化道疾病(OR:5.208, 95% CI: 1.774-15.294)，精神疾病(OR:4.233, 95%CI: 1.353-13.242)。107 例肺炎克雷伯菌感染的临床病例中共分离出肺炎克雷伯菌 119 株，其中 57 株（47.9%）为 CRKP 菌。41 株(71.9%)来自呼吸道标本，其次是尿液 13 株(22.8%)和血液 3 株(5.3%)。按照科室来源依次为：ICU 21 株(36.8%)，神经内科 18 株(31.6%)，精神科 14 株(24.6%)，神经外科 4 株(7.0%)。而不同科室 CRKP 检出率依次为：ICU 72.4%(21/29)，神经内科 64.3%(18/28)，精神科 34.2%(14/41)，神经外科 19.1%(4/21)。CRKP 菌对碳青霉烯类、氨基糖苷类、氟喹诺酮类、β-内酰胺/β-内酰胺酶抑制剂、头孢菌素类等抗生素均表现出较高的耐药率(≥98.2%)。采用胶体金免疫层析法检测其中 39 株 CRKP 菌株的耐碳青霉烯基因，发现 38 株(97.4%)表达 blaKPC，1 株(2.6%)为 blaNDM，未检出 blaIMP、blaVIM、blaOXA-48 等基因。

结论 本研究发现抗真菌药物暴露、消化道疾病和精神疾病是 CRKP 感染的重要独立危险因素。本研究中 CRKP 菌株主要来源于呼吸道标本，提示要多关注 CRKP 呼吸道感染风险。重症监护室，神经内科及精神科等是该医院 CRKP 感染的主要来源，针对这些科室患者的 CRKP 感染风险要引起重视。该精神专科医院碳青霉烯酶耐药基因主要是 blaKPC，在经验性用药选择时可以优先选择针对 A 类碳青霉烯酶的抗生素如头孢他啶-阿维巴坦、替加环素等药物。

一例以精神症状为早期表现的家族性致死性失眠症病例报道及文献回顾

王郑 陈洁芳 金曼 格桑梅朵 章晓英*

杭州市第七人民医院

目的 报道 1 例早期被诊断为精神疾病的家族性致死性失眠症（Fatal Familial Insomnia, FFI）患者的临床表现、辅助检查结果以及诊治经过，旨在提高本病的早期识别，减少临床误诊漏诊。

方法 总结 1 例来自浙江无阳性家族史患者的临床资料，对患者行脑电、影像学检查及脑脊液检测，应用 Sanger 法进行朊蛋白基因（PRNP）测定。

结果 本例患者为 28 岁男性，无阳性家族史，以睡眠行为紊乱、认知功能下降伴片段性幻视幻听为主要表现，多次头颅 MRI 和脑电图检查未见明显异常，先后考虑诊断为分离转换性障碍、精神分裂症，经奥氮平等药物治疗后，症状无明显改善。后脑脊液检测发现 T-tau 含量及 T-tau/P-tau 比值显著增高；PET-CT 提示大脑皮质糖代谢减低，额叶最为明显。最后通过基因检测显示 PRNP D178N / 129M 基因突变，确诊为 FFI。

结论 部分罕见疾病的早期症状缺乏特异性，准确诊断存在挑战性。临床遇到快速进展性认知功能下降的患者，即使年纪较轻或没有家族史，仍需考虑朊蛋白病可能，对于朊蛋白病患者的早期识别，脑脊液 tau 蛋白检测有重要意义，很多研究认为脑脊液总 tau 蛋白大于 1300pg/ml 是诊断散发性 Creutzfeldt-Jakob disease (sCJD)的临界值。而在遗传性朊蛋白病中，tau 蛋白虽然升高不似散发性 CJD 那么明显，但也有诊断意义。最新研究显示当脑脊液 T-tau 含量超过 284pg/ml 时，其诊断 FFI 的敏感性和特异性可分别达 78%和 80%。因此，对可疑的朊蛋白病患者，及时进行脑脊液 tau 蛋白检测有助于早期识别，完善 PET-CT 和基因检测，有助于疾病的早期诊断。

Ift172 Deficiency Causes Autism-like Behaviors in Mice Through Attenuating BDNF Expression

罗世林* 郑南希 郎兵*
中南大学湘雅二医院

Objective Dysfunctional primary cilia are commonly associated with neurodevelopmental disorders collectively termed neurociliopathies, including Bardet-Biedl syndrome (BBS) and intellectual disability. Intraflagellar transport (IFT) is a critical process for flagellar elongation that actively transports either structural axonemal proteins or functional ingredients along the outer microtubules of the primary cilia. Ift172 is a gene encoding a member of IFT complex B that facilitates anterograde cargo flow together with kinesin, which is critical for the regulation of anterograde-to-retrograde ITF transition at the tip of flagella. Our previous study reported that Ift172 regulated a range of fundamental biological processes, highlighting the pivotal roles of the primary cilium in cell physiology and brain development. However, the effects and internal mechanisms of Ift172 on neuropsychiatric behaviors are still unrevealed. Our current study aims to generate an Ift172 KO mouse model, evaluate its behavioral phenotypes, and explore the intrinsic mechanisms based on the abnormal functions of the primary cilia.

Methods CRISPR/Ca9-mediated genome-editing technique was utilized to generate an Ift172 KO mouse model (Ift172+/-). A series of behavior tests were performed to identify the behavioral phenotype of Ift172+/- mice. Transcriptome analysis was utilized to unveil differentially expressed genes between WT and Ift172+/- mice. Sparsely virus label and electron microscopy were performed to observe structure and density changes in the spines and synapses of pyramidal neurons. Patch-clamp recording and local field potentials (LFPs) were detected in the miniature inhibitory postsynaptic currents (mIPSC) of hippocampal CA1 pyramidal neurons and sharp wave ripples (SWRs) in CA1 layers, respectively. BDNF mimetic compound 7,8-dihydroxyflavone (7,8-DHF) was administrated to rescue the related abnormal behaviors. Luciferase reporter assay and chromatin immunoprecipitation-PCR (ChiP-PCR) were employed to reveal the molecular mechanism by which Ift172 regulates the expression of BDNF.

Results Ift172+/- mice display repetitive grooming, mild anxiety-like behavior, and excessive and spontaneous memory impairment, especially abnormal social interaction as well as deficits in discriminating social novelty; the RNA-seq data suggest that the absence of Ift172 could impair synaptic functions in brains; the deletion of Ift172 leads to BDNF deficiency and structural defects in the dendrites and spines of pyramidal neurons; a significant decrease in mIPCs amplitude and frequency, and an increase in SWR incidence and oscillatory amplitude in Ift172+/- mice compared to WT age-matched controls; the specific BDNF mimetic compounds can lead to the re **Conclusion** Ift172 deficiency results in autism-like behaviors in mice. The mechanism investigation reveals that Ift172 interrupts the activation process of Gli3 as a transcription factor of BDNF on primary cilia.

抑郁症患者快感缺失与脑影像特征的相关性研究

胡晏钦[1,3] 赵后锋[2] 赵超齐[3] 刘婷婷[3] 张柳怡[3] 乔娟[2]
1.重庆市精神卫生中心
2.徐州医科大学附属徐州东方医院
3.徐州医科大学第一临床医学院

目的 探讨抑郁症患者和健康对照在静息状态下颅脑功能磁共振的分数低频振幅（fALFF）和局部一致性（ReHo）的差异，以及差异脑区特征值与快感缺失严重程度之间的关联。

方法 对 66 例抑郁症患者和 31 例健康对照行 3.0T 静息态功能磁共振（fMRI）扫描，并使用蒙哥马利抑郁量表（MADRS）和时间性快感体验量表（TEPS）

对被试进行评估。比较两组间 fALFF 及 ReHo 值差异，将差异脑区的 fALFF 及 ReHo 值与临床量表得分作 Pearson 相关性分析。

结果 相比于对照组，抑郁症组在双侧中扣带回及旁扣带回的 fALFF 值降低（体素水平 p<0.001，且 FWEp<0.05）；抑郁症组在左侧距状裂周围皮层/右侧舌回的 ReHo 值降低（体素水平 p<0.001，且 FWEp<0.05）。全脑功能活动存在差异的脑区与快感缺失严重程度的关联分析显示，抑郁症组期待型 TEPS 得分(r=0.407，P=0.001，Bonferrnoi 法校正后 P=0.006)及消费型 TEPS 得分(r=0.361，P=0.003，Bonferrnoi 法校正后 P =0.018)与双侧中扣带回及旁扣带回的 fALFF 值均呈正相关；抑郁症组 ReHo 值与快感量表得分之间未发现相关性。

结论 抑郁症患者在双侧中扣带回及旁扣带回、左侧距状裂周围皮层/右侧舌回处存在功能受损，且双侧中扣带回及旁扣带回具有成为抑郁症患者快感缺失的神经影像学标志物的潜质。

基于基于生成对抗网络 FCN-GAN 数据增强的自闭症核磁共振影像分类

左劲松 周建松*
中南大学湘雅二医院

目的 本研究旨在深度学习算法的基础上，提出一个新型生成模型 FCN-GAN。利用生成模型来进行数据增强的方法，来生成具更多高价值和高质量的自闭症患者功能连接矩阵图像。从而能有效地扩展了原始数据集的图像数量，为后续分类任务提供更多的训练样本。

方法 我们在在 Conditional-GAN（CGAN）和变分自编码器（VAE）的基础上，将 CGAN 和 VAE 相结合提出了一种新型的生成模型 FCN-GAN。生成器模型由 4 个 2D 全卷积层组成，每层之间都添加了一个批正则化层和 ReLU 层来激活，最后一层由 Sigmoid 函数来激活。而判别器模型的架构与 VAE 网络相似，由 4 个 2D 反卷积层组成。先使用混合高斯模型（GMM）直接对高维数据的似然进行建模，使用期望最大化（EM）算法从训练数据中学习高斯分布的参数。生成器再从得到的多元高斯分布中抽取，并且鉴别器和生成器都以可用的标签为条件，此外我们还使用二维卷积和反卷积来捕捉功能连接矩阵的空间结构。最后我们以公开数据集 ABIDE 为训练数据，它整合了全球多个实验室或研究中心的自闭症患者脑影像。

结果 在实验中，我们使用了 CNN 和 SVM 作为分类器来验证数据增强的效果，通过准确率、ROC 曲线和 AUC 等指标来评估它们的分类准确度。实验结果显示，在经过 FCN-GAN 数据增强后，SVM 的分类准确度由没有进行数据增强时的 60.82%，上升到增强后的 70.14%，CNN 的分类准确度由没有进行数据增强时的 61.40%，上升到增强后的 71.86%。这一提升不仅在统计上是显著的，而且在参数优化后分类器的收敛速度也更快。

结论 本章研究通过提出 FCN-GAN 模型，并进行了详尽的实验评估，展示了该生成模型在医学影像数据增强方面的潜力和优势。通过生成有价值、高质量的功能连接矩阵图像，并与现有数据集混合，FCN-GAN 成功地提高了 CNN 和 SVM 的分类准确度。这一研究为医学影像领域的数据增强方法提供了新的思路和启示，有助于提升下游分类器的性能和应用的可行性。

关键字：自闭症、数据增强、fMRI、深度学习

Streptococcus Salivarius 定植引起小鼠精神分裂样行为的机制研究

郭熠洁 杨再 寻御风 于璐 朱峰 马现仓*
西安交通大学医学院第一附属医院精神心理卫生科

目的 精神分裂症是一种病因不明的精神疾病，涉及认知、思维、情感、行为等多方面精神活动的显著异常。虽然精神分裂症的发病机制尚未阐明，但已有大量证据表明肠道微生物群可以通过微生物群-肠-脑轴轴参与精神分裂症的发病。本课题组前期对精神分裂症患者的肠道菌群和健康人群的肠道菌群进行宏基因组测序，发现对精神分裂症患者的肠道菌群富含 Streptococcus salivarius 菌，但是该菌是否在精神分裂症的病理生理过程中发挥作用还不清楚。因此本研究，通过评估细菌定植对小鼠精神分裂样行为的影响，从而揭示 S. salivarius 菌诱发精神分裂样行为的潜在机制。

方法 本研究采用 6 周龄的雄性 C57BL/6J 小鼠，经过连续 10 天的混合抗生素清楚肠道菌群后，分别给小鼠连续 14 天灌胃细菌培养液对照组（Ctrl, 200 ul）、S. salivarius 菌体（SS cell body，108 cfu）和 S. salivarius 培养上清液（SS supernatant，200 ul），然后评估小鼠行为学变化，包括旷场、高架十字迷宫、三箱社交、条件恐惧、前脉冲抑制和强迫游泳实验。

结果 在旷场实验中，S. salivarius 菌体组在中央区域的停留时间较对照组显著减低，S. salivarius 培养上清液组在中央区域的停留时间较对照组无变化。在前脉冲抑制实验中，S. salivarius 菌体组和 S. salivarius 培养上清液组均较对照组显著显著增高。其他行为学实验，包括高架十字迷宫、三箱社交、条件恐惧等，三组之间均无显著差异。

结论 本研究利用 S. salivarius 细菌定植的小鼠行为学模型，发现精神分裂症患者肠道中富集的 S. salivarius 菌可有助于小鼠表达两种与精神分裂症相关的行为（焦虑样升高和感觉门控受损）。

关键字：精神分裂症；肠道微生物；S. salivarius 菌

肠道菌群代谢物短链脂肪酸与精神分裂症的关系研究

何潇言 朱峰 马现仓*
西安交通大学第一附属医院精神科

目的 微生物-肠-脑轴是精神分裂症的发病和机制的研究热点。肠道菌群可通过免疫、内分泌、神经和体液等途径，在免疫系统失调和微生物-肠-脑双向通讯中起着重要作用。短链脂肪酸(SCFAs)是肠道细菌发酵膳食纤维产生的主要代谢产物。基于肠道菌群和SCFAs 在宿主免疫应答中的关键作用，我们提出肠道菌群紊乱诱导的 SCFAs 水平上调可能与精神分裂症的病理机制有关。本研究通过比较精神分裂症患者和健康对照的血清及肠道 SCFAs 水平和肠道微生物组，探讨肠道菌群及其重要代谢产物短链脂肪酸在精神分裂症发病中可能的作用。

方法 本研究共纳入 146 名精神分裂症患者和 144 名健康对照，并采集了所有受试者的年龄、性别、受教育程度、BMI 等人口统计学资料。使用串联四极杆质谱（GC-QqQ-MS）和气相色谱-质谱联合法（GC-MS）检测血清和粪便中的 SCFAs 水平；采用鸟枪法宏基因组测序技术分析肠道微生物的多样性及差异，探讨细菌来源的 SCFAs 与精神分裂症的关系。

结果 本研究共纳入 146 名精神分裂症患者和 144 名健康对照。人口统计学资料表明，两组人群在年龄、性别、BMI、受教育程度、吸烟饮酒情况上均无统计学差异。首先，我们检测了血清中的 SCFAs 水平，发现精神分裂症患者血清中乙酸、丙酸和丁酸水平及其总和均显著高于健康对照组（P <0.001）。为探究患者血清中 SCFAs 的来源，我们检测了粪便 SCFAs。结果表明病例组粪便中的 SCFAs 水平也显著高于健康对照组（P<0.0001）。为筛选导致 SCFAs 升高的细菌，我们检测了粪便宏基因组，结果表明病例组的 α-多样性显著升高（P<0.001），β-多样性与健康对照组差异显著；在种水平上，Phocaeicola vulgatus, Lachnoapira pectinoschiza 显著升高；对两组差异菌分别和 SCFAs 做相关性分析结果表明，SCZ 患者肠道中 29 种细菌和至少一种 SCFAs 水平相关（FDR<0.05），SCZ 患者肠道中 25 种细菌和至少一种 SCFAs 水平相关（FDR <0.05），其中 Hungatella_hathewayi 在两组中均与粪便丁酸水平呈显著正相关。

结论 SCFAs 是精神分裂症肠道菌群失调的重要介质，这为进一步揭示 SCFAs 在精神分裂症发病机制中的作用提供依据，同时为探索精神分裂症的潜在治疗靶点提供了新的思路。

基于多组学的心理韧性肠-脑轴机制的探索性研究

刘睿娜[1,2] 张建波[3] 张玉丹[1] 郭熠洁[2] 朱峰[1,2] 马现仓[2]

1.西安交通大学第一附属医院转化医学中心
2.西安交通大学第一附属医院精神科
3.西安交通大学法医学院

目的 心理韧性水平差异导致个体抵抗逆境能力的不同。本研究旨在应用多组学技术手段，探究在受到相同水平心理应激下的模式动物小鼠中心理韧性差异，并分析脑肠轴在此过程中的作用。

方法 通过悬尾、强迫游泳和糖水偏好实验，评估小鼠在慢性社交挫败后的抑郁行为，并将其分为抑郁敏感组和抑郁抵抗组。收集抑郁敏感、抑郁抵抗以及对照组小鼠的血浆、肠内容物、海马、纹状体和前额叶皮质等样本。对小鼠肠内容物中的微生物群落进行宏基因组测序，分析不同组小鼠肠道微生物的组成和功能差异。同时对肠内容物中的微生物群落进行宏转录组测序，分析小鼠肠菌的基因表达模式，以进一步确定与抑郁状态相关的特征基因。此外，对小鼠的肠内容物、血浆、海马、纹状体和前额叶皮质样本进行代谢组学检测，研究不同组间的代谢物组成和通路富集情况的差异，筛选与抑郁表型相关的特征代谢物。

结果 宏基因组分析显示，抑郁抵抗组中的 Limosilactobacillus reuteri 和 Akkermansia muciniphila 等菌群相对丰度显著高于抑郁敏感组，这些菌群与抗炎作用相关。血浆和前额叶皮质等脑区的代谢组学分析揭示了抑郁抵抗小鼠和抑郁敏感小鼠在代谢产物水平上的差异，尤其是在氨基酸代谢、脂质代谢和短链脂肪酸等与菌群相关的代谢方面。通过多组学联合分析，筛选出与特征菌群相关的代谢产物，为未来抑郁症治疗提供了新的靶点。

结论 综合分析多组学数据发现，抑郁抵抗小鼠相对于抑郁敏感小鼠呈现出益生菌相对丰度增高、神经递质合成和信号传导增强、较低的炎症反应以及能量代谢水平增高。

青春期小鼠高脂饮食诱发抑郁样行为的机制研究

赵斌斌[1,2] 范亚娟[1] 王亚楠[2] 王云鹏[1] 朱峰[1] 马现仓[1]

1.西安交通大学第一附属医院精神心理卫生科
2.西安交通大学第一附属医院 MED-X 研究院免疫代谢性疾病研究所

目的 抑郁症是一种严重限制心理社会功能并降低生活质量的常见精神疾病，也是一种代谢性疾病。青少年期的肥胖以及其成年后的肥胖与抑郁症的高患病率密切相关，但目前肥胖诱发抑郁症的机制尚不清楚。本研究通过评估高脂饮食和压力对小鼠抑郁样行为的影响，从而揭示青少年肥胖诱发抑郁样行为的潜在机制。

方法 采用 3 周龄雄性 C57 小鼠，高脂组(HF)给予 60 kcal% Fat，对照组(LF)给 10 kcal% Fat 持续 5 周模拟青少年肥胖，随后继续食用高脂饲料到 13 周。分别评估脂肪和肌肉含量，血浆中 TC、TG 和 Glu 水平，

口服葡萄糖耐量和胰岛素耐量实验评估肥胖。慢性社会挫败应激(CSDS)模型分为 LF 组，LD 组(LF+CSDS)，HF1 组，HD 组(HF+CSDS)；慢性束缚应激 (CRS)模型分为 LF2 组，LR 组(LF+CRS)，HF2 组，HR 组(HF+CRS)。结肠内容物和血浆进行非靶向代谢组学和靶向氧化脂质代谢组学的分析；前额叶皮质和海马进行靶向氧化脂质代谢组学的分析。qRT-PCR 分析前额叶皮质和海马花生四烯酸代谢途径相关酶和炎症因子 mRNA 水平的表达。

结果 高脂饮食 5 周后，HF 组体重和脂肪含量显著增高，血浆 TC 和 Glu 显著升高，HF 组葡萄糖耐量减退和胰岛素抵抗；CSDS 后的 LD 组和 HD 组出现社交回避。HF 组糖水偏爱下降和强迫游泳不动时间增加，表明压力可以诱导正常小鼠的抑郁样行为。LD 组和 HD 组均出现社交性受损，但 HD 组出现社交新颖性受损。CRS 模型中，观察到了相似的结果。血浆和脑组织靶向代谢组学分析发现，HF 组的多不饱和脂肪酸(PUFA)代谢紊乱，特别是花生四烯酸(AA)及相关其代谢物在 HF 组显著升高。相关性分析发现 AA、LA 和 γ?LA 水平与 SPT 呈负相关，与 FST 呈正相关。qRT-PCR 发现 HF 组前额叶皮质和海马中花生四烯酸代谢途径相关酶(Alox5、Ptgs1、Ptgs2 和 Ltb4r2)表达异常，炎症因子 IL-6、IL-1β、CCL-2 和 IL-10 显著升高。免疫荧光分析发现，HF 组前额叶皮质和海马中小胶质细胞数量增多，分支变短，小胶质细胞数量也高于 LF 组，但与 HD 组相比没有统计学差异。

结论 青春期小鼠高脂饮食诱导外周和中枢神经系统的 PUFA 代谢紊乱引起代谢性神经炎症，从而导致青春期肥胖小鼠出现抑郁样行为。这为儿童青少年肥胖诱发抑郁症的研究和治疗提供了新的方向。

肠道菌群及血清细胞因子与轻度脑外伤所致脑白质高信号及认知损害相关

张建波 张玉丹 白丽君 张明 朱峰*
西安交通大学第一附属医院陕西省精神疾病精准医学“一带一路”联合实验室

目的 轻度脑外伤常导致长期认知损害，增加痴呆、精神障碍等疾病的发病风险，然而其机制未明。肠道菌群被报道与脑微血管稳态和认知功能相关。当前轻度脑外伤诊断主要依据格拉斯哥昏迷量表，指标具有主观性、易引入偏倚。本研究旨在探究轻度脑外伤导致的菌种水平的肠道菌群紊乱及血清细胞因子变化及其与脑白质高信号及认知损害的关联，并评估基于肠道菌群、细胞因子及脑白质高信号的客观指标对轻度脑外伤的诊断及远期认知功能的预测价值。

方法 轻度脑外伤患者和健康对照均通过核磁共振检测脑白质高信号（全脑及额叶皮层）；采用韦克斯勒成人智力量表的连线测试 A 和数字符号编码任务评估受试者认知水平；通过宏基因组测序在菌种水平解析肠道菌群组成；使用 Luminex 多重磁珠法检测血清细胞因子水平；使用随机森林模型筛选和构建可用于轻度脑外伤诊断和认知功能预测的客观指标模型。

结果 轻度脑外伤患者相比于健康对照在全脑和额叶皮层白质高信号均增高，认知水平降低；且全脑和额叶皮层白质高信号与认知功能存在负相关。两组受试者肠道菌群组成存在显著差异，轻度脑外伤患者相比于健康对照 15 个菌种丰度升高（其中包括 5 个梭菌菌种），8 个菌种丰度降低。个别组间差异菌种丰度及基因功能与脑白质高信号及认知功能相关。我们也发现了肠道菌群，血清细胞因子，脑白质高信号及认知功能之间的复杂关联网络。一个包含 4 个肠道菌种、2 个细胞因子和全脑白质高信号的联合诊断模型可提高轻度脑外伤的诊断效能至 94.1%。一个包含 9 个肠道菌种、1 个细胞因子和全脑及额叶皮层白质高信号的预测模型可推断患病一年后的认知功能，效能达 82.5%。

结论 肠道菌群及血清细胞因子与轻度脑外伤所致脑白质高信号及认知损害相关。整合肠道菌群、血清细胞因子及脑白质高信号的客观指标模型可提高轻度脑外伤及远期认知功能的诊断和预测效能。我们的结果提示肠道菌群有望作为轻度脑外伤相关认知障碍等并发症的治疗和干预靶点。

外周淋巴细胞计数与双相躁狂患者精神病性症状之间的关系

刘海兰 荣晗*
深圳市康宁医院

目的 双相障碍（bipolar disorder，BD）是一种严重的高致残性精神疾病，是一种发作性心境障碍，其特点是（轻）躁狂和抑郁发作交替出现。BD 被认为是一种多系统疾病，不仅影响患者的情绪和行为，还影响免疫系统。BD 患者的炎症水平升高，且 BD 会加剧患者外周淋巴细胞的凋亡。深入研究 BD 免疫系统功能异常被认为是发现生物标志物的关键，这些生物标志物可以预测疾病进展，甚至有助于治疗选择。相较于其他生物标记物，全血细胞计数（CBC）生物标记物在实验室条件下更容易获得。白细胞计数（WBC）是一种非特异性的炎症标记物，白细胞亚型包括淋巴细胞和 BD 之间的联系在先前研究中得到证实。研究发现双相躁狂患者的炎症水平高于健康对照，而约 68%的双相躁狂患者出现了精神病性症状。因此，本研究将考察伴精神病性症状双相躁狂（BMP）与不伴精神病性症状双相躁狂（BMN）患者在 CBC 计数指标上的差异。

方法 本研究纳入 18-65 岁双相障碍躁狂发作患者 160 例，其中有 80 例患者出现了精神病性症状。BMP 和 BMN 患者在性别、年龄、受教育年限、病程上无显著差异，所有患者均为复发。研究中采集患者的外周血，进行 CBC 检测，获得白细胞、中性粒细胞、淋巴细胞、单核细胞和血小板计数，以及中性粒/淋巴细胞比值（NLR）、单核/淋巴细胞比值（MLR）、血小

板/淋巴细胞比值（PLR）等指标。另外，使用住院患者风险评估表对患者的肇事风险与自杀风险进行评估。以性别和年龄为协变量，对两组患者的 CBC 指标、肇事风险和自杀风险进行差异性检验。

结果 （1）相较于 BMN 患者，近一周 BMP 患者的自杀意念更强；（2）在 CBC 指标上，BMN 患者的淋巴细胞计数高于 BMP 患者。

结论 （1）在症状层面，精神病性症状会增加双相躁狂患者的自杀风险；（2）在 CBC 指标上，精神病性症状的出现伴随着淋巴细胞计数的减少，即精神病性症状与双相躁狂患者的外周免疫有关。

Ghrelin 通过生长激素信号通路调节斑马鱼多动样行为的研究

陈聪聪[1,2] 关开宇[3] 李西[1,2]
1.温州医科大学附属康宁医院
2.浙江省精神心理疾病临床医学研究中心
3.温州市第七人民医院

目的 注意缺陷/多动障碍(ADHD)是一种儿童和青少年常见的、与遗传高度相关的神经发育障碍疾病。GHRELIN 是已知最强的生长激素促分泌素之一，我们前期研究对 248 例 ADHD 和 208 例健康对照组人群进行测序分析发现 GHRELIN 基因 rs696217 SNP 位点的纯合突变与 ADHD 发病具有显著相关性，ghrelin 敲除的斑马鱼（ghrelinΔ/Δ 斑马鱼）表现出多动、冲动、学习与记忆能力减退的 ADHD 样表型，并伴随多巴胺水平降低及多巴胺能神经元发育障碍等病理学改变。然而，生长激素通路是否参 ghrelin 缺陷所致多动样行为尚不清楚

方法 利用 RNA-seq 对 ghrelinΔ/Δ 斑马鱼进行全脑转录组测序，并使用实时荧光定量 PCR（qRT-PCR）验证生长激素通路相关基因的表达水平。ghrelinΔ/Δ 和野生型斑马成鱼各自随机分成人重组生长激素（rhGH）治疗组和对照组，使用腹腔注射技术进行给药，并通过 viewpoint 行为记录分析多动、冲动等行为变化

结果 我们对 ghrelinΔ/Δ 和野生型斑马鱼成鱼进行全脑转录组分析，发现 ghrelinΔ/Δ 斑马鱼 gh 信号通路相关基因的转录表达显著降低, qRT-PCR 同样发现 ghrelinΔ/Δ 幼鱼和成鱼大脑内 stat5b，map2k2b，adcy1a，gh1，atf2，itpr1b，itpr2 等 gh 信号通路相关基因表达显著降低，验证了全脑转录组分析的结果。我们以腹腔给药的方式将 rhGH 注射至 ghrelinΔ/Δ 和野生型斑马鱼成鱼体内，行为学分析发现：ghrelinΔ/Δ 斑马鱼过度活跃和对外界光刺激反应敏感的表型能够被 rhGH 挽救。

结论 前期研究中发现了人 GHRELIN 基因突变导致 ADHD，本研究对 ghrelin 缺陷斑马鱼大脑进行转录组分析后发现 GH 相关信号通路下调，利用 rhGH 治疗后 ghrelin 缺陷斑马鱼多动症样表型被部分挽救，进一步明确其机制为临床实验提供理论基础，探寻了 rhGH 作为 ADHD 治疗或辅助用药的可能性。

关键字：ADHD ,ghrelin，斑马鱼，转录组分析，人重组生长激素

基于磁共振成像的 HIV 感染人群感染新型冠状病毒后神经影像学研究

张彤* 张洋 季嘉豪
北京佑安医院

目的 新冠病毒感染者会发生大脑结构、功能改变，由于 HIV 感染导致机体免疫功能缺陷，HIV 感染者合并新冠感染后的大脑结构、功能等均可能与普通人群存在差异。目前，尚不清楚新冠病毒对 HIV 感染人群大脑的影响。本研究旨在通过多模态磁共振成像的方法，研究 HIV 感染人群感染新冠后脑结构和功能的神经影像学改变，并据此分析新冠病毒在 HIV 感染人群的神经机制。

方法 我们对 66 名 HIV 感染者在感染新冠病毒前后（新冠病毒感染诊断时间超过 2 个月）分别进行了基线和感染后共 2 次磁共振成像。所有被试的磁共振数据均采集于同一台飞利浦磁共振成像系统，所采集的数据模态主要包括:结构磁共振成像（sMRI）、静息态功能磁共振成像（rs-fMRI）。采用 MATLAB R2013b 软件的 spm12 工具包进行数据处理，分析新冠病毒感染后组较新冠病毒感染前组差异具有统计学意义的脑区。分析方法包括基于体素形态学分析、基于体素的分析、局部脑活动。

结果 在比较两组时，我们发现 HIV 感染者在感染新冠病毒后组较新冠病毒感染前组，（1）右侧海马、左侧海马旁回局部一致性（ReHo）显著降低（P 校正<0.05），双侧枕中回 ReHo 显著升高（P 校正<0.05）；（2）左侧丘脑、右侧背外侧额上回分数低频振幅（fALFF）降低（P 未校正<0.05），右侧颞上回、左侧中央前回、右侧中央后回 fALFF 升高（P 未校正<0.05）；（3）左侧杏仁核灰质体积增加（P 未校正<0.05）。

结论 这些主要的边缘区脑成像结果可能是新冠病毒通过嗅觉途径逆行性扩散、神经炎症事件或嗅觉缺失导致的感觉输入丧失的体内标志。这种有害影响是否可以部分逆转，或者这些影响是否会长期存在，仍有待进一步的随访研究。

The Role and Mechanism of LncRNA in Genetic Risk of Schizophrenia

党兴伦 罗雄剑*
东南大学生命健康高等研究院

Objective Adult schizophrenia patients and healthy

controls and prenatal brain tissue

Methods We first performed transcriptomic analysis using RNA-seq data from adult brain tissues, and analyzed lncRNA by weighted correlation network analysis (WGCNA), looking for co-expressed gene modules and hub genes of the modules. Secondly, we carried out the expression quantitative trait locus (eQTL) analysis. The results of eQTL analysis from prenatal and adult brain tissue samples provide the largest genome-wide human lncRNA eQTL map, comprehensively describing eQTL regulatory regions at different developmental stages. Thirdly, using integrative analytic methods such as transcriptome-wide association analysis, colocalization analysis, and Mendelian randomization (MR), we combined the GWAS results and eQTL data of schizophrenia to identify lncRNAs whose genetically regulated expression change are associated with schizophrenia. Combining results from different analyses, we revealed lncRNAs that may play an important role in schizophrenia. Finally, we used the database (LncRNADisease V2.0) to identify the mRNA targets of risk lncRNAs.

Results Transcriptome analysis showed that many differentially expressed lncRNAs (such as LINC01224, RP11-168O16.1, RP11-57A19.2, etc.) were down-regulated in schizophrenia cases compared with controls, which is consistent with the results observed in mRNA studies. All lncRNAs expressed in adult human brain tissue can be clustered into 6 co-expressed gene modules, among which, the MEturquoise module is significantly associated with schizophrenia, suggesting that the hub gene MAP4K3.DT of this module may be involved in the occurrence of schizophrenia and has a key role. The results of eQTL analysis from prenatal and adult brain tissue samples provide the largest genome-wide human lncRNA eQTL map, comprehensively describing eQTL regulatory regions at different developmental stages. Finally, combining results from integrated analyses, we revealed lncRNAs that may play an important role in schizophrenia, including LINC01068*, LINC02050, LINC01038, LINC02571, LINC01224, LINC02249, etc.

Conclusion Our study identified potential causal lncRNAs associated with the genetic risk of schizophrenia and explored the possible pathogenic mechanisms of candidate lncRNAs in the development of schizophrenia. Provide new evidence for studying the genetic risk and pathogenesis of schizophrenia and nominate potential diagnostic molecular markers and possible therapeutic targets for the prevention and treatment of schizophrenia.

母体免疫激活致子代精神分裂症大鼠青春期海马体突触异常及其行为学异常的相关研究

唐小涵[1,2,3] 闫鹏月[1,2,3] 胡筠卿[1,2,3] 邵明龙[1,2,3] 杨勇锋[1,2,3] 吕路线[1,2,3] 李文强[1,2,3]

1.新乡医学院第二附属医院，河南省精神病医院

2.河南省生物精神病学重点实验室

3.河南省精神神经医学国际联合实验室

目的 妊娠期母体免疫活化会增加其成年子代罹患精神分裂症的风险。通过在孕早期给予孕鼠聚肌胞苷酸（Poly（I:C））, 致其免疫活化，建立母体免疫激活致子代精神分裂症大鼠模型，观察该模型在疾病发生发展中脑内突触相关蛋白表达水平、行为学、脑内星形胶质细胞和小胶质细胞数量和形态的变化，并分析其突触缺损情况及其行为学异常的关系。

方法 将成功受孕雌鼠随机分为 Poly (I:C)模型组和生理盐水对照组， 在其子代青春期进行 PPI、潜伏抑制、条件恐惧学习测试的行为学测定，并通过免疫印记技术检测海马区突触相关蛋白的表达水平，采用免疫组织化学技术检测海马 Iba1 和 GFAP 的表达，采用高尔基染色观察神经元的形态。最后使用 SPSS20.0 软件对各组实验结果统计学分析。

结果 与对照组相比，在母体免疫激活致子代精神分裂症模型组大鼠青春期海马体中，神经元树突棘密度显著下降； PPI、潜伏抑制、恐惧记忆行为出现缺陷；磷酸化 Cofilin 和磷酸化 LIMK1 的表达显著下调；神经元骨架蛋白 NFM、NFH 和 NFL 的 mRNA 和蛋白在海马区的表达显著上调；Iba1 阳性的小胶质细胞数量显著增加（P<0.01），但 GFAP 阳性星形胶质细胞的数量在两组之间不具有统计学差异（P>0.05）。

结论 母体免疫激活致子代精神分裂症模型大鼠在青春期出现类精神分裂症样行为变化，且其海马体中神经元树突棘密度显著下降。

关键字：精神分裂症；母体免疫激活；突触异常

Genome-Wide Association Study Implicates Lipid Pathway Dysfunction in Antipsychotic Induced Weight Gain: Multi-Ancestry Validation

廖云丹 岳伟华*

北京大学第六医院

Objective Antipsychotic-induced weight gain (AIWG) is a common side effect of antipsychotic medication and may contribute to diabetes and coronary heart disease. This study aims to identify genetic predictors of AIWG to enable safer use of antipsychotics.

Methods We conducted a two-stage genome-wide association study in Han Chinese patients with schizophrenia, including a discovery cohort of 1,936 patients, a validation cohort of 534 patients, and an additional 630 multi-ancestry patients from the CATIE study for external validation. Fine-mapping and functional annotation were applied to identify the potentially causal gene for AIWG, and drug repositioning was performed based on the identified genes. To develop a predicted model for AIWG, we first developed and validated polygenic risk scores (PRSs) for the acute phase of AIWG. Further, we applied Mendelian randomization (MR) analysis to investigate the relationship between AIWG and antipsychotic-induced lipid

changes. Subsequently, demographic information, antipsychotic type, and significant factors in the PRS and MR analysis were selected to construct a comprehensive prediction model.

Results Our results identified two novel genome-wide significant loci associated with AIWG: rs10422861 in PEPD (P=1.373×10-9) and rs3824417 in PTPRD (P=3.348×10-9) in Chinese Han samples. The association of rs10422861 was validated in European samples. Fine-mapping and functional annotation revealed that PEPD and PTPRD are potentially causal genes for AIWG, with their proteins being prospective therapeutic targets. Colocalization analysis suggested that AIWG and type 2 diabetes (T2D) share a causal variant in PEPD. PRSs for AIWG and type 2 diabetes (T2D) significantly predicted AIWG in multi-ancestry samples. Furthermore, MR revealed a risky causal effect of genetically predicted antipsychotic-induced changes in low-density lipoprotein cholesterol (P=7.58×10?4) and triglycerides (P=2.06×10?3) on AIWG, which had not been previously reported. Our model, incorporating antipsychotic-induced lipid changes, PRSs, demographic information, and antipsychotic type, significantly predicted weight gain after 3-month antipsychotic treatment (AUC=0.76, P=2.26×10?10).

Conclusion Our results highlight that the mechanism of AIWG involves lipid pathway dysfunction and may share a genetic basis with T2D through PEPD. This study provides new insights into the pathogenesis of AIWG and contributes to personalized treatment of schizophrenia.

Exploring The Antidepressant Mechanism of Paroxetine Based on Network Pharmacology and Molecular Docking：A New Perspective

王永杰 谯喜荣 霍小宁*
兰州市第三人民医院

Objective To explore the antidepressant mechanism of Paroxetine from a new perspective of network pharmacology and molecular docking.

Methods PubChem and Swiss Target Prediction databases were searched to identify the potential targets of paroxetine;The related targets of depression were searched in DisGeNET and GeneCards databases;The intersection targets of drugs and diseases were obtained by using the Bioinformation online platform;The STRING database and cytoscape3.9.1 software were used to construct the PPI network and screen the core targets;The DAVID database was used for GO functional enrichment analysis and KEGG pathway enrichment analysis, and the Bioinformation platform was used for visual analysis. Finally, AutoDock tools 1.5.6 was used for molecular docking and Pymol was used for visualization.

Results 102 potential targets of Paroxetine, 1777 depression related targets and 39 intersection targets were obtained through database retrieval. By screening, a total of 10 core targets were obtained, including DRD2, MTOR, EGFR, MAOB, SLC6A4, PIK3CA, HTR2A, DRD1, HTR1A, and GSK3b; GO functional enrichment analysis (P<0.05) yielded 165 entries for biological processes (BP), 41 entries for cell composition (CC), and 46 entries for molecular function (MF); The main BP includes protein phosphorylation, chemical synaptic transmission, peptide serine phosphorylation, and regulation of vesicular exocytosis; The main CC includes synapses, postsynaptic membranes, intact components of plasma membranes, plasma membranes, etc; The main MF includes protein serine/Threonine/Tyrosine kinase activity, ATP binding, Neurotransmitter receptor activity, g-protein coupled 5-HT receptor activity, etc; KEGG pathway enrichment analysis (P<0.05) screened 86 signaling pathways, including Calcium signaling pathway, Serotonin ergic synaptic signaling pathway, endothelial growth factor Receptor tyrosine kinase inhibitory resistance signaling pathway, ErbB signaling pathway, etc; Macromolecular docking results showed that Paroxetine had good binding ability with core targets such as DRD2 and MTOR.

Conclusion Paroxetine exerts antidepressant effect through multiple targets and pathways, providing a theoretical basis for further scientific research and clinical application.

精神分裂症患者外周血补体 C4 与记忆功能的相关性研究

梁秋婵 张瀚迪*
汕头大学精神卫生中心

目的 本研究主要探讨外周血补体 C4 水平与精神分裂症患者记忆功能的相关性。

方法 本研究招募了 55 名处于急性发作期的首发或复发未用药精神分裂症住院患者，病程小于 5 年。分别在患者入院时（基线）、入院抗精神病药物治疗 4 周以及治疗 8 周时（随访期），使用阳性和阴性症状量表（PANSS）评估精神症状严重程度，韦氏记忆量表（WMS-RC）评定患者记忆功能情况，抽取清晨空腹静脉血，采用酶联免疫吸附测定（ELISA）法测定外周血浆补体 C4。

结果 1. 记忆商、长时记忆、短时记忆经抗精神病治疗后显著改善（P＜0.001）；瞬时记忆在治疗前后评分差异不显著（P＞0.05）。 2.抗精神病治疗后外周血补体 C4 呈递减趋势（P＝0.041）。 3.基线期受教育时长与记忆商、短时记忆、瞬时记忆呈正相关（P＜0.05），基线期 PANSS 总分及各因子分与记忆商、短时记忆呈负相关（P＜0.05）；治疗 4 周后 PANSS 总分与记忆商、长时记忆、短时记忆呈负相关（P＜0.05）；治疗 8 周后

PANSS 总分与短时记忆呈负相关（P < 0.05）；年龄、BMI、病程、服药量及外周血补体 C4 水平均与记忆商及各子测试无相关性（P > 0.05）。 4.治疗 4 周后外周血补体 C4 下降水平与治疗 4 周后记忆功能不存在相关性（P > 0.05）；治疗 8 周后外周血补体 C4 下降水平与治疗 8 周后记忆商、短时记忆正相关（P < 0.05）。 5.治疗 8 周后记忆商、短时记忆与外周血补体下降水平和临床症状的多元逐步线性回归分析显示：治疗 8 周后记忆商水平与外周血补体 C4 下降水平呈正相关关系（B = 0.041，t = 2.170，P = 0.044），治疗 8 周后短时记忆水平与补体C4下降水平呈正相关关系（B = 0.024，t = 2.246，P = 0.038）。

结论 1、抗精神病治疗期间外周血补体 C4 水平的降低程度与治疗后记忆商、短时记忆水平存在正相关关系，提示补体 C4 可能影响精神分裂症患者的记忆功能； 2、精神分裂症精神病性症状影响患者的记忆功能，随着症状的缓解，记忆功能得到部分改善；言语工作记忆在全病程中无明显变化，可能是精神分裂症认知功能的稳定标志； 3、抗精神病药物剂量与外周血补体 C4 水平变化相关，提示补体 C4 可能是抗精神病药的作用靶点之一。

Advances in Blood Biomarkers of Bipolar Disorder and Major Depressive Disorder

杜寒梅 孙毅*
北京回龙观医院

Bipolar disorder (BD) and major depressive disorder (MDD) are two common mood disorders in China at present. BD often recurs in the form of alternating or irregular episodes of depression, mania or hypomania or their mixture. MDD is characterized by sustained low mood, decreased volitional activity and sometimes somatic symptoms. Mood disorders not only induce abnormal mood swing and decreased social function, but also are accompanied by high risk of suicide and self-injury. In recent years, studies have shown that blood biomarkers change abnormally in BD and MDD. By reading a large number of domestic and foreign literatures, the author concluded that three indicators, i.e., inflammatory markers, blood lipids and hormones, were abnormal during the onset of BD and MDD: in inflammatory markers, the cytokines in plasma changed, the lymphocytes were activated, the neutrophil count changed, the platelet count and proportion of inflammation cells also changed, and so on. In blood lipids, high density lipoprotein (HDL) fell, triacylglycerol increased and cholesterol decreased, etc. In hormones, hypothalamic-pituitary-thyroid axis, hypothalamic-pituitary-adrenal axis and sex hormones change abnormally. The changes in the level of the above blood biomarkers work on the brain and trigger mental disorders. They can act as the state indicators of BD and MDD, in the hope of providing a new idea and entry point for the research of the pathogenesis of BD and MDD.

精神分裂症患者记忆力水平与 NLR、MLR 和 PLR 的相关性分析

郭静宜 梁秋蝉 任文喆 苏镜丰 张瀚迪*
汕头大学精神卫生中心

目的 本实验旨在探讨研究精神分裂症患者经药物治疗后外周血中性粒细胞/淋巴细胞、单核细胞/淋巴细胞、血小板/淋巴细胞比值变化，以及以上炎症指标与精神分裂症患者记忆水平的相关性

方法 本研究于 2022.6.5-2023.6.1 在汕头大学精神卫生中心招募21名首发或复发处于精神分裂症急性发病期的住院患者，入院前至少 1 月未服用相关抗精神病药物，分别于入院第二天、入院治疗第八周，清晨采集空腹外周静脉血，进行血常规分析，并于相同时间点对患者进行阳性和阴性症状量表（PANSS）和韦氏记忆量表（WMS-RC）评定。

结果 患者经过 8 周治疗后，PANSS 总分，阳性，阴性，一般病理得分均较前明显改善（P<0.01）；记忆总分，记忆商、长时记忆，短时记忆，瞬时记忆与 NLR, MLR，PLR 不具有显著相关性。炎症标志物改变与 PANSS 得分改变具有相关性（P<0.05）。

结论 精神分裂症患者经药物治疗后精神病性症状改善明显，其中以阳性症状为甚，伴随着记忆力等认知功能改善。NLR PLR MLR 与患者记忆力改变无明显关系，与精神病性症状恢复存在相关关系，提示其可能成为预测精神疾病病情相关的炎症因子指标。

探究无创 40 Hz 蓝光改善重复睡眠剥夺伴短暂间歇休息诱导的大鼠疲劳样行为

温轩 梁玥汐 吴映如 刘雪晴 方泽漫 张瀚迪*
汕头大学精神卫生中心

目的 本研究利用重复睡眠剥夺伴短暂间歇休息诱导的疲劳动物模型，探索光疗抗疲劳作用及其机制。

方法 我们将24只雄性SD大鼠随机分为对照组、疲劳组和光疗组，在 7 天适应期内的第五天进行尾静脉采血作为基线数据。之后疲劳组和光疗组大鼠进行 14 天的重复睡眠剥夺伴短暂休息的造模，光疗组大鼠在造模期间每天给予 1 小时 40Hz 蓝光照射。造模期间每天记录动物体重、体温、睡眠时间的生理变化，模型结束后对所有大鼠进行行为学检测(负载结束当天进行高架十字迷宫和自发活动测试，负载结束第二天进行 Y 迷宫测试)，负载结束第二天再次进行尾静脉采血，

负载结束第三天取脑做后续指标检测。

结果 1）与正常对照组相比，反复睡眠剥夺伴间歇短暂休息 14 天造成疲劳组(p<0.001)与光疗组(p=0.001)大鼠体重显著降低；疲劳组与光疗组体重无统计学差异，但光疗组大鼠体重增速有高于疲劳组的趋势；2）疲劳组与光疗组大鼠在疲劳负载期间的总睡眠时间呈波动式，于第 8 天和第 12 天达到高峰；3）疲劳负载期间疲劳组大鼠白天平均体温显著低于对照组(p<0.001)和光疗组(p<0.001)；光疗组大鼠白天平均体温显著低于对照组(p<0.001)；在疲劳负载结束后第 1 天，疲劳组大鼠体温显著低于对照组(p<0.005)和光疗组(p<0.001)，光疗组与对照组大鼠无统计学差异；4）自发活动实验结果显示三组在总的移动距离与平均速度、中央区移动距离与平均速度、边缘区移动距离与平均速度上无统计学差异；5）Y 迷宫实验结果显示，三组动物总入臂次数、正确入臂次数与自发交替率无统计学差异；6）高架十字迷宫结果显示，三组动物在开臂时间与开臂次数方面无明显差异；疲劳组(p<0.005)闭臂次数显著高于对照组，光疗组(p<0.001)闭臂时间显著低于对照组。

结论 重复睡眠剥夺伴短暂休息会破坏大鼠的生理稳态，无创 40Hz 蓝光可以在一定程度上改善其影响。

Deregulatory MiRNA-BDNF Network Inferred From Dynamic Expression Changes in Schizophrenia

付晓倩[1] 柳艳松[1], Ancha Baranova[2] 张付全[3]
1.苏州市广济医院
2.George Mason University
3.南京医科大学附属脑科医院

Objective : Brain-derived neurotrophic factor (BDNF) is one of the promising risk genes for schizophrenia (SZ), a disease with prominent dysregulation of miRNA networks. Here, we present a study of miRNA-BDNF co-expression changes in peripheral blood of SZ patients.

Methods The expression levels of the BDNF mRNA and three validated binding miRNAs— miR-124-3p, miR-132-3p, and miR-206—were quantified in the blood of 48 healthy controls and 32 SZ patients before and after 12 weeks of treatment. The co-expression patterns were evaluated in the three groups.

Results The expression levels of BDNF were significantly downregulated in SZ patients compared to the controls. After the treatment, the expression levels of BDNF were upregulated, while the expression levels of the three miRNAs were downregulated. Co-expression analyses showed positive correlations of this network in the SZ patients, while weak negative correlations were observed in the healthy controls. After the 12-week treatment, the overall correlation between BDNF and the three miRNAs reached the levels comparable to the healthy controls.

Conclusion Our findings suggest the involvement of the miRNA-BDNF network in the onset and treatment of SZ.

DNA Methylation in Patients with Major Depressive Disorder: A Matching Case-control Study

廖丹丹 王诗镔*
广东省人民医院

Objective This study aimed to compare the patterns of DNA methylation between patients with major depressive disorder (MDD) and healthy individuals.

Methods Seventeen patients (18-65 years) fulfiling the ICD-10 diagnostic criteria for MDD and 17 healthy age- and gender-matched control participants were recruited. Participation was voluntary and signed informed consent was obtained. McNemar test and Wilcoxon symbol level were applied to test the difference of clinical parameters between two groups. Illumina Infinium Methylation EPIC 850K Bead Chip was used to detect the DNA Methylation of participants. The pooled t test was performed to screen the significant differently methylated sites between the case group and the control group. Gene-Ontology (GO) functional and Kyoto Encyclopedia of Genes and Genomes (KEGG) pathway enrichment analyses were applied to analyze the classifications and signaling pathways of differentially methylated genes.

Results A total of total of 317 differentially methylated sites were screened according to the screening criteria compared with health controls, including 181 significantly hypermethylated sites, such as cg00082729, cg00191853 and cg00325917; and 145 significantly hypomethylated sites, such as cg00307203, cg00366190 and cg00475988. GO and KEGG pathway enrichment analysis showed that differently methylated genes significantly enriched in mitochondrial dysfunction related classifications and signaling pathways.

Conclusion DNA methylation changes may be important for the pathogenesis and biomarker exploration of c major depressive disorder.

分心刺激条件下的眼动特征：重性抑郁障碍客观标志物的探索研究

冉娅 邓伟*
杭州市第七人民医院

目的 尽管已经有许多研究关注重性抑郁障碍（Major Depressive Disorder, MDD）的诊断和治疗，但

其客观评估仍然面临挑战。眼动追踪技术可以准确测量眼球运动和注意力分配，但其在 MDD 研究中的应用相对有限。分心刺激条件下的任务能够提供 MDD 患者的认知功能特点，但其能够提供的结果指标相对较少。因此，有必要进一步探索分心刺激条件下的眼动特征作为 MDD 的客观标志物的潜力。所以本研究的目（1）比较 MDD 与健康对照（Healthy Control, HC）在分心刺激条件下眼动特征指标的差异，探索眼动追踪作为 MDD 客观标志物的潜力；（2）通过研究眼动特征指标与 MDD 症状之间的关联，为 MDD 的早期检测提供更可靠和客观的依据；（3）通过建立预测模型，评价眼动特征在 MDD 诊断中的价值。

方法 本研究纳入 28 名 MDD 患者及 61 名 HC，采用分心刺激条件下的眼动追踪任务评估 MDD 患者及 HC 的眼动特征，采用汉密尔顿抑郁量表和汉密尔顿焦虑量表评估 MDD 患者临床症状，使用 R 语言（R4.1.3）对两组被试的眼动特征指标进行成组检验，对 MDD 组眼动特征指标和临床量表得分进行 Pearson 相关分析，使用逻辑回归模型和决策树模型绘制 ROC 曲线，计算曲线下面积。

结果 两组年龄、性别差异无统计学意义（P>0.05）。MDD 组的反应时(T=2.776, P=0.008)较 HC 组长，轨迹偏离角度(W=1221.000, P=0.001)和瞳孔直径(T=5.012, P<0.001)较 HC 组大，眼跳幅度(T=-3.002, P=0.004)较 HC 组小，差异有统计学意义；在眼跳峰值速度及眼跳潜伏期上，两组差异无统计学意义（P>0.05）。在 MDD 组，反应时(r=0.485, P=0.010)、眼跳潜伏期(r=0.400, P=0.039)与汉密尔顿抑郁量表总分有统计学相关，其他各项眼动特征指标与临床量表得分无统计学相关（P>0.05）。根据逻辑回归模型和决策树模型绘制的 ROC 曲线下面积分别为 0.81 和 0.91。

结论 MDD 组与 HC 组在分心刺激条件下的眼动特征具有显著差异，MDD 组的眼动特征与 MDD 核心症状之间存在明显关联，且眼动特征可以较准确的预测 MDD 诊断，有作为快速客观的 MDD 筛查工具的价值。本研究为 MDD 研究领域带来了新的视角和方法，为搭建 MDD 辅助诊断工具奠定了重要的理论基础。

黄芪多糖通过抑制皮质酮对 N2a 神经细胞诱导的凋亡促进突触分化

周珊瑶* 佘燕玲 陈睿
广东省第二人民医院

目的 越来越多证据表明，中枢神经的微环境变化及神经细胞凋亡参与了抑郁症的病理生理学调控。黄芪多糖（Astragalus polysaccharide，APS）为中药黄芪的多糖成分，具有抗炎、抑制细胞凋亡等作用。本研究通过高浓度皮质酮（Corticosterone，CORT）模拟抑郁样大脑的微环境，对 Na 神经细胞诱导凋亡，抑制突触分化；通过 APS 干预，进一步探讨 APS 对 N2a 神经细胞的保护作用，是否通过抑制细胞凋亡，促进突触分化。

方法 建立细胞模型：Control 组、CORT 组，APS 组，CORT+APS 组。采用免疫荧光分析观察四个处理组 N2a 细胞突触分化的状态；采用流式细胞系统 Annexin V-PI 检测及活性氧 ROS 检测分析各组细胞的凋亡情况；采用实时荧光定量 PCR (qRT-PCR)、western blot (WB)对神经突触分化标志性因子 Synapsin1、Synapsin2、PSD95 等及 JNK/c-Jun 凋亡相关通路进行检测，炎症 APS 在 N2a 细胞抑制凋亡，促进神经突触分化中的作用。

结果 免疫荧光可见，在高浓度 CORT 处理下，N2a 细胞突触分化状态显著受到抑制，细胞呈圆梭形，突触数量明显减少；加入 APS 干预后，可明显逆转 CORT 对 N2a 细胞的分化抑制，改善突触生长。流式细胞检测显示，CORT 对 N2a 细胞的早期凋亡及晚期凋亡都有显著的促进作用，且 ROS 水平也高于其他三组；CORT+APS 组早期及晚期凋亡均重新被下调，ROS 水平也显著回落。qRT-PCR 及 WB 实验结果同样显示了 CORT 对 Na 细胞促进凋亡，抑制分化的影响，APS 的干预可提升突触分化标志性因子 Synapsin1、Synapsin2、PSD95 等的表达水平，并抑制 JNK/c-Jun 通路，减少细胞凋亡。

结论 APS 可显著抑制高浓度 CORT 环境下的 N2a 神经细胞的凋亡水平，并改善神经突触的分化。其作用可能是通过抑制 JNK/c-Jun 通路，减少神经细胞对微环境的应激。

关键字：黄芪多糖、抑郁、凋亡、突触分化

RORα 通过诱导 DNA 损伤和凋亡参与酒依赖所致认知损害的机制研究

刘帅 张瑞岭*
河南省精神卫生中心

目的 阐明 RORα-DNA 损伤-凋亡轴在酒依赖所致认知损害中的作用，为发展 RORα 抑制剂等治疗酒依赖认知损害的新药提供理论基础和实验证据

方法 （1） 利用酒依赖小鼠模型和原代细胞，验证 RORα 对酒精的响应，并检测 DNA 损伤、海马神经元凋亡及认知损害情况。 选取 7~8 周龄 C57BL/6 小鼠 24 只，分为对照组和酒依赖组，每组 12 只。采用双瓶选择的方式造酒依赖小鼠模型，具体如下：1. 适应期：第 1 周为适应期，实验组用 3%酒精单瓶饮用 2 d，5%酒精单瓶饮用 2 d，之后采用 8%的酒精单瓶饮用 3 d。对照组自由饮水。2. 双瓶选择期：第 2 周到第 9 周，酒依赖组采用 8%的酒精和水双瓶自由选择，对照组采用两瓶水自由饮用。每隔 3 d 测试一次酒精和水的饮用量，此步骤共进行 8 周。3. 行为学测试期：在第 9 周时进行旷场、Y 迷宫、新物体识别、高架和水迷宫等行为学测试，检测小鼠的认知损害情况。 造模结束后取材，并通过 Real-time PCR、Western blot 和免疫荧光等技术检测小鼠海马中 RORα 的表达，及

DNA 损伤的标志物 γH2AX 和 PARP，凋亡的标志物 BCL2，BAX 及 cleaved-Caspase3 的表达。通过尼氏染色和 TUNEL 染色判断酒依赖小鼠的海马神经元的凋亡及损伤情况。 分离小鼠的原代海马神经元细胞，分别用 0mM 和 200mM 的酒精处理细胞 24 h，通过 Real-time PCR、Western blot 和免疫荧光等技术检测小鼠海马中 RORα 的表达，及 DNA 损伤的标志物 γH2AX 和 PARP，凋亡的标志物 BCL2，BAX 及 cleaved-Caspase3 的表达。通过尼氏染色和 TUNEL 判断海马神经元细胞的凋亡及损伤情况。

结果 DNA 损伤、海马神经元凋亡及认知损害

结论 酒精激活 RORα 表达，进而诱导 DNA 损伤和凋亡，并最终导致认知功能损害

关键字：酒依赖、认知、DNA 损伤

双相障碍研究协作组

认知功能矫正对稳定期 BD 患者血清 BDNF/TrKB 水平的影响

李茹 李嘉欣 张勇*
天津市安定医院

目的 BD 患者认知功能干预研究较少，本研究主要通过比较认知功能矫正（FR）与常规治疗(treatment as usual, TAU)对稳定期双相障碍患者血清 BDNF 和 TrKB 水平的影响，探讨 FR 对 BD 患者干预的生物机制

方法 采用随机对照研究方法，通过计算机随机分组，将稳定期 BD 患者以 1：1 的比例随机分配到 FR 组（n=39）和 TAU 组（n=42）进行为期 12 周的干预。所有研究对象在基线和 12 周均采用 HDRS-17 及 YMRS 问卷评估患。同时，在基线和 12 周分别采集稳定期 BD 患者的血样（10 毫升），以检测血清 BDNF 及 TrKB 水平及其变化。

结果 （1）两组之间基线人口学变量及情绪稳定剂和联合非典型抗精神病药物使用比例方面均未发现显著差异（均 p>0.05）。（2）在基线水平，FR 组与 TAU 组组内相关变量 HDRS-17（5.1±2.9 /5.4±3.5，t=0.01，p=0.99）、YMRS（2.3±1.9 /2.6±2.0，t=1.48，p=0.14）得分、BDNF（14.4±1.3 ng/ml /14.5±1.4 ng/ml，t=-0.60，p=0.55）和 TrKB（4.1±0.7 ng/ml /4.2±0.6 ng/ml，t=-0.84，p=0.41）血清水平之间均未发现显著差异。（3）经过 12 周的干预，两组组内相关变量 HDRS17（F=8.62，df=1，p=0.004）、YMRS（F=5.31，df=1，p=0.024）得分、BDNF（F=298.51，df=1，p<0.001）和 TrKB（F=306.92，df=1，p<0.001）血清水平改善均存在显著差异。（4）当分析两组相关变量与时间（从基线到第 12 周）的交互作用时，FR 组的血清 BDNF 和 TrKB 水平改善程度显著优于 TAU 组（F=5.88，df=1，p=0.018/F=6.47，df=1，p=0.013），并且在控制混杂变量（年龄和病程）后仍具有显著效应。而 HDRS-17 及 YMRS 未发现显著差异。（5）在第 12 周，两组组内上述相关变量均未发现显著差异（均 p>0.05）。

结论 FR 干预可以更有效地改善稳定期 BD 患者血清 BDNF 和 TrKB 水平，但对情绪症状的改善效果并不明显。FR 可能通过改善血清中 BDNF 和 TrKB 水平来提高稳定期 BD 患者的认知功能。

基于网络分析方法识别抑郁症的核心残留症状及其与预后的相关性分析:一项基于中国抑郁症队列的研究

周晶晶 周佳 冯子昭 冯媛 丰雷 肖乐 陈旭 杨健 王刚*

首都医科大学附属北京安定医院

目的 大多数抑郁症（MDD）患者在急性期治疗后会得到症状好转或痊愈，但仍有很大一部分患者存在残留症状，残留症状往往提示较差的预后。识别 MDD 的核心残留症状，有助于早期干预，改善预后。既往很多研究已经对残留抑郁症状进行了量化和研究，并探索了每种残留症状与长期预后的关系。然而，大多数研究只是将每个症状项目在测量量表中的得分相加，或是计算个体残留症状在各种治疗后出现的频率。这些研究很少探讨残留症状之间的相互作用，以确定与其他症状相关性最大的核心残留症状。本研究拟基于网络分析，识别 MDD 的核心残留症状并评估其与患者远期预后的关系。

方法 数据来自两个多中心抑郁症前瞻性队列，随访计划相同，基线随访至 6 个月末。两个队列的纳入和排除标准相同。研究对象年龄在 18 到 65 岁之间，经过 MINI5.0 诊断为首发或者复发的抑郁症患者，且汉密尔顿抑郁量表(HAMD-17)得分≥14 分。缓解的定义为 QIDS-SR16 总分不超过 5 分。队列随访过程中，所有患者在急性期（12 周内）均给予艾司西酞普兰或度洛西汀治疗，并在随访期间继续接受抗抑郁药治疗。本研究共纳入 1487 名抑郁症患者，在第 12 周和第 6 个月随访人数分别为 808(478 例)和 708(521 例)。用 QIDS-SR16 量表评估残留症状，使用席汉残疾量表（SDS）和生活质量满意度问卷(Q-LES-Q-SF)评估社会功能及生活满意度等。在基线、第 12 周和第 6 个月分别进行评估。

结果 共纳入 521 例患者，其中男性 170 例(32.63%)，女性 351 例(67.37%)，平均年龄 36.0 岁。由网络分析的中心性测量确定，注意力集中/决策困难是 MDD 的核心残余症状，与社会功能、家庭负担呈正相关(r=0.35, P<0.01)，与生活满意度呈负相关(r=-0.29, P<0.01)。家族史与核心残留症状相关(OR=2.610[1.242-5.485])。

结论 注意力集中/决策困难是 MDD 的核心残留症状，与预后不佳相关，建议临床医生关注上述症状，能够早期识别并给予相应的干预，以进一步提高预后。

抗抑郁药治疗单相和双相抑郁障碍患者的 12 个月自然观察研究：对纵向抑郁负担的影响

朱玥 李志营 高慧敏 马燕桃*
北京大学第六医院

目的 探讨使用抗抑郁药治疗单相和双相抑郁障碍对疾病纵向抑郁负担的影响。

方法 被试来源于一项全国多中心的自然观察项目：心境障碍转归的随访研究（CAFE-BD）。纳入 2012 年 1 月至 2013 年 12 月于国内六家精神专科医院和三家综合医院门诊及病房连续招募的单相抑郁组 164 例，其中抗抑郁药组（ADs 组）123 例、非抗抑郁药组（非 ADs 组）41 例；双相抑郁组 110 例，其中抗抑郁药组（ADs 组）74 例、非抗抑郁药组（非 ADs 组）36 例。经 MINI 中文版诊断，分别采用心境障碍评估表（ADE）进行基线筛查、临床监测表（CMF）进行随访监测和结局评估。所有被试每间隔 2 个月接受定期随访。比较 ADs 组和非 ADs 组在随访中期（6 个月）和终点（12 个月）的抑郁负担，以及纵向抑郁负担变化。

结果 1）双相患者的随访抗抑郁药使用率低于单相抑郁患者（67.27%比 75%）；自中期到随访结束，双相组和单相抑郁组单独使用抗抑郁药治疗的比率保持稳定。2）基线时，ADs 组的个体抑郁症状数量（NUM-D）显著低于非 ADs 组（6.36±2.51 vs 7.36±1.78，P<0.05），两组间个体抑郁总分（SUM-D）没有差异；在中期访视（6 个月）和终点（12 个月）时，两组间的 NUM-D 和 SUM-D 得分均无明显差异。3）从基线到随访中期或终点，抑郁症状有明显的下降趋势（所有 P<0.001）。ADs 组中，SUM-D 从基线的 8.89 下降到 6 个月时的 0.99，终点时为 1.99；而 NUM-D 从 6.36 下降到 0.54，最后为 1.16。非 ADs 组也表现出类似的抑郁负担下降趋势（均为 P<0.001），SUM-D 从基线的 9.62 下降到 6 个月时的 0.53，并以 1.19 结束；而 NUM-D 则为 7.36、0.19 和 0.53。此外，多元回归分析显示，基线变量与结果指标之间没有明显的关联，包括随访终点的 SUM-D 和 NUM-D。

结论 在为期 12 个月的真实世界研究中，无论是否使用抗抑郁药治疗，单相和双相抑郁障碍患者的抑郁负担均有类似的下降趋势。提示双相障碍患者联合抗抑郁剂未增加额外获益，在其长期维持治疗中应谨慎使用抗抑郁剂。

Omega-3 不饱和脂肪酸配方改善抑郁症患者认知损害的临床随机双盲对照试验

马荣[1] 吴诗韵[1] 宋采[2] 戴旭[1] 张永平[2] 黄贺斌[1] 卢玮聪[1] 王润华[1] 徐贵云[1] 林康广[1]
1.广东省广州市荔湾区明心路 36 号广州医科大学附属脑科医院情感障碍科
2.广东省湛江市麻章区湖光镇海大路 1 号广东海洋大学食品科技学院海洋药物研究所

目的 比较 Omega-3 不饱和脂肪酸中 20 碳五烯酸（Eicosapentaenoic Acid，EPA）和 22 碳六烯酸（docosahexaenoic acid，DHA）的不同配比对抑郁症及其认知损害的辅助治疗效果。

方法 纳入重度抑郁症患者 43 名（26.23±9.83 岁，61%女性，受教育年限 13.88±3.54 年），随机分配到三个治疗组：分别是改善认知组（DHA：EPA=2：1）、改善抑郁组（DHA：EPA=2：3）以及安慰剂组（大豆油），为期 12 周。在基线、第 6 和 12 周末通过汉密尔顿抑郁量表 24 项（Hamilton Depression Scale,HAMD-24）、贝克抑郁量表（Beck Depression Inventory，BDI）等评

估患者抑郁程度，通过标准化的精神分裂症认知功能成套测验——共识版（MATRICS Consensus Cognitive Battery，MCCB）、托尼非语文智力测验第三版（TONI-3）及伦敦塔测验（Tower of London, ToL）等评估患者6个维度的认知功能。

结果 经治疗后，HAMD 等量表在改善抑郁组（EPA:DHA =3:2）与安慰剂组的组间差异有统计学意义（p=0.016），认知功能评估中，连线测验在改善认知组(EPA:DHA=1:2)与安慰剂组的组间差异有统计学意义（p=0.013），对于情绪智商测验，改善认知组和改善抑郁组与安慰剂组的组间差异均有统计学意义（p=0.012 vs. p=0.029），对于社会认知维度，改善认知组和改善抑郁组与安慰剂的组间差异也均有统计学意义（p=0.01 vs. p=0.039），空间广度和范畴流畅性测试在时间和组间的交互效应有统计学差异（F=2.798，P＜0.032 andF=3.351，P＜0.014），其他认知测试和认知维度的时间、组间和交互效应均无明显统计学差异。

结论 EPA 为主的多不饱和脂肪酸主要改善抑郁症患者的抑郁症状，对认知功能也有一定改善作用，而以 DHA 为主的多不饱和脂肪酸则主要改善抑郁症患者的认知功能。

Efficacy of Lycium Barbarum Polysaccharide on Cytokine Response in Youths with Subthreshold Depression

李小岳 林康广*
广州医科大学附属脑科医院

Objective Our recent double-blinded Randomized Placebo-controlled Trial (RCT) discovered significant efficacy of a traditional Chinese medicine substance, namely the Lycium barbarum polysaccharide (LBP), on reducing depressive symptoms among adolescents with subthreshold depression. Here, we further investigated whether the antidepressant property of LBP was associated with its anti-inflammatory effect on adolescents with subthreshold depression.

Methods In this 6-week RCT, we measured common cytokine levels from participants' peripheral blood samples, both at baseline and at the end of the 6-week intervention with either LBP (intervention group, N=14) or placebo (control group, N=10). Comparative analysis was performed on the alteration of cytokine levels between different groups. Network-based analysis was applied to evaluate the systemic immune responses to the interventions.

Results The intervention and control groups were matched on demographic and clinical characteristics. As expected, the LBP group exhibited a greater reduction in IL-17A compared to the placebo group (t = -2.25, P = 0.04) after the 6-week interventions. Moreover, network-level analysis showed that LBP reduced the correlations and connectivity among cytokines (Z = 3.34, P < 0.01), which was in turn associated with improvement of depressive symptoms.

Conclusion Our findings demonstrated that 6-week repeated LBP administrations downregulated immune responses in adolescents with StD, which could be a key mechanistic pathway underpinning the antidepressant effect of LBP.

2.上海交通大学医学院附属精神卫生中心心境障碍科
3.中国科学院上海生命科学研究院 CAS 脑智卓越创新中心
4.上海交通大学附属瑞金医院精神医学科/情感障碍中心

目的 抑郁症是一种异质性疾病，患者间的症状模式、病程轨迹和治疗反应差异极大，DSM-5 描述的、"纯"亚型患者数最多的三种临床亚型包括忧郁型抑郁症、非典型抑郁症和焦虑型抑郁症。目前，能量代谢相关蛋白被公认可能与抑郁症临床异质性相关，不同亚型抑郁症之间能量相关蛋白是否差异表达，以及是否与中枢差异表达有关呢？

方法 纳入忧郁型抑郁症（n = 44）、非典型抑郁症（n＝37）、焦虑型抑郁症（n＝44）患者及健康对照（n = 33），采用定制蛋白芯片技术、酶联免疫吸附技术检测能量代谢关键蛋白包括瘦素（Leptin）、组织蛋白酶 B（Cathepsin B）、脑源性神经营养因子（BDNF）及鸢尾素（Irisin）的表达；并采用 6 周龄 C57BL/6 小鼠构建慢性不可预知温和应激（CUMS）抑郁小鼠模型，测定小鼠行为学并采用免疫印迹实验检测前额叶、海马、下丘脑、皮层及肝脏中抑郁及能量代谢相关蛋白包括糖原合成酶激酶-3（Gsk3β）、orthodenticle 同源框 2（Otx2）、PPAR-γ 共激活因子-1α（Pgc1α）、Bdnf、Leptin、Irisin 和 Cathepsin B 的表达水平。

结果 焦虑型抑郁症患者的基线 Leptin（adj.P.Val = 0.027）表达水平显著高于忧郁型；12 周未治愈的非典型抑郁症患者的基线 Cathepsin B（adj.P.Val = 0.032）、BDNF（adj.P.Val = 0.042）、Leptin（adj.P.Val = 0.042）表达水平显著高于忧郁型抑郁症患者；Irisin 与忧郁型抑郁症（P＜0.001）和焦虑型抑郁症（P＜0.001）的性别相关，也与健康对照的性别（P＜0.001）、BMI（P＜0.001）相关；而 Leptin 与焦虑型抑郁症患者的性别（8，P＜0.001）相关。抑郁模型小鼠海马的 Leptin（P＝0.044）、Irisin（P = 0.004）、皮层的 Leptin（P = 0.011）和肝脏的 Otx2（P = 0.021）表达水平显著升高。

结论 本研究发现不同亚型抑郁症患者基线能量代谢相关蛋白表达差异显著，可能与海马、皮层等脑区

的免疫、能量相关蛋白的差异表达有关,为不同亚型抑郁症之间的能量代谢异质性的中枢调控提供了新实验基础，并为抑郁症临床异质性的生物学提供新证据。

Objective Recent studies have suggested that oxidative stress (OxS) and dysregulated neuroinflammatory pathways are involved in the pathophysiology of major depressive disorder (MDD), and the diversity of OxS may contribute to the heterogeneity among MDD patients. Here, we aimed to assess the differences in OxS markers of MDD patients and healthy controls (HCs), study if inflammation engagement act as a moderator of the heterogeneity on the severity of depressive symptoms, and explore whether baseline OxS protein levels could prodict prognosis.

Methods The sample consisted of participants (aged 18-55 years) from a previously reported multicentre randomised controlled trial with a parallel-group design registered with ClinicalTrials.gov (NCT03219008), including melancholic (n=30), atypical (n=27) and anxious (n=32) depression patients and HCs (n?=?34). Subtypes of MDD were classified according to QIDS-16 SR and HAMD-17. Blood OxS marker levels of superoxide dismutase (SOD), catalase (CAT) and malondialdehyde (MDA) were assessed using enzyme linked immunosorbent assay, and hsCRP were assessed by antibody array analysis.

Results The levels of CAT (p?

改良电休克疗法治疗单相抑郁和双相抑郁的远期结局及其相关因素研究

吴婷婷[1] 李文飞[1,2,3]
1.安徽医科大学附属心理医院
2.安徽省精神卫生中心情感障碍科
3.合肥市第四人民医院

目的 探讨改良电休克疗法（MECT）治疗双相抑郁和单相抑郁的远期结局及其相关因素。

方法 采用回顾性研究的方法，收集安徽省精神卫生中心 2020 年 1 月 1 日至 2020 年 12 月 31 日接受无抽搐电休克治疗（MECT）的 66 例双相抑郁和 285 例单相抑郁住院患者的病历资料，收集患者的一般资料(包括年龄、性别)、出院诊断、发病年龄、病程持续时间、治疗前后的汉密尔顿抑郁量表评分、治疗次数、最疗效等数据，对其全部资料输入 SPSS.26 进行统计分析，检验统计差异有无显著性。

结果 ⑴66 位接受电休克治疗的双相抑郁患者中，有 64 位患者临床症状好转或临床症状部分好转，治疗有效率为 96.97%。285 位接受电休克治疗的单相抑郁患者中，有 276 位患者临床症状好转或部分好转，治疗有效率分别为 96.84%。单相抑郁与双相抑郁患者治疗有效率无明显差异（z=-0.053,p>0.05）。⑵351 位患者中共有 99 位患者出现包括近记忆下降、肌肉酸痛、发热、头部不适等症状的不良反应，发生率为 28.21%，其中最常出现的不良反应为近记忆下降，有 81 人，其次为头部不适 8 人，另有 3 人出现了发热。副反应的发生率与发病年龄、病程病程、治疗次数呈正性相关。⑶285 位单相抑郁患者中，初次发病患者 209 人，其他次发病（两次及以上）患者 76 人，初发患者与其他次发病患者电休克治疗效果（好转、部分好转、不显）无明显差异（z=-0.845,p>0.05）；66 位双相抑郁患者中，初次发病患者 32 人，其他次发病患者 34 人，初发患者与其他次发病患者电休克治疗效果（好转、部分好转、不显）无明显差异（z=-1.482,p>0.05）（4）对于治疗后未完全好转的的患者，其汉密尔顿抑郁量表在治疗前后的差异有统计学意义（Z=-2.207，p<0.05）。（5）对于临床治疗有效的患者，不同性别之间的治疗次数有差异，发作次数与治疗次数呈正相关。

结论 ⑴改良电休克疗法对治疗单双相抑郁有效。⑵近记忆下降是改良电休克疗法的主要不良反应，但其大多是可逆的，电休克治疗时还可能出现发热等多种不良反应，因此我们应该思考如何降低副反应发生率。⑶对于临床治疗有效的患者，不同性别之间的治疗次数有差异。（4）无抽搐电休克治疗可以缓解单双相抑郁症状。

改良电休克疗法治疗对双相情感障碍治疗的近期结局对照研究

潘小莉[1] 吴婷婷[1] 李文飞[1,2,3]
1.安徽医科大学附属心理医院
2.安徽省精神卫生中心
3.合肥市第四人民医院

目的 探讨改良电休克治疗对双相情感障碍治疗的近期结局及相关因素。

方法 整群抽取 2020.1.1-2020.12.31 在安徽省精神卫生中心接受改良电休克治疗的双相情感障碍患者 163 例患者作为研究组，抽取同期住院并行改良电休克治疗神分裂症患者 308 例对照组，收集患者的一般资料(包括年龄、性别)、出院诊断、发病年龄、病程持续时间、治疗前后的汉密尔顿焦虑量表、汉密尔顿抑郁量表和杨氏躁狂症状量表的评分、治疗次数、最终疗效，精神分裂症患者治疗前后查阴性症状及阳性症状评估量表等数据，对其全部资料输入 SPSS.22 进行统计分析，检验统计差异有无显著性。

结果 ⑴163 位双相情感障碍接受电休克治疗的患者中，其中 157 位患者临床症状好转或临床症状部分好转，总治疗有效率为 96.32%，双相抑郁与双相躁狂患者治疗有效率无明显差异（x?=0.131,p>0.05）；接受改良电休克治疗的 308 位精神分裂症患者中有 292 位好转，总治疗有效率为 94.81%；精神分裂症与双相情感障碍的有效率有差异（Z=-1.959，p=0.05），双相情感障碍患者治疗效果更好。⑵共有 23 位患者出现包括近记忆下降、肌肉酸痛、发热、头部不适等症状的不良反应，发生率为 14.11%，其中最常出现的不良反应为近记忆下降，有 20 人，其次为肌肉酸痛和发热。⑶65 位双相抑郁患者中，初次发病患者 31 人，其他次发病（两次及以上）患者 34 人，初发患者与其他次发病患者电休克治疗效果（好转、部分好转、不显）无明显差异（Z=-1.845，p>0.05）。⑷92 位双相躁狂患者中，初次发病患者 32 人，其他次发病患者 60 人，初发患者与其他次发病患者电休克治疗效果（好转、部分好转、不显）无明显差异（Z=-0.402，p>0.05））。⑸对于治疗后未完全好转的的患者，其焦虑及躁狂在治疗前后的差异有统计学意义（Z1=-2.197，p<0.05，Z2=-2.521，p<0.05），其抑郁症状在治疗前后的差异无统计学意义（Z=-1.892，p>0.05）。（5）对于治疗有效的患者，不同性别之间的疗效无差异，发病越早，病程越长，症状好转所需要的治疗次数越多。

结论 ⑴改良电休克疗法治疗双相情感障碍的疗效确切。⑵近记忆下降及肌肉酸痛是改良电休克疗法的主要不良反应为，如何改善患者的不良反应显得十分重要。⑶改良电休克治疗可以改善双相情感障碍患者的临床症状，

4.南昌大学第一附属医院
5.安徽省精神卫生中心

Objective To evaluate the reliability and validity of the Chinese version of the Biological Rhythms Interview of Assessment in Neuropsychiatry (BRIAN-C) in patients with bipolar disorder.

Methods A total of 232 participants, including 110 bipolar disorders and 122 controls, were recruited. The Cronbach′s alpha, Spearman correlation analysis and intra-class correlation coefficient (ICC) were used to evaluate the reliability, the confirmatory factor analysis to analyze the construct validity, and the predictive validity of BRIAN-C was analyzed based on the receiver operation characteristic (ROC) curve of subjects with clinical diagnosis.

Results The Cronbach′s α of BRIAN-C was 0.929. The Cronbach's alpha of the subscales of sleep, activity, social rhythms, eating pattern were 0.826, 0.862, 0.785 and 0.845 respectively. The test?retest reliability over two weeks interval was 0.720 (P?0.001), and the ICC was 0.768 (95%CI: 0.591－0.875). The confirmatory factor analysis showed that the model fitting of BRIAN-C was $\chi 2$ =215.339 (P?0.001). The score of BRIAN-C was significantly correlated with the score of QIDS-SR16, GAD-7 and SF-6 (P?0.001). The area under ROC curve was 0.954 (95% CI: 0.930 to 0.977, ?0.001) for BRIAN-C identifying bipolar disorder, with a cut-off value of 28, sensitivity of 0.864 and specificity of 0.91.

Conclusion The result show that the BRIAN-C has good construct validity and internal consistency. This suggests that the BRIAN-C can be used to assess biological rhythms in the China population, especially for patients with mood disorder.

关键字：bipolar disorder; biological rhythm; BRIAN-C; reliability and validity; cut-off

双相抑郁发作的昼夜节律与临床特征的相关性研究

刘祎 陈梦菲 李娜*
昆明医科大学第一附属医院

目的 动态监测双相抑郁发作患者的血浆褪黑素、皮质醇水平，完善多导睡眠监测图，分析双相抑郁发作患者的昼夜节律特征，研究双相抑郁发作的临床特征包括时型、自杀意念和自杀倾向、认知功能和睡眠特点，探讨昼夜节律障碍和临床特征对诊断双相抑郁发作的价值。

方法 纳入符合入组标准的双相抑郁发作组 16 例、单相抑郁障碍组 12 例、双相抑郁缓解组 11 例和健康对照组 15 例，共计 54 例。采用清晨型和夜晚型量表（Morningness/Eveningness Questionnaire, MEQ）评估患者时型特征。使用贝克自杀意念量表评估患者自杀意念和自杀倾向,匹兹堡睡眠质量指数量表评估患者主

观睡眠情况，采用高效液相色谱-串联质谱法检测四组研究对象 8 时、12 时、16 时和 20 时的血浆褪黑素、皮质醇水平，并测定多导睡眠监测图。使用 SPSS 26.0 统计软件进行数据分析。

结果 相较于单相抑郁障碍组、双相缓解组和健康对照组，双相抑郁发作组的 MEQ 评分更低、更倾向于夜晚型、自杀意念和自杀倾向更高、认知功能测评中的即刻记忆评分更低、使用更多的睡眠药物。双相抑郁发作组血浆褪黑素水平 8 时低于单相抑郁障碍组，20 时高于单相抑郁障碍组。双相抑郁发作组 8 时、12 时和 20 时的血浆皮质醇水平高于单相抑郁障碍组。夜晚型与更严重的焦虑和抑郁症状评分、更高的自杀意念和自杀倾向评分、使用更多药物、12 时和 20 时更高的血浆皮质醇水平相关，夜晚型是双相抑郁的危险因素。

结论 双相抑郁发作患者存在血浆褪黑素和皮质醇失调，双相抑郁发作患者较单相抑郁患者的时型更倾向于夜晚型，夜晚型与更严重的焦虑抑郁症状、更高的自杀意念和自杀风险、使用更多的睡眠药物、夜间皮质醇水平升高及认知功能受损有关，双相抑郁发作患者存在昼夜节律紊乱，昼夜节律紊乱可能有助于双相抑郁发作的诊断。

关键字：双相抑郁, 昼夜节律, 褪黑素, 皮质醇, 时型, 认知功能

2 型糖尿病共病抑郁障碍及其认知功能损害与血管生长因子的相关研究

杨梅 李娜*
昆明医科大学第一附属医院

目的 研究 2 型糖尿病患者共病抑郁障碍及其认知功能损害与血清生长因子 VEGF、bFGF、ANG1、ANG2 的相关关系，进一步探究血管生长因子在 2 型糖尿病患者共病抑郁障碍患者认知功能损害中的作用。

方法 纳入符合入组标准的健康对照（HC）组 32 例，抑郁障碍（MDD）组 46 例，2 型糖尿病（T2DM）组 49 例，2 型糖尿病共病抑郁障碍组（共病组）42 例，共计 169 例。采用采用重复性成套神经心理状态测验（RBANS）评估认知功能；采用汉密尔顿抑郁量表-17（HAMD-17）和汉密尔顿焦虑量表 （HAMA）分别评估上述四组的抑郁和焦虑水平；采用酶联免疫吸附测定（ELISA）法测定血清血管生长因子包括血管内皮细胞生长因子（VEGF）、碱性成纤维细胞生长因子(bFGF)、血管生成素 1（ANG1）、血管生成素 2（ANG2）水平。并将血清 VEGF、bFGF、ANG1、ANG2 水平与 RBANS 评分进行进一步比较。

结果 与 HC 组和 T2DM 组相比，共病组 RBANS 总分、即刻记忆、延迟记忆、注意力、语言及视觉空间评分均降低（p 均＜0.05）；与 MDD 组相比，共病组视觉空间评分降低（p＜0.05）。共病组血清 VEGF 水平显著高于 HC 组；血清 bFGF 水平高于 HC 组和 MDD 组（p＜0.05）。ROC 曲线分析：与 HC 组相比，血清 VEGF、bFGF、ANG1、ANG2 对诊断 T2DM 共病 MDD 有统计学意义（p＜0.05）。血清 VEGF 水平与 RBANS 总分、延迟记忆及语言评分之间呈负相关，与即刻记忆之间可能存在负相关趋势。与 HC 组相比，血清 VEGF、bFGF、ANG1、ANG2 水平升高是共病发生的危险因素。

结论 血管生长因子 VEGF、bFGF、ANG1、ANG2 可能参与了 2 型糖尿病共病抑郁障碍疾病及其认知障碍的发病机制。并有望成为未来 2 型糖尿病共病抑郁障碍疾病诊断及其认知障碍评估的有效指标。

Identification and Validation of The Prognostic Biomarkers Associated with Immune Microenvironment between Hepatocellular Carcinoma and Major Depression Episode

吴莎莎[1] 李伊琳[2] 任燕[1]
1.山西白求恩医院第三临床医学院
2.山西医科大学

Objective Hepatocellular carcinoma (HCC) is highly aggressive and metastatic. Major Depression episode (MDE) is one of the most prevalent mental disorders wordwide. This article aimed to explore the shared genetic features and potential molecular mechanisms.

Methods Gene microarray expression data for MDE were downloaded from the Gene Expression Omnibus (GEO) databases. Targerts genes for MDE were screened based on differential expression analysis and weighted gene co-expression network analysis (WGCNA), followed by Gene Ontology (GO) and Kyoto Encyclopedia of Genes and Genomes (KEGG) analysis. The mRNA expression profiles and clinicopathological data were obtained in The Cancer Genome Atlas Liver Hepatocellular Carcinoma (TCGA-LIHC). Gene Set Enrichment Analyses (GSEA) was performed to further understand the molecular mechanism of HCC. Then, we combined HCC patients with Kaplan-Meier (KM) curves for survival analysis based on clinical information including age, gender and clinical stage. Meanwhile, univariate Cox and least absolute shrinkage and selection operator (LASSO) analysis were further performed in the TCGA-LIHC training cohort. The assessment of model was performed by survival analysis and receiver operating characteristic curve (ROC). In addition, the abundance was assessed by immune correlation analysis to evaluate the abundance of immune infiltrating cells. Finally, the expression levels of the hub genes-related to immune were assessed by RT-qPCR.

Results A total of 34 up-regulated genes and 44 down-regulated genes were selected for subsequent analyses by differential analysis. Four hub module (greenyellow, pink, black and tan) had a high correlation with MDE. After taking the intersection, a total of 19 targets genes as potential biomarkers for MDE. The 10 genes associated with HCC prognosis were obtained by lasso-cox analysis. Then the KM curves of the genes were demonstrated a

prime diagnostic value in different clinical subgroup conditions. A good prognostic value for models by using ROC curve. The 9 MDE-related genes between HCC and control were obtained. The present transcriptomic data analysis revealed a principal role for amino acid metabolism in both MDE and HCC. The RT-qPCR results showed that these three hub genes GPSM2, ALDH3A1 and NIN were highly associated with the immune environment.

Conclusion Our study revealed the hub genes associated with the immune microenvironment that are most closely related to the pathological progression of HCC and MDE, which may help in clinical decision making for individul treatment.

Search for Serum Biomarkers in Patients with Bipolar Disorder and Major Depressive Disorder Using Metabolome Analysis

孙晓丽 马丽娜 熊燕兵 贾娇 任燕*
山西白求恩医院第三临床医学院

Objective Bipolar disorder (BD) and major depressive disorder (MDD) are two common psychiatric disorders. Due to the overlapping clinical symptoms and the lack of objective diagnostic biomarkers, bipolar disorder (BD) is easily misdiagnosed as major depressive disorder (MDD), which in turn affects treatment decisions and prognosis. In this study, an NMR metabolomics approach was applied to analyze serum metabolic phenotypes in BD, MDD, and healthy controls to initially explore biomarkers that may help differentiate BD and MDD and to further understand the pathophysiology of both diseases.

Methods Nuclear magnetic resonance spectroscopy was performed to assess serum metabolic profiles in depressed patients with BD (n=59), patients with MDD (n=14), and healthy controls (n=10). Data were analyzed using partial least squares discriminant analysis, orthogonal partial least squares discriminant analysis, and t-tests. Different metabolites (VIP>1 and $p<0.05$) were identified and further analyzed using Metabo Analyst 5.0 to identify relevant metabolic pathways.

Results The metabolic phenotypes of the BD and MDD groups were significantly different from those of the healthy controls. Then we analyzed and compared the BD group and the MDD group with the HC group respectively to further identify the metabolites changes and analyze their changing trends.With the HC group as reference and VIP >1 and $p<0.05$, nine metabolites differentially expressed in the BD group were identified. The metabolic pathways involved mainly include: glycolysis/gluconeogenesis, glycerolipid metabolism, synthesis and degradation of ketone bodies, butanoate metabolism, pantothenate and COA, pyruvate metabolism, and galactose metabolism.With the HC group as a reference and VIP >1 and $p<0.05$, eight metabolites differentially expressed in the MDD group were identified. The metabolic pathways involved mainly include: pyruvate metabolism, glycolysis/gluconeogenesis, glyoxylate and dicarboxylate metabolism, glycine, serine and threonine metabolism, synthesis and degradation of ketone bodies, glycerolipid metabolism, butanoate metabolism, citrate cycle,and glycerophospholipid metabolism.

Conclusion In summary, this study used an NMR metabolomics platform to explore the metabolic phenotypic differences between BD and MDD, and found that the metabolic phenotypes of BD and MDD were significantly different from those of healthy controls, that glycerolipid metabolism was significantly involved in BD and MDD, that pyruvate metabolism was significantly involved in MDD, that pyruvate, choline, and acetate may be potential biomarkers for MDD to distinguish from BD, pantothenic acid may be a potential biomarker for BD to distinguish from MDD.

Identification of Hub Genes Related To Oxidative Stress in Peripheral Blood Mononuclear Cells for The Diagnosis of Bipolar Disorder

吴莎莎[1] 李伊琳[2] 任燕[1]
1.山西白求恩医院第三临床医学院
2.山西医科大学

Objective The aim of this study is to investigate the association between bipolar disorder(BD) and oxidative stress, screening the hub genes involved in the oxidative stress pathway.

Methods Gene microarray data GSE5392 were downloaded from the Gene Expression Omnibus (GEO). Hub genes for BD were mined based on differential expression analysis, weighted gene co-expression network analysis (WGCNA) and Protein-Protein Interaction (PPI) Network, followed by Gene Ontology (GO), Kyoto Encyclopedia of Genes and Genomes (KEGG) and Gene Set Enrichment Analysis (GSEA) of the hub genes related to oxidative stress. The receiver operating characteristic curve (ROC) were performed both on GSE5388 and GSE5389 datasets to evaluate the accuracy of the hub genes in diagnosing BD. In addition, we identificated these hub genes through the peripheral blood mononuclear cell (PBMC) between BD patients and healthy controls (HCs)

Results A total of 69 up-regulated genes and 411 down-regulated genes were selected for subsequent analyses. Twenty two co-expression modules were obatained via WGCNA; of which, one hub module (sienna3) had the highest correlation with BD. A total of 44 intersecting genes were acquired by differential analysis and oxidative stress-related genes. Three hub genes were subsequently confirmed by PPI Network and WGCNA analysis as potential biomarkers for BD. Functional enrichment pathway analysis revealed that these three hub genes were involved in neuronal signal transduction, oxidative phosphorylation and metabolism obstacle pathway. The ClueGo assay, a Cytoscape plugin, revealed that most targets were related

to regulation of neuronal synaptic plasticity. By using ROC curve analysis demonstrated a prime diagnostic value of the three hub genes. The RT-qPCR results showed that these three hub genes were significantly different in BD patients' PBMCs compared with HCs.

Conclusion These three hub genes we identified are directly or indirectly related to oxidative stress in BD. Based on limited preliminary data and our findings revealed the important role of oxidative stress in BD. However, the molecular mechanism of these three hub genes associated with oxidative stress are involved in the progression of BD pathogenesis is still poorly understood, it is still need to further study.

双相障碍患者的认知功能损伤与脑电微状态的关联

范玉[1] 田晴[1] 张晓斌[1] 贾秋放[1] 王传跃[2]
1.苏州市广济医院
2.首都医科大学附属北京安定医院

目的 脑电（EEG）微状态是对脑电地形图拓扑结构的分析，而双相障碍的认知功能损伤与微状态异常之间的关系知之甚少。本研究旨在探究双相障碍患者的脑电微状态异常，及其与认知功能损伤的关联。

方法 在本研究中，共纳入29名双相障碍患者（患者组）和 32 名健康人群（对照组）。通过可重复的成套神经心理状态测量（RBANS）采集神经认知数据。脑电微状态分为4个标准类型：A、B、C、D。组间比较采用协方差分析（控制变量为年龄、性别、受教育程度）。组内相关采用 Pearson 相关置换检验。

结果 1、人口学资料、临床特征、认知功能结果：患者组与对照组年龄、性别匹配无显著差异，受教育程度差异具有统计学意义。神经认知显示患者组在即刻记忆、语言、延迟记忆和 RBANS 总分呈现显著下降（P<0.05）。 2、在微状态持续时间上，患者组微状态A、B、C、D 显著升高（BPD vs CON：115.6 ± 12.1 vs 73.2 ± 7.4；119.7 ± 17.8 vs 69.3 ± 6.4；107.8 ± 18.8 vs 72.8 ± 10.2；114.2 ± 19.6 vs 85.5 ± 10.2；All P<0.001）；在微状态出现频率上，患者组微状态 A、B、C、D 都显著降低（BPD vs CON：2.3 ± 0.4 vs 3.5 ± 0.4；2.4 ± 0.3 vs 3.2 ± 0.3；2.1 ± 0.4 vs 3.4 ± 0.4；2.2 ± 0.3 vs 3.5 ± 0.4；All P<0.001）；在微状态覆盖范围上，患者组微状态 B 显著升高（P<0.001），微状态 D 显著降低（P=0.017）；在微状态转换概率上，患者组微状态 A to B 升高、A to D 降低（P=0.003；P=0.027），微状态 B to A、B to D 升高（P=0.038；P=0.027），微状态 C to D 降低（P<0.001），微状态 D to A、D to C 降低（P=0.005；P<0.001）。以上 P 值经过 FDR 校正。 3、Pearson 相关分析置换检验显示，微状态 B 覆盖范围、转换概率 C to D 与 RBANS 语言得分相关（r=-0.44，P=0.019；r=0.421，P=0.023）。

结论 相较于健康人群，患者微状态指标在持续时间延长、出现频率降低，提示患者可能需要更长时间完成认知过程。

单双相抑郁症患者情绪处理早期阶段皮层下通路信息加工异常模式

刘海燕[1] 史家波[1] 卢青[2] 姚志剑[1]
1.南京脑科医院
2.东南大学

目的 既往研究发现抑郁症和双相情感障碍在抑郁状态时存在负性情绪偏向，而在情绪处理无意识阶段情绪处理机制仍待进一步探究，这有助于进一步了解单双相情感障碍患者的发病机制。

方法 本实验共入组 40 例健康对照者（Healthy Control, HC），抑郁症（Major Depressive Disorder）患者 38 例，Bipolar Disorder 患者 36 例。所有入组受试者均通过脑磁图技术记录在情绪面孔任务中的脑活动。脑磁图数据基于 fieldtrip 平台进行处理，进行滤波、去除伪迹、溯源等处理，选取在识别负性情绪面孔时，右侧丘脑、初级视觉皮层、枕下回、梭状回、眶额回、杏仁核为感兴趣脑区。选取滑动感兴趣时间窗 0-80ms，0-130ms，0-180ms，0-230ms，通过动态因果模型方法计算感兴趣脑区之间的效能连接，并运用 Parametric Empirical Bayes（PEB）对效能连接进行贝叶斯统计。

结果 本研究结果发现负性情绪识别早期 0-230ms，三组在右侧枕中回到右侧丘脑、枕下回到梭状回的效能连接存在差异，而在随后的两组比较中发现抑郁症患者在情绪处理早期与正常人无明显差异，而双相情感障碍患者在情绪处理早期表现为右侧枕中回到丘脑的效能连接增强，枕下回到梭状回的效能连接减弱。与抑郁症患者相比，双相情感障碍患者表现为右侧梭状回到杏仁核的功能连接增强。

结论 本研究未发现抑郁症患者在负性情绪处理早期期间皮层下信息交互存在明显异常。双相情感障碍患者在处理负性情绪面孔时，早期视觉皮层到丘脑的感觉通路信息加工增强，而与面孔加工密切相关的梭状回到杏仁核的效能连接较抑郁症患者增强提示双相情感障碍患者对负性信息加工从情绪早期阶段便可能与抑郁症患者存在异常。

Variations in Olfactory Function Among Bipolar Disorder Patients with Different Episodes and Subtypes

李春阳[1] 洪柳[2] 陈超[1]
1.佛山市顺德区伍仲珮纪念医院
2.上海市虹口区精神卫生中心

Objective Most studies on olfactory function in individuals with bipolar disorder (BD) have not distinguished between the different subtypes or between the acute phase (mania or depression) and euthymic state. In this study, we compared olfactory function among BD patients with different subtypes and episodes to explore the potential use of olfactory function as a biomarker for the early identification of BD.

Methods The study sample consisted of 117 BD patients who were hospitalized between April 2019 and June 2019, and 47 healthy volunteers as controls. The BD patients were divided into a bipolar I disorder (BD I) (n = 86) and bipolar II disorder (BD II) group (n = 31) according to the different subtypes, and divided into depressive BD (n = 36), manic BD (n = 44), or euthymic BD (n = 37) groups according to the types of episodes they experienced. We assessed olfactory sensitivity (OS) and olfactory identification (OI) via the Sniffin' Sticks test and used the Hamilton Depression Rating Scale (HAMD) and Young Manic Rating Scale (YMRS) to evaluate BD characteristics among all subjects.

Results Compared with controls, the participants with BD showed decreased OS and OI. We found statistically significant differences in OS and OI between the BD I group and controls, as well as differences in OS between the BD I and BD II group. Least-significant difference multiple comparisons revealed statistically significant differences in OS between the depressive BD group, manic BD group and controls and also between the manic BD and euthymic BD group. OI was positively correlated with the YMRS score in the BD I group and OS was negatively correlated with the HAMD score in the BD II group.

Conclusion This may be the first study to compare olfactory function in patients with BD I versus BD II via pairwise comparisons. Our findings suggest that OS may have potential as a biomarker for distinguishing the different subtypes of BD and as a state-related biomarker for differentiating the acute phase from the euthymic state of BD. However, further prospective research is warranted.

Comparison of Olfactory Function in Patients with Unipolar and Bipolar Depression and Its Correlation with Mood Symptoms and Brain-derived Neurotrophic Factors

李春阳[1] 王琛[2] 陈超[1]
1.佛山市顺德区伍仲珮纪念医院
2.广东医科大学顺德妇女儿童医院

Objective The primary aim of the present investigation was to explore olfactory performance between patients with bipolar depression and unipolar depression. Previous studies have not tracked and compared olfactory function between the patients with bipolar depression in depressive and remission stage. The correlation between serum Brain-derived neurotrophic factor (BDNF) levels and olfactory function has not been previously reported in patients with bipolar depression. In this study, we aim to advance a new indicator for efficacy evaluation of patients with bipolar depression.

Methods A total of 35 bipolar depression patients and 31 unipolar depression patients who were hospitalized or out-patient treated in the psychiatric hospital were enrolled in this study. We also collected 41 healthy volunteers as controls. The olfactory sensitivity (OS) and olfactory identification (OI) of each study group were detected by Sniffin' Sticks test. At the same time, our study investigated serum BDNF levels in all subjects. In addition, we also followed up the bipolar depression patients to remission, and compared their olfactory function and serum BDNF levels between the depressive and remission stage. The emotional state was assessed by Hamilton Rating Scale for Depression (HAMD),Young Mania Rating Scale (YMRS),Hamilton Anxiety Scale (HAMA) and the social function was assessed by Global Assessment Function (GAF). The olfactory function between the depressive and remission stage was compared, and the correlation between olfactory dysfunction and serum BDNF in patients with bipolar depression was analyzed.

Results 1. The OS was significantly lower in the bipolar depression group than in the controls, while there was no statistically significant difference in OS between the bipolar depression group and the unipolar depression group. 2. There was no statistically significant difference in OI among the three groups. 3. There was a positive correlation between OI and HAMA and a negative correlation between OS and HAMD desperation factor in bipolar depression group. 4. There was no significant difference in serum BDNF among the three groups 5. In the bipolar depression group and the unipolar group, there was no correlation between OS or OI and serum BDNF levels. 6. In the bipolar depression group, the OS in remission stage was significantly higher than that in depressive episode.

Conclusion Olfactory sensitivity was decreased in patients with bipolar depression compared with controls, but there was no significant difference in olfactory function between bipolar depression and unipolar depression. In patients with bipolar depression, olfactory function was associated with some specific mood symptoms.Given the olfactory sensitivity of patients in depressive episode was significantly increased after remission, the olfactory sensitivity was expected to be a new indicator for efficacy evaluation of patients with bipolar depression.

Comparison of Olfactory Function, Cognitive Function and Serum Tumor Necrosis Factor-α between Bipolar and Schizophrenic Patients in The Remission Stage

李春阳* 苏朗钧
佛山市顺德区伍仲珮纪念医院

Objective Olfactory function, serum tumor necrosis factor-α (TNF-α) and cognitive function were compared between bipolar disorder (BD) and schizophrenia (SP) patients in the remission stage combined with correlation analysis, with the aim of identifying new indicators for the auxiliary diagnosis of these psychiatric illnesses.

Methods A total of 46 euthymic BD patients, 42 clinically stable SP patients and 42 healthy controls (HC) were included in this study. Olfactory sensitivity (OS) and olfactory identification (OI) were assessed using Sniffin' Sticks test, and serum TNF-α levels were measured by ELISA. Clinical symptoms were evaluated with the Hamilton Rating Scale for Depression, Young Mania Rating Scale, Hamilton anxiety scale, and the Positive and Negative Syndrome Scale (PANSS). Social function was evaluated with the Global Assessment Function (GAF) scale. Cognitive function was evaluated using the Trail Making Test-A (TMT-A) and Digit Cancellation Test (DCT).

Results OI and cognitive function scores and serum TNF-α levels were significantly lower in the BD and SP patients compared with the HC subjects. There was no significant difference between the BD and SP groups, and there were no significant differences in OS among the three groups. OI score was positively correlated with years of education in both the BD and SP groups. OI score in the SP group was negatively correlated with age and PANSS score, and positively correlated with GAF score. In the BD group, OS was positively correlated with DCT II and DCT III. In the SP group, OS and OI scores were positively correlated with DCT III, and negatively correlated with TMT-A time. Furthermore, there was a positive correlation between TNF-α and DCT II in the BD group. There was no significant linear correlation between olfactory function and TNF-α in the BD or SP group.

Conclusion OI may be a trait marker for BD and SP. Some cognitive functions may be correlated not only with TNF-α in BD patients in remission, but also with olfactory function in BD and SP patients in remission.

Significant Improvements in The Olfactory Sensitivity of Bipolar I Disorder Patients During Euthymia Versus Manic Episodes: A Longitudinal Study

李春阳* 刘显林
佛山市顺德区伍仲珮纪念医院

Objective Olfactory function and serum tumor necrosis factor-α (TNF-α) were compared between healthy control group and manic or euthymic patients of bipolar I disorder (BD I). The correlation between olfactory function and symptom rating scale score or serum TNF-α level in those patients with bipolar disorder was analyzed.

Methods 44 patients with manic BD Iand 32 healthy controls were collected, and 25 of the patients were successfully followed up to the remission period. Symptoms were assessed with Young Manic Rating Scale (YMRS), social function was evaluated with Global Assessment Function (GAF), olfactory sensitivity (OS) and olfactory identification (OI) were measured with Sniffin' Sticks test, and serum TNF-α was measured during manic episode and remission periods. The olfactory function and TNF-α levels were compared between manic episode or remission period and healthy controls, and those were compared between manic and remission period longitudinally. The correlation between olfactory function and clinical symptoms or serum TNF-α level was analyzed.

Results 1. The OS (P=0.025) and OI (P<0.001) in patients with manic BD I were worse than those in healthy controls. In the patients with manic BD I, there was a positive correlation between OS and GAF score (P=0.039) and also a positive correlation between OS and OI (P=0.011). 2. There was no statistical difference in OS between patients with euthymic BD I and healthy controls, but OI was worse than that in healthy controls (P<0.001). 3. The OS in patients with BD I in remission period was better than that in manic episode (P<0.001) and there was no statistical difference on the OS between euthymic BD I patients and healthy controls. The change of OS was positively correlated with the decrease of YMRS score (P=0.026), and negatively correlated with the course of disease (P=0.002). 4. The levels of serum TNF-α in patients with BD I were lower than that in healthy controls during manic episode (P<0.001), and they had no significant correlation with olfactory function.

Conclusion 1. Compared with healthy controls, the OS and OI of patients with manic BD I were simultaneously impaired and there was a positive correlation between OS and GAF score in patients with manic BD I. 2. The impairment of OS in patients with manic BD I can be improved when they are in remission period, and the degree of recovery in remission period is positively correlated with the improvement of manic symptoms. The difference of OS between patients with euthymic BD I and healthy controls was not statistically significant, suggesting that OS is expected to become a new index for the efficacy and prognosis of manic BD I. 3. In patients with manic BD I, OI is still significantly impaired even manic symptoms are relieved, suggesting that OI may be used as a characteristic index of patients with manic BD I.

Mapping The Global, Regional, and National Burden of Bipolar Disorder From 1990 To 2019: A Trend Analysis Revisiting The Global Burden of Disease Study 2019

Jianbo Lai[1], Shuting Li[2], Chen Wei[1], Jun Chen[3], Yiru Fang[3], Peige Song[2], Shaohua Hu[1]
1.浙江大学医学院附属第一医院
2.浙大医学院附属妇产科医院
3.上海交通大学附属瑞金医院

Objective Bipolar disorder (BD) is a severe psychiatric disorder that is costly to health systems worldwide. It has a complex etiology, and data regarding its burden and epidemiological trends are scarce. This study aimed to provide an overview of trends in BD burden at global, regional, and national levels from 1990 to 2019 and associations with age, period, and birth cohort.

Methods Revisiting the Global Burden of Disease Study (GBD) 2019, this study performed a trend analysis on the number, age-standardized rate (per 100,000), estimated annual percentage change (EAPC) of BD incidence, prevalence, and years lived with disability (YLDs) at global, regional, and national levels and across social development index (SDI) quintiles. Furthermore, age-period-cohort modeling was used to estimate the independent effects of age, period, and cohort on BD incidence, prevalence, and YLD rates.

Results Globally, the BD-related total cases of prevalence, incidence, and YLD all signi?cantly increased from 1990 to 2019. Regionally, the WHO Region of the Americas accounted for the highest estimated YLD number and rate, and had the highest age-standardised rate of prevalence in 1990 (816.8 per 100 000 population [95% UI 704.4-934.5]) and 2019 (845.1 per 100 000 population [721.8-947.3]), with the highest prevalence EAPC of 0.123 (95% CI 0.114-0.131). By SDI quintiles, all five SDI regions saw an increase in estimated incident cases. Nationally, New Zealand reported the highest age-standardised rate of incidence, prevalence, and YLDs in 1990 and 2019. The most prominent age effect on BD incidence rate was in those aged 15-19 years old. Decreased period risk on BD incidence, prevalence, and YLD rates was observed overall and in females, but not in males. The BD incidence, prevalence, and YLD rate showed an unfavorable trend in the younger cohorts born after 1990, with the males reporting a higher cohort risk than females.

Conclusion This study reveals a remarkable increase in BD incident cases, prevalent cases, and YLDs numbers from 1990 to 2019 globally. The overall trend of BD burden presents regional and national variations and differs by age, sex, period, and birth cohort. These findings inform appropriate public health policies and actions toward alleviating the extant burden of BD and preventing new-onset cases.

3.上海科技大学

Objective Depression with atypical features (AFD) is regarded as a bridge between major depressive disorder (MDD) and bipolar disorder (BD) or even a variant of BD-II. Features of functional connectivity about AFD are still unclear with different dysfunction of default mode network (DMN) or/and frontoparietal network (FPN) being frequently reported between MDD and BD. We hypothesize that AFD and BD shared common impairments of functional connectivity compared to depressed patients without atypical features (NAFD), and the relevant functional connectivity could help predict the risk of conversion to BD. This study aimed to explore brain connectivity features of AFD and build the risk warning model of conversion to BD.

Methods The Study of Individualized Diagnosis and Treatment for Depression with Atypical Features (iDoT-AFD) is a multicenter, prospective study consisting of a 12-week randomized controlled trial (RCT) and a continued follow-up until 4 years or switching to BD. Patients with AFD, patients with NAFD, patients with BD were recruited and scheduled clinical assessment and multimodal magnetic resonance imaging (MRI) scan. Brain functional connectivity networks were constructed based on Anatomical Automatic Labeling (AAL) from resting-state functional MRI, and clinical and brain functional features were compared among groups. Then the encoder is used to obtain the features toward analyzing disorder relationships and predicting the risk of conversion to BD.

Results AFD and BD shared common impairments of functional connectivity compared to NAFD in left angular gyrus belonging to DMN, and bilateral inferior parietal lobule, left opercular part of inferior frontal gyrus belonging to FPN, with the extent BD>AFD. When projecting brain functional features into two-dimensional space, AFD is between NAFD and BD, and tends to be BD. The risk warning model of conversion to BD was constructed, which was able to predict the rough time of AFD converting to BD. Up to now, 4 patients with AFD have developed hypomania and the time converting to BD could preliminarily verify the prediction model.

Conclusion AFD and BD shared common characteristics and dysfunction of brain network connectivity, indicating the high risk of AFD converting to BD. The risk warning model of conversion to BD has been constructed and preliminarily verified. *Correspondence: pdhsh@126.com; wangqian2@shanghaitech.edu.cn. Co-first authors: Rubai Zhou and Mengjun Liu contributed equally to this work.

青少年双相抑郁非自杀性自伤相关因素研究

郝楷荣 纪家武* 黄少雅 郑樱 陈华云
福建省福州神经精神病防治院

目的 研究和分析影响青少年双相抑郁患者出现

非自杀性自伤（NSSI）行为的相关因素。

方法 随机选取 157 例 2021 年 1 月-2023 年 6 月接受治疗的青少年双相抑郁患者，回顾性分析患者社会人口学资料，根据患者是否存在 NSSI 行为将其分为 NSSI 组与非 NSSI 组，比较两组组患者社会人口学资料并分析青少年双相抑郁非自杀性自伤的相关影响因素。

结果 存在 NSSI 行为者占 29.94%，不存在 NSSI 行为者占 70.06%。NSSI 组与非 NSSI 组患者年龄、文化程度、民族、有无宗教信仰、居住地、是否独生子女占比差异无统计学意义（P>0.05），两组性别、BMI、是否连续病程、父亲文化程度、母亲文化程度、留守经历、病程、家庭暴力、家庭外暴力及家庭功能不全占比差异均有统计学意义（P<0.05）。针对 NSSI 组与非 NSSI 组存在统计学意义的单因素作为自变量，以患者是否有 NSSI 作为因变量并实施多因素 Logistic 回归分析，结果表明患者性别、父亲文化程度、母亲文化程度、病程、家庭暴力、家庭外暴力及家庭功能不全为青少年双相抑郁出现非自杀性自伤行为的影响因素（P<0.05）。

结论 青少年双相抑郁患者出现 NSSI 行为的影响因素包括性别、父亲文化程度、母亲文化程度、病程、家庭暴力、家庭外暴力及家庭功能不全，应根据相关因素早期采取干预措施以降低 NSSI 发生风险，维护患者生命安全与身心健康。

The Associated Factors of Predominant Polarity in Bipolar Disorders Among Chinese Psychiatric Inpatients

侯筱菲[1] 李一江[2] 李明慧[1] 尹慧芳[1] 徐广明[1]
1.天津市安定医院
2.天津医科大学

Objective To identify the associated sociodemographic, clinical, and biochemical factors with Predominant Polarity (PP) of bipolar disorders in Chinese psychiatric inpatients.

Methods Psychiatric inpatients with bipolar disorders selected from "China Mental Disorders Cohort Study" were included in our study. They were divided into three groups according to the number of previous manic and depressive episodes: manic predominant polarity (MPP), depressive predominant polarity (DPP), and indeterminate predominant polarity (IPP). Multi-categorical logistic regression was performed to examine factors associated with predominant polarity, including gender, age, educational level, working status, somatic comorbidities, number of hospitalizations, suicide attempts, family history, and biochemical factors such as red blood cells count, white blood cells count, neutrophil/lymphocyte ratio (NLR), lymphocyte/monocyte ratio (MLR), and platelet/lymphocyte ratio (PLR).

Results Out of 463 patients included in this study, 272 (62.63%) fulfilled criteria for MPP, 64 (13.61%) for DPP, and 114 (23.76%) for IPP. Compared with patients in the IPP group, after controlling for current episode status, the number of hospitalizations and NLR in the DPP group were lower (p=0.025, OR=0.82, 95% CI: 0.68-0.98; p=0.023, OR=0.62, 95% CI: 0.41- 0.94); patients in the MPP group were less likely to have mixed episodes (p=0.011, OR=0.49, 95% CI: 0.28-0.85) and suicide attempts (p=0.013, OR=0.35, 95% CI: 0.16-0.81), however had greater number of hospitalizations (p=0.004,?OR=1.12, 95% CI:1.04-1.22).

Conclusion The results indicate that the classification of PP is helpful. Clinical and biochemical differences exist among different PP groups.?PP in bipolar disorders conveys clinically important information that aids a clinician in decision-making.

基于血浆神经递质相关代谢物的双相障碍诊断标志物研究

邱妍[1,2] 李素娟[1] 滕紫薇[1] 向慧[1] 伍海姗[1] 蔡骅琳[1] 陈晋东[1]
1.中南大学湘雅二医院
2.厦门市仙岳医院

目的 双相障碍（BD）是一类临床表现复杂、高复发率、高致残率的精神障碍，神经递质功能障碍是其主要的发病机制假说，但临床上尚缺乏可用于早期诊断的生物标志物。本研究的目的是建立基于血浆神经递质代谢组学的 BD 诊断模型，探讨外周血神经递质作为 BD 生物标志物的可能性及模型诊断效能。

方法 本研究于 2019 年 3 月至 2022 年 6 月在中南大学湘雅二医院精神科门诊共纳入了 152 名 BD 受试者，同时期在邻近的大学及社区招募了人口学特征匹配的 65 名健康对照受试者。使用超高效液相色谱-电喷雾电离质谱串联质谱（UPLS-MS/MS）方法进行了 14 种血浆神经递质及相关代谢物的定量检测。对两组受试者的外周血神经递质代谢物通过主成分分析法（PCA）分析并进行基于正交信号校正的偏最小二乘判别分析（OPLS-DA）模型拟合。使用交叉验证、置换检验、外部测试集验证对模型的拟合效果及判别能力进行检验。受试者工作特征曲线（ROC）和 ROC 曲线下面积（AUC）用于确定分类性能。最后，鉴别关键差异代谢物以优化诊断模型并进行检验。

结果 138 名 BD 和 59 名 HC（队列 1）用于模型构建和交叉验证，14 名 BD 和 6 名 HC（队列 2）用于模型的外部检验。成功构建 BD 与 HC 的 PCA 和 OPLS-DA 模型。在 OPLS-DA 模型中，两组完全分离，七折交叉验证法示 R2Y（cum）=0.582，Q2（cum）=0.527，提示模型具有较好的可靠性和预测度。置换检验 Q2=-0.113，检验图回归线斜率为正，强烈表明原始模型有效。原始模型（队列 1）的 AUC=0.976，敏感性为 94.93%，特异性为 84.75%，外部验证（队列 2）AUC=0.976，敏

感性为 100%，特异性为 83.33%。使用 VIP 联合 P 值的方法，共筛选出 5 种关键生物标志物：5-HIAA、VMA、TRP、GLN、DA（VIPpred>1，P＜0.001，均为含量下调），由以上关键标志物建立的模型仍能高效分类 BD 与 HC（AUC=95.96%，敏感性为 94.2%，特异性为 79.66%）。

结论 本研究成功建立基于神经递质代谢组学的 BD 诊断模型，提示外周血神经递质及相关代谢物具有作为 BD 诊断标志物的潜力和应用前景，可为进一步深入研究提供参考。

2.厦门市仙岳医院

目的 探讨精神药物治疗对双相障碍（BD）血浆神经递质代谢组的影响及临床意义。

方法 首次诊断为 BD 的受试者将接受心境稳定剂治疗，于治疗前、治疗后 1 个月、治疗后 3 个月、治疗后 6 个月随访时采集血液标本，用于血浆神经递质及相关代谢物的测量。使用线性混合效应模型（LMM）对重复测量的症状学指标、外周血神经递质相关代谢物含量进行治疗前后的比较。治疗前后及与健康人外周血神经递质相关代谢物建立主成分分析法（PCA）模型和基于正交信号校正的偏最小二乘判别分析（OPLS-DA）模型进行代谢轮廓分析。

结果 72 名 BD 受试者接受以心境稳定剂为主要治疗的纵向随访，其 HAMD、HAMA、YRMS 量表得分在治疗前、治疗 1 个月、3 个月、6 个月四个时间点之间存在显著差异（p<0.05），整体呈下降趋势；在所有受试者中成功检测到14种神经递质或相关代谢产物，除 GABA 水平外，其余 13 种代谢物含量在治疗前、治疗后 1 个月、3 个月、6 个月时间点存在显著差异（p＜0.05）。经过相关分析并校正人口学及临床特征后，治疗 1 个月和 3 个月时，HAMA 量表减分值与 KA 含量的增量均呈显著负相关（β=-0.224，p=0.047；β=-0.289，p=0.024），其余临床时点临床症状较基线变化值均未显示出与任何代谢物的含量改变的显著相关。进一步的多元统计分析显示，5 组样本在 OPLS-DA 得分图上呈分离趋势，BD 治疗前后的 4 个亚组样本点随治疗时间的变化空间位置呈连续性、同方向改变，先接近健康人组样本点，后逐渐远离健康人样本点。治疗后 6 月与 HC、治疗后 3 月与治疗前、治疗后 6 月与治疗前较好的区分，但对于短期治疗的 BD 患者与 HC 间的代谢差异不能良好的分辨，说明其代谢轮廓较为相似。

结论 心境稳定剂治疗可引起 BD 外周血神经递质代谢物含量及整体代谢轮廓的改变，治疗后患者的临床症状得到显著改善，但其外周神经递质代谢组仍与健康人显著不同。外周血神经递质及相关代谢物具有作为 BD 治疗标志物的潜力和应用前景，可为进一步深入研究提供参考。

单双相障碍患者静息态 γ 震荡脑磁图频谱能量的改变

尤为[1] 花玲玲[1] 杜易珊[1] 何晨[1] 姚志剑[1] 卢青[2]
1.南京医科大学附属脑科医院心境障碍科
2.东南大学生物科学与医学工程学院

目的 双相障碍是一种严重影响患者生活质量的疾病，表现为抑郁和躁狂或轻躁狂的反复发作。抑郁状态占据多数双相患者的多数病程时间，且多数双相患者以抑郁发作为首次表现，极易被误诊，导致病情迁延。早期鉴别单双相显得尤为重要。γ 震荡与注意、情绪等高级认知有关，既往研究提示 γ 频段在情绪面孔刺激任务中可区分单双相障碍，但 γ 震荡在静息状态下可否早期识别双相障碍仍待进一步研究。

方法 本实验共招募 210 例受试者，所有入组受试者均采集 5 分钟睁眼静息态脑磁图（MEG）活动。共纳入 58 例健康人（HC），抑郁状态 88 例，抑郁症 88 例（MDD），双相障碍 64 例(BD)，其中有 26 例双相障碍经过 5 年左右的随访，转为双相障碍（Converted to Bipolar disorder, ctBD），38 例患者入组时即为双相障碍（Raw Bipolar Disorder, rBD）。脑磁图数据基于 fieldtrip 平台进行处理，提取静息态 γ 能量（31-80Hz）进行频谱分析，运用 Cluster-based permutations 的非参数统计方法进行三组间及 post-hoc 两组间的统计分析（P<0.05，two-tailed, α=0.5）。

结果 研究发现 HC、MDD、BD 三组之间，有统计学差异的结果主要在左侧前额叶（背外侧前额叶、额下回、眶额部）、扣带回、左侧岛盖部、左侧小脑半球及蚓部、左侧枕叶（枕下回、枕中回、枕上回）、左侧颞叶（颞下回、颞中回）。两两比较的结果发现 BD 组 γ 能量较 HC 组减弱，有统计学差异的结果主要集中在顶枕叶、小脑半球及蚓部、初级运动皮层和感觉运动皮层，其中 rBD 组的 γ 能量较 HC 组减弱主要集中在小脑、梭状回脑区，而 ctBD 组的 γ 能量减弱较 HC 组无统计学意义。 rBD 组与 MDD 组相比 γ 能量减弱，差异具有统计学意义的结果主要集中在前额叶（额下回）、枕颞叶、顶叶、小脑等脑区；ctBD 组与 MDD 对照组相比，γ 能量减弱接近于有统计学差异（P=0.07）。MDD 组在 γ 频段与 HC 组相比，无明显统计学差异。

结论 本实验结果提示双相障碍组 γ 能量均较健康对照组和抑郁症组减弱，而 MDD 组、ctBD 组、rBD 组 γ 震荡能量呈逐渐下降趋势，提示 γ 能量可能是早期识别双相障碍的电生理标记物，减弱的 γ 震荡可能与双相障碍临床认知功能损害更严重有关，但仍需结合临床认知测试结果进一步分析验证。

心脑交互与抑郁症大脑自发 Theta 活动的关联研究

周红亮[1] 邹浩文[1] 盛俊岭[1] 何晨[1] 花玲玲[1] 王昊飞[1] 韩颖林[1] 史家波[1] 卢青[3] 姚志剑[1,2,3]
1.南京医科大学附属脑科医院心境障碍科
2.南京大学医学院
3.东南大学生物科学与医学工程学院

背景 ：静息状态下，心脏规律运动（心动周期）为大脑提供血流灌注，可诱发大脑 Theta（3-8 Hz）频段自发活动，参与机体对环境变化的应答。抑郁症（Major depressive disorder，MDD）大脑静息状态下 Theta 频段活动异常，且与心脑交互（Heart-brain interaction，HBI）的关系未明。本部分通过测量心动周期与大脑瞬时 Theta 频谱爆发之间的时间同步性，为心脑交互生物物理模式提供神经影像学证据；并进一步探讨其在 MDD 中的特征。

方法 选取符合 DSM-IV诊断标准的 MDD 患者 90 例以及 44 名 HC 者作为研究对象。进行 8 分钟的静息态脑电扫描的同时记录心电信号。应用 HEPlab 软件，根据 ECG 的 R 波及 T 波得出心脏收缩期（RT）与心脏舒张期（TR）的时间序列；采用隐马尔可夫模型（HMM）检测脑电 Theta 突发的时间序列；计算大脑 Theta 爆发时间序列与心脏收缩期以及舒张期时间序列的 Jaccard 系数，用于反映大脑神经元 Theta 爆发活动与心脏收缩期及舒张期活动的同步性；舒张期与收缩期 Jaccard 系数的差值记录为差值 Jaccard 系数，用于反映大脑神经元 Theta 爆发活动与心动周期活动的平衡性；应用独立样本 t 检验比较组间差异，配对 t 检验比较个体心动周期不同阶段的差异；Pearson 相关探索大脑 Theta 爆发与临床症状之间的关系。

结果 MDD 组与 HC 组的人口学资料比较差异无统计学意义（均 $p > 0.05$）。两组收缩期 Jaccard 系数均低于舒张期 Jaccard 系数（$p < 0.000$）; MDD 组收缩期与舒张期 Jaccard 系数均低于 HC 组，但差异无统计学意义（$p > 0.05$）；MDD 组差值 Jaccard 系数在右额顶叶电极（F4，F6，FC2，FC4）较 HC 组明显降低（$p < 0.05$），且异常的差值 Jaccard 系数与 HAMD-24 绝望因子成正相关（F4：$r = 0.321$，$p < 0.05$；F6：$r = 0.425$，$p < 0.05$）。

结论 心脏舒张期大脑自发 Theta 爆发活动比心收缩期更多。MDD 患者 HBI 生物物理模式的时间动力调节异常，大脑 Theta 爆发事件较 HC 者减少，与心脏运动的同步性减弱；MDD 患者大脑 Theta 爆发发生在收缩期的概率要比 HC 者增多；MDD 患者 HBI 生物物理模式的时间动力调节异常与绝望症状有关。

3.Child Development and Learning Science, Key Laboratory of Ministry of Education, Southeast University

Objective : Altered structural and functional networks have been extensively investigated in major depressive disorder (MDD). However, the results of relationships between structure and function were heterogeneous and unclear. While structure and function are closely aligned in the unimodal cortex (i.e., primary sensory and motor regions), they are disassociated in the transmodal cortex (i.e., default mode networks). , exploring structure-function coupling should consider its spatial variations across the whole brain. We aimed to explore altered structure-function coupling from a hierarchical perspective along with the macroscale functional gradient.

Methods A total of 258 patients with MDD and 99 healthy controls (HC) were enrolled at Nanjing Brain Hospital. They underwent baseline resting-state functional magnetic resonance imaging (rsfMRI) and diffusion tensor imaging. The structure-function coupling (SFC) at the regional level was assessed by calculating the Spearman rank correlation between regional connectivity profiles of structural and functional networks. We compared the regional coupling between HC and patients with MDD using the independent two-sample t-test or the Mann-Whitney test, depending on data normality. False discovery rate correction was applied for multiple comparison corrections. To evaluate how altered SFC varies across functional hierarchical networks, we categorized regions with significant differences into their corresponding functional networks and evaluated increased or decreased patterns along the principal gradient axis. The regional principal gradient value was calculated based on 217 healthy individuals from Human Connectome Project using the BrainSpace toolbox. The gradient value denoted the position of the region in the principal gradient axis.

Results We found 31 regions with significant differences between MDD and HC, spanning eight functional networks. The eight functional networks were ranked according to the increasing gradient values. The 31 significant regions were categorized into their corresponding networks. We identified two overall abnormal patterns in SFC: the increased patterns for low-level unimodal networks and decreased patterns for high-level transmodal networks in MDD. Notably, DMN was a unique network that had both increased and decreased abnormality.

Conclusions and discussions: Our findings suggested that the MDD-induced SFC impairments exhibited diverge patterns along with the functional hierarchical axis.

The higher SFC observed in the primary sensory and visual areas suggested a higher consistency between structure and function, indicating that functional communications are more likely to rely on the state of local white-matter pathways in MDD. The decreased coupling also suggested that functional communication was untethered by structural constraints in limbic systems and frontoparietal regions.

目的 非自杀性自伤（non-suicidal self-injury，NSSI）被认为是预测自杀的因子之一，是一种常见的抑郁症伴随症状。伴 NSSI 的 MDD 患者（MDD/NSSI）在疼痛处理过程中存在异常，其中岛叶异常在疼痛的发病机制中具有重要作用，但机制尚不清楚。本研究旨在探讨在伴 NSSI 的抑郁症中岛叶与其它脑区的功能连接特征。

方法 本研究根据是否伴有 NSSI，抑郁症患者被分成伴 NSSI 的抑郁症组（MDD/NSSI），和不伴 NSSI 的抑郁症组（sMDD）。一共纳入 54 名 MDD/NSSI 患者和 68 名 sMDD 患者及 66 名年龄、性别、受教育年限匹配的健康被试。对入组被试进行脑静息态功能磁共振成像扫描，并以每个感兴趣区的坐标为中心定义了六个 6mm 半径的种子点，包括：左腹侧前岛叶，右腹侧前岛叶，左背侧前岛叶，右背侧前岛叶，左后岛叶和右后岛叶。在 DPABI 软件中分别计算各岛叶亚区对全脑其它脑区的功能连接（functional connectivity）。用 REST 软件进行统计分析，首先将三组被试进行方差分析，并使用 GRF 方法进行多重比较校正，单个体素 $p<0.001$，连续体素≥50；然后进行 hoc T 检验，对三组进行两两比较，单个体素 $p<0.001$，连续体素≥50，将 GRF 多重比较校正后 $p<0.05$ 的区域定义为有统计学显著差异的脑区。

结果 与 sMDD 组相比，MDD/NSSI 组左腹侧前岛叶与全脑功能连接未见显著差异；右腹侧前岛叶与颞中回、左三角部额下回间功能连接减弱，与右内侧额上回之间的连接增强；左背侧前岛叶与左海马旁回之间的功能连接增强，与颞中回、左颞上回、左背外侧额上回、右楔前叶之间的功能连接减弱；右背侧前岛叶与左颞中回、右颞中回、右楔前叶连接减弱；左后岛叶与右楔叶、左楔前叶、左内侧和旁扣带脑回连接减弱；右后岛叶与左颞下回连接增强，与右颞中回、左颞中回、左额中回、左中央旁小叶连接减弱。

结论 伴 NSSI 的抑郁症与不伴 NSSI 的抑郁症之间，岛叶各亚区与其它脑区之间的功能连接上存在差异，结果集中在额叶及颞中回等脑区，提示岛叶在 NSSI 的发病机制中存在着重要作用。

单双相情感障碍患者静息态 alpha 波脑磁频谱能量的改变

何晨[1] 花玲玲[1] 杜易珊[1] 尤为[1] 鲍慈青[1] 史家波[1] 卢青[2] 姚志剑[1]
1.南京医科大学附属脑科医院心境障碍科
2.东南大学生物科学与医学工程学院

目的 目前临床上早期识别双相情感障碍仍具有较大挑战，部分双相情感障碍患者以抑郁症状为首发临床表现，起病初期两者临床症状相似，导致临床治疗效果欠佳和治疗延误。因此，早期识别双相情感障碍显得尤为重要。既往神经电生理研究提示 alpha 可能是抑郁症特征性改变，但目前关于 alpha 波可否早期识别双相情感障碍仍不清楚。

方法 本实验共招募 210 例受试者，采集所有被试记录 5 分钟的睁眼静息态脑磁图（MEG）活动。本研究纳入 58 例健康对照组（HC），抑郁症患者为 88 例（Major Depressive Disorder, MDD），双相情感障碍患者为 64 例(Bipolar Disorder, BD)，其中有 26 例双相情感障碍患者经过 5 年左右的随访，转为双相情感障碍患者（Converted to Bipolar disorder, ctBD），38 例入组时即为双相情感障碍（Raw Bipolar Disorder, rBD）。脑磁图数据基于 fieldtrip 平台进行处理，提取静息态 alpha 能量（8-12Hz）进行频谱分析，运用 Cluster-based permutations 的非参数统计方法进行统计分析（clusterapha=0.01，alpha=0.5）。

结果 通过对溯源结果进行分析，发现 HC、MDD、BD 三组之间，差异具有显著性统计学的结果主要集中在前额叶（背外侧前额叶、眶额回），扣带回，小脑（蚓状体，小脑半球），边缘结构（海马、海马旁回），皮层下结构（苍白球、壳核、丘脑），感觉运动皮层（初级运动皮层，感觉运动皮层）等多个脑区。两两比较的结果中发现 HC 与 MDD 在 alpha 频段的能量差异无明显统计学差异，BD 的 alpha 波能量显著高于 HC 和 MDD 组，能量差异主要集中在前额叶-边缘-皮层下-小脑等多个脑区。进一步研究发现 MDD，ctBD, rBD 的前额叶-边缘-皮层下-小脑环路等脑区的 alpha 波能量逐渐增强，其中 MDD 和 rBD 两组间的 alpha 波能量具有统计学显著差异。

结论 双相情感障碍患者前额叶-边缘-皮层下-小脑环路的 alpha 静息态能量较健康对照组和抑郁症组增强，在 rBD 患者组中更为明显，提示经历过躁狂或者轻躁狂发作的患者脑损害更明显。本实验结果提示双相情感障碍特征性的 alpha 波改变，但仍需结合临床特征和量表等结果进一步分析。

3.东南大学生物科学与医学工程学院

背景 ：灵活的心脑交互（Heart-brain interaction，HBI）是成功目标导向性行为的前提。抑郁症（Major depressive disorder，MDD）患者抑制控制功能损伤，属于目标导向行为障碍，与 HBI 的关系尚未明确。研究显示，前额叶-边缘系统神经环路损伤是 MDD 抑制控制功能损伤的神经基础。本部分基于前额叶-边缘系统神经环路，探讨 MDD 患者 HBI 与抑制控制功能的关系。

方法 入组 MDD 患者 20 例和 18 例 HC。采集 8 分钟静息态和执行红绿灯 Go/no-go 任务时的心电与脑电数据、静息状态下的功能核磁共振 T1 项。选定前额叶脑区、ACC、双侧脑岛做为感兴趣脑区（ROI），分析任务下 ROI 间的功能连接以及静息状态与任务下的心率变异性（HRV）；应用独立样本 t 检验比较 MDD 组与 HC 组之间的静息状态、任务状态 HRV 时域指标 RR 间期的平均值标准差（SDANN）、相邻心跳间期差值均方的平方根（RMSSD）以及脑区功能连接的差异，应用 Pearson 相关分析异常的脑区功能连接、HRV 及 HAMD-17 分值之间的相关关系。

结果 静息状态下 MDD 组 SDANN （$t = 3.034$，$p = 0.004$）与 RMSSD 均低于 HC 组（$t=2.712, p=0.010$），且在 Go/no-go 任务下，两个 HRV 指标在健康组与 MDD 组之间的比较差异更明显（SDANN：$t = 3.932$，$p < 0.001$；RMSSD：$t = 3.965$，$p < 0.001$）；与 HC 组相比，MDD 组左侧额中回与左侧额上回、左侧额中回与右侧额上回、左侧额中回与 ACC 功能连接异常（均 $p < 0.05$）；且 HC 组 HRV 中 RMSSD 与左侧额中回与 ACC 功能连接呈正相关（$r = 0.605$，$p = 0.008$），MDD 组 HRV 中 RMSSD 与左侧额中回与右脑岛功能连接呈负相关（r=?0.577，$p = 0.008$）；MDD 组 HAMD-17 总分与任务状态下的 SDANN（r=?0.555，$p = 0.011$）、RMSSD（r=?0.555，$p = 0.011$）及静息状态下的 RMSSD（r=?0.497，$p = 0.026$）呈负相关。

结论 MDD 患者 HBI 神经传递模式异常，与抑制控制功能损伤有关；ACC 及右脑岛与左侧额中回功能连接是 MDD 患者异常 HBI 神经传递模式与大脑抑制控制功能时空特性具有关联关系的神经基础。

首发早发性和晚发性抑郁症患者静息态脑灰质体积的研究

夏秋栋[1] 阎锐[1,2] 王晓芹[1] 孙浩[1,2] 史家波[1] 卢青[3] 姚志剑[1,2,3]
1.南京医科大学附属脑科医院心境障碍科
2.南京大学医学院
3.东南大学生物医学工程

目的 既往研究发现不同年龄段发病的抑郁症有不同的临床特征，且发现 30 岁前和 30 岁后起病的成年抑郁症患者灰质体积（gray matter，GM）存在差异，但发病年龄 18 岁以前的早发抑郁症（Early onset depression，EOD）较发病年龄在 45 岁以后晚发抑郁症（Later onset depression，LOD）GM 的不清楚。本研究旨在探讨首发早发性和晚发性抑郁症患者 GMV 特征，为不同年龄段抑郁症发病研究脑影像学机制提供依据。

方法 招募来自南京医科大学附属脑科医院符合 DSM5 抑郁症诊断标准的首发患者。按照起病年龄，分为 18 岁以前的早发抑郁症 40 名，45 岁以后起病的晚发抑郁症抑郁症 50 名，同时招募 70 名年龄、性别、受教育年限匹配的健康对照。将 3 组受试进行 3.0T 静息态功能磁共振扫描，计算 GMV。为去除年龄的影响，将灰质总体积和年龄为协变量计算三组值差异，首先进行单因素方差分析，高斯随机场法（Gaussian random field，GRF）校正，其次在三组比较差异有统计学意义的基础上，使用 GRF 矫正方法进行 hoc t 检验，对每两组 ReHo 值进行两两比较。

结果 三组受试在右杏仁核/右颞中回/右颞上回/右额下回（MNI 坐标 24, 2，-21，K=4027）、左梭状回(MNI 坐标-26，-34,- 18，K=367）、右舌回/右梭状回（MNI 坐标 17，-45,- 3，K=496）GMV 值存在差异（单体素 $p<0.001$，连续体素值 $K\geq228$，GRF 校正后 $p<0.05$）。在方差分析基础上进行两两事后独立样本 t 检验，与 LOD 组相比，EOD 组右颞上回/右额下回、右颞中回、双侧梭状回 GMV 值增高（单体素 $p<0.001$，连续体素值 $K\geq4$，GRF 校正后 $p<0.05$）。

结论 首发 LOD 与 EOD 患者脑结构灰质体积损害存在差异，EOD 较 LOD 组在右颞上回/右额下回、右颞中回、双侧梭状回体积降低更少，提示不同发病年龄的抑郁症患者右颞上回/右额下回、右颞中回、双侧梭状回灰质体积损害不同，可能有不同的发病机制。

Altered Beta Band Spatial-temporal Interactions During Negative Emotional Processing in Major Depressive Disorder: An MEG Study

Yishan Du[1], Lingling Hua[1], Shui Tian[4], ZhongPeng Dai[2,3], Yi Xia[1], ZhiJian Yao[1,2,3], Qing Lu[2,3]

3.Child Development and Learning Science, Key Laboratory of Ministry of Education, Southeast University
4.Department of Radiology, the First Affiliated Hospital of Nanjing Medical University

Background : The mood-concordance bias is a key feature of major depressive disorder (MDD), but the spatiotemporal neural activity associated with emotional processing in MDD remains unclear. Understanding the dysregulated connectivity patterns during emotional processing and their relationship with clinical symptoms could provide insights into MDD neuropathology.

Methods We enrolled 108 MDD patients and 64 healthy controls (HCs) who performed an emotion recognition task during magnetoencephalography recording. Network-based statistics (NBS) was used to analyze whole-brain functional connectivity (FC) across different frequency ranges during distinct temporal periods. The relationship between the aberrant FC and affective symptoms was explored.

Results MDD patients exhibited decreased FC strength in the beta band (13-30 Hz) compared to HCs. During the early stage of emotional processing (0-100ms), reduced FC was observed between the left parahippocampal gyrus and the left cuneus. In the late stage (250-400ms), aberrant FC was primarily found in the cortex-limbic-striatum systems. Moreover, the FC strength between the right fusiform gyrus and left thalamus, and between the left calcarine fissure and left inferior temporal gyrus were negatively associated with Hamilton Depression Rating Scale (HAMD) scores.

Conclusion MDD patients exhibited abnormal temporal-spatial neural interactions in the beta band, ranging from early sensory to later cognitive processing stages. These aberrant interactions involve the cortex-limbic-striatum circuit. Notably, aberrant FC in may serve as a potential biomarker for assessing depression severity.

悲伤面孔刺激下抑郁症脑磁图多尺度时空特性研究

赫雨欣[1,2,3] 史家波[1] 姚志剑[1] 卢青[2,3]
1.南京医科大学附属脑科医院心境障碍科
2.东南大学生物科学与医学工程学院
3.东南大学儿童发展与学习科学教育部重点实验室

目的 抑郁症患者在情绪刺激处理时呈现负性情绪偏向和情绪调节异常。为了探究这种损伤的神经机制和客观的生物学指标，既往影像学研究已通过对多种模态数据和特征的分析得到了一些成果。然而，基于脑磁图数据的悲伤面孔刺激的多尺度层面的相关研究目前尚不充分。本文利用脑磁图兼具时间、空间分辨率的优势，探索与负性情绪偏向及情绪调节异常存在关联的神经活动模式。

方法 借助多元经验模式分解将排序向量熵扩展到跨被试对齐的多尺度层面，计算不同固有模态函数下大脑复杂度随时间的动态变化过程。进一步采用相位-幅值跨频域耦合的方法比较不同脑区在不同模态函数下的交互情况。跨被试时间尺度对齐不能直接比较组间大脑固有时间尺度的异常，因而采用自相关窗口来量化内在神经时间尺度。自相关窗口测量信号中的重复模式，使我们能够测量不同时间点之间的神经活动模式的相关程度。

结果 在 0-50ms 的左侧丘脑和 100-200ms 的左侧眶额皮层、左侧杏仁核发现抑郁症患者脑区内复杂度显著上升，而 0-50ms 的右侧杏仁核抑郁症患者表现出复杂度显著降低，进一步通过相位-幅值跨频域耦合的方法发现 100-200ms 左侧眶额皮层对左侧杏仁核的调控显著减弱。为了计算内在神经时间尺度，选取五种不同自相关窗口的计算方式（自相关函数分别衰减到50%、40%、30%、20%、10%对应的滞后值）。利用聚类置换检验发现这五种尺度下都存在显著差异簇，簇内通道主要分布在额区、顶区、中央区，并且在这五种尺度下的显著簇内，相比于健康被试，抑郁症患者均表现出了异常增加的内在神经时间尺度。

结论 抑郁症患者在处理悲伤面孔刺激时脑区内复杂度增加，处理时间显著延长，同时脑区间交互性减弱，这种情绪处理功能异常导致了严重的负性情绪偏向。

3.东南大学儿童发展与学习科学教育部重点实验室

背景 ：研究显示选择性 5-羟色胺再摄取抑制剂（Selective Serotonin Reuptake Inhibitor，SSRI）可以帮助缓解重度抑郁症患者（Major Depressive Disorder，MDD）的抑郁症状，但是与症状缓解相关的大脑层级结构变化仍需进一步研究。

方法 本研究共招募 39 例健康被试（healthy controls，HCs）和 57 例经过 SSRI 治疗 12 周后达到缓解的 MDD 患者。MDD 患者在治疗前（pre-treatment）和治疗后 12 周（post-treatment）均进行了弥散张量成像（diffusion tensor imaging，DTI）扫描，所有健康被试在招募时也同样进行了 DTI 扫描。每个被试的大脑依据 Schaefer 模板进行脑区的划分，并进行纤维束追踪，将纤维束追踪结果与脑区划分结果进行结合，从而构建每个被试的大脑结构网络。组水平的梯度通过将流形算法分别应用到三组（治疗前组，治疗后组，健康组）的组平均结构连接网络上。然后将健康组的大脑梯度作为模板，计算每个患者治疗前后所有数据点距模板

中心的欧式距离，并将该距离定义为流形偏心率（Manifold Eccentricity，ME）。为了找到对 SSRI 治疗缓解具有显著贡献的脑区，我们采用偏最小二乘法（Partial Least Squares，PLS）回归方法来分析 ME 和 SSRI 治疗前后汉密尔顿抑郁量表（Hamilton Rating Scale for Depression，HAMD）缓解率之间的关系。

结果 在全局脑结构梯度来看，治疗前后大脑梯度从视觉层面看无显著的变化。PLS 回归算法得到了两个隐藏因子（latent components，LCs），可以用于描绘 ME 和 HAMD 缓解率之间的关系，其中，LC1（p=0.001，占 ME 和 HAMD 缓解率之间协方差的 67%），LC2（p=0.001，占协方差的 24%）。主梯度的 non-focal 脑区对 LC1 具有显著贡献，而主梯度的 focal 脑区对 LC2 有显著贡献。LC1 对预测 HAMD 因子-阻滞缓解较为敏感，而 LC2 对预测认知障碍缓解较为敏感。LC1 和 LC2 模式均主要分布于默认模式网络、额顶叶控制网络和躯体运动网络。

结论 我们从脑结构梯度的角度探索 SSRI 治疗后抑郁症患者大脑的神经生物学机制，为 SSRI 治疗后大脑变化提供了新视角。

双相伴快感缺失患者静息态低频振幅特征及其性别差异

王晓芹[1] 阎锐[1] 夏逸[1] 孙浩[1,2] 黄映红[1,2] 杜易珊[1] 史家波[1] 卢青[3] 姚志剑[1,2,3]
1.南京医科大学附属脑科医院心境障碍科
2.南京大学医学院
3.东南大学生物科学与医学工程学院

目的 功能神经影像学研究证明，奖赏环路的神经功能异常与单相抑郁的快感缺失症状密切相关。然而，双相障碍抑郁发作的患者伴快感缺失症状是否也存在类似的功能损伤尚不清楚。另外，临床前的研究表明，快感缺失症状的行为表现和神经机制具有性别差异。因此，本研究旨在探讨双相伴快感缺失症状患者的脑低频振幅（amplitude of low frequency fluctuation，ALFF）的性别差异。

方法 这项横断面研究招募自 2015 年到 2021 年南京医科大学附属脑科医院的重性抑郁障碍住院患者，符合美国精神障碍诊断与统计学手册第 4 版诊断标准。共纳入 263 名 18-50 岁之间的双相抑郁发作期患者，被分为高快感缺失组（n=174；男/女=77/97）和低快感缺失组（n=89；男/女=26/63），同时招募 213(男/女=93/120)名年龄、性别和教育程度匹配的健康对照。所有被试进行 3.0T 静息状态的功能磁共振扫描，计算全脑 ALFF 值。首先，将抑郁组与健康对照组的脑区 ALFF 值进行双样本 t 检验。随后，在差异脑区的基础上，通过双因素方差分析探索抑郁患者的两个不同因素（快感缺失症状和性别差异）的影响。

结果 本研究结果显示：与健康对照、低快感缺失症状的患者相比，伴高快感缺失的双相抑郁患者在双侧海马和右侧脑岛 ALFF 值增加（$p<0.05$，GRF 矫正）。快感缺失症状和性别在右脑岛和右海马有交互作用（$p<0.05$，GRF 矫正）。调节模型结果显示，只有男性患者中，快感缺失症状与上述脑区 ALFF 值相关，而在女性中这种相关性不存在。

结论 本研究结果表明，双相抑郁伴快感缺失症状的患者存在边缘奖赏环路相关脑区异常。伴快感缺失症状的双相男性患者在右侧脑岛和海马的脑局部神经活动具有更大的改变，提示功能偏侧化，且男性双相抑郁患者伴快感缺失症状是一种更为独特的亚型。

目的 既往临床前和临床的研究都发现抑郁症快感缺失症状存在性别差异，然而其背后的神经机制尚不明确。本研究利用低频振幅（amplitude of low frequency fluctuation，ALFF）指标，旨在探讨抑郁症伴快感缺失症状患者的脑局部神经活动特征是否存在性别差异。

方法 这项横断面研究招募自 2015 年到 2021 年南京医科大学附属脑科医院的重性抑郁障碍住院患者，符合美国精神障碍诊断与统计学手册第 4 版诊断标准。共纳入 414 名 18-50 岁之间的抑郁症患者，被分为高快感缺失组（n=281；男/女=136/145）和低快感缺失组（n=133；男/女=38/95）。同时招募 213 名(男/女=93/120)年龄、性别和教育程度匹配的健康对照。所有被试进行 3.0T 静息状态的功能磁共振扫描，计算全脑 ALFF 值。首先，将抑郁组与健康对照组的脑区 ALFF 值进行双样本 t 检验。随后，在差异脑区的基础上，通过双因素方差分析探索抑郁患者的两个不同因素（快感缺失症状和性别差异）的影响。除此之外，本研究对基线时伴有高快感缺失症状的患者进行了随访，其中 43 名患者在抑郁缓解期完成了第二次功能磁共振扫描，用配对 t 检验比较基线期和缓解期快感缺乏相关脑区 ALFF 值。

结果 本研究结果显示：与健康对照、低快感缺失症状的患者相比，伴高快感缺失症状患者在右侧梭状回、左侧海马、左侧额下回眶部、左侧颞下回的脑区 ALFF 值升高（$p<0.05$，GRF 矫正）。快感缺失症状和性别在双侧脑岛、右侧海马、左侧后扣带回、左侧壳核有交互作用（$p<0.05$，GRF 矫正）。调节模型结果显示，只有女性患者中，快感缺失症状与上述脑区 ALFF 值相关，而在男性中这种相关性不存在。此外，基线时伴高快感缺失症状的抑郁患者异常升高的 ALFF 值在

缓解期降低。

结论 本研究结果表明抑郁症伴快感缺失症状患者大脑功能活动模式在性别上存在差异，这可能对干预抑郁症患者的快感缺失症状具有临床意义。并且，快感缺失症状相关脑区异常 ALFF 值会随着抑郁症状的改善而趋向正常这一特征，或许提示快感缺失症状是抑郁症的状态性指标。在抑郁症研究中，将生理性别作为一个变量进行考虑，对于发现和开发对男性和女性都有效的药物疗法至关重要。

目的 探讨 RORA 基因多态性与抑郁障碍的交互作用对患者静息态脑功能的影响，为探究抑郁障碍患者静息态脑功能异常的遗传学基础。

方法 共收集到 297 例被试，其中抑郁障碍患者 187 例，110 名年龄和性别匹配的正常对照纳入研究。以上所有被试均完成静息态磁共振扫描，分析全脑低频振幅（amplitude of low frequency fluctuations，ALFF）值。采集被试静脉血，对 RORArs72752802 进行分型。运用 HAMD-24 评估患者疾病严重程度，探讨疾病主效应、基因型主效应和两者的交互效应下 ALFF 值差异，将差异脑区 ALFF 值与临床症状群严重程度进行相关分析。

结果 全脑低频振幅的全因子分析结果显示额中回存在显著的疾病和基因交互效应。研究发现右侧额中回 ALff 值在四组间方差分析中存在显出差异，最小显著差数分析表明，右侧额中回的 Alff 值在四组中程“U 型曲线”。具体的简单效应分析显示，携带 C 风险等位基因的抑郁障碍患者 ALFF 值显著高于携带风险等位基因的健康对照，而携带风险等位基因的健康对照 ALFF 值显著低于不携带的健康对照。疾病主效应分析结果显示患者组在眶部额上回、回直肌、左侧额中回以及中央后回的 ALFF 值显著大于对照组，而在楔前叶的 ALFF 值显著小于对照组。基因主效应分析结果显示携带 C 风险基因的受试者在颞上回的 ALFF 值显著大于非携带者。交互效应显著脑区的 ALFF 与疾病严重程度的相关性分析提取存在疾病和基因型交互作用显著的两个额中回脑区的 ALFF 值与患者疾病严重程度进行相关分析。相关性分析结果显示携带 C 风险等位基因的患者组中额中回 1 的 ALFF 值与疾病严重显著正相关（r=0.35，p< 0.0001）,而非携带风险等位基因的患者额中回 ALFF 值与疾病严重显著负相关（r=-0.28，p= 0.029）。额中回 2 的 ALFF 值与患者疾病严重程度相关性不显著。

结论 RORArs72752802 基因多态性与抑郁症的交互作用可能导致额中回局部自发神经活动存在异常，这种异常可能是部分症状群潜在的神经病理机制之一。

右额下回岛盖部 beta 事件相关去同步化与抗抑郁早期疗效相关性的脑磁图研究

熊婷婷[1] 夏逸[1] 花玲玲[1] 汤浩[1] 尤为[1] 阎锐[1] 史家波[1] 卢青[2] 姚志剑[1]
1.南京医科大学附属脑科医院心境障碍科
2.东南大学生物科学与医学工程学院

目的 抑郁症患者存在认知功能受损，且认知功能损害对抑郁症的疗效及转归存在影响。反应抑制是执行功能的重要组成部分，且最近的研究表明，反应抑制缺陷也可能是抗抑郁药物治疗反应不良的基础。反应抑制是由右额下回发起的，由 beta 振荡实现，当大脑皮质层某区域收到动作指令或想象运动等刺激时，因被激活，此时该区域代谢加快，进行信息加工导致特定频段的脑电信号的振幅减低，这种电生理现象称为事件相关去同步化。本研究通过探讨抑制控制网络关键脑区右额下回岛盖部 beta 频段的 ERD，寻找抗抑郁治疗早期疗效相关的生物学指标。

方法 随机入组 46 例抑郁症患者及 25 例健康对照，基线期以及治疗 2 周后 ，所有被试完成 HAMD17 评分。在完成 Go/No-Go 实验范式下采集脑磁图数据。对原始数据进行预处理和源重建，脑区信号基于 AAL（Automated Anatomical Labeling）模板从源重建后的体素信号计算得到。提取 200-500ms 感兴趣脑区的 beta(13～30Hz)频段信号，ERD 通过时间-频率图除以基线状态来描述，计算基线期右额下回岛盖部 beta 频段的 ERD，以抗抑郁治疗 2 周后 HAMD17 总分减分率是否 50%为标准划分为早期疗效有效组和无效组。患者组和对照组两组间 ERD 的比较采用 ANOVA 分析，并和 HAMD17 两周减分率进行 Logistic 回归分析。

结果 与对照组相比，抑郁症组基线右额下回岛盖部 beta 频段的 ERD 减少。且与早期治疗有效组相比，无效组右额下回岛盖部事件相关去同步化程度更差（P<0.001）。右额下回岛盖部(r=-0.397, P=0.006) beta 频段 ERD 与 2 周后 HAMD17 减分率呈负相关。

结论 右额下回岛盖部 beta 频段的 ERD 降低与抗抑郁早期疗效不佳相关，该区域 beta 频段的活动强度可能是抑郁症早期疗效预测的生物学指标。

基于脑磁图时空信息的深度学习模型在抑郁症识别中的应用研究

孙可欣[1,2,3] 史家波[1] 姚志剑[1] 卢青[2,3]
1.南京医科大学附属脑科医院心境障碍科
2.东南大学生物科学与医学工程学院
3.东南大学儿童发展与学习科学教育部重点实验室

目的 抑郁症是最常见的一种精神疾病，其核心特征是负性情绪偏向。我们希望借助深度学习，基于在负性情绪面孔刺激下的全通道脑磁图信号进行抑郁症识别，不仅能训练出高性能的分类模型，有助于进行客观的个体诊断，还能挖掘抑郁症患者的脑磁图信号中的异常时空信息，观察个体间的时空特征差异，有助于讨论抑郁症在脑磁图信号上的客观标记。

方法 我们招募了重度抑郁症患者和健康对照各43 名，基于他们在负性情绪面孔识别任务下的脑磁图信号设计并训练了一种结合了时空注意力机制的卷积神经网络模型，能使模型自适应地在时间维度和空间维度上分配注意力权重，让模型关注对抑郁症识别更为重要的时空区域，在提高分类性能的同时通过观察注意力权重分布图，获得抑郁症个体的关键时空区域。

结果 最终的模型在五折交叉验证下的平均分类准确率可达 86%。我们发现模型的注意力权重主要集中在情绪处理的早期阶段（刺激后 0～250 毫秒）的枕叶、颞叶区域，且在部分个体结果中发现前额叶区域也在早期阶段具有高权重。

结论 本文提出了一种具有高性能的时空注意力神经网络模型，证明了该方法应用于抑郁症识别的有效性。根据注意力权重的分布，发现了枕叶、颞叶、前额叶区域对脑磁图信号的抑郁症识别具有重要作用，提示这些空间区域可能与负性情绪处理密切相关，并在时间维度上展示出情绪处理早期阶段的显著重要性，这些结果与过往研究结论具有一定的一致性。本文还能从个体角度寻找抑郁症个体间的时空权重分布差异，为研究抑郁症患者的脑磁图个性化异常提供价值，并为抑郁症的个性化诊断与治疗提供方向。

3.Child Development and Learning Science, Key Laboratory of Ministry of Education, Southeast University

Background :Depression and rhythmic neural oscillations in the brain are closely related, but the underlying neuronal mechanisms are largely unknown. Previous MEG studies have mainly relied on the average power spectrum to study activity, but this approach ignores the temporal variation of the considered frequencies . Therefore, we investigated whether the spectral activity in these brain regions is specific , explored the changes in neural oscillatory activity from the region-specific spectrum in depressed patients.

Methods Resting-state magnetoencephalography (MEG) data were collected from 22 patients with depressive disorder(DP) , and 22 healthy controls (HC). Continuous resting state MEG data were preprocessed and segmented into trials of 1-s length. Complex Fourier spectra were computed for each trial separately and projected into source space . The data were spatially normalized, dividing each voxel's power by the mean power of all trials and voxels.. In the first-level analysis, power matrices were clustered into ten distinct spectral clusters per participant and brain region using k-means and GMM algorithms. In the second-level analysis, first-level individual clusters were again subjected to k-means clustering and GMMs to establish region-specific spectral clusters consistent at the group level.Second-level GM training models were created for all brain areas with data from half of the sample (group-level). Area-specific first-level GM test data from the remaining sample (subject-level) were then tested against each area-specific GM training model. The fit of each test set to each GM training model (determined through negative log-likelihood) was ranked. This was repeated 120 times, and the position of the correct area was averaged across iterations.

Results We analyzed resting-state MEG data and obtained specific spectra for 90 brain regions according to the AAL atlas, which in general consists of more than one spectrum for a single brain region. We give the corresponding durations of these frequency spectral patterns. The spectral characteristics differed between DP and HC individuals, and we performed a cross-group classification, drawing samples from HC as the training group and from DP as the test group. This analysis resulted in a mean rank of 8.1 (range = 2.03-26.34), which was higher than the mean rank within the HC group (mean rank=2.56, range = 1.03-21.18).

Conclusions Our findings show that the brain exhibits a characteristic and stable pattern of ongoing oscillatory activity. Whereas brain oscillations are altered in psychiatric disorders, this approach can be used to identify (region-specific) abnormalities associated with mental illness and further facilitate early diagnosis.

双相抑郁发作患者睡眠时型偏向对冲动性的影响：一项探索性研究

孙浩[1,2] 阎锐[1] 陈志璐[1] 黄映红[1] 王晓芹[1] 盛俊领[1] 史家波[1] 姚志剑[1,2]
1.南京医科大学附属脑科医院心境障碍科
2.南京大学医学院

目的 双相情感障碍抑郁发作期间常伴有睡眠时

型的紊乱与冲动性的增强，然而，目前尚不清楚两者之间的关联性。本研究旨在探索双相抑郁患者睡眠时型对冲动性的影响。

方法 共招募双相抑郁发作患者99例及年龄和性别相匹配的健康对照 113 例。通过清晨夜晚型量表评估所有被试的睡眠时型偏向，Barratt 冲动量表评估其多维度冲动性。对双相抑郁发作患者，采用 17 项汉密尔顿抑郁量表（HAMD-17）评估其抑郁严重程度。采用协方差分析，评估双相抑郁发作患者与健康对照组间及双相抑郁发作患者不同维度冲动性差异。采用回归模型进行多变量分析，以评估睡眠时型对双相抑郁发作患者的冲动性的影响。

结果 双相抑郁发作患者在冲动性总分及运动冲动性、认知冲动性及无计划冲动性均显著高于健康对照（均 $p < 0.05$）。在控制年龄、性别及教育年限后，在双相抑郁组中，睡眠时型对冲动性总分（$R2 = 0.125$, $p = 0.001$）、认知性冲动（$R2 = 0.096$, $p = 0.025$）及无计划冲动（$R2 = 0.201$, $p < 0.001$）均有贡献。此外，在此基础上，控制了抑郁严重程度后，睡眠时型对冲动性总分（$R2 = 0.143$, $p = 0.001$）、认知性冲动（$R2 = 0.100$, $p = 0.025$）及无计划冲动（$R2 = 0.203$, $p < 0.001$）仍然存在显著贡献。

结论 我们的研究结果表明，双相抑郁发作患者各维度冲动性明显增强。睡眠时型的偏向性可能会影响双相抑郁患者的冲动性，偏向于较晚的睡眠时型对患者的认知冲动性及无计划冲动性均有贡献。值得注意的是，尽管控制了抑郁的严重程度，睡眠时型仍然对认知冲动性及无计划冲动性存在贡献。

异常的自发神经元活动稳定性区分单双相抑郁发作

孙浩[1,2] 阎锐[1] 陈志璐[1] 黄映红[1] 王晓芹[1] 盛俊领[1] 史家波[1] 姚志剑[1,2]
1.南京医科大学附属脑科医院心境障碍科
2.南京大学医学院

目的 双相抑郁发作常被误诊为抑郁症，这可能会导致不恰当的治疗。 本研究旨在探索单双相抑郁发作期异同的自发神经元活动稳定性变化。

方法 招募于南京脑科医院住院治疗的双相抑郁发作患者 75 例，单相抑郁发作患者 157 例及年龄、性别相匹配的健康对照 132 例。以上所有被试均完成静息态磁共振扫描。采用滑动时间窗的方法，分析全脑低频振幅的动态波动性（dALFF）变化。以年龄、性别及教育年限作为协变量进行协方差分析及两两事后 T 检验，比较双相抑郁、单相抑郁及健康对照间的 dALFF。

结果 与健康对照相比，双相抑郁发作患者在左侧前运动皮层、右侧外侧颞叶和右侧早期听觉皮层表现出升高的 dALFF（$p < 0.05$），单相抑郁发作在左侧前运动皮层、左侧旁中央小叶和双侧内侧前额叶皮层、右侧眶额皮层、右侧背外侧前额叶皮层、右后扣带皮层表现 dALFF 降低（$p < 0.05$）和右侧外侧颞叶皮层表现 dALFF 升高（$p < 0.05$）。此外，与单相抑郁发作相比，双相抑郁发作在左侧前运动皮层、左侧旁中央小叶、双侧内侧前额叶皮层、双侧眶额皮层、右侧背外侧前额叶皮层、右侧后扣带皮层和右侧外侧颞叶皮层表现出升高的 dALFF（$p < 0.05$）。此外，基于差异脑区 dALFF 的 ROC 分析获得了 72.7%的曲线下面积（AUC）。

结论 我们的研究显示了双相抑郁发作与单相抑郁发作在 SMN、DMN 和 CEN 关键区域的共同的及特异的时间动态性异常。两种疾病之间差异的时间动力学异常模式有可能区分单双相抑郁发作。

盐城市双相障碍住院患者药物使用现状调查

沈素梅[1,2] 周爱华[1] 鲍喜燕[1] 阎锐[2] 夏逸[2] 姚志剑[2]
1.盐城市第四人民医院精神科
2.南京医科大学附属脑科医院心境障碍科

目的 为了解江苏省盐城市第四人民医院住院的双相障碍（bipolar disorder，BD）患者药物使用现状，同时评价其药物治疗是否符合《中国双相障碍防治指南（第二版）》（以下简称指南）的推荐，同时评估其副反应发生情况，以促进双相障碍治疗的规范化、合理化。

方法 本研究对 2016 年 1 月至 2019 年 12 月住院的所有 BD 患者进行回顾性调查分析，对人口学、药物使用、药物副反应方面、双相 I 型和 II 型患者抑郁发作期抗抑郁药是否使用及其不良反应数据汇总描述，认定符合指南首选推荐和次选推荐者为符合组、用药方案不符合指南首选推荐和次选推荐者为不符合组。使用 SPSS19.0 进行统计分析。

结果 最终纳入了 704 名 BD 患者，双相障碍的药物治疗以联合用药为主，单一用药仅占 7.24%（55/704）。躁狂发作药物治疗符合率 84.50%，双相障碍抑郁发作的治疗方案符合率 11.11%，其中双相 I 型障碍抑郁发作期药物治疗符合率 6.78%，双相 II 型障碍抑郁发作期药物治疗符合率 22.73%，双相 I 型障碍和双相 II 型障碍的抗抑郁药物使用无明显差异（$P>0.05$）。根据患者用药是否符合指南治疗推荐，进一步分析副反应情况，与指南符合组相比，不符合组在躁狂发作的心血管副反应发生高，差异存在统计学意义（$P<0.05$）；而在抑郁发作中血象异常现象存在统计学差异（$P<0.05$）。

结论 双相障碍躁狂发作期药物使用指南符合率比较高，未发现不良反应在各推荐方案中有明显差异。双相障碍抑郁发作期的药物使用指南符合率低，不良反应发生率高，且抗抑郁药物的使用在双相 I 型和 II 型患者抑郁发作期无差异。

双相抑郁患者认知执行功能损害及其风险因素研究

王昊飞[1] 田水[2] 卢青[3] 姚志剑[4]
1.南京医科大学第一附属医院临床心理科
2.南京医科大学第一附属医院放射科
3.东南大学生物科学与医学工程学院
4.南京医科大学附属脑科医院心境障碍科

目的 认知障碍是双相情感障碍患者的主要症状群之一，也是其核心特征，被认为是其内表型。不论是疾病的发作期，还是缓解期都存在稳定和持久的认知功能损害。执行功能损害是其认知损害最重要的维度之一。我们假设双相情感障碍患者抑郁发作期存在广泛的认知执行功能及工作记忆损害，并研究其临床相关风险因素。

方法 共招募 250 名受试者，进行临床信息采集和神经认知评估，包括威斯康辛卡片分类测试（WCST）、连线测试-A（TMT-A）、连线测试-B（TMT-B）、数字符号转换测试（DSST）、言语流畅度测试（VFT）、数字广度测试?（DST）和画钟测验（CDT），排除不符合入组标准的受试者，最终纳入健康对照组 131 例、BD（双相抑郁）组 193 例受试者，统计社会人口学信息、临床资料、心理评估和神经认知评估结果的组间差异，并对其相关性进行统计分析，在相关分析的基础上进行线性回归分析。

结果 与对照组相比，BD 组患者 WCST 中试验总数（TA）、总错误数（TE）、持续性应答数（PR）、持续性错误数（PE）、非持续性错误数（NPE）因子分（p< 0.01）均表现较差，BD 组患者在连线测试-A（TMT-A），连线测试-B（TMT-B），数字符号替换测试（DSST），画钟测验（CDT）和数字向后的数字广度测试（DB）中评分较低（p< 0.01），表明其执行功能、工作记忆等方面存在广泛的缺陷。相关分析的结果表明认知执行功能损害和工作记忆受损的相关影响因素主要是年龄和受教育程度（p< 0.001），这也是其风险因素。

结论 双相情感障碍患者抑郁发作期存在显著的认知执行功能及工作记忆损害，在处理速度、注意力等维度损害同样显著，其年龄和受教育程度不仅是其相关因素也是风险因素。

关键字：双相情感障碍，缓解期，执行功能，工作记忆

双相抑郁患者认知功能损害的 beta 神经振荡研究

王昊飞[1] 田水[2] 卢青[3] 姚志剑[4]
1.南京医科大学第一附属医院临床心理科
2.南京医科大学第一附属医院放射科
3.东南大学生物科学与医学工程学院
4.南京医科大学附属脑科医院心境障碍科

目的 认知功能损害是双相情感障碍患者的主要症状群之一，其主要维度包括执行功能，处理速度，注意力和记忆力。不论是其疾病的发作期，还是缓解期都存在稳定和持久的认知功能损害，目前，双相抑郁患者的认知功能损害的神经病理学机制尚未完全阐明。我们采用静息态脑磁图（MEG）来研究双相情感障碍患者的认知功能损害的神经电生理基础。我们假设双相情感障碍患者抑郁发作期存在广泛的认知功能多维度损害，额叶区域的 beta 神经振荡代偿性增高，并与其认知执行功能损害密切相关。

方法 共招募 120 名受试者，排除不符合入组标准，临床信息采集，神经认知评估不完整及未能完成静息态 MEG 数据采集的受试者，最终纳入健康对照组 52 例、双相情感障碍（BD）组 55 例受试者，统计社会人口学信息、临床资料、临床心理评估和认知功能数据的组间差异，并对其相关性进行统计分析。对 MEG 采集的静息态数据进行时频分析各组的信道水平能量密度，进行非参数聚类检验，对认知功能评分各因子和神经振荡进行相关分析，并将信道水平有统计学差异的 beta 能量密度进行源水平分析。

结果 BD 组患者威斯康星卡片分类测试（WCST）结果与健康对照组相比，试验总数（TA）、总错误数（TE）、持续性应答数（PR）、持续性错误数（PE）、非持续性错误数（NPE）五个因子分（p< 0.001）都表现较低。与对照组相比，BD 组连线测试-A（TMT-A）（p< 0.0001），连线测试-B（TMT-B）（p= 0.003）， 数字符号替换测试（DSST）（p< 0.0001），言语流畅性测验（VFT）（p= 0.006），画钟测验（CDT）（p= 0.001），数字向前的数字广度测试（DB）（p< 0.0001）表现较差。与对照相比，BD 组额中央 beta 能量显著增加（t= 4.13, p< 0.0001），对照组相比，源重建的水平记过表明 BD 组在 beta 频段 t 检验统计学差异显著增高（t= 2.639，p< 0.01）有差异的区域主要包括：额下回、楔前叶、缘上回、中央前回、中央后回、辅助运动区等。

结论 双相情感障碍抑郁发作期患者存在显著而广泛的的神经认知功能损害，其维度包括执行功能、工作记忆、处理速度、注意力、记忆力，静息态额下回、楔前叶等区域的 beta 频段神经振荡代偿性增高可能是其认知损害的神经病理学基础。

Does Rumination Mediate The Relationship between Sleep Quality and Depression in Both Patients with Major Depressive Episode and Healthy People: An Exploratory Study

Haowen Zou[1,2], Xumiao Wang[1], Ciqing Bao[1], Hao Sun[1,2], Qiudong Xia[1], Zhilu Chen[1], Zhijian Yao[1,2]
1.Department of mood disorder, the Affiliated Brain Hospital of Nanjing Medical University

2.Nanjing Brain Hospital, Medical School, Nanjing University, Nanjing, China

Background : Although majority of previous studies have demonstrated that rumination or its sub-factors mediate the relationship between sleep disorders and depressive symptoms, they focused on healthy individual instead of patients diagnosed with major depressive episode.

Objective The current study aims to exploratively examine the potential mediating role of symptom rumination, brooding, and reflective pondering in the relationship between sleep quality and depressive symptoms in both patients with major depressive episodes (MDE) and healthy subjects.

Methods A total eighty-three patients and one hundred heathy individuals were enrolled for the study. Eight patients were excluded due to the change in diagnosis after discharge, and three patients dropped out during the data collection. The sample size was determined through an internal pilot study, which suggesting a minimum of 82/247/374 patients and 85/81/76 participants were required to achieve a statistical power of 0.8 for each factor. Participants completed self-reported questionnaire including the Beck Depression Inventory (BDI), the Pittsburgh Sleep Quality Index (PSQI), the Ruminative Response Scale (RRS). Independent sample t-tests and the analysis of covariance (ANCOVA) were conducted to examine the differences in demographic characters and questionnaires scores between two groups correspondingly. Simple mediation analyses were performed using PROCESS Version 4.2, with the PSQI score as the independent variable and BDI score as the dependent variable.

Results Significant differences were observed in education (14.53±2.20/ 15.31±1.44, $t = -3.919$, $p < 0.001$), BDI (19.84±2.48/ 20.96±2.49, $t = -2.929$, $p = 0.004$) for demographical data. Compared to healthy controls, depressive group exhibited significantly higher scores on all questionnaire ($p<0.001$). In the MDE group, symptom rumination (indirect effect/standard error/95% confidential interval, 0.33/ 0.16/ [0.051, 0.668]) were identified as significant mediators in the association between sleep quality and depression, but not the brooding (0.12/ 0.10/ [- 0.044, 0.334]) and reflective pondering (0.0003/ 0.07/ [-0.127, 0.158]). However, in healthy group, symptom rumination (0.50/ 0.17/ [0.146, 0.799]), brooding (0.50/ 0.13/ [0.211, 0.720]), and reflective pondering (0.25/ 0.11/ [0.046, 0.491]) significantly mediate the relationship between sleep quality and depressive symptoms.

Conclusions Our results are consistent with previous studies indicating rumination mediates the relationship between sleep quality and depression in healthy individual. Nonetheless, in the patient group, only symptom rumination emerged as a significant mediator. One possible explanation for this discrepancy is the low statistical power, which might which might have hindered the detection of significant mediating effects.

关键字：Major depressive disorders, sleep disorders, rumination, brooding, reflection.

反应抑制相关的神经振荡模式是区分单相和双相抑郁症的可靠早期识别标志物

夏逸[1] 王晓芹[1] 杜易珊[1] 盛俊领[1] 花玲玲[1] 卢青[2] 姚志剑[1,2]
1.南京医科大学附属脑科医院心境障碍科
2.东南大学生物医学工程

目的 反应抑制损害是导致双相抑郁和单相抑郁冲动的关键认知因素。然而，在心境障碍中，反应抑制损害背后的神经机制尚不清楚。在这里，我们利用脑磁图的高时间分辨率，探讨与反应抑制损害相关的神经环路改变在双相抑郁和单相抑郁中的共性和差异，以及振荡特征是否可以作为双相抑郁的早期生物标志物。

方法 39 例双相抑郁患者、36 例单相抑郁患者、29 例最初被严格诊断为单相抑郁并在随访中转变为双相抑郁的患者和 36 名健康对照完成了 GO/NO-GO 任务下的脑磁图扫描。对脑磁图数据进行了时频分析和连通性分析。此外，我们使用振荡特征作为输入进行机器学习(线性判别分析、Logistic 回归、线性支持向量机、核支持向量机和朴素贝叶斯)，以探索在临床早期识别双相和单相抑郁的可能性。

结果 与健康对照组相比，心境障碍患者的右额下回到前辅助运动区的连接强度降低，右额下回的激活延迟。在患者中，双相患者的 beta 能量低于单相患者，峰值频率高于单相患者。运动冲动性评分与右额下回 beta 激活能量和潜伏期、右额下回与前辅助运动区的功能连接强度有关。这些大脑功能改变特征使双相和单相之间的分类准确率达到约 80%。

结论 前额叶控制网络效率低下是心境障碍反应抑制损害的共同机制，而右额下回的异常活动在双相中更为明显。我们的研究结果表明，反应抑制期间的神经反应可以作为双相早期诊断的生物标志物。

State-trait Anxiety and Perceived Stress As Mediators of Relationship between Sleep Quality and Depressive Symptoms in Patients with Major Depressive Episode and Healthy Individuals

Haowen Zou[1,2], Xumiao Wang[1], Hao Sun[1,2], Qiudong Xia[1], Ciqing Bao[1], Zhilu Chen[1], Zhijian Yao[1,2]
1.Department of mood disorder, the Affiliated Brain Hospital of Nanjing Medical University
2.Nanjing Brain Hospital, Medical School, Nanjing University, Nanjing, China

Background Patients diagnosed with major depressive episode (MDE) exhibit higher levels of anxiety symptoms and perceived stress. Previous research has identified sleep disorders as a risk factor for MDE. In light of the strong correlation between state-trait anxiety, perceived stress, sleep disruption, and depressive symptoms,

it is essential to investigate the potential psychological mechanism involved.

Objective The current study aims to examine whether state-trait anxiety and perceived stress mediate the correlation between sleep quality and depressive symptoms in both patients with MDE and healthy subjects, respectively.

Methods A total eighty-three patients and one hundred heathy individuals were enrolled for the study. Eight patients were excluded due to the change in diagnosis after discharge, and three patients dropped out during the data collection. The sample size was determined through an internal pilot study, which suggesting a minimum of sixty patients and ninety-six healthy subjects were required to achieve a statistical power of 0.8. Participants completed self-reported questionnaire including the Beck Depression Inventory (BDI), the Pittsburgh Sleep Quality Index (PSQI), the State-Trait Anxiety (STAI), and the Perceived Stress Scale (PSS). Independent sample t-tests and the analysis of covariance (ANCOVA) were conducted to examine the differences in demographic characters and questionnaires scores between two groups correspondingly. Simple mediation analyses were performed using PROCESS Version 4.2, with the PSQI score as the independent variable and BDI score as the dependent variable. Additionally, education year, body mass index (BMI), and medication load index (MLI) were involved in the model as covariances.

Results Significant differences were observed in education (14.53±2.20/ 15.31±1.44, t = -3.919, p < 0.001), BDI (19.84±2.48/ 20.96±2.49, t = -2.929, p = 0.004) for demographical data. Compared to healthy controls, depressive group exhibited significantly higher scores on all questionnaire (p<0.001). State anxiety (indirect effect/standard error/95% confidential interval, 0.50/ 0.21/ [0.113, 0.941]), trait anxiety (0.56/ 0.20/ [0.200,0.962]), and perceived stress (0.71/ 0.26/ [0.149, 0.401[) were identified as significant mediators in the association between sleep quality and depression for the MDE group. Similarly, in healthy group, state anxiety (0.59/ 0.23/ [0.138, 1.030]), trait anxiety (0.42/ 0.22/ [0.007, 0.842]), and perceived stress (0.49/ 0.12/ [0.241, 0.709]) significantly mediate the relationship between sleep quality and depressive symptoms.

Conclusions Findings from our mediation analyses confirm the mediating roles of state-trait anxiety and perceived stress in relationship between sleep quality and depressive symptoms. moreover, these influences were observed in both patient with MDE and healthy individuals.

3.东南大学儿童发展与学习科学教育部重点实验室

目的 自杀是全球十大死亡原因之一，目前每年有超过 70 万人死于自杀。其中，双相情感障碍(BD) 是自杀行为发生率最高的情感障碍疾病，BD 患者的自杀风险是一般人群的 20-30 倍。在双相情感障碍患者中普遍存在的自杀问题及其造成的严重负担使我们迫切需要开发不依赖患者自我报告的客观自杀风险标志物，旨在构建更好的智能模型来预测 BD 患者的自杀风险。

方法 本研究招募了 123 例 BD 患者（其中 61 例有自杀未遂史(SAs)，62 例无自杀未遂史(NSAs)），并招募了 68 例健康人作为健康对照组(HEs)。在本研究中，我们利用 LDA 模型将静息状态下的功能连接(RSFC) 分解为多个高连接和低连接模式，以探索 BD 患者中与自杀风险相关的静息态功能连接异常模式。LDA 模型的优势在于其能够量化体现每个样本个体的独特特征，故根据模型对于患者在多个不同潜在因子维度上个体异质性的量化结果，对潜在因子与自杀风险间的相关关系进行分析，检验自杀相关因子的自杀风险预测能力。

结果 建模分析得出了三个具有可分离的全脑高/低 RSFC 模式的因子。SAs 与 NSAs 因子分布的显著差异反映了其中一个以默认模式网络高连通性为特征的因子及其相应的异常 RSFC 模式与高自杀风险相关，而另一个以突显网络及中央执行网络内的高连通性为特征的因子与相对低的自杀风险相关。随后将受试者们在这两个自杀相关因子维度上的表达情况与护士用自杀风险综合评定量表(NGASR) 进行相关分析，证实了以默认模式网络高连通性为特征的因子具有较强的自杀风险预测潜力(r = 0.4180, p < 0.0001)。

结论 本研究提供了一个能够反映自杀相关脑网络异常连接模式的自杀相关风险因子，并挖掘了自杀风险相关脑机制，有望为临床决策和对自杀高危个体的及时筛查和干预提供支持。

Bidirectional Mendelian Randomisation Analysis of The Relationship between Psychiatric Disorders and Frailty

孙文喜[1] 孙平[2] 唐思嘉[3] 吴晓慧[3] 陈俊[3] 方贻儒[4] 张晓斌[1]

1.苏州市广济医院

2.青岛市精神卫生中心

3.上海市精神卫生中心

4.上海交通大学附属瑞金医院

Objective In observational studies, frailty has been strongly associated with mental illness. However, whether the observed associations reflect a causal relationship needs to be clarified. We conducted two-way Mendelian randomization (MR) study to assess the causal relationship

between frailty, as measured by the frailty index (FI), and ten common psychiatric disorders(Schizophrenia, SCZ; Major Depressive Disorder, MDD; Bipolar Disorder, BD; Insomnia, ISN; Obsessive Compulsive Disorder, OCD; Anxiety Disorders, AD; Autism Spectrum Disorder, ASD; Anorexia Nervosa, AN; Mental and behavioral disorders due to opioids, MBDO; Mental and behavioral disorders due to use of other stimulants, including caffeine, MBDS).

Methods Mendelian randomization (MR) was developed on the premise of three assumptions. First, SNPs designated as instrumental variables (IVs) should be extremely connected to exposure. Second, SNPs selected as IVs are required to be independent of confounders. Third, rather than being directly correlated, IVs and RS (outcome) only have a relationship through reproductive variables (exposure).Individuals of European ancestry such as FI (N=175,226) , SCZ (N=320,404), MDD(N=480,359), BD(N=337,199), ISN(N=462,341), OCD(N=33,925), AD(N=463,010), ASD(N=46,351), AN(N=14,477), MBDO(N=215,650), and MBDS (N=215,570) were extracted. Independent genetic variants associated with each phenotype at the genome-wide significance level were used as instruments. Two-sample MR analyses were performed mainly using inverse variance weighting followed by various sensitivity and validation analyses.

Results Genetically predicted increases in SCZ(β = 0.0191, 95% confidence interval [CI] 0.0052–0.0330) and MDD(β = 0.1671, 95% CI 0.1087–0.2255) risk were significantly associated with higher FI. No causal links were identified between genetically predicted BD, ISN, OCD, AD， ASD，AN， MBDO，MBDS risk, and FI. Unfortunately, 10 common psychiatric disorders with FI in the gene for causality prediction were not found in the reverse direction analysis. Additionally, genetic predictions of causal associations of ten common psychiatric disorders with FI were not found in the reverse direction analysis. In sensitivity and validation analyses, the results of the study confirmed stabilization.

Conclusion Our study strengthens the evidence for a causal relationship between two severe psychiatric disorders(SCZ and MDD) and frailty. Further understanding of the pathological mechanisms underlying this association will be crucial to optimize care in psychiatric patients.

真实世界边缘型人格障碍 9 年药物治疗状况及其相关因素研究

杨帆* 王晓露 吕丽华 钟宝亮
武汉市精神卫生中心

目的 开展真实世界BPD住院患者药物治疗状况及其相关因素的回顾性研究，为药物治疗边缘型人格障碍（borderline personality disorder, BPD）提供新参考。

方法 从电子病例中调取 2013 年~2022 年入院 BPD 住院患者人口学和病史资料，描述性分析患者出院时精神科药物治疗情况，采用无序多分类 Logistic 回归分析精神科药物不同联用处方的相关因素。

结果 入组患者 270 例，出院时均保留至少一种精神科药物，96.3%为联合用药。抗精神病药（93.3%）和心境稳定剂（73.3%）列前两位，联用也最多（26.7%），抗抑郁药（55.6%）列第三，镇静催眠药或抗焦虑药（35.9%）最少。不同联用处方的独立相关因素有：共病心境障碍，住院前自杀/自伤史，住院天数。与无共病者比较，共病双相情感障碍/躁狂发作和持续性心境障碍/未特定的心境障碍者均更可能使用抗精神病药和心境稳定剂二药联用（各有 OR 值=0.073， 0.068；OR 值的 95%CI=0.008~0.686， 0.007~0.670）；共病抑郁发作/复发性抑郁障碍者更可能使用除抗精神病药和心境稳定剂二药联用以外的其他组合（各有 OR 值=10.109，5.157， 6.985 ； OR 值的 95%CI=2.655~38.495 ，1.200~22.173，1.421~34.347）。与无自杀/自伤史者比较，有自杀/自伤史者均更可能使用抗精神病药和心境稳定剂为基础的三或四种药物联用（各有 OR 值=4.846，3.250；OR 值的 95%CI=1.758~13.361，1.203~8.779），而使用锐器或锐器合并其他方式自杀/自伤者还更可能使用其他药物组合或单药治疗（OR 值=6.129，OR 值的 95%CI=1.529~24.574）。住院天数多者更可能使用抗精神病药和心境稳定剂为基础的三或四种药物联用，和其他组合或单药治疗（各有 OR 值=1.015，1.019；OR 值的 95%CI=1.005~1.025，1.007~1.031）。以上均有 $P<0.05$。

结论 以更高的药物处方率验证真实世界BPD药物治疗比大多数临床指南推荐更加普遍的既往研究结论，进一步确认常用药物种类和首次着眼于不同联用处方的相关因素，与既往研究结果差异原因可能有研究对象是跨较长时段内入院的住院患者，以及中西方不同的社会文化因素所致不同的共病。

自杀未遂抑郁障碍患者临床特征相关研究

陈志璐[1] 田水[2] 史家波[1] 刘海燕[1] 陈瑜[1] 汤浩[1] 花玲玲[1] 姚志剑[1] 卢青[3]
1.南京医科大学附属脑科医院心境障碍科
2.南京医科大学第一附属医院
3.东南大学生物科学与医学工程学院

目的 根据世界卫生组织数据统计显示，全球每年死于自杀的人数平均超过 80 万人次，抑郁障碍已经位居世界疾病负担的第二名，接近四分之一抑郁障碍患者死于自杀。探讨抑郁障碍患者自杀的相关因素是预防自杀工作的关键，本研究旨在分析抑郁障碍住院患者临床样本资料，探究自杀未遂患者外周血特征，以期为早期识别、干预抑郁障碍患者自杀行为提供部分依据。

方法 收集南京脑科医院精神科诊断为抑郁障碍的住院患者 998 例，根据汉密尔顿抑郁量表第三项自杀条目评估患者本次抑郁发作的自杀意念，根据得分

将患者分为三组，其中 0 分被评定为无自杀意念组(NSI 组，n=347 人)；1～3 分意为过去 1 周内有不同程度的自杀意念，但无自杀未遂史，设为自杀意念组(SI 组，n=584 人)；4 分被评定为自杀未遂组(SA 组，n=67 人)。比较三组间一般资料及外周血临床资料的差异。

结果 三组间在年龄（$\chi 2$=7.05，P=0.001）、抑郁量表得分（F=92.55，P=0.001），抑郁量表得分（F=92.55，P=0.001）、白细胞计数(F=7.46，P=0.001)及免疫球蛋白 G (F=4.37，P=0.010)指标存在差异，事后检验提示 SA 组年龄、甲状腺激素水平、免疫球蛋白 G 水平均低于 NSI、SI 组，SA 白细胞计数水平高于 NSI、SI 组，SI 组汉密尔顿抑郁量表得分高于 NSI、SA 组。

结论 住院自杀未遂抑郁障碍患者年龄偏小可能与其冲动性相关，此外，自杀未遂患者白细胞水平略偏高，免疫球蛋白 G 水平略偏低，可能与其免疫水平相关。

Patterns of Mood Stabilizers Prescriptions in Psychiatric Patients in China: A National Survey

张雨龙[1,2] 刘志伟[3] 王萍[1,2] 刘寰忠[1,2]
1.安徽医科大学附属巢湖医院
2.安徽省精神医学中心
3.阜阳市第三人民医院

Objective To investigate the patterns and correlates of mood stabilizers among recently discharged inpatients with bipolar disorder in China.

Methods The study included discharged patients from 41 tertiary psychiatric hospitals in 29 provinces between March 19–30, 2019. A total of 439 inpatients with schizophrenia were included. Socio-demographic and clinical data were retrieved from medical records upon discharge.

Results The utilization rates of the top three mood stabilizers in patients with bipolar disorders were: lithium carbonate (23.0 %, 101/439), magnesium valproate (22.8 %, 100/439), sodium valproate (22.8%, 100/439). 13.4% patients with bipolar disorder were treated with more than two kinds of mood stabilizers.There were significant differences between groups taking mood stabilizers and those not taking mood stabilizers in terms of educational background, involuntary admission, restrained during hospitalization, agitation, and use of antipsychotics or antidepressants. Interestingly, there were 16.9 % (74/439) patients with bipolar disorders not taking mood stabilizers, mightily due to 81.1 % (60/74) of these patients were taking antipsychotics. 77.9 % (342/439) patients with bipolar disorder treated with mood stabilizers and antipsychotics, 13.7 % (60/439) patients only treated with antipsychotics and 5.2 % (23/439) patients only treated with mood stabilizers. 3.2 % (14/439) patients with bipolar disorder did not prescribe with mood stabilizers or antipsychotics neither.The binary logistic regression shown that patients with bipolar disorders who were treated in East, Central or West China, taking less antidepressants or more antipsychotics were significantly correlated factors on mood stabilizers prescription

Conclusion Mood stabilizers in China is common on inpatients settings. The proportion of mood stabilizers in China is higher than in many other countries, despite limited data to support the efficacy of many combinations.

首诊未用药精神分裂症及双相情感障碍患者低骨量及骨质疏松的风险比较

李素娟 邱妍 滕紫薇 徐雪蕾 陈晋东 伍海姗*
中南大学湘雅二医院

目的 越来越多的数据表明精神分裂症（SCZ）和双相情感障碍（BD）具有显著的代谢风险，但很少有研究关注骨代谢。本研究的目的是联合评估比较 SCZ、BD 患者低骨量和骨质疏松症的患病率及其相关影响因素。

方法 采用双能 X 射线吸收法测定首诊未用药的 SCZ 患者（n=56）、BD 患者（n=130）和 108 名健康志愿者的腰椎（L1–L4）和左髋（Neck/Troch/Ward's）骨密度（BMD）。此外，我们还测定了各组的骨转换标志物（BTMs），包括I型前胶原 N 末端前肽（PINP）、骨钙素（OC）和I型胶原 C 末端交联末端肽（CTX-I）。同时，收集了受试者的人口统计学和临床特征。

结果 本研究发现，与健康对照组相比，SCZ 和 BD 患者的 BMD 在多个部位显著较低，低骨量和骨质疏松症的发生率显著较高。在主要观察区域全腰椎（F=18.368，p＜0.001）和全左髋（F=14.790，p＜001）SCZ 和 BD 患者的 BMD 均显著低于健康对照组，SCZ 组低于 BD 组。SCZ 组和 BD 组 OC（H=11.421，p＝0.003）水平显著高于健康对照组。二元回归分析显示呗诊断为 SCZ 或 BD 是低骨量和骨质疏松症的独立危险因素。此外，性别、年龄和 BTM 也会影响低骨量和骨质疏松症的发生。

结论 本文的研究结果有助于我们理解 SCZ 和 BD 的骨代谢风险增加。

IHMT 与 MT 技术检测双相障碍大脑白质髓鞘微结构改变的对比评价研究

周智凤[1] 钱龙[2] 张迎黎[1] 侯刚强[1]
1.深圳市精神卫生中心/深圳市康宁医院
2.GE 医疗中国总部

目的 非均匀磁化传递（inhomogeneous magnetization transfer, IHMT）是磁化传递（magnetization transfer, MT）技术的延伸。 IHMT 技术根据组织偶极级弛豫时间（T1D）的不同，采用选择性饱和滤波技术将组织中唯一具有长 T1D 的髓磷脂结构进行成像，从而实现高选择性高特异性的髓鞘成像。本研究旨在对比探究二者在双相障碍（bipolar disorder, BD）患者大脑白质髓鞘微结构改变中的应用价值。

方法 纳入根据美国《精神障碍诊断与统计手册（第五版）》诊断标准诊断的 BD 患者 31 例（男 8 例，女 23 例；年龄 26.6±7.8 岁）以及健康志愿者 42 例（男 12 例，女 30 例；年龄 29.5±8.1 岁）。采用 3.0 T 磁共振扫描仪（Discovery MR750, GE, USA）采集各个被试的大脑 3D T1 结构像及 IHMT 序列图像，排除颅脑外伤史及大脑肿瘤、血管畸形等器质性病变者，经过后处理得到各个被试大脑白质纤维束的 2 个 IHMT 参数，即定量 IHMT（quantitative IHMT, qIHMT）及 IHMT 比率（IHMT ratio, IHMTR）值，以及 2 个 MT 参数，即定量 MT（qMT）及 MT 比率（MTR）值。采用双样本 t 检验比较两组被试之间 IHMT 及 MT 参数值的差异，并采用受试者工作特征曲线（ROC）分析评估这些参数在鉴别两组被试白质髓鞘中的显著性水平。

结果 双样本 t 检验结果显示：BD 组胼胝体膝部及体部、左侧内囊前肢、左侧前放射冠及扣带回的 IHMT 参数值比健康对照组明显降低（FDR 校正，$p<0.05$）；BD 组扣带回的 MT 参数比健康对照组明显降低（FDR 校正，$p<0.05$）。ROC 曲线分析结果显示：qIHMT 的曲线下面积（AUC）为 0.866，对应的敏感度及特异度分别为 100%和 67.7%；IHMTR 的 AUC 为 0.899，对应的敏感度及特异度分别为 85.7%和 87.1%；qMT 的 AUC 为 0.746，对应的敏感度及特异度分别为 100%和 41.9%；MTR 的 AUC 为 0.773，对应的敏感度及特异度分别为 95.2%和 51.6%。

结论 BD 患者脑内白质区域髓鞘微结构存在 IHMT 和 MT 成像可检测到的显著异常。与 MT 相比，IHMT 参数检测的白质髓鞘微结构变化范围更广，特异性更高。

关键字：磁化传递，双相障碍，白质，髓鞘，磁共振成像

Correlation between Elevated Serum Interleukin-1β，interleukin-16 Levels and Psychiatric Symptoms in Patients with Schizophrenia at Different Stages

Xialong Cheng Yu Xie Anzhen Wang Cuizhen Zhu Fanfan Yan Wenzhi Pei Xulai Zhang*
合肥市精神病医院

Background There is increasing evidence that immune dysfunction plays an important role in the pathogenesis of schizophrenia. Meso Scale Discovery (MSD) is bioanalytical method, which can detect serum inflammatory factors in patients.The present study was aimed to explore the correlation between the levels of serum inflammatory factors and psychiatric symptoms in patients with schizophrenia at different stages and investigate a wide panel of inflammatory factors as independent factors for the pathogenesis of schizophrenia.

Methods We recruited 116 participants, including patients with first-episode schizophrenia (FEG, n=40), recurrence patients (REG, n=40) with relapse-episode schizophrenia, and a control group (healthy people, HP, n=36). Patients are diagnosed according to the DSM -V. The plasma levels of IFN-γ, IL-10, IL-1β, IL-2, IL-6, TNF-α, CRP, VEGF, IL-15, and IL-16 were tested by the MSD technique. Patient-related data was collected, including sociodemographic data, positive and negative symptom scale (PANSS), and brief psychiatric rating scale (BPRS) and subscale scores.

Results There were significant differences in serum IL-1β (F=2.37, P=0.014) and IL-16 (F=4.40, P<0.001) levels among the three groups. The level of serum IL-1β in the first-episode group was significantly higher than in the recurrence group (F=0.87, P=0.021) and control group (F=2.03, P=0.013), but there was no significant difference between the recurrence group and control group (F=1.65, P=0.806). The serum IL-16 levels in the first-episode group (F=1.18, P<0.001) and the recurrence group (F=0.83, P<0.001) were significantly higher than in the control group, and there was no significant difference between the first-episode group and the recurrence group (F=1.65, P=0.61). Serum IL-1β was negatively correlated with the general psychopathological score (GPS) of PANSS (R=-0.353, P=0.026). In the recurrence group, serum IL-16 was positively correlated with the negative score (NEG) of the PANSS scale (R=0.335, P=0.035) and negatively correlated with the composite score (COM) (R=-0.329, P=0.038). In the study, IL-16 levels were an independent variable of the onset of schizophrenia both in the first-episode (OR=1.034, P=0.002) and recurrence groups (OR=1.049, P=0.003). ROC curve analysis showed that the areas under IL-16(FEG) and IL-16(REG) curves were 0.883 (95%CI:0.794-0.942) and 0.887 (95%CI:0.801-0.950).

Conclusions Serum IL-1β and IL-16 levels were different between patients with schizophrenia and healthy people. Serum IL-1β levels in first-episode schizophrenia and serum IL-16 levels in relapsing schizophrenia were correlated with the parts of psychiatric symptoms. The IL-16 level may be an independent factor associating with the onset of schizophrenia.

奖赏环路静息态功能连接特征在鉴别转相前双相障碍与单相抑郁中的价值

史家波[1] 耿纪婷[1] 阎锐[1] 刘晓雪[1] 陈瑜[1] 卢青[2] 姚志剑[1]
1.南京医科大学附属脑科医院心境障碍科
2.东南大学儿童发展与学习科学教育部重点实验室

目的 回顾性比较单相抑郁症(UD)和躁狂发作前双相抑郁(tBD)奖赏环路中的静息态功能连接，探究双相障碍(BD)早期识别的奖赏环路静息态功能连接特征。

方法 66 名抑郁症患者入组，他们在基线之前从未经历过躁狂/轻躁发作，根据随访中是否存在躁狂/轻躁狂，将所有患者回顾性分为两组(33 例 tBD 和 33 例 UD)。同时，还招募了 40 名匹配的健康对照(HC)。受试者在基线接受静息状态 fMRI 扫描获得影像数据，计算各组奖赏环路兴趣脑区间的静息态功能连接，用患者组间存在差异的 rsFC 值鉴别 tBD 与 UD 中的准确性，进行了 receiver operating characteristics (ROC)分析，利用 SPSS 软件可以得到曲线下的面积(AUC)，同时，计算敏感性、特异性和优势比三个统计量，以评估诊断效率。。

结果 tBD 组左腹侧被盖区(VTA)和左腹侧纹状体(VS)之间的 rsFC 较 UD 组降低，根据 ROC 分析，预测诊断 tBD 具有较好的准确性。两组患者奖赏回路内 rsFC 无显著差异。

结论 研究结果表明，在躁狂/轻躁发作前的双相障碍的早期抑郁阶段，双相情感障碍在静息状态时 VTA-VS 功能同步性的奖赏回路上已经与单极抑郁有所不同，可能是早期鉴别的影像标记。

Associations between Resting-state Functional Network Centrality and Cognitive Impairment in Unmedicated, Euthymic Bipolar Patients

王佳卉[1] 李红[1] 吴启今[1] 王栋[2]
1.郑州大学第一附属医院精准医学研究学组
2.苏州市广济医院

Objective Cognitive impairment is prevalent in bipolar disorder (BD), and has negative impacts on functional impairments and quality of life, despite euthymic states in most individuals. The underlying neurobiological basis of cognitive impairment in BD is still unclear.

Methods To further explore potential connectivity abnormalities and their associations with cognitive impairment, we conducted a degree centrality（DC）analysis and DC (seed)-based functional connectivity (FC) approach in unmedicated, euthymic individuals with BD. Our study included 34 euthymic BD patients and 35 healthy controls (HC) matched for age, gender and education years.

Results We found extensive DC changes in brain activity, with lower DC values in the left medial frontal gyrus, inferior frontal gyrus, and middle frontal gyrus, and increased DC values in the left insula, bilateral precentral gyrus, and right medial frontal gyrus in BD patients compared to HC. Furthermore, we observed positive or negative correlations between DC values of the inferior frontal gyrus, insula_L, precentral gyrus (L), precentral gyrus (R), and medial frontal gyrus and multiple-domain cognitive assessment scores. Additionally, we identified intra-network and internetwork functional connectivity alterations in the default mode network (DMN), fronto-parietal network (FPN), and fronto-insular network (FRN) in euthymic BD patients compared to HC.

Conclusion Our findings highlight abnormal neuronal networks involving multiple frontal brain regions and thalamus, which may contribute to cognitive deficits in individuals with euthymic BD. These findings may serve as potential hallmarks of BD, contributing to a better understanding of the neural mechanism of cognitive impairment during euthymia.

Metabolites Alterations in The Medial Prefrontal Cortex Following 6 Months of Medication Treatment in Bipolar Disorder Patients：A 1H MRS Study

李海锦[1] 李红[1] 王栋[2]
1.郑州大学附属第一医院
2.苏州市广济医院

Objective Medial prefrontal cortex (mPFC) plays a key role in the regulation of mood and aberrant structure or function in mPFC have been identified in bipolar disorder (BD). Although MRS studies on neuro-metabolism of mPFC have been performed extensively, no study has evaluated longitudinal clinical outcomes between acute and euthymic states of BD patients with both mania and depression associated with 1H-MRS metabolic changes. This study aimed to longitudinally assess brain metabolites difference of mPFC between acute- and euthymic-episode of BD depression and mania with 6-month medication treatment.

Methods Fifty-three BD patient (32 in depressive episode and 21 in manic episode) and 34 HC, matched for age and gender, were enrolled in this study. After 6 months of treatment, 40 (22 from depression group, 18 from mania group) out of 53 completed the follow-up scan. All subjects were submitted to a 3-Tesla brain 1H-MRS scan at baseline and month 6.

Results Both depressed and manic patients showed significant decreased NAA/PCr+Cr ratios (mean = 0.96 vs. 1.10, p = 0.004; mean = 0.95 vs. 1.10, p = 0.006) in baseline, Compared with HCs. In 6-month follow-up, manic group showed significant decline in Gln/Cr+PCr (t=2.45, P=0.03) compared with acute-episode. No significant alterations was found in depressed group between baseline and follow-up.

Conclusion Acute-episode of BD mania and depression is associated with decreased NAA/Cr+PCr ratio. Gln/Cr+PCr ratio may be a key identification between manic episode and depressive episode of BD. Taken together, this study implicates NAA and Gln abnormalities in mPFC are a prominent feature of dynamic evolution of BD.

2.淮安市第三人民医院

目的 抑郁症（MDD）和双相情感障碍（BD）是最常见的情绪障碍。两者病因不同，但在抑郁发作期临床表现相似，容易误诊。因此开发两者的特异性生物标志物对于 MDD 和 BD 的正确诊断和治疗是非常重要的。然而，对于代谢组学特征是否能区分重度抑郁症（MDD）、双相抑郁症（BP-D）知之甚少。因此，本研究探讨抑郁症及双相抑郁、双相躁狂的代谢组组特征，以及这些特征是否可以用于两者的鉴别诊断。

方法 纳入健康对照组（HC；n = 48）、MDD（n = 46）、BP-D（n = 48），并收集所有受试者的一般情况、临床特征（汉密尔顿抑郁量表、汉密尔顿焦虑量表、病程），采集血清标本，使用非靶向代谢组学技术对代谢组特征进行分析，计算各组间差异代谢物，并结合回归树和随机森林回归方法，寻找 3 组间差异特征，建立随机森林分类模型，探讨代谢组学特征在单双相抑郁障碍中的鉴别诊断效能。

结果 各组间一般资料无统计学差异，MDD、BP-D 患者的代谢物组成发生了明显的变化。相对于 HC, MDD 和 BP-D 患者中常见的代谢紊乱通路包括甘油磷脂的代谢、初级胆汁酸的生物合成、亚油酸代谢、鞘磷脂代谢和花生四烯酸的代谢等，两者具有差异的代谢物设涉及的通路是甘油磷脂的代谢、初级胆汁酸的生物合成. 此外，我们确定了一个由 10 个代谢物（包括磷脂酰乙醇胺、溶血磷脂酰胆碱、硫酸基化脂醇酯、胆固醇代谢、胆红素代谢、磷酰胆碱、牛黄胆酸等）组成的特征，可以区分 MDD 患者和 BP-D 或 HC 患者，曲线下面积（AUC）值从 0.797 到 0.958。

结论 我们的结果为通过非靶向代谢组技术鉴定的代谢组学特征对 MDD、BP-D 进行鉴别性诊断提供了临床依据。

Study on Exosomes for Identifying Bipolar Affective Disorder in Early Stage, A Study Protocol of Cross-sectional and Validity Trial

杨程皓*
天津市安定医院

Objective Bipolar disorder (BD) is a chronic and recurrent mental illness characterized by depressive episodes and manic or hypomanic episodes, leading to severe functional impairment and cognitive damage. Unfortunately, it is difficult to accurately distinguish between major depressive disorder (MDD) and BD in the early stages, resulting in misdiagnosis and mistreatment. According to statistics, only 20% of BD patients initiated with depressive symptoms receive a correct diagnosis within the first year of onset, with an average delay of 5-10 years from first episode to final diagnosis. BD patients are often treated with antidepressant medication systematically due to being diagnosed with MDD in absence of mood stabilisers, affecting the disease course and clinical outcomes. The current study aims to explore the role of plasma exosomes as biomarker to distinguish BD from MDD in early stage.

Methods The study includes two stages: the first stage is a case-control study, comparing the concentrations of plasma exosome metabolites (microRNA and related proteins) among three groups (BD patients, MDD patients, and healthy controls (HC), n=30 per group) to identify target microRNA and proteins with significant differences. The "latent class analysis (LCA)" on target microRNA and proteins will be performed on all samples to observe whether it can effectively distinguish BD, MDD, and HC. Then, based on the LCA analysis results, "receiver operating characteristic (ROC)" analysis will be conducted to further determine the optimal concentration for each indicator and ultimately determine the target biomarkers. The second stage is a clinical validation study in which subjects, who come from an on-going trial and with a first episode of depressive symptoms and were followed up for five years at least, are divided into two groups (MDD group and BD group, n=20 respectively) based on whether they have hypomanic/manic episodes currently or previously, according to the DSM-5 diagnosed with SCID-5. All target biomarkers will be test in plasma samples reserved at the initial stage to detect whether the diagnosis indicated by the biomarkers is consistent with diagnosis by DSM-5. As well as the accuracy of predicting diagnosis, the correlation between specific biomarkers and treatment response, clinical outcome, and adverse responses will also be observed.

Results unavailable for a study protocol.

Conclusion Exosomes can freely pass through the blood-brain barrier and serve as a good medium for connecting the peripheral system and the central nervous system. Improving the early diagnosis of BD would help develop appropriate clinical intervention strategy, improve the quality of disease management, and significantly reduce the burden of disease. At the same time, this study is also hope to provide a theoretical basis for exploring the pathogenesis of bipolar disorder.

关键字：Exosome, Bipolar affective disorder, early diagnosis, microRNA

双相情感障碍患者的情绪识别特征及其相关影响因素

李大志 李茹 孙霞 楚利君 李嘉欣 张健 焦清艳 贾晓菊 高萍 张勇*

天津市安定医院

目的 探索双相情感障碍患者的情绪识别特征及其与临床变量的相关性。

方法 稳定期双相情感障碍患者（BD）180 例，稳定期精神分裂症患者（SCH）60 例，按照年龄、性别及教育年限相匹配的健康对照（HC）100 例。所有被试均完成 MCCB、MoCA 及中文版 Bell-Lysaker 情绪识别任务（BLERT）的评估，BD 组完成 HAMD-17、YMRS，SCH 组完成 PANSS，HC 组完成 SCL-90 等工具的评估。

结果 1、BLERT 总分、正性、负性及中性情绪在 BD 组、SCH 组与 HC 组间差异有统计学意义（F=55.71，P<0.01；F=30.50，P<0.01；F=44.67，P<0.01；F=24.09，P<0.01），SCH 低于 BD 低于 HC 组。2、BLERT 总分在 BD 与 HC 最佳划界分为 15 分（敏感性为 0.85，特异性为 0.45），以 15 分为临界，BD 组中 82（45.6%）例患者存在情绪识别缺陷，其中男性 45.7%，女性 54.3%；双相I型 27.8%，双相II型 72.2%；阳性家族史 17.5%；未婚 28.4%，已婚 55.6%，离异 14.8%，再婚 1.2%；年龄 40.8±13.9；教育年限 13.4±3.1。3、BD 组 BLERT 总分与年龄（r=-0.52）、教育年限（r=0.31)存在一定的相关性，与 MCCB 中的信息处理速度（r=0.39）、词语学习能力（r=0.38）、视觉学习能力（r=0.42）（P 均<0.001）存在相关性；与 MoCA 总分（r=0.49）存在较高正相关性，其中视空间执行（r=0.32），命名（r=0.33），语言顺畅（r=0.31），抽象思维（r=0.28），延迟记忆（r=0.37）（P 均<0.001）相关显著。4、多元线性逐步回归分析显示调整后 R2 为 0.48（F=26.89，P<0.001），回归方程：BLERT 总分=0.77-0.103*年龄+0.322*教育年限+0.094*视觉学习+2.822*MoCA 命名。

结论 1、双相情感障碍患者情绪识别能力全面受损，无论是正性情绪、负性情绪及中性情绪等情绪维度均低于健康人群，但均高于精神分裂症患者。2、情绪识别能力存在缺陷的双相情感障碍患者具有一定的临床特征，以女性、双相II型、已婚占比较高，而教育程度及年龄适中。3、双相情感障碍患者情绪识别能力与年龄、教育年限及神经认知功能多个维度存在相关性。

首诊抑郁症和双相抑郁的认知障碍差异及与 CcfmtDNA 的相关性研究

金坤 滕紫薇 陈晋东 伍海姗*
中南大学湘雅二医院

目的 抑郁症与双相抑郁的临床症状高度重叠，在鉴别上有一定难度，比较其认知功能差异可能成为区分两种疾病的一种手段。本研究旨在比较抑郁症、双相抑郁患者及正常对照之间认知功能的差异，并探索血浆循环游离线粒体 DNA（circulating cell-free mitochondrial DNA，ccfmtDNA）与抑郁症、双相抑郁患者认知功能的关系。

方法 本研究为横断面研究，分别招募首诊未服药抑郁症患者 87 人、首诊未服药双相抑郁患者 78 人和健康对照 70 人。使用 HAMD-17、YMRS 评估受试者的临床症状，RBANS 量表、Stroop 色词测验评估受试者的认知功能，并检测其中部分受试者的血浆 ccfmtDNA 水平。统计分析在 SPSS25 中进行。

结果 抑郁症和双相抑郁患者在即刻记忆、延迟记忆、言语功能、注意力、视觉广度、执行功能等多个维度上均存在缺陷，抑郁症患者的视觉广度较双相抑郁患者损害得更严重（p=0.008）。抑郁症组的血浆 ccfmtDNA 水平显著高于双相抑郁组（p=0.028），两组均显著高于健康对照组（p＜0.05）。在抑郁症组中，血浆 ccfmtDNA 水平与言语功能呈负相关（r=-0.227，p=0.034）。

结论 抑郁症和双相抑郁患者普遍存在多维度的认知功能障碍，血浆 ccfmtDNA 水平与抑郁症患者的部分认知功能缺陷具有相关性。

关键字：抑郁症；双相抑郁；认知功能；ccfmtDNA

行为成瘾中的内在脑网络功能障碍：静息状态功能连接的荟萃分析

陈盼 王颖*
暨南大学附属第一医院(广州华侨医院)

目的 研究人员试图通过静息状态功能连接（rsFC）来识别行为成瘾（BA）中的网络功能障碍。本研究旨在识别 BA 中大规模网络的异常模式。

方法 从多个数据库中检索了基于全脑种子的 rs-FC 研究，比较了 BA 个体和健康对照组（HC）。采用多层次核密度分析来识别 BA 与每个先前网络的超连接或低连接相关的大脑网络。

结果 56 篇基于种子的 rs-FC 出版物（1755 例 BA 患者和 1828 名 HC 患者）纳入 meta 分析。本研究显示，BA 个体表现出(1)额顶叶网络（FN）内的低连通性和腹侧注意网络（VAN）内的低连通性；(2)FN 与 VAN 区域之间的低连通性，VAN 与 FN 与默认模式网络（DMN）之间的低连通性，DMN 与 FN 区域之间的超连通性；(3)奖励系统与感觉运动网络（SS）、DMN 和 VAN 区域之间的低连通性；(4)FN 与 SS 区域之间的低连通性，VAN 与 SS 区域之间的超连通性。

结论 网络内及网络间的功能紊乱，可能揭示了由于无法控制的行为可能导致突显信息的处理偏倚，难以区分自我产生的世界刺激和外部世界刺激，情绪感知和调节的缺陷，以及奖赏处理的功能失调。这些发现激发了 BA 的一个不间断的大规模脑网络模型，其中大规模网络之间的不间断的功能协调可能是 BA 的核心特征的基础。

Sex-differential Cognitive Performance on MCCB of Youth with BD-II Depression

黄东[1] 赖顺凯[1] 钟舒明[1] 张一靓[1] 何嘉丽[1] 严舒雅[1] 黄晓思[1] 陆晓丹[1] 段蔓莹[2] 宋恺琳[2] 叶恺唯[2] 陈妍荻[2] 叶穗怡[2] 赖健康[2] 钟琦琳[1] 宋小东[1] 贾艳滨[1]
1.暨南大学附属第一医院(广州华侨医院)
2.暨南大学管理学院

Objective Cognitive impairment is a core feature of bipolar disorder (BD) and hinders recovery. However, the sex-specific effect on cognitive impairment at the BD subtype level remains unclear. This study aimed to investigate the sex differentials in cognitive impairment in BD subtype II (BD-II).

Methods The cross-sectional study recruited 125 unmediated young adults with BD-II depression and 140 healthy controls (HCs) matched for age, sex, and education. The Measurement and Treatment Research to Improve Cognition in Schizophrenia (MATRICS) Consensus Cognitive Battery (MCCB) in Chinese version was used to assess cognitive functions. Hamilton Depression Rating Scale (24-HDRS) and Young Mania Rating Scale (YMRS) were used to measure mood state. Multivariate analysis of covariance (MANCOVA) was conducted.

Results The MCCB composite and its seven cognitive domains performed worse in BD-II depression patients than in HCs (all $p < 0.001$). MANCOVA revealed significant sex-by-group interactions on attention/vigilance ($F = 6.224$, $df = 1$, $p = 0.013$), verbal learning ($F = 9.847$, $df = 1$, $p = 0.002$), visual learning ($F = 4.242$, $df = 1$, $p = 0.040$), and composite ($F = 8.819$, $df = 1$, $p = 0.003$), when age and education were controlled. Post hoc analyses suggested that males performed worse in the above-mentioned MCCB tests than females in BD-II depression.

Conclusion Our study demonstrated generalized cognitive deficits in unmedicated patients with BD-II depression. Male patients performed more severe cognitive impairment on attention/vigilance, verbal learning, and visual learning compared to female patients.

苏州市青少年心理健康状况现状分析

孔令华* 王馨悦 杨勇
苏州市广济医院

目的 了解苏州市青少年心理健康状况并分析其影响因素，为提高青少年心理健康水平提供科学依据和理论指导。

方法 采用整群分层随机抽样的方法，于 2019 年 6 月至 12 月对苏州市某城区的 18 所中学进行调查，采用一般情况调查表、患者健康问卷抑郁量表(PHQ-9)、广泛性焦虑量表(GAD-7) 、匹兹堡睡眠质量指数量表（PSQI）调查其心理状况水平及其影响因素。

结果 本次研究的 10176 名青少年睡眠质量平均得分 4.99 分，焦虑情绪平均得分 5.15 分，抑郁情绪平均得分 5.30 分，睡眠问题检出率 19.4%，抑郁情绪检出率 18.0%。多因素 logistic 回归分析显示，消极应对方式（OR=1.061，P＜0.001）、父母关系差（OR=2.644，P＜0.001）、学校欺凌（OR=1.446，P＜0.001）、焦虑情绪（OR=1.153，P＜0.001）、高中年级（OR=1.807，P＜0.001）、女性（OR=1.217，P＜0.001）是青少年睡眠问题的危险因素。父母关系差（OR=2.103，P＜0.001）、学校欺凌（OR=1.731，P＜0.001）、焦虑情绪（OR=1.502，P＜0.001）、睡眠问题（OR=1.305，P＜0.001）、女性（OR=1.193，P＜0.05）、是青少年抑郁情绪的危险因素。

结论 青少年心理状况问题存在，消极应对方式、父母关系差、学校欺凌、焦虑情绪、女性是青少年心理健康状况的危险因素，应针对危险因素进行干预，提高青少年心理健康水平。

不同性别双相障碍患者临床特征和认知功能差异性研究

王中刚[1] 宋海宁[1,2] 高岭楠[1,2]
1.山东省戴庄医院
2.济宁医学院

目的 探讨不同性别双相情感障碍患者人口学特征和疾病临床特征的差异性，探讨不同性别双相情感障碍患者认知功能的差异性。

方法 （1）本研究纳入首次确诊的双相情感障碍患者 168 例，根据性别不同分为分为男性组（n=107）和女性组（n=61），同时纳入 75 例健康对照者。采集所有入组受试者的一般人口学信息，采集所有入组患者的临床疾病特征信息，在患者病情平稳 2 周后采用持续注意测验（Continuous Attention Test, CPT）、数字广度测验（Digital Span Test, DST）、威斯康星卡片分类测验（Wsiconsin card sorting test ,WCST）检测所有入组患者的认知功能，测查健康对照者的认知功能，比较三组间认知功能的差异性，分析影响认知功能的相关临床因素。

结果 （1）男性患者首次发病类型无差异，躁狂/轻躁狂发作例数与抑郁发作例数基本一致（50.70%vs.49.30%），而女性患者首次发病类型多为抑郁发作、躁狂发作/轻躁狂发作相对较少（62.70%vs.32,8%）；（2）男性组患者中，伴有精神病性症状的患者首次发病类型多为抑郁发作、躁狂/轻躁狂发作较少（65.60% vs.44.00%）；躁狂首发患者持续注意测验评分、数字广度评分、WCST 完成分类数等指标均高于首发抑郁组的患者（均 P<0.05）。（3）女性组患者中，躁狂首发的患者 CPT 评分、DST 评分均高于首发抑郁组的患者（均 P<0.05），前者的 WCST 总应答数、错误应答数均低于后者（均 P<0.05）；（4）男性组和女性组相比，男性患者的 WCST 总应答数、完成第一个分类所需应答数等均明显高于女性患者（均 P<0.05）；（5）男性组、女性组发病类型比较均提示躁

狂首发患者的 CPT、WCST 的概念形成能力等优于抑郁首发患者，同时较对照组差（均 P<0.05）；（6）男性组、女性组患者认知功能损害均与起病年龄呈负相关（均 P<0.05）。

结论 （1）男性和女性双相障碍均存在一定程度的认知功能损害；（2）男性双相障碍患者的认知功能相较于女性患者在抽象概括能力等方面较差，首次发病类型为躁狂/轻躁狂发作的患者认知功能受损程度轻于抑郁首发患者；（3）男性和和女性双相障碍认知功能损害均受首次起病年龄等多种因素影响，影响因素不完全一致。

关键字：双相障碍，性别，临床特征，首发症状，认知功能损害

双相情感障碍患者共病 2 型糖尿病的患病率及危险因素

张晓宇 张勇*
天津市安定医院

目的 双相情感障碍以反复发作的抑郁和躁狂症为特征，影响全球高达 2%的人口。有证据表明双相障碍患者有更高的 2 型糖尿病（T2DM）发病率，但报告发病率差异很大。目前也尚不清楚糖尿病的高发病率是由精神药物、不健康的生活方式、遗传风险因素、或共同的病理生理机制等，还是这些因素的组合引起的。因此本研究分析探讨双相障碍患者共病 T2DM 的患病率及其相关风险因素。

方法 本研究采用横断面研究的方法利用电子病历系统收集 2016 年 1 月 1 日—2020 年 12 月 31 日于天津市安定医院住院的双相情感障碍患者相关资料，包括社会人口学信息、临床特征资料及空腹血液检查结果，研究数据均来源于末次住院资料。所有患者均符合 ICD-10 双相情感障碍诊断标准，糖尿病的诊断根据美国糖尿病协会的标准。对分类变量采用卡方检验，连续变量进行正态分布检验后采用独立样本 T 检验或非参数检验比较伴或不伴 T2DM 双相障碍患者的组间差异。最后采用二元 logistic 回归分析双相障碍患者共病 T2DM 的危险因素。

结果 研究共计纳入 1106 例患者，共病 T2DM 121 人。T2DM 组首次发病年龄较大（F=19.24，p<0.001），病程较长（F=52.84，p<0.001），TG（Z=-4.894，P<0.001）和 LDL（Z=-2.374，P=0.018）显著高于非 T2DM 组，HDL（Z=-2.532，P=0.012）低于非 T2DM 组。两组间情绪稳定剂的使用有显著性差异（P=0.003），丙戊酸盐在 T2DM 组（P=0.003）中更常用。相比之下，奥氮平（P=0.005）在非 T2 型糖尿病组中使用更频繁。两组间 TSH、T3 和 T4 以及苯二氮卓类药物的使用无差异。进一步二元 logistic 回归分析显示，首次发病时年龄、总病程，TG、HDL、丙戊酸盐、奥氮平是影响共病糖尿病的危险因素。

结论 双相障碍患者的 2 型糖尿病患病率较高。首次发病年龄较大，总病程较长，使用丙戊酸盐，奥氮平，高 TG，低 HDL 是影响糖尿病发病的危险因素。本研究为横断面研究，存在一定局限性，未来可以进行纵向研究，并长期随访，来进一步阐明双相障碍患者伴发 T2DM 之间的关系。

Sleep Deprivation Alleviates Depression-like Behaviors in Mice Via Inhibiting Immune and Inflammatory Pathways in The Anterior Cingulate Cortex and Improving Neuroplasticity

石书香* 张梦珂 谢伟杰 鞠培俊 陈宁宁 王凡 吕洞宾 王嫩缇 洪武*
上海市精神卫生中心

Objective Sleep deprivation (SD) has been suggested to have a rapid antidepressant effect. There is substantial evidence that neuroinflammation and neuroplasticity play critical roles in the pathophysiology and treatment of depression. Here, we investigated whether SD attenuates depression-like behaviors by inhibiting the activation of neuroinflammation and improving neuroplasticity in depression.

Methods Adult male C57BL/6J mice were subjected to chronic restraint stress (CRS) for 6 weeks, and 6 hours of SD were administrated. Behavioral tests were performed to measure depression-like behaviors. RNA-sequencing and bioinformatic analysis were performed in the anterior cingulate cortex (ACC). The differentially expressed genes were confirmed by quantitative real-time polymerase chain reaction (RT-qPCR). Neuroinflammation and neuroplasticity were measured by western blotting and immunofluorescence staining.

Results Behavioral tests demonstrated that SD swiftly attenuated the depression-like behaviors induced by CRS. RNA-sequencing identified the upregulated immune and inflammatory pathways after CRS exposure were downregulated by SD. Furthermore, SD reversed the immune and inflammation-related mRNA, levels of pro-inflammatory factors, and the activation of microglia in ACC. Additionally, the impaired neuroplasticity elicited by CRS in the prefrontal cortex (PFC) and ACC were improved by SD.

Conclusion Our study revealed the rapid antidepressant effect of SD on CRS mice through the reduction of the neuroinflammatory response in ACC via regulating microglia and key genes that play important roles in MAPK, NFκB and PI3K signaling pathways, as well as the improvement of neuroplasticity in PFC and ACC, providing a rationale for the clinical application of SD as a rapid antidepressant therapy.

8.上海精神病学重点实验室

Objective To investigate the potential role of sex differences in suicidal ideation (SI) and cognitive symptoms among major depressive disorder (MDD) patients with recurrent depression, which is crucial for tailoring effective interventions and improving patient outcomes.

Methods Data were derived from the National Survey on Symptomatology of Depression (NSSD), a survey designed to investigate the extent of depressive symptoms experienced by patients under current major depressive episodes in 32 Chinese psychiatric settings. Demographics, SI, and cognitive symptoms of 1222 patients with recurrent MDD were compared and a logistic regression model was used to evaluate the association between cognitive symptoms and SI between the genders in the present analysis.

Results Compared to male patients with recurrent depression, female patients exhibited older age, a lower proportion of individuals with postgraduate and above-level education, reduced employment rates, lower rates of tobacco and alcohol use, and a shorter total duration of depression and current episode (all $P < 0.05$). Significant sex differences were observed in the frequency of cognitive symptoms, with male patients exhibiting a higher prevalence of memory loss, decrease in verbal, indecisiveness, and poor interpersonal relationships, while female patients showed a higher prevalence of impaired social and professional functions (all $P < 0.05$). However, there was no significant difference in the prevalence of suicidal ideation between male and female patients. The correlation analysis indicated that all cognitive symptoms were associated with SI in both male and female patients (all $P < 0.01$). The logistic regression analysis revealed that in male patients, indecisiveness and impaired interpersonal relationships were associated with SI. In female patients, in addition to the above-mentioned variables, reduced verbal output, poor concentration, and impaired social and professional functions were also associated with SI.

Conclusion The identification of distinct demographic and clinical symptomatology characteristics in male and female patients with recurrent depression provides valuable insights for clinical practice. Importantly, our findings demonstrate that cognitive symptoms are more strongly associated with SI in female patients. This knowledge has significant implications for guiding clinical practice, as it highlights the need for tailored assessment and intervention approaches that address gender-specific cognitive symptoms and their impact on suicidal ideation. Such targeted strategies can enhance the effectiveness of clinical management and improve patient outcomes in the treatment of recurrent depression.

Evaluating The Clinical Efficacy and Acceptability of A Structured Group Psychoeducation Program - Optimal Health Program for Bipolar Disorder: A Mixed-Methods Study

任青卓 李红* 曾晶 时君 郑友霞
深圳市精神卫生中心/深圳市康宁医院

Background and Objective Psychoeducation, a cost-effective, guideline-endorsed treatment strategy, is challenging to implement in the Chinese setting due to cultural barriers. The Optimal Health Program (OHP) was designed to overcome these obstacles, offering a culturally-adapted, nurse-led, structured group psychoeducation initiative for patients with bipolar disorder. This study examines OHP's clinical efficacy and acceptability.

Method This parallel-group, observer-blind controlled trial involved participants aged 18 and above with remitted bipolar disorder from two inpatient regions. Participants were randomly allocated to the OHP (two weekly sessions over two weeks) or treatment as usual (TAU). Primary outcomes included relapse rate, medication adherence, and qualitative participant experiences. Secondary outcomes analyzed emotional management and social adaptability. Semi-structured interviews were conducted post-intervention and at a three-month follow-up.

Result Between September 2021 and January 2023, we enrolled 133 participants, assigning them to either the OHP (n=68) or TAU (n=65). Males represented 51.1% of the cohort, with a mean participant age of 31.4±8.3 years. The OHP group demonstrated higher medication adherence compared to the TAU group (χ?=1.57, p=0.001). No significant differences in relapse rate were observed between the groups after three months (p=0.087). A pre-planned moderator analysis revealed a significant benefit of psychoeducation in participants experiencing their initial bipolar episodes (HR 0.38, 95% CI 0.17–0.76, p=0.038). Semi-structured interviews with four nurse leaders and 21 participants indicated that the OHP was feasible, well-accepted, and facilitated insights into personal routines and bipolar disorder relapse prevention.

Conclusion The OHP group psychoeducation for bipolar disorder is effective and well-received by patients. It positively impacts self-management behaviours and appears particularly suited for early intervention.

青少年及成年早期双相障碍患者自伤行为的危险因素及临床特征

陈书君 孙静*
南京脑科医院

目的 探讨青少年及成年早期双相障碍(BD) 患者出现自伤行为的危险因素及临床特征。

方法 于 2021 年 11 月至 2022 年 11 月在南京脑科医院精神科住院治疗的青少年及成年早期 BD 患者，共 104 例患者入组。依据伴发非自杀性自伤行为与否将受试者分为自伤组和非自伤组，自伤组为 69 例，非自伤组为 35 例。采用自制问卷、童年期创伤量表、家庭环境量表、认知情绪调节问卷、大五人格问卷、青少年自我伤害问卷、BECK 自杀意念量表收集相关资料。采用 SPSS 22.0 对资料进行统计分析。

结果 （1）研究对象的年龄为 17.46±2.627（14-25）岁，其中女性患者 78 例（75%），男性患者 26 例（25%）。（2）自伤组家人或朋友自伤史检出率为 42%，明显高于非自伤组（20%）。自伤组中女性患者 57 例（82.6%），非自伤组中女性 21 例（60%）。（3）儿童期创伤量表、家庭环境量表、知情绪调节问卷、大五人格问卷、BECK 自杀意念量表评分在两组的差异有统计学意义（$p<0.05$），Logistics 回归分析显示，性别、儿童期情感忽视、家庭环境低亲密度和低娱乐性有统计学意义($p<0.01$)。（4）在 104 名入组患者中，自伤检出率为 66.3%。15 种自伤方式中，用玻璃、小刀等划伤自己的皮肤（75.36%）是最常用的自伤方式，其次是用手打墙或玻璃等较硬的东西（72.46%）。（5）童年不良经历中情感虐待、躯体虐待；认知情绪调节问卷中的自我责难、接受、沉思、理性分析；大五人格问卷中的灾难化、神经质，与患者自伤行为严重程度呈正相关。家庭环境亲密度、组织性、大五人格问卷中的顺同性、外向性与患者自伤行为严重程度呈负相关。（6）自伤组与非自伤组自杀意念和自杀风险存在显著差异（$p<0.001$）。

结论 青少年和成年早期 BD 患者自伤行为发生率高，女性、情感忽视、家庭低亲密度、低娱乐性是青少年和成年早期 BD 患者自伤的危险因素，提示不良环境和经历会影响该年龄段 BD 患者病程发展，并与自伤行为的严重程度存在相关性。青少年和成年早期 BD 患者伴发自伤行为有更高的自杀风险，未来临床上需对该年龄段 BD 患者的自伤行为高度重视。

2.青岛大学
3.青岛市精神卫生中心

目的 研究合并家庭治疗与常规药物治疗对双相抑郁疗效的对比分析。

方法 选取 2022 年 1 月至 2022 年 12 月在临沂市精神卫生中心住院治疗的 60 名双相抑郁患者，采用随机数字表分组法，分为实验组（药物治疗联合家庭治疗）及对照组（常规药物治疗），每组各 30 人。实验组患者在常规药物治疗的基础上合并家庭治疗，每周一次,对照组患者入院后根据病情选择常规药物治疗方案。两组患者入院后在第 0 周、4 周、8 周，给予 HAMD、HAMA、TESS 量表分别进行评估，以治疗结束时 HAMD 的评分为最终评定标准，应用 SPSS 软件包进行统计学处理，并进行分析。

结果 实验组和对照组分别有 29 人和 28 人完成研究，治疗前实验组 HAMD 评分 (24.33±3.22)分,对照组评分(25.07±2.99)分，两组患者在 4 周、8 周 HAMD、HAMA 量表评分逐渐降低，治疗结束时 HAMD 评分实验组 (11.32±2.81)分,对照组(13.77±3.33)分，均较治疗前下降。治疗后实验组 HAMD 评分低于对照组；在治愈率及显效率方面，实验组显著高于对照组, 差异均有统计学意义(均 $P<0.05$)。两组在 TESS 评分上无明显差别。

结论 通过合并家庭治疗，双相抑郁患者治疗效果优于通过常规药物方案治疗双相抑郁患者。双相障碍患者的焦虑和抑郁情绪,及其他心理问题大多也源自于家庭环境和不良的家庭功能。家庭功能的优良直接与患者的焦虑、抑郁等心理问题显著相关。良好的家庭功能也有利于满足患者的情感需求和沟通需要，在传统药物治疗的基础上合并家庭治疗可以更早地改善双相抑郁患者的临床症状、显著提高双相抑郁患者的治愈率及有效率，具有一定的临床推广价值。

Gender Differences of Suicide Attempts in First-episode and Drug-naive Major Depressive Disorder Patients with Comorbid Metabolic Syndrome

黄莺莺[1] 孙平[2]
1.南京脑科医院
2.青岛市精神卫生中心

Objective Patients with major depressive disorder (MDD) have a high rate of metabolic syndrome (MetS), which may contribute to worse disease progression. One of the most serious progressions in MDD is suicide attempts (SAs). Previous studies have found gender differences in MetS and SAs among MDD patients respectively. Therefore, we aimed to explore gender differences of SAs in first-episode and drug-na?ve (FEDN) MDD patients with comorbid MetS.

Methods 1718 outpatients with FEDN MDD were

recruited. Depression, anxiety and psychotic symptoms were evaluated using the Hamilton Depression Scale (HAMD), Hamilton Anxiety Scale (HAMA) and Positive and Negative Syndrome Scale (PANSS) positive subscale, respectively. Blood sugar, blood fat, blood pressure and body mass index (BMI) were measured to evaluate MetS.

Results 34.4% patients with FEDN MDD were diagnosed as MetS and those subjects with or without MetS differed in the distribution of SAs and gender. In MetS subgroup, 29.5% and 29.7% of male and female subjects had SAs respectively, without significant differences. Suicide attempters had higher HAMD, HAMA, and PANSS positive subscale scores than non-suicide attempters in both male and female population. However, compared with non-suicide attempters, suicide attempters had higher level of blood pressure in female subjects, while there are no differences in any clinical variables in male subjects. Likewise, the influencing factors for SAs differed by gender. The HAMA scores and BMI were variables associated with SAs in male patients while HAMA scores, marital status and systolic blood pressure (SBP) were associated with SAs in female patients.

Conclusion In FEDN MDD patients with comorbid MetS, there were no gender differences in SAs. However, clinical characteristics and influencing factors of SAs differed in different gender groups, such as marital status and systolic blood pressure were associated with SAs in female subjects while only BMI was associated with SA in male subjects.

关键字：major depressive disorder; metabolic syndrome; suicide attempts; gender difference.

伏硫西汀联合经颅直流电刺激对首发抑郁症患者认知功能及血清炎症因子的影响

张天伟[1] 孙平[2]
1.淄博市精神卫生中心
2.青岛市精神卫生中心

目的 研究伏硫西汀联合以左背外侧前额叶为刺激靶点的经颅直流电刺激（tCDS）对首发抑郁症患者认知功能及血清炎症因子的影响。

方法 筛选淄博市精神卫生中心 2023 年 7 月-2024 年 7 月期间门诊及住院的收治的 70 例首发抑郁症患者作为研究对象，采用随机数字表法发分为研究组（n=35）和对照组（n=35）。研究组采用 tCDS(2mA 的经颅直流电刺激)联合伏硫西汀 10mg/d 治疗,对照组采用参数设置一定的伪刺激联合伏硫西汀 10mg/d 治疗，比较两组在治疗前、治疗 2 周后以重复性成套神经心理状态测验（RBANS）评价患者认知功能，汉密尔顿抑郁量表（HAMD）评价患者抑郁程度，以及测定白介素-2（IL-2）、肿瘤坏死因子-α（TNF-α）水平。

结果 两组治疗后 RBANS 中有关认知功能的评分均高于治疗前，且研究组高于对照组，差异有统计学意义（P＜0.05）；两组治疗后 HAMD 评分均低于治疗前，且研究组低于对照组，差异有统计学意义（P＜0.05）；两组治疗后 IL-2、TNF-α 水平均低于治疗前，且研究组低于对照组，差异有统计学意义（P＜0.05）。

结论 伏硫西汀联合以左背外侧前额叶为刺激靶点的经颅直流电刺激能显著改善首发抑郁症患者抑郁症状，同时能够有效提高认知功能，且降低首发抑郁症患者炎症因子水平。

关键字：伏硫西汀；经颅直流电刺激（tCDS）；首发抑郁症；认知功能；炎症因子

基于语音标记物的抑郁和躁狂情绪状态分类方法

纪俊[1,3] 董问天[2] 李嘉琪[4] 杨春[5] 石川[2] 冯超南[3] 杨明洋[6] 马燕桃[2]
1.山东省青岛市青岛大学计算机科学技术学院
2.北京大学第六医院，北京大学精神卫生研究所，国家精神心理疾病临床医学研究中心
3.北京万灵盘古科技有限公司
4.女王大学心理系
5.天津师范大学心理系
6.新加坡国立大学计算机学院

目的 抑郁和躁狂情绪状态发病率逐年上升，给社会带来沉重负担。然而目前并没有明显的标记物来区分这两种状态。为了解决这个问题，研究中提出一种基于语音标记物的抑郁和躁狂情绪状态分类方法。

方法 研究中使用来自 81 位受试者的 1287 条语音，其中，406 条抑郁状态，192 条躁狂状态，689 条缓解状态。利用 Python 工具包 PyAnalysisAudio 对每条语音提取特征，使用方差检验三组特征的差异性。使用循环神经网络门控制单元 GRU，随机森林 RF，支持向量机 SVM 和梯度提升树 GBRT 四种机器学习方法采用 10-折交叉验证训练分类模型。

结果 在提取的 34 个特征中，33 个特征在三组类别中存在显著差异（P<0.05）。在所有的分类模型中，门控制单元 GRU 性能表现最佳，其准确度为 0.842，抑郁状态敏感度，特异度分别为 0.811,0.901；躁狂状态敏感度，特异度分别为 0.818,0.911；缓解期敏感度，特异度分别为 0.907,0.951。随机森林表现次之，准确度为 0.830，抑郁状态敏感度，特异度分别为 0.780,0.912；躁狂状态敏感度，特异度分别为 0.837,0.858；缓解期敏感度，特异度分别为 0.873,0.974。支持向量机准确度为 0.823，抑郁状态敏感度，特异度分别为 0.787,0.890；躁狂状态敏感度，特异度分别为 0.769,0.895；缓解期敏感度，特异度分别为 0.915,0.950。梯度提升树表现最差，准确度为 0.814，抑郁状态敏感度，特异度分别为 0.787,0.892；躁狂状态敏感度，特异度分别为 0.769,0.895；缓解期敏感度，特异度分别为 0.915,0.950。

结论 语音可作为抑郁情绪和躁狂情绪分类的生物标记物，虽然研究中使用的样本为小样本，但这说明使用机器学习模型训练语音作为分类器来区分抑郁和躁狂是可行的。

Prevalence of Insulin Resistance and Its Associated Factors in Drug-na?ve Patients with Bipolar Disorder Among Han Chinese Population

Kanglai Li Tong Li Ting Yang Youzhen Lin Yingtao Liao Jiong Tao* Zhaoyu Gan*
中山大学附属第三医院

Objective Metabolic syndrome (Mets) is commonly seen in bipolar disorder. As the key component and early biological index of Mets, insulin resistance (IR) among BD has received more and more attention. However, little is known about the prevalence of IR and its associated factors in drug-na?ve patients with bipolar disorder (BD), especially among Han Chinese population.

Methods A cross-sectional study was conducted on 125 patients with bipolar disorder (BP) and 85 healthy controls (HC). HOMA-IR was calculated and IR was defined as HOMA-IR greater than the 75th percentile value for health controls (2.35). Clinical characteristics of BD were collected through semi-structural interview performed by trained interviewers with background of psychiatric education.

Results Among the measured anthropocentric variables including BMI, waist circumference, abdomen circumference, hipline, and hip-waist ratio, waist circumference was found to be the most closely related to IR (HR=1.070, 95%CI=1.031-1.110, P<0.001). Male was another factor that was associated with IR (HR-2.281, 95%CI=1.107-4.702, P=0.025). After adjusted for gender and waist circumference, the risk of IR was significantly higher in bipolar disorder than in healthy controls (HR=2.66, 95%CI=1.364-5.214, P=0.004). No significant association was found between IR and any of the observed physical and mental comorbidities (all P>0.05). when the number of depressive or (hypo)manic episode was treated as a binary categorical variable with 3 as the cut-off point, both of them were significantly associated with IR (HR=0.267, 95%CI=0.085-0.840, P=0.024;HR=0.165, 95%CI=0.028-0.974, P=0.047). Hypersomnia was the only symptomatic features that was significantly associated with IR (OR=0.316, 95%CI=0.124-0.803, P=0.016).

Conclusion Bipolar disorder increases two to three fold risk of IR, both circumference and male are the risk factors of IR but number of mood episode and hypersomnia act as protective factor.

Study on The Correlation between Suicidal Ideation and ABI3BP Gene、DPYSL2 Gene Methylation in Pediatric Bipolar Disorder with Depressive Episode

迪丽娜孜·卡日 邹韶红*
新疆维吾尔自治区人民医院

Objective Patients with bipolar disorder have a higher risk of suicide than the general population. This study aims to explore the correlation between suicide and gene methylation, as screened by genome-wide scanning, in children and adolescents with bipolar disorder.

Methods A total of 45 children and adolescents with bipolar disorder were divided into a suicidal ideation group (n = 41) and a non-suicidal ideation group (n = 4), as well as a low-risk group (n = 12) and a middle-high-risk group (n = 33). A pre-experiment was conducted on a suicidal ideation group (n = 6) and a non-suicidal ideation group (n = 4). Their blood was scanned using an Illumina HD 850K microarray, and the level of methylation was analyzed. Differential methylation sites among the sample groups were screened from the original data, and genes related to suicide were identified. The methylation of the ABI3BP gene and DPYSL2 gene was then detected by pyrophosphate sequencing and statistically analyzed.

Results There was a significant difference in age between the low-risk group and the middle-high-risk group. The results of GO analysis between the suicidal ideation group and the non-suicidal ideation group showed that the differential methylation sites were mainly involved in the interferon-γ-mediated signal pathway, with the main signal pathways being the inflammatory bowel disease (IBD) pathway, type 1 diabetes mellitus (T1DM) pathway, etc. There was a significant difference in the methylation of ABI3BP, HLA-DQB1, HLA-DRB1, AUTS2, SP3, NINJ2, DPYSL2, and other genes between the suicidal ideation group and the non-suicidal ideation group. There was also a statistically significant difference in gene methylation levels between these two groups. However, there was no significant difference in the degree of methylation of the ABI3BP gene and DPYSL2 gene between the low-risk group and the middle-high-risk group.

Conclusion These results suggest that suicidal ideation is correlated with methylation levels of differentially methylated genes in pediatric bipolar disorder. However, the severity of suicide risk in pediatric bipolar disorder patients may not be correlated with the degree of methylation of the ABI3BP and DPYSL2 genes. Further validation is still needed.

关键字：Pediatric; bipolar disorder; gene methylation; suicide.

心境障碍患者外周血中白细胞计数及其比率的横断面研究

张延凯[1,2] 孙平[2]
1.青岛大学医学部
2.青岛市精神卫生中心

目的 白细胞计数、中性粒细胞-淋巴细胞比率(neutrophil-lymphocyte ratio,NLR)、血小板-淋巴细胞比

率(platelet-lymphocyte ratio,PLR)和单核细胞-淋巴细胞比率(monocyte-lymphocyte ratio,MLR)能够敏感地反映全身炎性反应，且具有易获取、可重复性以及成本低廉等优势。本研究旨在比较双相障碍和抑郁障碍以及双相障碍不同阶段（躁狂发作、抑郁发作）之间的炎性反应。

方法 选取 2022 年 6 月至 2023 年 5 月青岛市精神卫生中心收治的 198 名汉族患者（抑郁障碍 103 名，双相抑郁 43 名，双相躁狂 52 名）。根据血液分析结果得出白细胞计数、中性粒细胞绝对值、淋巴细胞绝对值、血小板计数、单核细胞绝对值数据，并计算 NLR、PLR 和 MLR。采用 SPSS 26.0 进行统计分析，Kruskal Wallis 检验以评估不同组之间的 NLR、PLR 和 MLR 的差异。

结果 （1）双相组和抑郁组在实验室检查结果和炎症比率方面均无统计学差异（P>0.05）。（2）双相抑郁组、双相躁狂组和抑郁组相比，三组 NLR、MLR 总体分布存在着统计差异（P<0.05）。其中，与双相抑郁组相比，双相躁狂组的白细胞计数(H=4.9, P=0.028)、中性粒细胞绝对值(H=14.9, P=0.001)、单核细胞绝对值(H=5.1, P=0.026)计数均显著升高；双相躁狂组的NLR(H=12.8, P=0.001)和 MLR(H=7.1, P=0.009)显著高于双相抑郁组。抑郁组的 NLR 和 MLR 显著低于双相躁狂组（分别为 H=5.3, P=0.013 和 H=6.0, P=0.015）。双相抑郁组和抑郁组差异没有统计学意义（P>0.05）。

结论 与以往对其他炎症介质的研究一致，本研究发现双相障碍躁狂发作时中性粒细胞-淋巴细胞和单核细胞-淋巴细胞比值较高，表明炎症变化在躁狂急性发作期尤为明显。

Clinical Application of Electronic Measurement Based Care for Major Depressive Disorder in China

Na Niu Zuowei Wang*
Shanghai Hongkou Mental Health Center

Objective Electronic measurement based care (EMBC) may help to improve treatment adjustments and outcomes for major depressive disorder (MDD).

Methods This study enrolled 240 Outpatients at reproductive age from 2017 to 2020 in China. They were randomly assigned to standard treatment (n=121) or electronic measurement-based care (n=119). The EMBC group was adequately treated with escitalopram, using measurement-based intervention strategy. The treatment as usual (TAU) group was left to the clinician's discretion to determine the treatment strategy based on the patient's condition. Hamilton Depression Rating Scale (HAMD) was assessed at baseline and follow-up levels within 24 weeks, and patients' depressive symptoms were observed and followed up for 16 weeks.

Results The clinical remission rate was higher in the EMBC group than in the TAU group at the 12th week (P=0.025). The HAMD score of the two groups decreased significantly at each time point (P<0.05) while it showed difference between the two groups at the 12th week only (P<0.05). The clinical remission rate yielded no difference at the end point (P=0.344), and the HAMD score did not differ significantly between the two groups.

Conclusion It is suggested that the EMBC strategy may achieve better outcomes early in the treatment of MDD and significantly improve the quality of life for patients in both the short and long terms.

Prospecting The Intricate Role of Intestinal Microbe and Microbial Metabolite Biomarkers in Schizophrenia

石丽 张许来*
合肥市精神病医院

Objective The brain-gut axis has gained increasing attention due to its contribution to the etiology of various central nervous system disorders. In particular, impaired intestinal microflora and intestinal metabolite dysbiosis have been implicated in schizophrenia.

Methods In this study, we used a 16S ribosomal RNA (16S rRNA) gene sequence–based approach and an untargeted liquid chromatography-mass spectrometry-based metabolic profiling approach to measure the gut microbiome and microbial metabolites from 44 healthy controls, 41 acute patients, and 39 remission patients, to evaluate whether microbial dysbiosis and microbial metabolite biomarkers were linked with the severity of schizophrenic symptoms.

Results Here, we identified 20 dominant disturbances in the gut microbial composition of patients compared with healthy controls, with 3 orders, 4 families, 9 genera, and 4 species. Several unique bacterial taxa associated with schizophrenia severity. Compared with healthy controls, 145 unusual microflora metabolites were detected in the acute and remission groups, which were mainly involved in environmental information processing, metabolism, organismal systems, and human diseases in the Kyoto encyclopedia of genes and genomes pathway. The Sankey diagram showed that 4 abnormal intestinal and 4 anomalous intestinal microbial metabolites were associated with psychiatric clinical symptoms.

Conclusion These findings suggest a possible interactive influence of the gut microbiota and their metabolites on the pathophysiology of schizophrenia.

The Effectiveness of Interpersonal Psychotherapy - Adolescent Skills Training for Adolescents with Depression : A Systematic Review and

Meta-Analysis

郑柯蔚[1,2] 孙平[2]
1.滨州医学院
2.青岛市精神卫生中心

Objective Interpersonal Psychotherapy-Adolescent Skills Training (IPT-AST) is a standardized depression prevention program for adolescents conducted in campus settings. The purpose of this review is to examine the randomized controlled trials of IPT-AST for the prevention of adolescent depression in the past 20 years.

Methods A systematic search of relevant electronic databases (PubMed, WOS, Embase, PsycINFO, the Cochrane Library, CNKI and WANFANG DATA) and study reference lists was conducted. Any study investigating the effectiveness of IPT-AST in 12- to 20-year-olds with depressive symptoms was eligible. Synthesis was via narrative summary and meta-analysis.

Results A total of 6 studies met the inclusion criteria. Meta-analysis results showed a remarkable improvement in patients' depressive symptoms after IPT-AST intervention (WMD = -5.05 , 95% CI = -8.11 to -1.98 , $p < 0.05$, I2 = 77%). Six month follow-up data showed that the intervention outcomes of IPT-AST remained significant (WMD = -3.09 , 95% CI: -5.23 to -0.94 , $p < 0.05$, I2 = 57%).

Conclusion This meta-analysis showed that IPT-AST was effective in adolescents with depressive symptoms at post-prevention and at 6-month follow-up. However, these conclusions are cautious, as they are based on a small number of studies and the presence of author duplication. Future studies should use multi-center, large-sample randomized controlled trials to evaluate the efficacy of IPT-AST for preventing depression in adolescents.

关键字：Interpersonal psychotherapy-adolescent skills training, depression,adolescents, systematic review, meta-analysis.

How Long Can A Single Episode of Delirium Mania Last? A Case of Long-term and Refractory Delirium Mania

Yifan Shi[1], Daihui Peng[4], Yiru Fang[4,5,6,7], Zhiguo Wu[2,3]
1.Department of Psychiatry, Xijing Hospital, The Fourth Military Medical University, Xi'an, China
2.Shanghai Yangpu District Mental Health Center, Shanghai, China
3.Clinical Research Centre in Mental Health, Shanghai University of Medicine & Health Sciences
4.Division of Mood Disorders, Shanghai Mental Health Center, Shanghai Jiao Tong University School of Medicine, Shanghai, China
5.Department of Psychiatry & Affective Disorders Center, Ruijin Hospital, Shanghai Jiao Tong University School of Medicine
6.Shanghai Key Laboratory of Psychotic Disorders, Shanghai, China
7.CAS Center for Excellence in Brain Science and Intelligence Technology, Shanghai, China

Objective Delirium mania, a type of disorder where delirium and mania occur at the same time, has been repeatedly reported to have a relatively short-term (from days to weeks) duration. To provide more information about this potentially life-threatening condition, we studied a case with long-term delirium mania and hospitalization.

Methods We described a patient with bipolar disorder who presented with a long-term episode of delirium mania lasting for ten months and discussed the case in the context of a selective review of the clinical literature describing the clinical features and treatment of delirium mania.

Results The patient was a 37-year-old male with a 13-year history of recurrent bipolar disorder and poor drug compliance. At the beginning of the current manic episode, he presented unstable mood, euphoria, hyperactivity, pressured speech, and decreased need for sleep. He was initially hospitalized and treated with antipsychotics, mood stabilizers, and electroconvulsive therapy. However, his symptoms fluctuated, with periods of delirium and disorganization interspersed with periods of mania, which included disorganized behavior, incomprehensible speech, and urinary and fecal incontinence on day 11 after admission. Then he was diagnosed with delirium mania, and the medication treatment strategies were adjusted multiple times, with some initial improvement followed by a relapse of mania. He developed pneumonia at one point, which delayed treatment. As a result, he again continued to experience consistently altered consciousness, extreme euphoria, and disorganized speech patterns even after recovery from pneumonia. After ten months of delirium mania, his condition gradually improved and eventually recovered through the treatment regime of risperidone, clozapine, lithium, and sodium valproate, but he continued to exhibit disorganized and hypomanic thought patterns. He remained stable during nine-year follow-ups on his outpatient treatment regimen without recurrence of any mood episodes after discharge.

Conclusion Delirium mania is a relatively rare clinical condition not described in the Diagnostic and Statistical Manual of Mental Disorders (DSM), and there is no consensus on its clinical characteristics and treatment. However, it can potentially develop into a fatal form of acute psychosis, highlighting the necessity for proper diagnosis and treatment strategies. In this case, the long-term illness duration and hospitalization illustrate the challenges of managing severe and refractory delirium mania, with mixed psychopathology of mania, delirium, and catatonic features.

Prevalence and Correlates of Subclinical Hypothyroidism in Young First-episode Drug-naive Major Depression Patients with High BMI

刘乘洋[1] 孙平[2]
1.淄博市第五医院
2.青岛市精神卫生中心

Objective Both subclinical hypothyroidism (SCH) and overweight or obesity are prevalent in major depressive disorder (MDD), with inconsistent results due to differences in inclusion criteria in previous studies. Few previous studies have compared the prevalence and influencing factors of SCH in MDD patients accompanied by overweight or obesity between those who are not. The aim of our study was to examine the prevalence of SCH and associated risk factors among young Chinese first-episode drug-na?ve (FEND) MDD patients with overweight or obesity and exclude the impact of age and medication.

Methods This study recruited a total of 1289 young FEDN MDD outpatients and their demographic data, clinical information, thyroid function and biochemical parameters were collected. They were also assessed on the Hamilton Depression Inventory (HAMD), Hamilton Anxiety Inventory (HAMA), and Positive and Negative Symptom Scales (PANSS).

Results The incidence of SCH in young FEDN MDD patients with overweight or obesity was 65.78%, which was 1.59 times higher than that in patients without high BMI (28.6%). Patients with SCH had longer duration of illness, higher HAMA, HAMD, and PANSS positive symptom scores, stronger suicide attempts, higher blood pressure (BP), higher fasting blood glucose, total cholesterol (TC) levels and low-density lipoprotein (LDL) levels, and lower high-density lipoprotein (HDL) levels than those without SCH. Additionally, logistic regression showed that the HAMD score, fasting blood glucose, TC levels, HDL-C levels, systolic and diastolic BP were significantly associated with SCH. Furthermore, the combination of TC levels and systolic BP could differentiate patients with SCH from those without SCH.

Conclusion Our results suggested a high incidence of SCH in young MDD patients with high BMI. The severity of depression and several metabolic parameters contribute to the incidence of SCH in young MDD patients with high BMI.

双相抑郁障碍患者抑制控制能力特点：来自反向眼跳任务的证据

宋雨亭 张云淑* 韩警山
河北省精神卫生中心

目的 使用眼跳任务深入探究双相抑郁障碍患者抑制控制能力的特点。

方法 选取 36 例符合 DSM-5 双相障碍目前为重性抑郁发作诊断标准的双相抑郁障碍患者及36例健康对照。收集一般人口学资料，采用汉密顿抑郁量表（HAMD-17）、汉密顿焦虑量表（HAMA）评估患者抑郁、焦虑程度。采用反向眼跳范式通过评估受试者在朝向和反向眼跳任务下的错误率、潜伏期、反向眼跳成本等指标，反应个体抑制控制能力。分析双相抑郁症患者抑制控制能力的损伤与临床特征之间的关联。

结果 （1）双相抑郁组和健康对照组在性别、年龄、受教育年限以及 BMI 指数等方面无统计学差异（P>0.05）。（2）在朝向眼跳任务中，双相抑郁组的眼跳潜伏期显著高于健康对照组[(266.62±52.18) vs. (233.70±32.79)，P<0.01]；在反向眼跳任务中，双相抑郁组眼跳错误率、潜伏期显著高于健康对照组[(0.23±0.21) vs. (0.028±0.034)；(431.83±92.68) vs. (353.94±49.55)；P<0.01]。另外，双相抑郁组的反向眼跳成本显著高于健康对照组[(165.22±86.76) vs. (120.24±56.48)，P<0.05]。（3）相关分析显示，双相抑郁组反向潜伏期（r=0.483，P<0.01）、反向眼跳成本（r=0.728，p<0.001）与抑郁量表得分呈正相关。

结论 本研究提示双相抑郁障碍患者抑制控制能力受损，表现为反向眼跳错误率高、潜伏期长，反向眼跳成本高。患者抑制能力损伤与较重的抑郁症状相关。

The Limbic Network Is A Trigger for Triple Network Model in Pediatric Bipolar Disorder : Salience Network Is The Bridge

Yuan Zhong[1,2,3], Rong Wang[1,2,3], Qian Xiao[4], Chun Wang[5], Guangming Lu [6], Linyan Su[7]
1.School of Psychology, Nanjing Normal University, Nanjing, Jiangsu
2.Jiangsu Key Laboratory of Mental Health and Cognitive Science, Nanjing, Jiangsu
3.International Joint Laboratory of Child and Adolescent Psychological Development and Crisis Intervention, Nanjing, Jiangsu
4.Mental Health Centre of Xiangya Hospital, Central South University, Changsha, Hunan
5.Department of Psychiatry, Nanjing Brain Hospital Affiliated to Nanjing Medical University, Nanjing, Jiangsu
6.Department of Medical Imaging, Nanjing General Hospital of Nanjing Military Command, Nanjing, Jiangsu
7.The Second Xiangya Hospital of Central South University, Changsha, Hunan

Objective Pediatric Bipolar Disorder (PBD) is characterized by dysfunctional connectivity among distributed brain regions. Previous studies have proved that the core pathological alteration in BD is a damage of the limbic network. Based on the triple network model, i.e., the salience network drives the switching between default mode and central executive networks, we supposed that the limbic network, as a trigger, leads to phasic (and often recurrent) reconfigurations of the triple network model, and salience network is responsible for bridging between the limbic network and triple network model.

Methods Previous connectome studies based on functional magnetic resonance imaging (fMRI) have focused primarily on undirected functional connectivity for

the dysbalanced between networks. In this study, we combined Dynamic Causal Modeling (DCM) and Parametric Empirical Bayes (PEB) to investigate directed effective connectivity (EC) of a large-scale network with 12 regions of interest from four distributed functional brain networks (default mode, executive control, salience, and limbic networks, i.e., DMN, CEN, SN, LN), based on the 84 individuals with pediatric bipolar disorders (Mage = 16.21).

Results The results of the Bayesian Model Average (BMA) revealed an asymmetric effective connectivity (thresholded at posterior probability >95%), such that the regions in the LN exerted an excitatory influence on the SN and DMN, whereas exerted an inhibitory influence on the CEN. And most regions of SN were positively influenced by the regions from the other three networks. Moreover, using a procedure referred to as Bayesian Model Reduction (BMR), a set of candidate models defined was necessitated to evaluate the best explanation for the commonalities across subjects. The model, which was the best explanation for the commonalities across subjects, had a one-way direction from LN towards SN, the within-network and internetwork connections among SN, CEN, and DMN were open.

Conclusion This work confirms that changes in LN, as a trigger, may then lead to phasic reconfigurations of intrinsic brain activity (DMN, CEN, SN). And SN is responsible for bridging between the limbic network and the triple network model.

双相障碍患者儿童期虐待和自杀意念与自尊和抑郁水平的关系

马若云 钟丽霞 李珠琳 林小玲*
中山大学护理学院

目的 目前鲜有关注双相障碍患者儿童期虐待、自尊和抑郁对自杀意念影响机制的研究。本研究将探讨双相障碍患者的儿童期虐待、自尊、抑郁和自杀意念间的相关性，及自尊和抑郁在儿童期虐待和自杀意念间的中介作用。

方法 选取广州市两所医院精神科门诊 292 例双相障碍患者，采用儿童期创伤问卷（CTQ）、贝克自杀意念量表（BSI）、自尊量表（SES）、汉密尔顿抑郁量表-17 项（HAMD-17）和杨氏躁狂量表（YMRS）进行调查。以 t 检验、方差分析、Mann-Whitney U 检验和 Kruskal-Wallis H 检验比较不同人口学和疾病资料在各变量的得分；用 Pearson 相关或 Spearman 相关分析变量间的相关性；使用 SPSS 25.0 结合 Hayes 编制的 PROCESS 宏程序中的模型 6 检验中介效应。

结果 BSI 得分与 CTQ、HAMD-17 得分正向关联（r=0.37、0.53），与 SES 得分负向关联（r=-0.50）；CTQ 得分与 SES 得分负向关联（r=-0.29），与 HAMD-17 得分正向关联（r=0.30）；SES 得分与 HAMD-17 得分负向关联（r=-0.45）；SES 得分和 HAMD-17 得分分别在 CTQ 和 BSI 得分之间起中介作用（95%CI：0.01~0.08、0.01~0.10）和链式中介作用（95%CI：0.02~0.06）。

结论 双相障碍患者的儿童期虐待经历可能会提高其自杀意念，并且通过自尊水平和抑郁症状间接作用于自杀意念；以自尊和抑郁为靶点进行干预是可能是缓解伴有儿童期虐待的双相障碍患者自杀意念的有效手段。

Prevalence and Risk Factors of Abnormal Lipid Metabolism in Chinese First-episode, Untreated Major Depressive Disorder Patients with Comorbid Thyroid Dysfunction

王欣悦[1,2] 孙平[2]
1.济宁医学院
2.青岛市精神卫生中心

Objective Both abnormal lipid metabolism and thyroid dysfunction are common in patients with major depressive disorder (MDD). Previous studies have found that lipid metabolism level are closely associated with thyroid function in healthy individuals. This study aimed to further investigate the prevalence and associated risk factors of abnormal lipid metabolism in MDD patients with comorbid thyroid dysfunction.

Methods A total of 1718 first-episode drug-na?ve (FEND) MDD patients were recruited for this study. Clinical symptoms were assessed by the Hamilton Depression Rating Scale (HAMD), Hamilton Anxiety Rating Scale (HAMA), and Positive and Negative Syndrome Scale (PANSS). Biochemical parameters were measured by laboratory tests, including glucose, lipid metabolism parameters and thyroid function parameters. The diagnosis of abnormal lipid metabolism was based on the criteria of Guidelines for Prevention and Treatment of dyslipidemia in Adults in China (revised version 2016).

Results The prevalence of abnormal lipid metabolism was higher in MDD patients with thyroid dysfunction than in MDD patients without thyroid dysfunction. Among MDD patients with comorbid thyroid dysfunction, those with abnormal lipid metabolism had higher levels of glucose, thyroid stimulating hormone (TSH), free thyroxine (FT4), anti-thyroglobulin (TgAb) levels, and higher HAMD, HAMA and PANSS-positive subscale scores, suicide attempt rates, and blood pressure compared with those with normal lipid metabolism. Furthermore, the combination of HAMD score, TSH and FT4 levels distinguished between patients with and without dyslipidemia.

Conclusion Our results suggest a high prevalence of abnormal lipid metabolism in MDD patients with thyroid dysfunction. The severity of depression, TSH, and FT4 levels are independent risk factors for abnormal lipid metabolism in MDD patients with thyroid dysfunction.

The Role of Inflammation in Predicting Anhedonia and Fatigue in Patients with Major Depression Disorder: An Observational Study

魏喆懿 洪武*
上海市精神卫生中心

Objective Anhedonia and fatigue are core symptoms in patients with major depressive disorder (MDD) , which impair quality of life and lead to poor treatment outcomes. Immune dysregulation is thought to be their underlying mechanism. However, peripheral immune biomarkers in MDD patients with fatigue and anhedonia are not commonly described. This study was designed to investigate whether peripheral immune factors could be used as predictive biomarkers of anhedonia and fatigue in patients with MDD. And further explored their impact on antidepressant efficacy.

Methods Adult outpatients with major depressive disorder at the Shanghai Mental Health Center were the subject of this cohort study between 2019 and 2020. A SHAPS score of 5 or above was seen as being related with anhedonia. The HAMD-17 questionnaire was used to examine depressed symptoms, and the reduction rate of it was used to evaluate the effect of treatment. Patients' anhedonia symptoms were assessed using the SHAPS questionnaire, and their level of fatigue was assessed using the MFI. Peripheral blood samples at baseline will be used for inflammatory cytokines testing. The relationship between levels of inflammatory markers and these two symptoms was analyzed using Spearman's test and independent sample t test. A binary logistic regression will be used to analyze whether inflammation factors could be a predictor of anhedonia and fatigue in MDD patients.

Results A total of 50 patients with depression were included in the study, 27 of whom were considered to have anhedonia and 24 of whom were considered to have fatigue. Spearman Mann-Whitney test found that IFN-γ, IL-1β, IP-10, IL-18, TNF-α differed among patients with or without anhedonia, while IFN-γ, IL-1β, IP-10, TNF-α, TNF-β were higher in patients with fatigue than in patients without fatigue. Binary logistic regression analysis showed that IFN-γ showed significant value for predicting anhedonia while TNF-α and TNF-β were valuable in predicting fatigue.

Conclusion Our findings imply that inflammatory factors may be a rapid and easy way to recognize anhedonia and fatigue in depressive patients. In predicting anhedonia in depression, a predictive model based on IFN-γ protein concentrations performed well. Meanwhile, a prognostic model based on TNF-α and TNF-β protein concentrations of scores showed considerable accuracy in predicting fatigue in depression. These findings will offer further proof of the involvement of growth factors in neuroinflammation in the early detection of symptoms in depression. More research is required to fully understand how inflammatory variables contribute to these symptoms in depressed people.

富马酸喹硫平联用碳酸锂对双相障碍躁狂发作患者的临床疗效以及相关炎症因子的影响

董楷[1] 孙平[2]
1.济宁医学院
2.青岛市精神卫生中心

目的 观察并探讨富马酸喹硫平联用碳酸锂对双相障碍躁狂发作患者的临床疗效以及认知功能的影响。

方法 选取我院 2020 年 2 月到 2023 年 1 月 100 名诊断为双相障碍患者作为研究对象进行临床试验。通过随机数表法将患者随机分为观察组（50 例）和对照组（50 例），对照组患者给予碳酸锂治疗，观察组患者在对照组治疗的基础上给予富马酸喹硫治疗，均持续治疗 4 周比较两组临床疗效、Bech-Rafaelsen 躁狂评估量表(BRMS)评分、阳性与阴性症状量表（PANSS）评分、肿瘤坏死因子-α(TNF-α)、白介素-4(IL-4)、白介素-10(IL-10)等相关炎症因子浓度及治疗总有效率和不良反应。

结果 观察组患者的治疗总有效率为 93.32%，明显高于对照组的 71.63%，差异有统计学意义(P<0.05)；两组患者治疗前 BRMS、PANSS、TNF-α、IL-4、IL-10 相关数值差异均无统计学意义(P>0.05)；治疗后，观察组和对照组患者的 BRMS[(8.43±2.09)分 vs(14.74±3.29)分]、PANSS[(37.77±4.52)分 vs(50.08±4.99)分]、TNF-α[(105.5±20.3)ng/Lvs(137.96±22.73)ng/L] 、IL-4[(74.88±10.26)ng/Lvs(96.05±12.95)ng/L]比较，观察组明显低于对照组，差异均有统计学意义(P<0.05),观察组和对照组的 IL-10[(278.3±39.43)pg/mLvs(249.26±40.87)pg/mL],观察组明显高于对照组，两组患者的不良反应发生率比较差异无统计学意义(P>0.05)。

结论 富马酸喹硫平联用碳酸锂治疗双相障碍躁狂发作安全有效，且能提高患者的认知功能，降低炎症水平，值得临床推广应用。

The Effect of Emotional Dysregulation and Impulsivity on Suicidality in Patients with Bipolar Disorder

刘桓希[1] 孙平[2]
1.青岛大学医学部
2.青岛市精神卫生中心

Objective Bipolar disorder (BD) has the highest risk of suicide among psychiatric disorders，which patients have approximately 10-30 times higher suicide risk than the population. This study was to explore if emotional dysregulation dimensions and impulsive traits differ among patients with BD who had different suicidal behaviors.

Methods This study enrolled 65 patients (45 women, 20 men) with BD and education and agematched 50 (34 women, 16 men) healthy volunteers.The patient group is divided into 3 subgroups according to have suicide attempt history, have suicidal ideation without attempt, and have neither suicide attempt nor ideation. Barratt Impulsivity Scale (BIS-11), The Difficulties in Emotion Regulation Scale (DERS), The Beck Scale for Suicidal Ideation, and Suicide Behaviors Questionnaire scales were applied to the participants.

Results Patients with BD (n=65) had significantly higher scores for emotion dysregulation($p<0.001$) and impulsivity($p<0.001$) than the healthy controls . The scores of DERS, BIS-11, Suicidal ideation, and Suicide behavior scores showed a significant positive correlation. DERS Total and BIS Total scores of BD patients with suicide attempts were significantly higher than BD patients with suicidal ideation and BD patients with neither attempt nor ideation.BD patients with suicide attempt had higher emotion dysregulation problems and higher impulsivity scores than BD patients with suicidal ideation and BD patients with neither attempt not ideation.

Conclusion The results of our study showed that patients with BD had significantly higher emotion dysregulation problems and higher impulsivity scores than health control group. Clinicians should focus on assessing the emotional dysregulation and impulsivity of patients with BD to develop appropriate suicide prevention treatment strategies.

关键字：Bipolar disorder,suicide

双相障碍治疗前后外周血免疫图谱变化的研究

徐雪蕾 伍海姗* 邱妍 李素娟 滕紫薇 杨敏 金坤 徐保彦
中南大学湘雅二医院

目的 本研究旨在通过单细胞转录组测序来初步探索双相障碍药物治疗前后的外周血免疫图谱的差异及其可能机制。

方法 本研究招募首诊未服药双相抑郁发作4例，每天均接受喹硫平和丙戊酸盐联合治疗，在基线和药物治疗 1 月后采集外周血并分离单个核细胞进行单细胞转录组测序。随后，根据不同免疫细胞的转录本特征对各类细胞亚型降维、聚类和命名后，通过基因表达差异、差异基因功能富集和细胞通讯分析等方法比较不同细胞亚群在治疗前后的基因表达、功能以及细胞间通讯的差异。

结果 双相障碍药物治疗前后的外周血单细胞测序共鉴定了 10 种主要细胞类型，各免疫细胞类型的细胞数量比例在治疗前后没有显著差异，但细胞功能和细胞间通讯发生了改变：①在 B 淋巴细胞亚聚类中，治疗后患者与核糖体蛋白合成相关的基因 RPL13P12、RPS26 和 RPL9P9，线粒体 ATP 合成相关的基因 MTATP6P1 和 MTCO1P12 和 B 细胞活化相关的基因 IGHA1、IGHA2 和 IGHG3 的表达下降；②在 T 淋巴细胞和 NK 细胞亚聚类中，治疗后 CD4+和 CD8+ T 细胞中包括核糖体蛋白和炎症在内的基因均下调，在 NK 细胞中参与细胞因子介导的信号通路的基因（CCL3、CCL4、IFR1、IFNGR1、CXCR3R1、CXCR4 和 IL18RAP）的表达在治疗后上调；③与治疗前相比，治疗后患者免疫细胞的细胞间通讯显著下降，在治疗后参与炎症和免疫应答的 25 条特殊活动通路中，有 9 条的传入和传出信号减弱，包括 MCH-I、MCH-II、CD99、ITGB2、ADGRE5、SELPLG、LCK、APP 和 CD22。

结论 （1）双相患者在丙戊酸盐联合喹硫平治疗后整体免疫细胞之间的通讯显著减少，多种免疫应答和炎症途径被减弱；（2）药物治疗可能通过抑制 B 和 T 淋巴细胞的核糖体蛋白功能和线粒体活化来缓解炎症反应，而治疗后上调的 NK 介导的免疫可能与异常促炎细胞的清除相关。

Distinct Alterations of White Matter Microstructure in Bipolar Disorder with and with No Psychosis

Xiuli Wang[1], Xipeng Long[2], Bochao Cheng[3], Zhiyun Jia[2]
1.the Fourth People's Hospital of Chengdu
2.West China Hospital of Sichuan University
3.West China Second University Hospital of Sichuan University

Objectives The mixture of affective disturbance and psychosis in bipolar disorder (BD) considerably complicates the clarification of its etiology and the development of its targeted treatments. The present study aims to investigate whether white matter microstructures are similar or distinct in BD with psychosis (BDP) and BD with no psychosis (BDNP).

Methods Diffusion-weighted images were acquired from participants with BDP (n = 38), BDNP (n = 52), and healthy controls (HCs) (n = 70). We compared the indices of fractional anisotropy (FA), mean diffusivity (MD), radial diffusivity (RD) and axial diffusivity (AD) indexing white matter microstructures among BDP, BDNP and HCs groups, and between BDP and BDNP using tract-based spatial statistics (TBSS).

Results Analysis of variance showed significant differences in FA and RD values of the right anterior thalamic radiation (ATR), left corticospinal tract (CST) and the forceps minor of the corpus callosum (FMI), as well as in MD values of the right ATR and FMI among three groups (TFCE-FWE corrected $p < 0.05$). Post hoc analyses found that compared to HCs, BDP group showed lower FA value in the FMI, while BDNP group showed lower FA and

MD values in the right ATR, as well as higher FA and lower RD values in the left CST. Meanwhile BDP group showed lower FA and higher RD values in the FMI compared to BDNP group ($p < 0.05$).

Conclusions These findings suggest divergent contributions from the psychotic features specific to BDP and the affective disturbance common to BD regardless of psychosis to white matter abnormalities. In particular BDP may involve prominent inter-hemispheric white matter dysconnectivity of bilateral prefrontal regions, which may be specifically associated with psychotic features, while BDNP may present intra-hemispheric alterations of white matter microstructure of the right ATR and left CST. This study suggests that dysconnectivity between bilateral prefrontal regions may be a neuroanatomical characteristic of psychosis in BD, which provides substrates for further exploring specific mechanisms that target psychotic domains of BD.

Preventive Interventions for Individuals at Risk of Developing Bipolar Disorder: A Systematic Review and Meta-analysis

房萌 范自立 刘珊珊 冯思彤 朱虹 尹冬青 贾竑晓* 王刚*
首都医科大学附属北京安定医院

Objective This systematic review and meta-analysis aimed to explore whether early interventions can reduce affective symptoms and have long-term benefits among individuals at risk of bipolar disorder (BD).

Methods The PubMed, Embase, and Web of Science databases were searched. The primary outcome was continuous symptom scores before and after treatment. Random effects meta-analyses were conducted for each outcome arm studied and pooled mean difference estimates were calculated.

Results The search identified 10 controlled studies involving 425 participants and 8 single-arm studies involving 90 participants. For controlled trials, meta-analysis showed that the interventions led to greater reduction in clinical global score than placebo (standardized mean differences (SMD) = -0.96, 95% CI:-1.32, -0.60), and supported a long-term longitudinal effect for pharmacotherapy (SMD = -0.42, 95% CI: ?0.79, -0.05). For single-arm trials, both pharmacotherapy and psychotherapy showed efficacy for depressive symptoms, while pharmacotherapy only showed efficacy for hypomania symptoms (effect size (ES) = -9.16, 95% CI:-11.29, -7.04). Discontinuation of pharmacotherapy due to adverse effects did not show a difference.

Conclusion Based on the limited available data, early interventions show efficacy for individuals at risk of BD. Psychological therapy might be more beneficial for depressive symptoms and have long-term benefits for hypomania. Pharmacotherapy may be appropriate in situations of severe hypomanic symptoms and the poor functioning. Large, well-designed, double-blind -controlled trials are needed to make solid conclusions about the efficacy of early interventions.

Differences in Electrical Cortical Responses between Unipolar Depression and Bipolar Depression under An Emotional Picture Task: Time Domain and Time Frequency Analysis

张坤 冯慧琪 孙宁 张爱霞 刘鹏鸿 韩敏 任田 刘志芬* 杨春霞*
山西医科大学第一医院

Objective Patients with bipolar disorder during a depressive episode can be difficult to distinguish from patients with major depressive disorder (MDD) as both involve symptoms of abnormal emotional function. This study aimed to use electroencephalography (EEG) to explore the differences in neural activity during emotional scene perception between MDD patients and bipolar patients during a depressive episode.

Methods EEG data were collected from 32 patients with unipolar depression, 32 patients with bipolar depression, and 27 healthy controls in the inpatient department of the First Hospital of Shanxi Medical University during the viewing of mood pictures. The data were pre-processed to compare the differences in late positive potential (LPP) wave amplitude and neural oscillations during the processing of emotional stimuli between unipolar depression, bipolar depression, and healthy controls using EEG analysis techniques such as the event-related potential (ERP) and event-related spectral perturbations (ERSP).

Results The results showed that emotional pictures evoked higher LPP wave amplitudes than neutral pictures in both the disease and healthy control groups. The LPP waveform amplitude was lower in the unipolar depression group than in the healthy control group. Theta frequency bands with significant peak time windows were then selected for time-frequency analysis. We found that the theta-ERS induced by the mood picture paradigm was most pronounced in the occipital region, and the theta-ERS in the bipolar depression group was smaller than that in the unipolar depression group and the healthy control group.

Conclusion Our findings suggest that altered cortical neural oscillatory activity may be a feature of cognitive decline in patients with bipolar depression , and that theta-ERS may serve as a biomarker for distinguishing unipolar from bipolar depression.

关键字：unipolar depression, bipolar depression, emotion, event-related potential, late-positive potential, event related spectral perturbations, theta.

事件相关电位多指标联合用于单双相抑郁障碍

鉴别的临床价值

段亚娟 刘志芬 孙宁 高明雪 刘鹏鸿 张爱霞 韩敏 杨春霞*
山西医科大学第一医院

目的 以抑郁为首发症状的双相情感障碍初次就诊时常被误诊为单相抑郁障碍，给患者治疗及预后带来严重的不良后果。目前仍缺乏鉴别单相抑郁障碍和双相抑郁障碍的客观指标。越来越多研究发现作为客观评价认知功能的事件相关电位，通过评估检测患者神经电生理指标有望作为单相抑郁障碍和相双相抑郁障碍鉴别的标志物。本研究旨在探讨事件相关电位多指标联合用于单双相抑郁障碍鉴别诊断的临床价值。

方法 采用 2017 年至 2021 年期间 264 名住院患者的事件相关电位数据进行机器学习区分单相抑郁障碍和双相抑郁障碍的回顾性研究。首先使用参数检验分析事件相关电位中各单项指标的波幅及潜伏期在单相抑郁障碍和双相抑郁障碍患者间的差异指标，再以事件相关电位中各指标的波幅及潜伏期为分类特征，通过随机森林（Random Forest，RF）方法建立模型对两种疾病进行区分，最后采用交叉验证法验证模型的分类性能，以此建立能够区分单相抑郁障碍和双相抑郁障碍的预测模型。

结果 单相抑郁障碍和双相抑郁障碍两组间性别、年龄、婚姻及学历无显著统计学差异(均 P>0.05)。在数据测试集中，随机森林模型的准确率、灵敏度和特异度分别为 80%、89.8%和 79.6%。验证模型结果：贡献最大的前十位特征依次为 N1 潜伏期、P3a 潜伏期、P3b 波幅、S2-P50 波幅、CNV B 波幅、P3b 潜伏期、S1-P50 波幅、CNVB 潜伏期、P2 潜伏期、N2 潜伏期。

结论 1. 相较于单相抑郁障碍，双相抑郁障碍患者 P300 潜伏期更短、B 潜伏期更长，S1-P50 波幅、S2-P50 波幅、B 波幅更高；2.使用随机森林算法建立的事件相关电位多项指标联合预测模型有望用于区分单相抑郁障碍和双相抑郁障碍。

基于路径分析探讨循环气质、童年期创伤和社会支持对双相情感障碍患者药物依从性的影响

李自艳[1,2] 刘鑫子[1,2] 尹冬青[1,2] 朱虹[1,2] 贾竑晓[1,2]
1.首都医科大学附属北京安定医院,国家精神心理疾病临床研究中心，精神疾病诊断与治疗北京市重点实验室
2.人脑保护高精尖创新中心，首都医科大学

目的 探讨循环气质、童年期创伤和社会支持与双相情感障碍患者药物依从性变量间的作用通路。

方法 选取 2021 年 1 月至 2022 年 1 月间首都医科大学附属北京安定医院门诊就诊的 BD 共计 211 例，分为药物依从性差和依从性好两组，评估两组患者基本信息、循环气、社会支持、童年期创伤情况，运用 Spearson 相关分析和路径分析的方法确定各变量之间的关系。

结果 （1）循环气质对药物从性有负向直接效应（β=-0.163，P<0.001）；社会支持对药物依从性有正向直接效应（β=0.038，P=0.013）；童年期创伤对药物依从性无直接效应。(2)社会支持对循环气质有负向直接效应（β=-0.091，P=0.001），社会支持也可通过降低循环气质间接改善药物依从性。(3)童年期创伤对社会支持有负向直接效应（β=-0.133，P=0.008），对循环气质有正向直接效应（β=0.071，P<0.001），童年期创伤可通过提高循环气质降低药物依从性；也可通过减少社会支持进一步降低药物依从性。

结论 情感气质和社会支持是影响 BD 药物依从性的关键因素，两者介导了童年期创伤对药物依从性的影响，针对内在气质采取的干预方案更加有助于改善 BD 患者药物依从性。

伴混合特征抑郁症和双相情感障碍患者脑局部一致性和功能连接模式分析

刘悦[1] 刘瑞[2] 关霖[2] 刘歆怡[2] 周晶晶[2] 黄凯音[1] 鲁顺利[1] 于爱红[1]
1.首都医科大学附属北京安定医院放射科
2.首都医科大学附属北京安定医院 国家精神疾病医学中心 国家精神心理疾病临床医学研究中心 精神疾病诊断与治疗北京市重点实验室 人脑保护高精尖创新中心 首都医科大学

目的 探讨不伴有混合特征抑郁症（MDDnoMF）、伴混合特征抑郁症（MMF）、伴混合特征双相情感障碍（BMF）、不伴有混合特征双相情感障碍（BDnoMF）患者脑区的局部一致性（ReHo）特征，寻找伴混合特征抑郁症和双相情感障碍的脑功能活动和脑功能连接的神经影像学模式。

方法 共纳入 MDDnoMF 组 29 例、MMF 组 24 例、BMF 组 26 例、BDnoMF 组 29 例、HC 组 42 名。采集所有受试者的静息态功能像和结构像脑影像数据，应用基于 MATLAB 的 DPABI 软件获得受试者全脑的局部一致性（ReHo）值，先采用协方差分析和 LSD 或者 Games-Howell 事后检验方法进行组间比较；然后以差异脑区为种子点，计算其与去全脑的功能连接结果。

结果 5 组的左侧梭状回和左侧楔前叶脑区 ReHo 值的差异有统计学意义（P<0.05），其中 MMF 组、BMF 组和 BDnoMF 组患者左侧梭状回 ReHo 值较 HC 组降低，MDDnoMF 组、MMF 组、BMF 组、BDnoMF 组左侧楔前叶的 ReHo 值较 HC 组升高（P<0.05）；MMF 组左侧梭状回 ReHo 值较 MDDnoMF 组降低（P=0.001）；BMF 组左侧梭状回 ReHo 值较 MDDnoMF、BDnoMF 组降低（P<0.05）。5 组左侧梭状回与小脑蚓部、左侧脑岛、右侧壳核和左侧内侧额上回的功能连接差异有

统计学意义，左侧的楔前叶与右侧背外侧额上回功能连接差异有统计学意义（P <0.05）。

结论 MMF 和 BMF 患者在左侧梭状回和楔前叶存在局部功能活动同步性异常，并且与多个脑区之间存在异常功能连接模式。与 MDDnoMF 或 BDnoMF 患者比较，MMF 和 BMF 患者存在特异性神经影像特征，同时也拥有相似的神经影像发病机制。

2.State Key Laboratory of Biotherapy, Psychiatric Laboratory, West China Hospital, Sichuan University, Chengdu, Sichuan.
3.Affiliated Mental Health Center & Hangzhou Seventh People's Hospital, Zhejiang University School of Medicine, Hangzhou, Zhejiang, China.

Objective Misdiagnosis of bipolar disorder (BD) as unipolar depressive disorder (UD) may result in ineffective therapies and increased healthcare expenses, particularly in the early stages of the condition. The purpose of this study was to evaluate the fractional amplitude of low-frequency fluctuations (fALFF) for depressed patients who converted into BD (cBD) from UD and examine its utility to differentiate patients with cBD from UD using machine learning.

Methods 120 subjects (24 cBD, 48 UD, and 48 healthy controls, HC) were scanned by resting-state functional magnetic resonance imaging (rs-fMRI). The fractional amplitude of low-frequency fluctuations was used to evaluate the brain function of all subjects. The differences in fALFF among the three groups were calculated. In addition, pattern classification analysis was carried out using a support-vector machine (SVM) approach.

Results Using the machine learning (ML) technique, the fALFF effectively identified the cBD from the UD with 87.5% accuracy. Decreased fALFF in the middle temporal gyrus (MTG), left cerebellum posterior lobe, cuneus, and right middle occipital gyrus (MOG) at the early stages of disease may suggest a higher likelihood of a possible hypomanic or manic episode in the follow-up observation.

Conclusion The fALFF might be a possible candidate measure for distinguishing cBD from UD. The findings of this study, if replicated in larger samples and received further pragmatic evaluation in regular clinical practice, could have potential clinical applications.

血清周期蛋白 1/2 及环磷腺苷反应元件联合蛋白水平 在单、双相抑郁鉴别诊断的应用

黄蕾 陈炜*
浙江大学医学院附属邵逸夫医院

目的 了解 BPD 与 UPD 患者血清周期蛋白 1、周期蛋白 2 及磷酸化环磷腺苷反应元件联合蛋白水平变化，明确联合检测在 BPD 与 UPD 鉴别诊断中的应用价值。

方法 根据美国《精神疾病诊断与统计手册》第 5 版诊断标准，纳入 40 例单相抑郁患者、30 例双相抑郁患者，同时纳入 30 例健康志愿者。分别收集三组的基本人口学资料、17 项汉密尔顿抑郁量表及心境情感障碍问卷的分数。运用酶联免疫检测法检测三组血清 PER1、PER2、p-CREB 水平，两两分析组间血清 PER1、PER2、p-CREB 水平差异；研究 BPD 与 UPD 患者一般人口学资料、HAMD-17 分数和血清 PER1、PER2、p-CREB 水平的相关性；判断血清 PER1、PER2、p-CREB 水平区间范围单独检测及联合检测诊断的灵敏度、特异度、约登指数和 ROC 曲线；P＜0.05 表示差异具有统计学意义。

结果 （1）BPD 组血清 PER1 水平显著高于 UPD 组和正常对照组，UPD 组血清 PER1 水平显著低于正常对照组，差异具有统计学意义。（2）BPD 和 UPD 组血清 PER2 水平显著高于正常对照组，UPD 组低于 BPD 组，差异有统计学意义。（3）BPD 组血清 p-CREB 水平显著高于 UPD 组和正常对照组，差异有统计学意义。（4）UPD 组和 BPD 组血清 PER1、PER2、p-CREB 水平与 HAMD-17 评分均无相关性；与年龄有相关性。（5）联合检测血清 PER1 和 p-CREB 水平在鉴别诊断 UPD 和 BPD 中，敏感度为 0.933，特异度为 0.950，约登指数为 0.883，ROC 曲线下面积为 0.9858；联合检测血清 PER1、PER2、p-CREB 水平在鉴别诊断 UPD 与 BPD 中，敏感度为 1.000，特异度为 0.897，约登指数为 0.897，ROC 曲线下面积为 0.9906。

结论 血清 PER1、PER2 和 p-CREB 水平在单、双相抑郁发作患者中存在显著差异，单相抑郁发作患者组血清 PER1 水平下降，血清 PER2 水平升高，双相抑郁发作患者组血清 PER1、PER2 及 p-CREB 水平均升高，可作为鉴别诊断单、双相抑郁发作的生物标记物。联合检测血清 PER1 和 p-CREB 水平，或者联合检测血清 PER1、PER2、p-CREB 水平在鉴别诊断单、双相抑郁发作中具有较高的敏感度和特异度，可为早期正确鉴别单、双相抑郁提供重要参考。

焦虑程度对抑郁症患者非自杀性自伤频率的影响：情绪调节的中介作用

张燕 徐柳柳*
南京医科大学附属脑科医院

目的 探讨抑郁发作患者的情绪调节策略在焦虑程度与非自杀性自伤（NSSI）频率中的中介作用。

方法 选取从 2022 年 10 月-2023 年 06 月在南京脑科医院精神科住院的 252 例抑郁发作患者为研究对象，采用自残功能性评估量表（FASM）、焦虑自评量表（SAS）、情绪调节量表（ERQ）、自编人口学问卷对患者的自伤频率、焦虑状态以及情绪调节策略的使用进行调查。采用 Spearman 相关分析抑郁发作患者焦虑、情绪调节与 NSSI 频率之间的相关性，采用 PROCESS3.0 统计学软件进行中介效应检验。

结果 抑郁发作患者的 NSSI 检出率为 47.6%(120/252)。NSSI 组中认知重建调节策略得分为 23.25(28.00,32.00) 分，表达抑制策略得分为 18.00(21.00,25.00)分，SAS 得分 60.00(54.00,67.00)分。NSSI 组患者的焦虑状态与 NSSI 频率呈正相关（r=0.358;P<0.001)；认知重评策略与 NSSI 频率呈负相关（r=-0.397;P<0.001），表达抑制策略与 NSSI 频率呈正相关（r=0.411;P<0.001)。中介结果显示，情绪调节策略在焦虑状态与 NSSI 频率间存在部分中介作用，中介效应占比 21.74-33.33%。

结论 抑郁发作患者的情绪调节策略在焦虑程度与非自杀性自伤（NSSI）频率中起到中介作用，提示应重视抑郁发作患者的焦虑状态以及对认知重评进行干预，以减少 NSSI 的发生。

使用多基因风险评分在 9 万人样本中寻找抑郁症与双相情感障碍的 EEG 差异

徐月洋 荣晗*
深圳市康宁医院

目的 双相情感障碍的抑郁发作与重度抑郁症的抑郁发作有着惊人的相似性，对双相障碍的准确、及时的识别提出了相当大的挑战，导致了相当高的误诊率。且目前没有公认的生物标记物。先前的调查表明，多达三分之二的双相情感障碍患者最初被错误诊断。此外，对于超过三分之一的患者来说，准确的诊断往往要延迟十年或更长时间。在这些病例中，缺乏情绪稳定干预会增加躁狂发作和自杀倾向的风险，从而使后续治疗复杂化，并给受影响个体的社会和家庭带来重大负担。我们的目的是尝试使用 EEG 的多基因风险评分（Polygenic risk score；PRS）在 9 万人的大样本中寻找抑郁症与双相情感障碍 EEG 的差异，探寻 EEG 能否成为双相情感障碍的潜在生物标记物。

方法 使用 UK Biobank 数据库的基因表型数据和 Smit 等人计算的大型 EEG GWAS 数据在没有表型文件的情况下进行非回归 PRS 计算，得到六个 EEG 波段（alphaCz、betaCz、thetaCz、deltaCz、alphaOcc、peakOcc）各 11 组 PRS 值，共 66 组。PRS 计算使用 PRSices 软件在 Linux 环境中进行。然后计算 UK Biobank 数据库中抑郁症与双相情感障碍患者之间 EEG PRS 的差异情况。最后为了明确差异方向计算了 11 组 PRS 值的均值差。

结果 在 9 万人的样本中（包含 Smith 等人确认的可能的抑郁症与双相情感障碍），EEG alphaCz 波段 PRS 的差异明显，alphaCz 波段 11 组 PRS 值差异均为显著。在均值差结果中显示双相障碍患者 alphaCz 波段 11 组 PRS 值均低于抑郁症患者。在 5 万人的样本中（仅包含 ICD 10 确诊的抑郁症与双相情感障碍），alphaCz 波段 PRS 的差异不显著，但在六个波段中 alphaCz 仍然是最具有潜力的。

结论 EEG alphaCz 波段可能是分辨抑郁症与双相情感障碍的生物标记物。抑郁症患者 EEG alphaCz PRS 高于双相情感障碍患者。这与之前的研究结果类似，alpha 波段与人脑静息状态相关，抑郁症患者 alpha 频段较高。

PHQ-9 与 HAMD-17 量表的评估内容比较

马思梦 刘忠纯*
武汉大学人民医院精神卫生中心

目的 汉密尔顿抑郁量表（the Hamilton Rating Scale for Depression，HAMD-17）几十年来一直被用于评估抑郁症的严重程度。多项研究报道了该量表的缺陷，并认为它不适合临床评估。抑郁症筛查量表（the Patient Health Questionnaire-9，PHQ-9）因其简单易用而被建议作为 HAMD-17 量表的有效替代方案。本部分研究探讨 PHQ-9 量表是否可以替代 HAMD-17 量表以更好地评估抑郁症的严重程度。

方法 研究纳入 1741 名患有抑郁症的参与者。Cronbach's alpha、组内相关系数 （intraclass correlation coefficient，ICC）和加权 Kappa 分析用于确定量表的可靠性。效度分析采用 Pearson 相关分析和因子分析。项目反应理论（item response theory，IRT）被用来分析 HAMD-17 量表和 PHQ-9 量表题目的心理特征。

结果 信度分析表明，HAMD-17 和 PHQ-9 量表的 Cronbach's alpha 分别为 0.829 和 0.893，两个量表的 ICC 为 0.744。抑郁症严重程度评估一致性的 Kappa 得分为 0.248。效度分析表明 PHQ-9 量表是单因子结构，总分与 HAMD-17 量表强相关（r=0.724，P<0.001）。IRT 分析表明，PHQ-9 和 HAMD-17 量表题目的区分度范围分别为 1.45-2.80 和-0.02 - 1.73。通过对两个量表的题目进行匹配比较，发现 PHQ-9 量表的题目在各

维度的区分度均大于 HAMD-17 量表，说明 PHQ-9 的题目能够更好地区分严重程度不同的抑郁症患者。与 HAMD-17 量表相比，PHQ-9 量表提供了更多关于大多数受试者的信息，量表的测量精度令人满意。

结论 PHQ-9 量表在信度、效度和区分抑郁严重程度方面令人满意。它是一种简单、快速、有效和可靠的工具，可替代 HAMD-17 量表来评估抑郁症的严重程度。

关键字：抑郁症；量表评估；PHQ-9; HAMD-17

Autotaxin/LPA 轴通过影响突触可塑性介导抑郁的发生

王超 刘忠纯*
武汉大学人民医院精神卫生中心

目的 Autotaxin (ATX)是一种分泌酶，可以将细胞外的溶血磷脂酰胆碱转化为溶血磷脂酸（Lysophosphatidic acid, LPA），是 LPA 生成过程中最重要的酶之一， 而 LPA 是一种具有多种生物学特性的强效生物活性脂质介质，它通过 6 个 LPA 相关 G 蛋白偶联受体（LPA1-LPA6）发挥各种生理病理功能[1, 2]，包括神经祖细胞功能、髓鞘形成、突触传递、脑内免疫应答等，有临床研究显示重度抑郁症患者血清和脑脊液中 Autotaxin 和 LPA 都下降[3, 4]，鉴于 LPA 在脑内的关键作用，弄清抑郁症患者 Autotaxin 和 LPA 下降的作用尤为重要，本研究针对以上科学疑问作出了进一步研究，明确抑郁症患者 Autotaxin 和 LPA 下降的作用机制。

方法 在抑郁症患者血清和动物抑郁症模型血清、脑组织中通过 Elisa 和 WB、免疫荧光的方式明确抑郁后 Autotaxin 和 LPA 含量的变化，再通过注射 autotaxin 腺病毒的方式明确补充 Autotaxin 对慢性不可预知温和应激模型（CUMS，Chronic Unpredictable Mild Stress）小鼠行为学的影响，在 HT22 细胞添加 LPA 和动物侧脑室注射 LPA，提取蛋白通过 western-blot 验证脑源性神经营养因子 BDNF 的变化，再在此基础上通过 Western-blot 明确 LPA 影响 BDNF 变化的具体机制，最后通过在动物和细胞水平通过同时增加 LPA 和 LPA 受体抑制剂及信号通路抑制剂再次证明抑郁症患者脑内降低的 Autotaxin 和 LPA 是如何影响 BDNF 变化的。

结果 1. 抑郁症患者血清及抑郁模型动物海马组织中 autotaxin 和 LPA 是下降的；2. 在抑郁模型动物体内补充 autotaxin 可以有效缓解抑郁样行为；3. LPA 可以影响 BDNF 的表达；4. LPA 是通过 LPA 受体（LPAR）进一步影响 Erk/CREB 信号通路蛋白的变化，最终导致 BDNF 的变化。

结论 抑郁症患者脑内下降的 autotaxin 和 LPA 是通过 LPAR/ERK/CREB 信号通路影响 BDNF 变大，从而导致抑郁发生发展的，补充 autotaxin 可以有效缓解这一变化。

关键字：抑郁症、autotaxin、LPA

体感运动训练对双相抑郁患者认知功能和脑源性神经营养因子的作用

李沫演 温盛霖*
中山大学附属第五医院

目的 为寻求无创、易接受和有效的认知功能增强技术，本研究通过对双相抑郁患者进行体感运动训练干预，探索体感运动训练对双相抑郁患者认知功能和脑源性神经营养因子（Brain derived neurotrophic factor，BDNF）的影响效果。

方法 对符合纳入标准的 54 例双相抑郁患者，通过区组随机法分为实验组（n=27）和对照组（n=27）。实验组在常规治疗基础上接受为期 2 周、每周 4 次的体感运动训练，对照组仅进行常规治疗基础上保持原有日常活动。以 MCCB 评分作为主要指标，外周血 BDNF 水平、HAMD、YRMS、HAMA 作为次要指标，分别在治疗前、治疗 2 周结束时对患者抽取空腹血 3-5ml、评价各项指标，采用 SPSS25.0 软件进行统计分析。

结果 去除中止以及脱落病例 6 例，本研究最终纳入符合标准的病例 48 例，实验组 24 例，对照组 24 例。 1、MCCB 评分比较：组内比较：对照组患者治疗前后仅在符号编码、视觉记忆测验评分有显著改善（$P < 0.05$），实验组患者治疗前后 MCCB 总分及各测验得分均有显著改善，差异有统计学意义（$P < 0.05$）；组间比较：实验组 MCCB 总分、各测验得分治疗前后差值均高于对照组，差异有统计学意义（$P < 0.05$）。 2、量表评估：两组 HAMD 评分、YRMS 评分、HAMA 评分与治疗前相比较均下降，差异有统计学意义（$P < 0.05$）；治疗前后差值无明显差别，差异无统计学意义（$P > 0.05$）。 3、外周血 BDNF：经 2 周体感游戏训练后实验组治疗前后血 BDNF 水平差值高于对照组，差异有统计学意义（$P < 0.05$）。 4、相关性分析：实验组外周血 BDNF 水平与 MCCB 总分整体呈正相关（$r= 0.743$， $P = 0.001$）；对照组外周血 BDNF 水平与 MCCB 总分无明显相关性（$P > 0.05$）。

结论 1、体感运动训练联合常规治疗能够进一步改善双相情感障碍抑郁相患者的认知功能，提高患者的处理速度、注意/警觉、工作记忆、言语学习和记忆、视觉学习和记忆、推理与问题解决能力、社会认知。2、体感运动训练可以提高双相情感障碍抑郁相患者外周血 BDNF 水平。 3、体感运动训练可能是通过增加外周血 BDNF 水平改善 BD 患者认知功能。

伴有睡眠过多的心境障碍与发作性睡病患者睡眠进程的差异性研究

陈想想*

南京脑科医院

目的 探讨伴有睡眠过多症状的心境障碍患者与发作性睡病患者睡眠进程相关数值的差异，为鉴别诊断发作性睡病提供数值依据。

方法 研究对象选取 2012-2021 年在江苏省某三甲精神专科医院就诊，经门诊、住院确诊的发作性睡病患者 10 名和以睡眠过多为主要临床表现的心境障碍患者 13 名，发作性睡病组患者男性 6 例，女性 4 例，年龄 14-64 岁，平均（48.67±15.7）岁，心境障碍组患者男性 8 例，女性 5 例，年龄 17-57 岁，平均（33.2±11.3）岁。采用 Compumedics E Series EEG/PSG 多导睡眠脑电记录仪，观察两组患者睡眠各阶段时长、占比差异。

结果 在总记录时间（Total Recording Time，TRT）（t=6.971，p<0.001）、总睡眠时间（Total Sleeping Time，TST）（t=2.461，p=0.008）、睡眠 S1 阶段（S1）时间（t=7.85，p<0.001）、慢波睡眠（Slow Wave Sleep，SWS）时间（t=13.01，p<0.001）、快速眼球运动睡眠（Rapid Eye Movements，REM）时间（t=4.743，p<0.001）、睡眠 S1 阶段时间百分比（S1%）（t=5.389，p<0.001）、慢波睡眠百分比（SWS%）（t=7.51，p<0.001）和快速眼球运动睡眠时间百分比（REM%）（t=3.287，p<0.001）的比较中，发作性睡病组均低于心境障碍组；在睡眠 S2 阶段时间（S2）（t=2.624，p=0.005）、睡眠 S2 阶段时间百分比（S2%）（t=3.781，p<0.001）和非快速眼球运动睡眠（Non Rapid Eye Movements，NREM）时间（t=3.849，p<0.001）的比较中，发作性睡病组均高于心境障碍组，以上差异均具有统计学意义。

结论 发作性睡病患者与伴有睡眠过多症状的心境障碍患者在多导睡眠监测的相关数值比较中存在特征性差异，使用多导睡眠监测可有效辨别两种疾病。

双相障碍患者心境发作与中缝核回声改变的相关性研究

陈想想*
南京脑科医院

目的 分析双相障碍患者中脑中缝核回声改变（中断、消失）与心境发作（抑郁、躁狂、轻躁狂）次数、非自杀性自伤、自杀未遂之间的相关性，为评估自杀自伤风险及预后提供数据支持。

方法 对象选取 2018-2020 年在江苏省某三甲精神专科医院住院的双相障碍患者 73 名，其中中缝核回声异常者 43 名，自杀未遂者 19 名，非自杀性自伤患者 14 名，年龄 14-63 岁，平均年龄 37.73。采用 PHILIPS EPIQ 7 彩超诊断仪进行经颅 TCS 探查，观察中缝核回声异常与心境发作次数、非自杀性自伤、自杀未遂行为之间的相关性并对入组患者进行为期 3 年的随访（连续就诊患者 61 名，12 名脱落），观察系统治疗下的心境发作次数的变化。

结果 双相障碍患者中缝核回声改变发生率达 58.9%，远高于抑郁障碍组（入组 109 名，阳性 8 名）中缝核回声改变发生率的 7.3%；中缝核回声改变与系统治疗后心境发作次数相关（r=0.634）；非自杀性自伤组，自杀未遂组中缝核回声改变发生率高于对照组（t=5.22，p<0.01）。

结论 双相障碍患者中缝核回声改变发生率较抑郁障碍高，伴有自杀自伤行为患者中缝核回声改变发生率更高，经过系统治疗后心境发作次数较中缝核回声未改变患者多。综上，中缝核回声改变可能是双相障碍患者发生自杀自伤行为的一个高风险指标；提示病情控制困难。

抑郁症与双相情感障碍患者昼夜节律通路差异基因研究

陈磊[1,2] 沈甜[1] 陈子木[1] 袁勇贵[1] 徐治[1]
1.东南大学附属中大医院
2.南京军区总医院

目的 本研究旨在发现昼夜节律通路基因的多态性在 MDD 和 BD 之间的差异，为两者的鉴别提供遗传学依据。

方法 本研究纳入 70 名 5 年随访间一直诊断为 MDD 的患者（简称 MDD 组）和 68 名诊断为 BD 的患者（简称 BD 组），选取昼夜节律通路基因单核苷酸多态性（single nucleotide polymorphisms，SNPs）进行基因检测，采用 UNPHASED 3.1.7 软件包分析每个 SNP 的基因型频率、等位基因频率和单倍型在 MDD 和 BD 间的差异。

结果 本研究基因型频率分析发现两组患者中的 PER1rs2253820（OR=2.386，P=0.022）、PER1rs2735611（OR=2.357，P=0.020）、PER3rs12566042（OR=0.351，P=0.004）、PER3rs17031614（OR=0.389，P=0.010）、PER3rs79372391（OR=0.389，P=0.010）基因型频率的差异有统计学意义，单倍型分析发现 CLOCK 位点 rs12505266、rs2272073、rs3817444、rs11133389 和 rs12505265 构成的单倍型中，T-C-C-T-G 单倍型在两组患者中的差异有统计学意义（OR=0.108，P=0.027）。

结论 通过本文的研究，发现了昼夜节律基因多态性在 MDD 和 BD 间的差异，对临床诊断具有一定的指导意义。

Eight Weeks of Bright Light Therapy Increases Myelin Density in The Posterior Thalamic Radiation in Young Adults with Subthreshold Depression: A Inhomogeneous Magnetization Transfer MRI Study

陈观茂 汤桂贤 王颖*
暨南大学附属第一医院(广州华侨医院)

Objective Subthreshold depression (SD) is a significant risk indicator of major depressive episodes. The inhomogeneous magnetization transfer (ihMT) technique has not been used to probe myelin abnormalities and its response to bright light therapy (BLT) in SD.

Methods A total of 104 college students with SD and 91 age- and sex-matched healthy controls (HCs) were included. All participants underwent ihMT imaging, and pseudo-quantitative ihMT (qihMT), and ihMT ratio (ihMTR) were obtained. The qihMT and ihMTR values of 50 white matter (WM) fibers were compared between SD and HCs. Thirty-one SD participants underwent eight weeks of BLT, after which we observed the effect of treatment on WM fibers with abnormal qihMT and ihMTR values at baseline in SD. Also, the psychological variables were compared before and after BLT in SD.

Results Compared to HCs, SD showed decreased qihMT values in the bilateral posterior thalamic radiation (PTR) (including optic radiation), right sagittal stratum (including inferior longitudinal fasciculus and inferior fronto-occipital fasciculus), and right uncinate fasciculus, and decreased ihMTR values in the left PTR (include optic radiation) at baseline (all, $p \leq 0.001$). After eight weeks of treatment, qihMT values of all the above fiber tracts increased by BLT in SD patients, with no significant differences than HCs, and qihMT values of the right PTR increased in SD compared to baseline ($p < 0.05$).

Conclusion These findings suggest the macromolecular disruption of myelin in the PTR, sagittal stratum, and uncinate fasciculus in the early stages of depression. Furthermore, the myelin impairments in the PTR could be reversed by BLT, thus suggesting they might be used as the potential neural target for BLT in SD.

关键字：subthreshold depression; bright light therapy; inhomogeneous magnetization transfer; posterior thalamic radiation

Effects of Bright Light Therapy on Cingulate Cortex Dynamic Functional Connectivity in Young Adults with Subthreshold Depression: A Double-blind Randomized Controlled Trial

汤桂贤 陈盼 陈观茂 王颖*
暨南大学附属第一医院(广州华侨医院)

Objective Subthreshold depression is a strong risk factor for the onset of major depressive disorder and is associated with an increased burden of disease and suicide risk. Bright light therapy (BLT) is one of the effective interventions for subthreshold depression, but its neural mechanism is still unclear. The goal of this double-blind, randomized, placebo-controlled clinical trial was to assess the correlation between BLT and the dynamic functional connectivity (dFC) changes in the cingulate cortex in subthreshold depression.

Methods Participants with subthreshold depression were randomly assigned to either the BLT group (N = 38) or the placebo group (N = 39). The primary outcome was Hamilton Depression Rating Scale (HDRS), and secondary outcomes were Centre for Epidemiologic Studies Depression Scale (CESD) and Hamilton Anxiety Scale (HAMA), which were assessed before and after 8 weeks. The participants also underwent resting-state functional magnetic resonance imaging before and after 8 weeks. The subgenual, pregenual and the supracallosal anterior cingulate cortex (subACC, preACC, supACC), middle cingulate cortex (MCC) and posterior cingulate cortex (PCC) seed-based whole-brain dFC analysis was conducted. Furthermore, a multivariate regression model was adopted to predict HDRS and CESD scores changes after BLT.

Results BLT group showed decreased CESD score ($t = 3.195$, $p = 0.002$) and HDRS score ($t = 3.232$, $p = 0.002$) from pre-treatment to post-treatment compared to the placebo group. Also, compared to baseline, BLT group showed increased dFC of the right supACC-right temporal pole (TP), left MCC-right insula, and left supACC-pons, and decreased dFC of the right supACC- right middle frontal gyrus after intervention. Changes in dFC of the right supACC-right TP showed positive correlation with changes in CESD score (significant: $r = 0.522$, $p = 0.003$) and HDRS score (marginally significant: $r = 0.346$, $p = 0.061$) before and after BLT. Moreover, combining the baseline dFC variability of the cingulate cortex could predict HDRS changes in BLT.

Conclusion These results suggested that BLT alleviates depressive symptoms and changes the cingulate cortex dFC variability in subthreshold depression, which raises the possibility that pre-treatment dFC variability of the cingulate cortex could be used as a biomarker for improved BLT treatment in subthreshold depression.

基于独立成分分析双相障碍II型抑郁发作患者脑功能网络连接与炎性细胞因子的相关性研究

孙仕林[1] 陈观茂[1] 陈盼[1] 钟舒明[2] 贾艳滨[2] 王颖[1]
1.暨南大学附属第一医院影像中心
2.暨南大学附属第一医院精神心理科

目的 研究双相障碍II型抑郁发作患者的默认网络和边缘系统功能连接和炎性细胞因子表达水平及两者的相关性。

方法 纳入33例双相障碍II型抑郁发作患者和46名健康对照进行静息态磁共振数据采集，图像预处理后采用独立成分分析方法从影像数据中提取默认网络和边缘系统，比较患者组和对照组的静息态脑网络间功能连接差异；检测患者组和对照组的血清炎性细胞因子白介素-6（interleukin, IL-6）、IL-8、IL-10、肿瘤坏死因子-α（tumor necrosis factor-α，TNF-α）和趋化因子C-C配体4（C-C motif chemokine 4, CCL4）水平，探讨差异脑区的功能连接与炎性细胞因子表达水平之间

的相关性。

结果 患者组默认网络的右侧内侧前额叶、左侧额上回功能连接减弱，边缘系统的左侧小脑IV、V小叶和小脑后叶扁桃体功能连接增强，均 $p<0.05$。患者组血清炎性细胞因子 IL-10、CCL4 表达水平高于对照组（$p<0.05$）。患者组小脑IV、V小叶功能连接与血清 IL-10 水平呈正相关（$r=0.432$，$p=0.031$）；小脑后叶扁桃体功能连接与血清 IL-10 水平呈正相关（$r=0.429$，$p=0.032$），与血清 CCL4 水平呈正相关（$r=0.402$，$p=0.046$）。

结论 静息态下双相障碍II型抑郁发作患者默认网络和边缘系统功能连接异常，血清炎性细胞因子表达水平升高且与边缘系统功能连接存在相关。

Meta-analysis of Cortical Thickness Reduction in Adult Schizophrenia

孙仕林[1] 肖书[1] 龚佳英[2] 汤桂贤[1] 郭子玄[1] 王颖[1]
1.暨南大学附属第一医院影像中心
2.中山大学附属第六医院放射科

Objective Schizophrenia (SCZ) is a severe psychiatric disease characterized by cognitive impairment, auditory hallucination, delusions, abnormal behavioral disorders, and poor long-term prognosis leading to adverse effects on the life quality and social function of patients with SCZ1-4. SCZ affects approximately 1% of the general population in the world, places a tremendous burden on sufferers, families, and society, and remains a debilitatingly progressive and incurable disease5. It is recognized globally as the most significant reason for a chronic psychiatric disability. However, the specific pathophysiology and neuroanatomical biomarkers of SCZ remain elusive. Structural magnetic resonance imaging is a non-invasive neuroimaging technique widely used to research brain structural abnormalities in SCZ, significantly improving our understanding of the neurobiological characteristics of Schizophrenia6,7. Cortical thickness is one of the critical indicators of brain structure, mainly measured by surface-based morphometry (SBM), reflects the size, density, and arrangement of neurons, neuroglia, and nerve fibers8 and changes with typical development, aging, and specific pathologies9. Thus, there is an increasing number of exploratory studies on cortical thickness in SCZ patients. Although significant progress has been made in understanding the neurobiological characteristics of SCZ, previous studies have reported inconsistent alterations in cortical thickness in SCZ patients. These inconsistencies may be due to differences between studies in the sample characteristics (such as age, sexuality, and ethnicity), flexible analyses and statistical methods, illness duration and stage, and medication situation. Thus, a quantitative assessment of cortical thickness abnormalities using neuroimaging meta-analysis is needed to overcome such divergence in the SCZ literature.

Methods This meta-analysis of whole-brain study explored cortical thickness alteration in adult SCZ patients compared with healthy controls (HCs) by using the Seed-based d Mapping with Permutation of Subject Images (SDM-PSI) software.

Results A total of 25 studies (33 datasets) comprising 2008 SCZ patients and 2004 HCs were included by a systematic literature search. Overall, adult patients with SCZ displayed cortical thickness decrease in the right inferior frontal gyrus (IFG), and bilateral insula.

Conclusion The SBM meta-analysis suggested that SCZ patients showed aberrant cortical thickness mainly in the inferior frontal gyrus, insula suggesting that deficits in those regions might underlie the SCZ.

伴忧郁特征抑郁症患者纹状体亚区功能连接与其认知功能障碍的相关性研究

孙仕林[1] 郭子玄[1] 陈盼[1] 陈观茂[1] 肖书[1] 钟舒明[2] 贾艳滨[2] 王颖[1]
1.暨南大学附属第一医院影像中心
2.暨南大学附属第一医院精神心理科

目的 忧郁特征型抑郁症是普遍公认的重度抑郁症的亚型之一，其特征是精神运动困难、快感缺乏、体重减轻、不适当的内疚感和早醒。越来越多的研究表明，纹状体结构的改变可能与忧郁特征型抑郁症的神经生理病理有关。然而目前尚无研究探讨伴忧郁特征抑郁症患者的纹状体 12 亚区的全脑功能连接的改变。本次研究目的是揭示纹状体12亚区的功能连接异常的模式，以及其与伴忧郁特征抑郁症患者的认知功能障碍的关联。

方法 纳入 81 例伴忧郁特征抑郁症患者和 88 名健康对照进行静息态磁共振数据采集，图像预处理后，选取纹状体 12 个种子区，计算纹状体 12 亚区与全脑的功能连接，比较病例组和对照组的静息态下脑区之间功能连接差异。通过 MATRICS 共识认知成套测验(MCCB)，比较病例组和对照组的认知功能。最后进行相关性分析，探讨差异脑区的功能连接与 MCCB 认知表现之间的相关性。

结果 与健康对照组相比，伴忧郁特征抑郁症患者的右侧纹状体背侧尾状核 - 腹侧壳核亚区和左侧顶上小叶功能连接降低 [$t=-4.52$，体素 $P<0.001$, 团块 $P<0.004$ (0.05/12)，GRF 校正]。此外，信息处理速度、工作记忆、词语学习、视觉学习、社会认知、综合分数表现得分均低于对照组(均 $P<0.05$)。相关性分析显示，右侧纹状体背侧尾状核 - 腹侧壳核亚区和左侧顶上小叶差异脑区值与社会认知($r=0.308$, $P=0.021$)、视觉学习($r=0.402$, $P=0.002$)和综合分数($r=0.417$, $P=0.001$)均存在正相关。

结论 本研究发现伴忧郁特征抑郁症患者右侧纹状体背侧尾状核 - 腹侧壳核亚区存在功能连接异常，并提示右侧纹状体背侧尾状核 - 腹侧壳核亚区和左

侧顶上小叶功能连接异常可能是伴忧郁特征抑郁症患者认知功能障碍的神经生物学基础。

Systematic Review and Meta-analysis: Multimodal Functional and Anatomical Neural Alterations in Autism Spectrum Disorder

郭子玄 唐鑫悦 肖书 严虹 孙仕林 杨梓彬 钟舒明 黄力 贾艳滨 王颖*
暨南大学附属第一医院(广州华侨医院)

Objective This meta-analysis aimed to explore the most robust findings across numerous existing resting-state functional imaging and voxel-based morphometry (VBM) studies on the functional and structural brain alterations in patients with autism spectrum disorder (ASD).

Methods A whole-brain voxel-wise meta-analysis was conducted to compare the differences in the intrinsic functional activity and gray matter volume (GMV) between patients with ASD and typically developing individuals (TDs) using Seed-based d Mapping software.

Results A total of 23 functional imaging studies (786 ASD, 710 TDs) and 52 VBM studies (1728 ASD, 1747 TDs) were included. Compared with TDs, patients with ASD displayed resting-state functional decreases in the left insula (extending to left superior temporal gyrus [STG]), bilateral anterior cingulate cortex/medial prefrontal cortex (ACC/mPFC), left angular gyrus and right inferior temporal gyrus, as well as increases in the right supplementary motor area and precuneus. For VBM meta-analysis, patients with ASD displayed decreased GMV in the ACC/mPFC and left cerebellum, and increased GMV in the left middle temporal gyrus (extending to the left insula and STG), bilateral olfactory cortex, and right precentral gyrus. Further, patients with ASD displayed decreased resting-state functional activity and increased GMV in the left insula after overlapping the functional and structural differences.

Conclusion The present multimodal meta-analysis demonstrated that ASD exhibited similar alterations in both function and structure of the insula and ACC/mPFC, and functional or structural alterations in the default mode network (DMN), primary motor and sensory regions. These findings contribute to further understanding of the pathophysiology of ASD.

Gut Microbiota-brain- Inflammation Relationships in Unmedicated Bipolar Disorder II: A Prospective Study

郭子玄 孙仕林 肖书 陈观茂 陈盼 杨梓彬 钟舒明 黄力 贾艳滨 王颖*
暨南大学附属第一医院(广州华侨医院)

Objective The dysregulation of gut microbiota and immune are increasingly reported in bipolar disorder (BD), but the relationships of the gut microbiota-brain-immune remains unknown.

Methods 65 Patients with unmedicated BD II depression and 58 healthy controls (HCs) were prospectively enrolled. Fecal samples, blood samples and resting-state functional magnetic resonance imaging (rs-fMRI) were acquired from all subjects. 16S amplicon sequencing was used to assess gut diversity and enterotypes. Serum was assayed for levels of inflammatory cytokines (interleukin [IL]-6, IL-8, IL-10). The amplitude of low-frequency fluctuation (ALFF) was measured, and abnormal ALFF masks were subsequently set as regions of interest (ROIs) to calculate the whole-brain functional connectivity (FC) and dynamic functional connectivity (dFC). Then, the partial correlation coefficients among the abnormal neuroimaging measures, gut microbiota and inflammatory cytokines levels were performed. Additionally, the support vector machine (SVM) classifiers were carried out to distinguish patients with BD II from HCs.

Results Patients with BD II exhibited decreased ALFF values in the left cerebellum Crus II, as well as decreased FC between the left cerebellum Crus II and the right inferior parietal lobule (IPL), and decreased dFC between the left cerebellum Crus II and right cerebellum and right superior frontal gyrus compared to HCs. Moreover, higher IL-6, IL-8, IL-10 levels, and 14 species increased and 5 species decreased were identified in patients compared to HCs. Correlation analysis showed that genus Parabacteroides was positively correlated with IL-10 level, as well as negatively correlated with ALFF values in the left cerebellum Crus II in patients with BD II. IL-8 level was negatively correlated with FC of the left cerebellum Crus II to the right IPL in patients with BD II. In terms of the classification of BD from HCs, it reached optimized area under curve (AUC) at 0.852 when combining abnormal gut microbiota, inflammatory cytokines and neuroimaging measures.

Conclusion Our findings may enable a better understanding of the gut microbiota-brain- inflammation relationships in BD II.

关键字：Bipolar disorder; gut microbiota; functional MRI; inflammation

眼动追踪技术在情感障碍研究中的典型范式及研究进展

林健森[1] 吴晓慧[1] 陈俊[1] 方贻儒[2]
1.上海交通大学医学院附属精神卫生中心
2.上海交通大学医学院附属瑞金医院情感障碍中心

目的 情感障碍主要指抑郁障碍及双相情感障碍，常发病在成年早期，可损害患者的社会功能，造成巨大社会经济负担，但目前其发病机制仍不明确，临床诊疗仍缺乏客观的评估手段。眼动追踪技术是一项针对眼

球的一系列自发性、控制性及目的性运动的客观评估手段，可量化评估的范围包括瞳孔的动态变化、眼睛注视的位置和时间、运动轨迹等，为探索情感障碍患者的认知功能及情绪感知处理过程提供了可视化手段。本文拟围绕近十年情感障碍研究的眼动范式、眼动异常及潜在机制展开综述。

方法 以“眼动追踪”、“抑郁障碍”、“双相情感障碍”、"eye-tracking" 、“depression” "depressive disorder" 、“bipolar disorder”等为关键词在万方、Pubmed 等数据库检索总结目前有关眼动追踪技术与情感障碍相关的研究。

结果 常用的眼动追踪范式包括自由观看任务、点探针任务、视觉参与-脱离任务、社会压力下的演讲任务、视觉搜索任务、平滑眼球追踪运动、眼跳与反眼跳任务。抑郁患者存在消极刺激的注意增加及脱离困难，任务中的更长的图像注视时间提示其可能有认知损害。老年抑郁患者存在抑制能力缺陷，或可预测老年患者自杀的风险。缓解期抑郁症患者对积极刺激的注意有所恢复但仍难以脱离消极刺激；对威胁、愤怒刺激的注意偏向会增加抑郁症发病风险。双相障碍患者普遍对威胁刺激注意增加；双相躁狂患者则表现出对积极刺激注意增加；此外，平滑眼球追踪运动可以鉴别双相障碍患者是否伴随精神症状。眼动的异常与适应功能不良、情绪调节策略使用不足、认知资源分配异常等相关。

结论 眼动追踪技术可以量化评估情感障碍患者的注意力倾向、认知功能、视觉追踪能力、抑制能力等方面的异常，既能体现情感障碍的神经生理变化，也可以作为疾病严重程度的评估指标，辅助临床的诊断与治疗，有望成为情感障碍机制研究及临床诊治的有效工具。然而，目前情感障碍相关眼动的机制仍不明确，仍缺少针对更细化的情感障碍分型的眼动差异研究，未来仍需进一步拓展眼动追踪技术的应用。

外周全血细胞计数与情感障碍患者自杀风险和肇事风险之间的关系

蒋伟[1,2] 刘海兰[2] 荣晗[1,2]
1.安徽医科大学精神卫生与心理科学学院
2.深圳市康宁医院

目的 情感障碍是一种常见的精神疾病，它会导致疾病发生率和死亡率的增加，与自杀存在密切关系。在《国际疾病分类》第 10 版（ICD-10）中，抑郁症和双相情感障碍都隶属于情感障碍。目前它们的病因均尚未明确，两种疾病的病理生理学机制一直备受研究者关注，其中就包括炎症。白细胞计数（WBC）是一种非特异性的炎症标记物，中性粒/淋巴细胞比值（NLR）、单核/淋巴细胞比值（MLR）、血小板/淋巴细胞比值（PLR）已经成为重要的外周炎症生物标记物。研究发现 NLR、MLR 和 PLR 可作为区分单相与双相抑郁的潜在生物标记物；NLR 与自杀行为之间的关系也被发现。在情感障碍中，除了较高的自杀风险，还有可能出现肇事风险，研究发现，双相障碍患者抑郁发作期间自杀风险较高，而躁狂发作期间肇事风险较高。因此，本研究将（1）考察双相障碍不同状态下的自杀与肇事风险，以及全血细胞计数指标上的差异；（2）考察双相障碍患者与抑郁症患者全血细胞计数指标上的差异；（3）考察情感障碍患者全血细胞计数指标与自杀和肇事风险的关系。

方法 本研究纳入 18-65 岁双相障碍躁狂发作患者（双相躁狂）42 例，双相障碍抑郁发作（双相抑郁）患者 38 例，双相障碍伴混合特征（双相混合）患者 20 例，抑郁症患者 100 例。各组患者的性别、年龄、受教育年限均无显著性差异。研究中采集患者的外周血，进行全血细胞计数（CBC）检测，获得 WBC、中性粒细胞、淋巴细胞、单核细胞和血小板计数，以及 NLR、MLR、PLR 等指标。

结果 双相躁狂患者的自杀风险显著低于双相抑郁和双相混合患者，但三组患者全血细胞计数指标均无显著性差异。但双相障碍患者的 WBC、中性粒细胞数以及 NLR 均显著高于抑郁症患者。CBC 指标与自杀和肇事风险偏相关分析结果表明，自杀风险与淋巴细胞数呈正相关，与中性粒细胞数、NLR、PLR 呈负相关；自杀尝试史与 CBC 指标无显著相关。肇事风险与 WBC、中性粒细胞数、单核细胞数、NLR、MLR、PLR 均存在显著的正相关。

结论 （1）CBC 指标可能无法区分双相障碍的不同状态；（2）双相障碍与抑郁症患者 CBC 指标的差异表明，双相障碍患者的外周炎症水平可能高于抑郁症患者；（3）CBC 指标与自杀风险以及肇事风险均存在显著的相关，说明自杀风险与肇事风险均与外周炎症/免疫相关，这些指标可能成为风险监测的外周标记物。

关键字：抑郁症；双相障碍；全血细胞计数；自杀风险；肇事风险

锂盐对双相情感障碍患者血脂代谢的影响

焦志鹏[1,2] 阎丹峰[1,2] 王斌红[1,2]
1.山西医科大学
2.山西医科大学附属精神卫生医院

目的 在精神科的临床治疗中，应用锂盐等心境稳定剂治疗双相情感障碍(Bipolar disorder, BD) 往往会伴随出现代谢方面的并发症。目前，应用锂盐治疗 BD 对脂代谢的影响受到医生越来越多的关注。脂代谢紊乱会导致诸如心脑血管疾病等更严重的危害，更不利于疾病的治疗。基于此目的，本研究旨在探讨锂盐对双相障碍患者脂代谢的影响。

方法 采用回顾性研究方法，纳入 2021—2022 年在山西省精神卫生中心门诊就诊及住院治疗的 BD 患者 116 例，均接受锂盐治疗 1 个月。采用迈瑞 800 全自动生化分析仪检测患者基线及锂盐治疗 4 周后的空腹血脂水平，如血清甘油三酯、胆固醇、高密度脂蛋白、

低密度脂蛋白水平。

结果 共纳入BD患者116例(男69例，女47例)。我们发现应用锂盐治疗与血清甘油三酯水平呈显著正相关(r = 0.25, p = 0.038)，与血清高密度脂蛋白水平呈显著负相关(r = -0.19, p = 0.05)。进一步研究发现，女性患者的脂质代谢水平变化更为明显，主要表现为应用锂盐治疗与女性患者的胆固醇水平(r = 0.31, p = 0.032)和血甘油三酯水平(r = 0.41, p = 0.004)呈显著正相关。与低密度脂蛋白水平呈正相关(r = 0.36, p = 0.014)。

结论 锂盐治疗对双相障碍患者的脂代谢有显著影响，其中女性患者更为敏感。因此，定期监测患者的脂代谢水平十分必要。对于已经存在相关代谢性疾病风险的患者，应慎用锂盐。

关键字：锂盐；双相情感障碍；血脂代谢；胆固醇；甘油三酯；低密度脂蛋白；高密度脂蛋白；

住院双相情感障碍患者共病心血管疾病的患病率及危险因素

张燕 张勇*
天津市安定医院

目的 双相情感障碍（BD）是一种慢性、复发性精神疾病，其死亡率比一般人群高2-4倍，较高的死亡率导致预期寿命至少减少了10年。而其中心血管疾病（CVD）是导致双相障碍患者过多和过早死亡的主要原因之一。然而，关于双相障碍患者共病心血管疾病的危险因素还没有确切结论。本研究的目的是探讨在双相障碍患者中除心血管疾病的传统危险因素外，双相障碍临床特征与心血管疾病间的关系。

方法 本研究采用横断面研究的方法利用电子病历系统收集2016年1月1日~2020年12月31日于天津市安定医院住院的双相情感障碍患者相关资料，包括社会人口学信息、临床特征资料及空腹血液检查结果，研究数据均来源于末次住院资料。所有患者均符合ICD-10双相情感障碍诊断标准，并根据出院记录详细记录是否有心血管疾病（CVD）的明确诊断（本研究主要包括高血压、冠心病、心肌缺血）。心血管疾病的诊断有重要的身体或实验室检查结果支持，且这些疾病正在接受相关治疗。对分类变量采用卡方检验，连续变量进行正态分布检验后采用独立样本T检验或非参数检验比较伴或不伴心血管疾病的双相障碍患者的组间差异。最后采用二元logistic回归分析双相障碍患者共病心血管疾病的危险因素。

结果 本研究共包括1120名双相情感障碍患者，其中206例（18.4%）共病心血管疾病（CVD）。利用卡方检验分析，两组患者在年龄、性别、受教育程度、工作状况的差异有统计学意义（P<0.001）。共病CVD的BP患者病程更长，住院次数更多，使用更多的第二代抗精神病药物（P < 0.001）。而在疾病发作类型、是否伴精神病性症状和抗精神病药物的使用方面均未发现明显差异（P>0.05）。共病CVD的BP患者同时共病糖尿病比例更高，血清TG和LDL升高，而血清HDL显著降低（P<0.05）。两组患者在空腹血糖（FBG）、胆固醇（CHOL）、TSH、T3、T4 差异均无统计学意义（P>0.05）。最后通过logistic回归分析发现除糖尿病、TG传统因素外，双相障碍患者病程更长、使用第二代抗精神病药是其共病心血管疾病的重要非传统危险因素。

结论 与普通人群相比，双相障碍患者合并心血管疾病的风险更大，不仅与传统的危险因素相关，而且与疾病本身相关的非传统危险因素相关。为了阐明BP患者心血管疾病的发病机制，需要纵向研究传统危险因素与双相情感障碍特征之间的相互作用。

家庭单元式延续护理在双相情感障碍患者中的应用效果分析

田蕾*
天津市安定医院

目的 研究对于双相情感障碍（Bipolar Disorder，BD）患者应用家庭单元式延续护理的效果

方法 于我院BD患者中随机抽取60例分为对照组（30例，常规延续护理）和观察组（30例，家庭单元式延续护理），对比两组应用效果。对照组采取常规护理，定期电话随访，督促患者按时用药，定期复诊。观察组实施家庭单元式延续护理，措施如下：（1）调查家庭状况：详细了解患者家庭结构、居住情况、兴趣爱好、生活状态、家庭成员关系等信息。（2）出院后随访管理：根据患者及家属意愿选择电话随访或者家访等方式，电话随访患者主要通过电话沟通，家访则需要到患者家里面对面沟通，着重向家属了解患者的情况，对患者和家属进行健康宣教，科普药物、居家护理等知识，帮助患者和家属了解疾病，学习家庭护理。了解出院后是否按照医嘱用药，保证健康生活方式，家庭成员相处过程中是否出现冲突，患者情绪状况等内容。根据家属反馈给出建议，帮助家属建立信心，能够多关怀包容患者，主动分担家务劳动，有意识帮助患者恢复生活能力，对家属进行鼓励和支持。表达对家属的理解，认同家属对护理的支持和努力，理解家属产生的照护压力感，指导家属沟通技巧。（3）小组训练活动：鼓励家属和患者展开小组训练活动，可以选择不同社交场景，让患者和家属扮演不同的角色，进行互相问候，在特定场景下进行社交交流，家属能够根据患者的表达做出对应的回应，给予肯定和表扬，让患者积极参与训练，提高其社交能力。

结果 结果：观察组CD-RISC（64.76±4.62）分，HAMD（16.41±4.39）分，显著优于对照组[CD-RISC（56.22±4.15）分，HAMD（26.39±3.85）分]（P＜0.05）。观察组SDSS（5.16±0.44）分，GQOL-74（304.65±23.41）分，显著优于对照组[SDSS（8.19±0.52）分，GQOL-74（268.47±25.30）分]（P＜0.05）。观察组满意度（100%）

高于对照组（80%）（P＜0.05）。

结论 对于 BD 患者应用家庭单元式延续护理后能够有效改善患者抑郁情绪，促进患者社会功能的恢复，并提高其生活质量，更能达到患者满意，具有较高应用价值。

基于汉族人群的双相障碍患者独立样本的遗传关联研究

冯筱扬 宋煜青 张于亚楠 孙瑶瑶 卢喆 廖云丹 康哲维 岳伟华*
北京大学第六医院

目的 通过芯片测序和生物信息学方法，采用全基因组遗传关联研究的方法，对汉族人群中双相障碍患者的遗传特征进行分析。分别通过病例/对照研究和自主探索的转相建模方式的数量性状进行关联分析，寻找一些和双相障碍发病及其相位发生转化的生物学机制。

方法 分别纳入同为汉族人群的患者 194 例和对照 99 例，该部分患者皆为北京大学第六医院纳入，同时和浙江大学第一医院纳入的 1006 例患者及 863 慢病计划纳入的 3000 名对照进。利用 ASA、zhonghua-8 等芯片对样本进行芯片测序，之后再根据千人基因组计划等的人类基因库数据进行 imputation。对性别、杂合率、MAF、亲缘关系等进行质控后，利用采用 plink 软件进行全基因组关联分析（GWAS）。除了利用 case/ctrl 进行分析外，还根据患者的 ymrs、hamd 分数进行转相剧烈程度进行分析，采用 sigmoid 函数设置阈值，利用深度学习方法输出其数量性状。之后再根据结果进行 GWAS 分析。采用 R 的 qqman、ggplot2 等包进行作图和结果呈现。

结果 设置 threshold 为 1*10^-8，经过 F 校正后，case/ctrl 的结果发现 rs461105，和 rs2330454 两个 SNP 为显著，分别位于 LOC102467217 和非编码区。利用和转相相关的数量性状进行分析，发现 rs200847539、rs9366721 、rs4663334 显著，分别位于 SDHAP2 辅酶 Q 家族基因、ZBED9 紧张致高血压风险基因、UGT1A10 和肝脏活性酶相关基因的编码区。

结论 利用中国汉族人群的独立样本进行分析后发现了一些前人未报道的显著的 SNP，尤其是和转相相关的 SNP 位于一些之前尚未被报道和双相相关的功能基因编码区。这些基因可能在双相障碍的相位转化中扮演了重要角色，有进一步进行探索和分析的价值。

双相障碍患者疾病知识水平、自我管理 和生活质量的相关性研究

周甜[1] 赖九兰[2] 巴正玲[2] 熊令辉[1] 林小玲[2]
1.广州医科大学附属脑科医院
2.中山大学护理学院

目的 描述双相障碍患者疾病知识水平、自我管理和生活质量的现状；探讨疾病知识水平、自我管理和生活质量的相关性；分析双相障碍患者生活质量的相关影响因素。

方法 采用横断面研究方法，于 2022 年 1 月～2022 年 10 月便利抽取广州市某两所三甲医院精神心理科门诊符合纳入标准的 255 例双相障碍患者，分别采用一般资料问卷、双相障碍生活质量量表、双相障碍知识量表、双相障碍自我管理量表对双相障碍患者的社会人口学和疾病资料、生活质量、疾病知识水平及自我管理进行调查，使用 SPSS 25.0 软件进行数据整理和统计分析。

结果 （1）双相障碍患者的生活质量平均得分为（39.36±8.93）分，条目均分为（3.28±0.74）分，生活方面条目均分为（3.13±0.85）分，社会功能条目均分为（3.27±0.88）分，社会心理条目均分为（3.40±0.79）分。双相障碍患者的疾病知识水平平均得分为（12.28±2.76）分。双相障碍患者的自我管理平均得分为（66.01±13.83）分。（2）双相障碍患者的生活质量与疾病知识水平呈正相关关系（r=0.201，P＜0.01）；双相障碍患者的生活质量与自我管理呈正相关关系（r=0.546，P＜0.01）。（3）双相障碍患者生活质量的影响因素包括体质指数（Body Mass Index，BMI）18.5～23.9Kg/m2（β=0.131，P＜0.01）、经济收入（β=0.097，P＜0.05）、病程（β=-0.134，P＜0.01）、抑郁症状（β=-0.356，P＜0.01）、躁狂症状（β=-0.070，P＜0.05）、疾病知识水平（β=0.165，P＜0.01）、自我管理（β=0.380，P＜0.01），共解释 46.6% 的变异量（R2=0.466，F=30.794，P＜0.01）。

结论 （1）双相障碍患者的生活质量较差，疾病知识水平不足，自我管理欠佳，有待提高。（2）疾病知识水平越高、自我管理水平越高、BMI 处于正常范围的双相障碍患者，其生活质量越好；经济收入越低、病程越长、抑郁症状和躁狂症状越严重的双相障碍患者，其生活质量越差。

儿童青少年情绪障碍患者努力获得奖赏的动机受损的特征及影响因素

赵艳丽[1] 赵少琨[2] 徐家华[3] 宋佳起[1] 陈海滔[1] 刘攀琪[1] 王碧馨[1] 王静涵[1] 沈晴[1] 袁纯钰[1] 张进国[1] 李东[1] 王云辉[1] 李亚军[1] 刘华清[1] 谭淑平[1]
1.北京回龙观医院，北京大学临床教学医院，精神医学研究中心
2.北京师范大学,认知神经科学与学习国家重点实验室
3.北京脑科学与类脑研究中心

目的 动机缺乏是抑郁症的一个典型特征，会导致患者为获得奖励而付出努力（effort）的意愿降低，并且与快感缺乏的严重程度及社会功能的受损之间存在联系。既往研究聚焦于成人抑郁症群体，对儿童青少年情绪障碍患者努力获得奖赏的动机受损的特征及影响因素的考察较少。

方法 采用奖励-努力付出任务(Effort-Expenditure for Rewards Task)及包括情绪状态、家庭关系等量表评估，结合计算建模（computational modelling）考察青少年障碍患者的奖赏努力受损的特征及可能的影响因素。被试为 49 名儿童青少年情绪障碍患者及 35 名正常对照。要求他们完成奖励任务的努力付出的行为学任务及有关情绪状态、家庭关系等系列量表评估。

结果 1）行为学结果发现：患者组选择高努力/高回报的比例（Proportion of effortful choice）显著低于正常组（$t=-2.12, p=0.037$），而折现率（ discounting rate）则高于对照组（$t=2.16, p=0.033$）。此外，在患者组，女生选择高努力/高回报的比例显著低于男生。2)在患者组中发现：选择高努力/高回报的比例与汉密尔顿抑郁量表（HAMD）评分存在负相关（$r=-0.250, p=0.08$）；与童年创伤问卷（CTQ）性虐待因子分之间存在显著正相关，$r=-0.475, p=0.0006$；与述情障碍量表(TAS)情感描述不能因子分之间存在显著负相关，$r=-0.290, p=0.0430$. 在对照组中发现：选择高努力/高回报的比例与反刍思维量表分间存在显著负相关，$r=-0.440, p=0.022$; 与家庭沟通家庭关系量表分之间存在显著正相关（$r=0.728, p=0.0003$;$r=0.667, p=0.0013$），折现率与家庭沟通及家庭关系量表分之间存在显著负相关（$r=-0.571, p=0.0085$; $r=-0.542, p=0.0135$）。

结论 儿童青少年情绪障碍患者为获得奖励而付出身体和认知努力的意愿降低，且这种动机受损在女性患者中更为严重，抑郁情绪、童年创伤及情感描述能力显著影响动机投入。家庭关系、家庭沟通是儿童青少年维持正常努力动机的保护因素，不良的思维习惯（反刍）是破坏因素。

Peer Victimization and Non-suicidal Self-injury Among Depressed Adolescents: A Moderated Mediation Model

Wei Tang[1,2], Lan Hong[3], Jie Liu[2], Shiyao Ma[2], Siyu Tong[2], Jinqiu Zhang[2], Chengqian Jin[2], Lijun Wang[2], Mingjing Wu[2], Hong Chen[4], Tiansheng Zheng[1], Ke Zhao[1,2,5]
1.The Affiliated Kangning Hospital of Wenzhou Medical University, Zhejiang Provincial Clinical Research Center for Mental Disorder , Wenzhou, China.
2. School of Mental Health, Wenzhou Medical University, Wenzhou, China.
3.The Third Hospital of Quzhou, Quzhou, China.
4.Department of Psychiatry, First Affiliated Hospital of Wenzhou Medical University, Wenzhou, China.
5.The Second People's Hospital of Lishui, Lishui, China.

Background Non-suicidal self-injury (NSSI) is a serious and highly prevalent problem among adolescents with depression. Peer victimization as a risk factor for non-suicidal self-injury has been confirmed in previous studies. However, little is known about how it induces adolescents to commit non-suicidal self-injury.

Methods A total of 740 depressed outpatients aged 12-18 years with non-suicidal self-injury were selected. General demographic information was collected using the self-designed scale, and relevant information was collected using the Functional Assessment of Self-Mutilation, Patient Health Questionnaire-9, Multidimensional Peer Victimization Scale, and Borderline Personality Features Scale for Children.

Results After controlling for age and sex, it was found that depressive symptoms partially mediated the relationship between peer victimization and non-suicidal self-injury ($P < 0.001$). Borderline personality features moderated the mediating effect of depressive symptoms. The moderating effect occurs in the second half of the mediating effect ($P = 0.002$). Limitations: The research covered a short span of time. Secondly, and only adolescents were selected as study subjects.

Conclusion The moderated mediation model constructed in this study reveals the internal mechanism between adolescent peer victimization and non-suicidal self-injury, which is of great significance for the prevention and intervention of adolescent non-suicidal self-injury.

Severity Related Alterations of Gray Matter Volume, Cortical Thickness and Functional Activity in Young Adults with Major Depressive Disorder

操军 况利*
重庆医科大学附属第一医院

Objective The primary goal of the present study was to comprehensively clarify the neural basis of young depressed patients with suicide attempt through the combination of structural and functional analyses.

Methods In this study, we examined the cortical

and subcortical alterations of neuroanatomical structures and spontaneous functional activation in 50 unmedicated adolescents with MDD vs. 39 healthy controls through the combined structural and resting-state functional magnetic resonance imaging.Firstly, we utilized voxel-based morphometry (VBM) to examine the subcortical structure of GM volume in adult patients with MDD in comparison with healthy controls. Second, we used the surface-based morphometry (SBM) to examine the CT in MDD patients compared with healthy controls. Thirdly, we also investigated the subcortical ALFF and ReHo as measurements of functional activity in MDD patients compared to controls. Finally, we calculated the surface ALFF and ReHo measurements and compared between patients and control groups.

Results Significantly altered regional gray matter volume was found at broader frontal-temporal-parietal and subcortical brain areas involved with various forms of information processing in adolescent MDD. Specifically, the increased GM volume at the left paracentral lobule and right supplementary motor cortex was significantly correlated with depression severity in adolescent MDD. Furthermore, lower cortical thickness at brain areas responsible for visual and auditory processing as well as motor movements was found in adolescent MDD. The lower cortical thickness at the superior premotor subdivision was positively correlated with the course of the disease. Moreover, higher spontaneous neuronal activity was found at the anterior cingulum and medial prefrontal cortex, and this hyperactivity was also negatively correlated with the course of the disease. It potentially reflected the rumination, impaired concentration, and physiological arousal in adolescent MDD.

Conclusion The abnormal structural and functional findings at cortico-subcortical areas implied the dysfunctional cognitive control and emotional regulations in adolescent depression. The findings might help elaborate the underlying neural mechanisms of MDD in adolescents.

益生菌在有胃肠道症状孤独症儿童中的疗效和机制研究——一项随机、双盲、对照研究

赵英欣 孟凡超 陈旭 王亚萍 常天怡 周晶晶 田兰君 黄环环 刘梦琪 赵佳 杨健 何凡* 郑毅*
首都医科大学附属北京安定医院

目的 评估特定组合益生菌制剂对有胃肠道症状的孤独症儿童的疗效和安全性，挖掘与疗效相关的肠道微生物，初步阐明特定组合益生菌制剂对有胃肠道症状的孤独症儿童疗效的可能作用机制。

方法 我们在门诊招募3～6岁有胃肠道症状的孤独症受试者，进行了一项为期12周的益生菌随机、双盲、对照干预研究。所有孤独症儿童按1:1的比例随机分配到益生菌组或安慰机组，受试者原有的行为训练内容保持不变。干预过程中，我们评估了使用该特定组合益生菌制剂干预前后两组的临床症状和肠道微生物组变化。

结果 1. 益生菌干预 12 周末，孤独症儿童孤独症评定量表（the Childhood Autism Rating Scale, CARS）、孤独症行为量表（Autism Behavior Checklist, ABC）、临床总体印象量表-改善程度量表（Clinical Global Impressions of Improvement, CGI-I）、 6 项胃肠道症状严重程度指数量表（six gastrointestinal severity indices, 6-GSI）和 Zarit 护理负担量表评分显著下降。其中，6-GSI 评分中大便气味和便秘症状改善显著。整个干预过程中，未见与研究相关的严重不良反应。 2. 在研究结束时，益生菌组肠道微生物群落 α 多样性显著升高。干预后两组样本菌群组成在 4 周时接近明显分离，但到 12 周末，干预导致的菌群组成改变逐渐回落至无差异水平。在干预的 12 周末，有 2 种益生菌（ifidobacterium animalis 和 Lactobacillus paracasei）在干预组富集，所干预的益生菌部分成功定植于干预组孤独症儿童肠道中。3. 研究初步阐明了该益生菌对有胃肠道症状的孤独症儿童有效的可能作用机制，即孤独症儿童症状的改善与益生菌制剂中有益菌（主要是 Bifidobacterium animalis 和 Lactobacillus paracasei）在其肠道成功定植，并通过神经通路、代谢通路、肠道渗透通路等作用于肠道微生物-大脑轴有关。

结论 微生物疗法可使有益菌在3～6岁伴胃肠道症状的孤独症儿童肠道中成功定植，从而改善其肠道生态环境，显著缓解该群体临床症状和胃肠道症状，为孤独症精准治疗提供了科学依据和方向。

The Impact of Body Weight, Sex, Infection, and Comedication Administration on Oral Olanzapine: A Population Pharmacokinetic Model in Pediatric Chinese Patients

阮灿军* 臧彦楠 万舟 贾菲 杨琪 王传跃
首都医科大学附属北京安定医院

Objective To develop and validate a population pharmacokinetic (PPK) model of olanzapine in pediatric Chinese patients, and provide guidance for individualized therapy in this population.

Methods A total of 897 serum concentrations from 269 pediatric patients (aged from 8 to 17) were collected in this study. The data analysis was performed using a nonlinear mixed-effects modeling approach. Demographic parameters, co-occurrence of infections and concomitant medications were investigated as covariates. Bootstrap (1000 runs), normalized prediction distribution error (NPDE), and external validation of 32 patients were employed to evaluate the final model.

Results A one-compartment model with first-order absorption and elimination was developed for olanzapine

in pediatric patients. The clearance was significantly influenced by six variables: body weight (increasing with the 0.25 exponent), sex (33% higher in male patients), co-occurrence of infections (29% lower in patients with infections), and co-medications (27% higher in patients co-administrated with sertraline, 49% lower in patients co-administrated with fluvoxamine, and 43% higher in patients co-administrated with valproate). The typical estimates for absorption rate constant (Ka), apparent clearance (CL/F) and apparent distribution volume (V/F) were 0.30 h-1, 10.38L/h and 564.37 L, respectively. Model evaluation results indicated the final model's performance was good, stable and precise.

Conclusion A qualified PPK model of olanzapine was developed in pediatric Chinese patients. This model could be used as a suitable tool for the personalization of olanzapine dosing for pediatric patients.

青少年抑郁患者非自杀性自伤行为的影响因素分析

袁晓菲 尹胜健 周娇娇 吴元贞 陈旭*
首都医科大学附属北京安定医院，国家精神心理疾病临床医学中心，精神疾病诊断与治疗北京市重点实验室

目的 探讨青少年抑郁症患者伴有非自杀性自伤行为（NSSI）的影响因素。

方法 选取 2020 年 9 月 20 日至 2020 年 12 月 6 日在首都医科大学附属北京安定医院门诊就诊的青少年抑郁症患者进行横断面调查，采用一般情况调查表、应对方式问卷(CSQ)、青少年生活事件量表(ASCLE)、儿童期创伤问卷（CTQ）、简式父母教养方式问卷（s-EMBU）对患者的一般资料、自责、退避、人际关系因子、学习压力因子、丧失因子、健康适应因子、父亲过度保护、母亲过度保护进行评估。采用单因素和多因素 Logistic 逐步回归模型分析研究青少年抑郁症患者伴有 NSSI 的影响因素。

结果 本研究共纳入 67 例青少年抑郁症患者，根据是否伴有 NSSI 分为 44（65.7%）例 NSSI 组患者及 23（34.3%）例非 NSSI 组患者，两组在人口学资料方面无统计学差异（P＞0.05）。单因素分析结果显示，两组患者在应对方式问卷的自责、退避 2 个维度，青少年生活事件量表的人际关系因子、学习压力因子、丧失因子、健康适应因子 4 个维度，父母教养方式评价量表的父亲过度保护、母亲过度保护 2 个维度方面差异均有统计学意义（P＜0.05）。多因素 Logistic 逐步回归分析结果显示，应对方式问卷的避退（OR=19.647，95%CI=1.022~377.838，P=0.048），青少年生活事件量表的学习压力因子（OR=2.906，95%CI=1.126~7.502，P=0.027）以及父母教养方式评价量表的母亲过度保护（OR=2.996，95%CI=1.122~8.000，P=0.029）这 3 个维度是青少年抑郁症患者伴有 NSSI 的危险因素。

结论 青少年抑郁症患者伴有 NSSI 发生率较高，避退的应对方式、学习的压力高以及母亲过度保护者更容易发生 NSSI。

A DYNAMIC STUDY ON THE LOCAL AND FUNCTIONAL CONNECTIONS OF REWARD NETWORK IN YOUTH DEPRESSIVE PATIENTS WITH AND WITHOUT SUICIDAL ATTEMPTS

邱海棠 况利*
重庆医科大学附属第一医院

Objective Focusing on the dynamic characteristics of local resting state indicators (such as ALFF, ReHo, DC) and functional connectivity, this study systematically explored the abnormal characteristics of local neural activity and network functional connectivity indicators in young patients with or without suicide attempts compared with normal controls.

Methods The Temporal Dynamic Analysis software package in DPABI was used for data processing, and the mean and standard deviation between sliding Windows were calculated to characterize the variability of Dynamic FC. The statistical analysis method of ANOVA was used to calculate the statistical significance of the differences among the three groups in SPSS, and the post-test was conducted. The correlation between the change of index dynamic characteristics and MDD shape and suicide was analyzed.

Results 1. Variance analysis of ALFF dynamics in the ROI of the reward network revealed that there were statistically significant differences in bilateral striatum and vmPFC. Bonferroni post-test revealed that the three ROIs were all statistically significant differences between nMDD and HC groups (all p <0.05). 2. The results of dynamic ReHo analysis of variance (ANOVA) showed that there were statistically significant differences in the left striatum and ACC、PCC (both P < 0.05).Bonferroni post-mortem test showed that both ROIs were statistically significant differences in ReHo dynamics between nMDD and HC groups (p<0.05). 3. For the DC dynamic analysis of ROI based on reward network among the three groups, no significant inter-group difference was found. 4. The results of dynamic FC indicated that the dynamic of FC between the left ventral striatum and the putamen changed. Bonferroni's post hoc analysis showed that the differences between sMDD and nMDD groups and between nMDD and HC groups were statistically significant (all p <0.001).The dynamics of FC between the left anterior insula and the left medial superior frontal gyrus changed, with significant differences between sMDD and HC groups and between nMDD and HC groups (p

Clinical Characteristics and Risk Factors of Early-onset Schizophrenia in Children with Self-injurious Suicide Behavior

马银珠 李焱 江文庆* 杜亚松*
上海市精神卫生中心

Objective To understand the clinical characteristics and risk factors of early-onset schizophrenia in children with self-inflicted suicide behavior.

Methods From March 2021 to December 2021, the clinical information of 77 inpatients with Demography characteristics, family characteristics, and diseases who met the ICD-10 diagnostic criteria for "schizophrenia" in the pediatric wards of Shanghai Mental Health Center was retrospectively collected. According to whether there was self-injurious suicide, they were divided into the self-harm and suicidal behavior group (Self-harm and suicidal behavior - S) and the non-self-injurious suicide group (NS); they performed inter-group comparison and regression analysis between the two groups.

Result There were 51 cases (66.2%) of early-onset childhood schizophrenia patients with self-injurious suicidal behavior, with verbal auditory hallucinations (94.12%) and relationship delusions (92.16%) being the main psychological symptoms. Compared with early-onset schizophrenia patients without self-injurious suicidal behavior, early-onset schizophrenia patients with self-injurious suicidal behavior have a higher incidence of relationship delusions (t=3.184, p=0.002) and command auditory hallucinations (t=2.256, p=0.027). The Eysenck Personality Questionnaire showed that the score of Neuroticism was higher (F=4.139, p=0.001); The level of free tetraiodothyronine (FT4) was lower (t=-4.436, p<0.001); Logistic regression analysis showed that gender (p=0.036, OR=14.863), FT4 (p=0.011, OR=0.607,), and Neuroticism score (p=0.035, OR=1.073) were related to the occurrence of self-injurious suicide in children with early-onset schizophrenia.

Conclusion Early onset schizophrenia patients with self-injurious and suicidal behavior have typical psychiatric symptoms, accompanied by some characteristics associated with emotional instability. Females with low levels of FT4 and Neuroticism are risk factors for suicide with self-injury in early-onset schizophrenia.

The Relationship between Childhood Traumatic Experience and Suicidal Tendency Based on NSSI Behavior: Structural Equation Modeling and Mediating Behavior

程芳 王淑君 金琼 汪贝妮 张文武 胡珍玉*
宁波市康宁医院

Objective To explore the influence of childhood traumatic experience on suicidal behavior tendency in the context of NSSI problems.

Methods 311 adolescent NSSI behavioral patients were recruited at the Ningbo kangning hospital, according to the DSM-5 diagnostic criteria. Demographic data, childhood abuse and neglect, internet addiction, self-esteem, anxiety, and suicidal tendency were evaluated. A structural equation model with a path induction mechanism was constructed to evaluate the relationship between distal and proximal factors related to suicidal tendencies due to childhood traumatic experiences in NSSI behavioral individuals.

Results In the context of NSSI, childhood abuse and suicide showed complex and interlaced influential relationships, which often lead to personality problems (low self-esteem, anxiety, substance addiction, etc.). In particular, a mediating role with comorbidity influence mechanism is proposed: in the context of childhood traumatic experience, it is often accompanied by a series of regulatory behaviors such as Internet addiction, self-esteem, and so on, which finally leads to anxiety, mental symptoms, and even suicidal tendencies.

Conclusion The results provide effective support for the structural equation modeling to evaluate the multilevel influence of NSSI behavior individuals and emphasize that childhood familial factors may lead to psychiatric comorbidity symptoms and suicidal behavior.

关键字：suicidal tendency, structural equation model, childhood traumatic experience, psychiatric comorbidity mechanism, NSSI guidance, regulation

The Influence of Parenting Style and Coping Behavior on Nonsuicidal Self-injury Behavior in Different Genders Based on Path Analysis

程芳 胡长舟 张文武 胡珍玉 汪贝妮 禹海航*
宁波市康宁医院

Objective To examine mediating behaviors among parenting styles, students' coping styles,and endogenous and exogenous influencing variables of adolescents' NSSI behaviors.

Methods The Secondary school students in Ningbo,Zhejiang Province, China (n = 2,689; F/M:1532/1157) were surveyed for basic attributes, parenting styles, coping styles, and NSSI behaviors. After the initial screening of the sample data, several external derivatives were screened based on the single factor analysis method. On this basis, the construction of path analysis models under multivariate multiple elicitations was carried out.

Results The overall prevalence of NSSI was 15.16%, and the incidence of NSSI in boys was lower than that in girls (OR = 0.334, 95% CI [0.235–0.474]). The path analysis model data fit well; the indicators of female and male part are:CFI = 0.913/0.923, GFI = 0.964/0.977, SRMR = 0.055/0.047, RMSEA = 0.097/0.069 with 90% confidence interval (CI) [0.084–0.111]/[0.054–0.084]. For

female, when negative coping style and extreme education affect NSSI respectively, the standardized path coefficient values are 0.478 (z = 20.636, P = 0.000 < 0.01) and 0.151(z = 6.524, P = 0.000 < 0.01) respectively, while for male, the corresponding values become 0.225 (z = 7.057, P < 0.001) and 0.104 (z = 3.262, P < 0.001).

Conclusion In particular, we investigated the mediating effects of gender-specific NSSI influences and found that NSSI behaviors were strongly associated with environmental variables and individual factors, especially family parenting style and adolescent coping style, which influenced NSSI in a gender-specific manner.The results showed that males were the target of both positive and negative parenting styles, whereas females were more likely to choose negative coping styles directed towards emotions in response to external stimuli, and instead showed a more significant predisposition towards NSSI behaviors. This phenomenon seems to be influenced by multilevel factors such as sociocultural, individual value identity, and physiological structure differences. In the path analysis model with the introduction of mediating effects, the influence of gender differences on NSSI behavior becomes more pronounced under the interaction of multiple factors: women seem to be more significantly influenced by the external derivatives in the internal derivatives than male subjects, and are more likely to trigger NSSI behavior under the interaction of multiple factors.

学习压力与小学生冲动-多动症状和睡眠问题的关系：性别差异分析

刘剑波 卢建平*
深圳市康宁医院

目的 探讨学习压力与小学生冲动-多动症状和睡眠问题的关系。

方法 2019 年，以学校为调查整体，调查深圳市 14 所小学，共发放 17 400 份问卷，回收率 84.61%，本研究使用 Conners 父母问卷和自编的父母评睡眠质量条目（包括入睡困难、时睡时醒和醒来难以入睡）分别评估小学生冲动-多动症状和睡眠情况，学习压力由父母评估，选项包括“无”、“很小”、“一般”、“较大”和“非常大”。本研究以完整有效完成本研究所有变量的学生作为研究对象，其中女生 5508 人（8.84±1.87），男生 6743 人（8.89±1.87 岁）。

结果 研究发现：（1）相关分析结果显示，在男生和女生中，均发现学习压力与小学生冲动-多动症状和睡眠问题差呈正相关（p＜0.05），小学生冲动-多动症状与睡眠问题差呈正相关（p＜0.05）；（2）调节分析模型结果显示，在女生人群中，学习压力未调节冲动-多动症状与睡眠问题差之间的关系（p＞0.05），而在男生人群，学习压力调节了冲动-多动症状与睡眠问题差之间的关系（p=0.049），进一步分析发现，学习压力越大，冲动-多动症状对睡眠质量影响越大。

结论 小学生的学习压力越大，越容易出现冲动-多动症状和睡眠问题差的问题。在男生人群，学习压力越大，冲动-多动症状对睡眠质量影响越大，而在女生人群，未发现学习压力对冲动-多动症状与睡眠质量之间关系的影响。

Prevalence of and Risk Factors for Depressive and Anxiety Symptoms in A Large Sample of Chinese Adolescents in The Post-COVID-19 Era

杨海东[1] 张静[1] 杨曼[1] 袁年[1] 刘骏杰[1] 张晓斌[2]
1.连云港市第四人民医院
2.苏州市广济医院

Objective Depressive and anxiety symptoms are widespread among adolescents today, creating a large social problem. However, few previous studies have addressed depression and anxiety among adolescents in Chinese cohorts. The aim of this study was to evaluate the prevalence of and risk factors for depressive and anxiety symptoms among Chinese middle school adolescent students in the post-COVID-19 era.

Methods A total of 22380 middle school students from Jiangsu Province were surveyed online, and their general demographic data were collected. The Patient Health Questionnaire-9 (PHQ-9) was used to assess depressive symptoms, and the seven-item Generalized Anxiety Disorder (GAD-7) scale was used to measure anxiety symptoms.

Results Of these participants (aged 12–17 years), 25.6% had depressive symptoms, 26.9% had anxiety symptoms, and 20.6% had a combination of depression and anxiety symptoms. The prevalence of depressive symptoms was higher in female adolescents (27.6%) than in male adolescents (23.7%; ?2=45.479, P=0.000), and the proportion with anxiety symptoms was higher among female adolescents (28.6%) than among male adolescents (25.4%; ?2=29.390, P=0.000). Furthermore, binary logistic regression analysis showed that gender, region, and parental relationship were significantly associated with depressive symptoms among adolescents, while age, gender, region, and parental relationship were significantly associated with anxiety symptoms.

Conclusion Our findings demonstrated that the prevalence of reported depressive and anxiety symptoms in Chinese adolescents are high. Female gender, urban region, and poor parental relationship may be risk factors for depressive and anxiety symptoms. Furthermore, policy makers, schools, and families need to pay more attention to the psychological health of adolescents, develop response plans and take early intervention measures to reduce the prevalence of adolescent depression and anxiety.

静灵口服液治疗儿童注意缺陷多动障碍有效性和安全性的多中心、随机、双盲、安慰剂对照临床试验

戚艳杰 陈旭 罗翔升 郑毅*
首都医科大学附属北京安定医院

目的 注意缺陷多动障碍(Attention Deficit-Hyperactivity Disorder，ADHD)是一种儿童和青少年时期最常见、对生活质量影响较大的神经发育性障碍，主要表现为与年龄不相称的注意力易分散，过度活动，情绪冲动 并伴有认知障碍和学习困难。目前的一线治疗药物，如盐酸哌甲酯和托莫西汀存在食欲下降、发育减缓等副作用，并具有潜在的依赖和滥用的风险。作为纯中药制剂的静灵口服液，大量临床资料证实其可以改善ADHD 症状，且副作用小。但是，目前国内仍缺乏多中心的双盲随机对照研究用以验证静灵口服液的治疗效果和安全性。

方法 本研究采用多中心、随机、双盲、安慰剂对照设计。在首都医科大学附属北京安定医院，西安儿童医院、北京大学第六医院三个中心，纳入被试 85 例，其中试验组 41 人，对照组 44 人，脱落 7 人。患者连续用药 4 周和 8 周后，记录患者症状表现(ADHD-RS，CPRS)、用药情况以及药物不良反应进行分析。以ADHD-RS-IV 总分作为主要疗效指标，采用 ANCOVA 模型分析患者治疗前后的症状表现特征，并统计用药期间的不良反应情况。

结果 试验组和对照组的 ADHD-RS-IV 总分在 8 周治疗前后均得到改善，相比于对照组，试验组的 ADHD-RS-IV 总分减少量更大(p＝0.011)，试验组与对照组的 ADHD-RS-IV 总分差异为-4.8 (95%CI: -8.4 - -1.1)。分别分析注意缺陷得分和多动冲动得分的表现，试验组和对照组的注意缺陷得分并未表现出显著差异，但多动冲动得分试验组相比于对照组有显著改善(p = 0.002)。患者血常规、尿常规、生化指标在用药期间的正常到异常转化例数为 0，对照组有 1 例心电图由正常转化为异常。临床不良事件试验组为 4 例，对照组为 13 例，与药物关系均为可能无关或无关。

结论 静灵口服液可以显著改善 ADHD 儿童的症状表现，其中主要对多动冲动症状有明显的改善作用，同时，药物起效期间，未显示出对生理指标的显著影响，具有较高的安全性。

2.Martinos Center, Massachusetts General Hospital, Harvard Medical School
3.Brandeis University, 415 South Street, Waltham, MA 02453
4.McLean Hospital, Harvard Medical School, 115 Mill Street, Belmont, MA 02478
5.Beth Israel Deaconess Medical Center, Harvard Medical School, 330 Brookline Ave, Boston, MA 02115

Objective Electroencephalography (EEG) functional connectivity (EFC) and eye tracking (ET) have been explored as objective screening methods for autism spectrum disorder (ASD), but no study has yet evaluated them simultaneously to measure restricted and repetitive behavior (RRBs) to infer early ASD diagnosis.

Methods Typically developing (TD) children (n=27) and ASD (n=32), age- and sex-matched, were evaluated with EFC and ET simultaneously, using the restricted interest stimulus paradigm. Network-based machine learning prediction (NBS-predict) was used to identify ASD. Correlations between EFC, ET, and Autism Diagnostic Observation Schedule-Second Edition (ADOS-2) were performed. The Area Under the Curve (AUC) was measured to evaluate the predictive performance.

Results Under high restrictive interest stimuli (HRIS), ASD children have significantly higher α band connectivity and significantly more total fixation time (TFT)/pupil enlargement of ET relative to TD children (P<0.05). These biomarkers were not only significantly positively correlated with each other (R=0.716, P<0.05), but also with ADOS total scores and RRBs sub-score (R=0.749, R=0.770, P<0.01) for EFC (R=0.641, P<0.05) for TFT. The accuracy of NBS-predict in identifying ASD was 63.4%. ROC curve demonstrated TFT with 91% and 90% sensitivity, and 78.7% and 77.4% specificity for ADOS total and RRB sub-scores respectively.

Conclusion Simultaneous EFC and ET evaluation in ASD is highly correlated with RRB symptoms measured by ADOS-2. NBS-predict of EFC offered a direct prediction of ASD. The use of both EFC and ET substantially improves early ASD diagnosis.

青少年抑郁障碍患者述情障碍与自杀未遂的相关性研究

王硕 胡淑文 曹小梅 钟慧*
合肥市第四人民医院

目的 探讨伴与不伴自杀未遂青少年抑郁障碍患者述情障碍的差异及其与抑郁严重程度的相关性。

方法 从 2019 年 9 月至 2021 年 4 月,纳入 43 例自杀未遂青少年抑郁障碍患者(自杀未遂组)、93 例非自杀未遂青少年抑郁障碍患者(非自杀未遂组)以及 23 名性别、年龄和受教育年限相 匹配的健康对照者(健康对照组),采用汉密尔顿抑郁量表（HAMD17）、多伦多述情障碍量表（TAS）、儿童期创伤问卷（CTQ）对

所有被试进行抑郁严重程度和述情障碍相关临床心理量表评定,多伦多述情障碍量表包括总分、因子 1（描述情感的能力）、因子 2（认识和区分情感与躯体感受的能力）、因子 3（幻想）、因子 4（外向性思维）；儿童期创伤问卷包括情感虐待、躯体虐待、性虐待、情感无视、躯体无视。采用 SPSS25 对数据进行统计分析,独立样本 T 检验比较 3 组被试述情障碍的差异,采用 Pearson 相关分析对自杀未遂组的述情障碍与抑郁严重程度进行相关分析。

结果 自杀未遂组在述情障碍总分、因子 3、因子 4 显著高于非自杀未遂组总分、因子 3、因子 4 {P＜0.05}。自杀未遂组在述情障碍总分、因子 1、因子 2、因子 4 显著高于健康对照组总分、因子 1、因子 2、因子 4{P＜0.05}。非自杀未遂组在述情障碍总分、因子 1、因子 2、显著高于健康对照组总分、因子 1、因子 2{P＜0.05}。自杀未遂组在汉密尔顿抑郁量表中因子认知障碍显著高于非自杀未遂组认知障碍。自杀未遂组、非自杀未遂组、健康对照组三组之间童年创伤均无显著差异。Pearson 相关分析显示，自杀未遂组的述情障碍量表中因子 2、总分与 HAMD17 因子焦虑躯体化呈显著正相关(P<0.05),因子 4 与 HAMD17 因子阻滞呈显著正相关(P<0.05)，自杀未遂组的因子 1、因子 3 与抑郁总分及各因子无显著相关性。自杀未遂组的述情障碍量表中因子 1 与童年创伤问卷中躯体无视呈显著正相关（P<0.05），因子 2 与情感虐待、躯体无视呈显著正相关，因子 4 与情感无视、躯体无视呈显著负相关，总分与情感虐待呈显著正相关。

结论 自杀未遂组、非自杀未遂组、健康对照组三组之间童年创伤无显著差异，伴与不伴自杀未遂的青少年抑郁障碍患者述情障碍严重程度、幻想及外向性思维存在差异,差异因子分与抑郁严重程度无相关性，差异因子中述情障碍严重程度及外向性思维与童年创伤因子存在显著相关。

注意缺陷多动障碍儿童汉语阅读能力特点及其内在神经机制

吴赵敏[1] 钟蕴瑜[1] 王久菊[2] 刘云[1] 操小兰[1] 刘璐[2] 王玉凤[2] 杨斌让[1]
1.深圳市儿童医院
2.北京大学第六医院

目的 既往研究表明注意缺陷多动障碍（ADHD）儿童存在阅读能力低下，本研究计划探索 ADHD 儿童的阅读能力缺陷特征，并利用静息态核磁共振技术（fMRI）探讨其内在神经机制。

方法 本研究一共纳入 302 名单纯 ADHD 儿童和 105 名健康对照（年龄 6-15 岁）。利用工具评估 ADHD 儿童和健康对照的中文阅读能力，ADHD 有关临床和神经心理特征。中文阅读评估工具产生指标包括识字量、正交知识、切字水平等。所有临床和神经心理数据利用协方差分析（ANCOVA）分析，纳入性别年龄作为协变量。通过建立中介模型和结构方程模型深入探讨 ADHD 儿童中文阅读能力与认知功能的相关性。其中有 175 名被试同时采集了 fMRI 数据。利用基于体素的分析比较组间功能连接强度（functional connectivity, FC）。所有全脑分析均选用无阈值簇增强（TFCE）方法进行多重检验校正。

结果 在基本信息方面，对比对照组儿童，ADHD 儿童中男性比例更高（p<0.001）,年龄较小（p<0.001），总智商、言语理解指数、知觉推理指数、工作记忆指数和加工速度指数均较低（p<0.001）。在中文阅读水平方面，ADHD 儿童识字量较低、切字能力水平较低（p 分别为 0.0075 和 0.0045），正交知识水平方面，ADHD 组和对照组两组差异无统计学意义（p=0.069）。在中介模型中，总智商（IQ）、持续注意指标(RTIFMDRT 和 RTISMDRT)、快速视觉加工指数（RVPA）均为诊断 ADHD 和中文阅读水平低下之间的有效中介因素（中介效应 p 均<0.05）。在神经影像学方面，与对照组相比，ADHD 儿童组在默认网络和执行控制网络存在 FC 减低。对于中文阅读功能指标，在默认网络、执行控制网络和背侧注意网络的功能连接中存在诊断和阅读能力指标的交互作用。在 ADHD 儿童中，识字量和正交知识水平和默认网络的 FC 存在正相关，正交知识水平和执行控制网络或背侧注意网络的 FC 存在负相关（TFCE 校正 p<0.05）。这种相关关系在对照中是相反的。具体见图 1。

结论 儿童 ADHD 存在中文阅读能力下降，智商低下和执行功能缺陷是其中文阅读能力下降的有效中介因素。儿童 ADHD 的中文阅读能力下降与其默认网络、执行控制网络及背侧注意网络大脑所调用的功能连接异常有关。

3.合肥市教育研究院
4.安徽医科大学精神卫生与心理科学学院 认知与神经精神疾病安徽重点实验室

目的 非自杀性自伤（NSSI）行为在青少年中发生率较高，是目前主要的公共健康问题之一。NSSI 行为常首发于青少年早期或中期，并且发生率在整个青少年阶段呈逐步上升趋势。NSSI 行为的发生不仅影响了青少年群体的身体健康，更影响了他们的心理发展。NSSI 行为并非某一单一因素引起，它主要受到社会环境因素、家庭因素以及个人因素的相互影响。本研究建立青少年非自杀性自伤（NSSI）行为诊断性预测模型，以期对青少年 NSSI 行为的早期识别提供参考。

方法 采用随机整群抽样的方法，选取合肥市5所中学7 431名中学生作为研究对象，根据是否存在NSSI行为，将青少年分为伴 NSSI 行为组（n=5231）和不伴NSSI 行为组（n=2200）。将 7431 例患者按 7:3 随机分为训练集（n=5202）和验证集（n=2229）。使用 Logistic 回归分析筛选青少年 NSSI 行为的独立危险因素，建立预测模型。使用受试者工作特征（ROC）曲线下面积（AUC）评估训练集和验证集模型的区分度，使用校准曲线评估训练集和验证集模型的校准度，使用 Homser-Lemeshow（HL）检验评估模型的拟合优度，使用临床决策分析（DCA）曲线评价模型的临床获益情况。

结果 性别（β=0.17，OR=1.18，95% CI：1.06~1.32）、受家庭居住地（β=0.31，OR=1.74，95% CI：1.66~1.82）、快感缺失水平（β=0.21，OR=1.23，95% CI：1.11~1.38）、童年期虐待情况（β=1.89，OR=2.41，95% CI：2.36~3.46）、抑郁严重程度（β=1.02，OR=2.77，95% CI：2.46~3.12）是青少年 NSSI 行为的独立危险因素（P＜0.001）。训练集 ROC 曲线 AUC=0. 85（95% CI：0. 75~0. 87），验证集 AUC=0. 72（95% CI：0. 58~0. 86）。HL 检验评估校准图后显示出较好的拟合度（P=0. 566）。

结论 性别、受家庭居住地、快感缺失水平、童年期虐待情况以及抑郁严重程度是青少年 NSSI 行为的独立危险因素，构建的青少年 NSSI 行为的诊断性临床预测模型具有良好的敏感性和特异性。

Diminished Prefrontal Hemodynamic Response in Adult Attention Deficit Hyperactivity Disorder: A Multi-channel Functional Near-infrared Spectroscopy Study

张雨晨*
重庆市精神卫生中心

Objective Attention deficit hyperactivity disorder (ADHD) is a common neurodevelopmental disorder. Adult ADHD is currently diagnosed based only on subjective clinical and scoring measures, which inevitably lead to a low correct diagnosis rate. Hence, an effective auxiliary examination with higher sensitivity is needed.

Methods Twenty healthy controls (HC) subjects and 20 adults with ADHD were included in this study. The functional near-infrared spectroscopy (fNIRS) under verbal fluency test (VFT) was performed to detect cerebral cortex hemodynamics. Correlation and Receiver operating characteristic (ROC) curve analysis were employed to reveal the relationship between differences in hemodynamic response and clinical characteristics.

Results The HbO response of adult ADHD in the prefrontal cortex (PFC) was significantly smaller than that of HC. HbO concentration changes in the corresponding channels were negatively correlated with the ASRS-inattention score. HbO concentration changes of channels 16 and 26 corresponding to the medial PFC might be helpful for the diagnosis of adult ADHD.

Conclusion Adult ADHD patients have low activation of the PFC, changes of whose corresponding channels were significantly associated with attention deficit, indicating that fNIRS under VFT may be an effective auxiliary examination for adult ADHD.

2.North China University of Science and Technology, Hebei, China
3.Hebei Provincial Mental Health Center, Hebei, China
4.School of Public Health of Hebei University, Hebei, China
5.Hebei Provincial Key Laboratory of Major Mental and Behavioral Disorders, Hebei, China

Objective Suicidal behavior was strongly correlated with depressive symptoms and the degree of suicidal ideation(SI). Suicidal ideation and suicide attempts(SA) may be affected by varying degrees of cognitive impairment. This study was intended to show that The THINC-intelligent tool (THINC-IT)can be utilized as a concise method for comparing suicidal ideation and suicide attempt in adolescents.

Methods The cross-sectional sample consisted of 54 adolescents with major depressive disorder (MDD) and 32 healthy controls. THINC-it was used to evaluate cognitive function in depressed adolescents and healthy controls. Suicidal ideation was examined using the Positive and Negative Suicide Ideation (PANSI) scale.

Results Depression symptoms (HAMD-17) (F=72.515, P=0.001) and suicidal ideation (PANSI) (F=267.952, P=0.001) were considerably greater in the SA than in the SI. Analysis of between-group differences showed SA performed worse in THINC-it, especially in “Spotter” (P=0.033), “Objective cognition score” (P=0.027), and “Composite score” (P=0.017). After controlling for the differential effects of depressive symptoms, the cognitive performance of SA remained lower than SI.

Conclusion Adolescents with SI or SA exhibit a broad spectrum of cognitive impairments. Impaired attention may be markers that distinguish adolescent depression from SA and SI.

儿童青少年抑郁障碍患者血脂代谢异常检出率及相关因素分析

刘志伟* 杨荣春 孙亮 姚高峰 刘云
阜阳市第三人民医院

目的 探索儿童青少年抑郁障碍住院患者血脂代谢异常发生率及相关影响因素。

方法 选取在阜阳市第三人民医院住院的符合《国际疾病分类(第 10 版)》(International Classification of Diseases，tenth edition，ICD-10）抑郁障碍诊断标准的儿童青少年患者，收集年龄、性别等一般人口学资料及病程、发病年龄、自伤行为、自杀意念等临床数据。高胆固醇（TC）血症是指空腹血浆胆固醇水平≥5.18mmol/L；高甘油三酯（TG）血症系指空腹血浆 TG 水平≥1.70mmol/L；高 LDL-L 血症是指除空腹血浆 LDL-C 水平≥3.37mmol/L；低 HDL-C 血症指空腹血浆 HDL-C 水平≤1.04mmol/L。采用相关性分析及回归分析探讨抑郁障碍患者血脂代谢异常发生率及其独立影响因素。

结果 共计 756 例患者纳入该研究。儿童青少年抑郁障碍住院患者高 TC、TG、LDL-C 及低 HDL-C 检出率分别为 5.42%（41/756）、10.58%（80/756）、3.84%（29/756）和 5.42%（41/756）。高 TC 血症与空腹血糖、BMI 水平、肥胖、住院次数及自杀意念呈正相关关系（P<0.05）。高 TG 血症与空腹血糖、BMI 水平、肥胖、住院次数、自伤行为、抗抑郁药总剂量呈正相关关系，与发病年龄、体重过轻呈负相关关系（P<0.05）。高 LDL-L 血症与空腹血糖、BMI 水平、肥胖、自杀意念及抗抑郁药物总剂量呈正相关关系（P<0.05）。低 HDL-C 血症与 BMI 水平呈正相关，与空腹血糖、体重过轻呈负相关关系（P<0.05）。

结论 儿童青少年抑郁障碍住院患者血脂代谢异常检出率较高，应关注该人群体质指数、自伤行为或自杀意念，在使用抗抑郁药物时尽量选择增重效应较弱的药物。 [基金项目] 1.安徽省医疗卫生重点专科建设项目；2.安徽省卫生健康委科研项目（编号：AHWJ2021a035）；3.阜阳市卫生健康委科研项目（编号：FY2021-059）。

青少年及成人抑郁症 fNIRS 前额叶含氧血红蛋白非低激活状态的回顾性研究

冉曼利 冯亚菊 蒋国庆* 王敏建
重庆市精神卫生中心

目的 探讨青少年及成人抑郁症 fNIRS（function near-infrared spectroscopy，近红外脑功能成像）中前额叶非低激活状态，为抑郁症患者的准确识别诊断及个体化治疗提供客观生物学依据及应用价值。

方法 选择 2022 年 2 月-2023 年 6 月重庆市精神卫生中心诊断的青少年抑郁症(12-17 岁)患者 200 例，成人抑郁症（>18 岁）患者 200 例的 fNIRS 前额叶含氧血红蛋白脑激活结果进行回顾性研究。入组患者均完成在 VFT(言语流畅性范式)刺激下的近红外脑功能成像检查，比较分析两组患者中前额叶含氧血红蛋白非低激活状态（前额叶积分值>114）的差异。

结果 青少年抑郁症组前额叶含氧血红蛋白非低激活状态为 17%，共 34 例，成人抑郁症组前额叶含氧血红蛋白非低激活状态为 18%，共 36 例，两组 fNIRS 前额叶含氧血红蛋白非低激活状态例数百分比无统计学差异（x2=3.49,P>0.05,OR=2.31）。

结论 该研究提示青少年及成人抑郁症患者中约 18%左右的患者存在前额叶含氧血红蛋白非低激活状态，间接反映此类患者的前额叶脑功能受损可能并不显著，一方面从疾病诊断上来看，这部分非低激活状态的患者非常可能共患双相情感障碍、焦虑症等疾病，临床上应注意对这部分脑激活特征的患者加强共患病的筛查识别，另一方面从治疗上看，这部分非低激活状态的患者在抗抑郁药物以及物理治疗的选择使用上可能需要关注加重焦虑以及转躁的风险，例如避免使用 SNRI 之类药物、避免高频经颅磁刺激治疗。

Impaired Behavioral Inhibition for Effective Facial Information Among Adolescents with Bipolar Depression: Evidence Form ERPs and Behavioral Data

陈方方* 汪莲籽 吴明飞 蒋巧
芜湖市第四人民医院心理科

Objective To explore the impairment of emotional response inhibition and its underlying neural mechanism within adolescents with bipolar depression.

Methods Twenty-four adolescents with bipolar depression and nineteen healthy controls were enrolled in the study. All participants completed emotional go/no-go task and emotion regulation questionnaire, while the EEG data were recorded at the same time. Compared the behavioral performance and electrophysiological components (N170、N2 and P3) between the bipolar depressive adolescents and healthy controls.

Results The results of behavioral performance revealed that the scores of adolescents with bipolar depression on suppression dimension were significantly higher than healthy controls' (t=2.45，P<0.05), but the scores on reappraisal were lower than healthy controls' (t=-3.51，P<0.05). In the accuracy and discrimination d' value of emotional go/no-go task, the analysis revealed that adolescents with bipolar depression were lower than healthy controls in all conditions (both positive go/negative no-go and

negative go/positive no-go conditions) (P<0.05). The results of N170 analysis found that the group difference was not significant (P>0.05). The results of N2 amplitude have revealed that the N2 amplitude induced by positive and negative emotion all larger than healthy controls' (P<0.05). The analysis of P3 amplitude indicated that the P3 amplitude induced by no-go conditions within adolescents with bipolar disorder with depressive episodes was lower than healthy control's significantly (P<0.05). Correlation analysis suggested that the relation between the N170 induced by positive go and no-go conditions and HAMA scores revealed positive correction significantly (P<0.05).

Conclusion Adolescents with bipolar depression exhibited impaired behavioral inhibition for negative and positive emotion stimulus.

基于多维情绪认知监测和虚拟现实技术的家庭人际修复技术对抑郁症青少年自杀自伤行为的影响

张琪 况利*
重庆医科大学附属第一医院

目的 探索基于多维情绪认知监测和虚拟现实技术的家庭人际修复技术对抑郁症青少年自杀自伤行为的影响，为抑郁症青少年的心理干预提供新的方法和手段。

方法 多维情绪认知监测：使用脑电图（EEG）作为一种无创的脑电生理活动监测技术，记录受试者在不同情境下的脑电信号，提取与情绪状态相关的特征，（提取表情、语调等参数）并利用深度学习方法进行情绪分类和量化??。- 虚拟现实技术：使用虚拟现实（VR）设备，构建不同的家庭人际场景，让受试者在虚拟环境中体验和参与家庭成员之间的沟通、互动和冲突解决等活动，以增强受试者的家庭归属感、自我价值感和社会支持感。 - 家庭人际修复技术：根据受试者的多维情绪认知监测结果，动态调整虚拟现实场景中的内容、难度和反馈，以达到最佳的情绪调节效果，促进受试者的家庭人际关系的修复和改善。 主要指标：使用贝克抑郁量表（BDI）、贝克自杀意向量表（BSI）、自我伤害行为量表（SHBQ）等工具，评估受试者在干预前后的抑郁程度、自杀意向和自我伤害行为，并比较实验组和对照组之间的差异。 -次要指标：使用亲密关系经验量表（IRES）、家庭环境量表（FES）、社会支持评定量表（SSRS）等工具，评估受试者在干预前后的家庭关系质量、家庭环境特征和社会支持水平，并比较实验组和对照组之间的差异。

结果 使用描述性统计分析受试者的基本情况，使用重复测量方差分析和多元方差分析比较两组受试者在各个时间点的评估指标，使用相关分析和回归分析探讨多维情绪认知监测结果与家庭人际修复技术效果之间的关系。

结论 结果发现基于多维情绪认知监测和虚拟现实技术的家庭人际修复技术对抑郁症青少年自杀自伤行为具有一定积极影响，特别在家庭关系质量、家庭环境特征方面，

关键字：多维情绪认知监测、虚拟现实技术、家庭人际修复技术、抑郁症青少年、自杀自伤行为

青少年抑郁症患者心理健康素养现状及其影响因素

倪世芬*
重庆医科大学附属第一医院

目的 了解青少年抑郁障碍患者心理健康素养现状及其影响因素。

方法 选取于 2022 年 6 月至 2023 年 4 月在重庆医科大学附属第一医院精神科符合精神障碍诊断与统计手册第 5 版（DSM-5）抑郁障碍诊断标准的门诊、住院的青少年患者 310 例进行横断面调查。采用一般情况调查表，心理健康素养量表、精神疾病污名评估量表进行调查，采用 Spearman 相关分析童青少年抑郁障碍患者心理健康素养与一般资料、精神疾病污的相关性。采用多元 Logistic 回归分析儿童青少年抑郁障碍患者心理健康素养的影响因素。

结果 青少年抑郁障碍患者心理健康素养总分为（96.06±9.04）分，得分最高的两个条目为看心理医生意味着你没有能力处理好自己的困难以及如果我患有心理疾病，我不会向心理医生寻求帮助。精神疾病污名评估量表总分为（29.03±7.09）。相关分析显示，性别、年级、同伴支持、父母寻求专业帮助的意愿、精神疾病污名与心理健康素养呈正相关（P＜0.05）；多元线性回归分析结果显示，性别、同伴支持、父母寻求专业帮助的意愿、精神疾病污名是青少年心理健康素养的影响因素（P＜0.05）。

结论 青少年抑郁症患者心理健康素养处于较低水平，精神疾病污名处于较高水平，青少年抑郁障碍患者心理健康素养受社会-家庭-个人各个层面因素的影响，应根据影响因素采取针对性措施，以期提升青少年抑郁障碍患者的心理健康素养水平。

4.衢州市第三医院

5.康宁医院

Objective Many patients with major depressive disorder (MDD) have been found to exhibit psychotic symptoms. However, few studies have examined the relationship between psychotic symptoms and endocrine factors in adolescents with MDD. Therefore, this study aimed to investigate the prevalence and related endocrine clinical factors of psychotic symptoms in Chinese adolescents with MDD.

Methods In total, 601 adolescent inpatients with MDD were recruited. The Patient Health Questionnaire – 9 items (PHQ – 9) was utilized for assessing depressive symptoms, and the Bech–Rafaelsen Mania Rating Scale – Revised for determining psychotic symptoms. Prolactin (PRL), thyroid-stimulating hormone (TSH), triiodothyronine (T3), free triiodothyronine (FT3), thyroxine (T4), and free thyroxine (FT4) were also measured.

Results The incidence of psychotic symptoms in patients with MDD was 22.6%. Adolescent patients with MDD exhibiting psychotic symptoms were younger, had lower education levels, a higher incidence of self-harming behavior, and PHQ-9 scores, along with higher levels of T3, FT3, T4, FT4, and PRL (All $p<0.05$). Age (OR = 0.820; 95%CI: 0.715–0.942), self-harming behavior (OR = 1.986; 95%CI: 1.157–3.410), PHQ-9 score (OR = 1.103; 95%CI: 1.053–1.157), normalized PRL (OR = 1.220; 95%CI: 1.108–1.343), and FT4 (OR = 1.215; 95%CI: 1.145–1.289) were independently associated with psychotic symptoms of MDD.

Conclusion PRL and FT4 levels are more likely to be abnormally elevated in major depressive adolescents with psychotic symptoms. If initial hormonal abnormalities are ignored, they may develop into more serious clinical complications such as endocrine disturbances which will do great damage to the physical and mental health of teenagers in the future, but few people pay attention to it at present. Prolactin and thyroid hormones in adolescents with major depression should be paid more attention.

Mendelian Randomization Study on The Causal Relationship between Screen Exposure and Autism Spectrum Disorder

关陆阳[1] 韩路[1] 李锦卉[2] 黄安琪[2] 柯晓燕[1,2]
1.南京医科大学附属脑科医院儿童心理卫生研究中心
2.南京大学医学院附属南京脑科医院

Objective Autism spectrum disorder (ASD) is a condition with a high heritability rate, and both genetic and environmental factors may play a role in its development. Among the environmental factors, screen exposure is considered a potential risk factor for the onset of ASD. Thus, this study aims to investigate the causal relationship between screen media exposure and ASD through a Mendelian randomization study design.

Methods Data on screen media exposure and associated genetic variants were obtained from 360,895 European individuals. Genome-wide association study data were obtained from 18,381 European individuals with ASD and 27,969 healthy controls. Inverse variance weighted, multiplicative random effects inverse variance weighted, MR-Egger, and weighted median methods were used for analysis.

Results The multiplicative random effects inverse variance weighted method showed a positive association between screen media exposure and the relative risk of ASD (OR = 2.65, 95% CI: 1.82-3.88, $P < 0.01$), which was also supported by the weighted median method (OR = 2.10, 95% CI: 1.37-3.20, $P < 0.01$). The MR-Egger method also trended in the same direction, although the 95% confidence interval had a wider range (OR = 2.55, 95% CI: 0.37-17.58, $P = 0.35$).

Conclusion This study found statistically significant causal effects of screen media exposure on ASD, suggesting that it may be a potential environmental risk factor for the development of ASD.

Positive Effects of Parent-child Group Emotional Regulation and Resilience Training on Non-suicidal Self-injury (NSSI) Behavior in Adolescents--A Randomized Controlled Trial

程俊香 赵娟 宋保利 陈洋洁 刘晓梅 韩虹 刘娜 董玥 边维娜 刘志芬*
山西医科大学第一医院

Objective Globally, the incidence of non-suicidal self-injury (NSSI) among adolescents has been steadily increasing, becoming a public health problem and bringing a heavy burden to society and families. However, there is little evidence of effective interventions for adolescent NSSI. The main aim of the present study was to examine the effect of 12 weeks of parent-child group emotional regulation and resilience training on adolescent NSSI.

Methods A total of 132 adolescents with NSSI and their mother or father were recruited from the mental health department of the First Hospital of Shanxi Medical University between April 2020 and September 2021. 12-week parent-child group resilience training was compared with treatment-as-usual (TAU). The primary endpoint was the frequency of self-injury assessed by Ottawa Self-Injury Inventory (OSI), and the secondary endpoints were depression, hope, and family function assessed by using Hamilton Depression Rating Scale (HAMD), Herth Hope Scale (HHS), Connor-Davidson Resilience Scale (CD-RISC), and Family Adaptability and Cohesion Evaluation Scale, second edition (FACES-II-CV) , at baseline 12-week, 24-week, and 36-week.

Results Finally, the NSSI frequency significantly differed between the intervention group and the control group ($p <0.001$). The frequency of NSSI in the control

group at week 12, 24, and 36 was higher than in the experimental group, and the values were (OR=2.153，P=0.032), (OR=1.896， P=0.015), and (OR=13.245, P<0.001), respectively, while the rates of patients without NSSI in the past month in the intervention and control group were 27.9% vs 8.8%, 24.6% vs 1.8%, and 39.3% vs 5.3% respectively.

Conclusion In adolescents with NSSI, parent-child group emotional regulation and resilience training effectively reduced the NSSI behavior, improved the level of hope and resilience of patients, and enhanced family closeness and adaptability. This effect did not diminish over time at follow-up, supporting further clinical NSSI interventions in adolescents.

后疫情时代全国青少年心理健康状况及相关因素分析

杨兴洁[1] 张李斌[2] 王蕾蕾[1] 邓虎[1] 杨玉春[2] 陈景旭[1]
1.北京回龙观医院
2.北京师范大学

目的 青少年是重大公共卫生应激事件的脆弱人群，为了解后疫情时代全国青少年心理健康状况，人口学特征及相关危险因素，为后续干预及预防青少年心理障碍奠定基础。

方法 于2023年1月采用随机整群抽样方式在全国抽取50666名中学生（年龄：12-18岁），其中男性23687名，调查人口学基本情况、新冠感染情况，抑郁情绪、焦虑情绪、睡眠状况评估。其中，抑郁情绪筛查采用病人健康问卷抑郁量表（PHQ-9）、焦虑情绪筛查采用广泛性焦虑障碍量表（GAD-7）、睡眠状况采用匹兹堡睡眠质量指数量表（PSQI）进行评定。以自愿为原则填写。

结果 本次调研共有男性23687名，46.8%，生活在城市的中学生为30937名，占61.1%，曾感染新冠者为37633名，占74.3%。家庭成员曾感染新冠者为39971名，占78.9%。疫情后每天增加3小时以上电子屏幕使用者为18576名，占36.7%。PHQ-9显示，抑郁检出率为46.8%，焦虑检出率为31.5%。PSQI显示，每周大于3次，入睡困难者为6279名，占12.4%，夜间易醒或早醒为3893名，占7.7%。统计分析显示，在青少年人群中，16-18岁人群较12-15岁人群焦虑抑郁检出率高（p <0.001），女性较男性焦虑抑郁检出率高（p <0.001），自己和家人曾感染新冠者较未曾感染新冠者检出率高（p <0.001），其差异均有统计学意义，电子屏幕增加不同使用时间的焦虑抑郁检出率，其差异有统计学意义（p <0.001）。

结论 后疫情时代青少年的心理健康问题亟需重视，特别是女性，高中生及电子屏幕使用增加时间长的青少年人群后续需继续关注，学校应加强与心理卫生工作者的联系，早期干预和识别和治疗，预防学校危机事件发生。

Association between Peripheral Inflammation and Free-water Imaging in Adolescents with Major Depressive Disorder

Weicheng Li Zerui You Yanling Zhou* Yuping Ning*
Affiliated Brain Hospital of Guangzhou Medical University

Objective Free-water (FW) imaging, a diffusion-weighted magnetic resonance imaging (dMRI) technique, enables measuring water molecule diffusion in the brain. It is postulated that FW imaging can be utilized for the detection of inflammatory processes. This study aimed to investigate the association between peripheral inflammation markers and FW in brain white matter among adolescents with major depressive disorder (MDD).

Methods 3-T Multishell dMRI data were collected from 149 participants aged 12-18 years, including 65 adolescents with MDD and 84 healthy controls (HCs). Firstly, we examined the volume fraction of free water and peripheral cytokine deregulation in MDD. Subsequently, MDD participants were classified into low-grade inflammation (LGI) and high-grade inflammation (HGI) groups by aberrant cytokines. We then explored the relationship between aberrant peripheral cytokines and FW in brain white matter within these groups.

Results MDD participants exhibited significantly reduced levels of interleukin-2 (IL-2) ($F = 9.6$, $P = 0.020$), IL-4 ($F = 9.1$, $P = 0.030$), INF-γ ($F = 14.2$, $P < 0.001$), and TNFα ($F = 20.5$, $P < 0.001$) compared to HCs. We observed a significant interaction between group and inflammation composite score on FW in brain white matter ($t = -3.0$, $P = 0.004$). In the LGI-MDD group, a positive association was observed between the inflammation composite score and FW ($r = 0.46$, $P = 0.019$), but not in HGI-MDD group ($r = -0.27$, $P = 0.132$).

Conclusion The association between peripheral inflammation markers and FW in brain white matter depends on the grade of inflammation. Peripheral inflammation may serve as a potential biomarker for neuroinflammation in a specific subgroup of adolescents with MDD, indicating its utility for identifying neuroinflammatory processes in this population.

2.Psychiatry Department, The First Affiliated Hospital, Kunming Medical University, Kunming, Yunnan, China.
3.Mental Health Institute of Yunnan, The First Affiliated Hospital, Kunming Medical University, Kunming, Yunnan, China.
4.Yunnan Clinical Research Center for Mental Health, Kunming, Yunnan, China.

Objective The prevalence of clinically diagnosed depressive disorders (DD) in Chinese left-behind children (LBC) remains unknown. We aim to estimate the prevalence of DD, discuss the associations between DD and self-harm (SH) behaviors in a large representative sample of Chinese LBCs.

Methods A total of 5462 LBCs were selected from the most recent datasets of the Mental Health Survey for Children and Adolescents in Yunnan (MHSCAY), a mega population-based two-phase cross-sectional survey. Weighted prevalence rates and designed Logistic regression were adopted to estimate the prevalence of DD and the association between DD and SH.

Results The weighted prevalence of lifetime and current DD were 4.22% (95% CI: 3.13%-6.00%) and 3.84% (95% CI: 2.85%-5.00%) in Chinese LBCs. Higher lifetime and current depressive disorders prevalence rates were observed in girls and those reported adverse parental marital status and SH behaviors. The absence of depressive disorders was associated with over 85% reduction in odds of SH behavior, and decreased odds of repetitive SH, multiple SH methods, and severe SH. Subsequently performed stratified analyses identified prominent effect modification by sex and age.

Conclusion The prevalence of DD was high in Chinese LBCs. DD was associated with prominently increased risk of SH behaviors in LBCs. Attention and intervention are needed in this vulnerable population.

The Relationship between Serum Resolvin D1, NLRP3, Cytokine Levels, and Adolescents with First-episode Medication-na?ve Major Depressive Disorder

郭家梅 邱田*
重庆医科大学附属第一医院

Objective Inflammation has become a critical pathological mechanism of Major Depressive Disorder (MDD). NLRP3 is a critical inflammatory pathway to maintain the immune balance. Recently, evidence showed that Resolvin D1(RvD1) might be a new antidepressant choice due to its protective effects through the inhibition of neuroinflammation. However, whether they have clinical value in the diagnosis and treatment evaluation of adolescent depression was unclear.

Methods Forty-eight untreated first-episode adolescent patients with moderate to severe major depressive disorder, as well as 30 healthy adolescents (HCs, age and gender-matched), were enrolled for this study. Their ages ranged from 13 to 18 (15.75± 1.36) years. The patients were treated with fluoxetine for 6-8 weeks. HDRS-17 was used to evaluate the severity of depressive symptoms. Venous blood samples were collected at baseline (patients and HCs) and after treatment (only patients). Serum concentrations of RvD1, NLRP3, IL-1β, IL-18, and IL-4 were measured by enzyme-linked immunosorbent assays (ELISA) pre- and post-fluoxetine?treatment.

Results Serum levels of RvD1 and anti-inflammatory cytokine IL-4 were significantly elevated in adolescents with MDD compared to healthy adolescents, but no significant difference in NLRP3, IL-1β, and IL-18 between the two groups. Meanwhile, RvD1 (positively) and IL-4 (negatively) were correlated with the severity of symptoms (HDRS-17 scores) after adjusting age, gender, and BMI. Interestingly, fluoxetine treatment significantly reduced the serum levels of RvD1, NLRP3, IL-1β, and IL-18 in MDD adolescents but increased the levels of IL-4 relative to baseline. Furthermore, we observed that serum levels of RvD1 might be an excellent distinguishing indicator for depression and healthy adolescents.

Conclusion Our study is the first to compare RvD1 and NLRP3 between adolescent MDD and HCs. Our findings of reactive increase of RvD1 in adolescent MDD comprised a novel and critical contribution. Our results showed the presence of inflammation resolution unbalanced in adolescents with MDD and indicated that RvD1 might be an ideal biomarker for diagnosing and treating adolescent MDD.

Comparison of Three Intervention Methods in Improving Symptoms and Executive Function in Children with ADHD: A Retrospective Study

李焱[1] 孙金磊[2] 林裕雄[1] 江文庆[1] 文竹[3] 张喜燕[4]
1.上海交通大学医学院附属精神卫生中心
2.南京市儿童医院
3.复旦大学附属儿科医院
4.同济大学附属精神卫生

Objective To compare the therapeutic effects of medication therapy (MTG), executive function training (EFTG), and support group (SG) in improving the symptoms and executive function of children with attention deficit hyperactivity disorder (ADHD).

Methods The study sample involved 118 children, who were enrolled in the pediatric outpatient department of Shanghai Mental Health Center and met the DSM-5 diagnostic criteria for ADHD. The participants were treated

with medication(n=39), executive function training(n=51), or supportive group intervention(n=28) for 8 weeks respectively. The SNAP-IV scales and the Conners Parent Symptom Questionnaire were used to assess the children's clinical symptoms of the three intervention groups, and the Stroop color-word association test, the Wisconsin Card Sorting Test, and the digit span test were used to evaluate ADHD children's executive function. The symptom scores and executive function indexes of the three groups of intervention children were assessed at baseline and at the end of the 8th week of treatment, which was a retrospective analysis. With the baseline level as a covariate, the covariance analysis of the three groups after 8 weeks of intervention was made respectively.

Results ① After 8 weeks of treatment, the clinical symptoms in the MTG group were significantly improved compared with baseline (t= 2.10-7.96, p< 0.05). The improvement of the executive function indexes was statistically significant (t=-5.574.15, p< 0.05). The clinical symptoms of the EFTG group were also significantly improved (t=2.094.35, p < 0.05). The improvement of the executive function index was statistically significant (t=-4.584.39, p < 0.05). ② After 8 weeks of intervention, the baseline level was utilized as the covariance. The results revealed that the therapeutic effect of the MTG group was significantly better than that of the SG (p< 0.05). The improvements in executive function in the MTG group and EFTG group were superior to that in the SG group (p＜0.05), while there was no difference between the MTG group and the EFTG group.

Conclusion Although both medication therapy and executive function training can improve the clinical symptoms and executive function of ADHD children, medication therapy is better than executive function training, and the improvement of supportive groups is not significant.

A Cross-sectional Study of Depressive Symptoms Among Teenage Boys and Teenage Girls in Shanghai

王艺[1] 张喜燕[1] 王强[1] 秦虹云[1] 文竹[2]
1.同济大学附属精神卫生中心
2.复旦大学附属儿科医院

Objective To explore gender differences in affecting factors of depressive symptoms and in prevalence rate of anxiety-depression comorbidity.To compare the clinical characteristics among those with comorbid conditions and those with depression alone in different genders.

Methods A sampel of 3169 students aged 11-16, including 1616 boys and 1553 girls were selected in a district of Shanghai to participate in the on-site questionnaire survey. Children's Depression Inventory (CDI), Child Anxiety Related Emotional Disorders (SCARED),Strengths and Difficulties Questionnaire(SDQ) and a self-designed questionnaire were used for investigation.Binary logistic regression was conducted to explore the possible risk factors on prevalence rate of depressive symptoms.

Results The prevalence rate of depressive symptoms (CDI scores≥19) in adolescents was 16.72%，with 16.60% for boys and 16.90% for girls,and the prevalence rate was not differentiated on gender ($\chi2$=0.047，P=0.83). For boys, the prevalence rate of depressive symptoms was significantly different among different grades($\chi2$=8.79,P=0.032) and different school types ($\chi2$=7.86,P=0.005).Binary logistic regression analysis showed that senior class and private school were risk factors of depressive symptoms among boys(P＜0.05). For girls,the prevalence rate of depressive symptoms was significantly different among different grades($\chi2$=19.78,P＜0.001) and different family types ($\chi2$=11.48,P=0.003).Binary logistic regression analysis showed that senior class was risk factor and extended family was protective factor of depressive symptoms among girls(P＜0.05).The prevalence rate of anxiety-depression comorbidity in girls was higher than that in boys（$\chi2$ = 17.05,P<0.001).Boys with comorbid conditions scored higher on SDQ emotional symptoms (Z=-7.59,P<0.001), attention deficit/ hyperactivity problems（Z=-3.58,P<0.001) and total difficulty scores（Z=-5.20,P<0.001) than boys with depression alone；Girls with comorbid conditions scored higher on SDQ emotional symptoms（Z=-6.37,P<0.001), attention deficit/hyperactivity problems（Z=-3.90,P<0.001),peer relationship problems（Z=-3.03,P=0.002) and total difficulty scores（Z=-6.15,P<0.001) than girls with depression alone.

Conclusion There were gender differences in affecting factors of depressive symptoms and the prevalence rate of comorbidity.Boys with comorbid conditions had more emotional problems, attention deficit/ hyperactivity problems. Girls with comorbid conditions had more emotional problems, attention deficit/ hyperactivity problems and peer relationship problems.

Is Prosocial Behaviour Protective Against Depression: A Cross-sectional Study of Students in China

张喜燕[1] 陈燕华[1] 吕桃[2] 江文庆[3] 李焱[3] 林裕雄[3]
1.同济大学附属精神卫生中心
2.德阳市人民医院
3.上海市精神卫生中心

Objective Prosocial behavior in adolescents is considered to be negatively correlated with depression and anxiety. However, it remains unclear whether this protective effect of prosocial behavior is affected when anxiety symptoms or depressive symptoms are present. The present study aimed to investigate (a) whether the prosocial

behavior-anxiety association is moderated by depressive symptoms and (b) whether the association between prosocial behavior and depression is moderated by anxiety symptoms.

Methods A cross-sectional survey of middle school students using standardized instruments (Children's Depression Inventory (CDI), Screen for Child Anxiety Related Emotional Disorders child version (SCARED-C),and Strengths and Difficulties Questionnaire(SDQ)). We used structural equation modeling (SEM) to examine the protective effect of prosocial behavior when anxiety symptoms or depressive symptoms are present.

Results The prevalence of anxiety and depression in early adolescents were 31.6% and 16.7%, respectively. 70.8% of depressed adolescents had comorbidities of anxiety, and 37.5% of anxious adolescents had depressive symptoms. Regression models showed that compared with depressed adolescents , prosocial behaviors of adolescents without depressive symptoms were significantly negatively correlated with anxiety and depression (β = -0.01, P ＞0.01，β = -0.06, P＞0.01；β = -0.11, P < 0.01，β = -0.17, P < 0.01). There was no difference in the protective effect of prosocial behavior on depression between anxious and non-anxious adolescents(P＞0.05).

Conclusion Anxiety and depression are common in early adolescence and are often comorbidities. However, the level of comorbidity is not symmetrical. The protective effect of prosocial behavior in depressed adolescents is weakened.

关键字： prosocial behavior, anxiety, depressive symptoms, middle school students

Working Experiences Among Frontline Nurses Fighting Against Coronavirus Disease 2019 in Mobile Cabin Hospitals：a Qualitative Research

魏莎*
重庆医科大学附属第一医院

Objective Omicron outbreak in Shanghai in may 2022 In order to cope with the great shock, the government establishes the Mobile Cabin Hospitals (MCHs) to provide isolation and care for patients with mild to moderate symptoms. MCHs are rapidly built temporary hospitals composed of several movable shelters; they are equipped to provide services such as emergency treatment, surgical treatment and clinical examinations.. Frontline nurses working in this specific context may confronted dilemmas, such as heavy workloads, complicated and trivial nursing work contents, and sharp conflicts between doctors and patients, all of these may cause mental health challenges of frontline nurses.To understand the working experiences of frontline nurses in combat against Coronavirus Disease 2019 (COVID-19) in mobile cabin hospitals (MCHs) and provide a reference basis for improving the new path of prevention and control of public health emergencies in China.

Methods A purposive sampling method was used to conduct semi-structured in-depth interviews with 16 frontline nurses of the Chongqing-aid-Shanghai medical team from April to May 2022 as the study participants. A phenomenological qualitative design was followed throughout the study. The data were analyzed by applying the Colaizzi 7-step analysis method.

Results A total of three themes were summarized at three levels: change of mind (sense of responsibility and mission, worry and anxiety, moving, post-traumatic growth, sense of value and accomplishment), difficulty coping (unadapting to wearing protective equipment, unfamiliarity with processes, rapid change of work content dynamics, sleep disorder), and nursing focus (life care, psychological care, care for particular patients).

Conclusion A total of three themes were summarized: change of mind, difficulty coping, and key point of nursing/nursing priorities.

结合多基因风险评分和神经影像特征寻找孤独症谱系障碍预后相关标志物

罗婷婷 张漫雪 黄颐*
四川大学华西医院

目的 孤独症谱系障碍(Autism Spectrum Disorder, ASD)是遗传因素和环境因素相互作用的多致病因素导致的一类神经发育障碍，然而其病因学机制仍不明确，且少有研究对 ASD 进行长时间的随访，ASD 的预后信息知之甚少。本文将从神经影像和遗传学的角度寻找 ASD 预后相关的影像遗传学标志物，利用多基因风险评分(polygenetic risk score, PRS)，探索基因-脑-行为之间的关系。

方法 纳入 ASD 儿童 104 人，正常发育儿童 72 人，完善临床评估和一般情况问卷调查，采集磁共振成像数据；其中 90 名 ASD 儿童完成了为期 4 年的前瞻性纵向随访，采用五级评分方法对其整体社会功能（overall social outcome, OSO）进行系统性评价。59 例 ASD 患者进行全外显子测序，采用加权求和的公式计算全外显子组多基因风险评分(exon-PRS)，采用简单回归分析 PRS 与 ASD 预后的关系；支持向量回归（support vector regression, SVR）模型探索 exon-PRS 相关的 ASD 特征脑区；多元逻辑回归模型进一步探索 ASD 预后相关的影像遗传风险因素；最后建立中介模型探究基因-脑-行为的关系。

结果 1) exon-PRS 不能作为 ASD 症状的独立预测因素，不能预测 ASD 预后转归，能预测社会适应功能；2) SVR 模型发现与 exon-PRS 相关的脑区包括前额叶、扣带回、枕叶、楔前叶、梭状回、直回等；3)将预后分组和 OSO 分级分别作为因变量进行多元逻辑回归模型发现，对 OSO 分级有预测作用的因素是：右枕下回-左枕下回、左枕中回-右副中央小叶的功能连接，以及 exon-PRS 与左枕中回-右副中央小叶、左枕前回-右角回功能连接的交互作用。而预后分组的多元逻辑

回归拟合失败；4)成功构建两个基因-脑-行为中介模型，分别解释了脑作为内表型对 ASD 症状、ASD 预后社会适应能力的影响：exon-PRS 通过枕中回-苍白球功能连接中介作用间接影响 ASD 的沟通交流症状；随访时 ASD 社会功能的预测因素中 exon-PRS、枕中回间有交互作用，同时两者都受到基线语言表达能力的中介调节作用。

结论 影像遗传学研究发现影像内表型有利于 ASD 的遗传机制探索，枕叶中介调节了 ASD 外显子组多基因遗传风险与 ASD 预后的关系。

基于 fNIRS 对非自杀性自伤青少年患者经 SSRI 药物治疗前后的前额叶血流动力学特点的研究

何青萍*
贵州省第二人民医院

目的 ：本研究采用基于语言流畅性任务范式的近红外脑功能成像技术（Functional near-infrared spectroscopy,fNIRS）探讨非自杀性自杀（Non-suicidal self-injury,NSSI）青少年患者的脑血流动力学特点，了解青少年 NSSI 患者经五羟色胺再摄取抑制剂（Selective Serotonin Reu，SSRI）药物干预后的血流动力学及脑功能变化特点，寻找 SSRI 药物干预的神经生物学机制及疗效预测因子。

方法 选取 2022 年 04 月-2022 年 10 月贵州省第二人民医院就诊的 30 例符合 DSM-5 关于 NSSI 诊断标准的青少年患者，另招募 30 例与患者组性别、年龄、教育程度相匹配的健康志愿者，作为 NSSI 组和健康组。健康组及 NSSI 组均使用 53 通道近红外光谱成像仪 在言语流畅性任务（VFT）中采集前额叶血流变化，并进行思维反刍量表（RRS）评定；同时 NSSI 组进行舍曲林药物干预后第四周再次采集前额叶血流变化。

结果 结果：1.NSSI 组在进行言语流畅性任务时词组个数明显少于正常对照组（P<0.05）。此外，患者组思维反刍量表分数明显高于正常对照组（P<0.05）；2. NSSI 组和健康对照组以氧和血红蛋白浓度为指标在背外侧前额叶、额极差异有统计学意义，其中主要表现在通道 CH6、CH21、CH41 有统计学意义（P<0.05），与健康组比较，NSSI 组患者 Hbo 浓度比健康对照组显著降低。3.NSSI 组经药物干预后临床疗效可，HAMD 评分显著低于干预前 P<0.05。4. NSSI 组经舍曲林药物干预后，NSSI 组以氧和血红蛋白浓度为指标在前运动皮层与辅助运动皮层、左背外侧前额叶、右布诺卡区差异有统计学意义，CH6、CH7、CH47 通道 Hbo 浓度有统计学差异（P<0.05），经舍曲林药物治疗后 NSSI 组患者 Hbo 浓度较干预前明显激活。

结论 NSSI 青少年患者 VFT 任务期间存在与反应力、注意力等认知功能相关及情绪调节相关脑区（背外侧前额叶、额极）中表现出较低的氧和血红蛋白浓度的激活。fNIRS 可能作为没有表露出 NSSI 患者的筛查工具，脑血流氧和血红蛋白浓度可能作为 NSSI 患者生物学标记物之一； 在青少年 NSSI 患者的治疗中实施盐酸舍曲林不但能改善患者的抑郁症状，还能够提高其前额叶脑血流量，可能提高 NSSI 患者认知功能及情绪调节。

PRKCB 基因甲基化、童年慢性应激与青少年抑郁症的关联性研究

陶圆美[1,2,3] 金美江[1,2,3] 张航[1,2,3] 冉茂佳[1,2,3] 胥寒梅[1,2,3] 邹守康[1,2,3] 邓芳[1,2,3] 黄丽娟[1,2,3] 张宏[1,2,3] 王小兰[1,2,3] 汪燕苹[1,2,3] 殷莉[1,2,3]
1.四川大学华西医院心理卫生中心
2.四川大学疾病分子网络前沿科学中心
3.四川省精神心理疾病临床医学研究中心

目的 青少年抑郁症的患病率显著升高。既往研究发现 PRKCB 基因的变化与童年慢性应激及抑郁症相关。因此，本研究探讨童年慢性应激、PRKCB 基因甲基化及青少年抑郁症这三者的关系；童年慢性应激、PRKCB 基因甲基化与青少年抑郁症患者自杀行为的关系。

方法 本研究共纳入 100 例青少年抑郁症患者和 50 例健康对照。使用贝克抑郁量表（BDI）、童年慢性应激量表（CCSQ）对受试者进行评估，并对本课题组前期研究发现的 PRKCB 基因差异 CpG 位点-cg18526361 甲基化水平进行检测。比较两组 BDI、CCSQ 评分及 PRKCB 基因 CpG 位点甲基化水平。使用相关性分析及二元 Logistic 回归探索童年慢性应激、PRKCB 基因 CpG 位点甲基化与青少年抑郁症的关系。比较有、无自杀行为的青少年抑郁症患者的童年慢性应激及 PRKCB 基因 CpG 位点甲基化水平。构建交互模型及中介效应模型探讨 PRKCB 基因 CpG 位点甲基化和童年慢性应激的相互作用对青少年抑郁症的影响。

结果 1.患者组的 BDI 总分、CCSQ 总分及各维度评分均显著高于对照组（p＜0.05）。2.CCSQ 总分、3 个大维度及 4 个小维度评分与 BDI 总分呈正相关（p＜0.05）。除性虐待维度，其余童年慢性应激维度均与青少年抑郁症风险相关（p＜0.05）。3.患者组 PRKCB-108-34 甲基化水平显著高于对照组，且与 BDI 总分呈正相关（p＜0.05）。PRKCB-108-34 甲基化水平与青少年抑郁症风险相关（p＜0.05）。4.青少年抑郁症患者 PRKCB-108-34 甲基化水平与 CCSQ 总分、3 个大维度及 5 个小维度评分呈正相关（p＜0.05）。5.童年慢性应激与 PRKCB-108-34 甲基化的交互作用对青少年抑郁症没有影响，且 PRKCB-108-34 甲基化在童年慢性应激与青少年抑郁症严重程度之间无中介效应。6.有自杀行为组的 CCSQ 总分及各维度评分均高于无自杀行为组，但 PRKCB-108-34 甲基化水平在两组之间无显著差异。

结论 青少年抑郁症患者经历了更多的童年慢性应激，且童年慢性应激水平与青少年抑郁症相关。PRKCB-108-34 甲基化水平与青少年抑郁症相关，且与童年慢性应激水平相关。童年慢性应激与 PRKCB-108-34 甲基化的相互作用对青少年抑郁症没有影响。童年慢性应激水平高的青少年抑郁症患者自杀风险更高。

孤独症谱系障碍高危婴幼儿的眼动研究

吴舒娴 罗学荣*
中南大学湘雅二医院

目的 孤独症谱系障碍(Autism spectrum disorder, ASD)遗传高危（High risk, HR）婴幼儿,即 ASD 患者的婴幼儿同胞，患 ASD 的风险相对增高。既往研究发现 ASD 患者存在社交注意缺陷，主要表现为偏好注视非社交刺激。因此，本研究借助眼追踪技术：（1）探究 HR-ASD 婴幼儿对非社交刺激是否存在偏好注视；（2）探究 HR-ASD 婴幼儿的异常注视行为用于区分 ASD 风险的能力。

方法 本研究采用横断面设计，纳入 HR-ASD 婴幼儿、ASD 患儿、正常发育（Typically developing, TD）婴幼儿各 33 名。使用眼动仪采集三组被试观看小朋友互动的社交场景、人和卡通玩偶以及人和旋转物品 3 种刺激材料的眼动数据。采用协方差分析比较 3 组被试的眼动指标的差异，采用受试者工作特征（Receive operating characteristic, ROC）曲线探究 3 组间有差异的眼动指标区分 ASD 风险以及诊断结局的能力。

结果 （1）社交场景：HR-ASD 组对活动兴趣区（Area of interest, AOI）的首注视时间和注视时间百分比显著多于 TD 组（p<0.05），ASD 组对活动 AOI 的注视时间百分比显著多于 TD 组（p=0.002），（2）人和卡通玩偶：HR-ASD 组和 ASD 组首次注视到卡通 AOI 的潜伏期显著少于 TD 组（p<0.05），HR-ASD 组和 ASD 组对人物 AOI 的首注视时间以及卡通 AOI 的注视时间百分比显著高于 TD 组（p<0.05），另外，HR-ASD 组对头部和卡通 AOI 的首注视时间显著高于 TD 组（p<0.05）（3）人和旋转物品：ASD 组对物品 AOI 注视时间百分比显著高于 TD 组（p=0.002）（4）卡通 AOI 注视时间百分比用于区分 HR-ASD 组和 TD 组对应的 ROC 曲线下面积最高（0.81），相应的灵敏度、特异度、阳性预测值、阴性预测值分别为 0.80、0.72、0.74、0.78。

结论 （1）在观看人物互动的社交场景时，HR-ASD 婴幼儿表现出和 ASD 患儿类似的对人物所做的活动关注增加，而对人物不感兴趣。（2）观看同时呈现的社交刺激和非社交刺激物时，HR-ASD 婴幼儿表现出和 ASD 患儿类似的对非社交刺激物的注视偏好。（3）HR-ASD 婴幼儿对非社交刺激物的偏好注视用于区分 ASD 风险的效果良好。

青少年边缘性人格特质、学校适应、社会支持与自我效能感：一个有调节的中介作用

钱丽菊[1,2] 于腾飞[1] 付浩[2] 王茹[1] 李丽平[1] 郭绪嘉[2] 尚鲁宁[1] 张跃兵[1,2]
1.山东省戴庄医院
2.济宁医学院

目的 探索边缘性人格特质、青少年社会支持、学校适应与自我效能感的关系，为进一步提高青少年自我效能感提供理论依据。

方法 采用方便取样，对 2369 名青少年进行一般人口学调查、边缘性人格特质、青少年社会支持、学校适应及自我效能感评估，采用 SPSS26.0 对数据进行描述性统计分析、相关分析、中介及调节效应等分析。

结果 学校适应在边缘性人格特质与青少年自我效能之间起中介作用，中介效应占比分别为 52.00%，72.48%，69.95%，35.95%；学校适应（β=0.152~0.222，P 均<0.01）显著正向预测青少年自我效能感，且学校适应与社会支持的交互项对青少年自我效能的预测作用显著；情绪不稳定、冲动控制问题显著负向预测青少年自我效能感（β 情绪不稳定=-0.081，β 冲动控制问题=-0.181，P 均<0.01），边缘性人格特质 4 个维度与社会支持的交互项对青少年自我效能感的预测作用不显著；简单斜率检验：社会支持水平较高时，情绪不稳定对自我效能感的负向预测作用不显著（β=-0.035，P=0.250），冲动控制问题对青少年自我效能感的负向预测增强（β=-0.200，P<0.01），学校适应显著正向预测青少年自我效能感，对青少年自我效能感的预测显著增强（β 情绪不稳定=0.313，β 冲动控制问题=0.223，P 均＜0.01）；社会支持水平低时，情绪不稳定可显著负向预测自我效能感（β=-0.126，P<0.01），冲动控制问题能够显著负向预测青少年自我效能感（β=-0.161，P<0.01），学习适应可显著正向预测青少年自我效能感（β x：情绪不稳定=0.120，β x：冲动控制问题=0.081，P 均＜0.01）。有中介的调节作用分析结果显示：情绪不稳定经学校适应对青少年自我效能感的影响在社会支持水平较低时显著（高社会支持中介效应值 0.19，低社会支持中介效应值 0.16），冲动控制经学校适应对青少年自我效能感的间接影响随着社会支持的增加而逐渐增强（高社会支持中介效应值 0.11，低社会支持中介效应值 0.16）。

结论 学校适应在边缘性人格特质与青少年自我效能之间起中介作用；社会支持在情绪不稳定或冲动控制问题经学校适应对自我效能感作用路径中的学校适应至自我效能感途径中起到调节作用。

关键字：社会支持 学校适应 边缘性人格 自我效能感

微生态制剂对神经发育障碍有效性及安全性的网状 meta 分析

王宁 赵驿鹭 郑翔宇 高煦平 杨莉*
北京大学第六医院

目的 神经发育障碍发病率逐年升高，包括孤独症谱系障碍(autistic spectrum disorder, ASD)、注意缺陷多动障碍(attention deficit hyperactivity disorder, ADHD)、智力障碍、交流障碍、特定学习障碍等，给家庭、社会带来巨大负担。现有治疗药物副反应较多，且部分患者存在药物不耐受、用药依从性差的问题。微生态制剂由益生菌及其代谢产物和促进物组成，包括益生菌、益生元、合生元。国内外研究提示微生态制剂有助于改善神经发育障碍，但其干预效果及安全性仍不明确。本研究旨在采用网状 meta 分析方法对微生态制剂干预神经发育障碍的有效性及安全性进行评价。

方法 分别对 Pubmed, Web of Science, Embase, Cochrane Library, the Cochrane Central Register of Controlled Trials 及 PsycINFO 数据库进行检索，检索时限为建库至 2023 年 7 月 3 日。纳入标准：（1）研究对象为神经发育障碍患者；（2）干预措施为微生态制剂或微生态制剂合并常规神经发育障碍药物治疗；（3）比较组为安慰剂或常规药物治疗；（4）主要结局指标包括干预前后神经发育障碍症状评分、药物不良反应，次要结局指标包括胃肠道症状评分、其他疾病症状评分（情绪评分等）、脑电图变化、肠道菌群丰度等；（5）研究类型为随机对照试验。采用 ADDIS 1.16.5 软件进行网状 meta 分析。

结果 共纳入 26 项随机对照试验，包括 18 项 ASD 研究，6 项 ADHD 研究，1 项智力障碍研究，1 项抽动障碍研究，总样本量 1099 例。纳入益生菌：鼠李糖乳杆菌、益生菌合剂（罗伊氏乳杆菌、噬酸乳杆菌、双歧杆菌）、双歧杆菌、植物乳杆菌、De Simone 合剂；益生元：乳清蛋白、低聚半乳糖；合生元：Synbiotic2000（乳酸菌、植物乳杆菌、纤维素等）、SB-121 制剂。发现植物乳杆菌、双歧杆菌、低聚半乳糖等可显著改善 ASD 症状；益生菌合剂、鼠李糖乳杆菌可以改善 ADHD 症状评分，Synbiotic2000 可以改善多动/冲动行为；大部分研究均未发现不良反应，只有 2 项研究报道了皮肤瘙痒、食欲改变。

结论 微生态制剂有助于改善神经发育障碍症状，且安全性较好，但未来仍需更多大样本、多中心的随机对照研究进行补充与论证。

关键字：神经发育障碍；微生态制剂；网状 meta 分析

机器学习在严肃游戏预测青少年自杀风险中的应用

巫江丽[1] 王分分[2] 周国岭[1] 李凯悦[2] 胡敏[2] 蔡恬[3] 程晔[2] 施剑飞[1]
1.浙江大学医学院附属精神卫生中心（杭州市第七人民医院）
2.杭州云戒科技有限公司
3.浙江理工大学心理学系

目的 青少年心理危机频发，学校心理筛查多采用量表，存在测验焦虑、社会赞许性、话题敏感性等问题，容易导致结果不准确，更加客观的严肃游戏受到越来越多的关注。严肃游戏是为了达到教育、治疗等严肃的目的而设计的游戏化心理测评形式，能获得更高的参与度，同时由于是采集实时的行为反应，可以有效减少作假。现实生活中，自杀影响因素众多且相互关系复杂，传统的统计方法只能建立简单的线性关系，且无法处理大规模数据，而机器学习可以基于大量数据，结合众多自杀风险影响因素，建立复杂的预测模型，并可以根据数据的特征，自适应调整模型的参数，从而得到更加准确的预测结果。然而，目前结合严肃游戏和机器学习预测青少年自杀风险的研究极少，在正常青少年群体中也缺少等级分类的模型。本研究尝试运用机器学习，探索严肃游戏所获取的行为特征数据对青少年自杀风险的预测能力，为青少年自杀风险早期预测提供新的思路。

方法 从医院和学校共招募 1135 名 9~18 岁青少年，由医生或学校心理老师对其进行自杀潜在风险评估，通过严肃游戏软件获取其行为反应特征数据，运用机器学习 LightGBM 算法构建模型，并评估模型的预测性能。

结果 机器学习模型对高风险的预测准确度最高（AUC=0.92），其次依次是中风险（AUC=0.85），无风险（AUC=0.74），低风险（AUC=0.62）。模型在区分自杀风险的 4 个类别（无风险、低风险、中风险、高风险）上的预测准确率为 0.81，召回率为 0.69，精确率为 0.64，F1 值为 0.66；在区分有无自杀风险上的预测准确率为 0.84，召回率为 0.80，精确率为 0.66，F1 值为 0.69。

结论 基于严肃游戏软件初步构建的算法模型一定程度可以有效地预测青少年的自杀潜在风险等级，可作为青少年自杀风险早期预测和筛查的工具之一。

重复经颅磁刺激（rTMS）治疗伴有快感缺失的抑郁障碍患者的急性期疗效的病例研究

王小春 王皋茂*
重庆医科大学附属大学城医院

目的 本研究旨在比较高频 rTMS、低频 rTMS 和单纯药物对抑郁症患者急性期症状的改善效果，同时探讨高频组、低频组相较于单纯药物治疗组对抑郁症患者快感缺失的疗效，并探寻相关临床疗效的影响因素，为临床方案选择提供思路。

方法 本次实验收集了共 69 例，来自于重医附属大学城医院心理卫生中心就诊的患者，将符合入组的患者随机分为高频组、低频组和药物对照组，最终高频组患者共有 20 例，低频组患者共有 21 例，药物对照组共有 28 例。收集纳入患者的个人信息和相关病史资料。我们在治疗前、治疗 2、4 和 8 周末分别使用了汉

密尔顿焦虑量表（HAMA）、汉密尔顿抑郁量表（HAMD-17）和斯奈思-汉密尔顿快感量表（SHAPS）来评估他们的焦虑、抑郁和快感缺失症状。同时还要观察患者在整个治疗过程中是否存在不良反应。

结果 在基线资料比较中，性别存在统计学差异（p=0.004）。在 2 周的急性期治疗后，所有纳入患者的焦虑、抑郁和快感缺失得分均在治疗 2、4、8 周后逐渐降低（p=0.000）。在改善抑郁症状方面，高频组、低频组疗效显著优于药物对照组（p=0.010，p=0.008），在改善焦虑症状方面，高频组优于低频组和药物治疗组（p=0.026），在改善快感缺失方面，低频组优于高频组和药物对照组（p=0.004）。三组不良反应均较少，呈个别化。对快感缺失的相关因素进行分析，得出有饮酒史，基线 HAMA、HAMD-17、SHAPS 总分与快感缺失疗效呈负相关关系（p=0.044，p=0.037，p=0.023，p=0.003）。

结论 rTMS、药物均能改善抑郁患者的症状，但 rTMS 效果优于药物治疗，高频 rTMS 在改善焦虑症状方面效果更优，低频 rTMS 在改善快感缺失症状方面效果更优。三组均未见明显不良反应，低频 rTMS 可以在今后的抑郁障碍患者中发挥独特的作用优势，后续维持期的治疗可以延续更长的时间，也可以进一步探索新兴的治疗模式。

青少年抑郁症非自杀性自伤反应抑制功能的 ERP 研究

周东东[1] 赵琳[2] 马伶丽[2] 胡景辉[1] 彭新宇[2] 王我[1] 况利[2]
1.重庆医科大学附属大学城医院 心理卫生中心
2.重庆医科大学附属第一医院 精神科

目的 有学者认为非自杀性自伤（Nonsuicidal self-injury, NSSI）是一种行为成瘾，而线索反应性是成瘾障碍的特征之一。本研究旨在探索伴 NSSI 的青少年抑郁症患者在自伤相关线索下反应抑制的行为表现和电生理指标是否存在异常。

方法 年龄在 12 岁-18 岁之间的 47 个伴 NSSI 的重度抑郁（Major depressive disorder, MDD）患者，39 个不伴 NSSI 的 MDD 患者，以及 25 个健康对照（Healthy control, HC）在完成双选择 Oddball 范式下采集脑电图。准确率代价（Accuracy cost）和反应时代价（RT cost）作为反应抑制功能的行为学指标；偏差刺激减去标准刺激的差异波 N2d 和 P3d 的潜伏期和波幅作为反应抑制功能的电生理指标。我们使用 ERP 可靠性分析工具箱去估计 N2 和 P3 的可信度估计，阈值设置为 0.70。

结果 P3d 波幅的组别×线索交互效应显著[F(2, 108) = 4.54, p = 0.01, ηp2 = 0.08]。将年龄加入协变量后，组别×线索条件的交互效应仍然显著[F(2, 107) = 5.85, p = 0.004, ηp2 = 0.10]。进一步简单效应分析结果显示：自伤相关线索下 MDD+NSSI 组的 P3d 波幅较 HC 组显著增大（Bonferroni 校正后的 p=0.046）；在 MDD 组和 MDD+NSSI 组中，自伤相关线索下的 P3d 波幅显著大于中性线索下的 P3d 波幅（Bonferroni 校正后的 p 分别为 0.038 和 0.009），但在 HC 组中，自伤相关线索下的 P3d 波幅显著小于中性线索下的 P3d 波幅（Bonferroni 校正后的 p 为 0.038）。N2 和 P3 可信度估计结果显示：MDD+NSSI 组、MDD 组和 HC 组在各种刺激条件下均具有较好的可信度（均大于 0.7）。

结论 我们提供了伴有 NSSI 的青少年抑郁患者在自伤相关线索下神经反应性发生改变的神经电生理证据，具体来说，自伤相关线索能诱发 NSSI 青少年显著更大的 P3 波幅。仍需要未来的纵向研究去探索线索反应性对于预测未来自伤自杀行为的作用和价值。

阿戈美拉汀联合坦度螺酮治疗青少年抑郁焦虑共病 及非自杀性自杀干预的研究

徐学兵* 汪帅 解磊 郭宇鑫 鹿永坤 常高峰
宁夏回族自治区宁安医院

目的 探讨阿戈美拉汀联合坦度螺酮治疗青少年抑郁焦虑共病的临床效果与安全性及非自杀性自伤行为的发生率。

方法 选取 2021 年 1 月一 2023 年 1 月就诊于宁夏宁安医院的 168 例青少年抑郁共病焦虑障碍的患者作为研究对象，按照随机数字表法分为对照组（84 例）和观察组（84 例）。对照组采用单一阿戈美拉汀治疗，观察组采用阿戈美拉汀联合坦度螺酮组治疗。分别于治疗前及治疗 1、2、4 周末应用 17 项汉密尔顿抑郁量表(HAMD-17)、汉密尔顿焦虑量表(HAMA)、匹兹堡睡眠质量指数量表(PSQI)和不良反应症状量表(TESS)评定疗效及安全性，采用渥太华自我伤害调查表（OSI）评估 NSSI 行为发生情况。

结果 研究结束后两组患者在治疗有效率方面比较，观察组总有效率(96.3％)高于对照组(84.2％)，差异有统计学意义(P〈0.05)。治疗 1、2、4 周末，两组 HAMD-17、HAMA 总分与其治疗前比较均显著下降，且观察组 HAMD-17、HAMA 评分和 NSSI 行为发生率均明显低于对照组，差异均有统计学意义(P〈0.01) 。两组不良反应总发生率比较，差异无统计学意义(P>0．05)。

结论 阿戈美拉汀治疗青少年抑郁共病焦虑安全有效，不仅可缓解患者的焦虑抑郁情绪，而且可降低 NSSI 发生率。联用坦度螺酮治疗效果优于单用阿戈美拉汀治疗，值得临床应用推广。

Adjunctive Repetitive Transcranial Magnetic Stimulation for Adolescents with First-episode

Major Depressive Disorr: A Meta-analysis

Yang Xinhu Zheng Wei*
广州医科大学附属脑科医院

Objective This meta-analysis of randomized clinical trials (RCTs) was conducted to explore the therapeutic effects and acceptability of repetitive transcranial magnetic stimulation (rTMS) as an adjunct treatment in adolescents with first-episode major depressive disorder (FE-MDD).

Methods RCTs examining the efficacy and acceptability of adjunctive rTMS for adolescents with FE-MDD were included. Data were extracted by three independent authors and synthesized using RevMan 5.3 software with a random effects model.

Results A total of six RCTs involving 562 adolescents with FE-MDD were included. Adjunctive rTMS was superior in improving depressive symptoms over the control group (standardized mean difference (SMD)=-1.50, 95% confidence interval (CI): -2.16, -0.84; I2=89%, p<0.00001) in adolescents with FE-MDD. A sensitivity analysis and two subgroup analyses also confirmed the significant findings. Adolescents with FE-MDD treated with rTMS had significantly greater response (risk ratio (RR)=1.35, 95% CI: 1.04, 1.76; I2=56%, p=0.03) and remission (RR=1.35, 95% CI: 1.03, 1.77; I2=0%, p=0.03). All-cause discontinuations were similar between the two groups (RR=0.79, 95% CI: 0.32, 1.93; I2=0%, p=0.60). No significant differences were found regarding adverse events, including headache, loss of appetite, dizziness and nausea (p=0.14-0.82). Four out of six RCTs (66.7%, 4/6) showed that adjunctive rTMS was more efficacious over the control group in improving neurocognitive function (all p<0.05).

Conclusion Adjunctive rTMS appears to be a beneficial strategy in improving depressive symptoms and neurocognitive function in adolescents with FE-MDD. Higher quality RCTs with larger sample sizes and longer follow-up periods are warranted in the future.

Cognitive Functioning of Self-Injurious Or Suicidal Attempted Adolescents in Depressive Disorder Using Eye Tracking Technology

温敏[1] 栗克清[2]
1.华北理工大学
2.河北省精神卫生中心

Objective To explore the relationship between suicide and eye-movement characteristics in adolescent depression patients with and without self-injurious behavior.

Methods To investigated cognitive function in adolescents with depression with self-injurious or suicidal behavior: 30 depression patients with non-suicidal self-injurious behavior, 30 depression patients with suicide attempts, and 21 healthy controls were subjected to general condition, Hamilton Depression Inventory, THINC-it set of cognitive measurement tools and eye movement measurement.

Results Compared to the non-suicidal self-injurious behavior group, teenagers with depression who engage in self-injurious behavior have lower levels of the Hamilton Depression Scale (t=-3.753, P<0.05), the Adolescent Suicidal Ideation Scale（t=1.147，P<0.05）, and the Suicidal Behavior Questionnaire total score (Z=-4.079, P<0.05). There were no statistically significant differences in lifestyle self-injurious behavior and functioning between the two groups (P>0.05). THINC-it integrated cognitive measure instrument showed significant differences in all scores among the three groups (P< 0.05), and the five-item Perceived Deficits in Depression Questionnaire (OR=39.579, 95% CI: 3.995 to 329.124) and objective scores (OR=3.052, 95% CI: 0.904 to 10.295) were associated with adolescent depression. The total score of the Adolescent Suicidal Ideation Scale was associated with Spotter (r=-0.401, P<0.05), Codebreak (r=-0.274, P<0.05), Trails (r=-0.273, P<0.05), Objective score (r=-0.352, P<0.05), and Comprehensive score (r=-0.375, P<0.05) were negatively correlated in total score. In the antisaccade task, there were significant differences in gaze time, accuracy, latency, correct eye tracking latency, and peak velocity in all three groups (P<0.05), and in memory-guided saccade task, there were significant differences in gaze time, accuracy, latency, number of errors, total number of valid trials, spatial error, and mean number of eye tracking steps (P<0.05), while the rest of the differences were not significant (P>0.05). Correlation analysis revealed that antisaccade and memory guided saccade tasks were correlated with cognitive function (P<0.05).

Conclusion The degree of depression was related to suicidal ideation and suicidal behavior. Self-injury characteristics associated with suicidal ideation, self-injury may promote the occurrence of suicide. The degree of depression, suicidal ideation, NSSI behavior and function may affect the cognitive function of adolescents with depression. The eye movement characteristics of antisaccade and memory guided saccade tasks can reflect the subjects' working memory, attention control and executive function. There were differences in reverse saccade and memory saccade among non-suicidal NSSI patients, attempted suicide patients and healthy people.

加速重复经颅磁刺激治疗抑郁症的临床疗效研究

刘娇颖[1,2] 舒燕萍[2]
1.遵义医科大学研究生院
2.贵州省第二人民医院

目的 尽管已经明确抗抑郁药物对抑郁患者的疗效，但目前仍有三分之一左右的抑郁患者对规范的抗抑郁药物治疗反应欠佳，本文在传统经颅磁刺激治疗

的基础上，结合斯坦福加速智能神经调控法，采用不同作用靶点的加速经颅磁治疗(accelerated repetitive transcranial magnetic stimulation, arTMS)策略，探索新经颅磁刺激治疗方案能否优化难治性抑郁的治疗，从而减轻疾病负担，并深入理解不同靶点的加速经颅磁治疗方案对难治性抑郁患者局部脑功能活动的影响,从而找到 arTMS 治疗的预测因子，为个体化经颅磁治疗提供依据。

方法 将在贵州省第二人民医院招募的难治性抑郁障碍患者平均分为单靶点刺激组、双靶点刺激组及伪刺激组，其中，单靶点组患者接受左侧背外侧前额叶(left dorsolateral prefrontal cortex, L-DLPFC)真刺激及右侧眶额叶(right orbitofrontal cortex, OFC)伪刺激治疗；双靶点组患者接受 L-DLPFC 及 R-OFC 双侧真刺激治疗；而伪刺激组接受双侧伪刺激治疗。最终有 58 名符合条件的患者完成连续 5 天的加速经颅磁治疗及相应测评。三组患者间的年龄、性别及受教育年限的差异均无统计学意义。各组在基线期和 5 天 arTMS 治疗结束后减分率为主要评估指标，运用方差分析比较三组方案治疗的疗效差异，用配对 t 检验分析方法比较三组患者治疗前后脑功能活动变化特点。

结果 基线期各组间 HAMD24 评分差异无统计学意义。经过连续 5 天共 20 次的 arTMS 治疗后，单靶点组的平均 HAMD24 减分率约为 30%，双靶点组患者的平均 HAMD24 减分率约为 42%；伪刺激组的平均 HAMD24 减分率约为 13%。三组间减分率差异具有统计学意义（$p<0.05$）。此外，我们发现左侧颞上回比率低频振幅与 HAMD24 减分率呈显著负相关。

结论 作用于 L-DLPFC 及 R-OFC 的双靶点 arTMS 较单靶点及伪刺激 arTMS 更大地降低抑郁症患者的 HAMD24 评分，即可以更好地改善抑郁症患者的症状，减少患者住院周期。基线期左侧颞上回局部脑活动性增高可能对 arTMS 治疗抑郁症有积极预测作用。

关键字：加速重复经颅磁刺激；双靶点；抑郁症；背外侧前额叶；眶额叶

Multidimensional Voiceprint Feature Assessment System for Identifying The Depression of Child and Adolescent：A Diagnostic Test

罗杰 郑毅*
首都医科大学附属北京安定医院

Objective We design a diagnostic test to evaluate the effectiveness and accuracy of a multidimensional voiceprint feature diagnostic assessment (MVFDA) system versus Hamilton Rating Scale for Depression 24-Item (HAMD-24) for auxiliary diagnosis of child and adolescents with Major depressive disorder (MDD).

Methods This study include 55 children aged 6-16 who are clinically diagnosed as MDD by DSM-5 and analysis of professional doctors, and 55 healthy children (typically developing). Each subject completed speech feature capture and was assessed on the HAMD-24 scale by a trained rater. We calculate the indexes of validity, including sensitivity, specificity, Youden's index, likelihood ratio, and other indexes including predictive value, diagnostic odds ratio, diagnostic accuracy and area under the curve (AUC) to assess the effectiveness of MVFDA system as well as the HAMD-24.

Results The sensitivity (92.73% vs. 76.36%) and the specificity (90.91% vs. 85.45%) of the MVFDA system are significantly higher than the HAMD-24. The AUC of the MVFDA system is also higher than that of the HAMD-24. There is statistically significant difference between groups ($p<0.05$), and both of them have high diagnostic accuracy. In addition, the diagnostic efficacy of the MVFDA system is higher than that of HAMD-24 in terms of the Youden index, diagnostic accuracy, likelihood ratio, diagnostic odds ratio and predictive value.

Conclusion MVFDA has performed well in clinical diagnostic trials for identifying MDD in child and adolescents by capturing objective sound features. Compared with the scale assessment method, the MVFDA system could be further promoted in clinical practice for its advantages of simple operation, objective evaluation, and high diagnostic efficiency.

The P300 Amplitude Predicts Neural Reactivity and Responsiveness To Antidepressants in Adolescents with Depression: An ERP Study

Lin Zhao[1], Dongdong Zhou[2], Li Kuang[1]
1.The First Affiliated Hospital of Chongqing Medical University
2.University-Town Hospital of Chongqing Medical University

Objective Adolescent depression has extremely high rates of recurrence and disability and is significantly associated with suicide risk. No clear neurobiological markers have yet been identified. Antidepressants are widely used to treat depression, and there are also no neurobiological signatures that accurately reflect the effects of antidepressant treatment. Therefore, it is essential to find a reliable neurobiological marker.

Methods One hundred and seven patients with major depressive disorder (MDD group, 30 males, 77 females, mean age: 14.80 years), and 25 healthy subjects (HC group, 13 males, 12 females, mean age: 15.72 years) were recruited to perform a negative emotional stimulation task. All participants completed the Hamilton Depression Scale and a self-administered questionnaire to collect demographic information. We administered medication to 107 adolescents with MDD for 8 weeks; 61 of these patients were followed up. Multichannel EEG was recorded continuously from 64 scalp electrodes using the Curry 8 system. EEG signal preprocessing and analysis was performed offline, using the EEGLAB toolbox in MATLAB. ERP component characteristics associated with emotional processing were extracted from the difference waves and

statistically analyzed.

Results N100 and P300 amplitude was significantly greater in adolescents with depression than in healthy adolescents under neutral and negative emotional cues. P300 amplitude was greater under negative emotional cues than neutral emotional cues in adolescents with depression. The depression scale scores of adolescents with MDD decreased significantly after treatment with sertraline-based antidepressants. The P300 amplitude under neutral and negative emotional cues decreased significantly. Further, there was a strong positive correlation between depression scores in adolescents with MDD before and after treatment and in P300 amplitude under negative emotional cues.

Conclusion Adolescents with depression exhibited an increase in N100 and P300 amplitude than healthy adolescents in the face of negative emotional stimuli; the P300 amplitude in adolescents with depression significantly decreased after antidepressant medication and was positively correlated with improvement in depressive symptoms, suggesting that P300 amplitude may be a potential neurophysiological basis for the development of adolescent depression and response to medication treatment.

Acoustic Analysis of Speech for Screening Self-harm Behaviors During Depressive Episodes in Adolescents with Mood Disorders: Machine Learning Classifiers and Short-term Prediction

任永霞[1] 张然[1] 徐啸[2] 杨景钰[1] 朱荣鑫[1] 张锡哲[1] 王菲[1]
1.南京医科大学附属脑科医院早期干预科
2.南京医科大学生物医学工程与信息学院

Objective This study aimed to explore cross-sectional and longitudinal approaches for assessing self-harm behavior in adolescents with mood disorders（MDs） by utilizing artificial intelligence and analyzing acoustic features.

Methods This study collected self-harm history data and voice recordings from 193 adolescents with mood disorders at baseline. Self-harm behaviors were evaluated 6 months later using patient disclosures and medical history records. Acoustic features, including temporal, spectral, and cepstral characteristics, were extracted from the voice recordings. Using relevant acoustic principal component values, a self-harm behavior classification model was developed for identifying individuals with self-harm behavior through cross-sectional analysis. Additionally, a risk prediction model was created using baseline acoustic principal component values to accurately forecast the occurrence of self-harm behaviors within a short-term period of 6 months.

Results A person-to-person classification model was developed using five correlated acoustic principal components and support vector learning. Additionally, a risk prediction model was established for short-term self-harm behavior occurrence based on the same five acoustic principal components at baseline. The person-to-person classification model achieved an accuracy rate of 71.21% in accurately identifying mood disorder patients with depressive episodes and self-harm behavior. Similarly, the risk prediction model attained an accuracy rate of 67.31% in predicting the occurrence of self-harm behavior within six months of recruitment.

Conclusion Self-harm behavior in adolescent MDs patients during depressive episodes is linked to acoustic features like spectral centroid, spectral roll-off, fundamental frequency envelope, Mel-frequency cepstral coefficients (MFCC), etc. These acoustic features serve as intrinsic characteristics of self-harm behavior in adolescent MDs patients and effectively differentiate between the presence and absence of self-harm behavior. Moreover, they can also predict the short-term risk of self-harm behavior. This study introduces a novel approach for detecting self-harm behavior during depressive episodes in adolescent MDs patients, which can aid in early clinical identification of self-harm behavior.

ADHD 儿童药物响应者和非响应者的静息态脑功能差异：基于认知和行为改善的分析

冯源 刘倩溶 祝雨 高媛 党宸 吴桂森 郭晓杰 罗翔升 刘璐 孙黎*
北京大学第六医院/精神卫生研究所，国家精神心理疾病临床医学研究中心，卫生部精神卫生学重点实验室（北京大学）

目的 药物治疗是注意缺陷多动障碍（Attention Deficit Hyperactivity Disorder, ADHD）的重要的干预手段，然而不同个体对治疗的反应存在差异，表现为不同程度的认知和行为改善。基于症状改善和认知变化的机器学习聚类分析可以客观和系统地区分药物治疗响应者和非响应者。进一步比较不同响应群体的基线期脑功能差异，并探讨其与认知行为改善的关系，对于理解药物治疗相关的神经机制和指导临床用药具有重要意义。

方法 本研究选取 80 名 7~15 岁 ADHD 儿童，经过 4 周的哌甲酯或托莫西汀治疗。利用治疗前后的注意缺陷/多动障碍评定量表、Conners 评定量表以及执行功能评定量表的减分率进行 k-means 聚类分析，区分药物治疗响应者和非响应者，并进一步比较两组在不同维度上的减分率特征。此外通过分析比较两组基线期的低频振幅分数（fractional amplitude of low frequency fluctuations，fALFF）探究局部脑功能差异表现，并提取差异脑区信号值与两组减分率显著差异的认知行为评分进行相关分析。

结果 基于 k-means 聚类的 39 名治疗响应者和 41 名治疗非响应者在年龄、性别和用药类型方面无显著

差异。在治疗改善的行为评估方面，注意缺陷评分（p<0.001）、多动冲动评分（p<0.001）、行为（p<0.001）、学习（p<0.001）和焦虑（p=0.002）方面存在显著差异；在认知评估方面，转换（p=0.020）、情感控制（p<0.001）和工作记忆（p<0.001）方面存在显著差异。与非响应者相比，治疗响应者的右侧中央后回 fALFF 升高，且与行为（r=0.337, p=0.014）、学习（r=0.481, p<0.001）显著相关；与工作记忆（r=0.273 p=0.050）边缘相关。

结论 中央后回脑区局部功能激活增强的 ADHD 儿童可能表现出更好的药物早期反应性，并且与行为和学习方面的改善密切相关。

血清骨钙素与精神疾病的研究进展

唐伟杰[1] 廖婧[2] 傅一笑[3]
1.重庆市第十一人民医院
2.重庆医科大学附属大学城医院
3.重庆医科大学附属第一医院

目的 血清骨钙素（Osteocalcin，OC）是骨代谢的特异性标志物之一，由非增殖期的成骨细胞合成和分泌的，能反映骨转换、骨更新及成骨细胞的功能。骨钙素作为一种内分泌激素，研究发现骨钙素不仅参与骨代谢、糖脂代谢，也可以穿过血脑屏障并在脑干、中脑和海马发挥作用。近年来，已有多项基础实验和临床研究均发现血清 OC 与抑郁、认知功能、焦虑等精神疾病关系密切。因此本研究拟探讨血清骨钙素与精神疾病的相关研究进展。

方法 从中文数据库 CNKI 和英文数据库 PubMed 进行文献检索进行综述。相关检索词为：血清骨钙素/Osteocalcin；精神疾病/Mental illness。

结果 研究表明 OC 在大脑中生成并作为一种神经肽参与紧张感觉刺激的信息传输；OC 可直接作用于大脑诱导神经元中钙离子聚集，激活脑干和蓝斑中神经元的动作电位，同时抑制脑干 γ-氨基丁酸 (gamma-aminobutyric acid, GABA) 中间神经元动作电位频率，进而刺激 5-羟色胺、儿茶酚胺合成的基因表达，抑制 GABA 生物合成相关基因的表达，影响相应神经递质的合成；OC 还可直接阻止海马中神经元凋亡，从而保护与空间学习和记忆相关的认知功能。此外，研究发现骨钙素能够通过 G 蛋白偶联受体 37（GPCR37）调控中枢神经系统少突胶质细胞分化及髓鞘发生，这为骨钙素作为外周潜在靶点治疗中枢髓鞘病变提供了实验依据。既往利用核磁共振成像液体衰减反转恢复 (fluid-attenuated inversion recovery, FLAIR) 技术研究发现低 OC 水平的患者在其尾状核及壳核区有较低的 FLAIR 强度，其研究数据表明 OC 可能通过作用于基底节的微观结构来影响认知功能。

结论 目前关于血清骨钙素与抑郁、认知等精神疾病的研究越来越多，但具体机制仍不清楚，且在儿童青少年人群中鲜有研究，血清骨钙素是否有望成为精神疾病发病的潜在生物标记物，未来还需要更多的相关研究。

Study on Neuroimage Features Related To The Efficacy of High-definition Transcranial Direct Current Stimulation for Adolescents with Mood Disorder During Depressive Episode

张中国[1,2] 段佳[1] 位彦鸽[3] 赵鹏飞[1] 王宁[4] 秦士森[4] 朱荣鑫[1] 张婧[1] 王菲[1]
1.南京脑科医院
2.盐城市第四人民医院
3.新乡医学院第二附属医院
4.新乡医学院

Objective To investigate the efficacy of high-definition transcranial direct current stimulation (HD-tDCS) and its corresponding neuroimage features in adolescents with mood disorders during depressive episodes.

Methods 28 adolescents with mood disorders during depressive episodes were treated with 20 sessions of HD-tDCS targeting the left dorsolateral prefrontal cortex (DLPFC). Hamilton Depression Scale-17 Item (HAMD-17) scores were collected before and after treatment, and resting-state functional magnetic resonance imaging (fMRI) was performed. Patients were divided into effective and ineffective groups based on a ≥50% reduction in HAMD-17 scores. The differences in the amplitude of low-frequency fluctuations (ALFF) before treatment between the two groups were analyzed. A regression prediction model was constructed using significant ALFF values before treatment as independent variables and treatment efficacy as the dependent variable.

Results After treatment, all patients showed a significant reduction in HAMD-17 scores (t=-11.383, P<0.001). ALFF values in the right anterior cingulate gyrus and right rectus femoris were significantly decreased (tpeak=-3.816, P<0.05; tpeak=-4.077, P<0.05). Compared to the ineffective group, the effective group showed a significant increase in ALFF values in the right anterior cingulate gyrus and a significant decrease in ALFF values in the left paracingulate cortex before treatment (tpeak=3.816, P<0.05; tpeak=-4.127, P<0.05). Regression analysis showed that the larger the ALFF value in the right anterior cingulate gyrus before treatment, the more effective the HD-tDCS treatment was.

Conclusion HD-tDCS can be used as an adjunctive therapy for adolescents with mood disorders during depressive episodes. The ALFF value in the right anterior cingulate gyrus before treatment can assist in the early prediction of HD-tDCS treatment efficacy.

关键字：high-definition transcranial direct current stimulation, adolescent mood disorders, functional magnetic resonance imaging, response prediction.

基于脑沟的形态学测量对青少年抑郁症患者的

大脑皮层异常的研究

邓霏[2] 李雪[2] 郁仁强[1] 张小柳[1] 况利[1,2]
1.重庆医科大学附属第一医院
2.重庆医科大学附属大学城医院

目的 目前青少年抑郁症发病和皮质沟深度的特征关系尚不明确。本研究中，我们对未经治疗的青少年抑郁症神经影像的皮质沟深度的这一指标进行研究，了解潜在神经生物学机制，进而为青少年抑郁症的预防和治疗提供更多的影像学证据。

方法 本研究选择首发未服药的单纯抑郁青少年患者（n=66）作为研究对象，设立正常对照（n=40）。方式是通过精神病学定式访谈(M.I.N.I.KID 5.0)，并且由两名主治及以上职称的精神科专科医生确诊的。建立病例报告表，收集被试的一般资料，包括姓名、年龄、受教育程度、躯体健康状况、家族史等资料；使用 17 项汉密尔顿抑郁量表(HAMD-17)量表进行量表评估。磁共振数据采集采用 GE 3T Signa HDxt 扫描仪，配备标准 8 通道头部线圈；使用使用 DPABISurf 进行图像处理，使用 recin -all (FreeSurfer 6.0.1)进行预处理，使用一个 6mm 半高全宽(FWHM)的高斯滤波器对皮层影像进行滤波平滑，使用 DPABISurf 中的统计分析评估 MDD 患者与对照组之间的解剖形态统计学差异。

结果 1.一般资料结果提示：两组之间的性别比、年龄范围、受教育年限无统计学差异。 2.量表结果提示：其中 MDD 组的 HAMD 评分为 19.94+/-5.72 分，平均得分为 19.94，对应于抑郁症状的中度严重程度。3.大脑皮质沟深度的组间比较结果提示：抑郁患者在左侧外侧颞叶皮层区域显示沟深度增加；同时，沟深度增加的团块属于默认网络和边缘网络。 4.皮质脑沟改变与临床评分之间的相关性：该指标的变化和抑郁症状的严重程度没有相关性。 5.皮质沟改变的脑区受试者的 ROC 曲线：对于诊断青少年重度抑郁症，TE2a 的皮质沟深度变化的诊断灵敏度有一定准确性。

结论 本研究发现与正常青少年相比，首发青少年 MDD 的患者的左侧外侧颞叶皮层皮质沟深度增加。

关键字：青少年抑郁症；结构磁共振；左侧外侧颞叶皮层；皮质沟深度

Childhood Trauma Is Linked To Abnormal Static-dynamic Brain Topology in Adolescents with Major Depressive Disorder

李雪梅 周新雨*
重庆医科大学附属第一医院

Objective Childhood trauma is a leading risk factor for adolescents developing major depressive disorder (MDD); however, the underlying neuroimaging mechanisms remain unclear. This study aimed to investigate the association among childhood trauma, MDD and brain dysfunctions by combining static and dynamic brain network models.

Methods We recruited 46 first-episode drug-na?ve adolescent MDD patients with childhood trauma (MDD-CT), 53 MDD patients without childhood trauma (MDD-nCT), and 90 healthy controls (HCs) for resting-state functional magnetic resonance imaging (fMRI) scans; all participants were aged 13-18 years.

Results Compared to the HCs and MDD-nCT groups, the MDD-CT group exhibited significantly higher global and local efficiency in static brain networks and significantly higher temporal correlation coefficients in dynamic brain network models at the whole-brain level, and altered the local efficiency of default mode network (DMN) and temporal correlation coefficients of DMN, salience (SAN), and attention (ATN) networks at the local perspective. Correlation analysis indicated that altered brain network features and clinical symptoms, childhood trauma, and particularly emotional neglect were highly correlated in adolescents with MDD.

Conclusion This study may provide new evidence for the dysconnectivity hypothesis regarding the associations between childhood trauma and MDD in adolescents from the perspectives of both static and dynamic brain topology.

GNB4 基因 DNA 甲基化在青少年抑郁症中的相关研究

廖婧[1] 张晨钰[2] 曾琪[1] 冉柳毅[1] 向娇娇[2] 陶婉卿[1] 刘心怡[1] 况利[2]
1.重庆医科大学附属大学城医院
2.重庆医科大学附属第一医院

目的 青少年抑郁症严重危害生命健康，发病机制不清，缺乏客观生物标记物。DNA 甲基化在抑郁症的发生发展中发挥非常重要的作用，抑郁症可能是环境作用下甲基化水平增高所致，抑制甲基化水平，抑郁症状得到不同程度的缓解。因此 DNA 甲基化可能是抑郁症治疗干预的潜在靶点。既往研究发现 GNB4 基因与抑郁症相关，但具体机制不清。GNB4 基因可调节少突胶质细胞祖细胞分化，但其是否参与青少年抑郁症发生发展尚不清楚。本研究拟探究 GNB4 基因 DNA 甲基化是否参与青少年抑郁症发生发展。

方法 （1）收集 50 例青少年抑郁症患者和 50 例健康对照者的一般信息，使用 HAMD、CDRS- R 量表进行量表评估，采集外周静脉血进行基因 DNA 甲基化测序。（2）构建慢性社交挫败应激(CSDS)青幼期抑郁小鼠模型，通过社会交互实验、糖水糖水偏好实验及悬尾实验评估小鼠抑郁样行为，采集脑组织，检测小鼠脑组织 GNB4 基因 DNA 甲基化水平，qRT-PCR 检测 GNB4 基因表达情况，Western Blot 检测 GNB4 蛋白表达水平。

结果 （1）通过 50 例青少年抑郁症患者与 50 例健康对照组外周血进行 DNA 甲基化测序，结果发现两组研究对象性别、年龄、BMI、吸烟史、饮酒史等无显

著差异（P>0.05），外周血 GNB4 基因 DNA 甲基化水平在青少年抑郁症患者中升高，差异有统计学意义（P<0.05)。(2)通过构建 CSDS 青幼期抑郁小鼠模型，结果发现 CSDS 组小鼠社会交互比、悬尾静止不动时间显著高于对照组（P<0.05），糖水糖水偏好百分比显著低于对照组（P<0.05）；采用 qRT-PCR、WB 检测小鼠海马组织中 GNB4 基因及蛋白的表达水平，结果发现，CSDS 组海马组织中 GNB4 基因及蛋白表达水平较对照组显著下调（P<0.05）。

结论 我们的临床及动物研究一致性表明 GNB4 基因 DNA 甲基化影响其基因表达水平，这提示 GNB4 基因在青少年 MDD 的发病机制中可能发挥重要作用，未来还需要更深入的相关基础实验进行机制探索。

目的 研究舍曲林治疗前后的伴非自杀行自伤的青少年抑郁障碍患者的血清细胞炎症因子白细胞介素（Interleukin, IL）-1β、IL-6、肿瘤坏死因子-α(Tumor necrosis factor-α, TNF-α)水平的变化，探究青少年抑郁障碍患者出现非自杀性自伤的影响因素。

方法 本研究纳入就诊于重庆医科大学附属第一医院的青少年抑郁障碍患者 99 例，所有纳入病例均符合 DSM-5 关于抑郁障碍的诊断标准。根据 DSM-5《非自杀性自伤严重程度评定量表》对非自杀性自伤（non-suicidal self-injury，NSSI）的诊断，将 55 例伴有 NSSI 的青少年重性抑郁障碍患者纳入伴 NSSI 组，44 例不伴 NSSI 行为的青少年重性抑郁障碍患者纳入不伴 NSSI 组。采用血清细胞炎症因子 IL-1β、IL-6、TNF-α 评估炎性指标。纳入患者给与盐酸舍曲林抗抑郁治疗 8 周，初始剂量 25mg/d，第 1 周加量至 100mg/d，根据患者病情变化增加到 150～200 mg/d。以 HAMD-17 减分率 50%或以上来评估治疗有效性。分别在基线和第 8 周测定血清细胞炎症因子 IL-1β、IL-6、TNF-α 水平。使用 SPSS26.0 统计学软件对研究对象的炎症指标进行统计学分析。

结果 1.伴 NSSI 组的 IL-1β、IL-6、TNF-α 均高于不伴 NSSI 组。治疗后，伴 NSSI 组的 IL-1β、IL-6、TNF-α 水平呈下降趋势，差异具有统计学意义（P＜0.05)。与不伴 NSSI 组相比，伴 NSSI 组的 IL-6、TNF-α 水平较低，差异具有明显统计学意义（P＜0.05)。 2.基线期 IL-6 水平是青少年抑郁障碍患者发生 NSSI 的独立风险因素（OR=6.209，95%CI=0.804-0.974，P=0.01

结论 1. 与不伴 NSSI 的抑郁障碍青少年相比，伴有 NSSI 的抑郁障碍青少年的血清 IL-6、TNF-α 显著升高，伴有 NSSI 的青少年抑郁障碍患者存在更强的免疫激活和炎症反应。 2.IL-6 与青少年抑郁障碍患者的 NSSI 相关。 3. TNF-α 可能是预测青少年抑郁障碍患者 NSSI 的治疗应答的潜在生物标志物。

青少年和成人抑郁症状的对比分析

胡冰[1] 况利[1,2]
1.重庆医科大学附属第一医院
2.CSP 综合医院精神心理研究协作组

目的 了解青少年和成人抑郁症状群的差别，以早期发现青少年抑郁症提供可能的依据。

方法 选取 2022 年 7 月-12 月在重庆医科大学附属第一医院精神科门诊就诊的 14-40 岁的抑郁症患者，收集其抑郁自评量表（SDS）和症状自评量表（SCL-90），共计 1640 份，其中男生 456（27.8%）人，女生 1184（72.2%）人，青少年 564（34.4%）人，成年人 1076（65.60%）人

结果 年龄和性别对抑郁程度的影响是显著的（p＜0.001），且性别对抑郁程度的影响在青少年（p＜0.001）身上表现得更加明显。就症状分析而言，青少年整体症状更重、更敏感，尤其青少年在“想到死亡的事情”（p＜0.001）“想结束自己的生命”（p＜0.001）“感到自己没有什么价值”（p＜0.001）等消极观念相关条目、恐怖症状（p＜0.001）、敌对症状（p＜0.001）、人际关系敏感（p＜0.001）以及强迫症状等均与成人表现出显著差异，并且青少年更容易表现出明显的精神症状，如幻听、被控制感等，而关于睡眠、食欲方面，成人则表现的更加明显。

结论 在青少年期性别对抑郁的影响更大，随着年龄的增长，影响逐渐减少；青少年相比较成人表现出来的症状更严重，尤其表现在明显的消极想法、精神症状、人际关系、敌对症状等，我们在针对青少年抑郁的早期筛选中，要重点关注这些方面，并尽早给予干预。

血清胰岛素样生长因子与青少年抑郁症的相关性研究

刘心怡 王我*
重庆医科大学附属大学城医院

目的 本研究旨在探讨血清中胰岛素样生长因子 1（IGF-1），胰岛素样生长因子 2（IGF-2），胰岛素受体底物 1（IRS-1）水平与青少年抑郁症发病及临床特征的关系，探究其作为青少年抑郁症生物标志物的可能性。

方法 本研究共纳入 94 名 12-18 岁的青少年研究对象，包括 47 例青少年抑郁症患者（MDD 组）和 47

名青少年健康对照（HC 组）。收集所有研究对象的社会人口学资料，并在入组时使用汉密尔顿抑郁量表(HAMD-17)、儿童抑郁评定量表修订版(CDRS-R)、抑郁症自我评估量表(PHQ-9)、广泛性焦虑障碍量表(GAD-7)、认知功能缺陷自评问卷(PDQ-D)评估研究对象的抑郁症状、焦虑症状及认知状况。采用酶联免疫吸附（ELISA）测定所有研究对象血清的 IGF-1，IGF-2，IRS-1 水平，比较两组之间的差异，并探究 IGF-1，IGF-2，IRS-1 与青少年抑郁症临床特征的相关性。

结果 青少年抑郁症患者血清 IGF-1、IGF-2 水平显著高于青少年健康对照组（P<0.01），血清 IRS-1 水平在两组间未见显著差异（P>0.05）；青少年抑郁症女性患者血清 IGF-1 水平显著高于青少年抑郁症男性患者（P<0.05）；青少年抑郁症患者血清 IGF-1、IGF-2、IRS-1 水平与抑郁症病程及 HAMD-17、CDRS-R、PHQ-9、GAD-7 得分无显著相关性（P>0.05），IGF-1 与 PDQ-D 总分及 PDQ-D 注意力维度存在显著相关性（P<0.05）；logistic 回归分析显示血清 IGF-1（OR=1.051，P=0.003）、IGF-2（OR=1.029，P=0.014）与青少年抑郁症发病相关。

结论 本研究结果提示与健康对照相比青少年抑郁症患者血清 IGF-1, IGF-2 水平显著增高，IRS-1 水平无明显差异。IGF-1, IGF-2 是青少年抑郁症发病的危险因素。

关键字：青少年抑郁症，胰岛素样生长因子 1，胰岛素样生长因子 2，胰岛素受体底物 1

Based on Population Pharmacokinetics: Guidance for Rational Discontinuance in Chinese Adolescents Taking Long-term Sertraline

张孜 郭徵豪 李晓琳 孔琬 温预关 尚德为* 黄善情
广州医科大学附属脑科医院

Objective Adolescents with psychiatric disorders such as depression and obsessive-compulsive disorder are usually treated with sertraline as a first-line drug. The pharmacokinetics of sertraline in adolescent patients are not well understood. The safe discontinuation of medication after extended use is a common concern, especially for adolescent patients. This study aims to suggest safe ways of discontinuing medication in adolescents, along with appropriate dosage recommendations.

Methods Serum drug concentration data and related information such as age, gender, height, weight, body mass index, and combined medications were retrospectively collected from 140 inpatients. Nonlinear mixed-effects models (NONMEM) and inter-individual and intra-individual variance interactions (FOCE-I) were used for analysis and modeling. The final model predicts several discontinuation regimens for adolescent patients at 50-200 mg doses and the optimal dose to be administered to adolescents at the effective therapeutic concentration range.

Results A first-order absorption and elimination model of single-compartment sertraline based on Chinese patients with psychiatric disorders was developed with an apparent volume of distribution (V/F) and apparent clearance (CL/F) of 803 L and 76.1 L/h, respectively. Covariate screening revealed a significant effect of age on sertraline clearance (P<0.01), with a gradual decrease in clearance with increasing age. Simulation results suggest that for adolescent patients, a 3- or 7-day interval with a 25 mg fixed dose taper is recommended for OD doses of 50 mg and 100 mg, and a 25 mg taper regimen with a 7- or 14-day interval is recommended for OD doses of 150-200 mg. For 100-200 mg BID doses, a stepwise reduction at 7- and 14-day intervals with 25 mg as a fixed dose is recommended. To achieve effective therapeutic concentration, we recommend that the daily dose for adolescents aged 13 to 18 years should start at 100 mg and that BID (50 mg, 50 mg) dosing is preferred at a daily dose of 100 mg.

Conclusion Age was found with modeling as a potential sertraline-affecting factor. This study makes realistic sertraline dose recommendations for adolescents and protocol recommendations for drug discontinuation in adolescent patients using simulation.

The Effects of Non-suicidal Self-injury and Suicidal Ideation on White Matter Tracts of Adolescents with Depressive Disorders

徐飞宇[1] 杨楹[2] 王康程[3]
1.济宁医学院
2.山东省精神卫生中心
3.山东师范大学

Objective Non-suicidal self-injury (NSSI) and suicidal ideation (SI) are risk factors for adolescent suicide. It is necessary to clarify the neurobiological characteristics of changes in brain white matter fiber bundle integrity in adolescent NSSI and SI, in order to provide information for future interventions and the development of brain-based treatment plans.

Methods Clinical evaluations were conducted on 86 adolescent patients with depressive disorder and 77 healthy controls to clarify the history of NSSI and SI. 44 adolescent patients with depressive disorder diagnosed with NSSI were included in the NSSI group, and 40 patients were included in the SI group after evaluation (with 26 patients overlapping between the two groups). All participants underwent cranial magnetic resonance imaging to obtain DTI data. Automated fiber tract quantification was used to compare the differences in 100 equidistant nodes along the 18 fiber tracts among the three groups, and partial correlation analysis was performed between node diffusion parameters and clinical variables.

Results Compared to the healthy control group, the NSSI group exhibited significant changes in diffusion metrics in 38.89% (7/18) of fiber bundles, including the callosum forceps major, callosum forceps minor, right inferior fronto-occipital fasciculus, right inferior longitudinal fasciculus, left inferior longitudinal fasciculus, right thalamic radiation, and right uncinate fasciculus. The SI group

showed significant changes in diffusion metrics in 27.78% (5/18) of fiber bundles, including the callosum forceps major, callosum forceps minor, right inferior fronto-occipital fasciculus, right inferior longitudinal fasciculus, and right thalamic radiation. In the NSSI group, 16.67% (3/18) of fiber bundles showed significant partial correlations with the Ottawa Self-Injury Inventory (OSI) addiction scale (all P<0.05). In the SI group, 33.33% (6/18) of fiber bundles showed significant partial correlations with the Beck Suicidal Ideation (BSI) scale (all P<0.05).

Conclusion Adolescents with depression accompanied by non-suicidal self-injury (NSSI) and suicidal ideation (SI) exhibit widespread abnormal changes in white matter fiber tracts in the brain. Additionally, these abnormalities are associated with higher levels of self-injury addiction and suicidal ideation, respectively.

Assessment of The Causal Relationship between Depression and Traits of Sarcopenia: A Bidirectional Two-sample Mendelian Randomization Study

Jianyu, Tan[1,2], Yiting, Kong[1,2], Ming, Ai[1,2], Su, Hong[1,2], Li, Kuang[1,2]
1.重庆医科大学附属第一医院
2.CSP 综合医院精神心理研究协作组

Objective Growing evidence reveals a significant association between depression and sarcopenia. However, the causal association between them remains elusive. We aimed to investigate the bidirectional relationship between depression and traits of sarcopenia.

Methods We used genetic variants associated with depression (n=2,113,907), grip strength (n=256,523), appendicular lean mass (n=450,243), and walking pace (n=459,915) in bidirectional two-sample Mendelian randomization. The random-effects inverse-variance weighted method was adopted as the primary method.

Results Mendelian randomization results revealed a causal relationship between depression and appendicular lean mass [β (95% confidence interval (CI)) = -0.051 (-0.086?(-0.016)), P=0.004], walking pace [OR (95% CI) = 0.973 (0.955?0.992), P=0.005]. Walking pace also revealed a causal relationship with depression [OR (95% CI) = 0.663 (0.507?0.864), P=0.002] in the reverse analysis. We observed no causal relationships between depression and grip strength. The leave-one-out sensitivity analysis verified our results.

Conclusion This Mendelian randomization analysis verified the bidirectional relationship between depression and sarcopenia. Early diagnosis and prevention of either disease may enhance the management of another.

关键字：Depression, Sarcopenia, Mendelian randomization, Grip strength, Walking pace, Appendicular lean mass.

无抽搐电休克治疗对青少年重度抑郁症患者血清脑源性神经营养因子的影响

杜宁[2] 况利[1]
1.重庆医科大学附属第一医院
2.重庆医科大学附属大学城医院

目的 研究无抽搐电休克治疗(MECT)对青少年抑郁症患者的疗效与血清脑源性神经营养因子(BDNF)变化的相关关系。

方法 将 80 例重度青少年（12-18 岁）抑郁症患者按照入院先后顺序依次编号，采用数字随机表法分组，单号为研究组，双号为对照组。对照组采用舍曲林治疗；研究组采用舍曲林联合无抽搐电休克治疗，均治疗 3 周。用汉密尔顿抑郁量表(HAMD)评定疗效,用酶联免疫吸附法测定患者 M ECT 前后的血清 BDN F 水平。观察治疗 3 周后两组患者不良反应情况，比较治疗前及治疗 2、3 周后两组患者抑郁情况，比较治疗前和治疗 3 周后两组患者认知功能及血清 BDNF。

结果 与治疗前比，治疗 2 周后，两组患者 HAMD 评分呈降低趋势，治疗 2、3 周后实验组均低于对照组（P＜0.05）；与治疗前比，治疗 3 周后两组患者背数记忆评分均升高，实验组患者再认、联想、图片分测验评分均升高，实验组均高于对照组（P＜0.05）；与治疗前比，治疗 3 周后实验组患者血清 BDNF 水平升高，对照组下降，实验组高于对照组（P＜0.05）；两组患者不良反应总发生率差异无统计学意义（P＞0.05）。

结论 无抽搐电休克治疗青少年重症抑郁症可有效调节神经营养因子 BDNF 水平，改善患者抑郁症状，减少认知功能损害，缓解患者抑郁情绪，且安全性良好。但也有影响记忆功能和引起肌肉酸痛等副作用。

中文版青少年情景攻击动态评估量表的效度和信度检验

欧梦喜[1,2] 张四美[1] 王国君[1] 刘铁榜[1,2]
1.深圳市康宁医院/深圳市精神卫生中心
2.安徽医科大学精神卫生与心理科学学院

目的 检验引入的结构化动态风险评估工具青少年情景攻击动态评估量表（Dynamic Appraisal of Situational Aggression-Youth Version，DASA-YV）在中国大陆青少年精神障碍患者中的信度和效度，为我国儿少精神科工作人员提供一种简单、有效的早期动态识别青少年精神障碍患者情境性攻击风险的工具。

方法 经过原作者同意后对DASA-YV进行翻译、回译、文化调试、预实验得到符合汉语习惯的中文版青少年情景攻击动态评估量表。 邀请临床精神科工作的 10 名专家对中文版 DASA-YV 量表的内容效度评定。对参加本研究的护士进行统一培训考核，合格后评估

20 名青少年精神障碍患者，得出评分者信度。 收取 291 例住院的青少年精神障碍患者，每 24h 使用中文版青少年情景攻击动态评估量表对患者评估一次，应用布罗塞特风险评估量表（Broset-Violence Checklist,BVC）进行同时效度评定，采用接下来的 24h 内实际的行为表现检验预测效度，每名患者的评估周期为 14 天。

结果 在内容效度方面，量表水平的内容效度指数（平均 S-CVI）为 0.97，总体上量表水平的内容效度较好。 在预测效度方面，发生攻击组和未发生攻击组得分之间非参数检验结果有统计学差异(Z=-52.260，P＜0.01)。16 小时内的操作者特征曲线(ROC)的曲线下面积(AUC)值为 0.905，当截点为 1 时，量表的灵敏度和特异度分别为 84.70%和 95.50%，表明量表的预测效度较好。布罗塞特风险评估表（BVC）作为校标工具，其总分与中文版 DASA-YV 之间呈正相关。 5 名培训合格的护士对 20 名相同病例进行评估得出的中文版青少年情景攻击动态量表各条目的评分者信度在 0.820-0.921 之间，表明该量表在评估者间具有较好的一致性。同质性信度检验表明 Cronbach α 系数为 0.896，提示该量表评估结果一致性较好。各条目与总分之间的题总相关性 r=0.587-0.808（P<0.01），表明各条目评估的目的性一致。

结论 中文版青少年情景攻击动态评估量表（中文版 DASA-YV）在中国大陆青少年精神障碍人群中具有较好的信度和效度，可修订后应用于精神专科病房。

Correlation between Amplitude of Low Frequency Fluctuation Changes and Cognitive Improvement in Adolescents and Young Adults with Mood Disorder

穆卡代斯·赛达合买提 刘娟 郑俊杰 王菲*
南京脑科医院

Objective Cognitive impairment is a common issue in adolescents and young adults with Mood disorders (MDs), and it often leads to a poor functional prognosis. To better understand the neurobiology of cognitive improvement after psychiatric treatment, we conducted a study using resting-state magnetic resonance imaging (rs-fMRI).

Methods We enrolled a total of 194 patients with MDs, aged between 12 and 25, and assessed them at baseline and after hospitalization treatment. All participants completed clinical and neurocognitive assessments and underwent rs-fMRI at both time points. We utilized the amplitude of low-frequency fluctuation (ALFF) as a measure of neural activity to investigate potential changes.Using paired sample t-test analysis, we compared the differences in ALFF values between the baseline and post-treatment. Additionally, we performed Pearson correlation analysis to examine the relationship between the extracted ALFF values of specific brain regions and the difference in cognitive assessments (after treatment minus baseline).

Results At baseline, we observed negative correlations between RBANS total scale score, total score of speech and attention, and BPRS total scores. This suggests that more severe mental illness is associated with poorer cognitive performance. However, after treatment, we found significant improvements in WCST-cc, WCST-rp, WCST-rpe, WCST-nrpe scores, RBANS attention, immediate and delayed memory, and total scale scores.Furthermore, our analysis revealed decreased ALFF values in the right frontal lobe, left temporal lobe, and limbic lobe, which were positively correlated with cognitive improvement ($r = 0.185$, $P = 0.01$). This suggests that stronger functional activity in the frontal and temporal lobes is associated with better cognitive improvement after treatment in young individuals with MDs.

Conclusion In summary, our findings indicate that cognitive improvement after treatment in individuals with MDs is related to the function of the frontal and temporal lobes. Understanding these neurobiological mechanisms can help inform treatment strategies for cognitive impairment in this population.

关键字：Adolescent; Young Adult; Mood Disorder; Cognitive Improvement; ALFF

当前存在非自杀性自伤行为的青少年正念及自我关怀水平其相关心理特质：一项病例对照研究

刘珮 卢建平*
深圳市精神卫生中心

目的 青少年非自杀性自伤是世界瞩目的精神卫生问题，探讨非自杀性自伤的心理机制有助于为开发相关的干预方法提供思路。本研究的目的在于探索具有非自杀性自伤行为的儿童青少年和健康儿童青少年正念水平，自我关怀水平，经验回避水平，思维反刍水平之间的差异。

方法 对深圳市康宁医院儿少精神科门诊就诊的儿童青少年进行招募，使用渥太华自我伤害量表对当前存在非自杀性自伤行为（最近一个月至少存在一次以上非自杀性自伤行为）进行评估，纳入当前存在非自杀性自伤行为的青少年 115 例。从社区招募和病例相匹配的健康儿童青少年 46 例。使用儿童正念量表，自我关怀量表，接纳及行动问卷及思维反刍问卷对儿童青少年的正念水平，自我关怀水平，经验回避水平以及思维反刍水平进行评估。使用独立样本 t 检验对两组数据进行比较。

结果 相比于健康儿童青少年，最近一年内具有非自杀性自伤行为的青少年正念水平更低（t=9.173,p<0.01），自我关怀水平中的自我友善（t=-5.723,p<0.01），共通人性(t=-5.288,p<0.01)，静观当下(t=-7.07,p<0.01)更低，自我批判(t=7.981, p<0.01)，孤立(t=8.427,p<0.01)，过度认同(t=8.699,p<0.01)得分更高；

相比于健康儿童青少年，具有非自杀性自伤性行为的青少年思维反刍水平更高(t=10.632,p<0.01)，经验性回避水平更高(t=11.997,p<0.01)。

结论 缺乏正念及自我关怀能力，倾向于思维反刍并回避痛苦经验，可能是青少年出现非自杀性自伤行为的重要心理机制。增强青少年自我关怀水平，增加正念觉察水平，减少思维反刍及减少对痛苦经验的回避的相关心理干预手段值得进一步研究。

3.Key Laboratory of Neurogenetics and Channelopathies of Guangdong Province and the Ministry of Education of China, The Second Affiliated Hospital, Guangzhou Medical University, Guangzhou, China.

4.Guangdong Engineering Technology Research Center for Translational Medicine of Mental Disorders, Guangzhou, China

Objective More and more adolescents have been diagnosing major depressive disorder (MDD) with the increasing stress from our life. However, the symptoms of adolescent MDD are not typical as we used to describing in adult MDD. It was also limited in treatments and at higher risk for recurrences. What's more, adolescent MDD often trends to suicide or self-injury. It deeply affects their study and made them lose lots of opportunities to get a better life in the future. So it is important to research the mechanism of adolescent MDD. Although there were increasing studies showing that adolescent MDD were different between healthy adolescent in resting-state functional MRI(rs-fMRI) and structural MRI(s-MRI), they were often studying it from one or two aspects rather than combine sympotems, rs-fMRI and s-MRI together. Moreover, few researchers studied the role of the limbic system in adolescent MDD, which was a key network in the brain and played an important role in producing happiness and reward. This study researched the limbic system changes in adolescent MDD through rs-fMRI and s-MRI and also exposed the relationship between MRI, depression, suicide, and cognitive function.

Methods This study is a sub-study of the project "A Study to evaluate the efficacy and safety of Esketamine combined with oral antidepressants in the treatment of major depressive disorder with suicidal ideation ", which was run in Brain Hospital Affiliated to Guangzhou Medical University. We filtered the data which was collected from Dec 2020 to Oct 2021 in our inclusion and exclusion criteria and finally obtain 47 adolescent MDDs. We also recruited 47 healthy adolescents who match with adolescent MDD in age and sex as control .Comparing two groups in DC, ALFF, fALFF, ReHo, and grey matter volume in the limbic system using DPABI, CAT12, and SPM12. These regions with significant differences between groups were also correlated with cognitive function, depression, suicidal ideation and mediation analysis was also used to expose their relationship **Results** The adolescent MDD is hyperactive in the regions of hippocampus and amygdala, hypoactive in the region of thalamus. The hyperactive hippocampus compemsated the function of working memory. There are bigger volume in right anterior thalamus and hyper negative connectivity within limbic system in adolescent MDD group, which means dysfunction of limbic system. And the left anterior thalamus volume plays a mediative role between depressive systoms and cognitivie function. The thalamus is a key node in depression, and has potential to be an anti-depressive target.

Conclusion There were widely activity imbalance in the limbic system in adolescent MDD which showed more negetive connection than positive, especially in the regions of hippocampus, amygdala and thalamus. The volume of the left amygdala negatively mediates the decline in information processing speed caused by depressive symptoms.

3.Mental Health Institute of Yunnan, The First Affiliated Hospital, Kunming Medical University

4.Yunnan Clinical Research Center for Mental Health

5.Key Library in Public Health and Disease Prevention and Control, Yunnan Provincial Department of Education

Objective The Patient Health Questionnaire (PHQ-9) and the Generalized Anxiety Disorder scale (GAD-7) are valid symptom-based instruments for screening depression and anxiety. However, their suitable cut-offs for Chinese children and adolescents are still controversial. We aim to investigate the optimal cut-offs of PHQ-9 and GAD-7 in Chinese children and adolescents, and to discuss the influencing factors of the cut-offs.

Methods The study subjects were chosen from 3 study sites of the Mental Health Survey for Children and

Adolescents in Yunnan (MHSCAY), a total of 2,237 participants who had been screened positive by self-administered questionnaire and further diagnosed by using the gold standard were included into the final analysis.

Results For Chinese children and adolescents in general, 11 was the optimal cut-off in screening clinical depression and anxiety for both PHQ-9 and GAD-7. For children and adolescents of different age, gender, race, and left-behind status, discordant cut-offs should be used for the two instruments. Self-harm (SH) also showed conspicuous influence on the optimal cut-offs of PHQ-9 and GAD-7, and the combination of SH information can significantly increase screening accuracy of PHQ-9, particularly for some subgroups of children and adolescents.

Conclusion Different optimal cut-offs of PHQ-9 and GAD-7 should be adopted for screening clinical anxiety and depression in Chinese children and adolescents with varied characteristics. SH information can be incorporated when screening clinical depression by using PHQ-9 in Chinese youngsters.

Childhood Maltreatment and Suicidal Ideation in Chinese Children and Adolescents: The Mediating Role of Mindfulness

梁雪萌[1] 常巍[1] 冉海良[1] 方叠[1] 车玉三[1] 王思凡[1] 陈琳[1] 孙浩[1] 卢瑾[2] 肖媛媛[1]
1.昆明医学院
2.昆明医科大学第一附属医院

Objective Childhood maltreatment (CM) has been associated with suicidal ideation (SI) in children and adolescents, yet the mediating role of mindfulness in this association remains unclear. This study sought to test the mediating role of mindfulness in CM-SI association among a large sample of Chinese children and adolescents.

Methods A population-based cross-sectional study of 3455 children and adolescents aged 10-17 years from southwest China Yunnan province was conducted. The survey adopted a comprehensive self-administered questionnaire. The Chinese version of the Childhood Trauma Questionnaire (CTQ), Five Facet Mindfulness Questionnaire (FFMQ), and the Beck Scale for Suicidal Ideation (BSSI) were used to measure CM, mindfulness, and SI, respectively. Univariate and multivariate binary Logistic regression models were used to estimate the crude and adjusted associations between CM, mindfulness and SI (one-week, one-year, lifetime). Pathway analysis was subsequently performed to measure the mediating role of mindfulness in CM-SI association.

Results The findings showed that mindfulness, CM, and the three types of SI were significantly correlated with each other ($p<0.05$). Mindfulness is a significant mediator in CM-SI association, accounted for 7.5%, 11.4%, and 17.6% of the total associations for one-week SI, one-year SI, and lifetime SI, respectively. For the five types of CM, the highest mediation ratio of mindfulness had been found for physical neglect (PN) and one-year SI (34.3%), followed by emotional neglect (EN) and one-year SI (30.2%), sexual abuse (SA) and one-year SI (25.4%).

Conclusion Our study findings highlight the intervention potential of mindfulness in preventing CM associated suicidal risk. Future studies are warranted to corroborate the effectiveness of mindfulness-based intervention for Chinese children and adolescents.

生命早期环境污染物暴露与 ASD 和 ADHD 的风险：流行病学证据的伞状回顾

高煦平 郑翔宇 王宁 杨莉*
北京大学第六医院

目的 生命早期暴露于环境污染物可能与孤独症谱系障碍（autism spectrum disorders，ASD）以及注意力缺陷多动障碍（Attention-deficit/hyperactivity disorder，ADHD）风险的增加有关，但这些关联的证据尚未得到全面评估。 本研究旨在评估已发表的评估生命早期环境污染物暴露与 ASD 和 ADHD 之间关联的流行病学证据的可信度。

方法 在这项伞状回顾中，评估的主要环境污染物暴露包括，空气污染物、有毒元素、有机氯化合物、全氟烷基物质、多溴二苯醚、杀虫剂、邻苯二甲酸盐和双酚 A 等。 使用 AMSTAR 2（A Measurement Tool to Assess Systematic Reviews, Second Edition）对所有纳入的系统回顾质量进行了严格的评估。我们重新分析了每项 meta 分析的汇总估计值、研究间异质性、95%预测区间、发表偏倚、小研究效应和过度显着偏倚。 根据数据的分析结果和研究特征，基于 GRADE 和“Ioannidis”标准，严格评估了各项证据的可信度。

结果 本研究共纳入了 12 项 ASD 的系统综述（55 个 meta 分析结果）和 6 项 ADHD 的系统评价（55 个 meta 分析结果），主要环境暴露包括有毒元素，空气污染物，全氟烷基物质，增塑剂和农药。基于 AMSTAR 2 的质量评估，纳入的系统综述质量较低，12/18 项综述归类于低质量等级。可信度评估的结果表明，III 级证据支持较高的臭氧暴露与 ASD 的风险增加有关（Cohen’s g: 0.036 [95%CI: 0.017-0.055]），IV 级证据支持暴露于重金属（铅，汞，砷等）可能与 ASD 和 ADHD 风险的增加相关，此外还有 IV 级证据支持全氟烷基物质（PFNA）暴露可能与 ADHD 风险的增加相关。研究设计差异较大，异质性较高，样本量小是证据可信度偏低的主要因素。

结论 我们的研究结果提示，环境污染物暴露与 ASD 和 ADHD 风险的关联证据缺乏且证据质量普遍偏低，有部分证据表明环境污染物暴露对 ASD 和 ADHD 的有害效应。 未来需要高质量的研究来确定环境污染物暴露在 ASD 和 ADHD 病因学中的作用，确定是否应优先考虑环境污染物预警和干预来缓解 ASD 和 ADHD。

关键字：注意力缺陷多动障碍；环境污染物；伞状回顾

短视频使用和未成年人心理健康及认知功能的关联：一项横断面研究

陈海滔 洪江月 王静函 闫静怡 刘华清 谭淑平*
北京回龙观医院

目的 随着科技和社会的快速发展，未成年人的心理健康和认知发育越来越受到心理、生理和社会各系统的复杂影响。过度屏幕时间对年轻人的影响已有广泛关注。然而，一种新兴的媒体形式，短视频对未成年人心理健康和认知功能的影响尚未得到全面研究。本研究旨在提供短视频在不同使用水平下与未成年人心理健康和认知功能相关关系的初步证据。

方法 研究使用线上程序在北京、四川、山东等多个省市共纳入 2640 名 6 至 18 岁的学生参与者。参与者的心理健康状况使用“长处与困难问卷”（SDQ）进行评估，认知功能则使用“语音情绪感知测试”（VEPT）、“数字符号转换测试”（DSST）和“威斯康星卡片分类测试”（WCST）进行测量。此外，该程序还收集了参与者过去六个月内短视频和电子游戏的使用情况以及需要在分析中控制的性别、年龄、生长发育、家庭背景、生活环境、学习压力和生活习惯等协变量数据。

结果 组间比较发现相较于过去六个月内未观看过短视频的未成年人（n=761），观看组（n=1879）在情绪症状、行为问题、注意力不足/多动症状和亲社会行为四个心理健康问题得分显著高于未观看组，在悲伤语音情感识别中得分显著低于未观看组。线性回归分析进一步证实了短视频时间（SVT）与更高的心理健康问题，包括情绪症状（β=0.078），行为问题（β=0.038），注意力不足/多动（β=0.078），同伴关系问题（β=0.023）和亲社会行为（β=0.031）以及更差的语音情感识别（惊奇：β=-0.009；愤怒：β=-0.009）的相关性，p 值均小于 0.01。阈值分析发现 SVT 与心理健康问题和语音情绪识别之间存在不同的模式。随着 SVT 的增加，参与者心理健康问题增加，其增长趋势在折点处减缓或停止（折点 k=2.5-18 小时/周）。语音情感感知得分随着 SVT 的增加先增高后下降（K=4-10 小时/周）。

结论 本研究发现短视频时间与儿童和青少年的心理健康和认知功能相关，并表现出不同关联模式：心理健康问题首先随着短视频时长增加，随后趋于稳定；而语音情感识别能力表现出先改善后下降趋势。这种差异可能表明了短视频使用对儿童和青少年心理健康和认知功能不同的影响机制，提示未来关于人类发育模型的研究需要考虑到短视频时长这一因素的影响，并对具体的心理健康和神经认知问题进行专门探讨。

孤独症谱系障碍儿童与母亲的社交联系及变化：基于网络分析的纵向研究

侯艳婷 欧建君* 沈屹东*
中南大学湘雅二医院

目的 本研究旨在探索孤独症谱系障碍（Autism Spectrum Disorder，ASD）儿童和母亲社交特质的中心特征及内部联系，并确定这些中心特征及内部联系是否会随着时间的推移发生变化。

方法 本研究于 2018 年 10 月-2021 年 6 月期间招募 1294 个 ASD 家庭完成基线评估，2022 年 7 月-2022 年 9 月期间 193 个 ASD 家庭完成随访。我们将这 193 个 ASD 家庭纳入分析，基线和随访平均时间间隔为 28.84 个月。通过创建网络模型分别进行横向和纵向网络分析，来探讨不同时期 ASD 儿童和母亲社交特质的中心特征及内部联系。其中，社交特质通过社会性反应量表（SRS-2）测量，包括社交知觉、社交认知、社交沟通、社交动机和孤独症行为方式五种特征。我们研究了(A)哪些特征是社交网络的中心，以及(B)网络结构是否随着年龄的增长而改变。

结果 社交沟通在 ASD 儿童的社交网络中表现出较高的中心性，且随着年龄的增长其中心性不断增加（P＜0.05）；社交认知和社交沟通在 ASD 患者母亲的社交网络中表现出较高的中心性，其中社交认知随着年龄的增长其中心性不断降低（P＜0.05）；ASD 儿童及母亲的单个网络结构随着年龄的增长均保持稳定（网络不变性检验、全局强度不变性检验均 P＞0.05）。将 ASD 儿童和母亲的社交特征同时纳入网络分析，发现 ASD 母亲的社交特质主要通过孤独症行为方式与儿童产生联系，ASD 儿童和母亲社交维度之间的网络关系随着年龄的增长保持总体稳定（网络不变性检验、全局强度不变性检验 P＞0.05）。

结论 随着年龄的增长，ASD 儿童和母亲不同社交维度之间的内部网络关系总体稳定，ASD 儿童的社交特质主要通过孤独症行为方式与母亲产生联系，提示孤独症行为方式可能是一种遗传特质。同时，SRS 可以作为 ASD 可靠稳定的社交评估工具。

Associations Between Traumatic Events and Suicidality in Adolescents: A Large-scale Cross-sectional Study of 260,423 Participants

石心怡[1] 孟雅婧[1] 程博超[2] 龙璐[3] 殷莉[1] 叶安红[4] 易兴建[5] 冉茂盛[1]
1.四川大学华西医院
2.四川大学华西第二医院
3.四川大学华西公共卫生学院
4.西南医科大学附属自贡医院
5.达州元达联合医院

Objective To comprehensively examine the association between early life traumatic events and suicidality among adolescents.

Methods A cross-sectional mental health survey conducted in Deyang, southwestern China in September 2021, involved 260,423 students from upper primary to high school. We assessed 8 traumatic events, calculated cumulative traumatic event types, and identified traumatic patterns using latent class analysis. Suicide risk scores and the presence of suicide ideation, attempts, or plans were evaluated using the Suicide Behavior Questionnaire-Revised (SBQ-R). Linear and Poisson regressions, adjusted for demographic factors, examined the associations, and stratified analysis compared different subgroups.

Results Violence- and abuse-related traumatic events showed robust associations with higher suicidality, with physical abuse demonstrating the strongest association (β: 2.51, 95% CI: 2.48–2.54). SBQ-R scores showed a clear increasing trend with higher cumulative types of traumatic events: one (β: 0.47, 95% CI: 0.44–0.49), two (β: 1.04, 95% CI: 1.01–1.07), three (β: 2.18, 95% CI: 2.15–2.21), and more than three (β: 3.58, 95% CI: 3.55–3.61). Four distinct traumatic patterns emerged: low traumas, high physical abuse, high death/serious injuries of a loved one, and multiple traumas (strongest association with suicide risk score; β: 3.68, 95% CI: 3.64–3.73). These associations were more pronounced in females, urban residents, only children, left-behind children, and those aged 13–15. Conversely, participants from families with intact parental relationships and middle socioeconomic status showed a weaker association.

Conclusion Adolescents exposed to diverse traumatic events, particularly interpersonal violence, face significantly increased suicidality. The cumulative number of traumatic event types demonstrates a clear dose-response relationship, indicating a progressively stronger association with suicidality. Demographic factors and traumatic patterns will be crucial in identifying at-risk youth, enabling early detection and targeted interventions for suicide-related concerns.

Social Support, Psychopathology and Non-suicidal Self-injury: Specific Effect of Threatening Or Deprivation Experiences

龚靖波[2] 石利娟[1]
1.湖南科技大学
2.上海市长宁区精神卫生中心

Objective Non-suicidal self-injury (NSSI) are salient risk behaviors that threaten individual's physical and mental health, and the association of adverse experiences with NSSI has been widely recognized. However, based on the Dimensional Model of Adversity and Psychopathology (DMAP), the negative effects of different dimensions of adverse experiences (threatening experiences vs. deprivation experiences) on NSSI are not congruent. Identifying the specific effects of various adverse experiences on NSSI is of great significance for interventions.

Methods In a sample of Chinese college students (n = 1609), this study utilized latent category analysis (LCA) to identify and classify threatening and deprivation experiences, followed by structural equation modeling (SEM) to examine the effects of threatening and deprivation experiences on the correlations between social support, psychotic-like experiences, internet addiction, and NSSI.

Results Compared to individuals without adverse experiences, individuals with threatening and deprivation experiences both exhibited lower levels of social support and higher degrees of psychotic-like experiences, but only individuals with threatening experiences exhibited higher levels of internet addiction and NSSI. Furthermore, different dimensions of adverse experiences altered the psychopathological pathways by which social support influences NSSI, as manifested by the findings that social support indirectly and negatively affected NSSI by reducing psychotic-like experiences in individuals with threatening experiences only, whereas social support was ineffective to affect NSSI in individuals with deprivation experiences.

Conclusion Our findings highlighted that adverse experiences may not only be the risk factors directly associated with NSSI, but also be the significant factors in shaping developments of NSSI, and different dimensions of adverse experiences should be included as important considerations in the development of NSSI in early adult.

Abnormal Intrinsic Functional Connectivity in The Frontal Striatum Network in Adolescent Depression with and without Psychotic Symptoms

黄新淋[1] 高炬[2] 孙洪言[2] 王永明[3]
1.佳木斯大学
2.苏州市广济医院
3.苏州大学

Objective Adolescent depression with psychotic symptoms is characterized by more severe impairment and a poorer treatment response, along with a higher risk of suicide. Previous studies have demonstrated the involvement of the frontal striatal network (FSN) circuit in various psychiatric disorders such as depression, bipolar disorder and schizophrenia, indicating its crucial role in emotional regulation and cognitive control. However, it remains unclear whether adolescent depression with psychotic symptoms exhibits similar or different coupling with the orbitofrontal-striatal network. Therefore, the aim of this study is to compare adolescent depression, both with and without psychotic symptoms, in order to explore the potential disruptions in connectivity within the FSN and the neural mechanisms associated with psychotic symptoms.

Methods The study included 77 adolescents diagnosed with depression. Based on the presence or absence

of psychotic events such as hallucinations or delusions in their medical history, the participants were divided into two groups: the group with psychotic symptoms (n=33) and the group without psychotic symptoms (n=44). The Brief Psychiatric Rating Scale (BPRS) was used to assess the severity of psychotic symptoms, and the Patient Health Questionnaire-9 (PHQ-9) was used to assess the severity of depressive symptoms. Functional magnetic resonance imaging (fMRI) data were collected from each participant. Independent component analysis was then performed using the GIFT software to obtain the functional connectivity networks. The voxel-wise distribution of the FSN predominantly encompasses the frontal lobe and bilateral striatum regions, including the superior frontal gyrus, middle frontal gyrus, inferior frontal gyrus, anterior cingulate, frontal orbital cortex, caudate nucleus, putamen, and globus pallidus. Finally, two-sample t-tests were conducted to compare the two groups of participants.

Results There was no significant difference in sex, age, education years, disease duration, and PHQ-9 scores between the two subgroups. A significant difference in the BPRS total score was found ($P < 0.001$). The one-sample t-test revealed a typical spatial pattern in the FSN in each group, including superior frontal gyrus, middle frontal gyrus, inferior frontal gyrus, anterior cingulate, frontal orbital cortex, caudate nucleus, putamen, and globus pallidus. The adolescent depression with psychotic symptoms demonstrated decreased FSN connectivity in the bilateral caudate and bilateral putamen compared with the adolescent depression without psychotic symptoms (corrected at the cluster level using family-wise error, $P < 0.05$). Additionally, a negative correlation was observed between the left caudate, left putamen and BPRS scores ($r = -0.385$, $P = 0.030$) in adolescent depression with psychotic symptoms group.

Conclusion We found specific alterations in the striatum and temporal lobe in adolescent depression with psychotic symptoms.

Comparison of The Clancy Autism Behavior Scale (CABS) and Autism Behavior Checklist (ABC) for Autism

兰琨熠 刘佳佳*
北京大学护理学院

Objective Autism spectrum disorder (ASD) is a group of neurodevelopmental disorders characterized by impairments in social interaction and repetitive and stereotyped behaviors. To make early detection of individuals with ASD, caregiver-reported instruments remain an efficient and adaptable option for the preliminary assessment. This study compared the psychometric properties of the Clancy Autism Behavior Scale (CABS) and Autism Behavior Checklist (ABC) as screening tools for ASD by caregivers.

Methods A total of 154 pairs of outpatients and their parents, who sought medical attention for suspected autism at Peking University Sixth Hospital, were enrolled in the study. The CABS and ABC assessments were completed by the parents to evaluate their children's ASD symptoms, which were then compared with clinical diagnoses. Receiver operating characteristics (ROC) curves were generated for both instruments. The sensitivity, specificity, positive predictive value (PPV), negative predictive value (NPV), positive likelihood ratio (+LR), negative likelihood ratio (-LR), Youden index, and area under the ROC curve (AUC) of the CABS and ABC were calculated and compared using recommended cut-off values from initial papers. The optimal cut-off values for CABS and ABC were determined according to the maximum Youden index.

Results The ABC outperformed the CABS, in terms of sensitivity, PPV, NPV, +LR, -LR, AUC and Youden index for ASD screening. Specifically, the ABC demonstrated higher sensitivity than the CABS (79.310% vs. 44.828%) in identifying children with ASD, while the CABS exhibited superior specificity compared to the ABC (70.833% vs. 53.125%). According to the maximum Youden index, the optimal cut-off value was determined to be 13 for CABS and 62 for ABC.

Conclusion Both instruments demonstrate acceptable psychometric properties in assessing ASD. However, the ABC exhibits higher sensitivity and overall performance in screening individuals with ASD compared to the CABS. The ABC is more suitable as a screening tool for caregivers in both domestic and clinical settings, while the CABS may be utilized when evaluation time or medical resources are limited due to its shorter completion time and fewer items.

倒退型孤独症谱系障碍的临床特征和危险因素研究

韩路 关陆阳 柯晓燕*
南京脑科医院

目的 倒退型孤独症谱系障碍（ASD-R）是指儿童从出生后至生命早期经历一段正常发育阶段，后又出现已获得的语言、社交或运动等技能的倒退，继而发展成完整的 ASD 临床表现的独特 ASD 亚型。本研究探讨了 ASD-R 儿童临床特征及相关危险因素，旨在为 ASD-R 的早期诊断、个体化干预和致病机制研究提供临床线索。

方法 对 ASD-R、非倒退型孤独症（ASD-NR）和正常发育（TD）儿童进行病例对照研究。本研究最终纳入 128 名 ASD 儿童和 58 名 TD 儿童。使用自编一般情况调查表采集儿童及父母的一般情况及相关信息。采用孤独症诊断观察量表（ADOS）对儿童孤独症进行诊断。使用《倒退情况补充核查表》将 ASD 儿童分为ASD-R 儿童（50名）和ASD-NR儿童（70 名）。采用孤独症行为评定量表（ABC）评估 ASD 儿童的临床症状严重程度。采用格里菲斯发育量表中国版

（GDS-C）对儿童发育商进行评估。同时，采用《倒退情况补充核查表》评估 ASD-R 儿童的倒退特征和倒退相关危险因素。对比分析三组被试的一般情况、孤独症症状、发育商和倒退相关危险因素。采用单因素方差分析、卡方检验和 Kru- skal-Wallis H 检验等对三组儿童孤独症症状、发育商、倒退相关危险因素进行差异分析，并将结果中具有统计学差异（p＜0.05）的危险因素纳入 Logistic 回归模型，以进一步探讨与 ASD-R 儿童倒退发生相关的危险因素。

结果 本研究中，ASD-R 组倒退发生的平均年龄为 24.00（20.00-26.50）个月，其中语言技能出现倒退占比最多（39.66%）。与 ASD-NR 组相比，ASD-R 组儿童父母生育年龄和教育程度偏低。ASD-R 组儿童 ADOS 和 ABC 得分显著增加；ASD-R 组儿童 GDS-C 六个维度发育商评分降低，其中语言发育商差异有统计学差异（p＜0.05）。Logistic 回归分析显示：母亲生育年龄和受教育程度、儿童 GDS-C 语言项、发热和腹泻是 ASD-R 发生的危险因素，均有统计学意义（OR=0.725，0.165，0.970，4.011，6.324，均 p＜0.05）。

结论 本研究提示与 ASD-NR 组相比，ASD-R 儿童的核心症状更为严重。语言退化成为 ASD-R 的主要模式。母亲生育年龄、母亲受教育程度、GDS-C 语言项、发热和腹泻被确定为 ASD-R 的危险因素。

维生素 D 对 VPA 大鼠孤独症样行为的预防作用

杜琳* 贾飞勇 董涵宇
吉林大学第一临床医院

目的 维生素 D 除了具有经典的钙、磷调节功能外，还在神经元分化和成熟、神经保护和神经保护中发挥着重要作用。流行病学调查已经探讨了母体维生素 D 浓度与后代 ASD 风险之间的关系，但结果不一致。本研究拟于观察雌鼠孕前、孕期补充维生素 D 经 VPA 造模后对仔鼠孤独症样行为的预防作用。

方法 正常对照组雌鼠所生雄性仔鼠分为正常对照组（N=20）；合笼前 5 天雌鼠肌注维生素 D 3，造模后所生雄性仔鼠为维生素 D 预防 1 组（VDP1 组，N=20）；受孕后第五天肌注维生素 D 3，造模后所生雄性仔鼠为维生素 D 预防 2 组（VDP2 组，N=20）；受孕后第 12.5 天腹腔注射 VPA 同时肌注维生素 D 3，所生雄性仔鼠为维生素 D 预防 3 组（VDP3 组，N=20）；孤独症模型组雌鼠所生雄性仔鼠分为孤独症组（ASD 组，N=20）。比较各组大鼠的重复理毛时间、三箱实验数据。

结果 1.重复理毛时间：PN32、42 天，ASD 组大鼠重复理毛时间明显长于对照组（P＜0.05），VDP1 组、VDP2 组、VDP3 组大鼠重复理毛时间均明显短于 ASD 组（P＜0.05），VDP2 组大鼠重复理毛时间明显长于 VDP1 组（P＜0.05）。2.三箱实验：PN42 天，对照组、VDP1 组、VDP2 组、VDP3 组大鼠陌生鼠箱停留时间明显久于空白箱（P＜0.05），ASD 组大鼠陌生鼠箱、空白箱停留时间无明显差别（P＞0.05）；ASD 组大鼠陌生鼠箱停留时间明显短于对照组（P＜0.05），空白箱停留时间明显久于对照组（P＜0.05）；VDP1 组、VDP2 组、VDP3 组大鼠陌生鼠箱停留时间明显久于 ASD 组，VDP1 组大鼠空白箱停留时间均明显短于 ASD 组（P＜0.05）。

结论 雌鼠造模前及造模当天补充维生素 D3 可减少 VPA 大鼠重复行为、增加社会交往，对 VPA 大鼠出现孤独症样行为有预防作用，于受孕前补充维生素 D 可能最佳。

关键字：ASD；维生素 D；预防；行为；大鼠

Association of Emotion Regulation with Depressive Symptoms in Adolescent Girls: The Mediating and Moderating Roles of Self-esteem and Peer Rejection

韦雨欢[1,2] 刘中一[2,3] 李丛冉[2] 安序菊[2] 张巍献[2] 杨楹[1,2,3] 孔令华[4]
1.济宁医学院精神卫生学院
2.山东省精神卫生中心
3.山东大学齐鲁医学院
4.山东大学康复与护理学院

Objective Existing research proposed that emotion regulation may have an indirect effect on the elevated prevalence of depression. The aim of this cross-sectional study was to investigate whether self-esteem mediates the association between emotion regulation and depressive symptoms and whether social peer rejection serves a moderating role during the post-COVID-19 pandemic.

Methods This study was conducted among 326 adolescent girls with depressive disorders, and the data were collected at Shandong Mental Health Center from January to November 2022. Participants filled out self-report questionnaires, including the Emotion Regulation Questionnaire, Rosenberg Self-esteem Scale, Social Peer Rejection, and Children's Depression Inventory. The statistical model was tested by using bootstrapping with resampling strategies, and the Johnson-Neyman technique was used to visualize the moderating effect of peer rejection.

Results The participants had a mean age of 15.26 (SD=1.92) and scored high on the Children's Depression Inventory (M=27.60, SD=11.00). Depression was negatively correlated with cognitive reappraisal (r=-0.480, p<0.01) and positively correlated with expressive suppression (r=0.270, p<0.01). Self-esteem partially mediated the relationship between cognitive reappraisal and depressive symptoms (β=-0.395, 95%CI [-0.475, -0.310], p<0.001); as well as fully mediated the association between expressive suppression and depressive symptoms (β=0.255, 95%CI [0.161, 0.345], p<0.001). Insults in peer rejection showed a significant moderating effect (index of moderated mediation=-0.115, 95%CI [-0.205, -0.028], p=0.013).

Conclusion Our research identified the negative influence of reappraisal on depression as well as the positive

effect of suppression on depression, highlighting the mediating role of self-esteem. Of significance, we also found the moderation effect of peer rejection in the development of self-esteem. These findings provide theoretical and practical implications for intervention and treatment of depression.

关键字：Depressive symptoms, Emotion regulation, Self-esteem, Peer rejection, Adolescent girls

网络化认知行为疗法对青少年抑郁症状干预效果的 Meta 分析和系统评价

刘沛 黄颐*
四川大学华西医院

目的 本研究评估网络化认知行为疗法（iCBT）或心理健康教育对青少年抑郁症状的干预效果，并探索 iCBT 对青少年抑郁症状干预效果的影响因素。

方法 在中英文数据库中检索截止日期至2023年4月14日，有关网络化认知行为疗法干预青少年抑郁症状的 RCT 研究报告，纳入文献的研究对象为平均年龄13～17岁存在抑郁症状或具有轻中度抑郁症诊断的青少年，对照组多以心理健康教育为主，主要结局指标为抑郁症状和焦虑症状的严重程度。对纳入 meta 分析的文献进行质量偏倚风险评价，提取文献中有关受试对象、干预内容、统计学方法等特征，提取抑郁症状和焦虑症状的测量数据并采用均数差或标准化均数差计算干预措施的效应，针对异质性进行敏感性分析和亚组分析。

结果 文献检索的初步结果为 769 篇，通过排除重复文献、非随机对照试验、研究对象和方法不符合本系统评价纳入标准、无法提取想要数据的文献，最终纳入 10 篇文献进行 meta 分析，总体试验组 489 例，对照组 486 例。对于平均年龄 13～17 岁存在抑郁症状或具有轻中度抑郁症诊断的青少年，iCBT 组和对照组干预前后抑郁症状量表分数改变量的标准化均数差（SMD）较小而具有统计学意义，SMD = -0.36，95%CI（-0.57，-0.15），$p < 0.001$；试验组干预后 3 月以内的抑郁症状持续减轻，干预后 6 月以内、6 月以上的抑郁症状严重程度维持不变。iCBT 组和对照组干预前后焦虑症状量表分数改变量的 SMD 较小而具有统计学意义，SMD = -0.33，95%CI（-0.51，-0.15），$p < 0.001$；试验组干预后 3 月以内、6 月以内的焦虑症状持续减轻，干预后 6 月以上的焦虑症状严重程度维持不变。亚组分析结果发现，iCBT 干预内容特征、受试者来源是 iCBT 对青少年抑郁症状干预效果的影响因素。纳入的研究质量评价结果均为“中偏倚风险”或“高偏倚风险”。

结论 网络化认知行为疗法（iCBT）可有效缓解青少年的抑郁症状和焦虑症状，且具有一定的长期效果。iCBT 干预特征和受试者来源是 iCBT 改善青少年抑郁症状的影响因素，持续时间在 8 周以上、治疗师介入程度高、由家长参与部分模块以及临床环境样本的干预效果更佳。

Neural Progenitor Cells Derived From Autism Spectrum Disorder Patients Are More Susceptible To Ferroptosis

高书敏[1] 林清秀[2] 陆林[1] 时杰[1] 刘佳佳[2] 魏雅槟[1]
1.北京大学中国药物依赖性研究所
2.北京大学护理学院

Objective The etiology of autism spectrum disorder (ASD) is complex, including genetic, and environmental factors. Oxidative stress and antioxidants can participate in pathobiochemical mechanisms of autism. Ferroptosis, an iron-dependent cell death triggered by iron-mediated lipid peroxidation and oxidative stress, has been observed in many neurodegenerative diseases. However, it remains unclear whether ferroptosis is related to ASD.

Methods Here, we examined if ferroptosis could be detected in neural progenitor cells (NPCs) derived from induced pluripotent stem cells. We used CCK8 assays to demonstrate that RSL3, an ferroptosis inducer, can reduce NPCs cell viability. Fe2+ and mitochondrial ROS levels were confirmed using fluorescence microscopy. JC-1 was used to measure mitochondrial membrane potential were estimated by flow cytometry. qPCR and western blot were used to evaluate the expression of ferroptosis related genes and proteins.

Results We successfully induced NPCs from ASD patients, and the purity is basically the same.

Conclusion We hope these findings indicate that ferroptosis contributes to autism spectrum disorder progression and management of ferroptosis may be a novel strategy for ASD treatment.

关键字：autism spectrum disorder; ferroptosis; neural progenitor cells; ROS

抑郁大鼠电休克后认知功能变化及影响的现状以及相关研究综述

王余娜[1,2] 况利[1,2]
1.重庆医科大学附属第一医院
2.CSP 综合医院精神心理研究协作组

目的 探讨抑郁大鼠电休克后认知功能损害的机制和改善因素，为抑郁症患者尤其青少年抑郁症患者今后在电休克治疗认知功能受损提供基础研究理论和更好的保护其认知功能。

方法 通过知网，PubMed 等数据库检索了抑郁大鼠电休克后认知功能改变和干扰因素相关研究，已有研究提示电休克会引起大鼠认知功能损伤，这一损伤与过度激活的 N-甲基-D-天冬氨酸受体和长时程增强的受损有关。这些文章主要选用抑郁模型大鼠，分出对

照组，以及接受行为学实验评估抑郁行为和学习记忆能力后随机分为抑郁组、单纯电休克组或无抽搐电休克组进行干预。干预结束完毕行 Morris 水迷宫实验评估大鼠空间学习记忆能力；ELISA 法检测海马 GABA 浓度；免疫组化法和 Western-blot 检测海马 GABAARα5 的蛋白表达。

结果 电休克处理后的大鼠糖水偏好百分比上升，说明电休克具有抗抑郁效应。水迷宫实验结果提示，电休克组逃避潜伏期最长，空间探索时间最短。部分研究发现，相较于正常对照大鼠，抑郁模型大鼠海马 GABA 和 α5-GABAAR 低表达，空间学习记忆能力下降；电休克显著提高了抑郁大鼠 GABA 和α5-GABAARα5 的表达，改善大鼠抑郁状态，却引起学习记忆损伤；丙泊酚上调电休克抑郁大鼠海马 α5-GABAAR，保护大鼠学习记忆功能。

结论 抑郁大鼠电休克治疗后认知功能损害与电休克激活海马区自噬增加突触素表达有关，丙泊酚在电休克过程中具有脑保护作用，其机制可能与上调海马 GABA 能神经系统相关递质和受体的表达有关，目前实验进展提示可能是通过上调大鼠海马 α5-GABAAR 的表达，保护电休克后的学习记忆损伤。越来越多的证据表明，GABAergic 神经系统可调控 N-甲基-D-天冬氨酸受体介导的谷氨酸能神经系统活性。然而，在抑郁大鼠电休克模型中，GABAergic 系统是如何影响长时程增强的尚不清楚。考虑可以利用 siRNA 干扰技术调控 GABAAR 的表达，进一步研究丙泊酚通过激动 GABAAR 对认知功能的作用。随着青少年抑郁症发病年龄低龄化，考虑用青年期大鼠设计实验，研究其认知功能受损程度。

辩证行为疗法技能训练在青少年中开展现状及治疗效果的相关研究综述

黄众[1,3] 况利[2,3]
1.重庆医科大学附属大学城医院
2.重庆医科大学附属第一医院
3.CSP 综合医院精神心理研究协作组

目的 了解辨证行为疗法技能训练模块（DBT-ST）在青少年中开展的发展现状及治疗效果，为日后在国内精神科对青少年开展 DBT-ST 治疗提供启发并予以建议。

方法 通过 PubMed, Web of Science, PsycINFO、知网检索文献，采用年份过滤范围，2018~2023 年。另设置过滤条件“年龄 0~18 岁”。没有对研究方法进行限制，因为相关的研究较少。使用的关键词是“辩证行为疗法”、“技能训练”、“青少年”和“儿童”。这些文章研究了 DBT-ST 治疗前后，患者行为和各量表得分的变化、DBT-ST 与标准 DBT 的治疗完成率对比、青少年在 DBT-ST 后的主观体验等。

结果 研究结果显示，对青少年只提供 DBT-ST 是可行的，哪怕在不进行个体治疗的情况下也是。完成 DBT-ST 的青少年对该培训有积极评价，它能改变青少年内在的心理变化，如改善反思活动。并且 DBT-ST 对健康人群也有效。单独使用 DBT-ST 的情绪调节模块可以减少高中生的心理健康症状，其对低收入学校教师来说是可以接受和可行的，但需要考虑内容是否适合不同情况的学生、训练实施的便利性，以及支持教师在课堂外使用技能等。单独使用 DBT-ST 的情绪调节模块可能对完成干预的青少年产生积极影响，尤其是抑郁、焦虑、社会压力方面。进一步改进该技能训练的内容、结构和执行，可能使青少年更易接受。综上，DBT-ST 作为结构化的心理干预措施，对改善青少年的心理健康和促进心理社会功能恢复具有促进作用。它可以在缺乏资源来进行个体治疗的情况下就取得较好效果，也可以同时对较多人群进行干预。单独使用 DBT-ST 中的一部分也是可行的，能有效减少高中生的心理健康症状。尽管如此，DBT-ST 的实施仍面临一定挑战，需要根据实施对象的具体情况进行相应改进，才能使之更易被青少年接受。

结论 DBT-ST 为青少年精神科患者和有情绪问题的青少年提供了一种心理干预的手段，可在缺乏足够资源的条件下进行，也可同时干预大量患者。它帮助受训者改善情绪、减轻症状、恢复心理社会功能，从而帮助受训者更好适应社会生活。但目前 DBT-ST 的大多数研究均在西方社会背景下展开，国内相关研究较少，对于其在中国医疗体制下的疗效如何，需要进一步的临床研究加以判断。

Effect of Dynamic Functional Brain Connectivity Patterns in Moderating Early Antidepressant Treatment Response in Drug-naive, First-episode Adolescent MDD

Maojia Ran Hang Zhang Meijiang Jin Yuanmei Tao Shoukang Zou Hanmei Xu Li Yin*
Department of Psychiatry, West China Hospital of Sichuan University, Chengdu, China

Objective Major depressive disorder (MDD) is a highly prevalent mental disorder and is associated with aberrant dynamic functional connectivity (dyn-FC) of brain networks supporting emotion and cognitive processing. The aim of this study was to determine whether intrinsic patterns of whole-brain dynamic functional connectivity before and after 6 weeks of antidepressant treatment in adolescent MDD patients influence early antidepressant treatment response.

Methods All participants, aged 12 to 18 years, including 35 drug-na?ve, first-episode adolescents with major depressive disorder and 24 healthy controls completed a resting-state functional magnetic resonance imaging scan (rs-fMRI) at baseline. Subsequently, 35 MDD patients were treated with antidepressants (agomelatine, sertraline,

escitalopram, or venlafaxine) for 6 weeks and completed another rs-fMRI at the end of treatment. Dynamic independent component analysis (dyn-ICA) was utilized to compare dyn-FC and screen out networks with difference between groups. Binary logistic regression model was used to identify dyn-FC patterns between brain networks that influence early treatment response.

Results Early antidepressant treatment response was significantly moderated by several between-network dynamic functional connectivity patterns. In general, dynamic functional connectivity patterns between frontoparietal network and salience network at baseline were found to moderate in early treatment response. As did dynamic FC patterns between visual network and dorsal attention network at post-treatment.

Conclusion This study identified dynamic functional connectivity patterns between-networks play an important role in the antidepressant medication of adolescent MDD.

关键字：adolescent MDD, dynamic functional connectivity, salience network, visual network, dorsal attention network, antidepressant treatment response.

基于辩证行为治疗的痛苦承受与正念技能训练对青少年抑郁症患者非自杀性自伤行为干预效果研究

朱萍 孔凡贞 季彩芳 吉封 吴菊 王盛岚 穆桂如 朱峰* 陆心传
苏州市广济医院

目的 探讨基于辩证行为治疗的痛苦承受与正念技能训练对青少年 抑郁症患者非自杀性自伤（NSSI）行为的干预效果。

方法 选取我院 2021 年 7 月-2022 年 7 月在儿少精神科住院的伴有 NSSI 行为的青少年抑郁症患者 120 名为研究对象。按入院顺序编号，奇数者为对照组，偶数者为干预组，每组各 60 例。对照组患者接受为期 4 周的常规青少年抑郁症疾病护理，干预组在对照组的基础上开展痛苦承受与正念技术训练。两组均在入组时填写一般资料问卷，并于入组时、入组后第 2 周、第 4 周、出院后第 3 个月，第 6 个月接受 HAMD-17、HAMA、GSES、青少年学生生活满意度量表评定，并比较两组患者住院期间 NSSI 行为发生率。

结果 1、组间干预组患者住院期间 NSSI 行为发生率较对照组低，差异有统计学意义（16.28%vs48.26%，$\chi2$=10.634，P<0.01)。两组患者 HAMD-17、HAMA、GSES、青少年学生生活满意度量表评分比较第 2 周差异均无统计学意义（P>0.05)；第 4 周、出院后 3 个月、6 个月干预组较对照组改善，差异均有统计学意义（P<0.01)。2、组内对照组 HAMD-17、HAMA、GSES、青少年学生生活满意度量表评分与入院时比较第 2 周、第 4 周、出院后 6 个月差异均无统计学意义（P>0.05)，出院后 3 个月差异有统计学意义（P<0.01)。干预组 HAMD-17、HAMA、GSES、青少年学生生活满意度量表评分与入院时比较，第 2 周差异均无统计学意义（P>0.05)，第 4 周、出院后 3 个月、6 个月均差异均有统计学意义（P<0.01)。

结论 基于辩证行为治疗的痛苦承受与正念技能训练有助于降低青少年抑郁症患者 NSSI 行为发生率，减轻抑郁程度，增强自我效能，提高生活满意度。

关键字：痛苦承受技能；正念技能；青少年抑郁症；非自杀性自伤行为

功能失调性态度对青少年抑郁障碍的影响及自动思维的中介作用

侯雅婷[1,3] 江李梅[2] 那龙[3]
1.山西医科大学精神卫生学院
2.山西医科大学人文社会科学学院
3.太原市精神病医院

目的 探讨发作期青少年抑郁障碍患者功能失调性态度和自动思维的差异，以及功能失调性态度对抑郁的影响和自动思维的中介作用，为其心理干预提供参考。

方法 纳入 148 例符合《国际疾病分类（第 10 版）》（ICD-10）情感障碍诊断标准的发作期抑郁障碍的青少年患者（年龄 13～18 周岁），且抑郁自评量表（SDS）标准分≥53 分作为研究对象。采用功能失调性态度问卷（DAS）、自动思维问卷（ATQ）、抑郁自评量表（SDS）及自编基本资料调查表进行评定。采用独立样本 t 检验比较不同人口学资料在 DAS、ATQ 及 SDS 的差异，使用 Pearson 相关分析 DAS、ATQ 与 SDS 间的关系。最后，采用 AMOS 构建中介模型以阐释功能失调性态度通过自动思维进而影响抑郁症状的机制。

结果 （1）对比分析：女性组 DAS 总评分、ATQ 总评分、SDS 总评分、吸引和排斥因子分、完美化因子分、寻求赞许因子分、自主性态度因子分、认知哲学因子分均高于男性组，差异有统计学显著性（P＜0.05)；初中生组 DAS 总评分、ATQ 总评分、SDS 总评分、吸引和排斥因子分、寻求赞许因子分、依赖性因子分、认知哲学因子均高于高中生组，差异有统计学显著性(P＜0.05)；是否独生、父母婚姻状况及户口类型在各量表评分差异均无统计学显著性；（2）相关性分析：抑郁障碍青少年 DAS 评分与抑郁症状呈正相关（r=0.673，P＜0.01)，与 ATQ 自动思维评分呈正相关（r=0.744，P＜0.01)；抑郁症状与 ATQ 自动思维评分呈正相关（r=0.632，P＜0.01)；（3）中介效应的 Bootstrap 结果：功能失调性态度对抑郁症状有显著正向预测作用（β=0.480，Boot SE=0.110，95%CI：0.699～0.841)；自动思维在功能失调性态度与抑郁症状间起部分中介作用（β=0.243，Boot SE=0.089，95%CI：0.073～0.422)。

结论 （1）女性和受教育年限短的青少年抑郁障碍患者，往往功能失调性态度、负性自动思维和抑郁症状更严重；（2）功能失调性态度对青少年抑郁障碍患者抑郁症状有直接预测作用，负性自动思维在功能失调性态度与抑郁症状间起部分中间作用，这为青少年抑

郁障碍患者心理干预起参考作用。

The Associations of Brain-derived Neurotrophic Factor (BDNF) Levels with Psychopathology and Lipid Metabolism Parameters in Adolescents with Major Depressive Disorder

刘乐伟[1,2,3] 田英汉[1,2,3] 杨铖[1,2,3] 夏磊[1,3] 刘寰忠[1,2,3]
1.安徽医科大学附属巢湖医院
2.安徽医科大学精神卫生与心理科学学院
3.安徽省精神医学中心

Objective Brain-derived neurotrophic factor (BDNF) plays a critical role in growth, differentiation, maintenance and synaptic plasticity of neuronal systems, and is thought to be closely associated with major depressive disorder (MDD). This study aimed to compare BDNF levels between adolescents with MDD and healthy controls (HCs), and to investigate the associations of BDNF levels with psychopathology symptoms and lipid metabolism parameters in patients as well as gender differences in the above associations.

Methods A total of 141 adolescents with MDD and 90 HCs were included in this study, and BDNF levels and lipid metabolism parameters were measured. The Center for Epidemiological Studies Depression Scale (CES-D), the Insomnia Severity Index Scale (ISI), the Epworth Sleepiness Scale (ESS) and the Positive and Negative Suicidal Ideation Scale (PANSI) were used to assess patients' depressive symptoms, insomnia, excessive daytime sleepiness and suicidal ideation, respectively.

Results Compared to HCs, adolescents with MDD had significantly lower BDNF levels ($p<0.001$). In patients, the results of Pearson's correlation analyses showed that age, BMI, total cholesterol (TC), high-density lipoprotein cholesterol (HDL-C) and low-density lipoprotein cholesterol (LDL-C) were positively correlated with BDNF levels (all $p<0.05$). The total scores of CES-D and ISI were negatively correlated with BDNF levels (all $p<0.05$). In multivariate linear regression analyses, BDNF levels were positively associated with age (beta=0.160, t=1.997, p=0.048) and TC levels (beta=0.247, t=3.101, p=0.002), but negatively associated with the total scores of ESS (beta=-0.179, t=-2.270, p=0.025) and ISI (beta=-0.236, t=-3.026, p=0.003). Furthermore, the associations between BDNF levels and psychopathology were observed only in females and not in males.

Conclusion BDNF levels are significantly reduced in adolescents with MDD. Patients with low BDNF levels have more severe psychopathology and develop changes in lipid metabolism parameters, especially in female patients.

关键字：BDNF; major depressive disorder; psychopathology; lipid metabolism; adolescents.

Associations between Insomnia and Inflammatory Biomarkers in Adolescents with First-episode and Recurrent Major Depressive Disorder

刘乐伟[1,2,3] 田英汉[1,2,3] 杨铖[1,2,3] 夏磊[1,3] 刘寰忠[1,2,3]
1.安徽医科大学附属巢湖医院
2.安徽医科大学精神卫生与心理科学学院
3.安徽省精神医学中心

Objective Insomnia is often associated with increases in biomarkers of inflammation, which has been repeatedly confirmed in numerous previous studies. However, the association has not been adequately explored in adolescents with major depressive disorder (MDD). The purpose of this current study was to investigate the associations of insomnia with inflammatory biomarkers in adolescents with first-episode and recurrent MDD.

Methods A total of 164 adolescents with MDD and 76 health controls (HCs) were included in this cross-sectional study. The Center for Epidemiological Studies Depression Scale (CES-D) and the Insomnia Severity Index Scale (ISI) were used to assess subjects' depressive and insomnia symptoms, respectively. And plasma levels of interleukin-1β (IL-1β), interleukin-6 (IL-6), interleukin-8 (IL-8) interleukin-10 (IL-10), interleukin-17A (IL-17A) and tumor necrosis factor-α (TNF-α) were measured.

Results The prevalence of mild insomnia, moderate insomnia and severe insomnia in adolescents with MDD was 40.24%, 36.59% and 6.71%, respectively. Compared to HCs, the patients had higher levels of IL-1β, IL-6 and TNF-α (all $p<0.05$). There was no statistical difference in inflammatory biomarkers levels between patients with first-episode and recurrent MDD. In first-episode patients, the results of correlation analyses showed that ISI socre was positively correlated with CES-D score and levels of IL-1β, IL-6 and TNF-α (all $p<0.05$). Furthermore, in multivariate linear regression analyses, ISI socre was independently associated with CES-D score (beta=0.523, t=5.833, $p<0.001$) and TNF-α levels (beta=0.254, t=2.832, p=0.006). However, no associations between insomnia and inflammatory biomarkers were found in patients with recurrent MDD.

Conclusion Insomnia symptoms are common in adolescents with MDD and appear to be associated with inflammatory biomarkers in first-episode patients. Therefore, inflammatory biomarkers may be involved in insomnia of MDD, but further longitudinal studies are still needed to explore the underlying mechanisms.

关键字：insomnia; inflammatory biomarkers; adolescents; major depressive disorder; first-episode.

注意缺陷多动障碍青少年儿童时间知觉特征及其影响因素

高天舒[1] 关陆阳[1] 张子一[1] 王菲[1] 王永露[1] 朱清峣[1] 李锦卉[2] 黄安琪[2] 柯晓燕[1,2]
1.南京医科大学附属脑科医院儿童心理卫生研究中心

2.南京大学医学院附属南京脑科医院

目的 既往研究表明注意缺陷多动障碍（ADHD）儿童在时间知觉方面存在缺陷，这种缺陷与患儿的执行功能障碍和厌恶延迟的动机风格之间都有着密切的联系。本研究试图探讨 ADHD 儿童的时间知觉特征及可能的影响因素。

方法 选择符合美国精神障碍诊断与统计手册第 5 版（DSM-5）中 ADHD 诊断标准并且 SNAP-IV 父母及教师评定量表：注意力不集中平均分≥1.6 分或多动/冲动平均分≥1.6 的儿童 56 例及正常对照儿童 13 例。使用韦氏儿童智力量表-第四版中文版（WISC-IV）评定总智商，以时间辨别任务和时间复制任务，分别评定两组儿童的 500 ms 和 1500 ms 的时间辨别差别阈限值，及 2000ms、12000ms 和 45000ms 的时间复制任务表现。由家长评写执行功能行为评定量表（BRIEF-P）以评定两组儿童的执行功能水平；以注意力多项参数测试（TOVA）评定 ADHD 组儿童注意力持续表现。

结果 ADHD 儿童总体智商低于正常儿童，[(106.80±15.772)vs(118.92±14.660)，P＜0.05]，ADHD 儿童 BRIEF-P 量表元认知指数（MI）得分高于正常儿童[(106.80±15.772)vs(118.92±14.660)，P＜0.05]，两组儿童在 500ms 和 1500ms 条件下的时间辨别阈限不存在显著差异[F（1,67）=50.41，P＞0.05]，ADHD 儿童在 12000ms 时间复制任务中所表现出的绝对偏差错误（Absolute discrepancy errors）大于正常儿童[(5046.35±4025.50)vs(2333.10±1612.23)，P＜0.05]。注意缺陷多动障碍儿童在 12000ms 时间复制任务中的绝对偏差错误与其 TOVA 测试得分呈现负相关（r=-0.446，P ＜0.01）与其 SNAP-IV 量表中注意力不集中得分呈现正相关（r=0.323，P＜0.05），与其 WISC-IV 量表中的加工速度指数呈负相关（r=-0.302，P ＜0.05）。

结论 注意缺陷多动障碍儿童相比于正常儿童存在时间知觉的缺陷，这一缺陷可能与患儿的持续性注意、注意力不集中症状严重程度以及加工速度的受损有关。这些发现将对未来针对 ADHD 儿童执行功能缺陷的干预设计，提供新的视角和思路。

基于社会生态系统理论的青少年抑郁症影响因素分析-病例对照研究

徐华 张燕红* 陈兆红 季金杰 佘娟 侯春婷
南京脑科医院

目的 基于社会生态系统模型为理论框架，探讨青少年发生抑郁症的危险因素。

方法 采用病例对照研究设计。病例组包括 2021 年 11 月至 2022 年 7 月在中国江苏省南京某精神病专科医院住院的青少年抑郁症（13-18 周岁）。病例患者符合抑郁症国际疾病分类(ICD-10)标准。同期随机选取以性别、年龄（1:1）与之相匹配的在校健康青少年作为对照组。以性别、年龄为协变量进行 Logistic 回归分析抑郁症的相关因素。

结果 共有 200 名参与者（病例组、对照组各 100 人），其中男性各 20 人（22.0%），女性各 78 人（78.0%），平均年龄(15.00±1.33)岁。调整后 Logistic 回归分析显示，居住在城市（Adjusted OR =4.504，CI:1.349～15.038）、遭遇校园霸凌（Adjusted OR=8.193，CI:1.867～35.943）、家庭功能严重障碍（Adjusted OR =8.087，CI:1.275～51.278）、自我评价低（Adjusted OR =10.804，CI:2.961～39.426），差异有统计学意(P＜0.05)，且均为青少年抑郁症的危险因素（OR＞1，P<0.05）。

结论 本研究从社会生态系统角度出发，发现青少年抑郁症最显著的危险因素是低自我评价、校园欺凌、家庭功能严重障碍和城市区域，丰富了青少年抑郁症的社会生态内在机制研究。可为实施针对抑郁症危险因素的干预措施提供参考。

青少年抑郁症患者非自杀性自伤行为发生风险预测模型的构建与应用

申红 季金杰* 陈兆红
南京脑科医院

目的 根据青少年抑郁症患者非自杀性自伤行为发生危险因素构建风险预测模型，并评价模型应用效果。

方法 选择青少年抑郁症患者 200 例为训练集，青少年抑郁症患者 50 例为验证集，统计训练集有非自杀性自伤行为的患者例数，通过单因素、多因素 logistic 回归分析筛选青少年抑郁症患者非自杀性自伤行为发生的危险因素，结合回归分析结果构建风险预测模型，并采用模型对验证集患者非自杀性自伤行为发生风险实施评估，检验其预测效果。

结果 训练集非自杀性自伤行为患者 46 例，发生率 23.00%；单因素、多因素 logistic 回归分析得到，青少年抑郁症患者非自杀性自伤行为发生影响因素有抑郁程度、童年创伤/校园欺凌经历、存在睡眠障碍、同伴排斥/歧视、强冲动性、青少年生活事件中重度影响（P<0.05）；结合回归分析拟合青少年抑郁症患者非自杀性自伤行为发生风险预测模型的回归方程，Hosmer-Lemeshow 检验显示，P=0.148，差异无统计学意义，ROC 曲线下面积为 0.901，95%CI 为 0.872～0.924，当最佳风险截断值达到 48.39%，模型灵敏度为 0.827，特异度为 0.884，约登指数为 0.711；外部验证显示，模型预测准确率为 84.00%。

结论 青少年抑郁症患者非自杀性自伤行为发生风险较高，危险因素复杂，研究构建青少年抑郁症患者非自杀性自伤行为发生风险预测模型能有效预测风险，实现对高危患者的有效区分。

关键字：抑郁症；青少年；非自杀性自伤行为；危险因素；风险预测

Transcutaneous Electrical Acupoint Stimulation for Children with Attention-deficit/hyperactivity Disorder: A Randomized Clinical Trial

卓丽霞[1] 赵小艳[2] 翟一方[1] 赵博强[1] 田琳[2] 张艳楠[2] 王小丹[1] 张听雨[3] 甘欣怡[1] 杨程[1] 王卫刚[4] 高巍[1] 王强[1], Luis Augusto Rohde[5] 张婕[2] 李燕[1]

5.阿雷格里港临床医院

Objective Little is known about the effects of transcutaneous electrical acupoint stimulation (TEAS) for children with attention-deficit/ hyperactivity disorder (ADHD).

Methods We carried out a 4-week randomized clinical trial in which patients aged 6–12 years old with ADHD received TEAS or sham TEAS. The primary outcome measure was the investigator-rated Clinical Global Impression-Improvement (CGI-I) score at week 4. Secondary outcomes included the investigator-rated Clinical Global Impression-Severity of Illness (CGI-S) score, the Conners' Parent/Teacher Rating Scales-Revised: Short Form (CPRS-R: S/CTRS-R: S) score, go/no-go task performance, and functional near-infrared spectroscopy (fNIRS)-based oxygenated hemoglobin level within the prefrontal cortex.

Results After TEAS treatment for 4 weeks, the CGI-I score improved from 7.7% to 33.3% (P = 0.005). The mean CGI-S score (?0.87) in the TEAS group decreased markedly than the sham TEAS group (?0.28) (P = 0.003). A greater enhancement in the mean cerebral oxygenated hemoglobin within the prefrontal cortex was found in the TEAS group (P < 0.001). While CPRS-R: S/CTRS-R: S score, and go/no-go performance exhibited no significant improvement. The manipulation-associated adverse events were very mild in both groups.

Conclusion This study shows that noninvasive TEAS significantly improved general symptoms and increased prefrontal cortex blood flow within 4 weeks for children with ADHD. Further clinical trials are required to understand the long-term efficacy in a larger clinical sample.

Aberrant Local Brain Activity Related To Adolescent with Non-suicidal Self-injury

王瑶* 陆燕 王亚云 荀坤平 于海鹏
泰州市第五人民医院

Objective Non-suicidal self-injury (NSSI) is a significant mental health problem among adolescents. Research is needed to clarify the neurobiology of NSSI and identify candidate neurobiological targets for interventions. Based on prior research implicating heightened negative affect and dysfunction default mode network in NSSI, we pursued a systems approach to characterize default mode network during resting-state functional connectivity in adolescents with NSSI.

Methods We enroll adolescents with NSSI (n = 52) and healthy controls (n = 58). Two groups of participants were scanned by fMRI, then extracted the whole brain voxel of ALFF map. Additionally, contrast the difference of the ALFF values between two groups. Furthermore, we analyses the correlation between the aberrant brain regions in ALFF, and the characteristics of NSSI behavior in NSSI group.

Results Compared to healthy controls, adolescents with NSSI showed four significant ALFF brain regions between two group, as right lingua (F=30.89, p<0.05), right inferior occipital (F=26.30, p<0.05), left lingual (F=22.55, p<0.05) and right superior occipital (F=17.19, p<0.05). Using DPARSF-A extract ROIs' ALFF value. In Pearson correlation analysis, we found that right inferior occipital zALFF value was significant positive associated with severity of NSSI behavior (r= 0.566, p < 0.05).

Conclusion The study provides evidence for abnormalities of resting state functional connectivity in multiple brain regions in adolescent with non-suicidal self-injury, and the aberrant local brain activity were correlated with severity of NSSI behavior.

Novel Genetic Loci of Inhibitory Control in ADHD and Healthy Children and Genetic Correlations with ADHD

庞滔[1] 王宁[2] 赵驿鹭[2] 赵晶晶[2] 杨莉[1] 常素华[1]
1.北京大学第六医院
2.陕西师范大学

Objective Cumulative evidence proved the deficits of inhibitory control in patients with attention deficit hyperactivity disorder (ADHD), and it is considered as an endophenotype of ADHD. Genetic study of inhibitory control could advance the gene discovery and further facilitate the understanding of ADHD genetic basis, but the studies were limited in both general population and ADHD patients.

Methods To reveal genetic risk variants of inhibitory control and its potential genetic relationship with ADHD, we conducted genome-wide association studies (GWAS) for inhibitory control based on three datasets including 783 and 957 ADHD patients and 1350 healthy children and then used polygenic risk scores (PRS) to explore the association between inhibitory control and ADHD and related psychiatric disorders.

Results Firstly, we identified three significant loci for inhibitory control in the healthy dataset and two loci for

the case dataset, and one locus for the meta-analysis of three datasets. Besides, we found two significant genes and four risk loci by applying transcriptome-wide association study (TWAS) and conditional FDR method. Then by connecting the genes found in our study, we build a network and found some vital genes. Last, we identified a potential relationship between inhibitory control and ADHD and autism by PRS analysis and found the direct and mediation contribution of the identified genetic loci on ADHD symptoms.

Conclusion In conclusion, we revealed some genetic risk variants related to inhibitory control and elucidated the benefit of inhibitory control as an endophenotype to help explore the mechanism of ADHD.

关键字：ADHD, inhibitory control, GWAS, endophenotype, genetic loci

Peer Victimization and Non-suicidal Self-injury Among Depressed Adolescents: A Moderated Mediation Model

徐瑶[1] 洪兰[2] 赵可[1,3,4]
1.温州医科大学
2.衢州市第三医院
3.温州医科大学附属康宁医院
4.丽水市二院

Objective Non-suicidal self-injury (NSSI) among teenagers with depression is a major and pervasive issue. Previous studies have established peer victimization as a risk factor for non-suicidal self-injury. However, little is known about how it influences teenagers to harm themselves non-suicidally.

Methods A total of 740 depressive outpatients aged 12-18 years with non-suicidal self-injury were selected. General demographic information was collected using the self-designed scale, and relevant information was collected using the Functional Assessment of Self-Mutilation, the Patient Health Questionnaire-9, the Multidimensional Peer Victimization Scale, and the Borderline Personality Features Scale for Children.

Results After controlling for age and sex, it was discovered that depressive symptoms partially mediated the association between peer victimization and non-suicidal self-injury ($P < 0.001$). The mediating influence of depressive symptoms was modulated by borderline personality features. The moderating effect occurs in the second half of the mediating effect ($P = 0.002$).

Conclusion The moderated mediation model constructed in this study reveals the internal mechanism between adolescent peer victimization and non-suicidal self-injury, which is of great significance for the prevention and intervention of adolescent non-suicidal self-injury.

关键字：non-suicidal self-injury, depression, peer victimization, borderline personality features, adolescent

孤独症谱系障碍儿童的睡眠问题与食物选择性和食物不耐受的关系

胥柯[1] 柯晓燕[2,3] 周勤[2] 宋丽[1]
1.徐州医科大学
2.徐州医科大学附属徐州东方医院
3.南京医科大学附属脑科医院

目的 探讨孤独症谱系障碍（Autism spectrum disorder, ASD）儿童的睡眠问题与食物选择性及食物不耐受之间的关系。

方法 选取 2023 年 1 月至 2023 年 5 月期间在门诊就诊的 2-7 岁 ASD 患儿 211 名作为 ASD 组，同时社区招募年龄、性别相匹配的 91 名正常儿童作为对照组。采用儿童睡眠习惯问卷(CSHQ)评估两组被试的睡眠问题，采用自编问卷调查儿童的食物选择性，采用孤独症行为核查表(ABC)评估 ASD 严重程度。食物不耐受通过酶联免疫吸附法(ELISAs)检测血清 14 种特异性 IgG 抗体。使用 SPSS26.0 进行统计分析。采用卡方检验分析两组睡眠问题、食物选择性问题发生率的差异，t 检验比较两组被试 CSHQ 总分的差异，非参数检验分析 CSHQ 各分量表之间的差异。采用秩相关分析睡眠问题与 ASD 严重程度、食物选择性和食物不耐受之间的关系。使用多元 logistic 回归分析 ASD 组睡眠问题的影响因素。

结果 ASD 组患儿 CSHQ 总分及睡眠问题发生率[(48.55±6.07)分，85.30%] 显著高于 TD 组[(45.24±5.33)分，72.53%]。ASD 儿童更有可能出现就寝习惯、入睡潜伏期、睡眠持续时间、夜醒、异态睡眠、睡眠呼吸暂停等睡眠问题(Z= -2. 00~-4.61，均 P< 0. 05)。食物选择性问题（种类、质地、颜色）的发生率在 ASD 组中显著高于 TD 组(均 P<0.05)。有食物种类选择性的 ASD 儿童 CSHQ 总分[(49.19±6.15)分]显著增高[(47.43±5.81)分]，差异有统计学意义(P<0.05)。ASD 组患儿 CSHQ 总分与 ABC 总分呈正相关(r=2.42，P<0.01)。ASD 组患儿白天嗜睡得分与鸡蛋变应原呈显著正相关(r=0.27，P<0.01)。多元有序 logistic 回归分析显示入睡潜伏期延长受到 ABC 量表运动能力分量表得分(B=0.06，P<0.05)的正向影响，食物质地选择性(B=-0.67，P<0.05)和异食癖(B=-1.16，P<0.05)的负向影响。

结论 ASD 儿童常伴随更严重的睡眠问题和食物选择性问题。ASD 儿童的睡眠问题与 ASD 的严重程度和食物选择性有关，白天嗜睡和鸡蛋不耐受有关。ASD 儿童入睡困难受到运动能力、食物质地选择性和异食癖的影响。

Childhood Trauma, Peer Victimization, and Non-suicidal Self-injury Among Chinese Adolescents: A Latent Variable Mediation Analysis

仝思雨[1,2] 赵可[1,2]

1.丽水市二院
2.温州医科大学

Objective Childhood and peer experiences can influence adolescents' perceptions of interpersonal relationships, which can, in turn, influence their emotional states and behavior patterns. Non-suicidal self-injury (NSSI) is now a common problem behavior among adolescents. The present study examined the role of childhood trauma and peer victimization in adolescents' NSSI.

Methods A cross-sectional survey was conducted among 1783 adolescents (1464 girls and 318 boys) in the psychiatric outpatient clinics or wards of 14 psychiatric hospitals or general hospitals in nine provinces in China. Data were collected using the Multidimensional Peer Victimization Scale (MPVS), Short-form Childhood Trauma Questionnaire(CTQ-SF), and Functional Assessment of Self-Mutilation (FASM). Structural equation modeling (SEM) with?latent?variables was used to demonstrate the mediating role of peer victimization in the association between childhoodtrauma and NSSI.

Results The SEM analysis demonstrated that peer victimization plays a partial mediating role in the relationship between childhood trauma and NSSI. . In addition, several covariates (such as age, gender, education level, and place of residence) effectively regulated the relationship between peer victimization and NSSI.

Conclusion In future studies of NSSI among Chinese adolescents, attention should be paid to the roles of childhood trauma and peer bullying; there is a temporal sequence between these two variables and, to some extent, childhood trauma can have an impact on bullying during adolescence which, in turn, influences NSSI behavior.

3-6 岁孤独症幼儿认知灵活性研究

朱清峣 王菲 柯晓燕*
南京脑科医院

目的 认知灵活性被广泛地定义为根据情境在两种不同概念或任务之间切换的能力。很少有研究涉及到孤独症患者的认知灵活性,尤其是在低年龄段的患者中相关研究非常缺乏.本研究旨在调查 3-6 岁孤独症患儿及正常发育儿童的认知灵活性, 比较两组人群中认知灵活性的差异,寻找孤独症幼儿认知灵活性的相关因素,并进一步研究幼儿情绪与行为问题与认知灵活性的相关性.

方法 本研究纳入了符合入组标准的51名孤独症儿童及 60 名正常发育儿童.使用纬度变化卡片排序(DCCS)评估幼儿认知灵活性,儿童行为量表(CBCL)评估儿童情绪与行为问题.使用孤独症儿童行为评定量表(ABC)、孤独症症状访谈量表(ADI-R)、孤独症诊断观察量表(ADOS)等量表评估孤独症患儿孤独症相关症状.

结果 孤独症组中有21个孩子未能通过切换后的卡片分类任务,而正常发育儿童中仅有 5 个在该任务中失败.孤独症幼儿在 RBS-R 量表中的得分与 DCCS 任务中的表现呈显著相关性.在卡片分类任务中完成更差的儿童在 CBCL 量表中的得分越高.

结论 与正常儿童相比,孤独症儿童通过卡片分类测试的比例明显较少,这说明孤独症患儿在完成认知灵活性任务时存在显著困难.认知灵活性的变化与年龄密切相关.认知灵活性较差的孩子更容易出现情绪行为问题,这可能与幼儿解决复杂问题的能力相关.我们试图寻找一些办法改善孤独症幼儿的认知灵活性以降低问题行为的发生.

关键字：孤独症、认知灵活性、学龄前儿童、情绪行为问题

Parents' Rearing Practices Mediate The Negative Effects of Parents' Mental Health Problems on Rural-to-urban Migrant Children

吴怀能 祝思敏 谭忠林 汪红梅 周国岭 倪喆 徐莲莲 张雅敏*
杭州市第七人民医院

Objective (1) to investigate the impacts of parents' mental health on the mental health of rural-to-urban migrant children and local ruban children. (2) to study the differences in parents' rearing styles and attitudes between parents of migrant children and local children. (3) to test whether parents' rearing styles and attitudes could mediate the negative effect of parents' mental health problems on their children.

Methods We investigated 1274 parents and 1001 children aged 9-13 from two primary schools in Hangzhou, one for local children and one for rural-to-urban migrant children in a cross-sectional survey in 2022. The structural equation model (SEM) was used to test the hypothesis that parents' rearing styles and attitudes could mediate the negative effect of parents' mental health problems on their children.

Results The migrant groups, including children, fathers, and mothers all had higher levels of mental health problems than their urban local counterparts. The children of mothers with anxiety had a higher level of self-blaming tendency (qFDR =0.009) and sensitive tendency (qFDR =0.009). Parental mental health had significant impacts on their rearing styles and attitudes, with more effects on attitudes reported by themselves than styles reported by children. Parents' rearing practices were associated with the mental health of children, with a stronger association observed for rearing styles and in urban children. In SEM, emotional warmth and self-confidence were negatively associated with both mothers' anxiety and children's anxiety tendency. In contrast, overprotection/over-interference was positively associated, which supported our hypothesis.

Conclusion More actions should be taken to improve the mental health of migrant children. Our results suggest that we can achieve this goal by reducing mothers'

anxious symptoms and improving their parenting practices.

Shared and Unique Alterations of Large-Scale Network Connectivity in Adolescent and Adult Major Depressive Disorder

侯西蔓 刘瑞 王赟 周媛 陈旭 于爱红*
首都医科大学附属北京安定医院

Objective Compared with adult-onset MDD, adolescent-onset MDD is associated with an increased likelihood of recurrent depressive episodes, increased symptom severity, more insidious symptoms and higher risk of mania. Current MDD brain network studies only focus on one age level. We aim to explore the shared and unique alterations of Large-Scale network connectivity between the two different age level of MDD , and explain why MDD symptoms differ between two different age levels from the perspective of neural mechanisms.

Methods In this study, 46 adolescents with MDD, 35 adults with MDD, 19 healthy adolescents and 56 healthy adults completed resting-state functional magnetic resonance imaging (R-fMRI) scans. We used surface-based methods to preprocess R-fMRI data. Large-scale network analyses were applied based on the Schaefer's template. We calculated the intra-network and between-network functional connectivity(FC) of visual network (VN), sensorimotor network (SMN), dorsal attention network (DAN), ventral attention network (VAN), limbic network (LN), frontoparietal network (FPN) and default mode network (DMN). Then we used 2×2 ANOVA to analyze the main effects of diagnosis, age and their interaction effect on brain FC. In addition, we examined correlations between network abnormalities and HAMD sub-scores.

Results Results found that both the adult and adolescent groups have diagnosis main effect on FC of VN, LN, VN-DAN and VN-LN, uncorrelated with age stratification. Post hoc analysis showed that the shared increased network connectivities were found in MDD group. There was an interaction effect of diagnosis and age on FC between components of DAN. Post hoc analysis showed that adolescent MDD patients had decreased FC than the adolescent HC group, whereas adult MDD patients had increased FC than the adult HC group. Regression analysis showed that these abnormal FCs were associated with HAMD factor 1 anxiety somatization, and the association was more significant in the adults with MDD.

Conclusion Our findings indicated that adolescents and adults with MDD have shared and unique Large-Scale network alterations. And we found the correlation between factor 1 anxiety somatization and abnormal FC was more significant in the adults with MDD. The results may explain why symptoms are more insidious in adolescents with MDD. The results also suggest that when we explore biomarker of MDD, we should include age as a consideration.

南充市"正心"健康工程关于未成年人心理健康促进的模式探索

龚杰 刘月光*
南充市身心医院

目的 推动"南充市未成年人心理健康管理中心"和"南充市未成年人心理健康大数据平台"建设，整合资源、精准施策、统筹推进全市未成年人心理健康促进工作；建立未成年人心理健康服务的"准入制度"、"行业标准"和"人才共享"制度，为未成年人提供同质化服务；建立多元化的心理健康援助通道和覆盖全市的病患转介机制。掌握南充市在校学生心理健康状况，筛查潜在的心理健康问题，分析问题成因，从而建立四川地区适应性的、可推广的未成年人心理问题预测预警系统。

方法 测评采用师生同步线上测评的形式，通过"国家卫生健康委科学技术研究所"授权研发的微信小程序——"米慕爱心"导入受测者的基本信息，包括姓名、性别、年龄、年级和班级等，使用本人或家长的身份证号码进行账号密码登录，此外，由于教师和学生两大 群体的认知方式、知识水平、行为习惯、以及社会环境等方面各不相同，为保证测评问卷选择的适配性、基础信息采集的完整性和科学性，针对不同群体，采用不同的问卷和量表进行施测。

结果 在本次调查中，南充市儿童青少年抑郁检出率为 20.62%,跟全国流调结果基本一致。此外，中重度抑郁检出率明显高于全国平均水平。本次调查结果显示，在南充市，每 100 个儿童青少年中，就有一个残疾儿童 (1.08%)、1 个事实无人抚养儿童(1.22%)、10 个孩子生活在单亲家庭，56 个孩子长期与父母分离。小学、初中、高中学生分别有 65%、80%和 84%的人报告经历过不良生活事件，人际关系不和谐是不同学段孩子发生率最高的不良生活事件。超过 10%的孩子认为这些事件对自己心理产生严重或极其严重的影响。在南充市，具有心理健康教师资质的教师占比仅 1.14%，从事心理健康教育 工作的仅占比 0.4%。 此外，31.63%的教师检出存在不同程度的心理健康问题 (SCL-90)，超过 40%的教师有较为严重的职业倦怠。

结论 整合服务资源，统筹推进未成年人心理健康服务工作。尽快推动"南充市未成年人心理健康管理中心"的建设，统筹安排、统一部署全市心理健康教育工作；启动"南充市未成年人心理健康大数据平台"建设工作，增强资源配置的合理性、卫生决策的科学性；针对高危亚群或个体，尤其是经历过严重不良生活事件的青少年，除常规筛查外，及时、动态掌握其心理动向极为重要；此外，对于筛检出的中重度抑郁学生，提供规范化的医学服务也势在必行。

剧烈运动及网络游戏成瘾对高中学生心理健康状况的影响

陈燕[1] 刘典英[2] 宋佳起[1] 陈怡然[1] 许皓[1] 赵艳丽[1] 谭淑平[1]
1.北京回龙观医院
2.赣州市第三人民医院

目的 探究不同剧烈运动程度的高中生心理健康状态的差异，以及剧烈运动、网络游戏成瘾对高中生的抑郁症状、焦虑症状及失眠症状的影响。

方法 采用方便抽样，于 2022 年 9 月-10 月选取江西省三所职业高中的15300名在校学生为研究对象，根据每周剧烈运动情况分无运动组、轻度运动组（每周剧烈运动总时长≤90 分钟）、高度运动组（每周剧烈运动时长＞90 分钟）组，采用 9 项患者健康问卷、7 项广泛性焦虑障碍量表，7 项失眠严重程度量表，应激反应量表、领悟社会支持量表、同伴欺负量表、网络游戏障碍量表、青少年非自杀性自伤行为功能问卷、情绪调节问卷、心理僵化问卷、正念注意觉知量表评估学生的心理健康状况，采用方差分析比较组间差异，采用 logistic 回归分析探究影响心理健康状况的因素。

结果 最终共纳入 13983 名受试者，问卷有效率91.3%，心理健康总体阳性检出率为：抑郁症状 43.1%、焦虑症状 25.6%、失眠症状 18.4%。不同运动程度的三组组在9项患者健康问卷、7 项广泛性焦虑障碍量表、7 项失眠严重程度指数量表、应激反应、领悟社会支持、网络游戏障碍、青少年非自杀性自伤行为问卷、心理僵化问卷、正念注意觉知量表总分、同伴欺负量表、青少年非自杀性自伤功能问卷、情绪调节问卷总分、表达抑制维度的差异均有统计学意义（P 均<0.05）。多因素 Logistic 回归分析显示，高度运动组是无运动组出现抑郁症状风险的 0.747 倍（95%CI：0.670 -0.833）、焦虑症状风险的 0.869 倍（95%CI：0.768 -0.984），轻度运动组是无运动组出现抑郁症状风险的 0.867 倍（95%CI：0.793-0.948）、焦虑症状风险的 0.963（95%CI：0.872 -01.063）、失眠症状风险的 0.865 倍（95%CI：0.776-0.964）。而亚组分析发现有网络游戏成瘾组是无网络游戏成瘾组出现抑郁症状风险的 5.353 倍（95%CI：4.852-5.905）、焦虑症状风险的 4.718 倍（95%CI：4.29-5.188）、失眠症状风险的 4.323 倍（95%CI：3.914-4.775）。

结论 当下在职高中学生普遍存在一定的心理健康困扰，每周超过90分钟的剧烈运动是罹患抑郁症状、焦虑症状的保护性因素，而网络游戏成瘾是罹患抑郁症状、焦虑症状、失眠症状的危险因素。

血清促甲状腺激素和 BDNF 与儿童青少年抑郁障碍患者伴有激越症状的相关性

赵鑫[1,2,3] 刘乐伟[1,2,3] 杨铖[1,2,3] 田英汉[1,2,3] 夏磊[1,2,3] 刘寰忠[1,2,3]
1.安徽医科大学附属巢湖医院
2.安徽医科大学精神卫生与心理科学学院
3.安徽省精神医学中心

目的 探索血清促甲状腺激素和 BDNF 与儿童青少年抑郁障碍患者伴有激越症状的相关性

方法 入组符合《精神疾病诊断与统计手册》第 5 版(DSM-V)抑郁障碍诊断标准的患者 91 例，根据外显攻击行为量表修订版（Modified Overt Aggression Scale，MOAS）评分将患者分为伴激越组(60 例) 和不伴激越组 (31 例)。采用 MSD 电化学发光 (electrochemiluminescence) 检测技术测定患者脑源性神经营养因子（BDNF）和血清促甲状腺激素（TSH）水平；汉密尔顿焦虑评定量表（HAMA）和汉密尔顿抑郁评定量表（HAMD）被用来检测临床症状 ；使用 Logistic 回归分析探索抑郁障碍患者 TSH、BDNF 和 HAMD 评分与是否伴有激越症状的相关性；应用受试者工作曲线(ROC)探讨 TSH、BDNF 和 HAMD 评分作为抑郁障碍患者是否会伴有激越症状的潜在预测价值。

结果 抑郁障碍伴有激越症状的患者较不伴有激越症状的患者具有较低的 TSH 水平（P<0.001）、BDNF 水平（P=0.001）；激越组较非激越组具有较高的 HAMD 得分（P<0.001）。Logistic 回顾分析结果表明血清 TSH 水平(OR=0.002,P=0.002),血清 BDNF 水平（OR =0.098，P=0.001）、HAMD 评分(OR =1.148，P ＜ 0. 001) 是儿童青少年抑郁障碍患者伴有激越症状的独立危险因素。ROC 分析结果显示 TSH 的线下面积（AUC）为 0.733 ， 95%CI(0.63~0.84),TSH 的最佳截断点为 1.605?IU/mL；BDNF 的线下面积（AUC）为 0.712，95%CI(0.60~0.83),BDNF 的最佳截断点为 429.763pg/mL；HAMD 的线下面积（AUC）为 0.771，95%CI(0.67~0.88),最佳截断点为 30.5 分。

结论 伴有激越症状的儿童青少年抑郁障碍患者血清 TSH、BDNF 水平更低; 血清 TSH、BDNF 和 HAMD 是抑郁障碍伴有激越症状的独立危险因素，并可以作为是否伴有激越症状的预测因素。

关键字：抑郁障碍; 激越;BDNF; 促甲状腺激素

基于两样本孟德尔随机化方法分析流体智力与精神疾病的因果关系

黄安琪[1,2] 关陆阳[2] 张子一[2] 王菲[2] 干凯滟[2] 李锦卉[1,2] 柯晓燕[1,2]
1.南京大学医学院
2.南京脑科医院儿童心理卫生研究中心

目的 流体智力是个体信息处理和问题解决过程中所表现出来的能力。既往流行病学研究报道许多精神疾病都与流动智力有关，但其原因尚不清楚。两样本孟德尔随机化（two-sample Mendelian randomization, TSMR）分析方法以遗传变异为工具变量，利用遗传变

异的自然随机分配可以避免潜在混杂因素。本研究应用 TSMR 法分析流体智力和精神疾病之间的潜在因果关系，为更好的干预精神疾病提供参考。

方法 遗传数据源于 IEU openGWAS 数据库（https://gwas.mrcieu.ac.uk/）。利用 R 软件进行 TSMR 分析，从遗传学角度分析流体智力与常见精神疾病精神分裂症、重性抑郁障碍、双相情感障碍、焦虑障碍、强迫性障碍、神经性厌食、孤独症谱系障碍、注意缺陷多动障碍、失眠、品行障碍、创伤后应激障碍之间的因果关联。从 GWAS 数据库中筛选出与流体智力强相关的单核苷酸多态性位点 SNPs 作为工具变量，即设置 P＜5×10-8。同时去除连锁不平衡的 SNP，设置参数为 r2<0.001，遗传距离阈值为 10 000 kb，以保证 SNP 之间的独立性。以流体智力作为暴露因素，精神疾病为结局变量，使用反向方差加权（Inverse Variance Weighted, IVW）法、MR-Egger 回归法、加权中位数法进行 TSMR 分析，并为保证研究结果的准确性和稳定性，进行异质性检验、多效性检验以及敏感度分析。

结果 IVW 结果表明流体智力与 SCZ（OR=0.771, P=0.030）、AD（OR=0.999, P=0.009）、AN（OR=1.211, P=0.035 ）、 ASD （ OR=1.194, P=0.007 ）、 ADHD （ OR=0.775, P=0.000003 ）、 Insomnia （ OR=0.982, P=0.008 ）之间存在因果关系；流体智力与 MDD（OR=0.963, P=0.963）、BD（OR=1.022, P=0.743）、OCD（OR=0.981,P=0.856）、CD（OR=0.885,P=0.498）、PTSD（OR=0.899,P=0.387）不存在因果关系。

结论 从遗传学角度发现流体智力与 SCZ、AD、AN、ASD、ADHD、insomnia 存在明确因果关联，与 MDD、BD、OCD、CD、PTSD 不存在因果关系。

关键字：流体智力；精神疾病；孟德尔随机化；因果关联

基于症状学的青少年及成年早期重性抑郁发作重复经颅磁治疗的疗效预测研究

刘结 段佳 王俪霏 王菲*
南京医科大学附属脑科医院

目的 青少年时期及成年早期处于抑郁的高发阶段，其对于药物治疗反应个体差异大，寻找与重复经颅磁治疗疗效有关的生物标志物有助于患者治疗方案的选择。

方法 本研究为单中心真实世界研究，纳入 218 个青少年及成年早期患者，目前为重型抑郁发作，使用 17 项的汉密尔顿抑郁评分量表(HAMD-17)、汉密尔顿焦虑症评分量表(HAMA)、青少年躁狂评分量表(YMRS)和短精神精神病评分量表(BPRS)来测量症状严重程度。纳入标准为 HAMD 评分≥17 分，YMRS≤12 分。在 2 周内进行 20 次经颅磁治疗联合药物治疗，分别在治疗前、治疗 10 次、治疗 20 次时通过量表对进行临床症状评估。以治疗结束后以 HAMD 减分率≥50% 为有反应，分为治疗有反应组及无反应组，使用卡方检验或 t 检验分别比较两组在基线时人口学、症状学差异，通过配对 t 检验比较治疗后不同维度的临床症状改善情况，采用 logit 回归分析基线时与治疗效果相关的临床症状。

结果 两组在年龄、性别、教育、药物使用方面无显著差异，在诊断上有显著差异（(?2 = 7.80, P < 0.05）。基线中,有反应组相对于无反应组焦虑抑郁症状(核心抑郁和厌食症因子分数,HAM 总得分)得分更高,但在精神症状严重程度(思想障碍因子得分)得分较低。两组在治疗后症状均有改善（配对 t 检验，p<0.05）。logistic 回归分析显示，在控制了年龄、性别和诊断后，基线 HAMD 总分(OR = 1.10, 95% CI [1.00, 1.20]，P = 0.045) 和 BPRS 思维障碍因子分(OR = 0.79, 95% CI [0.70, 0.91]， P <0.001)与治疗反应显著相关。Hosmer-Lemeshow 拟合优度检验显示模型拟合可接受($\chi2$ = 2.38, df = 8, P = 0.97)。

结论 本研究结果表明，2 周 rTMS 治疗后患者症状得到改善，基线时的抑郁严重程度及思维障碍可以预测 rTMS 治疗疗效。

孤独症谱系障碍筛查阳性青少年的心理韧性研究

曾龙平 刘靖* 李雪*
北京大学第六医院

目的 比较孤独症谱系障碍筛查阳性与阴性青少年的心理弹性，探讨筛查阳性青少年是孤独症谱系障碍症状与心理韧性之间的相关性。

方法 采用自编社会人口学资料调查表、孤独症谱系障碍筛查量表（ASSQ）以及青少年心理韧性量表（RSCA）对北京市平谷区初中、高中共 9668 名青少年进行问卷调查。以 ASSQ 总分 12 分为界限分，将入组青少年分为筛查阳性组与筛查阴性组，比较两组青少年的心理韧性量表评分总分以及各因子分；对 ASSQ 总分及三因子得评分和青少年心理韧性量表总分及五因子得评分进行相关性分析；以 ASSQ 总分及各因子分为自变量，心理韧性量表总分为因变量进行多元回归分析。

结果 ASSQ 筛查阳性组的心理韧性量表总分及其五个因子分（目标专注、情绪控制、积极认知、家庭支持、人际交往）均显著低于 ASSQ 筛查阴性组（均 P<0.01）；ASSQ 总分及其三个因子分（局限性和重复行为、社交互动、交流问题）与青少年心理韧性总分及其五个因子分均存在显著的相关性（均 P<0.01）；ASSQ 总分与青少年心理韧性呈负相关（β=-0.553，P<0.01），三因子中以局限性和重复性行为因子(β=-0.358，P=0.015)、社交互动交往因子(β=-1.197，P<0.01)与青少年心理韧性呈负相关

结论 孤独症谱系障碍筛查阳性的的青少年心理韧性差于筛查阴性的青少年；孤独症谱系障碍症状与青少年心理韧性呈负相关；青少年的社交障碍与局限

性和重复性行为表现越突出，心理韧性越差。

关键字：孤独症谱系障碍；心理韧性；青少年；相关性

述情障碍、童年创伤和身体投入对青少年抑郁障碍患者非自杀性自伤行为预测作用

曹攀攀[1,2] 袁秋雨[3] 彭然[1,2] 周晓琴[1,2]
1.安徽医科大学附属巢湖医院
2.安徽医科大学精神卫生与心理科学学院
3.安徽省荣军医院

目的 分析述情障碍、童年创伤和身体投入对青少年抑郁障碍患者非自杀性自伤（non?suicidal self?injurious，NSSI）行为的关系以及其对青少年抑郁障碍患者 NSSI 行为是否有预测价值。

方法 纳入青少年抑郁障碍患者 225 例，根据 DSM-5 的诊断标准，将患者分为不伴 NSSI 组 98 例和伴 NSSI 组 127 例。比较 2 组一般人口学资料情况、24 项汉密尔顿抑郁量表（Hamilton depression scale, HAMD-24）、童年创伤问卷（Childhood Trauma Questionnaire，CTQ）、身体投入量表（Body Investment Scale，BIS）评分；采用二元 Logistic 回归分析青少年抑郁障碍患者 NSSI 行为的独立影响因素并建立预测模型。在模型预测概率的基础上，绘制 ROC 曲线计算预测效果。

结果 不伴 NSSI 组在 HAMD 总分（t=-3.887 p<0.001）、TAS-20 总分（t=-3.453 p=0.001）、情感辨别不能（t=-2.596 p=0.010）、情感描述不能（t=-2.745 p=0.007）、外向性思维（t=-2.063 p=0.040）、CTQ 总分（t=-4.120 p<0.001）、躯体忽视（t=-2.394 p=0.017）、情感忽视（t=-2.014 p=0.045）、躯体虐待（t=-2.772 p=0.006）、情感虐待（t=-4.920 p<0.001）均低于伴 NSSI 组，而 BIS 总分（t=7.223 p<0.001）、身体形象感受和态度（t=5.138 p<0.001）、身体护理（t=8.846 p<0.001）、身体保护（t=4.441 p<0.001）三个因子分均高于伴 NSSI 组。BIS 中身体护理因子分（OR=0.757，95% CI=0.690–0.829, p<0.001）和 CTQ 中情感虐待因子分（OR=1.078, 95% CI=1.002–1.160, p=0.044）与青少年抑郁障碍患者 NSSI 行为显著相关，诊断模型良好（ROC 曲线下面积=0.815，P<0.001）。

结论 低水平的身体护理、童年的情感虐待可能是青少年抑郁障碍患者实施 NSSI 的独立影响因素，身体投入与童年创伤对诊断和预测 NSSI 行为具有重要价值，应将其作为一个潜在的重要临床治疗手段。

Examining The Chain Mediating Role of Family Environment Intimacy and Children Emotional/Behavioral Difficulties in The Relationship Between Parental Anxiety and Internet Addiction in Youth

Yuxin Wang Yuanchen Xie Yang Wang Keyin Zhou Xinyu Chen Fei Wang*
南京脑科医院

Objective The purpose of study is to investigate the relationship between parental anxiety and adolescent internet addiction, exploring the mediating mechanisms of family environment intimacy and emotional and behavioral problems within it.

Methods This study surveyed 10-18-year-old students and their parents in Taizhou, Yixing, and Sheyang cities in Jiangsu Province, China. A total of 6243 valid questionnaires were collected. The study measured parental anxiety levels and family environment intimacy using Generalized Anxiety Disorde-7 and Family Environment Scale, respectively. Adolescent emotional and behavioral problems, as well as internet addiction, were assessed using Strengths and Difficulties Questionnaire and Internet Addiction Questionnaire. Statistical analyses included descriptive analysis, chi-square test, correlation analysis, and chain mediation analysis using SPSS .

Results The average age of the adolescents in the study was 13.5 years, with 3411 participants (54.6%) being male. There were significant positive correlations observed between parental anxiety, adolescent emotional and behavioral problems, and adolescent internet addiction variables. Family environment intimacy showed a negative correlation with all three variables. Parental anxiety had a direct impact on adolescent internet addiction and also played a mediating role through family environment intimacy and adolescent emotional and behavioral problems (β=0.096, β=0.267). Furthermore, a chain mediation effect was observed, with parental anxiety influencing adolescent internet addiction through family environment intimacy and adolescent emotional and behavioral problems (β=0.229), accounting for 55.8% of the total effect.

Conclusion The conclusions of this study contribute to a better understanding of the relationship and underlying mechanisms between parental anxiety, family environment intimacy, adolescent emotional and behavioral problems, and internet addiction. The findings suggest the need to address parental anxiety and maintain a positive family environment as effective measures to alleviate adolescent emotional and behavioral issues and reduce the risk of internet addiction.

注意缺陷多动障碍儿童社会功能损害的情绪与认知信息加工机制

洪丹萍* 殷炜珍
广州医科大学附属脑科医院

目的 注意缺陷多动障碍（ADHD）儿童社会功能损害领域主要是社会信息加工缺陷。其中，情绪信息加工的受损程度与认知信息与认知信息加工不同，但目前支持证据少。ADHD 儿童在情绪识别、心理理论、情绪控制与执行功能等功能损害领域可以用以解释其社会信息加工机制。但既往研究中存在概念混用、未比较情绪和认知过程、研究任务单一、缺少综合探索等不足。因此，本研究在区分概念和设计相应任务基础上，比较 ADHD 儿童与正常发育（TD）儿童的表现，以验证 ADHD 儿童在这四个部分上的受损模式，并使用社会信息加工模型和 ADHD 的情绪失调模型来解释 ADHD 儿童社会功能损害中的情绪和认知信息加工机制。

方法 在广州市某精神科医院招募 7-13 岁的 42 名确诊 ADHD 儿童（平均年龄 9.33，32 名男孩）、在小学招募 48 名 TD 儿童（平均年龄 9.81，31 名男孩），施测一组情绪识别、心理理论、情绪控制和执行功能任务。ADHD 组儿童在实验前 24 小时不服药。随后，排除共病、智商低于 80 和数据流失的儿童共 15 名，且使用独立样本 t 检验、重复测量方差分析等进行数据分析。两组儿童在人口学变量上不存在差异。

结果 与 TD 儿童相比，（1）ADHD 儿童在情绪识别的正确率较低，尤其体现在消极情绪（厌恶、悲伤）和高社会参与度的识别上，并且支持了在积极情绪识别、中立强度感知的潜在受损；（2）ADHD 儿童在情感心理理论、高阶心理理论表现显著更差，但认知心理理论的总体正确率更低（不显著），结果可能受到任务难度、个体差异的影响；（3）ADHD 儿童在情绪控制和同理心整体表现显著更差，具体表现在不稳定/消极、情绪调节维、认知重评策略、认知同理心子维度上；（4）ADHD 儿童在执行功能（抑制控制、认知灵活性和工作记忆）的整体表现显著较差，但在认知灵活性任务中，情绪材料任务的正确率明显低于认知材料；（5）ADHD 组的执行功能与大多数显著受损的部分存在较为稳定的相关关系，支持了执行功能参与基本信息加工的理论解释。

结论 本研究解释了 ADHD 儿童在情绪识别、心理理论、情绪控制和执行功能上的受损模式，说明执行功能参与基本信息加工的作用。除此之外，本研究提供了情绪信息加工比认知信息加工受损程度更大的两个支持证据。这四个变量在社会信息加工过程中的独立性和合作性，可以解释 ADHD 儿童的情绪和认知机制，适合将结论推广于临床评估 ADHD 儿童社会功能损害上。

关键字：儿童；情绪控制；情绪识别；社会功能损害；社会信息加工；心理理论；执行功能；注意缺陷多动障碍

母亲焦虑引起儿童青少年焦虑的代际机传递特征及其因素

徐家华[2] 陈海滔[1] 沈晴[1] 朱天怡[1] 袁纯钰[1] 赵艳丽[1] 谭淑平[1]
1.北京回龙观医院
2.北京脑科学与类脑研究中心

目的 儿童青少年是脑发育的关键期，同时也是焦虑、抑郁等情感障碍首发和高发时期。情感障碍受遗传和环境的交互影响，其中环境因素体现为父母焦虑的代际传递；同时，儿童青少年感受的压力无法准确表达并引起父母的关注。因此，探究家庭环境内焦虑的代际传递的相互作用模式具有重要意义。

方法 因此，本研究选取患者家庭 54 对，正常对照组 25 对进行研究。我们选取 PBI 和 CPRS 作为家庭关系测量手段，以 STAI-S 和 GAD-7 作为亲子焦虑评价手段，同时采用色-词 Stroop 认知任务，系统考察家庭关系对儿童青少年认知功能的影响。

结果 在控制性别和年龄后，母亲对于孩子的焦虑症状和孩子自知的焦虑症状具有高度一致性（$\beta=0.73$，$t=5.088$，$p<0.001$）。进一步中介效应分析显示孩子感受到的母亲关心，部分解释了母亲评价孩子焦虑和孩子自身焦虑的关系（路径 a,b：$\beta<-0.40$，$t<-3.785$，所有 $p<0.001$，直接效应：$\beta=0.337$，$p<0.001$，Bootstrap 95%CI = [0.151, 0.536]，间接效应：$\beta=0.163$，$p<0.003$，Bootstrap 95%CI =[0.056, 0.282]）。 进一步，我们发现，当母亲焦虑水平越高，母亲和孩子间的冲突越严重，引起孩子焦虑水平越高（路径 a,b：$\beta>0.24$，$t>1.4$，所有 $p<0.05$，直接效应：$\beta=0.161$，$t=1.395$，$p=0.167$，间接效应：$\beta=0.079$，Bootstrap 95%CI =[0.012，0.197]），并且母亲的焦虑会导致对孩子的关心减少，从而引起孩子的焦虑（路径 a,b：$\beta<-0.349$，$t<-3.238$，$p<0.001$，直接效应：$\beta=0.049$，$t=0.475$，$p=0.636$，间接效应：$\beta=0.193$，Bootstrap 95%CI =[0.088，0.355]）。 进一步我们揭示了上述家庭环境对儿童青少年执行功能的影响。我们发现，不良家庭环境增加了孩子的 Stroop 反应时（$\beta=0.25$，$sd=0.11$，$p=0.027$），揭示了家庭环境对孩子认知功能的潜在影响。

结论 家庭关系影响母亲对孩子症状判断的同时，加剧了母亲焦虑的代际传递。这种家庭关系和代际传递的交互并非是患者独有的，而是一般性特征，可能是家庭环境对儿童青少年情绪障碍影响的重要因素。

社交焦虑障碍青少年的应对方式潜在类型及其非自杀性自伤行为差异： 一个潜在剖面分析

马昌明皓[1] 程文红[1,2] 刘真[1] 刘文敬[1]
1.上海交通大学医学院附属精神卫生中心
2.上海市第一人民医院

目的 探索社交焦虑障碍青少年应对方式的潜在类型，比较不同应对方式潜在类型的社交焦虑青少年在非自杀性自伤行为上的差异

方法 对门诊 268 例社交焦虑障碍青少年使用中学生应对方式量表，儿童社交焦虑量表和渥太华自我伤害调查表进行调查。使用潜在剖面分析的方法探索

社交焦虑障碍青少年的应对方式潜在类型，使用卡方检验、独立样本 t 检验和 logistic 回归分析探索社交焦虑障碍青少年的应对方式类型的影响因素，使用独立样本 T 检验比较不同应对方式潜在类型的社交焦虑青少年的与非自杀性自伤行为。

结果 （1）社交焦虑障碍青少年应对方式具有明显的分类特征，可分为高问题导向型（51.12%）和低问题导向型（48.88%）两个潜在类型。（2）年龄更小的社交焦虑青少年更可能归属于低问题导向型。（3）低问题导向型的社交焦虑青少年近 1 月和近 6 月的非自杀性自伤行为显著多于高问题导向型的社交焦虑青少年。

结论 较少进行指向问题应对与社交焦虑障碍青少年的非自杀性自伤风险有关，未来应重点关注社交焦虑障碍青少年问题导向的应对方式，帮助其学习解决问题的方法，保护其身心健康。关键词：社交焦虑；青少年；应对方式；非自杀性自伤；潜在剖面分析

关键字：社交焦虑障碍；青少年；应对方式；非自杀性自伤；潜在剖面分析

系统式执行技能训练对阈下 ADHD 儿童的疗效：随机对照研究

李潞玮[1] 温鸿洋[2] 杨莉[1] 钱英[1]
1.北京大学精神卫生研究所
2.北京市亦庄实验小学

目的 我国注意缺陷多动障碍(Attention Deficit Hyperactivity Disorder，ADHD)发病率高达 6.26%，在达到 ADHD 诊断之前存在亚临床症状阶段，即阈下 ADHD，其发生率达 23.1%。同时 12%-70%阈下 ADHD 至少有一种共患病，常见共患病包括对立违抗性障碍、品行障碍、情绪障碍、焦虑障碍和抽动障碍。而当前阈下 ADHD 儿童心理治疗缺乏循证证据，系统式执行技能训练在确诊 ADHD 患儿中已有明确疗效证据，是极有前景的治疗手段。为探索针对阈下 ADHD 儿童有效的早期干预方法，预防 ADHD 等精神障碍的发生，改善儿童的功能障碍，减少各种继发性社会问题，我们设计本随机对照研究，旨在评估学校环境中系统式执行技能训练对阈下 ADHD 儿童的疗效。

方法 32 名儿童随机分在线下系统执行技能训练组(n=16)和心理健康教育组(n=16)。干预组和对照组分别接受 5 周的线下系统执行技能培训和 5 周的健康教育课程。在基线和实验结束时对干预组和对照组的 ADHD 核心症状(SwansonNolan, and Pelham-IV rating scales [SNAP-IV])和执行功能(SwansonNolan, and Pelham-IV rating scales [SNAP-IV])进行评估。

结果 重复测量方差分析显示，剑桥神经心理自动化成套测试(CANTAB)中，剑桥长筒袜试验(SOC)中的 SOC-MNM5 ($F = 6.305, P = 0.02$)，SOC-STMN5 ($F = 2.951, P=0.032$)以及额外维度集内移位(IED)试验中的 IED-EEDS ($F = 7.685, P =0.011$)在时间和组间存在显著的交互作用。从儿童注意力不集中这一核心症状的改变来看，我们的初步结果显示家长评-注意力不集中在时间*组间上存在显著交互作用($F = 4.612, P = 0.041$)。

结论 本研究中，系统式执行技能训练为改善阈下 ADHD 儿童的执行功能和 ADHD 症状提供了积极的证据。系统的执行技能训练对 ADHD 核心症状和其他社会功能的影响有待进一步研究。

关键字：阈下 ADHD、系统式执行技能训练、随机对照研究

青少年注意缺陷与多动障碍患者欺凌实施与被加害的相关性研究

翟佳敏，钟意娟，张海艳*
西安市精神卫生中心

目的 欺凌、受害和实施欺凌是儿童和青少年的严重健康问题。与没有参与欺凌的人相比，欺凌的受害者和实施者都有很大的抑郁、自杀意念和企图以及酒精滥用障碍的风险。罹患注意缺陷与多动障碍的儿童和青少年已被确定为欺凌、受害和实施暴力的高危群体。

方法 探讨诊断为注意缺陷与多动障碍的青少年欺凌行为的患病率及其相关因素。

方法 对在西安市精神卫生中心就诊的 50 例注意缺陷与多动障碍的儿童及青少年通过青少年校园欺凌体验问卷、家庭环境量表和注意缺陷与多动障碍特征、行为抑制/激活系统水平及精神障碍共病情况进行评估。使用多元回归分析来检验欺负和实施欺负(因变量)与性别、年龄、抑制/激活系统水平、注意缺陷与多动障碍特征、精神疾病、家庭因素(自变量)的关系。

结果 单纯受害人、单纯施暴者和受害人-施暴者的患病率分别为 14.6%、8.4%和 5.6%。年龄小、抑制系统评分高、孤独谱系障碍和对家庭关系的低满意度与严重欺凌受害者有关。BAS 娱乐得分高和对家庭关系满意度低与严重欺凌行为有关。

结论 患有注意缺陷与多动障的青少年中有很高比例的人受到欺凌。多因素与青少年注意缺陷多动障碍的欺负相关，其中以年龄小、抑制系统得分高、孤独谱系障碍的共病和对家庭关系的满意度低与严重的欺凌受害显著相关，激活系统娱乐得分高和对家庭关系满意度低与严重欺凌行为有关。

关键字：儿童及青少年，注意缺陷与多动障，校园欺凌

Gender Differences in The Association between Alexithymia and Insomnia in Adolescents with Major Depressive Disorder

杨小雪 刘寰忠*
巢湖市第一人民医院

Objective Insomnia is related to major depressive disorder (MDD), but the relationship between alexithymia

and insomnia in adolescents with MDD remains unclear. The purpose of this study was to investigate the potential gender differences in the prevalence of insomnia and the association between alexithymia and insomnia in adolescents with MDD.

Methods From October 2020 to April 2022, adolescent patients with MDD were recruited from psychiatric outpatients and inpatients of seven hospitals in Anhui Province, China. Their general demographic and clinical data were collected. The 20-item Toronto Alexithymia Scale (TAS-20), the Center for Epidemiologic Studies of Depression Scale (CES-D), and the Insomnia Severity Index Scale (ISI) were used to assess their alexithymia, depressive symptoms, and insomnia, respectively.

Results The prevalence of MDD with insomnia in female patients was similar to that of male patients (80.0%vs. 73.0%, P = 0.175). Compared with those without insomnia, patients with insomnia manifested more severe depression and alexithymia, worse family relationships, more academic stress, and more use of sedative hypnotics (P < 0.05). Correlation analysis showed that alexithymia was significantly associated with insomnia in male and female patients. Binary logistic regression analysis showed that, while depression was independently correlated with insomnia in both female and male patients, alexithymia was significantly associated with insomnia only in female patients, being only-child was significantly associated with insomnia only in male patients.

Conclusion Insomnia is common in adolescents with MDD. In female MDD patients, alexithymia is correlated with insomnia, which deserves attention in the understanding of the psychopathological mechanisms, treatments and psychological interventions of adolescents with MDD.

关键字：adolescents; major depressive disorder; insomnia; alexithymia

焦虑障碍儿童父母过度保护的代际传递：自尊的调节作用

刘真 程文红* 刘文敬 马昌明皓
上海市精神卫生中心

目的 本研究旨在探讨（1）过度保护的父母教养方式在临床诊断为焦虑障碍的儿童青少年家庭中是否存在代际一致性；（2）这种代际传递模式是否与对照组家庭存在差异；（3）自尊作为焦虑的缓冲剂，是否在焦虑障碍组中对父母过度保护的代际传递存在调节作用。

方法 本研究采用方便抽样法，在上海市精神卫生中心门诊入组 140 名诊断为 DSM-5 焦虑障碍的儿童青少年（平均年龄 14.82 ± 2.11 岁），在学校与社区招募 150 名年龄与性别匹配的健康组儿童青少年。采用人口学问卷、儿童焦虑性情绪筛选量表（SCARED）、自尊量表（SES）和父母教养方式问卷（EMBU）对儿童进行评定，父母也填写 EMBU 以测量父母感知到的祖辈的教养方式。采用 SPSS 进行统计分析，采用 PROCESS 程序检验调节效应。本研究的伦理批件号为 2018-50。

结果 在控制了年龄和性别之后，焦虑障碍组中，儿童报告的父亲过度保护与父亲报告的父亲过度保护呈正相关（r = 0.20，p < 0.01），而在健康对照组中没有显著的相关（r = -0.03，p > 0.05），两个相关系数有显著差异（Z = 2.17, p > 0.05）。在调节效应分析中，调节变量的数值为高斯分布。所以我们根据 Hayes（2017）将调节变量自尊水平分为三组（平均值±1SD）。在焦虑障碍组中，儿童的自尊在儿童和父亲感知的父亲过度保护之间的调节作用是显著的。对于低自尊的儿童，儿童报告的父亲过度保护与父亲报告的父亲过度保护显著相关。

结论 在这个中国焦虑障碍儿童青少年的样本中，存在着父亲过度保护的教养方式的代际传递模式。儿童的自尊对父亲感知的父辈过度保护和儿童感知的父辈过度保护有调节作用。自尊有其作为缓冲和保护因素的潜在作用。

Sex Differences in Factors Influencing Non-Suicidal Self-Injury in Chinese Adolescents with Mood Disorder

周勇杰[1] 朱珍珍[2] 王旸[2]
1.深圳市康宁医院
2.深圳大学管理学院

Objective Non-suicidal self-injury (NSSI) among adolescents is a considerable and widespread concern in public health. Previous researches have explored the variations in NSSI across sexes and the resulting effect of NSSI as an independent variable. However, whether sex differences exist in influencing NSSI remains largely unexplored, resulting into ambiguous and even contradictory findings. This study aims to identify the contributing factors and sex differences that impact NSSI in adolescents with Mood Disorder (MD).

Methods 2324 Chinese adolescents diagnosed with MD participated in this study to complete self-report surveys based on different questionnaires and demographic issues. To identify the primary factors influencing NSSI among adolescents and explore sex differences, cross-sectional data was evaluated with a random forest (RF) model and the findings were interpreted with the Shapley Additive Explanations (SHAP) method.

Results Factors influencing NSSI tended to be more related to family aspects for males, while factors are more diverse for females. As for family related factors, overprotection is a significant risk factor for females with NSSI (BSV=0.0065, GSV=0.0168), while emotional neglect inhibits NSSI in both sexes. For social relationship related factors, support from significant others is a risk factor for male NSSI and serves as a protective factor for females (BSV=0.0096, GSV=-0.0075). Additionally, BMI exerts a greater impact on females(BSV=0.0072,

GSV=0.0122), and males among non-only child were more likely to engage in NSSI (BSV=0.0148, GSV=0.0014).

Conclusion Machine learning techniques can effectively identify adolescent NSSI, which can contribute to early detection, preventive intervention and intensive monitoring. Our findings indicate that family interventions should be emphasized in treating NSSI among males, whereas tailored interventions targeting on specific contexts are recommended for females.

伴忧郁特征的青少年抑郁障碍患者促炎细胞因子水平及其与认知功能的相关研究

张璐璐* 谭洁颖 韩雪婷
广州市第一人民医院，华南理工大学附属第二医院

目的 探讨首发、未用药、伴忧郁特征的青少年抑郁障碍（Major depressive disorder，MDD）患者与不伴忧郁特征的青少年 MDD 患者之间促炎细胞因子水平的差异，以及其与认知功能的关系。

方法 对 300 例首发、未用药的青少年 MDD 患者（包括 150 例伴忧郁特征患者和 150 例不伴忧郁症特征患者），检测促炎细胞因子血清水平：白细胞介素（Interleukin，IL）-1β、IL-2、IL-6、干扰素（Interferon，IFN）-γ，和肿瘤坏死因子（Tumor necrosis factor，TNF）-α。80 名健康志愿者作为对照。采用改良版威斯康星卡片分类测验（Modified Wisconsin Card Sorting Test，M-WCST）、连线测验（Trail Making Test，TMT）和汉诺塔测验（Tower of Hanoi，TOH）评估认知功能。采用 17 项汉密尔顿抑郁量表（the 17-item Hamilton Rating Scale for Depression，HAMD17）、汉密尔顿焦虑量表（the Hamilton Rating Scale for Anxiety，HAMD）、斯奈思-汉密尔顿快感量表中文版（the Chinese version of the Snaith–Hamilton Pleasure Scale，SHAPS）和愉快情绪体验量表中文版（the Chinese version of the Temporal Experience of Pleasure Scale，TEPS）评估临床特征。

结果 与健康志愿者相比，伴忧郁特征和不伴忧郁特征的青少年 MDD 患者均表现促炎细胞因子血清水平升高和认知功能损害。与不伴忧郁特征的青少年 MDD 患者相比，伴忧郁特征的青少年 MDD 患者 IL-1β 和 IL-6 血清水平显著升高和认知损害更严重（P<0.001 或 P<0.05）。伴忧郁特征的青少年 MDD 患者 IL-1β、IL-6 和 IFN-γ 血清水平升高与快感缺失呈显著正相关，尤其 IL-1β 血清水平的升高与认知损害显著相关，但在不伴忧郁特征的青少年 MDD 患者中没有发现该结果。

结论 促炎细胞因子的异常与快感缺失和认知损害的严重程度相关，这可能是伴忧郁特征的青少年 MDD 患者的神经生物学潜在特征。

Depression in Children and Adolescents with Early Life Adversity: A Systematic Review and Meta-Analysis

于增艳 李平* 曹运华 王垚 齐金玲 尚婷惠子 李彤 杨旭 陈云辉
齐齐哈尔医学院精神卫生学院

Objective Globally, Early life adversity (ELA) is

linked to an increased risk of developing depression in adulthood; however, only a few studies have examined the specific effects of various types of ELA on depression in children and adolescents. The meta-analysis was to explore the association between sub-types of ELA and risk for youth-onset depression.

Methods Studies assessing ELA and depression before the age of 18 years were systematically searched in scientific databases. Our meta-analysis utilized the odds ratio (OR) and relied on a random-effects model. While detecting large heterogeneous effects, it was examined whether some factors moderated the association between ELA and depression in youths.

Results We found that individuals who experienced ELA were more likely to develop depression before the age of 18 years than were individuals without a history of ELA (odds ratio=2.15; 95% CI [1.91, 2.43]). The results of the subgroup analysis showed a strong association between ELA and depression in youth, both in terms of dimensions and specific types. Specifically, threat (OR = 2.58, 95% CI [2.21,3.01]) and emotional abuse (OR = 4.30, 95% CI [2.59, 7.16]) had stronger relationships with depression in children and adolescents than other forms of ELA.

Conclusion This meta-analysis confirms that the adverse effects of a broader consideration of ELA on the risk of depression appear during early development and vary according to the type of ELA.

氧化应激介导妊娠晚期晚睡损伤胎盘铁转移的相关性研究

蒋晓宁[1] 王帆[2]
1.内蒙古医科大学
2.北京回龙观医院

目的 探讨夜眠时间是否影响炎症因子介导胎盘氧化应激损伤孕妇胎盘铁转移功能，探索其病理生理学基础，为保障母婴身心健康提供新的科学依据和理论指导。

方法 收集妊娠晚期孕妇123例。收集夜眠时间，分为睡眠正常组（11点之前就寝，n=42）和晚睡组（11点之后就寝，n=81）。采集分娩时外周血、胎盘组织和脐动脉血，测定外周血清中白细胞介素-6（IL-6）水平，测定外周血清、胎盘和脐动脉血清中的铁蛋白、转铁蛋白（Tf）水平；测定胎盘中的谷胱甘肽过氧化物酶4(GPX4)、丙二醛(MDA)、还原型谷胱甘肽(GSH)水平。

结果 (1)睡眠正常组脐动脉血清铁蛋白、外周血Tf、胎盘MDA和GSH水平均高于晚睡组(P脐动脉血清铁蛋白=0.014, P外周血Tf=0.026, PMDA=0.010, PGSH=0.045)，睡眠正常组内胎盘铁蛋白和Tf水平＞脐动脉血清水平＞外周血水平(P铁蛋白=0.006，PTf<0.001)，晚睡组内胎盘Tf水平＞外周血水平＞脐动脉血清水平(P<0.001)。(2)睡眠正常组就寝时间与胎盘MDA和GSH水平正相关(PMDA=0.018, PGSH=0.031)，晚睡组就寝时间与脐动脉血清铁蛋白、Tf水平和胎盘Tf水平均为负相关(P脐动脉血清铁蛋白=0.015, P脐动脉血清Tf=0.048, P胎盘Tf=0.011)，晚睡组胎盘MDA和GSH水平与脐动脉血清Tf水平均负相关(PMDA=0.012, PGSH=0.021)。(3)分层逐步线性回归分析表明，睡眠正常组就寝时间与胎盘MDA、GSH水平正相关(PMDA=0.041, PGSH=0.039)；晚睡组就寝时间与脐动脉血清铁蛋白、Tf水平负相关(P脐动脉血清铁蛋白=0.015，P脐动脉血清Tf=0.048)，晚睡组胎盘MDA水平与脐动脉血清Tf水平负相关(P=0.012)；

结论 妊娠晚期晚睡通过胎盘氧化应激加重了胎盘铁转移功能异常发生，因此就寝时间早有助于预防和增强孕妇宫内铁水平转移情况从而降低孕产妇及胎儿并发症发生的可能性。

关键字：晚睡；铁转移；孕晚期；胎盘；氧化应激

中枢神经递质及炎症因子介导晚睡影响心血管风险因素的相关性研究

张蕊[1] 王帆[2]
1.内蒙古医科大学
2.北京回龙观医院

目的 载脂蛋白B1(Apo-B1)/载脂蛋白A(Apo-A1)反映胆固醇转运过程致除动脉粥样硬化(AS)-apoB和抗AS-apoA1，比值越高心血管事件风险越高。因此，研究中枢神经递质与炎症因子对晚睡与心血管疾病(CVD)风险因素关系的影响。

方法 共招募211名被试，年龄53.8±12.7周岁。按就寝时间分<11点组（早睡组, n=126）和≥11点组（晚睡组, n=85）。采集外周血和脑脊液(CSF)，检测CSF食欲素A(OXA)和MT水平，血清白介素10（IL-10）和IL-18以及Apo-A1、Apo-B100水平。比较两组Apo-A1、Apo-B与二者比值及IL-10、IL-18、OXA和MT含量差异；进行就寝时间、Apo-A1、Apo-B/Apo-A1与各生物标志物相关分析，完成就寝时间、Apo-A1、Apo-B/Apo-A1间相关分析。

结果 （1）早睡组Apo-A1水平高于晚睡组(P=0.014)，Apo-B/Apo-A1水平低于晚睡组(P=0.012)；（2）早睡组OXA、IL-18水平分别高于、低于晚睡组(P＜0.01，P=0.041)；（3）早睡组就寝时间与Apo-A1和Apo-B/Apo-A1无相关性(P＞0.05)，OXA和MT、IL-10、IL-18与就寝时间、Apo-A1和Apo-B/Apo-A1均无相关性(P＞0.05)；（4）晚睡组就寝时间与Apo-A1负相关（P=0.034），与Apo-B/Apo-A1正相关(P＜0.01)，OXA与就寝时间正相关（P=0.04）;CSF MT与Apo-A1正相关(P=0.036)；（5）晚睡组就寝时间影响Apo-A1、Apo-B/Apo-A1 (b=-0.074, t=-2.214, PApo-A1=0.03；b=0.123, t=2.902, PApo-B/Apo-A1=0.005)，早睡组就寝时间影响CSF LogOXA（b=0.038, t=2.442, P=0.017)，晚睡组CSF MT影响Apo-A1 (b=0.001, t=2.665, PApo-B/Apo-A1=0.009）。

结论 (1)晚睡是心血管风险因素的重要影响因素，

就寝晚于11点时，越晚睡患心血管病的风险越高；（2）低水平MT是CVD重要风险因素，晚睡是其发生调节因素；（3）CSF OXA水平受晚睡影响而上升

游离脂肪酸谱在长短夜眠时长人群中的分布特征及与血脂异常的相关性研究

王帆[1] 武楠[2]
1.北京回龙观医院
2.内蒙古医科大学

目的 血脂异常是心脑血管疾病和代谢性疾病的重要危险因素。本研究旨在探讨游离脂肪酸（FFA）谱及其联合作用在长、短夜眠时长人群中分布特征及与血脂异常的相关性。

方法 共招募138名男性与80名女性。平均年龄为(53.8±12.7)周岁。依据夜眠时长分为<7小时和≥7小时组，收集被试血浆和脑脊液(CSF)，采用气相色谱法测定CSF及血浆FFA谱(14种饱和脂肪酸，15种不饱和脂肪酸)水平。根据血浆总TC、LDL、TG和HDL水平分为血脂正常组和血脂异常组。本研究第一部分比较夜眠<7和≥7小时组间一般资料和CSF-FFA水平差异；分析CSF-FFA对长短夜眠时长的影响；第二部分，对比血脂正常和血脂异常组间一般资料；分析长短夜眠时长两组间血浆FFAs差异；分析夜眠时长与血脂异常以及外周FFAs间相关性；探讨外周FFAs的联合作用对血脂异常的影响。

结果 （1）CSF中FFA公因子4(C18:3和C20:1)和公因子5(C17:0、C17:1、C16:1和C18:2)与夜眠时长正相关（P公因子4=0.014, P公因子5=0.003）。（2）≥7h组C10:0，C16:1，C22:6水平高于<7h组(PC10:0=0.008, PC16:1=0.014, PC22:6=0.043），≥7h组C17:1水平低于<7h组(PC17:1=0.024);<7h是血脂异常的危险因素(P=0.034);≥7h组中C16:1与夜眠时长正相关(P<.001),<7h组中C17:1与夜眠时长负相关(P=0.038);在≥7h组中与C16:1正相关(P<.001);≥7h组内C16:1增加血脂异常的风险(P=0.004);<7h组内C22:6增加血脂异常的风险(P<.001);（3）≥7h组中，公因子1(C14:0、C16:1、C18:1、C15:0、C16:0、C17:0、C18:3、C21:0、C18:3、C18:2、C18:0、C20:1和C20:0）增加血脂异常的风险(P公因子1<.001)。

结论 （1）夜眠时长不足是血脂异常风险增加的影响因素，脂肪酸在其中发挥作用。高水平血浆棕榈油酸和DHA分别是≥7h与＜7h人群血脂异常的风险因素。（2）CSF高水平不饱和脂肪酸及联合作用可能是睡眠不足重要风险因素；（3）无论夜眠长短，高水平脂肪酸联合作用均为血脂异常的风险因素。

关键字：夜眠时长，脑脊液，血脂异常，饱和脂肪酸，不饱和脂肪酸

双相障碍患者血清催乳素（PRL）、血清尿酸(UA)、神经生长因子(NGF)和执行功能变化的临床意义分析

王金成 王冉* 李娜 宋美 刘琳 王强
河北医科大学第一医院精神卫生中心

目的 探讨双相障碍患者治疗前后血清催乳素(PRL)和血清尿酸(UA)、神经生长因子(NGF)和执行功能的变化情况,分析其与患者病情的关系。

方法 选取2020年5月至2022年5月在河北医科大学第一医院住院的100例双相障碍患者为实验组,其中双相抑郁发作患者46例,双相躁狂患者56例,另选我院同期100例体检健康者为健康对照组。比较3组血清血清催乳素(PRL)和血清尿酸(UA)、神经生长因子(NGF)和威斯康星卡片分类测验(WCST)各维度结果,比较治疗前后双相抑郁组HAMD-24评分及双相躁狂组BRMS评分,并分析血清PRL、UA、NGF水平和WCST各维度结果与HAMD-24、BRMS评分的相关性。

结果 治疗前双相抑郁组、双相躁狂组及健康对照组入组时血清PRL、UA、NGF水平和WCST各维度结果比较差异有统计学意义(P<0.05);治疗后双相抑郁组和双相躁狂组前述各指标较治疗前改善,差异均有统计学意义(P<0.05),且双相抑郁组、双相躁狂组、健康对照组前述各指标差异无统计学意义(P>0.05).治疗后双相抑郁组HAMD-24评分和双相躁狂组BRMS评分低于治疗前,差异均有统计学意义(P<0.05).双相抑郁组血清PRL、UA、NGF水平及WCST错误数、非持续性错误数、持续性错误数与HAMD-24评分呈正相关(P<0.05);双相躁狂组血清PRL、UA、NGF水平及WCST错误数、非持续性错误数、持续性错误数与BRMS评分呈正相关(P<0.05)。

结论 双相障碍患者血清PRL、UA、NGF水平和执行功能治疗前后变化明显,可能是双相障碍患者的生物标记物，且各指标间存在一定相关性，并与患者临床症状改善评分相关,有望成为双相障碍患者症状改善及疗效判定的辅助评估指标。

关键字：双相障碍、泌乳素、尿酸、神经生长因子、执行功能

恐惧消退 cfos 激活地图的性别差异

张凯 杨建立*
天津市医科大学总医院临床心理科

目的 恐惧性条件反射作为恐惧记忆及恐惧相关疾病研究的经典范式已经得到广泛的探索，其优点在于可以很好的模拟创伤后应激障碍（PTSD）的恐惧记忆形成以及应用暴露疗法治疗恐惧相关疾病时恐惧记忆消退的过程。但是以往的研究大多数都局限于雄性啮齿类动物，关于PTSD和暴露疗法两性差异的研究

较少。本研究旨在填补这一空白，利用分子手段探究条件恐惧消退过程中的两性差异。

方法 选取 8~10 周龄的雄性和雌性大鼠各 16 只，随机分为 4 组：雄性消退组、雄性未消退组、雌性消退组、雌性未消退组。按照分组对所有动物进行行为学训练后处死取脑进行 c-fos 免疫荧光染色，随后比较 15 个热门脑区的 c-fos 表达情况并与行为及脑区间进行皮尔逊相关性分析.

结果 经过消退训练，无论雄鼠还是雌鼠的僵直度水平均可降低到 40%以下，且分子实验发现消退过程中激活的脑区大部分相同，仅丘脑连结核和腹侧海马存在差异。随后的相关性分析实验发现，雄性大鼠的边缘下前额叶皮层与僵直度水平呈显著正相关，基底外侧杏仁核和背侧齿状回与僵直度水平呈显著负相关，而雌性大鼠仅腹侧齿状回与僵直度水平呈强正相关性。最后，脑区间相关性分析表明消退后雄性大鼠的边缘前前额叶皮层、后扣带回皮层和背侧齿状回间具有较强的相关性，岛叶皮层与腹侧 CA1 区呈强正相关性而与丘脑连结核呈强负相关性，中央杏仁核与前扣带回皮层间存在强正相关性而基底外侧杏仁核则与背侧齿状回间存在强正相关性。雌性大鼠则是中央杏仁核、后扣带回皮层、内嗅皮层间存在强相关性，边缘前前额叶皮层与基底外侧杏仁核间具有较高相关性，此外，雌性大鼠的海马与丘脑连结核和前扣带回皮层间也表现出较高的相关性。

结论 本研究通过行为学和分子技术评估大鼠在消退学习中的两性差异，结论如下：（1）雄性大鼠和雌性大鼠在恐惧消退的习得过程中差别不大；（2）雄性大鼠和雌性大鼠的各脑区在消退学习过程中存在明显差异。

关键字：恐惧记忆消退 性别差异 c-fos

青少年心境障碍患者非自杀性自伤行为及其影响因素研究

祝雪平 杨建立*
天津市医科大学总医院临床心理科

目的 评估青少年心境障碍患者非自杀性自伤（NSSI）行为及其影响因素，为心境障碍青少年 NSSI 行为预防及干预提供理论指导。

方法 首次就诊为抑郁发作的青少年心境障碍患者，共 70 名。采用自制的一般情况调查表、渥太华自伤量表（OSI）、汉密尔顿抑郁量表（HAMD-24）、32 项轻躁狂症状清单（HCL-32）、杨氏躁狂评定量表（YMRS）和汉密尔顿焦虑量表（HAMA）进行问卷调查。应用 SPSS 25.0 软件进行统计分析，P＜0.05 表明差异具有统计学意义。

结果 心境障碍青少年的非自杀性自伤行为报告率为 52.86%，平均年龄（14.60±1.65）岁，首次自伤平均年龄（12.13±1.90）岁，10~14 岁为高发年龄段。当前自伤最常用的方式是“切割”（45.6%），其次为“击打”（14.0%），最常自伤的部位是“下臂或腕部”（30.0%），其次为“手”（23.3%）。2.伴与不伴 NSSI 组在年龄、性别、受教育年限、家庭类型、性取向、家族史上均无统计学差异(P＞0.05)。伴 NSSI 组在校园欺凌、躯体忽视/虐待、同伴 NSSI 行为和同伴自杀行为占比上均高于不伴 NSSI 组（P＜0.05）；伴 NSSI 组在 HAMD-24 总分、HAMA 总分、焦虑躯体化、认知障碍、迟缓、绝望感、躯体性焦虑、精神性焦虑因子得分上均高于不伴 NSSI 组（P＜0.05）。青少年双相抑郁患者 NSSI 行为的报告率（62.2%）显著高于单相抑郁患者（37.8%）（P＜0.05）。NSSI 行为的成瘾性与 NSSI 行为频率、抑郁严重程度、体重减轻和绝望感呈正相关（P＜0.05）。5.logistic 逐步回归分析显示：同伴 NSSI 行为、焦虑躯体化因子是青少年心境障碍患者 NSSI 行为的危险因素。

结论 青少年心境障碍患者 NSSI 行为的发生率较高，同伴 NSSI 行为、焦虑躯体化因子是促进 NSSI 发生的危险因素；双相抑郁青少年 NSSI 的行为特征、功能等与单相抑郁青少年存在不同。未来的研究应扩大样本量，在多地区、多时间点进行调研，更全面的评估 NSSI 行为以期为其制定个体化干预策略，并通过研究 NSSI 行为的差异性为鉴别单双相抑郁提供参考依据。

Theta 爆发刺激联合舍曲林治疗强迫症的临床研究

马茂良 杨建立*
天津市医科大学总医院临床心理科

目的 θ爆发刺激（TBS）作为 rTMS 的一种特殊刺激模式，能以较低的刺激强度对大脑皮层兴奋性产生更强更持久的调节作用。本研究旨在对 TBS 治疗首发 OCD 患者的临床疗效及安全性进行治疗观察，并为 TBS 治疗 OCD 的临床应用和机制研究提供依据。

方法 本研究为随机、伪刺激、双盲对照试验，分为辅助运动区（SMA）的 TBS 联合舍曲林治疗和相同部位的伪刺激联合舍曲林治疗两组，为期 6 周，以观察治疗首发 OCD 患者的临床治疗效果差异及安全性。选取 2019 年 9 月至 2020 年 2 月期间就诊于天津医科大学总医院门诊、符合纳入标准的首发 OCD 患者 30 例，随机分为两组，一组接受连续 TBS 联合舍曲林 100mg/d 治疗，一组接受伪刺激联合舍曲林 100mg/d 治疗。其中，cTBS 治疗：为期 2 周(每周 5 次)，每个刺激序列包括 600 个刺激，刺激部位为辅助运动区（SMA）。采用耶鲁-布朗强迫症量表（Y-BOCS）、汉密尔顿焦虑量表（HAMA）以及汉密尔顿抑郁量表（HAMA），分别在基线、治疗 3 周后和治疗 6 周后对患者进行疗效评估。对治疗的有效反应被定义为 Y-BOCS 评分至少降低 25%。应用统计分析软件 SPSS24.0 进行数据分析，P<0．05)、HAMA 评分(F=203.636，P<0．05)、HAMD 评分(F=124.907，P<0．05)

差异均有统计学意义。cTBS 治疗组与对照组 2 组间 Y-BOCS 总分(F=5.564，P<0．05)各时点差异具有统计学意义。

结论 本研究是首次应用 cTBS 治疗首诊强迫症的随机对照研究。研究结果表明作用于 SMA 的连续 θ 爆发刺激（cTBS）联合抗抑郁药物来治疗强迫症具有潜在优势，且具有良好的安全性与耐受性。未来的研究需要进一步增大样本量，完善研究过程以及借助于神经导航技术，来验证和优化 TBS 治疗强迫症患者的最佳参数。

Npas4 分子缺失对大鼠行为学的影响

郭欣逸 杨建立*
天津市医科大学总医院临床心理科

目的 在生命进化的过程中，恐惧反应所产生的趋利避害的本能能帮助个体适应诡秘多变的自然环境，为挣扎求生所必须。然而当恐惧情绪过度表达跨越了正常的调节限度就会变成有害的，会导致焦虑障碍等疾病的发生，诸如创伤后应激障碍的核心症状的基础就是恐惧的调节紊乱。因此，针对恐惧记忆及消退记忆的分子机制的研究是十分必要的。在积年的记忆分子机制的研究中发现，Npas4 分子在记忆调节和焦虑情绪的发生中有着重要作用，因此推测其可能在恐惧记忆的编码或储存过程中有着关键性的作用。本文利用恐惧记忆模型和生物分子学的方法对 Npas4 分子在记忆维持和储存中的作用进行探究。

方法 实验一：利用聚合酶链式反应（PCR）确认 Npas4 转基因大鼠基因型，并对不同基因型大鼠进行免疫印迹试验（Western blot），测定 NPAS4 敲除鼠中 NPAS4 蛋白的表达水平在不同脑区中的表达是否与普通 SD 大鼠和阴性大鼠存在差异。实验二：通过旷场实验与高架十字迷宫实验研究 Npas4 敲除鼠与普通基因型大鼠之间焦虑样行为是否有差异。实验三：通过恐惧条件反射模型研究 NPAS4 蛋白在恐惧记忆、消退过程、恐惧记忆唤起等环节中所起的作用。

结果 实验一：普通野生型 SD 大鼠与 NPAS4 敲除鼠的纯合子组相比，NPAS4 的蛋白含量在基地外侧杏仁核(BLA)、中央杏仁核(CeA)、海马（HIP）及前额皮层（PFC）中明显增高(P<0.05)，而野生型大鼠与杂合子之间蛋白质的含量则没有显著性差异 (P>0.05)，但有表达下降的趋势。在实验二中，在遭受电击前，三组大鼠在旷场实验和高架十字迷宫实验中没有差异。接受电击后，Npas4 敲降组的大鼠在中心区和开臂中所待的时间显著低于对照组（P<0．05）。在实验三中，三组大鼠在恐惧记忆形成和消退过程均没有显著差异，而在消退训练后，Npas4 敲降组大鼠在恐惧记忆唤起测试中，freezing 值明显高于对照组。

结论 （1）Npas4 基因敲降手段能够成功降低大鼠脑中 Npas4 蛋白的表达水平，且被 PCR 手段所准确检测。（2）Npas4 蛋白表达的下降本身并不影响大鼠的活动行为，Npas4 蛋白本身可能仅调节在遭受应激后动物的焦虑样行为。（3）Npas4 蛋白分子可能不是唯一对恐惧记忆编码进行调节的分子，但在消退记忆的维持过程中起关键作用。

右侧眶额叶皮质连续爆发模式脉冲刺激治疗难治性强迫症:一项随机对照试验

刘维维 邵华 杨建立*
天津市医科大学总医院临床心理科

目的 研究连续爆发模式脉冲刺激(continue Theta Burst Stimulation)在难治性强迫症（obsessive compulsive disorder）患者右侧眶额叶皮质(OFC)的疗效。

方法 我们采用随机双盲假对照试验方法，将 28 名难治性强迫症患者随机分为 2 组（每组 14 人）。在患者的右侧 OFC 进行每天两次，每周 5 天，连续 2 周的 cTBS 治疗或伪刺激治疗。主要结局指标为：耶鲁-布朗强迫症量表(Y-BOCS)评分变化，次要结局指标为：汉密尔顿焦虑量表（HAMA）和汉密尔顿抑郁量表（HAMD）的评分变化。

结果 经过 2 周的治疗后，两组在 Y-BOCS 评分和 HAMA 评分上无统计学差异（p＞0.05）。治疗组的抑郁症状显著改善（p=0.027），但这种显著差异在第 6 周时消失（p=0.089）。

结论 本研究是第一个在难治性 OCD 患者右侧 OFC 上使用 cTBS 治疗的随机对照研究。 研究发现，每天 2 次的 cTBS 是安全的，但 2 周的治疗不足以达到疗效。未来需要进一步研究以确定用于难治性 OCD 患者的最佳参数，以及探索更长的疗程对于难治性 OCD 的疗效，同时联合药物治疗也是值得进一步研究的思路。

门诊青年抑郁障碍患者早期服药依从性及影响因素研究

杨大路 杨建立*
天津市医科大学总医院临床心理科

目的 抑郁障碍是一种常见的慢性精神疾病，其复发率高、社会功能损害严重，给社会和家庭带来沉重负担。但相当数量的患者服药依从性不佳，影响疗效和病情恢复。本研究针对国内青年抑郁患者服药依从性现状及其影响因素进行研究。

方法 研究纳入 2020.7 至 2021.1 期间就诊于天津医科大学总医院临床心理科门诊的患者；符合纳入标准和排除标准的首次就诊青年患者 94 例。使用自编一

般资料表收集患者人口学特征，使用服药信念问卷（BMQ）、中文版抑郁症病耻感量表（DSS）、父母控制量表（PCS）收集患者的资料。4 周后进行随访，通过患者自我报告结合 Morisky 服药依从性量表（MMAS），对服药依从性进行评估。

结果 1、患者的一般资料情况：94 名患者的年龄在 13-25 岁之间，平均年龄 18.95±2.945 岁。男性 24 人（25.5%），女性 70 人（74.5%）。83 人（88.3%）为在校学生，高中或中专生（28.7%）、大专生和大学生（56.4%）为主。所有患者均未婚。所有治疗方案中均包含了至少一种抗抑郁药，SSRIs 最为常用，使用 68 例（72.3%）。79 例（83.2%）患者采用联合治疗方案，苯二氮卓类药物使用 64 例（67.4%），是最常联用的药物。2、服药必要性得分 14.56±3.803 分，服药顾虑性得分 16（14~18）。个人病耻感得分 18.00±6.050 分，社会病耻感得分 23.60±7.050 分。心理控制得分 59.5（51~69）分，行为控制得分 46.51±11.88 分。3、入组患者服药依从性分布情况：服药依从性好的患者 36 名，占比 38.3%。服药依从性差的患者 58 名，占比 61.7%。4、在服药依从性好与差的组别中，个人病耻感、社会病耻感存在显著差异，抗抑郁药种类存在组间边缘显著差异。5、服药依从性的影响因素：Model1、Model2、Model3 中个人病耻感对服药依从性均具有显著影响，OR（CI）值分别为 1.128（1.021-1.247）、1.111（1.008-1.224）和 1.154（1.031-1.292）。

结论 1、门诊青年抑郁障碍患者的服药依从性较差；2、青年女性抑郁障碍患者显著多于男性，大部分患者为高中生、大学生；3、个人病耻感、社会病耻感、抗抑郁药种类影响患者依从性。

关键字：青年抑郁障碍患者；服药依从性

关注无业及低收入肿瘤患者的心理健康：多发性骨髓瘤患者中收入、就业及心理痛苦关系的横断面调查研究

刘飞[1] 蒋江灵[1] 侯健[2] 陆峥[1]
1.同济大学医学院附属同济医院
2.上海交通大学医学院附属仁济医院

目的 多发性骨髓瘤目前仍无治愈方法，长期严重的躯体不适及治疗给患者带来巨大的就业及经济压力，并造成严重的心理痛苦。虽然在一般人群中无业及低收入与心理痛苦密切相关，但在多发性骨髓瘤患者中尚无相关研究。通过本研究探索多发性骨髓瘤患者低收入和失业与心理压力之间的关系。

方法 自 2022 年 10 月至 2023 年 3 月在 15 个中心进行自愿参加的横断面调查，共筛查多发性骨髓瘤患者 567 人，回收有效问卷 490 份。问卷内容包括患者的人口学及临床特征、收入水平、就业状态，以及心理痛苦温度计（distress thermometer，DT）。使用卡方检验、Mann-Whitney U 检验和 Spearman 相关检验，用于根据测量类别确定收入水平和就业状况与心理痛苦的严重性和来源之间的关系。使用广义线性模型（GLM）探讨人口统计学和临床特征对收入水平和就业状况与心理困扰严重程度和来源之间关系的影响。

结果 54.7%的患者月收入低于 3000 人民币，27.8%的患者存在显著的心理痛苦。收入水平与 DT 得分存在弱的负相关（rho = -0.090，p = 0.047）。与在婚患者相比，此种相关在单身患者中更为显著（rho = -0.071vs. -0.099，F(1)= 6.66，p = 0.010）。在心理痛苦的来源中，现实问题与低收入水平关系密切（Z =-3.07，p = 0.002）。亚组分析显示，处于工作年龄的患者中存在收入水平与心理痛苦的负相关趋势（rho = -0.099, p = 0.075），而在处于退休年龄的患者中则不显著。对于处在工作年龄的患者，此种相关在女性患者中较男性更为明显（rho = -0.290vs. -0.101，F(1)= 5.85, p = 0.017）。此外，对于处在工作年龄的无业患者，其情绪问题比例高于同年龄段的就业患者（59.3% vs. 81.3%，OR = 2.99，X2 = 9.34，p = 0.002）。

结论 在多发性骨髓瘤患者中，低收入水平与心理痛苦程度及现实问题存在一定的相关性，且在单身及处于工作年龄的女性中更为显著；而失业则与情绪问题密切相关。因此，医务人员、社会工作者、及政策制定者需要关注相关人群的心理健康问题，实施有效的预防及干预措施。本调查的结果需更多研究进一步验证，尤其需要队列研究探索就业及收入水平对患者心理健康影响的动态变化。

近红外光谱成像辅助诊断常见精神疾病的临床研究

尹营营* 袁勇贵
东南大学附属中大医院

目的 研究近红外光谱（NIRS）客观诊断精神障碍灵敏度与特异度及 NIRS 相关指标对各类精神障碍的诊断价值。

方法 入组 18-60 岁的抑郁障碍、焦虑障碍、双相情感障碍及精神分裂症患者以及与性别和年龄匹配的对照组共 412 例。应用多通道近红外光谱仪检测所有被试在执行言语流利度任务过程中大脑氧合血红蛋白随时间变化的特征，参照患者的临床诊断，计算 NIRS 波谱客观诊断各类精神障碍的灵敏度与特异度；比较不同精神障碍 NIRS 相关指标（包括任务氧合血红蛋白的 K 激活值、S 积分值、峰值）的差异；应用 ROC 分析 NIRS 相关指标对各类精神障碍的诊断价值；计算各种精神疾病相应的量表评分与 NIRS 相关指标的相关性。

结果 NIRS 波谱客观诊断抑郁障碍的灵敏度 92%，特异度 85%，诊断双相抑郁的灵敏度 78%，特异度 85%，诊断双相躁狂的灵敏度 78%，特异度 93%，诊断焦虑障碍的灵敏度 73%，特异度 80%，诊断精神分裂症的灵敏度 82%，特异度 93%；抑郁障碍、双相抑郁、焦虑障碍、精神分裂症组的 K 激活值显著低于

正常对照，所有患者组的 S 积分值、峰值均显著低于正常对照，精神分裂症组的 T 重心显著高于正常对照；ROC 结果示 S 积分值诊断抑郁障碍的曲线下面积（AUC）为 0.832、诊断双相抑郁的 AUC 为 0.930、诊断焦虑障碍的 AUC 为 0.754，峰值诊断抑郁障碍的 AUC 为 0.761、诊断双相抑郁的 AUC 为 0.760、诊断精神分裂症的 AUC 为 0.776；双相抑郁患者的 HAMD 量表评分与 T 重心呈显著正相关，双相躁狂患者的 YMRS 量表评分与 K 激活值、S 积分值、峰值均呈显著正相关，焦虑障碍患者的 HAMA 量表评分与 K 激活值、S 积分值、峰值均呈显著正相关，与 T 重心呈显著负相关，精神分裂症患者的 PANSS 量表总分及阳性量表分与 S 积分值、峰值呈显著负相关，与 T 重心呈显著正相关，阴性量表分与 S 积分值、峰值呈显著正相关，与 T 重心呈显著负相关。

结论 NIRS 波谱对抑郁障碍和精神分裂症的诊断价值最高，对双相情感障碍的诊断价值中等，对焦虑障碍的诊断效果较差。其中，S 积分和峰值对抑郁障碍和双相抑郁的诊断具有重要价值。T 重心的大小能反映双相抑郁患者的抑郁严重程度。K 激活、S 积分、T 重心和峰值的大小均能反映躁狂和焦虑障碍的严重程度。S 积分、峰值和 T 重心能反映精神分裂症阳性症状和阴性症状严重程度，且与两种症状的相关性相反

Serum ACE Methylation Level and Its Significance in Patients with Comorbid Major Depressive Disorder and Hypertension

Gulibakeranmu?Abula Rui Ma Yi Zhang*
新疆维吾尔自治区人民医院

Objective Major depressive disorder (MDD) often coexists with hypertension (HYT) and is associated with poor health outcomes. Epigenetic mechanisms such as DNA methylation may play an essential role in their development. Angiotensin-converting enzyme (ACE) is a significant enzyme that regulates blood pressure. This study was intended to investigate the diagnostic values of ACE methylation in patients with comorbid MDD and HYT (MDD + HYT).

Methods A total of 119 patients with MDD + HYT were enrolled, including 15 patients with comorbid HYT and severe MDD (sMDD + HYT). Serum ACE methylation level was measured by bisulfite sequencing polymerase chain reaction (BSP), and the diagnostic efficacy of ACE methylation for MDD + HYT was analyzed by receiver operating characteristic curve. Pearson analysis was used to analyze the correlation between ACE methylation rate and depression and HYT. Logistics multivariate regression was utilized to evaluate the independent risk factors for sMDD + HYT.

Results Serum ACE methylation level was significantly increased in MDD + HYT patients. The area under the curve of serum ACE methylation level for differentiating MDD + HYT was 0.7980, and the cut-off value was 33.26 (sensitivity 57.98%, specificity 86.52%). Serum ACE methylation rate was positively correlated with HAMD-17 and self-rating depression scale scores, and diastolic and systolic blood pressure. ACE methylation was an independent risk factor for sMDD + HYT.

Conclusion The elevated serum ACE methylation level in patients with MDD + HYT has certain diagnostic values for MDD + HYT, and ACE methylation was independently correlated with sMDD + HYT.

Altered Regional Spontaneous Neuronal Activity at Rest in Drug-naive Obsessive Compulsive Disorder

Lv Dan[1,2], He Jie[2], Wang Xiaoping[2], Li Ping[1]
1.齐齐哈尔医学院
2.中南大学湘雅二医院

Objective Previous resting-state functional magnetic resonance imaging (rs-fMRI) studies have been used to detect intrinsic regional activity distinction between obsessive-compulsive disorder (OCD) patients and healthy controls (HCs). However, whether the group difference derived from univariate analysis could be useful for informing the diagnosis of individual OCD patients remains unclear.

Methods We combined the amplitude of low-frequency fluctuations (ALFF), fractional ALFF (fALFF), percentage ALFF (perALFF) methods to investigate the group difference in regional spontaneous brain activity between 50 drug-naive OCD patients and 50 demographically matched HCs. Support vector machine (SVM) was applied to to examine whether the abnormal spontaneous neuronal activity regions could be used to distinguish OCD patients from HCs.

Results Compared with HCs, OCD patients showed increased ALFF in the left inferior frontal gyrus (IFG) and right insula, and decreased ALFF in the left cerebellum, right inferior temporal gyrus (ITG), left middle occipital gyrus (MOG), as well as increased fALFF in the right middle frontal, and decreased fALFF in left superior temporal gyrus (STG), besides, increased perALFF in the right ITG, and decreased perALFF in right occipital lobe. A positive correlation was found between increased ALFF in the left IFG and Yale–Brown obsessive compulsive scale compulsive behavior scores in the patients. Moreover, the ALFF values in the combination of left IFG and right insula can be deemed as a potential biomarker to discriminate OCD from HCs with the highest accuracy of 85.00%, sensitivity of 78.00% and specificity of 92.00%.

Conclusion Our preliminary findings emphasized that abnormal regional spontaneous neuronal activity in

the frontal, temporal and occipital regions may play an important role in the neural basis of OCD, and the ALFF values in the combination of left IFG and right insula can be used as a future marker for OCD understanding-classification.

Abnormal Regional Homogeneity at Rest in Patients with Major Depressive Disorder Associated with Sleep Disturbances

Lv Dan Yangpan Ou Jingping Zhao Wenbin Guo*
Department of Psychiatry, and National Clinical Research Center for Mental Disorders, The Second Xiangya Hospital of Central South University, Changsha 410011, Hunan, China.

Objective Abnormal regional homogeneity at rest in patients with major depressive disorder associated with sleep disturbances

Methods Abnormal regional homogeneity at rest in patients with major depressive disorder associated with sleep disturbances

Results Compared with MDD without SD, MDD with SD exhibited increased ReHo values in the right posterior cingulate cortex (PCC)/precuneus, right median cingulate cortex, left postcentral gyrus (postCG), and right inferior temporal gyrus (ITG). Additionally, the ReHo values in the right PCC/precuneus and ITG were positively associated with clinical symptom in all patients. SVM classification results exhibited that a combination of abnormal ReHo in the left postCG and right ITG achieved an overall accuracy of 84.21%, sensitivity of 81.82%, and specificity of 87.50% in distinguishing SD in patients with MDD.

Conclusion We addressed disrupted ReHo patterns in MDD patients with SD, and presented a potential neuroimaging diagnostic biomarker for these patients.

老年血液透析患者睡眠状况、情绪调节与生存质量的相关研究

尚琴* 刘露 李静静
连云港市第四人民医院

目的 本研究旨在分析行血液透析治疗的老年患者的睡眠状况、情绪调节能力与生存质量之间的关系。

方法 研究对象是我市 2021 年 3 月至 2022 年 3 月行血液透析的 82 名老年患者。采用匹兹堡睡眠质量指数（PSQI）评估患者的睡眠质量，采用认知情绪调节策略问卷评估患者的情绪调节能力，采用生存质量测定量表简表（WHOQOL-BREF）评估患者的生存质量。通过分析血液透析患者的睡眠状况、情绪调节能力与生存质量之间的关系。

结果 不同收入和医疗自付方式的患者生存质量评分存在显著差异（P＜0.05）。血液透析患者的整体睡眠质量指数均分为 10.93±2.28 分，PSQI 总分（反向计分）与生存质量总分呈现明显的负相关（r=-0.351, P＜0.001）。PSQI 的 7 个维度与 WHOQOL-BREF 的 4 个维度均存在统计学意义的相关性（P＜0.05）。积极情绪调节策略与生存质量评分呈现明显的正相关（r=0.271, P=0.003），而消极情绪调节策略与生存质量总分呈现明显的负相关（r=-0.238, P=0.008）。

结论 老年血液透析患者的睡眠质量较差，情绪调节能力下降，这对他们的生存质量产生了显著的不良影响。因此，在临床实践中应关注患者的睡眠问题，并引导他们采取积极的情绪调节策略，以有效提高患者的生存质量。

Psychiatric Help-seeking During 1-year Follow-up in Chinese Patients Diagnosed with Type 2 Diabetes Mellitus Comorbid Major Depressive Disorder

耿文奇 姜忆南 洪霞 魏镜*
中国医学科学院北京协和医院

Objective Previous research has revealed a bidirectional relationship between type 2 diabetes mellitus (T2DM) and major depressive disorder (MDD). A very limited proportion of patients with T2DM comorbid MDD received adequate psychiatric intervention. This study investigated the help-seeking behaviors of patients with T2DM comorbid with MDD during one-year follow-up.

Methods At a medical center in China, a cohort of outpatients with T2DM were assessed and diagnosed for comorbid depression at baseline and after one year. Mental health help-seeking behaviors of patients during follow-up period were also evaluated.

Results Out of the 203 patients with T2DM at baseline, 114 completed the follow-up. A total of 26 patients had comorbid MDD during the follow-up period. Among the 17 patients diagnosed with MDD at baseline, who also completed the follow-up, five sought psychiatric care subsequent to the initial diagnose. Three of the nine newly diagnosed patients with MDD voluntarily visited psychiatric clinics, while others did not seek assistance.

Conclusion Voluntary psychiatric help-seeking for Chinese patients with comorbid T2DM and MDD is uncommon. It is crucial to increase awareness of depression among patients and healthcare professionals alike.

Predictive Factors of Psychiatric Syndrome in Patients with Systemic Erythematosus Lupus: A Retrospective Study

耿文奇 张上珠 曹锦亚 洪霞 段艳平 姜忆南 魏镜*
中国医学科学院北京协和医院

Objective Early detection of neuropsychiatric systemic lupus erythematosus (NPSLE) remains a challenge in clinical settings. Previous studies have found different autoantibodies as markers for NPSLE. This study aimed to describe the distribution of psychiatric syndromes in a group of patients with systemic lupus erythematosus (SLE) and to investigate the association between psychiatric syndromes and specific autoantibodies.

Methods This retrospective study was conducted at a single medical center. We reviewed medical records of hospitalized patients with SLE who were consulted by psychiatrists, those with accurate psychiatric diagnoses were included in the study. Results of serum autoantibodies and general laboratory tests were collected. The correlation between clinical variables was examined. Binary logistic regression analyses were used to determine factors related to different psychiatric diagnoses.

Results 148 of 160 (92.5%) patients with SLE had at least one psychiatric diagnosis. Acute confusional state had the highest prevalence (54.4%). Anti-β2 glycoprotein I (-β2GP1) antibody alone varied significantly between groups (X2 = 14.153, p = 0.028), the highest positive rate (46.2%) found in patients with depressive disorders. Immunoglobin A level was a predictor of cognitive dysfunction (OR 1.606 [95% CI 1.052 - 2.452]), whereas anti-β2GP1 antibody (OR 0.226 [95% CI 0.053 – 0.952]) and course of disease (OR 1.129 [95% CI 1.031 – 1.236]) were predictors of mood disorders.

Conclusion Immunoglobin A and anti-β2GP1 antibody are potential markers for NPSLE. In order to better elucidate the pathological mechanism of NPSLE, it is important to investigate neuropsychiatric disorders separately in future studies.

关键字：systemic lupus erythematosus, neuropsychiatric systemic lupus erythematosus, mental disorders, biomarkers, referral consultation

Aberrant Plasma Exosomal Derived CeRNA Networks As Diagnosis Biomarkers for Adolescent Major Depressive Disorder and Its Potential Prediction for Antidepressant

徐一凡 杜鑫哲 章蓉 黄阳茜 高耀 温宇娇 乔丹 孙宁* 刘志芬*
山西医科大学第一医院

Objective Major depressive disorder (MDD) in adolescence seriously endangers their mental and physical health and is associated with poor social and scholastic function. However, the diagnosis biomarkers for adolescent with MDD remain unclear.

Methods A total of 114 adolescent subjects were enrolled in this study, the comprehensive clinical and cognitive assessments were performed. Differential expressions of lncRNAs and mRNAs of plasma exosomes were screened by microarray assay. Two sets of ceRNA (lncRNAs-miRNAs-mRNAs) networks had been generated and candidate genes had been screened by bioinformatic analysis, and candidate genes were validated in cohort using qRT-PCR.

Results A total of 3752 differentially expressed lncRNAs and 1789 differentially expressed mRNAs were identified. AC156455.1, miR-126-5p, AAK1 and CCDC18AS1, miR-6835-5p, CCND2 were picked from each network as candidate genes. We found that the six candidate genes were differential expression between MDD patients and healthy controls, or before and after antidepressant treatment of MDD group. The expression levels of AAK1, CCDC18AS1 and miR6835 varied in efficacy after 8-week sertraline treatment. We also found that the expression of CCDC18AS1, miR-6835-5p, CCND2 (in the same network) at baseline could predicted antidepressant efficacy, which may be mediated through reducing suicidal ideation and improving cognitive function.

Conclusion Our study identified and validated the plasma exosome-derived ceRNA networks altered in adolescent with MDD, our findings provided potential diagnosis and therapeutic biomarkers for adolescent with MDD.

U-shaped Association between Fasting Blood Glucose and Suicide Attempts in Chinese Patients with First-episode Drug-na?ve Major Depressive Disorder

刘军军[1] 杜向东[2]
1.南京梅山医院
2.苏州广济医院

Objective Evidence regarding the relationship between fasting blood glucose (FBG) and suicide attempts (SA) in patients with major depressive disorder (MDD) was limited. Therefore, the objective of this research was to investigate whether FBG was independently related to SA in Chinese patients with first-episode drug-na?ve (FEDN) MDD after adjusting for other covariates.

Methods The present study was a cross-sectional study. A total of 1718 participants (average age: 34.9 ± 12.4 years, 65.8% females) with FEDN MDD were involved in a hospital in China from September 2016 to December 2018. Multiple logistic regression analysis and smooth curve fitting were used to estimate the association between FBG and the risk of SA. The threshold effect was examined by the two-piecewise linear regression model. Interaction and stratified analyses were conducted according to sex, education, marital status, comorbid anxiety, and psychotic symptoms.

Results The prevalence of SA in patients with FEDN MDD was 20.1%. The result of fully adjusted binary logistic regression showed FBG was positively associated with the risk of SA after adjusting for confounders (odds ratio (OR) = 1.62, 95% CI: 1.13–2.32). Smoothing plots also revealed a nonlinear relationship between FBG and SA, with the inflection point of FBG being 5.34 mmol/l. The effect sizes and the confidence intervals on the left and right sides of the inflection point were 0.53 (0.32-0.88, P= 0.014) and 1.48 (1.04–2.10, P=0.030), respectively.

Conclusion A U-shaped relationship between FBG and SA in FEDN MDD patients was found, with the lowest risk of SA at a FBG of 5.34 mmol/l, indicating that both the lower and higher FBG levels may lead to an increased risk of SA.

Combined Static and Dynamic Functional Signatures of Default Mode Network Identifying Anhedonia in Patients with Recurrent Major Depressive Disorder

Xiaoyun Liu[1], Fan Li[2], Youyong Kong[2], Yonggui Yuan[1]
1.Department of Psychosomatics and Psychiatry, Zhongda Hospital, School of Medicine, Southeast University, Nanjing, China
2.Lab of Image Science and Technology, School of Computer Science and Engineering, Key Laboratory of Computer Network and Information Integration, Ministry of Education, Southeast University, Nanjing, China

Objective Default mode network (DMN) is demonstrated to be closely related to major depressive disorder (MDD). However, most previous studies only focus on DMN static changes while ignoring the dynamic changes. This study analyzes both functional connectivity (FC, static characteristics) and time variability (TV, dynamic characteristics) for the purpose of exploring the pathogenesis of MDD.

Methods 47 patients with FEDN, 49 rMDD and 64 healthy controls (HCs) are recruited. DPASF software is used to calculate DMN-FC and DMN-TV. Then, the differences of the above characteristics among three groups as well as their correlations with the severity of depression and anhedonia are analyzed. Finally, the TVs or FCs which significantly correlated with symptoms severity are regarded as predictors to forecast the symptoms by receiver operating characteristics (ROC) curve.

Results FCs of both FEND and rMDD are generally decreased, while TVs are generally increased. In the patients with rMDD, there are significant positive correlations between anhedonia and the TV, FC. The ROC analyses demonstrate that combined FC and TV in clusters with significant differences between groups exhibited higher accuracy (84.6%) than those of TV (78.3%). While, as for the whole MDD, these static and dynamic indicators still have good accuracy in predicting anhedonia, and the combination of dynamic and static functions is more accurate (77.5%) than either dynamic (69.8%) or static indicator (70.7%) alone.

Conclusion Our current findings highlight the potential of combined brain static and dynamic function for identifying reliable diagnostic biomarkers and unique neuropathological mechanisms underlying anhedonia in rMDD.

关键字：first-episode drug-na?ve major depressive disorder (FEND); recurrent major depressive disorder (rMDD); default mode network (DMN); functional connectivity (FC); time variability (TV)

模拟健康教育对首次无抽搐电休克治疗前精神障碍患者的焦虑情绪影响研究

李小梅*
西安交通大学第一附属医院

目的 评估患者治疗前的知识需求满足度、自身准备完备率、MECT 治疗达标率、满意度及麻醉配合度，患者恐惧、焦虑程度，首次电休克治疗、患者的焦虑情绪与健康教育有关，我们在对其进行传统的健康宣教后或者改用模拟电休克治疗进行术前宣教对患者焦虑情绪有没有明显的影响，

方法 以精神障碍患者为研究对象，一般资料调查问卷、汉密尔顿焦虑量表为评定问卷为研究工具，对研究对象进行横断面调查，描述精神障碍患者首次电休克前健康教育方式对患者焦虑情绪的影响 筛选 2023 年 10 月至 2024 年 10 月交大一附院精神心理科住院首次进行 MECT 治疗的精神障碍患者 60 例。将 60 例病人随机分组，分成实验组和对照组，每组 30 人，对照组按照传统健康教育形式进行宣教，实验组按照模拟健康教育形式进行宣教。同时采用焦虑自评量表(SAS)评估患者的焦虑状况。

结果 ①心理状态测评值，护理前，两组对比无差异（p>0.05），护理后，实验组获值更理想，优于参照组，具备差异（P<0.05）；②实验组健康教育各项评分结果获值优于参照组，差异具有统计学意义（p<0.05）；③实验组总满意率更高，均优于参照组，组间对比（p<0.05）。

结论 临床上针对首次无抽搐电休克治疗前精神障碍患者开展模拟健康教育模式，可以减轻患者的心理焦虑状态，能够更多，更全面的了解电休克治疗全过程，提升患者治疗依从性，进而提升了患者满意率，值得普及和应用。

关键字：模拟健康教育，无抽搐电休克治疗，精神障碍，焦虑情绪

青少年抑郁症患者出院准备度现状与 30 天内非计划再入院的关系研究

刘薇*
西安交通大学第一附属医院

目的 调查青少年抑郁症患者的出院准备度现状及影响因素；统计青少年抑郁症患者 30 天内非计划再入院率；探讨青少年抑郁症患者的出院准备度与 30 天内非计划再入院的关系。为医护人员提高青少年抑郁症患者出院准备度提供新的视角，有针对性的提高青少年抑郁症患者出院准备度，更好完成过渡时期护理，减少患者再入院。

方法 1.采用出院准备度量表(RHDS)，出院指导质量量表(QDTS)，领悟社会支持量表(PSSS)，采用便利抽样法对西安市某三级甲等医院的 275 例青少年抑郁症患者问卷调查，并在患者出院第 30 天进行电话或床旁随访确认是否再入院。2.运用 Epidata3.1 双人录入数据，SPSS 24.0 进行数据分析。采用频数、构成比、均数、标准差进行描述性统计分析，采用 t 检验、方差分析进行单因素分析。采用 Pearson 相关分析法，描述量表各个维度之间的相关关系。将单因素及相关分析有统计学意义的变量纳入方程，进行多元逐步线性回归分析。青少年抑郁症患者出院准备度与 30 天内非计划再入院的关系采用卡方检验。

结果 1.青少年抑郁症患者出院准备度得分为(95.69±11.43)分，出院指导质量得分为(150.95+14.92)分，领悟社会支持得分为(52.16+666)分。2.青少年抑郁症患者人口社会学及疾病相关资料单因素分析结果显示:文化程度、父母教养，家庭人均月收入、居住状态、存在障碍类型、家庭支持、主要照顾者、共 7 个方面显示出青少年抑郁症患者的出院准备度，存在差异具有统计学意义(P<0.05)。3.青少年抑郁症患者出院准备度与出院指导质量(r=0.664，P<0.01)、领悟社会支持(r=0.427，p<0.01)均呈现正相关关系 4.多元逐步回归分析显示共有 7 个因子:文化程度、指导技巧及效果、出院前实际获得的内容、经济支持意愿、存在障碍类型、家庭支持、患者出院前需要的内容进入回归方程，可解释青少年抑郁症患者出院准备度总变异的 67.5%。5. 7.3%的青少年抑郁症患者发生了 30 天内非计划再入院。

结论 1.青少年抑郁症患者出院准备度为中等水平，有提升的空间。2.青少年抑郁症患者出院准备度与出院指导质量、领悟社会支持均呈正相关。3.文化程度、指导技巧及效果、出院前实际获得的内容、经济支持意愿、存在障碍类型、家庭支持、 患者出院前需要的内容、家庭支持是影响患者出院准备度的主要因素。4

关键字：青少年抑郁症，出院准备度，非计划再入院

探析规范化风险管理模式对提高精神科护理安全和护理质量的作用

王小婷 *
西安交通大学第一附属医院

探析规范化风险管理模式对提高精神科护理安全和护理质量的作用 目的 为使患者对护理工作更加满意，使护理满意度不断提高；可以降低不良事件的发生率，避免医疗纠纷的发生，提升精神科患者住院安全探析规范化风险管理模式对提高精神科护理安全和护理质量的作用。

方法 采用简单随机法选取 2019 年 1-6 月份 200 例精神障碍患者为研究对象，对 100 例对照组患者给予精神科护理常规，对 100 例观察组患者给予规范化风险管理措施，对比两组患者的临床护理质量与不良事件发生率。

结果 观察组临床护理质量明显要比对照组高(P<0.05)；观察组在临床护理过程中不良事件的发生情况要明显低于对照组(P<0.05)。

结论 在临床上护理精神科患者时，运用规范化风险管理模式可以提高临床护理质量，使患者对护理工作更加满意，使护理满意度不断提高；可以降低不良事件的发生率，避免医疗纠纷的发生，提升精神科患者住院安全，因此规范化风险管理模式具有提高精神科护理安全和护理质量的作用，在临床上值得进行应用。综上所述，在精神科住院患者护理中采用规范化风险管理模式，护理方面的满意度会显著上升；可有效预防或减少风险事件的发生，在临床上的应用价值较高。

心理干预及语言沟通在精神科护理中的应用效果研究

王晓萌*
西安交通大学第一附属医院

目的 探究心理干预及语言沟通在精神科护理中的应用效果。

方法 从我院精神科收治的患者中随机选择 50 人作为研究对象进行对比分析，时间在 2021 年 12 月-2022 年 12 月之间，并按照护理方法的不同进行分组研究，分别为采用常规护理的对照组和采用心理干预和语言沟通的观察组，每组均为 25 人。观察组男性患者人数为 13 例，女性患者人数为 12 例；年龄为 22～46 岁，平均年龄为 32.72±7.25 岁。对照组男性患者人数为 12 例，女性患者人数为 13 例；年龄为 21～45 岁，平均年龄为 32.32±7.43 岁。。

结果 两组患者 IDA 各评分在护理前均无显著性差异（P>0.05)；护理后观察组与对照组相比， IDA 各项评分均显著低于对照组（P<0.05）。观察组患者护理满意度（92.00%）显著高于对照组（68.00%)(P<0.05)；实验组冲动行为发生率显著低于对照组（P<0.05)； 结论：心理护理与语言沟通在临床精神病学护理中具有举足轻重的地位，可帮助病人克服疾病的自信心、减少言语、行为的异常，同时也能加强传统的理疗效果。随着社会生活水平的提高，精神疾病的发病率也越来越高，心理护理与言语交流在临床精神病治疗中的重要

性不言自明。现代护理工作者应具备良好的心理与言语交流，完善整体护理制度，以提升临床精神科护理质量。心理干预和语言沟通对精神病患者的护理效果显著，能缓解患者的不良精神症状，提高护理满意度，降低冲动行为发生率。

关键字：心理干预；语言沟通；精神科护理

心理护理及语言沟通在精神科护理中的价值分析

吴蓉*
西安交通大学第一附属医院

心理护理及语言沟通在精神科护理中的价值分析

目的 针对在精神科护理中应用心理护理和语言沟通的效果进行对比分析。

方法 从我院精神科收治的患者中随机选择 100 人作为研究对象进行对比分析，时间在 2021 年 11 月-2022 年 11 月之间，并按照护理方法的不同，将这些患者平均分为两组，分别为采用常规护理的对照组和采用心理护理和语言沟通的观察组，每组均为 50 人。

结果 在两组患者的服药依从性方面，与对照组相比，观察组有明显的提高，结果具有明显差异（P<0.05），在生活质量评分方面，观察组也明显高于对于对照组，结果具有明显差异（P<0.05）；观察组患者的汉密尔顿焦虑量表（HAMA）评分、汉密尔顿抑郁量表（HAMD）评分均显著较对照组低（P＜0.05）；观察组患者的 MOAS 评分显著低于对照组（P＜0.05），安全事件发生率、性格改变发生率、行为异常发生率、语言异常发生率和病情复发率均显著较对照组低（P＜0.05）。

结论 将心理护理及语言沟通运用在精神科临床护理中，可以使得患者的服药依从性以及患者得生活质量得到有效提升的同时，而且患者的心理状态也可以得到有效的改善，使得安全事件的发生概率以及病情复发率也得到有效的降低。

老年精神分裂症患者发生攻击行为的相关影响因素及其干预措施分析

肖瑾*
西安交通大学第一附属医院

目的 探讨老年精神分裂症（SP）患者发生攻击行为的相关影响因素及其干预措施。 方法 选取我院 2019 年 10 月至 2022 年 9 月期间收治的 94 例老年精神分裂症患者的临床资料进行收集、整理及分析。以调查问卷方式收集入组患者年龄、性别、婚姻状况、文化程度、共同居住者、家族史、病程、服药依从性、童年创伤水平、社会支持水平、攻击行为、伴有躯体疾病等资料。运用修订版外显攻击行为量表（MOAS）、童年创伤水平使用童年期创伤经历问卷（CTQ）及社会支持评定量表（SSRS）进行评分，分析老年精神分裂症患者发生攻击行为的相关影响因素。 结果 老年精神分裂症患者攻击行为发生率为 29.79%（28/94）；单因素分析显示：年龄、性别、婚姻状况、共同居住者、家族史、病程与老年 SP 患者发生攻击行为无关，差异无统计学意义（P＞0.05）；文化程度、服药依从性、童年创伤水平、社会支持、伴有躯体疾病与老年精神分裂症患者发生攻击行为有关，差异有统计学意义（P＜0.05）。多因素分析显示：初中及以下文化、服药依从性较差、童年创伤水平＞62 分、社会支持＞32 分、伴有躯体疾病是老年精神分裂症患者发生攻击行为的高危因素（P＜0.05）。 结论 研究数据显示老年精神分裂症患者发生攻击行为与文化程度、服药依从性、童年创伤水平、社会支持、伴有躯体疾病有关。早期识别高危患者而实施相应的预防措施干预，对于减少或预防攻击行为发生至关重要。

关键字：老年精神分裂症，攻击行为，干预措施

父母教养方式与青少年抑郁的关系研究--反刍思维的中介作用

张芳芳[1] 高睿[2] 王新凯[2] 张于巾[2] 杨海燕[2]
1.西安交通大学第一附属医院精神心理卫生科
2.西安交通大学医学部护理系

目的 通过探讨青少年父母教养方式、反刍思维、抑郁三者的关系，构建以反刍思维为中介作用的结构方程模型，为青少年抑郁的预防及心理治疗提供数据支持。

方法 本研究为横断面调查研究。2022 年 3～4 月采用分层随机抽样的方法选取甘肃省宁县某中学和高中 302 名同学为研究对象，使用一般资料调查问卷、贝克抑郁量表第二版、简式父母教养方式量表、中文版反刍思维量表进行调查。采用 Pearson 相关分析青少年父母教养方式、反刍思维和抑郁之间的相关性，采用 AMOS 建立结构方程模型分析青少年反刍思维在父母教养和抑郁之间的中介效应。

结果 1. 反刍思维总分及各维度得分与抑郁得分均呈显著正相关（r=0.452～0.739，p<0.05）、父母教养方式中的父母情感温暖得分与抑郁得分均呈显著负相关（r=-0.297～-0.424，p<0.05）、父母拒绝得分和父亲过度保护得分与抑郁得分均呈显著正相关（r=0.248～0.355，p<0.05）。 2. 结构方程模型结果显示，父亲情感温暖、父亲过度保护、母亲过度保护、母亲拒绝对反刍思维的效应值分别为-0.188、0.379、-0.208、0.233；反刍思维对抑郁的效应值为 0.584；父亲情感温暖对抑郁的总效应值为-0.305，直接效应值为-0.195，通过反刍思维而影响的间接效应值为-0.110；父亲过度保护对抑郁的总效应值为 0.221，直接效应值为 0，通过反刍思维而影响的间接效应值为 0.221；母亲过度保护对抑郁的总效应值为-0.121，直接效应值为 0，通过反刍思

维而影响的间接效应值为-0.121；母亲拒绝对抑郁的总效应值为 0.136，直接效应值为 0，通过反刍思维而影响的间接效应值为 0.136。

结论 1. 反刍思维总分及各维度得分与青少年抑郁得分呈正相关，父母教养方式中的父母情感温暖得分与青少年抑郁呈负相关、父母拒绝得分和父亲过度保护得分与青少年抑郁呈正相关。2. 父母教养方式中的父亲情感温暖可以直接影响抑郁，也可以通过反刍思维间接影响抑郁；而父亲过度保护、母亲过度保护、母亲拒绝仅通过反刍思维间接影响抑郁。其中，父亲情感温暖、母亲过度保护与抑郁之间呈负性效应，父亲过度保护、母亲拒绝与抑郁之间呈正性效应。

关键字：父母教养方式；反刍思维；抑郁；青少年

Quality of Life Among Patients with Bodily Distress Syndromes in China

Jing Ma[1], Linli Zheng[1], Kurt Fritzsche[2], Anne Christin Toussa[3], Jing Wei[4], Lan Zhang[1]
1.Mental Health Center, West China Hospital, Sichuan University, China
2.Department of Psychosomatic Medicine and Psychotherapy, University Medical Centre Freiburg, Germany
3.Department of Psychosomatic Medicine and Psychotherapy, University Medical Centre Hamburg-Eppendorf, Germany
4.Department of Psychological Medicine, Peking Union Medical College Hospital, Chinese Academy of Medical Sciences and Peking Union Medical College, China

Objective Somatoform and other functional disorders are common diseases with heavy social burden. It is necessary to explore the quality of life about the bodily distress syndrome (BDS), a new diagnosis of functional somatic symptoms, especially in primary care condition. Our study aims to investigate the quality of life in patients with the BDS and to explore the influencing factors, in order to gain more reference for treatment and prognosis.

Methods The data were derived from the 1269 patients' multicenter cross-sectional study, which conducted in 9 different Chinese hospitals. the BDS Checklist-25 and a brief version of the Schedules for Assessment in Neuropsychiatry (RIFD) were used to examine the BDS diagnosis. The quality of life was identified by the Short-form Health Survey-12 (SF-12). To accessed psychological characteristics, the Patient Health Questionnaire-9 (PHQ-9), the General Anxiety Disorder-7 (GAD-7) and the Whiteley scale -8 (WI-8) were applied.

Results A total of 697 patients were collected in the final analysis. The prevalence of the BDS in this sample was 26.8% (95% confidence interval: 23.5–30.1). Patients with BDS scored 72.61±15.08 on the SF-12, significantly lower than the patients without BDS(87.92±16.40, p<.001), of which scored 38.14±8.96 on the PCS and 34.72±11.87 on the MCS. The BDS patients scored significantly higher on PHQ-9(11.85±7.18), GAD-7(9.37±6.43), WI-8(25.11±8.64) (p<.001). In the stepwise regression analysis, the SF-12 total score was significantly associatied with WI-8 score (B=-1.127, p<.001), PHQ-9 (B=-.345, p<.001), and BDS (B=-3.416, p=.010), the explained variance was Nagelkerke's R2 = 0.424.

Conclusion The inferior quality of life of patients suffered from the BDS call for more attention for the BDS, including the recognition, diagnosis, treatment and prognosis.

静息态脑网络与抑郁症的因果关联研究：两样本双向孟德尔随机化分析

黄东苗 王相兰*
中山大学附属第五医院

目的 既往研究发现静息态脑网络（RSNs）与抑郁症密切相关，但 RSNs 与抑郁症之间的因果关系尚不明确，本研究通过双向孟德尔随机化研究进一步分析 RSNs 与抑郁症之间的因果效应。

方法 本研究全基因组关联分析（GWAS）静息态脑网络的数据来自于复杂性状遗传实验室（Complex Trait Genetics Lab），抑郁症的数据源于芬兰基因数据库（FinnGen Study）。选取默认网络、背侧注意网络、额顶网络、边缘网络、躯体运动网络、腹侧注意网络、视觉网络、全局网络共 8 个静息态脑网络进行分析，功能连接网络数据基于静息态脑功能成像（rs-fMRI），结构连接网络数据基于扩散加权成像（DWI）。采用两样本双向孟德尔随机化分析 8 个功能连接、8 个结构连接与抑郁症的关联，单核苷酸多态性（SNPs）采用的阈值为 $p < 5\times10\text{-}5$，连锁不平衡条件筛选设置为 $r2 < 0.01$，同时采用 MR-Egger 法、加权中值法、MR-PRESSO 方法检验结果的异质性、敏感性和多效性。本研究中使用的全基因组数据获取时间为 2023 年 5 月，由 R 软件进行统计分析。

结果 经逆方差加权法分析发现边缘网络结构连接与抑郁症存在因果关系：OR = 28.21, 95%CI: 3.32-239.54, P=0.002，但功能连接网络与抑郁症之间不存在具有统计学意义的因果关联，同时反向 MR 分析结果无统计学意义。

结论 结构连接边缘网络与抑郁症的发生相关联，但功能连接脑网络与抑郁症发生，或抑郁症与脑网络静息态结构或功能连接改变之间均无因果关联。

关键字：孟德尔随机化分析；抑郁症；静息态脑网络；神经影像学

MCRNN for Psychiatric Disorder Identification in Resting-state EEG

郑磊磊[1,2] 喻林珍[1] 林铮[1,2]
1.浙江大学医学院附属第二医院
2.CSP 综合医院精神心理研究协作组

Objective Accurate classification based on affordable objective neuroimaging biomarkers are important steps toward designing individualized treatment.

Methods In this work, we investigated a deep learning classification model, multi-scale convolutional recurrent neural network (MCRNN), to explore psychiatric disorder-related biomarkers by leveraging the spatiotemporal information of resting-state EEG (rsEEG) using a multiple psychiatric disorder database containing 327 individuals diagnosed with schizophrenia, bipolar, major depressive disorders and healthy controls. All subjects were mapped to a shared low-dimensional subspace for intuitively interpreting the inter-relationship and separation of psychiatric disorders.

Results Psychiatric disorders were identified using rsEEG with high accuracy ranged from 78.6% to 91.3% in patient vs controls 2-class classification, and 68.2% in 4-class classification. The control-to-schizophrenia trajectory interpretated by the model was consistent with the disease severity in clinical observation.

Conclusion The MCRNN demonstrated a capability in extracting discriminative rsEEG biomarkers for psychiatric disorder classification, indicating its potential to facilitate our understanding of psychiatric disorders and monitoring interventions.

The Trends of Psychosomatic Symptoms and Perceived Stress Among Healthcare Workers During The COVID-19 Pandemic in China: Four Cross-sectional Nationwide Surveys, 2020-2023.

江晨光 姜文颢 袁勇贵*
东南大学附属中大医院

Objective Three years have passed since the COVID-19 outbreak. Global healthcare workers made significant contributions while enduring extra workloads and immediate health threats. However, an unseen wave of vast infection was detected in China last December, and healthcare workers were faced with inevitable challenges and heavy stress. This study aggregated four waves of the psychosomatic survey lasting to last month, emphasizing healthcare workers but the rest of society. We aimed to present a dynamic mental health map and, most importantly, provide a timely report of the current situation in our colleagues.

Methods The current study successfully conducted four national cross-sectional online surveys from February and March 2020, Apr 2022, and Jan 2023. The Psychosomatic Symptom Scale (PSSS) and Perceived Stress Scale-10 (PSS-10) were used to assess psychosomatic symptoms and perceived stress.

Results 14945 participants participated in the surveys, including 8578 healthcare workers and 6367 others. The prevalence of psychosomatic syndrome, reflected by PSSS, was 19.3% (first wave), 22.9% (second wave), 36.4% (third wave), and 60.7% (fourth wave) among healthcare workers, compared to 24.0% (first wave), 35.7% (second wave), 34.2% (third wave) and 50.5% (fourth wave) among the others. In addition, healthcare workers exhibited lower PSSS total scores at the beginning (waves 1 and 2), but scores were higher at later waves (waves 3 and 4) (all $p < 0.05$). Despite their infection status, they now suffer from more severe psychosomatic symptoms than the rest of society.

Conclusion Healthcare workers?in China experienced severe?psychosomatic symptoms and tremendous stress now. There is an urgent need to utilize social support for them.

The Efficacy of Add-on Robot-Aided Transcranial Magnetic Stimulation on The Negative Thinking Related To Pain in Adolescent Depressive Disorder

Qiao Dan Ma Lu Zhang Xuemin Wen Yujiao Xu Yifan Li Gaizhi Yang Chunxia Liu Zhifen*
First Hospital of Shanxi Medical University

Objective The pain catastrophising and vigilance are typical manifestations of the fear of pain. Oftentimes, adolescent patients with major depressive disorder (MDD) complain of fear of pain that negatively impact their day-to-day function, and these pain problems are not alleviated by current first-line treatments. Converging evidence suggests this relationship is due in part to shared neural mechanisms, especially the altered function of dorsolateral prefrontal cortex (DLPFC). This study examined the therapeutic effect of targeting DLPFC on the level of pain catastrophising and vigilance in adolescent depressive disorder by add-on Robot-Aided Transcranial Magnetic Stimulation(TMS).

Methods 60 adolescent MDD patients were allocated to treatment with either Robot-Aided TMS combined with sertraline (add-on TMS group, n=30) or only setraline (Sertraline group, n=30). In addition to receiving the same dose of sertraline as the control group, patients in TMS group received 10 sessions of Robot-Aided TMS over the bilateral DLPFC (left: 10Hz, right: 1Hz). Clinical response to treatment was determined using the Pain Catastrophizing Scale (PCS) and Pain Vigilance and Awareness Questionnaire (PVAQ), and the primary efficacy was the change in score from baseline to posttreatment assessment. Additional measures were score changes after another 8 month of follow-up.

Results The add-on TMS group displayed a significant decreased score on the PCS, the rumination subscale of PCS, and PVAQ after the intervention, compared to that in the Sertraline group (all P<.05). Also, a mixed-effects repeated-measures model revealed significant improvement in scores on the PCS, the rumination subscale of PCS,

and PVAQ during the post-intervention and follow-up periods in the add-on TMS group (all P < .05, Bonferroni correction).

Conclusion Add-on Robot-Aided TMS over the DLPFC significantly improved the negative thinking related to pain and may be considered as a potential intervention for adolescent MDD patients with a high level of pain fear.

Differences in The Depression and Burnout Networks between Doctors and Nurses: Evidence From A Network Analysis

Zhang Zheng Chen Hui Li Xu-ting Chen Shu-rui Wang Ziyu Yang Jia-xin Chen Zeng-yu Wang Xiao-ping Tian Yusheng* Zhou Jian-song*
中南大学湘雅二医院

Objective Previous studies have demonstrated a strong association between depression and occupational burnout among healthcare professionals, but the results have been inconsistent, and there is a lack of in-depth exploration of such a relationship among different healthcare professions. The present study aims to investigate the interrelationships between depression and burnout among Chinese healthcare professionals and whether there are differences in the networks of these symptoms between doctors and nurses.

Methods The Maslach Burnout Inventory-General Survey and the 2-item Patient Health Questionnaire were employed to assess occupational burnout and depression among 3,684 healthcare professionals. The translation has been refined to ensure accuracy and academic suitability. Subsequently, network analysis was conducted on 2,244 participants with a higher level of occupational burnout to identify core symptoms and explore the associations between occupational burnout and depression.

Results The present study showed a network association between lack of interest and pleasure in things and being exhausted from work, excessive tiredness facing work, tendency to collapse at work, and lack of passion for work than before among healthcare professionals, as well as a notable difference in the network association between lack of interest and pleasure in things and lack of passion for work than before between nurses and doctors.

Conclusion The present study provided a reference for the development of targeted interventions to improve the mental health of healthcare professionals.

首发与复发抑郁症患者临床特征分析与护理对策

李晓俞*
山西医科大学第一医院

目的 通过分析首发与复发抑郁症患者的临床特征及其差异，以期能对不同患者提供更为针对性的护理措施。

方法 对 2017 年 5 月 1 日-2022 年 10 月 31 日在我院住院的 911 例抑郁症患者进行回顾分析，总结首发和复发抑郁症患者汉密尔顿抑郁量表（HAMD）、汉密尔顿焦虑量表（HAMA）评分情况，采用 t 检验对两者之间的差异进行分析。

结果 纳入的 911 例患者中，首发抑郁症患者 408 例，复发患者 503 例。本次研究的 408 名首发抑郁障碍患者中，男 137 例（33.58%）、女 271 例（66.42%），女性患者多于男性患者；复发患者 503 例，男 144 例（28.63%）、女 359 例（71.37%），女性患者也多于男性患者。本研究发现首发抑郁症及复发抑郁症女性患者所占比例大于男性患者。所有纳入患者中，年龄分布在 12 岁- 81 岁之间，平均 44.67±16.97 岁。首发抑郁症患者平均年龄为 41.75±17.24 岁，复发患者中平均年龄为 47.04±16.39。显示抑郁症患者平均发病年龄为 40 岁左右。首发和复发抑郁症患者 HAMD 评分中，得分较高的前三位因子均为焦虑/躯体化、阻滞和绝望感；复发患者在早晨情绪变化和能力减退感方面得分均高于首发患者，差异具有统计学意义（P<0.05）。首发和复发抑郁症患者 HAMA 评分中，两组患者各条目得分及 HAMA 总分均无明显差异，但两组患者中精神性焦虑得分均高于躯体性焦虑。

结论 首发抑郁症及复发抑郁症中，平均年龄 40 岁，且女性多于男性，首发与复发抑郁症患者的护理过程中，要加强对焦虑/躯体化、阻滞、绝望感和精神性焦虑的观察，与首发抑郁症患者相比，要更多关注复发抑郁症患者晨起的情绪和对自身能力的怀疑程度。复发抑郁症患者晨起的情绪低落较首发患者更明显，且绝望悲观感觉更强烈，因此针对疾病反复发作与住院时间较长的患者，护理人员应耐心讲解复发原因，疏导不良情绪。首发与复发抑郁症患者均伴有明显的焦虑情绪。因此，护理人员应帮助患者辨别焦虑行为，进一步引导患者接受焦虑行为。引导患者描述其解决焦虑的方式，设想初较好的应对方式；教会患者静坐、慢跑等放松技巧；鼓励患者参加活动分散注意力。

MIR124 Polygenic Risk and Childhood Trauma Is Associated with Bipolar Disorder and Affects Functional Connectivity of The Striatum

钟舒明 苏婷 赖顺凯 陈观茂 张一靓 何嘉丽 黄东 严舒雅 陈盼 陆晓丹 黄晓思 陈超 王颖 贾艳滨*
暨南大学附属第一医院

Objective Bipolar disorder (BD) is a highly heritable disease, with a complex multifactorial etiology, and the

specific mechanisms remain largely unknown. MicroRNA-124 (MIR124) is associated with polygenic risks in the BD, which may relate to the integrity of brain function. Our study was to investigate the associations between MIR124 polygenic risk score (PRS) and functional connectivity (FC) of the striatum, as well as their relationship with childhood trauma.

Methods We calculated MIR124 PRS from 80 patients with BD and 54 healthy controls (HCs). And childhood trauma was measured by the Chinese version of Childhood Trauma Questionnaire (CTQ). We also analyzed resting-state functional magnetic resonance imaging (fMRI) data from BD and HCs. The sliding-window analysis was used to evaluate whole-brain FC for each striatum subregion seed. Partial correlation and mediation analysis were performed to explore the associations between MIR124 PRS, CTQ scores and FC values.

Results MIR124 PRS in the BD patients was significantly higher than that in the HCs. The frequency and score of emotional abuse (EA), physical abuse (PA), emotional neglect (EN), and physical neglect (PN) were higher in those patients with BD than those in HCs. Compared with the HCs group, the BD group exhibited decreased FC between the left dorsal caudate (dCa) and the right thalamus, the right dCa and the left medial superior frontal gyrus, and between the right dorsolateral putamen (dlPu) and right median cingulate and paracingulate gyri, as well as increased FC between the right dlPu and left precentral gyrus, and between the right globus pallidus (GP) and left precentral gyrus. In BD patients, MIR124 PRS showed a positive correlation with the FC values in the right GP-left precentral gyrus, and a negative correlation with the FC values in the right dlPu-right median cingulate and paracingulate gyri. In addition, MIR124 PRS and the FC values in the right GP-left precentral gyrus showed positive correlations with CTQ scores. The mediation analyses showed that the CTQ EN and PN scores were complete mediators of the relationship between MIR124 PRS and FC between right GP and left precentral gyrus.

Conclusion The findings suggested that higher MIR124 PRS and childhood trauma may relate to aberrant FC of corticostriatal circuitry in BD, which may provide new information on the mechanism of BD.

关键字：Bipolar disorder; MicroRNA-124; Functional connectivity; Childhood trauma; Striatum

Sex Differences in Serum Trace Elements/Minerals Levels in Unmedicated Patients with Unipolar and Bipolar Depression: The Role of Suicidal Ideation

黄东 何嘉丽 张荣旭 钟舒明 赖顺凯 贾艳滨*
暨南大学附属第一医院(广州华侨医院)

Objective Suicide in major depressive disorder (MDD) and bipolar disorder (BD) is a global public health concern. Evidence suggests that trace elements and minerals contribute to the pathogenesis of MDD/BD and suicide. However, sex differences in trace elements/minerals in MDD/BD with suicidal ideation are unknown. We aimed to examine the influence of gender on serum levels of trace elements/minerals in depression, as well as the impact of suicidal ideation (SI) on these gender dimorphisms.

Methods A total of 260 depressed patients (84 BD and 176 MDD) were recruited in this cross-sectional study. Suicidal ideation (SI) was assessed by the Beck Scale for Suicide Ideation Part I. Serum levels of copper, zinc, iron, calcium, magnesium and phosphorus were measured using atomic absorption spectroscopy.

Results The prevalence of SI in males and females was 36% and 43% respectively, with no significant difference ($\chi2 = 3.103$, $p = 0.078$). A main effect of sex was observed on copper, zinc, iron, calcium, and phosphorus (all $p < 0.05$). Analysis of covariance further showed that serum levels of copper ($F = 10.991$, $p = 0.001$) and phosphorus ($F = 7.708$, $p = 0.008$) were higher while zinc ($F = 5.278$, $p = 0.022$) and calcium ($F = 7.127$, $p = 0.008$) were lower in females than in males within the non-SI (NSI) group, but there were no gender differences of these trace elements within the SI group (all $p > 0.05$). However, no group effect was found (all $p > 0.05$). Only for serum iron levels, a group-by-sex interaction effect was seen ($F=5.126$, $p = 0.024$). Simple effect analyses indicated that serum iron levels were higher in the SI group than in the NSI group among females ($F = 3.955$, $p = 0.048$), and lower in females than in males within the NSI group ($F = 18.786$, $p < 0.001$). In females, but not in males, iron levels in the fourth quantile were positively associated with SI (odds ratio [OR] = 2.88, 95% confidence interval [CI]: 1.08–8.11).

Conclusion SI attenuated sex differences in serum trace element/mineral levels in depressed patients with MDD/BD. Serum iron levels were elevated when SI occurred in female patients. In turn, female patients with high serum iron levels were susceptible to SI.

喹硫平联合碳酸锂对青少年双相情感障碍I型躁狂相患者认知功能及生活质量的影响

张华 孙志刚 王斌 付佳佳 孟苓苓 王晓明 宋雯*
石家庄市第八医院

目的 观察喹硫平联合碳酸锂对青少年双相情感障碍I型躁狂相患者认知功能及生活质量的影响。

方法 选择石家庄市第八医院精神病科 2019 年 2 月至 2020 年 2 月期间收治的 74 例青少年双相情感障碍I型躁狂相患者为研究对象，按照简单随机化法分为对照组和观察组，每组 37 例。对照组患者给予碳酸锂治疗，疗程为 8 周；观察组患者行喹硫平联合碳酸锂治疗，疗程为 8 周。比较 2 组患者治疗前后的倍克-拉范森躁狂评定量表 (BRMS)评分、临床总体印象疾病严重度量表（CGI-s-BP）评分、生活质量综合评定问卷（GQOLI-74）评分及重复性成套神经心理状态测验(RBANS)评分，并观察比较 2 组患者的疗效及治疗期间不良反应发生情况。

结果 治疗前，2 组患者的 BRMS 评分、CGI-s-BP 评分、各项 GQOLI-74 评分、各项认知功能评分比较差异均无统计学意义（P＞0.05）。治疗后，2 组患者的 BRMS、CGI-s-BP 评分与治疗前比较均显著降低（P＜0.05），各项 GQOLI-74 评分、各项认知功能评分与治疗前比较均显著升高（P＜0.05）。对照组 37 例患者中，显效 13 例（29.72%），有效 14 例（37.84），无效 10 例（27.03），总有效率 72.97%；观察组 37 例患者中，显效 19 例（51.35%），有效 13 例（35.14），无效 5 例（13.51），总有效率 86.49%；观察组患者的总有效率显著高于对照组（=3.331，P＜0.05）。对照组患者发生腹泻 2 例（5.40%），便秘 1 例（2.70%），恶心呕吐 2 例（5.40%），头晕嗜睡 2 例（5.40%），震颤 1 例（2.70%），乏力 4 例（8.11%），口干 1 例（5.40%），不良反应发生率为 35.14%（13/37）；观察组发生腹泻 2 例（5.40%），便秘 1 例（2.70%），恶心呕吐 3 例（8.11%），头晕嗜睡 1 例（2.70%），低血压 2 例（5.40%），震颤 1 例（2.70%），乏力 3 例（8.11%），口干 1 例（2.70%），不良反应发生率为 37.84%（14/37）；2 组患者的不良反应发生率比较差异无统计学意义（=0.778，P＞0.05）。

结论 喹硫平联合碳酸锂对少双相情感障碍I型躁狂相患者能改善患者认知功能及生活质量的影响，临床疗效确切，用药安全。

自尊、述情障碍、疏离感对青少年非自杀性自伤的影响

许春杏 蒙永彩 李红政* 张雨晴
中国人民解放军联勤保障部队第九二三医院

目的 探讨自尊、述情障碍、疏离感水平对青少年非自杀性自伤的影响。

方法 选取60例南宁市某医院精神心理科门诊及住院存在非自杀性自伤(non-suicidal self-injury,NSSI)行为的青少年作为研究组，以 60 例年龄、性别、受教育程度相匹配的青少年作为对照组，采用青少年自我伤害问卷(adolescents self-harm scale)、自尊问卷(Self-esteem Scale)、多伦多述情障碍问卷（Toronto Alexithymia scale，TAS）、青少年学生疏离感问卷（adolescent students′alienation scale，ASAS）分别进行测评。使用 SPSS 22.0 软件对数据进行独立样本 t 检验、χ2 检验、Pearson 线性相关、多因素 Logistic 回归分析。

结果 研究组和对照组在性别(χ2= 1.319,P = 0.251)、年龄(t= 0.240,P= 0. 811)、受教育年限(t = 0.290,P =0.772)差异无统计学意义，两组具有可比性；研究组的自尊水平得分低于对照组 [(19.38±5.437)分,(26.18±5.150)分]（P<0.01），述情障碍得分高于对照组[(82.10±8.276)分，(72.51±10.383)分] （P<0.01），疏离感均分高于对照组[(5.15±0.992)分，(3.53±1.191)分]（P<0.01）；自尊水平、社会疏离感、人际疏离感、环境疏离感均与青少年 NSSI 存在相关关系(r=-0.410，P<0.01；r=0.494，P<0.01；r=0.528，P<0.01;r=0.516，P<0.01)；Logistic 回归分析结果显示高疏离感(B=--1.505,OR= 0.222,95%CI=0.103-0.479,P=0.000)、女性(B=1.648,OR=5.195,95%CI=1.225-22.035,P=0.025)、居住地为农村 (B=-1.195,OR= 0.303,95%CI= 0.155-0.592,P= 0.000)，青少年发生 NSSI 风险较大。

结论 低自尊、高疏离感和青少年 NSSI 相关；高疏离感、女性、居住地为农村，可能是青少年 NSSI 的危险因素。

Individuals with Genetic High-risk for Psychosis Experience Impaired Coping Styles Compared with Healthy Controls

何小燕[1,2] 黄卓慧[1] 王斐[1] 贾福军[1] 侯彩兰[1]
1.广东省人民医院
2.无锡市精神卫生中心

Objectives The present study was designed to assess the role of coping style and self-esteem in the context of different phases of schizophrenia.

Methods Recurrent Schizophrenia(ReSch) ,first-episode schizophrenia patients (FEP), ultra-high riskfor psychosis (UHR) patients,and healthy controls (HC) (40 per group) were subjected to in-person clinical interviews. The results of these interviews were then used to gauge coping style and self-esteem using the Coping Styles Questionnaire (CSQ) and the Rosenberg's Self-Esteem Scale(RSES) . Data were analyzed through ANCOVAs and logistic regression analyses.

Results We found that positive coping style(CSQ problem-solving and CSQ seeking for help) generally decline with progression through the HC, UHR,and FEPgroups,while negative coping style(CSQ fantasy,CSQ repression and CSQ self-blame) generally increase with progression through the HC, UHR,and FEPgroups (except that UHR group was slightly lower than HC group in CSQself-blame).Results for members of ReSch group were in line with those of members of the FEP group in coping style.At the level of self-esteem, the UHR group was similar to the HC group and significantly higher than the FEP group and the ReSch group.Logistic regression analyses indicated that UHR group patients exhibited increased negative coping styles(CSQ fantasy) relative to members of the HC group, but had greater Positive coping style（CSQ problem-solving and CSQ seeking for help）than did members of the FEP group and RescH group. It also showed that the UHR group had higher levels of self-esteem than the members of Resch Group.

Conclusions These findings suggest that both UHR individuals experience impaired negative coping styles which expands the understanding of the psychological characteristics of the prodromal group. Further explorations are warranted to develop optimal psychosocial interventions.

关键字：coping style, schizophrenia, self-esteem, genetic-high risk for psychosis.

Gene Polymorphisms and Expression of NRG1, DAOA and DISC1 Gene in A Chinese Han Population with An Ultra-high Risk for Psychosis

何小燕[1,2] 黄卓慧[1] 王斐[1] 陈梓朗[3] 王诗镔[1] 贾福军[1] 侯彩兰[1]
1.广东省人民医院
2.无锡市精神卫生中心
3.云浮市第三人民医院

Objectives The objective of the current study was to explore the NRG1, DAOA, DISC1 gene polymorphism and the expression of NRG1 gene and DISC1 gene in ultra-high risk population, and to explore the biomarkers of UHR population.

Methods The study cohort consisted of 56 healthy controls,18 ultra-high risk (UHR) individuals, 61 first-episode (FEP) psychosis individuals and 61 first-degree relatives (FDR) of patients with schizophrenia. The genotypes at the four loci of the NRG1 gene, the four loci of the DAOA gene, and the two loci of the DISC1 gene were tested for all subjects, and the mRNAs of the NRG1, DISC1 of all subjects were examined and analyzed in a pairwise comparison between the UHR group and the FEP group, the UHR group and the FDR group, and the UHR group and the HC group. Statistical analysis of genetics was performed using snpstats software. For the case-control association analysis, single site association study, epistatic effect analysis as well as haplotype analysis were used to explore the association of the above genes with UHR from three perspectives.

Results 1. UHR group vs FEP group: the results of single site association analysis showed that: the rs3918341 locus of DAOA gene was associated with UHR; Epistatic effect analysis results showed that the rs6994992 polymorphism in the NRG1 gene interacted with the rs778294 polymorphism in the DAOA gene and that the rs6994992 polymorphism in the NRG1 gene interacted with the rs821616 polymorphism in the DISC1 gene in the susceptibility to UHR; The results of haplotype association analysis showed that all haplotypes were not significantly associated with UHR. 2. UHR groupvs FDRgroup: the results of single site association analysis showed that: the rs3918341 locus of DAOA gene was associated with UHR; Epistatic effect analysis results showed that the rs6994992 polymorphism in the NRG1 gene interacted with the rs2391191 polymorphism in the DAOA gene in the susceptibility to UHR; The results of haplotype association analysis showed that all haplotypes were not significantly associated with UHR. 3. UHR group vs HC group:No significant association was detected in two groups; Epistatic effect analysis results showed that the rs6994992 polymorphism in the NRG1 gene interacted with the rs2391191 polymorphism in the DAOA gene and that the rs4281084 polymorphism in the NRG1 gene interacted with the rs2391191polymorphism in the DAOA gene in the susceptibility to UHR; The results of haplotype association analysis showed that all haplotypes were not significantly associated with UHR. 4. Results of the four groups on gene expression of NRG1, DISC1:NRG1 mRNA was significantly downregulated in the UHR group compared with the HC group as well as the FEP group.

Conclusions Our preliminary results that NRG1、DAOA and DISC1 gene may play a role in psychosis onset,opening the way to the identification of prognostic biomarkers.

关键字：ultra-high risk for psychosis,Genetic susceptibility NRG1;DAOA;DISC1.

孤独谱系障碍的精神药物治疗研究进展

孙志刚 付佳佳 李霄宇 张翠芳 宋丽华 李素水*
石家庄市第八医院

目的 孤独症谱系障碍(autism spectrum disorder,ASD）是一种复杂的神经发育性障碍，是导致儿童精神残疾的主要原因，给患儿和家庭造成了严重的心理和经济负担。ASD 病因学很复杂，发病机制尚不清楚，针对核心症状还无有效的药物治疗方案，主要采用行为干预的方法。近年来，随着对该障碍及其共病问题认识的深入，如青少年 ASD 共病冲动、自残及其他挑战性行为时，需要抗精神病药物治疗。另外，其他相关药物的使用率也显著增加，有些患者联合多种药物，多种药物的使用率高达 12%~35% ，甚至在幼儿中出现抗精神病药物等超处方使用问题。为了规范 ASD 相关精神药理学的治疗，本文对 ASD 药物治疗相关研究进行综述。

方法 本文主要就近 3 年来孤独症谱系障碍的精神药物治疗方面的研究和文献进行综述。

结果 共检索到文献 571 篇，最终纳入 49 篇，文献主要来自儿科学、精神病学。

结论 ASD 是一种严重而复杂的早期神经发育性障碍，病因学异质性很大，预后差，是引起儿童精神残疾的主要原因。目前，有循证依据干预 ASD 核心症状的方法是行为干预，精神药物治疗主要是解决与 ASD 相关的并随年龄增长而表现突出的共病问题。抗精神病药物和中枢兴奋剂在 ASD 患者的临床管理中具有重要作用。依据已知的神经生物学异常所致的 ASD 表型，探讨对核心症状的靶向药物治疗研究已取得了一定的进步，至少在动物模型中看到了逆转其神经生物学异常的可能，催产素、布美他尼、二甲双胍、磷酸二酯酶 4D 抑制剂等化合物的研究结论不一致。许多 ASD 亚型也缺乏 GABA，作为 GABA 系统的激动剂 CBD、阿巴氯芬等值得进一步研究。线粒体功能异常也与一些 ASD 有关，改善线粒体功能的药物 AV2-73 也在进行研究。相信随着神经生物医药学技术的不断发展，有可能诞生治疗 ASD 核心症状的化合物。

重大疫情常态化防控下儿童青少年心理健康预警量表的编制及信效度检验

高维[1] 戎戈[2] 冯坤[1]
1.清华大学玉泉医院
2.北京柚果星空科技有限公司

目的 基于新型冠状病毒肺炎(COVID-19)疫情常态化防控期间儿童青少年心理健康评估及风险因素研究成果，编制重大疫情常态化防控下儿童青少年心理健康风险预警量表，并检验其信效度，以期对重大公共卫生事件下儿童青少年心理危机早期干预提供方法手段。

方法 根据 2021 年至 2022 年新冠肺炎大流行期间对全国五个省市（北京、山西、陕西、武汉、山东）的儿童青少年进行线下问卷调查，每 6 个月对同一批学生采集相关量表数据进行纵向动态追踪，评估其在疫情常态化防控期间的负性情绪、行为问题水平，分析其与人格特性、认知模式、家庭环境、人际关系、应激事件等内外源因素的交互影响情况。本研究使用机器学习的梯度提升决策树模型，在不同时间点对产生负面情绪结果的目标在各个横断面进行学习，寻找与之关联度最高的保护性因素与危险性因素。根据相关因素在原始调查量表中的问题，编制疫情常态化防控下儿童青少年心理健康风险预警量表。

结果 本研究共纳入 2413 名 10-18 岁儿童青少年，共采集 3 个时间点数据，利用梯度提升决策树模型筛选出包含家庭状况、自我认识、网络成瘾、社会事件等 4-5 个维度在内的 10 个问题，形成重大疫情常态化防控下儿童青少年心理健康预警量表。量表各维度与总量表相关系数为 0.55-0.87(P<0.01)，维度间相关系数为 0.19-0.53（P<0.01），量表各条目的内容效度指数为 0.8-1.0。对初中生在抑郁情绪和焦虑情绪的预警判断，ROC 曲线下面积分别为 0.92 和 0.91。

结论 重大疫情常态化防控下儿童青少年心理健康预警量表信度和效度均较高，尤其适用于初中阶段学生的快速筛查，在修改和新型冠状病毒肺炎相关的措辞后，可用于重大公共卫生事件防控期间快速筛查儿童青少年心理健康问题及风险预警。

综合医院患者抑郁、焦虑与失眠症状现况调查

张文乐 房捷欣 马含俏 胡永东*
首都医科大学附属北京朝阳医院

目的 综合医院躯体疾病患者常伴有抑郁、焦虑与失眠症状，但大多数患者未被识别与诊治。本研究对北京朝阳医院门诊和住院患者抑郁、焦虑与失眠症状进行现况调查，调查综合医院躯体疾病患者伴发抑郁、焦虑与失眠症状的情况，并分析相关影响因素。

方法 以北京朝阳医院门诊和住院患者为对象，通过“朝阳健康云”APP 中“情绪筛查”板块进行调查，抽样方法为方便抽样。该板块设置三个量表：患者健康问卷（PHQ-9），用于抑郁症状的评估；广泛性焦虑障碍量表（GAD-7），用于焦虑症状的评估；阿森斯失眠量表（AIS），用于失眠症状的评估。使用该 APP 对 2021 年 10 月份到 2023 年 3 月间回收的 4221 份有效问卷进行分析。PHQ-9 收集 1663 份、GAD-7 收集 2305 份、AIS 收集 2265 份，其中同时完成三份量表的共有 936 人，同时完成 PHQ-9 与 GAD-7 的共有 1100 人。研究使用 SPSS26.0 对问卷结果进行统计分析，以 5 分作为 PHQ-9 抑郁筛查和 GAD-7 焦虑筛查的阳性划界值，以 10 分作为 PHQ-9 抑郁诊断和 GAD-7 焦虑诊断的阳性划界值，调查各量表筛查与诊断阳性率，以及人口学因素对量表结果的影响。

结果 PHQ-9 抑郁筛查阳性率为 80.8%、GAD-7 焦虑筛查阳性率为 82.7%、AIS 失眠筛查阳性率为 74.5%；PHQ-9 抑郁诊断阳性率为 36.5%，GAD-7 焦虑诊断阳性率 48.2%。同时诊断阳性率为 21.8%。PHQ-9、GAD-7 与 AIS 量表得分之间具有相关性，且相关显著，三者与年龄的相关也较为显著；GAD-7 量表得分男性明显高于女性；文化程度、年龄和婚姻状态可以预测 PHQ-9 分数。

结论 综合医院躯体疾病患者伴发抑郁、焦虑与失眠症状较为常见。综合医院医生应加强精神卫生知识学习，提高对精神障碍的识别能力。

失眠症患者静息态功能磁共振脑默认网络功能连接分析

胡永雪 王艺明*
贵阳医学院附属医院

目的 探讨失眠症患者静息状态下大脑默认网络功能连接的变化。

方法 2021 年 7 月至 2022 年 1 月纳入符合国际睡眠障碍分类第三版诊断标准的失眠症患者 56 例，同期招募 50 例健康对照。采用匹兹堡睡眠指数量表、失眠严重指数、Epworth 嗜睡程度评价表、汉密尔顿抑郁量表 17 项对所有被试进行神经心理评估。对所有被试进行静息态功能磁共振扫描，在 MATLAB 上应用 SPM12 及 CONN18b 对 rs-fMRI 数据进行预处理，以双侧楔前叶、内侧额上回定义为种子点，比较两组研究对象功能连接强度的差异。并将差异有统计学意义脑区的 FC 值与 PSQI、ISI 评分进行 Pearson 相关性分析。

结果 FC 分析发现，与对照组相比，失眠症患者存在默认网络连接异常，具体如下：（1）左内侧额上回与左中央前回及前扣带回间 FC、右内侧额上回与左中央前回间 FC、左楔前叶与左中央前后回及左枕上回间 FC、右楔前叶与左中央后回间 FC 增强。（2）而左楔前

叶与右额中回及右角回间 FC、右楔前叶与左颞下回间 FC 减弱。相关性分析发现，以左内侧额上回为种子点，FC 值与 PSQI、ISI 评分呈正相关的脑区为前扣带回、左中央前回；以右楔前叶为种子点，FC 值与 PSQI、ISI 评分呈正相关的脑区为左中央后回

结论 失眠症患者可能存在多个网络的功能连接改变，DMN 内 FC 减弱可能是失眠症的潜在病因之一，DMN 与视空间注意网络间 FC 增强可能是失眠症大脑功能网络受损机制中的核心环节。

经颅直流电刺激对首发未用药抑郁患者的疗效及静息态局部一致性研究

陈贤亮 刘佳丽 周建松*
中南大学湘雅二医院

目的 本研究拟探讨高精度多通道经颅直流电刺激（Transcranial direct-current stimulation, tDCS）左侧背外侧前额叶（dorolateral prefrontal cortex, DLPFC）对首发未用药抑郁患者的疗效和认知水平变化，并基于静息态磁共振技术分析 tDCS 治疗前后的局部一致性（Regional Homogeneity，ReHo）指标，为 tDCS 治疗抑郁患者提供新的证据。

方法 本研究社区招募符合入排标准的 19 名抑郁发作患者和匹配的 14 名健康对照，抑郁组完成为期两周（刺激靶点：左侧 DLPFC，频率：5 次/周，30min/次，共 10 次）的 tDCS 治疗。使用自制的一般情况表收集受试者人口学资料，在基线、tDCS 治疗 2 周后使用贝克抑郁量表（Beck Depression Inventory, BDI）、贝克焦虑量表（Beck Anxiety Inventory, BAI）、匹兹堡睡眠质量指数（Pittsburgh sleep quality index, PSQI）、疼痛测量尺评估患者的临床症状，使用神经心理状态评定量表（Repeatable Battery for the Assessment of Neuropsychological Status, RBANS）及抑郁症患者感知缺陷问卷（Perceived Deficits Questionnaire Depression, PDQ-D）评估患者的认知水平。使用静息态磁共振 ReHo 指标探讨受试者治疗前后的功能差异。 提取差异脑区的 ReHo 值与抑郁受试者的临床及认知数据进行相关分析。

结果 1）疗效评估：①抑郁水平：基线抑郁患者较健康对照组抑郁症状明显（BDI 得分：19.1±5.8 vs 0.9±1.4, p＜0.001），tDCS 干预后抑郁得分明显降低（p＜0.001），治疗前后减分率达到 50%以上的有 11 人，占比 57.9%；②焦虑水平，基线抑郁患者的焦虑水平较健康对照高（p＜0.001），tDCS 干预 2 周后抑郁患者的 BAI 焦虑得分明显降低（p＜0.001）；③睡眠质量：基线抑郁患者的睡眠质量较健康对照差， tDCS 干预后患者睡眠质量改善明显（p＜0.01）；④疼痛测量，基线抑郁患者自评疼痛得分较健康对照高（p＜0.001），tDCS 干预前后下降明显（p＜0.01）；⑤

伴非自杀性自伤的抑郁障碍青少年患者经 SSRI 类抗抑郁药治疗前后的脑电微状态研究

胡锦辉[1,2] 周东东[1] 马伶丽[2] 何晓庆[1] 张正勇[1] 周杨[1] 王我[1] 况利[1,2]
1.重庆医科大学附属大学城医院
2.重庆医科大学附属第一医院

目的 单纯药物治疗对伴 NSSI 的抑郁障碍青少年患者疗效目前仍不明确，目前主流认为药物治疗仅针对抑郁障碍共病，而部分患者治疗后自伤行为缓解，具体原因仍待探究。

方法 为了探索 SSRI 类药物治疗伴 NSSI 的抑郁障碍青少年疗效，本研究对 58 名接受单纯药物治疗的伴有 NSSI 及单纯的抑郁障碍青少年进行随访，探究经过 8 周治疗后各组患者疗效反应及静息态脑电微状态变化，以及其内在的相关性分析。使用配对样本 t 检验被用来进行治疗前后比较，Spearman 相关性分析了基线水平脑电微状态参数与患者抑郁症状及自伤行为改善情况的相关。

结果 在经过单纯 SSRI 类药物治疗后，患者组 58 名抑郁青少年患者在微状态 B（P <0.01）的出现率，以及微状态 C（P <0.05）的平均持续时长均较基线水平降低，在转化动力水平上则在微状态 C 向 B 转化的概率（P <0.05）呈显著下降趋势。药物治疗 4 周时在患者自评（P <0.05）及医师他评（P <0.05）水平上观察单纯 MDD 组抑郁症状疗效反应均优于 NSSI 组，但在治疗 8 周后差异不再显著。NSSI 组经药物治疗后自伤频率下降患者，与未下降患者比在基线水平脑电微状态参数上无显著差异。NSSI 组抑郁症状改善患者基线水平脑电微状态 A 的覆盖率（P <0.05）及每秒出现频率（P <0.05）以及 B→A 的转化概率（P <0.01）上显著升高；而 MDD 组抑郁症状改善患者则在微状态 B 的平均持续时长（P <0.05）及覆盖率（P <0.05）上显著升高， 而微状态 C→A 的转化概率（P <0.05）显著降低。

结论 伴或不伴有 NSSI 的抑郁障碍青少年经 8 周 SSRI 类药物治疗后对抑郁症状的疗效反应无显著差异，其反应程度在基线水平脑电微状态上表现为不同模式。抑郁障碍青少年药物治疗前后在脑电微状态参数上识别到稳定地变化。

神经性厌食症患者杏仁核和海马亚区体积异常及其与临床特征的关联研究

王瑜 郑琳莉 马菁 王美鸥 李潇 张岚*
四川大学华西医院

目的 本研究旨在探索神经性厌食症（AN）患者的杏仁核和海马亚区体积是否存在异常，并探究其与临床心理特征之间的关联。

方法 我们在四川大学华西医院精神卫生中心招募了 31 名汉族女性 AN 患者和 80 名与其年龄相匹配的汉族女性健康对照者。采用 T1 加权 MRI 扫描，使用 FreeSurfer7 对杏仁核和海马进行亚区分割和多阶段质量控制。收集所有被试的一般人口学资料和 AN 患者的病程及发病年龄，并使用核心自我评价（CSES）、自尊水平（RSES）、父母教养方式问卷（EMBU）评估 AN 患者的心理特征。采用协方差分析比较 AN 患者和健康对照者的左/右半球杏仁核亚区和海马亚区体积。偏相关分析用于探究脑区体积与一般临床心理特征之间的相关性。

结果 在校正受试者的年龄、受教育年限和总颅内体积（TIV）后，我们发现相对于健康对照者，AN 患者在 6 个杏仁核亚区（即左侧副基底核、左侧中央核、左侧内侧核、左侧皮层核、右侧外侧核和右侧皮层杏仁核过渡区）和 2 个海马亚区（右侧海马纤维束和右侧海马肌嵴）的体积显著减小。此外，我们发现 AN 患者的右侧海马纤维束体积与其父亲的情感温暖与理解（r= 0.45, p =0.018）、父亲的过度保护（r = 0.47, p = 0.013）和母亲的情感温暖与理解（r= 0.46, p = 0.015）呈显著正相关。然而，差异脑区体积与 AN 患者的 BMI、病程、发病年龄、自尊水平和核心自我评价之间无显著相关性（p > 0.05）。

结论 本研究的结果显示，AN 患者在多个杏仁核亚区和海马亚区的体积显著减小，这些结构的异常可能通过影响患者的食欲、情绪和奖赏调节而参与 AN 的发生和发展。此外，右侧海马纤维束体积与父母教养方式有关，这提示家庭环境可能对疾病的发展存在潜在影响。本研究的发现有助于加深我们对 AN 病因和病理生理的理解，为进一步研究和临床诊疗提供了线索。

Efficacy of TDCS in The Treatment of Cognitive Function in Patients with Major Depressive Disorder: A Systematic Review and Meta-analysis

Hong Li[1,2], Zhifen Liu[1,2]
1.Department of Psychiatry, The First Hospital of Shanxi Medical University, Taiyuan, China.
2.Shanxi Key Laboratory of Artificial Intelligence Assisted Diagnosis and Treatment for Mental Disorder, The First Hospital of Shanxi Medical University, Taiyuan, China.

Objective Transcranial direct current stimulation (tDCS) has demonstrated as a promising treatment for depression. However, it remains to be determined whether a tDCS treatment course may also enhance cognitive function in depressed patients. We conducted the first systematic review and meta-analysis of the efficacy of tDCS in anti-depressive treatment and its impact on cognitive function (INPLASY registration number: INPLASY202360008).

Methods A systematic review was performed from the first date available in PubMed, EMBASE, Cochrane Library, and additional sources published in English from 1 January 2001 to 31 May 2023. We examined cognitive outcomes from randomised, sham-controlled trials of tDCS treatment for major depression. The evaluation process strictly followed the Cochrane bias risk assessment tool into the literature, and Metaanalysis was performed according to the Cochrane System Reviewer's Manual.

Results We included a total of 341 patients from 11 studies in this quantitative synthesis. Results showed no cognitive enhancement after active tDCS compared to sham for the antidepressant effect (SDM -1.89 [-4.14, 0.36]) as well as cognitive function and verbal memory measures (SDM 0.17 [-0.07, 0.41]). Active relative to sham tDCS treatment was associated with increased performance gains on a measure of processing speed (SDM 0.38 [0.01, 0.73]).

Conclusion Active tDCS treatment for depression exhibited limitted benefits compared to sham tDCS. Further well-designed, large-scale RCTs are warranted.

关键字：Transcranial direct current stimulation, treatment, depression, cognition.

右美托咪定滴鼻用于改良电休克治疗中的效果评估

常昱 何长江*
西安市精神卫生中心

目的 观察在 MECT 常规治疗前使用右美托咪定滴鼻对电疗效果的影响，以及对电疗副作用的疗效。

方法 选择住院 MECT 治疗的患者 60 例，年龄 18～65 岁；ASA 分级：I—II级；随机分为两组，在首次行 MECT 治疗前分别经鼻腔滴注 1ug/Kg 右美托咪定（试验组）或等量生理盐水（对照组）。滴鼻半小时后行常规 MECT 治疗。记录入室前（T0）麻醉前（T1）、麻醉后(T2) 、治疗后 MECT 通电后 30 s(T3) 及苏醒后（T4）的 MAP 和 HR。采集护理满意度评分，治疗前后认知评分评分、发作时间、苏醒时长、围治疗期不良事件。

结果 与对照组相比试验组护理满意度评分更高（P＜0.05），麻醉后的心率降低更明显（P＜0.05），治疗后血压心率试验组也低于对照组（P＜0.05），苏醒后试验组患者心率低于对照组（P＜0.05），治疗后躁动比例降低（P＜0.05）。首次通电未发作例数、发作时间＜25s 的例数以及发作时间长短方面没有统计学差异，苏醒时间，治疗前后的认知反应也无明显差异。

结论 MECT 治疗前右美托咪定滴鼻可降低心血管反应，提高患者配合度，减少治疗后躁动应，而不影响癫痫发作，不延长苏醒时间。

关键字：右美托咪定; 无抽搐电休克；滴鼻

预测焦虑障碍慢性化倾向的影响因素

刘玉霞 李恒芬*
郑州大学第一附属医院

目的 以广泛性焦虑障碍（GAD）和惊恐障碍（PD）住院患者为研究对象，构建焦虑障碍数据库，探索预测慢性化焦虑的临床及生物学标记，为临床的早期识别提供简单、可行的预测指标。

方法 1.构建焦虑障碍数据库：回顾性搜集 2014 年 5 月至 2021 年 5 月期间来郑州大学第一附属医院精神医学科就诊的住院患者 GAD 和 PD 病例，共 3440 例。根据入组标准（ICD-10 诊断标准）和排除标准（排除其他精神疾病和器质性疾病等），同时结合住院病历及追踪查询门诊病历进行复核性诊断，共有 1121 例患者被纳入本研究，构建包括社会人口学资料、临床特征和生物学指标的 GAD/PD 数据库，共有 61 个变量。2.统计学分析：采用 SPSS 26.0 统计学软件进行一般数据分析，P＜0.05 表示差异有统计学意义。

结果 1.焦虑慢性化患者的筛选 所纳入 1121 例患者的病程分布特征为非正态分布，排除“1 年＜病程＜2 年”仅有的 18 例患者；将“病程≥2 年”自定义为慢性组（简称 GAD/PD-C 组，共 429 例），“病程≤1 年”自定义为非慢性组（简称 GAD/PD-NC 组，共 674 例），最终共纳入 1103 例。2.两组的一般情况及临床资料比较 比较两组社会人口学及临床特征发现，性别、年龄、诊断亚型、首发年龄、诱因、个性倾向、系统药物治疗和精神疾病家族史差异具有统计学意义（P<0.05），其他特征差异无统计学意义（P＞0.05）。比较两组生物学指标发现，C 反应蛋白（CRP）、复合炎症指数 NLR（中性粒细胞/淋巴细胞比值）、的促肾上腺皮质激素（ACTH）16 点、皮质醇（Cor）16 点、甲状腺素（TT4）、游离甲状腺素（FT4）、泌乳素（PRL）、雌二醇（E2）、孕酮 P（PROG）、睾酮 T（TESTO）、尿素（Urea）、总胆固醇（T-CHO）、甘油三酯（TG）、载脂蛋白 B（APOB）、低密度脂蛋白（LDL）和血管紧张素转换酶（ACE）水平差异具有统计学意义（P<0.05），其他指标差异无统计学意义（P＞0.05）。

结论 1.GAD/PD-C 和 GAD/PD-NC 患者在临床特征上的差异，提示个体可能在病程轨迹上具有异质性，在早期阶段也能一定程度预测焦虑的慢性化。 2.焦虑障碍的慢性化是复杂、多因素的，机体神经内分泌免疫反应及代谢紊乱可能与 GAD/PD-C 关联，影响着其临床自然病程，甚至导致治疗效果上的差异。

Rumination and Alexithymia Conversely Mediate The Relationship between Somatic and Depressive Symptoms in Patients with Major Depressive Disorder

刘格呈[1,2] 许晶晶[3] 王军[1] 张晨[4] 方贻儒[4,5,6] 吴志国[1]
1.上海市杨浦区精神卫生中心，上海健康医学院附属精神卫生中心
2.哥伦比亚大学教育学院
3.上海市黄浦区精神卫生中心
4.上海交通大学医学院附属精神卫生中心
5.上海交通大学医学院附属瑞金医院
6.上海市精神卫生临床研究中心

Objective Somatic symptoms are of high prevalence in patients with major depressive disorder (MDD) and are identified as hallmarks of this population in China. The psychological mechanism between somatic symptoms and depression has not been well explored. Rumination and alexithymia as two psychological traits have been consecutively reported to be associated with both depression and somatization, implying their possible roles bridging the two symptom dimensions. This study aims to explore the underlying role of these two psychological traits in the relationship between depression and somatization in a clinical population with MDD.

Methods A total of 200 patients from a tertiary psychiatric hospital in mainland China who met DSM-5 criteria for MDD were enrolled. Rumination (including two components, brooding and reflection), alexithymia (including three components, difficulty identifying feelings (DIF), difficulty describing feelings (DDF), and externally oriented thinking (EOT)), depression, and somatic symptoms were measured by using the 10-items Rumination Rating Scale (RRS-10), 20-items Toronto Alexithymia Scale (TAS-20),16-items Quick Inventory for Depressive Symptoms SR (QIDS-16 SR), and 15-items Patient Health Questionnaire (PHQ-15), respectively. Six path analysis models were built by using “R” software to examine the potential effects of rumination and alexithymia (either acting as mediators or confounders) in the relationship between somatic symptoms and depression.

Results It showed that rumination and alexithymia significantly mediated the relationship between depression and somatization in converse directions. In detail, brooding rumination significantly mediated the path from somatic symptoms to depression, while DIF significantly mediated the converse path. Specifically, brooding explained 12.3 percent of impact of somatization on depression, yet the mediating effect of DIF contributed to 12 percent of the total causal effect of depression on somatization. Besides, while there were strong correlations among these four factors, the result confirmed that neither rumination nor alexithymia was a confounding factor in the relationship of the depression-somatic symptoms.

Conclusion Our findings provide novel evidence for how cognitive traits and emotional regulation strategies may bridge these two symptom domains. Specifically, this study reveals the mediating roles of brooding rumination and DIF alexithymia in the converse path between somatic symptoms and depression, which may be helpful to explain the high co-occurrence of these two symptom sets from a psychological perspective. Moreover, this implies the po-

tential treatment targets in psychotherapy for patients exhibiting clinical symptoms of both depression and somatization and provides segmented intervention targets for different scenarios.

住院医师规范化培训学员心理健康影响因素分析

罗佳荟[1] 杨伶俐[2] 刘芳[1] 包凌博[1] 于嘉乐[1]
1.昆明医科大学第一附属医院精神科
2.昆明医科大学第一附属医院科教处

目的 探讨住培学员心理健康的影响因素，为进一步提高住培学员心理健康水平及改善住培学员心理健康问题提供理论依据。

方法 采用自编《住培学员心理健康评定量表》，以及曹静等汉化的《接纳与行动问卷第二版》、陈思佚等汉化的《正念注意觉知量表》对云南省昆明市某两家住培基地学员进行调查，评估其心理健康水平、经验回避、正念水平状况。采用独立样本 t 检验、单因素方差分析，对全部调查的住培学员（共 650 人）心理健康水平的差异进行分析，采用 Pearson 积差相关分析、结构方程模型（SEM）探讨正念水平在经验回避对住培学员心理健康影响中的作用。

结果 对 650 名住培学员量表发放结果显示，心理健康水平得分为（102.34±24.43），经验回避（22.09±8.42）和正念水平（65.70±13.17）。女生在支持网络维度得分高于男生；研究生在临床工作失误上的得分低于本科生，表现出更好的临床工作处理能力；除了临床工作维度上，住培一年级的学员总分与其他 5 个维度得分都较低；专硕型研究生在躯体症状维度上得分显著高于另两类住培学员。此外，是否通过执医考试、是否轮转、对专业的喜欢以及管理床位数与值班频率都影响着住培学员的心理健康水平（P 值均＜0.05）。Pearson 积差相关分析显示，经验回避与心理健康水平的总分呈正相关（r＝0.684，P＜0.01）；与 6 个维度的得分均呈显著正相关（P 值均＜0.01）。正念水平与心理健康水平的总分呈负相关（r＝-0.653，P＜0.01）；与 6 个维度的得分均呈显著负相关（P 值均＜0.01）。结构方程模型（SEM）检验结果显示，正念水平在经验回避对心理健康的影响中发挥部分中介作用，占总效应的 32.33%。

结论 在大样本住培学员的调查中，心理健康水平与性别、住培年级、住培类型等多种因素有关；经验回避与心理健康水平总分及 6 个维度得分均呈正相关，正念水平与心理健康水平总分及 6 个维度得分均呈负相关；经验回避不仅直接影响其心理健康，同时还通过正念水平影响心理健康。

云南省两地儿童青少年校园欺凌、非自杀性自伤和正念水平现况调查

张长林 罗佳荟 张花霞 包凌博 于嘉乐 高梦雅 刘芳*
昆明医科大学第一附属医院精神科

目的 探究云南省两地区儿童青少年校园欺凌、非自杀性自伤与正念水平的现状

方法 本研究对云南省两地区共 5970 名儿童青少年进行基于人群的横断面调查。使用《Olweus 欺凌问卷中文版》评估儿童青少年校园欺凌行为，《五因素正念觉知量表》（FFMQ）测量其正念水平，《青少年自我伤害行为问卷修正版》（MASHS）测量其 NSSI 行为，广泛性焦虑障碍量表-7(GAD-7)和患者健康问卷-9(PHQ-9)评估其焦虑和抑郁情况。

结果 共 5897 名调查对象中纳入最后分析，其中 2043 人报告有自伤行为，自伤行为发生率为 34.6(95%CI:30.3%-39.0%)。进一步分析有过自伤行为的调查对象，反复自伤发生率达到 54.9%(95%CI:47.2%-62.0%)，严重自伤发生率为 20.4%(95%CI:14.6%-28.0%)。校园欺凌中仅被欺凌为 743 人，占比 12.60%(95%CI:8.54%-18.00%)，欺凌他人者计 117 人，占比 1.98%(95%CI:1.31%-3.00%)。所有调查对象的正念总分为 121.28±13.56 分，正念的五个维度中，正念觉知行动得分最高，正念不行动得分最低。

结论 NSSI 和校园欺凌在调查地区儿童青少年群体中的报告率较高，凸显了 NSSI 和校园欺凌干预在我国这一地区的重要性和紧迫性。

关键字：非自杀性自伤行为；校园欺凌；正念水平；心理健康

Depression and Suicidal Ideation Genetically Affect The Longitudinal Changes in Brain Structure Across The Lifespan: A Mendelian Randomization Study

Yusheng Tian[1,2], Jiaxin Yang[1], Xuting Li[1], Yamin Li[1], Jiansong Zhou[2]
1.Clinical Nursing Teaching and Research Section, The Second Xiangya Hospital, Central South University Changsha, Hunan, China.
2.Department of Psychiatry, National Clinical Research Center for Mental Disorders, The Second Xiangya Hospital, Central South University, Changsha, China.

Objective Abnormal development of brain structures underlie the anatomy of depression in adolescents. However, it is not known whether the changes in brain structure with age can be disrupted following the onset of this disease. The aim of the Mendelian randomization study was to explored the effect of depression on the longitudinal changes in brain structure across the lifespan.

Methods Genome-wide association studies summary data in 500199 participants from the PGC Consortium were adopted to identify genetically predicted depression, and data in 218792 participants from the FinnGen was used to assess predicted suicidal ideation. Data in 15640 subjects from the ENIGMA Consortium were included to measure the association of depression and suicidal ideation with the changes in 15 brain structures across the lifespan, and the latter expressed in a linear regression model (testing for an age-dependent effect of variants on rates of change). Analysis was performed using inverse-variance weighted, and MR-PRESSO, Cochran's Q test, MR-Egger intercept test, leave-one-out test and funnel plot were conducted for quality control.

Results Depression accelerated the rate of change in the volume of cerebral white matter (β= 22.003, 95%CI = 7.650 ~ 36.356, P = 0.0027), and suicidal ideation slowed down the rate of change in the volume and mean thickness of cortical gray matter across the lifespan (β= -55.426, 95%CI = -91.813 ~ -19.040, P = 0.0028; β= -0.221, 95%CI = -0.362 ~ -0.080, P = 0.0021).

Conclusion Depression and suicidal ideation genetically affect the longitudinal changes in brain structure across the lifespan.

Are ChatGPT Going To Replace Psychiatrist?

Fei Wang Shibin Wang Fujun Jia Cailan Hou*
广东省人民医院

Objective ChatGPT (Chat Generative Pre-Trained Transformer) is one of the hottest topics currently worldwide and this heatwave has also swept the entire medical industry. Medical research experts have attempted to use ChatGPT to solve patient's clinical problems, and ChatGPT fared well in answering all of queries regarding it and offering good explanations of the underlying reasoning. As is known to all, the diagnosis of mental health problems relies on face-to-face communication and emotional exchange between psychiatrists and patients. As the strongest chat robot in history, can ChatGPT replace psychiatrist?

Methods After we designed a series typical questions which could cover psychopathology (i.e., diagnosis, prognosis, treatment) with three experienced psychiatrists, we tested ChatGPT (available via OpenAI) retrieved from an online presentation.

Results Our psychiatrist discussed the questions for ChatGPT answered, and most of the answers provided effective suggestions. However, they were unable to provide individualized plans, corresponding interventions, and solutions in details, and more difficult to answer and explain specific medication plans instead of psychiatrists or doctors.

Conclusion ChatGPT could provide some useful information and answers, but cannot replace the expertise, training, and experience of a qualified psychiatrist. It is crucial for researchers, developers, and healthcare professionals to collaborate in order to create AI programs that are validated, reliable, and accurately tailored to the individual needs of people with mental health problems in the future.

关键字：ChatGPT replace psychiatrists

22139 名综合医院心理科门诊患者症状自评量表结果及影响因素研究

张慧娟[1] 周鸿影[1] 李踔然[1] 王兰兰[1,2] 程文红[1,2]
1.上海市第一人民医院
2.上海市精神卫生中心

目的 了解综合医院心理科不同病种患者的症状自评量表（the symptom checklist 90，SCL-90）评估结果及临床特征，探索 SCL-90 得分影响因素。

方法 研究纳入某三级甲等综合医院心理科 2009 年 2 月至 2023 年 3 月期间进行症状自评量表测评的患者 22139 名，并收集年龄、性别等人口学信息。根据患者诊断类别分组，统计不同病种患者症状自评量表的十项因子得分。将各项因子得分与常模[1]比较，并进行组间比较。并探索 SCL-90 各项因子得分与年龄、性别相关性。

结果 （1）22139 名患者平均年龄 45.02±18.95 岁，男性比例 32.7%，女性比例 67.3%。病种人数前四位分别为：焦虑组 11665 例、抑郁组 5435 例、睡眠障碍 864 例、强迫组 578 例。焦虑组患者比例总体呈上升趋势（R2=0.64，P<0.001）（2）焦虑组、抑郁组、强迫组各项因子得分均高于常模组（P 均＜0.001），睡眠障碍组"人际敏感"、"偏执"因子分与常模与明显差异，其余各因子得分均高于常模组（P 均＜0.001）。除"强迫"因子外，抑郁组各项因子分均高于其余各组；除"其他"因子外，睡眠障碍组各项因子均低于其余各组；与强迫组相比，焦虑组"躯体化"、"其他"因子得分更高，"强迫"、"人际敏感"、"敌对"、"偏执"、"精神病性"得分更低（P 均＜0.05）。（3）年龄与 SCL-90 各项因子分呈负相关，各因子与年龄的相关系数-0.11 至-0.43；女性患者"躯体化"、"抑郁"、"焦虑"、"恐怖"、"其他"因子得分高于男性组（P 均＜0.01）。

结论 综合医院心理科门诊焦虑症状、抑郁症状就诊患者比例较高，就诊患者 SCL-90 测评症状严重程度普遍高于常模平均水平。有抑郁症状的人群、女性患者、年龄较轻患者症状可能更加显著。 参考文献： 1. 刘媛媛, 武圣君, 李永奇, 邵峰, 苏景宽, 刘旭峰: 基于 SCL-90 的中国人群心理症状现况调查. 中国心理卫生杂志 2018, 32(5):5.

Video Game Addiction in Psychiatric Adolescent Population: A Hospital-based Study on The

Role of Individualism From South China

周睿 肖星玉 黄文君 王斐 贾福军 侯彩兰*
广东省精神卫生研究所

Background For decades, the video-game-related behaviors have been investigated in different psychologic researches, much of whose attention focus on video game addiction (VGA) while the differences between VGA and social media addiction (SMA) should have deserved more concerns. Beside detecting common risk factors to VGA, one core question is whether the social inclination (individualism or collectivism) matters to it. Object: to clarify the prevalence of VGA and SMA respectively; to identify the influencing factors of VGA; and to make clear the relationships between VGA and adolescents' individualism-collectivism inclination.

Method The survey was conducted among 110 adolescent psychiatric patients. To each interviewee, psychological scales were filled face to face. Path analysis was used to exam the causation structure of the childhood-trauma-related symptoms.

Result The prevalence for VGA was 40.9% (45 out of 110) and for SMA 41.8% (46 out of 110); childhood trauma, social media addiction, the individualistic inclination, and the rate of homosexuality were observed to be independent indicators for video game addiction (r2 =0.46).

Conclusion Psychological Counseling on patients' internet-related behaviors may focus on the individualistic personality and possible childhood trauma, which are two important risk factors of video game addiction. It is recommended to distinguish between video game addiction and social addiction in clinical practice.

关键字：Key word: individualism, video game addiction, social media addiction, childhood trauma, homosexuality.

Symptoms Mediate The Relationship Between Childhood Trauma and Non-suicidal Self-Injury: A Hospital-Based Study of Adolescents with Mood Disorder

周睿 戢婷 张季洁 刘银都 王斐 贾福军 侯彩兰*
广东省精神卫生研究所

Background Childhood trauma exerts a noticeable influence on adolescents' development, where the interpersonal and psychological factors are involved. It is important to identify the prevalence, risk factors and aftermaths of childhood trauma.

Methods The survey was conducted among the adolescent psychiatric patients with mood disorder. To each interviewee, psychological scales includingbeside the Childhood Trauma Questionnaire, a series of psychological scales assessing their NSSI behavior, internet behavior, family function, mood condition and sleep condition were filled face to face. Path analysis was used to exam the causation structure of the childhood-trauma-related symptoms. Result: there were 117 (74.5%) participants observed with at least one type of trauma. A lot of characteristics of traumatic adolescent patients including interpersonal and psychological features were detailed in this study. The path analysis model showed that the relationships between childhood trauma and NSSI were respectively mediated by depressive symptoms and thinking disorders, while depressive symptoms individually mediated the correlation between the childhood trauma and sleep disturbance in psychiatric adolescent patients (X 2/df=1.23).

Conclusion For psychiatric adolescent patients with childhood traumas, psychological counseling on interpersonal relationships should focus on their families and peers; it is recommended to begin the treatment by alleviating their depressive symptoms and thinking disorders firstly, before focusing on their NSSI behaviors and sleep disturbance.

The Weakening of Family Cohesion and Adaptability Aggravated The Risk of Non-suicidal Self-injury Behavior Among Chinese Adolescents with Psychiatric Diseases

刘银都 周睿 张季洁 陈虹蓓 王斐 王诗镔 贾福军 侯彩兰*
广东省人民医院

Background This study was conducted to explore the specific relationship between family cohesion, adaptability and non-suicidal self-injury (NSSI) in adolescent psychiatric patients.

Method 157 inpatients and outpatients (aged between 13 and 18 years) were recruited and they were divided into NSSI group and non-NSSI group. They were assessed with a revised Adolescent Self-Harm Scale and a scheduled unstructured one-by-one interview, and family cohesion and adaptability were evaluated through the Family Adaptability and Cohesion Evaluation Scales (FACES II).

Result The 12-month prevalence of NSSI in this representative clinical sample was 50.9%. After controlling for psychosocial and psychopathological factors, the results represented that engagement in NSSI was significantly related to family cohesion and adaptability. NSSI was also related to sexual orientation and severer depressive symptoms.

Conclusion Improving family function may be one of the complementary treatment strategies for NSSI in adolescent psychiatric patients. The disturbance of sexual orientation and the effective response to depressive symptoms also needed to be considered.

关键字：adolescents; psychiatric disease; non-suicidal self- injury; family function

抗抑郁药治疗肠易激综合征的网络荟萃分析

孙易歆 孙欢 徐佳军*
四川大学华西医院

目的 肠易激综合征（IBS）是一种常见的功能性胃肠道疾病，以反复腹痛和排便障碍为特征。抗抑郁药如三环类抗抑郁药和选择性 5-羟色胺再摄取抑制剂可能对 IBS 患者有效，但关于这些药物疗效的临床证据仍有争议。通过对随机对照试验（RCT）进行网络荟萃分析（NMA），评估抗抑郁药在 IBS 中的疗效和安全性。

方法 通过 EMBASE、MEDLINE、PsychINFO、Cochrane 和 Web of Science 检索抗抑郁药用于 IBS 患者的疗效和安全性的 RCT。使用 Rayyan 软件筛选文献、提取数据并评估文献质量。使用 RevMan 5.4、Stata 17.0 和 R 4.3.0 软件进行统计分析。主要结果指标包括反应率和腹部疼痛/不适。次要结果指标包括焦虑、抑郁程度、生活质量和不良事件。

结果 纳入了 27 篇关于抗抑郁药用于 IBS 治疗的 RCT，包括 1635 名受试者。纳入研究的质量普遍较高，偏倚风险较低。结果显示，TCAs（0.23 [0.10；0.50]）和非典型抗抑郁药（0.07 [0.01；0.35]）在提高反应率方面优于安慰剂，而在缓解腹痛方面无显著优势。其他药物在缓解焦虑、抑郁，提高生活质量和不良事件方面表现出不同程度的差异。然而，研究之间存在显著异质性，部分药物试验数量较少，且缺少大部分抗抑郁药之间的直接比较。

结论 推荐常规使用 TCAs 来治疗 IBS，而对其他类型的抗抑郁药持审慎态度，除非患者为症状较为严重，且对其他的治疗药物无效或合并精神疾病。需进行大型和长期的 RCT 以更好评估抗抑郁药的疗效。

关键字：抗抑郁药；肠易激综合征；网络荟萃分析

Gut Microbial Characteristics in Chinese Adolescents with Non-Suicidal Self-Injury and Childhood Trauma: A Comparative Study

蔡丽飞 贾福军* 侯彩兰*
广东省人民医院

Objective By assessing childhood trauma in Non-Suicidal Self-Injury (NSSI) adolescents, and using PCR detection technology to detect the diversity and abundance of the gut microbiota between NSSI adolescents with and without childhood trauma， to explore the relationship among childhood trauma, intestinal flora and NSSI, attempts to elucidate pathogenesis of adolescent NSSI from social-psycho-biological models. This will facilitate our implementation of NSSI-related health education for adolescents and enhance our comprehension of the pathogenesis of NSSI, thus enabling us to devise effective intervention strategies.

Methods Recruited 51 NSSI adolescents (KD) in Guangdong Province, China, among which 43 adolescents experienced childhood trauma (KD1) and 8 did not (KD2). Collected fecal samples from all subjects and assessed their childhood trauma and NSSI behaviors using standardized questionnaires. The gut microbiota taxonomic composition was determined by 16SrDNA gene sequencing, and utilized LEfSe software to analyze relative abundance and applied linear discriminative analysis (LDA) to perform differential species screening between groups.

Results There was no significant difference in Alpha diversity index between KD1 and KD2 ($P<0.05$). Metastat analysis revealed significant differences in relative abundance at the Order, Family, and Genus levels, with higher proportions of Brucellace and Chryseobacterium in KD1 than in KD2 and a lower proportion of Parabacteroides_chinchillae in KD1 compared to KD2. LEfSe analysis demonstrated higher proportions of Brucellaceae, Mollicutes RF9, and other bacteria in KD1 than in KD2, while Lachnospira, Subdoligranulum, Erysipelotrichales, and Eubacterium fissicatena_group were significantly lower in KD2 (all $P<0.05$). Mollicutes was the dominant flora in KD1.

Conclusion Although Alpha diversity of gut microbiota did not differ between the two groups, relative abundance of gut microbiota was altered at different taxonomic levels in adolescents with childhood trauma, characterized by increased abundance of inflammation-related pathogenic bacteria (e.g. Brucellace and Mollicute) and decreased abundance of probiotics (e.g. Parabacteroides, Lachnospira). These clinical findings suggest a link between gut-brain alterations and NSSI in adolescents with childhood trauma. Incorporating gut microbiota-based strategies in the auxiliary diagnosis of NSSI with childhood trauma may be of importance and may inform novel therapeutic targets aimed at modulating the gut microbiota. Understanding the pathological mechanisms of NSSI may benefit from considering the role of the gut microbiota.

关键字：adolescents, NSSI, childhood trauma, gut microbiota, gut-brain axis

Disrupted Functional Network Topology and Age-related Effects in First-episode Drug-na?ve Schizophrenia From Childhood To Adolescence

姚冠群[1,2] 冯坤[1,2] 徐勇[3] 刘破资[1,2]
1.清华大学玉泉医院
2.清华大学
3.太原市中心医院

Objective Few studies have comprehensively described abnormal developmental patterns of functional networks in EOS patients from childhood to adolescence. This study used functional network topology to explore the neurodevelopmental mechanism of early-onset (EOS) patients from childhood to adolescence.

Methods A total of 167 subjects aged 7 to 17 participated in the study, including 80 EOS patients and 87 healthy controls (HC), and all subjects were divided into childhood (7–13 years) and adolescents (14–17 years).

Two-way analyses of variance were used to compare the functional network topology of EOS patients and HC, and the quadratic nonlinear model was used to explore the different developmental curves of EOS patients and HC with age. Then, two-sample t-tests were used to compare network differences between EOS and HC in childhood and adolescence.

Results Interaction effects and quadratic nonlinear models revealed abnormal developmental trajectories from childhood to adolescence in the global metrics and nodal metrics of the sensorimotor, visual, and frontoparietal network in EOS patients. In addition, the nodal metrics of EOS patients was hyperactivated in cingulo-opercular network in childhood and decreased in cingulo-opercular and default network in adolescence.

Conclusion Our study found that the network topology of EOS patients was overactivated in childhood and abnormally decreased in adolescence. This study revealed the abnormal developmental trajectory of EOS patients from childhood to adolescence in functional network topology, which provided a basis for early clinical diagnosis and treatment of EOS in children and adolescents.

Mental Health Conditions in Patients with Systemic Lupus Erythematosus: A Systematic Review and Meta-analysis

刘晓潼[1] 刘佳佳[1] 魏雅槟[2]
1.北京大学护理学院
2.北京大学中国药物依赖性研究所

Objective To estimate the prevalence of mental health conditions (MHCs) in people with systemic lupus erythematosus (SLE), to identify whether pre-existing mental health conditions increase the risk of systemic lupus erythematosus, and to evaluate the association between mental health conditions and patient outcomes.

Methods We used evidence-based method to evaluate the mental health conditions among SLE patients and conducted a cross-sectional study to validate the findings of our meta-analysis. We searched PubMed, Web of Science and Embase for studies published before June 2023. Studies reported the prevalence of MHCs and the relationship between MHCs and SLE were included. Random-effect models were used to calculate the pooled prevalence and pooled risk ratio for each MHC.

Results 206 studies were eligible for inclusion in our qualitative synthesis, of which 200 were included in our meta-analyses: 192 studies reporting the prevalence of MHCs (13 focused on children and 179 on adults), and eight studies in prospective design assessing the association between preexisting MHCs and the risk of SLE. The remaining seven studies were described narratively due to the different outcome measures reported. The most prevalent MHCs observed in SLE patients was sleep disturbance (59.7[95% CI, 52.4%-66.8%]) among adults and sleep disturbance (59.0[95% CI, 32.8%-82.8%]) among children. Individuals with posttraumatic stress disorder were likely to develop systemic lupus erythematosus (RR=1.86, 95% CI=1.51-2.22, P＜0.001) compared to those without posttraumatic stress disorder. There was conflicting evidence regarding the association between mental health symptoms and patient outcomes. In patients with SLE, the presence of depressive symptoms was associated with unfavorable outcomes, such as increased risk of unemployment, reduced health-related quality of life, and higher likelihood of subclinical atherosclerosis. Additionally, mental disorders in SLE may also impact ICU admission rates and suicidal incidence. The results of our cross-sectional study supported the findings of our meta-analysis. The prevalence of depressive symptoms, anxiety symptoms, cognitive impairment, and sleep disturbance in 94 SLE patients was 25.5%, 43.6%, 59.6% and 63.8%, respectively.

Conclusion Our study revealed that MHCs are common among SLE patients. Compared with people without mental disorders, those with mental disorders have a greater risk of developing SLE. Our results contribute to identifying individuals who are at risk for SLE and optimizing early prevention strategies. The impact of MHCs on patient outcomes such as suicide rates remains to be clearly established. Clinicians should pay more attention to monitoring the implications of MHCs for SLE and improving patient outcomes by providing timely psychological interventions.

Psychological Criteria of Abnormal Thoughts, Feelings, and Behaviors Related To The Symptoms: An Investigation of DSM-V Somatic Symptom Disorders（SSD）of A Muti-center Research in China

殷嘉欣[1] 陈亦笑[1] 刘子明[1] 吴珩[1] 陆峥[1], Kurt Fritzsche[2]
1.同济大学附属同济医院
2.University of Freiburg, Freiburg, Germany

Objective There has been a debate among scholars about how to define psychological criteria between “normal” and excessive with no clear threshold. The main objectives of this study is determining a quantifiable threshold for disproportionate and persistent thoughts about the seriousness somatic symptoms of diagnostic criteria (B criteria).

Methods A cross-sectional study from May 2016 to January 2018 in China. Patients were recruited from 9 tertiary general hospitals in different regions of China, including outpatient department of Traditional Chinese Medicine, Biomedicine (neurology or gastroenterology or cardiology) and Psychosomatic. We analyzed group differences in the time of daily physical complaints between individuals with (SSD = yes, n=236) and without SSD (SSD = no, n=461). SSD patients confirmed diagnosis through structured interviews. Demographic data, lifestyle and medical treatment

behavior, time spent on physical discomfort per day, treatment satisfaction and subjective treatment effect were collected. Self-report questionnaires were used to operationalize the psychological criteria and severity of somatic symptoms. T-test was used to compare the measurement data, and chi-square test were used to compare the categorical data. Receiver operating curve (ROC) analysis was applied to obtain the optimal cut-off value of time to worry about physical discomfort per day. Pearson correlation analysis and multiple linear regression were used to analyze the correlation factors affecting the SSD-12 of psychological characteristics.

Results There was a significant difference of group (SSD yes/no) in daily time spent on symptoms. Compared to the non-SSD group, patients in SSD group were more worried about physical discomfort [(1.5±3.4) h/d vs. (3.9±4.1) h/d, t=8.14, P<0.01)], less satisfied with the treatment [(3.3±1.6) score vs. (2.5±1.8) score, t=4.945, P<0.01)], and had lower evaluation to the treatment effect [(3.1±1.6) score vs.〔2.4±1.6) score, t=4.271, P<0.01]. SSD group have a heavier psychological and physical burden and lower quality of life. Pearson correlation study showed that symptom-related cognitive behavior (SSD-12) was strongly correlated with health-related anxiety (r=0.823, P<0.01) and anxiety (r=0.642, P<0.01) and severity of somatic symptom (r=0.607, P<0.01). Multiple regression analysis showed that health-related anxiety, quality of life, severity of somatic symptoms and time spent on physical discomfort per day have a significant influence on psychological criteria, which explained 74% of the overall variation(P<0.05). The ROC curve analysis showed that the cut-off value of time to worry about physical discomfort per day was 1.25 hours (AUC=0.773).

Conclusion SSD should be considered if patients have at least one somatic symptom for more than 6 months and worry about physical discomfort for more than 1.25 h / d.

First Episode Psychosis(FEP) Experienced Significant Thickness Reduction and Volume Reduction in Many Brain Regions in Comparison To High Risk for Psychosis (HR).

黄卓慧 侯彩兰* 贾福军*
广东省精神卫生中心，南方医科大学附属广东省人民医院（广东省医学科学院）

Objective ：Ultra-high risk for psychosis(UHR) will see a transition into psychosis within a 2-3 year time period following the time of the individual's first assessment for UHR criteria. In this study, we aimed to study volumetric changes of brain regions in high risk for psychosis (HR) compared to first-episode patients with schizophrenia (FEP) and healthy controls (HC) in Chinese individuals. The better understanding of the morphological differences in the brain could potentially lead to the development of early interventions, delaying the onset of psychosis or preventing the transition into a first-episode psychosis and schizophrenia.

Methods : In the study, 12 FEP, 29 HR and 18 HC were recruited. Basic sociodemographic and clinical information were collected. Mini International Neuropsychiatric Interview (MINI) and Structured Interview for Prodromal Syndromes (SIPS) were investigated to confirm individuals' diagnosis and enrollment. Positive and negative syndrome scale (PANSS), Global Assessment Function (GAF) and Montgomery–Asberg Depression Rating Scale (MADRS) were applied to assess psychiatric symptoms. Magnetic resonance imaging (MRI) data included structural imaging, functional imaging and 3D structural image were collected and then volumetric analysis was performed.

Results : The mean age of FEP group was 22.4, and 30.1 for HR group while 30.06 for HC individuals (F=4.6, P=0.01). Significant differences were found between FEP and HR groups in the aspect of PANSS Total and all PANSS subscales (all P values<0.05), which showed a descending trend. There was also a declined trend for the score of SIPS Total and all SIPS subscales other than SIPS General between HR and HC groups (all P values<0.05). An ascending trend was found on GAF score among FEP, HR and HC groups (F=50.1, P<0.001). Otherwise, FEP group got the highest MADRS score, followed by HR group, then HC group (F=23.3, P<0.001). FEP group showed significant cortical thinning and volume reduction in multiple cortical ROIs compared to HR group, which was similarly found in some ROIs compared to HC group. However, to our surprise, HR group exhibited significant larger thickness and volume in few ROIs than HC group.

Conclusion : FEP group experienced significant thickness reduction and volume reduction in many brain regions in comparison to HR group. Thus, gray matter abnormality could be a neuroimaging biomarker of the occurrence and development of psychosis. More comprehensive researches on individuals with high risk for psychosis are needed to determine more promising biomarkers, enabling early detection and intervention for susceptibility to psychosis.

青少年抑郁症脑电微状态异常与童年期情感虐待的相关性研究

胡锦辉 周杨 王我*
重庆医科大学附属大学城医院

目的 探究睁眼状态下青少年抑郁症静息态脑电微状态的异常，并分析静息态脑电微状态指标与患者童年创伤经历的相关性。

方法 本研究采用了静息态脑电微状态分析，其反映了大脑静息态脑网络激活的短暂重叠，以探究伴童年期创伤的抑郁症青少年大脑活动的时间动力学特征。选用改良 k-means 聚类算法，将 64 通道的静息态脑电数据分类成不同微状态。本研究共纳入 27 名健康青少年、66 名患抑郁症青少年。使用独立样本 t 检验和 Spearman 相关，比较组间的微状态指标差异，并分析显著指标与患者童年期创伤间的相关性。

结果 组间在微状态 A 的出现频率上差异显著（P＜0.05）且与童年创伤中的情感虐待因子得分呈显著的负相关（Spearman's rho= -0.31，P= 0.013，N=66），病例组特异性非随机的微状态 B→A 转化（Spearman's rho=-0.3，P=0.015，N=66）及 C→A 转化（Spearman's rho=-0.31，P=0.013，N=66）均与童年期情感虐待因子得分呈显著负相关，并与健康对照有显著差异（P＜0.05）。以情感虐待因子分的高低四分位分组比较，三种指标经多重比较校正后均有显著差异（P＜0.05）。

结论 经历严重童年创伤的抑郁症青少年在大脑视觉网络、中央执行网络功能的时间动态上存在异常。脑电微状态具有辅助识别伴严重童年创伤的青少年抑郁症的潜能。

关键字：抑郁症；青少年；静息态脑电图；微状态；童年创伤

Dysregulated Cerebral Blood?flow and Its Relationship with Blood Inflammatory and Lipid Markers in Youth Depression

Lijun Kang Wei Wang Zhaowen Nie Qian Gong Zhongchun Liu*
Department of Psychiatry, Renmin Hospital of Wuhan University

Objective Arterial spin labeling (ASL) in detecting differences in perfusion for multiple brain regions thought to be important in?MDD. However, the potential of cerebral blood flow (CBF) to predict MDD and its correlations between the blood lipid levels and immune?markers, which are closely related to MDD and brain function change, remain unclear.

Methods We enrolled 451 participants. Then performe ASL and high-resolution 3-dimensional T1-weighted structural. The peripheral blood was drawn and tested for lipid and immunity profiling indicators. After completing CBF case-control comparisons, random forest model construction, and exploratory correlation exploration.

Results The CBF of bilateral inferior temporal gyrus, right middle temporal gyrus and left precentral gyrus in MDD are importance in predict MDD (the area under the receiver operating characteristic curve of the random forest model is 0.717), which is more sensitive than gray matter volume. And immunity and lipids are closely related to CBF change, with the immunity relationship potentially playing a greater role.

Conclusion The interactions between cerebral perfusion, plasma lipids and immune index could therefore represent a MDD pathophysiological mechanism. The current findings provide effective targets for the prevention, diagnosis, and treatment of MDD.

关键字：major depressive disorder, lipid, immunity, cerebral blood flow

Effect of Trazodone on Inflammatory Biomarkers in Arteriosclerotic Cerebral Small Vessel Disease Comorbid with Chronic Insomnia

王继辉 刘三鑫 陶炯 陆正齐*
中山大学附属第三医院

Objective Chronic insomnia is linked to inflammatory processes in patients with arteriosclerotic cerebral small vessel disease (aCSVD). Low-dose trazodone is beneficial to treat insomnia, but the evidence of its effects on inflammation regulation is scarce. The present study was conducted to explore the effects of trazodone on circulating biomarkers of inflammation in aCSVD comorbid with chronic insomnia.

Methods This was a prospective sleep intervention trial conducted in a randomized, double-blinded, and placebo-controlled design. Fifty eligible patients with aCSVD and chronic insomnia were sequentially recruited and randomized to either study group (trazodone) or control group (placebo). The sleep intervention lasted for 4 weeks, and the outcomes were assessed at baseline and after treatment. The primary outcome was the circulating counting of immune cells including [Monocyte，M (CD66b-CD14+), M1（CD66b-CD14+CD86+CD206-），M2（CD66b-CD14+CD86-CD206+）; Neutrophils，N（CD66b+CD14-），N1（CD66b+CD14-CD86+CD206-），N2（CD66b+CD14-CD86-CD206+）；B cells（CD19+CD27+）；Treg cells（CD4+CD25+Foxp3+）] measured by flow cytometry. Secondary outcomes included circulating cytokines (IL-1β, IL-6，TNF-α and IL-8) and objective sleep parameters measured with polysomnography (PSG).

Results The study group showed decreased N1 [(1.87±0.85) Vs (2.82±1.25), t =2.874, P =0.007] and IL-8[(6.52±2.87) Vs (9.77±3.56), t=23.218, P =0.003）]; increased N2 [(2.99±1.64) Vs (1.341±0.59), t=4.057, P＜0.001] and M2 [(4.13±3.34) Vs (1.77±1.02), t =3.031, P=0.004] compared with those in control group after the treatment. Trazodone caused batter improvements in sleep efficiency, N3 sleep ratio, and sleep continuity than the placebo.

Conclusion Trazodone is helpful to treat insomnia and promote neutrophil and monocyte to anti-inflammatory polarization in patients with aCSVD and insomnia.

关键字：trazodone, small vessel disease, sleep, inflammation, polysomnography

综合医院精神心理科青少年住院患者抑郁焦虑症状与人格特征的关系

王雅琴* 杨锦
中国人民解放军联勤保障部队第九二三医院

目的 ：探讨青少年住院患者抑郁焦虑症状与人格特征的关系，为他们的心理健康指导及干预提供有理依据。

方法 采用方便抽样的方法，选取中国人民解放军联勤保障部队第九二三医院精神心理科青少年77名住院患者进行心理测试，采用抑郁自评量表（SDS）、焦虑自评量表（SAS）和艾森克人格问卷（EPQ）对其进行问卷调查。

结果 被试者抑郁症状发生率为 75.32%，焦虑症状发生率为 61.04%;（抑郁症状、焦虑症状、抑郁焦虑共病和无症状）被试者的抑郁焦虑情绪发生率在性别、年龄构成比上，差异有统计学意义（x2=13.941，x2=5.627，P＜0.05），在文化程度构成比上，差异无统计学意义（x2=5.909，P＞0.05)。被试的 EPQ 精神质（P)因子得分差异有统计学意义(F=5.654，P＜0.01)。多因素 logistic 回归分析，神经质（N)、精神质（P）得分与抑郁、焦虑、抑郁焦虑共病发生的 OR 值均＞1（OR=4.623,14.273,3.397,8.213,3.397,8.213，均 P＜0.05)，是罹患抑郁、焦虑、抑郁焦虑共病的危险因素，而内外向(E)得分与抑郁发生的 OR 值＞1(OR=4.196，P＜0.05)，是罹患抑郁的危险因素；掩饰程度（L）得分和焦虑、抑郁焦虑共病发生的 OR 值＜1（均 OR=0.311)，可能是焦虑、抑郁焦虑共病的保护因素。

结论 不健全的人格特征可增加抑郁、焦虑等心理疾病的发生概率。人格特征对个体心理健康发展有着重要的意义。积极的心理状态是可干预和促进的。所以，培养良好的人格有利于提高个体的心理健康水平。

7.首都医科大学附属北京安贞医院内分泌代谢科
8.天津市中西医结合医院（天津市南开医院）消化内科
9.东南大学计算机学院
10.意大利佛罗伦萨大学健康科学系

目的 心身医学研究诊断标准-修订版（DCPR-R）作为特定心身综合症的识别和分类工具，有效填补了传统精神病诊断系统无法充分涵盖的部分。尽管全球对 DCPR-R 综合症的理解和评估已取得显著进步，中国在这方面的流行病学知识仍然有限。因此，中国心身医学会（CSPM）启动了一项全国多中心流行病学研究，旨在探索 DCPR-R 综合症在中国各区域和人群中的患病率和分布情况，调查风险因素并进行 DCPR-R 的跨文化研究。

方法 我们将根据第七次人口普查结果，通过概率比例抽样方法，招募 9865 名参与者。至 2023 年 3 月 1 日，五个工作组在 145 家综合医院中已成功招募了 2079 名心身疾病患者和 862 名健康对照组成员。收集的数据涵盖社会人口学信息、临床数据、DCPR-R 诊断面谈，以及补充心理评估。

结果 初步结果表明，纤维肌痛和偏头痛患者可能伴随着更多的心理困扰和心身综合征，如焦虑、抑郁和持续的躯体化。此外，无论健康对照组还是患者组，有 30.30%-49.56%的人可能存在述情障碍。然而，各工作组在受试者人数、性别比例、教育程度和社会经济地位方面存在差异，因此未来的分析需要根据潜在的站点效应进行调整。

结论 此项开创性的研究将对中国心身疾病的临床实践和未来研究产生深远影响，为实施更为精确且个性化的干预措施和治疗策略铺平道路。

基于跨理论模型的随访管理对抑郁症患者服药依从性的研究

谭靓靓* 王坤华 杨莉 于露
东南大学附属中大医院

目的 探讨跨理论模型（TTM）的健康教育对抑郁症患者健康管理行为及服药依从性的影响。

方法 随机抽取 2022 年 03 月-2023 年 03 月我院心理精神科 120 例抑郁症患者，应用随机数字表法将患者随机分为对照组和干预组各 60 例。对照组患者进行抑郁症患者常规护理、出院健康宣教和随访管理。干预组在此基础上，采用 TTM 的随访管理模式，即小组成员在患者出院 1 周内，采用电话随访、视频等对其运用行为阶段评估问卷进行评估，了解患者服药行为所处的改变阶段，然后根据所处的行为改变阶段及其健康需求，予以与之行为改变阶段相对应的干预措施。在干预过程中，根据患者行为变化，采用电话随访、互联网技术，互助小组、健康大讲堂、疾病日志等多种方法进行干预。提高患者对疾病的认知，促进行为的改变。两组均在出院前 1 天、出院后 1 个月、3 个月、6 个月后分别进行服药依从性量表、服药相关信念问卷、自知力与治疗态度问卷（ITAQ）、席汉失能量表的评定，

评估患者抑郁症复发情况。两组资料进行统计分析，判断基于跨理论模型的随访管理模式对抑郁症患者出院后的服药依从性、服药信念、对疾病的自知力、生活质量以及抑郁症复发率的干预有效性。

结果 干预组 干预后患者服药依从性、服药信念、对疾病的自知力、生活质量评分及相关维度评分高于对照组，差异有统计学意义（P<0.05）；抑郁症复发率低于对照组，差异有统计学意义（P<0.05）。

结论 基于 TTM 理论的健康教育能有效提高抑郁患者服药依从性、服药信念、自知力及生活质量，有助于患者抑郁症状控制，减少疾病的复发，改善患者社会生活质量。

东南大学附属中大医院

目的 对疼痛护理组成员授权赋能，改进疼痛管理模式，研究对疼痛管理质量的提升效果。

方法 研究医院于 2014 年成立疼痛护理组，负责全院疼痛护理培训及质量改善工作，网络成员为各病区选送的具有三年及以上临床经验的护士。采取便利抽样法，选择 2020 年每个季度第 5 周在院的疼痛病人为对照组，选择 2022 年同期在院的疼痛病人为试验组。对照组提供疼痛常规管理，疼痛护理组制定小组年度工作计划并组织实施，定期组织培训、学习，指导临床护理工作。每季度开展疼痛护理质量检查，针对存在问题，提出改进措施，持续改进疼痛护理质量。 试验组提供授权赋能模式管理，包括①明确成员权责 2021 年 1 月，召开网络成员会议，明确告知网络成员为各病区疼痛护理质量的责任人，负责本病区护理人员的疼痛知识培训、工作指导，参与质量检查。②定期培训 制定培训计划，每季度邀请专家进行疼痛护理专题讲座，网络推送相关指南、文献。举办个案分享、知识竞赛，经验交流活动。③保证赋权过程的稳定 2021 年 1-3 月修定疼痛护理手册、用药规范、疼痛评估流程，拍摄操作视频。完善标准化流程，指导疼痛护理。④及时进行纠偏处理 每季度质控，针对高频问题，提出要因及改进措施。及时向网络成员反馈，并要求传达给本病区护士，督促改进。 干预后每 3 个月进行疼痛质量检查，连续 4 次。干预 1 年后，对疼痛护理组成员进行心理授权评分，对照分析两种模式下疼痛护理的质量及成员的心理授权变化。

结果 试验组病人疼痛护理质量评分高于对照组，网络成员心理授权水平提高，差异有统计学意义（p＜0.05）。

结论 授权赋能模式下的疼痛护理管理，帮助疼痛护理组网络成员厘清工作重点，落实疼痛护理管理，提升疼痛护理质量。授权赋能模式充分调动护士的积极性和主观能动性,提高网络成员的心理授权水平。在疼痛护理组的规划带领下，发挥网络成员的管理才能,为住院病人疼痛护理管理提供了有效模式。

家庭支持干预对晚期宫颈癌患者的情绪及生活质量的影响研究

徐金晶*
东南大学附属中大医院

目的 开展积极的家庭支持干预，探讨对晚期宫颈癌患者的情绪及生活质量的影响。

方法 选取本院 2020 年 1 月至 2021 年 6 月收治的 110 例晚期宫颈癌患者作为研究对象。通过随机数字表法进行分组，分为对照组和试验组，各 55 例，对照组行常规护理干预，内容包括：开展健康知识教育，并进行心理疏导；积极做好饮食指导、用药指导等护理。观察组在对照组基础上增加家庭支持干预。具体实施措施如下：①同步教育。通过与家属进行面对面沟通交谈，提高家属对疾病的认识，增强相关的配合技能，给予患者更多地鼓励、照顾，让患者感受到温暖；②情感支持。“家-院”联动，共同帮助患者疏解恐惧、焦虑等不良情绪，帮助患者以积极乐观的人生态度，认识生命价值，感受生命尊严；指导家属做好倾听者，多陪同患者，增强家庭关怀的情感支持效能；③健康支持：建立患者家属微信群，通过群平台，进行疾病知识的推送，分享相关抗癌经验，正确认识疾病，保持良好心态。比较两组患者干预前后心理情绪、家庭支持效果、希望水平及生活质量等的变化。

结果 两组患者干预前心理情绪评分、家庭支持效果、希望水平及生活质量评估无统计学差异（P＞0.05）。干预后评估结果：①心理情绪评分，试验组 SAS、SDS 评分均明显小于对照组（P＜0.05）；②家庭支持效果评价，试验组患者亲密度、情感度等六个方面均明显高于对照组（P＜0.05）。③希望水平，试验组采取积极行为、与他人保持亲密关系及保持积极态度的评分均明显高于对照组（P＜0.05）。④生活质量，试验组生命质量评分明显高于对照组（P＜0.05）

结论 家庭支持已广泛用与晚期癌症患者护理，在晚期宫颈癌患者中积极开展家庭支持干预，通过建立“家-院”互动护理模式，在情感支持、健康支持等维度，实现对患者的精细化、全面化优质护理，改善患者心理情绪水平，提高家庭支持及希望水平，提高患者生存期生活质量，具有良好的应用价值。

曼陀罗绘画疗法对钙化防御患者抑郁、焦虑情绪的影响

袁玲*
东南大学附属中大医院

目的 钙化防御是一种罕见的致死性血管性疾病，透析人群中患病率仅为 0.01%-0.35%，而死亡率可高达 50%-80%。钙化防御临床症状复杂，基础疾病病程长，伤口疼痛难忍，药物疗效不佳，创面持续进展易造成视觉恐惧感，这为临床多学科诊疗（MDT）提出挑战。钙化防御患者常处于无助无望的精神状态，极易焦虑、恐惧与抑郁。而在钙化防御诊疗过程中因科室的专业性限制，往往疏忽精神状态诊治。作为全国拥有最大钙化防御生物样本库的研究中心，医疗组在探索钙化防御诊疗方案、制定适应中国人群钙化防御诊疗策略方面，取得了较大进展，同时积极询证，研究适合钙化防御患者的心理疗法。而曼陀罗绘画疗法是由卡尔荣格发明的一种特殊的心理治疗方法。该疗法具有减少心理障碍，维持内心秩序，反映内心世界，用绘画治愈心灵创伤的功能。研究表明其在缓解术前等候室患者、康复期精神分裂症患者、癌症患者、术后患者的焦虑及抑郁等负性情绪方面安全可行，效果良好。因此，本研究将其应用于钙化防御患者，目的在缓解患者焦虑、抑郁情绪，为钙化防御心理护理工作提供新思路及参考依据。本研究已经通过伦理委员会批准。

方法 便利抽样选取 2021 年 4 月-2022 年 3 月在南京市某三甲医院钙化防御研究中心患者 40 例作为研究对象，随机分成观察组（n=20)和对照组（n=20）。对照组进行常规护理，在此基础上，观察组进行曼陀罗绘画疗法干预，从患者进入治疗周期开始，每天 1 次，1 次 30 分钟，每周 5 次，共 4 周。采用抑郁、焦虑自评量表、匹兹堡睡眠质量指数量表、生活质量评估量表对两组患者进行比较。

结果 干预后，观察组焦虑、抑郁水平得分明显低于对照组（ P ＜0.05）；睡眠质量、生活质量得分明显高于对照组（ P ＜0.05）。

结论 曼陀罗绘画可改善钙化防御患者的焦虑抑郁情绪。而且能提升患者的睡眠、生活质量。

关键字：钙化防御；曼陀罗绘画；焦虑；抑郁；生活质量

石家庄市居民心理健康素养及服务需求调查

齐秀芳 孙志刚*
石家庄市第八医院

目的 了解石家庄市居民心理健康素养水平和服务需求，评价社会心理服务体系建设效果，为更好开展工作提供依据。

方法 石家庄市居民心理健康素养问卷由中国科学院心理研究所设计，通过线上问卷形式开展调查，调查范围为石家庄市常住居民。

结果 本次调查共收集有效问卷 153942 份，精神卫生知识知晓率为 74.11%，不同特征居民精神卫生知识知晓率不同，差异有统计学意义（P<0.01）；居民整体可求助资源不高，仅为 37.87%，与居民精神卫生服务需求高应答率形成对比；石家庄市居民对待精神疾病患者的态度得分 18.06±3.939，对待心理和精神疾病的态度得分 11.12±2.209。不同特征居民对待精神疾病及患者的态度差异有统计学意义（P<0.01），精神卫生知识知晓程度越高，对精神疾病及患者的态度越偏于正向，对疾病及患者包容性越好。

结论 石家庄市居民精神卫生知识知晓率已达到国家相关要求，但心理健康服务的高需求与可求助资源的不足矛盾较为突出，对待疾病和患者的态度也存在一定的偏见，尤其需关注农村县居民和青少年、学生的心理健康。提示要加快推进我市社会心理服务体系建设工作，促进居民精神卫生健康素养水平的整体提高。

补充膳食硒通过增加海马内 Sepp1 改善小鼠抑郁样行为

段豪 刘忠纯*
武汉大学人民医院精神卫生中心

目的 硒元素作为一种必需的微量元素，其缺乏与多种疾病尤其是神经系统疾病相关,而海马则处于大脑硒富集链的最高点，即使是在全身极度缺硒的状态下，海马中的硒元素浓度仍与正常对照无显著差异。此项研究表明了维持海马中的硒浓度对于哺乳动物至关重要。而海马作为抑郁症发病机制中的关键器官，其中的硒环境的改变极有可能对抑郁症的发病产生重要影响.本课题在原有探究硒元素浓度与抑郁症的关系的基础上，聚焦于其功能载体——硒蛋白上.

方法 取 80 只 6 周大的 C57/BL 雄性小鼠，根据行为学基线结果，20 只一组分为四组（组间无显著性差异）：CON-NC(正常饲料)、CUMS-NC（正常对照）、CON-SE+（富硒饲料）、CUMS-SE+（富硒饲料）。其中富硒饲料采用 Ain93G 对照饲料中添加硒代蛋氨酸使其硒元素达到 1mg/kg。CUMS（慢性不可预测性轻度应激）造模从以下刺激中每日随机选取 2 种施加：1.禁食 24h 2.禁水 24h 3.昼夜颠倒 24h 4.夹尾 5min 5.空笼 24h 6.震荡 10min 7.束缚 6h，持续 5 周。造模结束后，采用旷场试验（OFT）、悬尾实验（TST）、强迫游泳实验（FST）、糖水偏好实验（SPT）评估各组小鼠抑郁状态。行为学实验完成后，采用异氟烷麻醉小鼠后选取部分小鼠进行多聚甲醛灌注，取完整脑制石蜡切片。选取部分小鼠取海马制备单细胞悬液后采用流式细胞仪测量 ROS 水平。剩余小鼠取血液、海马、前额叶，剩余大脑部分做匀浆送检 ICP-MS 测量硒元素含量。血液 3000r 离心 15min 取血清通过 SEPP1 试剂盒测量血清 SEPP1 含量，海马前额叶制备蛋白样品，通过 WB 相对定量硒蛋白 P、GPX4、TXN、NLRP3 等蛋白的表达水平。通过免疫荧光观察上述蛋白的空间表达情况及

相对表达量。

结果 我们的研究结果显示，CUMS 小鼠海马内 Sepp1 水平降低，通过在饲料中添加硒代蛋氨酸可以有效增加小鼠海马内 Sepp1 水平、减低 NLRP3 水平并缓解小鼠抑郁样行为。这一现象可能是通过减少细胞内 ROS 水平实现的。

结论 ，CUMS 小鼠海马内 Sepp1 水平降低，通过在饲料中添加硒代蛋氨酸可以有效增加小鼠海马内 Sepp1 水平、减低 NLRP3 水平并缓解小鼠抑郁样行为。这一现象可能是通过减少细胞内 ROS 水平实现的。

精神分裂症患者基于简单眼区情绪识别范式的脑血氧浓度空间特征

李媛 王惠玲*
武汉大学人民医院精神卫生中心

目的 精神分裂症（schizophrenia，SCZ）患者的独立核心症状之一就是认知功能减退。简单眼区情绪识别任务（EBEDT）反映了社会认知功能中的社会知觉加工功能。近红外光谱脑功能成像（fNIRS）是一种新兴脑成像技术，检测人脑皮层的氧合血红蛋白（HbO2)和脱氧血红蛋白（HbR)在各种神经认知活动中的浓度变化。

方法 1.研究对象：受试者均为来自武汉大学人民医院精神卫生中心的精神分裂症患者（45 人），以及同期来自附近社区的自愿参与研究的健康志愿者（45 人）。2.EBEDT 的 Eprime 范式：简单眼部情绪识别任务（EBEDT）是 1997 年由英国心理学家 Baron-Cohen 等编制的反映社会知觉加工的评估量表。本研究将 EBEDT 改编成一个 block 设计的 fNIRS 范式。 3.统计学分析：使用 MATLAB R2014a 处理 fNIRS 数据：使用 Homer2 对数据进行预处理；NIRS_KIT 进行个体水平的 GLM 分析，然后对精分组和正常组的数据分别进行单样本 t 检验，以及精分组和正常组之间的双样本 t 检验。

结果 正常组在 EBEDT 下，通道 46 正激活，通道（25、27、29、30、40）负激活，差异均有统计学意义（均 $P < 0.05$），其余各通道差异均无统计学意义（均 $P > 0.05$）；精分组在 EBEDT 下，通道 5 正激活,通道（19、21、27、30、31）负激活，差异均有统计学意义（均 $P < 0.05$），其余各通道差异均无统计学意义（均 $P > 0.05$）。精分组在 EBEDT 下，通道 40 平均 OxyHb 水平高于高于正常组，差异有统计学意义（均 $P < 0.05$），其余各通道差异均无统计学意义（均 $P > 0.05$）。

结论 研究推测，Broca 区和社会认知功能的情绪识别有关。精神分裂症患者和正常受试者在情绪识别过程中，脑功能差异主要体现在右侧前运动皮层与辅助运动皮层。

Mapping Prodromal Symptoms in Patients with Bipolar Disorder: A Network Perspective

杨源*
广东省人民医院

Objective Bipolar disorder (BD) is a major mental disorder that significantly impairs individuals' behaviour and social functioning. Symptoms of bipolar disorder can cause unpredictable changes in mood and behaviour, resulting in significant distress and personal/family suffering. This study aimed to assess the network structure of prodromal symptoms in patients with BD prior to their index mood episode.

Methods Semi-structured interviews were conducted with the Bipolar Prodrome Symptom Scale-Retrospective (BPSS-R) to examine patients' prodromal symptoms. Network analysis was conducted to elucidate interrelations between BD symptoms.

Results A total of 120 eligible patients participated in this study. Network analysis indicated that the observed model was stable. The edge Mania3-Depression9 ('Racing thoughts' - 'Thinking about suicide', edge weight = 14.919) showed the strongest positive connection in the model, followed by the edge Mania1-depression1 ('Extremely energetic/active' - 'Depressed mood', edge weight = 14.643). The only negative correlation in the model was for Mania7-depression2 ('Overly self-confident' - 'Tiredness or lack of energy', edge weight = -1.068). Nodes Mania3 ('Racing thoughts'), Depression9 ('Thinking about suicide'), Mania1 ('Extremely energetic/active'), and Depression1 ('Depressed mood') were the most central symptoms. Both depressed and (hypo)manic symptoms appeared in the prodromal phase.

Conclusion In conclusion, 'Racing thoughts', 'Thinking about suicide', 'Extremely energetic/active', and 'Depressed mood' emerged as key symptoms within the network model of bipolar disorder in this research. Given the centrality of these symptoms, ongoing clinical care and targeted interventions to address them may be important for reducing the risk for both suicide and new episodes of bipolar disorder among currently remitted patients.

Application of Repeated Transcranial Magnetic Stimulation Therapy in Cancer Patients: A Systematic Review

杨源*
广东省人民医院

Objective The purpose of this review is to systematically summarize the application of repetitive transcra-

nial magnetic stimulation therapy (rTMS) in cancer patients, to provide a new choice for comprehensive treatment of cancer patients, and to improve cancer patient's social function and quality of life.

Methods Literature related to the effects of rTMS among cancer patients was systematically searched in the Web of Science Core collection database, PubMed, Cochrane Library, CNKI and Wanfang database from their inception dates until March 3rd, 2023. After literature screening, relevant data were extracted and literature quality was evaluated by the Cochrane Manual 5.1.0 randomized Controlled trial Bias Risk Assessment Scale.

Results Twelve literatures were included in this review, including 8 in Chinese and 4 in English, all of which were randomized controlled studies with good quality. Five studies reported the efficacy and safety of rTMS in the treatment of depression associated with cancer, three studies discussed the efficacy of rTMS on cancer pain, and two reports on the benefits of improved sleep. One each explored the treatment effects of rTMS on increasing physical activity and improving postoperative paralysis.

Conclusion rTMS therapy is rarely carried out in cancer patients, and its efficacy and safety are still unclear. However, the current review provided evidence regarding the efficacy of rTMS on the management of cancer-related emotional disturbances and cancer pain, and also provided crucial clinical implications for cancer treatment in the future.

Network Analysis of Suicidality and Internet Addiction Symptoms Among Chinese Primary and Secondary School Students

杨源*
广东省人民医院

Objective The COVID-19 pandemic has increased the risk of both Internet addiction and suicide across various populations, especially among children and adolescents. This study aimed to assess the inter-relationships between Internet addiction symptoms and suicidality among primary and secondary school students from the perspective of network analysis.

Methods This was a cross-sectional, multicenter study. The Internet Addiction Test (IAT) was used to assess internet addiction symptoms. Participants were also asked about having any suicidal ideation and suicide plan. Univariate analyses and network analysis were subsequently conducted.

Results Altogether, 5,380 primary and secondary school students participated in the study. Among them, 3,161 (58.8%, 95% CI = 57.4% - 60.1%) students reported having Internet addiction symptoms and 798 (14.8%, 95% CI = 13.9% - 15.8%) reported having suicidal ideation or suicide plan in the past two weeks. Network analysis revealed that IAT16 ('Request an extension for longer time spent online'; node strength = 1.223) was the most central symptom in the Suicidality-Internet addiction network model, while the edge suicidality-IAT4 ('Form new relationship with online users'; edge weight = 0.055) was the strongest edge linking both communities.

Conclusions Internet addiction symptoms were common among primary and secondary school students during the COVID-19 school closure period in China and were significantly associated with suicidality. Targeted strategies such as strengthening self-control, sense of belonging and connectedness may be important in reducing the risk of both suicidality and Internet addiction among primary and secondary school students.

鉴别单相抑郁与双相障碍列线图模型的构建及验证

黄洁平 侯雪娇 李沫演 温盛霖 王梓 岳计辉*
中山大学附属第五医院

目的 探讨单相抑郁与双相障碍临床特征及血液学指标的差异性，构建列线图预测模型并验证

方法 收集自 2019 年 1 月至 2021 年 12 月在中山大学附属第五医院精神心理科住院治疗的病例。根据 ICD-10 诊断标准，纳入抑郁障碍 234 例，双相障碍 487 例。收集的预测变量包括人口学指标及血液学指标，其中前者包括性别、年龄、病程、婚姻状况、家族史等；后者包括红细胞计数、白细胞计数、血小板计数、中性粒细胞计数、嗜酸性粒细胞计数、血清总胆固醇水平、血清甘油三酯水平、血清高密度脂蛋白水平、血清低密度脂蛋白水平、甲状腺功能指标、内分泌六项、风湿相关指标、C 反应蛋白、自身免疫性指标等。本研究首先通过单变量分析进行变量初筛；然后通过最佳子集法选择出预测效果最佳的变量组合；随后通过多变量逻辑回归进行模型构建，其中精神科药物大类使用情况被纳入回归方程进行模型调整；最后通过受试者工作特征曲线（C 指数）、校准曲线、重复 10 折交叉验证法对模型进行评估及验证。此外，还通过对研究人群进行年龄梯度分组，平衡两组患者的年龄差异后评估模型稳健型以进行敏感性分析。

结果 首先单变量分析将 47 个预测变量缩减至 22 个，随后最佳子集法挑选出由"年龄、嗜酸性粒细胞计数、促甲状腺素、卵泡刺激素、泌乳素、血清总胆固醇水平和血清低密度脂蛋白水平"构成的子集是鉴别单相抑郁与双相障碍的最优预测变量集合（AIC 值最小），然后通过多变量逻辑回归构建预测模型，并删除了控制精神科大类药物使用情况后失去统计学差异的指标"促甲状腺素和卵泡刺激素"，最后通过列线图将模型进行可视化。该模型的 C 值（ROC 曲线下面积）为 0.858，当模型选择 0.66 作为界值时，灵敏度为 0.716，特异性为 0.89，阳性似然比和阴性似然比分别为 6.51 和 0.32；校准曲线显示模型预测值与真实值一致性程度较高，Hosmer-Lemeshow 检验的 P 值为 0.705；上述

指标提示该模型区分度和校准度良好。10 折交叉验证重复 10 次后得出平均 C 统计量为 0.853 (0.850 - 0.856)，提示该模型稳定且可靠。敏感性分析显示平衡了两组患者的年龄差距后，该预测模型仍具有良好的区分度。

结论 本研究构建的鉴别单相抑郁与双相障碍的列线图预测模型，应用方便，准确度较好，具有一定的应用价值。

关键字：抑郁障碍；双相障碍；预测模型；列线图；模型验证

The Risk Factors of Psychotic Symptoms in Inpatients with Major Depressive Disorder: A Cross-sectional Naturalistic Study

毛俊雄[1] 马琦[1,2] 彭朕磊[1] 徐秋爽[3] 罗晓[1] 张丽丽[1] 张婷婷[1] 迪丽达尔·多力坤[1] 王茜莲[1] 景琳霞[1] 伊琦忠[1]

1.新疆医科大学第一附属医院心理医学中心
2.新疆医科大学第一附属医院临床医学研究院
3.新疆医科大学第四附属医院神志病科

Objective To explore the risk factors of psychotic symptoms in major depression disorder (MDD) patients , and to reveal the relationship between 25(OH)D level and psychotic symptoms in patients with MDD, so as to provide theoretical basis for the prevention and treatment of psychotic symptoms in MDD in the future.

Methods 233 MDD patients were recruited from the Psychological Medicine Center of the first affiliated Hospital of Xinjiang Medical University. All participates were assessed by Positive and Negative syndrome Scale (PANSS), Hamilton Depression Scale (HAMD-24) and its sub-scale, Hamilton Anxiety Scale (HAMA) and its subscale. The patients were divided into psychotic major depression (PMD, N=46) group and non-psychotic major depression (NPMD, N=187) group. In addition, we collected their basic information and blood biochemical indicators, and compared the differences of each index between the two groups. Finally, all differences indicators were included in the logistic regression model to explore the risk factors related to PMD.

Results The result showed that psychotic symptoms were more likely in recurrent episodes and single patients. In addition, PMD patients had higher HAMD-24 total score, especially in the sub-scale of cognitive disturbance, retardation, sleep disturbance and hopelessness, and with lower 25(OH)D level. The sub-scale scores of HAMA indicated that PMD patients had lower somatic anxiety score and more serious psychic anxiety symptom. The logistic regression model suggested that marital status, cognitive disturbance, retardation, sleep disturbance and 25(OH)D level were independently associated with PMD. Furthermore, ROC curve prompted us that the combination indicators of all independent risk factors screened by logistic regression model could distinguished well between PMD and NPMD patients (AUC=0.894).

Conclusion General clinical data and biochemical indicators may be able to predict psychotic symptoms in MDD patients, which needs to be taken seriously in clinical practice.

关键字：psychotic major disorder, 25-hydroxy-vitamin-D level, cognitive disturbance, retardation, sleep disturbance

The Effects of Managing Cancer and Living Meaningfully (CALM) on Psychological Distress in Patients with Esophageal Cancer

蔡银莲*
安徽医科大学第二附属医院

Objective Managing Cancer and Living Meaningfully (CALM) is an evidence-based, tailored, semistructured psychotherapeutic intervention. The aim of this study was to evaluate the effectiveness of CALM in esophageal cancer with psychological distress during treatment.

Methods Ninety-one patients with esophageal cancer who reported psychological distress during treatment were recruited for the study. Patients were assigned to either the CALM group (n = 45) or the care as usual (CAU) group (n = 46). Patients in the CALM group were regularly scheduled for six face-to-face individual psychotherapy sessions in the hospital. Assessed at baseline (T0), during the intervention period or control period (T1) and at the 1-month follow-up after the end of the intervention (T2) using the Hospital Anxiety and Depression Scale, the Distress Thermometer and the European Organization for Research and Treatment of Cancer Quality of Life Questionnaire Core 30. The primary outcome assessed differences in psychological distress between and within groups across the periods. Secondary outcomes measured anxiety depression, psychological distress and quality of life.

Results In contrast to CAU, patients showed a significant reduction in psychological distress ($P < 0.001$), as well as reduced anxiety ($P < 0.001$) depression ($P < 0.001$) and improved quality of life ($P = 0.042$) after the CALM intervention, and the positive effect remained after 1 month of follow-up ($P < 0.05$).

Conclusion This study suggests that CALM may be an effective approach for targeting psychological distress in patients with esophageal cancer and provides a strong rationale for further research on the use of CALM in patients with esophageal cancer.

基于暴力风险评估的针对性护理干预在住院精神疾病患者中的应用

刁雪云*
天津市安定医院

目的 探究基于暴力风险评估的针对性护理干预在住院精神疾病患者中的应用的效果

方法 依据纳入及排除标准将我院于2020年2月至2021年6月收入住院的100例精神疾病患者作为研究对象，并采用抽签法分为两组。对照组50例患者实施常规护理干预措施，而观察组50例患者实施基于暴力风险评估的针对性护理干预，两组均护理三个月。对比两组患者护理前后简明精神病评定量表（BPRS）、外显攻击行为量表（MOAS）以及护理过程中暴力事件发生情况。两种量表总分反映暴力行为严重性，总分越高患者暴力行为越严重。

结果 与参照组比较，护理后观察组BPRS量表、MOAS量表评分更低，P<0.05；与参照组比较，观察组暴力事件发生率更低，P<0.05。研究结果数据经SPSS22.0软件分析处理，卡方X2检验计数资料，样本t检验计量资料，P<0.05提示数据差异具有统计学意义。

结论 精神疾病患者的暴力冲动行为具有不确定性和突发性，且不同的精神疾病患者暴力行为发生频率、严重性、针对性不同，护理人员往往难以单纯靠护理经验和直觉判断患者暴力行为发生的时间及伤害性，而导致对患者疏于防范而造成暴力伤害。因此基于暴力风险评估的针对性护理干预在住院精神疾病患者中应用，有利于患者暴力行为的降低，使得患者危害性降低。

Differences between Bipolar I and Bipolar II Disorders in Biochemical Metabolism and Their Associations with Cognitive Function, and Thyroid Function

张荣旭[1] 钟舒明[1] 赖顺凯[1] 王颖[2] 张一靓[1] 何嘉丽[1] 黄东[1] 陈观茂[2] 严舒雅[1] 陈盼[2] 陆晓丹[1] 黄晓思[1] 贾艳滨[1]
1.暨南大学附属第一医院精神医学科
2.2 暨南大学医学影像中心

Objective Previous studies have reported abnormal brain function in bipolar disorder. Recent studies have shown that bipolar subtypes differ in the degree of biochemical metabolism. This study was to investigate the differences of biochemical metabolism between bipolar I disorder (BD I) and bipolar II disorder (BD II), as well as their associations with cognitive function and thyroid function.

Methods 50 patients with BD I, 80 patients with BD II, and 50 healthy controls (HCs) were recruited in our study. Bilateral metabolite levels of prefrontal cortex (PFC), anterior cingulated cortex (ACC), and thalamus were obtained by 1 H-MRS at 3.0 T, then determined the ratios of N-acetyl aspartate (NAA) and choline-containing compounds (Cho) to creatine (Cr). Cognitive function was measured using the Chinese versions of MATRICS Consensus Cognitive Battery (MCCB). Additionally, serum thyroid hormone levels including free tri-iodothyronine (FT3), total tri-iodothyronine (TT3), free thyroxin (FT4), total thyroxin (TT4), and thyroid-stimulating hormone (TSH) were detected.

Results Compared with the BD II group, BD I showed significantly lower Cho/Cr ratio in the right PFC and NAA/Cr ratio in the right thalamus, and higher Cho/Cr ratio in the left ACC. Both BD I and BD II were significantly impaired relative to the HCs group in terms of speed of processing, attention/vigilance, working memory, verbal learning, visual learning, reasoning problem solving, social cognition, and composite score. And the two patient groups showed lower FT3 and higher levels compared to HCs, in addition, patients with BD I performed higher TT4 level than patients with BD II. For BD I, the Cho/Cr ratio in the left ACC was negatively correlated with reasoning problem solving and attention vigilance, and positively correlated with the TT4 level; the Cho/Cr ratio in the right PFC was also positively correlated with the verbal learning. Additionally, the TT4 level was positively correlated with attention vigilance and composite score in patients with BD I.

Conclusion The findings suggested that BD I and BD II may have different biochemical abnormalities and thyroid dysfunction, which may help to distinguish the two subtypes. Further, thyroid dysfunction and abnormal Cho metabolism might be implicated in cognitive impairment in the early stages of BD I.

护士对自伤行为态度量表的汉化及信效度检验

彭珂昕 李亚敏*
中南大学湘雅二医院

目的 自我伤害（Self-harm，SH）是指通过各种各样的形式对个体生理进行自我伤害的行为，自伤行为已成为全球性的医疗问题。研究发现，患者自伤时需要护士的关怀与同情，然而护士在面对自伤行为时常存在消极态度。目前，我国护士对自伤行为的态度尚无直接测量的方法。英国学者研发了自我伤害态度量表（Self-Harm Antipathy Scale, SHAS），可作为评估护士对自伤行为态度的工具。本研究旨在引进并汉化自我伤害态度量表（Self-Harm Antipathy Scale, SHAS），检验中文版护士对自伤行为态度量表在我国护士人群中的信效度。

方法 本研究在经过量表原作者同意后，采用Brislin双向翻译法对SHAS量表进行翻译，由9名来自精神卫生和护理领域的专家组成专家小组，对量表进行评议和跨文化调试，最终形成中文版护士对自伤行为态度量表。于2022年8月～10月采用便利抽样法选取湖南3所三甲医院内420名护士为研究对象进行问卷调查。采用条目分析、探索性因子分析、验证性因子分析、信度分析对量表进行信效度检验。

结果 中文版护士对自伤行为态度量表包含21个条目，共6个维度，分别为能力评估、患者意图处理、帮助认知、无效照护、需求功能和自伤反感。在探索性因子分析中，因子累计贡献率为64.708%。在验证性因子分析中，一阶六因子模型拟合指数良好（模型绝对适配度指数：0.902，增值适配度指数：0.907，简约适配度指数卡方自由度比：2.723）。校标度检验中相关系数分别为0.615、0.646、0.754和0.291（P<0.01），校标度良好。量表条目水平的内容效度指数和量表内容效度分别为0.78～1.00和0.80～1.00，量表内容效度良好；总量表Cronbach's α系数为0.803,重测信度为0.97，信度良好。

结论 中文版护士对自伤行为态度量表包含21个条目，6个维度，具有良好的信效度、科学性和临床实用性。可用于测量我国护士人群对自伤行为的态度水平。

针刺治疗原发性抑郁症的研究进展

陈香梅*
西安市精神卫生中心

目的 抑郁症是指个体出现不同程度的情绪低落、兴趣减退、主动性缺乏等症状为主要临床特征的行为、心理障碍，是患病率高、复发率高、致残率高的精神疾病。抑郁症患者的生活质量严重下降并造成了巨大的医疗经济负担。目前在原发性抑郁症的治疗手段中，药物治疗是最常见的治疗手段，心理疗法用于辅助治疗，改善患者心理健康状况。此外，临床还应用电休克治疗、重复经颅磁刺激等用于加强治疗效果。临床实践中，针灸治疗原发性抑郁症疗效明显，治疗方案丰富，除了针灸治疗外，还有电针、耳针、温针灸、穴位注射等手段被广泛应用于抑郁症的临床诊疗过程中。针灸治疗的优势明显，其安全性、经济性、经济性等均受到了广泛的认可。

方法 通过搜集论文，进行分类总结，探究抑郁症的发病及治疗机制，总结针灸在抑郁症治疗过程中发挥的作用，并对其安全性进行讨论。

结果 近些年在5-羟色胺、神经递质、信号通路、脑肠轴等方面的研究都取得了重要进展，虽然其确切的机制尚未完全确定，但有一些研究表明针刺可能通过以下方面发挥抗抑郁作用。药物治疗仍是目前原发性抑郁症治疗的首选治疗手段，但在起效时间方面，针刺较药物治疗相比有起效时间短的优势。针刺在治疗抑郁症中能发挥积极的治疗作用，与单纯药物治疗相比能够减轻不良反应，是值得推广的治疗手段。

结论 抑郁症属中医学"郁证"的范畴，虞抟《医学正传·郁证》首先采用郁证这一病名。《金匮翼·积聚统论》所说："烦忧思郁怒，久不能解者，多此成疾"。郁证是由于原本肝旺，或体质素弱，复加情志所伤引起肝郁气滞，肝失疏泄，脾失健运，心失所养，脏腑阴阳气血失调而成，以心情抑郁、情绪不宁、胸部满闷或易怒易哭等为主要临床表现的一类病证。本病的基本治疗原则为理气解郁、调畅气机。中医学对抑郁症的诊治有着悠久的历史，同时也积累了丰富的经验。近年来，针刺对抑郁症的治疗在临床上有着较好的疗效，越来越被重视，因此针刺疗法治疗原发性抑郁症，值得进一步的推广和更深入的研究。但同时，针刺治疗抑郁症在机制研究、方法选择等多方面都存在着有待改进和提高之处。在临床研究过程中由于针刺疗法的选穴位置受个人经验影响较大，缺乏统一标准，且目前针刺治疗的临床研究大多样本量较小，盲法实施难度较大，限制了其临床研究。因此，未来应加大基础研究力度，优化选穴方案，开展大样本、多中心的随机对照试验，加强远期预后的随访调查，提高针刺治疗原发性抑郁症的临床应用有效性及规范

Cognitive Deficits in Clinical High Risk, Genetically at High-risk for Psychosis and Patients with First-episode Schizophrenia

董芳 毛珍 薄奇静 汪露 李峰 王传跃*
首都医科大学附属北京安定医院

Objective The goal of this study was to explore the cognitive impairments profiles in individuals at clinical high risk for psychosis (CHR), genetically high-risk of psychosis (GHR) and patients with first episode schizophrenia (FES).

Methods We compared the cognitive functions of three groups and a healthy control group (HCs) using the MATRICS Consensus Cognitive Battery (MCCB). Our sample consisted of 56 patients with first-episode schizophrenia (FES), 42 individuals at clinical high risk for psychosis (CHR), 26 individuals at genetic high risk for psychosis (GHR), and 62 HCs.

Results Individuals with FES, GHR, and CHR showed significant impairment in most MCCB domains, with the exception of visual learning, when compared to the HCs.None of the MCCB domains were able to accurately distinguish between CHR and GHR individuals. GHR and CHR individuals had intermediate scores between FES and HCs on the domain of processing speed and attention. However, the impairment levels in working memory and verbal learning were similar across all three groups. The CHR performance in social cognition was comparable to that of the HCs, whereas there was no significant difference in problem-solving scores between the GHR and HC groups.

Conclusion Our findings suggest that significant cognitive deficits exist in CHR, GHR, and FES individuals, and these deficits vary across domains. Cognitive impairment may be a key feature of individuals with schizophrenia, with processing speed and attention potentially serving as reliable markers for identifying those at risk for psychosis. The damage of reasoning/problem solving may be qualitative trait, while as social recgnition may be state characteristic of schizophrenia.

关键字：Cognition, Clinical high risk for psychosis, Genetically high-risk of psychosis, First episode schizophrenia

早发精神分裂症及精神病超高危个体静息态脑局部一致性特点

曹晓华[1] 刘莎[1] 冯健平[1] 李强[2] 程龙[1] 徐勇[3]
1.山西医科大学第一医院精神卫生科，山西医科大学第一医院精神障碍人工智能辅助诊疗山西省重点实验室
2.武警山西省总队医院
3.山西医科大学精神卫生学系

目的 早发精神分裂症（early-onset schizophrenia, EOS）起病于 18 岁之前，此类患者较成年起病者表现为更显著的前驱期神经发育异常和不良预后，多数患儿起病前已处于超高危风险状态。本研究纳入了 EOS 患者、精神病超高危状态个体及健康对照，拟通过静息态功能磁共振成像（fMRI）指标，探讨上述人群的神经影像表型特点。

方法 研究对象包括：（1）EOS 组：符合 DSM5 精神分裂症诊断标准，病程≤2 年，既往无系统用药史，共 23 例；（2）高危组：符合前驱期综合征（Criteria of Prodromal Syndromes，COPS）诊断标准，即处于精神病超高危状态，共 23 例；（3）健康对照组：共 23 例。上述三组年龄范围均为 7-18 岁。所有研究对象均接受一般资料收集、临床症状评估（阳性与阴性症状量表）及静息态 fMRI 扫描。主要分析指标为局部一致性（regional homogeneity, ReHo）。采用 DPARSF 软件进行常规预处理、ReHo 个体指标运算及统计分析。单因素方差分析进行三组间比较，以明确是否存在组间差异脑区；之后通过 LSD 法进行两两组间比较，之后进行多重比较校正（GRF 校正，体素水平 $p < 0.01$，团块水平 $p < 0.05$，团块大小 > 30 个体素）。

结果 （1）EOS 患者较精神病超高危个体及对照组均表现为双侧壳核静息状态局部一致性 ReHo 值增高；（2）健康对照、精神病超高危个体、EOS 患者三组被试的额中回 ReHo 值呈下降趋势；（3）精神病超高危个体较健康对照表现为右侧小脑、左侧海马/海马旁回 ReHo 值增高，右侧额中回、右侧额上回 ReHo 值降低。

结论 （1）壳核功能异常增高可能是精神分裂症发病的特异性指标；（2）额上回功能异常可能是出现精神病风险、进而罹患精神分裂症的早期识别指标；（3）精神病超高危患者存在额叶-边缘-小脑环路功能异常。本研究初步探索精神病超高危状态人群及早发精神分裂症特异性的脑功能特点，为寻找有助于早发精神分裂症早期识别、预后判断相关的客观指标提供了参考依据。

氯氮平相关性肺栓塞的系统评价

郭中孟*
江西省精神卫生中心

目的 氯氮平是治疗难治性精神分裂症的标准药物，它可通过多种机制导致肺栓塞（pulmonary embolism，PE），包括镇静、活动减少或不动、体重增加和血小板聚集增加等。肺栓塞是猝死的常见原因，死亡率约 30%-40%。为提高临床医生对于氯氮平引起肺栓塞这一严重而致命的不良反应的认识，我们对已发表的氯氮平相关性肺栓塞病例进行系统回顾性研究。

方法 我们遵照系统综述/Meta 分析报告指南流程(PRISMA ，2009 年版)，根据纳入标准和排除标准筛选文献。通过 Medline、Embase 和 Cochrane 图书馆

自开始至2020年12月31日发表的英文文献进行综合检索，使用的搜索词为：氯氮平（“Clozapine”或“Clozaril”）和肺栓塞（“pulmonary embolism”或“pulmonary thromboembolism”或“PE”）。共搜索到氯氮平相关性肺栓塞98篇，其中MEDLINE数据库49篇，EMBASE数据库82篇。排除不符合纳入标准、其他语种外文文章、评论文章，最后，符合纳入和排除标准的仅26篇。

结果 平均年龄43.2岁，男性占优势（63.6%）。氯氮平的平均剂量为281.4mg/d。使用氯氮平治疗时间从几天到几年不等。近半数患者（47.8%）除氯氮平导致PE外无其他合并症。在Stein等人发表的文章中，90%的PE患者的主要主诉是呼吸困难/呼吸过速，这与我们的综述发现相似（55.6%的患者出现呼吸窘迫）。同样地，晕厥是10%的PE患者的持续症状，这与我们的研究结果类似。对于PE患者的处置：80%选择抗凝治疗，10%选择溶栓治疗，5%选择放置下腔静脉滤器。死亡率为36.4%，其中3例死亡，另外9例在随访期间死亡。在18例有氯氮平随访资料的患者中，14例停用氯氮平。

结论 肺栓塞是氯氮平的一种罕见而致命的副作用，它不是剂量相关的副作用，即使氯氮平剂量低于正常剂量（300mg/d）时仍可发生肺栓塞，并且可能在治疗开始后几天到几年内发生。服用氯氮平的患者发生肺栓塞是否可以重新开始服用氯氮平尚不完全清楚，但应该考虑到继续用药的风险和益处，这方面还需要进一步的研究。

基于持续同调的精分脑电拓扑特征提取与分类

赵艳丽[1] 阴桂梅[2] 谭淑平[1]
1.北京回龙观医院精神医学研究中心
2.太原师范学院计算机科学与技术学院

目的 针对基于持续同调的高阶脑网络分析中，采用单一模态持续特征无法充分利用持续同调过滤过程中产生的丰富拓扑信息之一问题。

方法 本文提出一种提取复杂脑网络多模态持续拓扑特征及分类的方法，并且使用圈比度量高阶复杂脑网络中节点的重要性。采用104例首发精神分裂症患者和94个健康被试的静息态脑电信号数据，使用自适应阈值的方式对脑网络进行持续同调过滤提取持续拓扑特征，特征分布状态使用热图与持续熵表示，对持续特征生成的过程状态计算贝蒂曲线与持续景观特征，最后在多个机器学习分类器中进行十折交叉验证评价多模态持续拓扑特征的分类性能。

结果 结果表明，该方法可以提供首发精分患者高维的全局的拓扑变化有效特征，此特征用于识别首发精神分裂症患者的准确率上比传统基于图论方法的脑网络特征以及单一持续拓扑特征有所提高,在最优分类器LightgGBM下分类准确率达到了93.7%。进一步通过统计分析可知Delta和Theta数据频段所获取的一些拓扑特征与GLBF、PLBF呈现显著相关性。最后通过圈比度量脑节点，可以准确找到脑网络中的关键节点从而可以回溯到产生病发的脑区。

结论 本文提出的方法对首发精神分裂症患者的早期识别与诊断具有重要的临床指导意义，也为高阶功能连接网络构建及拓扑结构特征提取提供了新的研究思路。

叶酸干预血清同型半胱氨酸改善首发精神分裂症认知功能研究

贾娇 郭琪博 马丽娜 杨红 任燕*
山西白求恩医院第三临床医学院

目的 探讨血清同型半胱氨酸（HCY）水平与精神分裂症认知功能的关系，通过叶酸干预血清同型半胱氨酸探讨认知功能的变化，以利于进一步探讨精神分裂症发病机制及治疗。

方法 收集符合纳入和排除标准的200例首发SZ患者，随机分为2组： 100名SZ患者抗精神病药物+补充叶酸（SZ-干预组）、100名SZ患者抗精神病药物+补充安慰剂（SZ-非干预组）;招募与上述SZ患者年龄、性别匹配的100名健康志愿者作为对照组。收集三组受试者一般资料,测定血清HCY水平,评估重复性成套神经心理状态测验量表(RBANS),并对SZ组（SZ-干预组、SZ-非干预组）进行阳性与阴性症状量表(PANSS)评估,分析SZ组血清HCY水平与疾病严重程度和认知功能的相关性；SZ-干预组抗精神病药物、补充叶酸治疗3月；非干预组抗精神病药物、补充安慰剂3月，测定上述两组叶酸干预后同型半胱氨酸水平，比较叶酸干预前后认知功能的变化。

结果 SZ组（SZ-干预组、SZ-非干预组）血清HCY水平高于对照组(P<0.01)；SZ组（SZ-干预组、SZ-非干预组）RBANS量表总分及各分因子分值均低于对照组(P<0.01)；SZ组（SZ-干预组、SZ-非干预组）血清HCY水平与PANSS评分呈正相关(P<0.05)；与RBANS总分、即刻记忆、注意力因子分呈负相关(P<0.05)。药物治疗3月后，SZ-干预组治疗前后血清HCY水平存在统计学差异（P＜0.05）、SZ-非干预组治疗后血清HCY水平较治疗前下降，但无统计学差异；SZ-干预组血清HCY水平低于SZ-非干预组，结果有统计学差异(P<0.05)；SZ-干预组RBANS总分、即刻记忆、注意力因子分高于SZ-非干预组，结果有统计学差异(P<0.05)。

结论 首发SZ患者血清HCY水平高于对照人群,且与疾病严重程度和认知功能损害程度均呈正相关；抗精神病药物联合叶酸辅助治疗可通过降低同型半胱氨酸以改善精神分裂症患者认知功能。

关键字：精神分裂症；高同型半胱氨酸；叶酸；认知功能

10Hz 重复经颅磁刺激对慢性精神分裂症男性患者催乳素、雌二醇及认知功能的调节

段惠峰 梁学军 史振娟 祝希泉 白晶 李东河 甘景梨*
联勤保障部队第九八八医院 全军精神疾病防治研究所

目的 探讨慢性精神分裂症男性患者经 10Hz 重复经颅磁刺激治疗后催乳素、雌二醇及认知功能的变化特点。

方法 选取 2022 年 1 月至 2023 年 4 月期间收治住院的 60 例慢性精神分裂症男性患者，按照简单随机数字表法，按照 1:1 分组原则分为对照组（n=30）和研究组（n=30），两组均给予利培酮治疗 4 周。在药物治疗的基础上，研究组给予 10Hz rTMS 治疗，刺激左侧前额叶背外侧皮质区（DLPFC），刺激强度 100%运动阈值，疗程 4 周，每周 5 天，每天 1 次，每次 20 分钟；对照组采用伪刺激治疗。抽血检测患者血清中的催乳素（PRL）、雌二醇水平（E2）；使用阳性与阴性症状量表（PANSS）评估患者的临床精神症状，记录总分、阳性量表分、阴性量表分和一般精神病理分；使用认知功能成套测验（MATRICS Consensus Cognitive Battery，MCCB）评估患者的广泛认知功能，该测验包括 7 个维度 10 个分测验，记录总分及言语流畅性评分（CF）、连线测验评分（TMT）、符号编码评分（SC）、数字序列评分（DS）、空间广度评分（SS）、言语记忆评分（HVLT-R）、视觉记忆评分（BVMT-R）、迷宫测验评分（NAB-Mazes）、持续操作能力测验评分（CPT-IP）、情绪管理能力评分（MSCEIT-ME）。记录治疗前后各指标及其变化值。

结果 治疗前，研究组和对照组各指标比较差异无统计学意义（P>0.05）。治疗后，两组 PANSS 总分、阳性症状分、阴性症状分和一般精神病理分等均低于治疗前，E2 水平、MCCB 总分及各分测验得分均高于治疗前，差异有统计学意义（P<0.05）；对照组治疗后 PRL 水平高于治疗前，差异有统计学意义（P<0.05）。研究组治疗后的 PRL 水平、PANSS 总分、阴性症状分和一般精神病理分等均低于对照组，差异有统计学意义（P<0.05）；E2 水平、MCCB 总分及 CF、TMT、SC、DS、SS、HVLT-R、CPT-IP 分、MSCEIT-ME 等评分高于对照组，差异有统计学意义（P<0.05）。治疗前后，E2 水平变化值与 MCCB 总分以及 10 个认知维度分测验评分变化值之间均呈正相关（r=0.28-0.37，P<0.05）。

结论 相比于单一应用利培酮治疗慢性精神分裂症男性患者，联合 10Hz 重复经颅磁刺激治疗可更好的改善临床症状，调节性激素水平，提升认知功能。

关键字：精神分裂症，经颅磁刺激，催乳素，雌二醇，MCCB

基于集成生物信息学识别精神分裂症和冠状动脉粥样硬化共同枢纽基因

田晴[1] 范玉[1] 殷光中[1] 张晓斌[1] 王传跃[2]
1.苏州市广济医院
2.首都医科大学附属北京安定医院

目的 精神分裂症患者合并心血管疾病近年来逐渐受到临床医生和研究人员关注。心血管疾病易导致内皮细胞功能损伤，与血脑屏障微渗漏有关。因此，精神分裂症与心血管疾病可能存在某些共同基因涉及内皮细胞及血脑屏障功能。本研究旨在通过集成生物信息学方法，探索两者共同枢纽基因。

方法 自 GEO 数据库筛选出人类冠状动脉粥样硬化（CHD）DNA 甲基化数据集 GSE46394 和精神分裂症（SCZ）DNA 甲基化数据集 GSE84727。首先校正数据集批次及人口学信息。使用加权基因共相关网络分析（WGCNA）和 R 4.3.1 软件来鉴定与 CHD 和 SCZ 相关的差异甲基化基因（DMGs）。随后，使用基因本体论（GO）和京都基因和基因组百科全书（KEGG）途径进行功能富集分析，并使用 STRING 数据库在共同基因上进行蛋白质相互作用网络（PPI）。最后，使用 CytoHubba 插件的 MCC 算法从 PPI 网络中筛选出枢纽基因。

结果 通过 WGCNA，1023 个基因和 533 个基因分别与 CHD 和 SCZ 最为相关。通过韦恩图在 CHD 和 SCZ 中筛选出了 65 个差异甲基化基因（DMGs）是两种疾病所重叠的。功能富集分析表明，DMGs 主要参与突触前膜、谷氨酸能突触等细胞组分。基于此 65 个基因构建 PPI 网络，筛选 TOP10 共同枢纽基因（在 CytoHubba 中得分高），排序第一的是 GRIN2A，其余基因包括 RBFOX1、NRXN2、ATP2B2、NTN1、PLXNA1、CDH23、LRP1、HSPG2、CDH20。

结论 本研究根据与 CHD 和 SCZ 的 65 个共同基因筛选出了 10 个共同枢纽基因。这些枢纽基因可能为探索 CHD 导致 SCZ 风险增加的潜在机制提供新的视角。

基于前脉冲抑制评估首发精神分裂症患者抗精神病药物治疗疗效

田晴[1] 范玉[1] 张晓斌[1] 王传跃[2] 贾秋放[1]
1.苏州市广济医院
2.首都医科大学附属北京安定医院

目的 前脉冲抑制（PPI）被认为是反映精神分裂症患者感觉门控功能的电生理指标。而通过引入听觉优先效应优化 PPI 范式设计，使用知觉空间分离诱导的 PPI（PSS-PPI）评估精神分裂症的感觉门控水平，Cohen's d 提高到 1.2 以上。本研究旨在使用改良的 PPI 检测结果构建模型，探索用于首发精神分裂症患者抗精神病药物治疗疗效的评估。

方法 在本研究中，共纳入 31 名首发未用药精神

分裂症患者（患者组）和 26 名健康被试（对照组）。优化知觉空间分离诱导的 PPI 范式，形成目标刺激与干扰刺激知觉上的双耳分离，使空间注意更好的集中在某个特定方向，从而利用听觉注意增强效应提高人类被试的去掩蔽水平。首先进行 Pearson 相关分析，观察基线 PSS-PPI 与基线 PANSS 评分、基线 PSS-PPI 与治疗后 PANSS 减分率、治疗后 PSS-PPI 与治疗后 PANSS 减分率的相关性。针对治疗后 PANSS 减分率，利用基线 PSS-PPI 和治疗后 PSS-PPI 为变量，分别利用线性回归算法和随机森林回归算法，构建机器学习模型拟合治疗后 PANSS 减分率，用以评估药物治疗疗效。

结果 1、相较于对照组，患者组基线 PSS-PPI 显著下降（t=3.11，P=0.003），治疗后两者 PSS-PPI 无统计学差异（t=1.94，P=0.058）。2、相关分析结果显示，基线 PSS-PPI 与基线 PANSS 评分呈现负相关（r=-0.490，P=0.005）；基线 PSS-PPI 与治疗后 PANSS 减分率呈现正相关（r=0.36，P=0.045）；治疗后 PSS-PPI 与治疗后 PANSS 减分率呈现正相关（r=0.31，P=0.047），提示 PSS-PPI 可以反映精神分裂症药物治疗疗效。3、建模结果显示，线性回归算法机器学习模型拟合值与治疗后 PANSS 减分率呈现正相关（r=0.392，P<0.05），残差值为 0.000±11.569，总体离散程度较大；随机森林回归算法机器学习模型拟合值与治疗后 PANSS 减分率呈现正相关（r=0.941，P<0.001），总体收敛程度较线性回归算法理想。同时，随机森林回归算法拟合值分布情况也较类似于真实值。

结论 随机森林模型拟合值分布模式更接近与真实值，残差标准差也较低，为今后基于 PPI 的疗效评估工具开发提供了较好的数据支撑。

精神分裂症外周 DNA 甲基化异常及其免疫浸润模式改变

田晴[1] 杨威[2] 范玉[1] 张晓斌[1] 王传跃[3]
1.苏州市广济医院
2.厦门市仙岳医院
3.首都医科大学附属北京安定医院

目的 炎症是免疫系统对病原体、压力和损伤等因素的自然反应。越来越多的证据发现精神分裂症的炎性介质水平升高，提示慢性炎症可能与精神分裂症的发病机制有关。本研究旨在通过生物信息学方法，探索精神分裂症外周 DNA 甲基化与免疫功能异常的研究。

方法 自 GEO 数据库筛选出 GSE80417、GSE84727 血液样本 DNA 甲基化数据集。首先校正数据集批次及人口学信息。基于差异甲基化基，应用 R 软件 clusterProfiler 包进行基因本体论（Gene Ontology, GO）富集分析和基因集富集分析（Gene Set Enrichment Analysis, GSEA）；并应用 R 软件 EpiDISH 包推断代表细胞类型混合物的样品中存在的先验已知细胞亚型的分数，选用 Cibersort 反卷积法，评估外周免疫细胞浸润模式。

结果 GO 富集条目为淋巴免疫细胞的激活和分化及免疫因子产生等生物过程；GSEA 富集于免疫应答（校正后 P 值为 0.02）和免疫过程调控（校正后 P 值为 0.04）两个功能条目，提示 DNA 甲基化与精神分裂症免疫功能异常关系密切；经 DNA 甲基化评估免疫细胞浸润，显示患者与正常人在 NK 细胞、CD4+T 细胞、CD8+T 细胞、中性粒细胞的免疫浸润模式存在差异。

结论 虽然传统上，中枢免疫系统被认为与外周相互独立，但血脑屏障高渗状态可能导致免疫细胞通过缺损的血脑屏障扩散。外周免疫细胞浸润可能与血脑屏障滤过受损有关，进而可能参与精神分裂症的神经免疫异常的病理机制。

磁休克治疗对精神分裂症患者海马可塑性的影响

李金*
苏州市广济医院

目的 精神分裂症是一种严重的精神疾病，具有广泛的症状谱，包括行为、情绪和认知障碍，几乎每个患者都检测到某种程度的残疾。许多抗精神病药物可用于治疗，但 40% 的患者仅获得部分反应，而 10% 的患者几乎没有反应。对于对药物反应有限的患者，电休克疗法 (ECT) 是一种潜在的选择，因为 ECT 可以提供快速的整体症状改善。然而，认知不良反应很常见，如健忘症和发作后迷失方向。作为替代方案，磁力发作疗法 (MST) 在减轻症状方面的效果与 ECT 相当，但认知障碍较轻。据报道，在精神分裂症患者中，ECT 后海马体积增加。然而，目前尚不清楚磁休克治疗 (MST)对精神分裂症患者海马亚结构体积的影响。

方法 51 名精神分裂症患者，其中接受电休克（ECT）治疗 33 例，接受 MST 治疗 18 例。通过阳性与阴性症状量表（PANSS）和重复性成套神经心理状态测验 (RBANS) 测定临床症状和认知功能。FreeSurfer 6.0 软件对患者海马亚结构体积进行分析。

结果 在 ECT 组中，17 个海马亚区的体积在治疗后显著增加（P<0.05）；而 MST 组中，仅 1 个海马亚区的体积在治疗后显著增加（P<0.05）。干预后两组注意力评分和视觉空间/结构评分均显著下降（P<0.05）。两组治疗前后即时记忆评分一致。治疗后，两组语言评分均显著升高。ECT 组的延迟记忆和总分明显下降，而 MST 组没有。右侧海马总体积，下托，分子层增加值和语言评分增加值呈显著正相关。

结论 磁休克对精神分裂症患者海马亚结构影响较弱，与其认知保留机制有关。

关键字：电休克；磁休克；精神分裂症；海马亚结构体积

TBS 模式重复经颅磁刺激联合音乐治疗对慢性精神分裂症患者社会功能及生活质量的影响

易峰*
宜兴市第五人民医院

目的 探讨 TBS 模式重复经颅磁刺激(Repetitive transcranial magnetic stimulate, rTMS) 联合音乐治疗(Music therapy, MT)对长期住院的慢性精神分裂症患者社会功能及生活质量的影响。

方法 选择宜兴市精神卫生中心长期住院治疗的慢性精神分裂症患者 120 例，精神分裂症符合《美国精神障碍诊断与统计手册第 4 版》（DSM-IV）诊断标准，将 120 例患者随机分为三组（联合治疗组、MT 组、对照组各 40 例），联合治疗组给予 TBS 模式的 rTMS 联合 MT 各 20 次，MT 组给予 MT20 次，对照组予只给予药物维持治疗，访视时间 4 周。在治疗前后对所有受试者均给予住院精神病人社会功能量表（Scale of social function in psychosis inpatients，SSPI）、个人和社会功能量表（Personal and social function scale, PSP）、精神分裂症病人生活质量量表（Schizophrenia Quality of Life Scale，SQLS）评估，将治疗前后及组间测试结果进行比较。

结果 与 rTMS 治疗前相比，联合治疗组的 SSPI 总分、各因子分及 PSP 总分均升高，差异有统计学意义(均 P＜0.05)，SQLS 的总分、心理社会、动力/精力量表评分均降低，差异有统计学意义(均 P＜0.05)，SQLS 的症状和副作用量表评分无变化，无统计学差异(P＞0.05)；与 rTMS 治疗前相比，MT 组的 SSPI 总分、I、II因子分及 PSP 总分均升高，SSPI 的III因子分无变化，无统计学差异(P＞0.05)，SQLS 的总分、心理社会、动力/精力分量表评分均降低，差异有统计学意义(均 P＜0.05)；对照组治疗前后比较，SSPI、PSP 及 SQLS 的各项目评分均无变化，无统计学差异(均 P＞0.05)。三组治疗后的各项目评分进行组间比较，差异均有统计学意义(均 P＜0.05)，两两比较，联合治疗组的 SSPI 总分、III因子分及 PSP 总分均高于其他两组，SQLS 总分低于其他两组，联合治疗组、MT 组的 SSPII、II因子分高于对照组，SQLS 的心理社会、动力/精力评分低于对照组，差异均有统计学意义(均 P＜0.05)。

结论 TBS 模式的 rTMS 及音乐治疗均能够改善长期住院的慢性精神分裂症患者的社会功能及生活质量

The Causal Effect of Schizophrenia on Fractures and Bone Mineral Density: A Comprehensive Two-sample Mendelian Randomization Study of European Ancestry

惠李* 贾宁宁 朱振华 殷旭圆 侯文龙 蔡源 张广亚 陈茹凤
苏州市广济医院

Objective Schizophrenia was clinically documented to co-occur with fractures and aberrant bone mineral density (BMD), but the potential causal relationship remained unclear. This study aimed to test the causal effects between schizophrenia and fractures as well as aberrant BMD by conducting Mendelian randomization (MR) analyses.

Methods Two-sample MR was utilized, based on instrumental variables from large genome-wide association studies (GWAS) of schizophrenia as exposure, to identify the causal association of schizophrenia with mixed fractures, fractures at different body sites (including skull and facial bones, shoulder and upper arm, wrist and hand, and femur) and BMDs of forearm (FA), femoral neck (FN), lumbar spine (LS) and estimated BMD (eBMD). Multivariable Mendelian randomization (MVMR) analysis was performed to minimize the confounding effect of body mass index (BMI).

Results Result from inverse variance weighting (IVW) method provided evidence schizophrenia was positively associated with the fractures of skull and facial bones [odds ratio (OR) = 1.0006, 95% confidence interval (CI): 1.0003 to 1.0010] and femur [OR =1.0007, 95% CI: 1.0003 to 1.0011], whereas, inversely associated with eBMD [β (95%CI): -0.013 (-0.021, -0.004)]. These causal effects still existed after adjusting for BMI. Sensitivity analyses showed similar results. However, no causal effect of schizophrenia on fracture or BMD in other parts was detected.

Conclusion The current finding confirmed that schizophrenia was causally associated with the fractures of skull, face and femur as well as eBMD, which might remind psychiatrists to pay close attention to the fracture risk in schizophrenic patients when formulating their treatment strategies.

整合 GWAS 和 eQTL 数据识别精神分裂症的风险基因

谢梦桐[1] 张延赤[2] 金梦迪[1] 贾宁宁[1] 李惟真[1] 董霖[1] 张敏[1] 卢庆幸[1] 蒋林彤[1] 燕利娟[2] 路晓玉[3] 俞琼[1]

3.吉林省生物研究所

目的 精神分裂症（SCZ）是一种严重的慢性精神障碍性疾病，其发生与遗传易感性密切相关。全基因组关联研究（GWAS）已经确定了多种风险变异与 SCZ 之间存在密切关联。然而，尚不清楚这些变异如何对 SCZ 产生风险。

方法 首先，本研究使用选择性表达检测驱动组织（DESE）来检测 SCZ 的驱动组织。紧接着，使用 Sherlock 分析系统的整合来自 SCZ GWAS 和 SCZ 驱动组织的表达定量性状位点（eQTL）数据来鉴定表达水平与 SCZ 存在因果关联的基因，并使用来自基因表达谱数据库（GEO）的多个数据集来验证风险基因在 SCZ 中的表达差异。并进一步的探索风险基因在不同人体组织及细胞、不同时间和空间的表达情况、功能分析，以及与单核苷酸多态性（SNPs）的关联分析等，从而探讨风险基因在 SCZ 发病机制中的潜在作用。

结果 本研究共识别了 13 个 SCZ 驱动组织，全部位于脑中。结合 Sherlock 分析和风险基因的差异表达验证，CD46 最终被确定为 SCZ 的风险基因。与健康对照相比，CD46 在 SCZ 的脑组织和血液中均表达下调。表达分析结果显示，CD46 在人体各组织中均存在广泛的表达并且在不同的时间和空间具有不同的表达情况，在脑组织以及神经细胞中的表达水平较低。CD46 在免疫细胞中显著富集，功能分析结果表明 CD46 显著富集的功能有补体激活、调节体液免疫反应等。在 CD46 的表达与风险变异 rs7541230, rs6540443, rs11118668 之间均存在显著的相关性，rs7541230 通过与转录因子 SOX5 结合而发挥对 CD46 的表达调控作用。

结论 通过全面的综合分析，我们认为 CD46 可能是 SCZ 的风险基因，风险变异 rs7541230, rs6540443, rs11118668 可能是通过影响 CD46 的表达而赋予 SCZ 风险。CD46 的表达分析和功能研究会为进一步理解 SCZ 发病机制提供新的见解。

Objective Neurobiological heterogeneity of psychiatric disorders presents a significant obstacle to understanding their etiology, especially when heterogeneity remains uncertain due to medication effects and disease progression. We hypothesize that the biological subtypes of psychiatric disorders precedes the onset of psychotic disorders, and is unique independent of clinical features.

Methods This study employed a multivariate, data-driven method called single-cell interpretation through multikernel learning to investigate biological heterogeneity pertinent to the psychosis spectrum using individuals in a clinical high-risk (CHR) state for psychosis, unaffected by drugs or disease progression. Resting-state functional connectivity were used to reveal the features of biotypes.

Results Resting-state functional connectivity features revealed three biotypes, constituting 29.8%, 19.0%, and 51.0% of the 151 CHRs, independent of clinical characteristics. The multiclass support vector machine (SVM) model demonstrated 98.45% accuracy in predicting subtype for the training set and 84.54% for the testing set. Among the three biotypes, Biotype1 had the least impairment of cognition. Biotype 2 exhibited more severe spatial working memory deficits than the other two, while Biotype 3 displayed marginally increased symptom severity. In comparison to healthy controls, the three biotypes exhibited unique neurobiological traits distributed across subcortical, somatomotor, and visual networks. Within each biotype, there is distinctive functional connectivity pattern.

Conclusion Biotype-specific effect of symptom severity may reflect distinct neurotransmitter abnormalities: Biotype 1 with dopamine, Biotype 2 with glutamate, and Biotype 3 with serotonin, indicating diverse neurobiological mechanisms underlying symptom expression and disease progression.

关键字：Heterogeneity; Clinical High-Risk State for Psychosis; Single-Cell Interpretation via Multikernel Learning; Resting-state functional connectivity; Biotype.

胰岛素抵抗对首发精神分裂症患者皮质表面积和认知功能关系的调节作用

林晨[1] 勾梦壮[1] 潘淑娟[1] 仝景慧[1] 周衍芳[1] 谢婷[1] 于婷[1] 冯薇[1] 李艳丽[1] 陈松[1] 崔一民[2] 田宝鹏[1] 谭淑平[1] 王志仁[1] 罗星光[3] 张苹[1] 黄隽超[1], Chiang-Shan R, Li[3], L, Elliot Hong[4] 谭云龙[1]

目的 认知障碍是精神分裂症患者的重要症状，显著影响患者的社会功能和预后。目前改善认知障碍的药物选择有限，疗效不理想，且精神分裂症患者认知缺陷的潜在机制尚不清楚。有证据表明，胰岛素抵抗与大脑结构和认知障碍密切相关。我们的研究旨在探索胰岛素抵抗是否介导了首发精神分裂症(FEPS)患者皮质表面积(CSA)和认知功能之间的关联。

方法 我们的研究共纳入 140 名 FEPS 和 190 名年龄和性别匹配的健康对照(HCs)。我们使用阳性和阴性症状量表（PANSS）和精神分裂症认知功能成套测验(MCCB)评估受试者的精神症状和认知功能。采用 3.0 T 高分辨率磁共振成像系统测量 CSA。同时测量受试者血清胰岛素(FINS)、血糖(FPG)等水平，并计算胰岛素抵抗指数(FPG (mmol/L)×FINS (mIU/L)/22.5)。通过

SPSS PROCESS V3.5 进行调节和中介分析，探索胰岛素抵抗对 CSA 与认知功能障碍之间关系的影响。

结果 FEPS 组和 HCs 组的双侧 CSA 和胰岛素抵抗指数无显著差异(P>0.05)。协方差分析显示 HCs 的 MCCB 总分和七个 MCCB 分量表得分显著高于 FEPS (P<0.001)。在控制了年龄、性别和受教育程度后，偏相关分析显示，FEPS 的双侧 CSA 与 MCCB 总分和多个分量表得分显著相关(P<0.05)，其中，连线测验、注意/警觉分量表分和 MCCB 总分的关联在 Bonferroni 校正后仍然存在(P=0.05/11=0.0045)。回归分析显示，FEPS 组的胰岛素抵抗指数与左侧 CSA、视觉学习、注意/警觉分量表分及 MCCB 总分相关(P<0.05)。FEPS 组胰岛素抵抗在 CSA 和认知功能之间的关联中没有中介作用，然而 FEPS 组胰岛素抵抗指数正向调节双侧 CSA 与 MCCB 迷宫测验分的关系(P<0.05)，这种正向调节作用随着胰岛素抵抗指数的增加而增强。

结论 首发精神分裂症患者的认知功能较健康对照组更差。胰岛素抵抗与脑结构和认知功能相关，此外，胰岛素抵抗调节了首发精神病患者大脑皮层结构与认知功能之间的关系，这可能为精神分裂症患者认知功能障碍的机制提供线索。需要进一步的研究来确定调节胰岛素抵抗或改善皮质功能是否有助于减轻首发精神分裂症患者的认知障碍。胰岛素受体相关药物能否为改善认知功能的药物开发提供方向还有待进一步探索。

Genome-wide Analysis Reveals Extensive Genetic Overlap between Schizophrenia, Bipolar Disorder, and Hippocampal Volume

杜庆 向波*
西南医科大学附属医院精神科

Objective Schizophrenia (SCZ) and bipolar disorder (BD) are both complex polygenic disorders with subtle, distributed abnormalities in brain morphology. There are indications of shared genetic architecture between Schizophrenia (SCZ) and bipolar disorder (BD) and hippocampal (HIP) volume. Through the use of analytical methods that allow for mixed directions of effects, this overlap may be leveraged to improve our understanding of underlying mechanisms of schizophrenia and bipolar disorder.

Methods GWAS summary data sets on SCZ (N = 161,405) and BD (N = 130,644) were acquired from the Psychiatric Genomics Consortium (PGC). The left and right hippocampal volume GWAS data sets were downloaded from UK Biobank, including 33,224 participants. Using conditional/conjunctional false discovery rate (FDR) approach to evaluate overlap in common genetic variants and improve statistical power for genetic discovery. Using a variety of biological resources, we functionally characterized the identified genomic loci.

Results Conditional Q-Q plots showed single-nucleotide polymorphism (SNP) enrichment for both left and right hippocampal volumes across different levels of significance with SCZ and BD. Using conjFDR analysis we leveraged this genetic enrichment and identified several loci shared between SCZ and left HIP (n = 7) and right HIP (n = 12), BD and left HIP (n = 1) and right HIP (n = 3) at conjFDR

MPFC 脑区过表达 Gna13 基因诱导小鼠精神分裂症样行为及其机制研究

浦建林[1,2] 范芮[1,2] 马榕[1] 王丙龙[2] 邬建飞[2] 刘可智[1,2] 向波[1]
1.西南医科大学附属医院精神科
2.西南医科大学附属自贡医院

目的 探索内侧前额叶脑区（medial prefrontal cortex, mPFC）Gna13 基因表达量增加诱导小鼠精神分裂症样行为及其机制。

方法 采用 CRISPR/Cas9 技术构建 Gna13 过表达的 flox 小鼠，繁殖后选取 8 周龄转基因雄性成年小鼠纳入后续实验。在实验小鼠 mPFC 脑区的锥体神经元过表达 Gna13 基因，脑组织冰冻切片验证注射部位，RT-qPCR 及 WB 验证过表达情况。三箱社交实验、旷场实验观察过表达 Gna13 基因以后小鼠行为学改变。随机选取单侧 mPFC 脑区注射 rAAV-CaMkIIa-CRE-GCaMP6s-WPREs 6.05E+12vg/ml 病毒，以此实现在 mPFC 脑区的椎体神经元过表达 Gna13 基因的同时表达钙指示蛋白 GCaMP6s，使用光纤记录检测实验小鼠进行社交活动时椎体神经元钙信号的变化。旷场、社交行为学实验结束后，取小鼠脑组织进行高尔基染色、全细胞膜片钳记录和 RNA 测序。

结果 三箱社交实验第二阶段结果显示，EV 组（n=18）小鼠在第二阶段接触陌生鼠 1（Stranger 1，S1）的时间多于空笼（Empty，E），两者差异存在显著性（P＜0.001），而 Gna13-OE 组（n=18）接触 S1 和 E 的时间无统计学差异（P＞0.05）。这表明，Gna13 在 mPFC 脑区过表达损坏了小鼠的社交能力。三箱社交实验的第三阶段，EV 组小鼠接触陌生鼠 2（Stranger 2，S2）的时间多于接触 S1，两者比较有统计学差异（P＜0.001），表现出对新加入小鼠的社交新奇性。同时 Gna13-OE 组小鼠在第三阶段接触 S2 的时间也多于接触 S1，两者相比较也存在统计学差异（P＜0.001）。综合三箱社交实验第二、第三阶段结果，提示 Gna13 基因在小鼠 mPFC 脑区过表达，损害了小鼠的社交能力，但不影响小鼠的社交新奇性。5min 的旷场结果显示，相比于 EV 组（n=18），Gna13-OE 组（n=18）小鼠到中央区的时间和频率明显减少，两组差异有统计学意义（P＜0.05），表明在 mPFC 脑区过表达 Gna13 基因介导小鼠出现了焦虑样行为。小鼠中 30min 旷场箱活动结果显示，相较于 EV 组（n=18），Gna13-OE 组（n=18）

小鼠在旷场箱的活动距离和移动速度减少，两者有统计学差异（P＜0.05）。此结果说明，mPFC 脑区过表达 Gna13 基因使得小鼠自发活动减少。在 30m

Comparative Efficacy and Target of Common Interventions for Social Cognition in Schizophrenia: A Systematic Review and Network Meta-analysis

王骁 宋颂 赵文涛 陈苗 刘莎*
山西医科大学第一医院

Objective Although research on the pathological mechanism and treatment of schizophrenia (SCZ) has never stopped, the current disease burden caused by the disease is still serious. Social cognition may play a crucial role.To facilitate the development of standardized treatments for social cognition impairment in schizophrenia (SCIS), this network meta-analysis aims to synthesize previous studies' results to compare the efficacy of different treatment methods on different dimensions of social cognition, laying a foundation for further determining standardized treatment plans.

Methods Both blinded and open-label randomized controlled trials were included in our study with a sample size of 10 or more SCZ patients. We included any study on interventions of drugs treatment, behavioral intervention, or physical therapy and considered both acute and maintenance effectiveness. The Hedge's g statistic was used to measure the effect size of each research based on the mean change from pre- to post-test of the treatment and control group. Effect size synthesis was conducted using the network-meta-analysis based on the fixed- and random-effects model. All analyses were conducted by R version 4.1.1.

Results 11 151 studies were identified through our database search and 271 were identified through other sources. Finally, 161 studies met the predefined inclusion criteria with 88 studies evaluating emotion recognition (ER), 68 studies evaluating theory of mind (ToM), 27 studies evaluating attribution style (AS), 23 studies evaluating social perception (SP), and 52 studies evaluated a broader range of social cognition. Among behavioral interventions, SCIT (Hedge's g: 0.54, 95% CI: 0.14 to 0.95) and TAR (Hedge's g: 0.76, 95% CI: 0.02 to 1.5) were superior to treatment as usual (TAU) for ToM in the short-term period. So is for ER. They were also ranked as having the highest probability of being the most effective psychological interventions according to the SUCRA values. ToMI (Hedge's g: 1.50, 95% CI: 0.18 to 2.80) and SCIT (Hedge's g: 0.59, 95% CI: 0.036 to 1.1) showed statistically significant with TAU for ToM in the long-term period while ToMI had the highest probability of being the most long-term effective psychological interventions. Among drugs treatment and physical therapy, no interventions showed better therapeutic effects than TAU and oxytocin showed a trend of improvement. Treatment effects were not evident on measures of AS and SP.

Conclusion This meta-analysis found only a few behavioral interventions were associated with improvement of ER and ToM than TAU while oxytocin only showed a trend of improvement. We replicated previous findings of the effectiveness of SCIT in SCIS. Psychosocial interventions which support individuals to build and maintain social networks may improve outcomes in schizophrenia. Further research is required to explore in detail theoretical models relating to explanatory or mediating mechanisms.

关键字：schizophrenia; social cognition; oxytocin; psychosocial interventions; network meta-analysis

Early Non-response As A Predictor of Later Non-response To Antipsychotics in Schizophrenia: A Randomized Trial

龙雨君 邬琼琼 杨叶 蔡敬达 肖婧美 赵靖平 吴仁容*
中南大学湘雅二医院

Objective It remains a challenge to predict the long-term response to antipsychotics in patients with schizophrenia who do not respond at an early stage. This study aimed to investigate the optimal predictive cut-off value for early non-response that would better predict later non-response to antipsychotics in patients with schizophrenia.

Methods This multicenter, 8-week, open-label, randomized trial was conducted at 19 psychiatric centers throughout China. All enrolled participants were assigned to olanzapine, risperidone, amisulpride, or aripiprazole monotherapy for 8 weeks. The positive and negative syndrome scale (PANSS) was evaluated at baseline, week 2, week 4, and week 8. The main outcome was the prediction of nonresponse. Nonresponse is defined as a <20% reduction in the total scores of PANSS from baseline to endpoint. Severity ratings of mild, moderate, and severe illness corresponded to baseline PANSS total scores of 58, 75, and 95, respectively.

Results At week 2, a reduction of <5% in the PANSS total score showed the highest total accuracy in the severe and mild schizophrenia patients (total accuracy, 75.0% and 80.8%, respectively), and patients who treated with risperidone and amisulpride group (total accuracy, 82.4%, and 78.2%, respectively). A 10% decrease exhibited the best overall accuracy in the moderate schizophrenia patients (total accuracy, 84.0%), olanzapine (total accuracy, 79.2%), and aripiprazole group (total accuracy, 77.4%). At week 4, the best predictive cut-off value was <20% and regardless of the antipsychotic or severity of illness (total accuracy ranging from 89.8% to 92.1%).

Conclusion Symptom reduction at week 2 has acceptable discrimination in predicting later non-response to antipsychotics in schizophrenia, and a more accurate predictive cut-off value should be determined according to the

medication regimen and baseline illness severity. The response to treatment during the next two weeks after week 2 could be further assessed to determine whether there is a need to change antipsychotic medication during the first four weeks.

轻音乐干预对男性精神分裂症患者幻听症状和生活质量的影响研究

王秀霞 巢丽红*
苏州市广济医院

目的 分析轻音乐疗法对男性精神分裂症患者幻听症状和生活质量的效果。

方法 2022 年 1 月—2022 年 12 月，采用便利抽样法，选取苏州市广济医院急性精神科 2 个男病区的 84 例精神分裂症伴幻听症状的患者为研究对象，根据随机数字表法将患者分为试验组和对照组。试验组在常规护理的基础上通过音乐疗法进行干预，对照组进行常规幻听护理。比较两组患者入院时、出院时、出院后随访 1 个月、3 个月、6 个月时间节点的阳性症状（SAPS）、幻听风险得分的差异性；住院期间和出院后 6 个月生活质量的差异性。

结果 82 名患者完成了该研究，对照组和试验组各 41 名。两组患者住院时、出院时及出院后 1、3、6 个月随访时的阳性症状得分明显降低，试验组[入院时（47.78±17.53）分，出院时（29.28±10.19）分，出院后 1 个月（27.71±20.65）分，出院后 3 个月（28.85±16.39）分，出院后 6 个月（29.28±21.07）分，F=20.32，p<0.05]，对照组[入院时（51.64±26.34）分，出院时（27.64±22.90）分，出院后 1 个月（24.74±21.90）分，出院后 3 个月（30.28±26.25）分，出院后 6 个月（30.57±24.92）分，F=19.13，p<0.05]，但出院后无明显差异（p>0.05）；两组患者五个时间段幻听风险得分明显降低，对照组[入院时（24.98±5.91）分，出院时（6.70±10.18）分，出院后 1 个月（9.57±13.50）分，出院后 3 个月（8.28±12.30）分，出院后 6 个月（8.21±10.92）分，F=30.75，p<0.05]，试验组[入院时（22.50±4.60）分，出院时（14.76±6.74）分，出院后 1 个月（7.90±10.79）分，出院后 3 个月（9.09±10.48）分，出院后 6 个月（9.37±8.03）分，F=17.04，p<0.05]，但出院后幻听风险评分逐渐增高，但 6 个月内无明显差异（p>0.05）；试验组患者在随访 6 个月时的生活质量量表（生理功能、社会功能、心理功能、环境）得分分别明显高于住院期间（p<0.05），对照组患者出院后 6 个月生活质量得分无明显差异（p>0.05）。

结论 轻音乐治疗对幻听患者的阳性症状、幻听风险和生活质量有积极的影响可能被推荐用来应对幻听，提高精神分裂症患者的生活质量。

关键字：轻音乐；幻听；生活质量

情绪启动对精神分裂症患者病耻感注意偏向的影响研究

宇婷[1,2]
1.长江大学精神卫生研究所
2.荆州市精神卫生中心

目的 本研究探讨不同病耻感体验的精神分裂症患者自身注意偏向的特点以及情绪启动与注意偏向之间的交互影响，为精神疾病病耻感的作用机制及精神分裂症患者情绪与认知的交互作用提供理论支持。

方法 本研究利用精神疾病病耻感量表中文版（SSMI-C），筛选 40 名康复期精神分裂症患者作为研究被试，根据得分高低分为高病耻感组与低病耻感组同时进入实验研究阶段；采用点探测范式以及阈下情绪启动范式对两组患者进行实验，最终根据被试的实验结果对其认知偏向特点进行探讨。

结果 1.两组被试在负性刺激配对与正性刺激配对的情况下均显示出明显的注意偏向，高分组反应时相差 134ms 与 170ms；低分组反应时相差为 98ms 与 217ms。此外，高分组被试对情绪刺激的平均反应时明显低于低分组的反应时。 2.负性启动组与正性启动组的反应时具有显著性差异 F=15.340(p=0.000)，正性启动组与控制组的反应时也具有显著差异 F=16.887(p=0.000)，而负性启动组与控制组没有差异（p=0.646）。 3.对探测字母的位置进行简单效应检验，发现负性启动组与正性启动组被试的反应时具有显著性差异(F=6.36,p=0.034;F=12.25,p=0.000)，而控制组的被试则没有表现出显著性差异。4.在正性启动条件下，病耻感高分组被试的反应时显著低于低分组的反应时(F=6.415,p=0.026)，不同情绪启动条件，病耻感高分组和低分组在不同情绪启动的情况下都表现出显著差异(F=15.48,p=0.000;F=29.95,p=0.000)。

结论 精神分裂症患者对情绪刺激具有注意偏向，其中对消极刺激表现出显著的注意偏向；病耻感体验与注意偏向的交互作用显著，高病耻感组对情绪刺激的反应时明显快于低病耻感组；负性情绪启动条件下，患者对消极刺激表现出显著的注意偏向，说明对消极词语存在着警觉；正性情绪启动下，患者表现出对中性词语的注意优势效应，对中性词语的反应明显快于对消极词语的反应，说明注意偏向发生反转。病耻感体验与情绪启动的交互作用显著，正性情绪启动组中患者对情绪刺激的反应时显著大于负性启动组；负性启动条件下两组被试反应时并无明显差异，而正性启动条件下，低病耻感患者的反应时显著大于高病耻感组的患者。

Transcriptional Level of Inflammation Markers Associates with Short-term Brain Structural Changes in First-episode Schizophrenia

Longbiao Cui*
Schizophrenia Imaging Lab, Fourth Military Medical University

Objective Inflammation has been implicated in the pathology of schizophrenia, and may cause neuronal cell death and dendrite loss. Neuroimaging studies have highlighted longitudinal brain structural changes in patients with schizophrenia, yet it is unclear whether this is related to inflammation. We aim to address this question, by relating brain structural changes with the transcriptional profile of inflammation markers in the early stage of schizophrenia.

Methods Thirty-eight patients with first-episode schizophrenia and 51 healthy controls were included. High-resolution T1-weighted magnetic resonance imaging (MRI) and clinical assessments were performed at baseline and 2 ~ 6 months follow-up for all subjects. Changes of brain structure were analyzed using surface-based morphological analysis, and correlated with the expression of immune cells-related gene sets of interest reported by previous reviews. Transcriptional data were retrieved from the Allen Human Brain Atlas. Further, we examined brain structural changes and peripheral inflammation markers in association with behavioral symptoms and cognitive functioning in patients.

Results Patients exhibited accelerated cortical thickness decrease in the left frontal cortices, less decrease or an increase in the superior parietal lobule and right lateral occipital lobe, and increased volume in the bilateral pallidum, compared with controls. Changes of cortical thickness correlated with the transcriptional level of monocyte across cortical regions in patients ($r = 0.54$, $p < 0.01$), but not in controls ($r = ?0.05$, $p = 0.76$). In addition, cortical thickness change in the left superior parietal lobule positively correlated with changes of digital span-backward test scores in patients.

Conclusion Patients with schizophrenia exhibit regional specific cortical thickness changes in prefrontal and parietooccipital cortices, which is related to their cognitive impairment. Inflammation may be an important factor contributing to cortical thinning in first-episode schizophrenia. Our findings suggest that the immunity-brain-behavior association may play a crucial role in the pathogenesis of schizophrenia.

首发精神分裂症患者任务态中异常“翻转”的脑网络激活模式

胡欣怡 陆峥*
同济大学医学院附属同济医院

目的 探究首发未用药精神分裂症患者在静息态以及面孔表情识别任务中脑网络的异常激活模式。

方法 对 75 名首发未用药精神分裂症患者与 50 名健康对照进行静息态以及面孔表情识别任务下的功能磁共振扫描，基于 AAL 图谱构建功能连接网络，并运用图论方法分析功能脑网络拓扑属性在首发精神分裂症患者中所发生的异常改变。

结果 预处理过程中，经过头动校正，排除了头动大于 3mm 的被试，最终纳入 62 例精神分裂症患者与 46 例健康对照。对任务态功能磁共振下构建的功能脑网络进行连边分析，经校正后发现精神分裂症组存在显著低于健康对照的连边，峰值点位于额下回、杏仁核、梭状回、舌回、海马等脑区，与先前研究认为的社会认知核心脑区存在广泛重叠。静息态下，图论分析的双样本 T 检验结果显示，脑网络的同配性与层级性存在显著组间差异，患者组的网络同配性高于对照组（t=-2.67），而对照组的网络层级性高于患者组（t=2.34），全局效率和局部效率指标存在对照组大于患者组的趋势。在任务情境下，患者组的网络同配性显著低于对照组（t=2.78），网络层级性（t=-3.00）和全局效率（t=-2.05）属性则显著高于对照组。这种激活模式在从静息态切换到任务态时类似于进行了“翻转”，即静息态时患者组大于对照组的脑网络拓扑属性指标在任务态下往往会小于对照组。

结论 首发精神分裂症患者的脑网络拓扑属性在静息态和任务态下都存在一定程度的异常。有意思的是在任务态情况下精神分裂症患者脑网络的全局和局部的信息处理能力较健康对照增强，但显然这种增强与患者明显降低的任务表现是完全不匹配的，因而表明任务态下患者的脑网络存在严重失代偿的功能紊乱。

稳定期精神分裂症患者快感缺失特征及其与社会功能的相关性研究

周琪[1] 郭晓栋[2] 王毅[2] 蒲城城[1] 石川[1] 于欣[1]
1.北京大学第六医院
2.中国科学院心理研究所

目的 为探索稳定期精神分裂症（stable schizophrenia，SSZ）患者快感相关的奖赏加工过程异常特征，了解其与阴性症状、社会功能等临床特征的相关性。

方法 研究纳入 61 名 SSZ 患者和年龄、性别、受教育年限相匹配的 46 名健康对照，完成多维度快感评估，同时完成阴性症状、神经认知和社会功能评估。使用独立样本 t 检验、卡方检验用于比较 SSZ 患者和健康对照不同快感成分及临床特征的差异；相关性分析、线性回归用于探究 SSZ 患者快感水平与临床特征及社会功能的关联。

结果 SSZ 患者自评社交性快感、预期性快感、消费性快感水平、认知功能均低于健康被试（$p<0.05$）；SSZ 患者奖赏任务中困难任务选择比例显著低于健康对照（$p<0.05$），且在认知努力任务中尤为突出。阴性症状的动机/愉快因子分（motivation and pleasure，MAP）与社交性快感及认知努力的困难任务选择有关（β 分别

为 0.281，-0.303，p＜0.05）；而表达因子分（Expression，EXP）与预期性快感和躯体努力的困难任务选择比例有关（β 分别为-0.321，-0.359，p＜0.05）。预期性快感水平和 MAP 及 EXP 因子共同预测社会功能（β 分别为 0.227，-0.436，-0.297，p＜0.05）。

结论 SSZ 患者存在消费性快感下降、预期性快感下降、社交快感下降、动机下降等多维度快感缺失，且奖赏动机缺陷在认知努力中更加突出。预期性快感水平与阴性症状不同维度均为社会功能的预测因素。

关键字：精神分裂症；快感缺失；阴性症状；社会功能

Association between The Expression of MiRNA-137 in Plasma and The Efficacy of Olanzapine in The Treatment of Schizophrenia

Pan Yan Shengdong Wang Shuqi Wang Mingfen Song*
杭州市第七人民医院

Objective The relative expression of miRNA-137 in plasma of patients with schizophrenia (SZ) before and after olanzapine treatment was determined to explore its relationship with the clinical efficacy of olanzapine.

Methods A total of 78 schizophrenic patients who treated with olanzapine alone for 4 weeks were recruited. The positive and negative symptom scale (PANSS) scores were used to measure the clinical efficacy of olanzapine. Patients were divided into ineffective group and effective group with a 50% reduction rate of PANSS as the boundary. The expression of miRNA-137 in plasma was measured by real-time fluorescence quantitative PCR before and after treatment.

Results The expression of miRNA-137 in plasma was significantly decreased than that before treatment in the effective group (t=12.065, P<0.05); The down-regulation of the relative expression of miRNA-137 in plasma was positively correlated with the reduction scores of positive symptoms, general psychopathology and total scores of PANSS (r=0.493, 0.373, 0.495, all P<0.05); The area under the ROC curve (AUC) of the down-regulation of miRNA-137 in plasma to predict the efficacy of olanzapine in the treatment of schizophrenia was 0.8750 (95% CI: 0.8007-0.9493) with 75.0% sensitivity and 93.3% specificity.

Conclusion The down-regulation of miRNA-137 expression in plasma can predict the clinical efficacy of olanzapine in the treatment of schizophrenia to some extent.

关键字：miRNA-137 Schizophrenia Olanzapine Clinical efficacy

精神分裂症患者脑白质异常在 NMDA/CREB/BDNF 基因风险评分和认知功能关系中的作用

李智男 魏钦令*
中山大学附属第三医院

目的 N-甲基-D-天冬氨酸（N-Methyl-D-aspartic acid，NMDA）/环磷腺苷效应元件结合蛋白（cAMP responsive element-binding，CREB）/脑源性神经营养因子（brain-derived neurotrophic factor, BDNF）通路可以影响认知功能，其中机制可能涉及脑的异常改变；本研究探索精神分裂症（schizophrenia，SP）患者脑白质异常在 NMDA/CREB/BDNF 通路上基因风险评分和认知功能关系中的作用。

方法 共纳入 SP 组 67 例和健康对照（healthy control, HC）组 87 例。计算 NMDA/ CREB/ BDNF 通路上相关基因多态性累积基因风险评分，基于图论的方法探索 SP 患者脑白质受损的情况，MARTICS 共识认知功能成套测验评估 SP 患者的认知障碍。统计分析通过 SPSS 25.0 软件进行，对两组被试的性别和受教育水平进行 $\chi 2$ 检验，对年龄进行单因素方差分析；通过协方差分析比较两组脑白质和认知功能的差异，偏相关分析用于分析脑白质、认知功能与 NMDA/CREB/BDNF 基因风险评分间的相关性，当 p＜0.05 时具有统计学差异，Bonferroni 校正用于降低多重比较导致的假阳性率。使用 PROCESS 3.4.1 来建立中介模型，自变量为 NMDA/CREB/BDNF 基因风险评分，因变量为认知评分，中介变量为异常的脑参数，Bootstrap 法检验中介效应，抽样次数为 5000 次。

结果 以性别、年龄、受教育水平为协变量，SP 组的网络局域效率（Eloc）显著低于 HC 组；两组的右侧中央后回（Postcentral gyrus, PoCG）在节点最短路径长度和节点效率上具有显著差异；SP 组在信息处理速度、注意/警觉性、词语学习和推理和问题解决四个领域表现出显著的降低；SP 组信息处理速度、词语学习与 Eloc 存在正相关，信息处理速度与 PoCG 节点效率呈边缘正相关。以性别、年龄、受教育水平和组别为协变量时，以 PoCG 节点最短路径长度和节点效率为中介变量，注意/警觉性为因变量时，链式中介模型（Model6）成立。

结论 SP 患者存在脑白质网络拓扑属性的异常，并与不同认知领域相关；NMDA/CREB/BDNF 基因风险评分与注意功能存在相关性，并且右侧 PoCG 的节点拓扑属性在其中起到中介作用。

Association of Pathogen Infections on Neuropsychiatric Disorders: A Mendelian Randomization Analysis

尤子凡 唐劲松*
浙江大学医学院附属邵逸夫医院

Objective Correlations between pathogen infections and risk of neuropsychiatric disorders and symptoms have been reported in observational studies. However, the

evidence of effects of pathogen infections on such disorders were scarce and subject to bias, thus limiting our understanding of how pathogen infections influences the incidence of neuropsychiatric conditions.

Methods We performed a two-sample bidirectional Mendelian randomization (MR) and muti-variable MR (MVMR) analyses to evaluate the causality and direction of associations between 4 pathogen infections including toxoplasma gondii (T.gondii), chlamydia? trachomati (CT), herpes simplex virus (HSV), cytomegalovirus (CMV) and 15 neuropsychiatric conditions including posttraumatic stress disorder (PTSD), attention-deficit/hyperactivity disorder (ADHD), autism spectrum disorder (ASD), obsessive-compulsive disorder (OCD), bipolar disorder (BIP), Alzheimer's disease (AD) schizophrenia (SCZ), Parkinson's disease (PD), sleep disorder (SD), anorexia nervosa (AN), unspecified anxiety disorder (UAD), major depressive disorder (MDD), suicide attempt (SA), epilepsy and irritability with data derived from the IEU Open genome-wide association study (GWAS) project. Exposure-outcome correlations were primarily estimated by inverse variance weighted (IVW) method supplemented by a series of sensitivity analyses as validation of MR results.

Results Genetically predicted pathogen infection markers had the following causal effects on neuropsychiatric disorders with anti-CT IgG seropositivity on SCZ (odds ratio (OR) = 0.868, 95% confidence interval (CI)=(0.791, 0.953)), anti-CMV seropositivity on PTSD (OR=0.571, 95%CI=(0.459, 0.711)) and HSV2 mgG-1 antibody on MDD (OR=1.037, 95% CI=(1.021, 1.053)). Meanwhile, the biomarkers were possibly influenced by neuropsychiatric conditions, including anti-HSV1 IgG seropositivity (OR=0.964, 95%CI=(0.951, 0.977)), anti-HSV2 IgG seropositivity (OR=0.973, 95%CI=(0.957, 0.989)) by AN, HSV2 mgG-1 antibody by epilepsy (OR=1.57×10-27, 95%CI=(1.48×10-43, 1.67×10-11)) and HSV1 mgG-1 antibody by UAD(OR=0.009, 95%CI=(0.003, 0.027)) and irritability (OR=0.964, 95%CI= (1.914, 20.106). Using MVMR, anti-CT IgG seropositivity estimates remained after accounting for anti-CMV or anti-HSV2 IgG seropositivity (SCZ: OR=0.888, 95%CI=(0.815, 0.967)), BIP: OR=1.411, 95%CI=(1.009, 1.972)).

Conclusion Our analysis reveals that pathogen infection is bidirectionally associated with neuropsychiatric disorders. These results highlight the potential role of pathogen infection on the prevention of neuropsychiatric diseases.

Prediction of Anhedonia in Patients with First-Episode Schizophrenia Using Wavelet-ALFF-Based Support Vector Regression Model

邝启杰*
广州医科大学附属脑科医院

Objective Anhedonia is one of the core features of negative symptoms of schizophrenia and can be extremely burdensome. Our study applied resting-state magnetic resonance imaging (MRI)-based support vector regression (SVR) to predict the anhedonia in patients with first-episode schizophrenia (FSZ) and analyse the correlation between the wavelet-ALFF of the main brain region and anhedonia.

Methods We recruited 31 patients with FSZ and 33 healthy controls (HCs) from the Affiliated Brain Hospital of Guangzhou Medical University. All subjects completed the Temporal Experience of Pleasure Scale (TEPS) and received resting-state fMRI (rs-fMRI). We used Wavelet-Based Amplitude low frequency fluctuation amplitude method (wavelet-ALFF) and SVR to analyze the data **Results** Patients with FSZ have lower consummatory pleasure scores than healthy subjects(t=-2.71,p＜0.01). FSZ exhibited increased wavelet-ALFF in bilateral middle cingulate gyrus and right putamen, while decreased in bilateral postcentral, bilateral Calcarine, and right superior occipital gyrus (voxel significance: $p < 0.005$, cluster significance: $p < 0.05$, GFR). The SVR analysis showed that wavelet-ALFF, based primarily on the right putamen ($r = 0.411$, $P < 0.05$) and right superior occipital gyrus ($r = -0.394$, $P < 0.05$), was effective in predicting consumed pleasure scores with an accuracy of 56.43%.

Conclusion Our study shows abnormal spontaneous neural activity in FSZ may be related to the state of consummatory anhedonia in FSZ. Wavelet-ALFF changes in the right putamen and superior occipital gyrus may be a biological feature of FSZ with anhedonia, and may be a potential biological marker of FSZ with anhedonia.

Temporal Trends in The Burden of Schizophrenia From 1990 To 2019: A Age-Period-Cohort Analysis

Nanxi Li[1], Junjian Mo[2], Sihao Chen[1], Wei Wei[1], Tao Li[1]
1.Affiliated Mental Health Centre & Hangzhou Seventh People's Hospital
2.Department of Hematology, The Fifth Affiliated Hospital, Sun Yat-sen University

Objective Schizophrenia is a serious public health disorder. This study aimed to estimate temporal trends in the burden of schizophrenia at the global, regional, national, and to elucidate the associations with age, period, and birth cohort.

Methods We use data from Global Burden of Disease Study 2019 (GBD 2019) to describe the prevalence and incidence of schizophrenia at the global, regional, and national levels. Joinpoint regression analysis was adopted to analyze the 1990–2019 temporal trends. Age-Period-Cohort (APC) analysis was used to describe long-term trends of schizophrenia and interpret schizophrenia epidemiological characteristics. Pearson correlation analysis was used to explore the factors influencing Estimated annual percentage change (EAPC) and Nordpred models to

further forecast.

Results The global Age-Standardized Incidence Rate (ASIR) (EAPC=?0.1, 95% UI =?0.11 to ?0.1) and Age-Standardized Prevalence Rate (ASPR) (EAPC=?0.02, 95% UI=?0.03 to ?0.02) decreased slightly from 1990 to 2019. In the context of sex, the incidence and prevalence of schizophrenia were more considerable among boys than girls, so as the ASIR and ASPR. In 2019, ASPR of schizophrenia was highest in High-income North America (ASPR=418.94, 95% CI 363.84 to 479.24). The ASR was highest in countries with high sociodemographic index (SDI). APC model analysis showed that, the age effect on the risk of schizophrenia increased then decreased with age (effect coefficient was-2.2635-0.6532--1.2612). The period effect increased then decreased then increased with years (effect coefficient was - 0.0005--0.0008--0.0013-0.0003). The cohort effect showed a decreasing trend in the overall risk for those born at early birth cohort (effect coefficient was 0.0403--0.0197) and a increasing trend in the overall risk for those born at late birth cohort(effect coefficient was -0.0197--0.0338).

Conclusion On a global scale, schizophrenia burden has significantly increased over the last 30 years, and males bear heavier burden than females. However, the upward trend is descending although the burden remains high. Schizophrenia burden differed substantially based on SDI, with the higher the level of SDI, the more severe the burden of schizophrenia. The disease burden of schizophrenia is a major public health challenge.

目的 英国 Leff 教授团队于 2013 年首次提出虚拟化身疗法可有效治疗难治性言语性幻听。本研究拟探究我国本土化虚拟化身心理治疗（Computer Avatar Therapy System, CATS）对精神分裂症患者焦虑、幻听信念及幻听症状改善效果。

方法 本团队采用专家会议法，基于我国实情，结合虚拟化身疗法原理、幻听认知模型及经验现象学等，编制出本土化虚拟化身疗法方案。于 2020 年 7 月-2022 年 1 月，采用方便取样，根据研究纳排标准，招募来自某三甲医院精神卫生科就诊的精神分裂症患者，实施为期七周，每周一次，每次约 60 分钟的虚拟化身心理治疗。分别在干预前和干预后进行临床症状评估，包括阳性与阴性症状评估量表（PANSS）、汉密尔顿焦虑量表（HAMA）、幻听相关信念量表（BAVQ-R）、精神症状评定量表-幻听分量表（PSYRATS-AH）。采用 SPSS 22.0 进行数据统计分析，使用配对样本 T 检验探究干预前后患者各临床症状指标的差异，使用皮尔逊相关分析探究各临床症状之间的相关性，并使用 Processes v3.0 插件探究幻听相关信念在焦虑和幻听症状之间是否具有中介作用。

结果 共收集到 33 名伴言语性幻听精神分裂症患者，其中男性 19 名，女性 14 名，平均年龄（26.42±6.87）岁，平均病程（4.56±3.38）年。经虚拟化身心理治疗干预后，患者的 PANSS 总分（t=7.449, p＜0.001）、HAMA 总分（t=4.214, p＜0.001）、BAVQ-R 恶意子量表得分（t=5.728, p＜0.001）、PSYRATS-AH 总分（t=7.164, p＜0.001）均显著下降。皮尔逊相关分析显示，焦虑与幻听症状（r=0.383, p＜0.05）、焦虑与幻听恶意信念（r=0.690, p＜0.001）、幻听恶意信念与幻听症状（r=0.694, p＜0.001）均存在显著正相关。进一步中介分析发现，幻听恶意信念在焦虑和幻听症状之间具有完全中介作用（直接效应[95% CI = (?1.019, 0.415)]，间接效应[95% CI = (0.157, 1.925)]）。

结论 虚拟化身心理治疗可有效缓解患者的焦虑情绪及幻听症状，且幻听恶意信念在焦虑情绪和幻听症状之间具有中介作用。

Plasma Exosomes LncRNA-miRNA-mRNA Network Construction and Its Diagnostic Efficacy Identification in First-episode Schizophrenia

杜鑫哲[1] 吕金芝[1] 冯健平[1] 李忻蓉[1] 高耀[1] 王骁[1] 赵文涛[1] 曹晓华[1] 徐勇[2] 刘莎[1]
1.山西医科大学第一医院
2.太原市中心医院

Objective The exosomal lncRNA-miRNA-mRNA networks in first episode schizophrenia (FOS) have not reported yet. This study examined the lncRNA, miRNA and mRNA expression level in exosome derived from first episode schizophrenia (FOS) patients, and explored the the potential of exosomes as biomarkers for schizophrenia.

Methods we recruited 10 FOS patients and healthy controls (HCs) respectively, examined the lncRNA, miRNA and mRNA expression level of plasma exosome by high throughput sequencing, constructed lncRNA-miRNA-mRNA network, and performed correlation analysis, GO and KEGG pathway analysis, PPI network construction and ROC analysis.

Results there were 746 differently expressed lncRNA, 22 differently expressed miRNA, and 2637 differently expressed mRNA in plasma exosome in FOS compared with HCs. Then we constructed ceRNA network

consisting of 8 down-regulated lncRNA , 7 up-regulated miRNA and 65 down-regulated mRNA, and 1 up-regulated lncRNA, 1 down-regulated miRNA and 4 up-regulated mRNA. The expression level of 1 lncRNA and 7 mRNA in exosomal network were correlated with PANSS score. GO and KEGG pathway analysis showed that 4 up-regulated mRNAs were enriched in neuropsychiatric system function. Down-regulated mRNA EZH2 and SIRT1 were identified as hub gene. Finally, we detected the ROC curve of ENSG00000251562，miR-26a-5p，EZH2, miR-22-3p，SIRT1, ENSG00000251562—miR-26a-5p—EZH2, ENSG00000251562—miR-22-3p—SIRT1, and found that the AUC of ceRNA network was higher than lncRNA, miRNA and mRNA alone.

Conclusion We constructed the lncRNA-miRNA-mRNA network in exosome derived from FOS plasma, and found that lncRNA-miRNA-mRNA network has potential as biomarkers for FOS.

气体信号分子硫化氢通过缓解细胞凋亡调控精神分裂症

杜鑫哲 胡卫 吕金芝 刘莎*
山西医科大学第一医院

目的 硫化氢（hydrogen sulfide, H2S）是继 NO 和 CO 之后的第三种气体信号分子，在中枢神经系统中具有多种生物学功能。然而，目前尚不清楚 H2S 与精神分裂症（Schizophrenia，SZ）的关联及其相关机制。本研究旨在从人群层面、细胞层面以及动物层面去探索 H2S 对精神分裂症是否有调控作用以及其作用机制。

方法 人群层面，招募 26 名首发型 SZ（first episode SZ, FOS）患者以及 29 名健康对照（healthy control, HC）,收集临床资料和外周血，利用酶联免疫吸附法测定血浆中 H2S 含量。细胞水平和动物水平，利用地佐西平马来酸盐（MK-801）处理 SH-SY5Y 细胞和 SD 大鼠模拟精神分裂症，用 NaHS 作为外源 H2S 供体，分别分为四组：对照组、NaHS 组、MK801 组和 NaHS+MK801 组。随后，细胞水平进行 miRNA 与 mRNA 转录组测序，利用生物信息学筛学出关键的差异表达基因，用实时荧光定量聚合酶链式反应（qRT-PCR）检测基因表达，流式细胞仪检测细胞凋亡情况。动物水平通过 ELISA 技术测定血浆及海马组织中 H2S 含量，并进行行为学实验，最后利用免疫荧光实验检测海马组织细胞凋亡情况。

结果 人群水平：FOS 患者的血浆 H2S 含量明显降低，ROC 分析显示血浆 H2S 对首发 SCZ 具有较高的诊断效度。细胞水平：100μM NaHS 预处理最挽救了 MK801 诱导 SH-SY5Y 细胞所致的活力降低。根据转录组测序结果，筛选出 MK801 处理后发生改变并被 NaHS 预处理回调的基因，其中包括 4 个 miRNAs 和 68 个 mRNA；这些基因主要富集在细胞凋亡通路中，QRT-PCR 实验验证了凋亡通路相关基因的表达，流式细胞仪检测细胞凋亡情况发现 NaHS 预处理明显缓解了 MK801 诱导的 SH-SY5Y 细胞凋亡。动物水平：MK801 诱导的大鼠血浆和海马区组织中 H2S 含量较对照组明显降低。MK801 组大鼠在旷场实验、三箱社交试验、Y 迷宫实验、新物体识别实验中的均与对照产生明显的异常，而 NaHS 预处理后，缓解了 MK-801 造成的异常。免疫荧光实验发现 NaHS 能够缓解 MK801 造成的细胞凋亡。

结论 在精神分裂症中，H2S 的含量显著降低；外源补充 H2S 能够缓解精神分裂症样行为，该缓解作用有可能是通过调控细胞凋亡过程实现的。

Efficacy of Cortical-hippocampal Target Intermittent Theta Burst Stimulation(iTBS) on Associative Memory of Schizophrenia: A Double-blind, Randomized Sham-controlled Trial

李旋[1] 岑海欣[1] 翟兆琳[2] 高天昊[2] 路畅[2] 董语可[2] 张素贞[2] 卓恺明[1] 项琼[1] 王岩[3] 刘登堂[1,2]

3.华东师范大学

Objective Associative memory deficits are a core cognitive deficit symptom in schizophrenia, affecting the functional prognosis. The hippocampus is a critical brain region for the formation of associative memory. Studies have shown that rTMS stimulation of specific brain regions in the cortex can modulate hippocampal function by stimulating the cortico-hippocampal functional network, which is composed of the dorsolateral prefrontal cortex (DLPFC), the lateral parietal cortex (LPC), and hippocampal structures. Compared with traditional rTMS, TBS has a lower stimulus intensity than conventional rTMS and can change cortical excitability in a shorter period (3-4 min), significantly reducing treatment time and increasing patient compliance. The objective of our study was to assess whether intermittent theta burst stimulation(iTBS) to the locations with the strongest cortico-hippocampal connectivity within the LPC or DLPFC areas in schizophrenia enhances associative memory.

Methods We randomized 96 participants with schizophrenia to receive either active iTBS applied to the right DLPFC, left LPC or sham iTBS for 20 days. Clincal and cognitive assessments were performed at baseline and at the end of treatment. The primary outcome was change in associative memory. The secondary outcome was change in other cognitive functions and psychiatric symptoms. The associative memory paradigm of this study included visual-visual (Vis-Vis), auditory-auditory (Aud-Aud), and visual-auditory (Vis-Aud) pairing task. To discourage the “verbalization”, we used abstract visual and meaningless auditory stimuli.

Results Ultimately, 89 patients received the intervention. Of these 89 participants, 61 patients successfully

completed treatment and follow-up. Out of the 61 participants who completed the treatment, a total of 37 individuals completed the associative memory tasks, with 13 in the right DLPFC group, 13 in the left LPC group, and 12 in the sham group, respectively. The discriminability d-prime(d') was calculated to quantify the associative memory performance. We used repeated measures ANOVA to evaluate the d 'value pre- and post- intervention in the three groups among Aud-Aud associative memory (F=1.27 p=0.294), Aud-Vis associative memory (F= 0.49,p=0.617),Vis-Vis associative memory (F=1.094,p=0.347). No statistical differences were observed in intervention mode and time interaction on the three types of associative memory. Moreover, the results showed that the interaction of group and time had no significant effect on any of the seven cognitive modules of the patients.

Conclusion Compared to the sham group, iTBS targeting the right DLPFC or left LPC in schizophrenia fails to improve neither within-domain nor across-domain associative memory. However, if more participants could be recruited and hippocampal-targeted iTBS could be combined with fMRI, the regulatory role of rTMS in hippocampal regeneration could be better understood.

中文版 Bell-Lysaker 情绪识别任务在精神分裂症患者中的信效度

李大志 李茹 孙霞 楚利君 李嘉欣 张健 焦清艳 贾晓菊 高萍 张勇*
天津市安定医院

目的 评估中文版 Bell-Lysaker 情绪识别任务（Bell-Lysaker emotion recognition task，BLERT）在中国成年精神分裂症（SCH）患者中的信度和效度。

方法 招募稳定期精神分裂症(SCH)患者 60 例，按照年龄、性别及教育年限相匹配，招募来自社区体检中心的健康对照（HC）100 名，使用中文版 BLERT、中国面部表情图片系统（Chinese affective facial picture system，CAFPS）、阳性与阴性症状量表（PANSS）、蒙特利尔认知评估（MoCA)进行测评，其中 49 例 SCH 患者(81.67%)2 周后完成重测。

结果 中文版 BLERT 的总难度为 0.68，总区分度为 0.45；内部一致性信度为 0.73，重测信度为 0.70（P<0.001）；与 CAFPS 及 MoCA 的关联效度为 0.41、0.55（P<0.001），BLERT 在 SCH 组与 HC 组间区分效度较高（效应值 0.52），最佳划界分为 15 分（此时敏感性为 0.85，特异性为 0.87）；验证性因子分析显示 7 种基本情绪拟合良好。

结论 中文版 BLERT 在中国成年精神分裂症患者中具有可接受的信度和效度。

Coupling Analysis of Brain Structural Connectivity and Functional Connectivity before and after Treatment of Female Patients with Schizophrenia

Shuzhan Gao[1], Yunkai Sun [2], Jinsong Tang[2], Xijia Xu[1]
1.Department of Psychiatry, the Affiliated Brain Hospital of Nanjing Medical University, Nanjing, China, 210029
2.Department of Psychiatry, Sir Run Run Shaw Hospital, School of Medicine, Zhejiang University, Hangzhou, China, 310016

Objective Convergent evidence has suggested significant abnormalities in structural connectivity or functional connectivity of patients with schizophrenia, yet the changings of antipsychotic treatment-related alterations based on multimodal connectivity patterns within whole brain and their relationships to clinical characteristics in female patients with schizophrenia before and after 8 weeks of treatment were still unknown.

Methods 53 female patients with schizophrenia, which were treated with antipsychotic drugs for 8 weeks, and 44 female healthy controls were included. Structural network and functional network were analyzed by Network-Based Statistics (NBS). Non-zero structural connectivity-functional connectivity coupling at whole brain level was calculated. Finally, a predictive model for clinical efficacy was established based on random forest algorithm.

Results Compared with healthy control, structural connectivity of sub-network-1 was decreased in pre-treatment group, including structural connectivity between right posterior cingulate gyrus and right frontal gyrus, right supplementary motor area, as well as left medial cingulate gyrus. After treatment, compared with healthy control, structural connectivity of sub-network-1 tended to be normalized, while structural connectivity of sub-network-2 were significantly enhanced, including structural connectivity between right insula and left putamen, between left putamen and right putamen, between right putamen and left thalamus, between left thalamus and right medial cingulate gyrus, between left cerebellum and right medial cingulate gyrus, between left cerebellum and right precuneus, and between left cerebellum and right superior temporal gyrus. Compared with pre-treatment group, functional connectivity of sub-network-3 was decreased in post-treatment group significantly, widely distributed in the frontal, temporal, parietal, subcortical and cerebellum. Despite no significant difference in structural connectivity-functional connectivity coupling analysis was found among healthy controls, patients in pre-treatment and in post-treatment, changes in non-zero structural connectivity-functional connectivity coupling at whole brain level before and after treatment were associated with changes in information processing speed positively. What's more, random forest models based on structural connectivity within sub-network-1 could predict changes in working memory, based on functional connectivity within sub-network-3 could predict changes in social cognition in patients after 8 weeks of treatment.

Conclusion Different changing in structural connectivity, functional connectivity, and structural connectivity-functional connectivity coupling, suggesting that brain connectivity may be dissociated by modality. What's more, antipsychotic drugs may influence functional connectivity, but have a weak effect on structural connectivity during 8 weeks of treatment.

首发精神分裂症认知亚型的脑结构和功能磁共振研究

黄宇艳 吴仁容*
中南大学湘雅二医院

目的 精神分裂症的认知功能损害具有高度异质性。 越来越多的证据表明，在这种异质性中存在着可识别的认知亚型,这些亚型内部具有更同质化的认知特征，这为我们理解精神分裂症认知障碍机制提供重要的切入点。本研究旨在探讨首发精神分裂症认知亚型，并揭示不同认知亚型之间的脑结构及自发神经活动的差异。

方法 基于多中心的临床及磁共振数据，我们共筛选了 181 名首发精神分裂症患者和 107 名健康对照。采用 MATRICS 共识认知成套测验评估认知功能，所有受试者均完成结构和静息态功能磁共振成像扫描。采用潜在剖面分析识别认知亚型类别，采用协方差分析比较组间灰质体积（GMV）及低频振幅(ALFF)的差异，把年龄、性别、受教育年限、颅内总体积/头动设为协变量，同时采用偏相关分析探究差异脑区与认知领域的相关性。

结果 潜在剖面分析初步确定了认知损伤程度不同的 2 个类别，分别命名为低认知组和高认知组。 与健康对照相比，两个认知亚组右海马 GMV 均降低。与对照组和高认知组相比，低认知组右侧脑岛和左侧颞上回 GMV 明显降低。此外，与健康对照组相比，两个认知亚组右直回 ALFF 降低，左尾状核 ALFF 增加，而这两个区域的 ALFF 在亚组之间没有差异。与对照组和低认知组相比，高认知组左眶内额上回和左岛盖部额下回 ALFF 降低；与对照组和高认知组相比，低认知组左楔前叶和右角回 ALFF 降低。相关分析显示，在首发精神分裂症中，右侧岛叶、左侧颞上回的 GMV 和左侧岛盖部额下回 ALFF 与多个认知领域（信息处理速度、注意/警觉）相关。

结论 我们在首发精神分裂症不同的认知亚型中观察到不同范围和程度的 GMV 下降以及自发神经活动改变，主要分布在额-颞-边缘系统，其中岛叶、颞上回的 GMV 以及岛盖部额下回 ALFF 与多个认知领域相关。这些发现有助于进一步了解精神分裂症认知功能障碍的病理生理学机制。

3.安徽医科大学精神卫生与心理科学学院

Objective This study starts from the metabolic related indexes and cellular inflammatory factors in patients with chronic schizophrenia to find out that it can be used as an effective screening index of metabolic syndrome.

Methods 320 patients with chronic schizophrenia (course of disease > 5 years) and 165 healthy subjects were selected. The mental symptoms of the patients were measured by positive and negative syndrome scale. Blood samples from patients and healthy controls were collected to detect blood glucose, triglyceride, HDL and fasting insulin. The serum levels of IL-1β, IL-2, IL-6, IL-17, IFN-γ and TNF-α were determined repeatedly by sandwich enzyme-linked immunosorbent assay.

Results The levels of HOMA-IR, plasma inflammatory factors IL-2, IL-6, IL-17 and TNF-α in patient group were higher than those in healthy group. It was found that there were differences in age and related metabolic indexes between patients with chronic schizophrenia with and without metabolic syndrome. In addition, HOMA-IR, plasma cytokines IL-2 and IL-6 still showed differences between groups. In the Spearmen correlation analysis of insulin resistance index, cytokines and metabolic indexes, it was found that there was a significant correlation between HOMA-IR, IL-6 and related metabolic indexes and metabolic syndrome. ROC curve analysis showed that HOMA-IR and IL-6 could be used as screening indexes for MS in male and female patients with schizophrenia.

Conclusion Metabolic syndrome is an important risk factor for cardiovascular disease in patients with chronic schizophrenia. HOMA-IR and IL-6 can be used as effective biological indicators to screen MS in patients with chronic schizophrenia.

Drug-induced Liver Injury Associated with Atypical Generation Antipsychotics From The FDA Adverse Event Reporting System (FAERS)

何丝迪 李传威*
苏州市广济医院

Objective There are few systematic studieson

Drug-induced liver injury (DILI) related to Atypical antipsychotics(AAPs) use. Therefore, this study conducted an exploratory analysis of pharmacovigilance data from a global FAERS database to systematically evaluate the risk of DILI related to AAPs,in order to increase awareness of drug safety and promote further research.

Methods Data were obtained from the FAERS, one of the most comprehensive spontaneous reporting system databases. The FDA publishes FAERS files every quarter. In this study, reports submitted between the first quarter of 2017 and the first quarter of 2022 were extracted. The AAPs we analyzed included:Olanzapine, Paliperidone, Risperidone, Amisulpride, Clozapine, Aripiprazole, Quetiapine and Ziprasidone. Analyses were carried out using the SPSS V.26.0 and STATA 12.0 software. Normally distributed data were presented in the form of mean (SD), and non- normally distributed data were represented by median (Q1, Q3). In this study, a case/non-case approach was used to calculate reporting odds ratio (RORs) and 95% confidence intervals (CIs). The ROR represents the ratio of the odds of an adverse event for a specific drug against the odds of the same adverse event reported for all other drugs, p-value

关键字：AAPs, hepatotoxicity,reporting odds ratio (ROR), FAERS,DILI

基于中医临床复杂证候评价体系解决精神分裂症患者问诊关键问题的实证研究

范思有 宋震* 刘会英 高德江
沈阳市安宁医院

目的 精神分裂症归属于中医神志病范畴，中医辨证施治对精神分裂症具有较好的临床干预效果。但临证时由于精神分裂症患者的特殊性，往往做不到四诊合参，辨证时多缺乏证候诊断关键性问诊信息，导致应用中医药治疗的过程中存在中医精准辨证困难的问题，进而治疗中出现“药不对证”，甚至存在“无辨证用药”的现象，影响了中医临床辨证的准确性。解决精神分裂症患者问诊“难”的问题可以通过运用现代研究技术及方法，建立《精神分裂症中医临床复杂证候评价量表》解决。量表的拟定能够使精神分裂症的中医证候诊断过程中问诊中涉及的关键问题能够量化、客观化、易于临床使用，提高临床辨证准确率。

方法 基于前期拟定的《精神分裂症中医临床复杂证候评价量表》进行内部验证及临床实证研究。选取6名中西医结合临床或中医内科住院医师，通过临床信息调查表（已将患者中医诊断信息隐藏），应用《精神分裂症中医临床复杂证候评价量表》对纳入研究的80例患者进行中医辨证，记录辨证结果，并对辨证的真实性及可靠性进行评价。

结果 研究采用探索性因子分析和验证性因子分析量表中指标体系的结构效度进行统计分析。提取的公因子累计方差贡献率＞70%。提取的公因子可以比较充分的解释变量的信息。探索性因子分析与前期所构建量表指标体系的结构基本一致。临床实证研究结果显示应用《精神分裂症中医临床复杂证候评价量表》对患者的临床辨证的敏感性和特异性均＞70%，曲线下面积 AUC＞90%，说明应用《精神分裂症中医临床复杂证候评价量表》能够对中医辨证起到重要的辅助作用。

结论 解决精神分裂症患者问诊关键问题在于应用主观赋值与客观赋值相结合，宏观辨证与微观辨证相补充的研究思路，借鉴国际量表研制指南，基于病证结合模式，综合运用多种现代研究技术及方法，通过《精神分裂症中医临床复杂证候评价量表》的应用实现精准辨证的目的。本研究通过内部验证及临床实证研究证实《精神分裂症中医临床复杂证候评价量表》能够解决精神分裂症患者问诊缺失而影响精准辨证的难题，值得临床进一步研究与推广应用。

微表情对精神分裂症患者冲动行为预测的研究

邓怀丽* 王斌红
太原市精神病医院

目的 探讨微表情识别与精神分裂症患者冲动行为的相关性，为制订针对性干预对策提供依据。

方法 选取 2022 年 6 月—12 月山西省精神卫生中心确诊的伴有冲动行为的精神分裂症患者 120 例，性别不限，年龄 14～64 岁，排除标准: 心肺、肝胆等严重躯体疾病导致的失眠；严重自杀、自伤意念或行为；精神活性物质所致精神障碍；痴呆等依从性差，无法满足实验要求的患者。入组者自愿参加本研究，签署项目知情同意书，通过伦理委员会审查，对其微表情进行识别测验，通过计算机分析获得攻击性、压力、焦虑、可疑、平衡、自信、活力、自我调节、抑郁、神经质 10 项行为参数，通过振动影像统计程序及利用神经网络的标准方法学习与其同时被测试的修订版外显攻击行为量表（MOAS）和巴瑞特冲动性人格问卷（Baratt 冲动量表）得分做相关性研究，为认识精神分裂症患者冲动行为的病理心理学机制提供新的证据。

结果 微表情识别的综合参数值与 MOAS 和 Baratt 冲动量表检测结果一致，Pearson(皮尔逊)相关系数分别为 R=0.974 和 R=0.977，准确率均高于 97%。

结论 微表情识别对精神分裂症患者的冲动行为的发生可能有重要预测作用,具有较高临床价值。

Adrenocorticotropic Hormone and Suicide Among Patients with Schizophrenia Spectrum Disorders Visiting Emergency Department: A Network Analysis Running Head: Suicidality in Schizophrenia Spectrum Disorders

谢小萌 王一凡 韩天 刘毅 李娟 及晓*
首都医科大学附属北京安定医院

Objective Suicide-related behaviors are significantly associated with premature death in schizophrenia, with serious consequences and social burdens. The prevalence of suicidality and its pathophysiological processes exist among patients with schizophrenia spectrum disorders (SSD) are not well documented. This study examined the network structures of biomarkers on HPA axis, such as Adrenocorticotropic hormone (ACTH) and Corticosterone (Cort), as well as suicidality and symptoms in SSD patients in in psychiatric emergency departments (PED).

Methods SSD patients in PED were assessed with the measurements of suicidality and depressive symptoms, respectively. A network analysis was performed to identify central symptoms and bridge symptoms of this network and their links to ACTH and Cort. Network stability was examined using the case-dropping procedure. The Network Comparison Test (NCT) was conducted to evaluate whether network characteristics differed by gender.

Results A total of 467 SSD patients were recruited. The prevalence of SI was 5.6% (95% CI: 2.8%-8.6%), SA was 5.4% (95% CI: 3.4%-7.5%) among psychiatric outpatients. Network analysis revealed that 'Guilt feelings' had the highest expected centrality, followed by 'Difficulty in abstract thinking' and 'Poor rapport'. The network model showed a high degree of stability. Gender did not significantly influence the network structure. Within the male group, 'Corticosterone' and 'Poor attention' may be the main bridge symptoms between symptoms and the suicidality community. Within the female group, 'Unusual thought content' and 'Conceptual disorganization' may be the main bridge symptoms between symptoms and the suicidality community.

Conclusion The central symptoms and key bridge symptoms identified could be potential targets for interventions of the HPA axis, which is designed for regular screening of a range of suicidal activity, especially for male emergency patients.

关键字：schizophrenia spectrum disorders, suicidality, ACTH, network analysis

早期精神病患者听觉失匹配负波缺陷研究

秦湘琴 侯文鹏 王传跃*
首都医科大学附属北京安定医院

目的 比较频率 MMN 和持续时间 MMN 振幅以及能量、ITPS 等指标在早期精神病中的缺陷、临床认知相关性以及客观诊断价值。

方法 收集 39 例首发精神分裂症（first-episode schizophrenia, FES）和 35 例临床高危（clinical high risk for psychosis, CHR）个体，及其配对的 40 例健康对照（healthy control, HC）人群。使用时域分析和时频分析提取 MMN 相关指标，使用方差分析对各 MMN 指标受损差异进行分析、相关性分析研究各指标间的相关性、Logistic 回归判断各个指标对首发精神分裂症的诊断价值。

结果 1. MMN 时域指标受损结果：频率 MMN 振幅峰值受损只发现于 FES 患者（p=0.035），与 HC（p＜0.05，Cohen's d=0.52）及 CHR（p＜0.05，Cohen's d=0.58）相比均达到中区分效应；持续时间 MMN 振幅峰值在 FES 患者（p＜0.05，Cohen's d=0.50）及 CHR 个体中均受损（p＜0.05，Cohen's d=0.51），均具有中区分效应，但二者间受损无统计学意义。 2. MMN 时频指标受损结果：FES 患者标准刺激 alpha ITPS 显著降低，与 HC 相比具有中区分效应（p＜0.01，Cohen's d=0.75），与 CHR 个体相比也具有中区分效应（p＜0.05，Cohen's d=0.50），CHR 组的差异不具有统计学意义。 3. MMN 指标对 FES 的判别性能：频率 MMN 振幅峰值、标准刺激 alpha ITPS 的曲线下面积（area under curve, AUC）分别是 64%、65%，两个指标联合的 AUC 可达 72%，敏感度及特异度分别为 63%、72%。

结论 MMN 时域指标在 FES 及 CHR 个体中均受损，具有中等效应量，且频率 MMN 与 CHR 个体症状及功能相关。时域指标与时频指标相结合能提高对 FES 患者的判别性能。

关键字：早期精神病 失匹配负波 时域分析 时频分析

首发和复发精神分裂症患者烟酸皮肤潮红反应及其临床相关研究

郑帆帆*
武汉大学人民医院

目的 本研究以烟酸皮肤潮红反应为切入点，研究处于稳定期的首发和复发精神分裂症患者烟酸反应及临床症状、认知功能，旨在探究烟酸反应在精神分裂症不同阶段的特征及其与临床症状、认知功能的相关性。

方法 （1）招募 2020 年 12 月至 2022 年 12 月武汉大学人民医院住院及门诊服用非典型抗精神病药物治疗的稳定期首发精神分裂症患者 35 例，稳定期复发精神分裂症患者 63 例，及与其年龄、性别相匹配的健康对照者 33 例。(2)采用阳性与阴性症状量表（Positive and Negative Syndrome，PANSS）评估患者组临床症状的严重程度，采用中文版简明精神分裂症认知评估测验（Brief Assessment of Cognition in Schizophrenia，BACS）对患者组及健康对照组进行认知功能评估。(3)使用 BrainAid 皮肤烟酸反应测试仪 TY-AraSnap-H100 对被试者进行 6 个烟酸甲酯水溶液（AMN，C7H7NO2，99%，Sigma-Aldrich）浓度（60、20、6.67、2.22、0.74 和 0.25 mM）梯度的前臂烟酸皮肤潮红反应测试，计算烟酸皮肤潮红反应程度及整体烟酸皮肤潮红反应程度值，并比较三组之间的差异，随后分析其与临床症状及认知功能的相关关系。采用 SPSS 21.0 统计软件进行相关数据分析，采用 Origin 2023 软件绘制图片，P＜0.05 认为差异有统计学意义。

结果 对照组、首发组、复发组在性别及年龄等方面无显著差异(P＞0.05)，复发组体质量指数（body mass index，BMI）高于对照组，首发组和复发组受教育年限均低于对照组，差异具有统计学意义（P＜0.05）。与对照组相比，复发组的烟酸皮肤潮红反应在各浓度及时间点下均减弱，首发组的烟酸皮肤潮红反应在不同AMN浓度及时间点下呈现出不同的趋势。

结论 复发精神分裂症患者的烟酸反应普遍低于健康对照组，随精神分裂症的发生发展，烟酸表型开始趋于稳定钝化。首发精神分裂症的烟酸反应个体间差异更大，暗示该亚组患者的疾病进程混杂程度更高。精神分裂症患者的神经认知功能表现普遍显著弱于健康对照组。认知功能受损更严重的精神分裂症患者烟酸反应更差，且可能存在磷脂酶A2信号通路紊乱与烟酸皮肤潮红反应导致的认知功能下降之间的关联。

关键字：精神分裂症；烟酸皮肤潮红反应；临床症状；认知功能

Risk Analysis of QTc Prolongation Induced by Second-generation Antipsychotics in The Real World: A Retrospective Cohort Study Based on Hospital Electronic Medical Records

何路遥 张蕾 李华芳*
上海交通大学医学院附属精神卫生中心，上海市精神心理疾病临床医学研究中心，上海市重性精神病重点实验室

Objective Second-generation antipsychotics (SGAs) may prolong the QTc interval by blocking the hERG channel. To estimate the SGAs' risk of QTc prolongation, we conducted a cohort study by retrospectively reviewing the hospital medical records.

Methods This study was based on a previous study database which leveraged inpatient electronic medical records from Shanghai Mental Center Hospital Hospital Information System (from Feb. 1, 2007 to Oct. 31, 2019.) and integrated the desensitization information of schizophrenia patient. The outcome was QTc prolongation, defined as QTc exceeding 450ms in males and 470ms in females, or increasing by more than 60ms from the baseline QTc regardless of sex. We used the marginal structural Cox model, which constructed a counterfactual framework and a pseudo-population through inverse probability weighting to simulate a comparison between the exposed group and the non-exposed group.

Results The cohort consisted of 5180 patients who met the strict inclusion and exclusion criteria. Among them, 263 patients developed QTc prolongation during the study period. After fully adjusting the confounding, ziprasidone showed an association with QTc prolongation (HR:1.73, 95% CI, 1.04-2.89, adjusted p=0.027). The risk of amisulpride (HR:1.52, 95% CI, 1.02-2.26, adjusted p=0.037) was lower than that of ziprasidone and similar to that of olanzapine (HR:1.40, 95% CI, 1.01-1.95, adjusted p=0.044). No association was found between the other SGAs and QTc prolongation before or after adjusting for the p value, including risperidone, clozapine, perospirone, quetiapine, paliperidone and aripiprazole.In the subgroup analyses, we found olanzapine (HR:2.08, 95% CI, 1.23-3.51, adjusted p=0.002) and ziprasidone (HR:2.89, 95% CI, 1.47-5.67, adjusted p<0.001) were associated with QTc prolongation development in male patients. In addition, after stratifying on age, it was demonstrated that amisulpride (HR:1.91, 95% CI, 1.14-3.20, adjusted p=0.021) had significant risk of QTc prolongation in patients between age 40 to 65. The association between SGAs and QTc prolongation was not revealed in other sex group or age groups.

Conclusion Patients who took ziprasidone, amisulpride or olanzapine had an increased risk of QTc prolongation. The public should be aware of the risks of QTc prolongation caused by olanzapine and avoid making inappropriate drug adjustments after adverse events.

关键字：QTc prolongation, second-generation antipsychotics, hospital electronic medical records

Aberrant Brain Dynamics in Schizophrenia During Working Memory Task: Evidence From A?replication Functional MRI Study

王斐文 刘哲宁 阳洁*
中南大学湘雅二医院

Objective The integration of information that typifies working memory (WM) operation requires a flexible, dynamic functional relationship among brain regions. In schizophrenia, though WM capacity is prominently impaired at higher loads, the mechanistic underpinnings are unclear. As a result, we lack convincing cognitive remediation of load-dependent deficits. We hypothesize that reduced WM capacity arises from a disruption in dynamic functional connectivity when patients face cognitive demands.

Methods We calculate the dynamic voxel-wise degree centrality (DC) across the functional connectome in 142 patients with schizophrenia and 88 healthy controls (HCs) facing different WM loads during an n-back task. We tested associations of the altered dynamic variability in DC and clinical symptoms and identified intermediate connectivity configurations (clustered states) across time during WM operation. These analyses were repeated in another independent dataset of 169 subjects (102 with schizophrenia).

Results Compared with HCs, patients showed an increased DC variability of SMA (supplementary motor area) for the ‘2back vs. 0back’ contrast. This instability at the SMA seen in patients correlated with increased positive symptoms and followed a ‘U-shape’ pattern at rest-condition and two loads. In the clustering analysis, patients showed a decreased DC in the SMA, superior temporal gyrus, and putamen. These results were replicated in the second independent dataset.

Conclusion Schizophrenia is characterized by a load-dependent reduction of stable centrality in SMA; this relates to the severity of positive symptoms. Restoring

SMA stability in the presence of cognitive demands may have a therapeutic effect on positive symptoms in schizophrenia.

关键字：n-back task; cognitive; degree centrality; stability; supplementary motor area.

Oxidative Stress Impairs Cognitive Function by Affecting Hippocampal Fimbria Volume in First-episode Schizophrenia

贾茹飞 宋学勤*
郑州大学第一附属医院

Objective The aim of the present study was to explore influencing factors of cognitive impairments and their interrelationships in drug-na?ve, first-episode schizophrenia (SCZ).

Methods Patients with drug na?ve, first episode SCZ and healthy controls (HCs) were enrolled. Cognitive function was assessed by the MATRICS Consensus Cognitive Battery (MCCB). Serum levels of oxidative stress indices, including folate, superoxide dismutase (SOD), uric acid (UA) and homocysteine (Hcy), were determined after an overnight fast. Hippocampal subfield volumes were measured using FreeSurfer. Mediation models were conducted using the SPSS PROCESS v3.4 macro. A false discovery rate (FDR) correction was applied for multiple comparisons.

Results Sixty-seven patients with SCZ and 65 HCs were enrolled in our study. The patient group had significantly lower serum levels of folate and SOD and higher serum levels of HCY compared with the HCs (all $p < 0.05$). The patient group had a significantly smaller volume of the whole hippocampus than the HC group ($p < 0.05$). We also found significant volume differences between the two groups in the following subfields: CA1, molecular layer, GC-ML-DG and fimbria (all $p < 0.05$, uncorrected). The partial correlation analysis controlling for age and sex showed that the fimbria volume in the patient group was significantly positively associated with NAB scores ($r = 0.382$, $pFDR = 0.024$); serum levels of SOD in the patient group showed a significantly positive correlation with fimbria volume ($r = 0.360$, $pFDR = 0.036$). Mediation analyses controlling for age and sex showed that the serum levels of SOD in patients with SCZ had significant indirect effects on the NAB scores which were mediated by the fimbria volume (indirect effect = 0.0565, 95% CI from the bootstrap test excluding zero (0.0066 to 0.0891)).

Conclusion Oxidative stress, a reduction in hippocampal subfield volumes and cognitive impairments occur in early SCZ. Oxidative stress impairs cognitive function by affecting hippocampal subfield volumes.

关键字：schizophrenia, oxidative stress, hippocampal subfields, cognitive impairments, hippocampal fimbria volume

Across-domain Associative Memory Impairment in Schizophrenia

高天昊[1,2] 王晓良[1] 岑海欣[1] 李璇[1] 翟兆琳[1] 路畅[1,2] 董语可[1,2] 张素贞[1] 卓恺明[1] 项琼[1] 王岩[3] 刘登堂[1,2]
1.上海市精神卫生中心
2.复旦大学附属华山医院
3.华东师范大学

Objective Schizophrenia is a complex mental illness that causes significant societal expenditure worldwide. Those with this illness often have problems with memory, particularly associative memory. However, previous studies on associative memory in individuals with schizophrenia have been inconsistent. Our study focused on how individuals with schizophrenia process audiovisual stimuli and across-domain associative function using nonverbal materials. We hypothesized that associative memory would be impaired in individuals with schizophrenia, particularly in the across-domain condition, and that better performance in across-domain associative memory function would be correlated with lower negative symptoms severity.

Methods The study included 32 patients with schizophrenia and 29 healthy controls, matched for demographics. Patients were diagnosed using the DSM-5 and healthy controls were recruited from the community. Our study utilized non-verbal visual and abstract sound stimuli to avoid verbalization strategies. Three paradigms were used for the associative memory task: auditory-auditory, visual-visual, and auditory-visual pairs. Each paradigm involved a learning and testing phase, with participants rating the degree of correlation and confidence in their responses. Prior to the official task, participants had a chance to practice. The entire task took about 1 hour and was programmed using E-PRIME software.

Results Patients exhibited poorer associative memory performance than healthy controls, particularly in the across-domain tasks. The repeated measures ANOVA revealed reliably impaired associative memory in schizophrenia patients compared to controls across different domains. Further analysis showed that patients were significantly impaired in the Aud-Vis condition, but no effects were detected in the within-domain conditions. Moreover, we found a significant association between higher scores of discriminations and less severe negative symptoms in the Aud-Vis task.

Conclusion Our results showed that schizophrenia patients had a significant decline in associative memory performance, particularly in across-domain functionality. This impairment may be due to selective loss of information encoding and damage to the hippocampus. However, within-domain associative memory function remained relatively intact in patients. The study also found a significant correlation between across-domain associative memory scores and negative symptom scores in schizophrenia patients. The findings suggest that cross-domain associative memory deficits may serve as a promising biomarker for schizophrenia and could facilitate the development of novel cognitive-behavioral treatments. Limitations of the study include a small sample size and the use

of abstract stimuli that may not fully capture real-life associations.

Objective Aripiprazole modulates functional connectivity (FC) between several brain regions in first-episode schizophrenia patients, contributing to improvement in clinical symptoms. However, the effects of aripiprazole on abnormal connections among extensive brain networks in schizophrenia patients remain unclear. We aimed to investigate the effects of 12 weeks of aripiprazole treatment on the FC of large-scale brain networks.

Methods Forty-five first-episode drug-na?ve schizophrenia patients and 45 healthy controls were recruited for this longitudinal study. Resting-state functional magnetic resonance imaging (fMRI) data were collected at baseline and after 12 weeks of aripiprazole treatment. The patients were classified into those in response (SCHr group) and non-response (SCHnr group) according to the improvement of clinical symptoms after 12-weeks treatment. The FC were evaluated for seven large-scale brain networks. In addition, correlation analysis was performed to investigate associations between changes FC of large-scale brain networks and clinical symptoms.

Results Before aripiprazole treatment, schizophrenia patients showed decreased FC of extensive brain networks compared to healthy controls. The 12-week aripiprazole treatment significantly prevented the constantly decreased FC of subcortical network, default mode network and other brain networks in patients with SCHr, in association with the improvement of clinical symptoms.

Conclusion Taken together, these findings have revealed the effects of aripiprazole on FC in large-scale networks in schizophrenia patients, which could provide new insight on interpreting symptom improvement in SCH.

Associations between Thyroid Hormones and Frontal Gray Matter Volume in Male Schizophrenia Patients with A History of Violence

余涛 张许来*
合肥市精神病医院

Objective Schizophrenia (SCZ) is a severe mental disorder characterized by positive symptoms, negative symptoms and cognitive deficits, with its lifetime prevalence being about 1%. It has been reported that patients with SCZ are more likely to commit violent behavior in relation to the general population. Such violence carried out by individuals with SCZ not only results in physical harm to people and economic cost to society, but also increases social stigmatization to them. Hence, it is vital to understand the potential mechanisms of violence associated with SCZ. The gray matter volume (GMV) in frontal lobe has been frequently found to be reduced in schizophrenia (SCZ) patients with a history of violence, but there have been few studies investigating the potential mechanisms of GMV alternations. This study was aimed to explore the associations between thyroid hormones and frontal GMV in SCZ patients with violence.

Methods From December 2021 to March 2022, a total of 57 male inpatients with SCZ were enrolled from the Hefei Fourth People's Hospital and they met the diagnostic criteria of SCZ according to Diagnostic and Statistical Manual of Mental Disorders, 5th edition. 30 SCZ patients with and 27 counterparts without violent behavior were subjected to Triiodothyronine (T3), Thyroxine (T4), thyroid-stimulating hormone (TSH), free Triiodothyronine (fT3) and free Thyroxine (fT4) and underwent structural magnetic resonance imaging (sMRI). sMRI data were processed using FreeSurfer version 5.0. The linear regression analysis was used to investigate the associations between frontal GMV and thyroid hormones in SCZ persons with violence.

Results T3, T4, TSH, fT3, and fT4 levels were within the reference range. The levels of T3, T4, fT3, and fT4 did not differ between groups, but there were significantly differences in age, TSH, and total brain volume between two groups, with VSPs having increased age and TSH levels as well as decreased total brain volume than nVSPs. After controlling for age and total brain volume, we found VSPs had a reduced GMV of frontal pole, compared with nVSPs. In conclusion, SCZ patients with violence exhibited the reduced GMV of frontal pole and elevated levels of TSH, compared with those without violence. In SCZ patients with violence,Linear regression analysis showed the GMV of frontal pole was negatively associated with TSH level.

Conclusion In the present study, our aim was to explore the associations between thyroid hormones and frontal GMV in SCZ patients with violence. Our results indicate that SCZ persons with violence exhibited the decreased GMV of frontal pole and increased levels of TSH, compared with those without violence. Moreover, the GMV of frontal pole was negatively associated with TSH levels. These findings provide valuable insight into the important role of reduced frontal GMV in violence among SCZ patients. Therefore, alternations in thyroid hormones levels in SCZ patients should be emphasized.

Schizophrenia, Bipolar Disorder and Brain Network Connectivity: A Genetically Informed Study

刘蕴佳 任虹燕 王强*
四川大学华西医院

Objective Schizophrenia (SCZ) and bipolar disorder (BD) are severe psychiatric disorders recognized as leading causes of morbidity and mortality in the world. SCZ and BD share clinical characteristics, genetic susceptibility and neural circuit changes. Dysfunction of large-scale intrinsic brain networks has been demonstrated in schizophrenia and bipolar disorder, but it remains unknown whether those network alterations are shared between these two diseases or specific to each one from a genetics viewpoint. To disentangle the genetic overlap between schizophrenia (SCZ) and bipolar disorder (BD), and their relevance with structural connectivity (SC) and functional connectivity (FC) within resting-state networks (RSNs). And then, to identify shared and distinct brian network connectivities between SCZ and BD from a genetics viewpoint.

Methods We used GWAS summary statistics for schizophrenia with European ancestry (N-case=71,554, N-control=243,649), bipolar disorder (N-case=41,917, N-control=371,549) from the Psychiatric Genomics Consortium (PGC). For functional connectivity (FC) and structural connectivity (SC) within seven resting-state networks that previously have been identified (Yeo et al., 2011), we used GWAS summary statistics based on UK Biobank participants(N=24,336). We estimated genome-wide genetic correlations between SCZ, BD and SC/FC. Then we conducted the Omnigenic Mendelian Randomization (OMR) analysis using RSN-FC and RSN-SC as the exposures and SCZ and BD as the outcomes.

Results We identi?ed? two RSN-SC linked to both schizophrenia and bipolar disorder, including frontoparietal network (for SCZ: effect = -0.0393[-0.0465,-0.0321], P = 4.81e-8; for BD: effect = -0.0405[-0.0493,-0.0317], P = 4.41e-6) and limbic network (for SCZ: effect = -0.0666[-0.0854,-0.0478], P = 3.9e-4; for BD: effect = -0.0687[-0.0883,-0.0492], P = 4.43e-4), which all passed Bonferroni? correction for multiple comparisons. Moreover, visual network-FC (effect = -0.146[-0.168,-0.125], P = 5.84e-12)?and default mode network-SC (effect = -0.0865[-0.11,-0.0628], P = 2.61e-4)?are uniquely related to BD. However, we didn't find a unique FC or SC related to SCZ, possibly due to sample and disease heterogeneity.

Conclusion Our study provides genetics insights into the roles of brain network connectivity in the pathophysiology of SCZ and BD. Identified shared and unique brain network connectivity could help better understanding and further facilitate development of diagnosis and novel treatments.

Interaction between Depressive Symptoms and Psychotic Symptoms: A Longitudinal Study of College Students

唐熠果 王强*
四川大学华西医院

Objective Depressive symptoms overlap with psychotic symptoms in a complicated but not fully clear way. Since college students are experiencing their emerging adulthood, a period where depressive and psychotic disorders peak, effective assessments are of vital importance, as they can provide an opportunity to identify and intervene, as early as possible, the individuals at high risk. Based on a cohort of college students, this study aims to investigate the prevalence of depressive and psychotic symptoms, explore relevant risk factors for each symptom, observe the dynamic changes of depressive and psychotic symptoms during an individual's four-year campus life, and explore the potential causal relationship between them.

Methods This study assessed the mental states of all freshmen of Sichuan University through a set of online questionnaires from 2014 to 2018. By following them up every year until 2019, this study established a cohort of 22974 college students with multiple time points. Cross-sectional data were used to investigate the prevalence of depressive and psychotic symptoms at each time point, to seek the differences among different subgroups with correlation and subgroup analysis, and to identify risk factors through lasso regression and logistic regression. For longitudinal data, the cross-lagged panel model and the random intercept cross-lagged panel model were applied to explore the dynamic changes of the two symptoms at the population and within-person levels, respectively.

Results The prevalence of depressive symptoms were 24.0%, 32.6%, 34.3%, and 32.0%, of clinically significant depression (CSD) were 3.8%, 7.9%, 9.4% and 8.5%, of psychotic symptoms were 9.1%, 9.0%, 8.7%, 6.9%, of clinically significant psychosis were 1.0%, 1.1%, 1.2% and 0.7% at the four time points, respectively. The stable risk factors for CSD included somatic symptoms, suicide risk, internet addiction, negative life events, and psychotic symptoms; the stable risk factors for psychotic symptoms included male, childhood trauma, suicide risk, internet addiction, negative life events, and depressive symptoms. Depressive symptoms and psychotic symptoms positively predicted each other, in which the influence of the former was greater at the population level whereas the latter performed better at the within-person level.

Conclusion Depressive and psychotic symptoms among college students required attention, especially for male students and those with childhood trauma, somatic symptoms, suicide risk, internet addiction, and negative life events. During the four years of campus life, depressive and psychotic symptoms demonstrated dynamic changes and interacted with each other. There was a bidirectional causal relationship between the two symptoms, in which psychotic symptoms played the leading role at the within-person level, for their impact exerted on subsequent

depressive symptoms outweighed the influence of depressive symptoms on them.

NPTX2 and Cognitive Dysfunction in Schizophrenia

Jiahui Zhou[1,2], Xiaojing Li[1,2], Xiujuan Wang[1,2], Yongfeng Yang[1,2], Luxian Lv[1,2], Wenqiang Li[1,2]
1.The Second Affiliated Hospital of Xinxiang Medical University, Henan Mental Hospital, Xinxiang, China
2.Henan Key Lab of Biological Psychiatry, Xinxiang Medical University, Xinxiang, China

Objective Synaptic dysfunction and loss are thought to be closely related to the occurrence and development of schizophrenia (SCZ), and may be involved in cognitive dysfunction. Specifically, neuronal pentraxin 2 (NPTX2), which are involved in synaptogenesis, synaptic pruning, and regulation of excitatory signals in parvalbumin interneurons by recruiting post-synaptic receptors into synapses, have emerged as potential biomarkers of glutamatergic synaptic plasticity. Hence, we aimed to explore the molecular mechanism of synaptic pathology of SCZ to discover novel targets for diagnosis and therapy.

Methods We recruited 257 participants, of whom 130 were SCZ patients from psychiatric hospital and 127 healthy control (HC) subjects from communities. Plasma concentrations of NPTX2 were measured in HC and SCZ patients at baseline. Psychopathology was assessed on the Positive and Negative Syndrome Scale (PANSS). The MATRICS Cognitive Consensus Battery was used to evaluate cognitive function.

Results Plasma NPTX2 levels were significantly lower in SCZ patients compared with HC subjects (P=0.017). In addition, plasma NPTX2 levels were significantly positively correlated (r=0.272, P=0.005) with the Category Fluency Test.

Conclusion These findings indicate that NPTX2 may reveal novel aspects of disease etiology and act as a promising target for new drug development.

短链脂肪酸及海马体积与首发精神分裂症的关联研究

李亚军*
郑州大学第一附属医院

目的 观察首发未用药精神分裂症患者血清短链脂肪酸水平和海马亚区体积及其与认知功能的关系，探讨短链脂肪酸在精神分裂症中发挥的可能作用。

方法 选取2020年10月至2021年6月至郑州大学第一附属医院精神科就诊的首发未用药精神分裂症患者51例（患者组）和同期健康志愿者35名（健康对照组），采用气相色谱质谱法检测血清短链脂肪酸水平，采用GE Discovery 750 3.0T采集结构磁共振成像影像数据，采用精神分裂症认知功能成套测验（MCCB）评估认知功能。

结果 （1）患者组血清异丁酸、丙酸水平明显低于健康对照组，血清乙酸、异戊酸和己酸水平显著高于健康对照组，差异均有统计学意义（P<0.05）。（2）患者组右侧半球海马裂体积显著高于健康对照组，患者组右侧半球海马头部体积明显低于健康对照组，差异具有统计学意义（P<0.05）。（3）与健康对照组相比，患者组在认知功能七大领域中的得分下降较为明显（均P<0.05）。（4）相关性分析显示：患者组血清正丁酸水平与右侧半球海马尾部体积成正相关（r=0.371，P=0.012）。血清丙酸水平与认知功能中的视觉学习成负相关（r=-0.348，P=0.028）。患者组左侧半球海马裂体积与SOP T分、RPS T分均正相关（r=0.301、0.310，均P<0.05）；左侧半球海马头部体积与SC T分成正相关（r=0.336，P=0.021）；左侧半球海马体积与SC T分成正相关（r=0.357，P=0.014）；右侧半球海马头部体积与Vis.Lrng T分、SC T分成正相关（r=0.312、0.319，均P<0.05）；右侧半球海马尾部体积与RPS T分成负相关（r=-0.289，P=0.049）。（5）随机森林回归模型分析发现丁酸、异丁酸预测模型RMSE值为18.74±0.30；右侧半球海马头部体积、右侧半球海马尾部体积预测模型的RMSE值为17.98±0.33；丁酸、异丁酸、右侧半球海马头部体积和右侧半球海马尾部体积联合预测模型的RMSE值为17.59±0.58，其可以更好的预测Vis.Lrng水平。

结论 患者组血清丁酸水平与右侧半球海马尾部体积成正相关，并与认知功能部分得分具有一定的相关性，提示丁酸水平改变可能参与了精神分裂症的发生。丁酸和海马亚区体积联合做模型预测认知功能，优于分别单个做模型用于认知功能的预估。

Activation of The JAK-STAT Pathway in Clozapine-induced Metabolic Syndrome: An Intrinsic Intersection between Therapeutic and Metabolic Side Effects

王萍[1,2,3] 张雨龙[1,2,3] 刘寰忠[1,2,3]
1.安徽医科大学附属巢湖医院
2.安徽医科大学精神卫生与心理科学学院
3.安徽省精神医学中心

Objective to determine whether in vivo chronic clozapine administration cause metabolic syndrome in mice, then explore whether peripheral metabolic disorders caused by antipsychotic medications interact synergistically with the central nervous system and discussing possible mechanisms involved.

Methods In order to investigate the metabolic effects of antipsychotics on both the central and peripheral systems, we administered clozapine to mice for a duration of ten weeks to determine whether chronic administration resulted in the development of metabolic syndrome. Transcriptome analysis was employed to identify any changes in the prefrontal lobe, while protein levels were examined to ascertain whether clozapine caused central insulin resistance. Additionally, we observed whether similar changes occurred in the liver in relation to the JAK-STAT pathway.

Results The administration of clozapine over a prolonged period can result in the onset of metabolic syndrome in mice, which is linked to the activation of the JAK-STAT pathway and insulin resistance in the prefrontal cortex. Additionally, clozapine-induced central hyperinsulinism can cause the hepatic IL6-STAT3 pathway to become overactive, leading to chronic disruptions in hepatic glycogen production and gluconeogenesis.

Conclusion In mice, clozapine can cause prefrontal insulin resistance and increased insulin levels which leading to chronic activation of the hepatic JAK-STAT3 pathway, thereby promoting the release of downstream inflammatory factors and promoting the development of metabolic syndrome. STAT3 may be the brain-liver axis linking factor of AAPs on central therapeutic effect and peripheral metabolic disorder.

2.太原市中心医院

Objective There are significant differences in response to antipsychotic drugs in patients with schizophrenia. Several studies have shown that NPY and SATB2 genes are related to the efficacy of antipsychotic drugs. In this study, to explore the correlation between single nucleotide polymorphism (SNP) sites of NPY gene and SATB2 gene and antipsychotics response in Chinese Han population.

Methods The 228 Chinese Han patients with schizophrenia were enrolled in the present study. The polymorphisms of NPY (rs16141, rs16145 and rs5573) and SATB2 gene (rs1900327, rs7557687, rs733156 and rs6745135) in 228 schizophrenia patients were measured using the KASP technique. Patients were treated with single antipsychotic medication for 8 weeks during the study. The Positive and Negative Syndrome Scale (PANSS) scores were used to assess clinical efficacy. A reduction in total PANSS scores ≥50% were classified as good responders, while others were poor responders. We evaluated the association between 2 genes and antipsychotic efficacy by comparing allele and genotype distribution, correlation analysis, linkage imbalance, and five genetic models between the two groups.

Results (1) There was no significant relationship between the three SNPs polymorphisms in the NPY gene and reduction rate in PANSS score at each stage (all $p>0.05$). The distribution of genotype and allele frequencies of locus rs16141 was not statistically difference between good responders and poor responders (genotype: $\chi2=4.088$, $p=0.043$, p-correction=0.129; allele: $\chi2=4.088$, $p=0.027$, p-correction=0.081). The allele distribution of rs5573 was significantly different between groups, yet the difference was disappeared. after correcting ($\chi2=4.136$, $p=0.042$, p-correction=0.126). The distribution frequencies of TA/TG and GG haplotypes constituted by rs16141 and rs5573showed no statistical difference between the two groups ($p>0.05$). In recessive inheritance mode, NPYrs5573 was found to be associated with antipsychotic drug response (G/G vs. A/A +A/G: $p=0.028$, AIC=197.2, BIC=210.9). (2)Four SNP polymorphisms of SATB2 were associated with reduced general psychopathology scores at the 8th week. Rs733156 was associated with negative symptom changes at the 4th week. There was no significant difference in the distribution of alleles and genotypes of the four loci between the two groups ($p>0.05$). The haplotype frequency of rs6745135, rs1900327, rs7557687 and rs733156 showed no statistical difference between the two groups ($p>0.05$). No SNP was found to associate with antipsychotics response under five genetic models ($p>0.05$).

Conclusion This study did not find an association between polymorphisms in the NPY gene and response to antipsychotics. The SATB2 gene polymorphism is probably related to how well antipsychotics treat general psychopathological symptoms. This will need to be verified in larger pharmacogenetic studies in the future.

3.玉溪市第三人民医院

目的 本研究旨在通过生物信息学方法寻找差异N6-腺苷酸甲基化（N6-Methyladenosine，m6A）基因，建立模型评估差异 m6A 基因在精神分裂症（schizophrenia，SCZ）中的诊断特异性，并取 SCZ 患者外周血用 q-PCR 实验验证特征基因表达，以期为 SCZ 的辅助诊断提供可能的生物标记物。

方法 于 NCBI 数据库下载 SCZ 相关基因集，限制测序类型为高通量测序和芯片测序，样本类型为人血样本，筛选目标基因集进行分析：结合基因集中的测序信息，从当前已有文献报道的 m6A 相关基因中选择 21 个 m6A 相关基因，使用 R 4.0.3 版本进行分析。（1）

就差异 m6A 调节因子进行差异分析，绘制箱线图和热图；（2）建立随机森林模型和支持向量模型从差异 m6A 调节因子中筛选疾病特征基因，根据残差大小判断模型的优劣性，结合最优模型筛选出具有诊断特异性的特征 m6A 调节因子；（3）就特征 m6A 调节因子行列线图，判断特征 m6A 调节因子的诊断效力；（4）根据 6 个特征 m6A 调节因子行聚类分析对 SCZ 分类，对不同分类的 SCZ 行免疫细胞相关性分析。并纳入 SCZ 患者 60 例，平均年龄 34±13.05 岁，健康对照 47 例，平均年龄 35.92±11.18 岁。取其晨起空腹肘静脉血 5ml，用 q-PCR 实验验证 SCZ 患者及 HC 对照外周血中差异 m6A 调节因子的表达。

结果 1、差异分析结果显示：m6A 调节因子 RBM15 和 YTHDF3 在 SCZ 患者中高表达，ALKBH5、FTO、RBM15B 和 YTHDF1 则低表达于 SCZ 患者。2、RF 模型为最优模型，根据 RF 特征变量 Mean Decrease Gini 排序如下：YTHDF3 ＞ ALKBH5 ＞FTO＞ YTHDF1＞RBM15B ＞RBM15。3、列线图模型中 6 个特征 m6A 调节因子对 SCZ 诊断的贡献排序如下：FTO ＞ YTHDF3 ＞ ALKBH5 ＞ RBM15B ＞ RBM15 ＞ YTHDF1，且基于 m6A 调节因子分类的 m6A 模式可对 SCZ 的分类。4、m6A 调节因子 RBM15 免疫相关性最为显著。5、人血 q-PCR 验证结果示：FTO、 RBM15 和 YTHDF3 均在 SCZ 患者中低表达。

结论 尽管生信分析结果支持 6 个差异 m6A 调节因子在 SCZ 诊断和分类中的可能，但血液学验证结果仅支持 m6A 调节因子 FTO 作为外周血生物标记物的可能。

中国汉族人群 IDO 基因多态性与精神分裂症的关联研究

刘松 陈兆年 李晓静 崔祥正 张露文 刘青 王秀娟 史晗 李文强 杨勇锋*
河南省精神病院

目的 精神分裂症（Schizophrenia, SZ）是一种病因复杂的慢性精神疾病，病程迁延，致残率高。SZ 的病因之一是神经发育缺陷。造成神经发育缺陷的原因可以分为两类原因：先天性的发育不良以及后天性的损伤。因此，先天调控神经元发育以及后天参与炎症过程损伤神经元的两类基因都有可能是 SZ 的易感基因。吲哚胺 2,3-双加氧酶（indoleamine 2,3-dioxygenase，IDO）是一种氧化还原酶，编码该酶的基因为 IDO 基因，位于 8 号染色体的短臂上。IDO 是色氨酸犬尿氨酸途径代谢的限速酶之一，其广泛参与免疫过程，可能与神经炎症密切相关。IDO 基因被认为是 SZ 的风险基因之一，但是缺乏相关遗传学证据。因此本研究在中国汉族人群中开展一项两阶段病例-对照关联研究，以探讨 IDO 基因的单核苷酸多态性（Single nucleotide polymorphisms, SNPs）与 SZ 的关联。

方法 SZ 病例组和对照组样本来源于河南省地区 SZ 患者和健康正常人，由新乡医学院第二附属医院等医院严格按照入组标准及排除标准收集。研究招募的受试者分别纳入发现阶段和验证阶段。发现阶段纳入 2098 名 SZ 患者和 1690 名健康对照，验证阶段纳入 2458 名 SZ 患者和 6914 名健康对照。采集样本外周血并提取基因组 DNA，使用基因芯片和 ARMS-PCR 等方法对样本 DNA 进行基因分型。使用在线分析工具 SHEsis 对 IDO 基因 SNPs 与 SZ 进行关联性分析。

结果 病例-对照研究发现，IDO 基因的 rs9657182 与 SZ 存在显著关联性（P =0.0026），rs10109853 在女性群体中与 SZ 显著关联（P=0.022）。经过 Bonferroni 校正，rs9657182 与 SZ 的关联性仍然存在（P=0.010），rs10109853 与 SZ 的关联性消失。在总体样本中，IDO 基因中 rs9657182 和 rs7820268 组成的单倍型 CC 和 TC 与 SZ 显著关联（P=0.048 和 0.029）。

结论 本研究在中国汉族人群中开展两阶段的病例-对照研究，发现了 IDO 基因与 SZ 存在显著关联性的证据，其中 rs9657182 是在全性别层面与 SZ 强关联的 SNPs 位点，而 rs10109853 是与女性 SZ 弱关联的 SNP 位点。综上，本研究发现 IDO 基因的多态性能够显著影响 SZ 的患病风险，是 SZ 的易感基因，进一步丰富了 SZ 遗传学机制。

精神分裂症患者情绪语音识别和精神症状之间关联的神经机制

佘生林[2] 龚兵艳[1] 黎秋宏[1] 夏雨[2] 卢晓桦[2] 刘毅[2] 吴华旺[2] 郑英君[2] 吴超[1]
1.北京大学
2.广州医科大学附属脑科医院

目的 精神分裂症患者中，噪声中的语音识别和听觉情绪识别缺陷与精神症状有关。然而，嵌入目标语音中的韵律如何影响精分患者在噪声下的语音识别水平？由情绪韵律造成的语音识别的改变又是否以及如何与精神症状产生关联？目前这些问题尚不清楚。本研究旨在探讨情绪语音识别与精神症状的关系及其可能的神经机制。

方法 54 名精分患者和 59 名健康对照进行了噪声下的情绪语音识别任务（目标伪句以中性、快乐、悲伤、愤怒、恐惧和厌恶的韵律由专业演员读出，患者需要在不同噪声水平下复述听到的目标句），接受了阳性和阴性综合征量表（PANSS）评估和磁共振成像扫描。我们使用偏最小二乘（PLS）回归的多变量分析和中介分析来探索噪声下六种情绪韵律下的语音识别成绩、脑灰质体积和精神症状之间的关联。

结果 负性情绪韵律可以降低患者和对照组在噪声下的语音识别能力、降低语音识别随信噪比变化而变化的程度。精分患者在噪声下的情绪语音识别成绩和语音识别随信噪比的变化率均低于健康对照组。两

组受试者在噪声下的情绪语音识别成绩均与某些声学特征相关。正常对照组中，大脑灰质体积（尤其是各高级联合皮层、脑岛、楔叶和扣带皮层）的一个主成分与愤怒、恐惧和中性情绪条件下的语音识别能力有关；精分患者组中，以上大脑灰质体积的一个主成分和厌恶情绪韵律下的语音识别能力相关。精分患者中，噪声下的情绪（主要是厌恶情绪）语音识别的一个主成分与特定的症状特征的主成分（主要包含消极综合征、运动迟缓、注意力差、概念障碍和洞察力差）相关，而这个关联可以由以上大脑区域的灰质体积的主成分介导（解释了 39.3%的方差）。

结论 精分患者在噪声下的情绪语音识别异常和精神症状有关，这可能和患者处理语音和情绪的各脑区的结构异常有关。这些发现为基于皮层可塑性原理对精分患者进行行为干预、从而改善精分患者的精神症状提供了理论依据：即提高患者在噪声下韵律语音识别能力来改善相应精神症状的一种可能性。

分裂型特质个体心理时间旅行的自我优势效应和个人目标优势效应的行为研究

叶俊延[1,2] 王亚[1,2] 陈楚侨[1,2]
1.中国科学院心理研究所神经心理学与应用认知神经科学实验室
2.中国科学院大学心理学系

目的 分裂型特质个体（high level of schizotypal trait，HST）是与精神分裂症患者有类似症状但尚未达到临床诊断标准的亚临床群体。自我异常是精神分裂症谱系障碍最基本和最核心的病理特征之一，被视为高危人群转化为精神分裂症的重要风险因素。心理时间旅行（mental time travel，MTT）是通过心理模拟将自己投射到过去或未来的能力，包括自传体记忆和未来情景想象。MTT 具有自我优势效应，即自我相关心理时间旅行事件的表现优于他人相关事件；进一步地，还具有个人目标优势效应，即个人目标相关的心理时间旅行事件的表现优于目标无关事件。然而，目前仍不清楚分裂型特质个体在自我优势效应和个人目标优势效应上是否存在异常改变。本研究旨在通过两个行为实验对以上问题进行探讨。

方法 实验一招募了 37 名分裂型特质和 37 名低分裂型特质（Low level of schizotypal traits，LST）个体作为对照组，所有被试完成自我/他人 MTT 行为任务。实验二招募了 37 名分裂型特质个体和 40 名低分裂型特质个体作为对照组，并完成个人目标相关和目标无关事件的 MTT 行为任务。

结果 实验一的结果表明，对照组中自我相关事件比他人相关事件更加具体，而分裂型特质个体生成的自我相关事件与他人相关事件在具体性上没有显著差异，即分裂型特质个体的自我优势效应在具体性上减弱。此外，相较于对照组，分裂型特质个体报告的具体事件更少，伴随着更低的生动性和正性情绪。实验二的结果表明，相较于对照组，分裂型特质个体个人目标相关的 MTT 事件具体性显著降低，但目标无关事件具体性与对照组没有显著差异，即分裂型特质个体个人目标优势在具体性上减弱。此外，与对照组相比，分裂型特质个体生成的具体事件更少，且正性情绪更少。

结论 综上所述，分裂型特质个体在 MTT 中自我优势效应和个人目标优势效应减弱。本研究加深了对分裂型特质心理时间旅行改变机制的理解，并为未来开发心理时间旅行相关的行为干预提供了理论基础。

Quantifying Language Disturbances in Schizophrenia: Novel Metrics and Fine-Tuned Language Models

曹敏讷 邓伟*
杭州市第七人民医院

Objective This research presents two stable language metrics, namely Successful Prediction Rate (SPR) and Disfluency (DF), to objectively quantify the linguistic disturbances associated with schizophrenia. Natural Language Processing offers an objective approach to quantify subtle deviations and idiosyncrasies in speech through recorded readouts. However, accurately detecting and reliably assessing the severity of language disturbances remains challenging. To address this, we propose novel language metrics that capture both off-topic responses and incoherence in patients' speech by modeling speech information and fine-tuning techniques. These metrics exhibit cultural sensitivity while providing a more comprehensive evaluation of linguistic abnormalities in schizophrenia.

Methods In this study, we fine-tuned the ELECTRA Pretrained Language Model on a 750MB text corpus obtained from major Chinese mental health forums. The fine-tuning process involves masking tokens and training the model to predict the original tokens. The effectiveness of the fine-tuned language model is verified on a group comprising 38 individuals diagnosed with schizophrenia and 25 meticulously matched healthy controls. The study explores the association between the fine-tuned language model and the Positive and Negative Syndrome Scale (PANSS) items.

Results The results demonstrate that SPR is higher in healthy controls, indicating better language understanding by the pre-trained language model. Conversely, DF is higher in individuals with schizophrenia, indicating more inconsistent language structure. The relationship between linguistic features and P2 (conceptual disorganization) reveals that patients with positive P2 exhibit lower SPR and higher DF, indicating greater language disturbances. Binary logistic regression using the combined SPR and DF features achieves 84.5% accuracy in classifying P2, exceeding the performance of traditional features by 20.5%.

Moreover, the proposed linguistic features outperform traditional linguistic features in discriminating formal thought disorder, as demonstrated by multivariate linear regression analysis. Furthermore, the linguistic features exhibit significant correlations with PANSS N2 (Emotional Withdrawal), N4 (Passive/Apathetic Social Withdrawal), G1 (Somatic Concern), and total PANSS scores, indicating their potential for assessing a range of symptoms beyond conceptual disorganization.

Conclusion In conclusion, our study reveals that linguistic features derived from the pre-trained language model adeptly capture language abnormalities linked to schizophrenia. The fine-tuned language model showcases its efficacy in comprehending and assessing language impairments in individuals with schizophrenia. These findings contribute to a deeper understanding of language disturbances in schizophrenia and hold promise for advancing the development of more precise assessment and intervention strategies in clinical contexts.

Cortical Anatomical Variations, Gene Expression Profiles, and Clinical Phenotypes in Patients with Schizophrenia

韩勇* 杨勇锋 周之禄 靳雪艳 史晗 邵明龙 宋盟 苏玺 王琪 刘青 李文强 吕路线
新乡医学院第二附属医院 河南省生物精神病学重点实验室

Objective Schizophrenia (SZ) patients display significant structural brain abnormalities; nevertheless, the genetic mechanisms regulating cortical anatomical variations and their correlation with the disease phenotype are still ambiguous.

Methods We characterized anatomical variation using a surface-based method derived from structural magnetic resonance imaging of patients with SZ and age- and sex-matched healthy controls (HCs). Partial least-squares regression was performed across cortex regions between anatomical variation and average transcriptional profiles of SZ risk genes and all qualified genes from the Allen Human Brain Atlas. The morphological features of each brain region were correlated to symptomology variables in patients with SZ using partial correlation analysis.

Results A total of 203 SZ and 201 HCs were included in the final analysis. We observed significant variation of 55 regions of cortical thickness, 23 regions of volume, 7 regions of area, and 55 regions of local gyrification index (LGI) between SZ and HC groups. Expression profiles of 4 SZ risk genes and 96 genes from all qualified genes showed a correlation to anatomical variability, however, after multiple comparisons, the correlations were no longer significant. LGI variability in multiple frontal subregions was associated with specific symptoms of SZ, whereas cognitive function involving attention/vigilance was linked to LGI variability across nine brain regions.

Conclusion Cortical anatomical variation of patients with schizophrenia is associated with gene transcriptome profiles as well as clinical phenotypes.

经颅交流电刺激治疗精神分裂症的疗效研究

张蓉 张晨*
上海市精神卫生中心

目的 探究经颅交流电刺激（transcranial alternating current stimulation, tACS）治疗精神分裂症的潜在机制、刺激参数与靶点、临床疗效及不良反应等，展望未来的研究方向，以期为精神分裂症的神经调控治疗提供参考。

方法 对五个数据库（包括 Web of Science，Embase，Pubmed，Cochrane Central Register of Controlled Trials 和 PsycINFO）进行文献检索，以筛选 tACS 应用于精神分裂症治疗的研究。本综述纳入所有涉及在精神分裂症患者中实验性使用 tACS 治疗，并主要关注症状疗效的研究。

结果 本综述最终纳入 19 篇文献，其中 7 篇为会议摘要。tACS 可以在一定程度上改善精神分裂症患者的阴性症状和认知功能，并且在幻听、妄想以及其他精神病性症状的缓解方面也取得了一定的效果。目前最常用的电流强度是 2mA 和 1mA，最常用的频率是 alpha（10Hz），theta（4.5Hz 和 6Hz）和 gamma（40Hz）。但也有部分研究未发现 tACS 对精神分裂症患者症状的改善作用。此外，tACS 治疗无明显不良反应，患者接受度良好。

结论 总体来说，tACS 作为一种新型有效的治疗方法有望应用于治疗精神分裂症。未来需要更多的大规模、高质量的随机对照试验来验证 tACS 治疗精神分裂症的有效性，并评估其长期安全性。同时，还需要探讨 tACS 与其他治疗手段的联合应用，以提高治疗效果。

The Expression of Immune Related Genes and Potential Regulatory Mechanisms in Schizophrenia

蒋颖 欧萌萌 杜志强 沈远 朱浩浩*
无锡市精神卫生中心

Objective This study aimed to investigate the role of immune dysfunction in the pathogenesis of schizophrenia through single-cell transcriptome and bulk RNA data analyses.

Methods The single-cell RNA sequencing

(scRNA-seq) was selected to assess the cellular composition and gene expression profiles of the brain tissue. Further, bulk RNA sequencing data was utilized to corroborate findings from the single-cell analyses and provide additional insights into the molecular changes associated with the disease. Gene-drug interaction data was also included to identify potential therapeutic drugs targeting these dysregulated immune-related genes in schizophrenia.

Results We discovered significant differences in cellular composition within schizophrenia tissue, including increased infiltration of fibroblasts, horizontal basal cells, monocytes, mesenchymal cells, and smooth muscle cells. The investigation of immune-related genes revealed significantly different expression of genes such as S100A2, CCL14, IGHA1, BPIFA1, GDF15, IL32, BPIFB2, HLA-DRA, S100A8, PTX3, TPM2, TNFRSF12A, GREM1 and others. These genes possibly contribute to the progression of schizophrenia through various pathways such as humoral immune response, IL-17 signaling pathway, adaptive immune response, antigen processing and presentation, and gut IgA production. Our findings also suggest possible transcriptional regulation in schizophrenia's immune dysfunction by transcription factors in monocytes, neutrophils, endothelial cells, and epithelial cells. Lastly, potential therapeutic drugs were identified through gene-drug interaction data, such as those targeting HLA-A and HLA-B.

Conclusion The cellular heterogeneity and immune-related gene dysregulation play important roles in schizophrenia, which provides a foundation for understanding the pathogenesis and developing new treatment methods.

Objective Convergent evidence has suggested that a significant effect of antipsychotic exposure on brain structure and function in patients with schizophrenia (SZ), yet the characteristics of favourable treatment outcome remain largely unclear. In this work, we primarily through how grey matter (GM) and white matter (WM) density as also as functional connectivity (FC) were modulated by antipsychotic treatment, aiming to explore the probable efficacy predictor of SZ by the longitudinal changes.

Methods We take advantage of a dataset including 163 SZ patients and 131 healthy controls (HCs), 77 of SZ from them to have structure magnetic resonance imaging (sMRI) scans at baseline and 8 weeks of treatment with the second-generation antipsychotics to assess GM and WM density. Meanwhile, 88 SZ patients with resting-state functional MRI (rs-fMRI) information also before and after treatment, along with baseline scanning of 81 HCs for comparison purposes for the sake of calculating FC to evaluate the brain connectivity. The Positive and Negative Syndrome Scale (PANSS) and MATRICS Consensus Cognitive Battery (MCCB) were applied to measure psychiatric symptoms and cognitive impairment in SZ patients.

Results After antipsychotic treatment for 8 weeks, compared with the SZ non-response group (the reduction rate of PANSS＜50%), the GM density of the response group (the reduction rate of PANSS ≥50%) in right Cingulate gyrus (CG) decreased. At the same way, it was reduced in right Superior frontal gyrus (SFG) and five other regions of the WM density in the response group. On the other hand, the FC between the right inferior temporal gyrus (ITG) and the right medial superior frontal gyrus (SFGmed) increased in the response group of SZ.

Conclusion These results suggest that the efficacy of antipsychotics in SZ is related to FC and WM density in right SFG. Moreover, the findings tied to the brain change of SFG of SZ could be used as potential indicators in predicting the treatment outcome of antipsychotics.

3.上海交通大学附属精神卫生中心

目的 评价间歇性 θ 脉冲式经颅磁刺激（intermitted Theta Burst Stimulation，iTBS）干预左侧或双侧前额叶背外侧（dorsalateral prefrontal cortex，DLPFC）对精神分裂症认知功能的影响

方法 纳入 2020 年 1 月至 2022 年 1 月上海市徐汇区精神卫生中心 18-60 岁，符合 DSM-5 精神分裂症诊断标准的患者 90 例。按随机数字表法分为双侧 DLPFC 真刺激组（A 组，30 例），左侧 DLPFC 真刺激

/右侧 DLPFC 伪刺激组（B 组，30 例），或双侧 DLPFC 伪刺激组（C 组，30 例）。三组均在药物治疗方案不变的基础上使用 iTBS 干预，干预时间为 4 周（1 次/日，5 次/周，周末休息），共治疗 20 次。在基线及治疗第 4 周末，采用 MATRICS 认知成套测验（MATRICS Consensus Cognitive Battery, MCCB）评定患者认知功能。

结果 三组基线 MCCB 总分和 7 个认知维度分差异均无统计学意义（p>0.05）。治疗第 4 周末，三组均可以提高患者的 MCCB 总分及词语学习，双侧 DLPFC 真刺激组（A 组）可以改善患者的信息处理速度、视觉学习和推理和问题解决；伪刺激组（C 组）可以改善患者的视觉学习。三组干预对 MCCB 总分和 7 个认知维度评分变化差异均无统计学意义（p>0.05）。

结论 iTBS 干预左侧或双侧前额叶背外侧并不能改善精神分裂症的认知缺陷症状。

早发型精神分裂症的血浆代谢组学分析

李玉雪 陈姿 杜鑫哲 高耀 曹晓华 * 刘莎*
山西医科大学第一医院精神卫生科

目的 早发型精神分裂症(Early Onset Schizophrenia, EOS)是指起病年龄小于 18 岁的精神分裂症（Schizophrenia，SCZ）。目前临床诊断方式与精神分裂症的类似，主要依赖于对患者临床症状的主观识别，缺乏客观的生物学诊断指标，常出现漏诊或误诊的现象，早期诊断对后续的治疗及预后极为重要。采用代谢组学方法筛选出的代谢产物是机体内多种因素相互作用的最终产物, 代谢组学指标有助于深入认识 SCZ 的发生、发展、治疗和预后。本研究旨在利用靶向代谢组学鉴定 EOS 患者与健康人群的血浆中差异代谢物，以期为 EOS 早期诊断提供科学依据。

方法 本研究共招募 28 例 EOS 患者作为病例组，以及 23 例年龄、性别及受教育程度相当的健康志愿者作为对照组。分别收集其临床资料、外周血液样本，使用阳性与阴性症状量表（positive and negative syndrome scale, PANSS）评定症状严重程度。采用超高效液相色谱-高分辨质谱联用（ultra-high performance liquid chromatography-high resolution mass spectrometry, UPLC-MS）技术对研究对象的血浆进行全面代谢组学分析，运用非参数检验联合 OPLS-DA 模式识别方法筛选差异代谢物，并进行了富集分析和 KEGG pathway 富集分析，探索 EOS 患者紊乱的代谢通路。

结果 基于广泛靶向代谢组技术的代谢分析，共检测到 834 个代谢物。与健康对照组相比，EOS 患者血浆中差异代谢物数目为 60 个。在对所检测到的代谢物进行定性和定量分析后，挑选出差异倍数前 5 的代谢物，EOS 患者表现为血浆中 异亮氨酸-缬氨酸、水杨酸 β-D-O-葡萄糖醛酸、肉碱含量显著下降，六甘醇、三缩四乙二醇含量显著升高。通过对所有差异代谢物进行通路分析,主要涉及氨基酸代谢、脂质代谢、醇、胺类代谢异常。

结论 本研究发现 EOS 患者存在代谢紊乱，包括血浆中异亮氨酸-缬氨酸、水杨酸 β-D-O-葡萄糖醛酸、肉碱含量显著下降，六甘醇、三缩四乙二醇含量显著升高等。具体涉及氨基酸代谢、脂质代谢、醇、胺类代谢通路的异常。上述研究结果提示，精神分裂症的致病机制可能与氨基酸代谢、脂质代谢、醇、胺类代谢异常有关。

2.中国科学院大学昆明生命科学学院
3.临沧市精神病院
4.东南大学

Objective Schizophrenia (SCZ) is a prevalent and serious mental disorder, and the exact pathophysiology of this condition is not fully understood. In previous studies, it has been proven that ferroprotein levels are high in SCZ. It has also been shown that this inflammatory response may modify fibromodulin. Accumulating evidence indicates a strong link between metabolism and ferroptosis. Therefore, the present study aims to identify ferroptosis-linked hub genes to further investigate the role that ferroptosis plays in the development of SCZ.

Methods From the GEO database, four microarray data sets on SCZ (GSE53987, GSE38481, GSE18312, and GSE38484) and ferroptosis-linked genes were extracted. Using the prefrontal cortex expression matrix of SCZ patients and healthy individuals as the control group from GSE53987, weighted gene co-expression network analysis (WGCNA) was performed to discover SCZ-linked module genes. From the feed, genes associated with ferroptosis were retrieved. The intersection of the module and ferroptosis-linked genes was done to obtain the hub genes. Then, Gene Ontology (GO), Kyoto Encyclopedia of Genes and Genomes (KEGG) pathway enrichment analyses, and Gene Set Enrichment Analysis (GSEA) were conducted. The SCZ diagnostic model was established using logistic regression, and the GSE38481, GSE18312, and GSE38484 data sets were used to validate the model. Finally, hub genes linked to immune infiltration were examined.

Results A total of 13 SCZ module genes and 7 hub genes linked to ferroptosis were obtained: DECR1, GJA1, EFN2L2, PSAT1, SCL7A11, SOX2, and YAP1. The GO/KEGG/GSEA study indicated that these hub genes were predominantly enriched in mitochondria and lipid metabolism, oxidative stress, immunological inflammation, ferroptosis, Hippo signaling pathway, AMP-activated protein kinase pathway, and other associated biological

processes. The diagnostic model created using these hub genes was further confirmed using the data sets of three blood samples from patients with SCZ. The immune infiltration data showed that immune cell dysfunction enhanced ferroptosis and triggered SCZ.

Conclusion this study, seven critical genes that are strongly associated with ferroptosis in patients with SCZ were discovered, a valid clinical diagnostic model was built, and a novel therapeutic target for the treatment of SCZ was identified by the investigation of immune infiltration.

孕期母体免疫激活致子代突触损伤与 Eph-Ephrin 信号通路 紊乱的相关研究

邵祎倩[1,2] 蔡雅奇[1,2] 吕路线[1,2] 李文强[1,2]
1.河南省精神病院
2.河南省生物精神病学重点实验室

目的 运用孕早期注射聚肌胞苷酸（Poly I:C）构建母体免疫激活致子代精神分裂症大鼠模型，观察该模型在疾病发生发展过程中不同发育阶段突触损伤和 Eph-Ephrin 通路及其下游靶向分子表达及紊乱情况。

方法 1．选取孕 9.5 天 SD 大鼠尾静脉注射 10mg/kg Poly I:C (n=10)和等体积的 0.9%无菌生理盐水(n=10)。模型组和对照组子代在 21 日龄时离乳分笼，选取雄鼠作为研究对象，分别在青春期及成年期两个发育节点，对两组仔鼠进行旷场、高架十字迷宫、Y 迷宫、被动规避、前脉冲抑制等行为学检测。2．采用高尔基染色方法观察青春期和成年期两组大鼠海马锥体神经元树突棘的发育情况。3．采用蛋白质免疫印迹（Western Blot, WB）技术检测两组大鼠海马脑区中 Eph 信号通路及其下游靶向分子（p-LIMK1/LIMK1、p-Cofilin/Cofilin）的表达。4．用均数±标准差来表示计量资料。对两个时期的开放旷场、Y 迷宫、高架十字迷宫实验、高尔基染色结果和蛋白质结果实行双因素方差分析，对于 PPI 结果进行重复测量的双因素方差分析；使用 GraphPad Prism 9.0 软件进行统计学分析及绘图，检验结果 P<0.05 可认为有统计学差异。

结果 1．行为学检测结果显示：青春期模型大鼠表现出明显的自发活动增多，焦虑抑郁样情绪明显降低；成年期模型组大鼠出现自发活动降低，焦虑抑郁样情绪适度增加，认知功能减退，前脉冲抑制缺陷等行为表型（P 均<0.05）。2．高尔基染色结果显示：青春期和成年期模型组大鼠较对照组大鼠海马锥体神经元树突棘的密度降低（P 均<0.05）。3．模型组大鼠 EphB1-3 及 EphB2 蛋白在海马脑区的表达，自青春期已出现明显升高，这种变化持续到成年期（P 均<0.05）。4．EphB 信号通路下游分子，p-LIMK1/LIMK1，p-Cofilin/Cofilin 水平在青春期及成年期的海马脑区均表现出明显下降（P 均<0.05）。

结论 孕早期母体免疫激活子代在不同发育时期表现出突触结构损伤和 Eph 相关基因表达异常，Eph 通路介导的突触发育障碍可能是引起精神分裂症样行为及认知功能障碍发生的重要病理基础。

母体免疫激活子代大鼠 MAPK 通路相关研究

史佩灵 李珍 杨勇锋 苏玺 吕路线 李文强*
河南省精神病院

目的 研究母体免疫激活大鼠模型发育早期 MAP3K5 及其下游通路的异常表达；分析孕期感染子代精神分裂症大鼠 MAPK 通路紊乱与神经元功能的关系。

方法 1.在 SD 大鼠孕 9 天尾静脉注射 10 mg/kg 的 Poly I:C（n=9）或等体积生理盐水（n=9），3 小时后尾静脉采血做孕鼠血浆的炎症因子水平；挑选出生后的雄性后代，随机分为 Poly I:C 组和 Saline 组，在子代大鼠出生 60 天（postnatal day 60, P60）进行行为学检测，两种方法评估模型质量。。 2.分别在子代 P1、P7、P14 这三个离乳期时间节点进行免疫印迹分析，检测子代大鼠海马 MAP3K5、下游通路 JNK 和 p38 通路的磷酸化水平。 3.采用免疫荧光技术检测大鼠 MAP3K5 在海马的分布情况以及是否在神经元中表达。4.采用尼氏染色观察额叶尼氏小体含量及神经元形态。

结果 1.孕鼠血浆结果：Poly I:C 组 IL-6（P<0.01）、IL-1β（P<0.01）和 TNF-α（P<0.01）炎症因子水平均显著高。 2.行为学结果：开放旷场实验中 Poly I:C 组代大鼠运动总距离无显著统计学差异，中心区域活动距离明显减少（t=5.905，P<0.01）；在高架十字迷宫中 Poly I:C 组入开放臂的时间显著减少（t=1.122，P<0.01），进入开放臂的次数无显著统计学差异；在 Y 迷宫实验中 Poly I:C 组进入新异臂的时间显著减少（t=0.632，P<0.01）；在 PPI 实验中 Poly I:C 组在 75dB（t=3.033，P<0.01）、80dB（t=3.894，P<0.05）及 85dB（t=4.429，P<0.01）抑制率均显著降低。 3.免疫印迹实验结果显示：Poly I:C 组在 P1 海马 p-ASK1/t-ASK1 蛋白水平增加，下游通路 JNK、p38 表达显著被抑制；Poly I:C 组在 P7 海马区 p-p38 和 p-JNK 均显著降低；Poly I:C 组在 P14 海马区 p-JNK 明显降低。 4.免疫荧光结果：与对照组相比，ASK1 荧光密度在 P7 天海马区明显增加，在 P14 天海马中显著降低。 5.尼氏染色结果显示：与对照组相比，神经元胞体肿胀，数目没有明显改变。

结论 1.母体免疫激活子代大鼠在神经发育早期中枢神经系统 MAPK 通路相关蛋白表达异常。2.MAPK 通路的紊乱可能是影响神经系统发育的重要因素。

Diagnosis Biomarkers and Individualized Treatment of Schizophrenia Based on Multidimensional Data: Study Protocol for A Real-World Clinical Trial

Ying Yang Yongfeng Yang Yong Han Yi Chen Qing Liu Wenqiang Li* Luxian Lv*
Department of Psychiatry, Henan Mental Hospital, The Second Affiliated Hospital of Xinxiang Medical University, Xinxiang 453002, China

Objective We aimed to establish a standardized, two-stage, independent, large-sample clinical cohort, obtain a multi-dimensional large data set, explore the diagnostic and predictive models of objective biomarkers for schizophrenia, and explore the relevant biomarker mechanisms for the diagnosis and treatment of schizophrenia.

Methods In this study, 900 Chinese Han descendants aged 18 to 55 years who met the DSM-5 diagnostic criteria for schizophrenia and 2000 healthy volunteers were recruited to establish a multi-center standardized, two-stage independent large-sample clinical cohort, including 600 discovery samples in phase I and 300 validation samples in phase II. Using the real-world research strategy, the general data collection, clinical biochemical test, clinical symptom assessment, neuropsychological assessment, social psychological assessment, antipsychotic treatment effect assessment of patients with schizophrenia were conducted. Data on psychopathology, molecular genetics, neurobiochemistry, brain imaging, neuroelectrophysiology, and clinical treatment effects were collected at multiple time points (V1- treatment initiation, V2-day 28, V3-day 56, V4-3 months). A schizophrenia biobank and clinical information database were established to screen and establish multi-dimensional candidate biomarkers that may have diagnostic and therapeutic efficacy prediction value.

Results To establish a standardized, two-stage, independent, large-sample clinical cohort, and to construct an objective diagnosis and prediction model for schizophrenia, and to analyze the neurobiological mechanisms of diagnostic indicators, efficacy prediction, and treatment-related mechanisms.

Conclusion This study aims to establish a schizophrenia biobank and clinical information database by analyzing the collected and integrated information of schizophrenia patients, and to construct a biomarker system for SCH objective diagnosis and treatment prediction, and to explore the relevant mechanisms of biomarkers in the diagnosis and treatment of schizophrenia.

4.浙江大学生物医学工程系，生物医学工程与仪器科学学院，310000，浙江杭州
5.首都医科大学附属北京友谊医院放射科，100050，北京

目的 本研究基于磁共振(Magnetic Resonance Imaging, MRI)化学交换饱和转移(Chemical Exchange Saturation Transfer，CEST)谷氨酸成像探索精神分裂症（Schizophrenia, SCZ)神经生化物质特点，为 SCZ 的病理机制研究提供依据。CEST 是一种新的磁共振（Magnetic Resonance Imaging, MRI）方法，通过施加特定频率的饱和脉冲，对可交换的质子或分子进行预饱和，然后通过氢质子交换这种饱和传递给自由水引起水信号的下降，这种成像技术方法显示了更高的灵敏度。其中用于检测 Glu 中的胺基质子与自由水之间化学交换的CEST技术，称之为谷氨酸CEST(Glutamate chemical exchange saturation transfer，GluCEST)，GluCEST 可以定量分析大脑区域谷氨酸含量。

方法 应用磁共振化学交换饱和转移技术检测满足入组的 21 例 SCZ 患者及 16 例健康对照（Healthy Control，HC）的大脑不同区域谷氨酸的水平，分析 SCZ 和 HC 对照组 GluCEST 水平，分割、计算大脑区域海马、杏仁核、丘脑、尾状核、胼胝体、皮层下、额叶、顶叶、枕叶和颞叶谷氨酸水平。获得的 CEST 图像利用非对称分析方程式计算得出 GluCEST 量化参数图，定量分析谷氨酸含量。并对谷氨酸水平有差异的脑区分别与临床阳性和阴性症状评定量表（Positive and Negative Syndrome Scale，PANSS）评分进行相关性分析。

结果 本研究基于 GluCEST 成像，通过测量 SCZ 和 HC 大脑中的谷氨酸水平来研究 SCZ 谷氨酸神经递质的异常。结果显示，与 HC 相比，SCZ 组额叶和海马脑区存在谷氨酸水平的明显差异，表现为 SCZ 组额叶谷氨酸水平明显升高（$P<0.05$），而在海马谷氨酸水平明显降低（$P<0.05$）。SCZ 组额叶、海马的谷氨酸水平与 PANSS 评分无相关性（$p>0.05$）。

结论 SCZ GluCEST 成像发现谷氨酸神经递质功能异常，为 SCZ 的病理机制提供依据。

精神分裂症易感基因 NKAPL 与炎症激活相关研究

方妮 陈腾飞 李文强*
河南省精神病院

目的 1.通过以 BABL/C 小鼠为模型，了解 NKAPL 基因时空表达模式，为进一步研究提供基础。2.通过细胞及 BABL/C 小鼠炎症模型，了解炎症相关基因 NKAPL、NF-κB 和炎症因子表达变化，来探究精神分裂症易感基因 NKAPL 与神经发育及炎症的相关性。 3.通过 Poly I:C 孕期子代精神分裂症模型，研究 NKAPL 变化情况，为精神分裂症的发病机制提供相关依据。

方法 1.BABL/C 小鼠为实验动物，在不同时空点进行取材。将取得材料提取总 RNA 进行逆转录成 cDNA，利用 qRT-PCR 技术比较 NKAPL 基因的表达水平。同时取得材料提取总蛋白，利用免疫印迹比较 NKAPL 蛋白的表达水平。 2.炎症模型：LPS 刺激 BV2 细胞 12h 后收集培养基上清及细胞，另外将 LPS 通过腹腔注射刺激 BALB/C 小鼠，连续注射 7 天，并取相应的组织器官及血浆，利用 ELISA 试剂盒检测细胞因子及免疫印迹检测正常组和 LPS 组相关蛋白及 NKAPL 的表达情况。 3.选取孕 9 天 BABL/C 小鼠尾静脉注射 10mg/kg Poly I:C (n=10)和等体积的 0.9%无菌生理盐水 (n=10)。模型组子代和对照组子代在 21 日龄时离乳分笼，只选取雄鼠作为研究对象，在成年期进行取材，并通过分子技术进行相关基因表达检测。

结果 1.PND21 随着时间增长而增加，并且在 PND21-PND65 时趋于稳定，同时 mRNA 水平和蛋白水平表达趋势一致。 2.检测发现 LPS 刺激 BV2 细胞及 BABL/C 小鼠其炎症水平高于正常组，并且我们通过 qRT-PCR、分析 NKAPL 及炎症因子表达水平高于正常组。同时免疫荧光显示在海马区 LPS 组星形胶质细胞、小胶质细胞数目明显高于 PBS 组；小脑 LPS 组星形胶质细胞、NKAPL 阳性细胞数目明显高于 PBS 组。3.检测发现 Poly I:C 孕期感染子代模型中，成年期模型组相对于对照组部分脑区 NKAPL 表达下降，同时 PSD95 表达水平降低。

结论 1.NKAPL 基因在 PND21 表达几乎稳定，在发育早期随着发育需要而表达量逐渐增加，揭示可能与发育相关。 2.细胞及动物炎症模型中，NKAPL 基因表达水平增加，揭示 NKAPL 涉及炎症相关通路。3.Poly I:C 孕期感染子代模型中，模型组相对于对照组 NKAPL 表达下降，神经发育异常，揭示 NKAPL 可能与精神分裂症模型神经发育异常相关。

奥尔夫音乐治疗合并非洲鼓即兴演奏对精神分裂症患者的阴性症状及社交能力的影响

谢平* 赵越*
宁夏回族自治区宁安医院

目的 探讨奥尔夫音乐治疗合并非洲鼓即兴演奏对精神分裂症患者的阴性症状及社交能力的影响。

方法 选择 2019 年 5 月至 2020 年 5 月，在我院康复科参加康复活动的精神分裂症患者 100 例，均符合国际疾病分类（ICD）-10 的诊断标准，按临床医嘱分类，分为研究组和对照组各 50 例，两组患者均接受常规康复治疗，研究组在此基础参加奥尔夫音乐治疗及非洲鼓即兴演奏。 两组患者在康复科均进行常规的工娱疗康复，研究组在原有治疗的基础上给予奥尔夫音乐治疗及非洲鼓即兴演奏 8 周。 其中，研究组脱落 5 人，对照组脱落 3 人。脱落标准：①2 组患者在治疗的 5 周内，因病情复发不能正常参加治疗的允许脱落；②两组患者治疗期间有出院的允许脱落； ③研究组患者参加治疗次数低于 16 次的允许脱落。最后人数：研究组;45 名，对照组 47 名。2 组患者均给予常规工娱疗，研究组接受 8 周的奥尔夫音乐治疗合并非洲鼓即兴演奏治疗,治疗前后采用阳性与阴性症状评定量表(PANSS)、住院精神病人康复疗效评定量表（IPROS）、社会功能评定量表(SSPI)进行评定。

结果 治疗前两组各量表总分和各因子分差异无统计学意义。经奥尔夫音乐治疗合并非洲鼓即兴演奏 8 周后,研究组患者的 IPROS 得分较治疗前有所提高,差异有统计学意义(P<0.05),PANSS 量表总分和各因子分均较治疗前减少,(P<0.05)差异有统计学意义,SSPI 量表评分减少,差异有统计学意义(P<0.05)。

结论 奥尔夫音乐治疗合并非洲鼓即兴演奏能改善精神分裂症患者的阴性症状，提高社交能力，促进社会功能的恢复。

2.河南省生物精神病学重点实验室
3.河南省精神神经医学国际联合实验室
4.精神心理疾病防治河南省协同创新中心

目的 探讨精神分裂症纹状体功能与临床症状及认知功能相关性。

方法 收集 92 例精神分裂症患者，分别在基线和抗精神病药物治疗 8 周后进行静息态功能磁共振成像扫描。采用阳性与阴性症状量表和认知功能成套测验评估精神分裂症患者基线期及治疗 8 周后的临床症状及认知功能。根据阳性与阴性症状量表减分率，将患者通过二分法和四分法进行分组，分别比较各亚组治疗前后指标变化，探究精神分裂症患者治疗前后纹状体功能异常与临床症状及认知功能的相关性。

结果 与基线期相比，治疗 8 周后无论二分法的有效组/无效组，还是四分法的临床痊愈组/显效组/有效组/无效组纹状体功能异常评分均无显著性差异。在纹状体功能与认知功能相关性研究中发现：基线期有效组与无效组畴流畅测试评分呈现显著性差异（p

=0.011），且有效组在该时期纹状体功能异常评分与范围流畅测验得分呈正相关（R=0.343；p=0.033）；治疗8 周后有效组与无效组空间广度评分存在显著性差异（p =0.034），且无效组在该时期空间广度测验评分与纹状体功能异常评分差值呈正相关。

结论 精神分裂症纹状体功能可能并不受抗精神病治疗影响，但与患者的症状和认知功能存在关联。

南京脑科医院

目的 基于生态系统理论探讨慢性精神分裂症患者精神残疾的影响因素及其作用路径。

方法 本研究为横断面研究，采用便利抽样法，于2021 年 3 月至 2022 年 9 月在南京脑科医院就诊的 207 名慢性精神分裂症患者为研究对象，应用一般资料调查表、世界卫生组织残疾评定量表(WHO－DASII)、社会支持评定量表(SSRS)、中文版家庭坚韧性量表（FH）、心理弹性量表（CD-RISC）、匹兹堡睡眠质量问卷（PSQI）对其进行调查。采用多元线性回归分析慢性精神分裂症患者精神残疾的影响因素。采用 AMOS 软件，以精神残疾为因变量，家庭韧性、心理弹性为中介变量，社会支持为自变量建立结构方程模型并进行中介效应验证，共回收有效问卷 188 份，有效回收率为 90.8%。

结果 慢性精神分裂症患者 WHO－DASII得分（72.91±14.04）；SSRS 得分=（31.72±7.94）；FH 得分（56.84±7.11）；CD-RISC 得分（54.19±13.74）分，PSQI 得分（8.51±4.17）；WHO－DASII得分与 SSRS 得分呈负相关（r=-0.41，P＜0.01），WHO－DASII得分与 FH 得分呈负相关（r=-0.456，P＜0.01），WHO－DASII得分与 CD-RISC 得分呈负相关（r=-0.531，P＜0.01），WHO－DASII得分与 PSQI 得分呈正相关（r=0.351，P＜0.01）；多元线性回归分析显示：心理弹性、社会支持、家庭韧性、睡眠质量、文化程度是精神残疾的影响因素（P＜0.05）。中介效应分析显示，社会支持可通过家庭韧性、心理弹性路径负向预测精神残疾（β=-0.107，P＜0.001），采用 Bootstrap 抽样法进行检验，抽样 5000 次，结果显示，95％置信区间均未包括 0，说明社会支持、家庭韧性、心理弹性、精神残疾路径存在链式中介作用。中介效应占总效应的 21.4％。

结论 慢性精神分裂症患者精神残疾整体处于四级残疾水平，社会支持通过正向影响家庭韧性，家庭韧性正向影响心理弹性，心理弹性负向影响精神残疾，从而间接负向影响精神残疾。护士可以从生态系统理论视角，采取针对性的措施提高患者社会支持、家庭韧性、心理弹性水平及睡眠质量，降低慢性精神分裂症患者残疾水平。

精神分裂症易感基因 RELN 及其信号通路与母体感染介导的子代神经发育障碍相关研究

孟华丹[1] 陈梦雪[2] 吕路线[1] 李文强[1]
1.新乡医学院第二附属医院，河南省精神病医院
2.北京大学第六医院

目的 孕期母体免疫激活（MIA）会增加后代患精神分裂症和自闭症等疾病的风险。Reelin 是一种细胞外基质蛋白，在发育过程中介导神经元的正确定位、皮质板层形成及调节突触的功能和可塑性。通过构建 MIA 模型，研究子代重要发育阶段 RELN 及其下游信号通路分子表达变化、突触发育特点和行为学变化，探索 RELN 及其信号通路是否参与了母体感染介导的子代神经发育障碍。

方法 1．在 SD 大鼠孕 9 天时尾静脉注射聚肌胞苷酸（Poly I: C）（模型组）或等体积生理盐水（对照组），注射 3h 后，检测孕鼠血浆炎症因子水平，制备 MIA 模型。在子鼠成年期，利用开放旷场、Y 迷宫、高架、前脉冲抑制等行为学评价焦虑、空间记忆和感觉门控功能。2. 利用高尔基染色检测树突棘的数量和形态。 3．利用免疫印迹、免疫荧光、q-PCR 等方法检测子鼠各发育阶段海马和额叶中 Reelin 及下游信号通路分子表达变化。
