Contribution Science Progress

中华医学会第二十二次全国精神医学大会

论文汇编

主办单位：

中华医学会 中华医学会精神医学分会

承办单位：

辽宁省医学会 辽宁省医学会精神医学分会 中国医科大学附属盛京医院

协办单位：

中国医科大学附属第一医院 沈阳市精神卫生中心 大连市第七人民医院

2024年

9月11-14日

目录

口头交流

精准医学研究协作组.....	98
基于机器学习识别未出现躁狂或轻躁狂症状的双相情感障碍：一项静息态功能磁共振研究.....	98
利用临床心理特征、遗传变量构建抗抑郁药效预测模型.....	98
Genome-wide Association Study of Antipsychotic-induced Movement Disorder in Patients with Schizophrenia....	99
An Investigation on Genetic Mechanisms under Clinical Subgroups in Schizophrenia.....	100
Risk of Cardiovascular Disease Hospitalization after Common Psychiatric Disorders: Analyses of Disease Susceptibility and Progression Trajectory in The UK Biobank	101
Dose Adjustment of Paroxetine Based on CYP2D6 Activity Score Inferred Metabolizer Status in Chinese Han Patients with Depressive Or Anxiety Disorders: A Prospective Study and Cross-ethnic Meta-analysis	102
磁休克治疗对重性抑郁障碍症状及脑血流变化的研究.....	103
继续教育协作组.....	104
Relationship between Anxiety and Internet Addiction: A Network Analysis of Large-Population Chinese Adolescent Students.....	104
抑郁症患者脑电微状态时间动力学特征与皮层内抑制功能的研究.....	104
Virtual Reality Working Memory Training Improves Working Memory of Patients with Major Depressive Disorder: A Functional Near-infrared Spectroscopy Study.....	105
抑郁障碍研究协作组.....	106
中国单相抑郁症的药物联合/增效治疗现状	106
基于个体临床动态数据监测的混合电抽搐治疗（i-HECT）对青年抑郁患者的疗效和自杀意念研究	107
Alterations of Structure- Function Coupling in The Temporal Lobe and Thalamus in Major Depressive Disorder Patients with and without Anhedonia.....	107
Associations between Specific Dietary Patterns, Gut Microbiome Composition, and Incident Subthreshold Depression in Chinese Young Adults	108
基于机器学习算法和生物信息学识别自噬相关抑郁症诊断生物标志物和基因调控网络.....	108
一项基于真实世界数据对青少年抑郁与双相障碍住院患者临床特征的比较研究.....	109
Eight-week Antidepressant Treatment Changes Connectome Gradient in First-episode Drug-naïve Major Depressive Disorder Patients	110
The Efficacy and Safety of Pharmacological Treatment for Major Depressive Episode with Mixed Features Specifier: A Systematic Review and Meta-analysis	111
Representational Similarity Analysis of Brain Functional Patterns Across Resting-state, Rumination, and Distraction States in Depressed Patients.....	111
Non-invasive Temporal Interference Stimulation for Neural Circuit in Depression: A Proof-of-Concept Study	113
艾司氯胺酮激活 Nrf2 抑制炎症反应发挥快速抗抑郁作用	114
个体化精准重复经颅磁刺激治疗难治性抑郁的网络机制研究：一项随机对照试验.....	114
Consistency Analysis of Different Depressive Symptom Assessment Scales	115
阈下抑郁症状发展轨迹对自杀意念的影响研究.....	115
Association between Electroencephalographic Microstates Abnormalities and Cognitive Dysfunction in Drug-naïve MDD	116
Prescription Pattern and Network Pharmacology Prediction-based Strategy To Explore The Potential Anti-depressive Effect of Daying Tablets.....	117

生物精神病学组.....	118
The Synergistic Effects of Depressive Symptoms and Mild Cognitive Impairment on Evaluated Risks of Incident Dementia: A Prospective Study From Three Elderly Cohorts.....	118
Aberrant Prefrontal-hippocampal Connectivity of Cross-modal Associative Memory Impairment in Schizophrenia	119
Altered Multivariate Brain Morphological Patterns and Neurocognitive Markers Associated with Suicidal Ideation and Behaviors in Major Depressive Disorder	120
中枢神经系统发育过程中 GNA13 基因过表达对皮层功能的影响及其分子机制	121
Intranasal Delivered Tetrahedral Framework Nucleic Acid Loaded with MicroRNA-134 Antisense Oligonucleotides (tFNAs@miR-134ASO) To Improve Depressive Mood and Cognitive Impairment in Chronic Stress Mice ..	122
Deep Brain Stimulation of Nucleus Accumbens and Anterior Limb of Internal Capsule (NAc-ALIC) for Treatment-resistant Schizophrenia.....	123
经颅磁刺激个体化精准靶点与传统非精准靶点治疗抑郁症的疗效比较：一项随机对照临床试验	124
Long-term Characteristics of Antipsychotics Induced Changes in Weight and Feeding Behavior	125
双相障碍研究协作组.....	126
Gut Microbiota Modulates Glutamate Receptor Activity Via The IL-1 β Pathway in Bipolar Depression.....	126
基于数字孪生脑的双相情感障碍病人躁狂相-缓解相转相的静息态功能连接分析	127
双相障碍遗传高危人群伴有阈下症状的脑神经发育特征：一项队列纵向研究.....	127
Cognitive Enhancement in Bipolar Disorder: A Double-Blind, Randomized Controlled Trial Utilizing A Novel DTI-Guided Multimodal Neuro-stimulation Protocol	128
单相双相抑郁患者在识别正性情绪面孔时前额叶—纹状体通路 low-gamma 频段效能连接差异	129
Spatial Correspondence Across Molecular, Cellular, and Cortical Structural Axis Underlying Suicide Attempt in Bipolar Disorder.....	129
CRMP2 in The Hippocampal CA1 Region Improves Chronic Stress-induced Depression-like Behaviour in Mice by Affecting Synaptic Plasticity.....	130
伴自杀未遂双相抑郁患者“前额叶-扣带-纹状体”环路功能连接两种损伤模式.....	131
儿童精神病学组.....	132
Csnk2A1 基因 DNA 甲基化在青少年抑郁症外周血的表达研究	132
Predictors of Conversion From Major Depressive Disorder To Bipolar Disorder in Adolescents: A Prospective Study	132
Silent Suffering: Multidimensional Stressors Leading To High Self-Harm Behavior Levels in Chinese Preadolescents	133
双靶点加速重复经颅磁刺激对青少年重度抑郁症患者疗效及脑功能机制研究.....	133
“医校家社”心理健康服务模式在重庆市中小學生中的应用	134
Efficacy Verification of Potential Neuroregulation Targets for Social Impairments in Children with Autism Spectrum Disorder: A Randomized, Double-Blind, Controlled Trial.....	135
Network Analysis of Anxiety and Depression Symptoms in Elementary School Children: Identifying Central and Bridging Symptoms	136
数字医疗在 ADHD 治疗中的应用：一项基于全面认知评估的靶向认知训练的多中心随机对照研究.....	137
Dissecting Biological Heterogeneity in Major Depressive Disorder Based on Neuroimaging Subtypes with Multi-omics Data.....	137
青少年非自杀性自伤阈上与阈下亚型大脑结构-功能耦合性差异研究	138
青春期重复经颅磁刺激对精神分裂症动物模型大脑网络模块控制力的影响.....	139
催产素鼻喷雾剂治疗成年早期 Asperger 综合征社交障碍的随机对照研究	139

心境障碍疾病亚型的脑时空动态特征解析	140
Early Screening for Autism Spectrum Disorder in Young Children: Cross-Cultural Adaptation and Validation of The Behavior Development Screening for Toddlers(BeDevel) in China	141
基于 PET 对伴有自杀特征的青幼期抑郁样小鼠神经炎症变化的研究	141
电休克对抑郁样小鼠海马区小胶质细胞激活极化的影响及机制研究	142
综合医院精神心理研究协作组	143
精神疾病患者发生肺血栓栓塞的危险因素分析及风险预测	143
基于调控 GABAergic 系统探究改善抑郁模型大鼠认知功能障碍的潜在机制	144
Prevalence and Correlates of Short and Long Sleep Duration Among Schizophrenia Patients: A Large-scale Cross-sectional Survey	144
焦虑、抑郁障碍在言语流畅性任务中的前额叶激活及功能连接差异——基于 fNIRS 的研究	145
Nod2 受体在脂多糖诱导的抑郁样行为中的作用研究	146
Altered Functional Connectivity Networks and Cytokines on Schizophrenia with Hallucinations	146
精神分裂症研究协作组	147
Sensitivity and Clinical Application of New Neurocognitive Battery for Schizophrenia in China (NBSC) in First-episode Patients	147
Unraveling The PFC-BLA Pathway's Role on Schizophrenia's Cognitive Impairments: A Multi-Modal Study in Patients and Mouse Models	148
Machine Learning-Based Prediction of Antipsychotic Efficacy From Brain Gray Matter Structure in Drug-naive First-Episode Schizophrenia	149
Anterior Cingulate GABA Associations on Functional Connectivity in First Episode Schizophrenia	149
Prediction of Antipsychotics-therapeutic Response in First-episode Schizophrenia Based on Machine Learning ..	150
Cognitive Deficits in First-episode Schizophrenia: Baseline Characteristics and 1-year Trajectory	151
Abnormal Multilayer Network Configuration and Correlation with Cognitive Dysfunction, Clinical Symptoms in Schizophrenia	152
Imbalance of Thalamocortical Anatomical Connectivity in Adolescents with Early-onset Schizophrenia	153
难治性精神分裂症 NMDAR 抗体与胼胝体膝部微结构异常	154
Trajectory Analysis of BMI Increase Induced by Second-generation Antipsychotics in First-episode Schizophrenia: A Secondary Analysis Based on CNFEST	155
Effects of Parietal Intermittent Theta Burst Stimulation on Resting-state Effective Connectivity within The Frontoparietal Network in Patients with Schizophrenia: A Pilot fMRI Study	156
Altered Dynamic Functional Connectivity of Thalamocortical Circuit in Schizophrenia——based on Multi-site and Multi-machine Cross-validation Data	156
CBT 研究协作组	158
跨诊断认知行为团体治疗对情绪障碍患者负性情绪、认知情绪调节策略及正念水平的影响	158
VR 注意力训练干预伴注意损伤抑郁症患者的脑生化代谢研究	158
认知行为治疗不同技术成分在中国失眠患者中的应用评价与疗效对比	159
辩证行为治疗对抑郁障碍伴非自杀性自伤人群的肠道微生物作用	160
Evaluating The Effectiveness of Multimodal Psychotherapy Training Program for Medical Students in China: A Randomized Controlled Trial	160
焦虑障碍研究协作组	162
催产素通路影响焦虑易感性的神经机制研究	162
Disruption of Late Consolidation in The Medial Prefrontal Cortex Attenuates Remote Fear Memory in Humans ..	162
Low-frequency RTMS Enhance The Early and Long Effect of CBT in Unmedicated Outpatients with Panic Disorder	

with Or without Agoraphobia: A Randomized Double-blind Controlled Trial	163
“北小六”人工智能心理治疗机器人对住院患者焦虑和抑郁症状的效果	164
孕期焦虑症状的轨迹、预测因素及其与产妇结局的关系	164
Transcranial Alternating Current Stimulation for Treating Generalized Anxiety Disorder: A Randomized Controlled Trial	165
焦虑障碍不同亚型脑功能活动异同研究	166
广泛性焦虑障碍患者症状水平与无法忍受不确定性及情绪调节策略的相关研究	166
焦虑障碍患者在情绪冲突处理中的前额功能连通性：一项基于 fNIRS 的研究	167
老年精神病学组	168
Association of Gamma-glutamyl Transferase To High-density Lipoprotein Ratio with Cognitive Function in Older Adults: The NHANES 2011-2014	168
基于结构磁共振构建轻度认知损害进展为阿尔茨海默病的综合预测模型	168
The Correlation between Gene Differential Expression and Symptoms in Patients with Alzheimer's Disease and Mild Cognitive Impairment	169
Transcranial Electric Stimulation over The Frontopolar Region Improves Risky Decision-making in Age-related Cognitive Decline	169
Digital Mindfulness Intervention for Mild Late-Life Depression Using The FocusZen System: A Randomized Controlled Trial	170
Olfactory Dynamic Functional Dysconnectivity Mediates Cognitive Impairment in Late-Life Depression	171
Effects of Seasonal and Meteorological Variations on Sleep in Late-onset Depression Patients	172
社区抑郁症状轨迹及其对认知功能的影响：基于中国社区队列	173
Double-strand-break Repair Protein Rad21 Homolog/Synaptotagmin-7 Alleviates Alzheimer's Disease in Mice by Promoting M2 Polarization of Microglia	173
Discovery of A Novel Tau PET Tracer 18F-HXT-05: Synthesis, Radio-labeling, and Preclinical Evaluations	174
进食障碍研究协作组	175
基于氧化应激和炎症反应探讨铜代谢紊乱影响女性抑郁症的机制	175
神经性厌食患者肠道菌群特征初探	176
默认模式网络静息态功能连接预测强迫症药物治疗与心理治疗疗效	176
精神康复协作组	177
我国三级公立精神专科医院康复科建设现状与对策研究	177
Exploratory Study on The Relationship Between Negative Symptoms and Self-Stigma in Schizophrenia and Its Impact on Quality of Life	178
抑郁症患者长期药物治疗后功能恢复状况及相关预测因素的探讨	178
精神运动康复对住院精神分裂症康复期患者的治疗效应	179
HD-tDCS 对慢性精神分裂症患者小脑后叶功能连接及其认知功能相关性研究	179
民族心理与精神医学学组	181
Gender Difference in Correlation between Mental Symptoms and 10-year Cardiovascular Risk in Schizophrenia	181
后疫情时代四川省青少年及青年学生的心理健康：基于 2022 年和 2023 年两次大规模调查的研究	182
Effect of Dynamic Interpersonal Therapy on The Improvement of Mentalizing in Patients with Major Depressive Disorder and Its Association with Changes in Depressive Symptoms	182
未服药强迫症患者边缘与三重网络的静息态网络功能与 SSRIs 的疗效相关研究	183
社会精神医学学组	184
A Longitudinal Network of Psychotic-like Experiences, Depressive and Anxiety Symptoms, and Adverse Life Events: A Cohort Study of 3,358 College Students	184

Clinical Risk Factors for All-cause Mortality in People with Schizophrenia: A Nine-year Retrospective Cohort Study	184
The Prevalence and The Correlates of Mental Disorders Among The Elderly Population: Results From China Mental Health Survey.....	185
Preventing Post-discharge Suicides Using Brief Contact Interventions (BCIs) in Psychiatric Patients: Results From An Implementation Study of A Sequential Multiple Assignment Randomized Trial (SMART)	185
Exploring The Effect of Romantic Relationships on NSSI Behavior in Depressed Adolescents: Based on The Causal Forest Double Machine Learning Model	187
精神分裂症患者子女的精神健康调查: 一项多中心横断面研究的初步结果.....	188
Neurological, Mental Disorders and Injuries Attributable for DALYs To Tobacco, Alcohol and Drug Use in China, Findings From The Global Burden of Disease Study 2021	188
网络精神病学组	190
Differences in Dynamic Brain Functional Network Characteristics of Non-Suicidal Self-Injurious Behavior and Suicidal Ideation in First Episode Depression	190
Effect of MiR-218 Polygenic Risk on Cognition and Its Relation To Neurometabolism in Patients with Major Depressive Disorder	190
网络游戏成瘾严重程度及渴求相关脑电预测模型.....	191
慢波睡眠中暴露游戏声音线索对网络游戏成瘾的干预研究.....	192
社会心理服务研究协作组	193
Global, Regional and National Depressive and Anxiety Disorders From 1990 To 2021: Findings for The Global Burden of Disease Study 2021	193
农村初级卫生专业人员对精神疾病相关病耻感及其影响因素研究.....	193
以学校为基础的中学生危机干预的有效性评估.....	194
大学生阈下抑郁的光疗干预效果评价研究	195
大学生脑健康队列建设概况	195
物质依赖医学学组	196
甲基苯丙胺成瘾者线索反应性及抑制控制的闭环经颅交流电刺激研究.....	196
Predicting Drug Craving Among Ketamine-Dependent Users Through Machine Learning Based on Brain Structural Measures	197
Unraveling The Gut-Brain Axis: Mendelian Randomization Reveals Causal Links Between Specific Gut Microbiota and Alcohol Use Disorder	197
The Mediating Role of Social Connectedness and Negative Cognitive Emotion Regulation in Association of Problematic Internet Use and Depression Among Adolescents	198
应激-消退行为范式对可卡因成瘾消退学习的影响及其机制	199
Alteration in Brain Gray Matter Volume and Relationship with Motor Impulsivity and Drug Use Characteristics Among Abstinent Patients with Methamphetamine Use Disorder.....	199
靶向调控伏隔核脑区 Anks1b 表达对长时程可卡因自身给药的影响及机制研究.....	200
妇女精神医学学组	201
类惊恐发作大鼠模型的肠道菌群和肠道内代谢物动态变化的多组学研究.....	201
Studies on The Effects of Schizophrenia and Bipolar Disorder Or Psychotropic Medications on Reproductive Function in Female Patients	201
The Impact of Hearing Impairment on Cognitive Decline and Brain Morphology in Older Adults: Insights From Network Analysis and Mendelian Randomization.....	202
围产期睡眠剥夺降低肾清除认知损伤相关蛋白影响大鼠认知能力的研究.....	203

首发未用药重性抑郁患者的多层时序脑网络的模块化特点与切换次数的研究.....	203
阿普唑仑对小鼠类惊恐发作行为及脑神经元激活特征的影响研究.....	204
White Matter Integrity Upon Progesterone Antagonism in Individuals with Premenstrual Syndrome: A Placebo-controlled DTI Study	204
司法精神病学组	205
Predictive Analysis of Criminal Crimes in Patients with Mental Illness by Partial Differential Equation Model in Climate Change ---- Inspired by Academician Xuesen Qian's Book Engineering Cybernetics.....	205
高特质愤怒男性精神分裂症患者激惹情景下的反应及脑机制.....	208
睡眠障碍研究协作组	209
Different Roles of Homocysteine Metabolism in Hypertension Among Normal-weight and Obese Patients with Obstructive Sleep Apnea.....	209
A Randomized, Double-Blind Study Evaluating The Effectiveness of Concurrent Transcranial Direct Current and Repetitive Transcranial Magnetic Stimulation Versus Individual Treatments for Chronic Insomnia	209
Sleep and Cortisol Changes in Crews with Irregular Shifts During A 42-day Isolated, Confined and Extreme Environment Mission.....	210
Sleep Quality In Adolescents With Depression: Psychological Mechanisms And Networked ACT Combined With ITBS Intervention	211
精神创伤研究协作组	212
Altered Dynamic Functional Connectivity of Nucleus Accumbens Subregions in Major Depressive Disorder: The Interactive of Childhood Trauma and Diagnosis.....	212
千金藤啶碱干预早期社会隔离引起的精神分裂样行为 及其潜在机制研究	213
Study on The Sleep Sensitivity of Overweight Patients with Bipolar Disorder and The Correlation with Bmall Gene Methylation	214

壁报交流

精准医学研究协作组	217
Efficacy of Intermittent Theta Burst Stimulation (iTBS) on Depressive Symptoms of Adolescents with and without Antidepressants: A Preliminary Study	217
Subtyping Schizophrenia with Neurotransmitter-specific Individual Cortical Thickness Deviations.....	218
基于心率变异性对于青少年抑郁障碍患者非自杀性自伤影响因素的探究.....	219
Paliperidone Plasma Concentrations, and Its Correlation with Clinical Outcomes and Genetic Polymorphism	219
Integration of Multi-omics Summary Data Reveals The Role of N6-methyladenosine Methylation in Neuropsychiatric Disorders.....	220
伴焦虑症状的抑郁症患者心率变异性及压力水平特征的研究.....	221
MTORC1/SREBP 通路在奥氮平所致脂代谢异常和二甲双胍治疗作用中的机制研究.....	221
多基因风险评分联合临床特征与抗抑郁药疗效间的相关性研究.....	222
The Causal Relationship between Toll-Like Receptor 4 Protein Levels and Major Depressive Disorder: A Two-Sample Mendelian Randomization Study	222
A Controlled Study of The Regulation of Biorhythms and Physiological Markers of Depression by Light Room Therapy and Its Efficacy	223
Molecular Mechanism of The Tnik Gene Affecting The Action of Antipsychotic Drugs Through The Glutamate Pathway.....	224
伴和不伴忧郁特征的抑郁症患者的双侧伏隔核功能连接差异分析.....	225
血清可溶性 TREM2 在识别轻度认知障碍中的价值.....	225

青少年抑郁症患者血清中高迁移率族蛋白 1(HMGB1)与快感缺失相关脑区功能影像学研究的调查	226
生命不同阶段多重应激对焦虑抑郁症状检出率的调查研究	226
基于结构方程模型对河北大学生抑郁情绪影响因素的分析	227
Associations between Body Mass Index, High-Sensitivity C-Reactive Protein Levels and Depressive Symptoms: NHANES 2015-2016	228
Genome-wide Association Study in Patients with Schizophrenia Revealed Associations of Copy Number Variants and Antipsychotic Treatment Response	228
Analysis of Mitochondrial Gene Expression Related To Schizophrenia Patients	229
生活事件对经深部经颅磁刺激辅助治疗的抑郁症患者血浆 IL-10 和过氧化物酶体增殖物激活受体 γ 的影响	230
Theta 脉冲刺激治疗抑郁症疗效及安全性的探索性随机对照研究	230
Efficacy of Bright Light Therapy for Perinatal Depression: A Meta-analysis of A Randomized Controlled Trial	231
精神分裂症患者血浆外泌体的功能研究	231
Social Functioning Mediated The Relationship Between Childhood Emotional Neglect and Cognitive Deficits in Patients with Schizophrenia	232
Artificial Intelligence for Voice-Based Depression Detection: Bipolar Depression and Unipolar Depression	232
Mediation Effect of Sleep Disturbance between Psychotic-like Experiences and Depression Among Chinese Adolescents	233
Integrative Analysis of The Dysregulation of Long Non-coding RNAs and MRNAs and Key CeRNA Regulatory Network Associated with Major Depressive Disorder	234
Post-Marketing Safety Concerns with Lumateperone: A Disproportionality Analysis of Spontaneous Reports Submitted To The FDA Adverse Event Reporting System	235
肠道微生物-血清蛋白质组整合分析对单、双相抑郁的鉴别价值	238
Hippocampal Subregional Structure and Function Alterations in Major Depressive Disorder Patients with and without Mixed Features	238
Predicting Treatment Remission and Plasma Concentration of Paroxetine in Patients with Major Depressive Disorder	239
双相 I 型抑郁反刍思维与默认网络 alpha 频段功能连接的特定关联	240
The Frontoparietal Network Mediates The Antidepressant Effects of Accelerated Intermittent and Continuous Theta Burst Stimulation: A Randomised Controlled Trial and TMS-EEG Study	240
Age-Dependent Corpus Callosum Thickness Abnormalities and Clinical Implications in Schizophrenia	242
Effect of Propranolol on Reconsolidation of Alcohol Reward Memory	242
Functional Connectivity and Gene Expression in Major Depressive Disorder with Anxiety Symptoms	243
辅助运动区功能活动及有向连接预测抗抑郁药物疗效研究	244
MECT 治疗中锂盐对抑郁障碍患者疗效及认知功能的影响研究	245
Obesity-related Brain Structural Asymmetry in Major Depressive Disorder	245
Peer Bullying and Suicide Attempt Among Depressed Adolescents with Suicidal Ideation: A Double Machine Learning-based Causal Inference	246
Association between Physical Activity, Depression, and CRP: A Non-linear Regression and Mediation Model Analysis	247
Daily Dosing Frequency As A Determinant of Clozapine Concentration-to-dose Ratio: Data From A Therapeutic Drug Monitoring Service (2019–2022)	248
抑郁症患者的 SSRI 药物治疗响应轨迹亚型分析	249
基于抑郁症患者与慢性应激小鼠模型转录组学数据的联合分析探索潜在的抑郁症生物标记与治疗靶点	249

Unraveling The Role of De Novo Structural Variants in Schizophrenia Through Comprehensive Whole Genome Sequencing with Long-Read and Short-Read Technologies	250
继续教育协作组	251
大学新生网络成瘾与抑郁、焦虑情绪的网络分析研究.....	251
原位模拟教学法在精神科住培教学中的应用探索.....	252
青少年抑郁障碍患者皮层内抑制和易化功能及磁共振波谱研究.....	252
Influence of Parental Rearing Style on Suicide in Chinese Transgender Women	253
左甲状腺素及三碘甲状腺原氨酸在抑郁发作患者中治疗的研究进展.....	253
双相障碍共病焦虑障碍的神经影像多模态机制研究.....	254
Study on Intestinal Flora Characteristics and Metabolomic Analysis in Children and Adolescents with First Untreated Obsessive-compulsive Disorder	255
伴或不伴轻躁狂倾向的单相抑郁和双相抑郁青少年患者的大尺度脑网络功能连接及其分类研究	256
抑郁症功能连接梯度的偏侧化改变及其与长期治疗结局的关联.....	256
瑞替加滨通过调节内质网应激介导的凋亡改善慢性束缚小鼠的抑郁样及认知症状.....	257
Sex Differences in Brain Metabolites in Unmedicated Depressed Adolescents with Non-suicidal Self-injury	257
认知表现的影响因素分析及验证研究	258
TAAR1 参与的线粒体功能调节在慢性应激所致认知功能损害中的作用	259
Effects of Exercise on Cognitive Function in Depressed Adults: Systematic Review and Network Meta-analysis	259
Analysis of Hotspots in Geriatric Comorbidity Research in The Past Decade Based on CiteSpace	260
基于虚拟网络的新型教育模式探讨——以“精神课堂教学”为例	260
TNF- α mRNA 对经历慢性负性应激的抑郁症的识别作用：一项基于机器学习模型建立的研究	261
Compilation and Preliminary Application of The Awareness Questionnaire for Late Life Depression	261
抑郁障碍研究协作组	263
Effects of Dual TAAR1/5-HT1A Receptor Agonist SEP-363856 on Attenuating Depression-like Behavior Through IGF-1R β /PI3K/AKT Pathway in CUMS Mice Model.....	263
时域干涉刺激对抑郁症相关神经环路的调控作用.....	263
成年早期伴非自杀性自伤抑郁症与伴自杀未遂抑郁症脑局部一致性的特征.....	264
Multidimensional Assessment of Adverse Events of Bupropion: A Large-Scale Data Analysis From The FAERS Database.....	264
Interpretation of The Pathogenesis and Therapeutic Mechanisms of First-episode Major Depressive Disorder Based on Multiple Amino Acid Metabolic Pathways: A Metabolomics Study.....	265
抑郁症非自杀性自我伤害的疼痛行为学特征.....	265
Knowledge and Attitude of Depression Among Urban and Rural Residents in Beijing: A Cross-sectional Study ..	266
From Genes To Cells: Exploring The Role of Senescence in MDD Pathogenesis	267
The Impact of Accelerated Repetitive Transcranial Magnetic Stimulation on Major Depressive Disorder with Melancholic Features: An Rs-fMRI Study.....	267
CircFKBP8(5S,6)-encoded Protein As A Novel Endogenous Regulator in Major Depressive Disorder	268
首发未治疗青少年抑郁症肠道菌群的代谢组学研究.....	269
Vocal Acoustic Features and A Classification/Prediction Model for Major Depressive Disorders	270
Impaired Topology and Connectivity of Grey Matter Structural Networks in Major Depressive Disorder: Evidence From A Multi-site Neuroimaging Dataset.....	270
A Case-control Study of The Correlation between Social Cognition and Oxidative Stress in First-episode Drug-naïve Major Depressive Disorder	271
The Association of Clinical Correlates and Metabolic Parameters with Subclinical Hypothyroidism in First-episode	

and Drug-naive Patients with Major Depressive Disorder Comorbid with Glucose Disturbances: A Large Cross-sectional Study	271
Clinical Correlates, Lipid Metabolic Parameters and Thyroid Hormones Are Associated with Abnormal Glucose Metabolism in First-episode and Drug-naïve Major Depressive Disorder Patients with Suicide Attempts: A Large Cross-sectional Study.....	272
Efficacy and Safety of Eight Enhanced Therapies for Treatment-Resistant Depression: A Systematic Review and Network Meta-Analysis of RCTs.....	273
青少年重性抑郁障碍及双相抑郁障碍的多巴胺合成异常: [18F]DOPA PET-MRI 成像研究	274
Contribution of Resting-state Functional Connectivity of The Subgenual Anterior Cingulate To Prediction of Antidepressant Efficacy in Patients with Major Depressive Disorder	274
血药浓度数据处理软件辅助判读抗抑郁药治疗药物监测结果的一致性及临床应用价值研究.....	275
Targeting The ERK/NF- κ B Pathway with Maresin-1: Implications for Treating Depression Via Microglial Polarization	275
The Effect of Childhood Trauma on Depression in College Students: A Moderated Mediation Model.....	276
补益心脾法降低抑郁障碍患者自杀意念的队列研究.....	276
天然生物碱类成分 ELP 改善慢性社会挫败应激 (CSDS) 小鼠抑郁样行为的蛋白组学研究	277
中国精神障碍患者服用帕罗西汀的群体药代动力学研究及其临床应用.....	278
青少年非自杀性自伤患者额边缘系统多模态磁共振成像研究.....	278
基于静息态脑电图特征的多变量模式分析: 抑郁障碍识别研究.....	279
背外侧前额叶皮层活性和功能连接的早期变化作为重度抑郁障碍抗抑郁反应的潜在生物标志物	279
Predictive Models for Non-suicidal Self-injury (NSSI) in Mood Disorder: A Machine Learning Modeling Approach	280
不同阶段抑郁症的内感受障碍特征的研究	280
鲁拉西酮对比喹硫平单药治疗青少年和成年早期双相抑郁的疗效和安全性: 一项随机对照研究.....	281
Effects of Subanesthetic Repeated Esketamine Infusions on Memory Function and NGF in Patients with Depression: An Open-label Study.....	282
Phase Connectivity Dysfunction During The GO/NOGO Task Related To Suicide Attempt in Major Depressive Disorder.....	282
Assessment of The Causal Relationship between Depression and Traits of Sarcopenia: A Bidirectional Two-sample Mendelian Randomization Study	283
Gait Patterns in Depression: A Bibliometric Analysis and Knowledge Mapping of Research Trends Over The Past 20 Years.....	283
间歇性 θ 脉冲刺激模式治疗抑郁障碍的脑电 微状态特征分析	284
社会认知与互动训练(SCIT)对首发抑郁症患者社会功能及神经营养因子的影响.....	284
Abnormal Resting-state Functional Connectivity of Hippocampus and Amygdala in Major Depressive Disorder.....	285
Abnormal White Matter Integrity in Patients with Depression Revealed by Automated Fiber Quantification.....	285
外周血氧化应激标志物在抑郁症中的诊断与疗效预测研究.....	286
基于 CUMS 模型探讨短链脂肪酸的抗抑郁作用及对肠道菌群的影响.....	287
Healthy Lifestyle and Risk of Incidence, Mortality and Life Expectancy of Mental Disorders.....	287
Prevalence and Risk Factors for Depression in Somatic Symptom Disorder: A Large-Scale Cross-Sectional Study	288
青少年抑郁障碍患者昼夜节律调控蛋白表达模式及其与临床症状的相关性分析	289
首发青少年抑郁障碍患者童年创伤与精神病理及炎性细胞因子的相关性研究.....	289
Agomelatine As Adjunctive Therapy with SSRIs Or SNRIs for Major Depressive Disorder: A Multicentre, Double-	

blind, Randomized, Placebo-controlled Trial.....	290
青少年重性抑郁发作患者非自杀性自伤及自杀与甲状腺功能和皮质醇水平的关系.....	290
个体化混合电休克疗法 (i-HECT) 对青年抑郁症患者的认知影响.....	291
The Functional Connectivity of The Somatomotor Network Mediates The Relationship Between Alexithymia and Non-suicidal Self-injury in Depressive Adolescents.....	292
Network Analysis of Depression and Anxiety Symptoms During Pregnancy: A Longitudinal Study Across Three Trimesters.....	292
Obstetric Risk Factors of Antenatal Depression: A Cross-sectional Study in China.....	293
Prevalence and Risk Factors of Postpartum Depression During Late Puerperium: A Real-world Cross-sectional Study in A Developed District of South China.....	294
Group-based Trajectory Analysis of Antenatal Depression and Its Association with Polysocial Risk Score: A Retrospective Cohort Study.....	294
抑郁症患者童年创伤类型对思维反刍维度的影响: 一项纵向随访研究.....	295
抑郁症患者伴童年创伤类型数量与思维反刍维度的关系.....	296
Differences in The Effects of Electroconvulsive Therapy Combined with Antidepressants on Depression in Adolescents and Adults and Related Influencing Factors.....	296
抑郁症中情绪干扰效应的神经机制.....	297

[综述]抗抑郁药引起锥体外系反应机制的研究进展	1044
类风湿关节炎患者疼痛与抑郁的相关性研究.....	1045
Exploring The Predictive Markers of Efficacy of Accelerated Neuronavigation-guided RTMS for Depression with Suicidal Ideation Based on Multimodal Large-scale Brain Networks	1045
Neural Correlates of Cognitive Deficit in Emotional Directed Forgetting in Major Depressive Disorder: An Event-related Potential Study	1046
高频 rTMS 对脑卒中后抑郁症患者的临床疗效研究	1046

探讨艾司西酞普兰对抑郁症患者肠道菌群和粪便代谢组的调节作用.....	1047
The Current Situation of Comorbidities of Chronic Physical Diseases and Depression Among Chinese Community Residents.....	1047
同伴欺凌对青少年抑郁症的影响：手机使用的中介作用.....	1048
RTMS 结合度洛西汀对老年抑郁症患者认知能力的影响.....	1048
Association between Osteoporosis and Serum Prolactin and Calcium Levels in Postmenopausal Women with Major Depressive Disorder: A Retrospective Study Based on Quantitative CT.....	1049
Interoceptive Neural Circuits Mediating The Progression From Somatic Diseases To Comorbid Depression.....	1049
单相抑郁患者维生素水平探讨.....	1050
Exploring The Differences in Psychometric Properties of Commonly Used Self-rating Depression Scales Across Various Populations in China: A Quantitative Systematic Review.....	1050
Virtual Reality-based Interventions for People with Depressive Disorder: A Meta-analysis.....	1051
青少年抑郁症患者自杀意念与母亲的依恋模式及防御方式的关联研究.....	1053
Changes in Spectral Power Associated with Cognitive Function in Patients with Depression.....	1053
Global Functional Connectivity Analysis Indicating Dysconnectivity of The Hate Circuit in Major Depressive Disorder.....	1054
青少年抑郁障碍患者混合特征水平与认知功能相关研究.....	1054
Inflammatory Modulation of Sertraline Use in Patients with Depression: A Systematic Review and Meta-analysis.....	1055
Distinguishes Major Depressive Disorder and Bipolar Disorder Using Alpha-band Activity in Resting-state Electroencephalogram.....	1055
PTSS, Perceived Stress, and Social Media Use Affecting Somatic Symptoms in Healthcare Workers Recovering From COVID after Ending China's Dynamic Zero-COVID Policy: A Moderated Mediation Model.....	1056
NSSI Contagion in Adolescent Friendships: Explore The Process of Peer Influence.....	1057
重度抑郁症患者动脉粥样硬化指数相关因素的性别差异.....	1057
Prevalence and Correlates of Overweight and Obesity in Patients with Major Depression Accompanied by Abnormal Thyroid-stimulating Hormone Levels.....	1058
青少年抑郁症患者再入院情况及影响因素的回顾性分析.....	1058
家庭治疗在抑郁症治疗中的应用效果.....	1059
青少年抑郁症患者快感缺失水平变化分析.....	1059
谷氨酸系统与快感缺失的影像遗传学研究.....	1060
Dezocine's Rapid and Sustained Antidepressant Effects: A Case Report.....	1060
正念认知治疗对抑郁障碍患者生活质量的影响.....	1061
基于真实世界证据探索伴有自杀意念或行为的抑郁障碍患者的临床特征研究.....	1061
伴或不伴社交焦虑特征抑郁障碍患者情绪面孔加工的单眼优势差异.....	1062
Association between Personality and Cognitive Bias in Adults with and without Depression.....	1062
微表情识别训练对青少年抑郁症患者的有效性研究.....	1063
Abnormalities in Brain Function and Neuroinflammation Are Present in People with HIV-associated Suicide Risk.....	1063
EEG Microstate Analysis in Anhedonia Patients with Major Depressive Disorder.....	1064
12 种脂质与抑郁症的因果关系：双向双样本的孟德尔随机化分析.....	1065
基于蛋白组学分析的抗抑郁药生物标志物与治疗反应的关联性研究.....	1065
抑郁症患者元认知能力受损及其与临床症状的关系.....	1066
EEG Microstate Differences in Treatment-resistant Depression.....	1066

Near-infrared Brain Imaging Study of Depressive Liver Qi Stagnation Syndrome before and after Treatment....	1067
Identifying The Grades and Psychosocial Characteristics of Antenatal Depressive Symptoms in China: A Latent Analysis.....	1067
通过倾向性评分匹配法探索抑郁障碍伴自杀观念及行为的生物学指标及危险因素研究.....	1068
辨证行为疗法联合氟西汀治疗青少年抑郁症非自杀行自伤的疗效观察.....	1068
Association between Serum Uric Acid and Post-Stroke Depression: A Population-Based Study From The NHANES (2005–2016).....	1069
Effect of Group Cognitive Behavioral Therapy on Diabetic Patients with Sub-threshold Depression	1069
不同种类单药治疗对重度抑郁症患者抑郁焦虑症状作用的真实世界研究.....	1070
探讨血常规炎症指标在抑郁症诊断、治疗及预后评估的价值.....	1071
Alterations of Subcortical Structural Volume in Pediatric Bipolar Disorder Patients with and without Psychotic Symptoms.....	1071
Alterations of Subcortical Structure Volume in Pediatric Bipolar Disorder Patients with Manic Or Depressive First-episode	1072
Accelerated Repeated Transcranial Magnetic Stimulation Intervention for Depression	1072
双相情感障碍患者混合发作情况及影响因素分析.....	1073
The Gut Microbiome From Middle-aged Depressive Women Induces Depressive-like Behaviors and Regulates Plasma Fatty Acid Metabolism in Female Middle-aged Mice	1073
Acute Treatment of Bilateral RTMS Combined with Antidepressants on The Plasma Fatty Acids for Major Depressive Episodes	1074
首发青少年抑郁症的影响因素及干预：基于网络化接纳承诺疗法.....	1074
米安色林与舍曲林治疗伴有焦虑症状的抑郁症的疗效分析.....	1074
雷公藤红素活化棕色脂肪外泌体缓解小胶质细胞炎症反应的分子机制.....	1075
生物精神病学组	1076
Cross-scale Variations in Schizophrenia.....	1076
联合 CCRT 对精神分裂症患者疗效、认知功能及生物学指标的影响.....	1076
SOX11 基因多态性与精神分裂症的相关性及对抑郁行为的影响	1077
Ghrelin-cognition Relationship in The Chinese Han First-episode Drug-naive Major Depressive Disorder.....	1077
不同感觉门控水平首发精神分裂患者静息态脑自发神经活动.....	1078
中药汤剂治疗抗精神病药物引起的高泌乳素血症的临床对照观察.....	1078
Genes Associated with Cellular Q1 Senescence As Diagnostic Markers of Major Depressive Disorder and Their Correlations with Immune Infiltration.....	1078
羟氯喹通过阻止 TRPV1 的自噬降解来减轻母体分离诱导的精神分裂症样行为.....	1079
Neurobiological Mechanism Underlying The Rapid-acting Antidepressant Effect of Ketamine	1080
雷公藤多苷通过抑制焦亡改善阿尔茨海默症小鼠模型的工作记忆.....	1080
Association of Stmn1 Polymorphism and Cognitive Function in The Chinese Population	1081
Sex-Specific Metabolic Mechanisms in Mild To Moderate Depression: Investigating Isoleucine and Trimethylamine N-Oxide in Female Patients	1081
Brain Glycogen: A Key To Revealing The Pathology of Mental Diseases.....	1082
舞动治疗在改善精神分裂症住院患者身心健康的效果观察.....	1083
缺陷型精神分裂症患者海马亚结构萎缩与注意功能障碍无关.....	1083
KIBRA 基因多态性与健康汉族个体的不同人格特质相关	1084
Painful Olfactory Hallucinations after Trazodone Treatment	1084
脑机接口发展在精神疾病领域中应用的研究进展.....	1085

The Metabolic Indices of Smoking and Non-smoking Schizophrenia Patients Were Compared, and The Relationship between Smoking, Glucose and Lipid Metabolism Status and Cognitive Function Was Investigated	1086
基于靶向代谢组学探究精神分裂症的代谢性别差异.....	1086
基于多模态脑影像的精神分裂症和双相情感障碍鉴别诊断.....	1087
临床护士心身症状的现状分析及中介机制探寻.....	1088
肠道微生物群、细胞因子与五种精神疾病的因果关系：双向双样本孟德尔随机化分析与中介分析	1088
Essential Amino Acids and Psychiatric Disorders: A Two Sample Mendelian Randomization Study Combined Colocalization Analysis.....	1089
Tryptophan and Its Main Metabolite Kynurenine with Depression: A Bidirectional Two-sample Mendelian Randomization Study	1090
双相障碍混合状态的药物治疗有效性、安全性及可接受性的系统评价	1091
阿戈美拉汀片联合盐酸帕罗西汀对抑郁伴失眠患者 SOD、BDNF 水平的影响	1091
血浆 IL-6 水平与脑健康和痴呆风险的关系研究	1092
精神分裂症患者治疗效果与认知功能关系的研究.....	1092
精神分裂症与血压的因果关联：一项双向双样本孟德尔随机化研究.....	1092
Abnormal Functional Connectivity of The Reward Circuitry Is Associated with Negative Symptom and Cognitive Functions in First-episode Schizophrenia.	1093
Association between Blood Mitochondrial DNA Copy Number and Mental Disorders: A Bidirectional Two-sample Mendelian Randomization Study	1094
犬尿氨酸代谢产物及细胞因子负荷水平在单双相抑郁症患者间的差异分析及与临床特征的关联研究	1094
血浆外泌体蛋白质组学特征及其与未用药精神分裂症临床症状的相关性研究.....	1095
精神分裂症外周炎症因子、脑结构与认知功能障碍的研究.....	1096
单/双相抑郁额叶 alpha 波不对称的差异比较	1096
单/双相抑郁患者前额叶的功能性近红外光谱差异比较。.....	1097
Mapping The Involvement of Vitamin B12 in The Development of Affective Disorders Through Peripheral and Central Pathways.....	1097
不同性别首发未用药精神分裂症患者血清 VEGF 水平与临床症状的相关性	1098
Genome-wide Association Analysis of Gut Microbiome in Major Depressive Disorder: Associations with Mitochondrial DNA Variants	1098
抑郁障碍、双相抑郁客观睡眠特征及心率变异性对诊断的影响.....	1099
Ethylene Oxide Exposure, Inflammatory Indicators, and Depressive Symptoms: A Cross-sectional Study and Mediation Analysis	1099
以日间过度嗜睡为主诉的青少年抑郁 1 例并文献分析.....	1100
经颅电刺激技术在精神疾病治疗中的新进展：tACS 的临床应用	1100
伴有焦虑症状双相抑郁患者认知功能损害与 GRIN2B 基因启动子区 DNA 甲基化的相关性研究	1101
双相抑郁患者失眠相关执行功能损害与 NR2B 基因启动子区甲基化水平的关系.....	1101
C-reactive Protein Mediates The Correlation between Ambient Particulate Matters and Lipid Levels Among Patients with Depression.....	1102
Genetic Relationships and Biological Pathways Underlying Suicidality and Comorbid Mental Disorders.....	1103
慢性精神分裂症患者的述情障碍在童年创伤和阴性症状之间的中介作用.....	1104
Effects of MC1R and BIN1 Gene Polymorphisms on Chinese Patients with Alzheimer's Disease and Mild Cognitive Impairment	1104
母子同步运动训练对青少年抑郁症的影响	1105
小剂量喹硫平缓解伴发焦虑抑郁症状的迟发性运动障碍 1 例.....	1105

抑郁症患者 SSRI 类抗抑郁药早期起效的电生理预测指标	1105
抗衰老蛋白 Klotho 通过上调 NMDAR-GluN2B 突触膜表达调控精神分裂症模型大鼠的认知功能及突触可塑性损害	1106
胰岛素样生长因子-2 通过调控谷氨酸受体介导 早期生活应激所致的认知损伤	1106
Cognitive Impairment Following Maternal Separation in The Rat Is Regulated by Effects of The NAD ⁺ /SIRT3 Axis on Hippocampal Synaptic Plasticity	1107
Sex-dependent Associations of Serum BDNF, Glycolipid Metabolism and Cognitive Impairments in Parkinson's Disease with Depression: A Comprehensive Analysis	1107
CREB/BDNF/TrkB 通路在精神分裂症发病机制和疗效评估中的研究进展	1108
超越还原论：从复杂系统的视角看精神障碍	1109
基于 IepR-JAK2-STAT3 通路探讨瘦素影响抑郁小鼠 5-HT2B 受体表达的作用机制	1109
Impaired Myelin Integrity in Schizophrenia: A Systematic Evaluation and Meta-analysis	1109
基于生物信息学分析探索精神分裂症和代谢综合征的关联性研究	1110
上调海马 CA1 区 TRPV1 表达水平可改善母婴分离引起的精神分裂症样行为异常	1111
催产素对生命早期应激导致的同性性行为的调节作用	1111
Adjunctive Therapeutic Effect of Fish Oil on A Subgroup of Patients with Schizophrenia Exhibiting Blunted Niacin Responses	1112
精神分裂症中的线粒体功能障碍和认知损伤：炎症的作用	1112
在精神科 MECT 治疗中全麻下应用琥珀胆碱引起恶性高热风险的研究	1113
盐酸多奈哌齐片对 MECT 后精神分裂症患者记忆障碍恢复影响的研究	1113
A Research of Serum Homocysteine Levels in Unipolar Depression and Bipolar Depression	1114
精神疾病的血浆脂质组变异：孟德尔随机化分析的见解	1114
小鼠中过表达双相情感障碍相关 lncRNA 引起小鼠出现焦虑和抑郁样行为	1115
RVG 修饰的间充质干细胞外泌体治疗强迫症及其机制研究	1115
围绝经期抑郁症患者肠道菌群特征	1116
伴有非自杀性自伤的青少年抑郁障碍研究现状	1116
嘌呤代谢途径与精神分裂症、重度抑郁症、双相情感障碍的因果关系：双向双样本孟德尔随机化分析	1117
利用磁共振波普成像技术对双相情感障碍及强迫障碍可能共病机制的探讨	1117
非典型抗精神病药物对首发精神分裂症患者认知功能及脂代谢的影响	1118
认知行为治疗对重度抑郁患者无抽搐电休克治疗后认知功能障碍改善的效果	1118
研究不同年龄阶段男性抑郁障碍患者炎症反应、甲状腺功能、性激素、皮质醇相关指标水平的变化及其相关性，探讨更为个性化的治疗方案。	1119
GCH1 在跑步运动改善慢性社交挫败所致抑郁样行为中的作用	1119
The Efficacy of Exercise Interventions on Depressive Symptoms and Cognitive Function in Adults with Depression: An Umbrella Review	1120
An Epigenetic Clock To Assess The Differential Neurodevelopmental Trajectories and Prevalence of Three Major Psychiatric Disorders	1120
述情障碍的内感受知觉语义表征及其神经机制研究	1121
一例以记忆力减退及下肢抖动为主要症状的脆性 X 相关震颤/共济失调综合征病例报道及文献回顾	1122
Genome-wide DNA Methylation and Adverse Childhood Experiences in Youth at Clinical High Risk for Bipolar Disorder and Patients with Established Bipolar Disorder	1122
一例表现为反复亚木僵状态的肝功能正常的高氨血症性脑病病例报道及文献回顾	1123
肠道菌群、血清代谢物及关联分析针灸百会、足三里穴缓解抑郁样行为的潜在机制研究	1124
非自杀性自伤的内分泌免疫研究进展	1124

抑郁症与精神分裂症患者外周血中 ω -3 和 ω -6 多不饱和脂肪酸水平的系统评价和荟萃分析	1125
ZJU 指数与抑郁症状的关联性研究：基于 NHANES 数据的横断面分析	1125
Prefrontal Cortex Variation in Youth and Adolescents Who Engaged in Repetitive Non-suicidal Self-injury Vs. Psychiatric Controls	1126
时间干涉电刺激调节人类共情情绪	1127
合并益生菌治疗对抗精神病药源性肥胖的作用	1127
未治疗的精神分裂症患者的 EGF, NGAL 水平与暴力行为的关系	1127
基于精神专科医院职工的心率变异性与疲劳程度的关联分析	1128
抑郁症患者治疗前后认知功能改善与脑区代谢变化的关系	1128
谵妄风险因素、预防干预、重叠症状及临床措施最新进展	1129
DKK1/Wnt/ β -catenin 信号通路和炎症介质在首发精神分裂症患者中的表达及相关性研究	1129
MECT 治疗边缘性人格障碍的疗效	1130
Phase Synchronization in Neuronal Activities in Adults with Major Depressive Disorder and Bipolar Depression: A Resting-state Electroencephalogram Study	1130
大语言模型在投射测验解读中的优化策略探索：标准化施测与评估体系的建构	1131
基于生物信息学探究重性抑郁障碍共病炎症性肠病的分子机制	1132
Genetic Associations between Depression and Autoimmune Thyroiditis Identified by Common Variants and Rare Coding Variants	1132
精神科药物与抗利尿激素分泌失调综合征	1133

目的 重性抑郁障碍(Major depressive disorder, MDD)和双相情感障碍(Bipolar disorder, BD)的鉴别诊断一直是临床上的难点问题。由于两者存在重叠的抑郁症状,且BD处于抑郁期的时间较长,如果临床医生缺乏明确的躁狂或轻躁狂的诊断证据,往往会发生误诊。误诊则可能导致错误的治疗,进而引起治疗效果不佳,临床症状迁延不愈等不良后果。因此,对两种情感障碍的鉴别诊断不论从临床角度还是科研角度都尤为重要。

方法 本研究共纳入121名被试,所有被试均在基线采集磁共振影像数据,之后对MDD患者进行了平均每半年一次的电话随访或面对面访谈。在随访中出现躁狂或轻躁狂症状的患者纳入转躁患者组(BD组),维持MDD诊断的患者纳入MDD组。其中,MDD组平均随访了42.53个月,BD组平均随访了33.98个月。最终,40名患者纳入MDD组,41名患者纳入BD组,同时纳入年龄、性别、教育年限匹配的健康对照40名。使用度中心度(Voxel-based degree centrality, DC)衡量大脑功能变化。基于BD和MDD间存在差异脑区的DC特征,采用随机森林的算法构建分类器。采用10折交叉验证来验证算法的稳定性,同时计算每折中模型的曲线下面积(Area under the receiver operating characteristic curve, AUC)、准确度、敏感度和特异度来评估分类器性能。

结果 三组被试在额叶脑区和顶叶脑区存在DC差异。事后分析结果显示MDD患者存在特异性的左侧大脑的中央前回,中央前回,顶下小叶,额中回,缘上回,额下回(岛盖部),额下回(三角部)DC值增高,BD患者存在特异性的右侧大脑的中央

前回,中央前回,顶下小叶,额中回,缘上回,额下回(岛盖部),额下回(三角部)DC值减低。BD组和MDD组分类准确率=75.3%,敏感度=75%,特异度=75%,AUC=74.3%。

结论 额叶和顶叶的功能改变可能是MDD和BD早期鉴别诊断的影像学标志。

利用临床心理特征、遗传变量构建抗抑郁药效预测模型

蔡雨凡 邵永琪 唐海平 刘芮 徐治
东南大学附属中大医院

目的 抑郁症是一种常见的精神疾病,对患者身心健康造成了严重影响。现有的抗抑郁药物在治疗效果上存在很大差异,因此如何预测抗抑郁药物的治疗反应具有重要的临床价值。抗抑郁药效受遗传因素影响,抑郁症患者的临床和心理特征被认为是预测治疗反应的可能因素。本研究将进行靶向外显子基因测序,利用机器学习方法将基因单核苷酸多态性(SNPs)、临床特征和心理特征结合生成预测模型,提高预测抗抑郁药效的准确度,为临床治疗提供一定的参考。

方法 本研究共招募了1000名首发或未服药大于2周的抑郁症患者,接受单一抗抑郁药治疗8周。在基线期和治疗后第2、4周时采用17项汉密尔顿抑郁量表(HAMD-17)评估患者抑郁症状严重程度及其变化。观察患者4周时的治疗效果,标准为HAMD-17减分率<50%为无效,HAMD-17减分率≥50%为有效。在基线期收集患者的一般人口学资料、临床特征(包括Beck自杀意念量表、快感缺失量表、多伦多述情障碍量表)和心理特征(社会支持量表、家庭环境量表、童年创伤经历量表,生活事件量表),基于KEGG通路数据库,围绕MDD病因假说和发病机制以及抗抑郁作用相关通路共筛选1309个候选基因,通过Illumina MiSeq平台完成测序,使用PLINK软件筛选高质量SNP,剔除缺失率大于20%、最小基因频率低于5%的SNP标记。最终纳入845名患者、65个特征变量构建数据集。将数据集划分为训练集(N=591)和测试集(N=254),对训练

集做数据预处理,递归消除法筛选出 59 个特征,基于随机森林算法构建 4 周抗抑郁药效预测模型。利用网格搜索进行超参数优化,比较纳入不同特征变量组合后模型的预测效果,记录测试集的准确率、召回率和 F1 值等评估指标。

结果 对于接受 4 周抗抑郁药治疗的患者,仅纳入一般人口学资料和临床特征的疗效预测模型训练集和测试集的准确率为 79.9%、54.4%,增加心理变量后模型准确率为 79.9%、56.1%,增加遗传变量后模型准确率为 80.4%、58%,同时纳入心理、遗传变量后模型准确率为 99.7%、76.8%。

结论 通过对比不同特征变量组合下模型的预测性能,发现将遗传因素、心理特征和临床特征组合起来能够进一步提高模型的预测能力,为临床用药决策的制定提供了一定的参考价值。

Genome-wide Association Study of Antipsychotic-induced Movement Disorder in Patients with Schizophrenia

Lu Zhe, Yue Weihua

Peking University Sixth Hospital

Objective Antipsychotics are the first-line choice for the management of schizophrenia. Although there are many kinds of antipsychotics applied for patients with schizophrenia, roughly 75% patients with schizophrenia discontinue the treatment result from the poor efficacy and side-effects, which prolongs the optimum treatment time and influences the prognosis. One of the most common side effects is extrapyramidal syndrome (EPS). There is very limited understanding on the genetic factors that associated with antipsychotic-induced EPS

Methods We conducted a genome-wide association study (GWAS) of antipsychotic-induced EPS in patients with schizophrenia. The data was from the Chinese Antipsychotics Pharmacogenomics Consortium (CAPOC). This study was compliant with the Declara-

tion of Helsinki. The protocol was approved by the Clinical Research Ethics Committee at each site, and written informed consent was obtained. All the participants in this cohort were randomly assigned to six groups (olanzapine, risperidone, quetiapine, aripiprazole, ziprasidone, and first-generation antipsychotics; first-generation antipsychotics including haloperidol or perphenazine were also assigned randomly) and received 6-week antipsychotic treatment. A total of 2014 patients was included in this study

The Simpson-Angus Scale (SAS), the Barnes Akathisia Rating Scale (BARS), and the Abnormal Involuntary Movement Scale (AIMS, only used the first seven items) were evaluated to assess EPS. BARS was applied to assess the akathisia. AIMS was applied to assess the involuntary movement. The changes of three scale scores at 6th week were set as phenotypes.

We did the linear regression in PLINK (version 1.9) to assess the associations between allele and antipsychotic-induced EPS symptoms separately. Sex, age, type of antipsychotics, dosage of antipsychotics at endpoint (chlorpromazine equivalent dose equivalence), course of schizophrenia, center and the first five principal components of population structure were set as covariates. The accepted genome-wide significance threshold of a P value of less than 5×10^{-8} were adopted, and the associations with a P less than 1×10^{-5} were set as findings of interest. Furthermore, multiple several secondary analyses were carried out on the genome-wide association results, such as expression patterns of certain genes in human tissues, and enrichment analyses.

Results We identified 26 novel SNPs associated with antipsychotic-induced involuntary movement (assessed by AIMS) at a genome-wide significance level. The top SNP (rs11769191) is located in CNTNAP2 gene ($p = 5.65E-13$), namely contactin associated protein 2. CNTNAP2 gene encodes a member of the neurexin family which functions in the vertebrate nervous system as cell adhesion molecules and receptors, which is involved in interactions between neurons and glia during nervous system development and is also involved in localization of potassium channels within differentiating axons. This gene is highly expressed in the brain tissue,

and has been implicated in multiple neurodevelopmental disorders, including Gilles de la Tourette syndrome, schizophrenia, epilepsy, autism, ADHD and intellectual disability. The other SNPs at a genome-wide significance level were mapped in the ZNF638 (rs13032033, $p = 9.88E-11$), LUZP2 (rs149137825, $p = 3.91E-09$), FAM83B (rs16886072, $p = 5.27E-09$), GLO1 (rs117588402, $p = 5.55E-09$), ARHGEF4 (rs10196377, $p = 6.52E-09$), DYNC2H1 (rs146993202, $p = 1.57E-08$), UMOD (rs4238595, $p = 3.59E-08$), and MYH6 (rs76202841, $p = 4.00E-08$). Then we conducted the enrichment analyses by using 154 SNPs with P value less than 1×10^{-5} and found that these genes were associated with nervous system development. Moreover, we identified one novel SNP associated with antipsychotic-induced EPS (assessed by SAS) at a genome-wide significance level, namely rs116249243 which is located in the RAB44 gene ($p = 8.36E-09$). RAB44, Ras Related Protein Rab 44, is predicted to enable GTP binding activity and calcium ion binding activity, which is associated with innate immune system. Additionally, we one novel SNP related to the akathisia (assessed by BARS) at a genome-wide significance level ($p = 5.69E-09$), while this SNP is not located in gene. The enrichment analyses of SNPs related to akathisia with P value less than 1×10^{-5} showed that these SNPs were involved in severe intellectual disability, sleep disorders and spasticity

Conclusion This study is the largest GWAS on antipsychotic-induced EPS. We have identified CNTNAP2 (related to nervous system development and localization of potassium channels within differentiating axons) and other nine genes, which were associated with antipsychotic-induced involuntary movement. We also found RAB44 gene related to innate immune system which were associated with antipsychotic-induced EPS, as well as one novel SNP associated with antipsychotic-induced akathisia. These findings improve the understanding of the mechanisms underlying antipsychotic-induced EPS

An Investigation on Genetic Mechanisms under Clinical Subgroups in Schizophrenia

Meng Zhou², Yamin Zhang¹, Tao Li^{1,2}

1. Hangzhou Seventh People's Hospital

2. Zhejiang University School of Medicine

Background Clinical heterogeneity in schizophrenia (SZ) poses a significant challenge to genetic research, as varying symptoms may be linked to different genetic susceptibilities. Previous studies had identified various subgroups of SZ using cluster analysis based on phenotypes. However, the genetic mechanisms underlying these subgroups remain unclear. This study aims to investigate the genetic risk of SZ subgroups derived from clinical symptoms through polygenic scores (PGSs) analysis and Genome-Wide Association Studies (GWAS).

Methods In 2974 SZ patients and 720 healthy controls (HC), K-means cluster analysis using Positive and Negative Syndrome Scale (PANSS) was applied to classify the patients into subgroups with different clinical symptoms profiles. Then we compared the genetic liability of different SZ-related phenotypes among different subgroups using logistic regression model. Genetic liability was represented by PGSs for 191 brain functional networks assessed using resting-state functional magnetic resonance imaging (rsfMRI) and pathway specific PGS (pPGS) for four neurotransmitters systems (dopamine, serotonin, glutamate, GABA) and 24 pathways that showed enrichment in the PGC3 GWAS for SZ. Additionally, cluster-based GWAS analyses were performed for each cluster and HC, with sex, age, and microarray types as covariates.

Results We identified four subgroups of patients with schizophrenia, each with distinct symptom profiles: low symptoms (cluster-L), predominant affective and excited symptoms (cluster-AE), predominant negative symptoms (cluster-N), and predominant positive symptoms (cluster-P). Patients in cluster-N had the poorest social functioning, whereas those in cluster-P showed the least impairment.

After Bonferroni correction, six rsfMRI phenotypes showed differing genetic risks between patients and HC. Specifically, patients in cluster-L and cluster-AE exhibited decreased PGS for the motor network compared to HC. Patients in cluster-N showed changes three phenotypes related to default mode network, central executive network and saline network, while patients in cluster-P exhibited changes in two phenotypes related to visual network, default mode network and central executive network.

Furthermore, patients in cluster-L had as higher dopamine pPGS compared to HC. Glutamate pPGS were elevated in both cluster-AE and cluster-N, while GABA pPGS were higher only in cluster-N. Regarding the 24 pathways enriched in PGC3 GWAS for SZ, pPGS of synapse and transporter complex were higher in all four subgroups compared to HC, while pPGS of ion channels and voltage-gated channels had elevated levels only in cluster-N. Additionally, pPGS of axon and regulation of cation channel activity pathways were higher in cluster-AE.

For cluster-based GWAS analyses, we did not find genome-wide significance at the variants level and genes level in cluster-based GWAS analyses. Pathway analysis revealed enrichment of four immunology-related pathways from GO database in the GWAS results for cluster-N. No positive result was found in other subgroups.

Conclusion Our results suggest that SZ patients with distinct symptom profiles displayed varying genetic liability of brain functional networks and biological pathways. Notably, patients in cluster-N exhibited a higher genetic burden on immune-related pathways compared to other patients.

Risk of Cardiovascular Disease Hospitalization after Common Psychiatric Disorders: Analyses of Disease Susceptibility and Progression Trajectory in The UK Biobank

Xin Han, Huan Song

West China Hospital, Sichuan University

Objective Both psychiatric disorders and cardiovascular diseases (CVDs) are leading causes of disability, morbidity, and mortality worldwide according to the World Health Organization (WHO). In recent decades, accumulating evidence has indicated a link between psychiatric disorders and CVD. Whether associations between psychiatric disorders and hospitalization for cardiovascular diseases (CVDs) can be modified by disease susceptibility and the temporal pattern of these associated CVDs remain unknown. In the present study, taking advantage of enriched phenotypic information, almost complete follow-up, and individual-level genotyping data in the UK Biobank, we aimed to clarify whether disease susceptibility to CVD (i.e., indicated by genetic predisposition and familial history) modifies the association of common psychiatric disorders with subsequent risk of hospitalization for CVDs, and identify the key CVDs directly associated with a prior diagnosis of common psychiatric disorders

Methods In our study, we conducted a matched cohort study of the UK Biobank including 44,430 patients with common psychiatric disorders (anxiety, depression, and stress-related disorders) between 1997 and 2019, together with 222,150 sex-, Townsend deprivation index-, and birth year- individually matched unexposed individuals. We used a stratified Cox model (Holt and Prentice 1974) to estimate hazard ratios (HRs) with 95% CIs of any CVD hospitalization, in relation to a previous diagnosis of common psychiatric disorders, using time since the index date as the underlying time scale. The models were stratified by matched identifiers (unique ID for each exposed patient and their individually matched unexposed individuals), and partially or fully adjusted for sex, birth year, TDI, educational levels, ethnicity, smoking status, BMI, history of other psychiatric disorders, family history of CVD, and CCI. To determine the impact of disease susceptibility to CVD on the association between common psychiatric disorders and CVD, we conducted stratified analyses by family history of CVD (yes or no, for any CVD) and by level of CVD polygenic risk score (high, moderate, or low by

tertile distribution, for six subtypes of CVD). The CVD PRS was calculated by using LDpred2, based on a combination of summary statistics and a matrix of correlations between genetic variants. The temporal progression of CVD subsequent to a diagnosis of psychiatric disorders was explored using disease trajectory analysis, which is an approach that has been successfully applied for detecting directional networks of comorbidities after a diagnosis of depression and breast cancer.

Results During a mean follow-up of 12.28 years, we observed an elevated risk of CVD hospitalization among patients with psychiatric disorders, compared with matched unexposed individuals (hazard ratios [HRs] = 1.20, 95% confidence interval [CI]: 1.18-1.23), especially during the first six months of follow-up (1.72 [1.55-1.91]). We observed similar associations among individuals with and without a family history of CVD (1.73 [1.50-2.00] vs 1.88 [1.49-2.37], p for difference = 0.5506 within six months of follow-up, and 1.20 [1.16-1.23] vs 1.19 [1.14-1.24], p for difference = 0.7490 beyond six months follow-up). Likewise, comparable risk elevations were observed among individuals with different levels of CVD PRS within six months of follow-up (e.g., for ischemic heart disease, 3.33 [1.13-9.79] and 1.73 [1.03-2.92] for low and high PRS, p for difference = 0.2843) and beyond (1.31 [1.14-1.51] and 1.21 [1.12-1.32] for low and high PRS, p for difference = 0.3391). We conducted trajectory analysis to visualize the temporal pattern of CVDs after common psychiatric disorders, identifying primary hypertension, acute myocardial infarction, and stroke as three main intermediate steps leading to further increased risk of other CVDs

Conclusion In conclusion, the association between common psychiatric disorders and subsequent CVD hospitalization is not modified by predisposition to CVD. Hypertension, acute myocardial infarction, and stroke are three initial CVDs linking psychiatric disorders to other CVD sequelae, highlighting a need of timely intervention on these targets to prevent further CVD sequelae among all individuals with common psychiatric disorders

Dose Adjustment of Paroxetine Based on CYP2D6 Activity Score Inferred Metabolizer Status in Chinese Han Patients with Depressive Or Anxiety Disorders: A Prospective Study and Cross-ethnic Meta-analysis

Yundan Liao¹, Jing Guo¹, Weihua Yue¹, PMDEA Consortium²

1. Peking University Sixth Hospital

2. Precision Medicine to Enhance Depression and Anxiety Outcome Consortium

Objective Understanding the impact of CYP2D6 metabolism on paroxetine, a widely used antidepressant, is essential for precision dosing and remains unclear.

Methods We conducted an 8-week, multi-center, single-drug, prospective cohort study in 921 Chinese Han patients with depressive or anxiety disorders. We performed CYP2D6 genotyping (single nucleotide variant and copy number variant) to derive the CYP2D6 activity score and evaluated paroxetine treatment outcomes including steady-state concentration (C_{ss}), treatment efficacy, and adverse reaction. CYP2D6 metabolizer status was categorized into poor metabolizers (PMs), intermediate metabolizers (IMs), extensive metabolizers (EMs) and ultrarapid metabolizers (UMs). The influence of CYP2D6 metabolic phenotype on paroxetine treatment outcomes was examined using multiple regression analysis and cross-ethnic meta-analysis. We also explored how copy number variant (CNV) of CYP2D6 gene affect paroxetine treatment outcomes. The therapeutic reference range of paroxetine in Chinese Han patients was estimated by receiver operating characteristic analyses

Results After adjusting for demographic factors, the paroxetine C_{ss} in PMs, IMs, and UMs were 2.50, 1.12, and 0.39 times that of EMs, with PM and UM effects being statistically significant (multiple linear regression, exponentiated $\beta = 2.50$, 95%CI: 1.08-5.76, $P = 0.03$; exponentiated $\beta = 0.39$, 95%CI: 0.15-0.97, $P = 0.04$, respectively). Sex and ethnicity influenced the

comparison between IMs and EMs. Poor efficacy of paroxetine was associated with UM, and a higher risk of developing adverse reactions was associated with the lower activity score. Moreover, after adjusting for demographic factors, the paroxetine C_{ss} of CYP2D6-CNV deletion carrier and CYP2D6-CNV duplication carrier were 1.53 and 0.64 times that of CYP2D6-CNV non-carriers (multiple linear regression, exponentiated $\beta = 1.53$, 95%CI: 1.26-1.85, $P < 0.001$; exponentiated $\beta = 0.64$, 95%CI: 0.36-1.12, $P = 0.12$, respectively). Regarding efficacy, pooled analysis showed that CYP2D6-CNV-deletion carriers had significantly greater symptom improvement after 8-week paroxetine treatment compared to non-carriers (pooled standardized $\beta = 0.21$, 95%CI: 0.01-0.41, $P = 0.04$, $I^2 < 0.01$). The paroxetine therapeutic reference range was found to be 31.95-79.65ng/ml for depressive or anxiety disorders, and 31.55-52.5 ng/ml for major depressive disorder. Lastly, cross-ethnic meta-analysis suggesting dose adjustments for PMs, IMs, EMs, and UMs in the East Asian population to be 35%, 40%, 143%, and 241% of the manufacturer's recommended dose, and 62%, 68%, 131%, and 159% in the non-East Asian population

Conclusion Our findings advocate for precision dosing based on the CYP2D6 metabolic phenotype, with sex and ethnicity being crucial considerations in this approach. We recommend greater dose adjustment for CYP2D6 metabolizer status in East Asians and cautious adjustments for Chinese Han male patients

关键词: CYP2D6, copy number variant, metabolizer status, paroxetine, dose adjustment, precision medicine

磁休克治疗对重性抑郁障碍症状及脑血流变化的研究

焦丽欢 王冉

河北医科大学第一医院

目的 探讨磁休克(MST)治疗对重性抑郁障碍患者症状、脑血流的影响。

方法 收集2023年6月至2024年2月于河北医科大学第一医院精神卫生中心住院的18-50岁患者,符合DSM-5重性抑郁障碍的诊断标准,且HAMD-17评分 ≥ 25 分,共纳入患者14例,在药物治疗的基础上,给予患者8次磁休克治疗。分别在基线和治疗3周末采集fNIRS在言语流畅性任务下双侧颞叶和前额叶区域的HbO的积分值的变化。收集患者一般人口学资料,并在治疗前后评估受试者情况。使用17项汉密尔顿抑郁量表(Hamilton Depression Rating Scale, HAMD-17)、汉密尔顿焦虑量表(Hamilton Anxiety Rating Scale, HAMA)、匹兹堡睡眠质量指数量表(Pittsburgh sleep quality index, PSQI)、连线测验(Trail Making Test, TMT)、数字符号、数字广度测验及不良反应量表评估患者治疗前后症状变化。采用SPSS 27软件、MATLAB软件对数据进行分析研究。

结果 与磁休克治疗前相比,治疗后患者HAMD、HAMA、PSQI得分显著下降,差异具有统计学意义($t = -4.405$, $P = 0.000$; $t = 4.322$, $P = 0.000$; $t = 3.087$, $P = 0.005$)。治疗后患者连线测验(Trail Making Test, TMT)任务1、2,数字符号,数字广度测验顺背、倒背评分无明显变化,差异无统计学意义($Z = -0.590$, $P = 0.555$; $Z = -1.050$, $P = 0.294$; $Z = -0.508$, $P = 0.611$; $Z = -0.107$, $P = 0.915$; $Z = -0.482$, $P = 0.630$)。MST治疗后左、右颞叶、前额叶HbO积分值增加,差异具有统计学差异($T = -2.30$; $P = 0.029$; $T = -2.10$; $P = 0.044$; $T = -3.50$; $P = 0.0015$)。相关性分析使用线性回归以HAMD、HAMA、PSQI总分为因变量,前额叶、两侧颞叶HbO值为自变量进行分析,HbO值可以解释量表总分的35.7%,没有显著相关性($P = 0.342$)。其中有2名患者第一次治疗后存在头痛,不排除患者本身所存在的躯体症状,1名患者存在头晕不适,余未报告明显不良反应。

结论 磁休克疗法治疗对重性抑郁障碍患者的焦虑、抑郁情绪及睡眠症状有显著改善作用,治疗后左颞叶、右颞叶、前额叶脑血流较治疗前增加,与量表评分变化无明显相关性,还需进一步扩大样本量来验证。

Relationship between Anxiety and Internet Addiction: A Network Analysis of Large-Population Chinese Adolescent Students

Yi Xie, Mengmeng Zhang, Mingli Li, Maosheng Ran
Mental Health Center, West China Hospital, Sichuan University

Objective Anxiety is the most common mental disorder globally, with a significant impact on Chinese adolescents at a rate of 4.7%. It often appears alongside other mental health issues, such as Internet addiction (IA), characterized by losing control of internet use or functional impairments. Although the relationship between anxiety and IA has been previously studied, network analysis enables us to estimate relationships even further at the symptom level. The general network analysis considers all symptoms and symptom interactions. Bridge network analysis focuses on the symptom interaction across different disorders without considering the internal relationships within diseases. Additionally, Bayesian network analysis can provide the potential direction of these relationships. However, previous studies have rarely examined anxiety-IA comorbidity using all of these analyses simultaneously. Thus, this study aims to use general, bridge, and Bayesian network analyses to identify the most influential symptoms in anxiety-IA comorbid networks among Chinese adolescents.

Methods This cross-sectional study was conducted among adolescent students in Sichuan Province, China, from December 2022 to February 2023. A total of 122 middle schools and high schools participated in the survey. This study utilized the 7-item Generalized Anxiety Disorder Scale (GAD-7) and the modified 17-item Internet Addiction Test (IAT-17) for assessing anxiety and IA, respectively. Given the debate on the optimal network modeling approach beyond a binary classification, this study simplified all of the items into binary categories, representing the absence or presence of symptoms. Our main approaches included setting up

network models, analyzing the most influential symptoms, and accessing the accuracy and stability of our models. To preserve the positive and negative values, we opted for the Expected Influence (EI) measure to identify the most influential nodes.

Results The study included 60,268 adolescents (mean age = 15.90 ± 1.65 years; age range 12–19 years; 45.56% boys and 54.44% girls; 40.08% junior high and 59.92% senior high school). “Nervousness” and “complaints about prolonged internet usage” emerged as the most common in the GAD-7 and the IAT-17 separately. The total score for the dichotomized GAD-7 and IAT-17 was 2.47 ± 2.98 and 11.17 ± 5.48 , respectively. In the general network, “uncontrollable worry,” “irritability,” and “the web makes you feel better” were the most important symptoms in the model. In the bridge network, “restlessness,” “irritability,” “feeling afraid,” “defensive or secretive about being on the web,” and “using the web to escape from emotion” connected anxiety and IA sub-networks. Both network models revealed acceptable stability. In the Bayesian analysis, “losing sleep” had the highest latent predictive power. “Restlessness,” “irritability,” and “the web makes you feel better” activated multiple downstream symptom connections. Besides, Bayesian analysis pointed to a potential direct impact of IA on anxiety.

Conclusion Our findings provide a novel examination of the anxiety-IA comorbidity network in Chinese adolescents through multiple integrative network analyses, offering insights into the onset, development, and interactions of anxiety and IA at the symptom level. Our study emphasizes the need for future longitudinal studies to explore causality and develop tailored interventions for the comorbidity of anxiety and IA.

抑郁症患者脑电微状态时间动力学特征与皮层内抑制功能的研究

程宇琪 肖中梅
昆明医科大学第一附属医院

目的 通过评估抑郁症患者脑电微状态时间动力学特征,从动态的视角去探索抑郁症的神经机制。同时评估抑郁症患者的皮层内抑制功能,进一步探索大脑神经网络时间动力学改变与其皮层内抑制功能的关系。

方法 纳入 2022 年 9 月至 2023 年 12 月就诊于昆明医科大学第一附属医院的抑郁症(符合 DSM-V 诊断标准)患者 45 名,以及年龄、性别、受教育年限相匹配的健康对照 29 名。使用汉密尔顿抑郁量表-17 项(HAMD-17)、神经心理状态评定量表(RBANS)评估抑郁症状及认知功能。采集所有被试的静息态脑电数据,使用 CARTOOL 进行微状态分析,提取微状态(A、B、C、D)的时间动力学参数包括平均持续时间、出现频率、覆盖率、相互转换概率。采用成对脉冲经颅磁刺激联合肌电描记技术(ppTMS-EMG)测量皮层内抑制功能:短时程皮层内抑制(SICI)和长时程皮层内抑制(LICI),SICI、LICI 测量值越高皮层内抑制功能越差。最后使用 SPSS26 进行统计分析。

结果 1.抑郁组微状态 A 出现频率($P=0.002$)、时间覆盖率($P=0.005$)及微状态 D 出现频率($P=0.006$)高于健康对照组,微状态 C 平均持续时间($P=0.001$)、出现频率($P=0.038$)、时间覆盖率($P=0.001$)低于健康对照组。与健康对照组相比,抑郁组微状态 A→D($P<0.001$)、D→A($P<0.001$)转换概率增加, B→C($P=0.028$)、A→C($P<0.001$)、C→D($P=0.001$)、D→B($P=0.019$)转换概率减少。在相关性分析中,抑郁组 HAMD 因子分焦虑/躯体化与微状态 A 出现频率($r=0.330$, $P=0.033$)与呈正相关, HAMD 因子分认识障碍与微状态 D 出现频率($r=0.389$, $P=0.011$)、D→B 转换概率($r=0.381$, $P=0.013$)呈正相关。2.抑郁组 SICI($P<0.001$)、LICI($P=0.008$)较健康对照组增高。3.抑郁组 SICI 与微状态 A→B 转换概率($r=-0.308$, $P=0.047$)、B→A 转换概率($r=-0.322$, $P=0.038$)呈负相关。抑郁组 LICI 与 B→A 转换概率($r=-0.334$, $P=0.031$)呈负相关。

结论 1.抑郁症存在多个脑电微状态时间动力学的异常,从动态的视角说明抑郁症存在大尺度神经网络的紊乱以及不同神经网络之间的异常交流。此外,抑郁症脑电微状态的时间动力学的异常可能是不同症状的基础。2.抑郁症患者的短时程及长时程皮层内抑制功能均受损,其皮层内抑制受损可能

是其网络动态交流障碍的机制之一。

Virtual Reality Working Memory Training Improves Working Memory of Patients with Major Depressive Disorder: A Functional Near-infrared Spectroscopy Study

Xiaodan Lu Yanbin Jia*

First Affiliated Hospital, Jinan University

Objective Most patients with major depressive disorder (MDD) have working memory (WM) impairment, which can be improved by virtual reality working memory (VR-WM) training, but the specific neural mechanisms are still unclear. In this study, VR-WM training was conducted in patients with MDD to verify how it improves WM and further explore the role of the frontotemporal lobe in its related neural mechanisms

Methods Fifty-seven MDD patients were included. Among them, 29 MDD patients received VR-WM training, while 28 did not. Stroop color and word test, 2-back task, digit task switching, and digit span test were used to evaluate the inhibition, updating and switching function of WM, and working memory span. Functional near-infrared spectroscopy (fNIRS) was used to detect the functional features of the frontotemporal lobe in MDD patients at rest before and after training

Results After the VR-WM training, MDD patients exhibited significant improvements in the accuracy of the Stroop color and word test ($p = 0.013$) and 2-back task ($p = 0.002$), the scores of digit span test ($p = 0.030$) and HDRS score ($p = 0.006$). Significant group-by-time interactions of local efficiency ($p = 0.005$) and clustering coefficient ($p = 0.004$) of the frontotemporal lobe were observed between the two groups. After VR-WM training, the improvement of the scores of digit span test in MDD patients was positively correlated with the increase of clustering coefficient in frontotemporal lobe

Conclusion VR-WM training effectively improved the inhibition function, updating function and memory span in WM of patients with MDD. Besides, VR-WM training improves WM performance in patients with MDD by enhancing functional connectivity in the frontotemporal lobe

抑郁障碍研究协作组

中国单相抑郁症的药物联合/增效治疗现状

肖乐

首都医科大学附属北京安定医院

目的 尽管抑郁障碍的治疗指南一直强调单一用药的治疗原则，然而单一用药治疗的有效率低，因此在临床实际中药物增效/联合治疗非常普遍，对于疗效不佳的患者，增加当前抗抑郁药的剂量，换用另一种抗抑郁药，添加心境稳定剂或抗精神病药物（增效治疗），或联合另一种抗抑郁药（联合治疗）。很多尚未服药的单相抑郁症患者在初始用药阶段也用到了增效/联合治疗，但很少有相关研究。本研究旨在（1）对中国未用药的单相抑郁患者增效/联合治疗的现状进行初步分析；（2）探讨联合/增效治疗相关的影响因素。

方法 本研究为全国多中心的纵向随访观察，在 23 家中心入组抑郁发作尚未服药的患者。基线时收集社会人口统计学、临床特征和治疗药物，并进行抑郁症状、生活质量和社会功能的评估。我们采用单因素分析和多元 Logistic 回归分析联合/增效用药的相关因素。

结果 共有 1330 例患者纳入本研究分析，361 例（27.14%）患者接受了联合/增效治疗，其中 236 例（17.74%）接受了抗精神病药物治疗，50 例（3.76%）接受了锂盐治疗，37 例（2.78%）接受了丙戊酸钠治疗，105 例（7.89%）接受了两种及以上的抗抑郁药治疗。相比单药治疗，SNRIs、NaSSAs、安非他酮和曲唑酮在联合/增效治疗中更常见。接受联合/增效治疗的患者男性居多，年龄较大，受教育程度较低，月收入较低，在抑郁症状（IDS-SR30 评分）、社会功能损害（SDS 评分）中的得分更高。多因素分析显示精神运动性迟缓、躯体不适、躯体化焦虑症状、灌铅样麻痹是联合/增效治疗的相关因素。

结论 在真实世界的临床实践中，联合/增效治疗非常普遍。接受强化/联合治疗的患者更有可能是年龄较大的男性，伴有更严重的抑郁症状和功能损害。

基于个体临床动态数据监测的混合电抽搐治疗 (i-HECT) 对青年抑郁患者的疗效和自杀意念研究

张静雅 曾伦 刘晓浪 孙小童 谭柏坚* 李凌江
惠州市第二人民医院

目的 自杀是青少年死亡的第二大因素。重度抑郁是导致残疾和自杀死亡的主要原因。青年抑郁患者得到快速、有效的治疗,有助于缩短他们在学业、工作和社会活动中受损的时间。既往改良的无抽搐电休克疗法(modified-ECT, MECT 或 ECT)常因其副作用而被青年患者排斥,我们团队已发表了一项改良的策略混合 ECT (Hybrid-ECT, HECT) 在取得良好效果的同时尽量降低了认知副作用。本研究,我们进一步改良该方案,探索这种 i-HECT 对青年抑郁患者的疗效和自杀意念的影响。

方法 46 名青年抑郁患者(16-25 岁)在基线和 i-HECT 结束后接受了临床疗效和自杀意念评估。采用临床疗效总评量表-疾病严重程度分量表(CGI_S)评估当前抑郁的严重程度,哥伦比亚自杀严重程度评定量表(C-SSRS)意念强度分量表评估被试的自杀严重程度。i-HECT 方案为:在每次 ECT 治疗后对被试进行症状检测,达到预先设定条件即由常规 ECT 转变为低电量 LCE(电量为常规 ECT 的一半)治疗。

结果 配对样本 T 检验结果显示,被试经过 i-HECT 治疗后,自杀意念强度总分[(16.35±4.18)分]显著降低为[(8.54±6.48)分],差异显著($P < 0.01$)。其中分量表结果显示,自杀的频率、持续时间、可控性、阻碍因素和产生自杀的原因均显著降低($P < 0.05$),且疾病严重程度 CGI_S 得分[(1.93±0.98)分]也较基线水平[(5.65±0.71)分]下降显著($P < 0.05$)。

【局限性】缺乏常规 ECT 研究作为对照;无法控制年龄、性别和药物干预等影响。

结论 i-HECT 在青年抑郁患者中有良好的疗效表现和降低自杀意念的效果。该研究提示我们,针对有严重自杀风险的青年抑郁患者,在接受 ECT 治疗时可以根据患者的症状改善情况考虑更个性化的电量设置方案,在达到预期临床收益的同时降低其自杀意念的强度。我们也需要进一步考虑电量设

置、抽搐与否在降低抑郁患者自杀风险中的作用与必要性。

Alterations of Structure- Function Coupling in The Temporal Lobe and Thalamus in Major Depressive Disorder Patients with and without Anhedonia

Qingli Mu Shaojia Lu*

The First Affiliated Hospital, Zhejiang University School of Medicine

Objective Major depressive disorder (MDD) patients with anhedonia are generally considered to be characterized by severe social impairment, poor treatment outcomes, poor prognosis, and longer course of disease. In recent years, many magnetic resonance studies have shown that MDD with anhedonia may have unique brain structural and functional alterations. However, the effect of anhedonia on synchronized changes in the structure and function of individual brain regions in MDD is unclear

Methods A total of 88 individuals, including 29 MDD patients with anhedonia, 29 MDD patients without anhedonia, and 30 healthy controls (HCs) were enrolled in this study. All subjects underwent structural and resting-state functional magnetic resonance imaging scans. Using the obtained structural and functional data, the regional structure-function coupling of cortical and subcortical regions was constructed by quantifying the distribution similarity of gray matter volume (GMV) and the amplitude of low-frequency fluctuations (ALFF). Further, we investigated the alterations in structural and functional coupling in MDD with and without anhedonia. Finally, the partial correlation between structure-function coupling and clinical features of the temporal lobe and thalamus in MDD patients was further analyzed

Results The ANCOVA revealed significant structure-function coupling differences among three

groups in the precentral gyrus (PrG), middle temporal gyrus (MTG), insular gyrus (INS), and thalamus (Tha). When compared with HC, structure-function coupling decreased in the right INS, right PrG, and left PrG. When anhedonia was taken into account, the structure-function coupling of MDD with anhedonia was reduced in left MTG and right Tha compared with the other two groups. In addition, partial correlation analysis found that the structure-function coupling in the left MTG was positively correlated with the age of first onset but negatively correlated with the total course of disease

Conclusion Our findings highlight that reduced structure-function synchronicity in the temporal cortex and thalamus may be associated with the development of anhedonia symptoms in MDD patients

关键词: Structure-Function Coupling; Anhedonia; Major Depressive Disorder; Temporal Lobe; Thalamus

Associations between Specific Dietary Patterns, Gut Microbiome Composition, and Incident Subthreshold Depression in Chinese Young Adults

Xiumin Jiang, Yongjun Chen

Shandong University of Traditional Chinese Medicine

Objective Subthreshold depression (SD) characterizes a mood disorder where individuals experience 2-4 depressive symptoms persisting for at least 2 weeks. The interplay between influential factors and the incidence of SD in young adults remains poorly understood. This study sought to understand the dietary habits, gut microbiota composition, etc. among individuals with SD in young adults and to investigate their association with SD occurrence.

Methods Employing a cross-sectional approach, 178 individuals with SD, aged 18-32 years, were matched with 114 healthy counterparts. SD status was evaluated using the Zung Self-rating Depression Scale (SDS), Zung Self-rating Anxiety Scale (SAS), Beck Depression Inventory 2nd version (BDI-II), the 17-item Hamilton Rating Scales of Depression (HAMD-17), and

Pittsburgh Sleep Quality Index (PSQI). Metagenomic sequencing was utilized to identify fecal microbial profiles. Dietary patterns were discerned via factor analysis of a 25-item food frequency questionnaire (FFQ). Logistic regression analysis and mediation analysis were performed to explore the potential links between gut microbiota, dietary patterns, and incident SD

Results Data on dietary habits were available for 292 participants (mean [SD] age, 22.1 [2.9] years; 216 [73.9%] female). Logistic regression analysis revealed that dietary patterns I (odds ratio [OR], 0.34; 95% CI, 0.15-0.75) and IV (OR, 0.39; 95% CI, 0.17-0.86 and OR, 0.39; 95% CI, 0.18-0.84) were associated with reduced risk of SD. Distinct microbial profiles were observed in young adults with SD, marked by increased microbial diversity and taxonomic alterations. Moreover, mediation analysis suggested *Veillonella atypica* as a potential mediator linking SDS or BDI-II scores with a healthy dietary pattern rich in bean products, coarse grains, nuts, fruits, mushrooms, and potatoes ($\beta = 0.25$, 95% CI: 0.02-0.78 and $\beta = 0.18$, 95% CI: 0.01-0.54)

Conclusion The results imply a link between specific dietary patterns and the onset of SD. Individuals with SD tend to exhibit higher levels of gut microbiota, a correlation that aligns with certain dietary habits. This points to the gut microbiota potentially acting as a mediator between dietary patterns and SD, shedding light on a plausible mechanism underlying how dietary choices impact the severity of SD symptoms. To this end, dietary patterns or microbiota may be a promising therapeutic target for the prevention and treatment of SD

基于机器学习算法和生物信息学识别自噬相关抑郁症诊断生物标志物和基因调控网络

黄子涵 孔岩

东南大学医学院

目的 抑郁症作为世界第二大负担疾病, 给家

庭和社会造成了巨大的负担,由于发病机制不明确、患者个体差异大,抑郁症尚缺乏客观的诊断标准,本研究旨在采用多重机器学习算法和生物信息学方法筛选客观、可靠、高效的抑郁症诊断生物标志物,并进一步探究抑郁症的潜在发病机制和基因靶向药物,为临床精准治疗和实验研究提供思路,为抑郁症的早期诊断提供科学基础。

方法 1.收集和预处理 198 例抑郁患者及 139 例健康对照的外周血转录组数据,构建输入数据集;2.执行差异基因分析和 WGCNA 分析,获得与抑郁密切相关的基因序列,通过蛋白互作可视化基因间的相关性,采用 GO 和 KEGG 功能富集分析探索上述基因的功能及机制;3.执行最大团中心性拓扑分析算法,选取序前 30 位基因作为候选生物标志物;4.执行 LASSO 和 SVM-RFE 机器学习算法,过滤和识别抑郁症诊断生物标志物;5.使用外部数据集,以一致性指数、AUC、拟合优度检验和准确率等作为性能度量标准,验证生物标志物的诊断有效性;6.构建转录因子基因调控网络,并预测基因靶向的药物,为临床精准治疗和实验研究提供思路,并进一步进行了抑郁症与其他疾病的关联性分析,为进一步研究疾病的潜在发病机制提供了转录组基础。

结果 经差异基因分析和加权共表达网络分析,筛选出 302 个与抑郁密切相关的基因,功能富集发现上述基因在自噬体组装,细胞多糖分解代谢等生物过程中显著富集,主要通路为 AMPK、IL-17 信号通路。构建蛋白互作网络后采用 LASSO 和 SVM-RFE 算法构建最佳的诊断模型,并与自噬相关基因取交集,得到 4 个抑郁症关键基因: GABARAPL2, RB1CC1, ULK1, FOS, 经过外部数据集验证,均表现出良好的单基因诊断能力,基因联合诊断效率为 AUC=0.756。经验证模型的准确率最高达 85%,一致性指数 0.94,拟合优度检验 $P=0.15$,具有较强的准确性和稳定性。四个生物标志物受到 25 个转录因子的调控,其中 FOXC1 是共有的转录因子;原蚕蛾,蚕砂两种中药可能是治疗抑郁症的潜在药物,乳腺癌、大脑中动脉堵塞被确定为抑郁症的潜在合并症。

结论 本研究以大样本数据多维筛选和机器学习算法在基因表达水平上筛选了用于抑郁症辅助诊断的生物标志物,并探索了潜在的分子机制和药物靶点,经验证模型能够有效地区分抑郁患者与健康人,具有较强的准确性和稳定性,为抑郁症的早期诊断提供新的思路和方案。

一项基于真实世界数据对青少年抑郁与双相障碍住院患者临床特征的比较研究

唐海芸 赵彦杰 郭彤

首都医科大学附属北京安定医院

目的 由于处在成长特殊时期,青少年抑郁(MDD)和双相障碍(BD)患者临床表现均复杂和多元化,导致发病早期误诊率高,治疗效果不理想。本研究拟基于真实世界数据开展针对我院住院青少年抑郁和双相情感障碍患者的临床特征分析比较,为疾病风险预测和临床诊疗提供一定参考价值。

方法 本研究为一项回顾性、队列对照研究,基于我院大数据平台收集 2013 年 1 月 1 日至 2021 年 12 月 31 日青少年住院 MDD 和 BD 患者。入选 12-17 周岁性别不限,符合 ICD-10 BD 或 MDD 诊断标准,并排除精神分裂症、分裂情感性障碍;器质性精神障碍;酒精或药物滥用。SPSS26.0 软件进行数据统计分析。

结果 1. 共 3631 例次患者入选,青少年 MDD 组 2094 例次,青少年 BD 组 1537 例次。MDD 组男女比例为 1: 2.56, BD 组男女比例为 1: 1.06。MDD 组 12-14 岁患者比例(36.29%)高于 BD 组(19.32%),且 MDD 组女性患者占比(78.95%)高于 BD 组(51.18%)。BD 组平均住院时间长于 MDD 组(27.08 天 vs 23.57 天)。

2. 2013-2019 年青少年 MDD 和 BD 总体住院患者数量均呈现逐年递增趋势,增长率分别在 20-85% 和 12%-53% 之间且 MDD 组高于 BD 组。MDD 组 12-14 岁住院总数在 2018 年后高于 15-17 岁组;在 2020-2021 年 MDD 组住院人数先降低 13.92% 后增加 35.53% 而 BD 组住院人数降低 61.89% 后增加 14.53%;

3. MDD 组伴发精神病性症状更多见(MDD 组 34.29% vs. BD 组 16.92%) 且女性为主(75.91% vs 53.46%)。BD 组 15-17 岁合并精神病性症状的比例更高(86.15% vs 50.28%)。

4. 青少年 MDD 组伴有自伤/自杀意念和行为的比例高于青少年 BD 组(43.02% vs 15.55%),女性的

发生率 (MDD 组 78.98%, BD 组 74.48%) 在两组均明显大于男性。

结论 1. 2013-2019 年 12-17 岁青少年 MDD 和青少年 BD 患者的住院人数均呈现逐年递增的趋势, 青少年 MDD 住院人数递增速率明显大于 BD 组并呈现女性、低龄化的趋势;

2. 在 2020-2021 年新冠疫情期间, 青少年 MDD 的住院认识在刚开始略有下降外, 在 2021 年例数继续增加明显维持上升趋势, 这可能是由于 MDD 本身受外界因素影响大并多体现自杀自伤行为更易引起家长、社会关注而就诊;

3. 12-14 岁的女性青少年群体为住院 MDD 高发群体, 并伴有更大自杀自伤风险, 需要重点关注, 建议采取措施早期预防、筛查评估、心理干预和及时就医治疗。

Eight-week Antidepressant Treatment Changes Connectome Gradient in First-episode Drug-naïve Major Depressive Disorder Patients

Youran Dai¹, Yankun Wu¹, Linlin Zhu¹, Qian Yu², Ke Li³, Yawei Zeng³, Jitao Li¹, Yunai Su¹, Mingrui Xia², Tianmei Si¹

1. Peking University Sixth Hospital

2. State Key Laboratory of Cognitive Neuroscience and Learning, Beijing Normal University

3. PLA Strategic support Force Characteristic Medical Center

Objective Current treatment modalities for Major depressive disorder (MDD) relies on empirical methodologies, lacking comprehensive understanding of the pathogenesis underlying depression and the specific targets of antidepressant medications. Neuroimaging techniques, such as magnetic resonance imaging (MRI), offer a more in-depth view of the brain's structure and function as opposed to gross brain pathology. It also provides clues for identifying potential targets for the treatment of depression. Recently, a novel method utilizing

gradients has been proposed to establish nonlinear decomposition of high-dimensional resting-state functional connectivity. Unlike regional analyses, this approach can decompose functional brain networks into different gradient components to capture the topography of connectomes, where voxels with similar connectivity patterns are located close to one another along a given connectivity gradient. It comprehensively detects cortical functional hierarchies by representing brain connectivity in a continuous, low-dimensional space. Furthermore, functional gradients have been demonstrated to be associated with the neurodevelopment of brain, thereby offering novel insights into the functional alterations in individuals with depression. Previous studies utilizing connectome gradient methods have revealed disruptions of the principal gradient in MDD patients. However, the semiological meaning of brain gradient and the effect of antidepressants are unknown. We employed a longitudinal cohort collecting neuroimaging and clinical data before and after antidepressant treatment in first-episode drug-naïve (FEDN) MDD patients, and investigated the modifications in functional connectome gradients, their associations with clinical syndromes, and the effects of antidepressant treatment

Methods We recruited 159 MDD patients and 152 healthy controls. For all patients, clinical data including medication information and 17-item Hamilton Rating Scale for Depression were collected at baseline and after 8 weeks of treatment. The MRI data also collected at baseline and after 8 weeks of treatment and investigated MDD-related alterations in the principal connectome gradient. Altered gradient map regions were compared to gradient parameters after treatment. The interaction effects of change in gradient scores and treatment outcomes (remission and non-remission groups), as well as antidepressant types (single and multi-target target) were explored in MDD patients

Results Compared to controls, MDD patients exhibited gradient score alterations in default and visual networks. After antidepressant treatment, the gradient scores for the left ventromedial prefrontal cortex (VMPFC) declined in patients who responded to therapy. After antidepressant treatment, the gradient scores for VMPFC region and antidepressant type (single target or

multi-target) showed a significant group-by-time interaction. Post hoc analyses revealed that single-target antidepressants exhibited greater improvement in gradient scores for VMPFC compared to multi-target antidepressants. The correlation analysis with HRSD score also demonstrated that the baseline gradient score for VMPFC correlated negatively with the factor scores of core symptom

Conclusion Using a longitudinal sample, the present study demonstrated alterations in the connectome gradient of left VMPFC following antidepressant treatment in MDD patients, along with its association with the core syndrome and types of antidepressants. These findings advance our understanding of the neurobiological mechanisms of depression and the precise targets of antidepressants while providing potential biomarkers for medical treatment of MDD

The Efficacy and Safety of Pharmacological Treatment for Major Depressive Episode with Mixed Features Specifier: A Systematic Review and Meta-analysis

Sirui Gao, Lingjiang Li
Central South University

Objective With the increased prevalence of major depressive episodes with mixed features specifier (MDE-MFS), the pharmacological treatment for MDE-MFS has garnered significant clinical attention. This study is a systematic review and meta-analysis to investigate the efficacy and safety of medication use for MDE-MFS

Methods Commonly used databases were searched for the meta-analysis. Primary efficacy outcomes included response rate and the change in the Young Mania Rating Scale (YMRS) score from baseline, and the primary safety outcome was the rate of treatment-emergent hypomania/mania

Results The overall results showed that antipsychotics were superior to placebo in improving depressive and manic symptoms without increasing the risk of switching to mania. However, subgroup analysis on bipolar depression with MFS revealed a non-significant effect on improving manic symptoms. Mood stabilizers, especially short-term valproate treatment, were found to be effective in managing MDE-MFS in patients with bipolar disorder (BD) by alleviating depressive and manic symptoms. For MDE-MFS in major depressive disorder (MDD), trazodone was shown to be effective, while the use of antidepressants for MDE-MFS in BD lacked evidence

Conclusion This study presented findings on the efficacy and safety of pharmacological treatment for MDE-MFS, which provided preliminary evidence in this area. While antipsychotic therapy is a viable option for MDE-MFS, its effect in improving manic symptoms is still unclear. Mood stabilizers may also be considered for treatment, and the use of antidepressants remains a topic of controversy. It is imperative to conduct further research to produce more conclusive evidence on the treatment of MDE-MFS

关键词: Major depressive episode, mixed features specifier, antipsychotics, antidepressants, mood stabilizers, systematic review

Representational Similarity Analysis of Brain Functional Patterns Across Resting-state, Rumination, and Distraction States in Depressed Patients

Hanggai Taorigen¹, Fengnan Jia², Zhi Yang¹
1.Beijing Anding Hospital
2.Suzhou Guangji Hospital

Objective Rumination is a critical factor in the core pathological processes of Major Depressive Disorder (MDD), characterized by the persistent and repetitive self-focused rumination on depressive emotions and their potential causes and consequences. Previous

studies have revealed that the brain activity characteristics of MDD when engaging in rumination differ markedly from those of healthy individuals, but the neurological activity patterns of MDD in rumination states, and the differences in activity patterns between their states, remain to be understood intimately. This study applied Representational Similarity Analysis (RSA) to elucidate the similarity patterns of brain activity across resting-state, rumination, and distraction states in MDD patients, and compared with healthy control subjects

Methods In this study, we recruited 63 adult MDD patients and 57 healthy control subjects, who underwent MRI scanning and clinical assessment. For each participant, we collected functional MRI (fMRI) data during resting-state, rumination-state, and distraction-state. The data were preprocessed using standard procedures. We extracted brain representation features such as Functional Connectivity (FC), Amplitude of Low-Frequency Fluctuations (ALFF), and Fractional ALFF (fALFF) from different states. We constructed two conceptual matrices to describe the hypothesized relationships between different cognitive states. The first matrix was based on the hypothesis that both resting-state and rumination-state involve intrinsic thinking processes, making them most similar, while resting-state and distraction-state are dissimilar. The second matrix hypothesized that resting-state and distraction-state are most similar, as both involve states with low external interference, and are dissimilar to rumination-state. We constructed Representational Dissimilarity Matrices (RDM) to assess the correlation between brain representation patterns and conceptual matrices across different states. Significant group differences in brain region representations across different states were determined using two-sample permutation tests

Results There were no significant differences between the two groups in terms of age ($t = -1.725$, $p = 0.088$), gender ($X^2 = 0.091$, $p = 0.763$), and education level ($t = -1.009$, $p = 0.316$). Representational Similarity Analysis revealed that in MDD patients, the similarity of whole-brain functional connectivity patterns between states was significantly lower than that of healthy controls ($p < 0.05$) in the following regions: left somatosensory motor cortex (SMA), left dorsolateral prefrontal

cortex (dlPFC), left frontal eye field (FEF), left parietal cortex (PCC), right somatosensory motor cortex (M1), right dorsolateral prefrontal cortex (dlPFC), right frontal eye field (FEF), and right prefrontal cortex (PFC). Conversely, in the caudate nucleus, left inferior parietal lobule (IPL), and left temporoparietal junction (TPJ), the similarity of whole-brain functional connectivity patterns between states was significantly higher in MDD patients compared to healthy controls ($p < 0.05$)

Conclusion The RSA results indicate that, compared to MDD patients, healthy individuals exhibit significantly higher brain representational similarity between resting-state and rumination-state in the dorsal attention network and the default mode network. This suggests that healthy individuals may demonstrate greater flexibility in brain networks, effectively adjusting functional connectivity patterns across different tasks or states to maintain stable functional connectivity. In contrast, MDD patients exhibit lower adaptability and consistency in their brain networks, potentially indicating difficulties in adjusting connectivity across different states, leading to altered functional connectivity patterns during rumination

In conclusion, this study explored the patterns of neurological functional connectivity in MDD patients under different states of brain activity through the representational similarity analysis method. The results reveal specific changes in functional connectivity patterns in certain brain regions during rumination, which are associated with self-referential thinking, emotion regulation, and memory. These findings not only deepen our understanding of the neurobiological basis of MDD but also provide a theoretical foundation for developing individualized neuromodulation and treatment strategies. Future research should further explore the functional significance of these changes in neural connectivity patterns and their potential applications in long-term treatment, aiming to enhance recovery and improve the quality of life for MDD patients.

2.Shanghai Pudong New Area Mental Health Center, School of Medicine, Tongji University

3.Xi'an Jiaotong University

4.University of Surrey

5.University of Tübingen

Objective Given the heterogeneity of major depressive disorder (MDD), current first-line treatment methods including neuromodulation therapies provide convincing but limited effectiveness. Temporal interference stimulation (TIS) as a novel non-invasive brain stimulation technique being able to target deep brain regions, may have the ability to handle the heterogeneous pathological mechanism of MDD. In this proof-of-concept study, we investigated the safety and efficacy of TIS to reveal its potential in MDD treatment

Methods A complementary stereo electroencephalography in two epilepsy patients was performed to validate the accuracy and consistency of TIS. The intracranial electroencephalography signals were recorded from the surgically implanted SEEG depth electrodes when conducting TIS on four targeted brain regions of the participants to measure the accuracy and consistency of the expected electric field frequency and intensity

A within-subject design targeting multiple regions within the emotional neural circuit was adopted. Over a five-week period, 15 patients with MDD received weekly TIS targeting the left dorsolateral prefrontal cortex (DLPFC), left subgenual anterior cingulate cortex (sgACC), right ventral striatum (VS), and right amygdala, plus a control sham session, each target a week.

Clinical symptoms and neuroimaging outcomes were assessed weekly using clinician-rated scales and resting-state functional MRI respectively. Severity and characteristics of adverse events were assessed using self-reported measures.

Results Recorded intracranial EEG signals verifies an overall accuracy and stability of envelope frequency (DLPFC: 10.01 ± 0.03 Hz, sgACC: 100.08 ± 0.11 Hz, Amg: 100.01 ± 0.09 Hz, VS: 100.01 ± 0.02 Hz) and electric field power (DLPFC: 0.59 ± 0.07 V/m, sgACC: 0.63 ± 0.01 V/m, Amg: 0.15 ± 0.00 V/m, VS: 0.13 ± 0.01 V/m) during TIS on target areas. Significant improvement in depression was found after DLPFC ($P = 0.0047$), amygdala ($P = 0.003$) and VS ($P = 0.0074$) stimulations, while significant improvement in anxiety was found after DLPFC ($P = 0.0099$) and amygdala ($P = 0.0031$) stimulations. Significant increase in amplitude of low-frequency fluctuations (ALFF) was found in DLPFC after sgACC ($P = 0.021$) and VS ($P = 0.047$) stimulation. Amygdala stimulation induced improvement in depression was positively correlated with pre-stimulation DLPFC-sgACC connectivity ($P = 0.018$, $\rho = 0.600$). Patients were divided into hyper and hypo groups based on the median of their pre-treatment DLPFC-sgACC connectivity, showing differences in degree of improvement after amygdala or DLPFC stimulation. No severe adverse events were reported by the participants during the study. The most frequent adverse events were sleepiness and dizziness

Conclusion SEEG results provide evidence for the feasibility of TIS in modulating specific brain regions at a desired frequency, demonstrating that TIS could induce electric field with specified and consistent frequency at target sites. The improvement of depression and anxiety after single stimulation session indicated the efficacy of TIS as a tunable brain stimulation technique for MDD. Notably, amygdala, not stimulated in previous MDD studies, was proved to be an effective and accessible target for MDD treatment, which could be an alternative to traditional DLPFC transcranial magnetic stimulation (TMS) for individualized therapy. These findings combined, TIS was suggested to represent a promising non-invasive approach modulating neural circuit for depression therapy with individualized

therapeutic potential

艾司氯胺酮激活 Nrf2 抑制炎症反应发挥快速抗抑郁作用

马欣旭 陈海霞 彭正午 王化宁 蔡敏*
西京医院

目的 探讨艾司氯胺酮 (Es-Ket) 对 LPS 所诱导的抑郁样行为的影响及可能机制。

方法 LPS 腹腔注射的方法构建诱导抑郁样行为。实验一将 30 只 C57BL/6J 小鼠随机分为 Control、LPS+Sal 和 LPS+Es-Ket 组, 每组 10 只; 实验二将 40 只 C57BL/6J 小鼠随机分为 Control、LPS+Sal、LPS+Es-Ket 和 LPS+Es-Ket+ML385 组, 每组 10 只。实验中 LPS+Sal、LPS+Es-Ket 和 LPS+Es-Ket+ML385 均连续 5 天腹腔注射 LPS (1 mg/kg), Control 组仅注射生理盐水。造模结束后, Control 组和 LPS+Sal 组小鼠均接受 10 μ L/g 生理盐水, LPS+Es-Ket 组和 LPS+Es-Ket+ML385 组接受 10 mg/kg 艾司氯胺酮腹腔注射, 随后 LPS+Es-Ket+ML385 组立即接受 30 mg/kg ML385 腹腔注射, 24 h 后进行旷场实验、新奇抑制摄食实验、悬尾实验以检测各组小鼠的抑郁样行为。24 h 后, 处死小鼠分离出前额叶皮层和海马组织, 通过 Western Blot 检测小鼠前额叶皮层和海马组织中 Nrf2、IL-1 β 、TNF- α 和 iNOS、血浆中 TNF- α 、IL-1 β 、iNOS、CD206、YM-1/2、Arg-1 的表达情况。

结果 1. 较 Control 组, LPS+Sal 组和 LPS+Es-Ket+ML385 组旷场中心区运动距离比、中心区停留时间比均显著降低、进食潜伏期延长、悬尾不动时间均显著增加(均 $P < 0.05$); 较 LPS+Sal 组, LPS+Es-Ket 组旷场中心区运动距离比、中心区停留时间比均显著增加、进食潜伏期降低、悬尾不动时间减少(均 $P < 0.05$)。2. 与 Control 组相比, LPS+Sal 组前额叶皮层、海马组织和血浆中 Nrf2 分子表达下降, IL-1 β 、TNF- α 和 iNOS 分子表达上调(均 $P < 0.05$), 而 LPS+Es-Ket 组前额叶皮层、海马组织中 Nrf2 表达较 LPS+Saline 组增加, IL-1 β 、TNF- α 和 iNOS 分

子表达下降, 血浆中 IL-1 β 、TNF- α 和 iNOS 表达下降、CD206、YM-1/2、Arg-1 表达下降(均 $P < 0.05$); 较 Control 组, LPS+Es-Ket+ML385 组前额叶皮层、海马组织和血浆中上述分子表达水平同 LPS+Sal 组一致; LPS+Es-Ket 组逆转了该趋势。

结论 艾司氯胺酮可快速改善 LPS 所导致的小鼠抑郁样行为及炎症水平, 其抗抑郁作用会受到 Nrf2 通路抑制剂的影响。

个体化精准重复经颅磁刺激治疗难治性抑郁的网络机制研究: 一项随机对照试验

金静 曹燕翔 王赞 周媛 王刚
首都医科大学附属北京安定医院

目的 重复经颅磁刺激 (repetitive transcranial magnetic stimulation, rTMS) 刺激抑郁症患者不论刺激背外侧前额叶 (dorsolateral prefrontal cortex, DLPFC) 还是背内侧前额叶 (dorsomedial prefrontal cortex, DMPFC) 都能改善抑郁和焦虑症状, 而默认网络 (default mode network, DMN) 和额顶网络 (frontal-parietal network, FPN) 是抑郁症病因和治疗改善的核心网络, 因此本研究想探讨刺激不同靶点时抑郁/焦虑症状的改善是否与激活不同的网络有关。

方法 64 名难治性抑郁症患者, 根据刺激靶点不同 (即个体化 DLPFC 靶点和个体化 DMPFC 靶点) 被随机分至 DLPFC-rTMS 组 (36 人) 和 DMPFC-rTMS 组 (28 人), 分别接受 21 天干预。研究对比了两组分别在治疗前后个体化靶点与 DMN 和 FPN 网络的个体化 FC (individualized FC, iFC) 变化, 及其与抑郁/焦虑症状改善的相关性。同时验证了固定刺激靶点 (DLPFC 靶点和 DMPFC 靶点) 与这些网络的 FC 变化及其与抑郁/焦虑症状改善的相关性。

结果 两组治疗均可缓解抑郁/焦虑症状, 但刺激不同靶点引起的 iFC 变化不同。DLPFC-rTMS 组中 DLPFC 与 DMN (如楔前叶 ($t = -2.39, p = 0.022$)) 和 FPN (上内侧前额回 $t = -2.35, p = 0.024$), 左下顶叶 ($t = 2.3, p = 0.028$)) 的 iFC 显著改变。在 DMPFC-rTMS 组中, 也发现 DMPFC 与 DMN 里楔前叶 (t

= -2.78, $p = 0.01$, FDR 校正后 $p = 0.034$), 后扣带皮层 ($t = -3.15$, $p = 0.004$, FDR 校正后 $p = 0.028$) 的 iFC 显著改变。与 FPN 里的额下回 ($t = -3.65$, $p = 0.001$, FDR 校正后 $p = 0.019$), 辅助运动区 ($t = -2.24$, $p = 0.033$), 后扣带皮层 ($t = 2.27$, $p = 0.032$) 的 iFC 显著改变。此外, 特定基线 iFC 值与抑郁和焦虑评分的下降正相关。但使用固定刺激靶点而非个体化靶点时, 仅在 DLPFC-rTMS 组发现 DLPFC 与 FPN 部分区域的 FC 显著降低, 但未发现其与症状改善的相关性。

结论 刺激 DLPFC 和 DMPFC 这两个靶点均能缓解抑郁和焦虑症状, 但其激活的潜在神经环路并不相同。同时在未来研究中, 我们推荐采用个体化功能连接 (iFC) 来更好的探索 rTMS 治疗机制。

Consistency Analysis of Different Depressive Symptom Assessment Scales

Jia Zhou, Linghui Meng

Beijing Key Laboratory of Mental Disorders, National Clinical Research Center for Mental Disorders & National Center for Mental Disorders, Beijing An Ding Hospital, Capital Medical University, Beijing, China

Objective Meaningful and time-efficient measurements based on quantitative rating scales of symptoms is critical to accurately capture depression symptoms. However, using different scales to measure depression is common, if different scales markedly differ in monitoring treatment outcomes, it would pose a problem in comparisons and be of great significance for guidelines and policy development. So, the present study had two goals. First, we wanted to analyze the consistency of the extensively used instruments based on the national cohort study, including 17-item Hamilton Rating Scale for Depression (HAMD-17), 6-item Hamilton Rating Scale for Depression (HAMD-6), 16-item Quick Inventory of Depressive Symptoms-Self-Report (QIDS-SR16), and Patient Health Questionnaire-9 (PHQ-9). Second, equipercentile equating

method will be applied to provide the conversion table of these scales

Methods The participants diagnosed with MDD and aged 18 to 65 years were recruited from 12 sites. All patients were administered either escitalopram or duloxetine. The depressive symptoms were measured using HAMD-17, HAMD-6, PHQ-9 and QIDS-SR6. Spearman correlations were computed between the raw score and change in scores on each of the measures. In addition, equipercentile equating method was used to examine the linkage of the QIDS-SR16, PHQ-9, HAMD-6 and the HAMD-17

Results A total of 1418 patients were included for the study. The median age of the overall sample was 31.00(24.00-44.00) years. On each scale, the patients showed significant levels of improvement from baseline to follow-up. The assessment scores for all scales demonstrated a downward trend with treatment, indicating a reduction in symptom severity over time. Notably, the convergence of the trajectories of these scales was observed, with the curves for the PHQ-9 and QIDS-SR16, in particular, showing significant alignment. All correlations between the scales in scores at different visits were significant. The correlations amongst the self-report scales (i.e. QIDS-SR16 and PHQ-9, $r = 0.65$) and amongst the clinician rated scales (i.e. HAMD-17 and HAMD-6, $r = 0.73$) were higher than the correlations between the self-report and clinician rated scales. All correlations between the scales in score reduction and reduction rate from baseline to different visits were significant. The conversion table from the QIDS-SR16, PHQ-9, and HAMD-6 to HAMD-17 is computed

Conclusion The correlation of score between different scales at different severity. The magnitude of change in depressive symptoms is as great on self-report scales as on clinician rating scales. QIDS-SR16, PHQ-9, and HAMD-6 to HAMD-17 are convertible

阈下抑郁症状发展轨迹对自杀意念的影响研究

廖宇华¹ 张慧敏¹ 刘熠锋¹ 郭蓝² 王婉馨² 韩雪¹
李凌江³ 卢次勇² 范北方¹

1. 深圳市南山区慢性病防治院

2. 中山大学公共卫生学院流行病与卫生统计系

3. 中南大学湘雅二医院精神卫生临床研究中心

目的 阈下抑郁症状常被视为抑郁症前期, 缺乏早期干预易发展为抑郁症。阈下抑郁症状同样可产生自杀意念最终引发自杀, 但不同的阈下抑郁症状发展轨迹对自杀意念可产生不同程度的影响。有效识别阈下抑郁症状的发展轨迹及严重程度, 是为受影响的个体提供及时有效干预措施的基础。

方法 本研究基于 DCC 队列人群 (Depression Cohort of China) 开展队列研究。基线 (T1) 调查后, 于 6 月 (T2) 及 12 月 (T3) 开展随访, 通过抑郁症状评分的实际变化识别阈下抑郁症状异质性发展轨迹, 应用无序多分类 Logistic 回归发现异质性轨迹的危险因素。采用生存分析方法探索阈下抑郁症状异质性发展轨迹对自杀意念的影响。

结果 阈下抑郁症状人群研究中纳入完成 T1-T3 期随访共计 993 人, 异质性发展轨迹包括持续型 239 人 (24.07%), 间断型 338 人 (34.04%) 和缓解型 416 人 (41.89%)。采用无序多分类 Logistic 回归分析, 以缓解型为参照, 儿童期创伤的情感虐待 (AOR = 1.16, 95% CI = 1.08-1.25) 以及失眠症状可增加持续型阈下抑郁症状的风险; 儿童期创伤的情感虐待 (AOR = 1.07, 95% CI = 1.00-1.15) 以及中度以上失眠症状为间断型阈下抑郁症状的危险因素。基线无自杀意念阈下抑郁症状 896 人, 异质性轨迹中持续型及间断型是缓解型自杀意念风险的 13.41 倍 (95% CI = 5.01-35.844) 及 7.39 倍 (95% CI = 2.78-19.64), 持续型是间断型的 1.77 倍 (95% CI = 1.17-2.69), 此外每月 10 天及以上的吸烟行为 (AHR = 1.99, 95% CI = 1.09-3.63) 以及儿童期创伤 (AHR = 1.02, 95% CI = 1.01-1.04) 为阈下抑郁症状自杀意念的危险因素。

结论 在社区防治及临床诊疗中, 阈下抑郁症状与抑郁症的防治同等重要, 识别迁延不愈的阈下抑郁症状是自杀预防的关键。开展抑郁症状的随访监测, 发现影响症状发展的危险因素, 有针对性地开展预防措施, 对抑郁症的预防及治疗具有重要意义。

5. The Brain Cognition and Brain Disease Institute, Shenzhen Institute of Advanced Technology, Chinese Academy of Sciences

Objective Major depressive disorder (MDD) is often accompanied by cognitive dysfunctions, such as impaired executive function and memory, which are both prevalent and persistent. Electroencephalography (EEG) microstates, which reflect brain network activity, have been employed in psychiatric research. Although prior studies have identified four microstate classes in resting-state EEG, the connection between microstates, cognitive function, and depression warrants further exploration. This study aims to investigate the link between EEG microstate anomalies and cognitive impairments in individuals with drug-naive MDD.

Methods We recruited 29 patients with drug-naive MDD and 30 healthy controls. The Hamilton Depression Rating Scale (HDRS-17) measured symptom severity, the MATRICS Consensus Cognitive Battery (MCCB) assessed neurocognitive function, and resting-state EEG data were collected using 64 scalp electrodes. Analysis of EEG microstates was conducted via the Mi-

crostate Analysis plugin for EEGLAB, and Pearson correlation analysis was employed to discern the relationships between microstate parameters, symptom severity, and neurocognitive scores, with Bonferroni correction for multiple comparisons.

Results Compared to healthy controls, the MDD group displayed significantly lower MCCB domain-specific scores. Notably, the proportion and occurrence of microstate D and the duration of microstate C differed between groups. Significant negative correlations were found between HDRS-17 scores and the Speed of processing (SOP) score ($r = -0.463$, $df=26$, $P = 0.013$) and Visual learning score ($r = -0.511$, $df=26$, $P = 0.005$) in the MDD group respectively. Additionally, the proportion of microstate D was found positively correlated with SOP score ($r = 0.499$, $df = 26$, $P = 0.007$) and Working memory(WM) score ($r = 0.451$, $df = 26$, $P = 0.016$). The Occurrence of microstate D was found positively correlated with SOP score ($r = 0.383$, $df = 26$, $P = 0.044$) and WM score ($r = 0.389$, $df = 26$, $P = 0.041$).

Conclusion MDD patients show alterations in sub-second brain dynamics, characterized by a decreased proportion and occurrence of microstate D and shorter duration of microstate C, and significant shifts in microstate transition probabilities. These changes correlate with cognitive deficits across several domains, including processing speed and working memory

Prescription Pattern and Network Pharmacology Prediction-based Strategy To Explore The Potential Anti-depressive Effect of Daying Tablets

郑毓真¹ 魏宇梅¹ 李偲媛¹ 史悦¹ 李华芳^{1,2}

1.上海交通大学附属精神卫生中心

2.上海市重性精神病重点实验室

Objective Daying tablets are a Traditional Chinese medicine (TCM) formula (ingredients: Rhei Radix

Et Rhizome, Paeoniae Radix Rubra, and Zedoray Turmeric Oil) that has been empirically used for the treatment of psychotic or affective symptoms in mental disorders. Despite their historical usage, the application of Daying tablets in depression and the pharmacological mechanisms have not been studied. The components within the Daying formula are known to possess pharmacological effects such as antioxidant and anti-inflammatory activity with neurobiology closely related to the potential therapeutic targets in depression. This study aimed to explore the anti-depressive effect of Daying tablets based on human use experience and network pharmacology.

Methods Prescription data for Daying tablets from 2011 to 2021 was obtained from a hospital information system and pattern analysis was performed for depressed patients. The targets of Daying tablets and depression-related genes were derived from various databases. Following the herbs-compounds-disease-targets (H-C-D-T) and the protein-protein interaction (PPI) network, the hub targets for Daying tablets against depression were predicted by a network pharmacology approach. In order to improve the quality of the data, those active compounds were excluded from the literature filtering because they lacked experimental data support. Furthermore, enrichment analysis was used to analyze the hub targets in biofunction and process. The hub targets and compounds were verified through molecular docking.

Results In the past 11 years, Daying tablets were frequently prescribed as an adjunct to antidepressants for 665 patients with depression in a hospital. The patient population primarily consisted of young and middle-aged patients, predominantly females. Selective serotonin reuptake inhibitors (SSRIs) were the most common antidepressants used along with Daying tablets. Ultimately, we identified 7 hub targets (AKT1, TNF, IL6, IL1B, CASP3, PTGS2, and MMP9) closely associated with inflammation or oxidative stress pathways (such as TNF signaling, IL-17, Pathway of neurodegeneration) from 149 potential targets in the network. Molecular docking results showed that the main active compounds had good binding activity with the hub targets, along with the representative targets from antidepressants like

HTR2A and SLC6A4.

Conclusion The results showed that Daying tablets being the adjunction to antidepressants may exert an anti-depressive effect by regulating inflammation-associated targets. However, further research is required to validate these results. The underlying mechanisms should provide future pharmacological research directions for Daying tablets

The Synergistic Effects of Depressive Symptoms and Mild Cognitive Impairment on Evaluated Risks of Incident Dementia: A Prospective Study From Three Elderly Cohorts

Yushun Yan, Hailin Xiang, Xiao Yang, Xiaohong Ma
West China Hospital of Sichuan University

Background Depression and mild cognitive impairment (MCI) are considered as risk factors or prodromal syndrome of dementia. However, heterogeneity limits the ability of these two factors to independently predict incident dementia

Methods The analysis was conducted across three large prospective cohorts of Health and Retirement Study, English Longitudinal Study of Ageing, and Survey of health, Ageing and Retirement in Europe. Depressive symptoms were assessed by epidemiologic depression scale, while MCI was evaluated by several subjective cognitive tests. Dementia was ascertained by self-reported physician-diagnosed conditions. Cox proportional hazard models were employed to determine the hazard ratio (HR) and 95% confidence interval (95% CI), with adjustments made for potential confounding variables

Results A total of 64,706 participants were included at baseline (mean age: 63.9, female: 55.2%), where 4,197 (6.5%) individuals have only depressive symptoms, 28,175 (43.5%) individuals have only cognitive impairments, 11,564 (17.9%) individuals have both, and 20,770 (32.1%) individuals have neither. Compared with the Depression(-) MCI(-) group, all three groups had higher risks of subsequent dementia after adjusting for potential covariates (Depression(+) MCI(-): HR 1.65, 95% CI 1.26–2.17; Depression(-) MCI(+): HR 2.71, 95% CI 2.33–3.14; Depression(+) MCI(+): HR 3.51, 95% CI 2.95–4.17). The impact of MCI on dementia had a larger effect size compared to the impact of depression on dementia (HR 1.64, 95% CI 1.27–2.11)

Conclusions Depression and MCI exhibit a synergistic effect in augmenting the risk of incident dementia. Depression with cognitive impairment or MCI with depressive symptoms were better predictors of memory-related disorders

关键词: Depression, Dementia, Mild Cognitive Impairment

Aberrant Prefrontal-hippocampal Connectivity of Cross-modal Associative Memory Impairment in Schizophrenia

Zhaolin Zhai^{1,2,3}, Tianhao Gao^{1,2,3}, Xuan Li^{1,3}, Chang Lu^{1,2,3}, Yuke Dong^{1,2,3}, Kaiming Zhuo^{1,3}, Qiong Xiang^{1,3}, Dengtang Liu^{1,2,3}

1. Shanghai Mental Health Center

2. Huashan Hospital, Fudan University

3. Clinical Center for Psychotic Disorders, National Center for Mental Disorders

Objective Schizophrenia is a chronic and disabling psychiatric disorder causing substantial global burden of disease. Associative memory (AM) impairment is considered as a core cognitive dysfunction in schizophrenia and is indicative of poor functional outcomes. Prevailing hypothesis posits that the hippocampus (Hipp) and its interactivity with distributed cortical regions is crucial for the formation of AM. Despite the robust findings of abnormalities in prefrontal-hippocampal network in AM impairment, yet the specific regions and definitive patterns in schizophrenia have remained elusive. Our previous work has illustrated the disparities in AM capacity between schizophrenia and HCs, with specific attention paid to the extent of impairment in same- and cross-modality association tasks. Here, the present fMRI study was to further disentangle the contributions of the prefrontal-hippocampal networks to AM deficits in schizophrenia. For this purpose, we adopted an innovative AM task paradigm in which easy-to-verbalize materials were avoided to minimize the potential influence on the outcome. The specific

aims of the study were to (i) evaluate whether schizophrenia patients differed in AM performance and prefrontal-hippocampal connectivity, in comparison with HCs, and (ii) determine whether patient group exhibited differential relationships between prefrontal-hippocampal connectivity and AM performance, compared with HCs, and (iii) identified the specific prefrontal brain regions involved in AM which towards identifying potential underlying mechanisms or treatment targets for deficits in AM

Methods Sixty right-handed participants (aged 18-45; SCZ-n=30; HC=30) were recruited in this study. All participants were scheduled for an MRI session comprising structural and resting-state scans on a 3.0T Siemens, and completed clinical evaluations. To examine the neural substrate of AM impairment between SCZ and HCs, we adopted an innovative task paradigm previously used in the published work. Participants were guided to learn and later retrieve stimulus pairs, which identified capacity in the processing and memorization of information that integrates multiple sensory modalities. Brain regions were demarcated by the automated anatomical labeling (AAL) atlas. We performed seed-based FC analyses and selected the bilateral hippocampus derived from the AAL template provided by the MNI as the seed ROIs in the FC analysis. Further, Fisher's Z-transformed full correlation coefficients were calculated for each pair of regions to determine functional connectivity. As such, seed-to-voxel (S-V) thresholds was utilized (cluster threshold, $P < 0.05$ cluster-size false discovery rate (FDR) corrected; voxel threshold, $P < 0.001$ uncorrected). Pearson's correlation analyses were conducted between FC values and the associative memory performance. One HC participant with a history of head injuries was excluded from the study. Two additional schizophrenia participants were excluded due to anomalies in visual perception (n=1) and excessive head motion (n=1). The final sample included 28 SCZ and 29 HCs

Results The results of the independent sample t-tests and chi-square test revealed no significant differences between groups in terms of age, gender, and education. The d' scores of SCZ compared to HCs were significantly lower across tasks, suggesting general poorer

performance in associative memory for each condition ($F=15.211$, $P<0.0001$). Compared to HCs, the left hippocampus exhibited decreased FC in the clusters from medial and orbital parts of superior frontal gyrus (SFG) bilaterally (cluster size=385, $p\text{-FDR} < 0.001$). Conversely, FC values between the left Hippocampus and clusters from bilateral inferior frontal gyrus (IFG), pars opercularis and triangularis, were significantly higher (cluster size=59 and 70, $p\text{-FDR} < 0.01$) in the SCZ patients relative to HCs. More specifically, decreased left hippocampus-related FC values in bilateral medial orbital SFG were moderately positively correlated with AM performance in HCs ($P=0.009$, $r=0.474$) but not in the SCZ group. Furthermore, a significant positive correlation was found between left hippocampus-bilateral IFG FC values and AM capacities ($P=0.013$, $r=0.466$) in SCZ patients

Conclusion The current study demonstrated the disparities in AM impairment and substantiate fMRI correlative evidence for prefrontal-hippocampal network involvement in AM. These findings provide evidence for neuropathological mechanisms of AM impairment in schizophrenia, which potentially guiding relevant interventions and treatments

Altered Multivariate Brain Morphological Patterns and Neurocognitive Markers Associated with Suicidal Ideation and Behaviors in Major Depressive Disorder

Min Wang, Xiao Yang, Xiaohong Ma
West China Hospital, Sichuan University

Objective Brain structural abnormalities and cognitive dysfunction have been linked to suicidal ideation and behaviors (SIB) in individuals with major depressive disorder (MDD). However, the specific multimodal neuroimaging patterns and their association with cognitive functions remain poorly understood

Methods Neuroimaging maps of different structure features and cognitive markers were collected from 61 MDD patients with SIB (MDD-SIB), 38 MDD without SIB (MDD-nSIB), and 142 healthy controls (HC). Data-driven linked independent component analysis (LICA) and ANCOVA analysis were applied to identify differences in neuroimaging patterns across modalities (including gray matter volume, cortical thickness, cortical area, and white matter integrity) among three groups. Mediation analysis was further applied to explore the relationship between multimodal neuroimaging patterns, cognitive functions, and depressive symptoms

Results LICA identified four multimodal neuroimaging patterns that differed among three groups, three imaging patterns (IC1, IC9, IC14) differed between MDD-SIB and HC groups, one imaging pattern (IC12) differed between MDD-SIB and MDD-nSIB groups, two imaging patterns (IC12, IC14) differed between MDD-nSIB and HC groups. IC1 reflects PA (87% weight), FA (5% weight), and GMV (4% weight) with the MDD-SIB group showing significantly lower loading than the HC group ($p = 0.007$). IC9 showed a multimodal component mainly driven by FA (9%) and GMV (87% weight) with a distribution of positive weights in VMPFC, DMPFC, ACC, posterior cingulate cortex (PCC), insular cortex, superior temporal gyrus, precuneus cortex, as well as negative weights in OFC, occipital gyrus, lingual gyrus. MDD-SIB group exhibited significantly lower subject loading compared to HC groups ($p < 0.001$). IC12 revealed a distinct gradient in FA (93%weight), implicating an increase in ATR, inferior longitudinal fasciculus, corticospinal tract, inferior frontal-occipital fasciculus, cingulum, and decreased superior longitudinal fasciculus (temporal part). The MDD-nSIB group showed significantly lower loading in IC12 compared to the HC group ($p = 0.018$) and the MDD-SIB group ($p = 0.013$). IC14 is a multimodal component mainly driven by GMV (60% weight), FA (22% weight), and TH (12% weight), implicating increased GMV in ACC, PCC, precuneus, DLPFC, superior parietal lobule, supramarginal gyrus, angular gyrus, and decreased in superior temporal gyrus, insula cortex, and DMPFC. And increased anterior thalamic radiation,

superior longitudinal fasciculus, and decreased cortico-spinal tract, inferior longitudinal fasciculus, inferior fronto-occipital fasciculus in FA. As well as increased thickness in DMPFC, precuneus, ACC, and PCC, and decreased thickness in DLPFC, superior temporal gyrus, Heschl's gyrus, opercular cortex, and lingual gyrus. Compared to the HC group, MDD-SIB ($p = 0.007$) and MDD-nSIB ($p = 0.040$) showed significantly lower loading in IC14. In terms of cognitive function comparisons, it was revealed that MDD-SIB had cognitive impairment in attention, visual memory, and working memory. The lower of loadings of the brain network IC1 was correlated with the more severe depressive symptoms ($r = -0.279$, $p = 0.034$), more total missing and lower percent of hit in the RVP task (RVP_TM: $r = -0.27$, $p = 0.039$; RVP_PH: $r = 0.27$, $p = 0.044$), the more between errors, total errors, and poorer strategy in SWM task separately (SWM_BE: $r = -0.27$, $p = 0.039$; SWM_TE: $r = -0.28$, $p = 0.033$; SWM_Stra: $r = -0.29$, $p = 0.026$). The more severe the depressive symptom was correlated with more errors and lower percent of correct in DMS task, and poorer strategy in SWM task (DMS_PEGC: $r = 0.34$, $p = 0.0091$; DMS_PC: $r = -0.32$, $p = 0.013$). These significant correlations were mainly in MDD-SIB group. In addition, the mediation model confirmed the significant association between SWM_Stra and IC1 was observed in the mediation model (coefficient -0.0817 , SE 0.0247 , 95% CI -0.131 to -0.0323 , $t = -3.396$, $p = 0.0016$). Likewise, a significant association between HAMD and IC1 (coefficient -1.2164 , SE 0.583 , 95% CI -2.3841 to -0.0486 , $t = -2.0851$, $p = 0.041$). The mediation model yielded a significant positive indirect mediated effect of SWM_Stra on HAMD total scores through IC1 (indirect effect: coefficient 0.0993 , SE 0.0558 , 95% CI 0.0092 to 0.229 , $p = 0.0122$), whereas no significant direct effect of SWM_Stra on HAMD total scores could be detected (direct effect: coefficient 0.1521 , SE 0.1204 , 95% CI -0.089 to 0.0393 , $t = 1.2636$, $p = 0.2114$), indicating a significant mediation effect of SWM_Stra on HAMD total scores through IC1

Conclusion These findings have revealed altered multivariate brain morphological patterns and neu-

rocognitive associated with suicidality and demonstrated multimodal brain structural components that mediate working memory and depressive symptom severity. These results provide novel insights into the neurobiological mechanisms underlying suicide in patients with MDD

中枢神经系统发育过程中 GNA13 基因过表达 对皮层功能的影响及其分子机制

张晋 张万玲 刘可智 向波
西南医科大学附属医院心身医学科

目的 既往研究提示 GNA13 基因在人中枢神经系统发育过程中可能具有重要的作用, 但发育早期 GNA13 表达异常对大脑的影响仍不清楚。本研究拟通过在人脑类器官 (hCO) 中过表达 GNA13 的方法, 进一步探索其对成熟后 hCO 的影响, 并通过将 hCO 移植入免疫缺陷的小鼠观察其在小鼠社交行为中作用。

方法 人来源的诱导多能干细胞 (hiPSC) 诱导分化为 hCO。在 hCO 成熟前 (诱导分化的第 30 天), 通过慢病毒注射的方法过表达 GNA13 基因。然后通过免疫荧光染色检测 hCO 成熟后 TBR1 表达量及神经元活动, 用 RNA 测序的方法探索 GNA13 过表达对基因表达的影响。在培养的第 42 天、第 46 天和第 50 天分别进行了非靶向代谢组学检测。在 hCO 成熟后 (培养的第 50 天), 分别将过表达 GNA13 和非过表达 GNA13 的移植入重度联合免疫缺陷 (SCID) 小鼠。在移植手术六周后, 用旷场实验和三箱社交实验检测小鼠行为学变化。

结果 1) 随着 hCO 的分化成熟, 干细胞特异性标志物 SOX2 表达量下降, 而神经元标记物 TUJ1 表达量增加, 表明皮层类器官的成功诱导。

2) 过将慢病毒注射入 hCO, 成功的过表达了 GNA13, 且在 hCO 中过表达 GNA13 可导致皮层特异性标记物 TBR1 表达量上调以及皮层活动增强。

3) 过表达 GNA13 后, 发现 hCO 中 135 个基因表达下调, 224 个基因表达量上调。下调的基因富集

于对刺激的反应、免疫系统过程及发育过程等通路。而上调基因富集于多个神经发育和形态相关的通路,包括:突触后结构的组织、GPCR 信号转导通路、感觉器官发育、神经元投射形态发生、突触膜粘附、促进细胞迁移以及中枢神经系统细胞分化等通路。

4) 成熟前(D42) 差异代谢物主要富集于 D-氨基酸代谢、精氨酸生物合成、矿物质吸收及苯丙氨酸-酪氨酸-色氨酸生物合成等代谢通路。随着 hCO 逐渐倾向于成熟(D46), 差异代谢产物更多富集于氨基酸代谢相关通路及神经活性配体-受体相互作用。hCO 成熟后, 差异代谢产物不仅富集于氨基酸代谢相关通路, 也参与了多个兴奋性和抑制性突触的功能。

5) 移植过表达 GNA13 的皮层类器官至 SCID 小鼠内侧前额叶皮层 (medial prefrontal cortex, mPFC), 结果发现小鼠社交功能表现出显著退缩。但三组小鼠在焦虑行为及运动能力无差异。

结论 GNA13 过表达 hCO 移植入小鼠 mPFC 可导致小鼠社交退缩, 将特定处理的脑类器官植入免疫缺陷小鼠或可作为神经精神系统疾病模型建立的新手段, 为神经精神系统疾病机制的探索和药物筛选提供有效的工具。

Intranasal Delivered Tetrahedral Framework Nucleic Acid Loaded with MicroRNA-134 Antisense Oligonucleotides (tFNAs@miR-134ASO) To Improve Depressive Mood and Cognitive Impairment in Chronic Stress Mice

Yikai Dou¹, Min Wang¹, Xiao Yang¹, Weitong Cui¹, Yuan Zhang¹, Sihan Tu¹, Jinxue Wei¹, Liansheng Zhao¹, Xiaohong Ma^{1,2}

1. Mental Health Center and Institute of Psychiatry, West China Hospital, Sichuan University

2. Biological Psychiatry Group, Psychiatric Branch, Chinese Medical Association

Objective Depression patients often experience cognitive impairments that significantly affect their ac-

ademic and occupational performance, making it difficult for individuals to return to normal life trajectories. miR-134, as a brain-specific microRNA, significantly increases under chronic stress and can inhibit the target genes *Limk1* and *Creb*, leading to decreased neuronal synaptic plasticity, resulting in depressive mood and cognitive impairments. This study proposes using nano-material tetrahedral framework nucleic acids (tFNAs) loaded with microRNA-134 antisense oligonucleotides (tFNAs@miR-134ASO), administered intranasally, to effectively improve depressive mood and cognitive impairments in chronic stress mice

Methods In this research, we used sticky ends to conjugate miR-134ASO with the four vertices of tFNAs, and characterized the successful synthesis of materials and the morphology of complexes using polyacrylamide gel electrophoresis, capillary electrophoresis, transmission electron microscopy, atomic force microscopy, dynamic light scattering, and other characterization experiments. In vitro, transwell devices and bEND.3 cell-based blood-brain barrier models were used to explore the uptake rate of Cy5-labeled tFNAs@miR-134ASO in HT-22 neurons. SH-SY5Y cells treated with corticosterone were used to simulate an in vitro depression model, analyzing the promotion of synaptic plasticity among groups CON-saline, CORT-saline, CORT-tFNAs, CORT-miR-134ASO, and CORT-tFNAs@miR-134ASO treatments. An in vitro model of depression induced by 5 weeks of chronic restraint stress in mice was used with grouped interventions, evaluating post-treatment depression, anxiety, and cognitive function among 5 groups that CON-saline, CRS-saline, CRS-tFNAs, CRS-miR-134ASO, and CRS-tFNAs@miR-134ASO using sucrose preference test (SPT), tail suspension test (TST), open field test (OFT), elevated plus maze (EPM), novel object recognition test (NORT), and Y-maze test (YMT). Further, mouse brain tissue slices were isolated for Nissl staining and immunofluorescence labeling (LIMK1, PSD-95), and qPCR and WB were performed on both in vitro cells and mouse brain tissue to assess changes in synaptic plasticity-related genes and proteins such as miR-134, *Limk1*, *Cofilin*, *Creb*, *Bdnf*, *Psd-95*

Results Multidimensional materials characterization confirms the successful synthesis of tFNAs@miR-134ASO, with the complex exhibiting good serum stability, storage stability, and nuclease stability. Brain tissue transparency experiments demonstrate that the complex can enter important brain regions such as the olfactory bulb, frontal lobe, and hippocampus via the nasal cavity. In vitro blood-brain barrier cell models show that tFNA@miR-134ASO effectively crosses the blood-brain barrier, with fluorescence uptake rates significantly higher than those of pure miR-134ASO ($p < 0.05$). Furthermore, cell immunofluorescence reveals that the fluorescence intensity of complexed Limk1 and PSD-95 is significantly higher than that of the CRS-CORT group ($p < 0.05$). In vitro CRS model treatment demonstrates that tFNAs@miR-134ASO complexes effectively alleviate anhedonia and improve survival behavior in depressive mice, reduce anxiety, and repair cognitive impairments such as spatial and short-term memory (all $p < 0.05$). Additionally, Nissl staining and Golgi staining of frontal lobe and hippocampal brain tissues confirm that tFNAs@miR-134ASO complexes improve neuronal apoptosis and promote increased dendritic spine density in mice. TEM shows reduced neuronal damage, increased synaptic numbers, and significantly increased postsynaptic densities. qPCR and WB experiments on in vitro cells and in vivo brain tissues further confirm that chronic stress leads to increased miR-134 levels, while tFNAs@miR134ASO effectively reduces miR-134 and promotes the expression of Limk1, Creb, Bdnf, and PSD95, thereby enhancing synaptic plasticity changes.

Conclusion Intranasal administration of nanomaterial complexes tFNAs@miR-134ASO effectively crosses the blood-brain barrier, significantly inhibits miR-134 and its suppression of target genes Limk-1 and Creb, promotes synaptic plasticity changes in vitro SH-SY5Y cells and in vivo prefrontal cortex and hippocampus regions of mice, reduces neuronal damage induced by chronic stress, and exhibits therapeutic effects in improving depressive mood and promoting cognitive function recovery.

2.Department of Psychiatry, Huashan Hospital, Fudan University, Shanghai 200040, China

3.Clinical Center for Psychotic Disorders, National Center for Mental Disorders, Shanghai 200030, China

4.Department of Neurosurgery, Huashan Hospital, Fudan University, Shanghai 200040, China

Objective Schizophrenia is a brain disease with a high rate of relapse and disability. About 10% of patients are not responsive to any antipsychotic treatment including clozapine. In schizophrenia, reduced dopaminergic signals from VTA projecting to the prefrontal cortex (PFC) promote negative symptoms; increased signals projecting to the dorsal striatum underlie the pathology of positive symptoms. DBS intervention of nucleus accumbens and anterior limb of internal capsule (NAc-ALIC) may have a synergistic effect in modulating neuronal and alleviating psychotic symptoms. This pilot study is to explore the efficacy and safety of NAc-ALIC DBS for patients with treatment-resistant schizophrenia (TRS).

Methods The study was approved by the Shanghai Mental Health Centre Ethics Committee and all participants provided written informed consent before bilateral stereotactic neurosurgery of DBS implantation

(IPG; SR1181, SceneRay). Each electrode had four contacts covering NAc and ALIC. Researchers evaluated the clinical symptoms (PANSS/CRDPS/CGI-S) at preoperative baseline, and 1-, 2-, 4-, 8-, 12- and 24-week follow-ups after stimulation. Neurocognition (MCCB) was assessed at preoperative baseline and 12-week, 24-week follow-ups after stimulation. Adverse events (SAS/AIMS/BARS/C-SSRS) were assessed throughout the trial

Results Outcomes of the first subject who finished 24-week follow-up

(1) Symptom: After 24 weeks of stimulation, response rate was 62.1% in PANSS total, 60.0% in PANSS positive, 57.1% in PANSS negative, 68.2% in PANSS general. Remission was observed in both positive symptoms (delusions, conceptual disorganization) and negative symptoms (emotional withdrawal, poor rapport, apathy).

(2) Neurocognition: Compared with pre-surgery baseline, the neurocognitive composites in MCCB improved, with T-score rising from -4 to 17. Significant improvement was observed in “speed of processing” (from 2 to 29) and “attention/vigilance” (from 6 to 35).

(3) Side effects and stimulation parameters: After the first 2-week stimulation (electrode contacts in NAc 0,4, ALIC 2, 6: 210us, 145Hz, 4.5V 7:30-22:00 and 0V 22:00-7:30), the patient reported increased involuntary movements in upper and lower limbs (AIMS rating: “2=mild”). After switching off intranuclear stimulation contacts and adjusting parameters (bilateral electrode contacts in ALIC 2, 3, 6, 7: 210us, 145Hz, 6V 7:30-22:00 and 4V 22:00-7:30), the adverse effect disappeared till 4-week follow-up. By the end of this trial, the optimized stimulation parameters are bilateral electrode contacts in ALIC 2, 3, 6, 7: 210us, 130Hz, 6V (7:30-22:00) and 4V (22:00-7:30), unilateral electrode contact in NAc 1: 180us, 130Hz, 6V (7:30-22:00) and off (22:00-7:30). No other AEs were reported.

Conclusion DBS of NAc-ALIC can be safely applied to reduce symptoms and improve cognitive performance in TRS patients. Close monitoring of adverse effects is required to minimize the risk of DBS. Further studies are required to investigate electrophysiological

biomarkers and initiate personalized close-loop modulation

3.北京师范大学认知神经科学与学习国家重点实验室

目的 由抑郁症 (major depressive disorder, MDD) 个体水平的左侧背外侧前额叶 (dorsolateral prefrontal cortex, DLPFC) 与膝下前扣带回 (subgenual anterior cingulate cortex, sgACC) 功能连接引导, 确定个体化、精准经颅磁刺激 (transcranial magnetic stimulation, TMS) 干预靶点是备受瞩目的抗抑郁疗效提高策略之一。本研究开展随机对照临床试验, 直接比较个体 DLPFC-sgACC 功能连接精准定位与传统非精准定位 (脑电 F3 导联) TMS 治疗 MDD 的疗效。

方法 本研究在上海市精神卫生中心和苏州市广济医院招募符合 DSM-5 抑郁症诊断的患者 150 名, 按 1:1 随机分入 DLPFC-sgACC 功能连接精准定位组 (个体精准靶点组, N=75) 和传统非精准定位组 (F3 组, N=75)。两组均接受 20 次 TMS 治疗, 在基线、5 次、10 次和 20 次治疗后接受汉密尔顿抑郁量表 (17-item Hamilton Depression Scale, HAMD-17) 等临床评估。20 次 TMS 治疗后 HAMD-17 减分为主要结局指标, 有效率为次要评估指标。采用线性混合效应模型比较两组的疗效差异。

结果 个体精准靶点组和 F3 组分别有 53 例和 60 例完成 20 次 TMS 治疗。基线时两组人口学特征和临床症状严重程度均无统计学差异 ($p>0.05$)。F3 组接受 5 次、10 次和 20 次 TMS 治疗后 HAMD-17 平均减分分别为 6.1、10.1 和 13.1, 个体精准靶点组

为 8.1、10.8 和 13.3。HAMD-17 减分的时间主效应显著 ($p < 0.001$)，时间×组别交互作用在完成 5 次 TMS 治疗后显著 ($\beta = 1.96, SE = 0.10, p = 0.050$)，完成 10 次和 20 次 TMS 治疗后不显著 ($p > 0.05$)。简单效应分析，个体精准靶点组在完成 5 次治疗后 HAMD-17 评分显著低于 F3 组 ($\beta = -2.81, SE = 0.94, p = 0.003$)；其余时点无统计学差异 ($p > 0.05$)。在接受 5 次、10 次和 20 次 TMS 治疗后，F3 组有效率分别为 14.8%、39.1% 和 75.6%，个体精准靶点组有效率为 35.2%、50.7% 和 74.6%；个体精准靶点组在 5 次 TMS 治疗后有效率显著高于 F3 组 ($\chi^2 = 6.984, p = 0.008$)。

结论 本研究结果提示，在 20 次 TMS 治疗后个体精准定位组和常规非精准定位组未表现出显著的抗抑郁疗效差异，但个体 DLPFC-sgACC 功能连接精准靶点组治疗可能更快起效，在 5 次治疗后具有更高的有效率。

Long-term Characteristics of Antipsychotics Induced Changes in Weight and Feeding Behavior

Di Chang¹, Di Chang^{2,3}, Dengtang Liu^{1,2,3}

1.Division of Psychotic Disorders, Shanghai Mental Health Center, Shanghai Jiao Tong University School of Medicine, Shanghai, 200030, China

2.Clinical Center for Psychotic Disorders, National Center for Mental Disorders, Shanghai, 200030, China

3.Department of Psychiatry, Huashan Hospital, Fudan University, Shanghai, 200040, China

Objective This study aimed to assess long-term changes in body weight and feeding behavior following antipsychotic treatment in first-episode schizophrenia (FES) patients and make a comparison of olanzapine, risperidone, amisulpride, aripiprazole and perphenazine

Methods We recruited participants with first-episode schizophrenia (FES, $N = 156$) during their first psychiatric hospitalization. Enrolled patients who met the inclusion criteria were randomly assigned to five commonly used antipsychotics (olanzapine, risperidone,

amisulpride, aripiprazole, perphenazine) in a 1:1:1:1:1 ratio. We prospectively collected weight, body mass index, waist circumference at admission and during the 12-months follow-up. The Three-Factor Eating Questionnaire (TFEQ-R21) was also used at each follow-up site to assess feeding behavior, including uncontrolled eating (UE), cognitive restraint (CR), and emotional eating (EE)

Results Individuals with FES in each drug group had a significant increase in body weight, waist circumference and BMI ($p < 0.05$). After 8-week treatment of the acute stage, 33.3% of the patients had a significant weight gain (weight increased by $\geq 7\%$ from baseline), and 80.8% of the patients had a significant weight gain after 12 months of maintenance treatment. During the acute management, participants from risperidone group showed significantly higher weight gain than other groups. Olanzapine group showed significantly higher weight gain after the 12-months maintenance treatment, while aripiprazole group had the minimum change. There were significant between-group differences in weight gain over time between the olanzapine and aripiprazole groups ($p = 0.01$). Waist circumference increased most in risperidone group, followed by olanzapine, and the least in perphenazine. Emotional eating was significantly correlated with weight gain in the long-term maintenance phase. The risperidone group with the most significant increase in waist circumference during long-term maintenance treatment showed an upward trend in both UE and EE. Contrary to the trend of weight change, the olanzapine group showed a downward trend in UE and EE and a significant increase in CR score during the long-term maintenance treatment

Conclusion Antipsychotics are associated with a clinically significant weight gain in FES patients, which is long-term and sustained. At the early stage of antipsychotic treatment, risperidone effect on the weight of the most significant, characterized by increased abdominal circumference. In the long-term maintenance treatment, the significant weight gain by olanzapine should not be neglected. Early and long-term metabolic monitoring should accompany antipsychotic prescription. Despite the increased CR and decreased UE and EE, weight gain

was still significant in olanzapine group, which may indicate that olanzapine induced weight gain was mediated by other mechanisms besides the increase of appetite

Gut Microbiota Modulates Glutamate Receptor Activity Via The IL-1 β Pathway in Bipolar Depression

Anying Tang, Shaohua Hu

The First Affiliated Hospital of Zhejiang University School of Medicine

Objective Neuroinflammation is involved in the pathogenesis of bipolar disorder (BD), but whether gut dysbiosis contributes to the neuroinflammatory underpinnings in BD remains unclear. Herein, we investigated the relationship between gut microbiota and neuroinflammation in bipolar depression, by focusing on its regulatory effects on glutamate receptors, N-methyl-D-aspartate receptor (NMDAR) and α -amino-3-hydroxy-5-methyl-4 isoxazole receptor (AMPA)

Methods Antibiotic-treated C57 BL/J male mice were transplanted with gut microbiota derived from individuals with bipolar depression or healthy controls. Gut microbiota characterization, peripheral and prefrontal lobe levels of inflammatory factors, microglial activation, and transcription levels of NMDAR and AMPAR genes were measured in the “BD” mice and control mice. Furthermore, IL-1 receptor antagonist was used to further explore its effects on the glutamate pathways

Results Compared with control mice, “BD” mice displayed depression-like behaviors, with a higher diversity of bacteria and an increased abundance of specific bacterial species. “BD” mice also had increased levels of inflammatory factors (e.g., IL-1 β) in the serum and prefrontal cortex, along with the activation of microglia and changes in the mRNA levels of NMDAR and AMPAR. Treatment with IL-1 receptor antagonist partially reversed the behavior patterns, neuroinflammation and transcription levels of glutamate receptors in “BD” mice

Conclusion Our results provide preliminary evidence that gut microbiota may contribute to the neuroinflammation of bipolar depression via modulating the IL-

1 β effects on the brain glutamate receptors

关键词: bipolar disorder; gut microbiota; neuroinflammation; glutamate receptors; interleukin 1

基于数字孪生脑的双相情感障碍病人躁狂相-缓解相转相的静息态功能连接分析

徐月洋¹ 荣晗¹ 郑奇宝²

1.深圳市康宁医院

2.复旦大学类脑智能科学与技术研究院

目的 数字孪生脑(Digital twin brain, DTB)是基于计算神经科学理论和多模态神经图像数据集成的全脑尺度动态脑功能计算模拟平台。它将弥散磁共振成像获得的内部结构连接信息作为确定内部连接模型的基础,利用功能磁共振成像和脑电磁成像获得的功能信息对模型参数进行优化。最终的模型在结构和功能上都与大脑相似,因此可以被称为数字孪生脑。我们利用 DTB 模拟双相情感障碍患者躁狂发作期间进行的经颅直流电刺激治疗,模拟患者从躁狂发作到缓解的过程,寻找情绪转化的“扳机”。既往研究发现,双相情感障碍患者缓解状态下默认网络部分脑区静息状态功能连接高于躁狂状态。在本实验中,我们以这种上升作为区分躁狂状态和缓解状态的标准。

方法 收集深圳康宁医院两例双相情感障碍患者躁狂状态和缓解状态的纵向静息状态 MRI 数据,由类脑智能科学与技术研究院进行预处理,在全脑计算平台上进行 1 亿神经元、100 度、体素级别的 DTB 生成、同化和静息状态模拟。最后分别在既往研究确定的可以使躁狂增强(左侧 DLPFC, MNI-20、2、64, 促躁狂脑区)和使躁狂缓解的脑区(右侧 DLPFC, MNI 20、36、52, 降躁狂脑区)进行了刺激模拟,并将刺激模拟结果与静息状态模拟结果进行比较。

结果 从整体水平来看,缓解期的真实全脑功能连接均值为 0.364 (95% CI: 0.362, 0.365),躁狂期为 0.341 (95% CI: 0.340, 0.342),低于缓解期。对躁狂期的孪生脑进行刺激,在降躁狂脑区进行刺激后的全脑功能连接均值为 0.346 (95% CI: 0.344, 0.347),对比躁狂期略有上升。在促躁狂脑区进行刺激后为 0.337 (95% CI: 0.335, 0.338),对比躁狂期

略有下降,在四组数据中最低。从脑区水平来看,我们发现在默认网络的部分脑区(HCP 2016),如 Frontal_Opercular_Area_2_R、IntraParietal_Sulcus_Area_1_R、Perirhinal_Ectorhinal_Cortex_L 等,可以观察到预期的功能连接改变。

结论 初步模拟取得了预期的结果,即静息状态功能连接在降躁狂脑区进行刺激后上升,促躁狂脑区进行刺激后下降。实验刺激的促躁狂脑区和降躁狂脑区很有可能是情绪转化的“扳机”。然而,这些功能连接改变的绝对值很小,分析原始数据发现,刺激的传递范围非常有限,这可能是由于 100 度模型的传导效率较低。未来的研究计划是进行 20 亿神经元、1000 度的 DTB 模拟,并进行进一步的分析。

双相障碍遗传高危人群伴有阈下症状的脑神经发育特征: 一项队列纵向研究

林康广¹ 刘仲皖¹ 邵正義²

1.广州医科大学附属脑科医院

2.香港大学

目的 既往证据表明双相障碍 (BD) 的发病风险在有家族史或表现出阈下症状的个体中会大幅度提升。揭示与 BD 遗传和阈下症状高危相关的神经机制对疾病的早期预防和干预有重要临床意义。既往研究表明 BD 的发病高峰年龄从青春期开始,但 BD 高危的大脑发育特征尚不明确。本随访队列研究调查了与 BD 遗传风险和症状风险相关的纵向大脑结构特征,以及这些特征是否能够前瞻性预测个体的功能水平变化和未来心境病发作。

方法 我们招募了 26 名已出现阈下症状的 BD 病人子代(年龄 14.9±2.9 岁, 14 名女性), 35 名无症状的 BD 病人子代(年龄 15.3±2.7 岁, 19 名女性), 49 名具有阈下症状的健康人子代(年龄 14.5±2.2 岁, 30 名女性)和 68 名健康对照(年龄 5.0±2.3 岁, 37 名女性),于基线和随访时间点(平均间隔 2.63 年)测量被试的临床指标、功能水平和大脑结构(灰质体积)。我们运用组间方差分析和独立样本曼-惠特尼检验揭示了 BD 遗传风险和症状风险的横断面和纵向大脑结构特征,并计算了大脑结构特征与被试

的功能水平变化间的斯皮尔曼关联系数。我们的前瞻性分析检验了被试基线的脑结构是否预测了被试随访后的功能水平变化和心境病发作与否。

结果 在基线时, 具有遗传风险和症状风险的个体在与情感和认知功能相关的关键脑区域中表现出较大的灰质体积(所有 $p_{FWE} < 0.04$)。在随访中, 具有遗传风险的个体表现出海马和前扣带回皮层灰质体积的加速减少 ($p_{FDR} = 0.045$); 与之相反, 具有阈下症状风险的个体则表现出腹内侧前额皮质灰质体积更慢速的减少 ($p_{FDR} = 0.045$)。关联分析结果显示个体于基线时较大的灰质体积及后续更快速的灰质减少预测了其更好的基线功能水平及随访后的功能水平改善。并且, 随访后心境病发作的被试较随访后未发病被试的基线功能水平和枕叶皮质体积皆较低。

结论 本研究结果为 BD 遗传和阈下高危风险特异性的脑神经发育特征提供了新的证据。在较早脑发育期, BD 遗传和阈下高危风险人群皆展示出更大的关键脑区灰质体积, 可能代表其对抗 BD 高危的适应机制。在随后的脑发育中, BD 遗传高危个体展现出更高层次的神经修剪(灰质下降), 而其与功能水平改善的关联提示该特征为对抗基因高危的适应性机制。相反, BD 阈下症状高危个体的神经修剪程度较低, 可能导致其功能水平衰退和将来心境障碍疾病发作。

Cognitive Enhancement in Bipolar Disorder: A Double-Blind, Randomized Controlled Trial Utilizing A Novel DTI-Guided Multi-modal Neuro-stimulation Protocol

Hetong Zhou, Shaohua Hu

The First Affiliated Hospital, Zhejiang University School of Medicine

Objective Traditional neuromodulation strategies for enhancing cognitive abilities in patients with bipolar disorder (BD) have shown preliminary promise, yet there remains a need for novel intervention modalities

to improve therapeutic outcomes. This study introduces a novel multi-modal neuromodulation protocol (MNS protocol) that leverages personalized DTI data to identify fiber tracts between the DLPFC and dACC. The highest point of structural connectivity strength is selected as the individualized stimulation target, which is then targeted using a combination of optimized tACS and robot-assisted navigated rTMS for multi-modal intervention. A double-blind randomized controlled trial was conducted to investigate the clinical efficacy of this innovative neuromodulation approach on cognitive abilities in BD patients

Methods A total of 116 participants were initially recruited, with 100 BD patients ultimately included and randomly assigned to four treatment groups: Group A (Active tACS-Active rTMS (MNS Protocol), $n=25$), Group B (Sham tACS-Active rTMS, $n=25$), Group C (Active tACS-Sham rTMS, $n=25$), and Group D (Sham tACS-Sham rTMS, $n=25$). Participants underwent 15 sessions over three weeks. Cognitive assessments were conducted at baseline (Week 0), post-treatment (Week 3), and follow-up (Week 8)

Results Of the 100 participants, 66 completed all 15 sessions. The factorial ANOVA revealed significant interaction effects between tACS and rTMS on TMT and DSST scores ($P < 0.00001$). Group A (MNS Protocol) showed superior improvements in Spotter CRT, TMT, and DSST scores compared to other groups at Week 3, with sustained cognitive enhancement in Spotter CRT at Week 8 ($P < 0.01$). fMRI data indicated that only Group A exhibited significant activation in the left Frontal_Inf_Oper_L region after the MNS intervention. However, correlation analysis between induced electric fields and cognitive improvements yielded no significant associations ($R^2 < 0.2$)

Conclusion Our results indicate that MNS Protocol significantly improve cognitive indicators in bipolar disorder. The safety and efficacy were systematically evaluated, supporting the potential of personalized neurostimulation approaches for treating cognitive dysfunction in bipolar disorder. The study contributes valuable insights into the burgeoning field of targeted transcranial stimulation and highlights the importance of individualized interventions in psychiatric research

单双相抑郁患者在识别正性情绪面孔时前额叶—纹状体通路 low-gamma 频段效能连接差异

尤为¹ 花玲玲¹ 杜易珊¹ 黄莺莺² 林品华² 何晨¹ 卢青³ 姚志剑^{1,2,3}

1.南京医科大学附属脑科医院心境障碍科, 南京, 2100929

2.南京大学医学院教学医院南京脑科医院, 南京 210093

3.东南大学生物医学工程, 南京, 210096

目的 双相障碍是一种严重影响患者生活质量、社会功能, 并增加自杀风险的疾病, 表现为抑郁和躁狂或轻躁狂的反复发作。双相抑郁患者与抑郁症患者临床症状相似, 尤其是首次情绪发作表现为抑郁发作的双相患者, 这导致未发生躁狂的双相障碍患者与抑郁症患者难以鉴别, 从而导致误诊率高、家庭负担加重。在寻求治疗的第一年内, 接近 60% 的双相患者被误诊为抑郁症。虽然某些流行病学和症状特征有助于区分抑郁症和双相障碍, 但是区分有效性不足。因此, 更早地寻找出转相和单相潜在病理生理学差异是非常有必要的。Gamma 神经震荡参与注意、情绪等高级认知功能处理, 且既往研究表明双相抑郁患者与单相抑郁患者在处理正性情绪时存在不同激活模式, 尤其在前额叶-纹状体环路存在差异。但目前关于前额叶-纹状体环路是否有助于早期识别双相障碍仍有待进一步研究。

方法 对 75 例单相抑郁症患者 (unipolar disorder, UD)、39 名健康对照者 (health Control, HC) 进行脑磁图扫描, 选取正性情绪面孔刺激下的脑磁信号。经过 5 年以上随访, 75 例单相抑郁症患者中 23 例抑郁症患者转为双相障碍 (converted to Bipolar disorder, ctBD)。其中 ctBD 脑磁图像选择未发生过躁狂时的入组基线脑磁图像。基于 matlab 平台利用 fieldtrip 工具包对数据进行去公频、滤波, 去除伪迹处理。并基于个体化磁共振数据进行溯源分析, 选取眶额回、前扣带回、腹侧纹状体、杏仁核作为感兴

趣脑区, 以 30~50 Hz gamma 频段为感兴趣频段, 利用格兰杰因果模型计算各感兴趣脑区之间的效能连接值。对脑区间效能连接值采用非参数检验进行统计分析, 检验水准 $\alpha=0.05$ 。Bonferroni 矫正。

结果 ctBD、UD 两组患者在识别正性情绪面孔时, 前额叶—纹状体通路 gamma 频段均在左腹侧纹状体到左眶额回之间的效能连接减弱。ctBD 与 UD 右杏仁核到左眶额回、右杏仁核到左纹状体之间的效能连接在 low-gamma 频段差异具有统计学意义 ($p<0.05$), 且效能连接强度 ctBD 较 UD 增强。

结论 单相、未经历躁狂打击的双相患者在识别正性情绪面孔时前额叶-纹状体环路活动部异常, 抑郁症转相患者在该环路 low-gamma 频段存在特异性的改变, 是区分两者的潜在电生理学标志, 为早期识别双相情感障碍患者奠定基础。

4.Nanjing Brain Hospital, Medical School of Nanjing University, Nanjing 210093, China

Objective Suicide in bipolar disorder (BD) has been shown to be clearly heritable and associated with neuroanatomical disruptions among brain regions. However, it remains unclear how genetic risks might spatially correspond to the neuroanatomical disruptions in suicide

Methods Morphometric similarity network

(MSN) of structural MRI was established as a marker of inter-regional connectivity in two independent BD cohorts: totally, 83 patients with suicide attempt (SA), 94 without SA (NSA) and 96 healthy controls. We utilized normative brain gene expression data and partial least squares analysis to find the intrinsic expression gradients enriched for gene list of SA-related changes in MSN (SRM). Its spatial correspondence was further validated by additional paired measures of 14 SNPs in SRM genes (in 38 SA and 38 NSA patients). Then specific cell-type was identified by its capability of being rooted in above spatial correspondence

Results MSN analysis demonstrated replicable neuroanatomical disruptions of SA effects. Significantly increased MSNs in entorhinal part 1 and left lateral occipital part 7 were observed in SA group (FDR corrected $p < 0.05$). Spatial correspondence between SRM gene expressions and MSN alternations was supported by a partial mediation of MSN in left lateral occipital part 7 between genetic risks and suicide risk carried by patients (indirect effect = 0.0006, 95% CI = [6.67e-07, 0.01], $p < 0.05$). Furthermore, under-expression of negatively weighted SRM genes in excitatory neuron was suggested to account for the increased MSN in left lateral occipital part 7, especially for genes involved in glutamatergic synaptic plasticity

Conclusion Abnormal glutamatergic synaptic plasticity in excitatory neurons resulted from under-expression of SRM- genes could contribute to dysconnectivity between visual cortex and the other areas. Difficulty in top-down emotional regulation caused by above spatial correspondence would make patients more vulnerable to emotional states, accumulating suicide risks

CRMP2 in The Hippocampal CA1 Region Improves Chronic Stress-induced Depression-like Behaviour in Mice by Affecting Synaptic Plasticity

Ruiling Li, Zhongchun Liu

Department of Psychiatry, Renmin Hospital of Wuhan University

Background Major depressive disorder (MDD) is a prevalent psychiatric illness and a significant contributor to the global burden of disease. Previous studies have demonstrated that collapsin response mediator protein 2 (CRMP2) in the hippocampal CA1 region plays a pivotal role in regulating depression pathogenesis. The present study aimed to elucidate the underlying mechanism through which CRMP2 modulates synaptic plasticity, thereby mediating the development of depression.

Methods We stereotactically injected adeno-associated virus into the mouse brain to manipulate the expression of CRMP2 and subjected the mice to chronic unpredictable mild stress (CUMS) to induce a depression-like phenotype. The sucrose preference test, open field test, elevated plus maze test, forced swimming test and tail suspension test were used to detect behavioural changes. Western blotting, real-time PCR, immunofluorescence, coimmunoprecipitation and IP-MS were combined to explore the CRMP2-mediated synaptic plasticity phenotype

Results The expression of CRMP2 in the hippocampal CA1 region was observed to decreased following CUMS. Knockdown of CRMP2 in the hippocampal CA1 region resulted in impaired synaptic structure and plasticity, accompanied by increased anhedonia and hopelessness. Conversely, overexpression of CRMP2 in the hippocampal CA1 region has the potential to restore the compromised synaptic structure, plasticity, and associated behavioural deficits associated with depression. Furthermore, CRMP2 directly interacted with postsynaptic density protein 95 (PSD95), thereby influencing its expression.

Conclusions Our findings suggest that CRMP2 plays a crucial role in the regulation of synaptic plasticity and depression-like behaviour, indicating that CRMP2 may enhance synaptic plasticity by interacting with PSD95 and modulating the upregulation of PSD95 expression.

关键词: CRMP2, major depressive disorder, synaptic plasticity, PSD95

伴自杀未遂双相抑郁患者“前额叶-扣带-纹状体”环路功能连接两种损伤模式

田水¹ 陈志璐² 孙浩² 姚志剑²

1.江苏省人民医院

2.南京脑科医院

目的 双相障碍抑郁发作 (bipolar depression, BD) 是自杀风险最高的精神疾病, 其自杀风险是普通人的 30-60 倍。自杀未遂史是患者再次实施自杀行为的独立风险因素, 然而部分患者或家属会刻意隐瞒其自杀意图和自杀未遂史, 寻找自杀未遂行为的客观标记, 早期识别伴自杀未遂患者对指导临床防治具有重要意义。前人研究表明“前额叶-扣带-纹状体”神经环路是 BD 伴自杀未遂的重要神经基础。本研究将探究该神经环路功能连接下降对患者自杀行为的识别价值, 以期精准识别伴自杀未遂史的 BD 患者, 便于临床管理和防治。

方法 入组南京医科大学附属脑科医院住院汉族 BD 患者 176 例, 依据此次抑郁发作是否有自杀未遂行为 (定义为至少有过一次自我伤害行为, 并且是直接想死或暗示想死及符合 HAMD-17 第三项自杀评分 ≥ 2 分者) 将患者分为伴自杀未遂组 (SA 组, $n=75$) 和不伴自杀未遂组 (NSA 组, $n=101$)。所有受试者完临床信息采集及静息态 7min 功能磁共振扫描。提取背外侧前额叶、腹内侧前额叶、前扣带、前脑岛、尾状核、壳核、苍白球、杏仁核、海马等脑区时间序列计算 Person 相关性表示功能连接强度。异质性判别分析 (heterogeneity through discriminative analysis, HYDRA) 分类器和十折交叉法验证分类器效能以及对自杀未遂患者的聚类效果。

结果 根据聚类个数 $k=2$ 时 HYDRA 模型的校正后 Rand 指数最高, 提示 $k=2$ 是最佳聚类方案, 此时, 对自杀未遂行为患者的识别率为 89%。最佳方案下, 48 名伴自杀未遂的患者被分配到亚型 1, 27 名受试者分配到亚型 2。亚型 1 患者表现出广泛的前额叶-纹状体、海马和杏仁核功能连接下降。亚型 2 患者表现出少量的前额叶内部脑区之间功能连接下降。

结论 课题组前期研究表明低频振幅动态特性能敏感地反映 BD 患者自杀风险, 对自杀未遂行为识别率较高。本研究融合 HYDRA 分类器, 发现伴自杀未遂的 BD 患者功能连接存在两种损伤模式, 纳入两种损伤模式后, 对自杀未遂行为的识别率更高。本研究结果提示将磁共振数据与人工智能技术融合, 对个体化识别伴自杀未遂史 BD 患者的临床应用前景。值得注意的是, 伴自杀未遂 BD 患者神经环路损伤模式可能存在个体异质性, 可能会给个体化识别自杀未遂造成困扰。

Csnk2A1 基因 DNA 甲基化在青少年抑郁症外周血的表达研究

廖婧¹ 张晨钰² 陶婉卿¹ 向娇娇² 姜汝红¹ 周杨¹
冉柳毅¹ 况利²

1.重庆医科大学附属大学城医院

2.重庆医科大学附属第一医院

目的 本研究将对 50 例青少年 MDD 患者与 50 例匹配的健康对照外周血进行 MethylTarget 目标区域甲基化测序, 验证 Csnk2A1 (cg19702314)、MED13L (cg09370496)、STK3 (cg16089678) DNA 甲基化水平在青少年 MDD 患者外周血的表达是否与发现队列一致, 为早期识别青少年 MDD 和临床诊断提供一个新的方向。

方法 收集青少年 MDD 患者 50 例, 招募健康对照 50 例。收集一般信息, 采用 CDRS-R、HAMD-17 项、HAMA 量表进行临床评估, 采集外周血提取 DNA。

结果 (1)MDD 组患者的 CDRS-R、HAMD-17 项、HAMA 量表得分水平均显著高于健康对照组 ($P<0.001$), 两组之间的性别、年龄、BMI、吸烟史、饮酒史相比无明显差异 ($P>0.05$)。

(2) 与健康对照组相比, MDD 组患者外周血的 Csnk2A1 基因的 cg19702314_17 95 DNA 甲基化水平显著升高 ($P<0.05$), 而两组间 cg19702314_17、cg19702314_17 83、cg19702314_17 123、cg19702314_17 132、cg09370496_10、cg09370496_10 38、cg09370496_10 98、cg09370496_10 110、cg16089678_17、cg16089678_17 98、cg16089678_17 168 DNA 甲基化水平相比无明显差异 ($P>0.05$)。

(3) Spearman 相关性分析结果显示, cg19702314_17 95 DNA 甲基化水平与 CDRS-R ($r=0.275, P=0.006$)、HAMD-17 项($r=0.204, P=0.041$) 量表得分存在正相关, cg19702314_17 95 DNA 甲基化水平与性别、年龄、BMI、吸烟史、饮酒史、HAMA 量表得分无明显相关性 ($P>0.05$)。

(4) 以 cg19702314_17 95 DNA 甲基化水平作为青少年 MDD 患者的评价指标, ROC 曲线下面积为 0.661, 灵敏度为 68.0%, 特异性为 62.0%。

结论 (1) cg19702314_17 95 DNA 甲基化水平

在青少年 MDD 患者的外周血中表达升高, 与前期发现队列高甲基化结果表达方向一致。

(2) cg19702314_17 95 DNA 甲基化水平与 CDRS-R、HAMD-17 项量表得分呈正相关, 表明可能与青少年 MDD 的临床症状、抑郁症的严重程度相关。

(3) cg19702314_17 95 DNA 甲基化水平可能对预测青少年 MDD 有一定临床价值。

Predictors of Conversion From Major Depressive Disorder To Bipolar Disorder in Adolescents: A Prospective Study

Lewei Liu, Haojie Fan, Yun Zhang, Yinghan Tian, Mingru Hao, Xin Zhao, Lei Xia, Huanzhong Liu
Chaohu Hospital of Anhui Medical University

Objective In adolescents, many individuals with bipolar disorder (BD) are initially misdiagnosed with major depressive disorder (MDD), thereby delaying timely treatment. However, due to the similarity of early symptoms, it is difficult to differentiate between MDD and BD at an early stage. The present study aimed to investigate the rate as well as the clinical predictors of conversion from adolescents with MDD to BD in China through a prospective cohort design

Methods From January 2021 to March 2024, we conducted this cohort study and included 202 adolescents with MDD at baseline. All patients were followed up for more than 1 year and were categorized into a conversion to BD group ($n=38$) and a remained MDD group ($n=164$) based on follow-up diagnosis. We measured patients' depression, excessive daytime sleepiness, insomnia, internet addiction (IA), suicidal ideation (SI), history of suicide attempt, and non-suicidal self-injury (NSSI) based on clinical interviews and scale assessments. Statistical analyses were conducted using SPSS 23.0. Logistic regression was applied to analyze the independent influences on the conversion from MDD to

BD. The predictive value of each independent risk factor for conversion was evaluated by receiver operating characteristic (ROC) curve

Results In this study, the rate of conversion from MDD to BD was 18.81%. At baseline, patients who conversion to BD had a younger age at onset, were more likely to have comorbid use of mood-stabilizers or anti-psychotics, histories of suicide attempt, NSSI, and psychotic symptoms, higher severity of depression, insomnia, and SI, and lower levels of IA (all $P < 0.05$). Logistic regression analyses revealed that independent predictors of conversion from MDD to BD included age at onset (OR = 0.742, 95% CI = 0.576~0.955, $P = 0.021$), use of mood-stabilizers (OR = 5.253, 95% CI = 1.502~18.372, $P = 0.009$), suicide attempt (OR = 3.783, 95% CI = 1.165~12.282, $P = 0.027$), NSSI (OR = 3.830, 95% CI = 1.419~10.337, $P = 0.008$), and IA (OR = 0.959, 95% CI = 0.932~0.985, $P = 0.003$). And ROC curve analysis revealed that the combination of age at onset, suicide attempt, NSSI and IA had a better predictive value for the conversion of adolescent MDD to BD (AUC = 0.772, 95% CI = 0.693~0.852, $P < 0.001$)

Conclusion Adolescents with MDD had a higher overall risk of experiencing conversion to BD in China. This study initially identified risk factors for the conversion from adolescent MDD to BD and developed a predictive model. The model will enable early identification of risk groups and the application of more targeted interventions to improve clinical prognosis

Silent Suffering: Multidimensional Stressors Leading To High Self-Harm Behavior Levels in Chinese Preadolescents

Ming Ai, Li Kuang

Department of Psychiatry, The First Affiliated Hospital of Chongqing Medical University

Background Limited research has been conducted on self-harm among preadolescents in China.

This study investigated the influence of multidimensional stress on high self-harm behavior levels in preadolescents

Method This large-scale cross-sectional study of 7-14-year-old primary school students in grades 3-6 was conducted in Southwest China from November 2020–June 2021. Data on sociodemographic characteristics and multidimensional stressors were collected and analyzed

Results A total of 48,117 students (23,075 girls and 25,042 boys; mean age 10.45 years) completed this survey. 13.6% (6,561) reported self-harm behaviors. Chi-square and binary logistic regression analyses were employed. The most important risk factors for self-harm were ranked as follows: high academic pressure (OR=2.00, 95% CI 1.90-2.09), poor parental relationships (OR=1.89, 95% CI 1.78-2.00), frequently being bullied (OR=1.53, 95% CI 1.47-1.60), early-onset menstruation (OR=1.33, 95% CI 1.22-1.46), frequent smartphone use (OR=1.31, 95% CI 1.26-1.37), poor classmate relationships (OR=1.31, 95% CI 1.24-1.38), poor relationship between parents (OR=1.11, 95% CI 1.08-1.14), poor family financial situation (OR=1.11, 95% CI 1.05-1.17), and being bullied within the past 1 month (OR=1.05, 95% CI 1.02-1.07)

Limitations: The sample size of this study was relatively large. As only participants from Chongqing were included, the data obtained may not be representative of all of China. Therefore, further research investigating and confirming whether similar circumstances exist in various centers across the nation are needed.

Conclusion Preadolescents in China exhibited high rates of self-harm behaviors. It is necessary to establish a “School-Family-Hospital” trinity psychological intervention collaboration model to prevent self-harm among primary school students

关键词: Preadolescents; Self-harm; Multidimensional stress; School-Family-Hospital

双靶点加速重复经颅磁刺激对青少年重度抑郁症患者疗效及脑功能机制研究

张继元¹ 张继元² 舒燕萍² 罗禹¹ 谭江¹

1. 贵州师范大学

2. 贵州省第二人民医院

目的 据世界卫生组织调查报告,重度抑郁症已被列为全球疾病负担最重的三大疾病之一,青少年抑郁的患病率逐年增长,目前青少年群体抑郁问题已非常严峻。对于重度抑郁症患者,现有药物治疗虽有效但伴随着需要使用多种不同药物、起效时间长、存在副作用等问题。且整体疗效有限,尤其是青少年的治疗有效率相对更低,需要更有效的治疗方法。传统重复经颅磁刺激(repetitive transcranial magnetic stimulation, rTMS)治疗方案存在治疗周期长、起效慢等缺点,提出一种为高效的 rTMS 治疗模式——加速型经颅磁刺激。突破传统每日一次的治疗方案,使得患者治疗周期缩短的同时改善抑郁状况,并验证替代靶点右侧眶额叶(Orbitofrontal Cortex, OFC)的治疗效果,分析涉及脑区在双靶点加速型重复经颅磁刺激治疗前后脑功能变化,为青少年抑郁症治疗及其神经机制提供更多实证依据。

方法 将符合诊断标准的 66 例青少年重症抑郁症患者作为研究对象,分为单靶点组、双靶点组,伪治疗组,每组各 22 例,分别在治疗前、治疗 5 天后受试者进行磁共振扫描、HAMD17 量表评估。治疗结束 1 周后,再次对患者进行量表随访评估。TMS 的刺激方案为:双靶点组先对右侧 OFC 区进行连续 θ 爆发式刺激 600 脉冲,在左侧背外侧前额叶皮层(dorsolateral prefrontal cortex, DLPFC)区进行 20Hz 高频重复经颅磁刺激,进行每天 4 次,连续 5 天的加速 TMS;单靶组仅对左侧 DLPFC 区进行刺激;伪刺激组使用伪线圈刺激。对治疗前后磁共振成像进行 ALFF、ReHo 分析,以差异脑区为种子点进行 FC 分析。GRF 矫正取单位体素 $p < 0.001$,团块体素 $p < 0.01$,进行双尾检验,取连续体素大小 > 30 的脑区为结果脑区。

结果 三组治疗前在 HAMD17 量表上得分无显著差异,治疗后得分显著降低且有差异。治疗结束后及结束一周后减分率,两个治疗组显著高于伪刺激组,且双靶点组减分率较另外两组下降速度更快,幅度更大。治疗前后发现右侧小脑 6 区 ALFF 值显著升高;右侧小脑 8 区,右侧舌回、左侧颞中回 ALFF 值显著降低。双靶点组左侧角回、右侧中央后回 ReHo 值显著升高;右侧三角部额下回、中央沟盖 ReHo 值显著降低。以左侧角回为种子点发现与

左右侧颞下回、左侧枕中回 FC 显著升高,以左侧三角部额下回为种子点发现与右侧中央沟盖、左侧脑岛 FC 升高。

结论 双靶点加速经颅磁治疗青少年重度抑郁症患者在应答速度及症状改善程度优于单靶点组及伪刺激组且具有良好安全性。相关差异脑区及 FC 变化可能为双靶点治疗的脑功能机制。

2. 重庆医科大学附属第一医院精神医学中心

3. 重庆医科大学附属大学城医院精神科

4. 加拿大阿尔伯塔大学精神医学系

目的 儿童和青少年时期是心理发展的关键阶段,也是精神健康问题的易感期。本研究旨在构建一种集医院、学校、家庭和社区为一体的综合性学生心理健康服务模式,通过跨学科合作,共同促进青少年的心理健康。

方法 为确保学生心理服务工作切实做到科学、安全、规范,由重庆区政府与重庆市内拥有附属医院的医学院校(重庆医科大学)牵头,由具有多年儿童青少年情绪障碍研究基础,包括精神科医生、心理治疗师、社工师的专家团队领衔,整合社会资源合作开展面向 2 个行政辖区,共计 20 余万学生人群,开展为期四年的从“小学-初中-高中”全覆盖的学生心理健康服务。基于心理健康素养理论,通过早期识别、分诊和证据支持的心理健康干预措施,促进适当和及时地获得心理健康护理;通过提高学生、教育者和家长的心理健康素养,促进心理健康和减少污名化;让家长和社区参与解决青少年的心理健康需求。

结果 自 2020 年 9 月以来,已对超过 330,000 名学生进行了筛查,包括 165,302 名小学生、94,984 名初中生和 72,163 名高中生。37,580 名学生接受了

精神科医生/心理治疗师的面对面访谈。超过 300 名可能存在心理健康问题的学生，如高自杀风险、抑郁症、焦虑症和注意力缺陷多动障碍，被转介到重庆医科大学第一附属医院接受门诊/住院治疗或心理治疗。超过 85% 的学生接受了精神症状评估，并进行了药物治疗。6% 表现出精神病性症状、自伤倾向和自杀意念及行为的学生，建议立即住院接受治疗。9% 的学生接受心理辅导，并定期随访。经过治疗，约 12% 的学生复学。

结论 “医校家社”心理服务模式已在重庆成功实施多年，并得到了参与的学生、家长、教师以及学校的认可。通过早期识别存在潜在心理障碍的学生，将其转诊到卫生系统给予适当的治疗，促进青少年心理健康；通过一般筛查、访谈、不同级别的干预方法提供持续支持；促进和培训学生、教育者和家长的心理健康；整合教育和卫生系统中的资源，并在各个阶段明确学校、家庭、医院和社区的角色。

Efficacy Verification of Potential Neuroregulation Targets for Social Impairments in Children with Autism Spectrum Disorder: A Randomized, Double-Blind, Controlled Trial

Yonglou Wang, Xiaoyan Ke

the Affiliated Brain Hospital of Nanjing Medical University, Nanjing

Objective This study aims to explore the impact of high definition 5-channel transcranial Direct Current Stimulation (HD-tDCS) over the vertex (Cz) (10-20 electroencephalogram system) on the social impairments of Autism Spectrum Disorder (ASD) children, as well as the differences in therapeutic effects on social impairments in ASD children with or without sensory integration dysfunction

Methods This study is a randomized, double-blind, controlled trial conducted in two parts. Based on the results of brain network analysis from the functional magnetic resonance data of the Autism Specialty Cohort at Nanjing Medical University, the Cz is located in the social-related abnormal brain area of children with ASD,

covering the paracenter lobule, auxiliary motor area, and part of precentral gyrus and postcentral gyrus. Part one: A total of 118 ASD children aged 4-12 from the same cohort were enrolled. They were randomly assigned to receive true HD-tDCS with the anode centered over the Cz, true HD-tDCS with the anode centered over the left dorsolateral prefrontal cortex (F3), and sham HD-tDCS with the anode centered over Cz. The treatment involved 14 sessions over three weeks. Social function was assessed using the Social Responsiveness Scale (SRS) before and after treatment. Therapeutic effects were evaluated using the Autism Treatment Evaluation Scale (ATEC), and sleep changes were measured with the Children's Sleep Habits Questionnaire (CSHQ). Part two: This part included 72 ASD children aged 4-12 from the same cohort, divided based on the Children Sensory Integration Rating Scale (CSIRS) into typical sensory integration, sensory integration dysfunction, and sham stimulation groups. They received either true or sham HD-tDCS with the anode centered over Cz, using the same parameters as part one. Social function was assessed using the SRS. Additionally, a post-hoc analysis of 51 ASD children aged 4-8 was conducted. These children were divided into hypo-tactile response, hyper-tactile response, and typical tactile sensitivity groups based on the Sensory Processing and Self-Regulation Checklist (SPSRC), and differences in therapeutic efficacy were compared among these groups

Results At the end of the intervention, the true stimulation group with the anode over Cz showed significant improvements in SRS total score (-13.06%), social cognition (-18.53%), social communication (-15.26%), and autistic mannerism (-18.07%), especially in younger children and those with moderate to low functioning levels. The sham stimulation group showed no significant changes. The true stimulation group with the anode over F3 also showed significant improvements in SRS total score (-12.93%), social cognition (-19.78%), social communication (-11.97%), and autistic mannerism (-17.72%). Also improvements in CSHQ were observed, especially in the dimensions of sleep habits ($F=13.285, p<0.01$), nighttime awakenings ($F=11.308, p<0.01$), and daytime sleepiness ($F=9.731, p<0.01$), along with significant reductions in

ATEC scores. HD-tDCS was well-tolerated with no severe adverse reactions. Compared to the sensory integration dysfunction group, the typical sensory integration group showed significant changes in social awareness ($t=5.032$, $p < 0.001$) and autistic mannerisms ($t=3.085$, $p=0.004$). The hypo-tactile and typical tactile sensitivity groups showed significant improvements in all SRS domains, while the hyper-tactile group only showed significant improvement in social communication ($t=2.385$, $p=0.022$)

Conclusion HD-tDCS with the anode centered over Cz may be an effective treatment for improving social interaction and sleep disorders in children with ASD, and it shows greater potential in children with typical sensory integration and typical or hypo-sensitive touch responses. Further large-scale scientific research from mechanisms to manifestations is needed to verify the precise therapeutic effect of this target area

Network Analysis of Anxiety and Depression Symptoms in Elementary School Children: Identifying Central and Bridging Symptoms

Jianyu Tan², Jianyu Tan¹, Su Hong^{1,2}, Ming Ai^{1,2}, Wo Wang³, Jianmei Chen¹, Qi Zhang^{1,2}, Yiting Kong^{1,2}, Pan Ran^{1,2}, Rui Wang^{1,2}, Zhewei Su^{1,2}, Li Kuang^{1,2}

1.The First Affiliated Hospital of Chongqing Medical University

2.Psychiatric Center, The First Affiliated Hospital of Chongqing Medical University

3.Mental Health Center, University-Town Hospital of Chongqing Medical University

Objective While the co-occurrence of anxiety and depressive symptoms is well-documented in the general population, there is a lack of research specifically examining this phenomenon in children. Furthermore, previous studies have treated these symptoms as

distinct dimensions of latent variables, often overlooking their interactions. This approach misses the complex interplay between symptoms, which is crucial for a more effective understanding and treatment of this condition. Network analysis represents an effective method for investigating the complex relationships between psychiatric symptoms. The objective of this study was to examine the symptom-level relationships between depression and anxiety symptoms in a large-scale cross-sectional sample of children using network analysis. Additionally, the study aimed to identify the most central symptoms within the depression-anxiety symptom network and to investigate potential differences in network structure between genders

Methods We employed a cluster sampling method to collect psychological data from all third, fourth, and fifth-grade students in the Shapingba district of Chongqing, totaling 19,896 elementary school students. To evaluate depressive and anxiety symptoms among children, the Children's Depression Inventory and the General Anxiety Disorder-7 scales were utilized. We computed "Expected Influence" and "Bridge Expected Influence" as network centrality indices to characterize the structure of the symptom networks. Network stability was assessed through a case-dropping bootstrap approach. The Network Comparison Test (NCT) was also applied to examine potential differences in network characteristics across gender and grade groups

Results 19,514 children aged 10.98 ± 1.29 were included in the study. A total of 5,259 participants (26.95%) exhibited significant depressive symptoms, 4,885 (25.03%) showed significant anxiety symptoms, and 3,475 (17.81%) presented with both significant anxiety and depressive symptoms. Network analysis revealed that "Anhedonia," "Negative mood," and "Nervousness" were the most central symptoms in the network structure of anxiety and depression symptoms in children. Additionally, the most significant bridging symptoms connecting the anxiety-depression network were "Negative mood," "Anhedonia", and "Irritability" The NCT demonstrated that gender and grade did not significantly influence the network structure of anxiety and depression symptoms in children

Conclusion The central symptoms (anhedonia, negative mood, nervousness) and key bridging symptoms (negative mood, anhedonia, irritability) within the network of anxiety and depressive symptoms in children represent potential targets for interventions aimed at improving these conditions. These findings highlight the significance of focusing on these specific symptoms in future treatment strategies

3. 首都医科大学宣武医院

目的 注意缺陷多动障碍 (ADHD) 是一种常见的神经发育障碍, 目前一线治疗方式为药物治疗。既往研究提示药物对 ADHD 患者认知损伤改善有限, 而认知训练可辅助药物进一步改善认知功能。数字医疗具有便捷、灵活的优势, 但其疗效仍有争议。本研究开展基于全面认知评估的靶向认知训练的多中心随机对照研究, 探索靶向数字化认知训练联合药物对 ADHD 患者的治疗效果。

方法 北大六院及儿研所两个中心共有 160 名 ADHD 患儿符合入组要求, 将其随机分为数字化靶向认知训练联合药物治疗组及单纯药物治疗组。两组药物治疗选择哌甲酯或托莫西汀, 滴定至最佳剂量后维持用药。数字化靶向认知训练包括 5 个认知维度共 10 种训练任务, 目标频次为每周 5 次, 每次 40 分钟。每次训练内容基于患者之前的认知评估得分动态调整, 个性化推送靶向任务。入组患者经 8 周治疗后来院复诊, 前后测均完成临床症状评估及静息脑电采集。

结果 124 名 ADHD 患儿经 8 周治疗后完成后

测, 其中联合组 60 人, 单纯药物组 64 人。认知训练+托莫西汀联合组 ADHD 患儿与单纯托莫西汀组相比, 注意缺陷和多动/冲动症状减分率显著更低 ($p < 0.05$)、执行功能改善显著更高 ($p < 0.05$); 与单纯哌甲酯组相比, ADHD 核心症状及执行功能改善无显著差异 ($p > 0.05$), 认知训练联合托莫西汀可达到哌甲酯的疗效。在认知训练+托莫西汀联合组中, ADHD 患儿工作记忆改善与核心症状改善显著正相关 ($r \geq 0.288, p < 0.05$)。干预后认知训练+托莫西汀联合组 ADHD 患儿静息脑电 theta 频段能量显著升高, 而单纯托莫西汀组患儿脑电指标在干预前后变化不显著。对于哌甲酯治疗的患者, 联合组与单纯药物组之间的症状改善及脑电指标变化没有显著差异, 认知训练对哌甲酯疗效没有提升效果。

结论 认知训练联合托莫西汀治疗在症状改善方面更为显著, 可能是由于增加靶向认知训练后, 生态执行功能显著改善所致, 其潜在神经机制可能是 theta 频段能量的增大。本研究提供了将认知训练与托莫西汀联合使用比单纯药物治疗具有增强疗效的有力证据, 可推动 ADHD 靶向干预应用于实现个体化精准医疗, 同时为数字医疗对 ADHD 治疗的有效性提供了循证依据。(本研究在中国临床试验注册中心的预注册编号为 ChiCTR2100043525)

Dissecting Biological Heterogeneity in Major Depressive Disorder Based on Neuroimaging Subtypes with Multi-omics Data

Lili Tang¹, Rui Tang¹, Fei Wang^{1,2}

1. Early Intervention Unit, Department of Psychiatry, The Affiliated Brain Hospital of Nanjing Medical University

2. Department of Mental Health, School of Public Health, Nanjing Medical University

Objective The heterogeneity of Major Depressive Disorder (MDD) has been increasingly recognized, challenging traditional symptom-based diagnostics and the development of mechanism-targeted therapies. Neuroimaging-based subtypes offer promise in addressing

these challenges, but their biological underpinnings remain largely unexplored. This study aims to identify neuroimaging-based MDD subtypes and dissect their predominant biological characteristics using multi-omics data

Methods A total of 807 participants were included in this study, comprising 327 individuals with MDD and 480 matched healthy controls (HC). Functional neuroimaging features, specifically the amplitude of low-frequency fluctuations (ALFF), were extracted for each participant. These features were used to identify MDD subtypes through machine learning clustering. Multi-omics data, including profiles of pro-inflammatory cytokines, epigenetics, metabolomics, and genetics, were obtained for a subset of participants. Comparative analyses of these multi-omics data were conducted between each MDD subtype and HC to explore the molecular underpinnings involved in each subtype

Results We identified three neuroimaging-based MDD subtypes, each characterized by unique ALFF pattern alterations compared to HC. Subtype 1 features an imbalance of increased ALFF in the limbic system and decreased ALFF in primary cortices. Multi-omics analysis showed a strong genetic predisposition, with a significant Polygenic Risk Score (PRS) for MDD, primarily enriched in neuronal development and synaptic regulation pathways. This subtype also exhibited the most severe depressive symptoms and cognitive decline compared to the other subtypes. Subtype 2 displays increased ALFF in the prefrontal cortex and decreased ALFF in the primary cortices. This subtype is characterized by immuno-inflammation dysregulation, supported by elevated IL-1 β levels, altered epigenetic inflammatory measures, and differential metabolites correlated with IL-1 β levels. Subtype 3 presents decreased ALFF in the prefrontal cortex and increased ALFF in the primary cortices. No significant biological markers were identified for this subtype

Conclusion Our results identify neuroimaging-based MDD subtypes and delineate the distinct biological features of each subtype. This provides a proof of concept for mechanism-targeted therapy in MDD, highlighting the importance of personalized treatment ap-

proaches based on neurobiological and molecular profiles

青少年非自杀性自伤阈上与阈下亚型大脑结构-功能耦合性差异研究

胡兰¹ 刘芳¹ 李珂娜² 陈勇¹

1.成都市第四人民医院

2.电子科技大学

目的 本文旨在融合大脑磁共振结构连接与功能连接特征,探索伴有阈上非自杀性自伤(Nonsuicidal self-injury, NSSI)行为与伴有阈下NSSI行为青少年大脑结构-功能耦合特征的差异,并进一步探索大脑差异特征与各组抑郁程度、焦虑程度、自伤成瘾属性以及情绪调节功能之间的临床关联性。

方法 纳入30名阈上NSSI青少年和18名阈下NSSI青少年被试,采用儿童抑郁量表和儿童焦虑量表分别评估被试当前抑郁和焦虑情绪严重程度,采用渥太华自伤量表(Ottawa Self-injury Inventory, OSI)与情绪调节问卷(Emotion Regulation Questionnaire, ERQ)分别评估被试的自伤行为成瘾程度和情绪调节功能。采用3.0T MRI扫描仪获取被试大脑T1相、DTI相与静息态BOLD相三个序列的数据。基于结构连接与功能时间序列构建每个被试的全脑结构连接-功能序列耦合的拟合度矩阵,比较阈上组与阈下组全脑结构-功能耦合度差异并计算两组差异脑区耦合度与临床特征的线性相关性。

结果 相比于阈下组,阈上组大脑左侧额中回、双侧颞上回与左侧楔前叶的结构-功能耦合度显著升高(FDR-corrected, $p < 0.05$)。进一步相关性分析发现,在阈上组,左侧楔前叶的结构-功能耦合度与抑郁程度呈负相关($r = -0.42$, $p < 0.05$);在阈下组,左侧额中回、双侧颞上回与左侧楔前叶的结构-功能耦合度与自伤行为的主观成瘾性呈显著正相关($r = 0.47 \sim 0.72$, $p < 0.05$),且左侧楔前叶与自伤被试的情绪调节能力呈显著负相关($r = -0.71$, $p < 0.001$)。

结论 阈上NSSI和阈下NSSI青少年大脑注意

网络、听觉网络和默认网络的核心节点存在显著的结构-功能耦合性差异,提示两类人群存在不同的大脑拓扑属性。研究初步提示两类人群差异脑区的结构-功能耦合度与临床特征的线性相关性呈现出不同的映射特征。未来需进一步探究两类人群自伤行为的神经病理与心理机制,探索差异化的干预手段。

本研究由以下基金资助:国家自然科学基金(编号 82101620)和四川省医学青年创新课题(编号:Q23045)。

青春期重复经颅磁刺激对精神分裂症动物模型大脑网络模块控制力的影响

杨景钰¹ 潘春羽¹ 张锡哲² 王菲^{1,3}

- 1.南京医科大学附属脑科医院早期干预科
- 2.南京医科大学生物工程与信息学院
- 3.南京医科大学公共卫生学院精神卫生系

目的 精神分裂症发病年龄较早,通常在青春早期阶段发病。既往研究发现,精神分裂症患者存在大脑初级皮层和高级皮层的脑功能损害。另外,在青春期的神经发育过程中,初级皮层的发育尤为重要。因此,基于初级皮层的重复经颅磁治疗(repetitive Transcranial Magnetic Stimulation, rTMS)可能是精神分裂症一种潜在的早期干预方式。大脑的功能网络可以被划分为几种行使相似功能的网络模块,通过探究不同模块之间的关系,有助于理解疾病状态及干预过程中大脑的功能变化。本研究在精神分裂症神经发育异常动物模型——MAM(Methylazoxymethanol Acetate)模型的青春期阶段,通过重复经颅磁刺激(rTMS)干预模型动物的初级皮层后,探讨大脑功能网络不同模块之间控制力的变化,以评估神经调控治疗精神分裂症的有效性。

方法 本研究设计了三个实验组:模型真治疗组(N=8),模型伪治疗组(N=9)以及对照伪治疗组(N=10)。所有组别的动物在青春早期阶段接受频率为10Hz的rTMS治疗或伪治疗,治疗靶点为初级皮层,共持续两周。采集三组动物的大脑功能磁共振数据,依据动物大脑模版的解剖结构将全脑划分为13个模块:前额叶,扣带和岛叶,运动皮层,躯体

感觉皮层,顶叶皮层,视皮层,听皮层,颞叶皮层,嗅皮层,海马,杏仁核,纹状体和苍白球,以及丘脑。应用图渗流方法构建大脑功能网络,计算不同模块之间控制力,并使用单因素方差分析评估三组动物的网络模块控制力差异。

结果 单因素方差分析共发现4对有向连边在三组间有差异,嗅皮层-前额叶皮层($p=0.0081$),顶叶皮层-前额叶皮层($p=0.0301$),躯体感觉皮层-顶叶皮层($p=0.0369$)和听皮层-顶叶皮层($p=0.0477$)。进一步的两两比较后发现,与对照伪治疗组相比,模型伪治疗组表现为嗅皮层-前额叶皮层($p=0.0110$),顶叶皮层-前额叶皮层($p=0.0411$)和躯体感觉皮层-顶叶皮层($p=0.0361$)控制力升高;与模型伪治疗组相比,模型治疗组表现为嗅皮层-前额叶的控制力下降($p=0.0410$),听皮层-顶叶皮层的控制力升高($p=0.0447$)。

结论 本研究首次通过大脑网络模块间控制力的变化,证实了MAM模型中初级皮层对高级皮层控制力的异常增强,尤其是嗅皮层对前额叶的影响。rTMS治疗有效逆转了这一异常控制力,显示了其作为精神分裂症早期干预手段的潜在价值。同时,治疗引发的听皮层与顶叶皮层间控制力的非预期变化提示了潜在的副作用,未来的治疗策略应考虑这一点。

催产素鼻喷雾剂治疗成年早期 Asperger 综合征社交障碍的随机对照研究

赵佳 关霖 孟凡超 田音 常天怡 陈旭 郑毅
首都医科大学附属北京安定医院

目的 Asperger 综合征(AS)是一种广泛性发育障碍(pervasive developmental disorder, PDD),近年来的流行病学调查数据显示其患病率逐年上升。相比于儿童期,成年 AS 患者面临更大的生存需求及挑战。目前 AS 治疗方法缺乏,至今为止没有特效药物。催产素(Oxytocin, OT)在社会交往中发挥着重要的调节作用,既往研究发现 AS 患者血液中的 OT 浓度低于正常发育人群,外源性补充 OT 可能改变 AS 患者的社交行为,因此 OT 是 AS 药物治疗研

研究的热点。本研究聚焦于探索 OT 鼻喷雾剂治疗成年早期 AS 患者社会交往障碍的有效性和安全性。

方法 本研究为随机、双盲、安慰剂对照研究,所有受试者来自于北京安定医院门诊,符合国际精神疾病诊断与分类第 10 版(ICD-10) AS 诊断,年龄在 18 到 35 岁之间且近三个月使用精神科药物稳定者参加此项研究。经筛选合格的受试者将以 1:1 的比例随机分配到 OT 组和安慰剂组,分别接受 OT (48IU/日)鼻喷剂或安慰剂治疗 6 周。在基线、2 周末、4 周末、6 周末使用社会性反应量表(SRS)、成人自闭症量表(AQ)、成人重复性行为量表(RBQ-2A)、成人同理心量表(EQ)、成人系统化量表(SQ)、Liebowitz 社交焦虑量表(LSAS)评估 OT 鼻喷剂的疗效。在基线及 6 周末进行血常规、尿常规、生化、心电图等检查评估 OT 鼻喷剂的安全性。用 SPSS 26.0 完成统计分析,计量资料的组间比较根据数据分布情况选择参数/非参数检验,两组间各量表得分变化情况使用重复测量方差分析比较。

结果 一共纳入 44 例 AS 受试者,实际完成研究共 41 例,其中 OT 组 21 例,安慰剂组 20 例,2 例失访,1 例因其他身体疾病退出研究。两组受试者在年龄、韦氏智力、身高、基线各量表分数等方面,组间差异均无统计学意义;两组受试者体重在基线时组间差异有统计学意义($p=0.014$),在纠正基线差异后未发现主要结局指标发生显著变化,两组受试者具有可比性。在基线、2 周末、4 周末、6 周末,SRS 总分 OT 组与安慰剂组均有降低,但两组差异无统计学意义,OT 组 SRS 总分较基线减分值在各访视点与安慰剂组减分值比较,差异无统计学意义。在各随访点 AQ、SQ、RBQ、LSAS 量表总分 OT 组与安慰剂组均有降低,组内变化有统计学差异,但两组差异无统计学意义。EQ 量表组内及组间变化均无统计学差异。治疗后两组间不良事件出现频率比较,差异无统计学意义。

结论 连续鼻喷 OT 治疗成年早期 AS 的不良反应小、耐受性好,安全性高。但相对于安慰剂而言,OT 对改善孤独症患者的社交障碍的作用有待进一步研究。

蔡奥灵 杨景钰 王菲

南京医科大学附属脑科医院

目的 既往研究发现,心境障碍是一种高度异质性的疾病,根据影像学特征可以将心境障碍划分为不同的亚型。中央执行网络(Central Executive Network, CEN)和默认模式网络(Default Mode Network, DMN)是大脑最为活跃的网络。目前,尚未有研究从脑网络动态的角度,逐帧解析 CEN 和 DMN 在心境障碍不同亚型中活动情况。通过解析不同亚型的神经影像学机制,可能对未来基于疾病亚型实施的精准治疗提供依据。

方法 本研究使用了一个预训练的精神疾病分类模型将心境障碍患者分成两种亚型,同时使用共激活模式(Coactive patterns, CAPs)计算大脑的瞬时活动状态和状态间转换情况。首先,利用 142 例健康被试的大脑静息态数据识别出四种大脑基本的活动状态,然后计算疾病人群中与这四种基本状态相似的活动情况。接着,在第一个研究中心比较了两种心境障碍亚型($N_{\text{subtype1}}=58$, $N_{\text{subtype2}}=54$)共激活模式特征的差异。在第二个研究中心,对两种心境障碍亚型($N_{\text{subtype1}}=235$, $N_{\text{subtype2}}=188$)进行纵向数据分析,进一步探究了住院治疗一周后共激活模式特征的变化。

结果 本研究发现,从健康被试中提取的四种 CAP 分别代表 CEN 和 DMN 的不同活动时期,即 CEN+、CEN-、DMN+、DMN-。亚型 1 患者表现出更多的 DMN 相关状态活动和较少的 CEN 相关状态活动,而亚型 2 患者表现出更多的 CEN 相关状态活动,这种差异在状态占比、持续时间及状态间转移概率上显著,并在两个中心的数据集中均得到确认。此外,一周的住院治疗显著改善了亚型 1 过高的 DMN 活动和过低的 CEN 活动,而对于亚型 2,则是增强了 DMN 活动并抑制了过高的 CEN 活动。

结论 中央执行网络和默认模式网络与大脑的注意力控制、决策、自动思维等能力存在着紧密联系。通过逐帧分析,本研究揭示了 CEN 和 DMN 这两大网络在心境障碍不同亚型中的动态特征及对治疗的响应,为理解这些疾病亚型的成因及治疗反应提供了新的视角。这些发现将有助于改进心境障碍的诊断和治疗策略选择。

心境障碍疾病亚型的脑时空动态特征解析

Early Screening for Autism Spectrum Disorder in Young Children: Cross-Cultural Adaptation and Validation of The Behavior Development Screening for Toddlers(BeDevel) in China

Kaiyan Gan¹, Bei Sun^{1,3}, Anqi Huang², Ziyi Zhang¹, Nana Qiu¹, Yuan Chen¹, Fei Wang¹, Zenghe Yue¹, Xiaoyan Ke¹, Xiaoyan Ke²

1.Child Mental Health Research Center, The Affiliated Brain Hospital of Nanjing Medical University

2.Child Mental Health Research Center,Nanjing Brain Hospital, Clinical Teaching Hospital of Medical School, Nanjing University

3. Children's Hospital Affiliated to Nanjing Medical University

Objective Autism spectrum disorder(ASD) is a complex and heterogeneous neuro-developmental disorder characterized by persistent deficits in social communication and restricted and repetitive patterns of behavior, interests, or activities. Early screening tools for ASD have made great strides in recent years, but they still exist in a single format and are mostly developed in European countries leading to a lack of cross-cultural adaptation. The Behavior Development Screening for Toddlers (BeDevel) is a comprehensive and precise screening tool for ages 9-42 months. It was developed in South Korea and consists of semi-structured behavioral observation(BeDevel-Play) and structured interview (BeDevel-Interview), addressing many of the shortcomings found in other screening instruments. Therefore, we further localized and validated the BeDevel for screening autism in Chinese children

Methods We worked with the original development team to perform multiple translations and back-translations of the BeDevel into Chinese. With the guidance of a consultative committee, we made semantic and cultural modifications to the BeDevel to assess its cross-cultural adaptability. We gathered validation data from 498 participants (9-11 months, n=23; 12-17

months, n=50; 18-23 months, n=124; 24-35 months, n=210; 36-42 months, n=91), and the study included 177 individuals with ASD, 92 with developmental delay, and 206 with typical development. We conducted item analysis and calculated concurrent validity, screening accuracy (sensitivity, specificity, positive predictive value (PPV), negative predictive value (NPV)), cutoff scores, and consistency with existing assessment Tools

Results The mean Cronbach's α coefficients of the Chinese version of BeDevel-I/P were all above 0.9 (ranging from 0.875-0.939), with correlation coefficients greater than 0.3 ($r = 0.315-0.856$). The k values of BeDevel-I and BeDevel-P were 0.083-0.756 and 0.229-0.81, respectively. Sensitivity(BeDevel-I: 0.906-1; BeDevel-P: 0.844-0.937), specificity(BeDevel-I: 0.563-0.988; BeDevel-P: 0.688-0.941), PPV(BeDevel-I: 0.667-0.967; BeDevel-P: 0.826-0.978) and NPV(BeDevel-I: 0.87-1; BeDevel-P: 0.611-0.969) showed satisfactory results. Moreover, the K values between BeDevel and the ADOS-2, ADI-R, CARS, and M-CHAT ranged from 0.486-0.879, with consistency exceeding 70%

Conclusion BeDevel is one of the few ASD screening tools developed in Asian cultures. The Chinese version of BeDevel is further culturally adapted to the Chinese environment and has high reliability and validity in screening for autism. As a result, it can be utilized as a early screening tool for ASD in both clinical and community settings in China

关键词: Autism spectrum disorder, Early screening, BeDevel, Cross-Cultural, Chinese, Validity

基于 PET 对伴有自杀特征的青幼期抑郁样小鼠神经炎症变化的研究

陈羽佳*

重庆医科大学附属第一医院

目的 抑郁症是青少年中普遍的、严重的、危及生命的精神障碍，且自杀与抑郁症状的严重程度高度相关。为了更好的了解疾病的机制，在抑郁症的背景下开发伴有自杀特征青幼期动物模型，以了

解在青幼期阶段抑郁症的发病机制。本研究利用 [18F]DPA-714 PET-CT、免疫荧光、分子生物学等多模态评估具有自杀特征的抑郁模型小鼠的炎症改变, 评估抑郁症以及自杀和神经炎症之间的关联。

方法 习得性无助实验筛选 60 只 C57BL/6J 小鼠, 分为习得性无助敏感 (LHS) 的小鼠和习得性无助抵抗 (LHR) 的小鼠。将所有 LHS 小鼠和半数 LHR 小鼠暴露于 CSDS 下 10 天, 其余半数 LHR 小鼠作为对照处理。LHS+CSDS 组和 LHR+CSDS 组小鼠每天会被 CD-1 鼠攻击 10min, 使小鼠每日被不同的 CD-1 鼠进行攻击。造模结束后行为学测试, 以评估小鼠抑郁程度。每组随机抽取 3 只小鼠进行 PET-CT 扫描并对 PET 图像进行定量分析; 随机抽取 4~6 只小鼠安乐死后, 收集脑组织样本进行免疫荧光染色, 采用 ImageJ 对海马区域 Iba-1+、TSPO+ 进行统计; 试剂盒检测 TNF- α 、IL-1 β 、IL-18 和 IL-4 含量。

结果 与对照组相比, 接受 CSDS 范式的小鼠不动时间延长、蔗糖偏好率降低、总移动距离缩短、中央区探索时间减少、社会交互比下降和攻击入侵小鼠的潜伏期缩短、攻击次数增加, SUV 值增加。与 LHR+CSDS 组小鼠相比, LHS+CSDS 小鼠表现出更多与自杀相关的特征有关的行为, 具体表现在 RIT 中攻击入侵动物的潜伏期更短、攻击次数增加, 在 TST 中不动的时间更长。

与 LHR+CSDS 组相比, LHS+CSDS 组的 SUV 有所增加。

与对照组相比, CSDS 范式后海马中 Iba-1+、TSPO+ 明显增多。LHS+CSDS 组的 Iba-1+ 和 TSPO+ 在海马区域中与 LHR+CSDS 组相比也有增加。

与对照组相比, LHR+CSDS 组和 LHS+CSDS 组促炎细胞因子 TNF- α 和 IL-1 β 都有升高。与 LHR+CSDS 组相比, LHS+CSDS 组中的 IL-1 β 的表达水平也增加。

结论 CSDS 诱导了青幼期 C57BL/6J 小鼠表现出抑郁样行为, 成功构建了青幼期抑郁样小鼠模型。且 CSDS 导致了个体易感性更高的青幼期小鼠表现出更多与自杀相关的特征, 成功构建了伴有自杀特征的青幼期抑郁样小鼠模型。

PET-CT 研究证实了 CSDS 诱导海马 [18F]DPA-714 摄取值升高, 提示青幼期抑郁样小鼠海马区域神经胶质细胞活化。海马区域 Iba-1+、TSPO+ 和部分炎症细胞因子的增加, 再次验证了海马区域的神经炎症可能与青幼期抑郁以及自杀相关。

电休克对抑郁样小鼠海马区小胶质细胞激活极化的影响及机制研究

杜宁¹ 况利¹ 况利² 耿丹丹² 王余娜² 徐何雁² 石磊² 陈羽佳¹

1. 重庆医科大学附属大学城医院

2. 重庆医科大学附属第一医院

目的 使用 [18F]DPA-714 PET 技术, 深入探索电休克治疗对慢性不可预测性应激 (Chronic Unpredictable Stress, CUMS) 抑郁样小鼠海马神经胶质细胞和免疫炎症的作用。

方法 使用慢性不可预测性应激方法建立抑郁样小鼠模型。将模型小鼠随机分成不同组, 包括电休克组和抑郁样行为电休克组。对抑郁样行为电休克组进行每天 1 次连续 10 天的电休克刺激, 以模拟电休克治疗。进行体重测量、糖水偏好实验、旷场实验和悬尾实验, 分别评估小鼠的生理和行为表现。将四个小组的小鼠在各项行为学测试中的数据进行统计学分析, 比较电休克组和抑郁样行为电休克组的行为学差异。在各组小鼠进行电休克干预前和干预后分别选取 5 只小鼠进行 PET/CT 扫描和炎症生物标记物的检测。以评估电休克刺激对小鼠各脑区活性和结构的影响 (主要探究海马区)。通过 PET 示踪剂 [18F]DPA-714, 监测神经胶质细胞的激活情况。炎症生物标记物的检测: 收集小鼠脑组织样本, 使用免疫学技术, 如 ELISA、免疫印迹等, 检测与炎症反应相关的生物标记物, 如白细胞介素-6 (IL-6)、肿瘤坏死因子 α (TNF- α) 等。对 PET/CT 影像学数据进行定量分析, 比较实验组和对照组的脑区活性差异。同时, 对炎症生物标记物的检测结果进行统计学分析, 比较不同组间的差异。前两部分研究的基础上我们将分析炎症介质的变化, 并结合已知的炎症信号通路, 探究电休克是否能够影响这些信号通路的活性。

结果 电休克治疗改善了抑郁样小鼠的行为学, 各项炎症指标。

结论 电休克有可能通过抑制 NF-KB 通路发挥其抗炎作用, 进一步改善抑郁行为。

精神疾病患者发生肺血栓栓塞的危险因素分析及风险预测

付林燕 覃柳叶 陈明 黄烨楷 姜美俊

广东省人民医院

目的 近年来有研究报道精神疾病患者发生肺血栓栓塞（pulmonary thromboembolism embolism, PTE）的风险比一般人群更高。然而，由于 PTE 的临床表现复杂多样，个体差异大，且精神疾病患者由于沟通困难或将症状归因于精神疾病症状的一部分，很容易造成疾病诊治的延误。因此，本研究将分析住院精神疾病患者并发 PTE 的独立危险因素，并构建发生 PTE 风险预测模型，以便为患者的及时诊断和治疗提供指导。

方法 选取 2022 年 8 月至 2023 年 8 月在广东省精神卫生中心住院治疗并诊断 PTE 的 26 名精神疾病患者以及同期住院的 104 名不存在 PTE 的患者为研究对象。基于文献回顾分析确定包括一般人口学资料、既往史、药物使用和血液学因素等 4 类 PTE 潜在风险指标。对于既往史，重点关注高血压、糖尿病、血栓形成、冠心病和房颤疾病史。对于用药史，着重评估患者入院前是否使用抗精神病药物、是否存在抗精神病药物联合用药以及是否使用 SSRI 或 SNRI 药物。血液学因素分析包括血常规、血脂、肝肾功能、D-二聚体、凝血指标等入院常规检查指标。对患者并发 PTE 的影响因素进行 Logistic 回归分析，建立住院精神疾病患者发生肺血栓栓塞的风险预测模型。

结果 Logistic 回归分析显示高龄（ ≥ 60 岁）、高 D-二聚体（ > 500 mg/L）、高甘油三酯水平（ > 1.7 mmol/L）和高血压病史是住院精神疾病患者发生肺血栓栓塞的独立危险因素。通过以上因素构建列线图模型，Hosmer-Lemeshow 拟合优度检验结果（ $\chi^2=0.431$, $p=0.934$ ）显示曲线拟合良好，模型曲线下面积为 0.951（0.912-0.991），表明该模型具有良好的诊断效力。

结论 高龄（ ≥ 60 岁）、高 D-二聚体（ > 500 mg/L）、高甘油三酯水平（ > 1.7 mmol/L）和高血压病史是住院精神疾病患者并发肺血栓栓塞的独立危险因素。基于上述因素构建列线图模型对住院精神疾病患者

并发肺血栓栓塞具有良好的预测价值,可用于临床对精神疾病住院患者发生肺血栓栓塞风险的评估提供指导。

基于调控 GABAergic 系统探究改善抑郁模型大鼠认知功能障碍的潜在机制

刘龙飞^{1,2} 王艺明^{1,2}

1.贵州医科大学附属医院

2.贵州医科大学

目的 基于调控 GABAergic 中间神经元生物合成信号通路,探究 SSRIs 类药物氟西汀改善抑郁模型大鼠认知功能障碍的作用机制。

方法 45 只 SPF 级别 SD 雄性大鼠,适应性喂养 7 天,按照随机数字法分为正常对照组 (CON)、抑郁模型组 (DD) 及氟西汀组 (DD+F), $n=15$ 。CON 组正常饲养,DD 与 DD+F 组采用慢性不可预知温和应激方法(CUMS)联合孤养造模 28 天构建抑郁模型,造模成功后 DD 组予生理盐水 10ml/(kg·d)灌胃,DD+F 组予以氟西汀 10mg/(kg·d)灌胃,药物干预 14 天。在基线、造模后及药物干预结束后进行神经行为学评估。采用蛋白质印迹 (Western blot) 法、实时荧光定量 PCR (Quantitative Real-time PCR) 法检测大鼠前额叶区谷氨酸脱羧酶 65 (GAD65)、谷氨酸脱羧酶 67 (GAD67)、 γ -氨基丁酸 (GABA)、囊泡型 γ -氨基丁酸转运体(VGAT)、 γ -氨基丁酸 A 型受体(GABAAR)、 γ -氨基丁酸 B 型受(GABABR)的相对蛋白表达量及 mRNA 表达水平;HE 染色、尼氏染色及 Hoechst 染色观察前额叶区病理变化及神经元凋亡情况;高尔基染色观察大鼠前额叶神经元树突棘密度,进一步观察氟西汀干预效应;将 γ -氨基丁酸(GABA)生物合成通路蛋白的相对表达量与神经行为学指标进行相关性分析。

结果 在神经行为学评定方面,基线时各组大鼠在行为学指标上统计学未有明显差异;造模后,抑郁模型大鼠出现情绪、认知功能、学习能力及社交能力的损害;氟西汀干预后,抑郁模型大鼠的情感、认知、学习及社交都有不同程度的改善。与 CON 组相比,DD 组大鼠前额叶区 GAD65、GAD67、

GABA、VGAT、GABAAR、GABABR 蛋白的相对表达量及其 mRNA 表达均下降 ($p<0.05$),氟西汀干预后信号通路的相关蛋白表达水平显著升高;GAD65、GABA、VGAT、GABAAR 及 GABABR 的 mRNA 表达水平升高。组织学病理染色可观察到抑郁模型大鼠前额区出现病理损伤、神经元细胞凋亡及神经可塑性下降,氟西汀干预后有不同程度恢复。通路蛋白的相对表达量与神经行为学指标有显著相关性。随着抑郁模型大鼠绝望情绪、认知障碍及社交障碍的加重,通路蛋白相对表达量下降。

结论 CUMS 联合孤养造模 28 天后大鼠出现情绪、认知、学习及社交能力的受损,抑制性神经通路的生物合成信号出现障碍,前额叶区神经元出现病理损伤,药物动态调控该信号通路相关蛋白的表达,能不同程度上改善抑郁模型大鼠的抑郁样行为,恢复认知及社交能力,促进前额叶区神经元病理损伤的修复,发挥神经保护作用。

Prevalence and Correlates of Short and Long Sleep Duration Among Schizophrenia Patients: A Large-scale Cross-sectional Survey

Min Dong, Shibin Wang

Guangdong Provincial People's Hospital

Objective Sleep disturbance is pervasive in schizophrenia with a prevalence ranging from 30-80%. Either homeostatic or circadian processes of sleep regulation are disturbed in schizophrenia patients. The objective of this study is to examine risk factors in the correlates of short and long sleep duration in schizophrenia, and investigate if the risk of long sleep duration differed among inpatients and outpatients

Methods This study was conducted in 24 mental health institute of Guangdong Province. A multistage-stratified and random sampling method were used in the recruitment of participants. Patients' socio-demographic and clinical characteristics were recorded using self-designed questionnaire. The associations between sleep duration and sociodemographic and clinical factors

were investigated using multinomial logistic regressions and stratified across source of patients

Results A total of 6078 schizophrenia patients included in this study, with 8.7% (n=527) reported short sleep duration and 47.4% (n=2879) had long sleep duration, respectively. There were 45.2% (n=2717) of the participants were inpatients. The participants under the age of 18 (OR=3.27, 95% CI:1.21-8.84), female (OR=1.36, 95% CI: 1.07-1.71), current smoker (OR=1.41, 95% CI: 1.08-1.83), outpatients (OR=1.55, 95% CI: 1.22-1.95), reporting side effects (OR=1.61, 95% CI: 1.29-2.00), reporting comorbidities (OR=1.25, 95% CI: 1.00-1.57), age of onset (OR=1.01, 95% CI: 1.002-1.03), illness duration (OR=1.002, 95% CI: 1.000-1.003) were positively associated with short sleep duration. Having first-generation antipsychotics (FGAs) (OR=1.48, 95% CI: 1.30-1.68) and side effects (OR=1.42, 95% CI: -1.25-1.62) were positively associated with long sleep duration. Outpatients-specific factors for long sleep duration were BMI \geq 25 (OR=1.22, 95% CI: 1.03-1.44) and ex-drinker (OR=0.65, 95% CI:0.45-0.95)

Conclusion Given the harmful consequences of short and long sleep duration in schizophrenia patients coupled with the high rate of long sleep duration identified in this study, the prevention of the spectrum of sleep disturbances is necessary, including inpatients and outpatients

关键词: schizophrenia, sleep duration, outpatients

焦虑、抑郁障碍在言语流畅性任务中的前额叶激活及功能连接差异——基于 fNIRS 的研究

刘子明 冉琴 李清伟*
上海市同济医院

目的 本研究旨在比较焦虑、抑郁障碍患者在言语流畅性任务中前额叶激活特点和功能连接差异,深入理解焦虑和抑郁患者任务中的神经生物学特征,为精准诊断、个体化干预和治疗策略的制定提供科学依据。

方法 共纳入 18-60 岁的抑郁障碍 (MDD) 患者 21 名、焦虑障碍 (AD) 患者 21 名及健康受试 (HC)28 名,采用 17 项汉密尔顿抑郁量表(HAMD-17)、汉密尔顿焦虑量表评估受试的焦虑、抑郁水平;受试完成 2min 的言语流畅性任务 (VFT) (图 1);通过日立 ETG-4100 (22 通道)近红外脑功能成像系统同步记录受试在任务状态下前额叶的血流动力学信号。

结果 1. 对 VFT 期间激活水平的两两间比较发现, AD 在额极区 (Ch2、3、7) 的激活显著弱于 HC ($t < 0$, PCh2=0.007, PCh3=0.040, PCh7= 0.049), AD 在额极区、眶额叶 (Ch2、3、7、21) 激活显著弱于 MDD ($t < 0$, PCh2=0.006, PCh3=0.023, PCh7= 0.009, PCh21=0.020); MDD 在前额叶激活非显著弱于 HC ($t < 0$, $P > 0.05$)。

2. 组内水平比较任务基线和 VFT 期间的功能连接改变, HC 在左侧额叶内部 (Ch4-18、Ch4-22) 及左右额叶间 (Ch10-17、Ch1-21) 数个通道对间功能连接 (FC) 减弱 ($P < 0.05$); AD、MDD 在左右额叶间及内部 (Ch10-1、2、5; Ch11-5, Ch12-1、5) 更广泛的 FC 减弱。

3. 组间水平比较 VFT 期间的功能连接差异, AD 相比 HC 在右侧前额叶内(右侧额极区-背外侧前额叶; Ch2-5、6、10、11、14) 及左右额叶间 (右额极区-左侧背外侧前额叶; Ch2-9、13、18; Ch22-5、6、10、11、14、15) 的 FC 减弱 ($P < 0.05$); 而 MDD 相比 HC 在左侧前额叶内部 (Ch3-9、22) 及左右额叶间 (Ch1-17; Ch14-3、4、22) FC 显著减弱 ($P < 0.05$); MDD 相比 AD 在左右额叶间 (右额极区-左背外侧前额叶; Ch15-18) FC 显著增强 ($P < 0.05$)。

结论 1. 言语流畅性任务下, AD 在额极区的存在特征性激活减弱,可能与焦虑水平相关。

2. AD、MDD 任务导更广泛脑区的 FC 改变,提示 AD、MDD 在言语性认知任务下的前额叶功能连接反应模式存在异常表现。

3. AD 在任务期间的 FC 改变主要在右前额叶内部及左右额叶间,右额极区与其他脑区的 FC 强度可能与焦虑水平相关; MDD 的 FC 改变主要在左前额叶内部及左右额叶间,左侧背外侧前额叶及额极区与其他脑区的 FC 强度可能与抑郁水平相关。

Nod2 受体在脂多糖诱导的抑郁样行为中的作用研究

惠文字 董子青 赵斌斌 詹先炎 王云鹏 马现仓*
西安交通大学第一附属医院

目的 抑郁症是一种常见的精神心理疾病，主要表现为持久且反复的情绪低落、思维迟缓和意志活动减退。众多研究证据表明免疫平衡异常和抑郁症之间的联系越来越显著。Nod2 是一种细胞质内模式识别感受器，辨识细菌肽多糖中的细胞壁酰二肽（MDP）。Nod2 被 MDP 激活后，招募细胞内的 RIPK2 激活 NF- κ B 和 MAPKs 信号通路，引发炎症反应。革兰氏阴性细菌细胞壁中存在一种名为脂多糖（LPS）的成分，作为一种经典的促炎反应诱导剂，常用于建立抑郁症动物模型，但是 Nod2 在 LPS 诱导的抑郁样行为中的作用尚未得到证实。本研究对 Nod2^{-/-}小鼠在 LPS 诱导抑郁症模型中的行为改变进行系统检测，关注外周和中枢神经系统的免疫变化，试图初步揭示 Nod2 受体在炎症诱导的抑郁样行为中的作用以及潜在机制。

方法 采用基因背景为 C57BL/6N 的 8 周龄雄性 Nod2^{-/-}小鼠和野生型（WT）小鼠，通过腹腔注射生理盐水（Saline）或 0.5 mg/kg 的 LPS，分为 WT+Saline 组、WT+LPS 组、Nod2^{-/-}+Saline 组和 Nod2^{-/-}+LPS 组，持续干预 21 天。采用旷场实验、糖水偏好实验、悬尾实验、新奇抑制摄食实验评估小鼠自发活动能力和抑郁样行为。采用 ELISA 检测血清中炎症因子 TNF- α 、IL-1 β 和 IL-10 水平，评估外周炎症激活状态；通过 qRT-PCR 检测前额叶皮质血脑屏障连接蛋白 Occludin 和 ZO-1 的 mRNA 表达水平，评估血脑屏障损伤；应用前额叶皮质转录组测序分析筛选脑内关键信号通路改变。

结果 1) 与 WT+Saline 组小鼠相比，Nod2^{-/-}+Saline 小鼠的运动功能、焦虑及抑郁样行为无显著差异，接受慢性低剂量 LPS 干预后，WT 小鼠出现典型的抑郁样行为，与 WT+LPS 组相比，Nod2^{-/-}+LPS 组小鼠抑郁样行为的各项指标显著降低。

2) LPS 干预 Nod2^{-/-}小鼠和 WT 小鼠后，血清中 TNF- α 、IL-1 β 和 IL-10 水平增加，Occludin 和 ZO-1 蛋白表达下降。

3) 前额叶皮质的 RNA-seq 分析表明，接受 LPS 干预后，Nod2^{-/-}小鼠比 WT 小鼠上调基因 295 个，下调基因 63 个。KEGG 通路富集分析结果发现，差

异基因主要富集在凋亡信号通路和炎症激活信号通路，并且内源性凋亡信号通路的基因表达与行为学表型具有显著相关性。

结论 Nod2^{-/-}小鼠无自发活动能力和抑郁样行为改变。慢性炎症可诱导小鼠出现显著的抑郁样行为、外周炎症激活和血脑屏障损伤。Nod2 缺失可缓解慢性炎症诱导的抑郁样行为，其作用机制可能与 LPS 干预 Nod2^{-/-}小鼠后内源性凋亡信号通路有关。

Altered Functional Connectivity Networks and Cytokines on Schizophrenia with Hallucinations

Yening Li, Yajuan Fan, Xiancang Ma

The First Affiliated Hospital of Xi'an Jiaotong University

Objective Previous studies on schizophrenia have detected elevated cytokines and abnormal functional networks analysis in both blood and brain, suggesting neuroinflammation and brain imaging may contribute to the pathophysiology in some cases. However, we still do not know whether there are inflammatory cytokines and imaging differences in the subtypes of schizophrenia, ie, schizophrenia with or without hallucination. Here we used Seed-based functional connectivity analysis to explore the mechanism of brain function in unmedicated patients with schizophrenia. The purpose of this study was to investigate the relationship between functional connectivity networks, inflammatory cytokines and cognitive function in patients with schizophrenia with hallucinations

Methods 37 drug-naive patients of schizophrenia with hallucinations (SH), 29 drug-naive patients of schizophrenia without hallucinations (NSH) and 51 healthy controls (HC) were recruited in this study. All the subjects underwent Magnetic Resonance Imaging (MRI) scanning and performed the cognitive scales, all the patients with schizophrenia finished the Positive and Negative Syndrome Scale (PANSS). Hallucinations of

the PANSS will be the classification standard. Seed-based FC analysis was conducted using Conn toolbox version18 with SPM12, in MATLAB 20b version (MathWorks, Sherborn, MA) among the three groups. A Pearson correlation model was used to analyze associations of functional networks changes with clinical symptoms and cognitive tests. Spearman correlations between cytokines, brain regions and cognitive tests were calculated using R 3.5.1, and visual presentations of multiple omics correlations were performed using the ggplot2 and heatmap packages

Results Compared with HC, SH and NSH group had significant higher values in TNF- α , CCL2, IL-4 and TL-6 apparently. For the seed-based in default mode network (DMN), SH group exhibited reduced FC between the Superior Frontal Gyrus Right (SFG) and the medial prefrontal cortex (MPFC), compared to NSH. A higher cold detection threshold was found in the SH and NSH patients compared to the HCs. The SH and NSH patients had higher FC between the frontoparietal attentional networks compared to the HCs. As to cognitive aspect, we found IL4\BACS was associated with FC in DMN between two groups

Conclusion Levels of inflammatory cytokines in SC were significantly higher than those in healthy subjects. SH group is associated with reduced FC in networks known to be disrupted in cognition. Dysfunction of attentional processing detected by the conn is found in the SH and NSH patients. Altered functional connectivity in frontoparietal attentional networks, may indicate the possibility of pathophysiology in two groups. These findings raise the possibility that targeted anti-inflammatory treatments may ameliorate cognitive and brain functional abnormalities in some people with schizophrenia

Sensitivity and Clinical Application of New Neurocognitive Battery for Schizophrenia in China (NBSC) in First-episode Patients

Xuan Li^{1,2}, Xiangyi Ma^{1,2}, Suzhen Zhang^{1,2}, Tianhao Gao³, Zhaolin Zhai³, Chang Lu³, Yuke Dong³, Kaiming Zhuo^{1,2}, Qiong Xiang^{1,2}, Dengtang Liu^{1,2,3}

1. Shanghai Mental Health Center, Shanghai Jiao Tong University School of Medicine

2. National Center for Mental Disorders

3. Huashan Hospital, Fudan University

Objective Neuropsychological assessment is the primary tool for assessing cognitive deficits in schizophrenia. The MATRICS Consensus Cognitive Battery (MCCB) is the "gold standard" widely used to assess cognitive functioning in schizophrenia. However, cultural differences may result in different cognitive patterns, and the New Neurocognitive Battery for Schizophrenia in China (NBSC) was found to have better sensitivity than the MCCB in a study of chronic schizophrenic patients. Cognitive deficits in schizophrenia are widespread and persistent and are closely related to efficacy and functional prognosis. The objective of our study was to assess the sensitivity of NBSC in first-episode schizophrenia and constructed a predictive model of drug efficacy centered on cognitive function

Methods Patients with first-episode schizophrenia were randomly into five group, including perphenazine, olanzapine, risperidone, amisulpride, and aripiprazole for 8 weeks. Assessment was performed at baseline and after 8 weeks of treatment. All patients received the MCCB and NBSC additional tests: Grooved pegboard, Colour Connections I, Colour Connections II, Auditory Sequential Addition in Constant Pace, Hopkins Word Learning-Delayed Recall. Psychotic symptoms and emotional symptoms were evaluated with Positive and Negative Syndrome Scale (PANSS) and Calgary Schizophrenia Depression Scale (CDSS). Social function was assessed by The University of California, San Diego Performance-based Skills Assessment- Brief (UPSA-B).

Quality of life was assessed by Heinrich-quality of life Scale (HRQOL). T-tests and chi-square tests were used to compare MCCB and NBSC scores. Logistic regression was used to predict acute phase treatment outcomes

Results Of all patients included in the SMART-CAT cohort from Shanghai Mental Health Center, 161 patients were enrolled in the study, 147 completed all neurocognitive assessments at baseline, and 88 were followed up after treatment. (1) Cognitive impairment was assessed according to the Global Deficit Score (GDS) ≥ 0.50 . The rate of cognitive impairment in first-episode schizophrenia was 77.56% with NBSC and 55.10% with MCCB, which was statistically significantly different ($F=16.59$, $p < 0.001$). (2) The subdomain T scores of information processing speed ($p=0.037$), word learning ($p < 0.001$) and executive function ($p < 0.001$) of NBSC were significantly lower in patients with schizophrenia than were corresponding subdomains of MCCB. (3) Information processing speed, verbal learning, fine motor function, executive function, attention, QLS, CDSS, PANSS-N, PANSS-G along with age and education, predicted the treatment outcome at 8 weeks with an overall accuracy of 77%, the area under the curve of 0.761

Conclusion NBSC could be more sensitive than MCCB in recognizing cognitive deficit in patients with first-episode schizophrenia. Cognitive function is a good predictor of antipsychotic efficacy, so the assessment of patients' cognitive function should be emphasized in the treatment of schizophrenia. Early identification of cognitive deficits can help to improve disease prognosis through early intervention (e.g., using cognitive remediation training). At the same time, interventions can be more targeted when assessing the efficacy on neurocognitive functioning in Chinese patients

Unraveling The PFC-BLA Pathway's Role on Schizophrenia's Cognitive Impairments: A Multi-Modal Study in Patients and Mouse

Models

Jiaquan Liang

the third people's hospital of Foshan

Background and Hypothesis This study investigated the role of the medial prefrontal cortex (mPFC)-basolateral amygdala (BLA) pathway in schizophrenia (SCZ)-related cognitive impairments using various techniques.

Study Design This study utilized clinical scales, MRI, single-cell RNA sequencing, and optogenetics to investigate the mPFC-BLA pathway in SCZ patients. In the mouse model, 6-week-old MAM-induced mice demonstrated significant cognitive deficits, which were addressed through stereotaxic injections of an adeno-associated viral vector to unveil the neural connection between the mPFC and BLA.

Study Results Significant disparities in brain volume and neural activity, particularly in the DLPFC and BLA regions, were found between SCZ patients and HCs. Additionally, we observed correlations indicating that reduced volumes of the DLPFC and BLA were associated with lower cognitive function scores. Activation of the mPFC-BLA pathway notably improved cognitive performance in the SCZ model mice, with targeting of excitatory or inhibitory neurons alone failing to replicate this effect. Single-cell transcriptomic profiling revealed gene expression differences in excitatory and inhibitory neurons in the BLA of SCZ model mice. Notably, genes differentially expressed in the BLA of these model mice were also found in the blood exosomes of SCZ patients.

Conclusions Our research provides a comprehensive understanding of the role of the PFC-BLA pathway in SCZ, underscoring its significance in cognitive impairment and offering novel diagnostic and therapeutic avenues. Additionally, our research highlights the potential of blood exosomal mRNAs as noninvasive biomarkers for SCZ diagnosis, underscoring the clinical feasibility and utility of this method.

Machine Learning-Based Prediction of Antipsychotic Efficacy From Brain Gray Matter Structure in Drug-naïve First-Episode Schizophrenia

Xiaodong Guo, Enpeng Zhou, Xianghe Wang, Bingjie Huang, Tianqi Gao, Chengcheng Pu, Xin Yu
Peking University Sixth Hospital

Objective Schizophrenia's treatment outcomes vary significantly among individuals, challenging the prediction of responses to antipsychotic medications, especially for drug-naïve patients. Brain gray matter structure is closely associated with treatment outcomes in patients with schizophrenia. However, to date, there is a lack of research using comprehensive gray matter indices to predict both short-term and long-term therapeutic effects. Hence, this study proposed using machine learning techniques to combine various indicators, including gray matter volume (GMV), cortical thickness (Ct), and gyrification index (GI), to predict the treatment efficacy of acute stage at three months, and the maintenance phase at one year for drug-naïve patients with first-episode schizophrenia (FES)

Methods A cohort of 104 drug-naïve patients with FES was recruited, with T1-weighted anatomical images were obtained on a GE Signa 3.0T scanner before initiating treatment. The Positive and Negative Syndrome Scale (PANSS) and the Personal and Social Performance Scale (PSP) were used to assess clinical symptoms and social functions at baseline, three-month and one-year follow-up. At the three-month follow-up, patients were categorized into remission and non-remission group according to whether meeting the criterion for scores of 3 or less on eight main symptom items. Furthermore, patients were categorized into rehabilitation and non-rehabilitation group at the one-year follow-up based on the criteria for 'clinical remission with good social functioning.' For scores of PANSS and PSP, a series of 2 (Treatment: Baseline vs. three-month follow-

up) \times 2 (Remission vs. Non-remission OR Rehabilitation vs. Non-rehabilitation) repeated-measure analyses of variance (ANOVAs) were performed. Machine learning algorithms were applied to predict treatment outcomes based on gray matter volume, cortical thickness, and gyrification index, and the model performance was evaluated

Results 1) The results indicated that patients with less severe negative and general symptoms at baseline were more likely to achieve remission after 3 months of acute-phase treatment, whereas patients with better social functions at the baseline were more likely to rehabilitate following 1 year of maintenance therapy

2) More importantly, among machine learning algorithms, logistic regression emerged as the most effective model. Specifically, the posterior central gyrus, anterior cingulate gyrus, and parahippocampal gyrus showed substantial predictive value for 3-month treatment efficacy (74.32% accuracy). The inferior frontal gyrus, anterior cingulate gyrus, and inferior occipital gyrus demonstrated significant predictive power for treatment outcome at 1-year follow-up (70.31% accuracy).

Conclusion We developed a machine learning model to predict individual responses to antipsychotic treatments, which could positively impact clinical treatment protocols for schizophrenia

Anterior Cingulate GABA Associations on Functional Connectivity in First Episode Schizophrenia

Tianhao Gao, Zhaolin Zhai, Qing Kang, Xuan Li, Chang Lu, Yuke Dong, Qiong Xiang, Kaiming Zhuo, Dengtang Liu

Shanghai Mental Health Center, Shanghai Jiao Tong University School of Medicine

Objective The neurobiological mechanisms re-

sponsible for the abnormal functional connectivity observed in schizophrenia remain incompletely elucidated. Notably, there are significant disparities in the influence of brain metabolites on resting-state functionality between individuals with schizophrenia and healthy controls. This study aims to explore whether glutamate and GABA, metabolites that support excitatory and inhibitory functions respectively, exert differential impacts on functional connectivity in first-episode schizophrenia (FES) patients with varying responses to antipsychotics

Methods Ninety-one FES patients in the study were recruited from Sequential Multiple-Assignment Randomized Trials to Compare Antipsychotic Treatments (SMART-CAT). Each patient underwent resting-state functional magnetic resonance imaging and proton magnetic resonance spectroscopy (MRS) using a 3.0T Siemens system, and completed symptom evaluations based on the Positive and Negative Syndrome Scale (PANSS). Subsequently, patients were randomly assigned to one of five oral treatments: olanzapine, risperidone, amisulpride, aripiprazole, or perphenazine, for a duration of eight weeks. After this period, patients demonstrating less than or equal to 40% reduction in PANSS scores were classified as First Treatment Resistant (FTR) group, while those with greater than 40% reduction were classified as First Treatment Effective (FTE) group. Seed-based connectivity maps were generated to analyze the relationship between the anterior cingulate cortex (ACC) and all other brain voxels. The MRS spectra were processed to quantify levels of glutamate and GABA. Regression analysis was used to investigate the associations between functional connectivity and the levels of these metabolites

Results After the 8-weeks of treatment period, 37 FES patients were classified into FTR, while remaining 54 were classified as FTE. Increased functional connectivity was observed in bilateral lingual gyrus and the left calcarine in FTR compared to FTE. Additionally, the GABA levels in the ACC of the FTR were significantly lower than that of the FTE. In the FTR, positive correlations were found between GABA and functional connectivity in bilateral Lingual gyrus ($r = 0.45$, $p < 0.01$). A similar positive correlation was noted between GABA and left calcarine functional connectivity ($r =$

0.43 , $p = 0.0085$). Interaction analysis also showed that the effect of GABA on the functional connectivity with was significantly different between two groups ($p < 0.05$). These same relationships were not statistically significant in FTE

Conclusion This "This study constitutes one of the preliminary inquiries into the association between functional connectivity and GABA concentrations within the FES, stratified by the efficacy of drug response. The results indicate that FTR exhibit significantly enhanced functional connectivity strength compared to FTE, indicating a possible compensatory mechanism linked to reduced GABA levels. This variation in functional connectivity among FTR could be explicated by a neurochemical- functional connectivity coupling hypothesis. Furthermore, the observed aberrant metabolic- functional connectivity correlations across different groups may represent a differential mechanism influencing treatment outcomes

Prediction of Antipsychotics-therapeutic Response in First-episode Schizophrenia Based on Machine Learning

Xianghe Wang, Tianqi Gao, Xiaodong Guo, Bingjie Huang, Yunfei Ji, Wanheng Hu, Xiaolin Yin, Yue Zheng, Chuan Shi, Chengcheng Pu, Xin Yu
Peking University Sixth Hospital

Objective Schizophrenia's treatment trajectory vary significantly among different individuals, making it a challenge to predict patients' response to antipsychotic medications, especially for drug-naive patients. Cognitive function and clinical features are closely associated with acute response in group of schizophrenia. And there is a lack of research using comprehensive clinical factors and cognitive function to predict short-term therapeutic effects. Hence, this study, based on machine learning techniques, combines Positive and Negative Syndrome Scale (PANSS) five-factors scores

and MATRICS Consensus Cognitive Battery scores, to predict the treatment response of acute stage at eight weeks for drug-naive patients with first-episode schizophrenia (FES)

Methods A cohort of 453 drug-naive patients with FES was recruited. PANSS five-factors model was used to assess clinical symptoms and MCCB score for cognitive function. The Personal and Social Performance Scale (PSP) score was included to assess social functions at baseline. At the eight-week follow-up, patients were categorized into olanzapine, risperidone and aripiprazole group and maintained monotherapy. A higher reduction rate than 50% of PANSS was defined as good response individuals. Machine learning algorithm was used to fit the predictive model. Then we compared the contribution of different features in model. Finally, feature groups with different predictive abilities were divided and high related clinical features to outcome were recommended for clinical efficacy prediction

Results 1) 18 features which contribute to the model effectively were selected for model training, which purified the model and improved its accuracy. F scores were used to evaluate the recognition ability provided by each feature for the model

2) Machine learning algorithm showed better accuracy and interpretability than traditional statistical model. The average auc of predictive model was 62.09%(confidence interval: [56.86%,67.32%], permutation test $P=0.002$), and spec was 83.7%(confidence interval:[75.6%,91.8%], permutation test $P=0.002$).

3) Feature dependency graph displays the relationship between each feature. 10 features were positive predictors when predicting good response to antipsychotics treatment in acute-phase, including the score of negative factors, positive factors, excitement factors, cognitive factors, grooved pegboard test-dominant hand, paced auditory serial addition test, color trail test-1, category fluency test, stroop color test and hopkins verbal learning test. While PSP score, trail making test-Part A, stroop word test were negative predictors. Grooved pegboard test non-dominant hand, brief visual-spatial memory test(BVMT), color trail test-2 and Spatial Span Test t had no significant correlation with outcome.

Conclusion The psychotherapeutic response after eight-weeks' treatment in FES patients can be predicted in baseline. Machine learning algorithm Xgboost provided the most accessible predictive effects whose average accuracy is 62.09%, higher than traditional regression algorithms. We recommended excitement factors, cognitive factors, grooved pegboard test dominant hand, color trail test-1, Hopkins verbal learning test(HVLT) and paced auditory serial addition test as high-predictive factors with positive correlation in predicting treatment response. While trail making test-Part A and stroop word test are high-predictive factors with negative correlation. In addition, nonlinear factors have important potential roles in clinical subtypes and treatment response prediction classification

2.Clinical Center for Psychotic Disorders, National Center for Mental Disorders, Shanghai 200030, China

3.Department of Psychiatry, Huashan Hospital, Fudan University, Shanghai 200040, China

4.Shanghai Key Laboratory of Psychotic Disorders, Shanghai Mental Health Center, Shanghai Jiao Tong University School of Medicine, Shanghai 200030, China

Objective Cognitive deficit is a core characteristic of schizophrenia, and is strongly associated with

long-term functional outcomes. Sequential multiple-assignment randomized trials to compare antipsychotic treatments (SMART-CAT) was a registered clinical trial aimed to discover best treatment strategy for first-episode schizophrenia (FES) patients. The current study is deemed to report baseline and follow-up cognition results of the SMART-CAT cohort

Methods In the SMART-CAT trial, patients were firstly randomly allocated into 5 treatment groups (Olanzapine, Risperidone, Amisulpride, Aripiprazole and Perphenazine); after 8-week phase 1 treatment, non-responders will be further allocated into 3 treatment groups (Olanzapine, Amisulpride and Clozapine, not same with phase 1). Diagnosis included first-episode schizophrenia, schizophreniform and schizoaffective disorder, according to Diagnostic and Statistical Manual of Mental Disorders, Fifth Edition (DSM-5). Detailed study design is published elsewhere. In order to evaluate cognitive deficit, all patients were scheduled for MATRICS consensus cognitive battery (MCCB) and other clinical evaluations at baseline, 2-month, 4-month, 6-month and 1-year. MCCB results were normalized into T-score according to age, sex and education. Cognitive deficit was defined as global deficit score (GDS) ≥ 0.5 . Comparison among groups were performed using paired t-test was used for continuous variables and chi-square or Fisher's exact test for categorical variables. Linear regression was applied to describe trend of cognitive function. Statistical significance was defined as two-tailed P value < 0.05

Results Of all patients included in the SMART-CAT cohort from Shanghai Mental Health Center, 188 had complete baseline MCCB evaluation (age: mean 27.1y, range 15y-46y, male sex 61.7%), 44 had both baseline and 1-year follow-up, 21 had all time-point (baseline, 2-, 4-, 6-month and 1-year) follow-up. At baseline, an estimated 55% of FES patients had cognitive deficit in this cohort, with similar performances in seven tested cognitive domains. In patients with both baseline and 1-year follow-up, the rate of cognitive deficit decreased from 56.8% at baseline to 31.8% at 1-year (chi-square $P=0.03$). In patients with baseline, 2-month, 6-month and 1-year evaluation, the rate cognitive deficit was 66.7%, 61.9%, 38.1%, 33.3% and 33.3% at each

time-point, and mean T-score for each time point was 38.8, 40.7, 42.7, 43.9 and 47.96, showing a trend of slight increase in cognitive function (linear $r^2=0.99$, $P=0.0005$). In post-hoc analysis, the responders of phase 1 (acute-phase) treatment had less patients with baseline cognitive deficit compared with non-responders (48.1% vs. 70.9%, $P=0.004$, $n=188$) and showed a more solid decrease in rate of cognitive deficit ($n=30$, 50% to 23.3%, chi-square $P=0.03$) compared with non-responders ($n=14$, 64.3% to 50%, chi-square $P=0.45$) from baseline to 1-year

Conclusion The estimated rate of baseline cognitive deficit in FEP patients was about 55% in this cohort. The 1-year trajectory of cognitive function follows the trend of a slight increase. Patients with better treatment acute-phase response were less likely to have cognitive deficit in baseline, and were more likely to recover from cognitive deficit. This study illustrated that baseline cognitive function is a potential indicator of treatment response

Abnormal Multilayer Network Configuration and Correlation with Cognitive Dysfunction, Clinical Symptoms in Schizophrenia

Xinyi Hu, Zheng Lu

Tongji Hospital, School of Medicine, Tongji University

Objective Schizophrenia has been identified to exhibit significant abnormalities in brain functional networks, which are likely to underpin the cognitive and functional impairments observed in patients. Graph theoretical analysis revealed the disrupted modularity in schizophrenia, however, the dynamic network reconfiguration in schizophrenia remains unclear. Therefore, we aim to explore the potential correlations within these network dynamic properties, cognitive function and clinical symptoms in schizophrenia, hypothesizing that disruptions in brain network dynamics may underlie the

cognitive impairments commonly observed in schizophrenia.

Methods We collected the resting-state functional magnetic resonance imaging data from 82 first-episode schizophrenia (FES) patients and 55 healthy control (HC) subjects. We utilized Positive and Negative Syndrome Scale (PANSS) to evaluate clinical symptoms and the cognitive function were evaluated for all schizophrenia patients and a subset of health individuals using MATRICS Consensus Cognitive Battery (MCCB). RESTplus toolbox was employed for preprocessing resting-state functional MRI data, dynamic functional connectivity matrices were constructed and a multilayer network model was employed to run our dynamic modularity analysis. We also performed correlation analyses to investigate the relationship between flexibility and cognitive function and clinical symptoms. Independent sample t-tests and chi-square tests were used to analyze differences in demographic statistics and cognitive scores between FES and HC groups. Differences in dynamic brain network configuration indicators were statistically tested using a general linear model with gender, age, and years of education as covariates. The results of multiple comparisons were corrected for the false discovery rate (FDR), with a significance level set at 0.05 after correction. All data analyses were conducted using the R statistical software, version 4.2.

Results There were no significant differences in gender or age between our FEP group and the HC group. However, the HC group exhibited a higher level of education than the FEP group. A comparison of the global modularity value (Q) between FEP and HC groups revealed a statistically significant difference ($p=0.0058$), with FEP patients exhibiting a higher global modularity than the HC group. Subsequently, we further compared node flexibility between the two groups, and the results showed that significant differences in the flexibility of 13 nodes existed between the FEP and HC groups (all $p<0.05$, FDR corrected). And for all these nodes, the node flexibility of FEP group was significantly higher than that of the HC group. Analysis of the correlations between cognitive function and modularity Q was conducted and showed no significance. In node flexibility,

the results indicated that in the patient group, the node flexibility of the right anterior cingulate and paracingulate gyri (ACG.R) was negatively correlated with the scores in reasoning and problem-solving ($r=-0.26$, $p=0.029$). A significant negative correlation was observed between the node flexibility of the left parahippocampal gyrus (PHG.L) and scores in the attention vigilance dimension ($r=-0.25$, $p=0.036$). Meanwhile, the node flexibility of the left superior parietal gyrus (SPG.L) was positively correlated with scores in the working memory dimension ($r=0.26$, $p=0.025$). The correlation between node flexibility and clinical symptoms showed that left cuneus (CUN.L) was significantly associated with negative symptoms ($r=0.24$, $p=0.044$), and right lingual gyrus (LING.R) was also positively associated with negative symptoms ($r=0.27$, $p=0.022$). It's worth noting that right lingual gyrus was negatively associated with GAF scores ($r=-0.29$, $p=0.013$), indicating a potential relevance to overall functioning.

Conclusion The investigation in our study utilized a multilayer network model to provide novel insights into the dynamic network modularity configuration changes observed in FEP patients. The study revealed an increase in global dynamic modularity and node flexibility in several brain regions, which suggests a malfunctioning topological organization in FEP patients during the resting state. These abnormalities were found to correlate with cognitive scores, negative symptoms, and overall function. They may therefore be an underlying factor of the cognitive and functional deficits observed in schizophrenia

Imbalance of Thalamocortical Anatomical Connectivity in Adolescents with Early-onset Schizophrenia

Yonghui Xiang, Weidan Pu

The Third Xiangya Hospital of Central South University

Objective Thalamocortical circuit imbalance,

characterized by decreased thalamic connectivity with the prefrontal cortex and increased thalamic connectivity with the sensory/motor cortex, has been consistently reported in functional magnetic resonance imaging (fMRI) studies, particularly in adult-onset schizophrenia (AOS). Previous research has identified white matter deficits of the thalamocortical circuit in AOS, serving as the structural basis for functional dysconnectivity. However, this thalamocortical imbalance has not been examined in early-onset schizophrenia (EOS), limiting our understanding of its role in the development defects of schizophrenia

Methods A total of 145 adolescents with EOS (69 from Henan as the discovery sample and 76 from Xiangya as the replication sample) and 67 matched healthy controls (HC) were recruited and underwent T1-weighted structural scans and diffusion tensor imaging scans. Fourteen bilateral cortical regions of interest (ROIs) and the left/right thalamus were used as targets and seeds for probabilistic tractography to quantify anatomical connectivity of the thalamocortical circuit. We firstly compared the thalamic anatomical connectivity with target ROIs between EOS and HCs, and further performed a voxel-wise analysis to localize the exact thalamic subregions with abnormal anatomical connectivity. Finally, the association between the thalamocortical structural connectivity and the severity of clinical symptoms was examined in patients

Results In EOS, anatomical connectivity between the thalamus and the dorsolateral prefrontal cortex (dlPFC) was decreased, while connectivity with the sensory/motor cortex was increased, consistent with the prior findings in adult patient. Notably, out of our expectation, the medial prefrontal cortex (mPFC) exhibited increased anatomical connectivity with thalamus, possibly serving as a unique biomarker in EOS. These findings were replicated in the other independent sample. In addition, the correlation analysis revealed that both decreased dlPFC-thalamic anatomical connectivity and increased mPFC-thalamic anatomical connectivity were associated with psychiatric symptoms in patients. Finally, the voxel-wise analysis showed that the abnormal connectivity of thalamus with the prefrontal cortex was primarily located in the medial dorsal nucleus of the

thalamus (MD), while the connectivity deficits with the primary sensory/motor cortex were predominantly in the lateral and ventral nuclei

Conclusion Our findings address the gap in neuroimaging studies focusing on structural network aberrations in EOS. From the perspective of white matter structure, we verified the stable existence of thalamocortical circuit impairments in schizophrenia, independent of age of onset. The specific thalamocortical dysconnectivity involving the mPFC may underlie the distinctive features of emotional processing and social function disorders in EOS

关键词: early-onset schizophrenia, thalamocortical circuit, anatomical connectivity, DTI, neurodevelopment

难治性精神分裂症 NMDAR 抗体与胼胝体膝部微结构异常

全景慧 周衍芳 陈闻锦 李伟 谭云龙
北京回龙观医院

目的 约 30%的精神分裂症患者对抗精神病药物反应欠佳是精神病学领域的一大挑战。N-甲基-D-天冬氨酸谷氨酸受体 (NMDAR) 抗体作为靶向 NMDAR 的自身免疫的产物, 可引发 NMDAR 交联内化致其功能减退, 而 NMDAR 功能低下和白质微结构完整性受损可能与精神分裂症的治疗应答有关, 但 NMDAR 对白质的作用往往被忽视。本研究旨在探索 NMDAR 抗体与精神分裂症治疗应答的关联, 以及探究白质完整性受损在 NMDAR 抗体与精神分裂症治疗抵抗的关系中所起的作用。

方法 本研究纳入难治性精神分裂症 (TRS) 患者 50 例、非难治性精神分裂症 (NTRS) 患者 45 例。使用酶联免疫吸附实验检测血清 NMDAR 抗体水平, 使用弥散张量成像技术 (DTI) 对白质纤维束进行成像, 采用增强神经影像遗传学荟萃分析 (ENIGMA) -DTI 分析通道计算白质各向异性分数 (FA), 依据 ENIGMA-DTI 图谱生成 21 个主要白质束的区域白质 FA。使用阳性和阴性症状量表 (PANSS) 评估患者的精神病理症状。校正性别、年龄后, 比较两组间 NMDAR 抗体水平和白质 FA 水平, 并进一步分析区

域白质束 FA 和 NMDAR 抗体水平之间的关系。

结果 TRS 组与 NTRS 组在性别、年龄、受教育年限上均无显著差异。临床特征方面, TRS 组和 NTRS 组在病程和发病年龄上无显著性差异,但 TRS 组的 PANSS 评分和抗精神病药物剂量显著高于 NTRS 组。校正性别、年龄后, TRS 组的血清 NMDAR 抗体水平显著高于 NTRS 组, $[(11.10 \pm 4.72) \text{ ng/ml vs. } (8.89 \pm 5.36) \text{ ng/ml}]$, TRS 组在穹窿、胼胝体膝部和后丘脑辐射的 FA 值显著低于 NTRS 组。偏相关结果显示, 仅在 TRS 组, 四个白质束, 分别为胼胝体膝部、后放射冠、放射冠和前放射冠, 与 NMDAR 抗体水平显著负相关, 但经过 Bonferroni 多重比较校正后只有胼胝体膝部与 NMDAR 抗体水平显著相关 ($P < 0.05/21$)。

结论 本研究提示针对 NMDAR 的自身免疫是 TRS 的潜在机制之一, 而白质微结构完整性受损可能介导了 NMDAR 抗体在治疗抵抗中的作用。其中, 胼胝体膝部可能是 TRS 患者中 NMDAR 抗体作用的关键白质区域。膝部连接前额叶皮层和前扣带回, 其前部包含了密度最高的有髓鞘轴突, 连接着前额叶皮层和更高层次的感觉区域。我们推测, 在精神分裂症的发生发展中, 白质, 尤其是胼胝体膝部, 可能更容易受到较高 NMDAR 抗体水平的影响, 表现出对治疗抵抗的更高脆弱性。

Trajectory Analysis of BMI Increase Induced by Second-generation Antipsychotics in First-episode Schizophrenia: A Secondary Analysis Based on CNFEST

Xiaolin Yin^{1,2,3,4}, Tianhang Zhou^{1,2,3,4}, Bingjie Huang^{1,2,3,4}, Chengcheng Pu^{1,2,3,4}

1.Peking University Sixth Hospital, Beijing, China.

2.Peking University Institute of Mental Health, Beijing, China.

3.NHC Key Laboratory of Mental Health (Peking University), Beijing, China.

4.National Clinical Research Center for Mental Disorders (Peking University Sixth Hospital), Beijing, China.

Objective The prevalent concerns of weight gain and an elevated body mass index (BMI) induced by antipsychotics often hinder patients' treatment adherence and quality of life. Our objective was to identify and delineate the BMI trajectory patterns among patients with first-episode schizophrenia treated with second-generation antipsychotics, with a particular focus on elucidating latent classes and influential factors

Methods Leveraging data from the Chinese First-Episode Schizophrenia Trial (CNFEST), we gathered demographic characteristics, clinical and functional characteristics, which were assessed by the Positive and Negative Syndrome Scale (PANSS) and the Personal and Social Performance Scale (PSP), and regular BMI measurements at baseline and 1, 2, 3, 6, 9, 12-month follow-ups, from 363 patients with first-episode schizophrenia. Trajectory analysis was conducted in R (4.3.2) and logistic regression analysis was performed in SPSS

Results Our analysis uncovered a four-trajectory model outlining the temporal progression of antipsychotic-induced BMI increase. Specifically, these trajectories encompassed: a low and stable BMI, a high and stable BMI, a gently ascending BMI trajectory, and a sharply ascending BMI trajectory subsequently followed by a descent. Further, multiple logistic regression analysis revealed that duration of untreated psychosis (DUP), baseline PSP scores, baseline BMI, and medication group exerted a significant effect on the BMI trajectory groups. Patients who are taking olanzapine, have a lower baseline BMI, a lower baseline PSP score and a shorter DUP are more prone to experiencing significant BMI increase within a year

Conclusion Our research revealed that the dynamic changes in BMI among patients with schizophrenia following antipsychotic treatment can be classified into distinct subtypes. Furthermore, multiple baseline factors have potential impacts on BMI changes. Consequently, early intervention for patients with specific baseline factors is imperative

Effects of Parietal Intermittent Theta Burst Stimulation on Resting-state Effective Connectivity within The Frontoparietal Network in Patients with Schizophrenia: A Pilot fMRI Study

Li Li, Chaomeng Liu, Weigang Pan, Yanping Ren, Qijing Bo, Xin Ma

1. Beijing Key Laboratory of Mental Disorders, National Clinical Research Center for Mental Disorders & National Center for Mental Disorders, Beijing An Ding Hospital, Capital Medical University, Beijing, China

2. 2. Advanced Innovation Center for Human Brain Protection, Capital Medical University, Beijing, China

Objective Although intermittent theta burst stimulation (iTBS) has shown effectiveness in addressing working memory (WM) deficits in individuals with schizophrenia (SZ), the current body of evidence is limited and the specific mechanisms involved remain unclear. Therefore, this pilot fMRI study aimed to examine the efficacy of parietal iTBS in ameliorating WM impairments and explore its influence on the resting-state effective connectivity within the frontoparietal network in patients with SZ.

Methods A total of 48 patients diagnosed with SZ were randomly assigned to an active or sham iTBS group and underwent 20 sessions of active or sham iTBS over 4 weeks. Subsequently, all patients underwent cognitive tests, clinical symptom assessments, and resting-state functional MRI (rs-fMRI) scans. The effective connectivity between the frontal and parietal brain regions during the rs-fMRI scans was analyzed using a spectral dynamic causal modeling approach. In addition, this study was approved by the ethics committees of Hebei Provincial Mental Health Center and Beijing An Ding Hospital, Capital Medical University. This trial was registered at the Chinese Clinical Trial Registry in November 2022 (registry number: ChiCTR2200057286).

Results The study results revealed that iTBS treatment improved the positive symptoms, general psychopathology, and WM deficits. After treatment, the active group exhibited significantly enhanced connectivity strengths from the right middle frontal gyrus (MFG)

to the right superior parietal lobule (SPL) and from the left SPL to the left MFG compared to the pre-treatment levels. Furthermore, greater connectivity strength from the right MFG to the right SPL was demonstrated in the active group than in the sham group following iTBS treatment

Conclusion All these findings suggest that iTBS targeting the parietal region may influence the resting-state effective connectivity within the frontoparietal network, thereby offering promising therapeutic implications for alleviating the cognitive deficits in SZ

Altered Dynamic Functional Connectivity of Thalamocortical Circuit in Schizophrenia—based on Multi-site and Multi-machine Cross-validation Data

Can Xu, Weidan Pu

Department of Clinical Psychology, the Third Xiangya Hospital, Central South University

Objective Previous neuroimaging studies consistently documented decreased prefronto-thalamic connectivity and increased sensorimotor-thalamic connectivity using stationary functional connectivity (sFC) in schizophrenia (SCZ). Recently, the multilayer dynamic network model has been proposed as an effective method to understand the brain functional architecture, which raises a critical question of whether the thalamocortical imbalanced pattern exhibited at dynamic functional connectivity (dFC) in SCZ. In this study, we aimed firstly to investigate the dFC of the thalamocortical circuit in SCZ and examined its relationship between the severity of psychiatric symptoms; and secondly to cross-validate the discovery findings by using another independent sample and data from different MRI machines

Methods We recruited 1007 participants (508 patients) using 4 MRI scanners from 3 sites (Xiangya,

Hong Kong, Henan). Participants from Xiangya and Hong Kong comprised the discovery sample, while those from Henan constituted the replication sample. Sixteen thalamic subdivisions were employed as seeds for the dFC analysis with the whole brain. The sliding window approach was used to estimate dFC, with a window length of 22 TRs and an increment of 1 TR. Initially, validations were conducted in the discovery sample using a window size of 26 TRs. Subsequently, utilizing the significant regions identified in the discovery sample as masks, we validated our findings across different machines (Philips and Siemens scanners). Spearman's correlation analysis was performed to examine the associations of the thalamo-cortical hyper-/hypo-connectivity circuit with the severity of clinical symptoms in patients

Results Compared with healthy controls (HCs), the dFC of the thalamocortical circuit in SCZ exhibited thalamic hyperconnectivity with sensorimotor cortices but hypoconnectivity with prefrontal-cerebellar regions. This imbalanced pattern of dFC within the thalamocortical circuit was consistently observed in the discovery sample across different window lengths and MRI machines. Moreover, this dynamic thalamocortical imbalance was also replicated in another independent sample. Notably, both sensorimotor-thalamic hyperconnectivity and thalamo-prefronto-cerebellar hypoconnectivity were associated with clinical symptoms in patients. Finally, the prefronto-thalamic hypoconnectivity and sensorimotor-thalamic hyperconnectivity were anti-correlated in both SCZ and HCs

Conclusion The present study revealed that the thalamocortical dFC of SCZ was also characterized by prefronto-thalamic hypoconnectivity and sensorimotor-thalamic hyperconnectivity, coinciding with prior sFC findings. Importantly, this dynamic thalamocortical imbalance was consistently replicated across different window lengths, sites, and MRI machines, underscoring the robustness of our findings. Moreover, the thalamocortical hyper- and hypo-dFC was involved in the pathology of schizophrenia evidenced by their significant relationship with psychiatric symptoms in patients. These findings provide novel insights into the thalamocortical imbalance pattern in schizophrenia from static to dynamic brain network

跨诊断认知行为团体治疗对情绪障碍患者负性情绪、认知情绪调节策略及正念水平的影响

余慧慧 龙鲸
天津市安定医院

目的 评估跨诊断认知行为团体治疗对情绪障碍患者负性情绪、认知调节策略及正念水平的干预效果,探讨其主要治疗性因素,为方案的临床应用提供理论依据。

方法 1. 2023年7月1日-2024年3月31日,将天津市安定医院心理门诊招募的52名存在焦虑、抑郁情绪困扰的患者(包括符合精神障碍诊断与统计手册第5版诊断标准的精神障碍患者)作为被试。所有纳入患者均签署知情同意并接受入组前评估。

2. 采用对照设计,患者均为存在焦虑抑郁困扰的患者,按照患者编号分为治疗组和对照组。

3. 团体治疗设置:对照组进行常规的药物治,干预组在药物治疗的基础上进行为期8周的跨诊断认知行为团体治疗。治疗为封闭式团体,每期团体成员数为6-8人,治疗疗程共8次,每周1次,每次1.5小时,2名团体带领者共同实施跨诊断认知团体治疗。在团体开始之前,治疗师对每个成员进行一对一的个体评估。在治疗过程中设有督导与质量监控。

4. 评估工具:在治疗前和治疗后分别对患者采用总体焦虑水平与损害程度量表、总体抑郁水平与损害程度量表、认知情绪调节量表(CERQ)以及正念五因素量表(FFMQ)进行疗效评估。

结果 纳入的52名患者,分为干预组(26例)与对照组(26例)。两组在基本人口统计资料上均无统计学意义;干预前,干预组与对照组在总体焦虑水平与损害程度量表、总体抑郁水平与损害程度量表、认知情绪调节量表、正念五要素量表得分上无显著差异($p>0.05$)。经过8周为团体干预后,干预组总体焦虑水平和总体抑郁水平评分显著低于对照组($t=3.167,4.024;p<0.01$)。干预组认知情绪调节量表中自我责难、沉思、灾难化、责难他人维度得分显著低于对照组($t=2.112,2.207,2.032,0.045;p<0.05$);

认知情绪调节量表中接受、重新计划、重新评价维度得分显著高于对照组($t=-2.796,-2.032,-2.069;p<0.05$);正念五因素量表中,观察、描述、不反应维度得分显著高于对照组($t=-2.351,-2.738,-2.027,p<0.05$)。干预组,干预前后总体焦虑水平与损害程度量表、总体抑郁水平与损害程度量表、认知情绪调节量表中(沉思,重新评价,灾难化)维度得分、正念五要素量表中不反应维度得分存在显著差异($t=9.098,8.183,5.641,-2.922,3.889,-3.267;p<0.05$)。

结论 跨诊断认知行为团体治疗可以有效缓解情绪障碍患者焦虑、抑郁情绪,本治疗方案通过5大核心技巧训练提升了情绪障碍患者的情绪调节策略及正念水平。

关键词: 情绪障碍,跨诊断认知行为团体治疗,认知情绪调节策略,正念水平

VR 注意力训练干预伴注意损伤抑郁症患者的脑生化代谢研究

叶穗怡 贾艳滨*
暨南大学附属第一医院

目的 基于虚拟现实(Virtual Reality, VR)的注意力训练系统已被验证可有效改善抑郁患者的注意力表现,但其对于伴注意损伤抑郁症患者的疗效研究存在局限性,且该训练系统作用的脑机制尚未明确。本研究将验证VR注意力训练系统干预伴注意损伤抑郁症患者注意网络的疗效作用,随后探索VR注意力训练系统的脑生化代谢机制。

方法 本文分为两个研究。研究一根据DSM-5及CAARS纳入伴注意损伤抑郁症患者70例,招募健康对照30例;将患者随机分配到训练组与对照组。训练组每周训练3次,每次训练30min,共进行20次训练,对照组则不安排注意力相关训练。患者组训练前后均完成注意网络测试范式任务及HAMD24。以研究一为基础,研究二进一步对VR注意力训练系统的疗效作用进行脑生化代谢机制的探索。患者组在训练前后均接受1H-MRS扫描前额叶白质、豆状核、丘脑、小脑及前扣带回皮质,并计算比较NAA/Cr、Cho/Cr比值。

结果 研究一

干预后,在警觉网络中,训练组与对照组在组

别主效应有显著统计学意义 ($F=5.244, p=0.026$), 时点与组别的交互作用具有显著统计学意义 ($F=5.116, p=0.028$); 在定向网络中, 训练组与对照组在时点主效应作用显著 ($F=45.167, p<0.001$), 在时点与组别的交互作用具有显著统计学意义 ($F=11.701, p=0.001$); 在执行控制网络中, 训练组与对照组在在时点与组别的交互作用具有显著统计学意义 ($F=4.267, p=0.044$)。

研究二:

(1) 患者右侧豆状核 NAA/Cr 在时点主效应显著 ($F=16.399, p=0.035$), 时点与组别的交互作用显著 ($F=4.742, p<0.001$), 简单效应分析发现, 训练组后测 NAA/Cr 比值显著上升 ($p=0.011$);

(2) 患者右侧丘脑 NAA/Cr 在时点与组别的交互作用呈边缘显著 ($F=3.797, p=0.057$), 简单效应分析发现, 训练组后测 NAA/Cr 与前测相比有显著下降 ($p=0.007$);

定向网络效率值的变化与右侧豆状核 NAA/Cr 的变化呈显著正相关 ($r=0.346, p=0.016$)。

结论 (1) 伴注意损伤 MDD 患者存在注意网络功能受损;

(2) VR 注意力训练系统可改善伴注意损伤 MDD 患者的警觉网络、定向网络及执行控制网络功能;

(3) 伴注意损伤 MDD 患者右侧丘脑可能存在过度活跃情况, 通过 VR 注意力训练通过改善右侧丘脑的异常活跃以改善注意损;

(4) VR 注意力训练系统通过促进右侧豆状核神经元恢复或增长以改善注意损伤。

认知行为治疗不同技术成分在中国失眠患者中的应用评价与疗效对比

邢瀚月 李占江*

首都医科大学附属北京安定医院

目的 失眠是一种常见的睡眠障碍, 严重影响患者的生活质量。失眠的认知行为治疗 (Cognitive behavioral therapy of insomnia, CBT-I) 作为一种非药物治疗手段, 已被证实能有效改善失眠症状, 是国

内外多部指南推荐的失眠的一线治疗方法。尽管 CBT-I 已被广泛研究和应用, 但不同技术成分在实际应用中的有效性和适用性可能存在差异。因此, 对 CBT-I 不同技术进行系统的评价和比较, 以确定其在患者群体中的适用性和疗效, 对于优化失眠治疗策略具有重要意义。本研究旨在评估 CBT-I 中不同技术成分在失眠治疗中的使用频率和效果, 并进行疗效对比。

方法 研究采用随机对照试验设计, 选取了 120 名符合失眠诊断标准且用药稳定的成年患者。将患者随机分配到四个组: 认知行为治疗组 (CBT, $n=30$)、认知治疗组 (CT, $n=30$)、行为治疗组 (BT, $n=30$) 以及常规药物治疗组 (TAU, $n=30$)。CBT 组、BT 组和 CT 组患者接受每周一次, 持续 8 周的干预, 在基线、24 周末测量患者的睡眠质量指数 (PSQI) 以及对不同技术的使用频率及有效程度。使用相关系数探究技术使用频率与疗效的关系。治疗师在治疗结束后根据治疗过程对不同技术使用频率进行打分, 根据加权平均对不同技术使用频率排序。

结果 三组患者治疗后, PSQI 显著下降, 从三组整体技术成分的细化层面来看, 技术“避免服用含有咖啡因或尼古丁的物质”、“减少在床上的时间”、“减少有关睡眠的负性想法看到其他可能”、“记录担忧日记”、“接受目前的睡眠状态顺其自然”的使用频率与疗效呈显著正相关; CBT 组“睡前做放松训练”的使用频率与疗效呈显著正相关; BT 组“减少在床上的时间”和“坚持到应该上床的时间再睡觉”与疗效呈显著正相关, 而“合理安排夜间活动, 享受清醒时间”的使用频率与疗效呈负相关; CT 组“在困了的时间再睡觉”、“睡前做放松训练”、“合理安排夜间活动, 享受清醒时间”和“记录担忧日记”的使用频率与疗效呈显著正相关。患者和治疗师普遍认为, 睡眠卫生教育和认知技术在改善失眠状况方面发挥着积极作用

结论 认知行为治疗 (CBT) 包含多种技术成分, 在不同治疗组别中的运用频率及其产生的效果存在一定差异, 将睡眠卫生教育作为持续的支持手段, 有助于患者更好地理解睡眠的基本原理, 更易接受认知行为治疗技术, 并在治疗过程中保持动力和参与度。综合应用多种技术成分可能为失眠患者提供更全面的治疗效果。未来的研究应进一步探讨不同技术成分的最优组合以及个性化治疗方案的开发。

辩证行为治疗对抑郁障碍伴非自杀性自伤人群的肠道微生物作用

陈紫欣 王纯
南京脑科医院

目的 探讨辩证行为治疗后抑郁障碍伴非自杀性自伤人群的肠道微生物改变。

方法 招募抑郁障碍伴有非自杀性自伤行为患者进行为期 13 周的辩证行为治疗,同时纳入无非自杀性自伤行为的抑郁障碍患者作为疾病对照。在基线期采取患者以及疾病对照的 10g 以上粪便样本,治疗结束后再次采取患者粪便样本。继而提取肠道微生物 DNA 进行 16s rRNA 测序,获取粪便中的肠道微生物的物种分类信息,在此基础上治疗前后以及疾病对照进行三组比较,对样本进行 α 多样性、 β 多样性、物种差异分析。

结果 共收集到治疗前粪便样本 27 例,治疗后粪便样本 9 例,疾病对照 29 例。在 α 多样性上,三组 Sobs 指数、Shannon 指数和 Simpson 指数均未见统计学差异。在 β 多样性上,治疗前后肠道微生物群分布存在明显差异。物种差异分析显示,在门水平上,三组比较并未发现具有统计学差异的菌门,但能观察到治疗后放线菌门相对丰度存在下降趋势,拟杆菌门相对丰度存在上升趋势。而在属水平上,治疗后霍氏真杆菌的相对丰度显著下降。

结论 辩证行为治疗后,抑郁障碍伴非自杀性自伤人群的肠道微生物分布及菌属水平改变。这提示心理治疗可能也具有一定的生物学作用,辩证行为治疗可能通过脑肠轴机制发挥治疗效果。

关键词: 辩证行为治疗,非自杀性自伤行为,肠道微生物

Evaluating The Effectiveness of Multimodal Psychotherapy Training Program for Medical Students in China: A Randomized Controlled Trial

Yanhui Liao¹, Tao Pei^{1,2}, Yinan Ding^{1,3}

1.Sir Run Run Shaw Hospital, Zhejiang University School of Medicine

2.Mental Health Center, Nanjing Normal University

3.Department of Psychology and Neuroscience, Boston College

Objective The delivery of psychosocial and psychotherapeutic interventions remains central to the treatment of many patients with psychiatric disorders (e.g., obsessive-compulsive disorder, panic disorder, major depression, eating disorders, and addictive behaviors) and psychosomatic disorders (e.g., hypertension, bronchial asthma, and rheumatoid arthritis). For evaluating the effectiveness of the multimodal psychotherapy training program for medical students in China, well-designed, randomized controlled trials of psychotherapy teaching programs are urgently needed. The primary aim of this proposed project is to assess the effectiveness of a new multimodal psychotherapy teaching program for medical students and residents in China to improve their psychotherapeutic skills and ensure better work performance in entry-level clinical settings

Methods This study is a two-arm randomized controlled trial (RCT). The intervention group received a two-day multimodal-based intensive educational intervention with 8 weeks follow-up (supervision based online teaching). The wait-list control group did not receive the intervention until the end of the study. Both groups were followed up for 8 weeks. This trial was conducted at the Sir Run Run Shaw Hospital. The primary outcome measure is the changes of the Facilitative Interpersonal Skills task (FIS) scores. Secondary outcome measures include: training program acceptability; trainees' psychotherapy knowledge; utilization of psychotherapy; and self-reported self-efficacy and self-reported motivation for psychotherapy. Paired T-test was performed to compare the difference pre- and post-receiving intervention training. Independent T-test and χ^2 test (for categorical variables) has been applied to compare differences between the two study groups. Any participant with missing information on the follow-up was excluded. All tests will be 2-tailed. A two-sided $P < 0.05$ will be used to determine statistical significance

Results This study recruited 160 medical students, residents, and other health providers (HCPs, e.g., doctors and nurses). However, only 113 participated throughout the study, with 57 in the intervention group ($M = 26.02$, $SD = 4.31$, 68.4% female) and 56 in the control group ($M = 25.88$, $SD = 3.96$, 66.1% female). However, there were different numbers of participants filled out each survey measure. Participants' overall evaluation was excellent ($M = 4.78$, $SD = 0.50$, out of point 5) with great willingness on application ($M = 4.07$, $SD = 0.52$) and recommendation ($M = 4.41$, $SD = 0.70$). The intervention group ($M = 57.90$, $SD = 44.10$) revealed more improvement in psychotherapy knowledge than the control group ($M = 11.42$, $SD = 51.15$) by comparing their scores at baseline and 8-week follow-up, $t(92) = 4.73$, $p < .001$. Both groups' post-intervention scores were significantly higher than their pre-intervention scores. There was no significant difference between two groups' improvement, $t(99) = -0.58$, $p = 0.564$. However, the intervention group's pre-intervention FIS scores ($M = 3.53$, $SD = 0.77$) were higher than scores at 8-week follow-up, $t(49) = 9.40$, $p < .001$. No significant differences were found in two groups' changes over 8 weeks in utilization of psychotherapy, negative attitudes towards CBT, or attitudes towards counseling and intervention in primary care (APIC-PC). Still, the intervention group showed a significant improvement in utilization of psychotherapy after 8 weeks, $t(48) = -8.58$, $p < .001$; the control group also showed a significant improvement in self-reported self-motivation and self-efficacy after receiving intervention training, $t(50) = -2.98$, $p = 0.004$.

Conclusion To our knowledge, this is the first RCT to evaluate the efficacy of a multimodal psychotherapy training program for medical students in China. This CBT-based brief and short-term psychotherapy skill training program has been proven effective, the health impact of its expansion nationwide could be enormous. It provides evidence-based psychotherapy (mainly CBT) training programs for medical students needed, and its dissemination would help healthcare providers manage any mental problems, like stress and depression

催产素通路影响焦虑易感性的神经机制研究

史栋栋 张瀛丹 廖冰冰 李奕 田菲 王振*
上海市精神卫生中心

目的 明确早期应激对 mPFC 脑区的 OXTR-Ca²⁺通路的影响,及 OXTR-Ca²⁺对神经信号传递的影响,阐明 mPFC 下游脑区 BLA 的神经活动对动物焦虑易感性和应激耐受性的影响。

方法 基于前期“two-hit”应激模型的建立,通过免疫荧光技术和流式细胞技术分析 mPFC 脑区催产素受体主要在哪类细胞中发挥抗焦虑作用。利用 AAV shRNA 病毒特异性敲低催产素受体在该类细胞中的表达,验证催产素通路在早期应激影响成年后应激易感性和耐受性中的作用。利用光纤记录技术,观察 OXTR 敲低对 Ca²⁺活动的影响,AAV shRNA 结合转录组测序分析 OXTR 敲低对下游分子通路的影响。进一步利用药理学实验观察 OXTR 结合下游分子操纵对神经传递功能的影响。利用顺行标记病毒确定 mPFC 脑区 OXTR 类神经元的下游脑区 BLA,并结合化学遗传学和光遗传技术验证该神经环路的作用。利用药理学实验操纵 mPFC 脑区 Ca²⁺相关通路,观察动物行为学及 BLA 脑区的神经活动。

结果 建立了稳定的“two-hit”大鼠模型,并且发现重复可预见性母婴分离增加成年后的应激耐受性,而不可预期母婴分离增加成年后个体的应激易感性。而该行为学的变化与催产素及其受体的变化有关。在可预期母婴分离动物中发现,催产素受体的表达显著高于对照组,而在不可预期母婴分离的动物中,催产素受体的表达则显著低于对照组。敲低催产素受体的表达,增加大鼠束缚应激后的焦虑样行为;过表达催产素受体在 mPFC 脑区的表达,缓解大鼠束缚应激后的焦虑样行为。在 mPFC 脑区注射 AAV-CMV-betaglobin-cre-P2A-GFP,在 PVN 注射 AAV-OXT-DIO-Hm4di-mCherry,特异性的标记 PVN-mPFC 的催产素能神经元,通过注射 CNO,特异性的阻断 PVN-mPFC 的投射,发现可预期母婴分离的大鼠在成年束缚应激后也表现出明显的焦虑样行为。而正常饲养的对照动物在阻断了 PVN-mPFC 的催产素能神经元投射后,也表现出明显的应激易

感性,变现为束缚应激后的焦虑样行为增加。化学遗传学操纵 mPFC-BLA 脑区同样影响应激导致的焦虑样行为。利用 AAV-OXTR-shRNA 病毒注射在 mPFC 脑区,发现在敲低催产素受体后,mPFC 脑区的线粒体形态和功能均收到损害。

结论 我们发现可预期母婴分离可增加成年应激后焦虑样行为的耐受性,不可预期母婴分离增加了成年应激后焦虑抑郁的敏感性,主要影响了 OXTR 通路。OXTR 的敲低会严重影响神经元 Ca²⁺活动和线粒体 ATP 的产生。

Disruption of Late Consolidation in The Medial Prefrontal Cortex Attenuates Remote Fear Memory in Humans

Yuxin Zhang, Kai Yuan, Lin Lu
Peking University Sixth Hospital

Objective Alleviating fear memory effectively is of great significance for the treatment of fear-related disorders. Following fear memory acquisition, the memory enters a labile stage called memory consolidation, which contributes to the transition from unstable recent memory to stable remote memory. Previous studies suggested that the hippocampus plays a crucial role in recent memory, while the medial prefrontal cortex (mPFC) contributes to the remote memory. The latest research shows that there is still a late consolidation process of fear memory 12 to 24 hours following memory acquisition, which is crucial for maintaining remote memory. However, it is still unclear whether there is also a late consolidation process in mPFC in human fear memory

Methods In our study, we explored the late consolidation process of human fear memory in healthy participants through fear memory training. 223 participants were included. They acquired the fear memory during fMRI scanning. Then resting state scanning was performed 0.5, 9, 18, or 36 hours after fear memory acquisition, then participants received cTBS or sham

stimulation over mPFC, resting state scanning was performed again within 15 minutes. Finally, 3 and 15 days after fear memory acquisition, we tested the expression of recent and remote fear memory and explored the brain activity of mPFC at different stages after the formation of fear memory and its impact on the fear memory performance

Results In the present study, we found that delayed activation of the mPFC during the late consolidation phase of fear memory in humans. Deep transcranial magnetic stimulation of the mPFC during the memory consolidation phase reduced fear responses in a recent recall test in humans, whereas intervening during the late consolidation phase attenuated remote fear memory. Using functional brain imaging, we found that in the late consolidation phase after the conditioned fear memory was formed, mPFC exhibited increased spontaneous activation. Within fear circuits, mPFC exhibited higher information transmission rate and the degree of clusterization in network connections, serving as an information hub. Functional network connectivity analysis indicated that subcortical regions (including the hippocampus, amygdala, thalamus, and ventral tegmental area), the central executive network (including the mPFC and cingulate cortex), and the attention network (including the dorsolateral prefrontal cortex and frontal eye field) showed increased connectivity during the late consolidation phase. Following intervening mPFC in the late consolidation phase, the inhibition of fear-circuit connectivity predicted remote fear attenuation

Conclusion These findings provide evidence that late consolidation is a critical time window for remote memory storage and bring a new perspective of intervention during the late consolidation phase in clinical practice

Low-frequency rTMS Enhance The Early and Long Effect of CBT in Unmedicated Outpatients with Panic Disorder with Or without Agoraphobia: A Randomized Double-blind

Controlled Trial

Xiaojie Yang, Xiangyun Yang, Jia Luo, Fang He, Pengchong Wang

Beijing Anding Hospital, Capital Medical University, Beijing, China

Objective Cognitive behavioural therapy (CBT) is the first-line treatment for panic disorder (PD). However, some patients still have poor response to CBT, especially in the early stage of treatment. Thus, to find a new method to enhance the early effect of CBT is necessary. Current research aimed to verify whether low-frequency repetitive transcranial magnetic stimulation (l-rTMS) may enhancement the effect of CBT for PD patients in the early stage

Methods PD patients were recruited and randomly assigned to the experimental group and the control group using a random number table. The patient of experimental group received CBT combined with true l-rTMS, and the control group received CBT combined with pseudo l-rTMS. Both groups received 12 sessions of CBT and 20 times of l-rTMS intervention in the first month of CBT. The target of l-rTMS stimulation was the left dorsolateralprefrontal cortex, the stimulation time was 30 minutes, and the frequency was five times once week. The patients' panic symptoms and anxiety were assessed with the Panic Disorder Severity Scale (PDSS) and HAMA at 7 timepoints. The reduction rate of PDSS total score before and after treatment was the main therapeutic index

Results A total of 50 patients with panic disorder were recruited and randomly assigned to the experimental group and the control group with 25 cases each. A total of 10 cases fell out of the two groups. The IPP analysis method was used to analyse the general demographic data and clinical characteristics of 40 patients who completed the treatment. It was found that there were no statistically significant differences between the two groups in terms of age, sex, course of disease, education, severity of panic disorder, anxiety, depression, personal and social functions ($P>0.05$). The PDSS and HAMA scores significantly reduced after intervention in both groups. The difference of PDSS and HAMA

scores between the two groups at different time points (0,2, 4, 6, 8, 10 and 12 weekends) was compared by repeated measurement analysis of variance. It was found that there were statistical differences on PSSS and HAMA between groups, time points and interaction effects ($p<0.05$). Further post-mortem analysis: inter-group univariate analysis of variance found that there was a statistically significant difference in the total PDSS score and HAMA score between the two groups at the end of the 2nd, 4th, 6th and 12th weeks, and the PDSS score of the study group was lower than that of the control group; Intra-group paired t-test showed that the scores of PDSS in the two groups at the end of 2, 4, 6, 8 and 12 weeks were lower than the baseline

Conclusion The effect of l-rTMS real stimulation combined with CBT in the treatment of panic disorder is better than that of l-rTMS false stimulation combined with CBT, which can significantly improve panic symptoms, especially has the advantage of early stage. L-rTMS treatment has good safety and compliance, and can be further used in the clinic

“北小六”人工智能心理治疗机器人对住院患者焦虑和抑郁症状的效果

巨睿琳 黄薛冰
北京大学第六医院

目的 随着经济和社会的发展,我国民众心理健康问题日益凸显,而心理健康服务捉襟见肘、质量良莠不齐,需要更高效实用、利于低成本大规模应用的心理治疗服务,人工智能心理治疗机器人的出现是关键突破口,但其对心理障碍患者的有效性还有待验证。本研究旨验证一款人工智能心理治疗机器人对改善临床心理科住院患者焦虑和抑郁症状的有效性。

方法 研究时间为2023年2月至2024年1月,在精神专科医院的临床心理科病房滚动招募患者40人,患者分别独立完成“北小六”人工智能心理治疗

机器人内嵌的“针对焦虑的认知行为治疗”,治疗内容包括心理教育视频、认知行为练习等,治疗全程持续8天,每天20分钟。在治疗前和治疗完成后分别测试患者的焦虑(采用7项广泛性焦虑障碍量表)和抑郁(采用病人健康问卷抑郁量表)水平,并采用配对样本T检验进行差异性分析。

结果 本研究纳入的40位患者中,42.5%为焦虑障碍,37.5%为抑郁障碍,10%为心境障碍,7.5%为躯体化障碍,2.5%为药物依赖综合症。结果发现,经过8天的治疗,患者的焦虑水平($p<0.01$)和抑郁水平($p<0.01$)有显著下降,对改善焦虑(Cohen's $d=0.688$)和抑郁(Cohen's $d=0.756$)均有中等效应。

结论 人工智能心理治疗机器人的临床效果显著,能够改善患者的焦虑、抑郁水平;且“北小六”人工智能心理治疗机器人有标准化、数字化、循证化、本土化特点,能够降低临床成本,提高治疗效果,对改善群众心理健康具有重要意义。

孕期焦虑症状的轨迹、预测因素及其与产妇结局的关系

秦雪梅 熊金涛 彭艺霖 李凌江 张燕 刘帮杉*
中南大学湘雅二医院

目的 孕期焦虑症状较为常见,可能长期影响女性产后结局。本研究旨在探索女性孕期焦虑症状的纵向变化轨迹、预测因素及其与产后结局的关系。

方法 本研究的数据来自深圳市宝安区妇幼保健院2020年1月至2024年1月就诊的孕产妇数据。孕妇在孕早、中、晚期及产后1月、2月五个时点通过扫描二维码完成在线数据采集。使用爱丁堡产后抑郁量表(Edinburgh Postnatal Depression Scale, EPDS)及广泛性焦虑障碍量表(Generalized Anxiety Disorder 7-Item, GAD-7)进行情绪症状自评,孕早期EPDS ≥ 13 分被定义为有严重抑郁症状。采用基于群体的轨迹建模方法将孕期焦虑症状模式相似的妇女进行分组($n=5035$);多元多项式逻辑回归分析用于探索不同轨迹组的预测因素($n=4293$);方差分析、卡方检验及非参数检验用于比较各轨迹组产后结局的差异($n=4504$)。

结果 共识别出 4 个孕期焦虑症状的轨迹模式, 分别是: 孕期无焦虑症状组 (No anxious symptom, NAS; 78.7%)、孕期持续焦虑症状组 (Persistent anxious symptoms, PAS; 1.4%)、孕晚期新发焦虑症状组 (Emergent anxious symptoms, EAS; 7.3%) 及孕晚期焦虑症状缓解组 (Resolving anxious symptoms, RAS; 12.6%)。PAS、EAS、RAS 与既往精神疾病史、孕早期抑郁有关; PAS、RAS 与吸烟史有关; RAS 与人工受孕、初次生产和既往躯体疾病史有关。相比 NAS 组, PAS、EAS、RAS 组分娩 1 月后 EPDS 总分和焦虑分量表分明显增长 ($P<.05$), 但三组之间增长幅度无明显差异 ($P>0.05$)。

结论 孕期焦虑症状呈现 NAS、PAS、EAS 及 RAS 四种不同的轨迹模式, 不同轨迹模式的预测因素既有相似也有差异, 既往精神疾病史、孕早期抑郁均能增加孕期持续/新发焦虑症状的风险。EAS 和 RAS 组分娩 1 月后抑郁、焦虑症状明显增加且升高幅度与 PAS 组无明显差异。既往研究围产期焦虑女性时多关注于焦虑症状持续存在的个体, 本研究呼吁临床上应加强关注孕晚期新发焦虑症状甚至焦虑症状已经缓解的女性群体, 特别需要注重对其分娩 1 月以后的情绪症状筛查。

Transcranial Alternating Current Stimulation for Treating Generalized Anxiety Disorder: A Randomized Controlled Trial

Guanyi Lv, Yumeng Ju, Yan Zhang

The Second Xiangya Hospital of Central South University

Objective Generalized anxiety disorder (GAD) is a common mental health condition while treatment options are relatively limited. Non-invasive brain stimulation techniques might be considered a new treatment approach for GAD. Transcranial alternating current stimulation (tACS) has shown promising efficacy and tolerability for major depression but has not been investigated for GAD yet. Thus, we aim to investigate the clinical efficacy of tACS for treating patients with GAD

Methods This was a double-blinded, randomised, sham-controlled trial. Patients who met the diagnosis of GAD based on the Structured Clinical Interview for DSM-V (SCID) are considered eligible participants for the current study. Eligible participants were randomly divided into either active treatment group or sham treatment group. A 40-minute transcranial alternating current stimulation treatment was performed twice a day and lasting for 10 days, while participants maintaining their medication treatment as usual. The primary outcome was the score on Hamilton Anxiety Scale (HAMA14) at the trial end. A mixed linear model was applied in the statistical analysis for the severity level of anxiety at Day 5 and Day 10 in the treatment process, and Chi-Square analysis was used to compare the treatment efficacy between active and sham treatment conditions

Results A total of 56 participants were included in the study, of which 31 were randomised into the active treatment group and 26 were randomised into the sham treatment group. After 5 days of treatment, the between-group efficacy ($p=0.245$) and change of scores on HAMA14 ($p=0.171$) did not significantly differ between active and sham treatment groups. After 10 days of treatment, treatment efficacy of the active condition is significantly higher than the sham condition ($\chi^2=9.810$, $p=0.002$). In particular, 24 participants from the active treatment group experienced improvement in their anxiety symptoms (77.42%), while only 9 participants from the sham treatment group have improved in terms of their anxiety symptoms (36.00%). Meanwhile, the difference on HAMA14 scores between two treatment conditions were statistically significant ($p=0.048$)

Conclusion Transcranial alternating current stimulation could improve patients' anxiety symptoms within a short period. Nevertheless, the long-term efficacy of this treatment approach for general anxiety disorder needs to be further investigated with a long-term follow-up

关键词: Transcranial alternating current stimulation; Generalized anxiety disorder; Randomized Controlled Trial

焦虑障碍不同亚型脑功能活动异同研究

肖洪奇 朱鸿儒 袁敏兰 曹源 李海龙 张伟 黄晓琦
邱昌建

四川大学华西医院

目的 不同焦虑障碍脑功能活动的相似性和异质性尚不明确,本研究运用静息态功能磁共振方法,探索广泛性焦虑障碍(GAD)、惊恐障碍(PD)及社交焦虑障碍(SAD)共同及独特的脑功能活动改变,为了解不同焦虑障碍的神经病理机制及特异性治疗靶点提供参考。

方法 纳入33例未用药GAD患者、26例PD患者、36例SAD患者及32例健康对照(HC)。所有患者接受静息态磁共振扫描及量表评估。运用方差分析比较四组受试低频振幅(ALFF)差异,将有差异的结果脑区作为种子点进行功能连接(FC)分析,并运用方差分析比较四组功能连接差异。分别在焦虑障碍患者组、GAD组、PD组、SAD组内将组间比较有差异的脑区的ALFF值及FC值与量表评分进行皮尔逊相关分析。

结果 1. 低频振幅变化

(1) 共同变化: SAD和PD患者左侧角回、左侧额下回眶部的ALFF值高于健康对照组和GAD患者。(2) 特异性变化: SAD患者: 左侧楔前叶、左侧枕下回、左侧颞下回及双侧梭状回的ALFF值显著增加。PD患者: 右侧颞上回和右侧壳核的ALFF值显著增加。特别是PD患者的右侧壳核活动增加,而SAD患者在这一脑区的ALFF值却降低。

2. 功能连接变化:

SAD患者双侧梭状回与双侧舌回的功能连接显著增加,右侧壳核与右侧缘上回功能连接增加; PD患者右侧梭状回与右侧舌回的功能连接显著降低,右侧壳核与右侧缘上回的功能连接显著降低; GAD患者左侧楔前叶与前扣带回的功能连接显著降低; PD患者的左侧楔前叶与前扣带回的功能连接显著低于SAD患者。

3. 相关分析:

在影像指标与相关临床量表的相关分析中, PD患者的左角回ALFF值与躯体症状量表评分呈正相关($r=0.572, p=0.004$)。

结论 本研究发现不同焦虑障碍亚型患者在脑功能活动上既有共同的异常,也有各自的特异性变

化。SAD和PD患者均表现出左侧角回和左侧额下回眶部的ALFF值增加,反映了共同的脑功能活动异常。特异性方面, SAD患者在左侧楔前叶、左侧枕下回、左侧颞下回及双侧梭状回的ALFF值显著增加,表明其在视觉信息处理和社会情绪处理相关脑区的活动增强。PD患者则在右侧颞上回和右侧壳核的ALFF值显著增加,同时在视觉网络内的功能连接减少。GAD患者表现出前扣带回与楔前叶之间的功能连接障碍。这些发现为理解不同焦虑障碍的神经病理机制提供了重要线索,并可能为开发特异性治疗靶点提供依据。

广泛性焦虑障碍患者症状水平与无法忍受不确定性及情绪调节策略的相关研究

孙乐涛¹ 李伟¹ 崔慧茹¹ 庞娇艳² 李惠¹ 李春波¹

1.上海交通大学医学院附属精神卫生中心

2.上海政法学院政府管理学院

目的 探索广泛性焦虑障碍患者无法忍受不确定性(intolerance of uncertainty, IU)水平及情绪调节策略与焦虑症状严重程度的关系。

方法 募集符合《国际疾病分类第10版》(ICD-10)中广泛性焦虑障碍(generalized anxiety disorder, GAD)诊断标准的患者108例,同期募集健康对照(health control, HC)115例。采用无法忍受不确定性量表(intolerance of uncertainty scale, IUS)评价被试无法忍受不确定性水平,采用情绪调节量表(emotion regulation questionnaire, ERQ)评价被试情绪调节策略偏好,采用汉密尔顿焦虑量表(Hamilton Anxiety Scale, HAMA)评估焦虑症状程度,并进行Spearman相关性分析与线性回归分析。

结果 GAD组IUS各分量表、ERQ各分量表、HAMA得分均与HC组有显著差异($p \leq 0.001$)。IUS各分量表与ERQ各分量表之间均具有相关性,抑制性IU与表达抑制策略显著相关($p < 0.01$); IUS与HAMA得分呈正相关($p < 0.01$); ERQ与HAMA具有相关性($p < 0.05$)。IUS与ERQ在一定程度上可以解释焦虑症状程度($R^2 = 32.2\%$)。

结论 无法忍受不确定性及情绪调节策略与焦

虑症状严重程度水平存在关联。其中,无法忍受不确定性及表达抑制策略与焦虑症状程度呈正相关,认知重评策略与焦虑水平具有负向相关。

关键词:焦虑障碍,无法忍受不确定性,情绪调节,相关性分析

焦虑障碍患者在情绪冲突处理中的前额功能连通性:一项基于fNIRS的研究

刘子明 冉琴 张依然 李清伟*
上海市同济医院

目的 本研究旨在探索焦虑障碍患者(惊恐障碍和广泛性焦虑障碍患者)在处理情绪冲突任务时左右额叶的功能连接特点;从功能连接的角度理解焦虑障碍患者在冲突处理中的神经机制,为焦虑障碍的亚型鉴别和临床诊疗提供影像学依据。

方法 共纳入焦虑障碍患者23名(惊恐障碍患者12名、广泛性焦虑患者11名)、健康受试10名。从中国化面孔情绪图片系统(CAFPS)、现代汉语情感词系统(CAWS)中选取情绪面孔及情绪词,通过Eprime3.0软件构建面孔-词 Stroop 范式,包括四种条件:cI(在一致试次之后的不一致试次)、iI(在不一致试次之后的不一致试次)、iC(在不一致试次之后的一致试次)、cC(在一致试次之后的一致试次),按照伪随机顺序排列。受试需对面孔情绪价做出正确反应(高兴/愤怒)。通过22通道近红外脑功能成像系统(日立ETG-4100)同步记录受试在任务状态下前额叶的血流动力学信号;基于任务相关的血流动力学信号计算时间序列相关性指标。

结果 1. 三组受试对不一致试次(iI、cI)的反应时间均显著慢于一致试次(cC、iC);GAD在各条件下的反应时间均显著慢于PD、HC。

2.GAD相比HC在右侧额叶内部通道(Ch20-5、10、11、15;Ch19-5、11)和左右额叶间(Ch3-5、10;Ch4-15)的功能连接增强($P<0.05$);左侧前额叶内部通道(Ch4-Ch17)功能连接减弱($P<0.05$)。

3.PD相比HC未发现左右额叶内部通道的功能连接差异;PD在左右额叶间通道(Ch4-5、15)的功能连接相比HC显著增强($P<0.05$)。

4.GAD相比PD在任务期间的功能连接模式差异显著,相比PD,GAD在右侧前额叶内部通道

(Ch20-5、10、12;Ch15-5;Ch11-6、10)和左右额叶间(Ch5-3、8、9、12、13、17;Ch10-3、8、12;Ch14-3、8、12、13、Ch20-3、4)的功能连接显著增强($P<0.05$);而在左侧前额叶内部的通道功能连接减弱(Ch4-17、22、13、9)($P<0.05$)。

结论 1. 面孔-词 Stroop 范式下GAD、PD和HC均存在情绪冲突效应,GAD处理情绪冲突信息的速度显著慢于HC和PD;GAD、PD对情绪冲突信息的控制能力受损,更易受到冲突信息的干扰导致判断失误。

2.PD、GAD在处理情绪冲突期间呈现不同的功能连接模式,主要体现在左右额叶间及内部的交互同步差异;GAD在右侧前额叶内部及左右额叶间的存在显著的功能连接改变;而PD在左侧额叶内部的存在显著的功能连接改变。

老年精神病学组

Association of Gamma-glutamyl Transferase To High-density Lipoprotein Ratio with Cognitive Function in Older Adults: The NHANES 2011-2014

Ye Wang, Enyan Yu
Zhejiang Cancer Hospital

Objective The prevalence of cognitive impairment is increasing, posing a significant public health concern globally. The Gamma-glutamyltransferase (GGT) to high-density lipoprotein (HDL) ratio, which is associated with nonalcoholic fatty liver disease and insulin resistance, has an unclear relationship with cognitive function. This study investigated the relationship between the GGT/HDL ratio and cognitive function in older Americans

Methods Data from the National Health and Nutrition Examination Survey (NHANES) from 2011 to 2014 were analyzed. Cognitive function was assessed using the Consortium for the Establishment of an Alzheimer's Disease Registry (CERAD), the Animal Fluency Test (AFT) and the Digit Symbol Substitution Test (DSST), and the mean cognitive Z-score. Weighted post-hoc multiple linear regression and multiple logistic regression analyses were used to calculate odds ratios (ORs) and 95% confidence intervals (CIs) to explore the relationship between GGT/HDL ratios and cognitive functioning, and measure-response relationships were described for statistically significant cognitive scales. Finally, subgroup analyses of covariates were also performed

Results A total of 2452 participants were included in the study. After adjusting for covariates, the GGT/HDL ratio was significantly associated with the highest quartile of the AFT and the third quartile of the DSST compared to the lowest quartile group (AFT: $\beta = 0.478$, 95% CI 0.075 to 0.880, $P < 0.05$; DSST: $\beta = 0.509$, 95% CI -0.987 to -0.031, $P < 0.05$). In addition, we investigated the dose-response relationship between

GGT/HDL ratios and cognitive function scores using restricted cubic spline modeling. There was a linear relationship between the GGT/HDL ratio and the AFT ($P = 0.0344$) scores, whereas the relationship with the DSST score was nonlinear ($P = 0.0226$)

Conclusion A correlation exists between the GGT/HDL ratio and cognitive function in individuals over 60 years of age. Notably, this correlation appears to differ across various cognitive domains. Our findings may provide support for further large-scale prospective studies to elucidate the exact causal relationship

基于结构磁共振构建轻度认知损害进展为阿尔茨海默病的综合预测模型

李一飞 陈炜
浙江大学医学院附属邵逸夫医院

目的 构建结构磁共振成像 (Structural Magnetic Resonance Imaging, sMRI) 预测轻度认知损害 (mild cognitive impairment, MCI) 进展为阿尔茨海默病 (Alzheimer's disease, AD) 的综合模型。

方法 影像组学 (Radiomics) 是医学和计算机交叉融合的新兴产物, 通过图像定量特征高通量提取过程, 将图像转换为可挖掘数据特征, 并对这些数据进行分析来反映疾病的异质性, 影像组学已经应用于 MCI 和 AD 的诊断和分类评估。神经影像学的研究表明, 灰质和白质的结构性改变与 AD 的发病机制具有相关性, 并且其神经变性对主观认知下降具有交互作用, 而基于全脑评估的影像组学方法可能比单个感兴趣脑区分析提供更全面的信息。神经心理学测量可以改善 MCI 的诊断效能, 将影像组学与临床数据结合, 建立疾病预测模型可提高预测精度。本研究从阿尔茨海默病神经影像学计划 (Alzheimer's Disease Neuroimaging Initiative, ADNI) 数据库选取了 343 例 MCI 作为研究对象, 其中 154 例在 48 个月的随访期内进展为 AD。按照入组时间将所有受试者分为训练集 ($n=240$) 和验证集 ($n=103$)。基于训练集数据对每个病例的基线磁共振 T1WI 结

构像自动分割为全脑 3D 白质图像和灰质图像,并提取每个组织图像的影像组学特征,构建影像组学标志物,结合基线神经心理学评分,通过机器学习构建初步预测模型;使用工作特性曲线(ROC 曲线)和验证集数据确定模型的诊断精度和可靠性。

结果 采用 logistic 逐步回归法构建了影像组学标志物。标志物计算在训练集和验证集中的 MCI 进展和稳定亚组之间均有显著差异,两组的预测效果较好,AUC 分别为 0.796 和 0.784,特异性分别为 0.636 和 0.676,敏感性分别为 0.865 和 0.863。逐步 logistic 回归分析显示,临床痴呆评定量表(CDR)、阿尔茨海默病评定量表(ADAS-cog)和影像组学标志物是 MCI 进展为 AD 的独立预测因子。ROC 曲线显示,以 CDR、ADAS-cog 和影像组学标志物组成的综合模型在训练集和验证集的 AUC 值分别为 0.895 和 0.882;敏感性分别为 0.933 和 0.977,特异性分别为 0.669 和 0.661;Delong 检验显示综合模型的诊断效能与独立预测因子有显著性差异($P=0.023$)。

结论 磁共振结构影像组学联合 CDR、ADAS-cog 可预测 MCI 进展为 AD 的高风险人群。

The Correlation between Gene Differential Expression and Symptoms in Patients with Alzheimer's Disease and Mild Cognitive Impairment

Jingwei Li, Xulai Zhang

Hefei Fourth People's Hospital

Objective Alzheimer's disease (AD) is a cognitive degenerative disorder with a poor prognosis, and its pathogenesis remains unknown. Utilizing bioinformatics analysis of peripheral blood samples with differentially expressed genes (DEGs), we aimed to investigate distinctions between AD and mild cognitive impairment (MCI) in comparison to healthy controls (HC), as well as to explore the correlation between differential genes and clinical symptoms

Methods AD patients aged over 60 undergoing

outpatient and inpatient treatment for the first time at the Affiliated Psychological Hospital of Anhui Medical University, were selected as the study cohort and categorized into the AD group ($n=40$ cases). Similarly, patients with mild cognitive impairment aged over 60 were chosen and classified into the MCI group ($n=40$ cases). Healthy volunteers were recruited into the healthy control group ($n=42$ cases) during the same period. The Mini-Mental State Examination (MMSE) and The Montreal Cognitive Assessment (MoCA) were utilized to assess the cognitive function and mental behavior of the two groups. Transcriptome technology was employed for the expression analysis of peripheral blood, and the relationship between transcription gene content and the total score of the scale was explored through Spearman rank correlation analysis

Results Bioinformatics analysis revealed significant differences in the expression of a large number of DEGs among the three groups. GO and KEGG analyses indicated that these genes are associated with multiple signaling pathways, lipid metabolism, and axons. Correlation analysis demonstrated that the top 20 DEGs were generally correlated with clinical symptoms when compared with the HC group. Specifically, only FP671120 and FP236383 were positively correlated with the MMSE total score, while SLC7A5 showed a negative correlation with the MMSE total score

Conclusion Variations in peripheral blood transcription genes exist between AD and MCI patients, potentially contributing to the cognitive and psychiatric symptoms observed in these individuals. Some of these genes may serve as key predictors for the ultimate outcome of MCI, offering new avenues for the treatment and understanding of AD etiology

Transcranial Electric Stimulation over The Frontopolar Region Improves Risky Decision-making in Age-related Cognitive Decline

Ping Ren, Yunchen Gong, Guohua Xie, Meiling Tan, Shiwei Huang, Donghui Wu
Shenzhen Mental Health Center/Shenzhen Kangning Hospital

Objective Aging is often accompanied by declined cognitive function, leading to a high risk of neurodegenerative diseases such as dementia. Compared with young adults, older adults often have difficulty in making decisions under risk, which is closely related to the connections between the frontal and subcortical regions (e.g., amygdala). However, the extent to which cognitive decline influences risky decision-making is still unclear, and early intervention for cognitive impairment is scarce. The current study investigated the fronto-amygdala pathway in abnormal risky decision-making in older adults with different severity of cognitive decline. Furthermore, transcranial direct current stimulation (tDCS) were delivered over the frontopolar region to examine the effect of anodal current in modulating risk-taking behaviors

Methods The current study applied a risky decision-making task (Iowa gambling task, IGT) and resting-state fMRI. In Experiment 1, 38 young adults (aged 20–27 years) and 60 older adults (aged 56–80) were recruited, and underwent cognitive assessment, IGT test and fMRI. By comparing young and cognitive normal/impaired older adults, we examined the role of cognitive integrity in decision-making and underlying neural substrates. In Experiment 2, 46 older adults (aged 55–88 years) were randomly assigned into control (sham stimulation, $n = 23$) and intervention (anode stimulation, $n = 23$) groups, and assessed before and after tDCS intervention. Then we examined whether the frontopolar tDCS would improve risky decision-making and corresponding brain networks

Results In Experiment 1, the results showed significant changes in behaviors and the fronto-amygdala network in older adults relative to young adults. More importantly, age-effect on risk-taking behaviors was remarkably different in cognitively normal and impaired older adults ($b = 0.004$, $p = 0.004$, 95% CI [0.001, 0.01]). In the resting-state analysis, task performance was pos-

itively correlated with the ventral fronto-amygdala connectivity ($b = 0.39$, $p < 0.001$, 95% CI [0.17, 0.61]) and negatively correlated with the dorsal fronto-amygdala connectivity ($b = -0.24$, $p = 0.048$, 95% CI [-0.47, -0.002]) in cognitively impaired individuals. Based on these findings, in Experiment 2, the anodal tDCS over the frontopolar region (ventral frontal cortex) showed better capability of processing risky/safe information in older adults, compared with control group. Additionally, the fronto-subcortical connectivity was closely associated with enhanced decision-making performance after tDCS intervention

Conclusion These findings indicate that the fronto-amygdala network is crucial for understanding altered risky decision-making in aging. Moreover, non-invasive brain stimulation could be an effective interventional approach at the early stage of dementia. Our study would be helpful for understanding the neural mechanism of brain degeneration, and developing novel interventions for financial exploitation in aging

Digital Mindfulness Intervention for Mild Late-Life Depression Using The FocusZen System: A Randomized Controlled Trial

Kemeng Zhu, Qinge Zhang
Beijing Anding Hospital, Capital Medical University

Objective The increasing prevalence of Late-Life Depression (LLD) due to an aging population presents significant challenges to mental health care, particularly with low patient engagement and suboptimal treatment outcomes. Against this backdrop, digital mindfulness training has emerged as a promising approach due to its convenience and accessibility. This study aimed to assess the effectiveness of a novel digital intervention using the FocusZen Mindfulness Stress Relief System, a platform designed to deliver mindfulness-based therapy to individuals with mild LLD. A second-

ary objective was to explore whether changes in depressive symptoms following mindfulness intervention are associated with changes in brain electrical activity

Methods The study was conducted from March 2023 to January 2024, enrolling 200 elderly individuals from the outpatient department of Beijing Anding Hospital, affiliated with Capital Medical University, and the Yisayuan Community in Chaoyang District, Beijing. After screening, 54 individuals meeting the criteria for mild LLD were randomly assigned to either the intervention group (n=27) or the control group (n=27). This randomized controlled trial included a 6-week intervention period where the intervention group engaged in mindfulness exercises through a mobile application, while the control group received standard psychological health education. Clinical outcomes were assessed at baseline, 2 weeks, 4 weeks, and 6 weeks post-intervention using a series of standardized assessment tools, including the Hamilton Depression Scale-17 items (HAMD-17), Hamilton Anxiety Scale (HAMA), Montgomery Depression Rating Scale (MADRS), Geriatric Depression Scale (GDS), Pittsburgh Sleep Quality Index (PSQI), Mini-Mental State Examination (MMSE), and Montreal Cognitive Assessment (MOCA), to compare clinical efficacy between the two groups. Brain electrical activity was measured and compared using a wearable device provided by the FocusZen system

Results After 6 weeks, the intervention group showed significantly greater reductions in HAMD-17, HAMA, GDS, and MADRS total scores compared to the control group ($P<0.05$), and a significant increase in MOCA total scores ($P<0.05$). The difference in MMSE total score changes between the groups was not statistically significant ($P>0.05$). The intervention group also had higher efficacy rates (81.5% vs. 48.1%, $P=0.010$) and remission rates (59.3% vs. 11.1%, $P<0.001$). At the end of the intervention, the theta and alpha wave power values in the intervention group had significantly increased ($P<0.05$), and there was a negative correlation between alpha wave power and corresponding HAMD-17 total scores at all assessment points ($P<0.05$)

Conclusion This study indicates that the digital mindfulness intervention based on the FocusZen Mindfulness Stress Relief System can significantly improve

anxiety, depression, and sleep symptoms in patients with mild LLD and may have a positive impact on cognitive function. The mechanism by which mindfulness training improves depressive symptoms may be related to the increased power of alpha and theta waves, although further research is needed to confirm this

Olfactory Dynamic Functional Dysconnectivity Mediates Cognitive Impairment in Late-Life Depression

Shuang Liang, Yuping Ning, Ben Chen
The Affiliated Brain Hospital of Guangzhou Medical University,

Background Late-life depression (LLD) and odor identification (OI) dysfunction are risk factors for dementia. However, the neural mechanisms linking olfactory dysfunction to cognitive impairment in LLD remain unclear. This study investigated dynamic functional connectivity (dFC) of olfactory brain regions in LLD patients with and without OI dysfunction

Methods Resting-state functional MRI data were acquired from LLD patients with OI deficits (LLD-OID) (n=51), LLD patients without OI deficits (LLD-NOID) (n=59), and healthy controls (HC) (n=51). A sliding window approach was used to compute dFC variability between regions of interest in the primary and secondary olfactory regions. Correlation and mediation analyses were conducted to explore the relationships among abnormal olfactory dFC, OI dysfunction, and cognitive impairment in LLD patients

Results Compared to LLD-NOID and HC, LLD-OID exhibited decreased dFC variability between the right orbitofrontal cortex (OFC) and left inferior frontal gyrus (IFG), while increased variability between the right OFC and right middle frontal gyrus (MFG). No significant difference in dFC of primary olfactory regions was found between groups. LLD-NOID showed increased OFC-IFG dFC variability compared with HC.

Increased OFC-MFG dFC variability was associated with poorer performance of OI, global cognition, memory and language in LLD. Importantly, OFC-MFG dFC variability partially mediated the relationship between OI dysfunction and cognitive impairment (global cognition, memory and language)

Conclusion LLD patients with OI dysfunction exhibited more disrupted dFC in secondary olfactory regions compared with those without OI dysfunction. Dynamic OFC-MFG dysconnectivity may underlie accelerated cognitive decline and dementia risk in LLD patients

Effects of Seasonal and Meteorological Variations on Sleep in Late-onset Depression Patients

Yu Guo, Xiaoming Kong, Hao Geng, Siwen Lv
Affiliated Psychological Hospital of Anhui Medical University

Objective To investigate the seasonal distribution characteristics of sleep in late-onset depression (LOD) patients and to explore the effects of different meteorological parameters on their sleep, in order to provide a theoretical basis for interventions to improve the sleep of LOD patients

Method We retrospectively analyzed polysomnography(PSG) data (sleep duration, sleep efficiency, sleep latency, REM latency, N1/N2/N3/REM sleep period duration & percentage, mean oxygen saturation, minimum oxygen saturation, and oxygen saturation < 90% percentage) from 243 LOD patients hospitalized in Anhui Mental Health Center from 2019-2023 and the meteorological data (sunlight intensity, temperature, frost, humidity, wind speed, precipitation, barometric pressure, etc.) of the day were obtained at the U.S. National Centers for Environmental Information (<https://www.ncei.noaa.gov/global-summary-of-the->

[day/archive.](#)). According to the meteorological seasonal method in the northern hemisphere, we divided the patients into 66 patients in the spring group (March to May), 78 patients in the summer group (June to August), 56 patients in the autumn group (September to November), and 43 patients in the winter group (December to February); We also grouped LOD patients according to the characteristics of each meteorological parameter. Finally, we performed intergroup comparisons, correlation analyses, and generalized linear model analyses of the LOD patients' sleep data and the meteorological parameters.

Results There were no significant group differences in clinical and sleep data between the four season groups of LOD patients. Compared to winter-spring group, total sleep time ($Z = -2.284$, $P = 0.022$), sleep efficiency ($Z = -2.773$, $P = 0.006$), REM latency ($Z = -2.052$, $P = 0.040$), and N3 duration ($Z = -2.185$, $P = 0.029$) were significantly higher in the summer-autumn group, and wake time ($Z = 2.170$, $P = 0.030$) was significantly lower. There were significant differences in sleep efficiency ($H = 6.676$, $P = 0.036$), N3 ($H = 8.520$, $P = 0.014$) and N3% ($H = 9.226$, $P = 0.010$) between the high, medium and low temperature groups, there were significant intergroup differences in sleep efficiency ($H = -3.608$, $P = 0.002$) and awakening time ($H = 9.342$, $P = 0.006$) for different precipitation levels. The presence or absence of N3 stage was significantly different on minimum temperature ($Z = -2.102$, $P = 0.036$), relative humidity ($Z = -2.071$, $P = 0.038$), specific humidity ($Z = -2.520$, $P = 0.012$) and barometric pressure ($Z = -2.110$, $P = 0.035$). Sleep efficiency was positively correlated with temperature ($R = 0.132$, $P = 0.039$), specific humidity ($R = 0.147$, $P = 0.022$) and minimum wind speed ($R = 0.138$, $P = 0.032$). N1 ($R = -0.134$, $P = 0.037$) and N1% ($R = -0.129$, $P = 0.044$) were negatively correlated with relative humidity, N3 ($R = 0.133$, $P = 0.038$) and N3% ($R = 0.138$, $P = 0.032$) were positively correlated with specific humidity, and awakening time was negatively correlated with temperature ($R = -0.137$, $P = 0.033$), humidity ($R = -0.138$, $P = 0.032$) and wind speed ($R = -0.152$, $P = 0.018$). The N3 period was influenced by precipitation [$B = -0.26$, 95%CI (-0.50, -0.01), $P = 0.042$]

Conclusion Seasonal fluctuations in sleep characteristics of LOD patients are small, and summer sleep is more susceptible to meteorological factors. LOD patients' sleep quality is higher in warm and humid environments. The higher the temperature, humidity and wind speed, the higher the sleep efficiency of LOD patients and the shorter the awakening period; when humidity increases, patients' sleep transition period decreases and deep sleep time is prolonged. The length of deep sleep in LOD patients is affected by the amount of precipitation, and for every decrease of 0.26 mm in precipitation, the length of N3 sleep increases by 1 min. Therefore, it is necessary to pay attention to the possible sleep problems of LOD patients in cold and dry weather conditions and make targeted interventions

社区抑郁症状轨迹及其对认知功能的影响： 基于中国社区队列

仇琦 陈俊 李霞

上海市精神卫生中心, 上海交通大学医学院

目的 老年抑郁症(Late life Depression, LLD)或抑郁症状的转归异质性高, 而发展为痴呆是 LLD 区别于其他年龄抑郁症的特征性转归。多时间节点评估抑郁症状变化轨迹是特征之一, 可能对认知功能的影响存在差异。探索抑郁症状不同变化轨迹是否对认知功能的影响存在差异。

方法 在上海市 SHAPE 社区队列 546 人中进行 3 年, 至少 3 次以上的随访评估, 调查采用老年抑郁量表(GDS-30)评估情绪, 蒙特利尔认知测评(MoCA)及全套神经心理测试(NTB)评估情绪。据多次访视节点, 分析抑郁量表的波动性, 采用潜变量分类法, 将抑郁症状严重程度进行轨迹分类, 采用线性混合模型探索不同抑郁轨迹对随访的认知功能的影响。模型对性别、年龄、受教育年限、吸烟、饮酒等生活方式, 高血压、糖尿病等慢性疾病, 及基线认知功能进行校正。在中国健康与养老追踪调查(CHARLS)队列 8454 人中进行验证, 采用简版流调中心抑郁量表(CESD-10)评估抑郁情绪, 采用电

话认知功能问卷(TICS)调查认知功能。采用相同统计方式进行验证。

结果 在 SHAPE 队列和 CHARLS 两个队列中, 抑郁症状均分为四种轨迹。SHAPE 队列中分为: 无抑郁组(82.9%), 抑郁恢复组(4.2%), 高抑郁组(3.1%), 阈下抑郁组(9.8%)。CHARLS 队列中分为: 无抑郁组(64%), 抑郁恢复组(14%), 抑郁升高组(15%), 高抑郁水平组(7%)。SHAPE 队列中高抑郁水平组对随访中语言流畅度下降有影响($p=0.034$)。其他轨迹对随访的认知影响差异不显著。CHARLS 队列中抑郁升高组在随访中认知功能下降显著, 包括整体认知、词语回忆、计算力及定向力($p=0.001\sim 0.008$)。持续高抑郁水平组对认知功能的影响与抑郁升高组结果一致($p=0.001\sim 0.025$)。在校正其他协变量后, 结果保持一致。而抑郁恢复组在随访中认知功能未见显著影响, 尤其在词语回忆方面($p=0.782$)。

结论 本研究发现社区队列中多节点抑郁评估有助于划分抑郁症状轨迹, 对认知功能下降提供预警。

Double-strand-break Repair Protein Rad21 Homolog/Synaptotagmin-7 Alleviates Alzheimer's Disease in Mice by Promoting M2 Polarization of Microglia

Cheng Zhu¹, Jiayi Xu², Jixin Lin³, Jiahong Liu¹, Enyan Yu⁴

1.School of Mental Health, Zhejiang Provincial Clinical Research Center for Mental Illness, Affiliated Kangning Hospital, Wenzhou Medical University

2.Tongde Hospital of Zhejiang Province

3.Zhejiang Chinese Medical University

4.Zhejiang Cancer Hospital

Objective This study aimed to explore the potential therapeutic role of Synaptotagmin-7 (SYT7) in Alzheimer's disease (AD) by investigating its impact on cognitive impairment. Specifically, we focused on assessing whether targeting SYT7 could be a viable treatment strategy for AD

Methods Using APP/PS1 mice as an AD model, we conducted RNA-sequencing analysis to compare gene expression in the brains of AD mice and control mice. SYT7, identified as a significantly differentially expressed gene, was then investigated further. Through overexpression of SYT7 in AD mice, we evaluated its effects on cognitive function, neuroinflammation, and neuronal loss. Additionally, we studied the regulation of SYT7 by the transcription factor RAD21 and examined microglia polarization to understand the roles of SYT7 and RAD21 in microglial function

Results Our study revealed a notable decrease in SYT7 expression in AD-like mice compared to controls. Overexpressing SYT7 in AD mice led to improvements in cognitive function, reduction of neuroinflammation, and prevention of neuronal loss in the hippocampus. We also uncovered that RAD21 binds to the SYT7 promoter, activating its transcription. Both SYT7 and RAD21 were expressed in microglia and promoted M2 polarization of these cells. Conversely, silencing SYT7 hindered M2 polarization of microglia, even with RAD21 overexpression

Conclusion To summarize, RAD21's role in activating SYT7 transcription enhances M2 polarization of microglia, offering potential benefits for alleviating AD-like symptoms in mice. These findings suggest promising avenues for developing therapies to address cognitive impairment and disease progression in AD. Further research is essential to fully understand the mechanisms underlying the protective effects of SYT7 and RAD21 and to translate these insights into clinical applications

关键词：Alzheimer's disease, SYT7, RAD21, Neuronal loss, Microglia

Discovery of A Novel Tau PET Tracer 18F-HXT-05: Synthesis, Radio-labeling, and Pre-clinical Evaluations

Ni Zhang, Yongmei Xie, Rong Tian, Weihong Kuang
West China Hospital, Sichuan University

Objective Alzheimer's Disease is the major cause of dementia and usually affects people aged over 65, and brings a more and more serious medical and social burden worldwide for decades. Highly specific PET tracers are powerful tools to research brain disorders such as AD, which is found to be associated with misfolded tau aggregates in the brain. Tau PET tracers have shown its powerful capacity in clinical for early diagnosis of AD, as well as evaluations of AD therapies. However, the off-target issues for the first-generation tau tracers and the choroid plexus accumulation for the second-generation tau tracers hindered the clinical applications of these tracers. In recent years, tau PET tracer related studies have been focused on the optimization imidazo[1,2-a]pyridine scaffold, which showed promising properties in previous structure-relationship studies with tau aggregates. The aim of this study is to develop an optimized PET tracer with high affinity against tau aggregates, low off-target binding and more sensitive to early tau lesion in the brain of AD patients

Methods A series of imidazo[1,2-a]pyridine analogues were synthesized with the introduction of fluorine atom, and the binding with tau protein were tested by in vitro competition binding experiments. The subsequent radio-labeling experiments were then performed with the most active compound, HXT-05, and the radio-labeled compounds (18F-HXT-05) were then evaluated for in vitro stability and autoradiography binding profiles with brain slices of AD patients. In addition, PET imaging studies were also performed in health mice and rhesus macaques for biodistribution studies and evaluation of brain penetration of the 18F-HXT-05. Furthermore, PET imaging on AD mice (P301L transgenic mouse) were also performed to evaluate the in vivo binding properties of 18F-HXT-05

Results All compounds, including the radio-labeling precursors, were successfully synthesized, and characterized. In vitro screen led to the discovery of compound HXT-05, which showed potent binding to aggregated tau and hence was evaluated in the subsequent experiments. 18F-HXT-05 was produced in about 40% radiochemical yield ($n = 5$, decay uncorrected), greater than 99% radiochemical purity, and with 12.5 ± 3.1 ($n = 3$) GBq/ μmol of molar activity at the end of synthesis,

respectively. The log P value of 18F-HXT-05 was 2.07 ± 0.10 , and it displayed high stability in PBS saline and rat serum. According to the biodistribution profiles from tissue harvest and PET images (health mice and rhesus macaques), 18F-HXT-05 showed comparable initial brain uptake. However, a fast clearance of tracer from brain was also observed, and almost 60% of total activity from brain was washed out at 5 min post-injection. Compared with normal mice, tracer uptake in P301L transgenic mouse is higher in PET imaging studies for 1 hour post injection. A similar accumulation of radio signal and tau-positive area was found in autoradiography images and immunohistochemistry slices, which confirmed the selective binding of 18F-HXT-05 to tau protein

Conclusion 18F-HXT-05 was successfully synthesized, and it exhibited high stability in rat serum and selective binding to aggregated tau protein in vitro. Compared with normal mice, P301L transgenic mice displayed higher brain uptake of 18F-HXT-05 for 1 hour post injection. The selective binding of 18F-HXT-05 to tau protein was confirmed by autoradiography. Further optimizations of 18F-HXT-05 analogues to evaluate/strength its capacity to detect early tau lesion in the brain of AD patients are currently under investigations

基于氧化应激和炎症反应探讨铜代谢紊乱影响女性抑郁症的机制

何嘉丽 张剑昭 钟绮琳 宋小东 钟舒明 贾艳滨*
暨南大学附属第一医院

目的 既往研究发现铜代谢紊乱与抑郁症(MDD)的关系密切。在雌激素的影响下,机体对铜代谢紊乱表现出性别差异,可能是导致女性MDD高发的重要原因。因此,本研究拟结合临床研究与动物实验,探索MDD患者与抑郁样小鼠的铜代谢、氧化应激及炎症反应特征,并分析其性别差异。

方法 研究纳入85例首诊未服药的成人MDD患者(男性35例,女性50例)与72例健康对照(HC)(男性38例,女性34例)。所有受试者需进行临床症状量表评估和外周血采集,检测受试者的血清雌二醇(Estradiol, E2)、铜代谢、氧化应激以及炎症因子水平。然后通过慢性不可预知温和刺激(CUMS)构建抑郁模型小鼠,运用比色法、酶联免疫吸附测定、实时荧光定量聚合酶链反应、免疫荧光、RNA-Seq等分子生物学手段,验证雌性抑郁样小鼠的铜代谢紊乱、氧化应激及炎症反应特征。最后通过铜抑制剂四硫代钼酸盐(TTM)干预,观察对雌性小鼠抑郁样行为的影响及其病理生理变化。

结果 (1)与HC组相比,MDD组的血清铜离子和铜蓝蛋白(Cp)、丙二醛(MDA)、白介素6(IL-6)和肿瘤坏死因子 α (TNF- α)水平显著升高,血清铜离子转运ATP酶 α 肽(Atp7a)、E2、还原型谷胱甘肽(GSH)水平则显著降低。与男性相比,女性MDD患者表现出降低的抗氧化能力和增强的促炎反应,且观察到女性MDD患者的血清E2水平与Atp7a蛋白和MDA的相关性。

(2)与对照小鼠对比,两性CUMS小鼠均表现出铜代谢紊乱。雌性CUMS小鼠的血清GSH水平较雌性对照小鼠显著下降,且雌性CUMS小鼠的前额叶和海马小胶质细胞数量较雌性对照小鼠增多,而在雄性鼠中未发现类似差异。RNA-Seq和生物信息学分析结果显示,雌性抑郁样小鼠的炎症反应和活性氧代谢通路被激活。

(3)与雌性CUMS小鼠相比,CUMS+TTM处理的雌性小鼠的抑郁样行为改善,且使雌性CUMS

小鼠高铜代谢水平回落至正常,使上调的 Atp7a 和 Cp mRNA 表达回落至对照水平。TTM 处理能够使雌性 CUMS 小鼠升高的血清 MDA 和降低的血清 GSH 水平以及超氧化物歧化酶活性恢复至正常水平。同时,TTM 干预能够使雌性 CUMS 小鼠升高的血清 IL-6 和 TNF- α 水平以及前额叶和海马区域激活增多的小胶质细胞回落至正常水平。此外,我们观察到小鼠 E2 水平在铜代谢调节过程中发生变化。

结论 铜代谢紊乱与抑郁表型关系密切,且铜代谢紊乱介导的氧化应激损伤和炎症反应可能是导致 MDD 发生的重要机制。因雌激素水平波动,女性在面对铜代谢紊乱及其氧化应激和炎症反应时表现出脆弱性,这可能是女性高发 MDD 的重要原因。

神经性厌食患者肠道菌群特征初探

亢清 魏耀辉 连成 彭素芳 陈珏*
上海市精神卫生中心

目的 1. 探索神经性厌食患者的肠道菌群结构(多样性、菌属组成等)与健康对照的差异。2. 探索神经性厌食患者及健康对照的肠道菌群结构与临床参数(如体质量指数(Body mass index,BMI)、进食障碍症状、情绪症状、功能性消化道症状等疾病相关病理学症状等)的关系。

方法 本研究于 2022 年 2 月至 2023 年 2 月期间,从上海市精神卫生中心临床心理科住院部招募神经性厌食患者 41 人,并招募性别、年龄匹配的健康对照 46 人。使用 16S rRNA 基因测序检测患者及健康对照的肠道菌群多样性及种属分布情况,通过进食障碍检查自评问卷 6.0 (EDE-Q 6.0)量表评估被试的进食障碍症状,通过胃肠道症状分级评分量表(GSRS)评估被试的功能性消化道症状,探索肠道菌群与各临床参数的关系。

结果 1. 对于 alpha 多样性,患者组的 Shannon 指数显著高于对照组;对于 beta 多样性,两组在菌群组成方面存在明显差异($p < 0.001$)。在门的水平上,厚壁菌门、变形菌门等在患者组中显著富集;在属的水平上, Bacteroides、Blautia、Alistipes 和 Parabacterioides 等菌属在患者组中显著富集。未发

现限制型 AN ($n=30$) 和暴食清除型 AN ($n=11$) 组间菌群存在显著差异($p > 0.05$)。未发现用药的 AN 患者 ($n=19$) 和不用药的 AN 患者 ($n=22$) 组间的肠道菌群差异($p > 0.05$)。

2. 基于 Spearman 相关性分析,拟杆菌门与 BMI 正相关($r=0.367, p < 0.001$),与饮食限制负相关($r=-0.304, P=0.004$);变形菌门、厚壁菌门则与 BMI 呈负相关(分别为 $r=-0.221, P=0.040$; $r=-0.248, P=0.021$)。螺旋体门与胃肠道症状正相关($r=0.250, P=0.020$),拟杆菌门与胃肠道症状负相关($r=-0.235, P=0.028$)。Prevotella 与进食障碍症状($P < 0.05$)和病程($r=-0.299, P=0.005$)负相关,与 BMI ($r=0.446, p < 0.001$)正相关;Blautia 与进食障碍症状($P < 0.01$)和病程($r=0.281, P=0.008$)正相关,与 BMI 负相关($r = -0.407, p < 0.001$)。

结论 神经性厌食患者的肠道微生物多样性显著升高,与健康对照的菌群结构差异明显,主要表现为厚壁菌门、变形菌门的显著富集,和拟杆菌门含量降低。部分菌群与进食障碍相关病理学症状存在显著相关性。

默认模式网络静息态功能连接预测强迫症药物治疗与心理治疗疗效

李文卿^{1,2} 张晨¹ 张宗凤^{1,3} 高睿¹ 陈永军^{1,4} 曹璇^{1,5} 范青¹

1. 上海市精神卫生中心
2. 华东师范大学
3. 宁波市康宁医院
4. 南京脑科医院
5. 上海交通大学医学院附属新华医院

目的 强迫症是一种以反复出现的侵入性思维或重复行为为特征的精神疾病,一线治疗方案为选择性 5-羟色胺再摄取抑制剂(selective serotonin reuptake inhibitors, SSRIs)和认知行为疗法(cognitive behavioral therapy, CBT)。然而,这两种疗法的疗效存在较大的个体差异,亟需客观的疗效预测指标来预测疗效,辅助临床治疗方案的选择。默认模式网络(Default mode network, DMN)静息态功能连

接在以往研究中得到了广泛关注,被认为是一种有潜力的疗效预测指标。本研究旨在探索使用 DMN 静息态功能连接预测强迫症两种一线治疗方案的疗效。

方法 共 80 名未用药强迫症患者在治疗前接受了磁共振扫描,然后被随机分配到 SSRI 组或 CBT 组接受 12 周的治疗。耶鲁布朗强迫量表得分变化率作为主要疗效指标。我们探索了 DMN 静息态功能连接与疗效的关系,并提取出可以显著预测疗效的指标,结合线性支持向量机算法,探索整体的预测效果。

结果 (1) DMN 静息态功能连接中存在可同时预测两种疗法疗效的指标(疗法一般性疗效预测指标),也存在预测两种疗法存在显著差异的指标(疗法特异性疗效预测指标)。(2) 通过支持向量机算法,使用疗法一般性疗效预测指标可有效预测整体疗效($r=0.608$);而使用疗法特异性疗效预测指标可分别正向预测自身(SSRI: $r=0.552$; CBT: $r=0.703$),并负向预测另一种治疗方案的疗效(SSRI 预测 CBT: $r=-0.438$; CBT 预测 SSRI: $r=-0.504$)。

结论 默认模式网络静息态功能连接可有效预测强迫症两种一线治疗方案的疗效,在辅助临床治疗方案的选择上具有一定的潜力。

我国三级公立精神专科医院康复科建设现状与对策研究

康轶群¹ 杨云龙¹ 张丽丽¹ 张云淑¹ 刘铁榜² 杨甫德³ 栗克清¹

- 1.河北省第六人民医院(河北省精神卫生中心)
- 2.深圳市精神卫生中心
- 3.北京回龙观医院

目的 了解我国一级行政区卫生健康委直属的三级公立精神专科医院康复科的设施配置、从业人员、康复评定技术、康复服务项目、科研及教学情况,为卫生管理部门制定精神专科医院康复科建设标准和精神卫生服务政策提供科学依据。

方法 研究对象是我国现行除香港特别行政区、澳门特别行政区、台湾省,31 家一级行政区卫生健康委直属的三级公立精神专科医院康复科,由于个别医院未设置康复科,以及拒绝配合调查等,最终调查 24 家医院的康复科,经多次核对后问卷有效率 100%。通过初录、核实的方法录入数据,再通过 Excel 办公软件建立数据库,运用 Spss25.0 统计软件对调查数据进行统计分析。调查方法是普查,所选择的调查对象即为研究的总体,故对总体数据只需进行描述性统计即可,无需进行统计学推断。

结果 1.康复科设施配置情况。各医院康复科门诊和治疗室建筑面积占建筑总面积的比例范围是 0.3%~21.4%。8 家医院康复科配置实际开放床位,床位使用率的范围是 15%~110%,床位周转次数的范围是 0.3~13.1 次,2021 年出院者平均住院日的范围是 14.4~76 天。23 家医院配置了万元以上康复设备,医院西 04、中 05 分别配置了 66 台和 65 台万元以上康复设备,其中 9 家医院配置了国外进口康复设备,18 家医院配置了认知矫正治疗设备,14 家医院配置了心理 CT 测评系统和运动治疗设备。

2.康复从业人员情况。24 家医院康复科共有从业人员 691 名,其中康复医师共 112 名,构成比是 16.2%,康复治疗师共 117 名,构成比是 16.9%,心理治疗师共 89 名,构成比是 12.9%,护理人员共 304 名,构成比是 44.0%,其他人员共 69 名,构成比是 10.0%。

3.康复评定技术及服务项目配置情况。22 家医

院配置日常生活能力评定技术, 17家医院开展相关临床疾病早期介入康复服务。配置作业治疗、音乐治疗、特殊工娱治疗、生物反馈治疗康复服务项目的医院比例超过70%。

结论 面对床位管理和康复设备的优化需求, 医院可以采用基于病例特点和需求的科学方法, 以提升床位使用效率和资源的合理配置。相关部门须积极应对从业人员选择该领域的职业障碍, 包括社会偏见和职业发展的限制, 并加快建立康复治疗师规范化培训制度与准入标准, 以及开展继续教育和转岗技能培训, 来提高从业人员的岗位胜任力, 满足精神卫生领域的康复医疗需求。医院应通过精细化的康复评定、及时的早期介入服务和多样化的康复服务项目, 为患者提供全面、个性化的康复支持。教学与科研应紧密结合, 通过早期临床接触和跨学科合作的教学模式, 培养具有创新能力的康复专业人才, 以提高精神康复服务的整体质量和效率。

Exploratory Study on The Relationship Between Negative Symptoms and Self-Stigma in Schizophrenia and Its Impact on Quality of Life

Jiabao Chai¹, Fuquan Liu¹, Lin Liu¹, Ying Li²

1.Beijing Huilongguan Hospital, Peking University Huilongguan Clinical Medical School, Beijing

2.Department of Psychosomatic Medicine, Beijing Children's Hospital, Capital Medical University, National Center for Children Healthy, Beijing

Objective To explore the relationships among negative symptoms, self-stigma, and quality of life in patients with schizophrenia, and to examine how self-stigma impacts quality of life in groups with high and low negative symptoms.

Methods A cross-sectional study was conducted involving 403 inpatients with schizophrenia at Beijing Huilongguan Hospital from May to October 2023. Participants were assessed using various scales including the Positive and Negative Syndrome Scale (PANSS),

Self-Esteem Inventory (SEI), Connor-Davidson Resilience Scale (CD-RISC), Internalized Stigma of Mental Illness (ISMI) Scale, Schizophrenia Quality of Life Scale (SQLS), Coping Questionnaire for Schizophrenic Patients (CQSP), and Social Support Rating Scale (SSRS). Statistical analyses included descriptive statistics, correlation analysis, and regression.

Results This study found significant correlations between negative symptoms and self-stigma, as well as its subfactors. In the group with high negative symptoms, Objective support from the Social Skills Rating Scale ($T = -3.409, p = 0.001$), and coping style 2 (Avoidance) ($T = 5.631, p < 0.001$) showed a significant influence on self-stigma, while in the group with low negative symptoms, only the avoidance coping style 2 ($T = 4.704, p < 0.001$). The influence of self-stigma on quality of life differed between groups, in the group with low negative symptoms, Internalized Stigma of Mental Illness (Stereotype Endorsement) ($T = 2.095, p < 0.037$) and Internalized Stigma of Mental Illness (Stigma Resistance) ($T = 2.027, p = 0.044$) significantly influenced the quality of life. However, in the group with high negative symptoms, there was no significant impact on the quality of life.

Conclusion Negative symptoms of schizophrenia are closely related to self-stigma, which in turn affects the quality of life. The impact of self-stigma on quality of life differs between groups with high and low negative symptoms. Clinically, interventions targeting coping strategies and social support systems can improve self-stigma

关键词: Schizophrenia, Negative Symptoms, Self-Stigma, Quality of Life

抑郁症患者长期药物治疗后功能恢复状况及相关预测因素的探讨

王静怡 宋学勤

郑州大学第一附属医院

目的 探究长期的药物治疗过程中抑郁症患者社会功能及生活质量的变化规律, 并探索能预测急

性期及远期功能恢复情况的影响因素。

方法 本研究采用纵向设计,在基线以及药物治疗后1、2、3、6、9和12个月使用汉密尔顿抑量表(HAMD-17)、抑郁症状快速自评量表(QIDS-SR16)、席汉残疾量表(SDS)、生活质量与满意度程度问卷(Q-LES-Q-SF)对抑郁症状和社会功能进行评估,根据SDS各项评分定义社会功能是否恢复正常,采用多因素Logistics回归分析早期指标对急性期、远期功能恢复的影响。

结果 54例抑郁症患者中,有27例完成了为期12月的随访,其中2例在12月末时复发。社会功能和生活质量在1年内持续升高,前2个月缓解最明显。治疗1年后92%(23/25)的患者实现了症状缓解,64%(16/25)的患者达到功能缓解,两者均缓解的患者占60%(15/27)。1月末QIDS-SR16总分可以预测急性期(3月末)治疗后的功能水平($B=0.585, P=0.002$),急性期治疗后工作/学业水平还与1月末HAMA评分有关($B=0.105, P=0.03$)。3月末的功能水平、抑郁症状严重程度、残留核心情绪症状、体重/食欲改变可能影响12月末功能恢复情况,其中自评抑郁症状严重程度(QIDS-SR16总分)可以独立预测12月末的功能恢复($OR=0.674, P=0.009$)。

结论 长期、规律的药物可持续改善患者的功能障碍,早期的抑郁症状严重程度可以预测远期的社会功能恢复状况。

精神运动康复对住院精神分裂症康复期患者的治疗效应

陆如平¹ 高慧¹ 张晶晶¹ 罗岚¹ 彭红¹ 吕珍苏¹ 范青²

1.上海市民政第一精神卫生中心

2.上海交通大学医学院附属精神卫生中心

目的 本研究旨在评估精神运动康复对康复期精神分裂症患者的临床疗效,特别是对其精神症状、认知功能及生理指标的影响。

方法 将64例来自上海市民政第一精神卫生中心的康复期精神分裂症患者随机分为干预组和对

照组各32例,干预组在常规治疗基础上进行20次精神运动康复训练,对照组仅接受常规治疗。干预周期为10周,分别在治疗前、治疗5周时、治疗10周时对两组患者使用以下量表进行评估:阳性和阴性症状量表(PANSS)、自知力与治疗态度问卷(ITAQ)、个人和社会功能量表(PSP)、卡尔加里精神分裂症抑郁量表(CDSS)、总体幸福感量表(GWB)、自尊量表(SES)和简易智力状况检查法(MMSE)。此外,使用重复性成套神经心理状态测验(RBANS)对患者的认知功能进行评估,并在干预组治疗前后检测其外周血中的白介素6(IL-6)、肿瘤坏死因子(TNF- α)和人脑源性神经营养因子(BDNF)水平。

结果 干预组在10周后阳性和阴性症状量表(PANSS)得分显著降低($P<0.05$),表明精神症状得到明显改善。自知力与治疗态度问卷(ITAQ)得分提高($P<0.05$),患者对疾病的认识和治疗态度有所改善。个人和社会功能量表(PSP)评分显著提高($P<0.05$),患者的日常生活功能和社会交往能力增强。卡尔加里精神分裂症抑郁量表(CDSS)得分降低($P<0.05$),抑郁症状有所缓解。总体幸福感量表(GWB)和自尊量表(SES)得分显著提高($P<0.05$),患者的主观幸福感和自尊水平有所提升。简易智力状况检查法(MMSE)和重复性成套神经心理状态测验(RBANS)结果显示,干预组患者的认知功能有所改善($P<0.05$)。生理指标方面,干预组IL-6和TNF- α 水平显著降低($P<0.05$),表明炎症反应减弱;BDNF水平显著升高($P<0.05$),神经营养支持增强。

结论 精神运动康复在改善康复期精神分裂症患者的精神症状、认知功能及社会功能方面具有显著疗效,同时对降低炎症指标和提高神经营养因子水平有积极作用。这一康复方法可作为精神分裂症康复期患者的有效辅助治疗手段。

HD-tDCS对慢性精神分裂症患者小脑后叶功能连接及其认知功能相关性研究

刘霞 赵延震
深圳市康宁医院

目的 慢性精神分裂症患者大多存在认知功能损伤。本研究主要研究高精度经颅电刺激(HD-tDCS)对认知缺陷精分患者的作用,利用静息态功能磁共振成像(rs-fMRI)数据分析小脑后叶 ALFF 值、全脑功能连接及其与认知功能的相关性,探索 tDCS 治疗精神分裂症患者的神经作用机制。

方法 选取符合 DSM-IV 诊断标准的 71 名慢性精神分裂症患者,采用随机、双盲、伪刺激对照的实验方法,将 71 名被试分为 tDCS 治疗组和 tDCS 伪刺激组。所有被试使用 HD-tDCS 装置(Soterix Medical Inc., USA)进行 tDCS 或伪 tDCS 连续 10 天的干预(20min/day)。干预前、后 10 天,被试均完成了完整的临床评估、神经心理学评估和 MRI 数据采集,使用 PANSS 量表评估临床症状、神经心理状态评估量表(RBANS)评估其认知功能。治疗前后这些患者均采集 T1 BROVA、BOLD 数据,使用 DPABI 工具包分别计算两组被试治疗前后 ALFF 值并进行统计分析,以显著性差异的脑区作为感兴趣区(ROI),做全脑功能连接,并对治疗前后 FC 值做配对 T 检验,提取显著性差异脑区的 FC 值,将两组治疗前后 FC 值与 PANSS、RBANS 量表做偏相关分析。

结果 tDCS 治疗组与 tDCS 伪刺激组 ALFF 值统计分析的结果显示:与治疗前相比,tDCS 治疗组,治疗后 ALFF 显著增强的脑区为小脑后叶(双侧)($p < 0.01$, GRFcorrected);而 tDCS 伪刺激组,未发现 ALFF 值治疗前后存在显著性差异的脑区。小脑后叶全脑 FC 的结果显示,tDCS 治疗组小脑后叶 FC 显著增强的脑区有左侧海马、左侧小脑后叶和右侧海马。在 tDCS 治疗组,小脑后叶与右侧海马的 FC 值治疗前后变化率与 PANSS 总分变化率呈显著正相关($R=0.492$, $p=0.015$)、与 RBANS-词汇再识总分变化率呈显著正相关($R=0.598$, $p=0.002$)、与 RBANS-延时记忆变化率呈显著正相关($R=0.438$, $p=0.032$)。tDCS 伪刺激组,小脑后叶与右侧海马 FC 值治疗前后与 PANSS、RBANS 各指标均无相关性。

结论 tDCS 治疗组与 tDCS 伪刺激组比较,ALFF 值在 tDCS 组治疗前后小脑后叶出现显著性增强,说明 tDCS 对慢性精分患者脑功能活动有一定的改善,尤其是小脑后叶的自主脑神经活动有所增强。小脑后叶与右侧海马在 tDCS 治疗后功能连接增强,而且,其 FC 值治疗变化率与 PANSS、RBANS 变化率呈显著相关,这可能部分揭示了 tDCS 改善

脑功能的神经作用机制。同时,对小脑后叶在认知和情绪调控方面的作用有了更深入的认识。

Gender Difference in Correlation between Mental Symptoms and 10-year Cardiovascular Risk in Schizophrenia

Xiaoying Jin, Chenghao Lu, Shen Li

Tianjin Anding Hospital, Mental health center of Tianjin Medical University

Objective People with Schizophrenia have a shorter life expectancy than the general population, Cardiovascular disease (CVD) is the leading cause of death. The Framingham risk score (FRS) is a gender-specific multivariate risk factor algorithm that can be used in the clinical setting to estimate the 10-year risk of CVD and individual cardiovascular events. However, the current consensus on the correlation between psychiatric symptoms and cognitive function with FRS remains inconclusive, and there has been a lack of research addressing gender differences in this association. This study is focused on investigating the relationship between clinical characteristics and 10-year cardiovascular risk in individuals of different genders with Schizophrenia

Methods 802 patients with a diagnosis of Schizophrenia were included in the sample of this study. The Positive and Negative Syndrome Scale (PANSS) was administered to each patient to assess symptom severity of schizophrenia. To evaluate the patient's cognitive function, the Repeatable Battery for the Assessment of Neuropsychological Status (RBANS) was utilized. The Framingham risk score (FRS) was employed to estimate the participant's 10-year CVD risk

Results The patients had a 10-year CVD risk of $11.76\pm 8.99\%$ and an estimated vascular age of 58.18 ± 15.46 years. The average total score of the PANSS scale for the 802 patients was 75.49 ± 17.35 points, with an average positive score of 16.08 ± 5.68 points, which was higher in women than in men. In the RBANS scale, the total score was 67.68 ± 14.78 points, with the average visual breadth at 80.17 ± 19.17 points and speech function at 81.49 ± 15.04 points, where the

male score was higher than the female score. The attention score for women was 84.35 ± 16.47 points, significantly surpassing that of men ($P=0.007$). Notably, 36.3% of patients exhibited a high-risk 10-year cardiovascular disease level, while 16.5% of patients had intermediate risk. Furthermore, The FRS for male patients was 14.85 ± 9.38 , significantly exceeding the score for female patients (6.91 ± 5.60). The study found that there was a significant correlation between gender and FRS. FRS was significantly associated with age, age at first onset, years of education, WHR, SBP, GLU, HDL, diabetes, and hypertension in both males and females. Interestingly, we found that FRS was significantly associated with Positive and Negative scores, total RBANS scores, immediate memory, speech function and attention in males only. Multivariate linear regression analysis showed that FRS increased with the increase of BMI, Blood Pressure, Glucose, Total Cholesterol and Triglyceride levels, the relationship with HDL was inverse. The general psychopathological scale score was negatively associated with FRS (male: $B=-0.086$, $P=0.013$; female: $B=-0.056$, $P=0.039$). Negative scale score (male: $B=-0.088$, $P=-0.024$; female: $B=-0.022$, $P=0.499$) and total PANSS score (male: $B=-0.042$, $P=-0.013$; female: $B=-0.023$, $P=0.100$) showed a negative association with FRS only in males. No correlation has been found between the total RBANS score and its sub-scores with FRS. In addition, only in patients over 60 years old, general psychopathology ($B=-0.168$, $P=0.001$) and PANSS total score ($B=-0.057$, $P=0.041$) may reduce FRS, and immediate memory ($B=0.073$, $P=0.025$) may be associated with higher FRS

Conclusion A significant correlation was observed between the 10-year cardiovascular risk and general psychopathological symptoms in this study. Notably, we found that there was a negative correlation between negative symptoms and FRS only in males. Suggesting that we should take differentiated interventions to reduce the risk of CVD in patients of different genders in clinical practice

关键词: Framingham risk score, Cardiovascular disease, Schizophrenia, Gender

后疫情时代四川省青少年及青年学生的心理健康：基于 2022 年和 2023 年两次大规模调查的研究

王聪 慕云菲 蔡佳 冉茂盛*

四川大学华西医院

目的 本研究基于 2022 年和 2023 年四川省青少年及青年学生心理健康的两次大规模调查数据进行分析，旨在揭示新冠疫情之后，青少年和青年学生的心理健康问题（如抑郁、焦虑、创伤后应激障碍、睡眠障碍、网络成瘾）和不良行为（如校园霸凌和网络霸凌）的现状，为相关政策和干预服务的制定提供实证支持。

方法 本研究基于在中国四川省初中、高中和大学进行的 2 次大样本、横断面的在线调查。第一次调查时点为 2022 年 12 月 16 日，有效样本为 64624 人；第二次调查时点为 2023 年 12 月 16 日，有效样本为 55773 人。研究采用“问卷星”的方式进行线上问卷自评。问卷分为三大部分，第一部分包括基本信息；第二部分包括心理健康相关问卷；第三部分包括不良行为相关问卷。参与者在第一次调查为第一组，参与第二次调查为第二组。本研究使用方差分析的方法对两次调查的参与者的人口资料和量表资料进行了比较分析，并采用卡方检验。

结果 组一中女性参与者比例为 58.3%，组二中这一比例为 62.1% ($p < 0.001$)。组一的少数民族参与者比例为 10.6%，组二中这一比例为 7.8% ($p < 0.001$)。在年级方面，组一的初中生和高中生比例分别为 29.7% 和 42.2%，组二中这两个比例分别为 19.7% 和 29% ($p < 0.001$)。权威式教养方式占 55.1% 和 56.1% ($p < 0.001$)。不同时间点的青少年心理健康和行为问题如网络成瘾症状，睡眠问题，焦虑症状，校园霸凌和网络霸凌存在显著差异：网络成瘾 ($IAT \geq 40$) 在组一中占 59.8%，在组二中占 58.6% ($p < 0.001$)。睡眠问题 ($ISI \geq 8$) 在组一中占 33.5%，在组二中占 35.3% ($p < 0.001$)。焦虑症状 ($GAD-7 \geq 5$) 在组一中占 31.1%，在组二中占 31.9% ($p = 0.004$)。创伤后应激障碍 ($PTSD, PCL-5 \geq 33$) 在组一中占 11.4%，在组二中占 9.4% ($p < 0.001$)。校园霸凌在组一中占 22.4%，在组二中占 18.4% ($p < 0.001$)。网络霸凌在组一中占 16.9%，在组二中占 17.3% ($p = 0.047$)。但是抑郁症状 ($PHQ-9 \geq 5$) 在两组间无

显著差异 ($p = 0.349$)。

结论 研究结果显示，在后疫情时代的不同时间点，青少年和青年学生在心理健康和行为方面存在显著差异。其中，网络成瘾、PTSD 和校园霸凌比例下降，但睡眠问题、焦虑症状和网络霸凌比例上升。应重点关注青少年和青年学生的心理健康和行为问题，特别是抑郁、睡眠、焦虑和网络霸凌问题，发展有针对性的学生心理健康政策和心理社会干预服务，推动家-校-医-社合作，持续促进青少年和青年学生的心理健康。

关键词：青少年，青年学生，心理健康，行为问题，后疫情时代

Effect of Dynamic Interpersonal Therapy on The Improvement of Mentalizing in Patients with Major Depressive Disorder and Its Association with Changes in Depressive Symptoms

Wenhui Jiang, Jiayu Yao, Yuan Wang, Shanshan Su, Ziwei Zheng, Yang Yang, Jianyin Qiu
Shanghai Mental Health Center

Objective Dynamic Interpersonal Therapy (DIT) is a short-term psychodynamic psychotherapy that has been shown to effectively reduce depressive symptoms in patients with major depressive disorder (MDD). In DIT, the presenting symptoms of depression are formulated as a response to impaired mentalization. DIT aims to alleviate depressive symptoms by improving mentalizing. This study aimed to address the effect of DIT on the improvement of mentalizing and its association with changes in depressive symptoms

Methods Outpatients received either DIT combined with antidepressant medication treatment (DIT group, $n = 128$) or only antidepressant medication treatment (ADM group, $n = 102$) for 16 weeks. The Hamilton Depression Rating Scale (HAMD), Patient Health Questionnaire (PHQ), and Reflective Functioning Questionnaire (RFQ) were used. The intention-to-treat principle, mixed linear models, multiple imputation, Pearson correlation analysis, and mediation analysis were conducted. The per-protocol principle was used as

sensitivity analysis

Results The DIT group had significantly lower HAMD, PHQ, RFQ-U, and higher RFQ-C scores than the ADM group at posttreatment ($p < 0.05$). Only the DIT group showed RFQ-C ($p < 0.001$) and RFQ-U improvements from pre- to post-treatment ($p < 0.001$). The change in RFQ-C was significantly correlated with the change in HAMD ($r = -0.218, p = 0.015$). The change in RFQ-U was significantly correlated with the change in HAMD ($r = 0.269, p = 0.004$) and the change in PHQ ($r = 0.343, p < 0.001$). When using RFQ-U as the mediating variable and PHQ as the dependent variable, a significant mediating effect was found [$p = 0.043, 95\% CI = (0.024, 1.453)$]

Conclusion DIT group yielded a better outcome than ADM alone in reducing depressive symptoms and improving mentalizing. The changes in mentalizing covaried with the reduction of depressive symptoms. Mentalizing may be a factor producing therapeutic changes in DIT for MDD

关键词: major depressive disorder; mentalizing; Dynamic Interpersonal Therapy

未服药强迫症患者边缘与三重网络的静息态网络功能与SSRIs的疗效相关研究

徐之涵¹ 柳娜²

1.南京医科大学附属脑科医院

2.南京医科大学附属脑科医院 医学心理科

目的 强迫症 (Obsessive-compulsive disorder, OCD) 是一种常见的慢性精神疾病, 选择性 5-羟色胺再摄取抑制剂 (Selective Serotonin Reuptake Inhibitors, SSRIs) 是目前治疗 OCD 的一线药物。SSRIs 治疗 OCD 有效的神经机制并不明确, 有可能是作用于额-边缘环路, 但传统的额-边缘环路没有充分考虑大脑高级皮层的作用。“三重网络”——默认模式网络 (Default mode network, DMN)、突显网络 (Salience network, SN) 和额顶网络 (Fronto-parietal network, FPN) 是认知控制最核心的皮质网络。对于 OCD 边缘网络 (Limbic network, LIM) 与“三重网络”之间交互作用的研究尚不充分。

方法 共招募了 84 名未服药 OCD 患者与 90 名健康受试者 (Health controls, HCs), 其中 40 名 OCD 患者接受了 12 周的 SSRIs 治疗, 并根据 8 周时的耶鲁-布朗强迫量表 (Yale-Brown Obsessive Compulsive Scale, Y-BOCS) 减分率是否大于等于 35% 将这部分患者分为两个疗效亚组。比较 OCD 组与 HC 组以及 OCD 疗效亚组间的网络指标差异, 提取存在显著组间差异的网络指标, 采用重复测量线性混合效应模型对 SSRIs 进行疗效预测。

结果 与 HCs 相比, 治疗前未服药 OCD 患者的 LIM 与三重网络之间在 ROI 级别上的功能连接普遍减弱, OCD 患者 LIM 与 SN 的网络间平均功能连接强度显著降低。图论分析提示 OCD 患者 LIM 与 FPN 的全局效率更低, DMN 的局部效率更低。在 OCD 亚组间, 治疗有效组 LIM 的模块内交互作用以及 LIM 与 FPN、DMN 的模块间交互作用比治疗无效组更强。SSRIs 的疗效预测模型显示, 在有效组中, FPN 右侧颞叶的节点效率越低、LIM 与 DMN 的模块间交互作用越强, 强迫症状改善越明显, 在无效组中则相反。另外, 在所有 OCD 患者中, 更强的 LIM 与 SN、FPN、DMN 的基线网络间功能连接, 更强的 LIM 模块内交互作用预示着 SSRIs 治疗后的症状改善。

结论 未服药 OCD 患者 LIM 与 SN、FPN 及 DMN 之间的信息交流存在障碍, 可能提示了 OCD 患者皮层认知控制网络对边缘的调节能力减弱。OCD 患者异常的网络指标对 SSRIs 的疗效可能具有一定的预测作用, 更低的右侧颞叶节点效率以及更强的 LIM 与 DMN 模块间交互作用可以特异性地预测 SSRIs 治疗有效, 而 LIM 内部的功能交互可以预测 SSRIs 治疗后强迫症状的改善。

A Longitudinal Network of Psychotic-like Experiences, Depressive and Anxiety Symptoms, and Adverse Life Events: A Cohort Study of 3,358 College Students

Meng Sun¹, Heng Sun², Zijuan Ma³, Shaoling Zhong¹, Xinhu Yang¹, Hongling Zhou¹, Yue Li¹, Liang Zhou¹

1.Department of Social Psychiatry, the Affiliated Brain Hospital of Guangzhou Medical University

2.Department of IT Center, Affiliated Hospital of Jining Medical University,

3.Center for Studies of Psychological Application, School of Psychology, and Guangdong Key Laboratory of Mental Health and Cognitive Science, South China Normal University

Objective Psychotic-like experiences (PLEs), especially for persistent PLEs, are highly predictive of subsequent mental health problems. Hence, it is crucial to explore the psychopathological mechanisms underlying the occurrence and persistence of PLEs. This study aimed to explore the above issues through a longitudinal dynamic network approach among PLEs and psychological and psychosocial factors

Methods A total of 3,358 college students completed two waves of online survey (from Oct 2021 to Oct 2022). Socio-demographic information was collected at baseline, and PLEs, depressive and anxiety symptoms, and adverse life events were assessed in both waves. Cross-lagged panel network analyses were used to establish networks among individuals with baseline PLEs as well as those without

Results At baseline, 455(13.5%) students were screened positive for PLEs. Distinct dynamic network structures were revealed among participants with baseline PLEs and those without. While “psychomotor disturbance” had the strongest connection with PLEs in participants with baseline PLEs, “suicide/self-harm” was most associated with PLEs in those without. Among all three subtypes of PLEs, BEs and PI were the most affected nodes by other constructs in participants

with baseline PLEs and those without, respectively. Additionally, wide interconnections within the PLEs construct existed only among participants without baseline PLEs

Conclusion The study provides time-variant associations between PLEs and depressive symptoms, anxiety symptoms, and adverse life events using network structures. These findings help to elucidate the mechanisms underlying the occurrence and persistence of PLEs, and shed high light on future intervention targeting at individuals with PLEs

关键词: high-risk population; psychological factors; psychosocial factors;cross-lagged panel network

Clinical Risk Factors for All-cause Mortality in People with Schizophrenia: A Nine-year Retrospective Cohort Study

Zihua Pan, Shaoling Zhong

The Affiliated Brain Hospital of Guangzhou Medical University

Objective Schizophrenia is a severe mental illness associated with significantly elevated mortality rates. However, mortality risk factors among people with schizophrenia in low- and middle-income countries remain examined. This study aimed to explore the clinical risk factors due to all-cause mortality in people with schizophrenia

Methods We conducted a retrospective cohort study among people with schizophrenia in Guangzhou, China between January 1, 2013, and December 31, 2021. Sociodemographic, clinical, and mortality data were collected. Cox proportional hazards regression was used to identify clinical and illness-related factors associated with all-cause mortality risk

Results A total of 33080 participants were enrolled and 4,164 (12.59%) died over a mean follow-up of 69.73 (SD: 39.62) months. The overall standardized mortality rates in people with schizophrenia between 2013 and 2021 was 1606.04 (95% CI: 1583.01-1629.06). We found longer illness length (adjusted hazard ratio,

aHR: 1.27 [95% CI: 1.17-1.36]), relative stable illness (aHR: 1.18 [95% CI: 1.01-1.38] vs. stable illness) and unstable illness (aHR: 2.65 [95% CI: 1.90-3.68], vs. stable illness), and non-medical insurance payment (aHR: 2.49 [95% CI: 2.21-2.82]) were associated with higher all-cause mortality risk. Frequency of hospital stays (once: aHR: 0.46 [95% CI: 0.42-0.50], more than once: aHR: 0.23 [95% CI: 0.21-0.26], vs. no history of hospitalization) and family history of mental disorders (aHR: 0.50 [95% CI: 0.40-0.64]) were associated with lower mortality risks

Conclusion Cardiovascular and cerebrovascular diseases were the leading causes of death in this cohort of people with schizophrenia. Clinical high-risk groups should be considered to develop targeted interventions to reduce mortality in people with schizophrenia

关键词: Risk factors, All-cause mortality, Schizophrenia, Retrospective cohort study

The Prevalence and The Correlates of Mental Disorders Among The Elderly Population: Results From China Mental Health Survey

Huifang Yin¹, Jingjuan Pang¹, Minghui Li¹, Guoli Yan¹, Xiaofei Hou¹, Yueqin Huang², Zhaorui Liu², Guangming Xu¹

1. Tianjin Anding Hospital

2. Peking University Sixth Hospital

Objective The world is entering an ageing society and China with the world's largest population has entered. Mental disorders with high prevalence used to lead impairment among the elderly. The previous study about influence factor of mental disorders dispersed in specific mental disorder or largely localized, and the results vary widely. Although higher rates of GDP per capital growth are associated with a deterioration of mental health entering the 21st century, a population-based study focusing on mental disorders in the elderly population is lacking. In this study, we used data for diagnoses based on CIDI by trained lay interviewers to explore the 12-month and lifetime prevalence

of mental disorders among the 55 years old and above in China

Methods Data for this study was derived from the China Mental Health Survey (CMHS). Participants were diagnosed using CIDI, and epidemiological information and risk factors were collected. A total of 12667 adults aged 55 and above were surveyed, of which 10840 (85.6%) completed the study

Results The lifetime and 12-month prevalence of mental disorders were 15.2% and 8.0% among Chinese population. The most prevalent mental disorder were any anxiety disorder, any mood disorder and substance use disorder, with the lifetime prevalence of 9.1%, 8.2% and 4.2% respectively, with the 12-month prevalence of any anxiety disorder and mood disorder were 6.0% and 4.4%, respectively. Having ≥ 3 physical diseases, having chronic pain and having sleep disturbances were associated with higher odds of any disorders. Being ≥ 70 years old was associated with lower odds of any disorders

Conclusion The prevalence of mental disorders were high in the population aged 55 and above, among which anxiety disorders, mood disorders, substance-use disorders were prevalent. Although different mental disorders were associated with different demographic factors, chronic disease, pain and sleep disturbances played an important role in the prevalence of overall mental disorders

Preventing Post-discharge Suicides Using Brief Contact Interventions (BCIs) in Psychiatric Patients: Results From An Implementation Study of A Sequential Multiple Assignment Randomized Trial (SMART)

Tiantian Fu¹, Jinghua Li¹, Luyao Hu¹, Huiming Liu², Guanjie Chen², Yuanhan Bai², Fengsu Hou²

1. Sun Yat-sen University

2. Shenzhen Kangning Hospital

Objective Suicide is an acknowledged global public health concern. The post-discharge suicide risk among psychiatric patients is significantly higher than it is among patients with other diseases and general population. There is no specific mental health policy in China with respect to psychiatric patients at risk of post-discharge suicide. The brief contact interventions (BCIs) are evidence based and have been recommended to decrease postdischarge suicide risk in areas of limited mental health resources like China. WHO reported BCIs could decrease the postdischarge suicide risk among psychiatric patients effectively (OR 0.20, 95%CI 0.09 to 0.42), and recommended integrating BCIs in the suicide intervention framework. This study aims to develop a post-discharge suicide intervention strategy based on BCIs and evaluate its implementability under the implementation outcome framework

Methods This study established a brief contact intervention platform that sent greetings and encouraging messages to patients, and provides psychological crisis relief and related health services. This dynamic Sequential Multiple Assignment Randomized Trial (SMART) was conducted at Shenzhen Kangning Hospital in Shenzhen, China, involving adult post-discharge psychiatric patients. The study employed an adaptive strategy. After recruitment and a baseline survey, participants were randomized into group 1 and group 2, receiving BCIs monthly and weekly, respectively. Given the highest suicide risk within the first three months post-discharge, a checkpoint was set at three months to assess suicide risk in both groups. At this checkpoint, participants in group 1 with increased suicide risk were rerandomized into group 1a (weekly BCIs) and group 1b (biweekly BCIs); those with decreased or unchanged risk continued receiving monthly BCIs as group 1c. Participants in group 2 with increased or unchanged suicide risk continued receiving weekly BCIs as group 2a; those with decreased risk were rerandomized into group 2b (monthly BCIs) and group 2c (biweekly BCIs). After rerandomization, participants continued receiving BCIs until 12 months post-discharge, with suicide risk evaluated at 1, 3, 6, and 12 months. The primary outcome was change on suicide risk at 1, 3, 6, and 12 months, while secondary outcomes included change on social support

and social connectedness at 1, 3, 6, and 12 months. Outcomes were assessed independently at baseline and at 1, 3, 6, and 12 months post-discharge. An intention-to-treat (ITT) approach and generalized estimating equation (GEE) were utilized to determine the optimal BCIs frequency. The study also conducted a stratified analysis by gender and type of mental disorder to identify differences in intervention effects. Additionally, the study collected qualitative and quantitative information on implementation and service outcomes from a community team comprising psychiatric patients, family members, and clinical and community mental health service providers

Results From June 2022 to the present, 400 eligible participants were included. The mean age of the participants was 30.4 ± 8.9 years. Among them, 173 (43.3%) were male, and 271 (67.8%) had serious mental disorders, including schizophrenia, schizoaffective disorder, paranoid psychosis, bipolar disorder, mental disorders caused by epilepsy, and mental retardation accompanied by mental disorders. At baseline, suicide risk scores were 2.0 (0.0, 15.0), social connectedness scores were 83.4 ± 16.9 , and social support scores were 45.6 ± 6.0 . A total of 257 participants completed the one-month questionnaires, 310 completed the three-month questionnaires, and 200 completed the six-month questionnaires

Compared to baseline, the average reduction in suicide risk was 4.2 points ($p < 0.05$) at the end of the first month and 1.3 points ($p > 0.05$) at the end of the third month. By the end of the sixth month after discharge, the suicide risk for all participants increased by an average of 0.5 points ($p > 0.05$). Specifically, group 1c (monthly + monthly, $n=62$) and group 2c (weekly + bi-weekly, $n=67$) showed a statistically significant decrease in suicide risk by the end of the sixth month. Group 1a (monthly + weekly, $n=22$) and group 2b (weekly + monthly, $n=27$) exhibited a decrease in suicide risk by the end of the sixth month, but it was not statistically significant. Group 1b (monthly + bi-weekly, $n=16$) and group 2a (weekly + weekly, $n=33$) showed a statistically significant increase in suicide risk by the end of the sixth month. Compared to baseline, the average reduction in social connectedness was 2.6 points

($p < 0.05$) at the end of the first month, 4.6 points ($p < 0.05$) at the end of the third month, and 4.3 points ($p > 0.05$) by the end of the sixth month. Specifically, group 2b showed an increase in social connectedness by the end of the sixth month, though not statistically significant. Group 1b, 1c, and 2c exhibited a statistically significant decrease in social connectedness by the end of the sixth month. Group 1a and Group 2a showed a decrease in social connectedness by the end of the sixth month, but it was not statistically significant. Compared to baseline, the average reduction in social support was 0.4 points ($p > 0.05$) at the end of the first and third months, and 0.6 points ($p > 0.05$) by the end of the sixth month. At all time points, there was no statistical difference in the average reduction in social support between groups.

After adjusting for confounding factors, there was no difference in suicide risk, social connectedness, and social support between Group A (monthly) and Group B (weekly) at the end of the first and third months. By the end of the sixth month, there was a difference in the change in suicide risk among different groups: taking Group 2a as the reference, the effect of reducing suicide risk compared with baseline was $2c > 1c > 2b > 1a > 2a = 1b$. There was no statistical difference between groups in changes in social connectedness and social support. There was no statistical difference in the optimal frequency of intervention for patients of different genders and types of mental disorders. This study is conducting qualitative research to identify the promoting and hindering factors in the implementation process to optimize intervention strategies.

Conclusion This pioneering study in China utilizes adaptive strategies to investigate BCI intervention approaches to mitigate suicide risk among post-discharge patients with mental disorders. The study identified the optimal frequency of intervention to reduce post-discharge suicide risk. Given its low resource consumption, BCIs can be adopted as a routine intervention. Future research should further examine the specific content and frequency of BCIs needed for patients with varying types and severities of mental disorders

Exploring The Effect of Romantic Relationships on NSSI Behavior in Depressed Adolescents: Based on The Causal Forest Double Machine Learning Model

Yongjie Zhou¹, Haoli Xu², Dan Liu², Jingjing Yang², Xinwen Zou³, Yang Wang²

1. Shenzhen Kangning Hospital

2. College of Management, Shenzhen University

3. School of Business Informatics and Mathematics, University of Mannheim

Objective Romantic relationships are often regarded as a positive social connection and an important source of social support. However, for adolescents with depression, the impact of romantic relationships may be more complex. In fact, the relationship between romantic relationships and their non-suicidal self-injury (NSSI) behavior is not yet clear. To prevent NSSI behavior in depressed adolescents and protect their physical and mental health, it is particularly important to understand the causal relationship between romantic relationships and NSSI behavior. This study explored the impact of romantic relationships on NSSI behavior in depressed adolescents and analyzed the key factors influencing NSSI behavior

Methods A multicenter survey was conducted in the psychiatric departments of 14 tertiary hospitals in 9 provinces in China. A total of 2,343 adolescents aged 12-18 with depression were recruited through convenience sampling. We used a double machine learning model embedded with causal forest to examine the causal effect between romantic relationships and NSSI behavior, and employed SHAP analysis to identify the key factors. The study included 21 covariates covering demographic characteristics, psychological traits, traumatic experiences, and social relationships

Results Among the 2,343 participants, individu-

als with suicidal ideation during self-injury were excluded, leaving 1,204 depressed adolescents as the subjects of the study. Of these, 418 (34.7%; NSSI: 311) had romantic relationships, while 786 (65.3%; NSSI: 479) did not. The model showed good generalization performance, with an average treatment effect (ATE) of 0.111 (confidence interval [0.054, 0.168], $P=0.0$) on the training set and an ATE of 0.108 (confidence interval [0.018, 0.198], $P=0.019$) on the test set. Psychological resilience, rumination, and anxiety were the top three key characteristics affecting NSSI behavior in depressed adolescents. Low psychological resilience and moderate frequency of social media use had a positive impact on NSSI, while high rumination, high stress, and high educational attainment had a negative impact on NSSI

Conclusion Romantic relationships in depressed adolescents have a significant positive effect on their externalizing behavior of depression—NSSI. High psychological resilience and low rumination play important roles in reducing NSSI behavior, while high anxiety, stress, and a sense of despair significantly increase the risk of NSSI behavior

精神分裂症患者子女的精神健康调查：一项多中心横断面研究的初步结果

盛志 周天航 管丽丽 马弘 于欣*
北京大学第六医院

目的 精神分裂症是一种慢性衰退性精神疾病，常导致严重的功能损害和精神残疾。精神分裂症患者子女出现精神心理问题的风险较一般人群超出 4-14 倍，这一现象可能与不同精神疾病间存在部分共同的遗传基础以及不良环境因素的代际传递相关。本研究拟对精神分裂症患者进行家庭调查，旨在描述我国精神分裂症患者子女的精神健康状况，从而为这一弱势群体的预防和干预政策制定提供可靠的研究基础。

方法 对国内多个地区参与重性精神疾病管理

的 18-60 岁精神分裂症患者进行问卷调查，通过纳入生育子女的患者家庭，用描述性流行病学方法分析数据，并统计精神分裂症患者后代的精神健康状况及精神障碍患病率。

结果 本研究调查了全国 10 个地区管理的精神分裂症患者共 75,616 例；70,500 人参与调查，5,116 人拒绝调查，访到率 77.7%。数据显示，27,315 名 (38.7%) 精神分裂症患者共生育了 35,722 名后代，其中女性患者 (65.9%) 占比更高，而母亲患精神分裂症的子女也报告了更高的精神分裂症患病率 (1.58% vs. 1.12%, $p < 0.01$)。精神分裂症患者的成年子女中报告精神分裂症、精神发育迟滞及心境障碍的患病率分别为 1.88%、0.42% 及 0.31%。后代是否存在精神心理问题与患病父母的性别、父母患病与子女出生的时间关系以及家庭收入具有相关性。

结论 研究探索了国内多个中心在管的精神分裂症患者生育信息及其后代的精神健康状况。考虑到我国仍有大量精神分裂症患者在重性精神疾病管理项目中登记，如何改善其后代的心理健康水平、预防精神障碍的代际传递仍是一个巨大的挑战。

University

Objective Neurological and psychiatric disorders and injuries are important factors affecting the quality of life in the general population, and smoking, alcohol consumption and substance use are important risk factors for these diseases. In this study, we analysed the burden of disease of smoking, alcohol consumption and substance use in mainland China in 2021, which was included in the Global Burden of Disease (GBD) database, to analyse the burden of disease caused by the above diseases in the general population and the regional differences

Methods We selected data from 33 provinces in China from the burden of disease data collected by the Chinese Centre for Disease Control. The main diseases studied included neurological disorders: including Parkinson's disease and Alzheimer's disease, among others, mood disorders, mainly substance use disorders, and injuries, mainly unintentional injuries and suicidal self-inflicted injuries. The study used the Disability Adjusted Life Year (DALY) indicator to describe the severity of the burden of disease

Results Tobacco-induced DALYs include neurological disorders (288,089.33 person-years), traffic injuries (245,819.49 person-years), unintentional injuries (314,617.41 person-years), and self-inflicted injuries and interpersonal violence (4334.25 person-years). Alcohol-induced DALYs include neurological disorders (132,975.48 person-years), substance use disorders (2674,872.7 person-years) suicide and interpersonal violence (463,859.86 person-years). DALYs due to drug use include substance use disorders (1660891.34 person-years) suicide and interpersonal violence (42546.06 person-years). As a result of the enactment of anti-drug laws and regulations restricting the intake of tobacco and alcohol, among others, the burden of disease caused by these substances declined rapidly from 2000 to 2021. As a result of the enactment of anti-drug laws and regulations restricting the intake of tobacco and alcohol, among others, the burden of disease caused by these substances declined rapidly from 2000 to 2021. The DALY for traffic injuries due to smoking has declined by 35.6 %, and the DALY for substance use disorders

due to drugs has declined by 58.7%

Conclusion Tobacco, alcohol and drug use continue to cause a relatively serious burden of disease in mainland China. Of these, tobacco is a major controllable risk factor for a wide range of diseases and requires stronger means of control

Differences in Dynamic Brain Functional Network Characteristics of Non-Suicidal Self-Injurious Behavior and Suicidal Ideation in First Episode Depression

Shixuan Feng, Fengchun Wu, Yuanyuan Huang, Chenyu Liu

广州医科大学附属脑科医院

Objective Non-suicidal self-injury (NSSI) behavior and suicidal ideation (SI) are severe comorbid behaviors of depression, increasing the risk of suicide and affecting disease prognosis. Currently, the pathological mechanisms of both are unclear, and few studies have compared them within the same cohort. Using dynamic connectivity and graph theory methods can effectively quantify brain network characteristics

Methods This study included 71 first-episode depression patients divided into three groups: NSSI, SI, and Non (neither NSSI nor SI). Demographic data, Hamilton Depression Rating Scale-17 items (HAM-D-17), Young Mania Rating Scale (YMRS), Beck Scale for Suicide Ideation (BSI), and NSSI behavior assessment questionnaires were collected. Resting-state fMRI data were acquired, and dynamic functional networks were constructed based on the Brainnetome Atlas 246 (BNA246) and dynamic sliding window method. K-means clustering analysis was used to obtain various connectivity patterns and dynamic characteristics. Graph theory was employed to calculate the variability of topological properties, including small-world properties, global efficiency, assortativity, synchrony, hierarchy, degree centrality (DC), nodal efficiency (NE), betweenness centrality (BC), and nodal local efficiency (NLE). Subsequently, the connectivity patterns, dynamic characteristics, and variability of topological properties among the three groups were compared. Finally, partial correlation analysis was performed between dynamic brain functional network indicators and clinical characteristics

Results (1) The SI group more frequently exhibited the "DMN-VAN strong connectivity" state, which correlated with the severity of SI, suggesting that this state may be a characteristic connectivity pattern of first-episode depression with SI. (2) The variability in functional connectivity between the left superior frontal gyrus (SFG) and the right lateral orbital gyrus (LOG) differed between the NSSI and SI groups, correlating with the severity of SI. This may indicate a key neural circuit differentiating NSSI and SI in depression. (3) The brain dynamic functional network of depression with SI showed "low assortativity variability," indicating poorer resilience of the functional network in depression with SI

Conclusion This study explores the dynamic functional connectivity patterns and differences in dynamic topological properties of brain networks in first-episode depression with NSSI and SI based on rs-fMRI. It provides a theoretical basis for the early prediction and intervention of suicidal behaviors in depression

Effect of MiR-218 Polygenic Risk on Cognition and Its Relation To Neurometabolism in Patients with Major Depressive Disorder

Dong Huang, Shuming Zhong, Shunkai Lai, Yiliang Zhang, Rongxu Zhang, Yanbin Jia

Jinan University First Affiliated Hospital

Objective Cognitive dysfunction is a core symptom of major depressive disorder (MDD) with an unclear pathogenesis. This study investigates the role of microRNA-218 (miR-218) in cognitive impairment in MDD and its relationship with neurobiochemical metabolism

Methods A total of 104 patients with MDD and 59 healthy controls (HCs) were recruited for this cross-

sectional study. All subjects were aged 18-55 years. Patients with MDD were in a major depressive episode with a score ≥ 20 on the 24-item Hamilton Depression Rating Scale (HDRS-24). Peripheral blood samples were collected from all subjects for miR-218 testing and then the miR-218 polygenic risk score (miR-218 PRS) was calculated. Proton magnetic resonance spectroscopy (1H-MRS) was also used to obtain ratios of N-acetylaspartate (NAA) /creatine (Cr) and choline (Cho) /Cr ratios in the prefrontal cortex (PFC), anterior cingulate cortex (ACC), putamen, thalamus and cerebellum. Cognitive function was assessed using the Chinese version of the Measurement and Treatment Research to Improve Cognition in Schizophrenia (MATRICS) Consensus Cognitive Battery (MCCB). The miR-218 PRS were classified into quartiles based on their quartile values (Q1: < 25 th percentile, Q2: ≥ 25 th to 50th percentile, Q3: ≥ 50 th to 75th percentile, Q4: ≥ 75 th percentile). Then, we assessed the association between miR-218 PRS and cognition using univariate and multivariate logistic regression: Crude Model was adjusted for none covariate; Model 1 was adjusted for age, sex, and education; Model 2 was adjusted for age, sex, education, number of episodes, current duration, total duration, and HDRS-24 score. The variance inflation factors (VIF) were used to quantify multicollinearity between variables (VIF >10 indicated excessive correlation)

Results After controlling for age, sex and education, MDD patients had lower scores on the MCCB composite and its seven cognitive domains (all $p<0.05$) and miR-218 PRS ($F=49.762$, $p<0.001$) compared to HCs. In MDD, miR-218 PRS was negatively associated with speed of processing (SOP), attention/vigilance (ATT) and composite (COS) in Q1 compared to Q4 in all three models (all $p<0.05$), the same association was also observed with ATT in Q3 compared to Q4 in all three models (all $p<0.05$). However, other cognitive domains of the MCCB were not associated with miR-218 PRS (all $p>0.05$). In MDD patients with miR-218 PRS in Q1, both SOP ($r=0.495$, $p=0.010$) and COS ($r=0.419$, $p=0.033$) were positively related to left ACC Cho/Cr, with no other relationships found regarding cognition and neurobiochemical metabolism. In contrast, there was no association of cognition with neurometabolism

in MDD patients with miR-218 PRS during Q2 to Q4 (all $p>0.05$)

Conclusion Patients with MDD tend to be impaired in cognition, as well as having reduced miR-218 PRS. Metabolites in the left ACC may be involved in the effect of low miR-218 PRS on cognitive deficits in MDD patients

关键词: cognition, depression, microRNA, neurometabolism, polygenic risk

网络游戏成瘾严重程度及渴求相关脑电预测模型

宋奕璇^{1,2} 黄宇辰^{1,2} 孙艳^{1,2}

1.北京大学中国药物依赖性研究所

2.北京大学医学部基础医学院

目的 网络游戏成瘾 (IGD) 是青少年主要的精神心理疾病, 患病率逐年上升, 相关神经机制还未明确, 缺乏有效神经标志物和特异性干预方法。本研究通过分析游戏线索下网络游戏成瘾者的脑电活动, 明确能够预测成瘾严重程度以及渴求的脑电指标并构建机器学习模型, 并比较 IGD 与物质成瘾的共特异脑电指标。

方法 纳入网络游戏成瘾者 (IGD, $n=25$)、娱乐性使用者 (RGU, $n=22$)、健康对照 (HC, $n=28$) 以及海洛因成瘾者 (HUD, $n=27$), 采集成瘾相关线索暴露任务下的脑电, 用 DSM-5 和 IGDS9-SF 评估严重程度, QGU-B 量表进行渴求, 半年后进行随访。使用 32 导脑电设备, 在 MATLAB 中预处理并提取事件相关电位和时频指标。通过与健康对照组和物质成瘾组对比明确 IGD 特征性脑电指标, 构建识别 IGD 严重状态和预测渴求程度的机器学习模型, 采用留一交叉验证法, 应用支持向量机算法并进行超参数寻优。

结果 IGD 组每天游戏时间、渴求评分及成瘾严重程度均显著高于 RGU 和 HC 组。游戏线索反映任务中, 积极游戏线索能够显著增加 IGD 的渴求。在积极游戏线索呈现时, 顶枕叶区 P300 成分在三组之间存在显著差异, IGD 组的平均振幅高于另外两组。应用支持向量机模型发现 P300 成分 delta 频段区分 IGD 成瘾严重程度的准确性最高 (IGD vs HC

准确率 86.8%；RGU vs HC 准确率 70.2%）。经过多重校正分析发现 POz 电极点的 delta 频段与 IGD 组渴求程度显著正相关。此外，在奖赏游戏线索下前额和中央区的 N400 成分在三组间存在显著差异，IGD 组的 N400 成分（CP2 电极）的平均振幅与半年后的渴求呈显著负相关，进一步发现 N400 成分中 alpha 频段是与半年后渴求相关的关键频谱。将显著关联指标放入弹性网络模型，结果显示模型预测的渴求评分与实际评分显著正相关。在与 HUD 的比较中发现，两组在相应成瘾线索诱发条件下顶叶和枕叶区域均存在 P300 脑电成分，IGD 特异性脑电指标为前额和中央区的 N400 成分，海洛因成瘾的特异性脑电指标为中央区及顶叶的晚期 LPP 成分。

结论 游戏线索任务中脑电 P300 成分的 delta 频段能量能够有效识别网络游戏成瘾严重程度以及即时游戏渴求程度，而 N400 成分的 alpha 频段能够有效预测半年后的游戏渴求程度。N400 成分是网络游戏成瘾区别于海洛因成瘾的特异性脑电特征。

慢波睡眠中暴露游戏声音线索对网络游戏成瘾的干预研究

杨小琴 宋奕璇 刘玉玥 黄宇辰 孙艳* 时杰*

北京大学中国药物依赖性研究所

目的 网络游戏成瘾(IGD)是以持续、无节制的参与游戏活动为特征，从而导致严重的心理问题和社会功能障碍的一类行为成瘾所致障碍。目前网络游戏成瘾仍缺乏有效的治疗方法。线索暴露疗法是通过干预成瘾记忆再巩固的行为学治疗方法。已有研究提示，睡眠状态下（特别是慢波睡眠期）可以接受声音线索刺激，并对记忆和认知功能产生显著影响。本研究拟探索慢波睡眠中暴露游戏相关声音线索来干预游戏渴求的有效性，且与清醒状态中的线索暴露疗法进行比较，并进一步探索慢波睡眠状态下游戏声音线索暴露治疗的脑电机制。

方法 采用 RCT 设计，将符合 DSM-5 的网络游戏成瘾者随机分成 4 组，第 1 组为睡眠干预组（SIG），通过闭环操控设备（Digitimer 360）在慢波睡眠中的 up-state 阶段暴露游戏相关的声音线索（大

约播放 300 次，声强约 45dB，持续时间约 1s，间隔约 7s）。第 2 组为睡眠对照组（SCG），采用相同的方法暴露游戏无关的声音线索。睡眠组的所有被试均佩戴脑电帽进行两晚的试验干预。另外 2 组分别为清醒干预组（AIG）和清醒对照组（ACG）。所有清醒组的被试连续 2 天在清醒条件下进行线索暴露干预。其中清醒干预组暴露与睡眠干预组一样的游戏相关声音 300 次，暴露时长约 50 分钟。清醒对照组则暴露与睡眠对照组一样的游戏无关声音。四组被试均在干预前（基线）测量游戏渴求量表、采集人口学资料和量表信息，并在干预后以及第一周、二周、三周、一个月后测量游戏渴求问卷。

结果 1) 在经过两晚的干预后，与基线相比，睡眠干预组在干预后、一周后、二周后、三周后、一个月后的游戏渴求程度显著降低，且显著低于睡眠对照组。清醒干预组的渴求虽然在干预后有下降的趋势，但是在干预一周后、二周后、三周后、一个月后的游戏渴求程度持续回升。2) 通过对睡眠中声音线索诱发的脑电时频成分进行分析，发现睡眠干预组由声音诱发的低频能量和早期 spindle 波的能量显著高于睡眠对照组。并且早期低频能量及 spindle 波能量与干预 3 周和 4 周后游戏渴求降低呈显著负相关，而线索暴露后晚期 spindle 波能量与干预后及 1 周后游戏渴求的降低呈显著正相关。

结论 本研究发现睡眠中慢波的 UP-state 状态下暴露游戏相关的声音线索可以有效降低网络游戏成瘾者的渴求，且存在长期效应。这种渴求的降低与睡眠中游戏声音线索引起大脑低频能量和 spindle 波能量的变化有关。

3.Peking University Sixth Hospital

Objective To understand the prevalence and burden of depressive and anxiety disorders, and to develop effective interventions to improve the burden of major mental disorders

Methods Using data from the 2021 Global Burden of Disease Study, Data on prevalence, disability-adjusted life years (DALYs), and years of living with disabilities (YLDs) of depressive disorders and anxiety disorders were collected from 204 countries and territories between 1990 and 2021. Incidence per 100,000 people, percentage change from 1990 to 2021, 95% uncertainty interval (UIs), and correlation with socio-demographic index (SDI) were estimated

Results In 2021, there were an estimated 332.4(95% UI 297.7-376.1) million prevalent cases of depressive disorders and 338.2(95% UI) 307.2-420.0) million prevalent cases of anxiety disorders, accounting for 9.1% of all cases. DALY in depressive disorders (56.3million, 36.2%) and anxiety disorders (42.5million, 27.4%) accounted for 63.6% of mental disorders. Depressive and anxiety disorders are consistently the top two causes of the prevalence and DALY age-standardized rate of mental disorders. In the period 1990-2021, the prevalence age-standardized rate of depressive disorders increased from 3.6% in 1990 to 4.0% in 2021, and anxiety disorders increased from 3.7% in 1990 to 4.4% in 2021. In 2021, 66.9% of the global depressive disorders and 65.2% of anxiety disorders cases from

low-SDI and middle-SDI countries. Globally, 67.2% of depressive disorders and 65.5% of anxiety disorders DALYs are from low-SDI and middle-SDI countries. In global countries, the prevalent age standardized rate of COVID-19 is positively correlated with depressive disorders ($r=0.137$, $p<0.001$) and anxiety disorders ($r=0.085$, $p<0.001$), and the DALY age standardized rate of COVID-19 is also positively correlated with depressive disorders ($r=0.150$, $p<0.001$) and anxiety disorders ($r=0.070$, $p<0.001$) under considering time changes. Female have higher depressive and anxiety disorders burden than male. The cases of depressive and anxiety disorders in 5-24 years old accounted for 6.8% of all disease cases, and young adults accounted for 10.1% of all disease cases

Conclusion Depressive and anxiety disorders are the leading cause of all mental disorders worldwide, especially after the COVID-19. With the increasing influence of age on the population, future policies should strengthen the prevention and care services for depressive and anxiety disorders, adopt a mental health promotion approach, and implement effective interventions targeting the determinants of poor mental health

关键词: Depressive disorders; anxiety disorders; mental disorders; prevalence; burden

农村初级卫生专业人员对精神疾病相关病耻感及其影响因素研究

杨轶越 王聪 慕云菲 蔡佳 周烈 冉茂盛*
四川大学华西医院心理卫生中心

目的 在中国农村, 初级卫生专业人员是社区精神卫生服务的重要力量。由于种种原因导致他们对于精神疾病相关的病耻感尤为突出, 这会影响到他们对精神疾病患者及家属的服务态度和服务质量, 不利于患者的治疗和康复。至今, 相对缺乏对该群体精神疾病相关病耻感及其影响因素的研究。本研究旨在探讨农村初级卫生专业人员精神疾病相关病耻感及其影响因素, 以期提高农村社区精神卫生服务水平。

方法 本研究于2023年11月到12月对中国四

四川省成都市新津区 10 所社区服务中心 256 名初级卫生专业人员（包括医生、护士及医技人员）进行调查，最终获得 247 份有效数据。使用一般情况调查量表、精神疾病态度量表(MICA)、精神卫生知识量表(MAKS)、报告和预期行为量表(RIB)、社交距离量表(SDS)、接触数量量表(CQTS)、接触质量量表(CQLS)、患者健康问卷(PHQ-9)和广泛性焦虑自评量表(GAD-7)来评估参与者的社会人口学特征和病耻感相关的心理学特征。采用 T 检验和单因素方差分析来检验病耻感是否因参与者的社会人口学特征而不同。对相关因素进行了相关性分析。最后，以病耻感为因变量，其他相关因素为自变量，进行了多元线性回归分析。

结果 研究结果显示初级卫生专业人员的 MICA 平均分为 50.68 ± 8.084 ；40-65 岁组的 MICA 明显高于 18-39 岁组 ($p < 0.001$)，工作年限 ≥ 15 年组的 MICA 明显高于 < 15 年组 ($p = 0.001$)，已婚组的 MICA 明显高于未婚组 ($p = 0.041$)；相关性分析结果显示 MICA 与年龄 ($\beta = 0.292$, $p < 0.01$)、工作时长 ($\beta = 0.0287$, $p < 0.01$)、SDS ($\beta = 0.433$, $p < 0.01$) 呈现正向相关性，与 MAKs ($\beta = -0.210$, $p < 0.01$)、RIBS ($\beta = -0.400$, $p < 0.01$)、和 CQLS ($\beta = -0.351$, $p < 0.01$) 呈现负向相关性；多元线性回归分析结果显示自变量 RIBS、CQLS、SDS 均对 MICA 有显著影响，其中 RIBS ($\beta = -0.162$, $p = 0.018$) 和 CQLS ($\beta = -0.128$, $p = 0.045$) 对 MICA 呈负向影响，SDS ($\beta = 0.246$, $p < 0.001$) 对 MICA 呈正向影响。

结论 我国农村初级卫生专业人员对精神疾病相关的病耻感较重，影响因素包括对精神疾病患者的行为歧视、与患者的社交距离、和接触质量。为减少初级卫生专业人员精神疾病相关病耻感，应综合考虑我国的社会文化、加强精神卫生知识的培训、提升精神卫生专业水平、建立健全社区精神卫生服务体系等措施，以期提高农村社区精神卫生服务的整体质量，促进精神疾病患者的社区精神卫生服务和康复。

以学校为基础的中学生危机干预的有效性评估

钱雨欣¹ 杭跃跃² 韩璐² 柯晓燕¹ 焦公凯¹

1.南京医科大学附属脑科医院

2.南京市雨花台区赛虹桥社区卫生服务中心

目的 自杀是危害青少年身心健康的危险行为，以学校为基础的自杀预防计划是解决这一问题的关键工具。本研究旨在评估以学校为基础的危机干预——“医教协同”项目的有效性。

方法 “医教协同”项目主要包括筛查、分级管理、教师培训和双向转诊等。“医教协同”项目组自主编写了《危机学生风险管控操作手册》。筛查分为三级，第一级初筛为全体学生问卷筛查，第二级为心理老师针对初筛阳性的学生进行访谈，在访谈中会询问学生的自杀企图、自杀意念和自杀计划，第三级为必要时由医方对学生进行访谈。根据筛查中自杀风险进行危机等级分级，共分为 4 级，校方根据危机等级对学生进行不同的风险管控，同时建议具有自杀风险的学生转介至南京市雨花台区赛虹桥社区卫生服务中心进行危机干预咨询。危机干预咨询每周进行 1 次，每次约 1 小时，重点在于提供心理支持，减轻负面情绪，并制定计划。赛虹桥社区卫生服务中心定期开展针对全区心理老师的系列培训，如进行培训讲座、开展角色扮演课程、提供日常工作督导和发放《危机学生风险管控操作手册》等。此外，南京医科大学附属脑科医院开通了与赛虹桥社区卫生服务中心的双向转诊通道，并定期组织医方和校方开展相关培训和督导。在南京市雨花台区中随机选择 6 所初中的全体初一年级学生及其家长和教师进行相关内容评估。

结果 共有 858 名初一学生、2192 名学生家长和 48 名教师参与本研究。抑郁情绪的初筛阳性率为 11.31%，焦虑情绪的初筛阳性率为 14.80%。共有 86 名学生转介至南京市雨花台区赛虹桥社区卫生服务中心，接受危机干预的原因主要是学习压力、人际关系和亲子关系等，危机干预后学生的抑郁情绪、焦虑情绪、自杀行为、自杀意念和自杀计划较前明显减轻 ($t = 2.828 \sim 6.000$, $P < 0.05$)。在进行“医教协同”干预后，学生的一般自我效能感较前提高 ($t = 2.459$, $P < 0.05$)，学生对于“医教协同”项目的知晓率、认可度和寻求帮助意图较前增加 ($\chi^2 = 10.639 \sim 57.629$, $P < 0.001$)。教师对于帮助学生的信心和效能较前增加 ($t = -3.207 \sim -4.382$, $P < 0.01$)，教师对于青少年情绪问题相关知识的了解程度较前加强 ($t = -3.411$, $P < 0.01$)，但学生和教师对于青少年

年情绪问题相关知识的了解程度并无显著差异 ($P > 0.05$)。

结论 “医教协同”项目在减轻学生自杀风险、增强学生的自我效能和求助意识、增加教师关于青少年情绪问题相关知识的了解以及强化教师对于帮助学生的技能和信心等方面均具有显著作用,并打通了青少年就诊通道,能够有效预防青少年自杀。

- 6.北京大学精神卫生研究所北京大学第六医院

目的 对阈下抑郁大学生进行光照干预,评估光照疗法对其抑郁、焦虑、失眠症状的干预效果,同时探索不同光照强度的疗效差异,并比较其面部微表情特征变化。

方法 于2021年9月13日至2022年1月4日在武汉某高校招募符合阈下抑郁标准的大学生,随机分为亮光干预组、暗光干预组和等待对照组。亮光、暗光干预组光照强度分别为10000Lux和200Lux,受试者每天接受30分钟光照干预,持续2周,等待对照组不进行任何干预。在基线和第2周试验结束时,使用PHQ-9、BDI-II、GAD-7、ISI和PSQI评估受试者情况。PHQ-9得分用于衡量光疗有效率和缓解率,干预后减分率达到50%为有效,得分低于5分为缓解。通过Logistic回归分析比较各组有效率和缓解率差异。同时,受试者在基线和试验结束时接受正性、中性及负性视频刺激,获取面部运动单元AU并提取运动历史直方图MHH特征。采用重复测量方差分析比较三组干预前后各指标差异。

结果 共纳入135名受试者,随机分为亮光干预组54人、暗光干预组54人、等待对照组27人,

其中亮光干预组和暗光干预组分别有6和8人退出,共121人完成试验。结果显示,BDI-II及PSQI得分的时间主效应($F(1,118)=55.903, P < 0.001; F(1,118)=50.122, P < 0.001$)及时间 \times 组别交互效应($F(2,118)=4.083, P = 0.019; F(2,118)=9.271, P < 0.001$)有统计学意义。两两比较得出,亮光干预组与暗光干预组的BDI-II和PSQI得分在干预后显著低于基线($P < 0.001$),等待对照组无显著差异。三组ISI和GAD-7得分在试验后相对基线均显著降低,无组间差异。亮光干预组、暗光干预组和等待对照组的有效率分别为33.0%、37.0%、11.1%,亮光干预组($OR, 4.50; 95\%CI, 1.11-18.27; P = 0.035$)与暗光干预组($OR, 4.17; 95\%CI, 1.04-16.79; P = 0.045$)的有效率均高于等待对照组;缓解率分别为43.8%、45.7%、29.6%,三组无显著差异。表情方面,暗光干预组干预后AU14(收紧嘴角,提示恶心、高兴、伤心)特征值在正性、负性刺激下较基线显著上升,AU26(嘴巴小张口,提示惊讶、高兴)特征值在负性刺激下较基线显著上升;亮光干预组的AU20(嘴唇侧向拉伸,提示恐惧)特征值在负性刺激下较基线显著下降($P < 0.001$)。

结论 光照干预能有效改善阈下抑郁受试者的抑郁症状与睡眠质量。通过分析试验前后AU14、AU20和AU26特征值,可辅证光疗能改善被试的抑郁情况。

大学生脑健康队列建设概况

张智博¹ 鲍彦平² 陆林^{1,2}

- 1.北医六院
- 2.北京大学中国药物依赖性研究所

目的 1.使用多模态数据描绘大学生精神心理疾病的特征 2.大学生心理健康问题的脑-肠轴机制探索 3.基因型在脑-肠轴中发挥的潜在作用以及基因-环境(暴露)交互作用

方法 对山东第一医科大学和华北理工大学2023级大一新生进行为期四年的调查。收集受试者基本情况、行为习惯、精神心理、认知评估多方面问卷信息,以及血液、脑电、核磁、近红外、体动记录

仪、肠道菌群、体成分等多模态数据,辅以专业的精神科诊断,形成多模态互联,以脑影像和肠道菌群为特色的大学生脑健康队列研究。

结果 山东第一医科大学分中心共收集问卷4930份,应答率为94.7%。抑郁症状检出率为9.6%,焦虑症状检出率为6%。在失眠、焦虑、抑郁及自杀中,任意一种症状严重程度达到中度及以上(有过自杀行为均视为中度及以上)的学生703人,任意一种症状达到阈下/轻度的学生为1578人;26.3%的学生睡眠存在不同程度的失眠问题;过去一年有4.46%的学生至少发生过一次非自杀性自伤,过去一年至少发生五次以上NSSI行为的比例达到1.13%;3.5%的学生存在睡眠-觉醒时相延迟症状,当去除社会工作因素对睡眠的影响后,3265人中有389人(11.9%)存在睡眠-觉醒时相延迟。

结论 大学生心理精神问题以情绪症状为主,睡眠、非自杀性自伤等问题发生率不容忽视,亟需采用多模态数据对大学生心理精神问题进行监测、干预和管理

甲基苯丙胺成瘾者线索反应性及抑制控制的闭环经颅交流电刺激研究

郭垒 丁悦 陈天真 江海峰 苏杭 赵敏
上海交通大学医学院附属精神卫生中心

目的 甲基苯丙胺(Methamphetamine, MA)成瘾是严重的社会公共卫生问题。甲基苯丙胺成瘾者在面对与成瘾相关的线索时会出现强烈的渴求和生理反应,这被称为线索反应性。线索反应性是成瘾发展和维持的关键因素,传统的药物和物理干预手段存在一定局限性。闭环物理干预是一种根据大脑状态实时调整刺激参数的新型干预方法,具有提高干预精确性和效率的潜力。基于tACS的闭环物理干预有望成为治疗甲基苯丙胺成瘾的新方法,但仍需进一步研究。

方法 本研究旨在探讨闭环经颅交流电刺激(tACS)对重度甲基苯丙胺(MA)成瘾者线索反应性的影响。研究步骤如下:首先对重度MA成瘾者进行筛查评估,然后使用线索诱发任务结合EEG数据采集确认线索反应性神经特征,之后构建闭环tACS干预系统,并通过比较不同刺激频率(6 Hz、10 Hz、40 Hz)下的干预效果确定最佳刺激频率,最后将最佳频率闭环tACS干预与随机刺激和连续刺激进行比较,验证其效应特异性和优劣性。主要结局指标包括抑制控制能力(SSRT)、线索反应性和静息态EEG功能连接。

结果 选取了符合标准的34名MA成瘾者。通过对这些成瘾者进行线索诱发任务的EEG信号分析发现,在面对毒品刺激时,重度MA成瘾者在特定电极上出现了Theta频段(3~8 Hz)显著升高的能量。基于这一特征,建立了闭环tACS干预系统。经过对不同频率(6 Hz、10 Hz、40 Hz)的干预进行比较,发现只有40 Hz的闭环tACS刺激能够显著降低对毒品线索的神经反应性($t = -3.620, P = 0.007$),同时提高抑制控制功能($t = -2.688, P = 0.031$),因此确定40 Hz为最佳刺激频率。进一步比较了40 Hz闭环tACS刺激与随机刺激、连续刺激的效果,结果显示40 Hz闭环tACS刺激在降低毒品线索的神经反应性和提高抑制控制能力方面表现出显著效果。

结论 本研究对重度MA成瘾者进行了线索反

应性神经特征研究,并构建了闭环 tACS 干预系统进行干预。结果发现,重度 MA 成瘾者对毒品线索具有异常的神经反应特征,表现为顶枕叶 theta 频段活动增强。闭环 tACS 干预能够有效降低 MA 成瘾者的线索反应性,同时提高其抑制控制功能。40Hz 的闭环 tACS 干预比随机刺激和连续刺激更有效,说明闭环干预方式更加高效和精准。该研究提示了闭环 tACS 干预是一种有效且高效的干预方法,能够改善重度 MA 成瘾者的线索反应性和抑制控制功能,为 MA 成瘾的精准干预提供了新的思路和方法。

Predicting Drug Craving Among Ketamine-Dependent Users Through Machine Learning Based on Brain Structural Measures

Yunkai Sun, Yanhui Liao

1. Department of Psychiatry, Sir Run Run Shaw Hospital, Zhejiang University School of Medicine, Hangzhou, Zhejiang, P. R. China

Objective Craving is a core factor driving drug-seeking and -taking, representing a significant risk factor for relapse. This study aims to identify neuroanatomical biomarkers for quantifying and predicting craving

Methods The study enrolled 94 ketamine-dependent users and 103 healthy controls (HC). Utilizing support vector regression (SVR) with 10-fold cross-validated framework, we developed a neuroanatomical craving model based on measures of regional cortical thickness (CT), surface area (SA), and subcortical volume (SV) derived from T1 images. The generalizability of neuroanatomical craving model was examined in an independent set. Spatial correlation analysis was employed to assess the relationship between the regional contribution to craving and density maps of receptors/transporters from previous molecular imaging studies

Results The neuroanatomical craving model identified neuroanatomical biomarkers that predicted self-report craving ($r = 0.635$). The most importance of predictors of craving included the SA of the left medial

orbitofrontal cortex and the left supramarginal gyrus, CT in the left caudal anterior cingulate, the left cuneus, the right lateral occipital cortex and the right lingual gyrus, as well as the left amygdala GMV. Importantly, these predictors were generalized to an independent sample. Moreover, nodal contribution to predicted craving scores were associated with DA2, 5-HT_a, 5-HT_b receptor and serotonin reuptake transporter densities

Conclusion The results offer a key perspective on craving prediction among ketamine-dependent users, and identify neuroanatomical areas associated with craving in the frontal and parietal regions. Additionally, the underlying neuroanatomical structures involved in the craving process may be linked to the dopaminergic and serotonergic systems

Unraveling The Gut-Brain Axis: Mendelian Randomization Reveals Causal Links Between Specific Gut Microbiota and Alcohol Use Disorder

Xiaopeng Wu, Bo Wei, Jianwen Xiong, Zhongmeng Guo

Department of Psychiatry, Jiangxi Mental Hospital

Alcohol use disorder (AUD) is a prevalent condition associated with significant health implications. While genetic, neurobiological, and environmental factors contribute to AUD, the role of gut microbiota remains unclear. The purpose of this study was to utilize Mendelian randomization (MR) to investigate potential causal associations between gut microbiota and AUD.

A two-sample MR design was employed, using genetic variants associated with gut microbiota and AUD from Genome-Wide Association Studies (GWAS). The primary analysis used the inverse-variance weighted (IVW) approach, with sensitivity analyses, including MR-Egger, weighted median, and MR Pleiotropy Residual Sum and Outlier (PRESSO). Genetic data on gut

microbiota were sourced from the MiBioGen consortium's meta-analysis involving 24 cohorts and 18,340 individuals. AUD GWAS summary data came from the FinnGen study, including 15,715 cases and 361,562 controls. Instrumental variables underwent quality control, and analyses employed the IVW approach and several sensitivity analyses.

The MR analysis revealed a positive causal association between the Genus *Bifidobacterium* and AUD (OR 1.10, 95% CI: 1.01-1.19; p-value = 0.030). The Genus *Hungatella* exhibited a potential positive causal effect on AUD risk (OR 1.11, 95% CI: 1.01-1.23; p-value = 0.039). Conversely, the Genus *Butyrivibrio* showed a potential protective effect against AUD (OR 0.95, 95% CI: 0.90-1.00; p-value = 0.036), as did the Genus *Olsenella* (OR 0.90, 95% CI: 0.83-0.98; p-value = 0.011). Unlike *Bifidobacterium*, not all sensitivity analyses supported the other findings.

This MR analysis unveils novel insights into the intricate relationship between gut microbiota and AUD. Positive associations of the Genus *Bifidobacterium* and the Genus *Hungatella*, along with potential protective effects of the Genus *Butyrivibrio* and *Olsenella*, highlight the significance of gut microbiota in AUD pathogenesis. Our study lays the foundation for future research and potential therapeutic interventions in understanding and managing AUD.

The Mediating Role of Social Connectedness and Negative Cognitive Emotion Regulation in Association of Problematic Internet Use and Depression Among Adolescents

Jiaqi Xu², Jing Li², Jiajun Xu², Xiacan Chen^{1,3}

1. Sichuan University

2. Mental Health Center, West China Hospital

3. Institute of Forensic Medicine, West China School of Basic Medical Sciences and Forensic Medicine, Sichuan University

Objective While the relationship between adolescent problematic internet use (PIU) and depression has been extensively researched, few studies have investigated the role and mechanisms of social connectedness in this context

Methods This study aimed to investigate the mediating effect of social connectedness (SC) and cognitive emotion regulation, in the relationship between PIU and depression. We conducted a cross-sectional study among 9,407 adolescents aged 12-18 years in China from September 2022 to March 2023. We employed Young's 20-item internet addiction test (IAT-20), Social Connectedness Scale-Revised (SCS-R), Cognitive Emotion Regulation Scale (CER), and DSM5-level 2 Depression Scale to collect mental health outcomes. Logistic regression was performed to examine the independent association between measured variables and depression. Mediation analysis was performed to estimate the mediating role of social connectedness and cognitive emotion regulation, in the relationship between PIU and depression

Results We found the rate of PIU was 21.8%. The offline SC (indirect effect: 0.112, 95% CI: 0.104-0.121) and nCER (indirect effect: 0.140, 95% CI: 0.129-0.152) mainly played parallel mediating role in the relation between PIU and depression, as well as on_SC (indirect effect: 0.007, 95% CI: 0.005-0.010)

Conclusion Our study represents the pioneering investigation into the potential mediating role of social connectedness and cognitive emotion regulation strategies, unveiling an important mechanism for explaining why adolescents suffered from problematic internet use got higher risk at depressive symptoms. Targeted interventions and strategies in clinical practice, aiming at enhancing offline social connectedness of adolescents and promoting the adoption of positive coping strategies towards stressors, could help improve the comprehensive mental well-being of adolescents in clinical practice

应激-消退行为范式对可卡因成瘾消退学习的影响及其机制

李雪² 陆唐胜¹ 薛言学¹

1.北京大学

2.北京大学医学部

目的 药物成瘾是一种慢性易复发的脑疾病。成瘾性物质可以使奖赏、动机、记忆相关大脑环路发生改变,进而影响机体健康水平。药物成瘾包括不同的阶段,从娱乐性使用发展到强迫性使用药物,最后进入戒断与复吸的循环阶段。成瘾复吸行为指在戒除成瘾行为后,个体重新陷入原有的成瘾行为之中,这种复吸行为是动态且持续的,可以发生在治疗过程中的任何阶段。对于这种慢性复发性脑疾病,临床上常采用记忆消退原理抑制成瘾记忆,但疗效有限,且针对如何增强成瘾消退记忆的研究尚不充分。但已有研究表明应激能够潜在地影响与记忆功能有关的所有认知阶段,如记忆存储、提取或/和巩固的过程。在消退学习前给予应激不仅会加强恐惧消退记忆的巩固,而且还会减少消退效果对环境的依赖。因此本研究旨在明确应激对可卡因成瘾消退学习的影响,并探究该过程中的神经生物学机制。

方法 本研究采用大鼠可卡因自身给药训练作为成瘾记忆动物模型,建立应激-消退训练行为范式,结合免疫荧光、脑片膜片钳和化学遗传等技术探索应激-消退训练范式对可卡因成瘾消退学习的影响及其潜在神经机制。

结果 (1)可卡因自身给药训练后的消退训练和复吸测试的行为学结果表明,应激后进行消退训练(应激-消退范式)能够加快觅药行为的消退,从而抑制小剂量药物诱导的复吸,且应激-消退范式并不增加焦虑样行为;(2)免疫荧光结果显示,与消退组相比,应激-消退组的外侧缰核(Lateral habenula, LHb)脑区 c-Fos 蛋白表达水平显著增加,其中大部分为兴奋性神经元,说明应激-消退范式可增加 LHb 脑区的活性;(3)化学遗传学激活 LHb 神经元后进行消退训练能够模拟应激-消退范式的作用,即加速消退训练,抑制小剂量药物诱导的复吸行为;(4)在应激前给予化学遗传学抑制 LHb 神经元能够逆转应激-消退范式对消退学习及对可卡因复吸行为的作用,以及逆转应激-消退范式对 LHb 脑区神经元兴奋性的影响;(5) LHb 与吻内侧被盖核(Rostromedial

tegmental nucleus, RMTg)之间存在投射关系,化学遗传学激活 LHb-RMTg 环路能够促进消退学习,抑制可卡因复吸行为的发生。

结论 本研究表明,应激-消退行为范式通过 LHb-RMTg 环路的活动促进成瘾记忆的消退,从而抑制可卡因复吸行为的发生。

关键词: 应激,成瘾,消退,复吸,记忆

Alteration in Brain Gray Matter Volume and Relationship with Motor Impulsivity and Drug Use Characteristics Among Abstinent Patients with Methamphetamine Use Disorder

Dan Luo, Danlin Shen, Mingfeng Lai, Huiting Luo, Jiayi Zhang, Qiao Tang, Chen Chen, Jiajun Xu, Jing Li
West China Hospital of Sichuan University

Objective Methamphetamine is a highly addictive psychostimulant drug globally abused, resulting in a serious worldwide health problem. However, the neurobiological basis of METH addiction remains poorly understood. Therefore, this study aimed to use magnetic resonance imaging (MRI) to investigate changes in brain structure and their connection to impulsivity and drug use parameters in abstinent individuals with METH use disorder (MUDs)

Methods A total of 91 MUDs and 51 age- and gender-matched healthy controls (HCs) underwent T1-weighted imaging scans, and completed impulsivity and drug use characteristics measurements. We applied voxel-based morphometry (VBM) to investigate changes in the gray matter volume (GMV) of the whole brain. After controlling for age, educational level, smoking and drinking status, partial analyses and mediation analyses were respectively used to explore the relation between brain regions with altered gray matter volume, impulsivity, and drug use parameters

Results Compared with HCs, MUDs showed reduced GMV in the left thalamus ($p < 0.0001$, FWE corrected, voxel size = 1771). In addition, after controlling for age, educational level, current smoking and ever

drinking status, results of partial correlation analysis showed that GMV of thalamus was significantly associated with motor impulsivity ($r=-0.264$, $p<0.05$). Motor impulsivity played a completely mediating role between GMV of thalamus and METH use duration (indirect effect: 40.00%, $p<0.05$), and GMV of thalamus and MUD severity (indirect effect: 52.83%, $p<0.05$) in MUDs

Conclusion These findings suggest alterations in GMV underlying METH dependence, with thalamus potentially acting as a core neural substrate for impulse control disorders

关键词: Methamphetamine use disorder; structural magnetic resonance imaging; voxel-based morphometry; thalamus; motor impulsivity

靶向调控伏隔核脑区 Anks1b 表达对长时程可卡因自身给药的影响及机制研究

孙艳 杨丽萍

北京大学中国药物依赖性研究所

目的 可卡因成瘾是一种慢性复发性脑疾病,其形成过程是从最初娱乐性的偶然使用逐渐发展为强迫性用药,其中强迫性用药的核心特征为不计负性后果的强迫性觅药行为。目前,研究对于从可卡因娱乐性摄入到强迫性使用转变的分子机制知之甚少。伏隔核是大脑奖赏环路中关键的脑区,与药物强迫性使用密切相关。Anks1b 编码活性依赖的突触后效应蛋白,主要表达于大脑伏隔核脑区,目前临床研究与动物研究均提示其基因表达与多种物质成瘾行为显著关联。然而,Anks1b 是否参与可卡因成瘾行为及其具体机制尚缺乏研究。本研究采用大鼠自身给药模型,靶向调控伏隔核脑区 Anks1b 表达,探究 Anks1b 在可卡因娱乐性摄入到强迫性使用中的作用及其机制。

方法 (1) 通过大鼠脑立体定位注射技术,构建伏隔核脑区 Anks1b 过表达/敲低大鼠。建立可卡因静脉自身给药模型,比较对照组与 Anks1b 过表达/敲低组在可卡因自身给药范式中的差异。(2) 在长时程可卡因自身给药后,在戒断第 1 天和第 28 天,评估 Anks1b 对线索诱导的可卡因寻求的影响。(3) 通过原位杂交,探究伏隔核中 D1-MSN, D2-MSN

的表达。(4) 通过大鼠脑立体定位注射技术,构建伏隔核脑区 Anks1b 条件性敲低大鼠。建立可卡因静脉自身给药模型,比较对照组与条件性敲低组在可卡因自身给药范式中的差异。

结果 目前已有的结果表明,大鼠在接受 7 天短时程可卡因自我给药 (2h/day) 训练中,未发现干预组与对照组之间存在差异。在长时程自给药后的第 8 天到第 17 天,与对照组相比,Anks1b 过表达组显著减少了可卡因摄入;大鼠长时程可卡因自身给药后,在戒断第 1 天和第 28 天,Anks1b 过表达组对可卡因线索诱发的鼻触数显著低于对照组;与对照组相比,Anks1b 敲低组显著增加了可卡因摄入;在戒断第 1 天和第 28 天,Anks1b 敲低组对可卡因线索诱发的鼻触数显著低于对照组;与对照组相比,D1-MSN 和 D2-MSN 中 Anks1b 敲低显著增加了可卡因摄入。在戒断第 1 天和第 28 天,D1-MSN 和 D2-MSN 中 Anks1b 敲低增加对可卡因线索诱发的鼻触数。

结论 研究结果提示,伏隔核脑区的 Anks1b 可能特异性调节长时程 (6 h/day) 可卡因自身给药,而不影响短时程 (2 h/day) 给药行为的习得和维持。后续我们将通过多种神经生物学技术继续深入探索 Anks1b 对可卡因成瘾行为

关键词: Anks1b; 可卡因; 伏隔核; 自我给药

类惊恐发作大鼠模型的肠道菌群和肠道内代谢物动态变化的多组学研究

李梓嘉 汤艳清

中国医科大学附属盛京医院

目的 惊恐障碍是焦虑障碍的一个亚型,给个人、家庭、社会带来沉重的负担。惊恐障碍患者常出现消化系统症状,已有研究表明惊恐障碍患者的肠道菌群出现显著改变。这提示肠道微生物可能与惊恐障碍的病理生理特点密切相关。本研究采用电刺激背侧导水管周围灰质诱发的惊恐发作大鼠动物模型,应用宏基因组学和代谢组学技术,探究惊恐发作对肠道菌群的影响及其动态变化。从而进一步明确惊恐发作与肠道菌群变化之间的因果关系,增进我们对惊恐障碍中肠道菌群与宿主之间相互作用的整体认识。

方法 本研究对 40 只大鼠中脑背侧导水管周围灰质行电极植入手术,将大鼠随机分为电刺激后 24 小时组、电刺激后 72 小时组、电刺激后 168 小时组,和对照组,每组各 10 只。造模后在各自分组设计的时间点进行行为学实验用于评估焦虑样行为,并采集各组大鼠脑组织、盲肠内容物。脑组织检测电极尖端定位,盲肠内容物进行宏基因组测序、非靶向代谢组学检测。

结果 (1) 尼氏染色结果显示电极尖端位置均处于 dPAG,电刺激后均出现逃逸行为,且电流阈值小于 120 μ A,建模成功。(2) 行为学分析结果表明,类惊恐发作大鼠出现焦虑样行为。实验组旷场实验中心区域时间百分比和中心区域移动距离百分比减少($P < 0.05$),高架十字迷宫实验中开放臂移动距离百分比和开放臂移动时间百分比减少($P < 0.05$)。(3) 宏基因组结果:电刺激后各时间点在不同水平物种组成,属水平物种组成存在差异。 α 多样性分析显示,门水平上 ES-24h 组、ES-72h 组 α 多样性升高($P < 0.05$)。在差异物种分析中,我们发现 5 个差异菌种分别是 Rikenellaceae_bacterium、Corynebacterium_lowii、Firmicutes_bacterium、Bifidobacterium_animalis、Bacterium_1XD42_1。(4) 非靶向代谢组结果:OPLS-DA 分析显示,四组样本明显分离。进行差异代谢物筛选,我们发现 47 种

代谢物具有统计学意义。(5) 关联分析:我们发现 Rikenellaceae_bacterium 与开放臂活动时间呈负相关($P = 0.0292$)。宏基因组与代谢组关联分析:我们共发现 45 个具有统计学意义的关联对。

结论 (1) 类惊恐发作后大鼠存在肠道菌群和肠道内代谢物紊乱 (2) 类惊恐发作与肠道微生物、代谢物的改变之间存在因果关系。(3) 发现肠道内 Rikenellaceae_bacterium 菌株可能是惊恐发作后的关键菌,鞘氨醇、5-氨基戊酸可能是关键代谢物。

Studies on The Effects of Schizophrenia and Bipolar Disorder Or Psychotropic Medications on Reproductive Function in Female Patients

Xiaoqian Fu^{1,2}, Jianlin Chen³, Zihao Hu³, Yansong Liu², Xiangdong Du², Renrong Wu³

1. Medical College of Soochow University

2. Suzhou Guangji Hospital

3. Xiangya Hospital, Central South University

Objective The peak age of onset of mental diseases such as schizophrenia and bipolar disorder is mostly between 20 and 30 years old, which is the childbearing age of women. The influence of mental illness, antipsychotics and mood stabilizers on female reproductive function of different degree of adverse effects, leads to significant decline in the reproductive function of female patients with some mental disorders, which is also one of the main reasons for poor compliance of patients with drug therapy. This study explores the mental illness and antipsychotic drugs influence on women's reproductive function, hope to provide more reference for clinical diagnosis and treatment

Methods Using the Mann-Whitney test, a non-parametric rank sum test, the general indicators (body weight, body mass index, blood pressure, thyroid function) and fertility function-related indicators (a full range of sexual hormone, endometrial thickness and volume of uterus and ovary size and number of follicles,

anti-Müllerian hormone) were compared between case group (including schizophrenia and bipolar disorder) and control group, first-episode group and recurrence group of mental disorder, single and combination group of antipsychotic drugs, and different types of antipsychotic drugs. And multiple linear regression was used to analyze the possible risk factors affecting the reproductive function of female patients with mental disorders

Results (1) The case group of prolactin, estradiol, progesterone, polycystic ovary syndrome were higher than control group, and the difference is statistically significant ($P < 0.05$); The uterine volume is smaller than the control group, and the difference is statistically significant ($P < 0.05$); Multiple linear regression analysis showed that anti-Müllerian hormone in the case group was 0.469 ng/dl lower than that in the control group, and the difference was statistically significant ($P < 0.05$)

(2) The levels of prolactin in risperidone, paliperidone and amisulpride group were significantly higher than those in olanzapine, quetiapine, clozapine, valproate and lithium groups ($P < 0.05$); Recurrence of body weight and insulin is higher than the first episode group, and the difference is statistically significant ($P < 0.05$).

(3) The level of free triiodothyronine in patients using lithium carbonate is lower than that in patients using valproic acid salt, and the difference is statistically significant ($P < 0.05$); The level of free triiodothyronine in the combination group was lower than that in the single group, while the level of thyroid stimulating hormone was higher than that in the single group, and the difference was statistically significant ($P < 0.05$).

Conclusions The levels of prolactin, estradiol, progesterone and polycystic ovary syndrome in the case group were higher than those in the control group, while the uterine volume was smaller and anti-Müllerian hormone was lower, suggesting that the reproductive function of the case group may be affected. Different types of antipsychotic drugs to the influence of prolactin were different; The use of lithium carbonate or drug combination has an effect on thyroid function, with a tendency to hypothyroidism

The Impact of Hearing Impairment on Cognitive Decline and Brain Morphology in Older Adults: Insights From Network Analysis and Mendelian Randomization

Peiyi Wu, Yanqing Tang

Shengjing Hospital affiliated to China Medical University

Objective To investigate the relationship between hearing impairment (HI) and cognitive decline, and to explore the causal impact of HI on brain morphology in older adults using network analysis and Mendelian randomization (MR)

Methods This study comprised two parts. Part 1 was an observational study utilizing data from the 2018 wave of the China Health and Retirement Longitudinal Study (CHARLS). Cognitive function across 12 domains was assessed and analyzed in relation to HI using logistic regression and network analysis. Part 2 involved a two-sample MR analysis using genetic data from large-scale genome-wide association studies (GWAS) to determine the causal effect of HI on brain structure

Results The observational study found that HI is significantly associated with cognitive impairment, particularly impacting immediate memory, attention, and executive functions. Network analysis revealed complex interactions between HI and various cognitive domains. The MR analysis indicated a causal relationship between HI and structural changes in brain regions involved in auditory processing and cognitive functions, such as reduced cortical thickness and gray matter volume

Conclusion HI is linked to cognitive decline and structural brain changes in older adults. Addressing HI through targeted interventions and early detection strategies may help mitigate cognitive decline and promote healthy brain aging, improving quality of life for older adults

围产期睡眠剥夺降低肾清除认知损伤相关蛋白影响大鼠认知能力的研究

王帆*

北京回龙观医院

目的 探讨围产期睡眠剥夺 (SD) 对围产期大鼠认知能力的影响、和对肾清除 $A\beta$ 、tau 等认知损伤相关蛋白的影响及其作用机制。

方法 (1) 通过旷场实验、水迷宫分析围产期大鼠 SD 后焦虑抑郁水平、认知能力的改变。(2) 检测血浆 IL10、IL17、IL18, 中性粒细胞明胶酶相关脂质运载蛋白 (NGAL)、 $\beta 2$ 微球蛋白 ($\beta 2MG$)、N-乙酰- β -D-葡萄糖苷酶 (NAG) 及认知损伤相关蛋白 $A\beta 40$ 、 $A\beta 42$ 、pTau181、pTau217、神经纤维丝轻链 (NEFL)、脊椎蛋白 1 (SPON1) 水平。(3) 检测肾脏 NADPH 氧化酶 4 (NOX4) 及脑组织 6E10、pTau181、pTau217 含量。(4) 染色观察脑组织内淀粉样蛋白、6E10、pTau181、pTau217、pTau231 含量变化。(5) 免疫荧光共染 NeuN、MAP-2。

结果 (1) SD 组出现更长静止时间、外围停留时间, 更少站立次数与更短中心区域停留时间 ($P < 0.05$)。(2) 组别、时间对逃逸潜伏期主效应显著, 组别分别对逃逸平台运动距离、有效区域运动时间、有效区域进入次数、目标象限滞留时间百分比和目标象限进入次数百分比主效应显著, 时间对目标象限滞留时间主效应显著 (均 $P < 0.05$)。SD 组第一天、第二天均表现更少逃逸平台运动距离、有效区域运动时间; SD 组第一天表现更低目标象限滞留时间百分比。与 CG 组相比, SD 组表现更少有效区域进入次数、目标象限进入次数及更低目标象限进入次数百分比 (均 $P < 0.05$)。(3) IL17 水平随时间显著变化; SD 组孕中期 IL17 水平高于 CG 组 (均 $P < 0.05$)。

(4) 组别对 NGAL 主效应显著, 时间对 NGAL 主效应显著, 组别与时间对 NGAL 存在交互效应; SD 组孕中期和晚期 NGAL 水平均高于 CG 组。SD 组孕中期 $\beta 2MG$ 水平比 CG 组明显增加 (均 $P < 0.05$)。

(5) 组别分别对 pTau181、NEFL 主效应显著; SD 组孕中期 $A\beta 42/A\beta 40$ 显著高于 CG 组; SD 组孕晚

期具有更高水平 pTau181、NEFL 和 SPON1; 产褥期 SD 组具有更高水平 pTau217、pTau181 (均 $P < 0.05$)。

(6) 产后 pTau181 水平和第 3 象限进入次数百分比存在负相关 ($P = 0.032$, $r = -0.619$)。

结论 围产期睡眠剥夺鼠表现更多焦虑样行为; 通过促进炎症诱导肾功能下降, 增加外周与中枢认知损伤相关蛋白水平, 导致学习及空间记忆等认知损害。

关键词: 睡眠剥夺, 围产期, 炎症反应, pTau181, 肾功能

首发未用药重性抑郁患者的多层时序脑网络的模块化特点与切换次数的研究

嘉林那 汤艳清

中国医科大学附属盛京医院

背景 人脑网络由许多不同的节点连接起来, 它们分布在大脑中不同的模块内。脑动力学的特点是不断重新配置节点之间的时空连接模式, 节点的模块转换是大脑功能动态变化的基础。目前我们对重性抑郁症 (major depressive disorder, MDD) 患者的脑网络模块转换特点知之甚少, 并且这些转换对于患者的临床症状是否重要也很少有研究。

方法 本研究纳入 18~45 岁的首发未用药 MDD 患者与年龄、性别与之匹配的健康人 (healthy control, HC) 各 78 名。基于静息态功能磁共振数据, 以 AAL 模版的前 90 个脑区为节点, 采用划窗法, 计算各时间窗内节点间的皮尔逊相关系数。在此基础上构建超邻接矩阵, 使用多层时序网络方法对两组人群大脑网络模块之间的转换进行建模, 比较两组模型参数的差异, 并分析患者组转换次数和临床症状之间的关联。

结果 模块化度量值 (Q) 在两组间存在显著差异 ($t = -2.1485$, $p = 0.0332$, Cohen's $d = -0.3440$)。MDD 组在左侧额上回、双侧杏仁核、左侧楔叶、左侧枕中回、右侧顶上回、左侧颞上回、左侧颞极、双侧颞下回 (差异显著性前 10 的脑区) 等 26 个脑区的模块切换次数显著高于 HC, 而在左侧中扣带回和扣带旁回、右侧楔叶、右侧中央后回、左侧缘上回、左侧壳核、右侧额中回、双侧直回、左侧眶部额下回、右侧三角部额下回 (差异显著性前 10 的脑区)

等 22 个脑区则显著低于 HC 组(FDR 校正, $q < 0.05$)。此外, MDD 组所有节点的平均模块切换次数与 HAMD 量表总分 ($R = -0.2923$, $p = 0.0094$, $95\%CI = [-0.4697, -0.1008]$)和 HAMA 量表总分($R = -0.3436$, $p = 0.0021$, $95\%CI = [-0.5029, -0.1641]$)均显著相关。但各脑区间功能连接值的跨时间窗标准差(变异程度)在两组之间没有显著差异(FDR 校正, $q > 0.05$), 且整体中位数(0~0.3018)和四分位数间距(0~0.1692)范围均较小。并且两组在模块切换($t = 1.9646$, $p = 0.0513$, Cohen's $d = 0.3146$)和未切换($t = 1.9334$, $p = 0.0550$, Cohen's $d = 0.3096$)期间的绝对功能连接值的均值也没有显著差异。

结论 首发未用药 MDD 患者在动态脑功能连接的强度和稳定性上与 HC 相当, 患者脑网络的动态异常可能更多地体现在模块结构和切换特点, 即脑网络功能的动态整合和分离上。这一发现提示我们脑网络模块的跨时空构成及转换特点在 MDD 的疾病演变过程中发挥着重要作用。

阿普唑仑对小鼠类惊恐发作行为及脑神经元激活特征的影响研究

何心怡 汤艳清

中国医科大学盛京医院

目的 本研究旨在探讨阿普唑仑(alprazolam)对小鼠类惊恐发作(panic attack, PA)行为及脑神经元激活特征的影响, 以探索其在惊恐障碍治疗中的潜在机制。

方法 将 c57 小鼠随机分为空白盐水对照组、模型盐水组、空白阿普唑仑对照组和模型阿普唑仑治疗组, 每组各 6 只。通过诱导类惊恐发作模型建立惊恐状态, 给予阿普唑仑进行治疗。采用旷场实验记录和分析小鼠的行为学指标, 评估小鼠类惊恐发作行为变化。采用免疫荧光标记技术检测各组小鼠脑区神经元激活情况, 特别是背侧导水管周围灰质、海马和杏仁核区域的 c-Fos 表达水平。

结果 行为学指标显示, 与空白盐水对照组相比, 模型盐水组小鼠在旷场实验中的活动水平显著下降, 移动总距离减少, 进出中心区域次数减少, 冻

结时间增加($P < 0.05$); 阿普唑仑干预后, 这些行为学异常得到明显改善($P < 0.05$)。与模型盐水组相比, 模型阿普唑仑治疗组小鼠在旷场实验中表现显著减少的类惊恐发作行为($P < 0.05$)。c-Fos 染色结果显示, 模型盐水组小鼠的背侧导水管周围灰质及杏仁核的 c-Fos 表达水平显著高于空白盐水对照组($P < 0.05$)。阿普唑仑治疗后小鼠的上述脑区神经元激活显著减少($P < 0.05$)。

结论 阿普唑仑可显著减少小鼠类惊恐发作为表现, 并能够有效抑制类惊恐发作小鼠脑神经元的过度激活, 特别是在背侧导水管周围灰质和杏仁核区域, 提示阿普唑仑可能通过调节这些脑区的神经活动来发挥其抗惊恐发作作用, 表明阿普唑仑在治疗惊恐障碍方面具有潜在的应用价值。

White Matter Integrity Upon Progesterone Antagonism in Individuals with Premenstrual Syndrome: A Placebo-controlled DTI Study

Bochao Cheng¹, Yukun Kang¹, Wei Deng²

1. West China Second University Hospital of Sichuan University

2. Affiliated Mental Health Center & Hangzhou Seventh People's Hospital, Zhejiang University School of Medicine

Objective Premenstrual syndrome (PMS) is a recurrent, varying degree of emotional, somatic and behavioral disorders in the premenstrual period, triggered by fluctuations of progesterone and estradiol during the luteal phase of the menstrual cycle. Selective progesterone receptor modulation (SPRM), while exerting an antagonistic effect on progesterone and maintaining the estradiol on moderate levels, has shown beneficial effects on the mental symptoms of PMS. Progesterone is also known for its neuroprotective effects, while synthetic progestins have been suggested to promote myelination. However, the impact of this treatment on white matter integrity is unclear

Methods 46 PMS patients and 42 healthy controls (HCs) were enrolled. Diffusion tensor imaging (DTI) was used to collect data on white matter integrity in patients with PMS and HCs. PMS patients were checked before and after treatment with ulipristal acetate (an SPRM) or placebo, as part of a double-blind randomized controlled-trial. Tract based spatial statistics were performed to investigate SPRM treatment vs. placebo longitudinal effects on fractional anisotropy (FA), mean diffusivity (MD), radial diffusivity (RD), and axial diffusivity (AD) on the whole-brain white matter skeleton

Results Relative to HCs, PMS patients showed increased FA and AD in left anterior thalamic radiation tract and significantly increased FA in the cingulum tract. Voxel-wise analyses indicated no change over time in any white matter microstructure metrics in individuals treated with SPRM versus placebo. Improvement in PMS symptoms did not correlate with changes in white matter microstructure. In secondary, cross-sectional comparisons during treatment, the SPRM group displayed lower FA and higher MD, RD, and AD in several tracts

Conclusion Although we found impaired white matter integrity in the PMS group, SPRM treatment did not impact white matter microstructure. However, the between-group differences after treatment call for further investigation on the tracts potentially impacted by progesterone antagonism

Predictive Analysis of Criminal Crimes in Patients with Mental Illness by Partial Differential Equation Model in Climate Change ---- Inspired by Academician Xuesen Qian's Book Engineering Cybernetics

Hanmei Du, Yi Sun, Fuxin Yao

Beijing HuiLongGuan Hospital (Peking University Huilongguan Clinical School of Medicine)

Objective By combining Xuesen Qian's engineering cybernetics with the construction and application of partial differential equation model, we can more systematically understand the relationship between the types and nature of crimes caused by changes in symptoms or incidence of mental illness caused by climate change, and provide strong scientific support for the solution of practical problems

Methods The engineering cybernetics of Academician Xuesen Qian, the father of China's missile and aerospace, is a discipline that studies system engineering and control technology. It uses various mathematical and engineering methods to model, analyze, and design complex systems, aiming at realizing effective control and regulation of the system. A brief introduction to Academician Xuesen Qian's engineering cybernetics: Xuesen Qian's engineering cybernetics has been widely used in many fields, especially in missile technology and aerospace engineering. For example, in modern control systems, more and more attention is paid to applying multi-intelligent technologies, such as artificial neural networks, genetic algorithms, and fuzzy control. These models can be linear, non-linear, time-varying, or random according to different characteristics and requirements of the system. Based on model establishment, the system is analyzed and optimized by mathematical method and simulation experiment, and the characteristics and performance of the system are understood. The current characteristics of global climate change can be summarized as follows: continuous rise

in temperature, frequent and extensive droughts, increasing extreme climate events, precipitation changes, and significant regional climate differences. Second, The causes of global climate change can be summarized into two main aspects: human activities and natural factors. (1) Human activities: Due to the rapid increase in population and the acceleration of industrialization, the large amount of greenhouse gas emissions caused by human activities is one of the main reasons for global climate change. These greenhouse gases have a greenhouse-like effect in the atmosphere, causing the Earth's surface temperature to rise. (2) Natural factors: El Nino affects the global climate by changing the temperature of the water in the equatorial Pacific Ocean

Use engineering cybernetics to explain the link between climate change and mental illness

Although climate change and mental illness change seem to be two distinct areas, we can try to explore the connection between them from the perspective of control systems.

1. Observation from a system perspective:

Overall analysis: Engineering cybernetics emphasizes the integrity of the system, that is, the problem as an interconnected whole. Climate change and mental illness, though seemingly different, are part of a complex system. 2. Dynamic system and feedback mechanism:

Climate change is a complex dynamic system, which is influenced by many factors, including natural factors and human factors. Climate change is a continuous process of change, the speed and extent of which can affect people's psychological state.

(1) The impact of climate change on mental illness

Environmental factors: Extreme weather events brought about by climate change, such as heavy rains, droughts, heat waves, etc., may have a negative impact on people's mental health.

Changes in neurotransmitter levels: Weather changes, especially rainy days or lack of sunlight in winter, may affect neurotransmitter levels in the body.

(2) How can people with mental illness cope with climate change

Patients with mental illness in rainy days or winter, try to increase the indoor light time to make up for the lack of sunshine. This can be achieved by using bright

lighting or placing reflectors in the room, for example. Stability is an important concept in engineering cybernetics. For the climate change system, stability means that the climate system can resist a certain degree of external disturbance and maintain a relatively stable state. Similarly, there is some stability in the mental state of people with mental illness. When faced with external pressures or stimuli, if it exceeds the individual's ability to cope, it may lead to the onset or deterioration of mental illness.

4. Control and regulation:

Engineering cybernetics emphasizes the effective control and regulation of the system. For mental illness, control and adjustment are reflected in alleviating symptoms and improving the psychological state of patients through psychological therapy, drug therapy and social support network.

5. Prediction and Prevention:

Using the method of engineering cybernetics, climate change can be predicted and simulated.

To sum up, although climate change and mental illness change seem unrelated on the surface, we can use Xuesen Qian's engineering cybernetics to explore the internal connection between them.

Forth, the relationship between climate Change and mental illness Change (Analysis and calculation of Partial differential Equation Construction)

The relationship between climate change and mental illness is a complex and multifaceted topic. Using the partial differential equation mathematical model of Xuesen Qian's engineering cybernetics to explain the connection between climate change and changes in mental illness:

Here are the steps:

(1) Identify key variables and parameters of climate change; (2) Construct partial differential equation model; (3) Data integration and analysis; (4) Model coupling and validation: Coupling climate models with mental illness models to explore how climate change affects the incidence and symptoms of mental illness. (5) Prediction and simulation: Simulate different climate change scenarios by adjusting parameters in climate models and observe how these changes affect variables in models of mental illness. Based on current climate

trends, coupling models are used to predict the likely future trends in the incidence or symptoms of mental illness. (6) Develop response strategies: based on simulation and prediction results, provide policy recommendations to governments and relevant agencies to mitigate the adverse effects of climate change on people with mental illness.

Fifth, the impact of climate on the crime of people with mental illness is mainly reflected in the emotional, medical and social aspects. To reduce the risk of crime for people with mental illness, attention needs to be paid to the impact of climate change on patients and the necessary psychological support and treatment is provided. Meanwhile, all sectors of society should also work together to create a more inclusive and understanding social environment for people with mental illness.

Sixth, analysis of the incidence of mental illness and criminal crime (using partial differential equation analysis and calculation):

Using partial differential equations to understand the relationship between changes in mental illness and crime patterns, we need to take a series of logical and methodical steps. The clear goal of the study is to explore the relationship between changes in mental illness and specific types of crime. Identify key variables, such as the incidence of mental illness, severity of symptoms, etc. Collect and integrate data on people with mental illness, including incidence rates, types of diagnosis, changes in symptoms, etc., and collect data on crime, especially crimes related to people with mental illness. Selection equation: Based on the relevant data of mental illness and crime, choose the appropriate partial differential equation form to model the relationship between the two. Historical data is used to build and train models to ensure they accurately reflect the dynamic relationship between changes in mental illness and crime patterns. When choosing Pdes, we need to consider what factors can influence changes in mental illness and how these changes relate to crime types. For example, we can choose a convective diffusion equation to describe the spread and diffusion of information, which can be analogous to how changes in mental illness symptoms spread through a population and may affect crime rates. Alternatively, we can use the wave equation to describe

cyclical changes in a certain social phenomenon, which may be related to seasonal changes in mental illness and its relationship to types of crime.

Throughout the process, it is necessary to ensure the accuracy and integrity of the data, as well as the rationality and validity of the model.

At the same time, because both mental illness and crime are complex social and psychological phenomena, the findings need to be interpreted carefully and applied in context.

Through the above steps, we can use partial differential equations to explore the relationship between changes in mental illness and crime types, and provide scientific basis for the formulation of relevant policies and practical operations.

Results Climate change and criminal crime rate of patients with mental illness are two sets of equations which are interrelated and influence each other. Coupling is a complex and important concept, which has been widely used in many fields such as physics, engineering and biology. Coupled partial differential equations can be divided into linear and nonlinear types

The expression of linear coupled partial differential equation is linear combination of each variable.

The nonlinear coupled partial differential equation contains nonlinear terms such as product and power function, and its solution is usually more complicated.

Finite difference method and moment method can be used to solve the problem.

Conclusion Engineering cybernetics is an interdisciplinary theoretical framework that can be applied to many fields. When exploring the relationship between mental illness and crime types, we draw on the ideas of cybernetics and integrate the knowledge of medicine, psychology, sociology and other disciplines to form a comprehensive analytical framework

The ultimate goal of PDE models is to predict and control the behavior of systems. In the study of the relationship between mental illness and crime, this means that we want to use models to predict future trends and develop effective intervention strategies to control the system (i.e. reduce mental illness related crime).

In summary, Although it is difficult to learn relevant knowledge for doctors, natural climate scholars

and police officers, the model theory and method will be put into practical application in the near future, which can solve most scientific and humanistic philosophical problems that need to break through the bottleneck.

1.中南大学湘雅二医院

2.贵阳市第二人民医院

目的 高特质愤怒男性精神分裂症患者是攻击行为的高风险人群,了解该人群攻击行为的发生机制具有重要的意义。本研究旨在探索高特质愤怒男性精神分裂患者在激惹情景下的行为反应模式及相应的神经基础,了解该人群发生攻击行为的过程及机制。

方法 采用病例对照研究设计。从 503 名男性精神分裂症患者中筛选出高、低特质愤怒的受试者(分别为 37 名和 35 名),并招募与之匹配的高、低特质愤怒的健康受试者(每组 34 名)。共 140 名受试者完成了 Taylor 攻击范式下的近红外脑功能成像检测。采用 2(特质愤怒:高、低)×2(受试者类型:精神分裂症患者、健康受试者)×2(情景类型:激惹、非激惹)的重复测量方差分析比较四组受试者在攻击行为上的差异以及在攻击任务不同阶段的脑区激活程度差异。

结果 Taylor 攻击范式的结果显示:高特质愤怒精神分裂患者在激惹情景下的攻击行为显著高于其他三组($M \pm SD = 3.103 \pm 0.492$, $F = 9.766$, $P < 0.001$)。激活分析的结果显示:①精神分裂症患者在执行 Taylor 攻击范式的决策阶段,双侧额极、左侧前运动和辅助皮层、左侧 Broca 区、左侧背外侧前额叶等区域的激活程度显著低于健康受试者。②Taylor 攻击范式的决策阶段,高特质愤怒个体在激惹情景下,左侧前运动和辅助皮层、双侧 Broca 区、双侧额极、

双侧背外侧前额叶的激活程度高于非激惹情景下;低特质愤怒个体在激惹情景下,左侧 Broca 区、双侧背外侧前额叶、左侧额极的激活程度高于非激惹情景下。③Taylor 攻击范式的决策阶段,在非激惹情景下,高、低特质愤怒个体所有区域的激活程度均无显著差异;激惹情景下,高特质愤怒个体在左侧前运动和辅助皮层、双侧 Broca 区的激活程度高于低特质愤怒个体。④对于高特质愤怒个体,额极(通道 15)和眶额皮层(通道 21)在激惹情景下的激活程度与攻击行为呈显著负相关(通道 15: $r = -0.417$, $P < 0.001$, 通道 21: $r = -0.382$, $P = 0.001$)

结论 ①高特质愤怒精神分裂症患者在实验室攻击任务中表现出更高水平的攻击行为。②高特质愤怒精神分裂症患者的 Broca 区、内侧前额叶等区域的功能可能受损,而难以动员资源调控情绪,这可能是其容易发生攻击行为的机制。

Different Roles of Homocysteine Metabolism in Hypertension Among Normal-weight and Obese Patients with Obstructive Sleep Apnea

Baixin Chen, Yun Li

Shantou University Mental Health Center, Shantou University Medical College

Objective Obstructive sleep apnea (OSA) is causally associated with hypertension. Although obesity, highly prevalent in OSA, may mediate the development of hypertension, it has been reported that cardiovascular outcomes may be more benign in obese patients than normal weight. This seemingly paradoxical phenomenon has not been explored in terms of differential basic/molecular pathways that may provide useful information in terms of prognosis and specific treatment of cardiovascular problems in obese and normal-weight patients with OSA

Methods We studied 92 patients with OSA and 24 patients with continuous positive airway pressure (CPAP) treatment. Blood pressure (BP) was measured twice during awake and continuously monitored during sleep. Obesity was defined as body mass index ≥ 28 kg/m². Serum metabolite levels were assessed by metabolomics

Results Among 59 normal-weight and 33 obese patients, 651 and 167 metabolites showed differences between hypertension and normotension or were associated with systolic and diastolic BP (SBP, DBP) after controlling confounders. These metabolites involved 16 and 12 Kyoto Encyclopedia of Genes and Genomes enrichment pathways in normal-weight and obese patients respectively, whereas 6 pathways overlapped. Among these 6 overlapping pathways, 4 were related to homocysteine metabolism and 2 were non-specific pathways. In homocysteine metabolism pathway, 13 metabolites were identified. Interestingly, the change trends of 7 metabolites associated with SBP (all interaction- $p \leq 0.083$) and 8 metabolites associated with DBP (all interaction- $p \leq 0.033$) were opposite between normal-weight and

obese patients. Specifically, increased BP was associated with down-regulated folate-dependent remethylation and accelerated transsulfuration in normal-weight patients, whereas associated with enhanced betaine-dependent remethylation and reduced transsulfuration in obese patients. Similar findings were observed in ambulatory BP during sleep. After CPAP treatment, baseline low homocysteine levels predicted greater decrease in DBP among normal-weight but not obese patients

Conclusion Mechanisms in OSA-related hypertension differ between normal-weight and obese patients, which are explained by different changes in homocysteine metabolism

A Randomized, Double-Blind Study Evaluating The Effectiveness of Concurrent Transcranial Direct Current and Repetitive Transcranial Magnetic Stimulation Versus Individual Treatments for Chronic Insomnia

Qi Zhou^{1,2}, Zhiwang Liu^{1,2}, Haihang Yu^{1,2}, Dongsheng Zhou^{1,2}

1. Department of psychiatry, Affiliated Kangning Hospital of Ningbo University

2. Ningbo Kangning Hospital

Objective Chronic insomnia is a prevalent sleep disorder affecting an individual's normal life and work, increasing the risk of various health problems and mental illness. Although pharmacological and non-pharmacological treatments exist, limitations include dependence, side effects, and potentially limited efficacy for some approaches. Existing research suggests promise for both transcranial direct current stimulation (tDCS) and repetitive transcranial magnetic stimulation (rTMS) in treating chronic insomnia individually. However, the combined effects of tDCS and rTMS on this condition remain unclear. There is an urgent need for research investigating safe and efficient treatment methods that

may offer superior efficacy compared to single-modal-ity therapies. This study aimed to verify the efficacy and safety of tDCS combined with rTMS for the treatment of adult patients with chronic insomnia

Methods Overall, 157 participants with chronic primary insomnia were randomly assigned to one of three physical therapy regimens: tDCS+rTMS, sham tDCS+rTMS, or tDCS+sham rTMS. All groups received 20 treatment sessions over 4 consecutive weeks. The primary outcomes, measured using the Pittsburgh Sleep Quality Index, were the insomnia response and remission rates assessed at the end of both the 2nd week and 4th week of treatment

Results Out of 161 randomized patients, 157 completed the trial. After 2 weeks of intervention, the tDCS+rTMS treatment group had the highest response rate (53.57%, 30/56), with significant differences among the three groups. Similarly, after 4 weeks of intervention, the tDCS+rTMS treatment group showed the highest remission rate (46.43%, 26/56) and response rate (64.29%, 36/56), with a significant difference among the three groups. Notably, no adverse events or serious adverse reactions were observed during the study period

Conclusion Combining tDCS with rTMS effectively relieved chronic insomnia symptoms, achieving a significant therapeutic effect after just 2 weeks of intervention, demonstrating the rapid and effective augmentation of combination therapy. These benefits appeared to be maintained and potentially enhanced by the end of the 4-week intervention. This combined therapy may serve as a safe and effective treatment for adults with chronic insomnia

Sleep and Cortisol Changes in Crews with Irregular Shifts During A 42-day Isolated, Confined and Extreme Environment Mission

Sijia Lou¹, Sifan Hu¹, Jie Chen¹, Yun Chen¹, Anqi

Zhang¹, Yupeng Guo¹, Jianjun Hou², Weimin Dang¹, Hongqiang Sun¹

1.Peking University Sixth Hospital, Peking University Institute of Mental Health, NHC Key Laboratory of Mental Health (Peking University), National Clinical Research Center for Mental Disorders (Peking University Sixth Hospital), Beijing, China

2.Peking University Health Science Center, Beijing, China

Objective Humans often face physical and psychological challenges, when carrying out missions in isolated, confined and extreme (ICE) environments such as aerospace, submarines, and arctic conditions. A third-quarter phenomenon was discovered in the long-term ICE environment, where mood levels dropped after the midpoint of the mission and somewhat recovered before the end of the mission. We explore cortisol, sleep and mood changes in ICE environment involving numerous stressors, as well as whether the third-quarter phenomenon exist in the short-term

Methods Three males participated in 42 days of confined isolation, during which time was delayed by four hours for the first four days (D1-D4) to establish and adapt to new circadian rhythm under experimental conditions. This was followed by 38 consecutive days of irregular shift work(D5-D42). Throughout the study, we measured salivary cortisol and visual analog scales (VAS) on mood at adaptation stage (AS, D3-D4), early stage (ES, D12-D13), mid-stage (MS, D19-20), and late stage (LS, D33-D34). The data were collected every 4 hours, except during sleep time. Polysomnography (PSG) was used to record sleep on the night before entering the closed environment, during the mid-stage, and during the late stage. Crews maintained sleep diaries throughout the period of confined isolation. The Friedman test was used to detect differences across multiple stages. The area under the curve (AUC) was used to compare cortisol levels at each stage

Results The Area under the curve with respect to ground (AUCg) of cortisol was significantly higher at MS than at LS ($\chi^2=2.846$ $p=0.027$). There were no significant differences in mood between different stages at the same time point or within the same stage at different

time points. PSG indicated that the percentage of N2 sleep stage and the number of micro-arousals were significantly higher at the mid-stage compared to before the onset of irregular shifts in the ICE environment ($\chi^2=6.000$ $p=0.05$, $\chi^2=6.000$ $p=0.05$). No significant differences were found in sleep diaries at each stage

Conclusion There is a pattern of objective sleep and hormone level changes in the ICE environment with multiple stressors. Therefore, these biomarkers could be valuable for assessing the effectiveness of biomedical countermeasures for astronauts, as well as having potential applications in terrestrial research and treatment

Sleep Quality In Adolescents With Depression: Psychological Mechanisms And Networked ACT Combined With ITBS Intervention

柯颖资 何孔亮

合肥市第四人民医院

Objective Adolescents face multiple pressures such as academic and interpersonal stress, and the quality of sleep is closely related to their physical health, especially psychological health issues such as depression. At present, the treatment methods for improving the sleep quality of adolescent depression patients mainly focus on psychological therapy, drug therapy, and physical therapy. However, traditional psychological therapy is expensive, and drug therapy may have side effects. Only physical therapy has high safety and minimal side effects. Although in clinical practice, medical experts may adopt a comprehensive treatment that combines traditional psychotherapy with medication and physical therapy, it is a huge economic burden for many families. As a result, Internet based Acceptance and Commitment Therapy (iACT) is being increasingly promoted by researchers and practitioners due to its unique advantages. Based on this, this study focuses on the sleep quality of adolescent depression patients and develops a net-

worked self-help intervention program based on acceptance commitment therapy, combined with intermittent transcranial magnetic stimulation. The Intermittent Theta Burst Stimulation (iTBS) mode was used to design three different intervention plans to test which intervention plan has the best therapeutic effect on the sleep quality of adolescent depression patients, better helping them improve sleep quality, enhance psychological flexibility, and alleviate depressive symptoms.

Methods Recruit 120 adolescent depression patients from a certain tertiary psychiatric hospital and randomly divide them into three intervention groups and one control group, with 30 people in each group for a duration of 12 days. Before randomization, 30 days after intervention, and 30 days after intervention, all participants were subjected to offline evaluation using a scale. HAMD-14, MPFI-24, and PSQI were used to measure depressive symptoms, psychological flexibility, and sleep quality, respectively.

Results For adolescent depression patients, the sleep quality, depressive symptoms, and psychological flexibility of the three intervention groups showed improvement compared to the control group after intervention and one month of follow-up. The combined group had the largest intervention effect and the best intervention effect.

Conclusion Networked self-help psychological intervention provides patients with an autonomous and participatory psychotherapy method, which has the potential to serve as a new therapeutic approach. At the same time, combining networked self-help psychological intervention with iTBS can improve treatment effectiveness, reduce treatment time and cost, enhance treatment sustainability and long-term effectiveness, and produce better intervention effects. This study not only helps to deepen our understanding of adolescent depression, but also provides new directions and possibilities for future treatment

Altered Dynamic Functional Connectivity of Nucleus Accumbens Subregions in Major Depressive Disorder: The Interactive of Childhood Trauma and Diagnosis

Yurong Zou, Hongjun Peng, Tong Yu, Liwen Zhu, Yuhong Li, Juran Chen, Qianyi Luo

The Affiliated Brain Hospital of Guangzhou Medical University

Objective Childhood trauma is a grave and enduring chronic stressor, encompassing physical abuse (PA), emotional abuse (EA), sexual abuse (SA), physical neglect (PN), and emotional neglect (EN)¹. Major depressive disorder (MDD) with childhood trauma represents a heterogeneous clinical subtype of depression². Previous research has observed alterations in the reward circuitry centered around the nucleus accumbens (NAc) in MDD patients³⁻⁵. However, limited investigations have focused on aberrant functional connectivity (FC) within NAc subregions among MDD with childhood trauma. It remains unclear whether there are abnormalities in the reward circuitry of MDD patients with childhood trauma and whether such abnormalities are influenced by experiences of maltreatment. Thus, this study adopts analyses of both static FC (sFC) and dynamic FC (dFC), to examine functional abnormalities in NAc-centered reward circuits in MDD with childhood trauma. We hypothesize that: (i) MDD patients with childhood trauma exhibit abnormal sFC and dFC patterns in the subregions of the NAc compared to those without childhood trauma; (ii) abnormal sFC and dFC are associated with childhood trauma

Methods The study obtained approval from the Ethics Committee of the Affiliated Brain Hospital of Guangzhou Medical University, and all participants provided written informed consent. A total of 181 participants were included in baseline data from a registered clinical trial (ChiCTR2300078193), including 78 MDD patients and 103 healthy controls (HCs). Neuroimaging data were acquired utilizing a 3.0 Tesla Philips magnetic

resonance scanner. Depression severity was assessed by the Hamilton Depressive Rating Scale (HAMD)6, Childhood traumatic experiences were measured by childhood trauma questionnaire (CTQ)7. The research consisted of four groups: MDD with childhood trauma ($n = 48$), MDD without childhood trauma ($n = 30$), HCs with childhood trauma ($n = 57$), or HCs without childhood trauma ($n = 46$). Focusing on four NAc subregions as seeds to examine the differences in sFC and dFC between groups

Demographic and clinical differences among the four groups were assessed using one-way ANOVA, two-sample t-tests, and χ^2 tests in SPSS 25.0 software. Then, we employed a two-way ANOVA to explore the interactions, followed by t-tests to investigate the trauma effect (comparing groups with and without trauma experiences) and the depression effect (comparing depression and healthy control groups), as well as post-hoc analyses adjusted for the Benjamini-Hochberg (B-H) correction. Correlation analyses were used to assess the association between abnormal FC and the severity of childhood trauma. Finally, moderation analyses were then employed to investigate the moderating role of abnormal FC in the relationship between childhood trauma and depression severity.

Results 3.1 Demographic and clinical characteristics

No significant between-group differences were observed in age, gender, or mean FD among the MDD with and without childhood trauma, as well as the HCs with and without childhood trauma (all $p > 0.05$). There were also no significant differences in HAMD scores between MDD patients with and without childhood trauma ($p > 0.05$). However, significant group differences were noted in CTQ total scores, as well as EA, PA, EN, and PN subscale scores across the four groups (all $p < 0.05$).

3.2 Abnormal sFC of the NAc subregions

In sFC analysis, an abnormal sFC was observed between the right NAc-core and the left anterior cingulate cortex (ACC). In addition, the aberrant sFC was negatively correlated with the severity of childhood trauma. Regarding traumatic subtypes, correlation analyses showed that the abnormal sFC was mainly associated with PA and EN.

3.3 Abnormal dFC of the NAc subregions

Within the dFC analysis, dFC abnormalities influenced by the interaction effect of childhood trauma and depression were found in the following regions: left NAc-shell and right middle occipital gyrus; right NAc-shell and right opercular part of the inferior frontal gyrus; right NAc-core and left ACC. In addition, abnormal dFC affected by etiological effects of depression were observed between right NAc-shell and right triangular part of the inferior frontal gyrus. No significant difference was detected in the dFC analysis with the left NAc-core selected as ROIs. Furthermore, in moderation analysis, the pattern of dFC abnormalities played a moderating role in the relationship between sexual abuse and depression severity. Our findings elucidate the neurobiological foundations of childhood trauma and provide new evidence for our understanding of susceptibility to depression.

Conclusion In summary, this study investigated aberrant FC patterns within the NAc subregions in MDD patients with childhood trauma, with a approach utilizing combined dFC and sFC analyses. Compared to MDD without childhood trauma, abnormal connectivity patterns in different NAc subregions were found in MDD patients with childhood trauma, including the left NAc-shell, right NAc-shell, and right NAc-core. These findings suggest an intrinsic link between aberrant FC patterns and childhood trauma, which not only contributing to a deeper understanding of the neurobiological underpinnings of MDD patients with a history of childhood trauma, but providing potential diagnostic markers and therapeutic targets for MDD patients who have experienced childhood trauma. Our findings support NAc subregions dysfunction as neurobiological features of childhood maltreatment as well as vulnerability to MDD

千金藤啶碱干预早期社会隔离引起的精神分裂样行为 及其潜在机制研究

李白嘉 马现仓

西安交通大学医学院第一附属医院

目的 我国精神分裂症的患病率逐年升高,目前约为7%,临床治疗主要为对症治疗,但效果有限,且副作用较大。左旋千金藤啶碱(L-stepholidine, L-SPD)同时具有D1R激动和D2R抑制的双重药理作用,这与精神分裂症的中脑皮质边缘系统即腹侧被盖区/内侧前额叶皮质/伏隔核神经环路的紊乱相契合,使L-SPD具有治疗精神分裂症的潜在优势。

方法 本研究通过建立母婴分离(maternal separation, MS)模型以及早期社会隔离(social isolation, SI)模型,探究建立精神分裂症动物模型;L-SPD干预SI小鼠,对前额叶皮质和伏隔核中突触可塑性相关蛋白N-甲基-D-天冬氨酸受体(N-methyl-D-aspartate acid receptor, NMDAR)亚基1, NR1和突触后致密蛋白95(postsynaptic density protein 95, PSD95),以及蛋白激酶A(protein kinase A, PKA)和蛋白激酶B(protein kinase B, PKB);同时使用选取PC12类神经元细胞研究L-SPD是如何通过受体发挥作用。

结果 1)C57BL/6雌性MS小鼠自发活动能力、抗抑郁行为增加($P<0.05$)。

2)BALB/c雄性MS小鼠表现抑郁行为、逃避和攻击增加、筑巢能力下降和感觉运动门控障碍($P<0.05$)。雌性小鼠只表现出前脉冲抑制(prepulse inhibition, PPI)缺陷($P<0.05$)。

3)C57BL/6雄性SI小鼠表现出抑郁行为、焦虑行为、筑巢能力下降、社会交往行为减少、认知下降以及PPI受损($P<0.05$)。

4)L-SPD能够缓解SI诱导的抑郁行为、社会退缩、社会交往减少、认知功能改变,对PPI损害的干预效果优于利培酮;同时L-SPD使SI小鼠前额叶皮质中NR1、PSD95和磷酸化PKA/CREB增加,伏隔核中PSD95、磷酸化PKA/CREB和磷酸化Akt/GSK3 β 增加($P<0.05$)。

5)L-SPD干预NGF诱导分化PC12细胞后,D1R抑制剂和PKA抑制剂能够阻断L-SPD对NR1的促进作用,D2R激动剂能够阻断L-SPD对Akt/GSK3 β 的激活作用($P<0.05$)。

结论 1)早期SI能够稳定全面地诱导C57BL/6小鼠出现精神分裂样行为,更适合作为精神分裂症模型。

2)L-SPD对早期SI诱导的精神分裂样行为具

有干预作用,在前额叶皮质中通过激活D1R/PKA/CREB/NR1通路,在伏隔核中通过激活D2R/Akt/GSK3 β 通路发挥抗精神病作用。

Study on The Sleep Sensitivity of Overweight Patients with Bipolar Disorder and The Correlation with Bmal1 Gene Methylation

Xiaoxiao Tang, Shaohong Zou, Yao Wu

People's Hospital of Xinjiang Uygur Autonomous Region

Objective Bipolar disorder is one of the leading causes of disability among young people worldwide. There is a close relationship between obesity and overweight and the development of mental disorders. There is a connection between BMI increase and sleep changes in bipolar disorder. There is an association between disrupted circadian rhythms and metabolic changes in patients with bipolar disorder. This study aims to investigate the correlation and interaction between the sleep characteristics of overweight bipolar disorder patients and the methylation levels of the Bmal1 gene by detecting the methylation levels of the Bmal1 gene in overweight bipolar disorder patients

Methods This study selected 30 patients with bipolar depression (including 34 healthy controls) and divided them into four groups (groups of bipolar overweight, pure bipolar, pure overweight, and healthy control) for polysomnography. At the same time, the methylation levels of 7 CpG sites with a length of 494bp in the promoter region of the Bmal1 gene were detected using Massray time-of-flight mass spectrometry

Results After comparison, there were statistically significant differences in sleep efficiency among the groups of bipolar overweight, pure bipolar, pure overweight, and healthy control. Comparing the methylation levels of GPG (1-7) genes in the four groups, the results showed that the differences in methylation levels

of genes CpG2, CpG3, and CpG6 were statistically significant ($P < 0.05$). Further pairwise comparisons revealed that compared to the other three groups, the methylation level of gene CpG2 decreased in the healthy control group ($P < 0.05$); compared to the overweight bipolar group, the methylation level of gene CpG3 decreased in the healthy control group ($P = 0.023$); and the methylation level of gene CpG6 increased in the overweight bipolar group compared to the other three groups ($P < 0.05$). The correlation analysis results of sleep indicators and gene methylation show that sleep efficiency is negatively correlated with CpG2 and CpG3 methylation levels ($r = -0.271$, $P = 0.030$); sleep latency is positively correlated with CpG2 methylation levels ($r = 0.328$, $P = 0.008$), and with CpG7 methylation levels ($r = 0.290$, $P = 0.020$); the proportion of N1 total sleep is positively correlated with CpG3 methylation levels ($r = 0.259$, $P = 0.039$); the proportion of N2 total sleep is positively correlated with CpG6 methylation levels ($r = 0.323$, $P = 0.009$); the proportion of N3 total sleep is negatively correlated with CpG6 methylation levels ($r = -0.317$, $P = 0.011$); there is no correlation between other sleep indicators and Bmal1 gene CpG island methylation ($P > 0.05$). Multivariate logistic regression analysis revealed that being female is a protective factor for decreased sleep efficiency.

Conclusion The sleep efficiency of overweight patients with comorbid bipolar disorder is lower than that of patients with pure bipolar disorder and pure overweight, and the methylation levels of CpG2 and CpG3 on the Bmal1 gene site are negatively correlated with the decrease in sleep efficiency.

Efficacy of Intermittent Theta Burst Stimulation (iTBS) on Depressive Symptoms of Adolescents with and without Antidepressants: A Preliminary Study

Peiyong Li Yuwei Xia Xinyao Liu Shiqi Yuan Chengfeng Chen Kun Xie Wuyou Bao Shiying Wang Ru Hao Ling Sun Bin Zhang*

Tianjin Anding Hospital

Objective A wide range of affective disorders affects people of all age groups globally, playing a significant role in the overall burden of disease worldwide. Among all emotional disorders, major depressive disorder (MDD) and bipolar disorder (BD) are the most common. The first nationwide survey on the prevalence of affective disorders (3.21%), including MDD (2.00%) and BP (0.86%), among children and adolescent in China. Adolescent Major Depression Disorder is a common chronic mental illness with an estimated lifetime prevalence of 11.0%. Limited treatment options exist for adolescents, leading to ongoing concerns and debates regarding the safety of using antidepressants. Intermittent theta burst stimulation (iTBS) is a newer form of repetitive transcranial magnetic stimulation for depressive symptoms. However, the effectiveness of accelerated iTBS (aiTBS) and 4 weeks of maintenance treatment in adolescents with affective disorders, especially the comparison between the efficacy of this treatment approach in affective disorders adolescents who with and with not antidepressants have not been well studied. The aim of our study was to explore and compare the effectiveness of aiTBS and 4 weeks of maintenance treatment in alleviating depressive symptoms in adolescents with and with not antidepressants

Methods All participants enrolled in this study between August 2023 and January 2024, patients with unipolar MDD and depressive episodes of bipolar II disorder were recruited from the outpatient ward of Tianjin Anding Hospital. The Aim Magnetic Stimulation Robot (AIM-III), and Mag TD (Yiruide Medical Equipment

New Technology Co., Ltd., Wuhan, China) with an active, 70-mm figure-of-eight, air-cooled coil was used to applied the iTBS stimulation. T1 anatomical sequence was required. Various segments were utilized for the purpose of anatomical landmarking, alignment to the standardized Talairach coordinate system. The DLPFC target location was identified through cortical coregistration using each participant's MRI, the coordinates for targeting the left DLPFC were identified at the location (-41, 16, 54). The iTBS triplet 50-Hz bursts repeated at 5 Hz, 2 seconds on, 8 seconds off, totaling 1800 pulses per session at 70% RMT for each iTBS session. In a single day, participants underwent a schedule of five iTBS sessions, each consisting of 1800 pulses with intervals of 50 minutes between them. During 4 weeks of maintenance treatment, two sessions of 1800 pulses were administered weekly. The MADRS which is widely recognized as the primary and traditional method for assessing the severity of depression, was assessed at baseline, after aiTBS treatment, 1 to 4 weeks of iTBS maintenance treatment by well-trained psychiatrists. In addition, the evaluation of overall illness severity through the Clinical Global Impression severity subscale (CGI-S) was conducted at various time points. Participants self-reported any adverse events following each treatment, with special attention given to serious adverse events and factors leading to treatment discontinuation. Statistical analysis used independent samples t test, Mann-Whitney U test, Fischer's exact test and linear mixed model

Results A total of 30 participants were effectively included in our research project. 18 had taken one or more antidepressant medicine in the past month, and 12 was no antidepressant used. Among all the individuals in the study group, 73.3% were female, and the mean age was 15.75±1.78 years. All participants were right handed and Han nationality. Of the 30 youth, 3.3% reported a family history of mental illness. Median MADRS total scores and CGI-S scores were 27 and 4 at baseline. There were no statistically significant variations in sociodemographic and baseline clinical characteristics among the subgroups of individuals taking antidepressants versus those who were not. The variations in MADRS total score, MADRS score reduction, and

CGI-S score were showed significant differences over time. Rates of remission were 21.4% for antidepressant used and 75.0% for no antidepressant used group in third week, showing a significant difference between the two groups as determined by Fisher's exact test (OR: 0.091; 95% CI: 0.012 to 0.704; $p=0.026$). The results of linear mixed model indicated a significant decrease in MADRS scores and CGI-S score at the 4-week follow-up appointment. It also showed a notable variance in the mean MADRS total and reduced scores for decreased sleep, difficulty concentrating, lack of feelings and pessimistic thinking factors across different groups over time

Conclusion The combination of aiTBS and 4 weeks of iTBS maintenance guided by neuronavigation is both safe and well-tolerated, demonstrating a notable enhancement in depressive symptoms among adolescents. This treatment approach may offer greater benefits compared to adolescents not utilizing medicinal intervention. In general, there is a rapid advancement in the field of noninvasive neuromodulation techniques. Nevertheless, there is a noticeable absence of parametric approaches and extensively researched dosage schedules tailored specifically for adolescent. While this is a preliminary exploratory study and there is still need enhancement in many aspects, the findings of this research offer insights and guidance for optimizing treatment approaches for iTBS in adolescents, particularly with regards to the use or non-use of antidepressants.

Subtyping Schizophrenia with Neurotransmitter-specific Individual Cortical Thickness Deviations

Wei Wei Tao Li*

Affiliated Mental Health Center and Hangzhou Seventh People's Hospital, Zhejiang University School of Medicine

Objective Aberrations in diverse neurotransmitter systems are the primary etiology of schizophrenia and the main treatment targets. The heterogeneity of neurotransmitters disruptions in schizophrenia remains unclear. To construct individual profiles of neurotransmitter disruptions in schizophrenia patients through correlating normative model-derived individual cortical thickness (CTh) deviations with publicly accessible molecular images of neurotransmitter receptors/transporters and identify neurotransmitter-related biological subtypes of schizophrenia

Methods This study included structural brain imaging data from healthy controls across 6 datasets (2910 subjects, 1668 females and 1242 males) and first-episode treatment-naïve schizophrenia patients from 2 datasets (dataset 1: 205 subjects, 122 females and 83 males; dataset 2: 169 subjects, 106 females and 63 males). All healthy subjects were used to construct normative models of CTh. Clinical and genetic data were used to describe the identified subtypes. Data analysis was conducted between June 1, 2023, and April 1, 2024. For each brain region, a z score indexing the CTh deviating from the normative range from a reference population was evaluated using the hierarchical Bayesian regression. Spearman correlation coefficients were calculated for each schizophrenia patients to represent the similarity between CTh deviation map and molecular images of 21 neurotransmitter receptors/transporters distributed in dopamine, serotonin, cannabinoid, opioid, glutamate, γ -aminobutyric acid, histamine, norepinephrine, or choline systems. Consensus clustering was employed to identify subtypes within the 2 datasets separately. Partial least squares correlation was used to assess differences of clinical manifestations and neurotransmitter-specific polygenetic risk scores among subtypes

Results we identified 3 reproducible biological subtypes of schizophrenia across 2 independent datasets. These subtypes are characterized by unique profiles of CTh deviations and their associations with neurotransmitter systems. The burden of clinical symptom was found to correlate with the profiles of CTh deviations in all 3 subtypes in different manners. Genetic burdens also varied among subtypes. Additionally, analysis of

human brain gene expression data revealed that the CTh deviations of these subtypes are rooted in different brain cell types and neurodevelopmental stages

Conclusion Our findings indicate that although schizophrenia involves multiple neurotransmitter systems, the degree and pattern of involvement differ across individuals. This study provides a new perspective on the heterogeneity of brain structural anomalies in schizophrenia within the framework of neurotransmitter systems, which is crucial for the precise pharmacotherapy of the disorder.

基于心率变异性对于青少年抑郁障碍患者非自杀性自伤影响因素的探究

高明龙* 柳亚楠
河北医科大学第一医院

目的 探讨青少年抑郁障碍患者非自杀性自伤 (Non-suicidal self-injury, NSSI) 的影响因素, 并分析心率变异性与其非自杀性自伤的关系, 探究 NSSI 可能的生物标志物。

方法 本研究于 2023 年 11 月至 2024 年 5 月入组于河北医科大学第一医院门诊就诊的青少年患者, 用一般情况调查表收集患者姓名、年龄、长期居住地、是否独生子女、生物钟紊乱等社会人口学资料, 采用渥太华自伤调查表中文修订版、汉密尔顿抑郁量表 24、中学生心理健康调查量表、中学生应对方式、儿童期创伤问卷简版、自杀风险因素评估表评估入组患者是否存在自伤行为、心理健康状态、问题及情绪的应对方法、童年期创伤、自杀风险因素等情况, 采用心率变异性检查评估自主神经功能。计数资料间比较采用卡方检验、计量资料间比较采用两独立样本 t 检验或非参数检验, NSSI 的影响因素分析采用二元 logistic 回归分析, $P < 0.05$ 表示差异有统计学意义。

结果 本研究共入组 130 例门诊就诊的青少年患者, 筛选出 101 例抑郁障碍患者, 结果发现过去一年内心率变异的检出率为 80.2%。其中女生 (85.3%) 高于男生 (65.4%) ($\chi^2=4.838$, $P=0.028$)。NSSI 组

和无 NSSI 组在目前状态、父亲文化程度、家庭是否和睦、规律运动、生物钟紊乱之间的差异均有统计学意义 ($P < 0.05$)。在年龄、母亲文化程度、长期居住地、是否独生子女、目前治疗方式等方面差异无统计学意义。NSSI 组和无 NSSI 组在偏执、人际关系紧张与敏感、抑郁、焦虑、学习压力、适应不良、情绪不平衡、心理不平衡、情绪应对方式、情感忽视、自杀风险因素等因子评分差异均具有统计学意义 ($P < 0.05$) 且两组在高频心率变异性 (HF HRV)、心率等方面差异均具有统计学意义 ($P < 0.05$)。规律运动、生物钟紊乱、偏执、人际关系紧张与敏感、抑郁、学习压力、适应不良、情绪不平衡、心理不平衡、情绪应对方式、情感忽视、高自杀风险是 NSSI 的独立危险因素 (OR=3.225、3.394、1.086、1.130、1.101、1.075、1.145、1.123、1.118、1.083、1.137、1.168)。

结论 青少年抑郁障碍患者 NSSI 发生率较高, 规律运动、生物钟紊乱、偏执、人际关系紧张与敏感、抑郁、学习压力、适应不良、情绪不平衡、心理不平衡、情绪应对方式、情感忽视、较高的自杀风险与青少年抑郁障碍患者 NSSI 相关。高频心率变异性 (HF HRV) 的降低以及心率的增加可能是 NSSI 的生物标志物。

Paliperidone Plasma Concentrations, and Its Correlation with Clinical Outcomes and Genetic Polymorphism

Zhewei Kang Zhe Lu Weihua Yue*
Peking University Sixth Hospital

Objective Paliperidone (PAL) is the active metabolite of the second-generation antipsychotic risperidone, commonly used to treat schizophrenia. This study aims to explore the correlation between PAL plasma concentration and clinical outcomes, identify clinical and genetic factors affecting PAL plasma levels, and evaluate whether these factors can predict PAL plasma levels

Methods Two hundred sixty-eight patients receiving PAL were recruited and followed up for 6 weeks. Clinical effectiveness was assessed at baseline, and at weeks 2, 4, and 6 using the Positive and Negative Symptom Scale (PANSS). Extrapyramidal symptoms (EPS) were assessed using the Barnes Akathisia Scale (BAS) and the Extrapyramidal Symptom Rating Scale (ESRS). Other safety outcomes, including laboratory tests, were also monitored. Plasma steady-state PAL concentrations were measured at week 4 using high-performance liquid chromatography (HPLC). Single-nucleotide polymorphisms (SNPs) were tested for their association with PAL concentration levels

Results A total of 172 participants (median [IQR] age, 31 [25-40] years) were included in the analysis. By the end of week 6, 64.6% of the patients achieved a clinical response ($\geq 50\%$ reduction in PANSS score). No significant correlation was found between PAL plasma concentration and symptom improvement. However, higher plasma concentrations were associated with an increased risk of EPS, particularly akathisia. Oral dosage, sex, and renal function (measured by eGFR) were significantly associated with PAL plasma concentration, explaining 27.46% of the individual variability. The CNTNAP2 gene region (rs2141512, $P = 3.98 \times 10^{-8}$) showed the most significant association with PAL levels after controlling for eGFR, age, sex, and the first five principal components of population structure. Logistic regression using oral dosage, eGFR, age, sex, and rs2141512 to predict whether an individual's plasma concentration exceeds the therapeutic reference range demonstrated good predictive capability ($AUC = 0.822$), significantly higher than the model without rs2141512 ($AUC = 0.762$)

Conclusion Paliperidone was effective in significantly improving the symptoms of schizophrenia. The plasma levels of PAL were influenced by both clinical and genetic factors, and are associated with the risk of adverse effects. Incorporating clinical and genetic factors into clinical practice may improve personalized treatment strategies for individuals receiving PAL.

Integration of Multi-omics Summary Data Reveals The Role of N6-methyladenosine Methylation in Neuropsychiatric Disorders

Suhua Chang* Chao Liufu Lingxue Luo
Peking University Sixth Hospital

Objective Neurodevelopmental and neurodegenerative disorders are highly heritable, with numerous single nucleotide polymorphisms (SNPs) identified through genome-wide association study (GWAS). Nonetheless, GWAS have limitations in addressing the intricate relationships among genetic variants, DNA functional elements (e.g., gene expression/protein levels) and complex diseases. The impacts of SNP on disorders may be mediated through numerous regulatory mechanisms, one of which is mRNA N6-methyladenosine (m6A) modification. m6A is a dynamic reversible methylation modification of the adenosine N6 position and is the most common chemical epigenetic modification among mRNA post-transcriptional modifications. In addition, m6A is deposited both co-transcriptionally and post-transcriptionally. It may regulate the gene expression or be regulated after transcription by functional genes. Exploration of the interaction between various molecular phenotypes would facilitate the elucidation of the relationship among m6A, gene expression, protein abundance, and neuropsychiatric diseases

Methods We performed m6A-wide association studies (m6A-WAS) and Summary-data-based Mendelian Randomization (SMR) analyses for seven kinds of neuropsychiatric disorders including schizophrenia (SCZ), bipolar disorder (BP), attention deficit hyperactivity disorder (ADHD), autism spectrum disorder (ASD), major depressive disorder (MDD), Alzheimer's disease (AD) and Parkinson disease (PD) by integrating large-scale GWAS and human m6A-QTL datasets. We then integrated additional datasets for eQTL and protein QTL (pQTL) to investigate the intricate interactions among these molecular phenotypes

Results We first identified 86 m6A sites associ-

ated with seven neuropsychiatric diseases and subsequently uncovered 7881 associations between m6A sites and gene expression. Furthermore, we extracted 916 associations representing the relationships between the 82 disease-related m6A sites and 606 genes. We subsequently conducted a TWAS analysis based on the 606 genes and identified 58 risk genes related to these diseases. By integrating these results, we obtained 81 associations that suggest potential pathogenic mechanisms through which m6A may influence disease via the regulation of gene expression. Especially, we found the m6A regulated genes in these seven diseases were involved in the “response to stimulus” pathway, and analyzed the interaction among the m6A regulated genes and nearby genes from PPI network. Additionally, we analyzed the impact of gene expression on m6A and identified four gene - m6A - disease associations, and also examined the post-transcriptional effect of m6A on protein expression

Conclusion The analysis encompassed the impact of m6A on gene expression, the influence of gene expression on m6A modification, and the post-transcriptional effect of m6A on protein levels. Our study provided new insights into the genetic component of m6A in neuropsychiatric disorders and unveiled potential pathogenic mechanisms where m6A exerts influences on disease through gene expression/protein regulation

This study has been published in *Molecular Psychiatry*, 2024.

伴焦虑症状的抑郁症患者心率变异性及压力水平特征的研究

刘颖 王卓言 于鲁璐*
河北医科大学第一医院

目的 探讨伴焦虑症状的抑郁症患者心率变异性特征及压力水平、睡眠质量和免疫炎症水平的差异, 并分析焦虑症状与心率变异性的相关性。

方法 纳入抑郁症患者 80 例。根据汉密尔顿焦虑量表 (HAMA) 评分分为伴焦虑抑郁组 (n=50) 和不伴焦虑抑郁组 (n=30)。测量心率变异性 (HRV): 低频 (LF)、高频 (HF)、高频/低频 (LF/HF)、心搏中 RR 间期的标准差 (SDNN)、相邻 RR 间期差值均方根 (RMSSD), 采用匹兹堡睡眠质量指数量表 (PSQI)、压力知觉量表 (CPSS) 评估睡眠质量及压力水平, 检测血清 C 反应蛋白 (CRP) 和白介素-6 (IL-6) 水平。比较伴焦虑抑郁组与不伴焦虑抑郁组汉密尔顿抑郁量表 (HAMD) 评分及各项因子分、CPSS 评分、PSQI 评分、HRV 指标及 CRP 和 IL-6 的差异。探索抑郁症患者 HAMA 分值及 CPSS 分值与 HRV 指标间相关性。

结果 1、伴焦虑抑郁组的 CPSS 总分 ($t=3.230$, $P<0.05$) 及紧张感 ($t=2.352$, $P<0.05$) 及失控感 ($t=2.826$, $P<0.05$) 两项因子分、PSQI 量表中的睡眠节律紊乱因子 ($t=2.156$, $P<0.05$)、日间功能障碍因子 ($t=2.434$, $P<0.05$) 及 HAMD 总分 ($t=5.452$, $P<0.05$) 和因子分中焦虑躯体化因子 ($t=2.982$, $P<0.05$)、认知障碍因子 ($t=2.664$, $P<0.05$)、迟滞因子 ($t=4.225$, $P<0.05$)、睡眠障碍因子 ($t=2.240$, $P<0.05$)、IL-6 水平 ($t=2.002$, $P<0.05$) 及 CRP 水平 ($t=3.886$, $P<0.001$) 均显著高于不伴焦虑抑郁组, 差异具有统计学意义 ($P>0.05$)。2、不伴焦虑抑郁组 LF 均显著高于伴焦虑抑郁组, HF ($t=-4.996$, $P<0.05$)、RMSSD ($t=-2.308$, $P<0.05$) 显著低于不伴焦虑抑郁组。3、HF 与 HAMA 分值 ($r=-0.239$, $P=0.035$)、CPSS 分值 ($r=-0.234$, $P=0.039$) 呈负相关关系。

结论 伴有焦虑症状的抑郁症患者抑郁程度更严重, 睡眠质量更差、压力水平更高及血清 IL-6、CRP 水平更高, 且伴焦虑的抑郁症患者 HF 与 HAMA 分值及 CPSS 分值呈负相关, 提示抑郁症患者伴有焦虑症状时会加重自主神经紊乱。

MTORC1/SREBP 通路在奥氮平所致脂代谢异常和二甲双胍治疗作用中的机制研究

褚昊冉 朱厚名 蒋一佳 马家树 李然然*
山东省精神卫生中心

目的 本研究拟通过体外细胞实验探讨 mTORC1/SREBP 通路在奥氮平引起脂代谢异常中的作用以及 mTORC1/SREBP 通路在二甲双胍干预奥氮平所致脂代谢异常中的潜在机制

方法 使用 HepG2 肝细胞系,进行 Western Blot 试验研究,探究奥氮平对 mTORC1、SREBP 表达水平的影响;通过 mTORC1 相应的抑制剂(雷帕霉素、二甲双胍)观察抑制相关调控功能后奥氮平及二甲双胍所产生的相应生物效能改变

结果 HepG2 细胞 Western Blot 结果显示,在 mTORC1 相关蛋白(p-4ebp1、4ebp1、p-p70s6、p70s6、p-mTor、mTor)及 SREBP 相关蛋白(srebp-1、srebp-2)中,奥氮平组的 p-4ebp1、p-p70s6、mTor 及 srebp-2 蛋白表达水平较对照组(培养基组)增高;奥氮平+二甲双胍组的 p-4ebp1、p-p70s6、mTor 及 srebp-2 蛋白表达水平较奥氮平组虽然没有显著降低,但有降低的趋势。雷帕霉素作为 mTORC1 抑制剂,在此实验中充当二甲双胍的阳性对照作用,奥氮平+雷帕霉素组的 p-4ebp1、mTor 及 srebp-2 蛋白表达水平较奥氮平组也存在降低的趋势。而四组在 4ebp1、p70s6、p-mTor 及 srebp-1 蛋白表达水平中无明显变化。

结论 mTor 信号分子或是奥氮平潜在作用靶点,为奥氮平上调 SREBP 表达的上游目标因子;二甲双胍可能通过抑制 mTor 活性、抑制 srebp-2 表达,进而一定程度上改善奥氮平引起的脂代谢异常。

关键词: 脂代谢 mTORC1/SREBP 通路 二甲双胍

多基因风险评分联合临床特征与抗抑郁药疗效间的相关性研究

邵永琪 蔡雨凡 唐海平 刘芮 徐治*
东南大学附属中大医院

目的 全球有数百万人正饱受抑郁症的折磨,但在治疗过程中发现:抗抑郁药物治疗在个体间疗效存在明显差异,遗传因素、疾病临床特点、环境因素以及基因环境相互作用被认为是造成个体间差异的重要原因。本研究旨在探寻多基因风险评分、临床特征、环境因素与抗抑郁药疗效间的相关关系。

方法 本研究共纳入 999 名抑郁症患者,以日本生物银行数据集为参考集计算本研究受试对象精神分裂症表型及抑郁症表型下的多基因风险评分(polygenic risk score, PRS)。根据中位值将多基因风险评分分为高风险组和低风险组。采用 Mann-Whitney 检验评估两组间差异, Spearman 相关性分析用于寻找多基因风险评分与治疗反应的相关关系。接着,以 2 周抗抑郁治疗疗效作为结局变量,纳入不同表型下 PRS、疾病临床特点、环境因素为自变量,采用多元逐步线性回归分析构建模型。最后,我们通过评估 PRS 和负性生活事件间是否存在交互作用探究了遗传与环境的交互作用对 2 周治疗结局的影响。

结果 研究发现在抑郁症表型下,高 PRS 遗传风险组与低 PRS 遗传风险组间两周减分率存在统计学差异($P=0.009$),并且遗传风险得分与 2 周减分率之间存在负相关关系($r=-0.075$, $P=0.024$)。0.05 阈值下 MDD-PRS($\beta=-4.086$, $P=0.039$)、快感缺失量表总分($\beta=-0.009$, $P=0.005$)、是否为首次发作($\beta=-0.039$, $P<0.001$)均为抗抑郁疗效的影响因素,能解释抗抑郁疗效的部分变异。交互作用分析结果不显著。

结论 研究结果表明,抑郁症高遗传风险与低遗传风险患者的抗抑郁疗效存在差异。遗传风险越高,抗抑郁疗效越差。此外, MDD-PRS 结合临床特征(首次发作和快感缺失)能部分解释抗抑郁疗效的个体间差异。

The Causal Relationship between Toll-Like Receptor 4 Protein Levels and Major Depressive Disorder: A Two-Sample Mendelian Randomization Study

Fengya Zhen Cuixia An*
the First Hospital of Hebei Medical University

Objective This study aimed to explore the causal relationship between Toll-like receptor 4 (TLR4) protein levels and major depressive disorder (MDD) using two-sample Mendelian randomization (MR) study

Methods Data were collected from the Genome-

wide Association Study (GWAS). Genetic loci that were associated with TLR4 protein from African American and European ancestry were selected as instrumental variables and MDD as outcome variables, meanwhile weight change during the worst depressive episode (gained weight, lost weight or stayed about the same) were also considered as outcome variables in the European ancestry. The inverse variance weighting (IVW), weighted median methods and MR-Egger of MR analysis were employed to analysis the causality between TLR4 protein levels and MDD, and heterogeneity and pleiotropy were evaluated using a sensitivity analysis

Results In African American and European ancestry, the IVW analysis indicated no association between TLR4 protein levels and the risk of MDD (OR=1.022, 95%CI: 0.966-1.082, $P>0.05$; OR= 1.008, 95%CI: 0.994-1.021, $P>0.05$). However, TLR4 protein levels were found to be causally associated with weight stability during the worst depressive episode (OR=0.993, 95% CI: 0.985-0.999, $P<0.05$). Sensitivity analysis confirmed the robustness of these results

Conclusion There were no significant associations between TLR 4 protein levels and the risk of MDD. However, a causal association was found between TLR4 protein levels and weight change during worst episode of depression(which stayed about the same), suggesting that TLR4 protein levels are intricately link to certain depressive symptoms.

A Controlled Study of The Regulation of Bio-rhythms and Physiological Markers of Depression by Light Room Therapy and Its Efficacy

Li Yang¹, Xueyi Wang²

1.Chongqing Mental Health Center

2.Mental Health Center of the First Hospital of Hebei Medical University

Objective To investigate the efficacy of light room therapy on depression and sleep disorder and the potential effects on physiological indices related to circadian rhythms

Methods A total of 54 patients with acute-phase depression who were hospitalized in the Mental Health Center of the First Hospital of Hebei Medical University from October 2021 to July 2023 were recruited and assigned to 36 patients of bright light combined with medication (bright light group) and 18 patients of dim light combined with medication (dim light group). Both groups received light therapy for 2 weeks, with a light intensity of 10,000 lx in the high light group and 300 lx in the low light group, and 30 minutes of light therapy every morning from 7:30 am to 8:00 am. The Hamilton Depression Rating Scale (HAMD17) was used to assess patients' depressive symptoms and the Pittsburgh sleep quality index (PSQI) to assess patients' sleep quality at baseline, the end of every week. The 32-Item Hypomania Checklist (HCL-32) was used at the end of week 2 to assess the risk of mania after treatment. The temperature, heart rate and blood pressure of patients before and after the light therapy were measured and recorded every day during the light treatment period, and adverse events related to light therapy were assessed and recorded. Paired t-tests were used to compare the changes in body temperature, heart rate and blood pressure before and after treatment. Repeated measures ANOVA analysis were used to compare the differences in changes in clinical symptoms between the two groups

Results Thirty-one and Fifteen patients completed this study in the bright light and dim light groups, respectively, and the difference in shedding rates between the two groups was not statistically significant ($P>0.05$). There was an interaction between the time point and the group in HAMD17 and PSQI total score ($F=5.512, 4.113, \text{ all } P<0.05$). HAMD17 and PSQI scores at the end of the 1st, 2nd, and 3rd decreased sequentially and reached significant levels in both groups ($P<0.001$). Body temperatures in the bright light group were elevated compared to the pre-treatment period, and the differences in body temperatures before and after treatment were statistically significant on days 1-4, 7, and 12 ($P < 0.05$). Heart rate was elevated in the bright

light group on day 5 compared to pre-treatment, and the difference was statistically significant ($P < 0.05$). Systolic blood pressure in the bright light group decreased on days 4, 5, 11 and 12 compared to pre-treatment, with statistically significant differences ($P < 0.05$), while systolic blood pressure in the dim light group increased on day 11 compared to pre-treatment, with statistically significant differences ($P < 0.05$). The diastolic blood pressure of the subjects in the bright light group decreased on days 1, 5 and 6 compared with the pre-treatment period, and the difference was statistically significant ($P < 0.05$). There were no serious adverse events in both group, no vision loss or ocular structural changes, and the difference in the rates of adverse events between the two groups was not statistically significant ($P > 0.05$), and there was no occurrence of mania

Conclusion Medication combined with indoor bright light was more effective in treating depressive symptoms and sleep Symptoms than combined with low light therapy, and the bright light group was accompanied by a decrease in body temperature, a faster heart rate, and a decrease in blood pressure after light therapy.

Molecular Mechanism of The Tnik Gene Affecting The Action of Antipsychotic Drugs Through The Glutamate Pathway

Xu Qingqing¹, Yu Shunying¹, Shengying Qin², Lin He²

1.Shanghai Mental Health Centre

2.Shanghai Jiaotong University

Objective Schizophrenia (SCZ) is a complex psychiatric disorder primarily treated with antipsychotic drugs (APDs), yet the response to these treatments shows significant individual variability. Between 40% and 80% of patients exhibit minimal or no response to these medications, and some experience severe adverse effects. Genetic factors play a crucial role in these individual differences

Previous research revealed that three SNPs within

the intronic regions of the TNIK gene, rs2088885, rs7627954, and rs6444970, are significantly associated with the efficacy of APDs. However, the specific mechanisms of how TNIK affects the efficacy of antipsychotic drugs remain unknown. TNIK is a susceptibility gene for schizophrenia and is closely related to glutamate metabolism, which may play a crucial role in the response to antipsychotic drugs. Hence, this study investigates the impact of the TNIK on changes in the glutamate pathway induced by antipsychotic drugs. However, the specific mechanisms of how TNIK affects the efficacy of antipsychotic drugs remain unknown. TNIK is a susceptibility gene for schizophrenia and is closely related to glutamate metabolism, which may play a crucial role in the response to antipsychotic drugs. Hence, this study investigates the impact of the TNIK on changes in the glutamate pathway induced by antipsychotic drugs.

Methods The regulatory functions of rs2088885, rs7627954, and rs6444970 were studied using a dual-luciferase reporter gene assay. Subsequently, a TNIK knockdown SH-SY5Y cell model was established using siRNA interference techniques. Morpholino technology was used to knockdown the zebrafish homolog of TNIK (tnika). Post-treatment with risperidone in zebrafish, RT-qPCR analysis was used to evaluate expression of glutamate pathway genes

Results The regulatory functions of rs2088885, rs7627954, and rs6444970 were studied using a dual-luciferase reporter gene assay. The results revealed that the genomic regions of rs2088885 and rs7627954 exhibit promoter activity that diminishes upon mutation, while the genomic region of rs7627954 also exhibited enhancer activity. The wild-type region of rs6444970 did not show any apparent regulatory effect, however, mutation in this region demonstrated significant enhancer activity. These findings suggest that the three polymorphic sites, rs2088885, rs7627954, and rs6444970, may have a substantial impact on the expression of the TNIK gene

Subsequently, a TNIK knockdown SH-SY5Y cell model was established using siRNA interference techniques. RT-qPCR analysis post-treatment with antipsy-

chotic drugs risperidone and clozapine revealed significant increases in the expression of key enzymes in the glutamate pathway, GLS, GLUL, and GLUD. Knockdown of TNIK further elevated the expression of these enzymes, suggesting that TNIK may play a crucial role in maintaining glutamate homeostasis.

Morpholino technology was used to knockdown the zebrafish homolog of TNIK (tnika). Phenotypic observations revealed developmental anomalies such as axial curvature, cardiac edema, increased mortality, and reductions in head area and eye diameter, suggesting that tnika affects early head development and neurodevelopment in zebrafish. Post-treatment with risperidone in zebrafish, RT-qPCR results indicated that tnika knockdown further increased the expression of glutamate pathway genes (glula, glulb, glsa, glsb, and glud1), consistent with cellular findings, suggesting that tnika might play a role in maintaining glutamate metabolic homeostasis. Its deficiency leads to glutamate metabolism disorder, impacting the efficacy of APDs.

Conclusion In conclusion, this study aims to elucidate the function of TNIK in the action of antipsychotic drugs, particularly its effect on the glutamate pathway. The findings suggest that TNIK may influence APDs efficacy through its impact on glutamate metabolism. Further investigation into its molecular mechanisms will help understand how TNIK affects antipsychotic drug efficacy, providing insights for personalized treatment of schizophrenia and discovering new drug targets.

伴和不伴忧郁特征的抑郁症患者的双侧伏隔核功能连接差异分析

沈宗霖* 晏和智

昆明医科大学第一附属医院

目的 伴忧郁特征的抑郁症 (MD) 患者与不伴忧郁特征的抑郁症 (NMD) 患者和健康对照组 (HC) 相比, 双侧伏隔核体积 (NAc) 表现出差异, 且 MD

患者的 NAc 灰质体积比 HC 显著降低。然而, MD 组和 NMD 组中的 NAc 功能连接 (FC) 是否存在差异, 且这种差异是否与 MD 的发病机制有关, 还有待进一步探索。

方法 根据性别、年龄和教育程度, 共计招募了 60 名 MD 患者、58 名 NMD 患者和 80 名健康对照组。研究以双侧 NAc 为感兴趣区域 (ROI), 计算并比较各组之间双侧 NAc 与全脑 FC 的差异, 并探索与临床特征的相关性。

结果 与 HC 组相比, 在 MD 组中左侧 NAc 与左侧前扣带回皮层和右侧额叶中回之间的 FC 值降低, 右侧 NAc 与左侧颞下回和右侧额叶中回之间的 FC 也有所降低。相比之下, NMD 组在与 HC 组的比较中仅显示出左侧 NAc 与左侧扣带回后皮层之间的 FC 值降低, 右侧 NAc 的功能连接与 HC 相比无显著差异。与 NMD 组不同的是, MD 组右侧 NAc 和左侧额叶中回之间的 FC 增加。两组患者左侧额叶中回的平均 FC 与 HDRS 评分、快感缺失评分和病程的相关性无显著统计学差异 ($p>0.05$)。MD 组和 NMD 组在左侧 NAc 的 FC 上没有发现明显差异。

结论 MD 患者显示出与 NMD 患者和健康对照组不同的 NAc 功能连接模式, 尤其是与默认模式网络 (DMN) 和额中回的连接。与默认模式网络 (DMN) 的 FC 降低以及与右侧前额叶区域的连接增强可能表明, MD 患者的奖赏神经环路相互作用不典型, 而右侧 NAc 与左侧前额叶回的连接差异可能区分 MD 与 NMD 的神经机制。

血清可溶性 TREM2 在识别轻度认知障碍中的价值

黄接琦 王岚*

河北医科大学第一医院

目的 尽管目前有研究显示可溶性髓样细胞触发受体 2 (soluble triggering receptor expressed on myeloid cells 2, sTREM2) 与阿尔茨海默病 (Alzheimer's disease, AD) 的发生发展存在相关, 但在疾病的不同阶段 sTREM2 的水平也有所不同, 在外周血中

sTREM2 能否作为早期识别轻度认知障碍 (MCI) 的生物学指标结果尚不一致。因此,本研究分析了 MCI 和认知正常老年人之间血清 sTREM2 的差异,以及认知功能、血清 A β 、p-tau 与 sTREM2 水平的相关性,探讨血清 sTREM2 在识别 MCI 中的价值。

方法 纳入河北省石家庄及邢台市社区老年人 216 人,其中 MCI 组 106 人,认知功能正常 (NC) 组 110 人,采用蒙特利尔认知评估量表 (MoCA)、简易智能状态检查 (MMSE)、波士顿命名测验 (BNT)、数字广度测验 (DST) 评估两组的认知功能,空腹采集静脉血液,采用酶联免疫吸附试验的方式检测血清中 A β 42、A β 40、p-tau217、p-tau231、TREM2、sTREM2 浓度。

结果 1.MCI 组血清 sTREM2 水平高于 NC 组,差异存在统计学意义 ($H=4312.0, P=0.001$),其余血液学指标组间差异无统计学意义 ($P>0.05$)。2.相关性分析显示,sTREM2 与 p-tau217、文化程度、MMSE、MoCA、BNT、DST 呈负相关 ($P<0.05$); TREM2 与 p-tau217、A β 42 呈正相关 ($P<0.05$)。3.将是否为 MCI 作为因变量,性别、年龄、文化程度、居住方式、上述血液指标作为自变量纳入二元 Logistic 回归分析,结果表明,sTREM2 为 MCI 的危险因素 ($OR=1.009, 95\%CI=1.002-1.016, P=0.015$),初中及以上文化程度为 MCI 的保护因素 ($OR=0.163, 95\%CI=0.070-0.377, P<0.001$)。4.sTREM2 识别是否 MCI 的 ROC 曲线下面积为 0.630 (敏感度 0.472, 特异度 0.782), sTREM2 联合 MMSE 的 ROC 曲线下面积最佳为 0.849 (敏感度 0.679, 特异度 0.873)。

结论 血清 sTREM2 在 MCI 人群中明显升高,这与 MCI 认知功能下降呈弱相关。sTREM2 联合神经心理学测验 (主要为 MMSE) 能提高识别 MCI 的敏感性和特异性,有成为识别 MCI 的潜在应用价值。

青少年抑郁症患者血清中高迁移率族蛋白 1(HMGB1)与快感缺失相关脑区功能影像学研究

张亚兴 闫乐婷 赵媛媛*
河北医科大学第一医院

目的 青少年抑郁症是一种严重的、高发病率的精神疾病,罹患抑郁伴快感缺失的青少年病情更严重、自杀率更高。既往大量研究已表明 CRP、IL-6 及 TNF- α 等急性炎症因子损伤奖赏系统的功能活动,而慢性炎症因子是否能影响脑区的功能还未明确,本研究欲分析青少年抑郁症患者血清中高迁移率族蛋白 1(HMGB1)与快感缺失的相关性,并探索 HMGB1 与奖赏脑区自发神经活动之间的关系。

方法 选取 2023 年 2 月至 2023 年 8 月在河北医科大学第一医院精神卫生中心住院的 13-17 岁抑郁症患者 50 例和同时期年龄、性别与之相匹配的社区健康对照者 50 例进行 Snaith-Hamilton 快乐量表(SHAPS)评估、HMGB1 检测及静息态功能磁共振成像(functional magnetic resonance imaging, fMRI)检查,基于 BOLD 像分析 2 组分数低频振荡振幅(fractional amplitude of low-frequency fluctuation, fALFF)、局域一致性(regional homogeneity, ReHo)的差异脑区、并以差异脑区为感兴趣区域(Region of Interest, ROI)进行功能连接(functional connectivity, FC)分析,组间比较采用 t 检验。采用 Spearman 相关分析,分析快感缺失、HMGB1 与大脑自发神经活动的相关性。

结果 与对照组相比,MDD 组独生子女比例高 ($p=0.024$),亲子关系更差 ($p<0.001$),汉密尔顿抑郁量表 17 项 (HAMD-17) ($p<0.001$)、汉密尔顿焦虑量表 (HAMA) ($p<0.001$) 及 Snaith-Hamilton 快乐量表 (SHAPS) 评分 ($p<0.001$) 均显著升高, HMGB1 浓度显著升高 ($p<0.001$),中央前回 fALFF 值减少 (团块水平 FDR 校正,峰值 $P<0.01$,团块水平 $P<0.01$)。HMGB1 分别与 HAMA 评分 ($r=0.350, p=0.022$)、HAMD-17 评分 ($r=0.371, p=0.014$)、SHAPS 评分 ($r=0.365, p=0.016$) 呈正相关, HMGB1 与中央前回 fALFF 值呈负相关 ($r=-0.622, p=0.031$),中央前回 fALFF 值与 SHAPS 评分呈负相关 ($r=-0.756, p=0.004$)。

结论 HMGB1 可能通过影响中央前回自发性活动从而影响快感缺失,这为炎症作为伴快感缺失抑郁症患者的额外治疗目标奠定理论基础。

生命不同阶段多重应激对焦虑抑郁症状检出

率的调查研究

李娜 王岚 王学义*

河北医科大学第一医院

目的 探讨生命不同阶段（胎儿期、童年期和成年期）多重应激对焦虑抑郁症状的影响。

方法 在 2013-2014 年间调查开滦矿业集团工人，以胎儿期是否暴露于地震作为胎儿期创伤性事件，采用儿童期创伤问卷（Childhood Trauma Questionnaire, CTQ）和生活事件量表（life event scale, LES）分别评估儿童期创伤和成年期生活事件。收集所有受试者一般人口学资料，如性别、年龄、出生日期、家庭收入、受教育情况、吸烟及饮酒史等。胎儿期地震暴露组为 1976 年 7 月 29 日至 1977 年 4 月 28 日出生，在胎儿期经历地震；胎儿期非暴露组为 1977 年 7 月 29 日至 1978 年 4 月 28 日出生，地震至少 1 年后出生，胎儿期未遭受地震应激。将受试者的 CTQ 中满足以下任一项定义为存在童年期创伤：情感虐待 ≥ 13 分，躯体虐待 ≥ 10 分，性虐待 ≥ 8 分，情感忽视 ≥ 15 分，或躯体忽视 ≥ 10 分。将 LES > 32 分定义为存在成年期生活事件。采用 17 项汉密尔顿抑郁量表和 14 项汉密尔顿焦虑量表评估所有受试者的抑郁和焦虑症状。将这两个量表 ≥ 7 分定义为存在焦虑抑郁症状。将所有受试者根据生命不同阶段遭受创伤性事件的情况分为 4 组：无暴露组、暴露组 1、暴露组 2 和暴露组 3，比较四组焦虑抑郁症状的检出率。计量资料均数和标准差表示，多组间比较采用单因素方差分析；计数资料用百分率表示，采用 χ^2 检验进行组间比较；采用多因素 logistcs 回归分析进行抑郁症状的影响因素分析。

结果 最终有 626 人纳入统计分析，其中无暴露组 29 人、暴露组 1 为 249 人、暴露组 2 为 275 人和暴露组 3 为 73 人。随着遭受创伤时期数量增加抑郁症状检出率增加，分别是无暴露组为 0.5%，暴露组 1 为 1.5%，暴露组 2 为 2.7%，暴露组 3 为 9.7%，差异有统计学意义（ $\chi^2=12.715$, $P=0.006$ ）。多因素 logistcs 回归分析显示，在胎儿期、童年期和成年期均遭受创伤性事件是抑郁症状的独立风险因素（ $P<0.001$, $OR=24.527$, $95\%CI=2.193, 274.359$ ）。受教育年限小于 12 年是抑郁症状的保护性因素（ $P=0.004$, $OR=0.034$, $95\%CI=0.003, 0.337$ ）。

结论 生命不同阶段遭受多重创伤性事件会增加抑郁症状风险。

基于结构方程模型对河北大学生抑郁情绪影响因素的分析

卢文婷 王学义*

河北医科大学第一医院

目的 本研究的目的是探索河北大学生抑郁情绪检出率及影响因素，并构建抑郁情绪影响因素的结构方程模型，为我省高校人才培养的良性发展提供方向。

方法 本研究是基于互联网自评的横断面研究，于 2021 年 10 月至 2023 年 12 月随机选取河北省内三所院校（河北医科大学、河北科技大学以及石家庄铁道大学）本科生 23384 名，其中 2094 名同学不同意参与筛查，最终回收问卷 21290 份，评估资料回收率为 91.0%。采用患者健康问卷抑郁量表（PHQ-9）评估受试者抑郁情绪严重程度，并根据 PHQ-9 得分分组：得分大于等于 5 分为有抑郁情绪组，得分小于 5 分为无抑郁情绪组。资料回收整理后使用 SPSS 26.0 软件进行统计分析。连续性计量资料以平均值 \pm 标准偏差（Mean \pm SD）表示，计数资料以例数（百分比）来表示。采用 AMOS 20.0 软件包实现结构方程模型的拟合与分析。资料不全的受访者数据不纳入统计分析，双侧 P 值小于 0.05 认为差异具有统计学意义。

结果 以抑郁情绪的严重程度为内生观测变量，以心理弹性及压力感知作为中介变量，以儿童创伤和生活事件作为外源潜变量建立了一个全模型，经过多次调整，并且删除不显著的路径，以渐进残差均方和平方根（RMSEA）小于 0.08，GFI、IFI、NFI 大于 0.90 为标准确定最终结构方程模型，且本模型信度效度检验良好。结构方程模型提示：童年期创伤对抑郁情绪的直接效应（ $\beta=0.239$, $P<0.05$ ）及间接效应（ $\beta=0.063$, $P<0.05$ ）均存在统计学意义。童年期创伤对抑郁情绪的间接影响不仅是通过心理弹性（ $\beta=0.037$, $P<0.05$ ），还通过心理弹性和压力感知（ $\beta=0.026$, $P<0.05$ ）的影响，表明心理弹性和压力感知在童年期创伤与抑郁情绪之间存在连锁的中介作用（效应大小=41.3%）。生活事件影响抑郁情绪

主要以直接效应为主 ($\beta=0.052$, $P<0.05$), 效应大小为 89.7%, 生活事件对抑郁情绪的间接影响是以心理弹性为主 ($\beta=0.007$, $P<0.001$), 压力感知与心理弹性的联合中介效应微乎其微。

结论 童年期创伤、生活事件、心理弹性、压力感知与抑郁情绪之间存在显著的关联, 加强个体的心理弹性, 减少对压力的过度感知可能是预防抑郁情绪的有效干预措施。

Associations between Body Mass Index, High-Sensitivity C-Reactive Protein Levels and Depressive Symptoms: NHANES 2015-2016

Yan Zhang Cuixia An*

The First Hospital of Hebei Medical University

Objective Many studies have shown an association between Body Mass Index (BMI), High-Sensitivity C-reactive protein (HSCRP), and depressive symptoms (DP). However, the complex relationship between BMI, HSCRP and DP remains uncertain. The objective of this research is to examine the correlation between BMI, HSCRP levels, and DP in a substantial sample that is representative of the national level

Methods Our analysis was based on the 2015-2016 National Health and Nutrition Examination Survey (NHANES). BMI was used to assess obesity, and DP was measured by the Patient Health Questionnaire-9 (PHQ-9). Physical activity (PA) was assessed based on self-reported duration and frequency of various activities. Using multivariable logistic regression analysis and stratified analysis, we examined the relationship between BMI, HSCRP levels, and DP. In addition, we applied generalized additive models to explore the non-linear relationships among variables

Results This study included a total of 4834 participants. The results revealed that BMI ($P=0.029$) and HSCRP levels ($P=0.018$) were risk factors for DP. Moreover, our study revealed the relationship between BMI and DP ($P=0.013$), HSCRP levels and DP ($P=$

0.038), as well as BMI and HSCRP levels were non-linear ($P=0$). The nonlinear association between HSCRP and DP is significant in women when stratified by gender ($P=0.006$). Similarly, stratifying by gender, a nonlinear association between BMI and DP was found to be significant only in women ($P=5e-04$). No nonlinear association was found between BMI and DP ($P=0.979$), as well as between HSCRP and DP ($P=0.644$) in men

Conclusion Research have found links between increased risk of DP and elevated levels of both BMI and HSCRP and the relationship between them were non-linear. Furthermore, the nonlinear associations between BMI and DP, as well as between HSCRP and DP, are gender-dependent.

Genome-wide Association Study in Patients with Schizophrenia Revealed Associations of Copy Number Variants and Antipsychotic Treatment Response

Yaoyao Sun Yuyanan Zhang Weihua Yue*

Institute of Mental Health, Peking University Sixth Hospital

Objective Response to antipsychotic drugs (APD) varies greatly among individuals and is affected by genetic factors. While contribution of common single nucleotide variant (SNV) has been extensively explored, little is known about the copy number variant (CNV) associated with treatment response. This study aims to demonstrate genome-wide associations between copy number variants (CNV) and response to APD in patients with schizophrenia

Methods A total of 3,030 patients of Han Chinese ethnicity randomly received APD (aripiprazole, olanzapine, quetiapine, risperidone, ziprasidone, haloperidol and perphenazine) treatment for six weeks. Percentage change on the Positive and Negative Syndrome Scale (PANSS) reduction was used to assess APD efficacy, and more than 50% change was considered as APD response. CNVs were identified across the

whole genome and associations between CNV burden, gene set, CNV loci and CNV break-point and APD response were reported. Associations between APD response and schizophrenia-associated CNVs and CNVs intersected with antipsychotic target genes were also tested

Results Higher CNV losses burden decreased the odds of 6-week APD response (OR=0.66 [0.44, 0.98]). CNV losses in synaptic pathway involved in neurotransmitters were associated with 2-week PANSS reduction rate. CNV involved in sialylation (1p31.1 losses) and cellular metabolism (19q13.32 gains) associated with 6-week PANSS reduction rate at genome-wide significant level. Additional 36 CNVs associated with PANSS factors improvement. The OR of protective CNVs for 6-week APD response was 3.10 (95%CI: 1.33~7.19) and risk CNVs was 8.47 (95%CI: 1.92~37.43). CNV interacted with genetic risk score on APD efficacy (Beta=-1.53, SE=0.66, P=0.021). The area under curve to differ 6-week APD response attained 80.45% (95%CI: 78.07%~82.82%)

Conclusion Copy number variants contributed to poor efficacy of antipsychotic treatment and synaptic pathway involved in neurotransmitter was highlighted. Novel CNV loci associated with APD response provides potential innovative genetic therapeutics for schizophrenia.

Analysis of Mitochondrial Gene Expression Related To Schizophrenia Patients

Haoran Chu Ranran Li* Houming Zhu Yijia Jiang Jiashu Ma

山东省济南市历下区文东街道文化东路 49 号

Objective To explore the expression characteristics of mitochondrial functional genes in first-episode schizophrenia patients and the correlation between dif-

ferentially expressed genes and clinical metabolic indicators

Methods Twenty first-episode schizophrenia patients who had not taken antipsychotic drugs (patient group) and 20 healthy controls (control group) were included. Real-time quantitative PCR (qPCR) technology was used to detect the expression levels of mitochondrial quality control and oxidative phosphorylation-related genes in peripheral blood leukocytes, and metabolic indicators such as blood biochemistry, blood glucose, and uric acid were collected. The inter-group differences in gene expression levels and demographic information were compared using the Mann-Whitney U test or independent sample t-test, and the correlation analysis between differentially expressed genes and clinical metabolic indicators was conducted using Spearman correlation analysis

Results The gene expression levels of key genes related to mitochondrial function, PGC-1a, PARK2, and LC3B, in the patient group were significantly lower than those in the control group ($P < 0.05$). The gene expression levels of NRF2, SIRT1, NRF1, TFAM, P62, PINK1, PHB2, MFN1, MFN2, YME1L, OPA1, MFF, DRP1, FIS1, MTATP8, AIF, NDUFA2, and MTCO2 related to mitochondrial function and oxidative phosphorylation in the patient group showed no significant differences compared to the control group ($P > 0.05$), but exhibited a decreasing trend. The correlation analysis revealed a negative correlation between the expression level of the PGC-1a gene in the patient group and the levels of very low-density lipoprotein ($r = -0.451$) and a negative correlation between the expression level of the PARK2 gene in the patient group and uric acid levels ($r = -0.447$)

Conclusion The expression levels of several key genes involved in mitochondrial quality control and oxidative phosphorylation processes in first-episode schizophrenia patients show a downward trend. The differentially expressed genes are correlated with metabolic abnormalities in patients, suggesting that mitochondrial dysfunction may be associated with the high incidence of metabolic disorders in schizophrenia patients

生活事件对经深部经颅磁刺激辅助治疗的抑郁症患者血浆 IL-10 和过氧化物酶体增殖物激活受体 γ 的影响

林泉 王学义*

河北医科大学第一医院

目的 探究深部经颅磁刺激 (dTMS) 联合药物治疗伴应激的抑郁症患者的疗效, 以及治疗前后受试者外周血 IL-10 和过氧化物酶体增殖物激活受体 γ (PPAR γ) 水平的相关性。

方法 自 2022 年 9 月至 2023 年 12 月, 在河北医科大学第一医院精神卫生中心门诊就诊或住院的抑郁障碍患者为本研究主要的入组对象。根据抑郁障碍患者的生活事件量表评分, 将患者分为应激组和非应激组, 使用 dTMS 系统及 H1 线圈, 以左侧背外侧前额叶皮层作为刺激靶点, 强度为 120% 静息运动阈值, 频率为 18Hz。受试者连续两周接受 5 天的 dTMS 治疗, 共治疗 10 次。所有患者在治疗前后做两次访视, 基线时评估患者的一般人口学信息、生活事件量表 (LES)、汉密尔顿焦虑量表 (HAMA)、汉密尔顿抑郁量表 (HAMD) 并检测血浆 IL-10 和 PPAR γ 的水平。在 dTMS 治疗 2 周后, 再评估患者 HAMA、HAMD 及 IL-10 和 PPAR γ 水平。分析应激和抑郁症状的治疗效果与 IL-10 和 PPAR γ 变化的相关性。使用配对样本 t 检验, 分析治疗前后患者症状及炎症因子的变化。

结果 1. 应激组和非应激组患者在基线时 HAMA ($P=0.616$) 和 HAMD ($P=0.222$) 评分没有显著差异。应激组患者在治疗后 HAMA ($P<0.001$) 和 HAMD ($P<0.001$) 评分均显著下降, 非应激组患者在治疗后 HAMA ($P<0.001$) 和 HAMD ($P<0.001$) 评分也均显著下降。应激组的患者比非应激组的患者 HAMA ($P=0.006$)、HAMD ($P<0.001$) 评分下降显著; 2. 应激组受试者基线 IL-10 水平高于非应激组 ($P=0.041$), 且与 HAMD 量表评分呈负相关 ($R=-0.362$, $P<0.001$), 治疗后应激组 IL-10 水平明显升高 ($P=0.013$); 应激组的受试者基线 PPAR γ 水平比非应激组高 ($P<0.001$), 且与 LES 水平呈正相关 ($R=0.303$, $P<0.001$), 治疗后两组 PPAR γ 均明显升高, 但应激组升高更明显 ($P=0.030$)。

结论 1. dTMS 联合药物治疗对伴应激的抑郁

症的疗效优于对非应激的抑郁症的疗效;

2. 应激会诱导抑郁症患者抗炎细胞因子 IL-10 及 PPAR γ 水平升高, 经历应激之后患者 IL-10 水平越低, 抑郁情绪越严重。经过 dTMS 联合药物治疗 IL-10 和 PPAR γ 水平升高, 抑郁情绪好转, 表明 dTMS 联合药物治疗可以改善炎症因子水平, 并达到治疗伴应激抑郁症的效应。

关键词: 应激, 抑郁症, dTMS, IL-10, PPAR γ

Theta 脉冲刺激治疗抑郁症疗效及安全性的探索性随机对照研究

张浩然 王学义*

河北医科大学第一医院

目的 为寻求快速起效与缓解的治疗方案, 缩短治疗周期, 为抑郁症患者寻求有效的辅助治疗方案, 探讨 Theta 脉冲刺激 (theta burst stimulation, TBS) 辅助治疗抑郁症的疗效及安全性。

方法 招募 2024 年 3 月 7 日至 2024 年 6 月 8 日河北医科大学第一医院精神卫生中心

18-65 岁, 符合国际疾病分类第 10 版 (International Classification of Diseases, ICD-10) 抑郁症诊断标准的患者 60 例, 按随机数字表法分为 TBS 联合药物治疗组 (TBS 组, 30 例) 和伪 TBS 刺激联合药物治疗组 (伪 TBS 组, 30 例)。2 组均在药物治疗基础上使用 TBS 或伪 TBS, 每天 2 次, 每周 5 天, 共治疗 2 周。在基线及治疗第 2 周末, 采用 17 项汉密尔顿抑郁量表 (Hamilton Depression Rating Scale, HAMD17) 及汉密尔顿焦虑量表 (Hamilton Anxiety Rating Scale, HAMA) 评估患者的抑郁、焦虑症状, 采用 32 项轻躁狂症状清单 (32-Item Hypomania Checklist, HCL-32) 评估治疗后的转躁风险。以 HAMD17 及 HAMA 的减分及减分率为主要评估指标, HAMD17 反应率、不良事件及转躁风险为次要评估指标。使用独立样本 t 检验、卡方检验等比较疗效差异。

结果 2 组基线 HAMD17 和 HAMA 评分差异无统计学意义 ($P>0.05$)。治疗第 2 周末, TBS 组 HAMD17 减分及减分率高于伪 TBS 组, 差异有统计学意义 ($t=3.16$, $P=0.02$; $t=2.23$, $P=0.04$), TBS 组 HAMA 减分及减分率有高于伪 TBS 组趋势, 但差异

无统计学意义 ($t=1.06$, $P=0.37$; $t=0.62$, $P=0.45$)。TBS 组和伪 TBS 组 HAMD17 反应率分别为 60.0% (18/30) 和 36.7% (11/30), 差异无统计学意义 ($\chi^2=0.96$, $P=0.28$)。TBS 不良事件发生率为 14.3% (4/30), 伪 TBS 组为 3.3% (1/30), 2 组不良事件发生率差异无统计学意义 ($\chi^2=0.19$, $P=0.67$), 治疗过程中发生的主观不适在治疗结束 3d 内均可自行缓解, 且无轻躁狂或躁狂发生。

结论 TBS 是一种有效、快速、安全且耐受性好的抗抑郁疗法, 由于本研究样本量较小, 未来需要进行更多双盲假对照试验来确认我们的结论。

Efficacy of Bright Light Therapy for Perinatal Depression: A Meta-analysis of A Randomized Controlled Trial

Xue Yang Ran Wang*

The First Hospital of Hebei Medical University

Objective Although traditional pharmacological therapies are widely used in patients with perinatal depression (PPD), the reproductive safety of antidepressants remains controversial. A large number of pregnant women discontinue medication due to fear of adverse effects on the fetus, and antidepressant medications are often slow and inefficient, preventing patients with PPD from achieving rapid and desirable outcomes. Bright light therapy has been increasingly applied to patients with PPD recently. Nevertheless, the evidence from clinical trials is inconsistent

Methods We performed a meta-analysis of randomized controlled trials of PPD patients who were treated with bright light therapy versus placebo group according to the Preferred Reporting Items for Systematic Reviews and Meta-Analysis (PRISMA). We searched for randomized controlled studies in PubMed, Embase, Cochrane Library and Web of Science up to December 2023. The results were evaluated using the standardized mean difference (SMD) of improvement in depression score and the odds ratio (OR) for remission

rate, response rate, and drop-outs rate

Results The bright light therapy group had the higher PPD response rate (50.68% vs. 33.08%; OR = 2.05; 95% CI: [1.25, 3.35]; $P = 0.004$; $I^2 = 35\%$) and remission rate (54.10% vs. 18.52%; OR = 5.00; 95% CI: [2.09, 11.99]; $P = 0.0003$; $I^2 = 0\%$) than the placebo group. The improvement in depression score showed the bright light therapy group was superior to the placebo group in overall efficacy for treating PPD (SMD = -0.47; 95% CI: [-0.80, -0.13]; $P = 0.007$). Additionally, there was no statistical difference between the two groups in drop-outs (21.84% vs 29.63%; OR = 0.63; 95% CI, [0.31, 1.29]; $P = 0.21$; $I^2 = 0\%$)

Conclusion Bright light therapy holds great potential in treatment of PPD. Better results are available. It has been shown to be effective and safe, and it will likely further expand the therapeutic options available to psychiatrists in PPD.

关键词: Bright light therapy; Randomized controlled trial; Perinatal depression

精神分裂症患者血浆外泌体的功能研究

张廷开 王梁梁 徐楷 唐劲松*

浙江大学医学院附属邵逸夫医院

目的 本研究利用精神分裂症患者的外泌体 (SCZ EXO) 在细胞和动物模型层面探讨: 1、SCZ EXO 对神经元以及胶质细胞的影响; 2、SCZ EXO 对小鼠行为的影响; 3、利用蛋白组学技术挖掘外泌体中蛋白变化, 并分析其作为临床诊断标志物的可靠性, 以及与患者的临床指标的相关性, 以探究外泌体在精神分裂症发病机制中的作用。

方法 通过 qEV 柱提取难治性精神分裂症患者血浆外泌体 (TRS EXO) 和非难治性精神分裂症患者血浆外泌体 (NTRS EXO) 以及健康对照血浆外泌体 (HC EXO), 并进行质检。之后, 对原代神经元、星形胶质细胞和小胶质细胞分别进行 TRS EXO、NTRS EXO 和 HC EXO 处理, 以检测外泌体对神经元以及胶质细胞的影响。其次, 利用 TRS EXO 和 NTRS EXO 尾静脉注射, 观察对小鼠行为学表型的影响, 以及检测 HC EXO 对 MK801 精神分裂症模

型小鼠行为学表型的影响。进一步,利用蛋白组学技术研究 TRS EXO、NTRS EXO 和 HC EXO 中的蛋白质水平差异,并对差异表达蛋白(DEPs)进行 GO 分析和蛋白质相互作用分析,发掘 SCZ 潜在机制。最后,用 ELISA 验证组学分析得到的 DEPs,用 ROC 曲线分析其作为 SCZ 生物学标志物的可能性,并与患者的临床症状进行相关性分析。

结果 本研究成功提取 SCZ EXO 和 HC EXO。细胞实验证实,SCZ EXO 可引起原代神经元树突数量明显减少,引起原代星形胶质细胞增殖,但不引起原代小胶质细胞的激活。行为学结果显示,SCZ EXO 能够引起小鼠前脉冲抑制受损、运动亢进以及社交功能减退等精神分裂症样行为;而 HC EXO 可改善 MK801 导致的精神分裂症样行为。蛋白质谱分析发现,TRS EXO 和 NTRS EXO 的 DEPs 有较高的可信度且显著区别于 HC EXO,生信分析表明,富集到的蛋白集中在与氧化应激相关的蛋白网络中,包含过氧化物还原酶2(PRX2)、过氧化氢酶(CAT)和载脂蛋白4(APOA4)等,其中 PRDX2 起到枢纽作用。TRS EXO 和 NTRS EXO 中的 PRDX2 均显著低于 HC EXO,ROC 的曲线下面积(AUC)为 95.93%,但与各自的临床症状评分无相关性。

结论 SCZ EXO 可引起神经元及胶质细胞形态及增殖变化,引起正常小鼠精神分裂症样行为,且与 HC EXO 存在显著的差异。PRDX2 有潜力作为精神分裂症外周标志物,提示外泌体中的 PRDX2 及其相关的氧化应激和神经炎症通路可能与精神分裂症的发生相关。

Social Functioning Mediated The Relationship Between Childhood Emotional Neglect and Cognitive Deficits in Patients with Schizophrenia

Maoxing Zhong Peng Cheng Jie Yang*

National Clinical Research Center for Mental and Mental Diseases, Second Xiangya Hospital, Central South University

Objective Childhood maltreatment is frequently

reported to be associated with cognitive deficits in patients with schizophrenia, but research on the childhood neglect subtype in childhood maltreatment is limited. This study sets out from the impact of childhood neglect on cognitive impairment in schizophrenia, and explores the interrelationship of childhood neglect, social functioning, resilience, and cognitive functioning

Methods Two-hundred and thirty-two patients who met the DSM-IV criteria for schizophrenia were recruited at the Second Xiangya Hospital of Central South University. The Childhood Trauma Questionnaire (CTQ), Social and Occupational Functioning Assessment Scale (SOFAS), Connor-Davidson Resilience Scale (CD-RISC), and Digit Symbol Substitution Test (DSST) were used to assess childhood emotional and physical neglect, social functioning, resilience, and cognitive functioning respectively

Results The results indicate that (1) both emotional neglect (Spearman's $r=-0.167$, $p=0.015$) and physical neglect (Spearman's $r=-0.263$, $p<0.001$) are associated with cognitive deficits in patients with schizophrenia; (2) social functioning partially mediated the cognitive impairment in schizophrenia that related to emotional neglect ($\beta_{total}=-0.15$, $SE=0.07$, 95% CI: $LL=-0.31$ ~ $UL=-0.03$); (3) resilience is associated with emotional neglect (Spearman's $r=-0.244$, $p=0.002$) and appears to be independent of cognitive impairment (Spearman's $r=-0.006$, $p=0.942$)

Conclusion Through the mediating role of social functioning, some of the cognitive impairments caused by childhood emotional neglect can be alleviated. This suggests that interventions aimed at improving social functioning may help ameliorate cognitive deficits in patients with schizophrenia who have high levels of emotional neglect scores.

关键词: emotional neglect, cognitive functioning, social functioning, resilience

Artificial Intelligence for Voice-Based Depression Detection: Bipolar Depression and Unipolar Depression

Yunhan Lin Chuan Shi Weihua Yue*
the Sixth Hospital of Peking University

Objective Depression remains a significant global health issue, characterized by its heterogeneity and the absence of reliable, objective biomarkers for its diagnosis. The advent of artificial intelligence (AI) in assisting the identification of depressive disorders is emerging rapidly. While predominant research focuses on differentiating between depressed patients and healthy subjects, there is limited investigation into distinguishing between bipolar and unipolar depression, as well as comparisons involving individuals recovering from depression

Methods This study utilized a portion of data not included in the external validation set, comprising 32 individuals with bipolar depression, and 12 in remission from unipolar depression (remission duration exceeding two months). The analysis involved manual speech feature extraction and deep learning outputs, aiming to evaluate their efficacy in diagnosing different depressive conditions. The deep learning model was constructed using data from 1656 participants, who were classified into healthy and depressed groups by psychiatrists based on DSM-IV criteria. The dataset comprised 811 patients diagnosed with depression and 845 healthy individuals. This large-scale data acquisition allowed for a robust training and validation of the model, ensuring a comprehensive assessment of its diagnostic capabilities across diverse acoustic features and participant demographics

Results The AI model developed using deep learning techniques exhibited greater robustness compared to traditional machine learning models, demonstrating enhanced stability in distinguishing between depressed and healthy subjects. The average prediction scores for bipolar depression and unipolar depression were 0.769 and 0.690 respectively, which means for individuals with bipolar depression, the model tended to classify them within the depressive episode group, exhibiting higher prediction scores (p -value=0.152). Further analysis of vocal features indicated potential differences between bipolar and unipolar depression in specific acoustic features such as MFCC2, MFCC12, and

LSP2 (u test $p < 0.05$). For subjects in remission from depression, whose average prediction score is 0.401, the model tended to classify them closer to the healthy group (p -value=0.142), providing prediction scores that lay between those of healthy individuals, average prediction score is 0.302, and those of depressed patients. This suggests a nuanced capability of the model to reflect transitional states of mental health, which is crucial for monitoring recovery paths and adjusting therapeutic interventions accordingly

Conclusion Preliminary findings indicate significant potential in using vocal biomarkers for differentiating various states of depression. The model showcased a promising ability to discern between active bipolar and unipolar depressive states as well as varying stages of remission. Sensitivity to changes in depression status over time was noted, suggesting the model's utility in ongoing patient monitoring. This investigation into voice-based AI diagnostics for depression represents a significant stride towards establishing a non-invasive, efficient tool for early detection and differentiation of depressive disorders, promising to revolutionize treatment paradigms and patient outcomes in mental health care.

Mediation Effect of Sleep Disturbance between Psychotic-like Experiences and Depression Among Chinese Adolescents

Jinsong Tang* Kehan Su
Sir Run Run Shaw Hospital

Background Psychotic-like experiences (PLEs) have been associated with sleep disturbances and depression. However, the association between PLEs, sleep disturbances and depression has not been thoroughly investigated in prior studies. In this study, we aimed to explore as to whether sleep disturbances moderate the association between PLEs and depression

Methods Secondary school students were recruited using cluster sampling. The Prodromal Questionnaire (PQ-16), the Patient Health Questionnaire 9-item (PHQ-9), and The Pittsburgh Sleep Quality Index (PSQI) were used. Descriptive statistic was used to describe the sociodemographic characteristics of participants. Multicollinearity of the regression model and a hierarchical multiple regression analysis was firstly conducted. Next, we conducted a mediation analysis using SPSS PROCESS v4.1 model 4

Results (1) A total of 63,205 participants were involved, in which the weighted prevalence of depression in all subjects was 23.0% (95% CI: 19.6- 27.0%). (2) Depressive symptoms was independently associated with sex, family type, single-child status, residence sleep disturbances and PLEs, while in bivariate analysis, the PHQ-9 scores was not associated single-child status; (3) According to results of mediation analyses, the association, which was partially mediated by sleep disturbances was indicated between PLEs and depressive symptoms in both direct and indirect ways

Conclusion Depressive were prevalent among secondary school students in Western China. Our results demonstrated a positive relationship between PLEs and depressive symptoms. As a partial mediator role of sleep disturbances in the cross-sectional association between PLEs and depression was preliminarily confirmed in this study, clinical practitioners would benefit from reducing depression by screening for and treating sleep disturbances in individuals who self-report both PLEs and depression.

Integrative Analysis of The Dysregulation of Long Non-coding RNAs and MRNAs and Key CeRNA Regulatory Network Associated with Major Depressive Disorder

Tian Shen Jingyu Lin Jitao Li Yunai Su Tianmei Si*
Peking University Sixth Hospital

Introductio Major depressive disorder (MDD) is a complex psychiatric disorder with high prevalence and multiple symptoms. MDD-associated genetic mutations have been demonstrated to be affected by both coding and non-coding parts of the genome. Long non-coding RNAs (lncRNAs) have emerged as an important class of regulatory RNA that are involved in several biological functions by regulating gene transcription. Although accumulating evidence suggests that dysregulation of multiple RNA species in MDD may influence the pathophysiology of MDD, the molecular mechanisms and interaction between different types of RNAs are not fully understood. In the present study, the integration of different RNA species in transcriptome analysis was used to explore the potential lncRNAs and mRNAs associated with MDD disease mechanisms. A competitive endogenous RNA (ceRNA) network was identified as a key regulatory network associated with MDD. A diagnostic prediction model for MDD was then constructed using RNAs derived from the ceRNA network and validated in an independent dataset

Methods Subject data were derived from the Towards Neurobiology-based Diagnosis and Treatment of Affective Disorders (TNDTAD). It is a naturalistic prospective study of mood disorders (trial registration number: NCT03294525). Whole transcriptome sequencing was performed on the peripheral blood of 31 Han Chinese patients with MDD and 20 matched healthy controls (HCs). The differential expression of lncRNAs and mRNAs was identified using limma. Weighted gene co-expression network analysis (WGCNA) was employed to correlate the expression status of protein-coding transcripts with lncRNAs and screen the disease-associated co-expression modules. The microRNAs (miRNAs) that interacted with lncRNAs and mRNAs were respectively identified using the LncBase V3 database and miRTarBase, miRDB, TarBase, miRanda, TargetScan and Diana-micro T databases. A competitive endogenous RNA (ceRNA) network was constructed to interpret interactions between different RNA species. The biological functions of differentially expressed RNAs, associated co-expression modules and hub genes in ceRNA network were further

analyzed using functional enrichment analysis. Subsequently, a combination of four types of machine learning algorithms (Boruta, lasso regression, K-Nearest Neighbors - recursive feature elimination and random forest) retrieved the marker genes for MDD in the ceRNA network. Diagnostic prediction models were created based on the overlapping genes generated by four algorithms. The prefrontal cortex RNA-seq data from 15 patients with MDD and 15 normal samples in the GSE54568 dataset (expression microarray) was obtained from the NCBI Gene Expression Omnibus (GEO) database as an independent validation dataset. The diagnostic nomograms and receiver operating characteristic (ROC) curves were derived from the validation dataset

Results A total of 194 lncRNAs (107 up-regulated and 87 down-regulated) and 177 mRNAs (120 up-regulated and 57 down-regulated) were determined as significantly differentially expressed RNAs in MDD compared to HCs. Based on the criterion of approximate scale-free topology, 5 was selected as the soft threshold power. 24 co-expression modules of RNAs were identified, among which the darkorange ($r = -0.36$, $P = 0.009$) and the magenta ($r = -0.36$, $P = 0.009$) co-expression modules were significantly correlated with MDD, enriched with MDD susceptibility transcripts. A preliminary ceRNA regulatory network was constructed by integrating differential lncRNAs and mRNAs with significant co-expression modules which exhibited a significant correlation between the expression of lncRNAs and mRNAs. Afterwards, a total of 36 MDD-associated DE miRNAs, reported from at least two previous case-control studies were selected for the construction of hub ceRNA network. A hub lncRNA-miRNA-mRNA regulatory network consisting of 2 DE lncRNAs, 2 DE miRNAs and 16 DE mRNAs showed relevant to cell energy metabolism and inflammation molecular functions, which may provide new insights for the investigation of diagnostic biomarkers of MDD. Finally, 4 MDD-associated diagnostic marker genes obtained by four machine learning algorithms, ARMC8, UBE2V2, AASDHPPT and SELENOT, were utilized to construct logistic regression and lasso regression diagnostic prediction models. The AUCs of the diagnostic nomograms

for prefrontal cortex samples were 0.711 and 0.698 separately. The analyses of the AUC revealed that these 4 genes hold potential as diagnostic biomarkers

Conclusion Altogether, the results of our study provide evidence that lncRNA associated complex trait-specific networks may play a critical role in the pathophysiology of MDD by potentially regulating the process of energy metabolism and inflammation. This study provides new valuable information to explore the molecular mechanism of MDD and suggests that bioinformatics analysis studies could contribute to identifying epigenetic diagnostic biomarkers.

Post-Marketing Safety Concerns with Lulmateperone: A Disproportionality Analysis of Spontaneous Reports Submitted To The FDA Adverse Event Reporting System

李南曦 Sihao Chen Yamin Zhang Wei Wei Tao Li*
Affiliated Mental Health Center & Hangzhou Seventh People's Hospital and School of Brain Science and Brain Medicine, Zhejiang University School of Medicine, Hangzhou, 310058, China

Objective Schizophrenia and bipolar disorder are common psychiatric disorders which bring huge burden for patients and their family. The clinical manifestations of these patients are often specific, and the therapeutic effects of these diseases are often not significant. Therefore, identifying drugs that are effective, safe, and have fewer side effects is very important. Current major drug treatment strategy for schizophrenia is using antipsychotic drugs which could block the D2 family of postsynaptic dopamine receptors. One typical representative drug is olanzapine. For bipolar disorder, lithium is one kind of the first-line therapeutic drugs due to its anti-manic agent and it is also capable of attenuating depressive symptoms. However, due to the strong heterogeneity of these diseases, some patients may experience some serious or non-serious adverse reactions,

such as weight gain, extrapyramidal symptoms of parkinsonism, cognitive impairment and tardive dyskinesia. It is obvious that with these adverse reactions, it undoubtedly increases the treatment burden of schizophrenia and bipolar disorder. Recently, a mechanistically novel drug named lumateperone was investigated for its anti-schizophrenic and anti-emotional symptoms effect [12]. This drug can selectively and simultaneously regulate the neurotransmitter pathways of serotonin, dopamine, and glutamate, which are related to schizophrenia and bipolar disorder. Based on some clinical evidence, lumateperone has received approval as adjunctive treatment for schizophrenia in adults by the US Food and Drug Administration (FDA) in March 2019 and for bipolar disorder in 2021. However, its marketing authorization still triggered some concerns, mainly because of the lack of more evidence on its efficacy and safety. Most of the current safety evaluations of it mainly came from clinical trials. During the experiment, there may be potential issues such as incomplete medical history and inaccurate self-reporting during screening, and the sample size remains small. Additionally, the current evidence on safety is almost entirely based on short-term approval trials with a follow-up period of only 5 days to 8 weeks. Therefore, it is difficult to predict potential long-term adverse reactions of lumateperone. We need a larger sample of real-world data to confirm its safety. On these grounds, the aim of this study was to analyze post-marketing safety data of lumateperone through the largest publicly available worldwide pharmacovigilance database, the FDA Adverse Event Reporting System (FAERS), and to investigate the comparative reporting risks of lithium or olanzapine

Methods We conducted pharmacovigilance study on adverse events (AEs) related to lumateperone from January 1 2020 to December 31 2023 based on the FAERS database. To assess the disproportionality of lumateperone as compared to other drugs, two common methods, namely, the reporting odds ratio (ROR) and Bayesian information component (IC) were used. Significant threshold of ROR was defined as following: the lower limit of its 95% confidence interval (95%CI) should be higher than 1 and there should be at least four

adverse event records. For IC, the threshold was 0. Positive reaction signal was defined when two disproportionality measures for the adverse event met the aforementioned criteria. The combination of these two different methods for signal detection can increase the robustness of these findings and reduce the possibility of false positives. There may be bias in the disproportionality analysis compared to other drugs. To test the potential use of this drug, we further compared lumateperone with first-line treatment drugs such as lithium and olanzapine. In addition, we performed time-to-onset analysis in exploring time window for occurrence of adverse reactions and comparison analysis of serious clinical outcomes and non-serious clinical outcomes in exploring potential indicators which would affect clinical outcomes

Results During the study period, a total of 6,216,914 adverse event reports were obtained from the FAERS database after exclusion of duplicates, containing 5,074 lumateperone-related adverse events in 1,762 patients. Females accounted for a larger proportion than males (979 vs. 576). AEs tended to occur on middle-aged patients (18-65 years old) and individuals with 50-100kg. Bipolar disorder was the most reported indication. Lamictal and seroquel were the top 2 combination drugs for lumateperone-associated adverse events. Safety signals were detected for a large number of adverse events, such as dizziness ($n = 225$, ROR = 6.77, 95% CI = [5.92, 7.73]), nausea ($n = 164$, ROR = 2.97, 95% CI = [2.54, 3.47]), headache ($n = 144$, ROR = 3.16, 95% CI = [2.68, 3.73]), somnolence ($n = 125$, ROR = 8.95, 95% CI = [7.49, 10.69]), feeling abnormal ($n = 108$, ROR = 6.36, 95% CI = [5.25, 7.69]), sedation ($n = 76$, ROR = 42.72, 95% CI = [34.02, 53.65]), insomnia ($n = 71$, ROR = 4.05, 95% CI = [3.20, 5.12]) and burning sensation ($n = 71$, ROR = 15.35, 95% CI = [12.14, 19.41]). There are 4 SOCs with more than 200 cases related to the use of lumateperone in bipolar disorder, and the highest SOC is nervous system disorder, with exceeding 600 cases. Following is the psychiatric disorder with more than 400 cases. The third and fourth are general disorder and administration site condition, and gastrointestinal disorder, respectively. For schizophrenia,

there are a total of 3 SOC's which cumulative cases exceeded 200. They are psychiatric disorders, nervous system disorders, and general disorder and administration site conditions. When comparing with to first-line recommended drugs, 35 adverse reactions remain significant in bipolar disorder, such as dizziness ($n = 225$, $ROR = 9.97$, $95\% CI = [6.36, 15.62]$), and headache ($n = 144$, $ROR = 11.00$, $95\% CI = [6.10, 19.85]$). A total of 83 adverse reactions were not observed with significant signals (lower limit of $95\% CI < 1$), such as extrapyramidal diseases, loss of consciousness, and pruritus. For schizophrenia, 108 adverse reactions remain significant, such as burning sensation ($n = 71$, $ROR = 45.81$, $95\% CI = [25.80, 81.32]$) and migraine ($n = 33$, $ROR = 32.87$, $95\% CI = [15.72, 68.74]$). A total of 101 adverse reactions were not observed with significant signals (lower limit of $95\% CI < 1$), such as amnesia, orthostatic hypotension, and neuralgia. The only significant difference about gender observed is dizziness ($n = 94/18$, $ROR = 1.99$, $95\% CI = [1.19, 3.32]$) in bipolar disorder and falling ($n = 13/4$, $ROR = 3.86$, $95\% CI = [1.25, 11.87]$) in schizophrenia. The median TTO of AEs associated with lumateperone for bipolar disorder and schizophrenia was 7.00 (3.22-11.99) days, and 17.00 (6.01-21.71) days, respectively. Drug using in these two disease were all early failure type. Additionally, there were statistically significant differences in age (40 vs. 38 years; $p = 0.0498$) and men and women proportions ($n = 197$ vs. 363; $p = 0.016$) between serious and non-serious cases of patients receiving lumateperone. Five adverse events were more likely to be reported as serious outcomes with $p < 0.05$, such as tardive dyskinesia ($\chi^2 = 28.885$, $p < 0.001$), hallucination, auditory ($\chi^2 = 9.726$, $p = 0.002$), loss of consciousness ($\chi^2 = 10.458$, $p = 0.001$), hallucination ($\chi^2 = 4.655$, $p = 0.031$), and dystonia ($p = 0.039$)

Conclusion This work provides the most updated findings linking lumateperone with the safety based on the real-world data from FAERS. Firstly, we found its growth trend in line with the Weber effect. We propose the hypothesis that lumateperone reports may gradually stabilize after 2023 and estimate that it will maintain a certain level in the coming years. However, this increase raises questions for future reporting, and

strongly underlines the need for constant epidemiological surveillance. Secondly, current analysis suggests that lumateperone is most commonly prescribed in combination with lamotrigine or quetiapine. It has been approved as an adjuvant therapy for schizophrenia and bipolar disorder. Meanwhile, the screened data has other indications, including anxiety disorders, drug dependent insomnia, etc. Thirdly, dizziness, nausea, headache, abnormal sensation are the most common adverse reactions in bipolar disorder, and headache, dizziness, nausea, drowsiness are the most common adverse reactions for schizophrenia. All the common adverse reactions mentioned above may be related to the mechanism of action of lumateperone, so adverse reactions are mainly concentrated in psychiatric disorders and nervous system disorders. Fourthly, no matter compared with other drugs or first-line treatment drugs, most of the existing adverse reactions were not observed to be significant. these adverse reactions are common, mild and appear early, which can be intervened in time, and have little impact on patients' lives. Significant differences in adverse reactions observed between the serious and non-serious groups were tardive dyskinesia, hallucinations, loss of consciousness, and dystonia. Age and gender are potential influential factor as well. This study suggests that the safety of lumateperone in real-world populations may differ slightly from what is described in regulatory trials, therefore further clinical practice data is needed to better understand its safety and provide evidence-based medicine evidence. There is an urgent need for more real-world research, including practical clinical trials, observational studies, and meta-analysis of individual participants with rare and unexpected adverse reactions. Considering the lack of reports on efficacy in the FAERS database, the prescription of lumateperone should be extremely cautious and closely monitored during medication, only used as an adjuvant therapy for treatment. Clinicians also need to remember that if treatment does not take immediate effect, patients who have received more experimental treatment are more likely to feel hopeless. At the same time, attention should also be paid to the possibility of abuse. Further prospective studies are necessary to optimize the risk benefit assessment of this novel drug in the treatment of mental illness

and reduce the likelihood of severe clinical outcomes.

肠道微生物-血清蛋白质组整合分析对单、双相抑郁的鉴别价值

郑亚昕 安翠霞*

河北医科大学第一医院

目的 利用肠道微生物和血清蛋白质进行组学联合分析,对单、双相抑郁障碍进行鉴别,寻找疾病的客观生物标记物。

方法 1. 受试者来源于2021年5月至2022年11月在河北医科大学第一医院就诊的患者,其中单相抑郁患者(MDD组)15例、双相抑郁组患者(BDD组)15例。收集一般人口学资料,完成汉密尔顿抑郁量表(HAMD-24)、汉密尔顿焦虑量表(HAMA)等临床量表评估,采集患者的粪便及血液样本;2. 对肠道菌群进行16S rRNA测序,采用线性判别分析(LefSe)筛选差异菌群。利用ROC曲线分析评估所筛选差异菌的诊断效能。应用4D-Lable free技术检测血清中的蛋白质,分析组间有显著差异的蛋白质;利用ROC评估所筛选差异蛋白质的诊断效能;3. 将所筛差异菌属与差异蛋白质进行Spearman相关性分析。

结果 1. MDD组和BDD组一般情况比较,除起病年龄及病程($P < 0.05$)外,差异均无统计学意义(均 $P > 0.05$);2. 微生物组学分析:两组间有关 α 多样性、 β 多样性差异有统计学意义(均 $P < 0.05$)。BDD组和MDD组之间存在27个显著差异菌群($P < 0.05$; $LDA > 3$)。对属水平差异菌群进行ROC曲线分析,发现 *g_Bifidobacterium*、*g_un_f_Enterobacteriaceae*、*g_Clostridium_sensu_stricto_1*对BD患者预测的曲线下面积分别为0.777、0.814、0.721;3. 蛋白质组学分析:本研究共筛选出两组间差异表达蛋白质(DEPs, differentially express proteins)93个。对差异蛋白质进行ROC曲线分析,发现13个蛋白质具有良好的BDD鉴别诊断价值($AUC > 0.7$, $P > 0.05$)。对差异表达蛋白进行GO功能注释显示,在生物过程中参与蛋白数目最多的是生物学调节。KEGG信号通路注释

及富集分析,显示差异蛋白信号通路主要富集在病毒蛋白与细胞因子和细胞因子受体的相互作用抗病毒相关通路、细胞因子-细胞因子受体互作通路、趋化因子信号通路和补体与凝血级联信号通路;4. 微生物组学与血清代谢组学相关性分析:巨单胞菌属、毛螺菌属、罕见小球菌属、韦荣氏球菌属、*g_Dialister*菌与多种蛋白质呈负相关。双歧杆菌属与多种蛋白呈正相关。

结论 本研究发现肠道微生物及血清蛋白质能够有效的区分单、双相抑郁患者,找出了两组间显著不同的27种肠道菌群及93种内源性血清蛋白质;此外发现,8个菌属及13个血清蛋白质具有鉴别诊断单、双相抑郁的潜在作用,且肠道微生物与血清蛋白质之间可能存在互相影响。

Hippocampal Subregional Structure and Function Alterations in Major Depressive Disorder Patients with and without Mixed Features

Xuanqiang Chen^{1,2}, Manli Huang^{1,2}

1. Department of Psychiatry, First Affiliated Hospital, Zhejiang University School of Medicine, Hangzhou 310003, China

2. Zhejiang Key Laboratory of Precision psychiatry, Hangzhou 310003, China

Objective Major depressive disorder with mixed features (MDDMF) is a type of mood disorder characterized by symptoms of mania/hypomania during the episode of depressive disorder. MDDMF exhibits higher illness severity and worse prognosis. Therefore, it's of great importance to elucidate the pathophysiological mechanism of MDDMF, which could contribute to the diagnosis and treatments of the disease. As a vital part of the limbic system and the hypothalamic-pituitary-adrenal axis, the hippocampus is associated with the pathogenesis of major depressive disorder. Consequently, the goal of this study was to examine the hippocampal subregional structure and function features in

patients with MDDMF by calculating the volume of hippocampus and its subregions, as well as exploring the RSFC of the subregions with the whole brain among MDDMF, MDDnonMF and HC groups

Methods A total of 84 individuals including 20 patients with MDDMF, 33 patients with MDDnonMF and 31 healthy controls (HCs) were recruited for this study. All subjects underwent 3.0-T magnetic resonance imaging (MRI) scan. Utilize the Freesurfer software to segment the 3D-T1 MRI data and calculate the volume of the hippocampus and its subregions in both hemispheres. Subsequently, the resting-state functional connectivity (RSFC) of the hippocampus and its subregions was calculated separately. We performed analysis of variance (ANOVA) method to compare structural and functional alterations of hippocampus and its subregions among MDDMF, MDDnonMF and HC groups. Finally, we utilized spearman analysis to investigate the correlation between structural and functional changes and clinical indicators

Results No significant differences were observed among the three groups in age, gender, or years of education. There were significant volume differences among three groups in the left hippocampal fissure, right cornu ammonis 1(CA1) body and right cornu ammonis 3(CA3) body ($p < 0.05$, FDR corrected). MDDMF group exhibited decreased left hippocampal fissure, right CA1 body and right CA3 body volumes compared with MDDnonMF ($p < 0.05$). MDDnonMF group exhibited increased left hippocampal fissure, right CA1 body and right CA3 body volumes compared with HC ($p < 0.05$). Using l_hippocampal fissure, r_CA1body, and r_CA3body as ROIs seeds, we calculated voxel-wise functional connectivity of the whole brain. The ANOVA revealed significant differences in RSFC between l_hippocampal fissure and r_Pallidum, between r_CA1body and r_Inferior Temporal gyrus and between r_CA3body and r_Lingual gyrus among three groups. Compared with HC, MDDMF showed increased RSFC between l_hippocampal fissure and r_Pallidum, as well as decreased RSFC between r_CA1body and r_Inferior Temporal gyru and between r_CA3body and r_Lingual gyrus; MDDnonMF showed decreased RSFC between r_CA3body and r_Lingual

gyrus. Relative to MDDnonMF, MDDMF showed increased RSFC between l_hippocampal fissure and r_Pallidum, as well as decreased RSFC between r_CA1body and r_Inferior Temporal gyrus. Besides, there were positive correlations between the Clinically Useful Depression Outcome Scale supplemented with questions for the DSM-5 mixed features specifier (CUDOS-M) scores and RSFC between left hippocampal fissure and right pallidum, and negative correlations between CUDOS-M scores and RSFC between left CA1 body and right inferior temporal gyrus

Conclusion The current results demonstrated that mixed features in Major Depressive Disorder are linked to both structural and functional brain abnormalities in hippocampal subregions and limbic-cortical-striatal-pallidal-thalamic circuits. These alterations may form the pathological basis for the more severe symptoms observed in MDD patients with mixed features. Hopefully, these findings could potentially serve as a biomarker to differentiate between MDD with mixed features and MDD without mixed features, as well as HCs in the future, thereby aiding in the diagnosis and treatment of the condition.

Predicting Treatment Remission and Plasma Concentration of Paroxetine in Patients with Major Depressive Disorder

Rui Yuan Yundan Liao Weihua Yue*
Peking University Sixth Hospital

Objective We aimed at developing prediction models for treatment remission and steady-state concentration (C_{ss}) in plasma of paroxetine among patients with major depressive disorder (MDD)

Methods This post-hoc analysis originated from an 8-week multi-center prospective cohort study within the Precision Medicine to Enhance Depression and Anxiety Outcome (PMEDA) consortium, involving 530

Chinese Han MDD patients. Logistic regression models were developed using 10-fold cross-validation, with outcomes being treatment remission at the eighth week and C_{ss} defined as a binary variable by a therapeutic reference range (TRR) of 20-65 ng/ml (within/outside TRR). Model performance was assessed using ROC analysis, Hosmer-Lemeshow tests, and decision curve analysis (DCA)

Results The model for predicting treatment remission achieved a mean accuracy, balanced accuracy, and area under the curve (AUC) of 0.723 ± 0.057 , 0.719 ± 0.041 , and 0.707 ± 0.063 , respectively. The model for predicting C_{ss} had a mean accuracy, balanced accuracy, and AUC of 0.627 ± 0.056 , 0.629 ± 0.054 , and 0.615 ± 0.069 , respectively. Both models performed equally well in first-onset and relapse patients. C_{ss} (within/outside TRR) were associated with treatment remission, while CYP2D6 activity score were associated with C_{ss}

Conclusion We developed two prediction models for treatment remission and C_{ss} of paroxetine in MDD patients, demonstrating satisfying performance. Although future validation in independent samples is required, these models provide insight into improving the precision of paroxetine treatment

关键词: paroxetine, major depressive disorder, treatment remission, steady-state concentration, prediction model

双相 I 型抑郁反刍思维与默认网络 alpha 频段功能连接的特定关联

汤浩¹ 史家波¹ 张思启² 陈瑜¹ 熊婷婷¹ 卢青² 姚志剑¹

1. 南京医科大学附属脑科医院心境障碍科
2. 东南大学生物科学与医学工程学院

目的 反刍思维在双相障碍中被证实是常见的临床现象。默认网络 (default mode network, DMN) 及其子网络的活动在健康个体和抑郁症的反刍思维形成中起重要作用, 但对双相障碍反刍思维的影响并无定论, 尤其反刍思维相关的神经电生理活动模式尚不明确。既往研究认为默认网络主要活动频率

范围为 alpha 频段, 本研究旨在探讨双相障碍 DMN 子网络 alpha 频段的功能连接异常与反刍思维的关联。

方法 招募 44 名双相情感障碍 I 型抑郁发作患者和 46 名健康对照者进行脑磁图 (Magnetoencephalography, MEG) 静息态扫描。选取默认网络的两个核心节点, 即后扣带皮层 (Posterior Cingulate Cortex, PCC) 和前内侧前额叶皮层 (Anterior Medial Prefrontal Cortex, amPFC), 以及背内侧前额叶 (Dorsal Medial Prefrontal Cortex, dmPFC) 子网络和内侧颞叶 (Medial Temporal Lobe, MTL) 子网络为感兴趣区域, 采用能量包络算法计算 alpha 频段 DMN 各子网络间的功能连接。比较两组之间反刍思维水平和 DMN 网络内功能连接强度, 以 Spearman 偏相关分析来评估双相抑郁患者异常的功能连接与反刍思维总分和因子分之间的相关性。

结果 双相障碍患者的整体反刍以及强迫深思 (Brooding) 和反省深思 (Reflection) 因子分均显著高于健康对照组。双相抑郁患者组 alpha 频段 PCC-dmPFC 和 dmPFC-MTL 子网络的功能连接均显著增强。PCC-dmPFC 子网络功能连接与反省深思显著相关, 而 dmPFC-MTL 子网络功能连接则与强迫思考显著相关。

结论 默认网络 alpha 频段的网络内功能连接增强反映了双相 I 型抑郁患者过度的自我参照加工。反刍思维的两个子成分—反省深思和强迫思考, 分别与 PCC-dmPFC 和 dmPFC-MTL 子网络的功能连接表现出选择性相关。这些关联突显了默认网络在双相障碍患者反刍思维过程中的关键作用, 为制定针对反刍思维的干预策略提供了潜在的神经生物学靶点, 具有重要的临床指导意义。

5.The University of Melbourne

Objective Treatment-resistant depression (TRD) is a severe condition affecting 44% of depression patients who do not respond to two antidepressant therapies. Repetitive transcranial magnetic stimulation (rTMS) targeting the left dorsolateral prefrontal cortex (DLPFC) is effective for TRD. Stanford neuromodulation therapy (SNT) is an accelerated rTMS protocol with a 64% response rate after 4 weeks. This involves 10 daily intermittent theta burst stimulation (iTBS) sessions. Building on this, our group has recently demonstrated an equivalent antidepressant efficacy of accelerated continuous TBS (a-cTBS) by targeting the right DLPFC. These novel paradigms highlight the need to investigate neural circuitry changes, particularly involving the DLPFC and subgenual cingulate cortex (SGC). Studies also indicate the potential of frontoparietal networks in antidepressant effects. Thus, the neural circuitries underlying the antidepressant effects remain to be identified, and may inform optimisation strategies. In the current study, TMS-EEG was initially used to characterise local and network activity in TRD compared to healthy controls. We hypothesised that TRD individuals would demonstrate abnormal local and frontoparietal network activities. In an SNT course of left DLPFC (a-iTBS group) or right DLPFC (a-cTBS group) treatment, we further aimed to reduce depression symptoms and induce local and network changes in individuals with TRD. We hypothesised that a-iTBS and a-cTBS would normalise local and frontoparietal network activities and that these network changes would predict the antidepressant effects

Methods Totally, 40 TRD patients were randomised to receive a-cTBS or a-iTBS treatment. Each treatment involves 10 TBS sessions per day (1800 pulses/session), spaced at 50-minute intervals across 5 consecutive days. Single-pulse TMS and electroencephalogram co-registration (TME-EEG) was used to quantify neurophysiological changes from Pre- to Post-treatment. Healthy controls were recruited to match the TRD patients (20 for each arm). Both TBS and single pulses were delivered to the same hemisphere for consistency (right: a-cTBS and its controls; left: a-iTBS and its controls)

Results Compared to HC, TRD individuals demonstrated abnormal frontoparietal network properties, characterized by left hypoconnectivity and right hyperconnectivity. In the left DLPFC, TRD individuals had a significantly less positive P180 amplitude compared to healthy controls ($t_{38} = -2.26$, $p = 0.030$, Cohen's $d = 0.71$), which increased after a-iTBS treatment to levels comparable with healthy controls ($t_{19} = 2.64$, $p = 0.016$, Cohen's $d = 0.59$). In the a-iTBS group, current propagation from the left DLPFC to the left inferior parietal lobule (IPL) was significantly lower in TRD patients at baseline ($t_{38} = -2.08$, $p = 0.044$, Cohen's $d = 0.68$), but increased after treatment to levels comparable with healthy controls ($t_{19} = 2.46$, $p = 0.024$, Cohen's $d = 0.55$). In network analyses, a-iTBS increased current propagation to the left IPL ($t_{19} = 2.52$, $p = 0.021$, Cohen's $d = 0.56$), whereby increased current density in the left IPL was associated with a better antidepressant effect ($r = -0.47$, $p = 0.036$). In contrast to a-iTBS, a-cTBS decreased local N100 amplitude ($t_{19} = -3.07$, $p = 0.006$, Cohen's $d = 0.69$). In the a-cTBS group, current propagation from the right DLPFC to the left IPL was higher in TRD patients at baseline ($t_{38} = 2.06$, $p = 0.046$, Cohen's $d = 0.62$), but decreased after treatment to levels comparable with healthy controls ($t_{19} = 3.01$, $p = 0.007$, Cohen's $d = 0.67$). There was also a widespread inhibition over parietal cortices, with the left IPL being most prominent and correlated with a better antidepressant effect ($r = 0.47$, $p = 0.035$)

Conclusion These novel findings outline the frontoparietal circuitry in TMS antidepressant effects and provide insights for optimising treatment efficacy.

Age-Dependent Corpus Callosum Thickness Abnormalities and Clinical Implications in Schizophrenia

Jinni Lin Wei Wei Tao Li*

Affiliated Mental Health Center & Hangzhou Seventh People's Hospital, Zhejiang University School of Medicine.

Objective Previous studies on schizophrenia have reported morphological abnormalities in the corpus callosum (CC) in the midsagittal plane, but the results have been inconsistent, and it is unclear whether these abnormalities are modulated by age. We compared the thickness of the CC in schizophrenia patients and a control group and analyzed the moderating effect of age. We also explored the relationship between clinical symptoms and imaging measurements

Methods The study included 151 schizophrenia patients and 278 healthy controls. Using individual T1-weighted brain images, we segmented the CC on the midsagittal plane of T1-weighted images and applied a well-validated surface-based mesh-modeling approach to compare callosal thickness at 100 equidistant points between groups. The Johnson-Neyman technique was used to test if the schizophrenia-related CC structural abnormalities were moderated by age. The age moderation effect of CC thickness and its relationship with clinical symptoms were tested by partial least-squares correlation

Results Abnormal CC thickness in schizophrenia patients was primarily observed in the splenium, isthmus, anterior midbody, and rostral body regions of the CC. These regions were thinner in younger schizophrenia patients compared to healthy controls, but thicker in older patients. Thicker CC in older patients related to more severe clinical symptoms, while this correlation was not present in younger patients

Conclusion Our results demonstrate abnormal

CC thickness in schizophrenia patients, which is modulated by age. CC thickness affects the symptom burden in schizophrenia patients, with the effect conditional upon age. These findings suggest that the CC might be a key biological target for therapeutic interventions in schizophrenia

Effect of Propranolol on Reconsolidation of Alcohol Reward Memory

Shuai Yu Pengjiao Xu Ruiling Zhang Yahui Xu*

The Second Affiliated Hospital of Xinxiang Medical University

Objective Explore the effect of propranolol on the process of reconsolidation of alcohol reward memory retrieved by conditioned stimulus

Methods One hundred male alcohol-dependent patients completed the experiment and included for statistical analysis: 20 in each group (retrieval/propranolol group, retrieval/placebo group, no retrieval/propranolol group, no retrieval/placebo group, and retrieval/6 hours/propranolol group). Collect their general demographic data, assess drinking status, psychological thirst, emotional response and cognitive function. All subjects studied alcohol-related conditioned stimulus and were given placebo or propranolol 20mg immediately after retrieval. Blood pressure and heart rate were monitored during the retrieval and test process, and the degree of craving was assessed by visual analogue scores

Results 1. Demographic data and all scales score. Groups did not differ significantly in age ($P=0.34$), alcohol use years ($P=0.41$), education ($P=0.69$), FTND ($P=0.31$), AUDIT ($P=0.90$), AWS ($P=0.94$), OCDS ($P=0.92$), PSQI ($P=0.12$), MMSE ($P=0.31$), SAS ($P=0.28$) and SDS ($P=0.93$)

2. Learning phase. After alcohol-related learning, the heart rate, systolic blood pressure, diastolic blood pressure, and craving degree were increased in within-

five groups compared with learning before, and the differences were statistically significant ($P < 0.05$). The heart rate difference ($F_{4,95}=1.34$, $P=0.26$), systolic blood pressure ($F_{4,95}=0.80$, $P=0.52$), diastolic blood pressure difference ($F_{4,95}=0.38$, $P=0.82$), craving difference ($F_{4,95}=2.18$, $P=0.07$) were not statistically significant in between-five groups; after learning without alcohol, the heart rate, systolic blood pressure, diastolic blood pressure, and craving degree were not statistically significant differences in within-five groups compared with learning before. The heart rate difference ($F_{4,95}=1.07$, $P=0.37$), systolic blood pressure ($F_{4,95}=2.28$, $P=0.06$), diastolic blood pressure difference ($F_{4,95}=0.36$, $P=0.83$), craving difference ($F_{4,95}=0.55$, $P=0.69$) were not statistically significant in between-five groups.

3. Retrieval phase. After CS retrieval, the heart rate, systolic blood pressure, diastolic blood pressure, and craving degree were increased in within-retrieval groups, and the differences were statistically significant ($P < 0.05$). The heart rate difference ($F_{4,95}=3.07$, $P=0.05$), systolic blood pressure ($F_{4,95}=0.77$, $P=0.46$), diastolic blood pressure difference ($F_{4,95}=0.26$, $P=0.77$), craving difference ($F_{4,95}=0.39$, $P=0.67$) were not statistically significant in between-retrieval groups.

4. Test phase. After test, the heart rate, systolic blood pressure, diastolic blood pressure, and craving degree were reduced retrieval/propranolol group with test before, and the differences were statistically significant ($P < 0.05$). The heart rate, systolic blood pressure, diastolic blood pressure, and craving degree were still increased in other within-four groups. The heart rate difference ($F_{4,95}=25.25$, $P < 0.05$), systolic blood pressure ($F_{4,95}=22.17$, $P < 0.05$), diastolic blood pressure difference ($F_{4,95}=20.44$, $P < 0.05$), craving difference ($F_{4,95}=22.08$, $P < 0.05$) were statistically significant in between-five groups. But the heart rate difference ($F_{3,76}=1.71$, $P=0.17$), systolic blood pressure ($F_{3,76}=0.80$, $P=0.48$), diastolic blood pressure difference ($F_{3,76}=0.38$, $P=0.72$), craving difference ($F_{3,76}=0.47$, $P=0.69$) were not statistically significant in between group of retrieval/placebo group, no retrieval/propranolol group, no retrieval/placebo group, and retrieval/6 hours/propranolol group.

Conclusion Propranolol interfere with the process of reconsolidation of alcohol reward memory retrieved by conditioned stimulus, which may be an effective way to reduce alcohol craving

关键词: Propranolol; Alcohol dependence; Reward memory; Retrieval; Memory reconsolidation

Functional Connectivity and Gene Expression in Major Depressive Disorder with Anxiety Symptoms

Chen Chengfeng¹, Bin Zhang²

1. The Affiliated Brain Hospital of Guangzhou Medical University

2. Tianjin anding hospital

Objective Nearly two-thirds of individuals diagnosed with major depressive disorder (MDD) also experiencing clinical anxiety. Those with significant anxiety symptoms tend to show greater disease severity, an earlier onset, increased suicidal tendencies, prolonged duration of illness, comorbid substance abuse, and heightened resistance to existing therapeutic interventions. Considering that behavioral symptoms, functional and treatment outcomes differ between depression with and without significant anxiety, it is reasonable to hypothesize that these two subtypes of MDD are biologically distinct, particularly in terms of functional connectivity (FC) and gene expression patterns. Yet, the specific FC and gene expression profiles in MDD patients with significant anxiety symptoms (MDD/ANX+) are still to be determined. We aim to investigate the differences in FC and gene expression features between MDD/ANX+ patients and those without significant anxiety symptoms (MDD/ANX-) and hypothesize that variations in specific gene expressions could influence functional connectivity in patients with MDD, potentially conferring a risk for anxiety in MDD

Methods Using resting-state functional MRI from 512 individuals with MDD, we compared differences in FC between MDD/ANX+ and MDD/ANX-, both at the edge-based and network levels. Subsequently,

employing the Allen Human Brain Atlas dataset, we performed partial least squares regression analyses to identify genes associated with the observed FC disparities. Follow-up analysis included functional enrichment, which provided insights into the functions of the identified genes. Additionally, a validation analysis was performed to account for potential confounding variables. This involved narrowing the age range to 18 to 30 years and only including participants between 18 to 65 years old who were experiencing their first episode of depression, aiming to verify the reliability of the findings

Results The results from both edge-based and network-level FC analyses were generally consistent, indicating significantly increased FC between the subcortical network (SC) and visual network (VN), as well as between the SC and the dorsal attention network (DAN), in MDD/ANX+ compared to MDD/ANX-. Additionally, transcriptome-neuroimaging correlation analysis revealed that the expression of 1,066 genes was spatially correlated with the FC differences between MDD/ANX+ and MDD/ANX-. These genes were enriched in molecular functions, biological processes, and cellular components related to translation at synapses and ATP generation. They were also associated with common mental disorders, including depressive disorders and bipolar disorder. In the validation analysis, after controlling for potential confounding factors (including limiting the age to 18 to 30 years old and restricting participants to those aged 18 to 65 who experienced their first episode of depression), the pattern of FC differences between the main analysis and the validation analysis remained essentially consistent

Conclusion Our findings reveal that the differences in FC between MDD/ANX+ and MDD/ANX- patients may be modulated by the differential expression of specific genes related to synaptic translation and ATP generation. These expression differences may increase the risk of depressive disorder patients with anxiety symptoms and may be associated with poorer functional status and treatment outcomes

辅助运动区功能活动及有向连接预测抗抑郁药物疗效研究

臧振享* 乔凯妮 杨志 王刚
首都医科大学附属北京安定医院

目的 经颅磁刺激(TMS)是治疗抑郁症(MDD)的常见方法,但迄今为止主要靶点选择依旧围绕背外侧前额叶,寻找不同皮层靶点是推动 TMS 治疗 MDD 研究的重要过程。除了背外侧前额叶,辅助运动区(SMA)功能异常也是 MDD 最常见的影像学特征,与 MDD 核心特征精神运动迟滞(PMR)相关。研究 SMA 功能活动及其有向连接对抗抑郁药物疗效的预测性有助于为建立基于 SMA 的精准 TMS 治疗范式提供基础。

方法 本研究回溯性地分析了 110 名 MDD 患者及 111 名年龄、性别匹配的健康对照(HC)静息态 fMRI 数据(rs-fMRI),采用低频振幅 ALFF 作为功能活动指标,采用格兰杰因果关系 GCA 作为 SMA 有向连接计算方法。MDD 患者进行 rs-fMRI 扫描时至少停药 14 天,扫描结束后开始服用 SSRI 与 SNRI 类抗抑郁药物,并于 rs-fMRI 扫描结束后第 12 周进行临床随访。采用汉密尔顿抑郁量表(HAMD-17)评分。ALFF、GCA 图像组统计均采用 FDR 矫正,PFDR<0.05 为显著。

结果 双样本 T 检验表明,MDD 患者 SMA 区域 ALFF 值较 HC 显著下降(PFDR<0.05)。此外,组间 ANOVA 分析表明,SMA 区域 ALFF 值随 HAMD 第 8 项 PMR 评分呈线性下降,呈现出 HC>MDD(PMR=0)>MDD(PMR=1)>MDD(PMR≥2)的组间差异,团簇峰值 MNI 坐标点为[3,12,69]。以该点作为种子点计算 GCA,结果表明 HC 组与 MDD 组均表现出 SMA 对默认网络的异质性有向连接(PFDR<0.05),但两组无显著差异。MDD 组 SMA 至内侧前额叶的有向连接与 HAMD 总分存在显著负相关($r = 0.19, p = 0.048$)。SMA 的 ALFF 值与 SMA 至内侧前额叶的有向连接的交互作用可以显著预测 12 周的抗抑郁药物疗效($F = 5.17, P = 0.026$)。

结论 SMA 的静息态功能活动降低是 MDD 的神经影像特征,不受抗抑郁药物影响,且与 PMR 有关。SMA 对内侧前额叶的抑制作用不仅可以反映 MDD 患者严重程度,且其与 SMA 的功能活动可以共同预测 12 周的抗抑郁药物疗效。本研究结果提示

SMA[3,12,69]坐标点有望成为精准 TMS 干预治疗精神运动迟滞型抑郁症的新靶点。

MECT 治疗中锂盐对抑郁障碍患者疗效及认知功能的影响研究

张新宇¹ 王冉²

1. 张家口市精神卫生中心

2. 河北医科大学第一医院

目的 目前为止关于无抽搐电休克(MECT)治疗中服用锂盐对抑郁障碍的疗效及对认知功能的影响尚无定论,本研究旨在探讨 MECT 联合锂盐对伴自杀意念的抑郁障碍重度发作患者治疗疗效及认知功能的影响。

方法 纳入 2023 年 12 月至 2024 年 5 月在张家口市精神卫生中心住院的 20-50 岁,诊断符合 ICD-10 重度抑郁发作(HAMD \geq 35 分),且伴有自杀意念或行为(Beck 自杀意念量表 $>$ 10 分)的女性患者 36 例,分为 MECT+锂盐组(20 例)和单纯 MECT 组(16 例)。采集患者社会人口学资料,包括年龄、病程、药物使用情况等。所有患者进行 MECT 治疗 12 次,共 4 周。在基线和治疗 2 周末、4 周末时、6 周末采用 HAMD、HAMA、PSQI、Beck 自杀意念量表、电休克认知评估量表(ECCA)分别评估患者的症状严重程度及 MECT 相关认知功能变化;在基线和治疗 2 周末、4 周末时、6 周末和 8 周末使用成套神经心理状态评估工具(RBANS)评估患者神经认知功能变化,同时静脉采血检测血锂浓度。采用 Pearson 或 Spearman 进行相关性分析、Logistic 回归分析探讨 MECT 治疗中使用锂盐与症状及认知功能的相关性及影响因素分析。

结果 基线时所有患者人口学资料、HAMD、HAMA、PSQI 及 ECCA 总分无统计学差异。单纯 MECT 组与 MECT+锂盐组的 HAMA、HAMD、PSQI、Beck 自杀量表总分在基线和治疗第 4 周末均显著下降($P<0.001$),ECCA 量表 3 次评估总分在治疗 4 周末、6 周末显著下降($P=0.000$),RBANS 总分在治疗 4 周末显著下降,而在治疗 6 周末、8 周末则出现升高($P=0.000$)。与单纯 MECT 组比较,治疗 4 周

末 MECT+锂盐组的 HAMD、HAMA、PSQI 总分均降低($t=15.781, P=0.000$; $t=3.706, P=0.001$; $t=4.448, P=0.000$), Beck 自杀量表在治疗 4 周末未出现显著差异($t=1.815, P=0.089$);ECCA 量表 3 次总分治疗 4 周末、6 周末出现降低($t=-6.639, P=0.000$; $t=-7.467, P=0.000$),差异具有统计学意义。RBANS 总分在治疗 4 周末出现降低、6 周末开始升高、8 周末显著升高($t=2.044, P=0.049$; $t=-3.782, P=0.001$; $t=-8.252, P=0.000$)。

结论 MECT 联合锂盐治疗伴有自杀意念的抑郁障碍患者疗效优于单纯 MECT 组,对患者长期认知功能的影响更小。下一步需排除血锂浓度等混杂因素的影响,进一步随访两组患者认知功能变化。

Obesity-related Brain Structural Asymmetry in Major Depressive Disorder

Kaini Qiao Jingjing Zhou Yanting Luo Xuequan Zhu Gang Wang Yang*

Beijing Anding Hospital, Capital Medical University

Objective MDD presents significant challenges in psychiatric care due to its profound impact on individual well-being and socioeconomic burden. Structural brain alterations are prevalent among MDD patients, yet variability in findings underscores the need to investigate contributing factors, including comorbid medical conditions such as obesity

Obesity, highly prevalent in MDD, involves complex bidirectional influences driven by shared genetic factors, hypothalamic-pituitary-adrenal axis dysregulation, immune-inflammatory responses, neuroendocrine disruptions, microbiome alterations, and behavioral factors. Notably, obesity may exacerbate brain structural changes in MDD, complicating treatment outcomes.

Studies on brain asymmetry in psychiatric disorders show conflicting results. While the ENIGMA consortium found no significant alterations in MDD, obesity has been linked to frontal lobe asymmetry, supporting the 'right brain hypothesis'.

This study aims to investigate prompts investigation into whether obesity-related structural changes extend to individuals with MDD and potentially impact treatment outcomes.

Methods Participants included MDD patients recruited from Beijing An Ding Hospital, Capital Medical University, and healthy controls recruited via advertisement. Diagnosis was based on DSM-IV criteria using the Mini International Neuropsychiatric Interview (MINI) 5.0. Inclusion criteria included age 20-60 years, absence of systemic antidepressant treatment during the current episode or recent intake, and a Chinese version of the 17-item Hamilton Depression Rating Scale (HAMD-17) score ≥ 14 . All participants provided informed consent, and the study was approved by the Ethics Committee of Beijing An Ding Hospital, Capital Medical University. Follow-up measure? Symptom severity was assessed at baseline, and weeks 12 by independent raters using HAMD-17

MRI Acquisition and Preprocessing

All images were acquired using a 3.0 T Siemens MAGNETOM Prisma MRI scanner (Siemens Medical Solutions, Erlangen, Germany) with a 64-channel phased-array head coil. T1-weighted structural images were acquired with a sagittal magnetization-prepared rapid acquisition gradient-echo sequence. 1-weighted structural images were preprocessed using FreeSurfer and Advanced Normalization Tools (ANTs).

Statistical Analysis

Linear mixed models were employed using nlme in R, with BMI, age, sex, and total intracranial volume (ICV) as predictors. Models included a random effect for data collection site. Model residuals were checked for normality, and multicollinearity was assessed using variance inflation factors (VIF). False discovery rate (FDR) correction was applied for multiple comparisons. Associations between BMI and clinical variables were also tested, controlling for age, sex, and data collection site.

Mediation Analysis

Mediation analysis assessed the direct impact of BMI on percent change in HAMD total score from baseline to Visit 2, mediated through cortical thickness asymmetry in the rostral middle frontal region. Models

adjusted for age, sex, and data collection site, using 5000 bootstrap samples for robustness.

Results Regional Asymmetry Differences by BMI

Higher BMI correlated with increased leftward cortical thickness asymmetry in the rostral middle frontal region and decreased rightward cortical thickness in the parstriangularis region. No significant associations were found for surface area asymmetry, gray matter volume asymmetry, and subcortical volume asymmetry.

Correlations of BMI and Asymmetries with Clinical Variables

BMI was associated with the percent change in HAMD total score from baseline to Visit 2 weeks 12, suggesting an indirect effect on treatment outcomes. Cortical thickness asymmetry in the rostral middle frontal region showed a marginal association with the percent change in HAMD total score.

Mediating Effect of BMI

Mediation analysis indicated that cortical thickness asymmetry in the rostral middle frontal region partially mediated the association between BMI and percent change in HAMD total score.

Conclusion This study provides insights into the complex interplay between obesity, MDD, and brain structure, contributing to a deeper understanding of MDD heterogeneity. Such knowledge may inform personalized treatment strategies, improving clinical outcomes for individuals affected by this challenging psychiatric disorder

关键词: Major depressive disorder, obesity, cortical asymmetry, MRI, treatment outcomes

Peer Bullying and Suicide Attempt Among Depressed Adolescents with Suicidal Ideation: A Double Machine Learning-based Causal Inference

Yongjie Zhou¹, Dan Liu², Jingjing Yang², Haoli Xu², Xinwen Zou³, Yang Wang²

1. Shenzhen Kangning Hospital

2.College of Management, Shenzhen University
3.School of Business Informatics and Mathematics,
University of Mannheim

Objective Suicide has been recognized by the World Health Organization as a major global public health issue, and peer bullying has consistently been associated with higher levels of suicidal ideation and suicide attempt. But as far as we know, the causal relationship between peer bullying and suicide attempt among depressed adolescents with suicidal ideation has not been studied. The aim of this study is to reveal the causal and heterogeneous effects of peer bullying on suicide attempt among depressed adolescents with suicidal ideation

Methods 2336 depressed adolescents with suicidal ideation aged 12-18 from 9 provinces/cities in China participated in this cross-sectional study. We utilized Double machine learning, incorporating 37 confounding variables, all of which were divided into demographic variables, adverse childhood experiences, family related factors, social factors, lifestyle factors, and psychological factors

Results Peer bullying increases the risk of suicide attempt among depressed adolescents with suicidal ideation ($\theta=0.000$, 95%CI[0.001, 0.004]). Further exploration of the types of peer bullying reveals that only physical bullying increases the risk of suicide attempt among depressed adolescents with suicidal ideation ($\theta=0.008$, 95% CI[0.014, 0.095]) (no association was found between social bullying, verbal abuse, and assault on property). Heterogeneous causal effects were found in variables such as gender, education level, only child status, academic stress, mobile phone addiction, and sleep disorders

Conclusion Peer bullying, especially physical bullying, increases the risk of suicide attempt among depressed adolescents with suicidal ideation, and there is heterogeneity in gender and other variables. The findings of this study provide new perspectives and insights into the relationship between peer bullying and suicide attempt among depressed adolescents with suicidal ideation, as well as new evidence for the application of machine learning techniques in causal inference

关键词: Peer bullying; Physical bullying; Causal effect; Double machine learning; Heterogeneity analysis

Association between Physical Activity, Depression, and CRP: A Non-linear Regression and Mediation Model Analysis

Dongfang Wang^{1,2}, Jinsong Tang¹

1.Department of Psychiatry, Sir Run Run Shaw Hospital, Zhejiang University School of Medicine, Hangzhou, Zhejiang, China

2.Technical University of Munich, TUM School of Medicine and Health, Klinikum rechts der Isar, Department of Psychiatry and Psychotherapy, Munich, Germany

Objective This study aims to investigate the association between physical activity (PA), depressive symptoms, and C-reactive protein (CRP). The analysis utilizes non-linear regression and mediation models to elucidate the potential mediating effects of CRP on the relationship between PA and depression

Methods Data was extracted from the National Health and Nutrition Examination Survey (NHANES) from 2013 to 2020. The following variables were included in this study: depressive symptoms were assessed using the Patient Health Questionnaire-9 (PHQ-9), and high sensitivity CRP (Hs-CRP), recreational physical activity (RPA), including vigorous RPA (VRPA) and moderate RPA (MRPA). Covariates such as age, gender, race, education, income, marital status, body mass index (BMI), and smoking status were also considered. Statistical analyses were performed in R version 4.4.0 using non-linear regression models and mediation analyses

Results The study included 9796 participants (4749 males, 5047 females) with a mean age of 42.10 years. Depressed individuals had significantly lower VRPA and MRPA times compared to non-depressed individuals. Hs-CRP levels were significantly higher in depressed patients (5.82 ± 12.93 mg/L) compared to

non-depressed patients (3.96 ± 7.32 mg/L) ($F=44.45$; $p < 0.01$). Non-linear regression revealed that RPA was negatively correlated with depression, whereas CRP was positively correlated with depression. The OR for VRPA and MRPA in relation to depression were 0.64 (95% CI: 0.57-0.71) and 0.55 (95% CI: 0.47-0.65), respectively. After adjusting for covariates, these associations remained significant [VRPA: OR = 0.57, 95% CI: 0.37-0.89; MRPA: OR = 0.73, 95% CI: 0.58-0.9]. However, the association between Hs-CRP and depression was not significant [OR = 1.02, 95% CI: 0.82-1.26]. Non-linear regression plots illustrated a curve relationship between MET-RPA, CRP levels, and depression probability. Mediation analysis indicated significant mediation effects of CRP on the relationship between PA and depression

Conclusion This study demonstrates that higher levels of recreational physical activity are associated with lower probabilities of depression, and this relationship is partially mediated by CRP levels. The findings underscore the importance of PA in mental health interventions and suggest that reducing inflammation could be a potential pathway through which PA exerts its beneficial effects on depression. Further longitudinal studies are needed to confirm these findings and elucidate the underlying mechanisms

关键词: Depression, hs-CRP, Recreational Physical Activity, Non-linear Regression, Mediation Model.

Daily Dosing Frequency As A Determinant of Clozapine Concentration-to-dose Ratio: Data From A Therapeutic Drug Monitoring Service (2019–2022)

Jing Ding*

Xi'an Mental Health Center

Objective Clozapine plasma concentration is closely related to clinical efficacy and adverse reactions, and which is affected by many factors, among which daily dosing frequency is one of the important factor influencing the plasma concentration of clozapine. The

first objective was to investigate pharmacokinetic parameters in different daily dosing frequency regimens of clozapine in a naturalistic therapeutic drug monitoring (TDM) sample. The second objective was to establish the necessary clozapine dosage to achieve plasma levels of 350–600 ng/mL in the Chinese population

Methods A single-center, retrospective, cross-sectional study was conducted at Xi'an Mental Health Center in China, where data on clozapine-treated patients between 2019 and 2022 were collected. The clozapine concentration-to-dose (C/D) ratios were compared between subgroups receiving different dosing regimens (once, twice, or three times per day) using Kruskal–Wallis H and Mann–Whitney U-tests

Results The multiple linear regression analysis revealed that daily dosing frequency of clozapine had significant effects on the C/D ratio of clozapine (Table 1). And the C/D ratio of clozapine negatively correlated with the daily dosing frequency. The Kruskal–Wallis H test indicated significant variations in the C/D ratios among the three groups ($p < 0.001$, Figure 1). These findings were also consistent with the sex and age subgroup analyses. The receiver operating characteristic (ROC) analysis revealed that the twice-daily group required a daily clozapine dose of 125–225 mg to achieve the expected therapeutic reference concentration (Figure 2), with a corresponding clozapine C/D ratio of 1.6–2.8. In addition, the ROC analysis revealed that male patients needed a daily clozapine dose between 175 and 275 mg/day to reach plasma concentrations of 350–600 ng/mL, whereas female patients required a slightly lower daily dose of 125–225 mg/day. The daily dose required to achieve the therapeutic reference concentration range of clozapine for middle-aged and older patients was slightly lower than that for young patients, with the daily dose range of 100–175 and 150–225 mg/day, respectively

Conclusion The daily clozapine dosing frequency is an important factor influencing the pharmacokinetic profile of clozapine. Large-scale, multicenter, prospective studies are needed to validate the clinically significant results of this study by administering the same total daily dose at different daily dosing frequencies

关键词: Clozapine/Daily dosing frequency, Therapeutic drug monitoring, Clozapine concentration-to-dose, Receiver operating characteristic

抑郁症患者的 SSRI 药物治疗响应轨迹亚型分析

刘珂 陈熊鹰 臧振享 张志芳 刘瑞 王赞 肖乐 周晶晶 王刚 杨志*

首都医科大学附属北京安定医院

背景 抑郁症患者对抗抑郁药物治疗的响应存在很大异质性。通过分析抑郁症患者在接受抗抑郁药物(如 SSRI)单药治疗后的治疗轨迹及其相关因素,有助于在治疗初期就识别出哪些患者可能对特定药物有良好的反应,从而及时调整治疗方案。目前很难成功地为个体患者选择正确类型的抗抑郁药。通过研究响应轨迹,可以发现患者特征、治疗选择和结果的模式,从而实现更个性化的治疗方案。

目的 分析抑郁症抗抑郁药物治疗的纵向症状轨迹,识别不同的疗效亚型,为早期优化与调整治疗方案提供方向,以期提升个性化治疗效果。

方法 本研究纳入 449 例抗抑郁药物治疗的重度抑郁症患者,在基线、治疗的第 4 周末、第 8 周末、和第 12 周末进行抑郁症状评估。采用基于组的潜变量增长轨迹模型(Group-based latent growth trajectory model)对 4 次访视的 HAMD 评分进行分析,识别抑郁症状变化轨迹的异质性亚型,分析不同因素对治疗轨迹的影响。具体地,本研究逐步建立 1 至 7 个亚型的轨迹模型,并对各模型的分析结果和评价指标进行比较,以确定抑郁症状动态变化异质性的最优拟合模型。模型评估标准主要有:(1)贝叶斯信息准则,绝对值越低表明模型拟合越好;(2)赤池信息量准则,绝对值越低表明模型拟合越好;(3)隶属度,即每类数目占总数的比例,应不小于 5%;(4)平均后验概率,即将个体分配到组的平均后验概率,应大于 70%,分类更准确。此外,本研究在排除了站点、药物种类因素影响的数据子集中对模型的稳定性进行了测试,并进一步考察了多种影响因素对不同患者亚型的治疗轨迹的影响。

结果 本研究所纳入的 449 名患者样本,平均年龄 29.8 ± 9.05 岁,男性占 26.5%,根据基于组的潜

变量增长轨迹最优模型分析结果,可分为 5 个抑郁症状轨迹亚型:早期快速恢复亚型($n=87, 19\%$),早期快速恢复后期稳定恢复亚型($n=175, 39\%$),早期快速恢复后期出现反弹性亚型($n=57, 13\%$),稳定缓慢恢复亚型($n=104, 23\%$),快速抗药后难治性亚型($n=26, 6\%$)。本研究在对 5 个亚型患者的基线临床特征进行分析时发现,QIDS 评分、PHQ9 评分和 SDS 评分、家族史情况等存在显著的亚型组间差异。在对同一站点、仅使用 SSRI 类抗抑郁药物治疗的数据子集进行验证分析时发现,5 类亚型的抑郁症状轨迹保持稳定,可排除这些因素对亚型治疗轨迹的影响。

结论 重度抑郁症患者对抗抑郁药物治疗响应存在人群异质性,临床治疗可以根据不同亚型抑郁症状的轨迹变化特征开展精准干预。

基于抑郁症患者与慢性应激小鼠模型转录组学数据的联合分析探索潜在的抑郁症生物标记与治疗靶点

熊静 张献强 李继涛 苏允爱 司天梅*

北京大学第六医院

目的 抑郁症(major depressive disorder, MDD)是一种严重危害人类身心健康的精神障碍,发病机制尚不明确。研究表明,免疫炎症失调参与了 MDD 病理生理过程。外周血单个核细胞(Peripheral blood mononuclear cell, PBMC)与脑组织基因的表达模式具有高度相关性,其状态和功能能够在一定程度上反映机体包括大脑的免疫炎症水平。本研究通过联合分析抑郁症患者和慢性应激小鼠 PBMC 的基因表达谱和行为特征,旨在探究抑郁症的潜在生物标记物和治疗新靶点。

方法 本研究纳入首发未用药 MDD 患者和健康对照各 15 例,通过 17 项汉密尔顿抑郁量表(HAMD-17)和汉密尔顿焦虑量表(HAMA)对被试进行临床症状评估。此外,构建慢性应激小鼠模型,并评估动物的焦虑样和抑郁样行为。收集人和小鼠的外周血 PBMC 分别进行 RNA-seq 测序。我们系统比较了 MDD 患者和慢性应激小鼠外周血

PBMC 的 RNA 测序数据,通过维恩分析筛选共同差异基因。随后结合 MDD 患者临床量表评分和差异基因的相关性分析结果,寻找潜在的靶点基因,对这些基因表达的蛋白进行蛋白互作分析,探究参与抑郁症免疫调节的分子机制。

结果 临床评估结果显示抑郁症患者存在显著的焦虑和抑郁情绪,动物行为学检测显示应激小鼠存在显著的焦虑样和抑郁样行为表型。通过比较 MDD 患者和慢性应激小鼠 PBMC 的差异基因,本研究筛选出 28 个共同改变的显著差异基因 (Different genes, DGs),其主要涉及免疫反应、细胞信号传导、代谢和组织重塑等生物学过程。在这些 DGs 中,有 7 个基因在 MDD 患者和应激小鼠中的改变呈现相同趋势,其中 ATRNL1 和 PROM1 基因表达显著增加,CCR3、MEX3A、AKAP12、IL4 和 NTRK1 基因表达显著下降。其中 IL4 表达水平与 MDD 患者 HAMD 和 HAMA 评分均呈显著负相关,进一步蛋白互作分析显示 IL4 和 CCR3 存在互作关系。

结论 本研究通过联合分析 MDD 患者和慢性应激小鼠 PBMC 的基因表达谱,识别出多个潜在的生物标记和治疗靶点,其中 IL4 基因表达与抑郁症严重程度呈显著负相关。这为进一步探索抑郁症的分子机制和治疗新靶点提供了重要线索。

Objective Genetic liability to schizophrenia involves various types of mutations from across the allele frequency spectrum and distributed across the genome.

Findings from studies focusing on different types of mutations in schizophrenia converge partially on the same biological processes, while also providing complementary insights. This underscores the importance of studying the full spectrum of mutation. However, currently widely used genotyping technologies, microarrays and short read sequencing (SRS), have limited ability in detecting medium-sized structural variations (SVs) (e.g. 50-2000bp) compared to long-read sequencing (LRS), which is relatively new and has been rarely applied to genetic studies of schizophrenia so far, suggesting an opportunity to leverage this more comprehensive approach to uncover additional sources of genetic variation that may contribute to the disorder

Methods Utilizing both 20X LRS and 30X SRS, we performed comprehensive whole-genome analysis on 40 Han Chinese parent-offspring trios. We called single nucleotide variants (SNVs), insertions and deletions (indels), and SVs utilizing multiple algorithms. Our primary focus was on the detection and validation of de novo mutations (DNMs). Comparative analysis between LRS and SRS was conducted to assess their respective abilities in detecting SVs and de novo SVs. Subsequently, we annotated the de novo mutations and delved into their potential mechanisms in schizophrenia through mining public databases and conducting functional experiments. Finally, we compared the diagnostic yield of our approach to previous studies employing whole exome sequencing or whole genome sequencing using SRS

Results Our analysis identified an average of 71.55 DNMs per proband, including 12 de novo SVs. Notably, four of these de novo SVs were detected by more than three out of four algorithms employed for LRS, whereas none were detected by any of the four algorithms utilized for SRS. In addition, our analysis revealed a 2.8Mb region exclusively accessible via by LRS and not SRS. LRS demonstrated exceptional performance in phasing, while the call sets derived from both LRS and SRS exhibited comparable levels of Mendelian consistency. Of particular interest in our study is a de novo 11kb deletion encompassing the last intron, last exon, and 3' UTR of PPP3CA. Through experi-

mental investigations, we discovered a significant reduction in PPP3CA protein levels in blood cells from the schizophrenia patient harboring this DNM. Similar reductions in PPP3CA protein levels were also observed in HEK293T cell lines carrying a comparable mutation, indicating that the down-regulation of PPP3CA results from the identified de novo SV. Subsequently, in mice model with targeted knockdown of PPP3CA in excitatory neurons within the hippocampus, we observed alterations indicative of schizophrenia-like behavior and impaired cognitive function. Furthermore, our study revealed a slight enhancement in diagnostic yield when employing identical diagnostic criteria, as demonstrated in two comparative analyses

Conclusion Our findings underscore the superior performance of LRS over SRS in identifying risk mutations associated with schizophrenia. Moreover, our study implicates PPP3CA in the pathogenesis of schizophrenia, demonstrating reduced expression in excitatory neurons within the hippocampus, which correlates with schizophrenia-like behavior and impaired cognitive function

大学新生网络成瘾与抑郁、焦虑情绪的网络分析研究

吕秋玥 谢敏 王强*
四川大学华西医院

目的 网络成瘾是对互联网过度使用的成瘾行为,与不良预后相关。然而,尚缺乏探索大学生网络成瘾与抑郁、焦虑情绪间相互作用的研究。因此,本研究旨在通过网络分析方法,探索大学新生群体中网络成瘾与抑郁、焦虑情绪间的相互作用及其影响因素,并识别网络成瘾在其中的核心和桥梁症状。

方法 本研究通过网络及社群平台招募了8244名在校大学新生完成匿名在线测评问卷,对一般人口学特征、抑郁情绪(9项患者健康问卷)、焦虑情绪(7项广泛性焦虑障碍量表)、网络成瘾(Young网络成瘾量表)、睡眠质量(匹兹堡睡眠质量指数量表)、儿童期创伤(童年期创伤问卷)、生活事件(青少年生活事件量表)进行了调查。对提交的问卷进行筛选后,最终分析纳入了5316名参与者。采用网络分析方法构建了网络成瘾与抑郁、焦虑情绪的相关性网络,并使用R软件4.1.3的“qgraph”程序包和“bootnet”程序包评估网络结构、症状中心性和结果稳健性。最后,研究以Young网络成瘾量表得分中位数为分界点,将受试者分为网络成瘾组和非网络成瘾组,比较了网络属性的组间差异。

结果 1、大学新生中的网络成瘾检出率为6.79%,抑郁情绪检出率为21.85%,焦虑情绪检出率为18.67%。

2、在网络成瘾和抑郁、焦虑情绪的网络结构中,强度、接近中心性和预期影响最强的是“抑郁的躯体化因子”节点;强度、中介中心性和预期影响最强的是“对互联网的显著关注并过度依赖”节点、其次是“互联网使用时间过长”节点;除此之外,生活事件中的“人际关系”节点、睡眠质量中的“日间功能障碍”节点是网络成瘾与抑郁、焦虑情绪之间的桥梁症状。同时,网络成瘾与抑郁、焦虑情绪的网络分析模型表现出高度稳定性。

3、网络成瘾组和非网络成瘾组的网络属性组间差异分析结果显示:网络成瘾组的核心症状是“学业压力”、“焦虑的认知因子”和“对互联网的显著关注

并过度依赖”，而非网络成瘾组的核心症状是“主观睡眠质量”和“健康适应”。不同网络成瘾症状严重程度的大学新生的抑郁、焦虑情绪网络结构、网络连接强度、核心症状存在显著差异。

结论 “对互联网的显著关注并过度依赖”、“互联网使用时间过长”症状是网络成瘾与抑郁、焦虑情绪网络中最重要的核心症状；“人际关系”和“日间功能障碍”是其网络结构中最关键的桥梁症状。研究结果提示，以网络成瘾的“对互联网的显著关注并过度依赖”和“互联网使用时间过长”症状为主要的干预靶点，能有助于对大学生抑郁、焦虑情绪进行预防和干预。

原位模拟教学法在精神科住培教学中的应用探索

王韵*

上海市精神卫生中心 CSP 继续教育协作组

目的 探究原位模拟教学法在精神科住院医师规范化培训教学中应用效果。

方法 选择上海市精神卫生中心 147 名住培医师为研究对象，第一年期住培医师 46 人，原位模拟的项目为：询问病史和口头交接班；第二年期住培医师 51 人，原位模拟的项目为：协商、知情同意和传达坏消息；第三年期住培医师 50 人，原位模拟的项目为：告知医疗差错和临终谈话。采用置信职业行为评价法对住培医师进行胜任力评估，记录原位模拟教学前后置信职业行为评价得分，对比前后得分情况。

结果 较之原位模拟教学开展前，第一年期住培医师原位模拟教学（询问病史及口头交接班）后得分显著高于原位模拟教学前得分，且优良率有显著差异（ $P<0.05$ ）。第二年期住培医师原位模拟教学包含的协商、知情同意及传达坏消息三个项目，在开展原位模拟教学之后得分也是显著高于原位模拟教学前得分的，且优良率有显著差异（ $P<0.05$ ）。第三年期住培医师原位模拟教学包含告知医疗差错及临终谈话两个项目，在开展原位模拟教学之后得分也是显著高于原位模拟教学前得分的，且优良率有

显著差异（ $P<0.05$ ）。参与研究住培医师 147 人，其中对原位模拟教学表示很不满意仅有 2 人，占比 1.36%、不满意 8 人，占比 5.44%、表示满意 58 人占比 39.46%、表示非常满意 78 人，占比 53%，总体表示满意为 138 人，占比 93.88。从调查情况来看，原位模拟教学住培医师接受度较高，且住培医师参与积极性较高。

结论 经过原位模拟教学法的培训，住院医师在置信职业行为评价上取得了显著的提高。这意味着他们在特定的职业行为方面展现出了更高的胜任能力，使得他们能够被信任并独立执行特定的医学任务。原位模拟教学法能够显著提高学员的综合能力。这可能涉及临床技能、临床思维、团队合作、沟通能力等方面，这些都是医学专业人员必备的素质。原位模拟教学法通过增强师生之间的互动和学员的积极性，促进了教学过程的有效进行。相较于传统的被动知识传授，互动和参与式的教学方法可以更好地激发学员的学习兴趣和动力。其特点在于将真实情境和互动结合，让学员在实际操作中运用所学知识。这种实践与理论相结合有助于学员更好地理解和应用医学知识，同时培养临床思维能力。通过实际操作和情境模拟，学员被鼓励主动学习、拓展阅读，同时要学会总结和归纳。这培养了学员的学习自主性和知识整合能力，使他们能够更深入地理解和应用所学内容。

青少年抑郁障碍患者皮层内抑制和易化功能及磁共振波谱研究

许铭杰 程宇琪*

昆明医科大学第一附属医院

目的 通过评估青少年抑郁障碍患者皮层抑制及兴奋功能及磁共振波谱的改变，多维度地了解青少年抑郁障碍患者皮层功能的改变情况。

方法 纳入 2022 年 11 月至 2023 年 11 月就诊于昆明医科大学第一附属医院精神科住院部及门诊部就诊的青少年抑郁障碍（符合 DSM-V 标准）患者 41 名和年龄、性别相匹配的健康对照 22 名，使用双脉冲经颅磁刺激联合肌电描记技术(ppTMS-EMG)

进行皮层抑制及兴奋性的测量,共有 41 名患者和 22 名健康对照完成测量。以前额叶为感兴趣区,使用飞利浦 3.0T 磁共振扫描仪 MEGA-PRESS 序列进行磁共振波谱数据采集,共有 22 名患者和 14 名健康对照完成磁共振波谱数据采集。使用 Gannet 软件进行磁共振波谱数据的数据后处理。使用汉密尔顿抑郁量表 (HAMD-17) 和成套神经心理状态评定量表 (RBANS) 进行抑郁症状严重程度和认知功能的评定,然后将患者的皮层兴奋性和磁共振波谱结果与抑郁症状和认知功能进行相关分析。

结果 (1) 皮层兴奋性及抑制性分析发现,相比于健康对照,青少年抑郁障碍患者在间隔为 4ms ($Z=-3.151, P=0.002$)、5ms ($Z=-2.360, P=0.018$) 时测得的短间隔皮质内抑制(SICI)值和间隔为 150ms ($Z=-3.010, P=0.003$) 及 200ms ($Z=-1.976, P=0.048$) 时测得的长间隔皮质内抑制(LICI)值高于 HC 组。(2) 青少年抑郁障碍患者与健康对照前额叶 γ -氨基丁酸 (GABA) 及谷氨酸 (Glu) 浓度水平无显著差异($P>0.05$)。相关分析发现, aMDD 组认知功能中的视空间结构得分与前额叶 GABA 浓度 ($r=-0.516, P=0.028$) 和 Glu 浓度 ($r=-0.665, P=0.003$) 呈负相关。

结论 青少年抑郁障碍患者存在皮层 GABA 能受体功能的缺陷。未发现患者前额叶 GABA 和 Glu 水平的显著改变,猜测青少年抑郁障碍患者前额叶的功能变化可能是因相关神经递质受体的功能改变引起的。

Influence of Parental Rearing Style on Suicide in Chinese Transgender Women

Jie Yin Shuya Yan Jianzhao Zhang Yanbin Jia*

First Affiliated Hospital of Jinan University, Guangzhou, China

Objective Deficient parental bonding are associated with adverse health outcomes in transgender women, leading to an increased risk of suicide in transgender women. The impact of parental rearing

style on individual psychology may be lifelong, and parental rearing style in China are unique compared with western family. This study aimed to explore the impact of parenting style on suicide in Chinese transgender women (TW)

Methods A total of 106 TW and 52 cisgender males (CM) were recruited from March 12, 2023 to June 3, 2024. The primary outcomes were self-reported suicidal ideation, suicide attempt and self-perceived parental rearing style. Logistic regression analysis characterized influencing factors for suicidal ideation and suicide attempt

Results Of 106 transgender women recruited in our survey, 59 (55.7%) respondents reported suicidal ideation in the past 12 months and 38 (35.8%) respondents reported attempted suicide. Compared with CM, TW reported having suffered more adverse childhood experiences and received less perceived social support from family and friends. Stepwise multivariate logistic regression model found that paternal excess interference was significantly associated with both suicidal ideation and suicide attempt among Chinese TW when controlling for other factors (OR:1.19, 95% CI: 1.06 to 1.34, $P=0.002$; OR:1.13, 95% CI: 1.03 to 1.23, $P=0.010$), and maternal emotional warmth was associated with suicide attempt (OR:0.96, 95% CI: 0.92 to 1.00, $P=0.049$)

Conclusion Being minority group determines that the mental health status of TW faces more severe challenges, resulting in high risk of suicide. The present study emphasizes the importance of active parental rearing style to prevent adverse psychological outcomes in Chinese TW. However, it may be necessary to break the shackles of traditional Chinese concepts to solve the pressure on TW from families.

左甲状腺素及三碘甲状腺原氨酸在抑郁发作患者中治疗的研究进展

张蒙蒙 李名立* 谢怡 曹璐 徐亭晚
四川大学华西医院

目的 抑郁发作既可出现在抑郁障碍, 也可见于双相障碍, 导致痛苦体验、自杀风险、焦虑体验等后果。部分患者对常规的抗抑郁剂治疗应答不佳, 损害患者社会功能的恢复。既往有研究发现抑郁发作与下丘脑-垂体-甲状腺轴相关, 也有研究探索左甲状腺素 (Levothyroxine, T4)、三碘甲状腺原氨酸 (triiodothyronine, T3) 对抑郁发作的疗效, 但是研究结果不一。本文主要针对抑郁障碍及双相障碍抑郁发作患者使用 T4、T3 干预的实验进行综述, 探索 T4 及 T3 对抑郁发作转归的影响, 以期进一步指导临床。

方法 对中国知网、PubMed 和 Web of Science 中自建库以来至 2024 年 3 月 10 日之前发表的相关研究进行系统检索。纳入研究需满足: 研究对象符合《国际疾病分类 (第 9、10 或 11 版)》、《精神障碍诊断与统计手册 (第 III、IV 或 5 版)》双相障碍或者抑郁障碍的诊断标准, 排除有甲状腺手术史患者的研究。研究内容包括使用 T4 或 T3 治疗至少达 2 周; 研究结局指标的评价工具使用汉密尔顿抑郁量表、蒙哥马利抑郁量表或临床疗效总评量表的研究; 结局指标为: 应答率、缓解率、治疗前后量表评分差异。

结果 初步检索获取文献 4569 篇, 最终纳入 18 篇。研究结果发现甲状腺功能正常的抑郁症患者在三环类抗抑郁药 (TCA) 或选择性 5-羟色胺再摄取抑制剂 (SSRIs) 基础上加用 T3 治疗未发现一致性的有效证据, 但难治性抑郁症患者在原有药物基础上使用 T3 有约 50% 以上的应答率; 抑郁症患者使用 T4 治疗证据不足, 但女性、存在抑郁残留症状的患者可能获益。另外抑郁症共病亚临床甲减患者使用左甲状腺素辅助抗抑郁药的效果优于单用抗抑郁药, 且其应答良好与治疗前的甲状腺功能水平相关。抑郁症患者行电休克治疗 (ECT) 同时合并使用 T3 可以减少 ECT 次数并增强其发作效果, 且改善 ECT 带来的认知损害。双相障碍抑郁发作患者使用 T3 没有发现符合纳入标准的研究, 仅有回顾性研究提示治疗前后抑郁症状有改善。双相障碍抑郁发作患者使用大剂量 T4 ($\geq 300\mu\text{g}/\text{天}$) 对抑郁症状有改善, 特别是难治性及快速循环的双相障碍患者可能获益更多。

结论 难治性抑郁障碍及双相障碍抑郁发作患者更可能从 T4 或 T3 作为辅助治疗的方案中获益。对于抑郁障碍患者共病甲功异常的患者, 抗抑郁药

与 T4 联合疗效更佳。未来需要更多大规模、更同质的临床人群和随机盲法对照或真实世界的研究去进一步明确 T4 和 (或) T3 治疗抑郁发作的疗效, 并探索抑郁发作的患者使用 T4 或 T3 的最佳时机、剂量、疗程或发挥其最大抗抑郁疗效目标的甲状腺功能水平, 为未来使用甲状腺激素治疗抑郁发作提供更有价值的参考。

双相障碍共病焦虑障碍的神经影像多模态机制研究

聂旸柔 李名立*

四川大学华西医院

目的 双相障碍 (Bipolar Disorder, BD) 是一种复杂的精神疾病, 通常表现为情绪低落和高涨交替发作, 其特征是情绪不稳和社会功能障碍。焦虑障碍 (Anxiety Disorder, AD) 是一组以过度担心、害怕及相关行为紊乱为特征的精神疾病。46-75% 的 BD 至少有一次终生焦虑障碍诊断, 现患率约为 30%。伴焦虑的 BD 常常具有更严重的临床症状、更差的社会功能和更高的自杀风险, 导致疾病治疗难度增大。本文拟通过对 BD 共病 AD 患者、BD 患者及健康对照三者的大脑功能及结构磁共振成像进行研究, 探索共病患者与未共病患者大脑结构及功能异常脑区的异同, 并在此基础上探讨这些异常脑区与其临床特征之间的关系。

方法 本研究共纳入 109 名被试者, 其中包括 30 名 A-BD 患者, 28 名 BD 患者以及 51 名 HC, 所有患者均处于抑郁发作期。在 Matlab、SPM12、DPARSFA 等软件对三组受试者的脑影像数据进行预处理, 获得各组受试者的灰质体积、度中心以及分数低频振幅, 在 SPM12 中以性别、年龄、受教育年限以及颅内总体积为协变量, 对三组间上述指标的组间差异进行探索。提取患者组异常灰质体积及脑功能脑区的灰质体积、度中心以及分数低频振幅, 在 SPSS29.0 中与汉密尔顿焦虑量表、汉密尔顿抑郁量表、总病程以及本次病程进行偏相关分析。

结果 与健康对照相比, 两组患者存在共同异常的大脑灰质体积及大脑功能, 主要表现为左侧海

马旁回、右侧小脑后叶、左侧额下回、左侧眶额下回等脑区的灰质体积降低, 双侧丘脑、双侧尾状核等脑区度中心下降。然而共病组患者还存在独特的灰质体积及脑功能异常脑区, 主要表现为左侧梭状回、左侧舌回、左侧颞下回和左侧小脑后叶的灰质体积下降, 右侧小脑的低频振幅下降以及枕中下回、舌回、距状沟、梭状回、左侧颞中下回等枕叶和颞叶皮层的低频振幅升高。与未共病的双相障碍组相比, 双相障碍共病焦虑障碍患者大脑灰质体积与静息态脑功能活动及连接存在更广泛的损害, 主要位于枕中下回、颞中回和舌回。

结论 本研究探索了三组间大脑结构与局部大脑功能活动的差异。研究发现, 双相障碍两个亚组在神经影像学机制上存在异同, 两患者组均表现出前额叶-边缘系统(海马旁回、丘脑)-小脑的异常结构和功能变化, 但共病焦虑障碍双相障碍患者存在更为广泛的损害, 主要发生在枕叶、颞中下回和梭状回等区域, 这些脑区主要与不确定信息的识别处理及各类事物的视觉识别等相关, 其功能活动异常增高或减低可能通过识别和解读偏差引发焦虑情绪以及认知障碍。同时双相障碍患者脑灰质体积及脑功能与临床特征相关, 病程越长, 部分脑区灰质体积和功能的异常改变越显著, 症状也越重。

Study on Intestinal Flora Characteristics and Metabolomic Analysis in Children and Adolescents with First Untreated Obsessive-compulsive Disorder

Jiali Dai^{1,2}, Gang Zhu¹

1. The First Affiliated Hospital of China Medical University

2. The Third Hospital of Daqing

Objective Numbers of adult patients with obsessive-compulsive disorder (OCD) start from children or adolescents, so early identification and intervention become the key to control the disease. However, its etiology has not been fully clarified. This study sought to explore the relationship between the pathogenesis and

gut microbiota in children and adolescents with OCD

Methods Multi-omics combined analysis of the gut microbiota in first-episode children and adolescents with OCD was performed. Stool samples were collected from 49 first-episode untreated children and adolescents with OCD and 42 age- and sex-matched healthy controls (HC), and all subjects were evaluated for clinical parameters. A total of 91 samples were analyzed by 16S rRNA sequencing and metabolomic based on UHPLS-MS. Correlation analysis was conducted between metagenomic sequencing results and clinical parameters to explore the relationship between intestinal flora and OCD symptoms and the possible functional pathways involved in the pathogenesis. Fecal samples from 19 OCD and 18 HC subjects were analyzed by Illumina HiSeq sequencing platform using metagenomic high-throughput sequencing method. Association analysis was performed on metagenomic and metabolomics analysis data to clarify the association between differential flora and differential metabolites

Results 1. The diversity index of intestinal flora in patients with OCD was significantly decreased (obs, $P < 0.001$; chao1, $P < 0.001$; ACE, $P < 0.001$; shannon, $P < 0.001$; simpson, $P < 0.05$; good, $P < 0.001$), and the microbial interaction network was significantly weaker than that in HC group. 2. The relative abundance ratio (F/B) of Firmicutes /Bacteroidetes in OCD group was significantly lower ($P < 0.001$). 3. The abundance of butyrate-producing bacteria such as Romboutsia ($q < 0.01$), Mitsukella ($q < 0.01$), and Terrasporobacter ($q < 0.01$) in the intestine of patients with OCD decreased significantly. 4. The random forest model identified 30 specific bacteria as markers, and the AUC between OCD patients and HC was 0.9011. 5. There is a correlation between the changes of clinical parameters in OCD group and the abundance of specific bacteria in intestinal flora. 6. A total of 43 endogenous differential metabolites were screened out in OCD-HC group, and there was a correlation between the differential metabolites and the differential flora ($P < 0.05$). 7. The relative contents of Neopterin and Sepiapterin, the intermediate products of folate biosynthesis, were significantly higher in OCD group ($P < 0.05$); Glucocorticoids and

corticosterones significantly decreased in regulating lipolysis in adipocytes and prion diseases ($P < 0.05$)

Conclusion Gut microbiota of children and adolescents with OCD were disordered at phylum, genus and species level, and the diversity of flora was significantly reduced. The OCD and HC groups had distinctive intestinal flora. Several gene functional and metabolic pathways of intestinal flora in OCD patients are destroyed

伴或不伴轻躁狂倾向的单相抑郁和双相抑郁青少年患者的大尺度脑网络功能连接及其分类研究

孙朵 程宇琪* 刘译营 尚婷婷 刘娇
昆明医科大学第一附属医院

目的 青少年抑郁患者中很多伴随情绪不稳定以及阈下或阈上轻躁狂症状, 这些临床特征差异背后的神经机制仍待阐释。因此, 本研究旨在寻找青少年单相抑郁(Unipolar depression, UD)、单相抑郁伴轻躁狂倾向(Unipolar depression with hypomanic tendency, UD-Hm)和双相抑郁(bipolar disorder depression, BDD)患者在脑网络水平的静息态功能连接(FC)差异, 以及探索组水平的 FC 差异在个体水平是否具有分类能力。

方法 研究招募了 12 至 19 岁的 43 名 UD、33 名 UD-Hm、23 名 BDD 患者和 28 名健康对照(HC)。根据轻躁狂症状清单(HCL-32)评分, 将 UD 组定义为 $HCL-32 < 14$ 分, UD-Hm 为 $HCL-32 \geq 14$ 分。所有参与者完成静息态功能磁共振和 3D-T1 加权扫描, 预处理后提取感兴趣区(ROI)的神经信号构建脑网络, 并使用 Combat 算法去除站点效应。分别在 ROI 和大尺度脑网络水平比较 4 组间的 FC 差异, 然后与临床特征的进行相关性分析, 最后, 采用线性判别分析(LDA)方法对患者组进行分类。

结果 ① ROI 分析显示, 与 HC 相比, BDD 组的右侧中央前回(感觉运动网络)和右侧楔前叶(默认模式网络)之间的 FC 下降。② 大尺度脑网络分析显示, 3 个临床组均较 HC 的 FC 下降。具体而言,

UD 组感觉运动网络(SMN)内部连通性降低, UD-Hm 组 SMN 网络内、感觉运动网络-默认模式网络(SMN-DMN)和额顶网络-腹侧注意网络(FPN-VAN)间 FC 下降, BDD 组 SMN-DMN 网络间 FC 呈下降趋势, 但未通过 FDR 校正 ($p < 0.0025$)。③ 相关性分析发现, UD-Hm 患者的 FPN-VAN 网络间 FC 与汉密尔顿焦虑量表(HAMA)评分呈正相关($r = 0.507, p = 0.048, FDR$ 校正)。④ LDA 基于上述功能连接差异能够区分 UD 和 BDD 患者 (MeanAccuracy: 72.14%, Specificity: 70.83%, Sensitivity: 74.17%, AUC: 0.79, $p < 0.05$)。但是, 对于 UD-Hm 和 BDD、伴或不伴轻躁狂倾向的单相抑郁两对患者组分类准确性较低, 且 5000 次排列检验后分类准确性的 p 值不显著。

结论 青少年单、双相抑郁患者表现出一致的脑网络 FC 下降, 尤其 UD-Hm 患者受到更广泛的影响, 而且下降的 FC 只能将 UD 和 BDD 患者进行区分。因此我们推测, 在早发性情绪障碍患者中, 单相抑郁伴轻躁狂倾向可能是一个独立表型, 在临床诊疗过程中, 应密切关注和随访。

抑郁症功能连接梯度的偏侧化改变及其与长期治疗结局的关联

平亮亮^{1,2} 孙珊² 和梦鑫³ 周聪⁴ 沈宗霖¹ 许秀峰¹ 程宇琪¹

1. 昆明医科大学第一附属医院
2. 厦门市仙岳医院
3. 上海交通大学附属仁济医院
4. 济宁医学院

目的 探索抑郁症(MDD)是否影响大脑功能梯度的半球不对称性

方法 我们通过 DIDA-MDD 联盟的来自 9 个中心的 2227 名参与者 (1148 名抑郁症患者和 1079 名健康对照)的大型静息态 fMRI 数据集进行分析, 研究了与抑郁症相关的功能连接组梯度的偏侧化改变, 并采用留一站点交叉验证的方法验证结果的鲁棒性。采用偏最小二乘相关分析的方法探索抑郁症患者功能连接梯度的偏侧化模式与临床量表评分之

间的关联。此外，我们还分析了来自真实世界的随访时间大于2年的52名MDD患者的数据，通过支持向量回归的方法探索与MDD梯度偏侧化模式与长期治疗结局的关系。

结果 与健康对照组相比，MDD患者在感觉运动网络区域、默认网络区域、额顶控制网路区域、注意网络区域、边缘网络区域均存在功能连接梯度的偏侧化改变，而且这些异常沿着多个功能梯度呈现异质性的改变。我们还发现抑郁症患者功能连接梯度的偏侧化模式与临床h汉密尔顿抑郁量表(HRDS)评分之间显著关联。此外，通过支持向量模型，我们发现抑郁症患者基线时的第一梯度的半球内梯度不对性特征可以显著预测患者远期(>2年)HDRS评分的变化。

结论 MDD的连接组梯度偏侧化存在异常，并且可能和长期预后相关，该研究为这种疾病的潜在治疗评估生物标志物提供了依据。

瑞替加滨通过调节内质网应激介导的凋亡改善慢性束缚小鼠的抑郁样及认知症状

张晶¹ 张晶² 胡建^{1,2}

1.哈尔滨医科大学附属第一医院

2.南昌大学附属精神病院

目的 研究瑞替加滨(retigabine, RTG)对慢性束缚应激诱导的小鼠抑郁样症状及认知症状的改善作用，并初步探究其与内质网应激介导的细胞凋亡的相关机制。

方法 将7周龄的48只C57BL/6小鼠随机分为正常组、模型组(同等体积的药物溶剂:0.3%二甲亚砜+0.9%生理盐水)、RTG组(剂量:10mg/kg)和RTG+XE991【Kv7(KCNQ)通道阻滞剂】，每组12只。采用慢性束缚应激建立小鼠抑郁样及认知功能损害模型。给予相应的药物干预后，进行①行为学实验:旷场实验 检测小鼠中央区运动距离和停留时间;糖水偏好实验 检测小鼠糖水偏好度;悬尾实验 检测小鼠悬尾不动的时间;水迷宫实验统计小鼠到达隐藏平台的时间及穿越平台的次数，以检测小鼠的学习及记忆认知功能。②免疫荧光法检测各组小鼠海马组织中C/EBP同源蛋白和葡萄糖

调节蛋白78阳性表达强度。③Western blotting法检测各组小鼠脑海马组织中GRP78、CHOP、Bcl-2、Bax以及BNDF、ERK1/2、p-ERK1/2蛋白表达。

结果 与对照组比较，模型组小鼠OFT中央区运动距离和停留时间、糖水偏好百分率、WMW中穿越平台次数明显降低($P<0.05$)，而FST中悬尾不动时间、WMW中到达平台时间明显延长($P<0.05$)；IF染色可见CA3区的GRP78、CHOP表达明显增强($P<0.05$)；WB法可见CHOP、GRP78、Bax蛋白表达水平均明显升高($P<0.05$)，而Bcl-2、BNDF、p-ERK1/2与ERK1/2比值明显下降($P<0.05$)；与模型组对比，RTG组小鼠在OFT中央区运动距离和停留时间、糖水偏好百分率、WMW中穿越平台次数明显降低明显增加($P<0.05$)，IF染色可见CA3区的GRP78、CHOP表达减弱($P<0.05$)，WB法可见CHOP、GRP78、Bax蛋白表达水平均降低、p-ERK1/2与ERK1/2比值明显升高($P<0.05$)；与RTG组比较，RTG+XE991组小鼠FST中悬尾不动时间、WMW中到达平台时间明显延长($P<0.05$)，IF染色可见CA3区的GRP78、CHOP表达增强；WB法可见CHOP、GRP78、Bax蛋白表达水平均升高($P<0.05$)，BNDF、p-ERK1/2与ERK1/2比值下降($P<0.05$)。

结论 瑞替加滨能减轻CRS引起的小鼠抑郁样行为、改善认知损害，其可通过Kv7钾离子通道发挥主要作用，作用机制可能与抑制内质网应激介导的凋亡有关。

关键词：瑞替加滨；抑郁症；认知损害；内质网应激；XE991

Sex Differences in Brain Metabolites in Un-medicated Depressed Adolescents with Non-suicidal Self-injury

Shuya Yan¹, Hanglin Ran², Yiliang Zhang¹, Shuming Zhong¹, Shunkai Lai¹, Sihui Lv¹, Yange Luo³, Yanbin Jia¹

1.First Affiliated Hospital of Jinan University

2.Chongqing Medical University

3.the Eighth Affiliated Hospital, Sun Yet-Sen University

Objective Sex differences in the clinical characteristics of non-suicidal self-injury (NSSI) and biochemical metabolism alterations of NSSI can be found in adolescents with a current major depressive episode (MDE). However, the relationship between gender and biochemical metabolism in MDE adolescents with NSSI remains unclear

Methods 171 unmedicated MDE adolescent patients with NSSI (NSSI group), 71 unmedicated MDE adolescent patients without NSSI (non-NSSI group) and 32 healthy controls (HC) were included. The 24-item Hamilton Depression Rating Scale (24-HDRS) was used to assess depressive symptoms. Bilateral metabolic ratios of N-acetyl aspartate (NAA) and choline-containing compounds (Cho) to creatine (Cr) in the prefrontal cortex (PFC), anterior cingulate cortex (ACC), lenticular nucleus (LN), and thalamus were obtained by 1H-MRS at 3.0 T

Results In MDE male adolescents, the NSSI group had higher NAA/Cr ratios than the non-NSSI group of the left PFC ($p=0.013$). A significant group × sex interaction effect ($F=9.150$, $p=0.003$) for the Cho/Cr ratios was found in the right thalamus. In MDE male adolescents, the non-NSSI group had higher Cho/Cr ratios than the NSSI group ($p=0.004$) in the right thalamus. In non-NSSI group, male adolescents had higher Cho/Cr ratios than females ($p=0.002$) in the right thalamus. The binary logistic regression showed that there was a significant negative relationship between Cho/Cr ratios of right thalamus and NSSI in MDE male adolescents

Conclusion MDE male adolescents with NSSI demonstrated different biochemical metabolism compared with females in the left PFC. Furthermore, the low Cho/Cr ratios of the right thalamus can be a specific predictor for NSSI in MDE male adolescents.

目的 本文采用孟德尔随机化分析及临床验证对于抑郁、创伤史、神经质、睡眠、吸烟、饮酒、BMI、教育程度、体育锻炼与认知表现的关系进行探讨,并探讨其间的中介关系。

方法 首先选取抑郁、创伤史、神经质、失眠、睡眠时长、吸烟史、每日吸烟量、每周饮酒、BMI、教育程度、体育锻炼作为暴露因素,选取来自两个数据库的认知表现作为结局,进行孟德尔随机化分析及中介分析。其次选取年龄60岁以上的共407人的受试人群收集身高、体重、教育程度、体育锻炼情况、吸烟史、每日吸烟量、饮酒频率信息及HAMD、GDSLESE、CTQ-SF、EPQ-RSC、PSQI、MoCA量表评定结果进行相关性分析及中介分析来对于孟德尔随机化分析得出的结果进行临床验证。

结果 在孟德尔随机化分析中发现抑郁、创伤史、神经质分数、吸烟史、BMI分数与认知表现呈负相关,教育程度与认知表现分数呈正相关。失眠、睡眠时长、每周饮酒、每日吸烟量、体育锻炼与认知表现的关系在两个数据库中也均不显著。在中介孟德尔随机化分析中我们得出抑郁、神经质、吸烟史均在创伤史(暴露)到认知表现(结局)具有中介效应,中介效应平均值分别为16%、25%、15%;抑郁、创伤史均在神经质分数(暴露)到认知表现(结局)中具有中介效应,中介效应平均值分别为16%、13%。

在临床验证中发现抑郁、晚期创伤史(负性生活事件)、神经质与认知表现呈负相关;

失眠、睡眠时长、日吸烟量、饮酒频率、BMI、锻炼强度、锻炼时长与认知表现无明显的相关性;教育程度、吸烟史与认知表现呈正相关。

而在中介关系临床验证中抑郁、神经质均在创伤史到认知表现具有中介效应(GDS:完全中介,HAMD:33.3%中介效应,神经质:48.6%中介效应),抑郁、创伤史均在神经质分数到认知表现中具有中介效应(GDS:完全中介效应,HAMD:26.2%中介效应,LESE:19.4%中介效应),但吸烟史在创伤史与认知表现之间中介效应95%置信区间为(-0.003898479,0.014739276),包含0,认为中介效应不显著,因此认为吸烟史不是创伤史-认知表现的中介因素。

结论 我们的孟德尔随机化分析及临床验证均

认知表现的影响因素分析及验证研究

发现抑郁、神经质、创伤史均与认知表现负相关,教育程度与认知表现正相关,睡眠、饮酒、体育锻炼均与认知表现无关。在创伤史与认知表现的关系中,相比于早期创伤史,晚期创伤史对于认知表现的影响更为显著。且对于具有创伤史的人群而言,患有抑郁、神经质分数越高均会导致认知表现更差。而对于神经质分数较高的人群而言,患有抑郁、有创伤史均会导致认知表现更差。

TAAR1 参与的线粒体功能调节在慢性应激所致认知功能损害中的作用

张献强 熊静 刘德农 李继涛 司天梅 苏允爱*
北京大学第六医院

目的 痕量胺相关受体 1 (Trace amine-associated receptor 1, TAAR1) 是 2001 年被发现的 G 蛋白偶联受体, 现已被证实是治疗精神疾病非常有前景的新靶点。本研究旨在探究 TAAR1 在慢性应激导致小鼠海马相关认知功能损害中的调控作用和分子机制, 为抑郁症等应激相关精神疾病的新药研发提供新的靶标和实验依据。

方法 首先, 本研究通过构建 TAAR1 全敲小鼠, 利用行为学检测和 RNA 测序等方法探索 TAAR1 敲除对小鼠行为和生物学功能的影响。随后, 通过荧光定量 PCR、免疫蛋白印迹和流式细胞术等方法对特定生物学过程和差异分子进行深入探索, 以解析 TAAR1 作用效应的下游分子通路。最后, 本研究分别通过慢性应激小鼠和应激细胞模型, 伴随应激给予选择性 TAAR1 部分激动剂 RO5263397 进行干预, 进一步证实 TAAR1 及其下游信号分子在慢性应激所致海马神经元线粒体功能障碍中的调节作用。

结果 TAAR1 基因敲除导致成年小鼠的空间参考记忆和工作记忆出现损害。进一步研究发现, TAAR1 敲除引起了小鼠海马脑区神经元线粒体功能和形态受损, CaMKII 和调控线粒体裂变的主要分子-磷酸化动力蛋白相关蛋白 1 (p-Drp1ser616) 等表达水平下调, 并且电镜观察结果提示突触后致密区厚度显著下降。此外, 慢性社会挫败应激也导致小鼠海马神经元线粒体结构和功能受损, CaMKII 和 p-Drp1ser616 等蛋白显著下调, 突触超微结构受损。

TAAR1 部分激动剂-RO5263397 改善了慢性应激致小鼠认知功能、海马神经元线粒体、突触结构、调控线粒体裂变与突触可塑性等蛋白表达的变化。

结论 TAAR1 在慢性应激所致海马相关认知功能损害中发挥重要调节作用, 这可能与 TAAR1 通过下游信号通路分子-CaMKII 调控线粒体功能, 从而引起突触可塑性改变有关。TAAR1 是治疗应激相关精神障碍引起的认知功能损害的潜在靶点。

Effects of Exercise on Cognitive Function in Depressed Adults: Systematic Review and Network Meta-analysis

Li Duan Gang Zhu*

The first affiliated hospital of China Medical University

Objective This review aimed to investigate the effectiveness of exercise on global cognitive, memory, and executive function in adult patients with depression, regardless of the presence of cognitive dysfunction. Additionally, we intend to evaluate the optimal exercise interventions further based on network meta-analysis

Methods Eleven relevant databases were searched (inception to May 2024) and ultimately included 35 studies. Primary outcome was global cognitive function, and secondary outcomes included memory and attention. Pooled standardized mean differences or odds ratios with 95% credible intervals were estimated using pairwise and network meta-analysis with random effects. Differences among trial findings were explored in subgroup and sensitivity analyses. The Cochrane Risk of Bias Tool assessed the risk of bias in the randomized controlled trials. Quasi-experimental studies were evaluated according to the JBI Health Care Center 2016 version of the evaluation tool

Results Ultimately, 36 studies were included in this network meta-analysis. The comprehensive pooled results indicate that exercise could significantly improve global cognitive function (SMD=0.74, 95%CI: 0.62 to 0.86) and other cognitive domains. Specifically,

mind-body exercises demonstrated the most incredible effects on global cognitive function with a SUCRA (Surface Under the Cumulative Ranking Curves, SUCRA) value of 84.0% and executive function (96.9%), while multicomponent exercise showed the most substantial impact on improving memory (70.9%)

Conclusion Despite some heterogeneity, this study's findings provide preliminary yet cautionary support that exercise is helpful for cognitive function in adults with depression. These findings can offer some information for clinical practice, but continued research is needed to position exercise training within evidence-based intervention approaches.

Analysis of Hotspots in Geriatric Comorbidity Research in The Past Decade Based on CiteSpace

Li Duan Gang Zhu*

The first affiliated hospital of China Medical University

Objective To visually analyze the current status of research and hotspots related to geriatric comorbidities at home and abroad in the last decade, to understand the current research progress and future development trend of multimorbidity in the elderly

Methods Based on text mining technology and bibliometrics, the pieces of literature related to geriatric multi-morbidities published in China National Knowledge Infrastructure (CNKI) and Web of Science (WOS) from January 1, 2014, to April 27, 2024, were systematically retrieved. Cite Space 6.3 R1 was used to analyze and visualize authors, institutions, network software, keywords co-occurrence, clustering, dash forward show, timeline, and highly cited papers

Results A total of 196 Chinese literatures and 5534 English literatures were retrieved. This study found that the annual number of publications showed an overall upward trend. The Chinese core authors were Zhang Dan, Liu Xiaohong, and Xie Yanming, and the

foreign core authors were Singh Jasvinder A, Formiga Francesc, and Cleveland John D. Institutions at home and abroad to cooperate more frequently. Geriatric comorbidities research mainly concentrated on disease management and health outcomes, physical and social factors

Conclusion In the past decade, the research fever of geriatric comorbidities has been rising, and geriatric comorbidities with concomitant diseases and frailty have gradually become the mainstream research hotspots. Disease management health outcomes, and physical, and social factors may become the main direction of future research development

基于虚拟网络的新型教育模式探讨——以“精神课堂教学”为例

张煜晖 刘忠纯*

武汉大学人民医院精神卫生中心

目的 随着信息技术的迅猛发展,网络虚拟教学平台已经成为现代教育的重要组成部分。然而,传统的在线教育模式往往忽视了学生的临床诊疗技能培养,缺乏与学生的实践互动能力。本文旨在探讨如何利用网络虚拟教学平台创造具有人文关怀特质的精神课堂,以提升学生的学习体验和全面发展。

方法 1. 网络虚拟教学平台的优势与挑战

优势: 弹性学习时间、地域无关性、资源共享和互动性。

挑战: 缺乏面对面的情感表达、个性化学习方案、整体学习氛围的建立。

2. 精神课堂的特征与价值:

特征: 人文关怀、情感支持、诊疗技能的平衡。

价值: 提升学生的情感智力、社交技能和系统分析病案的能力。

3. 网络虚拟教学平台中实现精神课堂综合素质培养的策略

技术支持: 情感识别技术、虚拟社交互动工具、智能化学习管理系统。

教育实践: 培训师资、设计具体病例实践、促

进在线协作与团队项目。

4. 案例分析与实证研究

案例一： 我校《精神病学》课题组利用虚拟社区提升学生精神课堂体验的实践。

案例二：“思维训练”小程序在虚拟教学中应用交互技术的成效评估。

结果 本文探讨了网络虚拟教学平台在精神课堂中的应用，强调了临床知识掌握与精神诊疗实践的有机结合对医学学生全面发展的重要性。未来的研究可以进一步探索技术工具的优化和教育策略的创新，以提升在线教育的质量和影响力。

结论 在全球范围内，网络虚拟教学平台的广泛应用为教育带来了灵活性和便利性。然而，与传统课堂教学相比，这些平台通常缺乏面对面的情感交流和个性化支持，但这让教学团队对学生的课堂参与度多少、系统知识的实际掌握程度难以掌握。本文旨在探索如何通过网络虚拟教学平台实现精神病学课堂将理论知识与临床实践相结合的理念，为学生提供更为综合和全面的学习内容，帮助学生提升整体医学水平。

TNF- α MRNA 对经历慢性负性应激的抑郁症的识别作用：一项基于机器学习模型建立的研究

张丽丽* 张云淑 栗克清
河北省第六人民医院

目的 本研究通过机器学习建模方法，纳入海马结构和功能连接影像学指标、HPA 轴功能指标、免疫炎性指标等多维度数据，选择最优模型，并筛选有效的生物学标记物，对经历慢性负性应激的抑郁症进行早期识别。

方法 研究对象分为经历慢性负性应激的抑郁症组 (n=34) 和非经历慢性负性应激的抑郁症组 (n=30)。共纳入 21 个特征指标，其中海马影像指标 11 个 (海马体积：右侧海马颗粒细胞层-分子层-齿状回头部体积、右侧海马角 CA4 区头部体积、右侧海马角 CA3 区头部体积；海马与全脑体素的功能连接值：双侧海马与右侧颞中回、右侧楔前叶、右侧额

上回、右侧颞上回、左侧角回、右侧额下回三角部、右侧辅助运动区、左侧中央前回的 FC 值)；免疫炎性指标包括 IL-1 β 、IL-6、IL-8、TNF- α 及相应 mRNA；HPA 轴功能的指标包括血浆中 CORT、ACTH 的表达水平。使用 Python 3.11 和 scikit-learn 1.4.1 进行机器学习建模；鉴于样本量较小，采用了留一交叉验证，建立测试集和训练集；在模型选择上，使用了 3 种分类器：逻辑回归、支持向量分类、随机森林；为评估模型性能，计算准确率、精确率、敏感性、特异性、F1 分数、曲线下面积，并对分类模型进行了置换检验,共进行了 5000 次。通过综合这些指标，选择性能最佳模型，并探讨模型的可解释性来理解模型决策。

结果 (1) 使用随机森林时预测效果较好；在随机森林算法下：单独使用海马影像指标进行二分类，准确率为 64.2%，单独使用血液检测指标 (免疫炎性指标+HPA 轴功能指标) 进行二分类，准确率为 92.4%，结合海马影像和血液检测指标后预测效果准确率为 90.6%；提示结合海马影像指标对经历慢性负性应激的抑郁症组和非经历慢性负性应激的抑郁症组二分类帮助不大，可以聚焦在血液检测指标上。

(2) 通过特征权重图发现：TNF- α mRNA 权重值非常高，对二分类有较大影响。

结论 纳入免疫炎性指标和 HPA 轴功能指标的随机森林模型对经历慢性负性应激的抑郁症的预测效果最好，其中 TNF- α mRNA 特征权重最高，有望成为经历慢性负性应激的抑郁症的早期识别客观指标应用于临床。

Compilation and Preliminary Application of The Awareness Questionnaire for Late Life Depression

Juan He^{1,2}, Gang Zhu¹

1.The First Affiliated Hospital of China Medical University

2.Gansu Provincial Hospital

Objective To develop a awareness questionnaire for late life depression with good reliability and validity,

and to provide a tool for clinical and scientific research to evaluate depression awareness of elderly depression patients to lay scientific and theoretical foundation for the follow-up construction of psychosocial intervention program for senile depression; to apply initially the awareness questionnaire for late life depression in patients with senile depression, survey the preservation of depression diseases in elderly depression, and explore factors affecting the knowledge of old depression diseases

Methods (1) Taking Health Belief Theory and "knowledge, Attitude and Practice" theory as the theoretical framework, through a large number of searches and semi-structured interviews with medical staff, patients and their families, the item pool was established according to the results of retrieval and interviews. And compile the general condition questionnaire of patients. (2) After two rounds of expert consultation, the questionnaire was revised according to the opinions and suggestions of the experts. (3) 30 patients were selected for pre-survey in the outpatient clinic, and the words of the questionnaire were popularized to form the initial questionnaire. (4) Convenience sampling was used to investigate the elderly patients with depression in the outpatient department of psychology. (5) SPSS software was used to do t-test, correlation analysis and Cronbach's α coefficient to delete some unreasonable items, and Amos software was used to test the reliability and validity of the selected questionnaire. (6) Investigating elderly patients with depression using the awareness questionnaire for late life depression

Results (1) The result of expert letter inquiry: in the two rounds of expert letter inquiry, the expert accumulation was extremely 100%, and the questionnaire was adjusted more finely under the advice of experts. (2) After t-test, correlation analysis and Cronbach's α coefficient analysis, there were 4 dimensions and 26 items in the questionnaire. Exploratory factor analysis showed that three common factors were identified, and the contribution rate of cumulative variance was 52%. (3) The test results of reliability and validity: the total Cronbach's α coefficient of the questionnaire was 0.747, the Cronbach's α coefficient of the sub-dimension

was 0.593-0.894. The half-reliability of the questionnaire was 0.796, the split-half reliability of the sub-dimension was 0.559-0.771. The verification factor analysis shows $\chi^2/DF = 1.895$, GFI=0.948, AGFI=0.927, NFI=0.883, TLI=0.927, CFI=0.94, RMSEA=0.046. The questionnaire has a good structural validity. respectively, and the reliability was good. (4) The risk factor score is between 7-34, with a division of 19.313 ± 5.961 , and the drug treatment is 5-15, which is divided into 9.813 ± 3.373 , and the treatment of rehabilitation is 3-15. There are 8.173 ± 3.509 , and the psychotherapy score is between 3-15, with a score of 9.418 ± 3.434 , and the total questionnaire score is between 23-76 points, and it is divided into 46.716 ± 10.098 . (5) In the analysis of the impact of the questionnaire, the patient's children, the content, cultural level, the satisfaction of economic income, medical insurance, whether or not the common disease is different, etc. influence the total score of the questionnaire or various dimensions. The gender of the patient has an impact on questionnaire psychotherapy dimension

Conclusion (1) The awareness questionnaire for late life depression developed in this study contains 4 dimensions and 16 items. The reliability and validity of the questionnaire meet the requirements of the questionnaire and can be used in clinical investigation. (2) The score of the awareness questionnaire for late life depression is generally, and the score of rehabilitation treatment dimension is low. (3) The working nature, medical insurance situation, cultural level can reflect the general situation of patient life and economic level. (4) In gender, patients with elderly depression have differently differentiated. Female patients are more susceptible to psychotherapy. (5) Low awareness of depression affects the confidence of recovery, which in turn affects disease treatment. Elderly patients with depression need standardized scientific drug treatment and psychotherapy

Effects of Dual TAAR1/5-HT1A Receptor Agonist SEP-363856 on Attenuating Depression-like Behavior Through IGF-1R β /PI3K/AKT Pathway in CUMS Mice Model

Mengdie Li Huanzhong Liu* Yating Yang
Chaohu Hospital of Anhui Medical University

Background SEP-363856 (SEP-856) is a novel antipsychotic drug for the treatment of schizophrenia, and it also has antidepressant like effects. However, the role and mechanism of SEP-856 in improving behavioral symptoms of depression remain unclear

Purpose The aim of this study was to evaluate the effect and mechanism of SEP-856 on depression-like behavior induced by chronic unpredictable mild stress (CUMS) in mice

Methods The CUMS model was first established to test the antidepressant properties of SEP-856 through a series of behavioral tests, such as SPT, TST, FST, EPM and OFT. The number of Nissl bodies in DG region of hippocampus was determined by Nissl staining. The level of IGF-1 in mice hippocampus was determined by ELISA. The mRNA expression levels of BDNF, SYN and PSD95 were determined by qRT-PCR. The levels of IGF-1R β , PI3K, p-PI3K, AKT and p-AKT in hippocampus were detected by western blot

Results The results of CUMS model showed that SEP-856 had the same effect as fluoxetine, and could significantly shorten the immobile time of TST and FST in mice, increase the sucrose preference rate of SPT, improve the motor function, feeding behavior, and grooming behavior of OFT, and alleviate the anxiety behavior of EPM in mice, among which 10mg/kg SEP-856 had a more significant effect. Compared with CUMS model, SEP-856 up-regulated IGF-1 content in hippocampus. In addition, SEP-856 increased the number of Nissl bodies in hippocampus DG region, increased the activity of IGF-1R β , up-regulated the phosphorylation levels of p-PI3K and p-AKT, and promoted the mRNA expression of BDNF, SYN and PSD95 in hippocampus

Conclusion SEP-856 may increase the expression of IGF-1 in hippocampus, reverse the loss of hippocampal neurons, up-regulate the activity of IGF-1R β , activate PI3K/AKT signaling pathway, and further up-regulate the expression of mRNA levels of BDNF, SYN and PSD95 in hippocampus, thus promoting synaptic plasticity in hippocampus. Therefore, it has an antidepressant effect on depression-like behavior induced by CUMS in mice.

时域干涉刺激对抑郁症相关神经环路的调控作用

龚恒芬*

上海市浦东新区精神卫生中心, 同济大学附属精神卫生中心

目的 探索时域干涉刺激(TIS)在抑郁症治疗中的安全性与可行性, 为临床疗效验证试验提供证据支持; 探索时域干涉刺激不同抑郁症靶点对抑郁相关神经环路产生的影响。

方法 本研究共纳入 15 名抑郁症患者作为被试, 通过被试内设计对每名被试进行了每周一次 20 分钟共五周、每次随机不同靶点的 TIS 试验, 包括 10Hz 的左侧背外侧前额叶(DLPFC)刺激、100Hz 的左侧亚属前扣带回(sgACC)、右侧杏仁核(Amg)、右侧腹侧纹状体(VS)刺激共四个靶点刺激与一次靶点随机、包络频率为 0Hz 假刺激。每名被试在试验开始前均采集了 T1 与 8 分钟静息态功能核磁影像, 在每次刺激前后采集了 HAMD/HAMA 量表评分与 8 分钟静息态功能核磁影像, 在每次刺激后记录了患者的不良反应, 并在试验结束后一到两周内通过电话随访采集了 HAMD/HAMA 量表评分。本研究还另外纳入了两名癫痫患者, 通过 SEEG 电极记录 TIS 在上述四个靶点附近的电信号频率及强度。

结果 试验过程中没有观察到严重不良反应, 主要不良反应包括想睡觉与头晕; 相较于试验前, 五次刺激后 HAMD、HAMA 评分均显著降低; 针对单次单靶点刺激前与刺激后一周的量表评分分析发现, 在 DLPFC, Amg 和 VS 刺激后被试 HAMD 评

分显著降低,在 DLPFC 和 Amg 刺激后被试 HAMA 评分显著降低;神经影像分析显示,被试刺激前 DLPFC-sgACC 功能连接强度与 Amg 刺激后 HAMD 评分改善程度显著正相关;将患者按照试验开始前 DLPFC-sgACC 功能连接强度分为负连接组 (N = 8) 和正连接组 (N = 7) 发现, Amg 刺激后的 HAMD 改善程度均值在正连接组中更高, DLPFC 刺激后的 HAMD 改善程度均值在负连接组中更高,但两组间差异没有统计学显著性。SEEG 试验表明在四个靶点处 TIS 能够产生稳定强度与频率的电场。

结论 本研究结果表明 TIS 能够稳定有效刺激大脑深部抑郁症相关的四个靶点并改善抑郁症患者抑郁和焦虑症状,且不会引起严重的不良反应,初步证明了 TIS 治疗抑郁症的可行性与有效性。杏仁核作为一个尚未在抑郁症神经调控研究中得到验证的靶点,在试验中表现出了较好的抑郁与焦虑改善效果,为后续杏仁核调控抑郁症提供了证据。在既往 TMS 研究与 DLPFC 刺激疗效负相关的 DLPFC-sgACC 功能连接在本研究中被观察到与杏仁核刺激正相关,证明了抑郁症神经调控个体化靶点选择的可行性。

成年早期伴非自杀性自伤抑郁症与伴自杀未遂抑郁症脑局部一致性的特征

阎锐^{1,2} 黄映红¹ 王晓芹¹ 孙浩^{1,2} 林然¹ 刘海燕¹
陈瑜¹ 史家波¹ 卢青³ 姚志剑^{1,2,3}

1. 南京医科大学附属脑科医院心境障碍科
2. 南京大学医学院
3. 东南大学生物医学工程

目的 本研究旨在探讨成年早期伴非自杀性自伤 (Non-suicidal self-injury, NSSI) 抑郁症与伴自杀未遂 (suicide attempt, SA) 抑郁症脑活动特征。本研究生使用局部一致性 (regional homogeneity, ReHo) 的方法为寻找抑郁症 SA 和 NSSI 特征性影像学损害机制提供依据。

方法 招募来自南京医科大学附属脑科医院住院的抑郁症患者。根据 DSM5 推荐的 NSSI 标准诊断 NSSI。按照是否伴 SA 和 NSSI, 分为伴 SA 抑郁症 50 名, 伴 NSSI 抑郁症 54 名, 不伴 NSSI 的抑郁

症患者 68 名, 同时招募 66 名年龄、性别、受教育年限匹配的健康对照。将 4 组受试进行 3.0T 静息态功能磁共振扫描, 计算 ReHo, 对四组受试进行单因素方差分析, 高斯随机场法 (Gaussian random field, GRF) 校正, 在四组比较差异有统计学意义的基础上, 进行 hoc t 检验, 对每两组 GM 和 ALFF 进行两两比较, 继续使用 GRF 校正。

结果 四组被试在右颞下回、右颞中回、左颞上回、左罗兰氏岛盖部、左脑岛、右角回、左顶上回和左额中回/左额上回 ReHo 值差异存在统计学意义 (单因素 $p < 0.001$, 连续体素值 $K \geq 43$, GRF 校正后 $p < 0.05$)。在四组方差分析基础上事后独立样本 t 检验, 与 MDD/NSSI 组相比, MDD/SA 组左颞上回和左额上回 ReHo 值增高, 右颞中回和右颞下回 ReHo 值下降; 与 sMDD 组相比, MDD/SA 组右颞中回、左罗兰氏岛盖部、左顶上回和左额上回 ReHo 值增高, 右颞下回和右角回 ReHo 值下降; 与 HC 组相比, MDD/SA 组左颞上回、左罗兰氏岛盖部、右颞中回、左顶上回和左额中回 ReHo 值增高, 右颞下回 ReHo 值下降 (单因素 $p < 0.001$, 连续体素 K 值 ≥ 5 , GRF 校正, $p < 0.05$)。

结论 伴 SA 抑郁症较伴 NSSI 抑郁症患者表现为左颞上回和左额上回局部协调性增高, 右颞中回和右颞下回局部协调性下降, 存在不同的损害模式。

Multidimensional Assessment of Adverse Events of Bupropion: A Large-Scale Data Analysis From The FAERS Database

Haohao Zhu*

Wuxi Mental Health Center

Objective Bupropion, a monocyclic antidepressant, aids in smoking cessation, treats major depression, and prevents severe depression in seasonal affective disorder patients. Yet, its adverse reactions remain insufficiently studied

Methods All data from the ASCIID data packages for 78 quarters from the 1st quarter of 2004 to the 2nd quarter of 2023 were extracted and imported into the

SAS9.4 software for data cleaning and analysis. The ROR, PRR, BCPNN, and MGPS methods were used to analyze drug adverse events and assess their compliance with various screening criteria

Results The results showed a total of 36,862 reports related to Bupropion use, identifying 364 positive reaction terms (PT) covering 23 SOCs. In addition to known side effects, some new potential adverse reactions were found, such as Stool analysis abnormal, Oculocephalographic reflex absent, Suspected suicide, and so on. At the same time, reactions like Encephalopathy neonatal, Hyponatraemic coma, and Electrocardiogram QRS complex prolonged were prominently ranked. Notably, occurrences such as Urine amphetamine positive and Amphetamines positive were relatively high, suggesting extra caution for these potential adverse reactions during clinical use of Bupropion

Conclusion These findings highlight the potential health risks of long-term Bupropion use, especially concerning efficacy, positive drug tests, and suicidal tendencies. Therefore, it is recommended to monitor and assess patients using Bupropion more stringently to use this therapeutically potential drug more safely and effectively

Interpretation of The Pathogenesis and Therapeutic Mechanisms of First-episode Major Depressive Disorder Based on Multiple Amino Acid Metabolic Pathways: A Metabolomics Study

Zhihao Guo^{1,2}, Zi Zhang^{1,2}, Wanting Huang^{1,2}, Hui Xia^{1,2}, Shanqing Huang¹, Xiaofeng Lan¹, Yuping Ning¹, Yanling Zhou¹, Dewei Shang¹

1.The Affiliated Brain Hospital of Guangzhou Medical University

2.Guangzhou Medical University

Objective Due to the uncertain mechanisms of

occurrence and treatment of depression, we aimed to reveal the metabolic differences between major depressive disorder (MDD) patients versus healthy controls (HC) and escitalopram (ESC) treatment

Methods Our study recruited 78 participants including HC (n=38) and first-episode drug-naïve MDD (DN-MDD) patients (n=40). Collected serum samples from subjects at baseline, followed by administering ESC to MDD patients for 4 weeks and collecting samples again. Serum samples were conducted to non-targeted metabolomics analyses by UPLC-MS/MS. Applied MetaboAnalyst 5.0 to identify differential metabolites and execute pathway enrichment

Results Compared to DN-MDD patients, 905 and 455 differentially expressed metabolites were identified in HC and after ESC treatment. Depressive state existed dysregulation of histidine metabolism, beta-alanine metabolism, and alanine, aspartate and glutamate metabolism pathways. ESC treatment produced physiological response that the pathways of arginine, aspartate, and sphingolipid underwent significant modulation

Conclusion Multiple functional amino acid pathways were adjusted in MDD patients. ESC regulated the level of aspartate, arginine and sphingolipids in MDD patients compared to pre-dose. This metabolomics study has brought about new insights of the biology and treatment of MDD from the perspective of the endogenous metabolites.

抑郁症非自杀性自我伤害的疼痛行为学特征

吴百川 孙晨寅 张慧凤 王韵 彭代辉*
上海市精神卫生中心

目的 研究表明抑郁症患者与非自杀性自我伤害 (Nonsuicidal self-injury, NSSI) 患者都具有疼痛行为学的异常,但在伴有 NSSI 的抑郁症患者中证据不足。本研究旨在探究伴有 NSSI 的抑郁症患者的疼痛行为学特征, 及与社会心理学因素的关联。

方法 根据精神障碍诊断与统计手册第 5 版

“重性抑郁障碍”与“非自杀性自我伤害”诊断标准，从2022年9月至2023年11月于上海市精神卫生中心门诊及心境障碍科病房顺序入组20例伴NSSI的抑郁症患者，23例从未有过自伤行为的抑郁症患者，及23例匹配的健康对照。所有被试均对疼痛试验知情同意。使用Stimul 1340钕钇铝钙钛矿激光器测量被试的感觉阈值（感受到热觉的最低能量）、疼痛阈值（感受到疼痛的最低能量）与疼痛耐受性（能忍受的最高能量）。使用0~10的数字评价量表（Numerical Rating Scale, NRS）测量被试在接受疼痛刺激时的主观疼痛评分与瞬时情绪评分。使用简明国际神经精神障碍访谈检查、33项轻躁狂症状自评量表、17项汉密尔顿抑郁量表、汉密尔顿焦虑量表、儿童期创伤问卷、渥太华自伤调查表中文修订版采集社会心理学数据。分析疼痛行为学与社会心理学数据的组间差异及关联。

结果 与不伴有NSSI的抑郁症患者相比，伴有NSSI的抑郁症患者具有更高的疼痛阈值（ $Z=2.42$, $P=0.016$ ）和疼痛耐受性（ $Z=3.02$, $P=0.003$ ）。对于主观疼痛强度的评分以及瞬时情绪的评分，仅发现伴有NSSI的抑郁症患者在接受耐受性水平的疼痛刺激时情绪比健康对照更愉快（ $Z=2.34$, $P=0.019$ ）。在社会心理因素方面，伴有NSSI的抑郁症患者具有比不伴有NSSI的抑郁症患者更高的自杀风险（ $Z=3.47$, $P=0.001$ ）和更严重的童年创伤经历（ $Z=2.97$, $P=0.002$ ），主要集中在情感虐待（ $Z=2.71$, $P=0.006$ ）、性虐待（ $Z=3.92$, $P=0.001$ ）、情感忽视（ $Z=2.13$, $P=0.034$ ）和躯体忽视（ $Z=2.65$, $P=0.008$ ）。相关分析发现，抑郁症患者的疼痛阈值与性虐待分量表评分（ $r=0.347$, $P=0.028$ ）、疼痛耐受性与情感虐待分量表评分（ $r=0.391$, $P=0.013$ ）存在显著正相关。

结论 伴有NSSI的抑郁症患者可能具有较高的疼痛阈值和疼痛耐受性，并与童年创伤的严重程度正相关。

关键词：非自杀性自我伤害,抑郁症,疼痛,童年创伤

Knowledge and Attitude of Depression Among Urban and Rural Residents in Beijing: A Cross-sectional Study

Anan Cong Gang Wang* Ling Zhang Lili Shang

Beijing Anding Hospital

Objective To compare the level of knowledge of depression, recognition ability, and attitudes toward depression among urban and rural residents in Beijing

Methods From October to December 2021, a total of 6,463 valid samples aged 18 and above who had lived for more than 6 months over the prior year in Beijing were selected by non-proportional stratified sampling method. The Depression Knowledge Questionnaire and Case Quiz Questionnaire was used to assess the awareness and recognition of depression and reflect the views of residents towards people with depression

Results A total of 2,554 urban and 2,043 rural residents completed the survey. Urban residents of Beijing exhibited a higher average total score on the Depression Knowledge Questionnaire [(20.4±3.3) vs. (18.7±3.5), $P<0.001$] and a higher rate of correctly identifying individuals with depression (47.9% vs. 36.6%, $P<0.001$) than their counterparts in rural areas. Residents who correctly identified people with depression had higher scores on the Depression Knowledge Questionnaire. Depression knowledge varied significantly among urban and rural residents. The multivariate linear regression analysis revealed that rural residents scored significantly lower on measures of depression knowledge compared to urban residents ($B=-0.83$, 95%CI=-1.03~-0.63, $P<0.001$). Older individuals (aged 50+) showed lower understanding compared to the 18-49 age group, with significant negative regression coefficients (Urban: $B=-1.06$, Rural: $B=-1.35$, both $P<0.001$). Higher education levels were positively associated with greater depression knowledge (Urban: $B=1.40$, Rural: $B=1.21$, both $P<0.001$). Employment was linked to higher knowledge levels than unemployment (Urban: $B=-0.60$, Rural: $B=-0.58$, both $P=0.00$). A monthly income of 8,000 yuan or more correlated with better depression understanding than lower incomes (Urban: $B=0.81$, Rural: $B=1.04$, both $P<0.001$). Additionally, in urban areas, unmarried residents scored higher in depression knowledge than those divorced ($B=-0.55$, $P=0.04$). Residents in urban areas had relatively positive attitudes towards individuals with depression

Conclusion Rural residents of Beijing had lower levels of knowledge and recognition of depression and more negative attitudes toward individuals with depression than those from urban areas. The health authority needs to focus on the weak level of knowledge and increase mental health resources in rural areas as a priority site for future psychological popularization efforts.

From Genes To Cells: Exploring The Role of Senescence in MDD Pathogenesis

Kun Lian¹, Xiufeng Xu²

1.The Second Affiliated Hospital of Kunming Medical University

2.The First Affiliated Hospital of Kunming Medical University

Objective Multiple pieces of data indicate that patients diagnosed with Major Depressive Disorder (MDD) have a senescence phenotype or an increased susceptibility to premature senescence. Nevertheless, there is a lack of research on the correlation between senescence related genes (SRGs) and MDD

Methods We used 144 MDD samples and 72 healthy reference samples from the GEO database to compare SRG expression. Five important genes identified by RF and SVM-RFE were used to build a logistic regression model. Based on SRG expression patterns, consensus cluster analysis was used to identify MDD patients, and WGCNA was utilized to find modules of strongly linked genes of each cluster. MDD SRG functions were analyzed using single-cell RNA sequencing

Results Five hub genes: ALOX15B, TNFSF13, MARCH15, UBTD1, and MAPK14 had altered expression between groups. Hub gene-based diagnostics were highly accurate. The five hub SRGs correlated positively with neutrophils and negatively with T lymphocytes. SRG expression patterns suggest two MDD subclusters. WGCNA found significantly linked gene modules in these two subclusters. Individual endothelial

cells with high senescence scores develop new interaction with astrocytes via the Notch signaling pathway, suggesting their different involvement in MDD pathogenesis

Conclusion Our comprehensive study of MDD reveals the significant role of SRGs. We highlighted the importance of Notch signaling in mediating the effects of senescence

The Impact of Accelerated Repetitive Transcranial Magnetic Stimulation on Major Depressive Disorder with Melancholic Features: An Rs-fMRI Study

Yiyang Liu², Yanping Shu¹

1.The Second People's Hospital of Guizhou Province

2. Guizhou Medical University

Objective This study aimed to investigate the effects of Accelerated Repetitive Transcranial Magnetic Stimulation (arTMS) on major depressive disorder with melancholic features, incorporating the assessment of brain functional imaging changes using resting-state functional magnetic resonance imaging (rs-fMRI) measures of Regional Homogeneity (ReHo) and Functional Connectivity (FC)

Methods A total of 40 patients with melancholic depression were enrolled and randomly assigned to either the research group or the sham stimulation group. Both groups received arTMS treatment on top of standard medication, with the research group receiving real arTMS treatment and the sham group receiving sham arTMS treatment. Patients in both groups underwent assessment using the 24-item Hamilton Depression Rating Scale (HAM-D24) and rs-fMRI scanning before and after treatment. Changes in HAM-D24 scores, ReHo values, and FC values were analyzed between pre- and post-treatment, and correlations between these rs-fMRI indices and the reduction rate in HAM-D24 scores were

further calculated

Results After arTMS treatment, significant reductions in HAMD24 scores were observed in both groups, with the research group showing significantly lower HAMD24 scores compared to the sham group. ReHo values in the right superior frontal gyrus significantly decreased in the research group, along with significantly reduced FC values between the right superior frontal gyrus and the right angular gyrus and right middle temporal gyrus after treatment. FC values between the right superior frontal gyrus and right middle temporal gyrus at baseline were significantly negatively correlated with the reduction rate in HAMD24 scores

Conclusion arTMS significantly improves depressive symptoms in patients with major depressive disorder. arTMS treatment may influence the functioning of the right superior frontal gyrus, and FC values between the right superior frontal gyrus and right middle temporal gyrus at baseline could serve as predictive indicators of arTMS treatment efficacy in major depressive disorder

CircFKBP8(5S,6)-encoded Protein As A Novel Endogenous Regulator in Major Depressive Disorder

Dandan Xu Zhijun Zhang*

School of Medicine of Southeast University

Objective Major depressive disorder (MDD) is a serious psychiatric disorder, but the role of circRNAs encoding proteins in MDD is not yet clear. Based on this, the present work attempts to explore the molecular mechanisms of circRNAs involved in the pathogenesis of MDD, and to provide experimental basis for the identification of diagnostic biomarkers for depression and targeted therapies

Methods 1. Identification of circRNA using qPCR, RNase R and actinomycin D assays; LC-MS to verify coding capacity. 2. Detection of circFKBP8(5S,6) levels in plasma neuron-derived exosomes from patients with MDD and in the stress SH-SY5Y cell line by qPCR. 3. Immunofluorescence (IF) staining was used to assess the expression of circFKBP8 (5S,6)-encoding protein (cFKBP8) in autopsy brain tissues from patients with MDD and in organoids induced to be established by peripheral blood cells from MDD patients with a history of suicide (sMDD). 4. Knockdown of circFKBP8(5S,6) levels in sMDD organoids using AAV-hSyn-shRNA and assessment of neuronal activity by calcium imaging. 5. Depression-like behavior of mice was assessed by sugar-water preference test (SPT), forced swimming test (FST), and tail-suspension test (TST) after bilateral Prelimbic cortex (Prl) overexpression of circFKBP8 (5S,6) and cFKBP8 in male mice. 6. Whole transcriptomics sequencing analysis was performed to screen differentially expressed genes (DEGs), and biological function annotation and KEGG analysis were performed. 7. RT-qPCR, western blot and IF staining were used to detect the expression of dopamine D3 receptor (DRD3). 8. Western blot was used to detect the expression of p-AMPK, AMPK, p-mTOR, mTOR, p-ULK1(ser555), p-ULK1(ser757), p-ULK1(ser317), ULK1, and autophagy-associated proteins LC3, p62, and Beclin; IF was used to detect the expression of LC3 in neurons. 9. After overexpression of circFKBP8(5S,6) and cFKBP8 in Prl, mice were injected intraperitoneally with DRD3 agonist or overexpression of DRD3 to assess mouse behavior, and protein expression of the DRD3/AMPK-autophagy-related pathway was detected by western blot and IF

Results 1. In the present study, we identified circFKBP8(5S,6) encoding a 127-amino acid protein, cFKBP8. In addition, circFKBP8(5S,6) was up-regulated in plasma neuron-derived exosomes from MDD patients and stressed SH-SY5Y cells. The level of cFKBP8 was increased in postmortem brain tissues of MDD patients and sMDD organoids, and the knockdown of circFKBP8(5S,6) in organoids elevated [Ca²⁺] amplitude. 2. Two weeks after chronic unpredictable mild stress (CUMS), mice with neurons overexpressing

circFKBP8(5S,6) and cFKBP8 in the Prl exhibited decreased sugar-water preference and prolonged immobilization time in the FST, indicating increased stress sensitivity. At the end of the 5-week CUMS, mice overexpressing circFKBP8(5S,6) and cFKBP8 showed more severe depression-like behaviors, including decreased sugar-water preference and prolonged immobilization time in the TST and FST. 3. Whole transcriptomics sequencing analysis showed 520 DEGs in the overexpression of circFKBP8(5S,6) (oe-circ) group and 537 DEGs in the overexpression of cFKBP8 group (oe-cFKBP8), with 117 DEGs common to the two groups, and KEGG enrichment analysis showed that the neuroactive ligand-receptor interaction pathway was the most enriched pathway in the oe-circ group and oe-cFKBP8 group with the most enriched genes, in which the expression of DRD3 was significantly down-regulated and enriched in this pathway. RT-qPCR, western blot and IF showed that the expression level of neuronal DRD3 was significantly reduced in the oe-circ group and oe-cFKBP8 group. 4. Western blot showed that the ratio of p-AMPK/AMPK and p-ULK1(ser555)/ULK1 was significantly decreased, the ratio of p-mTOR/mTOR and p-ULK1(ser757)/ULK1 was significantly increased in the oe-circ and oe-cFKBP8 groups, and the p-ULK1(ser317)/ULK1 were not statistically different, the ratio of LC3II/LC3I was decreased, p62 expression was up-regulated, and Beclin expression was down-regulated; IF results showed a significant reduction of LC3-labeled autophagosomes in neurons. 5. Both intraperitoneal injection of DRD3 activator and overexpression of DRD3 in Prl reversed the depressive-like behavior induced by overexpression of circFKBP8(5S,6) and cFKBP8, and reversed the expression of AMPK-autophagy signaling-related proteins

Conclusion In this study, we systematically screened and identified an MDD-associated circRNA capable of encoding a protein in conjunction with cross-species studies. Further, studies revealed that circFKBP8(5S,6) and its encoded proteins inhibit the level of neuronal autophagy to promote stress susceptibility in mice by down-regulating the expression of neuronal DRD3, which in turn down-regulates AMPK/mTOR/ULK1 autophagy signaling pathway.

This may provide new ideas for the diagnosis and targeted therapy of MDD.

首发未治疗青少年抑郁症肠道菌群的代谢组学研究

向波* 曾志强 曾莹莹 贾晓楠 刘可智
西南医科大学附属医院心身医学科

目的 本研究拟对首发未治疗青少年抑郁症的肠道菌群的代谢产物进行研究, 试图找到差异代谢产物与患者症状及心理特征的相关性。

方法 本研究纳入 30 例首发未治疗青少年抑郁症患者以及 26 例健康对照。采用了汉密尔顿抑郁量表 24 项 (HAMD)、儿童抑郁量表 (CDI)、青少年生活事件量表 (ASLEC)、神经心理状态评估可重复性系列测验 (RBANS) 分别评估被试者的抑郁症状、生活经历、以及认知功能。使用液相色谱质谱联用 (LC-MS) 分析方法对肠道粪便进行代谢产物检测。使用 R 软件包 ropls 进行主成分分析 (PCA) 与正交最小偏二乘判别分析 (OPLS-DA)。通 KEGG 数据库对这些差异代谢产物进行注解。使用皮尔逊相关分析差异代谢产物与被试者的抑郁症状、心理评估分数进行相关性分析。

结果 1、青少年抑郁症组在 HAMD、CDI 总分、ASLEC 总分上高于健康对照组, 差异有统计学意义 ($p < 0.001$); 青少年抑郁症组在 RBANS 总分、RBANS 延迟记忆得分低于健康对照组, 差异有统计学意义 ($p < 0.05$)。

2、一共鉴定到 2309 种代谢产物, 其中有 2175 种代谢产物属于两组共有代谢产物, 有 55 种代谢产物独属于青少年抑郁症组, 79 种代谢产物独属于健康对照组。

3、一共鉴定到 71 种在青少年抑郁症组和健康对照组之间差异显著的代谢产物。

4、差异显著的代谢产物在 20 条代谢通路之中显著富集。

5、组胺 (Histamine) 与 HAMD 得分 ($r = 0.43$, $p < 0.01$)、CDI ($r = 0.47$, $p < 0.001$) 总分之间呈正相关, 与 RBANS 总分 ($r = -0.27$, $p < 0.05$)、RBANS 言

语功能 ($r=-0.38, p<0.01$)、视觉广度得分 ($r=-0.30, p<0.05$) 呈负相关。磷脂酰乙醇胺与 HAMD 得分 ($r=-0.42, p<0.01$)、CDI 得分 ($r=-0.38, p<0.01$) 呈负相关, 与 RBANS 总分($r=0.34, p<0.05$)、言语功能得分($r=0.36, p<0.01$)、注意力得分 ($r=0.30, p<0.05$) 呈正相关。2-萘酚与 HAMD 得分 ($r=0.34, p<0.05$)、CDI 总分 ($r=0.34, p<0.05$) 呈正相关, 与 RBANS 总分 ($r=-0.29, p<0.05$)、延迟记忆得分 ($r=-0.39, p<0.01$)、即刻记忆得分 ($r=-0.31, p<0.05$)、视觉广度 ($r=-0.30, p<0.05$) 呈负相关。

结论 本研究发现一些组间显著差异代谢产物在成瘾、细胞自噬、脂类代谢等通路显著富集, 这提示肠道菌群可能是通过这些代谢通路对抑郁造成影响。

Vocal Acoustic Features and A Classification/Prediction Model for Major Depressive Disorders

Lijuan Liang*

Hainan Medical University

Objective This study utilized deep learning methods to construct classification and prediction models for major depression and healthy control groups

Methods One-hundred-and-twenty-two participants aged 16–25 participated in this study, included 66 MDD group and 56 HC group. We used the Covarep open source algorithm to extract a total of 1200 high-level statistical functions for each sample. In addition, we used Python for correlation analysis, and neural network to establish the model to distinguish whether participants experienced depression, predict the total depression score, and evaluate the effectiveness of the classification and prediction model

Results The classification modelling of the major depression and the healthy control groups by relevant and significant vocal acoustic features was 0.90, and the Receiver Operating Characteristic (ROC)

curves analysis results showed that the classification accuracy was 84.16%, the sensitivity was 95.38%, and the specificity was 70.9%. The depression prediction model of speech characteristics showed that the predicted score was closely related to the total score of 17 items of the Hamilton Depression Scale(HAMD-17) ($r=0.687, P<0.01$); and the mean absolute error(MAE) between the model's predicted score and total HAMD-17 score was 4.51

Conclusion This research found 331 important vocal acoustic features associated with the severity of depressive disorders, including MCEP, MFCC_deltas, MFCC_delta_deltas, Formant, Peak2RMS, creak and others. These vocal acoustic features can accurately distinguish participants with MDD from those in the HC group. Furthermore, although the classification model performance showed a small decrease, the top 30 critical vocal acoustic features could discriminate between MDD and HC. Therefore, the classification model based on the vocal acoustic features could utilized to identify MDD and HC effectively and consistently

关键词: classification, prediction model, vocal acoustic features, major depressive disorders

Impaired Topology and Connectivity of Grey Matter Structural Networks in Major Depressive Disorder: Evidence From A Multi-site Neuroimaging Dataset

JingYi Long Kun Qin Yi Li Nan-Fang Pan Wen-Liang Fan*

Wu Han Mental Health Center

Objective Major depressive disorder (MDD) has been increasingly understood as a disruption of brain connectome. Investigating grey matter structural networks with a large sample size can provide valuable insights into the structural basis of network-level neuropathological underpinnings of MDD. Using a multisite MRI data-set including nearly 2000 individuals, this study aimed to identify robust topology and connectivity abnormalities of grey matter structural network

linked to MDD and relevant clinical phenotypes

Methods A total of 955 MDD patients and 1009 healthy controls were included from 23 sites. Individualised structural covariance networks (SCN) were established based on grey matter volume maps. Following data harmonisation, network topological metrics and focal connectivity were examined for group-level comparisons, individual-level classification performance and association with clinical ratings. Various validation strategies were applied to confirm the reliability of findings

Results Compared with healthy controls, MDD individuals exhibited increased global efficiency, abnormal regional centralities (i.e. thalamus, precentral gyrus, middle cingulate cortex and default mode network) and altered circuit connectivity (i.e. ventral attention network and frontoparietal network). First-episode drug-naïve and recurrent patients exhibited different patterns of deficits in network topology and connectivity. In addition, the individual-level classification of topological metrics outperforms that of structural connectivity. The thalamus-insula connectivity was positively associated with the severity of depressive symptoms

Conclusion Based on this high-powered data-set, we identified reliable patterns of impaired topology and connectivity of individualised SCN in MDD and relevant subtypes, which adds to the current understanding of neuropathology of MDD and might guide future development of diagnostic and therapeutic markers.

A Case-control Study of The Correlation between Social Cognition and Oxidative Stress in First-episode Drug-naïve Major Depressive Disorder

Shiwang Chen Jie Li* Meijuan Li Yuying Qiu Shen Li
Tianjin Anding Hospital

Objective Social cognitive skills are often impaired in patients with major depressive disorder

(MDD), and facial expression recognition, narration and empathy are closely related to social cognitive skills. Previous studies have found that oxidative stress indicators are often abnormal in the blood with reduced social cognition performance. The aim of this study was to investigate the correlation between social cognitive ability and oxidative stress in patients with first-episode drug-naïve (FEDN) MDD

Methods 165 FEDN MDD outpatients and 86 healthy volunteers were recruited. A self-administered questionnaire was used to collect general information. The Hamilton Depression Scale (HAMD) and Hamilton Anxiety Scale (HAMA) were used to assess the clinical symptoms of patients. The Facial Emotion Recognition Task, Toronto Alexithymia Scale (TAS-20) and the Interpersonal Reactivity Index Scale (IRI) assessed social cognitive function and a blood test for indicators of oxidative stress was administered

Results Our study showed that MDD patients have lower levels of education, are more unmarried, and are associated with more alcohol use than healthy patients. MDD patients showed more intense emotional sadness and poorer empathy, and impaired social cognitive function in MDD patients may be associated with age, HAMD scores, HAMA scores, and CAT (all $p < 0.05$)

Conclusion Our study shows that impaired social cognitive function in patients with FEDN MDD is strongly correlated with age, education level and indicators of oxidative stress. This finding may be help to improve the identification of patients with MDD and provide better treatment.

The Association of Clinical Correlates and Metabolic Parameters with Subclinical Hypothyroidism in First-episode and Drug-naïve Patients with Major Depressive Disorder Comorbid with Glucose Disturbances: A Large Cross-sectional Study

Shiwang Chen¹, Bin Zhang¹, Shen Li¹, Jie Li¹, Xiangyang Zhang²

1.Tianjin Anding Hospital

2.Chinese Academy of Science

Objective The factors associated with subclinical hypothyroidism (SCH) in major depressive disorder (MDD) patients with comorbid glucose disturbances remains unclear. To the best of our knowledge, this is the first study with a large sample size to examine risk factors of SCH in first-episode drug-naïve (FEDN) MDD patients with comorbid glucose disturbances, including clinically relevant factors, metabolic parameters, and thyroid hormone levels

Methods A total of 1718 FEDN MDD patients were enrolled. The Hamilton Depression Scale (HAMD), Hamilton Anxiety Scale (HAMA), and Positive and Negative Syndrome Scale (PANSS) were used to assess the clinical symptoms of patients. Fasting blood glucose, metabolic parameters and thyroid hormone levels were measured

Results The prevalence of SCH in MDD patients with comorbid glucose disturbances was 85.04%, which was 2.43 times higher than in MDD patients without glucose disturbances (56.94%). HAMD and HAMA scores, as well as TSH, TPOAb and PANSS positive symptoms scores were higher in patients with severe SCH compared to those with mild SCH in combination with glucose disturbances (all $p < 0.001$). TgAb, TC, Systolic and Diastolic blood pressure were all higher in patients with severe SCH than in those with mild SCH. In addition, HAMD score, HAMA score, Psychotic positive score, Diastolic BP, and TC were independently associated with the TSH levels in MDD patients with comorbid glucose disturbances

Conclusion Our results suggest a high prevalence of SCH in MDD patients with comorbid glucose disturbances. Several clinically relevant factors and metabolic parameters have an impact on SCH in MDD patients with comorbid glucose disturbances.

关键词: metabolic parameters; glucose disturbances; subclinical hypothyroidism; first-episode and drug-naïve major depressive disorder

Clinical Correlates, Lipid Metabolic Parameters and Thyroid Hormones Are Associated with Abnormal Glucose Metabolism in First-episode and Drug-naïve Major Depressive Disorder Patients with Suicide Attempts: A Large Cross-sectional Study

Shiwang Chen¹, Shen Li¹, Jie Li¹, Xiangyang Zhang²

1.Tianjin Anding Hospital

2.Chinese Academy of Science

Objective Those factors associated with glucose disturbances in major depressive disorder (MDD) patients with comorbid suicide attempts remains unclear. To the best of our knowledge, this is the first study with a large sample size to examine risk factors for glucose disturbances, including clinically relevant factors, lipid metabolic parameters, and thyroid hormone levels in first-episode drug-naïve (FEDN) MDD patients with comorbid suicide attempts

Methods A total of 1718 FEDN MDD patients were enrolled. The Hamilton Depression Scale (HAMD), Hamilton Anxiety Scale (HAMA), and Positive and Negative Syndrome Scale (PANSS) were used to assess the clinical symptoms of the patients. Fasting blood glucose, metabolic parameters and thyroid hormone levels were measured

Results The prevalence of glucose disturbances was 24% in MDD patients with comorbid suicide attempts, which was 1.88 times higher than that in MDD patients without suicide attempts (11%). Among MDD patients with comorbid suicide attempters, those with comorbid glucose metabolism disorders had higher HAMA, HAMD and PANSS positive subscale scores, and higher levels of TC, TG, thyroid stimulating hormone (TSH), HDL-C, LDL-C, and thyroid peroxidases antibody (TPOAb) compared with those without glucose metabolism disorders. The combination of HAMA score, HAMD score, PANSS positive subscale score and TSH distinguished between patients with and without glucose disturbances

Conclusion Our findings suggest a high prevalence of glucose disturbances in FEDN MDD patients with comorbid suicide attempts. Several clinical correlates, lipid metabolism parameters, and thyroid hormone function are associated with glucose disturbances in MDD patients with comorbid suicide attempts.

Efficacy and Safety of Eight Enhanced Therapies for Treatment-Resistant Depression: A Systematic Review and Network Meta-Analysis of RCTs.

Qinghua Guo¹, Qinghua Guo², Yong Wang¹, Libo Guo¹, Shaomei Shang²

1.Peking University Sixth Hospital

2.Peking University School of Nursing

Objective Treatment-Resistant Depression (TRD) remains a global challenge in psychiatric treatment. Current clinical guidelines only address a subset of augmentation strategies. To comprehensively assess the effectiveness and safety of these strategies in TRD patients, we conducted a network meta-analysis for comparison and ranking, thus providing evidence-based guidance for clinical practice and new TRD treatments

Methods This systematic review and network meta-analysis followed the PRISMA guidelines and searched eight databases: PubMed, The Cochrane Library, Web of Science, Embase, SCOPUS, PsycInfo, CINAHL Plus, and the WHO International Clinical Trials Registry Platform ClinicalTrials.gov, from their inception to January 28, 2024. The Cochrane Risk of Bias Tool was used for quality assessment, and the certainty of evidence was evaluated using the Network Meta-Analysis Framework (CINeMA). Primary outcomes were response rate (proportion of patients with a $\geq 50\%$ reduction on standardized depression observer rating scales), remission rate (MADRS score ≤ 10 or HAMD

score ≤ 8), tolerability (proportion of patients withdrawing due to any adverse event), and safety (proportion of patients experiencing at least one adverse event). Odds ratios (OR) were summarized using pairwise and random-effects network meta-analysis. This study was pre-registered on PROSPERO, registration number : CRD42024506909

Results We identified 6,824 studies, ultimately including 72 randomized controlled trials (RCTs) comprising 12,105 participants. In terms of response rate (66 RCTs with 11,663 patients), only Brexpiprazole (OR=1.2, 95%CI[0.6,2.41]) and Quetiapine (OR=1.7, 95%CI[0.92,3.14]) showed no significant difference compared to placebo. Other augmentation treatments ranged between Ketamine (OR=6.1, 95%CI[2.68,13.89]) and Psilocybin (OR=2.7, 95%CI[1.37,5.3]). For remission rate (49 RCTs with 9,902 patients), only Brexpiprazole, Quetiapine, and Ketamine showed no significant differences compared to placebo, with other treatments ranging between Psilocybin (OR=4.3, 95%CI[2.24,8.27]) and Esketamine (OR=2.0, 95%CI[1.44,2.78]). In terms of tolerability (64 RCTs with 11,320 patients), only Esketamine (OR=3.1, 95%CI[1.89,5.08]) and Psilocybin (OR=2.2, 95%CI[1.08,4.50]) showed significant differences compared to placebo, and were less tolerable than placebo. For safety (36 RCTs with 9,037 patients), all augmentation treatments showed no significant differences compared to placebo. The Cochrane risk assessment showed 81.9% low risk, 15.3% moderate risk, and 2.8% high risk. Details of the CINeMA network meta-analysis quality assessment are available in the appendix

Conclusion Considering treatment effectiveness (including response and remission rates), our results suggest using ECT, Ketamine, Esketamine, and Psilocybin as preferred first-line treatments for adult TRD patients, as these four drugs have the best balance between response rate, remission rate, tolerability, and safety. These findings should serve clinical practice and inform patients, physicians, guideline developers, and policymakers about the relative advantages of different augmentation strategies.

Safety

青少年重性抑郁障碍及双相抑郁障碍的多巴胺合成异常: [18F]DOPA PET-MRI 成像研究

孙熙哲 蔡艺娴 潘集阳*
暨南大学附属第一医院

目的 本研究旨在通过[18F]DOPA PET-MRI 多模态影像学技术,探索青少年重性抑郁障碍(MDD)和双相抑郁障碍(BDD)患者脑内感兴趣区域多巴胺合成能力及活性与健康对照者之间是否存在差异。期望通过患者的临床资料与PET-MRI多模态影像学结果进行相关性分析,为青少年MDD和BDD未来的临床诊断与鉴别策略制定提供初步科学依据。

方法 根据美国精神疾病诊断与统计手册第五版(DSM-5)中重性抑郁障碍和双相II型障碍(抑郁期,即BDD)的诊断标准,本研究共招募了12名青少年MDD患者、12名青少年BDD患者以及9名正常对照者。所有参与者均经过详细的精神病学评估,包括汉密尔顿抑郁量表(HAMD-17)、病人健康状况问卷(PHQ-9)等量表评估其情绪及其他临床症状严重程度。所有参与者均接受了[18F]DOPA PET-MRI多模态影像学扫描,且遵循标准化程序收集和

结果 1.与HC组相比,MDD组的HAMD-17和PHQ-9评分显著高于HC组($P<0.001$; $P<0.001$)。BDD组在HAMD-17、PHQ-9评分也明显高于HC组,具有统计学差异($P<0.001$; $P<0.001$)。

2.MDD组在GAD-7、HAMA-14、PSQI评分均高于HC组($P<0.001$; $P<0.001$; $P<0.001$)。BDD组的MDQ量表评分也显著高于HC组,显示统计学差异($P=0.002$)。此外,BDD组在GAD-7、HAMA-14、PSQI评分也均高于HC组($P<0.001$; $P<0.001$; $P<0.001$)。

3.BDD组与MDD组在右侧岛叶的SUVR以及中脑部分($p=0.015$, $p=0.018$)有显著差异。HC与MDD组在右侧岛叶和左侧黑质($p=0.048$, $p=0.013$)的SUVR值存在显著差异。

4.MDD组SUVR与HAMD-17、PHQ-9量表得分均未表现出显著相关性。左侧黑质的SUVR值与HAMA-14得分呈显著负相关($r=-0.619$, $P=0.032$),

且与MDQ得分呈显著正相关($r=0.600$, $P=0.039$)。

结论 1.青少年MDD及BDD患者的HAMD-17、PHQ-9、HAMA-14、GAD-7、PSQI评分显著高于健康对照组,BDD组的MDQ评分也显著高于健康对照组。BDD组在MDQ、GAD-7、HAMA-14量表上的得分显著高于MDD组。

2.青少年人群右侧岛叶及中脑部分的[18F]DOPA SUVR可作为区分MDD和BDD的生物标志物,同时,右侧岛叶及左侧黑质的SUVR用于辅助MDD有较高价值。

Contribution of Resting-state Functional Connectivity of The Subgenual Anterior Cingulate To Prediction of Antidepressant Efficacy in Patients with Major Depressive Disorder

Wang Yun¹, Changshuo Wang², Jingjing Zhou¹, Xiongying Chen¹, Rui Liu¹, Zhifang Zhang¹, Lei Feng¹, Yuan Feng¹, Jing Liu¹, Yuan Zhou², Gang Wang¹

1.Beijing Anding Hospital, Capital Medical University
2.Institute of Psychology, Chinese Academy of Sciences

Objective This study aimed to investigate the role of the resting-state functional connectivity (rsFC) of subgenual anterior cingulate cortex (sgACC) in predicting antidepressant response among patients with MDD

Methods A total of 87 medication-free patients with MDD underwent baseline resting-state functional magnetic resonance imaging scans. After a 12-week treatment with escitalopram, patients were divided into remission depression (RD, $n=42$) and nonremission depression (NRD, $n=45$) groups. Two parallel analyses were conducted. First, a voxelwise rsFC analysis using sgACC as a seed was performed to identify group differences. Second, a prediction model was developed based on the voxelwise rsFC map of sgACC to predict treatment efficacy and Haufe transformation was utilized to explain the predictive rsFC features of this

model

Results The RD group showed significantly higher rsFC between sgACC and regions within the fronto-parietal network (FPN), specifically bilateral dorsolateral prefrontal cortex (DLPFC) and the bilateral inferior parietal lobule (IPL), compared to the NRD group. These sgACC rsFC measures were positively correlated with the reduction ratio of the depressive symptom scores. Importantly, baseline sgACC rsFC significantly predicted treatment response following 12 weeks of escitalopram treatment, achieving a mean accuracy of 72.64% ($p < 0.001$), mean area under the curve of 0.71 ($p < 0.001$), mean specificity of 0.82, and mean sensitivity of 0.70 in 10-fold cross-validation. The predicted voxels were predominantly located within the FPN

Conclusion This study highlighted the importance of rsFC between the sgACC and the FPN as a valuable predictor of treatment efficacy in patients with MDD receiving antidepressant medication. These findings provided insights into the neurobiological mechanisms underlying antidepressant response and have the potential to inform personalized treatment strategies for MDD.

血药浓度数据处理软件辅助判读抗抑郁药治疗药物监测结果的一致性及临床应用价值研究

王瀚 果伟 范安豫阳 吕楠 朱雪泉 张玲 王刚*
首都医科大学附属北京安定医院

目的 评价血药浓度数据处理软件（以下简称“软件”）智能化判读抗抑郁药治疗药物监测（Therapeutic drug monitoring, TDM）结果与参考标准的一致性，并判断其在辅助初级精神科医师识别异常治疗药物监测结果的临床应用价值。

方法 研究纳入 226 例于 2024 年 3 月 1 日至 2024 年 3 月 31 日在首都医科大学附属北京安定医

院住院治疗的抑郁症患者，收集其当前服用抗抑郁药的 TDM 结果。首先验证“软件”在 TDM 结果判读与参考标准的一致性。随后，从 3 个临床中心招募 10 名通过考核且一致性良好的初级临床医师进行 TDM 结果判读。所有 TDM 结果随机平均分配，每名医师对同一病例的 TDM 结果进行先后 2 次判读，一次为单独医师判读，另一次为“软件”辅助医师（软件+医师）判读。

结果 纳入的 226 例患者的 TDM 结果中，有 109（48.23%）例异常。“软件”识别异常 TDM 结果与参考标准的一致率为 100%，原因分析的一致率为 71.56%。单独医师判读的准确率为 65.93%，在“软件”辅助下，准确率可提升至 99.12%。软件+医师联合判读异常 TDM 结果的敏感度（100% VS. 41.28%， $P < 0.0001$ ）及特异度（98.29% VS. 88.89%， $P < 0.0001$ ）均明显优于单独医师判读。软件+医师联合判读的曲线下面积(AUC)值相较于单独医师判读提高 34.50% (95%CI: 29.1%~39.9%)，差异具有统计学意义($Z = 12.514$, $P < 0.0001$)。

结论 血药浓度数据处理软件判读 TDM 结果与参考标准具有高度一致性，有助于提高初级精神科医生对异常 TDM 结果的识别与原因解析。

Targeting The ERK/NF- κ B Pathway with Maresin-1: Implications for Treating Depression Via Microglial Polarization

Tian Qiu* Jiamei Guo

The First Affiliated Hospital of Chongqing Medical University

Objective Neuroinflammation and microglial polarization constitute critical pathophysiological alterations implicated in the onset of depression. Maresin-1 (MaR1), an innovative lipid mediator synthesized from docosahexaenoic acid, exhibits potent anti-inflammatory properties, and facilitates the resolution of inflammation. Preliminary observations by our team suggest that a singular intraperitoneal administration of MaR1 (5 μ g/kg) ameliorates lipopolysaccharide (LPS)-induced depressive-like behaviors in mice through the

inhibition of microglial activation, though the precise molecular mechanisms underlying these effects have yet to be elucidated

Methods thereby alleviating neuroinflammation and its associated depressive symptoms. Based on the pre-constructed depressed mouse model and in vitro microglia model, this study aims to explore the role of MaR1 in microglia polarization and its antidepressant effect within the framework of the MAPK signaling pathway

Results Findings revealed that MaR1 suppressed the secretion of pro-inflammatory mediators such as IL-1 β , TNF- α , iNOS, and curtailed the expression of M1 microglial markers (CD11b/CD68), concurrently enhancing the release of the anti-inflammatory cytokine IL-10 and the expression of M2 microglial markers (CD206/Arg-1). This action may mainly relate to the inhibition of key molecules ERK and its downstream NF- κ b expression in the MAPK signaling pathway, and the ERK blocker had a similar effect in reducing the secretion of pro-inflammatory mediators and increasing the release of anti-inflammatory mediators; next, we further confirmed that intraperitoneal injection of MaR1 and ERK inhibitor significantly improved LPS-induced depressive-like behaviors in mice, manifested by increased sucrose preference, reduced immobility time in the TST, and increased movement distance in the open field test, moreover, we obtained consistent results in the animal model as in the cell model

Conclusion These findings suggest that MaR1 may exert its antidepressant effects by inhibiting the ERK/NF- κ b axis, promoting microglial polarization, and suppressing inflammatory responses

The Effect of Childhood Trauma on Depression in College Students: A Moderated Mediation Model

Hang Yu Yuqiong Zhu Chenguang Ji Chengcong Wu

Tiancheng Li Wenjuan Wang*

蚌埠医科大学

Objective Childhood trauma is considered as a critical risk factor for depression. Although many studies have investigated the pathway of Childhood trauma to depression, especially the mediating or moderating effects of cognitive emotion regulation strategies or neuroticism or stress perception, the results were inconsistent and the underlying psychological mechanisms of depression remain unclear. This study aims to explore the influence and mechanism of childhood trauma on depression in college students, and establish a full model among these interactive factors

Methods 1272 college students were surveyed using the childhood trauma questionnaire(CTQ), short version of center for epidemiologic studies depression scale(CES-D), chinese perceived stress scale(CPSS), neuroticism extraversion openness five-factor inventory(NEO-FFI), and the Cognitive Emotion Regulation Questionnaire(CERQ)

Results (1) childhood trauma, neuroticism, stress perception, and maladaptive cognitive emotion regulation strategies were all significantly and positively correlated with depression among college students; (2) Stress perception and neuroticism act as a chain mediator between childhood trauma and depression in college students. (3) Maladaptive cognitive emotion regulation strategies play a moderating role in "childhood trauma-neuroticism-depression"

Conclusion Childhood trauma increases the risk of depression in college students by affecting neuroticism and stress perception, and high levels of maladaptive cognitive emotion regulation strategies link neuroticism and enhance the effect of childhood trauma on depression in college students.

关键词: childhood trauma; depression; neuroticism; stress perception; cognitive emotion regulation strategies

补益心脾法降低抑郁障碍患者自杀意念的队列研究

袁善方 孙文军*

北京中医药大学第三附属医院

目的 探究补益心脾法对伴自杀意念的抑郁障碍(MDD)患者的临床疗效。

方法 2017年1月—2018年4月招募全国13家中医、中西医结合及精神专科医院符合纳入标准的MDD患者366例作为研究对象,按治疗方案自然形成中医、西医与中西医结合治疗3个队列,并根据中药暴露时间(TCM-ET)分为高、中、低3个水平。间隔3个月随访,以蒙哥马利-艾森贝格抑郁评定量表(MARDS)评估患者抑郁症状变化及终点事件发生情况。

结果 中医、西医、中西医结合治疗队列的2年自杀意念发生率分别为39.0%、49.1%、29.0%。在自杀意念发生率的多因素比较上,以西医队列为参照,中医队列自杀意念发生率降低28.1%(HR=0.719,95%CI(0.476~1.087), $P>0.05$),差异无统计学意义。中西医队列自杀意念发生率降低42.1%(HR=0.579,95%CI(0.373~0.899), $P<0.01$)。中医队列中,以低水平TCM-ET为参照,中水平TCM-ET自杀意念发生率降低22.2%(HR=0.778,95%CI(0.404~1.500), $P>0.05$),差异无统计学意义,高水平TCM-ET自杀意念发生率降低66.6%(HR=0.394,95%CI(0.167~0.931), $P<0.05$)。中西医队列中,以低水平TCM-ET为参照,中水平TCM-ET自杀意念发生率降低70.3%(HR=0.419,95%CI(0.189~0.927), $P<0.05$),高水平TCM-ET自杀意念发生率降低83.1%(HR=0.217,95%CI(0.094~0.501), $P<0.01$)。

结论 补益心脾法中医治疗与西医治疗具有同等的疗效,中西医结合治疗可更好降低心脾两虚型MDD患者自杀意念发生率;中、高水平TCM-ET对降低心脾两虚型MDD患者自杀意念的临床疗效与低水平TCM-ET相比更为显著。

天然生物碱类成分ELP改善慢性社会挫败应激(CSDS)小鼠抑郁样行为的蛋白组学研究

张翼¹ 李磊¹ 朱婷婷² 阙伟京¹ 王刚¹ 吉腾飞² 杜静¹

1.首都医科大学附属北京安定医院,国家精神心理疾病临床医学研究中心,精神疾病诊断与治疗北京市重点实验室

2.中国医学科学院&北京协和医学院药物研究所,天然药物活性物质与功能国家重点实验室

重性抑郁障碍(Major Depressive Disorder)是一种常见且严重的精神障碍,我国成人抑郁障碍终生患病率高达6.8%,为社会和家庭带来极大的负担。目前对于抑郁障碍的发病机制尚不清楚,导致现有的治疗方法对三分之一的病人无效。探索抑郁障碍新的治疗靶点和寻找新的治疗药物是精神病学研究的重要课题。天然生物碱类成分ELP为喹诺里西定类生物碱成分,该种成分的抗炎和抗肿瘤作用曾有报道,其抗抑郁作用尚属未知。

目的 探究ELP的抗抑郁作用,并深入研究其通过调节线粒体功能发挥抗抑郁作用的分子生物学机制。

方法 C57小鼠经CSDS造模后糖水偏好实验筛选抑郁鼠,随机分为正常对照(CON)组、抑郁(CSDS)组、ELP组、丙咪嗪(IMI)组,分别在给药1h和4天进行悬尾实验和糖水偏好实验,第5天行强迫游泳实验,后处死取前额叶提取蛋白质通过非标记定量蛋白组学检测,运用生物信息学方法进行相关差异蛋白的GO富集分析、蛋白相互作用(PPI)的分析等,探究其抗抑郁分子机制。

结果 我们发现在慢性社交挫败应激(CSDS)抑郁模型中,ELP在悬尾($F=5.10, P<0.05$)、强迫游泳($F=5.32, P<0.01$)和蔗糖偏好实验($F=8.54, P<0.01$)中,显示出抗抑郁样功效。非标定量蛋白组学共检出6467个蛋白,获得CSDS与CON(CSDSCON)、丙咪嗪(IMI)治疗与CSDS(IMICSDS)、ELP治疗与CSDS(ELPCSDS)的差异蛋白序列,这些蛋白表达变化首先采用方差分析(ANOVA, $P<0.05$),蛋白质聚类3中蛋白质水平趋势与行为学趋势相似,在线粒体、内质网、核糖体和突触相关的功能和定位上富集。进一步对ELPCSDS-IMICSDS组和ELPCSDS-CSDSCON组的共同差异蛋白进行GO富集,支持方差分析结果。我们使用PPI分析了ELPCSDS-IMICSDS和ELPCSDS-CSDSCON的共同蛋白群,发现与线粒体和突触功能相关的蛋白富集。蛋白网络分析上下调

差异蛋白主要成簇在突触和线粒体功能。ELP 治疗改变了突触及线粒体功能相关蛋白合成,从而改善了抑郁样行为,说明突触及线粒体相关功能蛋白在抑郁治疗过程中发挥重要作用。再次对关键蛋白行平行反应监测,结果显示: Rab27a (与突触功能相关)、Mrpl17 等 (与线粒体功能相关)、Ubt2 (与内质网功能相关)、Rpl13a (与核糖体功能相关),在 CSDS 组与 ELP 组之间存在显著差异,支持质谱分析的结果。

结论 ELP 改善 CSDS 小鼠抑郁样行为是通过调节线粒体、内质网、核糖体和突触相关蛋白表达水平实现的。

关键词: 抑郁障碍; ELP; 蛋白组学; CSDS

中国精神障碍患者服用帕罗西汀的群体药代动力学研究及其临床应用

黄婉婷 尚德为*

广州医科大学附属脑科医院

目的 建立中国精神障碍患者服用帕罗西汀的群体药代动力学 (PPK) 模型,制定不同协变量影响下亚群体的合理用药方案,并通过模型仿真优化帕罗西汀的停药策略,降低帕罗西汀停药综合发生的风险。

方法 收集 188 例住院患者的帕罗西汀血清药物浓度数据,录入帕罗西汀 PPK 数据集,采用非线性混合效应模型 (NONMEM) 和交互作用的一阶条件评估 (FOCE-I) 对帕罗西汀血药浓度数据进行拟合并考察不同协变量对帕罗西汀群体药代动力学参数的影响。通过目标函数值 (OFV)、自举法 (bootstrap)、正态化预测分布误差 (NPDE) 和拟合优度图 (GOF) 评价模型拟合度,验证模型的稳定性和预测性能。基于最终模型的参数群体典型值仿真模拟不同停药场景下帕罗西汀的血药浓度,遴选合适的停药方案。

结果 剂量和性别是影响帕罗西汀表观清除率的协变量。采用固定剂量递减停药策略,以说明书停药建议为参考,40 mg 及 40 mg 以下剂量推荐使用说明书停药策略,如患者发生停药反应,可考虑每两周减量 10 mg 的停药策略,延长用药时间;60 mg 时,建议每次降低剂量后维持用药时间 1 周以上,或每周降低 5 mg,同时注意观察患者耐受情况,

如患者病情反复或者发生不适,应调回前一个剂量水平,再使用一段时间。

结论 本研究以该药物说明书的停药方案为参考依据,设计了理论可行不同间隔、不同剂量的停药策略,为制定帕罗西汀停药策略提供技术性支持。

青少年非自杀性自伤患者额边缘系统多模态磁共振成像研究

付播 潘苗*

新乡医学院第二附属医院

目的 探究青少年非自杀性自伤 (NSSI) 患者额边缘系统的多个脑区皮质结构及静息状态下自发神经活动的异常。探讨抑郁焦虑症状及 NSSI 严重程度与上述异常指标之间的相关性,为早期识别这一群体提供可能的客观生物学指标。

方法 根据 DSM-5 中 NSSI 的诊断标准共纳入的 23 例青少年 NSSI 患者 (NSSI 组),匹配 20 例青少年为健康对照组 (HC 组)。NSSI 的诊断由精神科副主任及以上职称医师判断,使用汉密尔顿抑郁量表 17 项 (HAMD-17)、汉密尔顿焦虑量表 (HAMA) 评估受试者抑郁焦虑症状,采用中文版渥太华自我伤害调查表 (OSI) 评估 NSSI 的严重程度。对所有受试者进行 MRI 数据采集,采用基于体素的形态学分析、低频振幅、比率低频振幅、局部一致性、静息态功能连接多模态方法分析两组额边缘系统 8 个感兴趣脑区的灰质体积和局部神经功能差异,并将临床症状与异常脑区的影像学结果进行皮尔逊相关性分析。采用 SPSS 25.0 进行统计学分析,计数资料采用卡方检验,计量资料采用两样本 t 检验。

结果 1. 两组在年龄、性别等一般资料上无显著的统计学差异 ($P > 0.05$), NSSI 组首次自伤年龄为 13.83 ± 1.61 岁,近一年自伤次数 96.00 ± 103.34 次。2. NSSI 组左侧背外侧额上回、左侧脑岛皮质体积减小,差异有统计学意义 ($P < 0.05$, FWE 校正)。NSSI 组双侧杏仁核、右侧前后扣带回的 ALFF 值降低,双侧辅助运动区的 ALFF 值增高,右侧前扣带回的 fALFF 值降低,差异有统计学意义 ($P < 0.05$, FWE 校正); 右侧直回 ReHo 值降低,而双侧背外侧额上回

ReHo 值增高, 差异有统计学意义($P < 0.05$, FWE 校正)。NSSI 组右侧海马-左侧海马、双侧眶回、左侧扣带回, 右侧眶回-右侧杏仁核的 FC 值减弱; 双侧额上回-双侧眶回, 左侧额上回-右侧岛回、右侧额中回 FC 值增强, 差异有统计学意义($P < 0.05$, FWE 校正)。3.NSSI 组 HAMA、HAMD 总分与右侧前扣带回的 ALFF 值存在正相关($r=0.56$, $P=0.02$; $r=0.58$, $P=0.01$), NSSI 频率与右侧杏仁核的 ALFF 值存在正相关($r=0.50$, $P=0.04$); NSSI 频率与左侧背外侧额上回的 ReHo 值存在负相关($r=-0.53$, $P=0.02$); NSSI 组双侧额上回-双侧眶回, 左侧额上回-右侧岛回、右侧额中回增强的 FC 均值与 NSSI 频率存在正相关($r=0.55$, $P=0.02$)。

结论 青少年 NSSI 患者额边缘系统存在结构及功能的异常, 并且与抑郁焦虑症状及 NSSI 的严重程度有关, 可能参与了 NSSI 神经生物学机制。

基于静息态脑电图特征的多变量模式分析: 抑郁障碍识别研究

李存 张函 史珂 夏叶 宋艳惠 王紫薇 冯捷 杨渊*
华中科技大学附属同济医院

目的 抑郁障碍是一种常见精神健康疾病, 严重影响患者的生活质量, 抑郁障碍的诊断主要依赖于临床评估和症状报告, 目前尚缺乏特定的客观生物标记物。本部分旨在通过高密度脑电图 (EEG) 寻找与抑郁障碍相关的生物标记物, 以提高其诊断的客观性和精准性。

方法 本研究纳入于 2022 年 3 月至 2023 年 9 月在华中科技大学同济医学院附属同济医院神经内科就诊, 符合 DSM-V 抑郁障碍诊断标准的 115 名患者。同时, 本研究招募了 43 名年龄、性别和教育水平相匹配的健康对照者。收集所有受试者的临床资料, 包括一般人口学、心理测评及 EEG。使用独立两样本 t 检验、Mann-Whitney U 检验和基于 Rugu 软件的拓扑方差分析 (TANOVA) 比较脑电微状态和功能连接在抑郁障碍组和健康对照组之间的差异, 并且使用错误发现率 (FDR) 校正来控制多重比较问题。最后, 采用支持向量机 (SVM) 算法评估脑电

微状态特征和功能连接特征用于区分抑郁障碍患者和健康对照者的准确率。

结果 与健康对照组相比, 抑郁障碍组脑电微状态 D 向 B 的转换概率显著增加 (PFDR = 0.048)。此外, 抑郁障碍组默认网络 (DMN) 部分区域在 δ 频段、 θ 频段和 β 频段的功能连接 ($P < 0.05$), 以及 DMN 与突显网络 (SN) 部分区域在 θ 频段和 α 频段的功能连接 ($P < 0.05$) 均显著高于健康对照组, 但均未通过 FDR 校正 (PFDR > 0.05)。使用脑电微状态特征、功能连接特征、脑电微状态和功能连接特征, 在 SVM 分类器上区分抑郁障碍患者和健康对照者的准确率分别为 66.7%、76.2% 和 81.0%。

结论 抑郁障碍患者存在独特的脑电微状态和异常的脑网络连接改变, 结合脑电微状态和功能连接特征可以更好的进行疾病的诊断。

关键词: 抑郁障碍; 脑电微状态; 功能连接; 支持向量机

背外侧前额叶皮层活性和功能连接的早期变化作为重度抑郁障碍抗抑郁反应的潜在生物标志物

李存 张函 史珂 夏叶 宋艳惠 王紫薇 冯捷 杨渊*
华中科技大学附属同济医院

目的 既往研究表明, 重度抑郁障碍 (MDD) 患者存在认知缺陷。功能核磁共振成像 (fMRI) 研究发现背外侧前额叶皮层 (DLPFC) 可能参与了 MDD 的发病及抗抑郁治疗相关的神经生物学过程, 但研究结果尚不一致。本研究旨在明确 DLPFC 的活性及其功能连接的早期治疗变化和疗效预测中的作用。

方法 本研究为前瞻性队列研究, 纳入于 2022 年 3 月至 2023 年 9 月在华中科技大学同济医学院附属同济医院神经内科就诊, 符合 DSM-V MDD 诊断标准的 115 名患者。同时, 本研究招募了 43 名年龄、性别和教育水平相匹配的健康对照者。收集所有受试者的一般人口学资料, 在基线及文拉法辛治疗 1 周后进行心理测评、脑电图 (EEG) 及事件相关电位 (ERP), 并且进行为期 3 个月的随访。采用独立两样本 t 检验和 Mann-Whitney U 检验来比较组间差异。线性混合效应模型和二元逻辑回归分析

被用于评估抗抑郁治疗后 DLPFC 活性及功能连接变化与抑郁症状改变和治疗预后的相关性。

结果 与健康对照组相比, MDD 组偏差刺激诱发的 N2 期间 DLPFC 的电流密度显著减低 ($P = 0.028$), 并且与治疗 1 周的 HAMD-21 分数呈显著负相关 ($P = 0.041$)。此外, 电流密度的早期增加预示着治疗 3 月后达到缓解的概率越大 ($OR = 5.235$, $95\%CI: 1.638-16.730$, $P = 0.005$)。再者, 左侧 DLPFC 与左侧后扣带回皮层 (PCC) ($P = 0.003$) 和右侧 PCC ($P = 0.004$) 在 β 频段较低的功能连接预示了治疗后 1 周较低的 HAMD-21 分数, 并且这些功能连接的早期减低也预示了治疗 3 月后的缓解 (左侧: $OR = 0.534$, $95\% CI: 0.297-0.972$, $P = 0.036$; 右侧: $OR = 0.533$, $95\% CI: 0.299-0.950$, $P = 0.033$)。

结论 DLPFC 活性和功能连接的早期变化可能作为监测抗抑郁治疗效果和预测临床结局的生物标志物, 从而为个性化治疗提供依据。

Predictive Models for Non-suicidal Self-injury (NSSI) in Mood Disorder: A Machine Learning Modeling Approach

Sixiang Liang Yuxuan Xu Jinhe Zhang Yannan Deng Qitong Jiang Xinyu Liu Hongye Yu Guangwei Zhao Chen Hu Sha Sha Ling Zhang*

The National Clinical Research Center for Mental Disorders & Beijing Key Laboratory of Mental Disorders, Beijing Anding Hospital, Capital Medical University and the Advanced Innovation Center for Human Brain Protection, Capital Medical University, Beijing, China

Objective Non-suicidal self-injury (NSSI) is a highly prevalent behavioral problem among people with mood disorder (MD) that can result in numerous adverse outcomes. This study aims to develop and validate a prediction model based on machine learning (ML) to assess the risk of NSSI in MD. Meanwhile, to understand the importance and contribution of different input characteristics to the models and classification tasks, we

added the locally explanatory technique Shapley Additive exPlanations (SHAP), which calculates the relative contribution of each characteristic and explains the ML models

Methods This retrospective cross-sectional analysis of the inpatient medical records was conducted on 1099 participants. All patients were randomly divided into a training set ($N=769$) and a testing set ($N=330$). Logistic LASSO Regression Analyses were used to identify the risk factors of NSSI. Ten algorithms of ML were employed to evaluate the performance and relative importance of the extracted characteristics in identifying MD patients with/without NSSI separately. The best-performing ML model was confirmed based on metrics such as AUC, F1-Score, and accuracy. The SHAP method was used to rank the importance of features and interpret the best model, analyzing the potential impact of each feature on suicidal behavior

Results Eleven features that influence NSSI were identified through LASSO regression. When comparing all prediction models with different ML, the model depending on Random Forest (RF) showed the best discriminant capacity (AUC of Testing=0.870, AUC of Training= 0.903) and acceptable application performance (Recall=0.7188, Accuracy=80.61%, F1-Score=0.4182, MCC=0.3721). According to SHAP analysis, the top five predictors in the Model for identifying NSSI were the level of blood thyroid hormone, past NSSI history, age, the level of blood ACTH, and progesterone

Conclusion The ML based on FR can better construct an NSSI prediction model for patients with MD. It is necessary to maintain a cautious and optimistic attitude toward the Predictive Models for MD with NSSI.

不同阶段抑郁症的内感受障碍特征的研究

王文亮 周红亮*
江南大学

目的 重度抑郁障碍 (major depressive disorder, MDD) 的复杂病理生理机制需要开发能够反映情感、身体和认知因素复杂相互作用的综合早期指标。尽管内感受在满足这些标准方面具有潜力,但在 MDD 中的研究仍不充分。本研究旨在通过评估不同 MDD 阶段的内感受缺陷及其与抑郁症状谱的复杂关联,探讨内感受在转变 MDD 临床实践中的潜力。

方法 本研究包括 431 名健康个体、206 名亚临床抑郁个体和 483 名 MDD 患者。采用 PHQ-9 和 MAIA-2 评估抑郁症状和内感受功能。协方差分析比较各阶段 MDD 内感受损伤的差异。典型相关分析探讨内感受和抑郁 9 大核心症状之间的关系。预测模型用于评估内感受在 MDD 临床实践中的应用潜力。

结果 内感受功能障碍在 MDD 的前临床阶段已经出现,并在临床阶段进一步扩大。抗抑郁治疗在改善内感受方面显示出有限的疗效,甚至可能损害某些维度。内感受维度可能预测抑郁症状,主要是通过增强负面思维模式。基于内感受的预测模型经过随机分割验证,表现出良好的区分和预测性能,能够识别 MDD。

结论 在前临床阶段的早期变化、与抑郁症状的多变量关联,以及良好的区分和预测性能,突显了内感受在 MDD 管理中的重要性,指出了诊断和治疗方法的范式转变。

关键词: 重度抑郁障碍,病理生理机制,内感受,抑郁前临床阶段,PHQ-9,MAIA-2

鲁拉西酮对比喹硫平单药治疗青少年和成年早期双相抑郁的疗效和安全性:一项随机对照研究

徐劲节 王威*

首都医科大学附属北京安定医院

目的 比较鲁拉西酮与喹硫平单药治疗青少年和成年早期双相障碍抑郁发作患者的疗效与安全性。

方法 本研究采用单中心、随机、阳性对照、非劣效试验的研究设计。于 2021 年 8 月至 2024 年 3 月期间在首都医科大学附属北京安定医院纳入 60 例现患双相障碍抑郁发作的门诊患者,使用区组随机的方法将受试者按 1:1 比例随机分配至鲁拉西酮

组和喹硫平组。鲁拉西酮单药治疗组接受鲁拉西酮 20-40mg/日单药治疗,喹硫平单药治疗组接受喹硫平 12.5-300mg/日单药治疗,2 组治疗均持续 8 周。采用蒙哥马利-艾斯伯格抑郁量表 (MADRS)、汉密尔顿焦虑量表 (HAMA)、杨氏躁狂评定量表 (YMRS) 评估疗效,采用静坐不能评定量表 (BARS) 和异常不自主运动评定量表 (AIMS) 评估不良反应;采用哥伦比亚自杀严重程度评定量表评估自杀风险。主要结局指标为治疗后第 8 周末时 MADRS 评分相较于基线的减分值。次要结局指标包括治疗后第 8 周末时 HAMA 与 YMRS 评分相较于基线期的减分值。安全性指标包括 BARS 与 AIMS 评分的变化以及不良反应和不良事件发生率。按照意向性分析原则 (ITT),对所有服用 1 次药物并至少进行 1 次疗效评价的全部病例进行疗效分析。采用限制线性混合效应模型对结果变量进行分析。对所有服用 1 次药物并进行安全性评价的全部病例进行安全性分析。

结果 2 组患者人口学信息学和临床特征均具有可比性。鲁拉西酮单药治疗组完成随访 25/29 (86.2%) 人;喹硫平单药治疗组完成随访 23/26 (88.5%) 人。鲁拉西酮单药治疗组平均剂量为 35.17±9.11mg/d,喹硫平单药治疗组平均剂量 101.60±70.15mg/d。两组基线 MADRS 总分 (31.48±6.78 vs 29.81±4.39, $P>0.05$) 及治疗后第 8 周末 MADRS 减分值无显著差异 (19.12±1.79 vs 14.74±1.87, $P>0.05$)。两组在治疗后 8 周末 HAMA 减分值无显著性差异 (13.64±1.77 vs 10.32±1.89, $P>0.05$),在基线 YMRS 总分以及治疗后 8 周末 YMRS 减分值均无显著性差异 (-0.2±0.77 vs -0.35±0.80, $P>0.05$)。鲁拉西酮单药治疗组最常见的不良反应为恶心、静坐不能,喹硫平单药治疗组最常见的不良反应是困倦、心动过速,鲁拉西酮单药治疗组不良反应发生率显著低于喹硫平单药治疗组。两组对 BMI 和代谢指标的影响均较小,组间无显著性差异。

结论 在 20-40mg/日剂量下,鲁拉西酮单药治疗可显著改善青少年及成年早期双相障碍抑郁发作患者的抑郁症状,其疗效与喹硫平单药治疗相当,且安全性更佳。

Effects of Subanesthetic Repeated Esketamine Infusions on Memory Function and NGF in Patients with Depression: An Open-label Study

Qiongyao Yang Kai Zhang*

Chaohu Hospital of Anhui Medical University

Objective Subanesthetic ketamine is a rapidly acting antidepressant, yet the effects of ketamine on cognitive function are inconsistent. The primary objective of this study was to explore the effects of subanesthetic repeated esketamine infusions on memory function and plasma levels of nerve growth factor (NGF) in patients with depression

Methods A total of 132 patients with depression completed six intravenous esketamine infusions (0.4 mg/kg over 40 min) over 11 days (days 1, 3, 5, 7, 9, and 11). Depressive symptoms and neurocognitive function were assessed using the Montgomery-Asberg Depression Rating Scale (MADRS) and Repeatable Battery for the Assessment of Neuropsychological Status (RBANS) at baseline, 24 h after esketamine infusion. Plasma NGF levels were assayed by enzyme-linked immunosorbent assay (ELISA)

Results The mean MADRS score of depressed patients decreased from 32.11 ± 10.06 to 15.10 ± 8.62 after six infusions. Significant improvement in immediate memory, language, attention, and delayed memory were observed after the last esketamine infusion. NGF plasma levels increased from 226.13 ± 61.73 to 384.37 ± 56.89 . Pearson's correlation analysis showed a positive correlation between memory function and NGF levels at baseline ($r=0.346$, $p<0.001$). The baseline memory function was negatively associated with the changes in NGF levels ($r=-0.352$, $p<0.001$)

Conclusion Subanesthetic infusions of esketamine could improve depressive symptoms and neurocognitive function. Our study showed increased plasma NGF levels in depressed patients after treatment, suggesting that NGF may play a role in the improvement of memory function by esketamine.

Phase Connectivity Dysfunction During The GO/NOGO Task Related To Suicide Attempt in Major Depressive Disorder

Zhongpeng Dai¹, Wei Zhang¹, Zhijian Yao², Qing Lu¹

1.southeast university, school of biomedical engineering

2.Nanjing Brain Hospital

Objective Major depressive disorder (MDD) is a main risk factor of suicide, emphasizing the urgent need for understanding the neurobiological mechanisms underlying suicide attempts (SAs) in depressive patients. We hypothesized that aberrant frequency-specific functional connectivity patterns underlying an executive and inhibition task might be associated with SA in depression

Methods The current study enrolled 143 subjects including 43 healthy controls and 87 patients with MDD (43 patients with SA and 44 without SA), who attended a GO/NOGO task during the magnetoencephalography recording. Time-frequency features in the whole-brain sensors and frequency-specific brain network connectivity patterns were estimated. Behavioral data was recorded during the tasks and neurocognitive assessments were conducted

Results The SA group exhibited poorest behavioral and neurocognitive assessments performances. Decreased alpha/beta oscillations of the GO condition and increased alpha/beta oscillations of NOGO condition were observed in the SA group. Hypo-activated frontal-limbic connectivity in the alpha band and frontal-occipital connectivity in the beta band were observed in the SA group during the GO trials, meanwhile, hyper-activated frontal-temporal connectivity in the alpha band and frontal-parietal connectivity in the beta band were associated with SA during the NOGO trials. Frequency-specific features were correlated with the severity of suicide risk, neurocognitive assessments, and could be used to predict potential SAs

Conclusion Neuroimaging and neurocognitive

evidences supported altered alpha/beta oscillations and connectivity patterns associated with SA in depression, suggesting that depressive patients with SA might exhibit impaired cognitive control functions

Assessment of The Causal Relationship between Depression and Traits of Sarcopenia: A Bidirectional Two-sample Mendelian Randomization Study

Jianyu Tan^{1,2}, Li Kuang^{1,2}

1.The First Affiliated Hospital of Chongqing Medical University

2.Psychiatric Center, The First Affiliated Hospital of Chongqing Medical University

Objective A growing body of evidence indicates a significant association between depression and sarcopenia. However, the causal association between the two remains elusive. The objective of this study was to investigate the bidirectional relationship between depression and traits of sarcopenia

Methods We used genetic variants associated with depression (n=2,113,907), grip strength (n=256,523), appendicular lean mass (n=450,243), and walking pace (n=459,915) in bidirectional two-sample Mendelian randomization. The random-effects inverse-variance weighted method was adopted as the primary method

Results Mendelian randomization results revealed a causal relationship between depression and appendicular lean mass [β (95% confidence interval (CI)) = -0.051 (-0.086--(-0.016)), P=0.004], walking pace [OR (95% CI) = 0.973 (0.955--0.992), P=0.005]. Walking pace also revealed a causal relationship with depression [OR (95% CI) = 0.663 (0.507--0.864), P=0.002] in the reverse analysis. We observed no causal relationships between depression and grip strength. The leave-one-out sensitivity analysis verified our results

Conclusion This Mendelian randomization analysis verified the bidirectional relationship between depression and sarcopenia. Early diagnosis and prevention of either disease may enhance the management of another.

Gait Patterns in Depression: A Bibliometric Analysis and Knowledge Mapping of Research Trends Over The Past 20 Years

Shaokui Kan Nuannuan Chen Bo Peng Yingli Zhang*
Shenzhen Kangning Hospital/Shenzhen Mental Health Center

Objective Depression is a mental health disorder associated with a high risk of suicide, and patients with depression may conceal their symptoms, delaying treatment. Therefore, gait recognition is crucial for the early detection of depression. However, there is a lack of comprehensive and objective evaluations of the current research status on depression-related gait patterns. This study aims to visually analyze the research status and trends in depression-related gait using bibliometric and knowledge mapping methods

Methods We conducted a computer-based search of the Web of Science core collection to identify articles and reviews related to depression and gait. Bibliometric analysis was performed using Excel 365, CiteSpace, VOSViewer, and bibliometric software (R-Tool of R-Studio)

Results The bibliometric analysis included a total of 848 publications from 2005 to 2024. The results showed a phased increase in publication volume, peaking in 2020 with 102 publications, followed by a gradual decline. Citation frequency in this field showed a yearly increase, peaking in 2022 with 3920 citations before subsequently declining. The United States was identified as the most productive and influential country in this field, with the highest number of publications and

citations. They have the institutions with the highest number of publications and the highest citation frequencies. Leading authors in this field include Verghese, Joe; Shimada, Hiroyuki; and Rochester, Lynn. Key authoritative journals include BMC Geriatrics, Journals of Gerontology Series A: Biological Sciences and Medical Sciences, and Journal of the American Geriatrics Society. Frequently mentioned keywords in this field are depression, gait, people, gait speed, older adults, health, and dementia

Conclusion This study is the first to utilize bibliometric methods to visualize research in the field of depression-related gait. It reveals research trends and frontiers, providing valuable references for scholars seeking important research topics and potential collaborators.

间歇性 θ 脉冲刺激模式治疗抑郁障碍的脑电微状态特征分析

杨军 唐婷婷 桂千千 张坤 王婷 郭珊珊 杨春霞 孙宁*

山西医科大学第一医院

目的 间歇性 θ 脉冲刺激(iTBS)属于新型经颅磁刺激(TMS)模式,治疗抑郁障碍有效。重性抑郁障碍(MDD)与异常的脑电活动有关。TMS可能诱导与抑郁症状相关的异常脑电变化。脑电微状态被假设为代表大脑静息状态网络,基于既往研究脑电微状态有望作为MDD的脑电衍生标志物来探索TMS抗抑郁背后的脑网络机制。

方法 本研究纳入共纳入65例被试,随机分为2组,1组给予iTBS和SSRIs联合治疗,另1组给予SSRIs治疗。基线、2周、4周分别进行评估,基线和4周治疗结束时采集静息态脑电数据。评估量表主要采用HAMD-24项量表。采集5分钟的睁闭眼静息态脑电数据,采用不区分极性k-means聚类将脑电图分割为成微状态,T检验比较了联合治疗组和药物组组内及组间的微状态特征差异。

结果 1、临床疗效分析:4周治疗结束后联合

干预组HAMD-24项量表得分(11.21±3.67)与药物组HAMD-24项量表得分(13.40±3.11)存在明显差异($p=0.024$)。4周治疗结束时两组间有效率存在差异(联合干预组75.00%,药物组48.00%, $p=0.043$)。

2. 组内脑电微状态特征分析:4周治疗结束时联合治疗组微状态D的持续时间高于治疗前($t=-3.490, p=0.020$)。微状态B的发生率低于治疗前($t=2.329, p=0.028$)。微状态D的发生率低于治疗前($t=5.503, p<0.001$)。微状态C的发生率高于治疗前($t=-2.984, p=0.006$)。微状态D的覆盖率高于治疗前($t=-5.302, p<0.001$)。4周时药物组微状态D的发生率低于治疗前($t=4.133, p<0.001$)。微状态C的覆盖率高于治疗前($t=-5.340, p<0.001$)。微状态D的覆盖率低于治疗前($t=2.828, p=0.009$)。

3. 组间脑电微状态特征分析:基线时联合干预组微状态C的覆盖率高于药物组($t=2.927, p=0.005$)。治疗后联合干预组微状态A的覆盖率低于药物组($t=-2.423, p=0.019$)。微状态C的覆盖率低于药物组($t=-4.180, p<0.001$)。微状态D的覆盖率高于药物组($t=8.144, p<0.001$)。

结论 两种治疗方案对部分微状态特征均有影响,联合治疗组对不同微状态特征的影响更广泛。iTBS治疗可以独立影响微状态A和D的特征从而反映其调节MDD的脑网络活动,涉及默认模式网络和中央执行网络。微状态D覆盖率的增加可能是iTBS抗抑郁的特异性脑电标志物。

关键词: 重性抑郁障碍; 间歇性 θ 脉冲刺激; 脑电图; 微状态分析; 脑网络

社会认知与互动训练(SCIT)对首发抑郁症患者社会功能及神经营养因子的影响

李嘉欣^{1,2} 李茹¹ 李茹³ 张勇¹

1.天津市安定医院

2.深圳市龙岗中心医院

3.临汾市中心医院

目的 本研究旨在探讨社会认知和互动训练(SCIT)对首发抑郁症患者(FEDN)社会功能和外周神经营养因子的影响,探讨SCIT干预后社会功能的改善是否与抑郁症患者的生物标志物有关。

方法 这是一项随机对照试验(RCT),84例首

发抑郁患者随机分配到 SCIT 组 (n=45) 或认知行为干预 (CBT) 组 (n=39)。两组都接受每周 1 次, 共计 8 周的干预, 每次干预持续 2 小时。SCIT 组和 CBT 组在基线完成社会人口学信息评估, 此外, 两组均在基线和第 8 周完成汉密尔顿抑郁评定量表 17 项 (HDRS)、功能评估测试简版 (FAST) 以及血清脑源性神经营养因子 (BDNF) 和胶质细胞源性神经营养因子 (GDNF) 的检测。

结果 1、在基线水平, SCIT 组与 CBT 组一般人口学资料以及临床相关变量比较均无统计学差异 (均 $p > 0.05$); 2、重复测量方差分析结果显示, FEDN 患者 FAST 总分在 8 周干预前后有明显的改善 ($F = 120.44, df = 1, p < 0.001$), 且这种改善在 SCIT 组更显著 ($F = 10.67, df = 1, p = 0.002$)。组别*时间的交互作用显示, SCIT 组在职业功能 ($F = 5.53, df = 1, p = 0.021$)、认知功能 ($F = 4.75, df = 1, p = 0.032$)、人际关系 ($F = 5.73, df = 1, p = 0.019$) 三个社会功能子维度方面的改善比 CBT 组更有优势; 3、重复测量方差分析显示, SCIT 组和 CBT 组患者的 HDRS 总分 ($F = 112.30, df = 1, p < 0.001$), 血清 BDNF ($F = 38.19, df = 1, p < 0.001$) 和 GDNF ($F = 191.00, df = 1, p < 0.001$) 水平在 8 周内显著改善, 但组间 HDRS、BDNF 和 GDNF 的变化未发现统计学差异 (均 $p > 0.05$); 4、基于干预措施的相关性分析显示, 从基线到 8 周末血清 GDNF 水平的改善与 SCIT 组社会功能自主性 ($r = 0.32, df = 40, p = 0.038$)、财务问题 ($r = 0.44, df = 40, p = 0.004$) 两个子维度的改善显著正相关。而在 CBT 组中, FAST (包括其六个子维度) 和血清 BDNF、GDNF 水平在干预前后均未发现统计学相关性 (均 $p > 0.05$)。

结论 SCIT 干预对首发抑郁症患者总体社会功能以及职业功能、认知功能和人际关系子维度都有显著改善, 疗效优于 CBT 疗效。此外, 血清 GDNF 水平的升高与 SCIT 干预后抑郁症患者自主功能和财务功能的改善显著相关。

关键词: SCIT, CBT, 抑郁症, BDNF, GDNF

Abnormal Resting-state Functional Connectivity of Hippocampus and Amygdala in Major Depressive Disorder

Junhua Huang Gaohua Wang*

Department of Psychiatry, Renmin Hospital of Wuhan University, Wuhan, Hubei, China

Objective The present study was designed to investigate the alterations of resting-state functional connectivity concerning the hippocampus and amygdala in patients with major depressive disorder, as well as their correlations with depression severity

Methods We included 58 first-episode, drug-naïve patients with major depressive disorder and 78 age-, sex-, and education level-matched healthy controls that underwent resting-state functional MRI measurement. The hippocampus and amygdala were used as priori regions of interest to calculate seed-to-voxel connectivity. The correlations between the abnormal connectivity and the score of 17-item Hamilton Depression Scale (HAMD-17) in the patients were estimated

Results Compared to healthy controls, the patients with major depressive disorder exhibited lower functional connectivity between the left hippocampus and right precuneus. The patients also showed decreased functional connectivity between the left amygdala and right inferior frontal gyrus and superior frontal gyrus, as well as decreased functional connectivity between the right amygdala and left middle temporal gyrus. The correlations between abnormal functional connectivity of the left hippocampus and the score of HAMD-17 in the patients were significantly negative

Conclusion The abnormal resting-state functional connectivity of hippocampus and amygdala may partially explain neurobiological mechanisms of major depressive disorder and has the potential to serve as a neuroimaging diagnostic biomarker.

关键词: major depressive disorder, functional connectivity, hippocampus, amygdala

Abnormal White Matter Integrity in Patients with Depression Revealed by Automated Fiber Quantification

Sen Li¹, Yinghong Xu¹, Jian Cui², Shanling Ji¹, Hao Yu¹, Chuanxin Liu¹, Cong Zhou¹

1. Jining Medical University
2. Shandong Daizhuang Hospital

Objective This study aims to utilize diffusion tensor imaging (DTI)-based automatic fiber quantification (AFQ) technology to analyze changes in the integrity of white matter fibers in patients with major depressive disorder (MDD). Furthermore, the study seeks to employ machine learning methods, specifically support vector machines (SVM), to construct a classification model for identifying MDD from healthy controls (HC)

Methods In this study, we collected clinical and imaging data from 60 MDD patients and 52 HC. Using the AFQ method, we analyzed DTI data for all subjects, tracking 20 white matter fiber tracts and quantifying the differences in diffusion metrics across 100 nodes of each fiber tract between the groups. We then applied t-tests and the least absolute shrinkage and selection operator (LASSO) logistic regression algorithm to identify abnormal diffusion metrics. These selected metrics were further analyzed using an SVM model to identify the most significant features for distinguishing between MDD patients and HC, facilitating a machine learning classification study

Results The AFQ results indicated that, compared to the healthy control, the MDD patients exhibited reduced axial diffusivity (AD) and fractional anisotropy (FA) in the left cingulum bundle, as well as decreased AD values in the right cingulum bundle, splenium of the corpus callosum, right inferior fronto-occipital fasciculus, and left arcuate fasciculus. Based on fiber tract nodes with significant group differences as features, three types of SVM models constructed for FA, AD, and a combined FA+AD achieved satisfactory classification results. The FA+AD fusion model exhibited better predictive accuracy than the two individual metric models, with an Area Under the Curve (AUC) value of the Receiver Operating Characteristic (ROC) curve at 0.84, and the predictive accuracy reaching 0.85

Conclusion Using AFQ approach, the study identified specific regions of white matter fiber tract damage in the brains of MDD patients. The SVM method improved the accuracy of classification and prediction between MDD patients and HC, providing new

insights into the neuroimaging mechanisms of MDD and enhancing diagnostic accuracy.

外周血氧化应激标志物在抑郁症中的诊断与疗效预测研究

白羽洁 刘婉莹 张福旭 郭茜 胡昊 胡瑶 陈海莹
李冠军 刘晓华*
上海交通大学医学院附属精神卫生中心

目的 近年来抑郁症的免疫炎症假说倍受关注,其机制尚未被阐明。核因子 E2 相关因子 (Nrf2) 作为抗氧化应激与免疫炎症反应的共同转录因子,参与着抗氧化应激、抗炎、抗凋亡、神经保护等功能,可能在抑郁症发生发展及抗抑郁作用机制中起关键作用。本研究拟探讨抑郁症和以 Nrf2 为代表的氧化应激标志物之间的关系。

方法 本研究共纳入抑郁症患者 104 例,以及性别、年龄、受教育年限匹配的健康志愿者 50 名。所有患者来源于上海交通大学医学院附属精神卫生中心门诊。采用 ELISA 技术检测外周血 Nrf2、血红素氧合酶-1 (HO-1)、磷脂酶 A2 (PLA2)、环氧合酶 (COX-2)、超氧化物歧化酶 (SOD) 的水平,比较抑郁症和健康对照的氧化应激水平差异。在基线及抗抑郁药物干预的 2、4、8、12 周分别用汉密尔顿抑郁量表-17 项 (HAMD-17)、汉密尔顿焦虑量表 (HAMA)、抑郁症状 30 项问卷 (IDS-30) 评估患者组的临床症状。最后,探索氧化应激指标对抗抑郁药物治疗疗效的预测作用。

结果 相比于健康对照,抑郁症患者血浆中 Nrf2、HO-1 和 SOD 水平显著降低,PLA2、COX-2 水平显著升高 ($P < 0.001$),相关分析显示,血浆 Nrf2 和 COX-2 水平呈显著负相关 ($r = -0.236, P = 0.016$),其余指标两两均无明显相关性。将外周血氧化应激指标联合检测用于区分抑郁症和健康对照的 ROC 曲线下面积 (AUC) 为 0.930 ($P < 0.05$),灵敏度和特异度分别达到 0.83 和 0.84,具有非常高的诊断价值。与基线期相比,抑郁症患者治疗后 4 个随访时点的 HAMD-17 以及 HAMA 总分显著下降 ($P < 0.05$)。

根据 HAMD-17 减分率, 治疗 12 周 (N=98 例) 的有效率达到 74.5%, 治愈率达到 52%, 无效率为 25.5%。在外周血氧化应激指标方面, 我们发现对治疗有效的抑郁患者组基线血的 COX-2 水平明显高于治疗无效组 ($t=-2.383$, $p=0.019$)。

结论 抑郁症患者存在氧化应激和免疫炎症改变, Nrf2、HO-1 和 SOD 水平下调和 PLA2、COX-2 水平上调, 存在此消彼长的关系。血浆 COX-2 水平可能有助于预测抑郁症患者对 12 周的常规抗抑郁药物的疗效。本研究为免疫炎症与氧化应激假说提供实验依据, 也为开发可靠的抑郁症诊断与疗效预测的外周生物标记物提供了方向。

基于 CUMS 模型探讨短链脂肪酸的抗抑郁作用及对肠道菌群的影响

陈金蓉 孙宁*
山西医科大学

目的 探究短链脂肪酸 (short-chain fatty acids, SCFAs) 对慢性不可预测温和应激 (chronic unpredictable mild stress, CUMS) 大鼠抑郁行为及肠道菌群的影响。

方法 76 只雄性成年 SD 大鼠随机分为对照组 (n=10)、CUMS 组 (n=13)、乙酸钠干预组 (Acetate, n=12)、丙酸钠干预组 (Propionate, n=15)、丁酸钠干预组 (Butyrate, n=14)、短链脂肪酸干预组 (SCFAs, n=12)。除了对照组, 其他组均进行 CUMS 造模, 且在每日造模前进行干预。CUMS 组按体重 1mL/100g 腹腔注射生理盐水; Acetate 组、Propionate 组、Butyrate 组分别腹腔注射 50mg/(kg·d) 乙酸钠溶液、100mg/(kg·d) 丙酸钠溶液、50mg/(kg·d) 丁酸钠溶液; SCFAs 组腹腔注射 1: 1: 1 的乙酸钠、丙酸钠、丁酸钠混合溶液, 连续 28 天。通过糖水偏好、强迫游泳及旷场实验比较组间行为差异; 采集盲肠粪便样本, 用 16S rRNA 测序分析肠道菌群组成。

结果 与 CUMS 组相比, Butyrate 组、SCFAs 组的糖水偏好系数显著增加 ($P<0.001$, $P<0.001$), 不动时间显著缩短 ($P<0.05$, $P<0.01$), 其他组的糖水偏好系数、不动时间均无显著差异; 旷场实验

中干预组大鼠在中心区域运动时间和距离均无显著差异。在 β 多样性分析中, Control 组与 CUMS 组、干预组之间均有统计学差异; 与 CUMS 组相比, Acetate 组 ($P=0.024$)、SCFAs 组 ($P=0.005$) 有统计学差异; 我们发现了在 CUMS 组中有害菌 E-变形菌 (Epsilonproteobacteria)、螺杆菌属 (Helicobacter)、肠球菌属 (Enterococcus) 等出现富集; 在 Propionate 组中有益菌双歧杆菌属 (Bifidobacterium) 的富集, SCFAs 组中柯林斯菌属 (Collinsella) 的富集。

结论 Butyrate 及 SCFAs 干预能改善大鼠的抑郁行为, 其机制可能与改变大鼠肠道菌群组成有关。

Healthy Lifestyle and Risk of Incidence, Mortality and Life Expectancy of Mental Disorders

Shanshan Tian Gang Wang*
Beijing Anding Hospital

Objective People who adopt a healthy lifestyle have many health benefits. However, whether and to what extent a healthy lifestyle impacts on new onset of mental disorders, as well as the effect and difference in mortality and life expectancy in people without and with mental disorders is still no clear. The first aim of this cohort study was to evaluate the association between lifestyle and risk of mental disorders from UK Biobank. Our study also explored those findings on specific-diagnosis mental disorders, such as depression, anxiety, and bipolar disorder. Then, we investigated the association of lifestyle with mortality and life expectancy in people without and with mental disorders

Methods Overall, 277,875 participants were included in mental disorders incidence analysis. 277,875 without mental disorders and 50,250 with mental disorders participants at baseline were included in the mortality and life expectancy analysis. We developed a comprehensive lifestyle score by combining seven healthy lifestyle behaviors: healthy diet, regularly phys-

ical activity, no smoking, light or moderate alcohol consumption, adequate sleep duration, active social connection, and less sedentary behavior. Multivariable Cox proportional hazard models and the life table method were used to investigate the associations of lifestyle with the mental disorders incidence, mortality, and life expectancy in people without and with mental disorders

Results Our results showed that participants with healthy lifestyle pattern had a 69% (HR, 0.31; 95% CI, 0.30-0.32) lower risks of new onset of mental disorders, and specifically lower of 55%, 47% and 61% for depression (HR, 0.45; 95% CI, 0.41-0.49), anxiety (HR, 0.53; 95% CI, 0.49-0.58), and bipolar disorder (HR, 0.39; 95% CI, 0.27-0.58) respectively. The healthy lifestyle pattern had a 54% and 60% lower risks of death in participants without mental disorders (HR, 0.46; 95% CI, 0.43-0.49) and with mental disorders (HR, 0.40; 95% CI, 0.36-0.65) respectively. In addition, the healthy lifestyle levels had a longer life expectancy than those with poor lifestyle (intermediate: 9.0, healthy: 14.4) at age 40 years in participants with mental disorders, which is higher than that in participants without mental disorder (intermediate: 8.0, healthy: 11.6). The further stratification analysis of chronic disease and sensitivity analysis of men and women get the similar and robust results

Conclusion Healthy lifestyle pattern, is strongly associated with lower risk of incidence of mental disorders, depression, anxiety and bipolar disorder, lower mortality, and longer life expectancy. Our findings could help health professionals and policy makers to plan future healthcare services and needs.

Prevalence and Risk Factors for Depression in Somatic Symptom Disorder: A Large-Scale Cross-Sectional Study

Anquan Hu* Yunhui Zhong Fengkui Jin Fang Chen
The Third People' Hospital of Ganzhou

Objective The co-morbidity of somatic symptom disorder (SSD) and depression is common, yet the demographic and clinical factors correlating with depression among SSD patients remains unclear. The purpose of this study was to explore the prevalence and risk factors for depression in Chinese Han patients with SSD

Methods In this cross-sectional study, 899 outpatients diagnosed with SSD were included. Demographic data were collected, and clinical assessments were conducted, which involved blood pressure measurements and laboratory tests for thyroid-stimulating hormone (TSH), thyroid peroxidase antibody (TPOAb), anti-thyroglobulin (TGAb), free triiodothyronine (FT3), free thyroxine (FT4), fasting blood glucose, and lipid profiles. Participants were evaluated using the Patient Health Questionnaire-9 (PHQ-9), Generalized Anxiety Disorder-7 (GAD-7), Insomnia Severity Index (ISI), and the Perceived Social Support Scale (PSSS). The data was analyzed using descriptive statistics, chi-square test, non-parametric test, logistic regression, and the area under the receiver operating characteristics (AUCROC), as appropriate

Results The prevalence of depression in SSD patients was 83.6%. Compared SSD patients without depression, depression was associated with age, age of onset, duration of illness, marital status, TSH, total cholesterol (TC), triglycerides (TG), high-density lipoprotein cholesterol (HDL-C), low-density lipoprotein (LDL-C), fasting blood glucose (FBG), systolic blood pressure (SBP), diastolic blood pressure (DBP), anxiety symptoms, insomnia and levels of perceived social support (all $P < 0.05$). Further logistic regression showed that age, TC, insomnia and levels of perceived social support were correlates of depression in SSD patients (all $P < 0.01$). Insomnia had the highest AUC value of 0.908, while the combination of insomnia and levels of perceived social support had a higher AUC value of 0.926

Conclusion Our findings suggest a high prevalence of depression in SSD patients. Several factors are associated with depression in SSD patients. Insomnia is a robust predictor of depression in patients with SSD, and its predictive power is enhanced when combined with the assessment of perceived social support levels.

青少年抑郁障碍患者昼夜节律调控蛋白表达模式及其与临床症状的相关性分析

郭倩茹 刘志芬*

山西医科大学第一附属医院

目的 既往研究发现昼夜节律紊乱可能在抑郁障碍的病理学中发挥重要作用,然而两者之间的关联机制尚不清楚。本研究通过测定青少年重性抑郁障碍(Major depressive disorder, MDD)患者血浆中昼夜节律相关调控蛋白的水平,研究其与青少年MDD患者抑郁症状、睡眠状况、昼夜节律类型等临床特征之间的相关性,探讨昼夜节律相关调控蛋白在MDD诊治中的临床意义。

方法 依据纳入和排除标准,共入组192例青少年MDD患者。同时期招募103名健康青少年作为对照组。收集所有研究对象的一般人口学资料、汉密尔顿抑郁量表(HAMD24)、汉密尔顿焦虑量表(HAMA24)、匹兹堡睡眠质量指数量表(PSQI)及昼夜节律类型量表(CTI)评分,通过酶联免疫吸附法(ELISA)测定研究对象血浆样本中的9种昼夜节律相关调控蛋白水平,并于8周时进行随访。分析两组被试昼夜节律调控蛋白水平的差异,及其与临床特征之间的相关性。

结果 1.MDD组与对照组相比,性别、年龄、受教育年限和家族史比较差异有统计学意义($P<0.05$)。MDD组患者的HAMD、HAMA、PSQI、CTQ及CTI-LV得分高于对照组,CTI-FR得分较对照组低,CRY1、CRY2、ARNTL、PER1及PER2水平较低,差异有统计学意义($P<0.05$)。

2.采用受试者工作特征(ROC)曲线评估CRY1、CRY2、ARNTL、PER1、PER2联合检测在MDD中的诊断效能。结果显示ROC曲线下面积(AUC)为0.774,最佳临界值为0.31,敏感度为0.80,特异度为0.75。

3.MDD组患者的ARNTL、PER2水平与PSQI总分均呈正相关($P<0.05$),CLOCK水平与HAMA总分呈负相关($P<0.05$)。

4.多变量logistic回归分析提示血浆CRY1可能

是MDD的独立危险因素($OR=1.259$, 95%CI, 1.037-1.537; $P<0.05$),即CRY1每增加1ng/ml,个体患MDD的风险将变为原来的1.259倍。

5.MDD组患者经8周治疗后,HAMD、HAMA及PSQI总分显著下降,血浆中CLOCK、TIMELESS、ARNTL及PER1水平升高,CRY1、CRY2及CIART水平降低,差异有统计学意义($P<0.05$)。

结论 1.青少年MDD患者调整自身睡眠节律的能力下降,昼夜节律相关调控蛋白表达异常,CRY1可作为青少年MDD的重要评价指标。

2.青少年MDD患者治疗后部分昼夜节律相关调控蛋白水平升高,这一变化可能与抑郁症状及睡眠质量改善有关。未来研究可进一步探讨昼夜节律紊乱在青少年MDD中的病理机制。

首发青少年抑郁障碍患者童年创伤与精神病理及炎性细胞因子的相关性研究

张习 刘乐伟 凡豪杰 赵鑫 郝明茹 张云 刘寰忠*
安徽医科大学附属巢湖医院

目的 探讨首发青少年抑郁障碍患者童年创伤与精神病理及炎性细胞因子的相关性。

方法 本研究于2021年1月至12月招募了75名首发青少年抑郁障碍(FED)患者和76名健康对照(HCs)。采用儿童期创伤问卷(CTQ)、流调用抑郁自评量表(CES-D)、青少年自杀意念量表(PANSI)和20项多伦多述情障碍量表(TAS-20)分别评估受试者的童年创伤、抑郁、自杀意念及述情障碍症状;并采用电化学发光技术检测血浆IL-17A、IL-1 β 、IL-6和TNF- α 水平。

结果 与HCs相比,FED患者CTQ总分和各因子分、CES-D总分、PANSI总分、TAS-20总分、IL-1 β 、IL-6及TNF- α 水平均更高(均 $P<0.05$)。相关性分析显示,FED患者CTQ总分与病程、CES-D总分、PANSI总分、TAS-20总分、IL-17A、IL-1 β 水平呈正相关;情感虐待与CES-D总分、PANSI总分、TAS-20总分呈正相关;躯体虐待与病程呈正相关;性虐待与血清IL-17A、IL-1 β 、TNF- α 水平呈正相关;情感忽视与CES-D总分、PANSI总分、TAS-20总

分、IL-17A、IL-1 β 、TNF- α 水平呈正相关；躯体忽视与CES-D总分、PANSI总分、TAS-20总分、IL-1 β 、IL-6、TNF- α 水平呈正相关。多因素线性逐步回归分析显示，CTQ总分与病程($\beta=0.216$, $t=2.299$, $P=0.024$)、PANSI总分($\beta=0.509$, $t=5.418$, $P<0.001$)、IL-17A($\beta=0.252$, $t=2.681$, $P=0.009$)独立正相关；情感虐待与PANSI总分($\beta=0.448$, $t=4.281$, $P<0.001$)独立正相关；躯体虐待与病程($\beta=0.256$, $t=2.264$, $P=0.027$)独立正相关；性虐待与IL-17A水平($\beta=0.289$, $t=2.576$, $P=0.012$)独立正相关；情感忽视与PANSI总分($\beta=0.470$, $t=4.755$, $P<0.001$)、IL-17A水平($\beta=0.267$, $t=2.707$, $P=0.008$)独立正相关；躯体忽视与PANSI总分($\beta=0.263$, $t=2.258$, $P=0.027$)、IL-6水平($\beta=0.235$, $t=2.258$, $P=0.027$)独立正相关。

结论 童年创伤经历在FED中很常见，并且可能与病程、抑郁、自杀意念、述情障碍症状和炎性细胞因子升高显著相关。在临床上，应当重视FED患者童年创伤现象，积极采取早期干预措施，以改善临床症状及降低炎症水平，进而改善预后。

Agomelatine As Adjunctive Therapy with SSRIs Or SNRIs for Major Depressive Disorder: A Multicentre, Double-blind, Randomized, Placebo-controlled Trial

Yumeng Ju Wenwen Ou Mei Huang Wentao Chen Mei Liao Li Zhang Bangshan Liu Jin Liu Yan Zhang* Lingjiang Li
the Second Xiangya Hospital of Central South University

Objective Major depressive disorder is prevalent worldwide. Although antidepressant medications are the first choice for antidepressant treatment, patients often do not have adequate responses. agomelatine, as a novel antidepressant with a different mechanism of action compared to traditional antidepressants, it might have adjunctive effect when used in addition to patients' initial medication. This study aimed to investigate the

augmentation effect of agomelatine when used as adjunctive drug with selective serotonin reuptake inhibitors (SSRIs) and serotonin-noradrenaline reuptake inhibitors (SNRIs)

Methods Major depressive patients who did not demonstrate adequate response to SSRI or SNRI lasting at least 2 weeks were randomized into either agomelatine group or placebo group. Participants were instructed to take either one 25 mg capsule of agomelatine daily for two weeks followed by two 25 mg capsules of agomelatine for the subsequent six weeks (some participants remained one 25 mg capsule of agomelatine for the following six weeks), or to identical placebo. The primary outcomes were the HAMD-17 at 8 week, and secondary outcomes were HAMD-17 and HAMA at 2, 4, and 6 week, as well as the clinical remission and response. Linear mixed model for primary outcome and secondary outcome

Results A total of 123 eligible participants were involved, among which 60 participants were randomly divided into the agomelatine group, and 63 participants were randomized into the placebo group. The between group difference on HAMD-17 score reduction from baseline to Week 8 was not significant (difference -0.10, 95% CI -3.69 to 3.88, $P=0.92$; Cohen's $d=0.018$). In addition, we did not observe significant differences between two treatment conditions for response and remission rates. Adverse events in the agomelatine group did not differ from those in the placebo group

Conclusion This study did not obtain significant findings in favor of the augmentation effect of agomelatine for depression patients. As such, this remains an urgent need for evidence to support effective treatment options for depression

关键词：agomelatine; adjunctive therapy;

青少年重性抑郁发作患者非自杀性自伤及自杀与甲状腺功能和皮质醇水平的关系

杨建立* 朱嘉琦 任远莉 罗睿涵
天津医科大学总医院

目的 我们已经发现青少年重性抑郁障碍患者 (Major depressive disorder, MDD) 中存在生物学指标的异常, 并且部分患者表现出非自杀性自伤行为 (non-suicidal self-injury, NSSI) 及自杀想法和行为 (suicidal thoughts and behaviors, STBs)。然而, NSSI 行为及 STBs 与下丘脑-垂体-甲状腺 (Hypothalamic-Pituitary-thyroid, HPT) 轴和下丘脑-垂体-肾上腺 (Hypothalamic-Pituitary-Adrenal, HPA) 轴之间的关系尚不十分明确。我们旨在探讨 NSSI 行为、STBs 与这两个生物轴之间的潜在联系。

方法 采用描述性研究的方法, 对符合入组标准的首诊患者进行汉密尔顿抑郁量与汉密尔顿焦虑量表的初步评估, 然后应用渥太华自伤调查表将抑郁症患者分为存在非自杀性自伤组和不存在非自杀性自伤组, 使用哥伦比亚自杀严重程度评定量表将青少年抑郁症患者分为有自杀意念和行为组和无自杀意念和行为组。对所有患者进行甲状腺功能和皮质醇功能的测定。探索处于抑郁发作期的青少年患者甲状腺功能和皮质醇水平与非自杀性自伤行为及自杀意念和行为的关系。

结果 研究共纳入 110 名首次重性抑郁发作的青少年患者, 其中 69 名患者存在非自杀性自伤行为 (NSSI) 67 名患者存在自杀意念和行为 (STBs), 切割是最常用的方式, 下臂或腕部是最常见的部位。生物学指标方面, 三碘甲状腺原氨酸 (T3) 在有无 NSSI 组间存在显著差异, 且与 NSSI 行为呈负相关。二元 logistic 分析显示: 男性及三碘甲状腺原氨酸 (T3) 是青少年重性抑郁发作患者 NSSI 行为的保护性因素。而对于 STBs 患者, 焦虑躯体化、认知障碍、自杀意念频率和持续时间等与其临床特征相关, 皮质醇水平与 STBs 的发生呈正相关。在自杀意念和行为的预测方面, 皮质醇水平是 STBs 的独立危险因素。抑郁、焦虑严重程度在皮质醇介导的 STBs 中起中介作用。皮质醇与抑郁程度呈正相关, 而 TSH 与抑郁程度呈负相关。焦虑严重程度与皮质醇水平呈正相关。

结论 我们观察到甲状腺功能和皮质醇水平与抑郁严重程度、NSSI 和 STBs 之间存在相关性。这些生物学指标不仅可以作为 NSSI 的保护性因素, 还可以作为 STBs 的独立危险因素发挥作用。

个体化混合电休克疗法 (i-HECT) 对青年抑郁症患者的认知影响

张静雅 曾伦 李佳 谭柏坚*

惠州市第二人民医院

目的 电休克疗法 (ECT) 是快速缓解抑郁症状的最有效方法之一, 然而, 它常常伴随着急性认知副作用, 这给患者的日常生活和康复过程带来了挑战。尤其是青年抑郁症患者, 认知受损会给他们的学业和工作带来影响。为了应对这一问题, 我们团队设计了一种新的方法-混合策略 ECT (i-HECT) 疗法。该疗法结合了传统 ECT 与低电量疗法 (LCE) 以及个体化症状监测, 旨在减少认知损伤, 提高治疗的安全性。

方法 46 名青年抑郁患者 (16-25 岁) 在基线和 i-HECT 结束后接受了临床疗效和认知评估。采用蒙哥马利-阿斯伯格抑郁量表 (MADRS) 评估抑郁症状, 主观认知下降问卷 (SCD-Q) 评估主观认知, 可重复的成套神经心理状态测量 (RBANS)、和 Stroop 测试评估客观认知功能。i-HECT 疗法包含两种治疗方式: ECT 和 LCE。ECT 的电量设置为患者癫痫发作阈值 (ST) 的 1.5 倍, 而 LCE 的能量设置为 0.5 ST 以减少认知副作用。治疗前期采用传统 ECT 进行干预, 之后根据每次治疗后对患者的症状评估决定是否转换为 LCE 治疗。症状评估基于 MADRS 的总分, 标准为: MADRS 评分低于 22 分或者达到 50% 以上的减分率则转换为 LCE 治疗。

结果 接受 i-HECT 疗法的患者中, 80.4% 的患者对治疗有应答, 58.7% 的患者达到了临床缓解标准 (Hedges' $g = 3.29$)。值得注意的是, 疗程结束后以及 3 个月后的随访评估发现, 患者的主观和客观认知功能均显著改善。这表明 i-HECT 不仅能有效缓解青年抑郁症患者的抑郁症状, 也能显著改善患者的认知功能。

结论 i-HECT 疗法为青年抑郁症患者提供了一种新的治疗选择。该疗法结合了 ECT 的有效性和 LCE 的低认知副作用, 利用个体化症状监测来优化治疗过程, 从而提供了一种安全有效的抗抑郁治疗选择。通过这种创新性的治疗方法, 我们有望改善青年抑郁症患者的整体治疗体验, 减少认知损伤, 提高患者的生活质量。

The Functional Connectivity of The Somatomotor Network Mediates The Relationship Between Alexithymia and Non-suicidal Self-injury in Depressive Adolescents

Lijuan Huo¹, Shengmiao Ni¹, Yongjie Zhou²

1. Institute for Brain Research and Rehabilitation, South China Normal University

2. Shenzhen Kangning Hospital

Objective Background Non-suicidal self-injury (NSSI) manifests prevalently among adolescents with depression, posing significant public health concerns. While NSSI has been linked to heightened alexithymia—characterized by the inability to identify and describe emotions—the neurobiological underpinnings of these associations remain insufficiently understood. This study aims to elucidate the neural correlates of NSSI and alexithymia in adolescents with depression

Methods Methods This study included 233 adolescents diagnosed with major depressive disorder (MDD), from whom resting-state functional magnetic resonance images were collected. All participants completed the Toronto Alexithymia Scale (TAS) and the Functional Assessment of Self-Mutilation (FASM). We estimated functional connectivity (FC) within 17 brain sub-networks and assessed correlations between intra-network FC, TAS, and FASM. A mediation model was then developed to explore these relationships

Results TAS scores were positively correlated with the intra-network FC of somatomotor network B (SOM-B), while negatively correlated with the intra-network FC of salience network A (SAL-A), default mode network A (DMN-A), and default mode network B (DMN-B). Moreover, the presence of NSSI behavior was significantly positively correlated with intra-network FC of SOM-B, and negatively correlated with the intra-network FC of SAL-A and DMN-C. Importantly, the intra-network FC of SOM-B played a partial mediating role between alexithymia and NSSI

Conclusion Conclusion These findings

revealed that FC within the somatosensory areas influences the relationship between alexithymia and NSSI in depressed adolescents. The identified neural markers and pathways offer insights into potential therapeutic targets, emphasizing the importance of addressing emotion regulation deficits and alexithymia in the treatment of NSSI

Network Analysis of Depression and Anxiety Symptoms During Pregnancy: A Longitudinal Study Across Three Trimesters

Yilin Peng¹, Junzhe Cheng¹, Xuemei Qin¹, Zhuo Peng¹, Jintao Xiong¹, Weiguo Mao¹, Mi Wang², Hui Liang³, Li Zhang¹, Yumeng Ju¹, Jin Liu¹, Yan Yu^{1,3}, Bangshan Liu¹, Yan Zhang¹

1. Department of Psychiatry, National Clinical Research Center for Mental Disorders, and National Center for Mental Disorders, The Second Xiangya Hospital of Central South University, Changsha 410011, Hunan, China.

2. Department of Mental Health Center, Xiangya Hospital of Central South University, Changsha, Hunan 410008, China.

3. Department of Obstetrics, Shenzhen Bao'an Women's and Children's Hospital, Shenzhen, Guangdong 518100, China.

Objective With major physiological and psychological changes, pregnancy is an important and difficult period in a women's life. In the past few years, perinatal depression and anxiety symptoms have received much attention. The purpose of this research is to investigate how the symptoms of depression and anxiety change dynamically during pregnancy across the three trimesters of the pregnancy

Methods Pregnant women receiving standard medical care from January 2020 to January 2024 at Bao'an Maternal and Child Health Hospital in Shenzhen,

China, were included in this study. For the first, second and third trimesters, 44,001, 41,656 and 40,319 participants were enrolled, respectively. Depression and anxiety symptoms were assessed by Patient Health Questionnaire (PHQ-9) and Generalized Anxiety Disorder-7 (GAD-7), respectively. Network analyses were conducted to investigate the structure of depression and anxiety symptoms and mixed-effects models were used to analyze the effect of trimesters on the symptom structure

Results In the first, second and third trimesters, the detection rates of depression were 31.5%, 11.7%, and 12.3%, respectively; for anxiety, the rates were 15.9%, 8.2%, and 9.1%, respectively. Across all network models, 'PHQ-4: tired' and 'GAD-1: tension' emerged as central symptoms. According to linear mixed-effects models, the PHQ-9 and GAD-7 scores were significantly lower in the second and third trimesters compared to the first trimester. Specifically, the second trimester showed reductions of $b = -1.91$ and $b = -0.79$ (both $p < 0.001$) for PHQ-9 and GAD-7 respectively, and the third trimester showed reductions of $b = -1.82$ and $b = -0.70$ (both $p < 0.001$) compared to the first trimester

Conclusion The prevalence of depression and anxiety in pregnant women is high, especially in the first trimester. It is essential to screen pregnancy women throughout the first trimester, identify high-risk expectant mothers early on, and implement the appropriate intervention strategies. Tired and tension are the central symptoms of the depression-anxiety network and may serve as the target symptoms for alleviating the depression and anxiety during pregnancy.

Center for Mental Disorders, and National Center for Mental Disorders, The Second Xiangya Hospital of Central South University, Changsha 410011, Hunan, China.

2.Mental Health Institute of Central South University, China National Technology Institute on Mental Disorders, Hunan Technology Institute of Psychiatry, Hunan Key Laboratory of Psychiatry and Mental Health, Hunan Medical Center for Mental Health, Changsha 410011, Hunan, China.

3.Clinical Medicine Eight-Year Program, Xiangya School of Medicine, Central South University, Changsha, Hunan 41008, China.

4.Department of Obstetrics, Shenzhen Baoan Women's and Children's Hospital, Shenzhen, Guangdong 518100, China.

Objective Antenatal depression is a disabling mental disorder among pregnant women, which may induce adverse outcomes for both the mother and the offspring. Early identification and intervention of antenatal depression contribute to preventing adverse outcomes. However, few population-based studies focused on the association between social and obstetric risk factors and antenatal depression in China. The present study aimed to assess the sociodemographic and obstetric factors of antenatal depression in a large Chinese population

Methods The real-world cross-sectional survey was conducted in Shenzhen, China from 2020 to 2023. Antenatal depression was assessed using the Chinese version of the Edinburgh Postnatal Depression Scale (EPDS), with a score of ≥ 13 indicating the presence of antenatal depression. The Chi-square test and binary logistic regression were used to identify the associated factors of antenatal depression

Results Among 44220 pregnant women, the prevalence of antenatal depression was 4.4%. Age ≤ 24 years, low education levels (≤ 12 years), low or moderate economic status, with a history of mental disorders, the first trimester, primipara, unplanned pregnancy, and pregnancy without prenatal care are associated with antenatal depression among participants (all $p < 0.05$)

Conclusion This study suggested that the prevalence of antenatal depression was 4.4%. Several social

and obstetric factors were risk factors for antenatal depression. Identifying these high-risk groups early is crucial for implementing interventions and enhancing overall quality of life.

Prevalence and Risk Factors of Postpartum Depression During Late Puerperium: A Real-world Cross-sectional Study in A Developed District of South China.

Yilin Peng¹, Junzhe Cheng¹, Xuemei Qin¹, Jintao Xiong¹, Zhuo Peng¹, Weiguo Mao¹, Mi Wang², Hui Liang³, Li Zhang¹, Jin Liu¹, Yumeng Ju¹, Yan Yu³, Bangshan Liu¹, Yan Zhang¹

1.Department of Psychiatry, National Clinical Research Center for Mental Disorders, and National Center for Mental Disorders, The Second Xiangya Hospital of Central South University, Changsha 410011, Hunan, China.

2.Department of Mental Health Center, Xiangya Hospital of Central South University, Changsha, Hunan 410008, China.

3.Department of Obstetrics, Shenzhen Baoan Women's and Children's Hospital, Shenzhen, Guangdong 518100, China.

Objective Postpartum depression (PPD) seriously affects the physical and mental health of the mother and child. Yet in China, various unclear risk factors and insufficient resources restricts the screening and intervention of PPD. This study aimed to evaluate the impact of perinatal-related factors and infant outcomes on late puerperium PPD in a large population in a developed district of South China

Methods We performed a real-world cross-sectional survey with 5-8 weeks postpartum mothers getting routine medical care at Bao'an Maternal and Child Health Hospital in Shenzhen, China, between January 2020 and January 2024. We gathered information on so-

ciodemographic traits, pregnancy-related factors, delivery-related factors, infant outcomes, and feeding ways using self-reported screening questionnaires. The Edinburgh Postnatal Depression Scale (EPDS) was used to measure depression, with a score of >9 indicated the presence of depressive symptoms. The Generalized Anxiety Disorder-7 (GAD-7) was used to measure anxiety, with a score of >4 indicated the presence of anxiety symptoms. We utilized a binary logistic regression model to ascertain the predictive factors for postpartum depression by converting self-reported factors into binary variables

Results A total of 18,772 postpartum women were enrolled in this survey, among which 1,553 (8.3%) had an EPDS score >9. Age ≥ 30 years (OR = 0.69, 95% CI = 0.62-0.77), extraversion (OR = 0.73, 95% CI = 0.62-0.86), depression symptoms during pregnancy (OR = 2.80, 95% CI = 2.12-3.70), anxiety symptoms during pregnancy (OR = 2.34, 95% CI = 1.95-2.82), milk powder feeding (OR = 1.26, 95% CI = 1.13-1.40), and abnormal infant outcomes (OR = 1.25, 95% CI = 1.01-1.54) were among the factors linked to PPD in the logistic model

Conclusion Our study revealed that the prevalence of PPD during late puerperium was 8.3%. Younger age, introverted personality, anxiety and depression symptoms during pregnancy, poor baby outcomes, and milk powder feeding were the risk variables for PPD. Having a better understanding of PPD's risk factors can help medical staff monitor and treat patients more effectively

Group-based Trajectory Analysis of Antenatal Depression and Its Association with Polysocial Risk Score: A Retrospective Cohort Study

Jintao Xiong¹, Yilin Peng¹, Xuemei Qin¹, Zhuo Peng¹, Junzhe Chen¹, Weiguo Mao¹, Mi Wang², Hui Liang³, Li Zhang¹, Minxue Shen⁴, Yumeng Ju¹, Jin Liu¹, Yan Yu³,

Bangshan Liu¹, Yan Zhang¹

1.Department of Psychiatry, National Clinical Research Center for Mental Disorders, and National Center for Mental Disorders, The Second Xianava Hospital of Central South University, Chanasha 410011. Hunan, China

2.Department of Mental Health Center, Xiangya Hospital of Central South University, Changsha, Hunan 410008, China

3.Department of Obstetrics, Shenzhen Baoan Women's and Children's Hospital, Shenzhen, Guangdong 518100, China

4.Department of Social Medicine and Health Management, Xiangya School of Public Health, Central South University, Changsha, Hunan 410013, China

Objective Antenatal depression, especially moderate-to-severe depression (MSD), is associated with adverse maternal and infant health outcomes and is affected by multiple psychosocial factors. However, studies comprehensively exploring the distinct trajectories of antenatal MSD and their associations with psychosocial factors are lacking. This study aimed to investigate the trajectories of antenatal MSD based on group-based trajectory modeling (GBTM) and constructed a risk prediction model based on polysocial risk score (PsRS)

Methods A retrospective cohort study was conducted among 18,401 pregnant women in Shenzhen, China, from 2020 to 2023. Antenatal depressive symptoms were assessed using the Patient Health Questionnaire-9 (PHQ-9) at the early, middle, and late stages of pregnancy. GBTM was employed to identify distinct trajectories of depressive symptoms. PsRS was constructed based on twelve factors to analyze the polysocial risks associated with MSD. Subsequently, a logistic predictive model based on PsRS was developed to predict the risk of MSD. The predictive performance of the models was evaluated using the Receiver Operating Characteristic (ROC) curve

Results GBTM identified four distinct trajectories of antenatal depression: persistent MSD group, mild depressive group, resolving MSD group, and asymptomatic group. We constructed a PsRS for persistent MSD based on twelve factors, including income, education,

smoking, alcohol use, lacking exercise, unplanned pregnancy, a history of abortion, marital dissatisfaction, low willingness to confide, a history of mental illness, living alone, and low residential satisfaction. Significant positive associations were observed between all twelve PsRS factors and persistent MSD. We further constructed a predictive model for persistent MSD, which demonstrated good discrimination and calibration, with an AUC of 0.7534 for the testing set

Conclusion This study revealed four distinct trajectories of antenatal depression and constructed a comprehensive PsRS and a predictive model for persistent MSD. The predictive model offers a promising tool for early identification of high-risk women to guide targeted interventions to improve maternal mental health. Future research should validate the model in diverse populations and explore causal relationships through interventional studies.

中南大学湘雅二医院

目的 童年创伤发生率高，是抑郁障碍、焦虑障碍等精神障碍的公认危险因素。思维反刍作为一种适应不良的思维风格策略，与多种精神病理相关。本研究目的是探究抑郁症（Major depressive disorder, MDD）患者的童年创伤类型对思维反刍维度的影响，为对伴童年创伤、思维反刍的 MDD 患者采取针对特定创伤类型及思维反刍症状更精准有效的干预提供依据。

方法 在中南大学湘雅二医院及社区纳入 MDD 患者共 173 例，健康对照（healthy controls, HCs）81 例，其中 86 例 MDD 患者和 43 例 HCs 完成了入组 8 周后的自然随访评估。基线时童年创伤问卷（Childhood Trauma Questionnaire, CTQ）用于

自评童年创伤情况。采用反刍思维量表 (Ruminative Response Scale, RRS) 评定 MDD 患者和 HCs 的思维反刍功能。使用独立样本 t 检验、卡方检验和 Mann-Whitney U 检验比较组间差异。采取重复测量方差分析比较各组内思维反刍的变化特征。通过 Pearson 和 Spearman 相关分析探索童年创伤与思维反刍之间的关系。

结果 (1) MDD 患者中伴虐待组的 RRS 总分 ($t = 2.006, P = 0.046$)、反思维度得分 ($t = 2.579, P = 0.011$) 显著高于不伴虐待组。(2) MDD 患者中伴情感虐待 (Emotional Abuse, EA) 组及伴躯体虐待 (Physical Abuse, PA) 组的 RRS 总分 ($t = 2.304, 2.478; P = 0.022, 0.013$)、反思维度得分 ($t = 2.263, 2.900; P = 0.025, 0.004$) 和抑郁维度得分 ($t = 2.382, 2.476; P = 0.018, 0.014$) 显著高于不伴组。(3) MDD 患者沉思维度得分与 EA ($r = 0.153, P = 0.045$) 正相关。反思维度得分与 CTQ 总分 ($r = 0.180, 0.242, 0.218; P = 0.019, 0.001, 0.004$)、EA、PA 正相关。(4) MDD 组治疗 8 周后 RRS 总分及各维度得分较治疗前低 ($P < 0.001$)，伴与不伴忽视组的这种变化有显著差异 ($F = 4.404, P = 0.039$)。

结论 童年虐待显著提高思维反刍总体、反思及抑郁维度的水平。MDD 患者治疗后思维反刍水平下降，伴忽视组的反思维度水平治疗前后变化更明显。临床上应重视 MDD 患者童年创伤和思维反刍的筛查和评估。本研究也为伴童年创伤的 MDD 患者针对特定创伤类型及思维反刍维度采取更精准的干预措施提供了一定的理论依据。

抑郁症患者伴童年创伤类型数量与思维反刍维度的关系

覃雅琦 张燕*

中南大学湘雅二医院

目的 童年创伤发生率高，是抑郁障碍、焦虑障碍等精神障碍的公认危险因素。思维反刍作为一种适应不良的思维风格策略，与多种精神病理相关。本研究目的是探究抑郁症 (Major depressive disorder, MDD) 患者的伴童年创伤类型的数量与思维反刍维度的关系，为对伴童年创伤、思维反刍的 MDD 患

者采取针对特定创伤类型及思维反刍症状更精准有效的干预提供依据。

方法 在中南大学湘雅二医院及社区纳入 MDD 患者共 173 例，健康对照 (healthy controls, HCs) 81 例。童年创伤问卷 (Childhood Trauma Questionnaire, CTQ) 用于 MDD 患者和 HCs 自评童年创伤情况，采用反刍思维量表 (Ruminative Response Scale, RRS) 评定 MDD 患者和 HCs 的思维反刍功能。使用独立样本 t 检验、卡方检验和 Mann-Whitney U 检验比较组间差异。通过 Pearson 和 Spearman 相关分析探索童年创伤类型数量和思维反刍维度之间的关系。

结果 (1) 在 MDD 患者和 HCs 中，伴 2 种创伤组、伴 3 种创伤组及伴 4 种及以上组的家庭关系 ($F = 0.531, 0.716, 0.712; P = 0.025, 0.001, 0.001$) 较不伴创伤组更差。(2) MDD 患者中伴 4 种及以上创伤组较不伴创伤组、伴 1 种创伤组、伴 2 种创伤组、伴 3 种创伤组的 RRS 总分 ($F = 2.587, 2.752, 3.017$ 和 $3.046; P = 0.003, 0.010, 0.001$ 和 0.027) 更高。伴 4 种及以上组较伴 2 种创伤组的沉思维度得分更高 ($F = 0.881, P = 0.012$)。伴 4 种及以上组较不伴创伤组、伴 2 种创伤组的反思维度得分 ($F = 0.711, 0.829; P = 0.006, 0.039$) 更高。伴 4 种及以上组较不伴创伤组、伴 1 种创伤组、伴 2 种创伤组、伴 3 种创伤组的抑郁维度得分 ($F = 1.504, 1.600, 1.754$ 和 $1.771; P = 0.003, 0.007, 0.001$ 和 0.028) 更高。(3) MDD 患者伴童年创伤类型的数量 ($r = 0.173, 0.189$ 和 $0.168; P = 0.023, 0.013$ 和 0.027) 与 RRS 总分、反思维度和抑郁维度得分正相关。

结论 伴多种童年创伤类型的 MDD 患者具有更差的家庭关系及更高的思维反刍水平。伴童年创伤类型的数量与思维反刍的水平呈正相关关系。临床上应重视 MDD 患者童年创伤和思维反刍的筛查和评估。本研究也为伴童年创伤的 MDD 患者针对伴创伤类型数量及思维反刍维度采取更精准的干预措施提供了一定的理论依据。

Differences in The Effects of Electroconvulsive Therapy Combined with Antidepressants on Depression in Adolescents and Adults and Related Influencing Factors

Yahui Yang Lian Du*

The First Affiliated Hospital of Chongqing Medical University

Objective Electroconvulsive therapy (ECT) is an effective and safe treatment for adult depression. However, evidence on the efficacy and cognitive effects of ECT in adolescent patients with depression is very limited. This study aims to compare the effects of the same ECT protocol on adolescent and adult patients with depression, and to analyze the related influencing factors

Methods This study included 206 patients with depression who received a combination of antidepressant medication and electroconvulsive therapy (ECT). A prospective cohort study was conducted to follow up on these patients. The severity of depressive symptoms was assessed using the Hamilton Depression Rating Scale (HAMD) both before and after ECT treatment. Cognitive function was evaluated using the Montreal Cognitive Assessment (MoCA). The effectiveness of the treatment was measured by the reduction rate in HAMD scores, while the impact on cognitive function was assessed by the reduction rate in MoCA scores. The study compared the therapeutic effectiveness and cognitive effects of ECT between adolescent and adult patients with depression. Chi-square tests and binary logistic regression were used to analyze the related influencing factors

Results A total of 130 adolescent patients and 76 adult patients were enrolled in the study. The overall effectiveness rate of ECT for treating depression was 74.8%. However, the response rate to ECT was significantly higher in adults compared to adolescents (adults: 66/76 [86.8%] vs. adolescents: 88/130 [67.7%]; $p < 0.01$). Regression analysis revealed that, among adolescents, factors such as the number of hospitalizations ($P < 0.01$), baseline psychotic symptoms ($P < 0.05$), and MoCA cognitive-language scores ($P < 0.01$) were key determinants of treatment efficacy. Specifically, the first hospitalization, absence of psychotic symptoms at baseline, and higher MoCA-language scores were associated with

better outcomes. In contrast, no significant factors affecting treatment efficacy were found in the adult group. Regarding cognitive function, ECT led to a significant overall decline, with an overall reduction rate of 3.15%. There was no significant difference in the cognitive function reduction rates between the two groups ($P > 0.05$). Additionally, ECT significantly improved attention scores, but the increase rates did not differ significantly between the two groups ($P > 0.05$)

Conclusion The combined use of antidepressants and acute phase ECT significantly improved depressive symptoms and attention, but led to overall cognitive impairment. Although ECT is more effective for adult depression than for adolescents, the cognitive side effects are similar in both groups. Future research should focus more on the individualized characteristics of adolescent depression to predict their response to ECT at an early stage.

抑郁症中情绪干扰效应的神经机制

李东^{1,2} 李丹^{1,2} 刘瑞^{1,2} 周晶晶^{1,2} 王刚^{1,2} 杨志^{1,2}

1.首都医科大学附属北京安定医院, 国家精神疾病医学中心, 国家精神心理疾病临床医学研究中心, 精神疾病诊断与治疗北京市重点实验室, 100088

2.人脑保护高精尖创新中心, 首都医科大学, 100069

目的 注意缺陷和情绪障碍在抑郁症中是主要的临床表现, 其也是影响患者生活和社交的关键因素。注意和情绪在功能和神经基础上相互关联且相互影响, 本研究目的在于探究注意与情绪相互作用的神经机制, 及其与抑郁症状之间的关联。

方法 本研究结合 EEG 技术和情绪 stroop 任务, 设立抑郁症组(216人)和健康对照组(104人), 探究注意和情绪在不同认知加工阶段间的交互作用以及在抑郁症组和对照组间的差异。将各神经电生理指标与抑郁症实验组的汉密尔顿抑郁量表得分进行相关分析, 进一步验证所得到的神经机制结果与临床表现间的联系。

结果 在神经电生理数据中, P300 成分的波幅在健康对照组中存在显著的情绪一致性和情绪效价的交互作用, 在抑郁症组中仅发现了显著的情绪效价的主效应。此外, 抑郁症组在消极情绪的一致和不一致条件下 N400 成分的波幅差值与其汉密尔顿抑郁量表得分间存在显著的负相关。在 LPP 成分的波幅上, 无论抑郁症组还是对照组均存在显著的情绪效价主效应。

结论 相对于在健康群体中存在显著的情绪与注意的交互作用, 抑郁症群体在情绪刺激加工的晚期阶段, 情绪效价效应主导了认知加工过程, 对消极面孔有更深的认知加工, 而不受非注意情绪刺激的干扰, 即消极认知偏向。此外, 在消极条件下, 非注意情绪刺激的调节作用大小与抑郁症群体的严重程度成正相关。

3. School of Business Informatics and Mathematics, University of Mannheim
4. Shenzhen Health Development Research and Data Management center

Objective Non-suicidal self-injury (NSSI) among adolescents is a considerable and widespread concern in public health. However, whether sex differences exist in influencing NSSI remains largely unexplored, resulting in ambiguous and even contradictory findings. This study aims to identify the contributing factors and sex differences that impact NSSI in adolescents with Major Depressive Disorders (MDD)

Methods 2343 Chinese adolescents (22.1% male; mean age = 14.99, SD = 1.65) participated in this study

to complete self-report surveys. Cross-sectional data was evaluated with a random forest model and interpreted with the Shapley Additive Explanations method. The models exhibited strong performance (male accuracy=70%, female accuracy=69%)

Results The results indicate that factors related to depression, self-esteem, and family support were identified as crucial in predicting NSSI for both sexes. Sleep quality (male ranking=3, female ranking=14), emotional abuse (male ranking=6, female ranking=33), in a relationship (male ranking=7, female ranking=18) and residence (male ranking=11, female ranking=21) emerged as significantly more important for male adolescents in predicting NSSI. For female adolescents, age (female ranking=3, male ranking=17), attack on property (female ranking=5, male ranking=18), drink (female ranking=6, male ranking=21) and BMI (female ranking=10, male ranking=15) were found to be significant factors. Furthermore, the analysis revealed that more significant other support was positively associated with NSSI behavior in male

Conclusion These findings provide valuable insights into tailoring prevention strategies based on gender-specific risk factors for NSSI behavior. Our research can contribute to early detection, preventive intervention and intensive monitoring

Objective Extensive research, predominantly in adults, has highlighted structural brain variations among patients with major depressive disorder (MDD). However, emerging adults, who undergo significant cortical reshaping and are highly vulnerable to depression, receive relatively little attention, despite reporting a higher prevalence of childhood trauma experiences. This study examines cortical volume (CV) and surface area (SA) in emerging adults with first-episode, treatment-naïve MDD, with the objective of investigating their association with childhood trauma

Methods This study included eighty-six emerging adults, aged 18 to 25, experiencing their first episode of depression and who had not received prior treatment, along with eighty-one age- and gender-matched healthy controls (HCs), underwent T1-MRI scans. The data underwent preprocessing through FreeSurfer. Subsequently, individual subjects' data were mapped onto the standardized fsaverage brain template, characterized by 163,842 vertices. A 10-mm full-width at half-maximum (FWHM) Gaussian kernel was applied to smooth CV and SA. Differences in CV and SA between the groups were assessed at each vertex using generalized linear models (GLM), controlling for age, education, and intracranial volume as covariates unrelated to the primary investigation. To adjust for multiple comparisons, non-parametric permutation testing was utilized, setting a cluster-forming threshold at $p < 0.001$ with 1000 permutations. Clusters achieving a corrected cluster-wise p -value (CWP) < 0.05 were identified as exhibiting significant differences. For regions showing significant clusters, average measurements within each identified cluster were extracted to facilitate further analysis correlating these morphometric findings with clinical features and children trauma

Results This study revealed that 65.1% of emerging adults with MDD had experienced childhood trauma. Compared to healthy controls, individuals with MDD exhibited reduced surface area in the right caudal middle frontal region (cluster size = 528.12mm^2 , CWP = 0.0278). and decreased cortical volume in the right

precentral volume (cluster size = 411.13mm^2 , CWP = 0.0010). However, correlations between cortical measures and clinical features such as depressive and anxious symptoms or illness duration did not reach statistical significance. Notably, a negative correlation was observed between cortical area in the right caudal middle frontal region and experiences of sexual abuse ($p=0.025$, $r=-2.47$). However, this relationship did not survive correction for multiple comparisons

Conclusion The findings suggest that abnormal cortical development in emerging adults experiencing their first episode of depression may serve as a predisposing factor for depressive disorder, independent of clinical symptomatology. Moreover, these cortical abnormalities may be associated with experiences of childhood trauma.

Optimizing SSRI Dose Adjustment in Major Depressive Disorder Treatment: Insights From Clinical Practice

Yanjie Zhao Linghui Meng* Tong Guo
Beijing Anding Hospital, Capital Medical University

Objective This study aimed to explore the optimal time for dose adjustment of SSRI in antidepressive treatment, and to investigate which population were most likely to benefit from various dose-adjustment strategies

Methods This study included 490 patients diagnosed with MDD by the Diagnostic and Statistical Manual of Mental Disorders 5th edition (DSM-5) and receiving citalopram or escitalopram for antidepressive treatment for at least 12 weeks. All participants were 16 years older, had a Hamilton Depression Scale 17 items (HAMD-17) score of 17 or greater at baseline and provided written informed consents. Participants were considered as remission if the HAMD-17 score reached 7

or lower after 12-week treatment. A decision tree on remission was established using age, sex, HAMD-17 score at baseline, initial dose, 2-week and 4-week doses as features. Of all the participants, 390 were randomly selected as the training set and the rest 100 were used as the test set

Results For patients older than 50, quickly titration of the dose higher than 12.5mg at week 2 and remaining the dose higher than 7.5 mg at week 4 could maximize the likelihood of achieving remission. For patients younger than 50, dose adjustment method did not have a significant impact on antidepressant efficacy, but sex and symptom severity at baseline had a greater impact on efficacy. For those with severer depressive symptoms at baseline, treatment outcomes were better for male than for women. The accuracy of prediction was 0.66 in test set

Conclusion Patients older than 50 were most likely to benefit from a quick dose titration at week 2 and remaining dose higher than 7.5mg at week 4. Larger sample size and more comprehensive considerations such as including body weight could help improve the predictive performance of this model.

青少年抑郁障碍患者产生持续性自杀意念的心理社会因素——一项前瞻性研究

张云 刘乐伟 凡豪杰 张习 刘寰忠*
安徽医科大学附属巢湖医院

目的 青少年抑郁障碍的患病率不断上升,并伴随着高自杀率、高自残率等特征,已成为主要的公共卫生问题。自杀意念在抑郁障碍患者中很常见,是预测自杀行为的关键因素,但现有对持续性自杀意念的研究较少。本研究旨在评估自杀意念的纵向发展过程并确定持续性自杀意念的心理社会因素。

方法 本研究共纳入 150 名青少年抑郁障碍患者,在基线时收集一般资料,采用儿童期创伤问卷(Childhood Trauma Questionnaire, CTQ)、流调用抑

郁自评量表(the center for epidemiological study depression scale, CES-D)、多伦多述情障碍量表(Toronto Alexithymia Scale, TAS)评估童年创伤、抑郁症状和述情障碍,并进行自杀意念的评估。根据基线有无自杀意念将患者分为基线有自杀意念组和基线无自杀意念组,在一年后进行随访,再次评估有无自杀意念。使用 SPSS 26.0 对数据进行统计分析,应用二元逻辑回归(n=122)分析持续性自杀意念的独立危险因素。

结果 基线时,有 58 名患者存在自杀意念,一年后随访发现有 24 名患者存在持续性自杀意念(占基线有自杀意念组的 41.4%, 占总样本的 19.67%)。有持续性自杀意念的患者是独生子女比率($t=-2.426$, $P=0.015$)、伴有非自杀性自伤比率($t=-2.029$, $P=0.042$)、CES-D(人际关系)因子分($t=-2.102$, $P=0.04$)、TAS 总分($t=-2.339$, $P=0.023$)、TAS(情感辨别不能)因子分($t=-2.185$, $P=0.033$)高于无持续性自杀意念患者,其中独生子女[OR=3.969, 95%CI:1.227~12.839, $P=0.021$]、TAS 总分[OR=1.091, 95%CI:1.006~1.184, $P=0.035$]、TAS(情感辨别不能)[OR=1.134, 95%CI:1~1.287, $P=0.05$]是产生持续性自杀意念的心理社会因素。

结论 在有持续性自杀意念的青少年抑郁障碍患者中,独生子女、述情障碍以及情感辨别不能是产生持续性自杀意念的心理社会因素。因此,针对家庭结构和述情的干预措施对于预防青少年抑郁障碍患者的持续性自杀意念尤为重要。

心率变异性的昼夜节律模式与抑郁障碍患者临床症状的相关性

夏叶 张函 王紫薇 樊静静 杨渊*
华中科技大学附属同济医院

目的 抑郁障碍可引起心率变异性(Heart rate variability, HRV)水平的下降。本研究旨在探索抑郁障碍患者 HRV 的昼夜节律模式,以及抑郁症状与 HRV 昼夜节律的相关性。

方法 在同济医院焦虑抑郁专科门诊,纳入符合 DSM-V 抑郁障碍诊断标准且既往未曾服用抗抑

郁药或在近 6 个月内未曾服用抗抑郁药物的抑郁障碍患者 167 名,同时纳入健康对照受试者 60 名。收集受试者的一般人口学资料、24 小时长程动态心电图和心理学量表。使用 MATLAB 2023a 将每个受试者的每 5 分钟 RR 间期的 HRV 指数分别拟合成一个余弦周期回归模型,并从余弦曲线中提取出三个特征参数,包括中线平均值(Midline Estimating Statistic OF Rhythm, M)、振幅(Amplitude, A)和顶峰时间(Acrophase, θ)。采用 SPSS 25.0 进行 Mann-Whitney U 检验比较抑郁障碍与健康对照受试者的 HRV 昼夜节律,并进行多元线性回归分析分别评估抑郁、焦虑、躯体症状和失眠与 HRV 各指数(SDNN、SDANN、RMSSD、pNN50、LF、HF、LF/HF)昼夜节律特征(M、A、 θ)的相关性,以 $P < 0.05$ 认为差异具有统计学意义。

结果 162 名抑郁障碍患者和 58 名健康对照受试者的动态心电图数据被认为完整有效,纳入到研究分析中。1)抑郁障碍与健康对照受试者在 SDNN($z = -3.539, P < 0.001$)、RMSSD($z = -3.808, P < 0.001$)、pNN50($z = -3.921, P < 0.001$)、LF($z = -2.827, P = 0.005$)和 HF($z = -2.438, P = 0.015$)的参数 M, RMSSD($z = -2.245, P = 0.025$)、pNN50($z = -2.222, P = 0.026$)和 HF($z = -1.993, P = 0.046$)的参数 A 上存在显著性差异。2)在校正了性别、年龄、BMI、吸烟饮酒史和慢性疾病史等混杂因素后发现, RMSSD($\beta = 0.187, P = 0.028$)、pNN50($\beta = 0.173, P = 0.042$)、HF($\beta = 0.229, P = 0.006$)的参数 M 与抑郁严重程度呈正相关,SDANN 的参数 A 与抑郁严重程度呈负相关($\beta = -0.187, P = 0.024$)。3) pNN50 的参数 A 与抑郁障碍患者的躯体症状严重程度呈负相关($\beta = -0.187, P = 0.026$)。

结论 抑郁症状与抑郁障碍患者 HRV 昼夜节律的特征存在显著相关性,HRV 昼夜节律可在一定程度上反应抑郁的严重程度,可能是抑郁障碍患者长期自主神经功能波动变化的敏感生物标志物。

光照辅助氟西汀治疗女性重性抑郁障碍的临床疗效

张宇琦*

湖南省脑科医院

目的 探究光照辅助氟西汀治疗重性抑郁障碍患者在情绪、睡眠及认知功能方面的临床疗效,为光照治疗在重性抑郁障碍患者中的应用提供研究数据。

方法 本研究纳入 2021 年 10 月至 2023 年 12 月在湖南省脑科医院(湖南省第二人民医院)门诊就医的女性重性抑郁障碍患者 57 例,对照组(单药氟西汀治疗)27 例,实验组(光照辅助氟西汀治疗)30 例。对患者进行持续 2 周的干预治疗,对照组服用单药氟西汀治疗(前 3 天 20mg/天,第 4 天起 40mg/天);实验组的药物治疗同对照组,并于每日清晨 7:00-9:00 进行光照治疗。基线期、1 周末、2 周末三个时间节点,使用病例报告表、汉密尔顿抑郁量表-24 项(Hamilton depression scale-24, HAMD-24)、匹兹堡睡眠质量指数量表(Pittsburgh sleep quality index, PSQI)、药物副作用量表(Treatment emergent symptom scale, TESS)收集患者的一般信息资料及评估抑郁症状、睡眠情况、治疗副作用,在基线期及 2 周末利用 THINC 成套工具(Thinc-integrated tool, THINC-IT)评估认知功能。

结果 1.基线期,两组的年龄、HAMD 评分、PSQI 评分、入睡时间、睡眠时长、THINC-IT 评分均无显著性差异($P > 0.05$)。

2.治疗 1 周后,实验组与对照组的抑郁症状均得到改善,且两者间差异具有显著性($t = -3.42, P < 0.001$);治疗 2 周末时,两组患者的 HAMD 评分较基线期均得到大幅度下降,差异具有显著性($P < 0.001$)。

3.实验组与对照组经过 2 周治疗后,PSQI 评分与基线期相比,其差异均有显著性差异($P < 0.001$);实验组的入睡时间及睡眠时长均优于对照组($P < 0.05$);并在 1 周末,实验组 PSQI 评分与对照组间具有统计学差异($t = -2.93, P < 0.05$)。

4.治疗 2 周后,实验组的数字符号替代测试、连线测试 B 与基线期相比,其差异均具有显著性差异($P < 0.05$),对照组的认知损害 5 项问卷及替代测试与基线期相比均具有显著性差异($P < 0.05$)。

结论 1.光照辅助氟西汀治疗可以加速缓解 MDD 患者的抑郁情绪、缩短入睡时间、延长睡眠总时长,在 1 周时即可显现出较好的治疗效果。

2.光照辅助氟西汀治疗可以有效改善警觉性、反应速度、工作记忆及执行功能等认知功能。

基线期镜像体素同伦连接特征对 SSRI 类抗抑郁剂疗效预测作用的研究

李薇娣* 幸然 罗阳 王志仁
北京回龙观医院

目的 既往关于神经脑影像学研究表明, 抑郁症的发生、发展与转归与大脑重要脑区的功能调节有关。基线期的脑功能特征可能与后期临床症状改善的神经病理学机制密切相关。本研究旨在比较不同疗效的抑郁症患者的基线期镜像同伦功能连接, 探索其在临床症状改善中的机制。基于基线期镜像体素同伦功能连接特征与药物疗效的相关性, 进一步探讨其对 SSRI 抗抑郁剂疗效的预测效能。

方法 采用纵向的随访研究设计。依据 DSM-IV 诊断标准入组首发抑郁症患者, 对所有受试者进行基线期静息态功能性磁共振成像扫描, 并于 8 周急性期 SSRI 抗抑郁药物治疗, 采用 17 项汉密尔顿抑郁量表 (HAMD-17) 进行疗效评估。基于药物治疗 8 周后的 HAMD-17 评分, 将研究对象分为临床治愈组 (HAMD-17 评分 \leq 7 分) 和临床未治愈组 (HAMD-17 评分 $>$ 7 分)。比较两组间的基线期镜像同伦功能连接, 分析其与后期临床症状改善之间的关系。基于基线期的镜像体素同伦功能连接特征对急性期治疗 8 周后的抗抑郁剂疗效进行预测研究。采用 ROC 分析, 检验基线期镜像同伦功能连接特征对抗抑郁剂疗效的预测效能。

结果 共纳入 56 例首发抑郁症患者。研究发现不同疗效的首发抑郁症患者存在基线期镜像同伦功能连接的差异 (GRF 校正, 体素水平 $P<0.01$, 团块水平 $P<0.05$); 与临床治愈组 ($n=29$) 相比, 临床未治愈组 ($n=27$) 在双侧后扣带回/舌回/距状皮层的基线期镜像体素同伦功能连接增强 ($t=4.83$)。ROC 分析提示后扣带回/舌回/距状皮层的镜像同伦功能连接特征区分临床治愈组与临床未治愈的预测效能曲线下面积 $=0.858$, $P<0.001$, 95% CI $=0.761-0.955$, 灵敏度为 81.5%, 特异性为 82.8%。

结论 1. 静息状态下, 不同疗效的首发抑郁症患者存在基线期的脑功能差异。与疗效好的患者相比, 疗效差的患者双侧大脑半球后扣带回/楔前叶/舌

回/距状皮层的镜像体素同伦功能连接增强, 基于基线期镜像体素同伦功能连接的脑功能特征可能成为对治疗结局具有预测作用的潜在工具。2. 首发抑郁症患者双侧后扣带回/楔前叶/舌回/距状皮层的基线期镜像同伦功能连接与 SSRI 抗抑郁剂疗效相关, 功能连接增强可能预示着 SSRI 抗抑郁剂疗效不佳, 提示可能是抑郁症急性期疗效预测的生物学指标。

Abnormal Microbiota-SCFAs-immune Network in Major Depressive Disorder: A Combined Cross-sectional and Longitudinal Study

Mingxue Gao Ning Sun* Penghong Liu Chunxia Yang Kerang Zhang
Department of Psychiatry, First Hospital of Shanxi Medical University

Objective Major depressive disorder (MDD) is a chronic mental illness that poses a serious threat to human health characterized by persistent low mood, with high morbidity and disability rates. Many theories have been developed to explain the pathogenesis of MDD, but none of these theories has been universally accepted. There is robust evidence that MDD is accompanied by activation of the immune-inflammatory response. However, the cause of long-term immune activation in MDD remains unclear. There is growing evidence indicating that the gut microbiota might affect systemic inflammation and central neuroimmune function, with short-chain fatty acids (SCFAs) being candidate mediators of these effects. The present study is to explore the possible role of gut microbiota in immune activation of MDD

Methods We performed an integrative analysis of intestinal microbiota, plasma SCFAs, and plasma inflammatory cytokines in 82 MDD patients and 91 healthy controls through combining a cross-sectional and longitudinal study. Moreover, we sought to identify a discriminative microbial, immune and metabolic panel that could distinguish MDD from HCs, then fur-

ther validate the diagnostic performance of this gut microbiome, plasma immune and metabolism signature using discovery and validation set samples, respectively

Results We demonstrated that significant differences in intestinal microbiota, SCFAs and inflammatory cytokine levels in MDD patients compared with HCs through combining a cross-sectional and longitudinal study. Moreover, pro-inflammatory cytokines (IL-6 and hs-CRP) were found to be increased, while anti-inflammatory cytokine (IL-10) was decreased in MDD. Pro-inflammatory cytokines (IL-1 β) decreased after antidepressant treatment. There were 22 bacteria taxa and 15 bacteria taxa significantly decreased and increased, respectively, in MDD. Genus Faecalibacterium and Oscillospira were increased after antidepressant treatment. Three major SCFAs (acetic acid, propionic acid and butyric acid) were found to be significantly decreased in MDD compared to healthy controls. The concentration of butyric acid was significantly increased after antidepressant treatment. We revealed that SCFAs were significantly correlated with altered gut microbiota and inflammatory cytokines, and intestinal microbiota may influence immune responses by regulating host metabolic processes. Furthermore, we identified and independently validated a combinatorial marker panel that could distinguish MDD from HC subjects with high accuracy

Conclusion Our results indicated aberrant gut-SCFAs-immune network in MDD and gut microbiota may influence immune responses by regulating the levels of SCFAs.

基于语音特征和 LDA 主题模型联合分析的抑郁倾向言语模式研究

黄恋 罗禹* 谭江 张继元
贵州师范大学

目的 近年来, 抑郁症已成为全球范围内的重

大公共卫生问题, 影响了数百万人的生活质量。传统的抑郁症诊断主要依赖于临床访谈和自评量表, 但这些方法存在一定的主观性和局限性。因此, 寻找一种客观、有效的抑郁症识别方法显得尤为重要。语音作为一种自然且高频的交流方式, 包含了丰富的情感和心理状态信息, 成为近年来研究者关注的焦点。通过分析语音特征, 可以捕捉到情感变化和心理健康状态的细微差别, 从而为抑郁症的早期识别提供一种新的可能性。本研究旨在探索声学特征在抑郁症识别中的有效性, 揭示其声学特征与抑郁测评分数之间的关系, 应用 LDA 主题模型分析抑郁症患者的语言模式, 从而进一步理解抑郁倾向者的语言特征。

方法 本研究共收集了 122 名参与者在阅读词汇, 短文, 情绪面孔图片描述, 访谈时的语音数据, 同时收集了他们的抑郁测评分数。根据抑郁分数将参与者分为抑郁高分组 (36 人) 和低分组 (37 人)。基于 opensmile 工具包共提取了包括梅尔频谱, 梅尔倒谱系数 (MFCC) 基频在内的 6552 个语音特征, 并分析这些特征与抑郁测评分数的相关性, 然后对高低分组之间的语音特征进行了差异检验。基于这些差异特征, 进行了主成分分析 (PCA), 并与抑郁测评分数进行了线性回归分析, 最后, 将语音数据转换为文本数据, 基于 LDA 主题模型提取了 10 个主题, 并分析了各主题下的特征词汇, 揭示了抑郁高分组 and 低分组之间的独特语言模式。

结果 语音特征相关分析中, 发现抑郁高分组有 139 个语音特征存在显著相关性 ($p < 0.05$), 低分组有 242 个语音特征存在显著相关性 ($p < 0.05$); 语音特征差异分析中, 两组比较得到 205 个语音特征存在统计学差异显著 ($p < 0.05$); 主成分分析识别得出 33 个主成分, 其中主成分 1 ($r=0.326, p<0.01$), 主成分 11 ($r=0.198, p<0.05$), 主成分 12 ($r=-0.28, p<0.01$), 主成分 29 ($r=0.243, p<0.01$) 与抑郁倾向相关; 线性回归结果显示这些主成了解释了 57.78% 的抑郁测评分数的变异; 将语音数据转换为文本数据后, 基于 LDA 主题模型的词云, 词频分析共提取了 10 个主题, 每个主题下都有不同的特征词汇, 抑郁高分组和低分组之间的语言模式存在显著差异, 这些差异能够反映出抑郁症患者独特的语言表达方式。

结论 本研究通过对多任务情绪刺激下的语音特征进行系统分析, 验证了语音特征在抑郁症识别中的有效性。高低分组之间显著差异的语音特征以

及通过主成分分析得出的主成分能够有效解释抑郁测评分数的变异。此外, LDA 主题模型揭示了抑郁症患者独特的语言模式, 为抑郁症的识别和干预提供了新的视角和方法。

A Network Analysis of Pregnancy Anxiety Symptoms in The Early Stages: A Comparison of Persistent Anxiety and Late Remission Groups

Yilin Peng¹, Jintao Xiong¹, Weiguo Mao¹, Hui Liang², Mi Wang³, Yan Yu², Bangshan Liu¹

1.Department of Psychiatry, National Clinical Research Center for Mental Disorders, and National Center for Mental Disorders, The Second Xiangya Hospital of Central South University, Changsha 410011, Hunan, China.

2.Department of Obstetrics, Shenzhen Baoan Women's and Children's Hospital, Shenzhen, Guangdong 518100, China.

3.Department of Mental Health Center, Xiangya Hospital of Central South University, Changsha, Hunan 410008, China.

Objective Pregnancy is a special time for women, when psychological problems like anxiety are prevalent. Early pregnancy is when anxiety symptoms are more common, but it's unclear if these symptoms will last into the middle or late stages of pregnancy. We aimed to retrospectively compare the differences in the network structure of anxiety symptoms during early pregnancy between mothers in the persistent anxiety group and those in the remission group. Identifying the structural and dynamic characteristics of the anxiety network can provide new theoretical perspectives and measurable indicators for predicting the occurrence and evolution of anxiety disorders

Methods We performed a real-world cross-sectional survey with mothers getting routine medical care

at Bao'an Maternal and Child Health Hospital in Shenzhen, China, between January 2020 and January 2024. We measured anxiety using the Generalized Anxiety Disorder-7 (GAD-7), with a score of >4 indicating the presence of anxiety symptoms. We investigated the central symptoms of anxiety using network analysis. A Network Comparison Test was employed to compare the global strength and network structure differences between two groups

Results A total of 23,212 mothers were enrolled in this survey, among which 1,689 (7.3%) had persistent GAD scores > 4 and 2,334 (10.1%) had anxiety symptoms only in the early stages. The network had excellent stability and accuracy. The central symptom in the persistent group was "GAD-4: Unable to relax," while in the remission group it was "GAD-2: Worry." In the early stages, there was no significant difference in scores or network structure between the two groups, but the global strength of the persistent group was higher than that of the remission group ($t = 0.27, P = 0.003$)

Conclusion The persistent group exhibited a more densely connected network at baseline than the remission group. More pronounced associations between symptoms may be an important determinant of persistence in anxiety

关键词: pregnancy, anxiety, GAD, network analysis

Psychosocial Functioning and Its Influencing Factors in Patients with Depression Post-Remission: Implications for Assessment and Interventions

Hao Yang Hui Ma Ning Zhang*

The Affiliated Brain Hospital of Nanjing Medical University

Objective Enhancing psychosocial functioning is crucial for reducing relapse in depression, but methods for monitoring and recovery remain unclear

Methods A one-year follow-up study assessed psychosocial functioning in 182 patients with remitted depression at baseline (T0) and at 1, 2, 6, 9, and 12

months post-remission (T1-T5). Using Generalized Estimating Equations (GEE) and Multiple Linear Regression (MLR), we analyzed the impact of psychosocial functioning changes on relapse/recurrence risk and assessed the influence of various factors

Results An increase in psychosocial functioning significantly lowered relapse/recurrence odds by 54.2%, averaging a 3.1% risk reduction. GEE indicated residual symptoms ($\beta=-0.315$) most significantly impacted psychosocial functioning, followed by social support ($\beta=0.236$), positive coping ($\beta=0.225$), and negative automatic thoughts ($\beta=-0.183$). Negative coping and expressed emotion had minimal effects. MLR revealed that while the impact of negative automatic thoughts was most significant at initial remission, the relative importance of residual symptoms, positive coping, and social support on psychosocial functioning remained stable over time

Conclusion Recovery of psychosocial functioning significantly reduces relapse risk in post-remission depression patients more than residual symptoms. The degree of influence of factors on psychosocial functioning can change with the length of remission time

关键词 : Depression; remission; psychosocial functioning; residual subjective depressive symptom; psychosocial factors;

Study of The Efficacy of Berberine Add-on Therapy on Depressive Symptoms in Depressed Patients: A Randomised, Double-blind, Placebo-controlled Clinical Trial

Weiwei Meng Ruihua Ma Huihui Yang Chunlei Wu Runan Du Yunhui Ma Zhiren Wang*
Peking University Huilongguan Clinical Medical School

Objective Berberine (BBR) is a pentacyclic isoquinoline alkaloid extracted from a variety of natural medicinal plants, including *Coptis chinensis*, *Phellodendron amurense* and *Rheum palmatum*. It has been demonstrated to be effective in improving depressive

behaviour in animals in animal studies. The objective of this study was to assess the potential of BBR to improve depressive symptoms and evaluate its safety in clinical application in depressed patients

Methods In a double-blind, randomised, placebo-controlled clinical trial, 78 patients with depression were randomly assigned to either the BBR group ($n=39$) or the placebo group ($n=39$) for an 8-week period of combined conventional antidepressant medication. The Hamilton Depression Scale (HAMD-17) was employed to assess the severity of depressive symptoms in patients at baseline, 2-week, 4-week, 6-week, and 8-week. Additionally, Treatment Emergent Symptom Scale (TESS) was utilised to evaluate the safety of the intervention at baseline, 4-week, and 8-week

Results A total of 68 patients completed the trial. Compared to the Placebo group, the BBR group showed significant changes in scores at all weeks relative to baseline (9.38 ± 5.13 vs 6.00 ± 3.44 , $P=0.009$; 12.71 ± 5.17 vs 9.50 ± 6.63 , $P=0.049$; 15.62 ± 5.05 vs 10.62 ± 7.25 , $P<0.001$; 16.29 ± 5.04 vs 11.65 ± 6.99 , $P=0.002$). The analysis showed a significant difference in HAMD-17 total score between the BBR and Placebo groups at 6 and 8 weeks scores ($P<0.05$). Relative to Placebo, there was a significant increase in response rate at 6 weeks with BBR (OR=5.78 95%CI 1.42-23.50, $P=0.014$); and a significant increase in remission rate at 2 and 8 weeks (OR=6.17 95%CI 1.14-33.56, $P=0.035$; OR=6.25 95%CI 1.65-23.66, $P=0.007$). Early remission rate was also significantly increased (OR=7.2 95%CI 1.15-44.95, $P=0.035$). Patients in the BBR group had a significantly shorter response time (3.82 ± 0.27 vs 4.82 ± 0.36 ; Long Rank $P=0.013$). In addition, there were no significant differences between the two groups in baseline demographic characteristics, medication use, or other side effects, except for BMI, dizziness, or syncope

Conclusion The use of BBR as an add-on therapy may be an effective and safe method of improving depressive symptoms in patients with depression, resulting in higher clinical benefits over a shorter treatment period for patients. However, further studies with larger sample sizes are required to confirm the reliability of these results

青少年抑郁症患者中非自杀性自伤行为及其成瘾性、不同功能相关的大尺度脑网络

刘轩 张文新 王康程*
山东师范大学

目的 非自杀性自伤(Non-suicidal self-injury, NSSI)是儿童和青少年中普遍存在的高危风险行为。它在学龄早期出现,青春期显著增长,并持续到成年早期。此外,它在多种精神疾病中均有发生。精神疾病涉及脑功能网络的广泛失调,包括额顶叶网络、边缘网络和基底神经节网络等。鉴于 NSSI 是各种精神疾病中普遍伴随的成瘾问题行为,那么有必要探索 NSSI 行为伴随的脑功能网络改变。此外, NSSI 行为具有内外部情绪调节等功能,因此有必要继续探索 NSSI 不同功能的独特脑网络改变。因此,本文从大尺度脑功能网络的视角,在抑郁症青少年群体中探究 NSSI 行为、NSSI 成瘾性及其不同功能相关的脑网络机制,进一步揭示 NSSI 行为关联的神经网络靶点。

方法 本研究共纳入来自山东省抑郁症青少年神经影像学项目的 156 名参与者。其中伴有 NSSI 的重度抑郁症(Major depressive disorder, MDD)患者 44 例(MDD+NSSI 组),无 NSSI 的重度抑郁症(MDD-NSSI 组)32 例,健康对照组 80 例。采用渥太华自伤量表对青少年 NSSI 行为进行测量。使用支持向量机递归特征消除模型分类以及回归模型来探究与 NSSI 相关的大尺度脑网络,并随后探究了与 NSSI 成瘾性及其四个功能(内部情绪调节、社交影响、外部情绪调节、寻求刺激)相关的脑网络。

结果 与 NSSI 行为相关的脑网络由 60 条边构成,主要是额顶叶网络与边缘系统网络、基底神经节网络、运动网络、视觉关联网络、视觉 I 区网络、小脑网络之间的网络间连接。NSSI 成瘾性、内部情绪调节、社交影响、外部情绪调节以及寻求刺激相关的脑网络由额顶叶、边缘系统、运动和基底神经节网络与其他网络之间特定的连接模式构成。这些结果在外部数据集中得到了两次验证,包含在主要

结果中的部分连接——额顶叶网络、基底神经节网络、运动网络和边缘网络与其他网络的网络间连接在跨诊断与 ADHD 队列中能显著预测 NSSI 的严重程度。

结论 额顶叶、边缘系统、运动和基底神经节网络之间特定的连接模式构成了相应 NSSI 行为以及其成瘾性、内部情绪调节、社交影响、外部情绪调节和寻求刺激相关的脑网络。表明了 NSSI 患者存在着执行控制、情绪调节以及奖赏功能的整体性失调。在 NSSI 成瘾性及其四个功能相关的脑网络中,额顶叶网络以及边缘系统网络表现出了一致的高度参与,表明了执行控制功能以及情绪调节功能的异常可能是 NSSI 患者的核心功能损伤。

SLC6A4、5-HTR2A 基因多态性对艾司西酞普兰疗效的影响及相关因素的研究

闫 张玲*
首都医科大学附属北京安定医院

背景 既往研究发现溶质载体家族 6 成员 4 (SLC6A4)、5-羟色胺 2A 受体 (5-HTR2A) 部分基因多态性与艾司西酞普兰疗效相关,如 SLC6A4 启动子区域 (5-HTTLPR) L 等位基因携带者、5-HTR2Ars9316233 C 等位基因携带者抗抑郁疗效可能较好,较多实验室在 PGx 报告中根据上述基因多态性预测艾司西酞普兰疗效,但临床中常发现实际疗效与基因预测结果不一致。

目的 探讨 5-HTTLPR、5-HTR2A 基因多态性对艾司西酞普兰疗效的影响及相关因素。

方法 采用前瞻性队列研究设计,纳入服用艾司西酞普兰的急性期抑郁症患者,基线期 PGx 检测获取 5-HTTLPR、5-HTR2A rs9316233 基因型信息,收集一般人口学资料及病史信息,在基线期及 8 周末进行访视,利用 HAMD-17 评估疗效,并进行 8 周末血药浓度监测(therapeutic drug monitoring, TDM)。8 周末 HAMD-17 总分较基线降低 $\geq 50\%$ 为有效。使用 SPSS 23 软件进行统计分析,采用 t 检验或 χ^2 检验进行单因素比较,采用多因素 Logistic 回归分析探索基因型对疗效的影响。

结果 (1) 纳入 88 例患者, 74 例完成随访。(2) 8 周末达有效患者 55 例 (74.3%), 无效 19 例 (25.7%), 有效组与无效组在性别、家族史、是否为首发、基线 HAMD-17 总分方面差异均无统计学意义 (均 $P > 0.05$), 有效组平均年龄较无效组大 (32.42 ± 7.71 岁 vs. 28.26 ± 5.31 岁), 差异有统计学意义 ($t = -2.179, P = 0.033$)。(3) 有效组与无效组间 5-HTTLPR L 等位基因携带者构成比、5-HTR2A C 等位基因携带者构成比均无统计学差异 (41.8% vs. 47.4%, $\chi^2 = 0.177, P = 0.674$; 90.9% vs. 89.5%, $\chi^2 = 0.034, P = 0.854$)。(4) 有效组和无效组分别收集 8 周稳态 TDM 46 例和 16 例, 有效组平均血药浓度为 21.13 ± 16.39 ng/mL, 无效组为 27.49 ± 14.45 ng/mL, 两组间 TDM 无统计学差异 ($t = 1.376, P = 0.174$)。(5) 多因素 Logistic 回归分析显示, 5-HTTLPR 及 5-HTR2A 基因型仍不是艾司西酞普兰抗抑郁疗效的独立影响因素 ($OR = 0.711, P = 0.613$; $OR = 1.070, P = 0.946$)。

结论 本研究尚不支持仅依据 5-HTTLPR、5-HTR2A 基因多态性对艾司西酞普兰进行疗效预测, 未来需扩大样本探讨可能的疗效影响因素。

关键词: 艾司西酞普兰; 基因型; 疗效

The Activity of DMN Mediates The Effect of Peripheral Plasma GDNF Level on Rumination in MDD Patients.

Fengnan Jia¹, Xiangdong Du¹, Xiao Chen²

1. Suzhou Guangji Hospital

2. Institute of Psychology of the Chinese Academy of Sciences (CAS)

Objective Rumination is a pivotal psychopathological process in major depressive disorder (MDD). The neurotrophic hypothesis suggests that glial cell line-derived neurotrophic factor (GDNF) might play a role in brain dysfunction and clinical symptoms of MDD. However, the relationship remains unclear

Methods Thirty-three individuals with MDD and thirty-three healthy controls (HCs) completed a rumination state task during a magnetic resonance imag-

ing (MRI) scan, in which they were induced into a continuous, active rumination state. A Ruminative Response Scale (RRS) was used to assess the rumination tendency of each participant. Fractional amplitude of low-frequency fluctuations (fALFF) and functional connectivity (FC) were calculated to characterize the brain activity of default mode network (DMN) subsystem during rumination. Serum levels of GDNF, IL6, IL8, CRP were measured in all participants. The relationship between fALFF values, GDNF levels, and RRS score in MDD was explored

Results Compared with the HCs, MDD patients showed significantly decreased levels of GDNF ($t = -3.204, p = .002$) and IL8 ($t = -3.239, p = .002$). Significant interaction effects ($F = 25.075, p < .001$) for the fALFF of DMN dorsal medial prefrontal cortex (DMPFC) and medial temporal lobe (MTL) subsystem ($F = 25.075, p < .001, F = 28.753, p < .001$) were observed. Further analyses indicated that the impact of GDNF on brooding was mediated by the activity of the DMN DMPFC subsystem in MDD patients

Conclusion MDD patients modulate the effects of GDNF on the activity of DMN DMPFC subsystems, thereby influencing the manifestation of rumination symptoms

关键词: major depressive disorder, rumination, fMRI, fALFF, GDNF

特质冲动对青少年抑郁症患者自杀行为的影响

王兴莲*

重庆医科大学附属第一医院

目的 目前许多研究发现冲动是自杀的危险因素, 但尚不知冲动是否可以预测自杀意念到自杀行为的转变。本研究旨在研究青少年抑郁症患者自杀意念及自杀行为与冲动特质之间的关系。

方法 在具有自杀意念的青少年抑郁症患者中进行横断面研究, 比较仅有自杀意念的患者与曾有自杀未遂的患者之间的焦虑、抑郁、冲动水平等差异, 并对特质冲动与自杀意念及自杀行为进行相关

性分析。本研究采用 PHQ-9、GAD-7、BIS-11、BSSI 量表评估抑郁、焦虑、特质冲动水平及自杀意念水平。

结果 本研究纳入 195 名具有自杀意念的青少年抑郁症患者, 其中 127 名患者仅有自杀意念, 68 名患者曾有自杀未遂。自杀意念组中女性患者占 67.72%, 自杀未遂组中女性患者占 86.76%。自杀意念组的年龄高于自杀未遂组 (15.66 ± 1.88 VS. 14.88 ± 1.64 , $P=0.004$), 抑郁水平 (19.02 ± 4.87 VS. 21.13 ± 4.30 , $P=0.003$), 冲动水平 (55.46 ± 14.65 VS. 61.17 ± 12.29 , $P=0.020$) 及自杀意念 (39.18 ± 23.06 VS. 58.37 ± 22.52 , $P<0.001$) 均明显低于自杀未遂组, 焦虑水平无明显差异 (14.27 ± 5.19 VS. 14.79 ± 5.26 , $P=0.514$)。在单因素回归中, 女性 ($OR=3.13$, $95\%CI: 1.41-6.91$, $P=0.004$)、较小的年龄 ($OR=0.78$, $95\%CI: 0.66-0.93$, $P=0.005$)、较长的病程 ($OR=1.02$, $95\%CI: 1.01-1.04$, $P=0.011$)、较高的冲动总分 ($OR=1.03$, $95\%CI: 1.00-1.06$, $P=0.022$)、非计划冲动 ($OR=1.02$, $95\%CI: 1.00-1.04$, $P=0.033$) 及认知冲动 ($OR=1.02$, $95\%CI: 1.00-1.05$, $P=0.033$) 与自杀未遂有关。将性别、年龄、病程、抑郁、焦虑、冲动纳入多因素回归中, 女性、年龄较小、病程较长、抑郁得分高是自杀行为的独立危险因素 (P 值均 <0.05), 而冲动与自杀未遂无关。以 BSSI 量化的自杀意念作为因变量, 年龄、性别、病程、抑郁、焦虑、冲动水平作为自变量, 进行多因素线性回归, 自杀意念与冲动水平、抑郁水平呈正相关, 与年龄呈负相关。

结论 冲动特质可以预测较高的自杀意念, 但不能预测自杀意念向行为的转变。因此, 青少年抑郁症患者的自杀行为并非冲动性的。

关键词: 青少年, 抑郁症, 自杀意念, 自杀行为, 冲动

同伴侵害经历对抑郁症临床特征的影响

徐煜璇 张玲*

首都医科大学附属北京安定医院

目的 比较有无同伴侵害经历的抑郁症患者临床特征之间的差异, 分析探讨同伴侵害经历对抑郁症临床特征的影响

方法 于 2021 年 3 月至 2022 年 10 月在××医院招募 377 例 18-60 岁的抑郁症患者 (男 97; 女 280), 根据同伴侵害问卷 (Peer Victimization Questionnaire, PVQ) 得分将患者分为无同伴侵害经历组 (≤ 27 分, $n=262$) 和有同伴侵害经历组 (> 27 分, $n=115$)。采集社会人口学资料、疾病症状特征、汉密尔顿焦虑量表 (Hamilton Anxiety Scale-14, HAMA-14)、汉密尔顿抑郁量表-17 项 (The Hamilton Depression Rating Scale-17, HAMD-17), 比较两组间临床特征的差异, 分别使用 logistic 回归及线性回归分析同伴侵害经历对抑郁症各临床特征产生的影响。

结果 抑郁症患者无同伴侵害经历与有同伴侵害经历占比分别为 69.50% 和 30.50%。与无同伴侵害经历相比, 有同伴侵害经历的患者更多见于发病年龄较小、低 BMI、未婚、低收入家庭、无精神疾病家族史的人群, 更多患者存在自杀行为和非自杀性自伤行为, 差异有统计学意义 ($t=8.663$ 、 2.41 , $\chi^2=29.53$ 、 3.76 、 6.45 、 9.86 、 7.18 , 均 $P<0.05$)。量表评分方面, 有同伴侵害经历患者 HAMA 中的焦虑心境因子、肌肉系统症状因子得分更低, HAMD 中自杀因子得分更高, 迟滞因子得分更低, 差异有统计学意义 ($t=2.02$ 、 2.51 、 -2.77 、 2.08 , 均 $P<0.05$)。Logistic 回归分析和线性回归分析显示, 有同伴侵害经历是抑郁症患者发病年龄早 ($b=-6.58$, $t=-7.41$, $P<0.05$)、未婚 ($OR=0.21$, $95\%CI: 0.12-0.38$)、BMI 偏低 ($b=-1.09$, $t=-2.41$, $P<0.001$)、症状特征表现为焦虑心境较轻 ($b=-0.21$, $t=-2.02$, $P<0.05$)、肌肉系统不适感较轻 ($b=-0.30$, $t=-2.51$, $P<0.05$) 的影响因素, 但更常见自杀行为 ($OR=3.06$, $95\%CI: 1.48-6.31$)、非自杀性自伤行为 ($OR=2.30$, $95\%CI: 1.23-4.18$)。

结论 本研究揭示了同伴侵害经历对抑郁症患者临床特征的多方面影响。有同伴侵害经历的抑郁症患者表现为起病早, BMI 较低, 未婚比例较高。尽管焦虑症状较轻, 但自杀意念更强, 更容易出现自杀行为和非自杀性自伤行为。这些发现为临床诊断和治疗提供了重要依据, 并提示在评估抑郁症患者时应特别关注其同伴侵害经历。

抑郁患者工作记忆任务态 alpha 波脑磁频谱能量的改变

何晨¹ 花玲玲¹ 夏逸¹ 鲍慈青¹ 张乔阳¹ 卢青² 姚志剑^{1,3}

1.南京医科大学附属脑科医院

2.东南大学生物科学与医学工程学院

3.南京大学医学院

目的 抑郁症作为一种常见的心境障碍，常伴认知功能损伤，其中以记忆损伤较明显，影响个体日常生活和工作。但目前关于抑郁症患者工作记忆加工受损的动态神经电生理机制不清，既往研究发现 alpha 神经振荡（8-13 Hz）参与记忆加工处理。本研究旨在揭示抑郁症患者工作记忆功能损伤的神经电生理机制。

方法 本实验共招募 91 例受试者，43 例健康对照组（Healthy Control, HC），2023-2024 年期间在我院就诊的单相抑郁症（Major Depressive Disorder, MDD）患者 48 人。两组受试者的年龄、性别、受教育年限均相匹配，所有入组受试者均通过脑磁图扫描过程中完成了 5 分钟 2-back 工作记忆任务。脑磁图数据基于 Fieldtrip 平台进行滤波、去除伪迹、溯源等处理，提取 2-back 工作记忆任务态 alpha 能量（8-12Hz）进行频谱分析，运用 Cluster-based permutations 非参数统计方法进行统计分析（cluster α =0.01， α =0.5）。

结果 通过对溯源结果进行分析，发现 HC、MDD 两组之间，前额叶（背外侧前额叶），边缘结构（海马、杏仁核），皮层下结构（丘脑），等多个脑区在 alpha 频段的能量，差异具有统计学意义，抑郁症患者较健康对照组在 alpha 频段能量减弱。

结论 本研究结果表明，抑郁症患者在执行工作记忆加任务时，全脑多个区域表现出加工异常，以前额叶-边缘-皮层下环路的 alpha 频段异常最为显著，该环路是构成了工作记忆功能关键神经基础。研究发现，其 alpha 频段的能量降低，可能是抑郁症患者工作记忆损害的核心机制，对患者的日常生活及工作能力造成了显著影响。本研究揭示了抑郁患者工作记忆功能损伤背后的神经电生理机制，为针对抑郁症患者认知功能恢复制定有效干预策略提供了科学依据。未来需进一步研究调控 alpha 波活动的方法，以改善抑郁症患者的认知功能。

Associations between Rumination and The Incidence of First-episode Major Depressive Disorder in A Sample of Chinese University Students: From A 1-year Longitudinal Stud

Yi Zheng^{1,6}, Ningning Guo⁶, Ruixue Xu², Xingmeng Niu³, Yan Qin⁴, Hanyun Li⁵, Yan Liu¹

1.School of Public Health, Jining Medical University, Jining, Shandong, China

2.School of Public Health, Binzhou Medical University, Binzhou, Shandong, China

3.School of Public Health, Shandong Second Medical University, Weifang, Shandong, China

4.School of Public Health, Shandong First Medical University & Shandong Academy of Medical Sciences, Jinan, Shandong, China

5.Cheeloo College of Medicine, Shandong University, Jinan, Shandong, China

6.School of Mental Health, Jining Medical University, Jining, Shandong, China

Objective Rumination is a negative cognitive style that can increase the impact of risk factors on depression. This cohort study was to estimate the effect of rumination on the incidence of first-episode major depressive disorder (MDD) among freshmen in a Chinese medical university, to provide help for students' mental health counseling and reduce the incidence of MDD

Methods In this longitudinal cohort study, 6985 participants without MDD at baseline completed a follow-up survey one year later. The Chinese version of the Comprehensive International Diagnostic Interview (CIDI-3.0) was used to assess MDD. Rumination was measured by the Rumination Response Scale

Results The first-episode MDD incidence among Chinese freshmen was 2.26%. Rumination was significantly associated with a 1-year incidence of MDD (OR = 1.09, 95% confidence interval: 1.06-1.11), controlling for the effects of baseline depressive symptoms and stressful life events

Conclusion Rumination increases the likelihood

of first-episode MDD among Chinese university freshmen. Therefore, students should be guided to engage in aggressive rumination to reduce the risk of MDD

Limitations All the information collected in this survey is from the participants' personal recall and selection, so recall and reporting biases are possible.

抑郁症患者工作记忆任务状态下心率变异性的特征研究

何晨¹ 花玲玲¹ 鲍慈青¹ 夏逸¹ 卢青² 姚志剑^{1,3}

1.南京医科大学附属脑科医院

2.东南大学生物科学与医学工程学院

3.南京大学医学院

目的 抑郁症常伴认知功能损伤,尤以工作记忆损伤为著,影响个体日常生活。既往研究提示,抑郁患者存在自主神经系统功能失调,心率变异性(HRV)反映了交感与副交感神经的平衡,是有效的心理负荷和压力水平的生物标志物。工作记忆任务(如2-back任务)能够显著增加认知负荷,通过监测HRV,可以评估任务期间个体的心理负荷水平。研究抑郁患者在工作记忆任务中的HRV变化,可以帮助我们更好地理解他们在高负荷任务下的生理和心理反应。

方法 本研究共计招募了109名受试者,健康对照组(Healthy Control, HC)42人,2023-2024年期间在我院就诊的单相抑郁症(Major Depressive Disorder, MDD)患者67人。两组受试者的年龄、性别、受教育年限均相匹配。所有入组受试者完成5分钟的2-back工作记忆任务。2-back任务期间同时进行了心电图数据收集,在心电图数据采集阶段,利用心电监测设备以确保所得数据的高质量性。心电数据依托于Python编程环境进行了后续处理,提取心率变异性(Heart Rate Variability, HRV)指标。本研究采用SPSS26版本统计软件进行统计分析。由于行为学数据及HRV数据不符合正态分布,采用非参数统计检验(Mann-Whitney U检验)进行组间比

较。

结果 通过对低频心率变异性(HRV_LFN)、平均心跳间隔(HRV_MeanNN)、正常窦性心跳之间的时间间隔(HRV_SDANN1)、中位心跳间隔(HRV_MedianNN)及80百分位心跳间隔(HRV_Prc80NN)的比较,观察到MDD的HRV_LFN、HRV_MeanNN、HRV_MedianNN及HRV_Prc80NN与HC差异不具有统计学意义。MDD的HRV_SDANN1低于HC($Z = -2.154, p = 0.031$),差异有统计学意义。

结论 抑郁症患者在2-back任务中的HRV_SDANN1指标低于健康对照组,表明抑郁症患者心脏自主神经功能受到抑制,导致心率变异性降低。HRV_SDANN1(Standard Deviation of the Averages of NN intervals)是指5分钟段内RR间期平均值的标准差,它反映了较长时间段内心率变异性的总体水平。该指标降低提示抑郁患者在2-back工作记忆任务中可能存在较高的认知负荷,与患者的认知能力损伤有关。本研究旨在全面深入地揭示抑郁症的病理生理机制及其对患者认知功能的影响,为将来制定更为精确的个体化治疗方案和干预措施提供了科学依据。

基于网络分析探索童年期虐待对抑郁症患者认知功能的影响

侯芳萌 吴艳坤 于欣 苏允爱 司天梅*

北京大学第六医院

目的 童年期虐待是抑郁症发病及抑郁症认知功能损害的共同风险因素。本研究旨在利用网络分析的方法探索童年期虐待不同类型对抑郁症患者急性发作期不同维度认知功能的影响及经过抗抑郁药物治疗后上述影响是否存在。

方法 本研究纳入未用药的抑郁症患者634名,在基线期和使用选择性5-羟色胺再摄取抑制剂(SSRIs)单药治疗8周后完成临床症状与认知功能等评估,同时招募258名健康被试仅在基线期评估。使用17项汉密尔顿抑郁量表(HAMD-17)评估抑郁严重程度,儿童期虐待问卷(CTQ)评估童年期虐待水平,包括情感虐待(EA)、躯体虐待(PA)、性虐待(SA)、

躯体忽视(PN)、情感忽视(EN) 5 个方面。认知评估源于认知功能评估成套测验(MCCB), 包括信息处理速度、注意/警觉性、词语学习、视觉学习和执行功能共 5 个维度。首先进行正则化偏相关网络的统计分析和可视化, 关注网络中童年期虐待和认知功能之间的关联路径以及桥梁症状。随后基于网络分析的结果进行中介分析和单因素方差分析。

结果 1、基线网络分析: 基线网络分析结果提示 EA 与发病年龄呈负相关, PN 与词语学习、视觉学习水平呈负相关; 发病年龄与信息处理速度、执行功能正相关。发病年龄、EA 与执行功能分别为临床症状群、童年期虐待史和认知功能症状群中桥梁强度最高的节点。经检验, 网络的准确性和稳定性较好, 网络模型可靠。

2、验证分析: 基于网络分析结果, 构建中介模型提示发病年龄在 EA 与执行功能之间发挥完全中介作用。在患者躯体忽视阳性组 (PN+)、躯体忽视阴性 (PN-) 和健康对照组的认知功能比较中, 事后检验提示在信息处理速度、注意/警觉性、词语记忆和视觉记忆维度中 PN-组认知得分显著高于 PN+组认知得分($p < 0.05$)。

3、抗抑郁药物治疗后探索性分析: 纳入基线期童年期虐待、起病年龄与 8 周时 HAMD 减分率、认知功能评分进行网络分析, 结果表明发病年龄与治疗各认知维度未见关联, PN 仅与治疗词语记忆存在负相关。在患者 PN+组、PN-组和健康对照组比较中, PN+组在词语记忆和视觉记忆维度得分显著低于健康对照组, PN-组治疗后仅在词语记忆得分显著低于健康对照组。

结论 不同的童年期虐待类型会影响抑郁症患者急性期不同维度的认知功能, 这种效应可持续到抗抑郁治疗 8 周后。本研究提示童年期虐待对抑郁症患者认知功能存在持续的负性影响, 不同类型童年期虐待对认知功能产生的影响以及生物学机制可能存在差异。

Prevalence and Correlates of Anxiety Symptoms in First-episode and Untreated Major Depressive Disorder Patients with Comorbid Suicide Attempts at Different Age of Onset in

A Chinese Han Population: A Large Cross-sectional Study

LEI SHI¹, Xiangyang Zhang²

1. Guangxi Zhuang Autonomous Region Brain Hospital, 2. Chinese Academy of Sciences (CAS) Key Laboratory of Mental Health,

Objective Patients with suicide attempts(SA) are at increased risk of developing anxiety symptoms, especially those with major depressive disorder (MDD). Few studies have investigated the independent effects of anxiety symptoms on comorbid suicide attempts in patients with MDD. The aim of this study was to investigate the prevalence of anxiety symptoms and associated variables in first episode and untreated (FEUT) MDD patients with comorbid suicide attempts at different ages of onset

Methods We recruited 1718 patients with FEUT MDD in this study. We collected demographical and clinical data, and measured lipid, thyroid function, and blood glucose levels. The 17-item Hamilton Depression Scale (HAMD-17), Hamilton Anxiety Scale (HAMA), Clinical Global Impression Severity Scale (CGI), and Positive and Negative Syndrome Scale (PANSS) positive subscale were used to assess depression, anxiety, illness severity, and psychotic symptoms, respectively

Results The prevalence of suicide attempts among MDD patients was 20.1% (346/1718). Among MDD patients with suicide attempts(MDD-SA), the prevalence of anxiety symptoms was 31.4% (75/239) in those with early adult onset and 40.2% (43/107) in those with mid-adult onset. Independent factors associated with anxiety symptoms in early adult onset MDD-SA patients were as follows: marital status ($B=0.966$, $P < 0.05$, $OR=2.629$), HAMD score ($B=0.213$, $P < 0.05$, $OR=1.238$), and positive subscale score ($B=0.201$, $P < 0.01$, $OR=1.223$). Independent factors associated with anxiety symptoms in mid-adult onset MDD-SA patients were as follows: HAMD score ($B=0.374$, $P < 0.01$, $OR=1.454$), and positive subscale score ($B=0.142$, $P < 0.01$, $OR=1.153$)

Conclusion Our findings suggest that MDD-SA patients are at higher risk for anxiety symptoms. In

MDD-SA patients, the prevalence of anxiety symptoms was similar in the early and mid-adult onset subgroups, but the factors associated with anxiety symptoms differed in these two subgroups.

Observation on The Clinical Effect and Cognitive Function Improvement of Sertraline in Patients with First-episode Coronary Heart Disease Comorbid Major Depressive Disorder

Pan Pan Wenbin Guo*

Department of Psychiatry, and National Clinical Research Center for Mental Disorders, The Second Xiangya Hospital of Central South University, Changsha

Objective The coronary heart disease (CHD) and the major depressive disorder (MDD) are often accompanied in clinical treatment. Compared with CHD, the patients with coronary heart disease comorbid major depressive disorder (CHDD) exhibited higher admission rate, more chest pain attack, lower quality of life, and higher mortality. The antidepressant therapy should be considered at the same time as the basic treatment of CHD for the patients with CHDD. Sertraline has been proved to be safe and effective for the patients with CHDD. Several studies have shown the cognition impairment in MDD. Nevertheless, cognitive impairment in the patients with CHDD was rarely reported. This study aimed to investigate the efficacy of sertraline in the patients with first-episode CHDD and to assess the improvement in cognitive function

Methods A total of 114 patients with first-episode CHDD and 109 patients with CHD were recruited. 24-item Hamilton Rating Scale for Depression (HAMD-24) and Hamilton Anxiety Rating Scale (HAMA) were adopted to evaluate the clinical characteristics, and, Repeatable Battery for the Assessment of Neuropsychological Status (RBANS) was adopted to

evaluated the cognitive domain function (include immediate memory, spatial structure, verbal function, attentional ability, and delayed memory). The patients with CHDD were treated with sertraline. HAMD-24, HAMA, were evaluated at week 1, 2, 4, 6, 8 to observe the symptomatic improvement. The cognitive characteristics were compared at baseline and 8 weeks after treatment

Results CHDD was worse than CHD in terms of general memory, visual span, language, overall attention and word mastery. After 8 weeks of treatment, the effective rate of CHDD in intentional to treat analysis was 50.00%. The cure rate in intentional to treat analysis was 42.11%. The effective rate of CHDD in per-protocol analysis was 98.28%. The cure rate in per-protocol analysis was 82.75%. The scores of HAMD-24 and HAMA were significantly decreased from 2 weeks of treatment. After 6 weeks of treatment, the scores were significantly lower than those before treatment ($p < 0.05$). The delayed memory, visual attention in the patients with CHDD were improved after 8 weeks

Conclusion Sertraline exhibited significant efficacy and high compliance in the treatment for the patients with CHDD. Antidepressant treatment could improve the cognitive function in the patients with CHDD to a certain extent.

抑郁症自杀意念患者中不同性别间脑皮质结构改变的研究

刘加怡^{1,2} 吴杨^{1,2} 沈钦戈^{1,2} 李猛¹ 袁晓驰¹ 陈敏² 周晶晶³ 苏中华¹ 崔健¹
1.山东省戴庄医院, 精神科
2.济宁医学院精神卫生学院
3.首都医科大学附属北京安定医院

目的 抑郁症(MDD)伴自杀意念患者脑皮质结构存在异常, 且自杀意念患者存在性别差异。本研究旨在探讨抑郁症伴自杀患者不同性别间脑皮质结构的差异。以期为识别不同性别间抑郁症自杀意念患者提供客观标记。

对象与方法 本研究在山东省戴庄医院进行。研究自2022年4月份至2023年12月份采集磁共振图像的参与者177例,其中MDD患者117例(男性44例、女性73例),健康对照者60例(HCs,男性23例、女性37例)。研究者根据贝克意念量表评分大于等于3分判定为自杀意念组这一标准,将MDD分为MDD伴有自杀意念组57例(SI)和MDD不伴自杀意念组60例(NonSI)。

本研究使用FreeSurfer软件对数据进行处理并提取每位被试的颅内总容量(eTIV)数值。随后,采用广义线性模型(GLM)分别检测组别主效应、性别主效应以及性别与组别之间的交互效应,同时控制年龄、受教育年限和eTIV并对结果进行基于蒙特卡罗模拟的多重比较校正,显著性水平设定为CWP小于0.05。定义校正后显著性集群为感兴趣区域(ROI),并提取其平均值用于事后分析以及与临床特征之间的相关分析。

结果 在不分性别的情况下,与NonSI相比,SI的右侧下顶叶和上顶叶皮质局部回指数显著增加。在右侧舌回(LG)皮质厚度、右侧外侧枕叶皮质(LOC)和右侧上额叶皮质(SFC)表面积,以及左侧楔前叶和右侧视皮层周围区(PCAL)皮质体积中观察到了显著的性别与组别交互效应。事后分析显示,与伴有自杀意念的女性MDD相比,伴有自杀意念的男性MDD右侧舌回皮质厚度显著增加。与性别匹配的NonSI相比,男性SI的右侧LOC皮质面积和右侧PCAL皮质体积显著增加,而女性SI与NonSI皮质结构无显著差异。

相关分析发现,女性MDD左侧楔叶皮质体积与自杀评分显著正相关,男性MDD右侧PCAL皮质体积与自杀评分显著负相关,但均未通过多重比较校正。此外,右侧PCAL皮质体积与自杀评分的相关性在性别间存在显著差异。

结论 本研究提供了伴有和不伴自杀意念MDD患者在皮质厚度、皮质面积以及皮质体积方面存在性别差异的证据。这些发现强调了在理解MDD伴随自杀意念的神经生物学机制时考虑性别差异的重要性,这可能有助于开发针对性的治疗干预措施。

Altered Brain Network Dynamics During Rumination Relate To Depression Relapse

Su Shu Yumeng Ju Yan Zhang*

The Second Xiangya Hospital of Central South University

Objective Rumination is a maladaptive cognitive style and a risk factor for depression relapse. However, the clinically relevant pattern of dynamic network reconfiguration during rumination in remitted depression and its implication in depression relapse remained unclear

Methods We employed a rumination induction neuroimaging paradigm in which subjects would be guided into an active rumination state and a distraction state. Forty-two remitted depression patients and 34 healthy controls were involved. Participants underwent assessments of rumination behavior and imaging tasks; patients were then monitored for one year to assess the potential depression relapse. A time-resolved community detection approach was applied to investigate the temporal dynamics of brain networks, and the dynamic network properties including flexibility and integration were analyzed

Results The increased level of rumination was linked to the relapse of depression. During rumination state in patients, a significant decrease in the integration between the fronto-parietal network and dorsal attention network was observed compared to the distraction state. Furthermore, this integration showed a significantly negative correlation with rumination level and associated with depression relapse during a one-year follow-up. Besides, multivariate results indicated that features most influential in predicting relapse were associated with the default mode network during rumination

Conclusion Our findings implied a potential link between the dynamic brain networks engaged during rumination and depression relapse, shedding light on the intricate relationship between cognitive processes, neural dynamics, and the potential vulnerability to depression recurrence.

伴自杀行为的抑郁症患者“前额叶-扣带-纹状体”环路自发神经活动显著升高

陈志璐^{1,4} 沈娜^{1,3} 孙浩^{1,3} 田水² 姚志剑^{1,3,4}

1.南京医科大学附属脑科医院心境障碍科(江苏省抑郁症诊疗中心)

2.南京医科大学第一附属医院放射科

3.南京大学医学院

4.南京神经精神病学研究所

目的 我国抑郁症(major depressive disorder, MDD)患者超9500万,抑郁症与自杀密切相关,约65%的抑郁症患者有自杀意念,60%的自杀者被诊断为抑郁症。目前关于抑郁症自杀研究的热点是自杀意念如何进展到自杀行为,但目前仍未明确可预示自杀进展的稳定有效的生物学标记。神经影像学快速发展,研究表明“前额叶-扣带-纹状体”神经环路是MDD伴自杀行为的重要神经基础。本研究将探究该神经环路自发神经活动在不伴自杀意念组、自杀意念组、自杀未遂组的差异,以期寻找早期识别自杀进展的生物学标记,便于临床管理和防治。

方法 入组南京医科大学附属脑科医院住院汉族MDD患者499例,依据此次抑郁发作是否有自杀未遂行为(定义为至少有过一次自我伤害行为,并且是直接想死或暗示想死及符合HAMD-17第三项自杀评分 ≥ 2 分者)以及贝克自杀意念量评分,将受试者分成无自杀意念组(NSI组, $n=87$),伴自杀意念组(SI组, $n=327$)伴自杀未遂组(SA组, $n=69$)。同时招募性别、年龄和受教育年限等匹配的健康受试者247例。所有受试者完临床信息采集及静息态7分钟功能磁共振扫描。预处理后计算受试者全脑低频振幅(ALFF)值,多因素协方差分析比较四组受试者自发神经活动的异常。采用团块高斯随机场(体素水平 $p < 0.001$, 团块水平 $p < 0.05$, GRF)校正统计比较结果。

结果 与健康对照相比,不伴自杀意念组、自杀意念组、伴自杀未遂组的MDD患者在海马回ALFF值显著升高和内侧额上下降,但自杀意念组和自杀未遂组的MDD患者存在更广泛的ALFF值异常,如在脑岛和纹状体上,伴自杀意念组神经活动

显著升高,伴自杀未遂组显著下降等。与不伴自杀意念组相比,自杀意念组全脑ALFF值差异不显著,但是伴自杀未遂组患者在海马、脑岛、纹状体和额中回的ALFF值显著下降。

结论 前人和课题组前期研究均表明低频振幅特征能敏感地反映MDD患者自杀风险,对自杀未遂行为识别率较高。本研究依据自杀三步理论,进一步比较了不伴自杀意念、自杀意念和自杀未遂患者全脑自发神经活动的差异,研究结果进一步证实,“前额叶-扣带-纹状体”神经环路异常是MDD自杀进展的重要神经基础,尤其海马、纹状体等脑区参与患者情绪唤醒和奖赏调控,在自杀行为中起着重要作用。

关键词: 抑郁症; 低频振幅; 自杀行为

Metformin Treatment Improves Depressive Symptoms Associated with Type 2 Diabetes: A 24-week Longitudinal Study

Yating Yang^{1,2}, Suqi Song¹, Huanzhong Liu¹

1.Chaohu Hospital of Anhui Medical University

2.Huizhou Second People's Hospital

Objective Metformin is a medication that is widely used for lowering blood sugar in patients with type 2 diabetes. Metformin was shown to have significant antidepressant effects; however, it is not clear whether metformin treatment improves outcomes in patients with type 2 diabetes who have concomitant depressive symptoms

Methods A total of 475 patients with type 2 diabetes mellitus with depressive symptoms were included in this study and divided into metformin and nonmetformin groups according to whether they were taking metformin. The DASS-21 was used to assess patients' depression and anxiety scores before and after a 24-week intervention. In addition, general information about whether the patients had developed complications from diabetes and whether they had been diagnosed with other diseases was assessed

Results (1) After 24 weeks, anxiety and depression scores were significantly lower in the metformin

group than in the nonmetformin group. (2) The prevalence of depressive symptoms was significantly greater in female type 2 diabetic patients than in male patients (OR=2.039, 95% CI=1.160-3.568). (3) People with type 2 diabetes who develop complications from diabetes (OR=1.794, 95% CI=1.015-3.171) and those diagnosed with other conditions are more likely to experience depressive symptoms

Conclusion Metformin has an ameliorative effect on type 2 diabetes. However, women, those with diabetes complications, and those with type 2 diabetes who are also diagnosed with other conditions are more likely to experience depressive symptoms

关键词: Type 2 diabetes; depressive symptoms; metformin

孕妇孕晚期睡眠状况与产后抑郁关系的研究

王宁¹ 张蕾² 王晓茜²

1.北京回龙观医院

2.清华长庚医院

目的 本研究旨在探讨孕妇孕晚期睡眠状况与产后抑郁之间的关系, 以期为提高孕产妇的心理健康水平提供科学依据, 为预防和治疗产后抑郁提供新思路。

方法 本研究采用问卷调查、随访相结合的方式, 选取本地区一家大型综合性医院产科门诊就诊的孕晚期(孕周 ≥ 28 周)孕妇作为研究对象。共发放问卷 296 份, 回收有效问卷 276 份, 问卷有效率达 93.2%。问卷内容主要包括孕妇的基本信息、孕晚期睡眠状况评估量表和产后抑郁筛查量表。孕妇在孕晚期完成问卷填写, 并在产后 6 周进行随访, 再次填写产后抑郁筛查量表。本研究采用 SPSS 25.0 软件分析收集到的数据, 包括: 对孕妇孕晚期睡眠状况和产后抑郁的发生情况进行描述性统计分析、采用独立样本 t 检验和 χ^2 检验比较不同睡眠状况孕妇产后抑郁发生率的差异、通过相关性分析和 Logistic 回归分析探讨孕晚期睡眠状况与产后抑郁之间的关系。

结果 1. 描述性统计分析结果显示, 孕晚期孕

妇普遍存在不同程度的睡眠问题, 其中以入睡困难、多梦和易醒最为常见。产后 6 周随访发现, 约有 18.6% 的孕妇出现产后抑郁症状。

2. 独立样本 t 检验和 χ^2 检验结果显示, 孕晚期睡眠状况较差的孕妇(PSQI 得分 ≥ 7 分)产后抑郁的发生率显著高于睡眠状况良好的孕妇(PSQI 得分 < 7 分), 差异具有统计学意义($P < 0.05$)。

3. 相关性分析结果显示, 孕晚期睡眠状况与产后抑郁呈负相关($r = -0.42, P < 0.01$), 即孕晚期睡眠状况越差, 产后抑郁的发生率越高。

4. Logistic 回归分析结果显示, 在排除其他可能的干扰因素后, 孕晚期睡眠状况仍然与产后抑郁的发生密切相关。具体来说, 孕晚期 PSQI 得分每增加 1 分, 产后抑郁的发生率将增加约 1.3 倍(95% CI: 1.1-1.6)。

结论 本研究结果表明, 孕妇孕晚期睡眠状况与产后抑郁之间存在密切的关系。孕晚期睡眠状况较差的孕妇更容易发生产后抑郁。因此, 对于孕晚期孕妇来说, 关注并改善其睡眠状况对于预防产后抑郁具有重要意义。建议在孕期保健中加强对孕妇睡眠状况的关注和评估, 并提供相应的干预措施以改善其睡眠质量。同时, 对于已经出现产后抑郁症状的孕妇, 应及时进行心理干预和治疗以减轻其症状并提高其生活质量。

关键词: 孕晚期, 睡眠, 产后抑郁

青少年抑郁症患者快感缺失、童年期虐待和抑郁症状对非自杀性自伤行为的影响: 有调节的中介模型

杜洋¹ 吴贝贝² 张东梅³ 李妮⁴ 郭雅茹¹ 谢思思¹ 余凤琼⁵ 季益富¹

1.安徽省精神卫生中心

2.合肥市肥东县第一中学

3.合肥市庐江中学

4.合肥市教育研究院

5.安徽医科大学精神卫生与心理科学学院 认知与神经精神疾病安徽重点实验室

目的 探讨快感缺失、童年期虐待和抑郁症状对青少年抑郁症患者非自杀性自伤行为的影响, 以及快感缺失在其中的中介作用。

方法 选取 355 例安徽省精神卫生中心门诊及住院的青少年抑郁症作为研究组,以 350 例年龄、性别匹配的青少年作为对照组,采用青少年自我伤害问卷、汉密尔顿抑郁量表-24、儿童期虐待问卷和时间性快感体验量表分别评估青少年抑郁症患者的非自杀性自伤行为、抑郁症状、童年期虐待得分和快感缺失得分;采用独立样本 t 检验和 χ^2 检验进行 2 组间差异性检验;采用 Pearson 相关分析进行各量表得分之间的相关分析;采用 Hayes 编制的 PROCESS 宏程序进行有调节的中介模型分析;采用 Bootstrap 法分析抑郁症状在童年期虐待与自杀意念之间的中介效应值及 95%Bootstrap 置信区间;采用简单斜率法进行抑郁症状和快感缺失交互效应的比较。

结果 童年期虐待显著正向预测抑郁症状 ($\beta=0.46, P<0.001$);抑郁症状显著正向预测自杀意念 ($\beta=0.49, P<0.001$);抑郁症状和快感缺失的交互项对自杀意念的预测作用显著 ($\beta=-0.06, P<0.001$)。简单斜率法结果显示低快感缺失者抑郁症状对自杀意念的预测作用 ($\beta=0.41, P<0.001$) 大于高快感缺失者 ($\beta=0.37, P<0.001$)。

结论 抑郁症状在童年期虐待对自杀意念的影响中起部分中介作用,快感缺失在童年期虐待对自杀意念的影响中起调节作用,随着个体快感缺失水平的逐步增加,抑郁症状对自杀意念的预测作用呈逐渐降低趋势。

关键词: 青少年抑郁症;快感缺失;童年期虐待;非自杀性自伤

首发抑郁症患者睡眠障碍对认知功能的动态影响及相关因素研究

张文琼*

天津市安定医院

目的 睡眠障碍是重性抑郁障碍 (major depressive disorder, MDD) 的常见症状,与患者的认知症状密切相关[1]。本研究旨在通过较大样本的纵向随访研究,首次探索首发 MDD 患者睡眠障碍与认知功能的变化特征及相关性。

方法 本研究于 2019 年 1 月至 2023 年 1 月期间,在天津市安定医院纳入了首次发作的符合 DSM-

5 诊断标准的 MDD 患者 173 例,分别采用汉密尔顿抑郁量表、汉密尔顿焦虑量表、匹兹堡睡眠质量指数量表、神经心理状态评定量表评估患者的抑郁症状、焦虑症状、睡眠情况以及认知功能。研究共设置 3 个访视节点,分别为基线、第 4 周和第 8 周访视。采用平行增长曲线模型分析 MDD 患者睡眠障碍和认知功能两者之间的变化趋势及相关性。

结果 1.MDD 患者的基线睡眠情况对其基线认知功能存在正向预测作用 ($\beta=0.303, SE=0.126, p=0.016$)。

2.MDD 患者的抑郁症状变化对其认知功能的变化存在负向预测作用 ($\beta=-0.328, SE=0.142, p=0.021$),即患者抑郁症状好转得越快,认知功能改善得越快;焦虑症状变化对其认知功能的变化存在负向预测作用 ($\beta=-0.408, SE=0.147, p=0.005$),即患者焦虑情绪好转得越快,认知功能改善得越快;

睡眠情况变化对认知功能的变化具有负向预测作用 ($\beta=-0.390, SE=0.237, p=0.099$),即患者睡眠情况好转得越快,认知功能改善越快。

3.在影响因素分析中,在构建的睡眠情况和认知功能变化关系模型基础上,采用亚组间比较的方法得出:男性患者及女性患者之间的卡方差异无统计学意义 ($\Delta c^2=3.962, \Delta df=3, p=0.266>0.05$);35 岁及以下和 35 岁以上患者之间的卡方差异无统计学意义 ($\Delta c^2=5.151, \Delta df=3, p=0.161>0.05$);受教育年限 12 年及以下与受教育年限 12 年以上患者之间的卡方差异无统计学意义 ($\Delta c^2=4.876, \Delta df=3, p=0.166>0.05$);从事脑力劳动与体力劳动患者之间的卡方差异无统计学意义 ($\Delta c^2=5.083, \Delta df=3, p=0.217>0.05$)。

结论 1.在首发 MDD 患者中,睡眠质量对认知功能的动态影响具有正向相关性。

2.在首发 MDD 患者中,认知损害的严重程度独立于抑郁症状或焦虑症状,随着时间的推移,MDD 患者抑郁症状或焦虑症状缓解的速度与认知功能改善的速度存在关联。

3.在首发 MDD 患者中,性别、年龄、受教育年限、工作性质这 4 个因素均不影响认知功能随睡眠改变的动态变化趋势。

Identifying The Risk of Depression in A Large Sample of Adolescents: An Artificial Neural Network Based on Random Forest

Yanni Wang* Yue Zhou
Lanzhou University

Objective This study aims to develop an artificial neural network (ANN) prediction model incorporating random forest (RF) screening ability for predicting the risk of depression in adolescents and identifies key risk factors to provide a new approach for primary care screening of depression among adolescent

Methods The data were from a large cross-sectional study conducted in China from July to September 2021, enrolling 8635 adolescents aged 10–17 with their parents. We used the Patient health questionnaire (PHQ-9) to rate adolescent depression symptoms, using scales and single-item questions to collect demographic information and other variables. Initial model variables screening used the RF importance assessment, followed by building prediction model using the screened variables

through the ANN.

Results The rate of depression symptoms in adolescents was 24.6%, and the depression risk prediction model was built based on 70% of the training set and 30% of the test set. Ten variables were included in the final prediction model with a model accuracy of 85.03%, AUC of 0.892, specificity of 89.79%, and sensitivity of 70.81%. The top 10 significant factors of depression risk were adolescent rumination, adolescent self-esteem, adolescent mobile phone addiction, peer victimization, care in parenting styles, overprotection in parenting styles, academic pressure, conflict in parent–child relationship, parental rumination, and relationship between parents

Conclusion The ANN model based on the RF effectively identifies depression risk in adolescents and provides a methodological reference for large-scale primary screening. Cross-sectional studies and single-item scales limit further improvements in model accuracy

Microstructure Reveals Covariance Aberrant of MPFC-limbic Interactions with Atypical Depression

Huifeng Zhang¹, Rubai Zhou¹, Wenxian Lu¹, Yousong Su¹, Yiyun Cai¹, Jia Huang¹, Shen He¹, Lei Ding¹, Yun Wang¹, Min Zhang¹, Ye Wu², Daihui Peng²

1. Shanghai Mental Health Center

2. Nanjing University of Science and Technology

Objective The heterogeneity of symptoms and etiology in major depressive disorder (MDD) is impeding progress towards patient-specific treatment strategies and course trajectories. However, the profile of microstructural brain alterations associated with atypical depression (AD) remains elusive. To investigate altered synchronization of brain cyto- and myelo-architecture in the medial prefrontal-limbic pathway between individuals with AD and non-atypical depression (non-AD) using multi-shell diffusion-weighted MRI (dMRI)

Methods The iDoT-AFD study is a research project that aims to identify diagnostic biomarkers, optimal treatment strategies, and the trajectory of illness for depression with atypical features. The study collected multi-shell diffusion magnetic resonance imaging (dMRI) images from 50 patients with AD, 97 patients with non-AD, and 50 healthy controls (HCs) at the beginning of the study. The data were collected between August 2019 and September 2022, and the analysis was conducted from June 2022 through September 2023. Brain microstructure was investigated using dMRI tractography and soma/neurite density imaging with brain mapping algorithms and statistical models

Results Of 197 included participants, 145 (73.6%) were female, and the mean (SD) age was 25.27 (4.97) years. The microstructural covariance network reveals significantly aberrant soma and neurite density of medial prefrontal (mPFC)-limbic interactions among three groups [Effect size (η^2_p) = 5.50–43.88%, all PFDR < 0.05]. Comparative analysis between the AD group and the non-AD group showed similar findings.

Furthermore, the fiber tractography approach revealed that atypical depression showed significantly enhanced soma and neurite density of the superior frontal gyrus (SFG) - anterior cingulate gyrus (ACC) pathway (PFDR < 0.05), compared with nonatypical depression. These microstructural morphological features were also significantly correlated with atypical feature scores (PFDR < 0.05)

Conclusion Compared with non-AD patients, aberrant soma and neurite density of the mPFC-limbic pathway were associated with atypical depressive symptoms, capturing interindividual etiological heterogeneity in MDD patients and characterizing the histopathologic profile of mPFC-limbic pathway via a non-invasive in vivo approach. The development of patient-specific treatment approaches effectively targeting neural dysregulations may benefit patients with atypical features.

Heart-Brain Axis: A Narrative Review of The Interaction Between Depression and Arrhythmia.

Shuping Fang Wei Zhang*

West China Hospital, Sichuan University

Background Abundant evidence supports the notion that depression serves as a risk factor for the development of cardiovascular diseases, including arrhythmias, and there exists a significant comorbidity between depression and arrhythmias, indicating a close association between these two conditions. However, the precise mechanism underlying the interaction between depression and arrhythmia remains unclear, and effective clinical treatments are currently lacking. This review aims to investigate the bidirectional relationship between depression and arrhythmia along with its potential mechanistic underpinnings

Objective The objective of this review is to systematically investigate the interplay between depression

and arrhythmia, along with their underlying mechanisms, aiming to offer clinical management guidance and directions for future research.

Methods A comprehensive review of studies published up until June 2024 was conducted by searching the PubMed and Web of Science databases. The search terms utilized encompassed "cardiovascular disease," "arrhythmia," "depression," "interoception," and "heart-brain axis." Only articles published prior to June 20, 2024 were considered for inclusion in this review. English language texts were mandatory, and all forms of literature met the eligibility criteria. Furthermore, we also explored other pertinent topics such as "autonomic dysfunction," "heart rate variability," "HPA axis", "inflammation", "gene", "personality", "stress", "antidepressant drugs" among others

Results We posit that the heart and brain serve as the primary organs of the circulatory system and central nervous system, respectively. Although seemingly independent, they can be anatomically linked through the autonomic nervous system (ANS). Imbalances in ANS function commonly underlie arrhythmia and various mood disorders. Furthermore, extant research has demonstrated that ANS interacts with other factors in mood dysregulation and arrhythmia pathogenesis. At a biological level, stressful events can trigger activation of both the sympathetic nervous system (SNS) and hypothalamic-pituitary-adrenal (HPA) axis, thereby promoting the onset and progression of depression and arrhythmia. Activation of SNS and HPA axis also fosters an inflammatory response, with elevated levels of pro-inflammatory cytokines being associated with depressive symptoms and arrhythmic conditions. These two diseases may engender unhealthy lifestyles, thus establishing a detrimental cycle between arrhythmias and depression. Additionally, innate genes alongside personality traits exert significant influences on both disorders. Moreover, the ANS-based neural foundation of interoception explicated herein has been demonstrated to correlate with the quality and intensity of emotional experience. Prior research has also validated the interoceptive ascending pathway to some extent. β -adrenergic blockers can weaken sympathetic nervous system responses and potentially mitigate negative, high-arousal

emotions by attenuating peripheral signals. Individuals with Spinal Cord Injury, which is characterized by disruption of nerve flow from the periphery to the brain due to spinal cord injury, struggle with assessing their emotional responses to intricate scenarios that elicit fear and anger. However, previous studies have employed Human Intracranial Electrophysiology (HIE), an invasive technique, in investigating how complex brain networks give rise to emotional states. The results on causality from these studies are inconsistent and convoluted, while current investigations into interoception lack sufficient conditions for guiding causality. Furthermore, chemical and neural signals interact across almost all aspects of neural axis interaction - ranging from immune function and endocrine systems to bodily sensations such as nerve impulses - so further exploration may promote understanding of cardio-cerebral axis mechanisms. This is crucial for addressing cardiac arrhythmias as well as disorders affecting the heart-brain axis like depression

Conclusion In this review, the anatomical association between the heart and brain is established through autonomic nerves, enabling bidirectional communication via the interoceptive pathway in both ascending and descending directions. External stimuli can induce genetic and physiological changes in the body's internal variables, affecting information channels and playing a significant role in mood disorders and cardiovascular disease development as well as comorbidity. Currently, comorbidity of depression and arrhythmia is prevalent; however, effective clinical treatments are lacking. Furthermore, limitations such as inadequate sample sizes and absence of causal research still exist. This review provides crucial insights for clinical management while offering new avenues for future research.

基于真实世界数据的抑郁症患者共病代谢综合征用药特征分析

齐涵 闫芳*

首都医科大学附属北京安定医院

目的 抑郁症(major depressive disorder, MDD)与代谢综合征(metabolic syndrome, MetS)之间存在复杂的相互作用关系。随着抑郁症共病代谢综合征患者的逐年增加,不仅不利于抑郁症患者的预后,也增加了社会疾病负担。目前抑郁症共病代谢综合征患者的用药特征及药物间的关联强度尚不清楚,给共病患者的用药指导造成一定困难。本研究旨在利用大样本真实世界数据探讨抑郁症住院患者共病MetS的相关因素用药特征和药物间的关联强度,为探索不同药物模式对共病患者的疗效差异,指导共病患者的药物选择提供研究依据。

方法 选择 2015-2021 年在北京安定医院住院治疗,符合 ICD-10 抑郁症诊断(编码为 F32.0-F32.9 和 F33.0-F33.9),年龄 35-70 岁(性别不限),住院时间 ≥ 14 天的抑郁症患者为研究对象,提取医院电子病历系统中患者的一般人口学情况、抑郁症疾病信息、血生化检查和体格检查、医嘱信息等数据,使用国际糖尿病联盟(International Diabetes Federation, IDF)标准进行 MetS 的判定。将精神科用药分成 6 大类和 21 小类,利用 Apriori 算法进行不同种类药物间的关联规则分析。

结果 共有 4126 名符合标准的抑郁症患者纳入本研究,男性 1323 人(32.1%),平均年龄 53.68 ± 9.64 岁。其中共病 MetS 的患者比例为 32.6%(95% CI: 31.2%-34.1%)。在用药比例方面,共病 MetS 的患者中使用抗焦虑药的比例最高(71.6%),其次为抗抑郁剂(65.8%)和苯二氮卓类药物(55.8%)。三环类抗抑郁剂、四环类抗抑郁剂、去甲肾上腺素和多巴胺再摄取抑制剂(NDRIs)和中成药的比例在 MetS 和非 MetS 组间差异存在统计学意义($P < 0.05$)。复发性抑郁患者以及合并失眠患者其联合使用多种药物的比例更高($P < 0.05$)。在共病 MetS 的患者中共发现 15 种药物关联规则,其中苯二氮卓和非苯二氮卓类镇静催眠药物的支持度最强;苯二氮卓、非苯二氮卓类镇静催眠药物和多受体作用药物(MARTAs)的置信度最高。

结论 共病 MetS 的 MDD 患者其用药模式与非共病患者间无显著差异,用药种类以抗焦虑药、镇静催眠类药物和抗抑郁剂为主。后续可关注不同用药模式对共病患者疗效和安全性的影响,为临床指导共病患者的药物选择提供循证证据。

DBT 治疗对抑郁障碍青少年认知情绪调节的影响

安花花 姜晓梅*
兰州石化总医院

目的 探讨 DBT 团体治疗对抑郁障碍青少年认知情绪调节的影响, 以期改善抑郁障碍青少年的认知情绪提供参考资料。

方法 选取 2023 年 6 月-2014 年 3 月在兰州石化总医院门诊和住院部诊疗的 60 例患有抑郁障碍的青少年为研究对象, 随机分为对照组和实验组各 30 例。对照组进行常规的药物治疗和物理治疗 13 周, 实验组在对照组的基础上进行连续 13 周的 DBT 团体治疗, 2 小时/次/周。对照组和干预组在干预前后及半年随访时间均采用汉密尔顿抑郁量 (HAMD)、认知情绪调节问卷 (CERQ) 进行评估, 采用 t 检验进行两组差异分析。

结果 干预前, 对照组和实验组 HAMD 与 CERQ 各项目得分差异均无统计学意义差异 ($P > 0.05$); DBT 治疗 13 周后, 实验组和对照组 HAMD 得分 (12.63 ± 3.13 , 30.63 ± 7.66), CERQ 消极情绪调节策略得分 (32.33 ± 7.64 , 45.89 ± 6.72), 积极情绪调节策略得分 (68.23 ± 10.96 , 59.51 ± 7.23) 得分比较, 差异均有统计学意义 (P 值均 < 0.01); 半年随访, 实验组与对照组 HAMD 得分 (16.63 ± 4.25 , 33.63 ± 7.71), CERQ 消极情绪调节策略得分 (36.33 ± 7.82 , 44.89 ± 6.01) 积极情绪调节策略得分 (63.23 ± 9.82 , 52.51 ± 6.23) 得分比较, 差异均有统计学意义 (P 值均 < 0.05)。

结论 连续 DBT 团体治疗可有效改善抑郁障碍青少年的抑郁情绪与认知情绪调节, 并且巩固效果较好。在青少年抑郁障碍的诊疗中, 可积极开展 DBT 团体治疗, 以此促进疾病转归。

重复经颅磁刺激治疗重度抑郁症后功能连接

改变及其与基因转录表达的关系

关慕楨¹ 谢远俊³ 王忠恒² 王化宁²

1. 西安医学院

2. 空军军医大学第一附属医院

3. 空军军医大学军事医学心理学系

目的 抑郁症 (major depressive disorder, MDD) 是一种以情绪调节和认知功能障碍为表现的常见精神疾病, 为第二大致残性精神疾病, 现已成为一个重大的公共健康问题。重复经颅磁刺激 (repetitive transcranial magnetic stimulation, rTMS) 是一种非侵入性的大脑刺激技术, 广泛用于治疗 MDD。研究发现, 抑郁症症状群及严重程度可能与脑功能异常有关, rTMS 可以通过调节神经可塑性改善抑郁症患者大脑功能中的度中心性, 进而改善抑郁症状。尽管其临床效果已被广泛认可, 但 rTMS 对基因表达的影响机制仍不清楚。本研究通过整合神经影像学和转录组学数据, 探讨 rTMS 在 MDD 治疗中的分子机制, 揭示 rTMS 改善抑郁症状的关键基因, 为 rTMS 缓解抑郁症状提供神经分子依据。

方法 本研究为随机对照研究, 选取门诊就诊的 49 例首次发病未用药的抑郁症患者, 其中真刺激治疗组 30 例, 伪刺激对照组 24 例。两组患者服用辉瑞普强公司生产的盐酸文拉法辛缓释胶囊 (国药准字 H20160382, 规格: 75 mg), 并选取左背外侧前额叶为刺激靶点, 进行连续 15 天的真刺激或伪刺激 rTMS 治疗。于基线和治疗第 15 天采用 17 项汉密尔顿抑郁量表 (Hamilton Depression Rating Scale, HAMD-17)、广泛性焦虑量表 (generalized anxiety disorder, GAD-7) 和病人健康问卷 (patient health questionnaire, PHQ-9) 数据评估抑郁症状, 并采集两组静息态功能磁共振成像数据。对静息态功能磁共振数据进行度中心性 (degree centrality, DC) 分析, 以评估大脑连接性变化。此外, 利用 Allen 人脑图谱的数据分析基因表达水平, 并评估 DC 变化与基因表达的相关性。

结果 治疗组的 HAMD-17 和 PHQ-9 评分显著低于治疗前。体素度中心性分析显示, 治疗后左侧内侧额上回、左侧枕中回和右侧前扣带回的 DC 增加。基因本体富集分析强调了与突触信号、神经投射发展和钠离子跨膜运输相关的生物过程。蛋白质交互作用分析识别了包括 SCN1A、SNAP25 和 PVALB 在内的关键枢纽基因。这些枢纽基因的表达

水平与 DC 变化呈正相关, 其中 SCN1A 显著预测了这些变化。

结论 研究结果强调了特定基因和神经网络在 rTMS 治疗 MDD 中的作用, 为 rTMS 治疗 MDD 的分子机制提供了理论基础。

Altered Task-modulated Functional Connectivity During Emotional Face Processing in Mood Disorders Patients: A Whole-brain Task-based Connectome Study

Xue Han¹, Linling Li²

1.Nanshan center for chronic diseases control

2.Shenzhen University

Objective Neuroimaging characteristics have demonstrated abnormal regional brain activities during emotional face processing in bipolar disorder (BD) patients and major depressive disorder(MDD) patients. However, previous studies have ignored the investigation of altered task-modulated functional connectivity (FC) in BD and MDD from a large-scale network perspective

Methods Twenty-nine euthymic BD patients, 21 MDD patients and 29 healthy controls (HC) were recruited, and task fMRI data were collected during a faces-matching task. Whole-brain psychophysiological interaction (PPI) analysis was performed to identify task-modulated FC pattern. Both task-modulated FC strength and graph-theoretical-based network properties were compared between BD and HC, MDD and HC

Results Compared with HC, BD exhibited significantly different patterns (such as increased FC between the default mode network and cerebellum network, occipital, and sensorimotor network, and decreased FC between fronto-parietal network and cingulo-opercular and sensorimotor networks). Comparison of network-based metrics of task-modulated FC revealed no significant difference of global graphic-theo-

retical metrics (global efficiency and clustering coefficient), but increased local efficiency in the fronto-parietal network for MDD

Conclusion These results suggested that euthymic BD patients were still suffering from subthreshold clinical symptoms of associated with aberrant task-modulated FC patterns during emotional processing task. And these aberrant task-modulated FC might be considered an endophenotype of the MDD condition persistent in the euthymic state.

目的 双相障碍正确诊断一般需 3-5 年时间, 导致患者临床治疗效果欠佳, 自杀风险更高, 给患者和家庭带来沉重负担。因此, 早期识别双相障碍尤为重要。既往研究从临床症状, 脑影像学等多维度信息试图寻找可以早期识别 BD 的客观指标, 但目前仍存在很多未知。本研究通过对抑郁发作患者进行随访, 试图从神经电生理角度寻找可以早期识别 BD 的电生理指标。

方法 本研究选取 2009-2019 年期间入组的 138 例抑郁发作患者, 62 例健康对照者进行脑磁图 (magnetoencephalogram, MEG) 扫描, 收集静息态睁眼信号。经过 5-10 年随访, 有 29 例抑郁发作患者转为双相障碍 (converted to bipolar disorder, ctBD), 77 例抑郁发作诊断仍为抑郁症。基于 matlab 平台利用 fieldtrip 工具包对数据进行去高频、滤波, 去除伪迹处理。并基于个体化磁共振数据进行溯源分析, 选取感兴趣频段 theta(4-7Hz), alpha(8-12Hz), beta(13-30Hz), gamma(30-80Hz)。运用 Cluster-based permutations 的非参数统计方法进行统计分析

(cluster α =0.01, α =0.5)。

结果 溯源层面上发现三组间差异主要表现在 theta, alpha, gamma 频段差异具有统计学意义。差异具有显著性统计学的结果主要集中在前额叶 (背外侧前额叶、眶额回), 扣带回, 小脑 (蚓状体, 小脑半球), 边缘结构 (海马、海马旁回), 皮层下结构 (苍白球、壳核、丘脑), 感觉运动皮层 (初级运动皮层, 感觉运动皮层) 等多个脑区。两两比较发现转相组和健康人差异主要表现在右侧皮层下 (丘脑、壳核) 和前额叶、枕颞叶等脑区, 健康组和抑郁组, 转相组和抑郁症组差异主要表现为枕颞叶和小脑。

结论 本研究试图通过静息态频谱能量角度寻找可早期识别双相的神经电生理标记物, 结果发现转相患者与抑郁发作患者在情绪处理相关脑区均与正常人存在差异, 这可能是抑郁发作的神经电生理基础。而枕颞叶小脑有望成为早期识别双相的脑区。

Investigating Cognitive Improvement Using Transcranial Direct Current and Repetitive Transcranial Magnetic Stimulation in Major Depressive Disorder: A Double-Blind, Randomized, Placebo-Controlled Study"

Xingxing Li Junyao Liu Shuochi Wei Jiaxin Li Yuchen Li Ruichenxi Luo Yanli Li Dongsheng Zhou*
Affiliated Kangning Hospital of Ningbo University

Objective Cognitive dysfunction is one of the common symptoms in patients with major depressive disorder

(MDD). Repetitive transcranial magnetic stimulation (rTMS) and transcranial direct current stimulation (tDCS) have been studied separately in the treatment of cognitive dysfunction in MDD patients. We aimed to investigate the effectiveness and safety of rTMS combined with tDCS as a new therapy to improve neurocognitive impairment in MDD patients.

Methods In this brief 2-week, double-blind, randomized, and sham-controlled trial, a total of 550 patients were screened, and 240 MDD inpatients were randomized into four groups (active rTMS + active tDCS,

active rTMS + sham tDCS, sham rTMS + active tDCS, sham rTMS + sham tDCS). Finally, 203 patients completed the study and received 10 treatment sessions over a 2-week period. The Repeatable Battery for the Assessment of Neuropsychological Status (RBANS) was performed to assess patients' cognitive function at baseline and week 2. Also, we applied the 24-item Hamilton Depression Rating Scale (HDRS-24) to assess patients' depressive symptoms at baseline and week 2

Results After 10 sessions of treatment, the rTMS combined with the tDCS group showed more significant improvements in the RBANS total score, immediate memory, and visuospatial/constructional index score (all $p < 0.05$). Moreover, post hoc tests revealed a significant increase in the RBANS total score and Visuospatial/Constructional in the combined treatment group compared to the other three groups but in the immediate memory, the combined treatment group only showed a better improvement than the sham group. The results also showed the RBANS total score increased significantly higher in the active rTMS group compared with the sham group. However, rTMS or tDCS alone was not superior to the sham group in terms of other cognitive performance. In addition, the rTMS combined with the tDCS group showed a greater reduction in HDRS-24 total score and a better depression response rate than the other three groups.

Conclusion rTMS combined with tDCS treatment is more effective than any single intervention in treating cognitive dysfunction and depressive symptoms in MDD patients

Evaluating The Effectiveness and Tolerance of Combined RTMS and TDCS in Treating Depression: A Randomized, Double-Blind, Placebo-Controlled Trial

Xingxing Li¹, Dongsheng Zhou¹, Shuochi Wei¹, Yuchen Li¹, Jiaxin Li¹, Junyao Liu¹, Ruichenxi Luo¹, Yanli Li¹, Xiangyang Zhang^{2,3}

1. Affiliated Kangning Hospital of Ningbo University
2. Department of Psychology, University of Chinese Academy of Sciences
3. CAS Key Laboratory of Mental Health, Institute of Psychology, Chinese Academy of Sciences

Objective Non-invasive brain stimulation (NIBS) is an effective method of treating depression with fewer side effects than medications. Since repetitive transcranial magnetic stimulation (rTMS) and transcranial direct current stimulation (tDCS) are individually well-studied in the treatment of depression, we aimed to test the clinical effectiveness, safety, and tolerability of rTMS combined with tDCS as a new treatment for depression

Methods In this brief 2-week double-blind, randomized and sham-controlled trial with 10 sessions of rTMS +/- tDCS vs a mixture of pharmacotherapies, a total of 180 inpatients with major depressive disorder (MDD) were randomized to four groups (active rTMS + active tDCS, active rTMS + sham tDCS, sham rTMS + active tDCS, sham rTMS + sham tDCS), and received 10 treatments over two weeks. We measured the 24-item Hamilton Depression Rating Scale (HDRS-24) at baseline and at 2 weeks. Remission was defined as HDRS-24 total score ≤ 9 after treatment, and response was defined as a $\geq 50\%$ reduction in HDRS-24 total score from baseline. We reassessed the HDRS-24 at 4 weeks as a follow-up

Results After two weeks of treatment, rTMS alone was superior to the sham group on the reduction of HDRS-24 total score ($p < 0.01$), but tDCS alone was not. rTMS combined with tDCS significantly reduced HDRS-24 total score more than the other three groups (16.41 vs 13.62 vs 12.19 vs 9.77; all $p < 0.01$). Moreover, rTMS combined with tDCS also had significantly higher response and remission rates than the other three groups. In addition, rTMS combined with tDCS group reported similar side effect rates as the rTMS group alone

Conclusion rTMS combined with tDCS treatment is a new NIBS approach that is more effective than either single intervention and it has a comparable safety profile

关键词: Major depressive disorder; rTMS; tDCS; clinical trial; efficacy.

基于机器学习的抑郁症患者自杀意念预测模型的构建

陈芸¹ 杨海燕¹ 姜忠义² 董贯忠¹ 王珂¹ 张伟媛¹
1. 常州市第二人民医院
2. 常州大学

目的 采用机器学习算法建立汉密尔顿抑郁量表中各因子与自杀意念风险的预测模型,用于早期识别抑郁症患者是否伴有自杀意念。

方法 招募常州市第二人民医院心理科自杀意念问卷中文版(BSI-CV)将患者分为有自杀意念组和无自杀意念组。通过支持向量机(SVM)、朴素贝叶斯分类(NBC)、随机森林(RF)、极度随机树(ERTC)四种机器学习模型预测抑郁症患者自杀意念的风险,以模型的准确率、精确率、召回率、F1值、Kappa系数、MCC系数以及AUC值评估模型性能,选出最优模型,利用最优模型分析HAMD-24中与自杀意念相关性最强的因子。

结果 两组之间首诊/复诊($\chi^2=1.15, P=0.28$)、性别($\chi^2=1.98, P=0.16$)、文化程度($\chi^2=6.27, P=0.099$)、吸烟史($\chi^2=1.18, P=0.277$)、饮酒史($\chi^2=2.66, P=0.103$)比较无统计学差异。有自杀意念组平均年龄小于无自杀意念组($Z=-6.62, P < 0.001$),有无使用抗抑郁药($\chi^2=4.21, P < 0.05$)之间比较具有统计学差异。两组患者HAMD总分及相关因子包括:抑郁情绪、有罪恶感、入睡困难、工作和兴趣、迟缓、激越、躯体性焦虑、胃肠道症状、全身症状、疑病、体重减轻、自知力、日夜变化、偏执症状、能力减退感、绝望感、自卑感之间存在统计学差异($P < 0.05$ 或 $P < 0.001$)。睡眠不深、早醒、精神性焦虑、性症状、人格解体或现实解体、强迫症状相比较无统计学差异($P > 0.05$)。基于预测效能较优的极度随机树分析HAMD-24中与自杀意念相关性较强的因子主要为:绝望感、有罪恶感、自卑感、工作和兴趣、抑郁情绪。

结论 机器学习算法能有效预测HAMD-24中与自杀意念相关的危险因子,且极度随机树表现最佳,有助于早期识别抑郁症患者中有自杀意念者,尽早干预,降低自杀率。同时可以作为开发抑郁、自

杀等相关新量表条目的理论参考依据。

Abnormal Functional Connectivity Patterns of Amygdala and Relationships with Emotion Blunting in Treated MDD Patients

刘敏 张裕裕 蔡敏 王化宁*

空军军医大学附属西京医院

Objective Emotion blunting (EB) is one of the common symptoms in patients diagnosed with major depressive disorder (MDD). EB is still reported by many MDD patients during antidepressant treatment. The study aims to explore neuropsychological differences between MDD patients with EB symptoms after 6 weeks of systematic antidepressant treatment and healthy controls (HCs).

Methods In this study, 40 MDD patients with EB after 6 weeks of systematic antidepressant treatment and 28 HCs were recruited. The resting-state functional magnetic resonance imaging (rs-fMRI) data were collected. The amygdala was taken as the region of interest (ROI), and the functional connectivity (FC) between the amygdala and other brain regions was measured to confirm the different patterns of FC between the two groups. The correlation between the significantly different FC values and the severity of EB and depression symptoms was calculated.

Results Compared with HCs, MDD patients with EB symptoms demonstrated extensive decreased amygdala connectivity with cortical-limbic-subcortical regions. The abnormal FC in MDD patients with EB is associated with the severity of EB and depressive symptoms. In MDD patients with EB, the abnormal FC between amygdala and caudate, olfactory is significantly associated with depressive symptoms. The abnormal FC between amygdala and fusiform, paraHippocampal, anterior cingulum cortex (ACC), insula, middle occipital gyrus (MOG), prefrontal cortex is significantly associated with the severity of EB.

Conclusion This study indicate that the amygdala is a core brain region closely associated with the pathological mechanisms of depression, but the neural bases of general depressive symptoms and EB symptoms are mutually separated. The abnormal FC patterns of amygdala may be the neurobiological basis of EB symptoms in MDD

关键词：Emotional blunting, MDD, Functional connectivity, Amygdala.

Social Isolation Associated with Depression: A Mediation Analysis

Lian Li Hongying Yang Guolin Bian*

Affiliated Kangning Hospital of Ningbo University

Objective Social isolation was associated with depression among older adults, however, little is known in China

Methods We conducted a cross-sectional study including 6,664≥65 years older adults in Ningbo, China. We collected study data by self-report scales, and depression and social isolation were measured by Patient Health Questionnaire-9 scales and social isolation relevant scales. The relationship between social isolation and depression was estimated by Karlsson-Holm-Breen's mediation and multivariate-adjusted logistic regression models

Results Overall, the percentage of participants who had experienced social isolation, depression was 12.67% and 4.83%. Compared with the elderly without social isolation, the adjusted odds ratios (95% confidence interval) of depression with social isolation were 1.77 (1.25–2.51). However, no significant associations of social isolation with depression was observed in male participants [AOR (95% CI) = 1.42 (0.77-2.58)]. In contrast, female participants who had experienced social isolation were 1.99 times more likely to have depression. In addition, regarding the mediation models, the strong adjusted association between social isolation and depression was mediated through three lifestyle behaviors

(sedentary, physical inactivity and self-reported unhealthy diet) and two sleep behaviors (sleep disturbance and abnormal sleep duration), and these variables were found to mediate 3.07% to 9.98% of the total association

Conclusion In Chinese older adults, social isolation has been linked to depression, suggesting the importance of taking effective and feasible interventions to reduce social isolation

关键词: Social isolation, depression, mediation analysis

基于机器学习非自杀性自伤在青少年抑郁障碍患者中 自杀风险的中介因素研究

朱轩妍 陈芸 姜忠义 毕冉 张乔阳 曹音 董贯忠*
常州市第二人民医院

目的 青少年自杀是一个严重的公共卫生问题。非自杀性自伤行为在抑郁障碍患者自杀过程中所起作用仍存在争议。机器学习结合常见的临床资料判断 NSSI 的中介作用相关研究比较少。本研究旨在通过机器学习的方法探讨非自杀性自伤在抑郁障碍患者出现自杀风险的作用。

方法 纳入 179 例青少年抑郁症患者, 采用 HAMD-24、贝克自杀风险量表、非自杀性自伤量表进行问卷调查。通过梯度提升回归模型分析 NSSI、抑郁和自杀风险之间的相关性。中介分析分三步完成: 第一步检验抑郁得分与自杀风险的相关性, 第二步检验抑郁得分与非自杀性自伤的相关性, 第三步检验抑郁得分与非自杀性自伤与自杀风险的相关性。结果 非自杀性自伤在抑郁障碍的男生中发生比率 32.78%, 女性的发生率 35.59%; 以高中生中发生率最高, 63.27%, 大学生逐渐减少, 18.63%, 有吸烟、饮酒史的抑郁障碍患者中发生比例高。非自杀性自伤在高中生中发生率最高, 与性别无关。有吸烟饮酒史的抑郁障碍患者中发生 NSSI 的比例高。NSSI 在抑郁障碍患者的自杀风险具有部分中介作用。

结论 NSSI 加重了抑郁障碍患者自杀风险。重视抑郁障碍患者的 NSSI, 早期采取措施, 有利于减少自杀的风险。

关键词: 抑郁障碍; 非自杀性自伤; 自杀风险; 中介因素; 机器学习

正念减压疗法对降低抑郁症患者自杀行为发生率及对 QOL 评分的影响

邱吉明 金凤奎* 申璿 吴乔
赣州市第三人民医院

目的 抑郁症是临床常见疾病, 患者的典型症状为持久性心境障碍, 同时伴随有注意困难、思维迟缓、抑郁悲观、兴趣低落, 甚至是自杀倾向, 很难融入到家庭与社会当中, 社会功能显著降低, 生活质量明显受到影响。有研究显示, 单纯给予患者抗抑郁治疗患者的康复效果较差, 联合其他治疗更有利于提高效果, 加快社会功能恢复。正念减压疗法从我国佛教起源, 是一种通过调节自身内心的一种方式, 多项研究显示, 正念减压疗法可以改善个体不良情绪。但是具体如何还需要进一步进行研究, 故本次研究对正念减压疗法对降低抑郁症患者自杀行为发生率及对 QOL 评分的影响做了深入分析, 期望可以为临床更好的治疗抑郁症患者提供依据。

方法 选取三甲精神专科医院收治的抑郁症患者 80 例, 分为两组 (根据治疗方法不同), 对照组马来酸氟伏沙明治疗, 研究组联合正念减压疗法治疗。比较两组治疗效果、抑郁情况、睡眠质量、生存质量评分 (QOL)、自杀行为发生率。

结果 研究组效果比对照组大 ($P < 0.05$); 研究组抑郁、睡眠质量评分比对照组小 ($P < 0.05$); 研究组食欲、精神与体力、睡眠、毁形情况、疼痛、家庭理解与照顾、社会支持、自身疾病认识、对治疗的态度、活动能力、治疗副作用、面部表情、总分等 QOL 评分比对照组大 ($P < 0.05$); 研究组自杀行为发生率比对照组小 ($P < 0.05$)。

结论 在抑郁症治疗中, 使用马来酸氟伏沙明联合正念减压疗法治疗效果较好, 可以对患者的不良情绪进行改善, 且可以改善患者睡眠质量, 减少自杀行为。

目的 性功能障碍是抗抑郁药物的一个重要不良反应，会影响患者对治疗方案的依从性，降低患者的生活质量。本研究旨在系统评价不同抗抑郁药在抑郁障碍患者急性期治疗期间性功能障碍发生的风险。

方法 在 PubMed、Embase、Cochrane 临床对照试验中心注册数据库和 Web of Science 数据库中系统检索抗抑郁药治疗抑郁障碍的随机对照试验，检索时间范围限定为 1996 年 1 月 1 日至 2023 年 4 月 30 日。由两名研究者独立筛选文献、提取数据及评价纳入研究的偏倚风险。采用 R 4.0.1 软件进行成对 Meta 分析和网状 Meta 分析，并基于 Emax 方法评价抗抑郁药导致性功能障碍的剂量-反应关系。

结果 共纳入 73 项随机对照试验，样本量为 23481。网状 Meta 分析结果显示，与安慰剂相比，选择性 5-羟色胺再摄取抑制剂、5-羟色胺-去甲肾上腺素再摄取抑制剂和阿戈美拉汀与性功能障碍发生风险相关。文拉法辛 (OR 14.02 [95% CI 4.02-48.82])、瑞波西汀 (8.74 [4.23-18.03]) 和度洛西汀 (7.61 [2.80-20.70]) 的性功能障碍风险最高。奈法唑酮 (0.30 [0.01-7.36])、托鲁地文拉法辛 (0.48 [0.01-24.44]) 和伏硫西汀 (1.65 [0.44-5.20]) 发生性功能障碍风险最低。度洛西汀、艾司西酞普兰、氟西汀、左旋米那普仑、帕罗西汀、舍曲林和文拉法辛剂量的增加与性功能障碍的风险增加呈剂量-反应关系。

结论 多种抗抑郁药在抑郁障碍治疗的急性期会导致性功能障碍风险增加，其中奈法唑酮、托鲁地文拉法辛和伏硫西汀风险最低。本研究为基于患者价值偏好选择抗抑郁药物提供了临床依据。

目的 编制注意力评估量表 (ARS) 并进行信效度检验，初步探索其筛查抑郁症 (MDD) 注意力损害的理想划界值。

方法 根据文献查阅筛选注意力量表条目池，获得注意力评估包含的 6 个关键维度，应用 Delphi 专家咨询法进行 2 轮修订，拟定 ARS 的 12 个条目，进行量表条目分析、信效度分析。纳入 120 例成人健康受试 (HS) 进行 ARS 评估，随机纳入其中 84 例评估多伦多医院警觉性测试 (THAT)，作为量表金标准与 ARS 进行校标效度检验。随机纳入其中 30 例受试者进行注意网络测试 (ANT)，作为客观检测金标准与 ARS 进行校标效度检验。随机纳入 39 例 HS 在基线评估后 1 周进行 ARS 重测。分析量表的内部一致性信度、重测信度、结构效度、内容效度和效标效度。纳入 60 例成人 MDD 进行 ARS 信、效度的评估，应用 ROC 曲线分析 ARS 筛查 MDD 注意力损害的理想划界分。

结果 ARS 的 12 个条目分别评估注意力的 6 个维度：注意集中、注意维持、注意转移、选择注意、分配注意及反应抑制。各条目 CR 为 3.72-8.73 (均 $P < 0.01$)，各条目与总分 Pearson 相关系数为 0.36-0.71 (均 $P < 0.01$)。邀请 5 位相关领域专家进行量表条目评估，平均内容效度指数为 0.95。HS 组和 MDD 组 ARS 的克朗巴赫 α 分别为 0.776、0.718；重测信度分别为 0.825、0.807。HS 组因子分析发现 ARS 包含 4 个因子：注意力灵活性（注意集中，选择注意）、反应抑制、多任务处理（分配注意，注意维持）和注意转移，总贡献率为 53.42%。ARS 总分与 THAT 总分呈中高度正相关 ($r = 0.57, P < 0.01$)，与 ANT 的总 ER 中度负相关 ($r = -0.38, P < 0.05$)。以 43 分作为区分 HS 与 MDD 注意力损害的划界分，对应的灵敏度为 53.33%，特异度为 84.67%。

结论 ARS 编制条目结构合理，可以可靠、有效的评估注意力的 6 个维度。总分可以反映注意力水平，总分越高，注意力水平越高。ARS 能可靠、有效的评估 MDD 的注意力损害，43 分可特异性的区分 HS 与 MDD 注意力的差异，可以作为筛查 MDD 注意力损害的划界值。

Objective Recent clinical advances have shown promising developments in the use of psilocybin for treating psychological disorders such as depression, addiction, and obsessive-compulsive disorder. Psilocybin is a psychedelic whose metabolite, psilocin, is a 5-HT_{2A} receptor agonist. However, the mechanisms for effect of psilocybin in depression are not fully illustrated. The primary purpose of the current study was to elucidate the underlying mechanisms for the anti-depressant effect of psilocybin, and its cell-type-specific and circuit effects on the orbitofrontal cortex (OFC), a brain region vulnerable to brain disorders such as depression.

Methods Here, we combined single-nucleus RNA-seq with functional assays to study the long-term effects of psilocybin on the OFC. We characterized the intrinsic and synaptic properties of neurons in the OFC to understand the functional changes of the OFC after psilocybin injection. With AAV mediated cell-type-specific shRNA, we knockdowned Htr2a in neurons of the OFC to understand the cell-type-specific mechanism of it on neuronal activities in the OFC. We evaluated the anti-depressant effect of psilocybin with a chronic stress model, repeated forced swimming test.

Results We showed that a single dose of psilocybin induced long-term genetic and functional changes in neurons in the OFC, and excitatory and inhibitory neurons jointly reduced microcircuit activity of the brain region. Knockdown of 5-HT_{2A} receptor in deep layer excitatory neurons abated psilocybin-induced functional changes and the anti-depressant effect.

Conclusion Together, these results showed the cell-type-specific and microcircuit mechanisms of psilocybin on the functions of the OFC and shed light on the understandings of the anti-depressant effect of psychedelics

不同移植方式下人脱落乳牙牙髓干细胞对WKY 抑郁模型大鼠的治疗作用

于菲 刘莎 徐勇*

山西医科大学第一医院

目的 重度抑郁症 (Major depressive disorder, MDD) 是一种常见的精神疾病, 患病率高, 社会负担严重, 给患者及其家属带来痛苦, 但目前主要药物治疗方式的效果欠佳, 且副作用明显, 因此迫切需要一种新型高效的治疗方式。干细胞 (Stem cells) 是一类具有高度自我增殖和多向分化潜能的非特化细胞, 具有强大的组织修复能力, 干细胞疗法近年来发展为一种极具潜力的神经和精神疾病新型治疗方式。本研究拟探讨不同移植方式下人脱落乳牙牙髓干细胞 (SHED) 对 WKY 抑郁模型大鼠的治疗作用。

方法 复苏培养 SHED 细胞; 将 30 只 WKY 雄性大鼠随机分为模型对照组, 脑室内立体定位注射 SHED 细胞移植组、鼻内递送 SHED 细胞移植组, 每组 10 只, 另有 10 只雄性 Wistar 大鼠作为正常对照组。移植组 WKY 大鼠适应性饲养 1 周后分别给予脑室内立体定位注射 SHED 细胞和鼻内递送 SHED 细胞, 移植 3 周后通过蔗糖偏好实验、Y 迷宫、强迫游泳实验及旷场实验评估不同移植方式下 SHED 治疗的效果; 酶联免疫吸附实验 (ELISA) 检测神经营养因子 BDNF、GDNF 和炎症因子 IL-1 β , IL-6 及 TNF- α 等的表达水平。

结果 行为学实验观察到 SHED 移植治疗可以减轻 WKY 抑郁模型大鼠的抑郁行为并提高大鼠短期记忆力, 脑室内立体定位注射组的治疗作用高于经鼻递送组; ELISA 实验检测到 SHED 移植治疗后大鼠海马区和血清中神经营养因子 BDNF、GDNF 等表达水平升高, 而炎症因子 IL-1 β , IL-6 及 TNF- α 等的表达水平降低, 脑室内立体定位注射组的治疗作用高于经鼻递送组。

结论 SHED 移植治疗具有抗抑郁作用, 可能是通过神经营养保护和免疫调节抗炎的方式实现, 脑室内移植治疗的作用优于经鼻递送。

High-fat Diet Induced Depression-like Phenotype Via Hypocretin-HCRTR1 Mediated Inflammation Activation

Jingyi Dong Jinghui Zhang Shangping Cheng Bin Qin Kangyu Jin Bing Chen Yuyan Zhang Jing Lu*

The First Affiliated Hospital of Zhejiang University School of Medicine

Objective High-fat diet (HFD) is generally associated with an increased risk of mental disorders that constitute a sizeable worldwide health. HFD results in the gut microbiota-brain axis being altered and linked to mental disorders. Hypocretin-1, which can promote appetite, has been previously confirmed to be associated with depression. However, no exact relationship has been found in hypocretin between depression and HFD.

Methods Adult male SD rats were randomly assigned to either an HFD or a normal diet, followed by behavioral tests and plasma biochemical analyses. Then, we investigated the protein and mRNA levels of inflammation-related factors in the hippocampus. We also observed morphological changes in brain microglia and lipid accumulation. Additionally, metagenomics and metabolomics analyses of gut microbiomes were performed. 3T3-L1 cells were utilized in vitro to investigate the impact of hypocretin-1 and hypocretin receptor 1 antagonists (SB334867) on lipid accumulation. We used a conditioned medium (CM) treated with 3T3-L1 cells to observe the activation and phagocytosis of BV2 cells. Following a 12-week period of feeding a high-fat diet (HFD) to C57BL/6 mice, a three-week intervention period was initiated during which the administration of the hypocretin antagonist SB334867 was observed. This was followed by a series of assessments, including monitoring of body weight changes and emotional problems, as well as attention to plasma biochemical levels and microglial cell phenotypes in the brain.

Results The HFD rats displayed anxiety and depressive-like behaviors. HFD rats exhibited increased plasma HDL, LDL, and TC levels. HFD also causes an

increase in hypocretin-1 and hypocretin-2 in the hypothalamus. Metagenomic and metabolomics revealed that HFD caused an increase in the relative abundance of associated inflammatory bacteria and decreased the abundance of anti-inflammatory and bile acid metabolites. Hippocampal microglia in the HFD group were significantly activated and accompanied by lipid deposition. Levels of inflammation-related factors were increased. We found that SB334867 could significantly reduce lipid accumulation in 3T3-L1 cells after differentiation, and after adding treated CM to BV2 cells, BV2 cells were activated, and lipid droplets accumulated. The expression of inflammatory factors decreased in the SB334867 group. The administration of a hypocretin antagonist was found to reverse the adverse effects of the HFD on body weight, depressive-like behaviour and anxiety-like mood. Furthermore, this treatment was associated with improvements in plasma biochemical levels and a reduction in the number of microglia in the brain.

Conclusion Our results demonstrated that HFD induced anxiety and depressive-like behaviors, which may be linked to the increased hypocretin level and lipid accumulation.

Hypocretin-1/hypocretin Receptor 1 Regulates Neuroplasticity and Cognitive Function Through Hippocampal Lactate Homeostasis in Depressed Model

Bing Chen Kangyu Jin Jingyi Dong Shangping Cheng Lingzhuo Kong Shaohua Hu Zuobing Chen Jing Lu*
The First Affiliated Hospital of Zhejiang University School of Medicine

Objective Cognitive dysfunction is a common symptom of major depressive disorder. The disruption of hypocretin regulation is known to be associated with depression, however, their exact correlation is remains to be elucidated.

Methods We investigated the effects of hypocretin receptor 1 (HCRTR1) antagonists with chronic unpredictable mild stress (CUMS) on depressive and cognitive behaviors and hippocampal neuroplasticity. Plasma and hypothalamus hypocretin-1 level were determined by ELISA in each group. mRNA expression of the hypoxia inducible factor 1 α (HIF-1 α) and molecules of lactic acid transport pathway were measured in hippocampus. We also conducted intraventricular injection (icv.) of hypocretin-1 rats, microPET was used to analyze hippocampus glucose metabolism, molecules of lactic acid transport pathway and lactic acid were analysis. Specifically knockdown of HCRTR1 in hippocampal astrocytes in combination with the CUMS mouse model was used to further validate the role of the orexin system in depression. Additionally, further mechanisms also verified in hippocampus primary astrocytes and neuron invitro.

Results Hypocretin-1 levels were increased in the plasma and hypothalamus from chronic unpredictable mild stress (CUMS) model mice. Excessive hypocretin-1 via HCRTR1 conduction reduced lactic acid production and brain-derived neurotrophic factor (BDNF) expression by HIF-1 α , thus impairing adult hippocampal neuroplasticity, and cognitive impairment in CUMS model, which reversed by HCRTR1 antagonist. The direct effect of hypocretin-1 on hippocampal lactic acid production and cognitive behavior was further confirmed by intraventricular injection of hypocretin-1 and microPET-CT in rats. Additionally, these mechanisms were further validated in astrocytes and neurons in vitro. Moreover, these phenotypes and changes in molecules of lactic acid transport pathway could be duplicated by specifically knockdown of HCRTR1 in hippocampal astrocytes.

Conclusion In summary, the results provide molecular and functional insights for involvement of hypocretin-1-HCRTR1 in altered cognitive function in depression.

SEP-363856 Exerts Neuroprotection Through The PI3K/AKT/GSK-3 β Signaling Pathway in A Dual-hit Neurodevelopmental Model of Schizophrenia-like Mice

Mengdie Li Huanzhong Liu*

Chaohu Hospital of Anhui Medical University

Background Schizophrenia (SZ) is a serious, destructive neurodevelopmental disorder. Antipsychotic medications are the primary therapy approach for this illness, but it's important to pay attention to the adverse effects as well. Clinical studies for SZ are currently in phase III for SEP-363856 (SEP-856)-a new antipsychotic that doesn't work on D2 receptors. However, the underlying action mechanism of SEP-856 remains unknown

Objectives This study aimed to evaluate the impact and underlying mechanisms of SEP-856 on SZ-like behavior in a perinatal MK-801 treatment combined with social isolation from the weaning to adulthood model (MK-SI)

Methods First, we created an animal model that resembles SZ that combines the perinatal MK-801 dose with social isolation from the weaning to adulthood. Then, different classical behavioral tests were used to evaluate the antipsychotic properties of SEP-856. The levels of proinflammatory cytokines (TNF- α , IL-6, and IL-1 β), apoptosis-related genes (Bax and Bcl-2), and synaptic plasticity-related genes (BDNF and PSD95) in the hippocampus were analyzed by qRT-PCR. Hematoxylin and eosin staining (H&E) were used to observe the morphology of neurons in the hippocampal DG area. Western blot was performed to detect the protein expression levels of BDNF, PSD95, Bax, Bcl-2, PI3K, p-PI3K, AKT, p-AKT, GSK-3 β , p-GSK-3 β in the hippocampus

Results The MK-SI SZ neurodevelopmental disease model studies demonstrated that MK-SI mice exhibited considerably higher levels of autonomic activity, withdrew from social interactions, and had impairments in recognition memory when compared to sham mice.

These findings imply that the MK-SI model can mimic symptoms similar to those of SZ. Compared with the MK-SI model, both 1mg/kg and 10mg/kg SEP-856 significantly shortened increased activity, improved social interaction, and reversed recognition memory impairment in MK-SI mice. In addition, SEP-856 can reduce the release of proinflammatory factors in the MK-SI model, promote the expression of BDNF and PSD95 in the hippocampus, correct the Bax/Bcl-2 imbalance, turn on the PI3K/AKT/GSK-3 β signaling pathway, and ultimately help the MK-SI mice's behavioral abnormalities

Conclusion SEP-856 may play an antipsychotic role in MK-SI "dual-hit" model-induced SZ-like behavior mice by promoting synaptic plasticity recovery, decreasing death of hippocampal neurons, lowering the production of proinflammatory substances in the hippocampal region, and subsequently initiating the PI3K/AKT/GSK-3 β signaling cascade

Effects of Combined Computerized Cognitive Remediation Therapy on Efficacy, Cognitive Function and Biological Indicators in Schizophrenia

Jinling Zhang* Ziwei Wang

Shantou University Mental Health Center

Objective Schizophrenia is a severe chronic mental disorder, and cognitive impairment is now recognized as a clinical feature of the disease. There is a lack of effective pharmacological treatments for cognitive impairment in patients with schizophrenia, and the role of computer-programmed cognitive remediation therapy for schizophrenia is gradually gaining attention. The aim of this study was to investigate the role of Computerized Cognitive Remediation Therapy (CCRT) on the efficacy, cognitive function and biological indexes of unmedicated schizophrenia, and to further analyze the relationship between biological indexes and cognitive function

Methods Fifty-five patients with schizophrenia who were not taking antipsychotics more than 4 weeks before the first or admission were included in this study, and they were randomly assigned to the group of conventional medication combined with CCRT (denoted as CCRT group) and the group of conventional medication (denoted as TAU group). CCRT treatment was given for more than 3 times a week for 30 minutes each time. The patients were assessed using Positive and Negative Symptom Scale (PANSS), Montreal Cognitive Assessment Scale (MoCA), and Social Dysfunction Scale (SDSS) on the day of admission and at the 8th week of admission. Blood biochemical indexes were tested on the next day of admission and at the 8th week of admission and 5 ml of venous blood was collected to take the serum for freezing, and serum IGF-1 was uniformly measured by ELISA at the end of all the samples collection, BDNF levels. SPSS 26.0 software was used to analyze the data, and independent samples t-test, Mann-Whitney U and chi-square test were used to compare the differences between groups, paired t-test and Wilcoxon test were used to compare before and after, and Pearson, Spearman correlation analysis and partial correlation analysis were used to explore the correlation between the biological indexes and the scores of MoCA

Results 1. The PANSS scale factor scores decreased in the CCRT and TAU groups after follow-up compared with before follow-up, and the difference was statistically significant ($P<0.05$). Visual space and executive scores ($P<0.001$), attention scores ($P=0.012$), abstract thinking scores ($P=0.001$), delayed recall scores ($P<0.001$), orientation scores ($P<0.001$) and total MoCA scores ($P<0.001$) in CCRT group increased after follow-up, and the differences were statistically significant. The naming score ($P=0.012$) was lower than that before follow-up, and the difference was statistically significant. After follow-up, the visuospatial and executive scores ($P=0.008$) and abstract thinking scores ($P<0.001$) in TAU group were higher than before follow-up, and the differences were statistically significant, while the naming scores ($P=0.020$) and language scores ($P=0.003$) were lower than before follow-up, and the differences were statistically significant. The total score

of MoCA was not significantly different from that before follow-up ($P=0.242$). SDSS scores in CCRT and TAU groups were significantly lower after follow-up than before follow-up ($P<0.001$)

2. The difference of negative symptom score before and after follow-up in CCRT group was higher than that in TAU group, with statistical significance ($P=0.039$). The differences of visual space and executive score ($P=0.028$), delayed recall score ($P<0.001$), orientation score ($P=0.030$) and total MoCA score ($P<0.001$) before and after follow-up in CCRT group were higher than those in TAU group, and the differences were statistically significant. The difference of SDSS score before and after follow-up in CCRT group was higher than that in TAU group, and the difference was statistically significant ($P=0.033$).

3. The levels of insulin ($P=0.004$), triglyceride ($P<0.001$), IGF-1 ($P<0.001$), and BDNF ($P<0.001$) increased after follow-up in the CCRT group compared with those before follow-up, and the difference was statistically significant, and the levels of insulin ($P=0.033$), triglyceride ($P<0.001$), and BDNF ($P=0.001$) in the TAU group after follow-up increased compared with the pre-follow-up period, and the difference was statistically significant; the difference in triglyceride ($P=0.049$) and IGF-1 levels ($P=0.047$) before and after follow-up in the CCRT group was higher than that in the TAU group, and the difference was statistically significant.

4. Insulin level was negatively correlated with language ($r=-0.422$, $P=0.002$), MoCA total score ($r=-0.286$, $P=0.044$), glucose level was negatively correlated with language ($r=-0.311$, $P=0.028$). Low density lipoprotein cholesterol level was positively correlated with abstract thinking ($r=0.290$, $P=0.041$), IGF-1 level was positively correlated with delayed recall ($r=0.379$, $P=0.007$) and total MoCA score ($r=0.322$, $P=0.023$).

Conclusion 1. Schizophrenia showed significant remission of clinical symptoms, degree of social functioning deficits, and increased insulin, triglyceride, and serum BDNF levels after 8 weeks of follow-up

2. Combined CCRT treatment resulted in a more significant improvement in negative symptoms, cogni-

tive functioning, and degree of social functioning deficits in schizophrenia, and an increase in overall clinical efficacy.

3. Combined CCRT treatment resulted in more pronounced up-regulation of triglyceride levels and serum IGF-1 levels in schizophrenia, with higher IGF-1 levels resulting in better cognitive function.

A Novel Inflammatory Subtype, Consisting of RANTES, IL-9, MIP-1beta, TNF-alpha, IL-2 and IL-10, Acts As A Potential Diagnostic Marker in First-Episode of Major Depressive Disorder

Chuhao Zhang*

Tianjin Anding Hospital

Objective Inflammation is involved in the process of cognitive impairment in some psychiatric disorders, however, the relationship between cognitive function and inflammation markers in major depressive disorder (MDD) remains unclear. Herein, we sought to investigate the alterations in cytokine levels, and the relationships between cytokines levels and cognitive performance in MDD patients and healthy controls (HCs) from the perspective of inflammation panel

Methods This present study included 170 participants, including 101 first-episode drug-naïve MDD patients and 69 HCs. The levels of 27 cytokines were assayed by the Bio-Plex human 27-plex (BioRad). The depressive and anxiety symptoms were evaluated using the Hamilton Depression Rating Scale-17 (HAMD-17) and Hamilton Anxiety Rating Scale-14 (HAMA-14), respectively. The cognitive function was assessed by the Repeatable Battery for the Assessment of Neuropsychological Status (RBANS) and the Toronto Alexithymia Scale (TAS-20)

Results We found that first-episode drug-naïve MDD patients exhibited poorer cognitive function com-

pared to those in HCs, including neurocognitive and social cognition, even when accounting for potential confounders. 26 of the 27 cytokines levels were significantly higher in MDD patients. Principal component analysis for the 27 cytokines produced 5 principal components (PC) that represented 71.26% of the common variance, 4 of which were significantly different in the MDD and HCs groups. Importantly, PC3, consisting of RANTES, IL-9, MIP-1beta, TNF-alpha, IL-2 and IL-10, had a good diagnosis of MDD (area under the curve =0.829). Additionally, PC3 and the inflammatory factors it contains had different associations patterns with depressive symptoms and cognitive function in the MDD and HC groups

Conclusion Our findings provide novel insights into the potential interplay between clinical symptoms and cognitive impairments by inflammatory subtypes in first-episode drug-naïve MDD patients

关键词: First-episode of major depressive disorder; Cytokine; Inflammatory Subtypes; Depressive symptom; Cognitive function

MPFC 脑区过表达 FYN 基因诱导小鼠认知功能损伤及其机制研究

蒋丽雯¹ 刘可智² 刘可智¹ 向波^{1,2}

1.西南医科大学附属医院心身医学科

2.自贡市脑科学研究院

目的 本研究旨在探索在小鼠内侧前额叶过表达 FYN 基因对小鼠行为学的影响, 以及探讨其在精神分裂症病理生理过程可能的作用机制。

方法 在 7 周龄雄性鼠双侧的 mPFC 脑区均定位注射腺病毒载体过表达 Fyn 基因(Fyn-OE 组), 空载组小鼠注射空载病毒作为对照 (Vehicle 组)。注射病毒 3 周后开始行为实验, 包括新奇物体识别实验 (NORT)、社交行为测试 (SIT)、旷场实验 (OFT)、水迷宫测试 (MWM) 等行为学测试并与空载组进行比较, 使用光纤记录检测实验小鼠进行新物体识别任务时神经元钙信号活动的变化。通过高尔基染色观察 mPFC 脑区神经元树突长度、树突棘密度变化并对树突棘分型。同时利用 RNA 测序技术 (RNA-

seq) 对实验小鼠前额叶组织中的总 RNA 进行转录组学分析, 分析差异基因表达情况, 分别进行 RT-qPCR 及 Western Blot 验证差异基因。

结果 1. 新物体识别测试中, Fyn-OE 组小鼠新物体识别指数(DI)比 Vehicle 组降低, 识别新物体的能力下降。在 Morris 水迷宫实验中, Fyn-OE 组小鼠在训练阶段表现出更长的逃避潜伏期才能找到平台, 在测试阶段, 相对于 Vehicle 组小鼠, Fyn-OE 组小鼠探索平台象限时间更少, 跨越平台区域的次数也更少。

2. 在旷场实验中, Fyn-OE 组小鼠与 Vehicle 组小鼠在中央区探索时间以及运动距离没有表现出差异。三箱社交实验中, 两组小鼠社交指数没有差异, 两组小鼠表现出相似的社交好奇心和社交新颖性。

2. mPFC 脑区过表达 Fyn 基因影响神经元钙信号: Fyn-OE 组小鼠在接触新物体与熟悉物体时钙信号活动没有差异, 而空载组小鼠在接触新物体时钙信号活动比熟悉物体时高, Fyn-OE 组小鼠钙信号活动出现了变化。

3. RNA-seq 及差异基因分析结果: 在差异表达基因中, 排在前几位的上调基因与乙酰胆碱受体相关, 包括乙酰胆碱受体亚基 Chrb4、Chrb3、Chrna3。

4. 分别通过 RT-qPCR 和 WB 实验验证, 发现 Chrb3 mRNA 也显著升高, Chrb3 蛋白相对表达量升高。

5. 高尔基染色显示 Fyn-OE 组相对于 Vehicle 组神经元的树突棘密度增加, 树突棘分型结果显示, 主要是蘑菇型树突棘数量增加。

结论 本研究从行为学测试、差异基因、分子表达量、钙信号活动以及树突棘密度的变化方面探索了 Fyn 过表达导致的影响, 推测 Fyn 过表达可能与精神分裂症患者出现认知损伤有一定的关系, 而认知损伤也是精神分裂症患者的一项重要表现。

Analysis and Correlation of Thyroid Hormone Levels in Patients with Depression and Bipolar Disorder

Hanmei Du¹, Yi Sun¹, Fuxin Yao¹, Yaowen Xu²

1.Beijing HuiLongGuan Hospital (Peking University

Huilongguan Clinical School of Medicine)

2.Qingdao Municipal Hospital

Objective To explore the analysis and correlation of thyroid hormone levels in patients with depression and bipolar disorder

Methods A total of 73 patients with depression, 86 patients with bipolar disorder, and 66 health personnel admitted to our hospital from January 2021 to December 2022 were selected as the study objects. Five thyroid function levels were detected, and YMRS and HAMD depression scales were evaluated. The thyroid hormone levels of patients with depression and bipolar disorder and healthy physical examination subjects were compared and observed, and the five thyroid function levels of patients with depression and bipolar disorder in different groups were detected, as well as the correlation between HAMD, YMRS, and five thyroid function items

Observation Indicators

(1) The thyroid function (T3, T4, FT3, FT4, TS) levels in patients with depression and bipolar disorder were compared and observed.

(2) According to the severity of depression and whether it was accompanied by psychotic symptoms, 73 patients were divided into the severe DD attack group without psychotic symptoms (49 cases), the severe DD attack group with psychotic symptoms (14 cases), and the moderate DD attack group (10 cases), and the five levels of thyroid function in each group were compared and analyzed.

(3) Depending on the severity of bipolar disorder and whether it is accompanied by psychotic symptoms, The 86 patients were divided into BD manic episode group with psychotic symptoms (12 cases), BD manic episode group without psychotic symptoms (6 cases), BD major depressive episode group with psychotic symptoms (20 cases), BD major depressive episode group without psychotic symptoms (37 cases), and BD currently a mixed episode group (11 cases). The five levels of thyroid function in each group were compared and analyzed.

(4) Correlation analysis. To study the correlation between HAMD, YMRS, and five items of Jia Gong.

Statistical Methods In this paper, SPSS26.0 was used to process data. Measurement data consistent with normal distribution were represented by (\bar{x}), T-test was used, count data were represented by [n (%)], 2 test was used, and Spearman correlation analysis was used. $P < 0.05$ was considered statistically significant.

Results Among the five indexes of thyroid function in depression and bipolar disorder patients, there were significant statistical differences in T3, FT3, and FT4 ($P < 0.05$), but no statistical differences in T4 and TSH ($P > 0.05$). There was no significant difference in thyroid function among depression and bipolar disorder patients with different severity and with or without psychotic symptoms ($P > 0.05$). In terms of correlation, HAMD was positively correlated with T4 and FT4 ($r=0.259, 0.176, P < 0.05$). YMRS was significantly negatively correlated with T3 and TSH ($r=-4.02, -0.466, P < 0.05$)

Conclusion In the study of patients with different disease degrees and symptoms, it was found that there was no statistically significant difference in thyroid function in patients with depression and bipolar disorder with different severity and whether they were accompanied by psychotic symptoms ($P > 0.05$). Studies have shown that although abnormal expression of T3, FT3 and FT4 can be seen in the diagnosis of depression and bipolar disorder, there is no statistically significant difference in the five items of thyroid function in patients with different disease severity, and the value of thyroid hormone levels in assessing disease severity is limited. In addition, in the five correlation studies between HAMD, YMRS and thyroid function, HAMD was positively correlated with T4 and FT4 ($r=0.259, 0.176, P < 0.05$), and YMRS was negatively correlated with T3 and TSH ($r=-4.02, -0.466, P < 0.05$). Through the level of thyroid hormone, the degree of depression and mania can be evaluated. (1) At the time of BD manic episode, the human body will affect the secretion of thyroid hormones based on the needs of endocrine regulation. In order to maintain endocrine balance, the levels of T4 and FT4 can be compensated and enhanced in order to maintain endocrine balance, so the higher the levels of T4 and FT4, the higher the HAMD evaluation

score. (2) TSH affinity changes based on changes in thyroid receptor concentrations. Studies have shown that the severity of the disease in patients with both bipolar disorder and depression significantly decreases the affinity for TSH, and YMRS has a significant negative correlation with TSH. Therefore, in the clinical diagnosis and treatment, the degree of mania and depression can be evaluated through the detection of the five functions of the thyroid gland, but the evaluation effect is relatively limited, and there is no significant correlation between the five levels of some thyroid functions. The results of this study showed that compared with healthy subjects, T3, FT3 and FT4 in patients with bipolar disorder and depression had statistically significant differences ($P < 0.05$). Studies have shown that patients with bipolar disorder and depression can see abnormal expression of five functional indicators of thyroid function (T3, FT3, and FT4), mainly because: (1) The neurotransmitter system interacts with thyroid hormone, and thyroid hormone and neurotransmitter system (such as norepinephrine, dopamine, etc.) have the same biosynthetic tyrosine, which can play a role in regulating emotional state and brain activity in the pathogenesis of human mood disorders. (2) Patients with bipolar disorder and depression can affect the formation of the "pituitary-hypothalamic-thyroid" axis, resulting in the function of the thyroid axis being inhibited to varying degrees and abnormal secretion and expression of thyroid hormone; (3) Patients with bipolar disorder and depression can see a significant increase in the concentration of thyroid hormone receptors, which leads to a significant increase in T3, FT3, and FT4 levels; (4) In terms of TSH affinity, along with the increase of thyroid receptor concentration, TSH affinity can be seen to a certain extent, which leads to a decrease in TSH content. Still, the decrease degree is not obvious. Therefore, the detection of Q5 can provide a certain reference for the diagnosis of bipolar disorder and depression. Still, the reference value is relatively limited, and there is no significant difference between T4 and TSH. The abnormal expression of thyroid hormone is obvious in patients with depression and bipolar disorder, but there is no difference in the abnormal expression of thyroid hormone in patients

with different disease degrees. The severity of depression and bipolar disorder can be evaluated through the detection of the five functions of the thyroid, which can provide some reference for the development of clinical intervention.

母体免疫激活致子代精神分裂症大鼠青春期海马体突触异常及其行为学异常的相关研究

唐小涵^{1,2,3} 李文强^{1,2,3}

1. 新乡医学院第二附属医院, 河南省精神病医院
2. 河南省生物精神病学重点实验室
3. 河南省精神神经医学国际联合实验室

目的 通过在孕早期给予孕鼠聚肌胞苷酸 (Poly (I:C)), 致其免疫活化, 建立母体免疫激活致子代精神分裂症大鼠模型, 观察该模型在疾病发生发展中脑内突触相关蛋白表达水平、行为学、脑内星形胶质细胞和小胶质细胞数量和形态的变化, 并分析其突触缺损情况及其行为学异常的关系。

方法 将成功受孕雌鼠随机分为 Poly (I:C)模型组和生理盐水对照组, 在确认出现阴道栓后的第 9 天时, 两组尾静脉分别注射 10mg/kg Poly (I:C) 和等体积的 0.9% 无菌生理盐水, 注射结束后孕鼠立即返回原笼中, 等待小时后两组随机各选取 3 只动物作为质量控制, 其它孕鼠无干扰至产下仔鼠。仔鼠在 21 日龄时离乳, 将它们根据亲代来源的不同分为模型组和对照组, 使其无干扰自然生长。在其子代青春期 (出生后第 40 天, PND40) 进行 PPI、潜伏抑制、条件恐惧学习测试的行为学测定, 并通过免疫印记技术检测海马区突触相关蛋白的表达水平, 采用免疫组织化学技术检测海马 Iba1 和 GFAP 的表达, 采用高尔基染色观察神经元的形态。最后使用 SPSS20.0 软件对各组实验结果统计学分析。

结果 与对照组相比, 在母体免疫激活致子代精神分裂症模型组大鼠青春期海马体中, 神经元树突棘密度显著下降; PPI、潜伏抑制、恐惧记忆行为出现缺陷; 磷酸化 Cofilin 和磷酸化 LIMK1 的表达显著下调; 神经元骨架蛋白 NFM、NFH 和 NFL 的 mRNA 和蛋白在海马区的表达显著上调; Iba1 阳性

的小胶质细胞数量显著增加 ($P < 0.01$), 但 GFAP 阳性星形胶质细胞的数量在两组之间不具有统计学差异 ($P > 0.05$)。

结论 母体免疫激活致子代精神分裂症模型大鼠在青春期出现类精神分裂症样行为变化, 且其海马体中神经元树突棘密度显著下降。

二甲双胍和配对饮食对奥氮平诱导的肠道微生物群失调的影响

唐小涵^{1,2,3} 邵明龙^{1,2,3}

1. 新乡医学院第二附属医院, 河南省精神病医院
2. 河南省生物精神病学重点实验室
3. 河南省精神神经医学国际联合实验室

目的 肠道微生物的改变在很大程度上与抗精神病药物引起的肥胖密切相关, 本研究旨在探讨二甲双胍和配对饮食对奥氮平诱导的肠道微生物的影响。

方法 雌性 SD 大鼠在适应性饲养 2 周之后, 按体重均衡原则随机被分为四组: 对照组、配对饮食组、奥氮平组、以及二甲双胍干预组。对照组大鼠给予普通饲料喂养; 配对饮食组大鼠给予混有奥氮平的饲料喂养, 且该组大鼠接受的食物量等同于前 48 小时对照组大鼠的食物消耗量; 奥氮平组大鼠给予混有奥氮平的饲料喂养, 且自由摄食不限量; 二甲双胍干预组大鼠第五周末开始给予混有奥氮平和二甲双胍的饲料喂养, 二甲双胍干预为期三周。干预结束后, 采集各组大鼠粪便样本进行 16S 高通量测序分析肠道菌群物种组成和丰度的变化。

结果 α 多样性分析结果显示, 四组大鼠肠道菌群在 OTUs 水平上, Ace、Sobs、Shannon 以及 Chao 多样性指数均无统计学差异 ($P > 0.05$), 表明二甲双胍和配对饮食以及奥氮平均不能改变肠道菌群的多样性及丰富度。 β 多样性 3D-PCoA 在属水平上显示, 各组菌群结构轮廓均能明显分开 ($P < 0.01$), 二甲双胍干预组大鼠菌群结构轮廓部分与对照组有重合交叉。物种差异性分析显示, 与对照组相比, 奥氮平组显著增加脱硫弧菌的丰度, 降低乳酸杆菌和厚壁菌的丰度。与奥氮平组大鼠相比, 二甲双胍和配对饮

食均能显著抑制奥氮平引起的脱硫弧菌丰度增加,缓解奥氮平引起的厚壁菌丰度降低,逆转奥氮平引起的乳酸杆菌丰度至正常水平。

结论 二甲双胍和配对饮食显著改善了奥氮平引起的肠道微生物种群失调,增加了肠道有益菌群的丰度,减少了肠道有害菌群的丰度。

Deep Transcranial Magnetic Stimulation for The Treatment of Negative Symptoms and Cognitive Deficits of Schizophrenia: A Sham-Controlled, Randomized Trial

Yuke Dong Chang Lu Zhaolin Zhai Tianhao Gao Mengyi Luo Di Chang Jing Chen Jingxin Xue Yuqing Zhao Xuan Li Qing Kang Qiong Xiang Kaiming Zhuo Dengtang Liu*

Shanghai Mental Health Center

Background Negative symptoms and cognitive deficits are considered core symptoms of schizophrenia and are main contributors to disability and poor long-term outcome, yet both of them show limited response to antipsychotics. The prefrontal cortex (PFC) hypo-function is considered essential in neurobiological basis of negative symptoms and cognitive deficits. Deep transcranial magnetic stimulation (dTMS) is a novel technology of TMS that enables stimulation of deep layers of the PFC. Primary studies indicated that dTMS has the potential to treat negative symptoms and cognitive deficits

Objective This study is a randomized double-blind sham-controlled trial to examine the efficacy of dTMS on negative symptoms and cognitive deficits in schizophrenia

Methods A total of 99 patients with schizophrenia were randomly assigned to 3 treatment groups, 20-Hz dTMS, iTBS (intermittent Theta Burst Stimulation) dTMS or sham dTMS. The interventions were applied 5 days per week for 8 weeks with the use of H1 coil, whose main locus of stimulation is the left PFC. Extensive clinical and cognitive assessments were carried out

throughout the study. Primary outcome was severity of negative symptoms as measured with the Scale for the Assessment of Negative Symptoms (SANS). Secondary outcome measures included the Positive and Negative Syndrome Scale (PANSS), the Matrics Consensus Cognitive Battery (MCCB) and the Brief UCSD Performance-based Skills Assessment (UPSA-B). For analysis of the data a mixed-effects linear model was used

Results The results indicate that active dTMS induced marginally significant improvements in negative symptoms over 8 weeks of treatment (iTBS, $P=.084$; 20Hz, $P=.076$). iTBS dTMS displayed a better performance, with a significant improvement of the SANS at the end of treatment compared to sham dTMS (-7.15 [$-14.01, -0.29$], $P=.04$). Active dTMS is not superior to sham dTMS in the treatment of cognitive deficits in schizophrenia patients. dTMS treatments were generally well tolerated

Conclusion dTMS treatments with H1 coil reduced negative symptoms, as measured with the SANS. iTBS dTMS may be an optimized strategy for treating negative symptoms in schizophrenia. To better examine its efficacy a large-scale study is due. More studies are needed to clarify its specific clinical indications, establish standard protocols and investigate the neural basis

基于 *Cacna1a* 基因敲降小鼠模型研究氟西汀抗抑郁疗效的作用机制

武云¹ 杨建中²

1.昆明医科大学第二附属医院

2.浙江大学医学院附属第一医院

目的 抑郁症的药物治疗依赖于试错用药,导致个体间药物疗效差异有诸多因素,而遗传因素被认为在药物疗效的个体差异中起到关键作用。关于抗抑郁药物疗效的全基因组关联分析(GWAS)研究发现 *CACNA1A* 与服用氟西汀后患者的汉密尔顿抑郁量表减分率相关,携带不同等位基因型的患者服

用氟西汀后的疗效不同。本研究旨在通过动物实验验证前期 GWAS 研究中提出的假设,为 *Cacna1a* 影响氟西汀抗抑郁疗效提供证据支持。

方法 1.构建 *Cacna1a* 敲降表达载体,包装 *Cacna1a*-Control-AAV (Control) 和 *Cacna1a*-ShRNA-AAV (Sh3) 病毒, qPCR 检测病毒的敲降效率。

2.将病毒注射入小鼠腹侧海马。行为学检测:旷场、高架十字迷宫、O 迷宫、糖水偏好、转轮、悬尾。

3.慢性束缚应激 (CRS) 构建抑郁小鼠模型:连续束缚两周,每天 6 小时。用糖水偏好和悬尾实验检测小鼠抑郁造模情况。

4.将造模成功的小鼠分为四组,分别腹腔注射 4 周生理盐水和氟西汀,悬尾实验检测小鼠的抑郁表型是否挽救。每组选取三只小鼠,提取 RNA, qPCR 检测 *Cacna1a* 的相对表达量。

5.转录组测序,对各组的差异基因 (DEGs) 分别进行 KEGG 分析。

结果 1.与 Control 组相比, Sh3 组 *Cacna1a* 的相对表达量降低。

2.小鼠行为学表现:旷场实验中, Sh3 组小鼠比 Control 组小鼠在角落区域停留时间增多。高架十字迷宫实验中, Sh3 组小鼠在开臂的活动路程和停留时间降低。O 迷宫实验中, Sh3 组小鼠总的活动路程、在开臂的活动路程和停留时间显著降低,在闭臂的活动路程和停留时间显著升高。糖水偏好、转轮与悬尾实验中, Control 组和 Sh3 组小鼠均没有统计学差异。

3.慢性束缚应激两周后,悬尾实验中应激后小鼠的不动时间 (%) 显著降低。

4.分别给予 Control 组和 Sh3 组小鼠生理盐水和氟西汀,悬尾实验显示与给药前相比, Control 组+氟西汀表现为不动时间降低, Sh3 组+氟西汀的小鼠不动时间降低,但降低程度没有 Control 组明显。

5.转录组学结果:Sh3+生理盐水与 Control+生理盐水组小鼠差异基因主要富集的通路为甲状旁腺激素的合成、分泌和作用。Sh3+氟西汀与 Sh3+生理盐水的小鼠差异基因主要富集的通路有激素的合成、分泌及作用;钙信号通道等。

结论 1. Sh3 组小鼠腹侧海马 *Cacna1a* 的表达减少会使小鼠产生焦虑样行为。

2. 氟西汀对于抑郁小鼠有挽救作用; *Cacna1a* 表达减少会削弱氟西汀改善抑郁的效果。

3. *Cacna1a* 是通过调节编码钙离子通道蛋白的

相关基因来影响氟西汀疗效的。

关键词: *Cacna1a*;氟西汀;慢性束缚应激;基因敲降

母体免疫激活子代精神分裂症大鼠模型脑神经元钙信号紊乱的相关研究

方妮^{1,2} 周佳会^{1,2} 李文强^{1,2}

1.河南省精神病医院

2.河南省生物精神病学重点实验室

目的 以精神分裂症 MIA 大鼠模型为研究对象,从分子通路、钙成像及行为学等多个层面分析孕期感染、神经元钙信号表达和精神分裂症样行为三者之间的关系,探讨孕期感染影响子代神经元钙信号增加精神分裂症发病风险的机制。

方法 通过注射聚肌胞苷酸 (Poly I:C) 制备精神分裂症 MIA 大鼠模型。在子代成年期,使用多种行为范式,如开放旷场实验、Y 迷宫、高架十字迷宫和前脉冲抑制等评估焦虑、空间记忆和感觉门控功能。通过在体钙成像技术检测子代神经元钙离子活动水平,并通过 q-PCR、蛋白免疫印迹、免疫荧光等方法检测子代在不同发育阶段各脑区中钙信号相关分子的表达。

结果 1. 动物模型制备:酶联免疫吸附试验结果显示, Poly I:C 组孕鼠血浆炎症因子的表达水平显著升高。成年期行为学结果显示,与 Saline 组相比,在开放旷场实验中, Poly I:C 组在中心区域运动的距离显著减少;在高架十字迷宫实验中, Poly I:C 组进入开放臂的时间和次数均显著减少; Y 迷宫实验中, Poly I:C 组进入新异臂的时间显著减少;在前脉冲抑制实验中, Poly I:C 组在 72 dB、77 dB 和 82 dB 中抑制率均显著降低。

2. 在体的钙成像结果显示:自由活动状态下, Poly I:C 组子代大鼠成年期海马脑区锥体神经元钙超载;在 5 个循环的电击刺激 (5 mA, 2 S) 下, Poly I:C 组在电击前后钙调节能力减弱。

3. 基因转录结果显示:与 Saline 组相比, Poly I:C 组子代大鼠的离乳期额叶中 *CaMK2G* 基因水平降低 ($P < 0.05$);成年期额叶中 *CACNA1C* 基因水平降低 ($P < 0.05$);成年期海马、额叶中 *CaMK2G* 基因水平降低 ($P < 0.05$),其余各个时期各个部位两组基

因的转录水平无统计学差异。

4. 蛋白水平结果显示:与 Saline 组相比, Poly I:C 组子代大鼠的离乳期海马中 CaMK2G 蛋白水平下降 ($P<0.05$); 青春期额叶中 CACNA1C 和 CaMK2G 蛋白水平降低 ($P<0.05$); 成年期海马中 CACNA1C ($P<0.05$) 蛋白水平降低, 其余各个时期海马和额叶中 CACNA1C、CaMK2G 蛋白水平变化无统计学差异 ($P>0.05$)。

5. 形态学水平结果显示:与 Saline 组相比, Poly I:C 组子代大鼠的成年期海马中 CACNA1C 阳性细胞数减少 ($P<0.05$)。

结论 1. MIA 子代大鼠存在海马锥体神经元钙超载和钙调节能力减弱, 这种紊乱可能与钙信号相关分子表达异常有关。

2. MIA 子代大鼠成年期海马 CACNA1C 的低表达与行为障碍相关, 提示神经元钙信号紊乱可能参与了 MIA 致子代精神分裂症样行为的发生。

肠道组学、代谢组学及影像组学的多组学分析揭示菌肠脑轴调节减重手术后认知改善

向巧缘 刘煜敏*
武汉大学中南医院

目的 减重手术被证明可以导致肠道微生物组成和丰度变化并改变认知功能, 但这些变化的确切机制尚不清楚。我们通过研究减肥手术如何影响菌肠脑轴 (MGBA) 来改善认知功能, 以一种新颖的方式探索了这一点。

方法 (1) 收集腹腔镜袖状胃切除术 (LSG) 前和腹腔镜袖状胃切除术后 6 个月的 39 名肥胖患者人口统计学资料、血清、粪便、认知评估量表和脑静息态功能连接磁共振成像 (f-MRI); (2) 进行粪便 16s 微生物组学、血清代谢组学和神经影像学分析, 构建减重手术特征 f-MRI 脑功能连接网络; (3) 将具有显著改变的认知评估量表和静息态功能连接差异网络与差异血清代谢物和 16s 微生物组数据行相关分析确认关键肠道微生物和血清代谢因子。

结果 (1) 通过认知量表的测量, LSG 导致体重显著减轻和认知功能的改善 ($p<0.05$)。 (2) 与术前

相比, 减重术后肠道微生物群结构发生显著变化 ($p=0.001$), 微生物丰度和多样性显著增加 ($p<0.05$)。这些变化伴随着血清代谢物水平的显著改变, 在映射到 72 个代谢途径的 229 中代谢物中观察到组间差异。 (3) 采用 Spearman 秩相关分析认知评估量表与差异肠道微生物和血清代谢物之间的相关性, 结果表明 68 种肠道微生物和 138 种血清代谢物与认知评估量表相关, 差异肠道微生物和差异血清代谢物均两两相关。 (4) 基于功能性神经影像学, 发现 LSG 导致认知相关的左额顶网络功能连接增加, 默认模式网络 (DMN)、突显网络脑网络 (SN) 功能连接正常化。 (5) 进一步的协变量和相关性分析提示 LSG 诱导的认知相关脑网络变化与认知相关关键差异肠道微生物 (Akkermansia、Blautia、Collinsella、Phascolarctobacterium、及 Ruminococcus) 和神经活性代谢物 (Glycine、L-Serine、DL-Dopa、SM(d18:1/24:1(15Z))) 相关。

结论 我们的研究已经确定了认知相关的微生物 (Akkermansia 等), 神经活性代谢物 (Glycine 等) 和脑功能连接网络 (记忆及执行功能网络正常化、语言及内感受网络增强), 以显示减肥手术如何通过肠道微生物组、血清代谢物以及大脑功能连通性的改变来影响认知功能。我们的研究将肠道菌群和血清代谢物与大脑功能连接相结合, 从而揭示了从微生物群到肠道和大脑的潜在信号通路, 可能提示菌肠脑轴在减重手术改善认知功能中病理生理学作用。

Altered Tryptophan Metabolism Pathway in Both Major Depressive Disorder Patients and Bipolar Depression Patients: a Two-cohort Study

Taipeng Sun^{1,2}, Gang Chen², Yonggui Yuan¹

1. Southeast University ZhongDa Hospital

2. Huai'an Third People's Hospital

Background Altered tryptophan (TRP) metabolism has been implicated in major depressive disorder (MDD) and bipolar depression (BDD). However, it is

unclear whether plasma TRP metabolites could be biomarkers for the diagnosis of BDD and MDD

Methods The levels of TRP, and its metabolites kynurenic acid (KYNA), quinolinic acid (QUIN), picolinic acid (PICA), 3-hydroxykynurenine (3-HK), 3-hydroxyanthranilic acid (3-HAA), 5-hydroxytryptamine, and 5-hydroxytryptophan, were measured in the plasma of MDD patients, BDD patients, and healthy controls (HCs) from two centres. We used a discovery dataset of 181 cases to identify biomarkers and construct classification models for the diagnosis and differentiation of MDD and BDD, and external validation was performed in an independent cohort of 268 cases

Results Compared to those in HCs, the levels of PICA and KYNA decreased in both MDD patients and BDD patients. Differences in 3-HK, KYNA/QUIN ratio, and KYNA/3-HK ratio were also observed between MDD patients and BDD patients. Specific TRP-metabolic profiles can be used to distinguish among MDD patients, BDD patients, and HCs with good performance (area under the curve range: 0.705-0.987). In MDD patients, PICA level, KYNA/3-HK ratio, and Hamilton Rating Scale for Depression-24 (HAMD-24) score were positively correlated, while PICA level and HAMD-24 score were negatively correlated in BDD patients

Conclusion We demonstrated that the TRP metabolism pathway was dysregulated in both MDD patients and BDD patients. Peripheral TRP-related metabolites have potential as biomarkers for distinguishing among MDD patients, BDD patients, and HCs

MGlur2/3 Alleviates PTSD Fear Memories by Down Regulating The CaMKII/CREB Signaling Pathway in The Amygdala

Rui Li Lin Sun* Lifan Liu Xiangyu Fang Enqi Zhang Shuo Li Shuyi Li Baowei Guo Hongwei Sun Shandong Second Medical University

Objective People with post-traumatic stress disorder (PTSD) have recurring memory flashbacks of traumatic events, producing severe symptoms of anxiety and even phobias. Therefore, targeted drug staging interventions offer a possible way to eliminate or alleviate fear memories of traumatic events. Metabotropic glutamate receptor II (mGluR2/3) agonist LY379268 has been shown to reverse memory deficits, but whether it can treat PTSD fear memory in consolidation period and its mechanism of action are unclear

Methods This study employed a single prolonged stress and contextual fear condition (SPS&CFC) model and administered LY379268 at gradient concentrations (2,6,12 μ M) into the lateral ventricles during the consolidation period of fear memory. PTSD-like symptoms were assessed using open field test, elevated plus maze test, and freezing behavior test. Western blot and immunofluorescence analyses were conducted to determine the expression levels of phosphorylated Ca²⁺/calmodulin-dependent protein kinase II (P-CaMKII), phosphorylated extracellular signal-regulated kinase (P-ERK) and phosphorylated cyclic-AMP responsive element binding protein (P-CREB) in the amygdala (AMY) region of rats while transmission electron microscopy was utilized for observing synaptic ultrastructure changes in AMY of rats

Results In the SPS&CFC group, the expression of P-CaMKII, P-ERK and P-CREB was increased, and synaptic morphology was damaged in the AMY. In contrast, 6 μ M LY379268 can improved exploration and freeze behaviors, protein expression levels of AMY were reduced and synaptic ultrastructure was remodeled. 12 μ M LY379268 can improve the anxiety and freeze behavior of PTSD model, and increase the ability of autonomous exploration

Conclusion LY379268 may reduce fear memory of PTSD by regulating CaMKII/CREB signaling pathway downstream of AMY mGluR2/3, providing a promising target for reducing PTSD fear memories during consolidation

关键词: PTSD, fear memory, consolidation period, mGluR2/3, CaMKII/CREB

细胞因子负荷-犬尿酸代谢在首发精神分裂症短期疗效中的作用

陈闻锦 刘赵凡 全景慧 勾梦壮 谭云龙*
北京回龙观医院

目的 免疫失衡与色氨酸代谢分支中的犬尿酸代谢通路 (KP) 关系密切, 且在精神分裂症的治疗应答中发挥着重要的作用, 但在首发精神分裂症 (FES) 中这两个系统所形成的调节通路关系以及是否与短期的抗精神病药物治疗效果相关缺乏相应的研究。根据免疫失衡假说纳入的细胞因子群可进一步计算细胞因子负荷 (IRS/CIRS), 评估机体的净炎症水平。本研究旨在 FES 中探索 IRS/CIRS-KP 的网络连接以及与抗精神病药物短期疗效间的关系。

方法 纳入基线 FES 组 99 例, 同时招募年龄范围与 FES 组相同的健康被试 (HC) 55 名, 完成 8 周治疗后随访的 FES 患者 47 例。取基线两组被试外周血检测 IRS/CIRS 纳入的细胞因子, 采用酶联免疫吸附试验 (ELISA) 检测 18 种细胞因子和相关受体的表达水平 (包括但不限于 M1 型巨噬细胞、辅助型 T 细胞、Th-1、Th-2、Th-17 以及调节性 T 细胞来源); 取基线两组被试及 8 周治疗后 FES 患者的外周血, 采用高效液相色谱串联质谱法检测外周 KP 代谢水平, 包括犬尿酸 (KYN)、犬尿喹啉酸 (KYNA) 和喹啉酸 (QUIN), 以及 QUIN/KYNA 损伤代谢比率; 评估基线与治疗 8 周后 FES 患者的阳性和阴性症状量表 (PANSS) 量表得分。

结果 FES 患者基线期细胞因子负荷 IRS/CIRS 得分显著高于 HC 组 ($p = 9.00 \times 10^{-6}$), 犬尿酸代谢产物 KYN、QUIN 和 KYNA 水平均显著低于 HC 组 (分别为 $p = 0.003$; $p = 8.00 \times 10^{-6}$; $p = 1.60 \times 10^{-9}$), 而 QUIN/KYNA 损伤代谢比显著高于 HC 组 ($p = 0.001$), 且 QUIN/KYNA 水平与基线阳性症状得分显著正相关。对两组分别做网络构建发现, 在 FES 患者中升高的细胞因子负荷 IRS/CIRS 与 KYNA 的正相关关系更强, 而在 HC 组中 IRS/CIRS 与 QUIN 的正相关关系更强。FES 组, 8 周治疗后 QUIN/KYNA 及 PANSS 得分显著降低 ($p = 7.62 \times 10^{-9}$; $p = 2.22 \times 10^{-15}$) 且基线 IRS/CIRS 得分与治疗 8 周后 PANSS 量表减分率显著正相关 ($r = 0.40$, $p = 0.01$)。

结论 FES 患者与 HC 组相比存在显著的外周

细胞因子负荷 IRS/CIRS 的升高和 KP 代谢紊乱。在 FES 中较高的 IRS/CIRS 更倾向于促进 KP 向 KYNA 方向代谢, 这可能会部分代偿损伤代谢比 QUIN/KYNA 的升高。经过 8 周住院治疗后, PANSS 得分显著降低, 于此同时, TP 代谢紊乱有所缓解。这可能说明 FES 患者急性期高炎水平可能提示较好的短期疗效。

青春期短链脂肪酸过度摄入诱发成年期精神分裂样行为的代谢免疫机制研究

刘睿娜 朱峰* 马现仓
西安交通大学第一附属医院

目的 生命早期不利遭遇 (如社会隔离、感染等) 诱导神经发育问题是精神分裂症 (SCZ) 和孤独症等精神疾病发生的重要病理基础。肠-脑轴在神经发育中发挥了重要作用, 肠道分泌和消化中产生的各类信号分子, 对大脑功能产生深刻影响。短链脂肪酸 (SCFA) 是肠道消化膳食纤维产生的代谢物是调控大脑的重要分子, 我们前期发现, SCZ 患者血清中 SCFA 显著上调, 且与患者免疫激活状态呈显著正相关; 青春期过度摄入 SCFA 的小鼠成年后表现为社交及认知损害等精神分裂样行为。因此, 进一步探究 SCFA 在神经发育障碍中的作用及其生物学机制, 对我们认识 SCZ 发生机制, 理解肠道调控大脑发育的具体作用有很大帮助。

方法 本研究构建了青春期过度摄入 SCFA 的小鼠模型, 应用 Y 迷宫、前脉冲抑制、三箱社交等行为学测试成年小鼠行为改变。收集成年小鼠全脑及海马、前额叶、伏隔核、纹状体等区域的组织样本, 通过流式细胞分析、实时荧光定量 PCR、免疫荧光以及单细胞测序等技术, 探索小鼠中枢神经系统免疫改变情况及其与异常行为表型的相关性。同时, 我们应用流式分析、代谢组学、实时荧光定量 PCR、以及 luminex 等技术, 探索成年小鼠行为学异常的外周免疫机制。

结果 行为学结果表明, 与对照组相比, 青春期过量摄入 SCFA 会导致成年小鼠在 Y 迷宫和三箱社交测试中出现异常行为, 而成年期过量摄入 SCFA

并未引起行为异常。流式细胞术分析显示, 干预后的成年小鼠脑内小胶质细胞显著增加, Treg 细胞数量有下降趋势。免疫荧光结果发现, 干预后的成年小鼠脑海马区 c-fos 和 GFAP 反应性蛋白表达增加。RNA 及蛋白水平分析显示, 成年小鼠海马区 IL-6、CCL20、IL-1 β 等炎症因子水平显著升高, 差异基因显著富集于 IL-17A 及 T 细胞分化相关信号通路。单细胞测序结果表明, 干预后的成年小鼠脑内 T 细胞等免疫细胞数量显著增加。外周流式细胞术分析显示, 干预后的成年小鼠外周血 PBMC 及结肠固有层细胞中 Th17 细胞数量显著减少, Treg 细胞数量显著增加。

结论 青春期 SCFA 过度摄入, 导致成年小鼠肠道免疫、外周血以及中枢神经系统免疫激活, 机体免疫平衡被破坏, 进一步诱发精神分裂症认知及社交行为改变。

Network Meta-Analysis of The Impact of FKBP5 Polymorphisms on Antidepressant Response Rates

Jing Guo Weihua Yue*

Peking University Sixth Hospital

Objective Depression is a widespread mental health disorder necessitating management with antidepressant medications. However, the response to these treatments varies significantly among individuals, and polymorphisms in the FKBP5 gene may play a pivotal role. This study aims to conduct an exhaustive network meta-analysis to investigate the associations between various loci and genotypes of the FKBP5 gene and the effectiveness of antidepressant medications

Methods The study involves a meticulous systematic search of five major databases—PubMed, Cochrane Library, Embase, Web of Science, and PsycINFO—up to September 2023. The objective is to identify studies exploring the intricate relationship between FKBP5 gene polymorphisms and the efficacy of

antidepressant treatment. Relevant data regarding polymorphic sites and genotypes are meticulously extracted. To quantify the overall effect size (ES) for each genotype within the identified polymorphic sites, a robust random-effects model is employed. The ES, representing the standardized mean difference in antidepressant response rates between genotypes, is crucial for understanding the practical implications of genetic variations. A 95% confidence interval (CI) is calculated to assess the precision of the estimated ES. Additionally, the analysis incorporates the Surface Under the Cumulative Ranking (SUCRA) method to evaluate the sequential order of different loci concerning antidepressant response rates. SUCRA values are interpreted such that a higher SUCRA indicates better response rates and a more favorable ranking. To complement this, corresponding odds ratios (OR) are calculated, where a smaller OR signifies a better response rate. This dual approach enhances the comprehensive understanding of the genetic variations' impact on antidepressant efficacy. The analysis further delves into specific polymorphic sites, conducting a Bayesian network meta-analysis for selected genotypes. Model fit is assessed using the ratio of variances, and heterogeneity is quantified using the I² statistic

Results This analysis incorporated a total of 5564 participants from nine studies, forming 67 closed loops with statistically insignificant heterogeneity among them. Both random-effect and fixed-effect models displayed consistent interval results, indicating result stability. The Bayesian network meta-analysis focused on three polymorphic sites—rs3800373 (AA, CA, CC), rs1360780 (CC, CT, TT), and rs4713916 (GG, AG, AA)—with nine different genotypes. The model demonstrated good fit (ratio = 1.46) and low heterogeneity (I² = 32%). SUCRA ranking revealed the order of impact on antidepressant response rates across genotypes: rs4713916AA (93.5%) > rs3800373CC (72.6%) > rs4713916AG (54.7%) > rs1360780TT (51.9%) > rs1360780CT (45.4%) > rs3800373CA (42.3%) > rs1360780CC (38.4%) > rs3800373AA (34.7%) > rs4713916GG (16.4%). Notably, rs4713916AA exhibited the highest antidepressant response rate (93.5%), while rs4713916GG showed the lowest (16.4%), and

the difference between these genotypes was statistically significant (rs4713916AA vs. rs4713916GG, $n=4$, $OR=0.52$, $95\%CI [0.25-0.93]$). Within the rs3800373 site, the CC genotype demonstrated the highest response rate ($n=8$, $ES=0.58$, $95\%CI [0.48-0.68]$), whereas the AA genotype showed the lowest response rate ($n=8$, $ES=0.68$, $95\%CI [0.49-0.84]$). However, there was no significant difference between the two genotypes ($n=5$, $OR=0.79$, $95\%CI [0.51-1.2]$)

Conclusion This comprehensive analysis underscores the significant influence of FKBP5 gene polymorphisms on antidepressant response rates. Specifically, the rs4713916AA genotype is associated with the highest response rates, while rs4713916GG exhibits the lowest. Within rs3800373, the CC genotype tends to perform the best, and the AA genotype tends to perform the worst, although statistical significance is not observed. These findings offer valuable insights for personalized antidepressant treatment strategies, emphasizing the importance of considering genetic factors in clinical decision-making. Further research is needed to validate and expand upon these nuanced findings.

电针刺激调节前额叶皮层-背侧海马电信号同步性缓解 PTSD 模型小鼠焦虑恐惧样行为

周翠红 于欢 薛姗姗 彭正午 王化宁*
西京医院

目的 探究电针刺激 (EA) 对创伤后应激障碍模型小鼠焦虑恐惧样行为的改善作用及其生物学机制。

方法 为明确电针早期干预对单次延长应激 (mSPS) 小鼠 PTSD 样行为、海马皮层场电位 (local field potentials, LFPs) 及神经元活性的影响, 将 40 只小鼠随机分为对照组、EA 组、PTSD 组和电针治疗组。PTSD 组和 PTSD + EA 组小鼠接受 mSPS 造模。之后, EA 和 PTSD+EA 组小鼠接受 EA 刺激 7 天 (2/15 Hz, 1mA), Sham 组和 PTSD 组小鼠接受假刺激 7 天。7 天后进行行为测试; 随后每组取 6 只

小鼠, 在前额叶皮层 (mPFC) 和背侧海马 (dHPC) CA1 区埋置电极, 之后检测其在大架十字事件中的场电位变化; 剩余小鼠通过膜片钳检测 mPFC 神经元活性变化。为探究抑制 mPFC 神经元对电针抗 PTSD 的影响, 给 12 只小鼠 mPFC 注射化学遗传抑制病毒 AAV5-EF1a-hM4Di, 再进行 mSPS 造模, 之后给予电针刺激 7 天 (分为 PTSD + saline + EA 和 PTSD + CNO + EA 组), 每天电针刺激前 30min 腹腔注射 saline 或 CNO, 7 天后行为学测试。

结果 (1) mSPS 小鼠 dHPC 和 mPFC 场电位 theta 波能量值和同步性较 Sham 组显著降低, mPFC 神经元抑制性突触后放电频率和幅值增加 (mSPS vs. Sham, $P < 0.05$); (2) EA 干预可以缓解 PTSD 小鼠行为, 逆转其海马皮层电信号变化, 与 PTSD 组相比, PTSD + EA 组小鼠在旷场中心和高架十字开臂时间增加 ($P < 0.05$), 条件恐惧不动时间减少 ($P < 0.05$), 海马皮层的 theta 波能量值和同步性增加, mPFC 神经元突触后放电频率和幅值降低 ($P < 0.05$); (3) 抑制 mPFC 神经元阻断了电针的抗 PTSD 作用, 与 PTSD + saline + EA 相比, PTSD + CNO + EA 组小鼠在旷场中心和高架十字开臂活动时间减少 ($P < 0.05$), 条件恐惧不动时间增加 (均 $P < 0.05$)。

结论 PTSD 小鼠海马和皮层电信号异常, 电针干预可以改善模型小鼠 PTSD 样行为和大脑电信号紊乱。

2. 国家卫生健康中心精神卫生重点实验室 (北京大学)
3. PKU-IDG/北京大学麦戈文大脑研究所
4. 利伯大脑发展研究所
5. 约翰霍普金斯大学医学院精神病学和行为科学系
6. 中国医学科学院情绪认知障碍诊疗研究中心

目的 情感损伤是精神障碍的一个核心特征。多种精神障碍存在情绪情境记忆的异常,表现出对带有情绪色彩的信息材料的记忆偏差。情绪情境记忆指的是在特定时空背景下情绪唤起信息能够增强记忆的现象,对于个体快速识别和适应环境至关重要。包括杏仁核和海马在内的内侧颞叶记忆系统在上述过程中发挥重要作用,并常见于精神障碍患者的脑功能损害。然而,由于情绪情境记忆功能在个体间存在较大的异质性,可能是既往研究发现不一致的主要原因。本研究旨在构建情绪情境记忆大脑功能活动模式的规范模型,并探讨不同精神障碍患者的个体化偏移模式及其与临床症状的关系。

方法 本研究基于两个任务态功能磁共振成像队列开展分析。首先,基于一个大型健康队列($n=409$,年龄为 24.597 ± 3.832 岁,206名女性),使用情绪情境记忆任务范式评估被试的情绪情境记忆行为表现,并使用高斯过程回归模型建立其与大脑功能激活的规范性参考常模。既而,使用纳入328名被试的临床队列(168名健康对照者、56名抑郁障碍[MDD]、31名双相障碍[BD]和73名精神分裂症[SZ])评估不同精神障碍患者在规范性参考常模的位置,分别量化情绪情境记忆大脑功能激活在上述三种精神障碍中诊断特异性的个体化偏差模式;将诊断特异性偏差的脑区在四个情绪调节相关脑网络中进行网络富集分析;通过多元线性回归分析,识别个体化偏差模式和不同精神障碍情感症状的关系。

结果 首先,本研究构建一个可跨样本验证的情绪情境记忆大脑功能活动模式的规范模型,解析了情绪情境记忆大脑功能的个体水平异质性,并确定了三种主要精神障碍在该模型中的个体化偏移模式。其次,发现了在三种精神障碍中情绪情境记忆偏差相关的富集于彼此不重叠的情绪调节功能网络。MDD主要与情绪感知和生成相关的情绪调节网络关联;BD与认知情绪调节网络和情绪反应网络相关,共同负责整合情绪感知和认知;而SZ与工作记忆和反应抑制相关的情绪调节网络相关。最后,多元线性回归分析结果表明,个体化情绪情境记忆脑功能偏移模式能够预测不同精神障碍患者的临床情感症状,诊断特异的情绪调节网络在各自的预测模型中显示出最大的预测权重。

结论 本研究提出了一个稳定的、可验证的情绪情境记忆大脑功能活动模式的规范模型,表征了情绪情境记忆行为和大脑功能激活的潜在关系。基于该规范模型,我们发现了三种常见精神障碍情感

症状相关的脑功能偏移模式,提示不同情绪调节功能环路在特定精神障碍情感症状中的作用。本研究发现有助于理解精神障碍情感症状精神病理学的神经基础。

倍他司汀对精神分裂症患者认知功能的疗效及机制

王永前 王志仁 云雅君 赵文暄 杨甫德*
北京大学回龙观临床医学院

目的 倍他司汀作为一种组胺 H1 受体激动剂/H3 受体拮抗剂可能对精神分裂症认知功能障碍具有改善作用。本研究通过随机安慰剂对照试验探究精神分裂症患者附加倍他司汀对认知功能改善的效果和机制。

方法 本研究是一项为期三个月的随机、双盲、安慰剂对照试验。共 109 名患者签署了知情同意书,最终参与随机的有 89 人。患者入组后随机分为倍他司汀组($n=45$)和安慰剂组($n=44$)。倍他司汀组患者服用倍他司汀(72mg/d),安慰剂组服用与倍他司汀外表一致的安慰剂。在基线和药物干预三个月后采集患者的功能磁共振数据,在基线、1月末、2月末、3月末使用 MCCB 量表评估患者的认知功能。

结果 最终完成了基线和干预 3 个月后的静息态功能磁共振数据采集共 39 人(倍他司汀组 21 人,安慰剂组 18 人)。数据分析采用符合方案集(per-protocol analysis, PP 集)。两组患者的认知功能中,具有时间和组的交互作用的认知维度包括:言语学习($F=4.60$, $p=0.00$)、视觉学习($F=5.46$, $p=0.03$)、MCCB 总分($F=6.36$, $p=0.03$)。为此进一步进行简单效应分析发现,倍他司汀组的言语学习、视觉学习和 MCCB 总分较干预前增加,差异具有统计学意义($p<0.01$);安慰剂组的言语学习、视觉学习和 MCCB 总分较干预前增加但是无统计学意义($p>0.05$)。脑功能结果表明倍他司汀组和安慰剂组存在治疗和时间交互作用的脑区有 14 个。事后检验发现与干预前相比,干预后倍他司汀组左侧尾状核、右侧下回、右侧直回、右侧丘脑、右侧中扣带

回、右侧海马、右侧岛叶、右侧壳核、左侧楔前叶、左侧楔叶 fALFF 自发活动降低 ($p < 0.05$)，左侧梭状回、右侧背外侧前额叶、左侧内侧前额叶、右侧背内侧前额叶 fALFF 自发活动增高 ($p < 0.05$)。倍他司汀组干预后右侧丘脑 fALFF 自发活动水平与视觉学习分数具有弱的负相关性 ($r = -0.389$, $p = 0.081$)。

结论 附加倍他司汀可以显著改善精神分裂症患者的认知功能障碍，特别是视觉学习和言语学习方面，且安全性良好。倍他司汀改善精神分裂症患者认知功能的机制可能与其改善多个脑区的异常自发活动水平有关。未来可以通过多中心大样本的随机、双盲、安慰剂对照试验进一步探究倍他司汀对认知功能改善的效果和机制。

整合单细胞转录组学和免疫组库分析揭示抗抑郁药疗效的因果分子

袁敏兰¹ 刘欣冉² 陈洛南² 张伟¹

1. 四川大学华西医院心理卫生中心

2. 中国科学院分子细胞科学卓越中心，上海生物化学与细胞研究所系统生物学重点实验室

目的 抑郁症的发病率逐年上升，全球约有 3 亿人受到抑郁症的影响，这已经成为致残的主要原因之一。目前的抗抑郁治疗仅可使约 1/3 患者的症状完全缓解。大量证据表明免疫可以影响抑郁症的发病机制，然而免疫在抗抑郁疗效中的作用，特别是不同免疫细胞亚群的组成和功能却鲜少知道。本研究旨在整合单细胞转录组学和免疫组库分析展示抗抑郁疗效相关的免疫细胞景观，并找到抑郁症治疗潜在的免疫靶标。

方法 本研究分别纳入 20 例未用药抑郁症患者和 10 例健康对照（所有受试者均为女性），并提取其外周血单个核细胞（PBMC）。采用 10X Genomics 对 30 例受试者的 PBMC 分别进行单细胞转录谱表达分析，同时进行单个 T 细胞表面受体（TCR）V(D)J 基因片段测序。采用汉密尔顿抑郁量表（HAMD）评估患者接受抗抑郁药物治疗 3 个月之后的症状变化，HAMD 减分率 $\geq 50\%$ 为治疗有效。比

较治疗有效和无效组的免疫细胞亚群构成以及基因表达差异，用孟德尔随机化分析检验差异基因与抗抑郁疗效的因果关系。

结果 抗抑郁药物治疗的有效组与无效组分别为 10 例及 8 例（2 例失访）。对总共 291520 个细胞进行 t-分布随机邻域嵌入（t-SNE）分析鉴定到 5 类细胞群：T 细胞、NK&NKT 细胞、单核&DC 细胞、B 细胞以及其他细胞。抗抑郁药物治疗有效组的 CD4+ 中央记忆 T 细胞以及 CD4+/CD8+ 效应记忆 T 细胞数量多于治疗无效组以及健康对照，且有效组 TCR 超克隆扩增类型显著低于无效组，TCR 库多样性增加。在细胞亚群中进行的差异基因表达分析显示 $\gamma\delta$ T 以及 NKT 细胞亚群表现出疗效相关的差异表达基因，功能富集到抗原加工与呈递、白细胞介导的免疫、淋巴细胞介导的免疫、外来刺激应答的正向调节等，其中 ZNF80、S100B 基因在治疗有效组中明显上调、HOXA10、COLQ 基因明显下调。孟德尔随机化分析发现肿瘤坏死因子（TNF- α ）的产生与调节基因与抗抑郁疗效存在因果关系，TNF- α 表达水平越高，疗效越差。

结论 抗抑郁治疗有效的患者免疫应答更快并且广泛。TNF- α 与抗抑郁疗效存在因果关系，治疗无效患者的免疫细胞在抗炎因子释放能力方面可能存在缺陷，无法抑制促炎细胞因子的释放。这些研究发现可能为抗抑郁治疗的预后提供预测指标或者为发展免疫相关的新型抗抑郁治疗提供策略。

首发不吸烟精神分裂患者外周犬尿氨酸通路的特点

杨清艳 杨可冰 黄隽超 周衍芳 全景慧 王蕾蕾 谢婷 于婷 范宏振 谭淑平 谭云龙*
北京回龙观医院

目的 了解首发不吸烟精神分裂症（FENS）患者外周犬尿氨酸代谢通路中的神经活性产物浓度水平及其与精神病理症状间的关系。

方法 以对 FENS 患者（ $n=82$ ）和健康对照（HC， $n=73$ ）为研究对象，采用高效液相色谱法检测血清中犬尿氨酸代谢通路中的神经活性产物浓度，包括

犬尿氨酸 (KYN)、犬尿喹啉酸 (KYNA)、喹啉酸 (QUIN), 比较上述指标在 2 组间的差异。收集所有被试的人口学信息, 以阳性和阴性症状量表 (PANSS) 评估患者的精神病理症状。分析 FENS 患者外周 KYN、KYNA、QUIN 浓度与 PANSS 各量表得分进行相关性分析。

结果 FENS 患者血清 KYN[(251.46±65.93) ng/ml vs. (320.65±65.89) ng/ml; $t=-6.38$, $p<0.001$]、KYNA[(5.19±2.22) ng/ml vs. (13.26±4.23) ng/ml; $t=-14.73$, $p<0.001$]、QUIN[(39.50±13.00) ng/ml vs. (58.80±16.91) ng/ml; $t=-7.67$, $p<0.001$]水平均显著低于 HC。FENS 患者血清 KYNA 水平与 PANSS 量表的一般病理量表评分呈显著正相关 ($r=0.30$, $p=0.007$)。

结论 FENS 患者 KP 的神经活性代谢物浓度异常, 且与其精神症状相关, 提示 KP 代谢可能参与精神分裂症的病理性过程。

The Surface Area of The Right Inferior Parietal Gyrus Mediates The Relationship between Abdominal Obesity and Cognitive Impairment in Patients with First-episode Schizophrenia

Chen Lin¹, Yunlong Tan¹, Mengzhuang Gou¹, Jinghui Tong¹, Yanfang Zhou¹, Ting Xie¹, Ting Yu¹, Yanli Li¹, Baopeng Tian¹, Shuping Tan¹, Zhiren Wang¹, Xingguang Luo², Ping Zhang¹, Juanchao Huang¹, Song Chen¹

1.Beijing Huilongguan Hospital

2.Yale University School of Medicine

Objective The underlying mechanism of cognitive impairment in patients with schizophrenia is not clear, and the effect of drugs to improve cognitive impairment is not satisfactory. Obesity has been reported to be associated with altered brain structure and cognitive impairment. Our study was designed to explore whether Cortical Surface Area (CSA) and Cortical

Thickness (CT) mediate obesity-related cognitive impairment in Patients with First-episode Schizophrenia (FEPS)

Methods A total of 167 FEPS and 120 age - and sex-matched Healthy Controls (HCs) were included in our study. We used the Positive and Negative Syndrome Scale (PANSS) and the Chinese version of the Measurement and Treatment Research to Improve Cognition in Schizophrenia Consensus Cognitive Battery (MCCB) to assess the participants' psychiatric symptoms and cognitive function. A 3.0T high-resolution magnetic resonance imaging system was used to collect image data, and FreeSurfer software was used to calculate CSA and CT of specific Desikan-Killiany brain region. Body mass index (BMI), Waist-hip ratio (WHR) and Waist-to-height ratio (WHtR) were also calculated. Partial correlation analysis and regression analysis were used to analyze the relationship between BMI, WHR, WHtR, cortical structure and cognitive function. SPSS PROCESS V3.5 software was used for mediating and moderating analysis to explore the influence of cerebral cortex structure on the relationship between abdominal obesity and cognitive dysfunction

Results The MCCB composite score and seven subscale scores of HCs were significantly higher than those of FEPS ($p < 0.001$). After controlling for sex, age, education level and intracranial volume, the CT and CSA of multiple brain regions in HCs were significantly higher than those in FEPS ($p < 0.05$). WHR was significantly correlated with Working Memory, Verbal Learning and MCCB composite score, and WHtR was significantly correlated with Social Cognition and MCCB composite score (all $p < 0.05$). Total surface area of bilateral cerebral cortex played a complete mediating role in the relationship between WHR or WHtR and MCCB composite score ($p < 0.05$). CSA in the right inferior parietal gyrus played a complete mediating role in the relationship between WHR or WHtR and MCCB composite score ($p < 0.05$). The mediating effect of CSA in the relationship between WHtR and cognitive function was higher than that of WHR

Conclusion CSA, especially right inferior parietal gyrus, played a mediating role in the relationship be-

tween WHR or WHtR and cognitive function. Compared with BMI and WHR, WHtR may be a better indicator to assess the relationship between abdominal obesity and cognitive function, which may provide clues to explore the mechanism of cognitive impairment in patients with schizophrenia.

The Association between Dietary Quality, Sleep Duration, and Depression Symptoms in The General Population: Findings From Cross-sectional NHANES Study

Yue Du Min Wang Yu Wang Yikai Dou Yushun Yan Huanhuan Fan Ningdan Fan Xiao Yang Xiaohong Ma*
West China hospital of Sichuan University

Objective Unhealthy lifestyles, which include unhealthy diet and unhealthy sleep duration, have been widely recognized as modifiable risk factors for depressive symptoms. This study aims to explore the associations between dietary quality, sleep duration, and depression symptoms, as well as their combined effects

Methods The NHANES 2007 to 2014 cycles provided the data for this study, in which 19,134 adults between the ages of 20 and 80 were included. Unhealthy diet, measured using an average Healthy Eating Index (HEI)-2015 score below the 60th percentile, and unhealthy sleep duration, measured as sleep duration at night less than 7 hours or greater than/equal to 9 hours, were the primary exposures. Then participants were divided into four different lifestyles. A weighted-multivariable logistic regression was employed, controlling for relevant variables

Results Unhealthy diet (OR: 1.40, 95% CI: 1.18-1.67, $p < 0.001$) and unhealthy sleep duration (OR: 1.94, 95% CI: 1.63-2.31, $p < 0.001$) exhibited positive associations with depression symptoms. Individuals who maintained an unhealthy diet but healthy sleep duration (OR: 1.60, 95%CI: 1.20-2.13, $p = 0.002$), healthy diet

but unhealthy sleep duration (OR: 2.50, 95%CI: 1.64-3.80, $p < 0.001$), or an unhealthy diet and unhealthy sleep duration (OR: 2.91, 95%CI: 2.16-3.92, $p < 0.001$) were significantly associated with depressive symptoms compared to those with a healthy diet and healthy sleep duration, respectively

Conclusion In summary, our study suggests that individuals affected by the individual and synergistic effect of an unhealthy diet and unhealthy sleep duration are more susceptible to experiencing depressive symptoms.

HLA Region Local Heritability and Genetic Correlation Reveals Novel Genetic Pattern Underlying Complex Traits Across Multiple Ancestries

Menghan Wei Qiang Wang*

Mental Health Center and Psychiatric Laboratory, State Key Laboratory of Biotherapy, West China Hospital of Sichuan University, Chengdu, Sichuan, China

Objective The human leukocyte antigen (HLA) region (~5 Mb) has been associated with multiple complex traits across physical and mental health. However, advancement of genomic knowledge for HLA region lags that for other regions. With the help of the KGGSEE Effective Heritability Estimator (EHE), a novel population genomic statistic tool, and the GWAS summary statistic of diverse complex traits from MVP, a large cohort looking into different ancestries (i.e., European ancestries, African ancestries and Hispanic ancestries), we aim to characterize genetic architecture of HLA region in European, African, and Hispanic Americans, and its different impact on complex human traits or disorders via overall- and region-wise genetic heritability. We hope our study might offer a new point of view in understanding HLA region and human diversity

Methods Access to summary statistics for genome-wide association studies (GWAS) were approved

by Million Veteran Program via dbGap. In total 11 different common phenotypes (e.g., body mass index [BMI], lipid traits, and mental conditions) were included, covering >500,00 individuals with 3 different ancestral background (European, African, and Hispanic). Whole genome was divided into 550 regions (including HLA) with 5 Mb size, and local heritability (per region) was calculated using effective heritability estimator implemented in KGGSEE for each phenotype; global heritability was calculated using LDSC or LDK with overall GWAS summary statistics. For cross-phenotype, LDSC or LAVA was used to estimate global or local genetic correlations. Linkage disequilibrium data was from ancestry-matched population from 1000 Genome. For each ancestry, HLA region local heritability per phenotype and genetic correlation per phenotype-pair were compared with other regions by Monte Carlo procedure. Across ancestries, Wilcoxon signed-rank test was used to compare local heritability from different regions. Bonferroni method was used for multiple testing correction

Results Estimated heritability of HLA region ranged from 0.0001 (behavioural ideal health score in Africans) to 0.013 (low-density lipoprotein in Hispanics), while the median of estimated heritability of other regions ranged from 0.0001 to 0.0028 for 11 phenotypes across ancestries. Global heritability ranged from 0.0368 (suicidal ideation in Europeans) to 0.7332 (BMI in Africans), and the proportion of HLA vs genome ranged from 0.11% to 5.47%. When comparing to others, HLA region contributed to significant higher heritability for 8 traits (BMI, clinical ideal health score, high-density lipoprotein, low-density lipoprotein, total cholesterol, triglycerides, suicidal ideation without suicide attempt, suicidal thoughts and behaviors) in Europeans and 2 traits (low-density lipoprotein, total cholesterol) in Hispanics. The distributions of estimated local heritability in Europeans and Africans are significantly different across all 11 phenotypes. When looking into local genetic correlations at HLA region, estimates from 11 or 9 phenotype pairs were significant for Europeans or Africans, respectively; among them, only a few of them have also significant global genetic correlations

Conclusion The heritability and genetic correlation estimated for HLA varies differently across 11 complex phenotypes from 2 ancestry groups. This new pattern will be helpful to better understand complex traits from possible HLA-mediated immune pathways

关键词: human leukocyte antigen, heritability, genetic correlation

抑郁症患者治疗前后认知功能与前扣带回 γ -氨基丁酸水平的关联

咎思妍¹ 库从文² 赵少琨³ 马瑞华¹ 刘思佳¹ 石晶¹ 李颖娜¹ 李慧¹ 王璇¹ 杨甫德¹ 谭云龙¹ 田宝朋¹ 王志仁¹

1.北京回龙观医院, 北京大学回龙观临床医学院

2.北京中医药大学第一临床医学院

3.北京师范大学认知神经科学与学习国家重点实验室

目的 探讨抑郁症患者治疗前后认知功能与前扣带回 γ -氨基丁酸 (GABA) 水平的相关关系。

方法 选取 31 例符合美国精神障碍诊断与统计手册第 5 版 (DSM-5) 抑郁症诊断标准的未服药抑郁症患者和 33 例正常对照, 患者入组后给予单一选择性 5-羟色胺再摄取抑制剂 (SSRIs) 治疗 8 周, 正常对照组不施加干预。采用认知功能成套测验 (MCCB) 评估对照组及抑郁症组治疗 8 周前后的认知功能, 同时采用氢质子磁共振波谱成像技术检测前扣带回的 GABA 水平, 应用汉密尔顿抑郁量表 (HAMD-17) 评估抑郁症状严重程度, 应用汉密尔顿焦虑量表 (HAMA) 评估焦虑程度。使用 SPSS 26.0 统计软件进行数据分析, 基线期两组年龄、受教育年限、量表评分以及 MCCB 得分间的差异比较采用独立样本 t 检验, 两组前扣带回 GABA 浓度间差异比较采用协方差分析; 抑郁症组治疗前后差值符合正态分布的计量资料采用配对样本 t 检验, 差值不符合正态分布的计量资料采用配对 Wilcoxon 检验。以年龄、受教育年限、HAMD-17 和 HAMA 得分作为控制变量, 采用偏相关对抑郁症组 MCCB 测验各领域得分与 ACC GABA 浓度进行分析; 采用 Pearson 相关对抑郁症组治疗前后 MCCB 测验各领域得分的差值与前扣带回 GABA 浓度变化的差值进行分析。

结果 基线期抑郁症组 MCCB 测验中的工作记忆、社会认知两个领域的得分均低于对照组 (均 $P < 0.05$); 8 周抗抑郁药治疗后, 抑郁症患者的处理速度、工作记忆、推理及问题解决能力、视觉记忆和学习评分以及 MCCB 总分均高于基线期 (均 $P < 0.05$); 基线期抑郁症组基线期前扣带回 GABA 相对于水的浓度 (GABA+/W) 低于对照组 ($P < 0.05$), 经 8 周治疗后升高 ($P < 0.05$); 基线期抑郁症组前扣带回 GABA+/W 与言语学习和记忆以及视觉记忆和学习存在负相关 ($r = -0.40, P < 0.05$; $r = -0.42, P < 0.05$); 抑郁症患者治疗后认知功能与治疗前的差值与 HAMD-17 评分、HAMA 评分的前后差值相关无统计学意义; 抑郁症组治疗前后前扣带回 GABA+/W 的差值与工作记忆评分的差值及推理和问题解决能力评分的差值存在正相关 ($r = 0.58, P < 0.05$; $r = 0.66, P < 0.05$)。

结论 抑郁症患者认知功能障碍可能与其抑郁、焦虑程度不相关, 认知功能的改善可能与前扣带回 GABA 水平的升高有关。

The Entrainment of Rhythmic Tonal Sequence on Neural Oscillation and The Impact on Subjective Emotion

Jiixin Ding¹, Jingjing Liu^{1,2}, Xiaochen Zhang¹, Changminghao Ma¹, Yingying Tang¹, Yue Ding¹

1. Shanghai Mental Health Center, Shanghai Jiao Tong University School of Medicine

2. Department of Psychosomatic Medicine, Shanghai East Hospital, Tongji University School of Medicine

Objective This study investigates the entrainment of neural oscillations to rhythmic auditory stimuli, specifically examining how tonal sequences of varying frequencies affect subjective emotional experiences. The research aims to elucidate the mechanisms by which rhythmic auditory input influences affective states, focusing on the relationship between neural entrainment and emotional responses. By exploring these

dynamics, the study seeks to provide a deeper understanding of how rhythmic sounds can modulate emotional states

Methods Forty graduate students (19 males; age 22.46 ± 2.02) were recruited as the participants in this study. During the experiment, the participants were instructed to listen to 12 tonal sequences with different frequency ranging from 1Hz to 12Hz. The presentation order of tonal sequences was randomized among participants. After listening to each sequence, participants were requested to report their current emotional state, including valence, arousal, and dominance (VAD), using a self-assessment manikin with a 9-point Likert scale. VAD ratings were also measured before listening to the sequence, ending with a total of 13 time points of measurement per participant. Electroencephalography (EEG) was continuously recorded throughout the experiment with a 64-channel EEG system (NeuSen W3, China)

We first examined the neural entrainment of the rhythmic stimuli from both spectral and phase domains. Specifically, EEG data of each stimulus was preprocessed to remove artifacts and then evoked spectrum response, inter-trial phase coherence, and induced spectrum response were calculated. The statistical significance of neural entrainment at the target frequency was tested for these measurements individually. The null distribution of normalized power (or inter-trial phase coherence) was estimated based on the response at non-target frequencies, i.e., the responses at frequencies that are not harmonically related to the sequence frequency. The chance-level normalized power (or phase coherence) was pooled over frequencies. The statistical significance of the response at a target frequency was determined by the probability that the target-frequency response differed from the chance-level response.

To study the impact of the rhythmic stimuli on subjective emotion, we calculated the changes in VAD ratings after listening to a certain sequence compared with before. These changes served as the primary behavioral outcomes for our analyses. We used repeated measures ANOVA, linear mixed-effects models (LME), and analysis of covariance (ANCOVA) to explore the influence

of demographic factors, such as gender and age, stimulus frequency, and participants' psychological health status on these VAD changes.

Results For the EEG data, both evoked spectrum response and inter-trial phase coherence showed clear peaks at the corresponding frequency of stimuli. Statistical analyses indicated that neural oscillation response was stronger at the target frequencies than at the non-target frequencies, demonstrating that all twelve rhythmic tonal sequences entrained to the brain's neural oscillations

Regarding the behavior data, we noticed that the rhythmic tonal sequences with different frequencies influenced the emotional arousal differently for male and female subjects. For female subjects, 11 out of all the 12 frequencies affected the emotional arousal, with approximately half of these frequencies having an energizing effect. In contrast, as many as 4 frequencies showed no influence on male subjects' emotional arousal, while among the remaining 8 frequencies, about half were energizing. However, for valence and dominance, neither age, frequency, nor gender showed significant main effects or interaction effects on emotional change.

We further took participants' psychological health statuses into consideration, and found the rhythmic tonal sequences interacted with participants' demographic diversity and psychological health statuses, showing a tangled influence on emotion. When focusing on the anxiety side, two frequencies (3 and 11Hz) showed significant three-way interaction of gender, age and anxiety levels for valence. At 3Hz, high anxiety in males was associated with a decreasing trend in valence with age, while other anxiety levels showed the opposite pattern. For females, anxiety level, age, and their interaction did not significantly affect valence, with all anxiety levels showing a mild increase in positive valence with age. At 11 Hz, high anxiety in males corresponded to an increasing trend in valence with age, whereas the other groups exhibited the opposite trend. No significant patterns were found for females at this frequency. For arousal and dominance, no significant main effects or interaction effects were observed. When considering depression levels, two frequencies (1 and 8Hz) showed signif-

icant three-way interaction of gender, age and depression levels for valence. At 1 Hz, males with medium and high depression levels showed a mild increase in positive valence with age, while those with low depression experienced a steep decline. For females, low and high depression levels led to an increase in positive valence with age, whereas the medium depression group showed a slight decrease. At 8 Hz, females with high depression levels showed a significant increase in positive valence with age, while other groups had slight changes. Males showed a large increase in valence for the low depression group, with high depression remaining stable and medium depression slightly decreasing. Besides, at 12 Hz, a significant interaction between depression level and age was found. Medium and high depression levels resulted in a decrease in valence with age, while the low depression level group exhibited the opposite trend. For dominance, significant three-way interactions among age, stimuli, and depression level were found. Specifically, at 1Hz and 12Hz, depression level and age significantly interacted, showing that low and high depression levels resulted in decreasing dominance with age at 1Hz, but increasing dominance with age at 12Hz, with medium depression levels exhibiting opposite trends. Additionally, a significant interaction between gender and age was observed at 10Hz, indicating opposite patterns of dominance change with age for males and females. For arousal, no significant main effect or interaction effects were found after including the depression level.

At last, the relationship between the modulation intensity of neural entrainment, in terms of evoked spectrum and inter-trial phase coherence, and emotional changes was tested. Among all the 12 frequencies, only the 7Hz tonal sequence demonstrated a significantly negative correlation between modulation intensity and the change of emotional valence, indicating that stronger modulation intensity corresponds to lower valence.

Conclusion This study combines the subjective emotional assessments and electrophysiological measurements to explore the relationship between neural entrainment and emotional responses of rhythmic auditory input. Although all the rhythmic tonal sequence of

12 frequencies can significantly entrain the neural oscillation, sequences at varying frequencies affect the subjective emotion differently. The influence on different emotional dimensions varies based on an individual's gender, age and psychological status. Furthermore, under the specific frequency stimuli, the strength of neural entrainment correlates with changes in emotional valence.

Integrative Multi-omics Data From Early Development To Identify The Genes and Cell Types Underlying Attention-deficit/hyperactivity Disorder

Yong Wu* Shufen Jiao Yichen Li Xiaowen Lu
Wuhan Mental Health Center

Objective Attention-deficit hyperactivity disorder (ADHD) is a neurodevelopmental disorder with considerable prevalence and heritability. Genome wide association studies (GWASs) have identified dozens of loci significantly associated with ADHD, yet most of these loci reside in non-coding regions, hindering further understanding the pathogenesis of ADHD. Here, we integrated gene expression data from fetal brain and single-cell types with ADHD GWAS data to identify the ADHD-associated genes and cell types

Methods Summary data-based Mendelian randomization (SMR) method was firstly used to integrate gene expression quantitative trait loci (eQTL) data from bulk tissues of post-mortem specimens and fetal brains, as well as single-cell types of induced pluripotent stem cell (iPSC)-derived neurons and post-mortem specimens with ADHD GWAS. We also performed cell type enrichment analysis to identify the cell types implicated in ADHD

Results Integrative study using eQTL data from fetal brain and iPSC-derived neurons identified LSM6 and RPS26 were significantly associated with ADHD.

Genes showing significance in fetal brain and iPSC-derived neurons exhibited high expression levels during early developmental stages, while genes identified from post-mortem specimens were predominantly lowly expressed before the peak incidence period of ADHD. Additionally, cell type enrichment analysis revealed that the SNP heritability of ADHD was predominantly enriched in excitatory glutamatergic neurons, with lower enrichment observed in glial cells

Conclusion Our study highlights the importance of considering the dynamics of gene expression in such integrative analysis and genetic variants may influence neurodevelopment by modulating gene expression in fetal brain, potentially contributing to the development of ADHD.

Constructing A Predictive Model for Treatment Response in First-episode Schizophrenia Based on Lipidomics

Mengyi Luo Suzhen Zhang Tianhao Gao Xuan Li Zhaolin Zhai Chang Lu Yuke Dong Kaiming Zhuo Qiong Xiang Dengtang Liu*
Shanghai Mental Health Center

Objective Antipsychotic medications can alleviate the symptoms of schizophrenia, but individual treatment responses vary widely. Currently, no trustworthy biomarkers exist to forecast the clinical outcome of antipsychotic medication therapy. We used serum samples from the SMART-CAT cohort, a sequential randomized trial carried out in China to assess antipsychotic therapies in first-episode schizophrenia, to develop a prediction model for treatment outcomes for patients

Methods All Patients were assigned at random (1: 1: 1: 1: 1) to one of five different drugs (olanzapine, risperidone, perphenazine, amisulpride, aripiprazole) for 8 weeks. They were assessed using the Positive and Negative Syndrome Scale (PANSS) at baseline and 8 weeks later. Using untargeted Liquid Chromatography-

Mass Spectrometry (LC-MS) to acquire pre-treatment serum lipidomic profiles, correlating them with treatment responses at 8 weeks. The antipsychotic treatment response was measured using the percentage change on the PANSS scale, with a reduction in the PANSS of $\geq 40\%$ defined as responders and $< 40\%$ as non-responders

Results Seventy-two of the 98 patients who were enrolled in the study showed a positive response to antipsychotic treatment. Compared to the non-responders, twenty-four lipid molecules were observed to be significantly dysregulated in responders, where 20 lipid molecules were up-regulated and 4 down-regulated. Further analysis of these dysregulated lipid molecules in combination with LASSO and logistic regression revealed that a lipid model consisting of PS (22:0), PC (18:20 e_19:0), TG (4:0_11:0_12:3), and PC (26:0) was found to be highly predictive of antipsychotic treatment response, with an Area Under the Curve (AUC) of 0.847 (95% CI, 0.707-0.986). Furthermore, the predictive performance of the gender and age-inclusive model was slightly better, with an AUC of 0.864 (95% CI, 0.731-0.996), compared to that of the lipid model alone

Conclusion Our findings suggest that complicated lipid profiles at baseline may be used as potential predictors of outcomes of antipsychotic drug treatment. Moreover, combining clinical variables as a panel offers better predictive performance for treatment response.

基于机器学习抗精神病药物疗效遗传关联研究

孙浚源 岳伟华*
北京大学第六医院

目的 本研究旨在采用机器学习方法探索与急性期抗精神病药物疗效非线性关联的基因标记物, 利用这些基因构建并外部验证急性期抗精神病药物疗效预测模型。

方法 发现队列来自中国抗精神病药物基因组学联盟(CAPOC)的 2307 名 SCZ 患者, 他们分别接

受了奥氮平、利培酮、喹硫平、阿立哌唑、齐拉西酮和氟哌啶醇/奋乃静治疗 6 周。外部验证队列患者来自中国抗精神病药物遗传联盟(CAPEC), 接受阿立哌唑、奥氮平或利培酮治疗 8 周的 569 名 SCZ。药物疗效由阳性与阴性症状量表(PANSS)评估, 发现集和验证集分别以 6 周末和 8 周末的 PANSS 减分率 50% 为界将患者分为有效组和无效组; 基因多态性由中华 8 芯片测量; 结合 Logistic 回归、自助法、嵌套交叉验证以及递归消除, 对基因数据进行特征筛选; 筛选的特征在训练集中采用梯度提升决策树(XGBoost)10 折交叉验证以评估所筛选特征的预测能力和稳健性, 对训练集构建的抗精神病药疗效的基因预测模型, 在独立验证集中进行评估; 用 FUMA 网站进行功能注释。

结果 筛选出 366 个 SNP 作为抗精神病药物疗效的非线性基因特征, 内部交叉验证的 XGBoost 模型 AUC 为 0.816, 准确度为 0.760。外部验证的 AUC 为 0.671, 准确度为 0.720。功能注释显示这些基因在基底节、背外侧前额叶、下丘脑、前扣带皮层及杏仁核海马中显著高表达, 并在轴突和神经元发育、神经元生成和分化、神经元突触可塑性的调控等精神疾病相关通路中富集。

结论 通过机器学习筛选的非线性基因特征与抗精神病药物急性期疗效相关, 并富集在精神疾病相关的脑区和通路。这些基因标记物有助于预测抗精神病药物的疗效。

精神病临床高危和首发患者冲突加工功能的额叶脑电 theta 振荡机制探讨

洪祥飞 徐丽华 胡业刚 唐莺莹 唐晓晨 钱镇颖 魏燕燕 崔慧茹 张天宏 李春波 王继军*
上海交通大学医学院附属精神卫生中心

目的 冲突加工功能帮助人们从多个具有相互竞争的行为中做出最合适的选择, 是执行功能的核心子成分之一。已有研究表明, 精神分裂症患者在 Flanker 任务中与冲突加工有关的行为表现并未出现显著衰退, 而我们的前期研究则发现额叶脑电 theta (4~8 Hz) 振荡可能与冲突加工的内在机制有关。

本研究旨在进一步探讨冲突加工功能及额叶 theta 振荡在精神病临床高危和首发患者中的变化。

方法 本研究纳入 60 名健康对照、38 名精神病首发患者和 77 名临床高危被试,记录他们在 1 项修改版 Flanker 任务中的行为反应和 64 通道头皮脑电信号。对于行为学数据,主要考察基于反应时的冲突效应(冲突试次与非冲突试次相比)及其组间差异;对于脑电数据,采用时频分析提取额叶 theta 振荡能量,分析 theta 能量在冲突试次中的变化,重点考察其组间差异。采用混合设计方差分析和 t 检验进行统计学检验。

结果 (1) 行为学表现:三组受试者均较好地完成了任务(平均准确率均在 90%以上);与健康对照相比,虽然临床高危和首发患者的平均准确率显著下降($p=0.007$)且反应时显著增大($p=0.006$),但三组受试者均表现出显著的冲突效应(所有 $p<0.001$);对于归一化校正后的冲突效应,三组受试者之间无显著差异(所有 $p>0.05$)。(2) 个体水平的额叶 theta 能量:三组受试者均表现出显著的冲突效应,即冲突试次中的 theta 能量显著大于非冲突试次($p<0.001$);这一效应的幅度在健康对照、临床高危和首发患者之间出现了下降趋势,即健康对照和临床高危受试者显著大于首发患者($p=0.001, p=0.049$),而健康对照和临床高危受试者之间的差异并不显著($p>0.1$)。(3) 试次水平的额叶 theta 能量:在冲突试次中,随着反应时的增大(说明冲突效应增加),额叶 theta 能量也逐渐增大($p<0.001$);这一效应的幅度在三组受试者之间无显著差异($p>0.3$)。

结论 与健康对照相比,临床高危和首发患者的冲突加工功能并未出现显著衰退,但其在冲突试次中的平均额叶 theta 能量有下降趋势。而在试次水平上,额叶 theta 能量与冲突效应之间的关联性在三组受试者之间并无显著差异。本研究表明试次水平的额叶 theta 能量变化可能是精神病临床高危和首发患者仍然保留冲突加工功能的神经基础。

Aberrant Excitation, Inhibition and Plasticity of Orbitofrontal Cortex in Drug-naïve First-episode Schizophrenia: A Concurrent TMS-EEG Study

Xiong Jiao¹, Qiang Hu², Yingying Tang¹, Tianhong Zhang¹, Jie Zhang³, Junfeng Sun³, Jijun Wang¹

1. Shanghai Mental Health Center, Shanghai Jiao Tong University School of Medicine

2. Zhenjiang Mental Health Center

3. School of Biomedical Engineering, Shanghai Jiao Tong University

Objective Abnormalities in cortical excitability and plasticity have been considered to underlie the pathophysiology of schizophrenia. Transcranial magnetic stimulation (TMS) combined with electroencephalography (TMS-EEG) can provide a direct evaluation of cortical responses to TMS. Although postmortem, anatomical imaging, and functional imaging studies have implicated that structural and functional abnormalities of OFC were correlated with negative symptom severity, no study has assessed the cortical excitability of OFC in schizophrenia. Here, we employed TMS-EEG to investigate cortical responses to orbitofrontal cortex (OFC) stimulation in schizophrenia

Methods In total, we recruited 92 drug-naïve patients with first-episode schizophrenia and 51 age- and sex-matched healthy individuals. For each participant, one session of 1 Hz rTMS was delivered to right OFC, and TMS-EEG data was obtained to explore the change of cortical-evoked activities before and immediately after rTMS during the eyes-closed state. The MATRICS Consensus Cognitive Battery (MCCB) was used to assess neurocognitive performance

Results In the cognitive tests, patients with schizophrenia performed significantly worse than healthy controls on all seven cognitive domains and overall performance. The cortical responses indexed by global mean field amplitudes (i.e., P30, N45, and P60) were larger in schizophrenia patients compared with healthy controls at baseline. Furthermore, following one session of 1 Hz rTMS over right OFC, the N100 amplitude was significantly reduced in the healthy group but not in the schizophrenia group. In healthy controls, there was a significant correlation between modulation of P60 amplitude by rTMS and working memory; however, the correlation was absent in patients with schizophrenia

Conclusion Aberrant global cortical responses following right OFC stimulation were found in patients with drug-naïve first-episode schizophrenia, supporting its significance in the primary pathophysiology of schizophrenia. Our preliminary findings imply that OFC might be a promising therapeutic target for rTMS treatment in schizophrenia.

Bidirectional Mendelian Randomization and Immune Infiltration Analysis Identify IL10Ra As A Potential Therapeutic Target for Depression

Yao Gao^{1,2}, Nan Zhang², Xiaona Song², Jianzhen Hu^{1,2}, Xinzhe Du^{1,2}, Tingli Qu², Sha Liu^{1,2}

1.First Hospital/First Clinical Medical College of Shanxi Medical University

2.Shanxi Medical University

Objective Depression is a prevalent mental health issue with potentially severe consequences if left untreated. While numerous studies have suggested a link between depression and inflammation, effective targets for the treatment of inflammation-related depression remain elusive

Methods To identify reliable therapeutic targets, we utilized publicly available genome-wide association study (GWAS) summary statistics for a two-sample Mendelian randomization (MR) analysis. After accurately selecting instrumental variables, we applied five distinct MR methods and conducted heterogeneity and pleiotropy tests to ensure the reliability of our findings. Functional enrichment analysis was performed to determine the role and pathways of depression-related inflammatory factors. Coloc analysis was used to detect whether shared SNPs drive the risk of depression and gene expression, thereby identifying druggable genes. Further, drug predictions and molecular docking vali-

dated the therapeutic potential of these targets. The Human eFP Browser was employed to visualize the expression of druggable genes in brain regions. The GEOquery package from Bioconductor was used to analyze the differential expression of druggable genes, assessing their diagnostic value for depression. The STRING database was utilized to analyze the co-expression of genes related to druggable targets, shedding light on their biological roles and interactions. The R package GSVA was applied to analyze the immune cell infiltration associated with druggable genes

Results The forward MR results indicated associations between FGF23, IL10Ra, OSM, SULT1A1, TNF, and the occurrence of depression, with no reverse relationships found. Reverse MR results suggested that depression can lead to changes in FGF5, GDNF, IL18 levels. Functional enrichment analysis implicated pathways such as MAPK, PI3K-Akt, and JAK-STAT in depression's pathogenesis. Coloc analysis supported the notion that IL10Ra expression and depression risk are driven by shared causal variants. Drug predictions for IL10Ra identified Raloxifene and Prangenin hydrate as potential therapeutic agents with affinity for IL10Ra. Expression patterns of IL10Ra in brain regions indicated high expression in the olfactory bulb, corpus callosum, and substantia nigra. Differential expression analysis revealed decreased IL10RA expression in depression patients compared to controls, and co-expression analysis showed relationships between IL10RA and various genes, including CYTH4, ITGB2, CD53, among others. Immune infiltration analysis found positive correlations between IL10Ra and B cells, as well as cytotoxic cells and T cells, with an inverse relationship with neutrophils in depression

Conclusion This study identified IL10Ra as an attractive drug target for depression through multiple analytical approaches, suggesting that Raloxifene and Prangenin hydrate could be new treatments for depression. IL10Ra also shows promise as a diagnostic marker for assessing the condition of depression patients.

Resting State Functional Magnetic Resonance Imaging in Wilson's Disease

Yilin Guan Jiaying Gong*

the Sixth Affiliated Hospital, Sun Yat-sen University

Objective To explore the difference of brain function and activity in patients with Wilson's disease (WD), and identify the correlation between the difference of local internal activity of brain function in resting state functional magnetic resonance imaging (rs-fMRI) and clinical laboratory indicators such as serum copper, 24-hour urine copper and ceruloplasmin

Methods Forty-five patients with WD and thirty-two healthy controls (HCs) in Neurology from January 2021 to December 2022 were enrolled. All subjects underwent rs-fMRI and three-dimensional structural (T1-3D) data acquisition. We calculated the amplitude of low-frequency fluctuation (ALFF), fractional ALFF (fALFF), and regional homogeneity (ReHo) of each object, evaluated the differences in functional activity among different brain regions. Using Spearman correlation to analyze the correlation between differential brain regions and clinical laboratory indicators

Results The ALFF values in the cerebellum posterior lobe, right thalamus, left and right insula, right caudate nucleus, right precuneus, right supplementary motor area of the WD group were higher than those in the HCs group ($t=6.9561, 4.5234, 4.837, 4.915, 4.9927, 5.801, 4.1159, P < 0.05$). The ALFF values in the right middle frontal gyrus of orbit, right dorsal lateral superior frontal gyrus of the WD group were lower than those in the HCs group ($t=-5.3877, -4.8392, P < 0.05$). The fALFF value of the left precuneus and right precentral gyrus were lower than HCs group ($t=-5.2992, -4.2872, P < 0.05$). The ReHo value of the right precuneus was higher than HCs group ($t=6.8114, P < 0.05$). The ReHo value of the left fusiform gyrus, right middle occipital gyrus, left and right postcentral gyrus were lower than HCs group ($t=-4.4128, -4.8129, -5.9576, -5.5242, P < 0.05$). There was a negative correlation between the ALFF value in the right supplementary motor area and

serum copper ($r=-0.329, P=0.027$). The ALFF values in the right precuneus were inversely correlated with 24h urine copper ($r=-0.329, p=0.034$). The fALFF value in the left precuneus was positively correlated with 24-hour urine copper ($r = -0.405, p = 0.006$)

Conclusion Our study suggests that aberrant regional intrinsic brain activity may contribute to understand the pathophysiology feature of WD

The Multiomics Landscape of Plasma Exosomes in First-Episode Drug-Naïve of Schizophrenia

Yeqing Dong Shuo Wang Meijuan Li Qiao Su Fuyou Bi Xiaoxiao Sun Yuying Qiu Jie Li*

Tianjin Anding Hospital

Objective Schizophrenia (SZ) is a debilitating mental illness with uncertain etiology and challenges in early diagnosis and treatment outcomes. For the first time, we applied a multiomics techniques to explore plasma exosomal markers of SZ and underlying molecular mechanisms

Methods Exosomes were separated and identified from ten drug-naïve first-episode SZ patients and ten healthy controls. Then small RNA-seq and high-performance liquid chromatography-tandem mass spectrometry technology were used to detect the profiles of microRNAs (miRNAs) and proteomics, respectively. The integrative multiomics analysis was further performed

Results A total of 167 differentially expressed miRNAs (DE miRNAs) were identified in plasma exosomes from drug-naïve first-episode SZ patients. The potential target genes of DE miRNAs were predicted, and GO and KEGG enrichment analysis showed that they were associated with RNA catabolic process, proteasome-mediated ubiquitin-dependent protein cata-

bolic process, etc. Proteomic analysis identified 274 differentially expressed proteins (DEPs), and DEPs were mainly enriched in immune response and some signaling pathways. The combination of Top 10 DE miRNAs/DEPs both had good values to diagnose SZ. Importantly, miRNA-protein ceRNA networks were constructed by integrating multiomics, one consisting of 21 downregulated DE miRNAs and 21 upregulated DEPs and the other consisting of 64 upregulated DE miRNAs and 86 downregulated DEPs in SZ patients

Conclusion Our study for the first time describes the multiomics landscape of plasma exosomes in first-episode drug-naïve of SZ, and provides novel insights into the molecular alterations of SZ. These findings hold promise for advancing diagnostic and therapeutic strategies in SZ management.

星形胶质细胞端足 Cx43 在慢性束缚应激所致抑郁中的作用机制研究

彭莎² 石哲^{1,2}

1.中南大学湘雅二医院
2.湖南中医药大学

目的 社会经济迅速发展所带来的环境与社会压力持续影响着人们的精神健康。狭小空间与社交隔离所引起的情绪障碍是正常健康人在环境刺激下产生的不良应激反应,这种持续性的慢性应激刺激所导致的精神障碍最后极有可能发展成抑郁症。慢性应激刺激后血脑屏障结构受损从而导致外周免疫细胞进入中枢引发神经炎症是此类精神障碍的重要发病机制,星形胶质细胞端足对于血脑屏障的完整性维持具有关键调控作用,因此,本研究聚焦星形胶质细胞端足上 Cx43 表达,对其血脑屏障保护作用机制做深入探究。

方法 通过连续 28 天的每日 6 小时慢性束缚应激,模拟日常生活中反复出现的轻度、可预测但不可避免的环境应激。通过行为学观察抑郁样症状,检测血脑屏障通透性后观察中枢炎症水平;进一步通过透射电镜、免疫共沉淀以及过表达技术研究星

形胶质细胞端足 Cx43 对于血脑屏障保护作用机制。

结果 在连续 28 天的慢性束缚应激后,小鼠出现明显的抑郁样行为,血脑屏障结构损伤导致 Th17 细胞介导的神经炎症水平显著上升。我们观察到,血脑屏障损伤可能主要来源于星形胶质细胞 Cx43 的表达下调,导致其端足上肌营养不良聚糖与血管的锚定被抑制,从而介导胶质界膜结构的受损,另一方面,这一作用进而导致血管外基质中 3 型胶原蛋白、基质金属蛋白酶的增加影响了血管机械特性。我们进一步观察到,恢复 Cx43 表达后能够通过恢复其与肌营养不良聚糖的相互作用,从而改善胶质界膜结构,并且进一步抑制了血管外基质中 3 型胶原蛋白的水平保护血脑屏障。

结论 星形胶质细胞端足上 Cx43 通过与肌营养不良聚糖相互作用,维持胶质界膜完整性,从而保护血脑屏障结构完整。

关键词: 慢性应激; 抑郁症; 星形胶质细胞; 血脑屏障; Cx43

Linking Ambient Air Pollution To Mental Health: Evidence Based on A Two-Sample Mendelian Randomization Study

Huanhuan Fan Yikai Dou Yushun Yan Min Wang Xiao Yang Xiaohong Ma*

Mental Health Center and Laboratory of Psychiatry, West China Hospital of Sichuan University

Objective Growing evidence links air pollution, a ubiquitous environmental stressor, to a heightened risk of developing mental disorders, raising significant public health concerns. Mental disorders represent a significant global public health challenge which can have a profound impact on individual lives. In this study, we used Mendelian randomization (MR) to investigate the causal relationship between ambient air pollution and four common mental disorders

Methods Genome-wide association study (GWAS) data for ambient air pollution and summary-level GWAS data for four representative mental disorders were obtained from open-access database. Inverse variance weighted (IVW) method with multiplicative

random-effects model was the main analysis. Sensitivity analyses were conducted to validate the results

Results A suggestive association was observed between particulate matter (PM) 2.5 and anxiety disorders (OR 2.96, 95% CI 1.29-6.81, $p=0.010$). Exposure to nitrogen dioxide (NO₂) was significantly linked to an elevated risk of schizophrenia (OR 1.95, 95% CI 1.45-2.63, $p=1.13E-05$) and showed a nominal association with an increased risk of bipolar disorder (OR 1.43, 95% CI 1.09-1.86, $p=0.009$). A suggestive causal association was detected between nitrogen oxides (NO_x) and anxiety disorder (OR 2.90, 95% CI 1.21-6.97, $p=0.017$). No significant association was detected between exposure to PM_{2.5-10}, PM₁₀, and mental disorders. No significant horizontal pleiotropy or heterogeneity was found

Conclusion Our findings support causal associations between exposure to ambient air pollution, particularly PM_{2.5}, NO₂, and NO_x, and an increased risk of specific mental disorders

Altered Prefrontal Cortex Activity Mediates The Relationship between Anhedonia Experiences and Neurocognitive Function in Patients with Major Depressive Disorder

Huanhuan Fan Qing Li Yue Du Yushun Yan Rongjun Ni Jinxue Wei Liansheng Zhao Xiao Yang Xiaohong Ma*
Mental Health Center and Laboratory of Psychiatry, West China Hospital of Sichuan University

Objective Major depressive disorder (MDD) is associated with deficits in cognitive function, thought to be related to underlying decreased anhedonia experiences. However, little is known about whether and to what extent functional brain activity mediates this association. In this study, we investigated the neurofunctional correlate of the interplay between cognitive function and anhedonia experiences in medication-free MDD using functional near-infrared spectroscopy (fNIRS)

Methods We examine differences of brain activation corresponding to the verbal fluency test (VFT) between MDD patients and healthy controls (HCs). Depressed individuals with MDD ($n=56$) and HCs ($n=35$) were scanned while performing a VFT task. Neurocognitive results estimated by the Cambridge Neuropsychological Testing Automated Battery (CANTAB), four stages of hedonic processing (desire, motivation, effort and consummatory pleasure) using Dimensional Anhedonia Rating Scale (DARS) and relative concentration changes in oxygenated hemoglobin during VFT task were compared among all participants. We used a mediation analysis to detect the direct, indirect and total effects of brain activity on neurocognitive functions

Results The patients with MDD exhibited impaired sustained attention and working memory, as well as lower total DARS scores and all four dimensional scores. Compared to HCs, MDD patients showed reduced activation (CH₄, ch₆₋₁₀, CH₂₁₋₃₀, CH₃₂, CH₄₀ and CH₄₁; $t = 2.32-4.77$, FDR $p < 0.001$ - FDR $p = 0.02$) in the prefrontal cortex (PFC) during VFT task. Lower hedonic of motivation and effort scores, as well as decreased activation of two channels (CH₄ and CH₃₂) covering the dorsolateral PFC and Broca's area, were predictive of poorer neurocognitive function. Further analysis revealed that the change in VFT-related activation mediated the relationship between experiences of anhedonia and neurocognitive function

Conclusion These findings suggest that alterations in oxygenated-hemoglobin levels within the prefrontal lobe, which is implicated in sustained attention and working memory, may serve as promising indicators for interventions targeting individuals with MDD

关键词: anhedonia, hedonic processing, major depressive disorder, functional near-infrared spectroscopy, sustained attention, working memory.

Screening of Potential Antipsychotic Active Ingredients in Rhynchophylla Extract Based on Self-assembled Cell Membrane Chromatography of Mouse Brain Neurons

Liu Yang Gege Yu*
Xi'an Mental Health Center

Objective The cerebral cortex has multiple neural regulatory regions and abundant neuronal cells, making it an important site of antipsychotic drug action. By utilizing the interaction characteristics between mouse brain neuron cell membrane receptors and antipsychotic drugs, a mouse cortical neuron cell membrane chromatography stationary phase was constructed to screen for potential antipsychotic active ingredients in the extract of rhynchophylla, and to preliminarily study the targets of the active ingredients

Methods EDC/NHS cross-linking method was used to self-assembled mouse cortical neuronal cell membranes with microporous silica gel, and a neuronal cell membrane chromatography stationary phase has been constructed. The two-dimensional cell membrane chromatography online switching method was used to screen the components in the rhynchophylla extract that binding with neuronal cell membrane receptors. The potential active ingredients obtained from the screening were identified and analyzed using HPLC fingerprint comparison and HPLC-IT-TOF/MS analysis method. The acting target analysis of the obtained active ingredients was carried out using affinity chromatography zone elution method

Results Combining the online switching of two-dimensional cell membrane chromatography, HPLC fingerprint comparison, and HPLC-IT-TOF/MS, rhynchophylline, hirsutine, and hirsuteine were found have obvious affinity with neuronal cell membrane receptors. Through the band efflux experiment of DRD2 antagonist haloperidol, the action sites of three active ingredients were analyzed, and it was found that all three active ingredients could compete with haloperidol for the same action site on DRD2

Conclusion The constructed mouse brain neuron cell membrane chromatography model is a multi-target, reliable, and effective method for screening active ingredients in traditional Chinese medicine for antipsychotic treatment. The three components obtained by using this screening technique, namely rhynchophylline, hirsutine, and hirsuteine, exhibit affinity with DRD2

and have the same binding site as Haloperidol.

Investigation of Serum Cystatin C and Inflammatory Biomarkers Derived From Complete Blood Counts in Patients with Bipolar Disorder

Chenjiao Zhang*
Beijing Hui-Long-Guan Hospital

Objective Inflammation is considered to play an important role in pathogenesis of bipolar disorder (BD). In the meanwhile, recent evidences suggest that cystatin C (Cys C) is closely related to immune inflammation. The characteristics of Cys C in BD are worthy to be studied and the relationship between serum Cys C and inflammation related biomarkers may provide more information about disease progression. In present study, we aimed to use large-scale clinical data to investigate Cys C in patients with BD to explore its role and diagnostic value which would contribute to the identification and treatment of the disease

Methods A total of 3647 patients with BD including 2,431 BD-manic (BD-M) and 1,216 BD-depression (BD-D) in acute stage and 3,500 healthy controls (HC) were enrolled. The levels of Cys C and inflammatory biomarkers derived from complete blood counts were investigated among different groups. Spearman test was used to evaluate the correlation between Cys C and inflammatory indicators including NLR, MLR, PLR, SII and SIRI while logistic regression was employed to assess the predictive value of these indicators on the occurrence of diseases and receiver operating characteristic curve was used to compare the diagnostic effectiveness of single or combined parameters

Results Serum Cys C levels were found significantly elevated in BD, BD-M and BD-D groups compared with HC group as well as all male groups compared with female groups. Spearman correlation analysis showed that Cys C exhibited different correlation

pictures with inflammatory biomarkers in diagnostic groups and healthy controls. Binary logistic regression analysis indicated that serum Cys C levels were independent and positive predictors of occurrence of diseases. Receiver operating characteristic demonstrated that Cys C was more efficient than other inflammatory ratios and the combination of these parameters displayed highest diagnostic effectiveness

Conclusion Our study suggests that Cys C may be involved in the pathophysiological process of BD by affecting the proinflammatory processes. Besides, it should be noted that Cys C had remarkable predictive value in diagnosis of BD especially combined with other inflammatory indicators

关键词: bipolar disorder, cystatin C, inflammation, SIRI

Gray Matter Changes and Cognitive Impairment: A Comparative Study of Unipolar and Bipolar Depression

Xiaoxia Lei^{1,2}, Chen Zhang^{1,2}

1. Shanghai Jiao Tong University School of Medicine, Shanghai, China

2. National Center for Mental Disorders, Shanghai Mental Health Center, Shanghai 200030, China

Objective Cognitive impairment is a common symptom in patients with unipolar depression (UD) and bipolar depression (BD). While functional magnetic resonance imaging (fMRI) and other neuroimaging studies have reported changes in brain activity during cognitive tasks in depressive patients, there is a paucity of studies specifically examining the neuroimaging differences in cognitive impairment between UD and BD patients. Additionally, there is a lack of differentiation in studies focusing on various cognitive functions such as memory and attention. This study aims to investigate the changes in gray matter structure in patients with UD and BD and their association with different types of cognitive impairment

Methods This study included 31 patients with

bipolar depression, 54 patients with unipolar depression, and 75 healthy controls, all matched for age, gender, and education level. Cognitive function was assessed using the Repeatable Battery for the Assessment of Neuropsychological Status (RBANS). Cortical thickness and gray matter volume were analyzed using FreeSurfer software. General linear models (GLM) with multiple comparison corrections were used to compare the differences in cortical thickness and gray matter volume among the three groups

Results Preliminary results indicated that, compared to the BD group, the UD group had significantly reduced cortical thickness in the right middle temporal gyrus and decreased gray matter volume in the left post-central gyrus, with age as a covariate. Compared to healthy controls, BD patients exhibited increased cortical thickness in the right superior parietal lobule, though this difference was not significant when age was considered as a covariate, and reduced gray matter volume in the left inferior frontal gyrus, with age as a covariate. Compared to healthy controls, UD patients showed increased cortical thickness in the right inferior temporal gyrus, but this difference disappeared when age was considered as a covariate; they also had reduced gray matter volume in the right lingual gyrus, with age as a covariate. Preliminary correlation analysis showed significant associations between gray matter structural changes and different types of cognitive impairment in UD and BD patients

Conclusion These findings suggest that unipolar and bipolar depression exhibit distinct patterns of gray matter structural changes, which may be related to differences in emotional regulation and information processing dysfunctions. Preliminary evidence supports an association between changes in cortical thickness and gray matter volume and cognitive impairment in depressive patients. This provides a theoretical foundation for further exploration of the specific links between cognitive impairment and brain structure changes in UD and BD patients.

Reduced BCL2 Expression in Maternal Plasma and Offspring Caudate in Preeclampsia: Implications for Neurodevelopmental Disorders

Jiashuo Zhang*

West China Hospital of Sichuan University

Objective The early detection and treatment of psychiatric disorders are crucial for alleviating the societal and familial stress associated with these conditions. Our study uses preeclampsia as a focal point to investigate the impact of prenatal environmental factors on neurodevelopment, analyzing amniotic fluid cells

Methods In this study, we employed a combinatorial approach involving the data from an Adolescent Brain Cognitive Development (ABCD) human study and a Sprague-Dawley rat model of preeclampsia. We analyzed reports of 11,338 children of 9-11 years old from the ABCD study in order to study the effect of maternal preeclampsia on behavior and brain volume of offspring. Amniotic fluid cells were collected by establishing the rat model of preeclampsia and sequenced to screen the differentially expressed genes (DEGs). Maternal plasma was collected to investigate the possibility of the target gene in prenatal diagnosis. Behavior tests were performed to assess the effect of prenatal preeclampsia exposure on offspring behavior and offspring brain was collected to examine the expression of the target gene

Results Using the data from ABCD study, we found that offspring exposed to prenatal maternal preeclampsia showed increased behavioral issues and reduced caudate volume. Employing the rat model of preeclampsia, transcript sequencing showed that B-cell lymphoma 2 (BCL2) levels were reduced in the amniotic fluid cells. Offspring exposed to prenatal maternal preeclampsia exhibited behavioral deficits and reduced BCL2 levels in the caudate. Furthermore, BCL2 showed reduced expression in the cell-free RNA (cfRNA) of plasma from preeclamptic patients

Conclusion We verified maternal preeclampsia

could disturb offspring behaviors, and found BCL2 was reduced in amniotic fluid cells of preeclampsia rat and in caudate of preeclampsia offspring. BCL2 was also reduced in plasma cfRNA of preeclamptic patients. Our finding introduces a promising new avenue for prenatal psychiatric screening, potentially enabling earlier intervention strategies to mitigate long-term mental health issues.

Neuroimaging Study on Sleep Quality Mediating Childhood Trauma and Depressive Symptoms in Adolescents with Depressive Disorders

Li Xu Daomin Zhu*

Hefei Fourth People's Hospital

Background Adolescent depressive disorder is often related to traumatic childhood experiences, and the patients are often accompanied by sleep disorders. Patients exposed to traumatic events in childhood tend to have more severe depressive symptoms and an increased likelihood of experiencing multiple subsequent stressors throughout their lives, which can negatively affect their sleep quality. However, the neural mechanism by which sleep quality affects childhood trauma and depressive symptoms in adolescents with depressive disorder remain unclear

Methods A total of 118 patients and 118 controls were included in this study. Data from a total of 62 adolescents with depressive disorder were included after a rigorous assessment of head movement and image quality. The Pittsburgh Sleep Quality Index (PSQI), Childhood Trauma Questionnaire (CTQSF) and Hamilton Depression (HAMD) scale were used to evaluate the sleep quality, childhood abuse and neglect experience, and the severity of depressive symptoms of the two groups. Resting state functional magnetic resonance imaging (rs-fMRI) was performed on 62 adolescents with depressive disorder. ReHo was used to analyze the

changes of local brain activity at rest in adolescents with depressive disorder. Continuous variables with normal distribution were expressed as mean \pm standard deviation, independent sample t test was used for comparison between two groups. Categorical variables were expressed as frequency and percentage, and χ^2 test was used for comparison between groups. Pearson correlation analysis was used to analyze the correlation among PSQI, CTQSF and HAMD scores. The PROCESS program developed by Hayes was used to test the mediation effect. $P < 0.05$ was considered to be statistically significant

Results The scores of PSQI, CTQSF and HAMD in the study group were significantly higher than those in the control group (all $P < 0.05$). CTQSF, HAMD and PSQI were significantly positively correlated in adolescents with depressive disorder. Regional homogeneity (ReHo) analysis found that the ReHo positively correlated with PSQI was located in the right lingual gyrus and the right paracentral lobule, and the ReHo was positively correlated with HAMD. Mediation analysis found that PSQI significantly mediated the association between CTQSF and HAMD. ReHo of the right lingual gyrus significantly mediated the association between PSQI and HAMD. These results were not found in the right paracentral lobule. Sex-stratified analysis showed that ReHo in the right lingual gyri mediated the association between PSQI and HAMD in women

Conclusion Our study showed that childhood trauma was significantly positively correlated with the severity of depressive symptoms and sleep quality in adolescents with depression, and sleep quality mediated the association between childhood trauma and depressive symptoms severity. In addition, ReHo of the right lingual gyrus mediated the association between sleep quality and the severity of depressive symptoms. These findings help to determine the neural mechanisms underlying the association between childhood trauma, sleep quality, and depression severity in adolescents with depression.

精神分裂症患者智力与脑皮层的相关性

范宏振¹ 范丰梅¹ 王志仁¹ 谭云龙¹ 唐仕友² 王思颜² 谭淑平¹

1.北京回龙观医院

2.重庆三峡中心医院

目的 智力损伤是精神分裂症的常见特征,但智力损伤的影响因素及与大脑皮层的相关性尚不明确。

方法 进行方便取样,选取精神分裂症首发患者 117 人[年龄 16~46 岁、平均(年) 25.0 \pm 6.2;男 63 人,女 54 人;受教育年限(9.7 \pm 2.8)年]。选取年龄,性别,受教育程度匹配的正常对照 50 人[年龄 16~38 岁、平均(年) 25.3 \pm 5.4;男 28 人,女 22 人;受教育年限(10.1 \pm 3.0)年];使用 WAIS-IV 中文版积木,算术,常识,译码量表对所有受试者的智力水平进行简版 IQ 评估,使用 MRI 对患者左侧颞叶、中央前回,中央后回进行扫描;使用阳性与阴性症状量表(PANSS)分别对精神分裂症患者的临床症状进行评估。

结果 精神分裂症组与正常组比较在简版 IQ (患者: 72.4 \pm 13.8 vs 正常组: 96.6 \pm 13.2)上结果显著($p < 0.05$);患者组 IQ 与外侧颞上和颞横沟面积相关显著($p < 0.005$)。患者组与正常组比较外侧颞上和颞横沟面积差异显著($p < 0.05$)。控制年龄和受教育程度后,患者外侧颞上面积与 IQ 的相关仍然显著($p < 0.05$),与正常组的差异也仍然显著($p < 0.05$)。外侧颞上面积与 PANSS 量表各得分相关均不显著($p > 0.05$)。

结论 精神分裂症患者 IQ 损伤可能与脑区外侧颞上受损有关。

Prevalence of Non-suicidal Self-injury in Individuals with Psychotic-like Experience: A Systematic Review and Meta-analysis

Rite Si Chenxi Wang Yushen Ding Fuchun Zhou*

Beijing Key Laboratory of Mental Disorders, National Clinical Research Center for Mental Disorders & National Center for Mental Disorders, Beijing Anding Hospital, Capital Medical University, Beijing, China

Objective Psychotic-like experiences (PLEs) include attenuated or subthreshold psychotic symptoms such as hallucinations, delusional beliefs, suspiciousness, unusual experiences, and paranoid ideation, and are relatively common in adolescents and young adults. While most PLEs are transient and do not require clinical intervention, frequent or severe PLEs may increase the risk of developing psychosis. Research indicates a correlation between PLEs and an elevated risk of non-suicidal self-injury (NSSI). Despite numerous primary studies on NSSI in populations with PLEs, variations in populations, regions, and investigative methods result in differing NSSI prevalence rates. This study aims to systematically review and conduct a meta-analysis to compare NSSI prevalence in populations with PLEs versus the general population, calculate the increased risk of NSSI in those with PLEs, confirm PLEs as a risk factor for NSSI, and provide further protective strategies for populations with PLEs

Methods Two investigators (RTS and CXW) independently searched electronic databases (PubMed, Embase, and PsycINFO) using the following combination of terms in Title/Abstract: (Psychotic exp* OR sub-clinical psych* OR subthreshold psych* OR attenuated psych* OR psychotic-like OR psychotic sympt* OR delusion* OR hallucinat* OR schizotyp* OR “prodrom*” OR “ultra-high risk” OR “clinical high risk” OR “APS” OR “at-risk mental state” OR CHR OR UHR OR ARMS) AND (suic* OR parasuic* OR self-harm OR selfharm OR self-injur* OR self injur*). Only studies reporting the number of NSSI cases in both PLEs and healthy populations were included, and the respective and combined odds ratios (ORs) with 95% confidence intervals (CIs) were calculated. Statistical analyses were performed using RevMan5.3 software, and meta-analysis results were presented using a random-effects model

Results A total of 8 studies were included, comprising a total sample size of 19,957 individuals (3,748 with PLEs and 16,209 healthy controls). Individuals

with PLEs exhibited a significantly higher risk of NSSI compared to healthy controls (OR = 3.63, 95% CI: 2.77 – 4.75, $P < 0.001$). Subgroup analysis indicated that males with PLEs (OR = 4.33, 95% CI: 3.18 – 5.90) had a significantly higher risk of NSSI compared to females (OR = 2.55, 95% CI: 1.70 – 1.83) ($P < 0.001$). There was no significant impact on NSSI prevalence increase across different regions ($P = 0.59$) or whether standardized scales of NSSI were used ($P = 0.17$)

Conclusion The prevalence of NSSI is significantly higher in populations with PLEs, indicating a strong correlation between these subthreshold psychotic symptoms and self-injurious behaviors. This association is particularly pronounced in males, suggesting that gender may play a role in the severity or expression of this relationship. Understanding the reasons behind this gender difference could provide important insights for targeted interventions and prevention strategies aimed at reducing the risk of NSSI in individuals with PLEs

关键词: Psychotic-like experiences, Non-suicidal self-injury, Meta-analysis

SIGLECF 对出生后小鼠早期发育期间小胶质细胞吞噬功能的作用机制研究

魏雅槟¹ 韩蕾¹ 高书敏¹ 冯振东¹ 仇念壮¹ 时杰¹ 刘佳佳²

1. 北京大学中国药物依赖性研究所

2. 北京大学护理学院

目的 小胶质细胞是中枢神经系统(CNS)中重要的免疫细胞,除了对CNS进行经典的免疫监控职能,还在神经元发育、突触剪切、神经网络形成过程中发挥重要作用。小胶质细胞通过“吃我”和“不吃我”信号,对神经元突触进行精准的剪切和重塑。然而,小胶质细胞如何选择性地吞噬特定突触,其机制仍不清楚。唾液酸结合免疫球蛋白超家族凝集素 F (SIGLECF)作为“不要吃我”信号的识别受体,在先天免疫调节过程中有重要作用,但目前的相关研究只局限在外周免疫系统中。SIGLECF是否参与CNS中小胶质细胞的吞噬过程尚不清楚。本研究旨在探究 Siglecf 如何调控 CNS 发育过程中小胶质细胞的

特异性吞噬功能，并检测小胶质细胞特异性吞噬功能异常所导致的行为学变化

方法 本项目通过比较 Siglecf^{-/-}小鼠与野生型 C57BL/6J 小鼠，对 Siglecf^{-/-}小鼠的整体生长发育和行为学进行探索；通过细胞生物学、电生理、免疫染色、原代培养等技术手段对 Siglecf^{-/-}小胶质细胞、神经元形态和功能，以及小胶质细胞-神经元相互作用的影响进行研究；通过多组学等高通量测序及生物信息学分析技术，结合分子实验验证，明确 Siglecf 对小胶质细胞吞噬突触的调控方式的生物学机制。

结果 Siglecf^{-/-}小鼠海马区域小胶质细胞形态异常，呈现激活态改变，吞噬功能增强。

结论 在中枢神经系统中，Siglecf 影响小胶质细胞的吞噬作用。

关键词：小胶质细胞；突触吞噬；神经发育；凝集素；SIGLECF

精神障碍中非自杀性自伤行为功能分化的脑网络特征

李明珠 肖杨 严惠茹 葛宇琪 李雪霓 岳伟华 阎浩*

北京大学第六医院

目的 非自杀性自伤 (Non-suicidal self-injury, NSSI) 在精神障碍群体中高发, 严重损害患者预后。触发 NSSI 行为发生或强化 NSSI 行为维持的因素被定义为 NSSI 功能。目前 NSSI 功能分型尚未达成共识, 其神经生物学特征未知。深入理解 NSSI 功能分化及其脑功能特征有助于提出精准有效的干预措施。

方法 研究共纳入 304 例伴有 NSSI 行为主要诊断为抑郁、双相、进食障碍的住院患者 (16~26 岁, 80% 为女性)。收集早期个人及环境风险因素; 使用宗氏抑郁和焦虑自评量表评估患者临床症状; 采用渥太华自我伤害调查表 (Ottawa self-injury inventory, OSI) 评估 NSSI 功能; 其中, 163 名患者完成静息态功能磁共振成像扫描。使用正交投影非负矩阵分解对 OSI 中 NSSI 功能条目进行因子分解; 根据所识别的因子结构, 使用模糊 C 均值聚类将患者群体区分为不同的 NSSI 功能亚型; 通过典型相关分析识别与各功能因子相关的脑功能网络连接模式,

进而探索不同功能亚型的脑网络特征。

结果 (1) 非负矩阵分解确定了 NSSI 行为发生和强化的双因子结构: 自我功能因子和社会功能因子。自我功能包括情绪调节和自我惩罚等, 该因子载荷在情感障碍 (抑郁和双相障碍) 患者中更高, 且显著与抑郁症状相关 ($r=0.167, p=0.004$)。社会功能包括人际影响和人际关系等, 该因子显著与焦虑症状相关 ($r=0.229, p<0.001$), 并在非情感障碍 (进食障碍) 患者中表现出更高载荷。

(2) 基于双因子结构的模糊 C 均值聚类发现了三种 NSSI 功能亚型。亚型一 ($n=154$) 群体的 NSSI 行为以自我功能为主; 亚型二 ($n=98$) 的 NSSI 行为由自我和社会功能共同触发和强化; 亚型三 ($n=52$) 则未表现出明显的功能分化。亚型二个体呈现更严重的抑郁焦虑症状、更多的生活事件经历、更重的成瘾行为, 以及更高的神经质和更低的宜人性的人格特质。未发现以仅以社会功能为主的 NSSI 功能亚型。

(3) 神经影像分析发现, 自我功能因子主要与包括杏仁核和壳核在内的皮层下区域为核心的脑网络特征关联, 在亚型一中显著增强。社会功能因子则主要与额-颞叶功能连接模式相关, 该连接模式在亚型二中显著增强。

结论 本研究提出一个稳定可解释的“自我-社会”NSSI 双因子功能模型, 以表征触发和强化 NSSI 行为的两大因素。提示“自我功能”是 NSSI 行为发生的基础, “社会功能”与个体更高水平的焦虑抑郁特征、更薄弱的社交和情感回应能力以及更多的环境风险关联, 双因子分别与皮层下和皮层特定的脑功能网络特征相关。

Maresin-1 May Exert Antidepressant-like Effects Via Reversal of Microglia Loss and Overexpression of IL-4 and TSPO in Hippocampus: [18F] DPA-714 PET Dynamic Study

Jiamei Guo Tian qiu*

the first affiliated hospital of chongqing medical university

Objective Maresin-1 (MaR1) is an anti-inflammatory lipid mediator derived from docosahexaenoic acid (DHA), with potent anti-inflammatory and pro-resolving properties. We previously represented that single intraperitoneal injection (IP) of MaR1 partially relieved lipopolysaccharide-induced depressive-like behaviors. To further confirm the antidepressant-like effect of MaR1, the present study examined whether MaR1 ameliorated depression-like behavior induced by chronic unpredictable stress (CUS) in male C57/6J mice

Methods In the present study, we subjected adolescent male C57/6J mice to chronic unpredictable stress (CUS) for 5 weeks, followed by a 4-week Maresin1 treatment administered via intraperitoneal injection (5 μ g/kg/d, i.p.). We assessed anxiety and depression-like behaviors in mice using the Sucrose Preference Test (SPT), Tail Suspension Test (TST), and Open-Field Test (OFT). Additionally, we employed [18F]DPA-714 Positron Emission Tomography (PET) to dynamically evaluate microglial activation and associated neuroinflammation levels at three time-points: before treatment, and at 2 weeks and 4 weeks post-Maresin1 treatment. Immunofluorescence staining was used to quantify TSPO⁺ cells, ionized calcium-binding adaptor molecule (Iba)-1⁺ microglia, TSPO⁺/Iba-1⁺ cell counts, glial fibrillary acidic protein (GFAP)⁺ astrocytes, and TSPO⁺/GFAP⁺ cell populations. Real-time PCR and Western blot analyses were performed to assess the expressions of interleukin (IL)-1 β , IL-4, IL-18, TSPO, and NLRP3 in the hippocampus

Results Immunofluorescence staining of hippocampus demonstrated that MaR1 reversed microglial loss and led to a reduction in the hippocampal GFAP⁺ astrocyte numbers. Meanwhile, MaR1 reversed the reduced inflammation levels induced by CUS intervention during the early stages of treatment (at 2 weeks), while it maintained a balanced inflammatory level and increased the expression of TSPO and IL-4 in the hippocampus after 4 weeks of treatment. These results initially indicate that MaR1 produces antidepressant-like effects in a depression mouse model induced by CUS

Conclusion Maresin1 holds promise as a potential novel treatment for depression, and its antidepressant

effect may be associated with the promotion of hippocampal inflammatory homeostasis and the upregulation of TSPO and IL-4 levels

关键词 : Maresin-1, microglia, IL-4, TSPO, [18F]DPA-714 PET

The Role of HCAR3 in The Susceptibility and Impaired Niacin Skin Flushing Responses in Schizophrenia

Dandan Wang Chunling Wan*
Shanghai Jiao Tong University

Objective Blunted niacin response (BNR) was an endophenotype of schizophrenia with astonishing potential in the auxiliary diagnosis of schizophrenia, but its underlying mechanism remains unclarified. BNR involves the hydroxycarboxylic acid receptor (HCAR) - phospholipase (PLA2) - cyclooxygenase (COX) pathway, specifically, the binding of niacin to HCAR mediates the activation of PLA2 and the subsequent synthesis of prostaglandins, which evoke a skin flushing. This study reported whether genes associated with BNR pathway constitute the genetic basis and the pathological mechanism of BNR phenotypic psychiatric patients

Methods TagSNPs were selected for 6 key genes within the HCAR-PLA2-COX pathway, ultimately pinpointing 62 variants. The study included two independent sample groups (discovery set and validation set) with a total of 971 participants. Genotyping was performed on 62 variants in the discovery set, followed by validation of relevant variants in the validation set. Published PGC-GWAS data were used to validate the association between the relevant variants and psychiatry disorders. RT-PCR analysis, eQTL data, and Dual-Luciferase Reporter experiment were used to investigate the potential molecular mechanisms of the variants underlying BNR

Results The results reported that a SNP (rs2454721) located in the UTR5 region of the HCAR3 can affect the BNR phenotype of MPD by elevating the expression of the HCAR3 gene. It is proposed that an

increase in HCAR3 receptor may lead to enhancement downstream cascades and insufficient AA levels on the cell membrane, which may be a key cause of the BNR observed in psychiatric patients. This study also found that HCAR3 was a risk gene for SZ in East Asian populations. The findings provide genetic evidence for BNR as a subtype identifying marker for psychiatric disorders. In-depth investigations of HCAR3 will be of great significance for exploring the pathogenesis and therapeutic targets for the BNR subgroup patients with psychiatric disorders

Conclusion HCAR3 is a novel schizophrenia susceptibility gene which significantly associated with BNR in schizophrenia. In-depth investigation of HCAR3 is of great significance for uncovering the pathogenesis and propose new therapeutic targets for psychiatric disorders, especially for the BNR subgroup patients

关键词: Schizophrenia; HCAR3; blunted niacin response; niacin receptor; susceptibility

缺陷型与非缺陷型精神分裂症患者面部情绪识别的特征性研究: 基于 fNIRS 技术

胡晏钦*

重庆市精神卫生中心

目的 精神分裂症患者在面部表情识别方面存在缺陷, 但其神经病理机制尚不明确, 本研究旨在探索缺陷型精神分裂症(DSZ)与非缺陷型精神分裂症(NDSZ)患者在面部情绪识别任务中表现的特征性差异, 为寻找 DSZ 潜在的脑血流动力学生物标志物提供依据, 为理解缺陷型精神分裂症的病理机制提供思考。

方法 本研究共纳入了 18-55 岁精神分裂症患者 82 名和健康对照者 45 名, 其中缺陷型精神分裂症和非缺陷型精神分裂症患者分别为 32 名和 50 名。研究采用了简明精神病量表(BPRS)、阳性症状评定量表(SAPS)和阴性症状评定量表(SANS)评估受试者的精神病性症状的严重程度。中文版缺陷型精神分裂症诊断量表(SDS)用于区分精神分裂症的亚型。刺激材料选自日本人和高加索人面部表情图片库

(JACFFE), 该图片库包含了惊讶、蔑视、愤怒、恐惧、厌恶、悲伤和喜悦共 7 种基本面部情绪。采用 Emprine 2.0 软件在同一台电脑按照固定顺序呈现刺激, 每次刺激及刺激间歇均持续 10 秒。参与者对正确识别各种情绪图片的数量得分及在应对各种情绪时额颞叶皮层活动状态也将同步记录。

结果 (1) DSZ 组和 NDSZ 组在 BPRS、SANS、SAPS 量表上的平均得分均高于对照组。DSZ 组的 SANS 平均得分高于 NDSZ 组($P<0.05$), 而 DSZ 组与 NDSZ 组在 BPRS 及 SAPS 得分上无统计学意义。

(2) 与对照组相比, DSZ 组与 NDSZ 组识别上述 7 种刺激的反应时间明显延长, 且得分更低($P<0.05$)。相比 NDSZ 组, DSZ 组对喜悦情绪识别的反应时间更长, 得分更低($P<0.05$)。

(3) DSZ 组在处理喜悦相关的刺激任务时, 背外侧前额叶皮层(DLPFC)的氧合血红蛋白浓度较 NDSZ 组降低具有统计学意义($P<0.05$)。

(4) DSZ 患者的左侧 DLPFC 的平均氧合血红蛋白浓度与 BPRS 阴性症状群及 SAPS 得分呈负相关($P<0.05$)。

结论 (1) 相比 NDSZ 患者, DSZ 患者存在更严重的阴性症状。

(2) DSZ 患者和 NDSZ 组患者在识别积极情绪上存在差异, DSZ 患者在幸福情绪的识别受损较 NDSZ 组更严重, 而 NDSZ 患者主要表现在对负面情绪的识别功能受损。

(3) 在执行幸福情绪识别任务期间, DSZ 患者左侧 DLPFC 的激活水平与阴性症状的严重程度相关。

4. Hefei Fourth People's Hospital, Hefei 230022, China,

5. Institutes of Physical Science and Information Technology, Anhui University, Hefei 230039, China

Objective Metabolic syndrome is commonly seen in depression, and depression co-occurs with the components of metabolic syndrome (i.e. abnormal blood sugar, dyslipidemia, insulin resistance). An increasing number of evidences suggest that exposure to different times of bright light can change the involved metabolism. Therefore, we aimed to explore the effectiveness of different times of bright light therapy (BLT) on metabolism-related indicators in patients with depression

Methods In this single-blind randomised controlled trial, 83 depression inpatients were recruited from the department of sleep disorders, psychological hospital affiliated to Anhui Medical University and randomly divided into four groups: the morning BLT group (n=25), the morning placebo group (n=18), the evening BLT group (n=19) or the evening placebo group (n=21). The BLT groups were given 10,000 lux bright light therapy and the placebo groups were given <100 lux dim light therapy, respectively. Participants received 30 minutes of light therapy per day (between 9:00-10:00 for the morning groups or between 18:00-19:00 for the evening groups) for a 2-week period. The primary outcome of the study was fasting venous blood collected for total cholesterol, high-density lipoprotein, triglycerides, and blood glucose at baseline and 2 weeks after the light therapy. Baseline differences in demographic and clinical variables between the groups were analyzed using the Student's t-test for continuous variables or Pearson's chi-squared test for categorical variables. Primary and secondary outcomes were analysed for time (baseline, two-week), group (BLT and placebo) and group-time interaction effects using a mixed repeated-measures analysis of variance (ANOVA). The significance level was set at $p < 0.05$ for all tests

Results In terms of general demographic and

scale scores at baseline, there were no significant differences between the two groups in the morning or between the two groups in the evening. Fasting blood glucose in the morning BLT group was significantly improved compared with the morning placebo group ($p=0.032$), but cholesterol, high density lipoprotein and triglyceride were not significantly improved. No significant differences were found in cholesterol, high-density lipoprotein, and triglycerides

Conclusion The results suggest that the morning BLT is more effective than placebo in improving fasting blood glucose in depression. It may provide a new idea for clinical treatment of metabolic syndrome in patients with depression.

Baseline Cortical Thickness Abnormalities and Accelerated Longitudinal Cortical Thickness Thinning in Youth At Clinical High-risk for Psychosis: Findings From The Shanghai-At-Risk-for-Psychosis (SHARP) Cohort

Wensi Zheng Yingying Tang Dan Zhang Lihua Xu Tianhong Zhang Yawen Hong Yanyan Wei Jijun Wang* Shanghai Key Laboratory of Psychotic Disorders, Shanghai Mental Health Center, Shanghai Jiao Tong University School of Medicine, Shanghai, PR China, Shanghai 200030, China

Objective Cortical thickness (CT) abnormalities have been widely reported in individuals with a clinical high risk (CHR) of psychosis, but it remains vague what these alterations result from and whether they are related to antipsychotic (AP) medications. We conducted a two-month longitudinal magnetic resonance imaging (MRI) study to clarify the association between baseline CT changes and age, symptom, and neurocognitive, as well as the relationship between longitudinal CT changes and AP medications, and long-term functional outcomes

Methods 138 individuals with CHR and 65

matched healthy controls (HC) were enrolled in this study. Clinical assessment, neurocognitive measurements, and MRI scans were performed at baseline and 2-month follow-up. CHR was then followed up for 2 years to determine their functional outcomes. Based on the cumulative dose of AP use during the 2 scans, CHR was subdivided into a high-dose (CHR_HIGH) group and a low-dose (CHR_LOW) group. According to the 2-year Global Assessment Function (GAF) scores, CHR was subdivided into good function (CHR_GOOD) and poor function (CHR_POOR) groups. We measured the baseline CT and longitudinal CT changes and performed group comparisons using FreeSurfer software

Results CT was significantly reduced in the right inferiortemporal cortex in CHR individuals compared with HC at baseline. In the HC group, the baseline CT of the right inferiortemporal showed a significant decline with age, while in the CHR group, it remained at a low level in all age stages, which was comparable to the HC in the thirtysomethings. Moreover, thinner CT in the right inferiortemporal region was associated with more severe clinical symptoms, worse cognitive performance, and a trend toward lower GAF scores. In terms of longitudinal change, CHR subjects showed a steeper rate of gray matter loss in bilateral frontotemporal areas and right caudalanteriorcingulate region compared with HC, which may be related to AP use, since the CHR_HIGH group showed a more widespread accelerated CT decline than the CHR_LOW group compared with HC, and the rate of CT decline was significantly negatively correlated with cumulative AP dose in the left superiorfrontal cortex. Compared with HC, CHR_GOOD exhibited a broader acceleration CT decline than the CHR_POOR group, and the 2-year GAF score increase was significantly negatively correlated with the 2-month CT decline rate in the left superiorfrontal region. Furthermore, based on CT changes in several regions of interest, age, age², and AP dose, a random forest model trained in 70% of CHR subjects discriminates CHR_GOOD from CHR_POOR subjects in the validation set with an AUC of 0.74

Conclusion These findings demonstrate that CHR is associated with CT thinning, which may relate to clinical symptoms, cognitive performance, and GAF

scores. Early AP use plays a role in the accelerated reduction of CT in CHR, and this alteration connects with long-term functional outcomes. CHR individuals with more pronounced changes in CT during 2-month AP use are more likely to have their function improved at a 2-year follow-up.

Changes in Network Centrality of Anxiety and Depression Symptoms Associated with Childhood Trauma Among College Students

Huanhuan Fan Yuanmei Tao Xiaohong Ma*

Mental Health Center and Institute of Psychiatry, West China Hospital, Sichuan University

Objective This study used network analysis to explore the effects of childhood trauma on anxiety and depression symptoms among college students

Methods Depression, anxiety, and childhood trauma were assessed using the patient health questionnaire-9, generalized anxiety disorder-7, and childhood trauma questionnaire-28. The symptom networks were constructed according to whether participants have childhood trauma experiences or not, and the central indices were used

to identify the central symptom of the network. Then we evaluated the accuracy and stability of the networks. Network comparison test was used to compare the network properties between trauma and non-trauma groups

Results Loss of Energy and Worry too much were the central symptoms in the non-trauma group, while anhedonia and nervousness were the central symptoms in the trauma group. There was a significant difference in the global strength of the network between the trauma group and the non-trauma group (pFDR < 0.01), but no significant difference in the distribution of edge weights between the two networks (pFDR = 0.14). Anhedonia, Suicide ideation and feeling afraid in the

trauma group showed increased network centrality compared with the non-trauma group

Conclusion Childhood trauma can affect the central symptoms of anxiety and depression in college students, which may be an important research target to explore the mechanism of childhood trauma, anxiety and depression in the future

Event Related Potentials in Clinical High Risk for Psychosis: A Systematic Review and Meta-analysis

Anpei Wei Xiaoyan He*

The Wuxi City Mental Health Center

Objective In this study, we collected studies on event-related potentials in psychiatric ultra-high risk (UHR) or psychiatric clinical high-risk syndromes (CHR) in recent decades, and we learnt that the most recent meta-analysis was published in 2015, and no other meta-analyses have been conducted in this nearly ten-year period, so the present study updates the literature based on the previous studies, and focuses on exploring the differences in event-related potentials between individuals with psychiatric clinical high-risk and healthy populations. between individuals at clinical high risk for psychosis and healthy individuals, and more recently to explore whether there are differences in event-related potentials between transformed and non-transformed individuals with clinical high risk for psychosis syndromes. The main components of event-related potentials explored include MMN, P300 and N100, and it is sought whether these components of event-related potentials are better predictors of psychosis

Methods A search of Medline, PubMed, and Embase databases was conducted, and we used the following topics for the search: CHR OR UHR and ERP OR Event-Related Potential. Identified articles were first screened by title and abstract for possible inclusion.

The full text of relevant papers was then reviewed for eligibility. After identifying articles for inclusion, we also compared the event-related potentials of selected articles that included a CHR population that converted to schizophrenia after follow-up (CHR-T) with a non-converted CHR population (CHR-NT)

The following criteria were met to be included in the study: 1. it was an original article published in English, 2. it included individuals who met the CHR criteria as defined by any validated scale, 3. it was a trial using event-related potentials, and 4. it reported ERP data containing both control (HC) and CHR populations. Studies were excluded if the following criteria were met: 1. unpublished studies, reviews, conference abstracts, or case reports, 2. studies containing only the CHR population without control group data, and 3. studies for which amplitude data were not available.

The following information was extracted from the selected articles: first author, year of publication, sample size, task paradigm, electrode location and results.

The quality of all included studies was assessed using an Excel template for the Cochrane 'Risk of Bias' tool 2 (RoB 2). Included studies were assessed as being at high risk, low risk or having some problems by answering questions in five domains (randomisation process, deviation from the intended intervention, missing outcome data, outcome measures and choice of reported outcomes).

All statistical analyses were performed using the Cochrane Systematic Review Manager (RevMan, version 5.2; Cochrane Collaboration Network, London, UK). Comparisons of outcomes were made using the amplitude of each event-related potential component, and heterogeneity statistics were assessed using Cochran's Q and I². $p < 0.1$ or $I^2 > 50\%$ indicated significant heterogeneity. When significant heterogeneity existed, random effects models were applied; otherwise, fixed effects models were used. Clinical studies of individuals at clinical high risk for psychosis were included for meta-analysis. Meta-analyses were performed using random-effects models or fixed-effects models using the Cochrane Review Manager (RevMan, version 5.3) in order to calculate the ratio of ratios and mean differ-

ences, as well as the corresponding 95% confidence intervals.

Results A total of 27 studies were included in this meta-analysis and their information was extracted. Among them, 15 studies on MMN, 12 studies on P300 and 8 studies on N100. For MMN, most of the studies showed deficits in MMN in the CHR population compared to healthy controls. Two of these studies showed that the MMN exhibited lower amplitude in first psychiatric patients. Among the 15 included studies, the reported risk of bias and other biases was assessed to be low, and the results of Meta-analysis showed that patients at high clinical risk for psychosis had a lower amplitude of the MMN (MD(95% CI)=-0.36(0.23,0.49), $P=0.10$, $I^2=37\%$, $P<0.01$) compared to healthy individuals; for the P300, most studies have demonstrated a deficit in P300 in the CHR population compared to healthy controls. Among the 12 included studies, the reported risk of bias and other biases was assessed as low, and the results of the Meta-analysis showed that the amplitude of the P300 was lower in patients at clinical high risk of psychosis (MD(95%CI)=-1.44(-2.16,0.04), $P=0.0006$, $I^2=66\%$, $P<0.01$) compared to healthy individuals; similarly for the N100, the Most studies have demonstrated deficits in N100 in the CHR population compared to healthy controls, and in the eight included studies, the reported risk of bias and other biases was assessed to be low, and the results of the Meta-analysis showed that the N100 of the amplitude in patients at clinical high risk for psychosis compared to healthy individuals (MD(95% CI)=0.57(0.43,0.71), $P=0.81$, $I^2=0\%$, $P<0.01$) were lower. In the second step, we further explored the comparison of event-related potentials between converted and unconverted CHR populations, and the results showed that in the MMN(MD(95%CI)=0.50(0.10,0.90), $P=1.00$, $I^2=0\%$, $P<0.01$) potentials, when converted to schizophrenia, the MMN amplitude was lower in CHR populations than in unconverted CHR populations, whereas this phenomenon was not found in the P300(MD(95%CI)=-1.90(-6.73,-2.93), $P=0.001$, $I^2=85\%$, $P=0.44$) and N100 (MD(95%CI)=0.96(-0.03,1.96), $P=0.02$, $I^2=71\%$, $P=0.06$)

Conclusion The ERP components of the CHR population were all worse than normal compared to healthy individuals, and MMN showed better potential to predict transformation in the CHR population during the follow-up period, which also provides some direction for finding potential biomarkers for predicting the CHR population, which is important for the prediction and prevention of the CHR population. Meanwhile, both MMN and N100 showed differences between transformed and non-transformed individuals in the CHR population. Future research on ERP for psychiatric risk states should focus more on the impact of intervention modalities, in order to find effective means of preventing conversion in the CHR population

Identifying Shared Genetic Architecture between Atopic Dermatitis and Attention Deficit Hyperactivity Disorder: The Importance of Genetic Factors

Jinchuan Liu* Liang Peng Huan Liu
Shenzhen Mental Health Center/ Shenzhen Kangning Hospital

Objective Identifying shared genetic architecture between atopic dermatitis and attention deficit hyperactivity disorder: the importance of genetic factors

Methods Based on the latest large-scale Genome-wide association studies (GWAS), we employed Linkage disequilibrium score regression (LDSC) to investigate the global genetic correlation between AD and ADHD. Subsequently, Cross-trait meta-analysis (CPASSOC), Multi-marker Analysis of GenoMic Annotation (MAGMA), and Summary-data-based Mendelian randomization (SMR) were utilized to explore the genetic overlap between the two conditions at both the single nucleotide polymorphisms (SNP) and gene levels. Enrichment analysis was then conducted to speculate on the pathophysiological mechanisms influenced by genetic factors. Finally, we employed a latent causal

model (LCV) to investigate the presence of a causal relationship between AD and ADHD

Results We initially found a positive genetic association between ADHD and AD ($r_g = 0.02$, $P = 0.0714$). We identified a total of 152 potential pleiotropic SNPs, including 32 newly discovered pleiotropic SNPs. Subsequently, following physical annotation and MAGMA analysis, we identified 273 shared genes between ADHD and AD. Among these genes, four were significantly expressed in blood tissues. Additionally, TARS2 was also significantly expressed in skin tissues, and these genes primarily impact immune activity, particularly leukocyte proliferation (GO:007066, $P = 1.69E-05$, $\text{Padjust} = 0.021$). Moreover, our LCV analysis did not support the existence of a causal relationship between AD and ADHD

Conclusion We found a positive genetic correlation between ADHD and AD, but not a causal relationship, and the underlying mechanism behind them may be related to the immune system, RELA as a focal point can help regulate the mental and psychological state of AD patients

The Neural Mechanism Underlying Differences in Cognitive Functioning between Patients with First-episode and Recurrent Depression

GUAN LIANZI^{1,2,3}, Daomin Zhu^{1,2,3}

1.The School of Mental Health and Psychological Sciences, Anhui Medical University,

2.Department of Sleep Disorders, Affiliated Psychological Hospital of Anhui Medical University

3.Hefei Fourth People's Hospital

Objective Major Depressive disorder (MDD) is a common psychiatric disease affecting >300 million people across the globe. Accumulating evidence has

shown that cognitive deficits are prevalent among patients with MDD. However, the pattern and extent of cognitive deficits in patients with first-episode and recurrent depression remain unclear. In the present study, we aimed to investigate and compare the severity of cognitive impairments between first-episode of depression (FED) and recurrent major depression (RMD) patients and to explore the potential neural mechanisms using resting-state functional magnetic resonance imaging (r-fMRI) techniques

Methods A total of 43 patients with recurrent depression and 41 patients with first-episode depression were included in this study. All the patients underwent examinations of r-fMRI and event-related potentials (ERPs). All the patients completed standardized neuropsychological testing including event-based prospective memory (EBPM) tests, time-based prospective memory (TBPM) tests, and the computerized version of the Continuous Performance Task-Identical Pairs (CPT-IP). Two-sample t-tests were used to compare differences between cognitive function, ERP components, and brain imaging measures in patients with FED and RMD. Correlation analyses were conducted to investigate the associations among cognitive function, ERP components, and brain imaging measures

Results Patients with recurrent depression exhibited lower scores in prospective memory (PM) and retrospective memory (RM) compared to first-episode patients ($P < 0.05$). Compared to first-episode patients, Analysis of ERPs indicated a prolonged P300 latency in patients with recurrent depression. Furthermore, fMRI analysis revealed higher local neural activity synchrony (indexed by ReHo values) in the right inferior temporal gyrus and lower bilateral neural activity synchrony (indexed by VMHC values) in bilateral inferior temporal gyrus in patients with recurrent depression. Correlation analyses demonstrated a negative correlation between ReHo values in right inferior temporal gyrus and prospective memory (PM) scores ($P < 0.05$), and P300 latency ($P < 0.05$), and a positive correlation between VMHC values in bilateral inferior temporal gyrus and P300 amplitude ($P < 0.05$). Additionally, P300 amplitude was negatively correlated with EBPM scores ($P < 0.05$), P300 amplitude was negatively correlated with RM

scores($P<0.05$)

Conclusion The findings of this study indicate that recurrent patients have more severe cognitive impairment in prospective and retrospective memory (RM) memory compared to those with first-episode depression. Functional brain synchronization in the inferior temporal gyrus in patients with recurrent depression might be linked to reduced cognitive function during depressive episodes. These findings offer new insights into the neural mechanisms of cognitive impairment in individuals with depression and could help in developing more precise interventions.

深部经颅磁刺激对强迫症患者的临床干预效果研究

刘丹丹 薛闯 刘健*

浙江大学医学院附属精神卫生中心/杭州市第七人民医院

目的 强迫症是临床常见的一种精神疾病,并通常伴有抑郁焦虑情绪。TMS 是一种非侵入无创的物理治疗方法, rTMS 已经广泛用于 OCD 的治疗,且疗效显著,而 dTMS 用于 OCD 治疗的研究较少,本研究通过对 OCD 患者分别进行不同刺激强度 dTMS 刺激,比较分析其对 OCD 患者的临床治疗效果以及 dTMS 对 OCD 患者反应抑制能力的干预效果。

方法 对 21 名 OCD 患者进行为期两周(10 次)的 dTMS。并将其按照刺激强度分为高低强度两组,使用 Y-BOCS、HAMD-17、HAMA 以及行为学测试 (Stroop 任务、SST) 在干预前,干预 1 周以及干预后进行评估。

结果 干预后,在 Y-BOCS 得分上,两组之间时间主效应显著 ($F(2,18)=49.28, P=0.01$, 偏 $\eta^2=0.72$), 两组得分下降显著 ($P<0.001$), 不存在组别主效应 ($F(1,19)=0.10, P=0.76$, 偏 $\eta^2<0.001$) 和时间 \times 组别的交互作用 ($F(2,18)=0.93, P=0.39$,

偏 $\eta^2=0.05$), 在干预前($P=0.87$)、干预 1 周($P=0.89$) 以及干预治疗后 ($P=0.40$), 组别的简单效应均不显著; 两种强度的 dTMS 干预时间简单效应均显著(均 $P<0.001$); 在 HAMD-17 得分上, 两组之间时间主效应显著 ($F(2,18)=16.60, P<0.001$, 偏 $\eta^2=0.65$), 表明两组得分均有显著下降 ($P<0.001$), 不存在组别主效应 ($F(1,19)=0.002, P=0.96$, 偏 $\eta^2<0.001$) 和时间 \times 组别的交互作用 ($F(2,18)=0.29, P=0.75$, 偏 $\eta^2=0.03$), 在干预前($P=0.82$)、干预 1 周($P=0.92$) 以及干预治疗后 ($P=0.72$), 组别的简单效应均不显著; 两种强度的 dTMS 干预时间简单效应均显著(均 $P<0.01$); 在 HAMA 得分上, 两组之间时间主效应显著 ($F(2,18)=83.92, P<0.001$, 偏 $\eta^2=0.82$), 两组的得分均有显著下降 ($P<0.001$), 组别主效应不显著 ($F(1,19)=1.58, P=0.22$, 偏 $\eta^2=0.08$), 时间 \times 组别的交互作用不显著 ($F(2,18)=0.54, P=0.59$, 偏 $\eta^2=0.03$), 在干预前($P=0.37$)、干预 1 周($P=0.22$) 以及干预治疗后 ($P=0.25$), 组别的简单效应均不显著, 两种强度的 dTMS 干预时间简单效应均显著(均 $P<0.001$); 两组在 Stroop 任务和 SST 任务中的各个指标在干预前后均不存在显著差异 ($P>0.05$)。

结论 在 10 次治疗后, 高低刺激强度的 dTMS 均能改善 OCD 患者的强迫症状。

利用神经影像学数据预测 BPSD 的抗精神病药物剂量: 一种迁移学习方法

洪波¹ 陶天立² 张寒² 岳玲¹ 陈剑华¹

1.上海市精神卫生中心(上海市心理咨询培训中心)
2.上海科技大学

目的 痴呆的精神行为症状(BPSD)对患者和护理人员都构成了挑战。抗精神病药物被广泛用于控制严重的 BPSD 症状, 但使用存在严重的安全风险。这就强调了对抗精神病药物剂量进行个体化精确预测的必要性。神经成像, 特别是磁共振成像(MRI), 揭示了与衰老、认知能力下降和精神症状相关的大脑结构, 使其成为预测药物剂量的潜在工具。鉴于 BPSD 患者的可用 MRI 数据往往有限, 本研究采用迁移学习来预测药物剂量, 并从深度学习的角度提供 BPSD 的神经解剖学解释。

方法 我们利用在大规模老化 MRI 数据集上预训练的级联 ResNet (Cas-ResNet) 来预测 BPSD 患者的药物剂量。我们采用了两步过程来训练我们的模型。Cas-ResNet 的结构由作为特征提取器和最终预测模块的三个级联残差模块组成。首先, 中国大脑分子与功能图谱 (CBMFM) 项目的一个大型数据集用于通过大脑年龄预测任务对模型进行预训练。在预训练之后, 特征提取器的参数被冻结。随后, 我们对预训练的模型进行了微调, 用来预测上海交通大学阿尔茨海默病诊治中心 (ADRDC) 的 BPSD 患者的抗精神病药物使用剂量。最后, 我们利用梯度加权类激活映射生成注意力图, 并对注意力图进行统计分析, 以确定用于药物剂量预测的关键大脑区域。

CBMFM 数据纳入 646 名健康受试者 (334 名女性和 312 名男性, 年龄 18-82 岁) 的 T1w MRI。主要数据 (即药物剂量预测) 从 ADRDC 收集, 包括 83 名 BPSD 患者 (27 名男性和 56 名女性, 年龄 55-80 岁) 的 T1w MRI。为了确定不同抗精神病药物的个体使用情况, 使用了限定日剂量 (DDD) 的概念计算了个体化控制 BPSD 的 DDD, 范围为 0 至 1.2/天, 作为微调的标记。

结果 我们的 Cas-ResNet 模型的性能与其他基线模型进行了比较, 包括 3DCNN、VGG 和 DenseNet, 用更少的训练时期增强了性能, 预测的 DDD 和实际的 DDD 比较存在相关性 ($r=0.59$, $p<0.001$)。预训练过程减少了对 MRI 大量参数的需求和过度拟合的风险。通过特征可解释性分析, 我们确定了对预测 BPSD 药物剂量至关重要的五个大脑区域, 主要位于颞叶, 包括海马旁区和纹状体 (壳核和尾状核)。这些发现表明, 控制 BPSD 的抗精神病药物剂量与大脑结构改变有关, 涉及痴呆相关和情绪调节相关区域。

结论 我们首次展示了使用轻量级深度学习模型预测用于控制 BPSD 的药物剂量的有希望的结果。我们预训练的 Cas-ResNet 模型在临床场景中用有限的的数据展示了有效的大脑 MRI 表现。这项工作促进了对痴呆患者适当使用抗精神病药物的讨论。

双相障碍研究协作组

双相情感障碍 II 型抑郁相患者脑肠轴失调研究

郭子玄 王颖*

暨南大学附属第一医院(广州华侨医院)

目的 尽管失调的肠道菌群失调、脑功能和神经炎症在双相情感障碍 II 型抑郁相(BD II)患者中的报道越来越多, 但其肠道菌群-炎症-脑轴的关系仍未得到充分阐述。

方法 我们前瞻性纳入了 65 名未接受药物治疗的 BD II 型抑郁相患者和 58 名对照组(HCs)。我们收集了所有被试的静息态功能磁共振的动静态低频振幅 (ALFF) 数据, 并将 ALFF 异常的脑区作为种子点计算全脑的动静态功能连接 (FC)。我们还收集了所有被试的粪便样本并进行 16SrDNA 序列测序, 同时收集血液样本并检测白细胞介素[IL]-2、IL-4、IL-6、IL-8、IL-10、肿瘤坏死因子[TNF]- α 水平。此外, 利用支持向量机技术(SVM)基于对 BD II 型抑郁相患者和对照组进行分类。

结果 BD II 型抑郁相患者表现出默认网络 (DMN) 的功能改变, 即左侧小脑 Crus II 静态 ALFF 减低, 其及到右侧顶叶下小叶的静态 FC 减低和到右侧额上回的动态 FC 减低。同时, 在 BD II 型抑郁相患者中发现了更高的促炎 (IL-6、IL-8、TNF- α) 和抗炎 (IL-10) 细胞因子水平, 以及促炎细菌和谷氨酸和 γ -氨基丁酸代谢相关细菌相对丰度的增加。多元回归分析方法显示副拟杆菌相对丰度与 IL-8 水平的交互作用于左侧小脑 Crus II 静态 ALFF 减低。此外, 将改变的静息态功能指标及异常肠道菌群水平结合有效地区分 BD II 型抑郁相患者和对照组, 曲线下面积达到最佳值 0.892。

结论 本研究发现了 BD II 型抑郁相患者小脑-默认网络功能异常、肠道菌群紊乱及炎症失调, 并且肠道菌群的紊乱及失调的炎症细胞因子交互作用于 BD II 型抑郁相患者大脑默认网络功能的异常, 本研究填补了 BD II 型抑郁相脑肠轴病理生理机制的空白。

童年虐待与心境障碍的因果关系：两样本孟德尔随机化分析

张郑 罗庆华*

重庆医科大学附属第一医院

目的 本研究旨在采用孟德尔随机化方法 (Mendelian Randomization, MR) 探究童年虐待与成年后心境障碍发病及症状的潜在因果关联。童年虐待在社会和医学研究中被广泛关注, 研究其对成年后心理健康的长期影响具有重要意义。心境障碍, 如重性抑郁障碍 (Major Depressive Disorder, MDD) 和双相情感障碍 (Bipolar Disorder, BD), 常伴随严重的情绪波动和行为问题, 对个体生活质量和社会功能产生深远影响。

方法 本研究从公开发布的全基因组关联研究 (Genome-Wide Association Studies, GWAS) 数据中提取了关于童年虐待及心境障碍 (包括重性抑郁障碍、双相情感障碍、历史躁狂发作、自我伤害行为、首次抑郁发作年龄、抑郁发作频率) 的数据集。使用逆方差加权法 (Inverse Variance Weighted, IVW)、MR Egger 法、加权中位数法 (Weighted Median, WM) 以及 MR-PRESSO 模型, 进行了综合的 MR 分析和敏感性分析。这些方法有助于评估潜在的因果关系, 同时控制潜在的混杂因素和偏倚。分析结果以优势比 (Odds Ratio, OR) 和置信区间 (Confidence Interval, CI) 表达。

结果 研究结果显示, 童年虐待与 MDD (IVW: OR=2.28, 95% CI=1.66-3.14, PFDR <0.001) 和 BD (IVW: OR=2.00, 95% CI=1.18-3.39, PFDR=0.014) 的发病风险存在显著关联。此外, 童年虐待还可能增加躁狂发作 (IVW: OR=1.03, 95% CI=1.01-1.06, PFDR=0.002)、自我伤害行为 (IVW: OR=1.06, 95% CI=1.04-1.08, PFDR=0.002) 的风险, 以及抑郁发作频率 (IVW: $\beta=0.31$, 95% CI=0.17-0.46, PFDR <0.001)。这些结果表明, 童年虐待对成年后心境障碍的影响是多方面的, 且具有显著的统计学意义。

结论 本研究的发现表明, 童年虐待是成年后 MDD、BD 以及躁狂发作的潜在危险因素, 并与自残行为和抑郁发作频率显著相关。这些结果提示了早期干预和预防策略的重要性, 特别是在儿童保护和心理健康服务领域。未来的研究可以进一步探索

具体的生物机制和环境因素, 以更全面地理解童年虐待对成年后心理健康的影响。通过加强社会支持和提供及时的心理治疗, 可以减轻童年虐待对成年后心理健康的负面影响, 提高个体的生活质量和适应能力。

5. Institute of Neuropsychiatry, The Affiliated Brain Hospital of Nanjing Medical University

Objective Circulating inflammation-related proteins are associated with major depressive disorder (MDD) in an accumulating amount of observational studies, but little is known about the causal direction of this association. This study aimed to explore the potential causal relationship between inflammation-related proteins and the risk of MDD

Methods We used summary data from a genome-wide association study (GWAS) of 91 circulating inflammation-associated proteins in 14,824 Europeans, as well as meta-analyzed data from a large GWAS pooled from six major depression datasets (i.e., iPSYCH, FinnGen, PGC, UKB, 23andMe, and MVP), including up to 1,300,000 participants. We conducted a two-sample bidirectional Mendelian randomization (MR) analysis utilizing inverse variance weighting (IVW) as the main approach, complemented by two additional methods (MR-Egger and weighted median approaches) as sensitivity analyses to identify and correct

for pleiotropy. The heterogeneity of instrumental variables (IVs) was assessed using Cochran's Q test and I² measure

Results MR analysis revealed that genetically CASP-8 (odds ratio (OR): 0.97, confidence interval (CI): 0.95-1.00, $P = 3.10E-02$), CD40 (OR: 0.96, 95% CI: 0.94-0.98, $P = 3.72E-04$), IL-18 (OR: 0.98, CI: 0.96-0.99, $P = 2.84E-03$), SLAMF1 (OR: 0.97, 95% CI: 0.95-1.00, $P = 2.60E-02$), and uPA (OR: 0.98, 95% CI: 0.96-1.00, $P = 2.90E-02$) were significantly and causally associated with MDD. Reverse MR analysis identified that genetically CCL19 (OR: 1.15, CI: 1.03-1.27, $P = 1.00E-02$), HGF (OR: 1.15, 95% CI: 1.04-1.27, $P = 4.74E-03$), IL-8 (OR: 1.10, CI: 1.00-1.22, $P = 4.80E-02$), IL-18 (OR: 1.11, 95% CI: 1.01-1.23, $P = 3.70E-02$), IL20RA (OR: 1.12, 95% CI: 1.00-1.25, $P = 4.70E-02$), TGFA (OR: 1.12, 95% CI: 1.02-1.23, $P = 2.30E-02$) and TNFSF14 (OR: 1.16, 95% CI: 1.04-1.30, $P = 7.62E-03$) were notably affected by the causal effect of MDD. Finally, we observed a remarkable bidirectional causal association between IL-18 and MDD

Conclusion We identified a potential causal association of inflammation-related proteins with MDD, providing compelling and novel evidence to complement inflammatory mechanisms in MDD

Efficacy and Safety of Transcranial Direct Current Stimulation As An Add-on Trial Treatment for Acute Bipolar Depression Patients with Suicidal Ideation

Dandan Wang², Shaohua Hu², Xiaonan Guo², Qi Huang^{1,2}

1.Nanchong Psychosomatic Hospital

2.Department of Psychiatry, First Affiliated Hospital, Zhejiang University School of Medicine

Objective Bipolar depression undertakes an

overwhelming suicide risk. We aimed to examine the efficacy and safety of transcranial direct current stimulation (tDCS) combined with quetiapine in bipolar patients as suicidal intervention

Methods In a single center, double-blind, treatment-naive bipolar depression patients with suicidal ideation were randomly assigned to quetiapine in combination with either active (n=16) or sham (n=15) tDCS over the left DLPFC for 3 consecutive weeks. The 30-minute, 2-mA tDCS was conducted twice a day on the weekday of the first week and then once a day on the weekdays of two following weeks. Primary efficacy outcome measure was the change in the Beck Scale for Suicidal Ideation (BSSI). Secondary outcomes included changes on 17-item Hamilton Depression Rating Scale (HDRS-17) and Montgomery-Asberg Depression Rating Scale (MADRS). Outcome was evaluated at day 3 and week end. Safety outcome was based on the reported adverse reactions

Results Active tDCS was superior to sham tDCS on the BSSI at day 3 and tended to sustained at every week end during treatment process, compared to baseline. However, no difference was found between active and sham in HDRS-17 and MADRS. Response and remission rate also supported the anti-suicide effect of tDCS, with higher response and remission rate in BSSI, but not antidepressant effect, compared to sham, over time. Regarding to safety, active tDCS was well tolerated and all the adverse reactions reported were mild and limited to transient scalp discomfort

Conclusion The tDCS was effective as anti-suicide treatment for acute bipolar depression patients with suicidal ideation, with minimal side effects reported.

关键词: Bipolar disorder, depression, transcranial direct current stimulation, dorsal lateral prefrontal cortex, suicidal ideation

Time-frequency Characteristics of Amygdala and Its Interaction with The Whole Brain in Subliminal Emotional Processing in MDD

Yishan Du¹, Yi Xia¹, Lingling Hua¹, Wei You¹, Chen

He¹, Jiayu Liu¹, Junling Sheng¹, Qing Lu², Zhijian Yao¹
1.Department of Psychiatry, The Affiliated Brain Hospital of Nanjing Medical University, Nanjing 210029, China

2.School of Biological Sciences & Medical Engineering, Southeast University, Nanjing 210096, China

Objective To explore the temporal-frequency characteristics of amygdala activation and the differences in interaction patterns with the whole brain in major depressive disorder (MDD) patients compared to healthy controls (HCs) during subliminal emotional processing, and to investigate the correlation between neurobiological changes and depressive symptoms

Methods A total of 30 MDD patients and 26 HCs were included. Magnetoencephalography (MEG) data were collected while subjects identified subliminal emotional faces. Time-frequency characteristics of the amygdala during subliminal emotional processing were calculated using time-frequency analysis methods, and the time-frequency differences in amygdala activation between the two groups were compared using cluster permutation tests. Phase-locking value analysis was used to explore the interaction between the amygdala and other brain regions, and the differences in functional connectivity between the two groups were compared using independent samples t-tests. Pearson correlation analysis was performed to calculate the correlation between differential neural indicators and HAMD-17 and HAMA scores

Results Time-frequency analysis revealed that, compared to the HCs, the MDD group exhibited enhanced alpha (8-12Hz) power in the right amygdala ($P = 0.049$) and enhanced gamma (60-70Hz) power activation in the left amygdala ($P = 0.006$) within 50-200ms after negative emotional stimuli. Functional connectivity results indicated that the right amygdala showed increased functional connectivity with other brain regions ($P = 0.014$), including the left inferior occipital gyrus, left middle occipital gyrus, left precentral gyrus, left superior parietal lobule, left cuneus, left medial and lateral orbitofrontal cortex, right inferior frontal gyrus, and right supplementary motor area, and increased functional connectivity between the left amygdala and left

putamen ($P < 0.001$). Correlation analysis showed that increased functional connectivity between the right amygdala and the left superior parietal lobule was positively correlated with HAMA scores ($r = 0.408$, $P = 0.025$) and total HAMD-17 scores ($r=0.619$, $P < 0.001$); increased functional connectivity between the right amygdala and the left inferior occipital gyrus was positively correlated with HAMA total scores ($r = 0.392$, $P = 0.032$)

Conclusion During the unconscious emotional processing phase, MDD patients exhibit a processing bias towards negative emotions, characterized by enhanced alpha and gamma frequency activation of the amygdala in the early stages in response to negative emotional stimuli. Moreover, the enhanced connectivity between the amygdala and the occipital-parietal cortex is closely related to the severity of depressive and anxiety symptoms. These findings reveal specific neural mechanisms in MDD patients during suprathreshold emotional processing, which may serve as objective markers for the diagnosis of MDD

Causal Association Between Genetically Predicted of 731 Immunocyte Phenotype and Bipolar Disorder: A Bidirectional Two-sample Mendelian Randomization Study

Mengqin Dai Jiaming Luo*

Affiliated Hospital of North Sichuan Medical College

Objective Bipolar disorder is a severe mood disorder characterized by recurrent episodes of elevated mood (mania or hypomania) and depression. These episodes are accompanied by significant changes in activity or energy levels and are associated with distinct cognitive, physical, and behavioral symptoms. The disorder's severity often results in substantial impairment in daily functioning and carries a lifetime suicide risk esti-

mated to be as high as 20%. Besides, Inflammatory disturbances repeatedly observed in bipolar disorder, can explain some of the comorbidity between bipolar disorder and medical disorder. However, fewer have explored this relationship in BD and immune system. the causal relationship between immune traits and BD remains unclear. Our goal is to elucidate the role of immune cells in bipolar disorder to inform new treatment strategies

Methods Mendelian randomization is an analytical method that uses genetic variants as instrumental variables to infer causality between a risk factor and an outcome in observational studies. Comprehensive two-sample Mendelian randomization (MR) analysis was performed to determine the causal association between immune cell signatures and BD in this study. Based on publicly GWAS data, we explored causal associations between 731 immune cell signatures and BD(N=413466) risk. Immune cells include a total of four types of immune signatures median fluorescence intensities (MFI)(n=389), morphological parameters (MP)(n=32), absolute cell (AC)(n=118) and relative cell (RC)(n=192) were included. We employed complementary MR methods, such as the inverse-variance weighted (IVW) method; comprehensive sensitivity analyses were used to verify the robustness, heterogeneity, and horizontal pleiotropy of the results. This bidirectional approach allows us to assess whether immune cells influence the risk of bipolar disorder and whether genetic susceptibility to bipolar disorder affects immune cell phenotypes

This study explored the causal relationship between 731 immunocyte phenotypes and osteonecrosis utilizing a bidirectional two-sample Mendelian randomization (MR) analysis. This approach relied on three fundamental assumptions: ① Association assumption: Instrumental Variables (IVs) must have a robust association with the exposure factor. ② Independence assumption: IVs must be independent of confounding factors. ③ Exclusion restriction assumption: IVs must influence the outcome exclusively through the exposure factor. Informed consent was secured from all participants, adhering strictly to the original GWAS protocols, thus ensuring ethical compliance and participant awareness.

Results After FDR adjustment (PFDR<0.05), eighteen immunophenotypes were found to be significantly associated with BD risk. Specifically, pro-protective effects of four immunophenotypes on BD: CD8 on EM CD8br (OR =0.951, 95% CI =0.915~ 0,988, PFDR = 0.045); IgD⁻ CD27⁻ %lymphocyte (OR =0.918, 95% CI =0.880~ 0,956, PFDR = 0.001); CD62L on CD62L+ myeloid DC (OR =0.926, 95% CI =0.871~ 0,985, PFDR = 0.044); CD3 on secreting Treg (OR =0.970, 95% CI =0.947~ 0,993 PFDR = 0.040). Fourteen immunophenotypes were significantly associated with an increased risk of BD: BD had statistically significant effects on five immune traits: CD14 on CD14+ CD16+ monocyte (OR =1.072, 95% CI =1.021 ~ 1.125, PFDR = 0.025); CD16-CD56 on HLA DR+ NK (OR =1.030, 95% CI =1.005 ~ 1.056, PFDR = 0.049); CD20 on IgD- CD24- (OR =1.033, 95% CI =1.007 ~ 1.058, PFDR = 0.042); CD20 on IgD- CD27- (OR =1.068, 95% CI =1.023~ 1.115, PFDR = 0.026); CD25++ CD8br %CD8br (OR =1.038, 95% CI =1.005 ~ 1.072, PFDR = 0.048); CD27 on IgD- CD38- (OR =1.038, 95% CI =1.007 ~ 1.070, PFDR = 0.042); CD28+ CD45RA- CD8br %T cell (OR =1.024, 95% CI =1.008~1.041, PFDR=0.023); CD28+ DN (CD4-CD8-) %T cell (OR =1.032, 95% CI =1.004~1.061, PFDR=0.047); CD33br HLA DR+ AC (OR =1.022, 95% CI =1.007~1.036, PFDR=0.023); CD33br HLA DR+ CD14- AC (OR =1.020, 95% CI =1.009~1.030, PFDR=0.003); CD45RA- CD28- CD8br %T cell (OR =1.001, 95% CI =1.000~1.001, PFDR=0.050); CD8 on CD28+ CD45RA+ CD8br (OR =1.026, 95% CI =1.000~1.052, PFDR=0.050); HVEM on CD45RA- CD4+ (OR =1.031, 95% CI =1.005~1.058, PFDR=0.047); HVEM on naive CD4+ (OR =1.028, 95% CI =1.004~1.052, PFDR=0.046). BD had statistically significant effects on five immune traits: CD20 on IgD+ CD38- unswitched memory B cell (OR=0.819, 95% CI =0.684~0.979, PFDR=0.045); CD20 on IgD- CD39dim B cell (OR=0.869, 95% CI =0.757 ~0.998, PFDR=0.047); CD20 on naive-mature B cell (OR=0.858, 95% CI =0.751~ 0.980, PFDR=0.046); CX3CR1 on CD14- CD16- (OR=0.861, 95% CI =0.755 ~ 0.981, PFDR= 0.042); HLA DR on HLA DR+ CD4+ T cell (OR=0.868 , 95% CI =0.755~ 0.998, PFDR=0.049)

Conclusion Our bidirectional two-sample MR analysis demonstrates causal relationships between various immunophenotypes and bipolar disorder, revealing complex interactions between the immune system and bipolar disorder. These insights open new avenues for exploring the biological mechanisms underlying bipolar disorder and support the development of early interventions and treatments. By extending our understanding within the immunological domain, this study provides critical guidance for future clinical and basic research endeavors

However, our study has limitations. First, we used a P-value threshold of $P < 1 \times 10^{-5}$ to select instrumental variables (IVs), which may not be strongly correlated, although they allow for a comprehensive assessment of the relationship between immunophenotypes and BD. Second, the study is based on a European database, limiting the generalizability of our results to other ethnicities. While heterogeneity and horizontal pleiotropy were verified through the Q-test and Egger intercept and considered mitigated, this does not guarantee their absence in clinical settings. The two-sample Mendelian randomization analysis method has limitations with multiple exposures, necessitating the exploration of appropriate analytical methods. Lastly, comprehensive clinical trials are required for validation, necessitating a more extensive GWAS database and further analytical or experimental verification to elucidate the association between individual immunophenotypes and BD and their impact mechanisms.

Early Detection of Depression Using A Voice Signal-Based Deep Learning Model

Jinqiu Xu¹, Jian Li¹, Zhi Xu²

1.Southeast University

2.Zhongda Hospital, School of Medicine, Southeast University

Objective Depression is a common mental disorder characterized by prolonged low mood and loss of interest in daily activities, potentially leading to suicidal thoughts. Early identification and timely intervention are crucial for mitigating symptoms and preventing the worsening of the condition. However, traditional diagnostic methods for depression, which primarily rely on diagnostic scales and face-to-face interviews with professional psychologists, are subjective and complex to administer. Recently, voice-based depression detection methods have gained increasing attention and recognition due to their efficiency, non-invasiveness, accessibility, low cost, and privacy advantages. Our study aims to develop and validate a deep learning model based on voice signals for the auxiliary diagnosis of depression, thus improving early detection rates and reducing the subjectivity and operational complexity of traditional methods

Methods We collected Chinese voice data from 110 depression patients and 73 healthy controls in a hospital setting. The study employed the Bag of Audio Words (BOAW) technique to extract features from raw voice signals. This method converts continuous speech signals into discrete bag-of-words models by segmenting audio data and clustering features to generate quantifiable representations. The advantage of BOAW lies in its ability to effectively capture temporal patterns and frequency characteristics in voice signals, making it suitable for large-scale data processing and analysis

The extracted features were then fed into a deep learning model composed of Bidirectional Long Short-Term Memory (BiLSTM) networks and Graph Convolutional Networks (GCN). BiLSTM networks consider both forward and backward temporal dependencies in voice signals, capturing richer contextual information and thus improving the accuracy of feature representation. GCNs model the relationships between features using graph structures, further enhancing the inter-feature associations and global representation capabilities. The combined design of BiLSTM, and GCN leverages the temporal, frequency, and structural characteristics of voice signals, thereby enhancing the accuracy and robustness of depression detection.

Results Experimental results demonstrated that

the constructed model achieved an accuracy of 85% on the validation set, indicating excellent performance in identifying depression. This finding confirms the model's effectiveness and superior performance in recognizing depressive voice signals, providing a new, efficient, non-invasive, accessible, and low-cost tool for auxiliary depression diagnosis with potential for widespread clinical application

Conclusion Experimental results demonstrated that the constructed model achieved an accuracy of 85% on the validation set, indicating excellent performance in identifying depression. This finding confirms the model's effectiveness and superior performance in recognizing depressive voice signals, providing a new, efficient, non-invasive, accessible, and low-cost tool for auxiliary depression diagnosis with potential for widespread clinical application.

双相I型障碍三种临床相语言网络功能连接异常的研究

吕东升^{1,2} 刘敏¹ 姚萍¹ 陈敏¹ 赵靖平² 林武宏¹

1.内蒙古自治区精神卫生中心(内蒙古自治区第三医院、内蒙古自治区脑科医院)

2.中南大学湘雅二医院

目的 分析双相I型障碍(bipolar I disorder, BD)躁狂、抑郁、缓解三种临床相大脑语言网络内部的静息状态功能连接(resting-state functional connectivity, RSFC)及语言网络各组成脑区与全脑RSFC的变化特征,探究BD-I疾病状态相关的大脑静息态核磁影像特征性改变,为寻找BD-I不同疾病状态的影像学标记和潜在的干预靶点提供依据。

方法 招募BD-I患者107例(BD-I组)以及与之年龄、性别、受教育程度等相匹配的健康对照者46名(对照组)。根据精神障碍诊断与统计手册第五版(Diagnostic and Statistical Manual of Mental Disorders-5th Edition,DSM-5)的诊断标准并参考杨氏躁狂评定量表(Young Mania Rating Scale, YMRS)及17项汉密尔顿抑郁量表(Hamilton Depression Rating

Scale, HAMD17)评分将BD-I患者分为双相躁狂组、双相抑郁组、双相缓解组。分别采用基于感兴趣区和种子点的FC方法分析语言网络的内部FC及语言网络各组成脑区与全脑的FC,使用单因素方差分析及事后检验的方法比较四组之间FC值的差异。采用Pearson或Spearman相关系数对组间差异有统计学意义的FC值与临床量表总分及各因子分进行相关分析。

结果 与健康组相比,躁狂相语言网络内左侧缘上回与左侧下顶叶间的FC显著增高,抑郁相双侧辅助运动区与左侧颞上沟间的FC显著降低(FDR校正, $P<0.05$);躁狂相语言网络外左侧下顶叶与右侧岛叶、左右中扣带回间的FC显著增高;抑郁相左侧下顶叶与左侧颞下回间、双侧辅助运动区与右侧直回间的FC显著降低(FDR校正, $P<0.005$)。躁狂相左侧缘上回与左侧下顶叶间增高的FC值与YMRS语言速度与数量因子评分($r=0.376, P=0.041$)、语言思维形式障碍因子评分($r=0.376, P=0.041$)呈显著正相关;抑郁相双侧辅助运动区与右侧直回间降低的FC值与HAMD17迟滞因子评分($r=-0.357, P=0.045$)呈显著负相关。结果显示,躁狂相语言网络内(外)FC均增高,抑郁相语言网络内(外)FC均降低,未发现缓解相与健康组的显著差异。

结论 BD-I三种临床相语言网络内外FC的损坏模式可能是临床相的特异性改变。而且,躁狂相语言网络的过度连接和抑郁相语言网络的失连接可能是精神病理症状“思维奔逸”和“思维迟缓”的影像学标记。

Clinical and Cognitive Efficacy and Safety of Transcranial Direct Current Stimulation for Bipolar Depression:A Protocol for Systematic Review and Meta-analysis

Wei Wang* Yi Lu Guolin Mi
shandong mental health center

Objective The objective of this systematic review and meta-analysis is to critically evaluate the clin-

ical and cognitive efficacy and safety of transcranial direct current stimulation (tDCS) as an intervention for bipolar depression. Given the varying results from previous studies and the need for effective and tolerable treatment options, this review aims to synthesize the available evidence, focusing on both the therapeutic impact of tDCS on depressive symptoms and its influence on cognitive functions and other related domains. The ultimate goal is to provide a more precise and reliable direction for future research and clinical practice in the treatment of bipolar affective disorder

Methods This systematic review adheres to the PRISMA 2020 statement and was prospectively registered in PROSPERO. Data were extracted from electronic databases including PubMed, Embase, and Web of Science up to March 2023. The study included only randomized controlled trials that reported Hamilton Depression Rating Scale (HAM-D), Montgomery-Åsberg Depression Rating Scale (MADRS), or Beck Depression Inventory (BDI) scores as primary outcomes, alongside various secondary outcomes. The risk of bias was assessed using the Cochrane Handbook for Systematic Reviews of Interventions, and the quality of evidence was graded accordingly

Results The systematic search identified 573 articles, of which 8 randomized controlled trials met the inclusion criteria, involving a total of 318 participants. The meta-analysis revealed no statistically significant difference in the reduction of depressive symptoms as measured by HAMD/MADRS/BDI scores between the tDCS treatment group and the control group. While tDCS combined with treatment for bipolar disorder was found to be safe and well-tolerated, without severe adverse reactions or increased risk of manic episodes, it did not demonstrate significant improvement in bipolar depressive symptoms. The efficacy of tDCS was comparable to that of a placebo and lacked a sustained effect. Sensitivity analyses confirmed the stability of the overall weighted mean difference, despite persistent heterogeneity

Conclusion The present systematic review and meta-analysis provide preliminary evidence on the use of tDCS for bipolar depression, suggesting that it is a well-tolerated intervention with minimal adverse effects.

However, the efficacy of tDCS as an adjunctive treatment for bipolar depression is not conclusively supported by the current body of research. The review highlights the need for further investigation into standardized diagnostic and treatment protocols for tDCS, as well as the necessity for larger-scale, longer-term studies with consistent methodologies. The potential of tDCS in combination with other treatments and its role in the therapeutic landscape of bipolar affective disorder warrants additional exploration.

关键词: bipolar disorder, meta-analysis, transcranial direct current stimulation (tDCS), clinical, cognitive

Effect of Add-on Transcranial Alternating Current Stimulation (tACS) in Major Depressive Disorder: A Randomized Controlled Trial

Jingjing Zhou Gang Wang*

Beijing Anding Hospital, Capital Medical University

Objective The effect of transcranial alternating current stimulation (tACS) on major depressive disorder (MDD) was not confirmed

Methods The 4-week, double-blind, randomized, sham-controlled trial was performed from January 29, 2023 to December 22, 2023. Sixty-six participants were recruited and randomly assigned to receive 20 40-min sessions of either active (77.5Hz, 15mA) or sham stimulation, with one electrode on the forehead and two on the mastoid, each day ($n = 33$ for each group) for four weeks (till Week 4). The participants were followed for 4 more weeks (till Week 8) without stimulation for efficacy/safety assessment. During the 4-week trial, all participants were required to take 10-20mg of escitalopram daily. The primary efficacy endpoint was the change in HAMD-17 scores from baseline to Week 4 (with 20 treatment sessions completed). Resting-state electroencephalography (EEG) was collected with a 64-channel EEG system (Brain Products, Germany) at baseline and the Week 4 follow-up. The chi-square test, Fisher's exact test, independent-sample t-test, or Wilcoxon rank-

sum test were used, as appropriate, to compare the differences in variables between groups. The effect of the intervention on the HAMD-17 score was also evaluated with linear mixed modeling (LMM) as sensitivity analysis. The correlation between the mean reduction in EEG and the mean reduction in the HAMD-17 total score was evaluated using Spearman correlation analysis.

Results A total of 66 patients (mean [SD] age, 28.4 [8.18] years; 52 [78.8%] female) were randomized, and 57 patients completed the study. Significant differences were found in the reductions in the HAMD-17 scores at Week 4 ($t=3.44$, $P=0.001$). Response rates at Week 4 were significantly higher in the active tACS group than in the sham tACS group (22 out of 33 patients [66.7%] versus 11 out of 33 [33.3%], $P=0.007$). In the active tACS group, a correlation between the mean change in alpha power and HAMD-17 scores at Week 4 was found ($r=2.38$, $P=0.024$), and the mean change in alpha power was significantly bigger for responders ($Z=2.46$, $P=0.014$). No serious adverse events were observed in this trial.

Conclusion The additional antidepressant effect of tACS is significant, and the combination of tACS with antidepressants is a feasible and effective approach for the treatment of MDD. The antidepressant mechanism of tACS may be the reduction in alpha power in the left frontal lobe. Future research directions may include exploring more appropriate treatment parameters of tACS.

Objective Depressive episodes with mixed features in Major Depressive Disorder (MDD) and bipolar disorder (BD) patients are linked to more severe symptoms compared to episodes without mixed features. However, the relationship between mixed features and biological rhythms remains unclear.

Methods This multicenter cross-sectional study, conducted in four hospitals in China, comprehensively investigated the differences in biological rhythms between patients with depressive episodes of MDD and BD, both with and without mixed features, as well as the influencing factors of mixed features. This study included a total of 267 patients with mood disorders experiencing depressive episodes.

Results The findings revealed that the BRIAN total score of the BD without mixed features group was significantly lower than that of the BD with mixed features group and the MDD with mixed features group ($F=5.287$, $P=0.001$). There was no significant statistical difference between the MDD with mixed features group and other groups. This difference was particularly notable in sleep score ($F=6.512$, $P<0.001$) and eating score ($F=6.386$, $P<0.001$). Mixed features were also found to be associated with the following factors: alcohol abuse, excessive screen time, eating score, ASRM score, and suicidal ideation score.

Conclusion The study highlights that BD depressive episodes without mixed features have significantly lower biological rhythm scores compared to both

MDD and BD depressive episodes with mixed features. Additionally, there are no significant differences in biological rhythm scores between BD depressive episodes with mixed features and MDD depressive episodes with mixed features. Key influencing factors for mixed features include alcohol abuse, excessive screen time, suicidal ideation scores, ASRM scores, and eating scores. These findings highlight the correlation between mixed features and biological rhythms and identify critical lifestyle and psychological factors associated with mixed features in mood disorder patients.

目的 探讨伴自杀意念青少年抑郁症 (major depression disorder, MDD) 患者静息态动态脑功能改变及其与下丘脑-垂体-肾上腺 (hypothalamic-pituitary-adrenal, HPA) 轴失调的相关性。

方法 采用静息态功能磁共振成像对青少年 48 例伴自杀意念 MDD 患者 (MDD+SI)、38 例不伴自杀意念 MDD 患者 (MDD-SI) 和 41 例健康对照 (HC) 扫描。采用滑动时间窗分析方法, 计算三组的动态局部一致性 (dynamic regional homogeneity, dReHo) 和动态功能连接 (dynamic functional connectivity, dFC) 值; 在完成扫描 24 小时内静脉采血, 采用直接化学发光法测定促肾上腺皮质激素 (adrenocorticotrophic hormone, ACTH) 和皮质醇水平。采用单因素协方差分析的统计方法比较三组 dReHo、dFC 值和激素水平, 采用单因素方差分析的方法比较三组激素水平。提取差异有统计学意义的脑区的 dReHo 和 dFC 值采用最小显著差异法校正进行事后检验 ($P < 0.05$), 并将这两个动态指标与激素浓度进行偏相关分析。

结果 (1) 三组 dReHo 值差异脑区为右侧小脑后叶 (主要是 Crus II 和 Crus I) ($F=9.443$, $P <$

0.001 ; 事后检验: $MDD+SI > HC$, $MDD+SI > MDD-SI$) 及左侧楔前叶 ($F=10.926$, $P < 0.05$; 事后检验: $MDD+SI < HC$, $MDD-SI > HC$, $MDD+SI < MDD-SI$)。

(2) 三组间 dFC 值存在统计学差异的是左侧楔前叶与左侧颞中回 ($F=9.602$, $P < 0.001$; 事后检验: $MDD+SI < HC$, $MDD-SI < HC$), 左侧楔前叶与双侧楔前叶 ($F=9.659$, $P < 0.001$; 事后检验: $MDD-SI > HC$, $MDD+SI < MDD-SI$)。(3) HPA 轴激素比较: 与 HC 和 MDD-SI 组相比, MDD+SI 组皮质醇浓度较低。三组间 ACTH 浓度差异无统计学意义。(4) 相关性分析: MDD+SI 组左侧楔前叶的 dReHo 值、左侧楔前叶-左侧颞中回的 dFC 值均与皮质醇浓度正相关 ($r = 0.350$, $P = 0.018$; $r = 0.362$, $P = 0.015$)。

结论 伴或不伴自杀意念青少年 MDD 患者均存在楔前叶和颞中回的动态功能改变; 而小脑的动态功能改变可能为 MDD+SI 患者的特异性改变。而且, 伴自杀意念患者楔前叶和颞中回破坏异常与其皮质醇失调存在相关性。

Differences of Gut Microbiome between Patients with Bipolar Disorder Manic Episode and Treated-bipolar Patients

Zhuangru Zhao Jiajian Zhou*
Weifang Mental Health Center

Objective At present, it is found that many neuropsychiatric diseases are closely related to the imbalance of gut microbiome, which has become a research hotspot in recent years. There are quite a few studies on microgut biome of schizophrenia, depression and autism in the literature at home and abroad. Instead, there is almost no study on whether there is gut microbiome imbalance of manic episode in patients with bipolar disorder and treated-bipolar patients. And the role of gut microbiome in the pathogenesis and recovery treatment of bipolar disorder has not been systematically reported. By comparing the differences of gut microbiome between patients with bipolar disorder manic episode and treated-bipolar patients, this study provides a new idea

for clinical intervention and drug treatment of manic episode

Methods A total of 12 patients with bipolar manic episode hospitalized in Dalian Seventh People's Hospital from March 2021 to January 2022 were selected. In the control group, 12 employees of Dalian Seventh People's Hospital were selected. The Young Manic Rating Scale(YMRS) was used to evaluate the clinical characteristics and severity of the disease within 3 days after admission and 8 weeks after treatment with risperidone and valproate. At the same time, the fresh feces of the subjects were aseptically collected within 3 days after admission and 8 weeks after treatment, and stored in the refrigerator at - 80 °C within 10 minutes. All the fresh feces of the patients and those who come from healthy control group were collected and cryo-preserved from 6 a.m. to 9 a.m. Then DNA was extracted from feces samples, and the variable region of 16S rRNA gene v3v4 was amplified by PCR. Finally, Illumina miseqpe2 * 300 library and standard sequencing process were used to sequence, analyze the differences of gut microbiome between patients with bipolar disorder manic episode and treated-bipolar patients. These would be compared with healthy controls too. And analyze the changes of colony diversity and abundance of gut microbiome by bioinformatics

Results This study showed that the diversity of gut microbiome in patients with bipolar manic episode at the beginning of their hospitalization and after 8-week-treatment was lower than that in the healthy control group, and no statistical difference was found. But there were significant differences in the specific composition at the level of phylum, class, order, family and genus. At the phylum level, the abundance of Bacteroidetes and Mollicutes in BD manic patients within 3 days after admission was significantly higher than that in healthy controls, while the relative abundance of Firmicutes and Actinomycetes was significantly reduced. After 8-week-treatment, the relative abundance of Firmicutes and Actinomycetes in BD manic patients was significantly higher than that before receiving treatment, and was similar to that in healthy controls. Before receiving treatment, the relative abundance of Ruminococcus, Suboligranulum, Enterobacter, Coprococcus,

Bifidobacterium and Lactobacillus in the gut microbiome of BD manic patients was lower than that of healthy group, and the relative abundance of Klebsiella, Flavonifrator and Bacteroides was higher than that of healthy group. After 8-week-treatment, the relative abundance of Ruminococcus and Suboligranulum in BD manic patients was lower than that in healthy people. At the beginning of the treatment and treated for 8 weeks, BD manic patients had increased relative abundance of Ruminococcus, Suboligranulum, Enterobacter, Coprococcus, Bifidobacterium, Lactobacillus and decreased relative abundance of Klebsiella, Flavonifrator and Bacteroides

Conclusion The diversity of gut microbiome in patients with bipolar manic episode at the beginning and end of treatment is no lower than that in the healthy control group, and no statistical difference is found. But there are significant differences in the specific composition at the level of phylum, class, order, family and genus. The bacteria Ruminococcus, Suboligranulum, Enterobacter, Coprococcus, Bifidobacterium and Lactobacillus alleviate the manic symptoms of patients with BD manic episode, on the contrary, the bacteria Klebsiella, Flavonifrator and Bacteroides induce the manic symptoms of patients with BD manic episode.

双相障碍治疗前后炎症标志物特征及其与神经认知功能的关系研究

程晓菲 李名立*

四川大学华西医院

目的 神经认知功能障碍作为双相障碍的核心症状之一, 与患者的职业表现和社会功能缺陷密切相关, 但其生物学机制尚不明确, 严重影响了针对性治疗方案的确定。近年来, 越来越多的研究表明, 炎症可能参与了双相障碍的发生和发展过程, 但炎症与双相障碍神经认知功能障碍之间的关系仍有待阐明。本文旨在通过随访队列研究, 探索处于不同心境发作期和稳定期的双相障碍患者炎症标志物及

神经认知功能的变化特征以及二者之间的关系。

方法 本研究共纳入 132 例受试者,包括 44 名健康对照,40 例(轻)躁狂发作患者和 48 例抑郁发作患者(患者近 1 月均未使用药物治疗)。通过 ELISA 法检测受试者的 10 种血浆炎症标志物水平,使用 MATRICS 成套认知测验(MATRICS Consensus Cognitive Battery, MCCB)以及图形延迟记忆测验评估其认知功能;然后对双相障碍患者进行随访,在其治疗后处于平稳期时(HAMD 总评分 ≤ 7 分, YMRS 评分 ≤ 5 分,且临床症状稳定 ≥ 1 个月)再次进行临床评估、外周血标本的采集及神经认知功能测试。使用一般线性回归模型探索受试者炎症标志物水平与神经认知功能和临床特征之间的关系。

结果 与健康对照相比,双相障碍患者在发作期均出现促炎标志物水平升高、抗炎标志物水平下降,以及神经认知功能的广泛损害;而平稳期时,患者的促炎标志物水平降低、抗炎标志物水平回升,神经认知功能部分改善。线性回归结果显示,在发作期,(轻)躁狂发作患者的语言学习和记忆功能与 TNF- α 水平正相关,处理速度及注意力与 sIL-6 水平、视空间学习和记忆功能与 MCP-1 水平负相关;而抑郁发作患者的处理速度与 MCP-1 水平,工作记忆与 IL-10 水平,注意力、语言流畅性与 TNF- α 水平,语言学习和记忆功能与 IL-12 水平负相关;在平稳期,双相障碍患者的工作记忆与 TNF- α 、IL-4 水平,视空间学习和记忆功能与 TNF- α 水平正相关,而图形延迟记忆与 IL-10 水平负相关。

结论 本研究结果提示,炎症与双相障碍的神经认知功能之间存在关联,可能与促炎与抗炎之间的失衡有关;但这种关联仅在部分炎症标志物和神经认知功能领域被发现,且受到心境发作类型及情绪状态的影响。因此,一方面上述炎症标志物可能用于协助双相障碍患者社会功能预后的判断,另一方面,针对性地使用抗炎药物可能使这部分患者从神经认知功能障碍中受益。

目的 抑郁症(Major Depressive Disorder, MDD)通常伴有日常功能的损害,强调在维持期达到功能和生活质量(Quality of life, QOL)完全恢复的治疗目标。相当部分患者达到症状缓解后,仍存在残留症状,认知和社会功能无法彻底恢复,导致幸福感和 QOL 下降。既往研究发现 MDD 的认知损害分别与首发、复发、抑郁症状及 QOL 有明显双向相关性,可能是症状到 QOL 的中介因素。此外, MDD 常起病于青春期末至 45 岁,15-50 岁的患者约占 40%。但既往针对 MDD 功能损害的研究并未特别关注受到 MDD 影响最显著的工作和学习人群,或者关注残留症状对该群体的认知、功能以及 QOL 的影响及工作相关因素的预测价值。因此,本研究旨在探索来自学习工作人群的 MDD 临床稳定者的功能及 QOL 情况,分析其影响因素及路径。

方法 本研究选择全国 7 家具有代表性的重要精神卫生机构,通过全国多中心、横断面调研的方式,采用临床自然入组法,门诊入组 521 例稳定期 MDD 患者,随后社会招募年龄、性别匹配的健康对照(Healthy controls, HC) 250 例。评估内容主要包括人口学资料、疾病特征、认知水平、社会心理功能及 QOL。统计学方法包括描述性、差异性分析,相关与多元逐步回归,并以残留症状和首、复发变量分别作为自变量,以认知作为中介变量,构建简单及链式中介模型。

结果 两组人口学资料均衡可比。患者组存在残留的焦虑、抑郁和快感缺失,并且认知、社会心理功能,工作效率以及 QOL 显著低于 HC 组。人口学特征和疾病特征之间主要为低度正相关;临床症状、工作和学习能力之间呈低度正相关;QOL、心理社会功能与临床症状及工作学习能力呈中高度负相关。

缺勤和工作效率受损、残留焦虑和社会心理功能同时是功能残疾和 QOL 的预测因子。残留症状(间接效应 $\beta=-0.016$, $p=0.006$)和首发、复发(间接效应 $\beta=-0.043$, $p=0.025$)可通过以主观认知为中介,显著影响 QOL。以残留症状和主观认知作为链式中介,首发、复发到 QOL 总路径显著($\beta=0.148$, $p=0.004$),链式间接路径显著($\beta=0.011$, $p=0.004$)。

结论 MDD 患者经治疗达到临床缓解阶段后,仍有 92.1% 的患者至少存在一种残留症状,精神性焦虑的问题稍显突出。同匹配的 HC 相比,工作和学习能力、主观和客观认知并未完全恢复到正常水准,并影响社会心理功能和 QOL,导致功能残疾。首、复发的精神病史可通过残留症状和主观认知间接影响 QOL,并且残留症状可直接影响 QOL。提示在 MDD 的临床诊疗中应重视残留症状和社会功能的康复,并预防复发。

Identifying Bipolar Disorder and Predicting Its Therapeutic Response of Cognitive Impairment by The Fractional Amplitude of Low-frequency Fluctuation: A Resting-state FMRI Study

Baoyan Xu¹, Baoyan Xu², Sujuan Li¹, Haishan Wu¹

1.Department of Psychiatry, National Clinical Research Center for Mental Disorders, and National Center for Mental Disorders, The Second Xiangya Hospital of Central South University, Changsha 410011, Hunan, China

2.Department of Psychiatry, Hebei Provincial Mental Health Center, Hebei Key Laboratory of Major Mental and Behavioral Disorders, The Sixth Clinical Medical College of Hebei University, Baoding071000, Hebei, China

Objective Cognitive impairment has become a consensus as a core feature of bipolar disorder (BD). However, the neurobiological mechanisms underlying BD and its cognitive deficits are still unclear. This study

used the fractional amplitude of low-frequency fluctuation (fALFF) method to explore the neural activity and cognitive deficits in first-episode and drug-naive BD. In addition, we also analyzed the relationship between changes in fALFF values and clinical or psychometric variables

Methods In this study, 92 first-episode and drug-naive BD patients and 55 healthy controls (HCs) were recruited, and patients were followed up longitudinally for 24 weeks. All subjects completed clinical evaluations at baseline, 12-week and 24-week, and underwent resting-state functional magnetic resonance imaging (rs-fMRI) scans. The fALFF method was used to analyze rs-fMRI data, and Pearson correlation analysis was used to analyze changes in fALFF values with clinical variables or cognitive function. Simultaneously, support vector machine (SVM) and k-Nearest Neighbor (kNN) methods were used to classify and analyze the changes in fALFF between groups

Results Compared to the HCs, the fALFF values in BD patients showed a decrease in the right middle cingulate gyrus. After 12 weeks of treatment, patients were divided into the improved cognitive function group and the non-improved cognitive function group. Compared to HCs, the baseline fALFF values of the improved cognitive function patients showed no difference in any brain region, but that of the non-improved cognitive function patients showed decreases in the right middle cingulate gyrus(MCG). Moreover, compared with baseline fALFF values of the non-improved cognitive function patients, that of the improved cognitive function patients showed a decrease in right middle frontal gyrus(MFG).At baseline, increased fALFF values in the right MCG of BD group were negatively correlated with HAMD total scores, and increased fALFF values in the right MFG were negatively correlated with difference in visuospatial scores after and before 12 weeks of treatment

Conclusion The abnormal spontaneous activity in the right MCG can serve as a biological marker for distinguishing between HCs and BD. The changes in fALFF in the right MFG may be a biomarker for predicting the outcome of cognitive impairment in BD.

Causal Mechanisms of Quadruple Networks in Pediatric Bipolar Disorder

Rong Wang Yuan Zhong*
Nanjing Normal University

Objective Pediatric bipolar disorder (PBD) is a mental illness characterized by abnormal functional connectivity among distributed brain regions. A growing body of literature points to a role for triple network model in the pathophysiology of BD (bipolar disorder). However, the specific relationship of limbic network (LN) and triple network model in PBD remains unclear. This study aimed to explore the aberrancy of the causal connections among these four core networks of PBD

Methods In total, 92 subjects with PBD and 40 adolescent healthy controls (HCs) with resting-state functional magnetic resonance imaging (MRI) scan were analyzed. We used Dynamic Causal Modelling (DCM) to characterize effective connectivity (EC) among four core networks. Parametric empirical Bayes (PEB) was used to identify the ECs related to the group differences, depression and mania severity. Finally, leave-one-out-cross validation (LOOCV) analysis was used to test the accuracy of prediction

Results Relative to HCs, patients mainly showed excitatory bottom-up connections from LN to SN, and then the bidirectional excitatory connections between DMN and SN. In PBD, top-down connectivity from triple-network to LN was excitatory in people with high depression severity, but inhibitory in people with high mania severity. Dysconnectivity circuits associated with mania and depression severity were apparently involved the caudate and hippocampus respectively, according to the results of LOOCV

Conclusion Our study revealed that the bottom-up disruption from LN to triple-network, and the top-down disruption from triple-network to LN, constituting the pathophysiological of PBD group differences, and

mood states differences, respectively.

A Study on The Correlation between Non-suicidal Self-injury and VmPFC Neurometabolism in Adolescent Bipolar Depression Patients

Chengji Wang^{1,2}, Xiaoxiao Tang², Cheng Zhang², Yingshuai Li², Longyuan Zhang², Shaohong Zou²

1. Graduate School of Xinjiang Medical University

2. People's Hospital of Xinjiang Uygur Autonomous Region

Objective To explore the possible relationship between non-suicidal self-injury (NSSI) behavior and neurometabolism in the ventromedial prefrontal cortex (vmPFC) of adolescent bipolar depression (ABD) patients using proton magnetic resonance spectroscopy (1H-MRS) technology

Methods Firstly, participants were screened from the Clinical Psychology Department of Xinjiang Autonomous Region People's Hospital. Finally, 40 adolescent bipolar depression patients who visited the outpatient department and did not receive electroconvulsive therapy, psychotropic drug therapy, or systematic psychotherapy for 6 months before hospitalization from March 2022 to September 2023 were selected. The NSSI diagnostic criteria provided by DSM-5 were used to conduct semi-structured interviews with all participants, According to the presence or absence of NSSI, there were 21 cases in the group with NSSI and 19 cases in the group without NSSI

Secondly, Demographic data such as age, gender, only child status, residential status, age of onset, education level, age of onset, and course of illness were collected through a general situation survey. The 24 Hamilton Depression Scale (HAMD) and Young Mania Rating Scale (YMRS) were used to assess the psychological well-being of the participants. Using the Ingenia

3.0T magnetic resonance scanner, a chief imaging physician and a chief imaging technician conducted anatomical localization of the vmPFC brain regions in all subjects, followed by 1H-MRS scanning to quantitatively analyze the ratio of N-acetyl-L aspartic acid (NAA)/creatinine (Cr), choline complex (Choline, Cho)/Cr, myo inositol (mI)/Cr, and the above results were statistically analyzed.

Results 1. There was no statistically significant difference ($P>0.05$) in the age, gender, only child status, residential status, education level, age of onset, disease course, family history, and HAMD score between patients in the NSSI group and those without NSSI group

2. The NAA/Cr of patients with NSSI was lower than that of patients without NSSI, and the difference was statistically significant ($P<0.001$). There was no statistically significant difference in Cho/Cr and mI/Cr between the group with NSSI and the group without NSSI ($P>0.05$).

3. There is a positive correlation ($P<0.001$) between Cho/Cr and HAMD scores in patients with NSSI, while there is a varying degree of negative correlation ($P<0.05$) between mI/Cr and age and onset age in patients without NSSI. There is no correlation ($P>0.05$) between other indicators.

Conclusion 1. Compared with adolescent bipolar depression patients without NSSI, adolescent bipolar depression patients with NSSI have reduced NAA metabolism in the vmPFC brain area

2. The level of membrane phospholipid breakdown metabolism in the vmPFC brain area of adolescent bipolar depression patients with NSSI may be related to the severity of depression.

3. The level of phosphoinositol cycle in the vmPFC brain area of adolescent bipolar depression patients without NSSI may be related to age or onset age.

基于转移熵和临床脑电的跨中心单双相抑郁鉴别探究

孙静^{1,2} 薛芮¹ 江海腾^{1,2} 李涛^{1,2}

1.浙江大学医学院附属精神卫生中心 & 杭州第七人民医院 & 浙江大学医学院脑科学与脑医学学院
2.浙江大学生物医学工程与仪器科学学院

目的 重性抑郁症 (Major depressive disorder, MDD) 和双相情感障碍 (Bipolar disorder, BD) 是两种具有相似症状并广泛影响全球人群的主要精神疾病。目前, 诊断这两种疾病主要依赖于主观的临床访谈和问卷, 缺乏客观的生物标志物, 这限制了诊断的精确性。此外, 在多中心研究中, 模型的泛化能力不足, 影响了诊断方法的普遍适用性。本研究通过应用转移熵和迁移学习技术, 旨在发现能够区分 MDD 和 BD 的脑电生物标志物, 并探索如何有效地将这些模型从一个中心推广到另一个中心, 以提高诊断方法的客观性和普适性。

方法 在本研究中, 我们收集了成都华西医院和杭州市七医院两个中心的临床脑电数据 (成都: 3778 例, BD 1161 例, MDD 2457 例, HC 160 例; 杭州: 466 例, BD 146 例, MDD 250 例, HC 70 例)。所有参与者均在闭眼静息状态下进行了为期 5 分钟、采样率为 250Hz 的 16 导脑电记录。本研究的方法分为特征提取和迁移学习两大模块。在特征提取阶段, 首先将每名受试者的脑电数据分割成 5 秒长的片段, 随后计算每个片段的 δ 、 θ 、 α 和 β 频带的转移熵, 再通过叠加平均这些片段的转移熵, 形成每位受试者的特征矩阵。在迁移学习模块中, 首先通过比较两个中心的特征矩阵的均值和标准差的统计量, 对两个中心的特征矩阵进行了对齐。将一部分经过对齐处理的目标域样本融入源域, 构建新的源域特征集, 余下的目标域样本用于测试。最后, 通过在机器学习模型中训练源域数据, 并使用准确率、精确度、召回率和 F1 分数这些指标在目标域中评估模型的表现, 以此观察模型在新环境中的效果。

结果 本研究对比了多种分类模型, 其中 K 近邻分类器表现出最佳性能。在单中心实验中, 数据被随机划分为训练集和测试集 (比例 7:3)。在成都华西医院的数据集上, 模型展现了 97.57% ($\pm 1.5\%$) 的准确率。而在杭州市七医院的数据集中, 准确率为 89.08% ($\pm 3.06\%$)。在跨中心实验中, 以成都华西医院的数据作为源域, 目标域为杭州市七医院, 模型在目标域中的表现达到了 93.66% ($\pm 3.52\%$) 的准确率。

结论 本研究展示了转移熵特征结合迁移学习在BD和MDD判别中的有效性。单中心的实验中,在两个不同地区的数据集上分别应用此特征,结果表明了它在不同数据上良好的适应性和准确性。在跨中心的实验中,迁移学习模块的加入显著提高了模型在目标域中的泛化能力。这些结果展现了转移熵特征在精神健康诊断领域的应用前景,为未来临床实践和研究提供了有力的技术支持,同时为个性化治疗方法的开发奠定了基础。

基于成对脉冲经颅磁刺激检测探讨双相抑郁患者大脑皮层功能及其与疗效相关性

冯慧琪*

山西医科大学

目的 双相情感障碍是一类易复发的重性精神疾病,然而目前有关其病理生理机制仍不清楚,有研究显示大脑皮层功能的异常在本病的发生发展中发挥重要作用,应用成对脉冲经颅磁刺激(ppTMS)可对双相障碍患者进行大脑皮层兴奋性和抑制性检测,筛选双相障碍大脑皮层功能异常生物学指标,进行疾病鉴别及治疗监测。本研究拟以双相抑郁(BPD)患者为研究对象,运用ppTMS评估其大脑皮层功能,并进行治疗前后的对比,为进一步探索双相障碍神经生理机制,进行早期诊断及疗效的监测提供一定的理论依据。

方法 1.招募BPD患者、健康对照各30例,收集受试者的一般人口学资料,包括HAMD-24、HAMA、YMRS。测定基线时和治疗后(4周末)的HAMD-24、HAMA分数,计算HAMD-24减分率,将HAMD-24减分率 $\geq 50\%$ 定义为治疗有效组, HAMD-24减分率 $\leq 20\%$ 定义为治疗无效组。

2.运用ppTMS检测受试者大脑左、右半球皮层功能,指标为抑制性指标皮质内抑制(ICI)和皮质静息期(CSP),兴奋性指标皮质内易化(ICF)和静息运动阈值(RMT)。

3.将健康对照、BPD患者治疗前后的各项大脑皮层功能指标【RMT、ICI-2 ms、ICI-4 ms、ICF-10 ms、ICF-15 ms、CSP(ms)】进行统计学分析,进行

大脑皮层功能的比较。

结果 1.一般人口学资料统计分析结果显示,HAMD-24、HAMA量表评分在BPD患者治疗前后有统计学差异。

2.BPD患者基线时双侧半球ICI-4 ms值均高于健康对照。提取两组受试者双侧半球ICI-4 ms值,采用ROC曲线检验ppTMS检测大脑皮层功能测量值作为诊断双相抑郁指标的效能,结果显示左侧ICI-4 ms值AUC=0.764;右侧ICI-4ms值AUC=0.719。

3.BPD患者基线时左半球ICI-2 ms、ICI-4 ms及右半球RMT测量值均高于BPD患者治疗后。

4.BPD患者在基线时及治疗后的右侧大脑半球ICI-4 ms测量值均高于左侧。

5.BPD患者治疗有效组与治疗无效组大脑皮层功能分析显示,基线状态时双侧半球ICF-10 ms测量值有显著统计学差异,经过治疗后左侧半球ICF-15 ms测量值、CSP时程有显著统计学差异。

结论 1.双相抑郁患者双侧半球大脑皮层抑制功能受损,且左右侧大脑皮层功能存在不对称性,右侧半球大脑皮层抑制功能受损大于左侧。

2.ICI-4 ms测量值可能作为诊断双相抑郁的神经生理学检测因子。

3.双相抑郁患者治疗有效组治疗后大脑皮层兴奋、抑制功能较前明显增强。

Association between Circulating Cell-free Mitochondrial DNA and Clinical Symptoms and Cognitive Functions in Patients with First-diagnosis Bipolar Disorder: A 12-week Follow-up Study

Jiayang Zhang¹, Baoyan Xu², Sujuan Li¹, Ziwei Teng¹, Yan Qiu³, Hui Tang¹, Hui Xiang¹, Yuxi Tan¹, Jindong Chen¹, Haishan Wu¹

1.National Clinical Research Center for Mental Disorders, Department of Psychiatry, China National Technology Institute on Mental Disorders, The Second Xiangya Hospital of Central South University, Changsha 410011, Hunan, China

2.Department of Psychiatry, Hebei Provincial Mental

Health Center, Hebei Key Laboratory of Major Mental and Behavioral Disorders, The Sixth Clinical Medical College of Hebei University, Baoding, Hebei, China.

3.Xiamen Xianyue Hospital, Xianyue Hospital Affiliated with Xiamen Medical College, Fujian Psychiatric Center, Fujian Clinical Research Center for Mental Disorders, Xiamen 361012, Fujian, China.

Background Plasma circulating cell-free mitochondrial DNA (ccf-mtDNA) represents the degree of mitochondrial damage in the body, participates in various regulatory processes, and is involved in the pathophysiology of some diseases. However, its role in bipolar disorder (BD) was rarely studied. This study measured the plasma ccf-mtDNA level and explored its association with cognitive dysfunction and clinical symptoms in first-diagnosis drug-free patients with BD.

Methods We evaluated plasma ccf-mtDNA levels in 85 first-diagnosis, medication-naive bipolar disorder (BD) patients (25 males, 60 females) at baseline and after three months of treatment. Clinical symptoms were assessed using the Hamilton Depression Rating Scale (HAMD), the Hamilton Anxiety Rating Scale (HAMA), and the Young Mania Rating Scale (YMRS). Cognitive function changes were evaluated using the Repeatable Battery for the Assessment of Neuropsychological Status (RBANS). Subsequently, we investigated the association between plasma ccf-mtDNA levels and both clinical symptoms and cognitive functions

Results The plasma ccf-mtDNA levels significantly decreased ($Z = -3.186, p = 0.001$), and cognition significantly improved ($t = -2.033, p = 0.046$) after three months of treatment. The plasma ccf-mtDNA level at baseline was associated with immediate memory ($r = -0.320, p = 0.004$), and its level after three months of treatment was associated with the scores in the clinical symptom scales HAMD ($r = -0.324, p = 0.017$) and HAMA ($r = -0.329, p = 0.013$)

Conclusion The research results proved that impaired mitochondrial function was involved in the pathological process of BD and that restoration of mitochondrial function might be a translational therapeutic target of BD

关键词: Bipolar disorder; Circulating cell-free mitochondrial DNA; Cognitive function.

基于转录组测序探索免疫相关通路在双相情感障碍中的作用

黄牧芝¹ 伍海姗¹ 李素娟¹ 邱妍² 滕紫薇¹ 徐雪蕾¹ 陈晋东¹

1.中南大学湘雅二医院

2.厦门市仙岳医院

目的 双相障碍(Bipolar Disorder, BD)是一类在临床上既有抑郁发作又有躁狂或轻躁狂发作的重性精神障碍。其病理生理过程与免疫失调密切相关,炎症反应系统的激活可能是疾病躁狂和抑郁发作的重要触发因素。虽然目前已有诸多研究揭示了免疫反应在疾病中的作用,但是具体机制却并不明确。因此,本研究旨在通过 RNA-seq 技术探究 BD 致病的相关免疫机制。

方法 研究包括首诊未用药的 BD 患者以及健康志愿者两组,使用汉密尔顿抑郁量表、杨氏躁狂量表评估 BD 患者的临床症状,所有被试皆从中南大学湘雅二医院门诊及住院部招募。每名被试入组后均采集 2ml 全血。随机抽取 6 名患者及健康对照的血液样本,提取单个核细胞(PBMC)。随后采用酚氯仿法提取 PBMC 的基因组 DNA,基于高通量测序技术 RNA-seq 评估外周血单个核细胞的转录组学特征。使用 GO 富集分析探索显著差异表达基因所行使的主要生物学功能,使用 KEGG 富集分析探索显著差异表达的基因参与的主要生化代谢途径和信号转导途径,最后应用 STRING 数据库中的互作关系对差异表达基因及所对应蛋白质之间的相互作用进行分析,构建 PPI 网络。

结果 1.GO 分析表明,存在显著差异的基因在分子功能方面主要富集在抗原结合等;在细胞组分方面主要富集在免疫球蛋白复合物;生物过程方面主要富集在免疫相关生物过程。

2.KEGG 分析表明,存在显著差异的基因富集于类风湿性关节炎信号通路($p=0.000081$)、趋化因子信号通路($p=0.003$)、阿兹海默信号通路($p=0.0027$)、TNF 信号通路($p=0.02$)及白细胞跨内皮迁移信号通路($p=0.022$)。

3. PPI 分析表明, Top 10 关键网络中包含的 Hub 基因为 IL1B、PIK3CA、CXCL8、PIK3R1、CDH1、ATM、BRAF、CCL3、CSF1、FGFG9。其中 IL1B、PIK3CA、CXCL8、PIK3R1、CCL3 参与免疫反应; IL1B 参与类风湿性关节炎信号通路, PIK3CA、CXCL8、PIK3R1、CCL 参与趋化因子分化途径。

结论 本研究验证了免疫反应在双相障碍病理生理过程中发挥的重要作用, IL1B、PIK3CA、CXCL8、PIK3R1、CCL 基因可能是其中的关键。

Global Burden of Bipolar Disorder and Associated Inequalities From 1990 To 2021: A Systematic Analysis From The Global Burden of Disease Study 2021

Saeed Saboor¹, Saeed Saboor³, Huaizhi Wang^{2,3}, Shao-hua Hu^{1,2,3}

1.Department of Psychiatry, The First Affiliated Hospital, Zhejiang University School of Medicine, Hangzhou, China

2.School of Mental health, Wenzhou medical university, Wenzhou, China

3.Nanhu Brain-computer Interface Institute, Hangzhou, China

Importance Bipolar disorder is a severe mental disorder that affects millions of people worldwide, necessitating comprehensive mental health policies and interventions to address its global burden.

Objective To assess the global burden of bipolar disorder and associated inequalities from 1990 to 2021, with consideration for the potential impact of the COVID-19 pandemic on mental health outcomes.

Design, Setting, participants Data from the GBD, 2021 were used for analysis of bipolar disorder. Results were stratified by age group, sex, and sociodemographic index (SDI) quintiles across 204 countries and territories. Data for the 2021 GBD study were collected up to 2021, and data were analyzed for this article.

Main outcome measures: Age-standardized prevalence rate (ASPR), age-standardized incidence rate

(ASIR), and age-standardized YLD rate (ASR YLD) per 100,000 population. Absolute and relative inequalities measured by the slope index of inequality (SII) and concentration index (CI).

Results From 1990 to 2021, the global incidence of bipolar disorder increased, while prevalence and YLDs remained stable or slightly decreased, with a rise from 453.7 (95% UI: 381.62–540.77) to 454.59 (95% UI: 377.9–545.75) per 100,000 population. Throughout this period, females consistently exhibited higher rates compared to males (474.22 vs. 435.01 per 100,000 in 2021). Higher SDI regions and countries had higher prevalence rates, with the high SDI region having a prevalence rate of 631.28 (95% UI: 548.98, 731.97) in 2021. Australasia had the highest prevalence rate among all GBD regions in 2021 at 1110.78 (95% UI: 940.33, 1305.94). The SII for incidence slightly increased from 10.87 (95% CI: 5.33, 16.41) in 1990 to 11.38 (95% CI: 6.05, 16.71) in 2021, while the CI decreased from 0.0955 (95% CI: 0.0588, 0.1323) to 0.0119 (95% CI: -0.0252, 0.0491), suggesting a small rise in absolute inequality and a reduction in relative inequalities

Conclusion and Relevance Significant absolute inequalities exist in the global burden of bipolar disorder, particularly among females and in high-income regions. This emphasizes the importance of targeted interventions that take into account gender, socioeconomic, cultural, and healthcare factors. In addition, future research should focus on investigating the long-term impact of the COVID-19 pandemic on the burden of bipolar disorder and the associated inequalities.

Graded Changes in Local Functional Connectivity of The Cerebral Cortex in Patients with Mood Disorder

Xiaohui Wu¹, Rubai Zhou¹, Jamieson Alec², Jun Chen¹, Yiru Fang³

1.Shanghai Mental Health Center, Shanghai Jiao Tong University School of Medicine, Shanghai, China

2. Department of Psychiatry, University of Melbourne

3. Centre of Affective Disorder, Ruijin Hospital, Shanghai Jiao Tong University School of Medicine, Shanghai, China

Objective Accumulated studies have begun to reveal unique connectivity patterns in patients with mood disorders, including bipolar disorder (BD) and major depressive disorder (MDD). Traditional approaches for assessing local brain connectivity often rely on fixed or arbitrarily defined neighbourhood sizes, which would limit the ability to detect gradual changes in the spatial gradient of local correlations. To address this issue, the novel Iso-Distant Average Correlation (IDAC) method, which is attuned to classical anatomical and functional boundaries, was utilized. This method allowed for an enhanced examination of the alterations in local functional connectivity associated with BD and MDD. In this study, we mapped the functional anatomy of local synchrony in the cerebral cortex in BD and MDD using functional MRI

Methods Data of 85 patients with BD, 165 patients with MDD and 158 healthy controls were obtained from two clinical trials (Clinical Trial Registry ID: NCT01938859 and NCT01764867). All participants underwent a resting-state fMRI scan. Demographic and clinical information such as the 17-item Hamilton Depression Rating Scale (HAMD), the Young Mania Rating Scale (YMRS) and the Hamilton anxiety scale (HAMA) were collected. Whole-brain functional connectivity maps of intracortical neural activity within iso-distant local areas (5-10mm, 15-20mm, and 25-30mm) were generated to characterize local fMRI signal similarities. Between groups analysis was done by a 3×3 ANOVA (group [BD, MDD and HC] by distance [5-10, 15-20, and 25-30 mm]), covaried by age and sex. Finally, a regression analysis was conducted in the patient groups to establish whether symptom severity was associated with the identified functional connectivity alterations

Results Patients with BD showed greater local functional connectivity in Right-Insula, Right-Parahipp and Left-Fusiform. Across all spatial distances, BD participants demonstrated greater local functional connectivity of Right-DorsalAcc, Right-dIPFC(dorsal), Right-

Amygdala, Bilateral-Fusiform, Left-AntPFC, Right-DorsalPcc, Right-AngGyrus and Left-DorsalPcc, comparing with MDD participants. Additionally, in the short and medium range connections within BD participants, anxiety associated alterations were identified in the Right-dIPFC(dorsal), Right-AntPFC and Right VentAntCing (5-10mm), and Right-DorsalPCC(15-20mm)

Conclusion Our results thus provide detail of the functional anatomy of synchrony changes in the cerebral cortex in bipolar disorder and major depressive disorder and identified increased synchrony of the neural activity in several regions commonly implicated in the neurobiology of bipolar disorder. Such information could ultimately be relevant in the search for potential tools for differential diagnosis of BD and MDD.

非稳态负荷与首发未服药双相情感障碍患者临床症状的关系探索

陈秀杉 李素娟 伍海姗*

中南大学湘雅二医院

目的 双相情感障碍是一种严重、致残、反复发作的精神疾病。与一般人群相比,双相情感障碍患者共患II型糖尿病、肥胖、心血管疾病的概率更高。非稳态负荷(Allostatic Load, AL)是描述人体长期暴露于重复或慢性的应激下时,各个系统对应激产生超出调节范围的波动的总和。已有研究表明,长时间、持续的高AL与免疫系统、心血管系统、内分泌系统疾病的发生、发展有关,也会导致精神疾病风险的增加。本研究的目的在于探索AL与首发未用药双相情感障碍患者临床症状的相关性,为进一步评价AL在双相情感障碍患者的影响提供理论基础。

方法 本研究为横断面研究,于2019年3月至2022年8月在中南大学湘雅二医院精神卫生中心进行,于门诊及住院部随机筛选首发未用药的双相障碍患者,同时期在周围社区招募年龄及性别构成比相匹配的健康志愿者,收集所有被试者的收缩压、

舒张压、静息心率、体重指数、腰臀比；晨起空腹采血后提取血清，使用全自动生化分析仪（7170A，日本）测量高密度脂蛋白胆固醇浓度、总胆固醇浓度、血糖及超敏 C 反应蛋白浓度；使用电化学发光免疫测定系统（Roche Cobas 8000-e602，瑞士）测量皮质醇、血清脱氢表雄酮浓度；综合以上指标计算 AL 指数。采用汉密尔顿抑郁量表、汉密尔顿焦虑量表、杨氏躁狂量表评估参与者的临床症状。采用 t 检验、秩和检验（连续变量）和卡方检验（分类变量）比较两组间 AL 指数及 11 个生物学指标的差异；采用肯德尔相关性分析。

结果 本研究共纳入 116 名双相情感障碍患者及 123 名性别年龄匹配的健康志愿者。双相情感障碍组患者平均年龄 20.83 岁，平均 BMI 22.44 kg/m²，平均受教育年限为 13.56 年。双相情感障碍组 AL 指数 2.47±1.36，健康对照组 AL 指数 1.94±1.06，两组有显著的统计学差异（ $z=91.80, P=0.012$ ）；11 个生物学指标的组间比较显示，双相情感障碍组组血皮质醇水平显著高于对照组（ $z=63.48, P<0.001$ ），体重指数较高于对照组（ $z=96.35, P=0.047$ ）。而两组腰臀比，总胆固醇，高密度脂蛋白胆固醇，血糖，血清脱氢表雄酮，C-反应蛋白水平差异无统计学意义（ $P>0.05$ ）。双相情感障碍组 HAMD-17 评分为 22.38±7.39，HAMA 评分为 22.56±9.43，YRMS 评分为 9.88±6.56，肯德尔相关性分析显示高密度脂蛋白水平与抑郁症状呈负相关（ $\tau=-0.14, P=0.041$ ）。

结论 双相情感障碍患者 AL 指数和血皮质醇含量显著升高，高密度脂蛋白水平与抑郁症状呈负相关，提示双相发病与应激调节功能紊乱有关。

Changes and Correlation of Olfactory Function and Serum Interleukin-6 in Acute Phase of Bipolar Type I Disorder

Chunyang Li* Chunhong Yang

Shunde WuZhongpei Memorial Hospital, Foshan City, Guangdong

Objective Studies have found changes in olfactory function in patients with bipolar disorder, and olfaction, mood, and inflammation may be closely related.

In this study, olfactory function and interleukin-6 (IL-6) levels in patients with bipolar disorder and healthy controls under different emotional states were compared horizontally to seek new biological markers for the differential diagnosis of bipolar disorder. Secondly, the changes of olfactory function and IL-6 level in patients with bipolar disorder with different emotional states were compared longitudinally to explore a new tool for evaluating the efficacy of bipolar disorder. In addition, analyzing the relationship between olfactory function and IL-6 in patients with bipolar disorder is expected to provide more clinical evidence for verifying the hypothesis of pathophysiological mechanism of bipolar disorder

Methods A total of 50 patients with manic bipolar disorder (M-BD group) and 31 patients with depressive bipolar disorder (D-BD group) were selected from inpatients and outpatients of a psychiatric hospital and followed up to the remission stage. Finally, 40 patients with euthymic manic bipolar disorder (EM-BD group) and 28 patients with euthymic depressive bipolar disorder (ED-BD group) were successfully followed up. The 59 healthy control group (HC group) were from healthy workers matched to the patient group. Hamilton Rating Scale for Depression (HAMD), Young Mania Rating Scale (YMRS) and Hamilton Rating Scale for Anxiety (HAMA) were used to assess the mental and psychological states of all subjects, and their social functions were assessed by Global Assessment Function (GAF). The selection of the Sniffin' Sticks test (SST) to assess olfactory function includes olfactory sensitivity (OS) and Olfactory Identification (OI). Blood samples were collected and serum IL-6 levels were detected by ELISA

Results 1. OS and OI in M-BD group and D-BD group were significantly lower than those in HC group ($P < 0.05$)

2. OI of patients in EM-BD group and ED-BD group was significantly lower than that in HC group ($P < 0.0167$), but there was no significant difference in OS between the two groups.

3. Longitudinal comparison of olfactory function between M-BD group and EM-BD group, D-BD group and MD-BD group showed that BD in all remission

stages of OS was significantly higher than BD in corresponding attack stage ($P < 0.05$), but there was no significant difference in OI among all groups.

4. Serum IL-6 levels in M-BD group were significantly higher than those in D-BD group ($P=0.005$) and HC group ($P<0.001$), but there was no statistically significant difference between D-BD group and HC group.

5. Serum IL-6 level in EM-BD group was significantly higher than that in HC group ($P=0.006$), and there was no statistical difference in serum IL-6 level in ED-BD group compared with EM-BD group and HC group.

6. The longitudinal comparison of serum IL-6 levels in BD at the onset and remission stage showed that only the serum IL-6 in the EM-BD group was significantly lower than that in the M-BD group ($P=0.038$), and there was no significant difference among the other groups.

7. There was a positive correlation between OS and OI score in M-BD group ($r=0.330$, $P=0.019$), and OI score in EM-BD group was positively correlated with years of education ($r=0.320$, $P=0.044$).

8. There was a negative correlation between OS and serum IL-6 in M-BD group ($r=-0.386$, $P=0.006$).

Conclusion 1. Both olfactory sensitivity and olfactory identification were impaired in patients with bipolar disorder during manic episode and depressive episode, but there was no significant difference in olfactory function between the two groups.

2. The olfactory sensitivity of patients with bipolar disorder during manic episode and depressive episode returned to normal level with the remission of the disease, while the olfactory identification was continuously impaired. It is suggested that olfactory sensitivity may be a state marker of bipolar disorder, and olfactory identification may be a characteristic marker of bipolar disorder.

3. Serum IL-6 decreased with the remission of bipolar mania, but did not return to normal levels. It is suggested that serum IL-6 may be used as a biomarker to monitor patients with bipolar mania, and it persists in the course of bipolar mania.

4. Olfactory sensitivity in bipolar manic episode patients was negatively correlated with serum IL-6 lev-

els, suggesting that inflammatory factors may be involved in the pathophysiological mechanism of impaired olfactory function in manic bipolar disorder patients.

Differences in Risky Decision-making Feedback between Depressed Patients with and without Suicidal Ideation: An ERP Study

Ciqing Bao¹, Qiaoyang Zhang¹, Haowen Zou¹, Haowen Zou², Chen He¹, Qing Lu³, Zhijian Yao¹

1. Department of Psychiatry, the Affiliated Brain Hospital of Nanjing Medical University

2. Nanjing Brain Hospital, Medical School, Nanjing University

3. School of Biological Sciences & Medical Engineering, Southeast University

Objective The aim of this study was to explore behavioral and electrophysiological differences in risky decision-making between depressed patients with or without suicidal ideation and healthy controls

Methods According to the 24-item Hamilton Depression Rating Scale, we enrolled 61 untreated first-episode depressive patients from the depression clinic of the Nanjing Brain Hospital between September 2023 and January 2024. They were categorized into the suicidal ideation group (32 cases) and the non-suicidal ideation group (29 cases). Simultaneously, we recruited 36 healthy controls matching the patients in terms of gender, age, and years of education from the community. Then we employed the ERP detection on the subjects using the Iowa Gambling Task (IGT) paradigm with a focus on assessing amplitudes and latency of FRN and P300 during the feedback phase

Results The depressed group with suicidal ideation had the worst decision-making function. In the case of gain/loss, the FRN of the depressed group was more negative than that of healthy controls. Depressed pa-

tients with suicidal ideation have the smallest P300 amplitude and are negatively correlated with suicidal ideation

Conclusion P300 may be used as an electrophysiological index to differentiate patients with depression with suicidal ideation.

Objective Response inhibition, which is fundamental for purposeful behaviour, refers to the ability to suppress pre-activated dominant but inappropriate action tendencies. It is indistinct how chronotype influences the relationship between depression and response inhibition. Importantly, no evidence indicates whether the response inhibition varies across day

Methods A total 59 patients and one 56 healthy individuals were enrolled for the study. Participants completed self-reported questionnaire including the Beck Depression Inventory (BDI), the Morningness-Eveningness Questionnaire (MEQ), the Munich Chronotype Questionnaire (MCTQ), the Pittsburgh Sleep Quality Index (PSQI). The Go/NoGO task combining electroencephalogram (EEG) recording the brain activity was applied. Participants were asked to join two ses-

sions of experiments, i.e. morning and evening randomly. Event-related potential (ERP) and time-frequency analyses were performed to investigate the electrophysiological activity over brain. The Generalized Estimating Equations (GEE) method was employed to analyse the repeated measures data and account for within-subject correlations (the correlation structure is exchangeable)

Results GEE results revealed that both behavioural tests and ERP showing similar pattern of response inhibition. Specifically, depressive patients showed a significant worse performance (Wald $\chi^2 = 5.482$, $P = 0.019$) and lower ERP amplitude (P3) (Wald $\chi^2 = 9.844$, $P = 0.002$) in NoGo condition than healthy individuals. Since the interaction (Group \times Time) was significant in behavioural (Wald $\chi^2 = 5.128$, $P = 0.024$) and electrophysiological aspects (Wald $\chi^2 = 6.308$, $P = 0.012$), post hoc analyses were conducted. The results indicated that depressive patients had a worse accuracy (NoGo condition) in the morning session compared to evening session, while healthy individual showed a better performance in morning session than evening session. The ERP was consistent with behavioural test, which patients got lower P3 amplitude in the morning session than evening session, while no significant diurnal difference was found in healthy controls

Conclusion Our finding suggests that depressive patients exhibit a specific diurnal pattern of response inhibition (morning worse) than healthy individuals. This result may helpful to understand the relationship between circadian rhythm and depression.

State-trait Anxiety Mediates The Relationship between Chronotype and Depression

Haowen Zou^{1,2}, Xumiao Wang², Ciqing Bao², Zhilu Chen², Qing Lu^{3,4}, Zhijian Yao^{1,2,3}

1.Nanjing Brain Hospital, Medical School, Nanjing University, Nanjing, China

2.Department of Psychiatry, The Affiliated Brain Hospital of Nanjing Medical University, Nanjing, China

3.School of Biological Sciences and Medical Engineering, Southeast University, 2 sipailou, Nanjing210096, China

4.Child Development and Learning Science, Key Laboratory of Ministry of Education, Nanjing 210096, China

Objective Patients diagnosed with major depressive episode (MDE) exhibit higher levels of anxiety symptoms and perceived stress. Previous research has identified sleep disorders as a risk factor for MDE. In light of the strong correlation between state-trait anxiety, chronotype, and depression, it is essential to investigate the potential psychological mechanism involved. The current study aims to examine whether state-trait anxiety mediates the correlation between chronotype and depressive/healthy status

Methods A total 97 patients and 104 healthy individuals were enrolled for the study. Participants completed self-reported questionnaire including the Beck Depression Inventory (BDI), the Morningness-Eveningness Questionnaire (MEQ), and the State-Trait Anxiety (STAI). Independent sample t-tests and the analysis of covariance (ANCOVA) were conducted to examine the differences in demographic characters and questionnaires scores between two groups correspondingly. Simple mediation analyses were performed using PROCESS Version 4.2, with the MEQ score as the independent variable and depressive/healthy status as the dependent variable. Additionally, age, year of education, sex, and medication load index (MLI) were involved in the model as covariances

Results Compared to healthy controls, depressive group exhibited significantly higher scores on all questionnaire ($p < 0.001$). Only state anxiety (indirect effect/standard error/95% confidential interval, $-0.04/0.02/[-0.076, -0.005]$), but not trait anxiety ($-0.03/0.02/[-0.075, 0.002]$) was identified as significant a mediator in the association between chronotype and depression

Conclusion Findings from our mediation analyses confirm the mediating roles of state-trait anxiety in relationship between chronotype and depression. The

difference between state and trait anxiety in the role of mediating may imply a potential psychological mechanism of chronotype and depression.

关键词: Major depressive disorders, chronotype, state anxiety, trait anxiety

Study on The Neural Oscillation in The Pars Opercularis of The rIFG in Predicting The Efficacy of Early Antidepressant Treatment Outcome

Tingting Xiong¹, Lingling Hua¹, Yi Xia¹, Zhilu Chen¹, Yingying Huang¹, Moxuan Song¹, Qing Lu², Zhijian Yao¹

1.Department of Psychiatry, the Affiliated Brain Hospital of Nanjing Medical University, Nanjing, China, 210029

2.School of Biological Sciences & Medical Engineering, Southeast University, Nanjing, China, 210096

Objective In this study, we analyze the local activity of beta frequency band in the pars opercularis of the rIFG, to investigate the correlation between the pars opercularis of the rIFG and early antidepressant efficacy

Methods A total of 52 depressed patients and 26 healthy controls were included, All subjects completed a cranial magnetic resonance scan and magnetoencephalographic data acquisition under the Go/No-Go experimental paradigm at baseline. Based on the AAL90 template, the pars opercularis of the rIFG was used as a seed point to establish the Event-Related Desynchronization (ERD) in the beta frequency band of all subjects. According to whether the HAMD17 total score reduction rate reached 50% after 2 weeks, the patients were divided into Early responders and Early Nonresponders. The difference of the ERD, the relationship between the ERD and the change rate of HAMD17 score were explored

Results Early responders and nonresponders both showed a decrease in ERD of the beta frequency band in the pars opercularis of the rIFG during the baseline period ($P < 0.05$). Early nonresponders had higher

levels of desynchronization in the pars opercularis of the rIFG compared to early responders ($P < 0.05$). During the baseline period, ERD in the beta frequency band was inversely connected with the 2-week rate of reduction in overall HAMD score ($r = -0.364$, $P = 0.008$), cognitive impairment factor ($r = -0.365$, $P = 0.008$), and Block factor ($r = -0.441$, $P = 0.001$)

Conclusion Reduced ERDs of the pars opercularis of the rIFG in the beta band have been linked to poor efficacy of early antidepressants, ERDs in this region of the beta band can be used as a biomarker associated with early antidepressant efficacy, which can provide a certain objective basis for whether cognitive deficits and psychomotor block symptoms can be effectively improved in patients with depression after 2 weeks

关键词: Antidepressant effect, Early efficacy, Beta band, Magnetoencephalogram

双相情感障碍未患病一级亲属非典型神经振荡瞬时特征: 一项脑磁图研究

夏逸¹ 玲玲¹ 卢青² 姚志剑^{1,2}

1.南京医科大学附属脑科医院心境障碍科

2.东南大学生物医学工程

目的 反应抑制是双相情感障碍的核心认知障碍,与一系列不良事件有关,其神经机制目前尚不明晰。我们的前期工作发现右额下回 beta 频段能量降低可能是双相情感障碍潜在的特异性生物标志物。最近的文献表明,神经振荡是由瞬变的爆发事件驱动,而平均频谱能量掩盖了 beta 活动的瞬时、突发性特征。因此,本研究借助先进的脑磁图技术,进一步探索双相情感障碍遗传高危人群神经振荡瞬时特征,阐明双相情感障碍遗传风险的神经机制。

方法 共计纳入 22 名在 2010 至 2020 年间于南京医科大学附属脑科医院心境障碍科住院的双相情感障碍患者的未患病一级亲属。此外,于社区招募性别、年龄和受教育年限与之匹配的健康人 22 名。所有参与者均接受了 Go/No-go 任务下的脑磁图扫描和结构磁共振扫描。采用溯源分析方法提取右额下回和左侧运动皮层的虚拟时间序列。通过机器学习

得出最优的爆发阈值。基于虚拟时间序列,利用最优阈值,分别提取 beta 振荡的爆发率、爆发时间、爆发频段、爆发能量、爆发体积等局部脑区特征。最后,计算 Jaccard 系数,评估脑区间的长程协同性。

结果 与健康对照组相比,双相情感障碍患者的未患病一级亲属的右额下回 beta 爆发次数减少。然而,发生 beta 爆发的试次中,一级亲属运动皮层 beta 爆发率仍可上调,这表明右额下回一旦触发,他们仍可实施反应抑制。另一方面,一级亲属右额下回与左侧运动皮层之间的 Jaccard 系数无异常,进一步验证了一级亲属脑区长程协同性尚无变化。

结论 我们的发现提示,宏观 beta 频段能量降低的微观原因是 beta 爆发的次数减少,右额下回 beta 爆发特征是双相情感障碍遗传风险超早期可识别的潜在标志物之一。

The Relationship between Childhood Trauma and Depressive Severity in Unipolar and Bipolar Disorder: Mediation by The Role of Family Functioning

Yishan Du¹, Jiayu Liu¹, Lingling Hua¹, Yingying Huang^{1,4}, Qing Lu^{2,3}, Zhijian Yao^{1,4}

1. Department of Psychiatry, the Affiliated Brain Hospital of Nanjing Medical University

2. School of Biological Sciences & Medical Engineering, Southeast University

3. Child Development and Learning Science, Key Laboratory of Ministry of Education, Southeast University

4. Nanjing Brain Hospital, Medical School of Nanjing University

Background Childhood trauma (CT) has been found to impact mood disorders, and family functioning as a potential mediator. However, its distinct impact on unipolar disorder (UD) and bipolar disorder (BD) has not been thoroughly investigated. This study aims to examine the relationship between CT and family functioning and the severity of depressive episodes in patients with UD and BD, and to explore the mediating role of

family function. To investigate the ability of CT subtypes with clinical characteristics to distinguish between UD and BD

Methods A total of 562 patients with depressive episodes (UD=336, BD=226) and 204 healthy controls were recruited. The Hamilton Depression Rating Scale (HAMD), Childhood Trauma Questionnaire, and Family Adaptability and Cohesion Evaluation Scale IV were employed to assess psychological factors in the participants. Pearson correlation analysis and mediation analysis were performed in the UD and BD groups respectively. ROC curve was used to identify UD and BD

Results CT had a direct impact on the severity of depression in both UD and BD patients. In the UD group, family adaptability served as an intermediary factor between CT and HAMD scores. In the BD group, only emotional neglect exhibited a significant mediating effect on HAMD scores through family cohesion. The combination of clinical features and specific CT could be utilized to distinguish between UD and BD

Conclusions This study suggested that when considering the impact of CT on mood disorders, it is important to take into account the differential roles of family functioning in UD and BD.

抑郁症无意识情绪加工杏仁核 Gamma 频段活动异常的脑磁图研究

杜易珊¹ 夏逸¹ 花玲玲¹ 戴众鹏^{2,3} 何晨¹ 尤为¹ 卢青^{2,3} 姚志剑¹

- 1.南京医科大学附属脑科医院心境障碍科
- 2.东南大学生物科学与医学工程学院
- 3.儿童发展与学习科学教育部重点实验室

目的 抑郁症 (Major depressive disorder, MDD) 主要特征之一是对负面情绪信息的过度关注。情绪加工分为外显和内隐两种方式, 然而 MDD 患者在无意识水平下是否存在负性情绪偏向尚知之甚少。本研究旨在利用脑磁图高时空分辨率特性, 探索

MDD 患者杏仁核在 Gamma 频段中对悲伤面孔表情的无意识情绪加工的时间频率特征。

方法 本研究采用脑磁图 (MEG) 技术, 对 30 名 MDD 患者和 26 名健康对照在进行反向掩蔽任务时的脑活动进行了记录和分析。以 AAL90 模板进行溯源分析, 提取杏仁核脑区的时间序列, 利用时频分析方法计算 Gamma 频段下杏仁核脑区的时频能量值, 使用聚类置换检验比较两组间杏仁核能量值的差异, 并分析其与正负性情绪量表的相关性。

结果 在情绪加工早期 (50-250ms), 与健康对照相比, MDD 患者的左侧杏仁核高频 gamma (60-70Hz) 能量激活增强 (P=0.001), 且与正性情感评分存在显著负相关 (r=-0.352, P=0.009)。

结论 MDD 患者在无意识情绪加工早期就表现出对负性情绪信息的过度敏感性, 且杏仁核对负性情绪面孔的激活越强, 患者正性情绪分数越低, 这可以作为 MDD 诊断的客观标记。

- 1.广州医科大学附属脑科医院早期干预科
- 2.广州医科大学附属脑科医院儿少科

目的 双相障碍 (BD) 和抑郁症 (DP) 在早期难以鉴别, 研究 BD 的前驱期即阈下躁狂的生物学特征有助于解决此难题。丘脑的研究近年受到关注。已知丘脑参与认知等多种功能, 而初步研究表明具有认知损害的 BD 和 DP 存在丘脑亚区功能损害的差异。故本研究拟探索伴阈下躁狂的青少年抑郁症 (SubMD) 和不伴阈下躁狂的抑郁症 (nSubMD) 患者的丘脑亚区体积的差异, 以及其与认知功能的关系。

方法 本研究对象来自于 sBEAD 青少年抑郁障碍队列。根据 DSM-5 重性抑郁障碍的诊断标准和 Zimmermann 的阈下躁狂标准, 纳入 10-17 岁的

SubMD 患者 72 例、nSubMD 患者 74 例以及正常对照 (HC) 72 名。3 组被试的性别及年龄匹配。采集 3.0T MRI 数据, 并使用 Freesurfer 7.0 划分丘脑亚区。将年龄、性别、教育年限及估计颅内总体积 (eTIV) 为协变量, 比较三组间丘脑灰质体积, 并将 SubMD 和 nSubMD 有差异的脑区与认知功能进行偏相关分析。

结果 1) nSubMD 组的右侧丘脑腹内侧区 (VM)、枕下区 (PuI) 及外侧膝状体 (LGN) 分别小于 SubMD 组及 HC 组 ($P < 0.05$ Cohen's d 值为 $0.40 \sim 0.61$), 但后两组的差异无统计学意义; 2) SubMD 组的左侧丘脑腹侧前区 (VL_a)、中背外侧小细胞区 (MDI) 显著小于 nSubMD 组及 HC 组 ($P < 0.05$ Cohen's d 值为 $-0.44 \sim -0.62$), 但后两组无差异; 3) SubMD 组的左侧丘脑腹侧后区 (VL_p)、腹前侧大细胞区 (VAmc)、中背内侧大细胞区 (MDm) 小于 nSubMD 患者 ($P < 0.05$ Cohen's d 值为 $-0.3 \sim -0.23$), 但两个患者亚组与 HC 组均无显著差异; 4) SubMD 组与 nSubMD 组的右侧丘脑腹侧前区 (VL_a)、腹侧后区 (VL_p)、中背内侧大细胞区 (MDm)、中背外侧小细胞区 (MDI) 均显著小于 HC 组 ($P < 0.05$ Cohen's d 值为 $0.44 \sim 0.65$)。偏相关结果显示, 在 SubMD 组中, 右侧丘脑腹内侧区 (VM) 与语义流畅性呈负相关 ($P < 0.05$ $r = -0.25$); 在 nSubMD 组中, 右侧丘脑腹内侧区 (VM) 与符号编码呈正相关 ($P < 0.05$ $r = 0.34$), 右侧丘脑枕下区 (PuI) 与语义流畅性和符号编码呈正相关 ($P < 0.05$ $r = 0.26, 0.25$)。

结论 SubMD 和 nSubMD 的丘脑亚区灰质损害存在差异, VL_a 和 MDI 灰质受损可能为早期识别青少年 BD 的特征, 而 VM、PuI 及 LGN 灰质受损个体更可能为 DP; 患者受损脑区与精神处理速度相关。结果值得进一步验证。

3. School of Biological Sciences and Medical Engineering, Southeast University, 2 sipailou, Nanjing 210096, China

Objective Patients with bipolar disorder (BD) are often associated with childhood trauma, and hippocampal subregion volumes have varying sensitivities to such trauma. However, the role of these volumes in the relationship between childhood trauma and depressive symptoms in BD patients remains unclear. This study aimed to explore the relationship between childhood trauma and hippocampal subregion volume abnormalities in BD depressive symptoms

Methods A total of 112 patients in the depressive phase of BD and 62 healthy controls were recruited. Head magnetic resonance T1 images were collected, and hippocampal subregion volumes were segmented using FreeSurfer. Analysis of covariance (ANCOVA) was employed, with age and gender as covariates, to compare volume differences between groups. General linear regression modeling was used to explore the relationship between childhood trauma, hippocampal subregion volume, and depression severity

Results The volumes of the left CA3, bilateral CA4, bilateral granule cell and molecular layers of the dentate gyrus (GC-ML-DG), right molecular layer, and bilateral hippocampal-amygdala transition area (HATA) were reduced in the BD group with childhood trauma compared to healthy controls. No significant differences in hippocampal subregion volumes were observed between the BD group without childhood trauma and healthy controls. Within the BD group exposed to childhood trauma, the volumes of the left CA1 and CA3 regions, bilateral GC-ML-DG, and right molecular layer were reduced compared to those without childhood trauma. Notably, the reduction in the left CA3 subregion volume partially mediated the relationship between the Childhood Trauma Questionnaire (CTQ) total score and depression severity in BD patients

Conclusion Childhood trauma can lead to atrophy in the left CA3, bilateral CA4, bilateral GC-ML-DG, right molecular layer, and bilateral HATA in BD patients. Among these, the reduction in the left CA3 subregion volume plays a partial mediating role in the indirect effect between childhood trauma and depression severity

抑郁症患者童年创伤和焦虑的关系：反刍的中介作用

王一雯¹ 黄莺莺¹ 沈阿姿¹ 龚文玥¹ 翟清华¹ 黄映红¹ 卢青³ 姚志剑^{1,2}

1. 南京大学医学院

2. 南京医科大学附属脑科医院心境障碍科

3. 东南大学生物医学工程

目的 童年创伤 (childhood trauma, CT) 与严重的心理健康后果有关, 这种后果可能会持续到成年期。CT 使个体变得脆弱, 与抑郁症和焦虑症的高患病率相关, 其重大影响尤其体现在精神疾病合并症和慢性症的增加。尽管评估工具及诊断标准存在异质性, 既往研究表明 42-78% 的抑郁症患者伴有焦虑症状。焦虑症的发作通常先于抑郁症, 伴焦虑症的抑郁症患者自杀意念及自杀风险增高, 状态-特质焦虑量表 (State-Trait Anxiety Inventory Form Y, STAI-Y) 可用于对人群的焦虑状况进行评估。反刍作为一种适应不良的认知反应风格被认为是 CT 与情绪状态之间的合理候选者。本研究旨在探讨反刍是否是 CT 与抑郁症患者的状态焦虑及特质焦虑之间关系的中介。

方法 招募南京脑科医院 2021 年 5 月至 2024 年 5 月入院的符合 DSM-5 诊断标准的 14-60 岁的抑郁症患者。157 名参与者完成了童年创伤问卷、反刍反应量表、状态-特质焦虑量表的评估。使用 SPSS 26.0 和 Mplus 8.3 进行统计分析。SPSS 26.0 检查所有变量之间的初始相关性, 随后采用 Mplus 8.3 的路径分析反刍在 CT 与状态焦虑、特质焦虑的中介作用, 为了估计间接影响, 采用了 1000 次迭代。

结果 Spearman 相关分析表明 CT 与反刍成正相关 ($r_s=0.421, p<0.001$), 不同类型的 CT 与反刍

的相关关系表明: 性虐待 ($r_s=0.319, p<0.001$)、躯体虐待 ($r_s=0.326, p<0.001$)、情感虐待 ($r_s=0.404, p<0.001$), 情感忽视 ($r_s=0.209, p<0.01$) 与反刍成正相关, 且具有统计学意义, 而躯体忽视未发现与反刍存在相关关系。研究结果支持反刍部分中介了童年创伤与抑郁症患者的状态焦虑 (效应量=0.176, $p<0.001$)、特质焦虑 (效应量=0.143, $p<0.001$) 之间的关系, 且这种影响在女性受试者较男性受试者更为显著。

结论 CT 和反刍是抑郁症患者状态焦虑、特质焦虑的关键因素。童年创伤不仅对抑郁症患者的状态焦虑、特质焦虑有直接影响, 而且通过反刍产生间接影响。

童年创伤对双相障碍自杀风险的影响：心理弹性、领悟社会支持的链式中介作用

陈莹 纪家武*

福建医科大学附属神经精神病医院

目的 探索心理弹性、领悟社会支持在双相障碍 (Bipolar disorder, BD) 患者童年创伤与自杀风险关系中可能存在的链式中介作用。为 BD 患者自杀的干预及预防在心理、家庭及社会支持上提供新的思路。

方法 从 2023 年 3 月至 2023 年 9 月期间在福建医科大学附属神经精神病医院住院治疗的符合 ICD-10 双相障碍诊断标准患者中纳入 116 名患者, 进行自杀风险评估量表、童年创伤问卷、领悟社会支持量表、心理弹性量表评估。使用 SPSS 26.0 对数据进行统计分析。使用 Hayes 开发的 SPSS 的扩展 Process 建立中介模型, 分析心理弹性、领悟社会支持在童年创伤和自杀风险间的中介效应。

结果 1. 与低自杀风险组相比, 高自杀风险组的 BD 患者未婚状态比例较高 ($\chi^2=6.416, p=0.039$), 处于抑郁相的个体比例较高 ($\chi^2=24.685, p<0.001$), 发病年龄较小 ($Z=-2.061, p=0.036$)。2. 与低自杀风险组相比, 高自杀风险的 BD 患者童年创伤总分、不同创伤类型 (情感忽视、躯体忽视、情感虐待、躯体虐待) 的得分较高, 领悟社会支持 (家庭支持、朋友

支持、其他支持)、心理弹性(坚韧性、力量性、乐观性)得分较低(皆 $p < 0.05$)。3. BD 患者的自杀风险得分、童年创伤得分、领悟社会支持得分、心理弹性得分两两之间的相关性均有统计学意义(皆 $p < 0.05$)。情感忽视、躯体忽视、情感虐待、躯体虐待得分与自杀风险得分正相关,与领悟社会支持得分、心理弹性得分负相关(皆 $p < 0.05$)。4. 心理弹性、领悟社会支持在 BD 患者童年创伤和自杀风险之间起链式中介作用,中介模型的效应区间不包含零,中介效应量为 38.94%。

结论 心理弹性和领悟社会支持在 BD 患者童年创伤和自杀风险的关系中起链式中介作用。针对童年创伤及心理弹性、领悟社会支持等因素的评估与干预,可纳入 BD 患者自杀风险的管理。

关键词: 双相障碍,自杀风险,童年创伤,领悟社会支持,心理弹性

Based on White Matter Microstructure To Early Identify Bipolar Disorder From Patients with Depressive Episode

Hao Sun^{1,2}, Wubin Chen², Rui Yan^{1,2}, Lingling Hua^{1,2}, Qing Lu³, Qing Lu⁴, Zhijian Yao^{1,2,3}

1. Nanjing Brain Hospital, Clinical Teaching Hospital of Medical School, Nanjing University, Nanjing, China

2. Department of Psychiatry, The Affiliated Brain Hospital of Nanjing Medical University, Nanjing 210029, China

4. Child Development and Learning Science, Key Laboratory of Ministry of Education, China

Objective Because of similar clinical manifestations, bipolar disorder (BD) patients are often misdiagnosed as major depressive disorder (MDD). This study aimed to compare the difference between depressed patients later converting to BD and unipolar depression (UD) according to diffusion tensor imaging (DTI)

Methods Patients with MDD (562 participants) in depressive episode states and healthy controls (HCs)

(145 participants) were recruited over 10 years. Demographic and magnetic resonance imaging (MRI) data were collected at the time of recruitment. All patients with MDD were followed up for 5 years and classified into the transfer to BD (tBD) group (83 participants) and UD group (160 participants) according to the follow-up results. DTI and functional magnetic resonance imaging at baseline were compared

Results Common abnormalities were found in both tBD and UD groups, including left superior cerebellar peduncle (SCP.L), right anterior limb of the internal capsule (ALIC.R), right superior fronto-occipital fasciculus (SFOF.R), and right inferior fronto-occipital fasciculus (IFOF.R). The tBD showed more extensive abnormalities than the UD in the body of corpus callosum, fornix, left superior corona radiata, left posterior corona radiata, left superior longitudinal fasciculus, and left superior fronto-occipital fasciculus

Conclusion The study demonstrated the common and distinct abnormalities of tBD and UD when compared to HC. The tBD group showed more extensive disruptions of white matter integrity, which could be a potential biomarker for the early identification of BD

Abnormal Stability of Spontaneous Neuronal Activity As A Predictor of Diagnosis Conversion From Major Depressive Disorder To Bipolar Disorder

Hao Sun^{1,2}, Yujue Wang^{1,2}, Rui Yan^{1,2}, Lingling Hua^{1,2}, Qing Lu³, Qing Lu⁴, Zhijian Yao^{1,2,3}

1. Nanjing Brain Hospital, Clinical Teaching Hospital of Medical School, Nanjing University, Nanjing, China

2. Department of Psychiatry, The Affiliated Brain Hospital of Nanjing Medical University, Nanjing 210029, China

3. School of Biological Sciences and Medical Engineering, Southeast University, Nanjing 210096, China

4. Child Development and Learning Science, Key Laboratory of Ministry of Education, China

Objective Bipolar disorder (BD) is often misdiagnosed as major depressive disorder (MDD) in the early stage, which may lead to inappropriate treatment. This study aimed to characterize the alterations of spontaneous neuronal activity in patients with depressive episodes whose diagnosis transferred from MDD to BD

Methods 532 patients with MDD and 132 healthy controls (HCs) were recruited over 10 years. During the follow up period, 75 participants with MDD transferred to BD (tBD), and 157 participants remained with the diagnosis of unipolar depression (UD). After excluding participants with poor image quality and excessive head movement, 68 participants with the diagnosis of tBD, 150 participants with the diagnosis of UD, and 130 HCs were finally included in the analysis. The dynamic amplitude of low-frequency fluctuations (dALFF) of spontaneous neuronal activity was evaluated in tBD, UD and HC using functional magnetic resonance imaging at study inclusion. Receiver operating characteristic (ROC) analysis was performed to evaluate sensitivity and specificity of the conversion prediction from MDD to BD based on dALFF

Results Compared to HC, tBD exhibited elevated dALFF at left premotor cortex (PMC_L), right lateral temporal cortex (LTC_R) and right early auditory cortex (EAC_R), and UD showed reduced dALFF at PMC_L, left paracentral lobule (PCL_L), bilateral medial prefrontal cortex (mPFC), right orbital frontal cortex (OFC_R), right dorsolateral prefrontal cortex (DLPFC_R), right posterior cingulate cortex (PCC_R) and elevated dALFF at LTC_R. Furthermore, tBD exhibited elevated dALFF at PMC_L, PCL_L, bilateral mPFC, bilateral OFC, DLPFC_R, PCC_R and LTC_R than UD. In addition, ROC analysis based on dALFF in differential areas obtained an area under the curve (AUC) of 72.7%

Conclusion The study demonstrated the temporal dynamic abnormalities of tBD and UD in the critical regions of the somatomotor network (SMN), default mode network (DMN), and central executive network (CEN). The differential abnormal patterns of temporal

dynamics between the two diseases have the potential to predict the diagnosis transition from MDD to BD.

Distinguishing between Major Depressive Disorder and Bipolar Disorder Based on Spontaneous Transient States

Moxuan Song¹, Qian Liao³, Wenyue Gong², Lingling Hua¹, Rui Yan¹, Azi Shen², Yi Xia¹, Junling Sheng¹, Zhongpeng Dai³, Yishan Du¹, Jiabo Shi¹, Qing Lu^{3,4}, Zhijian Yao^{1,2,3}

1. Department of Psychiatry, The Affiliated Brain Hospital of Nanjing Medical University, Nanjing 210029, China

2. Nanjing Brain Hospital, Clinical Teaching Hospital of Medical School, Nanjing University, Nanjing, China

3. School of Biological Sciences and Medical Engineering, Southeast University, Nanjing 210096, China

4. Child Development and Learning Science, Key Laboratory of Ministry of Education, China

Objective Previous research on major depressive disorder (MDD) and bipolar disorder (BD) has found differences in brain structure and function, including key brain areas of the default mode network (DMN), sensorimotor network (SMN), and central executive network (CEN). Structural and functional abnormalities in those brain regions appear to differentiate between MDD and BD. However, little is known about how the spontaneous transient activated patterns organize and coordinate brain networks underlying the discrimination of MDD and BD. Therefore, the aim of this study is to differentiate between MDD and BD through sub-second-level spontaneous transient state activations

Methods This study collected resting-state magnetoencephalography (MEG) data from 30 major depressive disorder (MDD) patients, 30 bipolar disorder (BD) patients, and 30 matched healthy controls (HCs).

Hidden Markov Models (HMMs) were employed to capture sub-second-level dynamic activities with a finite number of latent states in the source space signal. Here, HMM states described the spatiotemporal characteristics of eight brain networks. Time parameters and spectral activation information were acquired for each state, and intergroup comparisons were performed for each state's fractional occupancy (FO), Life Time (LT), Interval Times (IT), and switching rates of states, utilizing a non-parametric permutation test while controlling for sex, age and years of education

Results Compared to BD cohort, MDD cohort had lower IT values during state 1, 3, 4, and 7 ($p=0.023$; $p=0.003$; $p=0.001$; $p<0.001$). There were no significant differences observed between the HCs and the BD cohort, nor between the HCs and the MDD cohort in state 1. Compared to HCs and BD cohort, MDD cohort had higher switching rates ($p<0.001$; $p<0.001$), with no difference between BD cohort and HCs. There were no significant differences among the three groups in the values of FO and LT in all the states

Conclusion The study reveals distinct brain activation patterns between MDD and BD. State 1, 3, 4, and 7 likely reflect the activity of specific neural networks associated with emotion regulation, cognitive control, and attention. BD experience more severe cognitive impairments and mood swings compared to MDD, show lower brain network dynamicity. These findings suggest that temporal descriptors built by HMM could serve as potential biomarkers for differentiating between major depressive disorder and bipolar disorder, aiding in diagnosis

关键词: Bipolar Disorder, Major Depressive Disorder, Dynamics, Magnetoencephalography

伴混合特征的双相抑郁患者认知功能水平与诱发电位 P300 特征的研究

张健 张勇*

天津市安定医院

目的 研究伴混合特征双相抑郁的神经认知功

能水平及其与诱发 P300 特征和其它相关因素之间的关联。

方法 对符合双相障碍抑郁发作诊断的共计 73 例患者采用临床实用 DSM-5 抑郁混合特征量表 (CUDOS-M) 进行评估, 并分为伴混合特征组 (34 例) 与不伴混合特征两组 (39 例); 采用 MATRICS 成套神经认知测试 (MCCB) 进行 7 个维度认知功能测评, 并进行听觉诱发 P300 检测。通过协方差分析进行组间认知功能水平和 P300 特征的比较和分析, 采用相关性分析及多元线性逐步回归分析患者认知功能水平和听觉 P300 特征以及其它临床相关因素之间的关联。

结果 伴与不伴混合特征两组间的临床特征 (性别、年龄、居住地、受教育年限、职业状态、总病程、发作次数、HAMD 评分、镇静药物使用) 仅总病程 (月) 之间具有显著性差异 (110.11 ± 71.57 vs. 80.56 ± 56.89 , $P=0.048$), 伴混合特征组的病程更长。协方差分析结果显示, 伴与不伴混合特征两组间 7 个认知维度中仅信息处理速度、推理和问题解决 2 个维度的认知功能具有显著差异, 伴混合特征组在这两个认知维度的表现更差; 在纳入协变量分析之后, 两组间 P300 潜伏期 (371.56 ± 29.37 ms vs. 344.28 ± 37.28 ms) 和波幅 (5.28 ± 1.86 μ V vs. 4.33 ± 1.31 μ V) 之间的差异性变得不显著。相关分析显示伴混合特征患者组中, 信息处理速度与教育年限 ($r=0.378$, $P=0.027$)、职业状态 ($r=0.375$, $P=0.029$) 正相关, 视觉学习与职业状态正相关 ($r=0.386$, $P=0.024$), 推理问题解决与城镇居住地正相关 ($r=0.556$, $P=0.001$), 仅注意警觉维度与 P300 潜伏期负相关 ($r=-0.478$, $P=0.004$), 所有认知维度均与 P300 波幅不相关联。逐步回归分析结果显示伴混合特征患者组中, 信息处理速度得分与受教育年限正相关 ($t=2.311$, $P=0.027$), 注意警觉得分与 P300 潜伏期 ($t=-3.67$, $P=0.001$) 与 P300 波幅 ($t=-2.33$, $P=0.027$) 负相关, 视觉学习得分与职业状态正相关 ($t=2.36$, $P=0.024$), 推理问题解决与城镇居住地正相关, ($t=3.79$, $P=0.001$)。

结论 伴混合特征的双相抑郁患者病程更长, 在少部分认知功能维度上的表现相较于不伴混合特征的患者更差, 两组间的 P300 特征在排除一系列混杂因素影响后的差异不显著。伴混合特征双相抑郁患者的认知功能表现与教育水平、职业状态等因素关联性更多, P300 特征未能显现出与多数认知功能维度之间的关联性。

Continuous Alterations in Brain Structure and Its Pathways in Pediatric Bipolar Disorder

Jianze Wu Yuan Zhong*

School of Psychology, Nanjing Normal University

Objective Pediatric Bipolar Disorder (PBD) is a recurrent, high-prevalence psychological disorder characterized by high suicidality and significant disability. It causes severe harm to mental and physical health of children and adolescents, and imposes a substantial burden on both patients and society. With the rapid development of magnetic resonance imaging (MRI) technology, research on structural and functional changes in the brains of PBD patients continues to accumulate. However, due to the heterogeneity of the disease course and the progressive nature of neurological changes, controversies remain in the research findings, leading to challenges in the clinical diagnosis of PBD. This neuroimaging study seeks to explore the pathophysiological mechanisms of PBD by focusing on the differences in gray matter volume among patients at various stages and integrating the theory of neural progression in Bipolar Disorder (BD), aiming to identify reliable biomarkers for clinical diagnosis and treatment

Methods The study included MRI data from 48 PBD patients and 31 gender and age-matched healthy controls (HC). Initially, the disease course of PBD patients was divided into different stages. Then, voxel-based morphometric analysis was employed to investigate significant nodes of structural brain differences between PBD patients and HCs, and to verify the heterogeneity of these nodes across different disease stages. Finally, based on the structural covariance networks and causal structural covariance network features which are specific to different stages of the disease, the study explored specific pathways of progressive neural changes in PBD patients

Results Multiple brain regions with reduced

gray matter volume were discovered in PBD patients compared to HCs. Further analysis showed that during the first stage of the disease, gray matter volume reduction was only observed in the left amygdala; during the second stage, significant reductions were found in bilateral amygdala, hippocampus, frontal lobes, insula, caudate, and cerebellum. This stage-specific changes in gray matter volume suggest that the amygdala may be the origin of progressive neural changes in PBD patients. The results of structural covariance network and causal structural covariance network analysis confirmed that gray matter volume of the left amygdala in PBD patients exhibited coordinated changes with hippocampus, frontal lobes, insula, caudate, and cerebellum. The changes in left amygdala could also predict gray matter volume changes in these regions

Conclusion The study revealed widespread reductions in gray matter volume in PBD patients, identifying a causal network of gray matter volume's continuous alterations originating from the amygdala. These specific pathways of neural progression in bipolar disorder may serve as important biomarkers for PBD, offering references and assistance for clinical diagnosis and treatment

Using Dynamic Graph Convolutional Network To Identify Individuals with Major Depression Disorder

Ni Zhou Wu Hong*

Shanghai Mental Health Center, Shanghai Jiao Tong University School of Medicine, Shanghai, China

Objective Objective and quantitative neuroimaging biomarkers are crucial for early diagnosis of major depressive disorder (MDD). However, previous studies using machine learning (ML) to identify MDD were often based on small sample sizes and probably overlooked MDD's neural connectome and mechanism.

The aim of this study was to find objective neuroimaging bioindicators capable of recognising MDD

Methods To address these gaps, we applied Dynamic Graph Convolutional Nets (DGCNs) to a large multi-site resting state functional MRI (RS-fMRI) dataset consisting of 2317 subjects (1081 MDD patients and 1236 healthy controls) from 16 Rest-meta-MDD consortium sites. We further completed the modelling of the GCN and then conducted separate stratified 10-fold cross-validation and leave-one-subject-out (LOSO) cross-validation

Results Our DGCN model achieved an accuracy of 82.5% (95% CI:81.6-83.4%, AUC:0.869), outperforming other universal ML classifiers. The most prominent domains for classification were mainly in the default mode network, fronto-parietal and cingulo-opercular network

Conclusion Our study demonstrates the stability and efficacy of using DGCN to characterize MDD and investigates its potential to enhance neurobiological comprehension of MDD by distinguishing it from other clinically related disorders in FC network topologies

NR1D1 mRNA Expression Level Increased after Antidepressant Treatment and May Predict The Cognitive Impairment Recovery in Depression Patients

Fan Wang Yiming Chen Shuxiang Shi Ni Zhou Ningning Li Qinte Huang Wu Hong*
Shanghai Mental Health Center

Objective Depression is characterized by not only low mood but also anhedonia, changes in appetite and sleep. In recent years, many studies have found the pathogenesis of depression is related to circadian rhythms, such as sleep-wake cycle, appetite changes. The study of genes related to circadian rhythms, also known as circadian gene, can help to investigate the

disease of depression. The mechanism is referred to as a transcriptional-translational feedback loop. Circadian rhythms relies mainly on the loop consists of the protein products of core biological clock genes, including the circadian locomotor output cycles kaput gene (CLOCK), the cryptochrome 1 gene (CRY1), the cryptochrome 2 gene (CRY2), the cycle 1 gene (CRY2), and the cycle 2 gene (CRY3). The receptors is encoded by the nuclear receptor subfamily 1D, group D member 1 gene (NR1D1). These genes interact with each other to drive the rhythmic expression of downstream genes and generate circadian rhythm disruption. In this study, we selected NR1D1, NLRP3, NPAS2 and CLOCK based on the number of studies, positive results and whether they play an important role in the regulatory loop. This study is designed to explore the changes of circadian genes expressing level after antidepressant treatment and the clinical features associated with the change in MDD patients

Methods Participant Description

Candidates who have had at least one depressive episode were recruited from Shanghai mental health center. Including : (1) age 18-65 years old, (2) using DSM-V structured clinical interview (SCID-5), currently in line with DSM-V diagnostic criteria for depressive episodes, (3) hamilton Depression Scale (HAMD-17) score ≥ 17 , (4) junior high school and above education level, (5) understand the study content and sign the informed consent. Exclusion criteria of the candidates included the following five reasons: (1) bipolar disorder, (2) pregnant or breastfeeding women, (3) or those planning to become pregnant, (3) other diagnoses, screening failure, or received electroconvulsive therapy or transcranial magnetic stimulation within 3 months.

Material and Methods Venous blood samples were collected via venipuncture in EDTA-anticoagulant and coagulant tubes after the admission. qPCR based on TaqMan technology was performed to test the mRNA expression. Relative expression changes were calculated with the $2^{-\Delta\Delta}$ method using ACTB as the reference transcript. A total of 36 (18* 2) items were involved in the linear test model, first, including clinical traits, psychiatric rating scales [HAMD-17 Deduction Rate, MDQ, PIQS], and their subscales [HAMD-17].

All of the 36 items yielding linear relationships after Bonferroni correction were applied, with the level of 0.014(0.05/36). Furthermore, outliers were deleted if their Studentized Residual was more than two standard deviations away from the mean. We then compiled a total of 7 continuous variables including clinical traits, and subscales, using student t' test. For the identification of the objective clinical traits of the increased patients, a backward Wald method in the Binary Logistic regression was performed, with a p value criterion of 0.05 and 0.10 for entry and removal, respectively. A receiver operating characteristic (ROC) curve was examined to discriminate the accuracy of the factors by the area under the curve (AUC) of the ROC curve. The actual positive state was 2= clinical cure, which was defined as HAMD-17 reduction rate more than 50%. The ability of the prediction models was calibrated via Hosmer-Lemeshow goodness of fit test.

Results Demographic and mRNA Expression Level

A total of 28 patients were enrolled, of which 8 (28.5%) were male and 20 (71.4%) were female. The average age of the patients was 27.61±7.45 year, ranging from 19-55 years old. The NR1D1 mRNA expression level increased after 8 weeks' antidepressant treatment(9.09±0.83/9.71±1.00, p=0.01). See Table 1. No difference was found in NLRP3, NPAS2, CLOCK mRNA expression level before or after treatment.

Comparison of Sociodemographic Factors, Clinical Traits and Psychiatric Rating Scales between mRNA increased and mRAN non-increased of MDD Patients

The HAMD8 cognitive impairment score of the NR1D1 non-increased group were significantly Higher than that of the NR1D1 increased group. No statistically significant difference was found in the other items (p-value>0.05). See able 2. In Table 2, age, age of first diagnosis, age at onset, Depressive episodes, sever episodes, HAMD insomnia score at baseline(HAMD0 insomnia) and HAMD cognitive impairment score at 8'th week(HAMD8 cognitive impairment) were included according to the linear relationships results.

Binary Logistic Regression Analysis of Factors for Predicting Responders or Non-responders of MDD Patients

In this research, we tried to include age, age of first diagnosis, age at onset, Depressive episodes, sever episodes, HAMD0 insomnia, HAMD8 cognitive impairment, NR1D1 mRNA expression level change to predict treatment response. But failed to construct an effect model.

NR1D1 mRNA level predict the cognitive impairment change

The ROC curve in Figure 1 showed the fair accuracy of NR1D1, yielding an AUC of 0.79 (95% CI, 0.63–0.96). The decision-rule cut-off that optimizes the sensitivity/specificity tradeoff was 0.00% of the NR1D1 changing.

Figure 1 ROC Curve of the NR1D1 mRNA level for Prediction of cognitive impairment change

Conclusion In this study, we found the NR1D1 mRNA expression level increased after 8 weeks' antidepressant treatment (9.09±0.83/9.71±1.00, p=0.01). Previous studies suggesting an decreased expression level of NR1D1 accompany by an mental health disorder status. Therefore, our results suggest that antidepressant treatment could reverse the decrease of NR1D1 expressing level. What's more, NR1D1 mRNA expression level change was fail to predict the total antidepressant treatment response but could predict the cognitive impairment recovery in depression patients.

关键词: NR1D1; MDD; circadian gene; cognitive impairment; antidepressant

光照疗法对阈下抑郁个体杏仁核连通性和血清素能系统的影响

陈盼 王颖*

广州华侨医院

目的 尽管强光疗法(BLT)的神经机制尚不清楚,但它被认为是阈下抑郁(StD)的有效干预措施。杏仁核已被证明在抑郁症中起着关键作用。本临床试验的目的是评估 BLT 与杏仁核亚区功能连通性(FC)改变之间的关系,以及与血清素能系统活性的相关性。

方法 将 StD 受试者随机分为两组: BLT 组

(N=47)和安慰剂组(N=42)。8周前后分别采用汉密尔顿抑郁评定量表(HAMD)、流行病学研究中心抑郁量表(CESD)和贝克抑郁量表(BDI)测量抑郁严重程度。在8周前后分别进行结构和静息状态功能磁共振成像。用FreeSurfer自动分割9个杏仁核。对双侧杏仁核及其亚区进行了基于种子的全脑静态FC(sFC)和动态FC(dFC)分析。此外,采用多元回归模型预测BLT后HAMD、CESD和BDI评分的变化。此外,使用JuSpace工具箱计算了BLT组和安慰剂组杏仁核子区sFC/dFC与单胺系统活性之间的相关性。

结果 与安慰剂组相比,BLT组的HAMD评分($t=-2.991, p=0.004$)、CESD评分($t=-3.447, p<0.001$)和BDI评分($t=-3.334, p=0.022$)从基线到治疗后均有所下降。与基线相比,BLT组干预后右侧基底外侧杏仁核(BLA)/浅表杏仁核(SFA)-右侧颞中回(MTG)的sFC增加,右侧中央内侧杏仁核(CMA)和右侧下眶额回的dFC增加,右侧杏仁核纹状体过渡(AStR)/CMA-左侧丘脑的sFC减少,右侧SFA-右侧内侧前额叶皮层的dFC减少;而整个杏仁核及其亚核体积在BLT后无明显变化。此外,BLT前后右侧BLA-右侧MTG的sFC变化与BDI评分的变化呈正相关(显著性: $r=0.322, p=0.027$)。结合基线杏仁核sFC和dFC可以预测BLT干预后HAMD、CESD和BDI的变化。此外,BLT后右侧BLA改变的sFC与5-HT_{1A}和5-HT_{2A}受体的空间分布显著相关,而BLT后右侧CMA改变的dFC与5-HT_{1A}受体的空间分布显著相关。

结论 这些发现表明,BLT可以改变StD受试者的杏仁核FC,特别是丘脑、额叶和MTG。此外,BLT后杏仁核亚区FC变化与血清素能系统活性之间的相关性可能强调了BLT的抗抑郁机制。结合杏仁核的基线静态和动态FC可能有潜力评估BLT治疗StD的有效性。

伴与不伴强迫症状双相抑郁患者的脑结构和功能网络拓扑属性比较研究

唐鑫悦 王颖*
暨南大学附属第一医院

目的 基于图论分析双相抑郁患者伴与不伴强迫症状(obsessive-compulsive symptoms)脑灰质结构网络和功能网络差异。

方法 收集2018年3月至2022年12月暨南大学附属第一医院精神科门诊和住院部90例双相抑郁患者。根据是否伴强迫症状分为伴强迫症状组53例和不伴强迫症状组37例,年龄18~55岁。同期招募健康对照50例,年龄18~55岁。采集受试者静息态磁共振结构和功能数据,分别构建灰质结构网络和功能网络,应用图论分析方法分别计算小世界属性等网络拓扑属性指标。对结构网络属性三组间比较及事后检验均采用置换检验。对功能网络属性三组间比较采用单因素方差分析,事后检验采用Bonferroni校正。将组间差异的网络指标与耶鲁-布朗强迫症状(Yale-Brown Obsessive-Compulsive Scale, Y-BOCS)等量表进行偏相关分析。进一步利用支持向量机(Support Vector Machines, SVM)进行分类。

结果 与对照组比,伴与不伴强迫症状双相抑郁组均存在结构网络最短路径长度($P=0.036, P=0.037$)和标准化特征路径长度($P=0.036, P=0.039$)增加,全局效率降低($P=0.024, P=0.017$);与不伴强迫症状组和对照组相比,伴强迫症状组在右侧罗兰迪克岛盖($P<0.001, P<0.001, P=0.002, P=0.001$)和左侧枕上回(均 $P<0.001$)节点中心度及介数中心度增高。功能网络分析:伴强迫症状组左侧额下回介数中心度低于对照组($P=0.004$);伴强迫症状组小脑介数中心度低于不伴强迫症状组和对照组($P=0.003, P=0.024$);不伴强迫症状组小脑节点效率低于伴强迫症状组和对照组($P=0.043, P=0.002$);伴强迫症状组右侧颞横回节点中心度和节点效率高于对照组($P=0.007, P=0.005$)。伴强迫症状组左侧额下回介数中心度与强迫思维因子分正相关($r=0.303, P=0.034$),右侧颞横回节点中心度、节点效率与Y-BOCS总分($r=-0.301, P=0.036; r=-0.311, P=0.030$)和强迫思维因子分($r=-0.385, P=0.006; r=-0.380, P=0.007$)负相关。SVM显示网络融合分类伴强迫症状与不伴强迫症状准确率为0.7986。

结论 伴与不伴强迫症状双相抑郁患者均存在向规则网络转变倾向,且伴强迫症状患者较不伴患者表现出更多节点属性异常。多网络特征融合具备一定的诊断性能。

Neurometabolic Alterations in Bipolar Disorder with Aggressive Behavior: A Study Based on Proton Magnetic Resonance Spectroscopy and Machine Learning Technology

Jiayue Chen¹, Xinxin Zhang², Yuan Qu³, Yingchao Song⁵, Shaohong Zou³, Hongjun Tian⁴

1. Shanghai Mental Health Center

2. Tianjin Children's Hospital

3. People's Hospital of Xinjiang Uygur Autonomous Region

4. Tianjin Fourth Center Hospital

5. Shandong First Medical University & Shandong Academy of Medical Sciences

Objective The neurobiological feature of aggressive behavior (AB) in bipolar disorder (BD) remains unknown. This study focused on exploring the alterations of intracerebral biochemical metabolism among BD patients with AB, finding specific neuroimaging markers for predicting the risk of AB in BD patients

Methods Twenty BD patients with AB, twenty-six BD patients without AB, and fifty healthy controls were enrolled in the current study. Metabolite levels in bilateral hippocampus and prefrontal white matter (PWM) were obtained through proton magnetic resonance spectroscopy, while potential brain biochemical differences were found using a support vector machine (SVM) algorithm. Furthermore, the association between abnormal metabolite ratios and clinical factors among BD patients with AB was also evaluated in the current study

Results The highest classification accuracy of 76.09% and an area under the curve of 0.78 in discriminating BD patients with and without AB, among the choline (Cho)/creatinine (Cr) ratios within the right hippocampus, myoinositol (mI)/Cr ratios within the left hippocampus, and N-acetyl aspartate (NAA)/Cr ratios within the left PWM contributed the most, and (2) the neuron functional level within the left PWM showed

negative correlation with Hamilton Depression Scale scores among BD patients with AB

Conclusion The combination of the Cho/Cr values within the right hippocampus, the mI/Cr values within the left hippocampus, and the NAA/Cr values within the left PWM can better predict the risk of AB among BD patients.

Guidelines Concordance of Maintenance Treatment in Euthymic Patients with Bipolar Disorder: A Multicenter Study of Mainland China

Jiansen Lin¹, Liu Hong², Yuncheng Zhu², Yiru Fang³

1. Shanghai Mental Health Center, Shanghai Jiaotong University School of Medicine

2. Shanghai Hongkou Mental Health Center

3. Ruijin Hospital, Shanghai Jiaotong University School of Medicine

Objective Medication therapy is the primary approach for treating bipolar disorder. With the development of evidence-based medicine, clinical guidelines for bipolar disorder have been introduced to standardize drug use and enhance treatment efficacy. It is worth exploring the consistency between real-world prescribing practices by clinicians and guideline-recommended treatments, and whether this consistency correlates with clinical outcomes and prognosis in bipolar disorder. Currently, there is limited research in this area, with significant heterogeneity in findings. The DSM-5 diagnostic criteria introduce the concept of bipolar disorder with mixed features, yet current research has not focused on the medication characteristics of this subgroup within their samples. We conducted a survey across 16 hospitals in mainland China to present data on maintenance treatments for bipolar disorder in China, and to investigate the alignment between real-world maintenance

treatment regimens and those recommended in the 2018 updated CANMAT guidelines

Methods 323 patients who had experienced a euthymia were eligible for entry into this survey on the maintenance treatment of bipolar disorder. Guidelines concordance was determined by comparing the medication(s) that patients were prescribed with the recommendations in the 2018 updated CANMAT guidelines

Results In this study, 40 patients (12.38%) had maintenance treatment regimens that were inconsistent with guidelines, including 4 patients (2.20% of Bipolar I type) and 36 patients (25.53% of Bipolar II type). Among the factors contributing to inconsistency, the most common was inappropriate use of antidepressants (25/40, 62.50%), followed by inappropriate use of mood stabilizers (20/40, 50.00%) and antipsychotic medications (12/40, 30.00%). One patient was treated solely with ziprasidone. Additionally, a total of 217 patients (67.80%) received adjunctive therapies in this study. Patients currently or recently experiencing hypomanic, depressive, or mixed episodes were more likely to receive adjunctive antidepressant therapy in addition to mood stabilizers compared to manic episodes

Conclusion In comparison to the 2014 study, there has been a significant improvement in medication adherence in this study. However, as patient demands for quality of life continue to rise, the trend of personalized treatment through adjunctive medications is becoming increasingly common. Further research is still needed to identify patient populations suitable for various types of medications in order to achieve better efficacy and reduce treatment burden.

Myelin Disruptions in Subthreshold Depression and Its Association with Neurotransmitter and Genetic Profiles: A Inhomogeneous Magnetization Transfer MRI Study

Guanmao Chen Guixian Tang Ying Wang*
The First Affiliated Hospital of Jinan University

Objective Subthreshold depression (SD) is a significant risk indicator of major depressive episodes. It's important to identify the specific disruption of white matter myelin in SD and its biological mechanism. The study aimed to develop quantitative measure of myelin content of SD by utilizing inhomogeneous magnetization transfer (ihMT) technique and examine its spatial correlations of neurotransmitter and gene expression

Methods In this prospective study, a total of 104 college students with SD and 91 age- and sex-matched healthy controls (HCs) were included. All participants underwent ihMT imaging, and pseudo-quantitative ihMT (qihMT), and ihMT ratio (ihMTR) were obtained. We then combined receptor/transporter, and post-mortem gene expression distribution data to uncover the potential molecular mechanisms underlying these myelin abnormalities in SD. In addition, thirty-one SD participants underwent light therapy, after which we observed the effect of treatment on myelin with abnormal ihMT measures at baseline in SD

Results Compared to HCs, SD showed decreased qihMT values in the bilateral posterior thalamic radiation (PTR), right sagittal stratum (SS), and right uncinate fasciculus, and decreased ihMTR values in the left PTR (all, $p \leq 0.001$). The spatial pattern of myelin content alterations was correlated with the distributions of serotonergic and dopaminergic neurotransmitters, and expression maps of specific genes. The genes expression explained 68.5% variance of the disrupted myelin content, with the most correlated genes enriched in regulation of axonogenesis, cotranslational protein targeting to membrane, and neuron projection. In addition, light therapy normalized decreased qihMT values in the right PTR in SD

Conclusion These findings suggest the macromolecular disruption of myelin in the PTR, sagittal stratum, and uncinate fasciculus in the early stages of depression, and its linkage with neurotransmitter and gene expression profiles. Furthermore, the myelin impairments in the PTR could be reversed by treatment in SD.

Disrupted Brain Glymphatic System Is Associated with Depressive Symptoms and Peripheral Inflammation in Unmedicated Bipolar II Disorder: A Diffusion Tensor Image Analysis Along The Perivascular Space (DTI-ALPS) Study

Guixian Tang Guanmao Chen Ying Wang*

First Affiliated Hospital of Jinan University

Objective Diffusion-based technique called diffusion tensor image analysis along the perivascular space (DTI-ALPS) has emerging as a tool for evaluating the activity of the glymphatic system. Besides, increasing evidences show that inflammation might be involved in bipolar disorder (BD), but the association between glymphatic dysfunction and central nervous system inflammation in BD patients is still unclear. In this study, we tried to explore the disrupted brain glymphatic system, peripheral cytokines levels and their correlations in unmedicated bipolar II disorder

Methods This study included 32 patients with unmedicated bipolar II disorder and 27 healthy controls (HCs). Diffusion tensor images were acquired to calculate diffusivities in the x, y, and z axes of the plane of the lateral ventricle body in two groups. We evaluated the diffusivity along the perivascular spaces as well as projection fibers and association fibers separately, to acquire an index for diffusivity along the perivascular space (ALPS-index). Group comparisons of the left/right side and whole-brain ALPS-index between BD and HCs were conducted. Furthermore, serum levels of 17 kinds of inflammatory cytokines were measured in patients with BD. Lastly, correlations between ALPS-index and the 24-item HDRS scores, inflammatory cytokines levels were calculated

Results Patients with BD showed significantly lower left side ALPS-index compared with HCs ($p = 0.045$). The left side ALPS-index was negatively correlated with 24-item HDRS scores ($r = -0.361$, $p = 0.042$)

in BD. Furthermore, the left side ALPS-index was positively correlated with IL-5 ($r = 0.534$, $p = 0.003$), IL-6 ($r = 0.541$, $p = 0.003$), IL-12 ($r = 0.566$, $p = 0.002$), G-CSF ($r = 0.483$, $p = 0.009$), GM-CSF ($r = 0.582$, $p = 0.001$) in BD

Conclusion Our results indicated that severer impaired glymphatic system may be associated with the severer depressive symptoms in BD. Also, this study provided preliminary evidence of the association between disrupted brain glymphatic system and neuroinflammation in BD.

双相情感障碍患者脑功能网络异常的神经机制与遗传基础

戴文钰 伍海姗* 黄牧芝 张佳阳 陈秀杉 陈晋东
中南大学湘雅二医院

目的 双相情感障碍 (bipolar disorder, BD) 患者普遍存在脑功能网络异常, 但具体神经机制和遗传基础仍不明确。度中心性 (degree centrality, DC) 是一种基于图论的神经影像学测量指标, 可识别脑网络的整体连接特征和具有高连接强度的关键节点。因此, 本研究旨在通过度中心性和相关功能连接 (functional connectivity, FC) 分析揭示与疾病症状和功能障碍密切相关的脑区, 并结合脑转录组学揭示异常脑区相关的神经机制和遗传基础。

方法 本研究纳入 49 名首发未用药 BD 患者和 49 名健康志愿者, 于基线、4 周末、12 周末进行随访。为明确 BD 患者中与临床症状密切相关的关键脑区, 我们使用汉密尔顿抑郁量表、杨氏躁狂量表评估 BD 患者临床症状, 采集静息态 fMRI 图像并计算 DC 作为评估脑区连接强度的标志, 并进一步以 DC 差异脑区为种子点计算 FC 明确异常脑功能网络。随后, 利用 Allen 人脑图谱结合脑影像转录组学分析差异脑区的相关基因, 使用 GSEA 富集分析探索显著差异表达基因所参与的皮质细胞类型、生化代谢途径和信号转导途径。使用神经递质图谱和 Neurosynth 数据库进一步明确所影响的神经递质和相关任务。

结果 BD 患者较健康对照存在左侧额上回的 DC 改变和大尺度 FC 异常。进一步的分析表明, BD 患者左侧额上回的 DC 改变与躁狂症状显著相关。BD 患者左侧额上回与岛叶的 FC 异常与抑郁症状密切相关。利用 Allen 人脑图谱进一步对异常脑影像指标进行脑影像转录组分析, 提示与炎症相关信号通路的基因模块表达谱具有空间相关性。GSEA-Lake 富集分析表明, BD 患者在左侧额上回的 DC 差异在空间上与星形胶质细胞之间存在显著关联, 而 FC 差异与内皮细胞和小胶质细胞显著相关。GSEA-KEGG、GSEA-Hallmark 和 GSEA-GO 的经典富集分析显示左侧额上回的 DC 差异主要与炎症和与炎症相关的生物合成过程显著相关。且 DC 差异与多巴胺能递质系统图谱存在空间相关性, 以左侧额上回为种子点的 FC 改变与多巴胺能、 γ -氨基丁酸能和谷氨酸能递质系统图谱以及包括认知功能、睡眠和情绪在内的多种行为域激活图存在空间相关性。

结论 双相患者在左侧额上回存在脑功能网络异常, 这些脑区的异常与炎症相关信号通路和多巴胺能、 γ -氨基丁酸能和谷氨酸能递质系统存在关联。这些发现为理解 BD 的神经机制和遗传基础提供了新视角, 也为未来开发针对性的治疗策略提供了重要的科学依据。

- 4.上海市法医学重点实验室

Objective Somatic symptoms are common manifestations in patients with major depressive disorders

(MDD). Transcranial direct current stimulation (tDCS) is one of the promising treatments for MDD. However, there is a lack of research on tDCS for the treatment of somatic symptoms in MDD and the suitable stimulating brain region. To investigate the efficacy of tDCS targeting the dorsolateral prefrontal cortex (DLPFC) versus orbitofrontal cortex (OFC) on somatic symptoms in MDD patients and identify the appropriate stimulating brain region.

Methods In this randomized, double-blind, sham-controlled study, a total of 70 patients diagnosed with MDD were randomly allocated into DLPFC group, OFC group, and Sham group. Subjects participated in 2 weeks of 10 primary interventions and subsequently 2-week maintenance interventions weekly (20 minutes, 2 mA). The Depression and Somatic Symptoms Scale (DSSS), 17-item Hamilton Depression Rating Scale (HAM-D-17) and Hamilton Anxiety Rating Scale (HAMA) were used to assess somatic symptoms, depression and anxiety at week 2, week 4 and follow-up.

Results After 2 weeks of interventions, the DLPFC group showed a more significant improvement in somatic symptoms compared to the Sham group. At the maintenance and follow-up stages, the DLPFC group outperformed the Sham and OFC groups, but the difference with the Sham group was not significant. Neither active group demonstrated superiority over the Sham group in improving depression and anxiety.

Conclusion In conclusion, the tDCS treatment targeting DLPFC proved to be more effective in ameliorating depressive somatic symptoms than the sham and OFC groups, suggesting the DLPFC a potentially effective therapeutic target for alleviating somatic symptoms in patients with MDD

首发抑郁障碍患者转相情况及其影响因素分析, 基于 7 年随访

崔伟 张云淑*

河北省精神卫生中心

因素

目的 了解首发抑郁障碍患者 7 年间转相情况,探讨发生转相的影响因素。

方法 1、纳入 18-60 岁、符合 DSM-IV 重性抑郁障碍单次发作的诊断标准、HAMD-17 \geq 18 分;排除严重躯体疾病、痴呆、精神发育迟滞、癫痫、酒药依赖/滥用者和哺乳/妊娠期妇女。2、收集首发时人口学信息、疾病特征、治疗情况等(为前期工作,于 2013 年-2016 年首发入组时完成)。通过自然观察随访,随访内容:人口学现况信息、纵向疾病特征(包括是否转相)、量表评估(第 7 年末采用 TESS 评估调查时的药物副反应、MARS 评估调查时的药物依从情况、GAF 评估调查时的功能水平)。

结果 基线入组 346 例,完成 7 年随访 138 例,随访完成率 39.9%,其中男性 47 例(34.1%),首发年龄 18-59 岁,平均 35.89 \pm 12.89 岁。转相组(7 年间出现躁狂、轻躁狂、混合发作者)54 例(39.1%)、未转相组(7 年间未出现躁狂、轻躁狂、混合发作者)84 例(60.9%)。首发时:转相组发病年龄早于未转相组、未婚者高于未转相组、初婚者低于未转相组、有诱因起病者低于未转相组、发病至接受治疗间隔时间短于未转相组($P<0.05$);性别、BMI、职业、受教育水平、精神旺盛性气质、阳性精神疾病家族史、自杀未遂者、伴精神病性症状、HAMD-17 总分、急性期治疗时间方面,两组间差异无统计学意义($P>0.05$)。转相组 7 年间总发作次数高于未转相组、7 年后 GAF 总分低于未转相组($P<0.05$);7 年间伴精神病性症状发作占比、危险行为占比、住院次数占比、维持治疗占比、7 年后 MARS 总分 \geq 6 分者、7 年后 TESS 总分,两组间差异无统计学意义($P>0.05$)。以 7 年间是否发生转相为因变量(赋值:转相组=0,非转相组=1),两组间首发时人口学和疾病特征资料比较有统计学差异的变量,年龄、婚姻、有诱因起病、发病至接受治疗间隔(天)(连续变量以实际值纳入)为自变量,进行二分类非条件 logistic 回归分析:首发年龄($OR=1.112$)、发病至接受治疗间隔(天)($OR=1.005$)为 7 年间首发抑郁障碍患者发生转相的独立影响因素($P<0.05$)。

结论 7 年间发生转相的患者总发作次数较未转相者高,且整体功能相对较差。首发年龄和首次发作时发病至接受治疗时间对后期是否发生转相具有预测作用。

首发抑郁障碍患者 7 年随访研究

王琳彦 崔伟* 于超 宋丽华 芦云平

河北省精神卫生中心

目的 探讨首发抑郁障碍患者 7 年间纵向疾病特点和 7 年后整体功能预后。

方法 纳入 2013 年 05 月至 2016 年 05 月河北省第六人民医院门诊和住院的首发抑郁障碍患者;年龄 18-60 岁;汉密尔顿抑郁量表 17 项(HAMD-17) \geq 18 分。首发入组时收集人口学、疾病特征、治疗情况等资料,随访时收集:7 年间纵向疾病特征、治疗情况等资料;7 年后随访时通过药物依从性评定量表(MARS)评估调查时患者对药物治疗的依从性(MARS 总分 \geq 6 分视为依从性好)、药物副反应量表(TESS)评估调查时患者存在的药物副反应和整体功能评定量表(GAF)评估调查时患者的整体功能水平(GAF 总分 \leq 70 分为整体功能不良)。

结果 完成 7 年随访 138 例,7 年后随访时,患者体质量指数(BMI)($\chi^2=9.098$)、无业/失业比例($\chi^2=26.965$)、再婚及分居/离异比例($\chi^2=17.833$)高于首发时(P 均 <0.01);7 年间复发次数(2.34 \pm 1.47),其中抑郁发作次数 2[1, 2]次、抑郁发作次数占比 1[0.38, 1]、躁狂发作次数 0[0, 2]次、躁狂发作次数占比 0[0, 0.62]、伴精神病性症状发作次数 0[0, 1]次、伴精神病性症状发作次数占比 0[0, 0.33]、伴危险行为次数 0[0, 1]次、伴危险行为次数占比 0[0, 0.17]、住院治疗次数 1[0, 2]、住院治疗次数占比 0.5[0, 1]、维持治疗次数 1[1, 2]、维持治疗次数占比 0.58[0.25, 1]、发生转相者 54 例(39.1%);7 年后 MARS 总分(5.77 \pm 2.45)、MARS 总分 \geq 6 分者 84 例(60.9%)、TESS 总分(9.43 \pm 7.60)、7 年后 GAF 总分(68.15 \pm 7.74)、GAF \leq 70 分者 92 例(66.7%)。多元线性回归分析显示:GAF 分与 BMI 差值(7 年后-首发时)($r=-0.189$, $P=0.026$)、7 年间复发次数($r=-0.274$, $P=0.001$)、躁狂发作次数占比($r=-0.178$, $P=0.037$)、住院治疗次数($r=-0.191$, $P=0.025$)、TESS 总分($r=-0.357$, $P=0.000$)呈负相关;GAF 分与 7 年间抑郁发作次数占比($r=0.190$, $P=0.026$)呈正相关。

结论 首发抑郁障碍患者 7 年后 66.7%的患者

存在整体功能不良，体质量指数增加越多、复发次数越多、躁狂发作在总发作次数中占比越高关键词：首发抑郁障碍；纵向疾病特征；整体功能；影响因素；随访研究

The Incidence Rates and Influence Factors of Newly Observed and Persistent Self-injurious Behavior Among Chinese Adolescents: A Short-term Longitudinal Survey

Xiao Liao Junren Wang Ting Zhu Wei Zhang*
West China hospital

Objective The prevalence of adolescent self-injurious behavior is increasing, posing a significant public health concern. While there is international variation, findings from numerous community-based studies indicate that approximately 10% of adolescents report engaging in self-injurious behavior. However, longitudinal studies on the prevalence of self-injurious behavior among Chinese adolescents are limited. Our study aims to explore the incidence rates and influence factors of newly observed and persistent self-injurious behavior in primary and middle school students

Methods This 2-wave longitudinal survey was respectively conducted in October and November 2023 among 19 primary and middle school students aged 9 to 19 years old in Chengdu, Sichuan Province. Data on demographics, individual factors (life style, mental health, somatic health and psychological characteristics), family factors (childhood adversity and family environment) and community factors (community environment and social support) were collected at baseline. The presence of self-injurious behavior was assessed at both baseline and follow-up with 1-month interval. Students with newly observed self-injurious behavior were those who didn't report it initially but did at follow-up, while those with persistent behavior reported it both times. The study assessed the prevalence of self-harm at baseline and the incidence rates of newly observed and persistent self-injurious behavior at follow-up, utilizing logistic regression to estimate the associations with individual, family, and community factors

Results The study encompassed 18,465 participants, of which 9,217 (49.9%) were girls, with an average age of 14.0 ± 2.3 years. At baseline, 2,420 (13.1%)

students reported engaging in self-injurious behavior, with 1,467 (60.6%) being female. The incidence rates of short-term newly observed and persistent self-injurious behavior were identified as 3.5% and 7.7% among all student. For students exhibiting newly observed self-injurious behavior, social bullying emerged as the primary risk factor, while impulse control was the key protective factor. The same results were observed in the students with persistent self-injurious behavior as well

Conclusion This longitudinal survey provides insight into the incidence rates of self-injurious behavior among Chinese adolescents, even though the 1-month interval period was limited. Additionally, the gender disparity remains evident, and the self-harm behavior among girls warrants attention. Given these findings, it is imperative not only to prioritize the development of self-control but also to establish robust measures that safeguard them from the detrimental effects of bullying.

2.Chaohu Hospital of Anhui Medical University

Objective Non-suicidal self-injury can lead to adverse consequences such as violent crime and cognitive impairment, and about 20% of adolescents (10-17 years old) experience non-suicidal self-injury, which is a major public health problem. However, the risk factors of adolescent non-suicidal self-injury are not clear. NSSI in adolescence is associated with multiple demographic and psychosocial factors, genetic and biological factors,

and psychiatric disorders. However, progress in the prevention and treatment of NSSI in adolescents depends on other modifiable risk factors. For example: interpersonal relationships, diet and sleep, social influences, and adverse childhood experiences. Network analysis can quantify and visually display the potential relationship between risk factors while controlling other variables in the network, in which detecting node centrality is a key step in network analysis, which helps to highlight key factors and further clarify the treatment target. Consequently, the purpose of this study is to understand the correlation network of sleep, negative mood, and diet habits in Chinese NSSI adolescents, to obtain the relationship among different factors, and to explore the key pathways between core factors and different factors, to help us to understand the causes of non-suicidal self-injury in adolescents and provide insights for their evaluation and intervention

Methods A total of 4040 secondary school students aged 12-17 years were recruited for this study. A self-administered questionnaire was used to collect basic demographic information such as gender, grade, age, height, weight, ethnicity, only child, parental education, family members, academic performance, academic stress, and interpersonal relationships. Our study used the Adolescent Non-Suicidal Self-Injury Assessment Questionnaire, the Eating Habits Questionnaire, the Children's Depression Scale, the Children's Multidimensional Anxiety Scale, and the Pittsburgh Sleep Quality Index to assess non-suicidal self-injurious behaviors, eating habits maladaptive mood, and sleep. The study was approved by the Ethics Committee of Chaohu Hospital of Anhui Medical University. Ethics number: KYXM20231001. All research procedures are carried out by the Helsinki Declaration

Data were analyzed using SPSS24.0 and R version 3.6.3 to analyze the data, and stratified analysis was performed according to whether there was non-suicidal self-injury behavior. The results of continuous variables were expressed by mean \pm standard deviation (MD \pm SD), and the categorical variables were presented by frequency or percentage. The rank sum test was used to analyze the differences between the two independent samples. A two-sided test was used in all analyses, and

it was considered that there was a significant difference in $p < 0.05$. We used network analysis to explore the interrelationships between risk factors and to identify core factors.

Results 1. Descriptive data

After excluding invalid questionnaires, the validity of the questionnaire in this study was 90.45%. Out of 3654 adolescents, 1159 (31.71%) had self-injurious behavior. Adolescents with self-injurious behaviors had generally higher depression (20.74 ± 8.20), anxiety (55.67 ± 20.03) and sleep problems (7.13 ± 3.35) scores than those without self-injurious behaviors (13.41 ± 8.04 for depression, 39.29 ± 21.46 for anxiety, and 4.68 ± 2.97 for sleep problems) (all $p < 0.001$). There was a significant difference in eating habits between adolescents with and without NSSI behavior ($P < 0.05$).

2. Network Results 2.1 Network structure

We found that in the adolescent network group, the strongest correlation node was negative symptom (CDI2) and low self-esteem (CDI3) (the marginal correlation coefficient was 3.11 for adolescents without NSSI behavior and 1.55 for adolescents with NSSI behavior). However, adolescents with NSSI behavior showed a significant correlation between injury avoidance (MASC1) and social anxiety (MASC2) (The correlation coefficient was 1.27). In the comparison of the network models of adolescents without NSSI behavior and those with NSSI behavior, the global strength of the two groups changed significantly after BonferroniHolm correction (global strength of NSSI behavior was 37.79, global strength of NSSI behavior was 23.58, $P < 0.05$), and network invariance test was significantly different ($M=1.56$, $P=0.030$). Adolescents demonstrated prominent negative emotions (CDI2) and low self-esteem (CDI3) regardless of whether they have NSSI behavior or not.

2.2 Centrality measure analysis

In terms of ExpectedInfluence, Adolescents with NSSI behavior had higher values of negative emotions (CDI2) and anhedonia (CDI1), while adolescents without NSSI behavior had higher values of anhedonia (CDI1) and somatic symptoms (MASC4).

2.3 Bridge symptoms analysis

Anhedonia (CDI1, strength value was 2.258) and

somatic symptoms (MASC4, strength value was 1.997) were the more important bridge symptoms in adolescents with NSSI behavior.

2.4 Network accuracy, stability, edge weight, and strength centrality differences

The casedrop bootstrap method showed that the median, proximity, and intensity values remained consistent even after the sample was dropped. The CS value of the node strength was 0.75, indicating that 75% of the samples could fall while maintaining stability. The CS coefficient of the strength was satisfactory, which showed that the accuracy and stability of the network graph centrality index were good.

Conclusion The results of the present study showed that the overall network structure diagrams were similar between the two network structures of adolescents with and without NSSI behaviors, but the links between the symptoms were different. Adolescents with NSSI behaviors showed prominent depression and anxiety problems with a core factor of anhedonia. Anhedonia is a key factor influencing adolescents' emotion regulation. We hypothesized that adolescent non-suicidal self-injury is an emotional disorder and that anhedonia plays an important role in preventing and intervening in adolescent non-suicidal self-injurious behavior.

Clinical, Neuropsychological, Family Environmental and Brain Microstructural Characteristics of ADHD Subgroups with Distinct Subcortical Volumetric Profiles

Zhaomin Wu^{1,2}, Binrang Yang^{1,2}

1. Shenzhen Children's Hospital

2. Shenzhen Pediatrics Institute of Shantou University Medical College

Objective Attention Deficit/Hyperactivity Disorder (ADHD) is a heterogeneous disease. The current

study aimed to explore whether it is possible to subgroup children with ADHD using their subcortical volumes

Methods Structural magnetic resonance images (sMRI) and diffusion tensor images (DTI) were obtained in a cohort of subjects with ADHD ($n = 171$) (all aged 6-15 years) and their healthy counterparts ($n = 95$). A series of clinical and family environmental scales, as well as neuropsychological tests, were applied. Latent profile analysis (LPA) was applied to classify the ADHD participants based on their subcortical volumes, and subsequent between-group comparisons on the clinical, neuropsychological, and family environmental measures were carried out, with age and sex as covariates. In addition, voxel-wise between-group comparisons were also performed on the gray matter volume, white matter volume, and four DTI measures, fractional anisotropy (FA), radial diffusivity (RD), mean diffusivity (MD), axial diffusivity (AD). Medication responses to either methylphenidate or atomoxetine in real-world settings were also documented and analyzed

Results LPA revealed that participants with ADHD could be grouped into two subgroups (Cluster-1 and Cluster-2). Compared with the control group, Cluster-1 had larger volumes in most subcortical regions, while Cluster-2 had smaller volumes. Subsequent analyses revealed minimal differences between the two ADHD subgroups in most clinical and family environmental measures, except that Cluster-1 had more social problems than Cluster-2 ($P=0.0048$). Compared with the control group, Cluster-2 performed worse in several cognitive domains, including processing speed, response inhibition, sustained attention, and planning, while Cluster-1 was only impaired in sustained attention and planning. Although Cluster-1 had greater subcortical volume, Cluster-2 had greater white matter volume, mainly in the right frontal cortex. In addition, Cluster-2 had higher FA values and lower RD values, mainly in the corpus callosum (CC), compared with the control group. Cluster-1 had higher AD, RD, and MD values than Cluster-2 in bilateral wide-spreading regions. The two ADHD groups do not differ in response rates to methylphenidate and atomoxetine

Conclusion There are indeed different subgroups of ADHD participants with different subcortical volumes. These subgroups of ADHD participants displayed shared clinical and family environmental profiles but with distinct cognitive and brain morphological profiles. The current study contributed to this field by providing insights into the possibility and necessity of classifying ADHD participants according to their brain structural features.

Association of Pain Intensity and Sensitivity with Suicidal Ideation in Adolescents with Depressive Disorder

Qingqing Shen Qing Zhang Yunxiao Liu Yingao Cui Jingwen Shang Huanzhong Liu*

Chaohu Hospital of Anhui Medical University

Objective The purpose of this study was to further explore the association of pain intensity and sensitivity with suicidal ideation in adolescents with depressive disorder by comparing the differences in pain intensity and sensitivity between adolescent patients with depressive disorders and healthy controls

Methods A consecutive enrollment method was used to select 158 adolescent patients with depressive disorders from three hospitals in Anhui Province as the MDD group, and 47 healthy adolescents were recruited as the control group. The subjects' suicidal ideation was assessed using the Positive and Negative Suicide Ideation scale (PANSI), and the intensity of somatic pain was assessed using the Numerical Rating Scale-11 (NRS-11). Subjects were assessed for forearm and tibial pain sensitivity using a hand-held pressure pain instrument, and experimental pain sensitivity measures included pressure pain threshold (PPT) and pressure pain tolerance (PTO). Differences in pain intensity and sensitivity between the MDD group and the control group were compared, and the association of pain intensity and sensitivity with suicidal ideation was analyzed

Results The incidence of physical pain in adolescent depressive disorder was higher at 88.6%, which was significantly higher than the control group ($p < 0.001$), and the pain intensity in the MDD group (3.77 ± 2.48) was significantly higher than the control group (0.617 ± 0.99) ($p < 0.001$). Forearm and tibia pain tolerance in the MDD group (forearm 105.37 ± 41.46 ; tibia 121.29 ± 41.60) was significantly higher than that of the control group (forearm 91.92 ± 37.62 ; tibia 105.47 ± 35.52) ($p < 0.05$). Linear regression analysis showed that the greater the pain intensity and pain tolerance, the higher the total PANSI score. Binary logistic regression showed that pain intensity was an influencing factor for suicidal ideation

Conclusion Adolescents with depressive disorders have higher pain intensity and lower pain sensitivity than healthy adolescents. Increased pain intensity and pain tolerance were positively correlated with suicidal ideation.

EEG and Eye Tracking Multimodality Approach for Early Diagnosis of Autism Spectrum Disorder

Binbin Sun¹, Elombe Calvert², Raymond K wang², Xinyuan Wang¹, Zhiliu Wu¹, Zhen Wei¹, xue jun Kong^{2,3}

1. henzen Maternity & Child Healthcare Hospital

2. Martinos Center, Massachusetts General Hospital, Harvard Medical School

3. Beth Israel Deaconess Medical Center, Harvard Medical School

Objective The etiology and heterogeneity of ASD have not been fully elucidated, posing significant challenges in accurately diagnosing the condition. By focusing on the overlooked domain of ASD symptomology, restrictive repetitive behaviors, a novel multimodal approach that not only incorporates EEG and eye tracking metrics, but also developmental parameters need to

be explored for the improved early diagnosis of the condition

Methods This study comprised 32 children between 2-4 years old in the ASD group and 27 typically developing children (TD) in the control group, matched for age and sex with no psychiatric or neurological disorders. All participants underwent a Gesell developmental assessment. The experimental stimulus utilized was the restricted interest stimulation paradigm, which consisted of 24 standardized images associated with common autistic interests. The experimental process included simultaneous data collection using the Eye-link1000plus eye tracker and EGI synchronization equipment. Calibration was conducted, and participants were sequentially presented with the 24 images. The analysis pipeline included preprocessing and feature selection from the eye-tracking and EEG data, along with applying statistical techniques such as t-tests, Pearson correlations, ROC curves, and logistic regression for testing associations, model construction and evaluation

Results We observed a positive correlation ($R=0.6805$, $p=0.0019$) between the time-frequency results in the α -band in the occipital region of children with autism spectrum disorder (ASD) and their pupil response under restricted interest stimulation. The area under curve (AUC) for predicting ASD was 0.73 (95%CI: 0.56-0.91) using only the α -band time-frequency index in the occipital region, while it was 0.8378 (95%CI: 0.72-0.98) using only the oculomotor pupil index alone. By fusing the different data modalities including the developmental parameter adaptability, we achieved an AUC of 0.84% for predicting ASD

Conclusion This study illuminates the unique propensities of children with ASD for non-social objects that supports the distinct neuronal activity patterns associated with such restrictive interests. Our multimodal prediction model, incorporating occipital alpha band time-frequency index, pupil size, and adaptive ability displayed strong predictive capabilities for ASD achieving an AUC of 0.84%, superior to our unimodal approaches for ASD prediction

学龄期青少年认知功能和大脑皮层激活的神经关联：一项大样本的 VFT 任务下的近红外光谱脑功能成像研究

桂瑰 舒畅 王惠玲 宗小芬 谭华威 白玉 李媛 王高华*

武汉大学人民医院

目的 比较不同学龄期青少年的认知功能及 VFT 任务下的大脑激活模式，探讨认知功能与不同大脑激活模式之间的关联

方法 2023 年 4 月到 2024 年 4 月在湖北省孝感市对 10-18 岁的学龄期青少年进行心理健康筛查，主要包括自评量表评估（PHQ-9 和 GAD-7）、认知功能评估（MCCB）、精神科评估。最终纳入心理健康的青少年共 681 名，其中小学组 295 人、初中组 203 人以及高中组 183 人。使用 fNIRS 检测受试者执行言语流畅性任务（VFT）期间的大脑血流动力学变化。以 PHQ-9 和 GAD-7 分数为协变量，对三组的大脑 Oxy-Hb 浓度进行协方差分析；对三组有差异通道和兴趣区的 Oxy-Hb 浓度和 MCCB 分数进行偏相关分析。

结果 （1）小学组的处理速度的得分显著高于初中组，且初中组显著高于高中组；而注意警觉、言语学习和记忆、推理及解决问题能力中，小学组的得分显著低于初中组，且初中组显著低于高中组。在工作记忆、视觉学习和记忆以及社会认知这三项，小学组和初中组的得分没有差异；而高中组的得分均显著高于小学组和初中组。（2）执行言语流畅性任务时，小学组的右侧 Broca、背外侧前额叶（DLPFC）以及前运动皮层和辅助运动皮层区（SMA）的激活水平较对照期有所下降；而初中组及高中组的大脑激活水平较对照期有所增加。（3）三组在 VFT 任务下激活水平相比，在 Broca、DLPFC、额极（FPR）以及 SMA 区，三组之间的激活水平存在显著差异。进一步两两比较分析，在左侧 Broca 和 FPR 区，小学组的激活水平显著低于初中组，且初中组显著低于高中组。在右侧 DLPFC 和 SMA 区，小学组的激活显著低于高中组，而小学组和初中组、初中组和高中组之间的激活水平没有显著性差异。右侧 Broca 区，小学组的激活水平显著低于初中组和高中组，但初中组和高中组两组之间的激活水平没有差

异。（4）偏相关分析提示，小学组注意警觉得分与 DLPFC、右侧 Broca 区的激活呈正相关，视觉学习和记忆的得分与右侧 DLPFC 的激活呈正相关。初中组处理速度得分与左侧 Broca 的激活呈负相关，而注意警觉得分与右侧 Broca、右侧 SMA 区以及左侧 FPR 区的激活均呈正相关。高中组推理及解决问题能力得分与 FPA 区和右侧 Broca 区的激活均呈正相关，工作记忆得分与右侧 SMA 区的激活成呈相关。

结论 在 VFT 任务下，学龄期青少年大脑激活模式不同；不同的激活模式可能与认知功能的不同有关。

基于功能及结构脑网络的孤独症辅助诊断方法

李俊畅¹ 韩向敏²

1.深圳市精神卫生中心/深圳市康宁医院

2.清华大学

目的 孤独症谱系障碍是发生在儿童早期的复杂神经发育障碍性疾病，严重影响儿童的社会功能和生活质量。本文基于功能磁共振成像（fMRI）和弥散张量成像（DTI）进行研究，旨在通过对孤独症患者的功能-结构脑网络进行融合建模和分析，提高孤独症辅助诊断的性能。

方法 本文提出了基于超图结构的功能-结构脑网络融合框架，共包含四个步骤：（1）首先使用 AAL 脑模板将每个受试者的大脑划分为 116 个不同的区域，这些区域覆盖了大脑的各个主要结构，如额叶、顶叶、颞叶等。（2）在功能脑网络超图结构建模模块中，提取每个脑区的时间序列信号并计算不同脑区之间的皮尔逊相关系数以量化其关联程度。将每一个脑区作为节点，将第 i 个脑区和其他所有脑区之间的皮尔逊相关系数作为其节点特征，通过 k 近邻算法生成包含第 i 个节点及其邻居节点的超边，重复该步骤即可得到功能脑网络的全部超边。

（3）在结构脑网络超图结构建模模块中，使用 DTI 数据获取不同脑区之间的纤维连接数矩阵以捕捉结构脑网络的高阶关联特征。在结构脑网络超图中，将不同的脑区作为节点，每一个脑区的聚类系数和

度中心性作为其节点特征, 结构脑网络超图的超边生成方法与功能脑网络超图相同。(4) 在得到功能脑网络超图和结构脑网络超图之后, 分别使用超图神经网络对其进行超图语义计算, 并将得到的节点特征进行拼接融合送入分类器中进行预测。最终的结果使用准确率、敏感性、特异性、F1 分数进行评估。

结果 本文提出的方法在公开数据库 ABIDE 中的 TCD 数据集和 NYU 数据集上进行了验证, 在 TCD 数据集上取得了 0.77 的准确率、0.75 的敏感性、0.80 的特异性、0.77 的 F1 分数, 相较于基于图结构的 GraphSage 方法在各项指标上分别提升了 10%、9%、9%和 7%; 在 NYU 数据集上取得了 0.83 的分类准确率, 0.94 的敏感性、0.67 的特异性、0.75 的 F1 分数, 在各项指标上相较于 GraphSage 分别提升了 25%、24%、26%和 30%。上述实验结果表明本文提出的方法可以有效的实现孤独症的精确辅助诊断, 具有较好的临床应用价值。

结论 本文提出了一种基于超图结构的功能-结构脑网络融合框架, 通过构建被试的功能与结构脑影像中的高阶关联并进行融合, 有效提高儿童孤独症的辅助诊断性能, 在公开数据集 ABIDE 的实验结果表明本文提出的方法优于对比方法, 具有较好的临床应用价值。

The Prevalence and Associated Risk Factors of Depression Symptoms in Schoolchildren and Adolescents Aged 9-18 Years in Zhejiang, Southeast China

Tian Haihua Hu Zhenyu*

Affiliated Kangning Hospital of Ningbo University

Objective This study aims to ascertain the prevalence and identify potential risk factors associated with depression among children and adolescents attending schools in the Zhejiang province, Southeast China

Methods A cross-sectional descriptive study design was employed to randomly select 8287 adolescent students in schools within Zhejiang province, China,

who met the study criteria. These participants completed standardized questionnaires pertaining to their socio-demographic characteristics and health history. Subsequently, they were assessed for depressive symptoms using the CES-D, with those scoring 20 or higher considered to have significant depression symptoms. Logistic regression analyses were then utilized to identify factors associated with these symptoms

Results A total of 8287 adolescents were included in the study, yielding a response rate of 98.71%. The sample consisted of 4428 (53.43%) boys and 3859 (46.57%) girls, aged between 9 and 18 years, with a mean age of 13.8 (SD 1.3). The prevalence of depression symptoms in the population was found to be 22.96%, with a higher prevalence observed in girls (26.94%) compared to boys (18.40%). Multivariate logistic regression analyses revealed that sex, grade level, academic performance, number of friends, parental absence, family income, family conflict, and time spent on parenting were independently associated with depression symptoms

Conclusion This study found a high prevalence of significant depression symptoms among school children and adolescents in Zhejiang province, southeast China. Risk factors associated with this disorder included being female, being in a higher grade, poor academic performance, having few friends, lack of parental presence, low family income, family conflict, and limited parental involvement. Culturally sensitive psychological interventions are necessary to address and prevent depression among this population

青少年抑郁障碍患者非自杀性自伤行为与 25 羟维生素 D3 和血脂水平的相关性研究

凡豪杰 刘乐伟 田英汉 杨铖 郝明茹 申晴晴 赵鑫 刘云道 崔迎奥 夏磊 刘震忠*
安徽医科大学附属巢湖医院

目的 抑郁障碍 (MDD) 在青少年人群中的发

病率逐年增高,非自杀性行自伤(NSSI)行为也是其常见的临床表现。有研究结果显示维生素D和血脂水平与抑郁障碍有关,但是其是否与NSSI有关尚不清楚。故本文目的在于比较伴有NSSI行为青少年MDD患者的25羟维生素D3[25(OH)D3]和血脂水平,并探索其对NSSI的诊断价值。

方法 选取自2020年10月至2022年3月在安徽医科大学附属巢湖医院精神科和合肥市第四人民医院就诊的青少年MDD患者129例,参考DSM-5中NSSI的诊断标准将其分为NSSI组(n=77)和非NSSI组(n=52)。采用青少年自杀意念量表(PANSI)、失眠严重指数(ISI)、流调抑郁量表(CES-D)评估患者的临床症状,采集空腹静脉血,检测样本中25(OH)D3和血脂水平,并进行两两比较。进一步采用二元Logistic回归分析探究青少年MDD患者发生NSSI行为的影响因素,并绘制受试者工作特征(ROC)曲线评估25(OH)D3和血脂水平对NSSI行为的诊断价值。

结果 两组患者BMI、病程、父母婚姻状况、抗抑郁药物服用比较,差异无统计学意义($P>0.05$);NSSI组的年龄低于非NSSI组,而PANSI总分、ISI总分、CES-D总分高于非NSSI组($P<0.05$)。25(OH)D3和血脂水平:两组TG水平差异无统计学意义($P>0.05$);NSSI组25(OH)D3水平低于非NSSI组,而TC、HDL-C和LDL-C水平高于非NSSI组($P<0.05$)。二元Logistic回归分析显示,在不同模型中LDL-C[OR=5.695, 95%CI=2.422~13.388, $P<0.001$]和25(OH)D3[OR=0.871, 95%CI=0.768~0.987, $P<0.05$]都是青少年MDD患者伴有NSSI行为的影响因素。LDL-C和25(OH)D3评估青少年MDD患者NSSI行为发生风险的AUC分别为0.73[95%CI(0.65, 0.82), $P<0.001$]、0.62[95%CI(0.52, 0.72), $P=0.023$];LDL-C联合25(OH)D3水平诊断青少年MDD患者NSSI行为的AUC为0.77[95%CI(0.69~0.85), $P<0.001$],灵敏度为77.92%、特异度为67.31%。

结论 NSSI在青少年MDD中很常见,且与年龄、自杀意念、25(OH)D3和LDL-C水平有关。鉴于NSSI与25(OH)D3和LDL-C水平之间的相关关系,临床应定期检测其动态变化并对症处理。

Psychosocial Predictors of Persistent Non-suicidal Self-injury in Adolescents with Major Depressive Disorder: A Longitudinal Study

Haojie Fan Lewei Liu Yun Zhang Mingru Hao Qingqing Shen Xin Zhao Yunxiao Liu Yingao Cui Yinghan Tian Cheng Yang Lei Xia Huanzhong Liu*
Chaohu Hospital of Anhui Medical University

Objective Major depressive disorder (MDD) is increasing in prevalence in the adolescent population, with non-suicidal self-injury (NSSI) as a common clinical manifestation. Although several studies have explored the relationship between MDD and NSSI, most have been cross-sectional studies, making it difficult to show a causal relationship. Therefore, this study aimed to explore the predictors of the persistent occurrence of NSSI in adolescents with MDD from a longitudinal research perspective

Methods Data were collected from 163 adolescents with MDD. These adolescents were assessed for NSSI at baseline and the second year. The 24-item Hamilton Depression Rating Scale (HAMD-24), the Childhood Trauma Questionnaire (CTQ), the Positive and Negative Suicide Ideation (PANSI), the Center for Epidemiological Survey, Depression Scale (CES-D), the Adolescent Life Events Scale (ASLEC), the Insomnia Severity Index (ISI), the Interpersonal Reactivity Index (IRI), and the Toronto Alexithymia Scale (TAS-20) were used to assess the patient's psychological status at baseline. We used binary logistic regression for the predictive effect of these factors on persistent NSSI. The diagnostic value of relevant influences on persistent NSSI behavior was also assessed by plotting the subject's work characteristics (ROC) curve

Results HAMD (blocking) are essential in predicting persistent NSSI behaviors (OR =4.38, $P=0.019$). Persistent NSSI behaviors were predicted by age (OR = 1.633, $P=0.004$) and age of onset (OR =0.682, $P=0.009$). And there was a significant association between NSSI behaviors and more general family relationships (OR =0.077, $P=0.019$). Finally, The AUC for the combined diagnosis of persistent occurrence of NSSI behaviors in

adolescents with MDD by HAMD (blocking), age, age of onset, and general family relationship was 0.792 [95% CI (0.698 to 0.886), $p < 0.001$], with a sensitivity of 86.8% and a specificity of 52.8%

Conclusion Among adolescents with MDD with persistent NSSI behaviors, HAMD (blocking) and, more generally, family relationships are at greater risk of persistent NSSI behaviors. Therefore, it may be helpful for patients to reduce the harm of NSSI by improving family relationships and treating depressed mood

Metabolomic Changes in Major Depressive Disorder Among Adolescent Females with Or without Suicide Attempts

Jing-Yi Long*

Wuhan Mental Health Center

Objective The incidence of major depressive disorder (MDD) is high among adolescent females, and MDD is often accompanied by suicide attempts (SA), which seriously negatively affect physical and mental health. However, changes in lipids, thyroid hormone, and brain metabolism among female adolescents with MDD and the relationships between these three markers and MDD with or without SA have yet to be elucidated. In this study, the changes in thyroid hormones, blood lipids, and brain metabolism-related factors in female adolescents with MDD were analyzed, and synergistic changes among the three factors were observed to reveal the metabolic and neural mechanisms related to SA

Methods This study was conducted by the Declaration of Helsinki. Female adolescents with MDD in the outpatient and inpatient departments of Wuhan Mental Health Centre (WMHC) from October 2021 to October 2023 were enrolled. The Medical Ethics Committee of WMHC approved the study protocol, and all the subjects provided written informed consent. We enrolled 71 MDD patients with SA (MDD+SA), 66 MDD patients without SA (MDD-SA), and 47 healthy controls

(HCs). We collected and analyzed the subjects' clinical characteristics, blood lipid levels, thyroid hormone levels, and magnetic resonance spectroscopy (MRI) data. 1) The clinical data of all the subjects were collected from medical records, and each participant completed the Beck Scale for Suicide Ideation-Chinese Version (BSI-CV), the Adolescent Self-Rating Life Events Checklist (ASLEC), and the Adolescent Social Support Scale (ASSS); 2) Venous plasma was collected through venepuncture of a cubital vein in the arm at 7-10 a.m. on the day after patient enrolment. An automatic chemiluminescence analyzer was used to detect thyroid stimulating hormone (TSH), free triiodothyronine (FT3), and free thyroxine (FT4); 3) The triglyceride (TG), total cholesterol (TC), high-density lipoprotein (HDL) and low-density lipoprotein (LDL) levels were measured with an AU680 Beckman Coulter automatic biochemical analyzer; 4) Magnetic resonance imaging (MRI) scanning was performed within 48 hours after completion of the psychological scale and measured the peak areas of N-acetyl aspartic acid (NAA), Cho, and Cr in the anterior cingulate cortex (ACC), prefrontal cortex (PFC), and thalamus

Results Low levels of social support, high levels of life stress, and high levels of suicidal ideation (SI) were risk factors for SA. In MDD patients, 1) the TSH was positively correlated with TG and NAA/creatinine in the PFC and negatively correlated with HDL and the choline/creatinine ratio in the thalamus; 2) free triiodothyronine was negatively correlated with the choline/creatinine level in the thalamus; 3) total cholesterol, TG, LDL, and choline/NAA in the PFC were positively correlated with the severity of SI and suicide risk; and 4) NAA/creatinine in the thalamus was negatively correlated with the severity of SI and suicide risk

Conclusion This study confirmed multiple differences in metabolic indexes among the MDD+SA, MDD-SA, and HC groups. Moreover, there were significant synergistic changes among the three types of factors, and some single/comprehensive indicators may be potential mechanisms or related to the appearance and details of SA, especially the thalamic NAA/Cr ratio. The findings of this study provide new evidence for understanding MDD and suicide-related metabolic-neural

mechanisms

目的 分析和验证中文版社交技巧提升系统家长评定量表(Social Skills Improvement System-Rating Scales (Parent version), SSIS-RS) 在青少年人群中的信度和效度。

方法 采取分层整群抽样的方法对 1486 名 12~18 岁青少年家长进行中文版 SSIS-RS 调查, 并以社交反应量表和长处与困难问卷作为校标效度检验工具。间隔 1 个月后进行重测, 对获取的数据进行描述性统计、相关性分析和信效度分析。

结果 项目分析显示各题项与总量表和分量表之间的得分呈显著性相关 ($r=0.179\sim0.782$, $P<0.001$), 且各题项在高、低分组上的差异均达到显著水平 ($t=4.035\sim37.038$, $P<0.001$)。验证性因素分析支持中文版 SSIS-RS 中社交技能分量表七因素(即沟通、合作、维护权利、责任感、同理心、参与投入和自我控制) ($\chi^2/df=3.377$, $RMSEA=0.049$, $GFI=0.864$, $AGFI=0.841$, $CFI=0.926$, $NFI=0.899$, $IFI=0.927$, $TLI=0.918$) 和问题行为分量表五因素结构(即外化问题、欺凌、多动/注意力不集中、内化问题和孤独症谱系障碍) ($\chi^2 / df=3.310$, $RMSEA=0.049$, $GFI=0.917$, $AGFI=0.891$, $CFI=0.952$, $NFI=0.933$, $IFI=0.952$, $TLI=0.941$)。社交技巧分量表与亲社会行为呈正相关 ($r=0.637$, $P<0.001$), 问题行为分量表与社交障碍和困难行为呈正相关 ($r=0.765$ 、 0.688 , $P<0.001$)。总量表的 Cronbach's a 系数为 0.934, 社交技能分量表的 Cronbach's a 系

数为 0.972, 问题行为分量表的 Cronbach's a 系数为 0.963, 各维度的 Cronbach's a 系数在 0.797~0.907 之间。中文版 SSIS-RS 总分、社交技巧分量表总分和问题行为分量表总分的重测相关系数分别为 0.665、0.871 和 0.598, 各维度的重测系数在 0.507~0.823 之间 ($P<0.001$)。青少年女性在社交技巧分量表总分以及沟通、维护权利、责任感和同理心维度的平均分高于青少年男性。

结论 中文版 SSIS-RS 在中国青少年人群中具有良好的信效度, 能有效地评估中国青少年的社交技巧和问题行为。

Language Feature-based Data Mining in Autism Spectrum Disorders Applications in Recognition

Rongjie Mao Yuncheng Zhu* Zuowei Wang
Shanghai Hongkou Mental Health Center

Objective This review systematically reviews the recent advances in the identification of autism spectrum disorder (ASD) by analyzing linguistic features of patients through data mining technology, and provides references for the diagnosis and treatment of ASD in the future

Methods In this review, extensive data retrieval strategies were used to collect literatures related to the diagnosis and recognition of ASD by analyzing linguistic features of patients through data mining in recent five years from PubMed, Google Scholar, Cochrane Library and other authoritative databases. Keywords cover the core symptoms of ASD and many aspects of data mining technology. In the screening process, only papers with high research quality, focusing on the application of language-related feature data mining in the identification of ASD, with clear methods and peer review were included, and irrelevant literatures with unknown methods were excluded

After two-stage screening, literature with high relevance is selected for comprehensive reading, and key

information is extracted, such as research design, sample characteristics, data sources, data mining techniques used and main research results. The application, effectiveness and accuracy of data mining technology in the identification and diagnosis of ASD in various studies were summarized by using narrative analysis method, and the value and contribution of data mining of various data sources related to language characteristics (text, scale, speech, body language, neuroimage, etc.) to the diagnosis of ASD was deeply discussed.

Results Data mining technology has achieved remarkable results in the identification of ASD. Natural language processing (NLP) and machine learning (ML) techniques can effectively mine unique language patterns associated with autism in medical text data, for example, successfully predicting ASD risk in social media content analysis. For scale data, ML technology achieves efficient diagnosis, and a deep neural network study even exceeds the judgment of professional doctors in diagnostic efficiency. In the aspect of speech features, the application of data mining technology can achieve up to 90% accurate ASD detection, especially in the analysis of children's natural language environment. The application of eye-tracking technology to body language studies has revealed facial feature gaze patterns unique to infants at risk for ASD. In addition, multi-modal data fusion also showed its advantages, combining NLP with speech analysis to conduct overall analysis of children's language text and audio data, which greatly improved the automatic classification accuracy of autism, and some studies found that the classification accuracy reached 86.71%. These studies indicate that data mining technology has broad application prospects in multi-dimensional characterization of ASD and improving diagnostic efficiency

However, there are also some challenges and limitations: for example, unbalanced or skewed data may lead to overfitting of the model, affecting diagnostic accuracy and generalization ability; Handling sensitive medical information may violate privacy protection laws and fail to ensure data security; There is a technology application threshold, which requires interdisciplinary expertise, increasing the complexity and cost of technology application.

Conclusion Data mining technology provides a new direction and method for the diagnosis and treatment of ASD, and its role in the future medical practice will be increasingly important. In order to realize the full potential of these technologies, it is recommended to strengthen interdisciplinary research, optimize the data processing process, improve the accuracy and reliability of the technology, and focus on privacy protection and ethical review to promote progress in the field of ASD diagnosis and treatment.

青少年抑郁障碍快感缺失的神经机制研究

梁娜娜 卢建平*
深圳市康宁医院

目的 快感缺失作为青少年抑郁障碍 (Adolescent depressive disorder, ADD) 的核心症状, 被视为内表型标记。鉴于前额叶-纹状体网络低功能状态可能是成人抑郁障碍快感缺失奖赏特征, 因此有必要探索 ADD 快感缺失患者临床特征及前额叶-纹状体功能连接变化。

方法 纳入 ADD 患者及健康对照, 采集一般资料, 临床量表 (儿童抑郁量表 (Children's Depression Inventory, CDI)、青少年多维焦虑量表 (the Multidimensional Anxiety Scale for Children, MASC) 及青少年生活事件量表 (Adolescent Self-Rating Life Events Check List, ASLEC)) 及静息态功能磁共振 (resting-state functional magnetic resonance imaging, rs-fMRI) 数据, 以双侧壳核及双侧尾状核为种子点, 进行全脑体素的功能连接分析。

结果 共纳入 92 例 ADD 快感缺失、58 例 ADD 非快感缺失患者及 51 例健康被试。ADD 快感缺失与非快感缺失在 CDI、MASC 及 ASLEC 及因子分方面有统计学差异 (all $p < 0.05$)。

以右侧尾状核为感兴趣区, 三组差异分析, 发现在右背外侧额上回、顶下缘角回、右侧角回、左侧 cerebellum_Crus1 及双侧 cerebellum_6 有统计学差异 ($p < 0.05$, AlphaSim 校正)。事后分析, 快感缺失组右侧尾状核与右背外侧额上回、左侧

cerebellum_Crus1 及右侧角回的 FC 低于非快感缺失组 ($p < 0.05$, AlphaSim 校正)。ADD 快感缺失右尾状核与右角回 FC 降低, 且与儿童抑郁量表的低效能呈负相关 ($r = 0.216$, $p = 0.038$)。

以左侧壳核为感兴趣区, 三组差异分析, 发现在右背外侧额上回、右侧海马旁回及双侧 cerebellum Crus1/2 有统计学差异 ($p < 0.05$, AlphaSim 校正)。事后分析比较, ADD 快感缺失在右背外侧额上回与左侧壳核的 FC 低于非快感缺失组 ($p < 0.05$, AlphaSim 校正)。ADD 快感缺失该 FC 与儿童抑郁量表中的快感缺失负相关 ($r = 0.216$, $p = 0.038$)。

结论 快感缺失可能是 ADD 患者的内表型。ADD 快感缺失组右尾状核与右角回 FC 降低, 与低效能呈负相关, 左侧壳核与右背外侧额上回的 FC 降低, 与快感缺失负相关。进一步提示前额叶-纹状体功能抑制可能是 ADD 快感缺失的特异性脑表现。

Attention Deficit Hyperactivity Disorder (ADHD) and Self-harm in Chinese Children and Adolescents: A Mediation by Resilience

Yi Xiang¹, Jin Lu^{3,4}, Jin Lu², Hailiang Ran¹, Yusan Che¹, Die Fang¹, Sifan Wang¹, Lin Chen¹, Xuemeng Liang¹, Junwei Peng¹, Hao Sun¹, Qiongxiang Li¹, Yuanyu Shi¹, Yuanyuan Xiao¹

1.School of Public Health, Kunming Medical University

2.Psychiatry Department, The First Affiliated Hospital, Kunming Medical University

3.Mental Health Institute of Yunnan

4.Yunnan Clinical Research Center for Mental Health

Objective Existing evidence suggests that resilience may play as a mediator in the association between attention deficit hyperactivity disorder (ADHD) and self-harm (SH) in youths. However, no published studies have ever thoroughly discussed this topic. We aim to analyze the mediation by resilience in ADHD-SH association by using a large representative sample of Chinese children and adolescents

Methods A total of 17151 study subjects chosen from 3 study sites of the ongoing Mental Health Survey for Children and Adolescents in Yunnan (MHSCAY) were included into the final analysis. Valid self-reporting instruments for measuring ADHD symptoms, resilience, and SH among children and adolescents were used for data collection. Based on sequential multivariate logistic regression models fitting results, a series of path models were constructed to estimate the mediation by resilience in ADHD-SH association. Stratified analysis was used to check for possible effect modification by key factors

Results Resilience played as a significant mediator, mediated 33.12%, 28.10%, 37.78% of the total associations between ADHD symptoms and SH prevalence, SH repetition, SH severity. The “outer resources” dimensions of resilience, which largely measure social support from parents and peers, presented much stronger mediation. Stratified analysis by age, sex, ethnicity, and left-behind status revealed prominent effect modification by the four factors in mediation of resilience

Conclusion Resilience-based intervention measures, especially those targeting at rebuilding parental and peer social support, might be effective in preventing ADHD symptoms related SH in Chinese children and adolescents.

Sex- and Age-dependent Alterations in White Matter Microstructure Among Pediatric Patients with Social Anxiety Disorder

Yufeng Xia¹, Xiaochen Zhang¹, Wenjing Liu¹, Zhen Liu¹, Yue Ding¹, Zhishan Hu¹, Zhi Yang^{1,2}, Wenhong Cheng^{1,3}

2.Beijing Anding Hospital, Capital Medical University

3. Shanghai General Hospital, Shanghai Jiao Tong University School of Medicine

Objective Social anxiety disorder (SAD) significantly disrupts social interactions and its neurobiological underpinnings remain poorly understood. Previous studies have identified atypical brain structures in individuals with SAD, noting pronounced sex and age disparities in the disorder's prevalence and severity. This is particularly relevant during early developmental stages, when the brain undergoes crucial changes. Our team previously pioneered investigations into sex- and age-specific variations in cerebral grey and white matter volumes in pediatric SAD cases. This study seeks to further elucidate the variations in white matter morphology attributable to sex and age within this group

Methods The study comprised 144 participants who, along with their guardians, consented to a protocol sanctioned by the Ethics Committee at the Shanghai Mental Health Center. Of these, 76 (44 females; aged 9.1 to 17.8 years) were deemed clinically normal and 68 (45 females; aged 9.3 to 17.7 years) were diagnosed with SAD by paediatric psychiatrists, with careful matching for sex and age. All subjects underwent high-resolution T1- and diffusion-weighted imaging on a Siemens 3.0-Tesla MRI scanner. We quantified white matter morphology using standard diffusion tensor imaging metrics such as fractional anisotropy (FA), mean diffusivity (MD), axial diffusivity (AD), and radial diffusivity (RD). Each parameter was analysed using voxel-based statistical parametric mapping, incorporating cluster-level adjustments for multiple comparisons

Results Significant sex- and age-related differences were observed in white matter diffusivity (AD, RD, MD) at the outer regions of the bilateral cerebella, whereas FA changes were not notable across the brain. In clinically normal males, white matter diffusivity did not correlate with age; however, in male SAD patients, older age was associated with increased diffusivity declines. In contrast, among females, normal aging correlated with decreased white matter diffusivity, whereas in female SAD patients, it correlated with an increase

Conclusion Our research identified focal

changes in white matter diffusivity at the cerebellar exterior in pediatric SAD patients, distinctly influenced by both sex and age. These findings underscore that the critical neurodevelopmental phase from childhood to adolescence manifests differently in male and female SAD patients, characterized by unique age-dependent cerebral alterations.

2. 重庆医科大学附属第一医院精神医学中心

3. 重庆医科大学附属大学城医院

目的 微状态类似于语言中的字母,由几个微状态组成的短片段(k-mers)类似于单词。本研究的目的是传统微状态动力学指标及k-mers是否可以用作神经生理标志物来区分伴非自杀性自伤(Nonsuicidal self-injury, NSSI)的重度抑郁症(Major depressive disorder, MDD)青少年和不伴NSSI的MDD青少年。

方法 我们使用三种不同的微状态分析方法比较年龄在12-17岁之间两组人群(MDD+NSSI组:116名伴NSSI的MDD患者;MDD组:74名不伴NSSI的MDD患者)的传统微状态动力学差异;使用传统微状态动力学指标或k-mers,加入年龄及性别共同作为特征,使用支持向量机(Support Vector Machine, SVM)作为分类模型,进行嵌套交叉验证,计算灵敏度、特异度、准确率及受试者工作特征曲线下面积(Area under the receiver operating characteristic curve, AUC)以评估模型性能。

结果 使用改进的微状态分析方法,MDD+NSSI组微状态B的出现频次大于MDD组微状态B的出现频次,MDD+NSSI组C到B的转换概率大于MDD组C到B的转换概率。使用年龄、性别及传统微状态动力学参数作为特征的模型可获

得 0.692 的最佳 AUC；使用年龄、性别及 5-mers 作为特征的模型 AUC 高达 0.739。

结论 我们的研究表明改进的微状态分析方法可能优于常见的微状态分析方法，并且微状态序列 k-mers 可能是更具潜力的能够在个体水平识别伴 NSSI 的 MDD 青少年的神经生理标志物。

ASD 幼儿两岁前的声学特征分析及预测模型的构建

尹胜健¹ 柯晓燕¹ 关陆阳¹ 岳增赫¹ 李志佳² 王菲¹ 王金岑³

1. 南京医科大学附属脑科医院儿童心理卫生研究中心
2. 南京医科大学 无锡市精神卫生中心
3. 东南大学儿童发展与学习科学教育部重点实验室, 东南大学生物科学与医学工程学院

目的 探究孤独症谱系障碍 (ASD) 患儿 9~18 月龄时静止脸试验 (SFP) 下声学特征及其作为预测指标的可行性。

方法 纳入南京医科大学孤独症专病队列中的 88 例 9~18 月龄高危 ASD 幼儿，随访至 24 月龄，根据随访结果分为 ASD 组和 TD 组，提取两组被试在 9~18 月龄时静止脸试验 (SFP) 下的声学特征，分析两组声学特征的差异性，并建立基于静止脸试验 (SFP) 下声学特征的预测模型。

结果 与 TD 组相比，ASD 组 SFP 下声学特征在韵律、频谱及响度方面存在显著增高。通过随机森林算法构建了一个分类模型，模型的准确率：0.8148，精确率：0.75；召回率：0.6667；F1 分数：0.7059；AUC 值为 0.8395。

结论 通过对 9~18 月龄幼儿进行声学特征的收集及分析，发现 24 月龄时确诊 ASD 的幼儿与正常幼儿相比，部分声学特征如韵律、响度等存在显著差异，通过随机森林算法构建了一个分类模型，并使用十折交叉验证和网格搜索进行参数调优。尽管模型在测试集上的准确率较高，但通过进一步优化和调整模型参数，可以有效提升模型预测性能。未来的研究可以探索更多的特征选择方法和参数调

优技术，以进一步提升模型的准确性和稳定性。

The Volume of The Left Pallidum Mediates The Effect of The Polygenic Risk of ADHD on The Working Memory Deficit in Daily Life

Zhaomin Wu Binrang Yang*

ShenZhen Children's Hospital

Objectives The current study aimed to systematically examine the interrelationship among genetic liability of ADHD, subcortical volumes, and daily-life executive function in a clinical cohort consisting of children with ADHD and their healthy peers

Methods In total, two hundred and eighty-five ADHD subjects and 108 healthy controls were enrolled. The Behavior Rating Inventory of Executive Function (BRIEF) was filled out by parents or caregivers of each subject. All participants were genotyped, and the polygenic risk scores were calculated. Structural magnetic imaging (MRI) scans were collected in a sub-sample of 182 ADHD patients and 94 healthy controls, and each subcortical region's volume was extracted. Linear regression models and mediation models were built to test the gene-brain-behavior interrelationships

Results The ADHD-PRS was significantly associated with the score of the working memory (Beta = 3130.69, P = 0.0023) and the organization of material (Beta = 1558.57, P = 0.020) factors of BRIEF, as well as the volumes of the left accumbens (Beta = -2.99×10⁴, P = 0.032), the left pallidum (Beta = -3.92×10⁴, P = 0.027), and the right amygdala (Beta = 8.86×10⁴, P = 0.023). The mediation model has revealed that the volume of the left pallidum significantly mediated the effects of ADHD-PRS on the working memory factor in BRIEF (Beta = 4.68×10², P = 0.03)

Conclusion The volume of the left pallidum mediated the effects of polygenic risk of ADHD on the ADHD-related working memory deficit in daily life. Our results provided more evidence about the gene-

brain-behavior relationships.

The Complex Relationship Between IQ and ADHD Symptoms: Insights From Behaviors, Cognition, Brain and Impairment in 5,138 Children with ADHD

Ningning Liu¹, Gaoding Jia², Haimei Li¹, Yinshan Wang³, Yufeng Wang¹, Lu Liu¹, Qian Qiujin¹

1.Peking University Sixth Hospital/Institute of Mental Health

2. Shijiazhuang University, school of teacher education.

3.Beijing Normal University, State Key Laboratory of Cognitive Neuroscience and Learning

Objective There has been speculation that a high IQ may not necessarily provide protection against attention deficit hyperactivity disorder (ADHD), and there may be a U-shaped correlation between IQ and ADHD symptoms. To investigate and validate this speculation, high-quality, multi-dimensional data including behavior and brain measures, with larger sample sizes in the ADHD population are necessary

Method We conducted a study with 5,138 children, aged 6-16 years, who have been professionally diagnosed with ADHD and have a wide range of IQ levels. General Linear Models were used to determine the relationship between IQ [Full-Scale IQ (FSIQ), Verbal IQ (VIQ), and Performance IQ (PIQ)] and ADHD core symptoms [total scores (TO), inattention (IA), hyperactivity/impulsivity (HI)] while considering sex and age as covariates. Furthermore, we examined the correlation between IQ and the execution function [Behavior Rating Inventory of Executive Function (BRIEF)], as well as between IQ and brain surface area, to determine if the complex associations between IQ and ADHD symptoms were reflected in executive functions and brain structure. Finally, we examined the behavioral performance of children with ADHD to investigate how dif-

ferent IQ levels impact the functional impairment associated with ADHD

Results Consistent with previous research, our study found a negative linear correlation between FSIQ and TO. However, only VIQ showed a linear negative correlation with ADHD IA scores, while PIQ showed an inverted U-shaped pattern with ADHD HI scores peaking at 103. These findings were partially validated in the relationship between IQ and executive functions, as well as IQ and brain surface area. Notably, the functional impairment in ADHD did not ameliorate when PIQ surpassed 103

Conclusion The correlation between IQ and ADHD symptoms is not straightforward. Our findings align with established academic hypotheses, revealing an inverted U-shaped relationship between PIQ and ADHD symptoms. This study advances our comprehension of ADHD symptoms and behaviors based on varying IQ characteristics, suggesting potential for targeted clinical interventions

ADHD 儿童多动冲动行为异质性的遗传与神经基础: 一项基于 MAOA 单基因表型半监督聚类的 fMRI 亚型分析

冯源^{1,2} 高媛^{1,2} 刘倩溶^{1,2} 祝雨^{1,2} 党宸^{1,2} 吴桂森^{1,2} 钟少根^{1,2} 梁太柱^{1,2} 罗翔升^{1,2} 郭晓杰^{1,2} 刘璐^{1,2} 孙黎^{1,2}

1.北京大学第六医院, 北京大学精神卫生研究所

2.国家卫生健康委员会精神卫生学重点实验室(北京大学), 国家精神心理疾病临床医学研究中心(北京大学第六医院)

目的 多动冲动是注意缺陷多动障碍(ADHD)核心临床症状表现之一, 在儿童期尤为明显。既往研究提示多动冲动与单胺氧化酶 A (MAOA) 基因遗传变异存在密切关联, 然而相同基因型患者的认知行为表现存在个体差异, 提示可能存在不同的神经生物亚型。本研究基于不同 MAOA 基因表型的认知行为特征进行半监督聚类, 比较不同神经生物亚

型的脑功能差异和药物治疗反应,为 ADHD 多动冲动的遗传神经机制以及临床治疗提供理论支持。

方法 本研究共纳入 ADHD 儿童 326 例,其中无风险基因患者 108 例,MAOA 风险基因患者 218 例。采用 ADHD 评定量表、Conners 评定量表以及执行功能行为评定量表测量行为与认知功能。基于多动冲动与执行功能评分,以无风险基因患者为参考,采用半监督聚类方法将 MAOA 风险基因患者分为不同的亚型,比较不同亚型静息态低频振幅比值(fALFF),构建“脑-认知-行为”中介模型;并进一步结合药物干预随访信息,观察不同生物亚型患者治疗反应差异。

结果 通过半监督聚类将 MAOA 风险基因患者分成两个亚型。与无风险基因患者相比,亚型 1 多动冲动评分较高,执行功能表现较差;亚型 2 多动冲动评分无差异,执行功能表现更好。影像分析发现,与无风险基因患者相比,亚型 1 颞下回 fALFF 升高,亚型 2 角回 fALFF 升高;与亚型 2 相比,亚型 1 左侧壳核 fALFF 升高,壳核 fALFF 与抑制、转换、情感控制、行为管理指数显著相关。中介分析显示,壳核 fALFF 可能通过执行功能的行为管理指数影响多动冲动行为。4 周药物治疗后,亚型 2 患者品行问题、焦虑因子减分率更高。

结论 壳核局部功能可能是 MAOA 风险基因患者多动冲动行为异质性的神经基础,该脑区局部功能越强,患者执行功能越好,多动冲动症状越轻,且药物治疗反应更好。

Started Low, But Did Not Go That Slow: Real-world Use of Blonanserin and Its Safety and Effectiveness in Chinese Adolescents with Schizophrenia

Gang Wang¹, Qijing Bo¹, Haiyun Li²

1.The National Clinical Research Center for Mental Disorders & Beijing Key Laboratory of Mental Disorders, Beijing Anding Hospital, Capital Medical University; Advanced Innovation Center for Human Brain Protection, Capital Medical University

2.Medical Affairs, Sumitomo Pharma (Suzhou) Co., Ltd.

Objective About 8.2% of schizophrenias are diagnosed before age 18. Dosing should be individualized in these population, given their unique drug metabolism and side effect liability. The aim of this analysis was to investigate the use of blonanserin in Chinese adolescent patients with schizophrenia in real-world clinical settings, using data from a post-marketing surveillance (PMS)

Methods Patients aged <18 were included in this analysis, using data from a 12-week, prospective, observational, single arm, open-label, multi-center PMS conducted in patients with schizophrenia receiving blonanserin across Mainland China. The dose of blonanserin was recorded. The adverse drug reactions (ADRs) were collected to evaluate the safety profile of blonanserin. Brief Psychiatric Rating Scale (BPRS) was used to evaluate the effectiveness.

Results Two hundred and eighty adolescents (99 male/181 female) were included, accounting for 8.5% of the total 3306 patients. 87.1% patients (244/280) completed the surveillance. The average age was 16.0 (range: 9-17) years old

The initial dose of blonanserin was slightly lower for adolescents than that of the adults (mean±SD: 6.8±3.06 vs 7.2±2.61 mg/d, $p = 0.038$). The proportion of starting blonanserin with 4 mg bid, 4 mg qd, and 2 mg bid in adolescents is 55.4%, 24.6%, and 12.1%, respectively, while the corresponding figures for adults are 66.6%, 22.2%, and 5.5%. Like adults, a rising trend was observed in the daily dose of blonanserin from week 2/4 (10.1±3.72 mg/d) to week 12 (13.0±4.77 mg/d) in adolescents. Both adolescent and adult patients took their first dose adjustment about 9 days (8.8±9.71 vs 8.7±10.74 d, $p = 0.961$) after initiating blonanserin, to 11.2±3.64 and 11.9±3.61 mg/d, respectively.

One hundred and two ADRs occurred in 67 patients (23.9%, 67/280). Most ADRs were mild (71.6%, 73/102), no severe ADR occurred. Extrapyramidal symptoms (EPS) including akathisia (11.1%), tremor (6.8%), dystonia (4.6%), and parkinsonism (3.2%) were found as the most frequent ADRs. They usually occurred in the third week (14.4-16.1 d) after starting

blonanserin except dystonia, which had an average onset time of 8.9 d after initiating blonanserin. 1 case of ADR of prolactin elevation occurred during the surveillance. The mean weight gain was 0.4 ± 2.52 kg at week 12 from baseline.

Over 80% adolescents (81.1%, 198/244) had a reduction in BPRS total score $\geq 50\%$ after 12-week treatment of blonanserin, from 53.2 ± 15.38 at baseline to 29.4 ± 12.37 ($p < 0.001$), while those for adults are 66.3% and 48.4 ± 14.93 to 27.5 ± 9.82 ($p < 0.001$).

Conclusion The use of blonanserin in adolescents with schizophrenia in China is similar to that in adults, though a slightly lower initial dose can be seen in this analysis. Blonanserin can be well tolerated as most ADRs were mild and has a low propensity to cause weight gain and prolactin elevation, while it significantly improved the symptoms of schizophrenia. Blonanserin might be a reasonable treatment for Chinese adolescents with schizophrenia.

电休克与磁休克治疗青少年抑郁症的回顾性分析

王伟 陆艺 杨楹*

山东省精神卫生中心

目的 本研究旨在通过回顾性分析, 评估电休克治疗(ECT)和磁休克治疗(MST)在青少年抑郁症患者中的临床效果和耐受性。考虑到青少年抑郁症的高发性和对健康造成的严重影响, 以及传统药物治疗的局限性, 本研究力图为青少年抑郁症患者提供更有效的治疗方法, 并为临床实践提供准确的指导。

方法 研究收集了 2023 年 5 月至 2024 年 4 月在山东省精神卫生中心接受 ECT 或 MST 治疗的青少年抑郁或双相抑郁患者的数据。研究获得了医学伦理审查委员会的批准, 并在获取患者知情同意后, 从电子病历和纸质病历中提取所需数据。患者必须符合 ICD-10 关于抑郁症或双相情感障碍抑郁发作的诊断标准, 年龄在 13 至 18 岁之间。使用儿童抑

郁量表(CDI)、贝克抑郁自评量表(BDI)、蒙特利尔认知评估(MoCA)等工具在治疗前后进行评估。排除了因各种原因提前终止治疗、更改诊断或接受其他物理治疗的患者。药物治疗方案保持正常, 所有患者均签署了治疗同意书。

结果 共有 251 名患者符合条件, 经过数据清洗和筛选, 最终 208 名患者纳入主要分析。这些患者被分为 ECT 治疗组(147 例)和 MST 治疗组(61 例)。两组在治疗的有效性上没有显著差异($P > 0.05$), ECT 组和 MST 组达到反应的患者比例分别为 60.4% 和 56.2% ($P = 0.153$), 达到缓解的患者比例分别为 48.1% 和 39.0% ($P = 0.287$)。在耐受性方面, ECT 组和 MST 组的总不良事件率分别为 31.57% 和 20.51%, 大多数不良事件为轻度。两组均未见明显不良反应。在认知评估方面, 根据 MoCA 评分, 两组均未发现显著的认知功能受损。

结论 本研究结果显示, ECT 和 MST 治疗在青少年抑郁症患者中均表现出良好的疗效和耐受性, 且没有显著的副作用。尽管两组在治疗效果上没有显著差异, 但考虑到 MST 作为一种非侵入性治疗手段, 其在青少年患者中的耐受性可能更优。本研究为青少年抑郁症患者提供了治疗的新选择, 但未来仍需开展更多研究, 以进一步验证 MST 的长期效果和安全性, 为临床提供更加坚实的证据基础。

Heterogeneity of Psychiatric Symptoms and Quality of Life in Children: A Network Analysis Perspective

Wenyan Zhang Tianyuan Lei Yonghua Cui*

Beijing Children's Hospital, Capital Medical University

Objective The heterogeneity of symptoms of child psychiatric disorders has a complex relationship with quality of life. This study employs latent profile analysis (LPA) and network analysis to explore the patterns of relationships between symptom heterogeneity in child psychiatric disorders and quality of life (QoL)

Methods A total of 3,958 children meeting the inclusion criteria were analyzed. The symptoms of

Tourette syndrome (TS), obsessive-compulsive disorder (OCD), attention-deficit/hyperactivity disorder (ADHD), and oppositional defiant disorder (ODD), as well as quality of life associated with these disorders, were assessed separately. Initially, the study employed the LPA approach to classify individuals into different latent subgroups (profiles) based on symptom levels. Subsequently, for each profile, network analysis was performed to construct network structures of symptom levels and quality of life, with the goal of identifying central and bridge symptoms within the network structure

Results Heterogeneity in the symptoms of child psychiatric disorders was identified, resulting in three latent subgroups: profile 1: low (TS, OCD) + low (ADHD, ODD), profile 2: moderate (TS, OCD) + high (ADHD, ODD), and profile 3: high (TS, OCD) + moderate (ADHD, ODD). Network analyses revealed “psychological” QoL and “Inattentive symptoms” as central and bridge symptoms across all profiles. Unique central symptoms related to quality of life were found in “physical and activities of daily living” QoL for profile 1, “family” QoL for profile 2, and “School and learning” QoL for profile 3

Conclusion The common central and bridge symptoms across all profiles are key targets for treatment, while the unique central and bridge symptoms within each profile are targets for personalized interventions.

跨诊断治疗统一方案(UP-A)对青少年情绪障碍个体和家庭的多维度短期及长期疗效研究

潘美蓉¹ 潘美蓉² 刘雪滢^{1,2} 高雪^{1,2} 符仲芳³ 刘璐^{1,2} 李海梅^{1,2} 王玉凤^{1,2} 钱秋谨^{1,2}

1.北京大学第六医院, 北京大学精神卫生研究所, 北京 100191

2.国家卫生健康委员会精神卫生学重点实验室(北京大学), 国家精神心理疾病临床医学研究中心(北

京大学第六医院), 北京 100191

3.北京市海淀区颐和园路5号, 北京大学心理与认知科学学院, 行为与心理健康北京市重点实验室

目的 情绪障碍在青少年中患病率高、共病率高、社会功能受损显著, 亟需得到有效干预, 但在国内尚缺乏高效便捷、可及性强的治疗方案; 基于跨诊断视角进行干预有望弥补这一不足, 其中青少年情绪障碍跨诊断治疗统一方案(UP-A)的疗效循证依据较为充分。本研究将初步探讨本土化 UP-A 在国内的适用性, 及其对青少年情绪障碍个体及其家庭的在短期及长期随访时的多维度影响。

方法 研究为自身前后对照研究, 纳入 24 名青少年情绪障碍患者及其家长, 对其开展团体 UP-A 治疗。治疗共 12 周, 每周 1 次, 每次 2 小时, 治疗师团队分别教授青少年及其家长情绪调节技能, 并教授家长科学教养方式。研究收集其治疗满意度及评价, 并分别在治疗前、治疗结束及治疗结束后 3 个月进行评估, 分别评估患者的疾病严重程度(CGI-S)、治疗疗效(CGI-I)、焦虑抑郁水平(DSRSC 及 SCARED)、情绪调节能力(CERQ-Ck 及 ERC)、心理韧性(RSCA、CD-RISC-10)、生活质量(PedsQLTM4.0)、社会功能(CGAS)以及家庭功能(FAD), 并在治疗结束后 1 年随访时对患者的疾病严重程度、临床疗效及社会功能进行评估。采用混合线性模型评估患者在不同评估时间点上述临床结局指标的变化。

结果 24 名青少年患者(14.1±1.2 岁)中以抑郁障碍为主要诊断(75.0%), 22(91.7%)名患者存在 1 种及以上的共病。在适用性方面, 患者及其家长完成度及参与程度均较高(青少年 10.2±1.6 次, 家长 10.7±2.0 次), 且呈现良好满意度(>7.5/10 分)。在疗效方面, 临床医生评定患者的 CGI-S 得分在治疗后显著下降($g = -1.298$), 并在 3 个月($g = -1.341$)及 1 年随访($g = -1.583$)中维持疗效。在完成 UP-A 治疗的青少年患者中, 约 55.0%、72.2% 及 80.0% 的患者分别在治疗结束、3 个月及 1 年随访中症状显著改善(CGI-I ≤ 2 分)。结合青少年、家长及医生评定结果提示, 患者焦虑抑郁情绪显著降低, 情绪调节能力、心理韧性、生活质量、社会功能及各维度家庭功能均在治疗中即显著改善, 并可持续至 3 个月随访时; 且 1 年随访时患者的社会功能继续维持显著改善(效应量均为中至高等)。

结论 本土化 UP-A 在我国青少年情绪障碍患

者及其家庭中适用性良好, 多维度评估初步验证其短期及持续 1 年的长期疗效: UP-A 可显著改善青少年患者的疾病严重程度、焦虑抑郁情绪及情绪调节能力、心理韧性、生活质量及社会功能水平, 同时也带来多维度家庭功能积极改善。本土化 UP-A 为青少年情绪障碍群体提供了科学性高、普及性高、便捷有效的治疗方法。

The Safety and Effectiveness of Lurasidone in The Treatment of Chinese Adolescent Patients with Schizophrenia: Data From A 12-week Post-marketing Surveillance

Yifeng Shen¹, Yumei Wei¹, Qi Wu²

1.The Institution of Clinical Trials on Drugs, Shanghai Mental Health Center, P.R.China

2.Sumitomo Pharma (Suzhou) Co., Ltd.

Objective To evaluate the safety and effectiveness of lurasidone for schizophrenia in adolescents in China

Methods A multi-center, prospective, open-label, 12-week surveillance was conducted in Chinese Mainland. All patients with schizophrenia who begin to receive lurasidone in 10 hospitals across China from September 2019 to August 2022 were eligible to take part. Safety assessments included adverse events (AEs), adverse drug reactions (ADRs), extrapyramidal symptoms (EPS), akathisia, weight gain. The effectiveness was evaluated by the Brief Psychiatric Rating Scale (BPRS) from baseline by the end of treatment. Patients in this analysis were stratified by age

Results 3718 patients were included in the safety set (SS) in this 12-week surveillance, with an age range of 10 to 81 years old. Among them, 210 patients with schizophrenia aged < 18 years were included in the safety set (SS). AEs and ADRs were developed in 21 patients (10.0%) and 17 patients (8.1%) respectively and mostly are mild. ADRs of EPS occurred in 3 pa-

tients with the incidence being 1.4%, including akathisia occurred in 1 patient with the incidence being 0.5%. The mean weight change was 0.05 ± 2.256 kg (mean \pm SD, $P=0.778$) and 3 patients (1.4%) gained weight $\geq 7\%$ at week 12 from the baseline. The mean changes in total BPRS scores were -9.4 ± 9.16 ($N=191$), -15.4 ± 12.04 ($N=192$) and -20.3 ± 13.45 ($N=192$) after 2/4, 6/8, and 12 weeks, respectively ($P<0.001$ for each visit compared with the baseline)

Conclusion Lurasidone was well tolerated and effective in the treatment of schizophrenia in Chinese adolescent patients in real-world clinical practice. Lurasidone might be a reasonable choice for the treatment of schizophrenia in adolescent patients.

青少年生活事件对其生活质量水平的影响: 失眠障碍和抑郁障碍的链式中介效应

张旭 刘宸忠*

安徽医科大学附属巢湖医院

目的 探讨青少年生活事件对其生活质量水平的影响, 以及失眠障碍和抑郁障碍在其中的中介机制。

方法 使用青少年生活事件量表 (ASLEC) 评估青少年遭遇不幸生活事件对其产生影响的严重程度、失眠严重程度指数量表 (ISI) 评估青少年是否有失眠症状及其失眠症状的严重程度、流行病学研究中心抑郁量表 (CES-D) 评估青少年是否有抑郁症状及其抑郁症状的严重程度、世界卫生组织生活质量问卷简表 (WHOQOL-BREF) 评估青少年生活质量的水平。从安徽医科大学附属巢湖医院精神科门诊患者中, 根据纳入标准: 1) 符合 DSM-5 中抑郁障碍的诊断标准; 2) 年龄 18 岁及以下; 3) 获得受试者或法定监护人的书面知情同意。以及排除标准: 1) 合并严重躯体疾病 (如心血管、肝、肾、胃肠道疾病等)、感染性疾病及免疫系统疾病患者; 2) 严重神经系统疾病、精神发育迟滞的患者; 3) 无法配合进行测评或不合作者。最终纳入 374 名青少年并对其进行调查。采用 IBM SPSS Statistics 26 软件,

建立生活事件(X)-失眠障碍(M1)-抑郁障碍(M2)-生活质量水平(Y)的链式中介模型,并对其数据进行分析。

结果 生活事件(X)包含5个因子,每个因子均建立中介模型进行分析。每个因子的模型中:X-Y的总效应及直接效应的95%置信区间均不包含0,而间接效应中:ind1路径的95%置信区间均包含0,ind2及ind3路径均不包含0。

结论 青少年遭遇不幸生活事件可以显著影响其生活质量水平下降,生活事件可以通过影响青少年失眠症状从而影响青少年抑郁症状最终导致生活质量水平的下降,或者通过直接影响青少年抑郁症状最终导致生活质量水平的下降,但似乎不能通过直接影响青少年失眠症状从而导致其生活质量水平的下降。

Correlation of Non-suicidal Self-injury with Childhood Maltreatment and Inflammatory Cytokines in Adolescents with Major Depressive Disorder

Haojie Fan Lewei Liu Qingqing Shen Mingru Hao Xin Zhao Yunxiao Liu Yingao Cui Yinghan Tian Cheng Yang Lei Xia Huanzhong Liu*
Chaohu Hospital of Anhui Medical University

Objective Major depressive disorder (MDD) is a common mental illness in adolescents, and non-suicidal self-injury (NSSI) is one of its characteristics. There is growing evidence that depressed adolescents with NSSI tend to have poor treatment outcomes, a poor prognosis, and frequent relapses. NSSI has been linked to childhood maltreatment (CM) and inflammatory cytokines, however, this link has not been adequately explored in adolescents with MDD. This study aimed to investigate the association between NSSI and CM and inflammatory cytokines in adolescents with MDD

Methods A total of 152 adolescents with MDD were included in the study and were categorized into NSSI (n=97) and non-NSSI (n=55) groups according to

the relevant DSM-5 criteria. The Centre for Epidemiological Studies Depression Scale (CES-D) and the Childhood Trauma Questionnaire (CTQ) were used to assess depressive symptoms and childhood maltreatment, respectively. In addition, plasma levels of interleukin (IL)-1 β , IL-6, IL-10, IL-17A and tumor necrosis factor- α (TNF- α) were measured

Results Compared with the MDD without NSSI, the patients with NSSI had higher scores of CES-D, and CTQ as well as five subscales, including emotional abuse, physical abuse, sexual abuse, emotional neglect, and physical neglect (all $p < 0.05$). In addition, IL-1 β and TNF- α levels were higher in MDD with NSSI (both $p < 0.05$) and remained statistically different after adding age, gender, CTQ, and CES-D scores as covariates in the ANOVA. Further binary logistic regression analyses showed that both IL-1 β (model 1:OR=6.862, 95%CI: 2.06~22.856, $P < 0.05$; model 2:OR=6.256, 95%CI: 1.861~21.032, $P < 0.05$) and childhood maltreatment (model 1, CTQ score:OR=1.054, 95%CI: 1.022~1.086, $P < 0.05$; model 2, Emotional abuse score:OR=1.117, 95%CI: 1.021~1.222, $P < 0.05$) were risk factors for NSSI in adolescents with MDD. Finally, the receiver operating characteristic (ROC) analyses showed that the regression models performed well with area under the curve (AUC) values of 0.764(model 1) and 0.78(model 2), respectively

Conclusion NSSI is common in adolescents with MDD and associated with childhood maltreatment and elevated levels of inflammatory cytokines. The findings suggest that childhood trauma and inflammatory cytokines may be related to the pathogenesis of NSSI in adolescents with MDD, but further longitudinal studies are needed to explore the causal relationship between NSSI and inflammatory cytokines in patients with MDD.

Characterizing The Efficacy and Predictive Neural Markers of Add-on Robot-Aided

Transcranial Magnetic Stimulation on The Pain Cognition in Adolescents with Depression

Dan Qiao Yiran Li Yujiao Wen Gaizhi Li Chunxia Yang Zhifen Liu*

the First Hospital of Shanxi Medical University

Objective The pain catastrophizing and vigilance are typical manifestations of the negative cognition of pain. Oftentimes, adolescent patients with depression complain of fear of pain that negatively impact their life, and such problems are not alleviated by current first-line treatments. Converging evidence suggests this symptom is due in part to the altered function of dorsolateral prefrontal cortex (DLPFC). The current study examined the therapeutic effect and predictive neural markers of targeting DLPFC on the level of pain catastrophizing and vigilance in adolescents with MDD by add-on Robot-Aided Transcranial Magnetic Stimulation (TMS)

Methods Here, we conducted a retrospective study using clinical and neuroimaging data of 60 adolescents with depression and 65 healthy controls during period of 2020-2022. Of these patients, 30 underwent Robot-Aided TMS combined with sertraline (add-on TMS group), while the others only received setraline (Sertraline group). We first compared functional connectivity (FC) of DLPFC between patients with depression and controls, and indentified abnormal FC associated with pain cognition. Then we explored the efficacy of add-on Robot-Aided TMS on pain cognition. Clinical response to treatment was determined using the Pain Catastrophizing Scale (PCS) and Pain Vigilance and Awareness Questionnaire (PVAQ), and the primary efficacy was the change in score from baseline to post-treatment assessment. Additional measures were score changes after another 8 month of follow-up. Finally, we performed regression analysis to evaluate the contributing effect of FC of DLPFC in predicting the clinical response to Robot-Aided TMS

Results Compared with healthy controls, patients with depression showed increase FC between

left DLPFC and bilateral pars triangularis and right supramarginal gyrus, also with increase FC between right DLPFC and left putamen and right supramarginal gyrus. The add-on TMS group displayed a significant decreased score on the PCS, the rumination subscale of PCS, and PVAQ after the intervention, compared to that in the Sertraline group. Also, a mixed-effects repeated-measures model revealed significant improvement in scores on the PCS, the rumination subscale of PCS, and PVAQ during the post-intervention and follow-up periods in the add-on TMS group. FC between left DLPFC and left pars triangularis can predicted the development of pain vigilance and magnification, while FC between right DLPFC and left putamen can predicted the change of pain catastrophizing, especially the rumination and magnification

Conclusion Add-on Robot-Aided TMS over the DLPFC significantly improved the pain cognition and the functional connectivity patterns of DLPFC can predict such efficacy. Further studies are warranted concerning sham-controlled Robot-Aided TMS studies for promoting pain cognition in adolescent patients with depression.

关键词: adolescent depression, pain, DLPFC, add-on Robot-Aided Transcranial Magnetic Stimulation

“院-校-家-社”中小学生学习心理健康服务模式在重庆市的应用

张琪 况利*

重庆医科大学附属第一医院

目的 儿童和青少年是心理健康发展的关键时期,也是心理障碍发生的高危时期。本文描述了一种学生心理健康服务模式,该模式将医院/三级护理、学校、社区和家庭联系起来,使不同角色的个人能够共同努力促进青少年心理健康。虽然此部分,全国各地均有实践,但尚未有清晰明了,可执行可细致联动多部分的合理举措及意见。

方法 根据加拿大、北美等地的经验,根据重庆市实际情况,引入了一种“通过照料的途径”模式,旨在促进青年的心理健康,早期识别有风险的青年,

将他们转介到适当的卫生护理机构,并提供持续的支持。这是通过一般筛查、访谈和不同层面的干预策略等方法实现的,包括对学生、教育工作者和家长的心理健康促进和培训。此外,该模式整合了教育和卫生系统内的资源,确定了学校、家庭和高等教育在各个实施阶段的作用,根据职能划分,确定每个关键部门的责任和实质工作内容,打通医院-学校-家庭-社区之间的壁垒,促成一条顺畅转介的绿色通道。此外,我们通过案例描述了各种利益相关者在改善青少年心理健康和减少学生自杀和自伤发生率方面的基本作用。

结果 通过四年的实践,从学生自杀预防和学生自杀率均有超 50% 下降。

结论 由此可见,多维度、多部门的密切联动模式,能有效降低学生自杀率。

关键词: 中小学、学生心理健康、预防模式

虚拟现实技术干预孤独谱系障碍儿童青少年适应性能力的效果及多模态核磁共振成像研究

闫文洁¹ 翟天妤¹ 杜亚松¹ 李焱¹ 江文庆¹ 林裕雄¹ 张喜燕²

1.上海交通大学医学院附属精神卫生中心
2.同济大学附属精神卫生中心

目的 孤独谱系障碍(Autism Spectrum Disorder, ASD)儿童青少年存在适应性能力缺陷,对成人期预后后有负面影响。本研究旨在探究虚拟现实(Virtual Reality, VR)技术干预孤独谱系障碍儿童青少年适应性能力的效果及脑机制。

方法 ①入排标准: 年龄 8-18 岁、经 DSM-5 及孤独症诊断访谈-修订版(ADI-R)诊断为 ASD、总智商 ≥ 50 、右利手、能够配合完成评估及干预、排除其他不适合干预的疾病。②VR 干预: 包括地下轨道交通、超市购物、家庭、游乐场 4 个场景,共 36 个与适应性能力相关的任务,所有被试均需完成 2 遍训练任务;每周训练 1 次,每次 1 小时,根据被试的完成速度,训练次数约为 6-10 次。③评估方法: 通过比较干预前后的 ADI-R 访谈、适应行为评定量表-第二版(ABAS-II)、执行功能评定量表-学龄版(BRIEF-SR)和多模态核磁共振成像结果,评估 ASD

儿童的临床表现及脑影像特征的变化。

结果 ①一般情况: 共招募 25 名 ASD 儿童青少年,其中 3 名分别因为内容简单、抽动症状严重、请假次数过多退出,22 名完成 VR 干预,男女比例为 2.67:1,年龄为 13.82 ± 2.94 岁,总智商为 98.05 ± 20.85 ,总适应能力为 83.64 ± 14.43 。②行为学评估: 主要结局指标 ABAS-II 中的一般适应综合分数较干预前显著增长了 3.88 分 ($p=0.005$),概念技能维度显著增长了 3.67 ($P=0.034$),社会技能及实用技能维度分数有增长趋势,但差值不显著;ADI-R 的三个维度——语言交流、社交互动及重复刻板局限的兴趣与行为的分数分别降低了 2.06 ($p<0.000$)、2.20 ($p=0.002$)、1.30 ($p=0.006$),均较干预前显著改善;BRIEF-SR 及行为管理指数、元认知指数两个分维度的得分分别降低了 5.29 ($p=0.042$)、5.29 ($p=0.010$)、5.59 ($p=0.013$),均较干预前显著改善。③以执行控制网络核心脑区为种子点的全脑功能连接: 以先前研究定义的执行控制网络的核心脑区(双侧背外侧前额叶、双侧后顶叶皮质)为种子点,进行基于种子点的功能连接的分析,右侧背外侧前额叶脑区与右侧中央前回的团块(体素大小 58,坐标 +36 -10 +56)的功能连接存在显著增强,其余三个种子点的功能连接未见显著变化。

结论 VR 干预可以有效提升 ASD 儿童青少年的适应性能力,尤其是概念技能方面,同时也可改善其核心症状及执行功能。干预效果可以从照养人访谈、问卷、儿童脑功能等多个维度体现。

Csnk2A1 基因 DNA 甲基化在青春期抑郁样行为小鼠中的表达及作用研究

廖婧¹ 张晨钰² 姜汝红¹ 向娇娇² 王小兰¹ 李静然¹ 周杨¹ 陶婉卿¹ 刘佳¹ 冉柳毅¹ 况利²

1.重庆医科大学附属大学城医院
2.重庆医科大学附属第一医院

目的 观察 Csnk2A1 基因 DNA 甲基化在 CSDS 青春期抑郁小鼠海马组织中的表达和探索 Csnk2A1 基因对小鼠抑郁样行为、分子病理学的影响。

方法 构建 CSDS 抑郁小鼠模型, 评估小鼠抑郁样行为; 对海马组织进行 MethylTarget® 目标区域甲基化测序, 采用 qRT-PCR 检测脑组织 Csnk2A1 的 mRNA 表达水平。海马脑立体定位注射 Csnk2A1 敲低腺相关病毒, 检测海马组织 Csnk2A1 基因和凋亡相关蛋白表达水平, 尼氏染色观察海马区神经元改变。

结果 (1) CSDS 组小鼠的社会交互比、糖水偏好百分比显著下降, 悬尾静止不动时间显著增加 ($P<0.05$)。 (2) CSDS 组海马组织的 Csnk2A1_451 DNA 甲基化水平显著降低, Csnk2A1 的 mRNA 表达水平显著升高 ($P<0.05$)。 (3) 海马立体定位注射 Csnk2A1 敲低腺相关病毒, 发现 CSDS 组、AAV-NC+CSDS 组小鼠的社会交互比和糖水偏好百分比显著下降, 而悬尾静止不动时间显著增加; AAV-Csnk2A1+CSDS 组小鼠的社会交互比和糖水偏好百分比显著升高, 而悬尾静止不动时间显著降低 ($P<0.05$)。 (4) CSDS 组、AAV-NC+CSDS 组海马组织 Bax 蛋白表达水平、Bax/Bcl-2 显著升高, Bcl-2 蛋白表达显著降低; AAV-Csnk2A1+CSDS 组 Bax 蛋白表达水平、Bax/Bcl-2 显著减少, Bcl-2 表达显著增加 ($P<0.05$)。 (5) Control 组海马区神经元细胞形态规则, 细胞核明显; CSDS 组、AAV-NC+CSDS 组海马区神经元细胞形态不规则, 细胞核不清晰; AAV-Csnk2A1+CSDS 组海马区神经元细胞排列较整齐, 核较清晰。CSDS 组、AAV-NC+CSDS 组 CA1、CA3 和 DG 区阳性细胞数量明显减少, AAV-Csnk2A1+CSDS 组 CA3、DG 区阳性细胞数量显著增加 ($P<0.05$)。

结论 (1) CSDS 可诱导青春期小鼠出现社交回避、快感缺失和绝望等抑郁样行为。 (2) CSDS 小鼠海马组织 Csnk2A1_451 DNA 甲基化影响其基因表达水平。 (3) 敲低 Csnk2A1 基因能改善抑郁小鼠的社会交互比、糖水偏好百分比和减少悬尾静止不动时间, 从而缓解小鼠的抑郁样行为, 影响海马组织凋亡相关蛋白表达水平, 改善海马区的神经元细胞受损情况和增加尼氏阳性细胞数量。 (4) Csnk2A1 基因可能通过改变海马神经元细胞凋亡从而发挥一定的抗抑郁作用, 但具体机制不清。

药物联合经颅交流电刺激治疗对青少年抑郁障碍的疗效研究

程丹丹 况利*

重庆医科大学附属第一医院

目的 探究药物联合经颅交流电刺激 (Transcranial Alternating Current Stimulation, tACS) 治疗对于青少年抑郁障碍患者的抗抑郁疗效和安全性。

方法 选择了 2023 年 11 月-2024 年 3 月在重庆医科大学附属第一医院精神科门诊、住院病房的 19 名患者, 最终 17 名患者完成了 20 次 tACS 治疗。采用频率为 77.5 Hz, 强度为 15 mA 的经颅交流电刺激以其, 治疗部位为前额部、双侧乳突部。采取一般人口学问卷、抑郁症状自评量表 (PHQ-9)、广泛性焦虑量表 (GAD-7)、汉密尔顿抑郁量表 (HAMD-24)、汉密尔顿焦虑量表 (HAMA)、Beck 自杀意念量表 (BSSI)、不良反应问卷等, 在基线、第 1 周、第 2 周、治疗结束后 2 周对患者的进行临床症状评估。

结果 对不同时间数据使用重复测量方差分析。在第 2 周即治疗完成时患者 PHQ-9、GAD-7、HAMD-24、HAMA、自杀意念、自杀倾向总评分均显著低于基线 ($p<0.05$), 具有统计学差异。随着 tACS 治疗结束, 在随访 2 周即第 4 周时, 量表评分均有一定的升高, 但仍低于基线值, 具有统计学差异。患者第 1 周、第 2 周、第 4 周 HAMD-24 减分率分别为 $41.41\% \pm 11.01\%$ 、 $66.85\% \pm 14.47\%$ 、 $61.41\% \pm 24.95\%$ 。

结论 药物联合经颅交流电刺激治疗对于青少年是安全的, 或许可作为青少年抑郁障碍的非侵入性神经调控的一项新方案, 需要未来进一步去验证。

DNA 甲基化与抑郁症的相关研究进展

唐伟杰¹ 黄兴东¹ 廖婧²

1. 重庆市第十一人民医院

2. 重庆医科大学附属大学城医院

目的 青少年 MDD 发病机制尚不清楚, 由于

其临床诊断依赖于专业医生对患者的症状评估和相关量表, 缺乏客观的生物标志物, 抗抑郁治疗效果不佳, 是临床上的重大难题。随着表观遗传学与精神疾病的相关研究发展, DNA 甲基化状态可能对临床诊断和治疗效果有影响, 可作为精神疾病的潜在表观遗传生物标志物。本文将对 BDNF、SLC6A4 和 NR3C1 基因 DNA 甲基化和与 MDD 的相关研究成果, 和抑郁动物模型脑组织 DNA 甲基化的研究结果, 以及组织异质性对 DNA 甲基化研究结果的影响进行综述。

方法 在中国知网、PubMed 数据库, 以“DNA 甲基化”、“抑郁症”、“DNA methylation”、“Depression”、“MDD”为关键字进行中英文文献检索, 阅读并总结相关研究结果。

结果 (1) BDNF、SLC6A4、NR3C1 这三个基因的甲基化目前被认为是 MDD 的可能潜在生物标记物, 此外 FK506 结合蛋白 5 (FKBP5)、纺锤体和着丝粒相关复合物 (SKA2)、催产素受体 (OXTR) 这些基因甲基化也被报道与 MDD 的诊断相关。这些临床研究大多未得出统一的结论。虽然 DNA 甲基化在抗抑郁治疗的研究中发现可能有着重要作用, 但由于地区人群的选择不同、药物种类及疗程不同, 疾病的亚型不同, 未来对抗抑郁药物反应的研究应该涵盖所有不同的治疗阶段, 因为 DNA 甲基化水平可能会在治疗期间发生改变。

(2) 抑郁动物模型的脑组织 DNA 甲基化水平相关研究, 为理解 MDD 的发生发展和大脑神经生物学的变化提供了许多研究数据。尽管目前在应激条件对啮齿动物的表观遗传机制研究较多, 但由于模型的差异、大脑脑区的不同, 且表观遗传随着环境可能会出现动态变化, 导致暂无一致的研究结果。未来不仅需要考虑临床和动物研究相结合, 同样需要考虑不同动物模型之间与所模拟的临床疾病的相关性。

(3) 当前关于 DNA 甲基化与 MDD 的研究生物样本以血液、脑组织、唾液等为主, 由于 MDD 这一疾病的特殊性, 人脑组织样本取材特殊, 以外周样本为临床研究材料较多。但是在未来的研究中, 选择研究样本时需要考虑组织差异性、所检测的基因等因素来选择外周样本, 以便发现监测疾病发生、发展的精准在体生物学标记。此外, 外周样本和大脑之间差异甲基化变化背后的机制未来仍有待探索。

结论 目前关于 DNA 甲基化与 MDD 的相关性研究较多, 但均未得出一致的结果, 未来需多角

度综合考虑研究设计以便更全面的深入其机制研究, 探讨这些基因 DNA 甲基化的变化如何引起行为和分子效应。

Broad Autism Phenotype Traits and Executive Function of Parents of children with Autism Spectrum Disorder

Zhijia Li^{1,2} Xiaoyan Ke¹ Shengjian Yin¹ Hui Fang¹ Lu Qian² Yonglou Wang¹ Luyang Guan¹

1.Child Mental Health Research Center, The Affiliated Brain Hospital of Nanjing Medical University

2.WuXi mental health center,Nanjing Medical University

Objective Previous studies have provided evidence for the important role of genetics in autism spectrum disorder (ASD) and whether this trait or symptom has a large impact on the executive functioning of ASD children's parents. The aim of our study is to investigate the distribution of the broad autism phenotype characteristics of ASD children's parents, and the impact of their executive function

Method The Broad Autism Phenotype Questionnaire (BAPQ) was used to assess the broad autism phenotype traits in parents of children with autism and parents of healthy children. A total of 427 parents with ASD child and 405 parents of typically developing children were recruited for this study. Among them 20 of the high-BAP ASD parents and 20 of the low-BAP healthy parents completed executive function tests. The researchers utilized the flanker, 2-back, and MOS psychological paradigms to examine their executive function, including inhibitory control, working memory, and task-switching abilities

Result The findings from the self-reported questionnaires revealed that BAPQ self-reported scores in parents of individuals with ASD were significantly higher compared to healthy control parents. Specifically, the self-reported scores of fathers of individuals with

ASD (41.21% VS 15%, $\chi^2=31.628$, $p<0.01$) and mothers of individuals with ASD (26.25% VS 8.37%, $\chi^2=25.764$, $p<0.01$) were elevated compared to healthy control parents. While the scores of mothers of individuals with ASD were higher than healthy control mothers (41.46% VS 23.5%, $\chi^2=11.628$, $p<0.01$), the scores of fathers of individuals with ASD did not show statistical significance compared to healthy control fathers (17.56% VS 13.22%, $\chi^2=1.571$, $p=0.21$). In terms of specific factors, fathers of individuals with ASD self-reported higher scores in Aloofness compared to healthy control fathers, although this difference was not statistically significant (15.15% VS 15%, $\chi^2=0.002$, $p=0.968$). Other factors, however, showed higher scores in fathers of individuals with ASD compared to healthy control fathers. On the other hand, mothers of individuals with ASD reported higher scores in three factors compared to healthy control mothers, with significantly higher ratings in Pragmatic Language (30.3% VS 15.5, $p<0.05$; $\chi^2=11.474$, $p=0.001$) and Aloofness (44.39% VS 32.16%, $\chi^2=6.843$, $p=0.009$) than healthy control mothers. Regarding executive function, parents of individuals with ASD who exhibited high BAP traits displayed worse accuracy in the 2-Back task compared to healthy controls (0.947±0.037 VS 0.983±0.016, $t=16.875$, $p<0.01$), along with significantly slower reaction times in the odd and even tasks of the MOS task (604.35±150.28 VS 593.90±87.52, $t=16.875$, $p<0.01$). The reaction time for the Flanker task was slower in the high BAP group compared to healthy controls (528.95±78.90 VS 426.80±18.40, $t=15.639$, $p<0.01$), whereas the 2-Back reaction time was faster in the high BAP group compared to healthy controls (515.10±76.94 VS 674.25±140.06, $t=15.639$, $p<0.01$). Additionally, the response time in the MOS task was slower in the high BAP group compared to healthy controls (884.25±454.37 VS 656.90±123.44, $t=12.079$, $p=0.042$).

Conclusion The study concludes that parents of individuals with ASD exhibit higher BAP traits compared to healthy control parents, with discrepancies between self-evaluation and external evaluation. ASD fathers perceive themselves to have more pragmatic and cognitive inflexibility issues compared to healthy fa-

thers, while ASD mothers view themselves as experiencing more apathy, pragmatic language difficulties, and cognitive inflexibility compared to healthy mothers. Furthermore, ASD mothers perceive the cognitive function of fathers with more indifference than healthy control fathers, highlighting poorer pragmatic skills in the cognition of mothers compared to healthy mothers. The accuracy in the 2-Back task was found to be worse in the high BAP group compared to healthy controls, with faster reaction times observed in the high BAP group. The study also noted slower task performance in simple task-switching tasks for individuals with high BAP traits compared to healthy subjects, with no notable differences in more challenging tasks.

电休克治疗对青少年重度抑郁症患者炎症因子水平及抑郁症状的影响

杜宁² 王余娜¹ 耿丹丹¹ 徐何雁¹ 陈羽佳² 况利^{1,2}
1.重庆医科大学附属第一医院
2.重庆医科大学附属大学城医院

目的 本研究旨在调查ECT对青少年重度抑郁症患者炎症因子的影响。我们调查了患有重度抑郁症的青少年(13-18岁),以探讨ECT在改善细胞炎症因子水平和抑郁症状方面的有效性。

方法 在这研究中,共有38名青少年重度抑郁症患者接受了抗抑郁药物治疗配合6-8轮ECT治疗,治疗周期为2周。另有29名正常同龄人作为对照组。MDD组分别在基线和治疗后8周进行采集血样检测血清中炎症因子水平和临床资料评定(17项汉密尔顿抑郁量表(17-items Hamilton Depression Scale, HAMD-17))研究评估了治疗前后患者的抑郁症状和炎症因子水平(IL-1 β 、IL-6、IL-10)。

结果 ECT治疗后,促炎细胞因子(IL-1 β 和IL-6)显著减少,抗炎细胞因子(IL-10)增加。应答者的HAMD-17评分显著降低,强调了ECT的治疗潜力。对ECT无应答者和应答者进行比较分析,发现治疗后炎症因子水平的变化与临床改善显著相关,表明炎症状态的变化能够预测治疗反应。此外,抑

郁症状的减轻与 ECT 后 IL-1 β 和 IL-6 水平的降低存在中度正相关, 强调了 MDD 的复杂性和 ECT 的多方面作用。

结论 我们的研究发现, 虽然基线时的炎症因子水平并不能预测 ECT 的治疗反应, 但治疗后的炎症因子水平与临床改善显著相关。进一步证实了 ECT 在治疗青少年重度抑郁症中的有效性, 并揭示了炎症因子在治疗反应中的重要性。

番茄红素通过改善突触可塑性损伤逆转抑郁模型小鼠的抑郁样行为

徐何雁¹ 徐何雁² 况利^{1,2} 王余娜^{1,2} 耿丹丹^{1,2} 陈羽佳^{1,2} 石磊^{1,2} 杜宁^{2,3}

1. 重庆医科大学附属第一医院
2. 重庆医科大学附属第一医院精神医学中心
3. 重庆医科大学附属大学城医院

目的 抑郁症是一种严重的精神疾病, 长期慢性的不良应激可能会增加患抑郁和自杀的风险, 而目前临床常规使用的抗抑郁药如氟西汀大多因疗效低或难以忍受的副作用而效果不佳。番茄红素是一种天然存在的植物色素, 已被证明其有潜在的抗抑郁作用, 但其发挥抗抑郁作用的机制还未阐明, 本研究旨在探索番茄红素的抗抑郁机制。

方法 6-8w C57BL/6J 小鼠 45 只随机分为对照+溶剂组、模型组+番茄红素 (20mg/kg) 组、模型+溶剂组, 每组 15 只。采用经典的 CSDS (Chronic social defeated stress) 模型, 行为学包括糖水偏好试验、悬尾试验、旷场试验、社会交互试验。Western blotting 检测小鼠海马突触相关蛋白 (PSD-95, Syn) 及 BDNF、Trkb 的蛋白表达, qRT-PCR 检测突触相关蛋白及 BDNF、Trkb 的基因表达, 通过尼氏染色分析各组之间的神经元损伤情况。

结果 模型小鼠表现出抑郁样行为, 经番茄红素治疗后的小鼠抑郁行为显著改善。模型小鼠海马突触相关蛋白及 BDNF、Trkb 的基因和蛋白表达水平下降, 而番茄红素可以上调突触相关蛋白及 BDNF、Trkb 的表达。尼氏染色显示模型组小鼠海马神经元损伤, 番茄红素组损伤显著降低。

结论 番茄红素可以通过 BDNF-Trkb 通路改善

突触可塑性, 从而发挥抗抑郁作用。相较于临床常用的氟西汀等抗抑郁药物, 番茄红素具有无毒副作用等优点, 患者的接受性更强, 尤其是儿童青少年患者; 再者番茄红素通过改善突触可塑性发挥抗抑郁作用, 或许可以作为氟西汀等 SSRI 类药物的辅助治疗, 但其合用疗效还有待进一步研究。

4. 贵州中医药大学第二附属医院

目的 抑郁症已成为全球性的公共卫生问题。据 WHO 估计, 全球有超过 3 亿人患有抑郁症, 且患病率逐年上升。传统抑郁症筛查方法, 如临床访谈和心理测量, 存在效率低、成本高、主观性强等局限。随着社交媒体的广泛应用, 用户在网络平台上表达情感的文本数据为抑郁症识别提供了新的思路和数据来源。研究表明, 抑郁症患者在社交媒体上的言语模式与健康人群存在显著差异。通过利用自然语言处理技术和机器学习算法, 尤其是 BERT (Bidirectional Encoder Representations from Transformers) 深度学习模型, 可从海量社交媒体文本数据中自动识别抑郁症患者, 为及时干预和治疗提供支持。

方法 首先, 本研究使用爬虫技术对征得同意的 10 位抑郁患者和 101 位健康者的微博进行爬取, 对数据清洗后, 有效文本数据超过 2000 条。其次, 使用词频分析、词云图、词共现网络分析等大数据文本分析方法和 LDA 主题模型 (Latent Dirichlet Allocation) 机器学习方法, 对微博文本数据进行系统的分析, 探索网络空间中抑郁与非抑郁者的情感表达差异、情绪文本特点和主题维度等。最后, 采用 DF-IDF 方法对文本进行特征转化, 并采用 BERT 深度学习算法对预处理好的文本进行训练, 以实现基

于社交文本的抑郁症识别。

结果 词频和词云分析结果显示抑郁组的前 5 个高频词为不快乐、抑郁、不开心、时间、生日，非抑郁组为第一、快乐、中国、时间、生活；词共现网络分析能正确发现词与词之间的共现关系；LDA 主题模型的机器学习方法发现并提取了 5 个较正确的主题 (K=5)。抑郁组的主题包括内心害怕与寻求安慰的冲突、面对改变时情绪低落与自我贬低、与物质世界的联系和价值、关注历史和影娱、反刍式关注文学艺术；健康组的主题包括关注国家大事、良好的社会支持和健康的生活方式、关注未来、积极的态度、关注美食，两组的社交媒体文本特征存在显著的差异。最后，BERT 深度学习模型对抑郁与非抑郁的分类准确率、特异度、灵敏度和 AUC 分别为 80.49%、80.95%、80%、0.80，模型性能良好，BERT 模型在基于社交媒体文本数据的抑郁症识别上具有良好的泛化能力。

结论 基于大数据的文本分析能准确发现抑郁组和非抑郁组的关键高频词及词之间的关系，有助于网络群体抑郁症的早期识别。基于机器学习的 LDA 主题模型精准地提取出抑郁与非抑郁组的情感文本特征，有效提升了网络群体抑郁识别的准确性和敏感性。而 BERT 深度学习模型能从社交媒体文本数据中对抑郁症患者进行有效的识别，可为精准识别网络空间中的抑郁症患者提供帮助。

yet to be elucidated. Furthermore, the factors that mediate the association between takeaway frequency and depressive symptoms remain unknown

Methods Questionnaires were employed to collect data from 6,417 new students at Chongqing Medical University in the autumn of 2023. The data collected included basic sociodemographic information, takeaway frequency, physical activity level, and depressive symptoms. Multiple linear regression and mediation analysis were performed. Multiple imputations were used to fill in missing data through sensitivity analyses

Results Among 6417 participants, 2,606 (40.6%) students ordered takeaway at least once a week, with 235 (3.7%) of them ordering takeaway food every day. Takeaway frequency was significantly associated with depressive symptoms ($\beta=0.034$, $P=0.006$), and physical activity partially mediated this relationship (95% bootstrap confidence interval=0.0024, 0.0371)

Conclusion The study highlights the negative relationship between takeaway frequency and emotional well-being, emphasizing the need to focus on the emotional health of frequent takeaway food consumers. Moreover, our study suggests that increased physical activity may alleviate takeaway-induced mood-related outcomes.

Takeaway Food Consumption and Depressive Symptoms in Chinese University Students: Mediating Effects of Physical Activity

Jianguo Tan^{1,2}, Li Kuang^{1,2}

1.The First Affiliated Hospital of Chongqing Medical University

2.Psychiatric Center, The First Affiliated Hospital of Chongqing Medical University

Objective The consumption of takeaways is becoming increasingly prevalent. However, despite this, the relationship between takeaway food consumption and depressive symptoms in Chinese populations has

Efficacy and Safety of Repetitive Transcranial Magnetic Stimulation in Adolescents with Depression: A Systematic Review and Meta-analysis of Randomized Sham-controlled Trials

Yujie Tao Xiaoxia Duan Pei Liu Meiwen Wang Sixun Li Xiaoyu Jiang Tingting Luo Yi Huang*

West China Hospital of Sichuan University

Objectives Repetitive Transcranial magnetic stimulation (rTMS) has emerged as a promising alternative therapy for major depressive disorder, while the available evidence on the comparative efficacy and

safety of rTMS in adolescents' depression is inconclusive. This presentation aims to evaluate the efficacy and safety of rTMS in randomized sham-controlled trials for depression among adolescents

Methods The databases of PubMed, Embase, PsycINFO, Cochrane Library, Scopus, ProQuest Dissertations and Theses, Web of Science, CNKI and WanFang were searched from database inception to April 28, 2024. Two reviewers selected randomized clinical trials evaluating rTMS vs sham-stimulation used as the controller therapy for adolescents with depression and reporting on an outcome of interest. Heterogeneity among studies was assessed by the I² and Cochran Q test, and if I² > 50% a random-effects model was used for meta-analysis. Standard mean deviation (SMD) of depression rating scale scores and risk difference (RD) with corresponding 95% CIs of adverse event were separately used to evaluate the efficacy and safety of rTMS. The possibility of publication bias was assessed by funnel plot, and Egger's test was used to assess funnel plot asymmetry

Results Fifteen studies with 1042 patients (61.2% female) aged from 10 to 25 years old were included. Our meta-analysis found active rTMS significantly reduced the score of depression scale (SMD=-0.86, 95%CI: -1.14~ -0.58). The subgroup analysis showed that the rTMS can significantly reduce depression severity from the first week (SMD=-0.38, 95%CI: -0.72~ -0.04) and continued through the second week (SMD=-0.79, 95%CI: -1.16~-0.42) and the fourth week (SMD=-1.28, 95%CI: -1.85~-0.72) when compared with sham stimulation. In addition, there was no significant difference in safety (RD=0.02, 95%CI: -0.04~0.08) between active and sham group

Conclusion These findings suggest that rTMS can be a safe and effective treatment for adolescents with depression, and may inspire future research and guide clinical practice.

基于脑影像特征的深度学习探究 ADHD 儿童生物亚型

冯源¹ 冯艾辰² 支冬梅³ 祝雨¹ 党宸¹ 吴桂森¹ 钟少根¹ 罗翔生³ 郭晓杰¹ 隋婧¹ 孙黎¹

1.北京大学第六医院

2.中国科学院自动化研究所

3.北京师范大学

目的 注意缺陷多动障碍 (Attention Deficit Hyperactivity Disorder, ADHD) 作为一种儿童期起病的神经发育性障碍, 其诊断与治疗的潜在神经机制并不明确。不仅神经影像特征的可重复性差, 且认知行为损伤以及药物反应也表现出广泛的异质性。因此如何克服 ADHD 多维度的异质性, 获取可靠的脑影像生物标志物, 对于探究疾病的神经机制以及指导临床干预具有重要意义。因此本研究的主要目的是基于影像特征的深度学习方法对患者群体进行生物亚型划分, 比较不同亚型的脑影像特征和认知行为损伤差异, 为疾病诊断分型提供客观的生物标志物。

方法 利用深度学习技术, 本研究基于功能连接 (Functional Connectivity, FC) 和年龄性别构建图卷积网络, 应用于美国青少年大脑认知发展研究队列 (Adolescent Brain Cognitive Development, ABCD) 中选取的 1069 名 ADHD 患者探索患者的生物亚型, 并进一步比较不同亚型的认知特征差异。映射 FC 模式到本课题组 PKU 数据集进一步验证生物亚型的可重复性, 并比较患者行为损伤表现。同时提取两个数据集重叠的差异性 FC 与认知行为进行相关性分析。

结果 基于 ABCD 脑影像数据利用生物亚型检测的图卷积网络模型 (GraphConvolutional Network for Biological Subtype Detection, GCN-BSD) 发现了两种生物亚型。生物亚型 1 表现为前额-小脑区域功能异常, 生物亚型 2 在所有网络中显示出更广泛的功能损伤, 主要涉及默认网络和感觉运动网络以及小脑和梭状回之间的 FC 异常。且在 PKU 数据集验证中具有良好可重复性。生物亚型 1 在工作记忆、处理速度方面显著优于生物亚型 2。在 PKU 验证集中生物亚型 1 的操作智商显著高于生

物亚型 2, 多动冲动评分显著低于生物亚型 2。此外, 顶上小叶与楔前叶和小脑与梭状回 FC 与多种认知功能以及多动冲动均表现出显著的相关性。

结论 基于 FC 的深度学习聚类发现了典型前额-小脑功能损伤和广泛脑网络异常两种 ADHD 生物亚型, 后者可能表现为更严重的认知行为损伤。

童年虐待对青少年首发抑郁障碍患者抑郁严重程度影响的影响: 反刍思维的中介作用

张暄昆 周勇杰*
深圳市康宁医院

目的 本研究旨在探讨青少年首发抑郁障碍患者中, 童年虐待不同亚型对抑郁情绪严重程度的影响, 并分析反刍思维在其中的中介作用, 为青少年抑郁障碍的预防及早期干预提供新思路。

方法 对 2464 名 12-18 岁青少年抑郁障碍患者, 选取其中 1958 名首发抑郁障碍患者为研究对象。通过儿童期创伤问卷(CTQ)、反刍思维量表(RRS)、抑郁筛查量表(PHQ-9)问卷进行调查。采用 Pearson 相关分析法探讨躯体虐待、躯体忽视、情感虐待、情感忽视、性虐待和抑郁严重程度之间的关系, 通过 Bootstrap 方法评估反刍思维的中介效应。

结果 ①童年躯体虐待、躯体忽视、情感虐待、情感忽视、性虐待与抑郁情绪严重程度呈显著正相关 ($r=0.14, 0.28, 0.37, 0.32, 0.08; P<0.001$)。②反刍思维与抑郁情绪严重程度也呈正相关 ($r=0.63; P<0.001$)。③躯体虐待、躯体忽视、情感虐待、情感忽视通过反刍思维对抑郁情绪的中介作用显著, 中介效应比重分别为 60%、35%、53.45%、32.75%; 而在受到性虐待的个体中, 反刍思维未显示出中介作用 ($\beta=0.05; P>0.05$)。

结论 本研究为第一项中国大样本抑郁青少年的研究, 研究发现躯体虐待、躯体忽视、情感虐待、情感忽视与性虐待直接影响首发抑郁症青少年的抑郁情绪严重程度, 同时也通过反刍思维对其抑郁情绪产生中介影响; 而性虐待对该群体抑郁情绪的影响未显示出反刍思维的中介作用。

跨诊断治疗统一方案 (UP-A) 对中国青少年情绪障碍患者的疗效: 一项随机对照研究方案

刘雪滢^{1,2} 潘美蓉^{1,2} 高雪^{1,2} 符仲芳³ 刘璐^{1,2} 李海梅^{1,2} 王玉凤^{1,2} 钱秋谨^{1,2}

1. 北京大学第六医院, 北京大学精神卫生研究所, 北京 100191

2. 国家卫生健康委员会精神卫生学重点实验室 (北京大学), 国家精神心理疾病临床医学研究中心 (北京大学第六医院), 北京 100191

3. 北京市海淀区颐和园路 5 号, 北京大学心理与认知科学学院, 行为与心理健康北京市重点实验室

目的 青少年情绪障碍是重要的公共卫生健康问题, 其患病率及共病率高, 亟需便捷有效的治疗方案以降低成本效益。青少年情绪障碍跨诊断治疗统一方案 (UP-A) 基于既往对情绪障碍共性特点的探索, 是一种循证依据较为充分的治疗方案。本课题组前期开放性研究表明改良的本土化 UP-A 在我国青少年情绪障碍患者及其家庭中的适用性良好, 短期及持续 1 年的长期疗效显著。本研究旨在采用随机对照的研究方法, 通过多维度评估工具探索本土化 UP-A 在我国青少年情绪障碍群体中的疗效。

方法 开展随机对照研究以验证 12 周 UP-A 对情绪障碍青少年及其家庭的多维疗效。研究计划纳入 48 名青少年情绪障碍患者 (主要诊断为焦虑障碍或抑郁障碍), 随机分至 UP-A 治疗组 (24 人) 或常规治疗组 (24 人)。UP-A 治疗为课题组前期改良的结合国内人群特征开展的团体心理治疗方案, 患者及家长将同时接受团体心理干预 (每周一次, 每次 90-120 分钟), 常规治疗组的患者定期在门诊接受常规诊疗。患者及其家长将在基线期、治疗第 4 周、治疗第 8 周、治疗结束后及治疗结束后 3 个月接受多维度评估, 包括疾病严重程度、情绪症状、情绪调节、认知模式、心理韧性、执行功能、生活质量、社会及家庭功能等。

结果 本研究针对国内青少年情绪障碍患者开展 UP-A 的临床研究。UP-A 将以团体形式开展, 同时纳入家长的团体治疗。预计 UP-A 治疗组的青少

年各项治疗评估均优于随机分配至常规治疗组的青少年, 且其疗效将在 3 个月的随访中维持。

结论 本研究为首项采用 UP-A 在我国青少年情绪障碍群体中开展的随机对照试验, 将为 UP-A 治疗中国青少年情绪障碍提供证据, 从而为我国青少年情绪障碍患者及其家庭提供更为普及化、简便化、易于传播的高效治疗方案。

认知行为疗法干预轻-中度青少年抑郁的临床应答和影响因素

杨海英*

淮安市第三人民医院

目的 青少年期(13-17 周岁)作为神经生理和心理迅速而不平衡发育的敏感时期, 是抑郁症的高发年龄段。本研究就认知行为疗法干预轻-中度青少年抑郁患者中的临床应答进行随访观察, 并探讨可资预测 CBT 疗效的影响因素。

本研究旨在探讨认知行为治疗(CBT)在轻-中度青少年抑郁患者中的临床应答和影响因素。

方法 研究对象来源于 2021 年 01 月 01 日至 2022 年 12 月 31 日期间, 在淮安市某三甲精神专科医院就诊的青少年抑郁患者。纳入 91 例轻-中度青少年抑郁患者为研究对象, 采集社会人口学资料, 并应用青少年生活事件量表(ASLEC)、简明应对方式问卷(CSQ)和社会支持评定量表(SSRS)采集心理特征信息。然后由专业心理治疗师实施为期 12 周的认知行为治疗(如 12 周内病情加重需要使用抗抑郁药乃至住院, 则提前终止随访)。采用蒙哥马利抑郁评定量表(MADRS)评定抑郁症状严重程度和疗效。最后使用 SPSS 26.0 软件分析 CBT 治疗轻-中度青少年抑郁的疗效和影响因素。

结果 观察终点时, 91 例研究对象的 MADRS 评分较基线显著下降(3.75 ± 0.85 Vs 8.47 ± 2.89), 差异有统计学意义($P < 0.001$); 其中痊愈 28 例(30.77%)、显效 23 例(25.27%)、有效 34 例(37.36%)、无效 6 例(6.59%)。与显效组(减分率 $\geq 50%$, $n=51$)相比, 非显效组(减分率 $< 50%$, $n=40$)的男性占比、ASLEC 量表人际关系因子、学习压力

因子、受惩罚因子、丧失因子、总刺激量和 CSQ 问卷消极应对因子评分较高, 而 SSRS 量表主观支持因子、支持利用度因子和总分较低, 差异具有统计学意义($P < 0.05$)。Logistics 二元回归分析发现: 性别、ASLEC 量表人际关系因子、学习压力因子、受惩罚因子和 SSRS 总分是 CBT 疗效的独立影响因子。

结论 CBT 对轻-中度青少年抑郁疗效肯定, 女性和人际关系较好、学习压力较低、近期无受惩罚等应激性生活事件的患者更容易在 CBT 治疗中获益。反言之, 对于男性、人际关系差、学习压力大、近期曾受惩罚等应激性生活事件的患者则可能疗效欠满意, 需要考虑早期联合药物治疗。

关键词: 青少年, 抑郁, 认知行为疗法, 临床应答, 影响因素

哌甲酯治疗注意缺陷多动障碍的脑效应连接机制

傅朝 曹庆久 杨莉*

北京大学第六医院, 北京大学精神卫生研究所, 国家卫生健康委员会精神卫生学重点实验室(北京大学), 国家精神心理疾病临床医学研究中心(北京大学第六医院)

目的 从大脑信息流动的角度, 使用效应连接(effective connectivity)指标, 研究哌甲酯(methylphenidate, MPH)改善注意缺陷多动障碍(Attention deficit hyperactive disorder, ADHD)临床疗效的磁共振脑机制, 为日后开发新的治疗方法及靶点提供理论依据。

方法 在儿童精神科门诊纳入符合 DSM 诊断标准的 6~16 岁 ADHD 儿童青少年, 从中小学校招募年龄匹配的正常对照组被试。基线状态下采集所有被试的人口学信息和静息态功能磁共振数据, 使用 ADHD 评定量表(ADHD-RS)评估 ADHD 组的临床症状。使用 MPH 治疗, 对药物进行标准的剂量滴定, 12 周后评估 ADHD 患者临床症状的变化, 再次收集患者的静息态功能磁共振数据。最终纳入分析的被试包括 18 例 ADHD 以及 24 例正常对照组, 将基线状态下 ADHD 组与正常对照组的度中心性有显著差异的脑区作为感兴趣区, 并进行格兰杰因果分析(Granger causality analysis, GCA), 探讨效应连

接改变与症状改善之间的关系。采用高斯随机场理论 (Gaussian Random Field, GRF) 对影像学结果进行多重比较校正, 体素水平显著性设为 $P < 0.01$, 团块水平显著性设为 $P < 0.05$ 。

结果 MPH 能显著改善 ADHD 患者的临床症状, 在基线状态下, 接受 MPH 治疗的 ADHD 组男孩在右侧枕中回、左侧枕上回的度中心性显著高于正常对照组儿童, 右侧壳核的度中心性显著低于正常对照组。ADHD-RS 评分的减分率主要与枕叶视觉区域与“皮质-纹状体-丘脑-皮质”环路之间效应连接的改变相关, 具体表现为: ADHD-RS 注意缺陷及多动冲动评分的减分率均与枕叶皮质到纹状体、感觉运动网络的效应连接增强成正相关, 与到默认模式网络成负相关, 而与默认模式网络到枕叶皮质的效应连接成正相关, 与感觉运动网络及纹状体区域到枕叶皮质的效应连接增强呈负相关。

结论 MPH 能显著改善 ADHD 的临床症状, MPH 改善患者临床症状主要涉及视觉网络与皮质-纹状体-丘脑-皮质环路之间效应连接的改变, 同时也参与调节默认模式网络与其他网络之间的交互, 提示可能作为日后精准干预的靶点。

青少年抑郁障碍自杀和非自杀性自伤行为的白质脑网络研究

汪帅² 汪帅¹ 杨莲莲³ 杨莲莲² 郭贞茹^{2,3} 田霖^{1,2,3}

1. 南京医科大学附属无锡精神卫生中心

2. 无锡市精神卫生中心

3. 江南大学

目的 研究表明青少年抑郁障碍自杀与非自杀性自伤行为涉及脑灰质结构及功能异常, 但是否存在脑白质组织模式的变化尚不清楚。本研究拟联合基于扩散张量成像的纤维跟踪和脑网络分析技术, 探索青少年抑郁障碍自杀与非自杀性自伤行为的白质脑网络特征及其临床特征相关性。

方法 本研究招募了伴自杀行为的抑郁障碍患者 (SA) 41 例, 伴非自杀性自伤行为的抑郁障碍患者 (NSSI) 27 例, 抑郁障碍患者 (MD) 17 例和正常对照 (NC) 33 例。采用渥太华自我伤害调查表 (中

文版)、哥伦比亚-自杀严重程度评定量表、BECK 自杀意念量表等对患者进行临床评估。采用 SPSS 25.0 软件对一般人口学资料和临床量表数据进行统计分析。采用 3T 的西门子 MRI 设备获取了被试的脑影像数据, 采用基于扩散张量成像的纤维跟踪和脑网络分析技术, 构建了不同类别被试的白质脑网络模型, 并采用基于节点的统计方法 (NBS) 对网络指标进行组间比较, 并采用皮尔逊相关分析探索网络特征与临床特征的相关性。

结果 被试在渥太华自我伤害调查表 (中文版)、哥伦比亚-自杀严重程度评定量表、BECK 自杀意念量表等多个量表指标存在显著差异 ($P < 0.05$)。NBS 分析结果提示 4 组被试间在左右侧眶额回间、左右侧扣带回间和丘脑间白质连接存在显著的组间差异 (FDR 校正, $P < 0.05$)。此外, 不同临床类别的被试在多个脑网络属性上存在显著差异, 包括 communication、diffusion 和 navigation 等多个指标。

事后检验显示 SA、NSSI 组和 NC 组之间存在统计学差异, 差异更为广泛, 而 NSSI 和 SA 组间差异较为局限。皮尔逊相关分析显示多个网络网络特征与临床特征具有相关性, 如网络指标 communication 与自杀意念的负相关有统计学意义 ($P < 0.05$); diffusion 与自伤持续时间的负相关有统计学意义 ($P < 0.05$)。

结论 伴自杀与非自杀性自伤行为的青少年抑郁障碍患者具有各自独特的白质网络组织模式, 并且这种网络特征与患者临床特征具有相关性, 提示脑白质的网络拓扑结构可能青少年抑郁障碍的自杀与非自杀性自伤行为的神经生物学机制上发挥了关键作用。

A Correlation Study on The Therapeutic Effect of Low-frequency RTMS in The Treatment of Depression with Sleep Disorders in Western Yunnan Region

Jierui Cai Jun Yang Lixia Wang*

First Affiliated Hospital of Dali University

Objective With the development of social modernization and the increase of life pressure, the incidence rate of depression with sleep disorder in China is rising rapidly. However, some patients have limited disease control with existing treatment options, and lack laboratory testing indicators for disease diagnosis and efficacy monitoring. Due to differences in economy, geography, and ethnic culture, the medical and treatment rates for depression with sleep disorders in the western Yunnan region are much lower than those in economically developed areas. This study aims to investigate the therapeutic effect of low-frequency rTMS on patients with depression and sleep disorders in western Yunnan, providing more effective and diverse treatment plans for patients with depression and sleep disorders, and seeking laboratory indicators that can diagnose and monitor the therapeutic effect. It advocates the use of drug combined with physical therapy to improve the sleep quality of patients with sleep disorders, and explores new diagnostic methods and treatment targets for patients with sleep disorders

Methods From January 2023 to January 2024, recruited patients with depression and sleep disorders and 40 healthy individuals who underwent physical examinations during the same period from the First Affiliated Hospital of Dali University for research. Patients with depression and sleep disorders were selected as the disease group, and the disease group was randomly divided into F3 group (stimulating the left lateral prefrontal cortex), F4 group (stimulating the right lateral prefrontal cortex), F3+F4 group (stimulating the left and right lateral prefrontal cortex), and a control group without stimulation. Healthy individuals were selected as the healthy group. The F3 group, F4 group, and F3+F4 group received 14 consecutive low-frequency repetitive transcranial magnetic stimulation (rTMS) treatments, known as the treatment group, while the control group did not receive rTMS treatment. Collect general clinical data of all enrolled patients and Pittsburgh Sleep Quality Index (PSQI) scores of patients in the affected group before and after treatment; Simultaneously collect serum samples from all enrolled patients upon admission and 14 days after treatment in the affected group, and detect levels of immune inflammatory factors, including IL-1

β , IL-18, TNF - α , IL10, NLRP1, Caspase-1, ASC, etc

Results The PSQI scores of patients in the F3, F4, and F3+F4 groups were all lower than those in the control group after treatment, and the differences were statistically significant ($P < 0.05$); The PHQ-9 scores of patients in the F3, F4, and F3+F4 groups were lower than those in the control group after treatment, but the difference was not statistically significant ($P > 0.05$); The difference in IL-1 β , IL-18, TNF - α , IL-10, NLRP1, and ASC levels between the diseased group and the healthy group was statistically significant ($P < 0.05$), while the difference in Caspase-1 levels was not statistically significant ($P < 0.05$); Multivariate binary logistic regression found that NLRP1 and ASC levels were considered independent risk factors for depression with sleep disorders ($P < 0.05$); ROC curve analysis shows that NLRP1 and ASC levels have good clinical predictive value for the occurrence of depression with sleep disorders

Conclusion rTMS treatment can improve the sleep quality and depressive symptoms of patients with depression and sleep disorders; TMS stimulation of the left, right, and combined left and right lateral prefrontal cortex showed no significant improvement in sleep and depression in patients with depression and sleep disorders; The levels of NLRP1 and ASC are independent risk factors for the occurrence of depression with sleep disorders, and have certain predictive value for the occurrence of depression with sleep disorders

GABAergic Neuron Specific Pax2 Deficient Mice Exhibit ASD Like Endophenotypes

Ningxia Zhang Liting Xue Hongen Wei*
Shanxi provincial people's hospital

Objective Autism spectrum disorder (ASD) is a complex neurodevelopmental disorder that affects millions of people. Despite its prevalence, the underlying mechanisms are still not fully understood. Paired box 2

(PAX2) is a transcription factor essential for brain development and patterning. Its dysregulation has been implicated in various neurological disorders, including ASD. Gamma-Aminobutyric Acid (GABA) is an inhibitory neurotransmitter that plays a crucial role in regulating neuronal activity. Previous studies have shown abnormal GABA metabolism in Pax2[±]-mice. This study aims to investigate whether Pax2 regulates GABAergic neurotransmission and whether its dysregulation contributes to ASD like behavioral endophenotypes by constructing a GABAergic neuron-specific Pax2 knockdown mouse model

Methods We randomly divided 26 C57 BL/6J mice into two groups, an experimental group and a control group. We specifically knocked down Pax2 in GABAergic neurons by using bilateral injection of the rAAV-VGAT1-Pax2 shRNA virus into the prefrontal cortex of adult C57 BL/6J mice in the experimental group. We injected rAAV-VGAT1-scramble shRNA into the prefrontal cortex of C57 BL/6J mice in the control group. Three weeks later, we used Western blotting and immunofluorescence staining to detect the expression of Pax2 and the presence of the virus in the brain. Meanwhile, we performed a battery of behavioral test.

Results We observed significant increases in grooming time and frequency in the experimental group mice compared to the control group. Specifically, the experimental group mice spent more time grooming ($p < 0.0003$) and groomed more frequently ($p < 0.0001$). The Spray-induced self-grooming test further supported these findings, with the experimental group mice displaying longer induced grooming times ($p < 0.05$) and higher induced grooming frequencies ($p < 0.0001$). In the marble burying test, we found a significant increase in marble burying behavior in the experimental group mice ($p < 0.0001$). The T-maze revealed that the experimental group mice had impaired learning ability, as evidenced by fewer correct responses per day during the acquisition phase ($p < 0.0001$). Moreover, the experimental group mice took longer to reach the reversal criterion ($p < 0.05$). Similarly, during the reversal learning phase, the experimental group mice performed worse than the control group ($p < 0.0001$). Finally, the elevated plus maze test indicated that the experimental group

mice spent more time in the open arms, suggesting decreased anxiety levels ($p < 0.05$), suggesting a decrease in anxiety levels. Notably, previous studies have shown that repetitive behaviors can alleviate anxiety, which is consistent with the increased repetitive behaviors observed in the experimental group mice

Conclusion Our study demonstrates that GABAergic neuron specific Pax2 knockdown mice exhibit a robust ASD-like endophenotype, characterized by increased repetitive behaviors and impaired learning and memory abilities. These findings suggest that these mice can be used as a valuable animal model for ASD research. Furthermore, we plan to explore the underlying molecular mechanisms driving these phenotypes, which may lead to the identification of novel therapeutic targets for the treatment of ASD

青少年抑郁障碍患者的网络成瘾特点及其与冲动攻击特质的关系

高颖¹ 来庆娟¹ 王慧¹ 李秋蓉¹ 倪婷璐陶² 李婉容² 赵汗青² 敦玥¹ 曹庆久¹

1. 北京大学第六医院 北京大学精神卫生研究所, 国家卫生健康委员会精神卫生学重点实验室 (北京大学), 国家精神心理疾病临床医学研究中心 (北京大学第六医院) 100191

2. 天津大学应用心理研究所

目的 了解青少年抑郁障碍患者的网络成瘾 (Internet Addiction, IA) 特点; 探索抑郁发作和冲动、攻击的人格特质对于网络成瘾的影响。

方法 纳入 78 名符合 ICD-10 抑郁障碍诊断标准并使用中国版学龄儿童 (6-18 岁) 情感障碍和精神分裂症问卷现在和终生版 (K-SADS-PL-C DSM-5) 半定式访谈除外其他精神障碍的青少年抑郁障碍患者和 83 名健康青少年对照, 使用网络成瘾诊断量表中文版 (YIAT)、Barratt 冲动性量表第十一版 (BIS-11)、Buss-Perry 攻击性量表 (BPAQ) 评估青少年网络成瘾、冲动性、攻击性, 使用 SPSS 25.0 统计分析软件对数据进行组间比较及分层回归分析等统计学

处理。

结果 以 YIAT 总分 ≥ 50 分界定患有网络成瘾, 青少年抑郁障碍患者网络成瘾率为 57.7%, 高于青少年健康对照组 (31.3%)。抑郁障碍组在 YIAT 的“退缩和社交问题”维度 ($\eta^2=0.156$, $P<0.01$)、 “现实替代”维度 ($\eta^2=0.143$, $P<0.01$) 得分高于对照组, 抑郁障碍患者的 BIS-11 总分 ($\eta^2=0.188$, $P<0.01$)、 BPAQ 总分 ($\eta^2=0.142$, $P<0.01$) 高于健康对照。分层回归分析结果显示攻击性、冲动性和网络成瘾症状相关 ($P<0.01$), 而控制社会环境因素及冲动、攻击性等因素的影响后, 是否患有抑郁障碍对于网络成瘾并无相关性 ($P=0.377$)。

结论 抑郁障碍患者相对于健康青少年更容易出现网络成瘾问题且具有独特的成瘾模式, 冲动攻击特质和网络成瘾相关, 可能在抑郁障碍患者的网络成瘾过程中发挥了中介作用或潜在的共同致病作用。

The Role of Inflammation-associated Tryptophan-kynurenine Pathway Disturbance in The Pathogenesis and Suicide Risk of Adolescent Depression

Jingjing Han^{1,2}, Shuran Yang^{1,2}, Chuanyuan Kang¹

1. Shanghai East Hospital

2. Tongji University School of Medicine

Objective investigate the role of TKP in adolescent depression, particularly its connection to inflammation and suicide risk

Methods Seventy-three adolescents with MDD were assessed for serum levels of interleukin (IL)-1 β , IL-6, IL-18, IL-10, tumor necrosis factor (TNF)- α , and TRP metabolites that TRP, KYN, 3-hydroxykynurenine (3-HK). Correlations between cytokines and TKP measures were examined. Patients were divided into high ($n=42$) and non-high suicide risk groups ($n=31$), and serum levels of cytokines and TKP metabolites were compared

Results Significant negative correlations were

found between TRP and IL-8 and IL-10, while a significant positive correlation was observed between 3-HK and IL-8 in depressed adolescents. The KYN/TPR (index of indoleamine 2,3-dioxygenase, IDO) was positively correlated with IL-1 β , IL-6, IL-10 and TNF- α levels; and 3-HK/KYN (index of kynurenine 3-monooxidase, KMO) was positively correlated with IL-8 level. Depressed adolescents at high suicide risk exhibited significantly higher levels of IL-1 β , IL-10, and TNF- α and lower levels of 3-HK compared to their non-high suicide risk counterparts

Conclusion This study first demonstrated the relationship between inflammatory cytokines and the activities of IDO and KMO in adolescent depression, providing evidence for TKP abnormalities as a link between inflammation and depression in adolescents. Notably, immune-related TKP dysregulation was more pronounced in depressed adolescents at high suicide risk

留守儿童心理健康状况研究现状

耿坤 王丽霞*

大理大学第一附属医院

摘要: 留守儿童心理健康状况近年来引起了广泛关注, 主要包括精神病性体验、歧视知觉与社会疏离感、心理虐待与攻击行为以及负性生活事件对留守儿童亲社会倾向等心理健康与心理弹性研究现状。(1) 留守儿童的精神病性体验痛苦程度与心理弹性和同伴依恋呈负相关。同伴依恋在留守儿童的心理弹性和精神病性体验之间存在显著的调节效应。高水平的心理弹性和同伴依恋对留守儿童精神病性体验的出现具有缓冲作用, 削弱留守经历带来的不良影响, 从而减少精神病性体验的产生。(2) 留守儿童歧视知觉与社会疏离感呈正相关。歧视知觉和社会疏离感与心理弹性呈负相关。心理弹性在留守儿童的歧视知觉和社会疏离感间起部分中介作用。心理弹性可以帮助留守儿童从歧视情境和社会疏离感中恢复出来。(3) 心理虐待主要通过 3 条中介路径

来影响留守儿童的攻击行为：①心理虐待→心理弹性→攻击行为。②心理虐待→人际敏感→攻击行为。③心理虐待→心理弹性→人际敏感→攻击行为。心理弹性和人际敏感在心理虐待与攻击行为之间起到链式中介作用。心理虐待与人际敏感和攻击行为之间呈正相关，心理弹性与心理虐待和攻击行为及人际敏感呈负相关。心理弹性能够有效降低心理虐待、人际敏感和攻击行为水平。(4)留守儿童的亲社会倾向显著低于非留守儿童，负性生活事件更不利于其亲社会倾向。负性生活事件与心理弹性和社会倾向呈负相关，心理弹性和亲社会倾向间呈正相关。心理弹性在负性生活事件和亲社会倾向间起中介作用。负性生活事件不仅可以直接作用于留守儿童的亲社会倾向，也可以通过心理弹性的中介作用对亲社会倾向产生间接效应。

DBT 日间病房对抑郁症青少年情绪调节的影响

贾惠羽 王我*

重庆医科大学附属大学城医院

目的 辩证行为疗法 (dialectical behavior therapy, DBT) 对青少年抑郁症状及其认知功能均有一定改善, 日间病房模式也被证实对抑郁症状有效。但在国内, 将二者相结合的研究还较少。研究旨在探究日间病房模式下 DBT 对于抑郁症青少年的疗效及其情绪调节策略使用的影响, 为抑郁症青少年的治疗提供一种新的干预途径与治疗方案。

方法 纳入抑郁症青少年患者 40 例。对照组 17 例, 接受常规抗抑郁药物治疗; 干预组 23 例, 接受常规抗抑郁药物治疗+日间病房模式的 DBT 技能训练。DBT 日间病房设置为连续 5 天, 每天共 4 小时的技能训练, 包含 DBT 技能训练的四个模块以及行为链分析、价值观澄清等内容。利用汉密尔顿抑郁量表 (HAMD)、情绪调节问卷 (ERQ) 评估患者情绪及情绪调节策略的使用情况。

结果 1.DBT 日间病房对抑郁症患者的疗效:

(1) 两组患者治疗前 HAMD 评分无显著差异 ($p>0.05$); (2) 治疗后, 患者 HAMD 评分减分率组

间差异显著 (干预组 51.10%, 药物组 31.82%, $p<0.05$)。2.DBT 日间病房对患者情绪调节策略的影响: (1) 干预组患者在经过治疗后, 在 ERQ 认知重评维度得分有显著增加 ($p<0.05$), 在表达抑制维度得分降低, 但差异不显著; (2) 对照组患者在 ERQ 两个维度得分均无明显变化。

结论 日间病房模式下的 DBT 技能训练显著改善了抑郁症青少年患者的抑郁情绪; 同时, 患者在认知重评维度上的得分明显提高, 说明日间病房模式下 DBT 技能训练对于抑郁症青少年患者使用积极情绪调节策略具有帮助。DBT 日间病房治疗模式或许可以成为国内青少年抑郁症治疗的一种新的干预途径。

注意缺陷多动障碍儿童伴情绪失调静息态局部功能活动特征

李思迅 黄颐*

四川大学华西医院

目的 情绪失调在注意缺陷多动障碍 (Attention-Deficit/Hyperactivity Disorder, ADHD) 儿童中非常普遍, 对 ADHD 儿童功能损害及不良预后影响较大。目前 ADHD 儿童情绪失调症状在临床上难以被早期识别及干预, 有必要进行 ADHD 儿童情绪失调相关影像学研究。本研究使用 ALFF 值及 ReHo 值探索 ADHD 儿童伴情绪失调相关的静息态局部功能活动特征。

方法 共有 240 名 6-14 岁儿童参与本研究, 其中包括 ADHD 儿童 160 名, 以及性别、年龄、智力与之匹配的健康对照 (TDC) 80 名。参与者父母配合提供人口学信息、SNAP-IV 和 Achenbach 儿童行为量表 (CBCL) 问卷。使用 CBCL 量表 (Anxiety/depression, Attention, Aggressive, AAA) 条目将 ADHD 儿童分为伴有与不伴有情绪失调的两个亚组。参与者配合完成静息态功能磁共振扫描, 经过图像质量检查后, 最终纳入伴有情绪失调的 ADHD 组 77 例, 不伴情绪失调的 ADHD 组 53 例, TDC 组 55 例进行统计分析。以性别、年龄、智力、平均头动参数为协变量, 采用 ANCOVA 分析及 LSD

事后检验, 比较了伴有情绪失调的 ADHD、不伴情绪失调的 ADHD、TDC 三组之间在 ALFF 值和 Reho 值上的差异。

结果 与不伴有情绪失调的 ADHD 儿童比较, 伴有情绪失调的 ADHD 儿童右侧角回 ALFF 值升高 ($p=0.002^{**}$), 左侧枕中回 Reho 值升高 ($p<0.001^{***}$)。进一步在 ADHD 儿童中进行的相关分析发现角回 ALFF 值及枕中回 Reho 值与 ADHD 儿童情绪失调得分成正相关关系 (左侧角回: $r=0.18, p=0.04^*$; 右侧角回: $r=0.24, p=0.006^{**}$; 左侧枕中回: $r=0.23, p=0.007^{**}$)。

结论 角回及枕中回局部功能活动的异常可能是伴有情绪失调的 ADHD 儿童与情绪失调相关的神经影像学特征。ADHD 儿童情绪失调可能与角回及枕中回在情绪调节中负责的对视觉相关情绪刺激的识别及整合能力受损相关。

注意缺陷多动障碍儿童情绪失调相关静息态功能连接特征

李思迅 黄颐*

四川大学华西医院

目的 情绪失调在注意缺陷多动障碍 (Attention-Deficit/Hyperactivity Disorder, ADHD) 儿童中非常普遍, 显著影响其功能损害和不良预后。前额叶皮层在情绪调节中起着关键作用。本研究将 ADHD 儿童分为伴与不伴情绪失调的两组, 以“背外侧/腹内侧前额叶皮层”为种子点, 旨在探索与 ADHD 儿童情绪失调相关的静息态功能连接特征。

方法 共有 240 名 6-14 岁儿童参与本研究, 其中包括 ADHD 儿童 160 名, 以及性别、年龄、智力与之匹配的健康对照 (TDC) 80 名。参与者父母配合提供人口学信息、SNAP-IV 和 Achenbach 儿童行为量表 (CBCL) 问卷。使用 CBCL 量表中 (Anxiety/depression, Attention, Aggressive, AAA) 条目将 ADHD 儿童分为伴有与不伴有情绪失调的两个亚组。参与者进行静息态功能磁共振扫描, 经过图像质量检查后, 最终纳入 ADHD 伴情绪失调组 77 例、ADHD 不伴情绪失调组 53 例和 TDC 组 55 例

进行统计分析。在控制性别、年龄、智力和平均头动参数的基础上, 比较伴与不伴情绪失调两组间以“背外侧/腹内侧前额叶皮层”为种子点的静息态功能连接特征。同时在伴有情绪失调的 ADHD 组中进行功能连接与情绪失调的相关性分析。

结果 与不伴情绪失调的 ADHD 儿童相比, 伴有情绪失调的 ADHD 儿童显示出“背外侧上额叶回-眶额中回/枕叶”的功能连接增强 (背外侧上额叶回-眶额中回: $p=0.007^{**}$, 背外侧上额叶回-枕叶: $p=0.008^{**}$)。相反, 其在“背外侧上额叶回-三角下额叶回”之间的功能连接减弱 (背外侧上额叶回-三角下额叶回: $p=0.04^*$)。此外, 在伴有情绪失调的 ADHD 儿童中, 背外侧上额叶回与眶额皮层之间的功能连接与情绪失调评分呈正相关 ($r=-0.32, p=0.005^{**}$)。

结论 伴有情绪失调的 ADHD 儿童在以“背外侧/腹内侧前额叶皮层”为种子点的功能连接异常方面显示出与不伴情绪失调的 ADHD 儿童不同的特征。伴有情绪失调的 ADHD 儿童情绪失调与“背外侧前额叶皮层 - 眶额叶皮层”之间的功能连接异常相关。这些研究结果对理解 ADHD 儿童情绪失调相关的神经影像学及神经心理特征意义有一定意义。

数字化干预技术促进 ADHD 儿童视觉相关脑电微状态的正常化

罗翔升¹ 郭晓杰³ 祝雨² 王玉凤², Stuart Johnstone⁴ 孙黎²

1. 首都医科大学附属北京安定医院
2. 北京大学第六医院
3. 解放军总医院第一医学中心
4. 澳大利亚 Wollongong 大学

目的 近年来, 数字化治疗技术如神经反馈和数字化认知训练在临床治疗注意缺陷多动障碍 (ADHD) 儿童中的应用越来越广泛。大量临床研究表明, 这些技术能够改善 ADHD 儿童的认知能力和注意力水平。然而, 对于这些治疗技术在客观脑功能改善方面的研究证据仍然较为缺乏, 尤其是与正常儿童的脑功能变化对比。本研究旨在通过脑电微状态分析, 探讨数字化干预技术对 ADHD 儿童客观

脑功能的影响。

方法 本研究包括 57 名 ADHD 儿童和 47 名年龄与性别匹配的正常对照儿童。57 名 ADHD 儿童接受了为期 3 个月的数字化训练，并采集了训练前后的静息态脑电活动。这 57 名儿童被分为三组：神经反馈训练组 (NFT, 17 名)、计算机化认知训练组 (CCT, 21 名) 和混合神经反馈和认知训练组 (COM, 19 名)。研究采用 Microstate analysis toolbox 分析了基线期 ADHD 和正常对照儿童微状态 A\B\C\D 在出现频率、持续时间及覆盖率上的差异，并进一步分析不同组别 ADHD 儿童训练前后四种微状态的变化特征。

结果 1) 基线期：ADHD 儿童的微状态 A 在出现频率 ($p = 0.002$)、持续时间 ($p = 0.016$) 及覆盖率 ($p = 0.004$) 均显著高于正常儿童。微状态 B 在出现频率 ($p < 0.001$)、持续时间 ($p < 0.001$) 及覆盖率 ($p < 0.001$) 均显著低于正常儿童。微状态 C 和 D 在两组间未表现出显著差异。2) 训练后：ADHD 儿童微状态 A 的出现频率 ($p = 0.030$) 及覆盖率 ($p = 0.028$) 显著降低，逐步接近正常儿童。微状态 B 在训练前后无明显差异。微状态 C 的出现频率 ($p < 0.001$)、持续时间 ($p < 0.001$) 及覆盖率 ($p < 0.001$) 在训练后显著降低。微状态 D 的出现频率 ($p < 0.001$)、持续时间 ($p < 0.001$) 及覆盖率 ($p < 0.001$) 在训练后显著升高。

结论 微状态 A 与视觉信息的处理和整合密切相关，是反映大脑在静息状态下视觉注意力和认知处理的一种特定模式。在基线时期，ADHD 儿童的微状态 A 在出现频率、持续时间及覆盖率上均显著高于正常儿童，表明 ADHD 儿童在视觉信息处理方面存在过度活跃或不正常的激活模式。经过数字化训练后，ADHD 儿童微状态 A 的出现频率及覆盖率显著降低，逐步接近正常儿童的水平，支持数字化认知训练在改善 ADHD 儿童视觉功能和整体认知能力方面的潜力。脑电微状态分析提供了一种客观评估治疗效果的方法，有助于进一步理解和优化 ADHD 的数字化治疗策略。

ADHD 伴社交障碍儿童的杏仁核动态功能连接缺陷

张康福 茜 闫佳仪 康斯敏 李彦霖 傅朝 杨莉 曹庆久*

北京大学第六医院/精神卫生研究所, 国家精神心理疾病临床医学研究中心 (北京大学第六医院), 国家卫生健康委员会精神卫生学重点实验室 (北京大学)

目的 约 52-82% 的注意缺陷多动障碍 (attention deficit and hyperactivity disorder, ADHD) 患者存在社交障碍 (social deficit, SD)。杏仁核是社交脑的重要组成部分，其功能异常可能与 ADHD 患者的社交功能缺陷有关。本研究旨在探讨 ADHD 伴社交障碍儿童的杏仁核动态功能连接 (dFC) 是否存在异常。

方法 纳入 ADHD 儿童 124 名以及年龄匹配的正常对照 (TDC) 72 名。以社交反应量表 (SRS) t 分数 60 分为界值，将 ADHD 儿童分为伴社交障碍组 (ADHD+SD, 53 名) 以及不伴社交障碍组 (ADHD-SD, 71 名)。构建基于杏仁核亚区的与全脑的 dFC 图谱，采用 ANCOVA 分析，控制年龄、智商、性别，比较三组被试的 dFC 的差异，利用 GRF 方法进行多重比较校正 (体素水平 $p < 0.005$, 团块水平 $p < 0.05$)，得到异常脑区。将通过校正的异常脑区的 dFC 与 SRS 各维度评分及 ADHD 症状评定量表做偏相关分析，探索异常脑区和社交功能的关系。

结果 ADHD+SD 组的杏仁核亚区的 dFC 显著高于 ADHD-SD 组及 TDC 组，ADHD-SD 组和正常对照组间无显著差异，具体异常连接脑区如下：左基底核到右额上回，左中央核到左额上回，左外侧核到右颞下回和右额上回，右中央核到左额上回，右外侧核到左额中回和右颞下回。其中，在 ADHD-SD 组中，左外侧核到右颞下回的 dFC 和 SRS 量表中的社交沟通 ($r = -0.382, p = 0.001$) 及总分 ($r = -0.311, p = 0.010$) 负相关，右中央核与左额上回的 dFC 和社交意识 ($r = -0.275, p = 0.023$) 负相关，右外侧核到左额中回的 dFC 和社交沟通 ($r = -0.324, p = 0.007$) 及总分 ($r = -0.292, p = 0.016$) 负相关，右外侧核到右颞下回的 dFC 和社交沟通 ($r = -0.352, p = 0.003$) 负相关。其余两组无显著相关。三组被试的异常脑区的 dFC 与 ADHD 症状评分均无显著相关。

结论 ADHD+SD 组的杏仁核的 dFC 显著增加，功能连接稳定性更差，其中，杏仁核三个亚区和额上回的 dFC 均增加，双侧外侧核和右颞下回的 dFC 增加，ADHD-SD 组和 TDC 组之间无显著差异。这

种异常主要和 SRS 评分而非 ADHD 症状评分相关,提示杏仁核的 dFC 异常可能是 ADHD 儿童社交功能受损的潜在机制。

注意缺陷多动障碍不同亚型的脑血流特征及其与执行功能关系的研究

张心怡^{1,2} 李海梅^{1,2} 王玉凤^{1,2} 刘璐^{1,2} 钱秋瑾^{1,2}

1.北京大学第六医院,北京大学精神卫生研究所,北京 100191

2.国家卫生健康委员会精神卫生学重点实验室(北京大学),国家精神心理疾病临床医学研究中心(北京大学第六医院),北京 100191

目的 基于动脉自旋标记(Arterial Spin Labeling, ASL)探讨注意缺陷多动障碍(Attention Deficit and Hyperactive Disorder, ADHD)不同亚型[注意缺陷为主型(Attention Deficit and Hyperactive Disorder-Inattentive, ADHD-I)及混合型(Attention Deficit and Hyperactive Disorder-Combined, ADHD-C)]儿童脑血流(Cerebral Blood Flow, CBF)的差异,并进一步研究这些差异与执行功能的关系,以深入理解 ADHD 的神经生物学基础。

方法 本研究共纳入 159 名完成伪连续 ASL(pseudo-continuous ASL, pcASL)扫描的被试,包括 83 名 ADHD-I 型患儿,51 名 ADHD-C 型患儿及 25 名健康对照(Healthy Control, HC),所有被试均为男孩。使用行为评定执行功能问卷(家长版)

(Behavior Rating Inventory of Executive Function-Parent Form, BRIEF)评估患者的生态执行功能。采用协方差分析(ANCOVA),探讨三组儿童在 CBF 上的差异,事后检验采用 Dunn 检验。对于存在组间差异的脑区,提取相应脑区的 CBF 值,并与上述 BRIEF 得分构建回归模型,进一步明确差异脑区与执行功能之间的关系。

结果 ADHD-I、ADHD-C 及 HC 三组在左侧颞中回的 CBF (GRF 校正:体素水平 $p < 0.001$,团块水平 $p < 0.05$,双侧检验)存在显著差异。Dunn 事后检验(Bonferroni 校正 $p < 0.05$)显示 ADHD-C 型与 HC ($P = 0.000$)、ADHD-C 型与 ADHD-I 型 ($P = 0.01$)

之间存在显著差异,ADHD-I 型较其它两组表现出较低的局部 CBF;而 ADHD-I 型与 HC 之间无显著差异。在与 BRIEF 量表得分的回归分析中,发现 ADHD-C 型的 CBF 值与计划/组织得分显著相关 ($b = -0.062$, $P = 0.03$)。

结论 ADHD-I 和 ADHD-C 两种亚型的局部脑血流存在显著差异。ADHD-C 型在左侧颞中回的 CBF 值显著低于 ADHD-I 型和健康对照,降低的局部脑血流可能与 ADHD-C 型的执行功能缺陷有关,尤其在组织和计划能力方面。而 ADHD-I 型与 HC 的局部脑血流之间无显著差异。该结果为进一步理解 ADHD 亚型的神经生物学机制提供了新的视角。

关键词: 注意缺陷多动障碍,动脉自旋标记,脑血流,执行功能

高精度经颅直流电刺激治疗青少年心境障碍抑郁发作疗效的脑影像标志

周靖帅 王菲*

南京脑科医院

目的 随着抑郁症在青少年中的发病率逐渐增加,寻找有效的物理治疗方法尤为重要。本研究旨在探讨高精度经颅直流电刺激(tDCS)在治疗青少年心境障碍抑郁发作中的疗效,特别是通过对不同靶点的 tDCS 治疗,评估其疗效差异及脑影像学标志的变化,以期为临床治疗提供新的思路。

方法 本研究纳入了符合 DSM-5 诊断标准的青少年抑郁患者,随机分配至三个治疗组:DLPFC 阳极刺激、OC 阴极刺激和 DMPFC 阳极刺激。每组患者接受 2 周的 tDCS 治疗,每天 2 次,每次 20 分钟,电流强度 2mA。在基线及治疗 20 次后,所有参与者均接受功能磁共振成像(fMRI)扫描以及临床量表评估,使用功能磁共振成像数据中的动态因果模型(DCM)值,基于 Yeo7 网络,来分析各网络之间的 DCM 变化。

结果 结果显示,所有三组患者的抑郁症状均有显著改善,但改善程度存在差异。DLPFC 阳极刺激组在症状缓解方面表现最为显著,其次是 DMPFC 阳极刺激组,而 OC 阴极刺激组的效果相对较弱。在脑影像学方面,DLPFC 阳极刺激组的 Yeo7 网络之间的 DCM 值变化最大,尤其是 DLPFC 区域与视

觉网络之间的连接增强。DMPFC 阳极刺激组则表现出 DMPFC 与默认网络的 DCM 值显著增强。OC 阴极刺激组在视觉皮层与其他脑区的连接性上也有一定变化,但整体效果不如前两组明显。

结论 本研究表明,高精度 tDCS 在治疗青少年心境障碍抑郁发作方面具有潜在的疗效,且不同靶点的治疗效果及其影像学标志存在显著差异。DLPFC 阳极刺激显示出最显著的症状缓解效果和 Yeo7 网络间功能连接的增强,提示其在调节情绪和认知功能方面的关键作用。DMPFC 阳极刺激同样有效,主要通过增强自我参照和情绪调节功能。OC 阴极刺激的疗效相对较弱,但仍对视觉皮层功能有一定影响。总之,本研究为个性化 tDCS 治疗青少年抑郁症提供了科学依据,并提示未来应进一步探索不同脑区在情绪调节中的具体机制及其临床应用潜力。

童年创伤在儿童青少年社交焦虑障碍奖赏加工机制的 ERP 研究

李天欣¹ 张骁晨¹ 巫静怡¹ 甘淑珍¹ 刘文敬¹ 程文红^{1,2}

1.上海市精神卫生中心(上海市心理咨询培训中心)
2.上海交通大学附属第一人民医院

目的 社交焦虑障碍(Social anxiety disorder, SAD)是一种以社交功能受损为特征的精神障碍,表现为过度害怕社交场合与退缩等症状,在儿童青少年时期发病率显著升高。目前的 SAD 循证治疗方法疗效有限,40%到60%的 SAD 患者的预后效果不佳。童年创伤是社交焦虑障碍的重要风险因素之一。有研究认为童年创伤可能会损伤大脑奖赏功能,使社交行为不再具有奖赏性,从而导致严重的社交退缩,但其对 SAD 的发生和发展机制仍不明确。因此,本研究采用事件相关电位(Event-related potential, ERP)探究童年创伤对青少年 SAD 在奖赏加工的神经机制。

方法 本研究共招募 120 名 10-18 岁儿童青少年被试,包括 SAD 病例组(n=62, M=14.79, SD=1.78)和健康对照组(n=58, M=14.06, SD=2.06)。本研究采用混合实验设计,以门任务范式研究青少年 SAD 患

者在奖赏反馈中是否存在异常表现以及童年创伤对此是否存在调节作用。

结果 1)与健康对照组相比,儿童青少年社交焦虑障碍患者在金钱奖赏和社交奖赏潜伏期更短。2)有童年创伤的 SAD 患者仅在社交奖赏条件下的奖赏反馈阶段 ERP 潜伏期显著长于无童年创伤的 SAD 患者,在金钱奖赏条件下二者的潜伏期无显著差异。

结论 社交焦虑障碍患者的奖赏加工功能存在异常。SAD 患者对奖赏的反应速度更快,这可能表明 SAD 患者对奖赏的敏感性更高,且存在社交特异性。然而,童年创伤对 SAD 奖赏反馈的具体影响取决于奖赏类型,有童年创伤的 SAD 患者仅对社交奖赏反应速度减慢,这可能提示了其对社交奖赏的敏感性降低。本研究有助于深入探讨童年创伤如何通过影响大脑奖赏加工系统来促进 SAD 的发展与维持,为童年创伤与 SAD 的关系提供了新的证据。

基于全国多中心的抑郁青少年手机依赖对睡眠质量影响的网络分析研究

汪燕妮¹ 周勇杰²

1.兰州大学
2.深圳康宁医院

目的 探索抑郁青少年手机依赖与睡眠质量症状间关联,识别核心症状及桥梁症状,进而探索两者症状间的潜在因果关系,深入了解两者间的发生机制,为改善睡眠质量提供一定的科学依据及理论指导。

方法 自 2020 年 12 月至 2022 年 12 月,从中国 9 个省份的 14 家精神专科医院招募符合《精神障碍诊断与统计手册(第五版)》抑郁发作标准的 12~18 岁门诊及住院患者。采用自编人口学及临床特征问卷、手机依赖指数量表(Mobile Phone Addiction Index, MPAI)、匹兹堡睡眠质量指数量表(Pittsburgh Sleep Quality Index, PSQI)以及患者健康问卷(Patient Health Questionnaire, PHQ-9)对抑郁青少年的一般人口学及临床资料、手机依赖行为、睡眠质量及抑郁程度进行调查。使用 R Studio 进行网络

分析及可视化,得到手机依赖-睡眠质量的正则化偏相关网络及症状节点的中心性及桥接中心性,并计算症状节点的可预测性;评估网络节点的稳定性;最后通过贝叶斯网络建立症状的有向无环图。

结果 本研究共纳入 2200 名抑郁青少年,平均年龄为 14.99 ± 1.65 岁。抑郁青少年 MPAI 与 PSQI 总分及七个维度得分之间存在正相关。MPAI 总分与 PSQI 呈正相关 ($r=0.214, p<0.01$)。在手机依赖-睡眠质量正则化偏相关网络中,共 40 条边的权重没有被缩减为零。手机依赖和睡眠质量内部症状的关联较强,边 P3- P4[睡眠时间-睡眠效率, EW(Edge Weight)=0.492]的权重最强,其次为边 P1-P2(主观睡眠质量-入睡时间, EW=0.377),边 M1-M2(失控性-戒断性, EW=0.352)与边 M1-M4(失控性-低效性, EW=0.352)。网络中症状 M2(戒断性)的预期影响最强,表明其是该网络的核心症状,其次是 P1(主观睡眠质量)。在桥接预期影响方面, M2 最高,其次为 P7(日间功能障碍)和 P5(睡眠障碍),表明以上三者为该网络的桥梁症状。有向无环图显示 M2(戒断性)及 P1(主观睡眠质量)症状处于有向无环图的顶端。P6(催眠药物)则处在最底部,受到睡眠质量症状及手机依赖症状的影响。M4(低效性)影响 P7(日间功能障碍)可能是手机依赖影响睡眠质量的路径。

结论 “戒断性”症状是手机依赖-睡眠质量网络的核心症状。“主观睡眠质量”则是睡眠质量症状群中的核心症状。“日间功能障碍”是睡眠质量中受手机依赖影响最严重的症状,并充当了进一步影响其他睡眠症状的渠道。

计算机认知矫正治疗在非自杀性自伤青少年抑郁发作患者中的应用

刘陈*

宜昌市精神卫生中心

目的 探讨计算机认知矫正治疗(Computerized Cognitive Remediation Therapy, CCRT)对非自杀性自伤(Non-suicidal Self-injury, NSSI)青少年抑郁发作患者中的应用效果。

方法 采用便利采样法选取 84 例 NSSI 青少年抑郁发作患者为研究对象,采用随机对照分为试验组和对照组,对照组接受氟西汀药物治疗和常规康复治疗,试验组在对照组的基础上,进行 CCRT 训练,对照组治疗:①由一名副主任医师对患者的病情进行常规抗抑郁药;②康复护士进行工娱治疗,1 次/天,45 分钟/次;③健康教育和心理疏导。试验组治疗:在对照组的基础上对患者进行 CCRT 训练,包括对患者注意力、信息处理能力、执行力、记忆力和空间视觉能力的训练。软件使用的是南京伟思科技公司生产的操作系统。每天 2 次,30 分钟/次,共 30 次。具体训练措施:①治疗前对患者进行全面评估,了解患者的情绪、自伤意念及认知水平,然后确定治疗的方案和计划。②根据患者的整体水平选择对患者有吸引力、强度适宜的训练程序,最初的治疗方案选择患者容易接受和掌握的程序,使患者得到更多的奖励,治疗师关注患者的自我适应能力,避免在治疗过程中出现退出;③治疗操作前,康复治疗师会对整体治疗方案进行详细讲解,告知患者最有助于提高训练成果的方法和手段,根据患者不同情况采取个性化方式指导。30 分钟结束后,根据患者训练的成功与否,帮助个人调整计划和目标。评价工具:采用自编一般资料问卷收集患者的主要信息,包括基本信息:性别、年龄、受教育程度;疾病相关因素:学习成绩、家庭支持、人际关系等。采 HAMD-17 评定患者抑郁状态,采用 FASM 评估自伤行为。

结果 抑郁情绪治疗前,计算机认知矫正训练组(试验组)与传统康复训练组(对照组)HAMD-17 评分比较,无显著差异($p>0.05$)。治疗 2 周后,试验组较对照组而言 HAMD-17 的评分明显下降,呈显著差异($p<0.05$);非自杀性自伤行为治疗前,计算机认知矫正训练组(试验组)与传统康复训练组(对照组)FASM 评分比较,该评分分为行为问卷与功能问卷,两部分无显著差异($p>0.05$)。治疗 2 周,试验组较对照组 FASM 评分,行为和功能问卷得分均下降,呈显著差异($p<0.05$)。在组内比较中,试验组行为问卷评分与功能问卷评分在两周治疗后显著降低($p<0.05$);对照组两部分评分变化不明显。

结论 对 NSSI 青少年抑郁发作患者采用药物治疗加上 CCRT,有积极的临床意义,可以改善患者的抑郁情绪,减少非自杀性自伤行为的发生,能帮助抑郁青少年患者的社会功能恢复,促进疾病康复。

双靶点加速重复经颅磁刺激治疗青少年抑郁快感缺失症状的疗效研究

刘逸洋¹ 舒燕萍²

1. 贵州医科大学

2. 贵州省第二人民医院

目的 青少年抑郁患者的快感缺失症状与奖赏环路功能失调有关，眶额皮质被认为与大脑奖赏系统密切相关，本研究旨在探究联合左侧背外侧前额叶(left dorsolateral prefrontal cortex, L-dIPFC)和右侧眶额叶(Right orbitofrontal cortex, R-OFC)的双靶点加速重复经颅磁刺激(accelerated repetitive transcranial magnetic stimulation, arTMS)治疗青少年抑郁患者快感缺失症状的疗效。

方法 本研究为随机单盲实验，在贵州省某医院随机选取 66 名青少年抑郁患者，随机分配到双靶点组、单靶点组和伪刺激组。其中，双靶点组患者先接受以 L-dIPFC 为刺激靶点的高频 arTMS 治疗，再接受以 R-OFC 为刺激靶点的持续性 θ 波短阵快速脉冲经颅磁刺激治疗(Continuous theta burst stimulation, CTBS)；单靶点组患者则先接受以 L-dIPFC 为刺激靶点的高频 arTMS 治疗，再采用伪刺激线圈对 R-OFC 进行伪 cTBS 治疗；伪刺激组先在 L-dIPFC 进行伪刺激治疗，接着对 R-OFC 进行伪刺激治疗。三组的治疗频次均为 4 次/天，连续 5 天，共 20 次。

三组均在 arTMS 干预前(T1)、干预结束当天(T2)和干预结束一周(T3)进行汉密尔顿抑郁量表(HAMD-17)评估和斯奈思-汉密尔顿快感量表(SHAPS)测评。

结果 对 HAMD-17 得分进行重复测量方差分析发现，组别 \times 时间的交互作用显著($F=7.804$, $p<0.001$)。进一步的简单效应分析显示，在 T1 期，三组在 SHAPS 得分上均无显著差异($F=0.087$, $p>0.05$)；在 T2 和 T3 期，单靶点组和双靶点组的 HAMD-17 得分显著低于伪刺激组($F=5.061$, $p<0.01$ ； $F=3.493$, $p<0.05$)。以 HAMD-17 减分率为协变量，对 SHAPS 得分进行重复测量方差分析发现，组别 \times 时间的交互作用显著($F=7.867$, $p<0.001$)。进一步的

简单效应分析显示，在 T1 期，三组在 SHAPS 得分上均无显著差异($F=0.932$, $p>0.05$)；在 T2 期，单靶点组和双靶点组的 SHAPS 得分显著低于伪刺激组($F=6.480$, $p<0.01$)；在 T3 期，双靶点组的 SHAPS 得分显著低于伪刺激组($F=4.481$, $p<0.01$)。

结论 arTMS 能够显著改善青少年抑郁患者的抑郁状况。联合 L-dIPFC 和 R-OFC 的双靶点 arTMS 能够显著改善青少年抑郁患者快感缺失症状，且在疗效持久性上显示出了一定的优势。

The Role of The Psychiatrist in Pediatric Solid Tumor Multidisciplinary Team (MDT) Consultation Model

Yanqing Xu* Yulin Wang

Children's Hospital of Fudan University, National Children's Medical Center, Shanghai

Objective With the advancement of pediatric oncology treatment, the Multidisciplinary Team (MDT) consultation model has become increasingly important. This study explores the contributions and challenges of the psychiatrist within the MDT consultation model of pediatric solid tumors

Methods Initiated by the department of pediatric oncology, the MDT consultation framework for pediatric solid tumors incorporates pediatric surgical oncologists, nurses, radiologists, pathologist, nutritionists, and psychiatrists. From January to April of 2024, 110 pediatric patients, either newly diagnosed with or having received partial treatment for solid tumors, were reviewed. The psychiatrist played a key role in enhancing communication between physicians and patients during the meetings and conducted biopsychosocial assessments afterward, including interviews with both pediatric patients and their caregivers to assess sleep patterns, appetite, pain levels, mood, medication adherence, lifestyle, coping strategies, and the overall emotional well-being and burden experienced by family members. Following these assessments, targeted and timely interventions

were implemented to support both the pediatric patients and their caregivers

Results The top three tumors reviewed were neuroblastoma (n=18), hepatoblastoma (n=7), and nephroblastoma (n=4), with patient ages ranging from 1 month to 15 years old (mean age=3.67 years). Psychosocial assessments identified 10 cases with loss of appetite (9.09%), 12 cases with sleeping disturbances (10.90%), 15 patients exhibiting pain, (13.64%), 5 cases of medication nonadherence (4.55%), 30 patients experiencing emotional problems (27.27%), and 11 cases (10.00%) of caregivers experiencing significant psychological distress. Interventions included disease education, parenting advice, dietary and sleep guidance, enhancement of parent-child communication, promotion of healthy lifestyles, and emotional support through play therapy (n=2) and music therapy (n=4). Caregivers' limited awareness and inadequate disease education result in poor mental health awareness, preventing them from sufficiently observing their children's suffering and seeking professional assistance

Conclusion The psychiatrist's involvement in the MDT consultation model for pediatric solid tumors enhances physician-patient communication, effectively screens children and caregivers at different risk levels, and provides timely interventions. Through the engagement of psychiatric professionals, this model contributes to alleviating suffering, enhancing medication adherence, providing ongoing monitoring, reducing the incidence of mental health disorders, supporting the normalization of daily activities for children, and ultimately improving the quality of life for patients. Further research on enhancing disease education, mental health awareness, community support, and resource sharing is recommended.

Diagnosis and Clinical Characteristics of Obsessive-Compulsive Disorder in Chinese Children and Adolescents: An Application Study Based on CBCL-OCS

Rongkun Su¹, Wanling Zhang², Na Hu², Xiuzhen Wang¹, Ying Li²

1.Shenyang Mental Health Center

2.Beijing Children's Hospital

Objective Obsessive-compulsive disorder (OCD) is recognized globally as a serious mental health concern among children and adolescents. Accurate early diagnosis and intervention are crucial for effective management and improving patient outcomes. This study utilized the Child Behavior Checklist-Obsessive Compulsive Scale (CBCL-OCS) to investigate the prevalence, clinical features, and comorbidities of OCD in a cohort of Chinese middle school students

Methods A cross-sectional epidemiological survey was conducted among 8,595 middle school students in Liaoning Province, China. The CBCL-OCS was employed as the primary screening tool. The optimal cutoff value for OCD screening was determined through receiver operating characteristic (ROC) curve analysis

Results The study found an OCD prevalence of 1.710% among all the samples, which was consistent with global estimates. ROC analysis determined a cutoff score of 2.5 for CBCL-OCS, with a sensitivity of 0.789 and specificity of 0.899. Furthermore, the analysis revealed that adolescent students exhibited significantly higher CBCL-OCS scores compared to younger children, suggesting an increase in OCD severity with age. Significant associations were also found between OCD symptoms and comorbid emotional disorders, behavioral problems, and anxiety symptoms

Conclusion This study confirms the utility of CBCL-OCS as an effective early screening tool for OCD in Chinese middle school students, highlighting its sensitivity and specificity. This study contributes valuable insights into the epidemiology of OCD among children and adolescents, underscoring the need for targeted interventions during critical developmental periods such as adolescence.

自我增强与自杀意念在非自杀自伤、阈下非自杀自伤及健康个体中的比较研究

李梦媛 吴超*

北京大学护理学院

目的 消极的自我观是非自杀性自伤(NSSI)患者重要的心理特点。自我增强是个体增加积极自我观、减少消极自我观的一种最常见的自我动机,它促使人们产生一种认为自己比他人好的积极偏向。本研究在NSSI组、阈下NSSI组和对照组中比较自我增强的差异,并在自伤个体中探索自我增强与自伤行为和自杀意念之间的关系。

方法 采用横断面的研究设计,NSSI组符合DSM-5中NSSI诊断标准($n=259$,男性165,21.3 \pm 1.3岁),阈下NSSI组有自伤经历但不符合NSSI诊断($n=61$,男性41,年龄20.9 \pm 1.4),健康对照无自伤经历($n=59$ 人,男性36,21.0 \pm 1.4岁)。自我增强与自我保护问卷包括四个维度:防御、拥抱积极、良好认知和自我肯定思维;NSSI采用非自杀性自伤行为功能评估量表,每一种自伤行为的次数与伤害程度相乘加和得到自伤指数(严重程度);采用自杀意念量表评价自杀意念。

结果 三组个体在人口学特征上无显著差异。自我增强各维度的组间比较发现,防御和拥抱积极两个维度上,NSSI组得分显著高于阈下NSSI组和对照组(校正后 $p<0.05$),良好认知维度上NSSI组显著低于阈下NSSI组和对照组(校正后 $p<0.05$)。自我增强各维度在对照组和阈下NSSI组间无差异。阈下组中,防御维度与自伤指数($r=0.34$, $p=0.006$ 、自杀意念显著正相关($r=0.29$, $p=0.02$);良好认知($r=-0.54$, $p<0.001$)和自我肯定思维($r=-0.26$, $p=0.04$)与自杀意念显著负相关。NSSI组中,良好认知与自伤指数显著负相关($r=-0.13$, $p=0.04$),自我增强各维度与自杀意念均显著相关(防御 $r=0.25$;拥抱积极 $r=-0.21$;良好认知 $r=-0.36$;自我肯定思维 $r=-0.37$, p 均 <0.001)。回归分析发现NSSI组良好认知($\beta=-0.71$, $p=0.013$)和自我肯定思维($\beta=-0.98$, $p=0.002$)与自杀意念的关联显著高于对照组,调整了焦虑抑郁协后,良好认知与组别对自杀意念的交互效应依然显著。

结论 相较于阈下NSSI个体和健康对照,NSSI个体自我增强防御水平和自我服务偏向的归因(拥

抱积极维度)较高,自我评价(良好认知)下降。NSSI和阈下NSSI个体中,自我增强的良好认知和自我肯定思维两个维度都与较低的自杀意念有关。本研究提示通过提升NSSI患者的自我认知和自我评价,可能会降低自伤行为个体的自伤严重程度和自杀意念。

一项孤独症谱系障碍纵向随访队列项目:基于社交分型的孤独症谱系障碍生物标记物和疾病发展轨迹的设计和方法

孟凡超 何凡*

首都医科大学附属北京安定医院

目的 孤独症谱系障碍(ASD)患者的临床表型和病因学多样性一直是ASD病因学研究及新疗法开发的主要障碍,目前尚不清楚细胞、分子、大脑系统、认知和/或行为水平上的不同病因和表型多样性是如何相互关联的。为了识别有用的生物标记物,我们需要从整体人群的差异转移到精确识别不同的亚组水平,以便于更好地理解个体差异。当前证据表明,由著名精神病学家、领域开拓者Lorna Wing提出的社交分型分型(冷漠型、被动型、主动但怪异型)是一种合理的ASD分型,在临床与科研方面应用潜力大,但目前该分型的神经基础是什么仍未知。本研究拟组建一个ASD纵向随访队列,使用脑影像、眼动、血液生化等多种技术手段及指标,探究不同社交分型的ASD发生发展的潜在生物学标记物及疾病发展规律,绘制不同社交分型ASD儿童的疾病发展轨迹,为ASD的精准诊疗提供生物学依据。

方法 该队列研究将包括200名患有ASD的3-12岁儿童、100名1-3岁的疑似ASD儿童,以及150名具有典型发育儿童。采用纵向随访研究设计,对每位参与儿童的临床症状、共病情况、智力发育水平、认知功能、大脑结构和功能、生化标记物和基因组学进行全面测查。同时,采集生活环境相关信息,探索环境对于不同分型ASD儿童疾病发生发展的影响。

结果 将疑似ASD儿童或不同分型确诊儿童的眼动、核磁共振、生物学指标与正常儿童进行对

比,采用多因素协方差分析各指标与组别的关系,采用不同的机器学习算法来建立诊断判别模型,分析判别的准确性、敏感性和特异性,最后通过受试者操作特征(ROC)分析,寻找ASD高危预警和分型判别的最佳模型;使用多次评估结果,利用分类潜变量模型和潜增长曲线模型识别目标指标轨迹亚组是否存在,使用0.7作为熵值标准,以评价模型的分类和预测效率。此后分别使用线性、类别等增长函数构建纵向分类增长模型和广义混合模型,使用光滑检验法用于误差分布的检验,使用BIC、AIC等参数进行最优模型的筛选,建立发展轨迹模型。

结论 通过建立此队列,能够使我们探究和完善不同社交分型ASD儿童具有不同神经生物学病因基础的假设,同时也希望能够构建具有生物学和临床意义的ASD亚组,帮助我们探究表型多样性和不同病因之间的关系。

注意缺陷多动障碍青少年社交困难特征及社交干预训练效果探究

杨依婧 文竹* 魏佳 李瑜 吴芷衡 徐赟佳
复旦大学附属儿科医院精神心理科

目的 探究注意缺陷多动障碍(ADHD)青少年社交困难的特征,以及社交技能教育和促进项目(PEERS)对其的干预效果。**方法** 在心理科门诊招募符合DSM-5中ADHD诊断标准、存在社交困难并自愿参与干预的10~15岁青少年79人,成为干预组;抽样上海市闵行区小学及初中同年龄无相关诊断学生作为健康对照组共307人。家长使用长处与困难问卷(SDQ)和社交技能家长评定量表(SSRP),学生使用友谊质量问卷(FQQ)评估同伴交往问题、社交技能,和友谊质量水平。在年龄、性别、是否共病阿斯伯格综合症(共12人共病阿斯伯格综合症)等因素下比较社会交往特征和困难。对干预组分批次进行PEERS干预(每轮团体6~8人,已累计干预29人,其余为等待组),干预后再次复评。

结果 ADHD组与健康组在SDQ各维度的得分差异均具有统计学意义($p<0.01$),其中ADHD组

的同伴交往问题得分更高($t=8.91, p<0.001$),亲社会行为得分更低($t=5.55, p<0.001$)。除社会敏感性、个体敏感性和掩饰性维度外,ADHD组在SSRP各维度得分均低于健康组,且差异具有统计学意义($p<0.001$)。除冲突与背叛维度外,ADHD组在FQQ各维度上的得分也均低于健康组,且差异具有统计学意义($p<0.001$)。ADHD女生在情绪问题上的得分高于男生($t=2.14, p<0.05$),而ADHD组男生在交往意向上的得分高于女生($t=2.84, p<0.01$)。小学组ADHD青少年在表达技巧($t=2.63, p<0.05$)和社会交往技巧($t=2.10, p<0.05$)上的得分低于初中组ADHD青少年。非共病阿斯伯格综合症的ADHD比共病的青少年,在SDQ情绪问题($t=3.37, p<0.01$)、品行问题($t=2.60, p<0.05$)及亲社会行为($t=3.30, p<0.01$)维度上得分更高。干预后,ADHD青少年在SSRP中的掩饰性维度($t=2.64, p<0.05$)和社交技能总分($t=2.52, p<0.05$)提高。是否共病阿斯伯格综合症对ADHD青少年的干预效果不存在显著差异。

结论 ADHD青少年在同伴交往上的困难可表现为社交技能的欠缺及友谊质量水平低。不同性别的ADHD青少年面临的困难略有不同:女生的情绪问题更突出且交往意向更低。上述结果提示PEERS训练能改善单纯ADHD及共病阿斯伯格综合症的青少年社交技能,干预目标在ADHD青少年群体中基本达成。

12个月ASD患儿的全基因组差异甲基化特征

张子一¹ 李旭光² 林明焰² 关陆阳¹ 李倩¹ 柯晓燕¹

1.南京医科大学附属脑科医院
2.南京医科大学

目的 遗传及环境因素相互作用增加了探究孤独症谱系障碍(Autism Spectrum Disorder, ASD)病因的难度。表观遗传为深入了解ASD病因以及症状发展提供了新的视角。DNA甲基化存在时空特异性,本研究目的基于南京医科大学高危ASD前瞻性队列探究12个月时是否存在于ASD早期非

典型性行为特征有关的 DNA 甲基化模式,再基于国家出生队列,对比 ASD 患儿和典型发育 (typical development, TD) 幼儿 12 个月时的全基因组差异甲基化特征,探究具有症状预测价值的表观遗传标志物。

方法 根据 ASD 早期非典型性行为对南京医科大学高危 ASD 前瞻性队列中的高危 ASD 婴幼儿进行分组,分为发育需警示组 (HR+) 和发育良好组 (HR-); 根据 3 岁时的诊断结果对国家出生队列的被试进行分组,分为 ASD 组和 TD 组。使用全基因组重亚硫酸盐测序技术探究 12 个月时外周血 DNA 甲基化特征,进行 PCA 分析、差异甲基化分析以及通路富集分析。将发现的差异甲基化基因 (differentially methylated genes, DMGs) 与 SFARI 数据库比对。

结果 HR+组 CG 甲基化程度更低更低,差异显著 DMR 主要存在于内含子区以及基因间区域。GO 富集分析结果 DMGs 主要富集在神经元突触生长与功能,以及 GTP 酶激活等。KEGG 富集分析结果表明 DMGs 主要富集在轴突引导, cGMP-PKG 信号通路以及细胞粘附连接等通路上。两个队列中发现共表达的 ASD 风险基因 13 个,以及 86 个未被纳入 SFARI 中的基因。

结论 DMG 主要富集在神经突触以及 GTP 酶相关基因上。这些 DNA 甲基化模式与早期行为学表现相关。提示 12 个月时的 ASD 相关行为特征与早期 DNA 甲基化模式异常有关。研究结果对未来 ASD 候选基因的选择,以及进一步探究 DNA 甲基化对 ASD 症状的影响提供线索。

Unveiling Sex Difference in Factors Associated with Suicide Attempts Among Chinese Adolescents with Depression: A Machine Learning-based Study

Yongjie Zhou¹, Siyu Chen², Jiayao Liu², Bowen Zhang², Xinwen Zou³, Yang Wang²

1. Shenzhen Kangning Hospital

2. College of Management, Shenzhen University

3. School of Business Informatics and Mathematics,

University of Mannheim

Objective Adolescents with depression are at higher risk of suicide, while in China, the suicidal phenomenon presents a unique sex pattern. This study aims to investigate the sex differences in factors influencing suicidal attempts among Chinese adolescents with depression

Methods We surveyed 2343 depressed adolescents from China. Building upon previous research, 36 potential influencing factors were selected from psychological, sociodemographic, and social stress perspectives. Models were constructed separately based on sexes using the random forest method to discern sex differences in factors influencing suicide attempts, followed by further result interpretation using the SHAP method

Results The random forest exhibited strong performance (male accuracy = 70%, female accuracy = 63%). The relative importance of each factor varies between depressed male and female adolescents, with sex differences observed in the relative importance of certain factors. Depression (female ranking=1, male ranking=12), parents' overprotection (female ranking=4, male ranking=21), have a more pronounced impact on the prediction of suicide attempts among female depressed adolescents. In contrast to the findings among females, the perception of parental relationships (female ranking=31, male ranking=2), hopelessness (female ranking=15, male ranking=4), BMI (female ranking=13, male ranking=6) are the significant factors more closely associated with suicide attempts for male adolescents with depression

Conclusion Our research highlights significant differences in factors influencing suicide attempts between sex groups among severely depressed Chinese adolescents, emphasizing the need for tailored suicide prevention measures.

关键词: suicide attempt; Major depression adolescents; Random forest; SHAP

基于机器学习开发的多模式诊断系统对

ADHD 诊断价值的初步研究

张雅茹 罗学荣*

中南大学湘雅二医院

目的 基于 CPT (Continuous Performance Test, CPT) 指标、头部动作、眼部注视特征、腿部动作等多模态数据特征, 开发并验证 5-14 岁中国儿童 ADHD 的筛查诊断辅助系统。

方法 (1) 开发包含 CPT 测试任务、头部动作、眼部注视特征、腿部动作的多模态诊断系统。

(2) 招募 2023 年 4 月至 2023 年 6 月期间在中南大学湘雅二医院就诊的 5-14 岁智力正常的儿童, 按照 DSM-5 中 ADHD 的诊断标准, 将明确诊断为 ADHD 的儿童纳入 ADHD 组, 正常儿童纳入对照组, 两组儿童均进行多模式诊断系统的评估。(3) 分别对 CPT 指标、头部动作、眼部注视特征、腿部动作几种技术进行 11 种组合, 再用人工智能的方法, 对采集到的数据进行机器学习得出每位受试者的标准测试分数。

(4) 将所有被试儿童按年龄性别进行分层, 按 4:1 的比例随机分配至训练集和验证集, 通过机器学习对训练集儿童进行特征分析, 再通过 ROC 曲线确定诊断阈值, 在验证集儿童中验证诊断有效性, 同时与临床常用的 ADHD-RS-IV 量表进行对比。

结果 (1) 研究共纳入 157 例儿童, ADHD 组 80 例, 对照组 77 例。将所有被试儿童按年龄进行分层, 按 4:1 的比例随机分配至训练集 126 例 (ADHD 组 64 例) 和验证集 31 例 (ADHD 组 16 例)。(2) 多模式诊断系统的 4 种技术 (CPT 指标、头部动作、眼部注视特征、腿部动作) 进行 11 中组合, 各组合 ROC 曲线下面积 AUC 均在 0.9 以上, 平均值为 0.98。(3) 4 种技术单独用于 ADHD 诊断时, CPT 的诊断效能最佳, 灵敏度和特异度分别为 0.75、0.87。(4) CPT 与眼部注视特征结合分析时, 灵敏度和特异度分别提高至 0.81、0.93, 其中特异度在所有组合中最高。(5) CPT 与头部和腿部动作结合分析时, 灵敏度提升至 0.94, 在所有组合中最高, 特异度 0.80。(6) 在验证集中, ADHD-RS-IV 评定量表诊断 ADHD 的灵敏度 0.75、特异度 0.80。

结论 (1) 基于机器学习开发的多模式诊断系统能够快速准确分析 ADHD 儿童的特征表现。(2) 单独应用 CPT 或腿部动作可以获得较好的诊断有效性, 单独应用眼部注视特征仅可较好的识别正常儿童, 单独应用头部动作诊断有效性低。(3) 多模态整

合中, CPT 与眼部注视特征的整合, 以及 CPT 与头部动作和腿部动作的整合, 诊断有效性均较高, 前者特异度最佳, 后者灵敏度最佳。

关键词: ADHD, CPT, 多模态, 机器学习, 眼部注视

Structural Covariance Network Activity in The Medial Prefrontal Cortex Is Modulated by Childhood Abuse in Adolescents with Depression

Zhanjie Luo Yanling Zhou Yuping Ning*

Zhanjie Luo

Objective Aberrant structural covariance (SC) in the medial prefrontal cortex (mPFC) is believed to play a crucial role in adolescent-onset major depressive disorder (AO-MDD). However, the effect of childhood abuse (CA) on SC in AO-MDD patients is still unknown

Methods Here, we measured anomalous SC in the mPFC of AO-MDD patients and assessed the potential modulation of this feature by CA. We acquired T1-weighted structural images of AO-MDD patients ($n = 93$) and healthy controls (HCs, $n = 81$). Using voxel-based morphometry analysis, we calculated gray matter volumes for each subject. Subsequently, we classified abnormal SC in the mPFC into three subtypes according to overall CA

Results Compared with HCs, AO-MDD patients showed alterations in the structural covariance network of the mPFC, which is a central region in the default mode network (DMN). We also found an anterior-posterior dissociation in the structural covariance connectivity of the DMN. A history of CA modulated bilateral mPFC SC. These changes were primarily focused on the SC between the mPFC and the limbic system, indicating a gap in the rate of neural maturation between these regions

Conclusion In summary, the DMN and frontal-limbic system, which are involved in emotional processing, appear to play a significant role in the development of AO-MDD. These findings highlight the crucial

effects of CA on neurophysiological alterations in individuals with AO-MDD

Associations between Abnormal Electroencephalogram Microstates and Childhood Emotional Abuse in Adolescent Depression

Jinhui Hu¹, Lingli Ma¹, Wo Wang², Li Kuang^{1,2}

1.The First Affiliated Hospital Of Chongqing Medical University

2.University-town Hospital Of Chongqing Medical University

Objective Childhood traumatic experiences greatly influenced the brain network activities of patients with depression, and there is an urgent need to explore the temporal dynamics for these changes. This study aims to investigate the abnormalities of resting-state electroencephalogram (EEG) microstates in eye-open state of depressed adolescents and to explore the correlations between their EEG microstates and the childhood traumatic experience

Methods Using resting-state EEG microstate analysis, we explored the temporal dynamics of brain activity in patients with adolescent depression. This study selected 66 adolescents with depression as a patient group, and 27 healthy adolescents as a healthy control group. A modified k-means clustering algorithm was used to classify the 64-channel resting-state EEG data into different microstates. Independent sample t-tests were used to compare the microstate parameters between the 2 groups and further associations between these parameters and childhood traumatic experience in patients were explored via using Spearman correlation

Results In this study, significant differences were observed in the occurrence and transition probabilities of EEG microstates between the healthy control and the patient group. Notably, there was a statistically

significant difference ($P < 0.05$) in the occurrence of microstate A across 2 groups, exhibiting a negative correlation with the emotional abuse component within the childhood trauma scores (Spearman's $\rho = -0.31$, $P = 0.013$). Furthermore, patient-specific, non-random transitions from microstate B to A (Spearman's $\rho = -0.30$, $P = 0.015$) and C to A (Spearman's $\rho = -0.31$, $P = 0.013$) were inversely associated with the scores of emotional abuse factors from childhood trauma in the patient group, showing statistically significant differences when comparing to the healthy controls ($P < 0.05$). Upon stratification into quartiles based on the emotional abuse factor scores, the occurrence of microstate A, as well as the transition rates from microstates B to A and C to A, retained statistical significance following adjustment for multiple comparisons (all $P < 0.05$)

Conclusion The abnormal temporal dynamics in brain networks of adolescents with depression are linked to childhood emotional abuse. Those who have suffered severe emotional abuse may show greater impairments in the brain's visual and central executive networks. EEG microstate analysis could be a potential tool for detecting adolescent depression with severe childhood trauma.

5 步式叙事护理实践模式对青少年抑郁症患者的心境状态、自我管理积极度及生活质量的影响

唐四红 刘川*

重庆医科大学附属大学城医院

目的 探究 5 步式叙事护理实践模式对青少年抑郁症患者的心境状态、自我管理积极度及生活质量的影响。

方法 选取重庆医科大学附属大学城医院精神科 2023 年 3 月至 2024 年 3 月诊治的青少年抑郁症患者 102 例,采用非同期对照的方法,随机选取 2023 年 3 月—2023 年 9 月的研究对象 51 例作为

对照组,给予精神科常规护理;2023年10—2024年3月的研究对象51例作为观察组,在精神科常规护理基础上实施叙事护理实践模式干预,以探讨叙事护理实践模式干预对青少年抑郁症患者心境状态、自我管理积极性及生活质量的影响。

结果 干预后SAS、SDS得分情况为观察组低于对照组,差异有统计学意义($P<0.05$);自我管理积极性得分情况为观察组高于对照组,差异有统计学意义($P<0.05$);干预后生活质量总分、生理状况、社会/家庭状况、情感状况、功能状况维度得分情况为观察组高于对照组,差异有统计学意义($P<0.05$);干预后患者满意度为观察组(92.1%)高于对照组(74.5%),差异有统计学意义($P<0.05$)。

结论 将5步式叙事护理实践模式应用于青少年抑郁症患者,可有效改善青少年抑郁症患者SAS、SDS等心境状态,提高患者自我管理积极性、生活质量和护理满意度水平。

网络视角下的青少年心境障碍患者的抑郁症状与心理弹性的关系

李彦霖¹ 陈培煜² 张康福茜¹ 来庆娟¹ 高颖¹ 崔再续² 曹庆久¹

1.北京大学第六医院/精神卫生研究所,国家精神心理疾病临床医学研究中心,卫生部精神卫生学重点实验室(北京大学)

2.北京脑科学与类脑研究所

目的 心理弹性能够帮助青少年更好地应对生活中的挑战和压力,从而减少抑郁情绪的产生和持续。本研究在网络视角下,致力于探究青少年心境障碍患者抑郁症状严重程度与心理弹性之间的联系,并比较与青少年健康群体之间的差异。期望能够更全面地理解心理弹性与抑郁症状发生发展的关系,并为临床干预和治疗提供有力的科学依据。

方法 招募12-18岁的青少年心境障碍患者及健康对照,使用儿童抑郁自评量表(DSRSC)评定抑郁症状的严重程度,使用心理弹性量表(CD-RISC)评定心理弹性能力,以DSRSC的总分以及CD-RISC的五因子作为节点,利用正则化偏相关模型,结合

扩展贝叶斯信息准则(EBIC)方法,构建了青少年心境障碍患者与健康对照两组人群的网络结构。

结果 (1)共入组219例心境障碍患者,136例健康对照。年龄(14.16 ± 1.48 VS 14.48 ± 1.82 , $p>0.05$)无显著差异、性别(男女1:3.7 VS 男女1:1.2, $p<0.001$)有显著差异。与健康对照组相比,青少年心境障碍患者报告的心理弹性(CD-RISC)水平明显较低($W=2965$, $p<0.001$),而抑郁症状(DSRSC)得分较高($W=28306$, $p<0.001$)。(2)青少年心境障碍患者网络中,抑郁总分-“积极接受变化并确保关系安全”成负相关($r=-0.27$);“相信直觉、容忍负面影响、抗压”是该网络中强度最高的节点;“个人能力、高标准、坚韧”是该网络中期望影响值最高的节点。而健康对照网络中,抑郁总分-“个人能力、高标准、坚韧”成负相关($r=-0.18$);“积极接受变化并确保关系安全”是该网络中强度和期望影响值最高的节点。(3)青少年心境障碍患者网络连接更为紧密,两个网络在结构上具有显著差异($M=0.58$, $p=0.003$)。控制性别后,该差异仍然显著($M=0.33$, $p=0.034$)。

结论 研究结果显示,无论是否被诊断为心境障碍,心理弹性都是情绪的重要保护因素。在青少年心境障碍患者与健康对照组之间,心理弹性的影响存在显著的差异。因此应推广具体的心理教育和心理治疗干预措施,以有针对性地提升青少年的心理弹性。对于青少年心境障碍患者,应更多地从接受变化和发展安全关系方面来提高心理弹性。

2.国家卫生健康委员会精神卫生学重点实验室[北京大学],国家精神心理疾病临床医学研究中心[北京大学第六医院]

目的 代偿被定义为一种自动或主动的机制。神经发育障碍中的代偿即是在神经认知水平存在核

心缺陷的情况下,仍致力于改善外显行为表现的过程。本研究旨在通过构建注意缺陷多动障碍(ADHD)代偿模型,探讨 ADHD 代偿的静息态脑功能机制。

方法 研究共纳入 253 名被试,包括成人 ADHD 患者 175 名及健康成人(HC)78 名。以执行功能行为评定量表-成人版工作记忆因子为 ADHD 代偿模型的横坐标,ADHD 评定量表注意缺陷因子为纵坐标,本研究 ADHD 受试者的得分中位数为分界值,分别将坐标系的左下、左上、右上、右下区间定义为深、浅、低、高代偿组。以低频振幅(ALFF)、局部一致性(Reho)和功能连接(FC)为评估指标,使用协方差分析探索四种代偿组别脑功能的差异(高斯随机场 GRF 校正:体素水平 $p < 0.001$,团块水平 $p < 0.05$,双侧检验),事后分析采用 Bonferroni 校正法。此外计算 HC 组在上述差异脑区相应的影像学数据,使用协方差分析探究 HC 组与 ADHD 代偿组别的脑影像学差异。

结果 根据代偿模型将成人 ADHD 分为深、浅、低、高代偿组,分别有 66、36、50、23 例。不同代偿组别右侧眶内额上回的 Reho 值存在显著差异,高代偿组高于深代偿($p=0.010$)、浅代偿($p=0.004$)、低代偿组($p < 0.001$);进一步进行 FC 分析,发现右侧眶内额上回(默认网络)与左侧颞下回(边缘网络)的 FC 值在不同代偿组别间差异存在统计学意义,高代偿组高于深、浅、低代偿组(均 $p < 0.001$)。不同代偿组别右侧直回的 ALFF 值存在显著差异,高代偿组分别显著高于深、浅、低代偿组(均 $p < 0.001$);进一步进行 FC 分析,发现右侧直回(边缘网络)与右侧中央旁小叶(感觉运动网络)的 FC 值在不同代偿组别间差异存在统计学意义,深代偿组高于浅代偿组($p=0.001$),高代偿组高于浅代偿($p < 0.001$)及低代偿组($p=0.047$)。HC 组右侧眶内额上回与左侧颞下回的 FC 值高于深代偿($p=0.005$)、浅代偿($p=0.001$)、低代偿组($p=0.014$),而与高代偿组无显著差异($p > 0.05$)。

结论 基于神经认知和核心症状构建的 ADHD 代偿模型在不同代偿水平中存在脑功能差异,且此模型可显著区分高代偿与低/深代偿患者的脑影像学特征。此外,高代偿成人 ADHD 患者的前额叶与颞叶的脑自发活动与健康人群类似,突出了高代偿 ADHD 脑神经功能的适应性。本研究揭示了前额叶及非高级认知脑网络在 ADHD 代偿机制中的重要作用,为深入理解 ADHD 的病理机制提供了科学依据和新的视角。

Multidimensional Analysis of Suicide Risk in Major Psychiatric Disorders Using Machine Learning

Jiayi Feng^{1,2}, Ran Zhang², Xinru Wei², Xizhe Zhang², Fei Wang²

1.Xinxiang Medical University

2.Nanjing Brain Hospital

Objective Suicide is a leading cause of death among patients with psychiatric disorders, and the neurobiological features associated with it are becoming increasingly significant. This study aims to describe a machine learning model that identifies reliable blood metabolites and imaging features to distinguish suicide subtypes. By correlating metabolomics with white matter network gradients, we further explore the neurobiological mechanisms in patients with major psychiatric disorders(MPD) who have suicidal ideation or have attempted suicide

Methods Using a cross-diagnostic group of major psychiatric disorders (schizophrenia, bipolar disorder, and major depressive disorder), we employed machine learning techniques to identify peripheral blood metabolites and white matter network gradients associated with suicidal ideation and suicide attempts. External validation was conducted using gene expression data from six donated brain tissues provided by the Allen Human Brain Atlas (AHBA). Initially, we recruited 205 patients with MPD categorized into three diagnostic groups: schizophrenia, bipolar disorder, and major depressive disorder. Based on their history of suicide, participants were divided into suicidal ideation (SI), suicide attempt (SA), and no suicide attempt (NSA) groups. A non-targeted metabolomic analysis measured 669 metabolites across 30 categories. After preprocessing the metabolic data, artificial neural network (ANN) algorithms were used for binary classification models com-

paring the SA and SI groups with the NSA group, separately. The top three classification models with an accuracy greater than 70% ($P \leq 0.05$) were selected using machine learning algorithms. Additionally, we conducted correlation analyses between metabolic products and white matter network gradients related to SI and SA. Further correlation analysis between gene expressions from AHBA datasets and identified brain region of white matter network gradients

Results The model performed well in identifying SI (lysophosphatidylcholine, $AUC=0.79$, $ACC=83.41\%$; microbiome metabolites, $AUC=0.76$, $ACC=74.29\%$) and SA (fatty acids, $AUC=0.70$, $ACC=72.20\%$; steroids, $AUC=0.69$, $ACC=73.33\%$). Enrichment analysis revealed that the SA group was most significantly enriched in pathways involving aminoacyl-tRNA biosynthesis, arginine biosynthesis, biosynthesis of unsaturated fatty acids, D-Glutamine and D-glutamate metabolism, valine, leucine and isoleucine biosynthesis, alanine, aspartate and glutamate metabolism. Interestingly, the SI group did not enrich in any specific pathways. The right supramarginal gyrus ($ACC = 73\%$) and the right medial orbitofrontal cortex ($ACC = 72\%$) were predictive of SI, while the left anterior cingulate ($ACC = 75\%$), right anterior cingulate ($ACC = 72\%$), and right medial orbitofrontal cortex ($ACC = 72\%$) were predictive of SA. Further correlation analysis revealed that Amino adipic acid was positively correlated with the right anterior cingulate ($r = 0.39$, $p = 0.004$), and Pipelic acid was positively correlated with the right medial orbitofrontal cortex ($r = 0.38$, $p = 0.006$). Conversely, 5-HETE was negatively correlated with the right medial orbitofrontal cortex ($r = -0.33$, $p = 0.02$). Finally, validation analysis using the AHBA datasets revealed significant correlations of the AAMDC and AANAT genes with the right orbital frontal cortex and right anterior cingulate gyrus, further indicating that the white matter related to suicide might be associated with energy metabolism

Conclusion Our study presents a classification framework based on metabolomics and imaging features, capable of identifying SI and SA highlighting the differential metabolites and imaging features between SI and SA. Additionally, metabolic-neuroimaging correlation analyses were utilized to investigate the frontal-

limbic system-related suicide-associated metabolic products identified by the machine learning model. Further validation in the AHBA dataset suggested that the brain structures related to suicide may involve genes associated with energy metabolism, offering potential targets for exploring the molecular mechanisms of brain structural damage in suicidal behavior

儿童青少年抑郁障碍的特点及诊疗现状调查——一项基于网络社群的问卷调研

白心竹¹ 秦小明² 石卓雨² 曹庆久¹

1. 北京大学精神卫生研究所

2. 灵北(北京)医药信息咨询有限公司

目的 抑郁障碍是目前引起儿童青少年残疾的主要原因之一,在病因及治疗方面,儿童青少年抑郁障碍与成人抑郁障碍有明显的不同,儿童青少年时期起病的抑郁障碍有更高的复发风险和更高层次的功能受损,选择性5-羟色胺再摄取抑制剂及三环类抗抑郁药对儿童青少年抑郁障碍的疗效较成人差。目前我国对儿童青少年抑郁障碍的诊疗现状的研究尚少。故本研究旨在通过线上问卷的方式,了解儿童青少年抑郁障碍患者群体的诊疗现状及需求,并比较儿童青少年期起病患者、不同性别患者的患病特点。

方法 受访群体为“渡过”网络社群中儿童青少年抑郁障碍患者或患者家属。通过线上问卷形式,从儿童青少年抑郁障碍患者当前患病情况、对疾病认知情况、疾病诊疗需要等角度设计共23题问卷。定义12岁以下起病患者为儿童期起病组,12-18岁起病患者为青少年期起病组。使用SPSS 26进行统计学分析。

结果 本研究共收集502份有效问卷(儿童期起病47例,青少年期起病455例,男性113例,女性389例)。三分之一的受访者为儿童青少年抑郁障碍患者本人,三分之二的受访者为儿童青少年抑郁障碍患者家属。在患病情况方面,在受访群体中,超过一半的患者尚未接受治疗或病情尚不稳定。女性

患者被诊断为重度抑郁发作更多,而男性患者被诊断为轻度及中度抑郁发作更多($p=0.010$)。女性患者抑郁病史 2-5 年较多,而男性患者抑郁病史短于 2 年及长于 5 年更多($p=0.019$)。在疾病负担方面,躯体症状多,工作、学习、社交受损多是困扰受访群体的主要问题。儿童期起病患者躯体疼痛或不适情况较青少年期起病患者多($p=0.045$),抑郁障碍对男性患者家庭生活的影响显著高于女性患者($p=0.034$)。此外,女性患者填写本问卷时间显著高于男性患者(女:男= $412.07\pm 333.81s$: $325.35\pm 305.81s$, $p=0.017$),这可能与注意力受损有关,也可能与性格特征有关。在疾病认知情况及期待方面,受访群体对疾病及治疗的了解仍存在很大欠缺。儿童期起病患者及家属对疾病的了解程度较青少年期起病患者及家属更为两极分化(非常了解与完全不了解, $p=0.003$)。对于目前的治疗方案,受访群体的平均满意度仅为 5.6/10。多数受访群体认为社会对儿童青少年抑郁障碍了解欠缺,家庭、学校及患者自身缺少足够的重视是目前的主要困境。

结论 儿童或青少年期起病患者及不同性别患者在抑郁障碍临床表现及自身体验方面有较多不同,关注不同患者群体的疾病特点可有助于日后更好的诊疗。儿童青少年抑郁障碍疾病及治疗相关宣教在家庭、学校、社会各方面均仍有较大提升空间。

注意缺陷多动障碍儿童大脑动态偏侧化特征及其与认知灵活性的关系

田俊斌 杨莉*

北京大学第六医院

目的 半球偏侧化是大脑的突出特征,偏侧化异常与许多精神障碍的发生发展有关。先前的研究提示注意缺陷多动障碍(Attention Deficit Hyperactivity Disorder, ADHD)个体存在大脑非典型偏侧化。新出现的证据发现了大脑偏侧化的动态变化,其动态特征可能与认知灵活性相关。认知灵活性差是 ADHD 主要的认知缺陷之一,目前尚未有研究探索 ADHD 的动态偏侧化特征,及其与认知灵活性的相关性。

方法 我们招募了 87 名 ADHD 和 53 名典型发

育(Typically Developing, TD)儿童,每位儿童采集了 8 分钟静息态磁共振数据并完成了数字字母连线测验。利用静息态 fMRI 数据,计算每个体素的动态偏侧化指数,使用偏侧化波动(Laterality Fluctuations, LF)以及偏侧化反转(Laterality Reversal, LR)来衡量动态模式。我们在全脑范围比较了两组儿童的动态偏侧化特征的差异,并探索其与 ADHD 认知灵活性的关联。

结果 ADHD 组和 TD 组平均偏侧化模式没有显著差异,具体而言,左侧语言网络、额顶网络和默认网络表现出较强的左侧化;右侧扣带盖网络和额顶网络表现出较强的右侧化。对动态偏侧化指数进行聚类分析发现,主要存在三种不同的偏侧化模式,模式一表现为较强的左额顶网络和默认网络左侧化和右扣带盖网络右侧化,模式二表现为较强的右默认网络和额顶网络右侧化,模式三介于二者之间。进一步比较两组动态特征发现,ADHD 组全脑 LF 增高,存在 5 个显著 LF 增高的簇,主要位于右侧中央后回、额极、舌回以及左侧额上回和颞中回。相关分析表明,ADHD 组 LF 增高与 ADHD 症状严重程度无关($P_s > 0.05$),而右侧中央后回的 LF 值与 ADHD 认知灵活性呈正相关($P=0.0047$)。未发现两组全脑偏侧化反转存在显著差异。

结论 我们的结果表明,ADHD 儿童大脑偏侧化的动态性存在异常,ADHD 组右侧中央后回 LF 增高可能与其较差的认知灵活性有关。

伴与不伴童年创伤的青少年心境障碍患者面孔情绪识别差异的神经机制

欧阳怡铭¹ 杨景钰¹ 王菲^{1,2}

1.南京医科大学附属脑科医院早期干预科

2.南京医科大学公共卫生学院精神卫生系

目的 童年创伤是心境障碍的重要风险因素之一。伴童年创伤的心境障碍患者表现出更严重的临床症状及认知功能损伤,尤其是社交能力。面孔情绪识别能力作为社会交往的关键技能,其损害在青少年心境障碍患者中尤为显著。本研究将探讨伴与不伴童年创伤的青少年心境障碍患者在面孔情绪识别能力上的差异并探索这些差异背后的神经机制,

将重点关注大脑功能网络中的介数中心性 (Betweenness Centrality, BC), 评估特定脑区作为信息传递枢纽的重要性。

方法 本研究纳入了 448 名 13 至 18 岁符合 DSM-IV 心境障碍诊断的青少年患者。通过童年期 (16 岁以前) 成长经历量表 (Childhood Trauma Questionnaire, CTQ) 评估童年创伤, 所有参与者均完成了面孔情绪识别任务 (Facial Emotion Perception Task, FEPT) 并接受功能性磁共振成像检查。使用数据分析工具进行脑图像预处理, 并构建基于 AAL90 的功能网络, 计算各节点的 BC 值。采用 t 检验比较两组患者的面孔情绪识别能力差异, 使用 Pearson 相关分析探讨童年创伤、面孔情绪识别能力及各脑区 BC 之间的相关性, 通过中介分析探索脑网络指标在童年创伤和面孔情绪识别能力中的中介作用。

结果 在 448 名青少年心境障碍患者中, 275 名伴有童年创伤 (CT), 173 名不伴童年创伤 (NCT), 两组在年龄和性别分布上无显著差异。CT 组在 CTQ 总分及各因子分 (情感虐待、身体虐待、性虐待、情感忽视、身体忽视) 上均显著高于 NCT 组。在 FEPT 中, CT 组在总体识别准确率以及对冷静、恐惧、快乐、悲伤和惊奇情绪的识别准确率上显著低于 NCT 组, 两组在愤怒和厌恶情绪识别准确率上无显著差异。相关分析发现, 面孔情绪总体识别准确率与情感虐待 ($r=-0.166$)、性虐待 ($r=-0.155$) 及躯体忽视 ($r=-0.165$) 显著负相关, 中介分析显示右侧旁扣带回的 BC 在其中均存在中介作用, 直接效应分别为 -0.1664 , -0.2646 和 -0.2442 , 间接效应分别为 -0.0110 , -0.0423 和 -0.0178 。此外, 快乐情绪识别能力与情感忽视 ($r=-0.175$) 显著相关, 右侧颞横回的 BC 在其中起中介作用, 直接效应为 -0.1449 , 间接效应为 -0.0123 。

结论 本研究表明, 童年创伤显著影响了青少年心境障碍患者的面孔情绪识别能力, 大脑右侧旁扣带回和右侧颞横回的介数中心性在其中存在中介作用, 揭示了童年创伤可能通过影响这些脑区的介数中心性来长期影响患者的情绪识别能力, 为此类患者的干预措施提供了重要的神经生物学依据。

处理差异研究

谢伊明¹ 罗翔升¹ 刘梦琪¹ 鲁雨晴² 张丹² 陈旭¹
陈旭¹

1. 首都医科大学附属北京安定医院, 国家精神心理疾病临床医学研究中心, 精神疾病诊断与治疗北京市重点实验室

2. 清华大学心理与认知科学系, 清华大学脑与智能实验室

目的 青少年抑郁症患病率逐年升高, 且易出现自伤及自杀等高风险行为, 早期诊断及干预可改善其预后。但目前国内医师资源严重短缺, 筛查仍依赖于被试主观评定, 缺乏客观测量手段, 因此寻求一种敏感的客观辅助诊断工具成为急需解决的问题。事件相关电位研究表明, 抑郁症患者的认知资源调配出现明显失衡, 与“情绪不敏感”理论相一致。但既往研究多局限于抑郁症患者与健康人群间的对比, 对不同严重程度患者的 ERP 研究相对不足。本研究旨在比较不同严重程度青少年抑郁症患者的 ERP 表现, 阐释其情绪处理特点及潜在的神经生物学差异, 为构建辅助青少年抑郁症识别及分级诊断的脑电标记物提供参考。

方法 本研究招募符合 DSM5 抑郁症诊断标准的 11-15 岁、性别不限的抑郁症患者, 使用 HAMD17 量表进行评估, 总分为 7-16 分入轻度抑郁组 (Mean=14.64, n=14), 17-23 分入中度抑郁组 (Mean=19.71, n=14), 24 分及以上入重度抑郁组 (Mean=26.38, n=13)。实验采用包含积极 (45 张)、中性 (15 张)、消极 (45 张) 共三种情绪类别的图片刺激任务, 被试观看图片的同时记录其事件相关电位。使用 Matlab 软件及 Eeglab 工具包提取三组被试在各类情绪图片刺激下的 N2、P3、LPP 波幅, 主要分析 Fz 及 Oz 电极上的 ERP 信息。使用 SPSS 软件采用 ANOVA 方法进行统计分析。

结果 对三组间 P3 进行分析: 在消极图片刺激下, 轻度与中度抑郁组 ($P=0.028$)、轻度与重度抑郁组 ($P<0.01$) 间波幅差异均存在统计学意义, 中度组与重度组间差异不显著 ($P>0.05$)。在积极图片刺激下, 轻度与重度组波幅差异存在统计学意义 ($P=0.014$), 余组间差异并不显著 ($P>0.05$)。对三组间 N2 进行分析: 在消极图片刺激下, 轻度与重度抑郁组波幅差异存在统计学意义 ($P=0.015$), 其余组间差异并不显著 ($P>0.05$)。在积极图片刺激下, 各

基于 ERP 的不同严重程度抑郁症青少年情绪

组间波幅差异均不显著 ($P>0.05$)。对三组间 LPP 进行分析: 在消极图片刺激下, 轻度与中度抑郁组 ($P=0.014$)、轻度与重度抑郁组 ($P=0.06$) 波幅差异存在统计学意义, 中度组与重度组间的差异不显著 ($P>0.05$)。在积极图片刺激下, 各组间的差异均不显著 ($P>0.05$)。

结论 青少年抑郁症患者对不同情绪刺激的反应均随严重程度的增加而减弱, 反映了更加严重的认知损伤。其中, 对积极情绪的加工并未随抑郁的严重程度而明显变化, 提示了一种相对稳定的处理模式, 但对抑郁情绪的反应在各组间存在较大差异, 可能与回避处理机制有关。消极情绪刺激下的 P300 及 LPP 波幅差异或可成为辅助分级诊断的指标。

高危 ASD 婴幼儿感觉特征及其与共情的关系

李倩¹ 干凯滢¹ 黄安琪² 韩雅竹² 李锦卉² 李文清¹ 岳增赫¹ 柯晓燕² 柯晓燕¹

1. 南京医科大学附属脑科医院儿童心理卫生研究中心

2. 南京大学医学院教学医院南京脑科医院儿童心理卫生研究中心

目的 孤独症谱系障碍 (Autism Spectrum Disorder, ASD) 是一种神经发育障碍性疾病, 以社会沟通与交往障碍、刻板重复的兴趣行为和感知觉方面的异常为临床核心特征。既往有关 ASD 的纵向研究表明, ASD 儿童很早就表现出感觉异常, 但这种感觉异常是否对 ASD 儿童早期的共情能力产生影响尚未明确。本研究旨在探究 ASD 儿童在 2 岁之前的感觉、共情发展特征及两者的关联。

方法 本研究选取了 94 名 9~12 月龄的高危 ASD 婴幼儿作为研究对象, 在入组时和 18~24 月龄时使用婴幼儿感觉概况量表、替代性疼痛实验和 Gesell 发育量表分别来评估其感觉特征、情绪共情能力和发育水平。在 18~24 月龄时同时使用孤独症诊断观察量表进行 ASD 临床诊断评估。最终共有 61 名婴幼儿完成了两次随访, 并根据临床诊断结果将其分为了 HR-ASD 组和 HR-Non-ASD 组。使用 SPSS 软件中的独立样本 T 检验和非参数检验对两组的感

觉特征和共情行为数据进行分析, 利用斯皮尔曼相关检验来探究高危 ASD 幼儿的感觉特征与共情之间的关系。

结果 研究发现, 9~12 月龄的 HR-ASD 组在低反应性方面的得分明显低于 HR-Non-ASD 组 ($t=2.12$, $p=0.04$)。仅有 29 名高危 ASD 幼儿 (HR-ASD 组=16, HR-Non-ASD 组=13) 完成了共情行为学观察, 且发现与 HR-Non-ASD 组相比, HR-ASD 组表现出更低的情绪共情能力 ($U=46.00$, $p=0.01$)。HR-ASD 组的情绪共情与感觉特征不存在相关性, 但我们发现 HR-ASD 组的低反应性与听觉、触觉和口腔感觉之间存在正相关 ($r=0.82$, 0.58 , 0.60 ; p 均 <0.05); 感觉寻求与视觉、触觉和口腔感觉之间存在正相关 ($r=0.62$, 0.53 , 0.70 ; p 均 <0.05); 高反应性与听觉、视觉、触觉、前庭觉之间存在正相关 ($r=0.55$, 0.54 , 0.87 , 0.69 ; p 均 <0.05)。在 18~24 月龄时, HR-ASD 组在低反应性、听觉、视觉方面的得分均明显低于 HR-Non-ASD 组 ($t=3.43$, 3.59 , 4.17 ; p 均 <0.001), 并且 HR-ASD 组幼儿的适应性和语言发育低于 HR-Non-ASD 组 ($t=2.16$, 2.47 ; $p=0.04$, 0.02)。

结论 对高风险 ASD 婴幼儿进行纵向研究发现, 感觉低反应性在高危 ASD 儿童生命早期并已经出现异常, 并且与听觉、触觉和口腔觉之间具有相关性; 高危 ASD 儿童的情绪共情能力较差, 这与既往研究结果相一致; 但本研究并未发现高风险 ASD 幼儿的感觉异常与共情之间的关系。

关键词: 高危 ASD 婴幼儿; 感觉特征; 情绪共情

青少年抑郁症患者 NSSI 行为对其疼痛感知的影响

周杨 王我*

重庆医科大学附属大学城医院

目的 抑郁症 (Major Depressive Disorder, MDD) 具有高患病率、高致残率、高复发率的特点; 其非自杀性自伤行为发生率高; 非自杀性自伤 (Non-suicidal self-injury, NSSI) 是指不以自杀为目的的, 直接地、故意地、重复地改变或伤害自己身体组织的行为。临床上, 许多伴 NSSI 的青少年抑郁症患者报告的自伤期间疼痛感受与常人无异。本研究主要探究伴非

自杀性自伤行为的抑郁症患者的疼痛感知是否发生改变,以及引起其改变的可能因素。

方法 本研究招募单纯抑郁症患者(MDD组)与伴非自杀性自伤行为的抑郁症患者(MDD+NSSI组)。分别使用中性和悲伤情绪视频和悲伤情绪视频资料作为情绪唤起材料,分别代替被试心情平静及心情悲伤时的状态,并采用冷压试验模拟患者自伤时产生的疼痛;在中性和悲伤情绪唤起后,分别立即进行冷压试验,并进行Wong-Baker面部表情疼痛评估量表(FPS-R)评分。使用独立样本t检验对数据进行分析。

结果 MDD组与MDD+NSSI组的汉密尔顿抑郁量表(HAMD)、汉密尔顿焦虑量表(HAMA)得分无明显差异($p>0.05$)。与MDD组相比,MDD+NSSI组在中性情绪唤起后疼痛评分均值较低;MDD组与MDD+NSSI组在中性情绪唤起后冷压试验的疼痛评分差异不显著,但在悲伤情绪唤起后冷压试验的疼痛评分中发现显著差异($P<0.05$);NSSI组疼痛评分明显降低。

结论 综上,我们可以得出结论,非自杀性自伤行为可能使抑郁症患者的疼痛感知降低,并更易受情绪改变的调节。

自主与自动抑制能力缺陷:探索抽动障碍患儿的抑制控制机制

丁强¹ 赵滢¹ 刘筱钰¹ 陈宇鹏¹ 黄媛媛² 蒋珍凤³ 钱飞⁴ 胡超异⁵ 徐雯¹ 沈淑琴¹ 孙锦华¹

1.复旦大学附属儿科医院

2.安徽省儿童医院

3.温岭市中医院

4.上海市嘉定一中附属小学

5.上海市曹杨中学

目的 抽动障碍(TD)主要影响儿童和青少年,其具体病因和发展机制仍不完全清楚。有研究表明,抑制控制的缺陷可能是TD表现的关键因素之一,尤其在Tourette综合征(TS)和慢性运动/发声抽动障碍(CTD)的成人患者中,自主抑制能力完好,而自动抑制能力受损。针对TD患儿自主与自动抑制

能力的研究尚不充分,本研究旨在解决这一研究缺口,并提供新视角以深入理解TD的病理机制。

方法 本研究于2024年2月至6月在复旦大学附属儿科医院以及其他两家医院和两所上海的中小学进行。招募年龄9至18岁、根据DSM-5诊断为CTD和TS的患儿。使用耶鲁综合抽动严重程度量表(YGTSS)症状严重程度分评估抽动症状,SNAP-IV评定量表(父母版)前18项总分评估注意缺陷多动障碍,儿童版耶鲁布朗强迫量表(CY-BOCS)总量表分评估强迫症状。研究纳入34名TD患儿和31名年龄及性别相匹配的健康对照(HC),使用意向性抑制任务(Intentional Inhibition Task)和掩蔽启动任务(The Masked Priming Task)评估自主和自动抑制能力。

结果 研究比较TD组患儿(21名CTD,13名TS;平均年龄13.8岁,SD=2.6;男26,女8)与HC(平均年龄14.1岁,SD=2.4;男23,女8);TD组在YGTSS上的平均得分为24.3(SD=7.5),SNAP-IV平均得分为17.4(SD=6.2),CY-BOCS平均得分为15.7(SD=4.3)。

在意向性抑制任务中,TD组的选择执行动作(Choose-Go)比例为51.3%,显著低于HC的65.2%($p<0.001$)。TD组的NoGo错误率为17.3%,显著高于HC的9.3%($p<0.001$)。TD组的Go反应时间和选择Go反应时间分别为431ms和453ms,均长于HC的403ms和417ms($p<0.01$)。在掩蔽启动任务中,TD组在不兼容启动反应时间为439ms,显著长于HC的417ms($p<0.01$),而在兼容启动反应时间和负兼容效应上与HC无显著差异。错误率分析显示TD组在兼容与不兼容启动错误率上均显著高于HC($p<0.01$)。多因素方差分析显示,在控制CY-BOCS和SNAP-IV评分后,TD组在主要任务指标上与HC仍存在显著差异($p<0.05$)。

结论 TD患儿在自主和自动抑制任务的表现明显差于HC,突显了在抑制控制方面的显著缺陷。控制CY-BOCS和SNAP-IV评分后,这些差异得到进一步验证。这一发现对于理解TD的神经认知基础至关重要,提示未来研究应着重开发针对这些抑制缺陷的有效干预措施。

辩证行为疗法多家庭团体技能训练模式在青少年抑郁症中的应用

黄众¹ 况利^{1,2}

1.重庆医科大学附属大学城医院

2.重庆医科大学附属第一医院精神卫生中心

目的 初步探讨辩证行为治疗(DBT)的多家庭团体技能训练模式在青少年抑郁障碍中的应用及其对家庭环境的影响,以评估家庭作为中介因子在DBT治疗青少年抑郁症中的意义。

方法 抽取2023年6月至2024年3月在重庆医科大学附属大学城医院心理卫生中心就诊的4例抑郁障碍青少年的家庭,组成由青少年及其家长共同参与的多家庭团体,进行为期12周的辩证行为治疗团体技能训练。干预前后分别采用汉密尔顿抑郁量表(HAMD-17)、抑郁症自评量表(PHQ-9)、家庭环境量表(FES-CV)、自尊量表(SES)、领悟社会支持量表(PSSS)、广泛性焦虑自评量表(GAD-7)、亲子沟通量表(父母卷)、照顾者负担量表、渥太华自伤量表等进行评估。统计分析采用配对样本t检验和方差分析。

结果 4名青少年及其家长完成了为期12周的团体技能训练及各项评估。与干预前相比,干预结束时各项量表得分均显著改善($P<0.05$),具体表现为汉密尔顿抑郁量表(HAMD-17)和抑郁症自评量表(PHQ-9)总分显著降低,并在随访期间持续下降;家庭环境量表(FES-CV)显示家庭氛围显著改善;自尊量表(SES)和领悟社会支持量表(PSSS)得分显著上升;广泛性焦虑自评量表(GAD-7)总分显著降低。在亲子沟通方面,亲子沟通量表(父母卷)得分显著提高;照顾者负担量表得分显著降低。此外,渥太华自伤量表结果显示自伤行为显著减少。

讨论 辩证行为治疗(DBT)在治疗青少年抑郁障碍中表现出显著效果,其多家庭团体技能训练模式通过改善家庭环境和亲子沟通,提升了治疗的有效性。家庭作为中介因子在DBT治疗中发挥了重要作用,家庭环境的改善不仅直接有助于青少年的情绪调节和自尊提升,还通过增强社会支持和降低照顾者负担,间接促进了青少年抑郁症状的改善。通过家庭参与的团体治疗,家长能够更好地理解和支持青少年的情绪管理需求,有助于构建一个更具支持性和理解性的家庭氛围,这对于青少年的心理健康恢复至关重要。

结论 辩证行为治疗能够显著改善青少年抑郁障碍的症状,提升其家庭环境、社会支持、自尊水平和亲子沟通质量,降低焦虑和照顾者负担,并减少自伤行为。家庭作为中介因子在DBT治疗中起到了关键作用,通过改善家庭环境和互动模式,增强了治疗效果。多家庭团体技能训练模式具备良好的可行性和可接受度,具有较高的临床应用价值。

基于个体化脑发育异常的心境障碍亚型及其遗传风险、影像表型和临床行为特征关联研究

郑俊杰 王菲*

南京脑科医院

目的 心境障碍患者的临床表现异质性较大,其与患者的遗传风险和大脑异常发育模式的关联性尚不明晰。利用基于神经影像学的个体化发育异常模式标志物,解析遗传风险、影像表型和临床行为特征,进而揭示心境障碍异质性,有助于阐明疾病的病因并辅助精准诊疗。

方法 本研究招募了174名未服药的重度抑郁障碍和双相情感障碍患者,以及404名健康对照者,并分析了其T1磁共振成像数据、临床症状、神经认知评估和遗传组学单核苷酸多态性数据。首先基于DK脑结构分区,提取区域灰质体积(GMV)并利用GMV与年龄相关性构建健康人常模脑发育曲线,然后计算个体在其对应年龄范围的GMV偏差;进而利用分层聚类方法划分患者亚型。进一步的,本研究比较了亚型之间的多基因遗传风险评分、GMV组水平偏差差异及其细胞特异性转录组关联、和患者亚型的临床症状以及认知功能水平。

结果 本研究发现了两种心境障碍患者亚型:亚型1中患者的前额叶皮层的GMV发育偏离相对健康被试显著升高,这种GMV发育异常与阿尔茨海默疾病通路的大脑基因表达模式显著相关,可能与少突胶质细胞及神经内皮细胞的基因表达相关,并且该组患者的具有显著的认知执行功能损害,进而还发现该组患者具有显著的阿尔茨海默多基因遗传风险;另一组亚型2中的患者呈现全脑水平GMV偏离降低,这种GMV发育异常与小胶质细胞和抑

制性神经元的基因表达相关,并且发现该组患者抑郁症状更严重,其重度抑郁症多基因遗传易感性更强。

结论 本研究结果提示利用基于个体化脑结构发育异常的影像表型特征,联合大脑空间转录组、遗传易感性和临床行为特征,解析其之间的微观和宏观关联,有助于揭示心境障碍在生物学和临床行为学方面的异质性,辅助精准诊疗。

团体干预改善 ADHD 儿童注意力及其神经机制——基于 EEG 的证据

黄兆文 洪丹萍*

广州医科大学附属脑科医院

目的 注意缺陷/多动障碍(ADHD)是一种常见高发于儿童期的神经发育障碍,近年我国学龄期儿童的发病率为 6-7%。ADHD 的核心症状有注意缺陷、多动-冲动,或者二者皆有。此外,过往实证数据指出,约 25%-45% 的 ADHD 儿童伴有情绪失调症状,DSM-5 中也将情绪失调列为 ADHD 的重要临床特征。行为干预常用于治疗 ADHD,本研究希望开发一系列团体干预疗法,以改善 ADHD 儿童的注意力。使用持续操作测试(CPT)测量 ADHD 儿童的持续注意力,同时使用脑电图(EEG)设备记录儿童脑电信号。

方法 基于 ADHD 的典型症状,本研究开发了三组治疗方案——注意力训练组,情绪训练组,积极对照组,以比较不同组别对 ADHD 儿童注意力的改善能力。干预形式为在一个半月内进行 2 次父母培训和 6 次儿童培训,共 8 次课程,每次 1.5 小时,在干预前后都基于计算机的行为实验记录了 ADHD 的注意力水平并且记录脑电数据。

行为实验改编自经典的 AX-70 结构,目标 A-X 刺激占总体试次的 70%,共计 4 个区块,每个区块 30 个试次,共 120 个试次。脑电记录使用 EGI 的 64 通道脑电帽。

对于行为数据和脑电数据,都进行了配对样本 T 检验,以检验干预前后相关指标的变化情况。并且计算了相关数据的相关性,以探究脑电指标与行

为数据的内在联系。

结果 对于行为数据,注意力训练组中儿童的任务应答率在后测呈现边缘显著的提升($t_{16} = 1.953$, $p = .069$),正确率与反应时未发现显著变化。情绪训练组与积极对照组未发现任何显著变化。

对于脑电信号,注意力训练组儿童在中央顶叶呈现了更大的 P1 振幅($t_{12} = 2.908$, $p = .013$),在左侧前额叶呈现了更大的 N1 振幅($t_{12} = -3.827$, $p = .002$)。

在相关分析中,智力与应答率在前测呈显著正相关($r = .376$, $p = .012$),后测未见相关,前测正确率和正确率的变化量呈显著负相关。在控制了年龄、性别、智力的偏相关中,左侧前额叶 N1 成分与正确率在后测中呈现显著负相关($r = -.406$, $p = .029$),而在前测未见相关。

结论 行为结果表明,注意力训练组能够比其余两组干预方案更有效地提高 ADHD 儿童的注意力水平。

脑电结果表明,干预可能通过改善中央顶叶和左侧前额叶的大脑功能从而使儿童注意力能力得到提高。

相关结果表明,智力更高的儿童注意力受影响程度更低,干预对于注意力受损更严重的儿童更加有效,儿童注意力受损可能与左侧前额叶激活异常有关,并且治疗改善了这种异常。

Declined Hippocampal Subfields and Composite Structures in Depressed Adolescents with Subthreshold Mania Are Associated with Illness Progression

Xiaofei Zhang^{1,2}, Tao Lin¹, Liping Cao¹, Xichao Wang¹, Yutong Liu¹, Yimiao Mao¹, Guanjie Zhang¹, Xuanlin Zeng¹, Weiming Li¹, Jiaqi Sun¹, Chanjuan Yang¹, Xuan Li¹, Biyu Ye¹

1.Affiliated Brain Hospital, Guangzhou Medical University, Guangzhou, Guangdong, PR China

2.The First School of Clinical Medicine, Southern Medical University, Guangzhou, Guangdong, PR China

Objective The aim of this study is to investigate

the alterations in hippocampal subregions and complex structures in adolescent depression patients with sub-threshold mania, as well as their influencing factors

Methods A total of 144 participants were selected from the sBEAD cohort baseline data, including 72 depressed adolescents with subthreshold mania (MDD-Sub) and 72 depressed adolescents without subthreshold mania (MDD-nSub), who underwent clinical follow-up ranging from six to twelve months. Additionally, 72 gender- and age-matched healthy adolescents (HC) were included. Magnetic resonance imaging (MRI) data were collected, and T1-weighted images were analyzed using the automated segmentation module in FreeSurfer 7.3.1. Volumetric assessments were performed at both the subfield and composite subfield levels among groups

Results The MDD-Sub group also exhibited smaller volumes in bilateral CA1, CA4, parasubiculum, dentate, molecular layer (ML), hippocampal-amygdala transition area (HATA), left CA3, left subiculum, right presubiculum, and the right whole hippocampus compared to both the HC and MDD-nSub groups. Additionally, compared to the HC group, the MDD-Sub group showed reduced volumes in the right CA3, right subiculum, and bilateral hippocampal tail

Furthermore, when hippocampal subregions were combined into distinct composite structures, the MDD-Sub group showed reduced volumes in bilateral hippocampal CA, CA2/4, hippocampal extended, hippocampal formation, hippocampal proper, combined dentate, and combined dentate/CA, compared to the HC and MDD-nSub groups. Importantly, this pattern of changes was validated in drug-naïve MDD-Sub patients.

Partial correlation analysis was found that bilateral CA1, CA, combined dentate/CA, left subiculum, hippocampal formation, extended hippocampus, hippocampal proper, combined dentate, and right CA2/4 volumes were positively correlated with illness duration.

Conclusion Our findings indicate that depressed adolescents with subthreshold mania exhibiting extensive hippocampal subregion volume alterations, which are associated with disease progression.

“Hope They Can Be Independent”: A Mixed Study Spotlighting Adult with Autism Spectrum Disorder

Anqi Huang¹, Yupei Ye², Kaiyan Gan², Zenghe Yue², Yazhu Han¹, Jinhui Li¹, Xiaoyan Ke^{1,2}

1.Child Mental Health Research Center, Nanjing Brain Hospital, Clinical Teaching Hospital of Medical School, Nanjing University

2.Child Mental Health Research Center, The Affiliated Brain Hospital of Nanjing Medical University

Objective Autism spectrum disorder (ASD) is a group of neurodevelopmental dysfunctions characterized by impaired social communication and interaction as well as repetitive and stereotypical behavior. These impairments persist across adulthood, so that adults with ASD often require external, substantial support and comprehensive care. In addition, adults with ASD are facing “service cliff”, and their aged parents can't take care of them all the time. ASD adult independent living problem has become the urgent problem that cannot be ignored, and previous studies have lacked heterogeneous requirements for adults with ASD. This study focuses on independence and its current situation in adults, aiming to find a tool suitable for evaluating the independence level of adults with ASD, to deeply explore the factors affecting independent living, and to analyze service acquiring and requiring conditions

Methods This study adopted the method of mixed research which included qualitative study and quantitative study, taking adults with ASD as subjects. First, based on the literature review interview outline, semi-structured interview with parents of adults with ASD was conducted. We used grounded theory to analyze the interview data to better understand the current situation and influencing factors for independence of adults with ASD, and to construct a theoretical model suitable for independence adults with ASD. We also revised the Chinese version of the Adult Independence Living Measurement Scale (AILMS) with the Italian

team. A questionnaire survey was conducted on parents adults with ASD, and confirmatory factor analysis was performed

Results Qualitative analysis was performed on the interview data. A total of 20 parents' interview materials were collected. Among their children, 10 of them had an $IQ \geq 80$. Three themes were obtained: the status of independence, the expectation of independence and factors affecting independence. Parents of adults with ASD hoped them to be more independent in aspects like daily life skills and employment. Parents of adults with high function ASD children reported that they needed to explore deeper level of independence, such as emotion regulation, autonomy. Almost all parents claimed that efforts from society, healthcare, families and schools were important to achieve their goal. CAILMS has a total of 20 items, using a seven-point scoring system. 123 questionnaires were collected. Cronbach's α coefficient of CAILMS was 0.91, indicated high internal consistency, with intraclass correlation coefficients greater than 0.53, showing nice reliability and validity results. CAILMS total scores were positively correlated with the scores of World Health Organization Quality of Life (WHOQOL)-BREF ($p < 0.05$). Statistically significant differences are observed between people with different levels of severity of IQ, while the total score did not differ by sex or age

Conclusion This was the first mixed study to comprehensively establish independence based on adults with ASD in China. Adults with ASD yearned for independence and had great potential for independence, but their current situation was mostly unsatisfactory, they needed more targeted support. Therefore, this study can help to better understand the significance of independence in adults with ASD, and to quantify independence, providing a theoretical basis for the construction of rehabilitation interventions, social support programs, and social management models for adults with ASD in the future. Also, this study provides a partial reference for the formulation of security policies for adults with ASD and their relatives

关键词: adult; autism spectrum disorder; qualitative study; independence

基底核-边缘网络动态交互作用与孤独症谱系障碍儿童重复刻板行为相关

郑翔宇¹ 赵驿鹭¹ 王宁¹ 傅朝¹ 田俊斌¹ 王欣悦¹
高煦平¹ 廖旭红² 贺永² 杨莉¹

1. 北京大学第六医院, 北京大学精神卫生研究所, 国家精神心理疾病临床医学研究中心(北京大学第六医院), 国家卫生健康委员会精神卫生学重点实验室(北京大学)

2. 北京师范大学

目的 重复刻板行为(Repetitive and restricted behaviors, RRB)是孤独症谱系障碍(Autism Spectrum Disorder, ASD)的核心特征之一。这些行为表现为缺乏目的性、形式变化少,并干扰适当行为。目前关于RRB的发生机制尚不清楚,理解RRB及其亚型的神经机制对于深入了解ASD的神经生物学具有重要意义,并能够为开发有针对性的干预措施提供依据。

方法 本研究纳入孤独症脑成像数据交换数据库(Autism brain imaging data exchange II, ABIDE-II)的功能性影像数据。孤独症诊断访谈检查(Autism Diagnostic Interview Revised, ADI-R)用来评估RRB行为。首先识别RRB相关的脑区:使用滑动窗口法计算脑区间的交互作用随时间的变化特征,并通过支持向量机分类器探索与RRB相关的脑区。其次聚类瞬时全脑活动模式得到瞬时神经活动的不同状态,并发现潜在的神经心理关联。然后通过共激活模式,验证滑动窗口分析的结果。进一步纳入50名ASD儿童,26名正常对照正常对照儿童进行了验证分析。

结果 ASD儿童在全脑和网络层面的脑活动时间变异性显著高于典型发育(TD)儿童。此外,认知、视觉、运动和边缘网络之间的动态交互可以预测RRB评分。数据驱动分析将ASD的脑活动分为四类,对应于疼痛、触觉和视觉等心理过程。从基于基底核的瞬时共激活模式的动态变化来看,运动网络、边缘网络、视觉加工网络与基底核交互作用的动态性与RRB得分有关($P < 0.05$)。瞬时共激活模式可分为5类。在第三类中,关联环路背侧前额叶与基底核交互作用的动态性与RRB得分正相关。在验证样本中,同样获得了边缘网络与基底核共激活模式的动态性与RRB相关。

结论 边缘网络与基底核交互作用的动态特征与 RRB 相关, 在不同数据集中得到一致支持。这些结果支持了边缘网络在 RRB 中的关键作用。提示未来 RRB 的临床干预可以将边缘网络的功能调节作为关注重点。

学龄 TD 儿童与 ADHD 儿童在观看情绪人像图片时的眼动行为比较研究

贺嘉贝^{1,2} 张劲松^{1,2}

1.上海交通大学医学院

2.上海交通大学附属新华医院

目的 本研究旨在比较学龄期 TD (典型发育) 儿童与 ADHD (注意缺陷多动障碍) 儿童在观看情绪人像图片时的眼动行为差异, 以期揭示两组儿童在情绪信息处理上的特点。

方法 本研究对 71 例学龄期 TD 儿童与 79 例学龄期 ADHD 儿童进行了眼动追踪实验。实验要求被试观看依次呈现的 27 张情绪人像图片含五种情绪 (悲伤、不典型情绪、愤怒惊讶、愉快、中性), 这些图片来源于中国儿童情感评价图片库 (上海版, 7~14 岁)。使用 Tobii Pro X3-120 眼动追踪仪记录儿童在实验期间的眼动行为。图片中人像的眼睛和嘴部区域被定义为主要情绪传递区。通过处理原始眼动数据, 导出了每张图片的总注视点数, 并进行了统计分析。

结果 TD 组对愉快和中性情绪图片主情绪传递区 (眼睛+嘴部) 的总注视点数具有显著差异, 愉快>中性; ADHD 组无显著差异; TD 组对不同情绪图片的主情绪传递区总注视点数均显著高于 ADHD 组。TD 组和 ADHD 组对眼睛区域的总注视点数均大于嘴部区域。TD 组对不同情绪图片眼睛区域的总注视点数无显著差异; 而 ADHD 组对愤怒惊讶情绪图片的眼睛注视点数显著高于愉快和不典型情绪图片; TD 组对不同情绪图片眼睛区域的总注视点数均显著高于 ADHD 组。TD 组对愉快、不典型和悲伤情绪图片的嘴部总注视点数显著高于愤怒、惊讶和中性情绪图片; ADHD 组对不同情绪图片嘴部区域的总注视点数无显著差异; 不区分情绪属性时, TD

组与 ADHD 组对嘴部的总注视点数无显著差异; 对于愉快和中性情绪图片, TD 组对嘴部的总注视点数显著高于 ADHD 组。

结论 TD 儿童在观察情绪人像图片时, 对主情绪传递区 (眼睛和嘴部) 的总注视点数显著高于 ADHD 儿童。相比于 ADHD 儿童, TD 儿童在情绪信息的处理上更为细致, 表现在对不同情绪图片的眼睛和嘴部注视点数分布差异上。而 ADHD 儿在相较于处理愉快和不典型情绪图片时, 他们对愤怒惊讶的情绪图片眼睛表现出更高的眼睛注视点数, 显示其在应对负性情绪信息时存在特定关注模式。本研究为理解 ADHD 儿童在情绪信息处理上的特殊性提供了数据支持。

青少年抑郁症患者抑郁症状的变化轨迹分析

刘梦琪^{1,2} 陈旭^{1,2} 袁晓菲^{1,2} 王巍巍^{1,2} 谢伊明^{1,2} 罗翔升^{1,2}

1.首都医科大学附属北京安定医院, 国家精神心理疾病临床医学研究中心, 精神疾病诊断与治疗北京市重点实验室

2.人脑保护高精尖创新中心, 首都医科大学

目的 青少年抑郁症作为全球性的公共卫生问题, 对个体的心理健康、社交和学业成就具有深远影响。了解青少年抑郁症患者抑郁症状的变化轨迹, 对于制定精准化治疗方案从而改善其预后具有重要意义。然而, 现有的相关研究多集中在学校样本, 针对临床样本的研究则较为匮乏。而这类群体通常面临更高的抑郁症状水平和自杀风险, 早期采取个性化的治疗方案对于降低其自杀风险具有重要意义。因此本研究旨在探讨临床青少年抑郁症患者抑郁症状的变化轨迹, 分析不同分组的基线特征差异和影响因素, 为制定精准化治疗策略提供数据支持。

方法 本研究纳入 81 名于北京安定医院住院的青少年抑郁症患者, 采用一般资料调查表、环境相关量表、症状相关量表于患者住院当天 (基线) 进行调查并完成脑 MRI 检查, 此后于 1 月末、3 月末、6 月末、12 月末追踪患者的抑郁症状。使用 1~6 类别参数潜变量增长模型拟合对 81 例患者 5 个时间

点的 PHQ9 得分进行变化轨迹分析, 类别 2 被认为是模型拟合中最优模型; 采用卡方检验、独立样本 t 检验比较两组间特征差异; 采用 logistic 回归分析其影响因素。

结果 根据潜变量增长模型, 住院青少年抑郁症患者的抑郁症状变化轨迹可分为两组: 快速下降-稳定组 (N=41, 50.6%) 和缓慢下降-回升组 (N=40, 49.4%)。进一步分析发现显示人口学方面, 快速下降-稳定组独生子女比例显著高于缓慢下降-回升组 ($P=0.010$)。临床特征方面, 快速下降-稳定组过去 1 年非自杀性自伤症状严重程度 ($P=0.006$)、自杀企图史比例 ($P=0.011$) 显著低于缓慢下降-回升组。童年创伤方面, 快速下降-稳定组中情感忽视 ($P=0.016$)、躯体忽视 ($P=0.002$) 得分显著低于缓慢下降-回升组; 家庭教养方式方面, 快速下降-稳定组中母亲过分干涉保护 ($P=0.019$)、父亲过分干涉 ($P=0.020$)、母亲拒绝否认 ($P=0.037$) 得分显著低于缓慢下降-回升组; 负性生活事件方面, 快速下降-稳定组的丧失 ($P=0.005$)、人际 ($P=0.004$)、学业 ($P=0.015$)、适应 ($P=0.034$)、总应激量 ($P=0.001$) 得分显著低于缓慢下降-回升组。脑 MRI 分析结果显示, 两组间右侧苍白球 fALFF 值存在显著差异 ($P=0.03$, FDR 校正后)。Logistic 回归分析结果显示自杀未遂史显著预测抑郁症状轨迹处于缓慢下降-回升组 ($OR=3.48$, $P=0.028$)。

结论 青少年抑郁症患者的抑郁症状变化轨迹可分为两种不同的类型, 提示了不同的预后, 且两组在基线特征上表现出明显的差异。在临床实践中应根据患者的基线特征在早期进行评估并制定个性化的干预措施。

自动化的感觉变化加工在注意缺陷多动障碍患者中的特点及其对药物疗效的预测作用

党宸¹ 吴桂森¹ 祝雨¹ 冯源¹ 钟少根¹ 宋艳² 孙黎¹

1. 北京大学第六医院

2. 北京师范大学

目的 除了高级认知功能的缺陷, 底层的感

加工能力受损同样是注意缺陷多动障碍患者 (ADHD) 典型的病理特征之一。近些年来, 绝大部分与 ADHD 相关的感觉加工研究均采用了问卷测量的方式, 因而难以对其背后的神经机制进行深入探索。视觉失匹配负波 (vMMN) 是一种被用来研究感觉加工特点的电生理指标, 反映了对环境中变化刺激的自动化觉察。截止目前, 还未有研究探索 vMMN 在儿童 ADHD 患者中的特点及其与核心症状间的联系。因此本研究拟通过病例对照的方法, 首次探索 ADHD 儿童的 vMMN 特点; 并进一步通过药物治疗的研究, 探索这种底层的感觉加工能力对药物疗效的预测作用。

方法 研究一纳入了 71 名 ADHD 及 56 名健康对照儿童, 两组被试分别在年龄、智商及性别上进行了匹配。ADHD-RS 及 BRIEF 量表分别用来测量 ADHD 症状的严重程度以及生态执行功能, vMMN 的诱发通过被动的视觉 Oddball 范式来完成。研究二纳入了研究一中的 39 名儿童 ADHD 患者, 并对他们进行了为期两个月的药物治疗, 在治疗结束后同样采用 ADHD-RS 及 BRIEF 量表评估了被试的 ADHD 症状及生态执行功能, 同时也再次采集了所有被试的 vMMN。

结果 研究一的结果显示在 O2 及 Pz 电极上, ADHD 儿童的 vMMN 振幅显著降低。Pz 电极上的 vMMN 振幅与患者的多动冲动症状及 ADHD 症状总分间呈显著正相关, 与生态执行功能总分及其子维度行为管理 (BRI) 及元认知指数 (MCI) 间也呈显著正相关。虽然本研究并未发现 vMMN 与注意缺陷症状间的显著相关, 但中介分析显示: MCI 可以显著介导 vMMN 与注意缺陷症状间的关系。研究二的结果发现, 在经过两个月的药物治疗后, 患者的 ADHD 症状及生态执行功能均得到了显著的改善, 同时 Pz 电极上的 vMMN 振幅相较于前测也出现了显著的增大。回归分析的结果显示, 虽然基线的 vMMN 振幅对 ADHD 症状变化 (包括注意缺陷及多动冲动) 的预测效应不显著, 但却可以显著预测 BRIEF 总分的变化。

结论 本研究为第一项探索 vMMN 在儿童 ADHD 患者中特点的研究, 结果显示 vMMN 在儿童 ADHD 中存在受损, 且这种损伤与其生态执行功能及核心症状间存在密切联系。表明这种底层的感觉加工受损可能是儿童 ADHD 患者出现生态执行功能异常及临床症状的重要原因之一。研究二发现通过药物治疗, ADHD 患者的 vMMN 振幅可以得到显著

提升。虽然基线的 vMMN 并不能对 ADHD 症状起到有效的预测作用,但却能够显著预测 ADHD 患者生态执行功能的变化。因此未来的研究除了要持续关注 ADHD 患者的高级认知功能受损,还要对该群体底层的感觉加工问题予以同等的重视。

The Structure and Patterns of Impulsivity in Adolescents with Non-suicidal Self-injury Behavior

Xiaoli Liu Dongsheng Zhou*

Affiliated Kangning Hospital of Ningbo University

Objective Impulsivity is one of the important influencing factors of non-suicidal self-injury (NSSI) but currently, few studies have characterized the impulsivity patterns in adolescents with NSSI and explored the interaction between the two. On the other hand, repetitive NSSI behavior in some individuals may exhibit addictive characteristics, but the relationship between impulsivity and addiction characteristics remains unclear. Therefore, this study aims to explore the structure and patterns of impulsivity in adolescents with NSSI behavior and to investigate the relationship between NSSI addiction characteristics and impulsivity

Methods The study enrolled 493 adolescents with NSSI behavior and 347 healthy controls (HC) aged from 12-18 years old. Each participant completed the Barratt Impulse Scale, and for individuals with NSSI, their self-injury frequency in the past month, age at first self-injury, NSSI act latency, and NSSI addiction characteristics were recorded according to the Ottawa Self-Injury Inventory (OSI). Network analysis was used to construct the impulsivity networks for both groups. The centrality of nodes in both networks was assessed, and comparisons were made between the two networks in terms of structural invariance, global strength invariance, and edge strength invariance

Results By focusing on the top 10% of items (i.e., 3 items) to comprehensively represent core impulsivity

items, it was found that the core items for the HC group were cognitive impulsivity and noplanning impulsivity, while for the NSSI group, the core items were included motor impulsivity and noplanning impulsivity and cognition impulsivity. Although there was no difference in the overall network strength between the two groups, there were significant differences in the structure of the impulsivity networks. Additionally, the overall strength of the impulsivity network was highest in individuals with NSSI addiction characteristics

Conclusion Adolescents with NSSI exhibit unique changes in specific connections within the impulsivity network, which may be related to NSSI behavior. NSSI addiction characteristics may be driven by specific structure and changes in the strength of the impulsivity network. This study can help further understand the differences in the manifestation of impulsivity across different populations and provide a basis for the treatment and intervention of NSSI behavior

关键词: NSSI, Impulsivity, Network Analysis

基于机器学习的青少年社交焦虑障碍血清非靶向代谢组学研究

赖俊宇 孙颖 鞠培俊 陈京红*

上海市精神卫生中心

目的 阐明青少年 SAD 的代谢图谱, 筛选出可靠生物标志物, 并构建带有客观生理指标的临床诊断模型。

方法 SAD 患者与健康人经严格评估后入组。研究对象填写儿童社交焦虑量表 (Social Anxiety Scale for Children, SASC) 和儿童焦虑性情绪筛选量表 (The Screen for Child Anxiety Related Emotional Disorders, SCARED) 并留下血样。血样送做非靶向代谢组学检测, 筛选出差异代谢物后经单因素 logistics 回归、多重线性诊断后, 采用最小绝对收缩和选择算子 (Least Absolute Shrinkage and Selection Operator, Lasso) 回归降低共线性影响筛选出最重要的代谢差异物, 再采用 XGBoost 分类法、AdaBoost 分类法、Random Forest 分类法、GBDT 分类法、KNN 分类法、SVM 分类法等分别进行模型构建并评估,

筛选出表现最优的模型,并根据物质的重要性排序筛选出在区分度、校准度和临床泛化性最佳的临床诊断模型。

结果 本研究总共纳入 59 例研究对象,其中疾病组 30 例,对照组 29 例,在筛选生物标志物和构建临床诊断模型中按照 7:3 分为训练组和测试组。代谢组学结果显示:(1)筛选出 665 种代谢产物,其中 48 种为差异代谢产物;(2)其中 48 种代谢产物对 SAD 发病均有关,但存在严重共线关系;(3)用 Lasso 回归从 48 种代谢物中挑选出 12 种物质;(4)多种模型比较显示 XGBoost 算法构建的模型表现最优,根据 Shapley 加性解释(Shapley Additive exPlanations, SHAP)分析对物质的重要性排序,构建纳入不同重要性代谢产物的临床模型并进行验证;(5)结果表明纳入重要性排名前 5 的代谢物(mannose、methionine、myo-inositol、3,7,12-Trihydroxycoprostone 和 uric acid)加上原有指标(SASC 量表和 SCARED 量表)比原来诊断模型的诊断效率提升最大(训练集中提升了 53.7%,测试集提升了 27.5%),并进行了区分度、校准度和临床泛化性评估,均得到了理想结果(均接近于 1)。

结论 本研究通过血清非靶向代谢组学检测,描绘了 SAD 代谢图谱,同时筛选出来了 5 个对疾病高度相关的差异代谢产物,分别为 mannose、methionine、myo-inositol、3,7,12-Trihydroxycoprostone 和 uric acid,并以此为依据构建的临床诊断模型能显著提高诊断效率。

家庭联合情绪调节团体治疗在抑郁障碍青少年非自杀性自伤中的应用研究

何旭斌 杨波*
重庆市精神卫生中心

目的 构建伴非自杀性自伤(NSSI)青少年抑郁障碍患者家庭参与式情绪调节团体治疗(ERGT)干预方案,并探讨该方案的治疗效果。

方法 (1)基于家庭系统理论、情绪调节理论,分析既往关于 ERGT 的研究,并对伴 NSSI 行为青少年及其主要照顾者的真实体验进行 Meta 整合,通

过课题组多次讨论,形成家庭联合 ERGT 方案初稿。在此基础上,采用专家会议法,对该方案进行系统评估并根据专家建议进行修订。选取 10 名患者及其照顾者进行预实验,最终形成方案终稿。(2)采用随机对照试验法,选取某三甲精神专科医院符合纳入排除标准的 80 例伴有 NSSI 行为的青少年抑郁障碍患者为被试,并随机分为干预组和对照组,每组 40 例。干预组对被试及其照顾者实施家庭参与式 ERGT,对照组仅对患者本人实施 ERGT。在干预前、干预结束时、干预结束后 1 个月、干预结束后 3 个月以及干预结束后 6 个月,分别采用青少年非自杀性自伤行为和功能问卷(ANSSIQ)、贝克自杀意念问卷(BSI)、Barratt 冲动性量表(BIS)、焦虑自评量表(SAS)以及抑郁自评量表(SDS)对所有被试进行资料收集,并对干预方案进行效果评价。

结果 (1)对青少年 NSSI 行为及其主要照顾者的真实体验进行质性 Meta 整合,分别提炼出 4 个整合结果、9 个新类别结果;3 个整合结果、7 个新类别结果。结合上述 Meta 整合结果并参考 Gratz 和 Bjureberg 等人的干预研究,形成干预方案初稿。采用专家会议法,选取 7 名相关领域专家对干预方案进行评估。对预实验过程中出现的问题,进行再次修改和讨论,最后形成终稿。(2)共 73 例被试完成了全部随访,其中干预组 36 例,对照组 37 例,两组被试基线资料间比较差异均无统计学意义($P>0.05$)。干预结束时,除 BSI 得分外,干预组自伤行为、BIS、SAS 及 SDS 得分组间比较差异均无统计学意义($P>0.05$);干预结束后 1 个月、3 个月及 6 个月,干预组自伤行为、BIS、SAS、SDS 及 BSI 得分均明显低于对照组,且组间比较差异均有统计学意义($P<0.05$)。此外,干预组上述量表的得分随时间推移而降低的趋势较对照组更加显著。

结论 家庭参与式 ERGT 干预方案较 ERGT 而言效果更佳,且能有效减少抑郁障碍青少年的 NSSI 行为、降低其冲动性、减少自杀想法、改善焦虑抑郁情绪,并为临床医护人员对其治疗提供参考和借鉴,具有一定的临床意义,值得进一步推广

不同方案 rTMS 治疗青少年非自杀性自伤行为的疗效分析及其可能脑神经机制研究

杜娜¹ 宦宗素² 岳玉川¹ 肖宇¹ 陈佳¹ 李云歌¹

1.成都市第四人民医院

2.遵义医学院

目的 探讨不同方案 rTMS 对青少年非自杀性自伤 (NSSI) 行为的疗效, 并利用 fNIRS 探寻疗效背后的神经机制。

方法 选取某医院精神科 99 名伴 NSSI 行为的抑郁症青少年为研究对象, 随机分为对照组、低频组及联合组各 33 名。对照组接受伪刺激 rTMS 治疗; 低频组和联合组分别进行: 右侧背外侧前额叶皮层 (RDLPFC) 低频 rTMS 治疗; RDLPFC 低频 rTMS+ 左侧背外侧前额叶皮层 (LDLPFC) 高频 rTMS 联合治疗。治疗时间为每天 1 次, 每周 5 天, 持续 4 周。上述三组分别在 rTMS 治疗前后进行非自杀性自伤行为量表 (ANSSIQ)、汉密尔顿抑郁量表 (HAMD)、Barratt 冲动性量表 (BIS) 等评估, 并在治疗前后分别进行 fNIRS 检测用于分析不同脑区氧合血红蛋白 (oxy-Hb) 含量。

结果 共有 7 名被试脱落, 最终完成者共 92 例, 其中对照组 30 例、低频组 32 例、联合组 30 例。三组被试的性别、年龄、精神病家族史、首发年龄、病程等一般人口学资料差异无统计学意义。干预前上述三组在 ANSSIQ 总分、HAMD 总分、BIS-11 总分、RDLPFC 氧合血红蛋白含量、LDLPFC 氧合血红蛋白含量等基线资料差异均无统计学意义。组内比较发现: 治疗后三组在 ANSSIQ、HAMD、BIS-11 各维度及总分上均明显低于治疗前, 且差异具有统计学意义。组间比较发现: 治疗后三组组间在上述三个量表各维度及量表总分上均存在显著差异。进一步两两比较发现, 在 ANSSIQ 总分上, 联合组 < 低频组 < 对照组, 且差异具有统计学意义。在 HAMD 的焦虑躯体化、体重减轻、阻滞、睡眠障碍及总分上, 均为联合组 > 低频组 > 对照组且差异均有统计学意义, 而在认知障碍分数上则为联合组 > 低频组 / 对照组且差异有统计学意义。在 BIS 的运动冲动、认知冲动、无计划冲动维度及总分上均为联合组 > 低频组 / 对照组且差异有统计学意义。治疗后三组被试 L/RDLPFC 的 oxy-Hb 值差异均有统计学意义。进一步两两比较发现: RDLPFC 的 oxy-Hb 值上, 联合组 / 低频组 > 对照组且差异有统计学意义; LDLPFC 的 oxy-Hb 值上, 联合组 > 低频组 / 对照组且差异均有统计学意义。

结论 L/RDLPFC 联合治疗模式能够更大程度的改善抑郁症青少年的 NSSI 及临床症状, 能够显著激活其 L/RDLPFC, 并同时改善患者冲动性及负性情绪, 而其疗效可能主要基于改善 DLPFC 的功能。

Unraveling The Network of Premonitory Urges, Tic Symptoms, Obsessive-Compulsive Symptoms, and Quality of Life in Drug-naive Children and Adolescents with Tic Disorder

Xianbin Wang Hui Xu Liping Yu Wenyan Zhang
Zhongliang Jiang Yonghua Cui* Ying Li*
Beijing Children's Hospital, Capital Medical University

Objective Premonitory urges (PU) in tic disorder (TD) are recognized as a crucial factor influencing tic symptoms and overall well-being. This study employs network analysis to explore the intricate relationships among PU, tic symptoms, obsessive-compulsive symptoms (OCS), and quality of life (QoL) in drug-naive children and adolescents with TD.

Methods Participants were drug-naive TD patients aged 6 to 16 years. All participants consented to undergo multiple assessments, including the Yale Global Tic Severity Scale (YGTSS), Premonitory Urge to Tic Scale (PUTS), Gilles de la Tourette-Quality of Life Scale (GTS-QOL), Children's Yale-Brown Obsessive-Compulsive Scale (CY-BOCS), and Obsessive-Compulsive Inventory-Revised (OCI-R). Network analysis was conducted using the R-package qgraph.

Results Based on a cohort of 344 TD patients, robust associations were identified between PU and tic symptoms, OCS, and QoL deficits. Centrality analysis identified ordering symptoms and obsessive thoughts as key nodes. Notable cross-scale associations were observed, such as the connections between PU and checking symptoms, as well as PU and obsessive thoughts. Bridge centrality analysis revealed that the deficit of QoL is a crucial bridge factor connecting various clusters within the network. PU was indirectly related to

QoL in individuals with TD, while OCS exerted a direct association.

Conclusion Our study underscores the pivotal role of OCS in tic-related symptoms among individuals with TD. Highlighting the significant associations between PU and OCS, it emphasizes the necessity for targeted interventions to improve overall well-being.

Risk Factors for Non-suicidal Self-injury in Adolescents and Children: An Umbrella Review

Yi Zhong¹, Ziwei Zhang², Jiahao Ding³, Yifan Yu¹, Yongbo Zheng¹, Xiaoxing Liu¹, Yanping Bao², Lin Lu¹

1.Peking University Hospital

2.National Institute on Drug Dependence and Beijing Key Laboratory of Drug Dependence Research, Peking University

3.Shandong First Medical University & Shandong Academy of Medical Sciences

Objective Non-suicidal self-injury (NSSI) remains a major public health challenge worldwide. Identifying and targeting risk factors for NSSI is a potential approach to prevention. We aimed to summarise current knowledge on the range and magnitude of risk factors for NSSI in adolescents and children and evaluate the quality of the evidence

Methods In this umbrella review, six bibliographic databases (PubMed, WOS, Embase, Cochrane, Wanfang and CNKI) were systematically searched for articles published from database inception to April 16, 2024. We included meta-analyses of observational studies on risk factors for NSSI in adolescents and children. To evaluate the credibility of evidence, pre-specified evidence classification criteria were applied, graded as convincing (“class I”), highly suggestive (“class II”), suggestive (“class III”), weak (“class IV”), or no evidence (“class V”). The protocol was pre-registered with

PROSPERO (CRD42024519520)

Results We identified 14 meta-analyses comprising 368 primary studies on 48 risk factors from 35 countries involving 1,727,552 children and adolescents at risk for NSSI. 58.3% of the included primary studies in the meta-analyses were from high-income countries. According to the re-analysis outcomes, prior NSSI history (odds ratio, OR 5.95, 95% confidence interval 3.57 to 9.93), Cluster B personality disorders (OR 5.93, 2.37 to 14.83), LGBTIQ (OR 4.12, 3.09 to 5.47), and the co-occurrence of traditional and cyber-bullying victimization (OR 3.39, 1.55 to 7.42) were the strongest associated factors for the risk of NSSI. Additionally, direct associations were found between individual, family, sociological, and combined factors and NSSI, which underscores NSSI in children and adolescents as a multifactorial phenomenon. Based on the pre-specified evidence classification criteria, highly suggestive evidence (class II) supported direct associations between NSSI and school absenteeism (OR 2.14, 1.59 to 2.89; Amstar-2=High), LGBTIQ (OR 4.12, 3.09 to 5.47; low), bully-victims (OR 2.98, 1.84 to 4.82; low), problem behaviors (OR 1.99, 1.81 to 2.19; low), sexting (OR 1.98, 1.75 to 2.25; low), mental disorders (OR 1.86, 1.60 to 2.16; low), female (OR 1.26, 1.12 to 1.43; low), and remaining 10 pooled analyses which were rated as critically low quality based on Amstar-2 framework. Suggestive evidence (class III) indicated that NSSI was directly associated with adverse childhood experiences (OR 2.31, 1.77 to 3.01; low) and left-behind children (OR 1.37, 1.11 to 1.69; low). Of the remaining 29 pooled analyses, 22 were graded as weak strength (class IV) and 7 were graded as no evidence (class V). Overall, using the Amstar-2 framework, 16 pooled analyses were rated as low quality, with 31 rated as critically low quality, limiting the quality of evidence

Conclusion A wide range of risk factors were identified across various domains, which underscores NSSI in adolescents and children as a multifactorial phenomenon. These findings provide a rationale for developing and evaluating the effectiveness of using population-based and public health measures to target and reduce NSSI for improved adolescent and children's health.

Heterogeneity in Adolescents' Non-suicidal Self-injury Behaviour Trajectories Based on The Group-based Trajectory Model and A Decision Tree Analysis of Family-related Determinants

李琳波*

山西医科大学第一医院

Objective The purpose of the study was to identify the heterogeneity in trajectories of adolescents' NSSI behaviour and their family-related influencing factors.

Methods The group-based trajectory model (GBTM) was used to identify the heterogeneity in the NSSI behaviour trajectories of 208 adolescents in China. Next, the decision tree model (DTM) was used to analyse which family related factors influence the trajectory type.

Results The GBTM revealed two heterogeneous trajectories of NSSI behaviour: the high-risk and low-risk NSSI behaviour groups. Next, DTM's average accuracy was 83.2%. A total of seven independent variables were used for the DTM: gender, number of NSSIs in the past month, and family economic, family structure, family conflict, parental psychological control, parental behavior control and family intimacy risks. Family conflict risk was located at the root node and was the most important factor.

Conclusion Heterogeneity within the population should be considered in the management of adolescents' NSSI behaviours. Further, from the perspective of family system theory and cumulative risk, focusing on the adverse effect of multiple risk factors on adolescents' NSSI addiction is more meaningful rather than the impact of single risk factors. Thus, targeted prevention and treatment interventions need to be tailored to the trajectory characteristics of different subgroups. For high-risk

groups, we should provide symptomatic interventions. Next, focusing on the decision tree model of family core risk factors, researchers and health professionals should examine the influence of family structure, resources, and atmosphere on NSSI behavioural addiction from the perspectives of family system theory and cumulative risk. Thus, even on admission in a treatment facility, the focus should be on identifying the adolescent's NSSI behaviour history as well as assessing family intimacy, family conflict, and parental control over the child. Meanwhile, while parenting, parents should create a harmonious and warm family atmosphere for children, reducing psychological control over adolescents, increasing tolerance of adolescents' individual independence and personality, and giving adolescents appropriate autonomy in personal issues for development attempts. This study advocates family therapy for parents rather than just for adolescents. This can help reduce the occurrence, development, and addiction of NSSI behaviours among adolescents by increasing parent classes, restoring autonomy, and reducing domestic violence language and conflict

Sleep Disturbance and Eating Disorders Among Adolescents with Depression: The Mediation of Anxiety and The Moderation of Testosterone

韦雨欢^{1,2} 王诗健^{1,2} 赵心睿^{1,3} 陈佳佳^{1,3} 李静雅¹
杨楹^{1,2,3}

1. 山东省精神卫生中心

2. 济宁医学院

3. 滨州医学院

Objective Although sleep disturbance has been reported to play a significant role in the elevated prevalence of eating disorders, limited research has examined the mediating and moderating mechanisms underlying this relationship. The aim of this cross-sectional study

was to investigate whether anxiety mediates the association between sleep disturbance and eating disorders and whether testosterone serves a moderating role.

Methods This study was conducted among 319 adolescents with depressive disorders, and the data were collected at Shandong Mental Health Center from January to November 2022. Participants filled out self-report questionnaires, including the Pittsburgh Sleep Quality Index, Eating Disorder Inventory, Multidimensional Anxiety Scale for Children, and Children's Depression Inventory. Testosterone levels were quantitatively assessed through blood samples collected upon admission to the hospital. The statistical model was tested using bootstrapping with resampling strategies, and the Johnson-Neyman technique was used to visualize the moderating effect of testosterone.

Results The participants had a mean age of 15.63 (SD=2.27) and scored high on the Children's Depression Inventory (M=24.48, SD=12.68). Eating disorders were positively correlated with sleep disturbance ($r=0.446, p<0.01$) and anxiety ($r=0.568, p<0.01$). Sleep disturbance was positively correlated with anxiety ($r=0.602, p<0.01$). Anxiety partially mediated the relationship between sleep disturbance and eating disorders ($\beta=0.942, 95\%CI [0.586, 0.328], p<0.001$). Testosterone showed a significant moderating effect (index of moderated mediation=-0.533, 95%CI [-0.986, -0.081], $p=0.021$).

Conclusion The findings from this cross-sectional study elucidate the complex interplay between sleep disturbance, anxiety, and testosterone in contributing to the risk of eating disorders among adolescents with depression. Specifically, anxiety serves as a crucial mediator in the relationship between sleep disturbance and eating disorders, while testosterone levels modulate the strength of this mediation. These results highlight the importance of considering both psychological factors, such as anxiety, and biological factors, like testosterone, in understanding and addressing the multifaceted nature of eating disorders in depressed adolescents. Further research is needed to explore these relationships longitudinally and to examine potential interventions that target these mediating and moderating mechanisms

儿童神经发育障碍的斑马鱼模型：从基础到临床的连接

黄政伟 苏正康 叶敏捷* 李西*

浙江省精神心理疾病临床研究中心, 温州医科大学附属康宁医院

目的 注意缺陷多动障碍(ADHD)是一种高度遗传的神经发育障碍, 包括注意力缺陷型、多动-冲动型和混合型。全球 ADHD 发病率约为 5.29%, 主要在儿童青少年时期发病, 这将对儿童患者的个人和家庭造成严重损害。本研究旨在通过基础实验和临床分析深入探索 GHRELIN 基因突变与儿童青少年 ADHD 之间的潜在联系。

方法 在基础研究中, 我们运用全基因组测序技术, 对大量儿童 ADHD 患者及其家族成员进行基因分析, 成功识别出 GHRELIN 基因作为儿童 ADHD 的潜在高风险基因。随后, 利用 CRISPR-Cas9 技术, 在斑马鱼模型中敲除 GHRELIN 基因 (*ghrelin*^{-/-})。在临床前研究中, 我们采用行为学实验, 详细观察这些模型是否表现出类似儿童 ADHD 患者的症状, 如多动、注意力缺陷和冲动。此外, 我们还利用高效液相色谱技术分析斑马鱼模型中神经递质的含量, 并通过转录组分析和荧光定量 PCR 技术, 深入探讨了其背后的分子机制。

结果 基础研究的成果为儿童 ADHD 的临床治疗提供了重要依据。通过病例对照研究, 我们证实 GHRELIN 基因的 SNP 位点 rs696217 的突变与儿童 ADHD 的发病风险存在显著关联, 进一步确认了 GHRELIN 基因在儿童 ADHD 中的重要角色。在斑马鱼模型中, *ghrelin*^{-/-}个体表现出类似儿童 ADHD 患者的行为特征, 如过度活跃、注意力难以集中和冲动行为, 且可被一线多动症药物 MPH 和 ATX 所缓解, 这为我们理解儿童 ADHD 的发病机制提供了直观的实验模型。在分子层面, 基础研究显示 *ghrelin*^{-/-}斑马鱼的大脑中多巴胺能神经元数量减少, 多巴胺含量降低, 这可能与儿童 ADHD 的症状直接相关。转录组分析和荧光定量 PCR 技术进一步揭示了 *ghrelin* 及其信号通路相关基因在 *ghrelin*^{-/-}斑马鱼

中的表达变化,为理解儿童 ADHD 的分子机制提供了新的视角。临床前研究的发现也为基础研究提供了反馈。GHRELIN 激动剂 MK-677 和人重组生长激素在斑马鱼模型中显示出缓解多动样行为的潜力,这为未来儿童 ADHD 的临床治疗提供了新的候选药物和治疗策略。

结论 本研究通过临床与基础研究的紧密结合,成功揭示了 GHRELIN 基因与儿童 ADHD 之间的关联,并通过斑马鱼模型深入探讨了其分子机制。GHRELIN 激动剂 MK-677 和人重组生长激素在斑马鱼模型中的疗效评估,为基础研究提供了新的研究方向。

5.School of Public Health, Peking University

6.Pain Medicine Center, Peking University Third Hospital, Peking University

Objective Previous studies of brain function alterations that are associated with modified electroconvulsive therapy (MECT) for major depressive disorder (MDD) have yielded conflicting results because of variations in treatment durations, types of antidepressants, and disease course. Consequently, predicting the efficacy of MECT remains challenging.

Methods Thirty patients with first-episode, drug-naive adolescent MDD and 34 healthy controls (HCs) underwent resting-state functional magnetic resonance imaging and neuropsychological tests. The patients received MECT and underwent scanning at two time points (baseline and posttreatment). Voxel-mirrored homotopic connectivity (VMHC), support vector machine (SVM), and support vector regression (SVR) analyses were employed to analyze the imaging data.

Results Compared with HCs, patients at baseline exhibited greater VMHC in the cerebellum_2 and cerebellum_8. Following treatment, patients exhibited the restoration of normal VMHC values. Additionally, SVM and receiver operating characteristic curve analyses revealed that VMHC values in the cerebellum_2 could differentiate MDD patients from HCs with 73.85% accuracy, 70.00% sensitivity, 79.41% specificity, and an area under the curve of 0.7486. Furthermore, the SVR results indicated a significant association between predicted and actual symptomatic improvement based on the reduction ratio of Hamilton Depression Rating Scale-17 total scores ($R^2 = 0.5269$, $P < 0.0001$).

Conclusion This study provides evidence that MECT modulates homotopic connectivity of the cerebellum_2 in first-episode, drug-naive adolescent MDD. Moreover, VMHC values in the cerebellum_2 may serve as a valuable neuroimaging biomarker for distinguishing MDD from HCs and potentially predicting early treatment response in MDD

目的 孤独症谱系障碍 (autism spectrum disorder, ASD) 是一种神经发育障碍, 其核心症状包括社交障碍和重复性感官运动行为。ASD 的发病机制复杂, 研究表明 ASD 主要受遗传学和环境因素影响。在大规模外显子组测序研究和全基因组关联分析, 混合谱系白血病 5 (mixed lineage leukemia, MLL5) 基因与 ASD 相关。临床报道携带 MLL5 杂合突变子会表现出一系列神经发育障碍, 其中包括 ASD。MLL5 在细胞周期、基因组稳定性、造血发生免疫调节等生物过程中发挥关键作用。小胶质细胞在大脑中具有免疫功能, 并参与神经元存活、突触形成和清除等过程。这些过程的异常与孤独症的发生发展有关。尽管 MLL5 突变与 ASD 有关, 但目前尚未明确其是否影响小胶质细胞功能从而导致 ASD 行为的出现。

方法 我们利用分子生物学、神经科学等技术手段探索 Mll5^{+/-}小鼠与野生型小鼠小胶质细胞功能, 并进行为了学实验, 以探讨 Mll5^{+/-}小鼠是否具有孤独症样行为。同时, 我们还使用诱导多能干细胞技术将携带了 MLL5 突变的 ASD 患者和健康对照的血样诱导成小胶质细胞和神经元以进一步验证相关机制。

结果 1. 我们对小鼠的发育情况进行了检测, 结果显示, 与野生型小鼠相比, Mll5^{+/-}小鼠脑重、脑长比正常, 皮层厚度正常, 且未观察到明显大脑畸形的现象。2. 在大脑早期发育阶段, Mll5^{+/-}小鼠其小胶质细胞呈现多分枝状, 同时 CD68 的表达降低, 这表明 Mll5^{+/-}小鼠小胶质细胞吞噬功能存在异常。3. 对 Mll5^{+/-}小鼠神经元的显示, 其骨架蛋白 MAP2 并没有发生变化, 相关的突触蛋白呈现出增多趋势, 神经元的数量没有变化。在海马 DG 神经元中, 树突棘密度增多, 不成熟的突触比例增多。神经元的 mEPSC 的频率降低, 振幅无影响。这表明 Mll5 单倍体不足改变了突触的功能。4. 通过体外神经元与小胶质细胞共培养系统检测小胶质细胞的吞噬功能, 发现加入 Mll5 单倍体不足小鼠来源的小胶质细胞后, 神经元的突触密度增多, 这提示 Mll5 突变影响了小胶质细胞吞噬的能力。5. 行为学实验显示, Mll5^{+/-}小鼠表现出社交障碍和刻板行为, 还出现了筑巢问题和抑郁样行为。6. 携带了 MLL5 突变的 ASD 患者诱导的小胶质细胞吞噬功能异常。

结论 Mll5 单倍体不足导致小胶质细胞吞噬功能异常及孤独症样行为。

青少年抑郁障碍高自杀风险的影响因素研究 -- 从炎症-犬尿氨酸通路和家庭环境的角度

杨舒然 韩冬 陈诗 王璐 冯强 赵旭东 康传媛*
同济大学附属东方医院 临床心理科

目的 近年来, 青少年自杀事件频发, 青少年自杀问题已经成为社会各界关注的热点问题。既往研究提示, 精神障碍是青少年自杀未遂和自杀死亡最重要的危险因素, 其中以抑郁障碍最为相关。此外, 青少年自杀可能还与生物、社会、心理等多方面的因素有关。有研究报道, 免疫紊乱和色氨酸-犬尿氨酸通路 (TKP) 代谢异常、以及家庭环境可能与抑郁障碍青少年的自杀倾向有关。本研究旨在探索除了抑郁障碍诊断以外, 影响青少年人群自杀风险的危险因素, 为青少年自杀防治提供科学依据。

方法 本研究从同济大学附属东方医院的门诊及住院部招募了 124 名符合 ICD-10 诊断标准的青少年抑郁障碍患者, 采集患者的静脉血用于检测: 血清白细胞介素 (IL) -1 β 、IL-6、IL-18、IL-10、肿瘤坏死因子 (TNF) - α 、以及色氨酸 (TRP)、犬尿氨酸 (KYN)、3-羟基犬尿氨酸 (3-HK) 和犬尿酸 (KA) 等代谢物的水平。采用简明儿童少年国际神经精神访谈 (MINI-Kid) 自杀模块评估青少年抑郁患者的自杀风险, 采用系统家庭动力学自评量表 (SSFD) 和童年创伤问卷 (CTQ) 评估家庭动力特征和心理创伤。采用多元线性回归分析探索青少年抑郁障碍高自杀风险危险因素。将 MINI-Kid 自杀模块的自杀风险评分作为因变量, 以单因素分析有意义的社会人口学特征 (性别、年龄、发病年龄、病程)、生物学指标 (皮质醇、细胞因子、TKP 代谢物) 和社会心理学指标 (家庭动力特征和童年创伤类型) 为自变量, 建立回归方程。

结果 发病年龄 ($B=-2.240, P=0.003$)、血清 IL-1 β 水平 ($B=9.240, P=0.002$)、家庭气氛 ($B=0.701, P=0.018$)、情感忽视 ($B=1.078, P=0.003$) 和情感虐待 ($B=1.056, P<.001$) 是青少年抑郁障碍高自杀风险的危险因素。发病年龄越早, 血清 IL-1 β 水平越高, 家庭气氛越沉闷敌对, 父母越不能提供儿童基本的心理和情感需要, 父母对孩子越多言语攻击或任意侮辱、羞辱及威胁行为, 青少年抑郁障碍患者的自杀风险越高。

结论 发病年龄早、体内炎症反应增强、不良的家庭气氛、成长阶段情感上被主要照料者忽视或虐待是除了抑郁障碍诊断以外，青少年人群高自杀风险的预测因素。其中，血清 IL-1 β 水平或可作为青少年抑郁障碍患者自杀风险的独立预测生物标志物。评估炎症反应状态以及家庭环境特点或可预测抑郁障碍青少年的自杀风险，并为防治提供干预靶点。

关键词：青少年抑郁，自杀风险，炎症，犬尿氨酸通路，家庭动力

Attribution of Psychiatric Manifestations To Systemic Lupus Erythematosus in Chinese Patients: A Retrospective Study of Psychiatric Consultation Cases

Wenqi Geng Jinya Cao* Jing Wei
CAMS&PUMC

Objective To understand the prevalence of neuropsychiatric systemic lupus erythematosus (NPSLE) and attribution of psychiatric manifestations among Chinese SLE patients

Methods This retrospective single-center study analyzed 160 patient records. Clinical diagnosis, deemed as the gold standard, divided the subjects into NPSLE group (G1) and secondary psychiatric symptoms group (G2). Clinical features were compared between these two groups. The Italian attribution model's sensitivity and specificity were explored

Results A total of 171 psychiatric syndromes were diagnosed in 138 patients, including 87 cases of acute confusional state (ACS), 40 cases of cognitive dysfunction (CD), 26 cases of mood disorders, and 18 cases of psychosis. 141 (82.5%) syndromes were attributed to SLE. In contrast to G2, G1 demonstrated higher SLEDAI-2K score (21 vs 12, $p = 0.001$), lower prevalence of anti-beta-2-glycoprotein 1 antibody (8.6% vs 25.9%, $p = 0.036$), and higher prevalence of anti-ribosomal ribonucleoprotein particle (rRNP) antibody (39.0% vs 22.2%, $p = 0.045$). G1 also exhibited higher utilization of cyclophosphamide (78.7% vs 53.3%, $p = 0.005$), antipsychotics (80.9% vs 43.3%, $p < 0.001$), and sedatives (43.3% vs 10.0%, $p < 0.001$) compared to G2. The Italian attribution model exhibited a sensitivity of 95.0% and a specificity of 70.0% when the threshold value was set at 7

Conclusion NPSLE tends to occur in patients with more severe disease activity and is connected with anti-rRNP antibody. The Italian model effectively assesses multiple psychiatric manifestations in Chinese SLE patients presenting NP symptoms.

年轻高血压住院患者的睡眠特点

王鹏 马文君 杜柳 赵明晶 冯雪*
中国医学科学院阜外医院

目的 既往研究已经验证了睡眠时间过短与高血压之间的联系。但是, 导致睡眠时间减少的各种因素尚不清楚, 包括睡眠机会、睡眠能力、情绪状态等因素。这些因素对未来的针对性干预具有重要意义。因此, 本研究的主要目的是通过分析年轻高血压住院患者的睡眠和焦虑/抑郁评定量表, 调查睡眠时间过短与睡眠机会之间的潜在关联。

方法 共 1677 名年轻高血压住院患者 (年龄 = 34.58 ± 7.90 岁) 完成了匹兹堡睡眠质量指数、焦虑自评量表和抑郁自评量表。我们评估了所有参与者的各种睡眠参数, 包括睡眠时间、睡眠效率和日间功能障碍。我们还检查了不同睡眠类型亚组的分布、就寝/起床时间, 并利用线性回归分析探索焦虑/抑郁与睡眠之间的关系。

结果 在青少年高血压住院患者中, 59.8% 报告睡眠时间减少, 其中 60.66% 可能缺乏睡眠机会, 16.39% 显示出睡眠能力下降。在成年参与者中, 37.5% 报告睡眠时间减少, 38.3%-46% 可能缺乏睡眠机会, 41.9%-46.8% 显示出睡眠能力下降。焦虑与睡眠效率 (coefficient = -0.130, $P < 0.001$) 和日间功能障碍 (coefficient = 0.423, $P < 0.001$) 相关, 但与睡眠时间无关 ($P = 0.857$); 抑郁也与睡眠效率 (系数 = -0.150, $P < 0.001$) 和日间功能障碍 (coefficient = 0.352, $P < 0.001$) 相关, 但与睡眠时间无关 ($P = 0.258$)。

结论 我们发现部分年轻高血压住院患者存在睡眠时间过短, 背后有多种潜在因素。特别是, 在青少年中, 睡眠机会不足可能是一个高度普遍的因素。因此, 关注年轻人的多维度睡眠特征对其整体身体健康具有重要意义。

Restless Legs Syndrome Is A Risk Factor for Major Depressive Disorder

Junwen Wang¹, Haiwang Zhang², Dianmei Yang³, Ying Luo¹, Yiming Wang³

1. Guiyang Second People's Hospital

2. Guizhou Provincial People's Hospital

3. Affiliated Hospital of Guizhou Medical University

Objective A significant association between major depressive disorder (MDD) and restless legs syndrome (RLS), but RLS prevalence is dramatically different among MDD individuals across studies. Our present work aimed to comprehensively evaluate available evidences to determine the role of RLS in MDD. PubMed, Web of Science, Embase, Scopus, Science Direct, Science Online, Wip Chinese Biomedical Journal, Wanfang and Chinese National Knowledge Infrastructure were searched to identify observational and case-control studies relevant to RLS and MDD. Stata 12.0 software was used for meta-analysis. RLS individuals exhibited a higher risk of MDD than non-RLS controls (OR 2.05, 95%CI 1.80–2.33; $p < 0.05$). No significant differences were found in MDD prevalence between young RLS patients (OR 2.10, 95%CI 1.72–2.56) and older RLS patients (OR 2.02, 95%CI 1.70–2.39). In addition, no significant difference in MDD prevalence was evident between Asian (OR 1.98, 95%CI 1.66–2.37) and European or American (OR 1.76, 95%CI 1.54–2.01) RLS patients. Our meta-analysis provides evidence that the risk for MDD is higher among RLS patients compared to non-RLS individuals suggesting that RLS may play an important role in MDD pathogenesis

Methods Literature Search

We searched the databases of PubMed, Web of Science, Embase, Science Online, Wip Chinese Biomedical Journal, Wanfang and Chinese National Knowledge Infrastructure up to 13 December 2018. The search was limited to randomized controlled trials on human populations and articles written in English language. The following search strings were used: [(depression) OR (major depressive disorder) OR (depressive symptoms)] AND [(restless legs syndrome) OR (Willis-Ekbom disease) OR (RLS) OR (WED)]

Selection criteria

Three authors (Haiwang Zhang, Changxi Zhou, Shuai Jin) reviewed all identified articles from the initial search for inclusion; Any disagreements regarding the inclusion of the articles were resolved through discussion between the authors. Inclusion criteria were established before the commencement of article reviews and contained the following aspects:

1. Descriptive research by collecting literature analyzing the role of RLS in MDD;
2. Diagnosing MDD based on the criteria of GDS, BDI, and EPDS score confirmation by clinicians;
3. RLS diagnosed according to the criteria of the international RLS study group and the data on the patients obtained through questionnaires or clinical interviews;
4. Reporting RLS prevalence or sufficient data for the prevalence calculation;
5. Being full-text articles available for the evaluation of all interested components;
6. Having available data allowing for the determination of effect size; and
7. Being articles written in English.

Exclusion criteria were as follows:

1. Failed to offer valid data or inconsistent variables;
2. Reporting no MDD prevalence among individuals with RLS or having no enough data for the prevalence calculation;
3. Having significant methodological flaws; or
4. Involving no individuals with MDD or RLS.

Results Literature search and included studies

Searching the seven databases and records identified 2425 articles, and 48 of them were further examined after the removal of duplicates and clearly irrelevant articles (Fig.1). After eliminating 29 articles based on the title and abstract, the remaining 18 were used for full-text articles assessment and eligibility, and 6 were subsequently excluded either because no data were extracted (n=4) or variable inconsistency (n=2)]. Therefore, 12 remaining studies were included in the present meta-analysis.

The eligible 12 studies contained 3357 individuals with RLS and 94912 non-RLS were included in the

meta-analysis (Table 1). Of these studies, five were done on Asians and seven on Europeans or Americans, with five on individuals younger than 50 and seven on people older than 50. All of the 12 studies assessed MDD prevalence in patients with RLS and compared MDD between RLS and non-RLS individuals, and investigated the relationship between RLS and MDD.

Higher MDD prevalence in patients with RLS

Detailed MDD prevalence among individuals with and without RLS is listed in Table 1. Among the 12 studies, low heterogeneity was detected ($I^2 = 20.9\%$, $p < 0.001$), therefore the random-effect model was used to meta-analyze the data. Sensitivity analysis showed that none of the 12 studies significantly affected results (Fig. 2). Funnel plot was visually symmetrical, suggesting no significant publication bias (Fig. 3).

No significant differences in the risk of MDD between younger and older adults

Of the 12 studies, 5 focused on people younger than 50, and 7 on those older than 50. Although the results of our study were not highly heterogeneous ($I^2 = 20.9\%$, $p < 0.001$), we compared these two age groups with an age of 50 as threshold for subgroup analysis. Our results showed no significant difference in MDD prevalence between these two patient groups (OR=2.10 for patients younger than 50 and OR=2.05 for those of 50 years or older). Sensitivity analysis showed that none of the 12 studies significantly affected the results (Fig. 4).

No significant difference in MDD risk between Asian RLS patients and European or American RLS patients

Of the 12 studies, five were done on Asian patients and seven from Europeans and Americas. Although the results of our study were not highly heterogeneous ($I^2 = 20.9\%$, $p < 0.001$), we nevertheless compared the risk of MDD among Asian RLS patients with that in American or European patients, but found no significant difference between two these two groups. Sensitivity analysis showed that none of the 12 studies significantly affected the results (Fig. 5).

Conclusion Higher MDD prevalence in patients with RLS, No significant differences in the risk of MDD

between younger and older adults, No significant difference in MDD risk between Asian RLS patients and European or American RLS patients 关键词: Major depressive disorder; Restless legs syndrome; Willis-Ekbom disease; mental diseases

Real-world Study on The Efficacy of Pharmacotherapy for Anxiety and Depression Patients in The Psychology Department of A Cancer Hospital

Kuan Zhao Youyang Wang Qun Liu Ze Yu Wei Feng*
Fudan University Shanghai Cancer Center

Objective The incidence of cancer has been rapidly increasing among Chinese populations, with an extreme susceptibility to anxiety and depressive disorders, which are significantly impacting the effectiveness of cancer treatments and long-term quality of life (QoL). However, this patient population has limited exposure to any possible clinical benefits of psychotropic drugs. Therefore, this study aimed to explore the efficacy of antidepressant treatments between the cancer and non-cancer patients' groups, to provide further clinical data support for improving the mental health of afflicted cancer patients

Methods It was a real-world cohort study. A total of 610 outpatients were selected and diagnosed with depressive episodes and/or anxiety disorders. Eligible subjects received antidepressants from the Psychological Clinic of Fudan University Shanghai Cancer Center. The Patient Health Questionnaire-9 (PHQ-9) and the Generalized Anxiety Disorder Questionnaire-7 (GAD-7) were used to evaluate the clinical characteristics and treatment efficacy of patients at baseline, 4 weeks, and 8 weeks of follow-up

Results Compared to the non-cancer group, the cancer group had higher proportions of females, older subjects, and patients with poor sleep quality and reportedly fewer somatic symptoms at baseline ($p < 0.05$). The scores of PHQ-9 and GAD-7 in cancer patients treated with antidepressants were significantly lower than those

at baseline at the 4th and 8th week time points. Escitalopram was found more effective than sertraline ($p < 0.05$) in treating psycho-behavioral symptoms in this cohort. Patients with comorbid anxiety and depression showed more pronounced improvement in their PHQ-9 and GAD-7 scores, while cancer patients receiving chemotherapy exhibited slower decreases in their respective behavioral testing scores in the 4th week ($p < 0.05$). Patients who were lost to follow-up exhibited more severe physical symptoms and depression, regardless of the cancer type ($p < 0.05$)

Conclusion This real-world study has found that the efficacy of antidepressant treatment in cancer patients with anxiety and depression is similar to that in non-cancer patients. However, due to the limitations of the study design and the significant loss to follow-up patient population, more clinical data, and further evidence-based clinical studies are warranted

精神分裂症与强迫症和双相情感障碍共有的和特异性脑网络改变

秦晓青 李平* 李成冲 尚婷惠子 杨旭 丁志鹏 齐佳乐 秦玮琪 李善聪 于增艳 李彤
齐齐哈尔医学院

目的 强迫症、精神分裂症和双相情感障碍的临床表现和影像学特征有相似之处。三种精神障碍均是以大规模脑网络异常为特征的脑疾病,其共有的和特异性的脑网络改变有待进一步研究。本研究采用多模态成像技术拟探讨精神分裂症、强迫症和双相情感障碍共有的和特异性的脑网络连接模式,以及特异性的脑网络连接模式是否可以作为潜在的生物标记物识别精神障碍。

方法 纳入精神分裂症患者 28 名,强迫症患者 23 名,双相情感障碍患者 19 名以及健康对照 24 名。采集被试的静息态功能磁共振成像数据, T1 加权成像和临床症状数据。采用图论分析方法分析精神障碍患者在静息状态下个体水平结构协方差脑网络和功能脑网络连接模式;采用斯皮尔曼相关分析方法

探讨异常脑网络指标与临床症状的相关性；采用支持向量机探讨异常的网络指标能否用于识别精神障碍。

结果 在静息态功能网络中，与健康对照组相比，识别到精神分裂症，强迫症和双相情感障碍共有的和特异性的脑网络连接模式，并与临床量表具有相关性；在个体水平结构协方差网络中，与健康对照组相比，识别到精神分裂症，强迫症和双相情感障碍共有的和特异性的脑网络连接模式，并与临床症状具有相关性；以特异性静息态功能脑网络改变为特征，识别精神分裂症的准确率为 90.84%，敏感度为 91.01%，特异性为 95.33%，识别强迫症的准确率为 88.17%，敏感度为 97.83%，特异性为 89.38%，识别双相情感障碍的准确率为 87.54%，敏感度为 97.37%，特异性为 86.34%。以特异性个体水平结构协方差网络改变为特征，识别精神分裂症的准确率为 78.41%，敏感度为 82.14%，特异性为 84.32%，识别强迫症的准确率为 85.78%，敏感度为 91.30%，特异性 100%，识别双相情感障碍的准确率为 89.11%，敏感度为 97.37%，特异性为 87.11%。结合个体水平个体水平结构协方差网络和静息态功能脑网络特征，识别精神分裂症的准确率为 92.89%，敏感度为 92.86%，特异性为 100.00%，识别强迫症的准确率为 92.51%，敏感度为 91.07%，特异性 94.25%，识别双相情感障碍的准确率为 92.17%，敏感度为 92.11%，特异性为 98.21%。

结论 精神分裂症与强迫症和双相情感障碍存在共有的和特异性的脑网络连接模式，并可以作为潜在的生物标志物进行识别和分类。

关键词：精神分裂症；强迫症；双相情感障碍；结构协方差网络

Prevalence and Characteristics of Somatic Symptom Disorder in Adult Patients with Chronic Cough

Tongyangzi Zhang Heng Wu Yinuermanglike A Xianghuai Xu Li Yu*

Tongji Hospital, School of Medicine, Tongji University

Background This study aimed at exploring the

frequency of somatic symptom disorder (SSD) in patients with chronic cough and comparing patients with chronic cough with or without SSD, including socio-demographic, clinical, and psychological characteristics

Methods This cross-sectional study analyzed general clinical data in patients with chronic cough, with versus without SSD. A total of 463 patients were enrolled. The structured clinical interview from the fifth edition of the Diagnostic and Statistical Manual of Mental Disorders was used for SSD diagnosis. Clinical features, cough-related assessment, and psychological assessment were used to compare patients with and without SSD

Results SSD was diagnosed in 13.8% (64/463) of all enrolled patients. Patients with refractory chronic cough experienced more severe SSD (27.7% moderate and severe vs. 7.8% in non-refractory cough patients). Patients with chronic cough rather than without SSD reported higher levels of capsaicin cough sensitivity (C2: $Z = -0.955$, $P = 0.339$; C5: $Z = -1.518$, $P = 0.129$), anxiety ($Z = -8.359$, $P < 0.001$), and depression ($Z = -9.241$, $P < 0.001$), and lower levels of cough symptom score, and Leicester cough questionnaire (LCQ) score ($Z = -8.827$, $P < 0.001$). Binary logistic stepwise regression indicated that GAD-7, LCQ, doctor visits, and sex were predictor variables of SSD diagnosis. The explained variance was Nagelkerke $R^2 = 0.645$

Conclusion SSD is not rare in patients with chronic cough, particularly those with refractory cough. Timely diagnosis is necessary for this group of patients, and treatment from the perspective of psychosomatic medicine is meaningful

关键词：Chronic cough, Clinical characteristics, Somatic symptom, Anxiety and depression, psychological

Comparison of Cognitive Performance in First-episode Drug-naïve Schizophrenia, Bipolar II Disorder, and Major Depressive Disorder Patients after Treatment

Jiaquan Liang*

The Third People's Hospital of Foshan

Background Cognitive impairment is a recognized fundamental deficit in individuals diagnosed with schizophrenia (SZ), bipolar II disorder (BD II), and major depressive disorder (MDD), among other psychiatric disorders. However, limited research has compared cognitive function among first-episode drug-naïve individuals with SZ, BD II, or MDD

Methods This study aimed to address this gap by assessing the cognitive performance of 235 participants (40 healthy controls, 58 SZ patients, 72 BD II patients, and 65 MDD patients) using the Repeatable Battery for the Assessment of Neuropsychological Status (RBANS) before and after 12 weeks of treatment in SZ, BD II, and MDD patients. To clarify, the healthy controls only underwent RBANS testing at baseline, whereas the patient groups were assessed before and after treatment. The severity of symptoms in SZ patients was measured using the Positive and Negative Syndrome Scale (PANSS), and depression in BD II and MDD patients was assessed using the Hamilton Depression Scale-24 items (HAMD-24 items)

Results Two hundred participants completed the 12-week treatment period, with 35 participants dropping out due to various reasons. This group included 49 SZ patients, 58 BD II patients, and 53 MDD patients. Among SZ patients, significant improvements in immediate and delayed memory were observed after 12 weeks of treatment compared to their initial scores. Similarly, BD II patients showed significant improvement in immediate and delayed memory following treatment. However, there were no significant differences in RBANS scores for MDD patients after 12 weeks of treatment

Conclusions In conclusion, the findings of this study suggest that individuals with BD II and SZ may share similar deficits in cognitive domains. It is important to note that standardized clinical treatment may have varying degrees of effectiveness in improving cognitive function in patients with BD II and SZ, which could potentially alleviate cognitive dysfunction.

关键词: Schizophrenia, Bipolar II disorder, Major depressive disorder, Cognitive dysfunction

Exploring The Risk of Suicidal and Self-injurious Behaviors (SSIBs) after Biologics for Psoriasis Or Psoriatic Arthritis: A 10-year Real-world Pharmacovigilance Analysis Using FAERS Database

Ming Chen Cailan Hou* Yufan Cheng
(GuaGuangdong Provincial People's Hospital ngdong Academy of Medical Sciences), Southern Medical University, Guangzhou, Guangdong Province, China

Background Biologics have been widely used in psoriasis or psoriatic arthritis (PsA). However, their adverse events (AEs) also need to be valued seriously

Objective We attempted to investigate the potential occurrence of suicidal and self-injurious behaviors (SSIBs) in the treatment of psoriasis or PsA with biologics in the real world

Methods A disproportionality analysis was conducted by utilizing real-world pharmacovigilance data from the U.S. Food and Drug Administration Adverse Event Reporting System (FAERS), engaging psoriasis or PsA patients reporting SSIBs

Results 796 cases were included from January 1, 2013, to December 31, 2022. The specific RORs for infliximab, adalimumab, and brodalumab were 1.890, 1.296, and 13.237 respectively. While the RORs of other antibodies (including IL-12/23 p40 inhibitor ustekinumab; IL-17A inhibitor secukinumab, ixekizumab; IL-23 p19 inhibitor guselkumab) did not show a statistical significance

Limitations: The FAERS database is a reactive reporting system and may not fully reflect the true incidence and risk. Future studies with more patients are warranted to validate and expand our findings.

Conclusion In treating psoriasis or PsA, TNF- α inhibitors infliximab, adalimumab, and brodalumab targeting IL-17RA (receptor subunit) were associated with the risk of SSIBs. While other biologics showed a relatively positive profile

关键词: Keywords: Biologics; Self-injury; Suicide; Psoriasis; Psoriasis arthritis; FAERS

ACE 基因甲基化水平在重度抑郁症合并高血压患者中的意义

张义* 阿力米热·阿力木
新疆维吾尔自治区人民医院

目的 重度抑郁症患者(MDD)常常共病高血压(HYT), 而血管紧张素转换酶(ACE)是影响高血压发生发展的至关重要的酶之一,其DNA基因甲基化的水平在高血压发生发展过程中发挥了非常重要的功能。本研究针对重度抑郁症共病高血压患者(MDD+HYT)的ACE基因甲基化水平及其意义进行了探索。

方法 共纳入119名MDD+HYT患者作为研究组(其中男性41名,女性78名,平均年龄为:56.8±9.1岁。纳入89名健康对照组(其中男性29名,女性60名,平均年龄为57.4±9.7岁。采用汉密尔顿抑郁量表(HDRS-17)和抑郁自评量表(SDS)评估患者的抑郁程度。采用亚硫酸氢盐测序聚合酶链反应的方法,测定重度抑郁症共病高血压患者血清ACE基因甲基化水平,并进行统计学分析,探索ACE基因甲基化是否对重度抑郁症共病高血压患者的诊断具有特异性,并进一步探讨了ACE基因甲基化是否为其共病的独立危险因素。

结果 重度抑郁症共病高血压患者血清ACE甲基化水平显著升高,血清ACE基因甲基化水平准确诊断重度抑郁症共病高血压的曲线下面积为0.8471,临界值为26.9(敏感性83.19%,特异性73.03%)。ACE甲基化是重度抑郁症共病高血压的独立危险因素($P=0.014$; 比值比为1.071; 95%置信区间为1.014-1.131)。

结论 重度抑郁症共病高血压患者血清ACE基因甲基化水平升高($P<0.001$)。其对重度抑郁症共病高血压具有明确的诊断价值,且ACE基因甲基化水平与重度抑郁症共病高血压独立相关($P<0.05$)。

关键词: 重度抑郁症; 高血压; 血管紧张素转换酶; 基因甲基化

Psychometric Properties of International Trauma Questionnaire (ITQ) and Symptom Structure of Complex Posttraumatic Stress Disorder Among Chinese Patients with MDD

Yongyi He¹, Yuan Yang¹, Cailan Hou^{1,2}

1.Guangdong Mental Health Center, Guangdong Provincial People's Hospital (Guangdong Academy of Medical Sciences), Southern Medical University

2.Department of Psychology, School of Public Health, Southern Medical University

Objective To assess the validity and internal reliability of the International Trauma Questionnaire (ITQ) among patients diagnosed with major depressive disorder (MDD), and to explore the network structure of Complex post-traumatic stress disorder (CPTSD) among MDD patients in China

Methods Eligible individuals were recruited from a large tertiary hospital in Guangdong Province. Trained researchers conducted in-person interviews and administered self-report questionnaires, including demographics, medical information, and psychological assessments. Confirmatory factor analyses (CFA) and network analysis were performed, with calculations of Average Variance Extracted (AVE), Cronbach's α , and composite reliability

Results A total of 113 patients with MDD participated in this study. The correlated six-factor one-order model was good representation of latent structure of ITQ ($\chi^2=60.114$, $df=39$, $P=0.017$, $SRMR=0.070$, $RMSEA=0.050$, $TLI=0.952$, $CFI=0.972$, $BIC=175.508$). All ITQ subscales possessed acceptable convergent validity and internal reliability. The square root of AVE for affective dysregulation was lower than its correlations with other clusters. Network analysis revealed that node C4 ("I feel worthless"), as a core symptom, was significantly associated with the development of CPTSD. Furthermore, a higher rate of repeated hospitalizations and more severe clinical symptoms were significantly associated with MDD comorbid with CPTSD

Conclusion The clinical applicability of the ITQ was demonstrated by overall validity and reliability

among patients with MDD. The affective dysregulation cluster, however, still needs to be revised and enhanced. Timely screening, recognition, and diagnosis are critical due to the worse clinical outcomes seen in comorbid patients.

Sex Differences in The MCCB Cognitive Performance of Unmedicated Patients with Major Depressive Disorder

Shunkai Lai Shuming Zhong Yijiang Zhang Shuya Yan Yanbin Jia*

Department of Psychiatry, First Affiliated Hospital of Jinan University, Guangzhou

Objective Cognitive impairment is acknowledged as a core feature of clinical manifestations of major depressive disorders (MDD). And sexual dimorphisms are thought to be the basis of sex differences in human cognition. However, the sex differences that occur in Measurement and Treatment Research to Improve Cognition Schizophrenia Consensus Cognitive Battery (MCCB) cognitive of MDD patients remains unclear

Methods One hundred and twenty-seven MDD (58 males and 69 females), and 124 demographically matched healthy controls (HCs) (49 males and 75 females) underwent MCCB cognitive assessment. We compared the sex difference of MCCB cognitive, and also performed association analysis to investigate the relationship between cognitive performance and clinical variables

Results Compared to HCs, the MDD group had remarkably lower scores in seven MCCB cognitive domains ($p < 0.05$). And the male patients performed higher scores in the cognitive domains of speed of processing ($p = 0.002$), attention/vigilance ($p = 0.005$), visual learning ($p < 0.001$), and MCCB composite score ($p = 0.001$) than male patients. And male HCs performed better in the MCCB composite score than female ($p =$

0.035). Additionally, the verbal learning showed an uncorrected negative correlation with the 24-items HAMD scale in female patients ($r = -0.303, p = 0.021$)

Conclusion Female MDD patients had more serious MCCB cognitive impairment than males in processing speed, attention/vigilance, and visual learning. Cognitive impairment was associated with depression severity only in female patients. Therefore, it is important to establish effective sex-specific interventions for cognitive impairment in MDD

综合医院患者心理状况筛查及住院患者分级干预模式研究

马含俏 胡永东*
北京朝阳医院

目的 调查综合医院就诊患者心理健康状况, 初步探索在住院患者中开展心理健康筛查及干预的路径。

方法 收集 2022 年 1 月-2023 年 6 月期间自愿采用北京朝阳医院官方 app“朝阳健康云”情绪筛查模块(包含一般健康问卷、病人健康问卷 PHQ-9、广泛性焦虑障碍量表 GAD-7、阿森斯失眠问卷 AIS)的患者 8471 人, 根据纳入与排除标准对住院患者 46 人开展心理健康筛查及干预。

结果 综合医院就诊患者中, PHQ-9 筛查阳性率为 83%, GAD-7 筛查阳性率为 82.44%, AIS 筛查阳性率为 88.2%, PHQ-9 和 GAD-7 同时筛查阳性率为 37.9%。焦虑阳性人群就诊最多科室为内分泌科(162 人)、妇科(154 人)、消化内科(96 人)。抑郁阳性就诊最多的科室是妇科(166 人)、内分泌科(124 人)、消化内科(78 人)睡眠阳性就诊最多的科室是内分泌科(108 人)、妇科(102 人)、消化内科(74 人)。总体心理健康水平阳性就诊最多的科室是妇科(149 人)、内分泌科(117 人)、消化内科(96 人)。一般健康状况筛查中, 不同职业($p = 0.018$)存在差异, 学生及护士得分高于其他人群, 年龄与一般健康状况得分存在负相关($r = -0.212$)。抑郁筛查结果, 不同文化程度($p < 0.05$)、婚姻($p < 0.05$)人群

存在差异,小学文化、未婚和离异人群得分显著高于其他人群,年龄与 PHQ-9 得分存在负相关 ($r=-0.186$)。焦虑状态筛查中,不同性别 ($p=0.001$)、婚姻状况 ($p=0.001$) 的人群存在显著差异,男性和未婚人群的得分显著高于其他人群,年龄与 GAD-7 得分存在负相关 ($r=-0.126$)。睡眠状态筛查结果中,不同文化程度 ($p=0.014$) 的人群得分存在显著差异,其中初中学历人群显著高于其他人群。对 46 名综合医院住院患者开展的心理健康状态筛查显示,筛查阳性比率为 39.13%。筛查阳性患者共出现 12 种症状表现,头晕占比最大 (27.78%),其次乏力、心悸均占比 11.11%。共 9 名患者诊断为精神心理疾病,其中焦虑状态占比最大 (33.33%),其次失眠、睡眠障碍、躯体化障碍均占比 16.67%,抑郁状态、焦虑合并抑郁状态占比 8.33%。对其中 8 名患者开展了药物治疗,2 名患者进行了心理健康教育,1 名患者采用了放松训练,干预后,患者在失眠状况 ($p=0.023$)、焦虑状况 ($p=0.001$) 方面得到明显改善。

结论 综合医院患者躯体疾病合并精神心理问题需重点关注内分泌科、妇科、消化内科。青年人群、男性、单身或离异人群应为重点关注对象。住院患者的心理健康筛查及干预对于患者躯体疾病的预后起到促进作用

关键词:综合医院;心理健康;筛查;干预;住院患者

光照疗法在非季节性抑郁症患者中的应用及研究

谭靓靓* 杨莉

东南大学附属中大医院

目的 光照疗法已被广泛应用于治疗季节性情感障碍 (SAD),但其在非季节性抑郁症患者中的效果尚未得到充分研究。本研究旨在评估光照疗法对非季节性抑郁症患者的疗效及研究。

方法 纳入确诊为非季节性抑郁症的患者 93 例,随机分为光照治疗组 (47 人) 与对照组 (46 人)。两组均给与常规治疗,如抗抑郁药物治疗和一般心理护理。光照治疗组在常规治疗的基础上,每日早晨接受 20 分钟的全光谱白光治疗,即波长:480nm,强度:10000LUX,持续 2 周。对照组再常规治疗的

基础上接受相同时间段的安慰剂光照治疗,即 20 分钟的 LED 光照治疗,波长:400nm,强度:538LUX,在基线期、治疗 1 周后、2 周后采用抑郁症筛查量表 (PHQ-9)、广泛性焦虑量表 (GAD-7)、心身症状量表 (PSSS) 和匹兹堡睡眠量表 (PSQI) 评估患者的焦虑、抑郁症状和睡眠质量等。

结果 干预 1 周后,两组患者的 PHQ-9 和 GAD-7 评分减分率比较发现,光照治疗组较对照组有显著降低 ($p<0.01$),但在干预 2 周后,两组减分率无显著差异 ($P>0.05$)。具体而言,PHQ-9 量表中的条目 1 (兴趣)、条目 5 (食欲) 和条目 7 (注意力) 在干预 1 周后显示出显著差异 ($p<0.05$)。对于 PSSS 评分的减分率比较,干预 1 周后,光照治疗组的 PSSS 总分和心理因子分数显著低于对照组 ($p<0.05$)。干预 2 周后,光照治疗组在 PSSS 总分、心理因子分和躯体因子分上均显著低于对照组 ($p<0.05$)。在 PSQI 评分的减分率比较中,干预 1 周后,两组在总分及睡眠时间、睡眠障碍、催眠药物使用和日间功能障碍四个维度上存在显著差异 ($p<0.05$)。然而,在干预 2 周后,这些差异不再显著 ($P>0.05$)。

结论 本研究结果表明,在常规治疗基础上,光照疗法对非季节性抑郁症患者的症状改善有显著的辅助作用。光照疗法在 1 周后显著改善了患者的心理健康和心身症状。然而,在干预 2 周后,光照疗法组与对照组在抑郁和焦虑症状方面的差异不再显著,表明光照疗法的短期效果较为明显,但其长期效益可能需要进一步研究。尽管如此,光照疗法在改善患者睡眠质量和日间功能方面显示出短期显著优势,特别是在睡眠时间、睡眠障碍和日间功能障碍等维度上。综合来看,光照疗法可以作为非季节性抑郁症患者的有效辅助治疗手段,特别适用于需要迅速缓解抑郁和焦虑症状的患者。未来的研究应进一步探索光照疗法的长期疗效及其在不同患者群体中的应用,以提供更加全面的治疗指导。

体重增加的精神分裂症患者认知功能损害的特征及与静息态功能连接的相关性

邵天男^{1,2} 黄兢² 王伟岩^{2,3} 郑磊磊¹ 林铮¹ 吴仁容²

- 1.浙江大学医学院附属第二医院
- 2.中南大学湘雅二医院
- 3.浙江大学医学院附属精神卫生中心（杭州市第七人民医院）

目的 精神分裂症患者的认知功能损害与大脑结构、功能等方面的异常有关。精神分裂症患者在抗精神病药物治疗后常出现代谢障碍，如体重增加、血脂异常、糖耐量受损、代谢综合征等，其中体重增加较为常见。研究证据表明代谢障碍可能会导致精神分裂症患者的认知功能损害进一步加重，因此本研究旨在探讨体重增加的精神分裂症患者认知功能损害的特征及与静息态功能连接的相关性。

方法 本研究纳入 71 例体重增加的精神分裂症患者，41 例体重未明显增加的精神分裂症患者以及 50 例健康对照。使用 MATRICS 共识认知成套测验 (MCCB) 评估所有被试的认知功能，并采集静息态功能磁共振 (fMRI) 数据。基于脑网络组图谱，以背外侧前额叶皮质 (DLPFC) 左右共 6 个亚区为种子点构建种子点-全脑功能连接 (FC)，比较三组间认知功能、FC 的差异，分析精神分裂症患者 FC 与认知功能的相关性。

结果 协方差分析显示，在控制性别、年龄、受教育水平后，三组间信息处理速度、注意警觉、词语学习、视觉学习、推理/问题解决、社会认知、MCCB 综合分均存在显著统计学差异 ($P < 0.001$)。事后检验显示体重增加组的信息处理速度、注意警觉、词语学习、推理/问题解决、社会认知、MCCB 综合分显著低于体重未增组。静息态 fMRI 事后分析显示，体重增加组 DLPFC 左 A46-前扣带回、右 A46-左侧眶部额下回、右 A46-直回、右 A46-右侧海马、右 A46-前扣带回、右 A46-左侧楔前叶、右 A9/46v-内侧额上回/前扣带回的 FC 显著低于体重未增组。多重比较校正后，左 A46-前扣带回的 FC 与推理/问题解决 ($r=0.321$, $P=0.003$) 呈正相关，右 A46-左侧眶部额下回的 FC 与注意警觉 ($r=0.291$, $P=0.007$)、MCCB 综合分 ($r=0.305$, $P=0.005$) 呈正相关，右 A46-直回的 FC 与推理/问题解决 ($r=0.292$, $P=0.007$) 呈正相关，右 A46-前扣带回的 FC 与注意警觉 ($r=0.299$, $P=0.005$)、推理/问题解决 ($r=0.357$, $P < 0.001$)、MCCB 综合分 ($r=0.339$, $P=0.002$) 呈正相关。

结论 与体重未明显增加的精神分裂症患者相比，伴体重增加的精神分裂症患者认知功能损害更为严重。体重增加的患者存在以 DLPFC 亚区为种子

点至突显网络、奖励系统、默认模式网络有关脑区的功能耦合下降。DLPFC 亚区-前扣带回/左侧眶部额下回/直回 FC 的降低与认知功能损害加重有关，提示这些脑区间 FC 的异常可能是体重增加的精神分裂症患者认知功能受损更为严重的潜在病理生理机制。

A Nomogram To Predict Suicide Attempts in Chinese Adolescents with Both Non-suicidal Self-injury and Suicidal Ideation

Yihui Liu^{1,2}, Ming Chen¹, Cailan Hou^{1,2}

- 1.Guangdong Provincial People's Hospital
- 2.Southern Medical University

Objective The study aims to develop a nomogram that predicts suicide attempts (SA) among Chinese adolescents with non-suicidal self-injury (NSSI) and suicidal ideation (SI). Given the high prevalence of NSSI and SI in this population and their strong association with SA, this study intends to assist clinicians in early detection and intervention

Methods This cross-sectional study involved 134 adolescents from two hospitals in Guangdong, China. Data were collected using the Chinese Version of the Self-Injurious Thoughts and Behaviors Interview-Revised (C-SITBI-R) and related assessment tools. Predictive variables for SA were identified using LASSO regression and further analyzed with multivariate logistic regression to construct a nomogram. The model's discriminative ability was assessed using the area under the curve (AUC), and internal verification was performed with the bootstrap method (1000 resamplings). Model calibration was evaluated using the Hosmer-Lemeshow test, and clinical practicability was assessed through decision curve analysis (DCA)

Results The study identified four major predictors for SA: interrupted suicide attempts, future likelihood of suicide plans, the score of the Emotional Regulation subscale, and years of education. The developed

nomogram, constructed using multivariate logistic regression, showed good predictive accuracy with an area under the curve (AUC) of 0.782. Internal verification using the bootstrap method with 1000 resamplings yielded a similar AUC of 0.780, indicating robust model performance. The Hosmer-Lemeshow test demonstrated good calibration with a non-significant p-value of 0.998, suggesting no statistical deviation between predicted and observed values. Decision curve analysis (DCA) indicated that the nomogram provided higher clinical net benefits when the threshold probability for predicting SA was between 10-94%, making it a valuable tool for clinical use in predicting suicide risk

Conclusion The current study has developed a predictive model for suicide attempts among adolescents with both NSSI and suicidal ideation. The nomogram developed in this study may assist clinicians in recognizing and intervening early in individuals at risk for suicidality.

Positive Pyramidal Sign As An Unexpected Presentation in Antipsychotic-Induced Acute Dystonia: Two Case Reports and Literature Review

Yihui Liu^{1,2}, Ming Chen¹, Cailan Hou^{1,2}

1. Guangdong Provincial People's Hospital

2. Southern Medical University

Objective Acute drug-induced dystonia (DID) is a movement disorder triggered by specific medications, primarily antipsychotics. It typically presents within hours to days of medication adjustment. This report highlights the unexpected presentation of positive pyramidal signs in acute DID and reviews previously published cases of acute DID caused by commonly used psychiatric drugs, focusing on auxiliary examinations for differential diagnosis and neurological physical examinations

Methods We detailed two cases of acute DID

following antipsychotic use in a 19-year-old male and a 23-year-old female, thoroughly documenting their diagnostic and treatment processes, clinical presentations, and test results. Subsequently, a literature review was conducted. The MEDLINE database was searched for all published articles on acute drug-induced dystonia using the terms ((acute dystonic reaction) OR (acute dystonic response) OR (acute drug-induced dystonia) OR (drug-induced dystonia)), restricted to "case reports." The search was conducted on February 11, 2024. The included literature was examined from two perspectives: (1) auxiliary examinations for differential diagnosis, including cerebrospinal fluid examination, cranial imaging (CT or MRI), and electroencephalogram, and (2) examination of neurological or pathological signs

Results Both cases exhibited acute dystonia induced by antipsychotic medications and presented with unusual positive pathological reflexes, leading to initial misdiagnosis and additional examinations. Through detailed medication history and subsequent management adjustments, correct diagnoses were established. Symptoms improved with treatment using scopolamine and trihexyphenidyl, and no recurrence of dystonia was observed during follow-up after discharge. In the literature review, 74 articles encompassing 102 cases were analyzed. Among the 21 cases (20.5%) that explicitly mentioned neurological or pathological reflex examination, all pyramidal signs were negative. The remaining 81 cases lacked a clear description of neurological studies. Of the 25 patients (24.5%) who underwent auxiliary examinations to exclude organic encephalopathy, 5 had both brain CT or MRI and EEG

Conclusion These cases emphasize the importance of considering acute DID when patients on antipsychotic medication regimens present with acute movement disorders and positive pathological signs. Empirical treatment with medications such as benzhexol and scopolamine may be necessary, and relevant auxiliary examinations can help avoid missing diagnoses of organic diseases. They also provide clues for future exploration of the mechanism underlying those unusual positive pathological signs.

The Relationship between Sexual Dysfunction, Sexual Intercourse Experience, Gender and Internet Addiction Among Chinese Medical Students

Yuan Yang¹, Yongfeng Xia², Kairong Ding³

1. Guangdong Provincial People's Hospital (Guangdong Academy of Medical Sciences)

2. The Affiliated Panyu Central Hospital of Guangzhou Medical University

3. The Third Affiliated Hospital of Sun Yat-sen University

Objective Internet addiction, which is a growingly prevalent behavioral addiction that causes numerous psychosocial problems, may be associated with sexual dysfunction, sexual intercourse experience and gender among Chinese medical students. This study investigated the associations between sexual dysfunction, sexual intercourse experience, gender and Internet addiction among Chinese medical students

Methods This cross-sectional study using data from a medical university in China, which included college students aged 17 to 26 years with a mean age of 19.05 (SD=1.1) years, of whom 37.2% were male. Sexual intercourse experience, sexual dysfunction and Internet addiction were measured. Mixed-effect linear regression models were performed

Results Among the participants, 62.0% reported a history of sexual intercourse experience and 78.8% reported sexual dysfunction. After adjusting for covariates, participants with sexual dysfunction was significantly and positively associated with Internet addiction ($B = 4.30$, 95% CI = 0.83–7.77). Stratified analyses revealed a significant association between sexual dysfunction and Internet addiction only among students who had sexual intercourse experience ($B = 4.86$, 95% CI = 1.15–8.58). Furthermore, the analyses indicated a positive association between female and Internet addiction

among students without sexual intercourse experience ($B = 5.05$, 95% CI = 0.62–9.48)

Conclusion Sexual dysfunction is positively associated with the Internet addiction among Chinese medical students, particularly among those who have had sexual intercourse experience. The findings underscore the significance of implementing interventions for sexual dysfunction as a means of mitigating Internet addiction and fostering positive learning and lifestyle behaviors among medical students.

运动-心理-睡眠干预对前列腺癌患者癌因性疲乏及心理弹性的影响

何春燕*

东南大学附属中大医院

目的 探讨运动-心理-睡眠干预对前列腺癌患者癌因性疲乏及心理弹性的影响。

方法 选取2021年8月至2022年8月前列腺癌患者92例,应用随机数字表将患者分为观察组及对照组,每组各46例,两组患者均行手术+术后化疗治疗,对照组予治疗前向患者讲解前列腺发病机制、手术+术后化疗治疗效果、术后常见并发症、饮食指导、心理指导常规护理。观察组在对照组基础上实施运动-心理-睡眠护理干预,即由康复人员、心理人员、责任护士综合评价患者身体状况,根据评价结果为患者制定适宜的运动计划;每日进行患者睡眠评价,询问睡眠质量、睡眠时间,为患者营造舒适的休养环境;结合“癌因性疲乏临床实践指南”,培训责任护理人员每周对患者展开群体支持、个体咨询、应激反应等训练,护理人员分析患者情绪诱因和表现,鼓励主诉并表示理解,尽可能满足患者需求,主动与患者沟通,在沟通时要以一些正能量、积极的语言为主,耐心解答问题,加强心理护理。比较两组干预前后癌性疲乏、心理弹性及生活质量的改变。

结果 干预后观察组癌性疲乏总评分及各维度评分(包括行为、躯体、情感及认知)较对照组明显

下降 ($P<0.05$), 而干预后观察组心理弹性总评分及欧洲癌症患者生命质量评定量表 (EORTC QLQ-C30) 评分较对照组明显提高 ($P<0.05$)。

结论 运动-心理-睡眠护理干预可减轻生理、心理负担, 促进患者身心健康, 能有效提高前列腺癌患者心理弹性, 运动-心理-睡眠护理干预有助于患者以积极健康的心态应对疾病, 增强患者康复信心, 减轻患者癌因性疲乏, 从而改善患者生活质量。

肠道菌群对 MK-801 诱导的精神分裂症样行为的调控作用研究

杨再 刘睿娜 张建波 张建波 朱峰 马现仓*
西安交通大学第一附属医院

目的 首先利用混合抗生素处理清除小鼠肠道菌群, 然后通过 MK-801 建立精神分裂症样行为模型。(1) 研究肠道菌群清除对 MK-801 诱导的小鼠精神分裂症样行为的影响;(2) 利用 16S rRNA 基因测序研究肠道菌群变化及代谢组学检测鉴定海马内代谢谱变化, 确定肠道菌群和代谢物特征与精神分裂症样行为的相关性, 以初步探讨精神分裂症的潜在发病机制。

方法 通过灌胃及饮水给与小鼠混合抗生素 10 天, 然后用 MK-801 建立急性精神分裂症动物模型。观察肠道菌群清除对 MK-801 诱导的小鼠精神分裂症样行为的影响; 收集并提取粪便 DNA, 通过 16S rRNA 扩增子测序, 观察肠道菌群变化; 对小鼠海马组织进行非靶向代谢组检测, 观察组织代谢物变化; 将精神分裂症样行为相关参数与差异菌和差异代谢物进行相关性分析, 初步探究精神分裂症的发病机制。

结果 (1) 肠道菌群清除使 MK-801 诱导的精神分裂症样小鼠的精神兴奋性增加, 而小鼠对周围环境的探索性降低, 并加重了 MK-801 诱导的精神分裂症模型小鼠的认知及记忆损害。(2) 抗生素处理导致小鼠菌群多样性下降, uncultured_bacterium_c_Gammaproteobacteria 成为主要优势菌。代谢组检测发现 MK-801 处理后小鼠海马组织中胆碱, N-甲基-L-谷氨酸, 4-(2-羟基乙

氧基羰基) 苯甲酸酯, 尿酸, 苯乙酰甘氨酸, DL-谷氨酸盐, 海藻糖均显著降低; 抗生素处理后胆碱含量降低, 其他几种代谢物均升高; 抗生素及 MK-801 共同处理使代谢物含量减少。(3) 通过行为学与肠道菌群的相关性研究发现抗生素与 MK-801 共同处理组显著富集的菌群与小鼠记忆能力呈负相关, MK-801 处理组富集菌群大多数与小鼠探索行为呈正相关; 通过行为学与代谢物的相关研究发现胆碱等与认知功能呈显著正相关, N-甲基-L-谷氨酸、海藻糖等与小鼠探索行为呈显著正相关。通过肠道菌群与代谢物分析发现相关性主要分为两簇。

结论 (1) 肠道菌群清除导致 MK-801 诱导的精神分裂症模型小鼠精神兴奋性增加, 记忆功能减弱。小鼠海马组织代谢物发生改变。(2) 肠道菌群、海马代谢物与精神分裂症样行为学指标之间具有相关性。肠道菌群可能通过影响海马代谢物变化而调控精神分裂症样行为变化。(3) 肠道菌群可能是缓冲 MK-801 诱导的精神分裂症样认知损害的原因。

关键词: 精神分裂症; 肠道菌群; MK-801; 代谢物

抑郁症患者自杀观念与血清炎症因子和代谢指标的相关性

贾敏 范雅娟 马青艳 王崴 马现仓*
西安交通大学医学院第一附属医院

目的 目前关于抑郁症自杀意念和行为的神经生物学原因知之甚少, 有证据表明免疫炎症和代谢紊乱均与自杀易感性有关。本研究通过对抑郁症患者血清炎症因子和代谢指标进行检测, 探讨抑郁症患者的自杀意念与免疫紊乱和代谢的关联。

方法 纳入 2020 年 5 月至 2022 年 8 月在我院精神科住院的首发抑郁症患者 119 例, 根据汉密尔顿抑郁量表条目 3“自杀”(H3) 的评分进行分组, $H3 \geq 1$ 分为有自杀观念组 (74 例), $H3 < 1$ 分为无自杀观念组 (45 例)。比较两组血清中代谢指标和炎症因子的差异。分析抑郁症患者自杀观念与血清中代谢指标和炎症因子的相关性。

结果 1. 一般资料比较

两组的性别、年龄、吸烟状况、饮酒情况、BMI 和平均病程无统计学差异。有自杀观念组的 HAMD

总分 ($P < 0.001$) 和 CGI ($P = 0.014$) 评分高于无自杀观念组, 差异有统计学意义。

2. 细胞因子和代谢指标比较

有自杀观念组血清中 IL-2 ($P < 0.001$)、IL-4 ($P = 0.019$)、IL-10 ($P = 0.033$)、IL-17 ($P < 0.001$) 水平高于无自杀观念组, 差异有统计学意义。代谢指标结果发现无自杀观念组的肌酐水平高于有自杀观念组 ($P = 0.014$), 差异有统计学意义。

3. 血清炎症因子和代谢指标与自杀观念的相关性

将上述组间有差异的炎症因子和代谢指标与 HAMD 总分和 H3 评分进行相关性分析, 发现 HAMD-17 中条目 H3 的评分与 IL-2 ($r = 0.29, P < 0.01$)、IL-4 ($r = 0.20, P = 0.03$) 和 IL-17 ($r = 0.21, P = 0.02$) 水平呈正相关, 与肌酐水平呈负相关 ($r = -0.22, P = 0.02$)。

结论 伴有自杀观念的抑郁症患者肌酐代谢和血清炎症因子与无自杀观念者存在差异, 且与自杀风险存在一定关联。

关键词: 抑郁症, 炎症因子, 自杀观念, 代谢指标

CD4/CD8 水平在伴或不伴童年期创伤的抑郁症患者中的差异研究

赵岩 王金成*

河北医科大学第一医院

目的 儿童期虐待是成年期抑郁障碍的重要风险因素。本研究旨在探讨外周血淋巴细胞 CD8、CD4 在伴或不伴童年期创伤的抑郁障碍患者中的表达差异, 及其与抑郁患者症状严重程度的相关性。

方法 研究收集了 2021 年 8 月至 2023 年 8 月在河北医科大学第一医院精神卫生中心住院的 18-65 岁患者, 疾病诊断符合 ICD-10 中、重度抑郁发作患者 118 例, 其中 43 名患者存在中重度童年期创伤 (儿童期创伤问卷量表中满足任一项即为中重度的童年创伤者)。基线收集患者一般人口学资料, 使用儿童期创伤问卷 (Childhood Trauma Questionnaire, CTQ) 评估受试者儿童期创伤、17 项汉密尔顿抑郁量表 (Hamilton Depression Rating Scale, HAMD-17) 评估抑郁情绪严重程度、汉密尔顿焦虑量表 (Hamilton Anxiety Rating Scale, HAMA) 评估焦虑

情绪严重程度、匹兹堡睡眠质量指数量表 (Pittsburgh sleep quality index, PSQI) 评估主观睡眠质量、社会支持评定量表评估身心健康程度、手机成瘾指数量表评估手机成瘾性。采用 ELISA 方法检测 CD4 和 CD8 表达水平, 并分析外周血淋巴细胞阳性结果与量表评分的相关性。并用 SPSS 27 软件对数据进行分析研究, 使用秩和检验分析非正态分布数据, 使用 T 检验分析正态分布数据。使用皮尔森相关系数与线性回归进行相关性分析。

结果 与不伴童年期创伤组比较, 伴童年期创伤组的 CD8 水平显著升高 ($Z = -2.883, P = 0.04$)、CD4/CD8 比值显著降低 ($Z = -2.575, P = 0.010$) 差异具有统计学意义。与不伴童年期创伤组比较, 伴童年期创伤组的 HAMD ($t = 4.524, P = 0.01$)、HAMA ($Z = -3.204, P = 0.001$)、PSQI ($Z = -2.149, P = 0.032$)、PCL ($t = 2.726, P = 0.044$)、手机依赖 ($Z = -2.440, P = 0.015$) 均较高, 结果具有统计学差异, 社会支持评分较低 ($Z = -2.684, P = 0.007$)。外周血淋巴细胞水平与各量表之间无相关性。

结论 伴有童年期创伤的抑郁症患者外周血 CD8 水平较高, CD4/CD8 比值较低, 且 HAMD、HAMA、PSQI、PCL、TESS、手机依赖量表评分较高, 社会支持评分较低。未来扩大样本量进一步分析外周血淋巴细胞水平与各量表之间的相关性。

Ketamine Regulates Lipid Metabolism To Alleviate Stereotyped Behavior in A Mouse Model of Obsessive-compulsive Disorder.

Weijie Wang Yuchong Luo Chen Yang Shenglin Wen*
The Fifth Affiliated Hospital of Sun-Yat sen University

Objective To explore the potential pathogenesis of obsessive-compulsive disorder and find more effective treatment methods

Methods We utilized RU24969 to construct an OCD mouse model. To explore its potential pathogenesis, we conducted whole-genome transcriptome sequencing on the striatum of these mice. The sequencing

results indicated abnormal activation of lipid metabolism. Traditional OCD treatments primarily target monoamine neurotransmitters, but in recent years, the glutamate neurotransmitter imbalance hypothesis for OCD has gained attention. The glutamate receptor antagonist ketamine, known for its rapid antidepressant effects in depression treatment, has been studied. Research has shown a close relationship between abnormal glutamate receptor function and lipid metabolism disorders. Therefore, we attempted to treat the OCD mice with ketamine. The stereotypic behaviors of the mice were alleviated to a certain extent, and subsequent whole-genome transcriptome sequencing of the striatum confirmed that the abnormalities in the lipid metabolism pathway had partially recovered

Results Whole-genome sequencing and bioinformatics analysis indicated that the striatum of OCD model mice exhibited abnormal activation in lipid homeostasis, bile acid, and fatty acid metabolism. Administering two types of glutamate receptor antagonists alleviated the stereotypic behaviors of the OCD model mice at different time points. Notably, in the ketamine treatment group, lipid metabolism was inhibited compared to the model group

Conclusion These results suggest that the pathogenesis of OCD may be related to abnormal lipid metabolism and homeostasis in the brain. The glutamate receptor antagonist ketamine may alleviate stereotypic behaviors in OCD mice by regulating lipid metabolism. This indicates a possible relationship between lipid metabolism and mental disorders, which should be given attention and further investigation. The connection between glutamate metabolism and lipid metabolism suggests that glutamate receptor antagonists could be an effective direction for treatment research.

Associations between Post-traumatic Stress Symptoms and Internet Addiction Among Chinese University Students

Kairong Ding¹, Yongfeng Xia², Yuan Yang³

1. Department of Psychiatry, The Third Affiliated Hospital, Sun Yat-sen University

2. Affiliated Panyu Central Hospital of Guangzhou Medical University

3. Guangdong Mental Health Center, Guangdong Provincial People's Hospital (Guangdong Academy of Medical Sciences)

Objective In Post-pandemic, exploration on the association between post-traumatic stress symptoms (PTSS) and internet addiction among university students is limited. The current study aims to investigate the relationship between PTSS and internet addiction among university students

Methods A cross-sectional study was conducted in southern China from Jan 2023 to Mar 2024. The Fear of COVID-19 scale (FCV-19S), Patient Health Questionnaire 9 item (PHQ-9), Post-traumatic stress disorder Check List (PCL-17), and 20-item internet addiction test (IAT-20) were used. A mediation model analysis was conducted using PROCESS macro in SPSS

Results A total of 1617 participants were recruited (mean age = 19.00; SD = 1.0). The total effect of PTSS on internet addiction was significant ($\beta_{PTSS}=0.376$, 95%CI: 0.323-0.430, $P<0.001$). Both direct and indirect effects of PTSS on internet addiction were found. When the fear of COVID-19 and depression were modeled as mediators, the path coefficients of PTSS on internet addiction revealed that fear and depression had a significant parallel mediating effect ($\beta_{fear}=0.125$, 95%CI: 0.097-0.156; $\beta_{depression}=0.155$, 95%CI: 0.105-0.211). Thus, PTSS might not only directly affect internet addiction but could also exert a significant indirect effect on internet addiction by fear of COVID-19 and depressive symptoms, respectively

Conclusion These findings provide valuable insights into possible paths for interventions and programs for reducing internet addiction through emotion-related treatments.

Effect of Pharmacogenomic Testing on The Clinical Treatment of Patients with Depressive Disorder: A Randomized Clinical Trial

Liyin Li Zheng Lin* Leilei Zheng

Department of Psychiatry, Second Affiliated Hospital of Zhejiang University School of Medicine

Objective Pharmacotherapy is one of the primary treatment modalities for depression. However, there is considerable variability in the individual response to antidepressant medications. Personalized medicine guided by pharmacogenomic testing may hold promise in addressing this issue

Methods In this study, 665 depressive patients were randomly enrolled into two groups: the pharmacogenomic testing group (n=333) and the control group (n=332). In the testing group, participants underwent pharmacogenomic testing, and clinicians customized the treatment plan with the result, while the control group relied solely on clinicians' experience. The primary outcomes were the proportion of remission and response, assessed with Hamilton Depression Rating Scale (HDRS). The secondary outcomes included changes in HDRS scores over time and frequency of adverse drug reactions by the participants

Results At week 8, the pharmacogenomic testing group showed significantly higher remission rates (24.0% v.s. 15.1%; RR=1.117; P=0.007) and response rates (39.3% v.s. 25.7%; RR=1.225; P<0.001) compared to the control group. By week 12, the pharmacogenomic testing group continued to demonstrate significant advantages in remission (31.0% v.s. 20.0%; RR=1.159; P=0.003) and response (48.7% v.s. 37.3%; RR=1.224; P=0.006). Additionally, adverse drug reactions were less frequent in the pharmacogenomic testing group

Conclusion Pharmacogenomic testing-guided drug therapy can provide greater assistance in the treatment of depression.

关键词: Pharmacogenomics, Precision medicine, Depression, Psychiatric, Pharmacotherapy

ANA-12 和 7,8-DHF 干预 UCMS 诱导的抑郁行为的机制研究

李白嘉 马现仓*

西安交通大学医学院第一附属医院

目的 重性抑郁障碍 (major depressive disorder, MDD), 又称重症抑郁 (major depression, MD), 是最常见的精神障碍之一, 世界范围内患病率据在 17% 左右。MDD 的临床表现包括情绪低落, 自责自罪, 自杀意念和行为, 自杀是其最严重的后果, 给社会和家庭、个人造成巨大危害和负担。脑源性神经营养因子 (brain-derived neurotrophic factor, BDNF) 中介神经元存活、分化、突触可塑性以及神经发生。BDNF 功能不足乃至由此引起的神经发生 (neurogenesis) 障碍是 MDD 发病机制中很有前景的一种假说。TrkB 是 BDNF 下游受体, 前期研究发现 TrkB 的激动剂(7,8-DHF)和拮抗剂(ANA-12)均具有抗抑郁效力, 为了解释这一矛盾现象需要更深一步的研究。

方法 采用 C57BL/6 小鼠, 利用不可预期慢性温和应激 (unpredictable chronic mild stress, UCMS) 建立抑郁模型, ANA-12 和 7,8-DHF 干预 UCMS 模型小鼠, 文拉法辛 (Venlafaxine) 做阳性药物对照, 分为对照组, UCMS 组, UCMS+ANA-12 组, UCMS+78DHF 组和 UCMS+VEN 组来研究行为表型和相关神经通路。

结果 研究结果发现 ANA-12, 7,8-DHF 和文拉法辛均能够改善 UCMS 引起的抑郁样行为: 旷场实验(open field test, OFT)中, UCMS 组在中央区域的活动距离与对照组, UCMS+ANA-12 组, UCMS+78DHF 组和 UCMS+VEN 组相比均出现明显下降, 有统计学差异; 糖水偏好(Sucrose preference test, SPT), 强迫游泳(forced swimming test, FST)中的不动时间, 高架十字迷宫实验(elevated plus maze, EPM)中进入开臂的时间中, UCMS 组与对照组相比有统计学差异, UCMS+ANA-12 组, UCMS+78DHF 组和 UCMS+VEN 组与对照组相比, 没有统计学差异; 但 ANA-12 和 7,8-DHF 对 UCMS 引起的血清中皮质酮的升高无明显干预作用。同时, 7,8DHF 和 ANA-12 能缓解 UCMS 小鼠 PFC, HIP 中 BDNF, TrkB 和 PSD95 表达的降低, 同时对 UCMS 引起的

BAX/Bcl-2 的升高有明显的干预作用。

结论 7,8DHF 和 ANA-12 能提高 PFC 和 HIP 中 BDNF, TrkB 和 PSD95 表达改善 UCMS 小鼠的抑郁样表型, 这可能是通过减少 UCMS 引起的凋亡来干预的。

精神分裂症患者胆汁酸谱异常对认知功能的影响

戚志扬 马青艳 贾敏 范雅娟 马现仓*
西安交通大学第一附属医院

目的 胆汁酸是由人类和肠道微生物组共同代谢产生的胆固醇代谢的最终产物, 可以穿透血脑屏障的血管内皮细胞, 继而影响精神分裂症、阿兹海默症等脑部疾病的病理特征。本研究的目的是研究精神分裂症患者外周血胆汁酸谱改变及其对患者认知功能的影响。

方法 本研究使用靶向代谢组学分析 23 例精神分裂症患者和 23 例健康志愿者血清中初级和次级胆汁酸代谢物水平。采用 MATRICS 公认认知成套测验量表 (MCCB) 测试所有被试者 5 个维度的认知功能。

结果 精神分裂症患者在信息处理速度、工作记忆、推理及问题解决能力、视觉学习能力等多个维度的认知功能均有受损。与健康对照组相比, 精神分裂症组血清中胆酸(CA)和鹅去氧胆酸(CDCA)的含量显著降低, 而甘氨酸胆酸(GCA)的含量显著升高, 去氧胆酸(DCA) /CA 的比值(3.04 vs.1.16) 更高。校正了年龄、性别、 身体质量指数 (BMI) 后, 信息处理速度、工作记忆、推理和问题解决和视觉学习能力与血清中牛磺胆酸(TCA)、GCA、甘氨酸鹅去氧胆酸(GCDCA)、CDCA 等初级胆汁酸的含量呈显著负相关。

结论 精神分裂症组的胆汁酸谱出现明显紊乱, CA, CDCA 等起神经保护作用的胆汁酸减少和具有细胞毒性的胆汁酸 GCA 增多可能造成精神分裂症患者认知水平下降。

Is Theta Burst Stimulation Ready As A Clinical Treatment for Bipolar Disorder?

Jianli Yang* Yufei Wu Danni Yan
Tianjin Medical University General Hospital

Objective Bipolar disorder (BD) is a chronic, relapsing disorder characterized by recurrent manic or hypomanic episodes that alternate with depressive episodes. Theta burst stimulation (TBS) is a safe, effective, and non-invasive neuromodulation therapy. Compared with traditional rTMS, the duration of TBS stimulation is shorter and the intensity of stimulation pulse is lower, the impact on synaptic plasticity is even greater. To date, no studies have investigated the efficacy of TBS in the treatment of BD, and the results are inconclusive. We aim to systematically review the existing literature related to the efficacy of TBS in BD and synthesize the results through meta-analysis

Methods We searched for PubMed, Embase, Cochrane Central Register of Controlled Trials, Web of science, PsycINFO, CNKI, and Wan fang databases without language restriction through July 30, 2023, and included randomized-controlled trials that assessed the treatment effect of TBS in patients with BD. We used a random-effects model to pool effect sizes, which were expressed as Cohen's d (or Odds ratio, OR) and 95% confidence intervals (CIs). The outcomes measures include changes in Montgomery-Asberg Depression Rating Scale (MADRS) scores, response and remission rates of depression and dropout rates. Heterogeneity was assessed using I² and Q tests

Results Eight randomized sham-controlled trials were included in the meta-analysis. For the first main outcome, changes in MADRS scores include 4 studies. The result showed that TBS was not statistically significantly different from sham group (Cohen's d = - 0.81; 95% CI: - 4.07 to 2.44; p = 0.52; I² = 0%). Second, we obtained response rate data from five randomized controlled trials. A total of 32 of 88 participants (36.4%) receiving active TBS were defined as responders. 37 of 98 participants (37.8%) receiving sham TBS responded.

The pooled OR was 1.07 (95% CI: 0.47 to 2.44; $p = 0.27$; $I^2 = 23\%$), indicating that the response rate after active TBS treatment was not significantly different from sham stimulation in patients with bipolar depression. Third, the result was derived from data extracted on remission rates from five studies. Overall, 21 of 88 (23.9%) participants after active TBS treatment and 30 of 98 (30.6%) sham stimulation participants were defined as responders. The pooled OR was 0.74 (95% CI: 0.38 to 1.45; $p = 0.59$; $I^2 = 0\%$) and the results showed no significant difference in remission rate after active TBS treatment. At last, 4 out of 8 studies showed patients withdrawing from treatment. The dropout rate was approximately 15.4% in the active TBS and sham groups. The pooled OR was 1.04 (95% CI: 0.51 to 2.13; $p = 0.70$; $I^2 = 0\%$). Notably, the TBS group showed favorable efficacy without major adverse events

Conclusion Current studies indicates that TBS does not show significant antidepressant efficacy in patients with BD, although it is very well tolerated. Long-term TBS studies in patients with bipolar disorder are still needed in the future to verify its efficacy through large-sample and large-scale controlled studies. More validation should be provided not only for bipolar depression, but also for manic episodes and mixed episodes.

精神科门诊抑郁症筛查列线图预测模型的构建与验证

刘念 张裕裕 蔡敏 王化宁*
西京医院

目的 抑郁症是全球性的重大社会公共问题, 而我国抑郁症患者呈现出较高共病率、较高社会功能损害和较低精神卫生服务率的特点。因此提高抑郁症筛查的准确率, 是精神卫生人员需要应对的巨大挑战。患者健康问卷 9 (PHQ-9) 被广泛用于抑郁症患者初级筛查, 但是仍有较多的抑郁症患者被误

诊或漏诊。目前尚未有针对精神科门诊抑郁症患者筛查的高精度工具。本研究旨在前瞻性构建一种列线图, 以提高精神科门诊抑郁症患者筛查的准确性。

方法 于 2023 年 02 月开始从西京医院和联勤保障部队第九〇四医院精神科门诊招募受试者。截止 2024 年 02 月, 西京医院招募 546 例抑郁症患者, 以 2: 1 的比例随机分为训练队列 ($N=364$) 和内部验证队列 ($N=182$), 第九〇四医院 196 名抑郁症患者组成了外部验证队列。使用 R 软件 (4.2.3) 进行统计分析, 采用 10 次交叉验证的 LASSO 回归分析对数据进行降维, 筛选出抑郁症的最优预测因子, 按其在多变量 Logistic 回归中的系数进行整合, 绘制列线图。通过 ROC 曲线下面积 (AUC) 来判断列线图的鉴别能力, 并使用决策曲线分析 (DCA) 对列线图 and PHQ-9 的临床效能进行比较。

结果 在训练队列和内、外部验证队列中, PHQ-9 评分 ≥ 10 的患者比例分别为 67.31% (245/364)、64.29% (117/182) 和 48.47% (95/196), 据 MINI 诊断为抑郁症患者的比例分别为 58.52% (213/364)、57.69% (105/182) 和 35.71% (70/196)。经散点图分析, 列线图 and PHQ-9 的总分在训练队列和验证队列中表现出很强的正相关性。在内部验证队列中, 列线图 AUC [0.946 (0.925-0.968)] 显著高于 PHQ-9 [0.915 (0.883-0.946)], $p < 0.01$; 同样在外部验证队列中, 列线图 AUC [0.943 (0.920-0.966)] 也优于 PHQ-9 [0.908 (0.874-0.942)], $p < 0.01$ 。总的来说, 列线图显示出了比 PHQ-9 更好的区分能力和更好的性能, 可以提高抑郁症患者筛查的准确性。

结论 PHQ-9 是最常用的抑郁症筛查工具, 但是忽略了不同症状的权重, 导致部分抑郁症患者的误诊和漏诊。本文权衡了 PHQ-9 不同症状在抑郁症患者中的权重, 首次前瞻性的构建了一种列线图, 提高了抑郁症筛查准确性, 且经内部和外部验证后发现其效果均优于 PHQ-9。在以后的工作中, 还需扩大样本量并在其他精神专科医院验证其效能, 进行改进, 以增加其可用性。

Effects of Childhood Trauma on Sustained Attention in Major Depressive Disorder: The Mediating Role of Brain Activity and Connectivity

Mingfeng Lai Ping Jiang Peiwei Xu Dan Luo Wenxin
 Bao Jing Li Jiajun Xu*
 West China Hospital, Sichuan University

Objective Cognitive deficits, particularly in sustained attention, are pivotal in both the development and aggravation of depression. The exposure to childhood trauma may impede sustained attention, but the underlying neuro-mechanisms remain unclear. Our study aimed to investigate these neuro-mechanisms that link childhood trauma to sustained attention

Methods We collected functional magnetic resonance imaging data of 45 adults diagnosed with major depressive disorder (MDD) and 54 healthy controls. We measured childhood trauma severity using the Childhood Trauma Questionnaire and sustained attention using the Continuous Performance Test, Identical Pairs version. Fractional amplitude of low-frequency fluctuation (fALFF) and seed-based functional connectivity (FC) analyses were used to explore the local brain activity and FC alterations

Results Whole-brain correlation analysis showed that impaired sustained attention was associated with increased fALFF in the left postcentral gyrus (PoCG.L), and FC of PoCG.L-left precentral gyrus (PreCG.L) and left angular gyrus (ANG.L)-right superior temporal gyrus (STG.R). Furthermore, mediation analysis showed that the fALFF in PoCG.L, and FC of PoCG.L-PreCG.L and ANG.L-STG.R mediated the relationship between the childhood trauma and sustained attention

Conclusion In conclusion, these alternations in fALFF and FC might serve as potential intervention targets for the treatment of sustained attention deficits in MDDs with childhood trauma history

关键词: childhood trauma; fALFF; functional connectivity; major depressive disorder; sustained attention

甲基苯丙胺使用障碍女性患者的精神健康状况分析与内观认知疗法干预研究

毛富强* 王书哲
 天津医科大学

目的 甲基苯丙胺(冰毒)是一种极易成瘾的精神活性物质,对女性健康造成严重威胁。本研究旨在探讨女性甲基苯丙胺使用者的精神健康状况及内观认知疗法的干预效果。

方法 研究一:在天津市戒毒所,我们招募了230位女性甲基苯丙胺使用障碍患者,使用SCL-90评估她们的心理健康状况。同时使用多维度社会支持量表(MSPSS)和巴瑞特冲动性量表(BIS-11)评估社会支持水平和冲动性。研究二:从招募的被试者中随机选择60名,分为内观认知疗法实验组和一般支持疗法对照组,对干预后效果进行对比。

结果 研究一:与健康常模相比,患者在SCL-90各维度评分显著较高。Pearson相关分析显示,社会支持与心理健康状况呈负相关,而冲动性呈正相关。多元线性回归进一步证实了这些关系,并揭示了社会支持在减少心理健康问题中的调节作用。研究二:经过干预后的评估显示,实验组的冲动性和心理健康状况显著改善,而社会支持水平有所提升。对比组间变化表明,内观认知疗法在降低冲动性和改善心理健康方面的效果显著优于一般支持疗法。

结论 本研究发现,女性甲基苯丙胺使用者普遍存在严重的精神症状,但社会支持的增强和冲动性的减少可以显著改善其精神健康状况。内观认知疗法在治疗这一人群中表现出良好的效果,具有潜力成为临床实践中的有效干预手段。

提升一线医护人员复原力与连贯感:应对公共卫生危机中的感知压力策略

魏作霖¹ 魏作霖² 蒋伶俐² 蒋伶俐¹ 夏博呈¹ 夏博呈² 祝怀义² 祝怀义¹ 李凌燕¹ 李凌燕² 王琳² 王琳¹ 赵峻¹ 范箬馨¹ 王鹏¹ 黄明金^{1,2}

1.绵阳市第三人民医院·四川省精神卫生中心

2.川北医学院

目的 重大公共卫生事件对一线医护人员的心

理健康造成了强烈冲击,感知压力的增加不利于医护人员心理健康,同样对医疗机构和社会发展产生不良影响。本研究旨在探究影响一线医护人员感知压力的影响因素及作用路径。

方法 采用整群随机抽样法,于2021年1月(COVID-19流行期间)以及2024年1月(流行结束后对应时间段)两个时期采用一般资料调查表、感知压力量表(PSS-4)、简短复原力量表(BRS-6)、连贯感量表(SOC-3)、ENRICHD社会支持量表(ESSI)以及自编问卷(工作场所的支持、私生活中的拒绝)对绵阳市的医务人员进行线上调查。采用克鲁斯卡尔-沃里斯检验查看两个时期中变量的总体分布差异。使用Pearson相关性分析探讨变量相关性。以感知压力为最终变量构建路径分析模型,Bootstrap法估计中介效应的置信区间。

结果 共935人完成问卷调查,其中885位一线医护人员(83.40%为女性)被纳入最终分析。社会支持($r=-0.34, P<0.01$)、工作场所的支持($r=-0.33, P<0.01$)、连贯感($r=-0.19, P<0.01$)、复原力($r=-0.41, P<0.01$)与感知压力成负相关,私生活中的拒绝($r=0.30, P<0.01$)与感知压力成正相关。路径分析模型结果显示:社会支持、工作场所的支持以及私生活中的拒绝对感知压力的直接效应成立,标准化效应值分别为-0.14、-0.09、0.13;工作场所的支持以及私生活中的拒绝通过复原力对感知压力起部分中介作用,标准化效应值分别为-0.03、0.05,分别占各自总效应的25.00%和27.78%;社会支持通过连贯感和复原力对感知压力起部分中介作用,标准化效应值为-0.11,占总效应的44.00%。

结论 在重大公共卫生事件发生早期以及结束后,增加一线医护人员的社会支持、工作场所的支持,以及减少私生活中的拒绝对改善他们的感知压力具有重要的现实意义,这有助于制定更加有效的干预措施和政策保证一线医护人员的心理健康。

1.The Third Hospital of Mianyang •Sichuan Mental Health Center,Mianyang,Sichuan Province,China

2.School of Clinical Medicine,North Sichuan Medical College, Nanchong, China

Objective To assess occupational burnout conditions and work-related factors among frontline medical staff during the COVID-19 pandemic and analyse the relationships among these factors utilizing the job demands-resources (JD-R) model as a theoretical framework

Methods From December 29, 2022 to January 10, 2023, an online survey of medical staff in a certain city was conducted through cluster random sampling. Path analysis was utilized to explore the relationship between work-related factors and occupational burnout among frontline medical staff during the COVID-19 outbreak

Results Among 474 respondents, 455 frontline medical staff (female=79.56%) were included in the final analysis. Medical staff aged <35 exhibited higher levels of occupational burnout than did older staff. Depression/anxiety and workload were positively correlated with occupational burnout and negatively correlated with self-compassion, workplace health/safety, and workplace support. Path analysis indicated the direct effects of workplace support, depression/anxiety, workplace health/safety, self-compassion, and workload on occupational burnout. There were also partial mediating effects of workplace support, depression/anxiety, workplace health/safety, and self-compassion on occupational burnout. The model demonstrated good fit

Conclusion Workplace support, a crucial job resource, can improve occupational burnout among frontline medical staff in various ways. Reducing anxiety, depression, and workload and improving workplace support, health/safety, and self-compassion are practical and effective measures for mitigating occupational burnout

关键词: Burnout,Job demands-resources,Medical staff,COVID-19

精神分裂症患者皮质厚度的异常和变化趋势：一项结合队列研究和荟萃分析的研究

韩琳 陈旭东 潘韵致*
中南大学湘雅二医院

目的 神经影像学研究发现精神分裂症患者存在大脑皮质厚度变薄，但当前研究结果包含了全脑广泛性的区域且未能统一，对精分的关键脑区定位仍存在争议。本研究基于荟萃分析结合本地样本队列验证，采用经典的脑网络 Desikan-Killiany (DK) 图谱从变化轨迹和关键临床因素进行研究，旨在确定精神分裂症患者关键皮质厚度异常脑区，构建关键脑区的皮层厚度变化轨迹，探索不同表型和临床因素对关键脑区及变化趋势的影响。

方法 本研究纳入了自 2006 年 6 月至 2023 年 9 月所有采用 DK 图谱分析精神分裂症患者全脑皮质厚度研究进行荟萃分析，并通过双中心（长沙、香港）招募的精神分裂症患者 (SZ) 和健康对照 (HC) 队列进行研究。受试者接受 3.0T 头部磁共振、临床和认知功能资料采集。随后，我们根据 DK 图谱对磁共振数据进行预处理，提取了全脑 68 个脑区的皮质厚度，并使用 Combat 校正中心效应。我们通过比较荟萃分析和本地研究结果，将一致性阳性脑区定义为本研究的关键脑区，并研究其在不同年龄阶段和疾病阶段的特征以及发展轨迹数据统计在 SPSS 软件进行。FDR 用于多重比较校正。

结果 荟萃分析共纳入 15 篇文章，涵盖 1224 名精神分裂症患者样本。基于严格纳排标准，本地队列共采集 425 名 SZ 和 272 名 HC。结合 Meta 分析和本地队列双重验证的结果、本研究确定了 9 个关键脑区：左颞中回、左岛盖部、左额正中回喙部、左额上回、右梭状回、右颞中回、右岛盖部、右额正中回喙部、右额上回。分层分析显示，左颞中回，右额正中回喙部，右岛盖部，右额上回在未成年样本中未表现出显著差异，而在成年样本中显著，右颞中回仅仅在 18-24 表现出差异 ($p < 0.05$)。差异脑区中，受到服药效果影响显著的脑区有右岛盖部，右梭状回，和双侧颞中回，其中右岛盖部在未成年阶段收到影响较大，其他两个脑区在成年早期受到较大影响 ($p < 0.05$)。从发展轨迹来看，首发患者组的横断面曲线下下降速度并不快，而微量服药患者和首发未服药患者呈现的曲线下下降速度增加 ($p < 0.05$)。

结论 通过结合队列研究和 Meta 分析，本研究全面证实了精神分裂症患者皮质变薄的一致区域，包括颞中部、岛盖、额叶中上部和纺锤体区域。但这些区域的皮质厚度在不同年龄段和不同疾病阶段的患者中表现出不同的异常。这些发现强化了一个假设，即不同年龄阶段的患者皮质变薄的具体区域和位置可能不同，而精神分裂症与总体区域的皮质变薄有关。这可能是神经病理学机制造成的，也可能是抗精神病药物的神经毒性效应所致。

Glymphatic System Dysfunction in Major Depressive Disorder Unveiled by DTI-ALPS: Correlation with Fatigue

Wenxin Bao¹, Ping Jiang^{2,3,4}, Peiwei Xu⁵, Peiwei Xu¹, Hai Lin⁶, Jiaqi Xu¹, Mingfeng Lai¹, Jianmin Yuan⁶, Jiajun Xu¹

1. Mental Health Center, West China Hospital of Sichuan University

2. Department of Radiology and Huaxi MR Research Center (HMRRCC), Functional and Molecular Imaging Key Laboratory of Sichuan Province, West China Hospital, Sichuan University

3. West China Medical Publishers, West China Hospital, Sichuan University

4. Research Unit of Psychoradiology, Chinese Academy of Medical Sciences

5. Department of Psychiatry, The First Affiliated Hospital, Zhejiang University School of Medicine

6. Central Research Institute, United Imaging Healthcare

Objective The glymphatic system is a critical intracranial waste clearance pathway, which could be linked to the pathogenesis of major depressive disorder (MDD). Additionally, fatigue—a common precursor of MDD—is also a psychiatric symptom closely connected to central nervous system (CNS) waste clearance, further underscoring the significance of efficient waste removal in MDD. However, evidence supporting the association between glymphatic system function and

MDD remains limited. This study aims to investigate the glymphatic function in MDD patients, and explore the potential interplay between glymphatic function, fatigue, and the presence of MDD

Methods A total of 46 MDD patients and 55 healthy controls (HC) were included in the study. All participants underwent diffusion tensor imaging using the same 3-T MRI scanner. The Diffusion Tensor Imaging along Perivascular Spaces (DTI-ALPS) index was performed to assess glymphatic function, the Chalder Fatigue Scale (CFS) was used to evaluate fatigue, and the 17-item Hamilton Depression Rating Scale (HAM-D-17) was used to evaluate the severity of depression. We compared the differences in the DTI-ALPS index and clinical characteristics between the MDD and HC group, and explored the relationship among the DTI-ALPS index, CFS scores, and the presence of MDD through further mediation analysis

Results The DTI-ALPS index in the right hemisphere (DTI-ALPS-R) is significantly lower in MDD patients (1.27 vs 1.35). MDD Patients exhibited significantly higher scores on the CFS scales compared with HCs (28.80 vs 12.93). Further mediation analysis highlights that CFS scores play a significant mediating role between DTI-ALPS-R and the presence of MDD, acting as full mediators (indirect effect $\beta = -0.230$, 95%CI: [-0.388, -0.059])

Conclusion Glymphatic function may be impaired in MDD patients unveiled by DTI-ALPS, and the glymphatic system dysfunction may not directly contribute to depression but rather facilitates the onset of MDD by promoting the accumulation of fatigue.

关键词: DTI-ALPS, Fatigue, Glymphatic function, Major depressive disorder

全程健康教育模式对非自杀性自伤患者心理弹性影响分析

王俊利*

西安交通大学第一附属医院

目的 研究在非自杀性自伤患者治疗过程中开

展全程健康教育模式取得成效结果, 以及对于心理弹性的影响, 为非自杀性自伤患者的治疗和护理提供指导方法, 减少患者非自杀性自伤的发生。

方法 选择 2021 年 5 月-2022 年 5 月收治的非自杀性自伤患者 98 例计入研究, 开展函数随机排列设为实验组、参照组, 其中参照组 (49 例/组, 常规护理), 实验组 (49 例/组, 基于以上内容进行全程健康教育模式), 分析护理前后心理状态测评值、健康教育评分结果、生活质量测评值, 满意率测评值。

结果 ①心理状态测评值, 护理前, 两组对比无差异 ($p>0.05$), 护理后, 实验组获值更理想, 优于参照组, 具备差异 ($P<0.05$); ②实验组健康教育各项评分结果获值优于参照组, 差异具有统计学意义 ($p<0.05$); ③实验组生活质量测评值所获值更高, 优于参照组, 组间对比 ($P<0.05$); ④实验组总满意率更高, 均优于参照组, 组间对比 ($p<0.05$)。

结论 临床上针对收治的非自杀性自伤患者开展全程健康教育模式, 有助于患者心理状态的调整, 使患者能够主动的倾述自己内心的想法, 减少自伤行为的发生, 提升生活质量和自我概念, 进而提升了患者满意率, 值得普及和应用。

基于静息态脑电图预测重度抑郁障碍伴认知障碍的研究

陈艳艳 燕利娟*

长春市第六医院

目的 重度抑郁障碍 (MDD) 与认知障碍相关。通过分析基于静息态脑电图在 MDD 患者中预测认知水平下降的能力, 评估其实用价值并寻找可靠的生物标记物, 以便早期识别 MDD 伴认知障碍, 更好的服务于抑郁症患者和指导临床早期干预治疗。

方法 1、基于静息态脑电图的快速傅立叶变换识别 MDD 伴认知障碍; 2、选取 2023 年 1 月至 2023 年 12 月长春市第六医院新诊断未经治疗的 MDD 患者作为抑郁组, 同期年龄和性别匹配的健康志愿者为健康对照组, 进行至少含有清醒期和一个睡眠周期的静息态视频脑电图监测; 3、采用抑郁自评量表 (SDS) 进行临床症状评估, 应用蒙特利尔认知评估

量表 (MoCa) 进行认知评估, 应用注意力网络测试 (ANT) 评估注意力水平; 4、脑电图数据采集使用尼高力 32 导脑电图仪, 国际 10-20 系统标准化放置电极; 5、使用 Python 和 Matlab 软件对静息态脑电图数据进行分析处理; 6、使用 Excel 软件和 SPSS 26.0 软件对所有数据整理和统计分析。

结果 共纳入 47 名 MDD 患者和 47 名健康对照组作为研究对象, 健康对照组与 MDD 患者组在静息态脑电图数据纳入率和每例脑电图数据的有效分段数上不存在显著性差异 ($P>0.05$)。与对照组相比, MDD 患者在清醒期 θ 功率增加 ($P=0.018$) 和 NREM 睡眠期间 θ 功率降低 ($P=0.002$), MDD 患者认知水平尤其是注意力水平的准确度较低 ($P=0.021$)。

结论 静息态脑电图清醒期 θ 功率增加、NREM 期 θ 功率减低与 MDD 伴认知障碍尤其是注意力水平下降显著相关, 有助于 MDD 伴认知障碍早期精准诊断和治疗。

A Predictive Model for Readmission within 1-year Post-discharge in Patients with Schizophrenia

Mingru Hou², Jun Wang², Yuqing Wu^{1,2}

1. Jiangnan University

2. The Affiliated Mental Health Center of Jiangnan University

Objective Schizophrenia is a pervasive and severe mental disorder characterized by significant disability and high rates of recurrence. The persistently high rates of readmission after discharge present a serious challenge and source of stress in treating this population. Early identification of this risk is critical for implementing targeted interventions. The present study aimed to develop an easy-to-use predictive instrument for identifying the risk of readmission within 1-year post-discharge among schizophrenia patients in China.

Methods A prediction model, based on static factors, was developed using data from 247 schizophrenia inpatients admitted to the Mental Health Center in Wuxi, China, from July 1 to December 31, 2020. For

internal validation, an additional 106 patients were included. Multivariate Cox regression was applied to identify independent predictors and to create a nomogram for predicting the likelihood of readmission within 1-year post-discharge. The model's performance in terms of discrimination and calibration was evaluated using bootstrapping with 1000 resamples.

Results Multivariate cox regression demonstrated that involuntary admission (adjusted hazard ratio [aHR] 4.35, 95% confidence interval [CI] 2.13 - 8.86), repeat admissions (aHR 3.49, 95% CI 2.08 - 5.85), the prescription of antipsychotic polypharmacy (aHR 2.16, 95% CI 1.34 - 3.48), and a course of disease ≥ 20 years (aHR 1.80, 95% CI 1.04 - 3.12) were independent predictors for the readmission of schizophrenia patients within 1-year post-discharge. The area under the curve (AUC) and concordance index (C-index) of the nomogram constructed from these four factors were 0.820 and 0.780 in the training set, and 0.846 and 0.796 for the validation set, respectively. Furthermore, the calibration curves of the nomogram for both the training and validation sets closely approximated the ideal diagonal line. Additionally, decision curve analyses (DCAs) demonstrated a significantly better net benefit with this model.

Conclusion A nomogram, developed using pre-discharge static factors, was designed to predict the likelihood of readmission within 1-year post-discharge for patients with schizophrenia. This tool may offer clinicians an accurate and effective way for the timely prediction and early management of psychiatric readmissions.

Aberrant Resting-state Functional Connectivity in Subthreshold Depression and Major Depressive Disorder

Yiliang Zhang Zhong Shuming Yanbin Jia*

First Affiliated Hospital of Jinan University

Objective Subthreshold depression (StD) is considered a prodromal stage of major depressive disorder (MDD). However, the lack of objective and reliable biomarkers often results in misdiagnosis and inappropriate treatment between MDD and StD. We aim to explore the underlying neurobiological mechanisms by detecting functional connectivity (FC), aiding in the differentiation between StD and MDD

Methods We analyzed resting-state functional magnetic resonance imaging (fMRI) data from 188 patients with MDD, 153 individuals with StD and 110 healthy controls (HCs). The whole-brain FC variability was calculated focusing on seeds for the default model network (DMN), executive control network (ECN), salience networks (SN), and affective (limbic) network (AN). Their correlations with cognitive dysfunction were further detected. Support vector machine (SVM) classification tested the potential of FC to differentiate StD, MDD from HCs

Results Patients with MDD exhibited multidomain cognitive impairments when compared to HCs, while individuals with StD only showed deficit in social cognition. Both MDD and StD showed decreased FC between the right AI and the left inferior frontal gyrus (IFG) and increased FC between the right SCC and left PCC compared to HCs, and MDD also showed decreased FC between the left PCC and middle temporal gyrus (MTG), and between the left PCC and the left PCC. In addition, MDD group showed significantly decreased FC between the left PCC and the left MTG, between the left PCC and the left PCC, and between the right AI and the left IFG when compared to StD group. The results of SVM showed that the fusion features of significantly different FC and cognitive function had the best performance in classification for differentiating StD from HCs, as well as MDD and StD from HCs. In addition, the mediation analyses indicated that the impact of the FC between the left PCC-left PCC and the right AI-left IFG on the depression severity were significantly influenced by cognitive function (mainly involving visual learning and composite) in depressed individuals, including MDD and StD

Conclusion Aberrant FC variability of DMN,

SN and AN may be involved in the emergence and development of depressive symptoms in StD and MDD, which might help to discriminate MDD or StD from healthy subjects when combining with cognitive dysfunction. And cognitive function could affect the relationship between DMN and SN to depression.

The Impact of Chronic Stress on Sleep in Mice

Huiming Nie Yanli Luo*

Department of Psychological Medicine, Renji Hospital, School of Medicine, Shanghai Jiao Tong University

Objective The comorbidity of sleep disorders with depression has garnered increasing attention from researchers. The occurrence of this condition is typically observed subsequent to prolonged exposure to chronic stress. The objective of this study is to investigate the impact of chronic stress on sleep in mice and elucidate its underlying neurobiological mechanisms.

Methods The EEG/EMG recording baseline was recording in 8-week-old male C57BL/6J mice, seven days following the implantation surgery of EEG/EMG electrodes. The mice were then divided into a control group and a CRS (chronic restraint stress) group, with the CRS group receiving 2-3 hours of daily restraint for 16 days. Following a 16-day period, the EEG/EMG recordings of two groups of mice were reassessed and subjected to statistical analysis in order to compare them with the baseline measurements.

Results The results showed that after chronic stress, the proportion of wakefulness in the light phase of CRS group was significantly increased (baseline: $40.9 \pm 1.8025\%$; after restraint: $45.525 \pm 2.1124\%$ ($P < 0.05$, $n=4/\text{group}$)); total sleep time (NREM+REM) was significantly reduced (baseline: $59.1 \pm 10.1844\%$; after restraint: $53.725 \pm 9.2254\%$ ($P < 0.05$, $n=4/\text{group}$)).

Conclusion These results indicate that after

long-term chronic stress, mice show increased wakefulness and decreased sleep ratio, suggesting that chronic stress may cause sleep disorders in mice by causing wakefulness regulation disorder.

精神分裂症研究协作组

单核细胞的转录组和能量代谢表型突显出精神分裂症患者免疫特征和线粒体功能的改变

王秀环 陈松* 滕志英 李若茗 董哲 杨贵刚 谭云龙

北京回龙观医院

目的 目前对精神分裂症(SCZ)患者外周血单核细胞(Peripheral blood monocytes, PBMs)的重要标志物等分子表达水平与线粒体功能、临床症状之间关系的理解仍然是有限的。本研究旨在挖掘SCZ的PMBs中差异表达基因和能量代谢差异、及二者与临床症状之间的相关性,并结合机器学习等算法初步探索和构建SCZ多维诊断模型,以期指导SCZ新干预手段的开发和加速SCZ临床诊疗的变革。

方法 收集我院2022年2月至2023年6月收录的SCZ门诊和住院患者,招募健康受试者,分别设为SCZ组(男/女:28/18)和HC组(男/女:28/13),整理其临床资料及CTQ、PANSS、MCCB等量表评估结果。通过RNA测序和seahorse技术获得两组PMBs中的差异表达基因(DEGs)和能量代谢表型;并将这些组间差异与临床症状等进行相关性分析。对DEGs开展相关功能注释及通路富集分析,结合多变量统计分析、机器学习算法构建和优化SCZ诊断模型。

结果 SCZ与HC组人口学差异无统计学意义。与HC相比,SCZ组PMBs中线粒体氧化磷酸化ATP生成速率、XF ATP指数均明显升高($P < 0.05$)。通过对两组受试者PMBs进行转录组测序,发现有70个DEGs(上调基因48个,下调基因22个)。这些DEGs主要参与胸腺细胞迁移、T细胞迁移、组蛋白H3K4甲基化、H3K27三甲基化等生物过程;涉及程序性细胞死亡、细胞对刺激的反应和信号转导等通路;并富集于神经系统自身免疫性疾病、中枢神经系统疾病等。线粒体ATP生成速率与阳性症状显著正相关($\rho > 0.6$, $FDR < 0.01$)。LINC00487的表达量与工作记忆分呈负相关($\rho = -0.695$, $FDR = 0.01$);TP53INP2的表达量与情感虐待总分呈负相关($\rho = -0.718$, $FDR = 0.03$)。但以上相关性在HC组均无阳性结果。根据VIP值排名,

DEGs (IFI27、PIM3)、INFR 和体重、腰围、臀围、心率、收缩压、舒张压被用于分类模型的建立,模型经置换检验后未表现出过拟合,AUC 值为 0.8696。

结论 SCZ 患者 PBMs 中的线粒体更偏向氧化磷酸化代谢表型,氧化损耗较大,可能引发免疫细胞的加速衰老和凋亡,并与更重的阳性症状相关。SCZ 的患病风险可能与组蛋白 H3K4 甲基化、H3K27 三甲基化等生物学过程有关,从而影响 PBMs 的基因表达。本研究所建立的 SCZ 诊断模型具有一定可行性和便利性,值得扩大样本验证。本研究有益于促进真实世界 SCZ 的快速识别和诊疗,为 SCZ 发病机制等研究提供科学参考和新角度。

Effects of Computerized Cognitive Remediation Therapy on Cognitive Function and Serum Bilirubin in Patients with First-episode Schizophrenia

Jiajian Zhou Jian Yu Yonghong Zhao*
Weifang Mental Health Center

Objective The purpose of this study was to explore the relationship between the Duration of Untreated Psychosis (DUP) and clinical features, cognitive function and Serum Bilirubin (SBIL) level in patients with first-episode schizophrenia, and to study the effects of Computerized Cognitive Remediation Therapy (CCRT) on clinical features, cognitive function and SBIL level in patients with first-episode schizophrenia

Methods Patients with first-episode schizophrenia who were hospitalized in Weifang Mental Health Center from January 2023 to August 2023 were selected. A total of 100 subjects were included in this study, which were divided into control group and experimental group by random number table method, with 50 cases in each group. After all subjects were enrolled, subjects were divided into long DUP group and short DUP group according to the Symptom Onset in Schizophrenia (SOS). The study was terminated in 4 cases due to treatment adjustment, automatic discharge and adverse drug

reactions, and a total of 96 subjects were included in the study. The DUP duration ranged from 3 months to 73 months, with a median of 20 months. According to the median DUP, the subjects were divided into four groups: long DUP drug group (control group 1), short DUP drug group (control group 2), long DUP drug +CCRT drug group (experimental group 1) and short DUP drug +CCRT drug group (experimental group 2), with 24 cases in each group, and The control group was treated with olanzapine alone, and the experimental group was treated with olanzapine combined with CCRT. The Positive and Negative Syndrome Scale (PANSS) and Chinese Version of Brief Neurocognitive Test Battery (CBCT) were used to assess the severity of psychiatric symptoms and cognitive function, and SBIL levels were measured at baseline and at the end of the treatment week

Results (1) The subjects (n=96) at baseline scored (28.16±6.03) points on the positive symptom scale, (21.41±5.29) points on the negative symptom scale, (47.07±5.34) points on the general symptom scale, with a total score of (96.64±8.41) points and (8.01±2.72) points on the additional symptom scale. There was no significant correlation between DUP and PANSS positive symptom scale score, negative symptom scale score, general symptom scale score and additional symptom scale score ($P>0.05$), but there was positive correlation between DUP and PANSS total score ($P<0.05$). (2) The subjects (n=96) scored (29.78±7.55) points for the baseline connection test, (28.55±7.31) points for the symbol coding test, (27.05±5.70) points for continuous operation test, the number span T score was (28.19±6.93) points, and the total number T score of CBCT was (113.57±20.32) points. DUP was negatively correlated with connection test, symbol coding, number span and total score of CBCT ($P<0.01$), and DUP was negatively correlated with continuous operation ($P<0.05$). (3) The subjects (n=96) at baseline were (3.49±1.12) $\mu\text{mol/L}$ for direct bilirubin (DBIL), (9.15±2.09) $\mu\text{mol/L}$ for indirect bilirubin (IBIL), and (12.64±2.92) $\mu\text{mol/L}$ for total bilirubin (TBIL). DUP was negatively correlated with DBIL, IBIL and TBIL ($P<0.01$). (4) After 8 weeks of treatment, the subjects (n=96) scored (18.94±6.24) points on the positive symptom scale, (16.16±4.77)

points on the negative symptom scale, (32.93±5.51) points on the general symptom scale, the total score was (68.02±10.73) points, and the additional symptom scale score was (5.57±1.47) points. The PANSS scores of the subjects (n=96) and the subjects in each group (n=24) were significantly higher at baseline than at 8 weeks after treatment, and the total score and subscale of PANSS in the experimental group (n=48) were significantly higher than those in the control group (n=48). (5) After 8 weeks of treatment, the subjects (n=96) scored (36.98±8.02) points for connection test, (35.92±7.18) points for symbol coding, (34.68±5.81) points for continuous operation, (35.54±6.67) points for digital breadth, and the total T score of CBCT was (143.11±23.42) points. The CBCT scores of the subjects (n=96) and the subjects in each group (n=24) were significantly lower at baseline than at 8 weeks after treatment, and the total scores and subscales of CBCT in experimental group (n=48) were significantly higher than those in control group (n=48). (6) After 8 weeks of treatment, the subjects (n=96) DBIL was (3.02±1.08) μmol/L, IBIL was (6.95±2.50) μmol/L, and TBIL was (9.97±2.80) μmol/L. The SBIL level of the subjects (n=96) and the subjects in each group (n=24) at baseline was higher than that at 8 weeks after treatment. SBIL levels in the experimental group (n=48) were significantly lower than those in the control group (n=48)

Conclusion (1) The longer the DUP of patients with first-episode schizophrenia, the more obvious the clinical characteristics and the higher the PANSS score. (2) The longer the DUP in patients with first-episode schizophrenia, the worse the cognitive function. (3) The longer the DUP in patients with first-episode schizophrenia, the lower the serum bilirubin level. (4) CCRT significantly improved the clinical features and cognitive function of patients with first-episode schizophrenia, and had a certain effect on the reduction of SBIL level

FTO Ameliorates Neonatal MK-801 Administration Combined with Early Social Isolation Model Induced Learning and Memory Impairment by Activating PI3K/AKT/mTOR Signaling Pathway

Mengdie Li Huanzhong Liu* Yating Yang
Chaohu Hospital of Anhui Medical University

Background The pathogenesis of cognitive dysfunction in schizophrenia (SCZ) is still unclear, and m6A methylation may be involved in the neuropsychiatric diseases. The aim of this study was to investigate the effect of m6A methylation on learning and memory impairment induced by a neurodevelopmental model of SCZ

Methods A perinatal NMDA receptor antagonist combined with postweaning social isolation (MK-SI) was used to construct a neurodevelopmental model of SCZ. FTO adeno-associated virus (AAV) was injected into the hippocampus via a stereotaxic technique. Then, there were evaluated through a series of behavioral tests, such as the OFT, SIT, PPI, NOR and MWM. In addition, m6A dot blot, LC-MS/MS, qRT-PCR, western blot, tissue staining, MeRIP-seq, and colorimetry were used to analyze brain tissue. FB23-2, an FTO small molecule inhibitor, was used to further investigate the effect of FTO on the MK-SI model. In addition, we analyzed markers related to synaptic plasticity and cell apoptosis

Results Our results suggested that FTO mediated m6A modification in the hippocampus of MK-SI mice to induce learning and memory impairment. Furthermore, AAV9 FTO knockdown (FTO-KD) increased the m6A modification level in MK-SI mice, aggravated neuronal pyknosis and synaptic plasticity damage, and induced severe learning and memory impairment. In contrast, AAV9 FTO overexpression (FTO-OE) reversed these effects. In addition, FB23-2 inhibited the reversal effect of FTO-OE on MK-SI mice, further confirming the important role of FTO in MK-SI induced learning and memory impairment. Next, by high-throughput sequencing analysis, we found that the PI3K/AKT/mTOR signaling pathway may play a key role. Western blot results confirmed that FTO-KD and

FTO-OE affected the phosphorylation levels of PI3K/AKT/mTOR proteins in opposite directions. Notably, we found that the expression levels of hippocampal apoptotic protein bax and pro-apoptotic protein bcl-2 were simultaneously affected by FTO changes

Conclusion Taken together, our data suggested that the demethylase FTO mediated m6A modification to induce learning and memory impairment, highlighting the important role played by FTO in cognitive dysfunction in the MK-SI model.

Comparison of Clinical Symptoms and Symptom Structure in Schizophrenia with Different Onset Ages

Zhaofan Liu Wenjin Chen Yunlong Tan*
Beijing Huilongguan Hospital

Objective Patients with early-onset schizophrenia (EOS) consistently demonstrate poorer treatment outcomes compared to those with typical-onset schizophrenia (TOS), while individuals with late-onset schizophrenia (LOS) tend to have better prognoses than adult-onset patients. The underlying reasons for these phenomena remain elusive. This study aims to utilize network analysis to uncover potential symptom interactions that may contribute to the differential outcomes observed across different age-onset patient groups

Methods Symptom severity was assessed using the Positive and Negative Syndrome Scale (PANSS) in 654 EOS, 1664 TOS, and 369 LOS patients from an open dataset. Symptom networks were constructed using partial correlation, and measurements such as closeness centrality and shortest path length were analyzed to investigate the interconnectivity between symptoms

Results Patients were divided into three groups based on age of onset: EOS (onset before 18 years old), TOS (onset between 18 and 40 years old), and LOS (onset after 40 years old). Clinical symptoms were evalu-

ated using the PANSS. EOS patients exhibited significantly higher total PANSS scores compared to TOS and LOS patients, primarily driven by more severe negative symptoms and general psychopathology. In contrast, LOS patients showed no significant differences in overall PANSS scores compared to adult-onset patients, except for slightly higher positive symptom scores (adjusted $P < 0.05$)

Network analysis revealed that in all three groups, negative symptoms were connected with other negative symptoms through general symptoms. Additionally, positive and negative symptoms had a direct connection through Conceptual disorganization(P2) and Difficulty in abstract thinking(N5). Notably, positive symptoms exhibited closer connections with other symptoms in the EOS group compared to the TOS group. And positive symptoms exhibited closer connections in the TOS, group compared to the LOS group. Closeness centrality, a measure of interconnectivity, showed a monotonic decrease in positive symptom centrality across the EOS, TOS, and LOS groups, indicating that positive symptoms had closer connections within the symptom network of the EOS group.

Conclusion These findings suggest that the underlying symptom structure and interconnectivity between symptoms differ across schizophrenia onset age groups. The more pronounced positive-general and positive-negative symptom interactions in EOS may contribute to the distinct clinical presentation and disease course observed in this subtype. Understanding these network-level differences could provide insights into the pathogenesis and treatment of schizophrenia across different age-onset groups

人脐带血间充质干细胞对 MIA 诱导子代精神分裂症大鼠的干预研究

孟华丹 崔祥正 郭素芹 李文强*
河南省精神病院

目的 研究人脐带血间充质干细胞 (hUCB-MSCs) 对母体免疫激活 (MIA) 模型子代大鼠是否具有改善行为异常的效果, 以及能否为精神分裂症治疗新方案提供理论依据; 分析 hUCB-MSCs 对 MIA 子代大鼠中枢神经系统及其相关的分子通路的影响

方法 1. 以 MIA 模型子代大鼠为研究对象 (模型组), 重复尾静脉输注 hUCB-MSCs (干预组) 和等体积生理盐水 (正常组)

2. 利用旷场实验和前脉冲抑制实验来评价动物焦虑、抑郁及感觉门控功能

3. 利用 Q-PCR、免疫印迹及免疫荧光方法检测子代大鼠海马和前额叶中 Iba1、GFAP、PSD95、SYP 和 HMGB1 的表达变化

4. 利用统计软件 SPSS 22.0 处理数据, $P < 0.05$ 被认为差异有统计学意义

结果 1. 孕鼠血浆结果: 模型组 IL-6 和 TNF- α 表达均显著高于正常组 (均 $P < 0.05$)

2. 行为学结果: 旷场实验中, 模型组运动总距离和中心区域活动时间及距离百分比均减少 (均 $P < 0.05$); 干预组运动总距离显著增加 ($P < 0.001$), 中心区域活动时间及运动距离百分比均显著增加 (均 $P < 0.01$)。PPI 实验中, 模型组惊吓反应幅度升高 ($P < 0.05$), 干预组则显著下降 ($P < 0.001$); 而三组在 75 dB、80 dB 及 85 dB 条件下抑制率差异均无统计学意义 (均 $P > 0.05$)

3. Q-PCR 实验结果: 模型组在海马和前额叶组织中 Iba1 表达增加 (均 $P < 0.01$), 干预组改善了这种变化 (均 $P < 0.01$); 而 GFAP 表达差异无统计学意义 (均 $P > 0.05$)

4. 免疫印迹实验结果: 模型组 Iba1、PSD95 和 HMGB1 在海马和前额叶组织中蛋白水平增加 (均 $P < 0.05$), GFAP 和 SYP 蛋白水平减少 ($P < 0.05$, $P > 0.05$; 均 $P < 0.05$), 干预组又改善了这种变化 ($P > 0.05$, $P < 0.01$; 均 $P < 0.01$; 均 $P < 0.001$) (均 $P > 0.05$; 均 $P < 0.01$)

5. 免疫荧光结果: 在海马左右两侧 DG 区, 模型组 Iba1+细胞数均显著增加 (均 $P < 0.05$), GFAP+细胞数减少趋势, 神经元突触相关分子 PSD95 增加趋势; 干预组 Iba1+细胞数均显著减少 (均 $P < 0.05$), GFAP+细胞数增加趋势, PSD95 减少趋势

结论 hUCB-MSCs 显著改善了 MIA 模型子代大鼠的精神分裂症样行为; hUCB-MSCs 可能通过

HMGB1、Iba1、PSD95 及相关通路分子发挥作用, 可能通过调节胶质细胞活性状态, 减少神经炎症和修复突触损伤, 进而改善 MIA 子代大鼠行为的异常

History of Tobacco Smoking and Alcohol Use Can Predict The Effectiveness of Electroconvulsive Therapy in Patients with Schizophrenia: A Multicenter Clinical Trial

Hongcheng Xie Tingting Wang Kezhi Liu Bo Xiang*
Affiliated Hospital of Southwest Medical University

Objective In our clinical practice, we anecdotally observed that tobacco smokers and alcohol drinkers with schizophrenia seemed to respond more effectively to electroconvulsive therapy (ECT) than non-smokers and non-drinkers. The current study aimed to examine whether history of tobacco smoking or alcohol consumption serve as indicators for predicting therapeutic efficacy of ECT in patients with schizophrenia

Methods A total of 481 patients receiving ECT combined with antipsychotic medication (ECT + AP medication) completed a two-week (six sessions of ECT) follow-up; 106 patients receiving only antipsychotic medication (AP medication) also completed a two-week follow-up. Smoking, alcohol consumption, and AP medication usage was recorded for these patients. Severity of psychotic symptoms was assessed using the Positive and Negative Syndrome Scale (PANSS)

Results ECT + AP medication: Compared to schizophrenic patients without a history of smoking (non-smokers), those with a history of smoking (smokers) showed a high decrease in negative symptoms (36.96% vs 24.76%; $F = 5.974$, $p = 0.015$). While, compared to patients without a history of alcohol consumption (non-drinkers), those with a history of alcohol consumption (drinkers) showed a high decrease in positive symptoms (48.90% vs 41.47%; $F = 5.074$, $p = 0.025$).

No differences were found in symptom reduction between smokers and non-smokers or between drinkers and non-drinkers ($p > 0.05$) in the AP medication group

Conclusion Both smoking history and alcohol consumption history can independently serve as predictors of the efficacy of ECT in patients with schizophrenia, which may provide recommendations for the clinical use of ECT

关键词: Smoking; alcohol drinking; ECT; schizophrenia; PANSS

Altered Functional Connectivity in Anterior Cingulate Cortex Subregions in Treatment-resistant Schizophrenia Patients

Ying Liu¹, Huiling Wang²

1.Jiangxi Mental Health Center

2.Renmin Hospital of Wuhan University

Objective This study aims to characterize resting-state functional connectivity (rs-FC) profiles of ACC subregions in patients with TRS. The association between these FC and clinical symptoms, neurocognitive function, and grey matter volume (GMV) was studied as well

Methods A total of 81 patients with schizophrenia (40 patients with TRS = 40, 41 patients with non-treatment resistant schizophrenia (NTRS)) and 39 age- and gender-matched healthy controls (HC) were enrolled, and underwent structural magnetic resonance imaging (MRI), resting-state functional MRI (rs-fMRI), clinical evaluation. The ACC subregions, including subgenual ACC (sgACC), pregenual ACC (pgACC), and dorsal ACC (dACC), were selected as seed regions from the automated anatomical labelling atlas 3 (AAL3). The GMV of the ACC subregions were calculated and seed-based FC maps for all ACC subregions were generated and compared between the TRS and NTRS, HC group. Additionally, correlations between altered FC and clinical symptoms, GMV, and neurocognitive functions in the TRS patients were explored

Results Compared with HC, increased FC was

observed in TRS and NTRS groups between bilateral sgACC and left cuneus, right cuneus, and left lingual gyrus, while decreased FC was found between bilateral dACC and thalamic. Additionally, compared with NTRS, the TRS group showed increased FC between bilateral dACC and right cuneus and decreased FC between bilateral dACC and thalamic. The TRS group showed decreased GMV in all ACC subregions than the HC group, and there is no significant difference between the TRS group and the NTRS group

Conclusion The findings in this study suggest that disrupted FC of subregional ACC has the potential as a marker for TRS. The dysconnectivity of bilateral dACC-right cuneus and bilateral dACC-thalamus, are likely to be the unique FC profiles of TRS. These findings further our understanding of the neurobiological impairments in TRS.

肠道菌群与糖代谢的关联对首发精神分裂症认知障碍的影响

张钰 宋学勤*

郑州大学第一附属医院

目的 1. 比较首发未用药精神分裂症 (SCZ) 患者与健康对照 (HC) 人群肠道菌群的差异, 了解与 SCZ 疾病和糖代谢共有的相关菌。2. 观察首发未用药 SCZ 患者与 HC 人群糖代谢水平的差异。

方法 1. 选取郑州大学第一附属医院精神科就诊的 189 例诊断为首发未用药 SCZ 的患者为 SCZ 组, 并招募 115 例健康人群为 HC 组。在入组当日收集受试者的相关个人资料; 运用认知功能成套测验 (MCCB) 进行认知功能的评定; 使用阳性和阴性症状量表 (PANSS) 评估 SCZ 组患者精神症状的严重性。所有受试者于第二天早上进行采血、收集粪便等。2. 用十六烷基三甲基溴化铵法/十二烷基硫酸钠法提取粪便样本中的基因组, 使用 16S 核糖体 RNA (16S rRNA) 基因高通量测序法分析受试者粪便样本中的肠道细菌特征。用己糖激酶法测

量空腹血糖 (FPG) 水平, 用化学发光法检测空腹胰岛素 (FINS) 浓度。3. 使用 SPSS 26.0 统计软件进行数据分析。

结果 1. 一般资料比较: 两组间的年龄、教育年限、体重质量指数 (BMI)、性别、吸烟史均无统计学意义 (均 $P>0.05$)。2. 认知功能比较: SCZ 组的信息处理速度、注意/警觉、工作记忆、词语学习、视觉学习、推理和问题解决以及社会认知水平均低于 HC 组 (均 $P<0.05$)。3. 肠道菌群比较: SCZ 组的 Shannon 指数和 Simpson 指数均低于 HC 组 (均 $P<0.05$), 两组的 Chao1 指数、ACE 指数差异均无统计学意义 (均 $P>0.05$)。SCZ 组红蠕菌纲、丹毒丝菌纲、链球菌科、丹毒丝菌科、双歧杆菌科、拟杆菌科、链球菌属、丁酸球菌属、多尔氏菌属、丹毒丝菌属、*g_Fusicatenibacter* 菌属、双歧杆菌属、经黏液真杆菌属、未命名厚壁菌属、未命名瘤胃菌属、拟杆菌属相对丰度均低于 HC 组 (均 $P<0.05$); 厌氧菌纲、黄曲霉属、*g_Lachnoclostridium* 菌属相对丰度均高于 HC 组 (均 $P<0.05$)。4. 糖代谢比较: SCZ 组的 FPG、FINS 和胰岛素抵抗指数 (HOMA-IR) 水平均高于 HC 组 (均 $P<0.05$); 胰岛素敏感性指数 (ISI) 水平低于 HC 组 ($P<0.05$)。

结论 首发未用药 SCZ 患者存在肠道菌群多样性及相对丰度改变、糖代谢异常和认知功能障碍。

Predictive Value of Serum SOCS3 in Unmedicated First-Episode Schizophrenia: A Potential Tool for Clinical Management

Jiali Luo Junjiao Ping Jing Wan Jianli Zhu Ying Zhang Jie Zhang Tingyun Jiang*

Third People's Hospital of Zhongshan City

Objective Schizophrenia is a significant mental disorder of uncertain origin, characterized by negative symptoms, positive symptoms, and cognitive dysfunction. It ranks 12th among 310 disease injuries globally, imposing a substantial burden on society. Therefore, research focused on schizophrenia has the potential to positively impact various aspects, including mental ill-

ness treatment and healthcare resource allocation. Accumulated evidence indicates dysregulated inflammation implicated in the development and pathogenesis of symptoms in schizophrenia. SOCS3, one of key component regulating inflammatory signaling pathway can exert influence on the brain leading to alteration in cognition, mood and behavior in major psychiatric disorders, including schizophrenia. The association between level of SOCS3 and clinical features in the unmedicated first-episode schizophrenia remains less understand. although the systemic and pro-inflammation, including CRP, cytokines, including IL-6 and IL-1 β has been associated with negative and mood symptoms inpatient with first-episode unmedicated schizophrenia. The ultimate two hypothesis in current study is 1) dysregulated SOCS3 pathway in first-episode unmedicated schizophrenia. 2) the level of SOCS3 could predict the susceptibility for the first-episode schizophrenia

Methods Total of 93 patients diagnosed with first-episode unmedicated schizophrenia were enrolled from the Third People's Hospital of Zhongshan City, and 60 healthy participants were advertised from hospital staffs and the residence in surrounding community, to detect the levels of CRP, IL-6, IL-1 β and SOCS3 in serum by ELISA. Clinical symptoms in patients with first-episode unmedicated schizophrenia were evaluated with the scores for PANSS scale and Stroop test. Clinical symptoms in the healthy control group were assessed by the Stroop test

Results Decreased serum levels of SOCS3 ($p<0.05$), whereas increased IL-6 ($p<0.05$) in individuals with first-episode schizophrenia comparing to the healthy participant control. Serum levels of CRP and IL-1 β were elevated in first-episode schizophrenia patients, although the differences between two groups does not research the statistically significant ($p>0.05$). Additionally, first-episode schizophrenia patients exhibited significantly longer Word response time, Word-Color time and Color-Word time in the Stroop test compared to healthy control ($p<0.05$). Within the first-episode schizophrenia patients group, negative correlation was observed between serum levels of SOCS3 and scores for cognitive subscale in PANSS ($r=-0.247$, $p=0.031$),

whereas serum levels of IL-6 exhibited a positive correlation with Color time ($r=0.241$, $p=0.036$). The predictive value of serum SOCS3 levels for first-episode SCH was determined to be 0.719 (sensitivity 56.9%, specificity 80.6%, cut-off 273.9pg/ml), surpassing that of IL-6 (AUC=0.644, sensitivity 85.0%, specificity 25.3%, cut-off 1.105pg/ml)

Conclusion The findings suggest that this study generally support the notion of substantial immune dysfunction in individuals with schizophrenia. Notably, levels of serum SOCS3 and IL-6 exhibit more pronounced changes compared to CRP and IL-1 β , suggesting their potential utility in the early detection of first-episode schizophrenia. Additionally, SOCS3 demonstrates superior specificity in clinical prediction, underscoring the importance of investigating its role in the context of first-episode schizophrenia and exploring novel therapeutic interventions. Furthermore, there is a correlation between serum IL-6 and SOCS3 levels with executive function and cognitive impairment, respectively, suggesting potential implications for early prevention of schizophrenia through anti-inflammatory treatment and enhancement of patient survival outcomes. The pharmaceutical approaches targeting on SOCS3 signaling pathway could potentiate improving in the clinical outcomes and quality of life for the first-episode schizophrenia.

血浆中 NPTX2 水平与精神分裂症患者的认知功能相关

王诗雨^{1,2,3} 周佳会^{1,2,3} 李文强^{1,2,3}

1. 新乡医学院第二附属医院
2. 北京大学第六医院河南医院
3. 河南省生物精神病学重点实验室

目的 精神分裂症 (schizophrenia, SCZ) 存在治愈率低、复发率高、总体预后差等临床难题, 核心在于缺乏有效且特异的客观生物学标记物, 严重阻碍 SCZ 精准诊疗的发展。认知障碍是精神分裂症的

核心临床表现, 突触是学习和记忆的生物学基础, 其功能缺陷在微观上影响突触传递, 宏观上影响大脑连通性, 是认知障碍的重要病理基础。神经元正五聚体蛋白家族 (Neuronal pentraxins, NPTXs) 包括 NPTX1、NPTX2 和 NPTXR, 在突触形成和突触可塑性发挥重要作用。因此检测 SCZ 患者治疗前后外周血突触损伤标记物表达水平的变化情况, 析其与临床严重程度及认知功能损害的关系, 为临床从突触损伤角度进行治疗提供理论依据, 在神经发育过程中起着至关重要的作用。

方法 1. 收集 148 例 SCZ 患者和 127 例健康对照 (healthy control, HC), 在基线期采集所有受试者外周血样本, 此外, 患者组在治疗 8 周后也需采集外周血样本。

2. 采用酶联免疫吸附法检测血浆中 NPTX2 的水平, 采用 Olink 蛋白质组学技术检测血浆中 NPTX1/NPTXR 的水平。治疗前后采用阳性和阴性症状量表 (PANSS) 评定临床症状及疾病严重程度, 采用 MCCB 评估 SCZ 患者的认知功能和使用 3.0-T 超导型 MRI 扫描仪采集常规 T1 结构像。

3. 采用 SPSS 26.0 进行统计分析。SCZ 和 HC 组间分析使用两独立样本 t 检验, 治疗前后使用两配对样本 t 检验, 两组数据相关性使用偏相关分析, 并进行 FDR 校正。

结果 1. 与 HC 相比, SCZ 患者血浆中 NPTX2 和 NPTXR 水平较低 ($p < 0.05$), NPTX1 水平无显著差异 ($p = 0.531$)。另外, 与基线期相比, SCZ 患者经过 8 周抗精神病治疗后 NPTX2 水平显著升高 ($p < 0.05$)。

2. 基线期血浆 NPTX2 水平与 SCZ 患者的言语流畅性测试 (信息处理速度) 得分呈正相关 ($r=0.272$, $p=0.005$), 且治疗后 NPTX2 水平的增加与言语流畅性测试得分的提高也呈正相关 ($r=0.204$, $p=0.040$)。

3. SCZ 患者 NPTX2 水平的增加与颞上回白质体积的减少呈负相关 ($p < 0.05$)。

结论 与 HC 相比, SCZ 患者血浆 NPTX2 水平较低, 但与基线期相比, SCZ 患者治疗后血浆 NPTX2 水平升高, 而且 NPTX2 表达的降低与认知功能障碍有关。因此, NPTX2 可能参与 SCZ 病理生理学机制, 是有价值的突触损伤相关生物标志物, 为新药研发提供了新靶点。未来需进一步探讨 NPTX2 在 SCZ 中的作用机制。

Effects on Multimodal Connectivity Patterns in Female Schizophrenia During 8 Weeks of Antipsychotic Treatment

Shuzhan Gao¹, Yunkai Sun², Jinsong Tang², Xijia Xu¹

1.the Affiliated Brain Hospital of Nanjing Medical University

2.Sir Run Run Shaw Hospital, School of Medicine, Zhejiang University

Objective Respective abnormal structural connectivity (SC) and functional connectivity (FC) are reported in patients with schizophrenia. However, the trans-modal associations between SC and FC following antipsychotic treatment, especially in female schizophrenia, remain unclear. We hypothesized that increased SC-FC coupling may be found in female schizophrenia, and that it could be normalized after treatment

Methods A total of 64 female drug-naive patients with first-episode schizophrenia treated with antipsychotic drugs for 8 weeks, and 55 female healthy controls (HCs) were included. SC and FC were analyzed by Network-Based Statistics. Non-zero SC-FC coupling at whole-brain level and at changing connectivity following treatment were calculated. Finally, elastic net logistic regression analysis was used to establish a predictive model to evaluate the clinical efficacy treatment

Results At baseline, significant differences in SC were observed in the cortical-subcortical-cerebellar circuitry between patients and HCs, with no abnormalities in FC. Following treatment, alterations in SC and FC were observed in cortical-subcortical-cerebellar circuitry, but there was no overlap between the two modalities. Besides, the SC-FC coupling of altered connectivity in female schizophrenia at baseline was higher than that in HC, showing a trend towards normalization after treatment. Furthermore, the identified FC or/and SC predicted changes in psychopathological symptoms and cognitive impairment in female schizophrenia after treatment

Conclusion Changes in SC, FC, and SC-FC coupling suggested the dissociation of brain connectivity by

modality in female schizophrenia. Cortical-subcortical-cerebellar circuitry might be potentially served as targets for antipsychotic drug therapy in female schizophrenia

The Co-varying Multimodal Pattern in Treatment-resistant and Non-treatment-resistant Schizophrenia

Shuzhan Gao¹, Chuang Liang², Xijia Xu¹, Shile Qi²

1.the Affiliated Brain Hospital of Nanjing Medical University

2.Department of Computer Science and Technology, Nanjing University of Aeronautics and Astronautics

Objective About one-third of individuals diagnosed with schizophrenia eventually progress to treatment-resistant schizophrenia (TR-SZ), where conventional treatments fail to alleviate symptoms. Despite its clinical significance, the underlying pathological mechanisms of TR-SZ remain largely unknown. This study aimed to identify a co-varying multimodal pattern that distinguishes among TR-SZ, non-treatment-resistant schizophrenia (NTR-SZ), and healthy controls (HCs) using unsupervised fusion. Additionally, it sought to explore the genetic background, correlation with clinical symptoms, and classification accuracy of this co-varying multimodal pattern

Methods This study included 63 TR-SZ individuals, 221 NTR-SZ individuals, and 86 HCs. Fractional amplitude of low-frequency fluctuation (fALFF), fractional anisotropy (FA), and gray matter volume (GMV) were used as fusion inputs. Subsequently, the study explored the relationship between the co-varying multimodal pattern and clinical symptoms. Additionally, it investigated gene expression data sourced from the Allen Human Brain Atlas database to potentially shed light on underlying biological mechanisms. Finally, the clas-

sification accuracy of the multimodal pattern distinguishing TR-SZ, NTR-SZ, and HCs was calculated

Results The study identified joint multimodal components (including fALFF_IC3, FA_IC12, GMV_IC9) that discriminate among TR-SZ, NTR-SZ, and HCs (TR-SZ<NTR-SZ<HCs), comprising the central executive network (CEN) and the salience network (SAN). Genetic enrichment analysis revealed that joint multimodal components were associated with genetics and highlighted genes such as RILPL2, PTPRF, MAPK3, and PLCH2. Moreover, these components correlated with cognitive scores, which were validated across three independent schizophrenia cohorts and could identify TR-SZ, NTR-SZ, and HCs

Conclusion The identified co-varying multimodal CEN and SAN could distinguish TR-SZ, NTR-SZ, and HC individuals with a genetic background, potentially elucidating the pathological mechanisms underlying disease severity in schizophrenia.

Depressive and Anxiety Symptoms Among Schizophrenia Patients

Mingzhe Zhao Haidong Song*

Affiliated Mental Health Center & Hangzhou Seventh People's Hospital

Background Depressive and anxiety symptoms commonly manifested throughout the progression of schizophrenia. However, the prevalence of these symptoms, alongside their co-occurrence, remains uncertain, and clinical correlates remain elusive

Objectives This study seeks to investigate the prevalence of such symptoms and their demographic and clinical associations among patients diagnosed with schizophrenia. **Methods** Conducted as a cross-sectional study, the study encompassed a total of 19623 patients diagnosed with schizophrenia

Results The prevalence rates of depressive and anxiety symptoms, as well as their co-occurrence, were

determined to be 19% (95%CI=18.5-19.6%), 37.4% (95%CI=36.8-38.0%), and 17.7% (95%CI=17.2-18.2%), respectively. Notably, a lower prevalence of depressive and anxiety symptoms, and their co-occurrence, was observed among patients prescribed quetiapine, olanzapine, and risperidone ($P<0.01$). Spearman's correlation analysis revealed a significant correlation between depressive symptoms and anxiety symptoms ($r=0.60$, $P=0.006$). Furthermore, age, social relationships, and sleep status exhibited associations with depressive and anxiety symptoms, as well as their co-occurrence, in both univariate and multivariate analyses

Conclusion Given the pervasive nature and detrimental consequences of these symptoms among individuals diagnosed with schizophrenia, comprehensive evaluation and implementation of efficacious interventions are highly recommended

Preliminary Investigation of The Human Gut Virome in First-episode Schizophrenia Through Metagenomic Sequencing

Yulu Wu Shiwan Tao Qiang Wang*

West China Hospital of Sichuan University

Objective The gut microbiome is increasingly recognized in schizophrenia research, yet the viral components have been less explored. Despite some studies have explored the potential connections between gut bacteria and schizophrenia, the alterations in the gut virome and their association with schizophrenia remain less understood To bridge this gap, we used metagenomic sequencing on stool samples from first-episode schizophrenia patients and matched healthy controls to examine the diversity and composition of the gut virome, aiming to identify viral patterns associated with early stages of schizophrenia

Methods We conducted metagenomic sequencing on fecal samples from 49 first-episode schizophrenia patients and 49 matched healthy controls to compare

virome diversity and taxonomic distribution. Multivariable association analysis (MaAsLin2) was utilized to identify differentially abundant viral taxa while controlling for confounders such as age, gender, and BMI. We further applied machine learning techniques, specifically Extreme Gradient Boosting (XGBoost), with five-fold cross-validation to evaluate the predictive power of the virome signatures, assessing model performance through metrics like the Area Under the Curve (AUC) and accuracy, thereby determining the most influential viral predictors of schizophrenia onset

Results Schizophrenia patients exhibited a significant reduction in gut viral alpha diversity compared to healthy controls, particularly viral richness at elevated taxonomic levels, as measured by the Chao1 at the species level ($p=0.006$). This decrease in richness was more pronounced in female patients. The MaAsLin2 analysis revealed differential abundances in 15 viruses between the schizophrenia group and controls. Notably, Weissella phage, crAssphage and Klebsiella pneumoniae phage which correlated with inflammatory conditions, were found significantly decreasing in patients with schizophrenia after covariate controlling. Furthermore the XGBoost model demonstrated strong predictive accuracy with the AUC of 0.828 and accuracy of 0.745 in distinguishing the patients and healthy controls. Within this model, Weissella phage ranked as the most significant viral predictor of schizophrenia

Conclusion This study offers initial insight into the role of gut virome in schizophrenia, highlighting significant compositional changes and potential functional impacts related to the onset of schizophrenia

关键词: Gut virome, Schizophrenia, Microbiome, Bacteriophage

Clinical Correlates of Autism Features in Initial-treatment and Drug-naïve Patients with Schizophrenia

Jun Ma*

Renmin Hospital of Wuhan University

Objective Schizophrenia (SCZ) with autism features (AF) is considered a distinct subtype of schizophrenia. The aim of this study was to explore the prevalence of AF in initial-treatment and drug-naïve (ITDN) schizophrenia (SCZ) patients, as well as the factors influencing AF

Methods The study included a total of 710 patients with ITDN SCZ. We collected sociodemographic data and general clinical information about the patients and performed a clinical psychological assessment to quantify their psychopathology and disease severity. Additionally, we calculated the severity of AF in patients based on psychopathology scores

Results The percentage of SCZ patients with AF was 19.01% (135/710). Patients with AF exhibited higher thyroid stimulating hormone (TSH) ($t = -4.54, p < .001$) levels and lower free triiodothyronine (FT3) and free tetraiodothyronine (FT4) levels ($t = 2.38, p = 0.018$; $t = 3.19, p = 0.002$) compared to patients without AF. Binary logistic regressions show that: waist circumference (WC) ($B = 0.03, p = 0.022, OR = 1.03$) and TSH level ($B = 0.54, p < .001, OR = 1.71$) were risk factors for AF, while low density lipoprotein cholesterol (LDL-C) level ($B = -0.43, p = 0.025, OR = 0.65$), fasting blood glucose (FBG) level ($B = -0.72, p = 0.013, OR = 0.49$), FT3 level ($B = -0.32, p = 0.034, OR = 0.73$), and FT4 level ($B = -0.08, p = 0.025, OR = 0.93$) were protective factors. Multiple linear regression identified FT3 level ($B = -0.85, t = -2.22, p = 0.028, 95\%CI: -1.61--0.09$) was a protective factor affecting the severity of AF

Conclusion This paper reports on the prevalence of AF in the target population and identifies factors influencing the development and severity of AF. The discernment of these distinctive clinical features facilitates the formulation of tailored prevention strategies and interventions for this precise subset of SCZ patients.

早期精神病患者听觉失匹配负波缺陷及其连通性研究

秦湘琴 王传跃* 侯文鹏 周福春
首都医科大学附属北京安定医院

目的 比较 fMMN、dMMN 振幅、不同刺激下 MMN 时频指标以及连通性在早期精神病中的缺陷程度以及相关性。

方法 收集 67 例首发精神分裂症 (first-episode schizophrenia, FES) 和 39 例临床高危 (clinical high risk for psychosis, CHR) 个体, 以及 39 例健康对照 (healthy control, HC)。采用 EGI 128 导联的高密度脑电设备 (Electrical Geodesics, Inc, Oregon, USA) 采集受试者脑电数据, 使用时域和时频分析分别提取 MMN 指标, 使用工具包 gretna 计算 MMN 连通性, 使用方差分析对各组 MMN 指标进行比较, 使用相关性分析研究各指标间的相关性。

结果 1. MMN 振幅受损结果: 与 HC 相比, fMMN 振幅受损只发现于 FES 组, 达到中区分效应 ($p < 0.01$, Cohen's $d = 0.67$), CHR 组的 fMMN 振幅与其余两组均未达到统计学差异; 与 HC 相比, dMMN 振幅在 FES ($p < 0.001$, Cohen's $d = 0.82$) 及 CHR 中 ($p < 0.01$, Cohen's $d = 0.73$) 均受损, 均具有较大区分效应, FES 与 CHR 之间的 dMMN 振幅无统计学差异。

2. 连通性结果: 与 HC 相比, 标准刺激 alpha 加权相位延迟指数 (weighted phase-lag index, wPLI) 在 FES 组显著增加, 连通性增强的脑区大部分集中于右侧前额叶与左侧后顶叶之间, 以及双侧顶叶之间。CHR 组的 wPLI 介于 FES 组和 HC 组之间, 但是均未与二者达到统计学差异。

3. 相关性分析结果: 在 HC 中, wPLI 与标准刺激 alpha 试次间相位一致性 (Inter-trial phase synchrony, ITPS) 呈负相关 ($p < 0.05$, $r = -0.36$); 在 FES 中, wPLI 与 fMMN 振幅 ($p < 0.05$, $r = -0.25$) 以及标准刺激 alpha ITPS ($p < 0.01$, $r = -0.29$) 均呈负相关。

结论 MMN 振幅在 FES 及 CHR 个体中均受损, 具有中至大的效应量, 提示 MMN 振幅是识别早期精神病的潜在生物标志。早期精神病的 MMN 连通性呈现“超连接”现象, 或许与大脑功能代偿有关, 且大脑连通性的增加与 MMN 相关指标的降低有关, 提示早期精神病患者局部脑区功能障碍的同时伴有脑区之间连接的代偿性增强。

Intermittent Theta Burst Stimulation For Negative Symptoms in Schizophrenia Patients With Mild Cognitive Impairment: A fNIRS Study

Jing Li Wei Zhang*

West China Hospital, Sichuan University

Objective This study aims to evaluate the intervention effect of intermittent Theta burst stimulation (iTBS) on bilateral dorsomedial prefrontal cortex (DMPFC) for negative symptoms in schizophrenia using functional near-infrared spectroscopy (fNIRS) in order to confirm the therapeutic significance of DMPFC in treating negative symptoms and provide new evidence for the treatment and research of negative symptoms in schizophrenia.

Methods 39 schizophrenia patients with negative symptoms and mild cognitive impairment were randomly divided into a treatment group ($n = 20$) and a control group ($n = 19$). The treatment group received iTBS on bilateral DMPFC. Negative symptoms, cognitive function, emotional state, and social function were assessed using PANSS, SANS, MoCA, CDSS, and SDSS at pre-treatment, post-treatment, 4-, 8-, and 12-week follow-ups. Brain activation in regions of interest (ROIs) was evaluated through verbal fluency tasks (VFT). Changes in scale scores were analyzed by repeated measures ANOVA

Results After 20 sessions of iTBS, SANS total and subscale scores significantly improved in the treatment group, with statistically significant differences. Negative symptom scores differed significantly between pre- and post-treatment in both groups, with post-treatment scores markedly lower than pre-treatment and better efficacy in the treatment group. However, differences in MoCA, CDSS, and SDSS scores were not statistically significant. ROIs did not differ significantly between groups before intervention. After treatment, prefrontal cortex (PFC) activation was significantly higher in the treatment group than in controls, with a

statistically significant difference. Regarding functional connectivity, inter-ROI connectivity improved to some extent, and small-world properties Sigma and Gamma were enhanced

Conclusion iTBS on bilateral DMPFC can effectively alleviate negative symptoms and enhance PFC activation and functional connectivity in schizophrenia patients

伴有和不伴有认知功能障碍的精神分裂症患者的认知相关功能、脑源性神经营养因子及脑电图 γ 活动的相关研究

张玉鹏¹ 张玉鹏³ 毛鹤¹ 段莉² 段莉³ 董哲¹ 朱刚³

1.锦州市康宁医院

2.承德医学院

3.中国医科大学附属第一医院

目的 通过量表评估、认知功能测试以及相关生物学指标了解伴有认知功能障碍的精神分裂症患者与不伴有认知功能障碍的精神分裂症患者之间的差异。

方法 研究纳入了 116 例受试者, 根据其 MMSE 量表评分结果分为对照组 (>24 分) 和观察组 (≤ 24 分)。获得对照组 32 例受试者, 观察组 84 例受试者。对照组和观察组分别有 2 例和 9 例受试者拒绝抽血检查, 故血清 BDNF 浓度水平检测结果为对照组 30 例, 观察组 75 例。利用 PANSS 量表对两组进行评分, 利用认知功能测试(连线测验、符号编码、言语记忆、数字序列)对所有受试者进行评估。抽取静脉血用以通过 ELISA 测定血清 BDNF 浓度水平, 通过脑电图检查观察受试者是否存在 γ 活动。根据脑电图 γ 活动的发生与否再将观察组受试者分为阳性组 (n=44) 和阴性组 (n=40), 观察相关结果指标。

结果 两组受试者在连线测验用时 ($Z=-6.566$, $P<0.001$)、符号编码测试完成数 ($Z=-4.324$, $P<$

0.001)、言语记忆完成数 ($Z=-7.077$, $P<0.001$)、数字序列完成数 ($Z=-5.416$, $P<0.001$) 的结果比较中有显著差异; 在脑电 γ 活动发生率 ($\chi^2=5.494$, $P=0.019$)、血清 BDNF 浓度 ($t=6.352$, $P<0.001$) 的比较中, 两组受试者的结果存在显著差异。观察组受试者的血清 BDNF 含量与连线测验所用时间呈负相关 ($r=-0.447$, $P<0.001$), 与符号编码完成数 ($r=0.321$, $P=0.005$)、言语记忆完成数 ($r=0.308$, $P=0.007$)、数字序列完成数 ($r=0.330$, $P=0.004$) 分别呈正相关; 脑电图 γ 活动的发生与 PANSS 量表评分阳性分 ($r=0.323$, $P=0.003$)、PANSS 量表总分 ($r=0.249$, $P=0.022$) 呈正相关; Logistic 回归分析结果发现: 服药量对脑电图 γ 活动的发生的影响具有统计学意义 ($OR=0.996$, $95\%CI 0.993, 1.000$, $P=0.045$); PANSS 量表总分评分对脑电图 γ 活动的发生的影响具有统计学意义 ($OR=1.035$, $95\%CI 1.010, 1.061$, $P=0.007$)。

结论 在精神分裂症患者, 血清 BDNF 浓度水平与认知功能状态存在较明显的关联, 观察组的血清 BDNF 浓度水平明显低于对照组; 脑电 γ 活动的发生与阳性精神病性症状存在相关性, 更高的阳性精神病性症状评分意味着更高的脑电 γ 活动发生率。

2.Tianjin Medical University General Hospital

3.Qiqihar Medical University

4.Center of Mental Health of Inner Mongolia Autonomous Region

5.Xiangya Hospital of Central South University

Objective Clinical high-risk (CHR) has similar

but milder cognitive impairments and brain abnormalities compared with first-episode schizophrenia (FSZ), and these alterations may increase vulnerability to transitioning to the disease. This study aims to examine cognitive-related functional connectivity (FC) to explore differences in the progression of schizophrenia

Methods Thirty drug-naive FSZ patients, 28 CHR individuals, and 30 healthy controls (HCs) were recruited to undergo resting-state functional magnetic resonance imaging (rs-fMRI). Connectome-based predictive modeling (CPM) was employed to extract cognitive-related brain regions. The most relevant regions were selected as seeds to form FC networks. The support vector machine (SVM) was used to distinguish FSZ patients from CHR individuals

Results FSZ group displayed decreased cognitive-related FC between the right posterior cingulate cortex (PCC) and right superior frontal gyrus (SFG) compared with HC group and between the right amygdala and left inferior parietal gyrus (IPG) compared with CHR group. SVM results showed that the Brief Assessment of Cognition in Schizophrenia-Symbol Coding (BACS-SC) and Category Fluency Test-Animal (CFT-A) scores combined with FC between the right PCC and right SFG could be a reliable biomarker to discriminate FSZ patients from HCs and a combination of the BACS-SC and CFT-A scores, and FC between the right amygdala and left IPG could serve as a potential biomarker for distinguishing FSZ patients from CHR individuals with high sensitivity

Conclusion FSZ and CHR individuals exhibited different patterns of cognitive-related FC. Our findings illustrate potential neuroimaging and cognitive markers for early identification of psychosis that could help in the intervention of schizophrenia in high-risk groups.

4.School of Psychology and Cognitive Science, East China Normal University, Shanghai 200062, China

Objective The hippocampal-prefrontal functional interaction is disrupted in schizophrenia and contributes to associative memory impairment. Intermittent theta burst stimulation (iTBS) of repetitive transcranial magnetic stimulation (rTMS) is a non-invasive neuromodulation technique which can modulate memory network connectivity. Here, we conducted a randomized controlled double-blinded clinical trial to investigate the effect of iTBS on the hippocampal-prefrontal functional connectivity (FC) in patients with schizophrenia and to assess the correlations between FC changes and associative memory or symptoms

Methods Subjects with schizophrenia were randomly allocated into three groups: right dorsal lateral prefrontal cortex (DLPFC) group (n=12), left lateral parietal cortex (LPC) group (n=17) or sham group (n=15). Anatomical T1-weighted images were obtained to identify a subject-specific right DLPFC or left LPC target for iTBS. Clinical symptoms (PANSS) and innovative associative memory tasks were assessed at baseline and shortly after 20-session iTBS treatment (one session per day, 5 days per week for 4 weeks; MagVenture MagPro X100). The innovative associative memory task asked subjects to learn and memorize the pairs of non-verbal sounds or abstract pictures (visual-visual, auditory-auditory, visual-auditory); then they were asked whether the pairs presented in the testing phase were rearranged.

All participants were scheduled for another structural and resting-state fMRI on a Siemens 3.0T scanner by the end of the trial. Brain regions were demarcated by the automated anatomical labeling (AAL3v) atlas. After preprocessing, hippocampus seed-based FC analyses were performed and Fisher's Z-transformed correlation coefficients were calculated for each pair of regions to represent FC (cluster threshold, $P < 0.05$ cluster-size family-wise error (FWE) corrected). Pearson's correlation analyses were conducted between the FC changes and PANSS score reduction and between the FC changes and the AM task performance improvement (d' score)

Results In the left LPC active group, we found evidence of enhanced FC between left hippocampus and the clusters in the medial prefrontal cortex (mPFC), including right anterior cingulate cortex (ACC), bilateral medial orbital superior frontal gyrus, bilateral rectus, bilateral medial orbital gyrus, and left anterior orbital gyrus (cluster size=108; FWE-cluster corrected $p < 0.001$; within-subject comparisons; baseline vs post-iTBS). We found no evidence of hippocampal FC change in the right DLPFC active group or sham group (within-subject comparisons; baseline vs post-iTBS). FC changes from the left hippocampus to the right ACC showed a significant positive correlation with changes in cross-modal associative memory functions (visual-auditory task; $r=0.714$, $p=0.009$) and a significant positive correlation with PANSS positive reduction rate ($r=0.613$, $p=0.015$)

Conclusion Targeted intermittent theta burst stimulation (iTBS) of the LPC can restore aberrant hippocampal-prefrontal FC in schizophrenia, which is closely related to reduced positive symptoms and improved associative memory performance, i.e. better multisensory information integration ability. Our findings suggest a complex interplay between iTBS and hippocampal-prefrontal memory network connectivity. Further study uncovering the pathological mechanisms of associative memory deficit is required to develop more effective iTBS treatment strategies for schizophrenia.

stimulation (rTMS), cross-modal associative memory, functional connectivity

Disrupted Default Mode Network Connectivity and Its Role in Predicting Symptom Severity in Schizophrenia Using Connectome-Based Predictive Modeling

Chuanlong Cao*

Department of Radiology, The Fourth People's Hospital of Chengdu, Chengdu, China

Objective This study investigates the abnormalities in the default mode network (DMN) and its connectivity in schizophrenia patients and explores the use of connectome-based predictive modeling (CPM) to predict the severity of both positive and negative symptoms

Methods Resting-state functional MRI (rs-fMRI) data from 47 schizophrenia patients and 45 healthy controls were analyzed. Graph theory was applied to assess the topological properties of the DMN. CPM was employed to predict symptom severity based on DMN connectivity patterns, utilizing the Scale for Assessment for Positive Symptoms (SAPS) and the Scale for the Assessment of Negative Symptoms (SANS). The analysis focused on identifying key connectivity patterns within the DMN and their correlation with clinical symptoms

Results Schizophrenia patients exhibited significant abnormalities in the global and local topological properties of the DMN, particularly reduced efficiency and disrupted connectivity within the medial temporal lobe (MTL) subsystem. CPM analysis revealed that positive network connectivity patterns within the DMN could reliably predict the severity of negative symptoms, including avolition and anhedonia, as measured by SANS scores. However, these connectivity patterns did not predict the severity of positive symptoms such as hallucinations and delusions, as measured by SAPS scores

Conclusions The study highlights the potential of DMN topological metrics and CPM as biomarkers for

negative symptom severity in schizophrenia. The findings suggest that the disrupted connectivity within the MTL subsystem of the DMN plays a crucial role in the manifestation of negative symptoms. These insights underscore the need for further research into personalized treatment approaches that target specific connectome abnormalities. This study contributes to a better understanding of the neural underpinnings of schizophrenia and supports the development of more effective diagnostic and therapeutic strategies

Basal Ganglia Subregion Volume Changes between Acute-phase Schizophrenia and Bipolar Disorder

Yilin Tang¹, Yuting Li¹, Yingbo Dong¹, Peiyu Cao¹, Guoxing Xu¹, Ruiqiu Zhu¹, Qi Si², Yuxiu Sui¹

1.Department of Psychiatry, the Affiliated Brain Hospital of Nanjing Medical University

2.Huai'an No. 3 People's Hospital

Objective Schizophrenia (SCZ) and bipolar disorder (BD) are two severely debilitating mental illnesses with significant overlap in diagnosis, pathophysiology, and genetic levels. This may be due to the existence of similar biological backgrounds for both disorders. The similar biological backgrounds make it challenging to provide accurate diagnosis and appropriate treatment for both diseases, especially when psychiatric symptoms are present. Therefore, it is meaningful to search for imaging evidence that can be used to distinguish between the two disorders in the presence of these symptoms

Methods This study included 90 patients with SCZ, 60 patients with bipolar disorder without psychotic symptoms (P-BD), 22 patients with bipolar disorder with psychotic symptoms (NP-BD), and 100 healthy control subjects (HC), who all underwent struc-

tural magnetic resonance imaging (MRI) scans. Covariance analysis was performed using SPSS 26.0 to compare the differences in basal ganglia volume between the SCZ group, P-BD group, and HC group, as well as between the P-BD group, NP-BD group, and HC group. Finally, a correlation analysis was conducted between regions of interest and the cumulative dose of antipsychotic medications

Results Using age and gender as covariates, comparing the volumes of interest among the SCZ group, P-BD group, and HC group through covariance analysis, the results showed significant differences in the volumes of the left putamen ($F=6.511$, $P=0.002$), right putamen ($F=5.416$, $P=0.005$), left pallidum ($F=29.920$, $P<0.001$), and right pallidum ($F=12.513$, $P<0.001$). Post-hoc analysis results showed that the left putamen volume was larger in the SCZ group compared to the HC group, and the bilateral pallidum volumes were larger in the SCZ group compared to both the P-BD group and HC group. The same method was used to compare the volumes of interest among the P-BD group, NP-BD group, and HC group, and the results showed significant differences in the volumes of the left pallidum ($F=6.776$, $P=0.001$) and right putamen ($F=9.930$, $P<0.001$). Post-hoc analysis results showed that the left pallidum volume was larger in the NP-BD group compared to the HC group, and the right putamen volume was smaller in both the P-BD group and NP-BD group compared to the HC group. Correlation analysis showed a significant negative correlation between cumulative antipsychotic medication dose and volume of the bilateral caudate nucleus and bilateral accumbens, and a significant positive correlation between the volume of the bilateral pallidum

Conclusion By comparing the volumes of subregions in the basal ganglia in the acute phase of patients with different diseases within a five-year course, the results showed significant differences in subregion volumes associated with psychiatric symptoms across different diseases. However, within the same disease, these differences were not evident, although the observed intergroup differences may partly be attributed to exposure to antipsychotic medications. We observed signifi-

cant differences in the right putamen and bilateral pallidum areas in the comparison of different disease groups, providing a reference basis for distinguishing between SCZ and P-BD. Additionally, this also provides further evidence for the pathological models explaining psychiatric symptoms.

女性精神分裂症患者药物治疗前后的多模态磁共振研究

何张峯 唐劲松*

浙江大学医学院附属邵逸夫医院

目的 本研究分析女性精神分裂症患者在抗精神病药物治疗后出现的灰质体积与功能连接变化,寻找能够反映女性精神分裂症疗效的客观指标。同时,将女性患者的脑影像与女性正常人群进行比较,观察抗精神病药物是否能使女性精神分裂症患者的脑影像更接近正常人群。

方法 本研究纳入了 38 名女性精神分裂症患者,40 名正常女性。所有被试在基线完成 3.0T 磁共振扫描(3D-T1 结构像及静息态功能像),患者组在 8 周的抗精神病药物治疗后再次完成 3.0T 磁共振扫描。采用基于体素的形态学测量方法计算灰质体积。采用两样本 t 检验,分别比较治疗前患者组与对照组、治疗后患者组与对照组的灰质体积差异。采用配对样本 t 检验,比较患者组治疗前、后的灰质体积差异。将患者组治疗前、后存在显著灰质体积改变的脑区作为种子点,计算与全脑其他脑区的静息态功能连接。采用配对 t 检验,比较患者组治疗前、后的功能连接变化。

结果 从灰质体积来看,患者组治疗前双侧扣带回,左侧的颞下回、颞中回、辅助运动区等脑区的灰质体积较对照组更小。8 周抗精神病药物治疗后,患者组双侧豆状壳核灰质体积大于对照组,而双侧小脑等脑区的灰质体积小于对照组。与治疗前自身对比,患者组治疗后右脑豆状壳核的灰质体积增大,而双侧的颞下回、颞上回、脑岛和左侧的颞中回、内侧额上回等脑区的灰质体积减少。从功能连接来看,与对照组相比,患者组在治疗前、后均存在广泛的

功能连接降低。患者组治疗后右脑岛,右脑豆状壳核,左脑颞中回,左脑颞上回与多个脑区的功能连接较治疗前下降。相关性结果表明,治疗前患者组的右脑豆状壳核灰质体积与基线的 PANSS 总分、一般精神病量表分呈负相关。治疗后患者组的双侧脑岛灰质体积较治疗前的减少量则与一般精神病量表分的减分率呈负相关。未发现功能连接与临床量表得分之间的显著相关性。

结论 8 周抗精神病药物治疗未能改善女性精神分裂症患者大脑广泛的灰质体积减少和功能连接降低。8 周抗精神病药物治疗可能促进女性精神分裂症患者的小脑灰质体积减少,然而,8 周抗精神病药物治疗没有逆转小脑与其他脑区的功能连接降低。女性精神分裂症患者中,右脑豆状壳核可能是与抗精神病药物治疗有关的重要脑区,右脑豆状壳核灰质体积越小,患者的临床精神病性症状越严重。脑岛灰质体积可能是女性精神分裂症患者潜在的疗效评价指标,脑岛的灰质体积减少程度可能与临床症状改善相关。

Berberine Intervenes To Alleviate Olanzapine-induced Glucose Metabolism Disorders in Patients with Schizophrenia Through IL-8 Intervention

Shouqing Liu Dandan Zhao Zhirong Yang Xine Xie*
The second Hospital of jinhua

Objective Schizophrenia is a complex psychiatric disorder for which olanzapine therapy is a common treatment, but is frequently associated with the adverse effects of disturbed glucose metabolism. Interleukin 8 (IL-8), a chemokine involved in systemic immunity, macrophage infiltration and activation in adipose tissue, may play an important role in the pathogenesis of olanzapine-induced pharmacological glucose metabolism disorders. The aim of this study was to investigate the role of berberine intervention in the treatment of plasma IL-8 as well as related indicators of glucose metabolism disorders in patients with olanzapine-induced schizophrenia

Methods In this study, we recruited 20 patients with schizophrenia treated with single-agent olanzapine as a control group. Another 20 non-diabetic patients of comparable gender, age and BMI were recruited to take concomitant olanzapine combined with berberine 0.9 g/d as an intervention group. Clinical parameters and medical history were recorded and blood samples were taken for clinical testing of fasting and 2-hour postprandial blood glucose levels. Enzyme-linked immunosorbent assay was used to detect plasma IL-8 and insulin levels at baseline and week 4 in both groups. And the degree of glucose metabolism disorder was assessed according to the insulin resistance index

Results 1) Compared with the baseline period, in the control group, there was no significant increase in fasting blood glucose, but plasma IL-8, 2-hour postprandial blood glucose, insulin, and insulin resistance index were significantly increased. In the experimental group, there was no significant change in the indexes compared to the baseline period. 2) After 4 weeks of intervention, in the comparison between the two groups, there was no significant increase in fasting blood glucose in the control group, but plasma IL-8, 2-hour postprandial blood glucose, insulin level and insulin resistance index were significantly increased

Conclusion 1) Berberine significantly reduced the level of IL-8, 2-hour postprandial glucose, insulin, and insulin resistance due to olanzapine, which provides theoretical basis and data support for berberine combined with olanzapine to improve insulin resistance. And further studies are necessary to assess the degree of risk of IL-8 as a risk for olanzapine-induced glucose metabolism disorders in patients with schizophrenia, and the possibility of further use as a marker. 2) Berberine may be a promising approach to intervene in olanzapine-induced glucose metabolism disorders in schizophrenic patients. The mechanism of this intervention may involve modulation of IL-8, which plays a crucial role in regulating metabolic processes. Future studies need to further elucidate the possible molecular mechanisms of berberine and explore its potential as an adjunctive therapy for schizophrenia and other psychiatric disorders accompanied by metabolic abnormalities.

精神分裂症患者及精神病临床高危人群工作记忆和反应抑制的功能磁共振研究

王逍遙 薄奇静*

首都医科大学附属北京安定医院

目的 采用功能磁共振成像技术比较首发精神分裂症患者 (First episode of schizophrenia, FES)、精神病临床高危个体 (Clinical high risk for psychosis, CHR) 及健康对照 (healthy controls, HC) 三组受试者在完成工作记忆和反应抑制任务时相关脑功能活动的差异。

方法 采集 48 例 FES、31 例 CHR 和 69 例 HC 的一般人口学、临床及神经认知数据, 并对所有受试者进行工作记忆任务 (N-back 任务) 态及反应抑制任务 (Stroop 任务) 态下的功能磁共振扫描。首先, 以反应时和正确率为计算指标, 采用方差分析比较三组间行为水平认知能力的差异。然后, 以年龄、性别和受教育年限为协变量, 采用协方差分析的方法分别检测三组受试者在完成不同任务时脑区激活的差异。最后, 针对不同任务, 以激活区检测呈现显著组间差异的脑区为感兴趣脑区, 采用心理生理交互作用 (PsychoPhysiological Interactions, PPI) 分析方法探究三组间与任务相关的功能连接的差异。

结果 1、N-back 任务

(1) 行为水平的认知能力: 三组受试者在正确率上存在具有统计学意义的差异, 事后分析发现 HC 组的正确率显著高于 FES 组及 CHR 组。

(2) 激活区检测: 三组受试者在右侧顶下小叶的激活存在具有统计学意义的差异。事后分析发现, 与 HC 组及 CHR 组相比, FES 组右侧顶下小叶的激活显著增强。

(3) 功能连接: 六个脑区与右侧顶下小叶的功能连接存在具有统计学意义的组间差异, 这六个脑区包括左侧中央后回、后扣带回皮层、左侧楔前叶、右侧楔前叶、右侧额上回和左侧额上回。事后分析虽然发现了一些两两组间的差异, 但均未达到具有统计学意义的显著水平。

2、Stroop 任务

(1) 行为水平的认知能力: 三组受试者在反应时上存在具有统计学意义的差异, 事后分析发现 FES 组的反应时显著高于 HC 组。

(2) 激活区检测: 三组受试者在内侧和旁扣带回皮层、左侧楔前叶和左侧丘脑存在具有统计学意义的差异。事后分析发现, 与 FES 组相比, HC 组在以上三个脑区的激活均显著增强; 与 CHR 组相比, HC 组在内侧和旁扣带回皮层及左侧楔前叶的激活显著增强。

(3) 功能连接: 未发现三组间具有统计学意义的 PPI 差异。

结论 FES 和 CHR 存在不同程度的行为水平认知能力缺陷。在工作记忆和反应抑制进程中, FES 和 CHR 脑功能活动的异常主要体现在局部脑功能活动上, 且 FES 异常的范围更广泛, 而 FES 和 CHR 两组间脑功能活动的差异即包括局部脑功能活动又包括脑区间的功能连接, 上述结果所涉及的脑区主要位于额顶网络和默认网络内。

血浆微小 RNA-193a-3p 表达水平对奥氮平治疗精神分裂症疗效的预测价值

闫盼¹ 江赵蔚² 宋明芬¹

1. 杭州市第七人民医院

2. 浙江中医药大学

目的 探讨血浆微小 RNA-193a-3p (miR-193a-3p) 表达水平预测奥氮平治疗精神分裂症疗效的价值。

方法 纳入本院 2021 年 6 月至 2023 年 12 月收治的 78 例奥氮平单药治疗的精神分裂症患者为研究对象, 连续观察 4 周, 疗效评定采用阳性与阴性症状量表(PANSS), 按 PANSS 减分率 $\geq 50\%$ 和 $< 50\%$, 分为有效组和无效组。血浆 miR-193a-3p 表达水平检测采用实时荧光定量 PCR 法。

结果 奥氮平治疗后血浆 miR-193a-3p 相对表达量较治疗前明显下调 ($t=12.112$, $P<0.05$)。血浆 miR-193a-3p 表达水平下调量与 PANSS 量表阳性症状评分、阴性症状评分、一般精神病理症状评分及总分减分值呈正相关 ($r=0.298, 0.351, 0.384, 0.465$,

均 $P<0.05$)。ROC 曲线分析显示, 血浆 miR-193a-3p 相对表达量下调预测奥氮平治疗精神分裂症疗效的 AUC 为 0.8278 (95% CI: 0.7385-0.9197), 灵敏度为 68.8%, 特异度为 83.3%。生物信息学分析表明, miR-193a-3p 预测靶基因参与多种与神经系统功能密切相关的生物学过程, 富集于轴突引导、神经营养信号通路、ErbB 信号通路、PI3K-Akt 信号通路。

结论 血浆 miR-193a-3p 表达水平一定程度上可以预测奥氮平治疗精神分裂症的临床疗效。

Diminished Functional Segregation and Resilience Are Associated with Symptomatic Severity and Cognitive Impairments in Schizophrenia: A Large-Scale Study

Yan Haohao*

The Second Xiangya Hospital of Central South University

Objective Inconsistencies and contradictions have characterised findings on the topological properties of the functional connectome (TP-FCs) in schizophrenia patients (SZPs). These discrepancies can be attributed to constraints such as small sample sizes and heterogeneous data processing techniques. To remedy these limitations, we conducted a large-scale study. Uniform data processing flows were employed to investigate the aberrant TP-FCs and associations between TP-FCs and symptoms or cognitions (A-TP-SCs) in SZPs

Methods The large-scale study included six datasets from four sites, involving 497 SZPs and 374 healthy controls (HCs). A uniform process for imaging data preprocessing and functional connectivity matrix configuration was used. ComBat was employed for data harmonization, and various TPs were calculated. We explored between-group differences in brain functional integration (FI) and functional segregation (FS) measured with TP-FCs, and conducted partial correlation analyses, with adjustments for age, gender, and educational level, to identify A-TP-SCs

Results Compared with random networks and HCs, SZPs maintained small-worldness and global FI capacity despite their compromised global FS capacity and resilience. A decline in nodal FI and FS capacity was observed in sensory areas, whereas an increase in nodal FI capacity was found in regions associated with cognition and information integration. In addition, associations between TP-FCs and positive symptoms, negative symptoms, or cognitive functions including speed of processing, visual learning, and the ability to inhibit cognitive interference were identified in SZPs

Conclusion Identified A-TP-SCs verify that reductions in FS and resilience indicate pathological impairments in schizophrenia. The A-TP-SCs or TP-FCs, which measure the same attributes of the functional connectome, exhibited high internal consistency, robustly reinforcing these findings.

Association of Serum Interleukin-6 with Negative Symptoms in Stable Early-onset Schizophrenia

Peng Chen Li Hui Hongliang Zhu Xiaobin Zhang*
Suzhou Guangji Hospital

Objective Accumulating evidence suggests that the inflammatory cytokine interleukin-6 (IL-6) contributes to the pathophysiology of psychiatric disorders. The purpose of the current study was to investigate the relationship between serum IL-6 concentration and the clinical features of early-onset schizophrenia (EOS). Therefore, this study investigated the relationship between serum IL-6 concentration and clinical features of EOS

Methods We measured serum IL-6 levels from 74 patients with chronic schizophrenia, including 33 with age at onset < 21 years [early-onset schizophrenia (EOS) group] and 41 with onset \geq 21 years in [adult-onset schizophrenia (AOS) group], and from 41 healthy

controls. Symptom severities were evaluated using the Positive and Negative Syndrome Scale (PANSS). Exploratory factor analysis yielded a two-factor structure of negative symptoms. The first factor, expressive deficits, consisted of PANSS items N1, N3, N6, G5, G7, and G13, while the second factor, avolition/asociality, consisted of PANSS items N2, N4, and G16. Serum IL-6 concentrations were measured using a BDTM FACSCanto Flow Cytometer and BDTM Cytometric Bead Array (CBA) Human Inflammatory Cytokines Kit

Results There was no significant difference in sex ratio and number of smokers among groups ($P > 0.05$). There were significant group differences in age, years of education, and BMI ($P < 0.05$), but neither years of education, duration of disease, nor CPZ equivalent dose differed between EOS and AOS groups ($P > 0.05$). According to the criterion for group stratification, age at schizophrenia onset was significantly older in the AOS group. Mean BMI was higher in the EOS group than the AOS group ($P < 0.05$), and so was included as a fixed effect covariate in subsequent analyses. Serum IL-6 concentrations were higher in both EOS and AOS groups than healthy controls ($F = 22.32$, $P < 0.01$), but did not differ significantly between EOS and AOS groups ($P > 0.05$) after controlling for age, body mass index, and other covariates. Negative symptom scores were higher in the EOS group than the AOS group ($F = 6.199$, $P = 0.015$). Serum IL-6 concentrations in the EOS group were negatively correlated with both total PANSS-negative symptom score ($r = -0.389$, $P = 0.032$) and avolition/asociality subscore ($r = -0.387$, $P = 0.026$). Furthermore, the correlation between total PANSS-negative score and serum log IL-6 concentration remained significant after controlling for age, years of education, BMI, smoking status, age of onset, duration of illness, and CPZ equivalence dose ($R^2 = 0.151$, $P = 0.025$). This association was also significant in stepwise multiple regression analysis ($R^2 = 0.150$, $P = 0.026$). In contrast, no such association was found between clinical factors and serum log IL-6 concentration in the AOS group

Conclusion Patients with early-onset schizophrenia may have more severe negative symptoms than those with adult-onset schizophrenia during the chronic

phase of the illness. IL-6 signaling may regulate negative symptoms and its avolition/asociality subsymptoms among the early-onset chronic schizophrenic patients

关键词: Early-onset schizophrenia; Interleukin 6; Negative symptoms; Avolition; Asociality

基于静息态功能连接体的神经特征预测精神分裂症的抗精神病药物疗效

刘松^{1,3} 刘须振^{1,3} 陈安冉^{1,3} 韩唯一^{1,3} 张露文^{1,3}
李文强^{1,2,3} 吕路线^{1,2,3} 杨勇锋^{1,2,3}

1. 新乡医学院第二附属医院
2. 河南省精神病医院精神科
3. 河南省生物精神病学重点实验室

目的 在精准精神病学领域, 确定可靠的生物标志物以预测精神分裂症 (SZ) 患者对抗精神病药物治疗的个体化反应是一个挑战。因此, 本研究旨在探索基于静息态连接体的功能性神经特征, 作为潜在的生物标志物, 用于预测治疗反应。

方法 本研究在发现样本中收集了 105 例 SZ 患者的基线静息态功能磁共振 (rs-fMRI) 扫描数据, 并进行了为期 8 周的抗精神病药物治疗的临床随访。个体的治疗反应是根据阳性与阴性症状量表 (PANSS) 进行评估的。通过使用静息态功能连接 (FC) 和基于连接体的预测建模 (CPM), 来训练模型以预测精神量表评分的个体减分率。模型的性能评估采用留一交叉验证 (LOOCV) 计算预测减分率与真实减分率之间的 Pearson 相关系数, 并进行了 5000 次的置换检验以确定预测结果的显著性。P 值是根据排列分布中相关系数大于真实值的比例计算得出的。最后, 在一个类似设计的 52 例 SZ 患者的独立验证样本中, 对模型的可推广性进行了检验。

结果 研究结果显示, 基于 CPM 模型的静息态连接组特征能够显著预测 SZ 患者个体化治疗结果, 在发现样本中 (预测与真实的 $r = 0.59$, 均方误差 (MSE) = 0.021) 和验证样本中 (预测与真实的 $r = 0.41$, MSE = 0.036)。共有 12 个连接被选择为最终特征用于预测模型 (其中 4 个为阳性特征, 8 个为阴性特征)。阳性特征主要涉及顶叶、枕叶、基底节和小脑之间的连接, 而阴性特征主要涉及额叶、颞叶、顶叶、岛回、丘脑和小脑之间的连接。

结论 本研究发现了一种基于静息态连接体的功能特征, 这种特征有望成为预测 SZ 患者对抗精神病药物治疗个体化反应的指标。这一发现强调了该生物标志物在精准精神病学领域具有潜在的临床价值。

From Eye To Mind: Clinical Significance of Findings From Non-invasive Retinal Examinations in Patients with Schizophrenia

Jiayi Zhu Zijing Wang Yun Zhou Jiang Du Min Zhao*
Shanghai Mental Health Center

Objective Schizophrenia is a severe chronic psychotic disease that leads to disability and higher risk of mortality. Throughout the course of disease, clinical evaluation remains challenging, because it solely depends on subjective methods such as reports from caretakers or interviews performed by clinicians. The need for reliable objective biomarkers to reflect disease state of schizophrenia is emerging. Lately, retinal changes as potential biomarkers of schizophrenia have gained much attention. The retina has the same embryonic origin as the cerebral, it exhibits similar pathological features as the brain in various diseases. Non-invasive inspection methods of the retina have developed rapidly in the past few decades. Retina optical coherence tomography (OCT) can provide rich structural information at spatial resolution of a few micrometers. Electroretinography (ERG), the electrophysiological examination of retina, could distinguish activity of different retinal neurons and even different neurotransmitters. The advancement in inspection methods enabled researchers to reveal retinal features of schizophrenic patients in aspects of structure, function and metabolism, which might serve as promising biomarkers in disease management. Thus, the aim of this review is to summarize findings of retinal changes from OCT and ERG examinations in schizophrenia and how they related to clinical features

Methods A systematic literature search of PubMed database was performed using the keywords schizophrenia, retina, electroretinogram, electroretinography, optical coherence tomography and/or optical coherence tomography angiography. The methods and major results from studies were summarized, tabulated and further discussed

Results Previous studies showed retinal structural, electrophysiological and perfusion changes in patients with schizophrenia. The most consistent OCT findings were thinner retinal nerve fiber layer (RNFL) and ganglion cell complex (GCC), lower macular volume and vessel density in patients. ERG findings reveal decreased amplitudes and increased latency of flash ERG waves under both scotopic and photopic conditions, as well as decreased photopic negative response (PhNR). In addition, retinal changes correlate with clinical features throughout the course of schizophrenia. In first-degree relatives of patients, GCC was found thinner than healthy controls. Decreased amplitudes and increased latency of flash ERG waves were also found, and correlated with their cognitive function. Patients with shorter disease duration mainly exhibited thinner GCC thickness and lower vascular density, while patients with longer disease duration exhibited profound RNFL thickness decrease. Symptom severity and overall symptom control of patients were correlated with RNFL thickness and GCC thickness. Antipsychotics dosage was correlated with RNFL thickness and macular thickness. Brain volume decrease as well as cognitive decline in patients were correlated with multiple retinal structures including RNFL and GCC. Comorbidity with metabolic disease would also affect RNFL thickness

Conclusion This review presents an overview of retinal changes in schizophrenia patients, and how these changes relate to clinical features of schizophrenia. We focus on how these findings can contribute to clinical practice in aspects of diagnosis, disease management and treatment, as well as highlight how retina abnormalities provide perspective for understanding the neuropathology of schizophrenia.

Immunoinflammatory Features and Cognitive Function in Treatment-Resistant Schizophrenia: Unraveling Distinct Patterns in Clozapine-Resistant Patients

Yanzhe Li Yeqing Dong Nannan Liu Shen Li*
Tianjin Anding Hospital

Objective Patients with treatment-resistant schizophrenia (TRS), particularly those resistant to clozapine (CTRS), pose a clinical challenge due to limited response to standard antipsychotic treatments. Inflammatory factors like tumor necrosis factor-alpha (TNF- α), interleukin 2 (IL-2), and interleukin 6 (IL-6) are implicated in schizophrenia's pathophysiology. Our study examines cognitive function, psychopathological symptoms and inflammatory factors in TRS patients, focusing on differences between CTRS and non-CTRS individuals, as well as healthy controls

Methods A cohort of 115 TRS patients and 84 healthy controls were recruited, assessing IL-2, IL-6 and TNF- α . The Positive and Negative Syndrome Scale (PANSS) was applied to assess psychopathological symptoms, while the Repeatable Battery for the Assessment of Neuropsychological Status (RBANS) was applied to assess cognitive functioning

Results CTRS patients showed lower visuospatial constructional score ($p = 0.015$), higher PANSS scores, higher levels of IL-2 and reduced TNF- α than non-CTRS patients ($p < 0.05$). Notably, IL-2 was independently associated with psychopathology symptoms in CTRS patients (Beta = 0.268, $t = 2.075$, $p = 0.042$), while IL-6 was associated with psychopathology symptoms in non-CTRS patients (Beta = -0.327, $t = -2.109$, $p = 0.042$). Sex-specific analysis in CTRS patients revealed IL-2 associations with PANSS total and positive symptoms in females, and TNF- α associations with PANSS positive symptoms in males. Furthermore, IL-2, IL-6, and TNF- α displayed potential diagnostic value in

TRS patients and CTRS patients ($p < 0.05$)

Conclusion Clozapine-resistant symptoms represent an independent endophenotype in schizophrenia with distinctive immunoinflammatory characteristics, potentially influenced by sex.

Exploring The Intricate Interplay between Metabolic Abnormalities and Multidimensional Cognitive Impairment in Stable Schizophrenia Patients

Xiao Wang Sha Liu* Jing Dang Wentao Zhao
First Hospital of Shanxi Medical University

Objective Patients with schizophrenia often experience deficits in various cognitive domains. Metabolic syndrome (MetS), a collection of cardiovascular risk factors, is linked to cognitive decline and may play a significant role in the cognitive impairments. However, it remains unclear whether MetS affects cognitive function in these patients through individual factors or a combination of factors. This study aims to investigate the intricate relationship between each component of MetS and the extent of cognitive impairment in patients with schizophrenia, providing valuable data to support the prevention of cognitive decline and the rehabilitation of social functioning in these patients

Methods The research was a cross-sectional study conducted from March to August 2022, involving stable-phase schizophrenia patients from 10 hospitals in Shanxi Province. Cognitive function was assessed using the Chinese Abbreviated Neuropsychological Battery (C-BCT), which includes the Trail-Making Tests (TMT), Symbol Encoding (SE), Continuous Performance Test (CPT), and Digit Span Test (DST). Additionally, we collected sociodemographic and general clinical information using the Short Form 12-Item Health Survey and a self-designed questionnaire. To explore the complex relationship between various components of metabolic syndrome and multidimensional cognitive dysfunction,

we employed network analysis and structural equation models (SEM). Machine learning techniques were used to predict cognitive dimensions based on symptom assessments and metabolic indicators, further verifying the effects of MetS components

Results A total of 727 stable-phase schizophrenia patients participated in this study. For abnormal blood lipid (ABL) levels, we found statistically significant differences in TMT ($t=-2.85$, $P=0.0045$) and DST ($t=-3.86$, $P=0.0002$). For abnormal blood pressure (ABP) levels, there were statistically significant differences in TMT ($t=4.1$, $P<0.0001$), SE ($t=2.82$, $P=0.0049$), CPT ($t=3.04$, $P=0.0024$), and DST ($t=4.37$, $P<0.0001$). Through network analysis, we found that Symbol Encoding (SE) showed the highest strength in cognitive function across both groups. In patients without any MetS domains, the Continuous Performance Test (CPT) had a high level of closeness, with the Trail-Making Test (TMT) having the highest betweenness. Structural equation modeling (SEM) indicated that metabolic indicators, including dyslipidemia and ABP, mediated the relationship between clinical symptoms and cognitive function. The Transformer model performed well in predicting cognitive dimensions, suggesting that MetS domains have a certain predictive ability for multidimensional cognitive function

Conclusion This study revealed significant correlations between metabolic syndrome components, particularly ABP and dyslipidemia, and cognitive impairments in schizophrenia. Treating hypertension in schizophrenia patients might lead to cognitive enhancement and social functional improvements

血清代谢组与精神分裂症发病风险及认知功能的关联研究

张丽媛 袁秀霞 宋学勤*
郑州大学第一附属医院

目的 观察首发未用药精神分裂症(SCZ)患者组和健康对照组之间血清代谢物的差异,探索代谢组学特征与SCZ发病及认知功能的关系。

方法 招募 210 名 首发精神分裂症患者(SCZ)和 159 名健康对照(HC)。进行 PANSS 评分,使用神经心理成套测试 MCCB 评估认知功能。空腹采集静脉血(10ml),用于进一步的血清代谢组 LC-MS 检测。使用 R 软件计算参数;构建分层抽样方法以降低样本偏差;配对 T 检验用于测试差异代谢物的变化。将认知功能于基线时在 SCZ 和 HCs 之间的差异和利培酮治疗后显著改变的生物标志物纳入统计分析,建立逐步线性回归模型。

结果 1.人口统计学和临床特征。SCZ 组基线时共 210 例患者,入院治疗半年后重新评估并采集血液样本,其中 98 例 SCZ 患者完成 24 周随访。SCZ 组和 HC 组在年龄、性别、教育程度、吸烟状况或身体质量指数(BMI)方面没有显著差异($p < 0.05$)。而与 HC 相比,SCZ 患者在几个认知领域有显著损伤($p < 0.05$)。

2.基线时,SCZ 血清代谢组学谱的改变。SCZ 患者组和健康对照组之间的代谢组谱具有显著差异。本研究鉴定出 398 种代谢物,其中 86 种代谢物在两组间存在显著差异。采用分层抽样法,并进行校正,25 个代谢物被确认为差异代谢物。这些代谢产物主要与氨基酸代谢(52%)和脂肪酸代谢(16%)有关。喹啉酸(QA), n-乙酰-血清素, n-乙酰-1-谷氨酸,这些物质参与氨基酸代谢途径,且受肠道菌群调节。硬脂酸、前列腺素 H₂、2-酮丁酸、2-oxo-4-甲基硫丁酸、9-OxoODE、12,13-dhome 属于脂肪酸代谢途径,也易受肠道菌群成分的影响。这些代谢产物与微生物代谢直接或间接相关。

3.治疗前后代谢物的改变。在基线时确认的 25 种 SCZ 相关代谢物中,有 5 种代谢物(硬脂酸、前列腺素 H₂、n-乙酰-血清素、n-乙酰-谷氨酸、1-甲基组氨酸)在利培酮治疗 24 周后水平发生逆转。用药前基线时,血清硬脂酸、n-乙酰-血清素水平与加工速度认知域(SOP)呈正相关($R^2=0.262$, $p=1.71 \times 10^{-4}$, 1.84×10^{-4});利培酮治疗半年后,硬脂酸、n-乙酰血清素的变化与 SOP 呈正相关($R^2=0.123$, $p=0.004$ 、 0.006);n-乙酰血清素的变化也与 AV、HVL、RPS 的认知域呈显著正相关($p=0.005$ 、 0.017 、 0.004)。结果提示硬脂酸和 n-乙酰血清素可能是 SCZ 患者认知功能的生物学标志物。

结论 我们的研究表明,血清代谢组谱的改变

可能与 SCZ 的发病机制和认知功能水平有关。

Gut Microbiota's Impact on White Matter Abnormalities and Cognitive Impairment in First-Episode, Drug-Naïve Schizophrenia

Gangrui Hei Rufeijia Xueqin Song*

The First Affiliated Hospital of Zhengzhou University

Objective This study aimed to investigate the interplay among gut microbiota dysbiosis, white matter microstructural changes, and cognitive impairment in first-episode, drug-naïve schizophrenia (SCZ) patients

Methods The study cohort included 54 patients with SCZ and 70 healthy controls (HCs). Cognitive function was assessed with the MATRICS Consensus Cognitive Battery (MCCB). Fractional anisotropy (FA), axial diffusivity (AD), radial diffusivity (RD), and mean diffusivity (MD) metrics were derived from diffusion tensor imaging (DTI) data. Gut microbiota composition was characterized through high-throughput 16S ribosomal RNA (16S rRNA) gene sequencing. Statistical analyses included false discovery rate (FDR) correction for DTI parameter differential analysis and mediation analysis using the PROCESS v3.4 macro in SPSS

Results Patients with SCZ showed significantly lower cognitive scores across seven domains than HCs (all $p < 0.05$). Microstructural abnormalities in six white matter fibre tracts were identified in the patient group (all $p < 0.05$). Gut microbiota α -diversity was reduced in patients, as indicated by lower Shannon and Simpson indices (all $p < 0.05$), and β -diversity analysis revealed significant difference in gut microbiota composition between the groups ($p < 0.001$). We found that the abnormal white matter fibre bundles associated with cognitive function including the posterior projections of the CC, right ILF, left SLF, left UF, right CB, and right IFOF in SCZ patients. Mediation analysis revealed that the relative abundance of the genus Coprococcus in patients with SCZ had an indirect impact on SOP scores through

the AD values in the left SLF (indirect effect: $\text{coeff}=-0.103$, $\text{SE}=0.052$, 95% $\text{CI}=-0.206$ to -0.006), and also had an indirect effect on MSCEIT scores through the AD values in the left SLF (indirect effect: $\text{coeff}=-0.131$, $\text{SE}=0.053$, 95% $\text{CI}=-0.246$ to -0.036).

Conclusion The study provides evidence that gut microbiota imbalance and alterations in cerebral white matter microstructure are present in drug-naïve first-episode schizophrenia and may contribute to cognitive impairment. The genera *Coprococcus* appear to be implicated in this process, potentially offering novel therapeutic targets for early intervention in schizophrenia.

早发型精神分裂症外周血神经递质的靶向代谢组学研究

刘美琪 杜鑫哲 高耀 李玉雪 刘莎*
山西医科大学

目的 早发型精神分裂症(EOS)是指发病年龄<18 周岁的一类精神分裂症,与成人精神分裂症患者相比,EOS 患者受环境因素影响较少,因此以 EOS 患者为研究对象有助于精神分裂症发病机制的确切研究。多巴胺系统紊乱长期在精神分裂症的病因学中占据主导地位,然而,近年来的新证据表明,其他多种神经递质也与精神分裂症的病理生理学相关,本研究旨在分析 EOS 患者外周血中差异表达的神经递质及其与临床症状之间的相关性,进一步从神经递质方向寻找诊断标志物。

方法 本研究共纳入 186 名研究对象,其中 EOS116 名,正常对照 80 名,收集所有参与研究者的一般人口学资料及外周血标本。(1)采用液相色谱串联质谱法检测外周血中神经递质的含量,采用单变量统计分析和多变量统计分析相结合的方法筛选差异代谢神经递质。(2)使用 MetaboAnalyst 进行通路分析,采用阳性和阴性症状量表(PANSS)评定患者的精神症状,使用斯皮尔曼相关性分析关键神经递质与早发型精神分裂症患者精神症状的相关性。

(3)采用随机森林和逻辑回归进行标志物筛选和诊

断模型构建。

结果 (1)与 HC 相比,患者血浆中共有 15 种神经递质(鸟氨酸、甲基甘氨酸、谷氨酰胺、L-赖氨酸、吡啶甲酸、酪氨酸、酪胺、L-亮氨酸、胆碱、苯丙氨酸、色氨酸、组氨酸、L-甲硫氨酸、苏氨酸、黄尿酸)表达异常,且均表达上调。(2)将上述差异物质导入 MetaboAnalyst 进行通路分析,发现与健康对照组相比,EOS 患者表现出苯丙氨酸代谢通路异常,差异代谢物中酪氨酸、苯丙氨酸参与其中。研究显示酪氨酸与 PANSS 总分呈明显正相关($r=0.249$, $p=0.008$),与阳性症状呈明显正相关($r=0.317$, $p=0.001$),苯丙氨酸与阳性症状呈明显正相关($r=0.238$, $p=0.011$)。(3)随机森林分析筛选神经递质后,逻辑回归分析进行了最终的模型构建,我们最终确认了一个诊断模型来预测 EOS 的存在,其中包含鸟氨酸、5-羟色氨酸、肌氨酸、亮氨酸、赖氨酸、谷氨酰胺、5-羟基吡啶-3-乙酸。我们将所有样本按 7:3 的比例随机分为训练集和验证集,并通过 ROC 曲线的 AUC 值检验模型效果,其中训练集的 AUC 值为 0.901,验证集的 AUC 值为 0.826。

结论 本研究筛选出了 15 种在 EOS 患者外周血浆中差异表达的神经递质,且均表达上调,关键作用的神经递质酪氨酸与阳性症状和 PANSS 总分呈明显正相关、苯丙氨酸和阳性症状呈明显正相关,此外我们通过随机森林和逻辑回归构建了包含 7 种神经递质在内的诊断模型,并通过验证具有较高的诊断效能,这为探索 EOS 的发病机制和诊断提供了新思路。

Sex-specific Differences in The Relationship between Thyroid Hormones and Neurocognition: A Large Cross-sectional Study in Chronic Schizophrenia

Junhao Chen^{1,2}, Hongmin Ge², Shen Li^{1,2}

1.Mental health center of Tianjin Medical University

2.Tianjin Anding Hospital

Objective Aiming to observe the relationships between endocrine-related blood markers, particularly thyroid hormones such as Triiodothyronine, T4, TSH,

and various dimensions of clinical symptoms as well as cognitive functions among individuals diagnosed with chronic schizophrenia, including differences between genders

Methods 602 male patients and 405 female patients with schizophrenia and 193 males and 133 females healthy controls were included in this study. Demographic and clinical characteristics were collected. Cognitive function and psychotic symptoms were assessed using the Repeatable Battery for the Assessment of Neuropsychological Status (RBANS) and the Positive and Negative Syndrome Scale (PANSS), respectively. Blood samples were collected to measure the levels of serum total thyroxine (TT4), total triiodothyronine (TT3), thyroid-stimulating hormone (TSH), free thyroxine (FT4), and free triiodothyronine (FT3). We conducted analysis of variance (ANOVA) in SPSS to compare general clinical characteristics and performed two-way ANOVA to examine gender differences in the cognitive domain. Additionally, we conducted hierarchical linear regression on RBANS, PANSS, and blood indicators. Furthermore, in R, we performed Pearson correlation analysis to examine the correlations, and created scatter plots with thyroid hormones as the independent variable

Results Compared to the healthy control group, patients with schizophrenia exhibited lower levels of thyroid hormones (both $p < 0.01$). Furthermore, among patients with schizophrenia, male patients had higher levels of TT3 and FT3 compared to female patients (both $p < 0.01$). In male patients, only TT3 levels showed a positive correlation with language and attention (both $p < 0.01$). In contrast, among female patients, TT3 levels were positively correlated only with attention ($p < 0.001$), while TT4 levels were negatively correlated with immediate memory ($p < 0.05$), and TSH levels were negatively correlated with attention ($p < 0.01$). The linear regression also found that the correlations of T3 and T4 with clinical symptoms were opposite. Furthermore, T4 shows opposite correlations between males and females in the cognitive domain.[s1]

Conclusion Gender differences exist in thyroid hormone T3 levels. Furthermore, the association between thyroid hormones and cognitive performance as

well as clinical symptoms varies according by gender in chronic schizophrenia.

基于NLP的精神分裂症语言表达差异及与临床症状关联性分析

黄杰 谭淑平*
北京回龙观医院

目的 本研究旨在通过深入剖析精神分裂症患者与健康对照组在观赏积极性视频后的主观叙述,探究两者在自然语言表述上的独特差异,并揭示这些差异与临床症状间的内在联系,为理解精神分裂症的沟通障碍提供新的洞见。

方法 本研究招募了135名精神分裂症患者和65名健康对照组参与者,让他们观看富含积极情绪的短片《爆笑虫子》。随后,要求参与者开放性地回答关于“视频中印象深刻的人物或场景是什么,它让你想到了什么?”的问题,对回答进行录音并转录为文本。采用先进的自然语言处理技术,从转录文本中提取包括总字数、句子数、句平均字数、句平均标准差、词数、不同词性频率、句法依赖距离、语义依赖距离、语义连贯性、主题契合度以及情绪分数等特征。利用年龄、教育背景和性别作为协变量,借助协方差分析方法,系统比较两组在上述文本特征上的显著性差异,并运用皮尔逊相关系数,探索PANSS量表的总分及其各因子与语言特征间的相关性,以期揭示症状严重度与自然语言表达之间的动态联系。

结果 研究结果显示,与健康对照组相比,精神分裂症患者在总字数、平均句长、句长标准差、总词数、副词和语气词使用频率、句法结构复杂度以及主题贴合度上展现出明显差异。尤为值得注意的是,与PANSSG11(注意障碍)呈显著相关性的语言特征——如总字数、句子数量、词汇总量、副词频数及语气词频数,揭示了注意功能受损与患者语言表达的简洁化倾向之间的直接联系,即症状越重,患者越倾向于使用简约的词汇和句式。另一方面,一阶至二阶连贯性、主题契合度及情绪表达得分与PANSSG6(抑郁症状)的显著相关性,凸显了抑郁情绪下患者在维护对话逻辑、有效传递情感和围绕

主题展开论述方面所遭遇的重重挑战, 这些挑战与抑郁体验相互作用, 共同制约了患者的社交互动效能与生活质量。

结论 综合上述发现, 精神分裂症患者在语言表达上的独有特性, 不仅直接映射出认知领域如注意障碍的问题, 还间接揭示了情感状态, 特别是抑郁症状, 对患者社交互动及生活品质的广泛影响。这些深刻见解强调了在精神分裂症的治疗与康复进程中, 针对性地改善语言表达能力、减轻抑郁症状及增强注意功能干预的紧迫性和重要性, 旨在通过这些多维度的努力, 全面提升患者的生存质量与社会功能。

Aberrant Metabolism of The Gut Microbiota Mediates Inflammation and Tryptophan-Associated Cognitive Impairment in Drug-naïve, First Episode Schizophrenia Patients

Xiuxia Yuan Xueqin Song*

the First Affiliated Hospital of Zhengzhou University

Cognitive impairments in patients with schizophrenia (SCZ) are associated with poor functional outcomes. The microbiome-gut-brain axis is related to brain health and cognition. Here, we present a half-year follow-up study involving metabolomics and metagenomics analysis of 210 first-episode, drug-naïve SCZ patients and 159 healthy controls (HCs). We collected biological samples at baseline (from all participants) and 6 months after risperidone treatment (from SCZ patients). Cognitive function was assessed using the MATRICS Consensus Cognitive Battery (MCCB). The differential metabolites and microbial markers were found to be associated with metabolic pathways involving amino and fatty acids. The follow-up analysis revealed that the metabolites N-acetyl-serotonin (NAS) and stearidonic acid (SDA) and microbial species from the genera *Blautia* spp. and *Ruminococcus* spp. were associated with cognitive function in SCZ patients. These

microbial species expressed genes that regulate tryptophan metabolism. Fecal microbiota transplantation resulted in higher colonic levels of microbial toxins (lipopolysaccharides and purlisin), proinflammatory cytokines and tryptophan-related genes and altered tryptophan-related metabolites in mice receiving microbiota from SCZ patients, suggesting that the intestinal microbiota and metabolome interact and converge on inflammation and tryptophan metabolism. Future research on genome-microbiome-metabolite interactions is warranted to advance our understanding of the role of NAS and SDA in the cognitive impairment in patients with SCZ.

社会认知在精神分裂症临床症状与功能结局中的调节作用

陈海滔 谭淑平*

北京回龙观医院

目的 精神分裂症是一种常见的精神障碍, 会导致严重的功能残疾和预期寿命减低。以往研究表明, 精神分裂症患者的临床症状是功能结局的主要影响因素。同时, 认知功能在患者的功能结局中也扮演着重要角色。然而, 社会认知和神经认知的缺陷如何影响患者临床症状与功能结局的关系尚不明确。本研究探讨了神经认知和社会认知对患者临床症状的调节效应。

方法 入组临床住院精神分裂症患者 203 人, 使用个人和社会功能量表 (PSP) 评估功能结局, 使用阴性和阳性症状量表 (PANSS) 评估临床症状, 使用计算机化面孔情绪识别测试 (FERT) 评估患者的社会认知, 使用精神分裂症认知功能成套测验 (MCCB) 评估患者的神经认知。在神经认知和面孔情绪识别的各个维度上, 以均值为界分别将患者分为高水平组和低水平组, 并通过带交互项的多因素回归分析探究患者的神经认知和面孔情绪识别对临床症状的调节效应。

结果 在控制年龄、性别、教育年限、首次发病年龄和发作次数后, 患者的 PSP 总分显著和 PANSS

总分负相关(标准化回归系数 $\beta=-0.55$, $P<0.00$)。交互效应分析显示,相较于面孔情绪识别总分较低的患者,高水平患者的临床症状和 PSP 总分的负性关系显著降低(低水平 $\beta=-0.66$, $P<0.001$;交互项 $\beta=0.29$, $P=0.021$)。进一步对临床症状的子维度进行分析,发现患者的面孔情绪识别能力主要调节了阳性症状和功能结局的关系(低水平 $\beta=-0.47$, $P<0.001$;交互项 $\beta=0.32$, $P=0.022$)。而进一步对情绪类别进行分析,发现更高水平的快乐(低水平 $\beta=-0.51$, $P<0.001$;交互项 $\beta=0.31$, $P=0.018$)、平静(低水平 $\beta=-0.50$, $P<0.001$;交互项 $\beta=0.41$, $P=0.003$)和焦虑(低水平 $\beta=-0.48$, $P<0.001$;交互项 $\beta=0.27$, $P=0.044$)面孔识别能力能降低患者阳性症状对功能结局的负性影响。此外,本研究并未发现六种神经认知(注意警觉、言语学习和记忆、视觉学习和记忆、工作记忆、处理速度和推理决策)对患者临床症状的调节效应(交互项均 $P>0.05$)。

结论 精神分裂症患者的社会认知而非神经认知能够调节患者临床症状和功能结局的关系。其中,更高的快乐、平静和焦虑面孔识别能力能够显著降低患者阳性症状对功能结局的负性影响。该结果启示,在临床干预方案中纳入社会认知训练可能有助于在改善患者症状的同时,促进患者的功能康复、改善患者的功能结局。

Purpureocillium Impairs Cognitive Function Via Metabolism of Amino Acids in Drug-naïve, First-episode Schizophrenia

Xiuxia Yuan Xueqin Song*

the First Affiliated Hospital of Zhengzhou University

Cognitive dysfunction of schizophrenia (SCZ) can lead to impaired social function and poor prognosis. Our previous study found alteration of metabolites and key fungal marker, Purpureocillium were associated with SCZ. Here, we present a case-control study including 136 first-episode, drug-naïve SCZ patients and 92 healthy controls (HCs). Untargeted liquid chromatography/mass spectrometry (LC/MS) was used to measure

serum metabolite levels. Internal transcribed spacer (ITS) was used to test abundance of Purpureocillium. Present study showed significant declines in attention and alertness (AV), speed of processing (SOP) in SCZ with TOP2 effect size. The abundance of Purpureocillium was negatively correlated with multiple domains of cognitive function. SCZ related metabolic markers 2-Oxoarginine, N-Acetyl-serotonin, Ergothioneine, Iso-butyric acid and Biotin showed significant association with both the abundance of Purpureocillium and cognitive scores (SOP and AV). Mediation analyses showed that abundance of Purpureocillium in patients with SCZ had significant direct and indirect effects on cognitive scores (SOP and AV) via metabolic markers (2-Oxoarginine, N-Acetyl-serotonin, Ergothioneine). Purpureocillium and those metabolic markers were all correlated with inflammation and oxidative stress, which have been associated with pathogenesis of SCZ. In conclusion, the role of Purpureocillium in cognitive impairments may be linked by regulating these metabolites of amino acids, inflammation and oxidative stress is involved in this process.

利用无监督学习和网络分析的方法对精神病性症状进行探究

栗晶晶 庞礼娟 刘芳 张钰 宋学勤*

郑州大学第一附属医院

目的 精神分裂症临床表现复杂,易与伴有精神病性症状的其他疾病混淆。在众多症状群中准确识别精神分裂症,可以减少疾病漏诊率。本研究利用网络分析方法探究了精神分裂症症状群之间的关系,并利用变分自编码器(variational auto encoder, VAE)和聚类分析对未明确诊断的精神病性症状量表进行分析,为后续的精神分裂症的识别和治疗打下基础。

方法 本研究分为两部分。第一部分纳入符合 DSM-5 的精神分裂症患者 392 例,使用 PANSS 评估患者精神病性症状,网络分析中以 PANSS 的 5 个

维度(阳性症状, 阴性症状, 思维紊乱, 无法控制的敌对/兴奋, 焦虑/抑郁)作为节点, 分析不同组症状群之间的关系; 第二部分纳入 BPRS \geq 35 分的诊断不明确的门诊病人 18025 例, BPRS 作为评估精神病性症状的指标, 通过 Isolation Forest 排除异常值后, 共纳入 17844 例门诊病人, 利用 VAE 无监督学习及 K-means 聚类分析后, 利用网络分析探索不同亚群特征。

结果 在 392 例精神分裂症患者的网络分析结果中, 思维紊乱的中心性最高, 且其与阴性症状和焦虑/抑郁关系密切。说明思维紊乱在精神分裂症精神病性症状中处于重要地位, 其对其他症状的影响性较高。对 17844 例的门诊病人进行无监督学习及聚类分析后, 共得出 5 个亚群, 聚类评价指标 (Silhouette Coefficient = 0.52, Davies-Bouldin Index = 0.35) 均较好。分别对 5 个亚群的 BPRS 五维度 (焦虑忧郁, 缺乏活力, 思维障碍, 激活性, 敌对性) 进行网络分析, 其中有一亚群 (1126 例) 具有和精神分裂症类似的精神病性结构, 思维障碍表现为最高的中心性。

结论 本研究发现了思维紊乱处于精神分裂症症状的中心地位, 且其与阴性症状关系密切; 此外, 利用 VAE 无监督学习及聚类分析, 可以在众多疾病中识别出一种与精神分裂症症状结构类似的亚群, 随着更多相关研究的深入, 该结论可以得到更进一步的证实, 为更深刻地理解、识别精神分裂症提供基础。

D-serine Reconstitutes Synaptic and Intrinsic Inhibitory Control of Pyramidal Neurons in A Neurodevelopmental Mouse Model for Schizophrenia

Zhang Xiao-Qin*

Ningbo University

Objective The hypothesis of N-methyl-D-aspartate receptor (NMDAR) dysfunction for cognitive impairment in schizophrenia constitutes the theoretical ba-

sis for the translational application of NMDAR co-agonist D-serine or its analogues. However, the cellular mechanism underlying the therapeutic effect of D-serine remains unclear. Clarifying these questions help us understand the pathophysiological basis of cognitive dysfunction in schizophrenia and the essential mechanisms underlying the therapeutic effect of D-serine, thereby facilitating the discovery of new pharmacotherapeutic targets

Methods The pregnant mice were injected with methylazoxymethanol acetate (MAM) on gestational day 16 for the neurodevelopmental MAM model of schizophrenia in our study. The cognitive function of mice was measured by a series of behavioral tests such as pre-pulse inhibition, Y maze, novel object and novel location recognition. We investigated the neuropathophysiological alterations in the cingulate neurons of the MAM group by whole-cell recordings

Results This study is the first to reveal that, relative to pyramidal neurons, NMDA receptor deficits preferentially occur in parvalbumin-positive (PV) neurons in a non-genetic mouse model for schizophrenia mimicking prenatal pathogenesis. Intriguingly, we discovered that D-serine could facilitate inhibitory control in the anterior cingulate cortex (ACC) of MAM group via a dual mechanism. D-serine restores excitation/inhibition balance by reconstituting both synaptic and intrinsic inhibitory control of cingulate pyramidal neurons through facilitating PV excitability and activating small-conductance Ca²⁺-activated K⁺ (SK) channels in pyramidal neurons, respectively. Either amplifying inhibitory drive via directly strengthening PV neuron activity or inhibiting pyramidal excitability via activating SK channels is sufficient to improve cognitive function in this model

Conclusion These findings reveal the cellular mechanism through which D-serine improves cognitive function and suggest a novel pharmacological target for the treatment of schizophrenia model.

精神分裂症患者电休克治疗后脑网络拓扑结构变化特点

丁宁宁 张海三*

新乡医学院第二附属医院

目的 已有大量研究表明,精神分裂症(SZ)患者的大脑网络拓扑结构存在破坏,电休克治疗(ECT)能够快速缓解急性精神症状。然而,目前对电休克治疗作用于SZ患者脑网络拓扑结构的机制尚不清楚,相关研究也相对较少。本研究基于静息态功能磁共振成像(rs-fMRI),应用图论方法探索SZ患者在接受电休克治疗前后脑功能网络的拓扑结构变化,旨在为相关机制提供神经影像学依据。

方法 我们收集了53名接受ECT治疗前后的SZ患者的rs-fMRI数据,同时获得了46名性别、年龄和教育程度匹配的健康对照组(HC)的数据。使用脑神经组图谱(Brainnetome Atlas)构建了每位受试者的大脑功能网络,并采用图论分析方法测量了全局和节点的拓扑属性。同时,利用阳性和阴性综合量表(PANSS)评估了临床症状。采用独立样本t检验比较患者组和健康对照组的网络拓扑属性,使用配对t检验比较患者组在治疗前后的拓扑属性变化,最后采用偏相关分析探讨SZ患者ECT治疗前后全局和节点属性变化与临床症状之间的关系。

结果 ECT治疗前,与健康对照组相比,患者组表现出局部效率(Eloc)和聚类系数(CP)降低($P<0.05$, FDR校正),右侧颞上回的节点全局效率(Ne)和度中心性(DC)降低,左侧扣带回的Ne和DC升高(P 均 <0.001 , Bonferroni校正);治疗后,患者组的Eloc和CP恢复正常,双侧额上回的节点局部效率(Nle)和节点聚类系数(Ncp)增加,但左侧顶下小叶的Ne和DC降低,最短路径长度(NLp)升高,双外侧枕叶皮质的Nle和Ncp在治疗前后均较低(P 均 <0.001 , Bonferroni校正)。治疗前后PANSS总评分的改变与聚类系数的改变呈正相关关系($r=0.33$, $P=0.019$)。

结论 我们的研究显示,ECT可能通过重组SZ患者受损的脑网络拓扑结构来改善精神症状,额上回、扣带回和颞上回的信息整合功能的恢复可能在缓解精神症状中发挥重要作用。此外,顶下小叶的功能异常可能与电休克治疗的副作用有关。

Auditory and Visual Oddball Stimulus Processing Deficits in Individuals in Clinical High Risk for Psychosis

Yawen Hong Jijun Wang* Xiaochen Tang Xiong Jiao
Dan Zhang Wensi Zheng Lihua Xu Huiru Cui Zhenying
Qian Tianhong Zhang Yingying Tang
Shanghai Mental Health Center

Objective Individuals at clinical high risk (CHR) for psychosis exhibit a reduced P300 oddball response, especially in auditory modality. While P300 reflects relatively late and complex cognitive functions such as context updating in working memory, N200 indexes stimulus probability and classification. Several studies have also reported N200 abnormalities in CHR individuals, but these findings are inconsistent. Furthermore, previous research has focused on the auditory oddball paradigm, reports on visual oddball abnormalities in CHR individuals are very limited. The present study compared the event-related potential responses in auditory and visual oddball paradigms between CHR individuals and healthy controls (HC) participants to contribute to the research on these components as potential biomarkers for CHR and associated with their clinical outcomes

Methods Baseline P300 and N200 were obtained from CHR participants ($n = 96$) and HC participants ($n = 60$). All CHR participants were followed up for five years and stratified into CHR converters and non-converters. The differences in P300 and N200 amplitude in auditory and visual oddball tasks were compared between the clinical outcome subgroups and HC participants

Results CHR participants exhibited smaller visual P300 amplitudes compared to HC participants. Furthermore, CHR converters showed significantly reduced P300 and N200 amplitudes in both oddball paradigms relative to CHR non-converters and HC participants. In addition, visual P300 amplitude was significantly reduced in CHR non-converters relative to HC

participants

Conclusion These results suggest that P300 and N200 amplitude deficits across auditory and visual modalities precede the onset of full psychosis. Moreover, visual P300 amplitudes may serve as a more sensitive prognostic biomarker for clinical outcomes in CHR individuals.

Objective Restricted scan path mode is hypothesized to explain abnormal scanning patterns in patients with schizophrenia. Here, we calculated entropy scores (drawing upon gaze data to measure the statistical randomness of eye movements) to quantify how strategical and random participants were to process image stimuli

Methods Eighty-six patients with first-episode schizophrenia (FES), 124 individuals at clinical high risk (CHR) for psychosis, and 115 healthy controls (HCs) completed an eye-tracking examination for freely viewing 35 static images (each presented 10s) and cognitive assessments. We compared the group differences in overall entropy score, as well as entropy scores under various conditions (different levels of meaning and time periods). Furthermore, we also investigated the correlation between entropy scores and symptoms along with cognitive function

Results Increased overall entropy scores were noted in FES and CHR groups relative to HCs, and these

differences were already apparent within 0~2.5s. In addition, the CHR group exhibited higher entropy when viewing low-meaning images compared to HCs. Moreover, the entropy within 0~2.5s showed significant correlations with negative symptoms in the FES group, Attention/Vigilance scores in the CHR group, as well as Speed of processing and Attention/Vigilance scores across all three groups

Conclusion FES and CHR individuals scanned pictures more randomly and less strategically than controls, with this distinction already apparent in the early stage of viewing. The scanning patterns might also be influenced by the meaning of the picture. Additionally, we also identified the associations between abnormal scanning patterns and negative symptoms as well as neurocognitive scores. The findings illuminate the potential of employing EME measures to characterize aberrant scanning patterns during the early stage of psychosis. This could significantly advance the identification of precise neurophysiological and neurocognitive targets for efficacious therapeutic interventions. Subsequent research is imperative to validate the robustness of these findings and to delineate how entropy metrics might contribute to the development of tailored and preventive interventions.

全蛋白质组和转录组关联分析探究不同组织中精神分裂症风险基因

史晶晶 宋学勤*

郑州大学第一附属医院

目的 精神分裂症 (SCZ) 是遗传和环境因素相互作用的结果。肠道与中枢神经系统 (CNS) 之间存在双向通信。全基因组关联研究 (GWAS) 已经确定了 SCZ 的多个风险变异位点。然而, 推定精神分裂症不同组织的致病基因和潜在机制仍然具有挑战性, 本研究探索了 CNS、消化系统和血液组织的基因表达情况与 SCZ 之间的关联。

方法 全蛋白质组关联研究 (PWAS) 使用 FUSION 软件整合 SCZ GWAS 数据和人脑及血浆的蛋白质组数据, 确定通过调节蛋白丰度发挥致病作用的基因。全转录组关联研究 (TWAS) 通过整合 SCZ GWAS 数据和来自 CNS、消化系统 (小肠, 乙状结肠, 横结肠等)、全血组织的共 21 个多组织的基因表达预测模型, 来确定可以调节性状表达的基因。因果基因集的精细定位 (FOCUS) 分析通过估计 TWAS 发现基因的后验包含概率, 进一步识别不同组织中与 SCZ 有因果关系的基因。

结果 PWAS 确定了 87 个基因在人脑和血液中基因调节的蛋白质丰度水平与 SCZ 有关。通过 TWAS 发现 728 个基因的表达与 SCZ 显著相关在 21 个组织中。脑中的 15 个基因 (ACE, CYP7B1, HLA-DRB1, TKT, ACTR1B, C4A, CNM2, CUL9, DARS2, HLA-DRB5, NAGA, NEK4, OGFOD2, SNX19, XPNPEP3) 和血液中的 6 个基因 (C2, CREB3L4, ITIH3, ITIH4, MAPK3, SERPING1) 在蛋白质组和转录组水平上都显示出与 SCZ 的显著关联。使用 FOCUS, 发现 728 个 TWAS 关联基因中有 311 个基因是 SCZ 的因果基因。研究发现其中 89 个基因同时在脑组织和消化系统的组织中的表达都表现出和 SCZ 的因果相关性。其中基因 *BTN2A2*, *FLOT1*, *GNL3*, *MRM2*, *PCCB*, *PRR12*, *PRSS16*, *SF3B1*, *VSIG2* 都证明是 SCZ 的因果基因在至少 14 个不同的脑和消化组织中, 基因 *LINC02033*, *GEF*, *ZFP57* 中观察到因果关联方向有组织特异性, 表明风险基因在不同组织中对 SCZ 发病机制的作用存在差异。通过 GO-KEGG 富集分析, 发现消化系统中的相关基因主要调控多肽抗原与 MHC 蛋白复合物的组装等免疫相关通路。研究还发现了长链非编码 RNA (lncRNA) 参与了 SCZ 的发病机制。

结论 本研究确定了 21 个基因其调控的转录和蛋白质丰度水平与 SCZ 风险相关。发现 89 个同时在脑组织和消化组织中的表达都和 SCZ 的有因果相关性的基因, 并且风险基因在不同组织中对 SCZ 发病机制的作用存在差异, 该研究为 SCZ 的脑肠轴机制提供了新的见解。

Hypomyelination in Schizophrenia: A Systematic Evaluation and Meta-analysis

Ting Peng*

Nanjing Brain Hospital

Objective Schizophrenia is a serious mental illness whose etiology and pathogenesis are still unclear. Impaired myelin integrity plays an important role in the pathogenesis of schizophrenia, but there is no uniform conclusion yet. This meta-analysis aims to systematically assess impaired myelin integrity in schizophrenia patients and further explore its role in the pathogenesis of schizophrenia

Methods We conducted a systematic literature search of studies in PubMed, Web of Science, Science Direct, PsycINFO, EMBASE, and Cochrane without language or time constraints. All studies reporting myelin abnormalities in patients with schizophrenia were included. Inclusion criteria included 1) cross-sectional or longitudinal studies, 2) use of imaging or biomarkers to assess myelin integrity, and 3) provision of sufficient data for meta-analysis. Using the MOOSE guidelines, data extraction and quality assessment were performed by two independent investigators. Meta-analysis of myelin integrity metrics was performed using a random-effects model, and heterogeneity and publication bias were assessed

Results A total of nine studies were included, which were published up to June 2024 and involved a total of 926 patients with schizophrenia and 719 healthy controls. The results of the meta-analysis showed that myelin integrity was significantly lower in patients with schizophrenia than in healthy controls (standardized mean difference, SMD = -0.45; 95% confidence interval, CI = -0.34 to -0.55; $p < 0.001$). Subgroup analyses indicated that factors such as disease duration, disease severity, and treatment regimen may have an impact on myelin integrity. Heterogeneity analysis showed moderate inter-study heterogeneity ($I^2 = 68\%$). Funnel plot analysis and Egger's test results did not reveal significant publication bias

Conclusion This systematic review and meta-analysis found that there is a significant impairment of

myelin integrity in schizophrenia patients, which may be closely related to the pathogenesis of schizophrenia. Future studies should further explore the specific mechanisms of impaired myelin integrity and its role in the disease process, with a view to providing new targets for the diagnosis and treatment of schizophrenia.

目的 探讨是否伴随童年创伤的精神分裂症的道德认知差异及其临床症状、神经电生理改变的相关性, 并探讨童年创伤对精神分裂症道德认知的潜在影响。

方法 在首都医科大学北京安定医院住院和门诊招募精神分裂症患者 65 例, 其中 35 例存在童年创伤 (SCZ-ct), 30 例不存在童年创伤 (SCZ-nct); 匹配招募不存在童年创伤的健康对照 (HC-nct) 37 名; 使用童年创伤问卷 (CTQ) 评估三组被试的童年创伤, 并根据结果进行分组; 使用韦氏成人智力排除存在智力损伤的个体; 使用道德基础问卷 (MFQ) 评估三组被试的道德认知; 采用国际精神科访谈问卷 (MINI) 对于三组被试进行筛查, 排除存在精神疾病及家族史健康对照。使用阳性与阴性症状量表 (PANSS) 评估两组患者的临床症状; 采用事件相关电位 (ERP) 探究三组阈上知觉道德认知加工的神经电生理活动。

结果 精神分裂症 (SCZ-ct/SCZ-nct) 的道德认知 (MFQ) ($F=3.201, p<0.001$) 及阈上知觉道德认知加工的正确率 (Con: $F=4.724, p=0.011$; UCon: $F=6.222, p=0.003$) 低于 HC-nct; 阈上知觉道德认知加工的反应时 (Con: $F=9.993, p<0.001$; UCon: $F=17.468, p<0.001$) 及 N400 effect 潜伏期 (FCz:

$F=3.056, p=0.052$; Cz: $F=6.189, p=0.003$; CPz: $F=4.704, p=0.011$; Pz: $F=3.373, p=0.038$) 高于 HC-nct; 其中 SCZ-ct 的 PANSS 与反应时 (Con: $r=0.413, p=0.043$) 及潜伏期 (FCz: $r=0.533, p=0.006$; Cz: $r=0.656, p<0.001$; CPz: $r=0.595, p=0.001$) 呈正相关, 与正确率 (Con: $r=-0.665, p<0.001$; UCon: $r=-0.570, p=0.002$) 呈负相关; Cz 电极点的潜伏期与 CTQ 的躯体忽视 (Physical Neglect, PN: $r=0.422, p=0.039$) 呈正相关, 与 MFQ ($r=-0.443, p=0.030$) 呈负相关; SCZ-nct 的 CTQ 的性虐待 (Sexual Abuse, SA) 与 MFQ 的伤害/关怀 (Harm/Care) 维度呈负相关 ($r=-0.585, p=0.012$); HC-nct 不存在任何相关。

结论 精神分裂症的道德认知存在损伤, 损伤与其临床症状及神经电生理指标的改变相关, 其中童年创伤对精神分裂症的道德认知具有负面影响。

Comparison of Neurocognitive Effects of Blonanserin, Olanzapine, and Aripiprazole in First-episode Schizophrenia

Wanheng Hu Bingjie Huang Xiaodong Guo Tianqi Gao Xiaolin Yin Xianghe Wang Yunfei Ji Yue Zheng Chuan Shi Chengcheng Pu Xin Yu*

Peking University Sixth Hospital

Objective Neurocognitive impairment is a core feature of schizophrenia closely linked to poor functional outcomes. Improving neurocognitive functions is a primary objective of therapeutic interventions. Previous evidence showed first-generation antipsychotics had neutral or detrimental effects, while second-generation antipsychotics (SGAs) demonstrated potential but heterogeneous benefits on neurocognitive functions in schizophrenia. However, the neurocognitive effectiveness of different SGAs remains controversial. This study aimed to investigate and compare the neurocognitive effectiveness of blonanserin, olanzapine, and aripiprazole in patients with first-episode schizophrenia (FES), hypothesizing that blonanserin would exhibit ad-

vantages over the other medications in improving neurocognitive functions after six months of treatment, based on its unique pharmacological characteristics potentially beneficial for neurocognition

Methods This study analyzed data from two open-label clinical trials involving drug-naïve FES patients aged 18-45. Patients received 26 weeks of treatment with blonanserin (4-24 mg/day), olanzapine (10-25 mg/day), or aripiprazole (15-30 mg/day). 199 patients who completed the 6-month follow-up on their initial antipsychotic were included. Neurocognitive functioning was assessed using the modified Chinese MATRICS Consensus Cognitive Battery (MCCB) and Grooved Pegboard Test at baseline and 6 months. Standardized t-score were compared within and between treatment groups using t-tests, ANOVA, and a 3 (Antipsychotics: blonanserin vs. olanzapine vs. aripiprazole) \times 2 (Time: baseline and endpoint) repeat measure ANOVA was conducted to examine the effect of antipsychotics and treatment time on neurocognitive functions. This allowed investigation of the neurocognitive effectiveness of the three antipsychotics with varied pharmacological characteristics in first-episode schizophrenia population

Results 1) All three treatments showed significant improvements in the Paced Auditory Serial Addition Test and Trail Making Test Part A after 6 months.

2) However, there were notable differences in the specific neurocognitive domains that improved with each antipsychotic. The blonanserin group demonstrated significant gains in Brief Visuospatial Memory Test-Revised (HVLT) ($p = 0.013$) and a trend toward improving in Hopkins Verbal Learning Test-Revised ($p = 0.051$). The olanzapine group showed notable improvement in the Grooved pegboard test ($p = 0.022$) and Wechsler Memory Scale-spatial Span Subtest ($p = 0.033$) while the aripiprazole group decreased in Brief Visuospatial Memory Test-Revised (BVMT) ($p = 0.028$).

3) The results of repeat-measure ANOVAs suggested the interaction between group and treatment was significant for HVLT ($F[2,196] = 2.637$, $p = 0.074$, $\eta^2 = 0.026$). Specifically, only the blonanserin group exhib-

ited a marginally significant improvement on HVLT after treatment ($t[42] = -2.006$, $p = 0.051$), but the other two groups showed no difference after treatment ($ps > 0.1$). Similar interaction was observed on BVMT ($F[2,196] = 2.934$, $p = 0.056$, $\eta^2 = 0.029$). Post-hoc analysis suggested both the blonanserin and aripiprazole group exhibited significant improvement on BVMT, of which the blonanserin group showed a better effect size, while the Olanzapine group showed no improvement after treatment ($t[83] = -0.445$, $p = 0.657$).

Conclusion In this study comparing the neurocognitive effects of blonanserin, olanzapine, and aripiprazole in drug-naïve first-episode schizophrenia patients, all three antipsychotics demonstrated benefits to neurocognitive functioning after 6 months of treatment. However, blonanserin exhibited advantages over the other medications in improving verbal and visual learning and memory. These findings align with blonanserin's hypothesized neurocognitive enhancement properties, with a higher D3 than 5-HT_{2A} receptor affinity, blonanserin may increase prefrontal dopamine and norepinephrine levels more effectively, benefiting neurocognitive processes like attention, working memory, and executive function. Blonanserin's lower risk of sedation, weight gain, and metabolic side effects compared to some antipsychotics could also indirectly improve neurocognitive performance. Enhancing verbal and visual learning is particularly important in schizophrenia, as these domains are severely impaired yet closely linked to functional outcomes and the quality of life (QOL). As a well-tolerated medication showing advantages in this key area, blonanserin represents a promising alternative antipsychotic treatment option for clinicians prioritizing neurocognitive rehabilitation in schizophrenia. However, further research is warranted to elucidate the underlying mechanisms of blonanserin's differential neurocognitive effects

chology & Neuroscience, London, United Kingdom

目的 认知症状 (CS) 为精神分裂症主要且普遍的特征之一, 目前还没有相应的诊断代码或治疗方法。真实世界数据有助于扩展对 CS 在临床表现和症状负担的理解。

方法 Holmusk NeuroBlu 为一个来自美国 25 个精神卫生机构的纵向行为健康真实世界数据库。研究纳入 8355 名 1999-2021 年诊断为精神分裂症的成年患者 (≥ 18 岁), 分析其 CS。认知损害特征通过自然语言处理模型识别并提取精神检查所记录的自由文本中的特定文本字符串, 时间窗为首次记录精神分裂症诊断的前后 14 天内 (基线期)。CS 相关的字符串包括“注意力不集中”、“注意力/专注力困难”、“推理能力有限”等。基线期也提取人口统计学和临床特征。研究比较有或无 CS 记录的基线临床特征。

结果 患者平均年龄 41.6 岁, 大多数为男性 (63.8%)。首次记录精神分裂症诊断时, 对 CS 的记录少于阳性症状和阴性症状 (27.9% vs 68.0% vs 61.7%)。有或无 CS 患者的人口统计学特征相似, 但临床特征有所不同。有 CS 患者更可能使用心境稳定剂 (8.5% vs 6.6%, $p=0.003$) 或镇痛药物 (6.7% vs 4.7%, $p<0.001$), 但更少使用一代抗精神病药物 (10.7% vs 12.5%, $p=0.024$), 二代抗精神病药物 (42.8% vs 44.1%) 或抗抑郁药 (21.0% vs 21.3%) 使用方面两组相似。此外, 有 CS 患者接受心理治疗的可能性更低 (15.7% vs 21.2%, $p<0.001$), 更可能合并物质使用障碍、分裂情感性障碍、PTSD、OCD、ADHD 等。有 CS 患者的基线疾病严重程度更高, 功能更差, 急诊科就诊 (26.3% vs 18.8%, $p<0.001$) 和住院 (45.3% vs 27.7%, $p<0.001$) 频率更高, 也更可能经历各方面负面社会因素 (家庭、财务、住宿、法律, 职业、学业功能等)。在首次诊断后 18 个月, 与无 CS 患者相比, 有 CS 患者的精神科住院风险、住院次数和住院总天数显著增加。

结论 有 CS 的精神分裂症患者病情更重, 功能损害的负担更大, 更可能经历负面的社会因素。CS 与临床表现和其他结局之间有重要关联, 疾病负担更重。心境稳定剂和镇痛药物的处方在有 CS 患者中更多, 提示此患者群可能有其他相关共病。尽管 CS 在精神分裂症中普遍存在, 此真实世界数据结果显示临床记录可能显著低估了 CS 患病率。原因可能是 CS 的治疗选择有限, 但也提示可以通过医生教育或数字方法和治疗手段提升 CS 的识别。

Prevalent and Characteristic Changes in The Associations between Peripheral Blood Transcriptome and Brain Functional Imaging in Schizophrenia: A Trans-Scale Multi-Omics Study

Yusha Ji Longbiao Cui Anan Yin*

Air Force Medical University

Background Schizophrenia (SCZ) is recently proposed as a multi-system disorder with systemic or peripheral comorbidities. Peripheral blood serves as a central link between the central and peripheral systems. However, the landscape and significance of the peripheral blood-brain associations are unstudied in SCZ. Here, by integrating microscale blood transcriptomic data and macroscale brain functional imaging data, this study aims to explore the associations between blood transcriptomic and neuroimaging data in SCZ

Methods A total of 43 SCZ patients and 60 healthy controls were included. Peripheral blood transcriptome analysis, high-resolution T1-weighted magnetic resonance imaging (MRI), and clinical assessments were conducted for all subjects. Initially, seven gene co-expression modules significantly associated with SZ were identified in the peripheral blood transcriptome by WGCNA. Through correlation analysis,

specific brain functional regions were identified as being associated with the gene co-expression modules, providing insights into the connections between peripheral blood transcriptome and brain function. Finally, we analyzed the correlations between blood gene module data (or associated brain imaging data) and the cognitive performance measured by the WAIS-RC in SCZ

Results The findings indicate prevalent and characteristic alterations in the associations between blood transcriptomic and neuroimaging data in SCZ, thereby reasoning out three alteration modes that may describe the pathogenic processes of SCZ, and showed distinctive correlations of blood transcriptomic and neuroimaging data with cognitive ability in SCZ compared to healthy controls. Machine learning models harnessing the trans-scale multi-omics information conferred enhanced diagnostic capability for SCZ

Conclusion Our study confirms and uncovers the significance of blood transcriptomic-neuroimaging connections in SCZ. this can offer a comprehensive analysis of the associations between peripheral blood and brain in SCZ, and emphasize the potential clinical utility of such trans-scale associations in improving diagnostic and clinical evaluations for SCZ

H2S Alleviates Schizophrenia-like Behavior Through Regulating Apoptosis by S-sulfhydrylation Modification

Xinzhe Du¹, Wei Hu²

1.First Hospital of Shanxi Medical University

2.Shanxi Medical University

Objective Considered as the third gaseous signaling molecule following nitric oxide (NO) and carbon monoxide (CO), hydrogen sulfide (H₂S) can promote the development of various central nervous system diseases through its anti-apoptotic effects. However, the relationship between H₂S and schizophrenia (SZ), as well as its underlying mechanisms, is not well understood. To address this, we embark on an in-depth exploration across three levels: population studies, cellular investigations, and animal models

Methods On the population level, clinical data and peripheral blood samples were collected from 81 first-episode SZ patients and 84 healthy controls, and the levels of H₂S in plasma were determined using the methylene blue method and Elisa. At the cellular and animal levels, dizocilpine (MK801) was used to establish SZ cell and animal models on SH-SY5Y cells and SD rats, respectively, while sodium hydrosulfide (NaHS) served as an exogenous donor of H₂S. Subsequently, cell-level high throughput sequencing of miRNA and mRNA transcriptomes was carried out to screen key target genes, and cell apoptosis was detected by flow cytometry. The levels of H₂S in rat plasma and hippocampal tissue were similarly measured using Elisa, and relevant behavioral indicators in model rats were detected through behavioral experiments. Finally, immunofluorescence was employed to detect cell apoptosis in the rat hippocampus, and protein S-sulfhydration assays were used to assess changes in S-sulfhydration of apoptosis-related proteins

Results The H₂S content decreased significantly in SZ patients' plasma and hippocampal brain tissue of the SZ rat model. In SH-SY5Y cells, NaHS pretreatment

significantly reduced the apoptosis level induced by MK801. Transcriptome sequencing and target gene prediction screening identified 4 miRNAs and 68 mRNAs enriched in the apoptosis pathway. The schizophrenia model rats exhibited significant behavioral abnormalities, increased levels of apoptosis in the hippocampal tissue, and decreased expression of the S-sulfhydration modification level of the apoptosis protein Birc6, all restored after NaHS pretreatment

Conclusion H2S content is significantly reduced in schizophrenia, and supplementation of H2S can alleviate schizophrenia, which is achieved through the regulation of the apoptosis process by S-sulfhydration modification

动态神经影像特征揭示精神分裂症和遗传高风险个体中的共同及特异性改变

张陆衡¹ 赵鹏飞³ 段佳² 王菲^{2,3,4}

1. 南京大学医学院附属鼓楼医院 心理科
2. 南京医科大学公共卫生学院精神卫生系
3. 南京医科大学附属脑科医院 早期干预科
4. 南京医科大学脑功能成像研究所

目的 精神分裂症(SCZ)是一种严重的精神疾病,通常表现为幻觉、妄想、思维混乱和社会功能障碍。具有SCZ遗传高风险(GHR)的人群可能更容易患上SCZ。研究SCZ和GHR有助于深入了解疾病的病因,并为早期诊断提供机会。然而,关于SCZ和GHR脑内自发动态特征的研究仍然很少。

方法 本研究共纳入符合入组标准的235名健康人(HC),67名GHR及133名SCZ患者,年龄范围为13-30岁,确保三组间性别、年龄、教育年限相匹配。对所有受试进行人口学资料和临床信息采集,临床症状采用简明精神量表(Brief Psychiatric Rating Scale)评定,随后进行静息态磁共振扫描。我们利用动态低频振幅(dALFF)分析来探索SCZ、GHR和健康对照组(HC)之间大脑活动的动态变化特征,采用滑动窗口法将扫描时间分为连续的段,并在每个段内计算ALFF值,以捕捉脑活动的动态

变化。

结果 我们观察到三组之间显著的dALFF差异,特别是在前额叶回、颞叶回、边缘系统、基底神经节系统和视觉皮层。其中SCZ和GHR组在右舌状回(LING)的dALFF均减少,且SCZ组较GHR组减少更多,这可能作为区分两组的标志。此外,与HC组相比,在SCZ组中,前额叶回、边缘系统和基底神经节系统的特定区域显示出增加的dALFF,而SCZ患者在颞叶回的特定区域显示出减少的dALFF。

结论 本研究首次采用dALFF方法研究了SCZ和GHR的神经影像特征。我们发现SCZ和GHR中存在异常的大脑动态活动。尤其是右侧LING中减少的dALFF可能作为SCZ和GHR之间潜在的共享生物标志物,暗示其在SCZ发病中的作用。这些发现有助于更深入地理解SCZ,并提供潜在的早期干预生物标志物。

目的 精神分裂症相关认知损害 (CIAS) 是精神分裂症的核心特征, 也是功能预后不良的主要决定因素。目前, 尚无药物获批用于治疗 CIAS。谷氨酸信号传递缺陷在精神分裂症尤其是认知症状的神经病理学中起着关键作用。Iclepertin (BI 425809) 是一种新型甘氨酸转运蛋白-1 抑制剂, 通过增加 N-甲基-D-天冬氨酸 (NMDA) 受体协同激动剂——甘氨酸的突触水平, 增强大脑 NMDA 受体的信号传递。为期 12 周的 II 期试验 (NCT02832037) 纳入 509 名精神分裂症患者, 提示 iclepertin 耐受性良好, 并显著改善认知表现。III 期临床试验 CONNEX 项目旨在通过更大样本的精神分裂症患者来确认 iclepertin 在改善 CIAS 和功能方面的有效性、安全性和耐受性。

方法 CONNEX 包括三项相似的随机、双盲、安慰剂对照平行组试验, 受试者为目前接受稳定抗精神病药物治疗的精神分裂症患者 (NCT04846868、NCT04846881、NCT04860830)。每项试验计划招募约 586 名年龄在 18-50 岁之间、接受 1-2 种抗精神病药物治疗的患者 (维持当前抗精神病药物 ≥ 12 周; 维持当前剂量 ≥ 35 天), 日常活动存在功能障碍, 每周与指定研究伙伴互动 ≥ 1 小时。排除因发育、神经系统或其他疾病导致的认知障碍或在筛选前 12 周内接受认知矫正治疗的患者。受试者从全球 41 个国家/地区招募, 并按 1:1 的比例随机分配接受口服 iclepertin 10mg (n=293) 或安慰剂 (n=293), 每日一次, 治疗 26 周。主要疗效终点是 MCCB 总体综合 T 评分相对于基线的变化。关键次要疗效终点是 SCoRS 总分相对于基线的变化以及虚拟现实认知能力评估工具 (VRFCAT) 校正总时间相对于基线的变化。长期安全性和耐受性数据将在开放标签安全性扩展的 CONNEX-X 研究中收集。

结果 研究目前正在招募, 并预计将于 2025 年第一季度完成试验。

结论 至今为止, 大多数药企发起的探讨各种化合物治疗认知功能的临床试验, 都未能达到临床概念验证。此 III 期项目通过显示 iclepertin 在改善认知方面的有效性结果可以为谷氨酸在认知症状以及其他相关认知疾病的作用提供重要见解。Iclepertin 有望成为治疗 CIAS 的首个有效药物。

Cognitive Impairment after Brief Or Ultra-brief Pulse Electroconvulsive Therapy in Schizophrenia

Qi Si¹, Qi Si², Yuting Li¹, Guoxin Xu¹, Yingbo Dong¹, Yilin Tang¹, Peiyu Cao¹, Congxin Chen³, Fangfang Ren¹, Runda Li⁴, Yuxiu Sui¹

- 1.Nanjing Brain Hospital
- 2.Huai'an NO.3 people's hospital
- 3.Nanjing Maternity and Child Health Care Hospital
- 4.the Vanderbilt University

Objective The majority of studies have shown substantially reduced cognitive impairment when an ultra-brief pulse (UBP) electroconvulsive therapy (ECT) compared with a brief pulse (BP) ECT, but the results are still inconclusive

Methods This study employed a sequential group, double-blind, control trial design. A total of 114 patients with schizophrenia (SCZ) enrolled and received BP ECT (63 participants) or UBP ECT (51 participants). Cognitive function of the participants was assessed before and after treatment, and peripheral blood biomarkers as well as hippocampal magnetic resonance spectroscopy (MRS) data were collected

Results No significant differences were detected in demographic and clinical data at baseline between the two groups. After the end of ECT sessions, the outcomes suggested that the UPB group outperformed the BP group in the Trail Making Test and negative overgeneral memory test; the levels of peripheral blood biomarkers and the right hippocampal myoinositol/creatinine ratio in the UBP group were significantly higher than those in the BP group

Conclusion The current results suggested that UBP ECT achieved similar efficacy to BP ECT when given the same dose of stimulation, indicating cognitive advantages for UBP ECT. Nonetheless, this study could not examine this issue with respect to the structural and functional magnetic resonance brain data. Long-term

cognitive impairment post ECT should also be measured in future studies. In summary, UBP ECT can promote clinical treatment

2.The Eighth Affiliated Hospital, Sun Yat-Sen University

Objective Treatment-resistant schizophrenia (TRS) is a specific subtype among patients with schizophrenia, characterized by poor response to pharmacological treatment and lower quality of life. Currently, apart from clozapine, there is a lack of effective treatment options for TRS patients. Magnetic seizure therapy (MST), as a novel neuromodulation treatment combining elements of electroconvulsive therapy (ECT) and transcranial magnetic stimulation, has shown promising efficacy and fewer side effects in treating treatment-resistant depression. There is limited research on the use of MST in treating TRS and the associated neuroimaging mechanisms. Therefore, this study aims to explore the efficacy and safety of MST in treating TRS and investigate changes in dynamic functional connectivity (DFC) using resting-state functional magnetic resonance imaging (rs-fMRI) in TRS patients before and after MST treatment, providing scientific evidence for precise treatment and effective intervention for this condition

Methods This study enrolled 26 subjects, each of whom underwent consecutive high-frequency MST treatment, followed by an 8-week clinical tracking and follow-up period after treatment completion. Before and

after MST treatment, we collected data on clinical symptoms, neurocognitive function, and resting-state structural and functional magnetic resonance imaging from the subjects. Clinical symptoms were assessed using the Positive and Negative Syndrome Scale (PANSS), while neurocognitive function was evaluated using the MATRICS Consensus Cognitive Battery (MCCB), which covers 7 cognitive domains. We compared the PANSS scores and MCCB cognitive scores of TRS subjects before and after treatment, and further conducted multiple comparisons of PANSS scores between before and after treatment as well as at two follow-up time points. Differences were considered statistically significant when the p-value was less than 0.05. Additionally, we preprocessed the rs-fMRI data, constructed dynamic functional networks using a sliding time window approach for DFC analysis, performed cluster analysis, and compared differences in DFC and temporal properties before and after MST treatment. Finally, we conducted Pearson correlation analysis to further explore the correlation between the temporal properties extracted from DFC and clinical symptoms as well as cognitive function

Results 1. Analysis of changes in clinical symptoms before and after MST treatment: In the TRS group, within 24 hours after the completion of MST treatment, significant reductions were observed in the PANSS total score ($t = 11.20, P < 0.001$), positive symptom score ($t = 8.917, P < 0.001$), negative symptom score ($t = 4.164, P < 0.001$), and general psychopathology score ($t = 9.513, P < 0.001$) compared to pre-treatment levels. Repeated Measures Analysis of Variance (ANOVA) revealed statistically significant differences in the PANSS total score at baseline (T0), within 24 hours post-treatment (T2), at 4 weeks post-treatment (T4), and at 8 weeks post-treatment (T8) ($F = 65.90, P < 0.001$)

2. Analysis of changes in cognitive function before and after MST treatment: Significant differences in three neurocognitive domains were observed in the TRS group before and after MST treatment, including attention/vigilance ($t = 2.066, P = 0.044$), verbal learning ($t = 2.316, P = 0.025$), and reasoning and problem-solving ($t = 2.190, P = 0.033$), all significantly increased com-

pared to before MST treatment. The remaining four neurocognitive domains - processing speed, working memory, visual learning, and social cognition - did not show significant differences, but demonstrated a trend of improvement post MST treatment. This indicates partial recovery of cognitive function in the TRS group after MST treatment, without cognitive decline.

3. Dynamic functional connectivity analysis Results Cluster analysis identified the optimal number of clusters in this study as 4, with state 2 having the highest frequency (33.21%) and state 3 the lowest (15.87%). Significant changes in dynamic functional connectivity across the whole brain and within each state were observed before and after MST treatment. Regarding temporal properties, TRS patients showed a significant decrease in the average dwell time in state 1 post MST treatment compared to pre-treatment ($t = 2.53$, $P = 0.02$), and significant increases in states 3 and 4 ($t = -2.22$, $P = 0.04$), ($t = -2.87$, $P = 0.01$). The time scores in state 1 significantly decreased post MST treatment compared to pre-treatment ($t = 2.38$, $P = 0.03$), while they significantly increased in states 3 and 4 ($t = -2.31$, $P = 0.03$), ($t = -2.88$, $P = 0.01$), with no significant differences in transition counts.

4. Correlation analysis Results Pearson correlation analysis of the dynamic temporal property changes before and after MST treatment with PANSS scores and changes in the 7 cognitive domains of the MCCB showed a significant positive correlation between the change in average dwell time in state 2 and the change in attention/vigilance ($r = 0.504$, $P = 0.039$), and a significant negative correlation between the change in average dwell time in state 4 and the change in reasoning and problem-solving ($r = -0.495$, $P = 0.043$); no other significant correlations were observed.

Conclusion This study found that high-frequency continuous MST treatment can effectively improve clinical symptoms in TRS patients and maintain the stability of efficacy within 8 weeks after treatment. Furthermore, no adverse effects on cognitive function were observed during the treatment process, and partial cognitive function in TRS patients was restored after MST treatment. Additionally, dynamic functional connectivity and temporal properties in TRS patients

changed in different states before and after MST treatment, showing partial correlation with cognitive function. This helps us understand the neuroimaging mechanisms behind the improvement of psychiatric symptoms with MST treatment. However, this study remains exploratory in nature, and future research should further increase the sample size with the inclusion of a control group to validate the findings.

Effectiveness and Safety of Blonanserin Monotherapy in First-episode Schizophrenia with and without Prominent Negative Symptoms: Data From A 12-week, Multicenter, Post-marketing Surveillance Study

Lihe Chen Qian Guo Yao Hu Xiaohua Liu Hao Hu Caiping Liu Huafang Li Haiying Chen Guanjun Li*
Shanghai Mental Health Center, Shanghai Jiao Tong University School of Medicine

Objective This study aims to evaluate the effectiveness and safety of blonanserin monotherapy in first-episode schizophrenia in real clinical settings and to determine a sufficient dose range for patients with and without prominent negative symptoms

Methods A 12-week, multicenter, prospective post-marketing surveillance was conducted. In this study, we included patients with first-episode schizophrenia who received blonanserin monotherapy. Patients were divided into those with prominent negative symptoms (PNS) and without prominent negative symptoms (non-PNS) based on the Brief Psychiatric Rating Scale (BPRS) negative symptoms subscale score. Additionally, patients were divided into high-dose and low-dose groups based on the maximum daily dose they received. Effectiveness was assessed using the BPRS, and safety was evaluated through the incidence of adverse drug reactions (ADRs)

Results A total of 653 patients were included in

the analysis. Among them, 276 patients (PNS: 139; non-PNS: 137) received low-dose blonanserin (2-10mg/d), and 377 (PNS: 204; non-PNS: 173) received high-dose blonanserin (12-32 mg/d). A total of 613 patients (93.9%) completed the study. The BPRS total score decreased significantly from 47.94 ± 16.31 at baseline to 26.88 ± 9.47 at 12 weeks ($p < 0.001$). A significant interaction of PNS \times dose \times time was observed for BPRS total score ($F = 3.47$, $p = 0.040$) and negative symptom subscale score ($F = 6.76$, $p = 0.002$). In the PNS group, the high-dose group showed greater reductions than the low-dose group at week 12 (total: $p = 0.001$; negative symptoms: $p = 0.003$). In the non-PNS group, no significant difference in the BPRS score was observed between the high-dose and low-dose groups at any visit. Most adverse reactions were mild or moderate. Extrapyramidal symptoms (EPS: 9.3%) were the most common adverse reactions. 1.5% of patients gained $\geq 7\%$ body weight at 12 weeks

Conclusion Blonanserin effectively improved the clinical symptoms of first-episode schizophrenia with an acceptable safety profile. High-dose blonanserin is particularly beneficial for patients with prominent negative symptoms in the long term, while low-dose blonanserin is sufficient for patients without prominent negative symptoms.

精神分裂症与年龄相关性黄斑变性之间的分子串扰: 免疫炎症是重点

邵小骏 朱刚*

中国医科大学附属第一医院

目的 精神分裂症是世界十大致残疾病之一, 常伴有感知觉、思维、情感、行为及认知等障碍, 存在病因不明、诊断不足、疗效不佳的困境, 探索精神分裂症确切的病理生理机制面临着重大挑战。眼作为中枢神经系统的一部分, 与脑具有高度的发育同源性和功能相似性, 精神分裂症中眼和脑均存在广泛的功能及结构损害, 但是现阶段二者相关潜在分

子机制是复杂而模糊的。由此, 本研究利用生物信息学工具, 通过从基因表达综合 (GEO) 数据库中收集三个精神分裂症数据集和两个年龄相关性黄斑变性数据集, 来揭示与二者相关的枢纽基因和潜在机制。

方法 利用 GEO 数据库筛选与精神分裂症及年龄相关性黄斑变性相关的转录组测序数据集, 通过整合精神分裂症和年龄相关性黄斑变性患者的基因表达水平和临床信息, 利用加权基因共表达网络分析 (WGCNA) 研究与二者之间相关的共表达网络, 并对共享基因进行富集分析, 筛选出最显著的核心基因。

结果 通过利用 GEO 数据库, 申请者团队收集了精神分裂症和年龄相关性黄斑变性患者相关的基因, 共获得了 511 个精神分裂症相关基因, 1056 个年龄相关性黄斑变性相关基因, 进行交叉处理后得到了这两种疾病的 63 个共同基因。通过装袋决策树算法 (Bagged Tress)、贝叶斯算法 (Bayesian)、随机森林算法 (Random forest)、Wrapper 算法 (Bpruta)、学习矢量量化 (LQV) 和 1000 次迭代 10 折交叉验证 LASSO-Logistic (Least absolute shrinkage and selection operator, LASSO) 算法等 6 种机器学习算法在精神分裂症数据集中分析上述 63 个共同特征基因 (DEGs) 与二者发病之间的关系, 并将不同算法的结果取交集。结果显示, 有 3 个重要特征基因 (Hub-OADEGs) 与二者发病最为密切, 分别为: FMO5、GPR132 和 S100A8, 分别计算了 3 个特征基因与免疫细胞含量之间的相关性后, 结果显示 3 个重要基因 (Hub-OADEGs) 与免疫细胞含量密切相关, P 值均小于 0.05。

结论 本研究首次挖掘了与精神分裂症相关的致病基因以阐明精神分裂症与后续年龄相关性黄斑变性之间的联系, 其中炎症和免疫过程包括 CD56bright natural killer cell、Activated CD4 T cell、Activated B cell 和 Immature B cell、Effector memory CD8 T cell 和 Activated CD8 T cell 可能是二者共病的潜在机制。

虹膜特征和色觉功能与首发未治疗精神分裂症的关联研究

田春生 朱刚*

中国医科大学附属第一医院

目的 精神分裂症(SCZ)是一种神经发育障碍性疾病,并伴有多器官功能的异常改变。眼部组织如虹膜、视网膜与大脑共同发育自神经外胚层,相关研究不仅发现虹膜和视网膜发育异常与脑功能结构的病理改变具有高度一致性,并且SCZ患者普遍存在视觉功能改变。本研究的目的是:明确SCZ患者与健康人(HC)虹膜特征和色觉功能差异性及虹膜特征与精神病性症状和暴力攻击行为之间的关联性,并验证虹膜特征作为精神分裂症生物标志物的可行性。同时,明确第二代抗精神病药物(SGAs)是否会对色觉功能产生影响,以及具有虹膜特征结构是否会对FUS患者的治疗效果造成显著影响。

方法 首发未治疗精神分裂症(FUS)患者作为病例组,共61人;HC61人。首先,应用虹膜仪采集所有被试的虹膜图像,并对虹膜图像按特征进行分类:包括隐窝、色素点和皱纹,之后统计虹膜各特征的频数数值。FUS组进行PANSS、MOAS评估。明确虹膜特征频数与罹患精神分裂症风险关系;明确虹膜特征频数对精神分裂症的诊断预测准确率,以及对PANSS及各分量表、MOAS得分影响。应用Spearman相关分析,统计虹膜特征频数分别与PANSS及各分量表、MOAS得分相关性,对具有显著相关性的变量进行线性回归分析,明确变量间影响程度。其次,应用法恩斯沃思D-15色觉功能测试(D-15)对全部被试进行色觉功能评估。于FUS患者开始采用SGAs治疗后随访6周。在基线期及第6周进行D-15评估和第二次虹膜特征频数统计,在第2周,第4周和第6周分别进行PANSS评估。明确FUS组与HC组D-15得分以及色觉障碍类型是否存在显著差异。对FUS患者,明确不同色觉障碍类型与PANSS及各分量表、MOAS的关联性。分析干预前后色觉障碍类型的变化及虹膜特征频数变化。明确各随访时点PANSS得分在有/无虹膜特征组间及组内的变化趋势和差异性,探讨虹膜特征是否会影响SCZ患者的治疗效果。

结果 FUS组较HC组具有虹膜隐窝($P<0.001$)和色素点($P<0.001$)者显著更多。而虹膜皱纹组间差异不显著($P>0.05$)。ROC曲线分析显示,虹膜隐窝频数(AUC)为:0.702;色素点频数AUC为0.701;联合预测曲线下面积(AUC)为0.793。与无虹膜隐

窝者相比,具有隐窝者MOAS得分更高($P<0.001$);与无虹膜色素点者相比,具有色素点者阴性量表得分更高($P<0.001$)。FUS组D-15得分显著高于HC组($P=0.019$)。

结论 虹膜隐窝和色素点具有作为SCZ生物标志物的潜力。

虹膜隐窝频数、色素点频数及其组合预测对SCZ诊断具有较高的预测价值。

精神分裂症社会知觉缺陷的神经相关性:一项与事件相关的电位研究

李江娟¹ 李江娟² 周振和² 周振和¹

1.江南大学附属精神卫生中心

2.江南大学

目的 精神分裂症患者的面部情绪识别障碍与其社会认知功能密切相关。本研究旨在描述精神分裂症患者社会知觉的事件相关电位(ERP)特征,并探讨其异常社会知觉认知过程的神经机制。

方法 33名符合DSM-V诊断的精神分裂症患者和35名健康参与者在完成情绪强度识别任务的同时接受了脑电图记录。使用重复测量方差分析对所有参与者的行为学数据以及潜在的ERP特征进行分析,并通过PANSS量表评估精神分裂症患者的精神病症状严重程度。

结果 行为学结果表明与厌恶的面孔相比,精神分裂症患者对悲伤面孔的反应时间更长,并且准确性低于健康对照组。此外,精神分裂症患者在厌恶面孔、惊讶面孔、愤怒面孔和恐惧面孔的准确性均低于健康对照组。在ERP成分方面,N100、P200和N250的平均振幅和潜伏期在组间没有发现明显差异;然而,对于悲伤和愉快面孔,精神分裂症组在额叶和中央叶的LPP平均振幅均小于健康对照组;愤怒和恐惧面孔诱发的LPP平均振幅也均低于健康对照组,主要集中在额叶、中央叶和顶叶;对于惊喜面孔,与精神分裂症患者相比,健康对照组在中央叶和顶叶有着更高的LPP平均振幅。精神分裂症组和健康对照组在不同情绪面孔和感兴趣脑区中的LPP平均振幅存在显著差异。

结论 精神分裂症患者在面部情绪识别方面存在显著缺陷, 主要表现于情绪处理的晚期阶段, 而非早期或中期阶段, 并具有情绪特异性, 包括对悲伤、愉快、惊讶、愤怒和恐惧面孔的识别困难。这一缺陷可能反映了精神分裂症患者认知资源分配的减少, 对其社会认知功能具有重要临床意义。

The Immediate, Subtle Reduction of Body Temperature Undergoing Antipsychotic Medications: A 10-year Retrospective Study

Shu Huang¹, Xiaonan Guo², Jianbo Lai²

1. Mental Health Center Affiliated to Zhejiang University/Hospital Affiliated to School of Brain Medicine and Brain Science of Zhejiang University/Hangzhou Seventh People's Hospital

2. The First Affiliated Hospital, Zhejiang University School of Medicine

Objective Antipsychotic drugs (APDs)-caused hypothermia is a rare yet potentially lethal adverse effect. However, latent impact of antipsychotic drugs on body temperature (Tb, °C) seems to be neglected in patients without overt temperature dysregulation. Herein, we aimed to identify whether APDs treatment had an impact on Tb

Methods In this population-based and self-control study, dynamic change of Tb of inpatients with schizophrenia or bipolar disorder on admission and after dose-escalating antipsychotic treatment including quetiapine, paliperidone ER, olanzapine and risperidone were collected

Results In quetiapine group (n = 138, age mean: 22.21 (20.63-23.79)), Tb in patients who had their doses escalated to 300mg/day (36.70 (36.40-36.90) vs. 36.80 (36.50-37.00), p = 0.022), 400mg/day (36.70 (36.25-36.85) vs. 36.80 (36.50-37.00), p = 0.011), and 500mg/day (36.45 (36.23-36.80) vs. 36.65 (36.50-36.88), p = 0.055) were significantly decreased compared to their baseline, in a dose-dependent manner (95

CI%: 0.0089-0.1826, r = 0.0965, p = 0.0264). Similar result was also observed in patients receiving paliperidone ER treatment (n = 45, age mean: 23.56 (20.69-26.42)), with doses going up to 3mg/day (36.70 (36.50-36.80) vs. 36.70 (36.55-37.00), p = 0.019), 6mg/day (36.60 (36.40-36.80) vs. 36.70 (36.50-37.00), p = 0.04), and 9mg/day (36.60 (36.40-36.90) vs. 36.70 (36.60-36.90), p = 0.019). However, no significant difference in the Tb was found in either olanzapine (n = 21, age mean: 29.52(24.13-34.92)) or risperidone (n = 24, age mean: 27.38(23.09-31.66)) at various doses (all p's > 0.05)

Conclusion This study presented that APDs use disrupted the thermal homeostasis within commenda-tion dose, providing the potential valuable insights for underlying the APDs-related metabolic perturbation

关键词: antipsychotic drug, body temperature, hypothermia, adverse effect

Humor Processing Ability in First-episode Schizophrenia and Its Relationship with Clinical Features

Yunfei Ji Bingjie Huang Chengcheng Pu*
Peking University Sixth Hospital,

Objective Humor is a high-order social cognition process unique to human beings which is commonly impaired in patients with chronic schizophrenia. However, humor processing and its associations with patients' clinical characteristics in the early stage of illness remains unknown. The current study aimed to investigate humor processing and its relationship with clinical features in patients with first episode schizophrenia (FES)

Methods This study recruited 45 patients with FES and 44 healthy controls matching for age, gender and education level. Participants completed the Picture Humor Processing Task (HPT-p) and the Video Humor Processing Task (HPT-v) which tapped into humor comprehension and appreciation, and a questionnaire assessing their humor styles. The clinical participants also

completed clinical and social functioning measurements. Signal detection theory analysis was used to calculate the d' and β values which represented the detection of humor signal in the comprehension phase and the inner criteria of the humor appreciation phase respectively

Results In HPT-p, patients with FES showed higher false alarm rate ($p = 0.048$) while comparable hitting rate, signal recognition ability (d' value) and intrinsic evaluation criterion (β value) compared to healthy controls. In HPT-v, patients with FES showed lower within-group coherence in funniness rating ($p = 0.023$). In addition, the false alarm rate in HPT-p and negative symptoms predicted social functioning well in patients with FES ($R^2 = 0.681, p < 0.001$)

Conclusion Our results indicated that impairment of humor comprehension in schizophrenia generated in the first episode and would contribute to social functioning deficit, which needs early recognition and intervention.

关键词: Schizophrenia; Humour processing; Signal detection theory (SDT); Social functioning; Negative symptoms

基于混沌游戏表示研究首发精神病患者的脑电微状态序列特征

周东东¹ 况利^{1,2}

1.重庆医科大学附属大学城医院

2.重庆医科大学附属第一医院

目的 我们的研究旨在利用混沌游戏表示法 (CGR) 来研究微状态序列, 并探索其作为精神疾病神经生物标志物的潜力。

方法 我们将所提出的方法应用于一个包含 82 名首发精神病 (FEP) 患者和 61 名对照组的数据集。构建了两种时间序列: 一种使用 CGR 中的微状态间距离 (时间序列 D), 另一种使用表示 CGR 中微状态坐标的复数 (时间序列 Z)。对两组时间序列的功率谱特征和频率矩阵 CGR (FCGR) 进行了比较, 并探索了基于上述特征识别 FEP 的机器学习性能。

结果 通过共享和单独模板, 识别出了四种典型的微状态 (A、B、C 和 D)。我们的结果表明, FEP

组的微状态振荡模式表现出变化。具体为: 对照组时间序列 D 的平均值、标准偏差 (SD) 和均方根 (RMS) 显著低于 FEP 组。在频域特征方面, 对照组时间序列的平均功率、中心频率 (CF) 和均方根频率 (RMSF) 显著低于 FEP 组, 而对照组时间序列的频率标准差 (RVF) 显著高于 FEP 组。对照组时间序列 Z 的功率谱 CF 和 RMSF 显著低于 FEP 组, 而平均功率和 RVF 之间的差异在组间不显著。相比于微状态的经典特征和 FCGR, 使用 CGR 衍生的振荡特征提高了机器学习的性能。

结论 这项研究为分析 EEG 微状态序列开辟了新途径。由微状态序列 CGR 得出的特征或可作为精神疾病更加细粒度的神经生物标志物。

精神分裂症患者色氨酸代谢途径的靶向代谢组学研究

青颖¹ 江艾菲¹ 邢熙文¹ 赵希彦¹ 崔高平²

1.上海交通大学

2.上海交通大学医学院附属仁济医院上海市肿瘤研究所

目的 精神分裂症是一种常见的重性精神病性障碍。研究发现该病患者体内色氨酸水平异常改变, 而色氨酸主要通过犬尿氨酸、5-羟色胺和吲哚 3 种途径进行分解代谢, 其中犬尿氨酸和 5-羟色胺参与精神分裂症的病理机制。但是, 目前系统研究精神分裂症色氨酸代谢途径的证据十分匮乏。因此, 本项目旨在应用靶向代谢组学技术检测色氨酸代谢途径中的关键代谢产物, 通过比较首发精神分裂症患者与其他精神障碍患者和健康对照组之间的差异及其与临床指标的关系, 研究色氨酸 3 种分解代谢途径在精神分裂症中的变化规律及其在疾病病理机制中的作用。

方法 本研究共纳入 124 名受试者, 包括 29 例首发精神分裂症患者, 22 例其他精神疾病患者以及 73 例健康对照, 采集受试者血浆样本并收集血生化、血脂等临床指标。应用超高效液相色谱-四极杆飞行时间质谱 (UHPLC-QTOF/MS) 技术对色氨酸代谢途径中的 16 种关键代谢物进行靶向代谢组学检测, 并对其中 7 种代谢物进行标准曲线绘制。使用 SPSS

26.0 进行秩和检验和斯皮尔曼相关性分析。

结果 靶向代谢组学研究结果表明,与健康对照组相比,精神分裂症组血浆色氨酸(FC=0.89)、5-羟基吲哚乙酸(FC=0.79)、犬尿氨酸(FC=0.80)和犬尿酸(FC=0.73)水平显著降低($p < 0.05$)。其他精神疾病组和健康对照组相比,色氨酸(FC=0.91)和犬尿酸(FC=0.80)水平显著降低($p < 0.05$),这与精神分裂症组相似;而5-羟基吲哚乙酸和犬尿氨酸并无显著变化,这与精神分裂症组不同。而精神分裂症组与其他精神疾病组相比,5-羟色胺水平显著降低(FC=0.86, $p=0.043$)。此外,我们进一步发现在精神分裂症组中,色氨酸与总胆红素($r=0.627$)、直接胆红素($r=0.597$)、间接胆红素($r=0.568$)、谷草转氨酶($r=0.480$)、肌酐($r=0.627$)呈显著正相关;而与高密度脂蛋白胆固醇($r=-0.604$)和载脂蛋白A1($r=-0.541$)呈显著负相关;而犬尿氨酸($r=0.571$)、5-羟基吲哚乙酸($r=0.533$)和犬尿酸($r=0.416$)也与谷草转氨酶显著正相关($p < 0.05$)。有趣的是,在健康对照组中上述相关性均消失。

结论 本研究系统揭示了精神分裂症患者体内色氨酸代谢途径功能障碍,其中色氨酸-犬尿氨酸和色氨酸-5-羟色胺这2条代谢途径显著下调,而色氨酸-吲哚代谢途径无明显变化,并且发现色氨酸代谢途径与血液指标呈现疾病特异性关联。我们的研究结果为揭示色氨酸代谢途径参与精神分裂症病理机制提供了新的生物学证据,为疾病的客观诊断和干预提供了新的线索。

慢性精神分裂症肠道真菌及代谢组学研究

赵心怡* 宋学勤

郑州大学第一附属医院

目的 1. 比较 CSCZ 患者和健康对照(HC)人群中肠道真菌群落结构及特征的差异;

2. 比较 CSCZ 患者和 HC 人群粪便代谢组学差异;

3. 探讨肠道真菌相关代谢改变和免疫炎症反应与 CSCZ 的关联。

方法 研究对象:参与者为2019年1月至2023年1月期间,于郑州大学第一附属医院住院治疗的 CSCZ 患者。同时通过广告面向大众招募 HC 人群。入组当天对受试者进行临床信息采集。对于 CSCZ 患者,使用阳性与阴性症状量表(PANSS)进行评分。入组次日晨,收集 CSCZ 组及 HC 组的空腹血液样本以及粪便样本。CSCZ 患者在入组第6周、12周分别进行门诊随访,收集血液及粪便样本。使用 Wilcoxon 秩和检验进行 α 多样性的组间差异分析,使用 Vegan 软件(版本 2.4.3)进行主坐标分析(PCoA)及置换多元方差分析(PERMANOVA)检验,评估两组间真菌群落相似性,使用线性判别分析(LEfSe)确定两组间丰度差异显著的真菌类群,使用偏小二乘判别分析(PLS-DA)确定两组间差异显著的代谢物,通过微生物组多变量线性模型关联分析(MaAsLin)方法探究肠道真菌与临床症状之间的关系,通过 Procrustes 分析 CSCZ 中真菌群落与所有代谢物的关系。

结果 CSCZ 组与 HC 组相比,肠道真菌群落的 α 多样性偏低,即物种组成的多样性及均匀度降低,PCoA 分析显示,两组间肠道真菌群落组成有显著差异。通过属和种水平的差异真菌种类,能够有效地将 CSCZ 组和 HC 组区分开来。肠型分析将所有入组人群分为2种肠型,肠型1(Candida 占优势)和肠型2(Saccharomyces 占优势)。与 HC 组相比,CSCZ 患者肠型1的个体明显减少,肠型2的个体明显增多。在 CSCZ 患者中,肠型1的患者 PANSS 阳性症状因子评分(PANSS-FSPS)和抑郁因子评分明显高于肠型2的 CSCZ 患者。相关分析显示,属水平的 Candida 与抑郁因子评分正相关,而属于 Candida 的物种及操作分类单元(OTUs)也与抑郁因子评分呈正相关(P 均 < 0.05)。粪便差异代谢物分析发现 1239 个差异代谢物,通过这些代谢物可以明显区分 CSCZ 组与 HC 组。CSCZ 患者肠道真菌改变与粪便代谢物之间存在显著相关性。

结论 1. CSCZ 患者存在肠道真菌群落结构及特性的差异,提示肠道真菌群落失调与 CSCZ 的发病有关;

2. CSCZ 患者粪便代谢组学具有特征性的改变,提示粪便代谢组学改变与 CSCZ 的发病有关;

3. 肠道真菌相关的代谢物改变与免疫状态显著相关,提示肠道真菌可能通过炎症及代谢通路影响 CSCZ。

南京脑科医院

目的 分析不同激越严重程度精神分裂症患者中炎症失衡和眶额叶皮层(orbitofrontal cortex, OFC)亚区结构的差异, 探讨炎症失衡和 OFC 亚区结构之间的关系, 探索炎症失衡和 OFC 在精神分裂症患者激越发生机制中可能的作用。

方法 选取 18~65 岁住院精神分裂症患者 119 例, 采用酶联免疫(Elisa)法检测所有研究对象的血浆促炎细胞因子 IL-1 β 、IL-2、IL-5、IL-6、IL-8、IL-12p70、IL-17、TNF- α 、IFN- α 和 IFN- γ , 抗炎细胞因子 IL-4 和 IL-10 浓度。评估患者免疫炎症反应系统和代偿性免疫调节反射系统(immune-inflammatory response system/compensatory immune-regulatory reflex system, IRS/CIRS)反映炎症失衡水平。免疫生物标志物主要包括巨噬细胞 M1、T 辅助细胞(Th)、Th-1、Th-2、Th-17 和 T 调节细胞因子(Treg)。采用结构磁共振成像检查, 利用 freesurfer 软件提取大脑 OFC 亚区灰质体积和皮层厚度。采用简明精神病评定量表(BPRS)评估患者精神病性症状严重程度, 简易激越评定量表(BARS)评估患者激越严重程度。根据患者 BARS 评分进行两步聚类分析, 将患者分为高激越组和低激越组。采用协方差分析进行组间差异性检验。采用偏相关分析, 分析细胞因子失衡与 OFC 亚区结构的相关性。筛选出显著相关的组合, 使用调节模型评估激越是否成为细胞因子失衡和 OFC 亚区结构之间关系的显著调节因子。

结果 与低激越组相比, 高激越组 IL-5(F=7.428)和 IL-6(F=10.409)水平显著降低(FDR 矫正, P<0.05), 细胞因子失衡 Th-2(F=9.632)和 M1(F=7.162)水平显著降低(FDR 矫正, P<0.05)。两组 OFC 亚区灰质体积和皮层厚度无显著差异。高激越组左侧外侧 OFC 体积增加与 M1+TH1+TH17/TH2+Treg(r=-0.394, P=0.042)和 IRS/CIRS(r=-0.496, P=0.008)比率呈负相关。调节模型显示, 激越严重程度显著调节左侧外

侧 OFC 体积和 IRS/CIRS 比率之间的关系(F=5.332, P=0.024)。

结论 激越精神分裂症患者促炎和抗炎细胞因子水平上升, 存在炎症失衡。高激越精神分裂症患者炎症失衡水平和左侧外侧 OFC 体积具有相关性, 并且受到激越严重程度的调节。炎症失衡和左侧外侧 OFC 体积可能参与了精神分裂症激越发生的机制。

精神分裂症患者家庭照顾者照顾体验现状及影响因素研究

孔娣¹ 张永淑²

1.成都市第四人民医院
2.遵义医科大学

目的 了解精神分裂症患者家庭照顾者心理困扰和积极感受现状, 探讨精神分裂症患者家庭照顾者心理困扰及积极感受的影响因素, 为临床工作中提高精神分裂症患者家庭照顾者积极感受水平, 降低心理困扰制定个性化的护理干预方案提供参考。

方法 选取 2023 年 2 月-2023 年 8 月到成都市第四人民医院就诊的 192 例精神分裂症患者的家庭照顾者作为研究对象, 进行问卷调查。研究工具: 一般资料调查表、PANSS 量表、社会支持评定量表、ZBI 照顾者负担量表、心理痛苦管理筛查工具(DMSM)、照顾者积极感受量表、家庭功能评定量表、简易应对方式问卷和简易心理弹性问卷。

结果 (1) 心理困扰平均分为 8.68 \pm 1.67, 心理困扰得分大于等于 6 的有 92.7%; 积极感受平均分为 29.76 \pm 6.41。

(2) 患者因素(婚姻状况、疾病了解程度、暴力行为史、冲动行为史)和照顾者因素(性别、与患者关系、每日照顾时长)在心理困扰得分之间的差异有统计学意义(P<0.05)。

(3) 照顾负担、PANSS 量表与心理困扰呈正相关(r=0.210~0.574, P<0.01), 心理弹性、家庭功能、应对方式及社会支持与心理困扰呈负相关(r=-0.289~0.543, P<0.01); 心理弹性、家庭功能应对方式与积极感受呈正相关(r=0.350~0.527, P<0.01), 照顾负担

及 PANSS 量表与积极感受呈负相关($r=-0.273 \sim 0.301$, $P<0.01$)

结论 (1)精神分裂症患者家庭照顾者心理困扰普遍存在且程度较重, 92.7%照顾者出现显著的心理困扰, 急需减轻; 其主要影响因素包括患者婚姻状况、阳性症状、照顾者照顾角色、每日照顾时长、心理弹性、照顾负担、问题解决等。

(2)精神分裂症患者家庭照顾者的积极感受水平处于中等偏下水平, 有待提高; 其主要影响因素包括患者疾病家族史、阳性症状、照顾者家中有无其他需要照顾的人、心理弹性、积极应对。

(3)在临床工作中, 医务人员应重视精神分裂症患者家庭照顾者的心理健康状况, 综合考虑上述影响因素, 为提高照顾者积极感受开展针对性、动态性、整体性的干预措施。

Brain eQTLs of European, African American, and Asian Ancestry Improve Interpretation of Schizophrenia GWAS

Yu Chen Chao Chen*

Central South University

Objective Research on brain expression quantitative trait loci (eQTLs) has illuminated the genetic underpinnings of schizophrenia (SCZ). Yet, the majority of these studies have been centered on European populations, leading to a constrained understanding of population diversities and disease risks. The purpose of this study is to enhance the interpretation of schizophrenia Genome-Wide Association Studies (GWAS) by integrating brain eQTLs from individuals of European, African American, and Asian ancestry

Methods Our data pool comprised genotype and RNA-seq data of AA ($n=158$) and EUR ($n=408$) from the PsychENCODE Consortium and EAS ($n=217$) from the Chinese Human Brain Bank. We conducted a comprehensive analysis of cis-eQTLs across different populations, leveraging a 5% empirical gene-level false discovery rate threshold. To investigate the genomic

features of these cis-eQTLs, we evaluated the SNP distributions and locations relative to various functional regions. To evaluate the effect sizes across populations, we conducted a correlation test of effect size values between the EUR and non-EUR populations. To determine if eQTLs detected from a specific population could explain the disease GWAS signals and SNP-based disease heritability better than eQTLs from non-matching populations, we employed the partitioned LD-score regression (LDSR) approach to assess the GWAS signal enrichment of these eQTLs. To uncover risk genes and pathways for SCZ in non-EUR populations, we used TWAS, regulatory Trait Concordance (RTC), and summary data-based mendelian randomization (SMR) to prioritize SCZ candidate risk genes in non-EUR populations and compared them with risk genes

Results Comparing eQTLs between EUR and non-EUR populations revealed concordant patterns of genetic regulatory effects, especially in eQTL effect sizes. However, 343,737 cis-eQTLs (representing approximately 17% of all eQTL pairs) linked to 1,276 genes (about 10% of all eGenes) and 198,769 SNPs (approximately 16% of all eSNPs) were unique to non-EUR populations. Over 90% of observed population differences in eQTLs were attributed to differences in allele frequency, with 35% of these eQTLs being notably rare ($MAF < 0.05$) in the EUR population. Integrating brain eQTLs with SCZ signals from diverse populations showed higher disease heritability enrichment of brain eQTLs in matched populations compared to mismatched ones. Prioritization analysis identified seven new risk genes (SFXN2, RP11-282018.3, CYP17A1, VPS37B, DENR, FTCDNL1, and NT5DC2), and three potential novel regulatory variants in known risk genes (CNNM2, C12orf65, and MPHOSPH9) that were missed in the EUR dataset

Conclusion Our findings underscore that increasing genetic ancestral diversity is more effective for improving analytical power than merely increasing the sample size within single-ancestry eQTL datasets. This approach not only enhances our understanding of the biological underpinnings of population structures but also facilitates the identification of novel risk genes in SCZ

Population diversity

Untargeted Metabolomics-based Understanding of The Serum Metabolic Profiles in Schizophrenia Patients with Antipsychotic-induced Tardive Dyskinesia

Chenghao Lu Yeqing Dong Shen Li* Jie Li
Tianjin Anding Hospital

Objective The treatment of schizophrenia (SZ) primarily relies on antipsychotics (APs), but their long-term use often leads to tardive dyskinesia (TD). The mechanisms by which APs cause TD are complex and involve multiple biological pathways. However, the specific metabolic pathways and biomarkers associated with TD remain unclear. Therefore, we employed untargeted metabolomics to explore the potential biological mechanisms underlying AP-induced TD. This study hypothesizes that schizophrenia patients with AP-induced TD exhibit distinct metabolic profiles compared to those without TD

Methods This study recruited 84 SZ patients with TD and 160 SZ patients without TD. The diagnosis of TD was based on the Schooler-Kane criteria, with the severity of TD and clinical symptoms of SZ patients evaluated using the AIMS and PANSS scales, respectively. Fasting blood samples were collected from all participants, followed by untargeted liquid chromatography-mass spectrometry (LC-MS) metabolomics analysis. Orthogonal partial least squares discriminant analysis (OPLS-DA) models were used to identify differential metabolites, and partial correlation analysis and receiver operating characteristic (ROC) curves were employed to determine TD biomarkers

Results In AP-induced TD, 57 metabolites were significantly altered ($VIP > 1$, $p < 0.05$), primarily affecting the biosynthesis of phenylalanine, tyrosine, and tryptophan ($p = 0.025$, Impact: 0.5) and phenylalanine metabolism ($p = 0.05$, Impact: 0.36). Among these, 18 metabolites were significantly correlated with the severity of TD (all $ps < 0.05$). Additionally, L-phenylalanine

and gamma-Glu-Thr had area under the curves (AUCs) of 0.727 and 0.704, respectively, for diagnosing TD, and their combined AUC reached 0.78

Conclusion Our study indicates that AP-induced TD is primarily associated with the phenylalanine metabolic pathway, with L-phenylalanine serving as a potential biomarker for distinguishing TD. This provides insights into the metabolic pathways and biological markers involved in AP-induced TD.

Effects of Sweet Dream Oral Liquid in Male Schizophrenic Patients on Long-term Atypical Antipsychotic Medication: A Double-center Prospective Randomized Controlled Trial

Xiaoyue Wang*
Wuhan Mental Health Center

Objective This study aimed to assess the effects of Sweet Dream Oral Liquid on cognitive function, sexual function, extrapyramidal responses, and serum prolactin levels in male schizophrenic patients undergoing long-term treatment with atypical antipsychotics

Methods We selected 120 male schizophrenic patients receiving long-term atypical antipsychotics at Wuhan Mental Health Center and Huanggang Provincial Veterans Administration Hospital from September 1, 2022, to March 2024. The control group received conventional drug treatment, while the experimental group received Sweet Dream Oral Liquid 10ml twice daily in addition to conventional treatment. Clinical assessments included the Hamilton Depression Rating Scale for symptom evaluation, the A Rating Scale for Extrapyramidal Side Effects for extrapyramidal reactions, the Montreal Cognitive Assessment for cognitive function, the Arizona Sexual Experience Scale for sexual dysfunction, and measurement of prolactin levels. Brain-derived neurotrophic factor and interleukin-6 levels were also measured at baseline and after 8 weeks of

treatment to assess cytokine effects in schizophrenia patients

Results There were no significant differences in BMI, heart rate, blood pressure, PANSS scale scores, or IL-6 levels between the two groups before and after treatment (BMI: $P = 0.710$; HR: $P = 0.416$; DBP: $P = 0.182$; SBP: $P = 0.400$; PANSS: $P = 0.541$; IL-6: $P = 0.099$). In the experimental group, significant improvements were observed in MoCA scores ($P = 0.034$), increased BDNF levels ($P = 0.006$), decreased prolactin levels ($P = 0.001$), reduced RESES scores ($P = 0.000$), and lower ASEX scores ($P = 0.024$)

Conclusion Sweet Dream Oral Liquid may enhance cognitive function, reduce extrapyramidal responses and sexual dysfunction, and decrease prolactin levels in schizophrenic patients. These findings suggest potential adjunctive therapeutic benefits in schizophrenia treatment.

Head-to-head Comparisons of Serum Prolactin Elevation Induced by 9 Second-Generation Antipsychotics in A Large Cohort of Patients with Schizophrenia: Analysis From A Real-World Study Database

Lei Zhang Huafang Li*

Shanghai Mental Health Center, Shanghai Jiao Tong University School of Medicine

Objective Antipsychotic-induced hyperprolactinemia (HPRL) seriously affect long-term treatment outcome. Available data is insufficient to guide the monitoring and treatment of HPRL with second-generation antipsychotics (SGAs)

Methods Data from 10,363 schizophrenia inpatients (62,428 prolactin tests) receiving SGAs were retrieved from the inpatient electronic medical record system of a large mental health center. Stratified Cox proportional hazard regression was used to compare the

hazard ratios (HR) of HPRL associated with 9 SGAs

Results It is significant ($p < 0.001$) in the distribution of HPRL severity between different age and gender. Amisulpride (HR 2.02, 95%CI 1.60 to 2.63), risperidone (HR 1.91, 95%CI 1.65 to 2.23), and paliperidone (HR 1.47, 95%CI 1.11 to 1.95) have a higher risk of HPRL. The lower risk of HPRL including olanzapine (HR 0.79, 95%CI 0.67 to 0.93), quetiapine (HR 0.75, 95%CI 0.63 to 0.89), clozapine (HR 0.61, 95%CI 0.49 to 0.78), aripiprazole (HR 0.36, 95%CI 0.29 to 0.44). Ziprasidone (HR 1.12, 95%CI 0.88 to 1.44), and piperipilone (HR 0.60, 95%CI 0.17 to 2.13) were not significantly correlated with the risk of HPRL. Amisulpride (HR 2.46, 95%CI 1.75 to 3.47) had the highest risk of HPRL among male patients while risperidone (HR 2.05, 95%CI 1.68 to 2.50) among female patients

Conclusion Amisulpride, risperidone, and paliperidone have a higher risk of HPRL in schizophrenia patients while olanzapine, quetiapine and aripiprazole have a relatively lower risk. It is necessary to analyze comprehensively in terms of gender and age in schizophrenia with SGAs

Insomnia and Aggression in Stable Schizophrenic Patients: Mediating Role of Quality of Life

周若尘¹ 叶孟婷¹ 周晓琴²

1.安徽医科大学附属巢湖医院

2.安徽医科大学第二附属医院

Objective Aggression in schizophrenia patients is an issue of concern. Previous studies have shown that aggression in schizophrenia patients may be related to insomnia and quality of life to different extents. This study intended to explore the potential mediating role of quality of life in the relationship between aggression and insomnia among schizophrenia patients. In addition, demographic factors affecting aggression in schizophrenia patients were also explored. Methods 781 stable

patients aged 18-75 who met the ICD10 diagnosis of "schizophrenia" completed the the completed questionnaire. Aggression was assessed using the Modified Overt Aggression Scale (MOAS), sleep was assessed using the Insomnia Severity Index Scale (ISI), and quality of life was assessed using the five Likert options. Descriptive statistics and correlation analysis examined the correlation between aggression and other variables. The mediating role of quality of life in the association between insomnia and aggression was examined by path analysis.

Results A total of 781 patients participated in this study, and approximately 16% of schizophrenia patients were aggressive. By mediation test, the direct effect of insomnia on aggression was 0.147, and the mediating effect of quality of life on insomnia and aggression was 0.021. Specifically, for the four dimensions of the MOAS, the direct effect of insomnia on verbal aggression, aggression toward property, and aggression against oneself were 0.028, 0.032, and 0.023, respectively, with mediating effects of 0.003, 0.007, 0.006, and no mediating effect on physical aggression was found.

Conclusion This study showed that insomnia significantly influenced aggression in schizophrenia patients. Quality of life significantly mediates insomnia and aggression and plays a vital role in moderating aggression. Therefore, we suggest that future improvements in aggression in schizophrenia patients, while paying attention to the importance of sleep, could also start with quality of life to improve this problem from multiple perspectives

关键词：schizophrenia, aggression, insomnia, quality of life, mediating effect

纵向静息态功能磁共振成像变化揭示精神分裂症患者大脑局部功能及与症状和认知功能的关联

刘松^{1,3} 刘须振^{1,3} 陈安冉^{1,3} 韩唯一^{1,3} 张露文^{1,3}

2.河南省精神病医院精神科

3.河南省生物精神病学重点实验室

目的 本研究使用 Brainnetome Atlas 研究 SZ 患者治疗前后 rs-fMRI 指标的变化及其与症状和认知功能的关系。

方法 招募了来自新乡医学院第二附属医院的 109 名 SZ 患者。收集他们的基线和治疗后 8 周的影像学、PANSS 和 MATRICS 共识认知测试(MCCB)数据。预处理患者的原始图像,然后计算个体 ALFF、fALFF 和 ReHo 以评估大脑功能活动。使用 Matlab2020a 软件将 SZ 患者的 ALFF、fALFF 和 ReHo 映射到中科院 246 脑网络组图谱。使用配对样本 t 检验对 rs-fMRI 指标进行分析,并对结果进行 Bonferroni 校正。最后使用有差异脑区的 rs-fMRI 指标和 PANSS 减分率及 MCCB 减分率做关联分析,并对结果进行 Bonferroni 校正。

结果 与基线时相比,治疗 8 周后,患者的 ALFF 增加的脑区分布在额叶、顶叶、岛回、扣带回和基底节; ALFF 降低的脑区分布在颞叶和枕叶; fALFF 增加的脑区分布在颞叶、扣带回、基底节和丘脑; fALFF 降低的脑区分布在额叶、颞、顶叶和枕叶; ReHo 增加的脑区分布在额叶; ReHo 降低的脑区分布在额叶、颞叶、顶叶、岛回和枕叶。同时,枕叶的 200 亚区的基线 fALFF 与 MCCB 的符号编码和词语学习减分率呈正相关(r 均为 0.30, p 均为 0.039, Bonferroni 校正);额叶的 15 亚区基线 ReHo 与 PANSS 的阳性因子减分率呈负相关($r=-0.36$, $p=0.0033$, Bonferroni 校正);额叶的 23 亚区与 PANSS 的一般症状因子减分率呈负相关($r=-0.31$, $p=0.028$, Bonferroni 校正);颞叶的 106 亚区和枕叶的 196 亚区与 MCCB 的符号编码减分率呈正相关($r=0.32$ 和 0.33 , $p=0.032$ 和 0.023 , Bonferroni 校正)。

结论 本研究发现,治疗前后局部脑功能变化的脑区主要集中在额叶、颞叶和枕叶。额中回的两个亚区分别与阳性因素和一般症状的减少率呈负相关。枕叶的两个亚区与 MCCB 中的单词学习和符号编码呈正相关。这些发现为 SZ 功能活动异常假说提供了新的证据,并为临床诊断和疗效预测提供了潜在的神经生物学客观指标。

WNK1-NKCC1/KCC2 通路作为精神分裂症药理靶点的研究

刘森淇^{1,2,3} 赵长乐^{1,2,3} 范晓云^{1,2,3} 苏玺^{1,2,3} 李文强^{1,2,3} 吕路线^{1,2,3}

1. 新乡医学院第二附属医院, 河南省精神病医院
2. 河南省生物精神病学重点实验室
3. 河南省精神神经医学国际联合实验室

目的 兴奋-抑制(EI)失衡是精神分裂症(SZ)的主要病理生理学特征。有证据显示 SZ 患者存在 GABA 能系统缺陷。WNKs-NKCC1/KCC2 通路影响神经元内氯离子浓度调节 GABA 能神经元兴奋性-抑制性效应, 可能作为 SZ 的治疗靶点。

方法 临床分析

1.1 利用 PGC3 数据分析 WNKs-NKCC1/KCC2 通路相关基因的 SZ 遗传风险。

1.2 对 WNKs-NKCC1/KCC2 通路相关的基因集进行 GSEA 富集分析。

1.3 利用 GEO 数据库分析 WNKs 在 SZ 患者大脑中的表达。

动物实验:

2.1 SD 大鼠孕 9.5 天尾静脉注射 10 mg/kg 的 Poly I:C 或等体积生理盐水, 制备母孕期感染子代 SZ 大鼠模型, 进行炎症因子、行为学、WNK1、NKCC1、KCC2 分子检测。

2.2 SZ 模型大鼠给予安慰剂或 WNK1 抑制剂(WNK463, 腹腔注射 3 mg/kg)或 NKCC1 抑制剂(布美他尼, 腹腔注射 15 mg/kg)干预, 进行动物行为学和脑电活动记录。

2.3 动物行为学和脑电活动记录: 采用开放旷场、高架十字迷宫、Y 迷宫和前脉冲抑制(PPI)等行为学来观察焦虑、空间记忆、认知功能和感觉门控功能状态。采用在体电生理记录海马场电活性以及神经元放电。

采用统计软件 SPSS 26.0, 独立样本 t 检验或单因素方差分析方法进行统计分析, $P < 0.05$ 代表差异具有统计学意义。

结果 遗传学研究鉴定出 WNKs-NKCC1/KCC2 通路相关基因中的 19 个基因的 984 个 SNPs 与 SZ 存在遗传关联。

WNKs-NKCC1/KCC2 通路相关基因在精神分

裂症组显著富集表达, 表明 WNKs-NKCC1/KCC2 通路在 SZ 中失调。

WNK1-4 的 mRNA 水平在纹状体、海马、前额叶皮层和小脑等不同脑区均显著升高。

与对照组相比, SZ 模型组大鼠炎症因子 IL-6、IL-1 β 和 TNF- α 表达水平明显升高。SZ 模型组大鼠在开放旷场中心区域探索减少, 在高架十字迷宫进入开放臂的次数和时间均减少, 在 Y 迷宫实验进入新异臂的次数和时间均减少, 在 PPI 实验 75dB、80dB 及 85dB 抑制率均降低, 提示 SZ 模型组大鼠存在焦虑水平增加、空间记忆、认知功能和感觉门控受损。同时, SZ 模型组大鼠海马区 WNK1 和 NKCC1 蛋白水平显著升高, KCC2 蛋白水平显著降低。

WNK463 以及布美他尼干预后, 大鼠精神分裂症样行为得到改善, 且海马 CA1 区 γ 和 β 波段的异常低频场电信号得到改善, 神经元放电频率降低。

结论 WNKs-NKCC1/KCC2 通路参与 SZ 相关行为和脑电异常, 具有可作为精神分裂症治疗靶点的潜在价值。

Differences in Cognitive Function and Serum Markers between Responders and Non-responders with Schizophrenia after Electroconvulsive Therapy

李玉婷¹ 董英博¹ 汤忆琳¹ 徐国新¹ 曹沛煜¹ 李润达² 隋毓秀¹

1. 南京脑科医院

2. 范德堡大学

Objective Electroconvulsive therapy (ECT) is considered one of the most effective physical treatments for schizophrenia, yet there are still some patients who do not respond to ECT at the clinical level. The difference in the response rate among patients may be related to multiple factors, such as the cognitive function, inflammatory reactions, the alterations in brain function and structure, etc. This retrospective study investigated

cognitive function disparities post-ECT between responders and non-responders with schizophrenia. Additionally, serum markers were examined to identify potential factors influencing these cognitive differences.

Methods The study encompassed patients with schizophrenia who underwent ECT at Nanjing Brain Hospital from June 2023 to January 2024. The ECT response was determined by at least a 50% reduction in the Brief Psychiatric Rating Scale (BPRS) total score. Assessment of cognitive function and serum marker collection were conducted at the study's outset and upon the completion of ECT. At baseline, the categorical variables among subgroups were analyzed by chi-square tests. For continuous variables, an independent samples t-test was conducted. At the end of the ECT course, multivariate analyses of variance (MANCOVA) were used to analyze the differences in cognitive function and serum markers among the subgroups. In addition, paired sample t-tests were used to compare cognitive function and serum markers pre- and post-ECT. P values less than 0.05 were regarded as statistically significant.

Results The study included 49 non-responders and 51 responders with schizophrenia post-ECT. Initial assessments revealed no significant differences in cognitive function or serum marker levels. Post-ECT, responders demonstrated superior performance in visual learning and autobiographical memory test (AMT). Additionally, higher levels of interleukin-4 (IL-4), interleukin-12P70 (IL-12P70) and tumor necrosis factor- α (TNF- α) were detected in the response group than non-response group.

Conclusion The study indicated that responders with schizophrenia exhibit enhanced cognitive performance post-ECT, particularly in visual learning and AMT. Serum markers such as IL-4, IL-12P70 and TNF- α might play a role in mediating these cognitive differences between response and non-response subgroups. These findings suggest a potential biomarker-based approach to understanding and predicting cognitive outcomes in schizophrenia treatment

Objective Schizophrenia (SCZ) and psychotic bipolar disorder (PBD) are two major psychotic disorders with similar symptoms and tight associations on the psychopathological level, posing a clinical challenge for their differentiation. This study aimed to investigate and compare the structural connectivity patterns of the limbic system between SCZ and PBD, and to identify specific regional disruptions associated with psychiatric symptoms. **Methods** Using sMRI data from 146 SCZ, 160 PBD, and 145 healthy control (HC) participants, we employed a data-driven approach to segment the hippocampus, thalamus, hypothalamus, amygdala, and cingulate cortex into subregions. We then investigated the structural connectivity patterns between these subregions at the global and nodal levels. Additionally, we assessed psychotic symptoms by utilizing the subscales of the Brief Psychiatric Rating Scale (BPRS) to examine correlations between symptom severity and network metrics between groups.

Results Patients with SCZ and PBD exhibited significantly weaker integration and segregation of the limbic system compared to HC, with SCZ showing more severe alterations. The most notable structural disruptions were observed in the hippocampus, thalamus and cingulate cortex, which correlated with different psychotic symptoms, respectively.

Conclusion This study provides evidence of distinct structural connectivity disruptions in the limbic system of patients with SCZ and PBD. These findings

might contribute to our understanding of the neuropathological basis for distinguishing SCZ and BD

DLG2 基因在精神分裂症中作用的新认识: 一项 fMRI 病例对照研究

朱涵育^{1,2} 李文强^{1,2} 张燕^{1,2}

1. 新乡医学院第二附属医院, 河南省精神病医院

2. 河南省生物精神病学重点实验室?

目的 旨在探索 DLG2 基因 rs11607886 多态性位点与精神分裂症的易感性, 以及不同基因型下与大脑功能、精神症状严重程度和认知功能的相关性。探究 DLG2 基因在精神分裂症脑功能改变的重要作用, 为遗传标志的价值提供基础。

方法 选取 DLG2 基因单核苷酸多态性(SNP)位点, 通过使用在线分析工具 SHEsis 分析 SNP 的等位基因频率和基因型频率在病例组 (n=350) 和对照组 (n=401) 之间的差异。总共纳入 123 名参与者的脑功能影像 (fMRI) 数据, 其中病例组 (n=49) 和对照组 (n=74), 使用 DPARSF、SPM 等工具包对脑功能影像数据进行预处理、分析以及提值。使用 SPSS 软件进行人口统计学分析, 差异脑区数值与临床症状数据进行分析。

结果 1. DLG2 基因的 rs11607886 与精神分裂症存在显著关联性 ($P=0.004$ 、 $P=0.002$); 2. 分析区域一致性 (ReHo) 发现, 以基因型为主效应在左侧楔前叶有显著差异, 事后 t 检验发现携带 A 等位基因组 ReHo 值更低。以诊断为主效应发现在左侧眶部额上回、右侧尾状核和左侧补充运动区有显著差异, 事后 t 检验发现精神分裂症患者右侧尾状核和左侧补充运动区的 ReHo 增加, 左侧眶部额上回的 ReHo 减少; 3. 分析低频振荡振幅 (ALFF) 发现, 在左侧楔前叶中观察到基因型与诊断有显著的交互作用, 事后 t 检验显示携带 GG 纯合子的精神分裂症患者 ALFF 值明显高于携带 GG 纯合子的对照组以及和携带 A 等位基因的 SZ 的携带者; 4. 以左侧楔前叶为感兴趣区域, 分析功能连接 (FC) 发现在左侧颞下叶、右侧梭状回、右侧颞中叶和右侧前扣带回发现基因型与诊断有显著的交互作用 (体素水平

P 均 <0.005 , 聚类水平 P 均 <0.05 , GRF 校正); 5. 对于 DLG2 A 等位基因携带者, 右侧梭形回-左侧楔前叶 FC 与符号编码评分显著负相关 ($P<0.001$); 与语义流畅度评分显著负相关 ($P<0.001$)。右侧颞中回-左楔前叶 FC 与符号编码评分呈负相关 ($P=0.018$); 与语义流畅度评分呈负相关 ($P=0.038$)。

结论 本研究发现了 DLG2 基因的 1 个 SNP 与精神分裂症显著关联。进一步研究发现 DLG2 rs11607886 基因多态性与大脑功能和临床症状之间的关联性, 提示楔前叶在精神分裂症中的重要作用。为进一步理解精神分裂症脑影像神经遗传学机制提供支持。

Cortical Morphometric Similarity Gradient in Schizophrenia and Its Association with Transcriptional Profiles and Clinical Phenotype

周之禄^{1,2} 生龙雨^{1,2} 杨勇锋^{1,2} 李文强^{1,2} 吕路线^{1,2} 韩勇^{1,2}

1. 新乡医学院第二附属医院

2. 河南省生物精神病学重点实验室

Objective Recent research has indicated that functional network gradient changes are present in schizophrenia (SCZ). However, it is still completely unknown whether changes to the cortical morphometric similarity (MS) network gradient exist. This study is to investigate the potential differences in the principal MS gradient between individuals with SCZ and healthy controls, and how these differences relate to transcriptional profiles and clinical phenomenology. **Methods** MS network was constructed in this study, and the gradient of the network was computed in 203 patients with SCZ and 201 healthy controls who shared the same demographics in terms of age and gender. To examine irregularities in the MS network gradient, between-group comparisons were carried out, and partial least squares regression analysis was used to study the relationships between the MS network gradient-based variations in

SCZ and gene expression patterns and clinical phenotype.

Results In contrast to healthy controls, the principal MS gradient of patients with SCZ was primarily significantly lower in sensorimotor areas, and higher in more areas. In addition, the aberrant gradient pattern was spatially linked with the genes enriched for neurobiologically significant pathways and preferential expression in various brain regions and cortical layers. Furthermore, there were strong positive connections between the principal MS network gradient and the symptomatologic score in SCZ individuals.

Conclusion These findings showed changes in principal MS network gradient in SCZ and offered potential molecular explanations for the structural changes underpinning SCZ.

Profiling Expressing Features of Surface Proteins on Single-Exosome in First-episode Schizophrenia Patients: A Preliminary Study

张思杰 廖爱军 王玉珏 刘芊 欧阳丽君 彭会清 袁柳 赵琳琳 杨心博 陈晓岗 贺莹* 李宗昌*

中南大学湘雅二医院精神科, 国家精神心理疾病临床医学研究中心, 国家精神疾病医学中心, 中国湖南省长沙市, 410011

Objective Previous evidence indicates that exosomes involve in the pathogenesis of schizophrenia (SCZ). Traditional bulk analysis may lead to loss of tissue- or disease-specific information of exosomes. To address this, we employed the proximity barcoding assay (PBA), an innovative method for single-exosome analysis, to profile the surface proteins expressing features of individual exosomes in SCZ patients.

Methods Fifty first-episode patients were collected for plasma and assessed for cognitive functions at baseline. After receiving risperidone for 3 months, patients were classified as either responders (RES) or non-

responders (NRES). Baseline plasma samples from patients with the top 10 RES and bottom 10 NRES, as well as 10 matched healthy controls (HCs), were used for PBA.

Results FN1, ITGB3, PECAM1, ITGA6, and CD5 exhibited differential expression between SCZ and HC, with an AUC up to 0.805 in ROC analysis. For NRES and RES, ITGB3, CD33, CD40, CD36, TENM2, and EGFR displayed differential expression, with an AUC up to 0.87 in ROC analysis. Furthermore, two clusters predominantly expressing PECAM1, ITGB3, ITGA6 and ITGB1, exhibited an increasing trend in proportion in SCZ. Moreover, PECAM1, ITGB3, ITGA6 and FN1 were negatively associated with visual memory and processing speed.

Conclusion Our study elucidated that exosome surface proteins PECAM1, ITGB3, ITGA6, FN1 and CD5 could serve as diagnostic potential biomarkers, while ITGB3, CD33, CD40, CD36, TENM2 and EGFR could serve as prognostic potential biomarkers in SCZ. Moreover, Exosome subpopulations featuring expression of PECAM1, ITGB3, ITGA6 and ITGB1 were associated with SCZ

CBT 研究协作组

Exploring Genetic Markers for Predicting CBT Response in OCD: A Systematic Review

Zhanjiang Li* Yu Chen Pengchong Wang
Beijing Anding Hospital, Capital Medical University
Department of Clinical Psychology

Objective Genetic alterations are recognized to play an essential role in the pathogenesis of OCD. CBT, a therapy for OCD, increasing research has demonstrated that its efficacy is related to genetic polymorphisms and DNA methylation. This review aimed to evaluate the correlation between alterations occurring genetically or epigenetically and the effectiveness of CBT in patients with OCD.

Methods Systematic searching of Web of Science, PubMed and CNKI were performed (1984 - May 2024) using the following medical subject headings (or similar headings) or text word terms: (((Disorder, Obsessive-Compulsive) OR (Disorders, Obsessive-Compulsive)) OR ((Obsessive Compulsive Disorder))) OR (((Obsessive-Compulsive Disorders))) AND (((Cognitive Behavioral Therapy) OR (Behavior Therapy)) OR ((Cognition))) OR (((CBT))) AND ((gene) OR (genes)). All articles identified in English or Chinese were evaluated. Randomized, controlled clinical trials involving humans were prioritized in the review

Results Eight articles were identified finally, and the following genes associated with OCD have genetic alterations related to CBT treatment efficacy. A gene associated with the genetic polymorphism is BDNF, whereas the epigenetic alterations occur in MAOA, SLC6A4, OXTR, PIWIL1, MIR886, PLEKHA1, KCNQ1, TRPM8, HEBP1, HTR7P1, MAPK8IP3, ENAH, RABGGTB (SNORD45C), MYEF2, GALK2, CEP192, and UIMC1

Conclusion Genetic markers could inform clinical treatment decisions for psycho-therapeutic interventions. Brain dysfunction could be a crucial mechanism affecting CBT. Future studies may focus on more candidate genes of OCD to predict CBT efficiency while

combining endophenotypes that reflect brain function and directions of specific OCD symptom dimensions

Influence of Family Environment and Obsessive Beliefs on The Developmental Trajectory of Internet Addiction Among College Students: A Two-year Follow-up Study

Chen Tan Jinqiang Zhang*
The Third Xiangya Hospital

Objective The youth during the college stage is of high-risk for internet addiction (IA) due to the high popularity and accessibility of internet. Understanding the developmental trajectory of IA and its influencing factors is critical for developing precise strategies for prevention and intervention among youth in college. The current study aimed to investigate the developmental trend and latent trajectory classes of IA, as well as the impact of family environment and obsessive beliefs on IA's growth trajectory. Furthermore, we mapped the road from the family environment and obsessive beliefs to followed-up IA in youth

Methods This study followed-up 3575 Chinese college students (Mage = 18.00, SD = 0.67; 65.29% girls at Wave 1) at three time points, using one-year assessment intervals

Results Employing a Latent Growth Mixture Model, we identified four trajectories of IA. Further using a Latent Growth Curve Model, we found that both family environment and obsessive beliefs significantly affected the intercept and linear slope of IA trajectory. The multivariate logistic regression analysis showed that negative family environment and obsessive beliefs served as significant predictors for IA classifications. Finally, the Structural Equation Modeling demonstrated a significant partial mediation effect of obsessive beliefs between family environment and followed-up IA. This study provided solid empirical evidence showing the

significant influence of family environment and obsessive beliefs on the initial level and growth rate of IA. Importantly, family environment not only influences the IA development directly, but also exerts its influence indirectly through the mediating effect of obsessive beliefs

Conclusion It is important to consider individual differences in understanding the developmental patterns of IA among youth. Identifying family and cognitive predictors with different developmental trajectories of IA, which may help to understand better risk factors related to specific developmental patterns of IA. Our findings emphasize the necessity of targeted interventions on the family environment and obsessive beliefs in youth for IA.

NAC 介导 ATF4 RNA 甲基化修饰抑制海马神经元焦亡治疗创伤后应激障碍认知功能障碍的研究

苏朝霞*
海南医学院

目的 探讨 N-乙酰半胱氨酸(N-acetylcysteine, NAC)介导 ATF4 RNA 甲基化修饰抑制海马神经元焦亡治疗创伤后应激障碍(Post Traumatic Stress Disorder, PTSD)认知功能障碍的机制。

方法 通过单次延长应激(single prolonged stress, SPS)法构建 PTSD 症状小鼠,使用 NAC 治疗 PTSD 症状小鼠。Morris 水迷宫实验和旷场试验检测小鼠认知功能。免疫组化检测海马区神经元标记物 NeuN 的阳性细胞数。qRT-PCR 检测 ATF4 mRNA 水平。WB 检测 GSDMD-N、cleaved-caspase-1 和 ATF4 蛋白表达。LDH 检测细胞死亡。ELISA 检测 IL-1 β 、IL-18 水平。SRAMP 数据库和预测 ATF4 m6A 甲基化修饰位点。Me-RIP 试验检测 ATF4 m6A 甲基化修饰水平。

结果 相比 Con 组,SPS 组小鼠潜伏逃逸期明显延长,平台停留时间、进入中央区域次数和中心

区域运动距离的百分比显著降低,出现认知功能障碍;同时海马神经元数量显著减少,焦亡相关蛋白 GSDMD-N 和 cleaved-caspase-1 水平、LDH 活性、IL-1 β 和 IL-18 水平均显著上调。使用 NAC 治疗后,显著改善了 PTSD 症状小鼠认知功能障碍,明显抑制 PTSD 症状小鼠海马神经元焦亡。NAC 通过介导 m6A 甲基化修饰下调 ATF4 的表达。过表达 ATF4 部分逆转 NAC 对 PTSD 症状小鼠海马神经元焦亡的抑制和认知功能的改善作用。

结论 NAC 介导 ATF4 RNA 甲基化修饰,抑制海马神经元焦亡,从而改善 PTSD 认知功能障碍,为明确 PTSD 发病机制提供了部分理论依据,也为治疗 PTSD 提供了新的思路。

关键词: PTSD; NAC; 认知功能障碍; 海马神经元; 焦亡; ATF4; m6A 甲基化修饰

慢性失眠障碍合并焦虑/抑郁患者强化失眠认知行为治疗的随机对照研究

罗鑫¹ 苑成梅¹ 李静茹² 卢静芳³ 葛方梅⁴ 张洁¹
张晶¹ 孙莞绮¹ 赵文清¹ 师彬彬¹
1.上海交通大学附属精神卫生中心
2.中南大学大学生心理健康教育中心
3.常州市儿童医院临床心理科
4.上海市普陀区精神卫生中心临医务科

目的 与常规失眠认知行为治疗(Cognitive Behavioral Treatment of Insomnia, CBT-I)对照,探讨强化失眠认知行为治疗(CBT-I Plus)对慢性失眠障碍合并焦虑/抑郁症状患者的干预效果。

方法 共纳入慢性失眠障碍伴焦虑/抑郁症状患者 148 例,按照随机数字表将被试按照 1:2 的比例随机分配至常规 CBT-I 组(n=54)和 CBT-I Plus 组(n=94),CBT-I Plus 组在 CBT-I 的基础上增加了对焦虑症状/抑郁症状的治疗内容。治疗时间共 8 周,分别在治疗开始前、治疗开始后第 2 周、第 4 周及第 8 周评估 PSQI、HAMD-17 和 HAMA 量表。采用配对样本 t 检验分别比较两组患者治疗前后分数的差异,采用重复测量方差分析比较两组治疗效果差异,采用协方差分析处理偏倚变量的影响。

结果 两组被试 PSQI、HAMD-17、HAMA 的总分与基线相比均有改善,差异具有统计学意义

($P<0.001$)。在控制药物使用情况和 HAMD-17 基线分数后, PSQI、HAMD-17、HAMA 分数变化的组间差异均未达到统计学意义 ($P>0.05$)。PSQI 的日间功能障碍因子分的时间与组别交互作用显著 ($F=4.87$, $P<0.01$)。

结论 强化失眠认知行为治疗(CBT-I Plus)对慢性失眠障碍合并焦虑/抑郁症状患者的睡眠状况及情绪均有改善作用, 但与常规 CBT-I 比较, 未显示出明显优势, 后续需要对干预时机、方案内容做更细致的探索。

团体认知行为治疗对未服药强迫症患者脑拓扑改变研究

张宗凤 贺艳 刘灵江*
宁波大学附属康宁医院

目的 团体认知行为治疗对强迫症患者网络拓扑属性改变尚不明确。本研究通过采集静息态功能磁共振数据及临床数据, 探究团体认知行为治疗前后脑拓扑改变。

方法 研究入组从未用药或 8 周以上未服药的强迫症患者 33 例, 健康对照 26 例, 来自社会招募。获取知情同意后进入研究, 采集两组被试一般人口学资料、临床资料以及磁共振数据, 强迫症患者进入 12 周团体认知行为治疗, 治疗 2 周、4 周、6 周、8 周及 12 周分别进行临床量表的评估随访, 12 周结束时再次采集临床数据以及磁共振数据。研究采用两样本 t 检验比较两组一般人口学资料; 基于 Matlab2012a 平台, 采用 GRETNA 软件分析基线强迫症组及健康对照组脑网络拓扑及小世界属性值, 及 GCBT 前后强迫症组脑网络拓扑及小世界属性值, 之后将强迫症组按照 Y-BOCS 减分率为 30% 进行分组 (有效组 vs 无效组), 比较两组基线及 GCBT 后脑网络拓扑及小世界属性值。

结果 研究共入组强迫症患者 33 例, 健康对照 26 例, 两组在性别、年龄及受教育年限上无显著差异; 基线 HAMD 及 HAMA 两组存在显著差异。所有被试在各个阈值上的小世界属性值均 >1 , 提示所有被试的脑网络的小世界属性均未遭到破坏; 两组

小世界属性、Eglob、Cp、比较差异有统计学意义。与 HC 相比, OCD 有 38 个脑区出现节点聚类系数升高, 主要位于额叶、扣带回、枕叶、顶叶, 另外还有颞叶、距状裂、楔叶、舌回、壳核等; 与 HC 相比, OCD 有 13 个脑区出现平均最短路径长度延长, 主要位于脑岛、海马旁回、尾状核、壳核、苍白球及丘脑, 另外还有杏仁核、缘上回等; 13 个脑区出现平均最短路径长度下降, 主要是扣带回、楔叶、楔前叶、枕中回、舌回; 与 HC 相比, OCD 有 35 个脑区出现节点全局效率下降, 主要位于额叶、脑岛、嗅觉皮层、后扣带回、海马、杏仁核、缘上回、尾状核、壳核、苍白球及颞中回, 另外还有角回、中央后回、海马旁回等; 与 HC 相比, OCD 有 8 个脑区出现节点全局效率下降, 主要位于嗅觉皮层、尾状核、颞上回、海马、海马旁回。OCD 组治疗 12 周结束, 3 人脱落, 10 人无效 (33.3%), 20 人有效 (66.7%), Y-BOCS、HAMD、HAMA 评分存在显著统计学差异。左侧后扣带回、左侧中央后回及左脑中央旁小叶聚类系数下降; 双侧扣带回中部最短路径长度下降及全局效率升高; 有效组较无效组在默认网络、边缘系统及经典 CSTC 环路脑区存在聚类系数及最短路径长度下降, 全局效率及局部效率的升高。

结论 GCBT 后扣带回聚类系数及最短路径长度改变, 有效组较无效组在默认网络、边缘系统及 CSTC 环路上存在拓扑属性差异。

基于虚拟现实平台的暴露治疗对恐高症干预有效性的神经机制研究

李昊伦 郭妹林 谢雅 张宁 王纯*
南京医科大学附属脑科医院

目的 暴露治疗是临床上针对恐怖症, 特别是恐高症的主要干预手段, 其疗效已得到大量研究的证实。相比较传统的现场暴露和想象暴露, 虚拟现实暴露治疗 (Virtual Reality Exposure Therapy, VRET) 具有安全、便捷等优点。本研究探索 VRET 在治疗恐高症上的有效性, 并运用功能磁共振方法揭示其作用机制。

方法 共纳入恐高症被试 40 名, 随机分成

VRET 组(n=21), 想象暴露治疗对照组(Imaginal Exposure Therapy, IET)(n=19), 两组患者分别接受为期 3 周, 每周 2 次, 共计 6 次暴露治疗, 所有被试采集与恐高和焦虑有关临床症状(恐高症问卷 AQ, 高度态度问卷 ATHQ, 行为回避测验 BAT, 广泛性焦虑量表 GAD-7), 静息态功能核磁共振影像学等数据。从脑网络角度, 运用独立成分分析的方法比较 VRET 作用的神经机制。

结果 重复测量方差分析比较发现, 两组在 AQ-焦虑 ($F=4.40, p=0.043$)、AQ-回避 ($F=4.80, p=0.035$) 和 BAT ($F=4.97, p=0.032$) 的临床量表评分上存在显著的交互效应, 而在 ATHQ 和 GAD-7 中无显著交互作用。进一步比较发现, VRET 组量表分差值大于 IET 组。影像学上, 在功能网络分析中发现, 视觉网络 (Visual Network, VIS) 内, VIS-SMN (Sensorimotor Network, 感觉运动网络)、VIS-CEN (Central Executive Network, 中央执行网络)、CB (Cerebellar, 小脑) -CEN 间存在交互作用。VRET 治疗后, VRET 组在 VIS 内 ($p=0.030$) 以及 VIS-SMN ($p=0.020$) 间的功能网络连接显著低于 IET 组。

结论 两种暴露治疗方案均可以缓解患者的恐怖和焦虑症状。与传统暴露治疗方法(IET)相比, 虚拟现实暴露治疗在疗效上更为显著。功能影像研究结果提示, VRET 有效性的潜在神经作用机制为通过调节 CEN 和 VIS 等网络的异常功能连接, 从而在缓解恐高症患者的核心症状方面发挥作用。

认知行为疗法对不同群体睡眠障碍的干预与效果研究分析

莫丽德·马拉提 张义* 陕晓嫣
新疆生产建设兵团总医院

目的 睡眠障碍作为一种普遍的心理健康问题, 广泛存在于青少年、青年、中年及老年等多个年龄群体之中, 对个体的生活质量造成了严重影响。近年来, 认知行为疗法作为一种非药物性的干预手段, 在睡眠障碍领域逐渐引起了广泛关注。大量科学研究与临床实践已充分验证了其在预防和干预睡眠障碍方面的显著作用。对认知行为疗法在睡眠障碍预

防与干预中的效果进行深入剖析与研究, 有助于我们更全面地了解其实际应用价值及潜力。本文将从睡眠障碍的基本概念、当前状况以及对不同年龄层个体健康的潜在影响出发, 深入探讨认知行为疗法在睡眠障碍治疗中的作用机理及其有效性。通过本研究, 我们旨在为睡眠障碍的治疗提供更为丰富的思路 and 多元化的方法选择, 以期提升患者的生活质量与心理健康水平。

方法 2021 年-2022 年在乌鲁木齐市第四人民医院心理科就诊的 102 例不同年龄段人群的睡眠障碍患者, 采用随机数字表法随机分为 CBT-i 组 (68 例) 和联合组 (34 例)。CBT-i 组仅给予 CBT-i 干预, 联合组给予 CBT-i 结合催眠药物递减方案干预。于基线、治疗第 4 周、治疗结束 (治疗第 8 周) 时, 记录各组的匹兹堡睡眠质量指数 (PSQI)、贝克抑郁量表 (BDI)、贝克焦虑量表 (BAI), 采用重复测量方差分析比较 2 组患者不同时点评分的情况。

结果 CBT-i 组与联合组治疗方案对失眠障碍治疗均有效, 前者在缩短入睡时间、提高睡眠效率方面优于后者, 后者的治疗方案可有效降低催眠药物使用频率。CBT-i 组与联合组治疗方案对失眠障碍治疗均有效, 前者在缩短入睡时间、提高睡眠效率方面优于后者, 后者的治疗方案可有效降低催眠药物使用频率。

结论 认知行为疗法在预防和干预睡眠障碍方面取得了显著的效果。通过调整患者的不良睡眠习惯、负面情绪和错误的认知, 认知行为疗法在改善睡眠质量和缓解睡眠障碍方面表现出了独特的优势。在实际应用中, 患者是否能够积极配合治疗、坚持练习相关的技巧和策略, 直接影响了认知行为疗法的预防和干预效果。此外, 认知行为疗法不仅对成人睡眠障碍有效, 对儿童和青少年的睡眠问题也具有有良好的干预效果。这表明认知行为疗法在不同年龄群体中都具有普适性和可操作性。综上所述, 认知行为疗法在睡眠障碍的预防和干预中具有显著效果, 对改善不同年龄段患者的睡眠质量和生活质量起到了积极的作用。并且针对老年患者, 我们要考虑到长期使用药物治疗不仅容易造成依赖和耐受性, 还可能产生药物副作用。而认知行为疗法则是一种安全、有效的非药物治疗手段。在未来的临床实践中, 我们应该进一步推广和应用认知行为疗法, 以帮助更多不同年龄段的患者摆脱睡眠障碍的困扰。

绘画干预联合认知行为护理对青少年抑郁症患者抑郁症状及日常生活能力的影响

万小丽*

九江市第五人民医院

目的 研究绘画干预联合认知行为护理对青少年抑郁症患者抑郁症状及日常生活能力的影响。方法 以九江市第五人民医院 2020 年 1 月—2021 年 6 月收治的 60 例 12~18 岁抑郁症患者为研究对象,按随机数表法分为观察组(27 例)和对照组(33 例),对照组实施常规干预护理,观察组实施绘画干预联合认知行为护理,2 组均干预 8 周。观察并比较干预前、干预 8 周后 2 组患者的心理状态、生活能力、生活质量、护理满意度。

方法 对照组患者进行常规干预,包括入院健康宣教、用药指导、定时心理辅导、生活习惯和饮食指导。观察组患者进行绘画干预联合认知行为干预护理。统计学方法 采用 SPSS 19.0 统计学软件数据分析,计量资料以 $\bar{x} \pm s$ 表示,组间比较采用独立样本 t 检验,组内两时间点比较采用配对样本 t 检验, $P < 0.05$ 为差异有统计学意义。

结果 干预 8 周后 2 组患者的焦虑自评量表(self-rating anxiety scale, SAS)、抑郁自评量表(self-rating depression scale, SDS)、症状自评量表(symptom checklist 90, SCL-90)、日常生活活动力量表(activities of daily living, ADL)得分均较干预前下降,差异有统计学意义($P < 0.05$);干预 8 周后观察组 SAS、SDS、SCL-90、ADL 得分低于对照组,差异有统计学意义($P < 0.05$);干预 8 周后 2 组患者的护士用住院病人观察量表(nurses observation scale for inpatient evaluation, NOSIE)得分均较干预前上升,差异有统计学意义($P < 0.05$);干预 8 周后观察组 NOSIE 得分高于对照组,差异有统计学意义($P < 0.05$)。

结论 在青少年抑郁症患者中应用绘画干预联合认知行为护理能有效减缓其负性情绪、平衡其心理状态,更有助于提高患者日常生活能力。

强迫症目标导向-习惯学习系统神经网络多模态特征及认知行为治疗疗效预测研究

陈豪诚¹ 张焕² 李王越¹ 张雪迪¹ 王钟琪¹ 姜文静¹ 柳娜² 张宁¹

1.南京医科大学附属脑科医院

2.南京医科大学附属脑科医院心理科

目的 本研究旨在评估认知行为疗法(CBT)对强迫症患者目标导向与习惯学习相关脑区的结构和功能连接的调节作用,并开发一个预测 CBT 疗效的模型。

方法 研究纳入 30 例强迫症患者,他们接受了为期 8 周、共 16 次的 CBT 治疗,同时纳入 29 名匹配的健康对照组。通过 YBOCS、BAI、BDI 和 OCI-R 量表评估患者的临床症状,并收集治疗前后的神经影像数据。采用基于网络的统计分析(NBS)、网络平均连接强度和结构-功能耦合系数来比较 CBT 治疗前后患者与对照组的差异。双因素方差分析用于识别基线异常并在治疗后显著变化的结构/功能连接,结合交叉滞后路径模型(CLPM)评估这些连接对 CBT 疗效的预测能力。显著的结构或功能连接被纳入支持向量回归(SVR)算法中,以构建并评估预测模型的拟合度。

结果 CBT 治疗显著降低了患者的 YBOCS、BDI 和 OCI-R 总分及各子量表得分($p < 0.05$)。治疗后,患者的目标导向与习惯学习相关脑区的结构和功能网络差异显著缩小,且习惯学习网络的耦合系数与对照组无显著差异。治疗有效组和无效组均观察到具有显著预测作用的功能连接。患者脑网络功能连接的减弱与强迫症严重程度的改善存在预测关系,主要体现在目标导向网络(涉及尾状核、背外侧前额叶皮质和眶额皮质)和习惯学习网络(涉及壳核、中央前回和辅助运动区)。SVR 模型显示,多脑区联合指标对治疗效果的预测最为准确,其中习惯学习网络指标对强迫思维的改善预测最佳($r=0.901$, $p < 0.01$),目标导向网络指标对强迫行为的改善预测最佳($r=0.761$, $p < 0.001$)。

结论 CBT 治疗不仅有效缓解了强迫症的严重程度,还改善了目标导向与习惯学习系统之间的脑网络失衡。CBT 可能通过优化相关脑区间的网络通信来实现其治疗效果。治疗有效组与无效组可能存

在不同的神经调控机制,且 CBT 的疗效预测依赖于多个脑区或神经回路的协同正常化。

强化失眠认知行为治疗对失眠患者情绪、生活质量和治疗联盟的影响

卢静芳 苑成梅*

上海市精神卫生中心(上海市心理咨询培训中心)

目的 探讨强化失眠认知行为治疗(CBTI plus)对失眠障碍合并抑郁、焦虑患者负面情绪、生活质量和治疗联盟的影响。

方法 收集 2020 年 7 月至 2023 年 6 月上海市精神卫生中心门诊失眠障碍伴抑郁、焦虑症状患者 149 例,按照随机数字表将患者随机分配至 CBTI 组(n=54)和 CBTI plus 组(n=95),分别在基线、2 周、4 周及 8 周进行抑郁症状快速检查量表(QIDS-SR16)、广泛性焦虑量表(GAD-7)和生活质量问卷(QOL-6)评估,在治疗 2 周、4 周和 8 周进行治疗联盟问卷(WAI-S)评估。

结果 (1) 两组患者在汉密尔顿抑郁量表(HAMD-17)基线评分差异有统计学意义($t=-2.136$, $P=0.035$),其他基线数据差异无统计学意义。(2) 治疗期间总体脱落率为 14.2%(20/141),CBTI 组 19.6%(10/51),CBTI plus 组 11.1%(10/90),两组脱落率差异无统计学意义($\chi^2=1.931$, $P=0.165$)。 (3) 两组患者的 QIDS-SR16、GAD-7 量表分数与基线相比均有显著下降,时间主效应显著($F=93.382$, $P<0.01$; $F=63.825$, $P<0.01$),组间主效应与交互作用不显著;在 QOL-6 量表上, CBTI plus 组患者生活质量显著提高,时间主效应、组间主效应以及交互效应均有统计学意义($F=11.976$, $P<0.01$; $F=7.891$, $P<0.01$; $F=5.191$, $P<0.01$); CBTI plus 组治疗前后治疗联盟及其因子分数显著提升($P<0.01$ 或 $P<0.05$),但未达到组间显著性差异。

结论 传统 CBTI 与强化版 CBTI plus 对失眠障碍合并焦虑、抑郁症状患者的负面情绪均有改善作用, CBTI plus 可显著提高患者生活质量以及治疗联盟,有独特优势。

疗联盟,生活质量

强化失眠认知行为治疗对失眠患者主观睡眠认知和生活质量的影响

卢静芳 苑成梅*

上海市精神卫生中心(上海市心理咨询培训中心)

目的 探讨强化失眠认知行为治疗(CBTI plus)对失眠障碍合并抑郁、焦虑患者失眠严重程度、睡眠信念和态度以及生活质量的影响。

方法 收集 2020 年 7 月至 2023 年 6 月上海市精神卫生中心门诊失眠障碍伴抑郁、焦虑症状患者 149 例,按照随机数字表将患者随机分配至 CBTI 组(n=54)和 CBTI plus 组(n=95),分别在基线、治疗 2 周、4 周及 8 周进行失眠严重程度指数量表(ISI)、简式睡眠信念和态度量表(DBAS-16)以及生活质量问卷(QOL-6)评估。

结果 (1) 两组患者在汉密尔顿抑郁量表(HAMD-17)基线评分差异有统计学意义($t=-2.136$, $P=0.035$),其他基线数据差异无统计学意义。(2) 治疗期间总体脱落率为 14.2%(20/141),CBTI 组 19.6%(10/51),CBTI plus 组 11.1%(10/90),两组脱落率差异无统计学意义($\chi^2=1.931$, $P=0.165$)。 (3) 两组患者的 ISI、DBAS-16 及其分量表分数与基线比均有改善,时间主效应显著($F=110.375$, $P<0.01$; $F=60.273$, $P<0.01$),组别与交互作用不显著($F=0.457$, $P>0.05$; $F=1.520$, $P>0.05$)。 (4) 在 QOL-6 量表上,时间主效应、组间主效应以及交互效应均有统计学意义($F=11.976$, $P<0.01$, $F=7.891$, $P<0.01$; $F=5.191$, $P<0.01$)。

结论 CBTI 与强化版 CBTI plus 对失眠障碍合并焦虑、抑郁症状患者的失眠严重程度,睡眠信念和态度均有改善作用, CBTI plus 可较早改善后果因子和期望因子,并且可提高患者生活质量,脱落率低,有独特优势。

强迫症患者共情及情绪调节能力对认知行为

治疗疗效的影响

江伊程¹ 柳娜³ 吴雨¹ 邵晨晨² 赵霄²

1. 南京师范大学心理学院

2. 南京医科大学附属脑科医院

3. 南京医科大学附属脑科医院医学心理科

目的 强迫症 (obsessive-compulsive disorder, OCD) 是一种慢性的精神和行为障碍, 以强迫思维和强迫行为为主要表现, 认知行为治疗 (Cognitive Behavior Therapy, CBT) 如暴露与反应阻止治疗 (Exposure and Response Prevention, ERP) 是强迫症的一线心理治疗方法。共情及情绪调节能力可能影响强迫症的 CBT 治疗疗效, 本研究拟探讨其对强迫症认知行为治疗疗效的影响机制, 指导强迫症心理治疗新方向。

方法 研究共纳入 17 名强迫症患者, 进行为期八周共计 16 次的认知行为治疗的干预, 于治疗基线期 (T0) 使用中文版人际反应指数 (IRI-C)、简版情绪调节困难量表 (DERS-16) 评估共情及情绪调节能力, 于治疗基线期 (T0)、治疗 2 周 (T1)、治疗 4 周 (T2)、治疗 8 周 (T3) 使用 Y 耶鲁-布朗强迫量表 (Y-BOCS)、强迫症状分类量表修订版 (OCI-R)、贝克抑郁量表 (BDI)、贝克焦虑量表 (BAI)、席汉残疾量表 (SDS) 评估临床症状变化, 对测量结果进行差异检验、相关分析、回归分析, 探究认知行为治疗的疗效, 同时比较共情、情绪调节能力在不同时期对临床症状治疗疗效的预测作用。

结果 强化认知行为治疗 8 周后, 患者 Y-BOCS、BDI、OCI-R 量表得分显著下降, BAI、SDS 得分未显著下降, 治疗有效的强迫症患者 IRI-个人痛苦得分显著高于治疗无效的强迫症患者, 共情能力得分对治疗疗效无预测作用, DERS-目标定向行为投入困难得分负向预测治疗 2 周的 Y-BOCS 减分值。

结论 强化认知行为治疗可改善强迫症状及情绪症状, 其疗效与患者的情绪调节能力有关, 情绪调节困难在治疗早期对治疗疗效和症状改善有负面影响。

Driven Subtypes of Insomnia Disorder and The Efficacy of Cognitive-Behavioral Therapy

Dongbin Lyu Jie Zhang Caojun Ji Yang Wang Ruiyi Qian Xin Luo Tianhong Zhang Chengmei Yuan*
Shanghai Mental Health Center

Objective The use of data-driven subtypes allows for a more nuanced understanding of insomnia disorder (ID). This study aims to explore the association between subtypes of ID and the efficacy of cognitive-behavioral therapy (CBT-I).

Methods This study conducted a post-hoc analysis on data from 118 participants with ID and mild anxiety or depressive symptoms, who had completed an 8-week randomized controlled trial of CBT-I and CBT-I plus (CBT-I with mood symptom modules). K-means clustering analysis determined subtypes, and T-tests assessed differences in baseline, eight weeks, and changes in subjective total sleep time (sTST), Pittsburgh Sleep Quality Index (PSQI), Hamilton Depression Rating Scale (HAM-D), and Hamilton Anxiety Rating Scale (HAMA) scores.

Results Two clusters showed no significant demographic differences. Subtype 2 had poorer baseline sleep quality (PSQI: 16.59 vs 12.74, $p < 0.01$), higher depressive (HAM-D: 18.47 vs 13.21, $p < 0.01$) and anxiety levels (HAMA: 17.47 vs 13.46, $p < 0.01$), and shorter sTST (4.67 vs 6.09 hours, $p < 0.01$) compared to Subtype 1. Post-treatment, both subtypes improved, with Subtype 2 showing larger gains in sleep duration (csTST: 0.58 vs 1.77 hours, $p < 0.01$) and greater improvements in sleep quality (cPSQI: 6.92 vs 8.88, $p < 0.01$), depression (cHAM-D: 8.07 vs 10.59, $p < 0.01$), and anxiety (cHAMA: 9.28 vs 11.22, $p < 0.01$). Subtype 1 maintained better outcomes at 8 weeks. Within Cluster 1, CBT-I plus was more effective for depression (cHAM-D: $p = 0.016$), whereas CBT-I improved sTST in Cluster 2 ($p = 0.049$).

Conclusion The study highlights the heterogeneity of insomnia subtypes and their differential response to CBT-I and CBT-I plus, underscoring the need for personalized treatment strategies.

Dialectical Behaviour Therapy Group Skills Training Induces Changes in Spontaneous Brain Activity in Depressed Patients with Non-suicidal Self-injurious Behaviour: A Randomised Controlled Trial

maochun Lei¹, Chun Wang²

1.XIHUA UNIVERSITY

2.NANJING BRAIN HOSPITAL

Objective Non-suicidal self-injury (NSSI) is a serious public health problem widespread among adolescents, with a high degree of co-morbidity with major depressive disorder (MDD), which greatly impairs physical and mental health, and there is an urgent need to find effective treatments. This study will investigate the efficacy of dialectical behavior therapy group skills training (DBT-ST) on major depressive disorder accompanied by non-suicidal self-injurious behavior (N-MDD) and the changes in spontaneous brain activity induced by DBT-ST training

Methods Participants were 80 N-MDD patients, and 20 patients were recruited from each of the four hospitals using a multicenter clinical controlled study. Patients at each participating centre were randomised into two groups to receive either the DBT-ST intervention or the social support group therapy (SSGT) intervention for a period of 13 weeks on 13 occasions. Data from the ottawa self-Injury inventory (OSI), simplified suicide inventory (SSI), hamilton depression scale (HAMD) and functional magnetic resonance imaging (fMRI) scans were collected before and after the intervention. Demographic data, intergroup psychological scores were analysed using the statistical package IBM SPSS 23.0 statistics software (SPSS). Functional imaging data were analysed using DPARSF and SPM 12 based on MATLAB 2013a for the tamplitude of low-frequency fluctuations (ALFF), regional homogeneity (REHO),

and corrected ALFF and ReHo regions after DBT-ST intervention were used as seed points for whole-brain functional connectivity (FC) analyses, controlling for age, sub-centre, and sex of the subjects as covariates

Results The results of the study showed that both groups were effective in improving depressive symptoms and self-injurious behaviors, and the DBT-ST intervention was more significant in improving depression compared to SSGT. Resting-state data revealed that the DBT-ST group significantly reduced the ALFF of the right insula (INS.R) and the ReHo of the left insula (INS.L) compared to the SSGT group, meanwhile, the intervention in the DBT-ST group significantly suppressed the strength of FC in the salience network (SN) region, as evidenced by a significant reduction in the strength of FC between the INS.L and the right median cingulate and paracingulate gyri (DCG.R), the superior temporal gyrus (STG), the left temporal pole of the brain: middle temporal gyrus (TPomid.L), and the left middle frontal gyrus (MFG.L)

Conclusion These results suggest that DBT-ST intervention has better efficacy in N-MDD and has the potential to remodel the abnormal patterns of spontaneous brain activity in the relevant neural circuits and improve the abnormal activity of the SN region, especially the insula there

Objective Knowledge is lacking on the effectiveness of dialectical behavior therapy skills training (DBT-ST) for non-suicidal self-injury (NSSI) thoughts and behaviors. Furthermore, the mechanism of therapeutic change of DBT-ST is poorly understood. Therefore, our aims were to investigate the effectiveness of DBT-ST for NSSI thoughts and behaviors within psychiatric patients compared to social support group therapy (SSGT) through 13 weeks intervention and to analyze possible mediators of treatment effects

Methods One hundred and ninety-six NSSI patients were randomized to 13 weeks of DBT-ST group ($n = 98$) or SSGT group ($n = 98$). The primary outcomes were NSSI thoughts and behaviors. Assessments were conducted at baseline and post-treatment

Results All treatment conditions resulted in similar improvements in NSSI thoughts and behaviors, whereas participants receiving DBT-ST had greater score reduction in NSSI behaviors than those in SSGT groups. There were significant sharper score reductions in alexithymia, borderline symptoms and emotion dysregulation in DBT-ST group than SSGT group. Mediation analysis indicated that change in emotion dysregulation, alexithymia and borderline symptoms mediated the relationship between DBT-ST and the severity of NSSI

Conclusion Our findings suggested that 13-

week of DBT-ST is a promising treatment for NSSI thoughts and behaviors, with positive effects on psychological functions for psychiatric patients

Childhood Maltreatment Predicts Poor Sleep Quality in Chinese Adults: The Influence of Coping Style Tendency

Jie Chen¹, Qian Wang², Jingxuan Zhang¹, Xiaojing Cheng²

1. Shandong Mental Health Center

2. Occupational Disease Hospital of Shandong First Medical University

Background Previous research has identified a relationship between childhood trauma and sleep disturbances in adulthood, yet few studies have explored the role of coping tendencies in the association between childhood trauma and sleep quality in adulthood. This longitudinal study assessed the prospective link between childhood maltreatment and sleep quality in adulthood, with a specific focus on examining whether different coping tendencies influence these associations

Methods The baseline sample included 1600 adult participants, with 1140 participants successfully followed up five years later. The key variables were measured using the Childhood Trauma Questionnaire (CTQ), Simplified Coping Style Questionnaire (SCSQ), and Pittsburgh Sleep Quality Index (PSQI). Continuous variables were analyzed using Student's *t* tests, and categorical variables were examined using chi-square tests. Generalized linear mixed models were employed to estimate unstandardized β estimates and 95% confidence intervals (95% CIs). Structural equation modeling was used to test the mediation model

Results Individuals who reported experiencing childhood maltreatment at baseline were at an increased risk of experiencing sleep disturbances during the fol-

low-up. Childhood maltreatment was a significant negative predictor of baseline period coping tendencies ($\beta = -0.27, P < 0.001$), baseline period coping tendencies were a significant negative predictor of subsequent sleep quality ($\beta = -0.11, P < 0.001$), and adverse childhood experiences were a significant positive predictor of subsequent sleep quality ($\beta = 0.43, P < 0.001$). There was a partial mediating effect of baseline coping tendencies between childhood trauma and subsequent sleep quality, with a mediation effect size of $-0.27 \times -0.11 = 0.03$

Conclusion Childhood maltreatment has emerged as a predictive factor for sleep disturbances in adulthood. Baseline-period coping tendencies partially mediate the moderating role between childhood trauma and follow-up-period sleep quality. When implementing interventions or treatments for adults with sleep disturbances, particular attention should be given to understanding their childhood trauma history and coping style tendency. Fostering positive coping strategies has emerged as a crucial approach to reducing the risk of sleep problems in adults with a history of childhood trauma.

失眠患者认知功能对数字化失眠认知行为疗法效果的影响

魏婷¹ 贾甜甜¹ 雷彬斌² 张继辉¹

1. 广州医科大学附属脑科医院

2. 广东省人民医院

目的 数字化失眠认知行为疗法(e-CBTI)被广泛认为是治疗失眠障碍的有效方法,然而其在真实世界中的疗效受多种因素影响。在临床实践中,认知功能被认为是影响认知行为疗法(CBT)的重要因素。探索认知功能对e-CBTI疗效的影响望为提高失眠障碍治疗效果提供实证支持。因此,本研究旨在明确认知功能对e-CBTI缓解率的影响。

方法 本研究纳入参与至少4周e-CBTI疗程的18-65岁失眠患者298名(年龄: 39.46 ± 11.93 ,

女性: 69.8%),以患者参与e-CBTI第四周的失眠严重程度指数量表(ISI)得分 ≤ 8 作为评估e-CBTI达到缓解效果的标准。研究使用精神运动警觉任务(PVT)评估警觉性注意能力、气球模拟风险决策任务(BART)评估风险决策能力、Go/no-go任务(Go/no-go task)评估抑制控制能力的。采用卡方检验和logistic回归进行分析。

结果 本研究中,78名失眠患者在参与e-CBTI的第四周达到缓解标准(年龄: 38.76 ± 12.35 岁,女性: 75.6%),220名失眠患者在参与e-CBTI的第四周末未达到缓解标准(年龄: 39.71 ± 11.80 ,女性: 67.7%),两组患者在年龄性别中均未有显著差异。精神运动警觉任务(PVT)的总错误频次与第四周e-CBTI效果呈负相关($OR = 1.933, 95\% CI: 1.081-3.459$),即警觉性注意能力较差的失眠患者通过e-CBTI更能得到有效缓解。进一步敏感性分析结果显示,将年龄25岁、40岁分别作为二分类变量引入校正,其结果与主分析一致,警觉性注意功能仍负向预测e-CBTI缓解率(25岁: $OR = 1.954, 95\% CI: 1.083-3.526$, 40岁: $OR = 1.874, 95\% CI: 1.032-3.402$)。其他认知功能指标,包括PVT平均反应时、BART值(总累计充气数/未爆炸气球数)及BART总收益、Go/No-Go的正确率及平均反应时间,与e-CBTI缓解率之间均不存在显著统计学差异。

结论 警觉性注意能力对e-CBTI缓解率具有负向预测作用。这一发现为优化数字化失眠认知行为疗法提供了实证支持,并为临床实践中e-CBTI的个体化应用提供理论依据。

影响失眠患者数字化失眠认知行为疗法依从性的认知因素初探

周娱菁¹ 张怡¹ 雷彬斌² 张继辉¹

1. 广州医科大学附属脑科医院

2. 广东省人民医院

目的 失眠认知行为疗法(CBTI)是失眠障碍的一线治疗手段,其依从性受认知在内的各项因素影响。数字化CBTI(e-CBTI)扩大了CBTI的应用场景且与传统CBTI疗效相当,但在临床实践中其依

从性仍有待提高。因此,本研究旨在探索失眠患者的认知功能对 e-CBTI 依从性的影响。

方法 本研究为真实世界观察性研究,纳入参与 e-CBTI 治疗的 18-65 岁慢性失眠患者 1255 名(36.36±12.20 岁,68%为女性)。将参与 4 周 e-CBTI 治疗课程的患者定义为依从性良好,未完全参与 4 周课程定义为依从性较差。研究采用三个心理学范式评估认知功能:精神运动警觉性任务(PVT)用于评估警觉性注意,气球模拟风险决策任务(BART)用于评估风险决策能力,Go/No-Go 任务用于评估抑制控制能力。通过卡方检验及 logistic 回归分析,评估上述认知功能对 e-CBTI 依从性的影响。

结果 本研究共有依从性良好患者 324 名(年龄:39.72±12.02 岁,70.1%为女性),依从性较差患者 931 名(年龄:35.19±12.05 岁,67.2%为女性),依从性良好患者年龄显著大于依从性较差患者($t=5.828, P<.001$)。在 Go/No-Go 任务中,正确率越高的患者被认为抑制控制能力越高。抑制控制能力高的患者表现出更高的 e-CBTI 依从性(45.4% vs. 31.5%, $P<.001$)。控制性别、年龄等人口学变量后,抑制控制能力仍显著正向预测 e-CBTI 依从性(OR = 1.767, 95% CI: 1.348-2.315)。以 25 岁和 35 岁作为分组依据进行敏感性分析,结果均与主分析结果一致,抑制控制能力仍能解释 e-CBTI 较好的依从性[25 岁:(OR = 1.709, 95% CI: 1.307-2.236); 35 岁:(OR = 1.79, 95% CI: 1.367-2.344)]。最后,在主分析和敏感性分析中均未发现警觉性注意与风险决策能力对 e-CBTI 依从性的显著影响。

结论 本研究揭示了抑制功能对 e-CBTI 依从性的预测作用。了解这一关系可以帮助临床上识别并支持认知上有困难的患者,通过个性化调整治疗方案,提高 e-CBTI 依从性,从而优化治疗效果。

成人注意缺陷多动障碍的团体辩证行为治疗:可行性及初步疗效

潘美蓉^{1,2} 邱孙伟^{1,2} 刘璐^{1,2} 李海梅^{1,2} 王玉凤^{1,2} 钱秋谨^{1,2}

1.北京大学第六医院,北京大学精神卫生研究所,北京,100191

2.国家卫生健康委员会精神卫生学重点实验室(北京大学),国家精神心理疾病临床医学研究中心(北京大学第六医院),北京,100191

目的 情绪失调是成人注意缺陷多动障碍(Attention-Deficit/Hyperactivity Disorder, ADHD)的重要临床特征之一,而辩证行为治疗(Dialectical Behavior Therapy, DBT)是针对情绪失调的有效治疗方法,故考虑 DBT 可以成为成人 ADHD 的干预方法。研究拟在国内成人 ADHD 群体中开展 DBT 团体技能训练,探讨其在国内 ADHD 群体中的可行性及可接受度,同时初步讨论该方案对 ADHD 核心症状及伴随症状的疗效,并对治疗疗效的预测因素进行探索。

方法 本研究采用自身前后对照设计,纳入 20 名成人 ADHD 患者,对其开展为期 12 周针对成人 ADHD 群体的 DBT 团体技能训练。治疗每周 2 小时,共 12 周,邀请患者匿名完成治疗满意度评价量表和治疗策略评价量表,以对治疗方案的可行性及可接受度进行评估。在治疗前(基线 T1)、第 4 周(T2)、第 8 周(T3)治疗结束(T4)时和结束 3 个月后随访(T5)时对患者进行多维度症状评估,包括 ADHD 核心症状(ADHD-RS)、焦虑抑郁情绪(BAI、BDI-II)及情绪调节能力(DERS)、自我觉察能力(FFMQ-C、SCS)、自尊水平(SES)及执行功能(BRIEF-A)。采用混合线性模型分析上述指标随时间相关变化;采用多元回归分析对 T4 及 T5 时的 ADHD-RS 总分的预测因子进行探索。

结果 患者治疗参与率为 88.3%、平均参与次数为 10.6±1.3 次、满意度在 4.3~4.8 分之间(1-5 分评分)。通过治疗,患者核心症状($g=0.634\sim 1.031$)及抑郁情绪($g=0.379\sim 0.664$)显著下降,情绪调节($g=0.296\sim 0.616$)、自我觉察能力($g=-0.386\sim -0.581$)及自尊水平($g=-0.305\sim -0.298$)显著提升;上述结果在 T2 时即出现,并维持至 T5。T4 和 T5 时治疗疗效的积极预测因子包括男性、治疗早期起效(治疗前 4 周 ADHD-RS 总分下降 $\geq 25\%$)、以及 T1 时 ADHD 核心症状得分更高;而消极预测因子包括存在轴 I 或轴 II 共患病,以及 T1 时 BRIEF-A 总分更高。

结论 DBT 在我国成人 ADHD 具有可行,可接受度良好;初步疗效结果证实了 DBT 对成人 ADHD 患者的有效性,为后续随机对照研究的开展奠定了基础。同时研究对 DBT 团体技能训练的治疗疗效预

测因素进行了初步探讨,为适应证的优化提供了初步理论依据。

杏仁核亚区静息态功能连接对强迫症认知行为治疗长期疗效的影响研究

李王越*

南京市脑科医院

目的 强迫症是一种常见的慢性精神疾病,以强迫思维和强迫行为为核心特征。CBT被认为是治疗强迫症的一线疗法。然而,CBT对强迫症的疗效产生的神经机制仍不清楚。本研究旨在探究CBT治疗后强迫症患者临床症状改善与治疗前杏仁核亚区的静息态功能连接的关系,以及这种关系是否可以作为长期治疗效果的潜在影响因素。

方法 招募72名强迫症患者以及人口学特征相匹配的67名健康受试者,采集两组基线期的临床症状以及静息态功能磁共振成像数据。在患者组中,在基线、治疗开始随访8周与24周分别采集临床特征,并且在8周治疗结束后再次进行磁共振扫描。以杏仁核亚区为种子点对患者组与健康组的全脑静息态功能连接进行比较,用COX回归分析功能连接模式与短期及长期临床结果间的关系。对治疗前后患者组与健康组三组之间的功能连接进行单因素方差分析以及多重比较分析,采用双因素方差分析探索治疗后有效组与无效组功能连接的变化。

结果 (1)以3个杏仁核亚区作为感兴趣区进行全脑的功能连接分析,相比于健康组,患者组在左侧基底外侧杏仁核与左侧颞上回、右侧颞中回的功能连接减弱;左侧浅表杏仁核与右侧颞极颞中回之间的静息态功能连接减弱;右侧基底外侧杏仁核与左侧颞上回、左侧颞中回、右侧颞上回之间的静息态功能连接减弱。(2)COX多因素回归结果表明,在8周随访中,左侧基底外侧杏仁核与左侧颞上回的功能连接与YBOCS有效率呈负相关($HR=0.000, P=0.009$),而左侧基底外侧杏仁核与右侧颞中回的功能连接与YBOCS有效率无显著相关($HR=28.95, P=0.336$)。在24周随访中,左侧基底外侧杏仁核与左侧颞上回的功能连接与Y-BOCS有效率也呈负相

关($HR=0.007, P=0.007$),即左侧基底外侧杏仁核与左侧颞上回功能连接越弱,YBOCS减分率越高。

(3)对治疗前后患者组以及健康组的杏仁核亚区功能连接进行方差分析,多重比较后发现治疗前后患者组左侧基底外侧杏仁核与左侧颞上回功能连接均弱于健康组,治疗前后患者组不存在显著差异。双因素方差分析结果表明,左侧基底外侧杏仁核与左侧颞上回的功能连接在时间(基线、CBT治疗后)的主效应中不显著,在组别(有效、无效)中的主效应不显著,时间×分组的交互作用不显著。

结论 强迫症患者左侧基底外侧杏仁核与左侧颞上回的功能连接可以影响CBT短期与长期的疗效,并且CBT治疗后左侧基底外侧杏仁核与左侧颞上回的纵向变化与强迫症患者治疗反应相关。

Effects of Brief Cognitive Behavioral Therapy on Medication Adherence in Adolescent Patients with Major Depressive Disorder

Chenlong Gu* Jiancong Liang Yanting Zhang
Second People's Hospital of Huizhou

Objective Major depressive disorder(MDD) is a common and recurrent emotional disorder. Medication is the primary treatment approach, with poor adherence being the main cause of the high recurrence rate. Compared to adults, adolescents with depressive disorder show lower medication adherence. Psychological therapy is a common method to enhance patient medication adherence, with Cognitive Behavior Therapy (CBT) being the preferred psychological treatment recommended in depressive disorder diagnosis and treatment guidelines, which can improve patient medication adherence and prevent recurrence. Due to the extended treatment duration and the significant requirements on therapists, CBT is not feasible for implementation in primary healthcare settings. In recent years, scholars have recommended Brief Cognitive Behavior Therapy (BCBT) to meet the treatment requirements of patients with depres-

sive disorder. Based on the conceptualization of depressive disorder, BCBT retains the most effective components of treatment from CBT (automatic thought correction and behavioral activation), while removing less effective components (such as core belief modification). This study examines the effects of BCBT on medication adherence in adolescent patients with major depressive disorder

Methods 43 adolescent patients diagnosed with major depressive disorder were selected as the study participants from the Second People's Hospital of Huzhou between December 2018 and October 2022. Among them, there were 19 males and 24 females, aged 12 to 18 (14.98 ± 1.77) years old. All patients received psychological intervention in addition to antidepressant medication, with 21 patients in the BCBT group and 22 patients in the psychological education group. The Morisky Medication Adherence Scale-8 (MMAS-8) scores, medication adherence coefficient, and Hamilton Depression Rating Scale-24 (HAMD-24) scores were compared before and after psychological intervention between the two groups of patients

Results The MMAS-8 scores of patients in the BCBT group showed a significant increase after psychological intervention, along with a higher coefficient of medication adherence compared to the control group, with statistically significant differences (both $P < 0.05$). Following psychological intervention, HAMD-24 scores decreased significantly in both groups, also showing statistically significant differences (both $P < 0.05$). There was no statistically significant variance in HAMD-24 scores between the two groups before and after the intervention (all $P > 0.05$)

Conclusion BCBT can effectively enhance medication adherence and decrease depressive symptoms in adolescent patients diagnosed with major depressive disorder.

Dialectical Behavioral Therapy Compared

Social Support Group Therapy for Non-suicidal Self-injury Behaviors: Outcomes Over A One-Year Follow-Up

Zhengyi Li¹, Haolun Li¹, Zhen Xiao¹, Xuelian Bai², Wenxuan Fan², Chun Wang¹

1. The Affiliated Brain Hospital of Nanjing Medical University

2. Nanjing Normal University

Objective To evaluate the clinical efficacy of 13 weeks of Dialectical Behavior Therapy Skills training (DBT-ST) with social support group therapy (SSGT) in patients with NSSI, including short-term efficacy after the intervention, and long-term efficacy at one-year follow-up

Methods This is a 13-week multicenter, randomized, double-blind, clinically controlled intervention study. Subjects included 203 participants aged 13-59 years who met the DSM-5 diagnostic criteria for NSSI and had no significant suicidal ideation or behavior one month prior to the start of the study. Participants were recruited from the psychiatric and psychological counseling departments of 14 hospitals in China

Participants were randomly assigned either to the DBT-ST group or SSGT group. In the DBT-ST group, participants were taught skills designed to reduce NSSI: emotion regulation, distress tolerance, mindfulness, and interpersonal effectiveness. At the same time, participants in the SSGT group discussed the challenges of their condition and supported each other.

Results Results were tested for time effects, speed, and between-group differences using generalized linear mixed models, t-tests. From baseline to follow-up, both groups showed significant improvements in most outcomes, while in terms of between-group comparisons, the DBT-ST group was significantly better than the SSGT group in NSSI behaviors and impulsivity. In addition, there was no significant difference between the two groups in the follow-up period on the outcome indicators of borderline symptoms, difficulties in emotion regulation; however, the DBT-ST group presented significantly faster improvement and showed significantly better improvement right after the intervention

Conclusion Combining short-term efficacy and long-term efficacy, the DBT-ST group showed superior efficacy to the SSGT group in the primary outcome indicator of NSSI behavior, as well as in several secondary outcome indicators, which is closely related to the advantages of DBT. These findings suggest that DBT may be a more effective treatment approach for NSSI.

Efficacy of Social Media-based Smoking Cessation Intervention in China: A Randomized Controlled Trial

Yanhui Liao*

1. Department of Psychiatry, Sir Run Run Shaw Hospital, Zhejiang University School of Medicine

Objective Tobacco use has enormous health and economic consequences. China has approximately 300 million current smokers, and smoking cessation services are limited. This study aimed to assess the efficacy of a Cognitive Behavioral Theory-based smoking cessation intervention via three social media (text, WeChat, and APP) in China

Methods A randomized controlled trial was conducted among 4396 Chinese-speaking adult smokers willing to quit within one month were recruited and randomised in a 1:1 ratio. The intervention group (n=2486, including 958 participants in the text messaging-based group, 523 participants in the APP-based group, and 1005 participants in the WeChat-based group) received the social media-based intervention and the control group (n=1910) received control messages for about 14 weeks (1 to 2-week prequit and 12-week postquit). Participants were followed up to 26 weeks after the quit date. The primary outcome was self-reported continuous smoking abstinence rate, biochemically validated at 26 weeks. The important secondary outcomes were self-reported 7-day and continuous abstinence rates at 6 months. All analyses were by intention to treat

Results By intention-to-treat analysis, the biochemically verified 26-week continuous abstinence rate was 8.65% in the intervention group (for each social media-based group: 6.37% the text messaging-based group, 6.50% in the APP-based group, and 11.94% in the WeChat-based group) and 2.57% in the control group (OR = 3.60, 95% CI: 2.64-4.98, $p < 0.0001$). The self-reported 7-day abstinence was 27.63% at week 1, 28.16% at week 4, 29.16% at week 8, 30.17% at week 12, 30.97% at week 16, 30.17% at week 20, and 27.27% at week 26 in the intervention group; and the self-reported 7-day abstinence was 17.75% at week 1, 16.28% at week 4, 17.02% at week 8, 15.97% at week 12, 16.39% at week 16, 16.81% at week 20, and 14.40% at week 26 in the control group (all $p < 0.0001$). The self-reported continuous abstinence rates at weeks 1 and 26 ranged from 17.86% to 23.69% and 12.15% to 8.64% in the intervention group and the control group respectively (all $p < 0.0001$). In the intervention group, the biochemically verified 26-week continuous abstinence rate was 12.8 % for participants who smoked ten or less cigarettes per day, and only 7.7% to 6.5% for participants who smoked more than ten cigarettes per day. Furthermore, the biochemically verified 26-week continuous abstinence rate was 9.7 % for participants who had previous quit attempts, and only 6.7% for participants who never tried to quit

Conclusion The social media-based smoking cessation intervention, especially the WeChat-based intervention, significantly increased smoking abstinence rates at 6 months and should be considered for treatment-seeking smokers in China. Participants with low nicotine dependence or previous quit attempts were more likely to successfully quit smoking

Attitudes and Knowledge for CBT-based Psychotherapy Among Medical Students and Residents in China: A Survey Study

Yanhui Liao¹, Tao Pei^{1,2}, Yinan Ding^{1,3}

1. Sir Run Run Shaw Hospital, Zhejiang University School of Medicine, Hangzhou
2. Mental health center, Nanjing Normal University
3. Department of Psychology and Neuroscience, Boston College

Background /Aim: Psychotherapy training for medical students and residents in China is still in development. To establish an appropriate training program, understanding medical students' and residents' current knowledge and attitudes toward psychotherapy is needed

Methods 149 participants, including medical students, residents, and other health providers (HCPs), self-reported their understanding of 18 types of psychotherapy, negative attitudes toward CBT, and their attitudes toward psychological interventions and counseling in primary care (APIC-PC) through an online survey

Results Participants' understanding of psychotherapy was generally low ($M = 26.25$, $SD = 22.99$). Surprisingly, medical students' ($M = 34.42$, $SD = 22.61$) and HCPs' ($M = 37.25$, $SD = 30.834$) understanding was significantly higher than residents' ($M = 20.08$, $SD = 19.54$), $F(2, 146) = 8.63$, $p < .001$. Participants from psychiatric departments ($M = 33.85$, $SD = 25.89$) understand more psychotherapy than those from non-psychiatric departments ($M = 20.98$, $SD = 19.20$), $t(147) = 3.46$, $p < .001$. Participants with a bachelor's degree ($M = 2.40$, $SD = 0.976$) scored lower in the Negative Attitude Toward CBT Scale than participants with a graduate degree ($M = 2.76$, $SD = 1.00$), $t(147) = -2.20$, $p = 0.029$. All participants' APIC-PC scores were relatively the same and indicated a neutral to slightly positive attitude toward psychotherapy and counseling practices. However, they showed a slightly negative attitude in the "willingness to counsel" subscale ($M = 2.65$, $SD = 0.93$)

Conclusion This study indicated a lack of knowledge of psychotherapy and a lack of psychotherapy courses for medical students and residents, especially those from non-psychiatric departments in China. Our findings suggest an urgent need for psychotherapy and relevant training for Chinese medical students and residents.

The Efficacy of Reading Prescription As Adjunct Therapy in Anxiety Disorder Treatment: Improving Sleep Quality and Reducing Medication Adverse Effects

Yanqun Zheng*

Huashan Hospital, Fudan University

Objective This study aimed to investigate the impact of adding a reading prescription intervention to pharmacological treatment on sleep quality improvement and reduction of medication adverse effects in patients with anxiety disorders

Methods Sixty patients diagnosed with anxiety disorders were randomly assigned to two groups: medication-only treatment ($n=30$) and medication treatment with an additional reading prescription ($n=30$). The reading prescription included articles focusing on anxiety management techniques, personal experiences of coping strategies, expert opinions on mental health, and updates on anxiety disorder research

Results Demographic Characteristics: The two groups (medication-only vs. medication + reading prescription) were comparable in terms of age, gender distribution, initial presenting symptoms, and baseline anxiety severity

Sleep Quality Improvement: At the end of the treatment period, the group receiving medication treatment with a reading prescription showed significantly lower scores on the Pittsburgh Sleep Quality Index (PSQI) compared to the medication-only group ($p < 0.05$).

Reduction in Medication Adverse Effects: Patients in the medication treatment with a reading prescription group reported significantly fewer and less severe medication adverse effects compared to the medication-only group ($p < 0.05$).

Conclusion The findings suggest that adding a reading prescription intervention to pharmacological

treatment for anxiety disorders enhances treatment outcomes. Specifically, it improves sleep quality and reduces medication adverse effects. Incorporating reading materials tailored to anxiety management and mental health education can be a beneficial adjunctive therapy in clinical practice, promoting better overall patient well-being and treatment adherence. Further research with larger sample sizes and long-term follow-up is recommended to validate these preliminary findings and explore sustained therapeutic benefits.

Structural Brain and White Matter Fiber Changes in Multidimensional Impulsivity of Non-suicidal Self-injury Patients

Ya Xie¹, Chun Wang^{1,2}, Yuan Zhong², Sichu Wu¹, Yumin Zhang¹, Congjie Zhang¹, Yaming Hang^{1,2}, Nan Lang^{1,2}, Zhangwei Lv¹, Pei Zhang¹, Minlu Liang¹, Yanglichen Ou¹, Liping Zhang¹, Yun Wu^{1,2}

1.The Affiliated Brain Hospital of Nanjing Medical University

2.School of Psychology, Nanjing Normal University

Objective Non-suicidal self-injury (NSSI) is defined as a series of direct, deliberate, and repeated acts of harming oneself that do not lead to death by an individual without suicidal intention. It is posited to stem from a multifaceted array of biopsychosocial factors where impulsivity plays a critical role. Current research on the neural mechanisms underlying this hypothesis is both inconsistent and limited in scope, especially with regard to reports of structural brain alterations. Impulsivity is a multidimensional construct, and the potential neural correlates of impulsivity may vary across different dimensions. Therefore, we combine behavioral and multimodal structural imaging techniques to address the question of how the occurrence of NSSI behaviors is associated with impulsivity resulting from brain structural alterations in NSSI patients

Methods 293 NSSI participants and 140 healthy controls (HCs), were enrolled in this study. The Ottawa Self-Injury Inventory (OSI) was used to assess NSSI behaviors. The level of impulsivity was assessed by the Barratt Impulsiveness Scale version 11 (BIS-11) and the attention network test. Of these, 182 NSSI subjects and 95 HCs participated in T1-weighted MRI and diffusion tensor imaging scans. Whole-brain voxel-based morphometry (VBM) and surface-based morphometry (SBM) were employed to explore differences in whole-brain gray matter volume (GMV), white matter volume (WMV), and cortical metrics between the two groups, as well as to analyze the relationship between the difference regions and different dimensions of impulsivity. Further region of interest (ROI)-based diffusion tensor imaging analysis was conducted to assess the fractional anisotropy of white matter fibers between specific brain regions in NSSI patients

Results NSSI patients have increased impulsivity, with the highest correlation between NSSI frequency and motor impulsivity (MI) ($r=0.203$, $p<0.001$). NSSI patients showed increased white matter volume (WMV) in the right dorsolateral superior frontal gyrus and inferior parietal lobule, along with enhanced cortical thickness and complexity in superior frontal gyrus (SFG) and caudal anterior cingulate cortex associated with motor impulsivity. Both non-planning impulsivity and attentional impulsivity in NSSI patients were associated with increased WMV in the inferior temporal gyrus and supramarginal gyrus, as well as increased cortical complexity in SFG, while increased WMV in the middle orbitofrontal cortex was only associated with non-planning impulsivity. Based on the above findings, a total of 14 white matter fiber tracts connecting the bilateral frontal lobules, right parietal lobule, bilateral temporal lobules, right hippocampus, and cingulum regions were selected as ROIs. We found that NSSI patients had significantly decreased fractional anisotropy values in the uncinate fasciculus and cingulate system as compared to HCs

Conclusion Our findings suggested that motor impulsivity, which is a prominent psychopathological characteristic of NSSI, is primarily modulated by the su-

perordinate cognitive attention network involving cingulate-frontal-parietal regions. Furthermore, the occurrence of NSSI may also involve structural abnormalities within the frontal-temporal structures, specifically relating to non-planning impulsivity and attentional impulsivity

关键词: non-suicidal self-injury, impulsivity, neuroimaging, white matter volume, fractional anisotropy

基于认知行为理论的戒烟干预疗效及其神经影像学特征研究

刘漪 廖艳辉*

浙江大学医学院附属邵逸夫医院

目的 吸烟作为全球性公共卫生问题,是造成可预防性疾病和死亡的主要原因。长期吸烟容易导致烟草成瘾,成瘾是一种复杂的慢性、易复发性脑部疾病,具有冲动性和强迫性特点,与心理健康状况、人格特征密切相关,同时也伴随脑结构和功能的变化。既往基于功能磁共振的研究发现成瘾核心特征如冲动、渴求存在激活的偏侧化。偏侧化作为人脑组织的显著特征,通常被认为是一种稳定的、类似特质的特征。与动态功能连接类似,偏侧化也具有时变性,即动态偏侧化。动态偏侧化与认知功能、情感等密切相关,然而目前尚无针对烟草成瘾者的脑动态偏侧化特征的研究。基于认知行为理论(CBT)的戒烟干预被认为是目前研究证据最多、疗效最肯定的心理干预方法之一,但其确切的神经机制尚不明确。深入探究基于CBT的戒烟干预的疗效及神经影像学特征,对于降低复吸率具有重要意义。通过对烟草成瘾者进行脑动态偏侧化的研究,结合基于CBT的戒烟干预,探索干预的疗效及其神经影像学特征。

方法 研究共纳入87名烟草成瘾者以及48名健康对照。所有受试者均完成临床特征评估、脑影像数据采集以及吸烟生物学验证。基线完成后,根据戒烟意愿共有47名烟草成瘾者被纳入为期4周的基于CBT的线上戒烟干预,并且在戒烟日后第四周末进行随访。使用基于滑动时间窗口来绘制时变的侧化结构从而评估脑功能活动,使用t检验比较干预后与干预前、健康对照的动态偏侧化差异,采

用皮尔逊相关分析对动态偏侧化的差异与临床特征的相关性进行分析。

结果 基于CBT的戒烟干预4周持续戒烟率为42.6%。在基线期发现烟草成瘾者出现广泛脑区的动态偏侧化异常,主要表现为偏侧性波动(LF)减小,涉及左侧前扣带回、内侧前额皮层、体感运动区、下额叶区、初级听觉区、眶极额叶区、背外侧前额叶以及右侧体感运动区、视觉联合区,并且右侧体感运动区的LF与每日吸烟量、渴求负相关;右侧听觉联合区的LF与渴求负相关;背外侧前额叶的LF与渴求负相关;左侧体感运动区的LF与每日吸烟量负相关。干预后,和健康对照相比,干预组仅有右侧初级听觉皮层、左侧前运动皮层的LF异常;双侧体感运动区的LF变化与渴求程度的变化负相关,左侧下额叶的LF变化与渴求程度的变化负相关,左侧前扣带回和内侧前额叶皮层区域的LF变化与每日吸烟量的变化负相关。

结论 烟草成瘾者表现出涉及前额叶、中央旁扣带回、顶叶、体感运动皮层等多个脑区的动态偏侧化改变,基于CBT的戒烟干预能有效矫正动态偏侧化的异常。

The Effectiveness of Mindfulness-based Interventions for Relieving Cravings and Preventing Relapse Among Drug Users: A Preliminary Study

Yanhui Liao* Dan Han

Department of Psychiatry, Sir Run Run Shaw Hospital, Zhejiang University School of Medicine

Objective Addiction and trauma-based mental health problems often co-occur. Substance use has frequently been associated with mental health problems, such as depression. Research on the efficacy of clinical psychotherapy on addiction-related mental problems is still insufficient. This study developed domestic Mindfulness-based Interventions targeting craving and aimed to verify their effectiveness, attempting to expand the cognition model of mindfulness-centered regulation of

addictive behavior

Methods Based on the Randomized Controlled Trial design, 12 adult SUD females with methamphetamine, heroin, or ketamine in the intervention group (MBI), the matched 12 females in the control group, and 24 Healthy Controls (HC) matched with the former two groups participated in this study. The intervention group received the 8-week Group mindfulness intervention performed by psychiatrists. A variety of clinical variables of SUD participants were assessed three times: before, during (2 weeks after the MBI began), and after the intervention. The cognitive task (regional segmental task, reflecting implicit cognitive ability) was conducted before and after the intervention

Results It was found that relative to the pre-MBI clinical variables, the levels of PHQ and BAI were significantly lower, approaching those of HC, while the correct rate increased significantly and the response time decreased significantly

Conclusion The findings demonstrated the effectiveness of Mindfulness-Based Intervention (MBI) that specifically targets craving in mitigating symptoms of depression and anxiety, improving the subconscious perception of the physical stimulus, thus contributing to the advancement of the conceptual framework that associates mindfulness-centered regulation of addictive behavior

基于虚拟现实眼动脱敏与再加工心理治疗对青少年抑郁症患者的母亲的干预研究

赖健康*

暨南大学附属第一医院

青少年抑郁症的治疗过程长,母亲作为青少年抑郁症患者最主要的照顾者,需承受巨大的身心负担,这一现象值得引起重视并寻求更高效便捷的治疗方式。本研究基于母亲抑郁代际传递的整合模型,采用眼动脱敏与再加工(EMDR)心理治疗对抑郁症结合虚拟现实(VR)技术对青少年抑郁症患者母亲

进行干预,改善母亲阈下抑郁症状、情绪调节自我效能感,同时验证母亲抑郁情绪改善是否能进一步缓解青少年抑郁。

本研究采用临床评估诊断和问卷调查法,于三甲医院精神医学科门诊开展随机临床招募,患者母亲入组标准:①符合《精神障碍诊断与统计手册》(DSM-5)阈下抑郁诊断标准;②年龄 18-60 岁;③其子女的年龄介于 10-18 岁,符合 DSM-5 抑郁症诊断标准;④母亲为其抑郁症患儿的主要养育者;⑤流调中心抑郁量表(CES-D)评分 ≥ 16 ;⑥汉密尔顿抑郁量表(HAMD)评分 ≥ 9 分;⑦杨氏躁狂评定量表(YMRS)评分 < 6 分;⑧训练期间没有使用精神类药物。共纳入 126 份有效数据,其中对患者母亲进行为期 6 周的 VR 化 EMDR 干预,观察干预前后的指标变化,并通过 Process 3.0 中的 Model4 拟合抑郁在 VR 化 EMDR 治疗影响患者母亲的情绪调节自我效能感间的中介作用模型,同时进一步探讨家庭功能在母亲抑郁与青少年抑郁之间可能中介机制。

研究结果表明:

(1) 抑郁症青少年患者的母亲存在阈下抑郁、创伤后应激的检出率较高,分别占 83%和 59%。

(2) 抑郁症青少年母亲与健康青少年母亲比较发现,情绪调节自我效能感总体显著低于健康青少年母亲;而伴有阈下抑郁的母亲比无阈下抑郁母亲的情绪调节自我效能感更差。

(3) 青少年抑郁症患者母亲干预前后,临床特征、情绪调节自我效能感的结果存在显著差异;且显著优于对照组。

(4) 抑郁在 VR 化 EMDR 治疗影响青少年抑郁症患者母亲管理生气/愤怒情绪的自我效能感间起中介作用。

(5) 母亲抑郁与青少年抑郁呈正相关,家庭功能在母亲抑郁影响青少年抑郁的之间不存在中介作用。

本研究发现青少年抑郁症患者母亲的抑郁、创伤后应激障碍检出率高,在经过 VR 化 EMDR 系统治疗后,母亲的抑郁和创伤后应激程度呈现更高效快速的好转,揭示了降低患者母亲的抑郁水平能提高其管理生气/愤怒情绪的自我效能感,并发现母亲抑郁恢复可正向影响青少年抑郁症,为进一步改善青少年抑郁症提供新视角。

简化失眠认知行为治疗对抑郁症伴失眠症状患者的疗效分析

王洪艳 苑成梅*

上海市精神卫生中心（上海市心理咨询培训中心）

目的 验证简化失眠认知行为治疗（Cognitive Behavioral Therapy for Insomnia-Simplified, CBTI-S）方案的有效性与对抑郁症患者的适用性，为抑郁症合并失眠症状患者提供更优治疗选择。

方法 本研究采用随机平行对照设计，选择符合入组标准的抑郁症伴失眠症状患者，按 1:2 的比例随机分配到对照组和研究组。对照组接受常规抗抑郁药物治疗+睡眠卫生教育，研究组进行常规抗抑郁药物治疗+CBTI-S 治疗。评估员于基线、干预后 2 周末、干预后即刻、干预后 1 月、干预后 6 月进行随访，采用匹兹堡睡眠指数量表（PSQI）、失眠严重指数量表（ISI）、17 项汉密尔顿抑郁量表（HAMD-17）、6 项生活质量问卷（QOL-6）、治疗联盟问卷（WAI）等评估患者的失眠症状、抑郁症状和生活质量，明确治疗效果。

结果 （1）两组患者人口学资料中，受教育年限、家庭经济情况等差异均无统计学意义，平均年龄差异有统计学意义，对照组（27.66±7.27）平均年龄略低于研究组（32.52±8.52）；两组患者治疗前 PSQI、ISI、HAMD-17、QOL-6、WAI 评分比较差异均无统计学意义（ $p>0.05$ ）。

（2）治疗后，两组患者 PSQI 总分、入睡潜伏期、ISI 总分、HAMD-17 评分均较治疗前降低，将年龄作为协变量，重复测量方差分析结果显示两组患者在 PSQI 量表中的入睡潜伏期的交互作用显著（ $p<0.05$ ）。两组患者 HAMD-17、ISI、QOL-6 指标的时间效应均显著（ $p<0.05$ ），组间效应及交互效应均不显著（ $p>0.05$ ）。

（3）治疗后 1 月随访及 6 月随访，两组患者 PSQI 总分、入睡潜伏期、ISI 总分、HAMD-17 评分的时间效应均显著（ $p<0.05$ ），组间效应及交互效应均不显著（ $p>0.05$ ）。

结论 CBTI-S 能有效缩短患者入睡潜伏期，在对抑郁症状的改善及生活质量的改善方面与睡眠卫生健康教育差别不大，但可适当增加 CBTI-S 治疗次数，增加随访时间。

DNA Methylation Changes Post-DBT in NSSI Patients

Pengyu Du Chun Wang*

Nanjing Brain Hospital affiliated to Nanjing Medical University

Objective The mechanism of action of dialectical behavior therapy (DBT) in patients with non-suicidal self-injury (NSSI) and epigenetic explanations of the complex interplay of genetic factors in NSSI are unclear

Methods DNA methylation sequencing was performed on samples from 37 NSSI patients at baseline and after DBT. Multiple target region methylation enrichment sequencing technology was used to conduct a randomized controlled study, and PCA analysis Cluster analysis, Methylation level difference analysis were used to analyze the difference of DNA methylation level before and after DBT treatment

Results Overall methylation levels are elevated in patients with NSSI. The efficacy of DBT on NSSI ideation was significantly better than that of the control group, and the efficacy on NSSI behavior, suicidal ideation and behavior was comparable to that of the control group. DNA methylation levels significantly changed after DBT treatment, and the five most significant genes with high methylation were ARG1, FYN, LAMA1, GPR160 and XIRP2. The five most significant hypomethylation genes were TTR, MIR6854, SH3D19, TATDN2 and AMY2B. Hypermethylation of ARG1 and FYN genes, and hypomethylation of C8B and SLC18A1 genes may be associated with improved NSSI behavior through signaling pathways such as RAS GTP-enzyme binding, small molecule GTP-enzyme binding, postsynaptic specialization, asymmetric synapses, axonogenesis, and axon development. After DBT treatment, there was significant hypomethylation of C8B gene in NSSI patients, and the difference of methylation level was significantly positively correlated with

self-injury behavior ($r = 0.757, p < 0.01$) and suicidal behavior ($r = 0.569, p = 0.03$). Therefore, the hypomethylation of C8B gene may be one of the mechanisms of DBT in treating NSSI behavior

Conclusion The methylation level of some genes was changed after DBT, indicating that DBT can change the composition of gene methylation before and after treatment, so as to achieve the therapeutic effect.

关键词: DNA methylation, dialectical behavior therapy, non-suicidal self-injury

The Effectiveness of Different Cognitive Behavioral Therapy Patterns on Anxiety and Depression in Patients with Chronic Obstructive Pulmonary Disease: A Review and Meta-analysis

Jinbo Jiang^{1,2}, Longbiao Cui^{1,2,3}, Huaning Wang⁴

1.Schizophrenia Imaging Lab, Xijing 986 Hospital, Fourth Military Medical University

2.Shaanxi Provincial Key Laboratory of Clinic Genetics, Fourth Military Medical University

3.Department of Radiology, The First Affiliated Hospital of Xi'an Jiaotong University

4.Department of Psychosomatic Medicine, Xijing Hospital, Fourth Military Medical University

Objective Anxiety and depression are common psychiatric symptoms in patients with chronic obstructive pulmonary disease (COPD), and these mental health issues have adverse effects on the treatment outcome of COPD patients. Cognitive behavioral therapy (CBT) is an effective method to treat anxiety and depression, but its intervention duration, intervention method, and follow-up are still unclear

Methods We searched Web of Science, Embase, PubMed, and Cochrane Library from the establishment of the library to June 2024, collecting the randomized controlled trial for this topic. Meta-analysis was performed using Stata/MP 17.0 software

Results A total of 12 studies were included with a total of 1773 patients. Meta-analysis showed that CBT

can reduce depression and anxiety in COPD patients. Subgroup analysis showed that both longer interventions and shorter interventions were effective in relieving anxiety and depression symptoms. Both group intervention and individual intervention were effective. CBT had a long-term effect on anxiety and depression symptoms

Conclusion According to the result of meta-analysis, CBT can effectively reduce anxiety and depression in COPD patients. Based on the subgroup analysis, considering the clinical efficacy, economic affordability, and operability of the intervention, we recommend short-course, group CBT for clinical practice. However, a multicentre, pragmatic, randomised controlled trial (RCT) claimed that this trial has closed the door on using a CBA approach to alleviate symptoms of mild/moderate anxiety and depression in people with moderate/severe COPD. Therefore, further large-scale clinical studies are still needed to explore the effect of CBT on anxiety and depression in COPD patients

关键词: anxiety, depression, chronic obstructive pulmonary disease, cognitive behavioral therapy, meta-analysis

团体认知行为治疗对高强迫症状大学生认知灵活性的干预

何孔亮* 季思凡

安徽省精神卫生中心

目的 探究团体认知行为治疗对高强迫症状大学生认知灵活性的影响。目前,国内关于强迫症的干预研究较多,但关于高强迫症状大学生认知灵活性的干预研究较少。认知灵活性是一个多方面的结合,包括认知思维上的僵化和不灵活,也包含行为和适应环境的困难。CBT也认为刻板、僵化的思维是导致异常情感或行为滋生的重要因素。为了提高高强迫症状大学生的认知灵活性,本研究以CBT理论为指导并结合团体辅导的相关理论,从强迫症状,认知灵活性受损及其特点来设计团体干预方案,来探讨团体认知行为治疗是否能提高高强迫症状大学生的认知灵活性。

方法 将入组的 58 名大学生随机分为实验组和对照组 (各 29 名), 对实验组进行团体认知行为治疗 (每周二次, 连续四周), 对照组处于常态。在干预前后对两组学生施测强迫量表 OCI-R、认知灵活性量表 CFI、接纳与行动问卷 AAQ-II 和认知融合问卷 CFQ, 评估干预后的效果。

结果 在强迫量表总分上, 测量时间和组别的交互作用显著, 实验组后测得分显著低于前测得分, 对照组在干预前后差异不显著。在认知灵活性量表总分上, 测量时间和组别的交互作用显著, 实验组后测得分显著高于前测得分, 对照组在干预前后差异不显著。在行动问卷第二版量表和认知融合问卷上, 测量时间和组别的交互作用显著, 实验组后测得分显著低于前测得分, 对照组在干预前后差异不显著。

结论 认知行为治疗对高强迫症状大学生认知灵活性有明显的提高, 而且显著降低了高强迫症状大学生的强迫症状。

The Chinese Version of The Perseverative Thinking Questionnaire (PTQ): Validation and Preliminary Clinical Application

Wenqi Geng Tao Li* Jing Wei
CAMS&PUMC

Objective To assess the psychometric performance of the Chinese version of the Perseverative Thinking Questionnaire (cPTQ) in patients with diagnosed mental disorders, and to examine perseverative thinking pattern within this population

Methods The cPTQ was administered to 285 outpatients at a general hospital. Three established factor models were tested through confirmatory factor analysis amongst the participants. The construct validity of the cPTQ was assessed by examining correlations with the Penn State Worry Questionnaire (PSWQ), the Ruminative Response Scale (RRS), the Patient Health Questionnaire Depression Scale-9 (PHQ-9), the 7-item Generalized Anxiety Disorder scale (GAD-7), and the Somatic Symptom Disorder-B Criteria Scale (SSD-12). Comparisons of cPTQ scores were conducted among patients with diverse psychiatric diagnoses

Results The cPTQ exhibited excellent internal consistency within this sample (Cronbach's $\alpha = 0.94$). The 2-factor model was consistent with the data, with all fit indices signifying satisfactory results ($\chi^2/df = 311.90/79$, the root mean square error of approximation = 0.089, the Comparative Fit Index = 0.935, the Tucker-Lewis Index = 0.925). Factor 1 and Factor 2 of cPTQ indicated fundamental features of repetitive negative thinking (RNT) and functional impairment instigated by RNT. Both GAD-7 and PHQ-9 demonstrated moderate correlations with measures of repetitive negative thinking. In comparison to patients with generalized anxiety disorder (GAD), major depressive disorder (MDD), or obsessive-compulsive disorder (OCD), patients with phobic disorder (PD) or somatic symptom disorder (SSD) exhibited lower cPTQ total score ($p < 0.05$)

Conclusion The Chinese version of the PTQ has

sufficient reliability and validity to warrant further application. Patients with GAD, MDD or OCD have more severe perseverative thinking than patients with PD or SSD.

Childhood Maltreatment and Mental Health: Causal Links To Depression, Anxiety, Self-Harm, Suicide Attempts, and PTSD

Zheng Zhang Qinghua Luo*

Department of Psychiatry, The First Affiliated Hospital of Chongqing Medical University

Objective This study aims to elucidate the causal relationship between Childhood maltreatment (CM) and subsequent mental health outcomes, including Major Depressive Disorder (MDD), anxiety (ANX), Post Traumatic Stress Disorder (PTSD), suicide attempts, and self-harm. Utilizing Mendelian Randomization (MR) and genome-wide association studies (GWAS) data from individuals of European descent, this research applies a rigorous analytical methodology to large-scale datasets. This approach overcomes the confounding variables inherent in previous observational studies, providing robust evidence of causality. The goal is to inform targeted prevention and intervention strategies to mitigate the adverse psychological effects of CM

Methods Genetic data were obtained from publicly available GWAS on CM, MDD, ANX, PTSD, age of depression onset, frequency of depressive episodes, and self-harm and suicide attempts. Comprehensive MR analyses were conducted to investigate the causal impact of CM on the prevalence and symptomatology of ANX, MDD, and PTSD. Sensitivity analyses included Inverse Variance Weighted (IVW), MR Egger, Weighted Median (WM), and MR-PRESSO methodologies. False Discovery Rate (FDR) corrections were applied to IVW-derived p-values to account for multiple testing. Results were presented as Odds Ratios (ORs)

with Confidence Interval (CI) to ensure precise and detailed reporting of findings

Results Significant associations were identified between CM and the likelihood of developing MDD (IVW: OR=2.28, 95% CI=1.66-3.14, PFDR<0.001), ANX (IVW: OR=1.01, 95% CI=1.00-1.02, PFDR=0.032), and PTSD (IVW: OR=2.29, 95% CI=1.43-3.67, PFDR=0.001). Additionally, CM was linked to an increased incidence of self-harm (IVW: OR=1.06, 95% CI=1.04-1.08, PFDR<0.001), a higher frequency of depressive episodes (IVW: β =0.31, 95% CI=0.17-0.46, PFDR<0.001), and an earlier onset of depression (IVW: β =-0.17, 95% CI=-0.32 to -0.02, PFDR=0.033). However, no significant association was found between CM and suicide attempts (IVW: OR = 1.09, 95% CI = 0.81-1.45, PFDR = 0.573)

Conclusion This study provides robust evidence that CM is a significant causal factor for MDD, ANX, PTSD, and self-harming behaviors. It is also associated with a higher frequency of depressive episodes and an earlier age of depression onset. These findings corroborate existing evidence and highlight the critical need for early intervention and targeted prevention strategies to address the long-lasting psychological impacts of CM.

彭卓 徐敏 张丽*

中南大学湘雅二医院

目的 重症监护病房 (Intensive Care Unit, ICU) 患者的家属是一个容易被忽视的人群。家属 ICU 后综合征 (Post-Intensive Care Syndrome-Family, PICS-F) 是指 ICU 患者的家属在心理和生理上呈现的不良表现。研究发现, 创伤后应激障碍 (Posttraumatic Stress Disorder, PTSD)、焦虑和抑郁是家属 ICU 后综合征中最常见心理困扰。本文目的是调查这三种常见心理困扰的患病率, 研究 ICU 患者家属上述心

理困扰中的核心症状以及症状之间的相互关系。

方法 在 2023 年 2 月至 2023 年 10 月期间,对湖南省 579 名 ICU 患者家属进行了横断面调查。创伤后应激障碍检查表、广泛性焦虑障碍量表和患者健康问卷-9 三种自我报告问卷用于评估 PTSD、焦虑和抑郁症状。采用 SPSS 26.0 和 R 4.3.2 软件进行统计分析和网络分析,并使用 EBICglasso 模型估计网络模型。

结果 最终纳入研究 487 例。ICU 患者家属中 PTSD、焦虑和抑郁的患病率分别为 27.72%、43.73% 和 50.51%。网络分析结果表明,“认知和情绪的负性改变(Negative Alterations in Cognition and Mood, NACM)”、“警觉性和反应的变化(Alterations in Arousal and Reactivity, AAR)”、“难以放松”和“烦躁不安”是 PTSD、焦虑和抑郁症状网络中的核心症状。而 PTSD、焦虑和抑郁的症状网络通过“AAR”、“易怒”、“害怕”和“烦躁不安”这些桥梁症状相互连接。此外,在抑郁网络中,男性主要表现为“运动性紧张”和“疲劳”,女性则主要表现为“情绪低落”和“内疚感”。

结论 在三种心理困扰中,PTSD 症状表现最为突出。需要密切关注 NACM 和 AAR 症状以减少或预防 ICU 患者家属的心理困扰症状。

团体正念认知疗法对广泛性焦虑障碍的心理弹性的调节及疗效研究

张田田^{1,2}

1.福建医科大学

2.厦门市仙岳医院

目的 本研究旨在探讨团体正念认知疗法(mindfulness-based cognitive therapy,MBCT)对广泛性焦虑障碍(generalized anxiety disorder,GAD)的心理弹性的调节及疗效,探索适用于中国 GAD 患者临床推广的团体心理治疗方案及研究改善 GAD 临床疗效的有效因素。

方法 采用随机对照组研究,将符合入组标准的 GAD 患者随机分为团体 MBCT+药物治疗组和心理健康教育+药物治疗组两组各 35 例,分别接受 8 周的心理干预,并在干预结束后进入 6 个月的随访

期。在基线(0 周),干预后(8 周)和随访期(32 周)等不同研究时点使用心理学量表来评估被试的心理弹性水平和临床症状。简式心理韧性量表(10-item connor-davidson resilience scale,CD-RISC-10)的得分为主要统计指标,而临床治愈率即汉密尔顿焦虑量表(hamilton anxiety scale,HAMA)得分 ≤ 7 及 7 项广泛性焦虑障碍量表(general anxiety disorder-7,GAD-7)的减分率及则为次要统计指标。数据的分析采用 SPSS 26 进行,所有的数据分析均采用双侧检验,并以 $p < 0.05$ 为具有统计学意义的标准。

结果 1.本研究在病房共入组 70 例 GAD 患者,在治疗过程中共脱落 10 人,团体 MBCT 组有效例数为 30 例,心理健康教育组有效例数 30 人,有效病例数 60 例。发现经过 8 周心理干预,心理韧性在 32 周的得分及其前后差值在两组间存在差异($F=19.208, P=0.000; t=2.470, P=0.016$),结果表明团体 MBCT+药物治疗组与心理健康教育+药物治疗组之间存在差异性。2.以临床治愈率作为指标划分临床疗效,发现两组在 32 周临床治愈率差异有统计学意义($F=9.017, P=0.003 < 0.05$),结果显示团体 MBCT+药物治疗组与心理健康教育+药物治疗组之间存在差异性。3.以 GAD 减分率为次要指标,发现团体 MBCT+药物治疗组与心理健康教育+药物治疗组两组间 GAD 减分率差异无统计学意义($P > 0.05$),结果提示两组在 GAD 减分率之间不存在明显差异性。4.发现心理韧性未提高组与提高组对临床治愈率差异有统计学意义($P=0.049 < 0.05$)。

结论 1.团体 MBCT 对心理弹性的调节优于心理健康教育;2.团体 MBCT 在 GAD 患者的疗效具有长期获益且优于心理健康教育;3.调节心理韧性可改善 GAD 的临床疗效。研究结果对探究 GAD 的临床疗效有效因素及团体心理治疗在 GAD 患者中的临床应用提供了新的方向。

The Partially Positive Impact of Non-Suicidal Self-Injury on Suicide Ideation and Suicide Attempts

Xin Yu Xu Chen*

Shandong Mental Health Center

Objective Given the varied results from prior studies on the impact of non-suicidal self-injury on suicide ideation and attempt risks and their complex interrelations, traditional analytical methods might not fully capture these interactions. Therefore, this study seeks to utilize sophisticated machine-learning models to more accurately discern and forecast the dynamic impacts of non-suicidal self-injury and other relevant factors on suicide ideation and attempts

Methods From April 12 to April 26, 2024, the psychological status of students at two middle schools in Fuyang City, Anhui Province, was assessed using stratified whole cluster sampling. A total of 2,023 students were systematically sampled class by class from these schools. To ensure participants' well-being, specialized personnel were available to assist with any discomfort during or after the test. Informed consent was obtained from all participants and their guardians. This study used Python 3.7 for statistical analysis, focusing on training and evaluating seven machine-learning models: Random Forest, Extra Trees, XGBoost, Logistic Regression, LightGBM, Decision Tree, and Gradient Boosting. The model with the highest accuracy in predicting suicide ideation and suicide attempts was selected. The optimal model was used to evaluate the significance of each variable, focusing on non-suicidal self-injury in predicting suicide ideation and suicide attempts. Ultimately, this model clarified how variations in non-suicidal self-injury affect suicide ideation and suicide attempt rates

Results Following the inclusion and exclusion criteria, the study collected 2,018 valid questionnaires, yielding a validity rate of 99.75%. Among these, 785 (38.9%) exhibited non-suicidal self-injury, 372 (18.4%) had attempted suicide, 582 (28.8%) showed suicide ideation, and 316 (15.7%) displayed both behaviors. The XGBoost model showed high accuracy in predicting suicide ideation and attempts, with an Area Under the Curve (AUC) of 0.89 for ideation and 0.92 for attempts. Feature importance analysis revealed that suicide attempts were the strongest predictor of suicide ideation, with an importance score of 0.73. In contrast, suicide

ideation was the most significant predictor of suicide attempts, scoring 0.86 in importance. An analysis of non-suicidal self-injury's impact on suicide ideation and attempts in adolescents showed that initially, increased frequency of non-suicidal self-injury raised the risks of both. However, these risks began to decline after surpassing a certain threshold, with a more pronounced decrease in suicide ideation than in attempts

Conclusion The study revealed that non-suicidal self-injury has a partially positive impact on suicide ideation and attempts. Adolescents, after multiple instances of non-suicidal self-injury, learn that it can temporarily counteract suicidal tendencies. They may then use non-suicidal self-injury as a substitute for suicide ideation and attempts. This self-soothing behavior can reduce the occurrence of more severe suicidal behaviors. However, while non-suicidal self-injury provides temporary relief, it is neither harmless nor a sustainable long-term solution for underlying psychological issues. Clinical psychologists and psychiatrists need to thoroughly understand the impact of non-suicidal self-injury on suicidal behaviors and combine immediate relief with long-term therapeutic strategies to address these complex issues effectively.

关键词: Non-suicidal self-injury, Suicide ideation, Suicide attempts, Machine-learning

虚拟现实暴露治疗对飞行恐惧的疗效研究

欧杨寅殷 惠慧 王振*

上海交通大学医学院附属精神卫生中心

目的 飞行恐惧症是一类常见的特定恐惧症，在临床治疗中多以暴露疗法为主要的心理治疗手段。但传统暴露疗法容易受时空局限，无法即时调整暴露场景；同时，由于治疗成本较高，难以实现大规模的推广和实施。虚拟现实暴露疗法（virtual reality exposure therapy, VRET）是近年来发展的一项新疗法，可利用虚拟现实技术增强暴露治疗的适用性和有效性。已有研究探索并证明了 VRET 用于治疗飞行恐惧症的有效性，但当前研究仍存在一些不足：首先，许多研究并未使用特定飞行座椅，与真实的飞行体

验差异较大,可能令疗效受限。其次,少有研究关注VR使用感受。最后,暂无公开发表的随机对照试验探索并验证VRET用于我国飞行恐惧人群的可行性和有效性。因此,本研究在前人研究基础上使用定制飞行座椅提供运动刺激,通过随机对照试验探索VR暴露干预用于我国飞行恐惧人群的可行性和有效性,并纳入使用者的沉浸感和眩晕感,尝试探索影响VR暴露干预缓解飞行恐惧疗效的因素。

方法 本研究招募64名具有显著飞行恐惧特征的成人,采用区组随机法将其随机分为VR暴露干预组和等待列表对照组。以飞行焦虑情境问卷(FAS)得分为主要指标,飞行焦虑模式问卷(FAM)得分、贝克焦虑量表(BAI)得分、焦虑状态特质量表(STAI)得分、主观痛苦感觉(SUDs)为次要指标,皮电数据、心率数据、沉浸感量表(IPQ)得分和模拟器眩晕感问卷(SSQ)得分为探索性指标,通过对比两组干预前后的焦虑情绪和客观生理指标是否存在显著性差异,探索VR暴露干预缓解飞行恐惧的疗效及VR使用感受。

结果 干预组干预后的FAS、飞行中焦虑以及飞行焦虑的认知模式水平显著低于对照组($F=3.359, p=0.015$; $F=3.395, p=0.014$; $F=3.128, p=0.021$),广泛性飞行焦虑、预期飞行焦虑、FAM、飞行焦虑的躯体模式水平、BAI和STAI-s没有发现显著差异($F=2.254, p=0.074$; $F=2.451, p=0.056$; $F=2.199, p=0.080$; $F=1.636, p=0.177$; $F=1.762, p=0.149$; $F=1.160, p=0.338$)。

结论 VR暴露干预可以有效缓解飞行恐惧,尤其是飞行中焦虑和与飞行危险有关的想法,对一般焦虑没有显著影响。VR的沉浸感整体较好,眩晕感较轻。VR暴露干预的初始飞行中焦虑得分越高的个体,VR暴露干预的效果越好,而初始飞行焦虑的认知模式得分、广泛性飞行焦虑得分和特质焦虑得分越高的个体,VR暴露干预的效果越差。因此,虚拟现实技术可以用于针对飞行恐惧症的暴露治疗,为飞行恐惧人群的治疗提供更多选择。

Identifying Psychopathological Phenotypes Based on Symptom Dimensions in Chinese Community-dwelling Adults: Dimensional and Network Perspectives

Chaoyi Wu Zhen Wang*

Shanghai Mental Health Center, Shanghai Jiao Tong University School of Medicine

Background Psychopathological conceptualizations are fundamental to scientific research and clinical practice. Traditional psychiatric nosology arbitrarily distinguishes between mental illness and health, impeding a precise understanding of the broad spectrum of psychopathology within the general population. Building on novel conceptualizations, this study employs symptom dimensions derived from dimensional and network approaches in person-centered statistical models to delineate psychopathological phenotypes

Methods In a large-scale sample of Chinese community adults ($N=4102$), comprehensive psychopathology and RDoC negative valence constructs were assessed. Advanced statistical methods within dimensional and network approaches were utilized to extract symptom dimensions and identify psychopathological phenotypes. The study also examined the incremental validity of the obtained phenotypes

Results Factor analysis and exploratory graph analysis extracted seven symptom dimensions from 23 specific symptoms. Subsequently, latent profile analysis identified four phenotypes: Substance use group, Moderate symptomatology unrelated to substance abuse group, Disengaged from symptomatology group, and Severe symptomatology group. The Severe symptomatology group exhibited the most pronounced differences in network characteristics compared to other phenotypes, displaying dense interconnections and the highest global network strength. Core symptoms within this phenotype included hostility in the aggressive dimension and delusions in the psychosis dimension. Furthermore, the psychopathological phenotypes provided unique predictive information for RDoC negative valence constructs beyond diagnostic status and purely dimensional approach

Conclusions This study identified four distinct psychopathological phenotypes in Chinese community-dwelling adults, characterized by overall intensity and

specific symptom dimensions (substance-related dimension). These findings contribute to the transdiagnostic conceptualization of mental health, advancing toward an empirically derived nosology and personalized medicine

关键词: transdiagnostic dimension approach, network approach, person-centered approach, symptom dimension, psychopathological phenotype

Early Intervention in Anxiety Disorder with Clinical High-risk Factors for Bipolar Disorder: A Randomized Controlled Trial

Hong Wang Shiliang Wang Chenjie Ge Lilei Lei Lei Zeng Mincai Qian*

Huzhou Third People's Hospital

Objective To investigate whether early intervention has a more positive outcome in anxiety disorder when associated with clinical high-risk factors for bipolar disorder

Methods 66 patient were enrolled in this study from July 2020 and March 2023 in Huzhou Third Municipal Hospital. They are randomly assigned to two groups: either receiving an antidepressant (Sertraline, n=32) or a combination therapy (Sertraline and Lithium, n=34). The main variables included alterations in HAMA, HAMD from the initial assessment to the final evaluation. We conducted a thorough combined Wald test to examine the differences in scale assessment based on intention-to-treat between the various treatment conditions across time

Results Significant differences in the change of HAMA scores were observed between the two groups during week 1, week 2, and week 4 ($p < 0.05$). However, after the treatment of 8 weeks and 12 weeks, there were no disparities ($p = .485$ and $p = 0.206$). There was no significant difference in the change over time in HAMD scores between the treatment groups ($p = 0.2$), except at week 12 ($p = 0.034$). Significant differences were not observed between the adverse effects reported in patients treated with sertraline alone (18%) and patients treated

with a combination treatment (21%)

Conclusion This current double-blind, case-controlled study assess effectiveness and tolerability of combined therapy versus monotherapy for anxiety disorder in this population. In light of the constraints associated with this initial study, the results imply that the combination of sertraline and lithium may provide a more favorable prognosis.

Associations between Depressive, Anxiety, and Stress Symptoms, and Burnout Among Psychiatric Nurses in China: A Network Analysis in The Context of The Early COVID-19 Pandemic

Rui Tao Huanzhong Liu*

Chaohu Hospital of Anhui Medical University

Background The levels of depression, anxiety, and stress, as well as job burnout, among healthcare workers increased during the early stage of the COVID-19 pandemic. However, little is known about the connection between anxiety, stress, and burnout, especially among psychiatric nurses. Therefore, this study aimed to investigate the intrinsic relationship between depression, anxiety, stress, and burnout in Chinese psychiatric nurses

Method This Cross-sectional Study Was Conducted As Part of The 2021 National Hospital Performance Evaluation Survey (NHPES), Which Is A Nationally Representative Survey in China. The Survey Was Conducted Using WeChat From January To March 2021. We Used Whole-group Sampling To Investigate Socio-demographic Variables, As Well As The Levels of Depression, Anxiety, Stress, and Job Burnout Among Psychiatric Nurses in The Early Stages of The Covid-19 Pandemic. For The Descriptive and Network Analyses, We Utilized The R Programming Language in The RStudio Environment (version 4.3.3). The Gaussian Graphical Model (GGM) Was Used To Construct Network Models for The DASS-21 (Depression, Anxiety,

and Stress) and MBI-HSS (emotional Exhaustion (EE), Depersonalization (DP), and Personal Accomplishment (PA)). Using Network Analysis, We Identified Central Symptoms, The Important Bridge Symptoms, and Central Symptom Combinations with Significant Correlations.

Results A total of ^{10,069}, psychiatric nurses completed the questionnaire at selected hospitals, resulting in a response rate of ^{91.6%}. The majority of the respondents were female (^{79.2%}). Overall, ^{27.6%} of participants were classified as having clinically significant depression, while ^{31.2%} had anxiety, ^{14.5%} had stress, and ^{23.8%} had burnout. Of all the participants in this study, ^{17.4%} (^{1,604}) reported experiencing moderate to extremely severe depression. Additionally, ^{23.3%} (^{2,268}) reported experiencing moderate to extremely severe anxiety, while ^{7.4%} (⁶⁸¹) reported experiencing moderate to extremely severe stress. The prevalence of moderate to extremely severe depression, anxiety, and stress among females was ^{8.7%} (⁶³⁶), ^{17.8%} (^{1,302}), and ^{7.2%} (⁵²⁵), respectively. Among those with clinically meaningful anxiety, ^{25.9%} (⁴⁵⁶) had participated in frontline work treating COVID-19, in the past year. The network analysis results showed that the stress of psychiatric nurses has the highest EI value of ^{0.920}, and the highest strength among all nodes. Additionally, the node depression has the highest scores for both closeness and betweenness, EE had the highest BEI of ^{0.340}, and the intergroup association between EE and depression was found to be the strongest. The independent groups Gaussian network comparison test showed no statistically significant difference in the gender network and the “whether to participate in frontline work treating COVID-19, patients” network (all, $p > 0.05$). However, the global strength invariance test for male and female networks showed a statistically significant difference (S: ^{0.113}, $p=0.020$), which indicates that the sum of the absolute values of the weights of all edges in the two networks is significantly different.

Conclusion The COVID-19 pandemic has significantly increased burnout and levels of depression, anxiety, and stress among psychiatric nurses. Although the study showed the highest prevalence of clinically significant anxiety, stress was identified as the central symptom, and depression was identified as an important

bridging node among psychiatric nurses. Therefore, interventions targeting central symptoms and bridging nodes are expected to improve the mental health of psychiatric nurses.

Multimodal neuroimaging reveals structure-function change in obsessive-compulsive disorder patients

Fengxia Zhang Rui Liu Xiangyun Yang Aihong Yu Zhanjiang Li*

Beijing Anding Hospital, Capital Medical University

Objective Obsessive-compulsive disorder (OCD) is a neurological disorder characterized by recurrent and persistent obsessive-compulsive thoughts (obsessions) or/and compulsive behaviors (compulsions), with a high incidence and lifetime prevalence. The considerable heterogeneity of the disease has resulted in the identification of conflicting findings with regard to the pathophysiological mechanisms of OCD. Based on the large-scale brain impairment in OCD, we sought to investigate gray matter volume (GMV) and functional connectivity (FC) abnormalities due to structural deficits based on a multimodal neuroimaging approach and to explore the relationship between abnormal neurological indicators and clinical features

Methods We collected structural and resting-state functional magnetic resonance imaging (rs-fMRI) data from 56 patients with OCD and 41 healthy controls(HC). Voxel-based morphometry (VBM) analysis was used to find out the differences in GMV between OCD patients and HC without making any assumptions. Furthermore, we will calculate the whole brain FC of regions with abnormal GMV in two groups. Finally, we will investigate the association between abnormal neurological indicators and the Yale-Brown Obsessive Compulsive Scale (YBOCS) total score by correlation analysis

Results For the OCD group, the gray matter volume of right Temporal pole: superior temporal gyrus (Temporal_Pole_Sup_R) and Cuneus (Cuneus_R), left Calcarine (CAL_L), middle occipital gyrus (Occipital_Mid_L), and Temporal pole: middle temporal gyrus (Temporal_Pole_Mid_L) significantly decreased than the HC group, however, the right putamen showed significant increased gray matter volume. Through the functional connectivity analysis, we find the functional connectivity of the CAL_L with left putamen and inferior frontal gyrus, triangular part (Frontal_Inf_Tri_L) and right thalamus; the ceneus with left middle frontal gyrus (Frontal_Mid_L), inferior frontal gyrus, opercular part (Frontal_Inf_Oper_L), Frontal_Inf_Tri_L and right Cerebellum; the putamen with right vermis, the right anterior cingulate and paracingulate gyri (Cingulum_Ant_R) were significantly increase in the OCD patients. The gray matter volume ratios of left Calcarine and middle temporal gyrus were significantly correlated with total score of YBOCS ($R=-0.31$, $P=0.019$; $R=0.32$, $P=0.015$)

Conclusion The present multimodal imaging study indicates that structural brain deficits on GMV and FC are crucially involved in the pathophysiology of OCD. This research contributes to the understanding of the pathophysiological mechanism underlying OCD and could provide a new perspective on future diagnosis and treatment of OCD

关键词: Obsessive-compulsive disorder; magnetic resonance imaging; Functional magnetic resonance imaging; voxel-based morphometry; Gray matter volume

社交焦虑与冲动性对攻击行为的影响

张爽 黄薛冰*
北京大学第六医院

目的 社交焦虑涉及到对社交情境强烈和持续的恐惧,常表现出回避和抑制的倾向。以往研究大多关注社交焦虑的回避反应,忽视了社交焦虑个体做出攻击反应的可能性。然而,社交焦虑的异质性研究提示社交焦虑个体中存在一类特殊群体,此群

体具有高冲动性的特征,常表现出风险寻求、物质成瘾等外化问题。这挑战了人们对于社交焦虑的刻板印象,同时也引发了对社交焦虑与攻击行为之间关系的思考。本研究旨在探究社交焦虑和冲动性对攻击行为的影响。

方法 研究1筛选了160名大学生被试,采用2(冲动性:高vs低)×2(社交焦虑:高vs低)的实验设计,结合竞争反应时任务,探究四组被试在主动性攻击和反应性攻击上的差异。研究2筛选了163名大学生被试,采用2(冲动性:高vs低)×2(社交焦虑:高vs低)的实验设计,结合社会倾向任务,探究四组被试在不同反应上(攻击、合作和利己)的差异。

结果 研究1结果显示,高冲动高社交焦虑组的反应性攻击显著高于其他组别,而主动性攻击与其他组别没有显著差异,这体现了此类群体在攻击上具有反应性、防御性的特点。研究2结果显示,高冲动高社交焦虑组的攻击反应显著高于其他组别,而合作和利己反应与其他组别没有显著差异。这体现了此类群体在攻击行为上具有僵化、刻板性的特点。

结论 本研究探讨了社交焦虑和冲动性对攻击行为的影响。只有当高冲动性和高社交焦虑同时存在时,才会出现更多的攻击行为。其次,高冲动性和高社交焦虑被试在攻击行为上具有反应性和刻板性的特点。本研究的结果有利于增进对社交焦虑与攻击行为的全面理解,也为社交焦虑和攻击行为的预防和干预研究提供了视角。

未治疗强迫障碍患者皮层下核团磁共振波谱成像和静息态功能连接的联合研究

侯西蔓 李岳朋 王鹏翀 刘悦 何芳 于爱红 杨祥云*

首都医科大学附属北京安定医院

目的 皮质-纹状体-丘脑-皮质(CSTC)回路中谷氨酸和γ-氨基丁酸的代谢失衡与强迫障碍的发作密切相关,尾状核和丘脑是CSTC回路的关键枢纽。然而,很少有研究探讨强迫障碍患者皮层下核团神经生化代谢产物水平和静息态功能连接性的相关关系。

方法 本研究纳入 24 名强迫障碍患者和 17 名健康志愿者, 进行静息态功能磁共振成像和氢质子磁共振波谱成像数据采集。分别以双侧尾状核和丘脑作为感兴趣区域, 经 LCMoel 软件拟合出谷氨酸及 γ -氨基丁酸的相对浓度, 并进行基于种子点的全脑功能连接分析, 以探索皮层下核团中代谢物浓度的变化及其与静息态功能连接的相关性。

结果 强迫障碍患者左侧丘脑谷氨酸浓度显著高于对照组($t=2.235, p=0.032$), 右侧丘脑谷氨酸浓度与 γ -氨基丁酸浓度比值显著高于对照组 ($t=2.539, p=0.015$), 右侧丘脑 γ -氨基丁酸浓度显著低于对照组 ($t=-2.63, P=0.012$)。与对照组相比, 强迫障碍患者左侧尾状核与右侧距状裂周围皮层的静息态功能连接升高 ($t=4.52, pFDR<0.001$), 且升高的功能连接值与左侧尾状核谷氨酸浓度、右侧丘脑谷氨酸浓度以及右侧丘脑的谷氨酸与 γ -氨基丁酸浓度比值呈负相关($r=-0.565, p=0.004; r=-0.445, p=0.029; r=-0.500, p=0.013$)。中介分析显示, 左侧尾状核谷氨酸浓度在异常的功能连接和耶鲁布朗强迫量表评分关系中起到完全中介效应。

结论 强迫障碍患者尾状核和丘脑的谷氨酸和 γ -氨基丁酸代谢异常, 并且存在左侧尾状核与全脑的功能连接-谷氨酸代谢的耦合改变, 我们的研究结果为强迫障碍的发病机制提供了神经影像学证据。

Association between Gut Microbiota and Perinatal Depression and Anxiety Among A Pregnancy Cohort in Hunan, China

Shuyin Xu¹, Jintao Xiong¹, Xuemei Qin¹, Mohan Ma¹, Yilin Peng¹, Junzhe Cheng¹, Xueqing Nie², Xing Fan², Yali Deng¹, Yumeng Ju¹, Jin Liu¹, Li Zhang¹, Bangshan Liu¹, Yan Zhang¹, Lingjiang Li¹

1.The Second Xiangya Hospital of Central South University

2.Changsha Hospital for Maternal and Child Health Care

Objective Perinatal depression and anxiety pose significant risks to maternal health, potentially leading

to suicide. The gut microbiota may play a crucial role in perinatal depression and anxiety. However, the relationship between the alterations in gut microbiota and perinatal depression and anxiety remains unclear. This study aimed to investigate the dynamic changes of gut microbiota over various perinatal stages and their associations with perinatal depression and anxiety symptoms, especially suicide ideation

Methods 177 pregnant and 19 postpartum women were recruited, with 48 of them participating longitudinally. Maternal depression and anxiety symptoms were assessed using the Edinburgh Postnatal Depression Scale (EPDS), 9-item Patient Health Questionnaire (PHQ-9), and 7-item Generalized Anxiety Disorder Scale (GAD-7). Fecal samples collected during the perinatal period were analyzed using 16S rRNA gene sequencing

Results Significant changes in microbial diversity and multi-polyphyletic taxa were observed during pregnancy. The random forest regression model showed that gut microbial features were associated with depression and anxiety symptoms. Some genera were significantly associated with gestation age and perinatal depression and anxiety, such as Akkermansia, Bifidobacterium and Streptococcus. In addition, Erysipelotrichaceae_UCG003 and Eubacterium_hallii was positively associated with suicidal ideation. The glycine biosynthesis pathway acted as a mediator between Eubacterium_hallii and suicidal ideation ($ab=3.27, p<0.05$)

Conclusion The gut microbiota undergoes a programmed shift during pregnancy and may play an essential role in perinatal depression and anxiety. Our findings underscore the impact of certain bacterial genera and metabolic pathways on perinatal mental health, which may help to develop new diagnostic tools and targeted interventions to reduce perinatal mental disorders and improve outcomes for both mothers and infants.

Prevalence and Risk Factors for Antenatal

Anxiety in The First Trimester Among Chinese Pregnant Women

Shuyin Xu¹, Yilin Peng¹, Mengqi Xu¹, Junzhe Cheng¹, Jintao Xiong¹, Xuemei Qin¹, Zhuo Peng¹, Weiguo Mao¹, Meiqun Xiao², Mi Wang³, Li Zhang¹, Yumeng Ju¹, Jin Liu¹, Yan Yu², Bangshan Liu¹, Yan Zhang¹

- 1.The Second Xiangya Hospital of Central South University
- 2.Shenzhen Baoan Women's and Children's Hospital
- 3.Xiangya Hospital of Central South University

Objective Antenatal anxiety (AA) is a common mental disorder during pregnancy and adversely affects the well-being of both pregnant women and their offspring. The prevalence of AA is exceptionally high in the first trimester, yet there is a lack of studies focusing exclusively on AA in the first trimester. This study aimed to investigate the prevalence and risk factors of AA among Chinese pregnant women during the first trimester

Methods We retrospectively retrieved and analyzed data on the mental health screening of perinatal women at Shenzhen Baoan Women's and Children's Hospital in China from Jan 1, 2020, to Jan 31, 2024. A total of 42,045 pregnant women with less than 14 weeks of gestation were assessed using the 7-item Generalized Anxiety Disorder Scale (GAD-7). A GAD-7 score ≥ 10 indicates AA. Univariable analyses and multivariable logistic regression were employed to identify risk factors for AA

Results Among the participants, 1,067 (2.5%) experienced AA in the first trimester. Factors associated with a higher risk of AA included being under 25 years old, temporary residence, below senior high school education, low or moderate economic status, primipara, unplanned pregnancy, smoking, alcohol use, lack of exercise, low or moderate living conditions, low or moderate marital satisfaction, and reluctance to discuss troubles with others

Conclusion AA manifests as a multifaceted phenomenon influenced by various sociodemographic, obstetrical, lifestyle, and psychosocial factors. Preventing

AA requires collaboration among hospitals, communities, and families.

Neural Correlates During Social Processing in Major Depressive Disorder: A Coordinate-based Meta-analysis of Task-Related Functional Magnetic Resonance Imaging Studies

Cui Yuan¹, Shengping Mi², Shengping Mi³, Chenghui Yang¹, Lu Yuan¹, Fan Chang¹, Ying He¹, Jiajia Chen^{2,3}, Zuxing Wang¹, Hongru Zhu²

- 1.Department of psychiatry intensive care unit, Sichuan Provincial People's Hospital, School of Medicine, University of Electronic Science and Technology of China
- 2.Mental Health Center and Psychiatric Laboratory, West China Hospital of Sichuan University
- 3.West China School of Public Health, Sichuan University

Objective Social processing deficits are widely reported in patients with major depressive disorder (MDD) in recently researches. However, the underlying mechanisms related to social processes of MDD are remain unclear and neuroimaging results in this field are also inconsistent. The present study firstly conducted a coordinate-based meta-analysis of functional magnetic resonance imaging (fMRI) to explore the potential dysfunctions in the neural correlates during social processing task in MDD individuals

Methods According to the Research Domain Criteria (RDoC), we included 14 studies (330 MDD patients and 405 health controls), encompassing 14 experiments related to social process domain. FMRI studies primarily examined changes of corresponding brain regions in various social processing processes. These were analyzed using anisotropic effect-size signed differential mapping software (SDM)

Results The current study reported increased activation in patients with MDD compared with HCs in the Left precuneus, Left cerebellum, hemispheric lobule,

Right angular gyrus, Right superior frontal gyrus, dorsolateral, Corpus callosum, Left middle frontal gyrus and Left postcentral gyrus. Decreased activation was found in the Right fusiform gyrus, Left inferior occipital gyrus, Right postcentral gyrus, Left precentral gyrus and Corpus callosum. The meta-regression showed that average age of patients was positively associated with brain activity in the left precentral gyrus. In addition, the percentage of MDD female participants (available in all studies but one) was positively associated with brain activity in the left middle frontal gyrus and in the left postcentral gyrus

Conclusion Taken together, the findings suggest aberrant regional intrinsic brain activity particularly involved in default mode network, cognitive processes and perception processes when MDD patients perform Social processing task. These aberrations may underlie the pathogenesis of social process in MDD and have important implications for development of new treatments.

Quantitative EEG in Patients with Anxiety Disorders: Comparison of Absolute and Relative Power Spectra and EEG Ratio

Danfeng Yuan Xiangyun Yang Lijuan Yang Fang He Zhanjiang Li*

Beijing Anding Hospital, Capital Medical University

Objective The objective of the current study was to explore the characteristics of EEG spectral power and slow/fast frequency power ratio in anxiety disorders. As QEEG characteristics are closely related to cognitive function and mental illness, we would like to explore the relationship between EEG power spectra, clinical symptoms and cognitive function. Additionally, we aimed to investigate the potential variations in quantitative EEG characteristics across different types of anxiety disorders

Methods The subjects included 65 patients with anxiety disorders and 46 age- and gender-matched healthy controls. Resting state EEG was recorded under eyes-open and eyes-closed conditions. Group differences in absolute power(μV^2), relative power(%), and EEG band ratio from four different frequency bands and five brain regions were compared by repeated-measures analysis of variance. A comparison of EEG spectral power between specific subtypes of anxiety disorders was conducted by the dependent-group t-test. In addition, Pearson's correlation analysis was applied to explore the correlation between resting-state EEG power and anxiety symptoms and cognitive function

Results The interaction between group and region showed a greater frontal dominance of theta, delta, and theta/beta ratio(TBR) in patients with anxiety disorders compared to healthy controls. In addition, patients with anxiety disorders exhibited a significant reduction of absolute beta band power in the temporal area. The reduction of beta spectral power between the two groups was only found in the low-beta frequency band. However, no significant difference was detected between two specific subtypes of anxiety disorders: panic disorder and generalized anxiety disorder. The correlation analysis in anxiety disorders showed that the temporal beta power was positively related to attention control assessed by the Attentional Control Scale(ACS)

Conclusion The results confirmed the attentional control theory that patients with anxiety disorders showed impaired cognitive processing, with a significant decrease in absolute temporal beta power. In addition, the decreased temporal beta power might be a common deficiency of EEG spectral power in patients with anxiety disorders

惊恐障碍患者大尺度脑网络功能连接模式研究

张萍¹ 张萍² 李占江¹ 杨祥云¹ 王鹏翀¹ 孟丽敏¹ 严子君¹

- 1.首都医科大学附属北京安定医院
- 2.河北省第六人民医院

目的 基于惊恐障碍 (Panic Disorder, PD) 恐惧网络模型 (Fear Network Model, FNM) 假说, 基于静息态功能磁共振 (rs-fMRI) 技术, 探索未治疗 PD 患者全脑大尺度网络间及网络内功能连接特征。

方法 应用 rs-fMRI 技术, 纳入未治疗 PD 患者 100 例和健康对照 71 例, 采集 fMRI 数据, 评估患者的症状严重程度, 利用 Yeo7 网络模板构建大尺度功能网络, 分析网络间及网络内的功能连接。应用两样本 t 检验比较两组被试上述指标的差异。最后, 采用相关分析探讨两组被试间存在差异的脑网络功能连接与 PD 患者临床症状的相关性。

结果 最终纳入分析的 98 例未治疗 PD 患者和与之一般资料匹配的 66 例健康对照。结果显示, 与健康对照组相比, PD 患者边缘网络与腹侧注意/突显网络, 默认网络与腹侧注意/突显网络之间的功能连接显著降低 (Family Wise Error, FWE 校正 $p < 0.05$); PD 患者组在腹侧注意/凸显网络内 (左右双侧内侧顶叶之间)、感觉运动网络内 (左右脑岛之间、右侧听觉区与右侧脑岛之间) 的功能连接显著升高 (FWE 校正 $p < 0.05$); 默认网络内功能连接存在广泛异常 (FWE 校正 $p < 0.05$)。偏相关分析显示, 在感觉运动网络内, 右侧听觉区与右侧脑岛之间的功能连接与病程呈负相关 ($r = -0.222, p = 0.049$), 双侧脑岛之间的功能连接惊恐障碍严重程度量表 (Panic Disorder Severity Scale, PDSS) 总分呈正相关 ($r = 0.027, p = 0.043$)。

结论 本研究结果提示感觉运动网络内脑区的功能连接可能是 PD 状态相关的生物学指标。PD 发病的 FNM 网络模型涉及多个大尺度功能网络的交互作用, 尤其是默认网络, 在网络协同的角度完善和发展了 FNM 假说。

氢溴酸西酞普兰对惊恐障碍恐惧网络相关功能连接模式的影响

张萍¹ 张萍² 李占江¹ 杨祥云¹ 王鹏翀¹ 孟丽敏¹ 严子君¹

- 1.首都医科大学附属北京安定医院
- 2.河北省第六人民医院

目的 基于惊恐障碍 (Panic Disorder, PD) 恐惧网络模型 (Fear Network Model, FNM) 假说, 探索接受氢溴酸西酞普兰治疗 6 周后 PD 患者杏仁核及其亚区与全脑的功能连接及网络间、网络内功能连接能够改善。

方法 纳入 29 例首发未经治疗的惊恐障碍患者和 23 例健康对照, 选择氢溴酸西酞普兰 (剂量 20mg/片) 作为治疗药物, 治疗 6 周后评估患者的症状严重程度的变化, 并在治疗前后采集 fMRI 数据, 采用配对 t 检验比较 PD 患者服用氢溴酸西酞普兰治疗前后的杏仁核全脑功能连接、全脑 7 个网络的网络内、网络间的功能连接。

结果 最终纳入统计分析的共 23 例 PD 患者和与之一般资料匹配的 23 例健康对照, 患者治疗后较治疗前惊恐障碍严重程度量表 (PDSS) 总分显著减低 ($p < 0.05$)。PD 患者右侧浅表杏仁核与双侧中央后回, 左侧枕中回的正性功能连接在治疗后降低 (voxel 水平 $p < 0.005$, cluster FWE 校正 $p < 0.05$)。PD 组患者治疗后较治疗前相比, 额顶控制网络与默认网络、背侧注意网络与视觉网络之间的功能连接升高。PD 组患者治疗后较治疗前相比, 默认网络 3 个子网络之间的功能连接均显著降低 ($p < 0.05$, FDR 校正)。

结论 本研究发现, SSRIs 类药物对杏仁核全脑功能连接模式的影响既包括“自下而上”即通过与感觉运动相关的脑区功能连接的影响, 又存在“自上而下”即与额叶功能连接的影响而发挥改善症状的作用。同时, SSRIs 类抗抑郁药改善背侧注意网络和视觉网络、默认网络与执行控制网络之间的功能交互作用可能是急性期治疗改善症状的机制, 进一步补充和改善 PD 发病的 FNM 假说。

惊恐障碍的脑网络拓扑属性及结构-功能连接耦合的改变

史珂 张函 杨渊*
华中科技大学同济医学院附属同济医院

目的 随着神经网络研究的深入, 探明惊恐障碍的脑网络拓扑属性的改变已成为研究热点。然而, 当前的研究结果呈现出一定的不一致性。此外, 惊恐障碍患者的结构和功能网络间的同步变化及其相互性尚未得到充分的探讨。本研究旨在进一步揭示惊恐障碍患者脑网络拓扑属性的特征, 并探讨其结构网络和功能网络之间的耦合程度, 以期为惊恐障碍的诊断、治疗及病理机制提供新的理论依据。

方法 本研究纳入了 30 名惊恐障碍患者和 31 名健康对照者, 通过采用扩散张量成像和静息态磁共振成像技术, 系统分析了惊恐障碍患者的结构网络和功能网络的拓扑属性, 并探讨了两者之间的耦合关系。同时, 我们还深入探究了这些脑网络特性与患者临床特征之间的潜在联系。

结果 与健康对照者相比, 惊恐障碍患者的结构网络拓扑属性并未呈现出显著差异。然而, 在功能网络层面, 惊恐障碍患者表现出了明显的变化, 具体表现为较高的局部效率、聚类系数以及归一化特征路径长度。特别值得注意的是, 惊恐障碍患者的结构连接与功能连接之间的耦合强度显著增强。进一步的相关性分析显示, 功能网络中较高的局部效率和聚类系数与患者的状态焦虑水平呈正相关, 而聚类系数的增加也与特质焦虑水平正相关。

结论 本研究为惊恐障碍患者的结构和功能脑网络拓扑属性及其耦合关系的改变提供了坚实的证据。这些发现不仅为理解惊恐障碍的神经病理机制提供了新的视角, 也为改善惊恐障碍的早期诊断和治疗策略提供了重要的理论支持和临床参考。

The Impact of Childhood Trauma on Functional Connectivity in Patients with Social Anxiety Disorder

Ang Hong Xitong Liu Shuangyi Zhou Chen Yang
Shanshan Su Zhen Wang*
Shanghai Mental Health Center

Objective Social Anxiety Disorder (SAD) is a

common psychiatric disorder characterized by persistent anxiety and fear in social situations. Multiple etiological models of SAD pointed out that the development of social anxiety symptoms is attributed to a variety of environmental risk factors, among which childhood trauma is the most common psychological stress event. However, the specific influencing mechanism is still unclear. Therefore, this study aimed to explore whether childhood trauma experience can affect the brain functional connectivity of SAD patients, and further explore the brain functional connectivity (FC) directly related to childhood trauma

Methods This study adopted a parallel control study design. 30 SAD patients and 35 healthy subjects were enrolled in this study. High-resolution magnetic resonance imaging (MRI) was performed, and seed-based functional connectivity analysis (seed-based FC) was used to investigate the brain functional connectivity of SAD patients with or without childhood trauma history and healthy controls

Results The FC between medial prefrontal cortex-precuneus and anterior cingulate cortex-right frontal pole was significantly higher in SAD patients than in healthy subjects. SAD Patients with childhood trauma exhibited stronger function connection in the medial prefrontal cortex - the right angular gyrus than patients without childhood trauma; Strengthened function connection in the anterior cingulate - right frontal pole and the medial prefrontal cortex -precuneus were found in SAD patients with childhood trauma compared with healthy subjects

Conclusion The brain regions affected by childhood trauma in patients with SAD are mainly the brain regions related to self-referential function, which may promote SAD patients to form a more sensitive self-reference consciousness and always be hypersensitive for the situation related to self-reference. Enhanced functional connectivity between the medial prefrontal cortex-precuneus and the anterior cingulate cortex-frontal pole may be a common feature of SAD patients, while increased functional connectivity between the medial prefrontal cortex-right angular gyrus may be a more specific neural correlate in SAD patients who have experienced childhood trauma

关键词：Social Anxiety Disorder, Childhood Trauma, resting-state functional MRI, Self-referential process

Research Hotspots and Frontiers of Internet-based Cognitive Behavior Therapy: A Bibliometric Analysis

Sinuo Jin^{1,2}, Can Guo^{1,2}, Aixia Zhang², Qiaorong Du², Ning Sun²

1.School of Humanities and Social Sciences, Shanxi Medical University

2.Department of Psychiatry, First Hospital of Shanxi Medical University

Objective Cognitive Behavior Therapy (CBT) is considered an effective method for the treatment of mental illness. Internet-based Cognitive Behavior Therapy (ICBT) came into being in recent years, with the development of the Internet, the combination of the Internet and cognitive behavior therapy, and has gradually become an innovative and effective method for the treatment of mental illness. Several studies on the effects and mechanisms of ICBT have been widely reported. However, there is little literature on the scientometric analysis on the subject. Therefore, this paper clarifies the research status in this field through bibliometrics study and visual analysis, and provides valuable information for researchers in this field

Methods Literature was retrieved from the core database of Web of Science, and CiteSpace and Vosviewer were used to visually analyze the current research status of ICBT, as well as the development trend and general interesting points of this topic

Results A total of 971 papers were retrieved. From 2002 to 2022, publications have grown at an average annual rate of 20.33%. Behaviour Research and Therapy is the most competitive journal. The most influential authors, institutions and countries are Anderson, Gerhard (n=193), Karolinska Institutet (n=320) and SWEDEN (n=371) respectively. The analysis on the key words shows that current research in the field of ICBT

focuses on the effectiveness of treatment for different populations and disease types, as well as the evaluation on ICBT methods

Conclusion The study on ICBT is expected to remain a hot topic in the future. The application of ICBT in mental disorders and different age groups can become a further research direction that should be paid attention to in the next few years in order to better promote ICBT treatment.

Abnormal Intrinsic Brain Activity of The Sensory-motor Area As A Predictor of The Response To Selective Serotonin Reuptake Inhibitors in Treatment-naïve Obsessive-compulsive Disorder

Chengbin Guan^{1,3}, Huan Wang², Changjun Teng^{1,3}, Da Zhang⁴, Xiao Hu^{1,3}

1.The Affiliated Brain Hospital of Nanjing Medical University

2.Changzhou University

3.Nanjing Brain hospital

4.Nanjing Brain Hospital

Objective Obsessive-compulsive disorder (OCD) is a highly prevalent and chronic neuropsychiatric disorder, which is often underdiagnosed and undertreated. Selective serotonin reuptake inhibitors (SSRI) are the first-line pharmacological agents for treating OCD. However, nearly half of patients exhibit insufficient responses to SSRIs, and there are no widely accepted predictors of treatment response. Therefore, this study aims to assess the relationship between intrinsic brain activity and SSRI response using the z-standardized fractional amplitude of low-frequency fluctuations (zfALFF)

Methods In the study, we extracted the fALFF to probe the brain activity patterns from resting-state functional magnetic resonance imaging (fMRI) data in 63

treatment-naïve OCD patients (classified into 31 responders and 32 nonresponders based on the percentage of improvement in symptoms) and 33 healthy controls (HC). Then, the fALFF values of large-scale networks and each brain region of the whole brain were compared among the three groups. The zfALFF values demonstrating significant intergroup differences were utilized to investigate characteristic neuroimaging changes in OCD and factors predicting SSRI response

Results In contrast to HCs, OCD patients exhibited significantly lower zfALFF in sensory-motor area (SMA), and the brain regions within this network, including the bilateral postcentral gyrus (PoCG.L and POCG.R) and the left paracentral lobule (PCL.L). Although the alteration of fALFF was not related to scores of the Yale-Brown Obsessive Compulsive Scale (Y-BOCS) before treatment, larger zfALFF was found in SSRI responder group compared to the nonresponders, indicating that zfALFF could serve as a significant predictor of SSRI response

Conclusion The fALFF of the SMA may reflect the neuropathological mechanisms underlying OCD and the neuroimaging basis of SSRI treatment response, potentially serving as a brain-based guide for clinical practice.

Genetic and Molecular Correlates of Cortical Thickness Alterations in Adults with Obsessive-Compulsive Disorder: A Transcription-Neuroimaging Association Analysis

Xiao Hu^{1,2}, Da Zhang³, Chengbin Guan^{1,2}

1.Nanjing Brain Hospital

2.The Affiliated Brain Hospital of Nanjing Medical University

3.Nanjing Medical University

Objective Although numerous neuroimaging

studies have shown neural alterations in individuals with obsessive-compulsive disorder (OCD), a psychiatric disorder characterised by intrusive cognitions and repetitive behaviours, the molecular mechanisms linking brain structural changes and gene expression remain poorly understood

Methods By combining the Allen Human Brain Atlas dataset with neuroimaging data from the Meta-Analysis (ENIGMA) consortium and independent cohorts, this study performed partial least squares regression and enrichment analysis to probe the correlation between transcription and cortical thickness variation in adults with OCD

Results The cortical map of case-control differences in cortical thickness was spatially correlated with cortical expression of a weighted combination of genes enriched for neurobiologically relevant ontology terms, preferentially expressed across different cell types and cortical layers. These genes were specifically expressed in brain tissue, spanning nearly all cortical developmental stages. Protein-protein interaction analysis revealed that these genes coded a network of proteins encompassing several highly interactive hubs

Conclusion These findings bridge the gap between macroscopic modifications in brain structure in OCD and specific microscopic molecular events, thereby providing unique insights into genetic and molecular factors that may contribute to cortical abnormalities in OCD. These findings lay the groundwork for future work to further elucidate the etiology of OCD, develop molecular biomarkers, and identify therapeutic targets.

Decreased MGlur5 Availability in The Amygdala Associated with Anxious Symptoms in Major Depressive Disorder: A Cross-Sectional [(18)F]FPEB PET Study

Deng Aoqian Zhang Yan*

The second Xiangya hospital

Objective Preclinical studies indicate that decreased availability of metabotropic glutamate receptor 5 (mGluR5) is associated with anxiety-like behaviors in chronic stress model mice, and anxious symptoms are linked to poorer treatment outcomes in depressive disorder patients. This cross-sectional study aims to investigate the association between mGluR5 availability and anxious symptoms in patients with Major Depressive Disorder (MDD)

Methods We recruited 25 MDD patients and 21 healthy controls (HCs). Within the MDD group, patients were divided into those with and without anxious symptoms based on Hamilton Anxiety Rating Scale (HAMA) scores. The availability of mGluR5 was measured using [(18)F]FPPEB-PET scans. HAMA includes 14 items, each scored from 0 to 4, covering psychological anxiety (e.g., tension, fear, insomnia) and somatic anxiety (e.g., palpitations, sweating, dizziness). Voxel-based analysis and region-of-interest (ROI) analysis were performed to compare mGluR5 availability between groups and to examine its association with anxious symptoms

Results MDD patients exhibited significantly lower mGluR5 availability in the anterior cingulate cortex (ACC) and amygdala compared to HCs. MDD patients with anxious symptoms showed significantly reduced mGluR5 availability in the amygdala ($p=0.041$). Reduced mGluR5 availability in the amygdala was significantly associated with higher HAMA scores, indicating that lower mGluR5 availability is related to more severe anxious symptoms

Conclusion This study highlights the critical role of mGluR5 in the pathophysiology of anxious symptoms in MDD patients. The findings suggest that mGluR5 could serve as a potential target for interventions aimed at alleviating anxious symptoms in MDD, providing valuable insights for developing more effective treatments. Further research into the mechanisms and effects of mGluR5 may help optimize existing therapeutic strategies and promote the development of novel anxiolytic drugs.

Differential Effects of Oxytocin on Threat Memory Processes: A Double-Blind, Placebo-Controlled Study

Jingchu Hu* Yunfei Zhou
Shenzhen Kangning Hospital

Objective This study aimed to investigate the differential effects of intranasal oxytocin (OT) on threat memory processes, specifically its ability to augment post-retrieval extinction (PRE) in healthy humans. Given the mixed results in the literature regarding the efficacy of PRE and the promising role of OT in facilitating threat extinction, we sought to determine whether OT could serve as an enhancer for PRE. Understanding the effects of OT on these processes has important implications for developing more effective treatments for anxiety disorders, where maladaptive threat memories play a crucial role.

Methods A double-blind, randomized, placebo-controlled, between-subject design was employed in this study. A total of 82 healthy human participants (49 women) completed a 3-day experiment. On day 1, all participants underwent differential threat conditioning, where high-arousal snake pictures served as the conditioned stimuli (CS), and an electric shock was the unconditioned stimulus (US). On day 2, participants were randomly assigned to one of three groups: the retrieval+OT group (received a single intranasal dose of OT, 24 IU, after memory retrieval), the no retrieval+OT group (received a single intranasal dose of OT 30 minutes before extinction without retrieval), and the retrieval+PLC group (received a placebo after memory retrieval). On day 3, all participants underwent re-extinction and reinstatement tests. Skin conductance response (SCR) was recorded throughout the experiment to measure physiological responses to the CS. Additionally, participants' anxiety levels and shock expectancy were assessed using self-report measures

Results Initial analyses showed no significant

differences between the three groups in terms of demographic information, baseline anxiety, or shock expectancy. During the re-extinction phase on day 3, the retrieval+OT group exhibited a significantly stronger increase in differential SCR compared to the no retrieval+OT and retrieval+PLC groups. This finding was contrary to our hypothesis that OT administration after memory retrieval would enhance PRE and reduce the return of threat memory. Repeated-measures ANOVA revealed a significant main effect of day, indicating lower anxiety and shock expectancy on day 3 compared to days 1 and 2. However, there was no significant interaction between group and day for these measures, suggesting that the differential SCR findings were not mirrored by subjective reports of anxiety and shock expectancy

Further, we explored the potential mechanisms underlying these effects. The unexpected increase in SCR in the retrieval+OT group suggests that OT might have amplified the prediction error during memory reactivation, thereby stabilizing the original threat memory rather than facilitating its extinction. This aligns with some previous studies suggesting that OT can enhance the salience of social and threat-related cues, potentially making the memory more resistant to subsequent interference.

Conclusion These findings add to the growing body of literature on the role of OT in human aversive memory processes and provide important insights into its potential clinical applications. Contrary to our initial hypothesis, intranasal OT administered after memory retrieval did not enhance PRE; instead, it appeared to increase the robustness of the threat memory, as evidenced by heightened SCR during re-extinction. This suggests that while OT has a role in modulating threat memory, its effects may not always align with the desired therapeutic outcomes. The results highlight the complexity of OT's effects on memory processes and suggest that its use in clinical settings should be carefully considered

Overall, our study suggests that OT may hold potential benefits for exposure-based therapies, where the goal is to reduce the response to threat cues through re-

peated exposure without the need for memory reactivation. However, its use in reconsolidation-based therapies, which rely on disrupting the reconsolidation of threat memories, may be less straightforward and could potentially be counterproductive. Future research should continue to explore the nuanced effects of OT on different phases of memory processing to understand its therapeutic potential and limitations better. Our findings underscore the importance of personalized approaches in applying OT in therapeutic settings, considering individual differences in response to OT and the specific nature of the therapeutic goals.

Understanding these mechanisms is crucial for the development of targeted interventions for anxiety disorders. Given that maladaptive threat memories are a core feature of many anxiety disorders, the ability to effectively modify these memories could significantly improve treatment outcomes. The current study highlights the potential for OT to enhance exposure-based treatments, suggesting that it may be a valuable tool in the therapeutic arsenal for anxiety disorders. However, caution is warranted in its application to reconsolidation-based therapies, underscoring the need for further research to optimize its use.

童年创伤是导致抑郁症患者情绪冲突处理能力受损的重要因素：一项 ERP 研究

张燕* 马墨涵 鞠玉朦
中南大学湘雅二医院

目的 童年创伤已被证明是影响抑郁症发生发展的重要因素，其可能导致个体的情绪调节困难，使得个体在面临情绪冲突刺激时，更易投入到负面情绪中，并可能进一步导致了抑郁症的发生。能够正确识别和处理情绪冲突，是个体情绪调节能力的体现，本研究旨在通过电生理数据，探索童年创伤与情绪冲突处理能力的关系，以及这种影响是否与疾病严重程度存在关联。

方法 本研究共纳入 155 例抑郁症 (MDD) 患

者和 58 例健康对照 (HC), 使用 HAMD-24 量表和 HAMA 量表对患者的疾病状态进行评估。使用脸-词 stroop 实验范式采集受试者的脑电数据, 刺激图片由表达快乐、悲伤、恐惧的三种情绪面孔叠加“快乐”、“悲伤”、“恐惧”的红色字体汉字形成情绪冲突刺激图片, 要求受试者忽略汉字, 判断情绪面孔的性质。分析过程中依据电极位置, 将前额叶区域分为左侧前额叶、额叶中间区和右侧前额叶进行脑区内的平均处理, 提取出在刺激呈现后 350ms-550ms 的 N450 成分, 该 ERP 成分被认为是反映冲突检测和处理功能的重要成分, 随后计算该成分的特征, 通过统计分析, 探索童年创伤对 N450 功能的影响, 以及与疾病严重程度的关系。

结果 对三个额叶区域的 ERP 特征进行组别 (MDD 和 HC) * 面孔类型 (快乐、悲伤、恐惧) * 分型 (有无童年创伤) 的三因素方差分析, 结果发现, 额叶中间区 N450 振幅 ($F=9.80, p=0.002$)、左侧额叶区 N450 振幅 ($F=4.554, P=0.033$) 和潜伏期 ($F=7.04, p=0.008$) 在分型条件主效应均显著, 且有童年创伤均大于无童年创伤; 此外, 左侧额叶区域的潜伏期组别主效应显著, $HC > MDD$; 进一步对 MDD 和 HC 分组进行有无童年创伤的比较: MDD 组: 有无童年创伤在左侧额叶振幅 ($F=4.33, p=0.038$) 和额叶中间区振幅 ($F=13.26, p<0.001$) 主效应均显著, 有童年创伤大于无童年创伤; HC 组: 有无童年创伤在额叶中间区振幅 ($F=4.87, p=0.029$)、左侧额叶潜伏期 ($F=6.99, p=0.009$) 主效应显著: 有童年创伤大于无童年创伤。进一步分析中发现, 在 MDD 患者中, 无童年创伤组额叶中间区振幅与 HAMD-24 ($r=0.524, p=0.003$) 及 HAMA ($r=0.332, p=0.048$) 均存在显著的正相关关系。

结论 童年创伤对情绪冲突处理能力存在影响, 且这种影响不仅存在于 MDD 人群, 在 HC 群体中同样存在。此外, N450 功能仅与无童年创伤的 MDD 患者疾病严重程度相关, 这可能是因为无童年创伤组 N450 受损严重, 失去了与情绪冲突处理功能的紧密联系, 进而失去了与疾病严重程度的关系。

经颅强交流电刺激治疗对抑郁症患者焦虑症状干预效果: 一项随机对照研究

吕冠仪 鞠玉朦 张燕*
中南大学湘雅二医院

目的 抑郁症是一种常见的心境障碍, 伴焦虑症状抑郁症是常见的抑郁症亚型, 该类患者病情较严重、治疗起效所需时间更长, 临床治疗难度较大。本研究探讨经颅强交流电刺激 (治疗参数: 15mA、77.5Hz) 治疗对抑郁症患者焦虑症状干预效果, 探究该治疗能否快速改善抑郁症患者的焦虑症状。

方法 患者为单中心招募的, 汉密尔顿焦虑量表 (14-item Hamilton rating scale for anxiety, HAMA14) 需要 ≥ 14 分、符合基于 DSM-V 的结构化临床访谈 (Structured clinical interview for DSM-V, SCID) 的抑郁症患者, 并采用随机双盲的研究设计方法随机分为真刺激组和伪刺激组。在不调整药物的基础上, 进行为期 10 天经颅交流电刺激, 每天治疗 2 次, 每次刺激时长 40 分钟。以 HAMA14 作为主要疗效指标。数据采用重复测量方差分析患者在治疗 5 天和 10 天的焦虑严重程度。

结果 共有 35 例有焦虑症状的抑郁症患者纳入此项研究, 真刺激组 19 例, 伪刺激组 16 例。在治疗 5 天后, 真刺激组较伪刺激组 HAMA14 评分均有下降, 在 HAMA-精神焦虑评分显示显著差异 ($p=0.023$), HAMA-躯体焦虑评分无统计学显著差异 ($p=0.904$)。在治疗 10 天后, 真刺激组和伪刺激组 HAMA14 平均分数均下降至 14 分以下, 两组之间 HAMA14 评分无统计学差异 ($p=0.632$), HAMA-精神焦虑评分未显示出统计学差异 ($p=0.575$)。

结论 经颅交流电刺激能在短期 (5 天) 改善患者的精神焦虑, 但长期疗效需要大样本研究来探索。

Objective Obsessive-compulsive disorder (OCD) has been classified as one of the ten most disabling conditions by the World Health Organization. However, there has been no available nationally representative epidemiological data demonstrating the prevalence of OCD and the healthcare utilization of patients with OCD in China. Therefore, the present study, which is a part of the China Mental Health Survey (CMHS), aims to investigate the prevalence, comorbidity, role impairment, and healthcare utilization in people with OCD in China

Methods The present study used a multi-stage clustered area probability sample to obtain representative population-based data on mental disorders in adults from 157 nationwide disease surveillance points in 31 provinces across China. Trained interviewers conducted face-to-face interviews with respondents to collect information about the presence of obsessions, compulsions, OCD, and other mental disorders based on the Composite International Diagnostic Interview 3.0 according to the DSM-IV criteria. The Sheehan Disability Scale was used to evaluate role impairments associated with 12-month obsessions and compulsions. Respondents with OCD reported whether and when they received any healthcare services for their obsessions or compulsions. Quality control procedures encompassed computerized logic checks, sequential recording verification, phone-call verification, and re-interviews conducted by psychiatrists. Data weighting was performed to account for differential selection probabilities and response rates and to post-stratify the sample to ensure its representativeness of the population in China

Results A total of 28,140 respondents [12,537 (44.6%) males and 15,603 (55.4%) females] completed the OCD module of the Composite International Diagnostic Interview 3.0. The lifetime prevalence of OCD was higher in people who were separated, widowed, or

divorced compared with those in marriage or cohabitation (OR: 1.79, 95% CI: 1.13-2.84). The lifetime and 12-month prevalences of OCD did not differ significantly across age, gender, work status, education level, place of residence, and region. Two-thirds of the respondents with lifetime OCD had comorbid mental disorders, with OCD typically emerging later than the comorbid mental disorders. The most common comorbidity of OCD were mood disorders (39.7%, OR: 9.6, 95% CI: 7.4-12.5) and anxiety disorders (32.8%, OR: 13.3, 95% CI: 10.1-17.5). Overall, 588 (weighted 58.2%) respondents with obsessions or compulsions experienced role impairment in any domains of the Sheehan Disability Scale. The "other" obsessive and compulsive symptoms, which were not specified by respondents, were associated with the most severe role impairment. Only 46 (6.7%) respondents with lifetime OCD and 28 (6.5%) with 12-month OCD received any healthcare services for their conditions

Conclusion In China, the weighted lifetime and 12-month prevalences of OCD were 2.4% and 1.6%, respectively. Most patients with OCD reported comorbid mental disorders and role impairment due to OCD. National programs to expand health service coverage and popularize the knowledge of OCD are significant for addressing the demands for healthcare services in China.

探索抑郁症患者疲乏、动力下降与认知功能的症状网络关系: 基于交叉滞后面板分析

张倩倩 张燕*
中南大学湘雅二医院

目的 了解抑郁症患者病程进展中症状的动态变化对制定有效的预防和干预措施至关重要。疲乏和动力下降是抑郁症患者中常见且具有显著影响的症状, 它们对主观和客观认知功能有重要影响。本研究通过交叉滞后面板网络分析方法, 探讨疲乏、动力下降与主客观认知功能在抑郁症状网络中的关系, 旨在揭示这些症状如何相互作用并影响抑郁症

的整体症状结构。

方法 本研究样本包括 172 名抑郁症患者, 在两个时间点 (基线和 8 周后) 进行评估。使用的指标包括主观认知 (如注意力/集中、前瞻记忆、回顾记忆、计划/组织)、客观认知 (如执行功能、注意力、处理速度、记忆) 以及抑郁症状 (如工作和活动、一般躯体症状)。通过交叉滞后面板网络分析方法, 构建时间点 1 到时间点 2 的症状网络模型, 分析症状间的动态关系。

结果 结果显示, 疲乏 (SS) 是对其他症状群输出影响最关键的节点, 尤其是对主观认知功能中的注意力 (ATS) 影响显著。SS 能够直接或通过影响前瞻性记忆 (PM) 来影响 ATS。动力下降 (WA) 显著影响主观认知功能中的计划性和前瞻性记忆。执行功能 (EF) 显著影响前瞻性记忆 (PM), 执行功能越强, 前瞻性记忆能力越强。记忆力 (M) 越好, 主观计划性 (PL) 越好。客观注意力 (AT) 越强, 主观注意力 (ATS) 越强。处理速度 (PS) 越强, 工作动力 (WA) 增强。在纵向交叉滞后面板网络分析中, 显著正向连边为: SS 到 ATS; SS 到 PM; SS 到 PL, 显著负向连边为 WA 到 PL; WA 到 PM; EF 到 PM。这些结果表明, 随着抑郁症患者病程的进展, 疲乏在症状网络中的影响力最强, 尤其是在主观认知功能中起到重要作用。动力下降则主要影响主观认知功能的计划性和前瞻性记忆。执行功能、记忆力、注意力和处理速度在主客观认知功能中相互关联, 并对抑郁症状的改善具有重要意义。

结论 本研究通过纵向主客观认知功能症状群与抑郁症状群的网络分析, 揭示了疲乏和动力下降在症状网络中的关键作用。疲乏是影响其他症状群的主要因素, 尤其在主观认知功能中的注意力方面起到重要作用。动力下降则主要影响主观认知功能的计划性和前瞻性记忆。执行功能、记忆力、注意力和处理速度在主客观认知功能中相互关联, 并对抑郁症状的改善具有重要意义。这些发现为 MDD 的诊断和治疗提供了新的视角, 未来研究应进一步探讨这些症状的潜在机制及其干预策略。

广泛性焦虑障碍患者中犬尿氨酸通路改变的特征研究

赵小天 张燕* 柳进
中南大学湘雅二医院

目的 探究犬尿氨酸通路 (kynurenine pathway, KP) 在广泛性焦虑障碍 (generalized anxiety disorder, GAD) 患者中的横断面改变及 2 月随访期间的纵向变化, 并探究其与焦虑症状的相关关系以及对 GAD 的诊断及 2 月临床预后的预测效能, 为探究 GAD 的病理机制、KP 能否作为 GAD 潜在的生物标志物及干预靶点等科学问题提供初步的临床依据。

方法 纳入 57 名 GAD 患者及 53 名健康被试, 对 20 名患者进行了为期 2 月的随访。采集了被试的人口学资料, 并对焦虑、抑郁症状进行评估, 采集外周血液样本, 并使用液相色谱串联质谱 (liquid chromatography-tandem mass spectrometry, LC-MS/MS) 检测被试血浆样本中 KP 代谢物的浓度。使用 t 检验、U 检验、协方差分析探究 GAD 患者与健康对照 KP 代谢物水平的差异; 通过相关分析探究 KP 改变与焦虑症状的横断面及纵向相关关系; 通过逻辑回归探究 KP 代谢物对 GAD 临床结局的预测效能以及 KP 代谢物对 GAD 的诊断效能。

结果 (1) GAD 患者较健康被试存在犬尿氨酸通路氧化分支代谢产物 3-羟基犬尿氨酸 (3-hydroxykynurenine, 3-HK; $t = 2.403, P = 0.018$)、吡啶-2-羧酸 (picolinic acid, PA; $t = 3.454, P < 0.001$) 及喹啉酸 (quinolinic acid, QA; $t = 2.697, P = 0.008$) 的升高; (2) GAD 患者的 PA 与 QA 升高可持续至 2 月其焦虑症状缓解后, 焦虑症状缓解组与未缓解组中 PA 与 QA 的水平无显著差异; (3) 缓解组与未缓解组基线至 2 月的重复测量方差分析中, 4 种代谢物 3-HK、XA、QA、PA 的时间*分组交互效应均没有显著差异; (4) 总体被试 (GAD 患者+健康被试) 中 PA 经多重比较校正后与汉密尔顿焦虑评估量表 (Hamilton anxiety rating scale, HAMA) 评分及 HAMA 精神焦虑因子显著相关, 而 GAD 组中 KP 代谢物水平与焦虑症状评分的相关性不显著; (5) 基线 KP 代谢物水平对 GAD 患者焦虑症状变化及临床预后 ($H = 8.160, P = 0.418$) 的预测效能较低; (6) KP 代谢物水平对 GAD 具有一定的预测效能 (准确率 = 70.9%, $AUC = 0.758$)。

结论 GAD 患者存在外周 PA 及 QA 水平升高, 该改变持续存在于不同疾病状态且独立于焦虑症状的变化, 对 GAD 具有一定的诊断效能。

Unraveling The Relationship between Neurotransmitter Impairment and Treatment Response in Obsessive-Compulsive Disorder

Xiao Hu^{1,2}, Da Zhang³, Chengbin Guan^{1,2}

- 1.Nanjing Brain Hospital
- 2.The Affiliated Brain Hospital of Nanjing Medical University
- 3.Nanjing Medical University

Objective Obsessive-Compulsive Disorder (OCD) is a chronic and treatment-refractory psychiatric disorder characterized by compulsive thoughts and behaviors. The complex etiology and pathology of OCD have been linked to structural abnormalities in gray matter through extensive neuroimaging studies. Insight into the morphological alterations and their link to neurotransmitter impairment could pave the way for developing customized therapeutic strategies

Methods This research utilized the JuSpace toolbox, enabling cross-modal correlations between Magnetic Resonance Imaging (MRI)-based measurements and nuclear imaging-derived estimates across various neurotransmitter systems, including dopaminergic, adrenergic, noradrenergic, GABAergic, and glutamatergic. The study cohort comprised 45 treatment-responsive OCD patients, 33 non-responders, and 38 age-matched healthy controls (HCs). We investigated the association between OCD-related gray matter volume (GMV) changes and specific neurotransmitter systems, further analyzing the link between GMV-neurotransmitter alterations and treatment response

Results Voxel-based analysis revealed that brain changes in OCD patients significantly correlated with the spatial distribution patterns of serotonin, GABA, and glutamate receptors ($p < 0.05$, corrected for false discovery rate). Furthermore, a negative correlation was observed between treatment response with the co-localization strength of GMV with 5HT-1b, GABAa, and

mGluR5 receptors

Conclusion This initial study indicates that neurotransmitter-specific impairment linked to regional gray matter atrophy in OCD may uncover novel pathophysiological insights, potentially guiding the customization of therapeutic approaches for OCD.

关键词: Gray matter volume, Obsessive-compulsive disorder, Neurotransmitter

童年创伤对抑郁症患者脑网络功能的影响

张燕* 马墨涵 鞠玉朦

中南大学湘雅二医院

目的 童年创伤已被证明是影响抑郁症(MDD)发生发展的重要因素,深入理解童年创伤对MDD患者所造成的脑功能改变具有重要的意义。脑电生理信号作为大脑活动的直接反映,长期以来受到了广泛的关注,近些年来发展起来的溯源技术能够更好的帮助我们理解脑区电生理所发生的改变及其与疾病之间的关系,本研究旨在探索MDD患者溯源后的脑电生理指标与童年创伤之间的关系,深入理解童年创伤的病理机制。

方法 本研究共纳入155例抑郁症(MDD)患者,使用CTQ量表对患者进行评估分为有童年创伤组(109例)和无童年创伤组(46例),并采集静息态闭眼的脑电数据。使用mne软件自带的标准头模型与源模型进行源重建,把每个脑区的源信号进行平均作为该脑区的代表信号,然后使用包络相关算法(Envelope Correlated, EC)进行功能连接网络建立。进一步使用NBS算法进行网络分析。

结果 使用NBS分别对全频段和五个子频段的功能连接矩阵进行有无童年创伤的组间比较,在全频段上未达到显著性差异 $p<0.05$ 。子频段中 α 频段:表现为有童年创伤存在功能连接降低的一个子网络,结果显示主要集中在左半球以及左右半球之间的连接,脑区主要集中在颞上回后部,梭状回,颞中回等,在 β 频段:发现有童年创伤组存在一个功能连接增加的子网络,主要集中在大脑左右半球的连接和右半球的连接,主要涉及到的有颞叶、额叶、枕叶以及脑岛等,在 θ 频段:有童年创伤组存在一个功能连接增加的子网络,主要集中在颞上回后部,

楔叶,枕叶等脑区。

结论 童年创伤对MDD患者的影响主要集中在 α 频段、 β 频段和 θ 频段,且在不同的频段表现为各自独立的特点,在脑区层面上我们发现, α 频段和 β 频段分别在左半球和右半球存在主导地位,而 θ 频段则主要表现在执行控制相关脑区的异常,以上结果提示我们童年创伤对MDD患者的影响十分广泛,基于现有对脑电生理的理解,童年创伤对执行控制功能的影响值得关注和进一步探讨。

The Efficacy of Mindfulness-based Cognitive Therapy for The Anxiety and Depression Symptoms in Subthreshold Depressive College Students, A Randomized Controlled Trial

Kangning Li Danlan Yang Yumeng Ju Bangshan Liu Mei Huang Jing Li Yan Zhang*

The Second XIANGYA Hospital Of Central South University

Objective Subthreshold depression (SD), usually a preclinical state in which an individual reports clinically relevant depressive symptoms (i.e., depressed mood or loss of interest) but fails to meet the diagnostic criteria for major depression, is a risk factor for the onset of depression and causes distress for 23% of Chinese college students. Mindfulness-based cognitive therapy (MBCT), a psychotherapeutic approach that combines mindfulness techniques with cognitive behavioral therapy, has been found to reduce depressive symptoms in adolescents with depressive tendencies. This study investigated the efficacy of MBCT on depressed mood in college students with SD to provide a basis for depression prevention in college students

Methods Sixty-seven SD patients were randomly assigned to either the MBCT group (n=34) or the health education group (HE, n=33) for an 8-week treatment. Patients' depressive symptoms and anxiety symptoms were assessed by the 9-item Patient Health Questionnaire -9 (PHQ-9) and Generalized Anxiety Disorder -7 (GAD-7) respectively, the Five Facet Mindfulness

Questionnaire (FFMQ) was used to assess patients' mindfulness skills, and the Psychotherapy Side Effects Scale (PSES) was used to measure the side-effects of the intervention. According to the principle of allocation according to the completion of the programme, independent t-tests were used to compare the changes in the scores of anxiety and depressive symptoms and the mindfulness skills before and after the treatment in the two groups

Results At baseline, there were no significant differences in demographic data, PHQ-9 scores ($P=0.675$), GAD-7 scores ($P=0.773$), and FFMQ scores between the MBCT and HE groups ($P=0.743$). At the end of the intervention at week 8, 31 people in each of the MBCT and HE groups completed the intervention and follow-up, with 3 people in the intervention group perceiving side effects, the main side effect being the length of the exercise and thus anxiety. The change in PHQ-9 scores before and after the intervention was higher in the MBCT group than in the HE group ($P=0.027$), and the change in GAD-7 scores was also higher ($P=0.045$), with 58.1% of the patients in the MBCT group moving to non-threshold compared to 25.8% in the HE group, which was a significant difference between the two groups ($P=0.01$). Before and after the intervention compared to the HE group, the main mindfulness skills increased in the MBCT group were: observing ($P=0.001$), describing ($P=0.016$), and there was no significant between-group difference in the remaining three mindfulness skills

Conclusion MBCT can effectively enhance the two mindfulness skills of observation and description and effectively reduce depression and anxiety among college students, and the intervention is safe and effective.

光照治疗焦虑障碍的系统评价

苏亮* 蔡亦蕴 王立伟
复旦大学附属华山医院

目的 焦虑障碍是临床常见的精神障碍, 研究显示焦虑障碍患者的症状与抑郁障碍存在重叠和共病现象。国外有研究表明光照治疗对季节性抑郁障碍和非季节性抑郁障碍都有一定疗效, 也是临床很有应用前景的治疗心境障碍的物理治疗方法。但尚未见光照治疗焦虑障碍的系统评价或 Meta 分析。为探讨光照治疗焦虑障碍的疗效和安全性, 我们用 Meta 分析方法对已经发表的相关文献进行系统综述, 定量描述光照治疗在焦虑障碍患者中的应用价值。

方法 制定原始文献的纳入标准、排除标准及检索策略, 检索 PubMed、EMbase、Web of knowledge、Cochrane Library、PsycINFO、中国期刊全文数据库、万方数据库、维普中文科技期刊数据库及中国生物医学文献光盘数据库等。应用 STROBE 即加强观察性流行病学研究报告的质量(strengthening the reporting of observational studies in epidemiology, STROBE)为参照评价标准评价文献质量。采用 RevMan 和 STATA 软件对满足纳入标准的研究进行 Meta 分析。

结果 共检索到 29 篇文献, 符合纳入标准的 4 项研究(其中一篇为 RCT)进入 Meta 分析。异质性检验结果, 光照治疗焦虑障碍[Heterogeneity: $Tau^2 = 0.695$; $Chi^2 = 21.42$, $df = 3$ ($P < 0.0001$); $I^2 = 86\%$]的各项研究之间存在异质性。故采用随机效应模型进行定量合并分析, 结果显示光照治疗对于焦虑障碍[总效应 $Z=2.12$, 合并 effect size=0.980, 95%CI(0.074, 1.887), $P=0.034$]。发表性偏倚检验提示无发表性偏倚 (Egger's test, $P=0.315$; Begg's test, $P=0.340$), 失效安全数为 7。各研究均缺乏系统的安全性报道。

结论 综合现有的初步研究, 尽管各研究对不良反应的报道缺乏系统性, 结果显示光照治疗对于焦虑障碍有效。但光照治疗焦虑障碍的相关研究较少, 缺乏大样本的随机对照研究, 故 Meta 分析的结果是否适用于临床环境尚需要更多的证据。

Different Alterations in The Kynurenine Pathway in Generalized Anxiety Disorder, Major Depressive Disorder, and Bipolar Disorder

Xiaotian Zhao Yan Zhang* Jin Liu

the Second Xiangya Hospital of Central South University

Objective To investigate the differential cross-sectional changes in the kynurenine pathway (KP) among patients with generalized anxiety disorder (GAD), major depressive disorder (MDD), and bipolar disorder (BD), and to explore the diagnostic efficacy of KP metabolites in distinguishing these common psychiatric disorders

Methods The study included 57 GAD patients, 180 MDD patients, and 40 BD patients. Demographic data were collected, and anxiety, depression, and manic symptoms were assessed. Peripheral blood samples were obtained, and plasma concentrations of KP metabolites were measured using liquid chromatography-tandem mass spectrometry (LC-MS/MS). Analysis of variance was employed to examine inter-group differences in KP metabolite levels, while logistic regression was used to evaluate the diagnostic efficacy of KP metabolites for GAD, MDD, and BD

Results (1) GAD patients exhibited significantly higher levels of oxidative branch metabolites, quinolinic acid (QA) and picolinic acid (PA), compared to MDD and BD patients. (2) No significant differences in peripheral kynurenine levels were observed between MDD and BD patients. (3) A diagnostic model incorporating 10 KP metabolites demonstrated good efficacy in distinguishing GAD patients from the entire cohort (AUC = 0.84), whereas the model's performance in differentiating between MDD and BD was suboptimal (AUC = 0.66)

Conclusion GAD patients display KP alterations characterized by elevated levels of oxidative branch metabolites QA and PA. Peripheral KP metabolite levels show moderate predictive efficacy in distinguishing GAD from MDD or BD. However, the model's performance in differentiating between MDD and BD patients is limited.

Prevalence and Correlates of Suicide Attempts in Chinese Outpatients with First-Episode and Drug-Naïve Psychotic Major Depressive Disorder at Different Ages of Onset

ZhaoXuan Shang¹, ChunQing Fang¹, XiaoE Lang², XiangYang Zhang³

1.Department of Psychology and Cognitive Science, East China Normal University

2.First Hospital of Shanxi Medical University

3.Institute of Psychology, Chinese Academy of Sciences

Objective The objective of this study was to examine the prevalence and associated risk factors for suicide attempts among Chinese outpatients diagnosed with first-episode and drug-naïve psychotic major depressive disorder (PMD), with a focus on different ages of onset

Methods This cross-sectional study included 1,289 participants aged 18-45 from the psychiatric outpatient clinic of the First Hospital of Shanxi Medical University, China. All participants were of Chinese Han ethnicity and met DSM-IV criteria for major depressive disorder (MDD) with psychotic features. Clinical assessments were conducted using structured interviews and standardized scales, including the Hamilton Anxiety Rating Scale (HAMA), the Hamilton Depression Rating Scale (HAMD), and the Positive and Negative Syndrome Scale (PANSS). Biochemical analyses were performed to measure thyroid function and lipid profiles

Results The prevalence of PMD was found to be 9.95%, with a significantly higher incidence in the middle-age onset (MAO) group (14.57%) compared to the early-age onset (EAO) group (8.27%). The overall prevalence of suicide attempts was 20.14%, with no significant difference between the EAO (19.24%) and MAO (22.61%) groups. In EAO PMD patients, HAMA scale score and thyroid stimulating hormone (TSH) levels were associated with suicide attempts. The area under the receiver operating characteristic curve (AUROC) was 0.892. In MAO PMD patients, TSH and diastolic blood pressure were associated with suicide attempts. The AUROC was 0.862

Conclusion This study highlights the high prevalence of suicide attempts among PMD patients, irrespective of the age of onset. Distinct clinical and biochemical profiles associated with suicide attempts in EAO and MAO groups underscore the need for age-specific preventive strategies and therapeutic interventions. Elevated anxiety levels and thyroid dysfunction were prominent predictors of suicide attempts in early-onset PMD, whereas hypertension and thyroid dysfunction played a significant role in middle-age onset PMD patients. Further prospective studies are warranted to validate these findings and to explore the underlying mechanisms linking these risk factors to suicidal behaviors in PMD.

Lipid Profiles and Suicide Risk in Young First-Episode Drug-Naïve Chinese Major Depressive Disorder Patients

Zhaoxuan Shang¹, XiangYang Zhang²

1.Department of Psychology and Cognitive Science, East China Normal University

2.Institute of Psychology, Chinese Academy of Sciences

Objective This study aimed to examine the relationship between lipid profiles and suicide risk among young first-episode drug-naïve (FEDN) patients diagnosed with major depressive disorder (MDD) in a Chinese population

Methods This cross-sectional study recruited 917 young Chinese patients aged 18-35 years with FEDN MDD from the psychiatric outpatient department of a general hospital in Taiyuan, Shanxi Province, between 2015 and 2017. Clinical assessments included the Hamilton Depression Rating Scale (HAMD), Hamilton Anxiety Rating Scale (HAMA), and Positive and Negative Syndrome Scale (PANSS). Biochemical analyses measured lipid profiles (total cholesterol (TC), triglycerides (TG), high-density lipoprotein (HDL), and low-density lipoprotein (LDL)). Binary logistic regression

was used to identify predictors of suicide attempts

Results The prevalence of suicide attempts among the study population was 19.5%. Suicide attempters had significantly higher HAMA, HAMD, and PANSS positive subscale scores compared to non-suicide attempters. Additionally, MDD patients who attempted suicide had elevated levels of TC and LDL-C and reduced levels of HDL-C. Logistic regression analysis indicated that suicide attempts were significantly linked to higher HAMD scores (OR = 1.116), higher HAMA scores (OR = 1.311), and elevated TC levels (OR = 1.500). The area under the receiver operating characteristic (AUROC) curve for the refined logistic regression model was 0.795, indicating good discriminative ability

Conclusion Young FEDN MDD patients are at a higher risk of attempting suicide, with significant correlations between suicide attempts and elevated TC levels. The findings highlight the importance of comprehensive clinical assessments, including psychological evaluations and lipid profile monitoring, to identify individuals at high risk for suicide. Further longitudinal studies are warranted to elucidate the causal pathways and underlying mechanisms linking lipid profiles and suicidal behavior in MDD patients.

Prevalence and Correlates of Severe Anxiety Among Front-line Nurses in China During and after The COVID-19 Pandemic: A Multi-center Survey

Guoshuai Luo*

Tianjin Anding Hospital

Objective Nurses have been at the forefront of the battle against the COVID-19 pandemic, facing extended work hours and heightened stress, predisposing them to psychological distress. This study aims to investigate the prevalence and correlates of severe anxiety among front-line nurses in China during and after the

COVID-19 pandemic

Methods A large-scale multicenter survey was conducted from November to December 2022 and from April to July 2023. Data were collected using online surveys, covering demographic characteristics, job-related factors, anxiety, depression, and sleep disorders. Statistical analyses, including chi-square tests, t-tests, and logistic regression, were performed to assess the incidence and factors influencing severe anxiety

Results The study included 816 nurses during the pandemic and 763 nurses after the pandemic. The prevalence of severe anxiety during the pandemic (52.3%) was significantly higher than after the pandemic (8.0%). Factors such as nursing title, night shift frequency, educational level, exercise frequency, COVID-19 infection status, economic pressure, and work pressure showed significant differences between the two periods. Binary logistic regression revealed associations between severe anxiety and factors such as night shift frequency, COVID-19 infection status, nursing title, depression, and sleep disorders. Receiver Operating Characteristic analysis demonstrated good predictive value for severe anxiety

Conclusion The study underscores the importance of understanding and addressing severe anxiety among front-line nurses during and after the COVID-19 pandemic. Future research should delve into long-term psychological effects and implement effective intervention measures to support nurses' mental health.

关键词： Severe anxiety, Front-line nurses, COVID-19 pandemic, Multicenter survey, Mental health

The Incidence and Influencing Factors of Suicide Attempts in Major Depressive Disorder Patients Comorbid with Moderate-to-severe Anxiety: A Large-scale Cross-sectional Study

Guoshuai Luo¹, Xiangyang Zhang²

1. Tianjin Anding Hospital

2. Chinese Academy of Sciences

Objective Major depressive disorder (MDD) is a recurrent and persistent mental illness. However, there is a lack of research that distinguishes the severity of comorbid anxiety disorders in MDD, and insufficient evidence exists regarding the prevalence of MDD patients with comorbid moderate-to-severe anxiety in the Chinese population

Methods The study included 1718 MDD patients (894 with moderate-to-severe anxiety symptoms and 824 without moderate-to-severe anxiety symptoms). Clinical symptoms and development were assessed using the Hamilton Depression Rating Scale-17 (HAM-D-17), Hamilton Anxiety Rating Scale-14 (HAMA-14), Positive and Negative Syndrome Scale (PANSS), and Clinical Global Impression (CGI). The blood pressure and thyroid hormone levels were measured

Results We found that the incidence of MDD patients with moderate-to-severe anxiety symptoms was 52.04%. The prevalence of suicide attempts in MDD comorbid moderate-to-severe anxiety patients was 31.8%, which was 4.58 times higher than that in patients without moderate-to-severe anxiety. Additionally, suicide attempters had elevated levels of thyroid stimulating hormone (TSH), anti-thyroglobulin (TgAb), thyroid peroxidases antibody (TPOAb), systolic blood pressure (SBP), and diastolic blood pressure (DBP) compared to non-suicide attempters. We further identified CGI score, TSH, TPOAb, and DBP as influential factors for suicide attempts in MDD individuals who had moderate-to-severe anxiety symptoms. These indexes could distinguish between suicide attempts and non-suicide attempts in MDD patients with moderate-to-severe anxiety symptoms

Conclusion Our findings mainly indicated a high prevalence of suicide attempts in MDD patients with comorbid moderate-to-severe anxiety. Several clinical correlates, thyroid hormones, and blood pressure might contribute to suicide attempts in MDD patients with moderate-to-severe anxiety symptoms

关键词： Major depressive disorder, Moderate-to-severe anxiety, Suicide, Influencing factors

MDD With Moderate To Severe Anxiety and Psychotic Symptoms: Mediating and Moderating Effects of TSH

Guoshuai Luo¹, Xiangyang Zhang²

1.Tianjin Anding Hospital

2.Chinese Academy of Sciences

Objective Anxiety and mood disorders often co-exist, with a high prevalence of comorbidity between depression and anxiety disorders. Anxious depression and psychotic symptoms are significant features of major depressive disorder (MDD), presenting challenges in prognosis and treatment outcomes. The relationship between thyroid function and psychiatric symptoms, particularly in the context of anxiety and psychosis in MDD, remains complex and not fully understood

Methods This observational cross-sectional study included 1718 patients with MDD attending an outpatient psychiatric clinic. Patients were assessed using standardized scales for depression, anxiety, and psychotic symptoms, with blood samples collected for thyroid function analysis. Statistical analyses, including t-tests, logistic regression, and correlation analyses, were conducted to explore the relationships between variables and the mediating and moderating effects of thyroid-stimulating hormone (TSH) on depressive and psychotic symptoms in MDD patients with moderate to severe anxiety

Results The study revealed a high prevalence of moderate-to-severe anxiety in first-episode unmedicated MDD patients, with no gender differences observed. Patients with moderate-to-severe anxiety exhibited higher levels of depressive and psychotic symptoms, as well as altered thyroid function markers. TSH levels were significantly associated with psychotic symptoms, acting as both a mediator and a moderator in the relationship between depressive symptoms and psychotic symptom severity. The findings suggest a complex interplay between mood disorders, thyroid function, and psychotic symptoms in MDD patients with comorbid anxiety

Conclusion TSH may serve as a biomarker for

comorbid anxiety in MDD patients and is closely related to schizophrenia. The study highlights the importance of considering thyroid function in the assessment and management of psychiatric symptoms in MDD patients with anxiety. TSH plays a significant role in moderating and mediating the relationship between depression and psychotic symptoms in MDD patients with comorbid anxiety, emphasizing the need for targeted interventions addressing thyroid function in this population. Further research, including longitudinal studies and investigations into potential confounding factors, is warranted to deepen our understanding of these complex relationships

关键词: Major Depression Disorder, anxious depression, psychotic symptoms, thyroid-stimulating hormone, gender differences

L-shaped Association of Fasting Blood Glucose and Comorbid Anxiety in Chinese Patients with First-episode Drug-naïve Major Depressive Disorder

Lian Yuan¹, Xueli Zhao¹, Junjun Liu², Xiangdong Du¹

1.Suzhou Guangji Hospital, The Affiliated Guangji Hospital of Soochow University, Suzhou, China

2.Nanjing Meishan Hospital, Nanjing, China

Objective Depression and anxiety are highly prevalent psychiatric conditions associated with social, medical, and economic burdens. Many previous studies on depression and anxiety have focused on glucose metabolism. However, few studies have examined the association between fasting blood glucose (FBG) and the risk of comorbid anxiety in patients with MDD. The purpose of the current study was to evaluate the relationship between FBG and the risk of comorbid anxiety in a Chinese population with first-episode drug-naïve (FEDN) MDD

Methods A total of 1718 patients with FEDN MDD were recruited in this cross-sectional study. Their socio-demographic characteristics as well as anthropo-

metric data were collected. The 17-item Hamilton Rating Scale (HAMD-17) and Hamilton Anxiety Scale (HAMA) were measured for depressive and anxiety symptoms, respectively. Biochemical indicators, including fasting blood glucose (FBG), were also measured. Multiple logistic regression analysis was used to estimate the association between FBG and the risk of comorbid anxiety. Two piecewise linear regression model and smooth fitting curve were used to elucidate the nonlinear relationship between FBG and the risk of comorbid anxiety in FEDN MDD patients

Results The univariate logistic regression analysis presented a significant relationship between FBG and comorbid anxiety (OR = 1.43, 95%CI, 1.18–1.73, $P < 0.001$). However, after adjustment for age, gender, HAMD, TSH, A-TG, A-TPO, TC, LDL-c, SBP, DBP, suicide attempts, and psychotic symptoms, multiple logistic regression analysis did not find any significant statistical correlation between FBG and anxiety (OR = 0.97, 95%CI: 0.76 to 1.23, $P = 0.797$) in patients with FEDN MDD. Interestingly, smoothing plots revealed a non-linear (L-shaped) relationship between FBG and comorbid anxiety, and a two-piecewise logistic regression model was used to calculate the inflection point of FBG as 4.8 mmol/L. On the left of the inflection point, a negative association between FBG and comorbid anxiety was detected (OR = 0.19, 95%CI: 0.06 to 0.65, $P = 0.008$), while no significant association was observed on the right side of the inflection point (OR = 1.21, 95%CI: 0.90 to 1.62, $P = 0.204$)

Conclusion An L-shaped non-linear association between FBG and comorbid anxiety was observed in Chinese patients with FEDN MDD. Lower FBG is associated with a higher risk of comorbid anxiety, especially in individuals with FBG below 4.8 mmol/L.

关键词: Association, Fasting blood glucose, Anxiety, Major depressive disorder

童年创伤史与青少年心境障碍患者焦虑症状的关联性研究

李佳欣 武雨霏 杨雨铃 孔令妍 王菲 朱荣鑫*

南京脑科医院

目的 伴有焦虑症状会导致青少年心境障碍治疗困难及自杀风险增加,因此焦虑症状近年越来越引起临床重视。童年创伤作为环境因素,与青少年心境障碍之间的关系仍有待进一步发掘。本研究通过探索童年创伤是否与青少年心境障碍焦虑症状存在相关性,探究童年创伤史与青少年心境障碍焦虑症状的关联。

方法 本研究共招募 528 例 12~18 岁的符合 ICD-10 关于心境障碍诊断标准的南京脑科医院早期干预科住院患者,所有患者目前均为重性抑郁发作。依据 17 项汉密尔顿抑郁量表(17-item Hamilton depression scale,HAMD-17)中焦虑/躯体化因子是否 ≥ 7 分,将 <7 分入组患者纳入不伴焦虑症状组($n=261$), ≥ 7 分入组患者纳入伴焦虑症状组($n=267$)。比较不伴焦虑症状(NA)组与伴焦虑症状(A)组之间童年创伤量表(CTQ)的差异,在焦虑障碍患者组中分析焦虑症状与童年创伤的关联,伴焦虑症状组患者焦虑/躯体化因子分与 CTQ 及因子分做 Pearson 相关分析。

结果 1) NA 组与 A 组的患者间 CTQ 中情感忽视因子分($t=-2.757,p=0.006$)及量表总分($t=-3.314,p=0.001$)存在显著差异,A 组 CTQ 情感忽视因子分及总分显著高于 NA 组。2) A 组患者的焦虑/躯体化因子分与童年创伤量表(CTQ)中情感忽视因子分存在相关性($r=0.148, p=0.017$)。3) NA 组与 A 组患者的 HAMD-17 总分存在显著差异($t=-17.581, p<0.001$),A 组 HAMD-17 总分显著高于 NA 组。

结论 本研究发现伴焦虑症状患者较不伴焦虑症状的患者童年创伤更严重,其中,伴焦虑症状组患者的焦虑躯体化因子与情感忽视因子分存在正相关,且伴焦虑症状组患者的抑郁症状较不伴焦虑症状患者症状更严重。提示进一步在青少年心境障碍患者中探索焦虑症状的相关影响因素对于指导临床防治具有重要意义。

目的 强迫症 (Obsessive-Compulsive Disorder, OCD) 是一种常见的慢性精神障碍, 它严重侵害患者的日常生活质量, 并给个体及社会带来了巨大的健康与经济负担。任务态功能磁共振成像 (functional magnetic resonance imaging, fMRI) 技术对于揭示 OCD 患者在执行特定任务时大脑功能的变化具有重要意义。本研究旨在探究 OCD 患者在执行任务时与健康对照组 (Health Control, HC) 相比大脑活动的差异。

方法 本研究在 PubMed、Embase 和 Web of Science 数据库中进行了全面的文献检索, 覆盖了从数据库建立之初至 2023 年 8 月期间的文献。我们采用了基于种子点的受试者图像排列映射 (Seed-based Mapping with Permutation of Subject Images, SDM-PSI) 软件进行了深入的荟萃分析。

结果 本研究共纳入了 39 项研究, 涉及 859 名 OCD 患者和 804 名 HC 个体。分析结果揭示, 与 HC 组相比, OCD 患者在大脑的特定区域内表现出显著的激活水平差异。具体来说, OCD 患者在左侧顶叶下回 (不包括边缘上回和角回) 和右侧中央前回显示出激活增强; 而在右侧额叶中回则观察到激活减弱。进一步的 meta 回归分析表明, 患者年龄与左扣带正中网络的脑活动呈负相关。

结论 这些大脑活动的变化与 OCD 患者认知灵活性的下降、社会认知障碍和注意力异常有关。本研究的发现不仅为理解 OCD 患者的脑功能异常提供了新的视角, 而且可能为药物治疗干预提供了潜在的神经影像学靶点。未来的研究可以利用先进的神经影像技术, 结合行为评估和生化分析等, 来提供更全面的 OCD 神经病理学理解, 并推动个体化医疗的发展。

中国医科大学附属第一医院

目的 焦虑症状是重性抑郁障碍 (Major depressive disorder, MDD) 最常伴发的症状, MDD 患者中约 50%-60% 的人同时共病焦虑。并且共病焦虑的 MDD 患者表现出更为严重的后果, 包括社会经济地位较低、适应性功能受损更严重、生活质量较低、预后更差等。然而, 与非焦虑性 MDD 相比, 目前针对共病焦虑的 MDD 的病理生理机制研究较少, 因此本研究拟使用功能磁共振 (functional Magnetic Resonance Imaging, fMRI) 方法比较共病焦虑 MDD 患者与未共病焦虑 MDD 患者的大脑功能, 为理解共病焦虑 MDD 影像机制提供研究基础。

方法 本研究纳入了共 143 名 18 岁至 65 岁之间的受试者, 所有被试均采集 fMRI 数据, 其中 103 名 MDD 患者, 并根据汉密尔顿焦虑量表 (Hamilton Anxiety Scale, HAMA) 评分将其分为 MDD 伴焦虑组 (HAMA \geq 14 分) 和 MDD 不伴焦虑组 (HAMA $<$ 14 分)。最后 58 名患者纳入 MDD 共病焦虑组 (MDD-A), 45 名患者纳入 MDD 未共病焦虑组 (MDD-NA), 同时纳入年龄、性别、教育年限匹配的健康对照 (Healthy control, HC) 40 名, 使用杏仁核作为种子点, 分析 ROI 到全脑的功能连接 (Functional connectivity, FC) 以此衡量大脑功能变化。

结果 三组被试在额叶区域 (额中回、额上回、眶额回、内侧眶额叶) FC 存在显著差异。事后分析结果显示, 与 HC 相比, MDD-A 患者双侧额上回、额中回、眶部额下回、枕中回, 右侧尾状核、枕下回、眶部额中回、眶内额上回, 左侧苍白球、壳核、前扣带回 FC 降低; MDD-NA 患者双侧额中回、额上回、眶部额下回、眶内额上回、前扣带回、尾状核, 右侧颞中回、脑岛、枕下回、中央前回, 左侧壳核、枕中回、舌回 FC 降低; 与 MDD-NA 患者相比, MDD-A 患者左侧海马 FC 降低。

结论 本研究表明共病 MDD 患者可能在前额叶、前扣带回、尾状核、中央前回、海马表现为 FC 降低。这可能为理解 MDD 共病焦虑的影像机制提供研究基础。

Identifying Risk Factors and Predictors of Psychotic Symptoms in First-episode and Medication-naïve Major Depressive Disorder Patients with A History of Suicide Attempts

Qian Yang¹, Xiangyang Zhang²

1.Department of Psychology, Zhongshan City People's Hospital

2.CAS Key Laboratory of Mental Health, Institute of Psychology, Chinese Academy of Sciences

Objective Psychotic symptoms (PS) are frequently seen in individuals diagnosed with major depressive disorder (MDD); nonetheless, limited research has been conducted on identifying risk factors for PS in first-episode and medication-naïve (FEMN) MDD patients with a prior suicide attempt. This investigation aimed to examine the incidence and potential risk factors for PS in FEMN MDD patients with a background of suicide efforts, to offer recommendations for prompt intervention

Methods In a cross-sectional study, 1718 patients diagnosed with FEMN MDD were recruited. The Hamilton Depression Scale (HAMD), Hamilton Anxiety Scale (HAMA), and Positive and Negative Syndrome Scale (PANSS) were employed to evaluate the symptoms of these patients. Additionally, demographic and clinical data were gathered

Results We found that FEMN MDD patients who had previously attempted suicide

were 5.06 times more prone to experiencing PS than those without a suicide history. HAMD score, HAMA score, and thyroid-stimulating hormone (TSH) were identified as strong indicators of PS in FEMN MDD patients with a suicide history. A combined area under the curve (AUC) value of 0.94 effectively distinguished patients with PS from those without PS.

Conclusion The research demonstrates a significant occurrence of PS in FEMN MDD patients who have attempted suicide in the past. In this group, it seems that anxiety and depressive symptoms, as well as TSH levels, can be indicators of PS.

stimulating hormone

A Classification Model for Identifying Cognitive Impairment in Chinese Patients with Major Depressive Disorder: A Machine Learning Approach

Jiarui Li¹, Wenqi Geng¹, Jing Wei¹, Yinan Jiang¹, Gang Zhu², Kerang Zhang³, Gang Wang⁴, Xin Yu⁵

1.Peking Union Medical College Hospital

2.The First Affiliated Hospital of China Medical University

3.First Hospital of Shanxi Medical University

4.Beijing An Ding Hospital, Capital Medical University

5.Peking University Sixth Hospital

Objective The factors related to cognitive impairment (CI) in major depressive disorder (MDD) patients have been discussed, but few studies have used machine learning (ML) to identify potentially related clinical variables and establish classification models for identifying CI in patients with MDD

Methods This was a post hoc analysis of a multicenter study. The included patients with MDD were divided into a cognition retention (CR) group and a cognition impairment (CI) group based on the MATRICS consensus cognitive battery. Least absolute shrinkage and selection operator (LASSO) regression was used for feature selection. Two support vector machine (SVM) classification models (with/without the Hamiltonian Depression Scale-17 [HAMD-17] and the Hamilton Anxiety Rating Scale [HAMA]) were compared. Twenty percent of the sample was randomly set aside as the final test set

Results A total of 509 patients with MDD were included. A total of 262 (45.58%) patients were classified into the CI group. Fifteen features were included in the classification models after LASSO regression, including age, education, body mass index, drinking status, HAMD items (Early, Middle, Retardation, Anxiety Psychic, Hypochondriasis, and Insight), and HAMA

items (Tension, Intellectual, Somatic/Muscular, Somatic/Sensory, and Genitourinary symptoms). For the SVM classification model without the HAMD and HAMA items, the accuracy was 0.76, and the AUC was 0.81 (95% CI: 0.72-0.89). SVM classification model with HAMD and HAMA items: accuracy = 0.82, AUC = 0.90 (95% CI: 0.84-0.96)

Conclusion The clinical features reflected in the HAMD and HAMA scores are helpful for identifying CI in patients with MDD. Psychiatrists may use ML models based on clinical variables to recognize CI more easily in MDD patients.

焦虑抑郁的脑动态激活模式研究及辅助诊断

郑炜豪¹ 杨淞宇¹ 鞠玉朦² 张燕²

1.兰州大学 信息科学与工程学院

2.中南大学湘雅二医院精神科

目的 作为最常见的精神疾病之一,广泛性焦虑症的终生患病率为3.7%。它是一种具有高共病率的精神疾病,终生共病率为81.9%,尤其是和其他焦虑症(51.7%)。由于临床症状相似,很难区分广泛性焦虑症和重度抑郁症,导致治疗不充分或不恰当,预后不佳。现有的基于脑成像的精神疾病识别研究通常侧重于通过采用各种机器学习方法来发现结构或功能成像生物标志物,如支持向量机、高斯过程分类器和线性判别分析。本研究将基于划分大脑状态,构建针对特定状态的疾病诊断深度学习模型,提高疾病的诊断准确性,从而为这两种疾病的辅助治疗和诊断提供帮助。

方法 将磁共振成像预处理后,通过独立成分分析得到独立成分,计算所得的独立成分的时间序列之间的皮尔逊相关系数,得到每个受试者的相关系数矩阵。接下来,我们使用聚类算法来识别每个受试者的大脑状态,整合全部被试获得最终状态,为每个被试所有时间点划分状态。接下来,构建了基于最终状态的3D-CNN深度学习模型,对受试者进行分类。简言之,我们分别构建了健康-焦虑症、健康-重度抑郁症和焦虑症-抑郁症的分类模型。并将

不同状态的图像输入分类器。受试者的类型是通过投票机制获得的。

结果 我们确定了四种最终的大脑状态,其中焦虑症和重度抑郁症在认知执行网络、默认模式网络、视觉网络和感觉运动网络的功能连接维度上表现出相同的超连接异常变化。重度抑郁症还表现出更广泛的功能连接异常,两者在丘脑与默认模式网络的连接强度方面存在显著差异。我们构建的深度学习模型在对所有三组受试者进行分类时实现了平均85%左右的准确率,与未划分状态(平均70%左右)相比有了显著提高。

结论 在本实验中,我们提出了一种新的功能连接分析框架来检测广泛性焦虑症和重度抑郁症患者的功能连接,以确定他们在神经机制方面的共同和独特变化,并通过构建状态依赖型的3D-CNN深度学习模型最终对这三组受试者进行分类。结果表明,广泛性焦虑症和重度抑郁症在某些网络之间的功能连接方面表现出相同的异常变化。此外,我们构建的状态相关3D-CNN模型获得了较高的分类精度,并在独立的数据集中验证了该模型。

Comparative Study of Emotional Cognitive Functional Characteristics in Patients with Obsessive-Compulsive Disorder and Depression: Evidence from fNIRS

Xin Wan², Yunhong Wu², Wan Jiang², Xingbo Suo², Qing Zou¹, Xin Yuan¹, Maorong Hu^{1,2}

1.The 1st Affiliated Hospital, Jiangxi Medical college, Nanchang University

2.First School of Clinical Medicine, Jiangxi Medical college, Nanchang University

Objective This study aims to explore differential changes in emotional cognitive functions among patients with obsessive-compulsive disorder (OCD), major depressive disorder (MDD), and depressive disorder

with or without accompanying obsessive-compulsive symptoms (DD-OC/DD-NOC). It investigates their behavioral and hemodynamic characteristics, as well as functional correlations, to offer new insights for clinical diagnosis and treatment, thereby establishing a foundation for future model development

Methods We enrolled 55 patients with OCD and 41 healthy volunteers, 37 treatment-naïve patients with MDD and 34 healthy volunteers, and 45 and 40 patients with DD-OC/DD-NOC respectively, along with 41 healthy volunteers. Clinical characteristics were evaluated using the HAMD-24, HAMA, SCL-90, Y-BOCS, OCI-R, and TAS-20 scales. Stimuli were sourced from the Chinese Facial Affective Picture System (CFAPS), depicting three emotional expressions: happiness, sadness, and neutrality. E-Prime software ensured precise stimulus presentation, alongside a specifically designed synchronized protocol for multi-channel fNIRS data collection

Results Healthy individuals demonstrated high accuracy and quick response times in facial emotion recognition tasks. Conversely, patients with OCD, MDD, and DD-OC/DD-NOC exhibited significantly lower accuracy and longer response times compared to controls ($P < 0.05$). Emotional cognitive impairments varied among the disorders: OCD and treatment-naïve MDD patients both showed reduced accuracy and slower responses when distinguishing sadness from neutrality ($P < 0.05$). The DD-OC group displayed prolonged response times in emotional tasks ($P < 0.05$), while the DD-OC/DD-NOC group exhibited decreased accuracy in recognizing sadness compared to neutrality ($P < 0.001$)

Healthy individuals displayed hemodynamic characteristics during facial emotion processing primarily correlated with the entire prefrontal cortex (56.30%). In tasks involving emotional cognitive impairments, OCD patients showed functional coherence primarily between the FPC, DLPFC, and FEF regions. Treatment-naïve MDD patients demonstrated coherence between the FPC, DLPFC, FEF, and Broca regions, regardless of emotional type. DD-OC/DD-NOC patients exhibited reduced connectivity strength and disrupted functional

connectivity patterns in ipsilateral and bilateral hemisphere cluster areas, with DD-OC showing more disruption compared to DD-NOC.

In OCD patients, changes in [oxy-Hb] in the R-PMA region were negatively correlated with the severity of compulsive symptoms ($P < 0.05$). Among DD patients, changes in [oxy-Hb] in the L-FPC, R-DLPFC, and L-Broca regions positively correlated with compulsive symptoms ($P < 0.05$), whereas changes in the R-Broca region showed a negative correlation ($P < 0.05$). Notably, the study did not find significant correlations between total HAMD/HAMA scores in treatment-naïve MDD patients and activation levels across channels.

Conclusion Patients with OCD, MDD, and DD-OC/DD-NOC present varying degrees of symptoms, including depression, anxiety, compulsions, alexithymia, and distinct impairments in emotional recognition functions

During emotional cognitive tasks, individuals with OCD, MDD, and DD-OC/DD-NOC exhibit unique patterns of overall functional coherence and connectivity within the prefrontal cortex.

The severity of compulsive symptoms in OCD patients correlates with activation levels in the R-PMA region. In DD patients, the severity of compulsive symptoms correlates with activation levels in the L-FPC, R-DLPFC, and bilateral Broca areas. Additionally, the hemodynamic characteristics observed in MDD patients may indicate potential biomarkers.

重度抑郁障碍和广泛性焦虑障碍的丘脑-皮层环路功能梯度差异模式研究

郑炜豪¹ 李晓桐¹ 张芹¹ 鞠玉朦² 张燕²

1. 兰州大学信息科学与工程学院

2. 中南大学湘雅二医院精神科

目的 重度抑郁障碍 (MDD) 和广泛性焦虑障

碍 (GAD) 是社会上常见的两种主要的精神疾病。在症状水平上, GAD 主要表现为过度担忧、无法静坐和自主神经功能失调, 而 MDD 主要表现为情绪低落、快感缺乏和精神运动迟滞。近年来, 越来越多的静息态功能磁共振成像研究揭示了这两种情绪障碍中丘脑-皮层环路的功能障碍。例如, MDD 患者表现出丘脑与前额叶, 颞叶, 顶叶以及感觉运动皮层之间的功能连接异常, 而 GAD 患者的丘脑活动显著高于健康对照, 患者在丘脑中表现出更强的功能连接。然而, 目前还没有研究去探究 MDD 和 GAD 之间丘脑-皮层环路的共同性以及特异性变化模式。在以往的基于功能梯度方法的研究中发现, MDD 患者中的梯度结构被破坏, 主要表现为初级感觉区域和包括默认模式网络在内的高阶认知区域之间的分化减弱。此外, 与健康对照相比, GAD 患者的功能梯度异常主要位于丘脑-皮层系统。但是, MDD 和 GAD 之间丘脑-皮层系统的功能梯度组织是否存在差异仍然未知。

方法 因此, 本文使用功能连接梯度分析方法探究了 MDD 与 GAD 中丘脑-皮层系统功能梯度的异常分布模式。首先, 基于丘脑-皮层功能连接计算丘脑-皮层连接梯度并进行组间差异分析。此外, 许多研究表明 MDD 和 GAD 都是具有中度遗传风险的疾病, 本文通过人脑基因图谱, 建立梯度异常模式与基因表达图谱之间的关联。最后, 使用分类模型评估这种功能梯度组织对 MDD 和 GAD 的识别能力。

结果 研究发现, MDD 患者、GAD 患者和健康对照的丘脑皮层环路梯度均表现出相似的空间分布模式, 即外侧-腹侧和前侧-后侧这两种空间分布模式。此外, 进一步分析发现, 功能梯度组织的异常主要集中在与背侧注意网络和躯体运动网络相关的局部环路。我们发现局部环路的梯度组织与 GAD 和 MDD 的相关基因显著相关。并且利用上述环路梯度的离心率作为特征, 我们成功地区分了患有这两种疾病的患者。

结论 最终结果表明, 丘脑-背侧注意网络和丘脑-感觉运动网络环路的宏观组织异常可能作为区分这两种疾病的有效神经生物学标志物, 有助于了解疾病的发病机制, 并有利于临床诊断和治疗。

Emotional Conflict control and cortical response in Anxiety Disorders: An fNIRS Study Using the Face-Word Stroop Paradigm

Ziming Liu^{1,2}, Qin Ran^{1,2}, Qingwei Li^{1,2}

1. Shanghai Tongji Hospital

2. Tongji Hospital Of Tongji University

Objective This study aims to explore the characteristic changes in emotional conflict information processing in patients with anxiety disorders (panic disorder and generalized anxiety disorder). It includes both behavioral and fNIRS imaging features, aiming to enhance the understanding of the neural mechanisms of anxiety disorders from the perspective of emotional conflict information processing

Methods The study included 21 patients with anxiety disorders (12 with panic disorder and 9 with generalized anxiety disorder) and 8 healthy controls. Participants were assessed for symptoms of anxiety and depression, sleep quality, and cognitive function. Emotional faces and words were selected from the Chinese Affective Face Picture System (CAFPS) and the Chinese Affective Words System (CAWS). The face-word Stroop paradigm was constructed using Eprime 3.0 software, including four conditions: cI (incongruent trial preceded by a congruent trial), iI (incongruent trial preceded by an incongruent trial), iC (congruent trial preceded by an incongruent trial), and cC (congruent trial preceded by a congruent trial), arranged in a pseudo-random order. Participants were required to ignore the interference of emotional words and correctly respond to the emotional faces. Hemodynamic signals in the prefrontal cortex during task performance were recorded simultaneously using a 22-channel near-infrared spectroscopy system (Hitachi ETG-4100)

Results 1. Symptom and Sleep Quality Assessment

GAD group exhibited significantly higher anxiety

and depression symptoms and poorer sleep quality compared to the PD and HC groups. PD group had significantly higher anxiety scores compared to the HC group. No significant differences in cognitive function scores were observed among the three groups.

2. Reaction Time and Accuracy

Significant main effects of conflict type ($F=8.073$, $P<0.001$, $\eta^2=0.008$) and group ($F=74.627$, $P<0.001$, $\eta^2=0.046$) were found for reaction time, but the interaction effect was not significant ($F=0.633$, $P=0.704$, $\eta^2=0.001$). GAD group had significantly slower reaction times compared to the PD and HC groups. All groups showed significantly slower reaction times for incongruent trials (iI, cI) compared to congruent trials (cC, iC). For accuracy, a significant main effect of conflict type ($F=10.179$, $P=0.001$, $\eta^2=0.281$) was observed, but the main effect of group was not significant ($F=0.172$, $P=0.843$, $\eta^2=0.013$). Accuracy was significantly lower under cI and iI conditions compared to cC and iC conditions. HC group showed no differences in accuracy across conflict conditions, while GAD group had significantly lower accuracy under cI and iI conditions compared to cC and iC conditions, and PD group had lower accuracy under iI and cI conditions compared to cC condition.

3. fNIRS Results

Under the cI condition, the GAD and PD groups showed significantly lower activation in the left dorsolateral prefrontal cortex (Ch2) and frontal pole (Ch 7, 11) compared to the HC group. Under the iI condition, the PD group showed significantly lower activation in the left dorsolateral prefrontal cortex (Ch1, 2), bilateral frontal pole (Ch6, 7, 11), and right dorsolateral prefrontal cortex (Ch9) compared to the HC group. No significant activation differences were found between the GAD and HC groups under the iI condition.

Comparing activation differences between the cI and iI conditions (iI-cI) to assess the impact of the previous trial's conflict type on conflict processing, the PD group showed significantly lower relative activation in the right dorsolateral prefrontal cortex (Ch1, 2) and right frontal pole (Ch15) compared to the HC group. Additionally, the PD group had significantly lower activation in widespread bilateral prefrontal regions (Ch1, 2, 5-15,

17-19, 22) compared to the GAD group. Correspondingly, the PD group showed a significant increase in reaction time under the iI condition compared to the cI condition without a notable improvement in accuracy, indicating a decline in conflict processing efficiency. In contrast, the GAD group did not show a significant increase in reaction time under the iI condition.

Conclusion GAD patients exhibit more significant anxiety symptoms compared to the PD and HC groups

All groups exhibit an emotional conflict effect under the face-word Stroop paradigm, with GAD patients processing emotional conflict information significantly slower than the HC and PD groups.

GAD and PD patients have impaired control over emotional conflict information, making them more susceptible to interference and judgment errors.

Abnormal activation in the left dorsolateral prefrontal cortex and frontal pole is observed in GAD and PD patients during emotional conflict information control.

GAD and PD patients exhibit different prefrontal response patterns and behavioral characteristics during conflict information adjustment.

Identification of Central Symptoms in Smartphone Addiction, Depression, and Anxiety Among College Students in China: A Network Analysis Perspective

ZhaoXuan Shang¹, XiangYang Zhang²

1. Department of Psychology and Cognitive Science, East China Normal University

2. Institute of Psychology, Chinese Academy of Sciences

Objective This study aims to explore the intricate relationships between smartphone addiction (SPA), depression, and anxiety among Chinese college students using a network analysis approach. By identifying cen-

tral and bridge symptoms, we seek to understand the underlying mechanisms and potential intervention targets for these co-occurring conditions

Methods A cross-sectional survey was conducted among 36,714 college students from 177 higher education institutions across China. Participants completed the Smartphone Addiction Scale (SAS-CS), the Generalized Anxiety Disorder Scale (GAD-7), and the 10-item Center for Epidemiological Studies Depression Scale (CES-D-10). Network analysis was employed to examine the relationships between symptoms of SPA, anxiety, and depression. The EBICglasso model was used to estimate the network, and centrality measures were computed to identify the most influential symptoms

Results The network analysis revealed that SPA11 ("Anxiety if not used for some time"), SPA21 ("Restless without smartphone"), SPA9 ("Smartphone use affects academic performance"), and CESD2 ("Difficulty with concentrating") were the most influential symptoms within the SPA-anxiety-depression network. GAD1 ("Nervousness") emerged as a critical bridge symptom linking SPA with anxiety and depression. The expected influence centrality values highlighted the significant role of these symptoms in maintaining the network structure. The case-dropping subset bootstrap procedure confirmed the stability and accuracy of the network, indicating that the identified symptoms are robust and reliable

Conclusion The study underscores the importance of addressing key symptoms such as anxiety related to smartphone use, restlessness without a smartphone, and academic performance issues to mitigate the impact of smartphone addiction on mental health. The findings suggest that interventions targeting fear of missing out (FoMO) and anxiety management could effectively reduce the interconnected effects of SPA, anxiety, and depression. The identification of GAD1 as a bridge symptom provides valuable insights for developing targeted clinical interventions. Future longitudinal research is necessary to further elucidate the causal relationships and refine intervention strategies.

Identifying Neuro-inflammatory Biomarkers of Generalized Anxiety Disorder From Lymphocyte Subsets Based on Machine Learning Approaches

Jingjing Lu*

Huzhou Third Municipal Hospital, the Affiliated Hospital of Huzhou University

Objective Activation of the inflammatory response system is involved in the pathogenesis of generalized anxiety disorder (GAD). In this study, we focused on the predictive value of immune indicators on GAD

Methods The evaluation of immune markers, including the neutrophil-to-lymphocyte ratio (NLR), platelet-to-lymphocyte ratio (PLR), monocyte-to-lymphocyte ratio (MLR), systemic immune-inflammation index (SII), and analysis of lymphocyte subsets, was performed on patients with GAD. Receiver operator characteristic (ROC) analysis was used to determine the predictive value of these immunological parameters for GAD. Machine learning technology was applied to classify the collected data from patients in the GAD and healthy control groups

Results Of the 340 patients enrolled, 171 were GAD patients and 169 were non-GAD patients as healthy control. ROC curve analysis showed that the level of lymphocyte subsets including CD3+CD4+ T cell% (0.953 ± 0.010), CD3-CD16+56+ NK cell count (0.864 ± 0.020), CD3-CD16+56+ NK cell% (0.882 ± 0.020), CD4+/CD8+ T cell ratio (0.851 ± 0.020) and CD4-/CD8- T cell% (0.875 ± 0.020) significantly altered in the patients with GAD. In addition, the level of NEU (0.657 ± 0.030), MON (0.611 ± 0.040), PLT (0.586 ± 0.040), and SII (0.589 ± 0.040) moderately altered between the control group and patients with GAD. The classification analysis conducted by machine learn-

ing using a weighted ensemble-L2 algorithm demonstrated an accuracy of 95.00±2.04% in assessing the predictive value of these lymphocyte subsets in GAD

Conclusion In the presented work, we show the level of lymphocyte subsets altered in GAD. These lymphocyte subsets can serve as neuroinflammatory biomarkers for GAD diagnostics. Furthermore, the application of machine learning offers a highly efficient approach for investigating neuroinflammatory biomarkers and predicting GAD. Our research has provided novel insights into the involvement of cellular immunity in GAD and highlighted the potential predictive value and therapeutic targets of lymphocyte subsets in this disorder.

强迫症患者的强迫信念: 心理病理学特征、临床治疗及大脑形态学研究

易香含¹ 张晨¹ 张宗凤² 高睿¹ 陈永军³ 曹璇⁴ 范青¹

- 1.上海交通大学医学院附属精神卫生中心
- 2.宁波大学附属康宁医院
- 3.南京医科大学附属南京脑科医院
- 4.上海交通大学医学院附属新华医院临床心理科

目的 强迫信念是一类与强迫相关的功能失调信念, 以往被认为在强迫症状的发展与维持中起到重要的作用, 对强迫症的临床干预效果起到了一定程度的影响。然而, 目前关于强迫症状与强迫信念的关系存在争议。本研究旨在探索强迫症患者中强迫症状与强迫信念的关系以及临床治疗前后两者的变化, 结合磁共振成像技术进行形态学分析, 为进一步阐明强迫信念在强迫症中的作用提供依据。

方法 本研究纳入 260 名强迫症患者 (Obsessive-Compulsive Disorder, OCD) 和 125 名健康对照 (Healthy Controls, HC)。强迫症患者中有 95 名进行了为期 12 周的药物或心理治疗干预, 并在治疗前后测量了强迫症状与强迫信念。采用耶鲁布朗强迫量表 (YBOCS)、强迫信念问卷 (OBQ-44)、汉密尔

顿抑郁量表 (HAMD)、汉密尔顿焦虑量表 (HAMA) 评估受试者的强迫症状、强迫信念、抑郁与焦虑水平。此外, 有 147 名强迫症患者在治疗前自愿接受了结构磁共振扫描。

结果 强迫症患者强迫信念得分显著高于健康对照 ($t=7.95, p<0.001$), 且与强迫症状 ($r=0.150, p=0.016$), 抑郁症状 ($r=0.156, p=0.012$), 焦虑症状 ($r=0.120, p=0.053$) 均有一定程度的相关。在接受了 12 周治疗后, 强迫症状显著降低 ($t=14.90, p<0.001$), 但强迫信念没有显著下降 ($t=1.57, p=0.119$), 两者的减分率没有显著相关性 ($r=0.068, p=0.511$)。强迫信念与右侧顶上小叶的皮层厚度呈负相关 ($x=32, y=-47, z=43, t=4.02, \text{cluster sizes}=132, p<0.05, \text{FWE-corrected}$)。强迫症状与左侧顶上小叶的分形维度呈负相关 ($x=-33, y=-48, z=43, t=3.68, \text{cluster sizes}=189, p<0.05, \text{FWE-corrected}$), 与左侧中央后回的分形维度呈负相关 ($x=-32, y=-29, z=49, t=3.67, \text{cluster sizes}=201, p<0.05, \text{FWE-corrected}$)。

结论 强迫信念可能是一种相对独立的心理病理学概念, 在强迫症患者中存在明显异常, 且不受一线治疗方案的影响, 强迫症状和强迫信念存在形态学指标的差异。这些发现为理解强迫信念在强迫症中的作用提供了新视角, 未来需要进一步在强迫症的概念化中考虑强迫信念。

Decreased Temporal Variability of Insula and Lingual Gyrus Facilitating The Better Early Treatment Response in Patients with Panic Disorder

Linlin You¹, Jiang Wenhao¹, Xiaotong Zhang², Yueying Li², Jiayin Wei², Yue Zhou¹, Suzhen Chen¹, Na Lu¹, Yingying Yue¹, Youyong Kong², Yonggui Yuan¹

1. Department of Psychosomatics and Psychiatry, ZhongDa Hospital, School of Medicine, Southeast University, Nanjing, 210009 China

2. Jiangsu Provincial Joint International Research Laboratory of Medical Information Processing, School of Computer Science and Engineering, Southeast University, Nanjing, 210096 China

Objective Panic disorder (PD) is a common disabling condition with limited biomarkers. We aimed to explore the diagnostic and treatment response prediction value of brain functional temporal variability in PD

Methods 82 PD patients and 105 HCs received resting-state functional magnetic resonance imaging scans and assessments. After two weeks of treatment, we divided patients into responsive panic disorder (RPD, $n = 39$) and non-responding panic disorder (NRPD, $n = 43$). The baseline temporal variabilities were analyzed with group differences and treatment outcomes

Results Decreased temporal variabilities in the left PCG, right lingual gyrus, right fusiform gyrus and right thalamus were found in the PD group (all $P < 0.01$, corrected with Bonferroni correction). A combination of lingual gyrus, PCG, and thalamus had optimal predictive value for distinguishing PD and HCs (AUC = 0.776, Sensitivity = 0.781, Specificity = 0.732). In addition, the RPD group showed significantly lower temporal variabilities in the left insula, right PCG, and bilateral lingual gyrus than the NRPD and HCs groups (all $P < 0.05$, corrected with Bonferroni correction). The variabilities in the left insula and left lingual gyrus were negatively correlated with the reduction rate of panic symptoms (all $P < 0.05$, corrected with Bonferroni correction)

Conclusion Combining lingual gyrus, PCG, and thalamus temporal variability alterations helped distinguish PD and HCs. The temporal variability in the insula and lingual gyrus are potential biomarkers for PD treatment.

Prevalence, Demographics, and Clinical Characteristics of Suicide Attempts in First-episode Drug Naïve Schizophrenia Patients with Severe Depression

Jinfeng Zhu¹, Xiaoe Lang², Fangfang ShangGuan¹, Xiang-Yang Zhang³

1.Capital Normal University, Beijing

2.Shanxi Medical University, Taiyuan

3.Institute of Psychology, Chinese Academy of Sciences, Beijing

Objective In patients with schizophrenia (SCZ), although depressive symptoms and suicide attempts are common, few studies have investigated suicide attempts in SCZ patients with severe depressive symptoms, especially in first-episode drug naïve (FEDN) patients. Therefore, we intended to investigate the incidence of suicide attempts and the associated factors in FEDN SCZ patients with severe depressive symptoms

Methods Overall, 317 FEDN SCZ patients were recruited into the study. Patients were assessed for symptoms using the Hamilton Depression Scale (HAMD), the Hamilton Anxiety Scale (HAMA), and the Positive and Negative Syndrome Scale (PANSS). Biochemical indicators such as total cholesterol, low-density lipoprotein cholesterol, triglycerides, and high-density lipoprotein cholesterol were measured

Results Suicide attempts occurred at a rate of 33.4% in SCZ patients with severe depressive symptoms, which was 2.6 times higher than in patients with SCZ who did not have severe depressive symptoms ($p < 0.05$). Among SCZ patients with severe depressive symptoms, HAMD and PANSS total scores were higher in those who attempted suicide than in those who did not (all $p < 0.05$). PANSS total score was independently connected to suicide attempts in FEDN SCZ people who had severe depressive symptoms ($p < 0.05$)

Conclusion Suicide attempts are more prevalent in those patients with FEDN SCZ who have severe depressive symptoms. Psychiatric symptoms are involved in suicide attempts in FEDN SCZ patients with severe depressive symptoms

关键词: Schizophrenia, suicide, prevalence, PANSS

Establishment and Verification of A Machine Learning Prediction Model for Suicide Attempts in First-episode and Drug Naive Patients with Major Depressive Disorder

Hang Tan¹, Zhanjin Wang¹, Jie Ma¹, Zhan Wang¹, Xiang Yang Zhang²

1. The Affiliated Hospital of Qinghai University, Qinghai, China

2. CAS Key Laboratory of Mental Health, Institute of Psychology, Chinese Academy of Sciences, Beijing, China

Objective Suicide stands as a significant adverse outcome within the realm of Major Depressive Disorder (MDD), exerting profound impacts on individuals, families, and society at large. Produce and validate a machine-learning predictive model for predicting the risk of post-suicide attempts in patients with MDD, which would facilitate timely and effective interventions for high-risk patients

Methods 1718 patients with a first episode of MDD who were not using medication were recruited. Collected data encompassed general information, clinical evaluations, and biochemical parameters. We used Machine Learning to establish a risk prediction model for suicide attempts in patients with MDD

Results The MDD prediction model constructed by screening variables based on the SHAP value significance profile, we identified 8 predictors out of 37 variables, including PANSS positive subscale scores, CGI-S (Clinical General Impression-Severity) scores, HAMA scores, Thyroglobulin antibodies (TgAb), Thyroid Stimulating Hormone (TSH), Age, Hypotension, and Hypertension. The model constructed using these eight predictors showed a good predictive ability with an AUC value of 0.868

Conclusion The integration of eight predictors—PANSS positive subscale score, CGI-S score, HAMA score, TSH, TgAb, age, hypotension, and hypertension—within a risk prediction model showcases efficacy in forecasting suicide risk attempts among MDD patients. This model holds potential to assist clinicians in making informed clinical decisions and fostering discussions with patients, especially concerning crisis interventions for individuals grappling with MDD

tempts; Machine Learning; prediction model; first-episode and drug naive patients

基底前脑调控社交焦虑的神经环路机制

汪军 杨倩 刘雪 李杰 徐晗*
浙江大学医学院附属第二医院

目的 对社交场景的焦虑和回避是社交焦虑障碍的典型行为症状,其涉及复杂的神经心理因素。其中,负性社交经历导致社交焦虑行为发生极为常见。然而到目前为止,负性社交经历如何影响大脑功能从而导致社交焦虑行为还很不清楚。

方法 采用条件性社交恐惧 (social fear conditioning, SFC) 模型诱导小鼠社交焦虑行为。采用在体多通道电生理、光纤钙测量等技术揭示基底前脑不同类型神经元在社交焦虑行为发生时的活动情况。结合药理学、光遗传学等神经活动操纵技术研究基底前脑 (Basal forebrain, BF) 及其神经环路在社交焦虑行为调控中的作用。利用脑片膜片钳技术分析基底前脑到外侧缰核 (lateral habenula, LHb) 神经通路在经历条件性社交恐惧造模后兴奋性与突触可塑性变化。

结果 经历 SFC 后小鼠对同类表现出强烈的社交回避与恐惧行为,且不伴随广泛性焦虑样行为,提示小鼠习得了特异性社交焦虑行为。通过在体多通道电生理和光纤钙测量技术发现经历过 SFC 的小鼠在靠近同类小鼠时 BF 内有大量表达 vGluT2 的谷氨酸能神经元被激活,而胆碱能神经元和 GABA 能神经元活动变化不明显。采用神经元类型特异性操纵技术发现只有抑制 vGluT2 神经元可以显著减轻社交焦虑行为症状,说明这群谷氨酸能神经元在社交焦虑表达中发挥重要作用。采用病毒示踪和脑片电生理技术揭示 BF vGluT2 神经元与腹侧被盖区 (ventral tegmental area, VTA) 和外侧缰核 (LHb) 均有密切的结构连接和单突触功能联系。有趣的是,社交焦虑行为发生时 BF vGluT2→LHb 的投射通路被选择性激活,并且特异性抑制 BF vGluT2→LHb 投射通路能够明显降低小鼠的社交焦虑行为,而抑制 BF vGluT2→VTA 的投射作用不明显。此外,在正常未经历 SFC 的小鼠上采用同样的方法抑制 BF vGluT2→LHb 投射通路则不改变小鼠社交行为,提

示负性社交经历可能改变了这条投射通路连接强度。进一步通过脑片膜片钳技术,团队证实了负性社交经历增强了BF vGluT2→LHb 投射通路的突触功能。

结论 该项研究从环路层面和细胞亚群水平提出以基底前脑为中心的社交焦虑表达新机制,对于我们理解社交焦虑疾病的神经基础有重要启示,未来可能会对社交恐惧和社交焦虑疾病的治疗提供新的方向。

Relationship of Mind Wandering Flexibility, Error Monitor and Executive Function in Patients with Obsessive Compulsive Disorder

Pengchong Wang Zhanjiang Li* Zijun Yan Wenwen
Cao Yuqing Liu Jinyu Zhang
Beijing Anding Hospital, Capital Medical University

Objective This research aim to explore the relationship among mind wandering, error monitor and executive function performance in patients with obsessive-compulsive disorder (OCD)

Methods The modified sustained attention to response task were used to measure the performance of mind wandering in 50 outpatient patients with OCD in task state and its correlation with error monitor, and compared with 47 healthy control subjects

Results (1)The level of mind wandering activity and the variability of mind wandering activity in patients with OCD in sustained attention to response task was significantly higher than that in healthy controls; (2)In the OCD group, the results of correlation analysis showed that the response accuracy of OCD patients in the stop-signal task under Nogo condition was negatively correlated with the degree of mind wandering in the sustained attention to response task task, and could significantly predict the level of mind wandering. On the other hand, the working memory capacity of OCD patients in spatial working memory task was negatively correlated with the mind wandering variability in sustained attention to response task and could significantly

predict the mind wandering variability. (3) The results of abnormal mind wandering activity showed that mind wandering activity was correlated with emotional experience and error monitor performance. In addition, mind wandering variability could be used as a mediator between executive function and error monitor performance

Conclusion The mind wandering activity of patients with obsessive-compulsive disorder is abnormally elevated in both general state and task state, and the abnormal changes are related to the executive function of patients. The maladaptive changes of mind wandering not only affect their emotional experience, but also affect the error monitor performance of patients in task.

额叶 tDCS 治疗抑郁患者焦虑症状的调控效果与评估靶标研究

汪君玲 刘潇雅 刘爽*
Tianjin University

目的 重性抑郁障碍 (Major depressive disorder, MDD) 常伴有焦虑症状, 焦虑严重程度与疾病缓解、自杀风险等密切相关。tDCS 作为一种安全、无创的调控技术, 为 MDD 患者焦虑症状的缓解提供了有效途径。然而, tDCS 治疗抑郁患者焦虑症状的调控效果和疗效评估指标尚不清楚。本研究旨在设计长时程的额叶 tDCS 调控策略, 探究 tDCS 对首发 MDD 患者焦虑症状的调节作用, 结合脑电技术挖掘表征 tDCS 调控焦虑症状效果的客观评估指标, 从而为首发 MDD 患者焦虑症状的治疗给予指导。

方法 研究招募未用药的首发 MDD 患者 18 例, 1:1 随机分为真、伪刺激两组, 分别采集基线、调控 4 周后的焦虑症状量表数据和 40Hz-chirp 听觉稳态响应 (Auditory steady-state response, ASSR) 任务下的脑电数据, 计算量表得分并提取相位加权滞后指数 (Weighted phase lag index, WPLI), 通过组内 (基线、调控 4 周)、组间 (真、伪刺激) 对比分析, 并采用斯皮尔曼相关系数定量分析调控疗效并挖掘疗效评估指标。

结果 通过混合模型重复测量方差分析,发现真、伪刺激组治疗后 HAMA 和 GAD 量表得分显著下降($p < 0.001$),且真刺激组调控后 HAMA 量表分数降低水平优于伪刺激组($p = 0.052$),GAD 量表得分的效能指数高于伪刺激组($p = 0.051$),呈现边缘显著趋势,表明经过治疗后两组患者焦虑症状均有效改善,且真刺激组对焦虑症状的改善效果更优,即额叶 tDCS 调控策略可有效治疗抑郁症患者的焦虑症状。提取并分析脑电 WPLI 特征,发现真刺激组调控 4 周后,左侧额叶与右侧颞叶及右侧额叶与右侧颞叶的连通性显著增强($p < 0.05$),表明 tDCS 可以调节靶向刺激脑区与听觉皮层之间的信息交流能力。相关性分析发现,真刺激组左侧额叶与右侧颞叶间的 WPLI 值与其 GAD-7 量表总分($p < 0.05$)、HAMA 量表总分均呈现显著的负相关($p < 0.05$),右侧额叶与右侧颞叶间的 WPLI 值与其 HAMA 量表总分呈现显著的负相关($p < 0.001$),说明随着焦虑症状缓解,患者在 40 Hz-chirp 刺激下其两侧额叶与右侧颞叶区域间的听觉信息交流能力增强,推测 40 Hz-chirp 刺激下两侧额叶与右侧颞叶区域的 WPLI 可作为 MDD 患者焦虑症状调控效果客观评估指标。

结论 本研究结果表明额叶 tDCS 可有效缓解首发 MDD 患者的焦虑症状,40 Hz-chirp 刺激下两侧额叶与颞叶区域的 WPLI 有望成为 MDD 患者焦虑症状的有效评估指标。

MPFC→BNST→PVN 神经环路介导青春期小鼠社会隔离引起的情绪和心功能障碍

姚远^{1,2} 郭丹^{1,2} 韩盈^{1,2}

- 1.北京大学中国药物依赖性研究所
- 2.北京大学医学部基础医学院神经生物学系

目的 本研究旨在揭示不同社会隔离应激模式对青春期小鼠情绪和心血管功能的影响,探讨社会隔离应激后 mPFC、BNST、PVN 等亚区神经元活动的变化,以及 mPFC→BNST→PVN 神经环路在社交隔离应激诱导的情绪和心功能障碍中的作用机制。

方法 3 周龄的 C57 小鼠经历 2 周或 6 周的社会隔离应激。采用旷场实验、高架十字迷宫实验和

新奇抑制摄食实验评价小鼠的焦虑样行为。采用强迫游泳实验和悬尾实验评价小鼠的抑郁样行为。采用三箱社交实验评价小鼠的社交行为。采用免疫荧光法检测 mPFC、BNST 和 PVN 神经元的激活情况和神经元类型。采用超声心动图检测小鼠心功能指标,DSI 遥测系统检测小鼠的血压、心率和核心体温。逆行示踪病毒法验证 mPFC→BNST→PVN 神经环路,采用化学遗传学或光遗传学调控该环路,观察对情绪和心功能的作用。

结果 社交隔离 6 周的小鼠产生抑郁、焦虑样行为,社交功能障碍增加,社交隔离 6 周加剧了心肌梗死小鼠心功能障碍。社交隔离应激降低了 mPFC 和 BNST 神经元的活性,增加了 PVN 神经元的活性。化学遗传激活 mPFC→BNST 的谷氨酸能投射可以缓解社交隔离应激引起的行为异常。

结论 社交隔离应激可导致情绪、认知相关脑区如 mPFC 和 BNST 的功能损害,并通过作用于 PVN 等自主神经中枢调节心血管功能。mPFC→BNST→PVN 神经环路在青春期小鼠社交隔离应激引起的情绪障碍和心功能障碍中发挥重要作用。

腹侧海马-基底外侧杏仁核环路调节非条件性刺激唤起诱导的远期恐惧记忆再巩固

刘芳林 郭丹 姚远 韩盈*

北京大学中国药物依赖性研究所

目的 恐惧记忆反复闪现会产生恐惧情绪失调,诱发创伤后应激障碍(post-traumatic stress disorder, PTSD)等精神疾病。各种现实因素导致 PTSD 患者很难在创伤记忆形成之初立即得到治疗,所以临床中需要干预的往往是顽固的远期恐惧记忆。相比于近期恐惧记忆,远期恐惧记忆常伴随多习得线索、难以消除且研究相对较少。与正常的学习记忆过程一样,短时暴露于恐惧记忆相关线索能唤起记忆进入不稳定的再巩固过程,再巩固时间窗内的有效干预能够改写记忆,从而达到治疗 PTSD 等精神疾病的目的。相比于传统的条件性刺激(Conditioned Stimulus, CS)唤起,非条件性刺激(Unconditioned

Stimulus, US) 可以唤起所有 CS 与该 US 的关联性记忆, 从而更彻底且持久地破坏病理性记忆。研究表明, 基底外侧杏仁核 (Basolateral Amygdala, BLA) 在 US 唤起诱导恐惧记忆再巩固中十分重要, 而 US 唤起诱导远期恐惧记忆再巩固的神经环路机制并不明确。因此, 本研究猜测存在投射至 BLA 的神经环路特异性调控 US 唤起诱导远期恐惧记忆的再巩固。

方法 本研究采用环境恐惧记忆模型、免疫荧光、病毒示踪、光纤记录、化学遗传学等方法, 从脑区和环路水平探索 US 唤起诱导远期恐惧记忆再巩固的神经机制。

结果 1) 通过免疫荧光染色, 分析不同唤起形式诱导近期和远期恐惧记忆再巩固激活的脑区, 确定目标上游脑区为前边缘皮质 (Prelimbic cortex, PL) 和腹侧海马 CA1 (ventral hippocampus CA1, vCA1); 2) 通过病毒示踪、光纤记录等, 发现 PL-BLA 谷氨酸能投射参与 CS 和 US 唤起诱导远期恐惧记忆再巩固, 而 vCA1-BLA 谷氨酸能投射只参与 US 唤起诱导远期恐惧记忆再巩固; 3) 在远期恐惧记忆再巩固时间窗内, 相比于 PL-BLA 谷氨酸能投射, 化学遗传学抑制 vCA1-BLA 谷氨酸能投射能够破坏 US 唤起诱导远期恐惧记忆的再巩固且具有长期效应, 而激活该投射能够挽救普萘洛尔对于远期恐惧再巩固的破坏作用。

结论 本研究揭示了 vCA1-BLA 谷氨酸能投射调控 US 唤起诱导远期恐惧记忆再巩固的神经机制, 从学习记忆角度为临床治疗 PTSD 等精神疾病提供新途径。

脑多靶点电刺激调控技术治疗抑郁症的动物研究

刘芳林 黄诗豪 郭丹 李鑫 韩盈*
北京大学中国药物依赖性研究所

目的 脑深部电刺激 (deep brain stimulation, DBS) 是一种很有前景的治疗重度抑郁症的优化替代疗法, 通过定向调节不同靶点实现抗抑郁作用, 改善了以往脑损伤手术对患者的伤害, 在临床中已被广泛使用。然而, 对于 DBS 治疗抑郁症的最佳靶

向脑区、最优刺激参数及其潜在神经生物学机制仍不明确, 亟需临床前研究探寻更为安全有效的治疗方案。

方法 本研究采用慢性不可预见性应激 (chronic unpredictable stress, CUS) 动物模型, 将研发的植入式脑多靶点电刺激装置的多通道电极分别及同时植入腹内侧前额叶皮层 (ventromedial prefrontal cortex, vmPFC) 和外侧缰核 (lateral habenula, LHb)、或者 vmPFC 和内侧前脑束 (medial forebrain bundle, MFB), 各电极独立设置刺激参数, 通过糖水偏爱测试、旷场测试、高架十字迷宫测试、新颖环境抑制摄食测试、强迫游泳测试等行为学评价以及蛋白免疫印迹、免疫荧光等方法, 探索多种匹配刺激模式对于大鼠抑郁样行为的交互调控效应及机制。

结果 脑深部联合电刺激 vmPFC (130Hz, 90 μ s, 100 μ A) 和 LHb (130Hz, 60 μ s, 150 μ A) 具有明显的抗抑郁作用, 能够显著改善 CUS 大鼠的抑郁样行为, 表现为增加大鼠的糖水偏爱值、降低大鼠在强迫游泳测试中的不动时间, 同时显著改善 CUS 大鼠的焦虑样行为, 表现为增加大鼠在旷场中心的停留时间、减少大鼠在新颖环境摄食测试中的摄食潜伏期、减少大鼠在高架十字测试中的闭臂停留时间。但脑深部联合电刺激 vmPFC (130Hz, 90 μ s, 100 μ A) 和 MFB (130Hz, 90 μ s, 200 μ A) 对大鼠的抑郁样和焦虑行为没有显著的改善作用。

结论 脑深部联合电刺激 vmPFC 和 LHb 显著改善了生理状态和慢性应激状态下大鼠的抑郁样和焦虑样行为, 为优化多靶点联合电刺激治疗抑郁症方案提供了坚实的理论依据。

氯马斯汀通过逆转脱髓鞘改善青春期社会隔离小鼠的情绪和社交障碍

郭丹^{1,2} 姚远^{1,2} 韩盈¹

1. 北京大学中国药物依赖性研究所
2. 北京大学医学部基础医学院神经生物学系

目的 自疫情以来的社会隔离对人们的身心健康产生了巨大影响。青春期是社会经验依赖性少突胶质细胞成熟和髓鞘形成的关键时期, 易受到环境

应激和压力的影响。青春期应激易导致大脑结构和功能发生不可逆转的变化,并导致成年后的持久情绪和社交障碍。然而,青春期社会隔离应激与情绪、社交能力之间的分子机制在很大程度上仍然未知。

方法 本研究通过构建社交隔离小鼠模型而后进行一系列评估社交、焦虑、抑郁行为的范式及超声发声检测,探究其情绪和社交能力的改变。使用 RT-QPCR、免疫印迹、免疫荧光分析内侧前额叶和海马及其亚区的髓鞘变化水平。而后使用 14 天给药氯马斯汀的药理学方法恢复髓鞘形成。

结果 (1) 青春期社会隔离小鼠超声发声模式改变。(2) 青春期社会隔离应激降低小鼠前额叶皮层和海马的髓鞘水平,髓鞘相关基因表达减少且髓鞘结构破坏。(3) 氯马斯汀可以逆转青春期社会隔离小鼠的焦虑和抑郁样行为。(4) 氯马斯汀恢复青春期社会隔离小鼠损伤的社交记忆能力及超声发声模式。(5) 氯马斯汀促进青春期社会隔离小鼠髓鞘形成与再生。

结论 本研究揭示了青春期社会隔离应激造成的情绪、社交障碍的前额叶皮层与海马的脱髓鞘机制,对深刻理解青春期的脑发育与行为特征有重要意义。并且对抑郁症、焦虑症等精神疾病的预防与治疗提供了靶向髓鞘的新靶点。

Neuroimaging Alterations of Amygdala Associated with Social Dysfunction in Deficit Schizophrenia

Jin Fang Chao Zhou Xiangrong Zhang*

The Affiliated Brain Hospital of Nanjing Medical University

Objective Abnormalities in the structure and function of the amygdala have been identified in patients with schizophrenia, its role in negative symptoms and social functioning remains unclear. This study aims to investigate the relationship between functional abnormalities of the amygdala and social dysfunction in deficit schizophrenia

Methods The study enrolled a total of 53 individuals with deficit schizophrenia (DS), 76 with non-deficit schizophrenia (NDS), and 76 healthy controls (HCs) matched for age, education, and gender. The Brief Negative Symptom Scale scores were utilized to quantify negative symptoms in patients, while the Scale of Social function in Psychosis Inpatients was employed to assess their social functioning. Additionally, a battery of classic neurocognitive tests was administered to evaluate cognitive functions. Structural and functional MRI data were collected from all participants. Functional connectivity (FC) analysis was constructed using amygdala subregions as seed points. Correlation analysis was conducted to investigate the relationship between altered brain features of the amygdala and social functioning in DS. Furthermore, the correlation between the altered FC and densities of neurotransmitter receptors/transporters was detected

Results This study revealed that the volume of the left amygdala was significantly smaller in DS than in NDS and HCs. Compared to the NDS group, the strength of functional connectivity between the ventral portion containing portions of basolateral of the lateral nuclei of left amygdala (LaV/BL.L) and the left paracentral lobule (PCL.L) was significantly decreased in DS. The reduced volume of the left amygdala was found

to be positively correlated with social dysfunction in DS. The altered FC between LaV/BL.L and PCL.L was positively correlated with social dysfunction and metabolic glutamate receptor type 5 density in DS group

Conclusion The structural and functional abnormalities observed in the left amygdala subregion may play a crucial role in the social impairment in DS, providing novel insights into potential treatments for improving social functioning and quality of life in deficit schizophrenia.

关键词: Deficit schizophrenia; Negative Symptoms; Social functioning; Functional connectivity; Amygdala

Aberrant Brain Functional Connectivity Mediates The Effects of Negative Symptoms on Cognitive Function in Schizophrenia: A Structural Equation Model

Jin Fang Chao Zhou Xiangrong Zhang*

The Affiliated Brain Hospital of Nanjing Medical University

Objective Schizophrenia is a severe psychiatric disorder, characterized by positive symptoms, negative symptoms, and cognitive deficits. Elucidating the mechanism of negative symptom and cognitive deficits could contribute to the treatment and prognosis of schizophrenia. We hypothesized that abnormal functional connectivity would be involved in the indirect effects of negative symptoms on cognitive function

Methods A total of 150 schizophrenia patients and 108 healthy controls matched for age and education were enrolled in the study. The scores of Brief Negative Symptom Scale (BNSS) were divided into two factors: motivation and pleasure deficits (MAP) and diminished expression (EXP). Subsequently, a series of classic neurocognitive tests were used to evaluate cognitive functions. Resting-state fMRI data was collected from all participants. The Anatomical Automatic Labeling template was employed to establish regions of interest (ROIs), thereby constructing the functional connectivity

network across the entire brain. Eventually, scores of patients' negative symptoms scale, cognitive function, and strengths of abnormal functional connectivity were incorporated into a structural equation model to explore the interactions among variables

Results MAP exhibited a distinctly and significantly negative impact on cognitive function. The functional connectivity between the left insula and left precuneus (PCUN.L), along with that between the PCUN.L and right angular gyrus, collectively served as intermediaries, contributing to the indirect effects of MAP and EXP on cognitive function

Conclusion Our findings demonstrated the moderating role of aberrant brain functional connectivity between negative symptoms and cognitive function, providing valuable insights for investigating the pathogenesis of schizophrenia.

Phenome-wide Investigation of Bidirectional Causal Relationships between Major Depressive Disorder and Common Human Diseases

Wenxi Sun¹, Ancha Baranova^{2,3}, Dongming Liu⁴, Hongbao Cao², Xiaobin Zhang¹, Fuquan Zhang⁵

1.Suzhou Guangji Hospital

2.George Mason University, Manassas, Virginia, USA

3.Research Centre for Medical Genetics, Moscow, Russia.

4.Nanjing Drum Tower Hospital

5.Institute of Neuropsychiatry, The Affiliated Brain Hospital of Nanjing Medical University

Objective The high comorbidity of major depressive disorder (MDD) with other diseases has been well-documented. However, the pairwise causal connections for MDD comorbid networks are not well characterized

Methods We performed Phenome-wide Mende-

lian randomization (MR) analyses to explore bidirectional causal associations between MDD (N = 807,553) and 877 common diseases from FinnGen datasets (N = 377,277). The inverse variance weighting method was the primary technique, and other methods (weighted median and MR-Egger) were used for sensitivity analyses

Results Our MR analyses showed that MDD is causally associated with the risk of 324 disease phenotypes (average b: 0.339), including 46 psychiatric and behavioral disorders (average b: 0.618), 18 neurological diseases (average b: 0.348), 44 respiratory diseases (average b: 0.345), 40 digestive diseases (average b: 0.281), 18 circulatory diseases (average b: 0.237), 37 genitourinary diseases (average b: 0.271), 66 musculoskeletal and connective diseases (average b: 0.326), 22 endocrine diseases (average b: 0.302), and others. In a reverse analysis, a total of 51 diseases were causally associated with the risk of MDD (average b: 0.086), including 5 infectious diseases (average b: 0.056), 11 neurological diseases (average b: 0.106), 14 oncological diseases (average b: 0.108), and 5 psychiatric and behavioral disorders (average b: 0.114). Bidirectional causal associations were identified between MDD and 15 diseases. For most MR analyses, little evidence of heterogeneity and pleiotropy was detected

Conclusion Our findings substantiate the extensive and substantial causal effects of MDD on human diseases, which were more pronounced than those seen in the reverse analysis of the causal influences of other diseases on MDD.

Relationship Between Sphingomyelin and Risk of Alzheimer's Disease: A Bidirectional Mendelian Randomization Study

Zhiqiang Du* Yuan Shen
Wuxi Mental Health Center

Objective This study employed a two-sample

Mendelian Randomization (TSMR) approach to investigate the potential causal relationship between sphingomyelin (SM) and Alzheimer's disease (AD)

Methods Data was extracted from the Genome Wide Association Study (GWAS) database. The primary method of analysis was the Inverse Variance Weighted (IVW) method, supplemented by the Weighted median, Weighted mode, and MR Egger methods. The bidirectional causal relationship between SM and AD was evaluated using OR values with a 95% Confidence Interval (95%CI)

Results The study found a bidirectional positive correlation between SM and AD. On one hand, SM was indicated as a risk factor for AD [IVW(MRE): OR: 1.001, 95%CI: 1.000 to 1.002; P=0.020<0.05]. This was further confirmed by IVW(FE) [OR: 1.001, 95%CI: 1.001 to 1.002; P=3.36e-07<0.05] and MR Egger [OR: 1.002, 95%CI: 1.000 to 1.004; P=0.036<0.05]. On the other hand, AD was shown to lead to an increase in SM [IVW(MRE): OR: 5.64e+08, 95%CI: 1.69e+05 to 1.89e+12; P=1.14e-06<0.05]. This causal relationship was also consistently indicated by IVW(FE), MR Egger, Weighted median, and Weighted mode methods

Conclusion A bidirectional positive correlation between SM and AD was found. On one side, increased SM is associated with a higher risk of AD onset. On the other side, AD can further elevate SM levels, potentially exacerbating the progression of AD. This research not only provides new clinical insights for the prevention and treatment of AD but also offers a theoretical basis for drug development

Progress in Magnetic Resonance Spectroscopy of Brain Metabolism in Late-life Depression

Wuyu Mao*
First Hospital of Shanxi Medical University

Objective This systematic review analyzed the available evidence on Magnetic Resonance Spectroscopy (MRS) in Late-life depression (LLD), focusing on MRS-associated brain metabolites and clinical studies in LLD, particularly with cognitive impairment

Methods PubMed, Embase, Web of science, Cochrane, and gray literature were systematically screened for studies deemed fit for the purpose of the current systematic review

Results In most studies, patients with Late-Life Depression (LLD) are characterized by a decrease in NAA/Cr levels in the frontal cortex, which is correlated with depressive symptoms and cognitive function. LLD also shows elevated mI levels in the frontal cortex, decreased NAA levels in the cingulate cortex and hippocampus, and increased Cho/Cr and mI/Cr ratios in the left basal ganglia area. There is some overlap in the changes of mI in the frontal cortex, hippocampus, and cingulate cortex NAA/Cr levels between LLD and Mild Cognitive Impairment (MCI) patients

Conclusion The decrease in frontal cortex NAA/Cr is closely associated with depressive symptoms and cognitive function, while the changes in hippocampus and cingulate cortex NAA/Cr levels overlap between LLD and MCI patients, suggesting that NAA/Cr may have greater diagnostic value in the cognitive symptoms of LLD

Research on A-Synuclein As A Biomarker in Alzheimer's Disease

Haojun Cao Enyan Yu*
ZheJiang Cancer Hospital

Objective This study aims to explore the potential application of α -synuclein (α -Syn) as a biomarker for Alzheimer's Disease (AD) and its role in the diagnosis and progression of the disease. Specific objectives include

1. Determining the expression levels of α -Syn in

the cerebrospinal fluid (CSF) of AD patients and their relationship with cognitive function changes. Previous research indicates that the levels of α -Syn in the CSF of AD patients are significantly elevated and correlate with cognitive decline.

2. Assessing the differential expression of α -Syn species (such as total α -Syn, oligomers, and phosphorylated forms) in AD patients and their diagnostic value. Studies have shown that different forms of α -Syn exhibit distinct expression patterns in the CSF of AD patients, which may provide a basis for further classification and diagnosis of AD.

3. Investigating the interaction between α -Syn and other AD-related proteins (such as A β and tau proteins) and their role in the pathology of AD. Research suggests that α -Syn may interact with A β and tau proteins, potentially exacerbating the pathological progression of AD.

4. Evaluating the incidence and clinical impact of α -Syn comorbidity in AD patients using α -Syn seeding amplification assay (α S-SAA) technology. Existing studies indicate that α S-SAA technology effectively detects α -Syn comorbidity in AD patients and is associated with poorer clinical outcomes.

Methods Sample Selection: The study subjects will include patients diagnosed with AD and a healthy control group. AD patients will be screened according to clinical diagnostic criteria and core biomarkers (such as A β and tau proteins) to ensure the accuracy and representativeness of the samples

Experimental and Control Group Setup: The experimental group will comprise AD patients at various stages (such as the preclinical stage, mild cognitive impairment stage, and dementia stage) to evaluate changes in α -Syn across different disease stages. The control group will include healthy individuals and patients with other neurodegenerative diseases (such as Parkinson's Disease and Lewy Body Dementia) to investigate the specificity of α -Syn in AD.

Sample Collection and Processing: All study subjects will undergo cerebrospinal fluid (CSF) and blood sample collection. CSF samples will be used for α -Syn detection, employing techniques such as α -Syn seeding amplification assay (α S-SAA) and real-time quaking-induced conversion (RT-QuIC) to enhance detection

sensitivity and specificity. Blood samples will be used for routine biochemical analysis and genetic testing.

Data Analysis: Experimental data will be analyzed using statistical methods to compare differences in α -Syn levels among different groups. Special attention will be given to the correlation between α -Syn positivity and cognitive function, behavioral disorders, and disease progression in AD patients. Additionally, the relationship between α -Syn and other AD biomarkers (such as A β and tau proteins) will be explored to assess its supplementary value in AD diagnosis.

Study subjects include AD patients, healthy controls, and patients with other neurodegenerative diseases. AD patients are categorized into different stages, including the preclinical, early, and dementia stages. Sample collection primarily involves obtaining cerebrospinal fluid (CSF) samples via lumbar puncture, and blood samples are also collected for subsequent analysis. All sample collections require informed consent from patients or their guardians and must adhere to the approval of the ethics committee.

Methods for Detecting α -Synuclein

1. α -Syn Seeding Amplification Assay (α S-SAA): This technique involves adding known α -Syn seeds to the CSF and observing their amplification. It is highly sensitive in detecting the presence of α -Syn in CSF and assessing its seeding activity .

2. Real-Time Quaking-Induced Conversion (RT-QuIC): RT-QuIC technology is used to detect α -Syn seeding activity in CSF and olfactory mucosa. This method induces α -Syn aggregation through oscillation, thereby detecting its presence in various samples .

3. Western Blot: Western Blot technique is employed to detect different forms of α -Syn in CSF samples, including total α -Syn, oligomers, and phosphorylated α -Syn. After protein extraction, SDS-PAGE electrophoresis, and membrane transfer, specific antibodies are used for detection .

4. Enzyme-Linked Immunosorbent Assay (ELISA): ELISA is utilized to quantitatively measure the concentration of α -Syn in CSF. This method involves an antigen-antibody reaction, coupled with an enzyme label for colorimetric detection, with the concentration of α -Syn ultimately calculated based on optical density values .

Results Firstly, we anticipate a significant elevation of α -Syn in the CSF of AD patients. Previous studies have demonstrated that α -Syn levels in the CSF of AD patients are markedly higher than those in control groups, correlating closely with cognitive decline, visuospatial impairment, and behavioral abnormalities. This finding will further support the potential of α -Syn as a biomarker for AD and provide a basis for its application in clinical diagnosis

Secondly, we expect to detect a positive response of α -Syn through the α -Syn seed amplification assay (α S-SAA) in AD patients. Existing research indicates that the positivity rate of α S-SAA in AD patients is approximately 30%, significantly higher than the 9% observed in control groups. This result will validate the efficacy of α S-SAA in AD diagnosis and may elucidate the connection between α -Syn and AD pathology.

Furthermore, we anticipate that in the brain tissue of AD patients, α -Syn is predominantly localized in lipid-rich regions and associated with amorphous elements within mature core AD plaques. This discovery will further elucidate the specific mechanisms of α -Syn in AD pathology and may offer new perspectives for understanding the progression of AD.

We also expect interactions between α -Syn and other key proteins such as A β and tau in AD patients. Previous studies have shown that the co-accumulation of A β and α -Syn in AD and Parkinson's disease (PD) patients may lead to more severe pathological manifestations. This finding will support the multifaceted role of α -Syn in AD and might provide a basis for developing integrated therapeutic strategies targeting multiple proteinopathies.

Conclusion The anticipated outcomes of this study will significantly advance our understanding of the mechanisms by which α -Syn functions in AD and provide robust scientific evidence for its clinical application as an AD biomarker. These findings will not only facilitate early diagnosis and disease monitoring but may also offer crucial insights for the development of novel therapeutic strategies. By delving into the relationship between α -Syn and AD pathology, we hope to uncover further critical details about the pathogenesis of AD, thereby propelling research progress in this field

外周血细胞因子对首发抑郁障碍及其严重程度的预测价值

乐丹盛¹ 于恩彦²

1.浙江省人民医院

2.浙江省肿瘤医院

目的 探究外周血细胞因子及临床数据与首发抑郁障碍及其症状严重程度的预测价值。

方法 前瞻性纳入 2020.7 至 2024.3 在浙江省人民医院进行心理评估的人群,分别收集临床数据、完成汉密尔顿抑郁量表-24 项 (HAMD-24) 量表评估,定量检测 12 项外周血细胞因子并对数化处理,包括白细胞介素(Interleukin, IL) -1 β 、IL-2、IL-4、IL-5、IL-6、IL-8、IL-10、IL-12p70、IL-17、肿瘤坏死因子 (Tumor necrosis Factor, TNF) - α 、干扰素 (Interferon- α , IFN) - α 、IFN- γ 。根据是否被诊断为首发抑郁障碍分为对照组 60 例和抑郁组 120 例,将抑郁组根据 HAMD-24 评分标准分为可能有轻度抑郁组、轻至中度抑郁组、重度抑郁组。比较对照组和抑郁组组间差异,采用 Spearman 相关分析抑郁症状严重程度与一般临床资料及血清细胞因子的相关性,构建多元线性回归模型分析首发抑郁障碍严重程度的影响因素,采用二元 logistic 回归模型分析首发抑郁障碍及首发重度抑郁障碍的影响因素并绘制 ROC 曲线评估模型效能。

结果 抑郁组与对照组组间 12 项外周血细胞因子相对浓度存在显著差异; Spearman 相关分析显示抑郁症状严重程度与 IL-1 β 、IL-2、IL-4、IL-5、IL-6、IL-8、IL-12p70、IL-17、TNF- α 、IFN- α 、IFN- γ 呈正相关。多元线性回归分析模型显示,抑郁严重程度 44% 变异率可用 lgIL-4、lgTNF- α 、lgIFN- α 解释。二元 logistic 回归模型显示教育年限、lgIL-2、lgIL-4、lgIL-12p70、lgIL-17、lgIFN- α 是首发抑郁障碍的独立危险因素,lgIL-5、lgIL-6 是首发重度抑郁障碍的独立危险因素。

结论 与健康人群相比,首发抑郁障碍患者外周血血清 12 项外周血细胞因子水平均显著升高。首

发抑郁障碍严重程度与 IL-1 β 、IL-2、IL-4、IL-5、IL-6、IL-8、IL-12p70、IL-17、TNF- α 、IFN- α 、IFN- γ 呈正相关,变异率可用 lgIL-4、lgTNF- α 、lgIFN- α 解释。调整混杂因素后发现,教育年限、lgIL-2、lgIL-4、lgIL-12p70、lgIL-17、lgIFN- α 是首发抑郁障碍的独立危险因素,lgIL-5、lgIL-6 是首发重度抑郁障碍的独立危险因素。

Genetically Predicted Emotion and Function in Colorectal Cancer The Causal Relationship Between Mood Disorders and Colorectal Cancer: A Mendelian Randomization Study

Yanping Mao Enyan Yu*

Zhejiang Cancer Hospital

Background Colorectal cancer (CRC) is a common tumor disease with high incidence that affects dozens of million people around the world. In the last decade, numerous studies have demonstrated the non-negligible role played by mental disorders in the pathogenesis process of cancer diseases. But the evidence of causal relationship between mood disorders and CRC is still sparse in human population. To evaluate the potential causal association between mood disorders and CRC

Methods We conducted a genome-wide association study (GWAS) summary statistic based two-sample Mendelian randomization (MR) study. The study utilized summary statistics of three mood disorders including bipolar disorder (BD), major depressive disorder (MDD) and ever had period of mania/excitability were used as exposure samples respectively, and summary statistics of CRC was used as outcome sample. Four popular MR methods, including the IVW test, the MR-Egger regression, the weighted median estimator and MR-Robust Adjusted Profile Score (MR-RAPS), were used for the MR analysis

Results Based on the IVW method while the other methods served as its complement. We found that BD [IVW-fixed: OR=1.01, CI=1.00-1.01, P=0.05;

IVW-random: OR=1.01, CI=1.00-1.01, P=0.04] and MDD [IVW-fixed: OR=1.54, CI=1.17-2.02, P=0.002; IVW-random: OR=1.54, CI=1.23-1.92, P=0.0001] were causal associated with CRC detected by IVW. The same results were also identified by at least one other MR methods. While, there was no causal relationship found between ever had period of mania/excitability and CRC

Conclusion Our findings provided insights into the potential causal relationship from BD and MDD to CRC, and enhanced our understanding of the role of mood disorders played in the occurrence and development of CRC

重度神经认知障碍患者多组分运动方案的应用研究

金群¹ 黄丽华² 胡悦¹ 姚春女¹ 胡梦倩¹

1.衢州市第三医院

2.浙江大学医学院附属第一医院护理部

目的 探究 Vivifrail 多组分运动干预方案在重度神经认知障碍患者中的应用及效果。

方法 采用类实验性研究,选取 2021 年 6 月—2022 年 6 月在浙江省衢州市精神专科医院住院的重度神经认知障碍患者 52 例作为研究对象, A 病房为试验组 (26 例), B 病房为对照 (26 例), 试验组在常规护理的基础上给予为期 12 周的 Vivifrail 多组分运动, 对照组采用常规护理。在干预前后均采用简易体能状况量表 (Short Physical Performance Battery, SPPB)、“起立-行走”计时测试 (Timed "Up and Go" Test, TUGT)、6 min 步行试验 (6 Minutes Walking Test, 6MWT)、椅子坐位体前屈 (Chair Sit and Reach, CSR) 测试等评估两组的躯体功能。

结果 干预 12 周后, SPPB 总分 ($t=-4.312$, $P<0.001$)及其 3 个测试维度——平衡测试 ($t=-3.029$, $P=0.004$)、4 m 步速测试 ($t=-3.972$, $P<0.001$)、椅子坐立测试 ($t=-2.912$, $P=0.005$)、CSR 测试结果 ($t=-3.446$, $P=0.001$) 两组间差异有统计学意义。重复测量方差分析结果显示, 两组患者所有指标均有交互效应 ($P<0.001$), 除 SPPB 的 4 m 步速测试外, 其余

指标的时间效应均有统计学意义 ($P<0.05$), 组间效应有统计学意义的变量有 SPPB 平衡测试、CSR 测试 ($P<0.05$)。

结论 Vivifrail 多组分运动可显著改善重度神经认知障碍患者的平衡功能、步行速度、肌肉力量、柔韧性等躯体功能, 但对躯体灵活性及心肺功能的改善不明显。

中文版淡漠评定量表信效度研究

叶睿欢 陈炜*

浙江大学医学院附属邵逸夫医院

目的 对淡漠评定量表-医生版 (Apathy Evaluation Scale-Clinician, AES-C) 进行汉化, 并检验其在阿尔茨海默病 (Alzheimer disease, AD) 患者中的信效度。

方法 遵循 Brislin 翻译模型, 对英文版 AES-C 量表进行翻译、回译、跨文化调适和预调查, 最终形成中文版 AES-C。招募 111 名 AD 患者进行调查, 2 周后对其中随机 30 名进行重测。运用临界比值法对量表进行项目分析, 采用计算条目水平的内容效度指数 (I-CVI) 与量表水平的内容效度指数 (S-CVI) 计算内容效度, 采用探索性因子分析和验证性因子分析检验结构效度, 通过内部一致性信度 (Cronbach's α 系数) 和重测信度法检验信度。

结果 项目分析各条目 CR 值均 >3.000 ($P<0.01$)。经专家一致讨论内容效度后删除低相关条目, I-CVI 和 S-CVI 均为 1.000。KMO 值为 0.722, Bartlett's 球形检验 $\chi^2=621.286$ ($df=55$), $P<0.01$ 。总共提取 4 个公因子, 方差贡献率为 33.0%、15.3%、15.1%、14.9%, 累计方差贡献率为 78.4%。验证性因子分析显示, RMSEA=0.084、 $\chi^2/df=1.778$ 、TLI=0.928、GFI=0.906、CFI=0.950、IFI=0.952, 该模型所有指标均符合模型拟合标准。Cronbach's 系数为 0.809, 重测信度系数为 0.928。

结论 中文版淡漠量表医生版在 AD 中具有良好的信度和效度。

Exploring The Association Between BIN1 Gene Polymorphisms and Hippocampal Subfield Volume in Community Mild Cognitive Impairment

Jiali Luo Junjiao Ping Haibo Zhang Ying Zhang Zhenkun Tan Chujia Kong Xinxia Liu*

Third People's Hospital of Zhongshan City

Objective Alzheimer's disease (AD) is a progressive neurodegenerative brain disorder characterized by dementia, cognitive impairment, memory loss, and severe behavioral abnormalities. Despite ongoing research efforts, there is currently no identified effective treatment for AD. Mild cognitive impairment (MCI) often presents in the preclinical phase of AD, while prodromal AD signifies the earliest symptomatic stage with cognitive symptoms that do not meet the criteria for a dementia diagnosis. The annual conversion rate of MCI to AD is estimated to range from 15.4% to 33.4%. Once AD is diagnosed, it undergoes an irreversible neurodegenerative progression. Therefore, early and accurate diagnosis of MCI is crucial. BIN1 is identified as the principal susceptibility gene for the pathogenesis of Alzheimer's disease, second only to the APOE gene. This gene encodes a scaffolding protein that is highly expressed in the brain and muscle, contributing to various cellular processes such as endocytosis, translational regulation, and signal transduction. In individuals with AD, there is an increased expression of BIN1 in the brain. The exacerbation of tau pathology is influenced by the interaction between the SH3 domain of BIN1 and the proline-rich domain in tau. BIN1 SNPs rs10200967, rs1060743, and rs4663093 have been associated with both AD and MCI, although the specific mechanisms underlying these associations remain unclear. This study seeks to elucidate the neurological mechanisms by which BIN1 gene polymorphisms may impact the development of MCI. Through the integration of BIN1 gene polymorphisms with structural MRI analysis, we

aim to investigate the prevalence of BIN1 gene polymorphisms within the MCI and cognitively normal (CN) populations in our region. Furthermore, this study aims to investigate the correlation between BIN1 genotype and the structural integrity of hippocampal subregions in individuals with MCI

Methods This study enrolled a total of 52 elderly individuals with MCI and 55 cognitively CN individuals from five communities in Zhongshan Torch Development Zone. Blood samples were collected for analysis of BIN1 rs10200967, rs1060743, and rs4663093 gene polymorphisms, and MRI scans were conducted to assess the volume of hippocampal subregions. The study also seeks to examine the distribution of BIN1 genotypes rs10200967, rs1060743, and rs4663093 in both MCI and healthy control populations, as well as to investigate the potential association between BIN1 rs10200967, rs1060743, and rs4663093 genotypes and hippocampal subregion structure in individuals with MCI

Results Significant structural atrophy was observed in multiple hippocampal subregions, including ICA, IDG, IHATA, lSubc, rCA, rDG, rSubc, lHIP, and rHIP in seniors with MCI compared to those in the CN ($P < 0.05$), after adjusting for age, gender, education level, and APOE ϵ 4 status. Conversely, no significant differences were observed in IEC, rEC, rHATA, and TIV ($P > 0.05$). Notably, there were no significant differences in the distribution of BIN1 rs10200967, rs1060743, and rs4663093 genotypes among elderly individuals ($P > 0.05$). Furthermore, the association between the BIN1 rs10200967 genotype and IHATA atrophy significant in the MCI after adjusting for age, gender, education level, APOE ϵ 4 status, and TIV ($P < 0.05$)

Conclusion This study presents novel findings indicating an association between the BIN1 rs10200967 genotype and IHATA atrophy, with the rs10200967 CC genotype showing a higher volume of IHATA in individuals with MCI. These results suggest that the rs10200967CC genotype may confer a protective effect against MCI, offering a potential basis for early detection and prevention of AD.

Causal Relationship between Psychiatric Disorders and Venous Thromboembolism: A Bidirectional Two-sample Mendelian Randomization Analysis

Renliang Cai Xiangrong Zhang*

The Affiliated Brain Hospital of Nanjing Medical University

Objective This study aims to explore the causal relationship between psychiatric disorders (including schizophrenia, bipolar disorder and major depressive disorder) and venous thromboembolism (VTE) using mendelian randomization (MR) analysis

Methods We used available summarized data from the most recent and largest genome-wide association studies (GWASs) on psychiatric disorders and VTE to conduct a bidirectional two-sample MR. The inverse-variance weighted (IVW) method was used as the main statistical method to estimate the potential bidirectional causal associations between psychiatric disorders and VTE. Various MR analysis methods, including MR-Egger, weighted-median, and leave-one out analyses, were used for sensitivity analysis, followed by heterogeneity tests

The most recent and largest genome-wide association studies (GWASs) on psychiatric disorders and VTE were used to conduct a bidirectional two-sample MR. The inverse-variance weighted (IVW) method was used as the main statistical method to investigate the causal relationship, and the Various MR analysis methods, including MR-Egger, weighted-median, and leave-one out analyses, were used for sensitivity analysis and heterogeneity tests.

Results The lack of sufficient estimation results could suggest a causal relationship between major depressive disorder (MDD) and VTE in the forward MR analysis. The causal odds ratio (OR) estimate of genetically determined MDD was 1.47 for VTE using IVW [95% confidence interval (CI) : 1.07-2.00, P = 0.016].

No pleiotropy or heterogeneity was detected in the analyses. However, we failed to find any association between schizophrenia, bipolar disorder and VTE

Conclusion Our findings provided genetic evidence that MDD was associated with an increased risk of VTE. This may offer opportunities to prevent and manage VTE in psychiatric disorders.

关键词: Psychiatric disorders, Venous thromboembolism, Mendelian randomization

抗痴呆药对阿尔茨海默病认知功能长期结局的影响: 来自 Meta 分析的证据

王声滂^{1,2} 陈晶^{1,2} 颜蓉^{1,2} 廖箬箬^{1,4} 金明敏^{1,2} 官莉莉² 金卫东³ 陈炜¹

1.浙江大学医学院附属邵逸夫医院

2.绍兴市第七人民医院

3.浙江省立同德医院

4.江山市第四人民医院

目的 分析已进入临床使用的抗痴呆药物对阿尔茨海默病 (Alzheimer's disease, AD) 治疗后 6、12 个月认知功能的影响。

方法 检索 PubMed、Embase、Cochrane Library、Web of Science、中国知网、万方数据库、维普、中国生物医学文献数据库, 检索年限均为建库至 2023 年 12 月 31 日。纳入随机、双盲、安慰剂对照的抗痴呆药物治疗 AD 的临床研究, 治疗观察时间至少 6 个月, 最长至 12 个月, 对治疗前、后认知功能评分进行 Meta 分析。结局指标为治疗前后简易智力状态检查 (Mini-mental State Examination, MMSE)、阿尔茨海默病评定量表-认知分量表 (Alzheimer's disease assessment scale, ADAS-cog) 的变化值。

结果 共纳入 19 项研究 7148 例患者。抗痴呆药有肯定的疗效, 与安慰剂比较, MMSE 总均数差为 0.89 (P<0.00001); ADAS-cog 总均数差为-1.49 (P<0.00001)。抗痴呆药与安慰剂比较, 6、12 个月时 MMSE 均数差分别为 0.95 (P<0.00001)、0.45 (P=0.15); ADAS-cog 均数差分别为 -1.52 (P<0.00001)、-0.94 (P=0.36)。治疗 6 个月时, 多奈哌齐、利斯的明、美金刚与安慰剂比较, MMSE 均数差分别为 1.1 (P<0.00001)、1.07 (P<0.00001) 和

0.19 ($P=0.51$); 多奈哌齐、利斯的明、加兰他敏、美金刚、甘露特钠与安慰剂比较, ADAS-cog 均数差分别为-2.0 ($P<0.0001$)、-1.59 ($P<0.0001$)、-2.02 ($P<0.0001$)、-1.13 ($P=0.007$)和-0.69 ($P<0.00001$)。治疗 12 个月时, 多奈哌齐与安慰剂 MMSE 均数差为 0.75 ($P=0.14$); 美金刚与安慰剂比较, MMSE、ADAS-cog 均数差分别为 0.28 ($P=0.47$)、-0.94 ($P=0.36$)。

结论 抗痴呆药能延缓 AD 认知功能衰退, 其中多奈哌齐疗效更好; ADAS-cog 比 MMSE 对疗效的评估更敏感。

慢性应激状态下老年人财务风险决策及事件相关电位 P300 研究

石君毅¹ 吴东辉²

1. 安徽医科大学

2. 深圳市精神卫生中心/深圳市康宁医院

目的 财务风险决策 (decision-making) 是老年人的认知活动之一。慢性应激是一种长期持续对个体造成压力的状态, 对老年人的决策能力产生显著影响。本研究旨在利用事件相关电位技术 (Event-related Potential, ERP) 探讨慢性应激影响老年人财务风险决策的神经机制。

方法 本研究以深圳市多个社区健康老年人为研究对象, 采取方便抽样的方法, 通过生活事件量表 (Life Event Scale, LES) 来评估慢性应激状态, 筛选出符合入组标准的 30 例高应激实验组和 30 例低应激对照组的实验被试。研究设计运用风险决策研究中的模拟气球风险决策任务 (Balloon Analogue Risk Task, BART), 采用 2 (组别: 高应激组 vs. 低应激组) \times 2 (高风险 vs. 低风险) 的混合实验设计, 收集不同组别的 BART 数据; 为了直接比较高风险与低风险情景下的脑电差异, 采用差异波的分析方法采集各组 ERP 的 P300 波幅; 同时收集了他们的一般情况调查表、汉密尔顿抑郁量表 (HAMD)、汉密尔顿焦虑量表 (HAMA)、蒙特利尔认知评估量表 (MOCA) 来控制变量。

结果 (1) 在 BART 任务中, 控制混杂因素后,

高应激组在未爆炸气球的平均泵数 ($F(1,60)=9.920$, $p=0.010$, $\eta^2=0.113$)、成功率 ($F(1,60)=4.718$, $p=0.043$, $\eta^2=0.057$)、成功打气次数 ($F(1,60)=12.384$, $p=0.021$, $\eta^2=0.137$) 上均低于低应激组; 同时在不同高低风险决策任务下, 高应激组相比低应激组, 高风险气球平均泵数 ($F(1,60)=7.54$, $p=0.012$, $\eta^2=0.164$) 和低风险气球平均泵数 ($F(1,60)=5.61$, $p=0.023$, $\eta^2=0.140$) 同样均显示降低。(2) 低应激组在 BART 任务中诱发了更大的 P300 波幅 (p 值 <0.01), 并表现出更高的冒险倾向。(3) 此外, 老年人的 BART 任务表现 (未爆炸气球的平均泵数) 与慢性应激状态呈负相关 ($p<0.001$), 与 P300 波幅呈负相关 ($p<0.01$); 中介效应分析显示, P300 波幅在老年人的慢性应激状态和 BART 任务表现之间起部分中介作用 ($IE=0.14$, $SE=0.07$, $95\%CI=[0.023, 0.328]$)。

结论 慢性应激状态的老年人在财务风险决策中可能会选择更加保守的风险决策, P300 波幅在老年人慢性应激状态与风险决策之间发挥部分中介效应。

Validation of AST/ALT As A Sarcopenia Index for The Prediction of Pneumonia and Delirium in Patients Experiencing Acute Withdrawal From Excessive Alcohol Consumption

sha Huang Xiaoyan Chen*

Zigong Affiliated Hospital of Southwest Medical University

Objective This study was developed with the goal of exploring the link between the sarcopenia index (aspartate transaminase (AST)/ alanine transaminase (ALT)) and the risk of pneumonia and delirium among hospitalized patients experiencing acute withdrawal from excessive alcohol consumption

Methods For this retrospective study, patients experiencing acute withdrawal from excessive alcohol consumption who underwent inpatient treatment at a psychiatric teaching hospital in western China between January 1, 2014 and December 31, 2023 were analyzed.

Patient-related data were accessed through an electronic medical record database, and logistic regression analyses were used to explore the relationship between the sarcopenia index and the risk of developing pneumonia and delirium in this population

Results This retrospective analysis included data from 557 patients who underwent inpatient treatment for acute alcohol withdrawal. The relative incidence of pneumonia and delirium was the same (13.64%) in this patient group, with an average time to delirium of 1.566 days and an average time to pneumonia of 5.99 days after admission. Patients were separated into two groups based upon whether or not their AST/ALT ratio was above or below the three-quarter level (2.18), classifying these two groups into those with high and low AST/ALT ratios, respectively. Treating the AST/ALT ratio as a continuous variable, patients with pneumonia or delirium presented with higher AST/ALT values relative to unaffected patients (pneumonia, 1.94 vs. 1.57, $p < 0.001$; delirium, 2.63 vs. 1.58, $p = 0.002$). Following adjustment for potential confounding factors, logistic regression analyses revealed that higher AST/ALT values were linked to a greater risk of pneumonia (OR=1.531, 95%CI: 1.146-2.045) and delirium (OR=1.497, 95%CI: 1.139-1.966). When AST/ALT was instead treated as a categorical variable, significantly higher incidences of pneumonia and delirium were observed in the high AST/ALT group relative to the low AST/ALT group (pneumonia, 21.58% vs. 11%, $p = 0.002$; delirium, 20.14% vs. 11.48%, $p = 0.001$). Logistic regression analyses indicated that individuals in the high AST/ALT group faced a higher risk of both pneumonia (OR=2.011, 95%CI: 1.164-3.477) and delirium (OR=1.829, 95%CI: 1.082-3.091) relative to the low AST/ALT group following adjustment for possible confounding factors

Conclusion These analyses revealed that among hospitalized for acute withdrawal from excessive alcohol consumption, the sarcopenia index (AST/ALT) is linked to a greater risk of both pneumonia and delirium when treated as both a continuous and a categorical variable.

Odor Identification Dysfunction in Late-life Depression with Suicidal Ideation

Danyan Xu^{1,2}, Yuping Ning², Yuping Ning¹, Ben Chen¹
1.The Affiliated Brain Hospital of Guangzhou Medical University
2.The first School of Clinical Medicine, Southern Medical University

Background Suicide is more prevalent among older individuals compared to younger individuals. Late-life depression (LLD) poses the highest risk for suicide. However, early recognition of suicidal ideation is challenging. Dysfunction in odor identification (OI), a characteristic of LLD, may hold potential for early identification of suicidal ideation. This study aims to compare OI between LLD patients with suicidal ideation (LLD-S) and LLD patients without suicidal ideation (LLD-NS), and examine its relationship with cognitive function

Methods A total of 262 LLD-NS patients, 63 LLD-S patients, and 316 healthy normal older adults (HOAs) underwent OI testing, standardized clinical interviews, and comprehensive neuropsychological assessments

Results (1) LLD-S patients exhibited lower OI scores and poorer cognitive performance (including global cognition, information processing speed, memory, language, executive function, and visuospatial ability) compared to LLD-NS patients and HOAs. (2) There were interactive effects between suicidal ideation and OI dysfunction, leading to lower scores in information processing speed and visuospatial ability. (3) OI dysfunction mediated the differences in cognition between the LLD-NS and LLD-S groups

Limitations: The present study was a cross-sectional design.

Conclusion LLD-S patients had worse odor identification than LLD-NS patients and HOAs, suggesting that OI testing could be a valuable approach for identifying suicidal ideation in LLD and screening for

suicide risk. The presence of both OI impairment and suicidal ideation was associated with poorer cognitive performance in LLD.

关键词: Suicidal ideation, Late-life depression, Odor identification, Cognitive function

伴和不伴有抑郁症状的阿尔茨海默病患者眼球运动分析的差异性研究

刘善雯 胡华*

核工业总医院 (苏州大学附属第二医院)

目的 探究阿尔茨海默病患者(AD)伴有或不伴有抑郁症状的眼动参数的差异。

方法 纳入记忆障碍门诊确诊的 65 例 AD 患者,分为不伴抑郁症状的 AD 组(nD-AD 组)和伴有抑郁症状的 AD 组(D-AD 组)。分析比较 2 组的临床基本资料。应用 Eyeknow 智能眼动分析评价系统收集受试者眼动信息,分析比较两组 6 个范式中的眼动参数。采用 logistic 回归分析评估眼动参数在诊断 AD 患者伴发抑郁症状方面的影响并绘制受试者操作特征(ROC)曲线。在控制混杂因素后,对存在组间差异的眼动参数和 D-AD 患者的 HAMD-17 评分进行偏相关分析。

结果 在重叠朝向眼跳任务中,D-AD 组的潜伏期长于 nD-AD 组,平均和峰值眼跳速度高于 nD-AD 组。在间隔朝向眼跳任务中,D-AD 组平均反应时长和平均眼跳速度大于 nD-AD 组。在反向眼跳任务中,仅峰值眼跳速度存在组间差异。平滑追踪任务中,相比于 nD-AD 组,D-AD 组的启动时长更长,追踪速度更慢,偏移次数和偏移量均更大。在注视任务中,D-AD 组的注视稳定性比 nD-AD 组差。平滑追踪启动时长和正中注视中大于 2°总偏移次数被纳入 logistic 回归模型。以上述两项眼动参数绘制的 ROC 曲线下面积为 0.8011,灵敏度为 53.13%,特异 90.91%。在偏相关分析中,D-AD 患者平滑追踪启动时长,追踪速度以及偏侧注视中大于 4°的总偏移次数与抑郁症状严重程度具有相关性。

结论 D-AD 患者与 nD-AD 在多个眼动范式中表现出差异,有助于以经济有效和非侵入性的方式区分 AD 患者是否伴发抑郁症状。

追踪技术

轻中度阿尔茨海默病患者肌肉力量与大脑灰质体积的相关性研究

刘善雯 胡华*

核工业总医院 (苏州大学附属第二医院)

目的 探讨阿尔茨海默病(AD)患者肌肉力量(MS)与大脑灰质体积(GMV)变化的相关性。

方法 对神经内科记忆障碍门诊确诊的 42 例 AD 患者(按痴呆严重程度分为轻度 24 例,中度 18 例)及 40 例正常对照者收集一般资料、神经心理学测试、肌少症相关指标与头颅磁共振成像扫描。肌少症相关指标中肌肉量(MM)为四肢骨骼肌量指数(ASMI),MS 包括握力与 5 次起坐试验,躯体功能为 6m 步速。头颅磁共振数据分析为基于体素的脑形态学分析,使用单因素方差分析得到轻、中度 AD 组 GMV 有差异的脑区,将差异脑区作为感兴趣区(ROI)并提取 GMV。分析三组间肌少症相关指标、ROI 脑区 GMV 差异,以及 ASMI、MS、躯体功能与大脑 GMV 的相关性。

结果 3 组在年龄、教育年限、高血压、身高、体重、肌少症患病率、MMSE、MoCA 差异均有统计学意义(均 $P < 0.05$)。3 组在 ASMI、握力、5 次起坐时间、6m 步速差异均有统计学意义(均 $P < 0.05$)。中度 AD 组在总灰质、左顶上回、左缘上回、右背外侧额上回、左额中回、左丘脑 GMV 较轻度 AD 组小(均 $P < 0.05$)。AD 组中 5 次起坐时间与总灰质、左右海马、左顶上回、左右缘上回、左右背外侧额上回、左额中回、左丘脑 GMV 呈负相关(均 $P < 0.05$);握力与总灰质、左海马、左右背外侧额上回、左右额中回 GMV 呈正相关(均 $P < 0.05$);6m 步速与左右海马、左颞横回、左顶上回、左右缘上回、右背外侧额上回、左额中回、右额中回、左右丘脑 GMV 呈正相关(均 $P < 0.05$);ASMI 与总灰质、右背外侧额上回、右额中回 GMV 呈正相关(均 $P < 0.05$)。控制年龄、性别、教育年限、MMSE、MoCA 做偏相关分析,轻中度 AD 组 5 次起坐时间与左右海马体积呈强负相关(均 $P > 0.05$);中度 AD 组中 5 次起坐时间还与右背外侧额上回、左顶上回 GMV 呈强负相关(均 $P > 0.05$),与右顶上回 GMV 呈中

等负相关 (均 $P > 0.05$)。

结论 AD 患者随着认知功能减退 MS 明显下降, 并与大脑 GMV 变化具有明显相关性, 其中下肢 MS 下降更为重要, 更多脑区 GMV 变化参与其中。轻、中度 AD 患者 MS 下降均与海马萎缩存在强相关, 且独立于年龄、性别、教育年限、MMSE 评分。与轻度 AD 患者相比, 中度 AD 患者 MS 下降还与更多脑区灰质体积减少有关, 如背外侧额上回、顶上回等。然而, 在调整混杂因素后, MM 减少与大脑灰质体积变化关系并不大。

阿尔茨海默病患者特异性脑白质结构改变介导握力减小和执行功能改变中的作用

刘善雯 胡华*

核工业总医院 (苏州大学附属第二医院)

目的 利用基于纤维束分析(FBA)技术探讨阿尔茨海默病(AD)患者脑白质结构改变与握力和认知功能的关系。

方法 取 54 例 AD 患者及 31 例认知和握力正常的对照者(NC), AD 患者分为 AD 伴有低握力组(AD-LGS)共 29 例, AD 不伴低握力组(AD-nLGS)共 25 例。收集一般资料、神经心理学测试、握力与头颅磁共振成像扫描。神经心理学测试包括简易精神状态量表(MMSE)、蒙特利尔认知评估量表(MoCA)、画钟测试(CDT)、记忆与执行功能筛查量表(MES)、数字符号转换测验(DSST)、数字广度测试(DST)、词语流畅性试验(VFT)。MES 总分(MES-T)包含记忆因子分(MES-M)和执行因子分(MES-E)。DST 包括顺序(FDST)和倒序(BDST)。应用 FBA 技术获得脑白质结构指标, 包括纤维密度(FD)、纤维束横截面积(FC)及纤维密度和横截面积(FDC), 在校正年龄、性别的基础上对 3 组脑白质结构指标进行方差分析。在 FBA 指标有显著差异的区域里提取感兴趣纤维束(ROI)的平均纤维指标, 比较组间差异并分析脑白质结构变化特性与神经心理学测试评分(CDT、MES-T、DSST)之间的相关性。

结果 神经心理学测试中, AD-LGS 组在 CDT、

MES-E、DSST 得分较 AD-nLGS 组低(均 $P < 0.05$)。FBA 结果显示, 调整年龄和性别, 三组间在胼胝体部(CC)、胼胝体膝部(GCC)、胼胝体压部(SCC)、大钳、小钳、左右额枕下束(IFO)、左右钩状束(UF)、左右前扣带束、左右下纵束(ILF)的 FC、FD、FDC 均有显著性差异。此外, 在左右上纵束(SLF)、左右皮质脊髓束(CST)、右后扣带束的 FC 和 FDC 也有显著性差异。事后检验分析显示, 与 AD-nLGS 组相比, AD-LGS 组在 SCC、左右 IFO、左右 ILF、左右钩状束、左右丘脑前部辐射(ATR)、右 CST、左右前扣带束、左右后扣带束、大钳、左右 SLF 的 FDC 明显降低。控制年龄、性别、教育年限后做相关性分析, 结果显示 AD 患者左右 UF、左 SLF 的 FDC 值与 CDT 得分呈正相关; SCC、左右前扣带束、大钳、左右 ILF 的 FDC 值与 MES-E 得分呈正相关。

结论 AD 患者握力减小与广泛性的脑白质结构完整性损害相关。与执行功能相关的特异性脑白质纤维束纤维密度和横截面积的变化在 AD 患者握力减少中起着重要介导作用。

轻度认知障碍患者决策能力的结果表征学习模型

张莽^{1,2} 张莹^{1,2,3} 谢雨涵^{1,2} 郑焱楠^{1,2} 马昕^{1,2} 张星宇^{1,2} 王露蕊^{1,2,3} 李汇子^{1,2} 于欣^{1,2} 王华丽^{1,2}

1. 北京大学第六医院

2. 痴呆诊治转化医学研究北京市重点实验室

3. 首都医科大学附属北京安定医院

目的 轻度认知障碍(mild cognitive impairment, MCI)患者的决策能力尚未得到充分探讨。本研究旨在利用结果表征学习(outcome-representation learning, ORL)模型检验 MCI 患者的决策能力。

方法 本研究招募了 52 名 MCI 患者和 49 名健康对照者。所有受试者均完成两次爱荷华博弈任务(Iowa gambling task, IGT), 旨在测量其在模糊情境下的决策能力。使用 IGT 的 ORL 模型分析了包括奖赏学习率、惩罚学习率、遗忘速率、对高获胜牌组的偏好以及牌组的切换倾向等五个参数, 以探究 MCI 患者决策能力及其随时间的变化。

结果 与健康对照相比, MCI 患者在决策反馈损失结果中对任务产生的学习较少, 而在获胜结果中对任务产生的学习与健康对照相当。此外, 与健康对照相比, MCI 患者在 IGT 中的遗忘倾向表现出更少的变化, 表明 MCI 患者对所做选择的记忆消退并未改善。与之对应, 健康对照在第二次完成 IGT 时表现出对所做选择记忆消退减弱的倾向。尽管与健康对照相比, MCI 患者仍同样偏爱高获胜牌组, 但 MCI 患者在第二次完成 IGT 时对高获胜牌组的偏好相较于第一次完成时有所减弱。

结论 本研究结果表明, 轻度认知障碍患者在复杂情境下很难从失败的决策反馈中产生学习。该研究为轻度认知障碍提供了一种潜在的新型计算神经认知标志物。

Help-seeking Behaviors and Its Related Factors Among Elderly with Mental Disorders in Tianjin Community, China: A Cross-sectional Study

Xiaofei Hou Linru Yin Guoli Yan Minghui Li Huifang
Yin Guangming Xu*
Tianjin Anding Hospital

Objective The prevalence of mental disorders in elder adults has increased in China, but the help-seeking rates are still low. This study was aimed to (1) investigate the help-seeking rates of medical and non-medical resources among Chinese elderly people with mental disorders and (2) explore the factors related to help-seeking behavior

Methods Data were from the Tianjin Mental Health Survey (TJMHS), which included 11,748 adult community residents in the Chinese municipality of Tianjin. Of these, 616 individuals aged 60 years old had ≥ 1 axis-I diagnosis according to the Diagnostic and Statistical manual-fourth edition (DSM-IV) and were interviewed by psychiatrists using a Help-Seeking Questionnaire with 23 potential sources

Results In the current survey, 14.8% elderly individuals with any lifetime mental disorder have sought help from any potential sources, with 5.2% seeking help in mental healthcare settings, 5.5% only in other healthcare settings, and 4.1% only in non-healthcare sources. Among help-seekers, the first help was mostly sought in Medical institutions 63.7%. Individuals with female gender, aged 60 to 79, not having health insurance, with two or more mental disorders with schizophrenia and without organic mental disorders were more likely to seek help.

Conclusion Only a small percentage of elderly patients with mental disorders seek help in the Tianjin region. Mental health help-seeking behaviors in elderly were related demographic and clinical features.

关键词: help-seeking, mental disorders, elderly, non-healthcare sources, health care settings

阿尔茨海默病性痴呆幻觉妄想症状在杏仁核、海马亚区的改变

魏红辉¹ 岳玲²

1.浙江省立同德医院(浙江省精神卫生中心)
2.上海市精神卫生中心

目的 探讨阿尔茨海默病痴呆患者幻觉妄想症状杏仁核和海马亚区的影像学变化。

方法 研究对象

所有病例组被试来自 2020 年 1 月至 2023 年 10 月上海市精神卫生中心老年精神科门诊就诊及住院的 AD 患者,将伴有精神病性症状的定义为研究组,将不伴有精神病性症状的定义为对照组,根据自愿原则入组,本研究通过上海市精神卫生中心伦理委员会审批,批件号为 2021-24。

研究评估工具

1.简明精神状态量表(MMSE):该量表由 Folstein 等人于 1975 年编制,是标准化智力状态检查工具之一,它包括时间定向、地点定向、即刻记忆、注意力及计算力、延迟记忆、命名、语言能力、视空间能力等方面,其作为认知功能的评估,最高分为 30 分,得分越低,痴呆越严重。

2.神经精神量表(NPI):该量表用于评估 AD 患

者的精神行为症状,包括妄想、幻觉、激越、抑郁、焦虑、情感高涨、情感淡漠、脱抑制、易激惹、运动行为异常、睡眠、食欲 12 个方面,患者评估分值最高 144 分,护理者苦恼评分值最高 60 分,得分越高,精神行为症状越重,对照料者造成的苦恼程度越重。

MRI 成像采集与处理

所有受试者在 3.0TMRI 扫描仪 (Siemens MAGNETOM VERIO 3.0T, 德国)上进行扫描。

影像分析:使用 Freesurfer7.0 进行皮层重建与分割, Freesurfer 使用先前定义的体内(基于图像的)和体外海马(基于解剖的)图谱来确定亚结构。使用 Freesurfer7.0 进行皮层重建与分割,分出 21 个海马亚区和 9 个杏仁核亚区。

统计分析

1.运用 SPSS24.0 统计软件对所获数据进行统计分析, P 值 ≤ 0.05 被认为差异具有统计意义 2.幻觉妄想组和无幻觉妄想组一般资料采用 t 检验或卡方检验进行比较 3.幻觉妄想组和无幻觉妄想组杏仁核及海马亚结构的组间差异,服从正态分布,采用 t 检验 4.NPI 幻觉得分和经 t 检验有差异的亚区体积进行相关分析 5.以 NPI 量表幻觉得分为因变量,以年龄、性别、文化程度、MMSE 量表分、TIV 以及经 t 检验有差异的亚区为自变量,进行多元线性回归分析。

结果 与非幻觉组比较,幻觉组杏仁核的中央核、内侧核、皮质核体积均增大,差异有统计学意义。与非幻觉组比较,幻觉组海马 CA1 头体积升高,差异有统计学意义。NPI 幻觉评分与杏仁核的内侧核、皮质核和海马 CA1 头体积呈正相关。妄想组和无妄想组杏仁核、海马亚区体积差异均无统计学意义。

结论 伴有幻觉症状的 AD 患者海马 CA1 头,杏仁核中央核、内侧核和皮质核体积增大。

The Protective Effect of Mangiferin on Formaldehyde-Induced HT22 Cell Damage and Cognitive Impairment

Fan Chen^{1,2}, Zhenhe Zhou¹, Xiaping He³

1. Mental Health Center Affiliated to Jiangnan University
2. Wuxi Medical College of Jiangnan University
3. Dali University School of Basic Medical Sciences

Formaldehyde (FA) has been found to induce major Alzheimer's disease (AD)-like features including cognitive impairment, $A\beta$ deposition, and Tau hyperphosphorylation, suggesting that it may play a significant role in the initiation and progression of AD. Therefore, elucidating the mechanism underlying FA-induced neurotoxicity is crucial for exploring more comprehensive approaches to delay or prevent the development of AD. Mangiferin (MGF) is a natural C-glucosyl-xanthone with promising neuroprotective effects, and is considered to have potential in the treatment of AD. The present study was designed to characterize the effects and mechanisms by which MGF protects against FA-induced neurotoxicity. The results in murine hippocampal cells (HT22) revealed that co-treatment with MGF significantly decreased FA-induced cytotoxicity and inhibited Tau hyperphosphorylation in a dose-dependent manner. It was further found that these protective effects were achieved by attenuating FA-induced endoplasmic reticulum stress (ERS), as indicated by the inhibition of the ERS markers, GRP78 and CHOP, and downstream Tau-associated kinases (GSK-3 β and CaMKII) expression. In addition, MGF markedly inhibited FA-induced oxidative damage, including Ca^{2+} overload, ROS generation, and mitochondrial dysfunction, all of which are associated with ERS. Further studies showed that the intragastric administration of 40 mg/kg/day MGF for 6 weeks significantly improved spatial learning ability and long-term memory in C57/BL6 mice with FA-induced cognitive impairment by reducing Tau hyperphosphorylation and the expression of GRP78, GSK-3 β , and CaMKII in the brains. Taken together, these findings provide the first evidence that MGF exerts a significant neuroprotective effect against FA-induced damage and ameliorates mice cognitive impairment, the possible underlying mechanisms of which are expected to provide a novel basis for the treatment of AD and diseases caused by FA pollution.

500nm Blue-green Light Therapy for Cognitive Function in Alzheimer's Continuum and Factors Affecting Efficacy

ziqu Wang*

Chengdu Fourth People's Hospital

Background Light therapy has emerged as an effective method for Alzheimer's disease (AD). However, the efficacy on cognitive function in Alzheimer's continuum and factors affecting efficacy have not been established. The study aimed to evaluate the efficacy of 500 nm blue-green light therapy on cognitive function for Alzheimer's continuum, and the main factors affecting light therapy efficacy were analyzed

Methods Forty-two participants were enrolled in this studies, including 13 healthy control [HC, equal to 0 standard deviation, (SD)], 9 subtle cognitive impairment (SCI, ≥ 0.5 SD), 8 early mild cognitive impairment (eMCI, ≥ 1.0 SD), 6 late MCI (lMCI, ≥ 1.5 SD), 6 dementia of AD (dAD, ≥ 2.0 SD). All the participants treated with 500 nm blue-green light for 50 minutes with 4 weeks in the morning. A reduction of 4 or more points in the Alzheimer's Disease Assessment Scale-cognitive subscale (ADAS-cog) scores was considered valid for cognitive improvement

Results The total efficacy after light therapy was 16.7%. The efficacy in HC, SCI, eMCI, lMCI and dAD after light therapy were 15.4%, 11.1%, 12.5%, 16.7% and 33.3%, respectively. Light therapy efficacy was not significantly correlated with the participant's sex, age, diagnostic type, education, apolipoprotein E epsilon 4, the Mini-mental State Examination scores; the Montreal Cognitive Assessment-Basic scores, Hamilton Anxiety Scale scores, Hamilton Depression Scale scores, or the Pittsburgh Sleep Quotient Index. In multivariate analysis, the ADAS-cog scores before light therapy (OR

1.279, 95% CI 1.021~1.602, $p = 0.033$) was an independent predictor, while the Everyday Cognition (ECog) scores and the Mild Behavioral Impairment Checklist (MBI-C) scores before light therapy didn't influence the efficacy

Conclusion Four weeks of 500 nm blue-green light therapy had different efficacy on cognitive function for Alzheimer's continuum. Baseline cognitive status may influence light therapy efficacy.

关键词: Light therapy, subjective cognitive decline, mild cognitive impairment, Alzheimer's disease, efficacy

主观认知下降干预措施研究进展的系统评价和荟萃分析

章文宣¹ 于恩彦²

1.浙江中医药大学

2.中国科学院大学附属肿瘤医院(浙江省肿瘤医院)

目的 探讨药理学及非药理学干预在改善主观认知下降(SCD)老年人认知功能方面的有效性。

方法 检索PubMed、Cochrane Library、Embase和中国知网数据库,纳入药理学和非药理学干预对SCD认知功能影响的随机对照研究,由2位研究人员筛选文献、提取数据、质量评价,主要结局为整体认知功能,次要结局为记忆力、注意力和执行功能,使用RevMan 5.3软件进行数据分析。

结果 共纳入文献28篇,包括2201名受试者。结果显示,在药理学干预中,亚精胺对改善记忆力有效(SMD=0.88, 95% CI 0.10~1.66)。在非药理学干预中,针刺疗法能显著改善整体认知功能(SMD=1.09, 95% CI 0.62~1.56, $P < 0.01$),体育运动(SMD=0.22, 95% CI 0.03~0.40, $P = 0.02$)和认知干预(SMD=0.36, 95% CI 0.09~0.62, $P = 0.008$)能显著改善记忆力,体育运动(SMD=0.16, 95% CI 0.01~0.30, $P = 0.04$)和多域干预(SMD=0.30, 95% CI 0.04~0.57, $P = 0.02$)能显著改善执行功能。本研究未发现对改善注意力有效的干预措施[体育运动(SMD=0.13, 95% CI -0.10~0.35, $P = 0.27$)、认知干预(SMD=0.04, 95% CI -0.34~0.41, $P = 0.85$)、正念冥想(SMD=0.06, 95% CI -0.19~0.32, $P = 0.62$)]。

此外,与对照组相比,正念冥想对认知功能没有显著影响[注意力(SMD=0.06, 95% CI -0.19~0.32, P=0.62)、执行功能(SMD=0.19, 95% CI -0.34~0.72, P=0.49)]。

结论 亚精胺可能对认知功能有益,但其疗效和安全性仍需更多研究来验证。针刺疗法、体育运动、认知干预和多域干预可有效改善认知功能,使用正念冥想改善认知功能的证据相对不足。

关键词: 荟萃分析、药物干预、非药物干预、主观认知下降

Effects of Antidepressants on Cognition in Older Adults with Subclinical Depressive Symptoms

Yan Li¹, Wenying Liu², Xuechu Wang¹, Kai Dong¹, Yintai Fan¹, Fengjuan Li¹, Chang Zhou¹, Yue Wang¹, Qing Zhang¹

1.Beijing Anding Hospital, Capital Medical University

2.Xuanwu Hospital, Capital Medical University

Objective Late-life depression has been identified as a modifiable risk factor of dementia, with subclinical depressive symptoms (SDS) being more common in older adults than clinical depression. However, evidence on the cognitive effects of antidepressants in this population is limited. This study aims to investigate the impact of antidepressants on cognition and the risk of dementia in non-demented participants with SDS

Methods A total of 480 non-dementia older adults were recruited from the Alzheimer's Disease Neuroimaging Initiative database and divided into antidepressant users group and non-users group to detect the effects of antidepressants on the risk of dementia. Over follow-up, participants underwent neuropsychiatric assessment, cerebrospinal fluid detection, positron emission tomography imaging, and blood-based microarray profiling. Kaplan-Meier analysis assessed conversion from non-dementia to dementia. The linear mixed-effects model investigated the longitudinal changes in cognition. Gene Set Enrichment Analysis (GSEA) was utilized to investigate the biological pathways related to

cognitive progression in the antidepressant users group

Results The results indicated that antidepressant treatment in dementia-free participants with SDS was linked to a 1.87-fold risk of developing dementia. No significant differences were observed among SSRIs (Selective Serotonin Reuptake Inhibitors), SSRIs combination, and other antidepressant treatment regarding the risk of dementia. Similarly, no differences were associated with the duration of treatment, whether short-term (≤ 3 years) or long-term (> 3 years). Further investigations did not observe a notable impact of antidepressant use on CSF biomarkers, including levels of A β 42, t-tau, and p-tau. Similarly, no differences were observed in AV45, AV1451, and FDG PET imaging markers between the groups. GSEA suggested that antidepressants might affect neurotransmitter transport and calcium homeostasis in users

Conclusion Antidepressant treatment may contribute to the progression to dementia and increase the risk of cognitive decline in elderly with SDS. Given these potential risks, it is crucial to exercise greater caution when managing depressive symptoms with antidepressant in this population.

微阵列分析阿尔茨海默病和轻度认知障碍的差异基因表达识别具有诊断价值的生物标志物

陈学梅 赵雯婧* 杨扬 简薇 柘菁仪
成都市第四人民医院

目的 阿尔茨海默病(AD)是一种常见且致命的痴呆症亚型,诊断和治疗仍然是一个挑战。本研究旨在通过识别 AD 和轻度认知障碍(MCI)的共同风险基因,发现影响 AD 预后的潜在生物标志物,探索 AD 早期诊断的可能性。

方法 基因表达综合数据库(gene expression Omnibus, GEO)中的一个基因表达谱被评估为 AD 和 MCI 共同生物标志物的潜力。我们使用微阵列(PAM)算法的预测分析来鉴定差异表达基因(DEGs)。然后

进行功能富集和蛋白-蛋白相互作用(PPI)网络分析, 鉴定与阿尔茨海默病相关的关键模块和关键基因。

结果 我们总共筛选了 160 个 AD 和 MCI 中共同显著差异基因, 其中 71 个上调基因, 89 个下调基因。功能富集分析显示, 这些共同的差异基因在突触膜结构中显著富集, 参与突触组装、膜电位调节、细胞连接组装等生物过程。其功能主要涉及钠离子跨膜转运蛋白活性和支架蛋白结合活性。以及与神经活动、配体-受体相互作用和干细胞多能性调控信号相关的通路。通过 PPI 网络分析、关键模块构建和关键基因构建, 鉴定出 ESR1、ASCL1、NFIB、AXIN2、GABRB3、GRIK2、GABRA2、WNT5A 8 个关键基因。他们可能是我们所寻找的参与 MCI 进展为 AD 的关键基因。

结论 这些发现揭示了新的具有预后和治疗价值的潜在 AD 生物标志物。然而, 未来还需要更多的实验来进一步探索这些基因与 AD 进展之间的关系。

Plasma Macrophage Migration Inhibitory Factor and Matrix Metalloproteinase-9 Levels, and Their Related Factors in Alzheimer's Disease: A Cross-sectional Study

Yali Zheng*

Affiliated Xiaoshan Hospital, Hangzhou Normal University

Objective Previous studies have shown that the levels of macrophage migration inhibitory factor (MIF) and matrix metalloproteinase-9 (MMP-9) in its downstream signaling pathway are related to the occurrence and development of Alzheimer's disease (AD); some studies have suggested that plasma levels of MIF and MMP-9 could be used as potential biomarkers for AD. This study aimed to explore the changes in MIF and MMP-9 levels in the plasma of patients with AD and whether they were correlated with other clinical indicators and cognitive function

Methods 43 patients with AD and 40 healthy

controls (HC) were enrolled in this study. Socio-demographic information of the subjects was collected, and their cognitive function was assessed using Mini-Mental State Examination (MMSE) and Montreal Cognitive Assessment (MoCA). Further, the biochemical indicators and plasma MIF and MMP-9 levels were detected

Results Our study found that plasma MIF levels were not significantly altered in patients with AD compared to HC, while MMP-9 levels were significantly increased, and prolactin levels had significant effects on MMP-9 levels. In addition, plasma levels of MIF and MMP-9 in patients with AD had no significant correlation with cognitive function

Conclusion we believe that plasma levels of MIF and MMP-9 are affected by a variety of factors, and it is not appropriate to use them as biomarkers of AD. Their levels in cerebrospinal fluid may be more representative, although, this needs to be verified by future studies.

运动与睡眠对老年人认知功能及相关血液生物标志物的影响

杨晶 安翠霞*

河北医科大学第一医院

目的 探究运动与睡眠对老年人认知功能和痴呆相关血液生物标志物的影响, 并分析睡眠与运动之间有无交互作用。

方法 本研究纳入了 2021 年 4 月-2022 年 2 月河北省石家庄市裕华区及河北省邢台市 60 岁以上的社区老年人 506 例。所有受试者由河北医科大学第一医院精神科医师进行临床资料采集, 包括一般资料, 简易智能状态量表 (MMSE)、蒙特利尔认知评估量表 (MoCA)、波士顿命名测试 (BNT)、数字广度测试 (DST) 等评估认知功能, 并采血检测血液生物标志物 β 淀粉样蛋白 40 ($A\beta_{40}$)、 $A\beta_{42}$ 、磷酸化 tau 蛋白 217 (p-tau217)、髓系细胞触发受体 2 (TREM2)、sTREM2。根据是否参加太极拳运动将参与者分为运动组与非运动组, 根据匹兹堡睡眠质

量指数 (PSQI) 得分对睡眠状态进行分组。采用秩和检验比较不同运动和睡眠分组的认知功能及血液生物标志物水平的差异性, 并通过一般线性分析探究睡眠和运动对认知及血液标志物的影响有无交互作用。

结果 相对于非运动组相比, 运动组的认知水平较高 (MMSE, $z=-2.596, P<0.05$; DST, $z=-3.876, P<0.05$; BNT, $z=-1.257, P=0.105$), 且两组部分血液生物标志物的差异存在统计学意义 ($A\beta_{40}$, $z=-10.615, P<0.05$; $A\beta_{42}$, $z=-8.531, P<0.05$; p-tau217, $z=-3.217, P<0.05$; sTREM2, $z=-1.825, P<0.05$); 不同睡眠分组的部分认知量表及血液标志物的差异存在统计学意义, 但主要在五六十岁的人群 (MoCA, $z=-1.301, P=0.09$; DST, $z=-1.737, P<0.05$; $A\beta_{40}$, $z=-1.567, P=0.05$; p-tau217, $z=-2.474, P<0.05$; TREM2, $z=-1.964, P<0.05$), 对于年龄较大的参与者 (70 岁及以上), 组间差异无统计学意义。运动与睡眠对认知和血液标志物的影响存在交互作用 (DST, $F=6.213, P<0.05$; $A\beta_{40}$, $F=72.285, P<0.05$; $A\beta_{42}$, $F=8.429, P<0.05$; p-tau217, $F=3.983, P<0.05$; TREM2, $F=2.028, P=0.05$)。

结论 运动和睡眠问题都会影响老年人的认知功能, 且二者之间存在相互作用, 是痴呆发生发展的重要影响因素, 我们应该结合多个因素的共同作用来综合制定相应的干预方案, 减缓老年人的认知下降或者延缓痴呆的发病时间。

Clinical Efficacy of The Combined Treatment of Acupuncture and Antidepressants for Late-life Depression

Haining Song Lingnan Gao Zhonggang Wang*
Shandong Daizhuang Hospital

Objective To investigate the clinical effect of acupuncture combined with antidepressants in treating late-life depression.

Methods Enrolled elderly patients who meet the diagnosis of late-life depression in our hospital. The pa-

tients were divided into the acupuncture group (antidepressants combined with electroacupuncture therapy) and the control group (mainly antidepressants alone). Two groups were treated simultaneously for 4 weeks. Regular assessments were conducted on both groups using the Hamilton Anxiety Scale (HAMA), Hamilton Depression Scale (HAMD), Common Sense Test, Pittsburgh Sleep Quality Index (PSQI), and in cases of positive symptoms, the Brief Psychiatric Rating Scale (BPRS) was used. Comparative observations were made to determine whether the combined acupuncture and antidepressant treatment is more effective in treating late-life depression than treatment with antidepressants alone.

Results 186 patients were recruited into the study (101 in the acupuncture group vs. 85 in the control group). There were no significant differences in age and gender between the two groups ($p>0.05$). The baseline scores of HAMA, HAMD, and Common Sense Test showed no significant differences between the two groups ($p>0.05$). The acupuncture group showed significantly higher reductions in HAMA scores compared to the control group after 1 and 2 weeks of treatment ($p<0.001$). However, after 3 and 4 weeks of treatment, there were no significant differences in the reduction of HAMA scores compared to baseline ($p>0.05$). The acupuncture group exhibited significantly higher reductions in HAMD scores compared to the control group after 1, 2, 3, and 4 weeks of treatment ($p<0.001$). The acupuncture group also showed a significant increase in Common Sense Test scores compared to the baseline after 1 and 2 weeks of treatment ($p<0.001$), with no significant difference after 3 weeks of treatment ($p>0.05$). Patients in the acupuncture group showed significantly higher reductions in PSQI scores compared to the control group after 4 weeks of treatment ($p<0.001$). There were no significant differences in the reduction of BPRS scores for patients with positive symptoms between baseline and post-treatment evaluations in both groups ($p>0.05$).

Conclusion Acupuncture combined with antidepressants for treating late-life depression can significantly reduce patients' depressive emotions, improve

sleep problems; quickly alleviate anxiety, promote cognitive function recovery in the short term, but the effectiveness is not long-lasting; no apparent improvement is observed for positive symptoms.

行为变异型额颞叶痴呆与中老年慢性精神分裂症在纹状体亚区结构与功能连接的比较研究

李汇子¹ 王华丽¹ 姚明洋² 潘国良³

1.北京大学第六医院

2.沈阳市精神卫生中心

3.沈阳市安宁医院

目的 行为变异型额颞叶痴呆(bvFTD)是早发痴呆的主要类型之一。其早期症状与慢性精神分裂症(Scz)存在误诊或漏诊。越来越多的研究报道bvFTD的纹状体的形态学可能具有诊断特异性。纹状体是由多个不同功能的亚区构成。然而,bvFTD纹状体亚区的结构和功能作用不清晰,因此本研究主要是探索bvFTD的纹状体亚区神经影像特征及与认知、精神行为症状的相关性。

方法 采用病例对照研究设计。纳入北京大学精神卫生研究所记忆障碍诊疗与研究团队自2007年6月至2023年10月符合入组的34例bvFTD患者和57例正常对照;另外纳入沈阳市精神卫生中心自2023年1月至2023年10月符合入组标准的21例中老年慢性精神分裂症患者和24例正常对照。所有被试均完成多维度认知评估和磁共振成像扫描(MRI),采用人类脑网络组图谱(HBA)对纹状体分区。不同中心影像数据采用ComBat校正。分析指标包括:(1)不同维度认知和行为评估得分;(2)纹状体亚区灰质体积变化;(3)纹状体亚区体积与认知、精神行为评分的相关性;(4)纹状体亚区与全脑基于体素的静息态功能连接(RSFC)(外部功能连接)变化;(5)纹状体亚区之间RSFC(内部功能连接)变化;(6)功能连接值与认知、精神行为评分的相关性。计算一般资料及认知、精神行为评估得分,三组间比较采用单因素方差分析及Bonferroni事后检验;分类变量采用卡方检验。纹状体亚区体积三

组间比较采用单因素方差分析及Bonferroni事后检验;外部功能连接比较采用双样本t检验;内部功能连接采用基于网络的统计(NBS)分析。MRI数据与认知、精神行为评分的相关性采用偏相关分析。

结果 bvFTD组与中老年慢性Scz组MMSE评分无显著差异,bvFTD组的MoCA评分更低;与Scz组相比,bvFTD组所有纹状体亚区灰质体积降低,bvFTD组右侧腹侧尾状核、苍白球、伏隔核、背外侧壳核及双侧背侧尾状核的外部RSFC降低,不同亚区RSFC模式不同,bvFTD纹状体内部RSFC降低,主要节点是双侧背侧尾状核与伏隔核;与NC组相比,Scz组右侧背侧尾状核与顶叶、扣带回的RSFC升高,Scz纹状体内部RSFC升高,表现为右侧背侧尾状核与右侧伏隔核的RSFC。

结论 行为变异型额颞叶痴呆患者纹状体亚区灰质体积萎缩和功能连接降低,为bvFTD与中老年慢性Scz疾病鉴别提供影像依据,为探索bvFTD的神经精神症状提供新的靶点。

Hypothetical Interventions on Cardiovascular Health Metrics for Abnormal Cognitive Aging: An Application of The Parametric G-formula in The CLHLS Cohort Study with 12 Years Follow-up

Sicheng Huang¹, Xiaozhen Lv¹, Ziru Zhao¹, Shengfeng Wang², Yang Xu³, Zhijiang Wang¹, Jing Wang¹, Huali Wang¹, Xin Yu¹

1.Peking University Sixth Hospital

2.Department of Epidemiology and Biostatistics, School of Public Health, Peking University

3.Department of Pharmacy Administration and Clinical Pharmacy, School of Pharmaceutical Sciences, Peking University Health Science Center

Objective Abnormal cognitive aging is closely related to dementia. Previous studies have shown that cardiovascular health (CVH) was associated with cognitive function. However, research on the association between CVH metrics and abnormal cognitive aging is

limited. This study aimed to estimate the effect of CVH metrics on abnormal cognitive aging

Methods A total of 3298 participants aged ≥ 65 years with normal cognitive performance at baseline were derived from Chinese Longitudinal Healthy Longevity Survey. Cognitive performance was measured by the Chinese version of the Mini-Mental State Examination (MMSE). CVH was assessed with six metrics, including hypertension, diabetes, exercise, body mass index (BMI), diet, and smoke. Group-based trajectory model was used to identify the trajectory groups of cognitive aging over 12 years (2002-2014 and 2005-2018). Logistic regression model was used to investigate the association between CVH metrics at baseline and abnormal cognitive aging. The parametric g-formula was subsequently applied to estimate the effect of each of six CVH metrics and their combinations on the 12-year cognitive aging trajectory

Results The mean age was 73.9 (8.0) years. Four trajectory groups of cognitive aging were identified, with Fluctuation (4.9%), Slow (11.1%), and Rapid (6.6%) trajectory groups considered as abnormal cognitive aging (22.6%), while Stable (77.4%) trajectory group as normal cognitive aging. The single interventions on hypertension, exercise, BMI, and diet could reduce the risk of abnormal cognitive aging. Moreover, the risk ratio of joint intervention on exercise, BMI, and diet for Fluctuation, Slow, and Rapid trajectory groups were 0.38 (95% CI: 0.30-0.48), 0.45 (95% CI: 0.37-0.54), and 0.3 (95% CI: 0.23-0.41), respectively

Conclusion A considerable proportion of the participants experienced abnormal cognitive aging during their aging process. Interventions on these CVH metrics (i.e., exercise, BMI, and diet), which are fairly practical and feasible for the older adults, may be effective strategies for preventing abnormal cognitive aging.

Chemosensory Anhedonia Facilitates Depressive Symptoms and Cognitive Impairment in Late-life Depression

Jiafu Li Yuping Ning*

The Affiliated Brain Hospital of Guangzhou Medical University

Objective Chemosensory anhedonia refers to the lack of hedonic ability to experience pleasure through the senses of smell and taste, which reduces the pleasure and comfort of food and increases the risk of nutritional and immune deficiencies. However, there is no direct scientific evidence regarding chemosensory anhedonia in patients with late-life depression (LLD). The aim of this study was to investigate the chemosensory anhedonia in patients with LLD and its potential association with depressive symptoms and cognitive function

Methods One hundred and fourteen patients with LLD and 92 normal controls (NCs) were included in this study. They experienced clinical assessment, Chemosensory Pleasure Scale (CPS) assessment, 17-item Hamilton Depression Rating Scale (HAMD-17) assessment and cognitive assessments which contains the Verbal Fluency Test (VFT). The associations between chemosensory pleasure and depressive symptoms or cognitive function in patients with LLD were explored using partial correlation analysis and mediation analysis

Results The CPS scores were lower in the LLD group than in the NC group and were negatively correlated with the total scores and factors' scores (Retardation, Cognitive bias and Anxiety/Somatisation) of HAMD-17 and positively correlated with the VFT scores. The scores for the Food and Imagination dimensions of CPS exhibited partial mediating effects on the differences in Cognitive bias (a factor of HAMD-17) between patients with LLD and NCs

Conclusion Patients with LLD exhibited significant chemosensory anhedonia, and both depressive symptoms and cognitive impairment were associated with the severity of chemosensory anhedonia. Enhancing chemosensory pleasure in patients with LLD may potentially ameliorate their depressive symptoms.

Vortioxetine for Depression in Adults: A Systematic Review and Dose-response Meta-analysis of Randomized Controlled Trials

Xin Yang Weihong Kuang*

Mental Health Center, West China Hospital, Sichuan University, Chengdu, Sichuan Province, China

Background Major depressive disorder (MDD) is a prevalent psychiatric condition characterized by persistent feelings of sadness, or loss of pleasure in daily activities accompanied by other cognitive, behavioral, or neurovegetative symptoms, affecting approximately 340 million people worldwide. Vortioxetine is a novel multimodal antidepressant that has emerged as a promising option for the management of MDD. However, the dose-response relationships of vortioxetine for MDD is not well established. We aimed to conduct dose-response meta-analyses to fill this gap and provide information and guidance for clinical practice

Methods We systematically searched multiple electronic databases for randomized controlled trials of vortioxetine for MDD, without language and publication year restrictions, and the last search was on February 8, 2024. The dose-response relationship was evaluated using a one-stage random-effects dose-response meta-analysis with restricted cubic spline model. The primary outcome was efficacy (mean change in depression scale score), with secondary outcomes including response, dropout for any reasons (acceptability), dropout for adverse events (tolerability), and any adverse events (safety). Subgroup analysis based on dosage were performed to preliminarily investigate the dose response relationships of vortioxetine. Sensitivity analyses were conducted to assess the robustness of the findings

Results The dose-response meta-analysis comprised 16 studies, with 4294 participants allocated to the vortioxetine group and 2299 participants allocated to the placebo group. The estimated 50% effective dose was 4.37 mg/d, and the near-maximal effective dose (95%

effective dose) was 17.93 mg/d. Visual inspection of the dose-response curve showed that efficacy increased linearly as the dose escalated from 0-5 mg/d, slowed between 5 mg/d to 10 mg/d, and then continued to rise linearly from 10 mg/d to 20 mg/d, without reaching a plateau at 20 mg/d. The relative risk (RR) for dropout due to any reasons, dropout due to adverse events, and adverse events all exhibited an upward trend with increasing doses. Specifically, the RR for dropout due to any reasons gradually escalated from 1 at placebo (0 mg/d) to 1.22 (95%CI: 1.01~1.48) at 20mg/d. Similarly, the RR for dropout due to adverse events rose from 1 at placebo to 1.98 (95%CI: 1.36~2.87) at 20mg/d. Additionally, the RR for adverse events reaches its peak at 1.18 (95%CI: 1.12~1.25) at 20mg/d. Subgroup analysis indicated that no significant differences were observed in acceptability, tolerability and safety among the dosage groups. The results of the dose-response meta-analysis were robust to several sensitivity analyses

Conclusion Vortioxetine may potentially provide additional therapeutic benefits when exceeding the current licensed dosage without significantly impacting safety. Conducting clinical trials exceeding the current approved dosage appears necessary to fully comprehend its efficacy and risk.

The Relationship between Cognitive and Global Function in Patients with Schizophrenia and Mood Disorders: A Transdiagnostic Network Analysis

Yuanyuan Zhu Rongrong Zhang Longyan Ni Xiangrong Zhang*

The Affiliated Brain Hospital of Nanjing Medical University

Objective Quite a number of patients with mental disorders can not achieve complete recovery of symptoms and functions after treatment, which is re-

lated to the impaired cognitive function. Cognitive deficits presents transdiagnostic characteristics in mental disorder groups. However, studies examining the interrelationship between neurocognition, social cognition and global function in a transdiagnostic sample are lacking. The purpose of this study is to investigating how global function and cognitive function are interrelated in a transdiagnostic sample and finding the important cognitive subdomains to global function by network analysis

Methods This transdiagnostic sample consists of 281 first-episode schizophrenia, 128 bipolar disorder, 73 depressive disorder patients and 196 healthy controls. We evaluated cognitive and global function in all subjects ($n=678$) using The Wechsler Adult Intelligence Scale (WAIS), The MATRICS Consensus Cognitive Battery (MCCB) and the Global Assessment of Functioning (GAF). Then the interaction and centrality indexes of cognitive function and global function were studied by network analysis

Results Information processing speed showed the highest strength and expected influence, while social cognition showed the lowest. The cognitive nodes that are closely related to global function are information processing speed, sustained attention and IQ. Subjects of different genders were modeled separately and the differences between the two networks were compared. It was found that the strength and expected influence of reasoning and problem solving in males were greater than that in females and the weight of social cognition and verbal memory was greater than that in females

Conclusion Information processing speed and verbal memory have a high centrality in the network of cognition and global function of patients with mental disorders. Meanwhile, information processing speed, sustained attention and working memory are directly related to the global function of patients. The research supports that intervention on these specific neurocognitive targets may have a certain positive impact on the overall network, which is conducive to the recovery of the global function of patients.

关键词: neurocognition, social cognition, global function, mental disorders, transdiagnostic, network analysis

Brain Network Mechanism of Different Subtypes of Cognitive Impairment in First-episode Drug-naive Major Depressive Disorder

Wenqi Lyu Yongbo Hu Jin Li Xin Yang Weihong Kuang*

West China Hospital, Sichuan University

Objective Major depressive disorder (MDD) is highly heterogeneous in symptoms, and the mechanism of cognitive impairment in MDD is unknown. This study aims to integrate data-driven and machine-learning approaches to define the biological subtypes of cognitive impairment in MDD by incorporating individualized functional connectivity (FC), cognitive dimensions, and clinical symptomatology

Methods A total of 80 patients aged 18-65 who had been diagnosed with MDD and 40 health controls (HC) matched by demographic data were recruited. The rs-fMRI data of all subjects were collected, pre-processed, and individually segmented, and the FC within and between the individual resting state networks were calculated. The verbal memory and visual memory were evaluated by the subitems Logic memory I/II (LM_I/II) and Visual reproduction I/II (VR_I/II) of the Wechsler memory scale. Digit symbol substitution test (DSST) and Trail making test A/B (TMT_A/B) were used to evaluate the processing speed of the subjects. Verbal fluency test (VFT), Stroop color and word test (Stroop color and word test, Stroop C/CW), and the Wisconsin card sorting test (WCST) to assess executive function. Hamilton Anxiety Scale and Hamilton Depression Scale were used to evaluate the clinical symptoms of MDD patients. Subsequently, sparse multivariate canonical correlation analysis was used to search for covariant features of FC, cognition, and symptoms, and K-means clustering was used to identify potential biological subtypes of MDD

Results Compared to HC, patients with MDD exhibited significant impairments in verbal memory

(LM_I, $t=4.75$, $P<0.01$; LM_II, $t=5.78$, $P<0.01$) and visual memory (VR_I, $t=3.48$, $P<0.01$; VR_II, $t=3.37$, $P<0.01$); in terms of brain network characterization, MDD has significantly enhanced FC in several networks compared with HC. It includes SMN and DAN ($P<0.001$), SMN and VAN ($P<0.001$), DAN and DMN ($P=0.027$), VAN and LN ($P<0.001$), VAN and FN ($P=0.008$), LN and FN ($P<0.001$), LN and DMN ($P<0.001$). Canonical correlation analysis demonstrated that FC within the Ventral Attention network (VAN), scores on the Hamilton Anxiety Rating Scale (HAM-A) item 5 (memory or concentration disturbance), and scores on the Symbol Digit Substitution Test contributed most significantly to the first set of canonical variables. Based on the canonical variables, K-means clustering categorized MDD into two subtypes: the significantly cognitively impaired subtype of MDD (ciMDD) and the relatively cognitively preserved subtype of MDD (cpMDD). Compared to HC, ciMDD exhibited widespread cognitive impairments in memory, processing speed, and executive function, whereas cpMDD primarily showed impairments in memory function. For the ciMDD, the FC between SMN and DAN ($F=7.09$, $P<0.001$), SMN and VAN ($F=6.34$, $P<0.001$), LN and FN ($F=9.26$, $P<0.001$), LN and DMN ($F=6.75$, $P<0.001$), DAN and FN ($F=4.04$, $P=0.005$), VAN and LN ($F=14.68$, $P<0.001$), and VAN and FN ($F=3.65$, $P=0.009$) was significantly increased. In the terms of cpMDD, the FC between SMN and DAN ($F=5.92$, $P<0.001$), LN and FN ($F=11.53$, $P<0.001$), SMN and VAN ($F=5.62$, $P<0.001$), VAN and LN ($F=11.31$, $P<0.001$), and LN and DMN ($F=8.21$, $P<0.001$) was significantly higher than HC

Conclusion MDD patients have memory-oriented cognitive impairment and some abnormal brain network features. Through typical correlation analysis of brain function, cognitive function and clinical symptoms and K-means clustering, we identified two subtypes of MDD. Among them, the MDD subtype with significant cognitive impairment had extensive cognitive impairment in memory, executive function and processing speed, while the MDD subtype with relative cognitive retention mainly had impairment in memory

function. There were differences in the functional connectivity patterns of resting brain networks among different subtypes of MDD with cognitive impairment, while MDD subtypes with significant cognitive impairment showed more extensive abnormal connectivity patterns among brain networks. The enhanced functional connectivity between DAN and FN and between VAN and FN may be a key pathway leading to cognitive impairment in MDD. These findings reveal the differences in cognitive impairment patterns and brain network mechanisms that lead to MDD subtypes with different levels of cognitive impairment, promote the understanding of the biological mechanism and cognitive heterogeneity of depression, and provide a theoretical basis for individualized treatment of MDD patients.

虚拟现实技术联合正念减压疗法对老年抑郁症患者的疗效研究

代佳利 孙大伟*
大庆市第三医院

目的 探讨后疫情背景下虚拟现实技术 (VR) 联合正念减压疗法对老年抑郁症患者疗效的影响。

方法 将 2023 年 1 月~2023 年 4 月于本院老年心理科治疗的 150 例老年抑郁症患者作为研究对象, 按随机数字表法分为三组, 对照 1 组采用常规药物治疗, 对照 2 组采用药物治疗联合正念减压疗法, 实验组在对照 1 组的基础上予以 VR 联合正念减压疗法, 各 50 例。三组均治疗 8 周, 比较三组好转率、脱落率。治疗前后, 采用汉密尔顿焦虑量表 (HAMA)、汉密尔顿抑郁量表 (HAMD)、五因素正念度量表 (FFMQ)、自我效能感量表 (GSES)、蒙特利尔认知量表 (MoCA)、社会功能缺陷筛查量表 (SDSS)、治疗中需处理的不良反应症状量表 (TESS) 进行评定, 比较两组患者的治疗效果、自我效能感的提高程度、社会功能及认知功能的改善程度及不良反应。

结果 对照 1 组、对照 2 组、实验组的脱落率分别为 10%、14%、6%, 三组间脱落率比较无差异

($P>0.05$)。实验组好转率(100.00%)高于常规药物治疗组(67.87%)与药物+正念减压组(83.63%)($P<0.05$)。与治疗前比较,三组治疗后HAMD、HAMA分值均显著下降,其中实验组的HAMD、HAMA分值均低于对照1组与对照2组($P<0.05$);治疗后三组患者FFMQ、GSES、MoCA、SDSS评分均显著升高,且实验组的FFMQ、GSES、MoCA、SDSS分值均显著高于对照1组与对照2组($P<0.05$)。

结论 VR联合正念减压疗法在后疫情背景下改善老年抑郁症患者的抑郁状态、焦虑状态、社会功能及认知功能,尤其在提高自我效能感等方面具有积极意义。

认知障碍合并慢性疼痛对大鼠行为学及海马神经元功能的影响

蒋佩佩 买买提热厦提·吐尔逊*
乌鲁木齐市第四人民医院

目的 探讨认知障碍合并慢性疼痛对SD大鼠行为及海马神经元功能的影响,为认知障碍合并慢性疼痛的诊疗提供科学依据。

方法 本研究纳入6-8周龄成年雄性SD大鼠共60只作为研究对象。给根据研究目的分为对照组、认知障碍组、慢性疼痛组、认知障碍+慢性疼痛组及认知障碍+慢性疼痛假手术组,共5组,每组12只,分别进行定位航行实验、空间探索试验、可见平台试验及痛觉测定,并对海马组织进行HE染色检测病理改变、TUNEL染色检测细胞凋亡。

结果 (1)行为学检测:定位航行实验在第1天到第4天,与对照组对比,各组大鼠潜伏期有明显的延长趋势($P<0.001$)。定位航行试验结束后撤出平台,任选一个入水点将大鼠面向池壁放入水中,记录大鼠在2min内进入原平台象限的时间,与对照组比较,其他组所用时间有明显的延长趋势,其中,认知障碍+慢性疼痛组延长最为显著($P<0.05$);定位航行试验和空间探索试验结束后,进行历时为两天的可见平台试验,结果显示在第1天和第2天,其他组大鼠可见平台穿越次数明显低于对照组,其中

认知障碍+慢性疼痛组最为显著($P<0.05$);(2)痛觉检测:在CFA佐剂注射后分别测定各组动物的热刺激痛觉阈值。与对照组相比,认知障碍组大鼠热刺激痛觉阈值所用时间较短,但差异在统计学上没有意义;其余各组大鼠热刺激痛觉阈值所用时间逐渐减少($P<0.001$)。在CFA佐剂注射后分别测定各组动物的机械刺激缩足阈值,结果显示:与对照组相比,各组实验大鼠机械刺激缩足阈值明显降低($P<0.001$);(3)HE染色结果显示,对照组大鼠海马锥体神经元细胞排列整齐,层次清楚,核大而圆,形态完整。认知障碍组与慢性疼痛组细胞排列紊乱,层次不清,出现细胞膜断裂,细胞核固缩,甚至空泡变性。认知障碍+慢性疼痛组与认知障碍+慢性疼痛假手术组出现不同程度的神经元变性,主要表现为细胞肿胀、核染色质肿胀、粗大,细胞排列紊乱,极向不清,部分细胞空泡变,细胞核大小不一致。(4)TUNEL染色实验结果显示:与对照组相比,海马组织中凋亡细胞数量在认知障碍组、认知障碍+慢性疼痛组、认知障碍+慢性疼痛假手术组中增加,其中认知障碍+慢性疼痛组增加最为显著,差异具有统计学意义($P<0.001$)。

结论 通过本研究的结果,可以看出,认知障碍合并慢性疼痛的SD大鼠行为迟缓,痛觉降低,同时海马组织病理改变最为显著、细胞凋亡数量增加,提示,慢性疼痛可以加剧认知障碍的程度。

低频 tACS 联合认知训练快速改善轻度阿尔茨海默病患者的认知并调节额颞叶功能连接

龚倩 陈炜*
浙大医学院附属邵逸夫医院

目的 神经调控对治疗阿尔茨海默病(AD)有广阔前景,研究发现经颅交流电刺激治疗(tACS)可改善正常衰老的健康人或AD患者的认知水平,但治疗的最佳部位、频率、电流等仍未明确,并且对疗效的脑电机理研究较少。为此本研究采用双层前额叶同步theta波tACS联合N-back认知训练治疗轻度AD患者探索疗效和脑电生理。

方法 收集2021年至2022年间住院的51例轻度阿尔茨海默症患者,随机分配到真假刺激组,每

位患者给予2周的双侧前额叶同步theta波tACS治疗,每周5次,每次20分钟,治疗期间同时进行N-back认知训练。治疗前、治疗2周后和治疗3月后分别评估患者的认知水平和神经心理状态,并采集静息态脑电图。

结果 临床认知量表(简明精神状态量表(MMSE)、轻度认知功能损害筛查量表(sMCI)及费城词语学习测验(PVLT))评估提示只有真刺激组在治疗2周后认知水平明显高于治疗前,假刺激组则无差异。静息态脑电分析提示两组治疗前后在额叶和颞叶的theta段功能连接和gamma段功率谱上有显著差异,且theta功能连接与MMSE在真刺激组治疗前后差值存在相关,提示双侧额叶同步低频tACS联合认知训练通过改善额颞叶功能连接和能量来提高轻度AD患者认知水平。

结论 本研究在既往文献基础上采用双侧前额叶同步低频经颅交流电刺激并联合N-back认知训练治疗轻度AD,提示该方法可快速改善轻度AD的认知水平并调节额颞叶功能连接,但是否存在长期效应仍需进一步研究。

关键词: 经颅交流电刺激、N-back 认知训练、临床认知量表、静息态脑电图

Lifespan and Causes of Death Among Severe Mental Illness in China: A Cohort Study of 4.6 Million Decedents

Xinyu Fang Xiangrong Zhang*

The Affiliated Brain Hospital of Nanjing Medical University, Nanjing, PR China

Objective Patients with severe mental illness (SMI) have a higher mortality than the general population, with an average of 10-20 years of life expectancy lost. The present study was the first one in China to systematically investigate the lifespan and death causes among patients with SMI, and make comparisons with the whole population during the same time period, and across the six types of SMI

Methods The death data of SMI patients and the whole population in Nanjing, China from January 2014 to September 2022 were extracted from the Jiangsu

Province Management Information System for Patients with SMI and Mortality Registration System in China

Results A total of 4 646 713 deaths were reported in Jiangsu Province from January 2014 to September 2022, with an average death age as 75.1 years (Male: 72.77, Female: 78.16). Of whom, 42 423 were registered for SMI, with an average death age as 64.25 years (Male: 61.93, Female: 66.65). The average lifespan of schizophrenia, bipolar disorder, intellectual disability, mental disorders due to epilepsy, paranoid disorder, and schizoaffective disorder is 64.90, 69.17, 59.21, 56.79, 69.03 and 69.06 years, respectively. Male patients had significantly shorter lifespan than female patients regardless of the types of SMI. The top ten causes of death in SMI are as follows: cerebrovascular disease (22.5%), other accident (downing, accidental falling, and et al) (10.2%), digestive system malignancies, acute cardiovascular disease (7.4%), chronic heart disease (6.4%), no cause specified (6.4%), chronic respiratory disease (5.2%), diabetes mellitus (4.5%), suicide (4.0%), and respiratory system neoplasms (3.6%). Compared to the whole population, patients with SMI died from the top ten death causes all had an earlier age, and the death proportion of chronic heart disease, diabetes mellitus, suicide, other accident (downing, accidental falling, and et al) and no cause specified in SMI were significantly increased. Additionally, we have preliminarily found differences in the characteristics of death across different types of SMI

Conclusion Patients with SMI in China, regardless of categories, experienced marked reductions in lifespan compared to the whole population, especially for male patients

The cerebrovascular accident but not the cardiovascular accident was the leading death cause for the patients with SMI regardless of the disease types. Our findings provide insights into the need to consider SMI spectrum when formulating better physical and mental health policies to prevent and reduce mortality in Chinese patients with SMI.

认知评估工具在神经认知损害中的测量等值性研究

张少伟 高玲玲 李晗 白丽 杨阳 李霞*
上海市精神卫生中心

目的 本研究旨在提供一种将两段式电子筛查工具 TCSA 测评分数转换为 MMSE 分数的简单方法。同时比较两种评估工具在社区队列中筛查认知损害患者的能力。

方法 研究共纳入来自社区队列的 532 名被试, 包括 142 名健康对照, 225 名 MCI 患者, 162 名痴呆患者。所有被试同一时间完成 MMSE 和 TCSA 两种评估, 其中 TCSA 要求初筛和整筛两段均需完成。使用等百分位相等法对 TCSA 初筛、TCSA 整筛分别与 MMSE 之间进行等值转换。比较 ROC 曲线评价两种量表的筛查能力。

结果 TCSA 与 MMSE 评分高度相关(Pearson $r=0.63, p<0.001$)。平均分 NC 在 MMSE=26.25(3.18)、pre-TCSA=6.65(2.01) 和 TCSA=21.44(3.19) 上的得分明显高于 MCI 组(MMSE=21.42(4.56)、pre-TCSA=5.18(1.95) 和 TCSA=18.17(3.77)) 和痴呆组(MMSE=15.08(6.39)、pre-TCSA=2.86(1.91) 和 TCSA=12.19(5.09))。我们分别做了 MMSE 和初筛、整筛的等值分数表, 方便进行分数转换。另外, TCSA 筛查轻度认知障碍(MCI)的曲线下面积(AUC)与 MMSE 相似(0.85 vs 0.83), 而在筛查痴呆方面优于 MMSE (0.99 vs 0.97, $P<0.05$)。

结论 TCSA 有筛查老年人的认知损害的能力, 具备在社区环境中进行大规模认知筛查的潜力, 可以与 MMSE 进行比较和转换。

Five-Year Trajectory of High-Density Lipoprotein Cholesterol Related To Cognitive Function Outcomes Among Community-Dwelling Older Adults

Yaping Li¹, Xia Li¹, Qianya Huang¹, Ling Li¹, Chunhua Lu², Shixing Qian¹

1.Department of Geriatric Psychiatry, Shanghai Mental Health Center, Shanghai Jiao Tong University School of Medicine

2.Sijing Community Health Service Center of Songjiang District

Objective This study examines the longitudinal relationship between metabolic markers and cognitive function among older adults living in a suburban community of Shanghai from 2017 to 2021. The primary aim was to analyze the trajectory of high-density lipoprotein cholesterol (HDL-C) and its protective effect on cognitive function, and to investigate the moderating role of low-density lipoprotein cholesterol (LDL-C) in this process.

Methods Participants from the Shanghai Action to Prevent the Elderly from Dementia (SHAPE) cohort underwent annual health check-ups focusing on metabolic indicators such as blood glucose and lipid profiles. Group-based trajectory analysis was used to classify HDL-C and LDL-C trajectories, and multiple regression models were employed to analyze the impact of these trajectories on cognitive function.

Results The findings indicated that the trajectory of HDL-C exhibited a significant protective effect on cognitive function, and maintaining HDL-C within a normal range was associated with the best cognitive performance. The moderating effect of LDL-C was found to mitigate the protective impact of high HDL-C levels on cognitive function, highlighting the importance of multiple lipid parameters in cognitive health. Specifically, the normal HDL-C trajectory group showed better cognitive performance in total cognitive assessment score, episodic memory, and attention compared to the low trajectory group. Additionally, lower LDL-C levels enhanced the protective effect of HDL-C on cognitive function, while higher LDL-C levels attenuated this effect.

Conclusion These results underscore the importance of monitoring and managing lipid levels for cognitive health in the aging population. Normal HDL-C trajectories were associated with better cognitive outcomes, and LDL-C played a moderating role in this pro-

cess. Therefore, cognitive health strategies for the elderly should focus on the management of HDL-C and LDL-C. This study provides new insights for prevention strategies and interventions to alleviate cognitive decline in aging populations.

关键词: This study examines the longitudinal relationship between metabolic markers and cognitive function among older adults living in a suburban community of Shanghai, from 2017 to 2021. Participants from the Shanghai Action to Prevent the elderly from dementia (SHAPE) cohort underwent annual health check-ups, focusing on metabolic indicators such as blood glucose and lipid profiles. Our findings indicated that the trajectory of high-density lipoprotein cholesterol (HDLc) exhibited a significant protective effect on cognitive function, and maintaining HDLc within a normal range was associated with the best cognitive performance. The study also revealed the moderating effect of low-density lipoprotein cholesterol (LDLc), which mitigated the protective impact of high HDLc levels on cognitive function. These results highlight the importance of monitoring lipid to keep cognitive health in the aging population.

Impact of Fasting Blood Glucose Trajectories on Cognitive Function in Community-Dwelling Elderly Adults: A Five-Year Longitudinal Study

Qianya Huang¹, Yaping Li¹, Chunhua Lu², Xia Li¹

1. Department of Geriatric Psychiatry, Shanghai Mental Health Center, Shanghai Jiao Tong University School of Medicine

2. Sijing Community Health Service Center of Songjiang District

Objective To examine the longitudinal relationship between metabolic markers, particularly fasting blood glucose (FBG), and cognitive function among older adults in a suburban community of Shanghai from 2017 to 2021

Methods Participants from the Shanghai Action

to Prevent the elderly from dementia (SHAPE) cohort underwent annual health check-ups focusing on FBG and inflammatory markers, including the neutrophil-to-lymphocyte ratio (NLR) and monocyte-to-high-density lipoprotein ratio (MHR). Gaussian mixture modeling (GMM) was used to categorize FBG trajectories into normal and elevated groups. Cognitive function was assessed in 2021 using the Thoven Cognitive Self-Assessment (TCSA)

Results The study included 870 participants. GMM identified two FBG trajectories: 21.72% of participants had elevated FBG levels, while 78.28% had normal levels. Cognitive testing revealed that visual perceptual memory was significantly lower in the elevated FBG group, though no significant differences were found in overall cognitive function, verbal repetition, or attention. Elevated FBG levels were associated with higher NLR and MHR values

Conclusion Elevated FBG levels are associated with poorer visual perceptual memory in older adults, independent of age and education level. Higher NLR and MHR values in the elevated FBG group suggest a potential link between inflammation and cognitive decline. Monitoring and managing blood glucose and inflammatory markers may help preserve cognitive function in the aging population.

Integrative Bioinformatics Analysis Unveils Lysosomal and Immune-Infiltration-Related Genes As Potential Therapeutic Targets in Late-Onset Major Depressive Disorder

Jianzhen Hu², Jianzhen Hu¹, Yao Gao¹, Yao Gao², Xiaona Song¹, Dan Wang³, Xinzhe Du², Xinzhe Du¹, Xiao Wang¹, Xiao Wang², Xiaodong Hu², Xiaodong Hu¹, Sha Liu², Sha Liu¹

1. Shanxi Medical University

2. First Hospital of Shanxi Medical University

3. Shanxi Provincial Integrated TCM and WM Hospital

Objective This study aims to utilize bioinformatics to analyze the differential genes associated with lysosomal changes in patients with late-onset major depressive disorder (LOD) and identify potential therapeutic drugs

Methods Differential genes in dataset GSE76826 were analyzed by WGCNA, and the modules associated with LOD were screened. After intersection with lysosomal genes, the diagnostic significance was determined by the receiver operating curve (ROC) and Lasso regression. Pathway enrichment analysis was performed on key modules, and then three kinds of CIBESORT, MCPcounter, and quanTIseq immunoinfiltration were used to analyze the immune infiltration of LOD patients. Then the LOD animal model was constructed to verify the selected genes. Finally, the ITCM database was used to predict small-molecule drugs for lysosome-related genes

Results The selection of ANK3, BIN1, CKAP4, GPRASP1, MYO7A, and RAB20 in the green module has diagnostic significance. The biological process of GO found that the Green module was related to T cell differentiation and its regulation, and further immune infiltration found that LOD patients were related to CD8+T cells and neuronal cells, and the BIN1 gene was positively correlated with CD8+T cells. The results of qPCR verification of ANK3, BIN1, CKAP4, and RAB20 genes using animal models were basically consistent with the results of our bioinformatics analysis. The ITCM database predicted that 17-beta-estradiol and nickel small-molecule compounds might target LOD

Conclusion The occurrence and development of LOD patients are the result of the joint participation of multiple genes and pathways, and CD8+T cells and nerve cells may promote the development of LOD. 17-beta-estradiol and nickel may be targeted as Chinese medicines for the potential treatment of LOD.

2.Shanxi Medical University

3.Shanxi Provincial Integrated TCM and WM Hospital

Objective Alzheimer's disease (AD) preclinical stages include late-life depression (LLD) and amnestic mild cognitive impairment (aMCI). Early identification of these two diseases plays an important role in the early prevention and treatment of AD. To explore the metabolic characteristics of LLD and aMCI and search for biomarkers, we hope to propose new exploration directions for the prevention and treatment of AD

Methods We collected plasma samples from 53 elderly subjects, including 11 LLD patients, 26 aMCI patients, and 16 healthy control patients, using 1H-nuclear magnetic resonance (1H-NMR) metabolomics. Differential metabolites were analyzed and associated with neurocognitive tests, and potential markers for diagnosis were explored using the receiver operating characteristic (ROC) curve

Results There were obvious metabolic disturbances in the LLD and aMCI groups, and the plasma differential metabolites were mainly concentrated in the three metabolic pathways of glycolysis/gluconeogenesis, galactose metabolism, and arginine biosynthesis. Scyllo-inositol was significantly up-regulated in LLD patients and significantly down-regulated in aMCI patients, with statistical significance. The area under the ROC curve (AUC = 0.7784, 0.7837) indicated that scyllo-inositol could well distinguish LLD, aMCI, and healthy people. In addition, scyllo-inositol was also associated with abnormal results in neurocognitive tests. Combining scyllo-inositol with the memory scale and analyzing joint diagnostic indicators (AUC = 0.9205, 0.9495) showed stronger diagnostic ability

Conclusion This study helps us understand the pathogenesis and relationship between LLD and aMCI,

and a new diagnostic model combining metabolite signatures with neurocognitive tests may provide new ideas for early detection and prevention of AD.

Investigation on EEG Power Spectral Density and Its Influencing Factors in Middle-Aged and Elderly Patients with Depression Disorder Based on Sleep Stage

Pengyu Xie*

合肥市第四人民医院

Objective To scrutinize the traits and influencing elements of EEG power spectral density at diverse sleep phases in various types of middle-aged and elderly patients with depressive disorders, and to furnish a theoretical foundation for the application of sleep EEG power spectral density in the sleep assessment of middle-aged and elderly patients with depressive disorders

Methods The general conditions and sleep EEG data of 33 middle-aged and elderly patients with depression who were hospitalized in Anhui Mental Health Center from 2019 to 2023 were retrospectively examined. Grouping approach: Based on the age of first onset, the patients were classified into the early-onset group (< 60 years old) and the late-onset group (\geq 60 years old). According to body mass index (BMI), the patients were divided into the overweight group ($>$ 24kg/m²) and the normal group (\leq 24kg/m²). The patients were categorized into the illiterate group (\leq 0 years) and the educated group (\geq 0 years). The Profusion PSG4 polysomnograph was utilized to collect sleep EEG data, and the MATLAB-EEGLAB toolbox was employed to analyze the data, and the rhythms and power spectral densities of N1, N2, N3, REM α , β , δ , and θ were computed. The t test of two independent samples was adopted to compare the disparity of sleep EEG power spectral density in different groups, and the spearman correlation analysis was implemented to investigate the relationship between the patients' general conditions and sleep EEG

power spectral density and the sleep process

Results 1. The results of the T-test of two independent samples indicated that there was no conspicuous difference in EEG power spectral density between the body disease state and the body weight state at various sleep phases. 2. The findings of the difference analysis among groups manifested: The REM sleep latency ($t = -2.073$, $p = 0.047$) and the δ wave power spectral density ($t = -2.242$, $p = 0.032$) in the late-onset group were significantly higher than those in the early-onset group. The REM delta wave power spectral density ($t = 2.102$, $p = 0.044$), REM theta wave power spectral density ($t = 2.102$, $p = 0.044$), REM duration ($t = 2.754$, $p = 0.011$), and REM duration ratio ($t = 3.258$, $p = 0.003$) were significantly lower. Compared with male patients, the α wave power spectral density in the N2 phase was significantly higher in female patients ($t = -2.288$, $p = 0.029$). Compared with the illiterate group, the proportion of the N1 phase in the educated group was significantly higher ($t = -2.176$, $p = 0.037$). The N3-phase α wave ($t = 2.732$, $p = 0.010$), β wave ($t = 2.461$, $p = 0.020$), and θ wave ($t = 2.181$, $p = 0.037$) power spectral density was significantly lower. 3. The results of the Spearman correlation analysis revealed: The age of first onset was negatively correlated with REM duration ($r = -0.396$, $p = 0.022$), REM duration proportion ($r = -0.354$, $p = 0.046$) and REM theta power spectral density ($r = -0.379$, $p = 0.029$)

Conclusion The current study demonstrated that the body disease status and body weight status did not have a significant effect on the EEG power spectral density at different sleep phases. Nevertheless, the sleep EEG power spectral density at different sleep phases, particularly REM, was markedly influenced by the age of onset, gender, and education level. The later the age of first onset, the lower the θ wave and δ wave power spectral density of REM and the shorter the REM duration, suggesting that the physiological function impairment is more pronounced. Hence, individualized interventions are requisite for patients with late-onset depression to enhance their sleep quality and overall health.

精神分裂症无抽搐电休克治疗效应相关的静息态脑磁图神经振荡功能连接特征研究

凌玉茹 张向荣*
南京脑科医院

目的 本研究采用静息态脑磁图技术从神经振荡功能连接特征分析 SZ 患者电休克治疗前后的全脑神经电生理改变,为探讨 MECT 治疗机制提供初步研究依据。

方法 本研究共招募 28 名 SZ 患者 (SZ 组) 在第 1 次 MECT 治疗前 (ECT0)、第 3 次 MECT 治疗后 (ECT3) 和第 6 次 MECT 治疗后 (ECT6) 24 小时内完成静息态 MEG 数据采集。招募 26 名年龄、性别和受教育年限与患者相匹配的健康对照者进行单次静息态脑磁图扫描。选取额叶眶部、海马、海马旁回、岛叶、杏仁核、颞叶和扣带回作为感兴趣区,采用加权相位滞后指数 (Weighted Phase-Lag Index, WPLI) 分析方法,评估 HC 组、SZ 组 delta 和 theta 频段感兴趣脑区间功能连接的变化,正态分布的数据采用独立样本 t 检验,偏态分布数据通过非参数 (Kruskal-Wallis H) 检验 ($p < 0.01$)。MECT 治疗前后 SZ 组 (ECT0、ECT3、ECT6) 间 WPLI 值的差异为通过配对样本 t 检验进行评估 ($P < 0.01$)。并进一步探讨功能连接指标 WPLI 值和阳性与阴性症状量表 (Positive and Negative Syndrome Scale, PANSS) 各项评分间进行相关分析。

结果 与基线期 (ECT0) 相比, SZ 患者 3 次 MECT 治疗后 delta 频段左侧颞横回和右侧脑岛、右侧眶部额上回和右侧眶部额中回、右侧眶部额上回和右侧眶部额下回、右侧后扣带回和右侧脑岛、左侧杏仁核和右侧杏仁核异常减弱的功能连接 WPLI 值恢复正常水平,与 HC 组无差异。与基线期 (ECT0) 相比, SZ 患者 theta 频段 3 次 MECT 治疗后右侧眶部额上回和右侧海马旁回、右侧眶部额上回和左侧海马、右侧海马旁回和右侧颞上回、左侧海马旁回和左侧岛叶、左侧颞下回和右侧海马旁回异常减弱的功能连接 WPLI 值恢复正常水平,与 HC 组无差异。6 次 MECT 治疗后左侧颞极颞上回和右侧眶部额中回异常减弱的功能连接 WPLI 值恢复正常水平。

相关性分析发现 3 次 MECT 治疗后 theta 频段

左侧海马旁回和左侧岛叶 WPLI 差值与 PANSS 量表总分减少分呈正相关。

结论 研究发现 SZ 患者存在多脑区间功能连接失调,3 次 MECT 治疗可以逆转部分脑区异常的功能连接,左侧海马旁回和左侧岛叶功能连接的恢复与 SZ 患者临床症状改善相关,MECT 治疗可能通过改变大脑区域间的功能连接,改善精神分裂症患者的临床症状。

Glycemic Variability and Lipid Metabolism Impact on The Risk of Depression in Elderly Patients with Diabetes Mellitus

Hao Geng¹, Xiaoming Kong¹, Yan Sun², Li Zhang¹, Siwen Lv¹, Yu Guo¹, Pengyu Xie¹, Xiaomin Hu¹

1. Affiliated Psychological Hospital of Anhui Medical University, Anhui Mental Health Center, Hefei Fourth People's Hospital

2. The First Affiliated Hospital of Anhui Medical University

Objective To observe the prevalence of depression among elderly diabetic patients; to study the effects of glycemic variability and lipid metabolism on the depressive condition of elderly diabetic patients; to explore the risk factors for the development of depressive disorders in elderly diabetic patients, and to provide a theoretical basis towards the long-term course of mood management for elderly diabetic patients

Methods Retrospective Analysis of Blood Glucose Variability, Lipid Metabolism Indices, and Anxiety-Depression Scores in 145 Elderly Diabetic Patients Hospitalized at Anhui Mental Health Center and The First Affiliated Hospital of Anhui Medical University from 2020 to 2023. Patients were categorized based on their scores on the Hamilton Depression Scale (HAMD-24): those with a total score of ≥ 20 were included in the depression group, while other elderly diabetic patients were placed in the control group. Biochemical analysis

was performed using the Roche c8000 analyzer to measure lipid metabolism indices, including total cholesterol (TC), high-density lipoprotein cholesterol (HDL-C), apolipoprotein A1 (ApoA-I), apolipoprotein B (ApoB), and triglycerides (TG). Dynamic glucose monitoring was conducted with the Abbott FreeStyle Libre H to gather blood glucose variability indices, such as the mean of daily differences (MODD), standard deviation of blood glucose (SDBG), coefficient of variation (CV), estimated glycated hemoglobin (eH1A1c), area under the glucose curve (AUC), high blood glucose index (HBGI), low blood glucose index (LBGI), time in target range (TIR), and mean blood glucose level (MBG). The associations between anxiety, depression, and various glycemic and lipid metabolic indices, along with risk factors, were investigated using Spearman's correlation analysis and logistic regression

Results 1. In this study, a total of 145 patients were surveyed, including 86 in the depression group (31 males and 55 females, with an average age of 72.42 ± 5.75), and 59 in the control group (32 males and 27 females; $\chi^2 = 4.713$, $p = 0.030$), with an average age of 70.24 ± 7.54 ($t = 1.879$, $p > 0.05$)

2. The results of the correlation analysis indicated that HAMD scores were positively correlated with total cholesterol (TC, $r = 0.25$) and apolipoprotein B (ApoB, $r = 0.28$) ($p < 0.05$). HAMA scores were positively correlated with total cholesterol (TC, $r = 0.23$), standard deviation of blood glucose (SDBG, $r = 0.29$), and low blood glucose index (LBGI, $r = 0.23$) ($p < 0.05$).

3. Univariate and multivariate logistic regression analyses, with depression as the dependent variable, revealed that ApoB [OR = 15.259, 95% CI (2.795, 83.315), $p = 0.002$], SDBG [OR = 1.404, 95% CI (1.120, 1.760), $p = 0.003$], and LBGI [OR = 1.318, 95% CI (1.099, 1.580), $p = 0.003$] were independent risk factors.

Conclusion The prevalence of depression among elderly diabetic patients is as high as 59.31%, higher than previously reported. Female elderly diabetic patients are more susceptible to depression. The level of depression is closely related to lipid metabolism; higher levels of TC and ApoB are associated with higher HAMD scores. Anxiety levels are also closely linked with both lipid metabolism and glucose variability;

higher levels of TC, SDBG, and LBGI correspond to higher HAMA scores. ApoB, SDBG, and LBGI are independent risk factors for depression in diabetic patients: for every 1 g/L increase in ApoB, the risk of depression increases by 14.259 times; for every 1 mmol/L increase in SDBG, the risk of depression increases by 40.4%; and for every unit increase in LBGI, the risk of depression increases by 31.8%. Attention should be paid to the lipid metabolism indicators, glucose variability, and frequency/severity of hypoglycemia in elderly diabetic patients to manage the risk of depression.

关键词: depression, elderly diabetic patients, lipid metabolism, glycemic variability

晚发型抑郁障碍的脑网络间功能异常与认知功能损害

萧芷代 宁玉萍* 杨铭枫 陈贵 王强 许丹燕 高鹏博 郑晓敏 钟笑梅
广州医科大学附属脑科医院

目的 探究晚发型抑郁障碍(Late-onset Depression, LOD)的静态和动态脑网络间功能改变及其与临床症状的关系。

方法 本研究共纳入了 82 名 LOD 患者与 101 名健康对照者(Healthy Control, HC)。所有被试均进行了人口学资料采集、临床评估、认知测试和功能磁共振扫描。利用 DPABI 和 GIFT 软件对磁共振数据进行预处理和独立成分分析后,进行静态功能网络连接(Static Functional Connectivity, sFNC)分析,并使用滑动窗口法和 K-Means 聚类方法进行动态功能网络连接(Dynamic Functional Connectivity, dFNC)分析,得出时间特性与功能连接矩阵。通过网络统计分析(Network Based Statistics, NBS)和协方差分析分别对静、动态的网络间功能连接矩阵及 dFNC 的时间特性进行组间比较,并与抑郁情绪、认知功能(总体认知、记忆、信息处理速度、执行、语言及视空间功能)进行相关分析和中介效应分析。

结果 共有 11 个独立成分被提取,并归类成 8 种网络。在 sFNC 中,与 HC 相比,LOD 的视觉网络-背侧注意网络(Visual Network-Dorsal Attention Network, VN-DAN)连接减弱(NBS 校正后 $p < 0.01$)。

在 dFNC 中, 整个扫描时间被分为 4 种状态。在状态 3 中, LOD 的平均停留时间 ($p=0.020$) 和占比时间 ($p=0.019$) 比 HC 具有更少的趋势, 而在状态 1 中 LOD 的占比时间具有更大的趋势 ($p=0.027$)。与 HC 相比, 状态 2 的突显网络-感觉运动网络 (Salience Network - Somatomotor Network, SN-SMN) 在 LOD 中呈现更弱的功能连接 (NBS 校正后 $p=0.04$)。同样 LOD 在状态 3 的默认模式网络-突显网络 (Default Mode Network-Salience Network, DMN-SN) 中呈现更弱的功能连接 (NBS 校正后 $p<0.01$)。SN-SMN 的 dFNC 与总体认知、记忆、语言、视空间功能测试呈正相关性, 而与老年抑郁量表得分和执行能力测试呈负相关。此外, 状态 2 的 SN-SMN 连接强度中介了老年抑郁对数字广度倒背测试和波士顿命名测试得分的影响。

结论 LOD 的 VN-DAN 的 sFNC 及 SN-SMN 和 DMN-SN 的 dFNC 均存在异常减弱, 并且 SN-SMN 的 dFNC 可能调控了抑郁情绪及认知受损的关系。这些异常的脑网络揭示了 LOD 潜在的发病机制, 有望在经颅磁刺激、经颅交流电刺激等治疗上成为干预靶点。

Causal Relationships of Mental Disorders and Human Aging: A Bidirectional Two-sample Mendelian Randomization Study

Xiangrong Zhang* Chaoran Wu
Nanjing Medical University

Objective Previous studies suggested that individuals with mental disorders have a shorter life expectancy than the general population, but no studies have explored the topic of mental disorders and aging based on genetic dimensions. Our study aimed to explore the genetic causal relationships between mental disorders (including schizophrenia, bipolar disorders, major depressive disorders (MDD), post-traumatic stress disorder (PTSD) and anxiety disorder) and human aging

Methods Single nucleotide polymorphism (SNP) data for both mental disorders and human aging used as

exposures and outcomes were summary-level data, sourced from the Psychiatric Genomics Consortium (PGC), IEU open GWAS project and Zenodo, separately. Five kinds of MR methods (Inverse variance weighted regression (IVW), MR Egger, Weighted median, Simple mode, and Weighted mode) were carried out to ascertain the causal effect and pleiotropy, heterogeneity, and sensitivity analyses were performed to ensure the robustness of our results

Results We found that MDD was causally associated with decreased risk of aging (IVW: OR=0.863, 95% CI=0.840-0.886, $p<0.01$; weighted median: OR=0.820, 95% CI=0.799-0.841, $p<0.01$; simple mode: OR=0.780, 95% CI=0.748-0.812, $p<0.01$; weighted mode: OR=0.791, 95% CI=0.754-0.825, $p<0.01$), whereas bipolar disorder was causally associated with increased risk for aging (IVW: OR=1.022, 95% CI=1.013-1.031, $p=0.045$; MR Egger: OR=1.138, 95% CI=1.086-1.190, $p=0.041$). Both pleiotropy and sensitivity analyses supported the robustness of these findings. As for schizophrenia, PTSD, and anxiety disorders, we didn't find a causal relationship between them and aging. When we consider mental aging as exposures, we found no evidence to support a causal relationship between aging and mental disorders

Conclusion Our study provided genetical evidence for a causal relationship between MDD and bipolar disorder and ageing, which provides new insights to improve the prognosis of patients with mental disorders and to achieve co-intervention between mental disorders and aging.

Predictors for Early-onset Psychotic Symptoms in Patients Newly Diagnosed with Parkinson's Disease without Psychosis at Baseline: A 5-year Cohort Study

Chen Jing Yuan Junliang*
Peking University Sixth Hospital

Objective To investigate the risk factors of early-onset psychosis in Parkinson's disease (PD) in a cohort of patients from the Parkinson's Progression Markers Initiative

Methods Longitudinal data on motor and nonmotor features, dopamine transporter (DAT) imaging, and cerebrospinal fluid (CSF) measurements were collected. The survival probability of psychotic symptoms, potential risk factors for psychosis development over a 5-year follow-up period, and the performance of the prediction model were evaluated

Results Among the 338 newly diagnosed patients with PD, 83 developed psychotic symptoms. Gastrointestinal autonomic dysfunction, presence of probable rapid-eye-movement sleep behavior disorder, and the ratio A β 42: total-tau could independently predict onset of psychosis in PD (Hazard ratio (HR) = 1.157, 95% confidence interval (CI) 1.022–1.309, $p = 0.021$, HR = 2.596, 95% CI 1.287–5.237, $p = 0.008$, and HR = 0.842, 95% CI 0.723–0.980, $p = 0.027$, respectively). The combined model integrating baseline clinical predictors, DAT imaging, and CSF measurements achieved better sensitivity than the clinical predictors alone (area under the curve = 0.770 [95% CI 0.672–0.868] vs. 0.714 [95% CI 0.625–0.802], $p = 0.098$)

Conclusion We identified clinical and CSF predictors of early-onset psychosis in patients with PD. Our study provides evidence and implications for prognostic stratification and therapeutic approaches for PD psychosis.

Comparative Evaluation of Nutritional Risk Screening Tools in Elderly Psychiatric Patients in China: NRS-2002, MUST, and MNA-SF

Siyao Shi¹, Shuang Zhou¹, Huijie Lu¹, Zheyi Du¹, Miao Du², Jiang Du¹, Ping Dong¹, Ying Jiang²

1.Shanghai Mental Health Center, Shanghai Jiao Tong University School of Medicine

2.Shanghai University of Medicine & Health Sciences

Objective This study aims to compare and evaluate the applicability and effectiveness of three commonly used nutritional risk screening tools—Nutritional Risk Screening 2002 (NRS-2002), Malnutrition Universal Screening Tool (MUST), and Mini Nutritional Assessment Short Form (MNA-SF)—in elderly psychiatric patients in China

Methods A cross-sectional study was conducted using a convenience sample of elderly psychiatric patients, aged 60 years and older, who were hospitalized between December 2020 and January 2021. Data collected included scores from NRS-2002, MUST, and MNA-SF, as well as measurements of weight, height, and fasting blood specimens. Statistical analysis was performed using SPSS version 22.0. Kendall's tau-b and Kendall's W coefficients were used to evaluate the association and concordance of the screening tools. Diagnostic performance was assessed through specificity, sensitivity, positive predictive value (PPV), negative predictive value (NPV), and area under the receiver operating characteristic curve (AUC)

Results A total of 270 elderly psychiatric patients, aged 60 to 93 years (mean age 69.8 \pm 7.6 years), were included in the study. More than 30% of the participants had anemia and hypoproteinemia. The MNA-SF identified a higher prevalence of nutritional risk (69.63%) compared to NRS-2002 (13.7%) and MUST (18.52%). The Kendall's W value of 0.45 indicated moderate agreement among the tools, with MNA-SF performing best in nutritional risk identification. The specificity for diagnosing malnutrition due to hypoproteinemia was highest for MNA-SF (96.8%), followed by NRS-2002 (94.1%) and MUST (84.9%), while the sensitivity was 17.9%, 31.0%, and 26.2%, respectively. For anemia, the specificity was 35.6% for MNA-SF, 92.6% for NRS-2002, and 86.7% for MUST, with sensitivities of 81.7%, 28.0%, and 30.5%, respectively

Conclusion The study concludes that MNA-SF is the most suitable tool for initial nutritional screening in elderly psychiatric patients due to its high sensitivity, ensuring that most at-risk individuals are identified for further assessment.

精神分裂症血浆内皮细胞微颗粒和炎症因子与颈动脉内膜中层厚度关系的研究

李德咏¹ 刘真如² 张向荣³

1.徐州医科大学附属东方医院老年精神科

2.徐州医科大学第一临床学院

3.南京医科大学附属脑科医院

目的 观察精神分裂症患者血浆内皮细胞微颗粒(EMP)水平和炎症因子(L-2、IL-4、IL-6、IL-10、TNF、GM-CSF、IL-1 β 、IFN- γ)与颈动脉内膜中层厚度(IMT)之间关系,探讨精神分裂症血管动脉硬化可能机制。

方法 选择精神分裂症患者92例,将其分为代谢综合征组和非代谢综合征组;选择健康查体者63例作为正常对照组,入选患者常规记录年龄、身高、体重、血脂、血糖指标并计算体质指数(BMI),采用彩色多普勒超声检测其左侧和右侧颈动脉IMT和斑块;采用流式细胞仪检测其血浆中CD31+/CD42-内皮细胞微颗粒(EMP)水平,酶联免疫法检测血浆炎症因子(L-2、IL-4、IL-6、IL-10、TNF、GM-CSF、IL-1 β 、IFN- γ)浓度。

结果 1)各组患者一般资料:比较精神分裂症代谢综合征组和非代谢综合征组与对照组相比在性别、年龄方面差异无意义($P>0.05$),而BMI、血脂、血糖、颈动脉IMT精神分裂症两组较正常对照组均显著升高($P<0.05$);2)精神分裂症代谢综合征组BMI、血脂、血糖颈动脉IMT较非代谢综合征组显著升高($P<0.05$);3)血浆内皮细胞微颗粒水平测定结果:精神分裂症代谢综合征组和非代谢综合征组血浆EMP水平均显著高于正常对照组(P 均 <0.01);精神分裂症代谢综合征组血浆EMP水平显著高于精神分裂症非代谢综合征组($P<0.05$)。4)血浆炎症因子测定结果:精神分裂症组血浆IL-6、IL-1 β 、TNF浓度均显著高于对照组($P<0.05$),而IL-4显著低于对照组($P<0.05$);精神分裂症代谢综合征组血浆IL-6、IL-1 β 浓度显著高于非代谢综合征组($P<0.05$);5)相关性分析:精神分裂症组内比较:精神分裂症组血浆EMP水平与颈动脉IMT(左侧 $r=0.31$,右侧 $r=0.21$, $P<0.05$)

呈显著正相关;IL-6、IL-1 β 、TNF浓度、斑块与颈动脉IMT(左侧 r 值分别为0.21、0.27、0.34、0.27,右侧 r 值分别为0.26、0.32、0.24、0.37, $P<0.05$)呈显著正相关,而IL-4与颈动脉IMT呈负相关 $P>0.05$ 无显著相关性;血浆IL-6、IL-1 β 浓度与血浆EMP水平(r 值分别为0.24、0.41, $P<0.05$)呈显著正相关。

结论 1)血浆EMP水平可用于评估精神分裂症颈动脉的损伤程度。2)血浆IL-6、IL-1 β 、TNF与精神分裂症颈动脉粥样硬化的发生和发展有关。

The Association between Cognitive Leisure Activities and Depressive Symptoms Among Older People: A Longitudinal Study of Health and Retirement in China (CHARLS)

Kaiwen Liang Lian Du*

The First Affiliated Hospital of Chongqing Medical University

Objective In recent years, depressive symptoms pose significant and growing public health challenges, with older adults being no exception. Cognitive leisure activities not only encourage social interaction among older adults, but also keep the brain active. This study aims to explore the cross-sectional and longitudinal relationship between cognitive leisure activities and depressive symptoms in older people

Methods The data in this study was collected from the China Health and Retirement Longitudinal Study (CHARLS) from 2011 to 2018. The frequency of engaging in cognitive leisure activities was measured through a self-reported questionnaire. Depressive symptoms were measured using the 10-item Center for Epidemiological Studies-Depression Scale (CES-D10). Logistic regression models and survival analysis Cox regression were used to investigate the cross-sectional and longitudinal relationship between cognitive leisure activities and depressive symptoms in older people

Results There were 11,424 participants, the mean age was 58.6 years, included in the cross-sectional

and 5,930, the mean age was 57.0 years, participants in the cohort analysis. Upon accounting for all confounding factors, the cross-sectional analysis revealed that the older people who engaged in one or more cognitive leisure activities were less likely to experience depressive symptoms than those who did not engage in any cognitive leisure activities. The odds ratios were 0.70 (95 % CI: 0.63–0.79, $p < 0.001$) for older adults engaged in one cognitive leisure activity and 0.63 (95 % CI: 0.36–1.05, $p = 0.089$) for older adults engaged in more than one cognitive leisure activity, respectively. Similarly, after adjusting for all confounding factors, the longitudinal analysis produced consistent results. The hazard ratios were 0.84 (95 % CI: 0.77–0.93, $p < 0.001$) and 0.84 (95 % CI: 0.56–1.27 $p = 0.414$), respectively. Furthermore, this study found that the mediating effects of life satisfaction was significant, accounting for 12.9 % of the impact of cognitive leisure activities on depressive symptoms

Conclusion Engaging in cognitive leisure activities has a positive impact on depressive symptoms among older individuals, potentially serving as a protective factor against their development. Furthermore, there is a need for an expansion of venues where elderly individuals can participate in such activities to enhance and uphold their psychological well-being.

Progressive Structural Alterations Associated with Negative Symptoms in Schizophrenia: A Causal Structural Covariance Network Analysis

Chao Zhou Rongrong Zhang Xiangrong Zhang*
Nanjing Medical University Affiliated Nanjing Brain Hospital

Objective This study aims to explore the synchronous and progressive alterations in gray matter volume (GMV) associated with negative symptoms

Methods 81 Deficit schizophrenia (DS) patients, 101 non-deficit schizophrenia (NDS) patients, and 177

healthy controls (HCs) were enrolled. The voxel-based morphometry and source-based morphometry were used for gray matter segmentation and structural covariance network construction. DS patients were ranked based on the severity of negative symptoms, and a causal structural covariance network was constructed using Granger causality analysis

Results Schizophrenia patients showed smaller GMV in multiple brain regions compared to HCs. Compared to NDS, DS exhibited decreased GMV in right inferior frontal gyrus triangular part, para-hippocampal gyrus, and anterior cerebellum, and showed decreased structural covariance among left middle frontal gyrus, inferior frontal gyrus and right superior frontal gyrus. As negative symptoms worsened, the volume of caudate decreased along with atrophy of para-hippocampal gyrus, the volume of thalamus increased along with the decline in multiple brain regions, and the decreased volume of posterior cingulate cortex resulted in increased volume of other brain regions

Conclusion The present study demonstrated specific brain structural covariance patterns in DS, providing new evidence for the causal effects of negative symptoms on progressive structural abnormalities in schizophrenia.

关键词: Schizophrenia, Negative symptoms, Causal structural covariance network, Granger causality analysis

Progress in The Study of The Effect of Intermittent Explosive Theta Stimulation on Cognitive Function and Brain Functional Connectivity in Elderly Depressed Patients with Cognitive Impairment

Yida Wang Qinge Zhang* Jiaojiao Zhou Xiao Wang
Beijing Anding Hospital, Capital Medical University

Objective This paper aims to explore the effects of intermittent theta burst stimulation (iTBS) on cognitive function and brain connectivity in elderly patients with depression accompanied by cognitive impairment

Methods By reviewing existing literature, this paper examines the progress of transcranial magnetic stimulation (TMS), particularly iTBS, in improving cognitive function. It analyzes the specific impacts of iTBS on executive function, memory, visuospatial function, and attention, and explores the potential mechanisms underlying these effects

Results Research indicates that iTBS, as a non-invasive brain stimulation technique, shows significant potential in improving cognitive function. Specific findings include: Executive Function: iTBS significantly improves executive function, especially when stimulating the left dorsolateral prefrontal cortex (DLPFC). Memory Function: Stimulation of the left parietal cortex (IPL) is more effective in enhancing imagery memory compared to the left DLPFC. Visuospatial Function: iTBS stimulation of the right DLPFC significantly improves visuospatial working memory. Attention: iTBS stimulation of the right parietal cortex significantly enhances attentional orientation efficiency

Conclusion iTBS, as an effective neuromodulation therapy, has significant potential in improving cognitive function in elderly patients with depression accompanied by cognitive impairment. However, current research results are inconsistent, and sample sizes are generally small. More large-scale, systematic studies are needed in the future to validate the efficacy of iTBS in this patient population and to optimize its application protocols.

Individualized Prediction of Cognitive Test Scores From Functional Brain Connectome in Patients with First-episode Late-life Depression

Chaomeng Liu Li Li Weigang Pan Dandi Zhu Peixian Mao Xin Ma*

1. Beijing Key Laboratory of Mental Disorders, National Clinical Research Center for Mental Disorders & National Center for Mental Disorders, Beijing Anding Hospital, Capital Medical University, Beijing, China 2.

Advanced Innovation Center for Human Brain Protection, Capital Medical University, Beijing, China

Objective In the realm of cognitive screening, the Mini-Mental State Examination (MMSE) and the Montreal Cognitive Assessment (MoCA) are widely utilized for detecting cognitive deficits in patients with late-life depression (LLD). However, the interindividual variability in neuroimaging biomarkers contributing to individual-specific symptom severity remains poorly understood. In this study, we used a connectome-based predictive model (CPM) approach on resting-state functional magnetic resonance imaging data from patients with LLD to establish individualized prediction models for the MoCA and the MMSE scores

Methods We recruited 135 individuals diagnosed with first-episode LLD for this research. Participants underwent the MMSE and MoCA tests, along with resting-state functional magnetic resonance imaging scans. Functional connectivity matrices derived from these scans were utilized in CPM models to predict MMSE or MoCA scores. Predictive precision was assessed by correlating predicted and observed scores, with the significance of prediction performance evaluated through a permutation test

In addition, ethical approval was granted by the Ethics Committee of Beijing Anding Hospital, Capital Medical University. All participants or their family members provided written informed consent, and the trial was registered on the Chinese Clinical Trial Registry website (ChiCTR2100042370) as part of a larger prospective cohort study.

Results The negative model of the CPM procedure demonstrated a significant capacity to predict MoCA scores ($r = -0.309$, $p = 0.002$). Similarly, the CPM procedure could predict MMSE scores ($r = -0.236$, $p = 0.016$). The predictive models for cognitive test scores in LLD primarily involved the visual network, somatomotor network, dorsal attention network, and ventral attention network

Conclusion Brain functional connectivity emerges as a promising predictor of personalized cognitive test scores in LLD, suggesting that functional con-

nectomes are potential neurobiological markers for cognitive performance in patients with LLD

MAPT 新发突变在额颞叶痴呆家系中的功能研究探索

汪前喜¹ 李霞¹ 邓淼菡¹ 周煜航² 袁沛哲¹ 王星懿² 张乘嘉² 马加良² 吴歆若² 杨阳¹ 钱时兴¹ 郑红花²

1.上海市精神卫生中心老年精神科
2.厦门大学神经科学研究所

目的 额颞叶痴呆 (Frontotemporal Dementia, FTD) 是主要损害大脑额叶和颞叶的神经退行性疾病, 具有较高的家族遗传特性。本研究通过对一个 FTD 家系进行基因突变分析, 并进行功能分析。

方法 本研究纳入了一个 FTD 家系, 共有 3 名临床表型为 FTD 的患者, 5 名正常。对家系成员开展神经心理学评估。先证者抽取外周静脉血进行目标区域捕获高通量外显子检测点突变及插入突变、PCR 以及检测动态突变, 对其 7 名家属抽取外周血进行 Sanger 测序验证, 确认家族 FTD 的突变位点。并通过构建突变型质粒, 转染细胞进行功能验证, 在分子生物学水平验证该基因新发位点突变的功能变化。

结果 先证者的高通量测序显示 PSEN2 基因、MAPT 基因、ABCA7 基因及 PPP2R2A 基因外显子区域均存在 1 个杂合突变, Sanger 验证显示先证者、亲属中 2 名 FTD 患者均存在 MAPT 基因位点的杂合突变, 1 名突变位点携带者, 通过 Tau-PET 检测证实其大脑存在 Tau 沉积, 考虑为 FTD 的临床前期。结合临床信息遗传共分离分析, 高度怀疑该 MAPT 基因的突变位点是该家族致病基因, 该突变在 1000 Genomes 数据库、ExAC 数据库及 gnomAD 数据库中均未见频率报道。对突变进行体外验证, 突变型质粒分别转染两种细胞的 Western Blot 结果显示, 与野生型相比, 该 MAPT 突变引起 HEK293T 细胞和 N2a 细胞的 Tau 及磷酸化 Tau 蛋白的表达量增加 ($P < 0.001$)。

结论 MAPT 基因新位点突变可导致 Tau 蛋白及磷酸化 Tau 蛋白表达量上升, 此 MAPT 新发突变填补了 FTD 致病基因突变位点的空白, 具有潜在的预测和诊断 FTD 功能。

Interaction between Serum Fibrinogen and P-Tau181 in The Cerebrospinal Fluid Correlates with Apathy Symptoms in Patients with Dementia

Yewei Wang¹, Lu Zhang², Bo Hong¹, Juanjuan Ren¹, Wei Li¹, Ning Su¹, Yuanyuan Liu¹, Chen Zhang¹, Ling Yue¹

1. Shanghai Mental Health Center
2. The Second People's Hospital of Chuzhou

Objective Behavioral and psychological symptoms of dementia (BPSD) brought caregivers both psychological and physical distress but in the elderly, the potential neuroimmunological mechanism of BPSD remains unclear. Fibrinogen (FBG), a kind of blood coagulation protein, is widely deposited in the brain with essential roles in coagulation, inflammation and tissue repair. However, few clinical studies focused on the association between FBG and BPSD. In this study, we investigated the potential mechanism of induction of serum biochemical indicators on Neuropsychiatric symptoms (NPS) through central cerebral pathological changes

Methods We identified 97 participants diagnosed with dementia between 21st, January, 2019 to 26th, March, 2024. All of them underwent lumbar puncture for collection of cerebrospinal fluid (CSF) in routine clinical practice in the inpatient ward. Furthermore, we assessed NPS using the informant-based Neuropsychiatric Inventory (NPI-Q). We used multivariate regression analysis to study the associations of NPS with CSF biomarkers including $A\beta_{42}$, $A\beta_{42}/A\beta_{40}$ ratio, p-Tau181 and T-Tau and serum indexes including coagulation and immune indicators including FBG, INR, prothrombin time (PT), activated partial thromboplastin

time (APTT), C-Reactive Protein(CRP) and blood cell count cross-sectionally. We modeled the association of NPS with serum indicators and CSF biomarkers and investigated the potential mechanism of how serum indicators and CSF biomarkers affected NPS. Statistical analyses were performed using the statistical program R (v4.3.3, R Foundation for Statistical Computing). We compared the clinical characteristics between high-level group and low-level group using either a two independent samplest-test with a significance threshold value of $p < 0.05$

Results Both of p-Tau181 and FBG may be positively associated with apathy symptoms (p-Tau181: t value = 2.250, Std Error = 0.0377, $p=0.02679$ *; FBG: value = 3.072, Std Error = 0.7633, $p=0.00279$ **). We stratified the cohort into high-level p-Tau181 group and low-level p-Tau181 group according to the median of p-Tau181 level. We found participants with elevated CSF p-Tau181 was associated with higher subscale scores of apathy symptoms ($t = -2.1696$, $p\text{-value} = 0.03253$ *). We also stratified the cohort into high-level FBG group and low-level FBG group according to the median of FBG level. There was a borderline statistical significant difference in apathy scores between high-level FBG group and low-level FBG group ($t = -1.8291$, $p\text{-value} = 0.07051$). In addition, there was a statistical significance in effect of interaction between p-Tau 181 and FBG with subgroup scores of apathy symptoms (t value = -2.074 , Std Error = 0.01368, $p = 0.04087$ *)

Conclusion These findings suggest that serum FBG might correlate with apathy symptoms through CSF p-Tau burden. Fibrinogen is unique among plasma proteins owing to its molecular structure, which contains binding sites for receptors expressed by nervous system cells and its inflammatory function is mediated primarily via binding to the CD11b/CD18 integrin receptor in microglia and macrophages contributing to deficits in neuroinflammatory function. This study highlights the predominant role of peripheral inflammatory disturbance in central pathological changes of BPSD patients

Cervical Shunting To Unclog Cerebral Lymphatic Systems Surgery for Alzheimer's Disease

Peizhe Yuan^{1,2}, Chaoyue Guo^{1,3}, Mei Xin², Yuan Fang^{1,3}, Chenpeng Zhang², Zhenhu Ren⁴, Jianjun Liu², Xia Li^{1,3}

1.Department of Geriatric Psychiatry, Shanghai Mental Health Center, Shanghai Jiao Tong University school of medicine, Shanghai, China

2.Department of Nuclear Medicine, Renji Hospital, Shanghai Jiaotong University School of Medicine, Shanghai, China

3.Alzheimer's Disease and Related Disorders Center, Shanghai Jiao Tong University, National Center for Mental Disorders, Shanghai, China

4.Department of Oral Maxillofacial-Head Neck Oncology, Shanghai Ninth People's Hospital, Shanghai Jiao Tong University School of Medicine, Shanghai, China

Objective Recent studies have revealed the crucial role of the glymphatic system in eliminating metabolic waste from the brain. Impairment of this system may contribute to the pathological accumulation of proteins, such as A β and tau, observed in patients with Alzheimer's disease (AD). Therefore, cervical lymphatic-venous anastomosis (LVA) has been proposed as a potential approach to enhance glymphatic drainage and expedite the clearance of harmful proteins. In this study, we developed a novel LVA procedure called cervical shunting to unclog cerebral lymphatic systems (CSUL) surgery, aiming to alleviate glymphatic obstruction and investigate its potential therapeutic benefits for AD patients

Methods Currently, three patients have undergone surgery with the informed consent of both the patients and their families. Prior to the surgery, psychological tests, routine blood tests, and 18F-FDG PET/MR were conducted to confirm their eligibility for intervention. Additionally, cerebrospinal fluid (CSF) was collected to detect A β 42/A β 40, t-tau and p-tau181 levels, while 18F-AV45 PET and 18F-PI2620 PET imaging were performed to visualize A β and tau in the brain. The

CSUL surgery was carried out by surgeons specializing in LVA supermicrosurgery for maxillofacial tumors and lymphedema. The data from psychological tests, CSF analysis, and PET/MR scans were collected again 5 to 10 weeks after the surgery for comparative analysis

Results The index of diffusion tensor image analysis along the perivascular space (DTI-ALPS) exhibited a significant increase in all three patients, indicating that surgical intervention effectively enhanced lymphatic drainage. The families of the patients reported improvements in memory function, and there was an observed elevation of 2-3 points in mini-mental status examination (MMSE) scores. Moreover, activity of daily living (ADL) scores decreased by 2-5 points post-surgery, suggesting enhanced mobility. The increased A β 42/A β 40 ratio and decreased levels of t-tau and p-tau181 detected through CSF analysis, along with a reduction in SUVr observed in 18F-AV45 PET and 18F-PI2620 PET imaging, provided objective evidence of diminished A β and tau pathology within the patient's brain. Furthermore, overall improvement in brain glucose metabolism was demonstrated through 18F-FDG PET imaging, implying enhanced brain health

Conclusion The CSUL surgery has demonstrated initial therapeutic efficacy in patients with AD and holds promise as a viable approach for AD treatment. Consequently, it is imperative to validate its therapeutic effectiveness in a larger cohort of AD patients and assess its long-term efficacy.

Exploring The Relationship Between Brain Structural and Antipsychotic Drug Dosage in BPSD

Bo Hong Yuanyuan Liu Ling Yue* Jianhua Chen
Shanghai Mental Health Center, Shanghai Jiao Tong University School of Medicine

Introduction Behavioral and psychological

symptoms of dementia (BPSD) affect over 75% of patients with Alzheimer's disease (AD) and impose a heavy burden on caregivers and the patient's family. Since psychotropic medications are commonly prescribed for BPSD, the safety of antipsychotic drugs has always been a concern. However, there is still a lack of objective indicators for evaluating drug dosage. In this study, our objective is to investigate the relationship between brain structural alteration and the effective dosage of antipsychotic drugs for BPSD patients, with the aim of advancing precision medicine

Methods This study focuses on AD patients who are outpatient or hospitalized in the geriatric psychiatry department at the Shanghai Mental Health Center, China. Baseline general demographic data were collected from the patients. Their cognitive function was evaluated using the Mini Mental State Scale (MMSE) and the behavioral and psychological symptoms were evaluated by the Neuropsychiatric Inventory (NPI). 3D T1w brain structural MRI data were acquired and processed with Freesurfer 7.0, resulting in 68 cortical thickness and 16 subcortical regions of interest (ROIs) based on the DesikanKilliany atlas (Desikan et al., 2006) and the Automatic Segmentation of Subcortical Structures (Fischl, 2002), respectively. All patients underwent standardized clinical treatment (with or without concomitant antipsychotic drugs) and were followed up until BPSD remission. Drug treatment procedures (including drug types and doses) were recorded, where the antipsychotic drugs were converted using a defined daily dose (DDD) method to obtain the final daily dose (Leucht S., 2016). We divided the patients into three groups: DDDs=0, 0<DDD<0.3, and DDDs \geq 0.3, representing a non-antipsychotic group (NAP), a low-dose group (LAP), and a high-dose group (HAP). Region-wise comparisons on cortical thickness and sub-cortical volume were conducted across different groups. Finally, we investigated the relationship between the altered brain regions and the DDDs

Results A total of 86 AD patients who met the ICD-10 diagnostic criteria were enrolled (NAP, n=28, LAP, n=26, HAP, n= 32). Among the three groups, NAP group showed less NPI score than LAP and HAP, while no difference was observed in age, gender, education

level and MMSE score. ANCOVA analysis on brain region-wise cortical thickness measures, after controlling age, gender, education level, showed significant differences in the thickness at the left pars orbitalis ($F=3.277$, $p=0.003$) and the volume of left thalamus ($F=4.279$, $p<0.001$) among three groups. Post hoc analysis indicated that the HAP group had thinner cortex in the left pars orbitalis compared to the NAP group. Ordinal logistic regression analysis revealed that NPI ($p=0.014$) and cortical thickness at the left pars orbitalis ($p=0.037$) were independent predictors of antipsychotic drug dosage. Further association analysis between cortical thickness of the left pars orbitalis and DDDs revealed a significant negative correlation ($r=-0.229$, $p=0.04$) even after adjusting for gender, age, education level, MMSE and NPI score

Conclusion This study provides the first-ever evidence that brain anatomical changes may serve as valuable biomarkers in the prediction of antipsychotic drug dosage for BPSD. The result has significant implications for optimizing clinical management strategies and offers insights into the intricate neuropathological mechanisms of BPSD.

The Negatively Association between Successful Aging and Emotional Problems

Lian Li Hongyin Yang*

Affiliated Kangning Hospital of Ningbo University

Objective Depression and anxiety are the emotional problems most frequently experienced by older adults. We aimed to investigate the associations between successful aging (SA) and depression and anxiety in older adults from Ningbo, China.

Methods A cross-sectional study of 6,672 community-dwelling adults aged 65 years or older was performed. SA, depression, and anxiety symptoms were self-reported and measured using the relative scales.

Linear and logistic regression analyses were used to estimate the associations of SA with depression and anxiety.

Results After multivariate adjustment, we found that the SAI score was independently associated with the GAD-7 and PHQ-9 scores ($\beta = ?0.048$ and $?0.069$, respectively). Multivariate-adjusted spline regression models showed negative, nonlinear dose-response associations between the SAI score and both anxiety and depression symptoms (P for nonlinearity = 0.001 for both). With the highest quartile set as the reference, we determined that the lowest SAI score quartile was independently associated with both anxiety symptoms (odds ratio [OR] = 10.926, 95% confidence interval [CI]: 5.268, 22.664) and depression symptoms (OR = 16.131, 95% CI: 8.423, 30.892). In subgroup analyses, the association between the SAI score and depression symptoms was significantly higher in rural than in urban areas (P for interaction = 0.024).

Conclusion Among older adults in Ningbo, China, SA was found to play an important role in depression and anxiety symptoms, suggesting the need for effective and feasible interventions to promote SA in Chinese older adults

前边缘皮层精准磁刺激技术对精神分裂症样小鼠治疗效应及其神经可塑性机制研究

胡蕴珊¹ 王紫旭¹ 张志珺² 张向荣¹

1.南京医科大学附属脑科医院老年精神科

2.东南大学附属中大医院神经内科

目的 使用磁性纳米药物增强磁刺激技术(c-MSS)对精神分裂症样(SCZ)小鼠前边缘皮层(PrL)进行精准干预,探讨磁刺激对SCZ大脑皮层可能的可塑性调节作用。通过c-MSS作用的特异性探究SCZ患者的个性化磁刺激方案,优化rTMS疗效。

方法 使用NMDAR拮抗剂MK-801对C57BL/6小鼠进行SCZ造模,行为学实验验证模型效度后,在PrL脑区脑立体定位注射磁性纳米药物

(SPIO), 其后予以为期 10 天的 c-MSS 干预治疗, 干预结束后再次行为学检测, 处死动物后采用 Golgi-Cox 染色观察 PrL 脑区树突棘变化, Western blot 检测 PrL 脑区 PSD-95 等突触后相关支架蛋白的表达水平。

结果 靶向 PrL 的磁刺激显著改善 SCZ 样小鼠的自发活动异常增加、新物体识别率降低和社交倾向下降等精神病性行为, 并将 MK-801 注射后明显减少的小鼠总树突棘密度和具有记忆功能的蘑菇状树突棘密度逆转至对照组水平 ($P < 0.001$)。SCZ 样小鼠 PrL 皮层突触相关蛋白 NMDAR1 和 NMDAR2A 的水平明显升高, 突触素 (synaptophysin) 的蛋白表达水平下降 ($P < 0.05$), 这些变化被 c-MSS 显著挽救。

结论 磁性纳米药物增强磁刺激可改善精神分裂症样小鼠认知、社交以及精神病性运动增加行为, 逆转前边缘皮层树突棘密度下降, 改善突触相关支架蛋白的异常表达, 可能具有调节神经可塑性效应。

The Influencing Factors of Cognitive Impairment in Elderly Individuals in Chengdu City

Shoukang Zou Yu Wang Yamei Nie Yan Li Yuanjing Li Qin Fan Baiwei Ni Yinxue Huang Xuan Hong Ting Sun Yuan Luo Xi Ruan*
the Fourth People's Hospital of Chengdu

Objective With the aging of society, cognitive impairment in elderly people is becoming increasingly common and has caused major public health problems. The screening of cognitive impairment in elderly people and its related influencing factors can aid in the development of relevant intervention and improvement strategies.

Methods In this study, stratified random cluster sampling was used to conduct a cross-sectional survey of elderly individuals aged 65 years in Chengdu, Sichuan Province, through an electronic questionnaire from November 2022 to November 2023. Descriptive

analysis and logistic regression analysis were used to investigate cognitive impairment and its relevant influencing factors.

Results Among the 16609 elderly people, 7524 (45.3%) were males and 9085 (54.7%) were females, with an average age of 73.6 ± 6.5 years (age range 65-101 years). The average years of education was 5.9 ± 6.2 years, and the proportion of individuals with cognitive impairment was 13.1%. With increasing age, the risk of cognitive impairment increased significantly. The risk factors for cognitive impairment in elderly individuals included advanced age, hypertension, heart disease, diabetes, cerebrovascular disease, depressive symptoms, and anxiety symptoms, while the protective factors included higher education level, married status, and greater life satisfaction.

Conclusion Cognitive impairment in elderly individuals in Chengdu is serious. We can intervene in and improve cognitive impairment in elderly people by controlling blood pressure and blood sugar, treating depressive and anxiety symptoms and developing community colleges for elderly people and increasing satisfaction with life

宁波大学附属康宁医院

Objective As a non-pharmacologic treatment, bright light therapy (BLT) is often used to improve affective disorders and memory function. In this study, we aimed to determine the effect of BLT on depression and electrophysiological features of the brain in patients with Alzheimer's disease (AD) and their caregivers using a light-emitting diode device of 14000 lux.

Methods A 4-week case-control trial was conducted. Neuropsychiatric and electroencephalogram

(EEG) examination were evaluated at baseline and after 4 weeks. EEG power in delta (1–4 Hz), theta (4–8 Hz), alpha (8–12 Hz), and beta (12–30 Hz) bands was calculated for our main analysis. Demographic and clinical variables were analyzed using Student's *t* test and the chi-square test. Pearson's correlation was used to determine the correlation between electrophysiological features, blood biochemical indicators, and cognitive assessment scale scores.

Results In this study, 22 in-patients with AD and 23 caregivers were recruited. After BLT, the Hamilton depression scale score decreased in the fourth week. Compared with the age-matched controls of their caregivers, a higher spectral power at the lower delta and theta frequencies was observed in the AD group. After BLT, the EEG power of the delta and theta frequencies in the AD group decreased. No change was observed in blood amyloid concentrations before and after BLT.

Conclusion In conclusion, a 4-week course of BLT significantly suppressed depression in patients with AD and their caregivers. Moreover, changes in EEG power were also significant in both groups

Identify Patients with Obsessive-compulsive Disorder of Different Severity Level with Brain Structural and Functional Connectivity Coupling

Jiale Qi Ping Li* Xu Yang Xiaoqing Qin Zhipeng Ding Shancong Li Weiqi Qin Siyi Wei Tinghuizi Shang Yunhui Chen Zengyan Yu Tong Li Yu Jiao Chengchong Li

Qiqihar Medical University

Objective Abnormalities in structural and functional brain networks in patients with obsessive-compulsive disorder (OCD) have been identified with previous studies. However, few studies have investigated the differences between structural and functional connectivity (SC-FC) coupling in patients with OCD with different severity levels

Methods Diffusion tensor imaging (DTI) and resting-state functional magnetic resonance imaging (rs-fMRI) scans were performed on 26 cases of OCD with severe level (S-OCD), 26 cases of OCD with moderate level (M-OCD) and 30 healthy controls (HCs). Graph theoretic analysis and SC-FC coupling methods were used to combination to study brain structural and functional networks. Support vector machines (SVM) were used to test whether altered MRI features could distinguish OCD with different severity levels. Correlation analyses were used to explore the relationship between graph theory metrics of abnormal brain regions and clinical symptoms of OCD

Results In the structural network, the S-OCD group had reduced clustering coefficient (C_p) of small world and reduced local efficiency (E_{loc}) of network efficiency compared to healthy controls; significant differences in nodal network metrics of the left dorsolateral superior frontal gyrus, left middle frontal gyrus, left rolandic operculum, medial orbital superior frontal gyrus, left insula, and left calcarine fissure and surrounding cortex were found in the S-OCD group compared to M-OCD. In the functional network, the S-OCD group

had abnormal nodal network metrics in the left orbital middle frontal gyrus and right supplementary motor area compared to M-OCD. Correlation analysis showed that decreased degree centrality (aDc) values in the left orbital middle frontal gyrus in the functional networks of S-OCD were positively correlated with the compulsive behavior scores. Importantly, both structural and functional coupling strengths were reduced in the S-OCD and M-OCD groups compared to controls. The regional SC-FC coupling of FFG.L exhibited a markedly elevated level in the S-OCD group compared to the M-OCD group. The index demonstrated an accuracy of 79.1%, a sensitivity of 91.7%, and a specificity of 63.2% in identifying the two groups of OCD patients

Conclusion The SC-FC coupling enhances our comprehension of the structural and functional networks of patients exhibiting varying degrees of severity in OCD, and also serves as a dependable means for identifying patients with disparate levels of severity in OCD

Objective Depressive symptoms are the most

prevalent comorbidity in individuals with obsessive-compulsive disorder (OCD). The objective of this study was to investigate the dynamic characteristics of resting-state neural activities in OCD patients with depressive symptoms

Methods We recruited 29 OCD patients with depressive symptoms, 21 OCD patients without depressive symptoms, and 27 healthy controls, and collected data via structural and functional magnetic resonance imaging (fMRI). We analyzed the fMRI results using the dynamic amplitude of low-frequency fluctuation (dALFF) and support vector machine (SVM) techniques

Results Compared with OCD patients without depressive symptoms, OCD patients with depressive symptoms exhibited an increased dALFF in the left precuneus and decreased dALFF in the right medial frontal gyrus. The SVM indicated that the integration of aberrant dALFF values in the left precuneus and right medial frontal gyrus led to an overall accuracy of 80%, a sensitivity of 79%, and a specificity of 100% in detecting depressive symptoms among OCD patients

Conclusion Our study reveals that OCD patients with depressive symptoms display neural activities with unique dynamic characteristics in the resting state. Accordingly, abnormal dALFF values in the left precuneus and right medial frontal gyrus could be used to identify depressive symptoms in OCD patients

神经性贪食背内侧前额叶结构和功能变化与冲动的关系

陈妍*

上海市精神卫生中心(上海市心理咨询培训中心)

目的 既往研究表明冲动特质是导致神经性贪食(bulimia nervosa, BN)患者出现暴食行为的危险因素之一。功能性磁共振成像(functional magnetic resonance imaging, fMRI)研究提示背内侧前额叶(dorsomedial prefrontal cortex, DMPFC)在复杂决策

任务中发挥着重要作用，且与价值相关的有意控制过程和抑郁、焦虑情绪有关。然而 DMPFC 与暴食的关系尚未完全阐明，有待于进一步研究。

方法 共招募 36 例 BN 患者和 41 名健康对照者(healthy control, HC)，进行结构像、静息态和任务态 fMRI 扫描，并使用心理问卷评估冲动性和情绪症状。比较 BN 患者和 HC 组在以 DMPFC 为感兴趣区(regions of interest, ROI)的结构和功能之间的差异，并分析异常脑指标与临床症状之间的关系。

结果 经过 Bonferroni 校正后，两组之间的皮层厚度差异呈边缘显著($P=0.068$)。静息态 fMRI 数据的分析结果表明，与 HC 组相比，BN 组左侧 DMPFC 到双侧尾状核团簇，左侧中央后回团簇，右侧海马团簇，右侧眶额回团簇等 4 个团块，以及右侧 DMPFC 到左侧额中回团簇，左侧额上回团簇，左侧尾状核团簇，左侧前扣带回(anterior cingulate cortex, ACC)团簇，左侧丘脑团簇等 5 个团块之间的功能连接(functional connectivity, FC)强度降低。且 BN 组右侧 DMPFC-左侧 ACC 团簇的 FC 激活强度与 BIS-11 量表中的运动冲动($r=-0.39$, $P=0.042$)和无计划冲动($r=-0.61$, $P=0.001$)呈负相关。在执行 DDT 任务时，发现 BN 组延迟选择次数较 HC 组明显减少，差异存在统计学意义($P=0.014$)。相比于 HC 组，BN 组在选择延迟条件时右侧 DMPFC-双侧顶上小叶团簇和双侧楔前叶团簇的 FC 强度增强。且右侧 DMPFC-双侧顶上小叶团簇(P 分别为 0.005 和 0.024)、双侧楔前叶团簇(P 分别为 0.000 和 0.004)的 FC 激活强度与延迟折扣率呈正相关。

结论 BN 患者存在以 DMPFC 为 ROI 到多个脑区的 FC 异常，且上述 FC 异常与冲动症状有关。

The Impact of Transcranial Direct Current Stimulation on Sleep Quality in OCD Patients: A Study on Electric Field Intensity and EEG Microstates

Yang Wang¹, Jiayue Cheng¹, Puzhe Li², Wenjun Jia³,

Jian Jiang³, Zhen Wang¹

1.Shanghai Mental Health Center

2.ShanghaiTech University

3.Lingang Laboratory

Objective Obsessive-compulsive disorder (OCD) is characterized by intrusive thoughts and repetitive behaviors, with a prevalence of 2-3%. Sleep disturbances are common in OCD and can impact symptom severity and treatment outcomes. High-definition transcranial direct current stimulation (HD-tDCS) is a promising treatment for both OCD and sleep disturbances, although its efficacy remains uncertain. This study was to investigate the effects of transcranial direct current stimulation (tDCS) on obsessive-compulsive symptoms and sleep quality in patients with OCD, focusing on the relationship between electric field intensity and EEG microstates.

Methods Forty-four drug-naïve OCD patients participated in a randomized controlled trial, with 34 undergoing MRI and EEG data collection. Participants were randomly assigned to active (18) or sham (16) HD-tDCS groups. HD-tDCS sessions targeted the orbitofrontal cortex, with 10 sessions administered over two weeks. Obsessive-compulsive symptoms and sleep quality were assessed using the Yale-Brown Obsessive-Compulsive Scale (Y-BOCS) and Pittsburgh Sleep Quality Index (PSQI) before and after treatment. The electric field (EF) strength modeling was used to quantify the intensity of electrical stimulation, and EEG microstate analysis was used to examine brain activity. We explored the relationship between these two factors and clinical outcomes.

Results There was no significant interaction between treatment and time for Y-BOCS and PSQI scores. The EF intensity was not related to improvements in OCD symptoms. However, in the active group, EF intensity in the right frontal cortex regions was significantly correlated with PSQI reduction, while no such correlation was found in the sham group. EEG microstates showed stable topologies across groups, with significant correlations between EF strength in the right orbitofrontal gyrus and changes in microstate A duration and PSQI scores

Conclusion tDCS appears to be an effective intervention for improving sleep quality in OCD patients, with electric field intensity and EEG microstates playing crucial roles in the therapeutic mechanism. These findings support the potential for tDCS to be used as a non-invasive treatment option for sleep disturbances in OCD, paving the way for further research and clinical application. Further research is needed to better understand the variability in HD-tDCS effects and its potential as a treatment for sleep disturbances in OCD.

抑郁障碍认知功能损伤与肠道菌群紊乱的相关机制研究

宋小东 贾艳滨*

暨南大学附属第一医院

目的 肠道菌群紊乱是抑郁障碍(MDD)及其认知功能损伤的重要机制之一,但具体作用关系尚不明确。炎症因子与脑生化代谢可能间接影响MDD患者认知功能变化。因此,研究围绕肠道菌群紊乱、促炎/抗炎失衡与脑生化代谢紊乱探讨其与MDD患者认知功能损伤的相关性,以期发现MDD认知功能损伤可能存在的脑-肠交互机制。

方法 选取2023年2月至2024年2月期间首次就诊于暨南大学附属第一医院精神医学科门诊的MDD患者作为研究对象,予完善MATRICS成套神经认知测试、留取粪便及血液样本,同时完成氢质子波谱磁共振扫描。采用Person/Spearman分析、多元逐步回归分析、分层回归分析等方法探究MDD患者认知功能相关影响因素。

结果 (1)认知功能比较:MDD患者信息处理速度、注意/警觉性、工作记忆、词语学习、视觉学习、社会认知、总认知均低于健康对照组(HC)。

(2)炎症因子比较:MDD患者TNF- α 、IL-1、IL-6、IL-17、IL-27、IL-33水平均高于HC组。

(3)脑生化代谢比较:MDD患者双侧额叶NAA/Cr值低于HC组,右侧扣带回和左侧小脑NAA/Cr、右侧丘脑Cho/Cr高于HC组。

(4)差异菌群比较:LEfSe分析显示,MDD组Blautia、Fusobacterium、Ruminococcus、Sellimonas等菌属丰度富集。HC组Prevotella、Dialister等菌属丰度较高。

(5)认知功能的影响因素:MDD患者信息处理速度和Peptostreptococcus丰度呈正相关,注意/警觉性与Sellimonas丰度呈负相关,工作记忆与Sellimonas丰度呈负相关;逐步回归分析发现,MDD患者注意/警觉性受Sellimonas、Erysipelatoclostridium丰度影响,工作记忆受Sellimonas丰度影响,视觉学习受Ruminococcus丰度影响。其中,炎症因子(TNF- α 、IL-27、IL-33)在Sellimonas菌影响注意警觉性的过程中起调节作用,左侧额叶和右侧扣带回NAA/Cr值可调节Ruminococcus菌属和视觉学习能力之间的关系。

结论 抑郁障碍患者存在广泛而多领域的认知功能损伤,机体促炎状态显著,肠道微环境失调,同时伴随着前额叶、丘脑和小脑生化代谢水平异常。其认知功能损伤与患者炎症因子水平、左侧小脑神经元功能及肠道菌群密切相关,其中Sellimonas菌属、Ruminococcus菌属分别对注意/警觉性和视觉学习存在显著预测作用。炎症因子和脑生化代谢在抑郁障碍患者肠道菌群和认知功能的关系中起调节作用。

冲动性特质、焦虑对进食障碍症状的影响

陈典^{1,2} 孔庆梅¹ 杨磊¹ 耿淑霞¹ 陈超¹ 宋培华¹ 李雪霓¹ 司天梅¹

1.北京大学第六医院 北京大学精神卫生研究所 国家卫生健康委员会精神卫生学重点实验室(北京大学) 国家精神心理疾病临床医学研究中心(北京大学第六医院)

2.北京市怀柔安佳医院

目的 探讨冲动性特质、焦虑对进食障碍症状的影响。

方法 选取2022年3月-2023年2月北京大学第六医院门诊及住院进食障碍患者,并由有进食障碍诊疗经验、副主任医师及以上职称的精神科医生

诊断,符合 DSM-5 中神经性厌食(Anorexia nervosa, AN)、神经性贪食(Bulimia nervosa, BN)诊断标准的进食障碍患者共 244 人,并对其用进食障碍调查量表(Eating Disorder Inventory-1, EDI-1)、巴瑞特冲动性人格量表(Barratt Impulsiveness Scale, BIS-11)、状态-特质焦虑问卷(State-Trait Anxiety Inventory, S-TAI)进行评定。使用 SPSS23.0 进行统计学处理,并通过 SPSS 宏 PROCESS 程序进行中介效应分析。

结果 1. AN 和 BN 患者中的 BIS 总分、SAI 总分与 EDI 总分之间均存在显著正相关($P < 0.01$)。

2. 在 AN 患者中 BIS 对 EDI 的预测作用显著($\beta = 0.63, t = 9.70, P < 0.001$); 放入中介变量 SAI, BIS 对 EDI 的直接预测作用依然显著($\beta = 0.34, t = 5.16, P < 0.001$); BIS 对 SAI ($\beta = 0.56, t = 8.06, P < 0.001$) 的正向预测显著; SAI ($\beta = 0.52, t = 7.75, P < 0.001$) 对 EDI 的正向预测也显著。AN 患者中, 在 BIS 对 EDI 影响的直接效应及 SAI 中介效应的 bootstrap95% 置信区间的上、下限不包含 0, 表明 BIS 不仅能够直接预测 EDI; 而且能够通过 SAI 的中介作用预测 EDI。该直接效应和中介效应分别占总效应的 53.07% 和 46.93%。

3. 在 BN 患者中 BIS 对 EDI 的预测作用显著($\beta = 0.27, t = 3.12, P < 0.01$); 放入中介变量 SAI, BIS 对 EDI 的直接预测作用不显著($\beta = -0.02, t = -0.18, P > 0.05$), 但 BIS 对 SAI ($\beta = 0.50, t = 5.84, P < 0.001$) 的正向预测显著, SAI ($\beta = 0.60, t = 6.78, P < 0.001$) 对 EDI 的正向预测显著。在 BIS 对 EDI 影响的效应下 bootstrap95% 置信区间的上、下限包含 0, 表明 BIS 不能直接预测 EDI。SAI 的中介效应的 bootstrap95% 置信区间的上、下限不包含 0, 表明 SAI 在 BIS 和 EDI 之间发挥中介作用。

结论 1. 冲动性特质、焦虑对进食障碍症状有正向预测作用。

2. 焦虑介导冲动性特质对进食障碍症状的影响, 其中在 AN 患者中焦虑发挥部分中介作用, 而在 BN 患者中发挥完全中介作用。

段维 陈珏* 高睿 韩慧

上海市精神卫生中心(上海市心理咨询培训中心)

目的 验证网络辩证行为团体治疗(G-DBT)对贪食症的疗效不亚于线下辩证行为团体治疗, 为未来干预和研究提供参考。

方法 将贪食症患者随机分配至线下 G-DBT 和网络 G-DBT 组以对比疗效。在治疗前、治疗结束时(第 12 周)、治疗结束后 1 个月和 3 个月使用进食障碍检查量表(EDE-Q)评估暴食频率、进食障碍病理症状, 使用贝克抑郁量表(BDI)、贝克焦虑量表(BAI)、巴瑞特冲动性量表(BIS-11)、情绪调节困难量表(DERS-16)分别评估抑郁、焦虑、冲动控制能力和情绪调节能力。使用重复测量方差分析检验两组的暴食次数和暴食天数在治疗前后的差异; 使用线性混合效应模型检验时间、治疗形式对进食障碍病理症状、抑郁、焦虑、冲动控制能力和情绪调节能力的影响。

结果 2022 年 9 月-2024 年 3 月期间共入组 112 名患者, 线下组 55 名, 网络组 57 名。基线评估时两组的人口学资料和各临床指标均无显著差异($p > 0.05$)。治疗后患者的暴食次数($F = 14.48, p < 0.01$)和天数($F = 7.17, p < 0.01$)均明显减少, 无显著组间差异($p > 0.05$)。两组患者的暴食次数与暴食天数以相同的趋势减少, 在治疗结束时显著低于基线水平($p < 0.01$), 且在 1 个月随访时继续下降($p < 0.05$), 3 个月随访时则与 1 个月随访并无差别($p > 0.05$)。线性混合模型检验结果表明, EDE-Q 总分、BDI 总分、BAI 总分、BIS-11 总分和 DERS-16 总分的治疗形式 \times 时间的交互作用、治疗形式固定效应均不显著($p > 0.05$), 时间固定效应均显著($p < 0.05$)。事后分析结果显示, 治疗结束时各项指标水平均显著低于基线水平($p < 0.01$), 且在后续 1 个月随访、3 个月随访中保持($p < 0.01$)。EDE-Q 总分在 3 个月随访时显著低于治疗结束时和 1 个月随访时($p < 0.05$)。

结论 本研究证实了网络 G-DBT 对贪食症患者的疗效不亚于线下 G-DBT, 能够显著改善贪食症患者普遍存在的暴食症状、进食障碍相关病理特征、抑郁和焦虑情绪、冲动控制能力和情绪调节能力。

网络辩证行为团体治疗对贪食症的疗效: 一项随机对照研究

Gut Microbiota Changes Are Associated with Abnormal Metabolism Activity in Children and Adolescents with Obsessive-compulsive Disorder

Jiali Dai^{1,2}, Gang Zhu¹

1.The First Affiliated Hospital of China Medical University

2.The Third Hospital of Daqing

Objective Numbers of adult patients with obsessive-compulsive disorder (OCD) start from children or adolescents, so early identification and intervention become the key to control the disease. However, its etiology has not been fully clarified. This study sought to explore the relationship between the pathogenesis and gut microbiota in children and adolescents with OCD

Methods Multi-omics combined analysis of the gut microbiota in first-episode children and adolescents with OCD was performed. Stool samples were collected from 49 first-episode untreated children and adolescents with OCD and 42 age - and sex-matched healthy controls (HC), and all subjects were evaluated for clinical parameters. A total of 91 samples were analyzed by 16S rRNA sequencing and metabonomic based on UHPLS-MS. Correlation analysis was conducted between metagenomic sequencing results and clinical parameters to explore the relationship between intestinal flora and OCD symptoms and the possible functional pathways involved in the pathogenesis. Fecal samples from 19 OCD and 18 HC subjects were analyzed by Illumina HiSeq sequencing platform using metagenomic high-throughput sequencing method. Association analysis was performed on metagenomic and metabonomics analysis data to clarify the association between differential flora and differential metabolites

Results 1. The diversity index of intestinal flora in patients with OCD was significantly decreased (obs, $P<0.001$; chao1, $P<0.001$; ACE, $P<0.001$; shannon, $P<0.001$; simpson, $P<0.05$; good, $P<0.001$), and the microbial interaction network was significantly weaker than that in HC group. 2. The relative abundance ratio (F/B) of Firmicutes /Bacteroidetes in OCD group was

significantly lower ($P<0.001$). 3. The abundance of butyrate-producing bacteria such as Romboutsia ($q<0.01$), Mitsukella ($q<0.01$), and Terrasporobacter ($q<0.01$) in the intestine of patients with OCD decreased significantly. 4. The random forest model identified 30 specific bacteria as markers, and the AUC between OCD patients and HC was 0.9011. 5. There is a correlation between the changes of clinical parameters in OCD group and the abundance of specific bacteria in intestinal flora. 6. A total of 43 endogenous differential metabolites were screened out in OCD-HC group, and there was a correlation between the differential metabolites and the differential flora ($P<0.05$). 7. The relative contents of Neopterin and Sepiapterin, the intermediate products of folate biosynthesis, were significantly higher in OCD group ($P<0.05$); Glucocorticoids and corticosterones significantly decreased in regulating lipolysis in adipocytes and prion diseases ($P<0.05$)

Conclusion Gut microbiota of children and adolescents with OCD were disordered at phylum, genus and species level, and the diversity of flora was significantly reduced. The OCD and HC groups had distinctive intestinal flora. Several gene functional and metabolic pathways of intestinal flora in OCD patients are destroyed

Association of Thyroid Hormones with Neurometabolism in Depression with Eating Disorders

Yangyu Wu Jianzhao Zhang Qilin Zhong Yanbin Jia*
The First Affiliated Hospital of Jinan University

Objective The underlying mechanism of major depressive disorder (MDD) with eating disorder (ED) remains unclear. There are few studies on the effects of thyroid hormones (THs) on MDD and ED. We aim to clarify the characteristic changes of THs and brain neurometabolic alterations in with ED, and to explore their

relationships.

Methods 28 MDD with ED, 81 MDD without ED, and 37 age-matched healthy controls (HCs) were included in our study. Serum THs levels were measured and proton magnetic resonance spectroscopy (H-MRS) was performed to obtain the ratios of N-acetylaspartate to creatine (NAA/Cr) and choline-containing compounds to creatine (Cho/Cr) in the prefrontal cortex (PFC), anterior cingulate cortex (ACC) and thalamus. Finally, differential, receiver operating characteristic (ROC), and correlation analysis were conducted to investigate their characteristics and relationships

Results Compared with HCs, The free tri-iodothyronine (FT3) levels of the MDD with ED and MDD without ED cohort significantly decreased, while their free thyroxine (FT4) and total thyroxine (TT4) levels increased. We also found significantly lower NAA/Cr ratios in the Right thalamus and higher NAA/Cr ratios in the Left Cerebellum of MDD with ED and MDD without ED than in HCs. In addition, neurometabolic factors yielded area under the ROC curve of 0.798 in distinguishing MDD with ED from MDD without ED. Neurometabolic factors and THs levels yielded area under the ROC curve of 0.830 in distinguishing MDD with ED from MDD without ED. Moreover, serum FT3 and TT4 levels were positively associated with the brain neurometabolic alterations of the ratios of NAA to Cr in the Left Cerebellum in MDD with ED

Conclusion Our results demonstrate coinciding thyroid hormone abnormalities and neurometabolic alterations of the thalamic-cerebellum circuitry occur of MDD with ED. Further understanding of the interaction between thyroid-stimulating hormone and NAA/Cr of thalamic-cerebellum circuitry may help elucidate the etiology of abnormal eating in depressive patients

Cognitive Neuroscience and Neuroimaging Decreased Degree Centrality and Dynamic

Functional Connectivity Variability in Obsessive-compulsive Disorder

Chengbin Guan^{1,2}, Changjun Teng^{1,2}, Wei Zhang^{1,2}, Xiao Hu^{1,2}

1.Nanjing Brain Hospital

2.The Affiliated Brain Hospital of Nanjing Medical University

Objective Neuroimaging studies have indicated widespread brain structural and functional disruption in the brain of individuals with obsessive-compulsive disorder (OCD); however, the underlying mechanisms of dysfunction remain unclear

Methods Forty-five patients with OCD and forty-two healthy controls (HC) were enrolled in this study. All the subjects received T1-weighted structural magnetic resonance imaging (MRI) scanning and resting-state functional MRI scanning. We investigated the degree centrality (DC) abnormalities between OCD and HC, and furtherly the abnormal regions were used as seeds to explore the dynamic functional connectivity (dFC) based on whole brain by sliding window approach. The relationship between abnormal DC and dFC as well as clinical parameters are assessed using correlation analysis

Results Our findings suggested decreased DC of bilateral thalamus, bilateral precuneus and bilateral cuneus in OCD, and significantly negative correlation between the average DC of thalamus and the score of Y-BOCS in patients. Furtherly, regarding seed-based dFC analysis, the OCD patients showed decreased dFC variability between the left thalamus and left cuneus and right lingual gyrus, between bilateral cuneus and bilateral postcentral gyrus relative to those in HC, and significantly positive correlation between duration of illness and the dFC variability between left cuneus and left postcentral gyrus

Conclusion The study revealed that individuals with OCD demonstrated decreased hub importance in the bilateral thalamus and cuneus throughout the entire brain. This reduction is associated with impaired coupling with dynamic function in the visual cortex and sensorimotor network, providing novel insights into the

neurophysiological mechanisms underlying OCD.

Construction and Validation of A Machine Learning-Based Model for Predicting The Risk of Suicidal Behavior in Mood Disorders

Qitong Jiang Sixiang Liang Jinhe Zhang Yannan Deng Xinyu Liu Yujie Xing Hongye Yu Guangwei Zhao Chen Hu Suo Sha*

The National Clinical Research Center for Mental Disorders & Beijing Key Laboratory of Mental Disorders, Beijing Anding Hospital, Capital Medical University and the Advanced Innovation Center for Human Brain Protection, Capital Medical University, Beijing, China

Objective Suicidal behavior refers to self-harm behavior initiated by an individual with the intention of causing death. Constructing a predictive model for suicidal behavior among patients with mood disorders can improve early identification of high-risk individuals. Currently, there is a lack of accurate predictive models for suicidal behavior in mood disorders. This study aims to develop a suicidal behavior prediction model for mood disorders based on various machine learning methods, selecting the optimal model to accurately assess the risk of suicidal behavior. The validity and stability of the constructed predictive model will also be verified

Methods Real-world data from inpatients in the Depression Treatment Center of Beijing Anding Hospital in 2022 were collected, and a retrospective analysis was conducted on 1099 patients diagnosed with mood disorders (ICD-10 codes F30-F39). Features potentially related to suicidal behavior were screened as predictor variables using the LASSO regression. All patients were randomly divided into a training set (N=769) and a testing set (N=330). Ten machine learning algorithms, including random forest, support vector machine, and decision tree, were applied to the training set to construct

suicidal behavior prediction models, and the optimal cut-off point and adjustment parameters were explored. The stability of the models was tested in the testing set. The machine learning model with the best sensitivity and stability was selected based on metrics such as AUC, F1 score, and accuracy. The SHAP (SHapley Additive exPlanation) method was used to rank the importance of features and explain the best model, analyzing the potential impact of each feature on suicidal behavior

Results This study included 10 features based on LASSO regression and 1 high-risk factor from previous research conducted by the team. Ultimately, 11 features were included in the prediction model, and an attempt was made to construct it based on ten different machine learning methods. It was found that the prediction model constructed using the random forest approach had good discriminative ability (AUC=0.715) and acceptable application performance (Recall=0.4190, Accuracy=69.4%, F1-Score=0.443, MCC=0.2383). Further SHAP analysis was used to rank the importance of the 11 features, showing that the three most valuable features for predicting suicide risk were onset polarity, age, and previous suicide attempts

Conclusion The random forest approach can better construct a suicidal behavior risk prediction model for patients with mood disorders, which has good discriminative ability and acceptable application performance. We should adopt a cautious optimism in constructing suicidal behavior risk models for mood disorders, and further develop more applicable models with multimodal data in the future

Association between Digital Addiction with Overweight and Obesity Among Chinese Children and Adolescents: A Large-scale Cross-sectional Study

Peng Pu¹, Zhangming Chen², Yanhui Liao¹

1.Department of Psychiatry, Sir Run Run Shaw Hospital, Zhejiang University School of Medicine, Hangzhou,

Zhejiang, P. R. China

2. Zigong mental health center

Objective Overweight and obesity are growing public health concerns, affecting about one-fourth of Chinese adolescents. Digital addiction is an emerging mental health issue in adolescents, characterized by excessive use of electronic devices such as the internet, smartphones, gaming, and social media. Recent studies suggest a positive association between digital addiction and obesity, a relationship that has rarely been explored in the Chinese population. This study aims to explore the association of three types of digital addiction—Internet Gaming Disorder (IGD), Smartphone Addiction (SA), and Social Media Addiction (SMA)—with overweight and obesity in a large cohort of Chinese adolescents. Additionally, we examined potential sex differences in this relationship

Methods A total of 193,190 children and adolescents were recruited using cluster sampling from primary and middle schools in Zigong City. Among them, 168,384 provided validated data on height and weight. Body Mass Index (BMI) was calculated using the formula: $BMI = \text{weight (kg)} / \text{height}^2 \text{ (m)}$. The short form of the Internet Gaming Disorder Scale, the Bergen Social Media Addiction Scale, and the Smartphone Application-Based Addiction Scale were used to detect respective digital addictions. Obesity and overweight were defined according to Chinese standards. Multiple logistic regression models were conducted, with age, residence, school type, only-child status, and left-behind status as covariates. Subgroup analysis was performed separately for boys and girls

Results Approximately 12% of the children and adolescents were overweight or obese. All types of digital addiction were positively associated with overweight and obesity in the whole sample, with an adjusted odds ratio (AOR) of 1.32 (95% confidence interval [CI], 1.18-1.47, $p < 0.001$) for IGD, 1.37 (95% CI, 1.18-1.47, $p < 0.001$) for SMA, and 1.20 (95% CI, 1.15-1.25, $p < 0.001$) for SA. Subgroup analysis revealed a significantly stronger relationship in girls (AOR = 1.90 for IGD, 1.42 for SMA, and 1.34 for SA) than in boys

Conclusion Digital addiction is positively associated with overweight and obesity in Chinese children and adolescents, particularly among girls. This finding highlights the need for targeted interventions to address digital addiction and its related health consequences in this vulnerable population

基于德尔菲法构建难治性抑郁障碍疾病严重程度分期模型及模型验证

袁宁¹ 朱刚²

1. 沈阳市精神卫生中心

2. 中国医科大学

目的 构建难治性抑郁障碍 (TRD) 概念内涵、疾病严重程度分期的可视化评估工具, 并进行信效度检验及评价, 评估工具可为预测预后和疗效提供参考。

方法 1、在文献研究法和两轮德尔菲专家函询基础上构建 TRD 疾病严重程度分期模型。对 17 名专家进行两轮专家函询并进行赋分, 最终形成初版风险预测工具。

2、便利抽取辽宁省某三级医院患者, 使用 TRD 疾病严重程度分期模型对其进行评分, 根据患者一般情况调查问卷及评分检验其信效度主要包括内部一致性检验、内容效度及预测效度, 计算评估工具各维度与间隔 8 周治疗后 HAMD-24 减分率相关性, 检验其对治疗效果预后的预测效果, 最终形成 TRD 疾病严重程度分期模型。

结果 1、经过 2 轮专家函询, 最终形成包括适用患者 (1 个条目)、总病程 (3 个条目)、疾病的严重程度 (4 个条目)、症状 (18 个条目)、功能障碍 (2 个条目)、共病精神障碍 (4 个条目)、治疗失败 (13 个条目)、系统性住院治疗 (2 个条目)、创伤或应激事件 (2 个条目) 共 9 个维度, 49 个条目的 TRD 疾病严重程度分期模型。两轮专家函询的有效问卷回收率均为 100%; 专家权威系数分别为 0.84、0.89。经两轮函询后专家意见集中程度提高, 最终形成 TRD 疾病严重程度分期模型。

2、对所形成的 TRD 疾病严重程度分期模型进行信效度检验, 纳入 ≥ 18 周岁的 TRD 患者。结果发现该评估工具内在一致性克隆巴赫系数、各条目内容效度指数及总体内容效度指数为良好。模型各维度与治疗预后效果呈显著负相关, 该模型具有科学性、可靠性, 对疾病预后治疗效果具有较好的预测效度。

结论 1、本研究基于文献研究法、德尔菲专家函询法构建的 TRD 概念内涵、疾病严重程度分期的评估工具, 具有科学性、可靠性。

2、经临床实证研究验证所构建的工具具有较好的信效度及预测效度, 可为后续临床开展预后和疗效风险预测提供有效评估工具。

免疫细胞与进食障碍的因果关系: 一项孟德尔随机化研究

邵小骏 朱刚*

中国医科大学附属第一医院

目的 为探讨进食障碍与免疫表型的因果效应, 基于公开的遗传数据, 探索了 731 个免疫细胞特征与进食障碍疾病风险之间的因果关系。

方法 本研究通过使用最新的全基因组关联研究进行双样本 MR 研究, 以阐明进食障碍与免疫表型是否有因果关系并评估这种关系的方向性, 将逆方差加权法作为主要分析方法, 并进行敏感性分析以保证结果稳健性。

结果 731 个免疫细胞特征包括绝对细胞(AC)计数 ($n=118$)、反映表面抗原水平的中值荧光强度 (MFI) ($n=389$)、形态参数[MP] ($n=32$) 和相对细胞 (RC) 计数 ($n=192$), 其中 MFI、AC 和 RC 特征包含 B 细胞、CDCs、T 细胞成熟期、单核细胞、骨髓细胞、TBNK (T 细胞、B 细胞、自然杀伤细胞) 和 Treg 面板, 而 MP 特征包含 CDC 和 TBNK 面板。逆方差加权法显示进食障碍对七种免疫表型在基因层次存在因果影响, 即进食障碍可增加淋巴细胞上的 SSC-A ($\beta=0.107$, $P=0.006$), FSC-A 水平 ($\beta=0.075$, $P=0.038$), 增加 CD8+T 细胞 ($\beta=0.082$, $P=0.021$)、CD45RA- CD28- CD8+ T 细胞 ($\beta=10.080$, $P=0.011$)、CD28- CD127- CD25++ CD8+ T 细胞 (β

$=0.097$, $P=0.010$)、浆细胞树突细胞 ($\beta=0.100$, $P=0.009$)、CD8+ NKT %T 细胞 ($\beta=0.086$, $P=0.020$)、CD28- CD25++ CD8+ T 细胞 ($\beta=0.079$, $P=0.026$)、CD45RA+ CD8+ T 细胞 ($\beta=0.071$, $P=0.028$) 绝对细胞计数, 减少 CD33dim HLA DR+ CD11b- ($\beta=-0.106$, $P=0.035$)、CD4+/CD8+ T 细胞 ($\beta=-0.094$, $P=0.012$)、CD45 on CD33dim HLA DR- ($\beta=-0.122$, $P=0.034$)、骨髓树突状细胞 ($\beta=-0.078$, $P=0.047$)、IgD+B 细胞 ($\beta=-0.099$, $P=0.007$)、HLA DR on HLA DR+ CD8+ T 细胞 ($\beta=-0.106$, $P=0.007$)、CD4+ T 细胞 ($\beta=-0.083$, $P=0.024$)。对 MR 分析进行敏感性分析, 在进食障碍与免疫表型的敏感性分析显示结果之间不存在异质性。

结论 我们的研究通过遗传学手段证明了免疫细胞与进食障碍之间的密切联系, 从而为未来的临床研究提供了指导。

上海大学生进食行为问题的心理社会危险因素研究

杨阳 陈珏*

上海市精神卫生中心

目的 进食行为同时受着生物、心理、社会文化因素的影响。严重的进食行为问题可能发展为进食障碍。本研究抽样上海某大学学生, 对其进食行为问题进行评估了解进食障碍高危人群比例; 同时对该抽样群体进行心理、社会特质的评估, 以了解进食行为问题的高危因素, 为进食障碍在大学生群体中的预防提供思路。

方法 本研究对上海某大学学生进行随机抽样。对抽样群体, 予基本信息如性别、学历等记录; 予进食障碍检查自评问卷 (EDE-Q6) 评估进食行为问题的严重程度; 予抑郁症状量表 (PHQ-9) 予广泛性焦虑量表 (GAD-7) 评估抑郁、焦虑状态; 予压力感知量表 (PSS-10) 评估心理压力状态; 予人际交往问题量表 (IIP-32) 评估人际关系中的问题。EDE-Q 量表总分 ≤ 1.27 为进食障碍低危组, 总分 > 1.27 为进食障碍高危组; 定量数据两亚组间比较用 Student-t 检验或, 多于两组则使用方差分析; 危险因素分析用多

因素线性回归分析；所有统计分析在 SPSS 26 软件中完成。

结果 本研究共回收 1688 份有效问卷。EDE-Q6 得分在女性群体显著高于男性群体 (1.17 ± 1.09 vs 0.71 ± 0.87 , $P < 0.001$)；EDE-Q6 得分在本科学历亚群中显著高于硕士学历、博士学历亚群 ($P = 0.007$)；总人群中，EDE-Q6 得分 > 1.27 的进食障碍高危组共 515 人，占抽样群体的 30.5%。进食障碍高危组比低危组评分在以下量表 GAD-7 (4.84 ± 4.65 vs 2.72 ± 3.39 , $P < 0.0001$)、PHQ-9 (6.52 ± 4.89 vs 4.09 ± 3.65 , $P < 0.0001$)、PSS-10 (21.31 ± 4.26 vs 19.11 ± 5.02 , $P < 0.0001$)、IIP-32 (45.46 ± 19.89 vs 33.89 ± 18.76 , $P < 0.001$) 中显著升高。多因素线性回归分析可见抑郁、感知压力、人际关系问题 ($P < 0.0001$) 量表得分分别显著与进食问题得分呈正相关。

结论 进食行为问题在抽样大学生群体中比例高，其中女性进食问题多于男性，学历更低人群的进食问题多于学历更高人群。在进食障碍高危人群中更有突出的焦虑、抑郁、感知压力、人际关系问题。抑郁、感知压力、人际关系问题是大学生发生进食问题的危险因素。

伴非典型特征抑郁障碍患者的糖脂代谢与脑氢质子磁共振波谱研究

钟绮琳 贾艳滨*

暨南大学附属第一医院(广州华侨医院)

目的 既往研究提示伴非典型特征抑郁障碍患者中存在糖脂代谢紊乱及相关代谢激素的失调，而这可能与伴非典型特征抑郁障碍的神经生物学机制有关。本研究拟探究糖脂代谢失调与脑生化代谢在伴非典型特征抑郁障碍患者中所起作用。

方法 研究纳入 29 名伴非典型特征抑郁障碍患者、31 名不伴非典型特征抑郁障碍患者以及 34 名健康对照，采用 24 项汉密尔顿抑郁量表、汉密尔顿焦虑量表、杨氏躁狂量表进行症状严重程度评估，用美国精神障碍诊断与统计手册第 5 版障碍定式临床检查对抑郁障碍患者进行分组。进行血液检测和

脑氢质子磁共振波谱扫描，获得空腹血糖、甘油三酯、总胆固醇、低密度脂蛋白、高密度脂蛋白、胰岛素、脂联素、瘦素、胃饥饿素水平，以及额叶、前扣带回、豆状核、丘脑、小脑区域的氢质子磁共振波谱代谢物水平。用稳态模型计算得到胰岛素抵抗指数。

结果 1、伴非典型特征抑郁障碍患者的空腹血糖、高密度脂蛋白胆固醇、总胆固醇、甘油三酯、胰岛素和胰岛素抵抗指数显著升高，胃饥饿素相对降低。其中胃饥饿素与首发年龄负相关，甘油三酯与总病程呈正相关，高密度脂蛋白胆固醇与总病程呈负相关。

2、伴非典型特征抑郁障碍患者右侧前扣带回的 N-乙酰天门冬氨酸 (N-acetylaspartate, NAA) /肌酸 (creatine, Cr) 值较不伴非典型特征抑郁障碍患者低，而左侧豆状核的 NAA/Cr 值和右侧丘脑的胆碱复合物 (choline-containing compounds, Cho) /Cr 值较健康对照升高。其中右侧丘脑的 Cho/Cr 值与首发年龄呈正相关，与抑郁严重程度呈负相关。而左侧豆状核的 NAA/Cr 值与焦虑严重程度呈负相关。

3、伴非典型特征抑郁障碍患者右侧丘脑的 Cho/Cr 值与胃饥饿素呈负相关，左侧豆状核的 NAA/Cr 值在控制身体质量指数和腰围后与瘦素呈负相关。

4、伴非典型特征抑郁障碍患者的胃饥饿素对右侧丘脑的 Cho/Cr 值与首发年龄的关系起负调节作用。

结论 1、伴非典型特征抑郁障碍患者存在明显的糖脂代谢紊乱，胰岛素及胰岛素抵抗指数升高，胃饥饿素相对降低，可能是该类患者新的潜在生物学标志物。

2、伴非典型特征抑郁障碍患者的左侧豆状核和右侧丘脑存在神经代谢方面的异常，并分别与焦虑严重程度和首发年龄相关，为开发针对性的脑部治疗策略提供了潜在的靶点。

3、伴非典型特征抑郁障碍患者的左侧豆状核的神经代谢活动与瘦素有关，而右侧丘脑的神经代谢与胃饥饿素及胰岛素抵抗有关，强调了代谢激素在调节神经代谢和改善临床症状中的潜在作用。

Bulimia Nervosa Selectively Reshapes The

Structure and Intrinsic Function of Anterior Insula Subregions Associated with Cognition-emotion Integration

Lirong Tang¹, Weihua Li², Zhanjiang Li¹, Peng Zhang², Jing Liu¹

1.Beijing Anding Hospital, Capital Medical University

2.Beijing Friendship Hospital, Capital Medical University

Objective Existing evidence suggests that anterior insula plays a crucial role in cognitive control and emotional regulation and is implicated in the onset and maintenance of bulimia nervosa (BN). However, it remains unclear how structural and functional abnormalities in specific subregions of anterior insula contribute to BN

Methods In this study, we analyzed structural MRI and resting-state functional MRI data from 54 BN patients and 56 healthy controls (HCs). We conducted voxel-based morphometry, amplitude of low frequency fluctuation (conventional band: 0.01-0.08 Hz, slow-5: 0.01-0.027 Hz) and seed-based whole-brain functional connectivity (FC) analysis of the anterior insula subregions for both groups. Additionally, we investigated the correlation between neuroimaging findings and clinical characteristics in the BN group
