Results Total thyroxine (tT4) and free thyroxine (FT4) were higher in patients with SCZ than that of HCs (p 's <0.0001). Sex hormones estradiol (E2) ($p=0.018$), Progesterone (PROG) ($p=0.026$) and testosterone (TESTO) ($p<0.0001$) are decreased in patients with SCZ than in HCs. Network analysis showed that the connection between domain "activation" and "anxiety-depression" was the strongest positive edge, followed by the edges between "activation" and "hostility" at symptoms-dimension levels. Expected influence showed that "activation" was the central symptoms domain, followed by "hostility". At symptoms-items levels, BPRS10 ("hostility") and BPRS14 ("uncooperativeness") was the strongest positive edge, followed by the edges between BPRS11 ("suspiciousness") and BPRS12 ("hallucination"). Nodes BPRS3 ("emotional withdrawal"), BPRS6 ("tension"), BPRS14 ("uncooperativeness") and BPRS10 ("hostility") might be central symptoms of SCZ. FT4 and TESTO levels were significantly correlated with central symptoms

Conclusion This study implicates that FT4 and TESTO may be potential markers of SCZ. Central symptoms identified by network analysis might be potential targets for clinical intervention

心理弹性在精神分裂症患者照顾者病耻感和 社会支持间的中介作用

廖小雨 廖巧玲*

绵阳市第三人民医院（四川省精神卫生中心）

目的 探讨精神分裂症患者照顾者病耻感现状及与社会心理学因素的相关性，并分析其心理弹性在社会支持与病耻感之间的中介效应，旨在为其制订有效的干预措施提供理论依据。

方法 2022年10月-2023年11月，采用便利抽样法选取165例在某院就诊的精神分裂症患者照顾者为研究对象，采用一般资料调查问卷、贬低-歧视量表、病人健康问卷（PHQ-9）、广泛性焦虑自评量表（GAD-7）、心理弹性、应对方式、社会支持对其进行横断面调查。

结果 精神分裂症患者照顾者的贬低-歧视量表得分（ 33.56 ± 7.24 ）、PHQ-9量表得分（ 5.74 ± 5.63 ）、GAD-7量表得分（ 5.76 ± 4.88 ）、心理弹性得分（ 20.28 ± 10.16 ）、应对方式总分（ 29.32 ± 11.69 ）、社会支持总分（ 37.80 ± 9.48 ），Pearson相关性分析显示：贬低-歧视量表与心理弹性、应对方式以及社会支持呈负相关，与PHQ-9、GAD-7量表成正相关。以社会支持为自变量，病耻感为因变量，心理弹性为中介变量构建中介效应模型，中介效应分析结果显示直接效应不显著（ $P>0.05$ ），间接效应为-0.076，模型总效应为-0.165，中介效应均显著（ $P<0.05$ ），心理弹性起完全中介作用。

结论 医护人员应重视精神分裂症患者照顾者的病耻感水平，可采用有效措施提升其心理弹性水平，改善其病耻感水平，帮助减轻心理负担。

关键词：精神分裂症；照顾者；病耻感；心理弹性；社会支持

3.0T 磁共振评价抗精神病药物治疗后心功能改变的应用研究

赵果城*

成都市第四人民医院

目的 探讨分析使用3.0T磁共振心脏扫描评价规律抗精神病药物（APS）治疗后心脏结构及功能特点，为早期发现心功能损伤提供临床依据。

方法 参照ICD-10诊断标准纳入2022年1月至2023年12月成都市第四人民医院诊断为精神分裂症并规律服用APS 6月至2年患者38例为实验

组，同时纳入健康对照组35例，收集并分析其临床资料及心脏磁共振（CMR）数据。

结果 1.一般资料：38例实验组中男性22例，女性16例，平均年龄 39.61 ± 9.50 岁，服用药物2~24个月，心率 79.34 ± 13.79 次/分钟；正常对照组35例，男性20例，女性15例，平均年龄 41.26 ± 10.31 岁。2.左心室：实验组左心室结构未见明显异常，左心功能未见明显减低（ $EF=60.03\pm 8.97\%$ ）；实验组左心输出量（LVCO）较对照组增高 [5.78 ± 1.61 l/(min \times m²) 比 5.02 ± 1.31 l/(min \times m²)， $t=2.197$ ， $P=0.031$]，差异具有统计学意义。3.右心室：实验组较对照组右心收缩末期容积（RVESV）（ 62.66 ± 23.41 ml 比 53.24 ± 15.38 ml）及右心每搏输出量（RVSV）（ 66.14 ± 19.80 ml 比 57.61 ± 14.57 ml）增大，且差异具有统计学意义（ $P<0.05$ ）；右心输出量（RVCO）较对照组增高 [5.11 ± 1.44 l/(min \times m²) 比 4.31 ± 1.42 l/(min \times m²)， $t=2.197$ ， $P=0.031$]。

结论 服用APS患者早期在心脏结构及功能未见明显改变及减低情况下，左右心输出量（LV/RVCO）可能已经发生代偿性增高。临床应密切结合CMR结果，高度重视无症状的亚临床影像学改变，有助于降低服用APS导致心肌损伤病死率，改善患者生存质量和预后。

计算机认知矫正疗法联合团体绘画治疗对慢性精神分裂症患者认知功能及社会功能的影响

谢平*

宁夏回族自治区宁安医院

目的 探讨计算机认知矫正疗法（CCRT）联合团体绘画治疗对慢性精神分裂症患者认知功能及社会功能的影响。

方法 选取2022年12月-2023年12月我院收治的慢性精神分裂症患者60例为研究对象，随机分为对照组（ $n=30$ ）和观察组（ $n=30$ ）。对照组给予患者常规康复治疗（有氧训练、作业治疗、改良森田治疗等）指导患者进行连续治疗3个月。观察组在对照组基础上采用CCRT联合团体绘画治疗，均

持续治疗 3 个月。对比两组的认知能力筛查量表测评(CASI)评分及社会功能缺陷筛选量表(SDSS)评分。具体如下:(1)CCRT:对患者进行简单的电脑操作培训,经电脑系统认知能力筛查量表评估根据范式提示对其进行指导,引导患者循序渐进地进行计算机认知作业练习。CCRT系统涵盖了6个治疗模块18项训练,包括:感知运动能力、综合注意力、学习和记忆能力、执行能力、语言能力、社会认知能力。每个模块包括2~5项不同的练习,每项练习涵盖了难易不同的练习任务。整个操作过程依照患者认知水平进行,同时需保证治疗过程的系统性及准确性,并给予患者一定的正反馈。CCRT治疗30min/次,1次/d,5次/周,连续治疗3个月。(2)团体绘画艺术治疗,为患者设置一个主题,指导其采用不同的绘画方法表达出自己内心的想法及完成绘画任务;分享时鼓励其上台介绍自己的绘画作品,表达绘画意图;在绘画艺术治疗结束后,指出患者绘画过程中出现的问题并帮助其解决。团体绘画治疗60min/次,1次/3d,2次/周,连续治疗3个月。

结果 治疗后,观察组的CASI中连线时间,符号检索评分分别为(33.19±2.02)分,(18.95±1.58)分,均低于对照组,数字正序、数字倒序评分分别为(11.21±1.60)分,(9.48±0.77)分,均高于对照组,组间差异有统计学意义($P<0.05$)。治疗后,观察组的SDSS评分为(4.16±0.51)分,低于对照组,差异有统计学意义($P<0.05$)。

结论 慢性精神分裂症患者采用CCRT联合团体绘画治疗的效果显著,能有效改善认知功能及社会功能,值得临床推广使用。

Decoding the striatum of drug-naive patients with obsessive-compulsive disorder: a transcriptome and longitudinal functional magnetic resonance imaging study

Yiding Han*

The Second Xiangya Hospital of Central South University

Objective The striatum's role in the pathology of obsessive-compulsive disorder (OCD) is recognized. However, the specific contributions of individual striatal subregions (SSs) to OCD pathology are underexplored

Methods We recruited 49 drug-naive OCD patients and 53 healthy controls, conducting clinical assessments and resting-state functional magnetic resonance imaging (rs-fMRI) scans pre- and post-4-week paroxetine treatment. Inter-group comparisons were conducted to investigate baseline and treatment-related changes in the patients' striatum using certain fMRI metrics. Furthermore, these metrics, functional connectivity (FC), and effective connectivity (EC) of SSs were analyzed. Associations between gene expression patterns and altered information flow patterns of SSs were investigated, followed by enrichment analysis of relevant genes

Results While no significant alterations were observed in the patients' striata, significant changes in degree centrality, FC, and EC were identified in SSs pre- and post-treatment. In particular, the EC analysis unveiled an enhanced top-down control and diminished bottom-up regulation in drug-naive OCD patients. Following treatment, bottom-up EC improved, along with an improvement in clinical symptoms. Additionally, information flow alteration-related genes were enriched in various biological processes and pathways. They substantially overlapped between bidirectional information flows among SSs and the rest of brain and between information flows among homotopical SSs and the rest of brain

Conclusion This study highlights the diverse contributions of each striatal subregion to OCD pathology. Paroxetine may alleviate the symptoms of OCD patients by enhancing bottom-up regulation. Furthermore, transcriptome and rs-fMRI findings together offer novel insights into the biological substrates underlying the altered EC of SSs in OCD patients

关键词: Granger causality analysis; effective connectivity; functional connectivity; gene

Altered Levels of Cytokine, T- and B-lymphocytes, and PD-1 Expression Rates in Drug-naïve Schizophrenia Patients with Acute Phase

Yali Zheng Zhengchuang Fu*

Affiliated Xiaoshan Hospital, Hangzhou Normal University

Objective Many studies have investigated the changes of immune cells and proinflammatory cytokines in patients with acute schizophrenia, but few studies have investigated the functional phenotypes of immune cells and the expression rate of programmed cell death protein 1 (PD-1)/ programmed cell death-Ligand 1 (PD-L1). The aim of this study was to investigate the extent of immune cells activation, PD-1/PD-L1 expressions, and altered cytokine levels in drug-naïve schizophrenia patients with acute-phase

Methods 23 drug-naïve schizophrenia patients in acute-phase and 23 healthy individuals were enrolled in this study as experimental and control groups, separately. Socio-demographic information including gender, age, duration of illness, and smoking status was collected for each subject. Beckman DXFLEX triple laser thirteen-color flow cytometer and self-contained software CytoFLEX flow cytometric analysis software were used to detect the expressions of PD-1/PD-L1 on CD4+/CD8+ T lymphocytes, B lymphocytes, monocytes and NK cells. BD Bioscience was used to examine the levels of cytokines including interferon (IFN)- γ , tumor necrosis factor (TNF)- α , Interleukin (IL)-2, IL-4, IL-6, and IL-10

Results Drug-naïve schizophrenia patients in acute-phase had higher levels of peripheral blood CD4+ T lymphocytes and B lymphocytes, higher PD-1 expression in B lymphocytes, and lower levels of CD8+ T lymphocytes. In addition, IL-6 levels of peripheral blood were higher in schizophrenia patients (all $P < 0.05$)

Conclusion Significant immune stress was present in schizophrenia patients with acute-phase

关键词: schizophrenia; immune; cytokines; programmed cell death protein 1

叶黄素联合低碳水饮食对改善精神分裂症代谢综合征的研究

盛宏伟 方向明*

武汉市荣军优抚医院/武汉市江汉区社区卫生服务中心

目的 本研究旨在探讨补充叶黄素及低碳水饮食对改善精神分裂症患者代谢综合征的影响。叶黄素是一种抗氧化剂,抑制负责激活脂肪细胞的转录因子过氧化物酶体增殖物激活受体- γ (PPAR γ)的活性。PPAR γ 的活化可下调炎症因子,如 TNF- α 、LP 和白细胞介素-6(IL-6)的表达,并诱导脂联素(一种使肝脏和肌肉对胰岛素敏感的脂肪因子)的表达,进而调节胰岛素的敏感性,干预脂肪细胞分化,发挥降脂作用。能够显著降低腹部脂肪组织的重量,并降低血清胆固醇和低密度脂蛋白胆固醇(LDL-C)的浓度。叶黄素可能有助于控制由饮食引起的肥胖及其相关并发症。低碳水饮食可以帮助机体将过多的脂肪以糖异生作用转化为葡萄糖,从而达到促进体内脂肪分解代谢的作用。因此,叶黄素联合低碳水饮食可能对治疗精神分裂症患者代谢综合征提供依据和思路。

方法 1.1 实验对象:选取 100 例精神分裂症伴发代谢综合征患者为研究对象,两组均干预 8 周。1.1.1 实验组 实验组采用叶黄素补剂 20mg/d,低碳水饮食。1.1.2 对照组 本研究对照组参与者将接受安慰剂。采用单纯限能量均衡饮食。1.1.3 观察指标及相关定义 检测干预前后血脂指标(三酰甘油(TG)、总胆固醇(TC)、高密度脂蛋白(HDL)、低密度脂蛋白(LDL)、空腹血糖(GLU)、糖化血红蛋白(GHb)及尿酸(UA))、体质指数(BMI)、胃肠道反应发生率及阳性与阴性症状量(PANSS)。采用 likert10 级评分法记录干预前、干预期间饥饿感程度(饥饿感严重程度:0 分为无饥饿感,1~3 分为轻度饥饿感,4~7 分为中度饥饿感,8~10 分为强烈饥饿感),统计腹泻、腹胀、便秘等胃肠道反应发生率。

结果 研究结果显示,与对照组相比,实验组在以下方面表现出显著改善:体重:实验组平均体重下降了约 2.79 公斤,而对照组体重无明显变化。血脂水平:实验组血清胆固醇和低密度脂蛋白胆固醇(LDL-C)、血糖、尿酸水平显著降低,而对照组

血脂水平无明显变化。饥饿感程度：实验组在干预期间的饥饿感程度明显降低，而对照组无明显变化。两组在胃肠道不良反应及精神症状方面无明显差异。统计学分析显示，实验组与对照组在体重、血脂、血糖、尿酸和饥饿感程度等方面的差异具有统计学意义 ($p < 0.05$)。

结论 结果表明，补充叶黄素及低碳水饮食对改善精神分裂症患者的代谢综合征具有显著效果。然而，本研究仅为初步发现，仍需进一步验证。未来的研究可以进一步探讨叶黄素及低碳水饮食对精神分裂症患者代谢综合征的长期影响。此外，还可以研究叶黄素的剂量和低碳水饮食疗程对治疗效果的影响，以期为临床治疗提供更为精确的指导。

关键词：叶黄素、低碳水饮食、精神分裂症、代谢综合征

关于男性精神分裂症伴骨质疏松症中西医结合多学科诊疗模式的研究

刘会英¹ 张锦²

1. 沈阳市安宁医院

2. 沈阳市骨科医院

目的 精神分裂症是临床常见的重性精神疾病，几乎占到精神卫生机构住院患者的 70% 以上。精神分裂症患者经常伴有骨质疏松症，但因其隐匿性发展，往往易被忽视。精神分裂症患者的骨质疏松与精神分裂症本身相关，与抗精神病药的应用相关，同时也与其某些不良生活习惯相关。骨质疏松已成为精神分裂症患者骨痛、骨折及骨折致残的主要原因之一，医院内发生的骨折更可能成为医患纠纷的一个诱导因素。目前，国家大力提倡及发展精神卫生事业，但精神分裂症患者伴随的骨质疏松症仍是一个当下较难解决的问题。本文关注该类患者群，将精神医学、中医学、骨科学、老年医学、内科学、心理学、康复医学、营养学、护理学、照护学等多个学科进行整合并研究规范化诊疗方案，既能解决精神疾患，又能保证其躯体健康，为精神科中西医结合多式探索提供一定帮助和借鉴。

方法 收集我院患者中，明确诊断为精神分裂症共病骨质疏松症患者，随机分为观察组和对照组，各 50 例。对照组给予常规诊疗模式，观察组给予多

学科规范化诊疗模式。治疗期 6 个月。对比分析治疗前后骨密度、泌乳素等各项骨质疏松有关评估指标，简明精神病评定量表 (BPRS) 等精神量表的评分及不良反应发生情况。

结果 经过 6 个月的治疗，观察组和对照组患者的简明精神病评定量表 (BPRS) 治疗前后均无显著差异 ($P > 0.05$)；两组骨密度评分均有所下降，但观察组下降幅度更大，表明中西医结合多学科诊疗模式在改善男性精神分裂症伴骨质疏松症方面具有一定的优势。

结论 本研究结果表明，将中西医结合多学科诊疗模式应用于精神分裂症伴骨质疏松症，疗效显著，拥有极高的有效率。因此，中西医结合多学科诊疗可以作为治疗精神分裂症伴骨质疏松症的一种有效的诊疗模式，值得进一步研究和推广。

关键词：精神分裂症；骨质疏松症；中西医结合；多学科诊疗

从气机升降出入探讨精神分裂症的发病机制

刘勇*

沈阳市安宁医院

精神分裂症 (Schizophrenia, SCH) 是临床常见的严重精神疾病，中医学将其为“癫狂”“痴呆”等范畴，临床上多表现为意志、情感、思维等多方面的障碍，因其病程迁延、病情反复发作、致残率高等特点。

精神分裂症多以精神症状为主，患者大部分无有效主诉，单从精神症状角度，难以进行中医的辨证分析，缺乏有效的治疗依据，但是气机紊乱形成的病理产物影响神志则相对较为容易，因此从气机紊乱探讨精神分裂症的病机。

五脏藏神指心和肝、脾、肺、肾共同贮藏人的思维活动，心神统管五脏之神；神既包括神、魂、魄、意、志，又包括其他生命活动力，五脏藏神中，心藏神的神是狭义的神；在五神所在主宰之位，为五脏之主。就人体而言，有广义与狭义之分，广义之神指生命活动的外在表现，狭义之神特指精神活动思维；中医认为心主神明指心主宰精神、情志、意志、思维、活动。在思维意识活动中，心与脑的关系是心为体脑为用；脑在功能上是阴阳气血精明流注的通道，

而且又贮藏精髓，神明流注之所；心是五脏六腑之大主，五脏功能表现神明之体藏于心神明之用发于脑，现代研究也证明心脑对脑对人体的精神活动都具有重要的控制和调节作用。

从气机升降出入讨论癫狂；由于气机逆乱，气血运行不畅，所致虚、火、痰、瘀等形成的病理产物，而影响心脑的神机逆乱，是癫狂发病的根本所在。在治疗上，从调畅气机的角度治疗癫狂，即降逆、升举、收补、开塞。

通过理论阐发，可以从气机升降出入角度来认识癫狂，人的生命活动全依赖于气的升降出入运动来维持，人体的气机升降出入失常，导机体致病理产物的出现，所致神志的逆乱为从气机升降出入角度论述癫狂奠定理论基础。气机升降出入论癫狂详细地论述了癫狂的发病与季节、时间的关系；本文认为可以从气机升降出入角度来阐述癫狂的发病形成机制，用气机升降出入理论指导临床用药，对癫狂治疗提供新的思路。

关键词：神志病，气机升降出入

基于中医整体观与辨证施治原则下中药治疗精神分裂症阴性症状的效果

李明 宋震*

沈阳市安宁医院

目的 本研究旨在探讨基于中医整体观与辨证施治原则下，中药治疗精神分裂症阴性症状的效果，并通过随机对照研究的方式，比较中药与西药（氨磺必利小剂量）在改善精神分裂症患者阴性症状、认知功能、睡眠情况和自我效能方面的差异。精神分裂症是一种复杂的慢性精神疾病，其阴性症状（如情感平淡、社交退缩、意志缺乏等）对患者的生活质量和社会功能造成严重影响。近年来，中医药在精神疾病治疗领域的应用逐渐受到重视。本研究通过随机对照研究，旨在探讨基于中医整体观与辨证施治原则下的中药治疗对精神分裂症阴性症状的影响，以期临床治疗提供新的思路和方法。

方法 本研究共纳入 60 例精神分裂症残留阴性症状患者，随机分为观察组和对照组，每组各 30 例。对照组患者给予氨磺必利 0.2 克晚口服治疗；观察组则根据中医整体观与辨证施治原则，给予中药

汤剂治疗。治疗周期为 8 周。研究过程中，采用阳性与阴性症状量表(PANSS)和阴性症状量表(SANS)作为评价标准，同时评估患者的认知功能、睡眠情况和自我效能。

结果 阴性症状改善情况：经过 8 周的治疗，观察组和对照组患者的 PANSS 和 SANS 评分均有所下降，但观察组下降幅度更大，表明中药在改善精神分裂症阴性症状方面具有一定的优势。认知功能改善情况：通过对比两组患者治疗前后的认知功能评分，发现观察组在认知功能改善方面优于对照组，表明中药在提高精神分裂症患者认知功能方面具有一定的作用。

睡眠情况改善情况：本研究采用匹兹堡睡眠质量指数(PSQI)评估患者的睡眠情况。结果显示，治疗前两组患者的 PSQI 评分无显著差异($P>0.05$)；治疗后，观察组 PSQI 评分为(6.23±2.86)，对照组 PSQI 评分为(5.89±1.98)，明显低于对照组($P<0.05$)，表明中药在改善精神分裂症患者睡眠情况方面具有较好的效果。自我效能改善情况：通过对比两组患者治疗前后的自我效能评分，发现观察组在自我效能改善方面优于对照组，表明中药在提高精神分裂症患者自我效能方面具有一定的作用。

结论 本研究结果表明，基于中医整体观与辨证施治原则下的中药治疗在改善精神分裂症阴性症状、认知功能、睡眠情况和自我效能方面具有一定的优势。这可能与中药具有多靶点、多途径的作用机制有关，能够针对精神分裂症的复杂病理过程进行整体调节。因此，中药可以作为治疗精神分裂症阴性症状的一种有效手段，值得进一步研究和推广。

关键词：中医整体观，精神分裂症，阴性症状

STON2 变异通过调控 Syt1 转运参与突触功能障碍和精神分裂症样行为

李俊*

北京大学第六医院

目的 精神分裂症是一种高遗传度的重性精神障碍，以阳性症状、阴性症状和认知功能缺陷为主要临床特征，影响全球约 1% 的人口，并具有较高的致残率、死亡率和沉重的疾病负担。网格蛋白介导的内吞作用(Clatrin-mediated endocytosis, CME)

在突触囊泡的循环和释放中起关键作用，而正常的突触结构和功能对于维持神经环路信号的精确传递有重要作用并参与脑高级功能。大量研究提示包括 CME 受损在内的突触结构和功能异常与精神分裂症的发病相关。然而，潜在的遗传风险因素和致病分子机制目前仍不完全清楚。此外，精神分裂症患者通常需要长期用药，而目前临床仍以“经验化”或“试错法”为主要治疗策略，由于疗效不佳导致的临床换药影响其治疗依从性和预后，因此亟需解析影响药物疗效个体化差异的遗传风险因素及机制并为将来精神分裂症的精准治疗提供相关依据。

方法 本研究基于分子遗传学研究发现精神分裂症易感基因多态性变异线索，进一步通过构建基因修饰小鼠模型，并运用动物行为学评定、免疫电镜、膜片钳电生理以及分子细胞生物学等手段深入研究易感基因变异致病的神经生物学机制，并探索潜在干预策略。

结果 通过大样本精神分裂症和对照人群的遗传分析发现 STON2 的 C-C (307Pro-851Ala) 单倍型增加了精神分裂症的易感性风险。神经生物学机制研究发现 STON2 (307Pro851Ala) 变异与突触前膜的钙传感器蛋白 Synaptotagmin-1 (Syt1) 的相互作用减弱，导致体内 Syt1 分布异常，兴奋性突触前的囊泡内吞和循环释放过程受损。突变敲入小鼠出现突触传递功能障碍，以及社会功能退缩、感觉门控功能受损和对 MK-801 等拟精神病药的敏感性增加等类似精神分裂症样的行为表现。进一步的药物基因组学数据分析表明，在七种抗精神病药物中，携带 C-C (307Pro-851Ala) 单倍型的精神分裂症患者对氟哌啶醇治疗响应优于 T-A (307Ser-851Ser) 携带者。通过急性氟哌啶醇给药可以挽救 STON2 (307Pro-851Ala) 突变敲入小鼠的突触传递缺陷，有效改善突变小鼠的精神分裂症样行为。

结论 精神分裂症相关 STON2 变异对兴奋性突触前的囊泡内吞、循环释放和突触功能的影响，且有望基于 STON2 基因分型分析指导精神分裂症的个体化治疗。

关键词：STON2；精神分裂症；突触功能障碍；氟哌啶醇

伴暴力行为精神分裂症患者的风险决策功能及社会认知特点的研究

易峰² 周德怡¹

1. 无锡市精神卫生中心

2. 宜兴市精神卫生中心

目的 探究伴暴力行为精神分裂症患者的风险决策功能及社会认知 (Social cognition) 功能特点。

方法 选择江南大学附属无锡市精神卫生中心精神科及宜兴市第五人民医院就诊的伴暴力行为精神分裂症患者 40 例作为研究组，诊断符合《美国精神障碍诊断与统计手册第 5 版》(DSM-V) 的精神分裂症的诊断标准，且伴有明显的暴力行为；同时选择无暴力精神分裂症患者 40 例作为对照组，诊断均由副主任医师以上的高年资医师评估。两组均给予失言察觉任务测试 (The faux pas recognition test, FPR) 评估患者的社会认知功能，同时予爱荷华赌博任务 (Iowa Gambling Task, IGT) 评估患者的风险决策功能。应用 SPSS13.0 统计软件包统计结果，对两组所测得结果进行比较，并对研究组的 FPR 评分与 IGT 评分进行相关分析。

结果 一般资料比较，两组性别构成、年龄及受教育年限比较无统计学意义 ($P > 0.05$)。两组 FPR、IGT 评分进行组间比较，研究组的 FPR 总分、失言故事分、控制故事分均低于对照组，差异均有统计学意义 ($t = 2.127 \sim 6.411$, 均 $P < 0.05$)；研究组的 IGT 净得分总分 (-1.36 ± 3.58) 低于对照组 (5.36 ± 4.41) 分，差异有统计学意义 ($t = 7.651$, $P = 0.000$)；IGT 各 Block 的净得分组间比较，重复测量方差分析结果显示组别主效应显著 ($F = 7.575$, $P = 0.007$)，研究组 Block 4、Block 5 的净得分低于对照组，差异有统计学意义 ($t = 4.124$ 、 2.772 , $P = 0.000$ 、 0.023)；研究组 FPR 总分、失言故事分与 IGT 的净得分总分的相关性分析均呈正相关 ($r = 0.558 \sim 0.374$, 均 $P < 0.01$)。

结论 与无暴力精神分裂症患者相比，伴暴力行为的精神分裂症患者的社会认知及风险决策功能均明显受损，且二者间存在明显相关。

关键词：精神分裂症；暴力行为；社会认知；风险决策

精神疾病治疗的闭环疗法

付庆荣 武玉鸿*

通用环球中铁唐山医院

目的 有效治愈精神疾病.精神疾病始初是不用药,经治疗痊愈后,也是不用药的,即回到原位----闭环疗法

方法 选用的均为首诊的抑郁症和精神分裂症患者,本研究为开放性门诊治疗,药物剂量可调整的临床试验,采用自然观察,预约随诊的研究方法,对 51 例精神分裂者和 57 例抑郁症患者进行为期 12 周的小剂量抗精神病药递减法然后停药进行治疗观察,随访 10 年.

精神分裂症的治疗:利培酮 1-2 毫克每日,治疗 4 周,第五周递减到 0.5-1 毫克每日,治疗 4 周后,再减至 0.25 毫克,维持治疗 4 周停药.

抑郁症的治疗:代力新 2 片每日,治疗 2 周,递减至 1.5 片每日,两周后递减至 1 片每日,治疗 3 周后,减至 0.5 片每日,维持 4 周后停药(代力新总量不超过 90 片)

疗效主要评定指标:精神症状完全消失,社会功能恢复如初,学生能继续上学,工人能继续做工,农民继续种田.

对照组:长期住院的精神分裂症和抑郁症患者,长期用药,久治不愈,已造成药物依赖,反复住院,失去基本社会功能,自杀,代谢综合症,大部分已成残疾.

结果 51 例精神分裂症患者,精神症状缓解充分,已回归社会,即回到原点,有 7 例复发患者,经再次服用利培酮 1 毫克每日,半月后减至 0.5 毫克每日,治疗 2 周停药,症状缓解,完成随访.

57 例抑郁症患者中,治疗过程即没有中断社会活动,治疗过程工作学习没受到影响,精神症状缓解充分,有 11 例复发,再次给予代力新 1 片每日,半月后减至半片每日,两周后停药.57 例均完成随访.

结论 1.精神疾病并不是残疾性疾病,闭环治疗是唯一可治愈疾病的有效、简便、安全、低费用的方法

2.精神药物是一把双刃剑,小量、适量可治愈各种精神疾病;长期、大量应用会导致各种精神疾病,甚至残疾

3.精神疾病的残疾是药物(过度治疗)导致的,这一点应引起同道们的警惕.

关键词: 闭环疗法,社会功能完好

基于五行生克理论对于幻听的病因分析

田野*

沈阳市安宁医院

目的 幻听是精神分裂症患者最常见的阳性症状之一,精神分裂患者中有 60%-83%的患者存在言语性幻听,其中包括真性幻听和假性幻听,约 23%的双相障碍患者、46%的边缘型人格障碍患者及 10%-15%的健康人群也不同程度的有过言语性幻听体验.幻听作为一种常见的精神病性症状,往往给患者带来了较大的精神痛苦,甚至影响其社会功能,特别是精神分裂症患者,可能在幻听的支配下出现行为异常甚至失控,进而出现伤人毁物的不良行为,对家庭和社会造成极大的危害.但幻听的发病机制至今不能明确,其治疗方法多为精神科药物治疗、经颅磁刺激治疗,以及包括阿凡达疗法在内的心理治疗,但有部分患者的幻听因长期治疗效果欠佳,逐渐演变为难治性幻听.精神分裂症属中医神志病范畴,秦汉时期已有相关记载和描述,如《灵枢·癫狂》曰:“耳妄闻”.通过中医的理论分析辨证论治使幻听的中医病因和治疗逐渐完整.

方法 肾开窍于耳,因此听觉主要取决于肾,但不仅限于肾,根据五行生克理论,肺为肾之母,肝为肾之子,若母病及子,或子盗母气,即肺病伤及肾,或肝病伤肾,则均可出现肾的病变,而出现听觉的异常,此处的听觉异常包括,耳聋、耳鸣、幻听等,又因肝藏魂而肺藏魄,魄的异常包括魄气过强,魄用不足和魄机惑乱,其中魄气过强可出现幻听或幻视,临床上,患者常常因情志不遂而发病,因此部分患者亦有肝气不疏而起病,因此,在辨证上应严格把握患者的发病病因,为肺实肾虚或为肝郁肾虚,在治疗上应区别用药拟方.

结果 通过五行生克的理论对幻听的病因进行中医辨证分析,把握幻听症状出现的主要脏腑及相关脏腑,完善幻听的中医病因理论的完整性和系统性,并在此基础上处方用药,提高临床治疗的有效性,减轻患者的痛苦.

结论 幻听作为精神类疾病患者的常见的阳性症状,治疗上,部分患者效果并不满意,小部分患者长期存在,严重影响了患者的生活质量,多手段,多种治疗方式的使用,使临床医师治疗更加灵活多样,并可取得更好的治疗效果,随着理论的深入和临床实践的丰富,令更多的患者较完整的恢复社会功能.

山西医科大学

伴攻击行为男性精神分裂症治疗前后甲状腺激素水平变化

张哲*

太原市精神病医院

目的 探讨伴攻击行为的男性精神分裂症患者治疗前后血清甲状腺激素水平变化。

结论 伴攻击行为的男性精神分裂症患者甲状腺激素水平治疗前升高、治疗后下降, FT3、FT4 水平及其变化值可能是攻击行为严重程度的敏感指标。

方法 将 80 例男性精神分裂症患者(患者组)分为攻击组(评分 ≥ 4 分)和非攻击组(评分 < 4 分)各 40 例,匹配健康对照组 40 例,于治疗前及治疗后第 8 周末患者组采用阳性和阴性综合征量表(PANSS)、修订版外显攻击行为量表(MOAS)进行评定,三组测定血清甲状腺素(TT4)、三碘甲状腺原氨酸(TT3)、促甲状腺激素(TSH)、游离三碘甲状腺原氨酸(FT3)、游离甲状腺素(FT4)水平。

结果 治疗后第 8 周末攻击组和非攻击组 PANSS 评分、MOAS 评分、TT4、TT3、FT3、FT4 均较治疗前下降($P < 0.01$);治疗前攻击组 MOAS 评分、TT4、TT3、FT3 均高于非攻击组($P < 0.05$),而治疗后均下降($P > 0.05$);治疗后患者组两组 TT4、TT3、FT4、FT3 均低于对照组($P < 0.05$)。攻击组治疗前 MOAS 评分与治疗前 TT4、FT3、FT4 水平均呈正相关($P < 0.05$);MOAS 评分变化值与 FT3、FT4 水平变化值均呈正相关($P < 0.05$, $P < 0.01$)。

结论 伴攻击行为的男性精神分裂症患者甲状腺激素水平治疗前升高、治疗后下降, FT3、FT4 水平及其变化值可能是攻击行为严重程度的敏感指标。

电休克和磁休克治疗在精神疾病动物模型的研究进展

刘美琪 杜鑫哲 高耀 刘莎*

目的 随着物理治疗的深入研究,电休克治疗逐渐成为全球范围内治疗精神疾病的常规手段之一,磁休克治疗凭借其“精准性”成为一种潜在的替代疗法,但治疗机制尚不明确,然而以人本身作为实验对象在道义和方法学上还受到种种限制。动物模型的优势就在于它克服了这些限制,在研究精神疾病的发生发展规律上成为了极其重要的手段和工具,同时有助于评估各种治疗措施的疗效。本文综述了电休克和磁休克治疗在精神疾病动物模型的研究进展,以期电休克和磁休克治疗更好应用于临床提供理论依据。

方法 本文围绕“电休克治疗”“磁休克治疗”“精神疾病”在中英文数据库中进行了检索,筛选了关于电休克和磁休克治疗在精神疾病动物模型的研究文献,从以下三个部分进行归纳汇总:(1)电休克和磁休克治疗改善精神疾病动物模型的异常行为学表现即神经调控技术对模型动物行为的影响。(2)电休克和磁休克治疗精神疾病如抑郁症、精神分裂症、自闭症的作用机制。(3)电休克治疗后认知功能损伤的潜在机制及可能的改善机制。

结果 (1)电休克治疗可以改善抑郁模型小鼠旷场实验、糖水偏好实验、强迫游泳实验等行为学实验中表现出的异常行为,精神分裂症大鼠在 PPI 实验中表现出的异常行为也得到控制,此外,电休克治疗还可以改善自闭症小鼠包括社交能力在内的自闭样行为。磁休克治疗可以改善抑郁模型小鼠的抑郁样行为,不同频率的磁休克治疗对抑郁症的改善具有差异性。(2)电休克治疗可能作用于内侧前额叶皮层,通过逆转谷氨酸和谷氨酰胺循环障碍及逆转 Glu 能神经元和 GABA 能神经元比例失衡改善小鼠抑郁样行为。电休克治疗改善精神分裂样行为的机制可能是通过抑制其神经胶质细胞的增生,大脑中可塑性变化可能是电休克治疗自闭样行为的关键。(3)电休克治疗导致认知功能损伤可能与海马 Tau 蛋白磷酸化程度增加、突触可塑性增加、炎症小体激活等相关,麻醉药物异丙酚、丙泊酚可单独或联合抗抑郁药物氯胺酮改善电休克治疗后认知损伤的副反应。

结论 本文围绕电休克与磁休克治疗在精神疾病动物模型的应用,综述了其可能的治疗机制及作用靶点,为我们深入探究精神疾病的神经生物学基础和治疗方法提供了重要的机会,将为后续探索物

理治理新靶点提供思路。

甜菜碱与精神分裂症的因果关系：双向双样本的孟德尔随机化研究

陈冰冰¹ 陈冰冰^{2,3} 徐勇³ 徐勇¹ 高耀¹ 高耀³ 刘煌辉³ 刘煌辉¹ 隗思萌¹ 隗思萌^{2,3} 张昊翔^{2,3} 张昊翔¹ 史军² 刘莎^{2,3} 刘莎¹

1.山西医科大学

2.山西医科大学第一医院

3.精神障碍人工智能辅助诊疗山西省重点实验室

目的 精神分裂症(Schizophrenia)是一种使人衰弱的常见精神疾病,具有不同的遗传和神经生物学背景,影响早期大脑发育,多在青壮年缓慢或亚急性起病,临床上往往表现为症状各异的综合症,涉及感知觉、思维、情感和行为等多方面的障碍以及精神活动的不协调。它影响着全球约 2400 万人。迄今为止精神分裂症的发病机理层出不穷,比如多巴胺假说、五羟色胺假说等,但仍未完全清楚。近年来精神分裂症代谢组学相关研究的增多为我们揭示了疾病的代谢特征和机制提供了新的视角,在这些研究中,有观察到精神分裂症患者的血液样本中甜菜碱(Betaine)的浓度低于健康对照组,这一发现引起了科研界的关注。然而,精神分裂症与甜菜碱之间的相关关系尚未明确。本研究的目的是基于双向双样本孟德尔随机化研究探索甜菜碱与精神分裂症之间的因果关系。

方法 本研究基于欧洲人群中甜菜碱和精神分裂症的全基因组关联研究(GWAS)的总结数据。使用双向双样本 MR,遗传因素作为工具变量,去除连锁不平衡、弱工具变量后,采用逆方差加权法(IVW)作为主要分析方法,采用 MR-Egger 截距法评估水平多效性。MR 结果以比值比(OR)和对应的 95%置信区间表示,当 $P < 0.05$ 时,结果被认为差异有统计学意义。在 MR 分析中,我们将甜菜碱作为暴露因素,将精神分裂症的风险作为结局;在反向 MR 分析时,精神分裂症的风险被作为暴露因子,并且选择甜菜碱作为结局,以此来评估甜菜碱与精神分裂症之间的潜在因果关系。

结果 甜菜碱和精神分裂症样本量分别为 7086 和 82315,最终我们选择了 13 个甜菜碱相关的 SNPs 作为 MR 分析的遗传工具变量。在 MR 中,甜菜碱与精神分裂症之间存在潜在的因果关系,比值比(OR)为 1.941(95%CI: 1.104-3.414, $P=0.021$)。在反向 MR 中,没有发现精神分裂症与甜菜碱之间潜在的因果关系,比值比(OR)为 1.006(95%CI: 1.000-1.012, $P=0.070$)。通过 MR-Egger 截距法评估后 $P=0.848$,表明不存在多效性。

结论 本研究表明甜菜碱升高可能会增加罹患精神分裂症的风险,但是精神分裂症患者中的甜菜碱含量的变化并无因果关系。该 MR 研究为临床精神分裂症诊断提供新思路,但二者之间因果关系的潜在机制还需进一步研究来探索。

血清 BDNF 及其磷酸化、甲基化水平与精神分裂症患者临床症状及认知功能的相关性研究

李倩倩 熊鹏*

昆明医科大学第一附属医院

目的 探讨脑源性神经营养因子(BDNF)、磷酸化脑源性神经营养因子(p-BDNF)和甲基化脑源性神经营养因子(MBDNF)对精神分裂症患者临床症状及认知功能的影响。

方法 选择 79 例精神分裂症患者作为病例组,健康体检者 63 名作为对照组。精神分裂症患者的临床症状采用阳性和阴性症状量表(PANSS)评估;MATRICS 公认认知功能成套测验(MCCB)用来评估受试者的认知功能;酶联免疫吸附试验(ELISA)方法用于测定病例组与对照组外周血 BDNF、p-BDNF 和 MBDNF 的浓度水平。使用 IBM SPSS25.0 软件进行统计分析。

结果 1.病例组血清 BDNF、p-BDNF 浓度低于对照组,而 MBDNF 浓度高于健康对照组,差异均具有统计学意义($p<0.001$)。2.在认知功能中,信息处理速度、词语学习、推理和问题解决及视觉学习得分病例组均低于对照组,差异具有统计学意义($p<0.01$)。3.病例组阴性量表得分与推理和问题解决得分呈负相关。阴性量表得分与 BDNF、p-BDNF 浓

度呈负相关,而与 MBDNF 浓度呈正相关。4.在病例组中推理和问题解决得分与 BDNF、p-BDNF 浓度呈正相关,与 MBDNF 浓度呈负相关。在健康对照组中,推理和问题解决得分与 MBDNF 浓度呈负相关。5.在病例组中 BDNF 与 p-BDNF 浓度呈正相关、与 MBDNF 浓度呈负相关;p-BDNF 浓度与 MBDNF 浓度呈负相关。在对照组中 BDNF 浓度与 p-BDNF 浓度呈正相关;BDNF 浓度与 MBDNF 浓度存在负相关。6.分别以病例组 PANSS 量表总分、阳性量表、阴性量表、一般精神病理量表得分和 MCCB 各因子得分作为因变量,以 BDNF、p-BDNF、MBDNF、年龄、性别、教育程度、婚姻情况、吸烟情况、BMI 为自变量进行多元线性回归分析,结果表明 BDNF 和 MBDNF 浓度可能是 PANSS 阴性量表得分的影响因素;性别和教育程度可能是信息处理速度的影响因素;BDNF 浓度和教育程度可能是视觉学习的影响因素;p-BDNF 浓度和教育程度可能是词语学习的影响因素;MBDNF 浓度、年龄、性别和教育程度可能都是推理和问题解决的影响因素。

结论 精神分裂症患者外周血 BDNF、p-BDNF 及 MBDNF 浓度与对照组之间存在显著差异,低血清 BDNF、p-BDNF 浓度水平和高血清 MBDNF 浓度水平与精神分裂症患者的阴性症状及推理和问题解决能力损害存在一定的相关性,表明外周血 BDNF、p-BDNF 和 MBDNF 水平对于精神分裂症患者临床症状、部分认知功能损害的评估可能有一定的贡献,为临床治疗评估提供一定的参考依据。

精神分裂症患者的默认模式网络与人格特质之间的关系:大脑偏侧化研究

温中平* 赵文涛
山西医科大学第一医院

目的 精神分裂症是一种严重的精神类疾病,以幻觉、妄想、主动性丧失和认知功能损伤为特点。默认模式网络(Default Mode Network, DMN)是大脑中一组与自我意识、内省、记忆和情绪调节等功能相关的脑区网络。研究表明,精神分裂症患者的

DMN 脑区与正常人在人格特质上可能存在焦虑、抑郁、社交互动、认知弹性和自我意识等方面的区别。本研究旨在通过采用大脑功能和结构的耦合方法,量化精神分裂症患者的默认模式网络(DMN)区域结构和功能之间的耦合强度,进而探讨 DMN 区域左右半脑的差异,并研究其与人格特质之间的关系。

方法 采用大脑功能和结构的耦合方法来量化 DMN 区域结构和功能之间的耦合强度,再根据耦合指数得出 DMN 区域左右半脑的差异,最后结合精神分裂症患者的人格特质评估结果,分析不同人格特质 DMN 活动中的差异。首先,使用功能磁共振成像(fMRI)技术获取精神分裂症患者的 DMN 活动情况和大脑结构信息。通过对 fMRI 数据进行分析,计算 DMN 区域内部的功能连接强度。然后,利用 MRI 数据分析大脑结构连接,计算 DMN 区域结构之间的连接强度。将这两种连接强度结合起来,计算 DMN 区域结构和功能之间的耦合指数。最后,根据耦合指数的结果,比较 DMN 区域在左右半脑的耦合强度差异。进一步分析精神分裂症患者在人格特质上这种耦合强度差异上的表现。

结果 DMN 区域在左右半脑的耦合强度存在显著差异,且不同人格特质在这种差异上表现出不同的模式。研究表明,在精神分裂症患者中,可能存在与神经质特征相关的 DMN 活动异常,包括更高的 DMN 活动水平以及更强的右侧大脑区域连接;外向性倾向的个体在执行认知任务时 DMN 与左侧大脑区域的连接较强。此外,开放性倾向的人在创造性任务中 DMN 活动较高,与双侧大脑区域的连接均衡。

结论 本研究通过大脑功能和结构的耦合方法,揭示了精神分裂症患者的大脑偏侧化与 DMN 活动在不同人格特质表现中的关系。发现 DMN 区域左右半脑的耦合强度差异,以及与人格特质之间的相关性,为理解大脑活动与结构在人格特质形成中的作用提供了新的视角。

基于流行病学调查的抑郁障碍与运动相关关系研究

胡奕颖¹ 刘兰英²

- 1.浙江中医药大学
- 2.上海交通大学医学院附属精神卫生中心

目的 探讨抑郁障碍患者抑郁程度与运动相关因素之间的关系

方法 调查抑郁障碍患者的流行病学资料,应用自行设计的调查表对患者的年龄、性别、运动相关因素、抑郁程度等进行分析。

结果 本研究共纳入 200 名 MDD 患者,年龄均值为(27.60±9.56)岁;睡眠时长均值为(6.58±1.73)时,每次运动时长均值为(34.165±50.973)分;运动频率均值为每周(2.94±1.914)次。运动时有或无监督的 MDD 患者在睡眠时长、运动频率、焦虑躯体化、阻滞因子上存在显著差异, ($P<0.05$),有监督者较无监督者睡眠时长更长,运动频率更高,焦虑躯体化、阻滞因子、睡眠障碍因子分值更高;运动时不同心率的 MDD 患者在睡眠时长、运动频率及焦虑躯体化、阻滞、睡眠障碍因子上存在显著差异, ($P<0.05$);运动时心率 >120 次/分的患者睡眠时长最长,为(7.06±1.93)时,心率 100~110 次/分的患者运动频率最高、睡眠障碍因子均值最低,心率 110~120 次/分的患者焦虑躯体化、阻滞因子均值最低。抑郁程度及运动相关因素的线性回归结果示运动时长是抑郁程度的危险因素,运动频率与运动强度是抑郁程度的保护因素。

结论 抑郁障碍患者抑郁程度与运动时有无监督情况、运动时心率、运动时长、运动频率、运动强度等具有相关性,运动可能作为防治抑郁障碍的一种有效的方法。

十八碳四烯酸和脂肪酸去饱和酶 2 基因内 Rs174570 基因型的交互作用和精神分裂症认知功能的关联研究

袁秀霞 宋学勤*

郑州大学第一附属医院

目的 探讨十八碳四烯酸(SDA)和脂肪酸去饱和酶 2(FADS2) rs174570 基因型的交互作用对精神分裂症(SCH)认知功能的影响。

方法 本研究为病例对照研究,选取 2017 年 10

月至 2019 年 10 月就诊于郑州大学第一附属医院精神科的首发未用药 SCH 患者作为病例组,选取同期经过广告招募及来医院体检的健康人群作为对照组。采用液相色谱质谱联用(LC-MS)检测外周血 SDA 的水平,采用全基因组关联分析(GWAS)进行全基因组单核苷酸多态性检测,并分析 SDA 关键酶 FADS2 基因位点基因型分布与 SDA 水平的关系。采用阳性和阴性精神症状评定量表(PANSS)和美国认知功能成套测验(MCCB)分别评估精神症状严重程度和认知功能。采用线性回归分析,分析 SDA 和 FADS2 基因位点基因型的交互作用和 SCH 认知功能损害的关系。

结果 本研究共纳入了 98 例首发未用药 SCH 患者(男 43 例,女 55 例)和 95 名健康对照者(男 36 名,女 59 名)。患者组年龄为(22.6±4.9)岁,对照组年龄为(23.1±1.9)岁。SCH 患者组 SDA 水平显著低于对照组($P<0.001$)。在认知功能评分方面,SCH 患者显著低于对照组(P 均 <0.05)。SCH 患者基线期低水平的 SDA 与认知功能领域的信息处理速度(SOP)评分显著正相关($r=0.406$, $P<0.001$)。利培酮治疗半年后,SDA 水平由(3.6±1.9) $\mu\text{mol/L}$ 升高至(4.4±2.3) $\mu\text{mol/L}$, SDA 水平治疗前后变化有统计学意义($t=-2.29$, $P=0.024$)。利培酮治疗前后 SDA 水平的变化与认知功能 SOP 分的变化显著正相关($r=0.327$, $P=0.002$)。SDA 关键酶 FADS2 的 SNP 位点基因型分析,发现 FADS2 rs174570 基因型与 SDA 水平($F=3.74$, $P=0.027$)和认知功能 SOP 分($F=4.28$, $P=0.017$)、AV 分($F=6.74$, $P=0.002$)显著相关。FADS2 rs174570 基因型 CC 人群 SDA 水平 [(4.2±1.7) vs (3.3±1.6)] 和认知功能 SOP [(35.8±10.3) vs (28.8±12.1)] 高于基因型为 CT 的人群 (P 均 <0.05)。且 SDA 水平和 FADS2 rs174570 基因型的交互作用与 SCH 认知功能领域 SOP 分显著正相关 ($\beta=1.82$, $P=0.029$)。

结论 SDA 和 FADS2 rs174570 基因型的交互作用和精神分裂症认知功能水平有关。

Abnormalities of Somatomotor Network in Patients with Major Depressive Disorder and Their Unaffected Siblings

Feng Li Zhifang Zhang Qijing Bo Fang Dong Chuanyue Wang*

The national clinical research center for mental disorders, Beijing key laboratory of mental disorders, Beijing institute for brain disorders center of schizophrenia, Beijing anding hospital capital medical university

Objective Major depressive disorder (MDD) is a prevalent and significant psychiatric condition. Degree centrality (DC), an index that gauges the significance of nodes within a network, has been extensively employed in investigating neural mechanism of MDD. The differences in network importance between MDD and its unaffected siblings in various brain regions as nodes and their correlation with depressive symptoms are not yet clear. This analysis may help to explore the qualitative and stateful brain network changes related to the pathological mechanism of MDD

Methods Resting-state functional magnetic resonance imaging (MRI) data were collected from a sample of 102 patients with MDD, 35 of their unaffected siblings (SL), and 71 healthy controls (HC). Firstly, a comprehensive analysis examined disparities in DC values across the entire brain among the three groups, including patients with MDD, SL, and HC. Secondly, regions exhibiting significant differences in the DC analysis were chosen as seed points for assessing whole-brain functional connectivity (FC) variations across patients with MDD, SL, and HC. Thirdly, the study conducted correlation analyses between DC values, FC values of notable aberrant brain regions, and total scores of 17-item Hamilton Depression Rating Scale in patients group respectively

Results The analysis of the DC index unveiled differences in medial frontal gyrus and right precentral gyrus among patients with MDD, SL, and HC (PFWE-Corr < 0.05). Post hoc analysis revealed that compared with SL, both patients with MDD and HC had reduced DC values in bilateral medial frontal gyurs. In addition, in right precentral gyrus, the DC values of the three groups change in a stepwise. Additionally, distinctions in FC were detected between the medial frontal gyrus and the right postcentral gyrus across the three groups

($P < 0.05$), post hoc analysis revealed that compared with patients, both HC and SL groups had increased FC values. While both DC and FC values exhibited significant differences, they were not found to correlate with the severity of depressive symptoms

Conclusion The somatomotor Network plays an important role in the neural mechanisms of major depressive disorder. The decreased FC values between the medial frontal gyrus and the right postcentral gyrus and decreased DC values in the right precentral gyrus may be related to the pathological mechanism of MDD; While the increased in DC values in the medial frontal gyrus may be related to the susceptibility mechanism of MDD

关键词: Major depressive disorder; somatomotor network; fMRI

吸烟、性别、种族和感染对氯氮平血药浓度影响及 剂量调整推荐

阮灿军 王传跃*

首都医科大学附属北京安定医院

目的 氯氮平是治疗难治精神分裂症的唯一推荐药物。氯氮平治疗窗窄, 血药浓度个体间变异大, 探索导致氯氮平浓度差异的因素, 并根据这些因素进行氯氮平给药剂量调整, 将会提高氯氮平临床应用的安全性, 本研究目的, 探索影响氯氮平浓度差异的因素, 为氯氮平剂量个体化提供数据支持。

方法 在 129 名中国住院患者(平均每名患者 8.8 个 TDM 样本)进行性别和吸烟分层后, 我们探讨了总浓度-剂量(C/D)比率与 CYP1A2(* 1C, * 1F 和 * 7)和 CYP2C19 等位基因(* 2 和 * 3)。回顾性分析 129 例患者的临床资料, 包括感染/炎症和/或氯氮平抑制剂的存在和持续时间。系统的文献回顾确定了 22 个氯氮平 TDM 先前的研究(13 在高加索人和 7 在东亚人)。

结果 22 名男性吸烟者的平均总氯氮平 C/D 比(ng/mL/mg/d)为 1.96, 5 名女性吸烟者为 2.07, 36 名男性非吸烟者为 2.47, 66 名女性非吸烟者为 2.95。CYP1A2 和 CYP2C19 的基因型对氯氮平 C/D 值无影响。在 129 例患者中, 发现 5 例患者(4%), 需要

75-115 mg/d 的低剂量氯氮平才能达到治疗浓度。使用同样的方法在一个已发表的意大利样本中, 我们发现了 5 例氯氮平慢代谢表型患者, 发生率约 3.3%(152 个的 3.3%)。此外, (1)876 名东亚人氯氮平 C/D 值的加权平均值为 1.57, 而 1147 名高加索人的加权平均值为 1.07; (2)东亚人氯氮平的 C/D 值 (ng/mL/mg/d) 比高加索人 C/D 值高 ($P < 0.001$)。研究发现, 129 例服用氯氮平治疗的患者住院期间, 有 16 例患者共发生 18 次感染或炎症。18 次炎症期间中有 2 次 (11%) 的感染或炎症期间不需要氯氮平剂量调整, 11 次 (61%) 炎症期间氯氮平剂量需要减半, 5 次 (28%) 炎症期间氯氮平剂量需要降低 2/3。该研究提示氯氮平临床应用过程中炎症或感染非常常见; 同时, 严重感染, 特别是肺炎是导致氯氮平产生严重不良反应, 甚至死亡的高风险原因之一。

结论 未来的 TDM 研究, 需要进一步探讨在对性别和吸烟分层后, 氯氮平慢代谢型患者在东亚和高加索患者的发生频率。与高加索人相比, 东亚人的氯氮平清除具有临床意义的下降。感染/炎症期间会导致氯氮平浓度升高。这可能解释了氯氮平患者在严重感染, 特别是肺炎期间死亡的风险比较高。

Differences in Fractional Amplitude of Low-frequency Fluctuations (fALFF) and Cognitive Function between Untreated Major Depressive Disorder and Schizophrenia with Depressive Mood Patients

Chunguo Zhang*

The Third People's Hospital of Foshan

Objective Distinguishing untreated major depressive disorder without medication (MDD) from schizophrenia with depressed mood (SZDM) poses a clinical challenge. This study aims to investigate differences in fractional amplitude of low-frequency fluctuations (fALFF) and cognition in untreated MDD and SZDM patients

Methods The study included 42 untreated MDD cases, 30 SZDM patients, and 46 healthy controls (HC).

Cognitive assessment utilized the Repeatable Battery for the Assessment of Neuropsychological Status (RBANS). Resting-state functional magnetic resonance imaging (rs-fMRI) scans were conducted, and data were processed using fALFF in slow-4 and slow-5 bands

Results Significant fALFF changes were observed in four brain regions across MDD, SZDM, and HC groups for both slow-4 and slow-5 fALFF. Compared to SZDM, the MDD group showed increased slow-5 fALFF in the right gyrus rectus (RGR). Relative to HC, SZDM exhibited decreased slow-5 fALFF in the left gyrus rectus (LGR) and increased slow-5 fALFF in the right putamen. Changes in slow-5 fALFF in both RGR and LGR were negatively correlated with RBANS scores. No significant correlations were found between remaining fALFF (slow-4 and slow-5 bands) and RBANS scores in MDD or SZDM groups

Conclusion Alterations in slow-5 fALFF in RGR may serve as potential biomarkers for distinguishing MDD from SZDM, providing preliminary insights into the neural mechanisms of cognitive function in schizophrenia

关键词: Fractional amplitude of low-frequency fluctuations; Gyrus rectus; Major depressive disorder; Repeatable battery for the Assessment of Neuropsychological Status; Schizophrenia with depressed mood.

精神分裂症不同症状之间的小脑功能差异研究

韩唯一¹ 韩唯一^{2,4} 刘须振^{1,2,4} 刘松^{1,2,4} 陈安冉^{2,4}
陈安冉¹ 李雪^{1,2,3,4} 刘康^{1,2,3,4} 李文强^{1,2,3,4} 吕路线^{1,2,3,4} 杨勇锋^{1,2,3,4}

1.新乡医学院第二附属医院

2.河南省精神病医院

3.北大六院河南医院

4.河南省生物精神病学重点实验室

目的 精神分裂症(SZ)的临床症状复杂多样, 并且阳性症状显著与阴性症状显著的 SZ 患者的治疗、预后不同。然而关于阳性症状显著的 SZ、阴性症状显著的 SZ 和健康对照 (HC) 大脑差异的病理

机制研究较少。在本项研究中,使用低频振幅(ALFF)、低频波动幅度分数(fALFF)、区域一致性(ReHo)、度中心性(DC)和差异脑区的功能连接(FC)进行分析,旨在比较三组被试脑区的差异,探索SZ不同症状发生的影像学机制。

方法 本研究在新乡医学院第二附属医院纳入34例HC,34例SZ(阴性症状显著),32例SZ(阳性症状显著)。使用dpabi进行预处理数据,SPM进行单因素方差分析比较三组之间的ALFF、fALFF、ReHo及DC值,得到三组之间的差异脑区。以三组均有差异的脑区为感兴趣区域得到全脑的FC值,使用单因素方差分析比较三组之间FC,进一步分析与认知功能的相关性。

结果 在SZ(阳性症状显著)、SZ(阴性症状显著)和HC中,右侧小脑上部的ALFF值存在差异(GRF校正, $F=9.3434$, $p<0.001$),左侧眶内额中回的ALFF值存在差异(GRF校正, $F=13.5792$, $p<0.001$),右侧小脑上部的DC值存在差异(GRF校正, $F=13.0471$, $p<0.001$)左侧豆状壳核的fALFF值存在差异(GRF校正, $F=12.9323$, $p<0.001$),右侧角回的fALFF值存在差异(GRF校正, $F=10.9139$, $p<0.001$),左侧颞下回的ReHo值存在差异(GRF校正, $F=11.7736$, $p<0.001$)。在右侧小脑上部,SZ(阳性症状显著)的DC值低于HC,SZ(阴性症状显著)的DC值高于HC,并有显著差异(GRF校正, $F=13.0471$, $p<0.001$)。在阴性症状显著的SZ中,右侧小脑上部和左侧丘脑的功能连接与迷宫得分存在相关性(FDR校正, $p=0.048$, $r=-0.465$)、右侧小脑上部和右侧小脑下部的功能连接与迷宫得分存在相关性(FDR校正, $p=0.048$, $r=-0.469$)、右侧小脑上部和左侧颞上回的功能连接与迷宫得分存在相关性(FDR校正, $p=0.048$, $r=-0.471$)。

结论 右侧小脑上部、左侧眶内额中回、左侧豆状壳核、右侧角回和左侧颞下回是SZ(阳性症状显著)、SZ(阴性症状显著)和HC的差异脑区。相比于阴性症状显著的SZ,阳性症状显著的SZ右侧小脑上部脑功能的异常更为突出。本研究可能对精神分裂症不同亚型的病理生理机制有更全面的了解。

Fractional Amplitude of Low-frequency Fluctuations in Sensory-motor Networks and Limbic System As A Potential Predictor of Treatment Response in Patients with Schizophrenia

Chunguo Zhang¹, Guojun Xie¹, Wenbin Guo²

1.The Third People's Hospital of Foshan

2.The Second Xiangya Hospital of Central South University

Objective Previous investigations have revealed substantial differences in neuroimaging characteristics between healthy controls (HCs) and individuals diagnosed with schizophrenia (SCZ). However, we are not entirely sure how brain activity links to symptoms in schizophrenia, and there is a need for reliable brain imaging markers for treatment prediction

Methods In this longitudinal study, we examined 56 individuals diagnosed with 56 SCZ and 51 HCs. The SCZ patients underwent a three-month course of anti-psychotic treatment. We employed resting-state functional magnetic resonance imaging (fMRI) along with fractional Amplitude of Low Frequency Fluctuations (fALFF) and support vector regression (SVR) methods for data acquisition and subsequent analysis

Results In this study, we initially noted lower fALFF values in the right postcentral/precentral gyrus and left postcentral gyrus, coupled with higher fALFF values in the left hippocampus and right putamen in SCZ patients compared to the HCs at baseline. However, when comparing fALFF values in brain regions with abnormal baseline fALFF values for SCZ patients who completed the follow-up, no significant differences in fALFF values were observed after 3 months of treatment compared to baseline data. The fALFF values in the right postcentral/precentral gyrus and left postcentral gyrus, and the left postcentral gyrus were useful in predicting treatment effects

Conclusion Our findings suggest that reduced fALFF values in the sensory-motor networks and increased fALFF values in the limbic system may constitute distinctive neurobiological features in SCZ patients. These findings may serve as potential neuroimaging markers for the prognosis of SCZ patients

研究首发精神分裂症患者采用自我管理训练的临床效果

田愉* 郝楠
宁安医院

目的 探究自我管理训练对首发精神分裂症患者的临床应用效果。

方法 随机遴选 2021 年 1 月~2023 年 1 月间, 在本院接受治疗的首发精神分裂症患者中, 抽选出 40 例患者, 根据抽签法, 将 40 例首发精神分裂症患者分成对照组与观察组各 20 例。对照组首发精神分裂症患者采取常规治疗护理, 而观察组采取自我管理训练。对比两组患者训练前后生活质量评分 (GQOLI)、韦氏成人智力量表 (WAIS-RC)、简明精神病评定量表评分 (BPRS), 自知力与治疗态度问卷调查量表评分 (ITAQ), 观察两组的效果。

结果 训练前, 两组患者 GQOLI、WAIS-RC、BPRS、ITAQ 各项指标相比较, 均无统计学意义 ($P > 0.05$); 训练后, 观察组患者的生活质量评分显著高于对照组, 认知功能评分显著高于对照组, 而且观察组的 BPRS、ITAQ 指标与对照组相比较均具有统计学差异性 ($P < 0.05$)。

结论 对首发精神分裂症患者采取自我管理训练, 能够明显提高患者的日常生活质量, 还能够改善患者的精神状态, 以及患者的社交技能, 有助于改善患者认知功能, 提升患者自我管理能力, 对患者、家庭, 乃至社会都有很打的帮助, 具有非常高的作用价值, 建议推广。

Aldosterone and Acylcarnitine: Novel Insights Into The Pathogenesis of First-Episode Schizophrenia

Yuxue Li Suo Liu*
Shanxi Medical University

Objective Schizophrenia (SCZ) is a severe mental disorder with an unclear etiology. The objective of this study is to identify potential metabolites that may play a role in the development of SCZ using untargeted metabolomics

Methods The comprehensive metabolomic profiles of 43 individuals with first-episode schizophrenia and 32 healthy controls were analyzed using ultra-high performance liquid chromatography-high resolution mass spectrometry (UPLC-MS). Non-parametric tests were employed in combination with the OPLS-DA pattern recognition method to identify differential metabolites. KEGG pathway enrichment analysis was conducted, and clinical symptoms were evaluated using the Positive and Negative Syndrome Scale (PANSS). The data was further analyzed using Machine Learning techniques

Results Through metabolomics analysis, 47 differential metabolites were identified and screened compared to the healthy control group. This included an increase in aldosterone levels and a decrease in carnitine. KEGG pathway analysis revealed significant enrichment of aldosterone synthesis and secretion pathways. Correlation analysis showed that aldosterone was negatively correlated with PANSS total score in the SCZ group. In the final analysis, Support Vector Machine and Random Forest algorithms were used to select metabolite panels of aldosterone, RvD1, carnitine C11:DC, and carnitine C12-OH as metabolite panels to distinguish patients with first-episode schizophrenia (FES) and healthy controls (HC). The area under the receiver operating characteristic curve on the validation set was 0.973

Conclusion This study identified metabolic disturbances in individuals with schizophrenia, highlighting the role of aldosterone synthesis and secretion, as well as acylcarnitine metabolic disorders in the development of the disorder. These findings may enhance our comprehension the pathogenesis of schizophrenia, suggesting that metabolite panels could serve as valuable diagnostic tools and aid in the creation of more efficient

treatments

首发精神分裂症患者高阶脑网络特征提取与分类方法

赵艳丽¹ 阴桂梅² 谭淑平¹

1.北京回龙观医院

2.太原师范学院

目的 脑电信号和复杂网络理论可用于阐明脑疾病的潜在机制。高阶脑功能网络的成功应用为临床脑疾病的诊断和评估提供了新的视角;但现有研究多数从低阶脑网络节点的局部属性和全局属性信息,无法充分利用基于持久同调过滤构建的高阶脑网络的丰富拓扑信息,而对人脑多尺度高阶网络的研究可以为精神分裂症的分类模型提供更丰富、更准确的数据特征。为了解决现有基于持久同调的高阶脑网络分析主要利用单一的持久性特征(如持久性图像),无法充分利用 PH 过滤过程中产生的丰富拓扑信息的问题,本研究提出了一种多模态持久拓扑特征提取及分类方法,旨在提高对首发精神分裂症患者的识别准确性。

方法 基于拓扑数据分析技术的持久同调技术,通过自适应阈值法构建动态脑网络并提取持久拓扑特征的方法。将持久同调过滤提取的持久拓扑特征的分布用热图和持久性熵表示,而持久特征的生成过程则通过 Betti 曲线和持久性景观进行解读,然后利用多种机器学习分类器评估了多模态持久拓扑特征的分类性能,并通过选择表现最佳的分类器,同时选取分类效果最好的分类器,并且进行十折交叉验证得出最后的分类准确率。然后,将多模态持久拓扑特征与基于图论的传统脑网络特征及单一持久拓扑特征进行了比较。此外,本文还用圈比这一指标度量脑网络节点的重要性,以期准确找到首发精神分裂症患者发病的关键脑节点。最后通过显著性明显的高阶拓扑特征与总体 PANSS 分和阳性 PANSS 分呈现相关性分析进一步探索其发病机制。

结果 实验在 104 个首发精神分裂症患者和 94 个健康被试在闭眼静息状态下采集的 59 通道 EEG

上展开。与传统脑网络特征分析方法相比,高阶脑网络特征获得了更好的分类性能(准确率=92.5%,精确度=88.7%,召回率=92.2%,F1=90.4%)。此外,本研究发现的显著高阶脑网络特征与此前已被证明与精神分裂症的临床特征也有关。

结论 本文提出的方法对首发精神分裂症患者的早期识别与诊断具有重要的临床指导意义,也为高阶脑功能网络构建及拓扑结构特征提取提供了新的研究思路。未来的研究可以进一步探索多模态持久拓扑特征在其他精神疾病中的应用,同时结合其他神经影像数据源,如功能磁共振成像(fMRI)和磁脑图(MEG),以便更全面地揭示脑网络的复杂性。此外,进一步优化分类器模型和验证方法也是未来研究的重要方向,以提高分类准确率和稳定性。

基于因子分析和聚类分析的首发精神分裂症认知障碍亚型探究

胡安然*

成都市第四人民医院

目的 针对首发精神分裂症认知功能障碍进行基于数据驱动的亚型分组,探索不同亚型患者独立认知维度的损伤差异。

方法 采用计算机自动化成套剑桥神经认知测试对 253 例首发精神分裂症患者和 293 例健康对照者进行神经认知功能评估,用因子分析方法分离不同的认知维度,并据此对首发精神分裂症患者进行聚类分析,结合阳性和阴性症状量表以及大体功能评定量表评估患者的临床症状,探索不同认知亚型首发精神分裂症的认知损伤机制及临床特征。

结果 首发精神分裂症患者和健康对照者的神经认知功能可分成 7 个维度。据此使用聚类分析,将首发精神分裂症分成低功能和高功能两个不同认知亚型,不同亚型间各个认知维度和临床症状均有显著差异($P < 0.01$)。与健康对照者相比,低功能组表现出更为严重且广泛的认知功能下降,高功能组则相对保留了抑制功能,其他认知维度的受损介

于低功能组和健康对照之间。

结论 首发精神分裂症存在不同认知亚型, 抑制功能在不同亚型患者中受损情况不同, 可能是识别首发精神分裂症不同认知亚型的核心标志。采用数据驱动的方法进行认知亚型分组, 可以尽可能消除治疗干预和研究者主观意愿带来的影响更加全面、客观地探索首发精神分裂症不同亚型患者的认知损伤特点。

Effect of Fluvoxamine Maleate on Gut Microbiota in Children and Adolescents with Obsessive-compulsive Disorder with Gastrointestinal Symptoms

Jiali Dai^{1,2}, Gang Zhu¹

1. The First Affiliated Hospital of China Medical University

2. The Third Hospital of Daqing

Objective To clarify the structural characteristics of gut microbiota in children and adolescents with first untreated obsessive-compulsive disorder (OCD) with gastrointestinal symptoms. Compare the changes in gut microbiota before and after treatment with fluvoxamine maleate in children and adolescents with OCD accompanied by gastrointestinal symptoms, and identify significant differences in gut microbiota and their correlation with clinical efficacy

Methods 1. A total of 30 children and adolescents with gastrointestinal symptoms with OCD were selected as the study subjects and evaluated for clinical parameters and collected the fecal samples. 2. All subjects were given sufficient treatment with fluvoxamine maleate for 12 weeks. CY-BOCS, HAMD, HAMA, GSRS, TESS, and CGI were retested after 4, 8, and 12 weeks of treatment. Fecal samples were collected again after follow-up, and 16S rRNA sequencing was performed on the samples before and after treatment. 3. By comparing the changes in gut microbiota of patients be-

fore and after treatment, as well as the severity of clinical symptoms such as compulsion, anxiety, and depression, the clinical efficacy and safety of fluvoxamine maleate in treating pediatric and adolescent OCD patients with gastrointestinal symptoms were clarified, and the impact of this drug on gut microbiota of pediatric and adolescent OCD patients with gastrointestinal symptoms was further explored

Results 1. After 12 weeks of treatment with fluvoxamine maleate, gastrointestinal symptoms in patients with OCD (OCD12W) were significantly reduced ($P < 0.05$). 2. The diversity indexes of intestinal flora in OCD12W group were significantly increased (obs, $P < 0.05$; chao1, $P < 0.05$; ACE, $P < 0.05$; shannon, $P < 0.05$; simpson, $P < 0.05$). 2. The relative abundance ratio (F/B) of Firmicutes to Bacteroidetes in OCD12W group was significantly increased ($P < 0.001$). 3. The relative abundance of Ruminococcus ($q < 0.01$), Escherichia-shigella ($q < 0.01$) and other bacteria related to gastrointestinal symptoms in OCD12W group was significantly increased. 4. There was a correlation between the changes of clinical parameters and the abundance of specific bacteria in the intestinal flora in the OCD group ($P < 0.05$)

Conclusion 1. After 12 weeks of treatment with fluvoxamine maleate, the gastrointestinal symptoms of first-episode untreated children and adolescents with OCD were significantly improved, and the diversity of intestinal microbiota was significantly increased. 2. The disruption of intestinal homeostasis in first-episode untreated children and adolescents with OCD is related to a significant decrease in the relative abundance of bacteria such as Ruminococcus, which are closely related to gastrointestinal symptoms. 3. There is a correlation between the changes in clinical parameters and the abundance of specific species of gut microbiota in first-episode untreated children and adolescents with OCD

关键词: fluvoxamine maleate; gut microbiota; children and adolescents; obsessive-compulsive disorder; gastrointestinal symptoms

Analysis of Intestinal Flora Metabolomics in

Children and Adolescents with First-episode and Drug-free Obsessive-compulsive Disorder

Jiali Dai^{1,2}, Gang Zhu¹

1.The First Affiliated Hospital of China Medical University

2.The Third Hospital of Daqing

Objective Obsessive-compulsive disorder (OCD) is a chronic and disabling psychiatric disorder characterized by recurrent intrusive thoughts or repetitive behaviors. We sought to better understand the relationship between gut microbiota and fecal metabolites in first-episode, drug-free children and adolescents with OCD, and to determine the metabolites changes in gut microbiota after treatment with selective serotonin reuptake inhibitors (SSRIs)

Methods 1. Stool samples were collected from 49 first-episode untreated children and adolescents with OCD and 42 age- and sex-matched healthy controls (HC). Samples were collected after 12 weeks of SSRIs monotherapy for OCD, and all subjects were evaluated for clinical parameters. 2. Fecal samples from 49 cases of OCD, 42 cases of HC and 26 cases of OCD12W were analyzed by metabolomic method based on UHPLS-MS. 3. Correlation analysis was conducted between metabolomics results and clinical parameters to explore the relationship between intestinal flora and OCD symptoms and the possible functional pathways involved in the pathogenesis

Results 1. A total of 43 endogenous differential metabolites were screened from OCD-HC group, and 63 endogenous differential metabolites were screened from OCD0W-OCD12W group. 2. The relative content of Neopterin and Sepiapterin, intermediates of Folate Biosynthesis pathway, increased significantly; Glucocorticoids and corticosterone significantly decreased in regulating Lipolysis in Adipocytes and Prion Diseases. Fumarate, 2-oxoisovalerate, 3-dehydroquinic acid (DHQ) and other metabolites involved in amino acid biosynthesis pathway decreased significantly. 3. Correlation analysis of differential flora and metabolites in

OCD patients showed that intestinal flora was associated with intestinal metabolites

Conclusion 1. The expression of intestinal microflora metabolites in OCD patients is disturbed, resulting in functional abnormalities of related metabolic pathways, which can be partially recovered by drug treatment. Neopterin, as a key factor of folic acid synthesis pathway, may be involved in the pathogenesis of OCD. 2. Glucocorticoid-mediated dysfunction of HPA axis can promote intestinal immune inflammatory response in patients with OCD. 3. Abnormal metabolites of gut microbiota in OCD patients are mainly manifested in folic acid biosynthesis, prion disease pathway and amino acid metabolic network

五羟色胺再摄取抑制剂对首发未用药儿童青少年强迫症患者肠道菌群的影响

代佳利^{1,2} 朱刚¹

1.中国医科大学附属第一医院

2.大庆市第三医院

目的 强迫症是一种以反复持久出现的强迫观念和(或)强迫行为为基本特征的慢性致残性精神障碍。五羟色胺再摄取抑制剂(SSRIs)作为OCD的一线治疗选择,可以增加突触中血清素的浓度,进而改善强迫症状,但目前强迫症治疗的有效率仅为40-60%。本研究旨在通过16S rRNA测序、宏基因组学和代谢组学多组学联合分析的方法,探讨SSRIs治疗对首发未用药儿童青少年强迫症患者肠道菌群结构和功能的影响,为强迫症的早期诊断和疗效提供重要的理论基础。

方法 本研究首先收集了26例首发未用药儿童青少年强迫症患者,对受试者进行随访及各临床参数的评估,并留取粪便样本。对26例经过12周SSRIs药物干预的OCD患者(OCD12W)肠道菌群粪便样本进行多组学分析,利用16S rRNA扩增子测序技术、宏基因组高通量测序,并基于超高效液相色谱系统-质谱联用(UHPLS-MS)技术采用代谢组学的方法对治疗前后样本进行分析,探讨治疗前

后(OCD0W-OCD12W)肠道菌群变化特征,并寻找与疗效相关的特异性菌群标记物和可能涉及到的代谢通路。

结果 1、药物干预后强迫症组(OCD12W)肠道菌群各多样性指数与干预前组(OCD0W)相比均无显著性差异($P>0.05$)。2、随机森林模型在治疗有效组(Respond)和无效组(Nonrespond)患者中识别了13个特异性菌属作为微生物标志物,其AUC为0.8274。3、OCD0W-OCD12W组共筛选出63个差异代谢物,其中叶酸合成通路(Folate Biosynthesis)的中间产物新喋呤(Neopterin)和墨喋呤(Sepiapterin)在OCD12W组的相对含量显著降低($P<0.05$);延胡索酸(Fumarate)、2-氧代异戊酸(2-oxoisovalerate)、3-脱氢奎尼酸(3-dehydroquinic acid, DHQ)等参与氨基酸生物合成通路的代谢物显著升高($P<0.05$)。

结论 1、短期SSRIs治疗可以改善儿童青少年OCD患者临床症状,但不能显著改变其肠道菌群的组成和结构。2、OCD患者对药物干预的疗效也可以通过以丛生放线菌属(Actinospica)为主的特异性生物标记物模型进行预测。3、OCD患者肠道菌群代谢产物表达存在紊乱,并造成相关代谢通路功能异常,药物治疗可部分恢复。

探索精神分裂症患者病程早期、中期及晚期启动帕利哌酮长效针剂治疗的疗效差异

司天梅¹ 中华医学会精神医学分会精神分裂症协作组¹ 李茜¹ 李杨² 杨轶莘³ 卓剑敏² 贾苗苗² 叶翀²

1.北京大学第六医院

2.西安杨森制药有限公司

3.艾昆纬医药科技(上海)有限公司

目的 评估中国精神分裂症患者在病程不同阶段启动每月一次帕利哌酮长效针剂(PP1M)治疗的疗效差异。

方法 这项事后分析纳入三项单臂、开放标签IV期研究(NCT01527305、NCT01947803、NCT01685931)数据,受试者均为中国精神分裂症

患者,接受PP1M治疗并随访13周。本研究评价了精神分裂症患者在不同病程阶段即早期(病程 ≤ 2 年)、中期(2年 $<$ 病程 ≤ 5 年)及晚期(病程 > 5 年)启动PP1M治疗的疗效差异。主要疗效指标为阳性与阴性症状量表(PANSS)总分在治疗13周时较基线的减分值,使用协变量分析方法(ANCOVA)在全分析集(FAS)进行分析,采用末次观测值结转法(LOCF)填补缺失值。

结果 FAS共纳入1053例患者(早期383例、中期290例、晚期380例)。基线时,早期、中期、晚期三组患者平均年龄(标准差,SD)分别为28.8(10.12)、28.9(9.66)、36.6(10.53)岁,男性比例分别为50.7%、63.1%和51.8%,从初次诊断精神分裂症至首次使用PP1M的平均病程(SD)分别为0.8(0.62)、3.5(0.87)、11.1(6.14)年;基线时三组患者的PANSS总分(SD)分别为89.6(13.58)、89.6(13.02)、89.3(13.11)。用ANCOVA方法(基线为协变量,组间、研究以及研究*组间的交互作用为因素)计算的早期、中期、晚期三组患者PANSS总分在13周较基线变化的最小二乘均数(95%CI)为-31.6(-34.1, -29.1)、-28.4(-31.2, -25.5)、-25.6(-27.7, -23.4),组间差异 $P=0.0003$;其中早期vs中期($P=0.2175$)、中期vs晚期($P=0.2783$)、早期vs晚期组($P=0.0011$)间差异最小二乘均数分别为-3.23、-2.78、-6.00;早期、中期、晚期三组患者PANSS总分在13周较基线减分率的最小二乘均数(95%CI)为34.9%(32.2%, 37.7%), 30.8%(27.6%, 33.9%), 27.7%(25.3%, 30.0%),组间差异 $P=0.0001$;其中早期vs中期($P=0.1239$)、中期vs晚期($P=0.2741$)、早期vs晚期组($P=0.0003$)间减分率差异最小二乘均数分别为4.15%、3.07%、7.22%。

结论 在中国精神分裂症患者中,在不同病程阶段启动PP1M治疗均可改善症状;越早使用PP1M,患者症状改善可能越明显。

基于HPA轴构建首发精神分裂症患者真性高泌乳素血症的预测模型

王澜*

湖州市第三人民医院

目的 探讨基于下丘脑-垂体-肾上腺 (HPA) 轴构建的首发精神分裂症患者真性高泌乳素血症 (THPRL) 的预测模型。

方法 选取 2021 年 6 月至 2023 年 6 月期间入院治疗的首发精神分裂症伴 HPRL 患者 102 例, 抽取空腹外周血检测 HPA 轴激素水平[泌乳素 (PRL)、肾上腺皮质激素 (ACTH)、皮质醇 (Cor)]。采用聚乙烯醇沉淀法进行巨泌乳素 (MPRL) 筛查, 以回收率 >60% 作为 THPRL 的判断标准, 分为 THPRL 组及非 THPRL 组, 比较两组的 HPA 轴激素水平及一般资料, Logistic 回归分析影响 THPRL 的危险因素, 并构建 THPRL 列线图预测模型, 进行模型评价。

结果 THPRL 组的女性患者闭经比例、使用典型抗精神疾病药物比例、溢乳比例及血清 ACTH、Cor 水平高于非 THPRL 组, 未辅助应用维生素 B6 比例低于非 THPRL 组 (均 $P < 0.05$)。Logistic 回归分析显示, 溢乳、使用典型抗精神疾病药物、女性患者闭经及血清 ACTH、Cor 水平升高是影响首发精神分裂症患者 THPRL 的独立危险因素 (均 $P < 0.05$)。基于 Logistic 回归分析结果构建的 THPRL 预测模型经 ROC 曲线评价列线图的预测能力良好, 曲线下面积 (AUC) 为 0.876; Bootstrap 法对预测模型进行内部验证, 结果显示模型区分度及拟合度良好, C-index 值为 0.782 (95%CI: 0.702~0.857), 列线图模型的预测概率和实际 THPRL 概率具有良好的一致性 (Hosmer-Lemeshow $\chi^2 = 0.562$, $P = 0.474$)。

结论 血清 ACTH、Cor 水平升高为首发精神分裂症患者 THPRL 的独立危险因素, 基于此构建的列线图预测模型对 THPRL 的发生具有较高的预测效能。

The Relationship between Mental Disorders and Cognitive Function: A Two-Sample Mendelian Randomization Study

Yanwei Guo Qinghua Luo*

The first affiliated hospital of Chongqing Medical University

Objective In 2018, The Lancet Commissions, within the context of the Sustainable Development Goals (SDGs), proposed new objectives for mental health, shifting the focus from reducing the treatment gap for mental disorders to improving mental health across the entire population and reducing the global burden of mental illness. Global Mental Health (GMH) also emphasized an interdisciplinary approach to achieving mental health equity and human rights. Mental disorders, defined by the World Health Organization as including anxiety, depression, schizophrenia, and alcohol and drug dependency, disrupt brain function and activities, leading to cognitive, emotional, behavioral, and volitional disturbances. Over 13% of adolescents globally suffer from mental disorders, with anxiety and depression accounting for approximately 40%. Other common disorders include bipolar disorder, obsessive-compulsive disorder, autism, and attention-deficit/hyperactivity disorder. Cognitive function, involving processes like memory, language, executive function, calculation, and judgment, is a high-level brain activity unique to humans. While mental disorder classifications are based on observed clinical symptoms, cognitive impairment is frequently observed in patients with mental disorders. Since the 1990s, cognitive function has been considered an important predictor of mental illness outcomes, with a better understanding of cognitive impairment potentially revealing the brain mechanisms involved. The purpose of this study is to explore the causal relationship between several high-prevalence mental disorders (depression, anxiety, bipolar disorder, schizophrenia, ADHD, ASD, OCD, and alcohol abuse) and cognitive function using a basic European data sample. Additionally, this study aims to identify new directions for the treatment of mental disorders and the improvement of patients' social functioning

Methods The working model of Mendelian randomization utilizes genetic variations that are strongly associated with exposure factors as instrumental variables to evaluate the causal relationship between genetically predicted exposure and outcomes. This approach effectively eliminates the interference of environmental and external factors, thereby allowing genetic variations to be better used as instrumental variables to study the

causal relationship between the two factors

Results We recommend that IVW results be considered the primary method for analyzing causal associations between exposure factors and outcome variables. This study demonstrated a positive and causal association between SCZ and the risk of Cognitive Function, with an OR of 0.926 (95%CI: 0.896–0.958) in the IVW MR analysis. The weighted median method and MR Egger also yielded consistent and similar estimates that supported the risk effect of SCZ on Cognitive Function, with an OR of 0.927 (95%CI: 0.884–0.972) and an OR of 0.809 (95%CI: 0.714–0.916). None of the three analyses revealed any causal effect of Depression, Anxiety, Bipolar disorder, ADHD, ASD, OCD, and alcohol abuse on Cognitive Function

Conclusion Our MR analysis provides evidence for a causal effect of SCZ on the risk of cognitive function decline. However, Depression, Anxiety, Bipolar disorder, ADHD, ASD, OCD, and alcohol abuse are not associated with the risk of Cognitive Function. This suggests that the need for increased attention to cognitive function decline in SCZ patients and the implementation of timely interventions and treatments. Improving cognitive function may play an important role in the subsequent treatment and prognosis of SCZ

关键词: Mendelian randomization study, schizophrenia, cognitive function

精神分裂症患者治疗依从性及生活质量现状调查研究

丁木兵*

芜湖市第四人民医院

目的 探究精神分裂症患者治疗依从性及生活质量现状。

方法 回顾性分析芜湖四院精神科 2020 年 5 月至 2022 年 5 月收治的 106 例精神分裂症患者的临床资料, 依据《Morisky 8-item Medication Adherence Questionnaire》标准对患者的依从性进行划分, 得分 ≤ 2 分归为高依从性组 (62 例), 得分 > 2 分归为低依从性组 (44 例)。对比两组患者一般资料, 采用多元

Logistic 回归分析探究影响患者治疗依从性的独立性危险因素, 通过生活质量综合评定问卷 (GQOLI-74)、住院精神病人社会功能评定量表 (SSFPI) 评价不同依从性患者生活质量及生活能力情况。

结果 (1) 多元 Logistic 回归分析结果显示, 居住情况、文化程度、用药情况、社会支持程度、一般自我效能感、复发、医患关系均为影响精神分裂症患者治疗依从性的独立危险因素, $P < 0.05$ 。(2) 高依从性组患者 GQOLI-74 量表躯体功能、心理能力、社会功能、物质生活评分 (51.65 ± 6.13 、 53.37 ± 5.99 、 52.32 ± 5.74 、 48.05 ± 5.22) 均明显高于低依从性组 (45.59 ± 5.11 、 44.13 ± 6.29 、 45.47 ± 6.38 、 42.20 ± 5.81), $P < 0.05$ 。(3) 高依从性组患者 SSFPI 量表日常生活能力、活动性和交往情况、社会活动技能评分 (8.60 ± 2.23 、 10.02 ± 1.33 、 7.45 ± 1.84) 均明显高于低依从性组 (7.16 ± 1.95 、 9.01 ± 2.21 、 6.22 ± 1.63), $P < 0.05$ 。

结论 精神分裂症患者治疗依从性不高, 且受到多种因素的影响, 低依从性患者的生活质量及生活能力水平也较低, 故临床应采取针对性措施提高患者质量依从性, 为其预后良好奠定基础。

康复期精神分裂症患者存在焦虑抑郁情绪采取相应护理干预的效果分析

张娜*

宁夏回族自治区宁安医院

目的 探究心理护理应用于康复期精神分裂症护理中的效果。

方法 方法 试验时间段为 2020 年 9 月~2021 年 3 月, 选取这期间本科室收治的确诊为精神分裂症患者 50 例, 将其依照随机数字表法分为对照组与试验组, 每组 25 例, 对照组: 给予常规护理方法 治疗前核对好患者的姓名、年龄等相关信息, 监测生命体征, 观察患者面部变化, 判断情绪感受, 向其讲解治疗计划, 治疗过程中注意患者情况, 告知疾病注意事项, 其中包含饮食、作息、生活习惯等方面。试验组: 在常规护理的基础上给予心理护理方法了解患者的姓名、年龄、学历等基本情况, 并注意与患者的交流, 因为患者的性格、喜好都有差异, 所以

在进行护理时,除言语交流外,还应注意与患者的交流以及患者的喜好。与患者保持适当的距离,既能让患者感到安全,也不会有压力。根据患者个性特点选用合适的沟通方法,尽可能使用简单明确的语言,让患者明白治疗过程以及要留意的问题,并用温和的语气与患者进行交流;针对患者的问题要有足够的耐心回答,大部分患者都会因为病情的原因而产生一系列的负面情绪,从而影响到治疗的结果,而且很有可能会拒绝接受任何的医疗。在这种情况下,护士要强化与患者的交流,使其提高配合意识。因为多数康复期的精神分裂症患者在认知能力尚处在恢复的过程中,容易出现对医护人员产生的逆反情绪,所以可以通过定期组织交流,来加强与患者的沟通。护理人员也可以参与进来,把平时相处比较融洽的患者分为一组,并鼓励患者用言语表达自己的担忧和负面的情感,使他们彼此得到安慰;在提问过程中,可以通过询问来提高学生的学习兴趣,帮助他们更好地了解自己的情况,提高自己的主观能动性。通过对患者的焦虑和抑郁的程度进行综合评价,并对其进行细致的心理疏导,通过散步、听音乐等方式缓解紧张的心情,提高睡眠的质量,并通过鼓励的形式,提高治疗的自信心。成立健康讲座,将疾病的相关知识打印成册,发放到各个患者手中,使用通俗易懂的语言为患者详细讲解康复期的治疗重点,指导患者正确服用药物。打扫好病房内卫生,营造一个干净卫生的空间,转移患者注意力。

结果 试验组生活质量得到显著改善,依从性相较于对照组明显更优,试验组整体焦虑抑郁程度评分、心理弹性评分更好,对照组护理满意度低于试验组。两者差异具有统计学方面意义($P<0.05$)。

结论 在临床上对于康复期精神分裂症采用心理护理方法,可以针对心理状态进行改善,并且提升依从性,使得患者病情恢复速度加快,具有良好的护理前景。

精神分裂症患者家庭育儿困境影响因素的质性研究

陆一莹 刘修军*

武汉市精神卫生中心

目的 深入了解患有精神分裂症的患者在养育子女过程中所遇到的问题以及他们的心理感受,为提高其家庭幸福度、社会参与感提供参考。

方法 2023年12月—2024年4月,以目的抽样法对社区在管的11例精神分裂症患者进行半结构式访谈。访谈入组标准:①子女年龄为6~17岁;②根据ICD-10诊断标准,患者诊断为精神分裂症、双相情感障碍其中之一,且目前病情控制稳定;③父母首次发病后,其未成年子女与父母共同生活时间超过半年;④知情同意参加本研究。排除标准:无法理解调查内容或因明显的健康风险不适宜参与调查。

访谈结束后,由访谈者在24h内及时将访谈资料转录成文字,并采用Colaizzi 7步分析法进行资料分析。①仔细、反复阅读访谈内容;②提取重要语句;③编码重复且有意义的观点;④汇集所编码的内容;⑤写出详细的描述;⑥找出相似的观点并升华主题;⑦将结果反馈给受访者进行验证。资料的整理分析始终在对质性研究具有丰富经验的教授(通信作者)的指导下进行,当分析过程存在异议时,为保证分析结果的严谨性,经课题小组共同讨论分析,提炼出最终主题。

结果 共提炼出3个主题及8个亚主题,包括①个人健康与育儿能力(疾病和药物治疗影响育儿能力;病耻感;育儿过程易诱发情绪失控);②家庭因素下的育儿挑战(精神分裂症治疗加重家庭经济负担;子女对患病父母缺乏信任感;加重代替照顾者身心负担);③社会排斥增加育儿难度(家校沟通存在障碍;社会偏见影响子女心理健康)。

结论 本研究通过对11例患者进行半结构式访谈,进一步了解了精神分裂症患者及其家庭这一弱势群体在育儿过程中的体验与挑战。患有精神分裂症的父母在兼顾治病和育儿的同时常常面临复杂的心理挑战,迫切需要获得更多的社会和医疗支持。未来的研究应关注患者的具体需求,帮助其改善家庭功能和生活质量。

关键词:精神分裂症;亲子沟通;未成年子女;家庭干预;质性研究

不同分型精神分裂症患者 P300 与述情障碍相关性研究

刘晶晶*

乌鲁木齐市安宁医院

目的 观察分析单纯性与偏执型精神分裂症患者事件相关电位 P300 与述情障碍的差异,并探索 P300 与述情障碍的相关性。

方法 本试验纳入 94 例精神分裂症患者作为研究对象,精神分裂症患者根据不同分型分组,将单纯性精神分裂症纳入观察组 44 例,偏执型精神分裂症纳入对照组 50 例。两组患者分别进行多伦多述情障碍量表(TAS-20)测评及时间相关电位 P300 检测,并对结果进行分析比较。

结果 与对照组相比,观察组 TAS-20 量表中因子 I、因子 II、因子 III 及 TAS-20 总分更高,组间对比差异显著($P < 0.05$)。观察组中央点(Cz)、顶叶点(Pz) N1、P2、N2、P3 潜伏期较对照组明显延长,而 Cz、Pz 点 N2、P3 波幅较对照组下降明显,组间对比差异显著($P < 0.05$)。观察组 Pz 点 N2、N3 潜伏期与 TAS-20 量表中各因子评分及总分呈正相关($r =$, $P < 0.05$),Pz 点 N2、P3 波幅与 TAS-20 量表各因子评分及总分呈负相关($r =$, $P < 0.05$)。观察组 TAS-20 量表中因子 I、因子 II、因子 III 及总分显著高于对照组,表明不同类型精神分裂症述情障碍存在一定差异性,与偏执型精神分裂症相比,单纯型精神分裂症患者述情障碍相对严重,考虑是单纯型精神分裂症患者述情障碍与其阳性症状(意志减退、情感迟钝、思想异常等)存在某种共同病理生理基础。

结论 P300 可反应精神分裂症患者认知功能,与偏执型精神分裂症相比,单纯型精神分裂症患者认知功能损害更严重,且与述情障碍相关。

探讨改良电抽搐治疗对精神分裂症患者血清脑源性神经营养因子的影响

杨林*

淮安市第三人民医院

目的 探讨改良电抽搐治疗对精神分裂症患者

血清脑源性神经营养因子的临床价值。

方法 选取 2021 年 6 月-2023 年 6 月我所收治的精神分裂症患者 50 例,作为观察组,进行改良电抽搐治疗;并选取同一时期在我院体检的健康者 50 例,作为对照组。两组均采用酶联免疫吸附法进行血清的 BDNF 水平检测。对比两组研究对象血清的 BDNF 水平。

结果 对照组研究对象的血清 BDNF 水平为(13.11 ± 1.50)ng/ml;观察组在改良电抽搐治疗前血清的 BDNF 水平为(9.42 ± 3.61)ng/ml,在改良电抽搐治疗后血清的 BDNF 水平为(12.31 ± 3.23)ng/ml,观察组研究对象在进行改良电抽搐治疗前的血清 BDNF 水平低于对照组,经过治疗,血清的 BDNF 水平有明显的升高,并且与对照组血清 BDNF 水平无明显差异。在经治疗前,观察组 PANSS 阳性分为(30.50 ± 8.12)分, PANSS 阴性分为(25.81 ± 9.42)分,一般精神病理分(27.41 ± 7.52)分,总分为(83.71 ± 9.23)分;在经治疗后,观察组 PANSS 阳性分为(18.22 ± 5.21)分, PANSS 阴性分为(16.31 ± 4.32)分,一般精神病理分(19.61 ± 3.82)分,总分为(54.11 ± 5.72)分。观察组研究对象在经改良电抽搐治疗后的 PANSS 总分以及各因子分与治疗前相比都有所降低。

结论 改良电抽搐治疗对精神分裂症患者有显著的治疗效果,可以提高患者血清的 BDNF 水平,有很高的应用价值。

关键词: 改良电抽搐治疗、精神分裂症、血清脑源性神经营养因子

Inflammatory Cytokines Are Differed in Different Genders with Chronic Schizophrenia Treated with Dibenzodiazepine

Xiaoping Yuan^{1,2}, Haiyun Yu^{1,2}, Kai Zhang^{1,2}, Huanzhong Liu^{1,2}

1.Department of Psychiatry, Chaohu Hospital of Anhui Medical University

2.Anhui Psychiatric Center, Anhui Medical University

Objective Dibenzodiazepines are the most commonly used drugs for patients with chronic schizophre-

nia, which have good therapeutic effects. However, because of their effects on glucose and lipid metabolism, doctors are prevented from choosing these drugs. The causes of metabolic problems may be related to inflammatory response and inflammatory cytokines. This study aimed to investigate the levels of plasma inflammatory cytokines in patients with chronic schizophrenia and the relationship between inflammatory cytokines and gender

Methods We measured the parameters of peripheral blood glucose and lipid metabolism and the levels of proinflammatory cytokines in 284 patients with chronic schizophrenia and 141 healthy people. According to the types of antipsychotic drugs taken, the patients were divided into dibenzodiazepine group and non-dibenzodiazepine group. The general data, fasting blood glucose, blood lipids and cytokines were compared between the healthy control group and the non-dibenzodiazepine and dibenzodiazepine group

Results The general data, blood biochemical indexes and inflammatory factors of 141 healthy controls and 284 patients with chronic schizophrenia (divided into non-dibenzodiazepine group and dibenzodiazepine group according to the types of drugs taken) were compared. The results showed that there were significant differences in education years, BMI, triglyceride, high density lipoprotein, low density lipoprotein, IL-2, IL-6, IL-17 α and TNF- α among the three groups. After sex grouping, we found that there was a certain trend in the distribution of inflammatory factors, which showed that there were significant differences in IL-1 β and IL-2 between female healthy control group and patients with different drugs. IL-6 not only showed the same trend, but also showed the difference between non dibenzodiazepine and dibenzodiazepine, and showed the difference between female group and male group in IL-17 α and TNF- α , respectively. After disassembling and analyzing the relevant biochemical metabolic indexes according to sex, we only found that there were only differences in inflammatory factors among the three groups, but there was no difference in glucose and lipid metabolism

Conclusion Dibenzodiazepines may increase the expression of inflammatory factors in patients with

chronic schizophrenia, and this difference is related to gender, while the difference in inflammatory factors can not directly lead to differences in metabolic indicators

基于代谢组学探讨柴胡加龙骨牡蛎汤对精神分裂症代谢的影响

孙文 杨萍*

湖南省脑科医院

目的 分析柴胡加龙骨牡蛎汤(Chaihu-Longgu-Muli Decotion, CLMD)干预精神分裂症患者治疗前后的代谢物差异性,研究精神分裂症潜在标志物及CLMD治疗后相关代谢产物变化规律,为精神分裂症的发病机制及CLMD治疗代谢途径提供科学依据。

方法 纳入32例健康人作为对照(CON)组,67例精神分裂症患者分为奥氮平(OLA)组($n=35$)、奥氮平+CLMD(OLA+CL)组($n=32$)。干预前、干预6周患者组予以阴性及阳性症状量表(PANSS)评估患者的精神病性症状,外显攻击行为量表(MOAS)测量患者的攻击行为,采用超高效液相色谱-高分辨质谱联用(UPLC-MS)技术分析治疗前后血浆代谢产物变化,采用多维统计分析,筛选差异代谢物。

结果 1.精神分裂症患者治疗6周后与治疗前比较:OLA组治疗后(OLA group after treatment, OLA-AT)的PANSS总分、MOAS总分均较OLA组治疗前(OLA group before treatment, OLA-BT)显著下降($t=53.98, P<0.05, t=15.41, P<0.05$);OLA+CL组治疗后(OLA+CL group after treatment, OLA+CL-AT)的PANSS总分、MOAS总分较OLA+CL组治疗前(OLA+CL group before treatment, OLA+CL-BT)均显著下降($t=55.29, P<0.05, t=21.97, P<0.05$);与OLA-AT比较,OLA+CL-AT的PANSS总分($t=4.86, P<0.05$)和MOAS总分($t=6.17, P<0.05$)均显著下降。2.与CON组比较,从OLA组血浆中检测160个差异代谢物,涉及氨酰-tRNA生物合成、D-精氨酸和D-鸟氨酸代谢、亚油酸代谢等52条差异代谢通路;与CON组比较,从OLA+CL组血浆中检测180个差异代谢物,涉及亚油酸代谢、精氨酸和脯氨酸代谢、D-精氨酸和D-鸟氨酸代谢等43条代谢通路;

与 OLA 组比较,从 OLA+CL 组患者血浆中检测 54 个差异代谢物,涉及亚油酸代谢、色氨酸代谢、泛醌和其他萜类醌的生物合成、花生四烯酸代谢、磷酸戊糖途径等 9 条代谢通路。

结论 差异代谢物可作为精神分裂症的潜在生物标志物,研究结果有助于阐述精神分裂症的发病机制,可为精神分裂症临床诊断及 CLMD 治疗提供思路。

精神科急危重症患者的临床特征研究

吴月静 何茜 张利 罗伏钢*
杭州市第七人民医院

目的 了解精神疾病患者急慢性躯体合并症情况,分析精神科急危重症病房患者临床特征

方法 本文对杭州市第七人民医院重症医学科成立以来(2021年1月至2024年5月)的1068名急危重症患者的临床特征进行统计分析,包括性别、年龄的分布差异,不同性别和年龄段患者原发精神疾病、合并慢性躯体疾病分布差异等。

结果 在<18岁、18-29岁、30-39岁、40-49岁、50-59岁、60-79岁、≥80岁7个年龄组的精神疾病患者中,均常见的急慢性躯体合并症为:肺部感染、低钾血症、心律失常、急性肝功能不全。药物中毒、急性肝功能不全、横纹肌溶解、高乳酸血症是青壮年组精神疾病患者(18-29岁、30-39岁、40-49岁)最常见的急性躯体疾病;重症肺炎、急性呼吸衰竭、低蛋白性营养不良是老年组患者(60-79岁、≥80岁)较多见的危重躯体疾病;其他精神疾病患者常见的急性躯体疾病还有癫痫、高血压急症、糖尿病急症、消化道出血、新近深静脉血栓形成、急性肾功能不全、肠梗阻等。

结论 精神科患者的急性躯体合并症不容忽视,尤其精神分裂症、使用酒精引起的精神和行为障碍、双相情感障碍、谵妄以及急性而短暂的精神障碍患者,更容易出现肺部感染/重症肺炎、横纹肌溶解、急性肝功能不全、肠梗阻等严重躯体疾病。临床医生应加强精神科急危重症的预判和及时干预,改善精神疾病患者的转归。

关键词: 精神疾病,急危重症,横纹肌溶解,急性肝功能不全,药物中毒

精神疾病对常见急危重症的风险因素研究

吴月静 何茜 张利 罗伏钢*
杭州市第七人民医院

目的 在精神科急危重症患者临床特征研究的基础上,针对精神疾病患者常见而危重的躯体疾病进行风险预测研究。

方法 应用二元 logistics 回归分析方法,建立重症肺炎、低蛋白性营养不良、肠梗阻、横纹肌溶解以及肺栓塞和深静脉血栓形成等精神科急危重症躯体合并症的风险预测模型。

结果 重症肺炎的危险因素分别为精神分裂症(OR=2.272, P=0.014, 95%CI: 1.183-4.466)、双相情感障碍(OR=2.507, P=0.035, 95%CI: 1.067-6.314)、年龄(OR=1.051, P<0.001, 95%CI: 1.183-4.466);低蛋白性营养不良的危险因素分别为痴呆(OR=1.887, P=0.004, 95%CI: 1.887-2.900)、进食障碍(OR=5.981, P=0.046, 95%CI: 1.032-34.648)、年龄(OR=1.049, P<0.001, 95%CI: 1.035-1.062);肠梗阻的危险因素分别为精神分裂症(OR=3.320, P=0.022, 95%CI: 1.192-9.243)、双相情感障碍(OR=3.511, P=0.047, 95%CI: 1.019-12.101)、性别(OR=3.430, P=0.006, 95%CI: 1.418-8.300);横纹肌溶解的危险因素分别为精神分裂症(OR=3.023, P=0.011, 95%CI: 1.294-7.065)、性别(OR=2.085, P=0.034, 95%CI: 1.057-4.115);肺栓塞的危险因素分别为谵妄(OR=6.689, P=0.012, 95%CI: 1.522-29.408)、急性而短暂的精神和行为障碍(OR=143.514, P<0.001, 95%CI: 9.481-212.394)、精神分裂症(OR=10.874, P=0.015, 95%CI: 1.588-74.483)、双相情感障碍(OR=11.314, P=0.012, 95%CI: 1.723-74.273)、分离转换障碍(OR=31.55, P=0.015, 95%CI: 1.953-509.773)。

结论 相较于其他精神疾病患者,精神分裂症患者出现重症肺炎、横纹肌溶解、肠梗阻、肺栓塞的风险分别是 2.27 倍、3.02 倍、3.32 倍以及 10.87 倍;双相情感障碍患者合并出现重症肺炎、肠梗阻和肺栓塞的风险分别是 2.51 倍、3.51 倍和 11.31 倍;男

性会增加横纹肌溶解和肠梗阻的风险。重症精神障碍患者更容易出现肺部感染/重症肺炎、横纹肌溶解、肠梗阻等严重躯体疾病。临床医生应加强精神科急危重症的预判和及时干预,改善精神疾病患者的转归。

关键词:精神疾病,急危重症,横纹肌溶解,低蛋白性营养不良,肺栓塞

精神分裂症药物干预的中文随机对照临床试验的质量评价

董愉¹ 李春波¹ 朱怡康¹, Johannes Schneider-Thoma²
秦梦常² 官世伟¹ 王嘉曦¹, Stefan Leucht²

1.上海市精神卫生中心(上海市心理咨询培训中心)
2.Department of Psychiatry and Psychotherapy, School of Medicine and Health, Technical University of Munich, Munich, Germany and German Center for Mental Health (DZPG), partner site München/Augsburg, Munich, Germany

目的 来自中国的临床研究占据世界临床研究数量的较大比例,且这个数字还在不断攀升,但是其影响力却未能达到应有的高度,在国际上仍面临着诸多质疑。因此,我们就精神分裂症文献展开研究,初步探究并评估中文数据库中精神分裂症药物干预随机对照试验的质量。

方法 我们检索国内包括中国知网、万方数据库、中国生物医学文摘数据库和中国台湾中文数据库等在内的中文电子文献数据库中有关抗精神病药物干预精神分裂症的随机对照试验。通过电话、电子邮件和信件联系作者,要求其提供有关随机序列生产、分配隐藏以及盲法等研究方法的具体信息。

结果 我们共从中文数据库中检索到中文文献记录 10298 条,总共筛查出提及随机和盲法的研究 206 篇,只提及随机的研究 4569 篇,只提及盲法的研究 34 篇,提及随机的开放性研究 94 篇。对于提及随机和盲法的 206 篇研究,采用邮件与电话联系作者的方式收集研究方法学的具体信息,发送邮件 76 封,电话联系 176 篇研究的作者;剩余的 4697 篇研究,采用邮件与邮寄信件的方式收集问卷以获得研究方法学的具体内容,发送邮件 441 封,寄出挂号信 6779 封。

关于电话联系 176 篇研究的作者,电话联系完成访谈为 10 (5.7%) 篇,另有 6 (3.4%) 篇的作者选择填写问卷。电话联系失败的原因包括:14 位作者拒绝接受回答,40 位作者已离开当前医院,40 位作者未接电话,29 位作者单位表示无法联系到本人,另有 34 家医院管理部门拒绝提供作者电话号码或无法联系。关于电子邮件联系,共发送 517 封电子邮件。

截至 2024 年 5 月 31 日,通过上述三种渠道共收到 333 条回复,包含 312 篇研究,回复率 4.5%。在 312 篇研究中,233 (74.7%) 篇研究为“试验是真实完成的,所报告的数据都不是编造的”,13 篇为“试验是真实完成的,但有些数据是修改或编造的”,53 篇表示对研究细节“不确定或记不清”,有 13 (4.2%) 篇承认其“试验从未进行过,数据是编造的”。在真实完成的 246 篇研究中,有 162 (66.9%) 篇符合随机对照试验的定义,还有 84 篇被认为不符合随机对照试验的定义。在 162 篇符合随机对照试验定义的研究中,仅 70 (43.2%) 篇为随机化低偏倚风险,29 (17.9%) 篇为分配隐藏低偏倚风险,在盲法方面,仅有 24 (14.8%) 篇为低偏倚风险。

结论 精神分裂症药物干预的中文随机对照研究其真实性和研究质量均有待提升,即便作者在文章中声称是随机对照试验,仍有近三分之一研究不符合随机对照试验的定义,甚至存在修改、捏造数据等情况;而对于真实进行的试验,也存在过程中使用高偏倚风险方法的现象。因此需要进一步重视国内精神障碍临床试验的研究质量。

精神分裂症患者血清炎性细胞因子水平与临床症状及疗效的相关性

于晨暘² 宋传福¹

1.首都医科大学附属北京安定医院芜湖医院
2.蚌埠医科大学

目的 探究精神分裂症患者血清炎性细胞因子水平与临床症状及疗效的相关性。

方法 纳入 2021 年 12 月至 2023 年 5 月在首都医科大学附属北京安定医院芜湖医院住院的首发或

停药 4 周以上的精神分裂症患者 50 例, 选择同时期在本院体检的健康志愿者 50 例作为对照组, 在使用奥氮平治疗 6 周前后检测血清白细胞介素 (IL)-2、IL-4、IL-8、IL-10、肿瘤坏死因子 (TNF)- α 的浓度, 使用阳性与阴性症状量表 (PANSS) 对患者精神病症状严重程度进行评估。比较精神分裂症患者治疗前后细胞因子水平、PANSS 评分的变化, 分析炎性细胞因子基线水平与 PANSS 评分及差值 (治疗后-治疗前) 的相关性, 并使用多元线性回归分析探索炎性细胞因子基线水平与 PANSS 评分差值之间的关系

结果 治疗前研究组血清 IL-10、TNF- α 水平较对照组高, 血清 IL-8 水平较对照组低, 差异有统计学意义 ($P < 0.05$)。奥氮平治疗 6 周后患者血清 IL-8 浓度升高, IL-10、TNF- α 浓度降低, 差异有统计学意义 ($P < 0.05$)。治疗前 IL-2 与阴性症状评分、总分负相关, IL-10 与一般病理症状评分、总分正相关, TNF- α 与阴性症状评分、一般病理症状评分、总分负相关 ($P < 0.05$)。TNF- α 基线水平与阴性症状评分差值正相关 ($P < 0.05$)。多元线性回归确定 TNF- α 的预测效应: TNF- α 基线水平与阴性症状评分差值 (调整 R 方=0.198, $\beta=0.445$, $p < 0.001$)

结论 精神分裂症患者血清炎性细胞因子水平与临床症状有一定相关性, 奥氮平可调节精神分裂症患者异常炎性细胞因子水平, TNF- α 可能可以预测奥氮平对阴性症状的疗效。

关键词: 精神分裂症, 炎性细胞因子, 奥氮平, PANSS

Disturbance of Neurotransmitter Metabolites in Peripheral Blood of Schizophrenia Patients Treated with Olanzapine: A Targeted Metabolomic Study

Jiajun Yin^{1,2}, Yansuo Gan^{1,2}, Zhenhe Zhou^{1,2}, Jun Wang^{1,2}

1. Wuxi mental health center

2. The Affiliated Mental Health Center of Jiangnan University

Objective The aim of this research was to characterize changes in peripheral blood neurotransmitter

metabolites in olanzapine-treated schizophrenia (SCZ) and to identify potential diagnostic biomarkers for SCZ. Concurrently, the relationship between these differential neurotransmitters and cognitive function is explored

Methods We recruited 40 SCZ treated with single-agent olanzapine and 40 healthy controls (HC). Cognitive function and psychopathology were assessed using the MCCB and PANSS, respectively. Neurotransmitter levels were determined by targeted metabolomics approach using liquid chromatography-mass spectrometry (LC/MS)

Results SCZ showed cognitive impairment in all domains of the MCCB compared to HC. Interestingly, a 4-neurotransmitter panel consisting of 3-Methoxytyramine hydrochloride (3-MT), 3,4-Dihydroxyphenylacetate (DOPAC), arginine, and r-aminobutyric acid (GABA) illustrated the highest determinative score between SCZ and HC. Arginine was positively correlated with PANSS general psychopathology scores. 3-MT independently predicted the verbal learning scores only in SCZ, whereas GABA independently predicted the social cognition scores only. Furthermore, GABA independently predicted the working memory scores only in HC

Conclusion The collective assessment of these four neurotransmitters (3-MT, DOPAC, arginine, and GABA) holds significant value in diagnosing SCZ. Moreover,

3-MT and GABA may contribute to the understanding of cognitive dysfunction in SCZ, particularly with respect to verbal learning and social cognitive dysfunction.

关键词: 3-methoxytyramine, r-Aminobutyric acid, neurotransmitters, schizophrenia, cognitive function, biomarker

静息态 f-MRI 在精神分裂症患者脑功能研究中的应用

姚明洋 栾燕 邵丽影 韩笑宇 王秀珍*
沈阳市精神卫生中心

目的 精神分裂症是一种严重的精神障碍，影响患者的认知功能和日常生活。研究其脑功能对于理解疾病机制、开发早期诊断工具、制定个性化治疗方案以及改善患者生活质量至关重要。本研究旨在利用静息态功能磁共振成像（f-MRI）技术，深入探讨精神分裂症患者的脑功能活动模式，以识别与该年龄段精神分裂症相关的神经生物学特征。通过比较精神分裂症患者与同龄健康对照组的静息态脑网络，本研究力图揭示疾病特有的脑功能异常，以期揭示精神分裂症的潜在生理学特征。

方法 选取 30 名精神分裂症患者作为患者组与 30 名正常人作为对照组，分别对他们进行静息态 f-MRI 测量，对测量结果进行时间层校正、头动校正、低频滤波、空间标准化等预处理后，分别得到患者组和对照组的 ALFF 和 ReHo 值，对二者分别进行双样本 t 检验，比较患者组和对照组的 ALFF 和 ReHo 的差异。

结果 统计分析表明患者组和对照组的 ALFF 值和 ReHo 值均有部分脑区存在显著性差异，其中患者组右侧舌回（Lingual Gyrus (R)）区域、右侧枕极（Occipital Pole (R)）区域的 ALFF 值显著低于对照组 ($p < 0.05$)，患者组右侧前极（Lingual Gyrus (R)）区域、右侧中央前回（Precentral Gyrus (R)）区域、右侧枕外侧皮质下分区（Lateral Occipital Cortex, inferior division (R)）的 ReHo 值显著低于对照组 ($p < 0.05$)。

结论 精神分裂症患者的静息态 fMRI 低频振幅和局部一致性存在差异，提示神经活动存在异常。

关键词：精神分裂症,静息态 f-MRI,低频振幅 (ALFF),局部一致性 (ReHo),神经生物学特征

宁波市在管严重精神障碍患者肇事肇祸的影响因素分析

李链 边国林*

宁波大学附属康宁医院

目的 探讨宁波市在管严重精神障碍患者肇事肇祸的主要影响因素。

方法 筛选出宁波市严重精神障碍信息管理系统中 2021 年 1 月-2023 年 12 月因肇事肇祸在司法

鉴定机构进行刑事责任能力评定的 90 例患者作为病例组，抽取系统中无肇事肇祸行为严重精神障碍患者作为对照组，按照年龄 (± 3 岁)、性别、病程 (± 1 年) 进行 1:2 配对病例对照研究。采用卡方检验及 logistic 回归分析严重精神障碍患者肇事肇祸行为的影响因素。

结果 肇事肇祸组城市户口、精神疾病家族史、家庭监护差、经济贫困、住院次数 ≥ 3 次、有妄想症状、不（规律）服药比例高于对照组 (均 $P < 0.05$)，肇事肇祸组社会功能缺陷量表评分高于对照组 (7.56 vs. 6.44, $P < 0.05$)。多因素 logistic 回归分析结果显示，家庭监护中和好 (OR=0.404 和 0.228)、无妄想症状 (OR=0.117)、规律服药/医嘱勿需服药 (OR=0.154) 是肇事肇祸保护因素。经济贫困 (OR=3.749) 和高社会功能缺陷评分 (OR=1.095) 是肇事肇祸危险因素 (均 $P < 0.05$)。

结论 应重点关注家庭监护差、经济贫困、不（规律）服药、有妄想症状、社会功能缺陷严重的严重精神障碍患者，通过采取针对性措施，降低该人群肇事肇祸行为发生。

关键词：严重精神障碍,肇事肇祸,影响因素

利培酮联用不同剂量二甲双胍对精神分裂症患者泌乳素及血脂的影响

缪文文 汪正华*

首都医科大学附属北京安定医院芜湖医院

目的 探讨不同剂量二甲双胍对利培酮治疗的精神分裂症患者泌乳素及血脂水平的影响。

方法 选取 2020 年 7 月至 2021 年 4 月于首都医科大学附属北京安定医院芜湖医院住院并使用利培酮治疗的精神分裂症患者 150 例 (男女各 75 例)，按随机数字法随机分为 A 组、B 组、C 组 (每组 50 例患者，男女各 25 例)，A 组、B 组、C 组分别给予二甲双胍 500mg/d、1000mg/d、1500mg/d 治疗 12 周。分别于治疗前及治疗 12 周后检测三组患者的泌乳素、血糖、甘油三酯、高密度脂蛋白胆固醇。组间比较采用方差分析，以 $P < 0.05$ 为差异有统计学意义。

结果 二甲双胍治疗前，三组中女性患者 PRL 均高于男性，比较差异有统计学意义 (P 均 < 0.001)。联合二甲双胍治疗后，三组血糖变化组间比较无差

异 ($P > 0.05$), B 组、C 组患者 TG、HDL、PRL 水平优于 A 组, 差异有统计学意义 (P 均 < 0.05)。

结论 二甲双胍可有效改善利培酮所致的精神分裂症患者泌乳素升高和脂代谢异常。泌乳素降低与二甲双胍使用剂量存在量效关系, 临床工作中可考虑使用二甲双胍来改善利培酮导致的泌乳素分泌增加及脂代谢紊乱, 提高患者对治疗的依从性, 改善预后。

关键词: 精神分裂症, 二甲双胍, 利培酮, 泌乳素, 甘油三酯

Advances in Functional Brain Connectivity in Schizophrenic Patients with Myelin Damage

Ting Peng*

Nanjing Brain Hospital

Objective Schizophrenia is a severe mental disorder of undetermined etiology, the pathogenesis of which has not been fully elucidated. In recent years, an increasing number of studies have suggested that myelin damage may play an important role in the pathogenesis of schizophrenia, but the specific mechanisms of myelin damage and its role in the disease process are still unclear. In this paper, we summarize the research progress of brain functional connectivity in schizophrenia patients with myelin damage, and discuss the effects of myelin damage on brain functional connectivity and its potential mechanisms

Methods We conducted a systematic literature search in PubMed, Web of Science, Science Direct, EMBASE and Cochrane for studies published in the last five years on functional brain connectivity and myelin damage in schizophrenia patients. Relevant high-quality studies were screened for comprehensive analysis and summarization

Results Studies have shown that patients with schizophrenia with myelin damage have significant abnormalities in the functional connectivity of several brain regions. These abnormalities are centered in areas such as the prefrontal cortex, hippocampus, and default mode network. In addition, myelin damage is closely

associated with dysregulation of neurotransmitter systems, inflammatory responses, and genetic factors, which together affect the integrity and stability of brain functional connectivity

Conclusion Myelin damage plays an important role in brain functional connectivity abnormalities in patients with schizophrenia. Future studies should further explore the specific mechanisms of myelin damage and its role in schizophrenia, with a view to providing new ideas and methods for clinical diagnosis and treatment

关键词: schizophrenia, myelin, brain functional connectivity, prefrontal cortex, default mode network

基于 Lasso 回归的精神分裂症患者磁休克疗效预测模型

目的 精神分裂症是一种严重的精神疾病, 常有感知觉、思维、情感和行为等障碍, 可导致患者出现严重的功能障碍和明显的社会适应不良。目前精神分裂症首先行抗精神病药物治疗, 然而研究发现约有 20% 的精神分裂症患者对目前治疗精神分裂症的主要抗精神病药物无效, 需要寻求其他治疗方案。磁休克治疗(MST)作为一种治疗重型精神疾病的无创神经调控新技术备受关注。目前已有研究证实了 MST 对于精神分裂症的治疗效果。本研究的目的是探究 MST 治疗精神分裂症的效果, 并构建预测模型来研究影响 MST 疗效的因素。

方法 本研究招募了 14 名精神分裂症患者, 使用阳性和阴性症状量表(PANSS)评估患者的症状严重程度; 使用精神分裂症认知功能成套测验-共识版(MCCB)评估患者的认知功能。采用配对样本 t 检验比较患者在 MST 治疗前后 PANSS 评分的差异。选择人口统计学变量、认知评估分数和基线 PANSS 评分作为自变量, 治疗前后 PANSS 及子量表的分数差

异作为因变量,进行 Lasso 回归分析,以探讨与 MST 治疗效果相关的因素。

结果 在 MST 治疗前后,患者 PANSS 总分有明显下降($p < 0.001$);阳性症状(P)、阴性症状(N)和一般精神病理症状(G)3 个子量表评分也均有明显下降($p < 0.01$)。Lasso 回归分析结果显示: PANSS 总分的下降与基线 PANSS 评分($\beta = 0.308$)、基线 N 子量表评分($\beta = 0.209$)、工作记忆($\beta = -0.081$)和社会认知($\beta = -0.083$)相关; P 子量表评分的下降与基线 P 子量表评分($\beta = 0.233$)相关; N 子量表评分的下降与人际关系($\beta = 0.136$)和基线 N 子量表评分($\beta = 0.605$)相关; G 子量表评分的下降与基线 PANSS 评分($\beta = 0.191$)、基线 G 子量表评分($\beta = 0.041$)和社会认知($\beta = -0.038$)相关。4 个预测模型的标准平均绝对误差均小于 1,均具有一定的预测性。

结论 研究结果表明, MST 能有效改善精神分裂症患者的阳性症状、阴性症状和一般精神病理症状。基线量表的评分是影响 MST 疗效的因素,表明基线症状重的精神分裂症患者在 MST 治疗后改善的程度更大。这可能说明严重精神分裂症患者可以从 MST 中获益更多;也可能是存在着“天花板效应”。此外,工作记忆和社会认知被发现与症状改善的程度呈轻度负相关,未来认知损害与 MST 疗效之间的关系需要进一步研究来验证。本研究表明,精神分裂症患者基线 PANSS 评分可以预测 MST 疗效,精神分裂症患者基线症状的严重程度可能是指导 MST 治疗的潜在指标之一。

DISC1 可能参与调节精神分裂症患者的线粒体功能

王小维 王惠玲*
武汉大学人民医院

目的 DISC1 被认为是一系列精神疾病的潜在易感基因,影响中枢神经系统功能的许多方面,包括神经发育、神经信号和突触可塑性。已有研究表明,DISC1 的基因突变、单核苷酸多态性与精神分裂症发病密切相关。但是 DISC1 参与精神分裂症发病的作用机制还不清楚。值得注意的是,DISC1 被证明

定位于线粒体中,并且可以和多种线粒体相关蛋白相互作用,参与调节线粒体的分布、形态、质量控制等。DISC1 异常则导致线粒体的 ATP 合成、细胞凋亡、钙离子缓冲等功能障碍。有趣的是,线粒体功能障碍在许多关于精神分裂症的脑部研究被观察到,表明线粒体功能障碍与精神分裂症的发病风险增加有关。本文就 DISC1 在线粒体功能和质量控制中的作用及其与 SCZ 的关系作一综述,为该病的诊断和治疗提供新的思路。

方法 使用生物医学文献数据库 Pubmed 输入以下关键词 "DISC1" 或 "schizophrenia" 或 "mitochondria"; "DISC1"和" mitochondrial dysfunction", "schizophrenia"和" mitochondrial dysfunction" 进行检索。结果 DISC1 与精神分裂症中线粒体功能障碍的发生发展关系密切。近年来对 DISC1 在精神分裂症和线粒体中的功能研究的文献有很多,本综述从 DISC1 的生物学特性、DISC1 的功能和分布、DISC1 异常影响线粒体功能、影响线粒体的运输、调控线粒体质量控制方面进行了归纳总结,以期为精神分裂症的诊断和治疗提供新的线索。

结果 DISC1 调节神经元功能,包括突触形成、迁移、增殖和可塑性。DISC1 作为一种多功能支架蛋白而不是一种酶,与不同的线粒体相关蛋白相互作用,如 Miro、Traks、Drp1、MFns、Lc3 和 Mic60。这种相互作用影响线粒体的数量、形状、分布和功能。DISC1 异常导致线粒体的氧化磷酸化障碍、钙失稳态、以及线粒体的运输、融合、分裂,自噬等生理过程紊乱,这些都与精神分裂症的病理机制有关,并且可以被抗精神病药物所逆转。因此,DISC1 可能解释线粒体功能障碍与精神分裂症之间的联系,阐明 DISC1 对线粒体各个生理过程和功能的调节的机制对于理解精神分裂症病理生理至关重要。

结论 DISC1 可能参与调节精神分裂症患者的线粒体功能。

目的 精神分裂症是一种严重的精神疾病，其典型特征是多维精神症状，包括阳性、阴性症状以及情感和认知障碍，可导致患者出现严重的功能障碍和明显的社会适应不良。研究显示，我国精神分裂症的终生患病率接近 1%，造成了巨大的疾病负担（如耻辱、活动受限、预期寿命缩短和医疗费用增加等）。精神分裂症发病机制非常复杂，目前仍未完全明确，主要存在脑功能连接异常、多巴胺假说、谷氨酸假说及神经发育等多种假说；此外，近日来精神分裂症与红细胞结构及生理特性之间的关联也收到越来越多的关注。已有研究表明，精神分裂症患者的红细胞计数升高；另有研究认为，红细胞计数升高与精神分裂症之间存在一定的相关性。然而，红细胞计数的改变是否与精神分裂症存在因果关系仍不清楚。因此，本研究的目的是基于双向双样本孟德尔随机化研究探索红细胞计数与精神分裂症之间的因果关系。

方法 本研究基于欧洲人群中红细胞计数和精神分裂症的全基因组关联研究(GWAS)的数据，使用双向双样本孟德尔随机化(MR)，遗传因素作为工具变量。使用 1000 个基因组连锁不平衡的欧洲群体作为参考群体，计算了 SNPS 之间的连锁不平衡。在前瞻性 MR 分析中，红细胞计数作为暴露因素，SCZ 风险作为结局；在反向 MR 分析中，SCZ 风险作为暴露因子，红细胞计数作为结局。评估红细胞计数与精神分裂症之间的潜在因果关系。

结果 在排除连锁不平衡及弱工具变量后，将 56 个独立 SNPs 作为遗传工具变量。MR 分析发现，红细胞计数与精神分裂症之间存在因果关系，比值比(OR) = 1.003 (95%CI: 1.000-1.006, $p = 0.023$)；在反向 MR 中，同样没有发现精神分裂症与红细胞计数之间潜在的因果关系，OR = 0.606 (95%CI: 0.011-32.604, $p = 0.805$)。

结论 本研究发现红细胞计数与精神分裂症之间存在因果关系，但由于 OR 值 95%CI=1.000-1.006，因此尚不能说明红细胞计数升高是患精神分裂症的风险因素。之后可能需要进一步研究来探究红细胞计数与精神分裂症之间的关联。

关键词：精神分裂症,红细胞计数,孟德尔随机化

Longitudinal Changes in Brain Structure in First-episode Schizophrenia

Qitong Jiang Zhenzhu Chen Tian Li Yimeng Wang Xiaoyao Wang Yujie Xing Chuanyue Wang Qijing Bo*
The National Clinical Research Center for Mental Disorders & Beijing Key Laboratory of Mental Disorders, Beijing Anding Hospital, Capital Medical University and the Advanced Innovation Center for Human Brain Protection, Capital Medical University, Beijing, China

Objective Schizophrenia has been widely confirmed to exhibit abnormal brain structures in neuroimaging studies. However, how these abnormalities evolve over time and how they correlate with antipsychotic drugs remains unclear. This study aims to conduct a longitudinal study on the differences in brain structure between first-episode schizophrenia (FES) and healthy controls (HC), using voxel-based morphometry (VBM) and surface-based morphometry (SBM). Furthermore, it will dynamically track the changes in brain structure before and after antipsychotic treatment, and explore the relationships between drug dosage, clinical symptoms, cognitive function, and these structural changes

Methods The study encompassed 28 FES and 30 HC participants. Post-enrollment, all FES patients received second-generation antipsychotic drugs. Baseline demographic, clinical, cognitive, and sMRI data were gathered from all subjects, while FES patients underwent follow-up assessments after 8 weeks of treatment. VBM and SBM analyses compared gray matter volume and cortical thickness between FES and HC, as well as FES changes over time. Correlation analysis examined the relationship between abnormal brain regions, clinical symptoms, cognition, and drug dosage

Results The FES group showed significantly reduced gray matter volume in multiple brain regions on the left precentral gyrus, inferior frontal gyrus, fusiform gyrus, inferior temporal gyrus, lingual gyrus, superior occipital gyrus, middle occipital gyrus, precuneus, cuneus, anterior lobe of the cerebellum, cerebellar inferior peduncle, and cerebellar tonsil at baseline. Additionally,

the cortical thickness of the left lateral occipital gyrus in the FES group was significantly reduced. After 8 weeks of antipsychotic treatment, the gray matter volume in the left anterior cingulate gyrus and the cortical thickness in the bilateral cingulate gyrus significantly decreased in the FES group, while the volume of the left caudate nucleus significantly increased. The correlation analysis revealed that after 8 weeks of treatment, the degree of reduction in gray matter volume of the left anterior cingulate gyrus was negatively correlated with the degree of reduction in total PANSS score and the degree of increase in social cognition score, while the degree of increase in the volume of the left caudate nucleus was positively correlated with the degree of reduction in PANSS negative symptom score. No relationship was found between brain structural changes and antipsychotic drug dose

Conclusion The brain structure of FES differs from HC in terms of gray matter volume and cortical thickness, and there are longitudinal changes in the structure of specific brain regions in FES after antipsychotic drugs. These changes are related to the clinical symptoms and cognition of FES, but not associated with the dosage of antipsychotic drugs

Iclepertin (BI 425809) 在健康志愿者 I 期试验和精神分裂症相关认知损害 II 期试验的安全性数据

Fredrik Gruenenfelder¹, Peter Nagy¹, Yury Shatillo², Michael Desch³, Eric Fu⁴, Corey Reuteman-Fowler⁴

1.Boehringer Ingelheim International GmbH, Ingelheim am Rhein, Germany

2.Boehringer Ingelheim Pharma GmbH & Co. KG, Ingelheim, Germany

3.Boehringer Ingelheim Pharma GmbH & Co. KG, Biberach an der Riss, Germany

4.Boehringer Ingelheim Pharmaceuticals, Inc., Ridgefield, CT, USA

目的 Iclepertin (BI 425809) 是一种强效的 GlyT1 选择性抑制剂, 正在进行精神分裂症相关认知损害 (CIAS) 的 III 期试验。已有的 I 期试验项目包括 330 例健康志愿者 (HV, iclepertin 组 278 例; 安慰剂组 52 例)。II 期试验中, 709 例 CIAS 患者接受了治疗 (iclepertin 组 438 例; 安慰剂组 271 例)。

结果 I 期试验中, 162 例 (58.3%) 服用 iclepertin 和 17 例 (32.7%) 服用安慰剂的 HV 报告任何不良事件 (AE), 其中 0.7% 的 AE 严重程度为重度, 26.9% 的 AE 被研究者定义为与药物相关, 1.9% 的 AE 导致治疗中断, 1.9% 的 AE 具有显著意义 (ICH E3 定义); 无特别关注 AE (AESI) 和严重 AE (SAE)。Iclepertin 组、安慰剂组最常见的 AE 是头痛 (18.0% vs 9.6%)、头晕 (10.1% vs 5.8%)、鼻咽炎 (5.4% vs 5.8%)、背痛 (5.4% vs 3.8%)、恶心 (8.3% vs 1.9%)、疲劳 (6.5% vs 5.8%) 和呕吐 (5.4% vs 1.9%), 两组相比未观察到血红蛋白或红细胞比容的明显下降。未报告自杀意念或行为。

II 期试验中, iclepertin 组 204 例 (46.6%) 和安慰剂组 131 例 (48.3%) 报告了任何 AE。Iclepertin 组、安慰剂组分别有 2.3% 和 1.1% 的 AE 严重程度为重度, 分别有 17.4% 和 18.5% 的 AE 被研究者定义为与药物相关, 3.2% 和 3.0% 的 AE 导致治疗中断, 2.5% 和 2.6% 的 AE 具有显著意义 (ICH E3 定义)。只有 iclepertin 组报告了 AESI (0.2%)。Iclepertin 组、安慰剂组分别有 3.0% 和 2.2% 发生 SAE。两组最常见的 AE 分别是头痛 (9.1% vs 7.4%)、嗜睡 (3.9% vs 2.6%)、头晕 (3.9% vs 2.2%) 和鼻咽炎 (6.6% vs 5.2%)。在 iclepertin 组和安慰剂组中, 分别有 0.5% 和 0.4% 的患者报告精神分裂症 SAE, 0.2% 和 1.1% 报告自杀意念。

结论 Iclepertin 在 HV 和 CIAS 患者中耐受性良好。总体 AE 没有剂量依赖性趋势。血红蛋白降低的类效应在一项 II 期试验的 CIAS 患者中显示剂量依赖性, 但均不认为具有临床相关性。与安慰剂治疗相比, 眼部安全性参数没有观察到有意义的变化。

【声明】 此摘要首发在 2024 年 4 月 3-7 日精神分裂症国际研究协会年会 (SIRS)。

Independent Deficit of The 2.5-Hz Auditory Steady-state Response in Schizophrenia

Xiangqin Qin Wenpeng Hou Chuanyue Wang*
Beijing Key Laboratory of Mental Disorders, National Clinical Research Center for Mental Disorders & National Center for Mental Disorders, Beijing An Ding Hospital, Capital Medical University, Beijing, 100088, China

Objective This study primarily aimed to investigate the impairment of the 2.5-Hz auditory steady-state response (ASSR) and its correlation with other auditory cognitive indicators, clinical symptoms, and multidomain cognition in individuals with schizophrenia

Methods In this cross-sectional study, 30 patients with schizophrenia and 30 healthy controls underwent 2.5- and 40-Hz ASSR and mismatch negativity (MMN) assessment. The Positive and Negative Syndrome Scale (PANSS) was utilized to assess the patients' clinical symptoms, and the MATRICS consensus cognitive battery (MCCB) was used to evaluate cognitive function

Results The 2.5-Hz ASSR inter-trial coherence (ITC) was significantly lower among patients with schizophrenia than among healthy controls ($P = 0.012$, Cohen's $d = 0.85$). The 2.5-Hz ASSR ITC alone distinguished these groups, with 53.3% sensitivity, 70.0% specificity, and 61.7% accuracy. In the schizophrenia group, the 2.5-Hz ASSR ITC did not correlate significantly with the MMN amplitude or any clinical symptoms or cognitive measurement. In healthy controls, the 2.5-Hz ASSR ITC correlated positively with verbal learning ($r = 0.381$, $P = 0.038$), although this correlation was not significant after Bonferroni correction

Conclusion The evoked activity maintaining delta-band oscillation entrainment in the auditory system reveals an independent deficit in schizophrenia and is valuable for the objective diagnosis of this disorder

关键词: Auditory steady-state response; Delta-band oscillation; Auditory cognition; Schizophrenia.

精神分裂症患者奖赏动机适应性的行为研究

潘奕名^{1,2} 王汇^{1,2} 黄佳^{1,2}

1.中国科学院心理研究所心理健康院重点实验室, 神经认知与应用认知神经科学实验室
2.中国科学院大学心理学系

目的 奖赏动机是指个体付出努力获得潜在益处的意愿程度, 而动机缺乏是精神分裂症阴性症状的核心症状。以往研究发现, 精神分裂症患者奖赏动机减弱, 但尚不清楚他们是否会随着外在付出-回报比的改变, 动态调整自己的奖赏动机。本研究旨在明确精神分裂症患者奖赏动机在付出-回报失衡条件改善以后, 是否随之提升, 并探究这种适应性与症状、社会功能之间的关系。厘清这些问题有助于进一步了解精神分裂症患者奖赏动机缺损的本质, 揭示阴性症状动机缺乏的认知机制, 并为奖赏动机是否处于健康状态提供评估方法。

方法 本研究共招募 30 名精神分裂症患者和 30 名健康对照被试, 使用基于心算努力的奖赏动机适应性任务(RMAT)测量奖赏动机及适应性。自变量为付出-回报条件, 根据预期奖赏和实际奖赏的相对大小设置付出=回报平衡、付出>回报失衡、付出<回报失衡三种条件; 因变量为每个试次开始时“渴求奖赏”和结束时“喜爱奖赏”的主观评分。测量两组的社会功能、动机和愉快体验等方面的得分, 并评估患者的临床症状。使用 SPSS 22 进行数据分析。

结果 与健康对照组相比, 患者的“喜爱奖赏”显著降低[$F(1, 58) = 4.56$, $p = 0.037$], “渴求奖赏”有降低趋势[$F(1, 58) = 3.14$, $p = 0.082$]; 组别和条件的交互作用均显著[渴求奖赏: $F(1.33, 77.26) = 9.19$, $p = 0.001$; 喜爱奖赏: $F(1.19, 68.93) = 15.17$, $p < 0.001$], 事后检验显示在付出-回报平衡和付出<回报失衡时, 患者的渴求、喜爱奖赏均显著低于健康对照组, 而在付出>回报失衡时两组的渴求、喜爱奖赏差异均不显著。患者渴求、喜爱奖赏的适应性系数均显著低于健康对照组[β 渴求: $t(54.28) = -2.89$, $p = 0.005$; β 喜爱: $t(58) = -3.45$, $p = 0.001$], 且患者的 β 渴求与阴性症状临床评估量表(CAINS)的表达维度显著负相关[$r(28) = -0.42$, $p = 0.022$], β 喜爱与动机与情绪自评量表(MAP-SR)[$r(16) = 0.48$, $p = 0.045$]、首发社会功能问卷(FESFS) 的家庭维度[$r(18) = 0.44$, $p = 0.050$]显著正相关。

结论 精神分裂症患者的奖赏动机并没有像对

照组那样随着付出-回报条件改善而提升,并且减弱的适应性与社会功能、日常生活中的动机与愉快体验均存在关联。这表明精神分裂症患者在外界环境条件变化时奖赏动机适应性调整的能力缺损,这是精神分裂症阴性症状动机缺乏的认知机制之一,一定程度上提示了阴性症状的严重程度及预后情况。

关键词:付出-回报失衡;奖赏动机;适应性;精神分裂症

重复经颅磁刺激在精神分裂症中的研究和治疗应用

范凯丽*

温州市第七人民医院

目的 本文综述了近年来重复经颅磁刺激(repetitive transcranial magnetic stimulation, rTMS)在精神分裂症治疗中的应用进展,通过对多篇文献的深入分析与提炼,探讨了其作用机制、治疗靶点、临床研究证据及安全性评估。

方法 检索知网、万方、维普、Embase、PubMed等数据库查阅文献,对过往 rTMS 在精神分裂症干预治疗进行了梳理和总结,从 rTMS 潜在作用机制、作用靶点及频率、分别在精神分裂症阳性症状、阴性症状、认知功能方面的临床应用几个方面分别阐述。

结果 一、 rTMS 治疗精神分裂症的潜在机制 rTMS 可能通过调节多种神经递质释放,对多种受体以及神经元兴奋性有明显影响。高频经颅磁刺激可能是一种通过调节大脑中的 γ 振荡活动来改善精神分裂症患者认知能力的可能方法。高频 rTMS 可促使精神分裂症患者脑血流量和代谢水平增加。利用 rTMS 调节神经功能和连接性的能力,治疗阳性、阴性、认知症状。

二、 rTMS 治疗精神分裂症的常用方案

目前 rTMS 的刺激频率主要分为高频刺激、低频刺激($\leq 1\text{Hz}$)和 TBS,刺激部位常见的有颞顶区(TPC)和 DLPFC,另外,近期研究发现 rTMS 刺激小脑也可改善患者的多种症状。

三、 rTMS 治疗精神分裂症的临床应用

大多研究认为低频($\leq 1\text{Hz}$)作用于左颞顶叶区域的重复经颅磁刺激对难治性幻听有一定的治疗效

果,采用高频($> 1\text{Hz}$)重复经颅磁刺激作用于左侧 DLPFC 对精神分裂症的阴性症状及认知功能有一定的疗效。但研究的结果均异质性的,结果的异质性可能与 rTMS 刺激频率,刺激强度、刺激位点和刺激周期以及患者个人特征有关,如年纪越小,女性,联合抗精神病药剂量越高以及治疗前刺激部位的局部脑血流量与更好的反应相关。此外, rTMS 改善患者认知功能损害的安全性、效果的持久性需要更精细的研究。

rTMS 的安全性

rTMS 的优点在于其安全性。已知最严重的副作用是癫痫发作,这种情况非常罕见,每 60000 次发作不到 1 次。rTMS 最常见的副作用是刺激时的头痛和头皮不适,幸运的是,疼痛可以被大部分人耐受。

结论 总之,相比于 rTMS 治疗抑郁症而言, rTMS 对精神分裂症的疗效并没有那么成功。目前多中心、多样本、高质量的研究很少,并且现有文章的结果存在争议,并不明确其临床效用。对于 rTMS 的适用人群、治疗模式(包括部位、频率、强度、持续时间等)在未来需要多中心的临床试验来探索。同时需要更多的研究来探索 rTMS 治疗精神分裂症的确切机制。

关键词:重复经颅磁刺激(rTMS);精神分裂症;认知功能

DTNBP1 与精神分裂症的关系

陈玲玉 王惠玲*

武汉大学人民医院

目的 精神分裂症是一种复杂且严重的精神疾病,涉及多个基因和环境因素的相互作用。近年来,研究者逐渐发现, dysbindin 基因(DTNBP1)在精神分裂症的病理生理学中可能扮演着重要的角色。该基因编码的蛋白质在神经元突触功能和神经传递过程中发挥关键作用,其变异可能影响认知功能和行为。本文旨在评估和分析现有文献,探讨 DTNBP1 基因变异与精神分裂症的相关性,特别是其在疾病发病机制和认知功能障碍中的潜在作用。通过综合分析关键研究,本文将揭示 DTNBP1 在精神分裂症中的复杂功能,为未来研究提供新的视角和方向。

方法 综合分析四篇关键文献,这四篇文献的

研究内容分别为：对 DTNBP1 外显子序列变异的全面评估、探索特定保护性单倍型对记忆性能的影响、利用 *sd*y 小鼠模型研究 DTNBP1 缺失对行为的影响，以及 DTNBP1 变异对健康个体和精神分裂症患者认知功能的作用研究。

结果 1.尽管存在多个 DTNBP1 外显子变异，但这些变异并未直接导致精神分裂症。

2.携带 DTNBP1 特定保护性单倍型的健康个体在记忆测试中表现更优，而精神分裂症患者中未观察到这一现象。

3.缺乏 DTNBP1 的 *sd*y 小鼠显示出与精神分裂症相关的行为异常，可能与前脑多巴胺传输减少有关。

4.DTNBP1 基因变异可能影响记忆功能，但不影响智商或其他认知领域。

结论 DTNBP1 基因在精神分裂症的发病机制和认知功能障碍中起到了重要且复杂的作用。这些发现强调了进一步研究 DTNBP1 的遗传变异如何影响精神分裂症发展和认知表现的必要性，为精神分裂症的治疗提供可能的新策略。未来研究需要更深入地探讨 DTNBP1 的分子机制及其在不同人群中的作用。

关键词：DTNBP1,精神分裂症

回旋指数 (Local Gyrfication Index, LGI)。利用 SPSS 统计软件分析两组间皮层厚度及认知功能的差异，在患者组采用 Pearson 偏相关分析探讨皮层结构与认知特征的关系。

结果 患者组在 MCCB 各项认知功能得分以及韦氏智力得分均明显低于健康组 ($p < 0.05$)。患者组与健康组的皮层厚度在双侧脑岛、左侧三角部、右侧距状旁回、右侧前扣带皮层吻侧部脑区存在显著差异 ($p < 0.05$)，且患者组的皮层厚度明显厚于健康组。患者组的 LGI 值在右侧海马旁回显著高于健康组 ($p < 0.05$)。根据偏相关分析的结果，在首发未服药精神分裂症患者组中，左侧脑岛的皮层厚度与情绪管理测验呈显著正相关 ($r = -0.249$, $p = 0.003$)，右侧脑岛的皮层厚度与情绪管理测验呈显著正相关 ($r = -0.268$, $p = 0.001$)。在健康组中未发现两者具有显著相关性。

结论 首发未服药精神分裂症患者存在局部脑区的皮层形态结构异常以及全面的认知损害。在精神分裂症早期阶段，部分脑区的皮层厚度可能存在代偿性增加。精神分裂症患者双侧脑岛皮层厚度的异常与社会认知有关，表明脑岛可能是精神分裂症社会认知损害的神经病理学基础。

关键词：精神分裂症，皮层厚度，局部回旋指数，情绪管理，社会认知

首发未服药精神分裂症皮层结构异常与认知功能损害的相关性研究

申旭冉 谢世平*

南京脑科医院

目的 本研究通过对首发未服药精神分裂症患者皮层形态结构的改变以及其认知水平的损害进行探讨，寻找与其认知特征相关的潜在神经生物学标志物。

方法 本研究共纳入 145 例首发未服药精神分裂症患者和 95 例健康对照。采用阳性与阴性症状量表 (PANSS) 评估患者精神症状的严重程度。采用精神分裂症认知功能成套测验 (MCCB) 及韦氏智力测验 (简式版) 评估所有被试的认知水平及智力。所有被试均使用 3.0T 磁共振扫描仪进行全脑扫描，选用 Freesurfer 软件进行磁共振数据处理，根据 Desikan-Kiliany Atlas 图谱获得各脑区的皮层厚度以及局部

门诊慢特病精神分裂症患者服药依从性及生活质量的观察性研究

江寒 魏雅楠 宋震*

沈阳市安宁医院

目的 精神分裂症是一种慢性病，给患者及其家庭以及社会造成了极大的经济负担和社会负担。政府投入了大量的资金、人力以期促进精神分裂症患者的院外康复，恢复其社会功能，而门诊慢特病医保政策正是在此理念下诞生。我们以享受门诊慢特病医保政策的精神分裂症患者为研究对象，探讨门诊慢特病政策是否可以通过降低患者的治疗费用、减轻患者及家属的经济负担来提高患者的依从性进而改善精神病症状，提高患者的生活质量，降低患者的再住院率，促进精神分裂症患者的院外康复，总结分享经验，以期精神为精神分裂症的治疗及康复提

供有力的参考依据。

方法 享受门诊慢特病政策的名门诊治疗的精神分裂症患者男女各 40 名为观察组,未享受慢特病(院外服药完全自费)的门诊治疗精神分裂症患者男女各 40 名为对照组,分别于基线、6 月后评估两组患者的服药依从性(MARS 量表)、生活质量(生活质量量表,SQLS),精神病性症状严重程度(简明精神病评定量表,BPRS),因病给家庭和成员带来的负担疾病(家庭负担量表,FBS)及再住院率。

结果 ①采用卡方检验,单因素分析显示,入组时两组患者年龄、性别、职业,文化程度、婚姻状况、照料者关系、病程,家庭收入情况、医保类型、用药种类、就诊频次及 MARS、SQLS、BPRS、FBS 量表方面比较,差异无统计学意义($P>0.05$);6 月后,观察组患者 MARS 量表评分高于对照组 $[(6.84\pm 2.68)\text{vs}(5.90\pm 2.16)]$ 、SQLS 量表评分低于对照组 $[(38.34\pm 5.34)\text{vs}(49.31\pm 4.23)]$ 、BPRS 量表评分低于对照组 $[(23.81\pm 5.35)\text{vs}(31.12\pm 6.71)]$ 、FBS 量表评分低于对照组 $[(11.14\pm 0.96)\text{vs}(15.41\pm 0.90)]$ 、观察组患者再住院率为 2.60%低于对照组 11.25%,差异均具有统计学意义($P<0.05$)。

结论 门诊慢特病政策能够提高患者的依从性进而改善精神病症状,提高患者的生活质量,降低患者的再住院率。

关键词: 精神分裂症;门诊慢特病;服药依从性;生活质量

经络放松疗法对改善精神分裂症患者焦虑症状效果研究

李群*

沈阳市安宁医院

目的 精神分裂症患者多伴有紧张、担心、害怕等焦虑症状,焦虑症状的存在对精神分裂症患者症状的控制是不利因素,治疗上需要同时给予抗焦虑药物。抗精神病药物多有药物不良反应,居家患者服药依从性一般,如同时服用抗焦虑药物可能会进一步影响患者服药依从性。中医针刺治疗焦虑症有显著的临床效果,渐进式放松训练也是一种比较有效的改善焦虑情绪的训练方式,临床上将两种治疗方法结合起来改善精神分裂症患者焦虑症状效果

更佳,同时能够减少药物的用量。

方法 选择伴有焦虑症状的精神分裂症患者 60 例做为研究对象,进行随机分组,观察组及对照组各 30 例。对照组给予常规治疗方案,观察组在对照组治疗的基础上给予经络放松治疗(针刺+渐进式放松训练),根据患者辨证论治结果选择相应治疗穴位,每周治疗 5 次,每次 30 分钟,1 个月为 1 疗程,共治疗 3 个月。

结果 治疗结束后观察组精神分裂症患者焦虑症状改善程度优于对照组,同时观察组患者夜间睡眠改善情况优于对照组,服药依从性更高。

结论 针刺治疗是传统的中医适宜治疗技术,有着数千年的临床应用经验,针刺治疗在神志病方面有着独特的治疗效果,尤其在焦虑症、抑郁症、睡眠障碍、分离转换障碍等疾病的治疗上,效果显著。经络放松疗法将传统针刺治疗与精神心理学中渐进式放松训练结合起来,治疗伴有焦虑症状的精神分裂症患者,能够很好的改善精神分裂患者的焦虑症状,针刺治疗不良反应小,适合推广应用

关键词: 经络放松疗法,精神分裂症,焦虑

基于 OPRL1 及其受体 NOP 介导 BDNF/TrkB/ERK 通路对膝关节损伤术后-PTSD 发病机制的研究

范思有 宋震*

沈阳市安宁医院

目的 膝关节损伤是临床常见的疾病,发病率在我国约为 8.1%,患者术后可能发生为创伤后应激障碍(Post-Traumatic Stress Disorder, PTSD),导致患者的日常生活和人际关系受到严重影响,进而影响患者术后康复效果及生活质量。本研究旨在通过文献研究探索 OPRL1 及其受体 NOP 介导 BDNF/TrkB/ERK 通路在膝关节损伤术后-PTSD 发病的机制。

方法 通过文献研究法对近 20 年内关于 OPRL1 及其受体 NOP 介导 BDNF/TrkB/ERK 通路参与膝关节损伤术后-PTSD 的发病机制进行分析总结。

结果 ①在膝关节损伤后,炎症和疼痛刺激可能激活中枢神经系统的 OPRL1 受体,导致疼痛感觉

的增强和敏感化,从而引发 PTSD 症状。OPRL1 可能还参与了多巴胺和乙酰胆碱等神经递质的调节,这些递质与诸多心理状态密切相关。OPRL1 及其受体 NOP 可能影响免疫系统来参与膝关节损伤术后 PTSD 的发生。OPRL1 可能通过调节免疫系统影响心理健康,从而在 PTSD 的发生中发挥作用。OPRL1 可能通过影响神经和突触的可塑性过程来参与 PTSD 的发生和发展。②BDNF (脑源性神经营养因子) 是神经系统中重要的生长因子,它通过与酪氨酸激酶 B (TrkB) 受体结合,激活了 ERK (细胞外信号调节激酶) 通路。该通路在神经细胞的生长、分化、存活及突触可塑性等方面发挥重要作用。膝关节损伤术后, BDNF/TrkB/ERK 通路可能被激活,以促进损伤部位的神经再生和修复。如果损伤严重或处理不当,该通路可能会过度激活,持续传递炎症反应和疼痛信号,从而可能引发心理应激反应,导致 PTSD 的发生。BDNF/TrkB/ERK 通路在膝关节损伤术后,可能影响患者的情绪状态和记忆功能,使患者更容易出现 PTSD 症状,如噩梦、回忆闪回等。BDNF/TrkB/ERK 通路还可能通过影响免疫系统来参与膝关节损伤术后 PTSD 的发生。BDNF 可能通过调节免疫系统影响心理健康,从而在 PTSD 的发生中发挥作用。③OPRL1 及其受体 NOP 可能通过 BDNF/TrkB/ERK 通路影响神经、突触的可塑性。在膝关节损伤后,大脑的神经网络和突触连接可能会发生改变,这些改变可能与 PTSD 的症状有关。OPRL1 可能通过调节 BDNF 的表达和 TrkB 受体的活性,影响 ERK 通路的信号转导。同时 OPRL1 及其受体 NOP 可能通过 BDNF/TrkB/ERK 通路参与了疼痛信号的传递和调控,也能影响免疫系统来参与膝关节损伤术后 PTSD 的发生。

结论 膝关节损伤术后-PTSD 共病模型发病机制可能是基于 OPRL1 及其受体 NOP 调控 BDNF/TrkB/ERK 通路。

Long-term Benzodiazepines Use Is Associated with Impaired Cognitive Function in Schizophrenia: A Longitudinal Observational Study

Caiping Liu Huafang Li* Lei Zhang Wenjuan Yu Shen

He Duan Zeng Yifeng Shen
Shanghai mental health center, Shanghai Jiao Tong university school of medicine

Objective To explore the effect of long-term exposure to benzodiazepines drugs on cognitive function in patients with schizophrenia

Methods This study was based on the "Observational Study of the Safety and Related Factors of Long-term Treatment with Atypical Antipsychotics in Chinese Patients with Schizophrenia". 57 patients with long-term exposure (medication ≥ 60 days) to benzodiazepines were recruited. Propensity score matching was used to match a non-exposure control group 1:1 according to age, gender, course of disease, and type of atypical antipsychotic drug. The scores of the Montreal Cognitive Assessment (MoCA) Scale, Positive and Negative Syndrome Scale (PANSS), Clinical Global Impression-severity (CGI-S), and Personal and Social Performance (PSP) Scale were compared between the two groups. Logistic regression was used to analyze the influencing factors of cognitive impairment in schizophrenia

Results We matched long-term benzodiazepines exposure group (n=57) 1:1 with a non-exposure group (n=57) with good Standardized Mean Difference (SMD). The total MoCA of the long-term benzodiazepines exposure group (16.02 \pm 6.69) was lower than the non-exposure group (19.33 \pm 7.11), with a statistically significant difference ($P < 0.05$). The PANSS total score of the study group was 57.50 (49.00, 75.75) and 55.00 (46.75, 70.25) in the non-exposure group, with no statistically significant difference ($P > 0.05$). The CGI-S score of the study group was 4.00 (3.00, 4.00) and 3.00 (3.00, 4.50) in the control group, with no significant difference ($P > 0.05$). The PSP total score of the study group was 60.00 (40.00, 70.50) and 60.00 (45.00, 65.00) in the control group, with no significant difference ($P > 0.05$). Long-term benzodiazepines exposure was a risk factor for cognitive impairment in schizophrenia patients (OR=7.73, $P < 0.05$), while years of education was a protective factor (OR=0.74, $P < 0.05$)

Conclusion Schizophrenia patients with long-term benzodiazepine exposure had poorer cognitive

function. Long-term benzodiazepines exposure is a risk factor for cognitive impairment in schizophrenia patients

关键词: schizophrenia, benzodiazepines, cognitive function, long-term exposure

精神分裂症患者血清 IL-33 表达水平与攻击行为相关性研究

张琦¹ 高峥^{1,2} 李雪¹ 解子良¹ 唐凡¹ 李硕¹ 张才溢^{1,2}

1.徐州医科大学(徐州, 221004)

2.徐州医科大学附属徐州东方医院(徐州, 221004)

目的 本研究旨在评估精神分裂症患者血清白介素-33(IL-33)表达水平及其与攻击行为的相关性,探索精神分裂症患者攻击行为潜在预测指标。

方法 63例精神分裂症患者作为精神分裂症组(攻击组 32例,非攻击组 31例),26名健康志愿者作为对照组。采集一般资料。使用修订版外显攻击行为量表(MOAS)评估患者近1周内有无明显攻击行为及其攻击性,MOAS加权总分 ≥ 4 分为攻击组, < 4 分为非攻击组。采用阳性和阴性综合征量(PANSS)评估患者的精神症状。采用酶联免疫吸附试验检测血清 IL-33 的水平。采用 Shapiro Wilk 进行正态性检验,符合正态分布的数据使用 t 检验或单因素方差分析,偏态分布数据使用 Mann-Whitney 检验或 Kruskal Wallis 检验。在精神分裂症组控制年龄、教育程度、婚姻情况后,对 IL-33 原始数据进行 Log 函数转换后进行偏相关分析;同时采用二元 logistic 回归分析攻击与非攻击患者 PANSS 量表评分及血清 IL-33 水平差异。应用 ROC 曲线通过曲线下面积(AUC)分析 IL-33 对攻击行为的判别价值。 $P < 0.05$ 为差异有统计学意义,多重比较使用 Bonferroni 校正。

结果 与非攻击组相比,攻击组患者阳性症状评分、一般精神病理症状评分以及 PANSS 总分更高($P < 0.05$)。精神分裂症组血清 IL-33 水平为 13.09 (9.07, 29.80) pg/ml,高于对照组的 7.86 (3.66, 14.04) pg/ml($P < 0.05$);攻击组为 19.91 (10.44, 40.51) pg/ml,高于非攻击组的 11.53 (8.31, 17.26) pg/ml 和对照组 ($P < 0.05/3$)。偏相关分析显示患者 MOAS

加权总分与阳性症状和 PANSS 总分呈正相关,血清 IL-33 水平与 MOAS 加权总分、阳性症状评分及 PANSS 总分呈正相关。二元 logistic 回归显示患者血清 IL-33 水平(OR=1.072, 95%CI: 1.021-1.125)、阳性症状评分(OR=1.320, 95%CI: 1.125-1.550)以及一般精神病理症状评分(OR=1.088, 95%CI: 1.015-1.167)与患者发生攻击行为呈正相关。血清 IL-33 水平判别患者攻击行为的 AUC 为 0.713,敏感性为 59.4%,敏感性 80.6%;血清 IL-33 水平联合阳性症状评分判别精神分裂症患者攻击行为的 AUC 为 0.766,敏感性为 56.3%,特异性为 90.3%。

结论 本研究提示伴有攻击行为精神分裂症患者的血清 IL-33 水平升高,IL-33 联合阳性症状评分可作为精神分裂症患者攻击行为的辅助预测指标。

更改“Catatonia”的中文译名(现译为紧张症)可能加深精神科对该综合征的认识

陈捷^{1,2} 刘梦薇¹ 林丽心¹ 林楠¹ 黄仁春¹

1.福州市第二总医院神经精神病防治院

2.香港中文大学

Catatonia(现译为紧张症)是一类以精神运动性紊乱为主的临床综合征,其临床特征包括精神运动性增强(极度多动或激越、冲动和好动)、精神运动性减退(凝视、矛盾性、违拗、木僵和缄默等)、及精神运动性异常(扮鬼脸、作态、装相、刻板行为、肌张力强直、模仿言语、模仿行为、言语重复、蜡样屈曲和姿势强直等)。Catatonia 可以在一些特定精神障碍的背景下出现(如精神分裂症、心境障碍和自闭症等),也可以继发性于一些不归于精神障碍的医疗状况或物质/药物因素。

回顾历史,Catatonia 概念的提出始于德国精神病学家 Karl Ludwig Kahlbaum 在 1874 年出版的文章“Catatonia or Tension Insanity”。Catatonia 源自希腊语的词根 keta=down + tonos=tension。他认为 Catatonia 的核心体征是肌肉强直/痉挛,常出现在许多不同的精神障碍病程中,包括抑郁、躁狂、木僵和假性痴呆。在 Kahlbaum 的观察和描述中,Catatonia 主要表现为精神运动性减退或增强,以木僵为典型,

患者保持固定呆滞的表情、沉默不动、肌肉紧张,这些临床表现与 Catatonia 的字面意思“减少/减退 + 紧张”相符,也是中文译名“紧张症”的由来。然而,尽管 Kahlbaum 第一次将 Catatonia 描述为一种独立的诊断实体(与心境障碍、焦虑相关障碍等处于同一层次),但他提出的 Catatonia 概念并未涵盖许多后来被认为同样属于这一综合征的表现 - 精神运动性异常,这一观点也被 Emil Kraepelin 所支持。

因此, Catatonia 的临床表现范围早已超越 Kahlbaum 最初的描述,虽然“紧张症”的中文译名体现了肌肉紧张这一核心体征,但参考 DSM-5, Catatonia 的诊断多基于精神科医生对患者临床表现的观察,而非肌张力检查或肌电图确诊。“紧张症”的译名主要给人以精神运动性减退/增强的印象,以至于 Catatonia 受到了许多临床执业精神科医生的忽视,而更改“Catatonia”的中文译名(现译为紧张症),如果直接以“精神运动性紊乱”进行翻译,可能可以加深我国精神科对该综合征的认识。

关键词:紧张症

绘画心理技术辅助氨磺必利、奥氮平治疗精神分裂症的疗效及对糖脂代谢、认知功能的影响

王志满*

开滦精神卫生中心

目的 探讨绘画心理技术辅助氨磺必利、奥氮平治疗精神分裂症的疗效及对糖脂代谢、认知功能的影响。

方法 选取 2022 年 6 月至 2023 年 6 月在我院诊治的精神分裂症患者 180 例,随机分为 3 组,观察 A 组、观察 B 组和观察 C 组,每组各 60 例,观察 A 组给予奥氮平治疗,观察 B 组给予氨磺必利联合奥氮平治疗,观察 C 组给予绘画心理技术辅助氨磺必利联合奥氮平治疗,比较三组治疗前后的糖脂代谢指标、阳性和阴性症状量表(PANSS)评分、简易精神状态检查评分表(MMSE)评分、威斯康星卡片分类测试(WCST)各维度评分。

结果 治疗后,观察 A 组、观察 B 组空腹血糖(FBG)、甘油三酯(TG)与观察 C 组比较明显较高($P<0.05$),观察 B 组 FBG、TG 与观察 C 组比较

明显较高($P<0.05$),观察 A 组总胆固醇(TC)与观察 B 组、观察 C 组比较明显较高($P<0.05$),观察 A 组低密度脂蛋白(LDL-C)与观察 C 组比较明显较高($P<0.05$),观察 B 组高密度脂蛋白(HDL-C)与观察 A 组、观察 C 组比较明显较高($P<0.05$)。治疗后,观察 A 组、观察 B 组 PANSS 评分与观察 C 组比较明显较高($P<0.05$),观察 B 组 PANSS 评分与观察 C 组比较明显较高($P<0.05$),观察 A 组、观察 B 组 MMSE 评分与观察 C 组比较明显较低($P<0.05$),观察 B 组 MMSE 评分与观察 C 组比较明显较低($P<0.05$)。治疗后,观察 A 组、观察 B 组概念化水平百分数、正确应答数、完成分类数、持续性应答数与观察 C 组比较明显较低($P<0.05$),观察 B 组概念化水平百分数、正确应答数、完成分类数、持续性应答数与观察 C 组比较明显较低($P<0.05$),观察 A 组、观察 B 组持续性错误数与观察 C 组比较明显较高($P<0.05$),观察 B 组持续性错误数与观察 C 组比较明显较高($P<0.05$)。

结论 绘画心理技术辅助氨磺必利、奥氮平治疗精神分裂症,对患者的糖脂代谢影响较小,且可减轻改善精神症状,提高智力和认知功能。

关键词:精神分裂症,氨磺必利,奥氮平,绘画心理技术,糖脂代谢,认知功能

缺陷型精神分裂症肠道菌群与认知的关联性研究

李雪莹*

江苏省扬州五台山医院

目的 目前缺陷型精神分裂症与非缺陷型精神分裂症的菌群差异鲜少有人研究,且缺陷型精神分裂症对于人类的危害更大、影响更深,本摘要目的是明确缺陷型与非缺陷型精神分裂症的异质性。

方法 本研究采用横断面设计,共纳入 136 例长期住院使用非典型抗精神病药物治疗且病情平稳的精神分裂症患者,(其中缺陷型精神分裂症 54 人,非缺陷型精神分裂症 82 人),采用 16S rRNA 基因测序法鉴定肠道菌群含量。并对这部分病人进行精神分裂症简易认知评估:符号编码、霍普金斯词语学习测验、简易视觉记忆测验及蒙特利尔认知评估等认知测试。

结果 缺陷型及非缺陷型精神分裂症患者的肠道菌群的 α 多样性无显著差异。 β 多样性分析显示, D-SCZ 患者的肠道菌群的以下属表现出不同的丰度, 包括霍尔德曼氏菌、真杆菌、梭杆菌、厚壁菌门毛螺菌科、厌氧菌、普雷沃氏菌、链杆菌、粪杆菌等。观察到的改变与两组患者的认知表现显著相关, 缺陷型精神分裂症患者的认知包括精神分裂症简易认知评估: 符号编码、霍普金斯词语学习测验修订版、简易视觉记忆测验及蒙特利尔认知评估等得分均低于非缺陷型精神分裂症患者。

结论 本研究结果表明, 患有 D-SCZ 的个体表现出与认知能力相关的肠道微生物群改变的独特特征。

关键词: 精神分裂症; 缺陷型精神分裂症; 肠道菌群; 认知评估

耳穴压豆辅助治疗精神分裂症阴性症状的临床研究

宋宣慧 赵黎萍* 邱义玲 李鸿
宝山精神卫生中心

目的 探讨耳穴压豆联合奥氮平治疗精神分裂症阴性症状的疗效。

方法 选取 2022 年 10 月-2023 年 10 月上海市宝山区精神卫生中心收治的 100 例精神分裂症患者, 按照随机数字表法分为对照组 ($n=50$) 和研究组 ($n=50$)。对照组给予奥氮平治疗, 研究组在对照组的基础上加用耳穴压豆辅助治疗, 两组均治疗 12 周, 分别于 4 周末、8 周末及 12 周末评定两组阳性与阴性症状量表(PANSS)、阴性症状量表(SANS)和成套神经心理测验(RBANS)得分, 比较两组之间治疗后精神症状及认知功能的差异。

结果 治疗前, 两组 PANSS 评分差异无统计学意义 ($P>0.05$), 治疗 12 周、16 周后, 研究组 PANSS 评分分别为 (59.2 ± 10.7) 分和 (58.0 ± 9.9) 分, 明显低于对照组的 (62.9 ± 10.5) 分和 (62.6 ± 10.8) 分, 差异有统计学意义 ($P<0.05$)。治疗前, 两组 SANS 评分差异无统计学意义 ($P>0.05$), 治疗 12 周、16 周后, 研究组 SANS 评分分别为 (52.2 ± 5.7) 分和 (48.7 ± 6.4) 分, 明显低于对照组的 (56.1 ± 9.4) 分和 (55.8 ± 7.8) 分, 差异有统计学意义 ($P<0.05$)。

治疗前, 两组 RBANS 评分差异无统计学意义 ($P>0.05$), 治疗 12 周、16 周后, 研究组 RBANS 评分分别为 (67.4 ± 11.2) 分和 (68.9 ± 10.6) 分, 明显高于对照组的 (60.5 ± 8.7) 分和 (61.3 ± 10.7) 分, 差异有统计学意义 ($P<0.05$)。

结论 耳穴压豆联合奥氮平治疗精神分裂症可改善患者阴性症状和认知功能。

关键词: 精神分裂症; 耳穴压豆; 阴性症状; 奥氮平

奥氮平联合阿立哌唑治疗对难治性精神分裂症疗效、糖脂代谢、安全性的影响研究

刘涛*
抚顺市第五医院

目的 观察在难治性精神分裂症中采用奥氮平联合阿立哌唑的临床诊疗效果。

方法 此研究的难治性精神分裂症病人选取时间为 2019 年 01 月~2020 年 8 月, 共有患者 214 例, 按随机原则分为服用奥氮平的对照组, 患者 107 例, 和服用阿立哌唑的实验组, 有患者 107 例。对两组患者治疗前后的精神状态和生活能力进行比较。

结果 治疗前病人的 MMSE 评分与 ADL 评分均没有明显差异 ($P>0.05$), 用药后实验组病人精神状态与生活能力优于对照组 ($P<0.05$)。在机体糖脂代谢方面的影响中, 实验组患者的空腹血糖水平、甘油三酯、胆固醇相比于对照组患者均相对稳定 ($P<0.05$)。在不良反应发生率方面, 两组间对比不存在可比性差异。同时实验组的生活质量评分高于对照组, 差异有统计学意义 ($P<0.05$)。实验组患者治疗 4 周后的阳性和阴性症状分与 PANSS 总分高于对照组, 差异有统计学意义 ($P<0.05$); 实验组治疗 8 周、12 周后的阳性和阴性症状分与 PANSS 总分低于对照组, 差异有统计学意义 ($P<0.05$)。

结论 研究结论为在治疗难治性精神分裂症病人时使用奥氮平与阿立哌唑能够有效的改善病人的精神状态, 并显著提升病人的生活能力。

关键词: 奥氮平、阿立哌唑、难治性精神分裂症、糖脂代谢、安全性

对比齐拉西酮、奥氮平对老年精神分裂症患者治疗效果对其机体糖脂代谢的影响情况

郭敏琦*

抚顺市第五医院

目的 研究应用齐拉西酮与奥氮平联合与奥氮平联合治疗老年精神分裂症患者对临床治疗效果和机体糖脂代谢的影响。

方法 参与研究的病例均为在我院接受治疗的患者，从中随机抽取 130 例老年精神分裂症的患者作为研究对象，选取的时间开始为 2020 年 1 月-2021 年 12 月。按照抽签法的方式将所有患者平均分成分析组和对照组两组，其中对照组的 65 例病患接受奥氮平进行治疗，分析组 65 例患者接受齐拉西酮与奥氮平联合进行治疗，对两组患者应该不同方法进行治疗后治疗效果及机体糖脂代谢水平进行分析和对比。

结果 在治疗有效率方面，对照组的疗效与分析组患者相比明显较差，患者治疗前阴性症状和 PANSS 总分与分析组对比，无明显差距，无对比意义 ($P>0.05$)；在治疗后 4 周、8 周、12 周分别进行评分，对照组患者阴性症状分与 PANSS 总分均高于分析组 ($P<0.05$)。在患者的生活质量方面，分析组明显好于与对照组，对比结果具有参考价值 ($P<0.05$)；同时在不良反应发生率方面，分析组明显表现在胃肠反正在上，对照组明显表现在过度镇静上，两组均没有重度的不良反应。在机体糖脂代谢方面的影响中，分析组患者的空腹血糖水平、甘油三酯、胆固醇相比于对照组患者均相对稳定 ($P<0.05$)。

结论 齐拉西酮与奥氮平联合能有效的稳定老年人群精神分裂症者的机体糖脂代谢水平，在治疗中获得了较好的应用效果，降低了药物对糖脂代谢的影响，而奥氮平表现稍差，会增加治疗风险。

关键词：齐拉西酮、奥氮平、老年患者、糖脂代谢

精神分裂症和心衰之间的遗传相关性研究

杜玉昕 郁昊*

济宁医学院

目的 心衰是威胁人类精神健康的一个重要的器质性因素。既往研究表明，同时患有精神分裂症和心衰的人群较正常人群寿命平均减少 10-17.5 年，二者之间存在共病关联，但其中的具体机制尚不完全清楚。本研究利用全基因组关联分析(GWAS)数据进行研究，鉴定精神分裂症与心衰之间的遗传多效性位点，探讨两者共病的潜在的遗传机制，为未来的靶向治疗提供线索。

方法 本研究的 GWAS 数据来自自由精神病基因组联盟和全球生物库荟萃分析项目。其中，精神分裂症 GWAS 数据来源于 76,755 例精神分裂症患者和 243,649 例正常人群对照，心衰 GWAS 数据来源于 68408 例心衰患者和 1286331 例正常对照。首先，本研究利用连锁不平衡分析方法来证实在精神分裂症与心衰之间是否存在遗传关联；其次，研究运用遗传基因多效性统计学方法 条件错误发现率 (condFDR) 和联合错误发现率 (conjFDR)，检验与两种疾病显著关联的基因位点和与两种疾病同时显著关联的基因位点。最后，通过 FUMA 网站对所发现的易感位点进行功能注释。

结果 (1) 连锁不平衡分析方法显示精神分裂症与心衰之间存在不显著的基因关联 ($rg=-0.01$, $se=0.02$, $P=0.61$)；(2) 当 condFDR <0.01 时，研究发现 431 个位点与心衰条件相关，而在反向 condFDR 分析中，30 个位点与精神分裂症条件相关，当 conjFDR <0.05 ，研究发现有 13 个位点同时与精神分裂症和心衰显著性相关，其中 12 个位点在之前未曾报道过。其中，8 个位点在精神分裂症和心衰中具有相同的作用方向，而 5 个具有相反的作用方向。

(4) conjFDR <0.05 时，精神分裂症和心衰的共享位点中共有 173 个位点，其中主要位于内含子 ($n=125$, 73.96%)、和基因间 ($n=27$, 15.98%) 区域，仅有 4 个位点位于 3'非翻译区区域，3 个位点位于 5'非翻译区区域，3 个位点位于非编码 RNA 内含子区域，3 个位点位于非编码 RNA 外显子区域，各有 1 个位点分别位于上游和下游区域。

结论 本研究发现精神分裂症和心衰之间存在遗传多效性，利用条件错误发现率发现 431 个位点与心衰条件相关，30 个位点与精神分裂症条件相关，并且在联合错误发现率中发现有 13 个位点同时与精神分裂症和心衰显著性相关，其中 8 个位点具有相同的作用方向，而 5 个具有相反的作用方向。结

果提示二者之间存在复杂的遗传机制。

有氧运动联合生活技能训练在男性慢性精神分裂症患者中的应用

鲍丽萍*

首都医科大学附属北京安定医院芜湖医院

目的 探讨有氧运动联合生活技能训练对男性慢性精神分裂症患者临床应用效果。

方法 选取 2022 年 6 月~2024 年 5 月芜湖市第四人民医院收治的 90 例男性慢性精神分裂症患者为研究对象，随机分为研究组和对照组各 45 例。对照组采用精神科常规护理，研究组在对照组的基础上实施为期 12 周的有氧运动联合生活技能训练，完成后给予患者适当物质和精神鼓励。每次有氧运动过程中均由两名护士参与，一名护士组织进行运动项目，一名护士做现场安全风险管控。采用阳性和阴性症状量表(PANSS)及简明健康问卷(SF-36)进行评定，比较两组男性慢性精神分裂症患者精神症状和生活质量的改变。

结果 研究组干预 6 周和 12 周后 PANSS 的评分均低于对照组 ($P<0.05$)，两组患者 PANSS 各维度评分随时间变化逐渐降低，差异均有统计学意义 (均 $P<0.05$)；入院后两组患者 PANSS 各维度评分差异均有统计学意义 (均 $P<0.05$)；组别和时间存在交互作用 (均 $P<0.05$)。研究组干预 6 周和 12 周后 SF-36 评分均高于对照组 ($P<0.05$)，两组患者 SF-36 各维度评分随时间变化逐渐升高，差异均有统计学意义 (均 $P<0.05$)；入院后两组患者 SF-36 各维度评分差异均有统计学意义 (均 $P<0.05$)；组别和时间存在交互作用 (均 $P<0.05$)。

结论 有氧运动联合生活技能训练能够有效改善男性慢性精神分裂症患者精神症状，提高患者生活质量，促进患者康复，回归家庭和社会。

关键词：有氧运动；生活技能训练；精神分裂症；生活质量

精神分裂症认知损害的干预与管理

党靓² 党靓¹ 刘莎^{1,2}

1.山西医科大学

2.山西医科大学第一医院

目的 精神分裂症是导致严重精神残疾的重性疾病之一，给社会及其家庭带来了重大负担。认知损害是其核心症状，严重影响患者的预后和生活质量。改善认知损害对于减轻精神分裂症患者的症状、预防复发、提高生活质量以及减轻社会负担等具有重要意义。本文回顾了精神分裂症认知损害最新治疗进展，探讨了多种治疗手段在精神分裂症认知损害中的优劣，同时对此领域仍然存在的问题提出了相应观点，以期在目前精神分裂症认知损害的治疗提供决策依据。

方法 本文通过文献综述，综合分析了药物治疗、物理治疗、心理治疗、运动疗法和康复训练等在精神分裂症认知损害治疗中的应用，并展望了治疗的发展方向。

结果 药物治疗在改善精神分裂症患者的症状和认知功能方面显示出积极效果。物理治疗虽能有效控制症状，但通常需要与其他治疗手段结合以实现更全面的治疗效果。认知行为疗法(CBT)等心理治疗方法直接针对患者的精神问题，有助于调整错误的认知和思维模式，提升情绪调节与问题解决能力。有氧运动，如跑步机和自行车运动，已被证实能显著改善患者的大脑功能。综合康复训练，包括生活能力和社会功能训练，对提升患者的认知功能具有显著效果。

结论 精神分裂症认知损害的治疗需要综合运用多种方法。药物治疗作为基础，辅以物理治疗和心理治疗，可以提高治疗效果。运动疗法和康复训练有助于患者恢复社会功能，提升生活质量。治疗过程中，患者的积极参与、家属的支持以及医疗团队的专业指导是实现最佳治疗效果的关键。

一例氨磺必利治疗使用酒精引起的精神性障碍中迟发性运动障碍的发生与处理策略

高太波* 孟令雯 王虹人 郑家瑞

抚顺市第五医院

目的 文章首先概述了氨磺必利在治疗中的广泛应用,并指出了其可能带来的 TD 风险。随后,详细描述了患者的临床症状以及具体的诊断过程,让读者对 TD 的复杂性和多变性有了更为直观的了解。通过对患者病例的详细解析,我们深入剖析了 TD 的临床表现,为进一步的治疗策略提供了重要依据。

方法 在应对策略方面,文章提出了多元化的治疗方案。首先,针对药物过量导致的 TD 问题,提出了药物减量的策略;其次,对于某些患者,更换药物种类可能更为适宜;以及康复训练作为辅助治疗手段。文章结合实际操作经验,分享了这些策略在处理 TD 问题时的心得体会,为临床实践提供了宝贵经验

结果 文章结合实际操作经验,分享了这些策略在完全缓解 TD 时的心得体会,并最终为临床实践提供了宝贵经验

结论 文章对氨磺必利引发 TD 的预防措施进行了深入探讨,并提出了具有针对性的建议。这些建议旨在帮助临床医生更加精准地掌握氨磺必利的使用规律,从而减少 TD 等并发症的发生。我们期望这些建议能够在未来类似病例的诊治过程中发挥指导作用,为患者提供更加安全、有效的治疗方案。最后,我们坚信通过不断的临床实践和经验积累,我们能够更好地掌握氨磺必利等抗精神病药物的使用规律,为患者提供更加全面、个性化的治疗服务。这不仅有助于提高患者的生活质量,也将推动精神医学领域的不断进步与发展。

关键词: 氨磺必利;迟发性运动障碍;处理策略;预防措施

精神分裂症住院患者的循环系统疾病共病模式及影响因素分析

董哲 谭云龙*
北京回龙观医院

目的 心血管疾病(CVDs)是导致精神分裂症谱系障碍(SSD)患者过早死亡的主要原因,而共病的类型尚未充分研究。本研究旨在表征精神分裂症谱系障碍患者共病循环系统疾病(CSDs)的模式,

并调查其相关因素。

方法 基于电子病例记录开展回顾性横断面研究,从中国三家精神病医院收集出院诊断属于精神分裂症、分裂型和妄想性障碍(SSDD)(ICD-10:F20-F29)的患者。采用潜在类别分析(LCA)识别共病模式,采用多项逻辑回归模型评估多种因素对共病模式的影响,计算其优势比(OR)和95%置信区间(CI)。

结果 在2830例SSDD住院患者中,确定了四种共病模式,根据主要特征命名为:低风险CSDs(47.86%),原发性高血压(30.15%),心力衰竭(12.99%),心脏瓣膜和血管疾病(8.99%)。以低风险CSDs类别作为参照,男性患者的共病模式为原发性高血压类(OR=1.15)和心衰类(OR=5.36)的概率显著高于女性。26岁以上的患者共病原发性高血压类的概率均显著较高。40岁以上的患者共病心脏瓣膜和血管疾病类的概率均较高。几种抗精神病药物的使用与CSDs并发症风险增加有关,包括使用奋乃静和氯丙嗪盐酸盐,分别与心力衰竭共病较高概率相关(OR分别为22.06和7.09)。

结论 这项横断面研究中,精神分裂症谱系患者共病循环系统疾病存在四种模式,其中高血压类和心衰类特异性强。人口学特征和精神类药物使用的差异可为共病的治疗和管理提供依据,为共病机制研究提供线索。

关键词: 共病模式;精神分裂症;抗精神病药物

睡眠障碍、奥氮平对男性首发精神分裂症患者血清超敏C-反应蛋白的影响

许锦泉* 陈健 刘贝
湛江市第三人民医院

目的 探讨睡眠障碍、奥氮平对男性首发精神分裂症患者血清超敏C-反应蛋白的影响。

方法 采用匹兹堡睡眠质量指数量表(PSQI)选取男性首发精神分裂症患者,PSQI>8分的为睡眠障碍组41例,PSQI≤8分的为非睡眠障碍组41例。同时把41例健康男性志愿者血清超敏C-反应蛋白浓度作为对照组,两组精神分裂症患者均接受奥氮平药物治疗,采用PSQI和阳性和阴性症状量表(PANSS)评定,于入院时、住院1、8周时评估两组的疗效和空腹采血检测血清超敏C-反应蛋白浓度。

结果 睡眠障碍组于治疗 1、8 周时 PSQI 减分明显($P<0.01$)；睡眠障碍组与非睡眠障碍组在治疗 1、8 周时的 PANSS 评分均较同组治疗前下降(均 $P<0.01$)。两组间入院时及治疗 1 周和 8 周时各时点 PANSS 评分的差异均无统计学意义(均 $P>0.05$)；睡眠障碍组于治疗 1 周时 C-反应蛋白浓度较入院时降低，差异具统计学意义 ($P<0.05$)，治疗 8 周时 C-反应蛋白浓度较治疗 1 周时升高，差异具统计学意义 ($P<0.05$)；非睡眠障碍组于治疗 1 周时 C-反应蛋白浓度与住院时无明显差异，差异无统计学意义 ($P>0.05$)，治疗 8 周时 C-反应蛋白浓度较治疗 1 周时升高 ($P<0.05$)，差异具统计学意义 ($P<0.05$)；两组 C-反应蛋白浓度于住院前均高于对照组 ($P<0.05$)。睡眠障碍组于入组时血清 C-反应蛋白浓度高于非睡眠障碍组，差异具统计学意义 ($P<0.05$)，治疗 1、8 周时两组 C-反应蛋白浓度无明显差异，差异无统计学意义($P>0.05$)。

结论 奥氮平对伴睡眠障碍的男性首发精神分裂症患者效果明显，睡眠障碍可能影响患者血清超敏 C-反应蛋白浓度，奥氮平有可能影响血清超敏 C-反应蛋白浓度升高。

关键词：不同睡眠状况，精神分裂症，奥氮平，血清超敏 C-反应蛋白

首发精神分裂症患者住院时间延长风险的列线图预测模型构建与验证

任少宇 黄焱 董玲玲 赵黎萍*
上海市宝山区精神卫生中心

目的 探索首发精神分裂症患者住院时间延长的影响因素，为针对影响因素进行干预减少患者因住院时间延长带来的不良结局提供理论支持。

方法 本回顾性队列研究纳入 2022-2023 年就诊于上海市宝山区精神卫生中心的首发精神分裂症 203 例。纳入标准包括：年龄 ≥ 18 岁；汉族；受教育年限 ≥ 9 年；首次急性起病且未经过系统治疗。排除标准包括：共病其他类型的精神疾病（如精神发育迟滞、强迫症、人格障碍等）；共病存在酒精或药物滥用或物质依赖史；合并有脑器质性疾病或其他不稳定或严重躯体疾病者；未出院；出院时症状未改善者。统计治疗前及出院前 1 周内的人口统计学、

生物学指标，住院期间主要用药、血药浓度以及住院时间等变量也被纳入分析。本研究主要结局是住院时间延长 (>60 天)。纳入预测模型的患者被分为训练集和测试集，LASSO 回归用于筛选多因素 logistic 回归模型的变量，对 LOS 延长的独立危险因素应用列线图构建预测模型，受试者工作特征曲线 (receiver operating characteristic, ROC)、校准曲线、决策曲线分析用于评估预测模型。

结果 共 155 例首发精神分裂症纳入研究，按照 7: 3 的比例随机分配至训练集和测试集。两个数据集的基线特征、住院治疗用药、住院时间无统计学差异。多因素 logistic 回归分析提示年龄 ($OR=1.042$, $95\% CI=1.012-1.073$, $P=0.006$) 和 25 羟维生素 D (25(OH)D) 水平 ($OR=1.088$, $95\% CI=1.021-1.160$, $P=0.01$) 是住院时间延长的危险因素。构建住院时间延长的列线图预测模型，训练集、测试集的 ROC 曲线下面积分别为 0.698、0.716，校准曲线证明这一模型预测住院时间延长表现良好，决策曲线证明了这一模型能适用于大部分首发精神分裂症患者。对于应用阿立哌唑的患者，在治疗 1 月的阿立哌唑血药浓度与治疗前 25(OH)D 水平呈负相关 ($P=0.03$)。

结论 本研究首次构建和验证了首发精神分裂症住院时间延长的列线图预测模型，年龄较大、较高的 25(OH)D 水平可能导致患者具有较长的住院时间，而较高的 25(OH)D 水平可能通过影响血药浓度从而延长住院时间。

Cognitive Effects of Adjunctive Sulforaphane for Schizophrenia: A Systematic Review

Zhenjuan Qin¹, Qiman Liu², Wei Zheng²

1.The Brain Hospital of Guangxi Zhuang Autonomous Region

2.The Affiliated Brain Hospital of Guangzhou Medical University

Objective Sulforaphane (SFN), a natural compound derived from broccoli, is considered to be an effective antioxidant, anti-inflammatory agent which

plays an important role in treating cognitive function of schizophrenia. The purpose of this systematic review is to systematically examine the cognitive effects of adjunctive sulforaphane in schizophrenia

Methods Chinese (Chinese Journal Net and WanFang) and English (Cochrane Library, PsycINFO, PubMed, and EMBASE) databases were searched on October 20 2023 by 2 independent authors. Only randomized controlled trials (RCTs) and single-arm perspective studies examining the cognitive effects of adjunctive sulforaphane for schizophrenia were included in this systematic review

Results Two RCTs (n=236) and two single-arm prospective studies (n=76) with 312 patients met the inclusion criteria. A significant superiority of adjunctive sulforaphane over placebo in improving working memory and verbal learning was found in one RCT (n=172) and no group difference was found in another RCT (n=64). In the two single-arm prospective studies, adjunctive sulforaphane was significantly associated with the improvement of cognitive function as measured by CogState or B-CATS. No group differences were found regarding the improvement of psychotic symptoms in two RCTs. Adjunctive sulforaphane was significantly associated with the improvement of psychotic symptoms in one single-arm prospective study (50%). No group differences were found in two RCTs in terms of adverse effects and no severe adverse effects were mentioned in the two single-arm prospective studies. No sulforaphane-related events were reported to be the cause of study discontinuation in all the retrieved studies

Conclusion This systematic review found that adjunctive sulforaphane appears to be effective and safety in improving cognitive function in schizophrenia. Further RCTs with higher quality are essential to confirm and expand these findings

关键词: Sulforaphane; schizophrenia; cognitive function; working memory; systematic review.

Inhibitory Control in Patients with Schizophrenia: A Systematic Review

Yan Ren* Miao Chen
Shanxi Provincial People's Hospital

Objective Executive dysfunction is widely understood as the core aspect of schizophrenia, and inhibitory control ability is the core component of executive function, which runs through the whole process of executive control. The purpose of this systematic review is to explore the mechanism of inhibition control damage in patients with schizophrenia by understanding the research status of inhibition control (response inhibition and interference control) in patients with schizophrenia, and to provide a reference for the diagnosis and treatment of patients with schizophrenia

Methods The keywords of 'inhibitory control', 'interference control', 'schizophrenia', and 'response inhibition' were used in PubMed, EMBASE, Cochrane Library Databases, and Web of Science. A systematic literature search of all published English studies from January 2000 to May 30, 2024, was conducted

Results First, there are diverse research paradigms for inhibitory control in patients with schizophrenia. In previous studies, interference control research used research paradigms such as continuous operation test task, Hailin sentence completion test (HSCT), and inhibition of current irrelevant memory task (ICIM). The research paradigms of response inhibition include the saccade and anti-saccade paradigm, stop signal task, and Go/NoGo task. Secondly, there are differences in the results of different experimental paradigms and different measurement methods. Finally, the study found that the reduction of active inhibition may be cortical striatum dysfunction, and is related to the activation failure of the right striatum, the right inferior frontal cortex, and the left and right temporal-parietal junction. The working memory span of patients with reduced active inhibition was also the shortest. Response inhibition injury is associated with abnormal activation of the striatum cortex, prefrontal cortex, and related connections

Conclusion First, the research paradigm for the inhibitory control ability of schizophrenic patients has not yet been unified, and different research paradigms need to be further distinguished in the future. Secondly,

there are some common neural mechanisms of different inhibitory control expressions in schizophrenic patients, and there may be simultaneous expressions. In the future, it is necessary to dissociate the inhibitory control components in patients with schizophrenia and to further explore the neural mechanism of inhibitory control damage in patients with high time and high spatial resolution equipment

关键词: schizophrenia, Inhibitory control, response inhibition, interference control

基于多参数功能磁共振成像预测电休克治疗对精神分裂症患者的疗效

刘佩*

河南省精神卫生中心

目的 电休克治疗(ECT)已被证明对精神分裂症有效,特别是在需要迅速减轻症状或对药物治疗产生耐药性的情况下。然而,缺乏可用的标记物来预测 ECT 的反应。研究基于多参数功能磁共振成像(MRI)的放射学特征是否可以有效预测精神分裂症患者对 ECT 的反应。

方法 2022年2月至2023年9月采集61例精神分裂症患者 ECT 前后和56例健康对照者的静息态功能磁共振影像数据并进行预处理,计算 ALFF, FALFF, REHO, DC 功能指标。将所有受试者划分为训练组与测试组,提取了差异脑区的放射学特征用于特征选择和预测。为了预测症状的持续改善(Δ PANSS),在训练组中使用基于留一交叉验证框架的支持向量回归模型进行预测过程,并在测试组中进行测试。通过递归特征消除算法优化模型,提取对预测性能做出最大贡献的特征,基于最优预测性能的训练模型计算测试组预测性能。采用预测值与实际值之间的 Pearson 相关系数(r)和均方根误差(RMSE)作为拟合优度的度量。

结果 基于静息态功能 MRI 的放射学模型,包括分别来自右侧额下回、左侧内侧和旁扣带脑回、右侧背外侧额上回、右侧楔前叶和左侧中央前回的5个功能性区域一致性特征,以及来自右侧楔前叶的功能性度中心性特征,其预测性能均方根误差较低,训练队列为15.183,测试队列为14.980。预测值

与实际值的 Pearson 相关系数分别为0.682和0.768。

结论 基于静息态功能MRI的放射学特征可以预测个体患者对ECT的反应。这些特征可以作为预后神经成像生物标志物,为预测精神分裂症的个体化治疗反应提供关键的一步。

Emerging Trends in Epigenetic and Schizophrenia From 2000 To 2023: A Bibliometric Analysis Via CiteSpace

Yan Ren¹, Qibo Guo¹, Yanbin Xiong²

1. Shanxi Provincial People's Hospital

2. Shanxi Bethune Hospital

Objective To comprehensively understand the current scenario and explore the prevailing research trends related to epigenetics in schizophrenia, thus providing valuable insights for scholars engaged in this field

Methods The literature was obtained from the database of Web of Science Core Collection. The current state of research on the relationship between epigenetics and schizophrenia, including notable trends and points of interest in this field, was visually analyzed using CiteSpace

Results A total of 1349 papers were retrieved. The annual number of publications has increased 1483.3% from 2000 to 2022. Schizophrenia Research was the most active journal. Schahram Akbarian holds significant sway. Harvard University is considered the research institution with the highest level of activity. The USA and China continue to lead in scientific productivity in this field. The current research hot topics in this field focus on DNA methylation, bipolar disorder, gene expression, and the prefrontal cortex. The findings derived from the keywords 'major depression', 'long noncoding RNA', 'blood', and 'stress', unveil novel research prospects within this domain. The identification of long noncoding RNA and microRNA as the foremost

biomarkers for epigenomic dysregulation in schizophrenia is of paramount significance

Conclusion The field of epigenetic for schizophrenia is progressing and has great potential. The research conducted in this field demonstrates a commendable level of excellence and depth. The identification of research areas with high activity and emerging trends provides valuable guidance for scholars engaged in this field. Enhancing global collaboration and communication among researchers is imperative for advancing progress in this field

关键词: schizophrenia, epigenetic, bibliometrics, Citespace

阿立哌唑（10mg）改善服用利培酮引起的催乳素升高的精神分裂症患者的疗效、安全性及社会功能的影响

康俊晶* 王方昀
徐州市邳州安康医院

目的 比较阿立哌唑（10mg）改善服用利培酮引起的催乳素升高的精神分裂症患者的疗效、安全性及社会功能的影响。

方法 在我院 2022 年 1 月-2023 年 12 期间, 选择 100 例服用单一服用利培酮 4mg/日精神分裂症患者进行比较, 精神分裂症年龄 40~50 岁, 其中男性 50 人, 女性 50 人（无绝经者）。使用随机数字法将 50 例男性患者和 50 例女性患者分为 2 组。其中, 对照组 50 例患者（男女各 25 例）, 只接受利培酮 4mg/日治疗; 研究组 50 例患者（男女各 25 例）接受阿立哌唑 10mg/日与利培酮 4mg/日治疗。对比 2 组患者之前后的催乳素（PRL）水平、阳性和阴性症状量表（Positive and Negative Syndrome Scale, PANSS）评分减分率、社会功能缺陷筛选量表（Socail disability screening Scale, SDSS）评分、不良反应总发生率。

结果 在研究组治疗 4 周后, 研究组 PANSS 量表减分率高于对照组（ $P < 0.05$ ）; 研究组 PRL 水平明显低于对照组（ $P < 0.05$ ）; 研究组 SDSS 评分均低于对照组（ $P < 0.05$ ）; 此外, 研究组不良反应总发生率（10.00%）对比于对照组（12.00%）的, 未观察到

显著差异（ $P > 0.05$ ）。

结论 阿立哌唑（10mg）能有效的改善服用利培酮引起的催乳素升高, 且不增加不良总反应率, 较为安全性; 阿立哌唑改善利培酮引起的催乳素升高时, 能改善精神分裂症患者临床症状及社会功能, 故精神分裂症患者在选用利培酮治疗期间应联合阿立哌唑治疗。

关键词: 阿立哌唑 利培酮 催乳素 精神分裂症 临床疗效 社会功能

Identification of Crucial Biomarkers Relevant To Immune Cell Infiltration in Schizophrenia by Comprehensive Bioinformatics Analysis

Yan Ren², Shasha Wu¹, Tailian Xue³

1. Shanxi Provincial People's Hospital

2. Shanxi Provincial People's Hospital

3. Shanxi Medical University

Objective Schizophrenia (SCZ) is a chronic and frequently disabling mental illness. Immune processes have long been recognized as potential triggers of schizophrenia and are supported by epidemiological, genetic, autopsy, peripheral biomarker and other relevant studies. The aim of this paper is to investigate the relationship between mRNAs and immune cells, immune-related genes and functional pathways, as well as the correlation between mRNAs and miRNAs in patients with schizophrenia. Searching for potential biomarkers for schizophrenia

Methods In this study, we recruited 11+15 SCZ patients and 12+15 healthy controls (HCs) in the clinical setting, respectively. Bioinformatics analysis of mRNA and miRNA expression profiles of peripheral blood by high-throughput sequencing. The differential genes obtained from the screening were analyzed for functional enrichment. The protein-protein interaction (PPI) network of target genes was constructed, and key genes were screened by Cytoscape software. The diagnostic value of the immune-related key genes was verified by subject work characteristics (ROC) curves. Analyzed the correlation between mRNAs and miRNAs

Results There were 546 DEGs between SCZ patients and healthy controls, and subsequently, by WGCNA, 15 different co-expression modules were identified. The intersection of DEGs with key module genes in SCZ was 330, and they were mainly enriched in the immune system. Subsequently, a PPI network was constructed, and four key modules were identified, and the top 10 genes were selected as candidate hub genes. Differences in immune infiltration were found between the SCZ and normal groups, and immune cells were shown to potentially interact with the hub genes. Comparing the sample data with two other datasets, a four-gene combinatorial model for four immune-critical genes (area under the curve value of 0.87) screened for genes of clinical value. Finally, we verified that the expression of miRNA, hsa-mir-34a-5p was significantly higher in SCZ than in healthy controls

Conclusion A growing body of evidence demonstrates that immune-related genes play an important role in schizophrenia. Related theories suggest that schizophrenia is accompanied by activation of the immune-inflammatory response system (IRS) and that abnormalities in the immune-inflammatory pathway may contribute to the pathophysiology of schizophrenia spectrum disorders. At the same time, the level of immune-related genes is altered in SCZ, and immune alterations associated with inflammation may further lead to brain abnormalities in schizophrenia patients, thus affecting their neurodevelopmental process

In this study, the relationship between immunity and SZ was analyzed by DEGs analysis, PPI network, and infiltrating immune cells. Four key immune-related candidate genes (CCL3, IL1B, CXCL8 and CXCL10) were identified. These genes are associated with immune processes in schizophrenia and may play a role in early-onset schizophrenia. A disproportionate ratio of immune cells in SCZ compared to healthy controls was noted. Finally, by identifying miRNAs targeting these genes and validating their potential, we found hsa-mir-34a-5p to be a promising biomarker for the detection of SCZ. Our study could provide potential peripheral blood diagnostic candidate genes for SCZ patients.

二苯二氮卓类药物治疗慢性精神分裂症患者炎症反应及相关胰岛损伤

宁晓帅¹ 刘邦文¹ 孙传峰¹ 肖婵婵¹ 苏慧娟² 蔡榕榕³ 夏文姐¹

1.阜阳市第三人民医院

2.池州市第三人民医院

3.宿州市第二·人民医院

目的 探讨慢性精神分裂症患者服用二苯二氮卓类药物可能导致炎症反应及相关胰岛损伤的临床研究。

方法 采用病例对照研究共收集 110 例慢性精神分裂症住院患者,其中 56 人为服用二苯二氮卓类药物者(服药组),54 人为未服用二苯二氮卓类药物者(未服药组)。三组问卷调查后对其进行实验室检测,比较三组研究者相关炎症指标与胰岛功能指标。

结果 未服药组与正常对照组相比在年龄、性别、BMI、血糖、胰岛素均无统计学意义,在受教育年限、HCY、C 肽、胰高血糖素有统计学意义($P<0.05$)。2、服药组与正常对照组相比在年龄、性别、血糖、均无统计学意义,在 BMI、受教育年限、hs-CRP、HCY、C 肽、胰岛素、胰高血糖素有统计学意义($P<0.05$)。3、服药组与未服药组相比在年龄、性别、受教育年限、BMI、血糖、HCY、C 肽、胰岛素、胰高血糖素均无统计学意义,在 hs-CRP、IL-6 有统计学意义($P<0.05$)。

结论 慢性精神分裂症患者(服药组与未服药组)炎症指标均明显高于普通人群,且与对照组相比胰岛相关指标均有差异。服药组与未服药组相比炎症指标出现差异,但胰岛相关指标无明显差异,因此二苯二氮卓类药物治疗慢性精神分裂症患者时存在炎症反应及相关胰岛功能指标异常,与未服药组相比炎症指标变化更为明显。

关键词:慢性精神分裂症;二苯二氮卓类药物;炎症反应;胰岛损伤

A Study of Schizophrenia Based on Retinal Degenerative Changes

Shuli Xu¹, Chuanjun Zhuo², Qinggang Chen²

1.The First Affiliated Hospital of Air Force Military Medical University

2.Tianjin Anding Hospital

Objective To explore the alterations in the thickness of the retinal macular area and peripapillary optic nerve fiber layer in schizophrenic patients and the correlation between the severity of psychotic symptoms and the structural damage of the retina

Methods 50 schizophrenic patients and 33 healthy controls were recruited, and retinal thickness in the macular region of both eyes of the subjects was collected using Optical Coherence Tomography. SPSS 27.0 was used to compare the count data using the chi-square test, to compare the two groups with normally distributed data using the independent samples t-test, and to compare the bivariate associations using correlation analysis

Results Compared with healthy controls, patients with schizophrenia had a thinner thickness of the central macular area of the retina, [(238.64 μm \pm 20.31 μm) vs. (248.86 μm \pm 17.23 μm), $P=0.002$], and a decrease in the mean thickness of the optic nerve fiber layer [(99.38 \pm 10.30 μm) vs. (100.12 \pm 9.01 μm), $P=0.045$], and the severity of positive symptoms was negatively correlated with retinal thickness ($P<0.05$)

Conclusion Patients with schizophrenia have structural damage to the macular area and optic nerve fiber layer of the retina, and the more severe the positive symptoms, the more severe the retinal damage

The Association between Different Symptom Groups of Schizophrenia and Retinal Structures

Shuli Xu¹, Chuanjun Zhuo², Qinggang Chen²

1.The First Affiliated Hospital of Air Force Military Medical University

2.Tianjin Anding Hospital

Objective Investigate the impairments of retinal macular thickness in the negative and positive symptom groups of schizophrenia

Methods 50 patients with schizophrenia were included. Considering the positive factor and negative factor components in PANSS scale, the patients were classified according to the main symptom groups, 26 patients were collected in the negative symptom group and 24 patients were raised in the positive symptom group. Meanwhile, 33 healthy controls matched with age and gender of schizophrenia group were recruited from hospital staff and adult medical students by using SCI-D NP version evaluation by professional psychiatrists. The age, sex, education level, geographical coordinates, course, first age, medication status, family history and other demographic data and clinical data were collected. SANS was used in the negative schizophrenia symptom group; SAPS was used in the positive symptom group. The scanning information of the eyes were collected by using the Zeiss optical coherence scanner 4000 system (OCT). SPSS 24.0 (Chicago, IL) software was used to analyze the basic data and OCT data of the subjects. The chi square test was used for the comparison of the counting data, the normal test for the measurement data, the independent sample t-test was used for the comparison of the normal distribution data, the single factor variance analysis was used among the groups, and the correlation analysis was used to analyse the relation of the two variables

Results 1.The central macular thickness of schizophrenia patients was thinner [(238.64 μm \pm 20.31 μm) vs. (248.86 μm \pm 17.23 μm), $P = 0.002$]

2. The central macular thickness of the negative symptoms group was thinner [(237.46 μm \pm 23.09 μm) vs. (248.86 μm \pm 17.23 μm), $P = 0.002$], and that of the positive symptoms group was thinner [(239.92 μm \pm 16.95 μm) vs. (248.86 μm \pm 17.23 μm), $P = 0.002$].

3.The macular in inferior quadrant area of the negative symptoms group tended to be thinner than positive group [(309.94 μm \pm 21.97 μm) vs. (313.27 μm \pm

13.19 μ m), $P = 0.059$].

Conclusion 1.The retinal thickness in schizophrenia became thinner in the central area of the macula

2.The retinal impairments were more serious in patients with negative symptoms.

Sleep Problems As A Risk Factor of First-episode Drug-naïve Schizophrenia: Associated with The Visuospatial/constructional Impairment

Zhenhua Zhu Li Hui*
Suzhou Guangji Hospital

Objective Sleep problems (SPs) occurred frequently in schizophrenia that both of which experienced cognitive impairments. The aims of this study would explore the SPs role of first-episode drug-naïve schizophrenia (FDS) as well as influencing their cognition

Methods 291 FDS patients (non-SPs/SPs = 197/94) and 685 subjects with general population (SGP, non-SPs/SPs = 577/108) were enrolled according to the DSM-IV and Pittsburgh Sleep Quality Index (PSQI) grouping. Cognition and sleep quality were assessed using the Repeatable Battery for the Assessment of Neuropsychological Status (RBANS) and PSQI. Compared with SGP, FDS patients had the higher SPs prevalence and the higher total PSQI score. Sleep quality influenced the visuospatial/constructional score in 2×2 analysis model

Results In FDS, the visuospatial/constructional score of SPs was lower than that of non-SPs, but not showed in SGP. The Pearson correlation and linear regression analyses showed the negative association of total PSQI score with the visuospatial/constructional score of FDS rather than SGP. In SPs or non-SPs, all RBANS scores of FDS were lower than those of SGP excepted for the visuospatial/constructional score

Conclusion Our data support that the SPs are a

high risk factor of FDS, and FDS patients with SPs experience more serious visuospatial/constructional impairment alleviated via improving sleep quality

关键词: schizophrenia, sleep problems, risk factor, cognitive impairments

探索精神分裂症患者条件推理能力异常的神经相关性：一项事件相关电位研究

刘畅 周振和*
南京医科大学附属无锡精神卫生中心

目的 以往研究提示，精神分裂症患者条件推理能力异常。本文旨在探索精神分裂症患者条件推理能力异常的事件相关电位(ERP)特征与神经相关性。

方法 在无锡市精神卫生中心住院部招募符合DSM-5 中精神分裂症诊断标准的患者为研究组(SCZ),在周边社区招募无精神障碍病史及家族史的健康人作为控制组(NC),两组均排除脑外伤、癫痫、严重躯体疾病、妊娠及哺乳期妇女、严重药物滥用或物质依赖、视力缺陷不足以完成研究等情形。采用阴性与阳性症状量表 PANSS 评定 SCZ 组症状严重程度。采用 E-peime3.0 编制改良版沃森选择任务范式。分别对 30 名 SCZ 和 30 名 NC 进行社会契约型、预防型、描述型和抽象型沃森选择任务下的行为学数据测定与 ERP 数据测定。对行为学数据采用 2(组别)×4(试验)混合设计方差分析(ANOVA);对 ERP 数据采用 2(组别)×4(试验)×3(ROI,感兴趣脑区)混合设计 ANOVA。结果未通过球形度检验者则采取 Greenhouse-Geisser 校正。

结果 最终有 24 名 SCZ 与 30 名 NC 通过质控并纳入数据分析,两组在年龄、性别构成、教育年限和利手性等人口学资料上均无统计学差异(均 $p > 0.05$)。混合设计 ANOVA 显示,行为学结果提示,正确率的组别主效应显著($p=0.01$),NC 组的正确率显著高于 SCZ 组;试验主效应显著($p < 0.001$),两组均在预防型任务中表现出更高的正确率,而在描述型和抽象型任务中表现更低;反应时的试验主效应显著($p < 0.001$),被试在抽象型任务中的反应时比在其他类型沃森选择任务中的反应时更小。ERP 数据提示,N1 与 P2 波幅的组别×试验交互作

用显著 (均 $p < 0.05$)；在抽象型任务中，NC 组相较于 SCZ 组诱发了更大的 N1 和 P2 成分波幅；N2 波幅的试验 \times ROI 交互作用显著 ($p < 0.001$)；相较于预防型任务，枕叶在社会契约型任务中诱发了更大的 N2 波幅；在抽象型任务中，枕叶诱发的 N2 波幅显著大于中央区，额叶诱发的 N2 波幅最大；P3 与慢波 (slow wave) 的主效应显著 (均 $p < 0.05$)；NC 组 P3 和 slow wave 的波幅均显著小于 SCZ 组。SCZ 组与 NC 组在不同类型任务与感兴趣脑区下观察到 N1、P2、N2、P3 和 slow wave 成分均有显著差异。

结论 本研究表明，精神分裂症患者与健康人在改良版沃森选择任务下存在 ERP 成分的客观差异，这为探索精神分裂症条件推理能力异常的神经机制提供了新的线索。

首发精神分裂症炎症亚组与色氨酸-犬尿氨酸代谢通路研究

李冕^{1,2} 吴月¹ 黄晨韵¹ 王大可¹ 徐艳¹ 梁素改¹
1. 浙江大学医学院附属精神卫生中心/杭州市第七人民医院
2. 浙江中医药大学第四临床医学院

目的 探索首发精神分裂症不同炎症水平血清和尿液色氨酸-犬尿氨酸代谢物改变，解析疾病异质性，明确疾病潜在的生物标志物。

方法 本研究纳入 38 例首发未服药精神分裂症患者和 43 例年龄、性别相匹配的健康对照。采用阳性和阴性症状量表 (PANSS) 评定患者症状严重程度，使用酶联免疫分析法 (ELISA) 检测所有受试者血清和尿液 IL-6 水平，使用超高效液相色谱串联三重四极杆质谱技术 (UHPLC-QTRAP) 检测血清和尿液色氨酸-犬尿氨酸代谢物，包括色氨酸 (TRP)、犬尿氨酸 (KYN)、犬尿喹啉酸 (KYNA)、喹啉酸 (QUIN)、吡啶甲酸 (PIC) 和黄尿酸 (XA)；通过计算代谢物比值 KYN/TRP、QUIN/KYN、KYNA/KYN、QUIN/KYNA 和 QUIN/PIC，分析两组在代谢通路间平衡的差异。应用 SPSS 26 进行统计分析。根据血清 IL-6 水平的中位数将 81 例受试者分为四组 (低 IL-6 患者组、低 IL-6 对照组、高 IL-

6 患者组和高 IL-6 对照组)，对 TRP 代谢物的原始数据进行对数 (log) 转换。采用 2×2 协方差分析 (炎症亚组 \times 疾病) 进行组间分析，年龄、性别和体重指数作为协变量。 $P < 0.05$ 为差异有统计学意义。

结果 四组间年龄、性别和体重指数均无显著性差异 ($P > 0.05$)。控制协变量后，协方差分析示高 IL-6 患者组血清和尿液 IgQUIN/KYNA 水平高于高 IL-6 对照组，而血清和尿液 IgKYNA 水平低于高 IL-6 对照组 ($P < 0.05$)；高 IL-6 患者组血清 IgQUIN/KYNA 水平高于低 IL-6 患者组，而血清 IgKYNA 水平低于低 IL-6 患者组 ($P < 0.05$)；低 IL-6 患者组血清 IgXA 水平低于低 IL-6 对照组 ($P < 0.05$)；低 IL-6 对照组与高 IL-6 对照组 TRP-KYN 代谢物及其比值均无显著性差异 ($P > 0.05$)。

结论 首发精神分裂症不同炎症亚组 TRP-KYN 代谢物及其比值存在显著差异，高炎症水平的患者神经保护性代谢物 KYNA 减少，神经毒性/神经保护比值 QUIN/KYNA 升高。研究炎症水平和 TRP-KYN 代谢通路的关系有助于揭示精神分裂症病理生理机制，为指导临床实践、制定个体化治疗方案提供依据。

关键词：首发精神分裂症；色氨酸代谢；白细胞介素-6；血清；尿液

Lachnoclostridium 菌引起小鼠神经炎症及行为学改变

张思维 宋学勤*
郑州大学第一附属医院

目的 1. 通过粪菌移植，探索 Lachnoclostridium 菌对前额叶皮质炎症和小鼠行为的影响。2. 通过检测前额叶皮质代谢物，探讨 L 菌引起小鼠行为变化的可能机制。

方法 将 6 周龄无特定病原体小鼠随机分为两组，实验组 ($n=20$) 和对照组 ($n=20$)。实验组使用 Lachnoclostridium 菌混悬液口服强饲，对照组使用等量生理盐水口服强饲。于 2 周末肛门刺激排便收集小鼠粪便，用 16S rRNA 测序法分析 L 菌丰度，并进行行为学测试 (包括小鼠新物体识别、强迫游泳和三腔社交在实验等)。取两组小鼠前额叶皮质脑组织，通过酶联免疫吸附试验检测各组小鼠的

前额叶皮质组织中的细胞因子的表达,包括促炎因子:肿瘤坏死因子- α 、白介素-1 β ,抗炎因子:白介素-4、白介素-10和脑源性神经营养因子。并应用亲水相互作用液相色谱柱进行靶向代谢组学检测,利用UPLC-MS/MS技术对其进行定性和定量。

结果 移植第2周末,移植组小鼠粪便L菌相对丰度高于移植前,两者存在显著差异($t=7.969$, $P=0.007$)。行为学结果显示,新物体识别实验中移植组小鼠的辨别指数显著低于对照组($t=2.311$, $P=0.0248$);在强迫游泳实验中,移植组小鼠绝望时间较对照组小鼠显著增加($t=3.641$, $P=0.0011$),移植组的高速运动时间显著短于对照组($t=2.805$, $P=0.0076$);在三腔社交实验中,移植组小鼠在第一只陌生小鼠腔内停留时间长于对照组小鼠($t=3.192$, $P=0.0182$),移植组小鼠在第二只陌生小鼠腔内停留的时间短于对照组小鼠($t=4.203$, $P=0.0001$)。移植组小鼠前额皮质促炎因子TNF- α 水平显著高于对照组($t=10.477$, $P=0.007$);移植组抗炎因子IL-10低于对照组($t=-5.106$, $P<0.001$);移植组小鼠IL-4水平相比于对照组($t=-4.62$, $P<0.001$)低;移植组BDNF水平显著低于对照组($t=-5.232$, $P<0.001$)。代谢组学揭示了20种不同的代谢物,其中16种在移植组中上调(谷氨酸、丙氨酸、 γ -氨基丁酸等)。通路分析结果包含9条差异代谢通路(丙氨酸、天冬氨酸和谷氨酸代谢、淀粉和蔗糖代谢以及三羧酸循环等)

结论 L菌丰度上调导致小鼠学习记忆受损、意志活动减退与社交障碍,前额叶皮质促炎因子上调,抗炎因子和脑源性神经营养因子下调,前额叶皮质代谢改变,其中谷氨酸、GABA的上调是小鼠行为改变的可能分子生物学机制。

首发未服药精神分裂症患者皮层厚度与超重肥胖的关系

李燕 谢世平* 申旭冉 张荣荣
南京脑科医院

目的 本研究主要以首发未服药精神分裂症患者及健康对照组为研究对象,并对其身体质量指数

以及皮层厚度变化进一步探索,旨在寻找与精神分裂症体重改变相关的潜在神经生物学标志物。

方法 本研究共招募129名首发未服药精神分裂症患者和80名健康对照。将首发未服药精神分裂症患者分为超重/肥胖组40名(身体质量指数 $\geq 24\text{kg}/\text{m}^2$),正常/低体重组89名(身体质量指数 $< 24\text{kg}/\text{m}^2$)。将健康对照组分为超重/肥胖组35名(身体质量指数 $\geq 24\text{kg}/\text{m}^2$),正常/低体重组45名(身体质量指数 $< 24\text{kg}/\text{m}^2$)。收集所有被试者的身高、体重以获取身体质量指数。所有被试者均接受了3.0T磁共振扫描,利用DKT Atlas脑区模板,通过Freesurfer软件计算皮层厚度。通过独立样本t检验对首发未服药精神分裂症患者、健康对照组间及组内的身体质量指数、皮层厚度差异进行分析。同时,通过Pearson偏相关分析,探讨身体质量指数与皮层厚度的关系。

结果 组间结果提示,首发未服药精神分裂症患者组体重指数低于健康对照组($p<0.05$);两者在右侧大脑半球的前扣带回后部、颞中回、前扣带回上部等脑区皮层厚度存在显著差异($p<0.05$),在左侧大脑半球的额下回三角部、颞中回、扣带回峡部、颞下回、楔叶等脑区的皮层厚度也存在显著差异($p<0.05$),且在这些区域首发精神分裂症患者组的皮层厚度值均大于健康对照组。组内结果提示,健康对照组内超重/肥胖组、正常/低体重组在颅内总体积上存在显著差异($p<0.05$),超重/肥胖组大于正常/低体重组。首发未服药精神分裂症患者组内超重/肥胖组、正常/低体重组在左侧顶叶下回、左侧舌回、右侧顶叶下回、右侧扣带回后部等脑区皮层厚度存在显著差异($p<0.05$),除左侧舌回外,超重/肥胖组均小于正常/低体重组($p<0.05$)。偏相关分析结果显示,健康对照组体重指数与颅内总体积呈正相关($r=0.234$, $p=0.04$),在首发未服药精神分裂症患者组中,体重指数与左侧舌回皮层厚度呈正相关($r=0.304$, $p=0.001$)。

结论 该研究中首发未服药精神分裂症患者存在多个脑区皮层厚度增加,且存在更低的体重指数。此外,健康对照组中颅内总体积与身体体重指数呈正相关关系,首发精神分裂症患者组中左侧舌回与身体体重指数呈正相关关系。该研究可能为探索精神分裂症患者体重改变的病理生理机制提供一定线索。

关键词: 首发未服药,精神分裂症,身体质量指数,皮层厚度

精神分裂症社会认知功能研究现状

梁倩 谢世平*

南京脑科医院

目的 社会认知在理解和推断他人心理及行为方面发挥着关键作用,它是人类思维领域中的重要组成部分。精神分裂症是一种严重的精神疾病,患者经常会出现明显的社会认知功能障碍,这对他们回归社会造成了重大阻碍。本文基于生物-心理-社会医学模式,综合分析了近年来相关研究,以期更深入地理解影响精神分裂症患者社会认知功能的关键因素。

方法 在 PubMed 数据库中,以“精神分裂症 AND 社会认知”“精神分裂症 AND 磁共振”“精神分裂症 AND 影响因素”为关键词对近 5 年文献进行检索,经过筛选,共选取 53 篇文献进行综述。

结果 精神分裂症患者的社会认知功能障碍与其大脑中后内侧前额叶和前扣带回的灰质体积、右侧颞上回和语言网络皮层的厚度、颞顶联合区的表面积以及枕颞脑回旋指数等结构变化密切相关。此外,功能上与脑区激活异常、功能连接障碍和脑网络异常有关。白质缺陷也可能是其结构基础。此外,患者的社会认知功能障碍还受到炎症因子、年龄、性别、教育水平、代谢等因素的影响。

结论 精神分裂症给患者、家庭及社会带来了沉重的压力与负担。患者在社会认知方面的障碍可能与大脑特定区域结构和功能的异常有关,同时,性别、年龄、童年创伤和炎症反应等因素也会影响社会认知障碍的程度。为了更深入地理解精神分裂症的诊断、治疗和预后,我们可以利用机器学习等技术,为患者回归社会提供更大的支持。

关键词: 精神分裂症,社会认知,磁共振,社会认知影响因素

抗精神病药物所致代谢综合征的治疗进展

吴书鑫*

山东省精神卫生中心

目的 在于探讨抗精神病药物所致代谢综合征的治疗现状、进展和策略,为相关疾病的治疗、改善预后提供参考。

方法 越来越多服用抗精神病药物的患者出现以过度肥胖、血糖异常、血脂升高、血压异常等症状为主的代谢综合征 (Metabolic syndrome, MS)。DEHertM 等研究认为精神分裂症患者合并 MS 的风险高于普通人群,患病率是他们的 2-3 倍[1]。钱小年[2]等人认为接受 AD 治疗的双相情感精神障碍患者 MS 发病率较高。

在《抗精神病药物的使用与代谢综合征相关性研究》中,研究者对 408 例精神病患者进行全面检查,并发现抗精神病药物引起 MS 的风险较高,典型抗精神病药更突出[3]。而在《非典型抗精神病药物所致代谢综合征的治疗进展》中,指出非典型抗精神病药物所引起的代谢综合征 (MS) 日益引起关注,对患者的生活质量、心脑血管疾病和糖尿病等方面有严重影响[4]。第一代典型抗精神病药物主要作用于中枢多巴胺 (D2) 受体,而第二代是具有较高 5-羟色胺(5-HT)₂ 受体阻断作用的非典型抗精神病药物。由于药物作用受体的差异,两代药物的不良反应也有所不同,第二代药物较少引起锥体外系不良反应,但体重增加、糖脂代谢异常等代谢综合征不良反应较多。有研究表明,服用不同的第二代抗精神病药物(SGA)发生 MS 的风险不同,服用氯氮平和奥氮平的患者 MS 发生风险最高,而服用齐拉西酮和阿立哌唑的患者发生风险最低[5,6]。

《长期服用抗精神病药物的精神分裂症患者的糖代谢异常相关分析》指出长期服用抗精神病药物的精神分裂症患者更易发生糖代谢异常,相关影响因素有年龄、病程等方面[7]。《阿立哌唑对服用抗精神病药物所致代谢综合征的改善效果研究》则提出了阿立哌唑运用于服用抗精神病药物引起代谢综合征患者中的改善效果[8]。徐赫等人的网状 Meta 分析结果显示,奥氮平和喹硫平更容易引起体重、BMI 增加,且奥氮平引起体重明显增加($\geq 7\%$)的风险最高,布南色林、氨磺必利和阿立哌唑则较少引起体重增加;帕利哌酮对 TG 影响较小;阿立哌唑引起 HDL-C 降低较少;氨磺必利引起 FPG 增加较少[9]。此外,齐拉西酮较少导致体重增加、高脂血症或血糖升高等代谢副作用[10]。

发现抗精神病药物所致代谢综合征对患者的生活质量、心脑血管疾病和糖尿病等方面有严重影响,长期服用抗精神病药物的患者更易发生肥胖和糖代

谢异常。同时，一些药物的运用也能够改善患者的症状。

结论 在临床工作中应提高对该类患者躯体健康的关注度，寻求更加有效的治疗方法，减少患者对代谢综合征的发生。

关键词：抗精神病药物 代谢综合征

精神分裂症和双相情感障碍脑白质完整性的神经影像学研究进展

彭婷*

南京脑科医院

目的 精神分裂症及双相情感障碍均属于重性精神障碍，已有研究表明精神分裂症及双相情感障碍均存在脑白质完整性受损，但二者在脑白质完整性方面的具体区别仍不清楚。本文综述了近年来关于精神分裂症和双相情感障碍患者脑白质完整性的神经影像学研究，探讨这两种精神疾病与脑白质完整性之间的关系及其临床意义。

方法 通过系统检索 PubMed、Web of Science 等数据库，收集和分析近年来关于精神分裂症和双相情感障碍患者脑白质完整性的神经影像学研究文献，重点关注磁共振成像（MRI）和扩散张量成像（DTI）等技术的应用及其研究结果。

结果 研究显示，精神分裂症患者主要在额叶、颞叶和顶叶等区域存在白质完整性下降，表现为白质体积减少和纤维束完整性受损。双相情感障碍患者则在额叶、胼胝体和情感调节相关区域显示出显著的白质异常。两种疾病的白质损伤部位有所重叠，但程度和特定区域存在差异。DTI 研究进一步揭示了精神分裂症患者白质各向异性（FA）值下降，而双相情感障碍患者则表现出特定区域的 FA 值变化。

结论 精神分裂症和双相情感障碍患者均存在显著的脑白质完整性损伤，但损伤模式和严重程度有所不同。这些差异可能反映了两种疾病不同的病理机制。未来研究应结合纵向研究和大样本分析，进一步明确白质损伤在这两种疾病中的具体作用和机制，为临床诊断和治疗提供更为精准的依据。

分析基于健康行为改变整合理论的护理干预对精神分裂症患者康复效果的影响

王小婷*

西安交通大学第一附属医院

目的 分析基于健康行为改变整合理论的护理干预对精神分裂症患者康复效果的影响，为促进精神分裂症患者的康复提供指导意见。

方法 选取 2022 年 6 月至 12 月出院的 30 例精神分裂症患者作为对照组，给予常规干预，包括常规的护理、用药、康复治疗、物理治疗等，选取 2023 年 1 月至 6 月出院的 30 例精神分裂症患者作为观察组，在常规干预的措施基础上给予基于健康行为改变整合理论的护理干预，两组的干预时间均为 3 个月，比较两组患者干预后的精神症状严重程度、服药依从性、社会功能及生活质量的情况。

结果 干预前，两组患者的 PANSS 评分、服药依从性、社会功能及生活质量得分均无统计学差异（ $P>0.05$ ），干预 3 个月后，两组患者 PANSS 评分均降低，且观察组低于对照组（ $P<0.05$ ）；两组患者的 MARS 评分、PSP 评分、WHOQOL-BREF 评分均升高，且观察组高于对照组（ $P<0.05$ ）。

结论 将健康行为改变整合理论的护理干预运用到精神分裂症患者中，有助于改善患者精神症状，提高患者的服药依从性、社会功能以及生活质量，促进疾病康复，同时发现，此种干预方法有助于家庭照顾者能力提升，密切了医患关系，临床干预效果满意，值得进一步应用推广。

康复期精神分裂症患者应用系统心理护理模式的价值分析

陈晨*

西安交通大学第一附属医院

目的 分析系统心理护理模式在康复期精神分

裂症患者中的应用价值,为进一步促进精神分裂症患者的康复提供指导意见。

方法 选取2020年3月至2022年5月在我院进行康复治疗的100例精神分裂症患者作为研究样本,并运用随机数表策略将患者等分为两个小组,每组各包含50例患者。其中对照组采取常规护理,观察组在常规护理的基础上应用系统心理护理,运用PANSS量表对患者护理前后的阳性与阴性症状进行评价,HAMA、HAMD量表对患者护理前后的心理状态进行评估,使用WHOQOL-BREF量表(该量表由世界卫生组织设计,涵盖生理、心理、环境和社会关系四个领域,每个领域评分从0到100分,分数越高,生活质量越好)评估观察组和对照组患者护理前后的生活质量。

结果 经过护理后发现,观察组中患者生理、心理、环境、社会关系评分优于对照组,观察组护理后的PANSS、HAMA、HAMD评分优于对照组, $P<0.05$,差异具有统计学意义。

结论 系统心理护理在精神分裂症康复期的应用能有效改善患者的心理状态,缓解精神症状,有助于控制疾病的复发,并减轻疾病对生活质量的负面影响,有效提升整体护理效果,值得进行临床推广。

TAAR1 激动剂在精神分裂症治疗中的潜力: 研究综述摘要

王惠玲*

武汉大学人民医院 (Renmin hospital of Wuhan University)

目的 精神分裂症是一种复杂的神经精神疾病,影响全球数百万人。尽管现有治疗方法主要靶向多巴胺受体,但这些方法往往伴随着显著的副作用。TAAR1 (微量胺相关受体1) 作为一种G蛋白偶联受体,在调节单胺能和谷氨酸能神经传递中具有重要的作用。近年来,TAAR1成为治疗精神分裂症的新兴靶点,受到了广泛关注。

本文旨在综合分析关键研究,探讨TAAR1激动剂在精神分裂症治疗中的潜力及其作用机制,为靶

向TAAR1开发新型抗精神病药物提供重要的理论基础和实践依据,推动精神分裂症治疗方法的创新和进步。

方法 综合分析相关关键文献,其研究内容分别为:TAAR1与精神分裂症相关的生物学功能、TAAR1激动剂对TAAR1的Gs信号通路的激活作用、利用MK801诱导的精神分裂症小鼠模型研究TAAR1激动剂的治疗潜力,以及在啮齿动物和非人类灵长类动物中进行TAAR1激动剂的临床前和临床研究。

结论 1.TAAR1在调节奖赏回路、边缘系统、认知过程和情感状态等方面起着关键作用。

2.TAAR1激动剂能够缓解动物模型中MK-801诱导的精神分裂样症状。

3.TAAR1激动剂在啮齿动物和非人类灵长类动物中表现出抗精神病药、抗焦虑药和抗抑郁药样特性,以及促认知和REM睡眠抑制作用。

关键词: TAAR1,精神分裂症,治疗潜力,抗精神病药物

多数据集探讨利培酮抗精神分裂症相关孟德尔随机化分析

张筱蕴 宋学勤*

郑州大学第一附属医院

目的 精神分裂症作为一种严重的慢性精神障碍,严重影响个体社会功能和生活质量。尽管对该疾病的研究已取得一定进展,其复杂的病因机制仍未完全阐明。目前,抗精神病药物,特别是利培酮,在治疗中发挥重要作用,能够有效改善患者症状,但可能导致代谢副作用。随着遗传学的发展,探索疾病的遗传背景及药物反应成为新趋势。特别是,孟德尔随机化方法的应用,为理解疾病的遗传基础和改善治疗策略提供了新的视角,推动了向更精准治疗的转变。

方法 首先,通过eQTLGen联盟和GEO数据库,获取了关于血液中基因表达的遗传数据和精神分裂症患者的RNA-seq数据。使用Limma软件包对数据进行差异表达分析。再通过Metascape进行基因功能富集分析。孟德尔随机化分析通过IEU数据库筛选的结局ID进行,以解释全血中基因表达对

精神分裂症影响的因果关系。此外，使用 CIBERSORT 方法评估了免疫细胞的浸润情况。GSVA 和 GSEA 分析评估了基因集的富集情况和生物学通路的变化。我们利用 RcisTarget 预测了转录因子的调控网络，并通过 miRcode 数据库构建了 miRNA 网络。整个研究的统计分析基于严格的假设条件，使用 R 语言进行。我们使用 ChAMP 软件包来分析本组 144 例健康对照组和 144 例精神分裂症组的差异甲基化基因 (DMG)，鉴定精神分裂症的差异甲基化探针，筛选条件为 $\text{adj.P} < 0.05$ 。通过 ggplot2 绘制关键基因的甲基化箱线图。

结果 通过以上方法，本研究共筛选出 120 个差异基因，进一步孟德尔随机化分析发现 DKK3、EEF1A1、PRKAA1 与精神分裂症风险相关。通过免疫细胞浸润分析发现关键基因与多种免疫细胞呈显著相关，GSVA 和 GSEA 分析揭示了关键基因在多个信号通路中的富集情况。相关性分析发现 DKK3 与糖脂代谢呈现显著负相关，而 PRKAA1 与糖代谢显著正相关，EEF1A1 和脂代谢显著正相关。继续通过本组的共 288 例样本分析显示，DKK3 甲基化水平也存在明显差异。

结论 本研究的结果不仅增强了我们对精神分裂症药物治疗机制的理解，尤其是在精确医疗领域，还为未来的药物发现和疾病治疗策略提供了新的方向。我们的发现支持了利培酮作为治疗精神分裂症的有效药物的观点，尤其 DKK3 基因的存在与精神分裂症的低风险相关，可能通过降低糖脂代谢紊乱风险来减少精神分裂症的发病率，并强调了在治疗选择和剂量调整时考虑个体遗传背景的重要性，以最大限度地减少副作用并优化疗效。

老年精神分裂症患者家庭照顾者照顾负担与生活质量相关性研究

肖瑾*

西安交通大学第一附属医院

目的 了解现阶段老年精神分裂症患者家庭照顾者的照顾负担水平及生活质量现状，并探讨两者之间的相关性，为改善老年精神分裂症患者家庭照

顾者生活质量提供指导意见。

方法 通过系统抽样的方法，采用一般资料问卷、家庭照顾负担访谈量表 (FBIS) 和生活质量测定量表简表 (WHOQOL-BREF) 于 2021 年 7 月~2024 年 1 月期间，在西安交通大学附属第一医院精神心理卫生科住院部选入符合纳入排除标准的 130 名精神分裂症老年患者的家庭主要照顾者进行现场调查，对回收数据进行单因素分析和相关性分析得出结果，进行讨论。

结果 老年精神分裂症患者家庭照顾者的 FBIS 得分为 (22.33±10.07) 分，单因素分析显示，不同受教育程度、居住地、与患者共同生活时间、日照时间、家庭月收入、有无精神疾病之间的家庭照顾者照顾负担存在差异；WHOQOL-BREF 得分为 (59.60±9.20) 分，不同受教育程度、职业、居住地、与患者的家属关系、日照时间、家庭月收入、有无精神疾病之间的家庭照顾者生活质量存在差异；老年精神分裂症患者家庭照顾者的 FBIS 得分与 WHOQOL-BREF 得分呈负相关。

结论 家庭照顾者照顾负担和生活质量呈中度负相关。

关键词：精神分裂症；家庭照顾者；照顾负担；生活质量

首发未服药精神分裂症患者激越和眶额叶皮层亚区结构的关系

董英博 陈从新 李玉婷 曹沛煜 汤忆琳 徐国新 司骐 隋毓秀*
南京脑科医院

目的 分析首发未服药精神分裂症患者激越和眶额叶皮层 (orbitofrontal cortex, OFC) 亚区结构之间的关系，探索精神分裂症患者激越可能发生的基础。

方法 选取 15~44 岁首次发病且未接受过药物治疗的精神分裂症患者 50 例 (患者组) 和性别、年龄、受教育程度与之相匹配的健康对照者 29 名 (对照组) 进行结构磁共振成像 (structural magnetic resonance imaging, sMRI) 检查，利用 freesurfer 软件提取大脑 OFC 亚区灰质体积、皮层厚度、皮层表面积和表面曲率，其中包括折叠指数、曲率指数、平均曲率和高斯曲率。采用阳性和阴性综合量表 (the Positive and

Negative Syndrome Scale, PANSS)评估患者精神病性症状严重程度, 简易激越评定量表(the Brief Agitation Rating Scale, BARS)评估患者激越严重程度。BARS 包含三项分量表: 躯体攻击、言语攻击和非攻击性激越。采用协方差检验、独立样本 t 检验和非参数检验进行组间差异性检验。采用偏相关分析, 分析首发未服药精神分裂症患者激越和 OFC 亚区结构之间的关系, 及精神病性症状和 OFC 亚区结构之间的关系。

结果 与对照组相比, 患者组右侧内侧 OFC ($t=2.38$), 左侧外侧 OFC ($U=1375.00$)和左侧内侧 OFC ($U=1733.50$)折叠指数更小(FDR 矫正, $P<0.05$)。患者组 BARS 量表评分增加与左侧内侧 OFC ($r=-0.375$, $P=0.012$), 左侧外侧 OFC ($r=-0.361$, $P=0.014$), 左侧内侧 OFC ($r=-0.376$, $P=0.018$) 体积呈负相关。患者组非攻击性激越评分增加与左侧外侧 OFC($r=-0.510$, $P<0.001$)和左侧内侧 OFC($r=-0.533$, $P<0.001$) 体积呈负相关。患者组中 OFC 亚区结构与 PANSS 分量表无显著相关性。

结论 首发未服药精神分裂症患者 OFC 亚区结构损伤, 并且与激越严重程度评分呈负相关。尤其左侧 OFC 结构损伤可能参与了精神分裂症激越发生的机制。

Sex Differences in The Smartphone Video Games Improving Executive Function in Patients with Chronic Schizophrenia

Wenhui Wang*

Chaohu Hospital Affiliated to Anhui Medical University

Objective Schizophrenia is a common neuropsychiatric disorder that clinically commonly reports psychotic symptoms, motivational and cognitive dysfunction. In recent years, smartphone video games have emerged as a novel treatment option in schizophrenia due to their high appeal, usage rates and excellent efficacy. It is unclear to what extent sex influences the efficacy of smartphone video games in schizophrenia, while changes in serological indicators during this process are also worth exploring.

Methods This study is a secondary analysis of a clinical trial which conducted at the Department of Psychiatry, Chaohu Hospital of Anhui Medical University, from July 2021 to February 2022. A total of 51 chronic schizophrenia patients were recruited in this study, 21 participants who did not meet the criteria were excluded from the study, 1 participant withdrew the consent, 3 participants dropped out, 26 chronic schizophrenia patients completed the study

An effective combination of the smartphone video games was employed. The participants attended a 6 week game training, playing video games on their smartphones for 1 hour daily, five times a week, for 6 weeks. Simultaneously, participants all maintain the original standard antipsychotic regimen, there was no difference in interventions between the two groups.

The Repeatable Battery for the Assessment of Neuropsychological Status (RBANS),

Stroop Color and Word Test (SCWT),

Positive and Negative Syndrome Scale (PANSS),

General Self-Efficacy Scale (GSE) and

Global Assessment of Function (GAF) were assessed at five time points (baseline, 3,6,9,12 weeks)

Results There were no significant sex differences could be found on immediate memory, visuospatial, attention, delayed memory of RBANS. Male group got better performance than female group on two words error and two words time of SCWT. Female group and male group showed no group effects on positive scale, negative scale, general psychopathology scale and total score of PANSS. Male patients got significantly higher BDNF levels than female patients. The statistically sex difference was only manifested in the third week after the end of the game training, the SNAP25 levels of male group were significantly higher than female group

Conclusion In this study, we emphasize that when it comes to treating executive function by smartphone video games in chronic schizophrenia, it may be more effective in male group than in female group. There were no significant sex differences in following domains: cognitive function, psychiatric symptoms, overall functioning and general self-efficacy

关键词: Schizophrenia, Sex, Executive function, Smartphone video games

Successful Treatment of Low-dose Deutetrabenazine in A Tumor Patient with Tardive Dyskinesia: Case Report

Ya Luo* Ying Chen Xiaojuan Deng Xun Yang Xiuli Wang Hong Deng Xueli Sun Fei Li Qiyong Gong Liling Mo

West China Hospital of Sichuan University

Tardive dyskinesia (TD) syndromes are still a public health concern. Even though second-generation antipsychotics are not less dangerous than first-generation medicines in terms of inducing tardive syndromes, they are increasingly being utilized. It is commonly used to treat schizophrenia, depression, bipolar disorder, and insomnia. To the best of our knowledge, there are not enough reports about the dose, safety, and effectiveness of using deutetrabenazine for the treatment of TD syndromes. We aim to present this case as a reference for the treatment of TD syndromes with low-dose deutetrabenazine and remind psychiatrists to consider the feasibility of low-dose deutetrabenazine during the use of antipsychotic medications. We presented the case of a 57-year-old woman who was diagnosed with schizophrenia when she was 45 years old. Her main clinical manifestations are feeling targeted, cheated, tracked, and auditory hallucination. At first, antipsychotics were effective, however, the patient presented TD after more than 5 years of antipsychotic treatment. After excluding Huntington disease, Tourette syndrome, and other possibilities, we prescribed 6.0-12.0 mg/d deutetrabenazine tablets to the patient. The TD syndrome was gradually relieved without stopping the antipsychotics in a month. As an exploratory successful treatment of TD, the prescribing information recommended that psychiatrists should consider a relatively lower dose of deutetrabenazine to reduce the risk of TD with ziprasidone in standard dose ranges. Although the middle-aged patient demonstrated excellent results in TD and mental status, the effect and safety after TD syndromes after one month would pose great concerns. In addition, we

should not underestimate the TD syndromes caused by second-generation antipsychotic medication. Moreover, it is important to assess and manage TD syndromes as promptly as possible.

关键词: tardive dyskinesia (TD), schizophrenia, deutetrabenazine, antipsychotic medication, case report

首发未用药精神分裂症患者血清丁酸水平和海马亚区体积及其与认知功能的关系

李亚军*

郑州大学第一附属医院

目的 观察首发未用药精神分裂症患者血清丁酸水平和海马亚区体积及其与认知功能的关系, 探讨短链脂肪酸在精神分裂症中发挥的可能作用。

方法 选取至郑州大学第一附属医院精神科就诊的首发未用药精神分裂症患者 51 例(患者组)和同期健康志愿者 35 名(健康对照组), 采用气相色谱质谱法检测血清丁酸水平, 采用 GE Discovery 750 3.0T 采集结构磁共振成像(sMRI)影像数据, 采用精神分裂症认知功能成套测验(MCCB)评估认知功能, 采用 Python 软件进行随机森林回归模型分析。

结果 (1) 患者组血清异丁酸、总丁酸水平明显低于健康对照组, 差异有统计学意义 ($P<0.05$)。

(2) 患者组右侧半球海马裂体积显著高于健康对照组, 患者组右侧半球海马头部体积明显低于健康对照组, 差异具有统计学意义 ($P<0.05$)。(3) 与健康对照组相比, 患者组在认知功能七大领域中的得分下降较为明显(均 $P<0.05$)。(4) 患者组血清丁酸水平与海马亚区体积的相关性分析显示: 患者组血清正丁酸水平与右侧半球海马尾部体积成正相关 ($r=0.371, P=0.012$)。(5) 患者组海马亚区体积与认知功能的相关性分析显示: 患者组的左侧半球海马裂体积与 SOP T 分、RPS T 分均正相关 ($r=0.301、0.310$, 均 $P<0.05$); 患者组的左侧半球海马头部体积与 SC T 分成正相关 ($r=0.336, P=0.021$); 患者组的左侧半球海马体积与 SC T 分成正相关 ($r=0.357, P=0.014$); 患者组的右侧半球海马头部体积与 Vis.Lrng T 分、SC T 分成正相关 ($r=0.312、0.319$, 均 $P<0.05$); 患者组的右侧半球海马尾部体积与 RPS T 分成负相关 ($r=-0.289, P=0.049$)。(6) 随机森林

回归模型分析发现丁酸、异丁酸预测模型 RMSE 值为 18.74 ± 0.30 ；右侧半球海马头部体积、右侧半球海马尾部体积预测模型的 RMSE 值为 17.98 ± 0.33 ；丁酸、异丁酸、右侧半球海马头部体积和右侧半球海马尾部体积联合预测模型的 RMSE 值为 17.59 ± 0.58 ，其可以更好的预测 Vis.Lrng 水平。

结论 1. 首发未用药精神分裂症患者组血清中丁酸水平发生了改变；海马亚区体积发生改变，部分海马亚区体积减少。2. 患者组血清丁酸水平与右侧半球海马尾部体积成正相关，并与认知功能部分得分具有一定的相关性，提示丁酸水平改变可能参与了精神分裂症的发生。3. 丁酸和海马亚区体积联合做模型预测认知功能，优于分别单个做模型用于认知功能的预估。

重镇安神类中药治疗难治性精神分裂症的疗效观察

高金松¹ 宋学勤²

1.河南省中医院（河南中医药大学第二附属医院）

2.郑州大学第一附属医院

目的 本研究旨在探讨重镇安神类中药在治疗难治性精神分裂症中的临床疗效。难治性精神分裂症作为一种病程长、治疗效果不佳的精神疾病，给患者及家庭带来沉重负担。本文首先介绍了难治性精神分裂症的定义、临床特点及治疗困境，随后详细阐述了重镇安神类中药的种类、药理作用及其在精神分裂症治疗中的潜在优势。通过对照试验设计，本研究对重镇安神类中药在难治性精神分裂症患者中的治疗效果进行了观察和分析。

方法 本研究采用随机对照试验设计，选取符合条件的难治性精神分裂症患者为研究对象。将患者随机分为两组，对照组采用常规西药治疗，实验组则在西药治疗基础上加用重镇安神类中药。治疗过程中，对两组患者进行定期评估，记录症状缓解程度、生活质量改善等指标。

结果 实验结果显示，与对照组相比，实验组患者在症状缓解程度和生活质量提高方面均表现出更明显的改善。具体而言，实验组患者的阳性和阴性症状量表（PANSS）评分较对照组显著降低，而生

活质量评分则显著升高。此外，实验组患者的不良反应发生率也相对较低。

结论 本研究表明，重镇安神类中药在难治性精神分裂症治疗中具有一定的疗效优势，值得临床应用。然而，为了进一步提高治疗效果和减少不良反应发生率，未来研究还需对中药的配方、剂量等进行优化与验证。同时，对于难治性精神分裂症的治疗还需结合心理治疗、康复训练等多种手段进行综合治疗。

Transcriptomic and Neurotransmitter Insights Into Gray Matter Volume Changes From 1 Hz rTMS in Treating Schizophrenia with Auditory Verbal Hallucinations

Yuanjun Xie¹, Muzhen Guan², Zhongheng Wang³, Huaning Wang³, Peng Fang¹

1.Military Medical Psychology School, Fourth Military Medical University

2.Department of Mental Health, Xi'an Medical College

3.Department of Psychiatry, the First Affiliated Hospital, Fourth Military Medical University

Background Auditory verbal hallucinations (AVH) are prominent positive symptoms of schizophrenia, often resistant to traditional antipsychotic treatments. Low-frequency repetitive transcranial magnetic stimulation (rTMS) has emerged as a potentially effective treatment for AV. However, the neurobiological mechanisms underlying its efficacy are not fully understood.

Objective This study aimed to investigate the impact of 1 Hz rTMS on AVH by examining changes in gray matter volume (GMV) within cortical regions and exploring the underlying neurobiological mechanisms, including alterations in gene expression levels and neurotransmitter receptor densities

Methods In a randomized controlled trial design, 1 Hz rTMS targeting the left temporoparietal junction (TPJ) was administered to patients diagnosed with

schizophrenia experiencing AVH. The changes in GMV in cortical regions were evaluated, with analyses focusing on their correlations with gene transcription expression levels and neurotransmitter distribution densities, utilizing data from the Allen Human Brain Atlas and PET images

Results rTMS treatment not only significantly reduced AVH symptoms but also enhanced GMV in critical cortical areas. These neuroplastic changes were associated with the upregulation of genes involved in neuroplasticity-related ontology pathways, including chromatin remodeling and vesicle cytoskeletal trafficking. Additionally, altered densities of key neurotransmitter receptors including serotonin, dopamine, glutamate, were observed. Notably, specific hub gene expressions, such as ANK1, identified through protein-protein interaction (PPI) analysis, and certain neurotransmitter density, particularly mGluR5, were significant predictors of GMV changes

Conclusion The findings suggest that 1 Hz rTMS may induce beneficial neuroplastic changes in cortical regions, significantly correlated with specific patterns of gene expression and neurotransmitter receptor profiles. These results enhance our understanding of the biological mechanisms through which rTMS exerts its therapeutic effects in treating AVH in schizophrenia patients

基于社交技能训练的稳定期精神分裂症患者社会功能改善研究

高慧 陆如平* 姚力立 吕珍苏 罗岚
上海市民政第一精神卫生中心

目的 通过实施 12 周的社交技能训练课程,探讨稳定期精神分裂症患者在社会功能方面的改善效果。

方法 本研究选取上海市民政第一精神卫生中心住院稳定期精神分裂症患者 64 人作为研究对象,

随机分为观察组和对照组,每组各 32 人。观察组中的患者进一步分成 4 个小组,进行为期 12 周的社交技能训练,每周两次,每次 50 分钟。对照组的患者则接受常规治疗。社交技能训练课程共 24 次,内容包括四项基本社交技能、会谈技能、有主见的技能、冲突管理技巧、公共生活技能、维护健康技能及职业/工作技能。研究在 0 周、6 周、12 周时,采用阳性和阴性症状量表(PANSS)和个人和社会表现量表(PSP)对患者进行评估。

结果 在研究结束时,通过数据分析发现,观察组患者的阳性和阴性症状量表(PANSS)评分显著降低,个人和社会表现量表(PSP)评分显著提高,与对照组相比具有统计学显著差异($P < 0.05$)。具体而言,观察组患者在精神症状的改善和社会功能的提升方面表现出显著优势。在社交沟通技能方面,观察组患者的倾听他人、提出要求和表达感受的能力均显著提高。情感反应技能方面,观察组患者能够更好地理解和表达情感,处理冲突的能力也得到明显提升。日常生活技能方面,观察组患者在个人卫生、烹饪和家务管理等方面表现出显著进步。工作和学习技能方面,观察组患者在任务管理、时间管理和团队合作方面的能力均有显著提高。进一步分析显示,社交技能训练的效果在不同的社会功能维度上均有显著体现。特别是在处理社会交往和情感反应方面,观察组患者的表现显著优于对照组,表明社交技能训练在提升精神分裂症患者的社会功能和生活质量方面具有显著效果。

结论 12 周的社交技能训练显著改善了稳定期精神分裂症患者的社会功能,提高了他们的生活质量。社交技能训练作为一种有效的心理社会干预方法,值得在精神分裂症的治疗中广泛应用,为患者的社会功能恢复和生活质量提升提供了新的思路和方法。

Correlation between Insulin Resistance and Thyroid Function in Hospitalized Patients with Schizophrenia Spectrum Disorders, and Exploration of Its Risk Factors

Xinke Shi Lou Wang Feifei Wang Chuanyue Wang Fang Dong*

Beijing Anding Hospital, Capital Medical University

Objective To investigate the correlation between insulin resistance and thyroid function in hospitalized patients with schizophrenia spectrum disorders and explore its risk factors

Methods By searching the electronic medical record system of Beijing Anding Hospital affiliated to Capital Medical University, screen patients with schizophrenia spectrum disorder who were hospitalized from December 31, 2015 to February 22, 2023 with complete information to be extracted. Extracted information includes general demographics (age, gender, marital status), personal history (smoking history, alcohol history), disease characteristics (duration of illness, times of hospitalization), fasting blood glucose, fasting insulin, and thyroid function. Calculate Thyroid Feedback Quantile Index (TFQI), TSH Index (TSHI), and Thyroid Hormone Resistance Index (TT4RI) to assess central thyroid hormone sensitivity, and use FT3/FT4 ratio to evaluate peripheral thyroid hormone sensitivity. Calculate Homeostasis Model Assessment of Insulin Resistance (HOMA-IR) to assess insulin resistance, with HOMA-IR > 2.6 as the cutoff defining insulin resistance. Classify research subjects into non-insulin resistant (non-IR) and insulin resistant (IR) groups. Analyze the correlation of HOMA-IR with demographic, clinical data, and thyroid function, and investigate risk factors for insulin resistance in hospitalized patients with schizophrenia spectrum disorders

Results A total of 8,171 hospitalized patients with schizophrenia spectrum disorders were included with an insulin resistance (IR) prevalence of 28.0% (2,286/8,171). Among them, IR prevalence was 30.3% (1,108/3,654) in males and 26.1% (1,178/4,517) in females. Patients in the IR group showed higher BMI, FT3, TSH, TT4RI, FT3/FT4 ratio, TSHI, and TFQI compared to the non-IR group, along with longer duration of illness and more hospitalizations ($P < 0.05$). Pearson correlation analysis indicated significant correlations between HOMA-IR and age, duration of illness, times of hospitalization, BMI, FT3, TSH, TT4RI, FT3/FT4 ratio, TSHI, and TFQI ($P < 0.05$). Binary logistic regression analysis results showed that high BMI (OR=1.224, 95%

CI: 1.209-1.240) and high TFQI (OR=1.388, 95% CI: 1.180-1.631) were risk factors for insulin resistance

Conclusion Thyroid dysfunction is associated with insulin resistance in patients with schizophrenia spectrum disorders. High central thyroid hormone sensitivity index (TFQI) and high BMI are independent risk factors for insulin resistance in patients with schizophrenia spectrum disorders

关键词: Schizophrenia spectrum disorders, Insulin resistance, Thyroid dysfunction

不同视听通道信息对精神分裂症患者共情能力的影响

王淼¹ 王淼^{2,3} 张丽颖¹ 付新玮¹ 王毅² 王毅³ 王艳郁¹ 陈楚侨² 陈楚侨³

1. 山东第二医科大学心理学院

2. 中国科学院心理研究所心理健康重点实验室, 神经心理学与应用认知神经科学实验室

3. 中国科学院大学心理系

目的 共情是一种复杂的社会认知过程, 指个体感知、理解他人情绪及心理状态的能力。研究表明, 精神分裂症患者的共情能力存在缺损, 但其内在机制尚不明确。视听觉通道是影响共情的重要因素之一。本研究旨在探讨不同视听觉通道信息对精神分裂症患者共情各指标的影响。

方法 本研究选取 50 例精神分裂症患者和 35 例健康对照, 采用中文版共情准确性任务 (EAT)。实验设置了三种条件: 仅音频、虚拟人有声视频、真人有声视频。每种条件下均包含积极和消极两种情绪的视频。通过 3 (实验条件) × 2 (情绪效价) × 2 (组别) 的重复测量方差分析, 比较两组在不同实验条件下共情各指标的表现。

结果 研究结果显示, 在共情准确性、认知共情和情感共情评分上, 精神分裂症患者均显著低于健康对照组 ($F(1, 83) = 18.65, p < 0.001$; $F(1, 83) = 10.57, p = 0.002$; $F(1, 83) = 3.22, p = 0.016$)。在情感共情评分上, 实验条件的主效应显著 ($F(2, 166) = 9.43, p < 0.001$), 其中虚拟人有声视频条件下的情感共情水平显著弱于仅音频和真人有声视频条件。在共情动机评分上, 实验条件和组别的交互作用显著

($F(2, 166) = 3.188, p = 0.044$), 患者组仅在虚拟人有声视频下的共情动机显著弱于健康对照组。在共情准确性和认知共情评分上, 情绪效价的主效应显著 ($F(1, 83) = 20.125, p < 0.001$; $F(1, 83) = 17.58, p < 0.001$), 积极视频下的表现显著优于消极视频。在共情准确性得分上, 实验条件、情绪效价和组别的交互作用显著 ($F(2, 166) = 8.28, p < 0.001$)。积极视频下, 患者在虚拟人有声视频条件下的共情准确性显著低于健康对照组; 消极视频下, 仅音频和真人有声视频条件下患者的共情准确性低于健康对照组。

结论 精神分裂症患者在共情准确性、认知共情和情感共情方面均存在异常, 这些异常受视听通道信息及情绪效价的影响。本研究为理解精神分裂症患者的社会认知缺陷提供了新的视角, 并可能为临床干预提供参考。

盐酸齐拉西酮胶囊致心肌酶谱升高 1 例报道

樊松强*

宁夏回族自治区宁安医院

目的 分析 1 例临床口服盐酸齐拉西酮胶囊致心肌酶谱升高的不良反应, 提高临床医生对其不良反应的认知并及时复查相关检查, 排除因盐酸齐拉西酮胶囊对心脏毒性致心肌酶谱升高, 并做好处理措施。

方法 对临床 1 例口服盐酸齐拉西酮胶囊致心肌酶谱升高的药物相关不良反应进行回顾性分析并查阅相关文献。

结果 患者口服盐酸齐拉西酮胶囊后出现心肌酶谱明显升高, 治疗过程中多次复查心电图一直正常, 肌酸激酶同工酶升高比例低于肌酸激酶。心梗二项: 超敏肌钙蛋白正常, 肌红蛋白升高, 予以停止服用盐酸齐拉西酮胶囊, 换服阿立哌唑片并予以补液促进代谢后心肌酶谱恢复正常。

结论 盐酸齐拉西酮胶囊作为第二代抗精神病药物, 该药的不良反应最常见的为皮疹, 心电图异常: QTc 间期增加, 口干、便秘、视物模糊, 常见肌痛、肌张力亢进等, 但盐酸齐拉西酮胶囊致肌张力

增高, 进一步导致横纹肌溶解、进行性肌营养不良出现心肌酶谱升高, 并且肌肉溶解形成血栓导致肾栓塞的不良反应罕见。临床医生在使用该药物过程中对其不良反应的认知仍需要进一步加强。定期复查心肌酶谱, 如果出现心肌酶谱升高应及时复查心电图、心梗二项、心脏彩超, 排除盐酸齐拉西酮胶囊诱发心肌损伤, 并做好处理措施。

关键词: 盐酸齐拉西酮胶囊, 心肌酶谱, 药品不良反应, 肾栓塞

重复经颅磁刺激治疗对精神分裂症患者认知功能的疗效

孙振杰¹ 孙振杰² 那龙² 那龙¹ 侯雅婷^{1,2}

1. 山西省精神卫生中心、山西医科大学

2. 太原市精神病院

目的 探讨重复经颅磁刺激 (rTMS) 对精神分裂症患者认知功能的治疗效果, 为减少精神分裂症患者认知功能损害提供参考。

方法 纳入 60 例符合《国际疾病分类 (第 10 版)》(ICD-10) 精神分裂症诊断标准的患者, 根据是否给予 rTMS 干预分组, 研究组接受 20 次 10Hz 高频 rTMS 治疗, 对照组接受伪高频 rTMS 治疗, 连续治疗 8 周。比较两组患者治疗前后阳性和阴性症状量表 (PANSS)、精神分裂症患者生活质量量表 (SQLS)、可重复的成套神经心理状态测量 (RBANS)、治疗效果和生活质量。

结果 基线两组患者在人口统计学信息 (性别、年龄、病程和受教育年限等) 方面无显著差异 (均 $P > 0.05$); 治疗 4 周后, 研究组 PANSS 总分及阴性症状评分显著降低, 且低于对照组, 差异有统计学意义 (均 $P < 0.05$)。研究组 RBANS 总分及即刻记忆、视觉广度、言语功能和延时记忆因子分显著升高, 且高于对照组, 差异有统计学意义 ($P < 0.05$)。治疗 8 周后, 研究组 PANSS 总分、SQLS 分值、RBANS 评分均低于对照组 ($P < 0.05$)。

结论 高频 rTMS 能有效改善精神分裂症患者的阴性症状, 有利于患者认知功能的改善, 对认知功能的损害较小, 且具有较高的安全性。

关键词: 重复经颅磁刺激治疗, 精神分裂症, 认知功能

Safety Assessment of Asenapine in The FAERS Database: Real Adverse Event Analysis and Discussion on Neurological and Psychiatric Side Effects

Jin Liuyin Guidong Zhu* Yun Wu Hua Xia
Lishui Second People's Hospital

Purpose This study aims to comprehensively assess the safety of Asenapine by conducting a comprehensive statistical analysis of adverse event reports in the FAERS database, with a particular focus on potential adverse reactions related to its use in the treatment of psychiatric disorders.

Methods Event reports from the first quarter of 2009 to the third quarter of 2023 were collected and analyzed. Detailed examinations of gender, age, reporter identity, and other aspects were conducted to reveal the fundamental characteristics of Asenapine-related adverse events. Signal mining techniques were employed to systematically evaluate various adverse reactions associated with Asenapine.

Results The study found that adverse event reports involving Asenapine were more common among female patients, with the age group mainly distributed between 18 and 45 years. Physicians were the primary reporters of adverse events, and psychiatric disorders, neurological disorders, and gastrointestinal disorders were the most common areas affected by adverse reactions. In addition to known adverse reactions, potential risks not mentioned in the drug label were identified, such as anosognosia, attentional drift, and psychogenic compensation disorder.

Conclusion Asenapine carries the risk of various adverse reactions alongside its therapeutic effects. In clinical practice, physicians should closely monitor the occurrence of neurological disorders, psychiatric disorders, and gastrointestinal system disorders.

关键词: Asenapine; Schizophrenia; Bipolar Disorder; FAERS Database; Side Effects

奋乃静联合盐酸帕罗西汀治疗精神分裂症引发锥体外系副反应个案分析

姜莹* 姜莹
抚顺市第五医院

目的 本文通过对一例服用奋乃静联合盐酸帕罗西汀治疗过程中出现锥体外系副反应的个案进行深入分析, 讨论了该现象发生的原因, 临床表现以及处理策略。

奋乃静作为一种典型抗精神病药物, 在治疗精神分裂症阳性症状方面疗效可观, 然而, 部分患者在使用奋乃静治疗过程中会出现锥体外系副反应, 在联合盐酸帕罗西汀后盐酸帕罗西汀重度抑制 2D6 酶, 增加了奋乃静的药物浓度使得锥体外系副反应出现的更多, 给患者的生活质量带来不利影响。因此, 本文旨在通过个案分析, 探讨奋乃静联合盐酸帕罗西汀治疗精神分裂症引发锥体外系副反应现象及其处理策略, 以期提高临床医生对该问题的认识和应对能力。

方法 个案分析

结果 文章总结了奋乃静联合盐酸帕罗西汀引发锥体外系副反应的预防措施及建议, 以期对未来类似病例的处理提供参考。

结论 本文通过对一例奋乃静联合盐酸帕罗西汀引起的锥体外系副反应个案进行分析, 探讨了该现象的发生原因、临床表现以及处理策略。文章强调了临床医生在用药过程中应密切关注患者的症状和体征, 及时发现并处理异常情况。同时, 提出了针对此类情况的处理策略及预防措施, 以期对未来类似病例的处理提供参考。

文章总结了奋乃静联合盐酸帕罗西汀引发锥体外系副反应的预防措施及建议, 以期对未来类似病例的处理提供参考。

Quercetin Modulation of The PTEN/AKT/CREB/BDNF Signaling Pathway

Reduces Microglial Activity To Improve Cognitive Deficits in Schizophrenia

Yating Yang Huanzhong Liu*

Chaohu Hospital of Anhui Medical University

Objective Quercetin has anti-inflammatory and neuroprotective effects and may be used to improve cognitive impairment. Cognitive dysfunction as one of the main clinical manifestations of schizophrenia, and antipsychotic drugs are not effective in improving cognitive impairment in schizophrenia. Therefore, this study verified whether quercetin has the effect of improving cognitive impairment in schizophrenia and the specific mechanism

Methods MK-801 was constructed as a schizophrenia model, and quercetin was administered to the schizophrenia model mice by treatment. We verified whether quercetin has the effect of improving cognitive impairment in schizophrenia by recording the behavioral results of NORT and MWT in mice. The specific mechanisms by which quercetin improves cognitive impairment in schizophrenia were explored using network pharmacological analysis. To verify the specific mechanism of quercetin to improve cognitive impairment in schizophrenia by Western blotting, immunofluorescence, Golgi staining, Nysted, and HE staining

Results Quercetin attenuated MK-801-induced cognitive deficits and neurological damage in a dose-dependent manner. Network pharmacological analyses revealed 57 potential targets of quercetin for the treatment of schizophrenia. KEGG enrichment analyses indicated that quercetin may exert its therapeutic effects by affecting the PTEN/PI3K/AKT signaling pathway. Quercetin was shown to ameliorate MK-801-induced cognitive impairment in schizophrenia-like mice and promote neurogenesis to ameliorate neuronal apoptosis. In addition, quercetin inhibits microglia activation, thus exerting anti-inflammatory effects

Conclusion Quercetin has the ability to improve cognitive impairment in schizophrenia, and our study provides a theoretical basis for the future use of quercetin in the clinic

关键词: schizophrenia, quercetin, cognitive function, PTEN, AKT, BDNF

自身免疫性精神病与急性原发性精神病临床特征的回顾性研究

律东* 梁晓欣 姚多财 熊素素 马业凯 唐雅妮 林志雄 林举达

广东医科大学附属第一医院

介绍 自身免疫性精神病是主要表现为精神症状的自身免疫性脑炎，与急性原发性精神病在早期很难鉴别。

目的 分析自身免疫性精神病与急性原发性精神病患者临床特征，以早期鉴别自身免疫性精神病。

方法 回顾性分析 2020 年 4 月至 2024 年 3 月在广东医科大学附属第一医院精神心理科住院，病程小于 3 个月，表现为急性精神病性症状且均完善了腰椎穿刺术的 62 例患者，分为自身免疫性精神病组即病例组 (n=20) 和急性原发性精神病组即对照组 (n=42)。收集两组患者入院时的一般情况、临床症状、影像学、脑电图、血液和脑脊液相关指标。采用 SPSS26.0 软件进行统计学分析。

结果 1 临床表现: 病例组中情感症状, 意识障碍、认知障碍、癫痫发作、病前感染、应激事件占比多于对照组, 具有统计学意义 ($P<0.05$); 2 实验室结果 病例组血液 WBC、中性粒细胞百分比 (NE%)、中性粒细胞绝对值/淋巴细胞绝对值 (NE#/LY#)、CRP、甘胆酸 (CG) 较对照组高, 有统计学意义 ($P<0.05$)、血液和脑脊液神经免疫抗体阳性率、寡克隆区带异常数、IgG 指数及 IgG24 小时鞘内合成率、脑脊液压力、白细胞较对照组高有统计学意义 ($P<0.01$); 而血液淋巴细胞百分比 (LY%)、ASO、游离三碘甲状腺素氨酸 (FT3)、游离甲状腺素 (FT4)、载脂蛋白 A1 (aPOA1)、胱抑素 C (Cysc) 则较对照组低, 差异均有统计学意义 ($P<0.05$); 3 头部磁共振出现病灶例数、脑电图异常较对照组高, 有统计学意义 ($P<0.05$); 4 年龄、性别、病程、肝肾功能指标、脑脊液蛋白、氯化物、糖差异则无统计学意义。

结论 1 与对照组相比, 病例组前驱感染史, 应激事件、意识障碍、认知障碍、癫痫发作多见; 2

病例组血液 WBC、NE%、NE#、LY#、CRP、CG、血液和脑脊液抗体阳性率、寡克隆区带异常数、IgG 指数及 IgG24 小时鞘内合成率、脑脊液压力、WBC、头部磁共振出现病灶例数、脑电图异常较对照组高；而血液 LY%、ASO、FT3、FT4、aPOA1、Cysc 则较对照组低。

Understanding The Trends and Patterns in Brain Health: A Bibliometric Analysis of Transcriptomics and Schizophrenia Research

Jinbo Jiang^{1,2}, Longbiao Cui^{1,2,3}, Huaning Wang⁴

1.Schizophrenia Imaging Lab, Xijing 986 Hospital, Fourth Military Medical University

2.Shaanxi Provincial Key Laboratory of Clinic Genetics, Fourth Military Medical University

3.Department of Radiology, The First Affiliated Hospital of Xi'an Jiaotong University

4.Department of Psychosomatic Medicine, Xijing Hospital, Fourth Military Medical University

Objective Schizophrenia is a kind of severe mental disorder related to heredity, so far, there has been a lot of evidence on transcriptional correlates with this disorder. At present, there is no bibliometric analysis on transcriptomics related to schizophrenia. We aimed to conduct a bibliometric study of this association to determine the current status and areas for advancement in this field

Methods Publications related to transcriptomics and schizophrenia were retrieved from the Web of Science Core Collection (WoSCC). The WoSCC literature analysis wire, VOSviewer 1.6.19 and CiteSpace 6.1.R6 (64-bit) were used to conduct the bibliometric analysis

Results In total, 4255 publications were included in our study. A total of 20730 authors from 3724 affiliations and 96 countries/regions contributed to this field. The leading authors were Lewis DA, Weinberger DR, and Kleinman JE. The leading institutions were University of California system, Harvard University,

and Icahn School of Medicine at Mount Sinai. The most productive countries were the United States (US), China, and England. In total, 912 journals contributed to this field. Among them, the top three productive journals were Molecular Psychiatry, Translational Psychiatry, and Biological Psychiatry. The important keywords in the clusters were schizophrenia, gene expression, bipolar disorder, prefrontal cortex, depression, microarray, hippocampus, epigenetics, DNA methylation, and autism

Conclusion Transcription-related schizophrenia studies have a very unique advantage in elucidating the pathogenesis of schizophrenia, and more studies are needed in the future to provide new insights into the pathogenesis and treatment of schizophrenia

鲁拉西酮对精神分裂症治疗安全性及疗效的研究

岳静*

丽水市第二人民医院

目的 探讨鲁拉西酮对精神分裂症治疗安全性及疗效的研究。

方法 患者选自丽水市第二人民医院 2021 年 1 月至 2023 年 1 月在本院住院治疗的精神分裂症男性患者 75 例，随机分为治疗组(n = 37) 和对照组(n = 38)，治疗组服用鲁拉西酮 60-80mg/日，对照组给予奥氮平 15-20mg/日，开始 8 周的治疗观察及评估阳性和阴性症状量表(PANSS)、临床疗效总评量表(CGI)以及药物不良反应(TESS)；比较两组的精神分裂症于基线期、2 周末、4 周末及 8 周末评定阳性和阴性症状量表(PANSS) 总分变化、临床疗效总评量表(CGI)判定临床疗效以及药物不良反应(TESS)评估安全性及相关不良反应。

结果 精神分裂症治疗组与对照组有效率分别为 91.89%和 89.47%，精神分裂症治疗组与对照组 PANSS 评分、CGI 评分治疗第 4 周及第 8 周与入组当日比较明显改善，差异有统计学意义(P<0.01)，治疗组与对照组比较差异无统计学意义(P>0.05)；

精神分裂症治疗组与对照组均未见严重药物不良反应, 治疗组不良反应发生率为 32.43%; 对照组为 39.47%。

结论 鲁拉西酮治疗精神分裂症疗效与奥氮平相近似, 鲁拉西酮安全性高、不良反应少。

关键词: 鲁拉西酮; 精神分裂症; 安全性; 疗效。

SALL1 调控小鼠运动兴奋性异常的机制研究

尚彬丽^{1,2} 程宇琪^{1,2}

1. 昆明医学院第一附属医院

2. 昆明医科大学第一附属医院

目的 小胶质细胞功能紊乱会影响中枢神经系统稳态。SALL1 是小胶质细胞的特异性基因, 控制小胶质细胞的命运和独特的转录特征, 使其在中枢神经系统的稳态中发挥作用。通过构建 SALL1 RNAi 小鼠模型探索 SALL1 改变影响前额叶皮层中的转录和神经递质代谢异常, 进一步阐明 SALL1 影响小鼠行为改变的作用机制。

方法 构建 SALL1 RNAi 的腺相关病毒和对照病毒, 利用脑立体定位技术注射于 c57B/L 小鼠双侧内侧前额皮层, 将小鼠随机分为 AAV-CON 对照组和 AAV-SALL1 实验组, 病毒感染 3 周后进行行为学测试, 行为学实验结束后取 mPFC 脑组织通过转录组和靶向神经递质代谢测序并结合生物信息学分析, 探索 SALL1 表达干扰后引起的基因表达变化和神经递质变化, 进一步明晰 SALL1 的生物学功能和机制。

结果 利用旷场实验, 三箱社交实验和前脉冲抑制实验进行小鼠行为学评价, 行为学结果提示: SALL1 敲低的小鼠 (AAV-SALL1) 在旷场实验中运动总路程和运动次数 ($t=4.385$, $P=0.0005$; $t=3.78$, $P=0.0018$) 减少, 表现为运动兴奋性下降; 但三箱社交和前脉冲抑制实验未表现出明显异常。SALL1 表达下调导致 799 个基因差异表达, 差异基因主要富集在免疫应答、炎症反应、细胞黏附、感染等生物学功能和途径; 同时, SALL1 敲低的小鼠在前额皮层中较明显的出现 γ -氨基丁酸、谷氨酰胺、谷氨酸和乙酰胆碱增多 ($P=3.61E-06$, $\text{Log}_2\text{FC}=2.245$; $P=0.0008$, $\text{Log}_2\text{FC}=1.77$; $P=0.015$, $\text{Log}_2\text{FC}=1.63$;

$P=6.59E-05$, $\text{Log}_2\text{FC}=1.36$)。

结论 内侧前额皮层 SALL1 表达降低的小鼠出现运动兴奋性下降的特异性行为表现, 且前额皮层中多种神经炎症基因表达异常, GABA 能神经递质增多。因此, SALL1 可能通过调控神经炎症和神经递质介导小鼠兴奋性异常的发生、发展。

神经胶质细胞与外泌体在精神分裂症诊疗中的研究进展

秦付怡 刘乙霖 高碧遥 文佳 李昕睿 方源 曾勇*
昆明医科大学第二附属医院

目的 精神分裂症是一种常见的重型精神障碍, 罹患此病的患者往往会合并很高的致残率, 是全球主要的公共卫生问题之一。精神分裂症患者发生的病理过程主要是在脑内, 虽然现有的技术已经能反映一部分病变变化, 但一些早期和实时的脑内微环境变化却不能获得, 这并不利于对精神分裂症患者的早期诊断及预后康复。外泌体具有性质稳定的双层膜结构, 且可以穿越血脑屏障, 几乎存在于身体的各个部位, 并且在神经系统的生理和病理过程中发挥着重要作用, 包括废物清除, 细胞间通讯以及保护性或致病性物质向细胞外空间的运输。本文主要回顾总结了外泌体在精神分裂症发病、诊断及治疗方面的研究成果, 重点聚焦于神经胶质细胞来源外泌体以及作用于神经胶质细胞的外泌体发挥作用参与精神分裂症的研究进展。

方法 主要通过在中国知网、PubMed 中输入关键词: 精神分裂症、小胶质细胞、星形胶质细胞、少突胶质细胞、神经炎症、神经可塑性、外泌体。检索日期主要设限在近 5 年内的文献。将这些检索关键词按需交叉组合后进行检索, 大部分选取发表在 I 区 IF>5 分, 阅读后进行归纳总结。

结果 总结归纳后可以发现, 神经胶质细胞能通过参与神经炎症、神经可塑性, 突触修剪等过程影响精神分裂症的发生发展, 而来源于神经胶质细胞的外泌体和作用于神经胶质细胞的外泌体则是神经胶质细胞影响精神分裂症发生发展的重要介质, 且在精神分裂症的诊疗中具有重要价值。

结论 鉴于外泌体的确参与了精神分裂症的多个发病机制,因此在诊断精神分裂症的过程中,它被视为一个颇具潜力的生物标志物。此外,由于外泌体的生物学特性,能够穿越血脑屏障,分布全身各处的特点,它被视作优良的药物载体,并在一系列细胞和动物实验中证实了它作为药物载体的优势。尽管外泌体在诊断和治疗精神分裂症中颇具潜力和优势,但仍未进一步发展运用到临床检测中来,究其原因在于外泌体来源位置多,但高效分离和提纯的技术有限,且关于外泌体的研究多是选择在细胞和小鼠上研究,缺乏更大、更多样化的队列以及对精神分裂症患者和健康人提取的外泌体研究。因此未来关于外泌体的研究可能需要借助于更精密的仪器和更科学的方法来分离提取和检测外泌体,并通过扩大的样本研究量来增强外泌体作为诊疗精神分裂症生物标志物的可行性。

首发精神分裂症患者时间整合窗口大小及ERP特点研究

林烁^{1,2} 王丽娜^{1,2} 谭伟豪^{1,2} 田璐^{1,2} 刘超猛¹ 刘超猛² 潘伟刚² 潘伟刚¹ 任艳萍^{1,2} 马辛^{1,2}

1.首都医科大学附属北京安定医院

2.精神疾病诊断与治疗北京市重点实验室

目的 精神分裂症(Schizophrenia, SCZ)是一种严重影响认知、情感和行为的神经障碍。研究表明,精神分裂症患者表现出明显的视听整合障碍,这与他们的日常功能缺陷密切相关。首发精神分裂症(first-episode schizophrenia, FES)患者作为SCZ的一类特殊人群,对于视听整合能力的系统研究较少,尤其是对患者时间整合窗(Temporal Integration Window, TIW)的神经生理反应的研究。本研究旨在填补这一研究空白,利用行为学实验计算FES人群的TIW大小,通过脑电图(EEG)技术分析FES患者的视听整合过程,从而揭示其认知处理的独特特征和潜在神经机制。

方法 本研究采用病例对照设计,包括FES患者和健康成人各30例。首先,对部分参与者进行多种刺激起始不同步(SOAs)的行为实验,以计算两组参与者的时间整合窗口;第二步,采集两组被试

面对视听刺激时的ERP。

结果 首发精神分裂症组的平均时间整合窗口为 $492.86 \pm 216.94 \text{ms}$,显著高于健康对照组的 $226.36 \pm 46.27 \text{ms}$ 。视听同步刺激下FES患者在枕叶区域的P1振幅低于健康成人($P=0.06$),潜伏期明显延长($P<0.01$)。视听异步刺激条件下所诱发的ERP成分不同,如视觉引导的异步刺激条件下FES患者顶叶N1振幅增大($P<0.01$),潜伏期缩短($P<0.01$);听觉引导的异步刺激条件下FES患者顶叶及枕叶均表现为P2振幅增大($P<0.01$),潜伏期缩短($P<0.01$)。

结论 FES患者TIW显著扩大,面对视听多感官刺激时认知决策过程延迟;FES患者面对不同刺激类型所产生的振幅差异不同,可能与视听刺激不同的加工通路有关。

关键词:首发精神分裂症;时间整合窗口

精神分裂症暴力攻击行为的脑结构及脑功能的荟萃分析研究

张蒙¹ 王永明² 宋佳起¹ 赵文暄¹ 陈燕¹ 黄文倩¹ 韩瑞俊¹ 陈海滔¹ 谭淑平¹ 杨甫德¹

1.北京回龙观医院,北京大学回龙观临床医学院

2.苏州大学

目的 精神分裂症的暴力攻击行为,是目前普遍关注的精神卫生问题,且患者的暴力攻击行为常导致治疗疗效欠佳和患者污名化。研究通过荟萃分析方法,基于脑结构及脑功能的文章,探讨精神分裂症患者暴力攻击行为的神经病理机制,为探索特征性神经生物学标记物提供一定的理论基础。

方法 本研究在Web of Science, Medline and PubMed上分别检索了精神分裂症脑结构、脑任务态功能的研究,研究检索时限从建库至2023年7月7日。由2位研究者独立筛选文献、提取资料并采用纽卡斯尔-渥太华量表的质量评价工具评价纳入研究的偏倚风险后,采用SDMPSI, version 6.2.1软件进行Meta分析。

结果 脑结构和脑功能影像学最终分别纳入了6例和8例研究。前者结果表明,有暴力行为的精神分裂症患者(VSZ)与无暴力行为的精神分裂症患者(NVSZ)的灰质体积无统计学差异。与正常

对照组相比, VSZ 患者的脑岛、颞上回 (STG)、左额下回、左海马旁和右壳核的灰质体积减少。与仅有暴力史的正常人群相比, VSZ 患者右侧脑岛和右侧 STG 的体积减少。荟萃回归分析显示, VSZ 患者的精神分裂症病程持续时间与右侧脑岛体积呈负相关。后者结果发现, 与 NVSZ 患者相比, VSZ 患者枕中回和直肌的脑激活明显增加。与正常人群比较, VSZ 患者的前扣带皮层、小脑 VI 区、舌回和纺锤形区的脑激活明显增加。情绪任务的研究进行的亚组分析显示, 与 NVSZ 患者相比, VSZ 患者枕中回的脑激活增强。

结论 情绪感知和调节异常显著增加了精神分裂症患者的暴力风险。额颞边缘网络结构异常及枕中回和直肌的脑功能异常激活可能是精神分裂症患者发生暴力行为的神经病理学基础。

利用大脑灰质形态学信息预测女性精神分裂症患者的疗效情况

李青峰 李春波*

上海市精神卫生中心

目的 针对临床采集的 86 例女性精神分裂症 (SZ) 患者的行为学量表数据及结构磁共振数据, 建立大脑灰质形态学特征与治疗响应情况 (住院-出院前后行为学指标的变化情况) 之间的关联, 为进一步建立基于神经影像的精神分裂症疗效预测模型提供参考。

方法 研究对象为接受住院治疗的 86 位女性 SZ 患者 (年龄的均值 (IQR): 38 (26.05-53.41), 单位: 年), 均记录入/出院时的阳性与阴性症状量表 (PANSS) 以及临床疗效总评量表 (CGI), 并采集了 3D T1 加权核磁影像。计算患者大脑皮层结构的体积、皮层厚度、表面积与患者治疗响应情况之间的相关性; 利用支持向量回归 (SVR) 建立基于皮层形态学特征的疗效预测模型。

结果 1、与 PANSS 变化量的相关分析: 体积方面, 右侧梭状回与 PANSS 阳性症状总分变化量 (PANSS-P) 和 PANSS 一般病理症状变化量 (PANSS-GP) 显著相关 (p 值为 0.038 和 0.049),

右侧颞下回与 PANSS-P 显著相关 ($p=0.044$); 表面积方面, 左侧颞上沟后坡与 PANSS-GP 和 PANSS 总分变化量 (PANSS-T) 显著相关 (p 值为 0.041、0.035), 左侧眶额外皮层与 PANSS-P 显著相关 ($p=0.049$), 右侧前扣带回上部与 PANSS 阴性症状变化量 (PANSS-N) 显著相关 ($p=0.043$), 右侧梭状回与 PANSS-P、PANSS-GP、PANSS-T 显著相关 (p 值为 0.03、0.028、0.031), 右侧颞下回与 PANSS-P、PANSS-T 显著相关 (p 值为 0.028、0.034), 右侧颞极与 PANSS-P 显著相关 ($p=0.017$)

2、与 CGI-SI 变化量的相关分析: 体积方面, 左侧颞极、右侧内嗅皮质与 CGI-SI 变化量显著相关 (p 值为 0.028、0.043); 皮层表面积方面, 左侧颞上沟后坡、左侧颞极、右侧梭状回、右侧颞极与 CGI-SI 的变化量显著相关 (p 值为 0.005、0.047、0.036、0.043)

3、与出院时 CGI-GI、CGI-EI 的相关分析: 体积方面, 右侧颞极与出院时 CGI-GI 显著相关 ($p=0.048$); 皮层厚度方面, 右侧扣带回峡部与出院时 CGI-EI 显著相关 ($p=0.038$)

4、基于 DK 皮层分区的体积指标建立的 SVR 回归模型可以对 PANSS G11 维度 (注意障碍) 的变化量进行预测 (MAE=1.41, $p=0.034$)

结论 大脑灰质形态学特征与治疗响应情况存在关联, 显著相关的脑区涵盖记忆、认知相关脑区, 且可利用皮层形态学特征建立针对住院前后症状改善情况的预测模型, 有望为进一步建立基于神经影像的精神分裂症疗效预测模型提供参考。

睡眠质量对社区精神分裂症患者攻击行为的影响: 抑郁的中介作用与个人和社会功能的调节作用

李心甜¹ 冯兰棱² 王富英³ 陈文博¹ 吴冬梅²

1. 成都医学院护理学院

2. 成都脑科学研究所临床医院护理科, 中国电子科技大学神经信息教育部重点实验室

3. 彭州市第四人民医院老年精神科

目的 本研究旨在探讨睡眠质量与攻击行为之

间的相关性,抑郁在二者间关系中的中介效应,以及个人和社会功能对这一中介过程的调节效应。

方法 采用便利抽样法,收集 785 份中国彭州社区精神分裂症患者的自我报告数据,使用匹兹堡睡眠质量指数问卷(PSQI)、抑郁症状快速评估量表(QIDS-SR16)、个人和社会功能量表(PSP)、修订版外显攻击行为量表(MOAS)进行调查。

结果 研究发现,睡眠质量与攻击行为呈显著正相关($\beta=0.212^{**}$),抑郁介导了睡眠质量与攻击行为之间的关系(间接效应 $=0.043$,95%CI [0.013, 0.076])。此外,调节中介检验发现,个人和社会功能调节了睡眠质量对抑郁的影响(调节效应 $=-0.005$,95% CI [-0.008, -0.002])。

结论 睡眠质量通过抑郁影响精神分裂症患者攻击行为发生的可能性。个人和社会功能调节了睡眠质量与抑郁、攻击行为之间的关系。本研究丰富了睡眠质量与攻击行为之间关系的研究,可为今后降低精神分裂症患者攻击行为的项目提供参考。此外,研究中获得的证据有利于制定与构建优质护理的策略,稳定医疗和社会秩序。但本研究仍存在一定的局限性。

Lactate Levels in The Brain and Blood of Schizophrenia Patients: A Systematic Review and Meta-analysis

Senqi Liu^{1,2,3}, Guanyu Wang^{1,2,3}, Wenqiang Li^{1,2,3}, Xi Su^{1,2,3}, Luxian Lv^{1,2,3}

1.Department of Psychiatry, Henan Mental Hospital, The Second Affiliated Hospital of Xinxiang Medical University, Xinxiang, China

2.Henan Key Lab of Biological Psychiatry, Xinxiang Medical University, Xinxiang, China

3.International Joint Research Laboratory for Psychiatry and Neuroscience of Henan, Xinxiang, China

Objective The pathophysiological mechanisms of schizophrenia are still unclear. Converging evidence suggests that energy metabolism abnormalities are in-

involved in schizophrenia, and support its role in the pathophysiology of this disease. Lactate plays an important role in energy metabolism. Many studies have reported changes in the levels of lactate in the brain and serum of schizophrenia patients; however, the results from these studies are not consistent. To overcome this limitation, the goal of the present meta-analysis is to analyze the changes in lactate levels in the brain and blood of schizophrenia patients.

Methods For this systematic review and meta-analysis, we performed a thorough search of relevant literature in the English language, using the MEDLINE, Cochrane, and Embase databases.

Results In the present meta-analysis, 20 studies were scrutinized, including 13 studies on brain lactate levels, which involved 322 schizophrenia patients and 324 healthy individuals as controls. 7 studies on blood lactate levels, involving 234 schizophrenia patients and 238 healthy individuals, were also included. Brain lactate levels were elevated in schizophrenia patients, both in vivo and in post-mortem studies. Nevertheless, blood lactate levels in schizophrenia patients have revealed no statistically significant difference, as compared with control individuals.

Conclusion In comparison with healthy individuals, schizophrenia patients had higher lactate levels in the brain, rather than in the blood. These findings suggest independent regulatory mechanisms of lactate levels in the brain and peripheral tissues. Abnormal lactate metabolism in the brain may be an important pathological mechanism in schizophrenia

关键词: Schizophrenia; lactate; energy metabolism

利培酮联合益生菌对首发精神分裂症患者治疗效果探讨

崔隽*

锡林郭勒盟安神医院

目的 分析对于首发精神分裂症患者通过合用利培酮及益生菌的治疗效果,评价益生菌在预防和

治疗精神分裂症中所起的治疗作用, 开辟益生菌作为食物常规食用预防精神疾病及其它相关疾病的新方法。

结果 治疗总有效率观察组为 97.30%, 对照组为 86.49%, $P < 0.05$; 施治前 PANSS、PSP 量表评分 2 组横向比较差异微小 $P > 0.05$, 施治后与对照组做横向对比 PANSS 量表评分为观察组较低, PSP 量表评分为观察组较高 $P < 0.05$; 药物不良反应率观察组为 2.70%, 对照组为 5.41%, $P > 0.05$ 。

结论 精神分裂症患者受病情影响可出现精神活动与所处现实环境相脱离的情况, 表现为情感、思维以及肢体行为等各个方面的异常障碍, 部分患者甚至可出现冲动、伤人以及自杀等行为。利培酮属于异恶唑衍生物, 能够实现对中枢神经系统和多巴胺的拮抗, 有助于促进多巴胺合成以及释放, 对于改善相关阴性症状有重要价值, 然而单一应用利培酮治疗部分患者的疗效仍然有限。近年来研究发现[3], 肠道微生物和人体大脑之间具有双向联系的关系, 通过脑-肠轴, 经由神经、内分泌系统等能够实现信息交流, 并且肠道内微生物也可对中枢神经系统产生一定的功能调节作用, 例如可对学习、记忆、情绪等相关认知功能产生影响。该益生菌配料有动物双歧杆菌乳亚种 V9、干酪乳酪杆菌 Zhang、植物乳植杆菌 P-8、长双歧杆菌婴儿亚种 B8762、乳酸菌类后生元 Probio-Eco 等, 应用益生菌能够对免疫系统产生优良的调节作用, 进而可改善肠道菌群, 进一步影响患者的大脑功能并促进患者的病情康复。本研究显示, 观察组的治疗总有效率明显高于对照组, 同时治疗后的社会功能量表评分改善情况好于对照组, 且两组的药物不良反应率均较低。表明, 利培酮与益生菌两者联合能够有效提升首发精神分裂症患者的整体疗效。对于首发精神分裂症患者合用利培酮以及益生菌治疗能够显著提升临床疗效, 并改善患者的社会功能, 且用药安全性良好。

关键词: 首发精神分裂症; 利培酮; 益生菌; 疗效

以治疗效果为导向的住院精神分裂症患者针灸治疗穴位配伍方案的改进研究

李鸿 康明秀 张国双*
天津市安定医院

目的 研究住院精神分裂症患者针灸治疗过程中的穴位配伍方案对治疗效果影响因素。在针灸治疗过程中依据患者体质及精神症状的变化, 改进穴位配伍方案, 并以疗效作为持续改进的依据, 从而达到提高治疗效果的目的是。

方法 回顾性分析了从 2020 年 3 月到 2023 年 12 月期间住院的 90 例精神分裂症患者, 其中 45 例患者在治疗过程中采用的是针灸联合利培酮进行治疗, 穴位依据常见的精神疾病治疗方案进行配伍, 初始治疗酌情考虑患者的具体情况进行方案微调。另外 45 名患者在治疗过程中是服用利培酮治疗, 针灸治疗过程中依据患者的病情或体质变化, 进行穴位配伍方案的持续改进。患者均以 PANSS 评分作为疗效的评价指标, 并且对结果从性别, 年龄, 出院情况三个方面来评估治疗的效果。

结果 针灸在辅助治疗住院精神分裂症患者效果明显, 通过对患者病情及体质的变化分析, 对穴位配伍方案进行改进, 治疗效果相对于单纯的针灸治疗具有一定程度的提高。在不同症状及性别, 年龄等方面, 患者在阳性症状和阴性症状的表现上存在差异。

结论 对精神分裂症患者实施针灸治疗, 具有确切的疗效。在治疗的过程中, 除考虑患者的精神症状外, 纳入更多的考量因素用以指导穴位配伍方案的改进, 能够在提高患者生存质量的前提下, 达到改善精神症状的效果。

家庭干预对社区精神分裂症患者康复的疗效

朱光¹ 牛娜¹ 刘丽娟² 肖春兰¹ 史泊海¹ 介勇¹

1.上海市虹口区精神卫生中心

2.海军军医大学卫生勤务学系

目的 探讨家庭干预对社区精神分裂症患者精神症状、社会关系、社交能力、服药依从性及疾病家庭负担的作用。

方法 本研究共纳入上海市虹口区 132 名门诊就诊社区康复的精神分裂症患者, 采用随机数字表法分为干预组与对照组, 对照组给与常规治疗及社区随访, 干预组在此基础上实施 1 年的家庭干预,

使用阳性与阴性症状量表、社会支持评定量表、药物依从性量表、社交回避及苦恼量表和疾病家庭负担量表分别评估其精神症状、社会关系、药物依从、社交情况及家庭负担。

结果 两组治疗前阳性与阴性症状量表、社会支持评定量表、药物依从性量表、社交回避及苦恼量表和疾病家庭负担量表评分差异均无统计学意义 ($P>0.05$)。两组治疗后阳性与阴性症状量表总分及各分量表分均较治疗前有下降,且两组间差异均有统计学意义 ($P<0.05$)。治疗后社会支持评定量表及药物依从性量表干预组得分升高、对照组得分降低,两组得分差异均有统计学意义 ($P<0.05$)。治疗后两组社交回避及苦恼量表和疾病家庭负担量表得分均降低,两组间差异均无统计学意义 ($P>0.05$)。

结论 家庭干预能够有效改善社区精神分裂症患者的精神症状、社会关系及服药依从性,对社交能力及疾病家庭负担无明显影响。

Suicidality, Perceived Chronic Stress, and Stress-induced Cortisol Changes Among Individuals with Schizophrenia.

殷怡 谭云龙*
北京回龙观医院

Objective High-level stress was related to suicide risk, but less is known about the associations of suicidal ideation or behavior with acute stress fluctuation and stress tolerance. The aim of this study was to determine whether high suicidality was correlated with perceived chronic stress and the cortisol fluctuations under stress tasks in schizophrenia.

Methods High suicidality was defined as a lifetime history of suicide attempts or suicidal ideation in the past two weeks. Individuals with schizophrenia and high suicidality (SZ-HS, $n = 59$), with low suicidality (SZ-LS, $n = 207$), and healthy controls (HC, $n = 196$) finished the Perceived Stress Scale. Then, they participated in an experiment that induced stress using the two cognitive tasks. Negative affect was measured at baseline and after finishing each task. The salivary cortisol

was collected before-, after 20 minutes, and after 40 minutes of the tasks.

Results SZ-HS had elevated perceived stress than SZ-LS and HC, but suicidality was not related to baseline cortisol level. Mixed effect models showed that stress tasks induced cortisol changes in all groups; cortisol of SZ-LS was reduced more than healthy controls, but SZ-HS and SZ-LS did not differ in cortisol fluctuations. SZ-HS and SZ-LS experienced similar negative affect changes during tasks and the difference in withdrawal rates was nonsignificant.

Conclusion Suicidality was correlated with high-level perceived stress but did not result in differences in cortisol levels and cortisol reactivities under stress tasks. It suggests the inconsistency between appraisal of stress and biological stress system disturbance among SZ-HS compared to SZ-LS

关键词: suicide, schizophrenia, stress, cortisol

男性精神分裂症亚型的结构磁共振分析

裴文志 张许来*
安徽省精神卫生中心

目的 精神分裂症有很多类型,本研究通过对精神分裂症患者结构磁共振结果的研究,用来识别偏执型与未分化型这两种亚型之间的差异。

方法 共纳入 55 例精神分裂症男性患者,其中偏执型组 33 例,未分化型组 22 例,采集所有患者的结构磁共振图像,使用 MRICron 软件将 3DT1WI 转换为 NIFIT 格式,使用相同版本 (5.3.0) 的 FreeSurfer 软件及 Ubuntu Linux (版本 3.2.0-29-generic) 来构建大脑皮层,根据 Desikan-Kiliany-Atlas, 每个大脑半球被划分为 34 个脑区域,并计算右、左两侧大脑半球的灰质体积、皮层表面积和皮层厚度。使用 SPSS16.0 软件进行统计分析,采用 logistic 回归构建预测模型,在控制整个脑容积和年龄后,使用一般线性模型比较两组之间的灰质体积、皮层表面积和皮层厚度,并采用了虚拟发现率 (FDR) 进行多重比较校正。

结果 偏执型精神分裂症患者的额中回上部灰质体积、颞下回折叠指数和扣带回峡部折叠指数均

大于未分化型精神分裂症患者，且差异均有统计学意义 ($P < 0.05$, FDR 校正)。使用 logistic 回归构建预测模型，模型的辨别能力为 0.798。

结论 利用患者的结构磁共振结果可以做到偏执型与未分化型在精神分裂症中的分类。

关键词：偏执型精神分裂症；未分化型精神分裂症；结构磁共振成像

深圳某区社区管理精神分裂症患者使用棕榈酸帕利哌酮注射液后脱落及其影响因素分析

刘成锋¹ 袁蛟连² 王卫云¹ 卢楚虹¹ 程娟¹ 卿利¹
徐英¹ 肖水源¹ 郭艳芳¹

1. 深圳市宝安区慢性病防治院
2. 深圳市龙岗区第三人民医院六约社区健康服务中心

目的 分析 2022 年 9 月 16 日至 2023 年 11 月 15 日深圳市某区社区管理精神分裂症患者棕榈酸帕利哌酮注射液 (PP-LAI) 脱落情况及影响因素。

方法 患者基本信息及管理信息来源于深圳市精神卫生防治管理系统，患者口服药及 PP-LAI 治疗信息来源于医院门诊诊疗系统，采用回顾性队列研究方法，使用 Kaplan-Meier 法拟合生存曲线，利用 Cox 比例风险回归模型分析脱落的影响因素。

结果 480 名精神分裂症患者先后使用 PP-LAI，患者年龄 (38.42 ± 10.68) 岁，男性占 51.46%，非深户籍占 84.79%，5 年以上病程 53.54%，注射前 1 年规律门诊 22.20% 注射后合并使用口服药 44.79%，有副反应患者占 16.67%，转为 PP3M 治疗的患者占 5.83%。68.33% 的社区患者维持 PP-LAI 治疗，脱落占 31.67%，30 天、90 天、180 天、360 天的维持治疗累积生存概率分别为 83.85%、75.54%、68.52%、60.04%。Cox 比例风险回归模型分析结果显示，进入 PP3M 治疗阶段的脱落风险是 PP1M 治疗阶段的 0.11(0.02-0.80) 倍，出现副反应的脱落风险是无副反应的 10.31(7.09-14.97) 倍，B、G 医院治疗的脱落风险分别是 A 医院的 3.78(1.05-13.63) 倍和 2.32(1.24-4.34) 倍，出现提前或超时注射的脱落风险分别是规律注射的 5.13(1.51-17.42) 倍和 2.33(1.55-3.52) 倍。

结论 治疗阶段、副反应、注射医院和注射时间规律性是 PP-LAI 脱落的主要影响因素，实施长效

针剂治疗时，加强医护人员培训、科学处置不良反应、及时进入 PP3M 治疗、做好注射患者跟踪，可以提高 PP-LAI 的规律治疗水平。

不同企业氨磺必利片转换前后患者疗效与安全性的比较

田露 马妍 毛伟腾
齐鲁制药有限公司

目的 研究不同企业氨磺必利片转换用药给患者带来的影响，以期对精神专科医院如何更加合理的执行国家集采政策，对精神科医生在给患者换药时采取什么样的态度及如何给患者解释，对企业是否需要改进现有的包装做参考。

方法 多中心、回顾性临床研究，在全国范围招募使用过两家企业氨磺必利片的患者，第一家企业氨磺必利用药 ≥ 4 周，第二家企业氨磺必利片用药 ≥ 2 周，用药剂量 50-1200mg，根据换药前后 BPRS 评分总分值变化判定疗效变化，安全性评估使用精神科常用副反应量表 (TESS)，采用使用第一家企业氨磺必利片最后一轮的评分及使用第二家企业的氨磺必利片两周的评分。

结果 全国共招募到 206 例患者，BPRS 评分两次观察的节点分别是：均值 58.5, 44 ($p < 0.05$)，中位数 59.5, 41，众数 63, 29、54、63。副反应量表 (TESS) 换药后无兴奋激越、情绪抑郁、失眠、嗜睡、出汗、头昏和头晕、食欲减退和厌食的人数占比更高，且换药前后失眠或食欲减退、厌食的变化差距更大。

结论 服用氨磺必利片疗效良好的患者换用第二家企业的氨磺必利片后，病情稳定且原有的不良反应能持续耐受。

CBT 研究协作组

CBT 联合 SSRI 药物治疗抑郁障碍的疗效与影响因素

侯淑君 李金阳 王纯*

南京医科大学附属脑科医院

目的 抑郁障碍是一类以显著且持久的抑郁症状群为主要特征的心境障碍，其中抑郁症是抑郁障碍的一种典型情况。抑郁障碍的治疗主要依赖于药物治疗、心理治疗和物理治疗等方式，然而在临床治疗中，单一治疗的疗效往往欠佳，尤其是在难治性抑郁障碍的症状改善方面。为了提高疗效，联合治疗的概念被提出，并在本世纪初引发了广泛的关注和研究。目前，CBT 与 SSRI 药物的联合治疗已有大量实证研究，且多数研究支持联合治疗较单一治疗更有优势，但对不同年龄段患者是否均有优势以及疗效的影响因素暂无定论。因此，本文对国内外近二十年已发表的文献进行筛选，对 CBT 联合 SSRI 药物治疗青少年、成人及老年抑郁障碍的疗效与影响因素进行讨论和综述。

方法 计算机检索中国知网数据库、万方数据库以及 PubMed 数据库，检索时限为 2003 年 1 月-2023 年 10 月，检索词包括一个诊断性关键词、至少一个药物治疗关键词以及至少一个心理治疗关键词。初步检索到相关文献 3101 篇，根据文献纳入与排除标准，经过查重、对标题、摘要和全文进行阅读后，最终纳入文献 42 篇，其中包括 36 篇 RCT、3 篇 Meta 分析和 3 篇综述。

结果 大多数研究支持 CBT 与 SSRI 药物的联合治疗较单一治疗在青少年、成人和老年抑郁障碍患者中更有优势，但也有不同结果。本文进一步分析发现，联合治疗的疗效在不同年龄段患者中有所差异，这与患者的抑郁程度、认知功能、文化水平、对治疗的反应性、治疗时长和结束时间等因素有关。此外，在已发表的研究中仍存在不足之处，CBT 与 SSRI 药物联合治疗抑郁障碍的神经机制研究较少，关于联合治疗的生物学证据需进一步探索。

结论 本文梳理了国内外近二十年有关 CBT 联合 SSRI 药物治疗抑郁障碍的相关研究，探讨了 CBT 与 SSRI 药物的联合治疗对青少年、成人及老年抑郁障碍患者的疗效及影响因素。从总体上看，

CBT 联合 SSRI 药物治疗比单纯 CBT 或药物治疗有优势，但这种优势在青少年、成人和老年抑郁障碍患者中受不同因素的影响而有所差异。在青少年中，联合治疗更适合具有共病、低绝望感和自杀意念的重性抑郁障碍患者，而不适合有 CBT 无反应史、接受过联合治疗的患者，其中 CBT 的次数不应小于 9 次，并在尽可能在暑假期间结束治疗。在成人中，联合治疗适用于轻度和轻中度抑郁障碍患者，而不适用于忧郁型抑郁障碍和产后抑郁障碍患者。在老年人中，70 岁以下具有正常认知功能和较高文化水平的老年人更能从联合治疗中获益。并且，联合治疗相比于单纯药物或心理治疗需要更多的资源也更加昂贵，因此，在临床实践中，应全面考虑患者的情况并根据患者的受益-负担平衡和偏好选择是否采取联合治疗方式。

关键词：抑郁障碍；认知行为疗法；选择性 5-羟色胺再摄取抑制剂；联合治疗

精神障碍的认知行为治疗现状与发展方向

李献云* 王绍礼

北京回龙观医院

目的 鉴于国内精神心理从业人员真正掌握认知行为治疗 (cognitive-behavioral therapy, CBT) 的人数并不多，且对 CBT 依然存在诸多误解，非常有必要面向国内同行开展连续性的 CBT 培训与督导，以有效提升从业人员的相关知识与技能，促进精神障碍患者的康复。展示 CBT 在精神障碍的临床实践与研究现状、发展方向，以供精神科同行参考。

方法 将 CBT 的文献复习与临床实践结合起来，系统阐述 CBT 在不同精神障碍中的应用情况。

结果 简要概述了精神病理学的认知模型，然后就共情理解与合作联盟、家庭作业、引导性发现、心理健康教育、其他治疗技术在 CBT 中的重要性做了说明，接着就包括抑郁症、焦虑障碍、强迫症、创伤后应激障碍、失眠、进食障碍、物质成瘾障碍、双相障碍、精神分裂症和人格障碍在内的不同精神障碍的 CBT 的理论、临床实践与研究结果进行了综述，指出了目前 CBT 研究的局限性，最后结合自助认知行为治疗 (书籍、计算机化、手机化和网络化 CBT) 简要展望了未来 CBT 的发展方向，即人工智能 CBT

的美好方向。

结论 越来越多的研究证实了 CBT 的疗效,历经七十多年的临床实践证实了 CBT 在精神科领域的风采与价值,国内同行需要在临床上弥补这一短板。

强迫障碍共病抽动秽语综合征 1 例

刘晓娜 张萍*
河北省精神卫生中心

目的 强迫障碍是一种慢性精神疾病,以强迫思维和强迫行为特征。抽动秽语综合征是一种慢性神经精神障碍,多起病于儿童时期,主要表现为不自主地多种运动和发声抽动。有研究表明,约 20% 的强迫障碍患者存在不自主抽动的症状。本文报道了 1 例强迫障碍共病抽动秽语综合征的诊疗案例,通过采用药物治疗(舍曲林 150 mg 早、阿立哌唑口服液 15 ml 晚),习惯逆转训练及重复经颅磁刺激治疗,使得患者强迫症状及抽动症状明显减少,社会功能较前恢复。为强迫障碍共病抽动秽语综合征的治疗提供参考。

方法 患者,男性,17 岁,因“反复想事情 3 年,肢体不自主抽动 1 年,加重 2 个月”入院。3 年前患者逐渐出现控制不住的想事情,1 年前间断出现不自主肢体抽动,拳打脚踢伴口中谩骂。曾就诊外院 1,诊断为强迫障碍,给予氟伏沙明 50 mg 早、150 mg 晚,后就诊外院 2,诊断抽动障碍,给予丙戊酸镁缓释片 0.5 g 早晚、氟哌啶醇 4 mg 晚、喹硫平 50 mg 晚、氯氮平 25 mg 晚,后减停氟哌啶醇、喹硫平、氯氮平,换用利培酮 2 mg 早、4 mg 晚,奥氮平 10 mg 早、晚治疗,效果不佳。2 个月前病情加重,不愿出门,时发脾气、想打人。为求治疗,来本院住院。

结果 依据 ICD-10 的诊断标准,诊断为强迫障碍、抽动秽语综合征。采用药物治疗(舍曲林 150 mg 早、阿立哌唑口服液 15 ml 晚),习惯逆转训练及重复经颅磁刺激治疗。患者住院治疗 4 周症状好转出院,强迫症状及抽动症状减轻,情绪稳定。患者出院后于门诊随访 6 个月,强迫症状及抽动症状明显减

少,社会功能恢复。

结论 药物治疗、心理治疗结合物理治疗,是改善强迫障碍共病抽动秽语综合征的有效方式,可获得较好的治疗效果。

关键词: 抽动秽语综合征,强迫障碍,儿童青少年,共病

1 例适应障碍产妇“问题管理加”干预的个案报告

余慧慧 龙鲸*
天津市安定医院

目的 本文介绍了对 1 例适应障碍产妇进行“问题管理加”(Problem Management Plus,简称 PM+)干预的整个治疗过程,并讨论了 PM+干预在此案例中的治疗效果,为 PM+干预技术在提升产妇群体心理健康水平方面提供循证证据。

方法 采用 PM+干预,进行 6 次面对面个体咨询,包括首次评估会谈与 5 次治疗会谈。每周 1 次,每次 90 分钟。在评估会谈中,治疗师确定患者问题在于 5 月前个案经历生产、感染流感(自己与家人)、月子中心拒收等应激源后,产生情绪困扰、家庭冲突以及社会功能受损等症状,同时治疗师从情绪水平、问题严重程度及对社会功能和健康影响、活动功能和社会支持对患者进行综合评估,并与患者签署知情同意后,确定采用 PM+干预方案进行治疗。治疗前后采用 PSYCHLOPS 量表、活动功能量表(WHODAS)、病人健康问卷抑郁症状群量表(Patient Health Questionnaire 9-Item PHQ-9)、广泛性焦虑量表(7-item Generalized Anxiety Disorder Scale,GAD-7)、领悟社会支持量表(Perceived Social Support Scale,PSSS)评估 PM+治疗效果。

结果 治疗结束后患者的 GAD-7 得分由 6 分降至 4 分,PHQ-9 得分由 11 分降至 3 分;PSYCHLOPS 得分从 20 分逐渐降至 5 分;WHODAS 量表得分从 20 分降至 17 分;PASS 量表得分由 58 提高至 69 分。

结论 妊娠分娩作为重大应激事件,容易使女性出现焦虑、抑郁、睡眠、疲乏等问题,孕产期全面心理健康促进(GMHP)理念在《健康中国行动(2019-2030 年)》中提出,心理健康保健成为孕产

期女性健康保健的重要一环。而目前针对孕妇心理健康问题的有效的干预模式研究较少,这是中国目前亟待解决的重要卫生问题。

PM+问题管理加(PM+),是一项基于认知行为疗法(CBT)和人际关系治疗(IPT)理论短程跨诊断的心理干预技术,它具有结构清晰、操作性强等优势,它主要适用于逆境下成人。在本案例中,PM+的减压、问题管理、行为激活、获得支持四大策略可有效帮助适应障碍产妇降低抑郁焦虑水平,恢复社会功能,改善人际关系,提升社会支持水平。PM+干预技术对适应障碍产妇的心理治疗有着重要指导意义。

关键词: 问题管理家,产妇,适应障碍,个案研究

重复经颅磁刺激对青少年抑郁障碍快感缺失的治疗

张杨骏 赵丁 林涌超 纪家武*
福州市神经精神病防治院

目的 随着青少年抑郁障碍的发病率逐年攀升,目前精神科收治的抑郁障碍患者年龄结构开始偏向于青少年为主,因青少年患者年龄小,其在用药安全性和有效性上均存在争议。重复经颅磁刺激治疗具有无创、安全、操作简便和不良反应小的优点,因此非药物治疗--重复经颅磁刺激治疗为临床治疗青少年抑郁障碍带来了新的方向。流行病学调查显示快感缺失为青少年抑郁障碍的主要核心症状之一,探讨重复经颅磁治疗对青少年抑郁障碍社会快感缺失的疗效评价,对于临床上制定青少年抑郁障碍的治疗方案具有重要的理论基础和指导意义。

方法 重复经颅磁刺激治疗(repetitive transcranial magnetic stimulation, rTMS)是运用磁场脉冲所诱发一定强度的感应电流,使治疗脑区的神经细胞去极化以达到双向调节兴奋与抑制之间的关系,具有无创、安全、操作简便和不良反应小的优点。rTMS治疗青少年抑郁障碍快感缺失的方案为10Hz,左侧额叶背外侧。快感缺失作为抑郁症的主要症状之一,使用快乐面孔识别任务探讨 rTMS 治疗快感缺失的疗效。

结果 经过10Hz,左侧额叶背外侧 rTMS 治疗,快感缺失患者提高了面孔识别任务中的正确率以及

反应时间,减少了快感缺失量表分,提示左侧额叶背外侧 rTMS 可以改善抑郁症患者的快感缺失症状及对现实生活中积极情绪线索识别的能力。

结论 目前 rTMS 治疗青少年抑郁障碍快感缺失的治疗方案尚处于初始阶段,刺激靶点、刺激强度、刺激模式和治疗周期等尚无明确指南,根据目前的文献资料,本研究采用10Hz,左侧额叶背外侧 rTMS 治疗方案,以20次为一个疗程,治疗青少年抑郁障碍快感缺失。研究证实, rTMS 能够有效降低青少年的抑郁症状,对于快感缺失情况同样有效果。

关键词: 重复经颅磁刺激,青少年,抑郁障碍,快感缺失,左侧额叶背外侧

阿立哌唑与利培酮治疗女性精神分裂症患者的认知功能及泌乳素水平疗效对比

张杨骏 赵丁 林涌超 纪家武*
福州市神经精神病防治院

目的 传统抗精神病药物存在闭经、泌乳及发胖等不良反应,相比男性患者,对女性患者的影响更大,这也是影响患者服药依从性的主要原因。本研究就阿立哌唑与利培酮治疗女性精神分裂症患者的疗效评估及对女性激素水平,以及事件相关电位P300的影响进行对比研究,从而更加个体化、合理性的指导临床用药。

方法 将2022年7月-2023年7月福建省福州神经精神病防治院符合入组条件的85例女性精神分裂症住院患者随机分成2组,分别给予阿立哌唑(42例)和利培酮(43例)治疗。分析对比两组的一般资料,以及两组在治疗前、治疗8周后阳性与阴性症状量表(Positive and Negative Syndrome Scale, PANSS)评分、P300成分、血清催乳素水平对比。

结果 阿立哌唑组和利培酮组其一般资料无显著差异($P>0.05$);两组 PANSS 量表总评分在治疗前未见显著差异($P>0.05$),治疗后 PANSS 量表总评分较治疗前均有降低($P<0.05$);阿立哌唑组和利培酮组其 P300 潜伏期较治疗前未见显著性差异($P>0.05$),但 P300 波幅治疗后较治疗前明显增高($P<0.05$);阿立哌唑组的泌乳素水平在治疗前后未见显著差异($P>0.05$),而利培酮组的泌乳素水平有所升

高 ($P < 0.05$)。

结论 阿立哌唑和利培酮作为疗效好的临床抗精神病药物,能够有效且快速的控制临床精神症状(阴性症状和阳性症状),改善认知功能,有利于精神分裂症患者预后恢复,具有安全性,且不良反应均较小,患者易于接受,服药依从性较好。此外,阿立哌唑和利培酮相比,基本不引起泌乳、月经紊乱、闭经等现象,更适合推荐女性患者服用。

关键词: 精神分裂症,女性,阿立哌唑,利培酮,P300成分,催乳素水平

首发精神障碍青少年患者父母心理社会轨迹探究

胡海霞*

九江市第五人民医院

目的 探索首发精神障碍青少年患者父母心理社会轨迹,为针对性干预提供参考

方法 对 42 例首发精神障碍青少年患者的 43 名父母,采用一般资料调查表、应付方式问卷、SCL-90 问卷于确诊 2 周内进行调查,于 6 个月,12 个月再用 SCL-90 问卷调查;于上述 3 个时间段对患者父母进行半结构化访谈,归的分析其心理社会轨迹

结果 父母 3 个时间段 SCL-90 得分呈下降趋势,差异有统计学意义($P < 0.05$);依据应付方式得分分为速避自责组(22 人)与非退避自责组(21 人),两组 SCL-90 得分比较,第 6 个月及时间效应有统计学意义(均 $P < 0.05$)。访谈资料呈现心理弹性、心理恢复、心理痛苦 3 种心理社会轨迹。弹性轨迹:非退避自责组 21 名父母,他们最初对孩子患病事实难以接受,互相责怪,通过学习和自我调整,在较短的时间内平衡了孩子疾病和生活之间的关系,这一轨迹随着时间推移保持平稳。2.痛苦轨迹:退避自责组后期访谈负反馈型结果 7 名父母,他们长时间拒绝接受现实,被迫求医,情绪崩溃,担忧疗效,害怕熟人知道,影响孩子前途。虽然他们为患者付出了努力,但 12 个月过去,仍持续处于痛苦和焦虑的状态。3.恢复轨迹:退避自责组后期访谈正反馈型结果 15 名父母,他们最初否认、愤怒;接受病情后,愧疚自责;治疗过程,焦虑痛苦、寝食难安,虽信任医生,又忧虑疗效;后 6 个月在家人和社会帮助下,通过

采取积极应对措施,改善了患者和自己的境况,工作基本恢复,虽忧虑孩子前途,但对孩子疾病治疗持积极态度

结论 首发精神障碍青少年患者父母早期心理社会轨迹呈 3 种不同形式,大部分父母心理健康水平随患者病情好转而逐渐恢复,少部分父母心理痛苦持续存在。医护人员应同步对患者父母实施针对性干预,以提高其心理健康水平。

社区居民的抑郁症认知状况及影响因素调查

汤秀成¹ 周建松²

1.九江市第五人民医院

2.中南大学湘雅二医院精神卫生研究所,国家精神心理疾病临床研究中心,精神疾病诊疗技术工程实验室,湖南省精神病学与精神卫生重点实验室

目的 了解现阶段社区居民对抑郁症在识别、归因、救助方式及对抑郁症患者态度等方面的信息及影响因素,以制定有效的健康教育计划和策略,提高居民对抑郁症的认知水平。

方法 于 2022 年 9 至 11 月采用方便抽样、通过问卷星平台,调查区域划分参照《中华人民共和国国民经济和社会发展第十三个五年规划纲要》四大经济区域的划分方法分别在东部、中部、西部及东北具有代表性的城市选取 18 岁及以上的常住居民共 1171 名进行问卷调查,调查问卷包括自编的社会人口学资料问卷和抑郁症案例问卷两部分;采用 SPSS 25.0 统计软件分析,一般人口学资料如性别、年龄等采用频数、构成比等统计描述,两组调查对象量表评分的比较采用两独立样本 t 检验分析,若方差不齐则改用校正 t 检验,3 组或 3 组以上调查对象量表评分的比较采用单因素方差分析。

结果 1171 份问卷中 1104 份有效,58%的居民能够正确识别抑郁症,64%的居民认为工作压力太大是抑郁症首要因素,“找人做心理咨询”(37%)是居民建议的首位求助方式,不到一半(45%)居民认为抑郁症患者具有是非判断能力,64%居民认为抑郁症患者治疗后能继续工作;过半(52%)居民认为抑郁症患者对他人造成伤害的可能性会增加。

结论 居民对抑郁症识别、归因、救助方式仍有不足,同时也存在公众对抑郁症的污名化现象,需要采取对特定人群的抑郁知识宣教,以提高社区居民的心理健康素养。

关键词:社区居民;抑郁症;态度

Comparison of Mental Health Networks Across Different Educational Stages

Siru Wang Bo Xiang*

Affiliated Hospital of Southwest Medical University

Objective Mental health concerns are growing more prevalent among students of school age. This study employed network analysis to view mental health problems as a network of interconnected symptoms. It aimed to identify central symptoms and connections between mental health symptoms, and to compare how these networks vary across different stages of school age

Methods In this study, a sum of 60,465 Chinese students in Grades 4 through 12 were selected to participate in the Middle School Student Mental Health Inventory. The mental health network and bridge centrality were assessed through network analysis. Network comparison tests were performed to compare the networks among elementary, junior high, and senior high school students

Results The findings indicated that anxiety emerged consistently as a central symptom of mental health issues across all educational levels. Furthermore, distinctive central symptoms were observed at each stage: paranoid ideation was prevalent in both junior and senior high school, whereas emotional disturbance was particularly characteristic of elementary school. Upon comparing the network structures at different educational stages, substantial differences were observed among the three network structures. A comparison of global strength revealed that the mental health network connectivity was more pronounced among senior high school students, indicating closer associations between symptoms in this group

Conclusion Identifying core symptoms and their unique connections, especially the strong links between symptoms in older high school students, and understanding these unique characteristics at each stage is crucial for creating successful mental health symptom prevention and intervention strategies for students in educational settings

关键词: Mental health, School-aged students, Network analysis

精神分裂症脑白质结构与功能耦合的异常

齐佳乐 李平* 李成冲 秦晓青 杨旭 丁志鹏 李善聪 秦玮琪 魏思懿 尚婷惠子 陈云辉 于增艳 李彤 齐齐哈尔医学院

目的 探讨精神分裂症患者脑白质结构网络和静息态功能网络的异常以及结构和功能网络耦合的差异。

方法 收集2019年4月到2020年12月就诊于齐齐哈尔医学院附属第四医院的共59例精神分裂症患者,其中35例作为原始数据集进行研究比较,24例作为独立验证集用以验证我们实验结果,同期招募了39例健康对照(HC)并对所有人进行弥散张量成像(diffusion tensor imaging, DTI)和静息态功能磁共振成像(resting-state functional magnetic resonance imaging, rs-fMRI)扫描。采用基于图论分析的方法,探讨精神分裂症患者脑白质结构网络和静息态功能网络节点连接属性的变化,及其与精神分裂症症状之间的关系;同时进一步探讨精神分裂症患者结构-功能耦合的异常表现;再结合SVM方法探讨脑区的异常变化是否可以用于精神分裂症的识别。

结果 与对照组相比,患者组在右侧梭状回、双侧尾状核、左侧丘脑、右侧颞极:颞中回的节点属性值在结构和功能脑网络中都存在异常改变;全局指标两组差异无统计学意义($P > 0.05$, FDR校正);在功能网络中,患者组左侧枕下回节点中心度值与PANSS量表总分呈负相关,左侧丘脑的节点中心度值与PANSS量表总分呈正相关(Bonferroni校正, $P < 0.025$);与对照组相比,患者组在右侧回直肌和左缘上回的结构-功能耦合呈现显著增加($P < 0.05$,

FDR 校正); 结构网络中降低的右侧回直肌的节点聚类系数和节点局部效率值的受试者操作特征曲线的曲线下面积为 0.845, 准确度为 81.08%, 敏感度为 100%, 特异度为 71.43%。

结论 精神分裂症患者的白质结构网络和静息态功能网络存在共有的改变; 右侧回直肌和左缘上回结构-功能耦合增加可能对于精神分裂症的识别有提示作用。

Abnormal Structure and Function of White Matter in Obsessive-compulsive Disorder

Xu Yang¹, Zhipeng Ding¹, Xiaoqing Qin¹, Jiale Qi¹, Shancong Li², Weiqi Qin², Siyi Wei², Ping Li²

1. Medical Technology Department, Qiqihar Medical University, Qiqihar, Heilongjiang 161006, China.

2. Department of Psychiatry, Qiqihar Medical University, Qiqihar, Heilongjiang 161006, China.

Objective Abnormal structure and function of gray matter (GM) have been discovered in the cortico-striatal-thalamic-cortical (CSTC) circuit in obsessive-compulsive disorder (OCD). The GM structure and function may be influenced by the structure and function of the white matter (WM). Therefore, it is crucial to explore the characteristics of WM in OCD

Methods Diffusion tensor imaging and resting-state functional magnetic resonance imaging data of 52 patients with OCD and 39 healthy controls (HCs) were collected. The tract-based spatial statistics, amplitude of low-frequency fluctuations (ALFF), and structural-functional coupling approaches were utilized to explore the WM structure and function. Furthermore, the relationship between the abnormal WM structure and function and clinical symptoms of OCD was investigated using Pearson's correlation. Support vector machine was performed to evaluate whether patients with OCD could be identified with the changed WM structure and function

Results Compared to HCs, the lower fractional

anisotropy (FA) values of four clusters including the superior corona radiata, anterior corona radiata, right superior longitudinal fasciculus, corpus callosum, left posterior corona radiata, fornix, and the right anterior limb of internal capsule, reduced ALFF/FA ratio in the left anterior thalamic radiation (ATR), and the decreased functional connectivity between the left ATR and the left dorsal lateral prefrontal cortex within CSTC circuit at rest were observed in OCD. The decreased ALFF/FA ratio in the left ATR negatively correlated with Yale-Brown Obsessive-Compulsive Scale obsessive thinking scores and Hamilton Anxiety Rating Scale scores in OCD. Furthermore, the features that combined the abnormal WM structure and function performed best in distinguishing OCD from HCs with the appropriate accuracy (0.80), sensitivity (0.82), as well as specificity (0.80)

Conclusion Current research discovered changed WM structure and function in OCD. Furthermore, abnormal WM structural-functional coupling may lead to aberrant GM connectivity within the CSTC circuit at rest in OCD

Causality of Genetically Determined Serum Metabolites on Emotional Lability: A Two-sample Mendelian Randomization Study

Zhen Xiao¹, Zhen Xiao³, Jieyi Xu¹, Chun Wang¹, Chun Wang²

1. Nanjing Brain Hospital Affiliated to Nanjing Medical University

2. Cognitive Behavioral Therapy Institute of Nanjing Medical University, Nanjing, China

3. Taizhou Fifth People's Hospital

Objective Emotional lability, a transdiagnostic feature characterized by rapid emotional shifts, contributes significantly to functional impairment across psy-

chiatric disorders, including depression, bipolar disorder, and schizophrenia. Despite its clinical relevance, the etiology remains poorly understood, hindering effective screening and interventions. Growing evidence suggests metabolic alterations may play a crucial role in psychiatric disorder pathophysiology

Methods A comprehensive Mendelian randomization (MR) design integrated summary-level data from large genome-wide association studies on serum metabolites (8,299 European participants) and emotional lability (3,268 European samples) to investigate causal associations between genetically determined metabolite levels and emotional lability. Instrumental variable assumptions, heterogeneity, horizontal pleiotropy, directionality, and sensitivity analyses were evaluated

Results Of 1,400 metabolites and ratios analyzed, 30 metabolites showed causal associations with increased emotional lability risk based on the inverse-variance weighted method. Sensitivity analyses identified three potential causal metabolites: hydrocinnamate (OR: 1.277, CI: 1.071-1.522, $P=6.3e-03$) associated with increased risk, while glycolithocholate (OR: 0.779, CI: 0.667-0.911, $P=1.7e-03$) and 3β -hydroxy-5-choleonic acid (OR: 0.857, CI: 0.756-0.971, $P=1.5e-02$) associated with decreased risk

Conclusion This MR study supports a causal link between hydrocinnamate, glycolithocholate, and 3β -hydroxy-5-choleonic acid levels and emotional lability incidence, providing potential metabolic biomarkers and therapeutic targets for emotional dysregulation in psychiatric disorders

关键词: Emotional lability, Mendelian randomization, Serum metabolite

童年情感虐待对青少年心境障碍患者非自杀性自伤行为的影响: 有调节的中介模型

汪莲籽² 查桂芳² 李占江¹ 罗佳¹

1.首都医科大学附属北京安定医院

2.首都医科大学附属北京安定医院芜湖医院

目的 探讨青少年心境障碍患者非自杀性自伤

的影响因素,并且了解童年创伤经历与NSSI的关系

方法 采用方便取样法,使用青少年自我伤害行为问卷、儿童期虐待问卷、多伦多述情障碍量表及贝克自杀意念量表对242名青少年情绪障碍患者进行调查,采用逐步回归分析探讨NSSI行为与各变量间的关系,最后采用Hayes-Process插件检验各模型的中介效应和调节效应。

结果 本研究中NSSI的检出率为81.40%(197例),被霸凌经历($\beta=0.19, P=0.001$)、童年情感虐待($\beta=0.25, P<0.001$)、情绪表达困难($\beta=0.25, P<0.001$)与青少年NSSI严重程度呈正相关,年龄($\beta=-0.12, P=0.046$)与NSSI严重程度呈负相关。情绪表达困难在童年情感虐待与NSSI之间起中介效应,中介作用大小为0.25,95%可信区间为(0.02~0.10),占总效应21%。该中介作用受到被霸凌经历的调节,NSSI严重程度与情绪表达困难和被霸凌的交互项正向关联($\beta=3.23, P<0.001$),调节中介指数为0.48,Bootstrap检验95%CI为0.08~1.14

结论 青少年心境障碍患者童年情感虐待既可以直接作用于也可通过情绪表达困难间接作用于NSSI,被霸凌经历调节了NSSI与情绪表达困难的关系。

关键词: 非自杀性自伤行为,青少年心境障碍,童年情感虐待,情绪表达困难

伴睡眠障碍首发抑郁症患者心率变异性与CRP、IL-6、TNF- α 相关性分析

阿力米热·阿力木 张义*

新疆医科大学研究生院,新疆维吾尔自治区人民医院

目的 本文研究并探讨伴睡眠障碍首发抑郁症患者24小时动态心电图心率变异性与C-反应蛋白、白细胞介素-6、肿瘤坏死因子- α 相关性分析。

方法 本文拟采用横断面设计,选取2023年12月到2024年4月期间于新疆维吾尔自治区人民医院临床心理科门诊和住院就诊的首发抑郁症患者,将伴睡眠障碍首发抑郁症患者、不伴睡眠障碍的首发抑郁症患者作为研究对象,通过收集受试者外周血液炎症标志物C-反应蛋白、白细胞介素-6、肿瘤坏死因子- α ,并检测受试者24小时动态心电图分析

心率变异性参数 SDNN 以及 RMSSD 指标, 使用适当的统计分析方法, 得出这些指标之间的相关性分析结果, 探讨可能机制和相互影响关系。

结果 研究发现, 伴睡眠障碍的首发抑郁症患者的心率变异性 SDNN 以及 RMSSD 指标明显降低。同时, 这些患者的血清 C-反应蛋白、白细胞介素-6 和肿瘤坏死因子- α 水平也呈现升高的趋势。进一步的相关性分析显示, 伴睡眠障碍首发抑郁症患者的心率变异性 SDNN 以及 RMSSD 指标与血清 C-反应蛋白、白细胞介素-6 和肿瘤坏死因子- α 水平炎症标志物的水平呈负相关关系

结论 伴睡眠障碍首发抑郁症患者的心率变异性与 C-反应蛋白、白细胞介素-6、肿瘤坏死因子- α 存在相关性。

关键词: 抑郁症; 睡眠障碍; 炎症标志物; 心率变异性; 相关性分析

伴非自杀性自伤精神障碍患者静息态功能磁共振成像研究

黄蓓蓓 王纯*

南京医科大学附属脑科医院

目的 探讨伴非自杀性自伤 (non-suicidal self-injury, NSSI) 的精神障碍患者静息态下功能磁共振成像特征。

方法 选取 2019 年 10 月至 2022 年 12 月在全国范围内不同地区的 12 家医院精神科和医学心理科门诊中, 入组伴发 NSSI 的精神障碍患者 149 例, 其中符合 NSSI 诊断(NSSI-Disorder)的患者 83 例, 不符合 NSSI 诊断 (NSSI-Behavior) 的患者 66 例, 并通过广告招募了 63 名年龄、性别、受教育程度与患者组相匹配的健康对照组。核磁共振扫描采用德国西门子公司最新型号的超高场 Verio MRI 机 (磁场强度 3.0T, 梯度场强 45mT, 切换率 150mT), 进行静息态功能磁共振成像 (rs-fMRI) 数据采集。计算低频振幅 (amplitude of low frequency fluctuation, ALFF) 和区域一致性 (regional homogeneity, ReHo) 等脑影像学指标, 研究大脑局部自发活动的特征, 在确定异常脑区后, 进行功能连接 (Functional connectivity, FC) 分析。

结果 与健康对照组比较, NSSI-Behavior 组和

NSSI-Disorder 组患者 ALFF 值增高的脑区是右侧内侧额上回, 降低的脑区是左侧楔前叶, ReHo 值增高的脑区是右侧额下回三角部, 并且在右侧额下回内部 FC 值显著增强, 差异有统计学意义 (P 均 <0.01 , Alphasim 矫正)。与 NSSI-Behavior 组相比, NSSI-Disorder 组患者 ALFF 值增高的脑区为右侧内侧额上回, 差异有统计学意义 (P <0.01 , Alphasim 矫正)。

结论 伴 NSSI 的精神障碍患者在静息态下表现出多个脑区的神经元异常活动, 主要包括右侧内侧额上回、左侧楔前叶和右侧额下回。此外, 内侧额上回在区分 NSSI-Behavior 和 NSSI-Disorder 患者方面具有较高的敏感度和特异度。

关键词: 精神障碍 非自杀性自伤 低频振幅 区域一致性 功能连接

精神障碍患者非自杀性自伤的危险因素分析

黄蓓蓓 王纯*

南京医科大学附属脑科医院

目的 探讨伴发 NSSI 的精神障碍患者在人格障碍、正念觉知、述情障碍、童年创伤及父母教养方式等表现出的心理特征及危险因素。

方法 在全国范围内不同地区的 12 家医院精神科和医学心理科门诊中, 入组伴发 NSSI 的精神障碍患者 275 例, 其中符合 NSSI 诊断(NSSI-Disorder) 的患者 162 例, 不符合 NSSI 诊断 (NSSI-Behavior) 的患者 113 例, 采用自编一般人口学资料问卷、简易自杀行为问卷、汉密尔顿抑郁量表、边缘症状清单缩减版、人格障碍诊断问卷、正念注意觉知量表、述情障碍量表、童年创伤问卷、父母教养方式量表对两组被试进行调查。采用 Logistic 回归分析导致 NSSI 行为的危险因素。

结果 NSSI-Disorder 组与 NSSI-Behavior 组在年龄、性别、教育背景、户籍所在地等人口学资料方面, 未表现出统计学差异; 相较于 NSSI-Behavior 组, NSSI-Disorder 组患者在边缘症状清单、人格障碍问卷的偏执型、分裂样、反社会型及回避型人格障碍评分、多伦多述情障碍量表中识别情感与躯体感受能力不足的评分、童年创伤量表的情感虐待、情感及躯体忽视评分和量表总分, 以及父亲惩罚严厉和

父母过分干涉的教养方式评分,均呈现出显著升高。而在正念注意觉知量表、多伦多述情障碍量表的少幻想维度和情感温暖理解的父母教养方式评分方面,则呈现出显著降低。运用 backward 算法进行二元 logistic 回归分析,分裂样人格障碍 OR 值为 1.221 (95%CI: 1.045~1.427),多伦多述情障碍中少幻想维度 OR 值为 0.917 (95%CI: 0.858~0.980),父亲情感温暖理解的教养方式 OR 值为 0.976 (95%CI: 0.955~0.998)。

结论 NSSI-Disorder 组的患者表现出显著的人格改变,特别在边缘型、偏执型、分裂样、反社会型和回避型人格障碍中,NSSI 出现的频率更高,症状表现更明显;在正念觉知方面,患者对当下的注意和觉知水平低,并且缺乏有效的情绪调节方法;在述情障碍方面,患者对情感与躯体感受的认识和区分能力不足,想象力增加;在童年创伤方面,患者在幼年时期经历更多的情感虐待、情感忽视与躯体忽视;在父母教养方式方面,患者缺少了父母温暖理解的教育方式,更多地经历了父亲严厉惩罚和父母过度干涉的教育方式。其中,分裂样人格障碍与 NSSI 发生的严重程度呈正相关,是精神障碍患者伴发 NSSI 的独立危险因素;少幻想和父亲情感温暖理解的教养方式与 NSSI 发生的严重程度呈负相关,是精神障碍患者伴发 NSSI 的保护因素。

非侵入性神经调控治疗广泛性焦虑障碍的临床研究进展

王纪帆¹ 王纪帆² 王纯¹ 王纯² 陈永军²

1.南京师范大学

2.南京脑科医院

背景 焦虑障碍是我国发病率最高的精神疾病之一,而广泛性焦虑障碍又是其最常见的亚型。安全、有效、起效快的非侵入性神经调控技术成为广泛性焦虑障碍的研究热点,目前已经有不少研究结果证明其治疗广泛性焦虑障碍有效,但在刺激靶点、参数设置等选择上存在争议。

目的 本文将述评近年来非侵入性神经调控技术在广泛性焦虑障碍治疗中的研究进展,提供最佳刺激靶点、参数和治疗方案的参考,以期为非侵入

性神经调控技术的临床实践提供新思路。

方法 在 PubMed、Web of science、中国知网、维普中文科技期刊数据库和万方数据库中检索文献,英文数据库以“anxiety disorders”、“generalized anxiety disorder”、“Non-invasive”、“neuromodulation”、“repetitive transcranial magnetic stimulation”、“transcranial direct current stimulation”、“transcranial alternating current stimulation”、“theta-burst stimulation”为检索词;中文数据库以“焦虑障碍”、“焦虑症”、“广泛性焦虑障碍”、“非侵入性”、“神经调控”、“重复经颅磁刺激”、“经颅直流电刺激”、“经颅交流电刺激”、“θ 波爆发刺激”为检索词,检索时限为建库至 2024 年 4 月,发表语言限定中文或英文。文献类型既包括系统综述,也包括临床研究,以随机对照试验为主。

结果 重复经颅磁刺激与经颅直流电刺激对广泛性焦虑障碍患者的治疗具有巨大的潜力,临床常用 DLPFC 作为刺激靶点,探索发现 OFC 可能是一个新兴靶点。对于重复经颅磁刺激,临床常用低频 ($\leq 1\text{Hz}$) 干预患者右侧 DLPFC 作为参考,干预 20~30 次为宜;对于经颅直流电刺激,高强度足疗程 (2mA, 20 分钟,每天 2 次,间隔 20 分钟,连续 5 天) 的刺激参数可能具有更明显的改善效果,此外,与药物、心理相结合的联合治疗方式临床疗效可能更好。

结论 非侵入性神经调控对广泛性焦虑障碍神经机制和治疗方案的研究和应用存在挑战与机遇,有望成为治疗广泛性焦虑障碍的有效手段。

关键词:非侵入性神经调控;广泛性焦虑障碍;重复经颅磁刺激;经颅直流电刺激

自我伤害行为的动物模型综述

许捷宜 王纯* 肖斟

南京医科大学附属脑科医院

目的 非自杀性自伤 (Non-Suicidal Self-Injury, NSSI) 行为在青少年和成年早期人群中的发生率呈上升趋势,严重影响身心健康。目前对 NSSI 行为发生因素的研究多集中于社会心理方面,也有一些人类研究发现 NSSI 行为与生物学因素有关,但深入的生物学机制研究较少。动物模型为研究人类 NSSI 提

供了一种替代方法。人们可以在实验条件下直接观察到动物自伤的频率和严重程度，也能够通过药物或环境刺激来对动物自伤行为进行控制，因此自伤动物模型为研究人类 NSSI 的生物学机制提供了更多的可能性。本文通过对不同的自我伤害行为 (Self-Injury Behavior, SIB) 动物模型研究现状的总结分析，探讨 SIB 动物模型在人类 NSSI 行为研究中的适用性。

方法 本文检索了 2003 年至 2023 年在 PubMed、Web of Science、中国知网等公开发表的文献，检索的英文关键词为 Non-suicidal self-injury behavior、Self-injury behavior、Animal models、Animal experiments、Rats、Mice、Monkeys 等，检索的中文关键词为非自杀性自伤行为、自我伤害行为、动物模型等，总结了现有的几种 SIB 动物模型，包括鼠、猴和水貂，对不同模型的特点、原理、优势与劣势进行整理和评价。

结果 目前关于 SIB 动物模型多集中在啮齿动物和恒河猴，其中又以鼠模型居多，SIB 鼠模型主要通过药物诱导来构建，而猴模型、水貂模型主要是环境因素导致自发形成的。

结论 这些 SIB 动物模型研究能够提供更多的 SIB 相关神经生物学信息、鉴定 SIB 的生理机制和行为的相关性以及开发新的治疗方式等，有助于进一步探讨人类 NSSI 的生物学机制，并可能显著提高对 NSSI 病因学、现象学和临床治疗的认识，为开展动物研究及进一步优化和发展 SIB 动物模型提供思路。

青少年心境障碍伴非自杀性自伤行为患者自我病耻感的影响因素研究：自尊、社交回避与苦恼的中介作用

陶甜美² 蒋巧² 查贵芳² 李占江¹ 罗佳¹

1.首都医科大学附属北京安定医院

2.首都医科大学附属北京安定医院芜湖医院

目的 探讨青少年心境障碍伴非自杀性自伤行为 (NSSI) 患者自我病耻感的影响因素及自尊、社交回避与苦恼在 NSSI 与自我病耻感间的中介效应。

方法 采用方便取样的横断面调查研究方法，选取 204 例青少年心境障碍患者进行青少年非自杀自伤性问卷 (ANSSIQ)、精神疾病自我病耻感量表 (ISMI)、自尊量表 (RSES)、社交回避及苦恼量表 (SADS)、社会支持评定量表 (SSRS) 的评估，采用多元线性回归分析青少年心境障碍伴 NSSI 组患者自我病耻感的影响因素，并采用 Bootstrap 方法检验自尊、社交回避与苦恼在 NSSI 严重程度与自我病耻感之间的中介效应。

结果 心境障碍伴 NSSI 组 ISMI 得分高于不伴 NSSI 组 ($P < 0.001$)；伴 NSSI 组患者的 ISMI 总分与 ANSSIQ 行为量表分、SADS 总分呈显著正相关 ($r = 0.316, r = 0.644, p < 0.01$)，与 RSES 总分、SSRS 总分呈显著负相关 ($r = -0.724, r = -0.548, P < 0.01$)；将与自我病耻感存在相关性的变量 (RSES 总分、ANSSIQ 行为量表分、SSRS 总分、SADS 总分) 与自我病耻感 (ISMI 总分) 进行多元线性回归分析。多元线性回归分析结果显示回归方程显著 ($P < 0.001$)，以上变量共同解释自我病耻感 60.5% 的变异，其中 NSSI 严重程度 ($\beta = 0.126, P < 0.05$)、社交回避与苦恼 ($\beta = 0.261, P < 0.01$) 显著正向预测 ISMI 总分，自尊水平 ($\beta = -0.438, P < 0.01$)、社会支持 ($\beta = -0.166, P < 0.01$) 显著负向预测 ISMI 总分。自尊、社交回避与苦恼在 NSSI 严重程度与自我病耻感之间起部分中介作用，中介效应值为 0.236，占总效应比例高达 56%，其中由 NSSI → 自尊 → 自我病耻感的间接效应为 0.163。

结论 NSSI 严重程度、自尊、社交回避与苦恼、社会支持是青少年心境障碍伴 NSSI 患者自我病耻感的重要影响因素。NSSI 严重程度既可以直接作用于也可通过自尊、社交回避与苦恼间接作用于自我病耻感，尤其是自尊的中介作用。

关键词：青少年心境障碍 非自杀性自伤行为 自我病耻感 自尊

Impaired Emotional Response Inhibition Among Adolescents with Bipolar Depression: Evidence From ERPs

Fangfang Chen^{1,2}, Lianzi Wang^{1,2}, Mingfei Wu¹, Mingfei Wu², Zhanjiang Li^{1,2}, Jia Luo^{1,2}

1.Wuhu Hospital Beijing An Ding Affiliated Hospital of

Capital Medical University

2.Wuhu Forth People's Hospital

Objective Impaired inhibition for inappropriate responses in the emotional context is a core feature in patients with bipolar disorder. However, there has been little research exploring its underlying mechanism of impaired response inhibition for emotional stimuli within adolescents with bipolar depression was unclear. To explore this issue, we employed the event-related potentials (ERPs) to investigate the underlying neuroelectrophysiological mechanisms of inhibition to inappropriate emotional stimuli in adolescents with bipolar depression

Methods Twenty-five adolescents with bipolar depression and nineteen healthy controls completed an emotional Go/No-Go task during electroencephalography (EEG) recording. Reaction time, with reaction time, discriminability (d') and response bias (β) was measured as behavioral performance indicators. ERPs components, theta-band oscillation and inter-trial coherence (ITC) were compared between the two groups

Results Behavioral performance analysis found that adolescents with bipolar depression showed smaller d' values than healthy controls. Nogo-P3 amplitude was decreased within adolescents with bipolar depression than healthy controls. The theta-band oscillation and ITC, compared to healthy controls, were reduced within adolescents with bipolar depression for emotional stimuli, especially negative stimuli

Conclusion These findings suggested that adolescents with bipolar depression exhibited abnormal response inhibition in the emotional context. Attenuated P3 amplitude and theta-band oscillation could be an electrophysiological indicator for this impaired inhibitory processing in the emotional context

关键词: bipolar depression, adolescents, response inhibition, emotion regulation

正念减压疗法在 NSSI 患者照顾者中的应用

张欣* 户晶

河北省精神卫生中心

目的 探讨正念减压疗法对非自杀性自伤患者照顾者的负性情绪的影响。

方法 本研究采用类实验设计, 选取 2022 年 2 月 1 日~2023 年 1 月 31 日在河北省某三级甲等专科医院儿少精神科收治的 78 例发生非自杀性自伤的青少年作为研究对象, 根据随机数字表法分为对照组和观察组各 39 例, 干预组除患者接受正念减压疗法干预和健康教育外, 对 NSSI 患者照顾者同时进行为期 6 周的正念疗法护理干预, 对照组患者接受正念减压疗法干预和健康教育, 照料者只接受常规心理护理及健康教育, 干预结束后分别运用五因素正念度量表 (Five Facet Mindfulness Questionnaire)、焦虑自评量表 (SAS)、抑郁自评量表 (SDS)、匹兹堡睡眠质量指数 (PSQI) 对患者及照料者都进行评分, 将干预前后的评分最终导入 SPSS 23.0 软件进行统计学处理, $P < 0.05$ 的结果代表数据间的差异存在统计学意义, 比较两组照顾者负性情绪。

结果 在干预结束后, 干预组的五因素正念度量表评分明显高于对照组, 焦虑和抑郁评分低于对照组, 差异均有统计学意义 ($P < 0.05$)。

结论 正念减压疗法对于患者及照顾者都有效, 可增加非自杀性自伤行为患者照顾者的正念能力, 减轻其焦虑抑郁情绪。

正念减压训练对孤独症照护者正负情绪的影响

陈楠^{1,2} 张欣^{1,2}

1.河北省第六人民医院(河北省精神卫生中心)

2.河北省精神卫生中心

目的 本研究对孤独症儿童照护者进行正念练习, 对训练前后照护者情绪状态、正念水平及病耻感变化进行评价, 旨在提高孤独症照护者的正念水平和身心健康, 间接提高对孤独症儿童的照顾质量, 从而促进患儿康复, 减轻照护者身心负担。

方法 选取孤独症儿童主要照护者 30 例作为对照组, 给予心理健康宣教, 固定 1 名护士进行宣

教,内容包括运用语言或非语言的沟通技巧,与照护者交谈感兴趣的话题,促进关系等,为期8周;同期选择孤独症儿童主要照护者30例作为试验组,在心理健康宣教的基础上给予系统正念减压训练,固定由1名治疗师带领每周进行一次正念训练,内容包括身体扫描、自我关怀、正念运动与饮食等,为期8周。入组时及干预8周后采用正性负性情绪量表、及五因素正念量表对两组照护者者进行评价。

第一周

见面会,课程说明

第二周

初识正念,建立身体觉察

科学认识孤独症

第三周

巩固身体觉察

有效的康复训练有哪些?

第四周

心情与情绪觉察

如何处理孤独症行为问题

第五周

情绪觉察与处理

如何进行家庭综合干预

第六周

念头想法觉察

孤独症长大后怎么样

第七周

正念人际沟通

如何吸引孤独症的注意力

第八周

活在当下的快乐与力量

家长如何应对孤独症孩子情绪问题

第九周

正念融入生活

如何区分低功能和高功能孤独症

结果 干预8周后试验组正性情绪与五因素正念量表得分高于对照组($P<0.05$),负性情绪量表得分低于对照组($P<0.05$)。

结论 正念减压训练可以帮助孤独症儿童照护者更好地管理自己的正负性情绪,提高情绪的稳定性 and 积极性。这将有助于他们更好地应对照护工作中的压力和负性情绪,增强自我幸福感和生活满意度。

心率变异性指标对惊恐障碍患者的辅助诊断价值

刘慧峰 刘竞*

首都医科大学附属北京安定医院

目的 探讨心率变异性(heart rate variability, HRV)在辅助诊断惊恐障碍中的应用价值。

方法 收集2023年9月至2024年3月在首都医科大学附属北京安定医院焦虑门诊就诊的32例未服药惊恐障碍患者(惊恐障碍组)的临床资料,另招募32名性别、年龄匹配的健康对照者(健康对照组)。使用心率变异分析系统(SA-3000P)测量HRV数据,分析指标包括平均心率(mean heart rate, mHR)、窦性心博间隔标准差(standard deviation of the normal-to-normal interval, SDNN)、NN间期均方根(root mean square of successive differences, RMSSD)、低频(low frequency, LF)、高频(high frequency, HF)和低频高频比例(low frequency to high frequency ratio, LF/HF)。采用双独立样本t检验和非参数Mann-Whitney U检验分析惊恐障碍患者与健康对照者之间的指标差异,采用二元logistic回归模型,结合10折交叉验证方法分析HRV指标对惊恐障碍的诊断效能。

结果 与健康对照组相比,惊恐障碍组的mHR显著升高(84.1 ± 12.7 比 76.8 ± 10.0 , $P=0.013$),SDNN(33.3 比 42.1 , $P=0.046$)、RMSSD(25.3 比 39.3 , $P=0.026$)及HF(5.2 ± 1.0 比 5.8 ± 1.1 , $P=0.046$)显著降低。二元logistic回归分析显示,mHR显著影响惊恐障碍患病($OR=1.091$, $P=0.039$)。单变量分析结果进一步表明,mHR、SDNN、RMSSD和HF在区分惊恐障碍患者和健康对照者方面具有显著的统计学意义(均 $P<0.05$)。基于全部数据集的模型评估结果显示,准确率为0.734,灵敏度为0.781,特异度为0.688,精确率为0.714,F1分数为0.746,AUC为0.774。基于10折交叉验证的结果显示,模型的准确率为0.600,灵敏度为0.675,特异度为0.842,精确率为0.650,F1分数为0.635,AUC为0.650。

结论 本研究初步揭示了HRV指标在辅助诊断惊恐障碍中的潜在价值。未服药惊恐障碍患者静息态HRV指标整体降低,特别是mHR、SDNN、

RMSSD 和 HF 指标与健康受试者差异显著, 基于 HRV 指标构建的二元 logistic 模型在 10 折交叉验证中展现了较好的诊断效能。

The Association between Expressive Suppression and Anxiety in Chinese Left-Behind Children in Middle School: Serial Mediation Roles of Psychological Resilience and Self-Esteem

Tingting Qu¹, Qiwen Gu², Huan Yang¹, Chennan Wang¹, Yuping Cao¹

1. The Second Xiangya Hospital of Central South University

2. University of Washington, Seattle, WA 98195, USA

Objective Left-behind children (LBC) have become a special population to be concerned due to the negative consequences of parental absence during their physical and psychological development both physically and psychologically in China. Expressive suppression (ES) is a response-focused emotion regulation and may be frequently used by LBC to suppress their emotions resulting in different forms of internalizing problems. The objective of the present study was to investigate the influence of ES as an emotion regulation strategy on anxiety in Chinese left-behind children in middle school (LBC-MS) by considering the mediating role(s) of psychological resilience and self-esteem

Methods 820 middle school students aged between 12 and 17 years ($M_{age} = 13.74$) were included. Screen for Child Anxiety Related Emotional Disorders (SCARED), Emotion Regulation Questionnaire, Resilience Scale for Chinese Adolescents (RSCA), and Rosenberg Self-Esteem Scale (SES) were administered. Descriptive statistics were used to present general characteristics, and regression-based statistical mediation was conducted using the PROCESS macro for SPSS

Results This study revealed that LBC-MS had higher anxiety and ES scores and lower psychological

resilience and self-esteem scores than non-left-behind children in middle school (non-LBC-MS) ($P_s < 0.01$). ES was found positively associated with anxiety in LBC-MS and negatively associated with psychological resilience and self-esteem ($P_s < 0.05-0.01$). Specifically, both psychological resilience and self-esteem significantly mediated the association between ES and anxiety, accounting for 7.50% and 10.68%, respectively, of the total associations. Moreover, psychological resilience and self-esteem had a chain mediating effect on ES and anxiety in LBC-MS

Conclusion The findings indicated that LBC-MS in China may frequently engage in the use of ES and have higher level of anxiety, and psychological interventions should be paid attention to this group. Intervention approaches that improve emotion regulation strategies (i.e., decreasing the ES) and increase psychological resilience and self-esteem may help to alleviate anxiety in LBC-MS

血浆炎症因子水平改变可能是重性抑郁障碍患者的生物标志物

刘依林 吴枫*

中国医科大学附属第一医院

背景 重性抑郁障碍 (Major Depressive Disorder, MDD) 是一种以情绪低落、兴趣减退、思维迟缓为主要特征的精神疾病。多项研究证实炎症因子在 MDD 的发病中发挥了作用。因此, 我们试图探索炎症因子水平是否能区分 MDD 患者与健康对照 (HC) 并且是否能预测抑郁症状的严重程度。

方法 本研究纳入 MDD 组 78 人和健康对照组 98 人。通过多因素试验检测血浆炎症因子水平。采用汉密尔顿抑郁-17 量表、汉密尔顿焦虑-14 量表和简易精神病学评定量表收集 MDD 患者的临床症状并进行评定。采用马氏距离法以及箱式图检测两组炎症因子的异常值, 采用 Kolmogorov-Smirnov 检验炎症因子的正态性。采用 Mann-Whitney 检验对不

同诊断的炎症因子进行比较, 并采用 Spearman 相关性分析评估炎症因子水平与汉密尔顿量表之间是否存在关系。

结果 MDD 组的 CXCL10 水平低于 HC 组 ($z=-2.018$ $p=0.044$), 且 TNF- α 也明显低于 HC 组 ($z=-2.990$ $p=0.003$)。外周细胞因子水平与汉密尔顿抑郁量表和汉密尔顿焦虑量表无相关性, 不能预测抑郁症状的严重程度。

局限性: 我们的横断面方法无法纵向评估所考虑的细胞因子水平的任何时间波动。

结论 本研究发现, 患者的 CXCL10 趋化因子和 TNF- α 血浆水平明显低于 HC 组。

关键词: 炎症因子, CXCL10, TNF- α , 重性抑郁障碍

疼痛加工神经环路对非自杀性自伤患者的预测

吴思楚 杭亚明 谢雅 张培 梁旻璐 王纯*
南京医科大学附属脑科医院

目的 非自杀性自伤 (non-suicidal self-injury, NSSI) 是指不以自杀为目的, 使用不被社会所认可的方法直接且故意地伤害身体组织, 在青少年和青年人群中非常普遍, 并且是自杀的已知风险因素, 其潜在机制仍有待进一步探索。既往神经影像学研究发现, NSSI 患者的疼痛加工神经环路与正常对照组相比存在异常激活。本研究基于既往疼痛加工过程激活的相关 NSSI 患者脑区构建了基于 NSSI 个体疼痛加工多模态网络, 并结合图神经网络 (graph neural network, GNN) 对 NSSI 患者进行风险预测。

方法 本研究纳入了 129 名 11~26 岁之间的被试, 其中 NSSI 患者 50 名, 健康对照者 79 名, 并选择 10 名 NSSI 患者和 16 名健康对照者作为人口学信息匹配的测试数据集。本研究使用 3T 磁共振获取静息态功能磁共振和扩散张量成像数据, 利用 DPABI 和 PANDA 工具箱进行预处理, 并使用自动解剖标记 (automated anatomical labeling, AAL) 图谱定位脑区, 根据既往研究提取双侧岛叶、杏仁核、海马旁回、额下回岛盖部、额下回三角部、额下回眶额部、前扣带皮层、颞上回和丘脑共 18 个疼痛相关的脑区, 计算每个区域平均时间序列之间的

Pearson 相关性作为节点之间的功能连接 (functional connectivity, FC), 计算平均分数各向异性 (fractional anisotropy, FA) 作为节点间的白质连接, 构建疼痛加工神经环路模型, 利用 GNN 进行 NSSI 风险预测, 并探索对预测准确率贡献最大的脑区间连接。

结果 利用影像数据构建的 NSSI 疼痛加工模型对 NSSI 患者的预测准确率 80.0%, 曲线下面积 79.3%, 特异性达到 60.0%, 灵敏度达到 93.0%。在所有脑区间连接中, 杏仁核-海马旁回及岛叶-额下回眶额部连接对该模型的预测准确率贡献最大。

结论 本研究使用 GNN, 利用疼痛加工神经环路对 NSSI 患者进行风险预测, 该 NSSI 疼痛加工模型在 NSSI 患者风险预测中达到了较高准确率, 表明疼痛加工可能是 NSSI 行为的重要潜在机制, 其中杏仁核-海马旁回及岛叶-额下回眶额部连接在预测准确率中贡献最大。本研究提供了一种探索 NSSI 潜在机制的新方法, 预示疼痛加工神经环路中的额叶及边缘系统脑区对 NSSI 行为具有重要影响。

精神类疾病患者常用治疗药物 TDM 回顾性研究

余建华*
九江市第五人民医院

目的 探索精神类疾病患者常用治疗药物的治疗药物监测 (Therapeutic Drug Monitoring, TDM) 的临床价值。

方法 对本院 2022 年 8 月至 2023 年 12 月期间收治的 457 例精神类疾病患者进行回顾性分析, 了解患者常用治疗抗精神药物 (氯氮平、奥氮平、利培酮)、抗抑郁药物 (舍曲林、帕罗西汀)、抗焦虑药物 (阿普唑仑) 及抗癫痫/情绪稳定药物 (丙戊酸钠) 的 TDM 情况, 对比药物的 TDM 频次分布及在控率。

结果 氯氮平 TDM 前的在控率为 42.99%, TDM 后在控率为 92.52%; 奥氮平 TDM 前的在控率为 31.58%, TDM 后在控率为 61.84%; 利培酮 TDM 前的在控率为 66.67%, TDM 后在控率为 90.74%; 舍曲林 TDM 前的在控率为 43.14%, TDM 后在控率

为 86.27%；帕罗西汀 TDM 前的在控率为 70.21%，TDM 后在控率为 93.62%；阿普唑仑 TDM 前的在控率为 57.50%，TDM 后在控率为 85.00%；丙戊酸钠 TDM 前的在控率为 62.20%，TDM 后在控率为 82.93%；差异均具有统计学意义 ($P < 0.05$)。

结论 实行 TDM 有助于提高药物治疗的安全性和有效性，指导临床合理用药，为精神类疾病患者群体提供个体化治疗。

关键词：精神类疾病,治疗药物监测,个体化治疗.

丙戊酸镁缓释片联合盐酸齐拉西酮治疗双相情感障碍躁狂发作的临床疗效

杨雪* 孙颖

辽宁省精神卫生中心

目的 分析丙戊酸镁缓释片联合盐酸齐拉西酮治疗双相情感障碍躁狂发作的临床疗效。

方法 以 2021 年-2022 年期间在我科室治疗的双相情感障碍躁狂发作患者 106 例为研究对象，按照入院顺序奇偶性划分为两组，即观察组和对照组，每组各 53 例。两组患者均给予丙戊酸镁缓释片进行治疗，观察组患者在此基础上同时联合给予盐酸齐拉西酮进行治疗。

结果 相比对照组 (73.58%)，观察组患者的临床治疗总有效率 (90.57%)，明显更高，组间比较差异有统计学意义 ($P < 0.05$)。两组患者治疗前的 BRMS 评分，均相当，组间比较差异无统计学意义 ($P > 0.05$)；两组患者治疗 1 周、3 周和 6 周后的 BRMS 评分，均较治疗前有明显降低，组内间比较差异有统计学意义 ($P < 0.05$)；但两组患者治疗 1 周后的 BRMS 评分，组间比较差异无统计学意义 ($P > 0.05$)；但治疗 3 周和 6 周后，观察组患者的 BRMS 评分，均显著低于对照组，组间比较差异有统计学意义 ($P < 0.05$)。观察组患者的 TMT 评分，显著低于对照组，组间比较差异有统计学意义 ($P < 0.05$)；但两组患者的 TESS 评分相当，组间比较差异无统计学意义 ($P > 0.05$)。

结论 丙戊酸镁缓释片联合盐酸齐拉西酮治疗双相情感障碍躁狂发作，不仅疗效显著，且能够显著改善患者的躁狂症状、提升患者的认知功能，且不会明显增加患者的脂代谢异常的风险。

关键词：丙戊酸镁缓释片；盐酸齐拉西酮；双相情感障碍躁狂发作

碳酸锂联合阿立哌唑治疗双相障碍抑郁发作的临床疗效和安全性

邱玲玲* 孙颖

辽宁省精神卫生中心

目的 探讨碳酸锂联合阿立哌唑治疗双相障碍抑郁发作的临床疗效及其安全性。

方法 将 150 例在 2020 年 6 月-2021 年 6 月时间段内我院接诊的双相障碍抑郁发作患者作为研究样本，随机分为观察组和对照组，各组均纳入 75 例患者。对照组单用碳酸锂，观察组则联合应用碳酸锂和阿立哌唑进行治疗。

结果 观察组患者的 HAMD-17 评分，在治疗前与对照组相当， $P > 0.05$ 差异没有统计学意义；在治疗 4 周后、治疗 8 周后和治疗 12 周后，均显著低于对照组， $P < 0.05$ 差异具有统计学意义。观察组患者的临床治疗总有效率 96.00%，明显高于对照组的 80.00%， $P < 0.05$ 差异具有统计学意义。观察组患者的临并发症发生率 29.33%，与对照组相当的 26.67%， $P < 0.05$ 差异具有统计学意义。

结论 碳酸锂联合阿立哌唑治疗双相障碍抑郁发作，可明显改善患者的抑郁状态，不仅能够获得更高的临床治疗效果，且具有较高的临床治疗安全性。

关键词：碳酸锂；阿立哌唑；双相障碍；抑郁发作；临床疗效；安全性

探究丙戊酸镁缓释片联合碳酸锂治疗双相情感障碍躁狂发作的效果

邱玲玲* 孙颖

辽宁省精神卫生中心

目的 探讨丙戊酸镁缓释片联合碳酸锂治疗双相情感障碍躁狂发作患者的临床疗效

方法 采取方便抽样法从 2020 年 10 月—2021

年 9 月期间我院收治的双相情感障碍躁狂发作患者中选取 120 例,以随机原则分成两组,包括观察组(例数=60)和对照组(例数=60)。对照组患者单纯口服碳酸锂进行治疗,观察组患者在对照组基础上,同时联合应用丙戊酸镁缓释片进行治疗。

结果 观察组患者的治疗总有效率为 95.00%,显著高于对照组的, $P<0.05$ 组间差异明显。两组患者治疗前的 BRMS 评分和 PANSS 评分,均相当, $P>0.05$ 组间差异不明显;两组患者在治疗 1 周后和治疗 4 周后的 BRMS 评分和 PANSS 评分,均较治疗前有明显降低, $P<0.05$ 组内差异明显;但观察组患者治疗 1 周后和治疗 4 周后的 BRMS 评分和 PANSS 评分,均显著低于对照组, $P<0.05$ 组间差异明显。观察组患者治疗期间的不良反应发生率 31.67%,与对照组的 28.33%相当, $P>0.05$ 组间差异不明显。

结论 采取丙戊酸镁缓释片联合碳酸锂的用药方案对双相情感障碍躁狂发作患者实施治疗,可强化其症状改善效果,从而显著提高其临床疗效,且不会增加不良反应,安全性较高。

关键词: 丙戊酸镁;碳酸锂;双相情感障碍躁狂发作

阿立哌唑与喹硫平在治疗老年精神分裂症患者的临床疗效及安全性对比分析

王亮* 孙颖
辽宁省精神卫生中心

目的 分析阿立哌唑与喹硫平治疗老年精神分裂症患者的临床疗效及安全性。

方法 研究对象为 114 例老年精神分裂症患者,研究时间为 2019 年 6 月到 2020 年 7 月,按研究需求分成观察组和对照组,每组例数均=57。A 组患者采用阿立哌唑进行治疗, B 组患者采用喹硫平进行治疗。

结果 A 组患者的临床治疗总有效率 92.98%,显著高于 B 组 78.95%, $P<0.05$ 组间比较差异有统计学意义。两组患者治疗前的阳性症状、阴性症状、病理症状及 PANSS 总分,均相当, $P>0.05$ 组间比较差异无统计学意义;两组患者治疗后的以上评分,均较治疗前有显著降低, $P<0.05$ 组内比较差异有统计

学意义;但 A 组患者治疗后的各项评分均显著低于 B 组, $P<0.05$ 组间比较差异有统计学意义。A 组患者的嗜睡、头晕、失眠、恶心、便秘、心动过速、静坐不能等不良反应发生 28.07%,显著低于 B 组 50.88%, $P<0.05$ 组间比较差异有统计学意义。

结论 阿立哌唑在治疗老年精神分裂症,较喹硫平具有明显的临床优势,不仅能够显著改善患者的临床症状,提升其临床治疗效果,且不良反应明显更少,治疗安全性更好。

关键词: 阿立哌唑;喹硫平;老年精神分裂症;临床疗效;安全性

坦度螺酮与丁螺环酮治疗广泛性焦虑症的效果观察

王亮* 孙颖
辽宁省精神卫生中心

目的 观察广泛性焦虑症采用坦度螺酮与丁螺环酮治疗的效果。

方法 选取 2016 年 8 月至 2018 年月收治的广泛性焦虑症患者 58 例,根据数字随机法进行分组,分别为观察组和对照组,每组各 29 例,对照组采用丁螺环酮治疗,观察组实施坦度螺酮治疗,对比治疗效果、不良反应、焦虑(HAMA)评分等。

结果 观察组治疗总有效率、生活质量各维度评分、不良反应发生率、HAMA 评分均优于对照组,对比有统计学意义($P<0.05$);但两组治疗效果、临床疗效评分并无差异,对比无统计学意义($P>0.05$)。

结论 坦度螺酮与丁螺环酮治疗广泛性焦虑症相当,但是在改善患者焦虑情绪方面更优,且安全性较高,更能改善患者的生活质量,值得推广。

关键词: 广泛性焦虑症;丁螺环酮;坦度螺酮;治疗效果

盐酸美金刚联合多奈哌齐治疗老年痴呆的临床疗效

刘科学*
九江市第五人民医院

目的 分析盐酸美金刚联合多奈哌齐治疗老年痴呆的临床疗效

方法 两组患者在参与研究前均停药一周, 随后接受降压、抗血小板聚集、扩张冠状动脉以及降糖等常规治疗措施。

对照组患者在常规治疗基础上, 每日口服一次多奈哌齐 (由重庆植恩药业生产, 国药准字 H20010723), 剂量为 5mg。观察组则在对照组治疗方案的基础上, 每日口服一次盐酸美金刚片 (由广州白云山制药股份有限公司生产, 国药准字 H20193268), 剂量为 20mg, 两组治疗均持续 6 个月。2021 年 1 月 2024 年 1 月共计收治 60 例老年痴呆患者, 随机分为 30 例采取多奈哌齐治疗的对照组, 30 例采取盐酸美联合多奈哌齐治疗的观察组, 对比两组患者临床治疗疗效、精神性症状、认知水平评分及生活能力及不良反应发生率。

结果 治疗 6 个月后, 观察组治疗总有效率、认知水平评分及生活能力均显著高于对照组 ($p < 0.05$), 精神性症状显著优于对照组 ($p < 0.05$); 不良反应发生率均低于对照组 ($p < 0.05$)。

结论 盐酸美金刚联合多奈哌齐治疗老年痴呆相较于单独使用多奈哌齐, 在临床疗效、精神性症状、认知水平及生活能力方面均表现出显著优势。同时, 联合用药还能有效降低不良反应发生率。因此, 盐酸美金刚联合多奈哌齐治疗老年痴呆是一种更为有效且安全的治疗策略, 值得在临床实践中进一步推广和应用。

失眠对孕晚期女性焦虑、抑郁影响的研究: 一项基于健康生态学的研究

魏倩倩 龙鲸*
天津市安定医院

目的 探究孕晚期女性失眠、焦虑、抑郁的普遍程度, 并分析失眠对焦虑、抑郁的具体影响, 通过健康生态学模型进一步揭示其相关因素。

方法 1. 采用方便抽样方法于 2021 年 5 月-2022 年 7 月在山东某妇幼保健门诊进行横断面调查, 招

募孕早期检查的孕晚期女性作为研究对象;

2. 利用自编的人口学问卷、阿森斯失眠量表 (AIS-8)、广泛性焦虑障碍量表 (GAD-7) 及抑郁症筛查量表 (PHQ-9) 来评估孕晚期女性的失眠、焦虑、抑郁状况。根据 AIS-8 分值, 将孕妇分为失眠组 (AIS 总分 ≥ 6 分) 和对照组 (AIS 总分 < 6 分)。

3. 借助 SPSS 26.0 统计软件, 对收集到的数据进行描述性统计分析、卡方检验、秩和检验、t 检验、Pearson 相关分析以及二元 Logistics 回归分析, 以探讨失眠与焦虑、抑郁之间的关系, 并识别其他潜在影响因素。

结果 共有 247 名孕妇参与研究, 经筛选后有效问卷为 200 份, 有效率达 81.0%。研究结果显示, 孕晚期女性中失眠、焦虑、抑郁的检出率分别为 58.0%、17.0%、19.0%。对比两组孕妇的一般资料, 发现失眠组与对照组在夫妻关系上存在显著差异 ($p \leq 0.001$)。失眠组的 GAD-7 和 PHQ-9 分值均高于对照组, 且差异显著 ($p < 0.01$)。Pearson 相关分析显示, 失眠与焦虑 ($r = 0.604, p < 0.01$) 及抑郁 ($r = 0.687, p < 0.01$) 均存在显著相关性。通过二元 logistic 回归分析, 发现失眠 (OR=1.453, 95%CI=1.260-1.676, $p < 0.001$) 及与丈夫的关系 (OR=0.244, 95%CI=0.076-0.784, $p < 0.05$) 是影响孕晚期女性焦虑的重要因素; 同时, 失眠 (OR=1.700, 95%CI=1.425-2.029, $p < 0.001$) 及与丈夫的关系 (OR=0.268, 95%CI=0.076-0.950, $p < 0.05$) 也是影响孕晚期女性抑郁的重要因素。

结论 本研究表明, 孕晚期女性失眠、焦虑、抑郁的检出率较高。失眠及与丈夫的关系欠佳可能是导致孕晚期女性焦虑、抑郁的重要因素。这一发现对于孕期保健和心理健康服务的提供具有重要的指导意义。未来研究可进一步扩大样本量, 从更多维度深入探讨相关因素, 以期为孕期女性提供更为全面、有效的心理健康支持。

6.Qingdao Mental Health Center

7.Linyi Mental Health Center

8.Zaozhuang Mental Health Center

9.The Fourth People's Hospital of Liaocheng

10.The Third People's Hospital of Heze

Objective To explore the disability situation of depressive disorders and related risk factors, and construct a risk factor model for the disability of depressive disorders, so as to provide a basis for the social function rehabilitation of depressive disorders

Methods The study participants were exclusively selected from the 2015 Epidemiologic Survey of Mental Disorders among Individuals Aged 18 and Older in Shandong Province. Among the 1237 surveyed individuals who met the diagnostic criteria for MDD, dysthymia, or unspecified depressive disorder as outlined in the Diagnostic and Statistical Manual of Mental Disorders, Fourth Edition (DSM-IV), a total of 871 participants from eight cities were selected. A follow-up study in 2020 involved 543 participants. Questionnaires included a general form, Global Assessment of Function (GAF)、Simple Quality of Life Questionnaire、Pittsburgh Sleep Quality Index (PSQI)、Global Pain Scale (GPS)、Simplified Coping Style Questionnaire (SCSQ)、Childhood Trauma Questionnaire (CTQ)、Social Support Rating Scale (SSRS)、Montreal Cognitive Assessment (MoCA)。Clinical data related to patients' episodes of illness, use of various psychiatric medications, hospitalization for mental illness, and suicidal behaviors were collected through a self-administered clinical information questionnaire over a 5-year period

Strict quality control was implemented throughout the two surveys. A database was created using Epidata,

and statistical analysis was performed using SPSS 23.0 and Amos 22.0 software. Descriptive analysis, chi-square test, Fisher's exact probability method test, hierarchical chi-square test and rank sum test were conducted to analyze the data according to the type of data, and Bonferroni method was used for post hoc multiple comparisons. The relationship between various influencing factors and the disability of depressive disorder was analyzed using logistic regression. Structural equation modeling was used to analyze the relationship between risk factors for disability of depressive disorder.

Results A multifactorial logistic regression analysis of the factors influencing disability in patients with depressive disorder found that activity restriction due to fear of something (OR=4.21), poor sleep quality (OR=1.65), use of hypnotic drugs (OR=1.48) in 2015 and poor general health at the time of the survey in 2020 (OR=1.21) were risk factors for depressive disorder as a risk factor for disability ($P < 0.05$); good psychosocial status and good social support (OR = 0.93) in 2015 (OR = 0.62) and 2020 (OR = 0.43) were protective factors for psychiatric disability in depressive disorder ($P < 0.05$)

Structural equation modeling analysis showed that social support, 2015 and 2020 mental health level, 2015 sleep quality, and 2020 quality of life could directly affect mental disability with standardized path coefficients of -0.12, 0.10, 0.26, 0.22, and -0.15, respectively; 2020 mental health level and quality of life, and 2015 sleep quality could also serve as mediating variables and thus influence mental disability. In addition, the factor loadings of each of the 2020 quality of life latent variables on economic status and psychiatric-psychological status were 0.61 and 0.80, respectively, and the factor loading of the 2015 sleep quality latent variable on the sleep quality factor was 0.70, indicating their strong ability to predict disability due to depressive disorder.

Conclusion Risk factors for the disability of depressive disorder include: poor general health, poor sleep quality, and application of hypnotic drugs; the protective factors are: good psychiatric condition and social support. The factors that directly affect the disability of depressive disorder are: social support, mental health level, sleep quality, and quality of life; the mediating

factors were: mental health level, sleep quality, and quality of life

关键词: depressive disorder; disability; influencing factors ; follow-up study

睡眠质量在山东省成年人群抑郁与疼痛程度之间的中介作用

王涛¹ 王倩² 李晓靖³ 王灿³ 王汝展³ 张敬悬³ 程小菁⁴

1. 台州市第二人民医院

2. 山东省职业病医院

3. 山东省精神卫生中心

4. 山东省职业卫生与职业病防治研究院

目的 探讨睡眠质量在抑郁与疼痛程度之间的中介作用, 为强化抑郁障碍患者的疼痛管理提供依据。

方法 从 2015 年山东省 18 岁及以上人群精神障碍流行病学调查数据库中, 选取 8 个市的 871 例符合《精神障碍诊断与统计手册第四版》重性抑郁障碍、心境恶劣障碍或未特定抑郁障碍诊断标准者作为抑郁障碍患者组, 以及按照同性别、同年龄组(相差不超过 ± 5 岁)、同村或街道的原则进行 1:1:1 配对, 随机抽取出的 825 例经一般健康问卷筛查阳性, 但无精神障碍诊断者作为高危组, 825 例筛查阴性者为低危组。于 2020 年对上述人群开展横断面研究, 随访到 2122 例(84.17%), 排除因各种原因未能完成调查者 274 例(10.87%)后, 最终成功接受调查并纳入分析者共计 1848 例(73.30%)。采用一般健康问卷及相关风险问题作为筛查工具, 美国精神障碍诊断与统计手册第四版作为诊断标准, 采用《DSM-IV-TR 轴 I 障碍定式临床检查研究版(用于病人)》进行抑郁障碍诊断, 采用自制的一般资料调查表、匹兹堡睡眠质量指数(Pittsburgh Sleep Quality Index, PSQI)及整体疼痛评估量表(Global Pain Scale, GPS)进行问卷调查。

结果 抑郁障碍患者组 GPS 总分高于高、低危组($F=59.26, P<0.01$)。研究人群抑郁诊断与 PSQI 总分、GPS 总分均呈正相关($r=0.40, 0.33; P<0.01$), PSQI 总分与 GPS 总分呈正相关($r=0.47, P<0.01$)。睡眠质量在抑郁与疼痛程度中起部分中介作用(间

接效应占总效应的 44.46%)。

结论 抑郁可以直接影响疼痛程度, 也可以通过睡眠质量间接影响疼痛程度, 因此改善睡眠质量有助于缓解抑郁障碍患者的疼痛。

价值取向短程治疗对轻中度抑郁症患者临床症状、反刍思维、决策能力及认知功能的效果分析

冀紫阳¹ 王长虹² 王长虹¹ 史利静¹ 和曼玉¹ 刘聪¹ 董娇¹ 邵秋静¹ 姚丰菊¹ 王慧颖¹

1. 新乡医学院第二附属医院

2. 精神心理疾病防治河南省协同创新中心

目的 探讨价值取向短程治疗(value orientation brief therapy, VBT)对轻中度抑郁患者的临床症状、决策功能、反刍思维及认知功能的改善效果。

方法 选择 2022 年 8 月-2023 年 12 月收治的符合 DSM-V 诊断标准 80 例抑郁障碍患者为研究对象, 根据随机数字表法将患者分为实验组($n=40$)与对照组($n=40$)。对照组使用常规治疗, 实验组在常规治疗基础上进行价值取向短程疗法干预, 共 6 周。分别于基线水平、干预 6 周后, 采用汉密尔顿抑郁量表 24 项(HAMD-24)及汉密尔顿焦虑量表(HAMA)对患者的抑郁及焦虑症状的严重程度进行评估; 采用反刍思维量表中文版(RRS-CV)评估患者反刍思维状况; 使用爱荷华博弈任务(IGT)评估患者模糊决策功能; 采用探索性眼球轨迹运动的凝视点数(NEF)和反应探索评分(RSS)评估患者的认知功能。

结果 两组患者在用药种类及剂量方面差异无统计学意义($P>0.05$)。实验组患者干预后在 HAMD-24、HAMA、症状反刍、反省深思、强迫冥想、RRS-CV 总分、IGT 净利分、NEF 及 RSS 方面与干预前及对照组比较差异存在统计学意义($P<0.05$)。两组患者在 HAMD-24、HAMA、症状反刍、反省深思、强迫冥想、RRS-CV 总分、IGT 净利分、NEF 及 RSS 干预前后变化值之间的差异存在统计学意义($P<0.05$)。

结论 价值取向短程治疗有效的治疗轻中度

抑郁患者的抑郁焦虑症状，并改善其决策功能、反刍思维及认知功能。

关键词：价值取向短程治疗；抑郁症；决策能力；反刍思维；认知功能

The Subtyping of Insomnia Disorder Based on Clinical, Psychological, and Sleep Electroencephalographic Characteristics: Preliminary Results From A Prospective Study

Dongbin Lyu Yang Wang Caojun Ji Ruiyi Qian Yu Zhang Xin Luo Tianhong Zhang Chengmei Yuan*
Shanghai Mental Health Center

Objective Although several subtypes of insomnia disorder (ID) have been proposed, there is little objective evidence for its subtyping and subtype-guided treatment. This study aimed to explore data-driven ID subtypes based on clinical, psychological, and sleep EEG features

Methods In a prospective observational study, 136 subjects aged 18-65, diagnosed with ID according to DSM-5, underwent comprehensive assessments, including clinical-psychological evaluations and polysomnographic monitoring. Data analysis involved feature selection through a random forest algorithm, data standardization, dimensionality reduction, and clustering analysis to identify ID subtypes. Subtypes were evaluated for their clinical outcomes, including subjective sleep quality and total sleep time

Results We identified three distinct subtypes of insomnia, each with significantly different characteristics. Subtype 1, "biological insomnia" (N=30), had a significantly higher average age than other subtypes (H=28.932, $p<0.001$) and showed a notable lack of N3 sleep (H=71.550, $p<0.001$). Subtype 2, "stress-related insomnia" (N=53), is associated with prominent clinical symptoms such as depression (F=10.831, $p<0.001$), anxiety (F=3.220, $p=0.043$), and fatigue (F=7.408, $p=0.001$). Subtype 2 displayed the highest levels of insomnia susceptibility (F=3.704, $p=0.027$), pre-sleep arousal (F=6.903, $p=0.001$), rumination (F=6.155,

$p=0.003$), and childhood trauma (H=13.252, $p=0.001$). Subtype 3, "insomnia with reduced spindles" (N=53), showed more positive experiences (F=6.399, $p=0.002$) and lower stress levels (F=4.658, $p=0.011$). EEG characteristics of this subtype indicate poor slow wave- σ coupling (H=14.464, $p=0.001$) and weaker spindle oscillations (H=40.430, $p<0.001$)

Conclusion Identifying distinct ID subtypes through a data-driven approach can significantly influence clinical outcomes, offering a path toward more effective management of ID

尼古丁依赖吸烟者的前扣带回神经代谢改变

廖艳辉* 李铃

浙江大学医学院附属邵逸夫医院

目的 吸烟对身心健康危害巨大，长期吸烟导致尼古丁依赖或成瘾是戒烟难的主要原因。前扣带回 (Anterior Cingulate Cortex, ACC) 被认为是成瘾相关的重要脑区。以往研究发现尼古丁依赖者 ACC 存在代谢紊乱，但研究结果不尽一致，且戒烟后能否改善尚不清楚。因此，本研究结合纵向随访，拟进一步阐明尼古丁依赖的脑代谢特征，并探索短期戒烟对该特征的影响，为寻找到更有效的戒烟方法提供依据。

方法 本研究共纳入了 104 例尼古丁依赖吸烟者 (SM 组) 和 43 例不吸烟的健康对照者 (HC 组) 基线期磁共振波普数据。同时，为吸烟者提供为期 4 周的基于认知行为疗法 (CBT) 的线上干预戒烟。在线上干预结束之后，对 21 例戒烟者 (qSM 组) 和 25 例持续吸烟者 (cSM 组) 进行了磁共振波普数据的二次采集。本研究采用线性回归分析分别探究了 ACC 脑区代谢物 (NAA/Cr、MI/Cr、Glu/Cr 和 Cho/Cr) 在 SM 组和 HC 组两组之间、qSM 组和 cSM 组两组之间的差异；采用配对样本 t 检验分别探究了在 qSM 组和 cSM 组 4 周前后的差异；采用皮尔逊相关分析探究了各代谢物与吸烟相关特征 (吸烟指数、每日吸烟量等) 在基线期吸烟组中的相关性。

结果 本研究发现,与HC组相比,SM组Glu/Cr降低($p=0.0124$),MI/Cr($p=0.021$)和Cho/Cr($p=0.032$)有降低的趋势;与持续吸烟者相比,戒烟者的Cho/Cr有升高的趋势($p=0.015$),NAA/Cr有降低的趋势($p=0.023$)。遗憾地是,本研究没有发现戒烟组和持续吸烟组在4周前后的差异。此外,本研究还发现SM组的Glu/Cr与吸烟指数(包年)($r=-0.292$, $p=0.003$)、每日吸烟量($r=-0.206$, $p=0.036$)均存在负相关。

结论 尼古丁依赖吸烟者存在前扣带回脑区的代谢紊乱。戒烟4周之后,与持续吸烟者相比,部分代谢紊乱有改善的趋势。以上的研究发现可能会为寻找到更有效的戒烟方法提供一定的依据。

中药酸枣仁汤联合重复经颅磁刺激治疗原发性失眠的疗效分析

肖伟斌* 曹丽娟
九江市第五人民医院

目的 分析中药酸枣仁汤联合重复经颅磁刺激治疗原发性失眠的疗效。

方法 以2021年10月至2022年07月在我院就诊的原发性失眠患者作为研究对象,共200例,采用随机方式将患者分为观察组(中药酸枣仁汤联合重复经颅磁刺激治疗(rTMS),100例)和对照组(传统西药阿普唑仑片口服治疗,100例),对不同治疗方式下患者治疗前和治疗后后的匹兹堡睡眠质量指数(Pittsburgh sleep quality index; PSQI)、阿森斯失眠量表(Asens Insomnia Scale; AIS)、中医症候评分以及治疗和症状改善时间进行比较分析。

结果 治疗前组间差异不显著($P>0.05$),治疗后,观察组患者PSQI得分明显低于对照组患者,组间有统计学意义($P<0.05$),治疗后,观察组患者AIS得分明显低于对照组患者,组间有($P<0.05$),观察组患者治疗后中医症候各项评分、症状改善时间、治疗时间均低于对照组患者,组间治疗效果差异较小, ($P>0.05$),但观察组患者治疗后不良反应发生率更低($P<0.05$)。

结论 中药酸枣仁汤联合重复经颅磁刺激

(rTMS)治疗原发性失眠症患者的治疗效果更好,患者在经过治疗后,睡眠质量更高,失眠症状明显改善,患者中医症候评分明显降低,且无明显的药物副作用及躯体不适的感觉,建议该方式在临床治疗中推广使用。

关键词: 中药,酸枣仁汤,重复经颅磁刺激,原发性失眠,疗效

CCBT联合米氮平对广泛性焦虑的疗效以及生活质量的影响

林奶冰*
福州市第二总医院神经精神病防治院

目的 探讨计算机化认知行为治疗(Computerized cognitive-behavioral therapy, CCBT)联合米氮平治疗对广泛性焦虑(Generalized anxiety, GAD)患者的效果及生活质量的影响。

方法 选取2022年3月至2024年3月期间福州市第二总医院神经精神病防治院收治的126例广泛性焦虑患者作为研究对象,按抽签法分为对照组和联合组各63例,对照组患者采用米氮平片治疗,联合组采用米氮平片联合计算机化认知行为治疗,两组均连续治疗8周后,比较两组患者治疗前后汉密尔顿焦虑量表(Hamilton anxiety scale, HAMA)、匹兹堡睡眠质量指数(Pittsburgh sleep quality index, PSQI)、生活质量评分。

结果 治疗前,两组HAMA评分中的各项评分比较差异均无统计学意义($P>0.05$);治疗后症状缓解的时间比较,联合组显著低于对照组($P<0.05$);联合组患者的治疗总有效率为93.65%,明显高于对照组的79.37%,差异有统计学意义($P<0.05$);治疗前,两组患者PSQI评分中的各项评分比较差异均无统计学意义($P>0.05$);治疗后,两组患者PSQI评分中的各项评分均明显降低,且联合组明显低于对照组,差异均有统计学意义($P<0.05$);治疗前,两组患者生活质量评分中的各项评分比较差异均无统计学意义($P>0.05$);治疗后,两组患者生活质量评分中的各项评分均明显升高,且联合组明显高于对照组,差异均有统计学意义($P<0.05$)。

结论 米氮平片联合计算机化认知行为治疗较单纯米氮平片治疗广泛性焦虑患者,能够更快速,有

效的控制广泛性焦虑症状,显著改善患者睡眠状况,并提高患者的生活质量。

加速重复经颅磁刺激对青少年抑郁症患者的自杀意念和快感缺失的疗效探究

温庆梅 林涌超*

福州市第二总医院神经精神病防治院

目的 探究重复经颅磁刺激(Repetitive ranscranial magnetic stimulation, rTMS)应用于青少年抑郁症患者的疗效,以及探究在青少年抑郁症患者中改善快感缺失症状、降低年自杀意念方面的疗效,探究1天2次的加速rTMS方案相比1天1次的常规rTMS方案的最终疗效是否具有差异性。

方法 选取了我院收治的19例青少年抑郁症患者作为研究对象,随机分为实验1组和实验2组,所有入组病人除了常规接受SSRI类抗抑郁药(Slective serotonin reuptake inhibitors)以及必要时使用苯二氮卓类药物之外,均接受为期2周、每周5天的rTMS治疗,治疗方案均为左侧DLPFC、10HZ、120%MT,其中实验1组每天接受1次rTMS治疗,实验2组以加速方案每天接受2次rTMS治疗,每次间隔1小时以上。所有入组病人在治疗开始前(T0)、治疗1周时(T1)、治疗2周时(T2),分别采用汉密尔顿抑郁量表(Hamilton depression Scale-24, HAMD-24)、斯奈思快感缺失量表(Snaith-Hamilton Pleasure Scale,SHAPS)、贝克自杀意念量表中文版(Beck Scale for Suicide Ideation Chinese Version, BSI-CV)评定症状严重程度。

结果 实验1组和实验2组之间HMAD-24、BSI-CV、SHAPS的T0时的分数无显著性差异($p=0.463$, $p=0.322$, $p=0.165$)。采用重复测量方差分析对比两组分数变化的差异,与T0期相比,两组在T2期的HAMD-24、BSI-CV分值均有不同程度的下降($p<0.05$),SHAPS的分值虽有下降,但无统计学意义($p>0.05$)。实验2组的HAMD-24平均减分25.78,大于实验1组的19.6,但差异无统计学意义($p>0.05$)。实验2组的BSI-CV平均减分13.11,大于实验1组的6.4,但差异无统计学意义($p>0.05$)。

实验1组T2时的HMAD-24、BSI-CV分数和实验2组T1时相比无显著性差异($p>0.05$)。2组治疗期间不良反应发生率无统计学差异($p>0.05$),且均未发生严重不良反应。

结论 加速rTMS治疗和常规rTMS治疗可以改善青少年抑郁症患者的抑郁症状及降低自杀意念,2种方案疗效相似,这可能与本研究样本量偏少有关,后期可以增大样本量进行进一步研究。加速rTMS方案相比常规rTMS方案能够更快速的改善抑郁症状及降低自杀意念。

关键词:重复经颅磁刺激,青少年,抑郁症,自杀意念,快感缺失

伴和不伴非自杀性自伤行为青少年抑郁症的共情损伤研究

陈方方^{1,2} 汪莲籽^{1,2} 李占江¹ 罗佳¹ 吴明飞^{1,2}

1.首都医科大学附属北京安定医院芜湖医院

2.芜湖市第四人民医院

目的 共情是个体人际关系的重要影响因素,而人际因素也常是青少年抑郁症患者实施非自杀性自伤行为(NSSI)的诱发因素之一,因此,本研究旨在探究伴和不伴非NSSI青少年抑郁症患者共情损伤的特点。

方法 本研究共纳入66名被试,其中,伴NSSI行为青少年抑郁症患者33名,不伴NSSI行为青少年抑郁症患者14名,正常对照被试19名。所有被试均完成汉密尔顿抑郁量表(HAMD)、中文版人际指针反应量表(IRI-C)及疼痛共情任务。

结果 三组被试HAMD和IRI-C得分One-Way ANOVA分析显示,HAMD得分主效应显著,LSD事后检验显示,伴NSSI行为青少年抑郁症组的HAMD得分显著高于不伴NSSI行为青少年抑郁症组及正常对照组,IRI-C中的个人痛苦因子分主效应显著,LSD事后检验显示,伴和不伴NSSI行为青少年抑郁症组的个人痛苦因子得分显著高于正常对照组,此外,伴NSSI行为青少年抑郁症组的观点采纳因子得分显著高于正常对照组。疼痛共情任务正确率的ANOVA分析显示,任务类别主效应显著,组别主效应显著,其中,伴NSSI行为青少年抑郁症组正确率低于不伴NSSI行为青少年抑郁症组,任务

类别和组别的交互效应显著,简单效应分析显示,伴 NSSI 行为青少年抑郁症组在疼痛判断任务中的正确率低于其他两组。疼痛共情任务反应时的 ANOVA 分析显示,任务类别主效应显著,组别主效应显著,其中,伴 NSSI 行为青少年抑郁症组反应时长于其他两组,效价类别和组别的交互效应显著,简单效应分析显示,伴 NSSI 行为青少年抑郁症组在疼痛刺激下的反应时长于其他两组。

结论 伴和不伴 NSSI 青少年抑郁症患者均表现出不同程度的共情损伤,相较于不伴 NSSI 青少年抑郁症患者,伴 NSSI 青少年抑郁症患者对疼痛刺激的敏感性降低。

关键词:非自杀性自伤;青少年;抑郁症;共情

阿里地区人民医院 221 名医务人员身心健康状况

印显刚¹ 杜宣运¹ 陈策² 马现仓² 郭丽阳²

1.阿里地区人民医院

2.西安交通大学第一附属医院

目的 阿里地区海拔高,人口少,医务人员作为一个特殊群体,每天面对大量需要帮助及诊治的患者压力巨大。如果压力不能很好的缓解和释放,容易产生心理问题。故对医院的医务人员进行了此次心理状况调查。

方法 1.调查时间与调查对象:2024年4月1日至4月30日,调查对象为阿里地区人民医院在岗的医务人员 221 名。2.调查方法 采用问卷星线上调研,自制问卷和 PHQ-9、GAD-7、ISI 量表收集信息。3.统计方法 SPSS24.0 进行统计分析。

结果 1.临床和人口统计特征:参与此次调查的阿里地区人民医院医务人员 221 人,男性 64 人,女性 157 人。汉族 113 人,藏族 99 人,其他民族 22 人。年龄 20-40 岁,193 人,40 岁以上 28 人。未婚 89 人,已婚 124 人,离异 8 人。家庭关系融洽 175 人,不融洽 46 人。医生 57 人,护士 113 人,医技 28 人,行政后勤人员 23 人。初级职称 173 人,中级 41 人,高级 7 人。平均每天工作时长小于等于 6 小时 12 人,6-8 小时 107 人,大于 8 小时 102。需要上夜班 161 人,不需要 60 人。完全实现理想人生 7 人,大部分实现 35 人,实现一半 51 人,小部分实

现 97 人,没实现 31 人。有躯体疾病 44 人,没有 177 人。

2.心理健康基本情况:221 位医院医务人员均存在抑郁症状,14 位有轻度抑郁症状,65 位有中度抑郁症状,66 位为重度抑郁症状,76 位有极重度抑郁症状。均存在焦虑症状:69 位轻度焦虑症状,79 位中度焦虑症状,73 位重度焦虑症状。

3.睡眠状况:221 名医务人员中,41 名不存在失眠问题,70 名存在亚临床意义的失眠,76 名存在临床中度失眠,22 名存在临床重度失眠。

4.以是否上夜班分层发现和是否达到理想状态分层发现,PHQ-9、GAD-7、ISI 量表在组间都有显著性差异, p 均 <0.05 。上夜班和未实现理想状态的医务人员评分较高。

5.以 PHQ-9、GAD-7 和 ISI 分别为因变量,以临床和人口统计特征项为自变量,发现以 PHQ-9 为因变量,建立的回归方程是 $y=1.719x$ 是否实现理想生活状态+17.095;以 GAD-7 为因变量,建立的回归方程是 $y=-2.078x$ 是否上夜班+1.154x 是否实现理想生活状态+12.885;以 ISI 为因变量,建立的回归方程是 $y=-2.361x$ 是否上夜班+2.082x 是否实现理想生活状态+14.565。

结论 1.医务人员普遍存在心理健康状况问题,医务人员发生睡眠问题也较明显。

2.上夜班人群及没有达到理想生活状态的人群,抑郁、焦虑及睡眠问题更加突出。是否实现理想生活状况和焦虑、抑郁及睡眠的关系最密切,上夜班和焦虑关系最密切。

Cognitive Function Characteristics and Influencing Factors in Patients with Depressive Disorders: A 5-year Follow-up Report Based on The Epidemiological Survey of Mental Disorders

Ziang Lin¹, Qian Wang², Xiaojing Li³, Yue Zhang³, Jingxuan Zhang³, Xiaojing Cheng⁴

1.Jining Medical College

2.Shandong Province Hospital of Occupational Diseases

3.Shandong Mental Health Center

4. Shandong Academy of Occupational Health and Occupational Medicine

Objective Cognitive impairment represents a notable feature of depressive disorders. Comprehending its characteristics and influencing factors is vital for patient rehabilitation.

Methods This study is based on the 2015 Shandong Province Epidemiological Survey of Mental Disorders (completed with 27,917 participants) and selected a total of 871 cases of depressive disorder patients diagnosed according to the Diagnostic and Statistical Manual of Mental Disorders, Fourth Edition (DSM-IV) from 1,237 cases across eight cities as the study group. Using a 1:1:1 matching method based on the same age group, gender, and place of residence as the study group, a total of 825 positive and 825 negative cases identified through general health questionnaires and additional risk assessment questions from the 2015 survey were randomly selected to form the high-risk and low-risk control groups. A five-year follow-up survey was conducted in 2020 on these three groups, employing tools such as a general information questionnaire, General Health Questionnaire-12 and additional risk assessment questions, SCID-I/P, Global Pain Scale, Quality of Life Questionnaire, Pittsburgh Sleep Quality Index, Montreal Cognitive Assessment, and clinical data questionnaire.

Results The current depressive group scored lower on the MoCA than the non-depressive group ($t=8.86$, $P<0.01$). The study group scored lower on the MoCA than the elevated and minimal risk group ($F=11.98$, $P<0.01$). The depression-unremitted group scored lower than the depression-remitted group ($t=6.44$, $P<0.01$). The Analysis indicated that males, with better life quality, and longer education were associated with higher MoCA scores. Conversely, older age, rural residency, employment, current depression, and poor marital were associated with lower MoCA scores.

Conclusion Individuals with depression commonly suffer cognitive impairment, which tends to partially improve as depression remits. Analysis indicates that males, better quality of life, and higher educational level are protective factors against cognitive impairment,

while older age and rural residency are risk factors for cognitive impairment.

关键词: depression disorder; cognitive function; case-control study; epidemiological survey; Shandong Province.

The Relationship between Depression and Cognitive Function Among Individuals Aged 18 and Above in Shandong Province: The Mediating Role of Sleep Quality

Ziang Lin¹, Xiaojing Li³, Qian Wang², Yue Zhang³, Jingxuan Zhang³, Xiaojing Cheng⁴

1. Jining Medical College

2. Shandong Province Hospital of Occupational Diseases

3. Shandong Mental Health Center

4. Shandong Academy of Occupational Health and Occupational Medicine

Objective Investigating the mediating role of sleep quality in the relationship between depression and cognitive function, providing a basis for interventions in the recovery of cognitive functioning in patients with depressive disorders

Methods This study is based on the 2015 Shandong Province Epidemiological Survey of Mental Disorders (completed with 27,917 participants) and selected a total of 871 cases of depressive disorder patients diagnosed according to the DSM-IV from 1,237 cases across eight cities as the study group. Using a 1:1:1 matching method based on the same age group, gender, and place of residence as the study group, a total of 825 positive and 825 negative cases identified through general health questionnaires and additional risk assessment questions from the 2015 survey were randomly selected to form the high-risk and low-risk control groups. A five-year follow-up survey was conducted in 2020 on these three groups, employing tools such as a general information questionnaire, General Health Questionnaire-12 and additional risk assessment questions, SCID-I/P, PSQI, and MoCA

Results A negative correlation was observed between depression in 2015 and the MoCA total score in 2020 ($r=-0.11$; $P<0.01$), while a positive correlation was found with the PSQI total score in 2015 ($r=0.48$; $P<0.01$). There was a negative correlation between the MoCA total score in 2020 and the PSQI total score in 2015 ($r=-0.27$, $P<0.01$). Sleep quality in 2015 served as a complete mediator between depression in 2015 and cognitive function in 2020. Conversely, depression in 2020 was negatively correlated with the MoCA total score in 2020 ($r=-0.20$; $P<0.01$) and positively correlated with the PSQI total score in 2020 ($r=0.40$; $P<0.01$). A negative correlation was also noted between the MoCA total score in 2020 and the PSQI total score in 2020 ($r=-0.30$, $P<0.01$). Sleep quality in 2020 acted as a partial mediator between depression in 2020 and cognitive function in 2020, with the indirect effect accounting for 61.96% of the total effect

Conclusion Depression disorders are influenced by sleep quality in their relationship with cognitive function, and this influence persists over time. Enhancing the sleep quality of patients with depressive disorders can contribute to the recovery of their cognitive function

关键词: Depressive disorders; Cognitive Function; Sleep Quality; Epidemiological survey; Shandong Province.

社交焦虑障碍虚拟现实暴露系列个案研究

刘瑜卿 王鹏翀 张瑾瑜 李占江*
首都医科大学附属北京安定医院

目的 社交焦虑障碍 (social anxiety disorder, SAD) 的传统暴露治疗存在拒绝率和脱落率高、难以控制暴露等级等问题。虚拟现实暴露已在 SAD 等疾病中初步表现出改善临床症状的有效性, 但仍然存在暴露场景暴露刺激因素单一、情绪诱发程度不理想等问题致使治疗效果不佳。此外, 单一虚拟现实暴露对患者注意力调节有限, 而改善 SAD 重要因素之一是对其注意偏向调节。因此, 本研究将注意训练任务与虚拟现实暴露结合, 采用系列个案研究

初步验证基于注意引导的虚拟现实暴露治疗联合方案的疗效。

方法 (1) 对象: 北京安定医院焦虑障碍门诊招募符合入组标准的 SAD 患者, 不限制药物治疗, 共 12 例被试参与。(2) 评估工具: 采用简明国际神经精神访谈 (MINI) 中文版诊断, 利博维茨社交焦虑量表 (LSAS)、汉密尔顿焦虑量表 (HAMA) 和抑郁量表 (HAMD) 于基线、第 2 周和第 4 周末评估社交焦虑障碍严重程度和焦虑抑郁情绪。采用社会交往焦虑量表 (SIAS) 和社交恐惧量表 (SPS)、特质性事后加工过程量表 (PEPI-T)、自我关注量表 (SFAS)、注视焦虑评定量表 (GARS) 于基线和第 1、2、3、4、6、8、12 周末评估。采用沉浸感量表中文版 (IPQ)、模拟器不适感量表 (SSQ) 和自编的现场暴露动机及注意力评估量表于每次治疗后评估适宜性和注意方面的变化。(3) 干预方法 12 例个案治疗以 2 次/周频率, 每次 90 分钟, 共 8 次的设置进行, 会谈内容包括初始访谈、注意引导 VR 暴露干预和总结性会谈。

结果 12 例 SAD 患者 8 次治疗后, LSAS 量表平均分由 73.58 ± 27.05 下降至 49.83 ± 34.92 , 平均减分率为 32.43%。HAMA 和 HAMD 减分率分别为 28.57% 和 50.00%。PEPI-T 量表分数由基线 41.42 ± 12.85 下降至 32.42 ± 12.43 , 自我关注量表平均分由 57.75 ± 7.55 下降至 52.25 ± 10.79 , 注视焦虑量表由基线 39.58 ± 11.53 下降至 33.00 ± 17.80 。治疗期间 VR 沉浸感平均分由 38.92 提高到 39.42, VR 副作用平均分由 13.41 下降至 3.94。现场暴露动机由基线 47.08, 提高至 72.92 分。

结论 完成 12 例基于注意引导的虚拟现实暴露个案治疗, 结果初步表明 VR 暴露联合药物治疗有效改善 SAD 被试社交焦虑症状并提高现场暴露动机, 且一定程度上缓解焦虑、抑郁情绪。结合注意引导训练的 VR 暴露减轻被试注视焦虑程度, 但在自我关注量表、事后反刍此类认知功能干预效果甚微。未来需要优化虚拟情境和注意引导任务的操作, 从而进一步提高基于注意引导的 VR 暴露治疗的有效性和适宜性。

细胞因子与焦虑障碍相关性研究进展

吴泽迪 王纯 张宁*

南京医科大学附属南京脑科医院

目的 总结现有细胞因子与焦虑障碍的相关性研究,探索新的焦虑障碍生物标志物,以辅助临床对焦虑障碍患者的诊断与治疗。

方法 本综述结合当前研究现状,从横向的相关性研究以及纵向因果性研究两个层次描述了被研究最多的 10 个细胞因子与各 AD 亚型的关系,在此基础上从机制、疾病相关性入手总结了现有研究的成果并对未来的研究进行了展望。

结果 各细胞因子与 AD 的人类横向相关性研究存在许多空白领域,已有的研究结果也很难得到统一。目前得到人类纵向研究证实相关的炎症因子较少,现有研究认为细胞因子(IL-6、CRP、IL-8)水平虽然与病程相关并受到治疗影响,但高水平炎症因子并不能指示未来的发病与否,无法被证明是病因性因素。在机制研究中除 IL-1 β 与 GM-CSF 在动物实验中被证明可以直接引发或抑制焦虑样行为,其他大多数细胞因子都通过影响包括神经发生、色氨酸代谢、血清素受体调控、血脑屏障完整性等通路与 AD 间接关联。

结论 细胞因子作为整体与 AD 的相关性是明确的,但是要将其作为 AD 的生物标记物以辅助临床诊断、治疗仍然要解决包括细胞因子特异性较低、干扰因素较多、因果性验证不足许多的问题。这提示我们在未来应当以更标准化的方法开展更多纵向研究确定各细胞因子与 AD 亚型的相关性,从机制上寻找更加特异性的指标,以及引入其他生物学标志与细胞因子结合以提高特异性,从而为 AD 临床诊断、分型、辅助治疗和判断预后提供新的可能性。

跨诊断过程的认知行为治疗研究进展

张迎黎* 彭博 白雪霞 阙绍奎

深圳市康宁医院

一、概念

2004 年, Harvey 提出跨诊断过程(Transdiagnostic process),指出一个心理过程要被

视为跨诊断,需满足两个条件:1.与健康对照组相比时,在不同障碍/疾病中出现;2.必须在心理病理学的发展和/或维持中起因果作用。跨诊断 CBT 侧重于识别常见和核心的适应不良的气质、心理、认知、情感、人际和行为过程。

二、不同疾病的跨诊断过程的 CBT 有效性

不同疾病的跨诊断过程的 CBT (tCBT) 最早使用在进食障碍患者(Fairburn, 2003),之后开始应用到焦虑障碍(Norton, 2004; 2008)、抑郁障碍(Clark, 2009)、强迫障碍(Hawley, 2017)等疾病。

Fairburn 等进食障碍强化型 CBT 针对饮食障碍的低自尊、情绪调节困难等问题,显示 CBT-E 在改善患者的体重、BMI 和心理症状方面是有效的,且有较好的依从性,持久性疗效。Newby 分析 tCBT 对焦虑和抑郁的疗效。发现在减少焦虑和抑郁症状方面显示出更有效, Dear, 等(2015)用 tCBT 治疗 GAD, 显示与传统 CBT 疗效相当。Bowers (2024) 的治疗也显示对 GAD 消极情感显著改善。团体治疗在治疗焦虑共病抑郁障碍中也有良好效果(Talkovsky 2017)。

三、起效机制

1.认知重构:帮助患者识别和挑战不合理思维模式,促进认知重构;2.行为实验:学会减少回避并增加对这些情境的控制感。3.情绪调节:通过深呼吸、放松、正念和其他策略更好地理解和管理情绪体验。4.加强自我效能感。5.神经网络:Fang (2024)发现 tCBT 自我聚焦注意力相关的大脑连接模式是有效标志物。

四、不同群体的有效性

Jeppese 等对青少年情绪和行为问题有效,减少家长报告的功能损害显著优于对照组。Sherrill (2024) 退伍军人中实施 UP-IOP 的 tCB, 发现依从性 94%。减少症状严重性方面有效。

五、计算机及网络形式

Orgilés(2024)通过计算机对儿童青少年进行 Super Skills for Life, 表明 SSL 预防儿童情感问题的有力工具。Riddle (2024) 研究家长引导的 tCBT, 减少青少年疫情期间情感问题。Benjet (2024) 比较自我指导的网络 tCBT 在减少大学生的焦虑和抑郁具有显著效果。Abramovitch(2024)发现,使用应用程序组在完美主义、强迫、功能损害和情感负担有显著减少。

以后的研究需要对 tCBT 的长期疗效、不同文化背景下的适用性,以及基于大数据和开发个性化治疗方案,关注 tCBT 改变心理状况的具体机制,包

括神经生物学变化、认知重构过程等。

错失恐惧研究现状与展望

张新雅² 吴波¹

1.长春市第六医院

2.东北师范大学

目的 随着互联网的发展,以微信、QQ、微博为代表的社交网络工具迅速兴起,社交媒体成为了世界各地许多人日常生活的一部分,人们可以随时随地与庞大的社交网络保持联系,分享信息。但与此同时,社交媒体使用也可能会引发人们的反思和恐惧,认为别人在自己不在场的时候正在经历令人难忘的事件,错失恐惧成为了当下的研究热点。因此,全面了解错失恐惧研究的现状,进一步完善相关领域的研究成果,并对未来的研究方向提出建议是很有必要的。

方法 本文整合国内外相关研究,从错失恐惧的概念、分类、理论、相关影响因素及干预措施等方面对错失恐惧的研究现状进行了综述。

结果 认知心理学家 Przybylski 于 2013 年首次开展了错失恐惧的概念研究,将错失恐惧定义为个体因担心错过他人的有意义经历而产生的一种弥散性焦虑,它会导致个体经常查看社交媒体软件或不停地参与各种社交活动,以便得知他人的实时状态。根据自我决定理论,错失恐惧源于基本心理需要缺失,个体寻求需要的满足,而社交媒体方便快捷,可满足个体的关系需要、自主需要、胜任需要。研究证明,年龄、人格特质、心理需要和社交媒体使用都会对错失恐惧产生影响。与此同时,错失恐惧对个体的认知、情绪、行为也会产生影响:(1)认知方面:国内外研究表明,错失恐惧会使个体的认知失败现象增多,能显著预测个体的低自尊、消极社会适应等,与生活满意度呈显著负相关;(2)情绪方面:国内外多项研究指出,错失恐惧对个体的情绪呈负向影响,与抑郁、焦虑、孤独感、压力水平等均呈显著正相关;(3)行为方面:研究表明,错失恐惧可导致个体睡眠质量下降,并能显著预测社交网络成瘾和低头症。目前对于错失恐惧的干预研究主要集中在

认知行为疗法、正念疗法中。

结论 已有研究仍旧存在一些不足,例如大多数研究为横断研究,只有少部分纵向研究,无法理清错失恐惧形成的具体路径;研究对象多为青少年和大学生,缺乏对特定职业群体、不同种族或跨文化领域的研究;测量方式较为单一,多为问卷法;干预措施较少,且缺乏其有效性的验证。在未来的研究中,可结合现场研究、实验室研究等方式,进一步探寻错失恐惧在不同情境下的变化及其内在机制;与此同时,可将软件工程、社会心理学、临床与咨询心理学等学科相结合,充分发挥社交媒体功能设计的作用,跨学科设计错失恐惧的干预措施。

中国医务人员心理健康服务需求研究

马菁¹ 曾箬² 王焱¹ 叶嘉璐¹ 李佳峰¹ 王婉轩² 倪士光³ 邓秀良⁴ 张岚¹

1.四川大学华西医院心理卫生中心

2.国家心理健康和精神卫生防治中心

3.清华大学深圳国际研究生院

4.深圳市龙华区人民医院临床心理科

目的 医务人员的精神心理状况与医疗服务的质量密切相关,随着我国社会经济的快速发展,我国医务工作者以抑郁、焦虑为代表的心理健康问题发生比例不容忽视,但现有的心理健康服务体系尚不能满足医务人员日益增长的精神心理健康服务的需求。

鉴于现有的我国医务人员心理健康服务的供给缺口,为了解医务人员心理服务的需求,我们设计了医务人员心理服务需求调查问卷,以了解我国医疗卫生系统医务人员心理健康服务的需求现状。

方法 基于前期研究团队具体维度的质性研究分析和讨论,设计了心理健康服务需求的自编在线问卷,在 2023 年 9 月-10 月采用方便抽样,在线发放给医务人员自愿作答。采用描述性统计整理一般人口学资料,采用独立样本 t 检验、卡方检验比较不同人群特征的心理服务需求差异,将有差异的因素纳入二元 logistic 回归模型中进一步分析需求差异。

结果 共有来自 31 个省市自治区的 8602 名医务人员参与调查,平均年龄 38.79±9.89 岁,以女性

为主(71.8%)。既往接受过心理服务的医务人员仅有16.98%，且2/3为所在医疗机构提供，他们对这些心理服务的满意度较高。有24.83%(2136人)医务人员有心理服务的需求，不同人群特征的医务人员对心理服务的需求存在差异：有罹患精神障碍风险、既往接受过心理服务者对心理服务的需求较高。从心理服务目前的供需状况来看，医务人员较易获得的心理服务种类前三位为心理测试、心理专题讲座和个别心理咨询与治疗。有需求但获取难度较高的心理服务种类为医院员工帮助计划，精神专科门诊，数字化的心理咨询与治疗。

结论 我国医务人员当前心理服务需求满足度有待提高，还需加强重点人群筛查机制，关注重点人群的心理健康状况及需求，按需提供心理健康服务。

在心理健康服务的供给方面，需要提供更多样化、便捷化的服务方式，特别是顺应新兴数字技术发展的趋势，提高心理健康服务的便捷性和可及性，以满足医务人员日益增长的心理健康服务需求。

艾司西酞普兰和度洛西汀治疗女性 抑郁症临床疗效及安全性观察

高婷婷*

辽宁省精神卫生中心

目的 观察艾司西酞普兰和度洛西汀治疗女性抑郁症临床疗效及安全性。

方法 选取了78例女性抑郁症患者作为研究对象，将其按随机数字表法分为A组和B组，每组各36例。A组患者采用艾司西酞普兰治疗，B组患者采用盐酸度洛西汀治疗，两组患者均共治疗8周的时间，比较两组患者的临床疗效及用药安全性。结果显示：治疗后，两组患者的HAMD评分及烧愈率对比无统计学差异($P>0.05$)；A组患者的主要不良反应为疲劳和失眠，B组患者的主要不良反应为食欲降低、失眠和便秘，所有患者症状均较轻微，可自行恢复或经对症处理后恢复。**结论**：艾司西酞普兰和度洛西汀治疗女性抑郁症均安全有效，疗效相当。

结果 两组患者治疗前后HAMD评分比较治

疗前后，两组患者各时间点的HAMD评分均未见明显差异，两组患者临床疗效的比较治疗后第1周的起效率，A组患者15例起效，B组13例起效，两组患者的起效率比较无统计学差异($\chi^2=0.509, P>0.05$)；治疗后第2周时，A组患者23例起效，B组25例起效，两组患者的起效率比较无统计学差异($\chi^2=0.823, P>0.05$)。

结论 艾司西酞普兰和度洛西汀治疗女性抑郁症患者均安全有效，疗效相当

关键词：抑郁症；女性；艾司西酞普兰；度洛西汀；疗效；安全性。

无抽搐电休克治疗对抑郁症患者记忆 功能、认知功能及疗效的影响分析

高婷婷*

辽宁省精神卫生中心

目的 目的探讨无抽搐电休克治疗(modified electric convulsive therapy, MECT)对抑郁症患者记忆功能、认知功能及疗效的影响。

方法 方法选取2013年4月-2015年8月共82例抑郁症患者作为调查对象，将其按数字表法分为对照组和研究组各41例。对比观察记忆功能、认知功能、疗效及安全性。不同治疗时间计量资料比较应采用重复测量资料方差分析，两两比较采用LSD法，计数资料比较采用 χ 检验或确切概率法， $P<0.05$ 为差异有统计学意义。

结果 不同治疗时间汉密顿抑郁量表(Hamilton depression scale, HAMD)评分比较，差异有统计学意义($P<0.05$)；两组患者HAMD评分比较，差异有统计学意义($P<0.05$)。与治疗前比较，对照组患者急性期治疗结束的HAMD评分明显下降，而研究组患者急性期治疗结束、维持治疗6周末、维持治疗16周末的HAMD评分陆续下降，差异均有统计学意义(均 $P<0.05$)。不同治疗时间背数、联想、图片、再认分值比较，差异均有统计学意义(均 $P<0.05$)；两组患者背数、联想、图片、再认分值比较，差异均有统计学意义(均 $P<0.05$)。研究组急性期治疗结束后1d的背数、图片、再认等分值较治疗前显著降低，差异均有统计学意义(均 $P<0.05$)，维持治疗6周末、维持治疗16周末4项分值较治疗前差异均无统计学意义(均

$P>0.05$),但与急性期治疗后 1 d 对比, 差异有统计学意义($P<0.05$)。

结论 MECT 治疗中患者无恐惧感, 且对记忆、认知的影响较小, 易被家属及患者所接受, 值得临床推广。

血清性激素及 5 羟色胺在更年期抑郁 患者体内的表达及临床价值

高婷婷*

辽宁省精神卫生中心

目的 对更年期抑郁女性血清性激素和 5-羟色胺检测水平的临床价值进行深入分析。

方法 方法对照组 60 例为我院安排体检的健康围绝经期女性, 观察组 90 例为我院就诊的更年期抑郁女性, 对比两组血清卵泡刺激素、雌二醇及 5-羟色胺检测数值, 结果观察组血清卵泡刺激素检测值与对照组比较明显较高.血清雌二醇和 5-羟色胺检测值与对照组比较明显较低, 差异均有统计学意义($P<0.05$).结论雌激素和 5-羟色胺表达水平在女性更年期抑郁患者体内明显下降、卵泡刺激素水平明显升高, 可以适当采用激素替代疗法。

结果 两组患者治疗前后 HAMD 评分比较不同治疗时间 HAMD 评分比较, 差异有统计学意义($P<0.05$); 两组患者 HAMD 评分比较, 差异有统计学意义($P<0.05$)。与治疗前比较, 对照组患者急性期治疗结束的 HAMD 评分明显下降, 而研究组患者急性期治疗结束、维持治疗 6 周末、维持治疗 16 周末的 HAMD 评分陆续下降, 差异均有统计学意义(均 $P<0.05$)。

结论 女性绝经期抑郁症患者雌激素和 5-羟色胺表达水平降低, 卵泡刺激素水平明显升高, 可以采用激素替代疗法。此外, 除了药物干预, 心理干预和良好社会支持也是减少绝经期妇女抑郁症的正确方法。

冰雪运动员心理因素研究

闫欣彤 卢亿汇 伍龙海 刘依林 朱芊颖 孔令韬 吴枫*

中国医科大学附属第一医院

目的 近年来越来越多关注于运动员心理健康的研究逐渐发现了运动锻炼与心理健康之间存在的互惠关系: 运动参与和锻炼对精神状态有益, 可以改善情绪和提高生活质量; 良好的心理健康也会带来更好的身体状况和运动表现。因此, 本研究检测冰雪运动员的心理因素, 比较其与健康对照是否存在显著差异, 为更好地监测运动员健康状态进而使其在运动竞技状态下达到的更高的水平和更稳定的发挥提供理论依据。

方法 本研究共纳入 55 名冰雪运动员及 62 名健康对照, 使用抑郁症筛查量表 (PHQ-9)、广泛性焦虑障碍量表 (GAD-7)、匹兹堡睡眠质量指数 (PSQI) 量表等评估受试者心理状态, 并比较冰雪运动员与健康对照的人口学资料与心理因素差异及其内部相关性。

结果 冰雪运动员的简易应对方式问卷 (SCSQ) 得分高于健康对照 ($P=0.035$), 其青少年生活事件量表 (ASLEC) 中的成绩压力分低于健康对照 ($P=0.024$), 且两者在健康对照 ($r=-0.291$, $P=0.019$) 及整体人群 ($r=-0.285$, $P=0.002$) 中存在负相关。

结论 冰雪运动员与健康对照相比更倾向于采取积极的应对方式, 冰雪运动员的成绩压力小于健康对照, 且积极的应对方式可以缓解成绩压力。

关键词: 冰雪运动员;心理因素

First Study of Inhibitory Function and Brain White Matter Diffusion Tensor Imaging in Adolescents with Obsessive-compulsive Disorder

ZhiYou Long Juan Peng* Wei Ou

Medicine&Technology College Of Zunyi Medical University

Objective This study aims to investigate the correlation between the white matter structure and inhibitory function in adolescents with first-episode obsessive-compulsive disorder (OCD) using neuropsychological measurement and Diffusion Tensor Imaging (DTI) technology, providing scientific evidence for clinical prevention and treatment

Methods Twenty-one adolescents with first-episode OCD who met the diagnostic criteria of the Diagnostic and Statistical Manual of Mental Disorders, Fifth Edition (DSM-5) were collected using convenience sampling in the Psychological Outpatient Department of the Second Affiliated Hospital of Zunyi Medical University as the study subjects. Meanwhile, 16 healthy adolescents were recruited as a control group. Clinical symptoms were assessed using the Yale-Brown Obsessive Compulsive Scale (Y-BOCS). go/no-go/NO-GO Association Task (GNAT) was used for cognitive function assessment. Whole brain white matter Diffusion Tensor Imaging (DTI) scanning was performed on all enrolled subjects using 3.0TGE MRI from the USA. The anisotropic anisotropy (FA) values and mean diffusivity (MD) of the white matter of the two groups were analysed to compare the differences in cognitive functions between the two groups, and the FA values, Yale-Brown Obsessive-Compulsive Disorder Scale (OCD) scores, onset times, and reaction times and correct rates in go/no goGo/No-Go tasks between the two groups were also compared in the white matter regions. Pearson correlation analyses were performed on indicators such as reaction time and correctness in the task

Results In terms of inhibitory function, there was a significant difference between the case group and the control group in terms of mean reaction time ($417\pm 36.93\text{ms}$) vs ($410.88\pm 25.30\text{ms}$) ($P < 0.05$), and in terms of correctness ($73.71\pm 3.67\%$) vs ($78.58\pm 2.26\%$) ($P < 0.05$). In terms of brain structure, the case group showed a statistically significant difference ($P < 0.05$) in terms of lower FA values in the middle temporal gyrus, posterior thalamic radiation, corpus callosum, geniculate corpus callosum, cingulate gyrus, and middle cerebellar peduncle with significant changes. In terms of inhibitory function, the mean correct rate was lower while the mean response time was longer compared to

the control group, and the difference was statistically significant ($P < 0.05$). Further Pearson correlation analysis revealed that the FA value was positively correlated with the mean correct rate ($r=0.49, P < 0.05$) and negatively correlated with the mean reaction time ($r=-0.84, P < 0.05$). the MD value was negatively correlated with the mean correct rate ($r=-0.46, P < 0.05$) and positively correlated with the mean reaction time ($r=0.47, P < 0.001$)

Conclusion 1. Compared to the healthy control group, adolescents with OCD showed decreased average accuracy rates and increased average reaction times in the go/no-go task, indicating significant cognitive impairment, particularly in inhibitory function 2. Adolescents with OCD exhibited reduced FA values and increased MD values in specific brain regions, including the middle temporal gyrus, corpus callosum body, genu, cingulate gyrus, and cerebellar peduncles. 3. A values in specific brain regions of adolescents with OCD were positively correlated with average accuracy rates and negatively correlated with average reaction times, while MD values were negatively correlated with average accuracy rates and positively correlated with average reaction times. These findings suggest that the middle temporal gyrus, corpus callosum body, genu, cingulate gyrus, and cerebellar peduncles may play a critical role in the impaired inhibitory function of adolescents with OCD.

ChatGPT 应用于网络认知行为治疗的初步探讨

苏亮^{1,2} 雷晓霞² 蔡亦蕴^{1,2}

1. 复旦大学附属华山医院

2. 上海市精神卫生中心

目的 ChatGPT (Generative Pre-trained Transformer) 是人工智能技术驱动的自然语言处理工具, 能够通过理解和学习人类的自然语言来进行对话,

并能根据聊天的上下文进行互动。ChatGPT 已显示其在诊断复杂医疗问题的巨大潜力，但在精神医学中的系统性研究较少。本研究拟系统综述 Chat GPT 在网络认知行为治疗领域的使用前景、研究进展和局限性，为将来有效合理使用人工智能技术帮助精神疾病患者探讨未来研究的方向和实践建议。

方法 使用 Chat GPT 为关键词，检索 PubMed 与精神医学、临床心理学、网络认知行为治疗相关的研究文献，并进行筛选和分类。我们使用系统性综述的方法分析研究文献，并进一步对 Chat GPT 在精神医学或心理疾病，特别是网络心理治疗中的应用情况进行总结。纳入标准为 ChatGPT 应用于精神医学或心理障碍的相关领域论文，排除标准为排除评论性文章、技术类文章等。

结果 根据纳入标准和排除标准，通过筛选共系统分析其中 35 篇与 Chat GPT 在医学领域的应用相关的论文。结果发现 Chat GPT 在心理治疗、药物依从性管理、患者自助健康管理、医学教育和研究等多个领域具有显著的应用优势。Chat GPT 在心理治疗中认知行为治疗的使用较为广泛，多个研究表明使用 Chat GPT 进行网络认知行为治疗的效果不劣于传统的面对面 (face to face) 心理治疗。在药物管理方面，使用 Chat GPT 可以帮助患者更好地管理药物使用，改善药物治疗的依从性。

结论 通过系统综述及总结 Chat GPT 在医学特别是精神或心理疾病中的应用情况，并提出了未来研究的方向和实践建议。尽管 Chat GPT 在医学领域的应用前景非常广泛，但其应用也存在一些限制，例如不能替代医生的面对面诊断和体格检查及精神检查。此外，由于 Chat GPT 的模型训练和推导需要海量的文本数据，使用不当可能会面临数据隐私保护的问题。将来需要更多的研究来探讨 Chat GPT 在精神医学领域的应用，并制定相关的标准和规范。

香兰素吸嗅联合 SSRIs 类抗抑郁药治疗抑郁症的疗效观察

于海宁* 刘扬
安徽省精神卫生中心

目的 观察香兰素吸嗅联合 SSRIs 类抗抑郁药治疗抑郁症的疗效。

方法 在这项随机对照试验中，我们旨在评估香兰素吸嗅治疗结合常规 SSRIs 类抗抑郁药物对抑郁症患者的疗效和安全性。我们将 80 例抑郁症患者随机分为两组，每组 40 例。治疗组患者在常规 SSRIs 类抗抑郁药治疗的基础上接受香兰素吸嗅治疗，而对照组仅接受常规 SSRIs 类抗抑郁药治疗。

为了评估治疗效果，我们将使用汉密尔顿抑郁量表 (HAMD) 来评估患者在治疗前、治疗后 2 周和治疗后 4 周的抑郁情绪。HAMD 是一种广泛使用的评估抑郁症状严重程度的工具，包括多个项目，如情绪低落、睡眠障碍、食欲减退等。通过比较两组患者的 HAMD 评分，我们可以评估香兰素吸嗅治疗是否能够显著改善患者的抑郁症状。

结果 疗效分析结果表明治疗后第 2 周和第 4 周，治疗组的 HAMD 评分相较于对照组均显著降低，且下降程度更高，差异具有统计学意义 ($P < 0.05$)。在治疗过程中，两组患者均未出现严重的过敏反应或其他不适感。TESS 评分显示两组患者在行为不良反应、实验室检查指标及神经系统反应等方面均未见显著性差异 ($P > 0.05$)。

结论 本研究结果表明香兰素吸嗅联合 SSRIs 类抗抑郁药治疗对抑郁症患者的抑郁情绪具有显著的改善作用，香兰素吸嗅治疗安全、无副作用，为抑郁症患者的抑郁情绪治疗提供了新的思路和方法。

不同等级冰雪运动员唾液代谢谱系特点及其心理状态相关性的研究

卢亿汇 吴枫*
中国医科大学附属第一医院

目的 冰雪运动的训练和比赛环境有其独特性。然而，人们对冰雪运动员的新陈代谢特征及其与心理状态的相关性知之甚少。本研究拟通过对比不同等级冰雪运动员的唾液代谢特点与心理状态，总结发现冰雪运动员的唾液代谢特点与心理状态，探寻冰雪运动员的特征代谢物与其心理状态的相关性，为理解冰雪运动员的生理心理状态对赛训表现的影响提供理论基础。

方法 本研究共纳入被试冰雪运动员组 68 人。所有受试者的心理状况均通过以下心理量表进行评估: 运动员流畅状态量表、患者健康问卷-9 (PHQ-9)、广泛性焦虑量表-7 (GAD-7)、心境状态量表 (简式 POMS)、匹兹堡睡眠质量指数 (PSQI)、竞技状态焦虑量表。采用液相色谱法 (LC) 和串联质谱法 (MS/MS) 鉴定差异代谢物。

结果 1、不同等级运动员在运动员流畅状态量表中的平衡、目标、集中、控制、融合、反馈、调控、享受、总分以及竞技状态焦虑量表中的认知状态焦虑和躯体状态焦虑得分上有显著差异 ($P < 0.05$)。2、不同等级的冰雪运动员在唾液代谢谱系主成分分析中没有显著差异, 在国家级运动员组与省级运动员组发生显著改变的通路是卟啉和叶绿素 II 的代谢; 国家级运动员组与其他等级赛事运动员组发生显著改变的通路是精氨酸和脯氨酸代谢和亚油酸代谢。3、不同等级冰雪运动员的前 20 位特征代谢物与心理状态量表得分有相关性。

结论 1、等级较高的冰雪运动员的运动流畅水平更高, 竞技状态焦虑水平较低。2、不同等级的冰雪运动员唾液代谢谱系主成分没有显著差异。3、冰雪运动员的唾液特征代谢物与冰雪运动员心理状态相关。

关键词: 冰雪运动员; 心理状态; 代谢组学; 唾液

Needs Assessment for Psychotherapy Training Among Psychiatric Residents: Qualitative Interview and Focus Group Study

Yanhui Liao¹, Tao Pei^{1,2}

1. Sir Run Run Shaw Hospital, Zhejiang University School of Medicine, Hangzhou

2. Mental health center, Nanjing Normal University

Background /Aim: As psychotherapy has growing demands in the clinic, psychotherapy training programs for psychiatric students to develop and master psychotherapy are in urgent need. In order to establish and improve high-quality psychotherapy training programs, the present study explored psychiatric students' insights, needs, preferences, and expectations for future

psychotherapy programs

Methods We established a qualitative study through Focus Group Interviews (FGIs) with three major interview questions and twenty-one specific questions. Fourteen Chinese psychiatric students (five females) participated in the online focus group interview, and their answers were collected and analyzed

Results No participants had ever received any form of psychotherapy training. During the interview, they offered their comments, expectations, and suggestions for current and future psychotherapy training. Based on the order of interview questions and significant, meaningful statements that participants brought up, we organized and refined participants' perspectives of psychotherapy training into thirteen categories and sixty-three themes

Conclusion The study found that even though no psychiatric students had received systematic training and had limited knowledge of psychotherapy, they had a strong and positive willingness to learn and apply psychotherapy in future clinical practice. They also offered many unique perspectives and expectations for future training, which should be considered for program improvement

产妇心理复原力和依恋与产后抑郁的关联

穆菁菁^{1,2,3}

1. 安徽省精神卫生中心

2. 安徽医科大学附属心理医院

3. 合肥市第四人民医院

目的 探讨合肥市产妇发生产后抑郁情况及其与心理复原力和依恋关系, 为产后抑郁的预防和干预提供基础资料。**方法** 采用问卷调查的方法, 对安徽省妇幼保健院某产科病区 301 名产妇进行一般人口特征、心理复原力、依恋、爱丁堡产后抑郁量表等方面调查。

方法 采用问卷调查的方法, 对安徽省妇幼保健院某产科病区 301 名产妇进行一般人口特征、心

理复原力、依恋、爱丁堡产后抑郁量表等方面调查。

结果 产妇产后抑郁状态检出率为 22.3% (67/301)。在不同文化程度、是否介意孕期形体改变和是否恐惧分娩方面,产妇产后抑郁检出率差异均有统计学意义。心理复原力总分及坚韧性、力量性、乐观性分量表分均减少产妇发生产后抑郁的风险(坚韧性: $OR=0.924$, 95%CI: 0.894~0.954, 力量性: $OR=0.882$, 95%CI: 0.838~0.928, 乐观性: $OR=0.748$, 95%CI: 0.671~0.833, 总分: $OR=0.954$, 95%CI: 0.936~0.971)。依恋总分及回避、焦虑分量表分均能增加产妇发生产后抑郁的风险(回避: $OR=1.025$, 95%CI: 1.055~1.046, 焦虑: $OR=1.031$, 95%CI: 1.014~1.049, 总分: $OR=1.025$, 95%CI: 1.012~1.038)。心理复原力三个维度中的乐观性显著降低了产妇出现产后抑郁的风险(乐观性: $OR=0.823$, 95%CI: 0.699~0.970); 依恋中的焦虑显著增加了产妇出现产后抑郁的风险(依恋: $OR=1.026$, 95%CI: 1.007~1.046)。此外,心理复原力总分和依恋总分也分别减少和增加了产妇产后抑郁的风险(心理复原力总分: $OR=0.958$, 95%CI: 0.941~0.975, 依恋总分: $OR=1.022$, 95%CI: 1.009~1.035)。

结论 心理复原力、依恋与产后抑郁关系密切。可通过提高产妇的心理复原力水平及降低不安全依恋来预防产后抑郁的发生。

关键词: 产后抑郁; 心理复原力; 依恋

基于 CBT 方法调节痴呆患者家属情绪的思考

吴春媛¹ 滕羽鸥² 冯坤²

1.北京中医药大学

2.清华大学玉泉医院

痴呆作为神经退行性疾病,给家属带来了持续增加的照护负担,诱发焦虑情绪,本文基于 CBT 方法,探讨其调节痴呆患者家属情绪的可行性。

痴呆患者对家属的影响是多方面的。首先,痴呆患者的主要症状包括记忆减退、认知下降、日常生活能力下降,甚至昼夜颠倒、不识人物、不能自理等,痴呆还常伴有精神行为症状,如幻觉、妄想和急躁易怒。随着痴呆的加重,家庭需要一位劳动力全职陪护,这导致了家庭收入的降低。同时,持续陪伴

痴呆患者但又难以有效沟通,增加了家属的心理压力,诱发焦虑情绪。家属对父母亲人的正面情绪与久病照护的负面情绪交织,产生了矛盾心理。良好的照护可以延长患者的存活时间,但也增加了家属的照护时间。放弃照护会带来良心谴责和可能的亲属邻里的指责,导致照护患者和个人压力之间的选择矛盾。

家属的认知和情绪变化可以分为确诊前后的变化以及病情日久后的变化。在确诊前,家属因四处求医积累的压力在确诊瞬间得以释放,但随之而来的是痴呆疾病导致的长期问题。虽然宣传普及让家属接受了痴呆是疾病的观念,但他们对疾病照护的难度缺乏充分认识。家属应改变对痴呆的认知,充分认识到合理的照护可以使患者在疾病减轻阶段停留更长时间,从而减小对家庭的影响。随着病情日久,儿女在照护老人和需要工作挣钱的现实之间产生矛盾。老伴相互照顾似乎解决了人力不足的问题,但实际上,健康老年人能否长期照护患病老伴缺少研究支持。家属应改变希望患者帮助完成家务的观念,客观分析老伴在照护中的承担能力,改变只能家人亲自照护患者的观念,寻求社区工作者等社会力量的帮助。基于 CBT 方法,医生应在指导患者治疗的同时,进行充分的家庭教育,让家属认识到好的照护可以使患者维持在较轻阶段,保留大部分日常生活能力,实现安全监护下的生活自理。家庭应充分认识到老伴相互照护存在的潜在问题,避免因照护患者而导致老伴出现身体和心理问题,改变照护观念。

家属在照护痴呆患者过程中会经历行为上的改变。确诊前后,一些家属在确诊后放弃药物治疗,另一些家属则采取积极治疗,这些行为受其独特的家庭背景因素影响。医生应在家庭力所能及的范围内对其进行治疗和生活指导。随着病情日久,长久的照护使行为成为习惯,但同样的照护方式并不能一直适应病情进展的患者,家属应对照护方式做出改变,并逐渐接受来自社会的帮助。基于 CBT 的行为改变,医生应主动提供不同程度痴呆患者的照护建议,帮助家属形成合适的照护行为和经历。家属应在聚焦问题、改变认知的基础上,做出行为改变,平衡照护和工作生活,释放压力,稳定情绪。

关键词: 认知行为疗法,痴呆,家属情绪

基于CBT方法调节帕金森病患者家属情绪的思考

吴春媛¹ 滕羽鸥² 冯坤²

1.北京中医药大学

2.清华大学玉泉医院

帕金森病是一种慢性神经退行性疾病，主要症状包括震颤、肌肉僵硬、运动迟缓和平衡障碍。这些症状不仅影响患者的日常生活，也给家属带来巨大压力。家属在照顾过程中常面临情感负担、经济压力和社会孤立等问题。此外，家属的心理健康也可能受到影响，出现焦虑和抑郁情绪。基于认知行为疗法(CBT)的聚焦问题方法，可以有效帮助家属应对这些挑战。通过CBT，家属可以学会识别和改变负面思维模式，增强应对压力的能力，并建立积极的支持网络，从而减轻照顾负担，提高生活质量。

在帕金森病确诊前，家属可能经历焦虑、不确定和担忧等情绪。当确诊后，家属的情绪变化会更加剧烈，可能会出现悲伤、恐惧和无助感。他们的认知也会从怀疑转变为接受现实，开始面对照顾患者的实际挑战。随着病情的进展，家属的情绪和认知会进一步变化。长期照顾的压力可能导致情绪的耗竭，出现抑郁、愤怒和无力感。同时，他们的认知也可能变得更加消极，认为自己的努力无法改变现状。基于认知行为疗法(CBT)的方法，可以有效帮助家属应对这些变化。通过CBT，家属可以识别并调整负面的思维模式，学习更积极的应对策略，从而减轻情绪负担，提高照顾患者的能力和自身的生活质量。

在帕金森病确诊前，家属的行为可能主要集中在寻找医疗帮助和解答疑问上，表现出频繁就医、咨询专家等行为。当确诊后，家属的行为会出现明显变化，他们开始更多地关注患者的日常照顾，如帮助患者进行日常活动、管理药物和安排医疗检查。随着病情的进展，家属的行为也会随之改变。他们可能需要承担更多的照顾责任，如协助患者进食、洗浴和移动，甚至在经济和情感上提供更多的支持。这种长期的照顾会导致家属的生活方式发生显著变化，可能减少社交活动和个人时间。基于CBT的行为改变方法，可以帮助家属更有效地应对这些挑战。通过CBT，家属可以学会制定合理的照顾计划，设定现实的目标，并通过积极的行为策略来减轻照顾压力，从而改善他们的整体生活质量和应对能力。

穴位贴敷联合耳穴压豆对精神分裂症患者便秘的护理观察

张华* 李建英

九江市第五人民医院

目的 探讨分析穴位贴敷联合耳穴压豆对精神分裂症患者便秘的护理观察。

方法 选取2022年1月-2023年10月在本院收治的80例精神分裂症的患者，根据入院时间将其分为对照组(实施常规护理干预)和中医组(在对照组基础上实施穴位贴敷联合耳穴压豆护理干预)，每组患者各40例，两组均持续干预1个月，比较两组患者的症状缓解时间，于干预前后，比较两组患者的便秘程度、生活质量、护理满意度。

结果 中医组的临床症状腹胀、便质干结、排便困难缓解时间均短于对照组，差异有统计学意义($P<0.05$)；干预后，中医组的便秘程度Wexner评分较对照组低，生活质量较对照组高，差异有统计学意义($P<0.05$)；中医组护理总满意度为95.00%比对照组的护理总满意度80.00%高，差异有统计学意义($P<0.05$)。

结论 本研究结果显示，中医组的临床症状改善时间较对照组短，便秘程度Wexner评分较对照组低，生活质量较对照组高，中医组护理总满意度为95.00%比对照组的护理总满意度80.00%高，这说明了穴位贴敷联合耳穴压豆能缩短精神分裂症患者便秘的临床症状，改善患者的便秘程度和护理满意度，提高患者的生活质量。分析其原因可能是因为，耳穴压耳为诸脉汇集之所，脏腑之气经血脉汇集于耳，对其进行刺激，可调节脏腑机能。综上所述，穴位贴敷与耳穴压豆能缩短精神分裂症患者便秘的临床症状，改善患者的便秘程度和护理满意度，提高患者的生活质量。

重复经颅磁刺激在抑郁障碍治疗中的应用进

展

徐梓峰 王纯* 张宁
南京脑科医院

目的 抑郁障碍是指在临床上由各种原因引起的以显著和持久的抑郁心境、精神运动性迟滞与激越、兴趣丧失等抑郁症状群为主要特征的一类常见精神障碍,具有共病率高、躯体不适症状多等特点。抑郁障碍在我国的终生患病率约为 6.8%,是现今国内常见的精神障碍,全球疾病负担研究显示,抑郁障碍已占非感染性疾病导致失能的比例达 10%。近几年抑郁障碍的患病率和社会负担呈上升趋势,仅在 2019~2020 年间,世界范围内抑郁障碍患病率增加 27.6%,患者增加约 5320 万例。

经颅磁刺激是目前具有代表性的治疗抑郁障碍的非侵入性神经刺激技术之一,其利用电磁转换原理在脑内产生聚焦的感应电流并形成脉冲刺激,重复经颅磁刺激以此原理按固定的刺激频率产生连续脉冲串,调节大脑相关功能区的兴奋性,刺激神经元并引发一系列生理生化反应,具有无痛、无创、安全性高、不良反应小等优点,是临床上较安全的物理治疗手段。近年来,基于循证医学证据的临床治疗指南已纳入重复经颅磁刺激用于治疗多种神经精神疾病,如抑郁障碍、强迫及相关障碍、焦虑障碍等,在精神障碍治疗的临床实践中广泛使用。

方法 本文以“TMS”“depression”为主题词检索了 EMBASE 数据库、PUBMED 数据库,并以“经颅磁刺激”“抑郁”为主题词检索了中国知网、万方数据库,年限限定为近 10 年。

结论 现就 rTMS 在抑郁障碍中的机制及应用进展进行综述,旨在探索重复经颅磁刺激未来可能的发展方向,为抑郁障碍临床治疗提供新的思路。

关键词:经颅磁刺激,抑郁障碍,磁共振成像

焦虑障碍不同亚型间影像学改变的相似性和异质性研究进展

李祎升 王纯* 张宁
南京医科大学附属脑科医院

目的 焦虑障碍是一组以过分恐惧、忧虑和相

关的行为异常为主要表现的精神障碍,对患者的社会功能和生活质量造成极大影响,给家庭和社会带来巨大负担。《Lancet Psychiatry》杂志最新报道焦虑障碍在我国年患病率为 4.98%,终生患病率 7.57%,位居所有精神疾病之首,根据现行的 DSM-5 的诊断标准各个焦虑障碍的区分主要依据焦虑的形式和内容,并且现行诊断标准与病因学的关联性不足。

方法 本文以“fMR”“Anxiety disorder”“NeuroImage”为主题词检索了 EMBASE 数据库、PUBMED 数据库,年限限定为近 10 年。

结论 本文综述了近年来利用 rsfMRI 方法对 PD、SAD、GAD 三种最常见焦虑障碍患者进行脑连接的研究。常见的改变涉及 DMN、SN 和 CEN 中的异常连接。我们发现 PD、SAD、GAD 在某些上述网络内和网络间存在相似的功能连接的改变,不仅是改变性质相同,改变的程度也并无显著差异。此外,在相同诊断的中,我们也可以看到在相同的脑区间产生了不同的功能连接的差异,由此反映出现行诊断存在的两个关键性问题:1 因为症状不同而将机制相同的疾病划分为不同的分类群。2 无法区分症状相同却由两种不同机制引起的疾病。并且为焦虑障碍较为精准的客观病理诊断和发病机制的探索与治疗提供新的观点。

自我怜悯和宽恕对产后抑郁的影响调查

穆菁菁^{1,2,3}

- 1.安徽省精神卫生中心
- 2.安徽医科大学附属心理医院
- 3.合肥市第四人民医院

目的 探讨合肥市产妇发生产后抑郁情况及其与自我怜悯及宽恕关系,为产后抑郁的预防和干预提供心理方面的基础资料。

方法 采用问卷调查的方法,对安徽省妇幼保健院某产科病区 301 名产妇进行一般人口特征、自悯、宽恕、爱丁堡产后抑郁量表等方面调查。

结果 产妇产后抑郁状态检出率为 22.3% (67/301)。在不同文化程度、是否介意孕期形体改变和是否恐惧分娩方面,产妇产后抑郁检出率差异

均有统计学意义。以产妇是否有产后抑郁作为因变量（是=1，否=0），分别将自悯的6个维度和总分与产后抑郁进行单因素 logistic 回归分析。研究结果显示，自我友善、自我评判、孤独感、正念、过度认同和自悯总分与产后抑郁之间均呈负向相关（ $P<0.05$ ）。在控制产妇文化程度、是否介意孕期形体改变和是否恐惧分娩后，分别将自悯的6个维度和总分与产后抑郁进行多因素 logistic 回归分析。研究结果显示，自我评判、孤独感、过度认同和自悯总分与产后抑郁之间均呈负向相关（ $P<0.05$ ）。宽恕自己、宽恕他人和宽恕总分与产后抑郁之间均呈负向相关（ $P<0.05$ ）。其中，与宽恕自己相比，宽恕他人对产后抑郁的风险比高（宽恕自己： $OR=0.936$ ，95%CI：0.902~0.971，宽恕他人 $OR=0.943$ ，95%CI：0.915~0.973）。同时将自悯和自我宽恕与产后抑郁进行多因素 logistic 回归分析。结果显示，仅有自悯总分和自我宽恕总分与产后抑郁之间存在负向关联（ $P<0.05$ ）。其中，与自悯相比，自我宽恕对产后抑郁的风险比高（自悯： $OR=0.968$ ，95%CI：0.937~0.999，自我宽恕： $OR=0.971$ ，95%CI：0.946~0.997）。

结论 自我怜悯及宽恕能力对产后抑郁有一定的影响。提示提高产妇的自我怜悯及宽恕能力对预防产后抑郁的发生有重要的意义。

关键词：产后抑郁；自我怜悯；宽恕

短时正念自助训练对焦虑和主观幸福感的效用研究

刘文双*

丽水市第二人民医院

目的 探索1周正念自助训练对个体焦虑状态、主观幸福感以及行为反应抑制能力的影响，验证短时正念自助训练的效果，为其推广提供实证支持。

方法 研究采用积极对照实验设计，在线公开招聘报告明显焦虑，且有缓解压力需求的大学生与社会人群共104名。通过随机数字排序随机分为正念自助组（ $n=37$ ）、正念音乐组（ $n=33$ ）、音乐训练组（ $n=34$ ）。比较正念自助训练（MBSH）、正念音乐训练（MBLM）和音乐训练（MT）三组之间在训练前（第0天）、单次训练后（第1天）和持续训练7次后（第7天），个体在正念（五因素正念量表，

FFMQ）、焦虑（焦虑自评量表，SAS）和主观幸福感成分（生活满意度量表，SWLS、积极消极情绪量表，PANAS）的变化，并采用 Go/Nogo 范式测试了被试的情绪刺激的反应（击中率、判断标准）变化。

结果 对量表和行为数据进行重复测量方差分析以及进一步的简单效应分析，发现：（1）MBSH 和 MT 在训练前期表现出一致的训练效果，单次训练后显著降低焦虑，1周训练后显著提高正念；1周的 MBLM 则未表现出在正念和焦虑方面的显著训练效果。其中，MBSH 显著提高被试的观察、有意行动水平；MT 显著提高被试的观察、描述水平；MBLM 仅显著提高被试的观察水平。（2）MBSH 可以显著提高生活满意度，降低消极情绪水平，对积极情绪水平没有影响；MBLM 与 MBSH 对主观幸福感三个成分的训练效果模式一致，但7天训练后的效果没有正念自助组效果明显；MT 对生活满意度和积极情绪均没有影响，仅显著降低消极情绪水平。（3）仅 MBSH 可以显著提升在悲伤和快乐刺激下，被试对平静面孔的击中率，并显著降低被试的判断标准，使之更加宽松。

结论 与正念音乐训练和音乐训练相比，短时正念自助训练表现最优，显著改善正念、焦虑和主观幸福感，并提高个体在悲伤和快乐情绪刺激下的反应准确率，降低判断标准。

关键词：正念，自助训练，焦虑，主观幸福感

Altered Functional Connectivity of Locus Coeruleus in Depression

Shuting Chen Weidan Pu*

Department of Clinical Psychology, the Third Xiangya Hospital, Central South University

Objective It has been a long time to propose the involvement of noradrenergic dysfunction in the pathology of depression, although the neuropathological process involved norepinephrine (NE) in depression remains elusive. The locus coeruleus (LC), as the primary source of NE, rarely comes into view in current literature, which may result in poor knowledge of the role of NE in depression. This study aims to map the whole

brain functional connectivity of the LC in depressive patients, which may help to provide a new understanding of the role of NE in depressive pathology.

Methods A total of 480 participants (253 patients with depression) were recruited from two clinical centers using two MRI machine types (Philips and Siemens 3.0T scanners). Dataset #1 from Xiangya, including 52 patients with major depressive disorder (MDD) and 78 healthy controls (HC) scanned by Philips 3.0T scanner, was employed as the discovery sample. Dataset #2 (MDD/HC=95/90) scanned by Siemens 3.0T scanner from Xiangya was utilized as a replication sample across MRI machine types. Dataset #3 (MDD/HC=88/53) from Inner Mongolia was utilized as a replication sample across centers. In order to investigate the anti-depressive effect on the LC-NE system, we followed the patients for 8 weeks after they received escitalopram treatment and a total of 48 patients completed the follow-up clinical and resting-state fMRI measurements. Bilateral LC were selected as regions of interest for whole-brain functional connectivity (FC) analysis. Two-sample t-test was performed on the FC maps between patients and HCs first. Then by using the brain regions with FC alterations at the baseline as masks, the paired t-test was performed to identify the longitudinal changes of FC in patients between the baseline (T1) and after treatment (T2). Finally, the Pearson correlation was evaluated to explore the association between FC and clinical symptoms in MDD

Results Compared to HCs, MDD patients showed decreased LC functional connectivity with the regions associated with higher-order cognitive functions such as the dorsolateral prefrontal cortex (DLPFC), medial prefrontal cortex, precuneus, insula, caudate and cerebellum, and increased connectivity with the primary sensory/motor cortex including the lingual gyrus, the postcentral gyrus, precentral gyrus (PreCG) and superior parietal gyrus. Correlation analysis showed that the decreased FC with DLPFC and cerebellum was negatively associated with depressive symptoms and the increased FC with the PreCG and the SPG was positively associated with the clinical symptoms in patients. These findings were consistently replicated in both independ-

ent samples. After 8 weeks of escitalopram drug treatment, HAMD total score, work and interest score, and depressed mood score were significantly decreased. However, no significant changes of FC with the bilateral LC were observed after treatment in patients

Conclusion The present study reveals an imbalanced connectivity pattern of LC in MDD, characterized by decreased connectivity with the superior association cortex and increased connectivity with the primary sensory/motor cortex. Along with their associations with clinical symptoms, the findings provide a novel insight into the potential role of the LC-NE system involved in the neuropathological mechanism of depression. The limited effect of drug treatment in this study implies that short-term SSRI treatment prominently targeting the serotonin system may not be sufficient to normalize underlying neuropathological deficit related to the LC-NE system in depression

关键词: locus coeruleus, LC-NE system, functional connectivity, resting-state fMRI, major depression disorder

重度抑郁障碍患者的决策行为及其与抑郁焦虑症状的关系

雷威*

西南医科大学附属医院

目的 探讨 MDD 在概率翻转学习 (Probability Reversal Learning, PRL) 任务中的决策特征, 并分析其与临床症状的关系。

方法 纳入 2020 年 10 月至 2023 年 5 月期间在西南医科大学附属医院精神科就诊并符合《精神疾病诊断与统计手册》(DSM-IV) 重度抑郁症诊断标准的 MDD 组 48 名, 以及年龄性别匹配的健康对照 (Healthy Controls, HCs) 组 52 名。分别通过贝克抑郁自评量表 (BDI)、贝克焦虑自评量表 (BAI) 评估受试者抑郁和焦虑症状, 并通过 PRL 任务考察受试者的决策特征, 分析指标包括达标试次、固执错误、赢后保持率、输后转移率等。采用独立样本 t 检验比较组间差异, 使用 Spearman 相关分析考查各临床症状与 PRL 指标间的相关性。

结果 MDD 组的输后转移率显著高于对照组 ($t=3.684, P<0.01$), 而两组在达标试次、固执错误和赢后保持率上差异无统计学意义 ($t=0.329, 0.132, 0.609, P>0.05$)。此外, BDI 和 BAI 得分与赢后保持率呈显著正相关 ($r=0.450, 0.398, P<0.01$)。

结论 MDD 患者在面对负性结果时更倾向于改变选择策略, 而抑郁和焦虑症状越严重, 患者在得到正反馈后越倾向于维持已有的决策。

基于 DBT 的情绪调节技巧对青少年抑郁症状改善作用的探索

邹晔峰² 林祯秀¹ 林李琼² 林涌超²

1.福建医科大学

2.福州市第二总医院神经精神病防治院

目的 本研究旨在探讨基于辩证行为疗法 (DBT) 的情绪调节技巧对青少年抑郁症状的改善作用。青少年时期是身心快速发展的时期, 情绪不稳定性是该阶段的重要特征, 难以区分是身心发展或疾病的影响。因此, 本研究通过实施基于 DBT 的情绪调节技巧, 期望能有效减轻青少年抑郁症状, 并为其临床干预提供科学依据。

方法 本研究选择了 2023 年 9 月至 2024 年 6 月间, 临床心理科收治的 32 名青少年抑郁症住院患者作为研究对象。这些患者接受了为期 8 周的 DBT 团体干预, 内容包括关系建立、正念训练、情绪调节、压力应对和人际效能等多个关键模块。干预前后, 采用汉密尔顿抑郁量表 (HAMD)、自评抑郁量表 (SDS) 以及患者健康问卷-9 项 (PHQ-9) 等标准化量表来评估患者抑郁症状的改善情况。

结果 经过 8 周的 DBT 干预后, 结果显示青少年患者的抑郁症状得到了显著的缓解。量表评估显示, 患者的抑郁症状评分明显降低, 并且这种改善具有持续性的趋势。更重要的是, 患者在掌握了情绪调节技巧后, 能够更有效地应对日常生活中的情绪挑战, 进而提升了整体的生活质量。

结论 基于 DBT 的情绪调节技巧对青少年抑郁症状具有显著的改善作用。该疗法不仅有效减轻了患者的抑郁症状, 还提高了患者及家属的情绪管

理能力。因此, 建议在青少年抑郁的临床治疗及日常心理健康教育中进一步推广和普及基于 DBT 的情绪调节技巧。

团体正念疗法对更年期女性抑郁症患者的疗效研究

邵春红* 宇淑涵

复旦大学附属华山医院

目的 女性进入更年期, 抑郁症患病率明显增高。本研究探讨团体基于正念的干预 (Mindfulness-Based Intervention, MBI) 对更年期女性抑郁症患者的治疗效果。

方法 患者来自于 2023 年 4 月至 2024 年 5 月在复旦大学附属华山医院精神医学科就诊的 98 位门诊患者。采用随机数字法, 将患者随机分配进入团体 MBI+常规治疗组和团体支持组+常规治疗组, 两组患者除进行常规的门诊药物治疗外, 分别给予 8 周的团体 MBI 和团体支持。治疗前后, 采用患者健康问卷-9 (Patient Health Questionnaire-9, PHQ-9) 和 17 项汉密尔顿抑郁量表 (17-Hamilton Depression Scale, HAMD) 评估患者基线及治疗 8 周后抑郁症状的程度。

结果 8 周治疗结束时, 团体 MBI 组及团体支持组患者的自评及他评抑郁量表评分均较基线降低 (均 $P<0.001$), 但团体 MBI 组有效率和临床治愈率均高于团体支持组, 差异具有统计学意义 ($p<0.05$)

结论

团体正念疗法可能对更年期女性抑郁症患者的抑郁症状具有良好的疗效, 由于操作方便, 患者更容易接受配合, 值得扩大样本量进一步深入研究。

Impact of Genetic Risk on Cognitive Functions: The Mediating Role of Cortical Thickness

Yixin Cheng Yunzhi Pan* Zhening Liu

1. Department of Psychiatry, National Clinical Research Center for Mental Disorders, and National Center for Mental Disorders, The Second Xiangya Hospital of Central South University

Objective This study aims to elucidate the intricate relationship between cortical features, genetic predispositions, and cognitive function in schizophrenia. Specifically, it delves into the correlations between polygenic risk scores (PRS) and synaptic-based polygenic risk scores (SPRS) with cognitive performance and cortical thickness among individuals diagnosed with schizophrenia

Methods Total of 245 participants, comprising 114 schizophrenia patients (SCZ), 42 unaffected siblings (SCB), and 89 healthy controls (HC), was recruited from the Second Xiangya Hospital of Central South University between 2020 and 2022. Cortical structural data were meticulously acquired utilizing a Siemens 3.0T MRI scanner. Cognitive function was comprehensively assessed using a battery of neuropsychological tests encompassing six dimensions: working memory, processing speed, executive function, visual memory, verbal memory, and verbal fluency

Polygenic risk scores (PRS) and synaptic-based polygenic risk scores (SPRS) were calculated based on SNPs identified through targeted genomic sequencing. Statistical analyses included rigorous variance analysis, partial correlation analysis, and mediation analysis, with covariates such as age, gender, and educational years duly considered to ensure robust and reliable results.

Results The results revealed that PRS was significantly negatively correlated with visual memory ($r=-0.303$, $p<0.001$), verbal memory ($r=-0.271$, $p<0.001$), working memory ($r=-0.260$, $p<0.001$), and executive function ($r=-0.263$, $p<0.001$). Similarly, SPRS demonstrated significant negative correlations with visual memory ($r=-0.211$, $p<0.001$), executive function ($r=-0.208$, $p<0.001$), working memory ($r=-0.195$, $p<0.001$), and verbal memory ($r=-0.195$, $p<0.001$). Furthermore, cortical thickness in the left pars opercularis and right postcentral gyrus was negatively correlated with PRS and SPRS, respectively

Mediation analysis further revealed that cortical

thickness of the right postcentral gyrus mediated the relationship between SPRS and visual memory, whereas the left pars opercularis was found to mediate the relationship between SPRS and verbal memory. These mediation effects underscore the intricate pathways through which genetic predispositions influence cognitive outcomes in schizophrenia, mediated by structural brain changes.

Conclusion This study underscores that memory-related cognitive functions exhibit heightened sensitivity to genetic risk factors in schizophrenia. The cortical thickness of specific brain regions, notably the right postcentral gyrus and left pars opercularis, plays a pivotal mediating role in the genetic influence on cognitive functions. These findings accentuate the significance of cortical structural changes in elucidating the genetic underpinnings of cognitive impairments in schizophrenia. Understanding these relationships offers crucial insights into potential intervention strategies targeting cognitive deficits in schizophrenia

强迫障碍的短程强化认知行为治疗研究进展

张春笑¹ 朱健立¹ 徐鑫鹏¹ 杨颖¹ 李晓虹²

1.首都医科大学附属北京安定医院

2.北京回龙观医院

目的 回顾强迫障碍短程强化认知行为治疗的研究进展,对短程强化认知行为治疗的定义进行讨论。对比短程强化认知行为治疗与药物治疗以及其他心理治疗的疗效。对比不同类型/不同人群(如:青少年儿童强迫障碍,产后强迫障碍)的治疗疗效,总结不足并展望未来研究方向。

方法 强迫障碍(Obsessive Compulsive Disorder, OCD)是一种以强迫思维和强迫行为为主要表现的临床常见精神障碍,目前其一线治疗方案包含认知行为治疗(Cognitive Behavioral Therapy, CBT),尤其是暴露与反应预防(Exposure and Response Prevention, ERP)。本研究对目前未明确的短程强化认知行为治疗定义进行讨论,即缩短常规认知行为治疗

次数并在四周内集中进行的治疗可称为短程强化认知行为治疗(Intensive Cognitive Behavioral Therapy)。文中回顾了强迫障碍短程强化认知行为治疗的发展历程、优势劣势以及具体治疗流程。回顾在不同类型/不同人群(如:青少年儿童强迫障碍,产后强迫障碍)中短程强化CBT的治疗疗效。最后对本方法的问题和不足进行总结,同时展望未来研究方向。

结果 总结了短程强化认知行为治疗对强迫障碍患者疗效研究的研究方法等方面,回顾短程强化认知行为治疗对强迫障碍的疗效研究,将其与药物治疗或药物联合短程强化CBT相比以及与心理健康教育等其他心理治疗方法进行比较,短程强化CBT疗效均等同或更优,但会随时间推移疗效有所下降。

结论 关键词:短程强化认知行为治疗;强迫障碍;研究进展

病共病失眠障碍患者和不同年龄段失眠障碍患者的残留症状、脱落率和配合度等方面存在短板。

结论 失眠认知行为治疗对于常见精神疾病共病失眠障碍患者和不同年龄段失眠障碍患者是一种非常有效且安全的方法;在应对失眠障碍患者残留症状、高脱落率和配合度低等问题时,及时调整治疗策略和治疗方法,帮助患者解决浮现的问题,以达到患者既定的治疗目标。

关键词:失眠障碍;精神疾病;年龄段;失眠认知行为治疗;综述

CBT-I 在精神疾病共病失眠障碍及不同年龄段失眠障碍患者中的应用

杨宏磊^{1,2} 谢康^{1,2} 刘文佳^{1,2} 刘振月³ 李献云²

1.承德医学院研究生学院

2.北京回龙观医院

3.承德医学院

目的 失眠障碍是常见的睡眠问题之一,易复发、患病率高是其主要特点,除药物治疗以外,失眠认知行为治疗在失眠障碍中的应用逐渐广泛。尽管失眠认知行为治疗在精神疾病共病失眠障碍和不同年龄段失眠障碍患者中取得了一定的成果,但仍有许多争议和不足。因此,本综述的目的旨在为将来应用失眠认知行为治疗改善常见精神疾病和不同年龄段失眠障碍患者症状的临床实践与研究提供一定的参考价值。

方法 现对常见精神疾病共病失眠障碍和不同年龄段失眠障碍的失眠认知行为治疗相关文献进行回顾,从其研究现状、存在问题和未来展望等方面进行论述。

结果 失眠认知行为治疗在常见精神疾病共病失眠障碍患者和不同年龄段失眠障碍患者中有显著治疗效果,失眠认知行为治疗是一种高效且安全的方法。同时也发现失眠认知行为治疗对某些精神疾

焦虑障碍研究协作组

延续护理对老年抑郁症、焦虑症患者护理疗效研究

王英歌*

宿迁第三医院

目的 探讨延续护理在老年抑郁症患者、焦虑症患者的护理疗效,不仅能提高患者的生活质量还能降低反复住院次数。

方法 选取2023年03月至2024年2月医学心理科出院的老年抑郁症患者、焦虑症患者330例中选160作为研究对象,随机将其分为对照组和干预组(各80例),对照组给予常规的电话随访,干预组在对照组的基础上采取延续护理模式。比较两组患者的服药依从性、抑郁及焦虑程度、心理应急状况、社交情况、睡眠质量及饮食情况。

对照组患者给予常规的电话随访及疾病知识指导(干预6次)。干预组除了给予对照组常规电话随访基础上增加延续护理措施(干预6次),具体如下:

1.参与延续护理条件。精神科能级及年资高的护士、糖尿病及高血压专科小组护士、沟通能力强的护士。

2.建立信任。护理人员专科知识扎实,态度温和,要让患者对护理人员比较信任,是实施延续护理模式的基础。

3.制定延续护理计划。通过对患者的情绪、兴趣、注意力、服药依从性、睡眠、饮食等了解后及时对患者及家属干预、心理疏导、社交功能训练、康复指导及健康宣教、伴有高血压、糖尿病的现场监测及饮食指导等。

4.选择患者的条件。我院周边的患者,与社区精神障碍管理人员一起将患者集中在社区会议室进行干预。

5.积极倾听、认真观察、正确指导。护理人员要认真、耐心倾听患者的讲述,及时给予鼓励和安慰,帮助患者正确应对各种生活事件,改善对服药的依从性,预防复发。

6.风险评估培训。延续护理同时也给予社区精神障碍管理人员进行专业知识培训,提高风险识别能力。

1.3 观察指标

干预后对比两组患者的服药依从性效果,通过差、一般、较好、好等结果进行划分。采用抑郁量表及焦虑量表对老年抑郁症患者、焦虑症患者进行评价,得分越高表明症状越严重。

1.4 统计学方法

采用统计学软件SPSS22.0进行数据处理,技术资料采用率(%)表示,计量资料以“ $\bar{X}\pm S$ ”表示,组间比较采用 χ^2 检验,以 $P<0.05$ 为差异具有统计学意义。

结果 干预后,干预组患者的服药依从性高于对照组($P<0.05$),抑郁量表及焦虑量表评分显著低于对照组($P<0.05$),干预组患者的社交能力高于对照组($P<0.05$),积极应对得分显著高于对照组,并且消极应对得分明显低于对照组($P<0.05$),睡眠质量及饮食情况高于对照组($P<0.05$)。

结论 延续护理模式对出院的老年抑郁症患者、焦虑症患者具有良好的护理效果,能降低患者反复住院,有效缓解抑郁、焦虑程度,提高生活质量,降低自杀风险。

关键词: 延续护理;老年抑郁症、焦虑症;生活质量;护理疗效

脑电生物反馈对焦虑障碍患者治疗影响效果分析

张兵 付慧* 周小念 谢霜

中国人民解放军联勤保障部队第九二三医院

目的 探讨脑电生物反馈训练对焦虑障碍患者治疗效果的临床影响。

方法 在我科2023年4月至2024年3月期间所收治的焦虑障碍患者中选取40例作为此次研究对象,采用脑电生物反馈训练对患者进行治疗,治疗时间为4周。每周一至周五上午由1名取得培训证书的护理人员在综合训练室给患者进行集体训练,脑电生物反馈训练的内容包括:开放式情景训练、开放式引导训练、团队对抗训练、团队协同训练等,每次训练时间为30分钟,共分为4个周期,每个周期时间为一周。练习结束后患者相互之间可以进行探讨,交流感受和训练心得体会,并对患者提出的问题进行答疑解惑。每个周期使用汉密尔顿焦虑量表及宗氏焦虑自评量表评估患者的治疗效果,使用

社会功能缺陷筛选量表评估患者的社会功能。

结果 通过脑电生物反馈训练,对改善焦虑障碍患者的心理健康和社会功能恢复具有促进作用。患者治疗前后的汉密尔顿焦虑量表评分、宗氏焦虑自评量表评分、社会功能缺陷筛选量表评分明显优于治疗前 ($P < 0.05$),具有统计学意义。

结论 脑电生物反馈训练对于焦虑障碍患者具有治疗效果,能够帮助患者有效改善焦虑情绪、减轻症状、提高生活质量以及社会功能,从而更好的适应社会生活,值得推广和应用。

关键词: 脑电生物反馈;焦虑障碍;效果分析;汉密尔顿焦虑量表

Effects of Comorbid Alexithymia on Cognitive Impairment in Chronic Schizophrenia: A Large Sample Study Based on Chinese Han Population

Yuanping Liao¹, Yunhui Zhong¹, Xiangyang Zhang²

1. The Third People's Hospital of Ganzhou

2. Institute of Psychology, Chinese Academy of Sciences

Objective Alexithymia and cognitive dysfunction are common in patients with schizophrenia. However, few studies have investigated the cognitive performance of patients with schizophrenia comorbid alexithymia. The main purpose of this study was to investigate whether and how alexithymia was correlated with neuro-cognitive impairment in patients with schizophrenia

Methods A total of 695 patients who met the DSM-IV diagnostic criteria for schizophrenia were recruited in this cross-sectional study (male/female=464/231). Demographic and clinical data were collected using self-reported questionnaires. We assessed alexithymia using the Toronto Alexithymia Scale (TAS-20), cognitive function using the Repeatable Battery for the Assessment of Neuropsychological Status (RBANS), and psychiatric symptoms using the Positive and Negative Syndrome Scale (PANSS)

Results The prevalence of comorbid alexithymia in chronic schizophrenia patients was 31.40%. Patients

with Alexithymia were more likely to be male, have higher scores on the Negative symptom subscale and PANSS total score than non-Alexithymia patients (all $p < 0.05$). Moreover, patients with alexithymia exhibited more cognitive dysfunction in immediate memory, language, delayed memory, and total score of RBANS than patients without alexithymia. Stepwise multivariate regression analysis showed that alexithymia was risk predictors for language and RBANS total scores

Conclusion Our results indicate that chronic schizophrenia patients with alexithymia have poorer cognitive dysfunction than those without alexithymia. Some demographic and alexithymia symptoms are risk factors for cognitive dysfunction in chronic schizophrenia patients

关键词: Schizophrenia; Alexithymia; Cognitive impairment; RBANS

强迫型人格障碍症状预测强迫症临床治疗疗效

4.上海交通大学医学院附属新华医院临床心理科

目的 强迫型人格障碍症状在强迫症中很常见,但目前尚不清楚强迫型人格障碍症状对于强迫症临床治疗效果的影响。探索强迫型人格障碍症状与强迫症治疗疗效之间的关系对于了解探索强迫型人格障碍症状在强迫症患者中的作用非常重要,同时也具有临床价值。本研究旨在探索强迫型人格障碍症状与选择性 5-羟色胺再摄取抑制剂和团体认知行为治疗疗效的关系。

方法 本研究共纳入了 80 名未接受治疗的强迫症患者。其中,40 名患者接受了为期 12 周的选择性 5-羟色胺再摄取抑制剂治疗,另外 40 名患者接受了为期 12 周的团体认知行为治疗。治疗前通过人格障碍结构化临床访谈评估强迫型人格障碍症状,治疗前后耶鲁-布朗强迫量表总分的减分率代表了临床治疗疗效。

结果 5-羟色胺再摄取抑制剂和团体认知行为治疗都能有效降低耶鲁-布朗强迫量表的得分。然而,强迫型人格障碍症状只能显著预测 5-羟色胺再摄取抑制剂的疗效,但不能预测团体认知行为治疗的疗效。线性回归表明,强迫型人格障碍症状每增加 1 分,5-羟色胺再摄取抑制剂治疗后的耶鲁-布朗强迫量表减分率下降 4.4%。

结论 强迫型人格障碍症状可能是强迫症药物治疗的不利因素,需要在未来的临床实践中被进一步关注。

关键词: 强迫症,强迫型人格障碍,选择性 5-羟色胺再摄取抑制剂,团体认知行为治疗,疗效预测

一例氘丁苯那嗪治疗迟发性运动障碍的案例报告

马静*

天津市安定医院

目的 迟发性运动障碍(tardive dyskinesia, TD)是药物诱发的多动性运动障碍,多由于长期接触多巴胺受体拮抗剂(DRA)引起,改善非常困难,对患者身心及社会功能造成持续性影响,进一步加重社会疾病负担。目前 TD 治疗的方法主要有药物治疗及非药物治疗。药物治疗包括苯二氮草类药物、银杏叶提取物 EGb-761、金刚烷胺、胆碱能药物、抗氧化剂(如维生素 B6 和维生素 E)、钙通道阻滞剂、普萘洛尔、肉毒素等。非药物治疗包括深部脑刺激治疗及电休克治疗。但是目前并未取得令人满意的疗效。氘丁苯那嗪是 FDA 和我国均批准用于治疗 TD 的新一代 VMAT-2 抑制剂,目前该药已在临床使用。本文为一例氘丁苯那嗪治疗迟发性运动障碍的案例报告,探讨氘丁苯那嗪治疗的疗效及安全性。

方法 患者男性,54 岁,主因“重复行为、重复回忆、伴不安、痛苦 8 年余,口唇不自主运动 3 年”于 2023 年 2 月就诊于我院。患者 2015 年无明显诱因起病,表现反复检查,每次出门必须反复检查门锁是否关好,反复多次仍然不放心,爱做某一个重复动作,有时反复询问一个问题,别人给予回答后,仍然多次询问同样的问题,脑子里反复回想发生过的某一个事情或者反复出现一个念头,每天花费很多的时间在这些行为或者想法上,不能正常生活及

工作,自己感到非常痛苦,心情差,焦虑,夜眠差,2017 年到我院门诊就诊,先后服用舍曲林 200mg/日、阿立哌唑 25mg/日、利培酮 4mg/日、氟哌啶醇 20mg/日,2020 年初患者出现口唇不自主的运动,反复做咂嘴及吞咽的动作,讲话口齿不清。曾加用苯海索 4mg/日,无效果,停用,不自主运动评定量表评分为 7 分。诊断 1 强迫性障碍、2 迟发性运动障碍。治疗上换用氟伏沙明改善精神症状,并予氘丁苯那嗪对症治疗。

结果 调整治疗后,给予氟伏沙明 200mg/日、氘丁苯那嗪 24mg/日治疗 12 周,不自主运动量表评分为 3 分,患者 TD 症状明显改善,口唇不自主运动、反复咂嘴及吞咽动作明显减少,交谈吐字较清晰,焦虑情绪减轻,强迫症状减轻,治疗中患者无明显不适,患者及家属对治疗效果表示满意。

结论 TD 对于大多数患者来说似乎都是不可逆的,目前关于 TD 的发病机制还不完全清楚,多巴胺受体的超敏反应是较为被认可的一种理论假设。氘丁苯那嗪主要作用是促进细胞质单胺类物质进入突触前囊泡,通过抑制囊泡单胺转运蛋白 2 来减少突触前多巴胺等单胺类物质的存储和释放,进而被细胞质中的单胺氧化酶降解,导致突触前多巴胺的消耗。避免突触后多巴胺神经遭受过多刺激,从而达到减轻 TD 症状的效果。本例患者采用氘丁苯那嗪治疗 TD,疗效和安全性较好,远期疗效及安全性还有待进一步观察及研究。

Plasma Orexin-A Combined with Inflammation Indices Predicts Acute Withdrawal Symptoms and Craving in Male Patients with Alcohol Dependence

Lingming Hu¹, Lingzi Cao², Xiangqi Kong², Xu Chen^{2,3}

1.Department of Clinical Psychology, Shandong Provincial Hospital Affiliated to Shandong First Medical University

2.Department of Psychiatry, School of Mental Health, Jining Medical University

3.Department of Psychiatry, Shandong Mental Health Center, Shandong University

Objective This study aimed to evaluate the diagnostic effectiveness of combining plasma Orexin-A levels with inflammatory indices in predicting the severity of withdrawal symptoms and psychological cravings in male patients with alcohol dependence (AD)

Methods A total of 63 male patients with AD and 60 healthy controls (HC) were recruited from Shandong Mental Health Center and Qianfoshan Hospital between January 2018 and January 2020. Plasma Orexin-A levels and inflammatory indices (neutrophil to lymphocyte ratio (NLR), derived neutrophil to lymphocyte ratio (dNLR), platelet to lymphocyte ratio (PLR), lymphocyte to monocyte ratio (LMR)) were measured at baseline and after two weeks of alcohol abstinence. The Clinical Institute Withdrawal Assessment for Alcohol (CIWA-Ar) and Visual Analogue Scale for Craving (VAS-Craving) were used to assess the severity of AWS and cravings, respectively. Binary logistic regression analyses and receiver operating characteristic (ROC) curve analysis was used to determine the predictive efficacy of Orexin-A and inflammatory indices

Results At baseline, plasma Orexin-A levels were significantly higher in the AD group compared to the HC group ($t = 2.21, p < 0.001$). After two weeks of abstinence, Orexin-A levels in the AD group decreased significantly compared with baseline ($t = 2.21, p = 0.03$). Inflammatory indices (NLR, dNLR, and LMR) also decreased significantly after two weeks of abstinence ($t = 2.38, p = 0.02$; $t = 3.40, p = 0.00$; $t = 2.10, p = 0.04$). Correlation analysis revealed that plasma Orexin-A levels were positively associated with CIWA-Ar and VAS-Craving scores ($r = 0.34, P = 0.00$; $r = 0.21, P = 0.03$). Binary logistic regression showed that increased Orexin-A levels were significantly associated with higher CIWA-Ar (OR=1.01, 95% CI [1.22 to 1.02], $p = 0.02$) and VAS-Craving (OR=1.01, 95% CI [1.00 to 1.02], $p = 0.03$) and LMR levels were significantly associated with higher CIWA-Ar (OR=1.24, 95% CI [1.01 to 1.53], $p = 0.04$) and VAS-Craving (OR=1.34, 95% CI [1.06 to 1.68], $p = 0.01$). ROC curve analysis demonstrated that plasma Orexin-A combined with LMR levels had an area under the curve (AUC) of 72.08% (90%CI: 62.52%-78.54%; $p = 0.00$) for predicting AWS severity and 72.11% (90%CI: 62.52%-81.70%; $p = 0.00$)

for predicting craving severity

Conclusion Plasma Orexin-A levels in combination with inflammatory indices, are effective in predicting the severity of acute withdrawal symptoms and psychological cravings in male patients with alcohol dependence

关键词: Alcohol dependence, Orexin-A, Inflammatory indices, Acute withdrawal syndrome, Craving.

A Study on Mahjong Intervention To Improve Cognitive Impairment in Patients with Schizophrenia: A Pilot, Single-blind, Randomized, Controlled Trial

Renqin Hu¹, Zongli Xie², Junyao Li¹, Huirong Luo¹, Yanwei Guo¹, Jinglan Tan¹, Qinghua Luo¹

1.Department of Psychiatry, the First Affiliated Hospital of Chongqing Medical University

2.Department of Psychiatry, Yubei District Hospital of Traditional Chinese Medicine, Chongqing

Objective Despite advancements in various therapy, cognitive impairments in schizophrenia remain inadequately addressed. Mahjong, a traditional Chinese tile-based game, has been widely reported to be closely associated with better cognitive function. However, its effects on the cognitive function of patients with schizophrenia have not yet been studied

Methods In a pilot study, 49 patients diagnosed with schizophrenia (DSM-5) were randomly assigned to the intervention group (Mahjong combined with standard treatment) and the control group (standard treatment). The intervention group engaged in cognitive training through Mahjong for 2 hours per day, 4 days per week for 12 weeks. Primary cognitive outcomes were assessed using Cambridge Neuropsychological Test Automated Battery (CANTAB), while secondary outcomes were evaluated with the Positive and Negative Syndrome Scale (PANSS), and the Self-report Quality of Life Measure for People with Schizophrenia (SQLS). Assessments were conducted at baseline (T0), the 4th week (T1), the 8th week (T2), and the 12th week (T3)

Results There is a significant group-by-time interaction effect in RTI and time effect in PAL. The intervention group showed significant improvements in reaction time and movement time of response to a visual target, visual memory and new learning at T3 compared to baseline. Additionally, the intervention group exhibited significant improvements in SQLS over time

Conclusion While this pilot study suggests that prolonged Mahjong intervention may benefit certain cognitive functions and quality of life in patients with chronic SZ, these findings should be interpreted with caution. Further research with larger, more diverse samples and longer follow-up periods is necessary to confirm and extend these findings

关键词: schizophrenia, cognitive function, Mahjong

A Study on The Correlation between Inflammatory Cells and Sleep and Psychiatric Symptoms in First-episode Schizophrenia Patients

Xulai Zhang^{1,2}, Chuancun Hu^{1,2}, Nan Du^{1,2}

1. Anhui Provincial Mental Health Center

2. Fourth People's Hospital of Hefei City

Objective To explore the correlation between inflammatory cell count, sleep quality, and psychiatric symptoms in first-episode schizophrenia patients

Methods A total of 103 first-episode schizophrenia patients (patient group) admitted to the Anhui Provincial Mental Health Center from November 2021 to August 2022 were included in the study, while 57 healthy individuals (control group) who met the criteria were recruited as the study subjects. The Positive and Negative Symptom Scale (PANSS) and Pittsburgh Sleep Quality Index (PSQI) were used to evaluate the mental symptoms and sleep status of the patients. Blood analysis results were used to determine the peripheral blood white blood cells (WBC) and lymphocytes (L) of the two groups. Count neutrophils (N), monocytes (M), and platelets (PLT) of the two groups. The neutrophil lymphocyte ratio (NLR), monocyte lymphocyte ratio

(MLR), and platelet lymphocyte ratio (PLR) were calculated. Differential, correlation, and regression analysis were performed on survey data using SPSS 26.0

Results (1) The WBC, N, M, NLR, and MLR of the patient group were significantly higher than those of the control group, and the differences were statistically significant (all $P < 0.05$). (2) The correlation analysis between WBC, N, M, NLR, MLR, PANSS, and PSQI scores in the patient group showed a negative correlation between M and sleep time factors ($r_s = -0.205$, $P = 0.037$), and a negative correlation between MLR and excitatory factors ($r_s = -0.204$, $P = 0.039$). (3) The results of linear regression analysis using variables with significant correlation in correlation analysis showed that MLR had a positive impact on excitatory factor scores ($\beta = 7.196$, $t = 2.781$, $P = 0.006$); M had a negative impact on the sleep time factor score ($\beta = -0.851$, $t = -2.157$, $P = 0.033$). (4) The ROC curve analysis results of WBC, N, M, NLR, and MLR for predicting the prognosis of SCZ showed that the area under the curves of WBC (AUC=0.744, 95% CI), N (AUC=0.779), M (AUC=0.815), NLR (AUC=0.728), and MLR (AUC=0.791) were all greater than 70%, indicating that these biomarkers can potentially predict the prognosis of SCZ

Conclusion The levels of inflammatory cells in first-episode schizophrenia patients, as indicated by the biomarkers WBC, N, M, NLR, and MLR, are associated with psychiatric symptoms and sleep disorders

血清 IGF-1 对精神分裂症患者认知功能的预测价值分析

许圆圆¹ 张许来²

1. 庐江县精神病医院

2. 安徽省精神卫生中心

目的 分析血清胰岛素样生长因子 (IGF-1) 对精神分裂症患者认知功能的预测价值。

方法 纳入我院 2021 年 7 月~2022 年 5 月收治

的 151 例精神分裂症患者, 按照其 MATRIS 成套神经认知测试 (MCCB) 评估结果, 将 $MCCB < 40$ 分者纳入认知功能异常组、 $MCCB \geq 40$ 分者纳入认知功能正常组。使用多因素 Logistic 回归分析, 归纳影响精神分裂症患者认知功能的相关因素; 使用 Pearson 相关性分析, 分析精神分裂症患者血清 IGF-1 与 MCCB 评分、阳性和阴性症状量表 (PANSS) 评分的相关性; 使用受试者工作特征曲线 (ROC) 分析血清 IGF-1 等因子预测精神分裂症患者认知功能的曲线下面积 (AUC)、灵敏度、特异性。

结果 151 例患者中, 60 例 MCCB 量表评分 < 40 分, 患者认知功能异常率为 39.74%。认知功能异常组血清 IGF-1 水平、MCCB 评分低于认知功能正常组, 其 PANSS 量表阳性症状、阴性症状、一般精神病量表评分和总分均高于认知功能正常组 ($P < 0.05$)。Logistic 多因素回归分析示, 年龄 > 51 岁、病程 > 1.5 年、文化程度初中及以下、复发性精神分裂症和 $IGF-1 < 65.11$ ng/mL 为导致精神分裂症患者认知功能异常的独立危险因素 ($P < 0.05$)。Pearson 相关性分析示, IGF-1 与 MCCB 评分呈正相关, 与 PANSS 总分呈负相关, MCCB 评分与 PANSS 总分呈负相关 ($P < 0.05$)。ROC 曲线示, IGF-1 联合年龄、病程、文化程度、精神分裂症发病情况预测患者认知功能异常的截断值为 65.11, 其 AUC 为 0.917, 灵敏度、特异性分别为 85.37%、90.44%。

结论 血清 IGF-1 的下降伴随着精神分裂症患者认知功能损伤的进展, 且 $IGF-1 < 65.11$ ng/mL 能够为患者认知功能异常的预测提供可靠参考。

Association between Atherosclerosis Index of Plasma and Psychotic Symptoms in Chinese Patients with First-episode Drug-naïve Major Depressive Disorder

Ping Xu¹, Junjun Liu²

1. Department of Psychiatry, Nanjing Lishui District Psychiatric Hospital

2. Department of Psychiatry, Nanjing Meishan Hospital

Objective Atherosclerosis index of plasma

(AIP), as a comprehensive index for assessing lipid metabolism, has received extensive attention from researchers in recent years. However, the relationship between AIP and psychiatric symptoms (PS) in patients with major depressive disorder (MDD) is still unclear. The purpose of this study was to investigate the relationship between AIP and PS in the Chinese population with first-episode drug-naïve major depressive disorder (FEDN MDD)

Methods A total of 1718 FEDN MDD patients were included in this cross-sectional study. Sociodemographic information, clinical data, and lipid parameters were collected. The positive symptom subscales of the Positive and Negative Syndrome Scale, the Hamilton Depression Scale, and the Hamilton Anxiety Scale were used to evaluate the psychiatric symptoms, depressive symptoms and anxiety symptoms, respectively. Multivariate binary logistic regression analysis was used to estimate the association between the AIP and PS. To investigate the potential threshold effect inherent in a non-linear correlation, a two-stage linear regression model should be employed

Results Multivariate logistic regression analysis showed that after adjusting for confounding factors, there was no correlation between AIP and PS (OR = 1.97, 95% CI: 0.70 to 5.50, $P = 0.197$). The smooth plot showed a non-linear relationship between AIP and PS, with an inflection point of 0.99. On the left side of the inflection point, a positive correlation was detected between AIP and PS (OR = 21.70, 95% CI: 2.41 to 195.28, $P = 0.006$), while no significant correlation was observed on the right side of the inflection point (OR = 0.26, 95% CI: 0.04 to 1.63, $P = 0.150$)

Conclusion The relationship between AIP and PS was non-linear and exhibited a threshold effect in Chinese patients with FEDN MDD. When AIP was less than 0.99, they showed a significant positive correlation

关键词: atherosclerosis index of plasma, Major depressive disorder, psychotic symptoms, Non-linear relationships

益生菌、益生元及合生元对焦虑、抑郁和睡眠

的疗效：随机对照临床试验的系统评价和 Meta 分析

张佳琳¹ 祝林青¹ 孟晴¹ 王祖星³ 朱鸿儒²

1. 四川大学华西临床医学院
2. 四川大学华西医院心理卫生中心
3. 四川省人民医院/四川省精神医学中心

目的 由于传统治疗的局限性，最近越来越多的研究使用益生菌、益生元和合生元作为焦虑和抑郁的辅助疗法。我们进行了系统回顾和 meta 分析，旨在评估它们在缓解焦虑抑郁方面的疗效。

方法 计算机系统检索 PubMed, Web of Science, Embase。检索时间从建库至 2023 年 10 月止，并对纳入的文献进行质量评价与数据提取。采用 Revman 5.3 用于质量评估。采用 stata15.0 进行 Meta 分析、Egger 检验和剪补法分析，以解决潜在的发表偏倚。

结果 最终纳入 49 篇文献，共 2352 例患者和 1832 对照，其中益生菌组纳入了 40 项研究包含 1715 位患者和 1408 例对照，益生元组纳入 9 项研究包含 432 位患者和 414 例对照，合生元组纳入 8 项研究 205 位患者和 194 例对照。Meta 分析结果显示：益生菌/益生元/合生元有助于降低抑郁（SMD = -0.68, 95% CI: -0.87 to -0.49, P < 0.001）和焦虑（SMD = -0.42, 95% CI: -0.60 to -0.23, P < 0.001）评分，同时益生菌可以缓解睡眠情况（SMD = -0.46, 95% CI: -0.75 to -0.18, P = 0.001）。亚组分析显示：益生菌和合生元单独使用时均能缓解焦虑抑郁，益生元单独使用可以缓解焦虑。除此之外，益生菌单独干预在焦虑和抑郁的不同人群中体现出不同的效果，并且不同干预时间在结果上也存在些许差异，同时益生菌的类型也会对结果产生影响。

结论 益生菌/益生元/合生元能缓解焦虑、抑郁和睡眠状况，这些发现有望为患有心理健康问题的人群提供更加精准、有效的辅助治疗选择。未来还需要更大规模的长期随访研究来验证我们的发现。

关键词：益生菌；益生元；合生元；焦虑；抑郁；对照临床试验

结合脑功能网络指标及临床指标共同预测强迫症患者的临床疗效

许婷婷 高见 王振*
上海市精神卫生中心

目的 通过构建难治性强迫症的全脑功能网络，利用功能网络特征及临床特征建立临床疗效预测模型，以期进一步阐明强迫症发病及转归的神经机制。

方法 研究基线期收集了 36 例强迫症患者及 80 例性别、年龄相匹配的健康被试，入组的受试者完成临床访谈、量表评估（耶鲁-布朗强迫量表 Y-BOCS、强迫信念问卷 OBQ、贝克抑郁量表 BDI 和贝克焦虑量表 BAI）以及磁共振扫描。其中 21 例强迫症患者经过 8 周的规范抗强迫治疗后，再次完成上述的量表评估及磁共振扫描。基于被试静息态磁共振数据，采用基于图论的方法计算大脑网络的网络参数，进行全脑网络功能模块化分析，比较了强迫症患者与健康成人脑功能网络差异。针对纵向数据，利用机器学习多核支持向量机的分析方法，分别建立基于单一临床指标和多模态指标的疗效预测模型，并对比了它们在临床疗效预测方面的差异。

结果 （1）独立样本 t 检验结果报告基线期，强迫症患者相比健康被试存在更高的强迫信念总分（ $t=4.03, p<0.001$ ）及各亚量表得分（包括责任感得分 $t=3.74, p<0.001$ 、完美主义得分 $t=3.51, p<0.001$ 和对思维的控制 $t=3.81, p<0.001$ ）；经过 8 周抗强迫治疗后，强迫症患者的症状 Y-BOCS 得分较前下降（ $F=9.17, p<0.001$ ），强迫信念量表得分也较前下降（ $F=2.44, p=0.009$ ）。

（2）全脑网络分析结果报告相比于健康成人，强迫症患者在额顶网络及默认模式网络内的连接子数目更多，模块内参与系数更高。两组的模块化属性比较结果显示，两组模块内连接未发现显著性差异；强迫症患者的额顶-边缘模块、默认模式-中央模块、边缘-枕叶模块的模块间连接值高于健康成人，而额顶-枕叶模块、额顶-中央模块、中央-边缘模块的模块间连接值低于健康成人。

（3）多核支持向量机分析结果显示通过结合临床及影像学的多模态指标，能够更好的拟合临床疗效预测模型（ $R^2=0.425, RMSE=3.771, p<0.001$ ），优于仅纳入单一临床指标（ $R^2=0.276, RMSE=4.219, p=0.001$ ）。

结论 与健康被试相比，强迫症患者表现出异常的认知信念及功能网络连接，结合临床指标及神经影像学指标有助于更好地预测强迫症的临床疗效。

关键词：强迫症，模块化，功能脑网络，强迫信

体重调整腰围指数与非酒精性脂肪肝病患者抑郁症之间的关系：性别和 BMI 的调节作用

张敬文¹ 黄啸¹ 王岩² 柯孙葵²

1. 复旦大学附属中山医院厦门医院

2. 福建医科大学临床医学院

目的 体重调整腰围指数(WWI)是一种新型肥胖指标。然而, WWI 与非酒精性脂肪肝病(NAFLD)患者抑郁症之间的关联尚不明确。本研究旨在通过全国代表性的横断面分析探讨 WWI 与 NAFLD 患者抑郁症的关系, 并考察性别和身体质量指数(BMI)在这一关联中的调节作用。

方法 本研究纳入了 2017-2020 年 NHANES 数据库中诊断为 NAFLD 的成年参与者。WWI 的计算方法为腰围(cm)除以体重(kg)的平方根。NAFLD 的诊断基于振动控制瞬时弹性成像(VCTE), 其中受控衰减参数(CAP)超过 248 dB/m 以指示肝脏脂肪变性。抑郁症通过患者健康问卷-(PHQ-9)评估, 得分 ≥ 10 表示存在重度抑郁症。研究采用多变量逻辑回归分析和限制立方样条分析评估 WWI 与抑郁症的关系, 并在调整协变量后考察性别和 BMI 的调节作用。

结果 在 4524 名符合条件的 NAFLD 参与者中, 366 人 (7.769%) 被诊断为重度抑郁症。研究发现, WWI 与 NAFLD 中的抑郁症显著正相关 (OR = 1.725, 95% CI: 1.442-2.063, $p < 0.00001$), 且呈剂量反应关系。性别分层分析显示, 该关联在男性 NAFLD 患者中更为显著 (男性 OR = 2.315, $p < 0.0001$; 女性 OR = 1.502, $p = 0.0001$)。BMI 分层分析显示, WWI 与抑郁症的关联在较低 BMI 组中更强 (BMI $< 25 \text{ kg/m}^2$: OR = 2.552, $p = 0.0027$; BMI $25-30 \text{ kg/m}^2$: OR = 2.143, $p < 0.0001$; BMI $\geq 30 \text{ kg/m}^2$: OR = 1.412, $p = 0.002$)。进一步调整 BMI 后, WWI 与抑郁症的关联仍然显著 (OR = 1.643, 95% CI: 1.357-1.989, $p < 0.00001$), 而 BMI 与抑郁症的关联在调整 WWI 后消失。

结论 本研究首次揭示了 WWI 与 NAFLD 患者重度抑郁症之间的显著正相关关系, 并发现这一关联独立于 BMI 存在。性别和 BMI 在这一关联中起到了显著的调节作用, 其中男性和瘦型 NAFLD 患

者的关联更为显著。研究结果表明, WWI 可能是 NAFLD 患者抑郁症的一个独立预测指标, 具有潜在的临床应用价值。未来的研究应进一步探讨 WWI 在其他慢性疾病中的应用及其对心理健康的影响。

关键词: 体重调整腰围指数 (WWI), 抑郁症, 非酒精性脂肪肝病 (NAFLD), NHANES

大学生自尊与社交回避行为的关系：心理弹性及社交苦恼的链式中介效应

冯丽平¹ 王梦美² 雷彤² 孙凌²

1. 青岛市市立医院

2. 天津市安定医院

目的 探讨大学生自尊、心理弹性、社交苦恼与社交回避行为之间的关系, 并验证心理弹性和社交苦恼在自尊与社交回避行为之间的链式中介作用, 以期为干预大学生社交苦恼与社交回避提供理论依据和方法。

方法 采用便利整群抽样方法在宁夏银川市便利选取某大学的全部大一新生作为调查对象, 获取学生的知情同意, 使用问卷星进行在线填写调查问卷, 包括一般情况调查问卷、自尊量表、心理弹性量表和社交回避及苦恼量表。共计有 2497 名在校大一学生填写了问卷。

结果 (1)不同性别、父母婚姻状态、自尊水平、心理弹性乐观性水平、心理弹性力量性水平、心理弹性坚韧性水平大学生的社交苦恼及社交回避差异均有统计学意义 (均 $P < 0.05$)。 (2)自尊、乐观性、力量性、坚韧性与社交苦恼得分均呈负相关且有统计学意义 (分别 $r = -0.256, p < 0.000; r = -0.045, p < 0.05; r = -0.047, p < 0.05; r = -0.118, p < 0.000$)；自尊、坚韧性与社交回避得分均呈负相关且有统计学意义 (分别 $r = -0.282, p < 0.000; r = -0.062, p < 0.05$)；社交苦恼与社交回避得分正相关且有统计学意义 ($r = 0.527, p < 0.000$)。 (3)在链式中介效应分析中, 自尊-社交回避路径效应量是 0.1993, 中介效应比为 33.5%；自尊-坚韧-社交回避路径效应量是 0.0536, 中介效应比为 9.01%；自尊-力量-社交回避路径效应量是 0.0872, 中介效应比为 14.66%；自尊-乐观-社交回避路径中介效应统计学意义不显著；自尊-社交苦恼-社交回避路径效应量是 0.1226, 中介效应比为 20.61%；自尊-坚韧-社

交苦恼-社交回避路径效应量是 0.0617, 中介效应比为 10.37%; 自尊-力量-社交苦恼-社交回避路径效应量是 0.0705, 中介效应比为 11.85%; 自尊-乐观-社交苦恼-社交回避路径中介效应无显著统计学意义。

结论 大学生性别、父母婚姻状态、自尊、心理弹性对社交苦恼及社交回避有一定的预测作用, 心理弹性和社交苦恼在大学生自尊和社交回避中的链式中介作用成立。大学教育过程中应提高大学生的自尊水平、心理弹性水平, 进而缓解社交焦虑情绪的发生和发展, 预防社交回避行为的进展。

关键词: 社交焦虑, 社交苦恼, 社交回避, 自尊, 心理弹性, 链式中介效应

The Heart Rate Variability In Depression And Anxiety Patients

Haibin Li Zexin Zhao Ye Liu Ruijie Geng Yuan Wang
Yuanyuan Li Wenjuan Liu Xiao Huang*
Zhongshan Hospital Fudan University

Objective Depression and anxiety is a common mental disorders, and many studies have found that they have influence on the cardiovascular system. Heart rate variability (HRV) is a method for studying cardiovascular function. However, the findings on the effects of depression on HRV are inconsistent, and most studies focus on the state of the patients at a particular moment, without continuous tracking. Our study explored the changes of HRV in patients with depression or anxiety through continuous follow-up

Methods All patients were diagnosed with depression and anxiety spectrum disorder. All the patients were assessed by Hamilton Anxiety Scale (HAMD), Patient Health Questionnaire-15 (PHQ-15), Pittsburgh Sleep Quality Index (PSQ) and heart rate variability (HRV) were assessed at baseline, one month and three months after the initial assessment. Mann-Whitney U tests and Chi-squared tests were used to examine the group differences. Friedman's rank tests were used for clinical and HRV data

Results Depression had an impact on heart rate variability. For patients, the severity of depression is

negatively correlated with RRIV. SSIRs also had a negative impact on RRIV

Conclusion This study found that the severity of symptoms in patients with depression and antidepressants were negatively correlated with heart rate variability

关键词: depression, anxiety, antidepressant, heart rate variability

配偶参与式干预联合强化降压对冠心病多支病变预后及负性情绪的影响

姜丹阳¹ 张许来²

1.亳州市人民医院

2.安徽省精神卫生中心

目的 探讨配偶参与式干预联合强化降压改善冠心病多支病变预后及负性情绪的影响。

方法 选取 2021 年 4 月至 2023 年 11 月本院收治的 152 例老年冠心病多支病变患者作为研究对象, 随机分为对照组、观察组, 每组 76 例。对照组予以常规降压治疗以及常规干预, 观察组以配偶参与式联合强化降压治疗; 分析两组患者血脂指标及血脂比值 (TG、TC、HDL-C、LDL-C、VLDL-C、TC / TG、TG / HDL-C、TG / LDL-C、LDL-C / HDL-C), 焦虑量表 (HAMA), 总体幸福感量表 (GWB), Beck 绝望量表 (Beck hopelessness scale, BHS), 自杀意念自评量表 (self-rating ideation of suicide scale, SIOSS) 评估两组患者的预后及负性情绪。

结果 与对照组相比, 观察组 TC、LDL-C、TC / TG、LDL-C / HDL-C 水平均明显降低, TG / LDL-C 水平明显升高; 而两组间 TG、HDL-C、VLDL-C 差异不显著 ($P > 0.05$)。两组患者干预后 HAMA、BHS、SIOSS 评分均明显低于干预前, 且观察组 HAMA、BHS、SIOSS 评分的降低幅度明显大于对照组。两组患者干预后 GWB 评分均明显高于干预前, 且观察组 GWB 评分的升高幅度明显大于对照组。

结论 配偶参与式干预联合强化降压可更加有效地改善冠心病多支病变预后, 并改善患者负性情绪。

关键词: 负性情绪, 配偶参与式干预, 强化降压, 冠心病, 干预, 预后

暗示治疗对强迫性焦虑患者的作用

韩毓*

西安市精神卫生中心

目的 随着现代社会压力的增加,有较多数据显示强迫症(OCD)患者数量与日俱增。强迫症是一种以反复出现的强迫性思维和行为为特征的心理障碍,患者常因难以控制的强迫行为或强迫思维而焦虑。虽然认知行为疗法和药物治疗是目前主流的治疗方法,但部分患者并未获得显著疗效,仍深陷其中无法自拔。本文旨在研究暗示治疗在缓解强迫性焦虑患者症状中的作用及其临床效果。

方法 本研究采用随机对照试验法,将符合ICD-11诊断标准的60例强迫性焦虑患者随机分为两组,每组各30例。治疗组在常规CBT治疗的基础上,加入为期8周的暗示治疗,每周2次,每次45分钟;对照组仅进行CBT治疗。暗示治疗包括心理暗示和催眠暗示等,通过潜意识层面的正向引导,期望减轻患者的强迫性症状和焦虑情绪。所有患者均在治疗前、治疗4周后和治疗8周后接受强迫症状量表(Y-BOCS)和焦虑自评量表(SAS)的评估,以测量治疗效果。

结果 研究发现,治疗组在接受暗示治疗后,其Y-BOCS和SAS评分的改善显著优于对照组($P < 0.05$)。具体表现为,治疗组在第8周末的Y-BOCS评分从基线的平均28.5降低至12.1,对照组则从28.3降低至18.4;治疗组的SAS评分从基线的平均58.2降低至32.3,对照组从57.9降低至40.6。通过数据分析,治疗组的强迫症状和焦虑水平的减轻幅度均显著高于对照组,且未观察到严重不良反应。

结论 暗示治疗对强迫性焦虑有较好的治疗效果

关键词:强迫,焦虑,暗示治疗,认知行为疗法

酒精使用障碍人群伴随症状间的网络特征

于鑫 陈旭*

山东省精神卫生中心

目的 酒精使用障碍,是全球最常见的慢性且反复发作的精神疾病之一,不仅高度致残,而且与多种健康问题相关,显著增加患者的早逝风险。酒精使用障碍者常伴有焦虑、抑郁和睡眠质量下降等症状,虽非诊断标准,却可能加剧依赖风险并增加治疗难度。因此,本研究旨在通过流行病学抽样调查结合网络分析,深入分析酒精使用障碍患者的并发症现状及其间的复杂关系,以提高临床酒精使用障碍者治疗成功率并减轻患者负担。

方法 本研究在全省16个市进行,采用多阶段分层整群系统随机抽样方法。精神科护士使用扩展一般健康问卷(GHQ-12)进行初筛,由精神科医生使用DSM-IV轴I诊断的SCID-P进行诊断,并对所有筛查的对象进行匹兹堡睡眠质量(PSQI)和简易应对方式(SCSQ)量表评估。使用R 4.4.0软件进行网络分析和可视化分析。使用R软件qgraph和bootnet包,通过estimateNetwork函数得到酒精使用障碍人群的心理健康、睡眠质量及应对方式的偏相关网络分析和节点的中心性;使用bootnet包评估网络的准确性和稳定性。使用R软件中的bnlearn包,通过贝叶斯爬山算法来构建酒精使用障碍人群的有向无环图。

结果 初始筛查发现1324例酒精使用障碍患者。剔除未完整回答问卷者后,最终有1239名患者被纳入研究,在偏相关网络中,“焦虑/抑郁情绪”与“信心缺失”相关性最强。“睡眠时间”与“睡眠效率”关系最紧密。三大伴随症状类别间,“焦虑/抑郁情绪”与“主观睡眠质量”的关联最强。“焦虑/抑郁情绪”与“主观睡眠质量”显示出最高的节点中心性,而“入睡时间”的中心性亦不可忽视。有向无环图结果表明“入睡时间”是具有最高概率优先级,它不仅直接影响“焦虑/抑郁情绪”和主要睡眠质量症状(如“主观睡眠质量”、“睡眠障碍”、“睡眠时间”、“睡眠效率”),还间接影响其他症状。在此模型中,“社会功能低下”、“催眠药物”和“应对方式”被视为结果症状,受到其他症状直接或间接的影响。

结论 酒精使用障碍的诸多伴随症状中,睡眠问题尤为突出,深刻影响患者的心理健康和行为方式。入睡时间在酒精使用障碍者伴随症状间起到了激活源的作用,而主观睡眠质量和焦虑/抑郁情绪也是关键症状与其他症状密切关联。因此,在治疗酒精使用障碍时不应仅限于降低饮酒频次,同样需要关注睡眠问题的管理。改善睡眠质量,尤其是缩短

患者的入睡时间,改善患者的夜间睡眠质量,增强他们心理和社会功能,从而有效地促进长期康复。

中小学生对厌学拒学现象的心理评估及“家校医”系统干预研究

常蕾 黄薛冰*

北京大学第六医院

目的 学习是中小学生的核心行为,是中小学生的主体活动,厌学拒学现象和心理健康水平密切相关。近年来,随着教育竞争的加剧和社会压力的增大,和学业压力相关的中小学生的心理健康问题引起了广泛关注。和时代“内卷”现象并行的是中小学生对厌学拒学现象愈发突出,成为影响中小学生对心理健康发展的突出矛盾。本研究就中小学生对厌学拒学现象,进行从多维度的心理分析,并建立心理评估与“家校医”干预体系,提出有效的预防和干预策略。

同时,本研究将阐明影响中小学生对厌学拒学行为的关键因素,并提出了包括家庭教育、学校支持和医疗干预在内的“家校医”系统干预策略及操作实施建议。旨在深入剖析中小学生对厌学拒学的心理机制,识别其成因,并探寻系统干预机制,具有理论和应用方面的多重意义。

方法 本研究聚焦于中小学生对厌学拒学现象的心理分析和“家校医”系统干预措施。内容包括

(1) 进行影响因素分析,形成评估方案;编制的《北大六院“厌学”专业心理门诊问卷》,临床问卷,结构化访谈等,进行系统评估。

(2) “家校医”系统干预策略研究。在上述研究基础上,本研究进一步提出了切实可行的“家校医”系统干预策略。

通过文献回顾与实证研究相结合的方式,系统整合厌学拒学现象的相关研究,建立起一个包含个体心理、家庭环境和学校环境三大维度的影响因素模型。在此基础上,结合北京大学第六医院厌学门诊的前期工作基础,以系统理论为指导,以探索源为导向,设计包含家庭、学校和医疗系统在内的干预措施和策略。

结果 通过本研究取得以下成果

(1) 评估工具的完善和评估效能提升;

(2) 相对固化的干预模式和差异化、个性化的干预;

(3) 系统干预中的协调和协同。

通过构建“家校医”系统的协同干预模型,探析中小学生对厌学拒学的心理机制,提出综合性干预方案并加以验证,以期达成预防与改善厌学拒学现象的目标,并在理论与实践层面为学生全面健康成长保驾护航。

结论 在相对有限的医疗资源支持下,各部门相互协同配合,开展“家校医”联合工作,通过高效的问卷筛查和有针对性的工作,通过家、校层面的支持得到解决,部分厌学拒学的青少年需要进一步的医疗介入,同时在家、校层面给予相应的支持,帮助学生尽快走出厌学拒学的困境。在家庭和学校层面,尊重家长和学校对学生的学业期待和学生的个人发展需求,将本土化的心理干预落地。

关键词:中小学生对,“厌学”,心理评估,家校医,系统干预

Effect of Acceptance and Commitment Therapy for Adolescent Depression: A Meta-analysis

Xin Yu Xu Chen*

山东省精神卫生中心

Objective This study conducted a systematic review of published randomized controlled trials (RCTs) to evaluate the efficacy of acceptance and commitment therapy (ACT) for adolescent depression, while also examining its pertinent characteristics

Methods Electronic database searches were performed adhering to PRISMA guidelines, which are recommended for the screening, data extraction, and quality assessment processes in systematic reviews and meta-analyses. The study utilized fixed-effect or random-effect models, as appropriate, and conducted subgroup analyses

Results The analysis of 12 studies, which included a total of 1317 participants, indicated that ACT

significantly reduced depressive symptoms in adolescents (SMD = -1.09, 95% CI: -1.83 ~ -0.35, $p = 0.004$), while also enhancing psychological flexibility (SMD = -0.86, 95% CI: -1.57 ~ -0.15, $p = 0.02$). Subgroup analysis revealed that ACT was significantly more effective than the wait-list control group at the immediate post-test (SMD = -1.58, 95% CI: -2.67 ~ -0.50, $p = 0.004$). Offline ACT reduced depressive symptoms in adolescents (SMD = -1.39, 95% CI: -2.44 ~ -0.34, $p = 0.009$). Group ACT intervention was found to be highly effective (SMD = -1.32, 95% CI: -2.24 ~ -0.39, $p = 0.005$) than individual intervention and had a greater impact on clinical samples (SMD = -1.66, 95% CI: -2.71 ~ -0.62, $p = 0.002$). A protocol for this review was preregistered with PROSPERO (CRD42023494677)

Conclusion ACT has been shown to be highly effective in reducing depression among adolescents compared to wait-for-treatment groups. However, compared to active treatment groups, like those receiving conventional therapy or medication, ACT's effects are not statistically significant. This indicates that although ACT is as effective as established treatments, it does not exceed them in reducing depressive symptoms. Furthermore, ACT significantly improves psychological flexibility in adolescents, a central element of its therapeutic approach. Additionally, ACT is especially effective in reducing depression symptoms in adolescents who have been diagnosed with the condition. Offline group format interventions are more effective in alleviating adolescent depression compared to IACT; while the sample size for IACT is smaller, its results still hold significant reference value

关键词: Acceptance and Commitment Therapy, Adolescent, Depression, Randomized Control, Meta-analysis

Association between Lipid Parameters and Severity of Depressive Symptoms in Patients with First-diagnosed Drug-free Major Depressive Disorder

Junjun Liu*

Nanjing Meishan Hospital

Objective The association between lipid biomarkers and the severity of depressive symptoms remains uncertain in patients with major depressive disorder (MDD), as previous findings have been debatable. The objective of this research was to examine the correlation between lipid parameters and the severity of depressive symptoms in patients with first-diagnosed drug-free (FDDF) MDD in Chinese

Methods

From 2016 to 2018, a total of 1718 individuals diagnosed with FDDF MDD were recruited. Detailed sociodemographic details and anthropometric measurements were gathered from each patient. An assessment of anxiety and depressive symptoms was conducted using the Hamilton Anxiety Scale (HAMA) and the 17-item Hamilton Rating Scale for Depression (HAM-D-17), respectively. Furthermore, thyroxine hormones, fasting blood glucose (FBG) levels, and lipid profiles were ascertained using blood samples taken by a trained clinician. Univariate and multivariate linear regression analyses were then employed to ascertain if there was an association between patient lipid profiles and depressive symptom severity. Additionally, a two-segmental linear regression analysis was used to investigate threshold effects.

Results Subsequent to adjusting for covariates, multivariate linear regression analysis unequivocally demonstrated a positive correlation between total cholesterol (TC), triglyceride (TG), and low-density lipoprotein cholesterol (LDL-c), but not high-density lipoprotein cholesterol (HDL-c), and the manifestation of depressive symptoms in patients with FDDF MDD. Intriguingly, the relationship between TC, TG, LDL-c, and depressive symptoms exhibited a non-linear pattern. By employing a two-segmental linear regression model, distinct inflection points at 6.17 mmol/l for TC, 1.80 mmol/l for TG, and 4.12 mmol/l for LDL-c were unveiled. At values higher than each inflection point, we observed a positive association between TC, TG, LDL-c, and depressive symptoms (all $P < 0.05$). However, this relationship between lipids and depressive symp-

toms appears to plateau at values higher than each inflection point (all $P > 0.05$). Notably, the correlation between HDL-c and depressive symptoms, on the other hand, appeared to exhibit a "U"-shaped pattern, where 1.10 mmol/l was found to be optimal

Conclusion Our investigation shed light on the intricacies regarding the association between lipid markers (TC, TG, LDL-c, and HDL-c) and the severity of depressive symptoms in patients with FDDF MDD, thereby offering valuable insights into the underlying mechanisms involved

食源性 γ -氨基丁酸通过调节神经免疫稳态缓解焦虑: 蛋白组学机制研究及验证

许吉怡¹ 葛子玉¹ 王瀚¹ 张晨辉¹ 徐劲节¹ 李颖¹ 杨祥云¹ 李占江¹ 张玲¹ 刘喆² 王刚¹ 杜静¹

1.首都医科大学附属北京安定医院

2.华熙生物科技股份有限公司

目的 应用蛋白组学分析和平行反应监测技术聚焦食源性 γ -氨基丁酸(GABA)对缓解焦虑状态的疗效及其分子作用机制。

方法 利用慢性束缚应激(CRS)诱导小鼠焦虑样行为后进行焦虑行为学实验(高架十字和旷场实验)检测 GABA 干预对小鼠焦虑行为的影响。对小鼠海马进行蛋白质组学分析,并利用平行反应监测(PRM)技术对蛋白质组学中确定的候选蛋白和通路进行验证。最后,通过 ELISA 技术测定小鼠前额叶中的 GABA 水平以及通过炎症因子抗体芯片检测抗炎因子(IL-10、TGF- β 1、IL-4、IL-13)的变化。

结果 口服 GABA (20mg/kg) 14 天后, CRS 小鼠的焦虑样行为显著改善,并且其小鼠的前额叶皮层中的 GABA 水平明显提高。进一步的蛋白质组学分析显示 CRS 和 GABA 干预对免疫相关过程产生影响,如“体液免疫反应”、“补体激活”和“急性炎症反应”等。而与之相关的免疫蛋白如 C3、C4b、Cfh、Cfi、B2m、Fgb、Pzp 等在 CRS 鼠中呈现下降趋势,但经过 GABA 干预后,这些蛋白水平得到了恢复($p < 0.05$)。此外, CRS 导致前额叶皮层中的抗炎细

胞因子(IL-10 和 TGF- β 1)减少,而 GABA 干预显著逆转这一下降趋势。

结论 食源性 GABA 能够有效减少焦虑样行为,这可能是通过增加大脑中的 GABA 含量并促进免疫系统的稳态来实现的,特别是通过调节补体和炎症反应来发挥作用。

Alterations in Fatty Acid Metabolism in Patients with Schizophrenia in A Multi-omics Perspective

Long Chen Xulai Zhang*

Hefei Psychiatric Hospital

Background Gut microbes are involved in most fatty acid metabolic processes, and these roles in host energy homeostasis and metabolism have been extensively studied recently. However, the overall profile of fatty acid metabolites in schizophrenia and the link to gut microbes has been little studied.

Method The present study investigated the gut microbiome composition of 63 individuals, including 35 patients with schizophrenia (SZ) and 28 demographically matched healthy control (HC) subjects. Stool and serum samples were collected, and stool samples were examined using 16S rRNA sequencing of region V4 and untargeted metabolomics, while serum samples were examined using untargeted metabolomics.

Results A total of 21 different genus-level species were identified in the SZ and HC groups. Predictive analysis of gut flora pathways suggests abnormal fatty acid degradation in schizophrenia. There were 17 abnormalities in faecal fatty acid metabolites and 43 abnormalities in serum fatty acid metabolites, with a significantly higher proportion of abnormalities in serum fatty acid metabolites than in faecal fatty acid metabolites. The major pathways enriched in fatty acid metabolites were biosynthesis of unsaturated fatty acids, arachidonic acid metabolism and linoleic acid metabolism. There was a significant correlation between intestinal

flora and fatty acids, as well as potential interactions between intestinal flora, faecal fatty acids and serum fatty acids.

Conclusions Our multi-omics study provides new insights into the pathogenesis of schizophrenia, which may inform the treatment of neurodevelopmental disorders by modifying fatty acid metabolism through modulation of the gut microbiota

关键词: schizophrenia; metabolism

伴非自杀性自伤抑郁障碍患者唾液褪黑素节律紊乱更加明显

张爱国 张许来*
合肥市精神病医院

目的 褪黑素节律紊乱可能与抑郁障碍和非自杀性自伤 (non-suicidal self-injury, NSSI) 有关, 我们进行了一项对照研究, 以调查共病 NSSI 的重性抑郁障碍患者是否存在更加明显的褪黑素紊乱, 以及褪黑素水平是否和 NSSI 的感受和停止有关。

方法 研究共纳入 100 例样本, 其中正常对照组 30 例, 抑郁障碍患者 70 例, 抑郁障碍亚组中, 伴 NSSI 组的患者 35 例、不伴 NSSI 的抑郁障碍患者 35 例 (非 NSSI 组); 我们采用酶联免疫吸附试验测量了所有被试 6 个时间节点的唾液褪黑素水平 (0AM、8AM、11AM、1PM、4PM、10PM)。并使用渥太华自伤量表 (Ottawa self-injury inventory, OSI) 对 NSSI 组患者的自伤感受和停止自伤的动力进行量化评估。

结果 NSSI 组 6 个时间点的唾液褪黑素水平均比非 NSSI 组和正常对照组明显降低 ($P < 0.05$), 褪黑素昼夜节律消失; 我们发现褪黑素水平与 NSSI 的几个维度存在明显的相关性, 特别是: 1PM 褪黑素水平和“冲动是侵入性的或者有攻击性的”得分 ($r = 0.487, P < 0.05$), OSI 第 7 项 (停止自伤的动力) 得分与 8AM 褪黑素水平呈负相关 ($r = -0.427, P < 0.05$), 11AM 褪黑素水平呈正相关 ($r = 0.345, P < 0.05$)。

结论 褪黑素水平的降低和昼夜节律紊乱, 可能会增加抑郁障碍患者发生 NSSI 的风险, 但其机制有待进一步探讨。

关键词: 非自杀性自伤; 褪黑素; 昼夜节律; 渥太华自伤量表

首发精神分裂症患者 α -防御素水平及相关性研究

张爱国*
合肥市精神病医院

目的 探讨首发未用药精神分裂症患者唾液 α -防御素水平是否异常, α -防御素水平与患者临床症状和认知功能的相关性。

方法 招募符合《精神障碍诊断与统计手册》(DSM-5) 精神分裂症诊断标准的首次发作未用药患者 95 例、正常对照组 90 例; 采用酶联免疫法检测被试唾液中 α -防御素水平, 采用阴性和阳性症状量表 (PANSS) 对患者进行评估, 使用中国简版神经认知成套测验 (C-BCT) 对患者进行认知功能评估。

结果 精神分裂症组 α -防御素水平明显高于对照组, 差异有统计学意义 ($P < 0.05$); 精神分裂症组在 C-BCT 数字广度、持续操作、符号编码测试得分低于对照组 ($P < 0.05$), 精神分裂症组 α -防御素水平与 PANSS 量表阳性因子分和总分呈正相关 ($r = 0.412, P < 0.05$; $r = 0.438, P < 0.05$), 与阴性症状无相关性 ($r = 0.013, P = 0.093$)。与连线测验 ($r = 0.139, P = 0.180$)、数字广度 ($r = -0.095, P = 0.359$)、持续操作 ($r = 0.047, P = 0.652$)、符号编码 ($r = 0.072, P = 0.491$) 测试得分均无相关性。

结论 α -防御素有作为精神分裂症筛查和严重程度评估的生物标记物的潜力, 但是对精神分裂症患者认知功能损害的预测能力不佳。

关键词: 精神分裂症 α -防御素 阴性和阳性症状量表 中国简版神经认知成套测验

机器学习和外周血炎症指标对抑郁症患者自杀的预测

余涛*
安徽省精神卫生防治中心

目的 研究外周血炎症因子与重度抑郁症 (Major depressive disorder, MDD) 患者自杀未遂之间的关系以及预测功能。

方法 将 2022 年 5 月至 12 月期间住院的 167 例 MDD 患者作为研究对象。计算每个患者的中性粒细胞-淋巴细胞比值 (neutrophillymphocyte ratio, NLR)、单核细胞-淋巴细胞比值 (monocytelymphocyte ratio, MLR)、血小板-淋巴细胞比值 (platelet-lymphocyte ratio, PLR) 及全身免疫-炎症指数 (systemic immune inflammation index, SII) 值。基于外周血炎症因子, 使用一般线性模型 (General Linear Model, GLM)、随机森林 (Random Forest, RF) 和支持向量机 (Support Vector Machine, SVM) 三种机器学习算法构建 MDD 患者自杀未遂的预测模型, 确定最佳算法。

结果 伴有自杀未遂的 MDD 患者的 NLR 和 SII 值高于不伴有自杀未遂的患者, 且差异有统计学意义 ($P < 0.05$)。基于 NLR 和 SII, 三种机器学习算法构建的预测模型中, GLM 的表现最佳, 其 ROC 曲线下面积 (Area of ROC, AUC) 值为 0.722。

结论 外周血炎症因子与抑郁症患者自杀未遂有关, 且起着有效的预测作用。

关键词: 机器学习; 抑郁

Decline in Working Memory in Stable Schizophrenia May Be Related To Attentional Impairment: Mediating Effects of Negative Symptoms

Nan Du Xulai Zhang*

Hefei Fourth People's Hospital

Objective Cognitive deficits and negative symptoms are prevalent in individuals with schizophrenia and are crucial indicators of functional recovery. However, the specific relationship between attention, working memory, and negative symptoms in stable schizophrenia remains unclear. This study aims to explore these associations and provide valuable insights for the subsequent treatment of schizophrenia

Methods We conducted a comprehensive assessment of 145 patients with stable schizophrenia using the

Chinese Brief Neurocognitive Suite of Tests (C-BCT) and the Positive and Negative Symptom Scale (PANSS)

Results Patients with abnormal cognition exhibited significantly higher PANSS total scores, cognitive symptom scores, and negative symptom scores than those with normal cognition ($P < 0.05$). Pearson's correlation analysis revealed significant positive correlations between digital breadth and sustained operation ($r = 0.389$, $P < 0.001$), as well as a significant negative correlation between digital breadth and negative symptoms ($r = -0.291$, $P < 0.001$). Moreover, continuous manipulation showed a negative correlation with negative symptoms ($r = -0.173$, $P < 0.05$). However, no significant correlations were found between the digital breadth conformity score and persistent manipulation or negative symptoms ($r = 0.148$, $P > 0.05$; $r = -0.068$, $P > 0.05$). Notably, negative symptoms were identified as a mediator in the relationship between attention and working memory (effect size = 0.024)

Conclusion Our findings highlight significant associations between working memory, attention, and negative symptoms in individuals with stable-phase schizophrenia. Moreover, attention not only directly impacts working memory but also indirectly influences it through negative symptoms. Addressing cognitive deficits and negative symptoms in the treatment of schizophrenia may lead to improved overall outcomes for affected individuals

“阳光新芽”线上科普对中学生抑郁及病耻感的效果分析

王玉璐¹ 秦梦文¹ 沈玲² 钱英¹ 黄薛冰¹

1. 北京大学第六医院

2. 沧州市人民医院

目的 在当前社会背景下, 中学生的心理健康问题日益凸显, 抑郁情绪和病耻感对青少年的学业、社交乃至整体发展都可能产生深远影响。本研究的主要目的是探索自主开发的线上心理健康科普平台

“阳光新芽”对中学生抑郁情绪及其病耻感的影响。

方法 本研究采用了方便取样法,选取 196 名中学生作为研究对象。根据性别和年级进行分层后,利用随机数字表法将学生随机分为干预组和对照组,每组各 98 人。干预组学生接受了“阳光新芽”平台提供的系列科普内容和练习活动,而对照组学生接收心理健康科普教材进行自学。研究前后,通过儿童抑郁量表(CDI)和抑郁病耻感量表(DSS)对两组学生进行了评估。

结果 研究结果显示,在干预后,对照组学生的 CDI 和 DSS 评分与干预前相比没有显著差异。而干预组学生的 CDI 评分在干预后显著下降($p<0.05$),表明“阳光新芽”平台的科普内容和练习对于降低中学生的抑郁情绪具有积极作用。此外,干预组学生的 DSS 总分以及个人病耻感得分也显著下降($p<0.05$),说明该平台在降低抑郁病耻感方面同样有效。然而,感知社会歧视的得分在干预前后没有显著变化,这提示社会对抑郁的歧视观念需要更广泛的教育和宣传来改变。

结论 “阳光新芽”线上科普平台通过提供专业的心理健康知识、实用的自我调节技巧以及互动式的学习体验,能够有效地帮助中学生改善抑郁情绪,并降低他们对抑郁的病耻感。这一发现对于学校、家庭以及社会在青少年心理健康教育方面的工作具有重要的启示意义。未来,可以进一步扩大该平台的影响力,为更多的中学生提供心理健康支持,同时也需要社会各界共同努力,消除对抑郁的偏见和歧视,创造一个更加包容和支持的环境,促进青少年的健康成长。

关键词:线上科普;抑郁;病耻感

无抽搐电休克治疗对重度抑郁症患者注意偏向中长期影响

张扬*

合肥市精神病医院

目的 探究重度抑郁症(MDD)患者在经过无抽搐电休克(MECT)治疗后,随访患者在治疗刚结束、结束后一个月、三个月及半年后中长期,患者注意偏向的改变。

方法 本研究纳入病例组取自合肥市第四人民

医院的 26 名重度抑郁症患者,健康对照组(HC) 26 名性别、年龄文化程度匹配的健康受试者,采用改良无抽搐电休克疗法,比较患者治疗前、疗程刚结束时、结束后一个月、三个月及半年注意偏向改变情况及不良反应。

结果 MECT 治疗后重度抑郁症(MDD)患者抑郁症状明显改善;MECT 治疗刚结束时及疗程结束一个月后的重度抑郁症(MDD)患者组对负性面孔刺激注意偏向与 HC 组有明显差异,差异有统计学意义($P<0.05$),疗程结束后三个月、半年后,重度抑郁症患者对负性面孔刺激注意偏向与 HC 组无明显差异($P>0.05$)。

结论 重度抑郁症患者对负性面孔刺激存在注意偏向,且 MECT 治疗对抑郁症患者病情具有改善,且对重度抑郁症患者未存在长期注意偏向的不良影响。

结果 显示 MECT 治疗对于 MDD 患者中长期影响是阳性结果,有助于患者改善抑郁症状,减少患者痛苦度,对负性注意偏向有着矫正性作用。可减少患者对于 MECT 治疗远期影响的顾虑。

关键词:重度抑郁症;无抽搐电休克治疗;注意偏向

带状疱疹后神经痛患者的负性情绪现状及影响因素

王千 罗学梅*

四川省精神医学中心

目的 了解带状疱疹后神经痛(post-herpetic neuralgia, PHN)患者的负性情绪现状及影响因素。

方法 抽取 2023 年 1 月至 2023 年 12 月于四川省人民医院疼痛科病区住院的带状疱疹后神经痛患者进行问卷调查。调查内容包括一般资料调查表、广泛性焦虑量表(generalized anxiety disorder-7, GAD-7)、健康问卷抑郁症状群量表(patient health questionnaire-9, PHQ-9)、数字评价量表(numerical rating scale, NRS)评分等。

结果 191 例 PHN 患者参与问卷调查, GAD-7 评分结果显示中, 191 例 PHN 患者中 117 例(61.25%)出现焦虑状态(评分 >4 分);在 PHQ-9 评分结果显示中, 191 例 PHN 患者中 101 例(52.87%)

出现抑郁状态(评分>4分)。另外,在191例患者中同时罹患焦虑和抑郁(GAD-7评分>4分和PHQ-9评分>4分)的病人有61例,占比为31.93%。文化程度、家庭人均月收入、病程、疼痛持续时间、疼痛强度是PHN患者负性情绪的影响因素,患者焦虑、抑郁水平与疼痛持续时间和疼痛强度成正相关。

结论 PHN病人负性情绪发生率较高,疼痛强度、疼痛持续时间为PHN病人产生负性情绪的高危因素,临床应重视PHN病人的负性情绪筛查,并开展预防性干预措施,改善患者慢性疼痛结局。

特质正念对新冠肺炎疫情期间基层医务人员身心健康的相关性研究

谢洪燕¹ 邱昌建²

1.成都市成华区第七人民医院

2.四川大学华西医院心理卫生中心

目的 探讨基层医务人员特质正念水平在长期应激状态下的变化及对焦虑、抑郁、职业倦怠、躯体症状和睡眠质量之间的关系。

方法 调查选取成都市成华区750名基层医务人员作为研究对象,使用一般资料表、正念注意觉知量表(Mindful Attention Awareness Scale,MAAS)、应激感受量表(Perceived Stress Scale,Pss-10)、职业倦怠量表(MBI-General Survey,MBI-GS)、心理弹性量表(Connor Davidson Resilience scale,CD-RISC)、匹兹堡睡眠质量指数(Pittsburgh Sleep Quality Index,PSQI)、广泛性焦虑量表(Generalized Anxiety Disorder-7 Scale,GAD-7)、抑郁自评量表(Self-Rating Depression Scale,SDS)、躯体症状群健康评定量表(Patient Health Questionnaire-15,PHQ-15)分别于2022年1月和2022年9月进行问卷调查。

结果 根据正念注意觉知量表(MAAS)得分,参与者被分为三个不同的正念水平组。基线资料显示,三组受试者性别、年龄、婚姻状态、岗位和职称均无显著差异($p=0.92$, $p=0.996$, $p=0.771$, $p=0.944$, $p=0.997$),学历水平在三组受试者之间显示出显著

差异($p=0.041$)。在基线(T0)及8个月后(T1)的调查中,各组的特质正念水平相对稳定($p>0.05$)。相较于T0,T1时应激感受得分(Pss-10)在MAAS得分较差和中等组显著上升($p<0.001$),较好组无显著变化($p>0.05$)。职业倦怠(MBI-GS)、广泛性焦虑(GAD-7)和抑郁自评(SDS)得分在较差和中等组显著上升($p<0.001$),较好组变化不显著($p>0.05$)。躯体症状(PHQ-15)在较差组中显著上升($p<0.001$),睡眠质量(PSQI)在较差组和中等组显著下降($p<0.001$),较好组在这两项指标上变化不显著($p>0.05$)。多因素逻辑回归分析显示较好的特质正念水平显著降低了职业倦怠、焦虑和抑郁的风险,调整后的比值比(adj.OR)分别为0.26($p=0.013$)、0.09($p<0.001$)和0.11($p<0.001$),显示出其对医务人员心理健康的独立预测作用。

结论 在长期应激状态下,基层医务人员特质正念水平显示出一定的稳定性,高特质正念水平有助于减轻焦虑、抑郁和职业倦怠。

首发抑郁障碍的综合干预研究

孙丽君*

杭州市第七人民医院

目的 对首发抑郁障碍患者采用不同的干预方法,了解各种干预方法的疗效和依从性。

方法 首发抑郁障碍的患者56人,随机分为药物治疗组(33人)、心理治疗组(7人)、联合治疗组(16人)。在基线、第2周、第6周、第12周、第6个月进行蒙哥马利抑郁量表(MADRS)、汉密尔顿抑郁量表(HAMD-17)、工作和社交量表(WSAS)、幸福的生活质量和满意度量表(Q-LES-Q)评估。

结果 在2周时,三组患者蒙哥马利抑郁量表减分率的差异有统计学意义($P<0.05$),其中心理治疗组和联合治疗组的减分率显著高于药物组($P<0.05$);在第12周时,三组患者汉密尔顿抑郁量表减分率的差异有统计学意义($P<0.05$),其中联合治疗组的减分率显著高于药物治疗组($P<0.05$);在其他时点三组患者的蒙哥马利抑郁量表和汉密尔顿抑郁量表减分率差异无统计学意义($P>0.05$)。在基线、第6周、第12周、第6个月三组Q-LES-Q总分、WSAS

各因子分的比较差异无显著性 ($P>0.05$)。三组在 6 周、12 周、6 月缓解情况,心理治疗组和联合治疗组在治疗 6 周后缓解率高于药物治疗组,在 12 周和 6 个月时,三组间缓解率无差异 ($P>0.05$);三组坚持治疗的比率分别为:6 周时心理治疗组>药物治疗组>联合治疗组,12 周时心理治疗组>联合治疗组>药物治疗组,6 个月时心理治疗组>联合治疗组>药物治疗组,但差异无统计学意义。

结论 首发抑郁障碍的总体疗效较好,生活质量和社会功能恢复较理想。同药物治疗相比,在早期疗效中心理治疗显示出更强的优势,患者对心理治疗的依从性更好。但首发抑郁障碍患者对治疗的依从性较差、对维持治疗的认识不足。

天然生物碱类成分 ELP 改善阿尔茨海默症小鼠记忆缺陷的机制研究

张晨辉¹ 许吉怡¹ 张思远² 吉腾飞² 王传跃¹ 王刚¹ 杜静¹

1.首都医科大学附属京安定医院,国家精神心理疾病临床医学研究中心,精神疾病诊断与治疗北京市重点实验室,100088 北京市西城区德外安康胡同 5 号

2.中国医学科学院&北京协和医学院药物研究所,天然药物活性物质与功能国家重点实验室 北京 100050

目的 阿尔茨海默病 (Alzheimer's disease, AD) 是一种以进行性认知功能障碍为主,逐渐影响日常生活能力的神经退行性疾病,研究表明神经炎症与 AD 的发生发展密切相关。由于目前批准的 AD 化学治疗药物不能有效阻止或缓解 AD 的进展,而天然产物及提取物具有多靶点、多途径、作用温和、不良反应小的特点,对于防治 AD 具有巨大潜力。本课程旨在探索天然生物碱类成分 ELP 对于阿尔茨海默症模型小鼠的疗效及其分子作用机制。

方法 通过盐酸东莨菪碱 (Scopolamine) 注射诱导记忆缺陷,构建阿尔茨海默症小鼠模型。利用 Morris 水迷宫和旷场行为学测试,分别观察 ELP 干预对 AD 小鼠学习记忆和运动能力的影响,在正式开始实验前,我们预先给药了 5 天。最后,使用炎

症因子抗体芯片检测小鼠前额叶炎症因子 (GM-CSF、INF-g、IL-2、IL-23) 的变化水平。

结果 水迷宫结果显示,与空白模型组相比,ELP 高剂量治疗组 (10mg/kg) 小鼠在测试阶段找到平台区的潜伏期明显缩短、平台区穿越次数显著增加。其次,与空白模型组相比,所有 ELP 干预对小鼠旷场运动距离均无明显影响,但 ELP 低剂量治疗组 (5mg/kg) 的中心区域活动时间增加。ELISA 检测结果也显示,ELP 高剂量治疗组 (10mg/kg) 小鼠前额叶的炎症因子 (GM-CSF、INF-g、IL-2、IL-23) 水平相较于空白模型组显著下调。

结论 ELP 可以有效改善阿尔茨海默症模型小鼠的记忆缺陷,相应机制可能涉及对关键炎症因子的调节。

Research on Protective Factors of Mental Health Literacy of Residents in Bengbu City, China

Quanming Zheng^{1,2}, Changping Zhai², Mengmeng Wang¹

1.Bengbu Medical University

2.Anhui Veterans Hospital

Objective To investigate the level of mental health literacy of residents in Bengbu City, China and analyze related influencing factors, so as to provide scientific basis for improving the level of mental health of residents

Methods A stratified multi-stage random sampling method was used to select 3122 permanent residents aged 18 and above in Bengbu City, China, and the national mental health literacy questionnaire was used to investigate

Results A total of 3029 valid questionnaires were collected. In 2023, 20.76% (849/3029) of Bengbu residents met the standard in mental health literacy. There were statistically significant differences in the level of mental health literacy among residents of different regions, ages and education levels ($P<0.05$). The

results of the Logistic-regression analysis showed that, The resident area is a city (OR = 1.971, 95% CI = 1.588~2.447), Age ranged from 18 to 29 years (OR = 1.922, 95% CI = 1.335~2.768), 30 to 44 years old (OR = 1.587, 95% CI = 1.195~2.109), Junior degree (OR = 1.436, 95% CI = 1.101~1.873), undergraduate degree (OR = 1.568, 95% CI = 1.143~2.152), master's degree or above (OR = 6.723, 95% CI = 1.703~26.543) is a protective factor for mental health literacy

Conclusion Bengbu City, China residents have a high level of mental health literacy, which is closely related to the region, age and educational background

惊恐障碍患者杏仁核亚区功能连接与临床症状、儿童期创伤的相关性研究

刘诗雨 段迎旭 师丽欣 邓然兮 肖洪奇 邱昌建*
四川大学华西医院

目的 儿童期创伤是惊恐障碍的发病重要危险因素,杏仁核已被证明和儿童期创伤有关,然而惊恐障碍患者杏仁核的神经机制以及与临床症状和儿童期创伤的关系尚不清楚。本研究运用基于种子点的静息态功能磁共振技术,探索惊恐障碍患者相较正常人杏仁核及其亚区的异常功能连接,并进一步探讨异常功能连接与惊恐患者临床症状和儿童期创伤的关联。

方法 本研究为横断面实验设计,根据简明国际神经精神访谈(中文版)纳入符合标准的47名惊恐障碍患者及52名性别年龄匹配的健康对照。采集了被试的人口学资料、临床量表及静息态功能磁共振数据。临床量表包括惊恐症状严重度量表、汉密尔顿焦虑量表、7项广泛性焦虑障碍量表、特质焦虑量表、汉密尔顿抑郁量表评估和儿童期创伤问卷。

采用双样本 t 检验对人口学资料及临床量表得分进行组间比较。将杏仁核分割为基底外侧杏仁核、中央内侧杏仁核、浅表杏仁核和杏仁核纹状体过渡区。然后以双侧杏仁核整体及其亚区为种子点进行基于体素的功能连接分析,将性别、年龄、头动作为协变量,采用双样本 t 检验比较惊恐障碍患者组和

健康对照组两组间的差异。提取惊恐障碍组有差异的异常功能连接值与患者的临床症状评分和儿童期创伤问卷得分进行皮尔逊相关分析。

结果 与健康对照相比,惊恐障碍患者双侧杏仁核与额中回之间的功能连接显著减弱,双侧杏仁核亚区与内侧前额叶、额中回、额下回、中扣带回、膝下前扣带回、颞中回和楔前叶存在广泛的异常功能连接,且异常功能连接与临床症状严重程度、儿童期创伤相关。

结论 惊恐障碍患者杏仁核存在功能异常,可能与儿童期创伤经历相关,提示儿童期创伤对惊恐障碍患者脑功能异常的影响值得进一步研究。

Identify Latent Subtypes of Symptom Trajectories in Major Depressive Disorder Patients and Their Predictors

Fanyu Meng Wenwen Ou Xiaotian Zhao Kangning Li Hui Liang Yumeng Ju*
The Second Xiangya Hospital of Central South University

Objective This study aimed to identify different symptom trajectories based on the severity of depression symptoms within a 2-month follow-up, and to explore predictive factors for different symptom trajectories

Methods Three hundred and ninety-two adults diagnosed with major depressive disorder (MDD) were recruited from two longitudinal cohorts. Patients received antidepressant treatment as usual, and the depression symptoms were evaluated by the 17-item Hamilton depression rating scale (HAMD-17) at baseline, two weeks, and eight weeks. Based on the HAMD-17 scores, different trajectories of symptom change were distinguished by applying Growth Mixture Modeling (GMM). Furthermore, the baseline sociodemographic, clinical, and cognitive characteristics were compared to identify potential predictors for different trajectories

Results Though GMM, three unique depressive

symptom trajectories of MDD patients were identified: (1) mild-severity class with significant improvement (Mild, $n = 255$); (2) high-severity class with significant improvement (High, $n = 39$); (3) moderate-severity class with limited improvement (Limited, $n = 98$)

Sociographic traits including age ($H = 20.656$, $P < 0.001$), education ($H = 21.913$, $P < 0.001$), smoking ($H = 6.349$, $P = 0.042$), and marital status ($H = 15.337$, $P = 0.018$) were different among the three classes. The High trajectory patients had higher age (M vs H , $P = 0.006$; H vs L , $P < 0.001$), lower years of education (M vs H , $P = 0.003$; H vs L , $P = 0.001$), and a lower rate of smoking (M vs H , $P = 0.012$; H vs L , $P = 0.034$) than the other two classes.

Considering the predictors in clinical features, age of onset, drug naïve or not, the types of antidepressants, anxiety symptoms, and childhood maltreatment would be the potential indicators. More specifically, results showed that the lowest level of somatic and psychic anxiety symptoms were found in the Mild class (all $P < 0.001$). Patients in the High trajectory were most likely prescribed SSRIs (all $P < 0.001$) and anti-anxiety agents (M vs H , $P = 0.047$; H vs L , $P = 0.007$) compared to other two classes. The Limited class individuals were the youngest at the first episode (M vs L , $P = 0.024$; H vs L , $P < 0.001$), and they were less likely to be drug naïve than other patients (M vs L , $P = 0.002$; H vs L , $P < 0.001$). Moreover, the Limited class had the highest level of emotional abuse (M vs L , $P = 0.001$; H vs L , $P = 0.045$).

As for the cognitive predictors, we did not find a significant difference in attitude dysfunction among the three trajectories ($H = 0.995$, $P = 0.609$). The High class had shown the worst performances in all executive function, attention, and processing speed tests (all $P < 0.05$). For the Intelligent Memory Test in site 2, three trajectories were presented differently ($H = 13.456$, $P = 0.001$), in which the Mild class performed better than the other two classes (M vs H , $P = 0.012$; M vs L , $P = 0.017$).

First, our study revealed a high levels of anxiety in both High trajectory and Limited trajectory, whereas patients in the Mild trajectory exhibited low levels of anxiety symptoms at baseline. Anxiety is a prominent focus in clinical research, it is often comorbid with depression

and is recognized as a risk factor for depression. Growing evidence has shown that high anxiety symptoms are associated with poor symptom trajectory in MDD patients. Although anxiety symptoms at baseline could not differentiate the High trajectory and the Limited trajectory, our findings suggested that lower levels of anxiety attributed to a better treatment outcome. In other words, in our results, severe anxious symptoms may not necessarily increase the risk of developing inferior treatment response in MDD patients. Further, in the subdimensions of anxiety, we also found that low levels of somatic anxiety and psychic anxiety were associated with better symptom trajectories, and high levels of somatic or psychic anxiety were not necessarily leading to poor symptom trajectory

Second, our study showed that the High trajectory was associated with worse cognitive dysfunction and a lower degree of education compared to the other two classes. More specifically, the High trajectory patients exhibited significant impairments in all executive function, attention, and processing speed tests. Additionally, we observed that the patients with High trajectory tend to exhibit a low level of education. It is suggested that the degree of education might contribute to severe cognitive dysfunctions. However, we did not find a correlation between cold cognitive dysfunction and poor treatment trajectory. The absence of cold cognition as a predictor in our study, since our sample is predominantly young adults. Therefore, taking age factors into consideration might elucidate the relationship between cognitive impairment and treatment response and might help determine the most suitable candidates for cognitive interventions.

Last, we found that the Limited trajectory was associated with high levels of childhood maltreatment compared to the other two classes. Specifically, individuals with high levels of emotional abuse were more likely to develop limited symptom improvement trajectory. Notably, the early age of onset observed in the Limited patients might be associated with childhood maltreatment. It has been suggested that the negative events experienced during early childhood may impede one's normal developments in neural circuits, which may increase one's vulnerability to develop depression

in early adulthood. Notably, such a long-term accumulated neural abnormality could not be easily remedied in a short-term treatment. These results showed that childhood trauma, especially emotional abuse, could predict antidepressant treatment response in MDD patients. Early intervention for childhood trauma may help patients in the Limited trajectory achieve a better symptom trajectory.

Conclusion The present study used GMM to explore the distinct trajectories of depressive symptoms among MDD patients who were followed up for 2 months. We identified three different symptom trajectories in MDD patients. One trajectory with limited improvement consisted of a quarter of the samples. The other two trajectories account for the rest of the sample, were distinguished by baseline depression severity. And participants categorized into these two trajectories demonstrated significant symptom improvement across 2-months follow up. Meanwhile, the identified predictors associated with each trajectory may provide a valuable foundation for further exploring the optimal treatment strategies and tailoring treatment plans for patients with different symptom trajectories

This study aimed to build a trajectory modeling based on the severity of depression within a 2-month follow-up period using GMMs, and three distinct symptom trajectories were identified. Our results suggested that anxiety symptoms, childhood maltreatment, and cold cognitive function could contribute to distinct different symptom trajectories in MDD patients. These findings could extend our recognition on the heterogeneity of depressive patients and might have clinical implications for selecting and tailoring treatment for patients with different symptom trajectories.

广泛性焦虑障碍患者杏仁核功能连接变化特征

孟凡煜 欧雯雯 马墨涵 梁慧 舒苏 鞠玉朦*
中南大学湘雅二医院

目的 杏仁核被认为是恐惧和焦虑反应的核心脑区,接受从皮质-丘脑传输来的威胁刺激信号并向外输出应激反应信号,并且存在左侧偏侧性。广泛性焦虑障碍(generalized anxiety disorder, GAD)是以对不确定事物的焦虑为核心症状的精神疾病。杏仁核的异常活动被认为是 GAD 发生发展的重要原因。本研究目的在于①发现健康人与 GAD 患者左侧杏仁核功能连接的差别;②经过治疗后 GAD 患者的左侧杏仁核功能连接变化。

方法 本研究收集了 68 名 GAD 患者及 68 名健康对照的静息态功能磁共振数据,其中 19 名 GAD 患者收集了基线与治疗后 2 月的核磁数据。基于 Brainnetome246 模板,以左侧杏仁核为种子,比较 GAD 患者与健康被试和 GAD 患者自身前后的杏仁核功能连接变化。

结果 在基线 GAD 与健康被试的比较中,共有 51 条与杏仁核连接的边有显著差异。这些边主要位于颞上回(10/51)、脑岛(6/51)、眶回(5/51)、顶下小叶(4/51)、颞下回(4/51)、额上回(4/51)。杏仁核与颞上回、脑岛的功能连接在 GAD 患者中减弱,与眶回、颞下回、额上回的功能连接增强。杏仁核与顶下小叶的功能连接变化不一。

在 GAD 患者治疗前后的比较中,共有 26 条边有显著差异。主要位于基底节(4/26)、海马旁回(4/26)、颞下回(3/26)、丘脑(3/26)、梭状回(2/26)、额中回(2/26)。杏仁核与基底节连接的边,治疗后显著增强;与海马旁回、颞下回、丘脑、梭状回、额中回连接的边,治疗后强度减弱。其中左杏仁核与右伏隔核的功能连接与焦虑症状呈负相关。

结论 在本研究中, GAD 患者杏仁核异常变化的边主要集中于颞叶、额叶及皮质下区域。其中,左杏仁核与右伏隔核的功能连接与焦虑症状呈负相关。在面对不确定的威胁信息时,伏隔核的参与尤为显著。伏隔核接收包括基底外侧杏仁核在内的多个脑区的信息输入以评估环境刺激,进而调节对威胁刺激的反应。杏仁核与伏隔核的功能连接增强,或许能帮助 GAD 患者更好的评估所处环境,从而改善焦虑症状。

Comparative Meta-analysis of Functional

Brain Abnormalities in Obsessive-compulsive Disorder and Anxiety Disorders

Dongping Gou*

Second Xiangya Hospital

Background In 2013, obsessive-compulsive disorder (OCD) was moved into a separate new category called obsessive-compulsive and related disorders (OCRDs) from anxiety disorders in Diagnostic and Statistical Manual of Mental Disorders V (DSM-V). However, both disorders frequently co-occur in clinical and are thought to be associated with abnormalities in the processing and regulation of anxiety. It is unclear whether these symptom profiles are mediated by common or distinct neural profiles. This comparative multimodal meta-analysis assessed and shared disorder-specific neurofunction in the two disorders.

Methods A comparative meta-analysis of 49 voxel-based resting state functional magnetic resonance imaging (rs-fMRI) studies was conducted comparing activation abnormalities between patients with OCD (1553) and anxiety disorders (339) and healthy control subjects

Results Disorder-differentiated functional abnormalities were both hyperactive in the left median cingulate/paracingulate gyrus (BA 24) and the left medial superior frontal gyrus (BA 32) in OCD patients relative to anxiety disorders patients where the regions above were hypoactive relatively. Additionally, we found hyperactivation in bilateral striatum (including the right lenticular nucleus/putamen) in OCD patients relative to control subjects and anxiety disorders patients where they are reduced relatively. However, this meta-analysis did not reveal significant between-group differences in the amygdala, and the

functional abnormalities shared by the two diseases were not highly significant.

Conclusion This comparative multimodal meta-analysis shows that different topdown dorsal prefrontal control over emotional regulation in OCD and anxiety disorders. Increased neural activation was shared in the dorsal lateral prefrontal cortex in both disorders, but disorder-differentiated functional abnormalities were both

hyperactive in dorsal anterior cingulate cortex/medial prefrontal cortex in OCD patients relative to anxiety disorders patients where the regions above were hypoactive relatively. Additionally, hyperactivation in striatal regions may be a disorder-specific neural structural biomarker for OCD relative to anxiety disorders

关键词: obsessive-compulsive disorder, anxiety disorders, rs-fMRI, metaanalysis

酒精依赖大鼠不同戒断时期促炎因子、氧化应激与戒断症状的相关性研究

孔祥齐 陈旭*

山东省精神卫生中心

目的 酒精戒断 (Ethanol Withdrawal, EW) 通过一系列生理和病理效应对机体产生损害, 并可能出现神经系统症状、精神症状、心血管系统症状等, 这一系列症状称之为酒精戒断综合征 (alcohol withdrawal syndrome, AWS)。研究表明, EW 期间体内氧化应激加剧, 自由基生成增加, 抗氧化防御能力显著降低, 导致细胞和组织损伤。此外, EW 还显著增加了促炎因子, 如: TNF- α 、IL-1 β 和 IL-6 的水平, 进一步加剧炎症反应和细胞损伤。本研究旨在进一步探究酒精依赖大鼠不同戒断时期促炎因子、氧化应激与戒断症状的相关性。

方法 选用 SPF 级 Wistar 雄性大鼠 29 只, 对其随机分为 A (n=5)、B (n=8)、C (n=8)、D (n=8) 四组。A 组为健康对照组, 予喂养普通固体饲料及蒸馏水饲养 28 d。B、C、D 三组为实验组, 均予喂养普通固体饲料及含有 6% (v/v) 的乙醇溶液作为唯一引用水来源饲养 28 d。A 组在第 29d 进行麻醉取血。B、C、D 组在第 29d 通过《酒精依赖大鼠戒断行为体征和听源性癫痫发作评分标准》(以下简称《量表》) 进行建模的评定, 并将笼内乙醇溶液更换为蒸馏水。以上 3 组在分别在停止酒精饲养的第 0h、6h、18h 时通过《量表》进行评分, 后麻醉取血。四组血液标本离心处理后取上层血浆。采用双抗夹心法酶联免疫吸附实验 (ELISA) 测定血浆中促炎因子 (IL-1 β 、IL-4、TNF- α)、氧化应激指标 (MDA、SOD、GSH-Px) 的浓度。

结果 四组大鼠血浆 GSH-Px 水平总体存在统

计学差异 ($H=9.217, p=0.027$)。其中,酒精依赖大鼠戒断 0h GSH-Px 水平高于戒断 18h 组大鼠 ($adj.p=0.032$)。四组大鼠血浆 SOD 水平总体存在统计学差异 ($F=7.687, p=0.001$)。其中,健康对照大鼠 SOD 水平高于戒断 18h 组大鼠 ($p=0.012$),酒精依赖大鼠戒断 0h SOD 水平高于戒断 6h 组大鼠 ($p=0.013$),酒精依赖大鼠戒断 0h SOD 水平高于戒断 18h 组大鼠 ($p<0.001$)。Spearman 相关分析发现,酒精依赖大鼠不同戒断时期血浆 SOD 水平与戒断症状存在负相关 ($r=-0.462, p=0.012$),酒精依赖大鼠不同戒断时期血浆 IL-1 β 水平与戒断症状存在正相关 ($r=0.430, p=0.020$),酒精依赖大鼠不同戒断时期血浆 TNF- α 水平与戒断症状存在正相关 ($r=0.369, p=0.049$)。

结论 酒精依赖大鼠不同戒断时期血浆中 SOD、IL-1 β 、TNF- α 水平与戒断症状相关。

关键词: 酒精戒断,促炎因子,氧化应激,戒断症状

枸橼酸坦度螺酮联合九味镇心颗粒治疗焦虑症的临床观察

顾汇*

海南省安宁医院

目的 焦虑症,也称为焦虑性神经症,是神经症这类疾病中最常见的一种,可分为广泛性焦虑障碍、社交焦虑障碍和惊恐障碍,即急性障碍。目前,全国的焦虑症患者数目仍在逐年上升。患者应该要早期重视、积极治疗,以防止疾病恶化。为了安全而高效的治疗焦虑症,广大医务工作者们在不断的进行探索与研究。西医主要使用抗焦虑及抗抑郁药物干预治疗,枸橼酸坦度螺酮为临床常用抗焦虑药,也具有较高的安全性和有效性,但是存在有副作用、起效缓慢、费用高等缺陷。中医药治疗郁病已有一千多年的历史,九味镇心颗粒为中成药,具有特异的抗焦虑作用,治疗广泛性焦虑障碍具有较好的疗效和安全性[4]。基于此,本次研究将枸橼酸坦度螺酮联合九味镇心颗粒联合进行治疗焦虑症,现对其临床效果进行探讨。

方法 选取 2023 年 1 月~2023 年 12 月我院收治的焦虑症患者 72 例作为研究对象,随机分为 2 组,

对照组采用枸橼酸坦度螺酮治疗,观察组采用枸橼酸坦度螺酮联合九味镇心颗粒治疗。比较两组临床疗效(采用汉密尔顿焦虑量表(HAMA))、不良反应发生情况并按 HAMA 减分率评定疗效。

结果 观察组治疗有效率高于对照组,差异有统计学意义 ($P<0.05$); 治疗 4 周、8 周及 12 周后两组患者 HAMA 评分均低于治疗前,差异有统计学意义 ($P<0.05$); 而治疗 4 周、8 周及 12 周后观察组患者 HAMA 评分均低于对照组,差异有统计学意义 ($P<0.05$);

两组患者不良反应比较,差异无统计学意义 ($P>0.05$)。

结论 枸橼酸坦度螺酮联合九味镇心颗粒治疗焦虑症的临床效果较佳,且安全性较好。

关键词: 焦虑症; 治疗; 九味镇心颗粒; 枸橼酸坦度螺酮

不同工作记忆负荷对强迫障碍患者注意偏向特征的影响

严子君 王鹏翀 李占江*

首都医科大学附属北京安定医院

目的 强迫障碍 (obsessive-compulsive disorder, OCD) 患者对威胁刺激的注意偏向在强迫症状的诱发、维持中起着重要的作用,但目前研究对于 OCD 患者的注意偏向特征尚未得出一致结论。因此,本研究旨在进一步探究 OCD 患者与健康人群之间注意偏向特征的差异以及不同工作记忆负荷条件对注意偏向特征的影响。

方法 选取 2021 年 12 月至 2024 年 5 月于北京安定医院就诊的 OCD 患者 60 例及社会招募的健康人群 60 例,采集两组受试者的人口学资料、症状以及情绪等临床资料,使用眼动技术,结合自由浏览与视觉空间工作记忆任务范式进行注意偏向特征的测量。使用独立样本 t 检验和卡方检验分析 OCD 患者和健康对照之间的人口学指标及临床量表的差异;使用重复测量方差分析、简单效应分析等对眼动指标与组别、工作记忆负荷之间的关系进行数据分析;对眼动指标和临床数据之间的关系进行相关分析。

结果 健康对照完成眼动视觉空间工作记忆任

务的正确率显著高于 OCD 患者，在低负荷和高负荷条件下均有显著差异，且两组受试者高负荷条件下的正确率均低于低负荷条件下的正确率。整体来看，OCD 患者对强迫图片表现出了显著的注意偏向。在高工作记忆负荷条件下，注意警觉指标与强迫洗涤症状的严重程度呈负相关。

结论 OCD 患者对强迫图片存在注意偏向，不同工作记忆负荷条件会影响受试者的注意偏向表现。为进一步探索 OCD 患者注意偏向的机制，优化临床治疗方案提供了基础。

关键词：强迫障碍；注意偏向；工作记忆负荷

青春期触觉干预早期应激所致焦虑样行为的作用及机制研究

廖冰冰¹ 王振¹ 史栋栋¹ 张瀛丹¹ 李奕¹ 田菲²

1.上海市精神卫生中心

2.上海中医药大学

目的 早期应激可影响儿童时期和青春期的的大脑结构和功能，增加个体成年后患焦虑障碍的易感性。近年来社交触觉因涉及情感和奖赏相关脑区的激活，成为潜在的治疗焦虑障碍的策略。开展触觉与早期应激相关焦虑障碍的研究有助于阐明触觉缓解焦虑的作用机制，为开发潜在的临床干预技术提供新方向。因此，我们探索了青春期触觉干预对早期应激所引起的抑郁和焦虑样行为的治疗效果及作用机制。

方法 在 SD 大鼠出生后 (postnatal day, PND) 的第 4 至 20 天，对幼鼠进行不可预测母婴分离。分离结束后，大鼠被分配到触摸组 (ST)、假处理组 (SHAM) 和不可预测母婴分离组 (UMS)；另设出生后标准饲养的对照组 (CTRL)。在 PND21-34，给 ST 组的大鼠触觉干预，给予 SHAM 组的大鼠假处理。在 PND35-39，采用糖水偏好测试、旷场实验和高架十字迷宫实验评估大鼠青春期的抑郁和焦虑样行为。在 PND64-68，复测大鼠成年后的抑郁和焦虑样行为。通过 c-Fos 免疫荧光染色初步确定触觉差异激活的脑区。采用化学遗传学技术操纵该脑区的活动以探索其在触觉干预发挥抗焦虑的作用机制。

结果 青春期触觉干预可减少不可预测母婴分离应激大鼠在青春期和成年后的焦虑样行为，对抑

郁样行为无影响。与假处理组相比，经历触觉干预的大鼠在青春期和成年后在旷场箱的中心区停留时间更长，在高架十字迷宫的开放臂探索时间占比更高，这表明青春期触觉干预可改善早期应激所致的焦虑样行为，且该效益可从青春期延续至成年后。c-Fos 免疫荧光染色实验表明，触觉可激活内侧前额叶皮质。采用化学遗传学技术抑制内侧前额叶皮质的谷氨酸能神经元的活动可阻断触觉干预的抗焦虑作用，激活内侧前额叶皮质的谷氨酸能神经元的活动对雄鼠的焦虑样行为无影响，这表明内侧前额叶皮质的谷氨酸能神经元的激活对触觉干预发挥抗焦虑作用是必要的。

结论 青春期触觉干预可在青春期可改善不可预测母婴分离所致的焦虑样行为，且这种干预效益可持续至成年。而内侧前额叶皮质的谷氨酸能神经元的激活介导触觉干预的抗焦虑作用。

正念减压疗法对焦虑性障碍患者心理状态的对照研究和机制探讨

郎甲然 杨国栋 陈亚欣 靳丽洋 任会鹏*

河北医科大学第一医院

目的 本研究将在心理治疗师的指导下，进行标准化正念减压 (mindfulness based stress reduction, MBSR) 干预对焦虑性障碍患者负性情绪的研究，并且评估相关可能机制。这项随机对照研究将通过分析干预前后的精神心理状态相关量表来评估 MBSR 的疗效。此外，本研究还将评估细胞因子水平，以探索 MBSR 发挥疗效的生物学机制。

方法 研究于 2023 年 9 月开始至 2024 年 12 月结束，实施单位为河北医科大学第一医院，这项随机对照试验将以 1: 1 的比例将符合纳入标准的 100 例焦虑性障碍患者随机分为试验组和对照组。试验组参与者接受为期 8 周的 MBSR 治疗结合药物治疗，对照组仅接受药物治疗，药物选用草酸艾司西酞普兰 10-20mg/日。主要结果包括汉密尔顿焦虑量表、汉密尔顿抑郁量表、匹兹堡睡眠质量指数量表、状态-特质焦虑问卷、五因素正念量表。次要结果包括血清细胞因子 IL-6(interleukin-6)、IL-10(interleukin-

10)、IFN- γ (Interferon- γ) 和 TNF- α (Tumor Necrosis Factor- α) 的浓度测定。采用 SPSS 25.0 软件、GraphPad Prism 8 软件进行数据分析,符合正态分布的计量资料描述为均值 \pm 标准差,组间比较采用 t 检验、非正态分布计量资料描述为中位数(四分位数间距),组间比较采用非参数检验(Wilcoxon 秩和检验)、计数资料采用 χ^2 检验,相关性分析采用 Pearson 相关分析。

结果 后期的研究正在进行中,前期的结果显示,相对于对照组,试验组患者的焦虑情绪 ($P=0.003$)、抑郁情绪 ($P=0.021$) 有更为明显的改善,状态焦虑 ($P<0.001$) 及特质焦虑 ($P<0.001$) 改善程度均优于对照组,正念得分 ($P=0.01$) 更高。外次,两组的匹兹堡睡眠质量指数量表得分 ($P=0.496$) 未表现出统计学差异。

结论 MBSR 是一种无风险、操作灵活、成本效益高的干预措施,会改善焦虑性障碍患者的心理状态。这项研究中的初步结果提示这种非药物干预结合常规药物治疗下疗效相较于单纯药物治疗更具有优势,可以更加明显的改善患者焦虑、抑郁的程度。

惊恐障碍中恐惧网络模型相关脑区的功能和结构改变: 静息态功能磁共振和 T1 加权成像研究

史珂 张函 杨渊*

华中科技大学同济医学院附属同济医院

目的 随着研究的深入,已有证据表明惊恐障碍患者的恐惧网络模型相关脑区在功能连接上存在异常。然而,关于这些脑区的局部功能和结构特性,以及它们之间有效连接的具体变化,仍需我们进行更深入的探讨。因此,本研究旨在进一步探明惊恐障碍中恐惧网络模型的结构与功能特征。

方法 我们招募了 33 名惊恐障碍患者和 35 名健康对照者,并收集了他们的磁共振成像数据。通过评估灰质体积、度中心性、区域同质性和低频波动振幅等指标,我们深入分析了惊恐障碍患者恐惧网络模型相关脑区的结构与功能特点。在此基础上,

我们进一步探讨了这些异常脑区的功能连接和有效连接模式,并分析了这些异常连接与临床特征之间的潜在关联。

结果 与健康对照者相比,惊恐障碍患者的恐惧网络模型脑区在灰质体积、区域同质性和低频波动振幅方面未显示出显著差异。然而,我们发现惊恐障碍患者的双侧杏仁核度中心性显著增强,这表明这些脑区在恐惧网络中的连接强度有所增加。此外,杏仁核及其亚核与中央沟盖、岛叶、内侧额上回、缘上回、岛盖部额下回和颞上回等区域之间的有效连接均出现异常变化。更为值得注意的是,惊恐障碍患者的汉密尔顿焦虑量表得分与其左侧杏仁核外侧核(背侧部分)到右侧中央沟盖和左侧颞上回的有效连接强度之间存在正相关关系。

结论 本研究揭示了惊恐障碍中涉及内-外感受信号调节、情绪调节与躯体症状相关的脑区功能网络发生了显著的重塑。这些发现不仅加深了我们对惊恐障碍神经生物学机制的理解,也为该疾病的诊断提供了新的神经影像学标记,并可能为未来的治疗干预提供潜在的靶点。

Metabolomic Profiling of Pediatric and Adolescent Depression: A Systematic Review of Biomarker Discovery

Tao Dong Zhifen Liu*

The First Hospital of Shanxi Medical University

Objective This systematic review aimed to synthesize metabolomics research on depressive disorders in the pediatric and adolescent population. The goals were to identify key metabolites that are substantially altered, elucidate the associated metabolic pathways, and assess the potential of metabolomics in the diagnosis and prognosis of depressive disorders in this age group

Methods A literature search was conducted from January 2010 to December 2023 across databases including PubMed, ScienceNet, Embase, and MENDA. A

systematic analysis was performed to identify and consolidate differential metabolites. Metabolic pathways were analyzed using the Metabolic Analyzer, an online tool. Additionally, the Metscape plugin within Cytoscape was employed to generate metabolite-gene network diagrams

Results The study incorporated 11 pertinent articles. Metabolites that were frequently reported to be differentially expressed include tryptophan, inosine, kynurenic acid, arachidonic acid, and others. The implicated metabolic pathways were found to be lipid metabolism and amino acid metabolism. The metabolite-gene interaction network analysis revealed that amino acid metabolism encompasses 24 metabolites and 38 genes, while C21-steroid hormone biosynthesis involves 28 metabolites and 38 genes

Conclusion This review encapsulates the significant metabolic shifts observed in depressive disorders among children and adolescents. Further exploration indicates that these metabolites are predominantly associated with lipid and amino acid metabolism, offering valuable insights for the predictive and diagnostic approaches to depression in this demographic

跨诊断视角下习惯特征在不确定性不容忍与精神病理症状维度之间的中介作用

袁晨语 王振*
上海市精神卫生中心

目的 不确定性不容忍 (IU) 是许多精神疾病的跨诊断脆弱性, 指的是一种对不可预测和不确定性的未来事件产生恐惧的特质, 并且相信感到不确定是不可取的。IU 是引起各种精神疾病的核心认知偏差, 例如广泛性焦虑症、抑郁症、创伤后应激障碍、强迫症、进食障碍和物质滥用障碍等。IU 被认为是一种普遍的脆弱性因素, 解释了各种精神疾病之间的高共病率, 并且是影响心理健康的一个跨诊断的机制。当前关于 IU 与精神类疾病关联等研究集中在与情绪相关的构造, 如恐惧、反刍等。鉴于不确定

性妨碍人们为未来事件做准备的能力, 并促使其采取减少不确定性的行为, 有必要考虑节省认知资源的习惯行为作为将 IU 与症状维度联系起来潜在机制。最新研究发现, 负责主观不确定性体验的大脑核心系统包括尾状核, 该区域也是一个对习惯学习和表达也至关重要的区域。基于此, 本研究采用跨诊断视角, 探讨在中国社区样本中, 习惯特征在症状维度和不确定性不容忍之间的中介作用。

方法 本研究招募了 4102 名年龄在 18 至 67 岁之间的中国成年人 (平均年龄 $M=26.9$ 岁, 标准差 $SD=8.01$), 以提取精神病理症状维度并探索习惯特征的中介作用。本研究使用了: 郁-健康问卷抑郁症状群量表 PHQ-9、广泛性焦虑量表 GAD-7、进食态度问卷中文版 EAT-26、应激感受量表 PSS、精使用障碍筛查量表 AUDIT、强迫症状行为问卷 OCI-R 等问卷作为症状维度测量问卷, 并使用无法忍受不确定性量表 IUS、习惯特征量表 COHS, 分别测量个体对不确定性的不容忍性及习惯倾向。

结果 研究提取了三种症状维度 (强迫性、成瘾性和情感压力维度)。所有症状维度、不确定性不容忍 (IU) 和习惯特征之间均显著相关 ($p<0.01$)。IU 对所有三个维度都有直接的正向影响 (强迫性: 效应值 = 0.41; 情感压力: 效应值 = 0.58; 成瘾性: 效应值 = 0.13), 并且通过自动化的习惯特征也产生间接的正向影响 (强迫性: 效应值 = 0.095; 情感压力: 效应值 = 0.062; 成瘾性: 效应值 = 0.050)。此外, IU 通过重复的习惯特征对强迫性维度产生正向影响 (效应值 = 0.053), 对情感压力维度产生负向影响 (效应值 = -0.026)

结论 本研究从中国社区样本中提取出三种症状维度 (强迫性、情感压力和成瘾性)。从维度角度来看, 本研究还发现较高水平的不确定性不容忍 (IU) 可以通过自动化的习惯特征加剧精神病理症状, 而重复的习惯特征可以缓解情感压力维度, 并加重强迫性维度。

关键词: 跨诊断; 强迫; 成瘾; 不确定性难容忍性; 习惯

情绪障碍的非适应性情绪调节策略及其心理干预进展

杨祥云 徐怡 李占江*

首都医科大学附属北京安定医院

目的 情绪失调作为一种跨诊断现象常见于多种情绪障碍，与不适应的情绪调节策略有关，这些策略可能导致疾病维持和恶化。本文通过回顾文献，总结抑郁障碍、焦虑障碍和双相情感障碍中非适应性情绪调节策略及其心理干预措施，为临床干预情绪障碍提供有效的靶点、优化治疗方案。

方法 本综述通过检索国内外相关文献，总结归纳情绪调节策略在抑郁障碍、双相情感障碍和焦虑障碍中的特征，发现其共性和特异性，并梳理相应的心理干预技术，为临床治疗情绪障碍提供依据。

结果 通过对已有文献的回顾我们发现，情绪失调是多种精神疾病共有的特征，与不适应的情绪调节策略紧密相关，这些策略可能导致疾病的持续和恶化。反刍、表达抑制、回避等策略更常被情绪障碍患者使用，通过正念、认知行为治疗、辩证行为疗法、情绪调节疗法等心理治疗可以有效提高患者的情绪调节能力，增加认知重评、接纳等策略的运用频率和成功率，从而有助于症状的缓解。

结论 未来的研究可以更多地利用生物标志物（如心率变异性、皮肤电反应等）来更客观地评估情绪调节策略。利用神经成像技术（如功能性磁共振成像）来探索情绪调节策略在大脑中的神经机制。另外，情绪调节策略的适应性与非适应性不是完全绝对的，将来可以更多研究情绪调节策略在不同情境下的适应性，例如在压力情境、社交互动或决策过程中，关注情绪调节策略的灵活性。

关键词：情绪障碍，情绪调节策略，非适应性，心理干预，反刍，回避

网络正念减压疗法对围术期 0-II 期乳腺癌患者负性情绪的影响

杨国栋 任会鹏*

河北医科大学第一医院

目的 了解乳腺癌患者负性情绪现状，分析乳腺癌患者负性情绪的相关影响因素，探究网络正念减压疗法对围术期 0-II 期乳腺癌患者负性情绪的影响效果。

方法 第一部分：患者负性情绪的现况研究。选取 2023 年 8 月至 2023 年 11 月，处于围术期的 0-II 期乳腺癌患者 102 名作为研究对象，通过一般资料调查表、汉密尔顿焦虑量表（HAMA）、汉密尔顿抑郁量表（HAMD）、匹兹堡睡眠质量指数量表（PSQI）、癌症复发恐惧量表（FCRI）、五因素正念量表（FFMQ）调查患者的负性情绪及正念水平，并分析患者负性情绪的相关因素。第二部分：网络正念减压疗法对乳腺癌患者负性情绪的影响。选取符合纳入排除标准的 70 名参与者，通过随机数表法将其分为干预组（n=35）与对照组（n=35）。对照组给予常规健康教育，干预组在对照组的基础上给予为期 8 周的网络正念减压干预课程。干预前后采用一般资料调查表、HAMA、HAMD、PSQI、FCRI、FFMQ 对参与者进行评估。采用 SPSS 25.0 软件、GraphPad Prism 8 软件进行数据分析，符合正态分布的计量资料描述为均值±标准差，组间比较采用 t 检验、非正态分布计量资料描述为中位数（四分位数间距），组间比较采用非参数检验（Wilcoxon 秩和检验）、计数资料采用 χ^2 检验，相关性分析采用 Pearson 相关分析。

结果 年龄、居住地、疾病分期对焦虑情绪的影响具有统计学意义（ $P < 0.05$ ）。线性回归显示，抑郁和癌症复发恐惧是焦虑的影响因素（ $P < 0.05$ ）。干预前后结果组内比较显示，对照组 HAMA、HAMD、PSQI、FCRI 总分差异无统计学意义（ $P > 0.05$ ）；干预组 HAMA、PSQI、FCRI 得分较前下降，FFMQ 得分较前增加，差异具有统计学意义（ $P < 0.05$ ）。干预后两组间比较显示，干预组 HAMA、PSQI、FCRI 得分较低，FFMQ 得分较高，差异具有统计学意义（ $P < 0.05$ ）。

结论 0-II 期乳腺癌患者在围术期广泛存在焦虑、抑郁及癌症复发恐惧情绪，睡眠质量差；年龄、居住地、癌症分期会影响患者的焦虑情绪。网络正念减压干预能够改善 0-II 期乳腺癌患者的焦虑情绪，缓解癌症复发恐惧，改善睡眠质量，提高正念水平。

关键词：乳腺癌，网络正念减压疗法，焦虑，睡眠障碍，癌症复发恐惧

Social Support and Sleep Health: A Cross-sectional Study in China

Yimiao Gong Yongbo Zheng Yingbo Yang Lin Lu*
Peking University Sixth Hospital

Objective Healthy sleep is essential for human beings to experience a general sense of wellbeing, whereas, a significant percentage of people have difficulties in enjoying natural sleep health due to a variety of reasons. Social support has been found to be associated with quality of sleep, however, the puzzle of social support and sleep health is not yet complete. Current study sought to identify a clear relationship between social support and sleep health in general Chinese population

Methods An online cross-sectional survey was established in mainland China from June to July 2022. Individuals' social support level was measured with Perceived Social Support Scale (PSSS) and identified as high social support and low-to-middle social support. In addition, sleep health was evaluated with sleep quality, sleep duration, sleep pattern, and the presence of any sleep disorder or disturbance including insomnia, excessive daytime sleepiness, obstructive apnea syndrome, and narcolepsy

Results A total of 41,061 individuals who completed the online survey were included in the final analysis, among whom, 13,633 individuals reported to have high social support level, while 27,428 had low-to-middle social support level. Multivariable logistic regression analysis was applied to explore social support associated with sleep health outcomes. After adjusting for covariates, participants with high social support were associated with a higher likelihood of good sleep quality (OR=1.47, 95% CI=1.40-1.55), normal sleep duration (OR=1.36, 95% CI=1.30-1.43), and healthy sleep pattern (OR=1.50, 95% CI=1.43-1.58). What's more, compared to those with low-to-middle social support, individuals with high support were shown to have lower risks of sleep problems such as insomnia (OR=0.65, 95% CI=0.61-0.69), excessive daytime sleepiness (OR=0.78, 95% CI=0.72-0.83), obstructive apnea syndrome (OR=0.58, 95% CI=0.53-0.62), and narcolepsy (OR=0.74, 95% CI=0.68-0.81)

Conclusion To conclude, higher social support can facilitate better and healthier sleep experience. The

findings will be an essential puzzle piece in the improvement of human sleep health

关键词: social support, sleep health

智能手机使用对青少年抑郁障碍患者负性情绪的影响研究

许丽芳 陈旭*
山东省精神卫生中心

目的 探讨智能手机使用的时间及动机对抑郁障碍青少年焦虑、抑郁、负性情绪的影响。

方法 选取2023年10月—2024年6月在山东省精神卫生中心就诊的116例青少年抑郁障碍患者为观察组,选取周围中学的185名健康青少年为对照组。采用一般资料问卷、手机使用动机量表、问题性手机使用量表(MPPUS-10)评估两组青少年的智能手机使用状况;采用抑郁自评量表(SDS)、焦虑自评量表(SAS)、负性情绪量表(PANA)评估两组青少年的负性情绪状况。

结果 ①观察组手机使用时间与健康组存在显著差异($p<0.01$);观察组手机使用动机量表中休闲娱乐、唤醒、信息获取维度评分均显著低于对照组($p<0.01$);逃避、习惯维度评分均显著高于对照组($p<0.01$);观察组问题性手机使用量表评分显著高于对照组($p<0.01$);②观察组抑郁自评量表评分、焦虑自评量表评分、负性情绪量表评分均显著高于对照组($p<0.01$);③相对于每日使用手机2小时以下,每日手机使用时间在4-6小时会显著增加患抑郁的风险,差异具有统计学意义(OR=11.342, 95%CI 2.182-58.958, $p<0.01$);④以逃避为动机的手机使用可以显著正向预测观察组及对照组的抑郁、焦虑及负性情绪($p<0.01$);以休闲娱乐为动机的手机使用可以显著负向预测观察组的焦虑及负性情绪($p<0.05$);以信息获取为动机的手机使用可以显著负向预测对照组的抑郁及负性情绪($p<0.05$)。⑤问题性手机使用可以显著正向预测观察组及对照组的抑郁、焦虑及负性情绪($p<0.01$)。

结论 每日使用手机时间在4-6小时会显著增加抑郁风险;以休闲娱乐、信息获取为动机的手机使用可能对抑郁、焦虑等负性情绪可以起到暂时的缓解作用;而以逃避为动机的手机使用以及问题性

手机使用可能会加重抑郁、焦虑等负性情绪。

关键词：智能手机使用；青少年；抑郁障碍患者；焦虑；抑郁；负性情绪

Advances in Basic and Clinical Research on Misophonia

Yuehan Zhao*

Weifang People's Hospital

Objective Misophonia is a complex multifactorial psychophysiological and behavioral disorder characterized by abnormally intense emotional and physiological responses to specific sounds, such as chewing, coughing, and tapping noises. The awareness of misophonia among psychiatrists in China is still very low. This study aims to review the clinical characteristics, epidemiology, pathogenesis, diagnosis, classification, and treatment of misophonia to enhance understanding and recognition among Chinese psychiatrists and clinical practitioners, thereby facilitating more research on misophonia in Chinese populations

Methods A comprehensive literature review was conducted, covering both Chinese and international studies on misophonia

Results **Concept and Clinical Characteristics:** Misophonia involves strong negative reactions to certain sounds, causing disgust, anxiety, fear, and anger, along with physical responses like muscle tension and increased heart rate. Common triggers include sounds from the human mouth, nose, and throat, as well as mechanical and animal sounds. Patients often use earplugs or headphones to avoid these sounds.

Epidemiology: Prevalence varies globally. In Florida, USA, 19.9% of university students are affected, while in China, about 6% report moderate symptoms. Misophonia typically starts in childhood or adolescence, with an average onset age of 12.61 years, and often worsens over time.

Pathogenesis:

Genetic Susceptibility: There is some association with obsessive-compulsive traits and familial clustering,

but the exact genetic link is unclear.

Neurobiological Mechanisms: Abnormal activation in brain regions like the anterior insular cortex and ventromedial prefrontal cortex has been observed. Increased connectivity between auditory and motor areas suggests abnormal sensory-motor integration.

Psychological Mechanisms: Misophonia may develop through associative learning, where neutral sounds are linked to negative emotions. Interoception, cognitive biases, and selective attention also play roles, exacerbating emotional responses.

Disease Classification and Diagnosis: There is no consensus on diagnostic criteria. Tools include the Amsterdam Misophonia Scale (A-MISO-S), Misophonia Questionnaire (MQ), and MisoQuest self-report questionnaire. Misophonia is not recognized in DSM-5 or ICD-11, leading to debates about its classification as a distinct disorder or part of other conditions.

Intervention and Treatment:

Audiological Treatment: Tinnitus retraining therapy (TRT) uses white noise to reduce attention to aversive sounds and has shown early success.

Psychological Treatment: Effective therapies include cognitive behavioral therapy (CBT), acceptance and commitment therapy (ACT), and dialectical behavior therapy (DBT). These therapies address maladaptive thoughts, encourage acceptance of negative experiences, and use mindfulness and emotion regulation techniques.

Pharmacological Treatment: Medications like fluoxetine, sertraline, and risperidone have shown some effectiveness, primarily for managing comorbid conditions like anxiety and obsessive-compulsive disorder, but more research is needed.

Conclusion Misophonia requires further investigation for its classification, diagnostic criteria, and treatment methods. Future research should focus on understanding its characteristics, differentiating it from other disorders, and establishing standardized diagnostic criteria. Expanding research to diverse populations and validating treatments through large trials are essential. Multidisciplinary collaboration can improve diagnostic and treatment frameworks, enhancing patient quality of life

关键词: Misophonia; Pathogenesis; Clinical characteristics; Diagnosis and Classification; treatment

网络自助式正念疗法对焦虑障碍的疗效研究

王紫薇 杨渊* 张函 夏叶

华中科技大学同济医学院附属同济医院

目的 随着对焦虑障碍治疗研究的深入,传统药物治疗的局限性逐渐显现,长期服药可能伴随多种副作用。互联网自助式正念干预作为一种新兴的心理治疗方法,其在焦虑障碍治疗中的效果日益受到关注。本研究旨在评估,在常规治疗的基础上,结合互联网自助式正念干预,对于焦虑障碍患者情绪改善情况的潜在效益。我们期望通过这一研究,为焦虑障碍患者提供更加全面、有效的治疗方案。

方法 本研究为随机对照试验,在同济医院焦虑抑郁专科门诊纳入 51 名 DSM-5 确诊的焦虑障碍患者,随机分为线上正念组(28 人)和常规治疗组(23 人)。两组均接受常规治疗,线上正念组还接受为期 8 周的网络自助正念干预,每周一节课,每节课 50 分钟左右,同时完成每周 6 天的课下练习。使用汉密尔顿抑郁量表-21 项(HAMD-21)、汉密尔顿焦虑量表(HAMA)、匹兹堡睡眠量表(PSQI)评估线上正念组和常规治疗组在基线和治疗 4 周、8 周、12 周时的情绪、睡眠及社会功能变化情况。数据分析使用 SPSS 25.0 进行,采用 t 检验、Mann-Whitney U 检验等用于分析,以 $p < 0.05$ 认为差异具有统计学意义。

结果 本研究中,线上正念治疗组与常规治疗组各有 23 人和 19 人完成了为期 8 周的干预。(1)在干预前,线上正念和常规治疗组在 HAMD-21 (16.71 ± 4.53 vs 15.39 ± 6.24 , $p = 0.401$), HAMA (18.04 ± 6.58 vs 16.39 ± 7.58 , $p = 0.411$), PSQI (11.71 ± 3.9 vs 11.91 ± 3.15 , $p = 0.844$), SDSS (4.71 ± 2.96 vs 3.96 ± 3.39 , $p = 0.398$) 得分无显著差异 ($p > 0.05$),具有可比性。(2)干预 8 周结束时,线上正念和常规治疗组相比,线上正念组焦虑症状好转率 (93.3% vs 61.5% , $p = 0.041$) 和抑郁症状的好转率 (100% vs 61.5% , $p = 0.008$) 显著高于常规治疗组,两组差异具有统计学意义 ($p < 0.05$)。线上正念组 PSQI 量表 ($35.8\% \pm 12.6\%$ vs $20.9\% \pm 14.3\%$,

$p = 0.027$)、SDSS 量表 ($73.4\% \pm 26.9\%$ vs $39.4\% \pm 43.5\%$, $p = 0.036$) 减分率高于常规治疗组,两组差异具有统计学意义 ($p < 0.05$)

结论 本研究结果表明,在针对焦虑障碍患者的治疗中,将线上正念疗法作为常规治疗的辅助手段,能够更有效地减轻患者的焦虑与抑郁症状,改善睡眠质量,并提升社会功能。这一发现为焦虑障碍的综合治疗提供了新的实证支持,证明了线上正念治疗作为一种附加疗法,在增强治疗效果方面具有重要的临床应用价值。

Cognitive Reappraisal As A Mediator between Anxiety Sensitivity and Negative Attentional Bias in Panic Disorder Patients

Fang He Xiangyun Yang Lijuan Yang Danfeng Yuan Zhanjiang Li*

Beijing Anding Hospital, Capital Medical University

Objective This study aims to explore the mediating role of cognitive reappraisal in the relationship between anxiety sensitivity and negative attentional bias among patients with panic disorder

Methods The study included 125 patients diagnosed with panic disorder according to the criteria set forth in the Diagnostic and Statistical Manual of Mental Disorders, Fifth Edition (DSM-5). Anxiety sensitivity was assessed using the Anxiety Sensitivity Index-3 (ASI-3); cognitive reappraisal was measured using the Cognitive Emotion Regulation Questionnaire (CERQ); and negative attentional bias was evaluated using the Positive and Negative Attentional Bias Questionnaire. Mediation analysis, using the Bootstrap method, was employed to examine the mediating effect of cognitive reappraisal on the relationship between anxiety sensitivity and negative attentional bias

Results Anxiety sensitivity (ASI-3 scores) was significantly correlated with cognitive reappraisal (CERQ scores) and negative attentional bias, with correlation coefficients of $R = 0.5701$ ($P < 0.001$) and $R = -$

0.1919 ($P < 0.001$), respectively. Mediation analysis indicated that cognitive reappraisal partially mediated the relationship between anxiety sensitivity and negative attentional bias, with an indirect effect of 0.1233 and a 95% Bootstrap confidence interval of [0.0768, 0.1771]

Conclusion Anxiety sensitivity is positively associated with negative attentional bias, and cognitive reappraisal partially mediates this relationship. As an emotion regulation strategy, cognitive reappraisal can modulate the link between anxiety sensitivity and negative attentional bias. These findings suggest that cognitive reappraisal may serve as a crucial target for intervention in the treatment of panic disorder

关键词: Panic disorder; Anxiety sensitivity; Cognitive reappraisal; Attentional bias; Mediation effect

焦虑障碍患者接受 CBT 疗法后在功能磁共振成像中的脑活动变化综述

杨紫玉*

山西医科大学

焦虑障碍是一种常见的精神障碍, 对患者的生活质量和心理健康造成严重影响。认知行为疗法 (CBT) 已被广泛应用于焦虑障碍的治疗, 但其作用机制尚未完全明确。本综述旨在探讨焦虑障碍患者接受 CBT 疗法后在功能磁共振成像 (fMRI) 中的脑活动变化, 以揭示 CBT 对焦虑障碍的神经机制。

目的 本研究旨在分析焦虑障碍患者接受 CBT 疗法后在 fMRI 中的脑活动变化, 探讨 CBT 对焦虑障碍患者大脑功能的影响, 为临床实践提供神经生理学依据。

材料与方法 本综述涵盖了近年来关于焦虑障碍患者接受 CBT 疗法后 fMRI 结果的相关研究。研究采用了系统性文献综述的方法, 对不同研究的研究对象、研究设计、fMRI 扫描参数等进行了综合分析。

结果 研究结果显示, 焦虑障碍患者接受 CBT 疗法后在 fMRI 中的脑活动出现了一系列变化。大多数研究表明, CBT 治疗可以显著改变焦虑障碍患者的大脑活动模式, 主要变化发生在以下部位: 1. 杏仁核 (Amygdala): 杏仁核是情绪加工的重要脑区,

焦虑障碍患者在接受 CBT 疗法后, 杏仁核的活动可能减少, 这可能与焦虑情绪的调节有关; 2. 前额叶皮层 (Prefrontal Cortex): 前额叶皮层是情绪调节和认知控制的核心脑区, CBT 治疗可能导致前额叶皮质活动的增加, 有助于患者更好地调节情绪和认知; 3. 海马 (Hippocampus): 海马是与学习和记忆相关的脑区, 焦虑障碍患者接受 CBT 疗法后, 海马可能显示出活动的增加, 这可能有助于患者更好地处理焦虑情绪和记忆; 4. 前扣带皮质 (Anterior Cingulate Cortex): 前扣带皮质是情绪调节和认知控制的重要脑区之一, CBT 治疗可能导致前扣带皮质活动的增加, 有助于患者更好地调节情绪和认知冲突。这些变化可能反映了 CBT 对焦虑障碍患者的情绪调节和认知重建的影响。

讨论 通过对焦虑障碍患者接受 CBT 疗法后 fMRI 结果的综合分析, 我们可以更好地理解 CBT 对焦虑障碍患者大脑功能的影响机制。这些神经生理学的变化可能有助于解释 CBT 治疗焦虑障碍的有效性, 为临床实践提供更具针对性的治疗方案。

综上所述, 焦虑障碍患者接受 CBT 疗法后在 fMRI 中的脑活动变化是一个备受关注的研究领域。通过深入研究 CBT 对焦虑障碍患者大脑功能的影响, 我们可以更好地理解焦虑障碍的神经机制, 为临床治疗提供更科学的依据。

青少年抑郁障碍患者冗思干预的有效性与依从性——一项荟萃分析与系统综述

梁慧 鞠玉朦 席祯蔓 欧雯雯 孟凡煜 张燕*
湘雅二医院

目的 近年来青少年抑郁障碍的发病率急剧上升, 给家庭和社会带来了巨大的负担。值得注意的是, 青少年患者处于不稳定的、身体和心理变化迅速的青春期阶段, 这使得他们容易陷入一种难以控制的, 对负性事件或消极情绪反复回想、过度自我聚焦的反刍思维, 即冗思。冗思会加重抑郁患者的症状, 延长发作时间, 导致复发风险增高。然而, 现有研究对青少年抑郁障碍的各类型干预手段在冗思水平改善方面的效果尚无确切结论。本荟萃分析旨在对青少年抑郁障碍冗思干预相关的随机对照试

验和队列试验结果进行综述,分析抑郁治疗手段改善青少年抑郁患者冗思水平的有效性与依从性。

方法 我们检索了PubMed、Web of Science 和Cochrane 英文数据库,采用PICO 原则进行文献检索:目标人群为确诊重度抑郁障碍的青少年;所有形式的干预均可纳入;对照组不限;主要结局指标为治疗前后冗思量表分数的变化;次要结局指标为因任意原因中断研究的人数。由两名人员独立筛选可纳入荟萃分析的研究,汇总后由一名人员进行数据的提取和分析。最后两名人员再分别进行文献质量的评估。

结果 荟萃分析最终纳入了18个研究。其中,心理治疗9个、无创神经调控6个及药物治疗3个。基于随机效应模型的荟萃分析结果显示,心理治疗后患者冗思分数较治疗前显著降低($SMC = -0.76$, $95\%CI: -0.90$ 至 -0.62 , $P < 0.001$);神经调控治疗后也较治疗前显著降低($SMC = -0.70$, $95\%CI: -0.98$ 至 -0.42 , $P < 0.001$);由于三篇报道药物治疗的文献提供的评估冗思的统计学指标各不相同,未能进行合并分析,但通过系统综述,发现四种药物治疗后患者冗思分数均降低,前后差值依次为赛洛西宾($Mean = -7$, $SD = 12.40$),艾司西酞普兰($Mean = -0.3$, $SD = 8.36$),氯胺酮($Median = -9$)和人类食欲素-2受体选择性拮抗剂($Mean = -8.6$)。依从性分析结果则显示,心理治疗组与对照组相比全因脱落率无明显差异($OR = 0.94$, $95\% CI: 0.54$ 至 1.63);神经调控组与对照组相比也无明显差异($OR = 0.40$, $95\% CI: 0.09$ 至 1.72),但具有较低的趋势。

结论 心理治疗和神经调控均能显著改善青少年抑郁障碍患者的冗思水平,且神经调控与心理治疗的疗效趋同;另外上述四种药物对于改善冗思水平均具有一定的疗效。心理治疗与神经调控确为有效的、依从性佳的冗思干预手段。未来我们需要更多的研究数据,进一步分析和比较抑郁干预手段对改善冗思水平的有效性,从而为临床治疗手段的选择提供更全面的参考。

Mental Health Literacy Among Graduate Students in China: A Cross-Sectional Study

Yubo Wang Bangshan Liu*

The Second Xiangya Hospital of Central South University

Objective Mental health literacy is an important aspect of mental health. A high level of mental health literacy contributes to the prevention, identification, and management of mental disorders. This study aims to investigate mental health literacy among Chinese graduate students and associated factors to fill the gap in data on mental health literacy among this group in China

Methods A cross-sectional study was conducted from December 7, 2023, to January 5, 2024, at Central South University in Changsha, Hunan, China. The Mental Health Knowledge Questionnaire (MHKQ) and the Mental Health Literacy Questionnaire (MHLQ) were used to assess the mental health literacy of medical students. Descriptive analyses, independent t-tests, and multiple linear regression were performed to assess mental health literacy and associated factors among graduate students

Results A total of 1917 students participated in this study, with 95.83% showing basic mental health knowledge. While postgraduate students exhibit a strong capacity for maintaining their mental well-being, they are relatively ill-equipped to deal with mental illnesses. Additionally, a portion of these students hold misconceptions about mental health disorders. Unmarried, raised in urban environments, or those without acquaintances having a mental disorder history possessed more extensive mental health knowledge. Female students and those residing in urban areas at present have higher mental health literacy. Graduates with acquaintances with a history of a mental disorder showed disadvantages in first aid skills and help-seeking behavior, but exhibited fewer misconceptions regarding mental health conditions

Conclusion This study indicates a relatively high level of mental health literacy among Chinese graduate students. However, there is a critical need to focus on students from rural backgrounds and those from lower-income families to ensure equitable mental health literacy levels. Moreover, there is a broader necessity to enhance education with practical mental

health skills and theoretical knowledge, emphasizing a comprehensive approach to improve mental health literacy

关键词: Mental health literacy, Graduate students, China, Mental health

基于症状网络分析的抑郁症患者认知功能与病程进展研究

张倩倩 张燕*

中南大学湘雅二医院

目的 抑郁症是一种常见的精神障碍,其症状包括主观和客观认知功能的损伤、动力下降和疲乏。尽管已有多种治疗方法,但抑郁症患者在病程进展过程中症状网络的变化仍需进一步研究。本研究利用网络分析探讨抑郁症患者在不同病程阶段的症状网络结构和功能的动态变化,重点关注主观和客观认知功能的中心地位。

方法 本研究采用网络分析方法,对两个不同病程阶段(Time1和Time2)的抑郁症患者进行横断面分析。研究样本包括172名抑郁症患者,分别在基线(Time1)和8周后(Time2)进行评估。使用的指标包括主观认知(如注意力/集中、前瞻记忆、回顾记忆、计划/组织)、客观认知(如执行功能、注意力、处理速度、记忆)以及抑郁症状(如工作和活动、一般躯体症状)。数据通过网络不变性测试、整体强度不变性测试、中心性不变性测试及边缘权重差异分析进行处理。

结果 结果显示,两个网络结构在网络不变性测试统计上没有显著差异,但接近显著性水平;整体强度不变性测试中,两个网络在整体强度上的差异在统计上没有显著差异,但接近显著性水平。中心性不变性测试中,有5个节点(工作和活动、一般躯体症状、注意力/集中、前瞻记忆、计划/组织)在两个网络中的中心性差异显著。边缘权重差异统计中,没有边缘权重的差异在统计上显著。上述结果显示,随着抑郁症患者病程的进展,症状网络的整体结构和强度保持相对稳定。然而,主观认知损伤、动力下降和疲乏的中心地位显著下降,而客观认知功能,特别是执行功能和处理速度,在症状网络中始终保持核心地位,并未随病程发生明显改变。

结论 本研究揭示了抑郁症患者病程进展过程中症状网络的动态变化。尽管整体网络结构和强度保持稳定,但特定症状的中心性发生了显著变化。客观认知功能在整个病程中始终处于核心地位,这一发现为抑郁症的诊断和治疗提供了重要的参考。未来研究应进一步探讨这些变化的潜在机制,以优化抑郁症的干预策略。

关键词: 抑郁症, 症状网络, 主观认知功能, 客观认知功能

Disconcordance between Objective and Subjective Cognitive Performance in Major Depressive Disorder Patients with Comorbid Anxiety Symptoms

Sirui Gao Jin Liu*

Center South University

Objective Studies have shown that there is a poor correlation between subjective and objective cognition in major depressive disorder (MDD) patients, posing difficulties for clinicians to identify the patients with cognitive impairments. As a common subtype of MDD, it is still unclear whether MDD patients comorbid anxiety (MDDA) also exhibit significant cognitive discrepancy, risk factors for cognitive disconcordance in MDDA, and whether comorbid anxiety is a risk factor for developing cognitive disconcordance in MDD patients

Methods A comprehensive neurocognitive test battery and Perceived Deficit Questionnaire (PDQ-D-5) were used to assess the objective cognition and subjective cognition respectively in 184 patients with MDD and 83 healthy controls (HCs). 14-item Hamilton Anxiety Rating Scale (HAM-A) was used for anxiety symptoms and MDD patients with HAM-A total score >14 were classified into MDDA group. Comprehensive demographic, clinical and other data were also collected. Whether he/she exhibiting cognitive disconcordance was judged by the cut-off points setting from the score of cognitive discrepancy (CD) deriving from HCs. Sta-

tistical analyses were conducted to assess the correlation between subjective and objective cognitive performance and to compare the differences in multi-dimensional characteristics between groups. Risk factors of cognitive discordance were evaluated through binary logistic regression analysis

Results There was a significant correlation between subjective and objective cognitive performance in HCs but not in MDD whether in MDDA or patients without anxiety. Individuals with CD score between -1.042 and 0.976 were assigned to the cognitive concordance group, while those with a $CD \geq 0.976$ or ≤ -1.042 were classified into the cognitive discordance group. In MDDA group, the cognitive discrepancy score was -2.519 ± 1.492 , with a significant higher proportion of patients with cognitive discordance compared to HCs. Nevertheless, in the preliminary exploration of factors contributing cognitive discordance in MDDA group, none of a clinical, psychological or any dimensional variables showed significant difference between groups, and an effective predictive regression modal was failed to established after conducting binary logistic regression analysis. Last, in the total MDD samples, MDDA were more prone to cognitive discordance compared to those without anxiety, indicating that comorbid anxiety may be a risk factor for cognitive discordance in MDD patients

Conclusion For MDDA patients, their subjective and objective cognitive performance also showed poor correlation, and the cognitive discrepancy was significant, with more patients exhibited cognitive discordance. Cognitive discordance was not related to any disease or psychological characteristics, revealing that cognitive discordance may be independent. For MDD patients, especially those comorbid anxiety, when evaluating their cognitive impairments, it is not enough to rely solely on subjective or objective measurements. It is necessary to assess both subjective and objective cognitive performance to precisely identify and develop targeting treatment strategy for MDDA patients with cognitive impairments

荆州市初中生焦虑、抑郁情绪问题与家庭功能的关系研究

张新风^{2,3} 王元^{1,2,3}

- 1.长江大学精神卫生中心
- 2.荆州市精神卫生中心
- 3.长江大学精神卫生研究所

目的 通过对荆州市在校初中生焦虑、抑郁情绪的调查,探讨初中生焦虑、抑郁情绪问题与家庭功能的关系,为预防和干预焦虑、抑郁情绪问题提供参考。

方法 于2023年9月至2023年11月采用自行整编《“阳光少年”调查问卷》调查工具,采用整群抽样的方法选取荆州市十八所中学的初中生作为研究对象,采用问卷星线上调查的方式,内容包括一般人口学资料、广泛性焦虑障碍量表(GAD-7)、抑郁自评量表(PHQ-9)、Epstein等编制的家庭功能评定量表(FAD)等问卷进行心理健康状况调查。采用SPSS 26.0软件对所得数据进行统计分析。

结果 (1)共收回12343份问卷,男性6488人,女性5855人。有效问卷10925份,有效率88.51%;(2)男生5703人,女生5222人;七年级4432人,八年级3317人,九年级3176人。GAD-7标准分的分界值为5分,其中5-9分为轻度焦虑,10-14分为中度焦虑,15-21分以上为重度焦虑。结果显示焦虑的总均分(4.63±1.14)分。轻度焦虑占18.7%。中度焦虑占5.7%,重度焦虑占1.2%。PHQ-9标准分的分界值为5分,其中5-9分为轻度抑郁,10-14分为中度抑郁,15分以上为重度抑郁。结果显示抑郁总均分(5.47±1.69)分,轻度抑郁17.9%,中度抑郁占6.5%,重度抑郁占2.3%。单因素分析显示在性别、年级与焦虑、抑郁情绪之间存在显著关联($P < 0.05$)。多因素分析结果显示,在初中阶段,女性(OR=1.47, 95% CI=1.14, 1.78)、年级(OR=1.64, 95% CI=1.43, 1.87)的初中生发生焦虑、抑郁情绪的风险增加。(3)家庭功能与抑郁、焦虑存在显著的相关($P < 0.05$),回归分析发现,角色、总的功能、情感反应和行为控制4个维度可以显著地预测个体的抑郁水平($F=17.89, P=0.00$),总的功能和问题解决能够显著地预测个体的焦虑水平($F=11.38,$

P=0.00)。

结论 荆州市初中生存在较严重的焦虑、抑郁情绪，应重点关注女性、九年级学生，家庭功能可能能够较好的预测焦虑、抑郁情绪。

Correlation Between Reduced Neurite Density in The Medial Prefrontal Cortex and Hamilton Anxiety Rating Scale Scores in Generalized Anxiety Disorder: A Cross-Sectional Study

Deng Aoqian Zhang Yan*
the second Xiangya hospital

Objective To investigate the differences in neurite density in the medial prefrontal cortex (mPFC) between patients with generalized anxiety disorder (GAD) and healthy controls, aiming to deepen the understanding of the neurobiological mechanisms of GAD. The mPFC plays a key role in emotional regulation and cognitive control, and its functional abnormalities are closely related to anxiety disorders. However, research on specific changes in neurite density in the mPFC in GAD is still limited. Additionally, this study aims to examine the correlation between reduced neurite density in the mPFC and Hamilton Anxiety Rating Scale (HAMA) scores

Methods In this cross-sectional study, we recruited 35 patients diagnosed with generalized anxiety disorder (GAD) and 71 matched healthy controls. Diagnoses were confirmed using the Structured Clinical Interview for DSM Disorders (SCID). Neurite density in the medial prefrontal cortex (mPFC) was assessed using advanced neuroimaging techniques, specifically diffusion magnetic resonance imaging (dMRI). Statistical analyses were performed to compare the neurite density between the GAD and control groups, controlling for potential confounding variables such as age, sex, and overall brain volume. Additionally, correlation analysis was conducted to explore the relationship between neurite density in the mPFC and Hamilton Anxiety Rating

Scale (HAMA) scores

Results The analysis revealed that patients with generalized anxiety disorder exhibited significantly lower neurite density in the medial prefrontal cortex compared to healthy controls (P = 0.019). This difference remained significant after adjusting for confounding factors. Furthermore, there was a significant negative correlation between neurite density in the mPFC and HAMA scores (P=0.027), suggesting that higher anxiety levels are associated with lower neurite density in this region

Conclusion This study provides evidence that generalized anxiety disorder is associated with reduced neurite density in the medial prefrontal cortex. The significant correlation between reduced neurite density and higher HAMA scores underscores the importance of the mPFC in the pathophysiology of GAD. These results may inform future research and treatment strategies aimed at targeting neural circuits implicated in anxiety disorders. Further studies are needed to explore the causal relationships and potential therapeutic interventions to address these neural deficits

情绪困扰与特应性皮炎发病及严重程度之关联：一项横断面研究

张汉伊 王汭*
中南大学湘雅医院

目的 特应性皮炎是一种常见的慢性炎症性皮肤病疾病，其发病率逐年增加，给患者的生活质量和心理健康带来了重大影响。许多研究已经证实，心理压力、焦虑和抑郁等精神困扰因素与特应性皮炎的发病和病情恶化存在密切关联。因此，探讨情绪困扰与特应性皮炎之间的关系，对于深入理解皮肤疾病的发病机制，提高治疗效果具有重要意义。本研究旨在通过一项横断面研究，探讨精神困扰与特应性皮炎发病及严重程度之间的关联，进一步揭示心理因素对特应性皮炎的影响机制，为临床治疗和综合干预提供科学依据。

方法 我们招募了 2023 年 1 月–2024 年 1 月于中南大学湘雅医院皮肤病医院就诊的 163 名特应性皮炎患者以及 36 名健康志愿者作为研究对象,通过问卷调查收集他们的基本信息以及与情绪困扰相关内容,包括心理压力、焦虑、抑郁、睡眠、生活质量等方面的评估。同时,我们收集患者的临床资料和特应性皮炎相关指标,分析精神困扰对于特应性皮炎的发病及病情严重程度的影响。通过单因素相关及回归分析统计学方法进行分析,探讨精神困扰与特应性皮炎之间的关联。

结果 在 199 名年龄在 10 - 68 岁的参与者中,共 36 例无特异性皮炎,163 例有特异性皮炎,其中轻度 31 例,中度 63 例,重度 69 例。199 名参与者的平均年龄为 28.68 岁。与非特异性皮炎受访者相比,特异性皮炎受访者患有情绪困扰的可能性更大,并且与 BMI、教育水平、吸烟情况和睡眠障碍有关。利用多元变量回归分析调整相关变量后发现,重度特异性皮炎和情绪困扰之间的关联在 5 种不同模型中均得到显著统计学结果。

结论 本研究结果表明,情绪困扰与特应性皮炎发病及严重程度存在一定关联,心理因素可能对特应性皮炎的病情有一定影响。因此,在特应性皮炎治疗过程中,应综合考虑患者的心理健康状况,采取有效的心理干预措施可能会提高治疗效果和有效改善患者的生活质量。

经颅磁刺激联合放松训练疗法对广泛性焦虑症的疗效观察

徐道祥* 胡小涵 黄小翠 徐玲
温州市第七人民医院

目的 探讨经颅磁刺激(r-TMS)和放松训练疗法在广泛性焦虑症治疗中的作用

方法 选择 2022 年 3 月-2024 年 2 月在我们医院西山院区儿童精神科住院的广泛性焦虑症的患者 48 例作为研究组,同时将同期在我院心身医学病区住院的广泛性焦虑症患者 48 例作为对照组,两组患者入组前在一般情况、疾病严重程度等方面无明显差异,对照组给予帕罗西汀 20-40mg/日联合放松训

练治疗,研究组除了药物帕罗西汀和放松训练治疗之外,同时给予经颅磁刺激(r-TMS)治疗,经颅磁治疗 10 次为一个疗程,一般 30 次左右,治疗前治疗中治疗后采用汉密尔顿焦虑量表(HAMA)和汉密尔顿抑郁量表(HAMD)以及副反应量表(TESS)来比较两组疗效及副反应;此外在治疗前治疗 2 周,4 周末及 6 周时给予复查血常规、肝功能、肾功能、心电图等常规检查。

结果 研究组和对照组的总有效率在治疗前后比较差异有统计学意义($P<0.05$),研究组在治疗第 2 周、4 周及 6 周时评定时的疗效都优于对照组($P<0.05$),治疗结束时两组的副反应比较无明显差异($P>0.05$);

结论 对于广泛性焦虑症患者,经颅磁刺激联合放松训练的疗效显著优于单纯药物治疗和放松训练,经颅刺激磁疗法安全无副作用,值得临床推广应用。

关键词: 经颅磁刺激,放松训练,广泛性焦虑症

青少年情感障碍患者非自杀性自伤行为相关风险因素分析

宇淑涵 邵春红*
复旦大学附属华山医院

目的 探索青少年情感障碍患者非自杀性自伤行为(Non-suicidal self-injury, NSSI)相关风险因素。

方法 回顾性分析 2022 年 7 月至 2024 年 5 月就诊于复旦大学附属华山医院精神医学科门诊的 400 例青少年情感障碍患者的病例资料,年龄 14-19 岁。以来院当天的简明国际神经精神访谈(International Neuropsychiatric Interview, MINI)自杀模块评估结果为指标,根据既往 1 个月内是否有自杀行为分为 NSSI 组($n=280$),非 NSSI 组($n=120$)。比较两组的社会人口学特征、临床特征、性激素水平、甲状腺激素指标、焦虑自评量表(Self-Rating Anxiety Scale, SAS)、抑郁自评量表(Self-Rating Depression Scale, SDS)、症状自评量表(Symptom Checklist 90, SCL-90)、艾森克个性测验(Eysenck Personality Questionnaire, EPQ)、青少年生活事件量表(Adolescent Self-rating Life Events Check list,

ASLEC)、童年期虐待问卷(Childhood Trauma Questionnaire, CTQ)的评分,使用 logistic 回归分析近 1 个月内 NSSI 行为的危险因素。

结果 相比非 NSSI 组, NSSI 组的患者精神病性症状、共病躯体疾病、既往有过自杀行为更常见(均 $P < 0.05$)。量表评分方面, NSSI 组的 SAS 得分更高; ASLEC 总分及其人际关系因子得分更高(均 $P < 0.05$); SCL-90 中躯体化得分、人际关系敏感得分更高(均 $P < 0.05$); CTQ 中的情感忽视因子分也更高(均 $P < 0.05$)。激素指标中, 睾酮水平更高, 而 T3/T4 和 FT3、TSH 水平更低(均 $P < 0.05$)。回归分析显示, 既往有过自杀行为、存在精神病性症状、共病躯体疾病、童年创伤是近 1 个月内自杀行为的危险因素(均 $P < 0.05$)。

结论 既往有过自杀行为、存在精神病性症状、共病躯体疾病、童年创伤可能是近 1 个月内青少年情感障碍自杀自伤行为风险因素。

Development and Validation of The Chinese Versions of The Childhood Perceived Poverty and Wealth Questionnaire(C-CPPWQ) and The Childhood Perceived Unpredictability Questionnaire (C-CPUQ)

Yinqing Fan Chenyu Yuan Ge Song Wang Zhen*
Shanghai Mental Health Center

Objective Childhood subjective socioeconomic status (operational definition of harshness) and unpredictability significantly influence life history strategies and subsequent psychological and behavioral patterns. Existing research on Chinese populations has been limited by inconsistent metrics and inadequate measurement items. This study aimed to develop and validate the Chinese versions of the Childhood Perceived Poverty and Wealth Questionnaire (C-CPPWQ) and the Childhood Perceived Unpredictability Questionnaire (C-CPUQ), addressing cultural differences and expanding measurement subjects.

Methods We conducted Exploratory Factor

Analysis (EFA) with 493 students and Confirmatory Factor Analysis (CFA) with 1217 students to validate the factor structures. Convergent validity was assessed using correlations with life history strategies (Mini-K) and childhood trauma (CTQ-SF). Construct validity and reliability were also evaluated

Results The C-CPPWQ's two-factor model (perceived wealth and perceived poverty) demonstrated good fit (CFI = 0.95; TLI = 0.94; SRMR = 0.05; RMSEA = 0.08) and strong internal consistency ($\alpha = 0.90$), with significant correlations with Mini-K ($r = -0.28, p < 0.001$) and childhood trauma ($r = 0.29, p < 0.001$). The C-CPUQ's three-factor model (Unpredictability of Parenting, Unpredictability of External Environment, and Unpredictability of Daily Happening) also showed a good fit (CFI = 0.96; TLI = 0.95; SRMR = 0.04; RMSEA = 0.07) and high reliability ($\alpha = 0.95$), with significant correlations with Mini-K ($r = -0.39, p < 0.001$) and childhood trauma ($r = 0.72, p < 0.001$)

Conclusion The newly developed 14-item C-CPPWQ and 16-item C-CPUQ for Chinese contexts exhibit satisfactory psychometric properties, making them valuable tools for researching and evaluating childhood adversity

父母心理控制对青少年抑郁情绪的影响: 心理灵活性和压力知觉的中介调节作用

韩晓源 于鑫 陈旭*
山东省精神卫生中心

目的 父母心理控制是家庭环境中父母对青少年的一种消极教养方式, 与其青少年的心理问题紧密相连, 也是导致青少年抑郁情绪的一个重要潜在因素。本研究通过建立有调节的中介模型探讨父母心理控制对青少年抑郁情绪的影响机制, 并特别关注心理灵活性和压力知觉的中介调节作用。

方法 采用父母心理控制量表、流调用抑郁自评量表 (CES-D)、压力知觉量表 (CPSS) 和心理灵

活性问卷 (AFQ-Y8) 对安徽省阜阳市一所普通中学七至九年级共 1056 名 (男生 583 人 (55.2%), 女生 473 人 (44.8%)) 学生进行问卷调查, 使用 SPSS 以及 PROCESS 进行相关分析和中介效应检验等。

结果 ①多元线性回归模型显示, 母亲的心理控制对青少年抑郁情绪的影响更为显著 ($\beta=0.227$, $t=4.547$, $p<0.001$)。②在父母心理控制对青少年抑郁情绪的影响中, 父母心理控制水平正向预测抑郁情绪 ($\beta=0.071$, $p=0.145$; $\beta=0.042$, $p=0.354$), 心理灵活性负向预测抑郁情绪 ($\beta=-0.456$, $p<0.05$; $\beta=-0.430$, $p<0.05$)。③压力知觉在父母心理控制与抑郁情绪之间起部分中介作用, 中介效应为 0.058 (95%CI[0.044,0.072]), 中介效应占总效应的 28.330%。④心理灵活性在父母心理控制、压力知觉和抑郁情绪之间起正向调节作用 (IMM=0.001,95%CI[0.0001,0.002])。

结论 父母心理控制与青少年抑郁情绪和压力知觉、心理灵活性有密切关系; 母亲心理控制对青少年抑郁情绪影响更明显; 在父母心理控制中介调节模型中, 压力知觉发挥中介作用, 心理灵活性调节父母心理控制与压力知觉, 进而影响青少年抑郁情绪。

NLRP3 炎症小体介导的小胶质细胞活化参与炎症性肠病伴抑郁的机制研究

刘琼 刘密* 陈琳 曹思慧 李祖强
湖南中医药大学

目的 抑郁是炎症性肠病 (IBD) 常见并发症, 炎症性肠病的炎症严重程度与抑郁症状的发生率呈正相关, 目前尚没有稳定的 IBD 伴抑郁动物模型, 小胶质细胞活化介导的神经炎症被认为是炎症性肠病伴抑郁的重要病理改变, 但其潜在的机制尚不明确。

方法 采用 DSS 制备 IBD 伴抑郁模型, 探讨不同 DSS 剂量诱导下 IBD 小鼠的抑郁样行为、外周炎症水平、中枢小胶质细胞激活和神经炎症改变等情况。采用分子生物学等技术手段, 检测血清、结肠、海马和皮质组织中炎症因子表达情况。免疫荧光技

术检测小胶质细胞状态, 及其活化标志物和 NLRP3 的共表达情况。

结果 1.5%组、2.0%组、2.5%组和 3.0%组血清和结肠组织中, 促炎性细胞因子表达增加, 抗炎性细胞因子表达减少; 当 DSS 浓度到达 1.5%及以上时, 可以成功复制 IBD 模型。2.0%组、2.5%组和 3.0%组小鼠总移动距离缩短(OFT), 强迫游泳的静止时间增加(FST), 蔗糖偏好减少(SPT)。当 DSS 浓度到达 2.0%及以上时, 可以成功复制 IBD 伴抑郁模型小鼠。2.0%及以上浓度 DSS 可以激活大脑海马和皮质区域的小胶质细胞和增加 NLRP3 表达, MCC950(NLRP3 抑制剂)可以挽救这一现象。

结论 2.0%浓度 DSS 制备 IBD 伴抑郁的动物模型最具稳定性。NLRP3 炎症小体激活介导的小胶质细胞活化为特征的神经炎症是 IBD 伴抑郁的关键病理环节。

关键词: 抑郁, NLRP3 炎症小体, 小胶质细胞, 神经炎症

Comparative Performance of Patient Health Questionnaire-9 and Edinburgh Postnatal Depression Scale for Screening Antenatal Depression in Chinese Pregnant Women

Junzhe Cheng^{1,2}, Junzhe Cheng³, Ling Yu^{1,2}, Bangshan Liu^{1,2}

1.Department of Psychiatry, National Clinical Research Center for Mental Disorders, and National Center for Mental Disorders, The Second Xiangya Hospital of Central South University, Changsha 410011, Hunan, China.

2.Mental Health Institute of Central South University, China National Technology Institute on Mental Disorders, Hunan Technology Institute of Psychiatry, Hunan Key Laboratory of Psychiatry and Mental Health, Hunan Medical Center for Mental Health, Changsha 410011, Hunan, China.

3.Clinical Medicine Eight-Year Program, Xiangya School of Medicine, Central South University, Changsha, Hunan 41008, China.

Background The Patient Health Questionnaire-

9 (PHQ-9) and Edinburgh Postnatal Depression Scale (EPDS) are the two most widely used scales for antenatal depression assessment in China. However, there is no clear consensus to guide the standards of the utilization of PHQ-9 and EPDS in Chinese pregnant women. The different measures and standards of antenatal depression are disadvantageous for the continuity of prenatal mental care and the facilitation of academic research. Thus, we sought to evaluate the psychometric properties of two widely used screening scales PHQ-9 and among pregnant women in China

Methods The cross-sectional study included 44220 women receiving prenatal care from January 1, 2020, to January 31, 2024. All the participants underwent a psychological screening during their maternity check-ups at the Shenzhen Baoan Women's and Children's Hospital, China. We examined reliability, construct and concurrent validity between two scales using internal consistency indices, factor structures, correlations, and Cohen's kappa.

Results PHQ-9 (Cronbach's $\alpha = 0.800$) and EPDS (Cronbach's $\alpha = 0.783$) had good internal consistency. The correlation between PHQ-9 and EPDS scores was fair ($\rho = 0.61$). Based on exploratory factor analysis (EFA), both scales yielded a two-factor structure. EFA including all items from PHQ-9 and EPDS yielded four factors, namely, "somatization", "negative cognitive bias and suicidal ideation", "anxiety and depression", and "anhedonia". The agreement between the two scales was generally fair at different cutoff scores with the highest Cohen's kappa being 0.493

Conclusion Both the PHQ-9 and EPDS are reliable and valid scales for antenatal depression assessment. The PHQ-9 captures somatic symptoms, while EPDS detects depressive symptoms comorbid with anxiety during early pregnancy. Our findings suggest simultaneous administration of both scales may improve the identification of antenatal depressive disorders in clinical settings.

关键词: PHQ-9, EPDS, antenatal depression, psychometric properties

Prevalence and Risk Factors of Antenatal Depression in The First Trimester: A Real-world Cross-sectional Study in A Developed District in South China

Background Antenatal depression may result in adverse outcomes for both the mother and the offspring. However, few studies have focused on the screening of pregnant women at a higher risk for antenatal depression in the first trimester. The present study aimed to assess the effect of lifestyle and family relationships on antenatal depression in the first trimester in a large Chinese population.

Methods Cross-sectional population data were obtained from a real-world cross-sectional survey conducted in Shenzhen, China from 2020 to 2024. The data on sociodemographic characteristics, lifestyle, and family relationships were obtained using self-reported questionnaires. Antenatal depression was assessed using the Edinburgh Postnatal Depression Scale (EPDS), with a score of ≥ 13 indicating the presence of probable antenatal depression. A binary logistic regression model was used to identify the risk factors of antenatal depression.

Results A total of 42,363 pregnant women in the first trimester were recruited in the cross-sectional survey, among whom 3,107 (7.3%) had probable antenatal depression. We found (1) age < 25 years, (2) low or moderate economic status, (3) smoking, (4) partner

smoking, (5) alcohol use, (6) lack of physical exercise, (7) poor or moderate living environment, (8) low or moderate marital happiness, and (9) never talking about problems were associated with antenatal depression. However, level of education, employment status, partner alcohol use, and living alone were not significantly related to antenatal depression in the first trimester.

Limitations

The cross-sectional design and the use of self-report measures must be considered while interpreting the results.

Conclusions This study suggested that the prevalence of antenatal depression in the first trimester was 7.3%. Public health prevention efforts aimed at reducing the prevalence of antenatal depression are recommended. Early identification of women at a higher risk in early pregnancy is necessary for preventing antenatal depression and improving quality of life.

Insomnia Moderates The Association between Positive Symptoms and Suicidal Ideation: A Large-scale Cross-sectional Study in Chinese Patients with Chronic Schizophrenia

Pu Peng¹, Xiangyang Zhang²

1.Department of Psychiatry, Sir Run Run Shaw Hospital, Zhejiang University School of Medicine, Hangzhou, Zhejiang, P. R. China

2.Department of Psychology, University of Chinese Academy of Sciences, Beijing, China

Objective Both insomnia and positive symptoms are linked to suicidal ideation (SI) in schizophrenia, yet their interaction remains unexplored. This study aims to investigate whether insomnia moderates the relationship between positive symptoms and SI in a large sample of Chinese patients with chronic schizophrenia.

Methods We recruited 1,407 patients and assessed them using the Positive and Negative Syndrome Scale (PANSS), Insomnia Severity Index (ISI), and

Beck Scale for Suicide Ideation (BSSI). We also collected demographic information and lifetime history of suicide attempts (SA). Positive symptoms were evaluated using the PANSS positive factor. Multivariate logistic regression identified independent correlates of SI, and Process Model 1 was used for moderation analysis (BSSI as the outcome, PANSS positive factor as the predictor, and ISI as the moderator)

Results The prevalence of insomnia and SI was 13.5% and 9.7%, respectively. Insomnia, positive symptoms, mood symptoms, and lifetime SA were independently associated with SI. Moderation analysis revealed that insomnia amplified the association between positive symptoms and SI. Specifically, higher levels of insomnia significantly strengthened this relationship, while the association was negligible in patients with low levels of insomnia

Conclusion Both insomnia and positive symptoms are independently related to SI in patients with chronic schizophrenia. Insomnia moderates the relationship between positive symptoms and SI, highlighting the importance of regular suicide risk assessments in patients with pronounced positive symptoms and insomnia. Interventions targeting insomnia may effectively reduce SI, particularly in patients with severe positive symptoms

Metabolic and Endocrine Correlates of Subclinical Hypothyroidism in Young Adults with First-Episode Drug-Naive Major Depressive Disorder

Zhaoxuan Shang¹, XiangYang Zhang²

1.Department of Psychology and Cognitive Science, East China Normal University

2.Institute of Psychology, Chinese Academy of Sciences

Objective Major Depressive Disorder (MDD) and Subclinical Hypothyroidism (SCH) are both prevalent conditions with significant health implications.

This study aims to explore the clinical and biochemical characteristics of young, drug-naive patients experiencing their first episode of MDD and their association with SCH

Methods A cross-sectional study was conducted with 917 young Chinese patients (aged 18-35 years) diagnosed with first-episode drug-naive MDD. Participants were recruited from the psychiatric outpatient clinic of the First Hospital of Shanxi Medical University between 2015 and 2017. Clinical assessments included the Hamilton Depression Rating Scale (HAMD), Hamilton Anxiety Rating Scale (HAMA), and Positive and Negative Syndrome Scale (PANSS). Biochemical analyses measured thyroid function (TSH, fT3, fT4) and metabolic parameters (fasting blood glucose, total cholesterol, triglycerides, HDL cholesterol, LDL cholesterol). Binary logistic regression was used to identify predictors of SCH

Results The prevalence of SCH among the study population was 43%. Significant differences were found between patients with and without SCH in terms of suicide attempts (11.7% vs. 25.4%, $p < 0.001$), severe anxiety (5.3% vs. 14.9%, $p < 0.001$), and psychotic symptoms (4.1% vs. 12.8%, $p < 0.001$). SCH patients had higher HAMD (28.71 ± 2.67 vs. 31.25 ± 2.69 , $p < 0.001$) and HAMA (20.07 ± 3.05 vs. 21.13 ± 3.56 , $p < 0.001$) scores. Biochemically, SCH patients had higher TSH (6.6 ± 1.83 vs. 2.56 ± 1.12 , $p < 0.001$), lower fasting blood glucose (5.08 ± 0.54 vs. 5.58 ± 0.63 , $p < 0.001$), lower total cholesterol (4.55 ± 0.88 vs. 5.62 ± 1.06 , $p < 0.001$), and higher HDL cholesterol (1.32 ± 0.22 vs. 1.16 ± 0.30 , $p < 0.001$). Logistic regression identified lower levels of thyroid peroxidase antibodies (TPOAb), fasting blood glucose, body mass index (BMI), systolic blood pressure (SBP), and total cholesterol, along with higher HDL cholesterol as significant predictors of SCH

Conclusion This study highlights the need for comprehensive metabolic and endocrine evaluations in young MDD patients. Regular monitoring of thyroid function, glucose levels, BMI, blood pressure, and lipid profiles is crucial for early detection and management of SCH, potentially improving clinical outcomes and overall well-being in this vulnerable population. Further

research should focus on longitudinal studies to elucidate causal pathways and effective treatment strategies

Impact of Anxiety, Depression, and Personality Traits on Career Expectations Among Chinese Medical Students During The COVID-19 Pandemic: A Large-scale Cross-sectional Study

Guoshuai Luo Daliang Sun*

Tianjin Anding Hospital

Objective The COVID-19 pandemic has reshaped career expectations among Chinese medical students, historically inclined towards non-medical professions due to limited opportunities and challenging work environments

Methods This large-scale cross-sectional study, conducted between December 10 and December 27, 2022, aimed to investigate the influence of the COVID-19 pandemic on the career expectations of Chinese medical students. Data were collected through an online survey, utilizing the Wenjuan Xing platform. Demographic information, anxiety, depression, sleep quality, and various factors potentially affecting career choices were assessed. Statistical analyses, including chi-square tests and binary logistic regression, were employed to identify predictors of medical students' career aspirations

Results Out of 538 participants, nearly 70% expressed a desire to pursue a medical career after graduation, challenging prevailing beliefs about medical career preferences. Factors such as personality traits, living situations, academic pressure, depression, and anxiety were identified as significant predictors of medical students' career aspirations during the pandemic. Intriguingly, introverted students, those living with family members, students experiencing academic pressure, and those with symptoms of depression and anxiety were more inclined to pursue a medical career

Conclusion The pandemic appears to have impacted medical students' career preferences, with potential shifts towards the healthcare sector. Understanding these dynamics is crucial for guiding and supporting the evolving aspirations of future healthcare professionals

关键词: COVID-19, medical students, career expectations, personality traits, mental health

Prevalence and Correlates of Sleep Disturbance Among Frontline Nurses in China During and after The COVID-19 Pandemic

Guoshuai Luo Daliang Sun*
Tianjin Anding Hospital

Objective The COVID-19 pandemic has exerted unparalleled strain on healthcare systems globally, with frontline nurses encountering substantial difficulties in delivering care despite heightened susceptibility to infection and onerous workloads. Sleep disruption is a common problem among frontline nurses, but there is less understanding of how often it occurs and what factors are associated with it during and after the epidemic, especially in the Chinese context

Methods An extensive multicenter study was carried out among frontline nurses in China to investigate the frequency and factors associated with sleep disruption during and after the COVID-19 pandemic. Data on demographic characteristics, job-related stressors, and psychological distress were collected using online surveys. The assessment of sleep disturbance was conducted using the Pittsburgh Sleep Quality Index (PSQI), while anxiety levels were measured using the Zung Self-Rating Anxiety Scale (SAS), and depression levels were determined using the Self-Rating Depression Scale (SDS)

Results A total of 1,555 frontline nurses participated in the study, with 801 recruited during the COVID-19 pandemic and 754 recruited after the pandemic. The incidence of sleep disturbance was significantly higher among nurses during the pandemic compared to those recruited after the pandemic (89.9% vs.

62.5%, $P < 0.001$). Factors such as regular night shifts, elevated job-related stress, anxiety, and depression were linked to a higher likelihood of sleep disruption among frontline nurses. While the overall incidence of sleep disturbance decreased after the pandemic, certain risk factors persisted, including infrequent exercise and high financial stress

Conclusion The findings highlight the significant impact of the COVID-19 pandemic on the sleep quality and mental well-being of frontline nurses in China. Interventions targeting modifiable risk factors, such as promoting work-life balance and providing psychosocial support, are crucial for mitigating the adverse effects of the pandemic on nurses' mental health

关键词: Sleep disturbance, Frontline nurses, COVID-19 pandemic, Multicenter survey, Mental health

Gender Differences in The Association Between Childhood Trauma, Clinical Symptoms, and Cognitive Function in Chinese Patients with Chronic Schizophrenia

Zhaoxuan Shang¹, XiangYang Zhang²

1.Department of Psychology and Cognitive Science, East China Normal University

2.Institute of Psychology, Chinese Academy of Sciences

Objective This study aims to explore gender differences in the relationship between childhood trauma, clinical symptoms, and cognitive function among Chinese patients with chronic schizophrenia

Methods A total of 601 patients with chronic schizophrenia were evaluated using the Childhood Trauma Questionnaire-Short Form (CTQ-SF), the Positive and Negative Syndrome Scale (PANSS), and the Repeatable Battery for the Assessment of Neuropsychological Status (RBANS). Correlation and regression analyses were performed to explore the relationships between childhood trauma and clinical symptoms and cognitive function, considering gender differences

Results The overall prevalence of childhood

trauma showed no significant gender differences. In male patients, physical neglect predicted PANSS Positive symptoms ($\beta = 0.123$, $p = 0.013$). In female patients, emotional abuse predicted PANSS Positive symptoms ($\beta = 0.225$, $p = 0.002$) and Depressive symptoms ($\beta = 0.186$, $p = 0.013$); sexual abuse predicted language scores ($\beta = -0.194$, $p = 0.007$), and physical neglect predicted delayed memory scores ($\beta = -0.153$, $p = 0.037$)

Conclusion This study highlights distinct gender differences in the impact of childhood trauma on clinical symptoms and cognitive function in patients with chronic schizophrenia. In males, physical neglect was significantly associated with positive symptoms, while in females, emotional and sexual abuse were linked to specific cognitive impairments and depressive symptoms. These findings underscore the importance of considering gender-specific therapeutic interventions to address the unique needs of male and female schizophrenia patients with a history of childhood trauma

关键词: Schizophrenia; Childhood Trauma; Clinical Symptoms; Cognitive Function; Gender Difference

Prevalence and Clinical Correlates of Suicide Attempts in Young MDD Patients with Subclinical Hypothyroidism

Guoshuai Luo¹, Na Wang¹, Xiangyang Zhang²

1.Tianjin Anding Hospital

2.Chinese Academy of Sciences

Objective Subclinical hypothyroidism (SCH) has been reported to be associated with depression; however, its role in suicide risk in young patients with major depressive disorder (MDD) remains unclear. The objective of this study was to explore suicide attempts in young MDD patients with SCH in a large sample of first episode drug naïve (FEDN) MDD patients, which has received little systemic investigation

Methods A total of 917 FEDN MDD outpatients aged 18-35 years were recruited. Socio-demographic, clinical data, and thyroid function parameters were collected. The Positive and Negative Syndrome Scale

(PANSS) positive subscale, Hamilton Anxiety Rating Scale (HAMA), and Hamilton Depression Rating Scale (HAMD) were used to measure psychotic, anxiety, and depressive symptoms, respectively. The clinical global impression of severity scale (CGI-S) was used to assess the overall mental status of patients

Results Young MDD patients had a high SCH prevalence (56.8%). In young MDD patients with SCH, suicide attempts were associated with HAMA score, TSH, CGI score, and TPOAb. The combination of HAMA score, TSH, and CGI score differentiated suicide attempters from non-suicide attempters (AUC was 0.792) in young MDD patients. HAMD, HAMA, illness duration, TSH, and TPOAb were independently associated with the number of suicide attempts

Conclusion

Our findings suggest an extremely high prevalence of co-morbid SCH in young MDD patients and a high incidence of suicide attempts in young FEDN MDD patients with comorbid SCH. Several clinical characteristics and thyroid function indicators are independently associated with suicide attempts in young MDD patients with SCH.

Comparative Study of Clinical Symptoms, Cognitive Functions, and BDNF Levels in First-Episode and Chronic Schizophrenia Among Chinese Patients

Zhaoxuan Shang¹, XiangYang Zhang²

1.Department of Psychology and Cognitive Science, East China Normal University

2.Institute of Psychology, Chinese Academy of Sciences

Objective This study investigates clinical symptoms, cognitive functions, and BDNF levels among first-episode schizophrenia (FES), chronic schizophrenia (CS), and healthy controls (HC) in a Chinese population. The aim is to provide a comprehensive analysis

across different stages of schizophrenia

Methods A cross-sectional study design was employed, comparing PANSS and RBANS scores as well as BDNF levels among 142 FES patients, 150 CS patients, and 184 HC participants. Statistical analyses included ANOVA, correlation analysis, and regression models to examine group differences and predictors of cognitive functions

Results FES and CS patients had significantly higher PANSS and RBANS scores compared to HC. BDNF levels were lowest in FES, intermediate in CS, and highest in HC. In FES patients, age, education, and gender were significantly associated with cognitive functions, while negative symptoms significantly predicted worse immediate memory, language, attention, and total RBANS scores. Total PANSS score negatively predicted visuoconstructional ability and delayed memory. In CS patients, age, education, onset age, and smoking were significantly associated with cognitive functions. Negative symptoms negatively predicted cognitive outcomes, and total PANSS score positively predicted language but negatively predicted total RBANS score. BDNF levels significantly predicted attention in CS patients

Conclusion Our findings highlight distinct clinical and cognitive profiles and the progression of schizophrenia from FES to CS. The differential impact of BDNF on cognitive functions, particularly attention, underscores the importance of early intervention and continuous treatment to mitigate cognitive decline and improve outcomes

关键词: Schizophrenia; Clinical Symptoms; Cognitive Functions; PANSS; RBANS; BDNF

Factors Influencing The Age of First Hospitalization in Patients with Chronic Schizophrenia: Role of Clinical Features and Blood Parameters

Guoshuai Luo¹, Xiangyang Zhang²

1. Tianjin Anding Hospital

2. Chinese Academy of Sciences

Objective This study aims to identify the factors influencing the age of first hospitalization in patients with chronic schizophrenia, focusing on clinical features and blood parameters

Methods A total of 1271 patients diagnosed with chronic schizophrenia were recruited from 17 psychiatric hospitals across China. Demographic and clinical data, including age of first hospitalization, were collected. The study also included assessments of psychiatric symptoms, duration of untreated psychosis (DUP), and various blood parameters. Statistical analyses were conducted to examine the relationships between these factors and the age of first hospitalization

Results The average age of first hospitalization was 28.07 ± 9.993 years. Single patients and those with a family history of mental illness were hospitalized at a younger age. Patients with suicidal ideation or behavior also had an earlier hospitalization age compared to those without such history. Regression analysis revealed that marital status (single), family history of mental illness, and suicide ideation or behavior were significant risk factors for earlier hospitalization age. Conversely, DUP, total protein (TP), and low-density lipoprotein (LDL) levels were positively correlated with the age of first hospitalization, while antipsychotic medication dosage and albumin (ALB) levels were negatively correlated

Conclusion The study identifies significant demographic, clinical, and biochemical factors associated with the age of first hospitalization in chronic schizophrenia patients in China. These findings underscore the importance of early intervention and targeted support for high-risk groups to improve treatment outcomes

关键词: Chronic Schizophrenia, Age of First Hospitalization, Clinical Features, Blood Parameters, Duration of Untreated Psychosis

Gender Differences and Risk Factors for Psychotic Symptoms in First-episode Drug-naïve Major Depressive Disorder Patients with Suicide Attempts: A Large-scale and Cross-sectional Study

Guoshuai Luo¹, Xiangyang Zhang²

1.Tianjin Anding Hospital

2.Chinese Academy of Sciences

Objective This cross-sectional study aimed to investigate the prevalence and gender differences of psychotic symptoms in Major Depressive Disorder (MDD) patients with suicide attempts, as well as the risk factors that contribute to these symptoms

Methods This study enrolled 1718 first-episode and drug-naïve patients. Patients were recruited from the Department of Psychiatry at the First Clinical Medical College of Shanxi Medical University. Demographic and clinical data were collected, and various rating scales were used to assess depression, anxiety, and psychotic symptoms. Fasting serum samples were collected to measure thyroid hormones, fasting blood glucose levels, and lipid profiles

Results Of the MDD patients, 20.1% had a history of suicide attempts. Compared to patients without suicide attempts, those with suicide attempts had a higher prevalence of psychotic symptoms in MDD. Significant gender differences were observed in psychotic symptoms, age of onset, education, marital status, FT3 levels, and systolic blood pressure among MDD patients. In the female MDD subgroup with suicide attempts, risk factors for psychotic symptoms included HAMD score, HAMA score, and TSH

Conclusion We found no gender differences in the prevalence of psychotic symptoms in MDD with suicide attempts. Anxiety and depression severity and high TSH levels were identified as risk factors for psychotic symptoms in female MDD patients with suicide attempts

关键词: Major Depressive Disorder, psychotic symptoms, suicide attempts, risk factors, gender differences

The Relationship between Serum Lipid Levels and Self-Harm Behavior in Adolescents with Mood Disorders

Lingyan Kong Yufei Wu Jiabin Li Yuling Yang Fei Wang Rongxin Zhu*

Nanjing Brain Hospital

Objective Increasing evidence suggests that serum lipid levels are associated with self-harm behavior, particularly in adolescents with mood disorders. This study aims to identify serum lipid levels in adolescents with mood disorders who exhibit self-harm behavior and explore whether these levels influence susceptibility to self-harm behavior

Methods The study included 544 adolescents aged 12-18 years diagnosed with mood disorders based on ICD-10 criteria and currently experiencing a major depressive episode. Self-harm behavior was identified using medical records, physical examinations, and reports provided by patients or their guardians. Participants were categorized into two groups: the Self-Harm group (SH, n=401) and the Non-Self-Harm group (NSH, n=143). The Hamilton Depression Scale (HAMD) and Childhood Trauma Questionnaire (CTQ) were administered. Levels of total cholesterol (TC), triglycerides (TG), high-density lipoprotein cholesterol (HDL), and small dense low-density lipoprotein cholesterol (sdLDL) were measured. Statistical analyses included t-tests and binary logistic regression

Results The SH group exhibited higher HAMD and CTQ scores, as well as elevated HDL levels, but lower TG and sdLDL levels compared to the NSH group (all $p < 0.05$). Regression analysis further revealed that sdLDL levels were significant factors associated with self-harm behavior among adolescents with mood disorders

Conclusion The study demonstrates that changes in serum lipid levels, particularly in sdLDL, are significant risk factors for self-harm behavior in adolescents with mood disorders. These results provide a potential basis for identifying objective biomarkers to guide clinical prevention and treatment strategies for self-harm behavior

关键词: Lipids, Self-harm behavior, Adolescents, Mood disorders, Biomarkers

艾司西酞普兰与文拉法辛治疗焦虑症的临床分析

徐延营*

抚顺市第五医院

目的 焦虑症属于神经症疾病，主要特征为焦虑情绪体验，可分为急性焦虑与慢性焦虑，患者处于紧张、恐惧、害怕的内心体验中，甚至可出现濒死感，若得不到有效诊治，患者反复就医，极其影响正常生活。

目前焦虑症的治疗包括药物治疗与心理治疗两个方面，以药物治疗为主，心理治疗为辅，常见的药物治疗种类包括安定类药物、抗抑郁药物、5-羟色胺1A(5-HT-1A)受体激动剂等。艾司西酞普兰、文拉法辛均属于抗抑郁药物，在焦虑症临床治疗中应用广泛，但二者联合治疗焦虑症的应用研究报道较少。基于此，本研究旨在探讨艾司西酞普兰与文拉法辛在焦虑症患者中的应用效果。

方法 回顾性分析2017年3月-2019年6月期间于我院诊治的98例焦虑症患者的临床资料，将其以治疗方案不同分为艾司西酞普兰组(33例，常规治疗+艾司西酞普兰治疗)，文拉法辛组(33例，常规治疗+文拉法辛治疗)，联合组(32例，常规治疗+艾司西酞普兰+文拉法辛治疗)，比较三组汉密尔顿焦虑量表(HAMA)与不良反应情况发生情况。

结果 治疗后，三组HAMA评分均下降，且联合组HAMA评分低于艾司西酞普兰组、文拉法辛组，差异有统计学意义($P < 0.05$)；艾司西酞普兰组不良反应发生率为9.09%，文拉法辛组不良反应发生率为9.09%，联合组不良反应发生率为15.63%，组间比较，差异无统计学意义($P > 0.05$)。

结论 艾司西酞普兰、文拉法辛均可缓解焦虑症患者临床症状，但两种药物联合用于焦虑症治疗可起到更好的治疗效果，且用药安全性相对较高，利于患者接受。

关键词：焦虑症；艾司西酞普兰；文拉法辛

邹容 柳进 张燕*

中南大学湘雅二医院

目的 探讨常见精神障碍患者的尿酸(Uric acid, UA)水平的差异。

方法 回顾性纳入2011年6月至2022年11月在中南大学湘雅二医院住院的12到60岁精神障碍患者14485例(包括抑郁障碍3928例、双相障碍3760例、焦虑障碍1004例、精神分裂症5469例、强迫障碍324例)，使用非参数检验分析5组人群的UA水平，使用K-W检验方法，按照男女分组分别比较5组人群的血清UA水平，按照青少年(12-17岁)与成年(18-60岁)进行年龄分层分别比较5组人群的血清UA水平，分析血清UA水平与精神障碍的关系。

结果 5组精神障碍人群的血清UA平均值由高到低为：精神分裂症(342.1 ± 94.9)、双相障碍(339.0 ± 90.2)、强迫障碍(324.6 ± 90.3)、抑郁障碍(309.4 ± 82.8)、焦虑障碍UA水平最低(285.9 ± 75.7)。非参数检验显示，精神分裂症与双相障碍的UA水平没有显著性差异，其余各组之间UA水平的差异均有统计学意义。男性尿酸水平(377.5 ± 87.5)显著高于女性(292.3 ± 75.3)，各疾病组中男性尿酸水平均显著高于女性。按性别分组进行K-W检验显示，女性患者中，强迫障碍与焦虑障碍的UA水平没有显著性差异，男性患者中，强迫障碍与抑郁患者、焦虑患者的UA水平没有显著性差异，其余各组之间UA水平的差异均有统计学意义。青少年人群UA水平(338.7 ± 85.9)较成年人群更高(323.9 ± 92.6)。按年龄分组进行K-W检验显示，青少年人群中，抑郁障碍和双相障碍、抑郁障碍和精神分裂症之间的UA水平有显著性差异，其余各组间没有差异；而在成年人群中，强迫障碍、双相障碍、精神分裂症之间的UA水平没有显著性差异，其余各组均有显著性差异。

结论 不同精神障碍UA水平存在差异，重性精神障碍尿酸水平更高，性别、年龄可能是影响因素。

关键词：尿酸,精神障碍

尿酸水平与精神障碍的相关性回顾性研究

U-shaped Relationship between Triglyceride

Glucose-body Mass Index and Suicide Attempts in Chinese Patients with Untreated First-episode Major Depressive Disorder

He Ma Xiangdong Du* Fengnan Jia

The Affiliated Guangji Hospital of Soochow University

Objective Triglyceride glucose-body mass index (TyG-BMI) has been suggested as a substitute measure for assessing insulin resistance (IR). Nevertheless, the relationship between TyG-BMI and suicide attempts (SA) remains ambiguous. This study aimed to examine the association between TyG-BMI and SA in patients with first-episode drug-naïve (FEDN) major depressive disorder (MDD) of Shanxi province

Methods Between September 2016 to December 2018, a cross-sectional study was conducted at the First Hospital of Shanxi Medical University in Taiyuan, Shanxi Province, China, enrolling 1,718 individuals with FEDN MDD who had an average age of 34.9 ± 12.4 years. We employed a multivariable logistic regression analysis to assess the relationship between TyG-BMI and the risk of SA. We investigated threshold effects using a two-piecewise linear regression model

Results After accounting for confounders, multivariate binary logistic regression analysis indicated that there was no significant relationship between TyG-BMI and SA (all p value >0.05). However, smoothing plots demonstrated a nonlinear association between TyG-BMI and SA, with a TyG-BMI inflection point observed at 210. On either side of the inflection point, the effect sizes were 0.985 (95% CI: 0.972-0.999, $P=0.031$) and 1.012 (95% CI: 1.003 to 1.047, $P=0.001$), along with their corresponding confidence intervals

Conclusions A U-shaped association between TyG-BMI and SA in FEDN MDD patients was found, with the lowest risk of SA at a TyG-BMI of 210, indicating that both the lower and higher TyG-BMI levels may lead to an increased risk of SA

关键词: Triglyceride glucose-body mass index, Suicide attempts, Insulin resistance, Major depressive disorder

童年创伤介导的尿酸代谢异常与青少年心境障碍患者自我伤害性为的关联性研究

武雨霏 李佳欣 孔令妍 杨雨铃 王菲 朱荣鑫*
南京脑科医院

目的 青少年心境障碍患者是自我伤害行为的高风险人群,目前缺乏客观生物学标记的引导仍是临床防治困难的关键因素之一,本研究旨在探究嘌呤能代谢系统功能紊乱是否增加青少年心境障碍患者自我伤害行为的易感性,以及其与环境因素的关联。

方法 本研究共招募了符合 ICD-10 心境障碍诊断标准的 544 名青少年心境障碍患者,根据病史及患者自我报告明确既往有无自我伤害史,进而分成自我伤害组(SH 组, $N=401$)、非自我伤害组(NSH 组, $N=143$)。1、明确两组间社会人口学特征(性别、年龄、受教育年限等)、汉密尔顿抑郁量表(HAMD)、童年期创伤量表(CTQ)、贝克自杀意念及强度量表(BSS)以及嘌呤代谢终产物(尿酸)是否存在显著差异;2、利用逐步回归分析,以单因素分析中差异指标为自变量,以有无自我伤害行为为因变量,明确尿酸是否为自我伤害行为的独立风险因素;3、在自我伤害组内分析尿酸与自杀意念的内在关联。

结果 1、相对于 NSH 组,SH 组患者血清尿酸水平显著降低($t=-6.429, P<0.001$);2、逐步回归分析后向选择法纳入了四个显著变量,其中尿酸($\beta=0.456, P<0.001$)、CTQ 情感忽视因子($\beta=0.018, P<0.001$);3、相关性分析示 CTQ 总分与尿酸间存在显著相关性($R=-0.145, P=0.036$),尿酸与自我伤害风险间存在显著相关性($R=-0.137, P=0.009$)。

结论 童年创伤性经历可能导致青少年心境障碍患者嘌呤能代谢系统功能紊乱,进而增加了自我伤害行为的易感性。进一步探索其病理机制,有助于为临床防治提供客观生物学标记。

基于线性回归分析的青少年情绪对同伴交往质量的影响:来自一项中国江苏省大型队列研究

杨雨铃 沈函潼 王洋 张馨月 左萍 王菲 朱荣鑫*
南京医科大学附属脑科医院

孟庆顺*
山东省肥城市精神卫生中心

目的 青少年时期是个体出现心理问题的高风险期,不良的心理健康状态可能会损害个体的社会功能,同伴关系作为青少年时期最主要的人际关系,对青少年的社会适应和人格发展起到了至关重要的作用。本研究旨在解析青少年情绪问题和同伴交往质量的关系,为及时进行青少年心理干预、改善其社会功能提供理论依据。

方法 本研究数据来自一项大型中国青少年“家校一体”心理健康队列(School-based Evaluation Advancing Response for Child Health, SEARCH),该队列面向中国江苏省的青少年及其照料者和教师,使用数字平台综合评估心理健康状况。在筛选有效问卷后,最终28个班级共1154名12-16岁的初中年级的青少年(Mage=13.73,SD=0.93)被纳入研究,采用抑郁症状长处与困难问卷(Strengths and Difficulties Questionnaire, SDQ)的同伴交往因子评估学生的同伴交往质量,抑郁-焦虑-压力量表(Depression Anxiety and Stress Scale, DASS-21)的抑郁分量表评估学生抑郁情绪问题,以SDQ的同伴交往问题因子评分作为因变量,DASS-21的抑郁分量表评分作为自变量,建立线性回归模型。

结果 线性回归模型分析显示:青少年SDQ同伴交往问题因子得分与DASS-21抑郁分量表得分呈正相关,抑郁症状可以显著负向预测青少年同伴交往质量。这表明抑郁症状对青少年同伴交往质量有显著的负向影响,即抑郁症状越严重,青少年与同伴的交往问题越多,交往质量越低。

结论 抑郁症状是青少年同伴交往恶化的危险因素,青少年抑郁症状越严重,其同伴交往质量越差。这一发现提示我们,在关注青少年心理健康时,不仅需要关注其抑郁症状本身,还应重视其抑郁症状对社交能力和人际关系的负面影响。早期识别和干预青少年的抑郁症状,对于改善其同伴交往质量具有重要意义。

一例特定惊恐障碍诊治的思考

目的 探讨一例特定惊恐障碍诊治的思考

方法和结果 患者董X,男,25岁,患者于3年前在外打工时,一次开早会时突然晕倒、急送综合医院救治,经一系列检查考虑为“低血糖”经治疗后恢复正常,以后每次想到此事便感到恐惧害怕,害怕站的时间长了再晕倒,不敢长时间的站立,有时站的时间长了(开会、工作时),不自主的产生一种晕倒的感觉,表现身体不自主前倾,浑身晃,心慌等植物神经功能紊乱表现,曾多次打120急救电话送综合医院诊治,上述表现大约20分钟左右都能自行缓解。3年来,患者因上述不适放弃工作,不敢外出,整天在家里(自己房间)呆着,看手机、睡觉,很少与家人交流,亦不与家人共处,整天无所事事,睡觉、玩手机,家人多次与其交流均沟通不了,有时自己外出游玩均正常,后经介绍来我院就诊,收治入院。自发病以来,无情绪低落与情绪高涨交替发作。患者入院前饮食差,睡眠一般,生活能自理。既往史、个人史:无特殊。病前性格:内向、胆小、不善交流。家族史:阴性。体格检查:未见明显异常。辅助检查:血常规、心电图、头颅CT、肝功、肾功、血脂、血糖、电解质、心肌酶谱均未见明显异常。入院诊断为“特定恐惧障碍”给予小剂量抗焦虑药坦度螺酮及帕罗西汀对症治疗,同时给予认知行为治疗及健康教育指导,让患者明白疾病的性质,增进患者在治疗中的合作,在焦虑发作时对焦虑体验有正确的认知,避免进一步加重焦虑。鼓励患者进行适当的体育锻炼,并坚持正常生活工作。

结论 总体而言,综合医院心理障碍患者总体识别率低,尤其当焦虑和抑郁障碍与躯体疾病并存时,其识别和治疗率更低。综合医院心理障碍总体识别率和治疗率如此低,原因之一是绝大多数焦虑或抑郁障碍患者主诉是躯体症状,而非情绪问题,给各科医师识别造成困难,尤其当躯体疾病和焦虑、抑郁障碍共病时更为突出。例如当抑郁症状与糖尿病症状互相重叠,或抑郁症状和糖尿病症状相似时,患者和临床医师常忽略了可能并发抑郁,简单将病情变化归结于糖尿病,延误了抑郁识别。其他原因还有患者羞耻感或通科医师对精神科诊疗相关知识和技能匮乏,对心理疾病重视不足和诊疗时间不足。由于焦虑障碍患者常表现多种情绪相关躯体症状,反复就诊于临床各科,成为各级医疗保健机构医疗

资源高使用者。识别临床症状是诊治的第一步综合医院临床各科常见到的焦虑及抑郁多数为躯体疾病伴发，可能是躯体疾病症状的一部分，或是由治疗躯体疾病的药物导致；部分患者可能并无躯体疾病，而是以躯体症状为主诉的焦虑、抑郁。为此，加大综合医院对精神科常见病、多发病的识别及诊治是必要和必须的。

General Adherence Status and Associated Factors in General Hospital Inpatients: A Cross-sectional Study

Jiarui Li¹, Tao Li¹, Yufei Wang^{1,2}, Yanping Duan¹, Yinan Jiang¹, Wenqi Geng¹, Lili Shi¹, Xia Hong¹, Jianhua Du¹, Yinghan Xie¹, Jiaojiao Hu¹, Jinya Cao¹, Jing Wei¹

1.Peking Union Medical College Hospital

2.Chinese Academy of Medical Sciences and Peking Union Medical College

Objective Medical adherence is important for medical quality and medical safety. There are still few investigations on the status quo and influencing factors of general adherence among inpatients in general hospitals

Methods This was a cross-sectional study. From July 2022 to November 2023, inpatients were recruited from 9 wards of Peking Union Medical College Hospital, China. Sociodemographic characteristics and some related psychological features were collected. General adherence was assessed by the General Adherence Scale (GAS)

Results A total of 746 patients were included. The average GAS score was 86.01 ± 18.91 . The GAS score of the nonsurgical wards ($n = 412$, $GAS = 82.72 \pm 22.27$) was significantly lower than that of the surgical wards ($n = 334$, $GAS = 90.08 \pm 18.72$) ($t = -2.22$, $p = 0.027 < 0.05$). The GAS score was negatively correlated with age ($r = -0.075$, $p = 0.040 < 0.05$), positively correlated with the score of the Hospitalized Patients' Expectations for Treatment Scale-Patient version ($r = 0.300$, $p < 0.01$) and negatively correlated with the

Union Physio-Psycho-Social Assessment Questionnaire (UPPSAQ-70) -pain subscale score ($r = -0.390$, $p = 0.011 < 0.05$)

Conclusion The adherence of hospitalized patients is generally high. Adherence in nonsurgical wards was lower than that in surgical wards. For older and less educated patients, more attention needs to be given to adherence. A reasonable setting of treatment expectations and positive improvement in patients' pain symptoms can improve adherence

中国成年首发未服药重度抑郁障碍患者首次自杀未遂风险因素研究

丛晓银¹ 卞荣荣¹ 徐华桢¹ 李勇¹ 郎小娥² 刘建军³ 张向阳⁴

1.江苏省人民医院（南京医科大学第一附属医院）

2.山西医科大学第一医院

3.南京梅山医院

4.中国科学院心理研究所

目的 本研究聚焦于中国成年首发未服药重度抑郁障碍（FEDN）患者，旨在识别这些患者在过去14天内发生首次自杀未遂（FSA）的潜在社会-人口、生理及心理风险因素

方法 通过一项横断面调查，我们纳入1718名FEDN成年患者，系统地评估抑郁、焦虑症状以及自杀企图，并收集生物样本进行了检测，采用逻辑回归分析，深入探讨影响FEDN MDD患者在过去14天内FSA发生的风险因素。

结果 在参与调查的FEDN MDD患者中，有12.11%（即208人）报告了近期（过去14天内）的首次自杀未遂经历。逻辑回归分析的结果显示，焦虑症状的严重程度（ $OR = 1.37$, $95\%CI: 1.275-1.477$, $p < 0.001$ ）、总胆固醇（TC）水平的升高（ $OR = 1.42$, $95\%CI: 1.129-1.774$, $p = 0.003$ ）以及促甲状腺激素（TSH）水平的异常上升（ $OR = 1.13$, $95\%CI: 1.030-1.247$, $p = 0.01$ ）均为FSA发生的重要风险因素。回归模型在预测FSA方面展现出了良好的判别能力，曲线下面积（AUC）高达0.82。

结论 本研究发现, 对于 FEDN MDD 患者而言, 严重的焦虑症状、高水平的总胆固醇 (TC) 以及异常升高的促甲状腺激素 (TSH) 水平可能增加他们在短期内发生首次自杀未遂的风险。这些发现不仅为我们提供了预防自杀行为的重要线索, 也为临床实践中早期干预措施的制定提供了科学依据

Prevalence and Clinical Correlates in Older Major Depressive Disorder Patients with Comorbid Abnormal Lipid Metabolism

Xiao Huang¹, Xiangyang Zhang²

1.Beijing Chao-Yang Hospital, Capital Medical University

2.CAS Key Laboratory of Mental Health, Institute of Psychology

Objective Older Major depressive disorder (MDD) patients have complex clinical symptoms and high ALM rates. This study aimed to compare clinical differences between those with and without ALM in a large sample of older first-episode drug naïve (FEDN) patients

Methods We recruited 266 older MDD patients. Socio-demographic variables, clinical data, and lipid parameters were obtained. The Hamilton Depression Rating Scale, the Hamilton Anxiety Rating Scale, and the positive symptom subscale of the Positive and Negative Syndrome Scale were conducted to evaluate patients' depressive, anxiety and psychotic symptoms, respectively

Results Compared with the NALM group, the ALM group had a higher duration of illness, the clinical global impression of severity scale (CGI-S), Hamilton Rating Scale for Depression (HAMD), thyroid stimulating hormone (TSH) and glucose level. Furthermore, logistic regression analysis indicated that higher CGI-S scores and longer duration of illness were linked with ALM in older FEDN MDD patients

Conclusion In this study, we found the prevalence of comorbid ALM was 86.1 % in older major depressive disorder (MDD) patients. And we also showed the higher duration of illness, HAMD and CGI-S score, and significant differences in blood glucose and TSH levels in the ALM group compared with the NALM group, indicating the specificity of clinical correlates and metabolic markers for ALM in older patients with FEDN MDD. The importance of regular lipid assessment in older MDD patients needs to be taken into account

关键词: Prevalence, older, major depressive disorder, abnormal lipid metabolism

Development and Validation of A Risk Prediction Model for Moderate-to-severe Anxiety in First-episode and Drug Naïve Patients with Major Depressive Disorder

Xiao Huang¹, Xiangyang Zhang²

1.Beijing Chao-Yang Hospital, Capital Medical University

2.CAS Key Laboratory of Mental Health, Institute of Psychology

Objective Moderate-to-severe anxiety symptoms are severe and common in patients with major depressive disorder (MDD) and have a significant impact on MDD patients and their families. The main objective of this study was to develop a risk prediction model for moderate-to-severe anxiety in MDD patients to make the detection of moderate-to-severe anxiety more accurate and effective

Methods We conducted a cross-sectional survey and tested biochemical indicators in 1718 first-episode and drug naïve (FEDN) patients with MDD. Using machine learning, we developed a risk prediction model for moderate-to-severe anxiety in these FEDN patients with MDD

Results Four predictors were identified from a total of 21 variables studied by LASSO regression anal-

ysis, namely psychotic symptoms, suicide attempts, thyroid stimulating hormone (TSH) and HAMD total score. The model built from the four predictors showed good predictive power, with an area under the ROC of 0.903 for the training set and 0.896 for the validation set. The DCA curve indicated that the nomogram could be applied to clinical practice if the risk thresholds were between 13 % and 40%. In the external validation, the risk threshold was found to be between 14 % and 40 %

Conclusion The inclusion of psychotic symptoms, suicide attempts, TSH and HAMD in the risk nomogram may improve its utility in identifying patients with MDD at risk of moderate-to-severe anxiety. It may be helpful in clinical decision-making or for conferring with patients, especially in risk-based interventions

Resilience, Rumination, and Emotional Intelligence: Pathways To Professional Efficacy in Pharmacy Practice

Shazia Rehman¹, Muhammad Akhlaq², Mehmood Ahmad³, Bangshan Liu¹

1.Department of Psychiatry, National Clinical Research Center for Mental Disorders, and National Center for Mental Disorders, The Second Xiangya Hospital of Central South University, Changsha, 410011, Hunan, China.

2.Department Pharmacy, Hazara University, Mansehra, KPK, Pakistan.

3.Department of Pharmacology and Toxicology, Faculty of Veterinary and Animal Sciences, The Islamia University of Bahawalpur, Bahawalpur, Pakistan.

Objective Within a high-pressure pharmaceutical practice environment, understanding the factors that enhance professional efficacy is essential for optimizing job performance and satisfaction. This study investigates the relationship between psychological resilience

and professional efficacy among pharmacists, with rumination and emotional intelligence as potential mediating factors

Methods We employed a cross-sectional design and structural equation modeling to analyze data from a sample of 576 pharmacists conducted in the Punjab province between September 2023 and January 2024. Psychological resilience was assessed using the six-item Brief Resilience Scale (BRS), the ten-item Ruminative Response Scale (RRS) measured rumination, emotional intelligence was evaluated using the ten-item Emotional Intelligence Scale (EIS), and professional efficacy was measured by the ten-item General Self-Efficacy Scale (GSS)

Results Our results demonstrated that psychological resilience significantly enhances professional efficacy both directly ($\beta = 0.396, p < 0.001$) and indirectly through reducing rumination ($\beta = -0.341, p < 0.001$) and increasing emotional intelligence ($\beta = 0.452, p < 0.001$). Additionally, a smaller chain mediation effect was observed, indicating that the combined influence of rumination and emotional intelligence contributes positively to professional efficacy ($\beta = 0.028, p < 0.05$)

Conclusion These findings underscore the importance of fostering psychological resilience and emotional intelligence while addressing negative cognitive patterns like rumination. The study's results have important implications and relevant evidence for developing focused interventions to bolster job performance and enhance well-being through supportive organization policies

Differences in The Prevalence and Clinical Correlates between Early-onset and Late-onset Major Depressive Disorder Patients with Comorbid Abnormal Lipid Metabolism

Xiao Huang¹, Xiangyang Zhang²

1.Beijing Chao-Yang Hospital, Capital Medical University
2.CAS Key Laboratory of Mental Health, Institute of Psychology

Objective There is growing evidence that patients with major depressive disorder (MDD) are more likely to suffer from abnormal lipid metabolism (ALM); however, few studies have compared ALM in early-onset and late-onset MDD patients. The purpose of this study was to compare the differences in the prevalence and correlates of ALM between early-onset and late-onset patients with first-episode and drug-naive (FEDN) MDD patients

Methods A total of 1718 FEDN MDD outpatients were recruited for this study. We collected basic clinical information, as well as serum total cholesterol (TC), low-density lipoprotein cholesterol (LDL-C), high-density lipoprotein cholesterol (HDL-C), triacylglycerols and glucose (TG). We used the 17-item Hamilton Rating Scale for Depression (HAMD-17), The Hamilton Anxiety Rating Scale (HAMA), Positive and Negative Syndrome Scale (PANSS) positive subscale, and Clinical Global Impression- Severity Scale (CGI-S) to assess their depressive, anxiety, and psychotic symptoms and clinical severity, respectively

Results The prevalence of ALM in the late-onset group was significantly higher than that in the early-onset group. In both the early-onset and late-onset groups, patients with ALM had higher scores on HAMD, HAMA, PANSS positive subscale and CGI scores, higher thyroid stimulating hormone (TSH) levels, blood glucose concentration, systolic blood pressure (DBP), diastolic blood pressure (DBP), and a higher rate of psychotic symptoms compared with those without ALM (all $P < 0.05$). Only in patients with late-onset MDD, patients with ALM had higher rates of suicide attempts and anxiety, greater age, age at onset and duration of illness, as well as higher BMI and anti-thyroglobulin (A-TG) levels (all $P < 0.05$). Further logistic regression analysis showed that HAMD was significantly associated with ALM in early-onset MDD patients ($P < 0.05$), whereas HAMD, CGI, TSH, blood glucose concentration and anxiety were significantly associated with

ALM in late-onset MDD patients ($P < 0.05$)

Conclusion Our results suggest that there are significant differences in the prevalence and clinical factors of comorbid ALM between early-onset and late-onset FEDN MDD patients

Abnormal Lipid Metabolism in Chinese Han Patients with Schizophrenia: Relationship with Cognitive, Demographic and Clinical Variables

Xiao Huang¹, Xiangyang Zhang²

1.Beijing Chao-Yang Hospital, Capital Medical University
2.CAS Key Laboratory of Mental Health, Institute of Psychology

Objective The diverse effects of abnormal lipid metabolism (ALM) on human health have prompted researchers to investigate its impact on neuropsychiatric disorders, particularly on schizophrenia. The aim of this study was to investigate the incidence, clinical characteristics and cognitive function of ALM in Chinese patients with chronic schizophrenia

Methods We obtained data on ALM from 763 schizophrenia inpatients. All patients were assessed using the Positive and Negative Syndrome Scale (PANSS), the Mini-Mental State Examination (MMSE), the Insomnia Severity Index (ISI), and the Repeatable Battery for the Assessment of Neuropsychological Status (RBANS)

Results Of all the patients, 460(60.3%) had ALM. Patients with ALM were heavier, had more women and higher rate of divorce or widowed compared to patients without ALM (all $p < 0.05$). Further, patients with ALM had higher RBANS immediate memory and total scores compared to patients without ALM ($p < 0.05$). Logistics regression analysis confirmed that female, higher weight and divorce or widowed status were independently associated with ALM in patients

with schizophrenia

Conclusion In summary, the results of this study showed that the rate of ALM among Chinese Han schizophrenia inpatients was 60.3%, which was significantly higher than that of the general population. Schizophrenia inpatients with ALM were more likely to be female, divorced or widowed, have a higher bodyweight, and perform better in RBANS. However, given the methodological limitations of this study, our findings should be considered preliminary and require further investigation. Future large-scale longitudinal studies are necessary to elucidate the relationship between lipid levels and schizophrenia severity

Graves 病与亚急性甲状腺炎所致甲状腺毒症患者焦虑状态的临床观察

李雪*

阜新市精神病防治院

目的 在内科疾病中, 甲状腺疾病与精神活动的关系比较密切。甲状腺激素在神经系统的正常发育中起到至关重要的作用, 大脑皮层中的甲状腺激素生理水平控制一个很严格的范围内, 即使甲状腺激素发生轻微改变也可能对情绪产生影响。本文以甲状腺毒症患者为研究对象, 选以弥漫性毒性甲状腺肿 (Graves disease, GD) 为代表的甲亢性甲状腺毒症和亚急性甲状腺炎 (Subacute thyroiditis, SAT) 为代表的破坏性甲状腺毒症, 比较两种病因所致甲状腺毒症患者焦虑状态的差异, 初步探讨甲状腺毒症患者焦虑状态与甲状腺激素水平的相关性。

方法 从2021年3月至2022年12月期间初次就诊于辽宁中医药大学附属医院内分泌科门诊的未经治疗的甲状腺毒症患者中选取符合纳入及排除标准的甲状腺毒症患者, 根据甲状腺毒症的病因分为GD组和SAT组。采集患者的信息包括性别、年龄, 以及患者填写的ISI失眠严重指数量表、SAS焦虑自评量表; 理化指标包括血清FT3、FT4、TSH、TRAb、TPOAb和TGAb。采用SPSS 22.0软件进行统计学分析, $P < 0.05$ 认为有统计学意义。

结果 (1) 两组患者在年龄、性别、睡眠质量评分上比较无统计学差异, 两种疾病均以女性患者居多 ($P > 0.05$)。GD组患者FT3、FT4、FT3/FT4、TRAb、TPOAb、TGAb均大于SAT组患者, 而TSH低于SAT组 ($P < 0.05$)。(2)GD组焦虑评分大于SAT组 ($P < 0.05$)。GD组患者焦虑评分与睡眠质量评分、FT3呈正相关 ($P < 0.05$)。SAT组患者焦虑评分与睡眠质量评分呈正相关, 与年龄呈负相关 ($P < 0.05$)。

结论 1.GD患者的焦虑情绪更严重且受FT3水平的影响, SAT患者的焦虑情绪与甲状腺激素水平无关, 与年龄相关。2.两种病因甲状腺毒症患者的焦虑情绪均与睡眠质量有关。

Incidence and Associated Factors of Psychotic Symptoms Associated in Older Major Depressive Disorder with Subclinical Hypothyroidism

Xiuwen Wang¹, Xiangyang Zhang², Jianjun Zhang¹

1. Shanxi University of Chinese Medicine

2. CAS Key Laboratory of Mental Health, Institute of Psychology

Objective In patients with major depressive disorder (MDD), thyroid dysfunction is highly associated with depression severity and psychotic symptoms. However, the prevalence and risk factors of psychotic symptoms in older MDD patients with subclinical hypothyroidism (SCH) are rarely reported in China

Methods We recruited 172 older patients with first-episode and untreated MDD (aged ≥ 50 years). The Hamilton Depression Scale (HAMD), Hamilton Anxiety Scale (HAMA), Positive and Negative Syndrome Scale (PANSS) positive subscale, and Global Impression of Severity Scale (CGI-S) were used to assess depression, anxiety, psychotic symptoms, and disease severity, respectively

Results The prevalence of psychotic symptoms was 18.6% (32/172) in older MDD patients with SCH. Compared to the non-PD patients, PD patients had higher HAMD scores, HAMA scores, PANSS positive

subscale scores, CGI scores, higher levels of TSH, systolic and diastolic blood pressure, TC, TG, and Fasting blood glucose, and were more likely to attempt suicide (all $P < 0.05$). TSH and HAMA scores were risk factors for psychotic symptoms in older MDD patients with SCH

Conclusion Our findings suggest that psychotic symptoms is common in older MDD patients with SCH. Higher TSH levels may indicate more psychotic symptoms in older MDD patients with SCH. Screening of serum thyroid hormones is crucial in older MDD patients

关键词: Major depressive disorder; Older adult; Subclinical hypothyroidism; Psychotic symptoms; Risk factor; First-episode

强迫症患者一级亲属的心理健康状况调查

牛琪惠* 杨磊 郝以辉 宋学勤

郑州大学第一附属医院

目的 了解强迫症患者一级亲属的心理健康状况。

方法 按照 DSM-5 的诊断标准, 收集 2023 年 1 月至 2023 年 6 月于郑州大学第一附属医院精神科就诊的强迫症患者的父亲或者母亲 24 例, 采用单样本 t 检验检测强迫症患者一级亲属的症状自评量表 SCL-90 各维度与中国常模的差异。

结果 共收集强迫症患者父亲 11 例, 母亲 13 例, 平均年龄: 49.71 ± 5.94 岁, 平均受教育程度: 12.29 ± 2.10 年; SCL-90 各项维度分析比较: 强迫症患者一级亲属组在强迫 (2.23 ± 1.02 , 常模 1.62 ± 0.58 , $t = 2.95$, $P = 0.007$)、抑郁 (2.05 ± 0.64 , 常模 1.50 ± 0.59 , $t = 4.22$, $P = 0.001$) 和焦虑 (1.83 ± 0.53 , 常模 1.39 ± 0.43 , $t = 4.11$, $P = 0.001$) 维度方面高于中国常模组。在躯体化 (1.50 ± 3.77 , 常模 1.37 ± 0.48 , $t = 1.63$, $P = 0.118$)、人际关系敏感 (1.58 ± 0.40 , 常模 1.65 ± 0.61 , $t = -0.88$, $P = 0.388$)、敌对 (1.46 ± 0.40 , 常模 1.46 ± 0.55 , $t = -0.02$, $P = 0.988$)、恐惧 (1.29 ± 0.25 , 常模 1.23 ± 0.41 , $t = 1.19$, $P = 0.247$)、偏执 (1.47 ± 0.45 , 常模 1.43 ± 0.57 , $t = 0.47$, $P = 0.477$) 和精神病性 (1.39 ± 0.28 , 常模 1.29 ± 0.42 , $t = 1.79$, $P = 0.086$) 维度方面的差异无统计学意义。

结论 强迫症患者的一级亲属也存在一定的心理健康问题, 需要引起临床重视。

关键词: 强迫症; 一级亲属; SCL-90

Subclinical Hypothyroidism and Risk Factors in Young and Middle-aged Adults with Major Depressive Disorder: A Large-scale Cross-sectional Study

Liyang Yang¹, Jiacheng Liu¹, Chuanyi Kang¹, Xiaohong Wang¹, Na Zhao¹, Xiangyang Zhang²

1. The First Affiliated Hospital of Harbin Medical University

2. CAS Key Laboratory of Mental Health, Institute of Psychology, Chinese Academy of Sciences

Objective Major depressive disorder (MDD) is a prevalent psychiatric disorder with concomitant thyroid dysfunction, but the link between them is unclear. The aim of this study was to elucidate the prevalence and correlates of subclinical hypothyroidism (SCH) in different age subgroups of first-episode and drug-naïve (FEDN) MDD patients

Methods 1717 FEDN MDD outpatients were divided into a younger group (≤ 45 years) and a middle-aged group (> 45 years). Serum thyroid function and lipid level parameters were measured. The Hamilton Depression Scale (HAMD) was used to assess patients' depressive symptoms

Results The prevalence of SCH was higher in middle-aged MDD patients (66.9%). Middle-aged patients had a longer duration of illness, a later age of onset, a higher proportion of female patients, and a lower level of education. Further logistic regression indicated that serum TC and HDL-C levels as well as overweight and obesity were significantly associated with SCH in both groups; however, LDL-C was an independent risk factor associated with SCH in the middle-aged group

Conclusion Our results suggest that the prevalence of SCH is higher in middle-aged MDD patients than in younger patients, and that LDL-C is associated with SCH in middle-aged FEDN MDD patients

关键词: Subclinical hypothyroidism; Major depressive disorder; Middle-aged adults; LDL-C

The Causal Associations of Depression, Anxiety, and Sleep Disorders with Constipation: A Bidirectional and Multivariable Mendelian Randomization Study

Qi Zheng¹, Jian He², Chunmei Shao³, Yajuan Ji¹, Qi Liu¹, Chenyun Zhang¹, Tiantian Zhang¹, Jilei Chen¹, Kai Song⁴, Yingjian Deng³, Xinchao Chen¹

1.Xiamen Xianyue Hospital, Xianyue Hospital Affiliated with Xiamen Medical College, Fujian Psychiatric Center, Fujian Clinical Research Center for Mental Disorders

2.Department of Gastroenterology, Nanfang Hospital, Southern Medical University

3.Department of Cardiology, Xiamen Cardiovascular Hospital of Xiamen University, School of Medicine, Xiamen University

4.Department of Psychiatry, Jiangxi Psychiatric Hospital, Jiangxi Mental Health Central, The Affiliated Hospital of Nanchang University

Objective Some previous studies have reported bidirectional associations between depression, anxiety, sleep disorders, and constipation. However, the existing observational studies yielded conflicting results and might be biased by residual confounding factors and reverse causality

Methods The associations were examined through a two-sample, bidirectional, univariable, and multivariable Mendelian randomization (MR) study. The inverse-variance weighted method was applied as the principal analytical approach, and other additional MR methods (maximum likelihood, robust adjusted profile score, and MR-Pleiotropy Residual Sum and Outlier) were used for sensitivity analyses. Multivariable MR analysis was performed to assess the independent effects of selected exposures

Results The univariable MR analyses indicated that major depression (MD) (odds ratio [OR], 1.28; 95%

confidence interval [CI], 1.12-1.46), broad depression (BD) (OR, 3.72; 95% CI, 1.55-8.97), depressed affect (OR, 1.41; 95% CI, 1.13-1.76), and worry (OR, 1.42; 95% CI, 1.13-1.77) were associated with an increased risk of constipation. There was no evidence supporting the causal effects of anxious feelings, sleep duration, and sleeplessness on constipation. The reverse MR analyses found no reverse causal association of constipation with depression, anxiety, and sleep disorders. In Multivariable MR, only MD still had a robust causal association with constipation, while the effect of worry was attenuated to null, and the effects of BD and depressed affect were completely reversed

Conclusion Our findings demonstrated that MD is causally associated with constipation. Worry might also increase the risk of constipation, but this finding needs to be further investigated

关键词: depression, anxiety, sleep disorders, constipation, causal association, Mendelian randomization

中职生抑郁与失眠间的关系：压力知觉的中介作用

邱模宇^{1,2} 刘典英¹ 夏雅康^{1,2} 钟艳^{1,2}

1.赣州市第三人民医院

2.赣南医科大学人文社会科学学院

目的 探讨中职生抑郁和失眠的关系,以及压力知觉在抑郁和失眠间的中介作用。

方法 采用病人健康问卷(Patient Health Questionnaire-9,PHQ-9)、压力知觉量表(Perceived Stress Scale,PSS)、失眠严重指数问卷(Insomnia Severity Index,ISI)对 1426 名中职生开展问卷调查,评估其抑郁症状、压力知觉水平、失眠严重程度,以 ISI≥8 为是否失眠划界分。应用 SPSS23.0 对数据进行描述统计、相关分析、分层回归分析;采用 PROCESS V3.4 插件进行 Bootstrap 中介效应检验。

结果 1. 中职生失眠发生率为 65.5%。2. 失眠组在 PHQ-9[(17.02±6.09)分 vs(8.80±7.61)分, $t=21.20, p < 0.01$]、PSS[(25.44±7.12)分 vs(18.22±7.50)分, $t=17.75, p < 0.01$]显著高于无失眠组,均差异有统计学意义。3. 相关分析结果表明,失眠

与抑郁和压力知觉均呈显著正相关 ($r=0.71, r=0.56$, 均 $p<0.01$, 95%CI 1.111-1.167)。4. 控制性别(混杂因素)后, 双变量回归分析显示抑郁症状 ($\beta=0.130, OR=1.139, p<0.001, 95\%CI 1.022-1.072$), 压力知觉 ($\beta=0.046, OR=1.047, p<0.001$) 是失眠的风险因素。5. 中介效应分析结果表明 压力知觉在抑郁与失眠间起着部分中介效应(直接效应值为 0.430, 95%CI 0.370-0.490, 间接效应值为 0.127, 95%CI 0.049-0.183), 间接效应占总效应的 22.8%。

结论 中职生社会压力大, 失眠率发生率高, 抑郁症状不仅直接影响失眠, 还可通过压力知觉加重失眠。心理健康促进工作可通过减轻中职生的压力知觉水平, 改善情绪对睡眠不良影响, 提升整体心理健康水平。

关键词: 压力知觉; 失眠; 抑郁; 中职生

基于事件相关电位的单相抑郁和双相抑郁鉴别诊断及对 MECT 疗效预测研究

黄佳鑫 刘玟汐 李雷俊 赵崇邦 王继辉 陈晓东 周弘韵 陶炯*
中山大学附属第三医院

目的 单相抑郁(UD)和双相抑郁(BD)鉴别诊断困难, 部分患者对改良电休克治疗(MECT)反应差。利用事件相关电位(ERP)辅助鉴别诊断及预测疗效逐渐成为热点, 但既往研究多为单一指标、结论不一致, 本研究拟基于 N170、P300、MMN 等指标为 UD 和 BD 鉴别诊断及预测 MECT 疗效提供依据。

方法 本研究纳入中山大学附属第三医院精神科 UD 和 BD 患者 58 例, 接受脑电实验并使用 HAMD 及 MCCB 评估抑郁症状及认知功能, 提取 N170、P300 和 MMN 成分的振幅和潜伏期。排除 6 例后分为 UD 组(24 例)和 BD 组(28 例), 接受 MECT 的 24 例以治疗前后 HAMD-24 减分率 50% 界值分为有效组(13 例)和无效组(11 例)。对临床数据和 ERP 指标进行差异分析和回归分析。

结果 (1) UD 组与 BD 组之间、MECT 有效组与无效组之间的性别、年龄、病程、HAMD 总分、MCCB 总分及因子分无显著差异。

(2) UD 和 BD 患者的 N170 潜伏期(UD 组

145.3±13.1ms, BD 组 157.7±12.4ms)和 P300 峰幅值(UD 组 4.0±2.6μV, BD 组 6.3±3.3μV)具有显著差异。

(3) 二元 logistic 回归显示 N170 潜伏期 ($OR=1.078, 95\%CI=1.017\sim 1.142, p=0.012$) 和 P300 振幅 ($OR=1.534, 95\%CI=1.059\sim 2.223, p=0.024$) 是诊断 BD 的危险因素。ROC 显示 P300 振幅的 AUC 值为 0.717 (95% CI=0.570~0.863), 最佳截断值为 6.22μV, 敏感度为 52.0%, 特异度为 91.3%, 约登指数为 0.433; N170 潜伏期的 AUC 值为 0.763 (95% CI=0.629~0.897), 最佳截断值为 154ms, 敏感度为 56.0%, 特异度为 82.6%, 约登指数为 0.386。二者联合指标的 AUC 值为 0.781 (95% CI=0.649~0.913), 最佳截断值为 0.344, 敏感度为 92.0%, 特异度为 60.9%, 约登指数为 0.529。P300 振幅、N170 潜伏期及二者联合指标对 UD 和 BD 的鉴别诊断有一定价值。

(4) 有效组和无效组之间的 N170、P300 和 MMN 振幅及潜伏期无显著差异。

结论 单相抑郁和双相抑郁的 N170 潜伏期和 P300 振幅具有显著差异, P300 振幅、N170 潜伏期及其联合指标对二者的鉴别诊断有一定价值, 但未发现 P300、N170、MMN 指标预测电休克治疗抑郁症状疗效的价值。

Silent Acute Cerebral Infarction with Psychotic Episode As The Primary Manifestation During Liver Transplantation: A Case Report and Comprehensive Review about The Risk Factors

Yanqun Zheng Chunhong Shao*
Huashan Hospital, Fudan University

Objective Postoperative neurological and neuropsychiatric complications (NCC) has become the research emphasis, with long-term survival after liver transplantation (LT) gradually improving. The causes of NCC are highly variable, but among them, acute cerebral infarction is an extremely rare complication of LT

Methods We report our experience with a case of acute cerebral infarction during LT. Also, we retrospectively analyze the entire diagnostic and treatment process of this case to explore its pathogenesis and the predictive diagnostic value of each factor

Results In this case, we report a middle-aged man with multiple and fluctuating psychiatric symptoms for nearly 2 weeks after LT, with significant personality changes in between, no overt neurologic signs, and partial response to antipsychotics. The patient underwent a magnetic resonance imaging (MRI) scan of the head to detect an acute cerebral infarction, and symptomatic and rehabilitative treatment was promptly initiated by the clinician. At the last follow-up, he was doing well with stable liver function and resolution of clinical neuropsychiatric symptoms. In this paper, we retrospectively analyze the entire diagnostic and treatment process of this case to explore its pathogenesis and the predictive diagnostic value of each factor

Analysis showed that hepatic encephalopathy active in the immediate preoperative period (OR=4.1, $p=0.00$), hepatorenal syndrome (OR=4.5, $p=0.02$), child-Pugh score C (OR=2.6-4.0, $p<0.05$), hepatic encephalopathy history ($p<0.05$), higher bilirubin levels (Cohen's $d=0.22$, $p<0.05$), 24-hour change in serum sodium (Cohen's $d=0.59$, $p<0.05$), total cholesterol level (Cohen's $d=-0.93$, $p<0.05$), HDL cholesterol level (Cohen's $d=-1.1$, $p<0.05$), adult (Cohen's $d=0.66$, $p=0.01$), acute liver failure (HR=4.95, $p=0.00$), Wilson disease (HR=6.64, $p=0.00$), increased preoperative creatinine (HR=1.33, $p<0.05$), seizure or intracranial hemorrhage history (HR=4.97, $p=0.00$), graft failure (HR=4.94, $p=0.00$), preoperative infection (OR 2.83, $p<0.05$), alcohol-related liver disease C including (including patients with alcohol and chronic hepatitis C infection) and metabolic liver disease (OR=9.90, $p=0.01$), mechanical ventilation pre-LT (OR=4.50, $p<0.05$) were significant risk factors for NCC after LT.

Conclusion This case is the first report of a combined acute stroke after LT with psychotic symptoms as the first and primary manifestation. Data on this are few and far between. In a 4-year follow-up case study, 60 of 1730 patients who underwent LT had definite neuroimaging changes, and only 3 (5%) of them had acute

stroke. Patients with vascular-related neurologic complications often present with seizures and coma, and have very high mortality rates. Difficulties arise with the diagnosis of the majority subclinical form of NCC

Careful consultation and follow-up will help identify this group of patients, and we have compiled a list of predictive factors that may aid in clinical diagnosis and prediction.

母亲状态焦虑如何影响孩子焦虑：家庭和父母行为的中介作用

苏曼沂*
上海市精神卫生中心

目的 本研究旨在探讨母亲的状态焦虑如何通过家庭系统功能和父母的顺应行为影响孩子的焦虑症状。具体来说，本研究检验了家庭系统功能在母亲状态焦虑与父母顺应行为之间的中介作用，以及父母顺应行为在母亲状态焦虑与孩子焦虑症状之间的中介作用，进而分析母亲状态焦虑对孩子焦虑症状的链式中介效应。

方法 本研究采用横断面调查数据，样本包括109对母亲及其孩子，来自上海精神卫生中心临床上参与焦虑儿童父母干预项目的家庭。通过问卷收集母亲状态焦虑、家庭系统功能、父母顺应行为和孩子焦虑症状的数据。使用链式中介模型进行数据分析，评估母亲状态焦虑对孩子焦虑症状的直接和间接影响。

结果 研究结果表明，母亲的状态焦虑通过家庭系统功能和父母的顺应行为对孩子的焦虑症状产生显著影响。具体而言，家庭系统功能在母亲状态焦虑与父母顺应行为之间起到显著的中介作用，而父母顺应行为在母亲状态焦虑与孩子焦虑症状之间也起到显著的中介作用。此外，链式中介效应显著，表明母亲的状态焦虑通过这两个中介变量对孩子的焦虑症状产生重要影响。

结论 本研究发现，母亲的状态焦虑可以通过家庭系统功能和父母的顺应行为间接影响孩子的焦

虑症状。家庭系统功能和父母顺应行为在其中起到重要的中介作用。这一发现强调了家庭环境和父母行为在儿童焦虑干预中的重要性,建议未来的干预策略应关注家庭系统功能的改善和父母顺应行为的调整,以有效降低孩子的焦虑水平。

Prevalence of Dyslipidemia and Its Correlates in First-episode Drug-naive Major Depressive Disorder Patients with Comorbid Anxiety Symptoms: A Large-scale Cross-sectional Study

Hongying Zhou¹, Xiangyang Zhang²

1.Department of Medical Psychology, Shanghai General Hospital

2.Institute of Psychology, University of Chinese Academy of Sciences

Objective Studies before have found that individuals diagnosed with major depressive disorder (MDD) often experience issues with dyslipidemia. Also, people with MDD suffer from anxiety symptoms. However, few studies have looked into what factors contribute to dyslipidemia in individuals with both MDD and anxiety symptoms. Consequently, the objective of this study was to ascertain the prevalence of dyslipidemia and to identify potential correlates in individuals experiencing first-episode drug-naive (FEDN) MDD with anxiety symptoms (MDDA)

Methods A cumulative sample size of 1718 FEDN MDD patients was recruited. The Hamilton Depression Scale (HAMD), Hamilton Anxiety Scale (HAMA), and Positive and Negative Syndrome Scale (PANSS) positive subscale were the measures for the assessment of patients' mental states. Several metabolic panels were collected, including total cholesterol (TC), high-density lipoprotein cholesterol (HDL-C), triglycerides (TG), low-density lipoprotein cholesterol (LDL-C) and thyroid hormone levels

Results The reported incidence of dyslipidemia

in MDDA patients was 91.67%, which was significantly above that of MDD patients who did not suffer from anxiety symptoms (85.47%). In comparison with MDDA patients without dyslipidemia, those patients with dyslipidemia had higher body mass index (BMI), systolic blood pressure (SBP) and diastolic blood pressure (DBP), they also had increased levels on the HAMD, HAMA, and PANSS positive subscale. Additionally, greater levels of TC, HDL-C, TG, LDL-C, thyroid stimulating hormone (TSH), and fasting blood glucose (FBG) were found. Furthermore, the combination of HAMD, TSH, SBP and DBP distinguished MDDA patients with dyslipidemia from those without dyslipidemia

Conclusion Our results suggested an increased incidence of dyslipidemia among MDDA patients. Various blood indicators and hormone levels were independently associated with dyslipidemia in MDDA patients. Furthermore, the combination of these factors may differentiate between MDDA patients with and without dyslipidemia

The Correlation of Overweight/obesity and Suicide Attempts in Young First-episode and Drug-naïve Major Depressive Disorder Patients and The Effect of Overweight/obesity on Factors Associated with Suicide Attempts: A Cross-sectional Study

Quanfeng Zhu*

Affiliated Xiaoshan Hospital, Hangzhou Normal University

Objective In recent years, with the increase of various social pressures, patients with depression are gradually younger. Obesity has a high incidence in young depressed patients, while the correlation of obesity and suicide in young depressed patients is still inconclusive. The purpose of this study was to explore the correlation of overweight/obesity and suicide attempts

in young patients with major depressive disorder (MDD) and the related factors of suicide attempts in patients with/without overweight/obesity

Methods 17-item Hamilton Rating Scale for Depression (HAMD-17), 14-item Hamilton Anxiety Rating Scale (HAMA-14) and Positive and Negative Syndrome Scale (PANSS) positive subscale were used to assess depressive, anxiety and psychotic symptoms, respectively. After excluding samples with incomplete data, a total of 520 young first-episode and drug-naïve (FEDN) MDD patients were finally included in this study for analysis

Results Overweight/obesity was a separate factor influencing suicide attempts in young FEDN MDD patients ($p < 0.05$, $OR = 0.57$, $95\%CI: 0.34-0.95$). Overweight/obese patients who attempted suicide had higher HAMD, HAMA scores, higher levels of total cholesterol (TC), thyroid stimulating hormone (TSH), and higher prevalence of thyroid peroxidase antibody abnormalities (all p values < 0.01). While in patients without overweight/obesity, those who attempted suicide had higher HAMD, HAMA, PANSS positive subscale scores, higher levels of TSH, fasting blood glucose, TC, blood pressure, lower levels of high-density lipoprotein cholesterol, and higher prevalence of TSH abnormalities (all p values < 0.01)

Conclusion In young FEDN MDD patients, overweight/obesity had an impact on suicide attempts

Neurobiology of Obsessive-Compulsive Disorder From Genes To Circuits: Insights From Animal Models

Yingdan Zhang², Yingdan Zhang¹, Dongdong Shi², Dongdong Shi¹, Zhen Wang¹, Zhen Wang²

1.Shanghai Mental Health Center, Shanghai Jiao Tong University School of Medicine, Shanghai 200030, China.

2.Shanghai Key Laboratory of Psychotic Disorders, Shanghai Mental Health Center, Shanghai Jiao Tong

University School of Medicine, Shanghai 201108, China.

Obsessive-compulsive disorder (OCD) is a chronic, severe psychiatric disorder that has been ranked by the World Health Organization as one of the leading causes of illness-related disability, and first-line interventions are limited in efficacy and have side-effect issues. However, the exact pathophysiology underlying this complex, heterogeneous disorder remains unknown. This scenario is now rapidly changing due to the advancement of powerful technologies that can be used to verify the function of the specific gene and dissect the neural circuits underlying the neurobiology of OCD in rodents. Genetic and circuit-specific manipulation in rodents has provided important insights into the neurobiology of OCD by identifying the molecular, cellular, and circuit events that induce OCD-like behaviors. This review will highlight recent progress specifically toward classic genetic animal models and advanced neural circuit findings, which provide theoretical evidence for targeted intervention on specific molecular, cellular, and neural circuit events. Here, building on the fine-grained gene and circuit-level insights afforded by animal models, we gain a better understanding of specific circuits and cell pathology in OCD. Despite the limitations in using animal models to study psychiatric disorders, these findings in the evolutionally conserved gene and circuitry provide promising avenues for future therapeutic discovery and might help to guide future translational studies.

Sex Differences in Prevalence and Clinical Correlates of Subclinical Hypothyroidism in Chinese Patients with First-episode Untreated Major Depressive Disorder

Junqiang Cui¹, Fangfang ShangGuan², Xiang-Yang Zhang³

1.Children's Hospital and Women Health Center of

Shanxi, Taiyuan

2.Capital Normal University, Beijing

3.Institute of Psychology, Chinese Academy of Sciences, Beijing

Objective Previous studies showed sex differences in the prevalences of both major depressive disorder (MDD) and subclinical hypothyroidism (SCH). This study aimed to further compare the prevalence and correlates of moderate-to-severe SCH between male and female Chinese MDD patients

Methods A total of 1706 first-episode drug naïve Chinese patients with MDD were recruited. Depressive symptoms were assessed by the 17-item Hamilton Depression Rating Scale, psychotic symptoms by the Positive and Negative Syndrome Scale and anxiety symptoms by the Hamilton Anxiety Rating Scale. Serum thyroid stimulating hormone (TSH), free triiodothyronine (fT3) and free thyroxine (fT4) concentrations were measured by chemiluminescence immunoassay. Moderate-to-severe SCH was defined as serum TSH > 8 mIU/L with normal fT4

Results The prevalence of moderate-to-severe SCH was 10.4% in male patients and 15.1% in female patients ($\chi^2 = 7.22, p < 0.01$). In female patients, binary logistic regression showed that systolic blood pressure (SBP), suicide attempts and psychotic symptoms (all $p < 0.001$) were associated with moderate-to-severe SCH, and severe anxiety was marginal significantly associated with moderate-to-severe SCH ($p = 0.070$). In male patients, SBP and psychotic symptoms were associated with moderate-to-severe SCH (both $p < 0.001$), while suicide attempts and severe anxiety were not ($p > 0.05$)

Conclusion Our findings reveal a higher prevalence rate of moderate-to-severe SCH in female untreated first-episode MDD patients compared with males. Moreover, there is a positive association between suicide attempts and moderate-to-severe SCH only in female MDD patients

Prevalence and Clinical Correlates of Anxiety Symptoms in Chinese Never-treated First-episode Major Depressive Disorder Patients with Co-morbid Subclinical Hypothyroidism

Yujia Weng¹, Fangfang ShangGuan¹, Xiang-Yang Zhang²

1.Capital Normal University, Beijing

2.Institute of Psychology, Chinese Academy of Sciences, Beijing

Objective Previous studies have highlighted the relationship between subclinical hypothyroidism (SCH) and depression. Moreover, SCH patients are often accompanied by anxiety symptoms. Therefore, this study aimed to further investigate the prevalence and clinical correlates of severe anxiety symptoms in major depressive disorder (MDD) patients with co-morbid SCH

Methods A total of 1706 never-treated first episode MDD patients were recruited from a hospital-based psychiatric clinic. Blood specimens and thyroid hormone parameters were assessed. The Positive and Negative Syndrome Scale (PANSS) positive subscale, Hamilton Depression Scale (HAMD), Hamilton Anxiety Scale (HAMA) and Clinical Global Impression of Severity Scale (CGI-S) were used to assess psychotic symptoms, depressive symptoms, anxiety symptoms and overall illness severity

Results The prevalence of severe anxiety symptoms in MDD patients with co-morbid SCH was 37.4%, and suicide attempts and psychotic symptoms were associated with severe anxiety symptoms (both $p < 0.05$). The combination of suicide attempts and psychotic symptoms distinguished anxious and non-anxious MDD patients with co-morbid SCH (AUC: 0.91)

Conclusion Our findings suggest a high prevalence of severe anxiety symptoms in MDD patients with co-morbid SCH. For MDD patients with co-morbid SCH and severe anxiety, suicide attempts and psychotic symptoms may be critical for medication or intervention

Modeling Brain Network Dynamics in Depressive Rumination Using Energy Landscape Analysis

Su Shu Yumeng Ju*

The Second Xiangya Hospital of Central South University

Objective Rumination is a repetitive self-focused cognitive style that can persist in the overall course of depression. Previous neuroimaging studies have revealed the neural correlates of rumination associated with the aberrant functional connections among multiple large-scale brain networks. However, the temporal dynamics of these brain networks during rumination in depression remain unclear

Methods We collected rumination and distraction induction functional magnetic resonance imaging (fMRI) data from 42 remitted depression patients (35 major depressive disorders and 7 bipolar II disorders). The energy landscape analysis was applied to characterize the brain network dynamics, and the metrics of appearance frequency and transition frequency were defined and compared between rumination and distraction conditions

Results The same four brain states were identified in both two conditions, which consisted of complementary activation of specific network modules. During rumination, the appearance frequency of one dominant state (state 1) was decreased, while the frequencies of two less dominant states (states 3 and 4) were increased, and the transition frequencies between states 2/3 and states 3/4 were also increased compared to distraction. Moreover, such metrics values were associated with the functional segregation related to salience / default-mode / fronto-parietal network module

Conclusion Our study revealed the altered dynamic characteristics of brain states composed of network modules during active rumination, which provided new insights into the temporal dynamics of large-scale brain networks in depressive rumination

Prevalence and Clinical Correlates of Suicide Attempts in Young MDD Patients with Subclinical Hypothyroidism: A Large-scale Cross-sectional Study

Na Wang¹, Guoshuai Luo¹, Jing Long¹, Qianqian Wei¹, Xiangyang Zhang²

1. Institute of Mental Health, Tianjin Anding Hospital, Tianjin, China

2. Institute of Psychology, Chinese Academy of Sciences, Beijing, China

Objective Subclinical hypothyroidism (SCH) has been reported to be associated with depression; however, its role in suicide risk in young patients with major depressive disorder (MDD) remains unclear. This study was to explore suicide attempts in young MDD patients with SCH in a large sample of first episode drug naïve (FEDN) MDD patients, which has received little systemic investigation

Methods A total of 917 FEDN MDD outpatients aged 18-35 years were recruited. Socio-demographic, clinical data, and thyroid function parameters were collected. The Positive and Negative Syndrome Scale (PANSS) positive subscale, Hamilton Anxiety Rating Scale (HAMA), and Hamilton Depression Rating Scale (HAMD) were used to measure psychotic, anxiety, and depressive symptoms, respectively. The clinical global impression of severity scale (CGI-S) was used to assess the overall mental status of patients

Results Young MDD patients had a high SCH prevalence (56.8%). In young MDD patients with SCH, suicide attempts were associated with HAMA score, TSH, CGI score, and TPOAb. The combination of HAMA score, TSH, and CGI score differentiated suicide attempters from non-suicide attempters (AUC was 0.792) in young MDD patients. HAMD, HAMA, illness duration, TSH, and TPOAb were independently associated with the number of suicide attempts

Conclusion Our findings suggest an extremely

high prevalence of co-morbid SCH in young MDD patients and a high incidence of suicide attempts in young FEDN MDD patients with comorbid SCH. Several clinical characteristics and thyroid function indicators are independently associated with suicide attempts in young MDD patients with SCH

关键词: Major depressive disorder; subclinical hypothyroidism; young adults; suicide attempts; first episode

犬尿氨酸途径在抑郁症的神经生物学角色： 一项影像-代谢联合分析研究

鞠玉朦 欧雯雯 黄梅 陈文涛 廖梅 张丽 刘帮杉
柳进 李凌江 张燕*
中南大学湘雅二医院

目的 免疫炎症可能介导抑郁症患者焦虑及植物神经等症状，然而炎症在抑郁症患者这些症状中具体作用机制尚未明确。犬尿氨酸途径(Kynurenine pathway, KP)是脑内色氨酸(Tryptophan, TRP)代谢的重要生物学途径，该通路受多种促炎介质的调节，可能介导抑郁症患者核心神经环路结构和功能异常，参与焦虑、植物神经等症状。因此，本研究旨在基于影像-代谢联合分析技术，解析KP在抑郁症患者中的神经生物学机制。

方法 本研究收集了188名抑郁症患者临床数据、静息态功能磁共振数据以及犬尿氨酸途径。采用汉密尔顿抑郁量表(HAMD-17)和汉密尔顿焦虑量表(HAMA)评估患者抑郁症状。采用基于功能连接组建模(connectome-based predictive modeling, CPM)筛选与HAMD、HAMA及其因子分具有稳定与各相关的功能连接，即在留一交叉验证中每次迭代过程中稳定出现的功能连接。计算与症状正相关的功能连接(FC-POS)和负相关的功能连接(FC-NEG)。计算FC-POS和FC-NEG与犬尿氨酸代谢物浓度的关系。

结果 所有CPM筛选得到的功能连接中，发现HAMA总分相关的功能连接，以及抑郁中阻滞因子分相关的功能连接和犬尿氨酸途径代谢物显著相关。其中FC-POS-HAMA和3-羟基犬尿氨酸($r=0.205$, $p=0.007$)、喹啉酸($r=0.235$, $p=0.002$)、犬尿氨酸

($r=0.403$, $p<0.001$)均显著相关，FC-NEG-HAMA和3-羟基犬尿氨酸($r=-0.194$, $p=0.007$)、喹啉酸($r=-0.239$, $p=0.002$)、犬尿氨酸($r=-0.395$, $p<0.001$)均显著相关。而FC-POS-HAMD阻滞和3-羟基犬尿氨酸($r=-0.178$, $p=0.02$)、喹啉酸($r=-0.222$, $p=0.003$)、犬尿氨酸($r=0.371$, $p<0.001$)均显著相关，FC-NEG-HAMD阻滞和3-羟基犬尿氨酸($r=-0.160$, $p=0.007$)、喹啉酸($r=-0.221$, $p=0.004$)、犬尿氨酸($r=-0.341$, $p<0.001$)均显著相关。

结论 这些发现表明抑郁患者的焦虑症状以及阻滞相关的功能连接与犬尿氨酸途径代谢物相关，提示该通路可能介导抑郁症患者相关神经环路功能异常，参与焦虑及阻滞症状。这些结果为理解KP在抑郁症中的作用提供了新的视角，但KP在抑郁症患者症状中的具体作用机制仍需进一步研究，未来的研究可以深入探讨KP如何影响神经环路，以及如何通过调节KP来改善抑郁患者的焦虑和植物神经症状。

Prevalence and Clinical Correlates of Anxiety Symptoms in First-episode and Drug-naïve Major Depressive Disorder Patients with Dyslipidemia at Different Ages of Onset: A Large Cross-sectional Study

Guanjun Wang¹, Xiangyang Zhang², Yunxin Ji¹, Kuilai Wang¹, Xiaoe Lang³, Yanting Liu⁴

1.Department of Psychosomatic Medicine, Ningbo First Hospital Affiliated to Ningbo University

2.Department of Psychology, University of Chinese Academy of Sciences

3.Department of Psychiatry, First Hospital of Shanxi Medical University

4.Ningbo Huaci Hospital

Objective Major depressive disorder (MDD) patients often have different clinical manifestations at different age of onset. Anxiety symptoms are frequently seen in patients with MDD, and dyslipidemia is also prevalent in these populations. There is limited report-

ing on the frequency of anxiety symptoms and their associations with clinical factors in patients with abnormal lipid metabolism who have MDD

Methods Our study included 1718 first-episode untreated MDD outpatients aged 18-60 years, 1408 of whom had dyslipidemia. We collected basic information, clinically relevant data, and biochemical indicators from these patients. Anxiety, depression and psychiatric symptoms were evaluated by Hamilton Anxiety Scale (HAMA), Hamilton Depression Scale (HAMD) and Positive and Negative Syndrome Scale (PANSS) positive subscale, respectively

Results Anxiety symptoms were found in 57.8% of depressed outpatients with dyslipidemia, a rate significantly higher than in MDD patients with normal lipid levels. No statistical difference was observed in the prevalence of anxiety symptoms between the early adulthood onset (EAO) group and mid-adulthood onset (MAO) group. Anxiety symptoms were significantly correlated with both HAMD and PANSS scores, regardless of the age of onset. Thyroid-stimulating hormone (TSH), total cholesterol (TC) levels and suicide attempts were independently associated with anxiety symptoms in the EAO group, whereas fasting blood glucose (FBG) was independently related to anxiety symptoms in the MAO group

Conclusion Our research findings indicated that the age of MDD onset in patients with dyslipidemia did not impact the presence of anxiety symptom. The clinical factors linked to anxiety symptoms varied between the EAO and MAO groups, potentially aiding in the prediction of anxiety symptoms in the specific population

Prevalence and Risk Factors for Suicide Attempts in First-episode and Drug-naïve Middle-aged Major Depressive Disorder Patients with Impaired Fasting Glucose

Guanjun Wang¹, Yunxin Ji¹, Kuilai Wang¹, Xiaoe Lang³,

Xiangyang Zhang²

1.Department of Psychosomatic Medicine, Ningbo First Hospital Affiliated to Ningbo University

2.Department of Psychology, University of Chinese Academy of Sciences

3.First Hospital of Shanxi Medical University

Objective Impaired fasting glucose (IFG) is prevalent among the middle-aged population. Recent studies have found an association between suicide attempts and abnormal glucose metabolism in patients with major depressive disorder (MDD). However, there are fewer studies on suicide attempts in middle-aged MDD patients with comorbid IFG. The aim of this study was to investigate the prevalence and risk of suicide attempts in first-episode, untreated middle-aged MDD patients with IFG

Methods A total of 830 middle-aged (35-60 years) patients with first-episode and drug-naïve(FEDN) MDD were included in the study. Among them, 119 patients comorbid abnormal glucose metabolism. Socio-demographic and clinical information, as well as depression, anxiety, and psychotic symptoms, were collected and evaluated. Blood glucose levels, lipid levels, and serum thyroid function were also measured. The predictors of suicide attempt risk of middle-aged FEND MDD patients were identified by binary logistic regression

Results Prevalence of suicide attempts in middle-aged MDD patients with IFG was 38.66% (46/119). Significant differences in disease duration, anxiety symptoms, depressive symptoms, psychiatric symptoms, blood pressure, anti-thyroglobulin(TGAb),thyroid peroxidases antibody(TPOAb), thyroid stimulating hormone(TSH), and total cholesterol (TC) were found in patients who attempted suicide as compared to those who did not. Furthermore, Hamilton anxiety rating scale(HAMA) score, TGAb and disease duration were predictors of suicide attempts in middle-aged MDD patients with comorbid IFG

Conclusion This study showed a high prevalence of suicide attempts in middle-aged MDD patients with comorbid IFG, and we had further identified

HAMA, TGAb and disease duration as predictors of suicide attempts in MDD patients with IFG

关键词: Major depression disorder, Suicide attempts, Impaired fasting glucose, Anxiety, Thyroid antibodies, HAMA score

Prevalence and Correlates of Past-month Suicide Attempts Among Adolescents with Depressive Episodes

Dianying Liu¹, Wanglin Liu¹, Shaohua Liu¹, Yonghui Dang²

1. Ganzhou City Key Laboratory of Mental Health, The Third People's Hospital of Ganzhou City, Ganzhou, China

2. College of Medicine & Forensics, Xi'an Jiaotong University Health Science Center, Xi'an, China

Objective This study assessed the prevalence and correlates of past-month suicide attempts in adolescents with depressive episodes

Methods 801 patients (70% female, 11-18 years) in a psychiatric hospital completed self-report questionnaires and the Chinese MINI Suicide Scale upon admission for routine clinical monitoring. We analyzed demographic and clinical correlates of past-month suicide attempts using descriptive statistics, logistic regression, random forest, and ROC curve analyses

Results

41.82% (335/801) of patients reported past-month suicide attempts. Significant factors included gender (OR=1.56, 95%CI=1.09-2.25), depressive symptoms (OR=1.09, 95%CI=1.06-1.12), rumination (OR=1.02, 95%CI=1.00-1.03), and childhood maltreatment (OR=1.03, 95%CI=1.02-1.04). The ROC curve analysis showed an area of 0.774 (95% CI=0.742-0.806), effectively distinguishing patients with and without past-month suicide attempts.

Conclusion

The study confirmed a high incidence of past-month suicide attempts and validated the risk prediction

model's effectiveness in differentiating between adolescents with and without attempts. It underscores the urgent need for enhanced screening, prevention, and intervention strategies for high-risk adolescents in psychiatric settings.

关键词: Depressive episodes; Past-month suicide attempts; Adolescent; Risk factor

Association between Depressive Symptoms and Cognitive Impairment in Chinese Patients with Chronic Schizophrenia

Boxi Zhang¹, Xiang-Yang Zhang², Fangfang ShangGuan¹

1. Capital Normal University, Beijing

2. Institute of Psychology, Chinese Academy of Sciences, Beijing

Objective Schizophrenia patients frequently experience depressive symptoms and cognitive impairment. The objective of the present study was to explore the potential link between depressive symptoms and neurocognitive deficits in chronic schizophrenia patients

Methods Psychopathologic symptoms in patients with schizophrenia were assessed using the Positive and Negative Syndrome Scale (PANSS), depressive symptoms were assessed using the 24-item Hamilton Depression Rating Scale (HAMD-24), and neurocognitive function was assessed using the Repeatable Battery for the Assessment of Neuropsychological Status (RBANS)

Results 283 patients (44.85%) fulfilled the criteria for comorbid depressive symptoms. Further, patients with comorbid depressive symptoms had higher levels of PANSS general psychopathology, negative symptoms, positive symptoms and total score, but lower language index score compared to patients without depressive symptoms. The HAMD-24 total score showed a significant negative correlation with language and a significant positive correlation with all subscale and total

scores on the PANSS scale. In addition, multiple regression analysis identified that PANSS negative symptom score and HAMD-24 score were independently associated with language index

Conclusion Our findings suggest a high prevalence of depressive symptoms in patients with chronic schizophrenia, and depressive symptoms are associated with psychopathology, neurocognitive dysfunction and especially language impairment

关键词: Schizophrenia, depressive symptoms, neurocognitive function, RBANS

首发成人重度抑郁症患者不同发病年龄自杀企图与焦虑的相关性研究

路文文¹ 张向阳²

1.天津市安定医院

2.中国科学院

目的 自杀是全球卫生系统需要面临的巨大挑战,为了有效干预自杀,减少自杀对个人及社会的影响,本研究主要探讨首发成人重度抑郁症(MDD)患者不同发病年龄自杀企图与焦虑的相关性。

方法 对 1716 名首发成人重度抑郁患者采用横断面设计,以 45 岁为节点,分为早发抑郁障碍组(EAO)1256 例(73.2%)及晚发抑郁障碍组(LAO)460 例(26.8%),采用方差分析、非参数检验比较两组间的测量数据。采用卡方检验对数据进行人口统计学比较。采用协方差分析控制性别、婚姻状况和教育背景、病程对汉密尔顿抑郁量表(HAMD)、汉密尔顿焦虑量表(HAMA)、临床疗效总评量表(CGI)、阳性和阴性症状量表(PANSS)阳性症状评分的影响。采用 Logistic 回归分析,寻找与自杀企图独立相关的因素。采用斯皮尔曼相关系数探讨焦虑症状、抑郁症状和自杀企图之间是否存在中介作用。最后,采用交互效应回归分析,探讨 MDD 患者自杀企图与焦虑症状的关系是否存在差异。

结果 EAO 及 LAO 两组患者自杀企图差异无统计学意义($P>0.05$)。在 EAO 患者中,将差异因素进入 logistics 回归,显示 HAMA(OR=1.36),HAMD(OR=1.13),猜疑(OR=0.60),过氧化物酶抗体(TPOAb)(OR=1.00),低密度脂蛋白(LDL-C)

(OR=0.77),高密度脂蛋白(HDL-C)(OR=0.48),收缩压(OR=1.03)对自杀企图影响有统计学意义。在 LAO 患者中,同样将分析中具有差异的条目进入 Logistic 回归分析显示,HAMA(OR=1.22)对自杀企图的影响有统计学意义。在 EAO 组的中介模型结果显示,抑郁症状对自杀企图的影响系数显著性消失,CGI 起到了完全中介效应的作用。采用带有交互效应的逻辑回归模型结果显示,在成年早期发病的患者中,抑郁症状严重程度、焦虑症状严重程度其差异均有统计学意义($p<0.05$),存在主效应,但该模型的拟合 r^2 为 0.09,说明预测意义不大。在成年晚期发病的患者中,抑郁症状严重程度、焦虑症状严重程度和抑郁症状严重程度*焦虑症状严重程度差异均无统计学,不存在无交互左右。

结论 EAO 患者与 LAO 患者在有无自杀企图方面无差异。不同发病年龄的 MDD 患者,共病焦虑症状越严重,自杀企图的风险也就越高。除焦虑症状外,在 EAO 患者中,我们还发现了抑郁症状、猜疑、TPOAb、HDL-C 是自杀企图的显著影响因素。

Oxidative Stress Markers Predict Treatment Outcomes in Patients with Generalized Anxiety Disorder Treated with Selective Serotonin Reuptake Inhibitors

lijun cui Xinhua Shen*

Huzhou Third Municipal Hospital, the Affiliated Hospital of Huzhou University

Objective The etiology of generalized anxiety disorder (GAD) remains unknown; oxidative stress may potentially contribute to its pathogenesis. However, there is no published evidence concerning the potential influence of oxidative stress on antidepressant treatment outcomes. This study investigated the ability of oxidative stress markers to predict treatment outcomes in GAD patients treated by selective serotonin reuptake inhibitors (SSRIs)

Methods 101 GAD patients and 100 healthy controls (HCs) were included in this study. The 101

GAD patients were selected for treatment with escitalopram (n=52) or sertraline (n=49) for eight weeks. Hamilton Anxiety Rating Scale (HAM-A) assessments were conducted before and after treatment. The levels of eight oxidative stress makers, malondialdehyde (MDA), lipid hydroperoxides (LPO), superoxide dismutase (SOD), glutathione peroxidase (GSH-Px), catalase (CAT), cortisol, high-density lipoprotein (HDL), and nitric oxide (NO) were measured using enzyme-linked immunosorbent assays (ELISA) before and after SSRIs treatment in GAD patients and at the time of HCs enrollment

Results The serum levels of MDA, cortisol, and LPO in GAD patients were higher than in HCs (all $p < 0.001$), while SOD, GSH-Px, and CAT were lower than in HCs (all $p < 0.001$). The baseline MDA, LPO, NO, and cortisol levels were positively correlated with anxiety severity, while GSH-Px was negatively correlated. After eight weeks of SSRI treatment, the GSH-Px levels increased, and MDA and LPO decreased (all $p < 0.05$). Alterations in the levels of MDA and LPO co-varied with changes in anxiety measures (all $p < 0.05$). The receiver operating characteristic (ROC) area of baseline MDA levels in predicting SSRIs endpoint treatment response was 0.804 ($p < 0.05$)

Conclusion The pathogenesis of GAD may involve oxidative stress. Moreover, serum MDA levels may predict treatment response to SSRIs. However, more research is warranted to confirm these findings

Comparison of The Prevalence of and Factors Associated with Disorders of Glucolipid Metabolism in Young and Middle-aged Patients with First Episode Drug Naïve Major Depressive Disorder

Xiuli Song¹, Xiangyang Zhang², Xiaoran Liu¹, Tongyu Lv¹

1.Yantai Affiliated Hospital of Binzhou Medical University

2.Chinese Academy of Sciences

Background Few studies have examined the prevalence and risk factors for glucolipid metabolism disorders (GLMD) in MDD patients. The aim of this study was to compare the prevalence of and risk factors of GLMD in young versus middle-aged patients with first episode drug naïve (FEDN) MDD, which has not been reported yet

Methods 1718 consecutive MDD outpatients aged between 18-60 years were recruited. Hamilton Depression Scale (HAMD), Hamilton Anxiety Scale (HAMA), Positive and Negative Syndrome Scale (PANSS) positive subscale, and Clinical Global Impression Severity Scale (CGI-S) were used to assess the clinical symptoms. In addition, fasting blood glucose (FBG) and lipid levels were measured

Results The prevalence of GLMD in all MDD patients, young and middle-aged MDD patients was 86.9%, 87.0% and 86.5%, respectively. In both young and middle-aged MDD patients, the HAMD and CGI-S scores, FBG, total cholesterol (TC), triglycerides (TG), and low-density lipoprotein cholesterol (LDL-C) levels were higher but the high-density lipoprotein cholesterol (HDL-C) levels were lower in those with than without GLMD (all $p < 0.05$). Further logistic regression analysis showed that FBG, TC, and TG were independently associated with GLMD in young MDD patients, whereas TG and LDL-C levels were associated with GLMD in middle-aged MDD patients

Limitations: The main limitations are cross-sectional design and inability to control selection bias.

Conclusion The prevalence of GLMD in young MDD patients was similar to that in middle-aged MDD patients. Factors associated with GLMD differed in young and middle-aged patients with FEND MDD.

Effects of Childhood Trauma on Executive Functioning in Adolescents with Major Depressive Disorder Suffering From Non-suicidal Self-injury: A Cross-sectional Study

Xiuli Song¹, Xiangyang Zhang², Xiaoran Liu¹, Tongyu Lv¹, Zhou Yongjie³

1. Yantai Affiliated Hospital of Binzhou Medical University

2. Chinese Academy of Sciences

3. Shenzhen Kangning Hospital

Objective Childhood trauma is a risk factor for a variety of psychological and behavioral problems, but there is little research on how executive functioning is altered in adolescent major depressive disorder (MDD) patients with non-suicidal self-injury (NSSI) who have experienced childhood trauma. The purpose of this study was to examine the relationship between childhood trauma and executive functioning in adolescent MDD patients with NSSI and the factors that may influence executive functioning.

Methods This cross-sectional study recruited 1690 adolescent MDD patients with NSSI. Depression, anxiety symptoms, and childhood trauma were assessed by the Patient Health Questionnaire-9 (PHQ-9), the Generalized Anxiety Disorder Scale-7 (GAD-7), and the Chinese version of the Childhood Trauma Questionnaire (CTQ). Executive functioning was assessed by the Wisconsin Card Sorting Test (WCST).

Results Overall, 1472 patients (87.10%) had at least one type of childhood trauma. Among adolescent MDD patients with NSSI, those with childhood trauma had significantly lower perseverative errors and number of categories completed on the WCST test, but higher nonperseverative errors and learning to learn than those without childhood trauma. Furthermore, executive functioning in adolescent MDD patients with NSSI who had childhood trauma was correlated with physical neglect, emotional neglect, and sexual abuse.

Conclusion Our results suggest that childhood trauma is extremely common in adolescent MDD patients with NSSI and that childhood trauma is associated

with several demographic and clinical characteristics as well as executive functioning in these adolescent MDD patients with NSSI.

奖赏正波在儿童青少年精神障碍中的研究进展

姚珂珂 董强利 叶兰仙*

兰州大学第二临床医学院

目的 青春期是个体奖赏回路发育的关键时期,其特征是神经奖赏敏感性增强。奖赏正波(reward positivity, RewP)作为反映奖赏处理的神经电生理指标之一,与多种儿童青少年精神障碍有关。通过对其进行综述研究,以期儿童青少年精神障碍发病机制的基础研究提供参考,有助于更有效地识别儿童青少年精神病理学的危险因素,为儿童青少年精神障碍的临床诊治寻找新的靶标。

方法 本文综述了近几年 RewP 在儿童青少年不同精神障碍中的异常变化,及 RewP 与快感缺乏、压力性生活事件及睡眠障碍等不同因素相互作用的研究结果。

结果 大量横向研究表明 RewP 异常与儿童青少年的焦虑障碍、抑郁障碍等精神障碍密切相关。此外,多个纵向研究证明快感缺乏、压力性生活事件及睡眠障碍等因素会影响与奖赏相关的大脑活动,可能会增加儿童青少年不同精神病理学的风险。除此之外,这些因素与 RewP 相互作用,可以预测青春期不同精神障碍的程度。

结论 奖励处理的个体差异与儿童青少年各种精神疾病的发生和维持有关。其中, RewP 与多种儿童青少年精神障碍密切相关,包括抑郁障碍、焦虑障碍及自杀等。异常的 RewP 可能是这些精神障碍发展风险的神经生物学标志物。

Clinical Characteristics, Metabolic Parameters, and Determinants of Psychotic Manifestations in Anxiety-related Depressive Disorder Patients: Extensive Cohort Examination in China

Qianjin Wang¹, Xiangyang Zhang²

1.Department of Psychiatry, National Clinical Research Center for Mental Disorders, and National Center for Mental Disorders, The Second Xiangya Hospital of Central South University, Changsha 410011, Hunan, China

2.CAS Key Laboratory of Mental Health, Institute of Psychology, Chinese Academy of Sciences, Beijing, China

Background Psychotic manifestations (PM) often emerge in individuals diagnosed with anxiety-related depressive disorder (ARDD), yet research into the predictors of PM within this demographic remains sparse. This investigation seeks to determine the prevalence and associated factors of PM, focusing on a considerable cohort of first-onset and treatment-naïve (FOTN) ARDD patients

Methods Involving a cohort of 697 FOTN patients newly diagnosed with ARDD. Clinical symptoms were evaluated using the Positive and Negative Syndrome Scale positive subscale, the Hamilton Depression Rating Scale (HAMD), and the Hamilton Anxiety Rating Scale (HAMA), with systematic collection of biochemical markers

Results The findings revealed that PM prevalence in ARDD patients was 3.45-fold higher (23.10%) than in those without ARDD. Significant predictors of PS in this group included levels of Thyroid Stimulating Hormone (TSH), total cholesterol (TC), triglycerides (TG), as well as scores on the HAMD and HAMA. Notably, an Area Under the Curve (AUC) of 0.88 efficiently discriminated between ARDD patients with and without PM

Conclusion The results underscore the relationship between PM in ARDD patients and factors such as anxiety, depression, TSH, TC, and TG levels. Effective

treatment of PM in ARDD patients should therefore encompass both clinical and metabolic considerations to optimize outcomes.

Clinical Correlates and Thyroid Hormones of Metabolic Syndrome in First-episode and Drug-naïve Major Depressive Disorder Outpatients with and without Hyperglycemia: A Comprehensive Cross-sectional Study

Siyang Zheng², Zhiyang Wang², Limin Yang¹, Xiangyang Zhang³

1.Dalian University

2.Dalian Medical University

3.University of Chinese Academy of Sciences

Objective Hyperglycemia and metabolic syndrome (MetS) are common in patients with major depressive disorder (MDD). This study aimed to explore the prevalence and clinical factors of MetS in first-episode and drug-naïve MDD (FEDND) patients with and without hyperglycemia.

Methods total of 1,718 FEDND patients' symptoms were assessed using the Hamilton Depression Scale (HAMD), Hamilton Anxiety Scale (HAMA), and positive subscale of the Positive and Negative Syndrome Scale (PANSS). Blood glucose levels, metabolic index, and thyroid hormones were measured during fasting.

Results The prevalence of MetS in FEDND patients with hyperglycemia was 35.67 times higher than in FEDND patients without hyperglycemia. FEDND patients with MetS were older, had later age of onset, and were predominantly married than those without MetS ($p < 0.05$). Among FEDND patients without hyperglycemia, suicide attempts, severe anxiety, HAMD, HAMA, PANSS subscale scores, thyroid stimulating hormone, antithyroglobulin, and total cholesterol levels were all higher in patients with MetS than those without MetS

(all $p < 0.05$). In FEDND patients without hyperglycemia, the combination of age and TgAb distinguished those patients with and without MetS.

Conclusion Our results suggest a high prevalence of MetS in FEDND patients with hyperglycemia. Several clinical variables and thyroid function-related hormones impact MetS in patients with FEDND.

Associated Factors and Network Analysis of Fertility Anxiety: A Cross-Sectional Study of Chinese Adults

Chuanxin Liu Yan Liu Yi Zheng*

Jining Medical University, Jining, Shandong, China

Objective Demographic change and ageing as a result of declining fertility has become a pressing issue globally. Especially in China, fertility anxiety has become a problem that cannot be ignored as the pressure of modern society increases. This study examined the influencing factors and interactions of fertility anxiety among Chinese adult residents

Methods A nationwide survey involving 30,054 participants was conducted in China from 20 June to 31 August 2023 to assess fertility anxiety using a subjective scale (0~100). We used Random Forest Classification to select potential correlates based on a socio-ecological model. We also conducted univariate analyses and multivariate stepwise regression analyses to explore factors associated with fertility anxiety. Network analysis was used to explore the network structure of fertility anxiety and related factors

Results The results of multivariate stepwise regression analyses showed that fertility anxiety was significantly correlated with several factors, including depression ($\beta = 0.04$, 95% CI = 0.02~0.06), body intention ($\beta = 0.09$, 95% CI = 0.08~0.10), anxiety ($\beta = 0.04$, 95% CI = 0.02~0.06), and mediated motivation ($\beta = 0.08$, 95% CI = 0.07 to 0.09) and public service motivation ($\beta =$

0.06, 95% CI = 0.05~0.08), family health ($\beta = -0.10$, 95% CI = -0.11~ -0.09), psychological resilience ($\beta = -0.03$, 95% CI = -0.05~ -0.02) and social support ($\beta = -0.05$, 95% CI = -0.06 ~ -0.03). In addition, females ($\beta = 0.09$, 95% CI = 0.07~0.12), married ($\beta = 0.05$, 95% CI = 0.02~0.09), undergraduate/college degree ($\beta = 0.118$, 95% CI = 0.09~0.15), and master's/doctoral degree ($\beta = 0.168$, 95% CI = 0.11~0.23) were more likely to have fertility Anxiety. 'Depression' and 'body intention' showed the highest node strengths in the network, while 'anxiety' and 'mediated motivation' showed the highest node strengths. 'anxiety' and 'media motivation' showed the highest predictability

Conclusion Based on the theoretical framework of the socio-ecological model, this study revealed the specific correlates and interactions of social and personal factors that shape fertility anxiety among adult Chinese residents. These findings have important implications for public health interventions targeting fertility anxiety and may help reduce the burden associated with fertility anxiety

关键词: Fertility anxiety, Network analysis, Socio-ecological model

EEG Microstates in Anxiety Disorders

Danfeng Yuan Xiangyun Yang Lijuan Yang Fang He Zhanjiang Li*

Beijing Anding Hospital Capital Medical University

Objective Anxiety disorders are a group of prevalent and highly disabling mental disorders and are often associated with cognitive dysfunction. EEG microstates (EEG-ms) refer to electric potential topographies recorded in a multichannel array across the scalp, that remain quasi-stable for 60-120ms before rapidly transitioning to a different microstate. The EEG-ms have gained increasing attention for their association with neuropsychiatric disorders, such as depression disorders, Schizophrenia, and bipolar disorders. However, there are relatively few studies on the microstate of anxiety disorders. Therefore, the objective of this study was

to explore the microstate differences between patients with anxiety disorders and healthy controls and whether there is a possible association between the EEG microstate pattern and anxiety symptoms

Methods A total of 58 patients with anxiety disorders and 35 healthy controls were recruited in this study. Brain activities during the eyes-closed state were recorded using 64-channel electroencephalography, and the patients' microstates were clustered into four maps according to their topography (labeled A, B, C, and D). The microstate analysis was conducted based on the CARTOOL. Microstate properties (the mean duration, occurrence frequency, and Time Coverage) were compared between the two groups with the independent samples t-test. Spearman correlation coefficients were calculated to identify the relationships between the anxiety symptoms and microstate parameters

[Result] The mean duration, occurrence, and time coverage of microstate C decreased significantly in patients with anxiety disorders compared with healthy controls. In addition, a significant increase was found in the mean duration, occurrence, and time coverage of microstate D in patients with anxiety disorders compared with healthy controls. No significant difference was found in the microstate parameters of A and B microstate classes.

Conclusion The EEG microstate analysis revealed significant differences in most of the parameters (mean duration, time coverage, and occurrence) of C and D microstate classes in patients with anxiety disorders compared with healthy controls. As the microstates A, B, C and D indicate a correlation with auditory, vision, saliency and frontal-apical network respectively, these results suggested a potential cognitive impairment in patients with anxiety disorders

关键词: EEG Microstates, Anxiety disorders, cognitive impairment

Induction of Anxiety-Like Phenotypes by Knockdown of Cannabinoid Type-1 Receptors in The Amygdala of Marmosets

Lixia Gao^{1,2}

1.Zhejiang University

2.Second Affiliated Hospital, School of Medicine, Zhejiang University

Objective The amygdala is an important hub for regulating emotions and is involved in the pathophysiology of many mental diseases, such as depression and anxiety. Meanwhile, the endocannabinoid system plays a crucial role in regulating emotions and mainly functions through the cannabinoid type-1 receptor (CB1R), which is strongly expressed in the amygdala of non-human primates (NHPs). However, it remains largely unknown how the CB1Rs in the amygdala of NHPs regulate mental diseases

Methods Using in vivo gene editing, Sanger sequencing, in situ hybridization, fluorescence staining, behavioral testing, and biochemical measurement, we studied the function of CB1Rs in the amygdala of adult marmosets

Results We found that AAV-mediated delivery of the CRISPR/Cas9 system successfully knocked down CB1Rs in the amygdala of adult marmosets and this induced anxiety-like behaviors. These symptoms included disrupted night sleep, agitated psychomotor activity in a new environment, decreased desire for vocal communication, and increased plasma cortisol levels

Conclusion These results indicate that the knockdown of CB1Rs in the amygdala induces anxiety-like behaviors in marmosets, and this may be the mechanism underlying the regulation of anxiety by CB1Rs in the amygdala of NHPs. This improves our understanding of the eCB system in the amygdala of NHPs and advances the clinical application of eCB for diagnosing and treating of psychiatric disorders, such as anxiety

海马 CA2 区域神经元的胞外 4-O-硫酸软骨素修饰介导焦虑和社交记忆

黄慧倩*

浙江大学医学院附属第二医院

目的 神经元胞外网状基质 (PNN) 高度富集硫酸软骨素蛋白多糖 (CSPG), 是一系列用硫酸软骨素 (CS) 多糖修饰的核心蛋白。其中 4-O-硫酸基序 CS-A 的表达增加与 PNN 的成熟和成长关键期的可塑性时间窗相一致。成年后, CS-A 基序占大脑中总 CS 的近 90%, 且被发现与衰老和突触可塑性的降低有关。因此, 软骨素 4-O-硫酸化传统上被视为抑制神经可塑性的“分子制动器”。然而, 它在成年大脑中 PNN 的形成和大脑中的功能尚未得到直接研究。因此, 解析 PNN 结构中 CS-4-O 硫酸软骨素修饰的特定功能, 将可能为神经元的功能连接和可能疾病的识别和治疗提供新的靶点。

方法 该研究将糖化学和神经生物学相结合, 通过构建突变小鼠, 并结合病毒敲降、动物行为学、免疫组化、细胞生物学, 研究了 4-O-硫酸软骨素 (CS) 多糖调控小鼠海马神经元胞外网络 (PNN) 和突触可塑性的关键机制, 并探索了该修饰位点对小鼠脑功能和行为学的影响。

结果 该研究首先通过构建神经元特异性的 CS-4-O 硫酸转移酶突变小鼠, 实现了小鼠脑内 CS 4-O-硫酸化的完全缺失。突变小鼠海马 CA2 区域的 PNN 密度显著增高, 并且伴随了神经元兴奋性与抑制性突触传递的失衡, CREB 激活减少, 因而小鼠的焦虑水平加剧, 出现社交记忆功能障碍。在小鼠成年阶段通过选择性消融 CA2 区域的 CS 4-O-硫酸化, 可以再现 PNN 的密度上调、CREB 活性和社交记忆的损伤。值得注意的是, 过量 PNN 的酶切降低了小鼠的焦虑水平并恢复了社交记忆, 而 CS 4-O-硫酸化水平的化学操作可逆地调节了海马神经元周围的 PNN 密度以及兴奋性和抑制性突触的平衡。

结论 这些发现揭示了 CS 4-O-硫酸化修饰在成人脑可塑性、社交记忆和焦虑调节中的关键作用, 并表明靶向 CS 4-O-硫酸化可能是解决与社交认知功能障碍相关的神经精神疾病的一种策略。

重复经颅磁刺激治疗广泛性焦虑障碍的研究现状

张焯 覃鑫 周弘韵 刘玟汐 李雷俊 王继辉 陶炯*
中山大学附属第三医院

目的 广泛性焦虑障碍 (GAD) 是一种常见的精神障碍。大多患者存在认知功能的下降, 如执行能力、注意力转移、抑制控制、工作记忆等, 认知功能紊乱是焦虑障碍维持和发展的因素。目前常规的治疗方法有药物治疗、心理治疗, 但仍有约 50% 患者对此无应答, 探索新的治疗方法如重复经颅磁刺激 (rTMS) 具有重大的临床意义。本文旨在对 rTMS 治疗广泛性焦虑障碍的现状进行系统性回顾, 探讨其疗效、最佳刺激部位及参数, 并为寻求更有效且个性化的辅助治疗方法提供新思路。

方法 本文在万方、中国知网、PubMed 等搜索引擎中, 以“广泛性焦虑障碍、焦虑障碍、重复经颅磁刺激、认知功能、anxiety、rTMS”等关键词进行文献检索, 最终选择 62 篇文献进行综述。回顾了 rTMS 治疗 GAD 的神经生物学机制、作用机制、不同频率和部位的治疗效果、对认知功能的影响、评估工具以及安全性评价。

结果 rTMS 作为一种无创、非侵入性的治疗手段, 通过改变大脑区域的电活动来调节神经元功能, 对 GAD 患者有一定的积极效应。低频和高频 rTMS 均可改善 GAD 患者的焦虑症状, 但最佳刺激部位和频率尚不明确。rTMS 联合药物治疗可改善患者的认知功能, 但具体机制需要进一步研究。评估工具主要依赖量表, 未来可能需要更多客观指标。rTMS 的安全性较高, 但需注意癫痫发作的风险。

结论 rTMS 对 GAD 具有潜在的治疗效果, 但目前疗效、最佳刺激位置和频率尚无一致性结论。未来研究需开展大样本、严格的随机双盲对照、多中心对照研究以进一步证实 rTMS 的有效性, 并探索其作用机制和生物学效应, 以实现精准医学治疗。

The Chinese Versions of The Childhood Perceived Poverty and Wealth Questionnaire (C-CPPWQ) and The Childhood Perceived Unpredictability Questionnaire (C-CPUQ): Evaluation of Dimensionality,

Validity, and Measurement Invariance with Bifactor Model and Latent Profile Analysis

Yinqing Fan Chenyu Yuan Chaoyi Wu Wang Zhen*
Shanghai Mental Health Center

Objective The Chinese versions of the Childhood Perceived Poverty and Wealth Questionnaire (C-CPPWQ) and the Childhood Perceived Unpredictability Questionnaire (C-CPUQ) have shown promising psychometric properties for measuring childhood subjective socioeconomic status (harshness) and unpredictability among university students. However, further validation in community samples is still needed. This study aims to examine the dimensionality, measurement invariance (across gender), reliability, and validity of the C-CPPWQ and C-CPUQ in a large community sample

Methods Data from 4,102 adults were analyzed to confirm the structures of the C-CPPWQ and C-CPUQ. Two bifactor models were established: one for the C-CPPWQ with one general and two specific factors, and one for the C-CPUQ with one general and three specific factors. Latent profile analysis (LPA) was used to identify subgroups based on the C-CPPWQ and C-CPUQ dimensions, allowing exploration of subgroup differences on concurrent validity measures

Results The bifactor models for both the C-CPPWQ and C-CPUQ fit well. Further testing confirmed the unidimensionality and measurement invariance of both questionnaires, demonstrating their suitability as unidimensional scales for total score calculation. In gender-based samples, the two-factor structure of the C-CPPWQ and the three-factor structure of the C-CPUQ met the requirements for configural, metric, scalar, and error variance invariance ($|\Delta CFI| < 0.01$, $|\Delta TLI| < 0.01$). LPA revealed six subgroups for each questionnaire, with distinct psychological characteristics and emotional symptom risks across subgroups

Conclusion The findings provide strong evidence for the validity of the C-CPPWQ and C-CPUQ in assessing the psychological impact of childhood poverty and unpredictability across the lifespan. Both overall and factor-specific scores of the C-CPPWQ and C-CPUQ offer valuable insights for studies on childhood

adversity

关键词: the Childhood Perceived Poverty and Wealth Questionnaire, the Childhood Perceived Unpredictability Questionnaire, validity, measurement invariance, latent profile analysis

嗅觉评估在焦虑障碍患者中的临床研究

张凤晓 王仕俊*
吉林大学第一医院

目的 研究表明,嗅觉与情绪,如焦虑、抑郁等相关。正常情况下,气味等嗅觉信息从嗅球传递到初级嗅觉皮层,包括内嗅皮质区等;再进一步投射到次级嗅觉皮层等,而情绪管理的神经环路可能与嗅觉感知功能拥有共同神经环路,两者之间有着紧密联系。本文主要通过研究嗅觉识别、内嗅皮质体积与焦虑患者的关系,探讨嗅觉评估在识别焦虑患者的作用。因此,我们寻求客观的检查手段为焦虑患者的诊断及治疗提供新思路。

方法 取 2023 年就诊于门诊符合入组标准的焦虑患者 35 例(注:14≤患者汉密尔顿焦虑量表;未曾服用过抗焦虑药物),与之相匹配的正常对照组 33 例。首先,需要收集入组人群的一般临床资料,再者给予应用宾夕法尼亚大学嗅觉识别测验(University of Pennsylvania Smell Identification Test, UPSIT)和头磁共振(Magnetic Resonance Imaging, MRI)影像中内嗅区皮质(Entorhinal Cortex, EC)体积(mm³)主观或客观评估嗅觉功能。应用 ITK-SNAP 3.8 软件在 sMRI 序列中冠状位手工逐层勾画双侧 EC 作为感兴趣区域,自动计算出相应的体积。分析嗅觉评估在两组的差别,以及嗅觉评估识别焦虑的效能。使用 SPSS 26.0 软件统计数据与分析。

结果 (1)正常对照组与焦虑障碍组的 UPSIT 评分均值分别为(19.61±5.83)和(15.25±6.51)($P < 0.05$),即正常对照组>焦虑障碍组。(2)正常对照组与焦虑障碍组的 EC 体积均值分别为(1709.42±421.72)和(1598.67±657.32)($P < 0.05$),即正常对照组>焦虑障碍组。(3)两组间 UPSIT 评分与 EC 体积相关,且呈正相关($r = 0.55$; $P < 0.05$),即 EC 体积随 UPSIT 评分升高而增加;(4) UPSIT

评分、EC 体积及 UPSIT 评分联合 EC 体积对区分曲线下, 敏感性与特异性分别为: 90.2%与 44.2%、89.3%与 51.2%、84.9%与 56.7%。

结论 (1) UPSIT、EC 在焦虑障碍患者中可出现相应的评分或体积的下降, 焦虑患者的嗅觉功能有所降低。(2) EC 体积、UPSIT 联合 EC 体积可能更好的用于焦虑障碍的诊断。

关键词: 嗅觉、焦虑障碍

并对其他精神障碍有潜在的疗效, 如物质使用障碍和创伤后应激障碍。

关键词: 致幻剂; 裸盖菇素; 死藤水; LSD; MDMA; 精神障碍; 安全性; meta 分析

致幻剂治疗精神障碍的有效性和安全性: 一项系统综述和荟萃分析

姚远^{1,2} 郭丹^{1,2} 韩盈^{1,2}

1. 北京大学中国药物依赖性研究所

2. 北京大学医学部基础医学院神经生物学系

目的 研究的目的是通过定量分析评估致幻剂 (LSD、死藤水、裸盖菇素和 MDMA) 对情感障碍 (物质使用障碍[SUD]和绝症患者的抑郁、焦虑、负面情绪) 和其他精神障碍 (如酒精使用障碍和创伤后应激障碍) 的潜在疗效, 并系统评估其安全性。

方法 检索了截止至 2024 年 2 月 Web of science、Cochrane、EBSCO 和 PubMed 数据库中, 关于裸盖菇素、死藤水、LSD、MDMA 的研究。比较了实验组和安慰剂对照组在治疗和随访期间的效应量 Hedges' g 及其 95% 置信区间。使用 I² 统计量对异质性进行量化, 对不同致幻剂、疾病类型、疗效持续时间和疗效指数进行亚组分析。

结果 结果显示, 裸盖菇素治疗情绪障碍的文章最多(N = 28), 其次是死藤水(N = 7)和 LSD (N = 6)。总体而言, 致幻剂对抑郁、焦虑等精神障碍有治疗作用。具体来说, 在四种致幻剂中, 裸盖菇素 (Hedges' g = -1.49, 95% CI[-1.67, -1.30]) 的治疗效果最强, 其次是死藤水(Hedges' g = -1.34, 95% CI[-1.86, -0.82])、MDMA (Hedges' g = -0.83, 95% CI[-1.33, -0.32])和 LSD (Hedges' g = -0.65, 95% CI[-1.03, -0.27])。少量证据也支持致幻剂改善烟瘾、饮食失调、睡眠失调、边缘型人格障碍、强迫症和身体畸形障碍。致幻剂最常见的不良反应是头痛。近三分之一的文章显示没有参与者报告有持续的不良反应。

结论 总体结果表明致幻剂可以改善消极情绪,

刘健* 欧丹谊

广州医科大学附属脑科医院

目的 为了提高医护人员对口腔衰弱与阿尔兹海默病的认识度,我们强调了这两种疾病之间的关联性和相互影响。我们建议在临床实践中,医护人员应关注老年人的口腔健康状况,及时发现并干预口腔衰弱问题。同时,对于已经患有阿尔兹海默病的老年人,我们也应关注其口腔衰弱状况,以制定更为全面和有效的治疗方案。

方法 本研究通过文献阅读,在中国知网、万方, Pubmed、Web Of Science 数据库等简要回顾老年人口腔衰弱与阿尔兹海默病的概述、评估工具、相关关系。

结果 结果发现,我们发现口腔衰弱与阿尔兹海默病之间存在密切的关联。口腔衰弱可能导致老年人咀嚼、吞咽和消化功能下降,进而影响营养吸收和全身健康状况。同时,口腔衰弱还可能引发口腔感染、炎症等问题,这些因素可能进一步加剧阿尔兹海默病的发展。

结论 本研究通过回顾老年人口腔衰弱与阿尔兹海默病的概述、评估工具和相关关系,提高了医护人员对这两种疾病的认识度,并为制定针对性的防治策略提供了参考。未来,我们期待更多的研究能够深入探讨口腔衰弱与阿尔兹海默病之间的复杂关系,为改善老年人的健康和生活方式提供新的思路和方法。早期发现和治疗口腔衰弱可能有助于预防阿尔兹海默病。针对口腔衰弱的预防策略应包括维持和改善口腔功能和营养状况,以减少衰弱和口腔功能障碍的负担。

社区失能老人孤独状况及影响因素研究

曹效亲 史艳茹* 李琦

空军军医大学第一附属医院心身科

目的 了解社区失能老人的孤独现状及其影响因素,为提高失能老人心理健康水平和生活质量提供依据。

方法 便利抽样选取西安市 5 家社区 325 位失能老人为研究对象,采用一般资料调查表、UCLA 孤独感量表简化版(the short-form of the UCLA Loneliness Scale, ULS-8)、Herth 希望量表(Herth Hope Index, HHI)、罗森伯格自尊量表(Rosenberg Self-Esteem Scale, SES)和社会支持量表(Social Support Rate Scale, SSRS)进行问卷调查。使用 SPSS18.0 进行数据统计分析,运用 Pearson 相关进行失能老人孤独感、希望水平、自尊水平及社会支持水平的相关性分析,运用多元线性回归分析失能老人孤独感的影响因素。

结果 ULS-8 得分(16.41 ± 5.44)分, HHI 得分(34.09 ± 6.66)分, SES 得分(29.58 ± 5.32)分, SSRS 得分(35.95 ± 8.15)分。Pearson 相关分析结果显示孤独感与希望水平($r=-0.694, P<0.001$)、自尊水平($r=-0.612, P<0.001$)、社会支持水平($r=-0.543, P<0.001$)均呈显著负相关。多元线性回归结果显示婚姻状况、与子女关系、对自身健康满意度、与他人交往的频率、希望水平、自尊水平、社会支持水平是影响社区失能老人孤独感得分的主要因素。

结论 影响社区失能老人孤独水平的因素众多,应加强对非在婚失能老人心理状况的关注,打造适老化小区,提高老人社会参与,进一步强化家庭及社会支持体系的构建,加强老年心理护理,降低失能老人的孤独感,提高生命质量。

MCI 老年人群午睡习惯与夜间睡眠质量、认知功能及血清指标的关系

蔡菡*

芜湖市第四人民医院

目的 探讨轻度认知功能障碍(MCI)老年人群午睡习惯与夜间睡眠质量、认知功能、血清维生素 D 水平及炎症因子水平的相关性,为临床干预提供理论基础。

方法 2023年2月-2024年2月在社区老人展开筛查, 入组372例MCI受试者, 抽取空腹静脉血测量维生素D、IL-6水平, 其中午睡组210人和非午睡组162人, 比较两组一般情况、简易智力状态检查量表(MMSE)、蒙特利尔认知评估量表(MoCA)、匹兹堡睡眠指数(PSQI)分数及维生素D、炎症因子水平的差异。

结果 与非午睡组相比, 午睡组MMSE的即刻记忆, 回忆, 阅读, 表达能力, 总分, MoCA语言, 抽象, 定向力, 总分明显增高(均 $P < 0.05$)。午睡组PQSI入睡时间、睡眠障碍、日间功能障碍、总分明显降低($P < 0.05$)。午睡组维生素D3水平、维生素D总水平、IL-6水平明显升高。午睡与吸烟、饮牛奶、食用鱼类等生活习惯及PSQI量表睡眠时长、日间功能障碍存在回归关系($P < 0.05$)。PSQI量表总分、睡眠质量、入睡时间、睡眠时长、睡眠效率、睡眠障碍等与维生素D水平及炎症因子IL-6水平存在回归关系($P < 0.05$)。

结论 MCI午睡人群较非午睡者有更好的认知功能和夜间睡眠质量, 夜间睡眠质量与血清维生素D及IL-6水平有关。

关键词: 午睡; 轻度认知障碍; 睡眠质量; 维生素D; 认知功能; 免疫

Prevalence of Potentially Inappropriate Medication Using PIM Criteria in Hospitalized Older Patients with Depression

Yanhong Sun*

Hefei Fourth People's Hospital

Objective To investigate and analyze the current situation of potential inappropriate drug use (PIM) in elderly patients with depression in a hospital, so as to provide basis for safe and rational drug use in elderly patients with depression

Methods according to the PIM standard of Chinese elderly, 206 hospitalized elderly patients with depression over 65 years old were evaluated and analyzed, and the influencing factors of PIM were analyzed by multiple linear regression

Results A total of 206 elderly patients with depression were collected, with an average age of (71.46 ± 0.39) years; Average length of stay (23.25 ± 1.03) ; The average number of drug varieties was 4.72 ± 0.13 , of which 32.54% of patients used ≥ 2 antidepressants at the same time. According to the PIM standard of Chinese elderly, the incidence of PIM in hospitalized elderly patients with depression was 167 cases (81.07%). Multiple linear regression analysis showed that according to the Chinese PIM standard, the main influencing factor of PIM was the number of drug varieties ($\beta = 0.316, t = 4.614, P < 0.001$)

Conclusion The incidence of PIM in elderly patients with depression is high. It is necessary to strengthen medication education, improve the rationality of multi drug combination and reduce the safety risk of medication

关键词: Elderly depression; Potential inappropriate medication use; Medication evaluation; Influence factor

精神病医院医务人员线上指导利培酮口服液精准治疗老年精神障碍的效果分析

张玉良*

如皋市精神病防治医院

目的 探寻新时代医药学服务领域新质生产力的新思维的拓展方向和路径! 探讨精神病医院医务人员借助"微信+"模式, 采用语音、文字、视频等形式, 远程指导老年精神病患者正确使用利培酮口服液治疗的效果。

方法 精神病医院医务人员随机抽取56名长期(大于两年的)居家服用利培酮口服液治疗患有精神分裂症的老年(大于50岁)患者为研究对象, 与患者(和/或家属), 在2023年3月至2024年5月期间, 借助"微信+"模式, 采用点对点(微信群)或点对点(一对一微信)的语音、文字、视频通话、公众号、视频号等形式互动交流, 远程普及推送精神健康知识、答疑解惑、指导患者正确量取利培酮药液的操作方法、准确执行医嘱用药的用法用量、告知个体化精准治疗方案的目的意义、提前预告可

能出现的哪些 ADR、提醒患者定期作血压血糖血脂血粘度肝心脑肾肺胃肠等脏器功能检查以便及早预防或发现 ADR、如出现 ADR 后及时帮助应对和采取正确处置方法、收集监测并网上填报 ADR 信息报表,线上发放调查表,统计测评开展线上延伸药学服务期间,患者量取药液的操作方法正确率、执行医嘱的准确率、药物不良反应知晓及正确处置率、精神症状改善有效控制率、对远程医药学服务的满意度等,数据化统计、量表化分析,并与前一年度同期数据作比较。

结果 相关统计数据明显优于前一年度的数据。

结论 精神病医院医务人员采取线上延伸医药学服务,对长期居家服用利培酮口服液治疗的精神分裂症老年患者有益,体现新时代“智慧医疗”的深度、广度和温度!值得推广。

MCI 老年人群血清饮茶习惯与认知功能、抑郁情绪及血清维生素 D、炎性因子水平的相关性研究

徐磊*

首都医科大学附属北京安定医院芜湖医院(芜湖市第四人民医院)

目的 探讨轻度认知功能障碍(MCI)老年人群饮茶习惯与认知功能、抑郁情绪、血清维生素 D 及炎性因子水平的相关性,为临床干预提供理论基础。

方法 2023 年 2 月-2023 年 8 月在社区老人展开筛查,入组 315 例 MCI 受试者,采血测量维生素 D、IL-6、TNF- α 水平,其中非饮茶组 149 人和饮茶组 166 人,比较两组一般情况、简易智力状态检查量表(MMSE)、蒙特利尔认知评估量表(MoCA)、老年抑郁量表(GDS)、流调用抑郁自评量表(CES-D)分数及维生素 D、炎性因子水平差异。

结果 与非饮茶组相比,饮茶组 MMSE 的即刻记忆,计算,复述,结构,MoCA 视空间,命名,注意力,语言明显增高(均 $P < 0.05$)。饮茶组 GDS 总分[8.00(6.00,11.00)分 vs.6.00(3.00,9.00)分]、CES-D 总分[12.00(10.00,16.00)分 vs.11.00(9.00,14.00)分]明显降低($P < 0.05$)。饮茶组维生素 D3 水平

[(24.45 ± 6.050) ng/ml vs. (26.69 ± 7.698) ng/ml]、维生素 D 总水平 [(25.23 ± 6.602) ng/ml vs. (27.53 ± 7.665) ng/ml] 明显升高,IL-6 水平[$1.50(1.00,3.77)$ ng/L vs. $1.50(1.00,2.12)$ ng/L]、TNF- α 水平[$9.73(6.73,14.50)$ ng/L vs. $8.77(5.93,11.44)$ ng/L]明显降低。饮茶与性别、文化程度、吸烟、吃鱼、抑郁情绪、TNF- α 、MMSE 量表注意力、复述能力、MoCA 命名能力存在回归关系($P < 0.05$)。

结论 MCI 人群饮茶习惯与认知功能、抑郁情绪、维生素 D 水平及炎性因子存在相关关系。

关键词: 饮茶;轻度认知障碍;维生素 D;认知功能;抑郁;免疫

重复经颅磁刺激对男性精神分裂症患者抑郁焦虑情绪的疗效观察

杨米兰 高红锐*

上海市民政第一精神卫生中心

目的 探索重复经颅磁刺激(rTMS)对男性精神分裂症患者抑郁、焦虑情绪的改善作用,便于今后临床应用提供依据。

方法 根据纳入标准与排除标准选取我院 2021 年 2 月~2023 年 12 月住院的男性伴有焦虑、抑郁情绪的精神分裂症患者共计 80 例作为研究对象,按照随机数字表法分为对照组(40 例,常规精神科药物治疗),研究组(40 例常规精神科药物治疗基础上另予为期 4 周的重复经颅磁治疗)。对比两组患者治疗前后阳性和阴性症状评定量表(PANSS)、汉密尔顿焦虑量表(HAMA)、汉密尔顿抑郁量表(HAMD)分值改变情况。

结果 治疗前两组患者 HAMA 评分、HAMD 评分、PANSS 量表分值无显著性差异($P > 0.05$),治疗 4 周后研究组 HAMA 评分、HAMD 评分、PANSS 量表分值均低于对照组($P < 0.05$)。

结论 精神分裂症是一种以精神活动不协调、情感、精神、行为、感知等障碍为特征的慢性、严重性精神疾病。针对长期住院的精神分裂症患者,抑郁、焦虑症状的预防及干预不容忽视,需要结合患者实际情况,筛查相关危险因素,给予针对性干预措施。当前精神分裂症的主要治疗手段包括药物治疗、心理治疗和物理治疗,其中重复经颅磁刺激是

一种治疗精神分裂症的常用物理治疗方法, 可通过形成磁信号影响机体脑代谢。本研究表明, 治疗前两组患者的 PANSS 评分、HAMA 评分、HAMD 评分比较差异均无统计学意义 ($p > 0.05$)。研究组经为期 4 周的 rTMS 治疗后, PANSS 评分、HAMA 评分、HAMD 评分均低于对照组, 差异有统计学意义 ($p < 0.05$), 提示应用重复经颅磁刺激治疗可以有效的缓解焦虑、抑郁症状, 提高治疗依从性。综上所述, 重复经颅磁刺激对男性精神分裂症患者抑郁焦虑情绪有改善作用, 是一种安全、有效的治疗方法, 临床值得推广。

Factors Influencing The Marriage Status Among Severe Mental Disorders Patients: A Study of 5206 Patients in The Chinese Community

Lin Zhang¹, Hongjun Mao¹, Jin Xu¹, Yanlong Liao¹, Lu Wen¹, Xinming Pan¹, Xinyu Fang², Xiangrong Zhang^{2,3}
1.The Second People's Hospital of Jiangning District, Nanjing, Jiangsu, China.

2. The Affiliated Nanjing Brain Hospital of Nanjing Medical University, Nanjing, Jiangsu, China.

3.The Affiliated Xuzhou Oriental Hospital of Xuzhou Medical University, Xuzhou, Jiangsu, China.

Objective People with severe mental disorders (SMD) have higher rates of unmarriage and divorce than the general population. The purpose of this study was to investigate the factors influencing the marriage status of SMD patients in the community

Methods The cases and follow-up data were collected from SMD patient Information Management system in Jiangning District, Nanjing, Jiangsu Province. The demographic and clinical data of the patients were described and analyzed. Disordered multi-classification logistic regression analysis was used to find out the most relevant factors with marital status in SMD patients

Results Among 5206 SMD patients in Jiangning

District, 33.9% (1765/5206) were unmarried and 6.4% (335/5206) were divorced. The disordered multi-classification logistic regression analysis indicated that age, male gender, more hospitalizations, longer duration of disease, guardians being parents or siblings, no mental disability certificate and diagnosis of mental retardation with mental disorder were associated with the unmarried in SMD patients (compared to married patients). Compared with married SMD patients group, junior high school education degree and above and more hospitalizations were risk factors for divorce in community SMD patients, and guardians being spouses or children, guardians being parents or siblings were protective factors for divorce in these patients

Conclusion Our findings suggest that community SMD patients have a higher incidence of being unmarried and divorce. Given that marriage helps strengthen family-based support and care, it provides valuable information for policy makers around the world to develop plans to increase marriage rates among people with SMD. In this way, SMD patients can get better monitoring, improve the quality of life of patients, reduce the recurrence of patients' diseases and the occurrence of dangerous behaviors, and better maintain social security

Efficacy of Standard Operating Procedures for Fall Protection in Hospitalized Patients with Schizophrenia

Meihong Xiu*

beijing huilongguan hospital

Objective Fall-related injury is the most common cause of functional disability and mortality in the older population. Falls in patients with schizophrenia are one of the major concerns in psychiatric hospitals. This study aimed to examine the impact of standardized operating procedures (SOP) on falls in veterans with

schizophrenia

Methods Patients with schizophrenia were allocated to the control group (n=345) and to the fall protection standardized operating procedures (FP-SOP) group (n=342). Patients in the control group were given routine nursing for falls, and patients in the FP-SOP group were intervened with FP-SOP plus routine nursing. All patients were observed for one year. The study methods comply with the Strengthening the Reporting of Observational Studies in Epidemiology (STROBE) checklist

Results We found a fall rate of 1.5% in the FP-SOP group and 4.6% in the control group, with a significant difference in the fall rate between the two groups. In addition, the difference in patient satisfaction between the two groups was statistically significant

Conclusion Falls are a significant problem for the healthcare system. This is an ambitious attempt to develop a standard FP-SOP for fall prevention and management in psychiatric hospitals. Patients in psychiatric units have unique risk factors for falls. Most previous studies about in-hospital fall prevention have focused on general acute care rather than on psychiatric units. The FP-SOP procedure has focused on patients with mental disorders in psychiatric units. Our studies demonstrate the importance of implementing FP-SOP for fall prevention in nursing care in psychiatric units. It is not only effective in preventing falls, but also in increasing patient satisfaction

关键词: Schizophrenia; Standard operating procedures; Fall prevention; Prospective study

睡眠呼吸暂停综合征与免疫细胞性状的因果关系——一项孟德尔随机化研究

杜建彬 季萍 张国富*

江南大学附属精神卫生中心(无锡市精神卫生中心)

目的 已有研究发现睡眠呼吸暂停综合征(SAS)患者的免疫功能相关指标有异常,然而免疫调节紊乱到底是疾病的因还是果尚不明确。为此,我们采用双向两样本孟德尔随机化(MR)研究方法

分析了SAS与免疫细胞性状之间的因果关系,讨论了免疫反应在SAS发生发展中扮演着的的重要作用。

方法 我们从全基因组关联研究(GWAS)中选取了单核苷酸多态性(SNPs)作为遗传工具,以SAS和免疫细胞性状互为暴露和结局进行了正向和反向MR研究。

结果 基于逆方差加权法(IVW),在以SAS为暴露的正向MR中我们发现9个免疫细胞性状的变化与SAS发病有关,其中有4个免疫细胞性状表现为负相关,包括CD14+ CD16- monocyte Absolute Count ($\beta = -0.447$, FDR = 0.007), Monocyte Absolute Count ($\beta = -0.383$, FDR = 0.015), CD14+ CD16- monocyte %monocyte ($\beta = -0.315$, FDR = 0.034), CD14- CD16- Absolute Count ($\beta = -0.308$, FDR = 0.049),另外5个免疫细胞性状表现为正相关,包括CD14- CD16+ monocyte %monocyte ($\beta = 0.403$, FDR = 0.017), CD16+ monocyte %monocyte ($\beta = 0.318$, FDR = 0.034), CD11c+ monocyte %monocyte ($\beta = 0.394$, FDR = 0.047), CD62L- monocyte %monocyte ($\beta = 0.401$, FDR = 0.047), CD11c+ CD62L- monocyte %monocyte ($\beta = 0.394$, FDR = 0.047)。在以免疫细胞性状为暴露的反向MR中,我们未发现SAS的保护性或危险性因素。

结论 我们发现了SAS与个别免疫细胞性状之间存在因果关系,反映出SAS对免疫功能影响的复杂性,同时也强调了预防和治疗SAS在改善个体免疫功能上的潜在价值。

Emotion Suppression and Grief in Chinese Culture with Concern of Face

Lu Bai Enyan Yu*

Zhejiang Cancer Hospital

Aim Explore the role of 'face' culture in the bereavement process within Chinese society, examining how it influences emotional expression and the grieving process.

Methods The article reviews various cultural,

philosophical, and religious influences on emotional restraint in bereavement, including Confucian philosophy, Buddhist beliefs, and the concept of 'face'. It also discusses the impact of emotional suppression on health and psychological outcomes, drawing on studies that highlight the potential negative effects of suppressing emotions

Results The results indicate that the cultural imperative to maintain 'face' often leads to the suppression of grief, which can increase psychological distress and hinder the natural grieving process. Emotional suppression is common, and while it may be initially beneficial, long-term reliance can lead to negative health effects and complicate the grieving process. The article also points out that the effects of emotional suppression may vary across cultures, with East Asians potentially experiencing fewer adverse effects due to the cultural acceptance and normalization of this behavior.

Conclusion The article concludes that there is a need for further research to understand the impact of emotional suppression on the grieving experience within Chinese culture. It suggests that cultural norms and practices must be considered when developing support and intervention strategies for the bereaved. The study aims to provide a more nuanced understanding of the relationship between emotional suppression and grief, with the goal of informing more culturally sensitive approaches.

关键词: Key Words: Face Culture Bereavement Emotional Suppression Psychological Flexibility

Clinical significant of calmodulin-dependent protein kinase II γ subunit mRNA levels in peripheral blood of patients with Alzheimer's disease

Shengdong Wang* Xiaohong Xu
Hangzhou Seventh People's Hospital

Objective To investigate the expression of calmodulin-dependent protein kinase II γ subunit mRNA in the peripheral blood of the patients with Alzheimer's

disease (AD), and explore the relationship between the calmodulin-dependent protein kinase II γ subunit mRNA levels and mini-mental state examination (MMSE) scores in AD patients

Methods A total of thirty-one patients with AD, twenty-eight with mild cognitive impairment (MCI) and forty healthy subjects were recruited in the study. The blood was collected in the fasting state and the expression of calmodulin-dependent protein kinase II γ subunit mRNA in peripheral blood leukocytes was detected by real-time PCR. The correlation between calmodulin-dependent protein kinase II γ subunit mRNA levels and MMSE scores in AD patients was analyzed

Results The calmodulin-dependent protein kinase II γ subunit mRNA levels in AD and MCI were significantly lower than that in healthy group ($p < 0.05$). the calmodulin-dependent protein kinase II γ subunit mRNA levels were correlated with MMSE scores in AD patients ($r = 0.4339$, $p = 0.0046$). Interestingly, calmodulin-dependent protein kinase II γ subunit mRNA levels decreased with age in AD patients

Conclusion the levels of calmodulin-dependent protein kinase II γ subunit mRNA in peripheral blood leukocytes of AD patients decreased, and the levels of calmodulin-dependent protein kinase II γ subunit mRNA is associated with age and the severity of AD in AD patients

关键词: Alzheimer's disease; calmodulin-dependent protein kinase II γ subunit; mini-mental state examination

Influencing Factors of Different Metabolic Status in Hospitalized Patients with Schizophrenia

Shaotong Zhang Renliang Cai Jin Fang Chao Zhou
Xinyu Fang Xiangrong Zhang*
The Affiliated Brain Hospital of Nanjing Medical University

Objective The aim of this study was to explore the risk factors for different metabolic status in patients

with schizophrenia

Methods A total of 968 hospitalized patients with schizophrenia were recruited. Fasting blood glucose (GLU) and lipid profile, including total cholesterol (TC), low-density lipoprotein cholesterol (LDL-C), high-density lipoprotein cholesterol (HDL-C), and triglyceride (TG) were measured. Patients were divided into four groups: normal metabolism and normal weight (NMNW), abnormal metabolism and normal weight (AMNW), normal metabolism and overweight/obesity (NMO), and abnormal metabolism and overweight/obesity (AMO)

Results Our results showed NMNW, AMNW, NMO and AMO accounted for 25.3%, 12.7%, 25.4% and 36.6% respectively. There were significant differences in age, disease duration, BMI, waist circumference, chronic disease, SBP, DBP, GLU, TG, TC, HDL-C, LDL-C among these four groups (all $P < 0.05$). With NMNW group as the reference, the disordered multiple classification regression analysis showed that chronic disease was a significant risk factor for AMNW (OR = 5.271, 95% CI = 3.165 to 8.780, $P < 0.001$) and AMO (OR = 3.245, 95% CI = 2.004 to 5.254, $P < 0.001$), age was an important protective factor for NMO (OR = 0.968, 95% CI = 0.943 to 0.994, $P = 0.015$) and AMO (OR = 0.973, 95% CI = 0.948 to 0.999, $P < 0.042$), waist circumference was a significant risk factor for NMO (OR = 1.218, 95% CI = 1.180 to 1.257, $P < 0.001$) and AMO (OR = 1.252, 95% CI = 1.212 to 1.291, $P < 0.001$), and with college education was an obvious protective factor for AMO (OR = 0.343, 95% CI = 0.123 to 0.953, $P < 0.040$) among patients with schizophrenia

Conclusion The findings of our study underscored the importance of factors such as age, education level, chronic disease and waist circumference when exploring the influencing factors and biological mechanisms of obesity-related metabolic problems in schizophrenia patients

关键词: schizophrenia, obesity, metabolism, risk factor, glucose, lipid

Epistaxis Following Electroconvulsive Therapy: A Case Report

Xin Yang Weihong Kuang*

Mental Health Center, West China Hospital, Sichuan University, Chengdu, Sichuan Province, China

Introduction Electroconvulsive therapy (ECT) is a medical procedure performed under general anesthesia, which induces seizures by applying electrical currents to the skull. It is effective in treating various psychiatric illnesses such as depression, bipolar disorder, and schizophrenia. Despite its clinical efficacy, ECT is associated with a range of side effects. The estimated mortality rate associated with ECT is very low (2.1 deaths per 100,000 treatments), and serious adverse events related to ECT are rare, including cardiac arrhythmias with or without hemodynamic changes, respiratory distress, prolonged apnea, aspiration, and prolonged paralysis and seizures. Common self-limiting or symptomatic side effects include nausea, headache, muscle pain, increased blood pressure and acute cognitive adverse effects. Post-ECT epistaxis is rare, with scant documentation in medical literature. We report a unique case of epistaxis following ECT. The patient developed epistaxis after ECT, and the subsequent ECT session resulted in more difficult-to-control epistaxis. Our case indicated that for patients who have already experienced epistaxis, the efficacy and risks of ECT should be re-evaluated

Case presentation An 18-year-old female with a history of depression lasting over a year presented to our hospital due to low mood and suicidal ideation. Upon admission, she exhibited significant depressive symptoms, psychomotor retardation, and auditory and visual hallucinations, diagnosed with severe depressive episode with psychotic symptoms, confirmed through ICD-11 diagnosis. The patient had no history of hypertension or diabetes and had not used anticoagulant medications. Following admission, she received pharmacotherapy with sertraline and aripiprazole. Given the severity of her symptoms and the potential efficacy of ECT, we recommended ECT. After obtaining the pa-

tient's informed consent, routine examinations, including complete blood cell counts, liver and kidney function tests, electrolytes, coagulation tests, head magnetic resonance imaging (MRI), and computed tomography (CT) of the chest, revealed no abnormalities. Similarly, this patient underwent induction anesthesia with S-ketamine and muscle relaxation with succinylcholine, followed by the application of bilateral electrodes to elicit a seizure, which lasted approximately 30-60 seconds. Following the third session, the patient experienced minor bilateral epistaxis, which was controlled by the anesthetist by applying pressure to the nasal wings. No acute increase in blood pressure was observed during ECT. Subsequent nasal endoscopy revealed marked vasodilation in the patient's bilateral Little's area, with the right side exhibiting more pronounced dilation. Despite some improvement in mood post-treatment, the patient remained passively engaged and had reduced speech, thus ECT was continued. However, after the fourth ECT session, the patient experienced bilateral epistaxis again, which was managed by the anesthetist (nasal injection of adrenaline, nasal packing with gauze, and pressure on the nasal wings) for approximately 20 minutes, after which the epistaxis was controlled. Repeat complete blood cell counts and coagulation tests showed that hemoglobin decreased from 128g/L at admission to 108g/L, with normal coagulation function. Considering the substantial decrease in the patient's hemoglobin levels and the disappearance of suicidal ideation, further ECT was not administered. Two weeks later, the patient's mood stabilized, suicidal ideation and hallucinations disappeared, and there was no further epistaxis. She was discharged and followed up. At one month follow-up, the patient remained stable with no further episodes of epistaxis during this period.

Conclusion While ECT remains a highly effective treatment for various psychiatric disorders, awareness and management of rare adverse effects like epistaxis are vital. Our cases highlight the potential risk of epistaxis following ECT, even in patients not on anticoagulant therapy. The hemodynamic changes induced by ECT, along with the sympathomimetic effects of the anesthetic S-ketamine, may contribute to increased arterial

blood pressure and subsequent nasal bleeding. Particularly, repeated ECT sessions may exacerbate this issue, making it increasingly difficult to control epistaxis. Therefore, it is essential for clinicians to be aware of this potential complication and consider a thorough nasal examination prior to ECT, meticulous airway management to minimize trauma, and the use of anesthetics with lower sympathomimetic activity. For patients who experience epistaxis, a reevaluation of the risks and benefits of continuing ECT is warranted. Further research is needed to better understand the incidence and mechanisms of post-ECT epistaxis, ultimately improving patient care protocols in this context

高龄老人认知功能的变化轨迹及其影响因素

屠丽回¹ 吕晓珍² 张庆斌¹

1.首都医科大学附属北京安定医院

2.北京大学第六医院

目的 探讨高龄老人与普通老人的认知变化轨迹及影响这些轨迹的因素的差异。

方法 研究纳入了 2008-2018 年中国老年健康调查 (Chinese Longitudinal Healthy Longevity Survey, CLHLS) 在基线期的 60 岁以上认知正常的 4401 例老人, 根据年龄分为低龄组 (<85 岁, 3359 例) 及高龄组 (≥85 岁, 1042 例)。使用简易精神状态评价量表 (MMSE) 评估认知功能, 用组基轨迹建模 (Group-based trajectory modelling, GBTM) 的方法分别拟合两组认知功能的变化轨迹, 并用 Logistic 回归分析基线期特征, 包括年龄、性别、婚姻状况、身体质量指数 (BMI)、业余活动、目前饮酒及运动、睡眠、工具性日常生活能力 (IADL)、心脑血管疾病及基线 MMSE 分数等与这些轨迹的关联程度。

结果 一般人口学特征方面, 相比低龄组, 高龄组老人的女性占比更高 (56.5% vs. 48.9%), 受教育程度低及独身占比高 (74% vs. 34.9%)。在其他指标上, 高龄组有更显著的低体重 (BMI < 18.5kg/m²)、IADL 残障, 锻炼不足、睡眠时长过长及基线认知差等表现, 而低龄组在饮酒及心脑血管疾病上更多见。

根据 MMSE 分数的变化趋势,两组老人的认知功能变化轨迹均可分为稳定组及衰退组。低龄组中,稳定组占比 89.9%,衰退组占比 10.1%;而高龄组的认知衰退更为突出,占比分别是 67.8%和 32.2%。在影响认知功能的关联因素中,高龄、低受教育水平、IADL 残障以及基线 MMSE 得分低是认知衰退的共同危险因素。而在高龄组,独身状态 (OR=1.58, P=0.019) 及低频业余活动 (OR=1.58, P=0.025) 也与认知衰退显著相关。

结论 与低龄老人类似,高龄老人的认知功能也表现出稳定及衰退两种变化趋势。但是,高龄老人的认知衰退更为显著。除去高龄、低受教育水平、IADL 残障以及基线 MMSE 得分低等认知衰退的共同危险因素,高龄老人还应关注婚姻及业余活动等因素。这些影响认知功能变化趋势的因素对于实现健康老龄化及预防认知衰退具有指导价值。

文盲老人认知功能的变化轨迹及其影响因素

屠丽回¹ 吕晓珍² 张庆娥¹

1.首都医科大学附属北京安定医院

2.北京大学第六医院

目的 探讨文盲老人与非文盲老人的认知变化轨迹及影响这些轨迹的因素的差异。

方法 研究纳入了 2008-2018 年中国老年健康调查 (CLHLS) 在基线期的 60 岁以上认知正常的 4393 例老人,根据受教育程度分为文盲组 (2159 例) 及非文盲组 (2234 例)。使用简易精神状态评价量表 (MMSE) 评估认知功能,用组基轨迹建模 (GBTM) 的方法分别拟合两组认知功能的变化轨迹,并用 Logistic 回归分析基线期特征,包括年龄、性别、婚姻状况、身体质量指数 (BMI)、业余活动、目前饮酒及运动、睡眠、工具性日常生活能力 (IADL)、心脑血管疾病及基线 MMSE 分数等与这些轨迹的关联程度。

结果 一般人口学特征方面,相比非文盲组,文盲组老人的平均年龄更大 (80 岁 vs.75.3 岁),女性占比高 (72.2% vs. 29.9%) 及独身占比高 (43.1% vs. 68.2%)。除外心脑血管疾病及饮酒,文盲组在其

他指标上均处于劣势,如低体重 (BMI<18.5kg/m²)、IADL 残障,锻炼不足、睡眠时长异常及基线认知差。根据 MMSE 分数的变化趋势,两组老年人的认知功能变化轨迹可分为三组:慢速衰退组,快速衰退组及稳定组。其中非文盲组,三组占比分别是 8%, 5.4%和 86.6%;而文盲组的认知衰退更为突出,占比分别是 16.3%, 12.5%和 71.2%。在影响认知功能的关联因素中,高龄、IADL 残障以及基线 MMSE 得分低是认知衰退的共同危险因素,与慢速及快速衰退组均显著相关。在非文盲组,低体重与认知的慢速衰退显著相关 (OR=1.56, P=0.047),而睡眠时长 <6h 则是认知慢速衰退的保护因素 (OR=0.46, P=0.034);低频业余活动与认知的快速衰退相关 (OR=1.6, P=0.045)。相对而言,在文盲组,独身状态与认知的慢速 (OR=1.48, P=0.012) 及快速衰退 (OR=2.03, P<0.001) 均显著相关;女性 (OR=1.51, P=0.019) 还与认知的慢速衰退显著相关。心脑血管疾病 (OR=0.7, P=0.038) 是认知快速衰退的保护性因素,睡眠时长 ≥10h (OR=1.54, P=0.01) 则是认知快速衰退的危险因素。

结论 文盲老人的认知功能呈现出三种不同的变化趋势。相较非文盲老人,文盲老人的认知衰退更为突出,除去高龄、IADL 残障以及基线 MMSE 得分低等认知衰退的共同危险因素,文盲老人还应该关注婚姻及睡眠时长等因素。这些影响认知功能变化趋势的因素对于实现健康老龄化及预防认知衰退具有指导意义。

认知治疗对精神分裂症效果分析

张强*

肥西县第二人民医院

目的 评价在精神分裂症临床治疗中应用认知治疗的价值。

方法 在 2020 年 9 月至 2023 年 9 月期间收集试验样本,96 例均为就诊于本院的精神分裂症患者,将其依照掷硬币法分组,接受常规抗精神病药物治疗的 48 例设置为对照组,在此基础上配合认知治疗的 48 例为研究组,就两组 PANSS 评分变化、临床疗效、自知力与治疗态度、社会功能、服药依从性、

生活质量等进行统计比较。

结果 临床治疗总有效率展开比较, 研究组与对照组差异不明显, $P > 0.05$; 治疗后两组阳性因子、阴性因子、一般精神病理、总分均比治疗前低, 其中研究组各项分值的降低幅度更大, 优于对照组, $P < 0.05$; 治疗前相比较, 组间 ITAQ 评分、SDSS 评分未有统计学意义, $P > 0.05$; 治疗后相比较, 研究组 ITAQ 评分更高于对照组, SDSS 评分更低于对照组, 数据差异明显, $P < 0.05$; 研究组与对照组入院前的服药依从性评分作比, $P > 0.05$, 而其出院时、出院后半年、出院后 1 年的服药依从性评分则均高于对照组, 存在统计学差异, $P < 0.05$; 两组未在治疗前的躯体功能、心理功能、社会功能、物质生活等分值上表现出统计学意义, $P > 0.05$; 治疗后相比, 研究组 4 个维度的分值均高于对照组, 且均有统计学意义, $P < 0.05$ 。

结论 认知治疗可有效改善精神分裂症患者的临床症状、治疗态度与自知力, 提高社会功能、服药依从性、生活质量, 具有在临床治疗工作中进一步推广的价值。

The Associated Factors of Comorbidities of Depression and Anxiety in The Community Elderly

Hongying Yang Lian Li Guolin Bian*
Affiliated Kangning Hospital of Ningbo University

Objective To analyze the mental health status (depression and anxiety) of older people ≥ 60 years old and its related factors in Ningbo, China

Methods 7771 elderly people aged 60 years and over were selected from Ningbo. Depressive and anxiety symptoms were determined by PHQ-9, and GAD-7. Multiple logistic regression model was used to analyze the influencing factors of mental health

Results There were 190 patients (2.4%) with depression and without anxiety, and 159 patients (2.1%) with comorbidities. After adjusting for relevant confounders, the elderly lived in rural areas (ORdepression=1.584, ORcomorbidities=3.217), exercised less

than 3 times/week (ORdepression=1.483, ORcomorbidities=1.911), reported normal and poor health (ORdepression=6.767 and 2.892, ORcomorbidities=5.968 and 1.925) were the positive correlation factor for depressive symptoms without anxiety symptoms and symptom comorbidity. Sedentary time < 3 and $3-5$ h/day (ORdepression=0.570 and 0.522, ORcomorbidities=0.323 and 0.425) and good sleep quality (ORdepression=0.406, ORcomorbidities=0.394) were the negative correlation factors with depressive symptoms without anxiety symptoms and symptom comorbidities

Conclusion The detection rate of mental health problems in the elderly was high in Ningbo, which needs to be paid more attention, and to actively take intervention measures to reduce the mental health problems of the elderly by the society and the government

关键词: Elderly, depression, anxiety, symptom comorbidities

精神专科医院抗菌药物使用现状与分析

王玉文¹ 王荣达¹ 陈成发² 王泽民¹

1. 浙江大学医学院附属精神卫生中心 杭州市第七人民医院
2. 杭州医学院

目的 本文通过研究某精神专科医院近四年住院患者抗菌药物的使用情况, 分析该精神专科医院抗菌药物使用现状。

方法 通过对住院各科室、各类抗菌药物的使用情况, 以及对抗菌药物使用率、使用强度、使用频度、使用金额等方面分析了该精神专科医院抗菌药物使用情况和现状, 并进一步随机抽取抗菌药物使用率较高的老年精神科抗菌药物出院病历 100 份进行用药合理性评价。

结果 精神专科医院住院患者抗菌药物使用以注射剂为主 (DDD_s 占 70% 以上), 主要使用类别为头孢菌素类、青霉素类和喹诺酮类, DDD_s 分别占 50.85%、21.72% 和 22.38%。从近四年的抗菌药物使用情况发现, 前三年抗菌药物使用率和使用强度呈下降趋势, 但 2023 年两项指标均上升并超过 2020 年。在精神专科医院, 老年精神科抗菌药物使用率

最高,以下呼吸道感染和泌尿道感染最为多见,2023年抗菌药物例次占全院的54.64%。随机抽样调查老年精神科抗菌药物使用合理率约75%。

结论 精神专科医院需要医生、药师以及医护人员的共同努力,并结合精神科患者疾病特征与专科用药的特点,降低患者感染风险,同时提高抗菌药物合理使用水平,从而降低抗菌药物使用率和使用强度。

关键词: 精神专科医院; 抗菌药物; 使用率; 使用强度; 合理性

T 淋巴细胞亚群检测对长期住院精神分裂症患者医院感染的相关性研究

余万庆* 曹昌德 姚伟 陈亚婷 郑毅

皖西卫生职业学院附属医院(六安市第二人民医院)

目的 探讨T淋巴细胞亚群联合炎性因子检测与长期住院精神分裂症患者医院感染的相关性。

方法 从2022年6月到2023年5月,从97例接受住院治疗的精神分裂症病人中抽样,同时从同期接受治疗的85例病人中抽样,并使用流式细胞术检测T淋巴细胞及其亚群以及炎性因子的含量,以此来评估两组病人的免疫炎性反应以及院内感染的可能程度。

结果 经过12周的住院治疗,研究发现,与未住院的患者相比,观察组的CD4+/CD8+、CD4+/CD8+、Th1/Th2、Th1/Th2的比值明显降低,而CD8+、cd8+、Th2的比值明显升高,这些变化都是可以统计出来的($P<0.05$)。此外,研究发现,在住院期间,观察组的IL-6、IL-8、TNF- α 的比值也都较之前的患者要高。最终,通过Logistic回归分析,得出了这些发现。长期住院精神分裂症患者的血液中CD4+/CD8+、Th1、Th1/Th2、IL-6、IL-8和TNF- α 浓度均与其疾病有显著的相关,其中 $P<0.05$ 。

结论 对长期住院精神分裂症患者进行T淋巴细胞亚群线粒体损伤检测,依据检测结果对免疫功能低下患者采取针对性免疫干预措施减少院感发生率方面值得推广。

关键词: 长期住院精神分裂症 T 细胞亚群检测 医院感染

老年期精神分裂症患者自知力与治疗态度现状及影响因素

周永玲*

宁夏回族自治区宁安医院

目的 探讨精神分裂症患者自知力与治疗态度及其影响因素,为提高精神分裂症患者自知力与治疗态度提供参考。

方法 选取144例老年期精神分裂症患者作为研究对象,使用自知力与治疗态度问卷进行横断面研究,采用统计学软件SPSS 25.0处理,单因素分析采用独立样本t检验或单因素方差分析;计数资料采用例数和百分比表示,采用多元logistic回归分析探讨影响精神分裂症患者ITAQ得分的因素, $P<0.05$ (双侧)表明差异具有显著性。

1.研究对象 选取2021年3月至2023年11月在本院住院接受治疗的144例精神分裂症患者作为研究对象。1.1纳入标准 ①符合国际疾病分类第10版(ICD-10)中精神分裂症诊断标准,年龄 ≥ 60 岁;②处于疾病稳定期,能理解并配合研究;③自愿参与,签署知情同意书。

1.2排除标准 ①合并其他类型精神系统疾病或存在神经病变;②有严重攻击行为或企图自杀者;③调查表填写不完整者。

结果 单因素分析结果显示,精神分裂症患者的自知力与治疗态度的影响因素为服药依从性、入院方式和主要照顾者,差异具有统计学意义($P<0.05$)。多元logistic回归分析结果显示,服药依从性、入院方式、主要照顾者是精神分裂症患者自知力与治疗态度的影响因素($P<0.05$)。服药依从性较高者的老年期精神分裂症患者的自知力和治疗态度更好。服药依从性高的患者对疾病的认识更为清晰,对治疗措施接受度也会更高,服药依从性低的患者对药物认知不全面,过度关注药物副作用,或由于被害妄想症状的影响,自行停药,从而影响治疗。规律服药是预防精神分裂症复发的关键因素,大部分精神分裂症患者进入反复发作、迁延加重的疾病发展过程,患者自知力也在此过程中逐渐降低。因此,对老年患者及其家属需进行药物健康宣教,明确药物治疗在精神分裂症治疗中的重要性,不可自行减药、停药。同时也应重视所出现的不良反应,及时根

据患者状况调整药物使用,尽量减少患者的不适感。及时解答患者用药疑惑,帮助其树立正确用药观念。

结论 老年期精神分裂症患者自知力与治疗态度得分较低,与服药依从性、主要照顾者、入院方式密切相关。临床需加强对这些患者的重视,及时采取针对性干预措施。同时良好的治疗环境、护患良好的沟通可以改善非自愿入院患者的负性感受。因此,针对非自愿入院的特殊患者,医护更应重视心理护理,同时完善入院评估机制,确保只在必要情况下采取非自愿入院措施,保障精神分裂症患者权益。

关键词:精神分裂症;自知力与治疗态度;影响因素

Association between The Sarcopenia, Frailty, and Intrinsic Capability Score on Falls in Hospitalized Patients with Stable Schizophrenia

sha Huang Xiaoyan Chen*

Zigong Affiliated Hospital of Southwest Medical University

Objective We aimed to evaluate the role of geriatric measures of sarcopenia, frailty, and intrinsic capability (IC) score as predictors of falls in hospitalized patients with stable schizophrenia aged 50 years and older

Methods This was a retrospective cohort study of patients with schizophrenia from two mental health centers in western China. Sarcopenia was diagnosed following the diagnostic criteria, defined by the Asian Working Group for Sarcopenia (AWGS) 2019. Frailty was measured by the FRAIL scale, while IC was evaluated through assessment of five characteristics: cognition, psychological, sensory function, vitality and locomotion. The IC score was used as both a categorical and a continuous variable. As a categorical variable, patients were divided into two groups based on IC score, namely, the high IC-score group (IC score ≥ 3 points) and the low IC-score group (IC score 0-2 points). Data were collected on falls that occurred between September 1, 2019, and August 30, 2020. The outcome measure (falls) was obtained by checking medical records and interrogating

patients and medical staff in person to obtain information on patients' falls during the past year. The association between sarcopenia, frailty, IC score, and falls was analyzed by logistic regression analysis

Results 339 patients diagnosed with stable schizophrenia were recruited in the study. 55 (16.22%) of them reported falls in the past year. Patients diagnosed with sarcopenia and frailty were 180 (53.1%) and 47(13.86%), respectively. 321 (94.69%) were diagnosed with IC decline, of which 22.74%, 40.5%, 21.18%, 13.71% and 1.87% were impaired in one, two, three, four, and five dimensions, respectively. The number of patients in the high IC-score group was 118 (34.81%), and the number of patients in the low IC-score group was 221 (65.19%). The incidence of falls in patients with sarcopenia was higher than that in patients without sarcopenia (20% vs. 11.95%, $P=0.045$). The incidence of falls among patients in the high IC-score group was higher than that in the low IC-score group (23.73% vs. 12.22%, $P=0.006$). In addition, the IC score of the fall group was higher than that of the non-fall group (2.65 ± 1.17 vs. 2.12 ± 1.11 , $p=0.001$). However, there was no significant difference in the incidence of falls between frail and non-frail patients. Logistic regression analysis showed that compared with the low IC-score group, patients with stable schizophrenia in the high IC-score group had a greater risk of falling (OR=1.865, 95%, CI: 1.019-3.412). Moreover, the higher the IC score, the higher the risk of falls in patients with stable schizophrenia (OR=1.321, 95%, CI: 1.005-1.736). However, sarcopenia and frailty were not associated with the risk of falls in patients with stable schizophrenia

Conclusion The findings demonstrated that patients with stable schizophrenia in the high IC-score group had a higher risk of falling than those in the low IC-score group. Moreover, the higher the IC score, the higher the risk of falls in patients with stable schizophrenia. However, sarcopenia and frailty were not associated with the risk of falls in patients with stable schizophrenia

关键词: sarcopenia, frailty, intrinsic capacity, schizophrenia, fall

SARC-F, SARC-CalF, and SARC-F-EBM As Practical Predictive Tools for The Risk of Pneumonia in Patients with Stable Schizophrenia—a Prospective Study

Xiaoyan Chen* sha Huang

Zigong Affiliated Hospital of Southwest Medical University

Objective Pneumonia incidence and death rates are high in individuals diagnosed with schizophrenia. Sarcopenia is one of the risk causes of pneumonia among individuals diagnosed with schizophrenia. Here, we investigate the efficiency of three simple sarcopenia screening questionnaires, SARC-F-EBM, SARC-CalF, and SARC-F, for predicting pneumonia in stable schizophrenia patients

Methods This was a prospective study that enrolled patients with stable schizophrenia aged ≥ 50 years from two psychiatric hospitals in western China. The patients' medical data were collected between September 1 and 30, 2020. The patients' pneumonia data referred to pneumonia that occurred between October 2020 and October 2021. Three hundred thirty-five stable schizophrenia patients, among whom 229 were males (68.36%), were enrolled in the prospective study. Our study applied three screening questionnaires: SARC-F-EBM, SARC-CalF, and SARC-F. SARC-F, SARC-CalF, and SARC-F-EBM scores ≥ 4 , 11, and 12, respectively, indicate sarcopenia. The gathered data were examined using logistic regression analysis to determine the link between the scores of these screening tools and the risk of pneumonia in individuals with stable schizophrenia

Results The rate of pneumonia in stable schizophrenia individuals was 24.5%. Among the included stable schizophrenia patients, the incidence of pneumonia in individuals with SARC-CalF scores ≥ 11 was higher than in those with SARC-CalF scores less than 11 (29.91% vs 14.88%, $P=0.002$). In individuals with SARC-F-EBM scores ≥ 12 , the pneumonia occurrence was higher than that in those with SARC-F-EBM scores

less than 12 (37.33% vs 20.77%, $P=0.003$). However, this pattern was not observed in patients with stable schizophrenia with SARC-F scores ≥ 4 and less than 4. After applying logistic regression data quantitation, we found that individuals with SARC-CalF scores ≥ 11 had a higher danger of developing pneumonia than patients with SARC-CalF scores < 11 (OR=2.441, 95%CI: 1.367-4.36). After adjusting the possible confounders, patients with SARC-CalF scores ≥ 11 had a greater danger of pneumonia (OR=2.518, 95%CI: 1.36-4.665). Correspondingly, the comparison between patients with SARC-F-EBM scores < 12 and ≥ 12 confirmed that SARC-F-EBM values ≥ 12 predicted a higher risk of developing pneumonia (OR=2.273, 95%CI: 1.304-3.961). We have set possible confounders, and the results showed that the patients with SARC-F-EBM scores ≥ 12 had a greater danger of developing pneumonia (OR=2.181, 95%CI: 1.182-4.026). However, in stable schizophrenia patients with SARC-F scores ≥ 4 and < 4 , we have not yet observed a similar pattern for pneumonia risk

Conclusion In conclusion, these findings show that SARC-F-EBM and SARC-CalF scores are related to pneumonia risk in stable individuals with schizophrenia. We advocate utilizing them to determine the likelihood of pneumonia in these individuals, particularly in medical facilities that cannot diagnose sarcopenia

关键词: Sarcopenia; SARC-F-EBM; SARC-CalF; SARC-F; Stable schizophrenia; Pneumonia

Simple Measurement Indicators Instead of Sarcopenia Obesity for The Risk of Pneumonia in Patients with Stable Schizophrenia—a Prospective Study

Xiaoyan Chen* Suo Huang

Zigong Affiliated Hospital of Southwest Medical University

Objective Sarcopenia obesity (SO) is associated with a variety of adverse outcomes, however, one of our previous results showed that SO as defined by ESPEN

was not associated with the occurrence of pneumonia. Therefore, this study intends to explore other indicators to establish SO and whether it can predict the occurrence of pneumonia

Methods This was a prospective study that enrolled patients with stable schizophrenia aged ≥ 50 years from two psychiatric hospitals in western China. Baseline data was established between September 1 and 30, 2020, while the pneumonia was collected within the following year. We composed SO by three variables: hand-grip strength (HGS), calf circumference (CC) and waist-to-hip ratio (WHR). The cutoff values for both HGS and CC are recommended by the AWGS2019 consensus. The WHR ratio is divided according to the threshold Chinese reference standard. When all three variables were abnormally defined as SO, we analyzed the correlation between SO and pneumonia according to logit regression

Results We included a total of 335 people in the analysis, 25.07% of whom were SO and 24.48% developed pneumonia in the following. The prevalence of pneumonia increased in the normal group compared with the low HGS and low CC group and SO groups (normal vs. low HGS and low CC vs. SO: 18.62% vs. 26.98% vs. 35.71%, $p=0.009$). Further logistic regression analysis showed that compared with the normal group, patients in the SO group had a higher risk of pneumonia (OR=2.429, 95%CI: 1.363-4.329). After adjusting for potential confounding factors, the results still showed that patients in the SO group had a higher risk of pneumonia (OR=2.461, 95%CI: 1.306-4.639). However, there was no difference in the risk of pneumonia between patients in the low HGS and low CC group and those in the normal group

Conclusion The indicators we constructed were associated with the development of pneumonia. It is thus recommended that these scores be utilized to assess the likelihood of pneumonia in these individuals

关键词: Schizophrenia; Pneumonia; Muscle mass; Obesity; sarcopenia

基于精神科记忆门诊评价阿尔兹海默病患者

的精神行为症状

徐莉丝 蔡清艳* 刘筱薇
成都市第四人民医院

目的 探索精神科记忆门诊就诊的阿尔兹海默病(AD)患者中精神行为症状(BPSD)的患病特点,以提高对 BPSD 的识别率,达到临床早发现、早治疗的目的。

方法 本研究按纳入标准收集 2019.4 至 2023.10 于成都市第四人民医院记忆门诊就诊的 AD 患者共 463 例,收集每个被试的一般人口学资料、既往史、家族史、婚姻史等。采集简易精神状态量表(MMSE)、日常生活能力量表(ADL)、神经精神问卷(NPI)等神经心理问卷。根据 MMSE 得分将患者分为轻度(123 例)、中度(178 例)及重度(162 例)AD 组。采用 SPSS27.0 统计学软件进行数据分析。组间比较采用单因素方差分析和卡方检验;相关性分析采用 Pearson 相关分析。以 $P<0.05$ 为差异有统计学意义。

结果 轻中重 AD 组患者的人口学资料无显著差异,但 MMSE、ADL、NPI 得分均有显著性差异,越重的 AD 患者,MMSE 得分越低,ADL 得分越高,NPI 得分越高。三组出现 BPSD 的几率分别为(66.7%, 91.6%, 100%, $P<0.05$)。整个人群中最常见的症状为易激惹(51.2%),而重度 AD 组患者最常见的 BPSD 为异常运动行为(67.9%)。是否患脑出血、慢阻肺对 BPSD 的出现几率有显著影响,其中患脑出血出现幻觉的概率增高(80% vs 33.7%, $P<0.05$),患慢阻肺出现异常运动行为概率增加(66.7% vs 42.6%, $P<0.05$)。女性 AD 患者妄想的发生率明显高于男性患者(38.9% vs 29.5%, $\chi^2=4.305$, $P=0.038$),NPI 总分与 MMSE 呈负相关($r=-0.408$, $P<0.01$),与 ADL 呈正相关($r=0.416$, $P<0.01$)。

结论 随着 AD 病程的进展,患者痴呆严重程度加重,生活自理能力愈加下降,出现 BPSD 的几率也随之增加。重度 AD 患者出现 BPSD 的几率为 100%,提示我们在 AD 患者中精神症状的识别和治疗的重要性。基础疾病影响着 BPSD,脑出血对大脑功能直接造成影响,慢阻肺则通过氧气的减少间接影响着脑功能,这些因素均会增加 BPSD 的概率和发生发展。生物学因素提示男女性别差异对 BPSD 的种类有影响,女性更容易产生妄想,这或许与女性的性格特点有一定关系。本研究提示,在精神科

记忆门诊就诊的 AD 人群中, BPSD 的识别率远高于社区调查和综合医院, 这可能与患者就诊目的有关, 也可能与精神科医生对精神症状的高识别率有关, 未来应加强对非精神科医生 BPSD 识别率的培训; 本研究还提示, 生物学因素影响 BPSD 的种类和程度, 未来应进一步开展 AD 患者 BPSD 的危险因素的研究, 有利于此类疾病的防治。

以情绪障碍为首表现的抗 NMDA 受体脑炎 1 例

徐莉丝 黄雨虹*

成都市第四人民医院

抗 N-甲基-D-天门冬氨酸(N-methyl-D-aspartate, NMDA)受体脑炎是一种中枢神经系统的自身免疫性疾病, 其由抗 NMDA 受体抗体介导, 属于边缘叶脑炎的一种, 主要累及海马、杏仁核、岛叶等边缘结构, 临床表现以精神行为异常、自主神经功能障碍、癫痫发作为特点。NMDA 受体脑炎临床表现不具有特异性, 症状常多变、不典型, 临床上极易漏诊和误诊, 预后较差。

本案例报道了我院收治的抗 NMDA 受体脑炎合并早发阿尔茨海默病男性患者 1 例, 该病例以情绪低落, 反应速度变慢, 注意力不集中, 兴趣下降为主要表现, 入院后头部核磁共振 (magnetic resonance imaging, MRI), 液体衰减反转恢复序列 (fluid-attenuated inversion recovery, FLAIR) 像显示皮质下点状高信号影, 双侧海马头、海马旁回、扣带回皮质层高信号, 脑脊液常规及生化未见异常, 脑脊液副肿瘤综合征抗体为阴性, 脑脊液抗 NMDA 受体抗体 IgG: 1:3.2, 血清 NMDA 受体抗体阳性, 滴度: 1:10。从而确诊抗 NMDA 受体脑炎。

给予抗抑郁药物、激素冲击治疗后病情得到大部分改善, 治疗后 6 个月随访, 患者抑郁综合征基本痊愈。该病例提示我们抗 NMDA 受体脑炎会以情绪障碍为首发症状, 在精神科临床实践时, 应注意及时甄别和尽早治疗。

关键词: 抗 NMDA 受体脑炎; 情绪障碍; 精神科

运动治疗在抑郁患者治疗中的研究进展

徐国栋 陶睿*

安徽医科大学附属巢湖医院

体育锻炼是一种健康而重要的生活方式, 因其能够促进心理健康、协助预防和管理心理健康障碍而受到越来越多的关注。体育锻炼对于情绪问题的改善作用也较为突出。抑郁症作为一种常见的精神障碍, 其特征是持续情绪低落和(或)对日常活动缺乏兴趣或乐趣, 伴有精神运动和认知症状。抑郁症的治疗一直是研究的重点, 目前仍需要更多并且有效的治疗方法来解决社会中不同群体的抑郁。

体育锻炼是一个有效且方便的方法, 可以广泛应用并融入日常生活。研究证实, 体育锻炼能够明显的减低抑郁症状, 并且体育锻炼是临床和亚临床环境中具有潜在缓解抑郁症状作用的一种可调整的健康行为。体育锻炼通过增加行为活动来提供愉悦感并减少疲劳, 这有助于缓解抑郁症状患者的社会和心理因素, 从而能够明显的减低抑郁症状; 而体育锻炼较少者的快感缺失和疲劳症状等抑郁症状可能更为多见, 对于久坐不动的人来说, 更高水平的体育锻炼可以防止抑郁症的风险。体育锻炼能够显著降低了抑郁的风险, 而抑郁同样可能会导致体育锻炼的减少, 而体育锻炼和抑郁之间这种的双向影响的生物学机制可能涉及大脑皮层的相关变化, 激素和细胞水平的变化以及体育锻炼-抑郁症关联的心理社会学机制等。

体育锻炼对于身体健康的影响可能涉及到体育锻炼的频率、强度以及锻炼的类型。研究显示, 跑步和球类运动对自我健康状态的影响更为显著, 并且一个人在一周内不同类型的体育锻炼越多, 身体健康状态评定为良好的可能性就越大。所以说, 慢跑和球类运动的相结合可能是最为有益的锻炼方式。在临床上, 体育锻炼仍然是一个未被充分利用的治疗手段。考虑到体育锻炼易于获得和操作, 可以优先将其作为预防和治疗抑郁的补充干预措施, 以便辅助药物治疗, 从而更为快速的达到改善抑郁的效果。

Schizophrenia, Bipolar Disorder and Major Depressive Disorder Are Probably Not Risk Factors for Cardiovascular Disease: a Mendelian Randomized Study

Jin Chen^{1,2}, Xiangrong Zhang²

1. The Affiliated Xuzhou Eastern Hospital of Xuzhou Medical University

2. The Affiliated Brain Hospital of Nanjing Medical University

Objective Individuals with severe mental illnesses (SMI) like schizophrenia, bipolar disorder (BD), and major depressive disorder (MDD) have an increased risk for cardiovascular diseases (CVD), but the causal relationship remains unclear

Methods Mendelian randomization (MR) was used to investigate the potential causal relationship between SMI and CVD and its five subtypes of disease, coronary heart disease, myocardial infarction, stroke, heart failure, and atrial fibrillation. Subsequently, the MR results of SMI with CVD and its subtypes were meta-analyzed separately. To assess the robustness of the findings, Cochran's Q test, MR-Egger intercept test, MR-PRESSO, and leave-one-out analysis were used

Results MR analyses have revealed correlations between schizophrenia and BD with CVD and their subtypes in certain datasets. No significant evidence of an association between MDD and CVD or its subtypes was observed in our MR analyses. After meta-analysis, no significant impact of genetically predicted schizophrenia, BD, or MDD on CVD and their subtypes was found

Conclusion Our MR study did not provide conclusive evidence for a causal association between genetic predisposition to SMI and CVD. Based on the available evidence, it would be more appropriate to consider SMI as potential risk markers for CVD and its subtypes rather than definitive risk factors

[Highlights]

1. This Mendelian randomization (MR) study includes more GWAS databases than other studies as-

sessing the risk of serious mental illness with cardiovascular diseases (CVD).

2. MR analysis showed a correlation between schizophrenia and bipolar disorder with CVD and its subtypes in some datasets, but the correlation disappeared after meta-analysis.

3. Based on the available evidence, it would be more appropriate to consider SMI as potential risk markers for CVD and its subtypes rather than definitive risk factors.

肌少性肥胖症对轻中度阿尔茨海默病患者认知功能的影响

刘善雯 胡华*

核工业总医院 (苏州大学附属第二医院)

目的 探讨轻中度阿尔茨海默病 (AD) 患者肌少性肥胖症 (SO) 与认知障碍的关系。

方法 取 2021 年 1 月至 12 月苏州大学附属第二医院神经内科记忆障碍门诊确诊的 120 例轻、中度 AD 患者和同期体检中心体检的 56 名对照者 (NC)。按照是否合并肌少症和/或肥胖, 将 AD 患者分为正常组、肌少症组、肥胖组、肌少性肥胖 (SO) 组共 4 个亚组。收集一般资料, 测定人体成分及肌少症相关指标, 进行神经心理学量表评估。比较 NC 组及轻、中度 AD 一般资料、身体成分、肌少症相关指标及 SO 的患病情况; 比较 AD 患者 4 个亚组间一般资料、身体成分、肌少症相关指标、认知功能各领域评分间的差异, 并进行两两之间进行偏相关分析; 用 Logistic 回归分析探讨 SO 与 AD 患病风险的相关性。

结果 120 例 AD 患者中, SO 患者在轻度 AD 组 9 例 (16.7%), 中度 AD 组 16 例 (24.2%), NC 组 4 例 (7.1%)。中度 AD 组 SO 患病率 ($P < 0.05$) 高于 NC 组。相较 NC 组, 轻、中度 AD 组握力较低 ($P < 0.05$), 三组中, 中度 AD 组四肢骨骼肌量指数 (AMSI) 最低, 体脂百分比 (PBF) 最高, 受教育年限最低 (均 $P < 0.05$)。AD 患者四个亚组之间 SO

组平均年龄(75.2±3.5)最大,高血压、糖尿病患病率较正常组高(P<0.05)。相较正常组,肌少症组及SO组的MMSE、MoCA、CDT、MES-T、MES-M、MES-E、BDST、VFT得分较低(均P<0.05),ADL得分较高(均P<0.05);与肥胖组相比,肌少症组及SO组MMSE、MoCA、画图、MES-T、MES-E、FDST、VFT得分较低,ADL得分较高(均P<0.05)。AD患者ASMI、PBF、腰臀比、内脏脂肪面积与多个认知功能领域及ADL评分具有相关性(均P<0.05)。经Logistic回归分析,调整潜在混杂因素后,与正常组相比,肥胖与AD患病风险无关,肌少症(OR=5.351,95%CI:1.274-22.463)、SO(OR=5.843,95%CI:1.259-27.111)与AD患病风险仍具有显著相关性(P<0.05),且相较肌少症组,SO与AD患病风险的相关性更高。

结论 SO与轻中度AD患者广泛性认知功能受损相关,相比肌少症而言,SO可能对AD影响更为显著。早期识别、有效干预SO或许可以预防和延缓AD的发生和发展。

轻中度女性阿尔茨海默病患者肌少症与睡眠状况及认知功能的关系

刘善雯 胡华*

核工业总医院 (苏州大学附属第二医院)

目的 睡眠障碍和肌少症均是认知功能恶化的危险因素,促使阿尔茨海默病(AD)的发生发展。然而,很少有研究评估女性AD患者肌少症与睡眠障碍间的关系。本研究旨在探讨轻中度女性AD患者肌少症与睡眠状况的关系。

方法 采用横断面研究,收集门诊女性AD患者112例,年龄60~85岁。收集人口统计学资料、四肢骨骼肌质量指数(ASMI)、握力和6m步速指标。根据亚洲肌少症工作组的标准诊断肌少症。匹兹堡睡眠质量指数(PSQI)量表评估睡眠变量。简易精神状态量表(MMSE)和蒙特利尔认知评估量表(MoCA)评估认知功能。二元逻辑回归模型探讨睡眠变量与认知功能和肌少症间的关系,并调整了潜在的混杂因素。

结果 门诊女性AD患者分为有肌少症(ADSa)36例和无肌少症(ADSa)76例,肌少症患病率为32.1%。ADSa组ASMI较低,握力较弱,步态速度较慢,睡眠质量差的发生率较高,认知功能较差。多因素二元逻辑回归分析显示,PSQI总分(OR=1.23)、睡眠质量(OR=3.67)、主观睡眠质量(OR=2.03)、睡眠效率(OR=2.54)、日间功能障碍(OR=1.70)、MMSE(OR=0.75)和MoCA(OR=0.71)与肌少症相关。与入睡时间≤15min相比,31-60min(OR=4.61)和>60分钟(OR=6.34)与肌少症相关,入睡时间延长有统计学意义的增加趋势(P for trend=0.026)。与睡眠持续时间7-8h相比,6h(OR=1.51)、8-9h(OR=7.48)和≥9h(OR=8.21)与肌少症有关。

结论 伴肌少症的女性AD患者存在更多的睡眠症状和更差的认知障碍。PSQI总分越高、主观睡眠质量越差、睡眠潜伏期越长、睡眠时间过多或不足、睡眠效率越低、白天功能障碍、认知功能越差,轻中度女性AD患者发生肌少症的几率越高。

Bibliometric Analysis of The Research Status and Global Trends in Behavioral and Psychological Symptoms of Dementia in Alzheimer's Disease From 2002 To 2022

Haipeng Cai^{1,2}, Ruonan Du¹, Keping Yang¹, Wei Li¹, Xin Wang¹, Jianyi Zhang¹, Jianxin Zhang¹, Xiaole Han¹, Zhiren Wang¹

1.Beijing Huilongguan Hospital

2.Huilonggun Clinical Medical School of Peking University

Objective Several reviews on behavioral and psychological symptoms (BPSDs) in patients with Alzheimer's disease (AD) have summarized the current state of this field, but global trends are unclear. This study utilized CiteSpace to provide a global overview of the current (from 2002 to 2022) state of research on AD and its BPSDs and to predict future research trends in the field

Methods Data were retrieved from the Web of

Science Core Collection. Bibliometric and co-occurrence analyses were performed using CiteSpace software. In total, 787 valid publications were included in the analysis

Results Publications on AD and BPSD have shown an increasing trend since 2002. The United States and the University of Toronto were the countries and institutions with the highest total number of publications, respectively, whereas Japan and China were the second and third most influential in the field in terms of number of publications. Clive Ballard was the top author in terms of the number of publications. Journal of Alzheimer's Disease had the highest number of publications on this topic. Co-occurrence analysis showed that AD, behavioral symptoms, cognitive impairment, and early markers are hot topics in this area. Non-drug management of BPSDs, pharmacological treatment, and physiotherapy will be a hot topic in this field in the future

Conclusion Our study visualized the relevant articles over the past 21 years to detect global hotspots and trends. Our findings may help researchers to identify research hotspots in this field and will help in the selection of appropriate research topics, while possibly leading to cross-regional cooperation

关键词: Alzheimer's disease, behavioral and psychological symptoms of dementia, bibliometrics analysis, CiteSpace, global trends.

A Study on The Potential Role of Mango Extract Mangiferin in Relieving Parkinson's Disease (PD)

Zhengkang Su*

The Affiliated Kangning Hospital of Wenzhou Medical University, Zhejiang Provincial Clinical Research Center for Mental Disorder, Wenzhou, Zhejiang 325000, China

Objective As the global population ages, the incidence of Parkinson's disease (PD) continues to escalate, imposing significant social and economic burdens.

Mangiferin (MGF), a polyphenolic bioactive compound has been shown to play a role in the prevention and treatment of PD. This study is set to investigate the neuroprotective effects of MGF in a MPTP-induced zebrafish PD model

Methods MPTP is used to induce zebrafish PD animal model, MGF treatment is performed to relieve the PD-related symptoms in zebrafish PD animal model. Initially, optimal concentrations for modeling were established using various MPTP and MGF combinations. The zebrafish were then divided into control, MPTP-treated, and MGF co-treated groups. Subsequent evaluations included hatching rates, mortality rates, growth and development conditions, and spontaneous motor abilities, as well as measurements of enzymatic activities of SOD, CAT, and levels of GSH. Ultimately, the therapeutic efficacy of MGF on the PD model in zebrafish was assessed through transcriptomic sequencing

Results MGF restored the delayed hatching and reduced embryonic mortality in MPTP-induced zebrafish larvae. In addition, MGF relieved oxidative stress and ameliorated the reduction in locomotor activity in MPTP-induced zebrafish larvae. Moreover, a part of PD-related genes changes were partially restored in MPTP-induced zebrafish larvae after MGF treatment

Conclusion MGF may partially alleviate symptoms in MPTP-induced zebrafish PD model and has a good clinical therapeutic prospect in the future treatment of PD

躯体生活自理能力缺陷老人认知水平现状研究——基于 CHARLS2020 数据的实证分析

史艳茹 李琦 曹效亲 罗亮 强晓玲*

中国人民解放军空军军医大学第一附属医院(西京医院)

目的 探讨我躯体生活自理能力缺陷老年人认知水平现状及相关影响因素, 为干预政策和措施的

制定提供依据和参考。

方法 使用中国健康与养老追踪调查 (China Health and Retirement Longitudinal Study, CHARLS) 2020 年全国调查数据, 选取受访中躯体生活自理能力量表 (Physical Self-Maintenance Scale, PSMS) ≥ 1 且年龄 ≥ 60 岁以上的老年人作为研究对象, 通过心智状况和情景记忆能力测量评估研究对象的认知水平; 应用单因素分析不同人群的认知水平现状。

结果 最终纳入研究对象 2568 例, 认知得分为 8.53 ± 5.95 分, 其中心智状况 (认知完整性) 得分 4.49 ± 3.53 分, 记忆得分 4.05 ± 2.96 分。认知水平得分在性别、年龄、文化程度、居住地、户口类型、婚姻状况、是否有养老金、睡眠时间、上网、社交、一年内有无发生摔倒等方面均存在差异 (均 $P < 0.05$)。

结论 躯体生活自理能力缺陷的老年人认知水平低于我国老年人常模, 随着年龄增长, 认知水平逐渐降低。同时女性认知水平低于男性; 丧偶或从未结婚的单身老年人认知水平明显低于已婚或离婚人群; 城市优于农村, 有固定的生活伴侣优于独居老年人, 经常参加社交活动会使老年人认知功能得到改善。

关键词: 自理能力缺陷老人; 认知水平; CHARLS2020

老年痴呆患者规范化管理措施及效果研究

张瑞莉 徐学兵* 周永玲 李峰
宁夏回族自治区宁安医院

目的 探究对于轻中度老年痴呆病人给予规范化管理之后的效果。**方法** 随机的选取 2022 年 1 月到 2023 年 5 月期间入住我院明确诊断有老年痴呆病人 60 例, 分为对照组和观察组, 对照组给予常规护理, 观察组进行 CST (认知促进治疗) 全病程干预, 对认知功能、生活质量水平以及生活能力进行评价。

方法 随机的选取 2022 年 1 月到 2023 年 5 月期间入住我院的需要进行治疗的明确诊断有老年痴呆的病人 60 例来作为本次的研究对象, 进行观察跟踪分析, 分为两组, 分别为对照组和观察组, 其中对照组共 30 人, 女性 18 人、男性 12 人, 他们的年龄都在 62~75 岁, 均值为 (66.32 ± 2.85) 岁, 病程为 2.2~5

年, 均值为 2.4 年。其中观察组共 30 人, 女性 16 人、男性 14 人, 他们的年龄都在 64~76 岁, 均值为 (67.25 ± 3.04) 岁, 病程为 2.3~4.9 年, 均值为 2.6 年。对照组的病人给予常规的非药物治疗干预。对观察组的病人进行 CST (认知促进治疗) 的非药物干预, 每周干预 1 次, 30-45min/次, 14 周为一个治疗疗程, 收集每周两组病人的简易智能精神状态 (MMSE) 以及阿兹海默症生活质量测量表 (QOL-AD), 对患有老年痴呆的病人的认知功能、生活质量水平以及生活能力进行评价。

结果 CST (认知促进治疗) 全病程干预后, 观察组病人的 MMSE 的总评分、定向力、回忆能力以及语言能力和 QOL-AD 表的得分均要高于对照组, ($P < 0.05$)。

结论 在临床上经过 CST (认知促进治疗) 的全病程干预之后, 病人的认知功能有明显的改善, 延缓了记忆力减退, 提高了病人的生活质量水平, 同时提高病人的自我管理能力和生活能力。

老年精神疾病患者多重用药合理使用的探讨

牛梦溪 张庆娥* 李鹏飞 刘珊珊 庄红艳 臧彦楠
鲍爽 贾菲
首都医科大学附属北京安定医院

目的 本文旨在探讨老年精神疾病患者多重用药的现状、适宜性评估方法、以及科学管理策略。随着全球人口老龄化的加剧, 老年精神疾病患者的多重用药问题日益凸显, 这对医疗系统提出了新的挑战。本文通过分析国内外研究数据, 评估多重用药的适宜性, 并提出有效的管理手段。

方法 本文整理近年来的研究, 分析了国内外关于老年精神疾病患者多重用药的研究报告和指南。通过定量数据和定性分析, 本文对老年精神疾病患者的多重用药发生率、风险因素、以及管理策略进行了综合评估。

结果 老年精神疾病患者的多重用药现象普遍存在, 且与躯体疾病共病情况紧密相关。多重用药不仅增加了药物不良反应的风险, 还可能导致医疗成本的增加和生命质量的降低。国内外的多重用药发生率存在显著差异, 我国华北地区的发生率尤为

突出。此外,本文还发现,多学科团队协作、患者自我管理、以及临床决策支持系统(CDSS)在多重用药管理中发挥着重要作用。

结论 老年精神疾病患者的多重用药问题是一个复杂的公共卫生问题,需要多方面的干预和管理。本文强调了多学科团队协作的重要性,并指出药师在药物审查中的关键角色。同时,患者的自我管理能力提升和临床决策支持系统的合理应用对于优化多重用药管理至关重要。未来的研究和实践应持续探索和优化针对老年精神疾病患者的多重用药管理策略,以适应不断变化的治疗需求和挑战。

血糖波动与老年 2 型糖尿病合并慢性疼痛的相关性研究

黄沁仪 孙艳*

安徽医科大学第一附属医院

目的 探讨血糖波动相关参数及其他临床资料与老年 2 型糖尿病(T2DM)合并慢性疼痛的相关性及其风险预测价值。

方法 收集安徽医科大学第一附属医院老年内分泌科住院的 60 例老年 T2DM 合并慢性疼痛患者的临床资料,由专人对所有研究对象利用数字评分量表(NRS)进行疼痛评分,根据疼痛评分分为轻度疼痛组(NRS≤5 分, n=28)和重度疼痛组(>5 分, n=32)。收集患者一般资料及临床检查数据,通过持续葡萄糖监测系统(CGMS)记录血糖情况, Spearman 相关性分析疼痛评分与血糖波动参数及其他临床资料的相关性,二元 Logistic 回归分析老年 T2DM 合并慢性疼痛程度的影响因素,受试者工作特征(ROC)曲线评价 MAGE、CV、TIR 对慢性疼痛程度的预测价值。

结果 Spearman 相关性分析显示,性别、年龄、病程、疼痛持续时间、MAGE、CV、MBG、SD、MODD、最高血糖值与老年 T2DM 患者合并慢性疼痛的疼痛得分呈正相关,RBC、Hb、eGFR、TIR 与老年 T2DM 患者合并慢性疼痛的疼痛得分呈负相关。Logistic 回归分析显示,性别、年龄、病程、疼痛持续时间、RBC、Hb、eGFR、MAGE、TIR、CV、MBG、SD、

MODD 是老年 T2DM 患者合并慢性疼痛程度的危险因素。ROC 曲线分析显示, MAGE 的 ROC 曲线下面积为 0.741,敏感度为 53.1%,特异度为 89.3%; CV 的 ROC 曲线下面积为 0.668,敏感度为 40.6%,特异度为 89.3%; TIR 的 ROC 曲线下面积为 0.763,敏感度为 67.9%,特异度为 84%。

结论 血糖波动相关指标等与老年 T2DM 合并慢性疼痛有相关性,并可能成为预测老年 T2DM 合并慢性疼痛的潜在观察指标。

关键词: 老年 T2DM,血糖波动,慢性疼痛,持续葡萄糖监测,相关性

Insulin Resistance Paradox of TyG Index and Cognitive Impairment in Older Adults without Diabetes: Evidence From A National Retrospective Cohort Study (CLHLS, 2014–2018)

Junjun Liu*

Nanjing Meishan Hospital

Objective There is a significant lack of clarity on the relationship between insulin resistance (IR) and vulnerability to cognitive decline, with conflicting research results. The aim of this research was to conduct a nationwide retrospective cohort study on an older Chinese population without diabetes in order to investigate the relationship between cognitive impairment and triglyceride glucose (TyG) index, which serves as a proxy indicator for IR

Methods The research utilized information from the Chinese Longitudinal Healthy Longevity Survey (CLHLS) 2014–2018 cohort, encompassing 988 non-diabetic adults with an average age of 79.78 ± 9.21 years, of which 572 were male (57.89%) and 416 were female (42.11%). The Mini-Mental State Examination (MMSE) was used to assess cognitive performance. To estimate the relationship between TyG index and cognitive impairment risk, multiple Cox regression analyses were employed. Threshold effects were examined via a two-piecewise logistic regression model. Additionally, interaction and stratified analyses were conducted taking into account characteristics including age, sex, marital

status, exercise habits, smoking, and alcohol consumption

Results Following a 4-year follow-up period, cognitive impairment developed in 201 participants (20.3%) who had normal cognition at baseline. After controlling for variables, the multiple Cox regression analysis revealed no significant link between the TyG score and cognitive impairment (HR = 0.77, 95% CI: 0.56–1.06, P = 0.106). Smoothing plots, however, indicated a non-linear association between the TyG index and cognitive impairment, identifying the inflection point of the TyG index at 7.57 through a two-segmental Cox regression model. A negative connection was found above this inflection point (HR = 0.67, 95% CI: 0.50 - 0.91, P = 0.009), but no significant association was found below it (P = 0.75)

Conclusion This study contributes to the understanding of the "insulin resistance paradox" hypothesis concerning cognitive decline in non-diabetic elderly individuals. The findings offer pertinent insights with implications for informing public health strategies and policy development

关键词: insulin resistance, paradox, triglyceride glucose index, cognitive impairment, older

社区老年人心理状况在慢性躯体疾病和社会支持影响生活质量的中介效应

冯蕾¹ 吴颖敏² 陈玲² 黄烜² 马中锐¹ 周莉华¹ 杨永学¹

1.成都市第五人民医院

2.成都中医药大学管理学院

目的 探究社区老年人心理状况在慢性躯体疾病患者社会支持对生活质量影响的中介效应,为老年人身心健康管理提供理论依据。

方法 采用多阶段随机抽样法,对某城市社区服务中心 60 岁以上的老年人运用计算机诊断系统开展老年慢性躯体疾病、抑郁症和焦虑症筛查,探讨老年人心理状况对慢性躯体疾病、社会支持影响生活质量的因素及相关性,运用结构方程模型进行假设验证。

结果 社区老年人生活质量得分(82.19±11.99)分,社会支持得分(5.37±1.61)分,抑郁得分(1.48±3.59)分,焦虑得分(6.82±5.25)分,80.29%的老年人患有 1 种及以上慢性躯体疾病;慢性躯体疾病、社会支持与心理状况均对老年人生活质量影响显著,其中心理状况影响效用最强,其次是慢性躯体疾病与社会支持;慢性躯体疾病与社会支持可直接影响老年人生活质量,还可通过心理状况的部分中介作用影响老年人生活质量(P<0.05),中介效应分别占总效应的 53.74%、49.10%。

结论 社区老年人生活质量处于中等偏上水平,社会、心理、躯体健康均会影响老年人生活质量,且心理健康是老年人生活质量最重要的影响因素,建议实施家庭-社区-医院三级监测、评估、干预机制,以提升老年人生活质量。

老年住院患者生物膜阳性 KPBSI 患者危险因素分析及血清 CPR、PCT、SAA 变化对预后的评估价值

陈小敏*

金华市第二医院

目的 探讨老年住院患者生物膜阳性肺炎克雷伯菌血流感染的危险因素。

方法 回顾性分析 2019 年 1 月~2020 年 12 月在本院收治的 88 例老年肺炎克雷伯菌血流感染患者,根据患者肺炎克雷伯菌生物膜的检出情况,将其分为生物膜阳性组(n=57)和生物膜阴性组(n=31)。记录两组患者年龄、性别、体质指数(BMI)、合并基础疾病、入住 ICU、使用免疫抑制剂、抗菌药物使用情况、抗生素使用时间、糖皮质激素使用时间、侵袭性操作及血流感染前住院时间等一般资料,对比两组老年住院患者肺炎克雷伯菌耐药情况,采用二分类 Logistic 回归分析影响老年住院患者生物膜阳性肺炎克雷伯菌血流感染的危险因素。

结果 88 例肺炎克雷伯菌血流感染患者共分离出 88 例克雷伯菌,其中生物膜阳性肺炎克雷伯菌 57 例(64.77%),生物膜阴性肺炎克雷伯菌 31 例(35.23%)。生物膜阳性肺炎克雷伯菌对氨曲南、氧

氟沙星、诺氟沙星及环丙沙星的耐药性明显高于对照组 ($\chi^2=5.301$ 、 2.134 、 2.098 、 2.327 , P 均 <0.05); Logistic 回归分析显示, 合并糖尿病 ($OR=2.751$, $P=0.016$)、气管切开或插管 ($OR=2.986$, $P=0.007$)、碳青霉烯类抗生素 ($OR=2.959$, $P=0.010$)、抗生素使用时间 >14 d ($OR=2.649$, $P=0.021$) 均为影响老年住院患者生物膜阳性肺炎克雷伯菌血流感染的独立危险因素。建立老年住院患者生物膜阳性肺炎克雷伯菌血流感染的 Logistic 回归风险预测模型模型预测概率 $P=1/[1+e^{-(2.319+1.012\times(\text{糖尿病})+1.094\times(\text{气管切开或插管})+1.085\times(\text{碳青霉烯类抗生素})+0.974\times(\text{抗生素使用时间}))}]$, Hosmer-Lemeshow $\chi^2=7.685$, $P=0.089$; ROC 分析显示, Logistic 回归风险预测模型预测 VAP 的 AUC 为 0.782。

结论 老年住院患者生物膜阳性肺炎克雷伯菌血流感染的 Logistic 回归风险预测模型具有较好的拟合度和预测效能, 临床可重点关注合并糖尿病、长期使用抗生素的患者, 尽量减少气管切开或插管等侵袭性操作, 合理选择抗菌药物, 以降低肺炎克雷伯菌血流感染的发生率。

The Potential Diagnostic Accuracy of Urine Formaldehyde Levels in Alzheimer's Disease: A Systematic Review and Meta-analysis

Fan Chen^{1,2}, Xiaping He³, Zhenhe Zhou¹

1.Mental Health Center Affiliated to Jiangnan University

2.Wuxi Medical College of Jiangnan University

3.School of Basic Medical Sciences of Dali University

Objective Formaldehyde (FA), a toxic aldehyde, has been shown to be associated with a variety of cognitive disorders, including Alzheimer's disease (AD). There is increasing evidence that FA levels are significantly increased in AD patients and may be involved in the pathological process of AD. The aim of this study was to assess the potential diagnostic value of urine FA levels in AD using meta-analysis techniques

Methods Original reports of morning urine FA levels in AD patients and healthy controls (HCs) were included in the meta-analysis. Standardized mean differences (SMD) were calculated using a random-effects model, heterogeneity was explored using methodological, age, sex difference and sensitivity analyses, and receiver operating characteristic (ROC) curves were constructed to assess the diagnostic value of urine FA levels in AD

Results A total of 12 studies were included, and the urine FA levels of 874 AD patients and 577 HCs were reviewed. Compared with those in HCs, the FA levels were significantly increased in AD patients. The heterogeneity of the results did not affect their robustness, and results of the area under the curve (AUC) suggested that urine FA levels had good potential diagnostic value

Conclusion Urine FA levels are involved in AD disease progression and are likely to be useful as a potential biomarker for clinical auxiliary diagnosis. However, further studies are needed to validate the results of this study

关键词: Alzheimer's disease, meta-analysis, formaldehyde, biomarkers, diagnosis

老年科患者护理管理中深入中医药文化建设的实践与效果

蓝敏*

金华市第二医院

目的 研究老年科患者护理管理中深入中医药文化建设的实践与效果。

方法 将 2021 年 1 月到 2021 年 12 月老年科开展深入中医药文化建设的护理管理时状况, 作为实施后阶段。将 2020 年 1 月到 2020 年 12 月老年科未开展深入中医药文化建设的护理管理时状况, 作为实施前阶段。纳入各 40 例老年科患者。纳入各 40 例老年科患者。其中, 实施前阶段中, 男 20 例, 女 20 例, 年龄在 61 岁~79 岁, 平均 (67.33±4.16) 岁。实施后阶段中, 男 19 例, 女 21 例, 年龄在 61 岁~78 岁, 平均 (67.29±4.22) 岁。共纳入科室 10 名护理

人员,其中男性护士2名,女性护士8名。年龄在31岁~43岁,平均(40.61±3.45)岁。

结果 实施后阶段,中医药文化建设水平评分、中医药特色护理文化水平评分、科室中医药文化环境评分、临床护理管理质量评分、中医药文化知识掌握评分、遵医依从性评分、患者满意率,相比实施前阶段的均显著提高($p<0.05$);实施后阶段,患者中医症候积分值,相比实施前阶段的均显著降低($p<0.05$)。实施后阶段,患者症状好转所需时间、下床活动所需时间,相比实施前阶段的均显著缩短($p<0.05$)。

结论 针对老年科患者,开展深入中医药文化建设的护理管理的实践与效果显著。

双相情感障碍合并糖尿病患者发生认知功能障碍的危险性分析

徐莉* 夏乐宏

丽水市第二人民医院

目的 探讨合并2型糖尿病(T2DM)的双相情感障碍(BD)患者认知功能的危险因素。

方法 选择2020年3月—2022年4月本院接受治疗的BD患者50例,根据有无认知功能障碍(CI)分为CI组(30例)和正常组(20例)。比较2组患者的临床资料,采用多因素logistic回归分析筛选BD患者认知功能障碍发生的影响因素,并用ROC曲线比较不同危险因素对认知功能障碍的预测价值。

结果 合并T2DM的BD患者的MoCA量表各维度评分除语言和定向力外均显著低于单纯BD患者(t 值分别为2.029、3.079、3.86、2.250、3.497、6.025, $P<0.05$)。多因素logistic回归分析结果显示BMI、T2DM、HAMD评分、HbA1c、LDL-C水平均为BD患者发生认知功能障碍的影响因素($P<0.05$)。

本研究局限性是样本量较小,仍需进一步增加样本量来验证该结论,而且有关BD和T2DM的共同发病机制尚未明确,仍需进一步的体内外实验进行验证。最后,有关脂代谢异常与BD患者认知功能障碍的研究机制也尚不明确,还需进一步

研究寻找相关作用基因和信号通路。总之,本研究结果显示BMI、T2DM、HAMD评分、HbA1c、LDL-C水平可能为

关键词:双相情感障碍合并糖尿病

老年痴呆合并隐匿性肺炎的CT征象与死亡预后的相关研究

罗长国*

金华市第二医院

目的 分析老年痴呆患者合并隐匿性肺炎的CT征象特点,以及与死亡预后的相关性,为评估临床预后提供客观的CT风险评分。

方法 回顾性总结2018年10月至2022年10月我院老年痴呆患者93例为研究对象,年龄 ≥ 70 岁,平均(78.6±6.9)岁,卧床39例。其中52例合并隐匿性肺炎(观察组),另外41例未合并隐匿性肺炎(对照组)。比较两组患者的临床资料和CT征象。观察组根据临床预后分为存活36例和死亡16例,对照组分为存活36例和死亡5例。

结果 单因素比较发现,观察组卧床比例高于对照组,痴呆病程延长,基础肺部疾病增多,CT征象(斑片状浸润影、肺气肿和积液)增多($P<0.05$),但两组血清白细胞计数、中性粒细胞百分比、C反应蛋白(CRP)和降钙素原(PCT)水平无明显差异($P>0.05$)。观察组死亡率显著高于对照组[30.8%(16/52)比12.2%(5/41), $\chi^2=4.524$, $P=0.033$]。双肺采用8区分类法进行CT征象半定量评分,总分24分。死亡患者合并隐匿性肺炎增多,CT评分和PCT升高,而自主进食减少($P<0.05$)。多因素Logistic回归分析显示,隐匿性肺炎($OR=2.659$,95%CI=2.102~3.326, $P<0.001$)和CT评分($OR=3.325$,95%CI=2.589~3.758, $P<0.001$)是老年痴呆患者死亡的危险因素。受试者工作曲线(ROC)显示,CT评分预测老年痴呆患者死亡的曲线下面积(AUC)为0.856(95%CI=0.801~0.899, $P<0.001$),敏感度为85.6%,特异度为89.7%,临界值为15分,即CT评分 >15 提示老年痴呆患者死亡风险较高。

结论 老年痴呆患者有较高的隐匿性肺炎患病率,常常缺乏典型临床症状,常规血生化也无显著

改变，CT 征象是辅助诊断隐匿性肺炎的重要工具。隐匿性肺炎增加了老年痴呆患者的院内死亡风险，采用双肺 CT 半定量评分法能够指导临床识别死亡高风险患者，准确性较好，为临床开发了一款实用性较强的诊断工具。

磁共振薄层扫描结合人工智能脑结构分割技术分析海马体积辅助诊断脑小血管病认知功能障碍

王含春*

金华市第二医院

目的 分析磁共振薄层扫描结合人工智能脑结构分割技术分析海马体积辅助诊断脑小血管病认知功能障碍的应用价值。

方法 选择确诊为脑小血管病患者 84 例，入院采用简易智力状态检查量表 (MMSE) 分为认知功能障碍组 39 例和正常组 45 例。采用 1.43T 磁共振薄层扫描结合人工智能脑结构分割技术分析内侧颞叶区和海马的体积绝对值及百分比。

结果 认知功能障碍组年龄大于正常组 ($t=8.63$, $P<0.05$)，内侧颞叶区和海马的体积绝对值及百分比明显低于正常组 (t 分别=5.86、5.00、6.03、9.63, P 均 <0.05)，而内侧颞叶萎缩视觉 (MTA) 评分明显高于正常组 ($t=4.75$, $P<0.05$)。Spearman 检验显示，内侧颞叶区和海马的体积绝对值及百分比与 MTA 评分呈负相关 (r_s 分别=-0.46、-0.50、-0.60、-0.63, P 均 <0.05)，与 MMSE 评分呈正相关 (r_s 分别=0.41、0.49、0.57、0.60, P 均 <0.05)。受试者工作特征曲线 (ROC) 显示，海马体积百分比预测认知功能障碍的曲线下面积为 0.88, 95%CI 0.82~0.90, 最佳临界值为 0.31%，即海马体积百分比 $<0.31\%$ 诊断认知功能障碍的灵敏度为 80.53%，特异度为 85.62%。

结论 磁共振薄层扫描结合人工智能脑结构分割技术能够精准定位脑功能亚区，通过准确测量海马体积能够辅助诊断脑小血管病的认知功能障碍，海马体积百分比 $<0.31\%$ 有较好的诊断性能。

脑卒中合并情感障碍病人的治疗及护理研究进展

吴霞*

金华市第二医院

目的 脑卒中是一种常见的神经系统疾病，若其合并情感障碍则需要特殊的治疗和护理。其中，脑卒中合并情感障碍患者的治疗及护理是一个复杂而重要的过程，需要综合运用药物治疗、心理治疗和社会支持等多种手段，以提高患者的康复效果和生活质量。故而对脑卒中合并情感障碍患者的治疗及护理研究进展加以明确就显得尤为重要。

脑卒中是一种常见的神经系统疾病，其发生率和死亡率在全球范围内都呈现出不断上升的趋势。脑卒中不仅给患者的生理功能带来严重的影响，还常常导致患者出现各种情感障碍，如抑郁、焦虑等。这些情感障碍不仅给患者的康复和生活质量带来了极大的困扰，也给其家人和社会带来了重大的负担。随着医学科技的不断发展，对脑卒中合并情感障碍病人的治疗和护理研究也在不断深入。许多学者和医生们致力于探索有效的方法来改善脑卒中患者的情感障碍，并提高其康复的成功率。这些研究涵盖了药物治疗、心理干预、康复训练等多个方面，取得了一定的进展。

结论 脑卒中合并情感障碍的治疗和护理研究取得了重要的进展，为患者带来了希望和改善。然而，我们仍然面临着挑战和不足之处，需要继续努力提高治疗效果和护理质量。相信在医疗技术和护理理念不断创新的推动下，能够为脑卒中合并情感障碍病人提供更好的治疗和护理，帮助患者重返健康和幸福的生活。

针灸联合草酸艾司西酞普兰治疗脑卒中后抑郁临床研究

余娜*

金华市第二医院

目的 探讨针灸联合草酸艾司西酞普兰治疗脑卒中后抑郁的临床疗效及安全性。

方法 按随机数字表法将浙江金华市第二医院2019年1月-2020年12月期间收治的70例脑卒中后抑郁患者分为治疗组与对照组。对照组35例给予草酸艾司西酞普兰治疗,治疗组35例联合针灸治疗。分别检测2组治疗前后各神经功能相关因子[中枢神经系统特异性生物蛋白(S100B)和髓鞘碱性蛋白(MBP)]水平,应用汉密尔顿抑郁量表(HAMD)(17项版)评定抑郁状况,简易精神状态量表(MMSE)筛选认知功能障碍,美国国立卫生研究院卒中量表(NIHSS)评定神经功能缺损状况,功能独立性评定量表(FIM)评定患者日常独立生活能力变化,并记录其疗效及不良反应发生情况。

结果 与对照组比较,治疗组总有效率更高(94.29%vs 74.29%)($\chi^2=5.285, P=0.022$);2组治疗前S100B、MBP因子比较无差异($P>0.05$),治疗组治疗后S100B、MBP因子水平均低于对照组($P<0.05$);两组治疗前HAMD、MMSE、NIHSS与FIM评分比较无差异($P>0.05$);治疗组治疗后HAMD与NIHSS评分低于对照组,MMSE与FIM评分高于对照组($P<0.05$);治疗组不良反应发生率5.71%,对照组为14.29%,2组比较差异无统计学意义($P=1.429, \chi^2=0.232$)。

结论 针灸联合草酸艾司西酞普兰治疗脑卒中后抑郁的临床疗效较理想,能有效改善患者神经功能相关因子水平、卒中后抑郁、认知功能障碍,促进其神经功能恢复,提高日常生活能力,未增加用药不良反应,值得推广。

某院老年精神科中成药应用现状与需求调查

余英*

金华市第二医院

目的 调查某院老年精神科中成药应用现状与需求。

方法 选择随机等距抽样的方法抽取2021年6

月~2022年6月金华市第二医院老年精神科就诊患者调查其中成药的应用现状与需求。

结果 本研究共计纳入金华市第二医院老年精神科患者1260例,中成药的使用率为71.98%。使用1种中成药的患者占46.43%;使用2种中成药的患者占18.10%。中成药的累积用药频次共1342次。常用中成药功效类型包括养心安神药(33.53%)、补肾安神药(22.73%)、清肝安神药(19.37%)。安神类中成药的累积使用频次为1015次,占75.63%。最常用的9种药物为枣仁安神颗粒、舒眠胶囊、乌灵胶囊、九味镇心颗粒、清脑复神液、百乐眠胶囊、养胃颗粒、麻仁丸、稳心颗粒。使用率排第1位的中成药是枣仁安神颗粒,占18.26%;排在第2位的中成药是乌灵胶囊,占14.90%;排在第3位的是稳心颗粒,占14.01%。1260例患者对中成药的整体需求率达95.24%。患者对口服类中成药的需求率最高,达94.44%。在中成药药物作用方面,具有安神作用的药物需求率最高,达67.78%;在中成药科普知识方面,有超过6成的患者对饮食、生活注意事项、药物贮藏与保存、药物毒性与禁忌、剂量与疗程规范有需求。

结论 该院老年精神科中成药使用率较高,尤其是口服类安神药,包括枣仁安神颗粒、乌灵胶囊等。患者对中成药的需求率高,尤其是具有安神作用的口服类中成药,对中成药科普知识的需求率较高。

血府逐瘀汤联合耳穴埋豆治疗老年失眠的疗效分析

周学平*

金华市第二医院

目的 研究中药联合中医耳穴埋豆在老年失眠中的效果。

方法 回顾性分析2017年7月至2020年3月期间我院纳入研究的124例老年失眠患者的临床资料,将其按照随机数字表法分为实验组和对照组,每组各62例。实验组男性34例,女性28例,年龄为61~86岁,平均年龄(71.34±4.59)岁;病程7.2个月~47.4个月,平均病程(18.2±4.2)个月。对照组:男

性 36 例, 女性 26 例, 年龄为 60~88 岁, 平均年龄 (71.43±4.52 岁; 病程 7.0 个月~48.3 个月, 平均病程 (18.5±4.1)个月。实验组予以血府逐瘀汤联合耳穴埋豆治疗, 对照组予以单纯耳穴压豆治疗, 对两组患者治疗前后的睡眠质量及临床疗效的进行对比。

结果 治疗后, 实验组与对照组患者的睡眠质量量表条目评分及总分均较治疗前降低, 对比存在明显差异($P<0.05$)。治疗后, 实验组患者的睡眠质量量表条目评分及总分均低于对照组患者, 对比存在明显差异($P<0.05$)实验组的总有效率明显高于对照组患者, 两组对比存在明显差异 ($P<0.05$)。

结论 血府逐瘀汤联合耳穴埋豆治疗老年失眠的疗效显著, 且耳穴埋豆疗法具有简便易行、治疗次数少、治疗方式灵活的优点, 是值得临床推广的治疗方法。

关键词: 血府逐瘀汤, 耳穴埋豆, 老年失眠

某三甲医院老年科病区中成药使用情况调查

周永乐*

金华市第二医院

目的 对某三甲医院(金华市第二医院)老年科病区中成药的使用情况进行调查, 基于相关数据分析问题, 提出中成药管理建议, 促进中成药合理、安全使用。

方法 通过随机分层抽样的方法对 2021 年 1 月-12 月期间该院老年科病区中成药处方进行分析, 每月抽取的中成药处方绝对数为 36 张, 共计抽取 2021 年的中成药处方数 432 张。由课题组成员对该院老年科病区中成药处方信息进行分类统计, 统计中成药功效、剂型、常用药物等特征, 并开展中成药处方点评以了解用药合理性。

结果 本次调查的 432 张中成药处方中共计包括 26 种中成药, 主要的功效类别为祛瘀药(71.76%)、安神药(24.31%)、扶正药(22.69%)、开窍药(18.52%)。中成药的主要剂型为胶囊剂(37.02%)、丸剂(26.11%)、片剂(22.12%)。常用药物依据累积处方频率从高到低排序依次为脑心通胶囊(17.36%)、速效救心丸(15.28%)、复方丹参滴丸(10.42%)、通心络胶囊(9.95%)、麝香保心丸(9.26%)、复方海蛇胶囊(8.10%)、安脑片(7.41%)、

银杏叶片(6.48%)、复方苻蓉益智胶囊(6.02%)。处方点评发现, 共 24 张处方出现用药不适宜问题, 发生频率为 5.56%。主要包括联合用药不适宜(1.62%)、特殊人群用药不适宜累(1.62%)、有配伍禁忌或不良相互作用(1.16%)、重复给药(0.70%)。

结论 该院老年科病区中成药多用祛瘀药, 多配伍安神、扶正、开窍药, 药物剂型以胶囊剂、丸剂、片剂等传统剂型为主, 常用药物均为医保覆盖药物, 药效理想。应针对目前仍然存在的不合理用药情况加强管理, 规避用药风险, 促进合理用药。

中医“象思维”模式在中医老年科临床带教中的应用效果

宋永亮*

金华市第二医院

目的 观察中医“象思维”模式在中医老年科临床带教中的应用效果。

方法 2019 年 1 月到 2019 年 12 月, 我院中医老年科未实施基于中医“象思维”模式的临床带教, 将此阶段作为实施前阶段, 从中抽取参与科室临床带教的实习医学生 25 名。其中, 实施前阶段, 25 名实习医学生中, 10 名为女性, 15 名为男性, 年龄在 26 岁~28 岁, 平均(27.33±1.19)岁。实施后阶段, 25 名实习医学生中, 10 名为女性, 15 名为男性, 年龄在 26 岁~28 岁, 平均(27.28±1.22)岁。2020 年 1 月到 2020 年 12 月, 我院中医老年科实施基于中医“象思维”模式的临床带教, 将此阶段作为实施后阶段。从中抽取参与科室临床带教的实习医学生 25 名。比较开展基于中医“象思维”模式的临床带教前后的科室疾病管理质量考核评分、临床带教质量水平评分、岗位胜任力评分、中医临床思维能力水平评分、临床带教满意度评分。

结果 实施后阶段中, 实习医学生的科室疾病管理质量考核评分、临床带教质量水平评分、岗位胜任力评分、中医临床思维能力水平评分、临床带教满意度评分, 同实施前阶段比较而言均显著升高($p<0.05$)。

结论 将基于中医“象思维”模式的临床带教用

于中医老年科,在提升实习医学生临床带教水平中的作用显著,更有利于促使中医诊疗质量、岗位胜任力、中医临床思维能力水平提升,让实习医学生对临床带教模式更满意。

针灸在调节炎性因子并改善认知障碍中的作用与进展

李嶙嶙^{1,2} 汪子琪² 陈蕾^{1,2} 冯乾森^{1,2} 岳玉川^{1,2}

1.遵义医科大学护理学院

2.成都市第四人民医院

目的 了解目前针灸对于炎性因子的作用和认知障碍的影响,为进一步明确针灸改善认知功能的脑内作用靶器官或靶点,及是否可能通过针灸抑制炎症通路激活、炎症因子的释放等途径精确导航治疗认知障碍提供新的研究思路。

方法 计算机检索 Embase、PubMed、The Cochrane Library、Web of Science、CBM、维普数据库、万方、中国知网,检索了针灸对于炎性因子和认知障碍的作用随机对照研究,检索时限为建库至2024年6月,阅读并整理。

结果 针灸疗法具有通经脉、调气血,使阴阳归于相对平衡、脏腑功能趋于调和的作用。其疗效确切、副作用小,尤其在调控炎症性疾病中显示出独特的优势。

炎性因子,如肿瘤坏死因子- α (TNF- α)、白细胞介素- 1β (IL- 1β)等,常见于多种疾病中。它们的产生和释放可导致小胶质细胞被大量激活,进一步分化并分泌促炎因子、氧自由基和活性氧等物质,对神经元产生毒性作用,造成不可逆的神经元损伤。这些炎性因子也可诱导脑内神经元-淀粉样蛋白前体蛋白(APP)合成增加和 β 淀粉样蛋白(A β)产生。A β 与炎症因子在脑内形成恶性循环,相互促进,从而增加A β 的生成和神经元的变性死亡。这一过程涉及到阿尔兹海默病认知损害的重要病理机制—神经炎症。近期的研究发现,针灸可以刺激迷走神经,通过作用于巨噬细胞、减轻肥胖体质促进乙酰胆碱释放、抑制海马区小胶质细胞的活化等,从而抑制炎症细胞因子TNF- α 、IL- 1β 、IL-6等的合成与释放,

从而改善学习和记忆能力。这些发现为针灸治疗阿尔茨海默病提供了新的理论依据。

结论 针灸通过调节神经-免疫-内分泌网络,改变神经元内环境,降低炎症因子水平,从而改善认知障碍。但目前针灸对神经炎症的抑制作用具体是通过哪一个靶点器官实现的还未能明确,这对于针灸是否能够通过认知障碍相关抗炎途径精确导航治疗认知障碍具有重要意义,也为认知障碍相关疾病机制研究提供了新思路 and 新的突破点。

关键词:针灸;炎症因子;认知障碍;阿尔茨海默病;淀粉样蛋白

血清 miR-17、miR-34a 与 VEGF 在老年血管性痴呆中的表达与相关性分析

陈建飞*

金华市第二医院

目的 探讨血清微小核糖核酸-17(miR-17)、微小核糖核酸-34a(miR-34a)与血管内皮生长因子(VEGF)在老年血管性痴呆(VD)中的表达水平与相关性。

方法 收集2022年6月至2023年5月于金华市第二医院就诊的老年VD患者和轻度认知功能障碍(MCI)患者各35例,选取同期健康体检者30例为对照组。采用简易智能状态检测量表(MMSE)对受试者进行评分,采用定量反转录酶-聚合酶连锁反应(qRT-PCR)检测三组受试者血清miR-17、miR-34a水平,采用酶联免疫吸附试验(ELISA)检测VEGF水平,并采用Pearson相关系数和ROC曲线分析三者在VD中相关性和对VD的诊断价值。

结果 VD组和MCI组患者MMSE评分、血清miR-17、VEGF表达水平显著低于对照组($P < 0.05$),且VD组低于MCI组($P < 0.05$)。三组间miR-34a表达水平呈上升趋势,但差异均不显著($P > 0.05$)。Pearson相关性分析表明,MMSE评分与miR-34a水平呈负相关,与miR-17、VEGF水平呈正相关($P < 0.05$)。miR-17、miR-34a与VEGF诊断VD的AUC分别为0.712、0.506和0.898,三者联合检测诊断VD的AUC为0.930。

结论 老年VD患者血清miR-17、VEGF表达下调,而miR-34a表达上调,且与VD的严重程度

密切相关，三者联合检测对 VD 的临床诊断、病情评估具有重要意义。

关键词：miR-17；miR-34a；VEGF；血管性痴呆；表达水平；相关性

老年抑郁认知损害与外周免疫炎症标记物的相关性研究

陈嫣 廖峥雯*

浙江省人民医院

目的 探讨外周免疫炎症标记物与老年抑郁伴认知损害之间的相关性及其对认知损害的预测价值。

方法 在这项回顾性横断面的研究中，我们收集了 40 例老年抑郁伴认知损害患者 (LLD+CI+)、38 例老年抑郁不伴认知损害患者 (LLD+CI-) 和 26 例健康对照组(HC)的人口统计学信息、血液学指标、认知功能评分。分析 CRP、中性粒细胞计数、淋巴细胞计数、单核细胞计数、血小板、系统性免疫炎症指数(Systemic immune-inflammation index, SII)、系统炎症反应指数(System inflammation response index, SIRI)、中性粒细胞/HDL 比值(NHR)、淋巴细胞/HDL 比值(LHR)、中性粒细胞/淋巴细胞 (NLR)、单核细胞/HDL 比值(MHR)和血小板/HDL 比值(PHR)的差异及其与认知功能评分的相关性，并采用受试者工作特征(ROC)曲线分析这些参数的诊断预测潜力。

结果 老年抑郁伴认知损害患者在淋巴细胞、CRP、SII 和 NLR 方面显著升高，且与认知功能密切相关。CRP 是老年抑郁伴认知损害的预测因子。

结论 外周免疫炎症标志物为探究老年抑郁伴认知损害相关病理生理变化及预测提供了一种经济有效的方法，为其发病机制和治疗的研究提供了新的见解。

A Mediation Analysis of The Role of Total Free Fatty Acids on Pertinence of Gut Microbiota Composition and Cognitive Function in Late-life Depression

Liao Zhengluan Zhengluan Liao*

Zhejiang Provincial People's Hospital (Affiliated People's Hospital), Hangzhou Medical College

Objective Extensive evidences exist to confirm correlation among gut microbiota, lipid metabolism and cognitive function. However, there is still a lack of such research in the field of Late-Life Depression (LLD). Our research targeted at investigating relationship among gut microbiota, lipid metabolism, and cognitive deficits in LLD

Methods Twenty-nine LLD patients from the Cognitive Outcome Cohort Study of Depression in Older Adults were contained in our study. Cognitive functions of the patients were evaluated via the Montreal Cognitive Assessment (MoCA) scale, blood samples were collected for evaluation on serum lipid metabolism parameters and fecal samples for gut microbiota determination via 16S rRNA sequencing. Spearman correlation analysis, linear regression analysis and mediation analysis were utilized for exploring relationship among gut microbiota, lipid metabolism and cognitive function in LLD

Results Spearman correlation analysis showed that Akkermansia, total Free Fatty Acids (FFAs) and MoCA scores were significantly correlated ($P < 0.05$). Multiple regression analysis showed Akkermansia and FFAs had tremendous predictive influences upon MoCA score ($P < 0.05$). Furthermore, total FFAs acted a tremendous mediating role in effects of Akkermansia on cognitive function in LLD (Bootstrap 95% CI [0.023-0.557]), and the pathway from Akkermansia to FFAs to cognitive deficit produced a moderate effect size of 40.3%

Conclusion This study revealed cognitive impairment in LLD significantly related to Akkermansia and total FFAs. FFAs is a partial mediator of the relationship between Akkermansia and MoCA. These results help to understand the gut microbial-host lipid metabolism axis in LLD cognitive function

关键词：Late-Life Depression, Gut microbiota, Lipid metabolism, Mediation Analysis

Gut Microbiota Dysbiosis and Inflammation Dysfunction in Late-life Depression: An Observational Study

Chen yan Zhengluan Liao*

Zhejiang Provincial People's Hospital (Affiliated People's Hospital), Hangzhou Medical College

Objective Late-life depression (LLD) is a commonest mental health disorder among the elderly, and hard to identify. Though many studies have found abnormal gut microbiota and inflammatory cytokines in neuropsychiatric disorders, gut microbiota features and peripheral inflammatory responses of LLD remain unclear. And whether they contribute to the identification of LLD needs further study. We analyzed gut microbiota characteristics and abnormal serum inflammatory cytokines in individuals with LLD to explore the combined use of these two factors in LLD discrimination and to identify potential biomarkers of LLD

Methods Fecal samples from 29 patients suffering from LLD and 33 sex- and age-matched healthy controls (HCs) were collected, along with the participants' demographic, smoking history and alcohol use data. The intestinal flora in feces was analysed by 16S rRNA sequencing. The 12 inflammatory factors in peripheral blood were determined by enzyme-linked immunosorbent assay. We first analyzed differences in diversities and compositions of gut microbiota between samples and HCs, and evaluated relations among gut microbiota, inflammatory factors, and neuropsychological scales. Then, with logistic regression and receiver operating characteristic (ROC) curve analysis, we extracted potential biomarkers to predict LLD utilizing the combination of the microbiota and inflammatory cytokines

Results Elevated systemic inflammatory cytokine levels, increased taxonomic richness and changes in gut microbiota composition were found among patients suffering from LLD in contrast with HCs. Under phylum level, relative abundance of Verrucomicrobia among LLD patients was lower relative to HCs. Abundances of Coprococcus, Lachnobacterium, Oscillospira,

and Sutterella were higher in LLD patients under genus level. In contrast, Megamonas, Citrobacter and Akkermansia levels remained lower among LLD patients. Notably, IL-6, IFN- γ , Verrucomicrobia and Akkermansia levels were correlated with depression severity. Our study identified IL-6, Akkermansia and Sutterella as predictors of LLD, and with a combination of gut microbiota features and inflammatory cytokine levels achieved the area under the curve (AUC) of 0.962 in distinguishing LLD patients from HCs

Conclusion To date, this research initially offers evidences for changes within gut microbiota and systemic inflammation in LLD, and reveals a new way to distinguish between LLD and HC based on gut microbiota and systemic inflammation. These findings possibly help elucidate functions of gut microbiota and systemic inflammation on LLD development and offer fresh ideas on biomarkers for clinical use of LLD

关键词: Late-life depression, gut microbiota, inflammation, inflammatory cytokines

阿尔茨海默病患者肠道菌群改变与认知功能损害的相关性研究

杨庚林*

乌鲁木齐市妇幼保健院

目的 探讨阿尔茨海默病(AD)患者肠道菌群改变及其与认知功能损害相关性。

方法 该研究使用临床痴呆评定量表(CDR),将35名AD患者分为轻中度组(15名)和重度组(20名),收集两组患者的粪便样本,对粪便标本进行16S rRNA高通量测序分析粪便中微生物群的组成。采用调查问卷及量表调查AD患者的一般情况、抑郁状态及认知损害状况。通过血液检测AD患者白细胞、血脂、胆固醇等指标。

结果 AD重度组(S)组MMSE, RBANS分值均低于AD轻中度组(M)组($P < 0.01$);肠道菌群 β 多样性分析结果提示两组间菌群多样性差异有统计学意义($P < 0.05$);S组和M组肠道菌门相对丰度差异有统计学意义($P < 0.05$);S组和M组肠道菌属相对丰度差异有统计学意义($P < 0.05$);大肠

埃希氏菌、志贺氏菌与 LPA 呈正相关 ($P < 0.01$), 与 LDL 呈负相关 ($P < 0.05$)。; 双歧杆菌与 RBANS、HLP 呈正相关 ($P < 0.05$), 与 LPA 呈负相关 ($P < 0.01$); 克雷伯杆菌与病程、CDR 呈正相关 ($P < 0.01$)。; 阿克曼菌 (Akkermansia) 与高脂血症呈负相关。; 肠球菌与 CDR 呈正相关。; 乳酸杆菌与年龄呈正相关 ($P < 0.05$); 粪杆菌与 CDR、病程、年龄和 MMSE 负相关 ($P < 0.05$)。

结论 肠道菌群的变化与 AD 患者认知功能的损害具有显著相关性。未来抗 AD 药物可以通过改变肠道菌群优势菌的构成、细菌丰度, 或调节肠道菌群代谢产物来发挥阻止 AD 病理机制, 改善认知功能的作用。

基于代谢组学探索精神分裂症电休克疗效相关免疫炎症特征研究

王玉 张向荣*
南京脑科医院

目的 基于非靶向及靶向代谢组学技术, 结合精神分裂症患者的炎症特征探索免疫炎症在电休克治疗精神分裂症中的作用及其与临床疗效相关性。

方法 采用 GC-MS 及 LC-MS 测量 76 名健康对照组及 78 名精神分裂症患者电休克前后血浆样本广泛代谢谱。R 包 ropls 用于主成分分析及偏最小二乘判别分析展示组间血浆代谢谱差异。R 包 limma 用于单变量统计分析确定组间差异代谢物。R 包 WGCNA 用于加权基因共表达网络分析确认与临床特征显著相关代谢物。Spearman's 相关性分析用于确认精神分裂症患者电休克前后与临床特征显著相关的差异代谢物与其炎症特征的关联。

结果 与对照组相比, 精神分裂症患者基线血浆 594 个代谢物下调, 210 个代谢物上调, 富集分析显示差异代谢物主要与能量代谢等炎症异常相关通路有关。6 次电休克治疗后, 精神分裂症患者血浆 175 个代谢物上调, 54 个代谢物下调, 富集分析显示差异代谢物与能量代谢和炎症调节有关。加权基因共表达网络分析结果显示 turquoise 模块中代谢物表达量与精神分裂症患者的临床症状显著负

相关。取电休克前后差异代谢物与 turquoise 模块代谢物交集后共得到 55 个 ECT 临床疗效相关差异代谢物, 进一步分析显示这些代谢物与花生四烯酸代谢、色氨酸代谢、能量代谢等密切相关。此外, 相关性分析结果显示 ECT 临床疗效相关差异代谢物与系统炎症生物标志物 NLR (中性粒细胞计数/淋巴细胞计数) 密切相关。

结论 外周血多条代谢通路异常和免疫失衡参与精神分裂症的发生发展, 电休克可能通过调节代谢紊乱, 改善免疫失衡发挥精神分裂症治疗效应。

关键词: 精神分裂症、电休克、代谢组学、免疫炎症、犬尿氨酸通路

慢病老年人抑郁状况及影响因素分析——基于 CLHLS 研究

董美君*
自贡市精神卫生中心

目的 了解我国老年人在不同患慢性病数量情况下的老年抑郁现状及其影响因素。

方法 使用 2018 年中国老年健康影响因素跟踪调查 (CLHLS) 横断面数据, 运用描述性统计分析以及独立样本 T 检验和卡方检验分析 65 岁以上老年人慢性病数量情况及抑郁情况, 并采用多元逐步线性回归分析在不同患慢性病数量状况下的老年人抑郁的影响因素。

结果 老年人在不同慢性病数量状态下抑郁得分存在显著差异 ($\chi^2=4.397, p < 0.001$), 根据分析结果表明, 年龄、焦虑得分与抑郁得分呈明显正相关 ($r=0.501, 0.106; p < 0.01$)。且患有慢性病数量与抑郁得分呈正相关。患一种慢性病老年人的状况下, 文盲、未婚、养老机构居住、年龄越大、焦虑得分越高、无养老保险、生活来源不足够、不喝酒、不锻炼身体、自评生活状况较差、自评健康状况较差老年人抑郁得分高。患两种及以上慢性病老年人, 文盲、未婚、独居或养老机构居住、年纪越大、焦虑得分、生活来源不足够、不喝酒、不锻炼身体、自评生活状况较差、自评健康状况较差老年人抑郁得分高。

结论 患有慢性病种类越多、年龄越大、教育程度越低、自评状况较差的老年人心理健康状况越差。关注不同慢性病状况下老年人的心理健康, 完

善老年人精神卫生服务工作，提高其生命、生活质量。

银杏叶治疗老年精神分裂症患者疗效和安全性的 Meta 分析

覃振捐 李嘉豹 韦鑫*

广西壮族自治区脑科医院

目的 银杏叶在传统医学中被广泛应用，被认为具有改善记忆、促进血液循环、抗氧化等多种生物活性。近年来，越来越多的研究表明，银杏叶可能对老年精神分裂症患者的某些症状具有改善作用，但这些研究样本量小，研究结局不一致，且缺乏相关的系统评价。因此，本研究通过文献检索并系统评价银杏叶治疗老年精神分裂症患者的疗效和安全性，为临床合理用药提供循证医学证据。

方法 计算机系统检索英文数据库（PubMed、PsycINFO 和 Cochrane Library）和中文数据库（中国知网、万方数据库），手工检索相关的已发表文献，检索时限为建库至 2024 年 5 月，纳入关于银杏叶治疗老年精神分裂症患者的随机对照试验（Randomized Controlled Trials, RCTs）。由 3 位研究者独立筛选文献、提取数据和方法学进行质量评价，采用 RevMan 5.3 进行 Meta 分析。

结果 共检索到文献 334 篇，最终筛选到符合纳入及排除标准的 RCTs 共 6 篇，包括 492 例老年精神分裂症患者，其中银杏叶组和对照组各 246 例。结果 Meta 分析结果显示，在治疗终点时，银杏叶组的治疗有效率显著高于对照组〔(Risk Ratio, RR) = 1.38, 95% 置信区间 (Confidence Interval, CI): 1.19~1.58, $P < 0.00001$ 〕，差异有统计学意义；银杏叶组阳性与阴性症状量表 (Positive and Negative Symptoms Scale, PANSS) 总分低于对照组〔标准化均数差 (Standard Mean Difference, SMD) = -1.14, 95% CI: -2.01~-0.26, $P = 0.01$ 〕，阴性量表低于对照组 (SMD = -1.23, 95% CI: -1.53~-0.93, $P < 0.00001$)，差异有统计学意义；阳性量表稍低于对照组 (SMD = -0.18, 95% CI: -2.73~3.09, $P = 0.90$)，差异无统计学意义。

结论 银杏叶辅助治疗能提高老年精神分裂症

患者的疗效，能有效改善患者的阴性症状和认知功能，且不会增加不良反应。

关键词：银杏叶；精神分裂症；Meta 分析；疗效。

基于人工智能技术对精神分裂症患者肋骨骨折筛查的研究

蒋荣宾*

赣州市第三人民医院

目的 本研究旨在探讨人工智能 (AI) 技术在精神分裂症患者肋骨骨折筛查中的应用效果，评估其在诊断准确性和效率方面的可行性和优势。精神分裂症患者由于认知障碍和行为异常，往往延误骨折的诊断和治疗，同时，长期服用精神类药物导致骨质疏松，使肋骨骨折的风险增加。因此，提高肋骨骨折筛查的准确性和效率对于保障精神分裂症患者的健康安全和减少医疗纠纷具有重要意义。

方法 本研究采用回顾性分析的方法，选取 2023 年 1 月 1 日至 2024 年 5 月 30 日期间收治的精神分裂症老年患者共 1402 例，所有患者均接受胸部 DR、胸部螺旋 CT 及 AI 辅助诊断系统的检查。具体检查方法如下：胸部 DR 片、胸部螺旋 CT 及重建图像和结合 AI 辅助诊断系统进行快速连续扫描和容积性数据采集，基于深度学习算法对胸部 CT 影像进行智能分析，自动检测肋骨骨折并标示位置、错位情况及是否为陈旧性骨折。通过对比分析三种检查方法的诊断准确性和效率，评估 AI 技术在精神分裂症患者肋骨骨折筛查中的可行性和优势。

结果 研究结果显示，螺旋 CT 及重建图像结合 AI 辅助诊断系统在肋骨骨折筛查中的准确性显著高于传统胸部螺旋 CT 和胸部 DR。AI 辅助诊断系统的诊断准确率超过 99%，所有的诊断都进过两位放射诊断，胸部 DR 诊断准确率约为 52.17%，而胸部螺旋 CT 的准确率约为 87.52%。在 1402 例患者中，胸部 DR 诊断出肋骨骨折 60 例；胸部螺旋 CT 通过两位诊断医师发现肋骨骨折 100 例，结合 AI 辅助诊断系统检测出肋骨骨折 115 例，表明 AI 系统在筛查中具有更高的敏感性和准确性。在诊断效率方面，螺旋 CT 及重建图像结合 AI 辅助诊断系统能够在短时间内完成大量胸部 CT 影像的分析和诊断，

显著提高了诊断效率。相比之下,传统胸部 DR 正侧位片需要人工阅片和分析,耗时较长。具体数据显示, AI 辅助诊断系统在平均 10 分钟内完成一个患者的影像分析,而人工阅片平均需要 30 分钟至 1 小时。

结论 研究表明, AI 辅助诊断系统在精神分裂症患者肋骨骨折筛查中表现出显著的准确性和效率优势。AI 系统能够显著减少人工阅片的工作量,提高诊断准确性,降低漏诊和误诊风险。未来应进一步优化 AI 算法,以更好地支持临床诊断和治疗。

高纤维饮食、肠道菌群与抑郁症: 最新研究进展

林仝鑫¹ 李婷² 朱程³ 仇雅菊⁴ 于恩彦⁴

1.富阳区第三人民医院

2.杭州医学院附属人民医院(浙江省人民医院)康复医学科

3.温州医科大学精神医学学院

4.中国科学院大学附属肿瘤医院(浙江省肿瘤医院)临床心理科

重性抑郁障碍是一种常见的精神疾病,严重影响患者的身心健康、生活质量和社会功能,随着人们工作、生活方式的改变,抑郁症的发病率正逐年上升,而近年新型冠状病毒肺炎的大流行使这一数字呈现出更为明显的上升趋势。传统观点认为,神经递质如 5-羟色胺、多巴胺等的失衡可能是抑郁症的关键病理生理基础。然而,近年来的研究发现,免疫系统的异常、神经可塑性改变、神经炎症反应以及氧化应激等也在抑郁症的发生发展中扮演重要角色。随着肠-脑轴理论的持续发展,肠道菌群与抑郁症之间的关系日益受到关注,肠道菌群不仅能通过代谢产物影响神经递质的浓度和释放,还能调节肠道屏障的完整性和免疫系统的活性,进而影响情绪相关的神经功能。肠道菌群还可以通过产生神经活性分子参与神经发生、可塑性的调控,并能诱导神经炎症和氧化应激反应。高纤维饮食作为一种非药物性的调节手段,通过改善肠道菌群的多样性和组成,促进产生有益代谢产物如短链脂肪酸和调节肠黏膜的

免疫反应对肠道菌群和炎症产生深远的影响。本综述旨在探讨高纤维饮食对肠道菌群调节的机制,以及其通过肠道菌群影响抑郁症的潜在机制,为抑郁症的治疗提供了新的视角和研究方向。

文拉法辛导致牙痛一例

吕文齐 况伟宏*

四川大学华西医院

目的 报道一名老年女性因使用文拉法辛所导致牙痛一例。

方法 个案报道

结果 一名 68 岁汉族女性因“反复担心、情绪低落 6 个月”入院。入院前 6 个月,患者的孙子感冒后,患者逐渐开始反复担心孙子的健康,并逐渐扩大到各种家居事务。她还经历了各种躯体不适,如心悸、出汗和乏力等。患者逐渐出现情绪低落和兴趣下降等抑郁症状。既往在门诊使用艾司西酞普兰和劳拉西泮治疗无效。入院后对患者进行症状量表评估提示: HAMA 评分为 25 分, HAMD-17 评分为 29 分。由于患者目前主要表现为焦虑和抑郁症状,因此患者被处方了文拉法辛 75mg qd, 氯硝西泮 0.5mg bid。3 天后,文拉法辛剂量调整为 150mg qd。然而,在调整文拉法辛剂量后的第二天,患者开始经历牙痛,表现为持续的、尖锐痛,并伴有偶尔的尖锐疼痛,当做咀嚼动作时会加重疼痛。值得注意的是,之前患者没有任何关于牙齿不适的报道。由于严重的牙痛,患者甚至无法进食, VAS 疼痛评分为 5 分。查体: 未见面部皮肤及口腔黏膜异常, 龈部无肿胀, 无缺牙, 颞下颌关节无明显功能障碍征象。停用文拉法辛后,患者不再抱怨牙痛。然而,她仍然表现出与心悸有关的不适。随后,我们将抗抑郁药调整为舍曲林, 滴定至 150mg qd 后,患者焦虑抑郁症状明显改善。随后嘱咐患者遵医嘱服药, 定期于门诊评估疗效和副作用情况, 并嘱咐患者定期门诊评估记忆功能变化情况。

文拉法辛是 5-羟色胺和去甲肾上腺素再摄取抑制剂(SNRI), 广泛用于治疗抑郁和焦虑。在临床实践中, 它是一种安全且耐受性良好的抗抑郁药。文拉法辛最常见的副作用是恶心和呕吐。据我们所知,

目前还没有关于文拉法辛或任何 SNRIs 引起牙痛报道。在某些情况下, SNRIs 甚至被用于缓解疼痛。一项系统综述显示文拉法辛是一种安全且耐受性良好的镇痛药物, 可对症治疗神经性疼痛。然而, 先前有一份报告详细描述了文拉法辛剂量相关的感觉异常, 其中年轻男性在达到 150mg/天剂量时表现出上肢刺痛、麻木和瘙痒等症状。当剂量降至 75 mg/d 后症状消失, 但再次增加至 150 mg 后症状又出现。

结论 本病例牙痛的发生和消失与文拉法辛的使用暂时相关, 提示文拉法辛的潜在罕见不良反应。该病例强调了考虑文拉法辛诱导的神经过敏或感觉异常的重要性, 当老年患者在文拉法辛治疗期间出现不明原因的疼痛时, 在这种情况下, 除了充分评估引起疼痛的潜在因素外, 应考虑立即停止文拉法辛并改用其他抗抑郁药物。

上海市城区老年居民 BMI 水平对认知功能的影响及其性别差异和风险因素分析

余璐^{1,2} 岳玲²

1.宿州市第二人民医院

2.上海交通大学医学院附属精神卫生中心

目的 分析 BMI(身体质量指数)对上海市城区老人认知功能的影响。

方法 以 CLAS 队列中的上海社区老年居民作为研究对象,采用统一编制的调查表采集人口学信息、日常生活信息等一般资料。测量身高体重,使用北京版蒙特利尔认知评估(MoCA)来评估认知功能。调查对象按照 BMI 数值分为体重过轻(<18.5 kg.m⁻²)、正常(18.5 ~ 23.9 kg.m⁻²)、超重(24 ~ 27.9 kg.m⁻²)、肥胖(≥28.0 kg.m⁻²)四组。分别比较各组 BMI 不同人群与认知功能的相关性及其影响因素。

结果 共 1000 名社区老人纳入研究,不同 BMI 指数分组间 MOCA 分值 (P=0.040) 存在差异性。肥胖组 MOCA 分值最低 (21.52±4.884)。男性 BMI 与 MOCA 分值存在相关性 (P=0.034) 而女性无明显相关性 (P=0.684)。Logistics 多因素回归分析显示,罹患高血压病 (P=0.001) 和 (P=0.003) 丙氨酸转移酶升高是肥胖老人出现认知功能损害的主要危险因素。

结论 认知功能在不同 BMI 人群中存在差异,

肥胖老人认知功能水平相对最差, 男性 BMI 指数与认知功能的相关性更强, 罹患高血压病及丙氨酸转移酶升高是肥胖老人出现认知功能损害的主要危险因素。

关键词: 认知功能, BMI, 肥胖, 丙氨酸转移酶

健康老龄化背景下回忆疗法联合认知功能训练对阿尔茨海默病患者记忆功能的影响研究

刘天艳*

盐城市第四人民医院

目的 探讨健康老龄化背景下回忆疗法联合认知功能训练对阿尔茨海默病患者记忆功能的应用效果。

方法 选取盐城市某三级甲等精神病专科医院老年科于 2023 年 1 月 1 日~2023 年 12 月 31 日收治的 60 例阿尔茨海默病患者,采用随机数字表法进行分组,分为观察组和对照组各 30 例,对照组行常规护理干预,观察组患者 30 例,在对照组基础上实施回忆疗法联合认知功能训练的护理干预。回忆疗法: ①组织护理人员参加培训工作,重点讲解回忆疗法的具体操作步骤; ②护理人员需要从家属或知情者处获取有用信息, 详细掌握患者的生活习惯、兴趣爱好、以往最重要的事件、文化水平等,结合所掌握的信息去寻找患者熟悉的图画、书籍、音乐、照片、录音、视频等作为回忆疗法的引物; ③内容:借助引导物来引出交谈的主题,引导患者回顾以往的生活,交谈的主题集中在患者过去快乐的经历上,诱导启发患者用语言表达经历过的重大事件,如:与家人、好友共同经历的时光、工作上的美好记忆、旅游中的开心时刻,帮助患者完成生命回顾; ④形式:一对一和小组训练相结合; ⑤时间安排:第 1 个月每周 3 次,第 2 个月每周 1 次,第 3 个月每周 1 次,每次活动时间为 0.5—1 h; ⑥环境布置:布置中融入怀旧的元素,触发患者对过去的记忆,以唤起长辈们曾经拥有的存在价值。⑦对家庭照护者进行指导,介绍疾病知识及照顾技巧,提供回忆疗法的相关材料,鼓励其共同参与。

认知功能训练①注意力训练:根据患者喜好和病情程度,选择难度相对应的游戏或手工训练等项目,并根据其个性特征进行引导,促进其参与的积

极性。②记忆力训练③执行功能训练。④知觉功能训练观察两组阿尔茨海默病患者干预前后的简易精神状态量表(MMSE)、日常生活能力量表(ADL)、记忆与执行筛查量表(MES)的变化。

结果 对阿尔茨海默病患者实施回忆疗法联合认知功能训练后,结果显示:研究组简易精神状态量表、日常生活能力量表、记忆与执行筛查量表均高于对照组,差异均有统计学意义($P<0.05$)

结论 健康老龄化背景下回忆疗法联合认知功能训练应用于阿尔茨海默病患者,老年人认知和智能功能方面未有进一步衰退,能提高患者的日常生活能力,改善患者的记忆功能,值得在临床上进一步推广。

关键词:回忆疗法;认知功能训练;阿尔茨海默病;记忆功能;

相关病理变化的预测作用。

结果 与CN受试者相比,MCI和AD受试者的血浆 ptau-181 水平更高,在MCI受试者中,血浆 ptau-181 水平与A β 病理、tau病理、海马体积、内嗅皮层体积以及记忆域和视空间域量表评分均具有相关性。纵向分析发现,具有高水平血浆 ptau-181 的受试者进展为MCI和AD的风险更高,tau病理、A β 病理沉积速度更快,海马、内嗅皮层、梭状回和内侧颞叶体积萎缩更快、记忆、执行、语言和视空间领域的认知量表分数降低也更明显。

结论 血浆 ptau-181 水平与典型AD病理指标具有相关性,基线期的血浆 ptau-181 水平可预测病程进展和AD病理、认知的纵向变化。血浆 p-tau181 作为一种非侵入性生物标志物,在AD早期检测和预测AD病理方面具有潜在的应用价值。

关键词:阿尔茨海默病,血浆标记物,ptau-181,疾病预测

血浆 ptau-181 对阿尔茨海默病的预测效果研究

倪良卉¹ 倪良卉² 林立³ 杨财水^{4,5} 刘真² 刘真¹

1.北京大学基础医学院

2.北京大学中国药物依赖性研究所

3.中山大学附属第三医院放射科

4.北京师范大学认知神经科学与学习国家重点实验室

5.北京师范大学系统科学学院

目的 评估血浆中磷酸化的 tau181 (ptau-181) 是否可以预测阿尔茨海默病(AD)的病程进展和AD相关的病理变化。

方法 本研究纳入了阿尔茨海默病神经影像学计划(ADNI)数据库中的1055例纵向数据,其中包括378名认知正常受试(CN),496名轻度认知障碍受试(MCI)和181AD痴呆受试。评价指标包括基线期和随访期的A β 病理,tau病理,脑体积和认知量表评分。通过组间比较和偏相关分析分析三组受试者的基线期组间特征和各指标与血浆 ptau-181 的相关性。采用ROC分析对未进展为认知障碍的CN和AD受试者进行分类并确定血浆 ptau181 的划分阈值从而将所有受试者在基线期分为高血浆 ptau181 组和低血浆 ptau181 组。采用COX风险回归模型和线性混合效应模型分析血浆 ptau181 对疾病进展和AD

探究社会技能训练对老年康复期精神分裂症患者社会功能的影响

陈强*

吉林省神经精神病医院

目的 探究社会技能训练对老年康复期精神分裂症患者社会功能的影响。

方法 选取60岁以上康复期患者,对照组药物治疗:医生为患者制定治疗方案,每天与患者交流了解病情变化,以调整用药方案。观察组社会技能巽寮:院内治疗:医生根据每名患者症状情况制定药物治疗方案,期间要求患者保持良好的个人卫生习惯。康复治疗过程中培养患者劳动思维改变懒惰习惯,让患者参与娱乐活动调动人际交流能力。在治疗影响下帮助患者逐渐恢复社会功能,改善其退缩和被动行为,以提升其语言表达能力,进而恢复其自信心和人际交往能力。治疗期间组织患者进行社会技能训练,每周2次,每次时间为50min。

结果 应用社会技能训练的老年康复期患者复发少,社会功能恢复好。

结论 精神分裂症具有较高的复发性,该病精神活动不协调,有行为、情感、知觉、思维等方面障碍,对患者社会功能和生活质量均造成严重的影

响。康复期精神分裂症患者会有不同程度心理障碍,存在人际交往困难、抑郁焦虑情绪等,社会技能训练可改善患者不良情绪,以建立积极健康的人生观,进而提升治疗依从性和整体治疗效果。本文研究对老年康复期精神分裂症患者进行社会技能训练干预,实施效果较为理想,可一定程度改善患者对疾病的认知,使其积极配合治疗工作,以促进其恢复社会功能和健康状态。

关键词: 社会技能训练,老年,精神分裂症,社会功能

Research on The Trend of Antipsychotic Drug Use and Its Associated Factors in Persons Living with Dementia

Xiance He¹, Xiance He³, Peiyuan Qiu², Jin Li¹, Wenqi Lv¹, Xin Yang¹, Weihong Kuang¹

1.Mental Health Center, West China Hospital, Sichuan University, Chengdu, People's Republic of China

2.Department of Epidemiology and Statistics, West China School of Public Health and West China Fourth Hospital, Sichuan University, Chengdu, China

3.The Fourth People's Hospital of Chengdu, Chengdu, China

Objective Behavioral and psychological symptoms are present in over 90% of persons living with dementia, who are often treated with psychotropic medications, particularly antipsychotics. However, the benefit-to-risk ratio of antipsychotic use in persons living with dementia is suboptimal. Foreign research indicates variability in the utilization of antipsychotics within persons living with dementia, but there is a lack of such studies in our country. This study aims to investigate the evolving trends and contributing factors of antipsychotic use in persons living with dementia

Methods A repeated cross-sectional study design was employed to assess the changing patterns of antipsychotic use in persons living with dementia. Study subjects: Persons living with dementia seen at a major comprehensive hospital from January 1, 2009, to December 31, 2021. Inclusion criteria: meeting any ICD-

10 diagnostic criteria for dementia; age ≥ 18 years. Exclusion criteria: meeting ICD-10 criteria for severe mental disorders. Research Methods (1) Data retrieval: Retrieval of persons living with dementia data from the Hospital Information System (HIS); (2) Data integration: Demographic information, type of dementia, medication usage, etc.; (3) Data analysis: Statistical analysis using SPSS 22.0 and R version 4.1.2

Results A total of 35,218 persons living with dementia (48.8% male, 51.2% female), with an average age of 73.98 ± 11.93 years, predominantly diagnosed with Alzheimer's disease. The overall utilization rate of antipsychotic drugs was 30.5%, with a standardized daily dose of 4.29mg. From 2009 to 2021, trends indicated increasing utilization rates of anti-dementia drugs, antidepressants, anxiolytics, antiepileptic drugs/mood stabilizers, and sedative-hypnotics, while the use of antipsychotics exhibited a decreasing trend. Regression analysis demonstrated positive associations of age ≥ 65 years, female gender, Lewy body dementia + Parkinson's disease dementia, vascular dementia, antidepressants, antiepileptic drugs/mood stabilizers, and sedative-hypnotics with antipsychotic use. Negative associations were observed for cholinesterase inhibitors, anxiolytics, and analgesics. Age ≥ 75 years, female gender, vascular dementia, antidepressants, antiepileptic drugs/mood stabilizers, and sedative-hypnotics were positively correlated with increased daily dosages of antipsychotics, while cholinesterase inhibitors, anxiolytics, and analgesics were negatively correlated

Conclusion The utilization of antipsychotic drugs in persons living with dementia is decreasing, without a significant reduction in prescribed dosages. The utilization rates of antipsychotics in persons living with Lewy body dementia and Parkinson's disease dementia have risen, with a 1.2 times higher risk compared to Alzheimer's disease, possibly due to associated psychiatric symptoms. The decreased use of cholinesterase inhibitors, anxiolytics, and analgesics may be related to the decline in antipsychotic drug usage

关键词: Dementia; Antipsychotic drug; Repeated cross-sectional study

老年抑郁症患者血液系统紊乱的研究进展

葛海龙 王高华*

武汉大学人民医院

目的 随着抑郁症造成的疾病负担不断增加,而其中尤其是老年抑郁症带来的危害占将随着人口老龄化而主要位置,然而现今对老年抑郁症发病机制及相关医疗手段仍不清晰。截至 2019 年,全球 65 岁以上的老年人口已达 7.03 亿,据估计,到 2050 年,这个年龄段的老年人口将超过 15 亿。统计数据显示,约有 13.3% 的老年人患有抑郁症,这意味着全球有近 1 亿名老年抑郁症患者。然而,对于老年抑郁症的发病机制和治疗方案认识仍然缺乏。鉴于目前的紧迫情况,迫切需要深入研究老年抑郁症的致病机制,并寻找特定的相关靶点并及时治疗。

方法 一、资源来源和检索策略

第一作者在 2014 年 3 月至 2024 年 3 月期间,在 Pubmed、Web of Science、中国知网、万方学术期刊等数据库中检索了近 10 年的文献。检索的关键词包括“老年抑郁症”、“血液系统”、“血液”,以及“Late life depression”、“Blood”、“Sanguis”、“Elderly depression”。检索的时间范围为 2014 年至 2024 年,共获得了 694 篇相关文献。

二、文献纳入标准和排除标准

1. 纳入标准:与老年抑郁症和血液系统相关的文献;近十年内发表在公开期刊上的中英文文献。

2. 排除标准:非中文或非英文的文献;案例报告、会议论文或编辑意见等文体的文献;重复的相关文献。

结果 老年人抑郁症的发生和发展与血液系统的变化密切相关。具体表现为红细胞代谢失衡、循环细胞尿酸通路过度激活、炎症介质变化,以及血浆中糖皮质激素、甘油三酯、循环表皮生长因子、成纤维生长因子 2 以及其他代谢物的紊乱。老年抑郁症具有隐匿性和危害性突出的特点,这给早期诊断和治疗带来了巨大困难。Tan 等人构建了多种老年抑郁症的预测模型,能够很好地预测老年人中抑郁症状的存在程度,但由于方法学上的限制,目前尚无法在大范围人群中进行广泛测试,因此需要进一步深入研究。此外,研究显示抗抑郁药物可以降低老年抑郁患者的死亡率并显著改善其生活质量。有关抗抑郁药物的疗效研究发现,抗抑郁药物可以

调节血细胞代谢、缓解循环炎症、改善血液代谢紊乱,从而有效的缓解老年患者的抑郁症状。另一项来自中国农村的研究表明,47.26% 的个人医疗支出与抑郁症状密切相关,故抗抑郁药物的使用还可极大程度减少个人、家庭及社会的沉重负担。

结论 老年抑郁症是全球卫生系统面临的重大挑战,其机制研究与药物研发亟待深入研究。本综述显示,老年抑郁症与血液系统紊乱密切相关。由于老年人群的年龄特殊性,通常伴随血液系统功能的紊乱。因此,血液系统紊乱是一种切入老年抑郁疾病的有效且新颖的视角,亟待更多深入的研究及发现。

关键词:老年抑郁症,血液系统紊乱,血液系统

The Interaction of The GABRB3 Gene Mutation and Brain Structure in Major Depressive Disorder

Huifang Xu^{1,2}, Tongtong Li³, Yongbo Hu¹, Qiyong Gong¹, Jin Li¹, Wenqi Lv¹, Xin Yang¹, Wenming Xu³, Weihong Kuang¹

1. West China Hospital, Sichuan University

2. The Fourth People's Hospital of Chengdu

3. West China Second University Hospital, Sichuan University

Objective Major depressive disorder (MDD) is a complex polygenic disorder, whose pathogenesis has not yet been fully elucidated. This study aims to investigate the low-frequency and rare genetic variation of MDD and its relationship with brain neuroimaging, which provides underlying evidence for genetic imaging mechanism of MDD

Methods This study was approved by the Clinical Trials and Biomedical Ethics Committee of Sichuan University. All patients were diagnosed by the Structured Clinical Interview for DSM-IV Disorders. The low-frequency variants and rare mutations (Minor allele frequencies < 0.05) related to depressive phenotypes were filtered based on whole exome sequencing. Enrichment analyses on the set of genetic mutations specific to the MDD were run to investigate biological

functions in the Kyoto Encyclopedia of Genes and Genomes (KEGG) pathway. The pathogenicity rank order was used to explore the degree of genetic contribution to MDD. Then, this study extracted the structural indicators of each subject, including cortical thickness, cortical volume, gyrus curvature and brain sulcus depth by using the individualized brain region segmentation divided into 92 brain regions. The association between the GABRB3 gene and brain structure was performed by two-way analysis of covariance. The brain regions with statistical differences after multiple comparisons via the False Discovery Rate were analyzed post hoc

Results A total of 87 people with MDD and 62 Health Control (HC) was recruited in this study. There were 146 genes mutated in people with MDD compared to HC, enriched in 17 KEGG pathways. The retrograde endocannabinoid signaling pathway was the most significant in function with MDD, in which GABRB3 gene ranked the highest through pathogenicity rank order, and its rs3751582 locus was screened to the genetic imaging analysis. This study found that the curvature of the left precentral gyrus of MDD was reduced compared with HC group ($F=13.898$, $P_{ad}=0.028$); the interaction between rs3751582 and diagnosis had a statistically significant difference in the curvature of the right middle frontal gyrus ($F=13.592$, $P_{ad}=0.039$). The post-hoc analysis found that compared with the HC unmutated group (TT), the absolute value of the curvature of the right middle frontal gyrus of the MDD unmutated group and the HC mutation group (CC+CT) both increased

Conclusion GABRB3 gene mutation occupied an important position in the genetic pathogenicity of MDD. The curvature of the gyri was an index to evaluate the morphology of the cerebral cortex, which may be involved in the pathogenesis of MDD. Abnormal cortical morphology in the left precentral and right middle temporal gyrus may be potential biomarkers involved in the pathogenesis of MDD. Rs375158 mutation was associated with abnormal morphology of the right middle temporal gyrus cortex, leading to dysfunction of neural signaling of γ -aminobutyric acid type A receptors. But it's not about whether it causes MDD or not

关键词: Major depressive disorder; Gene enrichment analysis; GABRB3 gene; Curvature of gyrus

Cannabidiol in Treatment with Mental Disorders: Mechanism and Clinical Research Progress

Huifang Xu^{1,2}, Weihong Kuang¹, Jin Li¹

1. West China Hospital, Sichuan University

2. The Fourth People's Hospital of Chengdu

Objective Cannabidiol (CBD), one of the main components of *Cannabis sativa L.*, has higher safety and tolerability compared with Tetrahydrocannabinol (THC). In addition, CBD has been approved by the Food and Drug Administration (FDA) to treat intractable epilepsy in children. The clinical treatment prospects of CBD are more promising. Besides, numerous studies have found that CBD has anti-depressant, anxiety, stress, and addiction effects and is one of the drug candidates for mental disorders

Methods This review primarily summarized the possible mechanisms and clinical research progress of CBD in the treatment of substance use disorder, major depressive disorder, anxiety disorder, post-traumatic stress disorder, and autism spectrum disorder by reviewing domestic and foreign research

Conclusion CBD works through the endocannabinoid system and multiple receptors, and is expected to become a candidate drug for the treatment of mental illness. However, the clinical trials that have been carried out so far have limitations. This paper aims to provide a theoretical basis for further developing new drugs for psychiatric disorders. CBD and its related compounds are expected to become alternative treatments for mental illness. In the future, a large number of high-quality, multi-center clinical trials will be needed to evaluate the effectiveness and safety of CBD in patients with mental illness

Distinct White Matter Abnormalities and Cognitive Impairments in Deficit Schizophrenia: A Cross-sectional Diffusion Tensor Imaging Study

Ju Gao¹, Doudou Yu², Ming Yin¹, Jin Li¹, Xiaobin Zhang¹, Xiaowei Tang², Xiangrong Zhang³

- 1.The Affiliated Guangji Hospital of Soochow University
- 2.Wutaishan Hospital of Yangzhou
- 3.Nanjing brain hospital

Objective Deficit schizophrenia (DS), characterized by persistent and primary negative symptoms, is considered a promising homogeneous subtype of schizophrenia. According to the disconnection hypothesis, abnormalities in white matter fibers are common in schizophrenia. However, comprehensive measurement of white matter metrics and exploration of the relationships between neuroanatomical changes and cognitive functions in DS patients are still unknown

Methods A cross-sectional study was conducted, including 35 DS patients, 37 non-deficit schizophrenia (NDS) patients, and 39 healthy controls (HC), all male and matched for age and education level. The tract-based spatial statistics method was performed to detect differences in fractional anisotropy (FA), mean diffusivity (MD), axial diffusivity (AD) and radial diffusivity (RD) among these three groups. Cognitive function in DS and NDS patients was assessed using the Mini-Mental State Examination (MMSE) and Mattis Dementia Rating Scale. Correlation analyses were performed between diffusion metrics in regions showing differences and clinical scales

Results The results showed significant differences in diffusion metrics (FA, RD, AD, MD) across DS, NDS, and HC groups, particularly in the corpus callosum, corona radiata, and thalamic radiations. Compare to NDS, DS patients exhibited more reductions in FA and increases in RD, especially in the right posterior thalamic radiation and right superior longitudinal fasciculus. Correlation analysis revealed that lower FA in specific regions was linked to worse cognitive and clinical symptoms

Conclusion These findings reinforce the dysconnectivity hypothesis of schizophrenia and highlight the distinct pathological mechanisms of white matter impairments in DS. Correlations in crucial white matter regions suggest disruptions in thalamo-cortical feedback loops, potentially contributing to the cognitive impairments observed. This provides a deeper understanding of how structural brain changes relate to clinical symptoms

Subcortical Volume Alteration and Correlation with Social Function Under Chlorpromazine Versus Clozapine Treatment in Schizophrenia

Ju Gao¹, Jinxing Jia¹, Yuncheng Zhu², Jin Li¹, Xiaobin Zhang¹, Xiangrong Zhang³, Xiaowei Tang⁴

- 1.The Affiliated Guangji Hospital of Soochow University
- 2.Shanghai Hongkou Mental Health Center
- 3.Nanjing Brain Hospital
- 4.Wutaishan Hospital of Yangzhou

Objective Schizophrenia is a complex psychiatric disorder that affects multiple brain regions, especially those located beneath the cerebral cortex. This investigation examines the differences in subcortical volume between schizophrenia patients treated with chlorpromazine (CPZ) or clozapine (CLZ) and healthy controls and examines how these antipsychotic treatments affect brain structure

Methods High-resolution MRI was used to assess subcortical volumes, with clinical symptoms and social function assessed using PANSS and SSPI scales. Correlate and predictive analyses were performed to explore the relationship between the volume of subcortical structures and social functioning

Results Analysis revealed a significant increase in pallidum and putamen volumes in the CPZ group compared to both the CLZ group and healthy controls.

Thalamic volume was not significantly different between the CPZ and CLZ groups but was reduced compared to controls. A significant correlation between total thalamic volume and improved social function was observed in the CPZ group. According the predictive analysis, only the whole thalamus and bilateral thalamus volume showed statistically significant effects on prediction of SSPI scores

Conclusion Our results highlight distinct neuro-anatomical changes associated with various antipsychotic treatments in schizophrenia. The unique alteration specific of subcortical areas in the different antipsychotic treatment groups reflect different psychopharmacological effect and the thalamus may be a neuroimage biomarker of social function in schizophrenia

关键词: subcortical volume, social function, chlorpromazine versus clozapine, antipsychotic treatment

美金刚治疗阿尔茨海默病性痴呆致活动异常 1 例及分析

李纪迎 张艳*

山东省精神卫生中心

目的 对 1 例阿尔茨海默病性痴呆患者使用美金刚后出现活动异常的临床资料进行回顾并进行相关文献复习, 为临床应用提供参考依据。

方法 阿尔茨海默病性痴呆是最常见老年痴呆类型, 目前尚无法治愈。该病为神经系统退行性疾病具有起病隐袭的特征, 临床上主要表现为记忆障碍、失语、失用、失认、视空间技能损害、执行功能障碍以及人格和行为改变等全面性痴呆。其主要病理改变为老年斑(Senile plaque, SP) 和神经原纤维缠结(Neurofibrillary tangles, NFT)。近年来越来越多的研究证据显示, N-甲基-D 天冬氨酸(NMDA)受体功能损害时, 会影响谷氨酸能神经递质功能, 表现神经退行性痴呆症状, 加速疾病进展。美金刚作为治疗 AD 的常用药物, 可选择性阻断 NMDA 型谷氨酸受体, 增加脑内谷氨酸浓度, 拮抗神经毒性, 延缓神经退行性病变进程。能增加边缘皮质源性神经营养因子的浓度, 进而保护神经细胞, 改善认知功能。其常见的不良反应有头晕、高血压、呼吸困难、

意识模糊、便秘等。活动异常不良反应报道罕见。

结果 本例为 66 岁老年女性, 主诉“记忆进行性下降 3 年, 加重伴言行紊乱半月”, 于 2022 年 8 月 22 日入院。入院体格检查: 血压 142/97 mmHg、心率 90 次/分。精神检查: 意识清, 定向障碍, 未引出感知觉障碍。简单问题可, 难以深入。存在被害妄想, 称自己老伴被邻居害死, 又想害自己的孩子。记忆力下降, 智能明显受损。情绪欠稳定。意志活动总体减退。无自知力。入院辅助检查: 颅脑磁共振: 脑内多发缺血灶、腔隙灶、脑萎缩。韦氏智力: 42; 韦氏记忆: 52; MMSE: 2 分。诊断: 阿尔茨海默病性痴呆(老年型)。入院给予奥氮平、丙戊酸镁缓释片、劳拉西泮等药物治疗, 合并盐酸美金刚 5mg/天改善认知。

结论 患者服用美金刚第二天出现较明显活动异常, 表现起步困难, 行动迟缓, 坐位时身体僵硬后仰。停用美金刚第 2 天上述症状好转, 后活动异常渐消失。

Serum Gut Hormone Levels in Patients with Antipsychotic-induced Gastrointestinal Hypomotility

Yue Xu Xiangrong Zhang*

The Brain Hospital Affiliated to Nanjing Medical University

Objective Constipation is a frequently, however, overlooked side effect in patients treated with antipsychotic medications, which is named as antipsychotic-induced gastrointestinal hypomotility. Gut hormones play important roles in gut motility related to constipation. While gut hormones have not previously been measured together with this side effect. We aimed to investigate serum gut hormones difference in schizophrenia patients prescribed antipsychotic medications

Methods We conducted a cross-sectional study of 88 patients with schizophrenia. Rome IV criteria for constipation and radiopaque markers for colonic transit

time were jointly used to identify gastrointestinal hypomotility in patients with schizophrenia. Moreover, using the self-reported Constipation Assessment Scale (CAS) and the researcher-evaluated Bristol Stool Scale (BSS), we assessed the severity of constipation. Then, Seven gut hormones related to gastrointestinal motility were measured from fasting blood samples. Demographic and clinical data including age, gender, BMI, smoking status, medication, diagnoses, and serum total bile acid levels were further analyzed

Results The age range of patients was between 30 and 65 with an average age of 50.85. There were 44 patients diagnosed with gastrointestinal hypomotility (C), the other 44 patients with normal gastrointestinal hypomotility (NC) had matched age and gender. The main findings were as follows: (1) BSS and CAS scores were significant between the two groups ($p < 0.05$); (2) Gut hormone Ghrelin showed a higher level in the C group than that in the NC group (382.48 (266.79, 467.23) mmol/L v.s. 292.23 (225.55, 417.41) mmol/L, $p = 0.033$); (3) In the C group, there was a negative correlation between Ghrelin level and CAS (Spearman's $r = 0.280$, $p = 0.008$)

Conclusion In addition to antipsychotic pharmacological mechanisms, ghrelin seems to be another way related to antipsychotic-induced gastrointestinal hypomotility. Moreover, patients with antipsychotic-induced gastrointestinal hypomotility seem to have dysregulated enterohepatic circulations of bile acids related to the gut microbiome

关键词: Antipsychotics, Side effect, Gastrointestinal hypomotility

Analysis of The Current Status and Comorbidity Characteristics of Cognitive Impairment in Elderly People in Fujian Region

Wei Wang* Duanhua Xiong Jiawu Ji
Neuropsychiatric prevention and control hospital belongs to the second General Hospital of Fuzhou

Objective To analyze the status quo, comorbidity and related influencing factors of cognitive dysfunction in the elderly in Fujian province

Methods A cross-sectional survey was conducted in 3 districts and 3 townships in Fujian Province from April to May 2023. The enrolled age was ≥ 65 years old. Dementia Community Screening Scale (CSI-D) or 8-item Dementia Screening Questionnaire (AD8) were used as screening tools, in which AD8 scores ≥ 2 or CSI-D ≤ 7 were judged as cognitive dysfunction. The questionnaire was made by ourselves to study the related factors, comorbidity

Results A total of 19385 people completed the survey, The mean age was (71.87 \pm 5.68) years, with the smallest being 65.00 years and the largest being 100.00 years. Among them 3720 cases (19.19%) (2964 people scored AD8 ≥ 2 , 1699 people scored CSI-D ≤ 7 , and 943 people scored AD8 ≥ 2 and CSI-D ≤ 7) had cognitive impairment. There were statistically significant differences in age, education, marital status, residence, insomnia, sleep time, comorbidity and types of comorbidity between the two groups ($P < 0.05$). Chronic gastroenteritis, rheumatoid arthritis, heart disease, cerebrovascular disease, gallstone cholecystitis, cancer and atopic dermatitis were associated with cognitive impairment in the elderly ($P < 0.05$). Multivariate logistic regression analysis showed that age, education level, marital status, residence condition, insomnia, sleep time, number of comorbidities, chronic gastroenteritis, rheumatoid arthritis, cerebrovascular disease, heart disease, gallstone cholecystitis and atopic dermatitis were independent influencing factors. Older age [OR=1.07], widowed OR divorced [OR=1.67], frequent insomnia [OR=1.97], chronic gastroenteritis [OR=1.69], cerebrovascular disease [OR=1.60], heart disease [OR=1.85], gallstone cholecystitis [OR=2.94], allergic dermatitis Patients [OR=2.73] had an increased risk of cognitive impairment. Couples living with two and two [OR=0.63] and three generations living together [OR=0.63] had a significantly lower risk of disease. Conclusion The prevalence of cognitive impairment in the elderly aged ≥ 65 years in Fujian increased with the increase of age, some diseases would increase the risk of cognitive impairment in the elderly, and co-residents could reduce the

risk of cognitive impairment in the elderly

Conclusion The prevalence of cognitive impairment in the elderly aged ≥ 65 years in Fujian increased with the increase of age, some diseases would increase the risk of cognitive impairment in the elderly, and co-residents could reduce the risk of cognitive impairment in the elderly

关键词: the elderly ; cognitive dysfunction ; comorbidity characteristics ; Influencing factors

脑电图相对波段动态检查与帕金森患者认知障碍病情程度的关联性及其疗效评估价值研究

曹媛媛¹ 黄剑 石川² 王玉霞 高志刚¹

1.北京市昌平区中西医结合医院

2.北京大学第六医院

目的 探讨脑电图相对波段动态检查与帕金森(PD)患者认知障碍病情程度的关联性及其疗效评估价值。

方法 选取2020年6月~2023年7月我院收治的98例PD患者设为研究组,另选取同期健康体检者98例设为对照组。所有受检者均接受脑电图相对波段动态检查及简易智力状态检查量表(MMSE)测评,并给予研究组左旋多巴治疗。统计研究组与对照组、研究组不同认知障碍程度患者脑电图相对波段动态检查情况、MMSE评分,分析脑电图相对波段动态检查情况与PD患者认知障碍程度的相关性,比较研究组治疗前后脑电图相对波段动态检查情况。

结果 研究组 α 、 β 波段低于对照组, δ 、 θ 波段高于对照组($P<0.05$)。研究组MMSE分值低于对照组($P<0.05$)。不同认知障碍程度患者脑电图相对波段动态检查情况存在显著差异($P<0.05$);多重比较,轻度认知障碍者 α 、 β 波段低于认知正常者, δ 、 θ 波段高于认知正常者($P<0.05$);中度认知障碍者 α 、 β 波段低于轻度认知障碍者, δ 、 θ 波段高于轻度认知障碍者($P<0.05$);重度认知障碍者 α 、 β 波段低于中度认知障碍者, δ 、 θ 波段高于中度认知障碍者($P<0.05$)。经Spearman检验证实,脑电图相对波段动态检查中 α 、 β 波与认知功能正相关, δ 、 θ 波与认知功能负相关($P<0.05$)。治疗后研究组 α 、 β

波段较治疗前增高, δ 、 θ 波段较治疗前降低($P<0.05$)。

结论 PD患者脑电图相对波段动态检查情况与认知障碍程度具有密切关联性,可用于疾病认知功能及治疗情况的评估。

阿尔茨海默病患者精神行为症状的照护态度及应对方式

白春兰 罗艳*

绵阳市第三人民医院(四川省精神卫生中心)

目的 了解照护者对阿尔茨海默病精神行为症状现状及照护者的照护态度。

方法 对2023年6月-2023年12月于绵阳市第三人民医院住院的阿尔茨海默病住院患者及其照护者进行面对面问卷调查。调查工具为《痴呆病人精神行为症状照顾者问卷(ABS)》、《失智症照护态度量表》。

结果 共有86名阿尔茨海默症患者、86名照护者参与本次调查。86名患者中男性42人,女性44人;年龄分布为58-93岁,平均年龄为77.56岁,病程为0.5年-11年,平均病程为3.74年。86名照护者中家属42名,平均年龄62.05岁;医疗护理员44名,平均年龄58.59岁,平均工作年限4.24年,其中有照护经验的10人,经过照护培训的9人。根据《痴呆病人精神行为症状照顾者问卷(ABS)》,由照护者对阿尔茨海默症患者的精神行为症状进行评估,评估结果显示:阿尔茨海默病患者中出现频次最多的精神行为症状为作息异常,其次是行为异常维度中的幻觉和妄想、言语攻击行为;异常行为中得分最高的是睡眠日夜颠倒,其次是徘徊行为、用餐和如厕行为异常。面对阿尔茨海默病患者的精神行为症状,62.79%的照护者不能有效应对。《失智症照护态度量表》调查结果显示:17.76%的照护者对阿尔茨海默病患者的照护持中立态度,38.27%照护者持消极态度,仅有43.97%持积极态度。

讨论 照护者对阿尔茨海默病患者精神行为症状的照护态度不容乐观,大多数照护者不能有效应对精神行为症状,这可能与照护者年龄偏大,本身

照护能力不足；照护者未接受疾病知识、照护技巧培训；阿尔茨海默病患者最常见精神症状直接影响照护者正常睡眠需求、心理承受能力、照护安全风险有关。

Efficacy, Acceptability and Tolerability of Second-generation Antipsychotics for Behavioral and Psychological Symptoms of Dementia: A Systematic Review and Network Meta-analysis

Wenqi Lyu Weihong Kuang*
West China Hospital, Sichuan University

Objective Behavioral and psychological symptoms of dementia (BPSD) are highly prevalent in people living with dementia. Second-generation antipsychotics (SGAs) are commonly used to treat BPSD, but their comparative efficacy and acceptability are unknown

Methods This study was conducted following the guidelines of the Preferred Reporting Items for Systematic Review and Meta-Analysis (PRISMA). Stata/SE (version 15.1) in a frequentist framework was used for the data analysis. The standard mean difference (SMD) was used to pool the fixed effect of continuous outcomes. We calculated odds ratios (ORs) with corresponding 95% credible intervals (CI) for the categorical variable. Efficacy was defined as the scores improved on the standardized scales. The acceptability was defined as all-cause dropout rate. The tolerability was defined as the discontinuation rate due to adverse effects. The Relative treatment rankings were reported with mean ranks and the surface under the cumulative ranking curve

Results Twenty RCTs with a total of 6374 individuals containing 5 types of SGAs (quetiapine, olanzapine, risperidone, brexpiprazole, and aripiprazole) with intervention lengths ranging from 6 weeks to 36 weeks were included in this NMA. For the efficacy outcome, compared with the placebo, brexpiprazole (SMD

= -1.77, 95% CI -2.80 to -0.74) was more efficacious, and brexpiprazole was better than quetiapine, olanzapine, and aripiprazole. Regarding acceptability, only aripiprazole (OR = 0.72, 95% CI 0.54 to 0.96) was better than the placebo, and the aripiprazole was also better than brexpiprazole (OR = 0.61, 95% CI 0.37 to 0.99). In terms of tolerability, olanzapine was worse than placebo (OR = 6.02, 95% CI 2.87 to 12.66), risperidone (OR = 3.67, 95% CI 1.66 to 8.11), and quetiapine (OR = 3.71, 95% CI 1.46 to 9.42), while aripiprazole was better than olanzapine (OR = 0.25, 95% CI 0.08 to 0.78). (Figure and Table)

Conclusion Brexpiprazole has shown great potential efficacy in the treatment of BPSD, with the highest acceptability of aripiprazole and the worst tolerability of olanzapine. The results of this study may be used to guide decision-making

关键词：BPSD, Antipsychotics, Efficacy, Network meta-analysis

Leveraging Diverse Regulated Cell Death Patterns To Identify Diagnosis Biomarkers for AD

Li Ren Qinge Zhang Xueyan Chen*
Capital Medical University Affiliated Beijing Anding Hospital

Objective The functions of regulated cell death (RCD) are closely related to Alzheimer's disease (AD). However, very few studies have systematically investigated the diagnosis and immunologic role of RCD-related genes in AD patients

Methods 8 multicenter AD cohorts were included in this study, and then were merged into a meta cohort. Then, an unsupervised clustering analysis was carried out to detect

unique subtypes of AD based on RCD-related genes. Subsequently, differently expressed genes (DEGs) and weighted correlation network analysis (WGCNA) between subtypes were

identified. Finally, to establish an optimal risk

model, an RCD. score was constructed by using computational algorithm (10 machine-learning algorithms, 113 combinations).

Results We identified two distinct subtypes based on RCD- related genes, each exhibiting distinct hallmark pathway activity and immunologic landscape. Specifically, cluster.A

patients had a higher immune infiltration, a higher immune modulators and poor AD progression. Utilizing the shared DEGs and WGCNA of these subtypes, we constructed an RCD. score that demonstrated excellent predictive ability in AD across multiple datasets. Furthermore, RCD.score was identified to exhibit the strongest association with poor AD progression. Mechanistically, we observed activation of signaling pathways

and effective immune infiltration and immune modulators in the high RCD.score group, thus leading to a poor AD progression. Additionally, Mendelian randomization screening

revealed four genes (CXCL1, ENTPD2, METTL7A, and SERPINB6) as feature genes for AD.

Conclusion The RCD model is a valuable tool in categorizing AD patients. This model can be of great assistance to clinicians in determining the most suitable personalized

treatment plan for each individual AD patient.

关键词: Alzheimer's disease, artificial intelligence, mendelian randomization, biomarkers.

22-29 分中度, >29 分重度。BPRS 用作精神病性症状检查内容。

结果 一、AD 病人精神症状出现率 33 例病人 (33%) 伴有精神症状, 其中 11 例出现在近记忆下降之前, 包括被害妄想 2 例, 抑郁 6 例, 性格/人格改变 3 例。其余 22 例精神症状呈现在记忆下降之后。100 例病人中, 伴幻觉 9 例 (9%), 依次为幻听 4 例、幻视 3 例和幻嗅 2 例; 伴妄想 11 例 (11%), 依次为被窃妄想 3 例、被害妄想 3 例、关系妄想 3 例和嫉妒妄想 2 例; 伴抑郁 8 例 (8%), 均为轻度抑郁; 伴焦虑 13 例 (13%), 依次为轻度焦虑 10 例、中度焦虑 3 例、无重度焦虑; 伴行为障碍 14 例 (14%), 依次为易激惹 11 例、攻击 3 例。

二、MMSE 与精神症状

100 例 AD 病人中, MMSE 分 24 - 18 分者 73 例, 17-13 分者 27 例。行为障碍在智能损害较重组中出现率 (14/100=14%) 显著高于智能损害较轻组 (13/100=13%) ($P < 0.05$); 幻觉、妄想、抑郁及焦虑无差异 ($P > 0.05$)。

三、精神症状间相互关系

1. 有妄想或/和幻觉的病人 20 例, 易激惹、攻击行为在有幻觉/妄想组中出现率 (分别为 11/100=11%、3/100=3%) 显著高于无幻觉/妄想组 (3/100=3%、1/100=1%, $P < 0.05$)。2. 8 例病人伴抑郁。焦虑在有抑郁组中出现率 (8/100=8%) 显著高于无抑郁组 (2/100=2%, $P < 0.05$)。

结论 随着 AD 疾病程度的加重, 出现精神行为异常者明显增多, 且重度 AD 患者抑郁程度明显高于轻、中度患者。

阿尔茨海默病精神症状学分析

胡垒*

厦门市仙岳医院 (厦门市精神卫生中心)

目的 探讨 AD 病人的精神症状学特点

方法 一、采用简明精神病量表 (BPRS)、汉密尔顿抑郁量表 (HAMD)、汉密尔顿焦虑量表 (HAMA) 调查 AD 病人精神症状。HAMD 参照 Devis JM 标准: <8 分无抑郁, 8-17 分轻度, 18-35 分中度, >35 分重度。HAMA 参照全国量表协作组提供标准 (1993 年): <15 分无焦虑, 15-21 分轻度,

Association between Window Ventilation Frequency and Depressive Symptoms Among Older Chinese Adults

Xinxin Luo* Yuanlong Wang

Department of Psychiatry, The Third People's Hospital of Zhongshan City, Zhongshan, China

Objectives Indoor air pollution exposure is harmful to people's physical and mental health, especially in the elderly population. Depressive symptoms

are the most common mental health issue among elderly individuals. However, evidence linking the frequency of indoor natural ventilation to depressive symptoms in the elderly population is limited

Methods This study included 7887 individuals 65 years and older from 2017 to 2018 the China Longitudinal Healthy Longevity Survey (CLHLS). The frequency of indoor window ventilation was measured as the self-reported times of ventilation of indoor window per week in each season, and the four seasons' scores were added up to calculate the annual ventilation frequency. Depressive symptoms were measured by the 10-item Center for Epidemiologic Studies Short Depression Scale (CES-D). Using three models adjusted for demographic, socio-economic, health status, and environmental factors successively, the correlation between indoor window ventilation frequency and depressive symptoms was verified through logistic regression

Results Among the 7887 elderly people included in this study, 1952 (24.7%) had depressive symptoms. In the fully adjusted model, compared with the lower indoor annual ventilation frequency group, high indoor annual ventilation frequency group was significantly associated with a 33% (OR: 0.67, 95%CI: 0.51–0.88) lower probability of depressive symptoms. Subgroup analysis and sensitivity analysis yielded similar results

Conclusion High frequency of window ventilation is significantly associated with the lower risk of depressive symptoms in Chinese individuals aged 65 and older. This result provides strong evidence for health intervention and policy formulation.

病程对老年焦虑障碍睡眠结构及认知功能的影响

魏佳 齐若兵* 曾金坤

浙江大学医学院附属精神卫生中心 / 杭州市第七人民医院

目的 探讨病程对老年焦虑障碍患者睡眠结构

及认知功能的影响。

方法 选取 2021 年至 2023 年在杭州市第七人民医院老年睡眠障碍科确诊焦虑障碍的患者共 48 例。根据病程长短分为短病程组 (Short duration of illness, SD<3 个月), 共 24 人, 长病程组 (Long duration of illness, LD≥3 个月), 共 25 人。分别采用自制一般情况调查量表, 汉密尔顿焦虑量表 (HMHA), 汉密尔顿抑郁量表 (HAMD), 匹兹堡睡眠指数量表 (PSQI), 简易智力状态检查量表 (MMSE)、蒙特利尔认知评估量表 (Moca) 以及数字广度量表 (DSST) 对患者进行评估, 利用多导睡眠监测仪监测患者睡眠结构。

结果 两组患者在一般人口学资料上无明显差异, 两组患者在汉密尔顿焦虑量表总分、汉密尔顿抑郁量表总分以及匹兹堡睡眠指数量表方面均不存在明显的组间差异。两组患者非 REM 期所占总睡眠时间百分比组间比较无显著性差异, LD 组患者的 N3 期潜伏期时间、N1 期总睡眠时间较 SD 组显著延长 ($P < 0.05$), LD 组患者的简易智力状态检查量表总分、数字广度量表总分, 蒙特利尔认知评估量表总分显著高于 SD 组患者 ($P < 0.05$), 其中, 蒙特利尔认知评估量表在执行功能分量分数上明显高于 SD 组 ($P < 0.05$), 其他分量表上则不具有显著的组间差异。

结论 病程可显著影响老年焦虑患者的睡眠结构, 导致认知功能下降。

A Long-term High-fat Diet Influences Brain Damage and Is Linked To The Activation of HIF-1 α /AMPK/mTOR/p70S6K Signalling

Fei Chen*

Chongqing Medical University

Objective We investigated the effects of the damage of the brain tissue of mice fed a high-fat diet (HFD) or normal diet (ND) and on the molecular mechanisms of autophagy

Methods In this study, Male C57BL/6J mice (13 months old) were divided into ND and HFD group for 24 weeks. The spatial memory learning and memory

was assessed using Morris water maze (MWM) test. For in vitro experiments, BV2 cells were seeded in 100 μ M culture dishes pre-coated with PA. Immunofluorescence staining and Western blot were used to detect the expression of AMPK/mTOR signaling pathway-related proteins. Autophagy levels were assessed by autophagy-related protein expression and transmission electron microscope

Results In our study, we found that 24 weeks of a HFD effectively induced obesity and a change in fur color in mice. In addition, the mice also exhibited deficits in learning and memory. We further found that autophagic flux was impaired in mice after HFD feeding. Hypoxia-inducible factor 1 α (HIF-1 α) expression was significantly increased in HFD-fed mice, and HFD feeding inhibited adenosine monophosphate-activated protein kinase (AMPK) phosphorylation and induced mechanistic target of rapamycin (mTOR) phosphorylation and p70S6K expression. Treatment of HFD-induced BV2 cell model with PA was used to further verify a similar result

Conclusion We concluded that improving tissue hypoxia or enhancing autophagy through the AMPK/mTOR/p70S6K pathway may be a relevant strategy for improving obesity- and ageing-related disorders

关键词: AMPK/mTOR pathway; HIF-1 α ; ageing; autophagy; high-fat (HF) diet; obesity

老年精神障碍患者暴力攻击行为与临床特征的相关性研究

李振阳^{1,2} 班晨^{1,3}

1. 重庆市长寿区精神卫生中心
2. 重庆医科大学附属大学城医院
3. 重庆医科大学附属第一医院

目的 探讨首发老年精神障碍患者的暴力攻击行为与临床特征的相关性。

方法 连续纳入 2023 年 4 月-2024 年 4 月首次在我院住院的符合老年精神障碍诊断标准的 126 例患者, 评估其一般资料问卷 (包括性别、年龄、病

程、暴力行为史、BMI 等)、外显攻击行为量表 (MOAS)、神经精神问卷 (NPI)、长谷川痴呆量表 (HDS) 及临床资料, 根据 MOAS 评分是否 ≥ 4 分将患者分为暴力行为组 (n=72) 和非暴力行为组 (n=54), 对比两组的一般资料、临床资料及 NPI 评分和 HDS 评分差异, 进一步使用二元 Logistic 回归模型分析首发老年精神障碍患者的暴力攻击行为的风险因素。

结果 126 例首发老年精神障碍患者年龄在 65-94 岁, 平均 75.85 \pm 6.33 岁, 其中男性 63 例、女性 63 例, 其中有 72 例 (57.1%) 患者伴有暴力攻击行为。单因素分析中, 两组患者在性别 (p=0.03)、抽烟史 (p=0.02)、暴力行为史 (p=0.00)、NPI 总分 (p=0.00) 等方面具有显著统计学差异 (P<0.05)。二分类 Logistic 回归分析显示 NPI 总分 (OR=1.129)、暴力行为史 (OR=13.66) 是老年精神障碍暴力行为的危险因素。进一步分析, 两组患者 NPI 量表中是否伴有激越攻击 (p=0.00)、焦虑 (p=0.02)、激惹 (p=0.00)、睡眠 (p=0.05) 等症状具有统计学差异 (p<0.05)。二分类 Logistic 回归分析显示, 激越攻击 (OR=25.546) 因子是暴力攻击行为的危险因素。

结论 老年精神障碍患者暴力攻击行为发生率较高, 需要重点关注伴有激越攻击症状和既往有过暴力行为史的老年患者。

青少年抑郁症患者非自杀性自伤行为的心理学机制探讨及风险预测模型构建

汪卫华*

联勤保障部队第 904 医院

目的 进一步探讨青少年抑郁症患者发生非自杀性自伤 (Non-suicidal self-injury, NSSI) 的心理学相关影响因素及构建风险预测模型。

方法 依据《美国精神障碍诊断与统计手册第五版》的标准, 将 2022 年 5 月至 2023 年 11 月按住院顺序在联勤保障部队第九〇四医院常州医疗院区少儿心理科住院就诊的 127 例青少年抑郁症患者分无 NSSI 组 (59 例) 和 NSSI 组 (68 例)。收集儿童期创伤问卷、自尊量表、特质应对方式问卷、青少年

心理韧性量表和防御方式问卷等。通过单因素检验筛选出有意义的自变量 ($P < 0.05$) 纳入多因素 Logistic 回归分析, 筛选影响 NSSI 发生的独立影响因素, 再进一步使用 R 包“rms”绘制预测模型的列线图, ROC 曲线和校准曲线用于评估列线图模型准确性。

结果 127 例患者有 68 例存在 NSSI 行为, NSSI 发生率为 53%。单因素分析两组患者在情感虐待、躯体虐待、情感忽视、躯体忽视、消极应对、自尊总分、情绪控制、家庭支持、心理韧性总分、成熟防御机制等心理学特质方面差异均有统计学意义 (均 $P < 0.05$)。多因素 Logistic 回归分析显示情感虐待、消极应对、家庭支持和成熟防御机制为青少年抑郁症 NSSI 发生的独立影响因素 (均 $P < 0.05$), 其中, 情感虐待和消极应对是危险因素, 家庭支持和成熟防御机制是保护因素。风险预测模型结果提示, 情感虐待和消极应对量表的评分越高, 家庭支持和成熟防御机制量表的评分越低, 所获得的模型得分越高, 意味着 NSSI 的发生风险也相应的增高。校准曲线发现拟合度与参考曲线拟合度较高。风险预测模型 ROC 曲线下面积 (Area under the curve, AUC) 为 0.863, 而情感虐待、消极应对、家庭支持和成熟防御机制 AUC 值分别为 0.811、0.751、0.703 和 0.720, 提示该模型预测青少年抑郁症患者 NSSI 发生风险较单因素效能更佳。

结论 伴 NSSI 行为的青少年抑郁症患者发生率较高, 这可能与童年情感虐待、消极的应对方式、家庭支持少和较少使用成熟防御机制相关。本研究所构建的风险预测模型对青少年抑郁症患者 NSSI 的发生风险具有良好的预测能力。

老年夫妇行动能力受限轨迹的异质性研究

姚明洋¹ 刘利² 邵丽影¹ 韩笑宇¹ 栾燕¹

1. 沈阳市精神卫生中心

2. 中国医科大学

目的 本研究目的在于揭示老年夫妇行动能力受限的多样化发展轨迹, 并分析这些轨迹与个体生物、心理、社会特征之间的关联。通过识别不同行动

能力受限轨迹的群体, 进一步探讨了这些特征如何预测老年夫妇随后的幸福感和生活满意度, 以期为制定有针对性的健康干预措施提供依据。

方法 本研究使用了中国健康与养老追踪研究 (CHARLS) 的数据, 选择了 2011 年至 2018 年期间保持持续婚姻和同居状态, 并参与了所有四次调查的 60 岁及以上的夫妇。使用抑郁量表 (CESD-10) 和自我评估的健康、记忆力、生活满意度等问题进行数据收集。应用卡方检验及多元线性回归分析, 评估参与者不同行动能力受限轨迹类别与基线 (2011 年) 生物、心理、社会特征以及随后 (2018 年) 结局之间的关系。

结果 丈夫和妻子的个体行动能力受限轨迹被分为四组, 每组具有不同的轨迹模式。表现出非典型行动能力受限轨迹的亚组 (包括行动能力受限水平高、持续增加和波动降低) 与不利的基线生物、心理、社会特征相关。

结论 老年夫妇个体行动能力受限可分为四种发展轨迹。表现出非典型轨迹的群体, 如行动能力受限水平高、持续增加或波动下降的个体, 与不利的基线特征紧密相关。早期的生物、心理、社会条件对老年夫妇的行动能力有长期影响, 强调了在制定健康干预措施时考虑这些初始条件的重要性。

Frailty Mediates The Association between Activities of Daily Living Disability and Depressive Symptoms: A Prospective Cohort Study

Yan Liu Bo Li*

Jilin University

Objective Globally, depression is a serious public health problem and it has a high incidence and recurrence rate. The underlying mechanism between the activities of daily living (ADL) disability and depression was not well understood. Our study aimed to explore the mediating role of frailty on the longitudinal association between ADL disability and depressive symptoms

Methods This study analyzed data from the China Health and Retirement Longitudinal Study

(CHARLS) from 2011 to 2018. A total of 2,245 participants aged ≥ 45 years old were included. Linear regression, cox regression, and mediation analysis were used to explore the association of ADL disability with development of depressive symptoms and the potential mediating role of frailty

Results The results showed that both scores on ADL and frailty were positively associated with the risk of depressive symptoms ($P < 0.05$). No interaction between ADL and covariates on depressive symptoms was found for all subgroups. The association between ADL disability and depressive symptom scores was partially mediated by frailty (mediated proportion = 16.05%) in the Chinese middle-aged and elderly population

Conclusion There were positive associations between both scores on ADL and frailty and new-onset depressive symptoms. Individuals with high scores on ADL disability had a higher risk of depressive symptoms, and frailty partially mediated this association

关键词: ADL disability, Depressive Symptoms, Mediating effect, Frailty, CHARLS

Unnatural Death in Schizophrenia-spectrum Disorder and Bipolar Disorder in China

Xinyu Fang Xiangrong Zhang*

The Affiliated Brain Hospital of Nanjing Medical University, Nanjing, PR China.

Objective We aimed to systematically investigate the distribution of all forms of unnatural deaths (including suicide, traffic accidents, drowning, accidental falls and others) and their age characteristics in patients diagnosed with schizophrenia-spectrum disorder (SSD) and bipolar disorder (BD) in Jiangsu Province, China, and further to examine the gender patterns of the death age and causes of unnatural deaths among those patients

Methods In the present study, the sample comprised all patients in Jiangsu province with a primary diagnosis of SSD or BD who died by unnatural causes, including suicide, traffic accidents, drowning, acci-

dental falls, and others, between January 2014 and September 2022 inclusive through the Jiangsu Province Management Information System for Patients with SMI

Results A total of 5885 eligible unnatural death were identified, including 4965 with SSD (2484 male and 2481 female) and 920 (431 male and 489 female) with BD. Of the patients with SSD, 25.5% died from suicide, 20.7 died from drowning, 20.3% died from falling, 15.4% died from road accident, and 18.1% died from other unnatural causes. BD patients died from suicide, drowning, traffic accident, traffic accident, drowning, falling and other unnatural causes accounted for 35.1%, 20.2%, 19.8%, 13.0%, 11.8%, respectively. There were significant differences in death age among the five forms of unnatural death groups (SSD: $F = 161.953$, $P < 0.001$; BD: $F = 33.614$, $P < 0.001$). Furthermore, we found that regardless of the type of unnatural death, the number of deaths in SSD and BD increased with age in almost all causes, with at least half of the unnatural deaths occurring in these patients over the age of 50. Interestingly, our results showed that the females had a higher unnatural death age compared to the males (SSD: $t = 11.630$, $P < 0.001$; BD: $t = 4.742$, $P < 0.001$). there were also significant differences in the proportion of unnatural deaths (SSD: $X^2 = 80.758$, $P < 0.001$; BD: $X^2 = 22.436$, $P < 0.001$) and the corresponding age of death (All $P < 0.001$) between males and females both in SSD and BD patients (All $P < 0.05$), except the death age under the traffic accident between males and females with BD ($P > 0.05$)

Conclusion Our results provided evidence demonstrated that suicide is not the only significant unnatural death in SMI, accidental death (including drowning, falling, traffic accident and others) also need draw enough attention. The elderly become the hardest hit of unnatural death among patients with SSD and BD. Age and gender should be fully considered in future when making mental health policies to prevent and reduce unnatural death among patients with SMI

关键词: Schizophrenia, Bipolar, Unnatural death, Suicide, Accident

一例 5-羟色胺综合征患者的护理

李云雁*

山西医科大学第一医院

目的 总结 1 例 5-羟色胺综合征患者的病情观察和护理问题及护理经验。

方法 5-羟色胺综合征(SS)是一种由于药物及其相互作用产生中枢和外周神经系统细胞突触间隙 5-羟色胺(5-HT)递质浓度过多所致的药物不良反应综合征,该病临床表现为认知功能和行为改变、神经肌肉异常、自主神经功能不稳定三联征。其一种中毒状态由于存在个体差异病人的症状不一但主要表现为 3 大症候群:①精神状态的改变如兴奋、焦虑、轻度躁狂、混乱;②神经肌肉兴奋性异常如肌阵挛、反射亢进、抽搐、共济失调;③自主神经运动功能障碍如畏寒、发热、腹泻、出汗、心动过速、血压升高或降低。入院以后,护士通过观察、病史收集、身体评估、辅助检查等方式,整体评估患者的文化程度、身体、心理,确定护理方面主要关注的问题有:用药护理、症状护理、安全护理、心理护理、健康教育。

结果 通过停用 SSRI 类相关药物,并对护理问题实施护理措施,最终患者病情好转,好转出院。出院 1 个月后回访,患者恢复正常生活。

结论 护士做好预见性的判断和对症处理,最常见的表现为自主神经系统障碍,其次为神经肌肉症状、精神或意识状态改变。5-羟色胺综合征在国内目前重视度尚不够,早期发现、早期干预对于减少临床不良结局有积极作用。提高对 5-羟色胺综合征的认识,尽早确诊和尽早停用激发 5-羟色胺综合征的药物,警惕医源性造成的危及患者生命的 5-羟色胺综合征。

关键词: 5-羟色胺综合征;病情观察;护理

目的 探讨主观认知下降(Subjective Cognitive Decline, SCD)及轻度认知障碍(Mild Cognitive Impairment, MCI)患者降低痴呆风险的生活方式的水平及其与认知功能的关系,为其制定有针对性的健康管理措施、改善老年人认知功能提供参考依据。

方法 本研究为横断面研究,采用方便抽样法于 2022 年 10 月至 2023 年 6 月,在社区、医院招募 55 岁及以上志愿者 300 名。研究人员指导患者填写一般资料调查问卷、主观认知下降问卷 9(subjective cognitive decline-questionnaire 9,SCD-Q9)、老年人快速认知筛查量表(Quick Cognitive Screening Scale For Elderly, QCSS-E)、降低痴呆风险的生活方式量表(Dementia Risk Reduction Lifestyle Scale, DRRLS)、核心神经认知测验(TMT、VFT、AVLT)、APOE 基因、相关生化指标与部分体格检查,研究老年人群生活行为、APOE 基因对认知功能的影响研究。

结果 NC、SCD 和 MCI 三组 DRRLS 总分差异有统计学意义,除了压力管理和精神成长,SCD 和 MCI 组的 DRRLS 各因子分均低于 NC 组。Spearman 相关性分析显示,SCD 和 MCI 患者 DRRLS 和神经认知测验具有相关性;线性回归分析显示,DRRLS 总分和部分条目是 SCD、MCI 患者 TMT、VFT、AVLT 评分的影响因素。

结论 AD 临床前期患者生活方式、APOE 与认知功能存在关联,生活方式的不同维度对认知领域的影响各有不同,社区脑健康服务应该在评估的基础上针对潜在可改变因素制定个体化、精准化的干预措施。聚焦可控危险因素,加强相关健康教育和预防干预,促使老年人采纳有益于降低痴呆风险和促进脑健康的生活方式,对个人的认知水平、减轻家庭和社会负担具有重大意义。

Analysis of Clinical Characteristics and Diagnostic and Treatment Patterns of Patients with Geriatric Psychiatric Disorders

Lingnan Gao Haining Song Zhonggang Wang*

Shandong Daizhuang Hospital

Objective To explore the clinical characteristics and current status of diagnosis and treatment of patients with geriatric mental disorders, and to provide reference for optimizing the diagnosis and treatment plan

Methods A total of 6272 patients with geriatric psychiatric disorders hospitalized from 2017 to 2021 were included. A self-administered survey scale was adopted to collect patients' general information and disease information, including gender, age, disease distribution, medical co-morbidities and other characteristics, for statistical analysis

Results The distribution of geriatric patients with mental disorders by age groups was as follows: 65-70 years old (3508 cases, 55.9%), 71-75 years old (1613 cases, 25.7%), 76-80 years old (786 cases, 12.5%), 81-85 years old (294 cases, 4.7%), ≥ 86 years old (71 cases, 1.1%). 6272 geriatric patients with mental disorders were predominantly female (4144 cases, 66.1%) and fewer male (2128 cases, 33.9%); among them, rural patients were predominantly female patients (4524 cases, 72.1%) and urban patients were less (1748 cases, 27.9%). The composition ratio of the diseases suffered was distributed as follows: the top five were depressive disorders (2796 cases, 44.6%), organic brain mental disorders (894 cases, 14.3%), bipolar disorders (681 cases, 10.9%), medical somatization disorders (632 cases, 10.1%), and schizophrenia (566 cases, 9.0%), with depressive disorders being the most common geriatric mental disorder. Mental and behavioral disorders due to alcohol use (90 cases, 98.9%) and manic episodes (316 cases, 80.6%) were predominantly male, and the rest of the types of mental disorders were predominantly female patients. The co-morbidity rate of geriatric psychiatric disorders was high at 93.8%, and the top five comorbid medical diseases were cerebral infarction (2810 cases, 44.8%), hypertension (2645 cases, 42.2%), coronary artery disease (2481 cases, 39.6%), cerebral atrophy (2081 cases, 33.2%), and thyroid gland disease (1339 cases, 21.3%). Geriatric patients with more comorbid medical disorders and older age would be more inclined to choose the multidisciplinary treatment model (all $P < 0.01$), and geriatric patients with psychiatric disorders who chose the multidisciplinary treatment model had fewer hospitalization days and spent

less on hospitalization costs (all $P < 0.01$)

Conclusion Depressive disorders are the most common mental disorders in geriatrics. Geriatric patients with psychiatric disorders have a higher rate of co-morbidity of medical disorders. A multidisciplinary treatment model is a more optimal choice for patients with geriatric psychiatric disorders

Association of Sleep Patterns and Depression Symptoms in Older Adults: a Cross-sectional Study Using Data From The National Health and Nutrition Examination Survey 2007–2014

Yi Niu¹, Shun Yu², Yuqin Sun¹, Yijie Xie²

1. Wuxi Medical College of Jiangnan University

2. Jiangnan University Affiliated Hospital

Objective To assess the correlation between sleep behavior and sleep factors (sleep duration, sleep problems, sleep disorders) and the risk of depression in older adults

Methods A total of 5636 participants (2754 males and 2882 females) aged 60 and above from the National Health and Nutrition Examination Survey (NHANES) 2007–2014 waves were included. Sleep duration, trouble sleeping and sleep disorder were asked in the home by trained interviewers using the Computer-Assisted Personal Interviewing (CAPI) system. The combined sleep behaviours were referred to as 'sleep patterns (healthy, intermediate and poor)', with a 'healthy sleep pattern' defined as sleeping 7–9 h per night with no self-reported trouble sleeping or sleep disorders. And intermediate and poor sleep patterns indicated 1 and 2–3 sleep problems, respectively. Weighted logistic regression was performed to evaluate the association of sleep factors and sleep patterns with the risk of depressive symptoms

Results The total prevalence of depression was 7.7% among the 5636 participants analysed, with the

depression rate in elderly women is 1.6 times higher than that in elderly men. Compared to normal sleep duration (7–9 h), short sleep duration (<7h) were linked with a higher risk of depression, but long sleep duration (>9h) has no statistical significance. (short sleep: OR: 2.04, 95% CI: 1.65–2.52; long sleep: OR: 1.47, 95% CI: 0.87–2.48). The self-reported sleep complaints, whether trouble sleeping or sleep disorder, were significantly related with depression (trouble sleeping: OR: 0.3, 95% CI: 0.24–0.37; sleep disorder: OR: 0.35, 95% CI: 0.27–0.45). Furthermore, the correlations appeared to be higher for individuals with poor sleep pattern (OR: 5.6, 95% CI: 4.25–7.39)

Conclusion In this national representative survey, it was shown that there was a dose-response relationship between sleep patterns and depression in older adults

社区居家老年人衰弱现状及年龄拐点研究

梁笑笑¹ 梁笑笑² 何燕²

1. 郑州大学

2. 海南医学院

目的 衰弱包含身体、心理及社会三个层面,本研究了解社区居家老年人衰弱现状,为改善老年人身体及心理健康状况,提高老年人生命质量,预防衰弱提供参考依据;探讨老年人衰弱年龄拐点,能够更加精准地制定预防策略,帮助老年人在衰弱初期便采取有效措施,从而延缓衰弱进程,保持更好的身体和心理状态。

方法 本研究采用多阶段分层整群随机抽样方法对社区居家老年人进行调查,采用描述性分析和卡方检验分析老年人的一般资料差异及衰弱患病率情况,计算最大约登指数,确定最佳截断值为衰弱的衰减拐点,通过绘制 RCS 曲线及 Logistic 回归模型进行拐点验证分析。

结果 社区居家老年人衰弱患病率为 64.6%。总体衰弱发生率排名前五名为:记忆力差(82.6%)、缺乏社会支持(81.3%)、缺乏社会关系(76.3%)、

不善处理问题(53.1%)和行走困难(44.8%)。社区居家老年人衰弱的衰减拐点为 78.5 岁, RCS 曲线和 Hosmer-Lemeshow 检验表明预测模型具有较好的校准度和判别区分度。

结论 社区居家老年人衰弱患病率较高,拐点以上年龄的老年人衰弱风险较高,相关部门需重视衰弱的预防与改善,关注高龄老年人,提高老年人的生命质量。

衰老相关分泌表型在老年期抑郁症中的研究进展

胡建贞¹ 胡建贞² 高耀² 高耀¹ 杜鑫哲¹ 杜鑫哲²
陈苗² 陈苗¹ 刘莎¹ 刘莎²

1. 山西医科大学

2. 山西医科大学第一医院

目的 老年期抑郁症(Late-Life Depression, LLD)是一种在老年人群中普遍出现的精神疾病,其特征是发病率高、识别率低、治疗不足,与衰老过程紧密相关。衰老相关分泌表型(Senescent-Associated Secretary Phenotype, SASP)是衰老细胞释放的多种因子的复杂混合物,包括促炎细胞因子、趋化因子、生长因子和基质金属蛋白酶等,对细胞微环境具有显著影响,是衰老过程中的关键特征。SASP 作为调节衰老效应的潜在药物靶点,其与 LLD 之间的联系值得深入探讨。

方法 本研究通过医学数据库检索,系统回顾了 LLD 与 SASP 的相关文献,并对 SASP 与 LLD 的炎症机制、血管损伤、神经递质异常、氧化应激和神经内分泌紊乱等发病机制进行了综合分析。此外,本研究还探讨了 SASP 与 LLD 之间的临床研究关系,以及通过干预 SASP 来缓解 LLD 的潜在策略。

结果 研究发现 SASP 中的细胞因子与 LLD 的多种发病机制假说存在显著关联。在临床研究中, SASP 因子涉及炎症控制、组织重塑、细胞生长、细胞周期控制和代谢调节等多个生物级联反应。单一生物标志物的分析可能无法全面反映 SASP 的复杂性。因此,本研究引入 SASP 指数的概念,以综合反映不同 SASP 因子之间的相互作用,并作为评估系统性细胞衰老负担的单一指标。研究显示,较高

的 SASP 指数与 LLD 的发生、严重程度、认知功能障碍及治疗缓解率低有关。基于 SASP 与 LLD 之间的密切联系,通过调控 SASP 为 LLD 治疗提供了新的视角,包括抗衰老药物、非编码 RNA 调控、组蛋白修饰、线粒体功能调节和天然化合物干预等方面。

结论 SASP 与 LLD 之间的潜在联系为两者的关系提供了新的解释框架。尽管目前关于 SASP 在 LLD 中作用的研究尚不充分,但本研究进一步明确了 SASP 与 LLD 病理机制之间的联系,并提出了 SASP 指数在 LLD 临床研究中的应用价值。深入理解 SASP 的调控机制,为 LLD 的预防和治疗提供了新的策略和方向。

Enhancing The Precision: A Systematic Review of Metabolomics-Based Biomarkers for Late-Life Depression

Jianzhen Hu¹, Jianzhen Hu², Yao Gao², Yao Gao¹, Tao Dong¹, Tao Dong², Xinzhe Du², Xinzhe Du¹, Sha Liu¹, Sha Liu²

1. Shanxi Medical University

2. First Hospital of Shanxi Medical University

目的 晚年抑郁症 (LLD) 是老年人群常见的精神障碍,其病理机制尚未完全阐明。代谢组学作为一种对小分子代谢物进行高通量定量的技术,为探索 LLD 的潜在机制提供了新的视角。本系统综述的目的是通过对 LLD 代谢组学研究的综合分析,鉴定和评估具有诊断潜力的代谢物,并探讨它们在 LLD 病理生理学中的作用。

方法 2004 年 1 月至 2024 年 3 月,系统检索 Pubmed、Web of Science、Embase 和 MENDA 数据库中的文献。通过严格的筛选和分析,我们确定了与 LLD 相关的代谢物。此外,使用 MetaboAnalyst 在线工具,我们分析了这些代谢物及其代谢途径,以确定 LLD 的生物标志物和受影响的代谢途径。

结果 本综述纳入了 13 项 LLD 代谢组学研究,包括 12 项临床研究和 1 项动物研究。共鉴定出 32 种与 LLD 相关的不同代谢物,这些代谢物在 LLD 患者中显示出显著的水平变化,主要涉及氨基酸、

脂肪酸、磷脂和其他有机酸等关键代谢类别。特别是色氨酸、犬尿里定和 n-3 多不饱和脂肪酸对 LLD 的氨基酸、脂肪酸和葡萄糖代谢途径有显著变化。

结论 本系统综述揭示了与 LLD 相关的多种潜在代谢组学生物标志物,为理解其复杂的病理生理机制提供了新的线索。我们强调需要在更大的样本队列和纵向研究中进一步验证这些生物标志物,这将有助于开发新的诊断工具和治疗策略,以改善 LLD 患者的治疗结果和生活质量。

Cannabinoids for Treatment of Neuropsychiatric Symptoms of Dementia[review]

Yurou Zhao^{1,2}, Weihong Kuang¹

1. Mental Health Center, West China Hospital, Sichuan University, Chengdu, People's Republic of China

2. The Fourth People's Hospital of Chengdu, Chengdu, China

Behavioral and Psychological Symptoms of Dementia (BPSD) seriously affect patients' social function and quality of life, imposing a great burden on caregivers and society. Effective treatment of BPSD have become a significant concern for patients, families, and society. Non-pharmacological treatments are preferred for their minimal harm to patients, but they are less effective for severe cases, needing combination with pharmacological treatments. Pharmacological treatments, primarily with antipsychotic drugs, are effective for severe BPSD and are widely used in clinical practice, but they have significant side effects and a low benefit-to-risk ratio. Cannabinoids, specifically the cannabis extracts, esp. tetrahydrocannabinol (THC) and cannabidiol (CBD), have become a hot topic in BPSD research due to their unique brain effects in recent years. This article reviews the basic and clinical research findings related to the treatment of BPD with cannabinoids.

The use of cannabis in human life has thousands of years, mainly used for both recreational and religious purposes as well as the treatment of diseases. Due to its

hallucinogenic and sensory-altering effects, it was listed under international control in 1961.

THC and CBD are the main biologically active substances extracted from cannabis. THC is the main component responsible for psychoactive effects of cannabis including the hallucinogenic and substance dependence, while CBD doesn't have these severe toxic effects. Moreover, it can block the toxic effects of THC and has shown therapeutic effects such as anti-epilepsy, anti-spasms, anti-anxiety, and anti-inflammatory. THC and CBD mainly exert the biological effects through the endocannabinoid system (ECS), which is involved in the homeostasis of many body functions, including cognition (such as learning and memory), anxiety, neurogenesis, pain sensation, immune signaling, and inflammation. CBD has low affinity for CB1R and CB2R, does not activate the central CB1R, and acts as an agonist interacting with the transient receptor potential cation channel subfamily V member 1 (TRPV1), peroxisome proliferator-activated receptor (PPAR) γ , adenosine A2A receptor (A2AR), and 5-HT1A receptor. CBD is also an antagonist of the novel endothelial receptor and G protein-coupled receptor 55 (GPR55) and a moderate inhibitor of FAAH hydrolyzing AEA. In a mouse model of BPSD, CBD inhibits the expression of β -secretase 1 (BACE1) through the inactivation of MAGL and inhibits the generation of A β , playing an anti-inflammatory and neuroprotective role, improving synaptic function and cognitive ability in the animal model; CBD inhibits tau hyperphosphorylation in rat PC12 neuronal cells treated with antibody through glycogen synthase kinase 3 β (GSK-3 β).

In a crossover design, placebo-controlled clinical study of dronabinol (tetrahydrocannabinol-rich preparation) for the treatment of anorexia and behavioral disorders in patients with Alzheimer's disease (1997), cannabinoids were found to reduce the severity of behavioral disorders such as agitation and elation. Mahlberg's research results (2007) showed that, compared with the placebo group, treatment with delta-9-tetrahydrocannabinol or melatonin significantly improved patients' nighttime agitation. Van den Elsen and colleagues' small randomized controlled trial found (2015) that, compared with placebo, CBD did not have an advantage in

NPS (including agitation and aggression), but low-dose tetrahydrocannabinol was well-tolerated and safe, supporting the study of increased dosages. In an open-label pilot study (2006), Walther and colleagues observed the effects of cannabinoid treatment in six elderly patients with Alzheimer's dementia, and the results showed that agitation and nocturnal motor activity in all patients decreased compared to baseline, and irritability, anxiety, and appetite disorders were also improved. In 2016, a prospective open-label trial involving 10 patients with AD-BPSD showed that high-dose THC cannabis extracts could alleviate neuropsychiatric symptoms, including improving agitation, irritability, sleep, apathy, delusions, and the distress of caregivers. Herrmann and colleagues conducted a randomized, double-blind, crossover trial using nabilone, a tetrahydrocannabinol analog, and synthetic cannabinoids, and the results showed (2019) that nabilone treatment was associated with a significant reduction in agitation, significantly reducing the burden on caregivers, with sedation being the most common adverse event. In a prospective observational pilot study of 10 women with severe dementia and BPSD in 2019, after two weeks of oral administration of an average THC/CBD, half of the patients reduced or discontinued other psychoactive medications. The THC tincture or oil (with THC up to 9 mg/day and CBD twice that of THC) reduced neuropsychiatric symptoms, agitation, and rigidity, and improved abnormal behaviors such as screaming and aggression.

CBD may be more effective in managing sleep, agitation, and anxiety in BPSD. Although low-dose THC has not shown positive results in the treatment of BPSD, studies of high-dose oral medications of THC and CBD have shown promising results. As a multi-target molecule, cannabinoids have the potential to become a high-potential drug for the treatment of Alzheimer's disease dementia.

一例安非他酮结合 CBT 干预成人阿斯伯格综合征者社交焦虑障碍的案例报告

朱鑫浩 仇雅菊 于恩彦*

浙江省肿瘤医院

目的 探索成人阿斯伯格综合征人士社交焦虑障碍的精神心理干预方法

方法 本研究采用个案研究的形式,对该名患者进行药物治疗结合心理干预的形式开展治疗。具有资质的精神医师嘱安非他酮 450mg 行药物干预(初始剂量为 150mg),接受过系统认知行为疗法培训的心理治疗师行认知行为干预,在良好咨访关系的基础上,开展心理教育、角色扮演、行为实验、系统暴露等心理干预技术,干预频率为一周一次,累计 60 余次,每次干预后书写治疗记录,每 10 次干预整理系统的案例报告。累计开展 10 次家长访谈(包含心理教育、阿斯伯格综合征相关知识学习、信息沟通、情绪疏导、干预指导等),家长访谈的频率为一月一次。同时,心理治疗师就该个案每月接受 1 次个体或团体督导。个案的数据通过社交焦虑量表(LSAS)、焦虑自评量表(SAS)、抑郁自评量表(SDS)进行评估,数据采集 4 次,分别为干预前、干预 3 个月时、干预 6 个月时、干预 12 个月时,数据通过 SPSS 进行量化分析。

结果 社交焦虑量表(LSAS)、焦虑自评量表(SAS)、抑郁自评量表(SDS)的得分显著下降, $P<0.05$,干预 3 个月时与干预 6 个月时的数值差异最大。

结论 安非他酮结合 CBT 干预成人阿斯伯格综合征者社交焦虑障碍显示有效,且在干预 6 个月 after 效果最显著。

老年期抑郁症患者 PST 疗效及其影响因素

房圆 薛冰 聂静 龙彬 李霞*

上海市精神卫生中心

目的 问题解决心理治疗(Problem-solving therapy, PST)由于具有易于操作、成本低廉的特点,适合中国国情。本研究拟探讨 PST 在中国老年期抑郁症(Late-life depression, LLD)患者中的疗效和疗效的影响因素。

方法 门诊招募老年期抑郁症患者,将患者根据入组顺序 2:1 伪随机分为心理治疗组和对照组,两组分别进行药物联合 12 次团体 PST 治疗和单纯药物治疗。评估员单盲使用 GDS、SAS、HAMD、HAMA 量表进行情绪评估;使用 MoCA、CDR、数字广度、词语流畅度量表进行认知评估;同时采集心理治疗组基线多模态头颅磁共振。在 3 个月和 2 年进行患者情绪和认知随访。将 3 个月随访 HAMD 减分率大于 50%的患者视为治疗有效,比较心理治疗组和对照组的治療有效率。采用意向性分析,将基线和随访评估的差值进行组间比较,探讨在 3 个月和 2 年时, PST 对 LLD 患者情绪和认知的治療疗效。在心理治疗组中,将是否治療有效作为因变量,将人口学资料、生活习惯、既往史、临床特征等共计 31 个特征作为自变量,进行 LASSO 回归,分析心理治療疗效不佳患者可能的影响因素,并比较不同心理治療疗效患者的多模态头颅磁共振差异。

结果 共 114 例老年期抑郁障碍患者纳入研究分析,包括 74 例心理治療组和 40 例对照组。心理治療组和对照组一般人口学资料和临床特征无显著差异。74 例心理治療组患者中 56 例完成心理治療,70 例参与 3 月随访,67 例参与 2 年随访;40 例对照组患者中 34 例参与 3 月随访,32 例参与 2 年随访。3 个月随访,对照组治療有效率为 40.6%,心理治療组有效率为 64.3%;心理治療组患者 GDS, HAMD、MoCA、语言流利度测验分数相较基线的好转较对照组更明显。2 年随访,两组在情绪和认知方面均无显著性差异。LASSO 回归分析 PST 疗效影响因素的结果显示,心理治療次数,基线 CDR 分级和高血压病史是影响心理治療疗效的因素。多模态磁共振结果显示,与治療有效者相比,治療无效患者在左侧和右侧钩束 FA 显著降低,左侧钩束 MD 和 RD 显著升高。

结论 PST 联合药物治疗能够在 3 个月内加速改善中国老年抑郁患者的情绪和认知功能;心理治療次数、基线认知减退、高血压病史和患者大脑钩束完整性对 PST 的疗效存在一定影响。

老年期精神障碍患者临床特征及早期多学科联合会诊必要性的分析

王东来*

吉林省神经精神病医院

目的 探讨老年精神障碍患者的临床症状表象多样性和目前精神科专科医院诊疗现状,为优化诊疗方案提供参考。

方法 归纳出 2019-2023 年住院的老年精神障碍患者共 458 例,采取自病案室归档数据表收集一般资料及疾病信息等,分析其性别、年龄、疾病分布、躯体共病等特点,并进行对比分析。

结果 2019 年至 2023 年期间,老年期精神障碍患者年龄主要集中在 60-85 岁之间(254 例,55.45%),且以女性(171 例,67.32%)显著多于男性老年患者;其中农村患者居多(203 例,79.92%),城镇患者偏少(51 例,20.22%)。所患疾病构成比分布如下:前五位分别为抑郁障碍(138 例)、脑器质性精神障碍(50 例)、双相障碍(26 例)、躯体化障碍(24 例)、精神分裂症(16 例),抑郁障碍是最常见的老年期精神障碍。在本研究中,使用酒精所致精神及行为障碍、躁狂发作以男性居多,其余类型精神障碍的患病率均以女性居多。老年期精神障碍患者躯体疾病共病率较高,达 93.8%,老年精神障碍患者最常见的躯体疾病前五位分别为脑梗死、高血压、冠心病、脑萎缩、甲状腺疾病。共病躯体疾病较多、年龄较大的老年精神障碍患者会更倾向于选择多学科诊疗模式(均 $P < 0.01$),提早选择多学科诊疗模式的老年期精神障碍患者住院天数更少、所花费的住院费用较低(均 $P < 0.01$)。

结论 抑郁障碍为老年人最常见的精神障碍;老年精神障碍患者的躯体疾病共病率较高,多学科诊疗模式是老年精神障碍患者更优的选择。

临床缓解抑郁症患者累积生态风险对自尊的影响:三阶调节模型

滕昌军^{1,2} 史晓蒙^{1,2}

1.南京脑科医院

2.南京医科大学附属脑科医院

目的 探究累积生态风险、自动思维、应对方

式和临床缓解抑郁症患者自尊的关系。

方法 使用生活质量综合评定问卷(Generic Quality of Life Inventory-74, GQOLI-74)的因子评估累积生态风险和自尊水平、自动思维问卷(Automatic Thoughts Questionnaire,ATQ)评估负性自动思维、特质应对方式问卷(Trait Coping Style Questionnaire,TCSQ)评估应对策略,对 117 名临床治愈抑郁症患者进行调查,通过 SPSS28.0 和 Process4.0 完成分析。

结果 累积风险指数与自尊负相关($r = -0.523$, $P < 0.01$),负向预测自尊($\beta = -0.200$, $t = -5.428$, $95\%CI: -0.273 \sim -0.127$)。负性自动思维可调节累积风险指数 \rightarrow 自尊的关系($\beta = -0.152$, $t = -3.627$, $95\%CI: -0.235 \sim -0.069$)。积极应对可正向调节负性自动思维的调节作用($\beta = 0.073$, $t = 2.317$, $95\%CI: 0.011 \sim 0.135$),三阶交互项 F 检验显著($\Delta R^2 = 0.029$, $F = 5.369$, $df_1 = 1$, $df_2 = 109$, $P = 0.022$)。消极应对可负向调节负性自动思维的调节作用($\beta = -0.159$, $t = -2.106$, $95\%CI: -0.310 \sim -0.009$),三阶交互项 F 检验显著($\Delta R^2 = 0.024$, $F = 4.434$, $df_1 = 1$, $df_2 = 109$, $P = 0.038$)。

结论 临床缓解抑郁症患者的累积生态风险与自尊间存在三阶调节作用,自动思维和应对方式分别起二阶和三阶调节作用。

肠道微生物在孤独谱系障碍发病及治疗中的研究进展

谭云飞^{1,2} 朱怡晨^{1,2}

1.浙江省人民医院

2.杭州师范大学

目的 探讨肠道微生物在孤独谱系障碍发病及治疗中的研究进展。

方法 在 PUBMED、CNKI 等公共文献数据库中以“肠道微生物”AND“孤独谱系障碍”为关键词检索临床研究型论文,收集并整理相关论文,进行综述。

结果 肠道微生物与孤独谱系障碍的发病有一定的相关性,但具体机制仍不明确。与肠道微生物相关的饮食和 FMT 等治疗对孤独谱系障碍患者的

行为及症状有一定的改善。

结论 肠道微生物能够调节中枢神经系统 (CNS) 和神经发育中的多种过程, 包括影响血脑屏障的通透性、神经发生、神经元信号传导, 以及社交、感官、记忆、学习和压力等行为或情绪。越来越多的关于肠道微生物在 ASD 患者中作用机制的研究表明, 肠道微生物在开发新的诊断工具和治疗方法上具有巨大的潜力。使得肠道微生物与孤独谱系障碍之间的潜在联系成为一个复杂且日益受到关注的研究领域, 尽管研究者对该领域的认知日益增长, 但仍有许多问题未解决, 并且某些研究结果之间也存在冲突。虽然积累了越来越多关于肠道微生物对神经发育及大脑功能影响的证据, 但对某些肠道微生物的代谢及免疫机制研究仍不成熟。关于各种其他微生物衍生代谢产物及微生物细胞壁成分通过免疫、神经和内分泌途径通过表观遗传调节影响神经发育过程的确切机制的数据仍然稀缺。虽然益生菌、益生元、合生元、饮食和 FMT 等治疗干预被视为在 NDDs 中具有前景, 但尽管动物实验提供了大量数据, 人类证据仍然不足。

The Impact of Cognitive Impairments and Emotional Symptoms on Risky Decision-making in Aging

Yunchen Gong Ping Ren* Shiwei Huang Guohua Xie Meiling Tan Donghui Wu
Shenzhen Mental Health Center/Shenzhen Kangning Hospital

Objective The global aging of the population has intensified, and aging is often accompanied by cognitive dysfunctions, emotional symptoms and decision-making deficits. Although a number of studies have reported age-related alterations in cognitive and mental health, it is still unclear how aging impacts complex behavior under uncertainty such as risky decision-making. The present study aimed to identify subtypes of subtle cognitive decline in the elderly, and characterized risky decision-making among different elderly subtypes, to

explore the relationship of cognitive impairment, emotional symptoms and risk-taking behaviors

Methods The present study recruited 113 healthy older adults (aged 56-80) and 66 healthy younger adults (aged 20-27) in different communities in Shenzhen. For each participant, cognitive function was assessed by the Montreal Cognitive Assessment (MoCA), emotional symptoms were assessed by the Hamilton depression and Anxiety (HAMD/HAMA) Scales, and risky decision-making was measured by the Iowa Gambling Task (IGT). In data analysis, k-means clustering was used to identify subtypes of older adults based on multiple domains in MoCA (i.e., memory, language, executive functions, visuospatial skills, abstraction, attention, concentration, and orientation). Subsequently, ANOVA was used to examine differences in risk-taking behaviors across different subtypes of older and young adults. In the moderation analysis, we examine the role of emotional symptoms in modulating risky decision-making in older adults based on cognitive states

Results In the elderly group, the clustering model defined four subgroups (89.20% precision): cognitively normal group (n=24, 21.24%), memory-deficit group (n=36, 31.86%), executive function(EF)-deficit group (n=13, 11.50%), and composite-deficit group (n=40, 35.4%). After controlling for several covariates, there were significant differences in IGT performance among older and young adults. All subtypes of older adults showed reduced distinguishing ability (Good versus bad selections) than younger adults. Memory-deficit and composite-deficit groups selected less good decks than younger adults ($t_{\text{memory}}=-2.072$, $p<0.05$; $t_{\text{composite}}=-3.489$, $p<0.001$), and EF-deficit group selected more bad decks than young adults ($t=2.043$, $p<0.05$). Furthermore, the moderation analyses showed significantly higher HAMD/HAMA scores with less bad deck selections in cognitively impaired older adults ($b_{\text{HAMD}}=-0.019$, $p<0.001$, 95% CI= [-0.029, -0.010]; $b_{\text{HAMA}}=-0.019$, $p<0.005$, 95% CI= [-0.030, -0.007])

Conclusion The present study suggests that the alteration of risky decision-making in age-related cognitive deficits is domain specific. Interestingly, modest

emotional symptoms reduce risk-tolerance in cognitively impaired older adults, which may be helpful for avoiding high-risk factors in daily life

关键词: aging, risky decision-making, emotional symptoms, cognitive decline

老年期抑郁焦虑的生物标志物研究进展

薛凯耀¹ 薛凯耀² 胡建贞² 胡建贞¹ 张咪雪¹ 张咪雪² 高耀² 高耀¹ 刘莎¹ 刘莎²

1.山西医科大学第一医院/第一临床医学院精神卫生科,太原,中国

2.山西省人工智能辅助精神障碍诊断与治疗重点实验室,山西医科大学第一医院,太原,中国

目的 我国正步入老龄化时代,抑郁和焦虑是老年人常见的精神障碍。老年期抑郁焦虑患者具有认知下降,症状多样化且不典型,共病复杂等区别于一般患者的特殊性,临床识别难度大、误诊率高。本文概述了老年期抑郁焦虑疾病中生物标志物研究的最新进展。

方法 检索包括 PubMed、Web of Science 等数据库,设定文献筛选标准,包括文献的年代、研究对象、生物标志物类型等方面,以确保选取符合主题的文献进行综述。从选定的文献中提取了关于老年期抑郁焦虑生物标志物研究的重要信息,包括研究设计、样本特征、生物标志物类型、主要结果等内容,随后对这些信息进行了综合分析和总结,以揭示该领域的研究进展和趋势。

结果 目前,关于老年期焦虑抑郁障碍的发病机制提出了多种假说,包括脑结构和功能的改变、应激与炎症反应、神经递质的失衡、神经可塑性的变化、基因表达的异常、代谢途径的紊乱、蛋白稳态的失控以及肠道菌群结构的改变等。为了深入探索这些机制,多种检测技术被广泛应用于临床和研究中,如脑影像检测、传统生化检测以及组学等新型检测技术。通过广泛搜集与分析近年来的研究成果,我们总结了多种与老年期焦虑抑郁障碍相关的生物标志物。这些生物标志物涵盖了多个领域,包括脑成像生物标志物、炎症生物标志物、神经递质生物标志物、神经营养生物标志物等。同时,基因组学、代谢组学、蛋白组学和微生物组学等组学研究也为

揭示疾病的发病机制提供了新的视角。

结论 老年期焦虑抑郁障碍的发病机制复杂多样,涉及脑结构功能、应激反应、神经递质等多个方面。多种检测技术的应用已揭示出多领域的生物标志物,而组学研究的进展为理解其发病机制提供了新视角。未来的研究需要在多个方向上进行深化和拓展。首先,对各类生物标志物背后的分子机制进行更详细的探讨,以揭示它们在焦虑抑郁障碍发生发展中的确切作用。其次,进一步探究生物标志物在不同疾病亚型中的表达模式和意义,以提高疾病分类和诊断的精准性。最后,开展多层次的研究,结合多种生物标志物进行综合分析,以提升在个体水平预测治疗效果和不良反应的能力,为个性化治疗提供更为科学的依据。

肥胖与认知功能相关研究概述

方丽丽^{1,2} 谭云飞^{1,2}

1.杭州师范大学

2.浙江省人民医院

目的 本文着重描述了肥胖作为一个日益严重的公共卫生问题对认知功能的潜在影响,旨在增强公众对肥胖与认知健康的理解,改善肥胖人群整体生活质量,并为后续研究提供新的视角和方向。

方法 本文采用了文献综述的形式,系统梳理了在肥胖与认知功能关系领域的部分研究成果。通过对国内外文献的分析,总结了肥胖对认知功能的具体影响及其潜在的生物学机制,并概述了一系列面向肥胖和认知功能的综合性干预措施。

结果 研究表明,肥胖与认知功能之间存在显著的负向关联。肥胖状态可能会通过影响大脑结构、神经递质平衡以及炎症反应等生理机制,对个体的记忆力、注意力控制等关键认知领域产生不利影响。为了有效预防和改善肥胖与认知功能问题,本文建议采取综合性的干预措施,包括调整生活方式、改善饮食习惯、加强体育锻炼以及进行认知训练等。

结论 肥胖不仅关乎身体健康,也对认知健康有着潜在威胁。肥胖人群常常会遭遇一系列的认知功能减退,比如记忆力减退、注意力控制能力下降

以及语言表达能力的减弱。这些问题可能与肥胖引起的大脑结构变化、神经递质功能的异常以及慢性炎症反应等因素紧密相关。因此,在对肥胖人群进行管理和治疗时,必须高度重视认知功能的评估和干预工作。通过综合性的干预措施,我们有望减轻肥胖对认知功能的不利影响,进一步提升肥胖人群的整体生活质量。

MECT 治疗帕金森病病例报道及文献复习

李园 袁俊亮*
北大六院

目的 帕金森病是常见的神经系统变性疾病,表现为运动迟缓、肌张力升高、静止性震颤等运动症状,以及感觉障碍、自主神经功能障碍、精神情绪障碍等非运动症状。多巴胺能药物对改善运动症状有效,但长期用药可能导致异动症等运动并发症,对于非运动症状,目前无有效的药物治疗,且多巴胺能药物可能加重幻觉妄想、直立位低血压、冲动控制障碍等非运动症状。改良电休克治疗(modified electroconvulsive treatment, MECT)在精神科广泛使用,能快速有效的缓解精神情绪症状。本研究拟探究 MECT 对于帕金森病运动症状及非运动症状的疗效及治疗安全性。

方法 本研究报道了 24 例在我院住院治疗的帕金森病患者,使用 MDS-UPDRS 量表分析 MECT 治疗前后患者运动症状及非运动症状变化,使用汉密尔顿抑郁量表、汉密尔顿焦虑量表、简明精神病评定量表评估患者 MECT 治疗前后情绪及精神症状变化,使用多导睡眠图、直立倾斜试验评估患者 MECT 治疗前后自主神经功能变化,使用简明精神状况检查量表、蒙特利尔认知评估量表分析患者 MECT 治疗前后认知水平变化。

结果 21 例患者中男性 7 例,女性 17 例,平均发病年龄 67.5 岁,帕金森病运动症状中位病程为 36.0 月,非运动症状中位病程为 48.0 月,24 例患者均有情绪障碍、精神症状及自主神经功能障碍,11 例患者存在认知障碍。MECT 治疗中位次数为 10 次,MECT 治疗后,帕金森患者运动症状及非运动症状

均得到改善。MECT 治疗副反应包括头痛 1 例、记忆力下降 8 例、心电图提示频发室性早搏 1 例,均为短期可逆的。我们的结果与既往文献报道结论一致。

结论 MECT 能有效改善帕金森病患者的运动及非运动症状,且无明显副反应,具体机制目前仍不明确,尚需进一步研究以阐明。

抗精神病药物对慢性老年精神分裂症患者外周血中性粒细胞与淋巴细胞比值的影响

宁晓帅¹ 夏文姐¹ 刘邦文¹ 孙传峰¹ 肖婵婵¹ 苏慧娟² 蔡榕榕³

1.阜阳市第三人民医院
2.池州市第三人民医院
3.宿州市第二人民医院

目的 研究旨在评估抗精神病药物对慢性精神分裂症患者外周血中性粒细胞与淋巴细胞比值(NLR)的影响,探讨其在老年精神分裂症患者中的作用与可能对免疫功能的影响。

方法 选取 110 例老年慢性精神分裂症患者,根据治疗方案分为两组,一组使用典型抗精神病药物,另一组使用非典型抗精神病药物。收集患者治疗前后的外周血样本,采用自动化血液分析仪检测中性粒细胞和淋巴细胞计数,计算 NLR。同时,使用 SPSS 软件对两组药物进行对比分析,使用 PANSS 量表评估患者症状严重程度,同时对患者外周血中性粒细胞与淋巴细胞比值(NLR)的关系及两组患者的症状严重程度和生活质量进行评估。

结果 与治疗前相比,患者在使用抗精神病药物治疗后,NLR 显著升高($P < 0.05$)。典型抗精神病药物组 NLR 的升高程度显著大于非典型抗精神病药物组($P < 0.05$)。此外,治疗后患者症状严重程度和生活质量评分均显著改善($P < 0.05$),且 NLR 较高者 PANSS 得分较低者更高。

结论 抗精神病药物对老年慢性精神分裂症患者外周血中性粒细胞与淋巴细胞比值具有显著影响,典型抗精神病药物可能导致 NLR 升高更明显。在临床治疗过程中,临床在对患者进行症状评估时也

可使用 NLR 粗略判断患者可能的预后,以优化治疗方案。

关键词:抗精神病药物;慢性老年精神分裂症;外周血中性粒细胞与淋巴细胞比值(NLR)

负性生活事件压力对中年女性抑郁的影响

姜红燕* 张玥

昆明医科大学第一附属医院

目的 本研究旨在了解现代中年女性产生抑郁情绪可能存在的生活事件压力因素;探讨生活事件压力对中年女性的影响,并检验反刍思维和应对方式的中介效应模型及其适用性,从而搭建四个变量之间的关系模型,探索促进中年女性心理健康发展的内在机制。

方法 对前往昆明医科大学第一附属医院就诊及在昆明某社区生活的共 241 名 35-55 岁中年女性进行问卷调查,采用生活事件量表 LES、反刍思维量表 RRS、简易应对方式 SCSQ 及抑郁自评量表 SDS 进行评测。

结果 (1) 负性生活事件压力、抑郁、反刍思维和消极应对方式两两相关显著,负性生活事件压力、反刍思维和消极应对方式是中年女性的抑郁症状的重要影响因素;(2) 负性生活事件压力通过反刍思维对中年女性抑郁症状的中介效应显著;(3) 负性生活事件压力通过消极应对方式对中年女性抑郁症状的中介效应显著;(4) 反刍思维和消极应对方式在负性生活事件压力对中年女性抑郁的影响中起链式中介的作用。

结论 研究结果证实了负性生活事件压力影响抑郁症状及反刍思维和消极应对方式链式中介的心理机制,为中年女性抑郁症状产生机制提供了一种可塑途径,从而为有针对性地解决中年女性心理健康问题提供了参考建议。

关键词:中年女性;反刍思维;应对方式;抑郁;链式中介

中老年抑郁障碍与认知损害的遗传学关联研究

姜红燕* 陶圆佳

昆明医科大学第一附属医院

目的 探究中老年抑郁障碍发病年龄与认知损害的遗传相关性

方法 入组昆明医科大学第一附属医院精神科住院部 50 岁以上病例组 142 例(包括早发及晚发型抑郁);对照组 52 例。收集患者人口学信息、量表测评,进行 GWAS 分析,使用 G-nomAD 数据库进行位点功能注释,并寻找对应基因。此外,通过对相关文献的研究,选择分别与抑郁发病和认知损害有关的 APOE 基因、BDNF 基因(rs6265)以及 COMT 基因(rs4689、rs4818)作为候选基因重点研究。

结果 1.GWAS 分析发现未发现与认知水平相关的显著位点。2.候选基因 COMT(rs4680、rs4818),BDNF(rs6265)及 ApoE 的不同基因型分组在年龄、发病时间等方面无统计学差异。3.回归分析显示:(1) 年龄、中度和极重度焦虑、多种疾病共病、初等教育、COMT(rs4818)、BDNF(rs6265)对认知功能的影响,差异有统计学意义($P<0.05$)。(2) 年龄、极重度焦虑、重度抑郁、初等教育、未婚、兼职、COMT(rs4680),BDNF(rs6265)对视空间和执行功能的影响,差异有统计学意义($P<0.05$)。

结论 1. 研究从 GWAS 及候选基因方面,均未发现同时与抑郁障碍发病年龄和认知水平相关的遗传位点。2. 认知功能较好可能与 COMT(rs4818)、BDNF(rs6265)相关;下降可能与年龄、焦虑程度、既往史、受教育程度相关。下降可能与焦虑程度、既往史相关。(4) 语言功能较好可能与 BDNF(rs6265)相关;下降可能与年龄、受教育程度、职业状态相关。

关键词:老年抑郁障碍;早发性抑郁症;认知损害;全基因组关联分析;候选基因

BDNF、CYP19A1 基因与青少年期、老年期发病女性抑郁症患者遗传学关联分析

姜红燕* 晏和智

昆明医科大学第一附属医院

目的 探索 BDNF、CYP19A1 基因与青少年及老年期发病女性抑郁症的遗传关联

方法 本研究收集了昆明医科大学第一附属医院精神科住院部及门诊部青少年女性组(201例)和老年女性组(178例)MDD患者共计379例,所有参与者均符合ICD-10诊断标准,并给予了充分的知情书面同意,通过健康记录、血样采集、问卷调查,收集了病例入院时的抑郁程度、焦虑程度、精神病性症状、自杀行为史等临床表型数据,健康对照组为当地学校和社区招募了215名,其年龄、性别、教育程度与病例相匹配。首先,我们将青少年女性抑郁组、老年女性抑郁组与健康对照组两两之间进行全基因组遗传关联分析(GWAS)以探索两组间的遗传学差异。重点关注了与神经可塑性相关的BDNF、CYP19A1候选基因。将病例样本中BDNF、CYP19A1的MDD风险位点进行基因型提取,与临床表型:精神病性症状、自杀行为、激素水平等进行关联分析。

结果 1 GWAS 结果 青少年女性MDD组与老年女性MDD组中未发现神经可塑性相关的BDNF和CYP19A1基因的显著性遗传差异位点。

2 基因型与临床表型关联结果 BDNF rs6265基因型与抑郁程度、焦虑程度、精神病性症状、自杀行为史均未表现出相关性;CYP19A1基因rs10046的基因型与自杀行为史($\chi^2=10.026, P=0.007$)有显著相关性,同时组间比较发现AG组相比GG组女性患者自杀风险增加($P=0.046$),与抑郁程度、焦虑程度、精神病性症状、自杀行为史均未表现出相关性。

结论 与神经可塑性相关的BDNF、CYP19A1基因在青少年期及老年期发病的女性MDD患者组间可能无遗传学差异;进一步与临床表现关联分析CYP19A1基因rs10046的基因型与自杀行为史相关。

关键词: 抑郁症,遗传学,神经可塑性,BDNF, CYP19A1

帕金森病伴精神症状患者临床及护理特点的回顾性分析

李春月¹ 陈宝玉¹ 王彦东¹ 张方方¹ 袁俊亮¹ 陈靖¹ 王志稳²

1.北京大学第六医院,北京大学精神卫生研究所,国家卫生健康委员会精神卫生学重点实验室(北京大学),国家精神心理疾病临床医学研究中心(北京大

学第六医院)

2.北京大学护理学院

目的 分析帕金森病伴精神症状患者的临床特点及护理要点。

方法 选取2022年2月-2023年12月北京大学第六医院神经内科收治的101例帕金森病伴精神症状患者为研究对象。采用自行设计的调查表记录一般人口学资料、疾病相关资料、治疗及康复相关资料以及精神症状评估相关资料,分析和总结帕金森病患者精神症状的临床及护理特点。

结果 共纳入101例患者,其中焦虑73例(72.28%);抑郁68例(67.33%);同时患焦虑和抑郁51例(50.50%);精神病性症状36例(35.64%);淡漠9例(8.91%);冲动控制与相关疾病10例(9.90%);关于药物治疗,95例(94.01%)患者进行了药物的优化调整,43例(42.57%)增加了多巴胺受体激动剂;73例焦虑患者中,34例(46.58%)加用了苯二氮卓类药物;68例抑郁患者中,54例(79.41%)使用了抗抑郁剂;36例存在精神病性症状的患者中,27例(75.00%)患者加用了抗精神病药物。关于非药物治疗,步态训练29例(28.71%);嗅觉训练33例(32.67%);重复经颅磁刺激84例(83.17%);经颅直流电刺激32例(31.68%);其他康复治疗,神经肌肉电刺激2例(1.98%);吞咽功能刺激4例(3.96%);血液循环驱动治疗4例(3.97%);红外偏振光治疗6例(5.94%);专项康复治疗75例(74.26%);团体心理治疗26例(25.74%);正念干预39例(38.61%);患者出院时在焦虑、抑郁以及精神病性症状等方面均得到改善($P\leq 0.05$)。

结论 帕金森病患者的精神症状以焦虑、抑郁最为常见。在药物的优化调整和对症治疗的基础上,可辅以非药物治疗,包括物理治疗、心理治疗及康复治疗等,以实现帕金森病伴精神症状患者的个体化、全程化的综合管理。

外周血生物标记物在老年抑郁症与阿尔茨海默病源性认知障碍鉴别诊断中的效力

邓淼菡 孙一丹 汪前喜 郭超越 赵璐 仇琦 洪波 李霞*

上海交通大学附属精神卫生中心老年科

镇江市精神卫生中心

目的 老年抑郁症与阿尔茨海默病源性认知障碍存在症状重叠,临床上较难区分。本研究旨在探讨外周血神经生物标志物 A β 42、A β 40、A β 42/A β 40、pTau 181、pTau 217、GFAP 和 NfL 在老年抑郁障碍 (LLD)、阿尔茨海默病 (AD) 及阿尔茨海默病源性轻度认知障碍 (aMCI) 中的诊断潜力,以期提供一种非侵入性、成本效益高的鉴别诊断工具。

方法 本研究纳入 41 名 LLD、22 名 AD 患者、63 名 aMCI 和 25 名健康对照 (NC)。所有患者均由精神科医生经过 DSM-5 标准诊断,并接受了神经心理学评估和认知功能评估。采集外周血样本进行单分子免疫检测,分析上述生物标志物水平。采用 SPSS 26.0 软件对数据进行统计分析。

结果 对于血清 A β 42、A β 40、pTau 181、pTau 217、GFAP 和 NfL 水平,LLD 患者均显著高于 aAMCI 患者和 NC 组 (LLD vs AMCI vs NC vs AD: 43.60 vs 22.20 vs 20.99 vs 74.94, 785.24 vs 317.21 vs 191.64 vs 767.19, 2.26 vs 1.21 vs 1.26 vs 2.12, 4.41 vs 2.98 vs 2.08 vs 3.97, 14.4 vs 8.64 vs 8.16 vs 25.24, 24.45 vs 11.14 vs 10.63 vs 21.24, 浓度单位 pg/ml, 均 $P < 0.001$); AD 患者的血清 A β 42、A β 42/A β 40 水平显著高于 LLD 患者 (74.94 vs 43.60 pg/ml, $P = 0.039$; 0.11 vs 0.05, $P = 0.045$)。ROC 分析显示血清 A β 40 鉴别 LLD 和 AMCI 患者的 AUC = 0.868 (临界值 = 626.46 pg/ml, 灵敏度 = 82.5%, 特异度 = 77.8%); 血清 pTau217 鉴别 LLD 和 NC 组的 AUC = 0.765 (临界值 = 3.55 pg/ml, 灵敏度 = 62.5%, 特异度 = 83.3%)。Logistic 回归分析显示,根据性别、年龄、血清 A β 42、A β 42/A β 40 比值、GFAP 建立预测模型,用于鉴别 AD 与 LLD 患者的 ROC 曲线下面积 (AUC) 为 0.732 (95%CI 0.599 - 0.865, $P = 0.003$)。

结论 外周血神经生物标志物 A β 42、A β 42/A β 40 比值和 GFAP 在鉴别 LLD 和 AD 源性认知障碍患者方面效力良好,具有潜在应用价值。

关键词: 外周血生物标志物; 老年抑郁障碍; 阿尔茨海默病; 鉴别诊断。

目的 由于失独家庭发生的不幸遭遇、家庭变故、家庭负担增加、心理压力过大等原因使得他们承受巨大的心灵创伤,容易出现睡眠质量问题。目前研究发现失独家庭失眠的国内外检出率约为 41.2%。学界对于这一特殊群体的研究主要遵循着“弱势群体-社会援助”传统模式,研究内容主要集中在社会救助、社会扶助和社会保障等相关层面,却忽视了此类特殊家庭的心理健康及诸多因素带来的失眠问题。因此,关注和改善失独家庭的睡眠状况显得非常重要。本调查旨在调查失独家庭睡眠质量状况,分析失眠的影响因素,为更好地提高失独家庭睡眠质量、促进心理健康发展、实现“老有所养,老有所依,老有所乐”提供科学依据。

方法 采用一般资料调查表、匹兹堡睡眠质量、焦虑自评量表 (SAS)、抑郁自评量表 (SDS)、生存质量及社会支持评定量表、对某市卫生健康委员会人口家庭计划发展处所管理的 286 例失独家庭进行分析调查。

结果 失独家庭睡眠质量总分 (7.66 \pm 3.77), 多元逐步 logistic 回归分析结果显示: 抑郁状态 ($\beta = 0.382$, $P < 0.05$)、焦虑状态 ($\beta = 0.573$, $P < 0.05$)、养老模式 ($\beta = 0.077$, $P < 0.05$)、接受帮扶公益活动 ($\beta = 0.243$, $P < 0.05$)、社会支持 ($\beta = -2.937$, $P < 0.05$) 是失独家庭睡眠质量的影响因素。

结论 政府、社区及相关专业人员应针对失独家庭提供帮扶公益活动,加强对他们心理健康、养老模式及社会支持方面的改进,以提高睡眠质量。心理状态、养老模式、接受帮扶及社会支持对失独家庭睡眠质量有着积极的影响。我们应该关注社会上失独家庭的睡眠情况,特别是重点关注不良心理健康状态、养老模式差、缺少社会帮扶及社会支持不足的失独家庭,有针对性地进行干预,重视以睡眠质量为基础的失独家庭的身心健康保障和扶助体系。

抑郁症患者情绪面孔识别与大脑自发活动异常的研究

沈雨欣 孔令韬*

中国医科大学附属盛京医院精神医学科

目的 重性抑郁障碍 (major depressive disorder, MDD) 患者常表现出情绪加工异常和大脑静息态自发活动的异常。然而情绪面孔处理异常及大脑自发活动的改变是与情绪相关的状态标志还是 MDD 患者的特质目前尚不清楚。本研究旨在探讨 MDD 患者情绪面孔处理异常、静息态脑局部一致性 (regional homogeneity, ReHo) 特征及其与情绪状态的关系。

方法 研究纳入符合《美国精神疾病诊断与统计手册》第五版 (DSM-5) 重性抑郁发作诊断的患者 43 例, 并选取年龄、性别和受教育程度相匹配的健康被试 60 例。所有被试均接受静息态磁共振扫描、情绪面孔识别任务及汉密尔顿抑郁量表 17 项 (HAMD-17) 评估。

结果 在情绪面孔识别任务中, MDD 组对愉快、中性、悲伤面孔的识别率均低于 HC 组 (p 均 < 0.01)。MDD 组在左枕下回、左侧梭状回、左侧颞下回的 ReHo 值相较于 HC 组下降 (单体素 $p < 0.001$, 连续体素值 $k \geq 21$, GRF 校正后 $p < 0.01$)。MDD 组异常脑区的 ReHo 值与 HAMD-17 呈负相关 ($p < 0.01$)。此外, MDD 患者愉快面孔的正确识别数与 HAMD-17 呈负相关 ($p = 0.039$), 将愉快面孔误认为悲伤面孔的次数与 HAMD-17 分数呈正相关 ($p = 0.048$)。

结论 MDD 患者在情绪面孔识别和脑区局部一致性上存在异常, 这些异常均与患者的情绪状态相关。

团体心理剧联合行为干预对老年人抑郁状态和认知功能的影响

马明芳*

西安交通大学第一附属医院

目的 探讨团体心理剧 (GP) 联合认知行为疗法 (CBT) 对老年人抑郁状态和认知功能的影响, 并分析老年人抑郁症状与认知功能的相互关系。

方法 将西安市某社区 159 名患有轻中度抑郁

症的老年人随机分为对照组、单纯 CBT 组和 GP 联合 CBT 干预组, 每组 53 人。对照组接受常规健康教育; 在对照组的基础上, 单纯 CBT 组进行认知行为治疗; GP 联合 CBT 干预组同时进行团体心理剧治疗和认知行为干预。在干预前和干预 4 个月末, 采用老年抑郁量表 (GDS)、简易精神状态量表 (MMSE)、蒙特利尔认知评估量表 (MoCA) 对各组的抑郁状态和认知功能进行评价, 采用 SPSS 19.0 对数据进行统计分析。

结果 (1) 159 例老年抑郁症患者的 MoCA 评分为 16.59 ± 3.86 , 其中, 视空间与执行功能 2.48 ± 1.30 , 命名 2.61 ± 0.62 , 注意 3.35 ± 1.02 , 语言 1.76 ± 0.68 , 抽象 0.88 ± 0.72 , 延迟回忆 1.49 ± 1.27 , 定向 4.02 ± 0.54 。

(2) Pearson 相关分析显示: GDS 评分与 MoCA 总分、视空间与执行功能、注意、语言得分均呈负相关 ($P < 0.05$, $P < 0.01$)。 (3) 与对照组相比, 单纯 CBT 组及 GP 联合 CBT 组的 GDS、MMSE 和 MoCA 得分均数有统计学差异 ($P < 0.01$); 与单纯 CBT 组相比, GP 联合 CBT 组的上述三项得分差异有统计学意义 ($P < 0.05$)。

结论 (1) 西安市社区患有抑郁症的老年人认知损害较为明显, 尤其是视空间与执行功能、注意、语言、延迟回忆等领域。 (2) 老年人的抑郁症状与认知功能下降密切相关, 应着眼于重点人群进行认知心理干预。 (3) 单纯 CBT 治疗及 GP 联合 CBT 干预均能改善老年人的抑郁状态和认知功能, GP 联合 CBT 干预效果优于单纯的 CBT 治疗。

多奈哌齐与美金刚联合用于老年痴呆患者治疗对炎症因子水平及认知功能的影响

赵玉丽 梁伟业* 范宁 韩笑乐 燕江陵 张兴理

北京回龙观医院

目的 探讨美金刚与多奈哌齐联合治疗老年痴呆患者的效果及对炎症因子水平、认知功能的影响。

方法 选择 90 例 2022 年 1 月-2023 年 3 月期间入院诊治的老年痴呆患者作为研究分析目标。纳入者分组方法选用随机数字表法。对照组 45 例, 性别: 男 26 例, 女 19 例; 年龄: 65~85 岁, 平均 (73.45 ± 4.72) 岁; 病程: 6~22 个月, 平均

(17.15 ± 3.26)个月;痴呆程度[4]:轻度28例,中度17例。研究组45例,性别:男30例,女10例;年龄:65~86岁,平均(75.08 ± 5.38)岁;病程:6~21个月,平均(17.10 ± 3.53)个月;痴呆程度:轻度29例,中度16例。纳入病例基础资料组间对比,差异无统计学意义($P>0.05$)。观察患者炎症因子水平、认知功能、日常活动能力变化情况及药物不良反应发生情况。

结果 治疗后与对照组相比较,研究组IL-6、CRP及TNF- α 水平均更低($P<0.05$);治疗后研究组WHO-UCLA AVLT中即时回忆评分、延迟回忆评分相比对照组均更高($P<0.05$);治疗后研究组ADL量表评分相比对照组($P<0.05$);研究组药物不良反应与对照组相比,差异无统计学意义($P>0.05$)。

结论 老年痴呆临床治疗中同时使用多奈哌齐与美金刚,可明显提高机体抗炎效果,促进患者认知功能更好恢复,有助于提高患者日常生活活动能力,且不会增加药物不良反应。

伴躯体化症状的老年期抑郁障碍患者急性期抗抑郁治疗的疗效预测研究

苗齐¹ 卢美旭² 王乾龙² 温天杨¹ 马海涛¹ 李纪迎¹ 焦玉壮¹ 王明真¹ 杨晓华¹ 张夏¹ 刘雪莹¹ 赵玉萍¹ 张艳¹

1.山东省精神卫生中心(山东大学附属精神卫生中心),精神病学,山东省医药卫生老年医学重点学科,山东济南,250014

2.济宁医学院,精神卫生学院

目的 探索伴躯体化症状的老年期抑郁障碍患者在急性期抗抑郁药物治疗效果的潜在预测因素。

方法 在山东省精神卫生中心入组伴有躯体化症状的老年期抑郁障碍患者28例,患者在入组基线时未进行系统的抗抑郁治疗。在治疗前基线,收集患者的人口学资料;同时,使用匹兹堡睡眠质量指数量表(Pittsburgh sleep quality index, PSQI)评估患者主观睡眠质量,使用认知功能缺陷自评量表(Perceived Deficits Questionnaire-Depression, PDQ-D)评估患者的主观认知水平。使用简明幸福与生活

质量满意度问卷(Quality of Life Enjoyment and Satisfaction Questionnaire, Short Form, Q-LES-Q-SF)评估患者的生活质量;计算患者的中性粒细胞与淋巴细胞比率,简称粒淋比(neutrophil/lymphocyte ratio, NLR)水平,评估患者的全身性炎症状态。在基线及抗抑郁药治疗2周后,使用汉密尔顿抑郁量表(Hamilton Depression Scale, HAMD)、汉密尔顿焦虑量表(Hamilton Anxiety Scale, HAMA)量表评估患者的抑郁及焦虑情况。以年龄、病程、PDQ-D评分、HAMA评分、Q-LES-Q-SF评分、主观睡眠质量各项评分和NLR水平为自变量,以HAMD减分率(主要结局指标)作为因变量,使用多元线性回归进行统计分析。

结果 在伴有躯体化症状的老年期抑郁障碍患者中,患者治疗前基线年龄与治疗2周后的HAMD减分率呈负相关($P=0.007$);患者治疗前基线的年龄越大,治疗2周后的HAMD减分率越低。患者在治疗前基线的主观入睡时间得分与治疗2周后HAMD减分率呈正相关($P=0.039$);患者基线的主观入睡时间得分越高,治疗2周后的HAMD减分率越高。同时,患者治疗前基线的主观睡眠时间得分与治疗2周后的HAMD减分率呈正相关($P=0.021$);患者基线的主观睡眠时间得分越高,治疗2周后的HAMD减分率越高。患者在治疗前基线的NLR水平与治疗2周后HAMD减分率呈正相关($P=0.022$);患者基线的NLR水平越高,治疗2周后的HAMD减分率越高。

结论 在伴有躯体化症状的老年期抑郁障碍患者中,治疗前患者的年龄越小、主观入睡越困难、主观睡眠时间越短、全身性炎症水平越严重,则经2周急性期抗抑郁药治疗后的抑郁症状改善可能越明显。未来仍需要进一步扩大样本量进行验证。

关键词:老年期抑郁障碍,躯体化症状,抗抑郁治疗,疗效预测

痴呆患者确诊前精神心理问题的临床特征分析

李雨航 岳玲*

上海市精神卫生中心

目的 轻度行为损害 (Mild Behavioral Impairment, MBI) 是一组在老年期 (50 岁以上) 发生的一系列精神行为症状, 包括抑郁、躁狂以及幻觉、妄想等。这一系列症状被认为可能与认知障碍, 尤其阿尔茨海默病 (Alzheimer's disease, AD) 相关, 并发生在 AD 痴呆症状前多年。然而在临床上, 痴呆前的精神行为症状包括 MBI 和睡眠障碍, 与 AD 的联系往往被忽视, 故本研究对上海住院老人痴呆前发生的精神心理问题进行回顾性研究, 拟进一步明确痴呆确诊前精神心理问题的临床特点。

方法 选取 2023 年 10 月-2024 年 5 月于上海交通大学附属精神卫生中心老年科门诊或住院患者 307 名, 从中筛选出 138 名临床诊断为痴呆的患者, 进行既往病历和既往史回溯, 并分析痴呆患者发病前精神心理异常 (精神病性症状、睡眠障碍、情绪问题) 的发生比率、时间及人群的分布情况。

结果 本研究纳入的痴呆患者中, 年龄为 75.4 ± 9.5 岁, 受教育年限为 10.2 ± 4.3 年, MMSE 为 13.6 ± 7.2 。其中, 诊断为 AD 的共 101 人, 占比 73.1%, 一半以上的患者 (57.9%) 在确诊为痴呆前出现精神心理问题。不同精神心理症状群的发生比例略有不同: 从高到低分别为精神病性症状 (38.4%)、睡眠障碍 (36.2%)、情绪问题 (35.5%); 患者出现精神心理症状到记忆下降的时长差异很大, 总体来说, 出现最早的为睡眠障碍 (58.7 ± 100.8 个月), 随后是情绪问题 (51.5 ± 77.4 个月), 最后是精神病性症状 (18.4 ± 40.0 个月)。不同性别的患病情况也存在差异, 主要是睡眠障碍的分布, 女性患睡眠障碍的比例显著高于男性 (37% vs. 13%), 且出现症状到发生记忆下降的时间也是女性较长 (月) (71.1 vs. 23.4)。研究进一步比较不同痴呆类型的特征, 发现 AD 患者不同症状群的患病率和发生顺序与非 AD 类似, 只在发生时长上略有不同: AD 患者出现睡眠障碍和情绪问题后记忆下降发生较非 AD 稍快 (月) (53.2 vs. 81.6 ; 52.1 vs. 58.4), 而精神病性症状后记忆下降发生较非 AD 稍慢 (月) (25.0 vs. 9.3)。

结论 本研究发现, 痴呆确诊前除记忆缺损外, 超过一半的患者存在精神心理问题, 如精神病性症状、睡眠障碍和情绪问题。老年期精神心理问题与痴呆密切相关, 精神科医生应重视认知功能评估, 开展早期诊断。

TCSA 在安徽省农村地区老人认知功能筛查中有效性研究

房传龙¹ 李霞² 赵勇¹ 齐龙¹ 管建群¹ 杨善杰¹

1. 安庆市精神病医院

2. 上海市精神卫生中心

目的 探索电子筛查工具在安徽省农村老年人群中认知功能筛查的有效性。

方法 在安庆市农村地区招募 224 名农村老人, 采用电子筛查工具 (Thoven Cognitive Self-Assessment, TCSA)、简明精神状态检查量表 (Mini-Mental State Examination, MMSE) 进行认知功能筛查, 并使用 geriatric depression screening scale-15 (GDS-15)、日常生活功能量表 (activity of daily living scale, ADL) 进行临床评价。

结果 完成评估老人平均年龄为 72.96 ± 7.60 岁, 平均受教育年限为 3.29 ± 3.55 年。TCSA 初筛分 >7 分 (判定为认知功能正常) 有 128 人 (57.1%)。TCSA 初筛分与 MMSE 呈正相关 ($r=0.4871^{**}$, $p<0.001$), 与 TCSA 完整筛查分呈正相关 ($r=0.6498^{**}$, $p<0.001$), TCSA 初筛 >7 分中随机 15 人的 MMSE 平均分为: 24.13 ± 3.14 , 平均受教育年限: 5.93 ± 3.88 。

结论 电子筛查工具 TCSA 适用于农村地区, 与国际通用工具相当, 值得推广。

Study on The Correlation between Sleep Quality and Neuroticism Among Elderly People Aged over 65 in The Community

Mo Zhu Xia Li*

Department of Geriatrics, Shanghai Mental Health Center, Shanghai Jiao Tong University School of Medicine

Objective Sleep has increasingly become a key health concern among the elderly population. Considering that sleep is closely linked to the development and

progression of various illnesses and is a modifiable factor, it is essential to recognize and assess sleep disturbances, as well as to understand their underlying causes. Personality traits, which emerge from the interplay between individuals and their environment, shaping patterns of behavior, cognition, and emotion, are closely tied to overall health and well-being. The objective of this study was to examine the association between sleep quality and personality traits among elderly community members, and to explore the potential impact of personality traits on sleep

Methods This study collected general demographic data from elderly individuals aged 65 and above in the community. The 60-item version of the Big Five Personality Traits Scale was utilized for personality assessment. It encompasses five primary traits: openness, conscientiousness, extroversion, agreeableness, and neuroticism. Each trait is evaluated through 12 items, scored from 1 to 5, with higher scores indicating a stronger alignment with the respective trait. Sleep quality was assessed using the Pittsburgh Sleep Quality Index (PSQI), where higher scores denote poorer sleep quality. PSQI score > 5 served as the criterion for grouping. The Geriatric Depression Scale-15 (GDS-15) was used to assess emotional status, with higher scores indicating poorer emotional well-being

Results The study enrolled a total of 330 elderly participants, with a mean age of 70 ± 4.6 years. Among them, 147 (47.5%) were male. No significant differences were observed between the two groups in terms of age, gender, lifestyle habits (smoking, drinking), and histories (heart disease, diabetes, hyperlipidemia). A comparative analysis of neuropsychological assessments revealed that individuals with poor sleep quality exhibited higher GDS-15 and neuroticism scores, with a statistically significant difference ($p < 0.05$). Furthermore, Spearman correlation analysis indicated a positive correlation between neuroticism and both the PSQI and GDS-15 scores ($p < 0.05$)

Conclusion The sleep quality of elderly individuals is influenced by factors such as emotional state and personality traits. Specifically, those with a neuroticism personality trait tend to experience poorer sleep quality

关键词: sleep quality; personality traits; community screening

改良道家认知疗法对老年精神分裂症患者抑郁焦虑情绪的改善作用

陆如平* 高慧 罗岚 张晶晶 孙忠 吕珍芬
上海市民政第一精神卫生中心

目的 本研究旨在探究改良道家认知疗法结合角色扮演对老年精神分裂症患者抑郁焦虑情绪的影响。由于老年精神分裂症患者常伴有明显的抑郁和焦虑症状,传统的治疗方法在这一方面的效果有限,因此需要探索新的心理干预手段,以期改善患者的情绪状态,提高其生活质量。

方法 研究选取了上海市民政第一精神卫生中心住院的60名老年精神分裂症患者(年龄 ≥ 60 岁)。通过随机分组,将患者分为研究组和对照组,各30人。两组均接受常规精神科治疗、康复及护理,研究组额外接受改良道家认知疗法干预。治疗包括5个步骤,总共8次治疗,每周1次,每次90分钟。采用阳性和阴性症状量表(PANSS)、卡尔加里精神分裂症抑郁量表(CDSS)、抑郁症筛查量表(PHQ-9)、汉密顿焦虑量表(HAMA)和焦虑症筛查量表(GAD-7)进行评定。

结果 治疗后,研究组在各评定量表上的得分显著降低(P 均 < 0.05),显示出抑郁和焦虑症状的明显改善。与对照组相比,研究组在阳性和阴性症状量表(PANSS)、卡尔加里精神分裂症抑郁量表(CDSS)、抑郁症筛查量表(PHQ-9)、汉密顿焦虑量表(HAMA)和焦虑症筛查量表(GAD-7)上的得分变化均更为显著(P 均 < 0.05)。具体表现为,研究组的精神症状、抑郁情绪和焦虑情绪均显著减少,而对照组在这些方面的变化较小。此外,统计分析显示,研究组的改善程度在各项指标上均显著优于对照组(P 均 < 0.05),进一步验证了改良道家认知疗法的有效性。

结论 改良道家认知疗法结合角色扮演能显著改善老年精神分裂症患者的抑郁和焦虑症状,为老年精神分裂症患者的心理治疗提供了一种新的可能性。这一疗法的应用不仅可以有效缓解患者的抑郁和焦虑情绪,还可能在促进康复、提高生活质量等

方面发挥积极作用。因此,改良道家认知疗法结合角色扮演值得在老年精神分裂症患者的心理干预中进一步推广与应用。

国内外老年人失智症照护服务模式综述

陈亚萍*

宁波市精神病院

As China experiences a rapid aging process, the number of elderly individuals with dementia has increased significantly. Dementia has emerged as a major cause of disability and the subsequent need for caregiving among the elderly population. The cognitive decline observed in dementia patients often leads to communication barriers and mental and behavioral abnormalities, thereby greatly enhancing the complexity of caregiving services for these individuals. This poses immense challenges to society, the economy, and families. Drawing from the demand for health and elderly care services in an aging society, as well as the evolution of dementia caregiving service models, this article delves into advanced domestic and foreign dementia caregiving service models. Its objective is to offer valuable references and insights that can optimize and enhance the development of dementia caregiving service models in China

老年急性缺血性脑卒中患者治疗后发生老年衰弱综合征预测模型的建立及验证

王珊珊*

宁波市精神病院

目的 构建并验证老年急性缺血性脑卒中(AIS)患者治疗后发生老年衰弱综合征的预测模型。

方法 回顾性收集2020年1月至2022年12月解放军联勤保障部队第九〇六医院收治的老年AIS患者156例,根据患者治疗后是否发生老年衰弱综

合征,将患者分为老年衰弱综合征组57例和对照组99例。比较2组临床特征差异,分析老年AIS患者治疗后发生老年衰弱综合征的危险因素并构建预测模型。

结果 老年衰弱综合征组年龄、糖尿病、大面积脑梗死、吞咽困难比例高于对照组($P < 0.05$, $P < 0.01$)。多因素logistics回归分析显示年龄 ≥ 80 岁、糖尿病、大面积脑梗死、吞咽困难是老年AIS患者治疗后发生老年衰弱综合征的独立危险因素($P < 0.05$)。构建列线图预测模型,并将数据集按照7:3的比例随机分为训练集和验证集,训练集和验证集ROC曲线下面积分别为0.840(95%CI:0.754~0.927)、0.676(95%CI:0.518~0.833)。验证集中进行Hosmer-Lemeshow拟合优度检验, $\chi^2 = 14.394$, $P = 0.072$,表明本模型具有良好的可信度和预测价值。

结论 本模型对老年AIS患者治疗后发生老年衰弱综合征具有良好的预测价值。

The Therapeutic Effects of Theta Burst Stimulation on Negative Symptoms in Chronic Schizophrenia Using Functional Near-Infrared Spectroscopy

Chunying Gao¹, Chao Zhou², Xiangrong Zhang²

1.Changzhou Dean hospital

2.Nanjing Medical University Affiliated Nanjing Brain Hospital

Objective To explore the efficacy of theta burst stimulation (TBS) on the negative symptoms of patients with chronic schizophrenia (CS), and to investigate the alterations of local brain activity using functional near-infrared spectroscopy (fNIRS)

Methods 104 patients with CS were enrolled and divided into experimental group (52 subjects) and control group (52 subjects). The experimental group was given real stimulation of TBS for 4 weeks, and the control group was sham stimulated with the same site. The Positive and Negative Symptom Scale (PANSS) and the Scale for Assessment of Negative Symptoms (SANS)

were used to assess the clinical symptoms. fNIRS was used to detect the Amplitude of low frequency fluctuation (ALFF) of cortical hemoglobin before and after TBS. Correlation analysis was used to explore the associations between altered zALFF and clinical features

Results Compared to baseline, the total scores of SANS and PANSS, and the subscale score of PANSS negative symptom significantly decreased after TBS in the experimental group ($P<0.05$). Compared to control group, experimental group exhibited significant reduction in SANS, PANSS total scores, and PANSS negative symptom subscale scores after treatment ($P<0.05$). fNIRS revealed that the zALFF of deoxyhemoglobin in left dorsolateral prefrontal cortex was decreased in experimental group after TBS. Furthermore, the zALFF of oxyhemoglobin was increased in the right and left frontal pole regions, and decreased in the right superior temporal gyrus in experimental group compared to control group after TBS. Correlation analysis showed that the alterations of zALFF of frontal regions after treatment may associated with the improvement of negative symptoms in CS patients

Conclusion Short-term TBS is effective in the improving of negative symptoms of CS. fNIRS could reveals the changes of brain activity after TBS treatment, providing an effective technique for exploring the efficacy of TBS in schizophrenia

关键词: Repetitive transcranial magnetic stimulation, chronic schizophrenia, negative symptoms, functional near infrared spectroscopy

奥拉西坦+尼莫地平对 ACI 后 VD 患者的氧化应激反应、血液流变学的影响

蒲犇*

宁波市精神病院

目的 探讨急性脑梗死 (ACI) 后发生血管性痴呆 (VD) 的患者采用奥拉西坦联合尼莫地平治疗的效果及其作用机制。

方法 采用单中心临床随机试验, 选取 2019 年 6 月~2022 年 6 月 ACI 后 VD 患者 123 例进行临床

研究。采用信封法随机分为两组, 其中研究组 62 例患者采用基础治疗方案+奥拉西坦+尼莫地平治疗, 对照组 61 例患者采用基础治疗方案+尼莫地平治疗, 均连续治疗 3 周, 观察两组患者的认知功能评分、临床痴呆量表 (CDR) 评分, 血清丙二醛 (MDA)、超氧化物歧化酶 (SOD)、胱抑素 C (cystatin C)、神经元凋亡相关因子 (Bcl-2、Bax、Caspase-3) 蛋白表达、血浆纤维蛋白原 (factor X)、血红蛋白 (PCV) 及全血黏度高切 (BVH)、全血黏度低切 (BVL) 和临床治疗效果的差异。

结果 研究组患者和对照组患者在治疗 1 周、3 周的 MMSE 评分较本组治疗前增高、CDR 评分较本组治疗前显著降低 ($P<0.05$); 研究组治疗 3 周的 MMSE 评分显著高于对照组, CDR 评分低于对照组, 差异均具有统计学意义 ($P<0.05$);

研究组患者和对照组患者在治疗后的 MDA、cystatin C 较本组治疗前降低、SOD 较本组治疗前升高 ($P<0.05$); 研究组治疗后的 SOD 显著高于对照组, MDA、cystatin C 低于对照组, 差异均具有统计学意义 ($P<0.05$);

研究组患者和对照组患者在治疗后的 Bax、Caspase-3 表达水平较本组治疗前降低、Bcl-2 较本组治疗前升高 ($P<0.05$); 研究组治疗后的 Bcl-2 显著高于对照组, Bax、Caspase-3 低于对照组, 差异均具有统计学意义 ($P<0.05$);

研究组患者和对照组患者在治疗后的 BVH、BVL、PCV 水平较本组治疗前降低 ($P<0.05$); 研究组治疗后的 BVH、BVL、PCV 低于对照组, 差异均具有统计学意义 ($P<0.05$); 经过连续 3 周治疗, 研究组患者总体疗效优于对照组患者, 差异具有统计学意义 ($P<0.05$)。

结论 ACI 后发生 VD 的患者采用奥拉西坦联合尼莫地平治疗有利于减轻氧化应激反应、改善血液流变学水平、调节神经元凋亡因子水平, 从而提高临床治疗效果。

阿尔茨海默病患者血清 ZnT8, zonulin, LPE 水平与病情及认知功能的关系

阮乃荣*

宁波市精神病院

目的 探究阿尔茨海默病患者血清锌转运蛋白8(ZnT8)、连蛋白(zonulin)、溶血磷脂酰乙醇胺(LPE)水平与病情, 认知功能的关系。

方法 观察组选取2021年8月~2023年8月期间在本院收治的131例阿尔茨海默病患者, 根据临床痴呆评定量表(CDR)将其分为轻度组(45例), 中度组(51例), 重度组(35例)。对照组为同期在本院行体检的119名健康者。采用ELISA对各组血清ZnT8、zonulin水平进行检测, 高效液相色谱-串联质谱法检测血清LPE水平, 比较观察组和对照组一般资料; Logistic回归分析影响发生阿尔茨海默病的相关因素; Pearson和Spearman法对阿尔茨海默病患者血清ZnT8、zonulin、LPE水平之间以及与MMSE评分的相关性进行分析。

结果 观察组和对照组文化程度、吸烟史、饮酒史、高血压病史、高血脂病史、婚姻状况、TG等比较, 差异不显著($P>0.05$), TC、HDL-C、LDL-C、MMSE评分等比较, 差异显著($P<0.05$)。与对照组相比, 观察组血清ZnT8、zonulin、LPE水平升高, 差异显著($P<0.05$)。重度组、中度组血清ZnT8、zonulin、LPE水平较轻度组升高, 且与中度组相比, 重度组血清ZnT8、zonulin、LPE水平显著升高($P<0.05$)。TC、LDL-C、HDL-C、MMSE评分、血清ZnT8、zonulin、LPE水平是发生阿尔茨海默病的影响因素($P<0.05$)。Pearson分析显示, 阿尔茨海默病患者血清ZnT8与zonulin、ZnT8与LPE、zonulin与LPE水平均呈正相关($P<0.05$); Spearman分析显示, MMSE评分与血清ZnT8、zonulin、LPE水平均呈负相关($P<0.05$)。

结论 阿尔茨海默病患者中血清ZnT8、zonulin、LPE水平升高且与患者病情, 认知功能相关。

The Application, Progress, and Prospects of TACS in The Elderly: A Review.

Wenhao Zhuang Dongsheng Zhou*
Affiliated Kangning Hospital of Ningbo University

In the elderly, the gradual decline in cognitive function can lead to mild cognitive impairment (MCI) and even dementia. Despite the availability of various drugs that can enhance cognitive function, they often come with adverse effects and poor long-term efficacy, thus highlighting the urgent need for a safe and effective approach. This review assesses the extensive application of transcranial alternating current stimulation (tACS) in the cognitive functions of the elderly. tACS is a non-invasive brain stimulation technique that applies low-intensity alternating current to the scalp to stimulate cortical neurons, regulate endogenous neural oscillations, induce synaptic plasticity changes, and improve brain function. Following the PRISMA-DTA guidelines, this review screened 252 studies involving MCI, AD patients, and healthy elderly individuals, ultimately including 21 studies in the analysis. Results indicate that tACS positively impacts various cognitive dimensions in AD and MCI patients, showing superiority over other interventions like cognitive training and tDCS in cognitive function enhancement. Moreover, tACS also significantly benefits the cognition of healthy elderly individuals. The primary aim of this systematic review is to evaluate the therapeutic effect of tACS on cognitive impairment in AD or MCI patients and its feasibility in improving cognitive function in normal aging individuals, while also looking forward to the broad application prospects of tACS in enhancing cognitive function in the elderly.

关键词: Transcranial Alternating Current Stimulation(tACS); Cognitive Function; Alzheimer's Disease (AD); Mild Cognitive Impairment (MCI); Elderly

盐酸美金刚与重酒石酸卡巴拉汀联合治疗中度阿尔茨海默病患者的临床效果分析

钮伟芳*
河北省第三荣军优抚医院

目的 探讨盐酸美金刚与重酒石酸卡巴拉汀联合治疗中度阿尔茨海默病的疗效。

方法 选择2022年1月5日至2023年12月5

日收治的 60 例中度阿尔茨海默病患者为研究对象。我们选取随机抽取法,分别为新式组(30 例)和传统组(30 例)。传统组采用重酒石酸卡巴拉汀治疗,新式组在此基础上联合使用盐酸美金刚治疗中度阿尔茨海默症患者。对比两组患者临床痴呆评定量表(CDR)、日常生活活动能力量表(ADL)和简易精神状态评价量表(MMSE)的评分及出现不良反应的情况。

结果 干预前两组患者在认知评分、精神状态和生活能力方面基本持平。但干预后,新式组在 ADAS-cog、MMSE 和 ADL 评分上均显示出明显进步,优于传统组。新式组在神经递质水平上也展现优势,Ach、5-HT 和 BDNF 值显著提升,而 S100 β 值则降低,这表明其神经元保护效果更佳。在炎症因子方面,新式组 IL-6、IL-1 β 和 TNF- α 水平更低,显示出良好的抗炎效果。这些数据充分证明,新式联合治疗方案在阿尔茨海默病的治疗中表现出显著优势。

结论 盐酸美金刚与重酒石酸卡巴拉汀的联合治疗方案,针对中度阿尔茨海默病疗效显著,有效改善患者症状,提高生活质量。这一创新治疗方法经临床验证,效果卓越,值得广泛应用于相关患者的治疗。

关键词: 盐酸美金刚,重酒石酸卡巴拉汀,联合治疗,中度阿尔茨海默病,效果分析

老年精神分裂症患者主观睡眠质量与认知功能的相关性分析

邱义玲*

上海市宝山区精神卫生中心

目的 调查老年精神分裂症患者主观睡眠质量及认知功能现状,分析患者主观睡眠质量的高低和认知功能水平之间的具体联系。

方法 选取 2021 年 3 月~2022 年 3 月上海市宝山区精神卫生中心在院的 130 名老年精神分裂症患者为研究对象,采用一般资料调查表、阳性和阴性症状量表(PANSS)、重复性成套神经心理状态测验(RBANS)、匹兹堡睡眠质量指数(PSQI)对其进行评测,并根据 PSQI 评分具体分值,若 PSQI 总分 ≤ 7 分纳入睡眠质量好组,总分 > 7 分为睡眠质量差组。

采用单因素分析、Pearson 相关分析对睡眠和认知功能进行比较分析。

结果 睡眠质量好组 PANSS 一般精神病理症状(25.63 \pm 6.43)低于睡眠质量差组(28.40 \pm 7.74),睡眠质量好组的 RBANS 注意评分(92.93 \pm 6.37)高于睡眠质量差组(89.78 \pm 5.68),睡眠质量好组的 RBANS 延迟记忆评分(80.27 \pm 10.83)高于睡眠质量差组(76.24 \pm 8.12)(P 均 < 0.05)。患者的 PSQI 评分与 RBANS 量表的注意力、延迟记忆维度呈负相关($P < 0.05$)。睡眠质量、睡眠效率、睡眠障碍、日间功能障碍分项与注意力均呈负相关($r = -0.184$, $P < 0.05$; $r = -0.299$, $P < 0.05$; $r = -0.175$, $P < 0.05$; $r = -0.244$, $P < 0.05$),睡眠质量分项与延迟记忆呈负相关($r = -0.223$, $P < 0.05$)。

结论 老年精神分裂症患者的睡眠质量与精神症状、认知功能相关,且与认知功能的注意、延迟记忆维度更具相关性。

基于外周血 microRNA 的差异性表达识别早期单相抑郁和双相 II 型

倪龙燕¹ 朱园园¹ 张向荣¹ 吕兰兰²

1.南京脑科医院

2.徐州东方医院

目的 单相抑郁和双相 II 型因抑郁症状相似而轻躁狂症状难以觉察导致临床鉴别困难,特别是在仅有抑郁发作的早期阶段。双相抑郁被误诊为单相抑郁最长时间可达 8-13 年,严重影响了患者的治疗和预后。本研究旨在早期阶段帮助识别两者。

方法 总入组单相抑郁(MDD)33 例、双相 II 型(BDII)33 例和健康对照(HC)27 例总计 93 例受试者。两病例组总病程小于 3 年,HAMD 评分 > 17 分,并进行至少 1 年以上的随访以排除转相患者。在入组时完成人口学资料收集、HAMD、HCL-32、YMRS 量表评估,以及采外周血 5ml 用于 microRNA 二代测序、microRNA 差异性表达、靶基因 GO 和 KEGG 分析。

结果 MDD 组有 3 例患者转相剔除本研究。三组受试者在性别、受教育年均无统计学差异($P = 0.38$,

$P=0.26$), 而年龄有统计学差异 ($P=0.002$), BDII组年龄小于 MDD 组($P=0.001$)。BDII组与 MDD 组 HAMD 评分无统计学差异($P=0.67$), 病程($P=0.037$) 和 HCL-32 评分 ($P<0.01$) 均有统计学差异。BDII组与 MDD 组相比, 共有 130 个 microRNA 表达有差异 ($p<0.05$), 其中 50 个 microRNA 上调, 80 个 microRNA 下调, 主要参与调控 PI3K-Akt、Hippo、Neurotrophin、ErbB 等信号通路。将三组 microRNA 表达进行方差分析, 共发现 8 个高表达的差异 microRNA ($P<0.001$), 再进行组间两两比较。与 HC 组比较, BDII组 8 个 microRNA 均有差异 ($P<0.01$), 而 MDD 组仅有 2 个 microRNA (miR-16-5p、hsa-miR-7g-5p) 有差异 ($P<0.05$)。选择这两个在病例组与健康对照组均有差异的 microRNA 进行两两比较, 发现 miR-16-5p 在 BDII组与 MDD 组有差异, 且 BDII组 miR-16-5p 表达水平低于 MDD 组($P<0.01$)。

结论 miR-16-5p 表达水平在 MDD 组和 BDII 组均低于健康对照组, 且 BDII组较 MDD 组表达水平更低。miR-16 可能参与 5-HT 转运体调控, 低水平的 miR-16 减弱对 5-HT 转运体抑制作用, 导致抑郁频发或症状持续。miR-16-5p 可能是早期识别单相抑郁和双相 II 型的生物标志物。

关键词: 单相抑郁, 双相抑郁 II 型, 早期识别, miR-16, 5-HT 转运体

High Neutrophil-to-Lymphocyte Ratio in APOE ϵ 4 Allele Carriers Increasing The Risk of Dementia

Jing Nie Xia Li*

1. Department of Geriatric Psychiatry, Shanghai Mental Health Center

Objective The ϵ 4 allele of the apolipoprotein E (APOE) gene is the major genetic risk factor for Alzheimer's disease (AD). Recently, the neutrophil-to-lymphocyte (NLR) have been proposed to be useful peripheral markers of inflammation. However, few studies have explored apolipoprotein E4 genetic effects to inflammation with incident dementia. The objective of this study is to investigate the interaction between the APOE ϵ 4 and dose of NLR with incident AD

Methods Observational cohort study with inflammatory biomarkers and cognitive performance measured over 5760 participants in China from the Shanghai Action of Dementia Prevention for the elderly projects (SHAPE). One longitude external sample from Alzheimer's Disease Neuroimaging Initiative database (ADNI) was assayed to further confirm the results

Results High NLR level was associated with increased prevalence of dementia only in APOE ϵ 4 (odds ratio for highest(Q4) vs lowest quartile(Q1), 2.89, 95% CI, 1.23–6.79; $P=0.015$). Furthermore, this corresponds to a rapid cognitive decline over a 6 years follow-up for APOE ϵ 4 carriers versus for non-APOE ϵ 4 persons in top quartile (Q4) of NLR from the Alzheimer's Disease Neuroimaging Initiative(ADNI)($\beta=-1.694, p<0.001$). In addition, the effects of NLR on cognitive function were mediated by total-tau and A β 42/total-tau pathology (proportion: 23%–40%, $p < 0.05$)

Conclusion This study is the first to found that peripheral inflammation appeared to enhance the association between APOE ϵ 4 status and dementia, whereas total tau appears to be an important intermediate condition. The study provides further insight for individuals with APOE ϵ 4 targeting systemic inflammation, geared towards Alzheimer's risk reduction

我国精神障碍患者养老模式现状的研究

陈良梅*

西安市精神卫生中心

目的 本文旨在通过分析现有文献资料, 探讨我国精神障碍患者养老模式的现状, 并提出相应的改进建议。

方法 本研究通过对相关文献的综述, 通过引用专家学者的观点和相关统计数据, 分析了中国精神障碍患者养老模式的现状, 重点关注现有的养老服务体系、政策支持及社会认知情况, 揭示了当前中国精神障碍患者养老模式的主要特点及存在的问题。

结果 研究表明, 现有养老模式主要有: 家庭照料、社区服务、机构养老; 面临的主要问题: 服务供给不足, 专业人才短缺, 社会认知与歧视。家庭护理仍是主要方式, 超过 70% 的精神障碍患者依赖于家庭护理, 但面临着巨大的压力和挑战; 机构养老、社区服务体系的建设正在逐步发展, 但仍存在资源不足、服务质量不高、城乡分布不均的现象。政策建议与发展展望: 加强社区支持体系的建设和完善, 扩大服务覆盖范围; 提高专业人员培训力度, 确保服务质量; 制定和完善相关政策法规, 保障患者的权益; 提升公众意识, 减少偏见和歧视; 利用科技手段辅助养老, 缓解人力资源紧张。建议未来应加强社区支持体系建设, 提高专业服务水平, 以改善精神障碍患者的养老状况。

结论 中国精神障碍患者的养老模式正处于转型期, 家庭护理依然是主流, 但也面临着巨大挑战。机构养老和社区服务虽有发展, 但尚不足以完全替代家庭的作用。尽管近年来中国政府在完善社会保障体系方面做出了积极努力, 但在精神障碍患者养老服务领域仍有许多工作要做。未来的发展方向应当是多维度的, 既包括政策层面的支持与引导, 也离不开社会各界共同努力, 来改变公众观念和提供更多优质服务资源。形成一个多元化、立体化的养老服务网络, 逐步构建一个更加包容和谐的社会环境, 从而全面提升精神障碍患者的生活质量。

Aberrant Dynamic Functional Connectivity of Amygdala Subregions in Adolescents with Depression

Ju Gao Hongyan Sun*

苏州市广济医院

Objective Research has indicated that aberrant amygdala is a crucial neurobiological underpinning of juvenile depression. This study aims to further identify resting-state dynamic functional connectivity (dFC) changes between the lateral amygdala (LA), medial amygdala (MeA) and whole-brain voxels, and their correlations with clinical symptoms in adolescents with depression

Methods Materials and Methods The bilateral LA and MeA were selected as regions of interest (ROIs), and the sliding window method was applied for investigating dFC changes in 47 adolescents with depression, compared with 35 sex-, age-, and education-matched healthy controls (HCs). Subsequently, the relationship between the dFC variability values and scores of Patient Health Questionnaire-9 (PHQ-9), the Simplified Coping Styles Questionnaire (SCSQ) in the patient group was investigated

Results The results revealed reduced dFC variability between the left LA, the left MeA and the right precentral gyrus (PreCG), between the right LA, the right MeA and the left median cingulate and paracingulate gyri (DCG), and between the right MeA and the right cuneus in adolescents with depression. The dFC variability between the right MeA and the right cuneus correlated positively with negative coping scores of the SCSQ ($r=0.414$, $p=0.005$) in adolescents with depression

Conclusion These findings confirm abnormal dynamic functional pathways of amygdala subregions in adolescent depression, and suggest that these abnormal dFCs may be involved in the neural mechanisms underlying the pathogenesis of adolescent depression

Research Progress of Mild Cognitive Dysfunction in The Elderly [Review]

Shan Rao¹, Weihong Kuang²

1.Jinxin Psychiatric Disease Hospital, Chengdu, People's Republic of China

2.Mental Health Center, West China Hospital, Sichuan University, Chengdu, People's Republic of China

Mild cognitive impairment (MCI) has subjective complaints of decline in cognitive functions such as memory, and objective examination finds that one or more cognitive functions are impaired beyond the level

appropriate for age and education, but this condition has not reached the level of dementia, and the ability to live daily life has not been significantly affected. MCI has a higher likelihood of dementia development, and 10% to 15% of patients progress from MCI to dementia every year, which is the annual incidence of dementia in the same population. Times. MCI is an important stage in the prevention of AD-related dementia, and effective intervention can reduce the prevalence of dementia in the population. This paper reviews the prevalence of MCI and its influencing factors.

Prevalence of MCI: A systematic review of 11 previous studies in the United States, Europe, Asia, and Australia found that the estimated prevalence of MCI ranged from 5.0% to 36.7%. A large national study that collected data from 2015 to 2018 showed that the prevalence of MCI in people aged 60 years and older was 15.5%, of which 11.9% were aged 60 to 69 years, 19.3% were aged 70 to 79 years, 24.4% were aged 80 to 89 years, and 33.1% were aged 90 years and older. The differences in the prevalence of MCI may be related to the sample size, age range, population culture and survey tools.

Influencing factors of MCI: (1) Sociodemographic factors include: ① Gender: female risk factor. Age: The prevalence of MCI increased with age; (3) Nationality/race: The prevalence of MCI was higher in Han nationality and lower in minority nationality; African Americans are high, white Americans are low. Marital status and residence: living alone is a risk factor, and being married is a protective factor. Education level: Low education level is an independent risk factor. ⑥ Place of residence (urban/rural) : The prevalence in rural areas is higher than that in urban areas. ① Genetic factors: ApoE-ε4 allele is the main genetic risk factor for cognitive impairment, carrying ApoE-ε4 will increase the prevalence of MCI by 57.9%. Disease factors: obesity, hypertension, hyperlipidemia, diabetes and cerebrovascular diseases are risk factors for MCI. (3) Psychological and behavioral factors: ① smoking is a risk factor; The effect of alcohol consumption on mild cognitive impairment is currently inconsistent. Physical and intellectual activities, social support and social partici-

pation are protective factors; (3) Depression is an independent risk factor for MCI, and targeted anti-anxiety and depression drugs have protective effects on MCI.

Summary : Globally, MCI and dementia have caused a serious public health burden, and China, as a large country with an aging population, is more affected by MCI. Paying attention to the elderly group of MCI, understanding the influencing factors of their cognitive function, and active intervention can effectively prevent or delay the occurrence of dementia, improve the quality of life of individuals, and reduce the disease burden of families and society.

Synaptic Vesicle Glycoprotein 2A As A Potential Biomarker in Alzheimer's Disease

Yunxiang Ling¹, Shiliang Wang^{1,2}, Weihong Song^{2,3}

1.Huzhou Third Municipal Hospital, Huzhou Third Municipal Hospital, the Affiliated Hospital of Wenzhou Medical University, Huzhou, Zhejiang Province, 313000, China

2. Institute of Aging, Key Laboratory of Alzheimer's Disease of Zhejiang Province, North Building of Biological Research, wenzhou Medical University, Chashan Higher Education Park, Ouhai District, Wenzhou, Zhejiang, 325035, China

3.Oujiang Laboratory (Zhejiang Lab for Regenerative Medicine, Vision and Brain Health).999 jinshi Road, Yongzhong Street, Longwan District, Wenzhou, Zhejiang Province.325035, China

Objective Alzheimer's disease (AD) is the most common neurodegenerative disease, with no specific drugs currently available for prevention and treatment. The lack of reliable predictive biomarkers is a significant challenge in AD research and clinical practice. This study aimed to explore the potential of SV2A in serum as a biomarker for AD

Methods Blood samples from 20 AD patients and 20 healthy controls from Huzhou Third Municipal

Hospital were confirmed by ELISA technology to detect SV2A in human serum; Then, the SV2A content of the cells was detected by Western blot (WB); Additionally, WB and tissue immunofluorescence staining were used to assess the expression of SV2A in the hippocampus of mice

Results (1) SV2A can be detected in human serum, and compared with the control group, The concentration of SV2A in the serum of AD patients was significantly reduced; ROC curve analysis results showed that there was no significant difference between SV2A (AUC=77.5%) and A β , p-Tau, and ApoE, suggesting that SV2A has similar predictive power as the core pathological biomarkers of AD. (2) In the cell, the expression of SV2A was significantly lower in the stable expression of APP gene in SH-SY5Y cells (SAS) compared with SH-SY5Y cells with human bone marrow neuroblastoma cell line. (3) At the level of animal models, the results of WB showed that the expression level of SV2A in the hippocampus of 4-month-old APP23/PS45 double mutant AD transgenic mice was lower than that of wild type mice of the same age. The immunofluorescence staining results showed that the expression of SV2A in the hippocampus of 12-month-old APP^{swe}/PS1^{dE9} double mutant AD transgenic mice was significantly lower than that of wild type mice of the same age

Conclusion Our research indicates that SV2A levels in serum serves as a promising biomarker for Alzheimer's disease

关键词: Alzheimer's disease, biomarker, SV2A

基于颞上沟脑区的结构像对社区认知正常老年人的 MCI 转归预测

熊文魁 肖世富 岳玲*

上海市精神卫生中心

目的 阿尔茨海默病 (Alzheimer's Disease, AD) 作为一种慢性神经退行性疾病, 其早期诊断尤为重要。轻度认知障碍 (Mild Cognitive Impairment, MCI) 是正常衰老与痴呆之间的中间状态, 从认知正常到

MCI 的预测对于实现疾病的早期发现至关重要。近年来, 多项研究均报道了颞上沟后坡 (Banks of Superior Temporal Sulcus, STSbanks) 脑区结构变化可能与早期认知损伤存在关联, 鉴于此, 本研究旨在分析基于 STSbanks 脑区特征在预测社区中认知正常的老年人群进展为 MCI 的可能性。

方法 样本来自上海脑健康队列研究 (SHBAS), 筛选基线调查时认知功能正常, 且完成基线包括磁共振在内的评估和后续长程认知随访的被试。使用全套神经心理量表评估认知心理; 以 Freesurfer 标准流程提取海马、杏仁核体积, STSbanks 脑区灰质、白质体积; 以 Simoa 技术分析外周血 AD 标志物。根据其在后续随访中是否进展为 MCI 分为维持组与进展组, 比较组间差异, 结合回归分析与 ROC 曲线的曲线下面积 (area under curve, AUC) 寻找诊断模型以探寻预测认知下降的预测模型。

结果 共 188 名社区老人纳入研究, 按末次随访 (4.2 \pm 1.8 年) 的诊断结果, 146 人认知维持正常, 42 人进展为 MCI, 分别标记为维持组和进展组。组间比较发现: 两组年龄、性别无显著性差异, 进展组的受教育年限显著低于维持组, 进一步分析比较发现, 两组在瞬时回忆、延迟回忆及左侧海马体积、右侧 STSbanks 皮层厚度上存在显著差异 ($p < 0.05$), 以上结果在控制了年龄、性别、受教育年限后仍具显著性。而在血浆标志物方面, NFL 和 A β 42 存在组间差异的趋势 ($p < 0.1$)。以是否进展为 MCI 为分组构建诊断模型, 依次纳入人口统计学、神经心理测试构建基础诊断模型 (AUC=0.696, $p < 0.001$), 再进一步将 NFL 和 A β 42 纳入诊断模型 (AUC=0.734, $p < 0.001$)。在结合了血浆标志物的诊断模型中分别右侧 STSbanks 皮质厚度和左侧海马体积进行比较, 经 ROC 曲线分析发现颞上沟模型 (AUC=0.746, $P < 0.001$) 的诊断效能优于海马模型 (AUC=0.742, $P < 0.001$)。

结论 颞上沟脑区在认知进展早期存在皮层结构的异常, 其敏感性高于海马, 建立基于颞上沟脑区的诊断模型对于预测认知功能正常老人的 MCI 发生有较好的作用。结合神经心理测试、血浆标志物以及脑影像学检查, 可以较好地预测认知转归, 为 MCI 以及 AD 的早期识别提供了一个潜在可行的检查方案。

重度抑郁症背外侧前额叶皮层与外周血的综合转录分析

陈耀 张向荣* 端文欢 刘佩姿 Wenhuan 卢萨雅
方新宇 周超

南京医科大学附属脑科医院老年精神科

目的 重度抑郁症 (MDD) 是一种以复杂病因为特征的严重疾病。目前 MDD 的诊断依赖于对临床症状的主观评估, 缺乏可靠的诊断标志物。由于生物标志物研究通常集中在单一样本类型上, 因此本研究旨在通过对两种不同样本类型的综合转录分析来探寻 MDD 的关键基因和发病机制。

方法 从 GEO 数据库中获取 GSE76826 (外周血标本) 和 GSE92538 (死后背外侧前额叶皮层 (DLPFC) 组织) 两个数据集。使用在线工具 GEO2R 提取差异表达基因 (DEGs), 利用 DAVID 对共有的 DEGs 进行 GO 及 KEGG 分析。使用 STRING 数据库构建共有 DEGs 的蛋白-蛋白相互作用 (PPI) 网络, 并选取前 10 个枢纽基因进行进一步分析。

结果 外周血和 DLPFC 组织共有 8 个上调和 92 个下调的 DEGs。下调的 DEGs 在蛋白酶体通路中显著富集, 以及参与多种神经退行性疾病、非酒精性脂肪性肝病、糖尿病性心肌病、致癌和能量平衡相关的代谢过程。在前 10 个枢纽基因中, 有几种差异基因在 MDD 中下调, 即 PSMD6、PSMD7、PSMA4、PSMD4、PSMA2、PSMD13、PSMD2、PSMB1、PSMB10 和 PSMA7。其中 9 个基因参与蛋白酶体介导的泛素依赖性蛋白分解代谢。PSMD13、PSMD6 和 PSMD2 在 MDD 中具有高度的功能相似性。

结论 鉴定出的蛋白酶体表明蛋白酶体相关免疫系统异常、炎症、氧化应激和神经元因子可能与 MDD 的发生发展密切相关。

关键词: 背外侧前额叶皮层 (DLPFC)、基因表达、重度抑郁症 (MDD)、外周血、蛋白酶体。

The Associations of Antihypertensive Drug Targets with Alzheimer's Disease and Its Cog-

nitive Phenotypes: A Mendelian Randomization Study

Zixi Zhu Sizhi Ai* Rui Zheng Zezhi Li

The Affiliated Brain Hospital, Guangzhou Medical University

Background Alzheimer's disease (AD) is a neurodegenerative disorder that primarily affects cognitive functions. Currently, there is a lack of comprehensive and conclusive evidence on the relationship between antihypertensive medications and AD or cognitive performance (CP). Drug-target Mendelian Randomization (MR) is a method used to explore causal relationships between drug targets and diseases.

Objective To investigate the associations and potential mechanisms between antihypertensive drug targets and AD/CP.

Methods We conducted dual validation using two-sample MR and summary-data-based MR (SMR) analyses to confirm the causal relationship between hypertension drug target genes and both AD and cognitive performance. We performed colocalization and other sensitivity analyses to validate the robustness of IVs, and utilized multi-cohort data and supplementary analyses to confirm gene effects. Finally, through PPI analysis and phenome-wide MR analysis, we explored the potential mechanisms of these genes on AD and cognitive function.

Results We identified 8 antihypertensive drug target genes with dual significant effects, including 2 AD-related targets (ACE and CACNA2D3) and 6 CP-related targets (HIF1A, KCNMA1, SLC12A4, KCNJ11, CACNA1A, and CACNA1D). Increased expression of the ACE (OR=0.660, 95%CI: 0.499-0.872) and CACNA2D3 (OR=0.903, 95%CI: 0.854-0.954) genes reduces the risk of AD, while increased expression of HIF1A (OR=1.039, 95%CI: 1.022-1.057) and KCNJ11 (OR=1.062, 95%CI: 1.023-1.102) genes promotes CP. Increased expression of KCNMA1 (OR=0.985, 95%CI: 0.980-0.991), SLC12A4 (OR=0.943, 95%CI: 0.911-0.977), CACNA1A (OR=0.996, 95%CI: 0.993-0.999), and CACNA1D (OR=0.938, 95%CI: 0.902-0.975)

genes reduces CP. A series of sensitivity analyses, including colocalization analysis, and external validation further support these findings. The exploration of mechanisms suggests their potential roles in brain region expression, protein interactions, and broader effects.

Conclusions This study provides genetic evidence for 8 antihypertensive drug target genes, supporting their potential therapeutic efficacy in treating AD or cognition-related disorders. These findings aid in the development of new drugs based on these genes and contribute to a deeper understanding of the mechanisms underlying AD and cognitive impairments.

上海市精神卫生中心

目的 阿尔茨海默病 (Alzheimer's disease, AD) 是一种逐渐进展的中枢神经系统退行性病变, 随着人口老龄化进展, 患有 AD 的人群数量和疾病负担与日俱增。TRPC (Transient Receptor Potential Canonical) 是瞬时受体电位 (TRP) 通道家族的一个亚群, 其中的 TRPC6 由 6 个跨膜结构域构成, 参与调控多种细胞功能。研究表明, TRPC6 能特异性调节 APP 的 γ -分泌酶裂解进而减少 A β 沉积。本研究旨在探讨 TRPC6 在区分正常老人、阿尔茨海默病源性轻度认知障碍 (aMCI) 及阿尔茨海默病 (AD) 中的诊断潜力, 以期提供一种非侵入性、成本效益高的辅助鉴别诊断工具。

方法 本研究纳入 55 名 AD、18 名 aMCI 和 186 名健康对照 (NC)。所有患者均由精神科医生经过 DSM-5 标准诊断, 并接受了神经心理学评估和认知功能评估, 并行正电子发射断层扫描 (PET) 或脑脊液检查明确诊断。采集外周血样本提取 RNA, 利用实时荧光定量 PCR 获得 TRPC6 基因的相对表达水平。采用 SPSS 27.0.1 软件对数据进行统计分析。

结果 AD 组和 aMCI 组 TRPC6 基因的相对表达水平显著低于 NC 组 (AD vs aMCI vs NC: 1.298 vs 1.231 vs 4.833, 均 $P < 0.001$), 而在 AD 和 aMCI 组间未见显著差异。将 aMCI 纳入 AD 组中, TRPC6 基因的相对表达水平与简易智力状态检查量表 (MMSE) 之间存在显著相关性 (相关系数为 -0.24, $P=0.041$)。ROC 分析显示 TRPC6 相对表达量鉴别 NC 组和 AD 组的 AUC = 0.973 (临界值 = 2.204, 灵敏度 = 94.5%, 特异度 = 95.7%)。风险评估分析表明 TRPC6 阳性患者的疾病风险程度是正常老人的 347.77 倍。Logistic 回归分析显示, 根据性别、MMSE 得分建立预测模型, 用于鉴别 AD 与 NC 所建立的模型有统计学意义 ($\chi^2=120.773$, $P < 0.001$), 对因变量正确分类的准确性为 91.5%, 灵敏度为 86.7%、特异度为 94%, ROC 曲线下面积为 94.8% (95%CI 0.914 - 0.981, $P < 0.001$)。

结论 TRPC6 在 MCI 阶段及 AD 早期阶段即出现明显改变, 提示 TRPC6 的 mRNA 表达可用于阿尔茨海默病的早期辅助诊断。

穴位埋线疗法对精神疾病合并代谢综合征的影响

杜春红*
台州市第二人民医院

目的 观察穴位埋线疗法对重性精神疾病合并代谢综合征的治疗作用。

方法 观察临床工作中重性精神疾病合并代谢综合征患者 20 例, 随机分为埋线组和对照组各 10 例, 埋线组经中医辨证论治, 选择足三里、三阴交、关元、气海、大横、脾腧、胃腧穴位, 应用可吸收外科缝线, 严格执行无菌操作下进行穴位埋线治疗, 每次 5-10 个穴位, 每 14 天一次, 同时为患者选择适合的有氧训练和饮食调整, 训练中观察患者心肺功能及体能变化, 对照组仅进行有氧训练和饮食调整, 分别治疗 12 周, 治疗开始前及结束后记录 BMI 指数、血压、血糖、血脂等相关数据。对两组数据进行统计学处理。

结果 埋线组在降低 BMI 指数、血脂方面效果

明显, 在控制血压、血糖方面也具有一定疗效。

结论 代谢综合征是指人体的蛋白质、脂肪、碳水化合物等物质发生代谢紊乱的病理状态, 是一组复杂的代谢紊乱症候群, 是导致糖尿病心脑血管疾病的危险因素。重性精神疾病由于长期口服抗精神病药物及活动量较少等原因, 代谢综合征的发生率较高。同时, 患者多不易配合临床治疗, 且口服降脂药物、降糖药物、降压药物仅解决单一问题, 无法综合调理, 穴位埋线疗法作为安全有效的中医治疗方法, 可根据不同病情辨证施治, 有效控制体重增加及各项指标减少, 临床效果明显, 可进行大样本多模态的对比研究, 推广于临床。

Worsened Frontotemporal Dementia Following Electroconvulsive Therapy: A Case Report

Youzhen Lin*

Third Affiliated Hospital of Sun yat-sen University

Frontotemporal dementia (FTD) patients often present with behavioral, functional and language disturbance. It is the second leading cause of presenile dementia (the first being Alzheimer's disease). FTD refers to a group of syndromes often due to frontotemporal lobar degeneration (FTLD), of which, behavioral variant of FTD (bvFTD) is a major subtype. Patients with bvFTD are often misdiagnosed with psychiatric disorders, particularly bipolar disorder, where affective symptoms such as mania and depression are observed in both. A case is presented where this patient was diagnosed with bipolar disorder at a different institution 6 months ago due to obvious personality change observed by her family, including euphoria, mania, decreased need for sleep, proneness to anger and crying, etc. She was given olanzapine, alprazolam and sodium valproate and 6 rounds of MECT. She was discharged after showing slight improvements affectively, however, her memory impaired profoundly, followed by severe functional deterioration, such as losing the ability to shower and use

the remote control. in the meantime, her upper body tilted to the right for no obvious reason, which resided after her medications were reduced. She came to our hospital presenting with obvious orientation, memory and sleep disorder. Her tongue slanted to her left, further physical exam revealed elevated muscle tone of the upper limbs, tendon reflex (+), tremor in the upper limbs, Rossolimo's sign (+), fast rotation (+), finger-to-nose test (+). Her MRI revealed brain atrophy (which was not apparent in her CT scan 6 months ago), and FDG-PET showed frontal and temporal lobe atrophies. Her behavior and cognition worsened drastically, her mood swings in particular. This article surrounds the patient's clinical data and literature regarding FTD and the role MECT plays in it.

关键词: Frontotemporal dementia, FTD, bvFTD, MECT, bipolar disorder

间歇性 θ 短阵脉冲刺激对酒精依赖患者的疗效

郑高健 许学明*

台州市第二人民医院

目的 探讨间歇性 θ 短阵脉冲刺激 (iTBS) 对酒精依赖患者的治疗效果。

方法 96 例酒精依赖患者随机分为实验组和对照组, 每组 48 例。两组各项指标比较差异无统计学意义 ($P>0.05$)。两组在给予地西洋替代治疗和常规对症支持治疗基础上, 实验组和对照组分别给予左侧背外侧前额叶皮质 iTBS 刺激和伪刺激。于治疗前及治疗后 4、12 周时, 采用 VAS 和宾夕法尼亚酒精渴求量表 (PACS) 评分评估患者对酒精渴求程度, 贝克抑郁量表 (BDI) 和贝克焦虑量表 (BAI) 评分分别评估患者的抑郁和焦虑情绪, 停止信号反应时间 (SSRT) 评价患者的反应抑制能力, 并于出院后 4、12 周时随访患者的复饮情况。

结果 与治疗前相比, 两组治疗后 4、12 周时 VAS、PACS、BDI、BAI 评分及 SSRT 均减少 ($P<0.05$); 实验组治疗后 4、12 周时 VAS、PACS、BDI、BAI 评分及 SSRT 少于对照组 ($P<0.05$)。实验组出院后 12 周时患者复饮率低于对照组 (4.17% vs. 10.42%)

($P<0.05$)。

结论 本研究所采用的 iTBS 属于高频脉冲刺激,与传统 rTMS 比较,其刺激强度更低,刺激时间更短,易接受程度更高。iTBS 治疗能够有效改善酒精依赖患者的负性情绪、酒精渴求程度、反应抑制能力,并降低复发率。

光生物调节疗法在阿尔茨海默病中的研究进展

冯乾森^{1,2} 陈蕾^{1,2} 李嶙嶙^{1,2} 岳玉川² 汪子琪²

1.遵义医科大学护理学院
2.成都市第四人民医院

目的 光生物调节(PBM)为一种新兴的物理治疗方式,已被证实可以改善阿尔茨海默病(AD)患者的认知能力、情绪与睡眠等,这为AD患者的非药物治疗提供了新的思路,但缺乏对既往有关阿尔茨海默病的光生物调节疗法的研究成果的有效整合。本文旨从AD病理机制的角度,系统、全面地总结PBM在AD中的作用机制,并通过梳理相关文献,概括不同路径的PBM在AD中的应用进展。

方法 通过文献研究法对PBM改善AD的作用机制及不同路径PBM在AD中的临床应用的研究进展进行综述

结果 本文表明PBM改善AD认知功能的作用机制主要为减少脑内 $A\beta$ 蛋白的沉积,抑制大脑内神经炎症,恢复线粒体功能等;在阿尔茨海默病的光生物调节干预中:经血管的PBM因其操作难度大,风险高,故研究较少;经颅光生物调节疗法应用最为广泛,其波长多选择810nm或1060-1080nm,脉冲频率和方式多为10Hz或40Hz的脉冲波模式;经视觉路径的PBM治疗,为一种新兴的刺激方式,多采用可见光中的蓝光或采用40Hz的光闪烁刺激方案,其疗效与机制均有待探究。本文能够为PBM改善认知机制研究的深入开展提供借鉴,并为我国阿尔茨海默病的光生物调节疗法方案的制定和应用提供参考

结论 AD可能的发病机制主要与淀粉样蛋白的异常沉积、线粒体功能障碍和神经炎症等病理变

化有关。PBM作为一种新的物理治疗方式,其对改善AD认知的机制目前得到了初步阐明,无论是单独或联合不同路径的PBM方案,都在一定程度上改善了AD患者认知功能、睡眠和情绪等,但视觉路径的40Hz光闪烁刺激方案的治疗有效性仍存在争议,还需进一步探究其改善认知的机制。此外,PBM治疗效果还受不同路径、相同路径的不同参数(如:功率、波长、脉冲频率和治疗时间等)、AD的不同病程阶段的影响,目前尚无统一的治疗方案。未来需要纳入更多不同AD病程阶段的样本,采用多中心和随机对照研究来进一步探索PBM治疗AD的作用机制,并进一步寻找PBM治疗AD患者的最佳路径和具体参数,从而制定统一标准的最佳治疗策略,为治疗AD患者、改善AD患者认知功能提供更大的帮助

以患者为中心的心理干预对消化道恶性肿瘤患者情绪障碍和生命质量的影响

许沁颖* 齐钢桥
台州市第二人民医院

目的 分析以患者为中心的心理干预对消化道恶性肿瘤患者情绪障碍及生命质量的影响。方法 选取2023年1月-2023年12月本院80例消化道恶性肿瘤患者,采取随机数字表法分为对照组(常规护理干预)与观察组(以患者为中心的心理护理干预),对比干预效果。结果 观察组干预后焦虑评分、抑郁评分比对照组低($P<0.05$)。干预后,观察组生活质量评分较对照组高($P<0.05$)。观察组干预后睡眠质量评分比对照组低,而日常生活能力评分较对照组高($P<0.05$)。观察组不良事件发生率较对照组低,而护理满意度比对照组高($P<0.05$)。结论 以患者为中心的心理干预有助于消化道恶性肿瘤患者情绪障碍、睡眠质量、生命质量改善,且可以降低不良事件发生率,提升满意度,值得采纳。

方法 选取住院治疗消化道恶性肿瘤的患者为研究对象,对自愿参与本项研究的患者应用焦虑自评量表、抑郁自评量表和日生活力量表进行心理状况调查。焦虑自评得分 ≥ 25 分、抑郁自评得分 ≥ 25

分或日常生活能力量表 ≥ 16 分作为心理筛查标准对所有入组患者进行筛查,筛选出心理状况不良患者。将筛选出的患者按随机数字法等分为理性情绪治疗、正念冥想治疗组和对照组,不同性别不同年龄不同类型的消化道肿瘤随机分组。

纳入标准:①病理诊断为消化道恶性肿瘤,生存期 >6 个月;②年龄 ≥ 18 岁且 ≤ 75 岁;③知情同意,自愿参加者。焦虑自评得分 ≥ 25 分,抑郁自评得分 ≥ 25 分, SF-36。

排除标准:①合并有严重高血压、糖尿病、冠心病、肝肾功能障碍和严重恶液质者;②沟通障碍者、脑转移、精神障碍者。

(1)将入组的受试者随机分为3组,即:对照组、理性情绪治疗组和正念冥想治疗组;每组样本量40;一般特征性资料包括年龄、性别、疾病性质、病程、受教育水平、个性特征等。

(2)入组人员进行 SAS、ADS、SF-36 进行评估,一个月后进行第二次评估。二个月后进行第三次评估。

(3)检测相关指标,数据分析并得出结论。

结果 两组干预前焦虑评分及抑郁评分未见明显差异($P>0.05$);干预后,观察组更低($P<0.05$)。

结论 结果显示,观察组干预后 SDS 评分及 SAS 评分较对照组低,而生活质量评分比对照组高,可见,以患者为中心的心理干预可明显改善患者负面情绪,且有助于其生活质量提高。以患者为中心的心理干预在消化道恶性肿瘤患者护理中应用效果明显,不仅可以改善患者不良情绪、生活质量、睡眠质量,且有助于不良事件发生率降低,值得采纳。

关键词: 消化道恶性肿瘤;心理干预;情绪障碍;生命质量

患者血化验、肌电图等检查资料,并对患者血液标本进行全外显子基因检测及随访2年。

结果 该患者为66岁女性,隐袭起病,症状逐渐进展,突出表现为非流利性失语,目前病程5年,病程3年时已发展为完全性混合性失语并开始出现行为异常,行为幼稚化、不合时宜,频繁外走,随地大小便,暴躁易怒,生活懒散,情感淡漠,缺乏兴趣,外院予丙戊酸镁、氟伏沙明、哌罗匹隆治疗副作用明显,患者吞咽困难、饮水呛咳,伴下肢抖动、静坐不能。头 MR 示额颞叶萎缩、双侧海马萎缩;直立倾斜试验阳性,血管迷走性晕厥,混合型;基因检测示 GBA 基因 c.1453G>T(p.A485S) 突变。诊断为进行性非流利性失语型 FTD。予调整药物后患者吞咽困难、静坐不能及行为异常减轻。出院后每月随访,患者间断出现进食困难及流涎,予减停喹硫平,2023年2月开始不能自行进食,需要家人喂饭,行动慢,3个月体重下降15kg,舌肌及肢体萎缩,四肢腱反射活跃,病理征未引出,肌电图神经传导未见明显异常,患者无法配合 EMG 检查及认知测评。后患者病情相对稳定,体重逐渐恢复,语言功能差,难以交流,仅能发出“啊”声,行为异常在家人可控范围。但2024年3月患者感冒后病情恶化,不会咀嚼食物,只能吃流食及半流食,吞咽功能尚可。6月复诊进食情况稍改善,进食固体食物仍困难,予饮食添加全营养粉、蛋白粉,持续随访中。

结论 本患者以进行性语言障碍为主要表现,后出现行为异常,符合 FTD 诊断,随访过程中存在波动性吞咽困难,伴体重下降、肌肉萎缩、腱反射活跃,基因检测发现 GBA 基因突变,提示 GBA 基因可能参与 FTD 发病过程,支持运动神经元病-FTD 为谱系疾病的学说。

GBA 基因突变的额颞叶痴呆一例病例分析

陈君逸 袁俊亮*
北京大学第六医院

目的 报道1例以进行性非流利性失语及行为异常为主要表现的额颞叶痴呆(FTD)患者的临床表现、基因特点及随访情况。

方法 分析1例2022年6月就诊于北京大学第六医院的 FTD 患者的临床表现、影像学特征,收集

缺陷型精神分裂症患者的社会认知损害及临床影响因素

黄成兵* 王家庄丽荣
淮安市第三人民医院,精神科

背景 以社会认知损害为切入点,研究精神分裂症的发病机制、干预策略和临床预后,是近年来

探索该病防治策略的重要途径之一。遗憾的是,限于精神分裂症具有高异质性的特点,相关研究中混杂因素太多,目前尚缺乏高水平的研究结果。

目的 观察缺陷型精神分裂症(Deficit Schizophrenia, DS)和非缺陷型精神分裂症(Non-Deficit Schizophrenia, NDS)患者的社会认知损害,并探讨其临床影响因素。

方法 纳入DS患者和NDS患者各100例为研究对象,并招募100例健康常人为对照组。采用复杂眼区情绪识别、色子博弈任务和爱荷华博弈测验进行社会认知功能评测,应用画钟测验和词语流畅性测试、数字广度测验、字色干扰实验、连线实验等进行神经认知功能评测。比较三组间评测结果的差异,并使用Person相关分析来比较社会认知损害和神经认知功能、PANSS评分间之间的相关性。

结果 ①与NDS组患者相比,DS组男性患者更多、家族史阳性者更多、起病年龄更早、病程更长、PANSS阳性症状分更低而阴性症状分更高,差异具有统计学意义($P<0.05$);年龄、婚姻、受教育年限和PANSS一般病理分、总分之间未见统计学意义的差异($P>0.05$)。②三组间社会认知功能评测结果比较发现:与HC组相比,DS组、NDS组的复杂眼区情绪识别测验的情绪识别正确数和性别识别正确数、色子博弈任务的负反馈利用率、爱荷华博弈测验的各区间因子分等观察指标均显著下降,同时在色子博弈任务中的风险选项个数显著增高;且在情绪识别正确数、负反馈利用率、爱荷华博弈测验区间2-4方面,DS比NDS下降更明显,风险选项个数DS也比NDS得分更高,差异具有统计学意义($P<0.05$)。③三组间神经认知功能评测结果比较发现:DS组患者的画钟测验、词语流畅性测试、数字广度测验、字色干扰实验和连线实验等测验结果与NDS组、HC组存在显著差异,同时NDS组数字广度测验逆序分显著低于HC组而连线实验的测验结果显著高于HC组,差异具有统计学意义($P<0.05$)。④Person相关分析结果显示:精神分裂症患者(DS组和NDS组)的社会认知功能评分,与PANSS阳性症状分、阴性症状分及画钟测验、词语流畅性测试、数字广度测验、字色干扰实验、连线实验等神经认知功能之间,存在不同程度的相关性($r=0.128\sim 0.791, p<0.05$ 或 $p<0.01$)

结论 精神分裂症患者在社会信息感知以及社会问题判断、解决等维度均存在不同程度的社会认知损害,且与阳性症状、阴性症状及神经认知功能

关系密切,DS患者存在比NDS患者更为显著的社会认知损害。

关键词: 缺陷型精神分裂症,社会认知损害,神经认知功能,临床影响因素

双相情感障碍患者血清GFAP和GSK-3 β 水平与认知功能的关系

田国强* 潘友让

浙江省绍兴市第七人民医院

目的 分析双相情感障碍患者血清胶质纤维酸性蛋白(GFAP)和糖原合成酶激酶-3 β (GSK-3 β)水平与认知功能的关系。

方法 选取2020年1月-2023年1月绍兴市第七人民医院收治的双相情感障碍患者61例作为研究组,另选取同期健康体检者61例作为对照组,采用酶联免疫吸附(ELISA)法检测血清GFAP和GSK-3 β 水平;采用重复性成套神经心理状态测验(RBANS)来评估患者的认知功能;采用Pearson法分析血清GFAP和GSK-3 β 水平相关性;采用spearman相关性分析血清GFAP和GSK-3 β 与认知功能的相关性;采用Logistic回归分析双相情感障碍患者认知功能的影响因素;受试者工作特征(ROC)曲线分析血清GFAP和GSK-3 β 水平对双相情感障碍患者认知功能差的诊断价值。

结果 研究组腰围、收缩压、舒张压、总胆固醇、高密度脂蛋白、血清GFAP和GSK-3 β 水平显著高于对照组,差异有统计学意义($P<0.05$)。研究组延时记忆、言语功能、即刻记忆、注意功能、视觉广度以及RBANS总分显著低于对照组,差异有统计学意义($P<0.05$)。认知功能较好、一般、差的患者血清GFAP和GSK-3 β 水平依次显著升高,差异有统计学意义($P<0.05$)。血清GFAP和GSK-3 β 呈正相关($P<0.05$)。血清GFAP和GSK-3 β 均与延时记忆、言语功能、即刻记忆、注意功能、视觉广度以及RBANS总分呈负相关($P<0.05$)。GFAP和GSK-3 β 升高是影响双相情感障碍患者认知功能的危险因素($P<0.05$)。ROC曲线显示,GFAP和GSK-3 β 联合诊断双相情感障碍患者认知功能差的AUC要优于各自单独诊断(Z联合vsGFAP=2.530、Z联合vsGSK-3 β =2.710, P 均 <0.05)。

结论 双相情感障碍患者血清 GFAP 和 GSK-3 β 水平显著升高,二者与认知功能密切相关。

关键词: 双相情感障碍,胶质纤维酸性蛋白,糖原合成酶激酶-3 β ,认知功能

音乐疗法联合生物反馈对恢复期卒中后抑郁患者睡眠的改善作用

田国强* 郑吉锋

浙江省绍兴市第七人民医院

目的 评估音乐疗法联合生物反馈的干预方式对恢复期卒中后抑郁患者睡眠的改善效果。

方法 选取 2021 年 7 月-2023 年 7 月间我院收治的恢复期卒中后抑郁患者 119 例,随机分为干预组 52 例和对照组 67 例。针对卒中后抑郁相关症状,对照组患者酌情采用常规药物以及心理治疗;干预组在此基础上施加音乐疗法联合生物反馈的干预措施,评估两组患者干预前后组间抑郁程度分布情况与睡眠的改善情况。

结果 干预前,两组患者各项基线数据、抑郁严重程度分布以及睡眠指标组间差异均无统计学意义 ($P>0.05$)。干预后,干预组中/重度抑郁患者构成比显著低于对照组 ($P<0.05$)。干预前后,各组组内患者睡眠指标差异均有统计学意义 ($P<0.05$);干预后,干预组较对照组 PSQI 评分下降更为显著,睡眠总时间 (TST) 更长,睡眠效率 (SE) 更高,睡眠潜伏期 (SOL) 更短,快速眼球运动睡眠百分比 (REM%) 更大,以及微觉醒指数更小,差异均有统计学意义 ($P<0.05$)。

结论 音乐疗法联合生物反馈对改善恢复期卒中后抑郁患者睡眠结构,提高睡眠质量具有积极作用。采用音乐疗法联合生物反馈干预的恢复期卒中后抑郁患者,抑郁缓解程度更佳;其总体睡眠质量显著提升。不论从睡眠总时长,入睡时间,睡眠效率上,还是从睡眠结构中的快动眼睡眠比例以及睡眠过程中的觉醒情况等方面,干预组患者都收获了更加优良的干预结果。

关键词: 卒中后抑郁,睡眠,音乐疗法,生物反馈

To Evaluate The Accuracy of Brain CT Combined with Uric Acid Test in Early Screening for Alzheimer's Disease (AD)

邹灿* 林雪松 邱威霖

玉林市第四人民医院

Objective This study aims to evaluate the accuracy of brain CT combined with uric acid test in the early screening of Alzheimer's disease (AD).

Methods A total of 150 outpatients were selected, including 75 AD patients and 75 healthy controls. Brain CT scan and uric acid test were used to compare the difference between the two groups.

Results The results showed that the brain CT scan of AD patients showed pathological changes such as brain atrophy and cerebral infarction, and the level of uric acid was significantly higher than that of healthy controls ($p<0.05$). In the early screening, the accuracy of brain CT combined with uric acid detection was 98.67%, which was significantly higher than that of single detection method ($p<0.05$).

Conclusion Brain CT combined with uric acid test has high accuracy in the early screening of Alzheimer's disease, and can be used as an effective auxiliary examination

关键词: Brain CT; uric acid test; Alzheimer's disease; early screening; high accuracy

酸奶类益生菌对老年精神科治疗便秘的盲对照实验和分析

季乐新¹ 李秋思²

1.抚顺市第五医院

2.沈阳市精神卫生中心

目的 评价酸奶类益生菌对老年精神科治疗便秘的临床疗效,分析目前研究现状并为指导临床提供参考。

方法 选取抚顺市第五医院和沈阳市静安医院精神科 2022 年 6 月至 2024 年 2 月接受治疗的老年患者 70 例,随机分到实验组或者对照组,比较两组

的治疗效果。患者均为男性,对照组年龄 60-80 岁。实验组 35 例,年龄为 60-80 岁,患者 2 天以上未排便,排便的习惯改变,存在排便困难的情况,同时排除伴有其他胃肠道疾病的患者。两组基本资料差异无显著性 ($p>0.05$)。排除标准:合并使用影响酸奶类益生菌的药物(如抗生素或其他微生态制剂,包括酸奶等);合并其他影响肠道微生态的疾病(如炎症性肠病等)。

结果 老年精神科便秘患者干预后的临床效果对比中实验组的总有效率 94.29%明显高于对照组的 65.71%,精神科患者家属的满意度实验组的 91.43%明显高于对照组患者家属的满意度的 65.71%,实验组患者的服药依从性 88.57%优于对照组的 55.71%;

结论 酸奶类益生菌可有效治疗老年精神科便秘,增加老年精神科便秘患者的每周排便频次,增强患者的主观排便顺畅感。安全有效,值得临床推广和应用。患者持续跟踪评定服药依从性,明显高于对照组,有效预防了病情反复波动,得到了患者以及家属的一致好评。治疗时应采取观察评估病情,心理活动、饮食,使患者适当运动、规律排便、合理用药等多种措施相结合以有效减轻患者的病情。

进食障碍研究协作组

双相情感障碍患者睡眠障碍特征及代谢障碍特征分析

沈子童*

宿州市第二人民医院=宿州精神病院

目的 探讨双相情感障碍患者睡眠障碍及代谢障碍特征

方法 选自我院 2020 年 1 月至 2023 年 12 月收治的双相情感障碍患者 80 例作为研究对象,根据患者是够存在睡眠障碍将其分为睡眠障碍组 ($n=47$) 和无睡眠障碍组 ($n=33$),对比其人口学和临床特征、代谢特征。通过 Logistic 回归分析双相情感障碍患者睡眠障碍与其基线资料、代谢特征相关性。

结果 两组患者性别、年龄、婚姻状况、吸烟史、性格冲动、人际关系、饮酒史及职业差异无统计学意义 ($P>0.05$);睡眠障碍组在重大精神创伤史、家族精神异常史、既往自杀史、代谢障碍发生率、病程及 YMRS、HAMD、BPRS、RSESE 评分高于无睡眠障碍组 ($P<0.05$);睡眠障碍组空腹血糖、TG、HSL-C、收缩压、舒张压、甲状腺素、皮质醇水平高于无睡眠障碍组,促甲状腺激素水平低于无睡眠障碍组 ($P<0.05$);Logistic 多因素回归分析结果显示,重大精神创伤史、家族精神异常史、既往自杀史、病程长、代谢障碍综合征、空腹血糖、TG、HSL-C、收缩压、舒张压、甲状腺素、皮质醇水平高及促甲状腺激素水平低是引起患者睡眠障碍独立危险因素 ($P<0.05$);Pearson 相关性分析结果显示,患者 PSQI 评分与病程 ($r=0.476, P<0.01$)、YMRS ($r=0.363, P<0.01$)、HAMD ($r=0.744, P<0.01$)、BPRS ($r=0.529, P<0.01$)、RSESE ($r=0.531, P<0.01$) 评分及空腹血糖 ($r=0.644, P<0.01$)、TG ($r=0.485, P<0.01$)、HSL-C ($r=0.396, P<0.01$)、收缩压 ($r=0.522, P<0.01$)、舒张压 ($r=0.541, P<0.01$)、甲状腺素 ($r=0.608, P<0.01$)、皮质醇 ($r=0.349, P<0.01$) 水平及呈正相关,与促甲状腺激素 ($r=-0.518, P<0.01$) 水平呈负相关 ($P<0.05$)

结论 相情感障碍睡眠障碍患者呈现出代谢障碍加重,且患者重大精神创伤史、家族精神异常史、既往自杀史、代谢障碍发生率及代谢指标均是引起患者睡眠障碍危险因素。

关键词: 双相情感障碍; 睡眠障碍; 代谢; 危险因素

强迫症伴与不伴强迫型人格障碍: 临床特点与大脑形态学特征

张晨¹ 张宗凤^{1,2} 高睿¹ 陈永军^{1,3} 曹璇^{1,4} 范青¹

1.上海交通大学医学院附属精神卫生中心

2.宁波大学附属康宁医院

3.南京医科大学附属南京脑科医院

4.上海交通大学医学院附属新华医院临床心理科

目的 强迫症常常共病强迫型人格障碍。虽然强迫型人格障碍在现象学, 神经认知和治疗反应上与强迫症相似, 但共病强迫型人格障碍对强迫症的复杂影响需要进一步研究。本研究旨在探索共病强迫型人格障碍对强迫症心理病理学症状和大脑形态学特征带来的影响, 以及强迫症状与强迫型人格障碍症状之间的关系。

方法 共 248 名未用药的强迫症患者(45 名共病强迫型人格障碍)被纳入本项研究。所有患者均接受了强迫症状, 强迫型人格障碍症状, 强迫信念, 抑郁症状, 焦虑症状的评估。其中, 145 名患者(23 名共病强迫型人格障碍)接受了磁共振扫描。

结果 大约有 18% 的强迫症患者共病强迫型人格障碍(45/248)。共病强迫型人格障碍的患者表现出了更高的强迫, 强迫信念, 抑郁, 焦虑症状, 且强迫型人格障碍症状与强迫症状存在显著正相关。脑影像学结果发现: 共病强迫型人格障碍的患者左侧顶上小叶和左侧楔前叶的复杂度显著高于未共病强迫型人格障碍的患者, 且与强迫型人格障碍症状存在显著正相关。有调节的中介模型进一步发现: 左侧顶上小叶和左侧楔前叶的复杂度中介了未共病强迫型人格障碍的患者强迫型人格障碍症状与强迫症状之间的关系。

结论 共病强迫型人格障碍可能会导致强迫症患者更严重的心理病理学症状以及大脑形态学特征的改变, 表明这两种疾病之间可能存在不同但相互关联的结构。

舍曲林对轻度认知障碍伴抑郁的疗效及对神经炎症影响的研究

胡耀华*

福州市第二总医院神经精神病防治院精神科

目的 探讨舍曲林治疗轻度认知障碍合并抑郁患者的疗效分析以及治疗对患者辅助性 T 细胞 17(T helper cell 17,Th17)和相关炎症细胞因子水平的影响

方法 选取 2020 年 6 月—2021 年 12 月福州神经精神病防治院的 70 例轻度认知障碍患者,选取 35 例汉密尔顿抑郁量表(17 项)(Hamilton depression scale,HAMD 17)评分 ≥ 7 分患者分为轻度认知障碍伴抑郁组,35 例 HAMD 17 < 7 分患者分为轻度认知障碍无抑郁组,35 例健康受试者入选健康对照组。分析比较外周血 Th17 细胞和相关炎症细胞因子的水平。对轻度认知障碍合并抑郁患者进行舍曲林治疗,比较舍曲林对轻度认知障碍合并抑郁患者治疗前后的影响。分析舍曲林治疗前后认知功能和生存能力的影响以及 Th17 细胞及相关炎症细胞因子的变化。

结果 轻度认知障碍伴抑郁组患者外周血 Th17 细胞百分比、IL-1 β 、IL-6、IL-17 和 TNF- α 水平平均高于健康对照组,差异有统计学意义($P < 0.05$)。轻度认知障碍伴抑郁组患者外周血 Th17 细胞、IL-1 β 、IL-6、IL-17 和 TNF- α 水平高于轻度认知障碍无抑郁组患者,差异有统计学意义($P < 0.05$)。舍曲林治疗后轻度认知障碍伴抑郁组的 MoCA 评分和 MMSE 评分均高于治疗前,差异有统计学意义($P < 0.05$)。日常生活活动能力评定量表(activities of daily living,ADL)评分、HAMD 17 总分和各因子分及外周血中 Th17 细胞百分比、IL-1 β 、IL-6、IL-17 和 TNF- α 水平与治疗前相比有所下降,差异有统计学意义($P < 0.05$)。

结论 轻度认知障碍伴抑郁患者体内存在一些免疫系统紊乱导致的神经炎症,舍曲林治疗可以改善轻度认知障碍伴抑郁患者的抑郁症状与认知系统功能。

药物联合无抽搐电休克治疗难治性精神分裂症的疗效评估

占家铤*

福建省福州神经精神病防治院

目的 评估难治性精神分裂症阴性症状患者应用氨磺必利、氯氮平与无抽搐电休克联合治疗对促进患者阴性症状及预后改善所发挥的作用。

方法 选择福建省福州神经精神病防治院 2022 年 1 月—2023 年 1 月进行治疗的难治性精神分裂症患者 136 例作为研究对象,随机数表法分为对照组和观察组,各 68 例。对照组患者联合应用氨磺必利及氯氮平治疗,观察组患者在采用氨磺必利与氯氮平治疗的基础上联合应用无抽搐电休克治疗。比较两组阴性和阳性症状量表(positive and negative symptom scale,PANSS)、韦氏记忆力量表(Webster memory strength scale,WMS-RS)、简明精神分裂症认知评估测验(brief assessment of cognition in schizophrenia,BACS)、健康调查简表(health survey summary form,SF-36)及不良反应总发生率。

结果 治疗前,两组患者 PANSS 各维度评分比较,差异无统计学意义($P > 0.05$);治疗后,观察组患者 PANSS 评分均低于对照组($P < 0.05$);治疗后,观察组患者 WMS-RS、BACS 评分显著高于对照组($P < 0.05$);治疗后,观察组患者各维度评分均高于对照组($P < 0.05$)。

结论 难治性精神分裂症阴性症状患者采用氨磺必利、氯氮平联合无抽搐电休克能够促进病情缓解,可使患者记忆力、认知功能与生活质量获得显著改善,安全高效。

关键词: 难治性精神分裂症; 阴性症状; 氨磺必利; 氯氮平; 无抽搐电休克治疗; 记忆力; 认知功能; 生活质量;

团体怀旧疗法对早期血管性痴呆患者社会功能的影响

林明钦* 胡耀华

福州神经精神病防治院精神科

目的 探讨早期血管性痴呆患者的疾病干预中团体怀旧疗法对患者社会功能的影响。

方法 选取 2020 年 7 月~2021 年 9 月福州神经精神病防治院收治的 48 例早期血管性痴呆患者为研究对象,按照数字表法,随机将患者分为对照组和观察组各 24 例,观察组进行团体怀旧疗法干预,对照组进行痴呆常规护理干预,对比两组在社会功能、生活质量等方面差异。

结果 干预前两组病情状况、社会功能评分差异无统计学意义($P > 0.05$),干预后两组病情状况的评分高于干预前,社会功能评分低于干预前,且观察组病情状况的评分高于对照组,社会功能评分低于对照组,差异均有统计学意义($P < 0.05$)。两组干预前的躯体、社会、心理、环境和总分评分比较差异无统计学意义($P > 0.05$);干预后两组的躯体、社会、心理、环境和总分评分高于干预前,且观察组高于对照组,差异均有统计学意义($P < 0.05$)。

结论 在早期血管性痴呆患者疾病干预中利用团体怀旧疗法具有显著的价值,其不仅能够提升患者的认知能力,还能够提升患者的认知功能,改善患者的生活质量,促进痴呆情况的改善。

关键词: 团体怀旧疗法;早期血管性痴呆;社会功能;生活质量

柴胡加龙骨牡蛎汤联合西药治疗抑郁症的效果分析

刘智敏*

福建省福能集团总医院

目的 探讨使用柴胡加龙骨牡蛎汤联合抗抑郁西药临床治疗抑郁症(major depressive disorder,MDD)患者的治疗效果。

方法 通过选取 2020 年 1 月份—2021 年 12 月份在福建省能源集团总医院心理科接受临床治疗的 121 例临床诊断为抑郁症(major depressive disorder,MDD)患者,通过以随机数表法将其分为研究组(60 例)与对照组(61 例)。对照组(61 例)选择采用常规西药抗抑郁进行临床治疗,研究组(60 例)在常规西药抗抑郁临床治疗的基础上加以应用柴胡加龙骨牡蛎汤进行中西医联合临床治疗。针对研究组(60 例)与对照组(61 例)的临床治疗效果、睡眠障碍的情况、

生活质量情况以及药物不良反应情况等进行分析比较。

结果 研究组总有效率为 96.67%较对照组的 83.61%高,差异有统计学意义($\chi^2=5.775, P<0.05$)。

结论 临床上采用柴胡加龙骨牡蛎汤联合常规抗抑郁西药治疗抑郁症(major depressive disorder, MDD)的临床治疗效果确切,其治疗安全性较佳,能够有效的改善患者的抑郁症状,保障其睡眠质量与生活质量,具有临床推广价值。

关键词: 柴胡加龙骨牡蛎汤; 西药; 抑郁症;

百合知母汤联合伏硫西汀治疗对抑郁症患者的影响

刘智敏*

福建省福能集团总医院

目的 分析临床使用百合知母汤联合伏硫西汀治疗对抑郁症患者治疗效果的影响。

方法 选取 2019 年 1 月 -2020 年 4 月 105 例福建省赋能集团总医院心理科收治的抑郁症患者,根据患者治疗方案的不同将其分别分为观察组(观察组采取百合知母汤联合伏硫西汀进行治疗,共 50 例)与对照组(对照组采取伏硫西汀进行治疗,共 55 例)。比较观察组与对照组的临床疗效及治疗前后汉密顿抑郁量表(Hamilton Depression Scale, HAMD)评分的变化情况,比较观察组与对照组在用药期间的不良反应发生率。

结果 观察组治疗总有效率明显高于对照组($\chi^2=4.719, P=0.030$);两组治疗前汉密顿抑郁量表(Hamilton Depression Scale, HAMD)评分比较差异无统计学意义($t=1.374, P=0.128$),观察组治疗后汉密顿抑郁量表(Hamilton Depression Scale, HAMD)评分明显低于对照组($t=5.465, P=0.044$);两组治疗期间不良反应发生率比较差异无统计学意义($\chi^2=1.428, P=0.133$)。

结论 百合知母汤联合伏硫西汀治疗抑郁症具有较高的疗效与安全性,能够有效改善患者的 HAMD 评分,值得推广应用。

关键词: 百合知母汤 伏硫西汀 抑郁症

肿瘤患者营养相关心理问题研究进展

邢丽丽 于恩彦*

浙江省肿瘤医院

目的 肿瘤患者常常面临很多营养问题:没有食欲、早饱、吞咽困难、预期性恶心呕吐、吞咽困难、吞咽困难、消瘦、疲乏无力等。而这些有营养问题的患者往往同时被心理痛苦困扰。为了探索肿瘤患者营养问题与心理问题之间的相互影响,更好的管理肿瘤患者营养相关心理问题,本文尝试梳理肿瘤患者营养相关心理问题的研究进展。

方法 以“肿瘤患者”“营养”“心理问题”等为关键词,大量查阅及梳理国内外相关文献。

结果 (1)胃肠外营养的肿瘤患者常面临抑郁、身体形象的改变、对器官问题的恐惧以及行活动的减少等复杂的心理困扰,这些心理痛苦降低了患者的生活质量。

(2)肠内营养对肿瘤患者生活质量也有影响,因为它可以导致味觉变化和身体上的痛苦。回顾性研究表明肠内营养可能比肠外营养带来更少的压力和产生更少的心理社会问题。

(3)直接进食的肿瘤患者营养相关心理问题主要有:习得性厌食(影响食物的摄入和滞留);食物偏好和选择的改变;预期性恶心和呕吐。

(4)肿瘤患者营养相关心理问题的管理方法有很多,包括:改善情绪的饮食和运动管理、认知行为疗法、放松练习、帮助患者寻找社会支持等。

结论 使用不同营养支持方式的肿瘤患者,包括胃肠外营养、肠内营养和直接进食的肿瘤患者都会面临不同的心理问题,而通过改善情绪的饮食和运动管理、认知行为疗法、放松练习和帮助患者寻找社会支持等方法可以有效地管理肿瘤患者营养相关心理问题。

一例接纳承诺疗法对阿斯伯格综合征患儿的情绪调节

陈志翔^{1,2,3}

1.江西中医药大学人文学院

2.南昌大学第一附属医院心身医学科 3.鼓楼加洲心理门诊部

在临床工作中经常碰到患有阿斯伯格综合征的孩子,他们的智商没有问题,甚至许多人成绩优秀能够考上重点中学,但是情商却显得低下,在与人交往中因为缺乏交往技巧,难以维持良好的人际关系在周围人眼里会觉得是怪人或者“显眼包”,他们有的人兴趣爱好比较特殊,言语交流时直白,不懂得察言观色,不顾及别人的感受,常被同伴孤立,甚至会被戏弄与欺凌,容易造成缺乏自信、焦虑、抑郁和愤怒的情绪,他们有时还在学校里有过激的言行,甚至如本案例一样出现跳楼自杀等冲动行为。

阿斯伯格综合征(1 具有与孤独症同样的社会交往障碍,局限的兴趣和重复、刻板的活动方式,但没有明显的语言和智力障碍,社交困难是本病的核心问题。随着孩子逐渐长大,各种挑战和困境会接踵而至,使孩子适应学校和社会难上加难,乃至出现各种行为问题,甚至是抑郁、焦虑等精神问题。接纳承诺疗法(acceptance and commitment therapy)[2]是认知行为疗法“第三次浪潮”中最具有代表性的治疗方法之一,ACT 通过关注当下、以己为景、明确价值观、承诺行动等过程来帮助患儿认识和接纳自己的情绪,明确自己的价值观,促使个体接纳自己的心理体验,来减少患儿的经验性回避,提升心理灵活性,帮助患儿过有意义的人生。接纳承诺疗法的诞生为阿斯伯格综合征的干预提供了一种新的取向。

关键词: 纳承诺疗法, 阿斯伯格综合征, 个案报告

HIV 防治同伴教育者积极心理资本和压力应对方式关系研究

陈志翔^{1,2,3}

- 1.江西中医药大学人文学院
- 2.南昌大学第一附属医院心身医学科
- 3.鼓楼加洲心理门诊部

现如今高校大学生群体性观念较为开放,但缺乏艾滋病相关知识,已经逐渐成为艾滋病的主要患者群,因此高校大学生群体的 HIV 防控尤为重要。同伴教育作为高校 HIV 防控的主要方式,其实施者

即同伴教育者的理和行为特征是一个值得研究的特点了,在前人的相关研究中,极少从特殊的志愿者群体角度出发。为探讨 HIV 治同伴教育者积极心理资本和压力应对关系,本研究通过福州高校青年志愿者以及红十字会发放线上问卷,共收 128 名同伴教育者为被试,以志愿者心理资本量表和应对方式问卷作为施测量进行研究,了解心理资本和应对方式的关系。

结论 (1)HIV 防治同伴教育者的心理资本总体良好,拥有较高的心理资本;压力应对方式倾向成熟型应对方式。

(2)心理资本量表坚强韧性因子分与三种压力应对方式呈显著负相关;心理资本量表总分与混合型、不成熟型应对方式呈显著负相关;坚强韧性因子分与混合型应对方式有着显著的负向预测作用。

关键词: 同伴教育者, 心理资本, 应对方式, HIV 防治

神经性厌食症的肠道菌群变化: 治疗新视角

张霄霁 陈珏*
上海市精神卫生中心

目的 神经性厌食症 (Anorexia Nervosa, AN) 是一种严重的进食障碍,其病理机制尚未明确。近年来,肠道菌群在调节食欲与进食行为方面的重要作用引起了广泛关注。本文旨在综述 AN 与肠道菌群的关系,并探讨肠道菌群调节治疗在 AN 中的应用前景。

方法 通过查阅相关文献,分析了 AN 患者的肠道菌群变化及其可能的病理机制。重点关注肠道菌群通过“微生物—肠道—大脑轴”影响食欲和进食行为的机制。此外,本文还综述了益生菌和粪菌移植 (Fecal microbiota transplantation, FMT) 在神经、精神疾病治疗中的潜力,并探讨其在 AN 中的应用可能。

结果 研究表明,AN 患者的肠道菌群多样性显著降低,革兰氏阳性菌如厚壁菌门减少,革兰氏阴性菌如拟杆菌门增加,厚壁菌门罗氏菌属的减少与肠道通透性增加和肠道低度炎症相关,肠杆菌科大肠杆菌升高与饱腹感信号传递相关。肠道菌群及其代谢产物通过调控神经递质(如 5-羟色胺、 γ -氨基

丁酸和多巴胺)和食欲相关激素(如GLP-1和胃饥饿素),影响宿主的情绪和食欲。此外,益生菌和FMT在调节肠道菌群平衡、缓解精神疾病方面显示出潜力,但在AN中的应用研究尚少。

结论 AN患者的肠道菌群发生显著变化,这些变化可能与AN的病理机制密切相关。通过“微生物—肠道—大脑轴”调节肠道菌群,可能为AN的治疗提供新的方向。益生菌和FMT在AN治疗中的应用尚需进一步研究和验证。未来应通过多学科交叉研究,探索个性化的微生物调节方法,为AN治疗提供新的有效途径。

神经性厌食患者出现脑桥中央髓鞘溶解症 1例

殷高焱 周天航*

北京大学第六医院

脑桥中央髓鞘溶解症(central pontine myelinolysis, CPM)是一种罕见的、非感染性的、对称性的脱髓鞘疾病,主要累及脑桥基底部分,以假性延髓麻痹、四肢瘫痪和意识障碍为特征性临床表现。该疾病进展迅速,多数患者预后不良。不同于国外以慢性酒精中毒为主要病因,国内报道首位病因为水电解质紊乱及快速纠正史,尤其是在迅速纠正低钠血症过程中发生。其他病因有酒精中毒、垂体危象、肝移植术后、肾透析后、神经性厌食等。我们报道了一个13岁的神经性厌食症女孩,病程中并没有发生严重的电解质失衡,而大脑核磁影像检查显示出典型的CPM损伤——脑桥基底部分对称性“蝙蝠翅”、“三叉戟”样长T1长T2信号。尽管该患者的早期临床表现很差,但是经过治疗她的神经性厌食和CPM都得到了明显的缓解。本例患者的临床早期特征以精神症状为主,类似于谵妄的器质性脑病综合征,与脑桥损伤相关的神经系统症状却不典型。神经性厌食是精神科疾病中致死率最高的疾病,患者常伴有一系列行为问题,如过度运动、大量饮水、滥用泻药或利尿剂等,更容易发生躯体问题。尽管电解质紊乱的病因可能被高估,但是精神科医生应该警惕在再喂养的过程中发生CPM的可能。当患者出现意识障碍的时候,尽早完善头颅磁共振检查以减少对

CPM的误诊、漏诊。

关键词:脑桥髓鞘溶解,神经性厌食,电解质紊乱,磁共振

地衣芽孢杆菌在阿尔茨海默病性痴呆终末期患者安宁疗护中的作用

曹倬 宋震* 李俊

沈阳市安宁医院

目的 阿尔茨海默病性痴呆是一类渐进性认知功能退化性疾病,处于疾病的终末期,患者的记忆力严重受损,只剩零星的片段,导致出现包括进食障碍等症状,日常生活完全依赖他人照护,最终常死于器官衰竭等并发症。重度痴呆的患者及患者家属往往最终被动的接受了此病无法被治愈的事实,最后只能寄希望于控制痛苦和不适症状,改善患者的生活质量。起源于英国的安宁疗护,恰恰满足了此类患者及患者家属的需求。本文尝试将“脑-肠-微生物轴”理论融入阿尔茨海默病性患者的安宁疗护中,探讨地衣芽孢杆菌制剂在阿尔茨海默病性痴呆患者安宁疗护中的作用及机制,争取探索出一条适合并服务于我国国情的安宁疗护模式,为阿尔茨海默病性痴呆患者的安宁疗护提供全新的视角和疗护靶点。

方法 收集我院患者中,明确诊断为阿尔茨海默病性痴呆终末期的患者,随机分为观察组和对照组,各25例。对照组患者给予常规安宁疗护,观察组患者给予安宁疗护及地衣芽孢杆菌制剂,并严格按照诊疗方案进行临床各项活动。观察组及对照组患者住院治疗8周后,给予患者简易智能状态检查表(MMSE)、生活质量评估表、动态疼痛评估表、埃德蒙顿症状评估量表等相关量表的评估,对比观察组、对照组患者上述指标的变化情况,进行统计学分析。

结果 经过8周的治疗,观察组和对照组患者的简易智能状态检查表(MMSE)治疗前后均无显著差异($P>0.05$);生活质量量表、动态疼痛评估表及埃德蒙顿症状评估量表的评分均有所下降,但观察组下降幅度更大,表明地衣芽孢杆菌制剂在改善阿尔茨海默病性痴呆终末期患者症状方面具有一定的优势。

结论 本研究结果表明,基于“脑-肠-微生物轴”理论,地衣芽孢杆菌制剂联合安宁疗护在治疗与改善阿尔茨海默病性痴呆终末期症状方面具有一定的优势。这可能与地衣芽孢杆菌制剂不仅与阿尔茨海默病性痴呆疾病本身关系密切,还与其终末期安宁疗护的主要躯体不适症状紧密相联有关,能够针对阿尔茨海默病性痴呆终末期复杂的病理过程进行整体调节。因此,地衣芽孢杆菌制剂联合安宁疗护可以作为治疗阿尔茨海默病性痴呆终末期症状的一种有效手段,值得进一步研究和推广。

关键词: 地衣芽孢杆菌;阿尔茨海默病性痴呆;安宁疗护;脑-肠-微生物轴

一例危险性低体质量神经性厌食症患者的护理

李晓俞*

山西医科大学第一医院

目的 总结一例危险性低体质量(BMI 18.63kg/m²)神经性厌食症患者的护理经验。

方法 1. 饮食行为管理

- (1) 保证患者的入量,维持水电解质平衡。
- (2) 使用固定体重计每日定时测量患者体重。
- (3) 评估和监测限制饮食、运动及清除行为,

同时记录上述行为发生频次。

(4) 环境监督、进餐管理、观察患者是否在餐后出现运动或呕吐等行为、运动管理、行为强化。

- (5) 家庭心理治疗、支持性心理治疗。

2. 遵医嘱补钾

3. 预防心衰: 控制液体入量: 病入 24 小时内液体入量控制在 2000ML 以内; 抬高下肢, 以利于静脉回流。

4. 预防感染

- (1) 严格执行手卫生。
- (2) 加强口腔护理, 预防口腔溃疡。
- (3) 注意肛周清洁, 预防肛周感染。
- (4) 注意环境卫生, 病房多通风、消毒; 外出戴好口罩。

5. 安全护理。

结果 1. 患者的水、电解质失衡得到纠正。患者出院时, 出入量基本平衡(入院时: 入量

1480 毫升, 出量 523 毫升; 出院时: 入量平均约 2400 毫升/天, 出量平均约 1600 毫升/天)。血清钾由 2.17mmol/L 升至 3.65mmol/L。

2. 患者的营养状况的得到好转。

患者 NT-proBNP 由 933.28pg/ml, 降至 498.5pg/ml, 下肢水肿消退。体重由 23.5kg 增长至 26kg。

3. 患者住院期间未发生意外和不良事件。

结论 神经性厌食症患者营养治疗是最基本也是最重要的治疗手段。但首先, 序贯营养治疗避免再喂养综合征发生, 即遵循循序渐进原则: 热量逐渐增加, 速度由慢到快, 纠正营养状态和水、电解质失衡。其次, 严格控制肠外营养支持量和速度, 预防心衰及其它并发症。最后注意环境卫生、手卫生及皮肤护理, 预防感染的发生。除了上述护理要点外还应包括患者安全管理、支持性心理护理和认知重构等方面的护理。

关键词: 神经性厌食; 重度营养不良; 营养支持; 护理

Altered Gut Microbial Profile in Children and Adolescents with Obsessive-compulsive Disorder Treated with Selective Serotonin Reuptake Inhibitor

Jiali Dai^{1,2}, Gang Zhu¹

1. The First Affiliated Hospital of China Medical University

2. The Third Hospital of Daqing

Objective Obsessive-compulsive disorder (OCD) is a chronic disabling mental disorder characterized by repeated and persistent obsessive and/or compulsive behaviors. This study aims to explore the changes of gut microbiota in first-onset children and adolescents with OCD before and after selective serotonin reuptake inhibitor (SSRIs) treatment by Multiple omics analysis of 16SrRNA sequencing, metagenomics and metabolomics, and to find potential biomarkers related to the efficacy of OCD and reveal its pathophysiological mechanism. It provides theoretical basis for the early diagnosis and prognosis of OCD

Methods 1. Stool samples were collected from 26 first-episode untreated children and samples were collected again after 12 weeks of SSRIs monotherapy for OCD, which were evaluated for clinical parameters. 2. Fecal samples from 26 OCD0W and 26 treated with SSRIs for 12 weeks (OCD12W) were analyzed by 16S rRNA sequencing and metabonomic method based on UHPLS-MS. 3. Fecal samples from 14 Responders and 12 Nonresponders were analyzed by Illumina HiSeq sequencing platform using metagenomic high-throughput sequencing method. 4. Association analysis was performed on metagenomic and metabonomics analysis data to clarify the association between differential flora and differential metabolites

Results 1. There was no significant difference in the diversity index of intestinal flora in patients with obsessive-compulsive disorder (OCD12W) after drug intervention compared with those in the pre-intervention group (OCD0W) ($P>0.05$). 2. The random forest model identified 13 specific bacteria as microbial markers in patients in the treatment effective group (Respond) and non-response group (Nonrespond), with AUC of 0.8274. 3. A total of 63 different metabolites were screened in the OCD0W-OCD12W group, among which the relative contents of neopterin and Sepiapterin, the intermediate products of folate biosynthesis, were significantly reduced in the OCD12W group ($P<0.05$); The metabolites involved in amino acid biosynthesis pathway such as fumarate, 2-oxyisovalerate and 3-dehydroquinic acid (DHQ) were significantly increased ($P<0.05$)

Conclusion 1. Short-term treatment with SSRIs can alleviate clinical symptoms, but fails to make the microbial ecosystem of children and adolescents with OCD close to healthy individuals. 2. Microbial markers can also predict treatment outcomes of children and adolescents with OCD. 3. The expression of intestinal microflora metabolites in OCD patients is disturbed, resulting in functional abnormalities of related metabolic pathways, which can be partially recovered by drug treatment. Neopterin, as a key factor of folic acid synthesis pathway, may be involved in the pathogenesis of OCD. 4. Abnormal metabolites of gut microbiota in OCD patients are mainly manifested in folic acid bio-

synthesis, prion disease pathway and amino acid metabolic network

关键词: Gut microbiota; Obsessive compulsive disorder; Children and adolescents; Metagenomics; Metabonomics

基于高通量测序方法的儿童青少年强迫症患者肠道菌群特征分析

代佳利^{1,2} 朱刚¹

1.中国医科大学附属第一医院

2.大庆市第三医院

目的 强迫症 (obsessive compulsive disorder, OCD) 是一种病因未明的致残性精神障碍, 其发生发展过程与肠道菌群的关联尚未被完全阐明。本研究旨在通过 16SrRNA 测序和宏基因组学联合分析的方法, 为首发未用药儿童青少年强迫症患者是否存在肠道菌群功能紊乱提供直接证据, 同时寻找强迫症的潜在生物标志物。

方法 1、本研究首先收集了 49 例首发未用药儿童青少年强迫症患者 (OCD) 和 42 例年龄、性别与之匹配的健康对照者 (HC) 的粪便样本, 同时对受试者进行随访及各临床参数的评估。2、采用 16S rRNA 测序的方法对 49 例强迫症组 (OCD 组) 和 42 例健康对照组 (HC 组) 的粪便样本进行分析。3、利用宏基因组学高通量测序方法基于 Illumina HiSeq 测序平台对 19 例 OCD 及 18 例 HC 受试者的粪便样本进行分析。4、将宏基因组测序结果与各临床参数进行关联分析, 探究肠道菌群与强迫症症状之间的关系及其发病机制中可能参与的功能通路。

结果 1、OCD 患者肠道菌群各多样性指数均显著降低 (obs, $P<0.001$; chao1, $P<0.001$; ACE, $P<0.001$; shannon, $P<0.001$; simpson, $P<0.05$; goods, $P<0.001$), 同时其微生物互作网络明显弱于 HC 组。2、OCD 组厚壁菌门 / 拟杆菌门的相对丰度比值 (F/B) 显著降低 ($P<0.001$)。3、OCD 患者肠道罗姆布茨菌属 (Romboutsia, $q<0.01$)、光冈菌属 (Mitsuokella, $q<0.01$)、土孢杆菌属 (Terrisporobacter, $q<0.01$) 等产丁酸盐菌的丰度显著降低。4、随机森林模型识别 30 个特异性菌属作

为生物标记物, OCD 组和 HC 组之间的 AUC 为 0.9011。5、OCD 组各临床参数的变化与肠道菌群中特定细菌的丰度改变之间存在相关性 ($P < 0.05$)。

结论 1、首发未用药儿童青少年 OCD 患者肠道菌群的多样性显著降低, 且微生物互作网络存在明显缺陷。2、首发未用药儿童青少年 OCD 患者肠道稳态被破坏与罗姆布茨菌属 (*Romboutsia*) 等产丁酸盐细菌的相对丰度显著降低有关。3、OCD 组和 HC 组可通过以包特氏菌属 (*Bordetella*) 为主的特异性肠道菌群生物标记物进行区分。

P11 (S100A10) 和突触相关蛋白参与卒中后抑郁大鼠的机制研究

张佳林 陈颖 岳莹莹* 袁勇贵
东南大学附属中大医院心身医学科

目的 卒中后抑郁 (PSD) 是卒中的常见并发症, 显著影响患者功能恢复和回归社会。既往研究发现 P11 可能通过 BDNF 通路参与了抑郁症发生以及抗抑郁疗效, 但 P11 是否参与 PSD 发生尚不清楚, 本研究旨在通过建立卒中后抑郁动物模型探讨 P11 参与 PSD 的发病机制。

方法 选取 5-6 周龄大小的 SD 大鼠, 随机分为空白对照组, 卒中模型组和 PSD 模型组三组。通过糖水偏爱实验, 强迫游泳, 悬尾实验对大鼠抑郁样行为进行评估; 通过氯化三苯基四氮唑 (*triphenyltetrazolium chloride*, TTC) 染色评估卒中模型大鼠形态学变化, 通过蛋白质印迹法 (*western blot*, WB) 分别检测各组大鼠前额叶皮层和海马区 P11, PSD95 以及 *synapsin1* 突触相关蛋白的表达。

结果 与对照组相比, 卒中组和 PSD 组大鼠糖水偏好显著降低, 游泳测试不动时间、悬尾试验不动时间显著延长, 前额叶皮层以及海马区 PSD95, S100A10, *synapsin1* 蛋白表达水平减少, 差异均有统计学意义 (均 $P < 0.05$)。

结论 S100A10/PSD95/*synapsin1* 的表达水平下降可能参与卒中后抑郁的发生, S100A10 可能通过影响突触相关蛋白的表达调节突触功能参与卒中后抑郁的发病。

关键词: 卒中后抑郁; S100A10; 突触相关蛋白

特质冲动与 mPFC 脑区 GABA 浓度预测舍曲林对强迫症的疗效

郑紫锋¹ 闫毅毅² 高见¹ 王杨¹ 王振^{1,3}

1. 上海交通大学医学院附属上海市精神卫生中心, 上海, 200030

2. 山东省戴庄医院, 济宁, 272051

3. 上海交通大学心理与行为科学研究所, 上海, 200030

目的 舍曲林作为选择性 5-羟色胺再摄取抑制剂, 是强迫治疗的一线药物, 但此类药物服药周期长, 治疗有效的比例低, 寻找疗效预测指标成为了研究的重点。特质冲动有预测强迫症疗效的潜力, 但并无研究做过实际的探索。内侧前额叶 (*medial prefrontal cortex*, mPFC) 的 γ 氨基丁酸 (*gamma-aminobutyric acid*, GABA) 浓度与特质冲动紧密相关, 但二者在强迫症中的关联还缺少研究。本研究探索特质冲动对强迫症舍曲林疗效的预测效果以及强迫症中特质冲动水平与 mPFC 脑区 GABA 浓度的关系。基于特质冲动与 mPFC 脑区 GABA 浓度的相关性, 我们探索了二者联合是否能够更好地预测强迫症的治疗结局。

方法 研究纳入 51 例未服药强迫症患者与 35 例健康对照, 于基线采集所有被试的人口学及耶鲁布朗强迫量表、贝克抑郁量表第二版、巴瑞特冲动量表第 11 版得分 (*Barratt Impulsivity Scale-11*, BIS-11), 使用质子磁共振波谱技术采集患者与健康对照基线 mPFC 脑区的 GABA 信号。而后强迫症患者完成 12 周舍曲林治疗, 于治疗后再次采集除 BIS-11 外其他量表得分, 并邀请完成治疗的患者进行治疗后的再次扫描。对比两组基线状态下特质冲动、mPFC 脑区 GABA 浓度及症状量表差异; 比较患者组治疗前后症状及 GABA 浓度改变; 统计冲动、GABA 浓度与症状及人口学的关联; 以治疗有效与治疗无效分组比较特质冲动、GABA 浓度及症状的组间差异及各亚组中变量的相关性; 最后使用二元 Logistic 回归构建疗效预测模型, 并比较单独使用特质冲动和联合特质冲动与基线 GABA 浓度对疗效预测效果的差异。

结果 强迫症患者注意冲动水平显著高于健康对照；基线状态下 mPFC 脑区 GABA 浓度显著低于健康对照，与无计划冲动水平有相关趋势；舍曲林治疗前后 GABA 浓度无显著变化。Logistic 回归显示无计划冲动水平对预测舍曲林疗效有显著贡献。mPFC 脑区 GABA 浓度对疗效预测无显著贡献，且联合基线 mPFC 脑区 GABA 浓度并未增强无计划冲动对舍曲林疗效的预测效果。

结论 无计划冲动可预测强迫症患者舍曲林治疗疗效，mPFC 脑区 GABA 浓度无显著预测效果。

关键词：强迫症,疗效预测,特质冲动,质子磁共振波谱,舍曲林

中国进食障碍简明筛查量表的开发及信效度检验

朱睿臻 陈珏*

上海交通大学医学院附属精神卫生中心

结论 开发信效度良好的中国本土化的进食障碍简明筛查量表，用以在学生群体中的心理健康普查，在早期对进食障碍风险患者进行初步筛查。

方法 1.通过建立项目池、样本库数据驱动的形式进行项目分析、专家评审形成初版量表，在健康对照群体 (N=146) 和进食障碍群体 (N=34) 中进行预试验，根据项目分析结果对初版量表进行修订，最终形成终版的中国进食障碍简明筛查量表 (CEDBS)。2.将 CEDBS 投放至大样本的高中生群体 (N=1036) 中进行信效度检验，并在 1 个月后随机抽取同一批被试 (N=106) 进行复测。3.检验 CEDBS 的临床适用性，即在进食障碍患者群体 (N=325) 中进行信效度检验，在 1 个月后对前来复诊的患者 (N=51) 进行复测，并通过 ROC 分析计算量表的敏感度、特异性和划界分。

结果 1.CEDBS 终版量表一共包含 10 个条目，采用 6 点计分的形式对受试者过去 28 天的进食障碍核心症状进行评估。2. CEDBS 在高中生群体中的内部一致性系数为 0.932，1 个月后的重测信度 ICC 为 0.741，CEDBS 的前后测总分无显著差异 (p=0.477)。在效度指标上，探索性因子分析结果显示 CEDBS 在高中生群体中表现为单维结构，各条目的因子负荷在 0.70-0.87 之间；CEDBS 与 EDI-1、

EAT-26、EDE-Q 总分之间的相关系数分别为 0.726、0.716、0.849，均达到显著水平 (p<0.01)；CEDBS 能显著预测高中生 1 个月后的 EDI-1 总分情况 (R²=0.213, p<0.001)。3.在进食障碍患者群体中，CEDBS 的内部一致性系数为 0.956，1 个月后的重测信度 ICC 为 0.828，但 CEDBS 的前后测总分存在显著差异 (p=0.002)。在效度指标上，探索性因子分析结果显示 CEDBS 在患者群体中同样表现为单维结构，各条目的因子负荷在 0.70-0.90 之间；CEDBS 与 EDI-1、EAT-26、EDE-Q 总分之间的相关系数分别为 0.758、0.843、0.901，均达到显著水平 (p<0.01)；CEDBS 能显著预测 ED 患者 1 个月后的 EDI-1 总分情况 (R²=0.295, p=0.002)。4.ROC 分析结果显示 AUC 为 0.908，当选取划界分为 17 分时，CEDBS 的敏感度和特异度分别为 0.809 和 0.877，达到最佳水平。

结论 1.CEDBS 的开发过程科学严谨，具有良好的内容效度。2.CEDBS 在高中生和进食障碍群体中均具有良好的信效度，适合在大样本的高中生群体中筛查使用。3.CEDBS 的划界分为 17 分，总分高于此分数表明其存在进食障碍的倾向。

关键词：进食障碍，筛查量表，量表开发，信效度检验，划界分

神经性厌食症患者自我忽视的诠释性现象学研究

刘梦玥*

山西医科大学第一医院

目的 探索神经性厌食症患者自我忽视的体验和原因，为医护人员识别和干预神经性厌食症患者自我忽视行为提供参考。

方法 采用诠释性现象学方法，通过目的抽样，通过专家小组访谈法修订研究方案，以访谈过程中不再出现新主题为标准，选取 2023 年 10 月—2024 年 3 月在山西医科大学第一医院精神卫生科住院的神经性厌食症患者进行半结构式访谈，采用 Van Manen 方法分析质性资料。本研究遵循知情同意原则，所有受访者均签署知情同意书。

结果 本研究共访谈了 11 名神经性厌食症患者，其中女 10 例，男 1 例；年龄(12.6±3.6)岁；婚姻

状况以未婚为主；以学生为主；大部分受访者伴有抑郁、焦虑情绪；自我忽视评估量表得分为(15.5±1.8)分。神经性厌食症患者自我忽视的体验共归纳为4个主题和8个亚主题，包括忽视个人健康（高体型知觉感知、完美主义、高自尊、高冲动人格特质），忽视体重管理（健康意识薄弱、低自我同情），自我照护能力不足（情绪调节能力差、自我行为负强化）和感知支持不足（社会支持较低、情感支持不足）。

结论 神经性厌食症患者自我忽视的体验和原因是多元化的，医护人员需重视神经性厌食症患者自我忽视行为的表现，并积极探索有效的防治措施，科学评估患者的需求，继而实施精准护理服务，提高患者疾病认知及应对能力。

关键词：神经性厌食症；自我忽视；诠释性现象学

Analysis of Clinical Characteristics, Depression Levels, and Treatment Outcomes in Inpatients with Anorexia Nervosa and Bulimia Nervosa

Chengbin Guan^{1,2}, Wei Zhang^{1,2}, Changjun Teng^{1,2}, Xiao Hu^{1,2}

1.Nanjing Brain Hospital

2.The Affiliated Brain Hospital of Nanjing Medical University

Objective Anorexia nervosa (AN) and bulimia nervosa (BN) are severe eating disorders, often associated with multiple psychiatric and somatic disorders. Comorbidity of depression and eating disorders is common and may exacerbate each other. However, little research has compared depressive episodes in AN and BN

Methods 160 AN and BN inpatients from 2012 to 2023 were retrospectively reviewed. This study compared the characteristics of AN and BN in hospitalized patients with and without depressive episodes and investigated the factors influencing prognosis

Results The prevalence of depressive episodes is 50% among patients with AN and 67.5% among patients with BN. There were no statistically significant differences in the scores on the Hamilton Rating Scale

for Depression (24 items) (HAMD24) or the Hamilton Anxiety Scale (HAMA) between the AN patients with depressive episodes (AND) and the BN patients with depressive episodes (BND). AND patients exhibited a higher incidence of first episodes ($F=27.941, P<0.001$), self-injurious behaviors ($F=9.769, P=0.016$), and sleep disturbances ($F=33.719, P<0.001$) compared to the two groups without depressive episode. Similarly, BND patients demonstrated a significantly higher prevalence of first episodes ($F=27.941, P<0.001$), suicidal ideation ($F=16.840, P=0.001$) and attempts ($F=8.515, P=0.027$), and sleep disturbances ($F=33.719, P<0.001$) compared to these two groups. No significant differences in prognosis were observed between AN patients without depressive episodes (ANO) and BN patients without depressive episodes (BNO) ($P>0.05$), nor between AND and BND ($P>0.05$). Interestingly, both ANO and BNO patients achieved higher cure rate. Length of hospitalization was positively correlated with prognosis in all four patient groups (all $P<0.05$). In addition, for patients with depressive episodes (AND, BND), lower HAMD24 and HAMA scores at discharge (all $P<0.05$) and greater HAMD24 score reduction rates ($P<0.05$) were associated with better prognosis

Conclusion Patients with BN exhibited a significantly higher prevalence of depressive episodes compared to the AN. Patients with AND and BND Patients exhibited lower cure rates. Also, in both AND and BND patients, prognosis was associated with residual symptoms of depression and anxiety

中医治疗神经性厌食症研究进展

安阳阳*

沈阳市安宁医院

神经性厌食症是以自我饥饿、体质量显著减轻和营养不良为特征的一类进食障碍。西医治疗主要以药物治疗、心理疗法等治疗方式为主，具有一定

的局限性。中医注重形神合一,认为本病以脾胃虚弱为本,以肝气郁结、情志失常为标,并与心、肾关系密切,治疗以健脾养胃、疏肝理气为本,辩证施治,可根据患者症状不同,兼顾温补肾阳、调补冲任等多种治疗方向,对症治疗;治疗手段多样,不论单独治疗或配合西药协同治疗,均可获确切疗效。

神经性厌食症作为进食障碍中的一种主要类型,以反常的进食行为和心理紊乱为特征,伴发生理、社会功能紊乱。该疾病症状复杂、对患者生活质量和生命安全危害严重,进食障碍在国外的研究较为成熟,早在17世纪已有类似神经性厌食的报道,相较国外来说,国内相关研究起步较晚,尤其是应用中医治疗AN;但随着近年来国内研究者及医者的不断研究,现阶段通过中医学治疗AN已经具有许多相对成熟、疗效明确的治疗药物及治疗手段,并且手段多样,如汤药、针灸、按摩等等。在临床应用治疗中,无论是单独治疗或联合西药治疗均具有明显疗效。如何发挥中医药特色,早期诊断治疗,减少误诊率和复发率,为患者减少痛苦,将是未来中医人努力研究发展的方向。

QEEG测试在心理疾病症状检出中的应用

席巧真¹ 阎明² 刘振静¹

1.青岛市精神卫生中心

2.青岛逸凡诺脑科技发展有限公司

目的 QEEG测试在心理疾病症状检出中的应用

方法 现有的心理疾病的诊断极大的依赖于患者的主诉,对于早期或心理疾病症状表现不明显、患者年龄偏小,或因某种原因自身表达能力欠缺,无法表达清楚自身精神症状,其主诉的内容是患者自身的感受,是非具象的,与神经系统的神经数据表达出脑功能的实际问题存在偏差,如心理问题中的反刍(反刍思维是一种反复关注自身消极情绪及相应事件的思维方式[1]),患者对反刍思维的表达千差万别。针对以上问题,将定量脑电图(QEEG)测试引入心理疾病的症状检出,通过脑电数据的量化和大数据比对后的具体脑数据和脑图像来对心理疾病进行定量和定性的分析,对心理疾病以数字化的、可重

复的、涉及到全脑各脑区的方式实施诊断,而不是依赖患者主观自述或量表的测试,QEEG测试在心理疾病的症状检出成为必要。QEEG测试的快速筛查能力,使得通过大规模群体的主动性筛查成为可能,对心理健康筛查的升级具有重要的作用。QEEG症状检出技术以QEEG测试技术为基础,是脑科学、大数据、计算机技术相结合的产物,应用QEEG症状检出技术完成对包括抑郁症,焦虑症,双相情感障碍等在内的心理疾病的诊断技术已经日臻完善。本文介绍了QEEG症状检出技术及QEEG技术的原理及测试过程,分析了心理疾病各种症状的脑神经原因,心理疾病各相似症状在脑区即点位层面的异同,对QEEG症状检出技术及QEEG测试的实际应用进行总结与分析。

结果 QEEG症状检出技术与测试与传统的量表测量方法相比,具有受主客观干扰因素影响较小、脑电数据经过定性、定量分析后其结果更为客观、不依赖患者的自我感觉,并实现患者症状的主动检出等优点,

结论 QEEG症状检出技术与测试宜在临床中应用和推广,同时开创了一种创新、成熟、准确、全面的心理健康筛查系统技术,是心理健康监测技术的创新并对其技术进步具有重要的意义。

伴及不伴非自杀性自伤行为的青少年心境障碍患者的临床特征及疗效差异

袁毓蔓 朱刚*

中国医科大学附属第一医院

目的 非自杀性自伤(Non-Suicidal Self-Injury, NSSI)是指个体采取的一系列故意伤害自己身体的行为,并产生轻度或中度损伤。目前针对NSSI的治疗,有实证研究证据的干预措施主要为心理治疗,药物治疗主要针对其共病的精神障碍,如5-HT再摄取抑制剂类(SSRIs)药物和非典型抗精神病药物等。本研究旨在立足于真实的临床环境中,分析比较伴及不伴NSSI行为的青少年心境障碍患者的一般人口学特征、临床特征以及疗效差异,以期针对伴非自杀性自伤青少年患者的临床治疗提供新思路

科学依据。

方法 选取在精神医学科门诊就诊并符合入组条件的青少年心境障碍患者进行问卷调查,共纳入148例患者。根据1年内是否实施5次以上非自杀性自伤行为将患者分为2组:伴非自杀性自伤行为组(NSSI组),共52例患者;不伴非自杀性自伤行为组(Non-NSSI组),共96例患者。调查工具采用一般人口学和临床特征调查问卷、渥太华自伤量表(OSI)、青少年非自杀性自伤问卷(ANSAQ)、汉密尔顿抑郁量表(HAMD-17)、汉密尔顿焦虑量表(HAMA)、临床实用抑郁混合特征量表中文版(CUDOS-M-C)、中国大五人格问卷简式版(CBF-P-IB)、儿童期虐待问卷(CTQ-SF)、青少年生活事件量表(ASLEC)、家庭环境量表中文版、防御方式问卷以及药物副反应量表。对受试者共进行4次评估,在基线水平分析伴及不伴NSSI的青少年心境障碍患者的一般人口学特征及临床特征;分别在随访第2周、第4周、第8周采集资料分析两组疗效差异。基于GraphPad Prism 10.0版本对数据进行统计学分析以及绘图,检验水平选取双侧 $P < 0.05$ 为有统计学意义。

结果 1. 基线水平上,NSSI组与Non-NSSI在是否为独生子女、临床诊断、共病、HAMD-17、HAMA、CUDOS-M-C、尽责性、宜人性、情感虐待、人际关系因子得分上有统计学差异($P < 0.05$)。

2. NSSI组首次发生自伤行为的平均年龄为(13.04 ± 2.07)岁,实施自伤行为频率最高的身体部位是手(25.00%)及下臂或腕部(23.08%),最常使用的自伤方式为切割(26.92%)。

3. 两组HAMD-17($P = 0.002$)、HAMA($P < 0.001$)得分均随时间推移呈下降趋势,HAMA得分存在组间差异($P = 0.019$),治疗前后得分差异存在组内差异($P < 0.05$)。

结论 抑郁症状、焦虑症状、临床诊断、共病、独生子女、尽责性人格特质、宜人性人格特质、儿童期情感虐待、人际关系是青少年心境障碍患者NSSI的影响因素。

关键词:非自杀性自伤;心境障碍;临床特征;疗效

产后抑郁风险预测模型的构建和验证

朱晓彤 朱刚*

中国医科大学附属第一医院

目的 产后抑郁症(PND)是一种严重影响产妇身心健康的疾病,其发病率逐年上升,成为威胁产妇身心健康,更是全球关注的公共卫生问题。目前,尽管已有一些临床指标用于预测PND的风险,但受限于其准确性和敏感性,仍难以满足临床需求。构建产后抑郁发病风险的预测模型,综合考虑心理、社会等多方面的因素,预测模型的建立为产后抑郁的早期识别和干预提供了新的思路和方法,有望为未来的临床实践提供有力支持。

方法 选取了464例产科门诊的孕晚期孕妇(孕28-40周)。通过综合运用问卷调查、临床访谈及心理评估工具,系统地收集了可能与产后抑郁(PND)发病风险相关的数据。所有受试者均接受了产后4-6周的跟踪随访,并据此分为产后抑郁组(PND组)和未抑郁组(NPND组)。

结果 基于心理和社会学因素,成功构建了PND发病风险预测模型。经过筛选最终确定的预测因子包括:GAD-7焦虑得分、PSQI睡眠状况、状态特质问卷-特质维度、经前期烦躁史、婚姻质量问卷中的性格相容度维度,以及艾森克人格特质中蕴含的抑郁质个性特点。该模型在验证人群中的AUC值达0.904,显示较好的区分能力。同时,验证模型的敏感性达到92.9%,特异性为76.90%,进一步印证了模型的有效性。Hosmer-Lemeshow检验值为0.09($p > 0.05$),充分说明模型拟合度良好。

结论 本研究成功构建了一个性能良好的PND发病风险预测模型,该模型综合考虑了心理和社会学等因素,发现孕晚期睡眠状况、焦虑情绪、特质焦虑、性格相容度以及抑郁质人格特征是PND发病的重要预测因子和影响因素

关键词:产后抑郁;影响因素;预测模型;肠道菌群;宏基因组学

Abnormal Dynamic Functional Connectivity in First-episode and Untreatment Patients with Obsessive-compulsive Disorder Based on The Triple-network Model Abstract

Xiao Hu^{1,2}, Da Zhang³, Chengbin Guan^{1,2}

- 1.Nanjing Brain Hospital
- 2.The Affiliated Brain Hospital of Nanjing Medical university
- 3.Nanjing Medical University

Objective The aim of this study was to assess the triple-network dynamic functional connectivity and topological properties of first-episode and untreated patients with obsessive-compulsive disorder (OCD) and to investigate the clinical correlations of abnormal changes in dynamic functional connectivity and topological properties

Methods Sixty-eight patients in our hospital diagnosed with first-episode OCD and 68 healthy controls (HC) matched for age and sex were included in our study. Resting-state functional magnetic resonance imaging scans were performed on a 3.0-Tesla magnetic resonance scanner. Three temporal metrics of connectivity state expression were calculated: (i) fraction of time; (ii) mean dwell time; and (iii) number of transitions. We further performed dynamic graph-theoretical analysis to examine the variability of topological metrics. The Yale-Brown Obsessive-Compulsive Scale (Y-BOCS) was used to assess the severity of OCD symptoms, and Wisconsin Card Sorting Test was used to assess the executive function of OCD

Results In the comparison of dynamic functional connectivity indicators, we found that there were significant differences in the fraction of time and the mean dwell time in the state1 and state3, and significant differences in the number of transitions among the four functional connectivity states. The OCD group showed less variability in the local efficiency of the network. Both the total Y-BOCS score and the persistent error rate were positively correlated with the fraction of time and the mean dwell time in the state1, both the total Y-BOCS score and the persistent error rate were negatively correlated with the local efficiency of the network. In the validation analysis, when the size of the sliding window changed, there was still significant differences in the the fraction of time, the mean dwell time and the number of transitions between OCD patients and HC

Conclusion The triple-network of OCD patients have lost the correct dynamic rhythm, which may be

considered as a potential marker for pathophysiological mechanism of OCD

关键词: dynamic functional connectivity, functional magnetic resonance imaging, obsessive-compulsive disorder, resting state, triple-network

Effects of Childhood Experiences on Obsessive-Compulsive and Internalizing Symptoms: A Latent Profile and Network Analysis

Yinqing Fan Chenyu Yuan Chaoyi Wu Wang Zhen*
Shanghai Mental Health Center

Objective Trauma exposure is linked to adverse psychological outcomes such as anxiety, depression, and obsessive-compulsive (OC) symptoms. The impact of childhood experiences on personality, behavior, and perceived stress may differ across subgroups based on the type and severity of childhood adversities. This study aimed to identify subgroups with different childhood experiences using latent profile analysis (LPA) and explore the relationship between OC and related symptoms and their risk factors through network analysis

Methods A large community sample (N = 4102) provided data on childhood experiences (childhood trauma, perceived unpredictability, and perceived poverty), anxiety, depressive, and OC symptoms, and related risk factors. LPA was conducted to identify subgroups based on childhood adversity experiences. Network analysis (NA) and exploratory graph analysis were used to examine symptom-symptom interactions of OC and related symptoms within each subgroup

Results LPA identified six subgroups: (a) Low childhood adversity, (b) Low childhood adversity with relative poverty, (c) Medium adversity with high unpredictability, (d) High emotional abuse and parental unpredictability, (e) Medium-high adversity, and (f) Highest adversity with highest abuse. Core nodes in the OC symptoms and related risk factors networks varied significantly across subgroups. Network analysis identified

poor self-regulation as a bridging symptom across networks

Conclusion Poor self-regulation appears to be a stable mechanism linking different risk factors and symptoms. Individuals with different childhood experiences may exhibit distinct mechanisms for OC symptoms. These findings highlight potential targets for clinical intervention to improve outcomes for individuals with various types of childhood adversity

关键词: Childhood adversity, latent profile analysis, network analysis, obsessive-compulsive symptoms, risk factors

暴食障碍对减重手术疗效的影响

郑理匀¹ 熊建文¹ 陈楚翘² 吴金晏² 孔庆梅² 刘桥生¹

1.江西省精神病院

2.北京大学第六医院

目的 减重手术是用于暴食障碍患者肥胖症的推荐治疗手段之一。然而,仍有部分患者在术后最初几年体重下降不理想或体重明显反弹。本文拟就此问题进行综述,从减重手术前或术后两方面探究暴食障碍的发生对减重手术疗效的可能影响,并提出相应建议。

方法 本文通过对相关文献的系统检索和分析,综合多项研究结果,系统评估暴食障碍患者在接受减重手术前后的心理和行为特征以及减重手术前后暴食障碍的发生对手术疗效的影响,并进一步探讨了术前和术后针对暴食障碍的心理和药物干预措施及其效果。

结果 研究表明,寻求减重手术的暴食障碍患者在情绪调节、冲动、抑郁和焦虑方面存在显著问题。尽管如此,术前暴食障碍对术后体重减轻的直接影响较小。术前进行心理干预,如认知行为治疗,对改善术后体重减轻效果有积极影响。术后暴食障碍的发生率增加,并可能导致减重效果下降或体重反弹。术后暴食障碍患者接受短期认知行为治疗可显著改善体重减轻效果、进食障碍的精神病理症状、抑郁症状及自尊。此外,药物干预如托吡酯和益生菌补充在控制术后暴食障碍和改善体重结局方面也

显示出一定的疗效。

结论 尽管术前暴食障碍对术后体重结局影响有限,但术前心理干预仍具有积极意义。术后暴食障碍的管理对于长期减重效果至关重要,综合心理和药物干预可有效控制术后暴食障碍,改善体重结局。

关键词: 暴食障碍,减重手术,认知行为治疗,药物干预

从臧象学说论治神经性贪食

张紫薇* 李德利

沈阳市安宁医院

神经性贪食(bulimia nervosa, BN),又称贪食症,患者紊乱的进食行为,可导致电解质异常、胃肠道疾病、代谢和内分泌紊乱等躯体问题,同时BN也常共病多种精神问题,如抑郁障碍、焦虑障碍、双相情感障碍、物质使用障碍等。

1.神经性贪食表现

中医学中无BN的直接记载,根据其多食、体瘦兼神志障碍的典型特征,将其归属于“百合病”“郁病”“食亦”“中消”等范畴。

BN的行为心理特征有BN主要特征为反复发作难以控制的、冲动性的暴食,继之采取防止增重的不恰当的代偿行为,如禁食、过度运动、诱导呕吐,滥用泻药、利尿剂等,同时伴有情绪波动性大,易产生不良情绪及冲动行为,如愤怒、焦虑不安、抑郁、孤独感、自伤、自杀等行为。

2.机制

中医从臧象学说出发,认为五脏均对BN存在影响,心神接受外界客观事物并作出反应,进行心理、意识和思维活动的器官,人体各项复杂的精神生理活动均是在“心神”主导下,由五脏协作共同完成。肝失疏泄,则魂失所藏,心虚火扰,则神失主宰,脾虚失运,则意失滋养,肺失制节,则魄无所安,肾元亏虚,则志无所依。BN始病于肝脾,因“七情”致病,抑郁伤肝,初则病气,继则及血,中期累及心肺,脾虚气血乏源,末期损肾。

3.治疗

现代医学药物治疗上多选择SSRIs类药物,例如氟西汀、氟伏沙明等药物,有研究表明,曲唑酮、

安非他酮以及部分抗癫痫药也有一定疗效。针对共病精神问题,可根据病情,选用丙戊酸盐、锂盐等药物治疗。

中医治疗根据,肝脾一心肺一肾的病理机制,予以疏肝理气、健脾助运、甘寒清胃、补肺宁心、温补脾肾等综合对症治疗疾病初期,肝为起病之源,胃为传病之所,肝胃郁火,胃腐熟机能亢进,口干口苦、消谷善饥。此阶段应着重于疏肝健脾清胃,中期在初期肝脾胃病变的基础上累及心肺,心神失养,表现为心烦易怒,易激惹,失眠伴多噩梦。在初期调理肝脾胃的基础上滋补心肺,兼顾调理肝脾胃。进展至末期,损肾伤志是必然结果。上下气机闭塞,心肾失交,最终导致肾脏虚衰,表现为怕冷、痛经、腰酸、便溏、记忆力差、性冷淡,甚则耳鸣目眩。此阶段诸脏腑病机杂糅,诸症蜂起,当五脏兼顾,形神同调,以期救大厦之将倾,且清且补。

4.小结

总之,目前大部分神经性贪食未被确诊且未接受专业治疗,某些病情严重的患者甚至会出现厌食症、贪食症交替发作的情况。目前对神经性贪食症的中医研究资料较少中医古籍中又无相应论述故需要更多的中医研究者对其病因病机及辨证分型得出更为准确的认知制定出更准确的中医治则。

关键词:臧象学说,神经性贪食

Exploring Central Traits of Eating Disorders in The Chinese Population: A Comprehensive Network Analysis of A Large Sample

Liyun Zheng¹, Chao Chen², Chuqiao Chen², Jingjing Yang², Jinyan Wu², Xueni Li², Qingmei Kong², Tianmei Si²

1.Department of Psychiatry, Jiangxi Mental Hospital, Affiliated Mental Hospital of Nanchang University

2.Peking University Sixth Hospital, Peking University Institute of Mental Health, NHC Key Laboratory of Mental Health (Peking University), National Clinical Research Center for Mental Disorders (Peking University Sixth Hospital)

Objective The treatment of eating disorders (EDs) is challenging due to their complex causes and

clinical symptoms. Targeting the central traits of EDs could help make treatment more effective. This study aims to use network analysis to examine the central traits of EDs within the Chinese population from different perspectives, contributing to a better understanding of these disorders

Methods Network analysis was applied to data from 1001 patients enrolled in the Eating Disorders Registration Project (ED-RP). Multiple undirected weighted symptom networks were constructed using the subscales of the Eating Disorder Inventory (EDI) as nodes, with the importance of each node assessed through expected influence values

Results Network analysis identified three central nodes: Interoceptive Awareness, Drive for Thinness, and Ineffectiveness, which appeared with high consistency across diagnoses and age groups (both above and below 18 years old). Additionally, a strong correlation between Interoceptive Awareness and Ineffectiveness was found in nearly all network models, indicating a robust connection between these traits

Conclusion This study identifies Interoceptive Awareness, Drive for Thinness, and Ineffectiveness as central traits that are relatively invariant across diagnoses and ages. Further evaluation and targeted intervention for these central traits could be crucial in developing effective therapeutic strategies

关键词: Eating disorders, Central traits, Eating Disorder Inventory, Network analysis

焦虑障碍潜在的炎症相关生物标志物研究进展

卢书怡 刘竞*

首都医科大学附属北京安定医院

目的 焦虑障碍是一种常见的精神障碍,给家庭及社会增加了沉重的疾病负担。目前焦虑障碍的诊断仍依赖于结构性访谈、量表和行为观察等主观方法,亟待探索焦虑障碍潜在的客观生物标志物。

方法 汇总白介素、肿瘤坏死因子(TNF- α)、C反应蛋白(CRP)、中性粒细胞-淋巴细胞比值(NLR)

等炎症指标在焦虑障碍中的研究进展,对文献进行综述。

结果 近年来有关焦虑障碍的炎症神经生理学机制研究明显增加,已有大量文献证实白介素、TNF- α 、CRP、淋巴细胞相关比值等炎症指标与焦虑水平密切相关。尽管确切的分子机制尚不清楚,但已有学者观察到慢性应激性生活事件是导致个体罹患焦虑障碍的重大危险因素之一。应激反应系统是一个复杂的多层次负反馈调节机制,慢性压力事件会激活体内的下丘脑-垂体-肾上腺(HPA)轴,释放肾上腺素、去甲肾上腺素等儿茶酚胺类物质,使交感神经活性增强,肾上腺素能 β_2 受体分别通过NF κ B和ERK信号通路刺激巨噬细胞和单核细胞分泌IL-6、IL-18、IL-1 β 、TNF- α 、CRP等大量细胞因子,产生炎症反应,导致细胞凋亡,促使焦虑样行为的发生。大脑中内侧前额叶皮层(mPFC)和杏仁核、海马广泛相互连接,基于杏仁核环路的神经模型是目前焦虑障碍相关研究中最多的模型之一。中枢炎症细胞因子(包括IL-1 β 、IL-6和TNF- α)会影响调节焦虑或恐惧情绪的结构,通过影响有关大脑区域的活动和连接,从而维持恐惧和焦虑的症状。

结论 目前国内外已对焦虑障碍的生物标志物进行了较多研究,由于外周血相比于其他影像学等评估指标更便宜且易获取,已在躯体疾病的诊断及预后评估中发挥着重要作用,因此有望在焦虑障碍中进行相关研究,探索焦虑障碍的潜在生物标志物。但上述炎症指标如何影响焦虑症状的产生及维持,其具体的神经生理机制尚不清楚,还需要更深入研究来探讨不同生物标志物对焦虑障碍诊断及治疗的价值,以期阐明焦虑障碍的神经机制,为焦虑障碍的预防与干预提供参考依据。

关键词:焦虑障碍 炎症机制 生物标志物

青少年抑郁障碍患者非自杀性自伤行为的影响因素分析及干预策略

郭慧荣* 王佳欣

郑州大学第一附属医院

目的 1、探讨青少年抑郁障碍患者非自杀性自伤行为的发生率、临床特征及影响因素。构建青少年抑郁障碍患者非自杀性自伤风险的临床预测模

型。

2、探讨青少年非自杀性自伤的干预策略。

方法 1、本研究共收集郑州大学第一附属医院精神医学科门诊和住院患者符合DSM-5中抑郁障碍诊断标准的青少年患者462例。依据DSM-5中NSSI的建议诊断标准将患者分为伴NSSI组(n=295)和不伴NSSI组(n=167)。采用问卷和量表收集社会人口学及影响因素资料。通过单因素及多因素Logistic回归分析筛选独立影响因素,在此基础上建立青少年非自杀性自伤风险的临床预测模型。

2、以案例实证法探讨对青少年非自杀性自伤的家庭系统干预策略。

结果 1.青少年抑郁障碍患者NSSI行为的检出率为63.85%,女性多于男性。青少年抑郁障碍患者中最常见的NSSI方式为用刀片、玻璃等划伤皮肤。实施NSSI常见的原因因为发泄自己的情绪、惩罚自己、得到更多的关注和帮助。

2.多因素Logistic回归分析结果显示,女性(OR=10.46, 95%CI 3.91-27.94)、抑郁(OR=1.20, 95%CI 1.13-1.38)、冲动性(OR=1.05, 95%CI 1.01-1.09)、母亲拒绝(OR=1.42, 95%CI 1.20-1.70)、母亲情感温暖(OR=0.77, 95%CI 0.70-0.86)是青少年抑郁障碍患者NSSI行为的独立预测因素。

3.基于多因素回归分析模型构建的青少年抑郁障碍NSSI行为预测模型。该模型的受试者工作特征曲线(ROC)线下面积(AUC)为0.965(95%CI 0.035-0.965),提示该模型可以较好区分伴NSSI和不伴NSSI行为的患者;该模型校准曲线中,基于贝叶斯检验与该模型的实际曲线,均围绕理想曲线上波动,提示预测模型预测NSSI行为风险与实际发生风险一致,具有一定的临床适用性。

结论 1.青少年抑郁障碍患者NSSI行为发病率较高。女性、抑郁情绪、冲动性、母亲拒绝、母亲情感温暖是青少年抑郁障碍患者NSSI行为的独立影响因素。

2.青少年抑郁障碍患者NSSI风险临床预测模型具有较好的区分度、校准度及临床适用性,能够识别高风险人群,可以有效预测NSSI行为的发生,为采取预防性措施提供参考。

3.家庭系统视角综合干预方法对青少年抑郁障碍患者非自杀性自伤行为具有良好的效果,值得推广。

Risk Factors Influencing Cognitive Function in Elderly Patients with Late-Life Depression: A Scoping Review

Li Duan Gang Zhu*

The first affiliated hospital of China Medical University

Objective The purpose of this study is to examine the current state of negative influencing factors and assessment tools for cognitive impairment in patients with Late-life depression (LLD), thereby providing a theoretical framework for the construction of subsequent targeted intervention programs

Methods The search strategy employed in this study followed an evidence-based approach, utilizing a systematic scoping review to thoroughly explore 6 English and 4 Chinese databases up until Nov. 2023. Two researchers independently conducted article screening and employed thematic analysis to categorize the results into themes

Results Following two rounds of rigorous screening conducted by the evidence-based research team, data were meticulously extracted and succinctly summarized from five distinct themes encompassing socio-demographic, physiological, psychological, genetic, and other related factors. Additionally, a comprehensive compilation of 19 diverse assessment tools was undertaken. Ultimately, a total of 22 articles met the eligibility criteria for inclusion in this study. These comprised 5 longitudinal studies, 9 pathological controlled studies, 5 cross-sectional studies, 2 cohort studies, and 1 randomized controlled study

Conclusion The conclusions regarding risk factors associated with cognitive function exhibit some inconsistencies. Among the aforementioned 5 themes, a relatively consistent consensus is observed in social demography, while genetics still holds promising prospects despite ethical constraints. Additionally, the Mini-Mental State Examination (MMSE), as a widely utilized simple screening scale in clinical research as-

sessments, primarily serves to evaluate overall cognitive function scores. Conversely, there remains no consensus on the optimal combination of assessment tools for each specific dimension of cognitive functions in patients with LLD

关键词: late-life depression, cognitive dysfunction, assessment tools, influencing factors, scoping review

Functional Connectivity Alterations Associated with COVID-19-sleep Problems: A Longitudinal Resting-state FMRI Study

Yanhui Liao^{1,2}, Haobo Chen², Ling Li¹, Yunkai Sun¹, Yi Liu^{1,2}, Peng Liu², An Xie²

1.Sir Run Run Shaw Hospital, Zhejiang University School of Medicine

2.The First Affiliated Hospital of Hunan Normal University (Hunan Provincial People's Hospital)

Objective n: Corona Virus Disease 2019 (COVID-19) infection was widespread. Some people had problems like fatigue and sleep disturbance after COVID-19 infection. Nevertheless, brain function changes related to the development of sleep problems (SP) after COVID-19 infection are still unclear. Therefore, this study aimed to investigate the changes in the brain function of the population with SP after COVID-19 infection

Methods In this study, 55 participants who developed SP after COVID-19 (COVID_SP) and 33 participants whose gender, age and years of education matched without SP (COVID_NSP) were recruited. All the participants measured the Pittsburgh Sleep Quality Index (PSQI) and underwent resting-state magnetic resonance imaging (rs-fMRI) at baseline and two months, respectively. The purpose was to explore the abnormalities in brain function between groups and its changes by the use of functional connectivity (FC). Correlations between FC and clinical data were analyzed by Pearson correlation analysis and were corrected by Gaussian Random Field (GRF)

Results At baseline, the COVID_SP group exhibited significantly higher FC from the right precentral gyrus (PrG) to the left lateral occipital cortex (LOcC)/right PrG, the left inferior parietal lobule (IPL) to the right superior frontal gyrus (SFG), and the left hippocampus to the right inferior frontal gyrus (IFG) compared with the COVID_NSP one. Additionally, it was found that the FC from the left hippocampus to the right SFG had a significant positive correlation with PSQI scores. Two months after follow-up, the FC between brain regions associated with emotion regulation, task decision-making, execution, visual processing and memory was shown to be reduced in the SP group. Meanwhile, the FC between brain regions related to semantics, attention control, long-term and spatial memory, as well as auditory-visual processing showed a direct increase. In addition, it was observed that the changes in FC between the right basal ganglia (BG) and right orbital gyrus (OrG) were negatively correlated with those in PSQI scores. Similarly, the changes in FC in certain brain regions, including frontal, temporal, occipital and parietal lobes, were associated with those in scores of Generalized Anxiety Disorder-7 (GAD-7) and Patient Health Questionnaire-9 (PHQ-9) scales. Moreover, an improvement was detected in various symptoms at the 2-month follow-up compared to the baseline

Conclusion This partly explained the changes in the sleep-related brain areas of people with SP after COVID-19. Changes in brain function associated with SP would fade over time

关键词: COVID-19, SP, rs-fMRI, FC

首发未用药广泛性焦虑障碍患者反应抑制及注意偏向研究

杨丽娟*

北京安定医院

目的 比较首发未用药广泛性焦虑障碍患者 (generalized anxiety disorder, GAD) 与健康对照者反应抑制及注意偏向的差异, 探讨反应抑制、注意偏向及临床症状的关系。

方法 选取 2023 年 5 月至 2024 年 6 月在首都医科大学附属北京安定医院门诊就诊的 GAD 患者 40 例, 同期在社区、学校招募年龄、性别、文化程度相匹配的健康志愿者 30 例。使用汉密尔顿焦虑量表 (HAMA)、汉密尔顿抑郁量表 (HAMD) 和广泛性焦虑问卷-7 项 (GAD-7) 进行临床症状评估, 采用停止信号任务、点探测任务分别评估 GAD 和健康对照的反应抑制功能及注意偏向。采用卡方检验、t 检验或 Mann-Whitney U 检验比较 GAD 及健康对照组的一般资料、临床资料及认知功能差异, 用多元线性回归分析探讨焦虑症状的影响因素。

结果 GAD 组和健康对照组在年龄、性别、婚姻状况、受教育年限上等差异无统计学意义 ($P>0.05$)。GAD 组 HAMA、HAMD、GAD-7 总分明显高于健康对照组 ($t=13.29, t=20.98, t=16.63$; 均 $P<0.001$)。GAD 组停止信号反应时、负性图片注意偏向值显著高于健康对照组 ($z=1.67, z=1.90$; 均 $P<0.05$)。No-go 条件正确率显著低于健康对照 ($z=-1.66, P<0.05$)。多元线性回归分析结果显示, 停止信号反应时是焦虑症状的影响因素 ($\beta=0.49, P<0.05$)。

结论 广泛性焦虑障碍患者存在反应抑制功能缺陷及对负性的注意偏向, 反应抑制功能缺陷可能是焦虑症状的影响因素, 值得后续进一步研究。

Comparison Study of Mental Health Status of Adolescent and Youth Students with and without HIV/AIDS after The Lifting of COVID-19 Restrictions in China

Shoukang Zou¹, Xiaozhen Song¹, Cong Wang¹, Hang Zhang¹, Meijiang Jin¹, Maojia Ran¹, Yu Wang¹, Jia Cai¹, Mu Yun-Fei¹, Liyu Chen², Ping Feng², Ying Wang², Yi Huang¹, Li Yin¹, Ran Mao-Sheng¹

1.Mental Health Center, West China Hospital, Sichuan University

2.Department of Infectious Diseases, West China Hospital, Sichuan University

Objective To investigate the mental health status

of adolescent and youth students with HIV/AIDS in Sichuan Province after the lifting of COVID-19 restrictions in China

Methods A comparison study was conducted to compare the mental health status and the influencing factors between adolescent and youth students with HIV/AIDS and those without HIV/AIDS in Sichuan Province after the lifting of the COVID-19 restrictions in China

Results A total of 292 students with HIV/AIDS and 1083 general students matched in R software (matching ratio 1:4) were included in this study. Compared with general students (30.8%, 15.6%, 12.0%), students with HIV/AIDS had significantly higher rates of total mental health problems (56.8%), depression symptoms (32.2%), and anxiety symptoms (24.0%) ($p < 0.05$). Among students with HIV/AIDS, risk factors for mental health problems included poor sleep quality and exposure to school bullying, and protective factors for mental health problems included physical exercise habits and better social support. Among general students, risk factors for mental health problems included infection with COVID-19, poor sleep quality, posttraumatic stress disorders (PTSD) symptoms and school bullying, and social support was a protective factor of mental health problems. Students with HIV/AIDS and general students had different risk factors and protective factors for depression and anxiety symptoms

Conclusion This study revealed that students with HIV/AIDS had significantly poor mental health status than general students without HIV/AIDS, and the influencing factors of mental health problems were different between those two groups. It is crucial to develop specific health policies, mental health services and interventions for students with HIV/AIDS and general students to facilitate social support and physical exercise and improve mental health

Evaluating The Impact of A Two-day Family

Therapy Training on Course Mastery, Trainee Attitude and Therapeutic Competence

Yanhui Liao* Ruihuan Ye

Sir Run Run Shaw Hospital, Zhejiang University School of Medicine

Objective This study aims to evaluate the impact of a two-day family therapy training program on trainees. Then to explore the effectiveness of this training, as well as to explore whether participants' attitudes and self-efficacy toward family therapy are related to demographic characteristics

Methods A total of 127 trainees participated in the training, which included lectures on the application of family therapy in adolescents, real-case demonstrations, and practical exercises. 93 participants completed an evaluation questionnaire measuring their mastery of the training content, attitudes toward family therapy, and self-efficacy at the end of the program. Independent t-tests were used to analyze the differences between trainees with various characteristics, and the paired sample t-tests were used to see trainees' mastery of the course content

Results The analysis of pre- and post-content mastery levels revealed statistically significant improvements across all six content areas. Regarding attitudes toward cognitive-behavioral therapy, there were significant differences among trainees based on gender, prior experience with psychotherapy, and educational level. Also, as the participants' age increased, their attitudes toward family therapy became more positive. Trainees with prior experience in psychotherapy exhibited significantly higher capability and self-efficacy in family therapy compared to those without such experience

Conclusion The results proved the positive effectiveness of the training. Notably, participants with prior relevant experience in psychotherapy scored significantly higher on the family therapy behavior scale, highlighting the critical role of practical experience in mastering therapeutic skills

Effectiveness of Mixed-method Family Psychotherapy Training on Adolescent Emotional and Behavioral Problems for Practitioners

Rongrong Chen Yanhui Liao*
Sir Run Run Shaw Hospital

Background Family psychotherapy for adolescents still needs promotion in China. Therefore, to develop a proper method to teach the essential skills for this therapy, an effective training program is needed

Objective In this article, we developed a mixed-method program to explore the effectiveness of different method of skill training in practitioners of psychology-related industries

Methods We recruited 93 participants including doctors and nurses in psychiatric departments and other practitioners in psychology-related industries into our mixed-method training programs lasting 2 days. A questionnaire concerning the satisfaction and preference on the detailed settings of our program was distributed to all the participants and their options were collected for further analyses

Results Participants' interest for family psychotherapy was generally higher than cognitive-behavioral therapy ($p < 0.05$). For detailed settings of the program, we found higher satisfaction in real-case presenting, case supervision and PPT teaching than others ($p < 0.05$). In the further analyses, we found that gender as well as major contributed different level of satisfaction in the detailed settings of our program, such as case supervision and group practice ($p < 0.05$)

Conclusion Our study showed that there were profound effectiveness in our program. Further analyses also discovered the difference between different genders and majors in preferences of training details. However, due to the limitations of the trial, we weren't able to apply comparisons between before and after the program to support the effects of our program

Changes in Brain Biochemical Metabolites of Cognitive Flexibility Impairment in Non-medicated Obsessive-compulsive Disorder Patients

Yiliang Zhang Yanbin Jia*
First Affiliated Hospital of Jinan University

Objective Impairment of cognitive flexibility can be found in patients with currently severe Obsessive-compulsive disorder(OCD). However, the imaging mechanisms underlying the decline in cognitive flexibility in OCD remain unclear

Methods The study included 30 patients with untreated OCD (OCD group) and 29 healthy controls (HC). The Yale-Brown compulsion scale was used to score the obsessive-compulsive symptoms. Cognitive function was assessed using a full set of MCCB tests. At 3.0 T, the bilateral metabolic ratios of creatine (Cr) in prefrontal cortex (PFC), anterior cingulate cortex (ACC), pyramidal nucleus (LN) and thalamus were measured by 1H-MRS

Results The information processing speed, visual learning and total cognitive function were decreased in the OCD group compared with the normal control group ($p = 0.007, 0.016, < 0.001$). NAA/Cr values in the left ACC, right ACC and right LN in OCD group were higher than those in HC group ($p = 0.003, < 0.001, 0.017$). However, the NAA/Cr value in the left thalamus was lower than that in the HC group ($p = < 0.001, 0.002$)

Conclusion Changes in ACC, left thalamus and right LN are associated with cognitive flexibility impairment in obsessive-compulsive disorder patients

关键词: OCD, cognitive flexibility, MCCB, 1H protons magnetic resonance spectroscopy

中国人群中进食障碍症状的发展及诊断变迁: 一项回顾性研究

张嘉嘉 林哲宇 乔慧芬*
南京医科大学附属脑科医院

目的 进食障碍是一组与进食行为异常相关的精神障碍，临床上往往识别率低、症状复杂多变、病程迁延难愈、致死率高，近年来越发引起关注。许多研究发现进食障碍的诊断稳定性会随着时间的推移而发生变化，但很少有研究在国内开展。因此，本研究旨在通过高质量的回顾性检查来探讨在中国文化背景下进食障碍症状的发展和诊断的变迁特征。

方法 回顾性地分析了在 2018-2024 年间诊断为进食障碍且病程大于 2 年的患者。通过审查门诊病历记录，我们收集了患者的起病年龄、身体质量指数、临床表现等数据以确定纵向的症状发展过程，同时根据《精神障碍诊断与统计手册第五版（DSM-5）》确定诊断的变迁过程。

结果 共有 131 名门诊进食障碍患者被纳入，其平均发病年龄为 18.6 ± 3.9 岁。症状层面上，对体型体重的高估是大部分进食障碍亚型首先出现的认知症状，限制进食是首先出现的行为症状，而超过一半的患者在节食行为后出现暴饮暴食和补偿行为。诊断层面上，初始诊断中最常见的是限制型厌食（36.6%），其次是神经性贪食（26.0%）和暴食/清除型厌食（19.8%），其他特定的喂养或进食障碍（13.0%）和暴食障碍（4.6%）出现频率则较低；大约 48.1% 的患者出现诊断的变迁。其中，常见的是从限制型厌食到暴食/清除型厌食（33.3%）或神经性贪食（27.9%），以及从其他特定的喂养或进食障碍到神经性贪食（26.2%），这些变迁往往在疾病发生后的 2 年内最容易出现，而从与暴饮暴食有关的进食障碍到限制性厌食的诊断交叉则很少见，且与暴饮暴食有关的进食障碍的诊断稳定性相对要高于限制性厌食。

结论 在中国文化背景下，同样观察到进食障碍各个亚型不仅在症状上有所重叠，也常表现出诊断的变迁，这可能代表了一种临床现象的自然发展，进一步支持了 Christopher G. Fairburn 所提出的关于进食障碍的跨诊断理论，有助于我们更好地了解、预防、诊治进食障碍，促进康复和减少复发。

Objective In the post pandemic period of COVID-19, the influence factors of insomnia and the relationship between insomnia severity and mental health in youth are unclear. This study aimed to explore the influence factors and related mental health problems of insomnia in youth students after lifting the COVID-19 restrictions in China

Methods From December 14, 2022 to February 28, 2023, the cross-sectional survey was conducted among young students aged 10-26 in Sichuan, China, and 92.0% (82,873/90,118) of students fully responded. The Insomnia Severity Index (ISI) was used to investigate the prevalence and severity of insomnia. General Health Questionnaire, Patient Health Questionnaire-9, Generalized Anxiety Disorder-7, and PTSD Checklist for DSM-5 were used to assess other psychological

Insomnia in The Post-pandemic Period of

symptoms. Logistic regression analysis was used to explore the influence factors of insomnia and the relationship between insomnia and other mental health symptoms

Results Among 28178 (34.0%) students with insomnia symptoms, 20715 (24.9%) had mild insomnia, 5597 (6.8%) had moderate insomnia, and 1866 (2.3%) had severe insomnia. After China lifting the COVID-19 restrictions, with history of mental disorders (OR [95%CI]=2.20[2.05,2.35]), started drinking during the pandemic(OR [95%CI]=2.01[1.75,2.31]), with neglectful parenting style (OR [95%CI]=1.81[1.70,1.92]) were the top 3 risk factors, while being satisfied with academy (OR [95% CI]=0.38 [0.35, 0.42]) was the most protective factor of insomnia. The prevalence rates and odds ratios (ORs) of the psychological symptoms without insomnia were much lower than the average levels of the surveyed population, and the prevalence rates and ORs increased with the increase of insomnia severity. After adjusting for the confounding effects of demographics and other psychopathologies, depression symptom was most strongly associated with insomnia severity

Conclusion After China lifting the COVID-19 restrictions, the prevalence and severity of insomnia were affected by demographic factors, family status factors, COVID-19 related factors and the lifestyles and behaviors changed by COVID-19. Furthermore, the insomnia severities can also affect other mental health symptoms especially depression symptom. This finding also supports the illness validity of insomnia severity in mental health status. Attention should be paid to students' sleep problems in the post-pandemic period of public health event to improve the long-term mental health. And health policies should be taken to ensure students' sleep duration and improve their sleep quality

关键词: insomnia severity, influence factor, mental health, COVID-19

精神康复协作组

数字技术在精神分裂症康复治疗中的应用进展

王茹 李先宾*

首都医科大学附属北京安定医院

目的 本文旨在探讨数字技术在精神分裂症康复治疗中的应用,并评估其对患者回归社会的促进作用。鉴于精神分裂症是一种慢性致残性疾病,传统的面对面康复治疗方式受限于资源和地域,数字化康复提供了一种可行的替代方案,以扩大服务覆盖面,降低医疗成本,并提高医疗服务的公平性。

方法 通过文献回顾和分析,本文总结了数字化精神康复的主要领域,包括监测和改善治疗依从性、症状识别、社交技能训练、认知功能改善以及家庭干预等。同时,考察了这些技术的应用现状和患者的接受程度。

结果 研究表明,数字化康复技术已被广泛应用于精神分裂症的康复治疗过程中。这些技术不仅提高了患者对治疗的依从性,还有助于更早地识别症状,从而及时调整治疗方案。此外,通过社交技能训练和认知功能改善,患者的社会功能得到了显著提升。家庭干预模块则增强了家庭成员的支持能力,为患者创造了更加有利的康复环境。多数患者对于数字化康复持积极态度,认为它为自己提供了更多的康复机会。

结论 数字技术在精神分裂症康复治疗中的应用显示出巨大的潜力和积极的效果。它不仅扩大了康复服务的可及性,还降低了成本,促进了医疗服务的公平性。未来研究应进一步探索数字化康复技术的优化和应用,以便为精神分裂症患者提供更加个性化和有效的康复治疗方案。

阿尔茨海默症发病原因与发病机制的探讨

孙作东*

黑龙江省亚欧脑科学研究院

目的 阿尔茨海默病(AD),自1906年首次报告发现结果至今,已有一百多年,其真正发病原因及发病机制的研究,并无显著进展和明确答案。本文就是在这样背景下的一个基于脑细胞激活论的启发性观点,是应用细胞的物理生物学原理在分子水平对散发性AD发病原因及发病机制的探讨,其目的是协调统一已有AD病因学说,解决长期以来困扰神经元退行性变疾病研究领域源头问题。

方法 1.论述与已有假说的关系: A β 假说、tau假说、PS假说、ApoE假说、胆碱能假说、炎症假说、金属离子代谢紊乱假说; 2.论证:生物物理学证明、医学病理学证明、生物学模型证明; 3.解释:离子通道与血脑屏障、钾离子与钾通道、离子泵与癫痫与癌症、A β 蛋白与斑点和斑块、有关AD解决方案。

结果 1.A β 不是AD致病原因,而是AD后期事件; 2.引起膜电位巨大改变的K⁺浓度差0.00001%是有效浓度,不可以忽略不计; 3.钾通道异常受损,钠离子提前进入胞内占钾位,与癫痫与癌症与HeLa细胞有关; 4.AD是物理病,治疗应首选物理手段,尤其是经颅磁电刺激技术,能够精准激活异常神经元而不干扰正常神经元。

结论 1.基本内容:过量阳离子从细胞外转入细胞内,在细胞膜内表面与钾离子产生竞争性占位,并因此消减膜电位,使所产生的动作电位无法正常激活钙离子通道,最终导致脑细胞异常凋亡。淀粉样斑点是脑细胞异常凋亡后的遗骸,淀粉样斑块是淀粉样斑点之间通过范德华力、静电吸引力聚集而成,间质为淀粉样蛋白。脑细胞依次包含神经元、小胶质细胞、星形胶质细胞,其遗骸形成斑点的核多为阳离子。2.解决方案:本文核心观点可视为探讨散发性AD病因学说,是脑细胞激活论姊妹篇,脑细胞激活论是对AD等神经元退行性变疾病治疗方法与治疗机理的阐释,适用于脑病又不局限于脑病,解决AD方案应从预防与治疗二方面入手,预防的外因在环境,尤其是重金属离子,内因则是身体酸碱度;治疗应首选物理手段,尤其是经颅磁电刺激技术。

关键词: 精神康复;阿尔茨海默;病因学说;淀粉样斑块;细胞遗骸;物理手段

连续 θ 爆发式经颅磁刺激治疗孤独症谱系障碍儿童临床疗效与安全性研究

崔舒¹ 刘寰忠^{2,3} 周晓琴³ 张凯^{2,3}

1.阜阳市第三人民医院

2.安徽医科大学附属巢湖医院

3.安徽医科大学精神卫生与心理科学学院

目的 观察连续 θ 爆发式经颅磁刺激(continuous theta burst transcranial magnetic stimulation, cTBS)治疗孤独症谱系障碍(Autism spectrum disorder, ASD)儿童的治疗效果、安全性和可行性。

方法 选取符合美国精神障碍诊断与统计手册第5版(DSM-5)中ASD诊断标准的46例汉族儿童,其中23例分配至cTBS组,另外23例保持既往常规治疗不变。其中cTBS组患儿接受为期3周,每周5天,一共60次的cTBS治疗。cTBS刺激靶点为左侧大脑半球背外侧前额叶皮层(DLPFC)和左侧大脑半球初级运动皮质(M1)。试验流程是先刺激左侧大脑半球的M1和DLPFC靶点,间隔半小时后重复刺激左侧大脑半球的M1和DLPFC靶点。分别在基线时、治疗1、2、3周末、治疗后1、2月使用父母填写的孤独症儿童行为检查量表(ABC)和克氏孤独症行为量表(CABS)对ASD患儿的临床症状进行评估,并比较2组结果。每次治疗结束时由儿童和家长共同报告不良事件,儿童报告在cTBS治疗过程中感受到的疼痛强度。

结果 38例ASD儿童和家长最终完成了所有的治疗和评估,其中cTBS组和常规治疗组各19例。患儿的平均年龄为(6.11 \pm 1.62)岁,其中29人(76.3%)为男性。常规治疗组中,患儿治疗前后ABC量表和CABS量表得分无统计学差异。cTBS组患儿经过3周治疗后,ABC量表和CABS量表得分较治疗前降低20.63分(降幅为23%)和3.6分(降幅为19%),治疗前后分值差异有统计学意义($P < 0.05$)。随访结束时(治疗后2月),ABC量表和CABS量表得分较基线时降低17.84分(降幅为20%)和约2.06分(降幅为10%),和基线间的差异有统计学意义($P < 0.05$)。23名接受cTBS治疗患儿中,有3例患儿报告治疗时治疗部位的疼痛,1例患儿家长报告治疗后患儿多动,均无需特殊治疗。

结论 本探索性试验证明了在ASD患儿大脑左侧半球的DLPFC和M1位点实施3周的cTBS治疗的安全性和短期疗效。本研究初步说明cTBS

治疗可短期改善 ASD 症状,并未出现严重不良反应。

工作行为教育与训练应用于职业康复的研究进展

朱彤 李先宾*

首都医科大学附属北京安定医院

2022年6月17日国家卫生健康委新闻发布会指出,截至2021年年底,全国登记在册的重性精神障碍患者高达660万人。大多精神障碍患者患病后无法回归社会,承担工作,无论给家庭还是社会都造成了很高的疾病负担。研究发现精神障碍患者大多希望回到工作岗位,在我国近80%精神残疾人有康复需求,是各类别残疾中比例最高的,拥有一份“职业”不仅能帮助个体获得生活来源,提高生活质量,还能提供潜在的利益,包括社会身份和地位,建立社会联系和支持,让时间结构化,分配工作和生活的时间,更能建立自我认同感,实现自我价值,从而减少精神症状,而失业可能会导致早亡在内等多种躯体及自杀等心理健康问题的增加。但精神障碍患者手脚健全,却遭受着比肢体残缺者更大的就业歧视,哪怕是社会福利相对完善的香港,仅有20.3%的精神疾病患者被雇佣,在美国也仅有17.8%。

为了精神疾病患者更好的回归社会,工作行为教育与训练技术应运而生,内容包括6个技能领域:与工作相关的社交技能、认知训练、问题解决技能、基本职业技能、求职技能、保职技能,旨在帮助精神障碍患者提高工作能力,从而回归社会。该康复技术在我院开展且工作例数逐年增加,2021年开展11964人次、2022年开展53967人次,2023年开展67751人次,患者辅助就业率提高44%,帮助大量的精神疾病患者部分减轻或消除症状所致精神残疾的作用,提高患者的职业功能和社会功能,促进其融入社会。

关键词:工作行为教育与训练;职业康复

青少年非自杀性自伤的心理康复干预进展

余鸽 徐方忠* 汤路瀚

浙江省立同德医院

目的 本文对青少年非自杀性自伤行为(NSSI)的相关心理康复干预的国内外研究现状进行综述,为该行为的进一步临床综合性干预管理提供参考。

方法 综述相关文献,对青少年非自杀性自伤行为(NSSI)的相关心理康复干预进行多角度阐述。非自杀性自伤行为(NSSI)是指不以自杀为目的的,直接的、故意的损伤自己身体组织,而且不被社会和文化所认可的行为。青少年NSSI的发生率居高不下,美国青少年流行病学调查报告($n=61\ 767$),NSSI年检出率约为7.3%,比例逐年上升,已成为重要的公共卫生问题,部分青少年自伤成瘾,对其身心健康管理不利。国内外相关学者对该行为的流行病学调查,成因和功能性,相关影响因素及神经生物学机制等做了初步研究,但没有得出统一结论。该行为可能与心理因素相关,但诱发机制尚不明确,病情迁延,治疗具有困难性。当前,对于青少年NSSI的干预大多以药物或住院治疗精神症状为主,也有一些物理治疗如电休克、经颅磁刺激等,但成效不足。近年来生物-社会-心理模式为大家所熟知,对NSSI的患者来说,关系是很重要的一环,因此加入心理康复干预和患者建立关系能增强治疗效果,尤其帮助青少年患者重建和父母之间的关系。从大量研究来看,心理康复干预可能是该行为的有效治疗方式,除了传统心理康复干预之外,辩证行为治疗(DBT)和心智化治疗作为新技术也在青少年群体的研究中被证实有效。此外,“互联网+”DBT的干预模式能有效降低青少年NSSI患者的自杀意念,提高对情绪控制水平,缓解抑郁状态,改善患者生活质量和社会功能。

结果 国内对非自杀性自伤的心理康复干预目前尚无统一指南或结论,对青少年群体的干预也鲜有所见。在该行为的治疗上,从生物-社会-心理模式来看,心理康复干预成为有效的干预方式,但国内起步尚晚。

结论 建议在国家层面开展针对青少年NSSI综合心理康复干预。精神专科医院设立专职干预团队,对学校教育者、患者父母、非精神专科医务人员等从父母教养方式、早期干预、健康讲座、学校危机干预等全面开展综合性干预,关口前移,作为未来

研究的方向。

关键词：非自杀性自伤,心理康复,DBT,互联网+

节奏听觉刺激(RAS)在帕金森步态训练中的应用个案报道

丁琳*

首都医科大学附属北京安定医院

目的 观察节奏听觉刺激对帕金森患者步态功能训练改善的作用

方法 音乐治疗方法 采用 RAS 方法进行一对一治疗。共 2 周 6 次,每周 3 次,每次 20 分钟。根据患者行走的速度,治疗师以 4/4 拍子的歌曲加入到平常的行走训练中,用节奏听觉刺激方法增强大脑对运动反应计划和实施,促进患者步行能力的提高。第一次治疗,先用节拍器配合患者的行走速度,然后治疗师用吉他伴奏,使用节拍器的所测的速度,演唱歌曲《东方红》,作为节奏指示信号来促进患者的行走节奏。要求患者听着和唱着音乐进行行走练习。行走 10 分钟后,休息 2 分钟,反复 3 次。治疗后,用节拍器再次测量患者的行走速度,作为下一次治疗的基础速度。第二次治疗,使用第一次最后的速度,演唱歌曲《东方红》,用吉他伴奏,反复两遍。在第一次治疗最后速度的基础上,提高 2%,使用节拍器,并用吉他伴奏,演唱歌曲《东方红》,让患者跟随音乐边唱边走,行走 10 分钟后,休息 2 分钟,反复 3 次。治疗后,用节拍器再次测量患者的行走速度,作为下一次治疗的基础速度。第三次治疗,使用第二次最后的速度,演唱歌曲《东方红》,用吉他伴奏,反复两遍。在第二次治疗最后速度的基础上,提高 2%,使用节拍器,并用吉他伴奏,演唱歌曲《东方红》,让患者跟随音乐边唱边走,行走 10 分钟后,休息 2 分钟,反复 3 次。治疗后,用节拍器再次测量患者的行走速度,作为下一次治疗的基础速度。第四次治疗,使用第三次最后的速度,演唱歌曲《东方红》,用吉他伴奏,反复两遍。在第三次治疗最后速度的基础上,提高 2%,使用节拍器,并用吉他伴奏,演唱歌曲《东方红》,让患者跟随音乐边唱边走,行走 10 分钟后,休息 2 分钟,反复 3 次。治疗后,用节拍器再次测量患者的行走速度,作为下一次治疗的基础速度。第五次治疗,使用第四

次最后的速度,演唱歌曲《东方红》,用吉他伴奏,反复两遍。在第四次治疗最后速度的基础上,提高 2%,使用节拍器,演唱歌曲《东方红》,让患者跟随音乐边唱边走的同时,治疗师又给出新的指令,治疗师手拿铃鼓,让患者每迈一步,用反侧手去敲响治疗师手中的铃鼓,来锻炼患者的身体协调能力,行走 10 分钟后,休息 2 分钟,反复 3 次。治疗后,用节拍器再次测量患者的行走速度,作为下一次治疗的基础速度。第六次治疗,使用第五次最后的速度,演唱歌曲《东方红》,用吉他伴奏,反复两遍。在第五次治疗最后速度的基础上,提高 2%,以此类推用节拍器再次测量患者的行走速度,作为下一次治疗的基础速度

结果 患者治疗前后步态明显改善,自主活动能力加强,生活满意度提高

结论 节奏听觉刺激训练,把运动和音乐相结合,为患者提供安全的,具有目标的,有组织的治疗活动,它有利于身体动能性的康复

关键词:帕金森症、节奏听觉刺激(RAS)、音乐治疗、步态

多家庭干预在精神分裂症中应用的研究进展

宋琨¹ 王聪² 李先宾²

1.北京市朝阳区第三医院

2.首都医科大学附属北京安定医院

精神分裂症是一种严重的慢性致残性疾病,以认知障碍、精神病性症状、情感障碍和意志活动障碍等为主要临床表现,患者常有复发率高、社会功能损害、较易共病情绪障碍等特点,给个人、家庭和社会带来的负担远超高血压、糖尿病等慢性疾病。目前精神分裂症的发病机制未明,治疗上仍以药物治疗为主,但是药物治疗主要减轻阳性症状,对阴性症状的治疗效果和患者功能的改善并不理想。研究中发现家庭作为精神分裂症患者生活的载体,家庭的功能、成员之间的关系以及患者的生活环境与疾病的发生、发展及预后都息息相关,当家庭某一成员突然被诊断为精神分裂症,一方面,由于家属和患者对疾病的无知,难以处理疾病治疗的相关问题,另一方面,家属和患者可能产生病耻感,表现自责、过度的自我牺牲、焦虑抑郁等负面情绪。而指

责、过度干预等高情感表达(High Expressed Emotion, HEE)的家庭氛围、不良的家庭关系及互动也会影响患者疾病康复和家庭良性发展。对家庭成员和(或)患者进行专业性指导,通过更多学习疾病相关知识,增加对疾病科学认识及应对,同时提供心理教育、情绪处理、支持系统建立、问题解决方法等干预措施可以帮助家庭恢复功能,积极和恰当的介入更有助于患者疾病的治疗及康复。大量研究证实多家庭干预(Multiple Family Therapy, MFT)可以改善阴性症状,提高服药依从性,改善社会功能,因此,本文对MFT在精神分裂症治疗中的研究进行简要梳理和探讨,以期为精神分裂症患者提供更多的循证证据。

精神科护士对严重精神障碍患者参与共享决策的认知与态度的质性研究

韩燕 徐彬*

淮安市第三人民医院

目的 为深入剖析精神科护士对严重精神障碍患者参与共享决策的理解与看法,本研究旨在通过实证调查,揭示护士群体的认知与态度,从而为精神科护理实践中共享决策的推进提供有力支持。

方法 本研究为质性研究,采用目的抽样法,于2024年4月-5月对淮安市精神卫生中心12名临床一线的护士进行半结构式访谈,采用Colaizzi的7步分析法对访谈资料进行分析。

结果 共提炼出3个主题:对严重精神障碍患者参与共享决策的认知(普遍认可患者参与共享决策的重要性、护士在共享决策中承担着多重且关键角色、影响护士参与共享决策的因素);对严重精神障碍患者参与共享决策的态度(支持态度、中立态度、反对态度);实行严重精神障碍患者共享决策现存的不足与建议(现存不足、相关建议)。

结论 本研究结果表明,精神科护士普遍认同严重精神障碍患者参与共享决策的重要性。但实践中的诸多挑战,导致共享决策的普及与护士的参与积极性受到了一定程度的限制。因此,我们建议医疗机构应建立健全风险评估机制,强化护患间的沟

通,提升护士的专业素养和沟通技巧,并制定明确的决策流程和参与机制。同时,政府和社会各界也应给予更多关注和支持,通过立法保障和政策引导,共同推动共享决策在严重精神障碍患者中的实施与发展。

精神科护理中人文关怀的应用价值与有效性评价

陈慧琴*

丽水市第二人民医院

目的 研究精神科护理中人文关怀的应用价值与有效性的评价。

方法 对照组患者使用常规护理:注意患者的饮食健康,根据医嘱调整相关所需的营养元素;注意患者的卫生情况,对患者的心理健康多多关注,鼓励患者树立治疗信心并参与院内或家里自行组建的集体活动,获得集体参与感。

研究组在常规护理的基础上融入了更多的人文关怀元素,具体措施如下:①医护人员培训。全面培训科室护士,对其基础医疗知识及人文关怀理念尤其注重培养,对医护人员强调在护理中应当具有的良好心态及服务态度,创造出温馨的人文护理氛围,使得患者获得充分的情感满足[5]。另外,设立专项小组进行护理质量检查,考核结果与绩效挂钩,确保每位成员恪尽职责。②对氛围环境进行符合患者心理的改造。为提升患者的治疗疗效,打造优美温馨的居住环境:根据患者喜好添加花卉、植物装饰;早晚播放让人身心愉悦的轻音乐,以舒缓患者的情绪。③注重病患的安全保障。排查可能威胁患者和医护人员的有害物品,必要的时候可以使用专业的仪器或者专业人员进行帮助。④建立医患沟通的桥梁。初来乍到的患者及家庭进行友好细心的陪同并讲解医院设施环境,减轻他们对医院的焦虑和恐惧。在面对面的接触中始终保持让患者舒适的良好距离,以确保患者的隐私权和个人尊严;当患者持有困惑的时候对其进行耐心的解释,以提升患者对医院的信任度。⑤医疗教育普及化。对患者本人及家属详细的阐述该病情、危害以及后续治疗方针。

对患者的困惑进行耐心的解答并对患者自身问题更进一步的抱有理解态度,提高患者对病情的理解程度[5]。讲解医疗方案的可行性和对病情的针对性,加强患者对其治疗的配合度。医院定期开展治疗讲座,公众号发布精神科疾病讲解,解答患者及家属的疑惑并加深其医疗知识,让患者更深入的了解医护人员的工作增加其满意度。⑥情感护理服务。部分病患可能长期积累精神压力对周围一切事物抱有抗拒心理,所以医护人员需要与患者展开友好积极的沟通,向其展现病例治疗成功的案例,增强患者的治疗信心。在患者的治疗过程中,家属的陪伴至关重要,所以医护人员要积极的与家属进行沟通,引起他们对患者身体、心理情况的关心,增强其对患者内心需求的注重度。

结果 两组患者焦虑自评表比较、两组患者抑郁自评表比较

护理前, 研究组评分与对照组相仿, 护理后却明显低于对照组 ($P < 0.05$)。

两组患者配合度比较

研究组的配合度显著高于对照组 ($P < 0.05$)。

两组患者满意度比较

研究组的满意度显著高于对照组 ($P < 0.05$)。

结论 综上所述, 精神科护理中人文关怀的应用能有效缓解患者焦虑忧郁的情绪、增强其对治疗的信心使其配合度提高, 提升患者对治疗和医护人员的满意度。

一例颅内压升高引起的精神障碍的诊疗

陆永艺 王雅琴* 韦秋媛 岑俊翰

中国人民解放军联勤保障部队第 923 医院

目的 探讨一例脑器质性病变精神障碍患者的康复过程

方法 我院 2023 年 12 月 9 日收治的一例脑器质性病变所致精神障碍。患者, 男性, 于 3 个多月前无明显诱因下出现言行异常, 表现为在日常生活中不遵守规章制度, 家人与其联系时脾气暴躁, 与人交流明显减少。不参加集体活动, 闭眼重复说话, 自言自语, 反应迟钝, 生活懒散。行为怪异, 有时长

时间发呆, 走路拐弯时拐直角弯。在寝室时喜欢关窗拉上窗帘, 同事打开窗, 患者会生气, 甚至双方发生肢体冲突但患者也不沟通交流, 饮食、睡眠正常。6 天前患者病情加重, 表现为对周围事物无反应, 完全不言语, 拒食, 自行上厕所。12 月 9 日送至我院治疗。2023 年 12 月 6 日武警贵州总队医院头颅 CT: 脑萎缩征象。肌酸激酶 849.2U/L。2023-12-08 九二三医院贵港医疗区: 双侧额叶白质异常信号。入院后完善腰椎穿刺术, 脑脊液病原学: 生化: 腺苷脱氨酶 1U/L, 氯(脑脊液)126mmol/L, 葡萄糖(脑脊液)3.90mmol/L, 蛋白(脑脊液)251mg/l。脑脊液常规: 颜色无色, 透明度清晰透明, 凝集现象无凝块, 潘氏试验阴性阴性, 红细胞计数 1/mm³, 白细胞计数 1/mm³; 测量颅内压:210mmH₂O。

结果 经过使用甘露醇降低颅内压, 舒必利抗精神症状后患者能自主进行日常生活, 并与他人进行有效沟通

结论 通过使用甘露醇降低颅内压合并使用抗精神病药物治疗, 可以有效缓解精神障碍。

关键词: 亚木僵状态, 颅内压升高

抑郁青少年边缘人格特征、情绪调节与非自杀性自伤的关系

徐丹*

沈阳市精神卫生中心

目的 在当今社会, 青少年的心理健康问题日益凸显, 其中非自杀性自伤(Non-Suicidal Self-Injury, NSSI) 现象尤为值得关注。据估计, 全球青少年群体中有 10%至 30%的人曾有过至少一次的 NSSI 经历, 且这一比例在近年来呈现出上升趋势。NSSI 被认为是边缘人格特征的潜在表现, 这与边缘型人格障碍(Borderline Personality Disorder, BPD) 的核心特点——强烈的情绪反应和不稳定的情绪调节能力相吻合。本研究深入探索抑郁青少年中边缘人格特征、情绪调节与非自杀性自伤(NSSI) 的密切关联, 为理解 NSSI 的发生机制和制定有效的预防策略提供了坚实的实证依据。

方法 招募 186 名门诊及住院病人 12-18 岁被专业医生诊断为抑郁症的青少年, 所有青少年完成结构化问卷包括自残功能评估量表、儿童青少年情

绪调节量表和儿童边缘人格特征量表,确保数据的可靠性和有效性。

结果 本研究通过严谨的量化方法,探索了抑郁青少年中边缘人格特征、情绪调节与非自杀性自伤(NSSI)之间的关系。研究发现,近七成的抑郁青少年在过去一年中经历过 NSSI,且以割伤或抓伤最为常见。进一步的分析揭示了 NSSI 与边缘人格特征之间存在显著负相关,与情绪调节能力呈正相关,特别是与情绪表达抑制维度的关系更为紧密。值得注意的是,认知再评价这一情绪调节策略与 NSSI 无显著关联。此外,研究还发现边缘人格特征总体上与 NSSI 发生率正相关。

结论 边缘型人格特征和情绪调节能力与抑郁青少年 NSSI 显著相关。边缘型人格障碍的症状不仅直接影响 NSSI 青少年抑郁症的风险,也可通过情绪调节间接影响 NSSI 风险。这一发现强调了在青少年抑郁治疗中,不仅要关注个体的抑郁症状,还需重视边缘人格特征的识别和情绪调节技能的提升,以降低 NSSI 的风险。这为临床实践提供了新的干预策略,即通过情绪调节策略,可能有助于控制 NSSI 的行为。

关键词:抑郁青少年,边缘人格特征,情绪调节,非自杀性自伤

慢性重精优化治疗科患者长期住院的质性研究

秦珊*

成都市第四人民医院

目的 探讨慢性重精优化治疗科患者发长期住院原因的研究。

方法 选取成都市第四人民医院慢性重精优化治疗科长期住院的 11 名患者采用面对面半结构化访谈收集资料,访谈过程全程录音。访谈内容包括“是否想早日出院?”“为什么长期住院”“家人为什么不早日接你出院”等问题。访谈时,研究者灵活提问,及时追问与澄清,并通过聚焦访谈来丰富范畴的属性、面向。访谈后,研究者立刻撰写访谈笔记,尽快将录音转为 word 字稿。最终 11 名慢性重精优化治疗科患者接受了 13 次访谈(其中,2 名患者接受了两次访谈)采取三级编码,不断比较方法及

撰写备忘录的策略分析资料。

结果 慢性重精优化治疗科长期住院的患者主要是家里父母年迈或者去世,无人照料他们,子女工作忙,无法顾及他们,家人对病员发病的恐惧与失望,病员社会功能退化,害怕病员出院没有按时吃药或者病情复发给家人、社会增加安全隐患。

结论 建议病员能坚持服药,控制病情,与病员家属沟通,做好精神病患者病情好转的普及工作,能够早日将病员接出院,病员有病情变化应该立即寻找医生调整药物,加强患者社会功能锻炼,病员住院的时候做好住院健康宣教,出院的时候做好出院健康宣教,使患者能够更好的配合治疗,控制病情,减少病情复发的几率,减少患者的住院时间,提高患者的生活质量与满意度。

接纳承诺疗法联合暴露反应预防干预强迫症

杨红 胡茂荣*

南昌大学第一附属医院

目的 报道 1 例强迫症患者通过接纳承诺疗法(ACT)联合暴露和反应预防(ERP)的应用对其强迫症状、负性情绪及心理社会功能的心理治疗过程。

方法 2023 年 7 月招募江西省南昌大学第一附属医院心身医学科门诊强迫症患者小强为研究对象,在常规药物治疗的基础上开展线下 12 次集中短程接纳承诺疗法联合暴露和反应预防干预。通过访谈了解人口学信息与患者强迫起源,根据强迫症症状分类量表(OCI-R)对其强迫行为与强迫思维侧重程度制定治疗方案有针对性的干预,使用正念呼吸、认知解离、价值澄清、接纳行动、想象与现实暴露、反应阻止等技术,结合面谈与家庭作业方式联动实施治疗。采用耶鲁布朗强迫症量表(Y-BOCS)比较干预前后强迫症状改善程度;采用贝克焦虑量表(BAI)和贝克抑郁量表第 2 版(BDI-II)比较干预前后负性情绪变化程度;采用接纳与行动问卷第二版(AAQ-II)与认知融合分问卷(CFQ-F)比较干预前后心理社会功能变化情况。

结果 干预前后耶鲁布朗强迫症量表评分分别 8 分与 10 分、贝克焦虑量表评分分别 19 分与 11 分、贝克抑郁量表评分分别 15 分与 9 分、接纳与行动问

卷第二版评分分别 46 分与 35 分、认知融合分问卷评分分别 61 分与 46 分。

结论 ACT 结合 ERP 干预方案可增强认知水平高的强迫症患者对强迫思维和强迫行为以及治疗原理的理解,有效改善负性情绪以减轻症状困扰程度,且能改善心理社会功能,提高心理弹性水平促进积极应对,提高生活质量。

关键词: 接纳承诺疗法;暴露和反应预防;强迫症;认知融合

Exploring Chess As A Tool in Decision-Making and Psychiatry Research

Uludag Kadir* kadir uludag

shanghai jiao tong university mental health center

Objective Chess data is used in the fields of psychology, sociology, biology, mathematics, programming, psychiatry, and decision-making. The application of chess in decision-making lacks clarity, and there is currently no established framework that provides guidance on utilizing chess for decision-making purposes. Chess literature delves into diverse facets of the game, exploring certain demographic factors (e.g., age and gender) that contribute to chess expertise, the influence of technology in analyzing and learning the game comprehensively, and its potential cognitive benefits.

Our goal of the manuscript is to find an association between chess moves and complex behavioral factors.

Methods We have examined potential parameters for chess and their application in behavioral research. Additionally, we have incorporated the Python chess package into the discussion. Stockfish chess analysis was used to calculate accuracy of chess moves.

Results We found that chess accuracy is related to cognitive scale scores.

Conclusion In conclusion, chess data can be used in behavioral research. Chess engines and technology related to chess analysis can help us to understand complex human behavior.

Suggestions for Further Studies:

Additional research can establish a connection between genetic variability and the game of chess.

Limitations:

Stockfish parameters may differ according to certain Stockfish parameters. Tiebreaks during tournaments may be one of the confounding factors. Internet speed is also one of the main confounding factors in this study as it may affect success in blitz and bullet chess.

关键词: chess, psychiatry, decision making, chess psychology

精神科应用中医护理技术存在的安全隐患及防范措施

王菲 金鑫* 邵荣华 孙维双 陈沛 郭雨萌 杨杨
首都医科大学附属北京安定医院

目的 中医治疗精神疾病有悠久的历史及丰富的临床经验,对于改善精神疾病患者的治疗效果、减少西药治疗的副作用都大有裨益。但由于精神疾患的特殊性,患者的自知力和对治疗的配合度相对较差,对中医治疗的安全实施提出了较大挑战,风险防范要求高。因此我们通过分析可能存在安全隐患的因素,提出相应的护理安全防范措施,进一步完善精神科中医护理规范。

方法 分别从对患者的安全评估、护理人员职业素养、病房管理以及其他相关因素,对精神科病房实施中医护理存在的安全隐患进行分析,有针对性的完善护理操作流程,制定相应护理制度,从而有效排除中医护理操作中的安全隐患,降低精神科病房中由于中医护理引发安全风险,提高科室护理安全质量。

结果 精神科病房在实施中医护理操作技术前、中、后均有一定安全隐患,在护理实施过程中,加强各方面管理监督,能得到有效防范。

结论 在精神科开展中医技术存在的护理安全隐患较多,排除中医护理技术实施过程中的不安全因素,加强中医护理安全管理,提高精神科病房护理质量和水平,是精神科工作需要关注的重点问题。在临床工作中通过完善工作制度和技术操作规范流程,提高护理人员自身职业素养,提高患者认知水平等,能有效确保中医护理技术在精神科安全实施。

关键词: 精神科, 中医护理, 安全隐患, 防范措施

Alpha 个体峰值频率测评在 TMS 治疗精神疾病中的应用

曾玲芸* 翟伟光 祝欣缘 叶梦欣
深圳市康宁医院

目的 探索 alpha 个体峰值频率(individual Alpha frequency, IAF)脑电图测评技术[1, 2]在经颅磁刺激(transcranial magnetic stimulation, TMS)治疗精神疾病中的应用价值。

方法 以“Alpha”、“TMS”、“transcranial magnetic stimulation”为搜索关键词, 在 PubMed 上检索对 Alpha 节律引导 TMS 治疗的相关文献 8 项(截至 2024 年 3 月), 进行研究文献系统综述和荟萃分析。

结果 脑电波测评中 Alpha 波段在人类脑电波中占据主导地位, 代表丘脑皮质内源性振荡, 与各种认知领域有关[1]。研究发现首发精神障碍患者的精神障碍与异常的人体内源性神经振荡相关[2]。精神分裂症 IAF 较健康人异常降低, 较慢的 IAF 可预测视觉注意力等认知缺陷[3]。

研究发现 TMS 可通过外在刺激产生对 Alpha 振荡的干扰, 重置重度抑郁症(MDD)患者的不正常的 Alpha 振荡[4]。内源振荡共振的程度和外在刺激的节律是耦合的, 取决于外在刺激的振幅和频率, 刺激越接近内源性频率, 共振越强, 神经可塑性越强。个体 IAF 是一种差异度高且稳定的神经节律[5], 根据 IAF 设定 TMS 频率, 从时间分辨率的角度提高 TMS 频率精度, 疗效可能优于固定刺激频率。

在该荟萃分析中, MDD 采用 IAF 进行 TMS 治疗研究发现依据 IAF 进行治疗的真刺激组的抑郁严重程度降低显著大于伪刺激组, 且对药物反应不佳或不耐受史的患者改善更明显[6,7,8]。另一项抑郁症 TMS 干预中真刺激组前额叶及顶正中的 Alpha 电流源密度发生的变化与症状变化显著正相关。另外两项研究采用 TMS-EEG 闭环的调控形式[9,10], 均以 IAF 为治疗频率, 被随机分配到与额叶 Alpha 节律同步组或不同步组中, 数周治疗后 IAF 同步组患者出现强烈的夹带效应, 且夹带效应会移至前扣带回皮层。关于强迫症的研究中[11], 真伪刺激组采用刺

激频率为 IAF, 刺激靶点为双侧背外侧前额叶, 治疗 1 周后两组患者的强迫症和 HAMA 评分存在显著差异。关于精神分裂症的研究[12], 真刺激组以 IAF 为治疗频率, 靶点为双侧额叶和双侧顶叶, 以 IAF 为刺激频率的治疗, 患者的阳性和一般精神病症状明显改善。此外, 以上研究患者均未出现严重不良事件。

结论 测评 IAF 作为 TMS 定频的精准治疗, 应用到抑郁症、精神分裂症、强迫症的 TMS 治疗效果优于固定刺激频率; 可能机制与 IAF 节律下 TMS 产生的外源性与内源振荡共振节律相耦合, 频率越接近, 共振越强。

儿童青少年注意缺陷多动韦氏智力测试结果分析

张伟*
河南省儿童医院郑州儿童医院

目的 本研究主要目的是分析河南省儿童医院儿童保健科的注意缺陷与多动障碍(ADHD)儿童的韦氏儿童智力测试结果。

方法 本研究采用回溯性研究方法, 选择 2014 年 10 月至 2022 年 9 月在河南省儿童医院儿童保健科就诊, 同时完成韦氏智力测试的注意缺陷多动障碍儿童, 采用韦克斯勒儿童力量表(WISC-IV)进行的智力测试评估, 采用描述性分析方法对测试结果进行统计分析。

结果 本研究通过描述性统计分析的结果显示, 注意缺陷与多动障碍儿童中男性患儿多于女性患儿, 统计结果显示: 男: 女=5.68:1; 韦氏儿童智力的总智商的平均分为 87.04 ± 14.46 , 这个结果位于总智商平均分以下水平; 研究结果中不同年龄阶段及性别之间注意缺陷与多动障碍儿童, 并且在认知效率指数和工作记忆指数等认知功能方面, 差异有统计学意义(p 均 < 0.05)。

结论 本研究得出的结论是注意缺陷与多动障碍儿童之间存在性别差异, 注意缺陷与多动障碍儿童的智力水平及其认知功能的存在不同程度的损伤, 这个结果需要引起各位专家及家长的高度重视, 同

时希望各位家长能够早发现、早诊断并给予相应干预措施, 尽早治疗, 使 ADHD 患儿症状能够得到明显的改善和康复。

双相障碍抑郁相患者肠道菌群多样性和结构研究

张丞 邹韶红*

新疆维吾尔自治区人民医院

目的 探索双相障碍(BD)抑郁相患者肠道菌群的多样性和结构, 经喹硫平治疗对肠道菌群的变化与临床参数的相关性。

方法 筛选 2021 年 1 月至 2022 年 12 月我院接受治疗的 40 例双相障碍抑郁相患者和 40 例健康者。入选患者使用蒙哥马利-艾森伯格抑郁量表(MADRS)、17 项汉密尔顿抑郁量表(HAMD)评估患者抑郁程度, 杨氏躁狂量表(YMRS)评估躁狂程度。入选者粪便样本于就诊当日上午 10 点前收集, 经喹硫平治疗后 4 周后再次收集患者粪便样本。采用宏基因组测序技术方法分析 BD 抑郁相患者喹硫平治疗前后的肠道菌群与健康者的差异性, 评估肠道菌群的变化与临床参数的相关性, 分析肠道菌群评估 BD 抑郁相诊断和疗效的临床价值。

结果 观察组患者肠道菌群多样性在 Fisher 水平上小于对照组 ($P < 0.05$), 在 Shannon 水平大于对照组 ($P < 0.05$)。Alpha-多样性的 Simpson 指数与发病次数呈负相关 ($r = -0.643, P < 0.05$); Shannon 指数与发病次数也呈负相关 ($r = -0.475, P < 0.05$), 而 α -多样性与发病年龄、HAMD 评分、YMRS 评分及 MADRS 评分无相关性 ($P > 0.05$)。根据 Lefse 方法, 观察组在厚壁菌门、梭杆菌门、放线菌门、螺旋体门、互养菌门、双歧杆菌科、毛螺菌科、梭菌科、双歧杆菌属、肠道核心菌属、巨球形菌属、链球菌属、大肠杆菌属、梭菌属的相对丰度均高于对照组 ($P < 0.05$); 而在拟杆菌门、拟杆菌科、拟杆菌属、克雷伯杆菌属均较低于对照组 ($P < 0.05$)。观察组患者肠道菌群相对丰度与 HCL33 总分呈负相关 ($r = -0.621, P < 0.05$)。观察组患者肠道菌群相对丰度与 HAMD 总分呈负相关 ($r = -0.432, P < 0.05$)。

结论 BD 抑郁相患者较正常健康者的肠道菌

群多样性和结构上发生明显不同, 肠道菌群有助于评估 BD 抑郁相患者的疗效, 具有较高的临床价值。

阿立哌唑与利培酮联合氯氮平治疗难治性精神分裂症的临床效果评价

张丞¹ 姜峰²

1.新疆维吾尔自治区人民医院

2.石河子绿洲医院

目的 探讨阿立哌唑与利培酮联合氯氮平治疗难治性精神分裂症的临床效果。

方法 从本院于 2022 年 1 月至 2024 年 1 月间收治的难治性精神分裂症患者中, 随机抽选 110 例进行研究, 应用随机数字表法, 分为实验组与对照组, 对照组给予利培酮联合氯氮平治疗, 实验组给予阿立哌唑联合氯氮平治疗, 两组各 55 例, 比较两组临床效果。

结果 在糖脂代谢指标方面, 治疗后, 实验组的 FBC(5.52 ± 0.31)mmol/L、TC(4.31 ± 0.34)mmol/L、TG(1.51 ± 0.14)mmol/L 均低于对照组 ($P < 0.05$)。在 PANSS 评分方面, 治疗后, 实验组的阳性症状得分(9.42 ± 1.02)分、阴性症状得分(15.36 ± 2.25)分、一般精神病理量表评分(11.16 ± 0.73)分、总分(35.16 ± 3.57)分均低于对照组 ($P < 0.05$)。在炎症因子方面, 治疗后, 实验组的 IL-13(0.72 ± 0.18)pg/ml 高于对照组, 实验组的 TNF- α (7.81 ± 1.08)pg/ml 低于对照组 ($P < 0.05$)。在不良反应情况方面, 实验组总发生率 3.63%, 对照组总发生率 30.91%, 实验组的不良反应发生率明显低于对照组 ($P < 0.05$)。在治疗效果方面, 实验组总有效率 96.36%, 对照组总有效率 74.54%, 实验组的治疗有效率明显高于对照组 ($P < 0.05$)。

结论 在难治性精神分裂症的治疗中, 采用阿立哌唑联合氯氮平治疗, 其效果显著, 能改善患者的糖脂代谢指标与炎症因子, 减少不良反应的同时, 改善其症状表现, 值得临床推广和使用。

关键词: 阿立哌唑; 利培酮; 氯氮平; 难治性精神分裂症; 临床效果

Evaluation of Bidirectional Relationships Between Alcohol Misuse and Bipolar Disorder: A 2-Sample Mendelian Randomization Study

Cheng Zhang Manna Hu Pengli Chen Chengji Wang Xiaqin Shen Rui Ma Xiaoxiao Tang Ruonan Liu Shaohong Zou*

People's Hospital of Xinjiang Uygur Autonomous Region

Objective Increasing evidence shows that alcohol misuse is associated with bipolar disorder. However, the causality and direction of this association are not clear; Therefore, we used Mendelian randomization (MR) to examine bidirectional relationships between alcohol misuse and mood disorder

Methods Genome-wide association studies summary data of risk preference in 151067 participants from UK Biobank and 23andMe were used to identify general risk preference. Data from 413466 samples from The Psychiatric Genomics Consortium were used to identify bipolar disorder (BP). The weighted median, the inverse variance weighted, and the Mendelian randomization-Egger methods were conducted for the MR analysis to estimate a causal effect and detect the directional pleiotropy

Results GWAS summary data were respectively from two combined samples, containing 151067 and 413466 sample sizes of European adult participants. Mendelian randomization evidence suggested that BP raised alcohol misuse ($P < 0.05$). In contrast, there was no reliable results to describe the relationship of alcohol misuse on BP ($P > 0.05$)

Conclusion Using large-scale GWAS data, robust evidence supports a causal relationship about BP on alcohol misuse, but no relationship about alcohol misuse on BP has been found. This study provides new ideas for the treatment and prognosis of BP patients, and more research is still needed with regard to the association about alcohol misuse on BP

关键词: alcohol misuse; bipolar disorder; Mendelian Randomization Study

浅论中医五音疗法在精神疾病中的临床应用价值

朱琦玥 宋学勤*
郑州大学第一附属医院

目的 探讨《黄帝内经》中五音疗法思想及其在精神疾病中的临床应用价值。

方法 基于 CiteSpace 6.1.R3 软件对现代文献知识图谱进行可视化分析的结果,通过查阅古代医典古籍,从《黄帝内经》提出的五行-五脏-五音-七情的关系探讨五音疗法在精神疾病治疗中的机制,分析总结五音疗法思想及其在精神疾病中的临床应用价值。

结果 1.CiteSpace 分析显示“五音疗法”在关键词突现分析示频次排名第一。2.药的祖先是音乐,音乐产生之初是为了治病,仓颉造字的药【藥】字是从乐【樂】字而来。3.《黄帝内经》强调阴阳平衡、五脏相因、情志相胜、三因制宜。五脏与精神活动密切相关,心主神明,脾藏意,肺藏魄,肾藏志,肝藏魂,胆主决断,灵机在脑,七情可对五脏产生影响。在精神疾病临床应用中,五音疗法主要根据脏腑之气的差异,运用五音(宫、商、角、徵、羽)调和搭配一个辨证鲜明的治疗方案,尤其通过古琴,因其与天地相应的特殊形制及散音、按音、泛音与自然音律相和的独特频率,可调节五脏十二经及大脑电生理信号,进而改善抑郁障碍、广泛性焦虑障碍、惊恐发作、睡眠障碍、认知功能障碍、肥胖、躯体不适等,达到身心灵的疗愈,臻达“乐与人和”、“天人合一”的境界。

结论 百病生于气而止于音,中医五音疗法历史悠久,其基于中医整体观念对生理与精神心理可起到双向调节作用,通过古琴五音疗法对精神疾病有着良好的应用前景。

优质护理服务在精神科护理管理工作中的应用价值分析

王辉*

大连市第七人民医院

目的 目的 探讨分析优质护理服务在精神科护理管理工作中的应用价值,从而为优质护理服务的开展提供科学依据。

方法 方法 选取2016年7月至2019年10月由我院收治的126例住院精神科患者进行研究,将其采用随机数字表法分为对照组和研究组,各63例。对照组患者给予常规护理干预措施,研究组患者则给予优质护理干预措施。比较两组患者对护理服务的满意度、患者对健康知识的掌握情况、护理不良事件发生情况及患者治疗效果。

结果 结果 研究组患者对护理人员工作能力、沟通能力、服务态度、信任度及病区管理情况的满意度相比对照组均显著升高,护理意外事件和投诉事件发生率相比对照组均显著降低,其对疾病健康知识掌握优良率相比对照组明显升高,且1个月后患者治疗总有效率相比对照组也明显升高,比较差异均存在统计学意义($P<0.05$),护理后研究组生活质量及睡眠质量与对照组相比较好,比较具有统计学意义($P<0.05$)。

结论 结论 在精神科护理管理工作中对患者采取优质护理干预模式能有效提高护理服务质量,进而提高患者对护理服务的满意度,减少护理不良事件的发生,还有利于增加患者对疾病的了解,从而提高患者的治疗效果,其临床应用价值较高,值得推广。

优质护理干预对老年广泛性焦虑症患者的效果及 HAMA 评分的影响

王雪茹*

新疆维吾尔自治区人民医院

目的 利用优质护理模式对老年广泛性焦虑症患者进行干预,探讨其疗效作用及对患者 HAMA 评分的影响。

方法 选择 100 位广泛性焦虑症患者,年龄在

62-86 岁之间,经过随机分组,形成观察组和对照组各 50 人,两组对比没有统计学差异。其中对照组按常规护理进行,观察组则接受优质护理干预。

结果 通过评估两组患者护理前后的睡眠质量,入睡时间,睡眠时间,睡眠效率,睡眠障碍,催眠药物使用情况和日间功能障碍等方面,发现观察组在护理后的各项指标上都显示出显著优于对照组,且统计性差异有意义。同时,观察组患者的焦虑(SAS)和抑郁(SDS)评分护理后明显低于对照组,差异显著($P<0.007$)。观察组在生活质量各方面的得分也明显高于对照组,包括生理功能,躯体疼痛,社会功能,情感职能,精神健康,总体健康,生命活力和心理健

结论 观察组患者在接受优质护理干预后,其社会功能、生命活力及精神健康的评分改善最为显著。优质护理干预能显著改善广泛性焦虑症老年患者的病情,提高其生活质量,改善其睡眠质量,缩短入睡时间,提高睡眠效率,减轻睡眠障碍,并且能显著降低患者的焦虑和抑郁评分。优质护理干预对老年广泛性焦虑症患者具有重要的临床意义。

关键词: 优质护理干预,广泛性焦虑症,老年患者,HAMA 评分,生活质量

有氧运动对青少年抑郁症患者临床症状、快感缺失及自我效能感的影响——一项预试验研究

李妲 范宏振 刘琳*

北京回龙观医院

目的 目前有充分的证据表明体育锻炼能够辅助治疗抑郁症,近年来研究体育锻炼对青少年抑郁症影响的研究越来越多,但是数量有限,特别是针对临床诊断的青少年抑郁症患者需要进行更多的研究。本研究探究 4 周有氧运动辅助干预对青少年抑郁症的临床症状、快感缺失和自我效能感的影响。

方法 纳入北京某精神专科医院 2023 年 4-12 月收治的 23 名青少年抑郁症患者(年龄为 15.0 ± 1.6 年;性别为男性 5 人,女性 17 人),在常规药物治疗的基础上进行 4 周、4 次/周、30min/次的中等强度有氧运动。使用汉密尔顿抑郁量表(HAMD-17)进行临床症状评价,快感缺失量表(DARS)进行快

感缺失评价,一般自我效能感量表(GSES)进行自我效能感评价;使用配对t检验进行数据分析。

结果 汉密尔顿抑郁量表总分治疗前后(治疗前 27.8 ± 5.0 vs 7.1 ± 3.4)差异有统计学意义($p < 0.05$),患者治疗后抑郁症状改善;快感缺失量表总分治疗前后(治疗前 47.5 ± 14.3 vs 49.7 ± 14.7)差异无统计学意义($p > 0.05$),在各分维度上治疗前后均无统计学意义($p > 0.05$);一般自我效能感量表总分治疗前后(治疗前 11.2 ± 4.4 vs 14.4 ± 6.9)差异有统计学意义($p < 0.05$),患者治疗后自我效能感提高。

结论 有氧运动辅助常规药物治疗能有效改善患者的抑郁症状和提高自我效能感。

关键词: 青少年抑郁症;有氧运动;快感缺失;自我效能感

脑血管病所致精神障碍患者发生代谢综合征的相关危险因素分析

顾锐¹ 汪子琪¹ 蔡清艳¹ 何雅丽²

1.成都市第四人民医院

2.都江堰市第三人民医院

目的 探讨脑血管病所致精神障碍患者诱发代谢综合征的危险因素。

方法 选取四川某精神专科医院2023年7月-2024年4月住院治疗的68例诊断脑血管病所致精神障碍患者,根据是否存在代谢综合征将其分为脑血管病所致精神障碍伴代谢综合征组56人、脑血管病所致精神障碍不伴代谢综合征组12人,通过分析、Logistics回归分析等统计学方法比较两组之间临床资料以及生化指标的差异与联系。另参考精神分裂症患者代谢综合征管理的中国专家共识,将68例脑血管病所致精神障碍患者进一步分为高风险人群12人、临界人群46人、代谢综合征人群10人,比较三组之间临床资料以及生化指标的异同。结合两次分组比较的结果探讨脑血管病所致精神障碍患者诱发代谢综合征的危险因素。所有数据采用SPSS25.0软件进行统计学分析。

结果 脑血管病所致精神障碍伴代谢综合征组与脑血管病所致精神障碍不伴代谢综合征组在身体质量指数、甘油三酯、高密度脂蛋白水平间差异有统计学意义($P < 0.05$),而性别、年龄、病程、抽

烟、饮酒、合并躯体疾病、空腹血糖水平两组间差异无统计学意义($P > 0.05$)。脑血管病所致精神障碍患者是否会伴发代谢综合征与身体质量指数、甘油三酯水平呈正相关($P < 0.05$),与高密度脂蛋白水平呈负相关。将高风险人群组、临界人群组、代谢综合征组进行三组间ANCOVA分析,结果显示三组人群在身体质量指数及高密度脂蛋白指标上存在组间差异,进行事后分析两两比较。结果显示,高风险人群、临界人群、代谢综合征人群的BMI分别存在差异且具有统计学意义($P < 0.05$, Bonferroni校正)。与高风险人群相比,临界人群、代谢综合征人群的高密度脂蛋白存在差异且具有统计学意义($P < 0.05$, Bonferroni校正)。

结论 身体质量指数、甘油三酯的升高可能是脑血管病所致精神障碍患者发生代谢综合征的危险因素,而高密度脂蛋白的降低可能导致高风险人群发展成真正的代谢综合征人群。

关于将康复融入青少年情感障碍诊治的几点建议

来建波*

浙江大学医学院附属第一医院

目的 青少年是罹患情感障碍的高发人群,相当比例患者社会功能显著损害。本文旨在探讨将康复理念融入青少年情感障碍诊治的必要性,优化综合诊治策略,提升治疗效果,促进患者的全面康复。

方法 本文采用文献回顾与临床实践经验相结合的方法,以青少年情感障碍患者为研究对象,结合精神康复的原则和方法,充分讨论了将康复融入青少年情感障碍诊治的可行性和必要性。

结果 作者提出将康复理念融入青少年情感障碍诊治的以下几点建议

(1) 青少年情感障碍常导致休学、辍学,如何减少失学、促进复学以及学业的持续发展是精神康复临床和研究领域需要重点关注的困境;

(2) 精神康复指导下的青少年情感障碍诊治,将促进形成医患同盟和合作关系,促进家人及其他照料者的共同参与,以便提供持续、可及、协调的精

神康复服务:

(3) 青少年情感障碍群体是实践去机构化康复的适宜群体, 在学校、社区、家庭等环境中促进全面整合(物理、社交和心理层面), 并通过改善学习环境、人际关系、家庭关系等全面提高生活质量;

(4) 融合康复诊断(准备状态、功能、资源、认知)与临床诊断, 开展全面的、个性化评估, 以指导技能培养、资源获取和环境优化, 最终制定以患者为中心、康复为导向的综合治疗方案;

(5) 青少年情感障碍康复实践鼓励患者参与与自我管理, 形成“医疗支持、自我支持、同伴支持、家庭支持”多维支持网络, 并对康复过程持续监测评估, 动态调整康复目标, 确保治疗的针对性和有效性。

结论 将康复理念融入青少年情感障碍的诊治过程, 或许是应对当前该群体疾病负担日趋沉重的必要途径, 有助于优化诊疗策略, 以促进痊愈、回归社会并提升生活质量。

Continuous Theta Burst Stimulation Inhibits Oxidative Stress-induced Inflammation and Autophagy in Hippocampal Neurons by Activating Glutathione Synthesis Pathway, Improving Cognitive Impairment in Sleep-deprived Mice

Rui Ma* Yi Zhang

People's Hospital of Xinjiang Uygur Autonomous Region

Objective Sleep deprivation (SD) has been reported to have a negative impact on cognitive function. Continuous theta burst stimulation (cTBS) shows certain effects in improving sleep and neurological diseases, and its molecular or cellular role in SD-induced cognition impairment still need further exploration

Methods In this study, C57BL/6 mice were subjected to 48 hours of SD and cTBS treatment. Data from morris water maze test showed that cTBS treatment significantly improved SD-triggered impairment of spatial learning and memory abilities in mice

Results Then, through using commercial kits, we found that cTBS reduced malondialdehyde (MDA) levels, increased superoxide dismutase (SOD) activities, and inhibited production of inflammatory cytokines, alleviating oxidative stress and inflammation levels in hippocampal tissues of SD model mice. As shown by western blot assay and immunofluorescence staining, cTBS decreased LC3II/LC3I ratio, Beclin1 protein levels, and LC3B puncta intensity, and elevated p62 protein levels to suppress excessive autophagy in hippocampal tissues of SD-stimulated mice. Through an in vitro cellular model for oxidative stress, we proved that inhibiting oxidative stress alleviated inflammation, autophagy and death of neuron cells. Notably, cTBS treatment increased glutathione (GSH) levels, the nuclear levels of nuclear factor erythroid 2-related factor 2 (Nrf2) and the mRNA expression levels of GSH synthesis-related genes in hippocampal tissues of SD mice. The functional recovery experiments suggested that Nrf2 inhibitor ML385 or GSH synthesis inhibitor BSO reversed the alleviating effects of cTBS treatment on oxidative stress, inflammation and autophagy of hippocampal tissues and cognitive impairment in SD model mice

Conclusion Altogether, our study demonstrated that cTBS mitigates oxidative stress-associated inflammation and autophagy through activating the Nrf2/GSH pathway, improving cognitive impairment in SD mice

关键词: continuous theta burst stimulation, oxidative stress, cognitive impairment, glutathione

家庭心理干预对酒依赖患者复饮率的影响

古丽巴努·阿不都外力*

新疆维吾尔自治区人民医院

目的 探讨心理治疗与家庭干预对酒依赖患者复饮率的影响。

方法 选取 2021 年 5 月-2023 年 5 月我院收治的 30 例酒依赖患者作为观察对象, 随机分为对照组和观察组, 每组 15 例。对照组男性 10 例, 女性 5 例, 年龄 30-40 岁, 平均年龄 (35.67±2.27) 岁; 观察组男性 9 例, 女性 6 例, 年龄 30-40 岁, 平均年

龄(35.66±2.18)岁。对照组给予药物治疗,观察组在对照组的基础上给予心理治疗和家庭干预,随访6个月,比较两组患者的复饮率。

结果 心理治疗和家庭干预对酒依赖患者的生活质量产生积极影响。通过帮助患者建立戒酒目标、改善自我管理技能和情感应对能力,这些治疗方法有助于患者更好地适应戒酒生活。家庭干预可以帮助患者和他们的亲人建立更健康的沟通和支持模式,这不仅对患者的生活质量有积极影响,还有助于减少家庭内部的紧张和冲突,改善整个家庭的幸福感。干预6个月后,观察组的复饮率明显低于对照组($P < 0.05$);观察组患者的不良情绪明显低于对照组($P < 0.05$);观察组患者的生活质量明显高于对照组($P < 0.05$)。

结论 对酒依赖患者在药物治疗的基础上行心理治疗及家庭干预,通过处理心理问题、提高戒酒决心以及提供稳定的家庭支持,能够明显降低患者的复饮率,改善患者的不良情绪,提高患者的生活质量,值得临床推广应用。

关键词: 酒依赖,家庭干预,心理治疗,复饮率

个性化护理在抑郁症护理中的应用效果

古丽巴努·阿不都外力*

新疆维吾尔自治区人民医院

目的 探究个性化护理在抑郁症护理中的应用效果。

方法 选择2019年1月~2023年1月在我院就诊的40例抑郁症患者作为研究对象,用随机数字表法分为对照组20例,实验组20例。对照组接受常规护理,实验组则采用个性化护理,比较两组患者的焦虑抑郁评分、生活质量以及护理满意度。

结果 护理前两组患者负性情绪评分差异不明显($P > 0.05$),护理后两组的HAMA及HAMD评分相较本组护理前有所降低,实验组显著低于对照组,比较有统计学意义($P < 0.05$);护理前两组患者四项生活质量评分差异不明显($P > 0.05$),护理后两组的生理功能、躯体健康、情感职能、社会功能评分相较本组护理前有所提高,实验组的四项评分均显著高于对照组($P < 0.05$);实验组患者对护理工作的满意程度显著高于对照组,差异有统计学意义($P < 0.05$)。

结论 通过关注患者的独特性、提供个性化的心理支持、改善生活质量和提高治疗满意度,个性化护理有助于提高抑郁症患者的康复率和生活质量。个性化护理不仅能够减轻症状,还有助于改善患者的心理健康和整体幸福感。同时还可以提升患者对医院护理工作的满意程度,增加患者对医院的忠诚度,值得推广。

基于语音指标的抑郁症病情监测研究

徐晨阳 石川*

北京大学第六医院

目的 随着人工智能的发展,自动语音检测技术因其便捷无创的优点,在抑郁症的识别中得到了越来越广泛的应用。研究表明,声学客观指标如韵律特征、频谱特征等能够有效区分抑郁患者及健康被试。既往研究多为横断面研究,而抑郁障碍是不断动态变化的,治疗期间对病情的监测具有重要意义,而目前关于声学指标在治疗中随抑郁症严重程度变化的纵向研究尚较缺乏。本研究将使用人机交互中产生的语音数据,在纵向研究中探究相关声学指标是否能够反映治疗早期抑郁病情的变化,以为自动化病情监测提供依据。

方法 对明确诊断的抑郁障碍患者,进行为期8周的真实世界观察性研究。使用我们研发的人机交互症状访谈平台,在基线及治疗8周时,由电脑自动采集患者人机交互过程中产生的语音数据。同时使用汉密尔顿抑郁量表(HAMD-17)对基线及治疗8周时的抑郁严重程度进行评分。提取88个声学指标,并对其进行夏皮洛-威尔克(S-W)检验,发现部分声学指标数据不符合正态分布,故采用配对样本Wilcoxon符号秩检验比较治疗前后声学指标的变化。采用配对t检验比较治疗前后的HAMD-17得分差异。

结果 纳入54例明确诊断的抑郁障碍患者,其中男性13人,女性41人,平均年龄32.83岁($SD=11.80$),治疗前HAMD-17平均得分为20.28分($SD=4.77$),治疗后HAMD-17平均得分为8.56分($SD=6.67$),配对t检验提示,治疗前后HAMD-17得分差异显著($P < 0.01$)。Wilcoxon检验结果发

现共有 16 个声学指标在治疗前后差异显著 ($P < 0.05$), 包括 F0, F1, F3, MFCC 等各项指标。

结论 本研究通过纵向随访发现, 声学指标能够有效反映治疗前后抑郁病情严重程度的变化。这表明声学指标有望成为新的客观生物标记物, 在治疗中提供无创、便捷、远程的病情监测。

循证护理服务模式对焦虑伴湿疹皮炎患者疾病认知及并发症的影响分析

米日古丽·麦休克*

新疆维吾尔自治区人民医院

目的 研究循证护理 (EBN) 模式对湿疹皮炎患者疾病认知及并发症的影响。

方法 抽取 2021 年 3 月~2024 年 03 月本院收治的 30 例湿疹皮炎患者, 运用数字分组法分作研究组 (常规治疗+循证护理) 和对照组 (常规治疗), 研究组 15 例, 年龄 11-78 (48.16±4.28) 岁; 对照组 15 例, 年龄 10-78 (48.14±4.24) 岁, 分析护理价值。常规治疗: 曲安奈德酸乙酯尿素乳膏用药, 由安徽先求药业股份有限公司制造, 仅限局部外敷。使用前须彻底清洁疾患部位, 然后用力揉搓 60 秒, 后取合适数量乳膏均匀敷于患处, 日复一日, 每日两遍。在夜间使用时, 要用安全的薄塑料膜紧裹已涂药的区域。研究组实施 EBN 模式: 包括认知行为治疗: 构筑信赖与指导之基、认知调整、行动矫治、家庭情感支持; 实施优质心理护理: 加强与患者的交流, 及时了解其心理情绪变化, 并根据患者的个性特点提供个性化的心理指导。给予优质皮肤护理, 维护皮肤的湿润, 同时防止使用如碱性肥皂、沐浴露、洗涤剂等产品对皮肤造成损伤。如果有皮肤受到损伤, 选择使用温和的清洁剂来清洁, 选择舒适且轻便的衣物, 防止因衣物摩擦而导致疾病恶化; 防止瘙痒和皮肤过度曝光, 如果出现渗出或者肿大的皮疹, 使用硼酸溶液来进行湿敷。实施饮食护, 根据患者的饮食偏好, 制定出科学且适当的营养配餐方案, 以低盐低脂的饮食为主, 避免吸烟和喝酒, 不吃有刺激和高脂肪的食品; 实施优质健康教育。每天循证组对护士的临床护理任务进行两次审查, 记

录下护理过程中遇到的问题并做出总结。每天举行一次会议讨论, 并对方案进行适当的修改。

1.3 观察指标及评价标准

结果 研究组并发症发生率低, $P < 0.05$; 护理后, 研究组焦虑抑郁评分更低, $P < 0.05$; 护理后, 研究组疾病认知水平明显高, $P < 0.05$; 护理后, 研究组自我管理能力强, $P < 0.05$ 。

结论 在湿疹皮炎患者的医疗护理过程中采取 EBN 模式, 可降低并发症发生率, 改善其焦虑抑郁评分、疾病认知水平和自我管理能力强, 预后良好, 建议推广。

关键词: 循证护理, 焦虑, 湿疹皮炎, 疾病认知, 并发症

PERMA 模式下的心理护理在青少年抑郁症患者中的应用价值及 SAS、SDS 评分影响分析

肖伊诺*

新疆维吾尔自治区人民医院

目的 评价对青少年抑郁症患者进行 PERMA 模式下的心理护理的应用效果。

方法 选取 2022 年 12 月到 2024 年 3 月青少年抑郁症患者 200 例, 分为两组, 对照组患者 100 例, 平均年龄 (15.46±3.57) 岁, 观察组患者 100 例, 平均年龄 (15.52±3.06) 岁。纳入患者年龄 < 18 岁, 经过临床确诊为抑郁症。对照组进行常规护理, 观察组进行 PERMA 模式下的心理护理, 具体方法包括积极情绪培养 (Positive Emotion)、投入与参与 (Engagement)、人际关系建立 (Relationships)、意义与目的寻找 (Meaning)、成就与目标实现 (Achievement)。对比组间患者的焦虑抑郁变化情况、生活质量、心理干预效果和护理满意度。统计学结果由 SPSS26.0 统计学软件统计完成, 若组间数据对比结果差异显著 $P < 0.05$, 则具有统计学意义。

结果 通过对青少年抑郁症患者进行 PERMA 模式下的心理护理, 结果表明, 观察组患者的焦虑抑郁情况轻于对照组 ($P < 0.05$), 生活质量, 心理干预效果和护理满意度优于对照组 ($P < 0.05$)。

结论 通过对青少年抑郁症患者进行 PERMA 模式下的心理护理, 能改善患者的焦虑抑郁水平和

心理状况,提高生活质量和治疗依从性。

丙泊酚联合依托咪酯对无抽搐电休克治疗后不良反应的影响

罗德亮*

西安市精神卫生中心

目的 探讨丙泊酚联合依托咪酯对精神障碍患者行无抽搐电休克治疗后不良反应的影响。

方法 回顾性分析西安市精神卫生中心近两年所有行无抽搐电休克治疗的精神障碍患者不良反应发生情况,2022年(丙泊酚组)所有患者无抽搐电休克治疗静脉麻醉药物选择单独使用丙泊酚,2023年(丙泊酚+依托咪酯组)所有患者无抽搐电休克治疗静脉麻醉药物选择丙泊酚联合依托咪酯,所有行无抽搐电休克治疗的患者均在全程标准化流程下进行,密切观察两组治疗后不良反应的发生情况。结合两年不良反应发生情况进行对比分析,为电休克治疗患者选择个体化麻醉用药方案。

结果 2022年全年共行无抽搐电休克治疗23156人次,不良反应发生5084人次,不良反应发生率21.96%。2023年全年共行无抽搐电休克治疗28916人次,不良反应发生3496人次,不良反应发生率12.09%。两年间不良反应发生次数从高到低依次为血压变化、心动过速、兴奋躁动、呼吸恢复时间延长、呼吸道分泌物过多、恶心呕吐、头晕头痛、记忆障碍。丙泊酚+依托咪酯组不良反应的发生率均低于丙泊酚组($P<0.05$)。

结论 丙泊酚联合依托咪酯全身麻醉有助于降低精神障碍患者无抽搐电休克治疗的不良反应的发生率。

关键词:无抽搐电休克治疗 丙泊酚 依托咪酯 不良反应

小红章奖励对精神科患者行为矫正护理干预效果的应用研究

秦珊*

成都市第四人民医院

目的 探讨小红章奖励对精神科患者行为矫正护理干预效果的应用,并观察其临床效果

方法 选取在我院2018年7月-2020年6月所住院的精神科患者以随机数字表法分成对照组与观察组。其中选取2018年7月~2019年6月的60名精神科患者为对照组,给予常规护理与药物治疗;再选取2019年7月~2020年6月的60名精神科患者为观察组,在对照组模式基础上给予小红章奖励(每一个病员发一张行为矫正记录单,内容为:按时起床/睡觉,整理床铺柜子,吸烟管理,洗澡洗漱,个人整洁,进食,服药治疗,每完成一项给病员奖励一个小红章,每一周更换一次。病员安排在定时吸烟、打电话、买东西的基础上,还要根据所集的小红章数量来满足其要求。通过小红章激励机制,病员能更好的配合治疗,遵守医院的规章制度,完成个人卫生护理及生活护理)。对观察组与对照组精神科患者的干预效果进行观察与统计。

结果 相较于常规治疗与护理的对照组,观察组精神科患者IPROS(康复疗效)各维度评分明显下降。

结论 绝大多数精神疾病患者绝被家属送入病房接受封闭式住院治疗,而长时间处于封闭的治疗环境,社会功能出现退化,病员的心理也会发生改变,因此行为矫正康复训练对病人十分重要,而小红章的激励对行为矫正的病员起到促进作用,使病人能够恢复正常的生活能力与社会适应能力,提高患者的生活质量,为早日回归社会做好准备。

关键词:小红章奖励,精神科患者,行为矫正护理

行为激活技术在女性抑郁症患者心理护理康复中的应用研究

戴尊孝* 张普过 刘凯 刘涛

西安市精神卫生中心, 山阳圣泉康复医院

目的 探究在女性抑郁症病人心理护理康复中应用行为激活技术的临床效果。

方法 随机选取精神专科医院2021年6月1日至2022年12月30日在妇女心理卫生科住院的成

人抑郁症患者,诊断符合 DSM-5 中抑郁症的诊断标准与排除标准而且 HAMD>17 分的 64 例患者,分为对照组与研究组各 32 例,两组间年龄、文化程度相匹配。对照组的病人给予抗抑郁药治疗,应用 SSRI 类 5 朵金花中的任意一种,常规剂量用药,常规日常护理,研究组的患者在对照组方法的同时实施行为激活技术进行心理护理,评定选用 ADL、HAMD、SDSS,观察护理康复靶目标,统计分析应用统计软件为 SPSS statistics26 版本。

结果 64 例中 4 例脱落,60 例患者完成观察。在心理护理康复中实施行为激活技术干预后 5 个靶目标(医护患关系,不良事件,人际关系,社会适应性,治疗依从性)中,研究组与对照组有显著性的统计学差异($P<0.01$);研究组 HAMD、CGI 和 ADL 以及 SDSS 评分与对照组差异同样具有统计学意义($P<0.05$)

结论 在女性抑郁症患者的心理护理康复中实施行为激活技术,不但能改善患者的抑郁等症状,而且还能改善患者的功能损害,助力提高治疗效果,还使得护理康复靶目标依从性更好,不良事件发生更少,人际关系更协调,社会适应性更强,医护患关系更好,为女性抑郁症患者的心理护理康复模式提供了参考依据和实证研究数据。值得推广应用。

关键词: 行为激活技术;抑郁症;心理护理康复;评定量表

正念疗法对伴有非自杀性自伤青少年抑郁症的疗效

陈鹏莉*

新疆维吾尔自治区人民医院

目的 分析正念认知疗法对伴有非自杀性自伤青少年抑郁症患者认知功能,心理状态的影响。

方法 选取 2020 年 1 月至 2022 年 12 月在我院临床心理科门诊及住院诊治伴有非自杀性自伤青少年抑郁症患者 108 例,根据随机表法分为 2 组,对照组给予口服丙戊酸镁缓释片+盐酸舍曲林的疗法,研究组在对照组的基础上联合正念认知疗法。记录并比较两组在治疗前后的汉密尔顿抑郁量表(HAMD)、五因素正念问卷(FFMQ)、症状自评量表(SCL-90)、认知功能缺陷自评量表(PDQ-D-20)

及每日平均抗抑郁药物剂、疗效分析情况。结果 两组治疗前 HAMD 评分比较,无统计学意义($P>0.05$)。治疗 3 个月后,两组 HAMD 评分均降低,且研究组的 HAMD 评分、平均抗抑郁药物剂量均低于对照组($P<0.05$)。两组治疗前 FFMQ 评分中观察、描述、觉知地行动、不判断、不反应的 5 个因子及总分比较,无统计学意义($P>0.05$)。治疗 3 个月后,两组 FFMQ 评分 5 个因子及总分均提高,且研究组的 FFMQ 评分 5 个因子及总分均高于对照组($P<0.05$)。两组治疗前 SCL-90、PDQ-D-20 评分比较,无统计学意义($P>0.05$)。治疗 3 个月后,两组 SCL-90、PDQ-D-20 评分均降低,且研究组的 SCL-90、PDQ-D-20 评分均低于对照组($P<0.05$)。治疗 3 个月后,研究组的总有效率 92.59%,高于对照组的 77.78%($P<0.05$)。

结果 治疗 3 个月后,两组 HAMD 评分均降低,且研究组的 HAMD 评分、平均抗抑郁药物剂量均低于对照组($P<0.05$)。治疗 3 个月后,两组 FFMQ 评分 5 个因子及总分均提高, SCL-90、PDQ-D-20 评分均降低,研究组的 SCL-90、PDQ-D-20 评分均低于对照组($P<0.05$),FFMQ 评分 5 个因子及总分均高于对照组($P<0.05$)。治疗 3 个月后,研究组的总有效率 92.59%,高于对照组的 77.78%($P<0.05$)。

结论 正念认知疗法联合盐酸舍曲林片可以有效地减轻伴有非自杀性自伤青少年抑郁症患者抑郁症抑郁状态,提高正念能力与认知功能,改善心理疾病,临床疗效良好。

关键词: 正念认知疗法;盐酸舍曲林片;伴有非自杀性自伤青少年;抑郁症;认知功能;心理

心理护理干预改善重症肺炎患者睡眠质量、负性情绪的效果观察

马香*

新疆维吾尔自治区人民医院

目的 探讨心理护理干预对改善重症肺炎患者睡眠质量、负性情绪的效果。

方法 从患有重症肺炎的 114 例患者中,随机分为实验组 57 人和对照组 57 人,两组的基本情况如年龄、病程、病型分布没有显著性差异。对照组给予常规护理,实验组在此基础上给予根据他们的个

性和需要定制的个性化的护理计划。这个计划可能包括个人心理咨询、心理支持小组、放松和压力管理技巧的训练,以及符合他们需要的行为疗法。采用 SPSS22.0 软件进行数据分析。选取不同的统计方法根据测量计量的类型和数据的分布。对于符合正态分布的计量资料,选择 t 检验和均值±标准差 (“ $\bar{x}\pm s$ ”)来展示结果。对于计数资料,选用卡方检验并以百分比表示。无论是 t 检验还是卡方检验,取统计学意义的标准为 P 值小于 0.05,即 $P<0.05$ 。若 P 值小于 0.05,表明实验组与对比组之间具有统计学意义的差异,证明的心理护理干预对重症肺炎患者睡眠质量、负性情绪确实有所改进效果。

结果 实验组在治疗后,SDS 评分,SAS 评分,睡眠质量评分较对照组显著改善,而且在恶心呕吐、睡眠过短、入睡困难、便秘等不良反应率上明显低于对照组。实验组护理与生活质量,护理依从度,睡眠时间也优于对照组。并且实验组的护理满意度显著高于对照组。

结论 心理护理干预可以显著提高重症肺炎患者的睡眠质量,缓解其负性情绪,并且不良反应较少,其护理满意度一致性好,对提高患者的生活质量有显著的效果。

关键词:心理护理干预;重症肺炎患者;睡眠质量;负性情绪;生活质量

系统家庭支持下延伸护理对精神分裂症患者居家康复效果影响

秦建美*

如皋市精神病防治医院

目的 观察系统家庭支持下延伸护理对精神分裂症(SCZ)患者居家康复效果影响。

方法 选择 2020 年 9 月—2023 年 8 月在我院收治的 83 例 SCZ 患者为研究对象,采用随机数字表法将其分为对照组($n=41$)、观察组($n=42$)。对照组予以常规护理干预,观察组在对照组基础上予以系统家庭支持下延伸护理干预,均干预 6 个月。运用家庭功能评定量表(FAD)评估家庭功能;运用康复状态量表(MRSS)评估康复状况;运用简明精神病量表(BPRS)评估精神症状;运用世界卫生组织生存质量测定量表简表(WHOQOL-BREF)评估生活质量;运

用功能独立性评定量表(FIM)评估独立生活能力。

结果 干预 6 个月后,两组家庭功能低于干预前($P<0.05$),观察组家庭功能低于对照组($P<0.05$);干预 6 个月后,两组康复状况低于干预前($P<0.05$),观察组康复状况低于对照组($P<0.05$);干预 6 个月后,两组精神症状低于干预前($P<0.05$),观察组精神症状低于对照组($P<0.05$);干预 6 个月后,两组生活质量高于干预前($P<0.05$),观察组生活质量高于对照组($P<0.05$);干预 6 个月后,两组独立生活能力高于干预前($P<0.05$),观察组独立生活能力高于对照组($P<0.05$)。

结论 系统家庭支持下延伸护理干预可降低 SCZ 患者精神症状严重程度,增强其家庭功能,改善其康复状态,提高其生活质量,进一步恢复其独立生活能力。

关键词:系统家庭支持下延伸护理;精神分裂症;家庭功能;康复状况;生活质量

呼吸康复对精神分裂症住院患者肺通气功能、情绪与生活质量的效应——一项单臂研究

白朝晖 安孝群* 曹芳芳 陈正权 杨迪 房依婷 汤俊怡 陈一郡

上海健康医学院附属杨浦区精神卫生中心

目的 与健康人群相比,精神分裂症患者罹患呼吸系统疾病的概率高约 2 至 5 倍,是导致精神分裂症患者残疾和寿命缩短的重要原因之一,如何预防与管理精神分裂症患者呼吸系统疾病并提高其生活质量已成为一项亟待解决的问题。本文旨在探讨呼吸康复对对稳定期精神科住院患者肺通气功能、情绪以及生活质量的改善情况。

方法 纳入 2024 年 3 月至 2024 年 6 月在杨浦区精神卫生中心住院的稳定期精神分裂症患者共 23 例。纳入标准为(1)年龄 18-75 周岁,(2)精神分裂症经临床治疗后处于稳定期,(3)简易智力状态检查评分 ≥ 20 分(文盲大于等于 18 分),(4)患者监护人及本人同意并签署了知情同意书。排除标准为(1)高热、出血状态或其他严重躯体疾病例如脑卒中急性期、急性心梗、恶性心律失常等,(2)慢性病的急性发作期,例如未经控制的高血压等,(3)经评估其他不适用于呼吸康复的情况。所纳入患者除常

规精神康复治疗外,进行40分钟的呼吸训练,每周3次,持续4周,包括抗阻呼吸(10分钟)、腹式呼吸(10分钟)、集体呼吸康复操(15分钟)和5分钟的整理运动。在入组后和干预后开展肺通气功能测试,焦虑和抑郁自评量表测试(SAS, SDS),以及WHO生存质量测定简表测试(WHOQOL-BREF)。连续性变量以均值±标准差表示,使用配对t检验分析干预前后评估指标的变化,显著性水平设置为0.05。

结果 共纳入23名精神分裂症住院患者,平均年龄为 60.74 ± 10.13 ,BMI为 24.49 ± 5.97 ,平均住院时长为 280.5 ± 148.5 天。在4周呼吸康复干预后,患者SAS、SDS评分均显著降低($t_{SAS}=2.110, p=0.047$,Cohen's $d=0.450$; $t_{SDS}=4.146, p<0.001$,Cohen's $d=0.884$),WHOQOL-BREF的社会与环境维度显著提高($t_{社会}=-2.193, p=0.039$,Cohen's $d=-0.457$; $t_{环境}=-2.897, p=0.008$,Cohen's $d=-0.604$)。治疗前后患者肺通气功能无显著差异(所有 $p>0.05$)。

结论 短期呼吸康复能够改善精神分裂症患者的焦虑与抑郁情绪,并能够显著提升患者的生活质量。未来需要招募对照组,并延长呼吸康复的干预时间,以改善精神分裂症患者的肺通气功能。同时需要建立患者队列,以观察呼吸康复干预是否能够有效降低未来呼吸系统疾病的发病率。

关键词: 精神分裂症,肺通气功能,呼吸康复,生活质量

社交技能训练联合计算机认知矫正治疗在慢性精神分裂症患者住院治疗中的应用效果

樊献丽* 白丽娟 武振宁 王艳 闫冬梅 武秀
山西省荣军精神康宁医院

目的 探讨社交技能训练联合计算机认知矫正治疗在慢性精神分裂症患者住院治疗中的应用效果

方法 选择2022年3月1日至2023年10月30日在山西省社会福利精神康宁医院住院且符合慢性精神分裂症诊断标准的100例患者为研究对象,按随机数字表法将其分为干预组和对照组各50例,实际完成了89例,其中干预组为44例,男23例、女21例,患者平均年龄(47.3 ± 5.2)岁;对照组为45例,男22例、女23例,患者平均年龄(45.1 ± 6.5)

岁。入组患者均接受常规抗精神病药物治疗,干预组在此基础上实施12周的社交技能训练联合计算机认知矫正治疗。社交技能训练次数为每周3次,时间定为每周一、三、五上午,每次训练时间为60min左右。计算机认知矫正治疗次数为每周3次,时间定为每周一、三、五下午,每次治疗时间为40min左右。采用阳性与阴性症状量表(PANSS)、社交技能评定目录量表(SSC)、精神分裂症患者生活质量量表(SQLS)为评定工具,在患者干预前后分别进行康复疗效评定并比较。

结果 实施12周的社交技能训练联合计算机认知矫正治疗后,干预组PANSS量表评分总分为(55.36 ± 9.43)分、阴性症状因子评分为(19.08 ± 3.71)分,两组数据得分均明显低于对照组的(61.06 ± 10.26)分、(22.42 ± 4.32)分,差异均有统计学意义($t=2.790, 3.989$,均 $P<0.01$);干预组干预后SSC量表评分中SSC总分、冲突解决能力、建立关系能力分别为(16.03 ± 6.87)分、(3.38 ± 1.64)分、(3.15 ± 1.82)分,三组数据得分均明显低于对照组的(21.06 ± 8.26)分、(5.91 ± 2.36)分、(6.73 ± 2.52)分,两组差异均有统计学意义($t=2.876, 5.349, 7.003$,均 $P<0.01$);干预组干预后SQLS量表评分(42.56 ± 11.74)明显低于对照组(49.53 ± 12.11),差异具有统计学意义($t=2.818, P<0.01$)。

结论 对住院治疗期间的慢性精神分裂症患者运用社交技能训练联合计算机认知矫正治疗进行科学干预,可以有效改善患者的社交技能缺陷及阴性症状,并显著提升患者的住院生活质量。

关键词: 慢性精神分裂症; 社交技能缺陷; 阴性症状; 社交技能训练; 计算机认知矫正治疗; 生活质量

积极心理学理论在精神分裂症康复护理应用效果

马梦芝*
新疆维吾尔自治区人民医院

目的 研究在精神分裂症康复护理中应用积极心理学理论的价值。方法 择选90例精神分裂症患者作为研究对象(2022年6月至2023年6月),随机分配法划分两组,对照组($n=45$)实施常规护理,

观察组 (n=45) 实施积极心理学理论干预, 分析对比两组干预效果。

方法 两组干预后 BPRS、TPROS 评分降低, 且观察组分值更低 ($P<0.05$)。两组干预 1 个月、2 个月、3 个月 HEIQ 评分比对照组更高 ($P<0.05$)。两组干预 1 个月、2 个月、3 个月 SPHMS 评分比对照组更高 ($P<0.05$)。观察组干预满意度 95.56% 比对照组 75.56% 更高 ($P<0.05$)。

择选 90 例精神分裂症患者作为研究对象 (2022 年 6 月至 2023 年 6 月), 随机分配法划分两组, 对照组 (n=45) 实施常规护理, 观察组 (n=45) 实施积极心理学理论干预。对照组男性、女性各 26 例、19 例, 年龄 24-76 (49.18±3.64) 岁, 病程 0.7-8 (4.21±0.70) 年。观察组男性、女性各 25 例、20 例, 年龄 25-76 (48.97±3.58) 岁, 病程 0.6-8 (4.13±0.64) 年。两组基本资料无统计学价值 ($P>0.05$), 存在可比性。本研究已交由医院医学伦理委员会审批, 并获得批准。(1) 纳入标准: 与精神分裂症相关诊断标准相符; 存在意识情感障碍、反复性言语幻听等症状; 知情并在“知情协议”上签字。(2) 排除标准: 继发性意识障碍; 智能障碍患者; 沟通障碍; 并发严重脏器功能不全; 中途退出。

结果 两组干预后 BPRS、TPROS 评分降低, 且观察组分值更低 ($P<0.05$)。两组干预 1 个月、2 个月、3 个月 HEIQ 评分比对照组更高 ($P<0.05$)。两组干预 1 个月、2 个月、3 个月 SPHMS 评分比对照组更高 ($P<0.05$)。观察组干预满意度 95.56% 比对照组 75.56% 更高 ($P<0.05$)。

结论 在精神分裂症患者康复护理中应用积极心理学理论效果突出, 有助于提升患者幸福进取能力, 改善患者健康状态, 增加患者对医护服务的认可, 推广价值较高。

关键词: 积极心理学理论; 精神分裂症; 康复护理

综合个性化护理干预应用于双向情感障碍抑郁发作病人护理效果

周婷*

新疆维吾尔自治区人民医院

目的 探究双向情感障碍抑郁发作患者行综合

个性化护理干预的效果。

方法 择选 88 例双向情感障碍抑郁发作患者 (2023.01-2023.08) 作为研究对象, 随机数表法划分两组, 对照组 (44 例) 行常规护理, 观察组 (44 例) 行综合个性化护理干预, 对比分析两组护理效果。

结果 护理后两组 MMSE 评分升高, 且观察组评分更高 ($P<0.05$)。观察组护理后 HAMD、HAMA 评分比对照组更低 ($P<0.05$)。两组护理后生活质量改善, 且观察组评分更高 ($P<0.05$)。观察组护理满意度 93.18% 比对照组 77.27% 更高 ($P<0.05$)。

结论 本研究结果显示, 护理后两组 MMSE 评分升高, 且观察组评分更高, 可见对双向情感障碍抑郁发作患者行综合个性化护理干预有助于改善患者认知功能。观察组护理后 HAMD、HAMA 评分比对照组更低, 提示将综合个性化护理干预用于双向情感障碍抑郁发作患者护理中可促进患者情绪状态改善。两组护理后生活质量改善, 且观察组评分更高, 可见将两组护理后生活质量改善, 且观察组评分更高有助于改善患者生活质量。观察组护理满意度 93.18% 比对照组 77.27% 更高, 提示对双向情感障碍抑郁发作患者实施综合个性化护理干预有助于增加患者对护理服务的认可。

综上所述, 将综合个性化护理干预用于双向情感障碍抑郁发作患者护理中效果理想, 有助于促进患者认知功能、情绪状态、生活质量改善, 增加患者对护理服务的认可, 值得推广。

共情护理干预对青少年抑郁症患者心理状况及护理观察

古力努尔·艾尔肯*

新疆维吾尔自治区人民医院

目的 共情护理干预对青少年抑郁症患者心理状况及护理观察。

方法 整理 2023 年 1 月至 2023 年 12 月本院收治的少年抑郁症患者 90 例为研究对象, 采用随机数字表法分为对照组、观察组, 各 45 例。对照组应用常规护理, 观察组应用共情护理干预。对比护理效果。

结果 观察组汉密尔顿焦虑量表(Hamilton Anxiety Scale,HAMA)评分、汉密尔顿抑郁量表(Hamilton depressive scale,HAMD)评分 优于对照组,对比有统计学意义($P < 0.05$);观察组睡眠质量优于对照组,对比有统计学意义($P < 0.05$);观察组生活质量综合评定问卷(Generic Quality of Life Inventory-74,GQO-LI-74)评分优于对照组,对比有统计学意义($P < 0.05$);观察组护理满意度高于对照组,对比有统计学意义($P < 0.05$)。

结论 观察组睡眠质量优于对照组($P < 0.05$)。分析原因是,通过共情护理的实施能促进抑郁情绪缓解,减轻患者的心理压力,这使患者可以更好的进入睡眠,并且在共情护理实施后,还可帮向患者提供有效的社会支持,使患者感受到医务人员的关怀、支持等,强化患者的归属感,进而作用于睡眠质量的提升。同时本研究证实,观察组 GQO-LI-74 评分优于对照组($P < 0.05$)。生命质量是衡量疾病预后的重要指标,而通过此种护理方法的实施,能够减少患者的自我贬低感,给予情感上的支持、肯定,帮助患者稳定情绪状态,减轻抑郁症状,并且通过对患者的深入理解,还可以充分了解患者的实际情况,并在此基础上给予患者具有针对性的治疗、管理,继而强化患者应对疾病的能力,满足患者的特定需求,在此基础上即可提高患者的生命质量。最后本研究还发现,观察组护理满意度优于对照组($P < 0.05$)。在对患者应用共情护理后,能给予患者有效的情感支持,使患者打开心扉,并与医务人员建立信任关系。共情护理干预可减轻患者焦虑、抑郁情绪,改善睡眠质量,且能提升患者生命质量,保证护理满意度,有推广价值。

关键词: 青少年; 抑郁症; 共情护理干预; 心理状况; 睡眠质量

心理护理干预对焦虑症患者睡眠质量的影响观察

杨蕊*

新疆维吾尔自治区人民医院

目的 分析心理护理干预对焦虑症患者睡眠质量的影响。

方法 选取本院 2023 年 01 月至 2024 年 01 月

间 60 例焦虑症患者作为观察对象,依照不同护理方法,分为对照组和观察组,各 30 例。对照组男 17 例,女 13 例,年龄为 16~51 岁,平均年龄为(35.49±2.36)岁;观察组男 16 例,女 14 例,年龄为 17~52 岁,平均年龄为(36.06±2.19)岁;对比两组患者的一般资料,差异无统计学意义($P > 0.05$)。

结果 护理前,两组患者的负面情绪评分无明显差别($P > 0.05$);护理后,观察组患者的负面情绪评分低于对照组($P < 0.05$)。观察组患者的睡眠质量改善情况均优于对照组($P < 0.05$)。

观察组患者的依从性高于对照组($P < 0.05$),观察组患者的护理满意度高于对照组($P < 0.05$)。

结论 本次实践结果显示,予以常规护理联合心理护理的观察组,其负面情绪评分低于实施常规护理的对照组($P < 0.05$),可见心理护理对于调整患者负面情绪具有重要作用,这是因为心理护理能够给予患者积极正面的情感支持和心理疏导,有利于改善患者的不良情绪,强化他们的心理承受能力,让患者更好地调节自己的情绪和心态。同时心理护理强调与患者沟通交流,通过满足患者需求,倾听患者想法的方式与患者建立起相互信任的良好关系,从而引导患者更好地释放不良情绪,减轻疾病所造成的压力和负担。另外,心理护理也能够激发出患者内在的积极因素,从而建立起对自身的信心,使其更加积极主动地配合治疗和护理,进一步优化疗效。观察组患者经过护理后,其睡眠质量优于对照组($P < 0.05$),证明心理护理有利于改善患者的睡眠品质,究其原因在于心理护理能够给予患者更多的心理安慰和情绪支持,将护理工作从照顾患者身体方面扩展到关爱患者心理状态方面,有利于促使患者释放压力和负面情绪,从而放松身心,拥有良好的睡眠品质[12]。观察组患者的依从性高于对照组($P < 0.05$),可见心理护理能够促使患者积极主动地配合护理工作,主要是因为心理护理能够照顾到患者的身心需求,因此在护理过程中患者可以表现出更好的积极性和配合度,他们更愿意接受护理人员的建议和指导,并且可以取得理想的护理效果。另外,在心理护理的支持下,患者的心理状态越来越好,情绪也越来越稳定,对于后续治疗的信心也会随之提高。观察组患者的护理满意度高于对照组($P < 0.05$),由此证明心理护理更能够满足患者的需求,对于提高患者满意度具有重要意义。

数字疗法在精神疾病中的应用现状

徐婉睿 王惠玲*

武汉大学人民医院 (Renmin hospital of Wuhan University)

目的 精神疾病是当今社会面临的重要问题,精神病患者往往表现出情绪、思维、行为上的异常,对患者个人、家庭乃至社会均带来重大负担。数字疗法(digital therapeutics, DTx)是近年来备受关注的,一种通过应用程序或者人工智能平台治疗、管理、预防疾病的非药物疗法。本综述旨在探讨 DTx 在精神疾病诊疗中的应用现状,分析其优势、面临的挑战以及未来的发展方向,以期精神疾病的临床治疗提供新的思路和方法。

方法 我们就 DTx 在各种精神疾病中的应用现状进行综述。使用生物医学文献数据库 Pubmed 输入以下关键词“digital therapeutic”或“digital therapy”和“mental illness”或“mental disorder”

结果 数字疗法在精神领域的许多疾病都已有应用的实例并且部分拥有已被证明的疗效,目前主要在以下几种疾病中应用较多,精神分裂症:数字疗法如 PEAR-004 应用程序,提供了认知行为治疗模块,有助于患者管理病情。抑郁症:在线自助治疗产品如 Deprexis,采用认知行为疗法,为轻中度抑郁症患者提供了有效的治疗方式。乙醇成瘾: Vorvida 软件基于认知行为疗法,为患者提供个性化的康复计划。注意缺陷多动障碍(ADHD): EndeavorRx 通过数字游戏提高患儿的认知能力和注意力。失眠症: Somryst 作为处方数字疗法,提供失眠认知行为疗法,改善慢性失眠症状。认知障碍: VR 数字疗法通过虚拟现实技术提供认知功能康复训练。

结论 数字疗法在精神疾病治疗中展现出巨大的潜力和优势,包括个性化治疗、便捷性、灵活性以及降低医疗成本等。然而,数字疗法的广泛应用仍面临技术、隐私保护、数据管理、临床验证、标准化不足以及患者接受度等挑战。未来的研究需进一步完善数字疗法的临床应用效果评估。数字疗法有望在精神疾病领域实现更广泛的应用,为患者提供更高效、个性化的治疗方案。

Efficacy of Locust Rice in The Treatment of Tardive Dyspraxia

Jinquan Xu* Zhi Wu Cheng Wan

the third people's hospital of zhanjiang city

Objective objective to investigate the efficacy of sophorae in the treatment of tardive dyspraxia caused by antipsychotic drugs

Methods 60 cases of schizophrenic patients with tardis were randomly divided into two groups. In the control group, 30 patients were treated with promethazine, tardy dyspraea rating scale (TDRS) was used to assess the therapeutic effect and adverse drug reactions of the two groups, and treatment was observed for 8 weeks

Results after 8 weeks, the effective rate was 76.7% in the observation group and 83.3% in the control group. There was no statistically significant difference in clinical efficacy between the two groups ($H_c=0.416$, $P>0.05$). TDRS scores in both the observation group and the control group decreased after 8 weeks of treatment compared with those before treatment in the same group (all $P<0.05$), and there was no statistically significant difference in TDRS scores between the two groups ($P>0.05$). The incidence of sleepiness, weight gain, dizziness and nausea in the observation group was significantly lower than that in the control group ($P<0.05$)

Conclusion acacia rice has a good therapeutic effect on tardiness dysparexia caused by antipsychotic drugs, and the adverse reactions are mild

关键词: acacia, promethazine, schizophrenia, tardiness dyspraxia

出院指导服务对精神障碍患者预防复发的干预效果研究

程嘉* 耿彤 于玲 韩冬影 李静静 徐建芳 王天姿 焦艳 姚贵忠

北京大学第六医院

目的 出院计划是精神卫生服务中的重要内容,研究其对保证治疗护理的连续性、提高患者的依从性、降低再入院率的有效性。

方法 方法 对2015年1-6月在北京大学第六医院住院的精神障碍患者,出院后开展三方会谈,制定出院计划,链接日间康复包括个案管理、团体治疗、健康教育,参与服务3个月后评估病人复发、再住院率。

三方会谈内容:

第一讨论的信息,主要是了解疾病转归中的生物学和医学因素。包括患者通过住院治疗是否能梳理清楚自己精神健康在哪些方面发生变化,积极的变化有什么?重点了解对疾病的自我识别能力。如患者能认识到原来自己想的太多了,疑心大了,没边的事都联想到自己身上。不仅影响自己情绪,还影响了自己的人际关系。认识到药物治疗对自己的帮助。能接受需要系统治疗、定期看门诊。说明患者有一定自知力,药物依从性也比较好,近期复发的风险低。

第二方面重点收集影响疾病转归有什么社会心理因素的影响。如很多青少年患者对学校环境不适应,学习压力大,或家庭环境不和谐,家庭长期处于缺乏交流,互相指责的状态。即使疾病症状康复了,回到生活环境中长期精神不愉快,容易引起疾病的复发。也会影响康复期社会功能的恢复。在出院指导中都会做相应的评估和指导工作。其中评估工作会在访谈之前患者和家庭填写个人生活事件表和家庭功能量表。

第三方面,链接社区、日间康复资源和家庭护理的指导。患者回到社区,可以了解居住地社区卫生服务中心的精神卫生服务资源,如是否有免费服药、社区日间康复站等。患者在康复期不能马上恢复到学习或工作生活中,能参加日间康复活动对充实生活、恢复自信是非常有帮助的。同时很多专科医院也设有日间康复活动中心,组织康复者参加团体活动如预防疾病复发团体、情绪管理团体、恢复自信、社交技能团体活动,还有在康复期起到教练作用的个案管理服务都可以根据自己的需求选择参加。同时医务人员也会结合患者的社会功能状态,探讨复学、社会就业合适的时机,家庭护理中需要注意的事项,如何结合患者的优势丰富康复期的生活等。

结果 参与服务患者年龄 23.74 ± 8.53 岁,性别男 18 例, 47.37%, 女 20 例, 52.63%, 精神分裂症 26 例, 68.42%, 情感障碍 8 例, 21.05% 其它 4 例, 10.53%; 病程 48.45 ± 47.96 (月) 参与服务情况, 均参加三方会谈的出院计划, 个案管理 22 例, 57.89%, 团体 15, 39.47%, 健康讲座 12, 31.58%。参与服务 2.4 月, 3 个月后随访, 复发率 13.16%, 再住院率 7.89%, 明显低于文献报道。

结论 出院指导可以衔接日间康复服务, 提高患者服药依从性, 降低复发率和在住院率。

关键词: 精神障碍 出院指导 复发 再入院

一例先天性颅脑发育异常青年期出现的精神障碍

韦秋媛 谢霜* 陆永艺 岑俊翰

中国人民解放军联勤保障部队第 923 医院

目的 探讨先天性颅脑发育异常青年期出现精神障碍的临床特征, 如何快速让患者回归生活

方法 我院 2023 年 10 月 18 日收治的一例脑器质性病变所致精神障碍。患者, 男性, 27 岁, 于 1 年前奶奶去世后感心情差, 感觉难以接受事实。后逐渐出现言行异常, 表现为经常无故傻笑, 少语少动, 不愿外出, 不愿和别人交流, 懒散被动, 经常唉声叹气。有时和家人说自己不安全, 有人要害自己。经常发呆, 反应迟钝, 有时问东答西, 无法听懂他讲话的意思。逐渐和家人疏离, 不懂的关心家人及朋友, 变得淡漠, 不工作, 天天在家里, 不愿就医。家属见其异常, 曾带其就诊于南宁市第二人民医院, 行头颅 CT 检查提示: 胼胝体缺如, 额顶叶脑裂畸形。10 月 18 日送至我院治疗。入院后头颅磁共振显示: 双侧胼胝体及相邻局部大脑镰结构缺如, 中线附近脑回结构紊乱, 双侧侧脑室与第三脑室融合, 考虑先天性发育异常。

结果 治疗上予盐酸哌罗匹隆片改善精神症状、艾地苯醌片改善脑功能, 奥沙西洋片及乌灵胶囊改善睡眠等。护理上加强健康教育, 督促患者进行生活自理, 进行工娱治疗。

结论 抗精神病性药物治疗及改善脑功能药物治疗可以缓解改善精神症状, 督促患者生活自理能促进患者更快恢复日常生活。

关键词: 先天颅脑发育异常, 胼胝体缺如, 精神障碍

近 4 年新疆女性抑郁障碍患者血清-25 羟维生素 D3 水平的现况调查

叶静*

新疆维吾尔自治区人民医院

目的 观察近 4 年新疆女性抑郁障碍患者血清-25 羟维生素 D3 水平的现况, 探讨其缺乏对于该地区女性抑郁障碍患者的影响。

方法 在研究中, 此次以 2020 年 1 月至 2023 年 8 月于本院临床心理科住院的 147 名女性抑郁症患者为研究对象, 通过不同血清浓度、不同年龄、不同族别来观察该地区女性抑郁障碍患者的血清-25 羟维生素 D3 水平的现况, 通过抑郁自评量表(GAD-7)、焦虑自评量表(PHQ-9)、匹兹堡睡眠质量量表(PSQI)评估不同血清 25(OH)D 水平之间是否具有差异。研究中的女性患者涉及多年龄段、多民族, 其血清-25 羟维生素 D3 水平均明显低于正常充足水平 30ng/mL, 并且差异具有明显统计学意义。不同血清-25 羟维生素 D3 水平之间抑郁、焦虑自评评分具有差异。

结果 研究中的女性患者涉及多年龄段、多民族, 其血清-25 羟维生素 D3 水平均明显低于正常充足水平 30ng/mL, 并且差异具有明显统计学意义。不同血清-25 羟维生素 D3 水平之间抑郁、焦虑自评评分具有差异。

结论 近 4 年新疆女性抑郁障碍患者血清-25 羟维生素 D3 水平均显著低于正常水平, 该人群需要及时关注并且补充维生素 D。

关键词: 抑郁障碍; 血清-25 羟维生素 D3; 女性患者;

首发未用药精神分裂症患者炎症因子、脱髓鞘与认知损害的关联研究

张艳 宋学勤*

郑州大学第一附属医院

目的 探究首发未用药精神分裂症群体中, 炎症因子、脱髓鞘与认知损害的关系

方法 选择 2020 年-2023 年于我院就诊的 73 例首发未用药精神分裂症患者, 依据脑部磁共振平扫结果分为首发未用药精神分裂症伴脱髓鞘改变患者组 (n=38) 和首发未用药精神分裂症不伴有脱髓鞘改变患者组 (n=35), 使用精神分裂症认知功能成套测验 (MCCB) 评估两组患者的认知功能, 使用酶联免疫吸附测定法检测血清中的炎症因子水平。

结果 两组患者的年龄、性别、吸烟史、家族史、体质指数无统计学差异 ($p>0.05$)。与首发未用药精神分裂症不伴脱髓鞘改变的患者相比, 首发未用药精神分裂症伴脱髓鞘改变的患者认知障碍更严重, 主要表现在信息处理速度、视觉学习、推理和解决问题的能力方面 ($p<0.005$)。首发未用药精神分裂症伴脱髓鞘改变患者组的 IL-2 水平明显高于不伴有脱髓鞘改变患者组 ($p<0.005$), IL-4、IFN- γ 水平低于不伴有脱髓鞘改变患者组 ($p<0.005$)。中介分析表明, 在精神分裂症患者中, IL-2、IL-4 和 IFN- γ 水平对认知功能的影响由脱髓鞘介导。

结论 与首发未用药精神分裂症不伴脱髓鞘改变的患者相比, 首发未用药精神分裂症伴脱髓鞘改变的患者认知障碍更为严重, 脱髓鞘在精神分裂症患者的炎症因子和认知障碍之间的关系中起着重要的中介作用。

关键词: 精神分裂症, 脱髓鞘, 认知障碍, 炎症因子

自我控制与领悟社会支持对新生社会交往的影响

苗雨*

无

目的 分析自我控制与领悟社会支持对新生社会交往的影响, 为心理健康教育提供依据, 增强新生心理适应性。

方法 采用横断面研究, 用一般人口学量表、自我控制量表 (SCS)、领悟社会支持量表 (PSSS)、社交回避及苦恼量表 (SAD) 对 2013 年河南省某校秋季入学新生进行问卷调查。给予被试者统一的指

导语并现场回收问卷。所有被试者均自愿参与调查且签署知情同意书。剔除无效作答问卷。采用Harman单因素法对所有题项进行同源方差检验。对社交回避及苦恼和自我控制及领悟社会支持量表得分进行回归分析。

结果 共有 891 名新生纳入研究。社交回避及苦恼量表 (8.36±6.031) 分, 自我控制量表 (69.06±10.205) 分, 领悟社会支持量表 (68.00±8.577) 分。3.9% 的学生在社交方面存在明显困难。不同性别、吸烟组与非吸烟组、独生子女组与非独生子女组、不同生源地组间社交得分无明显差异。线性回归分析结果显示新生社交得分和自我控制得分与领悟社会支持得分相关, 回归系数分别为 -0.209 和 -0.177 (P 均 < 0.001)。

结论 存在部分新生需重点关注人际关系, 增强自我控制和领悟社会支持能力可作为改善个体心理健康的依据。

穴位埋线疗法对重性精神疾病合并代谢综合征的影响

张礼礼*

台州市第二人民医院

目的 观察穴位埋线疗法对重性精神疾病合并代谢综合征的治疗作用。

方法 观察临床工作中重性精神疾病合并代谢综合征患者 20 例, 随机分为埋线组和对照组各 10 例, 埋线组经中医辨证论治, 选择足三里、三阴交、关元、气海、大横、脾腧、胃腧穴位, 应用可吸收外科缝线, 严格执行无菌操作下进行穴位埋线治疗, 每次 5-10 个穴位, 每 14 天一次, 同时为患者选择适合的有氧训练和饮食调整, 训练中观察患者心肺功能及体能变化, 对照组仅进行有氧训练和饮食调整, 分别治疗 12 周, 治疗开始前及结束后记录 BMI 指数、血压、血糖、血脂等相关数据。对两组数据进行统计学处理。

结果 经过 t 检验, 埋线组在降低 BMI 指数、血脂方面效果明显, 在控制血压、血糖方面也具有一定疗效。

结论 代谢综合征是指人体的蛋白质、脂肪、

碳水化合物等物质发生代谢紊乱的病理状态, 是一组复杂的代谢紊乱症候群, 是导致糖尿病心脑血管疾病的危险因素。重性精神疾病由于长期口服抗精神病药物及活动量较少等原因, 代谢综合征的发生率较高。同时, 患者多不易配合临床治疗, 且口服降脂药物、降糖药物、降压药物仅解决单一问题, 无法综合调理, 穴位埋线疗法作为安全有效的中医治疗方法, 可根据不同病情辨证施治, 有效控制体重增加及各项指标减少, 临床效果明显, 可进行大样本多模态的对比研究, 推广于临床。

关键词: 穴位埋线疗法 重性精神疾病 代谢综合征

中药黄芩在预防精神分裂症复发中的疗效观察

高金松¹ 宋学勤²

1. 河南省中医院 (河南中医药大学第二附属医院)

2. 郑州大学第一附属医院

目的 精神分裂症是一种复杂的慢性神经精神疾病, 以幻觉、妄想、认知功能障碍及情感障碍等为主要特征, 其高复发率一直是治疗中的难点。近年来, 中药黄芩因其在神经精神疾病治疗中的潜在价值, 尤其是在抗复发方面的应用, 受到广泛关注。本研究旨在探究中药黄芩在预防精神分裂症复发中的疗效。

方法 本研究采用随机对照的临床试验方法, 选取近 3 年内复发次数 ≥ 2 的精神分裂症患者为研究对象。参与者被随机分为黄芩治疗组和对照组, 其中黄芩治疗组在常规西药治疗基础上加用黄芩提取物, 对照组仅采用常规西药治疗。研究周期为一年, 期间定期评估患者的精神症状、生活质量及复发情况。在剂量和使用频率方面, 本研究采用的黄芩提取物剂量为每日 300mg, 分两次服用。

结果 经过一年的治疗观察, 黄芩治疗组在预防精神分裂症复发方面显示出一定效果。与对照组相比, 黄芩治疗组的患者在精神症状改善、生活质量提升及复发率降低等方面均表现出明显优势。具体而言, 黄芩治疗组患者的 PANSS 量表得分显著下降, 复发率较对照组低约 30%。

结论 本研究结果表明, 中药黄芩在预防精神

分裂症复发方面具有一定的疗效。其可能的作用机制包括抗氧化、抗炎及镇静等。然而,本研究仍存在一些局限性,如样本量较小、观察时间相对较短等。未来研究可进一步扩大样本量、延长观察时间,并深入探究黄芩预防精神分裂症复发的具体机制。此外,黄芩与其他药物的联合应用也是值得进一步研究的方向。综上所述,中药黄芩在预防精神分裂症复发中显示出一定的疗效和安全性,具有较好的应用前景。未来研究应进一步探究其作用机制及优化治疗方案,以期精神分裂症患者提供更好的治疗选择。

关键词: 中药黄芩 精神分裂症 复发

森田治疗对社区精神分裂症康复期患者社会功能和生活质量的影响

陈一郡 宋兵福*

上海市杨浦区精神卫生中心

目的 旨在探讨森田治疗对社区精神分裂症康复期患者的社会功能和生活质量的影响情况。

方法 选取上海市杨浦区社区 60 例精神分裂症康复期患者为研究对象。纳入标准:(1)符合 ICD-10 精神分裂症诊断标准;(2)经药物治疗后病情稳定;(3)在社区进行康复治疗时间大于 1 年;(4)患者及家属知情同意并愿意配合;(5)年龄为 25-55 岁,性别不限。排除标准:合并其他精神科疾病;合并严重慢性躯体疾病;酒精及药物依赖;文盲。将患者随机分为对照组和研究组,每组各 30 例,两组患者一般资料比较,差异均无统计学意义。两组患者均坚持我院门诊随访和社区一般康复训练,研究组在此基础上给予森田治疗,每周治疗 3 次,每次 45 分钟,连续治疗 10 周,治疗在我区示范性阳光心园进行,每次由 1-2 名康复治疗师主持,治疗期间发现患者病情波动或明显不适合继续治疗的给予立即终止。两组患者分别在治疗前后进行阳性和阴性症状评分表(PANSS)、健康状况调查问卷(SF-36)、社会功能缺陷筛选量表(SDSS)评估。

结果 2.1 治疗后研究组患者症状较治疗前及对照组明显改善,差异具有统计学意义。2.2 研究组患者治疗后 SDSS 总分明显低于治疗前及对照组总分。2.3 研究组患者治疗后 SF-36 总分明显高于治疗

前及对照组治疗后 SF-36 总分,差异均具有统计学意义($P<0.05$)。

结论 精神分裂症患者因疾病、药物、家庭、心理等多方面因素的影响,康复期患者多表现出退缩回避、缺乏主动性,不利于进一步治疗效果,且社会功能和生活质量受到不同程度的影响。森田治疗是国际上认同的心理治疗方法之一,经过不断的实践和改进,适合治疗的人群不断扩大,对负性情绪、适应环境不良、交流障碍及精神病后残留症状的患者,可以通过森田治疗让患者的病态注意力从固着于症状逐步转向现实生活,扭转“情绪本位”的心理状态,以达到精神康复、回归社会的目标。本研究显示森田治疗对改善社区精神分裂症康复期患者疗效、社会功能和生活质量有积极影响,是社区精神分裂症患者重要的康复手段。

关键词: 森田治疗 康复期 社会功能 生活质量

托吡酯对药物导致超重的精神病患者认知功能的影响:一项随机双盲研究

黄俊洁 王高华*

湖北省人民医院

目的 体重增加/肥胖是限制临床使用第二代抗精神病药物治疗精神病患者的主要弊端之一。应对抗精神病药物引起的体重增加有几种策略,如控制食物摄入量、运动、改用其他无体重增加作用的抗精神病药物,或同时服用可减轻体重的药物。不少药物被认为可以有效控制精神分裂症患者的体重增加,包括托吡酯、二甲双胍、雷贝西汀、阿立哌唑等。一项荟萃分析研究显示,与安慰剂相比,托吡酯和二甲双胍能有效对抗抗精神病药物引起的体重增加,且无严重副作用。然而,在针对癫痫和偏头痛患者的临床试验中,发现托吡酯与认知功能障碍有关。托吡酯如何影响抗精神病药物所致体重增加患者的认知能力,还有待进一步研究。本研究目的为:(1)比较使用托吡酯(TPM 组)和二甲双胍(MTF 组)治疗的抗精神病药物所致体重增加患者的认知功能。(2)比较 TPM 组和 MTF 组治疗 12 周后的体重变化。

方法 这是一项双盲随机对照临床实验。受试

者将被随机分为两组，一组接受托吡酯治疗，剂量从 25mg/bid 开始，7 天后增至 50mg/bid，14 天后增至 100 mg/bid；另一组接受二甲双胍治疗，剂量从 0.25mg/bid 开始，7 天后增至 0.50 mg/bid。记录所有受试者在基线、4 周、8 周及 12 周时的体重和腰围。使用 BCAS 量表评估所有受试者治疗 12 周前后认知功能差异。

结果 服用托吡酯和二甲双胍的患者各有 37 人完成了这项研究。与二甲双胍相比，托吡酯治疗没有损伤患者的认知功能；两者均可降低受试者的体重/体重指数。

结论 研究表明，托吡酯和/或二甲双胍附加疗法在接受抗精神病药物治疗的超重/肥胖精神分裂症患者的体重/体重指数是有效的。托吡酯可以作为减轻精神分裂症患者体重指数的一种选择。

关键词：精神障碍；托吡酯；抗精神病药物；抗精神病药物副作用

医院社区联合管理对精神分裂症认知功能影响

刘晶晶^{1,2}

1.乌鲁木齐市安宁医院

2.乌鲁木齐市精神病福利院

目的 观察分析医院社区联合管理对精神分裂症患者认知功能的影响。

方法 本试验采用基线评定法，纳入截止至 2023 年 6 月 1 日前沙依巴克区长江路街道辖区内的 60 例慢性精神分裂症患者，对患者实施医院社区联合管理，并进行 1 年队列随访研究，观察基线期、第一、二、三、四季度的康复效果及认知功能，统计复发率、再住院率。

结果 第一、二、三、四季度阳性和阴性症状评定量表（PANSS）量表评分、社会功能缺陷量表（SDSS）评分与基线期比较均降低明显（ $P<0.05$ ），且第四季度 PANSS 量表、SDSS 评分与第一、二、三季度更低（ $P<0.05$ ）。与基线期比较，第一、二、三、四季度韦氏记忆量表（WMS）均显著升高（ $P<0.05$ ）。第一、二、三、四季度 Halstead2Retain 神经心理成套试验（HRB2RC）中的连线测验 A 和 B 均显著低于基线期（ $P<0.05$ ）。与基线期比较，第

一、二、三、四季度威斯康星卡片分类测验（WCST）量表持续性错误数（Rpe）、非持续性错误数（nRpe）、完成分类数（Cc）和正确应答数（Rc）显著下降（ $P<0.05$ ）。第一、二、三、四季度字色混淆测验（Stroop）评分较基线期显著提高（ $P<0.05$ ）。随访 1 年，复发率、再住院率、再就业率分别降低。

结论 医院社区联合管理对促进精神分裂症患者全面康复有积极作用，能改善认知功能，减少复发，降低住院率，有利于患者回归社会明显改善精神分裂症患者认知功能，对促进患者全面康复有积极作用，减少复发及再住院率。

头颅 CT 在胼胝体发育不全（脑干萎缩）预后评估的临床价值

邹灿*

玉林市第四人民医院

目的 探讨头颅 CT 在胼胝体发育不全（脑干萎缩）患者预后评估中的临床价值。通过回顾性分析经头颅 CT 检查的临床确诊患者，评估 CT 图像的解读以及与其他影像学技术的比较，为患者提供更好的预后评估。

方法 回顾性分析经头颅 CT 检查并经临床确诊的胼胝体发育不全患者，评估头颅 CT 在预测患者预后中的作用。分析 CT 图像的影像学表现，包括胼胝体的形态和结构，以及脑干的形态和结构。同时，结合临床资料和患者的临床表现，对 CT 图像进行综合分析，以评估患者的预后。

结果 共纳入 20 例胼胝体发育不全患者，头颅 CT 表现包括胼胝体发育不良和脑干萎缩。通过综合分析 CT 图像，我们发现脑干的萎缩程度与患者的预后密切相关。其中，部分患者经过治疗后症状得到改善，而另一些患者则因病情严重而死亡或遗留长期残疾。这些结果提示，头颅 CT 在胼胝体发育不全的预后评估中具有重要价值。

结论 头颅 CT 在胼胝体发育不全（脑干萎缩）的预后评估中具有重要价值。通过准确的图像解读和综合分析，我们可以更好地了解患者的病情，从而为患者提供更好的预后评估和治疗方案。

关键词: 头颅 CT; 胼胝体发育不全; 脑干萎缩; 预后评估; 治疗方法。

PDCA 循环法在精神科患者影像检查中安全的预判评估分析

邹灿* 杨媚 徐向明
玉林市第四人民医院

目的 精神科患者在影像检查过程中存在一定的安全隐患, 如焦虑、恐惧、暴力倾向等问题, 可能影响检查的顺利进行和结果的准确性。本研究采用 PDCA 循环法对精神科患者影像检查中的安全预判进行评估分析, 旨在提高检查的安全性和效率。

方法 选取我院的精神科患者作为研究对象, 采用 PDCA 循环法对其影像检查中的安全预判进行评估分析。

结果 通过 PDCA 循环法对精神科患者影像检查中的安全预判进行评估分析, 发现在影像检查过程中存在一些安全隐患, 如患者焦虑、暴力倾向等问题可能影响检查的进行和结果的准确性。通过改进措施的实施, 检查的安全性和效率得到了提高。

结论 采用 PDCA 循环法对精神科患者影像检查中的安全预判进行的评估分析, 取得了一定的效果。然而, 仍有一些问题需要进一步研究和改进, 如如何更好地预判患者的安全风险、如何有效应对患者的不良情绪等。

关键词: PDCA 循环法; 精神科患者; 影像检查; 安全预判; 评估分析

正念减压疗法联合阶段性康复训练在精神科疾病患者康复中的研究进展

陶凉*
成都市第四人民医院

目的 文章综述了正念减压疗法联合阶段性康复训练在精神疾病患者中的应用现状及应用效果方法 首先通过描述正念减压疗法与阶段性康复疗法的基本概念, 然后整合联合应用在精神疾病患

者中的应用现状, 最后分析出正念减压疗法联合阶段性康复疗法的应用效果 结果 精神疾病是指在各种内外环境因素影响下, 患者的脑部功能出现严重失调, 导致各种精神活动均发生不同程度障碍的临床表现。精神疾病患者虽然意识清晰, 但思维和认知功能障碍, 无法正常控制自我行为, 甚至会出现情感障碍和幻觉。若不及时采取有效的控制或治疗措施, 将导致患者的精神严重衰退或残疾, 严重降低患者的生活质量和社会功能。目前, 临床上针对精神疾病的治疗方式主要有药物治疗、心理辅导、康复训练等。虽然药物治疗或心理辅导能够有效控制精神疾病患者的病情进展, 但精神疾病复发率高且预后较差, 长周期的服用药物还会增加患者发生并发症的风险。

结论 除了巩固疗效之外, 还需要采取有效的康复措施改善患者的预后, 恢复患者的社会功能, 提高患者的生活质量。研究表明, 多阶段康复训练能够有效改善患者的精神症状, 缓解患者的精神活动障碍等问题。而正念减压疗法是一种心理治疗方法, 通过指导患者专注于当下的呼吸, 放松身心, 培育正念来减轻心理、精神及身体有关的痛苦, 从而达到辅助治疗的目的。陶凉, 成都市第四人民医院 610000

认知行为治疗联合奥氮平对精神分裂症患者认知功能、治疗态度及生活质量的影响

黄冬华*
江西省赣州市第三人民医院

目的 探讨精神分裂症患者采用认知行为治疗联合奥氮平治疗后, 对患者的认知功能、治疗态度及生活质量的影响。

方法 选取 2023 年 1 月至 2024 年 1 月于我院确诊的 90 例精神分裂症患者, 按照随机数字表法, 将患者分为对照组 (n=45, 奥氮平治疗) 和观察组 (n=45, 对照组基础上给予认知行为治疗)。比较两组总有效率、认知功能[神经心理状态评定量表评分 (RBANS)]、治疗态度[自知力与治疗态度问卷评分 (ITAQ)]、生活质量[世界卫生组织生存质量测定量表简表 (WHOQOL-BREF) 评分]及不良反应发生

情况。

结果 对照组临床总有效例数 36 例，占比 80.00%，观察组临床总有效例数 43 例，占比 95.56%，两组临床总有效率对比有差异 ($P<0.05$)；治疗后，两组治疗环境认知、言语功能、生理机能、疾病认知、即刻记忆、情感功能、延时记忆、用药态度认知、社会功能评分、注意力、躯体疼痛、视觉广度评分、病情复发及求助评分均升高，观察组升高更显著 ($P<0.05$)；不良反应发生率：对照组的为 8.89%，观察组的为 4.44% ($P>0.05$)。

结论 认知行为治疗联合奥氮平对精神分裂症的治疗效果较好，能改善患者的认知功能及治疗态度，有助于提高患者的生活质量。

关键词：精神分裂症；认知行为治疗；奥氮平；认知功能；治疗态度；生活质量

社区精神康复项目中康复治疗技术的应用及效果评价

刘静*

海南省平山医院

目的 探讨精神康复治疗技术在社区精神康复项目中的应用效果

方法 选取 2022 年 3 月至 2023 年 3 月期间接受精神康复治疗的成人社区康复项目参与者，分为常规治疗组和综合治疗组，每组 35 例。常规治疗组接受传统精神康复方法，综合治疗组则采用新型的精神康复治疗技术。评估两组的康复效果和生活质量。

结果 综合治疗组的康复效果和生活质量显著优于常规治疗组 ($P<0.05$)。

结论 精神康复治疗技术在社区精神康复项目中的应用效果显著，能有效提升患者的康复效果和生活质量。前言 随着对社会对精神心理健康重视程度的提高，精神康复治疗成为精神疾病恢复期的重要康复手段，也是社区日间康复服务的一个重要组成部分。精神康复治疗技术，特别是结合了个性化和集体支持的方法，为提升精神疾病患者康复效果和生活质量提供了新的可行性。本研究旨在评估这些技术在精神日间照护社区康复项目中的应用效果。通过深入分析，我们发现应用这些技术能够显

著增强患者的日常生活适应能力，提升其整体生活质量。精神康复治疗技术的核心在于其个性化治疗方案。康复师依据患者的个体差异，比如年龄、性别、病程、个人偏好和社会支持系统，量身定制一套综合性的康复计划，确保了治疗的针对性和有效性。这种个性化的方法有助于加强患者对治疗的认同感和参与度，提高治疗的响应率。从技术层面来看，精神康复治疗技术不仅限于传统的药物管理和普通康复治疗，它还包括认知行为疗法、社会技能训练、精神动力学治疗和家庭治疗、心理咨询及治疗等。

关键词：精神康复治疗技术；社区精神康复项目；康复效果；生活质量

口腔崩解片在精神卫生科用药中的临床分析

李旭士*

山西省长治心理康复医院

目的 口腔崩解片这种药物剂型在精神卫生科临床实践中的应用优势体现及具体表现。

方法 通过本院 69 例住院患者服用奥氮平口腔崩解片与服用奥氮平片 73 例患者的临床观察对照以及 86 例住院患者服用利培酮口腔崩解片与服用利培酮片 82 例患者的症状改善情况分析、对比口腔崩解片的剂型优势。

结果 对 35 例拒绝服药伴有注意力分散、夸大、语速加快、自我评价过高，判断力低下，情绪高涨等症状的患者服用奥氮平口腔崩解片后，以上症状改善的时间明显早于 38 例伴有同样症状服用奥氮平片的对照患者（5 天至 8 天）；对 34 例拒绝服药伴有情绪淡漠、少语、反映迟钝、社交淡漠的患者服用奥氮平口腔崩解片后，原有症状的改善程度明显优于 35 例伴有同样症状服用奥氮平片的对照患者。对 45 例拒绝服药伴有敌视、妄想、怀疑、思维紊乱、幻觉等症状的患者服用利培酮口腔崩解片后，原有此类阳性症状的改善明显优于 42 例服用利培酮片的对照组患者；对 41 例拒绝服药伴有负罪感、焦虑、抑郁等精神分裂症有关的情感症状的患者服用利培酮口腔崩解片后，症状改善的时间明显早于 40 例服用利培酮片的对照组患者（6 天至 10 天）。

结论 口腔崩解片这种药物剂型更方便于拒绝服药的精神疾病患者，崩解速度快、患者服药依从

性好、生物利用度高、便于精神卫生科特殊疾患的临床用药。

关键词：口腔崩解 药物剂型 生物利用度

扶阳穴位针灸治疗迟发性运动障碍的临床研究

陈自悦 刘飞 肖泽丹 滕文 赵金慧 袁晓雨 陈汉华*

武汉科技大学附属武汉市武昌医院精神心理科

目的 迟发性运动障碍 (Tardive dyskinesia, TD) 是一种由于长期使用抗精神病药物引起的锥体外系反应, 临床上以异常不自主运动为主要表现, 多影响患者舌、嘴唇、下颌和面部的运动, 严重影响患者的生活质量。本研究旨在探讨扶阳穴位针灸治疗 TD 的临床疗效, 为临床实践提供参考。

方法 研究自 2023 年 1 月至 2023 年 12 月收集病例进行分析。共 60 例迟发性运动障碍患者, 其中 30 例对照组不做处理, 另外 30 例观察组进行扶阳穴位针灸治疗 (大椎穴、脾俞 (shu) 穴、命门穴、腰阳关穴针灸治疗, 针刺得气后, 再用艾条灸每穴灸 5 分钟, 四穴, 反复灸 3 次, 疗程 8 周), 对比分析两组疗效。

结果 两组不自主运动量表 (AIMS) 评分比较: 两组治疗前的不自主运动量表 (AIMS) 评分差异无统计学意义 ($P>0.05$), 治疗后观察组的不自主运动量表 (AIMS) 评分小于对照组, 差异有统计学意义 ($P<0.05$)。

结论 观察组干预后, 不自主运动量表 (AIMS) 评分低于对照组, 差异显著 ($P<0.05$), 说明扶阳穴位针灸治疗对患者的 TD 症状改善较好, 能在一定程度上改善 TD 症状。扶阳穴位针灸治疗对患者的迟发性运动障碍效果具有良好的改善效果, 有助于提高患者生活质量, 临床应用价值较高。

海南省少数民族地区精神科护理管理新思路与新方法

黄海霞 刘辉* 陈盛柏

海南省平山医院

目的 精神病患者可能无太大身体上的疾病, 但他们大脑功能受到严重损害, 思维紊乱, 无法正常思考。所以开设精神科的临床意义在于更好的护理管理精神病患者, 并避免他们伤害他人。这次调查针对少数民族地区精神科护理管理, 探讨新思路与新方法, 更好的改善精神科护理管理工作, 同时分析精神科护理人员的执业压力, 为管理工作提供参考。

方法 2023 年 1 月至 2024 年 5 月, 对海南省中部少数民族 6 市县 230 名护士人员进行了聚类抽样, 并展开了问卷调查活动, 所有护士均签署了知情同意书, 表示愿意接受调查。纳入范围: 精神科临床护理的执业护士。总共发放了 230 份调查问卷, 211 份有效问卷, 回收率是 91.74%。以问卷调查的方式对海南省中部少数民族 6 市县 230 位精神科护士做描述性统计。

结果 在 211 名正在调查期间的护士队伍中, 只有 5 名男性护士。女性护理为 206 (97.63%); 平均年龄 (33 ± 7.82) 岁; 学历: 大专 76 名 (36.02%), 本科分别为 80 名 (37.91%)。全部精神科护士人员的执业压力认知准确概论从高到低如下: 医院环境的安全性能占 95.3%, 护理工作量 85.4%, 管理能力 82.1%, 医疗保健的合作为 71.6%, 自我素质能力 66.4%, 了解病人及其家属情况为 63.5%。

综上所述分析结果为少数民族地区精神科护理人员的工作压力主要因素包括医院的环境安全、护理工作量、管理的重要性及护理人员的素质等。

结论 随着时代的发展, 少数民族地区精神科护理人员紧缺是医院护理管理的突出问题, 相关管理者有效地支持与管理有利于缓解护理人员的工作压力, 建立完善的护理安全管理体系, 以减轻护士的心理负担。

精神卫生法实施前后海南省少数民族地区精神专科医院住院患者入院情况的对比分析

刘辉 黄海霞*
海南省平山医院

目的 非自愿住院制度是国际精神卫生立法过程中备受争议的问题。在《中华人民共和国精神卫生法》立法和实施进程中，非自愿住院制度的实体和程序要件始终处于争议和讨论之中。本次调查就是为了解精神卫生法实施前后海南省少数民族地区精神专科医院封闭式病房精神障碍患者入院相关情况的变化。

方法 参照国内外相关研究设计《海南省平山医院精神病人非自愿住院的调查表》，在相应病房进行问卷调查，要求主管护师在收治患者的时候询问家属相关情况填写，剔除填写不全及有填写错误的问卷。其中危险度评估参照卫生部《重性精神疾病管理治疗工作规范(2018版)》[3]中危险度的6级评估法，采用问卷调查的方式收集精神卫生法实施前后某精神专科医院的两个封闭式病房入院患者的一般资料、入院方式及危险度等信息，比较分析两组数据的差异。

结果 精神卫生法实施前后，住院形式的差异具有统计学意义($\chi^2=29.834, P=0.000$)，自愿住院的比例增加，强制住院的比例的下降；入院患者的诊断均以精神分裂症为主，但是精神卫生法实施后非精神分裂症患者的比例有增加；精神卫生法实施前后入院患者的危险度评估有统计学差异($\chi^2=34.457, P=0.000$)，0级比例上升，但同时3级及以上的比例也稍有增加。

结论 精神卫生法实施后封闭式病房自愿住院的比例虽有升高，但是还是处于偏低的水平，精神专科医院对于住院患者危险度的发掘更加规范、严谨，需要通过采取扩建开放式病房、规范非自愿住院程序等方法来进一步落实自愿住院原则。

关键词：精神卫生法；非自愿住院制度；自愿原则；精神专科医院；对比分析

特色团体心理治疗在白族老年睡眠障碍伴焦虑、抑郁患者中的应用

杜蕊*
大理白族自治州第二人民医院

目的 本研究旨在分析特色团体心理治疗对白族老年睡眠问题伴随焦虑和抑郁症状的患者的作用。

方法 采用便利抽样法，选取2023年3月至2023年8月在我院住院的白族老年睡眠障碍伴焦虑、抑郁患者，通过随机数表法进行分组，干预组46例，对照组46例。对两组患者的性别比例、年龄和病程等基本信息进行比较后，结果显示两组之间无显著统计差异($P>0.05$)，具有可比性。所有参与者在研究前已签署了知情同意书，此研究得到了本院伦理审查委员会的正式批准。

纳入标准：①患者需符合国际疾病分类第十版(ICD-10)中规定的睡眠障碍并伴有焦虑或抑郁障碍的诊断标准，且需由两位具备至少五年临床经验的精神科医生共同复审诊断；②年龄 ≥ 60 岁，男女均可；③患者为白族。排除条件：①存在严重的身体疾病、脑部器质性疾病、饮酒或药物成瘾以及怀孕者；②受试者在辅导周期内中途退出，未能完整参与，随访期间联系不上失访者。③辅导期间如果连续2周中断，则视为脱落。

对照组接受了抗精神病药物的治疗以及常规心理干预(如心理疏导、将康宣教等)。干预组患者在抗精神病药物的基础上，接受了含有白族特色的团体心理治疗。持续4周，每周进行两次。在干预开始和结束时，两个组别都接受了量表的评估。在此研究中，所有受试者都接受了稳定的药物治疗和指导。

结果 比较两组患者的基本信息后发现，两者之间没有显著的统计学差异(P 值均大于0.05)。干预后，对照组的HAMD、HAMA以及Piper疲劳量表的评分均显著低于干预组，这种差异具有显著的统计学意义($P<0.05$)。

结论 综上所述，特色团体心理治疗针对白族老年睡眠障碍伴焦虑、抑郁患者表现出良好的疗效，团体心理治疗能够有助于缓解患者的不良情绪及疲乏状态。由于研究条件、样本量限制及特色团体心理治疗方案的合理性等诸多因素，同时本研究未对特色团体心理治疗进行长期效应随访和评估，未来的研究需要增加样本量，以便更好地评估团体心理治疗有效性并为未来研究提供指导。

健脾疏肝润肠方对服用抗精神病药所致便秘患者血清 VIP、Ach 的影响及疗效观察

龚毅 吴东妮 张* 于纪泽
昆明市精神病院

目的 观察健脾疏肝润肠方治疗抗精神病药喹硫平所致脾虚肝郁型便秘对患者血清乙酰胆碱(Ach)和血管活性肠肽(VIP)的影响及临床疗效,探讨抗精神病所致便秘的病理机制和健脾疏肝润肠方可能的疗效机理,为中医药治疗抗精神病药所致便秘提供一定的理论依据。

方法 符合纳入标准的 35 例服用抗精神病药喹硫平后出现便秘的患者,采集基线数据后,内服健脾舒肝润肠方治疗 14 天,采用自身对照方法,在治疗前后分别测定患者血清 VIP、Ach 含量,对均值进行比较;同时记录治疗前后患者便秘主要症状分级量化积分表评分、患者便秘症状自评量表(PAC-SYM)评分,对临床疗效进行评估。

结果 治疗后,患者血清血管活性肠肽(VIP)含量较治疗前显著下降,乙酰胆碱(Ach)含量显著升高($P<0.01$),差异有统计学意义;同时,患者的便秘症状得到明显改善,便秘主要症状分级量化积分表评分和便秘患者症状自评量表(PAC-SYM)评分均显著下降,与治疗前比较,差异有统计学意义($P<0.05$)。

结论 健脾疏肝润肠方治疗抗精神病药喹硫平所致便秘,能显著改善患者的便秘症状,且未见明显不良反应,其机制可能与健脾疏肝润肠方对患者血清 VIP、Ach 两种神经递质的调节作用有关。

关键词: 便秘;抗精神病药;脾虚肝郁;乙酰胆碱(Ach);血管活性肠肽(VIP);中医药治疗

青少年精神病性抑郁症临床症状与认知功能间的中介效应

刘威¹ 杨建中²

1.昆明医科大学第二附属医院

目的 研究旨在探讨青少年抑郁症患者抑郁症状、焦虑症状和精神病性症状的严重程度与认知功能之间的相关性。

方法 本研究为病例-对照研究,分别纳入首次就诊且未用药的伴有精神病性症状的抑郁症患者(Psychotic Depression, PD) 88 例、不伴有精神病性症状的抑郁症患者(Non-psychotic Depression, Non-PD) 76 例和在性别、年龄、受教育程度上匹配的健康对照 87 例。研究中使用贝克抑郁量表、贝克焦虑量表、简明精神病量表、认知功能用认知成套测量工具(MATRICES Consensus Cognitive Battery, MCCB)来评定患者的临床症状及基线水平的认知功能。首先,对三组间进行一般人口学、临床症状、认知功能的差异性比较;然后,分别对 No-PD 组和 PD 组进行临床症状与认知功能之间的相关性分析;最后针对 PD 组中的相关变量进行中介分析。

结果 1. PD 组在焦虑及抑郁症状量表的评估中所有得分均高于 No-PD 组,且具有统计学意义($P<0.05$)。

2.三组之间在认知功能的差异性比较中,发现三组间在不同认知领域得分及 MCCB 总分比较之间均存在统计学差异($P<0.001$),其中 MCCB 总分以 PD 组得分最低(38.5(29.0,48.0)分)。

3.链式中介效应由 3 个间接途径组成:间接效应 1:一般因子-生理反应因子-注意力/警觉性领域(34.65%);间接效应 2:一般因子-思维障碍因子-注意力/警觉性领域(24.49%);间接效应 3 一般因子-生理反应因子-思维障碍因子-注意力/警觉性(13.61%)。间接效应 1 所对应的 95%置信区间为[-0.0039,-0.2186];间接效应 2 所对应的 95%置信区间为[-0.0133,-0.1502];间接效应 3 所对应的 95%置信区间为[-0.0065,-0.0944],上述区间均不包含 0,因此说明上述 3 条间接效应成立,所以生理反应因子和思维障碍因子在模型中起到了显著的中介作用,而直接效应检验的结果置信区间包含 0,说明直接效应不成立。根据系数检验的结果可以计算中介作用的间接效应为 72.78%,直接效应占比为 27.22%。

结论 对于青少年抑郁症而言,精神病性症状的产生使情绪障碍变得复杂化。本研究结果发现相较于 Non-PD 患者,PD 患者的抑郁及焦虑症状更重,并且更严重的焦虑及抑郁症状与更多认知领域的功能损伤之间存在相关性,以信息处理速度领域和注

意力/警觉性领域中的功能损害最为显著。研究中通过中介效应分析结果发现：在 PD 组中“一般因子-生理反应因子-思维障碍因子-注意力/警觉性领域”链式中介结果成立。

关键词：青少年；抑郁症；精神病性抑郁症；神经认知功能；链式中介效应

青少年精神病性抑郁症认知功能与前额叶神经生化代谢物的相关研究

刘威¹ 杨建中²

1.昆明医科大学第二附属医院

2.浙江大学医学院附属第一医院

目的 研究旨在探讨伴有精神病性症状的青少年抑郁症患者抑郁症状、焦虑症状、精神病性症状及认知功能与前额叶中 GABA、Glu、Cho、NAA 等神经生化代谢物含量的相关性。

方法 本研究为病例-对照研究，分别纳入首次就诊且未用药的伴有精神病性症状的抑郁症（PD）36 例和在性别、年龄、受教育程度上匹配的健康对照 35 例。研究中使用贝克抑郁量表（BDI-II）、贝克焦虑量表（BAI）、简明精神病量表（BPRS）、认知功能用认知成套测量工具（MCCB）来评定患者的临床症状及基线水平的认知功能。使用磁共振波谱成像技术（MRS）进行前额叶神经生化代谢物的测量。利用 J 差异编辑点分辨波谱技术（MEGA-press）及 Gannet 软件对 MRS 数据进行绝对定量分析，获得 GABA/W、Glu/W、GABA/Glu 的比值；利用磁共振系统自带波谱处理软件自动完成基线校准、信号平均、代谢物识别的半定量分析，得到 NAA/Cr、Cho/Cr、NAA/Cho 比值。首先进行两组间一般人口学、临床症状、认知功能的差异性比较；然后对临床症状、认知功能分别与前额叶脑区中的神经生化代谢物含量进行相关性分析；最后，针对相关变量进行线性回归分析。

结果 线性回归分析结果显示：①以 NAA/Cr 为自变量 X1，思维障碍因子为应变量 Y1 构建线性回归方程，结果发现 NAA/Cr 比值大小对思维障碍因子的影响存在统计学差异。线性回归方程为： $Y1 = 12.182 - 4.062 \times X1$ 。②以 NAA/Cr 为自变量 X1，信息处理速度领域为应变量 Y2 构建线性回归方程，

结果发现 NAA/Cr 比值大小对息处理速度领域的影响存在统计学差异。线性回归方程为： $Y2 = 19.791 + 16.430 \times X1$ 。③以 NAA/Cr 为自变量 X1，MCCB 总分为应变量 Y3 构建线性回归方程，结果发现 NAA/Cr 比值大小对 MCCB 总分的影响存在统计学差异。线性回归方程为： $Y3 = 19.304 + 17.409 \times X1$ 。④以 NAA/Cho 为自变量 X2，MCCB 总分为应变量 Y3 构建线性回归方程，结果发现 NAA/Cho 比值大小对 MCCB 总分的影响存在统计学差异。线性回归方程为： $Y3 = 22.941 + 8.681 \times X2$ 。

结论 与健康对照组相比，青少年精神病性抑郁症（PD）患者不仅认知功能存在缺陷，而且在内侧前额叶脑区中神经生化代谢物含量也存在差异。在青少年 PD 患者中，精神病性症状的产生和认知功能会随着内侧前额叶脑区中神经生化代谢物含量的变化而变化，说明青少年 PD 患者中精神病性症状和认知功能存在神经生化的异常。

一例“嗜铬细胞瘤所致精神障碍”患者的诊疗分析

马学银（宁夏）^{1,2} 马圆圆^{1,2}

1.宁夏回族自治区宁安医院

2.宁夏精神卫生中心

目的 探讨以幻觉妄想为首发症状的躯体疾病的诊疗思路

方法 患者，女性，42 岁。主因“情绪不稳，兴奋话多 2 月余，自杀 1 天”收入院。患者于 2 月前无明显诱因渐出现精神异常，表现为情绪不稳，兴奋话多，易于他人攀比，花钱大手大脚，夜眠差，有时整晚不睡觉。之后上述症状加重，表现为言语夸大，称“自己是神仙，全世界、地球都是自己的；自己是国家领导人”。当时首次在我院住院治疗，诊断为“躁狂发作”，给予“齐拉西酮片 60mg/日，碳酸锂缓释片 1.2g/日”治疗 10 天，患者精神症状有所好转，但病情未完全缓解。出院后患者自行停药，再次出现骂人，打人，言语紊乱，称“自己是神仙”等，不停拍打自己，殴打丈夫，坚信孩子被绑架。后再次住院治疗，住院期间患者总是诉说“心里有一个人和自己说

话”；情感高涨，言行夸大，激惹性增高。诊断为“伴有精神病性症状的躁狂发作”，给予抗精神病药物对症治疗，精神症状无缓解，且有自杀企图及行为，病情逐渐加重，先后3次住院治疗，末次住院诊断“分裂情感性障碍”。患者既往有“晕厥”史，住院期间有过2次“晕厥”现象，血压最高达180/110mmHg，口服两种降压药后血压仍控制不理想。否认高热惊厥。否认癫痫发作病史。家族史无特殊记载。

体格检查及辅助检查：BP155/110mmHg，K⁺2.9mmol/L，意识朦胧，颜面部浮肿。生理反射存在，病理征未引出。腹部B超未发现肝脏、肾脏、脾脏异常结果。精神检查：意识朦胧，对答欠切题，情感反应不协调，可查及幻觉及妄想等精神病性症状；言语夸大，激惹性增高；自知力缺失。

结果 (1)综合患者的精神症状特征、疾病演变及既往躯体疾病情况，初步考虑诊断“分裂情感性障碍”；高血压病；低钾原因待查。(2)处理措施：综合评估患者存在不明原因血压升高、低钾，且经过抗精神病药物治疗后精神病性症状改善无效，故就诊综合医院进一步明确病因。行腹部增强CT示“肾上腺肿瘤”，后诊断为“原发性醛固酮增多症”、“嗜铬细胞瘤”，行手术治疗。疗效评估：行“嗜铬细胞瘤摘除术”后，患者精神症状随之消除，院外生活如常人，坚持上班，工作胜任，未再服用精神科药物。

结论 诊疗思考：针对以精神症状为首发症状的躯体疾病，尤其涉及内分泌疾病时，应全面评估躯体状况，优先考虑躯体疾病亦可能出现精神症状，尤其以精神病性症状更为突出。其次，全面评估躯体症状与精神症状之间的关联性，精神症状难以控制时，要全面分析引起“精神症状”的原发病因，及时处理原发疾病，降低疾病风险及负担。该患者不明原因血压升高、低钾、颜面部浮肿、晕厥、难以控制的精神症状，为最终的疾病诊断提供了强有力的临床线索。

关键词：原发性醛固酮增多症 嗜铬细胞瘤 幻觉妄想 情感症状 高血压 低钾

一例“难治性精神分裂症”患者的诊疗分析

马圆圆^{1,2} 马学银^{1,2} 田沛云^{1,2} 杨秋丽^{1,2}

1.宁夏回族自治区宁安医院

2.宁夏精神卫生中心

目的 探讨难治性精神分裂症的诊疗思路

方法 患者，女性，53岁。主因“凭空闻语、怀疑被害16年，复发2月”收入院。患者于16年前因婚姻问题逐渐出现精神异常，主要表现为对亲人冷漠，自言自语，述凭空听到许多声音在议论她，说她坏话。行为怪异，不停挥动手臂。疑心大，怀疑有人迫害她、敲诈她，怀疑当地有一黑社会团伙组织到处跟踪、监控她，坚信电视上的节目与自己的经历有关。曾先后多次住院治疗，均诊断“精神分裂症”，先后给予“利培酮片”“氯氮平”足量、足疗程治疗后症状未充分缓解。期间服用氯氮平时出现白细胞、中性粒细胞缺乏，故未再使用氯氮平。院外患者不规律服药，甚至拒绝服药，病情一直未完全缓解，个人生活能力、人际交往及社会功能明显受损，独居，不与他人交往。后因病情加重再次住院治疗。既往史无特殊记载。家族中其妹妹患有“精神分裂症”，曾住院治疗。

体格检查及辅助检查：生命体征平稳，未发现阳性体征。辅助检查未见明显异常。

精神检查：意识清，定向力完整，接触极差，主动违拗，治疗护理不合作，拒食，拒药。明显情绪不稳，行为冲动，伤人毁物。存在反复出现的言语性、命令性幻听，原发性被害妄想及被跟踪、被监视体验；思维散漫，言语交流困难；行为怪异、愚蠢，随地小便，赤身裸体。存在消极观念，言语表达自杀企图。意志行为明显减退，自知力丧失。未查及显著情绪低落或情感高涨等病理性情感症状。

结果 (1)诊断：综合患者的精神症状特征、疾病演变及既往住院诊疗经过，诊断难治性精神分裂症(TRS)已明确。(2)处理措施：综合评估患者存在营养摄入、冲动伤人、自杀等风险，故首选MECT(无抽搐电休克)治疗及口服利培酮口服液，控制急性期激越症状，降低医疗风险；考虑患者既往院外服药依从性差，故给予棕榈酸帕利哌酮注射液长效剂肌肉注射(每月一次)，提高治疗依从性，期望有效改善精神症状，降低复发风险。(3)疗效评估：经系统治疗后幻觉、妄想及行为瓦解完全消除，病情痊愈出院。院外门诊规律随诊，定期每月肌注棕榈酸帕利哌酮注射液长效针，日常生活能力及社会功能恢复良好，近3年来病情未复发。

结论 诊疗思考：据文献报道，经过初始治疗的首发精神分裂症患者有10%-15%会成为TRs，所

有患者中, 最终有 30% 成为 TRS。(1) 针对难治性精神分裂症患者应全面评估病情, 加强对急性期精神症状的控制, 延缓病情发展, 降低复发风险。(2) MECT、棕榈酸帕利哌酮注射液长效针剂的应用对于难治性精神分裂症的改善是一种较好的治疗措施, 值得临床推广。

关键词: 难治性精神分裂症 MECT 棕榈酸帕利哌酮注射液长效针剂 复发风险

人际心理治疗对产后抑郁障碍疗效的随机对照研究

陶晶 王洪艳 姚佳宇 郑子蔚 赵文清 王媛 苏珊珊 粟幼嵩 赵亚婷 仇剑峯*
上海市精神卫生中心

目的 了解产后抑郁障碍患者采用人际心理治疗 (Interpersonal therapy, IPT) 联合药物治疗与单用药物治疗对比的疗效差异。

方法 纳入 2020 年 4 月到 2023 年 2 月在我院门诊就诊的发病于产后一年内的抑郁障碍 (Major Depressive Disorder, MDD) 患者共 27 人, 随机将其分入药物治疗组以及药物治疗联合 IPT 治疗组, 药物治疗采取抗抑郁药物治疗, 本研究选择用 SSRIs、SNRIs 类药物, 持续治疗 16 周。有睡眠障碍者可合并使用促眠药物, 但连续使用不超过 1 月, 不合并使用其他精神类药物。IPT 治疗为期 8 周, 每周一次, 每次 50 分钟, IPT 治疗师完成 IPT 治疗的理论培训且获得相应证书, 并在治疗过程中持续接受督导。采用汉密尔顿抑郁量表 (HAMD)、汉密尔顿焦虑量表 (HAMA) 作为主要结局指标。

结果 研究对象在入组基线之后脱落 9 人; 治疗开始之后随访脱落 2 人; 最终纳入分析数据共计 16 人 (其中药物治疗组 7 人, IPT 联合药物治疗组 9 人)。主要疗效指标 HAMD 结果显示, 时间的主效应显著 ($F = 15.312, p < 0.001$), 提示两组在接受治疗后 HAMD 分数均有所改善, 但组别和时间的交互作用不显著 ($F = 0.581, p = 0.744$)。提示两组改变的组间差异不显著。对于药物组, 从治疗后的 8 周 (LS mean difference = 12.273, $t = 4.091, p = 0.003$) 开始后的随访和基线存在显著差异, 即治疗的改善从治疗后的 8 周开始; 而联合 IPT 治疗组的显著改善从

4 周开始 (LS mean difference = 10.750, $t = 4.379, p = 0.001$)。主要疗效指标 HAMA 结果显示, 时间主效应显著 ($F = 21.309, p < 0.001$), 提示两组在接受治疗后的 HAMA 分数均有所改善, 但组别和时间的交互作用不显著 ($F = 0.963, p = 0.459$), 提示两组改变的组间差异不显著。药物组的显著改善从 8 周开始 (LS mean difference = 9.063, $t = 4.617, p = 0.001$); 而联合 IPT 治疗组的显著改善从 4 周开始 (LS mean difference = 7.750, $t = 4.843, p < 0.001$)。

结论 单用抗抑郁药物治疗与抗抑郁药物联合 IPT 治疗对于改善产后抑郁障碍患者的抑郁焦虑症状均有较好的疗效, 本研究提示两组间总体疗效无明显差异, 但联合 IPT 治疗能够帮助更早期改善症状。

关键词: 人际心理治疗, 围产期, 抑郁障碍, 随机对照, 疗效

高焦虑组和低焦虑组患者焦虑症状、生活质量、认知情绪关联性网络分析研究

苏珊珊 任雪晴 仇剑峯*
上海市精神卫生中心

目的 不同焦虑障碍患者的焦虑水平和认知情绪调节能力有所不同, 且既往研究提示焦虑水平越高其生活质量越差。本研究旨在通过网络分析的方法探索不同焦虑水平的焦虑障碍患者焦虑症状、生活质量、认知情绪的差异。

方法 研究收集 458 例焦虑障碍受试者, 网络分析纳入的变量有焦虑症状、生活质量、认知情绪。采用汉密尔顿焦虑量表 (Hamilton Anxiety Scale, HAMA) 和 7 项广泛性焦虑障碍量表 (Generalized Anxiety Disorder-7, GAD) 评估患者的焦虑症状, 且以汉密尔顿焦虑量表 (Hamilton Anxiety Scale, HAMA) 得分为分类标准, ≥ 21 分为高焦虑组 ($n_1 = 232$), < 21 分为低焦虑组 ($n_2 = 226$)。使用世界卫生组织生活质量测定简表 (World Health Organization Quality of Life Scale-Brief Form Questionnaire, WHOQOL-BREF) 评估患者的生活质量; 使用认知情绪调节问卷 (Cognitive Emotion Regulation Questionnaire, CREQ) 来评估患者的认知情绪。

结果 高焦虑组和低焦虑组网络比较分析结果

显示两组分在显著差异 ($\text{maximum difference} = 0.353$, $p < 0.01$)。其中,低焦虑组的不自主担忧和难以放松之间的相关、焦虑和易激惹之间的相关、焦虑和躯体化之间的相关、难以放松和自责之间的相关等症状之间的关联均显著大于高焦虑组。

结论 不同焦虑水平的焦虑障碍患者焦虑症状、生活质量、认知情绪等维度之间的关联性存在明显异常。

关键词: 焦虑障碍, 网络分析, 高焦虑组, 低焦虑组

边缘型人格障碍的症状特征的范式研究进展

杨阳 仇剑峯*
上海市精神卫生中心

目的 边缘型人格障碍指 (Borderline Personality Disorder, BPD) 的是一种以情绪、自我意识以及人际关系不稳定为特点的人格障碍类型。以往针对 BPD 症状的研究主要采用量表的方式,其结果容易受主观性和社会赞许性的影响,使用行为学范式对 BPD 症状的研究能够弥补这一部分,较准确、客观地测量到相对真实的情境下 BPD 患者的外显和内隐模式。本文旨在整理边缘型人格行为学研究范式的结果和未来研究展望,以期扩大针对 BPD 患者的行为学研究的规模及应用场景,结合多种干预方法以及生理测量方法,揭露 BPD 患者深层的认知和行为模式,增进研究者和精神卫生工作实践者对于 BPD 的思考和理解。

方法 本文使用文献检索与梳理的方法,就人际不稳定性、情绪不稳定性、自我观念不稳定性及冲动性四个角度梳理了针对 BPD 症状特征的行为学研究范式及其进展,比较了不同行为学范式中结果的差异并提出未来可能的研究发展方向。

结果 人际不稳定: 主要范式有眼神读心测验、信任博弈范式、情绪 Stroop 范式和情绪 go/no-go 范式。BPD 患者非常在意人际关系中的各种信息,但容易“夸大”社交对象的消极情绪或“曲解”积极情绪相关线索。以往研究缺少对于心理状态与人际模式交互作用的探讨。

情绪不稳定: 主要范式有网络投球范式和材料启动范式。BPD 患者更容易产生强烈的消极情绪,

通常和人际交往有关; BPD 患者会低估自己的外在情绪表露,病尽力放大自己的情绪表现以达成某种“社交目的”。未来研究可进一步探讨人际和情绪之间的交互作用,或者弥补 BPD 积极情绪相关研究的空白。

自我不稳定: 主要范式有自我参照启动和特质判断回忆任务。BPD 患者对自己的评价是负面的,也会预测外界给自己的评价全部是负面的,甚至在得到积极评价时感到“更加不悦”。对 BPD 自我不稳定性的研究相对较少,未来研究可适当增加该方面研究。

冲动性: 主要范式有相似图像配对范式、概率反转范式、延迟折扣任务、停止信号任务、仿真气球风险任务等。BPD 患者所共有的冲动性更多地体现在某些特定的维度上,且某些亚型具有某些特定的冲动性特质,似乎和情绪相关。未来研究可在基于上述结果进一步探讨 BPD 冲动性“共性”和“个性”以及与情绪相关的部分。

结论 相比于量表, BPD 行为学研究少。行为学研究具有标准统一、能测得内隐特征、外部效度高、适合相互比较的优点。未来研究可尝试纳入多种生理测量方法关注干预阶段各项行为学指标的动态变化,并纵向或横向地结合或对比多种行为学范式以深入探讨 BPD 患者异常的思维、情绪和行为模式,为针对性干预提供实证证据。

Sex Differences in Loneliness, Social Isolation, and Their Impact on Psychiatric Symptoms and Cognitive Functioning in Schizophrenia.

Jinghui Chi Shen Li*
Tianjin Anding Hospital

Background Social isolation and loneliness, objective and subjective features of dysfunctional social relationships, are more prevalent in schizophrenia (SCZ) patients. This study aimed to explore sex differences in loneliness and social isolation among Chinese SCZ patients, and to investigate their relationships with psychiatric symptoms and cognition

Methods A total of 323 SCZ patients, comprising 136 males and 187 females, were recruited. Psychopathology, cognitive functioning, loneliness and social isolation were assessed using the Positive and Negative Syndrome Scale (PANSS), the Repeated Battery for Assessment of Neuropsychological Status (RBANS), the UCLA Loneliness Scale (Version 3) and the Social Isolation Index

Results Male patients exhibited higher UCLA total score and social isolation score compared to females ($p < 0.05$). In male patients, both loneliness and social isolation significantly predicted PANSS total score ($p < 0.01$), N subscore ($p < 0.05$) and G subscore ($p < 0.05$). For female patients, loneliness significantly predicted immediate memory ($p < 0.001$), language ($p = 0.013$), delayed memory ($p = 0.017$), and RBANS total scores ($p = 0.002$). Further examination of loneliness components in female revealed that personal feelings of isolation were negatively associated with language ($p = 0.001$) and lack of collective connectedness were negatively associated with delayed memory ($p = 0.048$)

Conclusion Loneliness and social isolation are more pronounced in male SCZ patients than in females. Both loneliness and social isolation are positively related to psychiatric symptoms and cognitive functioning in male patients, while loneliness is negatively associated with cognitive functioning in female patients

Brief Interpersonal Psychotherapy For Major Depressive Disorder Patients In China: A Pilot Randomized Controlled Trial

Jingkai Chen², Xiaoyi Zhou², Manli Huang², Chanchan Hu², Zhong Wang², Jianbo Hu², Shiyi Zhang¹

1.Zhejiang University

2.The First Affiliated Hospital of Zhejiang University School of Medicine

Objective Brief Interpersonal Psychotherapy

(IPT-B) suits Chinese population for its brevity and accessibility. However, evidence supporting its effectiveness for depressive patients in China is scarce. This randomized controlled pilot trial examined the preliminary efficacy of IPT-B for adult major depressive disorder (MDD) patients in China

Methods Thirty-eight patients diagnosed with MDD were randomized to IPT-B + medication group and medication group. IPT-B was delivered in-person with 8 weekly 45-minute sessions. Assessments were conducted at baseline, treatment weeks 2, 4 and post-treatment to track changes in depression and anxiety symptoms (Hamilton Depression Scale-24, Hamilton Anxiety Scale), suicidal risks (Beck Scale for Suicide Ideation), subjective experiences (McGill Pain Questionnaire, Snaith-Hamilton Pleasure Scale, Motivation and Energy Inventory) and cognitive functioning (Perceived Deficits Questionnaire-Depression)

Results For both groups, there were significant pre- and post-treatment decrease in depression symptoms, anxiety, suicidal risk, and sensory and affective pain ($p < 0.05$), as well as significant increase in motivation/energy, cognitive functioning, and pleasure experience ($p < 0.05$). Motivation/energy increased more in the IPT-B + medication group than in the medication group ($p = 0.001$). Significant differences favoured IPT-B + medication group for lower levels of pain at Week 2 and 4, and lower suicidal risk at Week 4

Conclusion IPT-B is promisingly an effective and feasible treatment for depressive patients in China, which can be combined with medication and perform better in many aspects than medication alone. This trial is pioneering in investigating use of IPT-B in China. Future studies should benefit from exploration of its applicability, efficacy and mechanism of change in Chinese population

关键词: brief interpersonal psychotherapy; major depressive disorder; Chinese population; combining medication; symptoms; suicidal risks

Plasma Metabolites and Inflammatory Factor

Characteristics in Obsessive-compulsive Disorder Patients

Guoqing Chen^{1,2}, Minyao Xie^{1,2}, Xiao Zhao^{1,2}, Haocheng Chen^{1,2}, Chenchen Shao^{1,2}, Xuedi Zhang^{1,2}, Yu Wu^{1,2}, Na Liu^{1,2}, Ning Zhang^{1,2}

1.The Affiliated Brain Hospital of Nanjing Medical University

2.Department of Medical Psychology,The Affiliated Brain Hospital of Nanjing Medical University

Background Individuals with obsessive-compulsive disorder (OCD) frequently exhibit metabolic disorders and atypical inflammatory responses. However, research on specific metabolic characteristics associated with OCD is lacking. This study aimed to investigate alterations in serum metabolites and inflammatory factors in OCD patients and analyze their correlation with the severity of the disorder

Methods The study included 55 patients with moderate-to-severe OCD (either medication-naive or off-medication for at least eight weeks) and 54 healthy controls (HCs). Demographic information and clinical scales were collected for both groups. We assessed obsessive-compulsive symptoms using the Yale-Brown Obsessive-Compulsive Disorder Scale (Y-BOCS). Untargeted metabolomics analyses were performed using ultra-high-performance liquid chromatography with high-resolution mass spectrometry (UHPLC-LC-MS/MS) to detect metabolites in blood samples. An enzyme-linked immunosorbent assay (ELISA) measured levels of interleukin-1 β (IL-1 β), IL-6, IL-2, IL-12, and tumor necrosis factor α (TNF- α). Spearman correlation analysis examined the relationships between blood metabolites, inflammatory factors, and clinical measures

Results A total of 298 metabolites were identified from 109 samples, with 49 showing notable variations. After false discovery rate (FDR) correction, 11 metabolites were statistically significant ($P < 0.05$). These metabolites, mainly lipids, organic acids, and organic compounds, are involved in amino acid, lipid, and vitamin biosynthesis, energy metabolism, and other secondary metabolites. In addition, five inflammatory factors were significantly higher in OCD patients than in

HCs. Spearman correlation analysis revealed significant correlations among metabolites, inflammatory factors, and clinical symptoms in patients with severe OCD (Y-BOCS > 25). Specifically, the neurotransmitter acetylcholine was positively correlated with the Y-BOCS score and compulsion. Phosphocholine was positively correlated with the Obsessive-Compulsive Inventory-Revised (OCI-R), and ordering behavior was positively correlated with lysophosphatidylcholine 20:4 (LPC 20:4) and phosphocholine. IL-1 β was negatively correlated with compulsion, OCI-R total score, and neutralization. IL-6 was negatively correlated with lysophosphatidylethanolamine 22:6 (LPE 22:6), and TNF- α was negatively correlated with hoarding. Using the 4 key metabolites (acetylcholine, dimethyl 4-hydroxyisophthalate, scutellarin, and LPE 22:6) as biomarkers for diagnosing OCD, the receiver operating characteristic (ROC) curve showed an area under the curve (AUC) of 0.89, indicating high diagnostic ability

Conclusion The study found distinct changes in blood metabolites and inflammatory factors in OCD patients, with strong links to clinical symptoms. Specific plasma metabolites have the potential to serve as biomarkers for diagnosing OCD, providing new insights for future diagnostic and therapeutic approaches.

精神分裂症患者加用组胺类药物服用疗效的荟萃分析

胥大鹏 朱宇章*

中国医科大学附属第一医院

目的 精神分裂症是常见的精神疾病。患者主要临床表现为思维、知觉、情感、意志以及认知功能异于常人，且不同患者的临床表现不尽相同，对患者自身、家庭以及社会均会造成较大的困扰和负担。患者服用的抗精神病药物因为对体内激素，递质的影响，导致目前有一些研究发现组胺类药物，包括H1受体激动类药物及H2受体拮抗类药物可以改善精神分裂症患者服用抗精神病药引起的体重增加及

改善精神症状。本研究旨在通过 meta 分析提高原结果的统计效能,解决各研究结果的不一致性,得出更加合理可信的结论用于指导临床治疗,使更多的精神分裂症患者获益。

方法 本研究选取了 16 篇文献,数据来源于 Pubmed,Embase,Web of Science,Cochrane Library,PsycINFO,and Chinese database。研究数据截止到 2024 年 6 月。Revman5.4 软件被用来分析相关的数据,包括患者的体重,BMI,甘油三酯,胆固醇,高低密度酯蛋白,血糖,PANSS 总分,PANSS 阴性得分等数据,对其用森林图等方法 meta 分析

结果 最后,16 个随机对照实验满足了相关的入排标准,总共包括了 1045 名患者。数据的结果展示了 H1 受体激动类药物及 H2 受体拮抗类药物可以减少精神分裂症患者服用抗精神病药物所引起的患者的体重的增加程度,患者用体重变化进行比较有显著的区别 (SMD=-1.35, 95% CI [-1.67,-1.03], P<0.00001。患者用甘油三酯变化进行比较有显著的区别 (SMD=-0.17, 95% CI [-0.24,-0.11], P<0.00001。患者用 PANSS 阴性变化值进行比较有显著的区别 (SMD=-1.53, 95% CI [-2.59,-0.47], P=0.005; 患者用 BMI 变化进行了比较有显著的区别 (SMD=-1.04, 95% CI [-1.78,-0.3], P=0.01;

结论 精神分裂症患者服用抗精神病药物同时加用组胺类药物,包括 H1 受体激动类药物及 H2 受体拮抗类药物可以减少精神分裂症患者服用抗精神病药物所引起的患者的体重的增加程度并改善精神分裂症患者的阴性症状,且不良反应少,患者依从性高,可以作为辅助精神分裂症患者服用抗精神病药物的一种选择

Efficacy of Micro-Video Psychological Training Camp in Reducing Symptom of Depression and Anxiety and Improving Mental Resilience

Wenqing Zhao^{1,2}, Wanlin Tang^{1,2}, Jianyin Qiu^{1,2}

1.Shanghai Mental Health Center, Shanghai Jiao Tong University School of Medicine, Shanghai

2.Shanghai Mental Health Center

Objective Digital self-help psychological interventions based on modern new media technology can effectively address the current imbalance between supply and demand in mental health services, with significant economic and social benefits. As an online self-help platform for psychological intervention, Micro-Video Psychological Training Camp (MVPTC) platform was developed for those who suffer from mild to moderate symptoms of depression and/or anxiety and is tasked with the goal of reducing depressive and anxious symptoms while improving mental resilience. Thus, this study will be carried out to verify its efficacy and applicability

Methods A total of 242 individuals with mild to moderate symptoms of depression and anxiety were recruited and randomly assigned to either the micro-video psychological training camp intervention group (N=166) or the wait-list control group (N=76). Both the intervention and assessment were completed by participants online. The appropriateness indicators used in this study, according to its research objectives, included completion rate, dropout rate, overall satisfaction, and user feedback for the intervention group. The effectiveness indicators included differences in scores on self-rating depression scale (SDS), self-rating anxiety scale (SAS), and Connor-Davidson resilience scale (CD-RISC) at different time points (Baseline, post-intervention, 1-month and 3-month follow-up) between the two groups

Results For adherence, one hundred and one participants (60.84%) completed the courses, whose average satisfaction score was 3.06±0.41. Of these, forty-eight patients (73.85%) dropped out during the intervention. For intervention outcomes, the results of linear mixed model showed that the Group × Time effect was significant for SDS scale scores (F(3, 1026) = 6.84, p < 0.001, η²=0.07), SAS scale scores (F(3, 1026) = 6.15, p < 0.001, η²=0.10) and CD-RISC scale scores (F(3, 1026) = 4.50, p = 0.004 < 0.01, η²=0.26). Compared to the Controlled group, participants' depression symptoms and anxiety symptoms in the Intervention group declined faster, and their resilience score improved significantly, which could maintain during the three-month follow-up period

Conclusion MVPTC developed in this study is

applicable to individuals with mild to moderate depression and anxiety symptoms. And its effectiveness has been verified. It can effectively alleviate the depressive and anxious symptoms of individuals with mild to moderate depression and anxiety, which can be maintained during a 3-month follow-up period. At the same time, it can also improve the psychological resilience of individuals with mild to moderate depression and anxiety. Digital self-help psychological interventions can be used for mental health services targeting individuals with mild to moderate depression and anxiety symptoms

The Unique Value of Reading The Bible in The Psychological Treatment of Patients with Depression and Its Deeper Implications

Hanmei Du*

Beijing HuiLongGuan Hospital (Peking University Huilongguan Clinical School of Medicine)

Objective In exploring the influence of various religious classics on psychotherapy, we can gain a deeper understanding of why the Bible has its unique value and significance in this area. Reading the Bible can be used as an adjunctive therapeutic tool in the treatment of depression, although not a direct medical treatment

Methods Uniqueness of the Bible

The Bible has several unique characteristics compared to the classics of other religions:

1. Formation process and time span: The process of writing the Bible took about 1,600 years to complete, and this long time span reflects its deep historical deposits and continuous religious development. Compared with the classics of other religions, the formation process of the Bible is more complex and time-consuming.

2. Diversity of authorship: The Bible was written by more than forty people of different professions, including kings, farmers, philosophers, fishermen, etc.

This diversity of authorship backgrounds makes the Bible rich and diversified, and able to reflect the life and beliefs of mankind from multiple perspectives.

3. Harmony and consistency of content: Despite the fact that the Bible has many authors and was written at different times and places, its content shows a high degree of harmony and consistency. The volumes interpret each other and together they build a complete and unified religious worldview. Such coherence and unity of content is not common in other religious classics.

4. Popularity and Influence: The Bible is one of the best-selling books in the world, and its popularity and influence are difficult to compare with those of other religious classics. It not only has an important position in the field of religion, but also has a far-reaching influence on many fields such as literature, art and philosophy.

5. Miracle of Preservation and Transmission: Although the Bible has been in danger of being destroyed many times in the course of history, it has still been preserved intact and transmitted to this day. This miracle of preservation and transmission highlights the high status and irreplaceability of the Bible in the hearts of believers.

To summarize, the Bible shows its uniqueness compared to other religious classics in terms of its formation process, the diversity of its authorship, the harmony and consistency of its content, its popularity and influence, and the miracle of its preservation and transmission.

The Bible is more than a fundamental Christian classic; it is a universal guide to morality and behavior. The values embedded in it, such as tolerance, love, kindness and sacrifice, provide a clear direction for patients to live by. In psychotherapy, these values can help patients to re-examine their behaviors and attitudes and guide them towards a more positive and active lifestyle. By reading and understanding these teachings, depressed patients can better think about and adjust their behavior, find more positive and healthy goals in life, and gradually change their negative emotions and mindsets in practice.

In addition, the moral code of the Bible provides a mirror for patients to reflect on their own behavior. It encourages people to do good and avoid ill will, and this

positive moral guidance helps the patient to adjust his or her behavior and thought patterns in psychotherapy.

2. Strong psychological comfort and support

Sufferers of psychological problems, especially those who are emotionally traumatized or who are experiencing psychological difficulties, often need outside comfort and support. Many chapters in the Bible are strongly comforting in nature, and they provide a spiritual pillar for patients to rely on. This comfort comes not only from the text, but from the power of faith, which can help patients regain meaning and purpose in their lives.

3. Community Support and Sense of Belonging

Religious groups usually provide a community environment with common beliefs and values. In such an environment, individuals are able to receive support, encouragement and care from other members, reducing feelings of loneliness and low self-esteem, and this community support plays an important role in the treatment and prevention of depression. Human beings are social animals, and we all need to connect with others and feel belonging and accepted.

4. Clear motivation for behavior change

The teachings in the Bible not only provide patients with spiritual comfort, but also provide them with clear guidance on behavior. It encourages people to pursue truth, goodness and beauty, and to avoid evil and depravity. This clear moral guidance, combined with community support and encouragement, provides patients with a powerful motivation to change their behavior. In psychotherapy, this motivation is crucial in helping patients overcome their own inertia and actively seek to change themselves in pursuit of a healthier lifestyle.

5. Comprehensive Mental Health Enhancement

In summary, the value of the Bible in psychotherapy is all-encompassing. It not only provides spiritual comfort and support, but also offers patients clear moral and behavioral guidance to help them adjust their values and lifestyles. Combined with community support, Bible reading brings about a more comprehensive enhancement of mental health for patients.

At the same time, it is important to note that each person's faith and cultural background is different, and

therefore the individual differences and needs of the patient should be fully taken into account when choosing a psychotherapeutic approach. Bible reading may not be suitable for everyone, but it is certainly a valuable psychotherapeutic resource for those who have a Christian faith or are interested in it.

Results In the field of psychotherapy, the unique value and deep impact of the Bible can be further elucidated through specific examples. Below are some practical examples of how the Bible can be useful in psychotherapy. Examples : Universal values guidance and moral reshaping; The power of psychological comfort and support;

Clear motivation for behavior change; Facing loss and acceptance; Community support and sense of belonging building; Resolving family conflict and restoring harmony; Overcoming Fear and Building Confidence; Cultivating Gratitude and a Positive Mindset.

Through these specific examples, we can see the practical application and effectiveness of the Bible in psychotherapy. Through these examples, we can see the multidimensional value of the Bible in psychotherapy. It can not only provide universal values and moral codes to guide patients to adjust their behavior and attitudes, but also give them strong psychological comfort and support. At the same time, Bible reading can also help patients build community support and a sense of belonging, and stimulate their intrinsic motivation to change their behavior.

Whether it's dealing with loss and acceptance, resolving family conflict, overcoming fears, or cultivating gratitude, the Bible can provide invaluable guidance and support for patients. Of course, this does not mean that the Bible is the only or best approach to psychotherapy, but it is certainly a valuable resource to consider and try. However, we should also realize that the Bible is not a panacea for psychotherapy. In applying the Bible to psychotherapy, full consideration needs to be given to the individual differences and needs of patients, as well as their faith and cultural background. For patients who do not have Christian faith or are not interested in the Bible, it may not be appropriate to forcefully introduce the Bible. Therefore, psychotherapists should apply various therapeutic methods flexibly according to the specific

conditions of the patients in order to achieve the best therapeutic effect.

Conclusion It is worth noting that reading the Bible is not a direct cure for depression, but can be used as an aid to help patients cope with depression. When dealing with depression, a combination of professional medical help, counseling, and possibly medication should be used to comprehensively manage symptoms. Also, an individual's acceptance and attitude toward religious beliefs can affect the effectiveness of the Bible in adjunctive therapy. Overall, the Bible has its own unique value and significance in the field of psychotherapy. More than just a religious classic, it is a valuable resource that can provide spiritual comfort, moral guidance, and behavioral motivation

强迫症患者共情、情绪调节能力的特征及其对临床症状的影响

江伊程¹ 柳娜³ 吴雨¹ 邵晨晨² 赵霄²

1. 南京师范大学心理学院

2. 南京医科大学附属脑科医院

3. 南京医科大学附属脑科医院医学心理科

目的 强迫症 (obsessive-compulsive disorder, OCD) 是一种慢性的精神和行为障碍, 以强迫思维和强迫行为为主要表现。强迫症患者的共情和情绪调节能力缺陷可能与其临床症状有关, 本研究拟探索患者共情能力、情绪调节能力、临床症状三者的关系, 分析情绪调节和共情能力对临床症状的影响机制。

方法 研究共纳入 90 名强迫症患者及 40 名健康被试, 使用自编信息调查表、耶鲁-布朗强迫量表 (Y-BOCS)、强迫症状分类量表修订版 (OCI-R)、贝克抑郁量表 (BDI)、贝克焦虑量表 (BAI)、席汉残疾量表 (SDS)、国际神经精神科简式访谈问卷 (M.I.N.I.) 搜集被试的基本信息、临床症状表现及共病情况, 使用公认真认知成套测验 (MCCB) 测量被试的神经认知功能水平, 使用中文版人际反应指数 (IRI-C) 及简版情绪调节困难量表 (DERS-16) 测

量被试的共情能力及情绪调节能力, 对测量结果进行差异检验及相关分析, 明确强迫症患者的共情与情绪调节能力特点, 探究其与神经认知功能症状、强迫症状、情绪症状等临床症状变量的关系, 再以情绪调节困难为自变量、共情能力为中介变量、临床症状为因变量进行中介效应检验, 以了解共情及情绪调节能力对临床症状的作用机制。

结果 (1) 强迫症患者认知共情得分显著低于健康对照, 情感共情得分与健康对照无显著差异, 情绪调节困难各维度得分及总分均显著高于健康对照, DERS 总分与 IRI-个人痛苦得分显著正相关, 共病抑郁或焦虑障碍的患者 IRI-个人痛苦得分更高;

(2) IRI-换位思考得分与 MCCB 注意-警觉得分显著负相关, IRI-共情关注得分与 MCCB 信息处理速度得分显著正相关, 情绪调节困难量表总分正向预测 OCI-R 得分, 无共病的强迫症患者的认知共情得分负向预测 Y-BOCS 得分, 强迫症患者 IRI-个人痛苦在情绪调节困难与抑郁之间存在中介作用。

结论 (1) 强迫症患者认知共情水平低, 情绪调节困难程度高, 共病情绪障碍的患者情感共情体验更强, 共情能力与情绪调节能力有关; (2) 强迫症患者认知功能症状与共情有关, 情绪调节困难可直接或通过共情间接影响情绪症状, 强迫症状严重程度主要受认知共情影响, 强迫症状维度主要与情绪调节困难有关。

关键词: 强迫症; 共情; 情绪调节

伴强迫型人格障碍的强迫症患者临床特征和影响因素

姜文静¹ 柳娜¹ 汪旭回²

1. 南京医科大学附属脑科医院

2. 南京佑安医院

目的 本研究旨在探究伴强迫型人格障碍的强迫症患者的临床特征差异及影响因素, 为进一步临床诊疗提供理论支持。

方法 2022 年 7 月至 2023 年 12 月在南京医科大学附属脑科医院强迫症专病门诊治疗的强迫症患者 (n=195) 及同时期招募的健康志愿者 (n=53)。将 YBOCS 得分大于等于 16 分的受试者作为强迫症患者组, 并对其进行分组, 强迫型人格障碍筛查分

量表得分 ≤ 5 分为不伴有强迫型人格障碍的强迫症组 ($n=137$), >5 分为伴有强迫型人格障碍的强迫症组 ($n=58$)。采用描述统计、单因素方差分析、独立样本 t 检验比较患者组与健康对照组间人口学资料及临床症状的差异。使用双变量皮尔逊相关计算和多元线性回归分析影响强迫型人格障碍分量表得分的因素。

结果 本研究共纳入了 195 名强迫症患者和 53 名健康被试, 总计 248 例受试者, 年龄范围 18-59 岁。男性占 51.20%, 女性占 48.80%。在 195 名强迫症患者中, 有 41 例受试者报告有精神疾病家族史, 占 21.03%。未治疗时间范围为 0-23 年, 总体平均值为 2.77 年。在本次就诊前, 有 130 例患者 (66.67%) 未接受过任何治疗。伴或不伴强迫型人格障碍的强迫症患者在年龄、未治疗时间、精神疾病家族史、强迫症症状筛查量表、排序维度、囤积维度、贝克抑郁量表得分方面存在统计学意义的差异 ($F/t=3.175$ 、 2.668 、 2.637 、 68.570 、 21.693 、 4.749 、 44.438 , $p<0.05$)。未治疗时间、囤积维度、排序维度和贝克抑郁量表得分被发现是 PDQ 得分的相关影响因素 ($r=0.141$ 、 0.153 、 0.365 、 0.492 、 0.414 , $p<0.05$)。囤积维度和排序维度对 PDQ 得分的预测效果比其他因素更为显著 ($B=0.231$ 、 0.274)。

结论 相比于单纯强迫症患者, 囤积行为、排序行为和更严重的抑郁情绪可能是伴有强迫型人格障碍的强迫症患者的重要症状特征。

关键词: 强迫型人格障碍, 强迫, 未治疗时间, 症状维度

远程精神心理服务使用现状调查: 以从业者的视角

常心怡¹ 胡心悦² 冯韵孜¹ 邵阳¹

1. 上海市精神卫生中心

2. 嘉兴职业技术学院

目的 由于传统心理服务资源分布不均、可覆盖人群有限, 远程精神心理服务 (telemental health) 凭时空便利性、间接成本低在国内普及, 但其也存在隐私安全保障差等伦理问题。本研究目的是调查目前远程精神心理服务的实践模式和伦理情况, 探究影响从业者使用远程服务的因素, 以及如何促进

从业者更伦理地进行远程服务, 有利于推动我国精神卫生服务的均质化与可及性。

方法 本研究采用全国性横断面线上设计问卷调查, 招募国内执业的精神心理服务从业者填写。问卷中包括 1) 基本信息及远程服务模式调查; 2) 态度认知调查, 含态度、主观规范、感知行为控制、感知有用性、感知易用性和行为意图六个因子; 3) 伦理情况调查。

结果 共回收 972 份有效问卷, 含精神科医生 431 名, 心理师 541 名。其中 690 名从业者报告使用远程服务, 多数从业者使用视频提供服务 (65.9%), 在办公区域等公共空间进行服务的从业者 (78.84%) 与在家等私人空间进行服务的从业者 (67.25%) 数量相当; 多数从业者表示远程服务价格低于传统心理服务 (37.7%) 或与其相当 (58.1%); 44.5% 的公立机构从业者表示机构要求记录服务全程, 在私立机构中机构要求 (29.2%) 和自行记录 (33.9%) 比例相当。职业 ($\beta=1.130$, $p<0.001$) 和工作地点 ($\beta=-1.508$, $p<0.001$) 对从业者是否使用远程服务的影响显著, 心理师使用的可能性比精神科医生高 3.097 倍, 公立机构使用可能性仅为私立机构的 0.221 倍, 从业者的态度 ($\beta=0.081$, $p=0.039$) 也有显著影响。在使用远程服务的群体中, 行为意图 ($\beta=1.314$, $p<0.001$) 提高促使他们使用时间上升。关于伦理问题, 缺乏专门规章制度 (58.55%)、培训不足 (30.58%)、无法处理紧急情况 (71.88%) 普遍存在, 行为意图过高 ($\beta=-0.408$, $p<0.001$)、主观规范低 ($\beta=0.395$, $p=0.006$)、感知行为控制低 ($\beta=0.357$, $p=0.006$) 成为危险因素。

结论 精神科医生和公立机构从业者受限于潜在服务对象和客观条件制约, 进行远程服务的比例低于心理师和私立机构从业者。从业者对远程精神心理服务的态度和意图能够正向预测使用, 提高主观规范和感知行为控制也有利于促使服务更为伦理。但从业者应据实选择适合方式, 过于想要使用远程服务可能会造成伦理问题。

关键词: 远程精神心理服务, 从业者, 行为模式, 伦理规范

一位痛并快乐着的男生——经典精神分析视角下的俄狄浦斯冲突

骆遥特*

厦门市仙岳医院

目的 阐述俄狄浦斯冲突的象征性隐喻,借助三角关系中的象征内容来探讨个人内心复杂的情感体验。

方法 本文首先介绍了一个惊恐障碍的心理治疗案例,从经典精神分析的视角探讨患者与父母亲的三角关系以及与女性的关系,从而揭示出其潜意识的俄狄浦斯冲突。然后通过阐述希腊神话俄狄浦斯王弑父娶母事件背后的隐喻,引入俄狄浦斯情结的概念。以男孩为例,介绍俄狄浦斯冲突的成因,从象征层面探讨儿童对异性父母的乱伦冲动、与同性父母的竞争、同胞竞争、阉割性焦虑、内疚、超我发展、心理性别身份认同等情感体验,强调父亲在三元关系中的作用。解决了俄狄浦斯冲突,儿童就能获得“成熟的三元之爱”。最后描述俄狄浦斯冲突在成年人的人际交往以及国家之间相互竞争中随处可见。

结果 俄狄浦斯冲突在很多精神症状的深层潜藏着,是心理发展水平进入神经症阶段之后的核心冲突。

结论 俄狄浦斯冲突在日常生活中无处不在,在人际交往、国家之间相互竞争中经常能看到它的影子。出现俄狄浦斯冲突,标志着人的心理发展阶段从二元关系进入三角关系,这是心理走向成熟的必经之路。走出俄狄浦斯冲突,人的性别身份认同逐渐形成,更有可能建立好的人际关系。每个人的一生都在演绎三角关系。

短程动力性人际治疗对于改善抑郁症患者解释偏差的疗效研究

孙迅 仇剑峯* 姚佳宇 郑子蔚

上海交通大学医学院附属精神卫生中心

目的 解释偏差是指个体对模糊情境做出正性或负性解释的倾向,是影响个体人际体验和互动的重要因素。抑郁症患者被认为会对人际情境做出消极解释偏差,并基于此采取敌对或回避等消极行为,

进而负性影响其人际关系,成为抑郁症维持的重要因素之一。短程动力性人际治疗(Dynamic Interpersonal Therapy, DIT)是16次手册化的短程心理动力性治疗方法,目前国内已有随机对照研究证明了其对抑郁症患者症状的改善作用,然而其对解释偏差特征是否起作用尚待深入研究。因此,本研究旨在探究DIT对抑郁症患者解释偏差的影响。

方法 本研究采用随机平行对照设计,根据美国精神疾病诊断与统计手册第五版(DSM-5)标准,纳入重症抑郁障碍患者共102例。其中对照组40例,接受常规抗抑郁药物治疗。DIT组62例,接受常规抗抑郁药物治疗和DIT治疗。词句联想范式(Word Sentence Association Paradigm, WSAP)分别在治疗前和治疗后(16周)测量患者的解释偏差特征。此外汉密尔顿抑郁量表(HAMD-17)和9项患者健康抑郁量表(PHQ-9)评估患者的抑郁症状。

结果 (1) 抑郁疗效指标显示: HAMD-17 ($F=15.65, p<0.001$) 和 PHQ-9 ($F=4.91, p=0.03$) 的时间 \times 组别交互作用均显著,且 DIT 组症状下降更快,在治疗后 HAMD-17 ($F=9.79, p=0.002$) 分数显著低于对照组。(2) 疗效指标与解释偏差指标变化的相关分析显示: DIT 组 ($r=0.307, p=0.02$) 和对照组 ($r=0.338, p=0.03$) 的 HAMD-17 得分变化均与积极词认可率变化显著负相关。(3) 患者积极解释偏差的三个指标均表现出显著的时间主效应,具体体现于,两个组别在治疗前后的积极词认可率显著提升 ($F=85.89, p<0.001$), 认可积极词的速度显著加快 ($F=19.98, p<0.001$), 拒绝积极词的速度显著变慢 ($F=17.96, p<0.001$), 组别主效应和交互效应未达到统计学显著水平; DIT 组患者拒绝消极词的速度加快,与对照组的差异具有统计学意义 ($F=4.03, p=0.47$)。

结论 DIT 和纯药物治疗均能有效提升抑郁症患者的积极解释偏差,且 DIT 治疗在减少患者消极解释偏差方面效果优于纯药物治疗。

The Role of Social Support and Perceived Stress in Quality of Life in Patients with Major Depressive Disorder

Changlin Zhang^{1,2}

1.Tianjin Anding Hospital

2.Tianjin University

Objective Major depressive disorder (MDD) is a prevalent and debilitating mental illness that significantly impacts patients' health and quality of life. This study aims to investigate the mediating effect of social support and perceived stress in the relationship between the severity of depressive symptoms and quality of life in patients with MDD

Methods A total of 146 drug-naïve patients with MDD according to Diagnostic and Statistical Manual of Mental Disorders Fifth Edition (DSM-5) completed the Hamilton Depression Rating Scale-17 (HAMD-17), Quality Of Life Scale-6 item (QOL-6), Social Support Rate Scale (SSRS), and Perceived Stress Scale-10 item (PSS-10)

Results The results revealed significant associations among severity of depressive symptoms, social support, perceived stress, and quality of life. The HAMD-17 was negatively correlated with QOL-6 ($p < 0.001$) and SSRS ($p = 0.04$), whereas positively correlated with PSS-10 ($p < 0.001$). SSRS and PSS-10 also played a mediating role in the chain prediction model linking HAMD-17 to QOL-6 ($\beta = -0.1467$, $p < 0.001$)

Conclusion Engaging in social interactions provides both some level of stress as well as substantial social support for individuals with depressive disorder. This finding suggests that such engagement may mitigate the negative impact of depression on their quality of life

关键词: Depression, Quality of Life, Social Support, Perceived Stress.

强迫症患者不恰如其分体验的临床特征研究

张雪迪 谢民耀 陈豪诚 江伊程 柳娜*
南京脑科医院

目的 不恰如其分体验 (Not just right experience, NJRE) 是强迫症 (Obsessive-compulsive disorder,

OCD) 患者常见的特殊主观体验, 影响了患者的症状表现、治疗疗效以及疾病预后。因此本研究旨在探索伴 NJRE 的 OCD 患者临床症状特征及神经认知特点, 增强我们对 OCD 患者 NJRE 相关症状的理解, 为未来的临床干预提供新的思路。

方法 本研究从南京脑科医院强迫症专病门诊及住院病区招募强迫症患者。通过网络广告和社区海报招募健康对照人群。对所有被试进行一般人口学资料采集及临床量表评估, 对其中部分被试进行神经认知功能测验。采用卡方检验、独立样本 t 检验、单因素方差分析对被试一般临床信息包括性别、年龄、受教育年限等人口学特征、强迫症患者组的强迫症状严重程度、病程、OCI-R 得分、MCCB 测验得分进行比较。在认知成套测验结果部分使用单因素方差分析进行组间比较, 并将性别、年龄、受教育年限作为协变量, 事后分析时使用 Bonferroni 法进行多重比较校正。

结果 (1) 共招募评估 377 名 OCD 患者。结果发现其中有 184 名 OCD 患者当前存在 NJRE, 193 名 OCD 患者当前不存在 NJRE。伴 NJRE 的 OCD 患者起病年龄更小, 强迫思维、强迫行为严重程度及 YBOCS 总分均显著高于不伴 NJRE 的 OCD 患者。除强迫思维维度得分, 伴 NJRE 的 OCD 患者 OCI-R 各症状维度得分均显著高于不伴 NJRE 的 OCD 患者。此外伴 NJRE 的 OCD 患者 BAI、BDI 量表得分显著高于不伴 NJRE 的 OCD 患者。(2) 伴 NJRE 的 OCD 患者组 (OCD+NJRE 患者组) 强迫症症状分类量表 (OCI-R) 清洗维度、囤积维度、排序维度、检查维度、精神中和维度得分显著高于不伴 NJRE 的 OCD 患者组 (OCD-NJRE 患者组)。三组在连线测验 (TMT)、符号编码测验 (BACS)、迷宫 (NAB) 和 范畴流畅测试 (Fluency) 上的得分存在显著差异 ($P < 0.05$)。事后比较显示, 健康对照组 (HC 组) TMT、NAB、Fluency 测验得分均显著高于 OCD-NJRE 组, 而 OCD+NJRE 组与 HC 组之间的差异不显著; 但 OCD+NJRE 组在 BACS 测验得分低于 HC 组, 而 OCD-NJRE 组与 HC 组之间的差异不显著。

结论 伴 NJRE 的 OCD 患者在对称、清洗、检查、精神中和等症状维度更严重; 在大部分神经认知功能测验中的表现优于不伴 NJRE 的 OCD 患者, 但在符号编码测验中的表现相对较差, 这提示 NJRE 的 OCD 患者注意维持及转移能力受损较明显。

雌激素在精神病学中的研究进展

陈洁如 杨雪*
大连市第七人民医院

近年来,精神分裂症的患病率逐年上升,提高治疗应答率的问题日趋突出,而且在治疗上已不仅仅满足于症状的缓解。它涉及到了多种领域的功能缺损,同时在性别、年龄等多个方面均存在着一定的性别差异。根据流行病学调查显示,精神分裂症患者中男性的比例高于女性,同时女性精神障碍的2个高峰,青春期前后及绝经期前后,在雌激素水平突然下降的情况下易诱发精神障碍包括精神分裂症、心境障碍,由此提出了精神分裂症的“雌激素假说”。理论上雌激素可以改善精神分裂症患者的预后,但目前应用雌激素作为辅助治疗的情况并不常见,且我国相关临床研究相对较少,多停留在理论及动物实验层面。为避免雌激素带来的癌变不良风险,临床研究多应用选择性雌激素受体调节剂(SERMs)作为雌激素辅助治疗的代表,包括了1代SERMs的他莫昔芬以及2代SERMs的雷洛昔芬。此种假说向临床提供了一个新的思路,即应对特殊人群如绝经期的女性分裂症患者、难治性精神分裂症等可能会有意外收获,在抗精神病药物难以改善的精神症状、弥补抗精神病药物内分泌紊乱副作用、分裂症后的心境障碍及物质滥用、提高生活质量及社会功能上可能会存在意想不到的效果。由此可见,为进一步改善精神分裂症患者的预后,提高生活质量,了解雌激素在精神分裂症疾病发展过程中的作用至关重要。

NOS1AP 基因多态性与中国汉族健康人群人格特质的相关性研究

周静* 陈保平 王晓明 刘蕊
大连市第七人民医院

目的 目前,关于人格的分子遗传学的研究受

到越来越多的重视。已经报道的与人格相关的候选基因大部分都是多巴胺(DA)、5-羟色胺(5-HT)、去甲肾上腺素(NE)、谷氨酸(Glu)、 γ -氨基丁酸(GABA)等神经递质相关的基因。除此之外,另有研究表明人格的发展与神经发育、以及参与认知功能的基因和蛋白也具有明显相关性。NOS1AP 作为神经型一氧化氮合酶(nNOS)的接头蛋白,影响一氧化氮(NO)的产生,调节多巴胺、谷氨酸和乙酰胆碱等神经递质的释放,参与脑内多种神经信号的传导过程。NOS1AP 通过其羧基末端磷酸酪氨酸结构域(PTB)与突触蛋白结合,影响突触的发生及可塑。另外,NOS1AP 的 PTB 结构域还可与 Dexas1 结合,参与神经元内信号转导以及与 NMDA 受体介导的神经元毒性有关。综上,我们猜测 NOS1AP 可能通过影响脑内多种信号转导系统及神经元的发育等方面而与人格特质之间存在潜在的相关性。目前,国内外尚无这方面的报道。因此,本研究采用 PCR-RFLP 方法,探讨 NOS1AP 基因多态性与中国汉族健康人人格特质是否具有相关性。

方法 本实验选取 522 名中国汉族健康志愿者为研究对象。采用 Cloninger 编制的三维人格问卷(TPQ)的中文版对所有入组的被试者进行人格的评定,留取受试者外周静脉血 2ml,碘化钾法提取基因组 DNA,采用 PCR-RFLP 法测定其基因型,应用 SPSS17.0 统计软件,检验 NOS1AP 基因四个位点各基因型间人格维度的差异, $p < 0.05$ 被认为有显著统计学意义。

结果 (1) rs1858232 的各基因型与 NS3($x^2=7.497$, $p=0.024$)及 HA4($x^2=6.437$, $p=0.040$)有显著性差异;(2) rs4531275 的各基因型与 RD2($x^2=11.484$, $p=0.003$)有显著性差异;(3) rs4657178 的各基因型与 NS($x^2=5.223$, $p=0.073$), HA($x^2=3.660$, $p=0.165$)及 RD ($x^2=0.061$, $p=0.970$)总分及其分量表均无显著性差异;(4) rs6704393 的各基因型与 HA1($x^2=7.216$, $p=0.027$)有显著性差异。

结论 研究结果表明 NOS1AP 基因多态性与中国汉族健康人人格特质有关, NOS1AP 基因可能是影响人格的候选基因之一。

不同类型抑郁障碍患者肠道菌群的差异性研

究

许俊亭*

大连市第七人民医院

目的 了解不同类型抑郁障碍患者与健康人群的肠道菌群的差别,探讨不同类型抑郁障碍与肠道微生物失衡相关性,为进一步抑郁障碍的精确诊治提供科学依据。

方法 选取2022年1月至2023年11月就诊于大连市第七医院的首发抑郁障碍患者67例(抑郁障碍组),完成一般情况调查问卷、汉密尔顿抑郁量表(HAMD),杨德森等编制的48条目生活事件量表(LES)、赵幸福等引进的儿童期虐待问卷(CTQ-SF),抑郁障碍分为遗传性起源型、应激性起源型和其他起源型。同时选取与患者组同期来自同一地区的健康志愿者20人(对照组)。收集粪便后使用琼脂糖凝胶电泳提取DNA,使用聚合酶链式反应(PCR)扩增细菌或古菌16SrDNA基因和其他功能基因的不同区域,于Illumina测序平台进行上机测序,通过生物信息学分析获得肠道菌群中细菌或古菌物种组成、物种丰度、系统进化、群落比较等信息,探讨不同种类抑郁障碍与肠道菌群的相关性。用SPSS进行统计学计算;采用生物学信息的方法来分析肠道菌群群落各个水平丰度和多样性的变化,采用QIIME2方法分析组间各分类水平菌群显著性差异,采用Kruskal-Wallis法和Wilcoxon Test来分析各组间肠道菌群的 α 和 β 多样性,使用LEfSe方法检验生物标志物,LDA值与物种进化树。以 $P<0.05$ 表示差异具有统计学意义。

结果 1.不同类型抑郁障碍组与对照组在肠道菌群多样性方面无明显差异。

2.门水平上,肠道菌群丰度较高的种类主要是四个门,厚壁菌门、变形菌门、放线菌门和拟杆菌门,占最多的是厚壁细菌门。在属水平上,肠道菌群丰度较高的种类主要是一些属如埃希氏菌属,普拉梭菌属,Phocaeicola A,拟杆菌属,和戴阿利斯特杆菌属。

3.遗传性起源型、应激性起源型和其他起源型的肠道菌群的标志物差异,具有统计学意义($P<0.05$)。应激性起源型中肠道定植产气肠杆菌属(Enterocloster)、丁酸盐产生菌属(Anaerostipes)、Faecalimonas水平高于其余三组;遗传性起源型中梭菌属(Clostridium)、Phocaea水平高于其余三组;对

照组中放线菌科(Actinomycetaceae)、保罗詹森菌属(Pauljensenia)、内脏臭杆菌(Odoribacter)水平高于其余三组。

结论 1.不同类型抑郁障碍患者与普通健康人群在肠道菌群多样性方面无明显差异。

2.不同类型抑郁障碍患者之间的肠道菌群可能存在差异性标志物,肠道菌群在未来可能作为抑郁障碍分类新的生物标志物,推动抑郁障碍的个体化精准治疗。

重度抑郁障碍患者的快感缺失与炎性细胞因子及补体因子H的研究进展

杨安奇*

大连市第七人民医院

目的 重度抑郁障碍作为一种常见的慢性疾病,具有多种多样的症状。其病程、症状和治疗反应的异质性很大,导致治疗和机制研究的困难。为了提高治疗的准确性和临床结果,需要对抑郁症的各种特征的神经生物学基础有更深入的了解。快感缺失,即体验快乐的能力下降,是抑郁症的典型特征之一,同时也是精神分裂症、其他情感障碍和物质滥用的典型特征。根据DSM-5,快感缺失作为重度抑郁症发作的核心特征,也被认为是最有前途的内表型之一。在抑郁症患者中,快感缺失不仅是一种症状,而且与不良预后和自杀行为有更强的相关性。此外,许多心理、药理学甚至一些物理疗法对抑郁症患者的影响差异很大,主要是由于享乐障碍。因此,虽然有大量证据表明异常的奖赏环路会导致抑郁症的快感缺失症状,但迫切需要更多的生物学测定提出GDNF可以作重度抑郁障碍的快感缺失的生物标志物,为诊断和治疗提供了一种新的方向。

方法 本文通过对近十余年来抑郁障碍的快感缺失、炎性细胞因子及补体因子H的相关的研究进行总结分析,探究重度抑郁障碍患者的快感缺失与炎性细胞因子及补体因子H的相关性。

结果 重度抑郁障碍的快感缺失和炎性细胞因子及补体因子H之间可能存在的关联。

结论 重度抑郁障碍的快感缺失和炎性细胞因

子及补体因子 H 之间可能存在的关联,可以作重度抑郁障碍的快感缺失的生物标志物,为诊断和治疗提供了一种新的方向。

关键词: 重度抑郁障碍 炎症细胞因子 补体因子 H

童年创伤与成年应激对于强迫症状的影响: 炎症及丘脑功能连接所发挥的作用

邵晨晨¹ 赵霄¹ 吴雨² 江伊程² 柳娜³

1.南京医科大学附属脑科医院

2.南京师范大学心理学院

3.南京医科大学附属脑科医院 医学心理科

目的 强迫症是一种与 CSTC 环路异常相关的神经精神疾病。既往研究表明,童年创伤和应激事件可能通过影响大脑功能连接而增加 OCD 风险。本文研究探讨了强迫症(OCD)患者中儿童创伤经历、应激、神经炎症与大脑功能连接之间的关系。研究基于皮层-纹状体-丘脑-皮层(CSTC)环路的神经病理模型,分析了童年创伤、应激事件对强迫症症状的影响,并考察了炎症因子在其中扮演的角色。

方法 本研究纳入 105 名受试者,包括 50 名 OCD 患者和 55 名健康对照组(HC)。采用耶鲁-布朗强迫量表(Y-BOCS)、应激感受量表(PSS)和童年期创伤量表(CTQ)进行临床评估。通过 ELISA 法测定血浆炎症因子水平,并利用 3.0 T MRI 系统进行神经影像学数据采集。使用 SPSS 和 Process 宏程序进行回归和中介分析。

结果 OCD 患者组在 Y-BOCS、CTQ、PSS 得分上显著高于 HC 组,且炎症因子水平也显著升高。进一步的中介分析显示,炎症因子水平能够介导应激感受与 OCD 症状严重程度之间的关系。同时神经影像学分析发现, OCD 患者的炎症因子水平与丘脑亚区-背外侧前额叶皮层(dIPFC)、丘脑亚区-顶上回的功能连接强度负相关,并且功能连接强度同时强迫症状严重程度及童年创伤严重程度负相关。

结论 本研究结果支持创伤-应激-炎症-强迫症状模型,提示应激感受可能通过促进神经炎症来加剧 OCD 症状。此外,与炎症相关的丘脑亚区的功能连接改变可能与 OCD 症状的严重程度及童年创伤经历有关。这些发现为理解 OCD 的发病机制提供了

新的视角,并可能有助于开发新的治疗策略。

代谢综合征与双相障碍躁狂发作患者认知功能的相关性研究

常珊珊 许俊亭* 陈巧灵 姜飞

大连市第七人民医院

目的 近年来,双相障碍的发病率正在逐年增长,成为全球人类疾病负担之一。越来越多研究报告,认知损害导致双相障碍患者生活质量减退,生活满意度下降。导致双相障碍患者认知损害的原因多方多面,代谢综合征则是当前研究较多的领域之一。国内外研究发现肥胖、血压、血脂异常及胰岛素抵抗对认知域影响存在差异性,认知域受损亦存在不均衡性。现有的认知评估工具多种多样,繁琐费时。中国简版神经认知成套测验(C-BCT)作为新兴的认知测评工具,被广泛应用到精神分裂症患者认知功能评级中,具有耗时短、操作方便等优点,在双相障碍疾病中使用较少。因此,本研究目的为探索代谢综合征对双相障碍躁狂发作患者认知功能的影响,代谢综合征各组分与认知功能是否存在相关性,为临床医生提供新的理论依据。

方法 本研究收集 2022 年 10 月至 2023 年 12 月于大连市第七人民医院门诊就诊或住院的双相障碍躁狂发作患者,依据患者是否存在代谢综合征,将患者分为研究组(伴代谢综合征)和对照组(不伴代谢综合征),每组各 30 例,基线期对两组患者分别使用中国简版神经认知成套测验(C-BCT)进行认知功能评估,采用 SPSS 26.0 上进行统计学分析,组间比较采用独立样本 t 检验,将代谢综合征各组分与认知功能分数进行相关性分析及回归分析, $P < 0.05$ 具有统计学意义。

结果 1.基线期组间比较符号编码分数有统计学差异(研究组 38.37 ± 8.74 , 对照组 $43.20 \pm 8.34, p = 0.032$);基线期组间比较连线测试、持续操作、数字广度测试分数无统计学差异($p > 0.05$)。

2.基线期患者连线测试分数与体重指数呈负相关($r = -0.258, p = 0.047$);患者符号编码分数与体重指数、舒张压呈负相关($r = -0.292, p = 0.023$; $r = -$

0.281, $p=0.030$); 患者持续操作分数与体重指数呈负相关 ($r=-0.333, p=0.009$); 患者数字广度与代谢综合征各组别则无相关性。回归分析显示随着体重指数的升高, 患者连线测试分数降低 ($B=-0.409, t=-2.030, p=0.047$); 随着体重指数的升高, 患者符号编码分数降低 ($B=-0.693, t=-2.030, p=0.047$); 随着体重指数的升高, 患者持续操作分数降低 ($B=-0.783, t=-2.690, p=0.009$)。

结论 1. 共病代谢综合征的双相障碍躁狂发作患者具有更差的认知表现。

2. 双相障碍躁狂发作患者认知功能下降可能与肥胖相关。

关键词: 双相障碍, 躁狂发作, 认知功能, 代谢综合征

Incorporating Culture Consideration In Practice Of Interpersonal Psychotherapy In China: A Comparison Of Two Cases And The Role Of Chinese Funeral Ritual

JingWen Huang¹, Xiaoyi Zhou¹, Jianbo Hu¹, Manli Huang¹, Haoyang Zhao²

1. The First Affiliated Hospital, Zhejiang University School of Medicine

2. Zhejiang University School

Objective For Interpersonal psychotherapy (IPT) to be more effective in its worldwide dissemination, cultural factors should be taken into account and adaptations should be made. This article assessed two cases contrasting the influence of attending or missing Chinese keening rituals on later depression among bereaved young adults. It also examined IPT's effectiveness in treating bereavement-related depression

Methods Two cases were compared in this article, with two bereaved individuals, one diagnosed with depression two years after missing mother's keening ritual, and her sister, who participated in the keening ritual and displayed no depressive symptoms. The former sought and received IPT. Cases were presented in details, IPT treatment was presented, and assessments evaluating depression symptoms (Hamilton Depression Scale-17)

were conducted for both individuals at baseline and before every session

Results Scores of the health individual indicated no significant depressive symptoms throughout the process. Scores showed decrease in depressive symptoms for the depressive individual. Her scores decreased drastically at the third measurement and remained relatively low throughout the treatment. IPT alleviated depression by addressing emotional difficulties in interpersonal contexts and resolving past and current relationship problems related to depressive symptoms

Conclusion The two cases suggest the protective role of keening in Chinese funeral ceremonies for decreasing the risk of subsequent depression among young adults following the death of a family member. IPT effectively treated depression for bereaved population. We call on future studies to investigate other culture-specific rituals with potential psychological significance to better understand how to incorporate culture consideration in practice of IPT in China

关键词: interpersonal psychotherapy; bereavement; depression; funeral rituals; keening; case comparison; cultural adaptation

老年痴呆症的现状及分析

姚焯*

大连市第七人民医院

目的 目前众多的慢性疾病中, 老年痴呆病人所带来的家庭负担是最大的。那么, 如何有效的降低这些负担已经成为一项重要的工作。本文主要为了探讨老年痴呆病的发病特征及社区管理模式。

方法 一是社区医疗机构对老年痴呆症患者的健康管理, 1、照顾人的客观压力。2、主观照顾负担, 通过分析主观照顾负担影响因素, BPSD 属于最为严重的影响因素, 越高的病人 BPSD 严重程度, 从而就会加剧照顾者所感知到的主观负担。二是健康管理的内容, (一) 照护的管理要点,

①日常生活的照护 ②居住环境和安全的照护 ③沟通障碍的照护 ④失语的照护 ⑤行为异常的照护

⑥心理照护老年痴呆是一种不可逆的病症，发病机理与环境及社会文化、心理因素密切相关。⑦饮食护理⑧皮肤护理⑨服药的照护（二）认知训练管理，（三）对家属的健康管理，（四）健康饮食管理，（五）环境管理，（六）运动管理，（七）医疗管理，（八）健康体检，（九）早期症状。

老年痴呆症的早期发现及筛查评估，系统规范治疗指导。以及对病人人家属的心理健康状况以及对其实施教育后对病人生活质量的影响。

结果 指导家属调节自己的心态，减轻了心理负担，不断完好护理的方法，正确对待患病者，改善护理质量，提高患者的生活质量。

结论 提高家属的护理质量，提高患者的生活质量。

关键词：痴呆，社区管理

碳酸锂联合用药治疗双相情感障碍的研究进展

赵雪莹*

大连市第七人民医院

双相情感障碍是一种以心境高涨与心境低落交替作为主要特点的心境障碍，存在多种发作形式，随着发作次数的增加，其病情往往逐渐复杂化，治疗难度亦逐渐升高。双相情感障碍患者在发病时自知力受损，容易造成自己及他人的人身伤害及财产损失，因而需要迅速有效的控制病情，并预防复发。碳酸锂是一种常用的心境稳定剂，其通过提升血锂浓度而稳定情绪，被广泛应用于在双相情感障碍的急性期治疗及巩固期维持疗效上，具体作用机制尚未完全阐明。碳酸锂可以单独使用或联合其他药物及非药物治疗使用。我国双相障碍诊疗指南将碳酸锂作为双相情感障碍急性期治疗的一线药物。在临床应用时，由于血锂浓度提升较慢，为了更快控制病情，减少疾病对患者身体及其他方面造成的损伤，提升预后，对于精神病性症状较重、以及躁狂或抑郁症状较重的患者，往往会联合其他抗精神病药物、心境稳定剂或抗抑郁药物进行治疗。然而在何时选择何种药物使用何种剂量进行联合治疗往往需要根据临床医生自己的临床经验进行探索，本文对国内外近年来使用对双相情感障碍患者使用碳酸锂进行

单药或与其他药物进行联合用药的文献进行总结，以期为碳酸锂治疗双相情感障碍时进行治疗方案选择提供更多依据，并为碳酸锂的进一步研究提供思路。

关键词：碳酸锂，双相情感障碍，联合用药

Association between Alexithymia and Neurocognition in Chinese Han First-episode, Drug-naïve Major Depressive Disorder

Xue Tian Ying Gao Chuhao Zhang Meijuan Li Jie Li*
Tianjin Anding Hospital

Objective Alexithymia is defined as a difficulty in identifying and describing one's own emotions. It represents a risk factor for cognitive deficits and is frequently observed in individuals with depressive disorders. However, the relationship between alexithymia and neurocognitive function in major depressive disorder (MDD) is still unknown. This study aimed to explore the association between alexithymia and neurocognition in patients with MDD

Methods A total of 134 Chinese Han first-episode drug-naïve MDD patients were recruited. The 20-item Toronto Alexithymia scale (TAS-20), the Repeatable Battery for the Assessment of Neuropsychological Status (RBANS), the 9-item Patient Health Questionnaire (PHQ-9) and the Generalized Anxiety Disorder-7 items (GAD-7) was used to assess alexithymia, neurocognitive functioning, and emotion. Multivariable linear regression models were used to estimate the association between alexithymia and neurocognition. Interaction and stratified analyses were conducted according to age, gender, marital and education status

Results Among the 134 MDD patients, 55 participants (41%) had alexithymia. In the fully adjusted model, TAS total score (TAS-T) and difficulty identifying feelings (DIF) were statistically significantly associated with immediate memory. The interaction analysis showed no interactive role in the association between alexithymia and immediate memory

Conclusion Alexithymia is negatively associated with immediate memory in MDD patients, highlighting that more attention should be paid to the alteration of cognitive functioning in MDD patients with alexithymia

关键词: Alexithymia, Immediate memory, Multi-variable liner regression, Stratified analysis, Interaction analysis, Major depressive disorder

令人“困”“获”的心理咨詢 ——浅谈精神分析之移情与反移情

刘宏*

大连市第七人民医院

目的 精神分析治疗中的移情与反移情

方法 案例报告

结果 心理咨询过程中, 及时处理移情与反移情, 迅速解除来访者心理问题

结论 1、男 35 岁 未婚, 和父母不亲近, 不愿回家 10 年。大学毕业后曾有过短暂工作, 和男性领导关系不好而辞职, 开始在外旅居生活, 喜欢找年长男性陪同自己。即使给父母打电话要钱也不喊爸爸妈妈, 总感觉和父母亲近不起来, 在家很不舒服。父母已经年迈, 也不愿回家照顾父母。爸爸是船员。由父母陪陪同咨询。

来访者存在轻度的焦虑和抑郁情绪, 感觉在外旅游时心情能好一些, 自己也希望回家照顾父母, 但又觉得在家不舒服, 因此无法长时间在家生活。无情感高涨和乱花钱等表现。

咨询过程: 通过首次访谈后, 来访者愿意接受心理咨询, 并约定每周一早上 8 点开始咨询, 每次咨询 40 分钟。咨询时来访者语速慢, 语速低, 多喜欢低头, 少有目光接触。每次咨询过程中咨询师感到非常困倦, 感觉几乎睁不开眼睛, 即使喝浓茶或者咖啡也非常困倦, 咨询结束, 咨询师立刻清醒。咨询师觉察后和来访者讨论, 来访者表示真的睡着了也没事的, 只是想找个人说说话, 这时来访者突然明白到就像爸爸远远的在海上飘荡一样。于是来访者开始愿意和父母交流了, 在家也感觉舒服多了, 通过评估之后结束咨询。

2.移情与反移情

在精神分析的理论框架中, 移情与反移情是构成心理咨询关系动态性的核心要素。

2.1 移情: 来访者将过去对重要他人的情感、态度或期望投射到咨询师身上的过程。它为来访者提供了一个安全的环境, 使其能够重新体验并处理过去未解决的情感冲突。通过识别与评估来访者的移情, 咨询师能够更准确地把握来访者的心理需求, 从而制定更为个性化的咨询方案。同时, 移情也是咨询师与来访者建立信任与亲近感的关键环节, 促进咨询过程的顺利进行。

2.2 反移情, 是咨询师在回应来访者移情时产生的情感反应, 它反映了咨询师对来访者情感的共鸣与理解。

反移情在咨询实践中同样具有不可忽视的重要性。咨询师在应对来访者移情时产生的情感反应, 不仅是对来访者情感的共鸣与理解, 也是咨询师自我认知的反映。通过反移情, 咨询师能够更深入地了解自己的价值观、信念和偏见, 从而避免在咨询过程中受到个人情感的影响。此外, 反移情还能帮助咨询师识别潜在的风险与陷阱, 确保咨询过程的安全与有效。

3、案例分析: 本案例中来访者因爸爸常年在外工作, 因而长期在外寻找年长男性(象爸爸一样)陪伴自己。心理咨询也愿意寻找男性咨询师, 咨询师只是远远的存在这是来访者的移情。即使是周一的早上咨询师也非常困倦, 且咨询师只对该来访者困倦(反移情), 也是来访者的投射性认同, 通过分析, 来访者意识到自己的潜意识, 心理困惑立即烟消云散, 回归正常生活。

强迫症患者的情绪调节困难与临床特征的相关研究

王钟琪 柳娜*

南京医科大学附属脑科医院医学心理科

目的 对伴有情绪调节困难的强迫症患者进行相关评估, 收集基本人口学资料、临床特征、心理学因素及社会功能信息并进行相关性研究。

方法 纳入强迫症患者 85 人, 健康对照 44 人, 使用简式情绪调节困难量表(Difficulties in Emotion

Regulation Scale-16, DERS-16) 进行访谈, 明确患者是否存在情绪调节困难以及存在的维度。对基本人口学资料、临床特征、心理学因素及社会功能信息和量表得分进行分组比较, 采用斯皮尔曼相关分析探索患者情绪调节困难与人口学及临床特征的相关性。

结果 在对强迫症患者与健康对照组进行比较的研究中, 年龄因素在两组间未显示出统计学上的显著差异 (独立 t 检验, $P > 0.05$)。然而, 在性别、受教育年限以及耶鲁-布朗强迫量表 (Yale-Brown Obsessive Compulsive Scale, Y-BOCS)、强迫量表修订版 (Obsessive Compulsive Inventory-Revised, OCI-R)、贝克抑郁量表第二版 (Beck Depression Inventory, BDI-II)、贝克焦虑量表 (Beck Anxiety Inventory, BAI)、席汉残疾量表 (Sheehan Disability Scale, SDS)、应激感受量表 (10-item Perceived Stress Scale, PSS-10) 的总分和分量表分方面, 两组之间存在显著的统计差异 ($P < 0.05$)。此外, DERS-16 量表在总分、清晰性缺失、目标定向行为投入困难、控制冲动行为困难、有效情绪调节策略获取有限、不接受情绪反应等分量表分上显示出显著的组间差异。进一步的相关分析揭示, DERS-16 量表中清晰性缺失、目标定向行为投入困难、控制冲动行为困难、不接受情绪反应等分量表分与年龄呈现显著的负相关。DERS-16 总分与 OCI-R 总分及其各个分量表分、BDI-II、BAI、SDS 量表分之间存在显著的正相关。特别地, DERS-16 的清晰性缺失与 Y-BOCS 总分、Y-BOCS-思维分量表、OCI-R 总分及其分量表分、BDI-II、BAI 量表分之间显示出显著的正相关。DERS-16 的目标定向行为投入困难、控制冲动行为困难分量表分、有效情绪调节策略获取有限、不接受情绪反应分量表分与 OCI-R 总分、OCI-R 的各个分量表分、BDI-II、BAI、SDS 量表分也均显示显著的正相关。

结论 强迫症患者普遍存在情绪调节困难, 且情绪调节困难各维度与临床特征及心理、社会功能存在一定的联系。对情绪调节的识别评估有助于进一步认识强迫的异质性。

关键词: 强迫症, 情绪调节困难

王钟琪 柳娜*

南京医科大学附属脑科医院医学心理科

目的 对伴有情绪调节困难的强迫症患者进行情绪调节相关评估和基本人口学资料、病史及临床特征、心理学相关因素及社会功能信息收集, 通过核磁共振技术进行功能神经环路的脑影像研究。

方法 基于强迫症患者与健康对照组的静息态功能脑影像数据进行比较, 纳入强迫症患者 49 人, 健康对照 40 人。以双侧尾端额中回、双侧外眶额、双侧内眶额、双侧额下回岛盖区、双侧额下回眶区、双侧额下回三角区、双侧嘴端额中回、双侧额上回、双侧伏隔核、双侧杏仁核、双侧尾状核、双侧苍白球、双侧核壳、双侧丘脑 28 个脑区为感兴趣区 (Region Of Interest, ROI) 进行基于种子点的功能连接 (Seed-Based Functional Connectivity) 分析, 进行不同脑区间的功能连接强度 (Functional Connectivity Strength, FCS) 比较。采用偏相关分析探索差异脑区特征值与患者情绪调节困难的相关性。

结果 与健康对照组相比, 强迫症患者在 ROI 左侧苍白球-左侧外眶额、左侧内眶额-左侧外眶额、左侧额上回-左侧外眶额、右侧额上回-左侧外眶额、右侧尾状核-左侧外眶额、右侧核壳-左侧外眶额、右侧额上回-右侧嘴端额中回之间的功能连接强度明显降低。其中右侧苍白球-左侧外眶额间的功能连接强度与 Y-BOCS 总分及强迫观念分量表得分呈显著正相关。右侧尾状核-左侧外眶额与 OCI-R 检查分量表得分呈显著负相关。左侧额上回-左侧外眶额间的功能连接强度与 PSS-10 量表得分呈显著正相关 ($P < 0.05$)。

结论 本研究指出, 与健康对照相比, 强迫症患者在多个脑区间的功能连接强度存在差异。这些发现揭示了强迫症患者脑区功能连接强度的特定缺陷。进一步的相关性分析表明, 这些功能连接强度的降低与强迫症的症状严重程度及心理应激因素密切相关。这为理解强迫症的神经生物学基础提供了重要线索, 并可能为未来的治疗策略开发提供理论依据。

强迫症患者情绪调节困难与功能神经环路的关联研究

氧化应激和炎症反应在青少年抑郁症中的作用

王琴 曾剑飞 王冰 张英*

深圳市康宁医院, 深圳市精神卫生中心, 深圳大学医学部

目的 近年来, 青少年抑郁症患病率急剧上升, 其确切的发病机制尚不完全清楚。许多研究指出了可能的生物学和心理社会因素, 其中氧化应激和炎症反应被认为是抑郁症的发病机制之一。本综述着重探讨氧化应激和炎症反应在青少年抑郁症患者中的作用以及可能的治疗方向。

方法 通过中国知网、万方数据、维普数据库、中国生物医学文献数据库、PubMed、PsycINFO、Web of Science 等学术数据库, 检索关于青少年抑郁症、氧化应激和炎症反应之间关系的研究文献。关键词包括但不限于青少年抑郁症 (Adolescent depression)、氧化应激 (Oxidative stress)、炎症反应 (Inflammatory response)、炎症因子 (inflammatory factor)。根据题目和摘要的相关性, 筛选出与研究主题相关的文献。包括原始研究、综述文章和 Meta 分析。综合分析提取的数据, 探讨青少年抑郁症、氧化应激和炎症反应之间的关联。

结果 多项研究表明, 青少年抑郁症患者与氧化应激水平增加和炎症反应的增强相关, 如氧化应激标志物 (一氧化氮、8-hydroxy-20 脱氧鸟苷、谷胱甘肽过氧化物酶和丙二醛等) 和炎症因子 (肿瘤坏死因子 α 、干扰素 γ 和 IL-6 等) 均显示出不同程度的异常; 活性氧的增加和促炎信号通路的激活加剧炎症过程, 进而加剧抑郁症症状, 如自伤行为; 同时发现超重或肥胖与抑郁症的共存会加剧炎症反应, 导致青少年抑郁症患者自伤风险增加; 目前发现抗氧化剂和长链多不饱和脂肪酸能改善青少年抑郁患者的临床症状, 显示出潜在的治疗作用。此外, 一些实验研究表明, 氧化应激和炎症反应可能通过影响神经递质的释放、损害神经元和影响神经递质相关途径等途径共同参与了青少年抑郁症的发病机制。

结论 氧化应激和炎症反应在青少年抑郁症的发病机制中扮演重要角色。青少年抑郁症患者体内存在氧化应激和炎症反应, 两者相互作用共同加剧了青少年抑郁患者健康问题的进展。因此对抗高水平氧化应激和炎症反应的有害影响是治疗青少年抑郁症的一种前景广阔的策略。而抗氧化剂 N-乙酰半

胱氨酸和 ω -3 脂肪酸可以改善青少年抑郁症患者相关症状, 提示这些机制在治疗中具有潜力。但需进一步研究确认氧化应激和炎症反应与青少年抑郁症的确切关系, 并开发有效的个性化干预和治疗方向。

The Associations between Duration of Untreated Psychosis, Growth Factors, and Neurocognition in Drug-Naïve Schizophrenic Patients

Qiao Su*

Tianjin Anding Hospital

Objective Cognitive impairment is a core feature of schizophrenia with unclear mechanisms, particularly neurocognition. The objective of this study was to investigate the association between duration of untreated psychosis (DUP) and cognitive function, as well as potential biological mechanisms

Methods A total of 219 drug-naïve schizophrenic patients were recruited in this study. DUP was measured in years, reflecting the untreated period observed in this population. Cognitive function was assessed by the MATRICS Consensus Cognitive Battery (MCCB). The plasma concentrations of three growth factors, VEGF, BDNF, and EGF were detected by enzyme-linked immunosorbent assay (ELISA) in 128 patients. Multiple linear regression analysis was used to analyze the association between DUP, growth factors, and cognitive function

Results Our findings showed that DUP was significantly negatively correlated with speed of processing and reasoning and problem-solving in all patients ($N=219$, $P < 0.05$). Five years was defined cut-off point for long and short DUP group in the present study. Only in the short DUP patients, DUP was strongly associated with visual learning and neurocognition ($P < 0.05$). In patients with growth factor ($N=128$), DUP was independently associated with speed of processing, verbal learning, and neurocognitive ($P < 0.05$). Further,

plasma concentrations of VEGF, BDNF, and EGF were all significantly correlated with cognitive function ($P < 0.05$). Additionally, we found a potential trend of correlation between DUP and BDNF ($P = 0.061$)

Conclusion Our study provides insights into a negative correlation between DUP and cognitive function, and BDNF may serve as a potential biological mechanism

关键词: Schizophrenia, Drug naïve, DUP, BDNF, Cognition function

Prevalence and Characteristics of Cognitive Impairment in OCD Patients with Or without OCPD

Xuhui Wang*
NanJing Youan Hospital

Objective Cognitive dysfunction is one of the characteristics of patients with OCD combined with obsessive-compulsive personality disorder(OCPD).This study explored the characteristics and prevalence of cognitive impairment in patients with OCD combined with OCPD based on the use of the Measurement and Treatment of Cognition to Improve Cognition in Schizophrenia Consensus Cognitive Battery (MCCB)

Methods We assessed cognitive functioning using the MCCB in 60 patients with OCD combined with OCPD(OCPD group),50 with OCD without OCPD(OCD group) and 50 healthy controls,and performed correlation analyses to explore the relationship between cognitive dysfunction and clinical characteristics

Results Patients in the OCPD group performed significantly worse in all cognitive domains of the MCCB except social cognition compared to the HC group.OCPD group also showed significant variability in a number of cognitive domains when compared to the OCD group.Patients in the OCPD group had significantly more clinical impairment in the cognitive domain of MCCB than those in the OCD group

Conclusion Cognitive impairment was more

common in OCD patients with OCPD. The degree of cognitive impairment can be used as a clinical difference between OCD patients and OCPD patients. And it can remind clinicians to consider the impact of cognitive impairment in treatment planning for OCD patients with OCPD

关键词: Obsessive-Compulsive Personality Disorder;Obsessive-Compulsive Disorder;cognitive impairment;Measurement and Treatment of Cognition to Improve Cognition in Schizophrenia Consensus Cognitive Battery

情绪对阈下抑郁个体情绪性信息工作记忆加工的影响及其神经机制

王丽娜^{1,2} 李寿欣² 韩含³

- 1.山东省精神卫生中心
- 2.山东师范大学
- 3.曲阜师范大学

目的 阈下抑郁个体是指具有部分抑郁症状但未达到临床抑郁障碍诊断标准的个体,其对情绪性信息的记忆偏向在抑郁的发生与发展中起到重要的作用。然而,情绪对阈下抑郁个体情绪性信息工作记忆加工产生怎样的影响仍不明确。本研究采用行为实验和事件相关电位(event-related potential, ERP)技术,以中性、正性和负性情绪面孔为工作记忆材料,以面孔以外的正性、负性与中性图片为诱发情绪的材料,采用变化觉察任务范式,探讨情绪对阈下抑郁个体情绪性信息工作记忆加工的影响及其神经机制。

方法 实验1共纳入30名阈下抑郁个体和30名健康对照者,通过图片诱发被试不同情绪后,整体呈现记忆项目(中性+负性面孔、中性+正性面孔),并进行检测,探讨情绪对阈下抑郁个体情绪性信息工作记忆加工的影响。实验2采用ERP技术探讨情绪影响阈下抑郁个体情绪性信息工作记忆加工的神经机制。

结果 行为实验结果表明,在诱发被试中性和负性情绪条件下,编码阶段呈现负性情绪信息和中性信息,提取阶段检测负性情绪信息时,阈下抑郁个体正确率高于正常人;而在诱发被试正性情绪条

件下,两者的正确率无差异。ERP 结果显示,在编码阶段,在诱发个体负性和中性情绪条件下,阈下抑郁个体加工负性情绪信息诱发的 P1 高于正常人;而在诱发个体正性情绪条件下,两者加工三类情绪性信息诱发的 P1 无差异。说明阈下抑郁个体偏向于加工与当前情绪状态一致的负性情绪信息。在提取阶段,在诱发个体中性和负性情绪条件下,阈下抑郁个体加工负性情绪信息诱发的晚期正成分(LPC)高于正常被试;而在诱发个体正性情绪条件下,两者加工三类情绪性信息诱发的 LPC 无差异。

结论 本研究结果表明,诱发负性情绪后阈下抑郁个体在提取负性情绪信息时消耗更多的认知资源,而诱发正性情绪可改变阈下抑郁个体对负性情绪信息工作记忆加工的偏向,其潜在机制是,诱发正性情绪减少阈下抑郁个体对负性情绪信息编码和提取阶段的资源投入。

非自杀性自伤与边缘型人格障碍、创伤后应激障碍的关联性研究进展

王珊¹ 王珊² 刘竞² 刘竞¹

1.首都医科大学附属北京安定医院,国家精神疾病医学中心,国家精神心理疾病临床医学研究中心,精神疾病诊断与治疗北京市重点实验室,北京 100088

2.人脑保护高精尖创新中心,首都医科大学,北京 100069

目的 非自杀性自伤(NSSI)是指故意造成自己身体受伤,预期仅导致轻微身体伤害的行为。近年来在我国青少年群体中的检出率呈逐年上升趋势,已成为亟待解决的公共卫生问题。童年期创伤是指个体在 18 岁以前所经历的各种负性生活事件,被认为是 NSSI 的重要危险因素,而其又与一系列成人期精神障碍的发生显著相关,这些精神障碍亦被证实是 NSSI 的危险因素。因此有研究者推测,与童年期创伤相关的精神障碍及其症状可能在童年期创伤和 NSSI 间起中介作用。故本文就与童年期创伤高度相关的三种精神障碍——边缘型人格障碍(BPD)、创伤后应激障碍(PTSD)和复杂性创伤后应激障碍

(CPTSD)与 NSSI 的关联性进行阐述。

方法 以“非自杀性自伤”、“边缘型人格障碍”、“NSSI”、“BPD”、“PTSD”等为关键词,检索知网、PubMed、Web of Science 等数据库,收集发表的相关研究文献,并进行整理综述。

结果 NSSI 和三种精神障碍的关系:目前多数学者倾向于认为 NSSI 是一个独立的诊断实体,但和 BPD 显著相关。NSSI 也与 PTSD 相关,因 PTSD 症候群(即唤醒症状、再体验/侵入性记忆和回避)会导致情绪失调,故其是 NSSI 的危险因素。PTSD 可导致自伤,而边缘型人格倾向会提高其自伤的严重程度。以往关于 NSSI 和 CPTSD 关系的研究较少,可能是由于 CPTSD 是新兴的主题,早期研究中对 CPTSD 和 PTSD 并未做出区分。但研究发现童年期创伤和 CPTSD 的解离症状可以预测成年后的自伤行为,CPTSD 患者自伤的概率和频率均高于 PTSD 患者,这种差异可通过自我组织障碍症状(DSO)进行解释。

三种精神障碍间的关系:有研究认为 CPTSD 和 BPD 存在重叠,BPD 合并 PTSD 的患者易被误诊为 CPTSD。随研究推进发现 BPD、PTSD 和 CPTSD 虽均存在额顶叶-边缘回路的异常,但存在差异性,支持了三者相互独立且存在一定关联的观点,但目前对如何关联尚未达成一致。有研究发现从临床症状、生物学机制和创伤发生时间与严重程度进行分析,推论这三种疾病可能是一个从 PTSD 到 CPTSD 再到 BPD 的连续体,但目前尚无实证研究证明。三者间可能只是存在共同病因而非连续体关系,抑或是由于与创伤无关的其它危险因素所致的连锁效应而出现同时或相继共患。因此除创伤外的其它潜在病因也应纳入评估。

结论 BPD、PTSD 和 CPTSD 作为 NSSI 的危险因素,童年期创伤又与其高度相关,它们可能在童年期创伤和 NSSI 之间起不同的中介作用,以创伤相关精神障碍诊断作为 NSSI 的分类依据也许可行,可为进一步探索非自杀性自伤的分类、预防和干预机制提供参考依据。

关键词: 非自杀性自伤,童年期创伤,边缘型人格障碍,创伤后应激障碍,复杂性创伤后应激障碍

一例难治性强迫症 DBS 治疗 2 年随访

郭慧荣* 王佳欣
郑州大学第一附属医院

一般资料：患者，男，29岁，未婚。

病情概要：因“反复想事、担心、反复洗手20年，加重伴心情不好8年”多次在多家医院就诊，因为症状复杂多变，有四次自杀经历（3次过量口服“对乙酰氨基酚”、1次“大量饮酒”），曾先后诊断为“抑郁症”、“强迫症”，“精神分裂症”，几乎用遍所有抗抑郁剂及抗精神病药（“舍曲林、阿立哌唑、利培酮、氯氮平、氨磺必利、艾司西酞普兰等），每种药物足量使用均大于3个月，CBT12余次，效果均不好，药物不良反应大，患者剧烈头痛，不能正常生活，无法社交，伴有短期被跟踪感，觉得父母要害自己，2021年10月再次因病情加重，上厕所要反复检查几个小时，再次来我院，经由详细评估病情，YBOCS评分35分，确诊为“强迫性障碍”，并且符合难治性强迫症的诊断标准，第三次收住院，给予“氟伏沙明最高300mg/日，加用氯米帕明100mg/日，增效剂哌罗匹隆24mg/日，坦度螺酮30mg/日”，CBT8次，住院两周症状明显好转出院。

DBS治疗：2022年1月（出院后3月），患者病情无故加重，强迫症状几乎占满患者的所有时间，再次住院，对其病情进行详细评估，考虑进行脑深部电刺激术（DBS），与患者和家属进行知情同意，和神经外科、磁共振室联袂在脑影像立体定向引导下进行了脑深部电刺激术，于内囊前肢和伏隔核植入双靶点电极，术后3周开机，患者抑郁焦虑情绪瞬间改善，根据患者个体反应调控电刺激量，术后半年强迫症状逐渐缓解，术后一年强迫症状几乎完全消失，至今随访2年，病情稳定，无不良反应，YBOCS评分5分，患者恢复正常工作生活，已经在恋爱中。

讨论：强迫症（OCD）是一种常见的慢性精神障碍，WHO将其列为十大致残性疾病之一，其年患病率在中国为1.63%。经过规范的药物和心理全程治疗，40-60%的患者症状得到改善，但仍有约20-30%的患者疗效差，成为难治性强迫症（ROCD）。脑深部刺激术（DBS）又称脑起搏器治疗，采用立体定向技术，在微创手术下将微电极植入到脑内的相关核团靶点处，并通过导线连接植入锁骨下皮下的脉冲发生器。通过微电极发放弱电脉冲，抑制颅内异常的脑电信号，改善症状，长期刺激可重塑颅内的神经网络和神经递质，重建神经功能。皮质-纹状

体-丘脑-皮质（CSTC）环路在强迫症的神经生物学发病机制中日益受到重视，内囊前肢、伏隔核等多个结构位点进行综合的神经调控可能是DBS治疗难治性强迫症的新思路。2016年，《中国强迫症防治指南》明确提出DBS可作为经过精神科医生通过符合防治指南的系统药物和心理治疗仍无效的难治性强迫症的临床治疗。

关键词：难治性强迫症，DBS，随访

基于心智化的精神动力学治疗在青少年情绪障碍中的应用

孟素香*
合肥市精神病医院

目的 青少年情绪障碍是一组以焦虑、抑郁、恐惧等症状为主要表现的心理疾病，其患病率呈逐年增高的趋势，对于儿童青少年的身心人格的健康发展产生重要的影响。这个阶段的年轻人需要巩固独立的身份认同，情绪障碍可以被认为是一种发展的危机，青春期心智化阶段的特点让一些具有潜在脆弱性的青少年发展面临更大的困难。在中国仅有约6.4%的儿童青少年的情绪障碍寻求心理健康专家的帮助。

方法 心智化是个体推测自己和他人心理状态的能力（知识、信念、需要、意图等），包括认知心智化和情感心智化（使用认知理解说话的意思，推测他人的情感）。具有强大心智能力的人，通常在面对压力环境时表现出复原力。他们可以从压力性事件中迅速恢复，表现出良好的、有效协同调节能力和面对不幸的人际调节能力。缺乏思考精神状态的能力可能会迫使个人在物质领域管理思想、信仰和欲望，主要表现在控制身体状态和行为过程。心智化的失败引起对身体的暴力性攻击，这种暴力产生对自己和他人的物化，导致自我的分裂，一部分是施虐者，另一部分是受害者。通过对患者和治疗师心智状态的好奇，得以在治疗过程中使心智化“在线”，让情绪、感受得以被觉察和尊重，让引起情绪困扰的扳机事件有反思的可能。在治疗的过程中，治疗师对来访者的情绪体验进行标记和回应，打断来访者原始的内在运作模式，需要治疗师对来访者

的想法更加透明和开放,治疗师把自己的心智借给来访,考虑与病人相关的自己的心理状态,为患者提供一个可供考虑的替代视角,帮助来访思考自己的心智,帮助其恢复对心智化能力的信心,同时回复对未来的合理希望。

结果 儿童青少年的心智化功能得到整合和发展

结论 文章基于心智化角度探索精神动力学治疗在青少年情绪障碍中的应用,为青少年情绪障碍心理治疗提供循证参考。

关键词: 心智化 青少年情绪障碍

取得了卓越的成就,但是国人内心深处的创伤一直被“向上”、“进取”的理念压抑住了,近几年这些“防御”方式渐渐无法掩盖内心的不安,“内卷”成立对抗焦虑的方式,尤其疫情后生存的焦虑再度被唤醒,心理问题越来越多了,系统里最薄弱的环节——“儿童青少年”尤其受影响较大,“学霸综合征”屡见不鲜,“生病”的现象层出不穷,其实背后都是时代之殇!我们从未真正修复近代史的心理创伤!没有真正的哀悼和恢复!解决儿童青少年的心理问题,需要将教育回归“育人”的本质,需要正视创伤后的生存焦虑和哀伤!

关键词: 儿童青少年 心理健康 创伤 防御方式

创伤视角下探索儿童青少年心理问题影响因素

吕娜*

厦门市仙岳医院

《中国儿童健康成长白皮书(2022)》指出:心理健康问题,已经成为目前我国儿童健康成长的3个最大阻碍之一。处于12-18岁的中学阶段的儿童出现情绪不稳定、自闭/抑郁倾向等心理问题的比例也是最高的,达到17.3%。《2022年青少年心理健康状况调查报告(蓝皮书)》指出:家庭因素、手机依赖是影响青少年心理健康重要因素。《中国儿童健康成长白皮书(2022)》指出学业压力、家长的焦虑是影响儿童心理健康重要因素。从两份报告中我们可以看出无论是家庭教育还是学校教育,都出现了一定问题。教育应该是教书、育人,但是目前无论从家庭教育和学校教育,只看重了“教书”的功能,就是过分注重成绩。育人的功能没有了,对孩子的品质教育、生命教育都严重缺失,导致很多孩子要通过“疾病化”的方式进入到医疗的系统里面,通过心理咨询与治疗获得“育人”的途径,补足人格和生命教育,可以说我们现在心理咨询的行业承担了教育系统和家庭系统缺失的“育人”功能!为何我们的教育系统会顾此失彼了?教育的内卷有时代和社会的因素,这些因素的背后与近现代中国屈辱历史背景下所致的创伤有关,近代中国一直在“落后就要挨打”这样的创伤后应激障碍状态里面,战争的创伤和复杂的国际环境导致的生存焦虑、恐惧不安升华,化成了高度的发展动力,我们从衰落到复苏到繁荣,这些年

短程注意缺陷多动障碍家长培训的干预效果及其影响因素

殷炜珍¹ 闫林远² 朱智航¹ 洪丹萍¹ 程道猛¹ 麦思茗¹ 胡樱子¹ 杨婵娟¹ 党彩萍² 周燕玲¹

1.广州医科大学附属脑科医院

2.广州医科大学

目的 探究短程注意缺陷多动障碍家长培训的干预效果,并探索该培训方案可能的起效影响因素。

方法 于2022年10月—2023年12月,连续纳入107名参加为期5小时的“短程ADHD家长培训”的ADHD儿童青少年的家长。采用自编问卷、养育心理灵活性问卷(PPFQ)、简式养育倦怠问卷(S-PBA)和Conners父母用症状问卷(PSQ)进行前后测。采用配对样本t检验、Pearson相关分析、多元线性回归进行统计学分析。

结果 干预后ADHD儿童青少年家长的疾病了解程度显著提高($t=-9.62, P 0.01$)、家长评定的儿童多动指数显著降低($t=2.04, P 0.05$)。ADHD儿童青少年家长的疾病了解程度变化、养育心理灵活性变化及养育倦怠变化($r=0.195、0.206、0.208, P$ 均 0.05)均与家长评定儿童的多动指数变化呈正相关。疾病了解程度的变化、养育心理灵活性的变化、养育倦怠的变化($\beta=0.205、0.190、0.206, P$ 均 0.05)均是ADHD儿童青少年家长评定的多动指数变化的影响因素。

结论 短程ADHD家长培训能提高家长对ADHD的了解程度,可能改善儿童青少年多动症状。

此外,疾病了解程度、养育心理灵活性、养育倦怠可能是干预发挥作用的重要影响因素。

关键词:注意缺陷多动障碍;养育心理灵活性;养育倦怠;家长培训

精神障碍与艺术创作关系的定性研究

陈智民*

上海市精神卫生中心

目的 探讨精神障碍与创作之间相互影响的一般规律。

方法 招募涵盖不同艺术门类的有精神障碍诊断的艺术创作者。以半结构化的访谈提纲,通过电话和视频结合部分文字回复进行访谈。采用扎根理论的方法,从原始资料出发,自下而上进行分析。

结果 28位艺术家被纳入深度访谈。艺术家从事最多的艺术门类是绘画和诗歌,所诊断最多的是双相障碍和抑郁障碍。

经过分析形成一级编码 28 个,二级编码 17 个;三级 6 个。三级编码包括“精神障碍对艺术创作的有益影响、有害影响”、“艺术创作对精神健康的有益作用、有害作用”、“精神障碍与艺术创作的共因”、“精神障碍与艺术创作之间的中介因素”。

其中,“精神障碍对艺术创作的有益影响”包括:高度投入的创作状态和丰沛的创作动力、带来灵感和素材、提高创作素养、特别的审美和表达、推动人去思考人生意义和精神探索、因为疗愈作用而促进创作、带来某种现实中好处。而“艺术创作对精神健康的有害作用”包括:创作过度投入、推崇独特价值、为促进创作而加重自己病情、创作中的某种痴迷状态损害了现实生活的功能、带来现实中的困难。“精神障碍与创作之间的共因”包括:遭遇创伤和荒谬、独特的敏感的个性、精神追求。“精神障碍与创作之间的中介因素”包括:社会认可、文艺志向、病情严重程度、治疗后康复程度。

结论 现实中患有精神障碍的创作者,相比于历史上的名人,能够为二者之间联系提供更细致和更直接的例证,能够对来自历史名人的研究结论形成交叉论证。

双相障碍患者在受访者中占多数,为二者相互影响提供了许多例子,尤其是在“精神障碍直接促进

创作”的 5 个影响中提供了许多见解。

“为促进创作而加重自己病情”,是令人难以理解的影响,但在本研究中得到了受访者的例子的明确支持。

受访者在频繁提到精神障碍对创作的有益作用时,也会提到随着病情好转、药物影响或经过治疗康复后,出现灵感减少、创作激情降低、麻木不仁等情况。例证了“倒 U 型理论”。

精神障碍和艺术创作都是难以把握的现象、存在明显个体差异性、并共同构成一个长时间跨度下的复杂系统,难以用量性方法来研究。本研究通过质性研究方法总结出二者之间的具体影响,能够为进一步研究提供基础。

清洗类住院强迫症患者临床特征及其影响因素

周萍 陈豪诚 吴雨 柳娜*

南京脑科医院

目的 探讨清洗类强迫症患者临床特征及影响强迫症症状特征的因素,为清洗类强迫症患者的筛查及早期干预提供参考。

方法 收集 2012 年 3 月-2023 年 3 月在南京医科大学附属脑科医院住院治疗 539 例强迫症患者的病历资料。从症状表现维度将患者分为清洗类(n=237)和非清洗类(n=302),比较两组患者人口学资料及临床症状的差异。使用二元 Logistic 回归分析影响清洗类住院强迫症患者症状特征的因素。

结果 人口学及临床资料方面,清洗类强迫症患者与非清洗类强迫症患者性别、强迫症症状种类数、精神类疾病家族史、共病其他精神类疾病差异均具有统计学意义($\chi^2 = 10.293、32.732、4.656、6.004, P$ 均小于 0.05 或 0.01)。两组起病年龄差异具有统计学意义($Z = -2.456, P < 0.05$)。清洗类症状与患者性别、起病年龄呈正相关,与精神类疾病家族史、共病其他精神疾病呈负相关(P 均小于 0.05 或 0.01)。危险因素方面,女性、阳性精神疾病家族史是清洗类住院强迫症患者的独立风险因素($OR = 1.801、1.574, P$ 均小于 0.05 或 0.01)。

结论 清洗类和非清洗类强迫症住院患者在人口学资料及临床症状上存在差异,清洗类症状与女性、起病年龄呈正相关。女性、阳性精神疾病家族史是清洗类住院强迫症患者的独立风险因素。

云南边境地区某市世居少数民族严重精神障碍患者发病情况调查分析

邵曰府¹ 邵维集¹ 申安平¹ 邵维坤² 任玉华¹

1.芒市护康精神病医院

2.德宏州芒市人民医院

目的 调查分析云南边境地区某市世居少数民族严重精神障碍患者的情况,为有效救治、关怀边境少数民族地区严重精神障碍患者和制定针对性防治措施提供依据。

方法 采用实地调查分析方法,对边境少数民族地区某市世居在册少数民族严重精神障碍患者数据资料进行调查分析。

结果 五种世居少数民族严重精神障碍患病率为4.24% (803/18.92),同地区患病率为4.68% (2160/46.19),差异无统计学意义, $P>0.05$;精神分裂症占比最高 58.90% (473/803)、其次为精神发育迟滞伴精神障碍占 29.51% (273/803)和癫痫所致精神障碍占 7.97% (64/803),明显高于其他严重精神障碍疾病类型, $P<0.05$ 。男性患者 474 例(59.03%)、女性 329 例(40.97%),男女性别比为 1.44: 1,男女总患病率在统计学上有差异($P<0.05$); 18~45 岁患者 382 例,占 47.57% (382/803),明显高于其它年龄段患者, $P<0.05$;初中以下文化患者占 86.30% (693/803),占比最高;未婚 49.07%(394/803)、离异和丧偶患者 15.82%(127/80),明显高于普通人群。

结论 世居少数民族中男性、18~45 岁、初中以下文化是严重精神障碍患者主要人群。精神分裂症、精神发育迟滞伴精神障碍、癫痫所致精神障碍发病明显高于其他严重精神障碍疾病类型。癫痫病及其所致的精神障碍的防治应引起高度重视。政府实施严重精神障碍管理治疗工作规范在早期筛查和发现患者方面成效显著。

神经语言学视角下近红外脑功能成像的中日言语流畅任务范式对比研究

任雨菲¹ 崔刚¹ 冯坤² 张小芊² 刘破资^{2,3}

1.清华大学人文学院

2.清华大学玉泉医院

3.清华大学临床医学院

目的 中日两国精神科领域都使用言语流畅任务,作为近红外脑功能成像的主要认知任务,但两范式临床使用中存在差异。言语流畅任务设计的变化可能会对诊断带来挑战,保证结果可重复性和有效性所需的统一范式、协议和分析方法刻不容缓。本研究旨在检查VFT模式在中国和日本的临床环境中用于精神病学诊断的不同实施方式。这项比较研究将有助于理解语言处理中的神经激活作用,并为fNIRS在精神病学诊断和管理中的未来发展和应用提供思路。

方法 通过综述中日相关文献,总结两国在临床应用及VFT的差异。本综述的设计遵循了乔安娜·布里格斯研究所(Joanna Briggs Institute)发布的最新范围综述指南(Peters等,2020)。为确保标准化和透明的报告过程,我们采用了Tricco等人在2018年提出的系统综述和荟萃分析扩展范围综述(PRISMA-ScR)指南。这种方法保证了对现有文献的严谨和全面探索,遵循了系统综述方法学的标准。

结果 我们总结了“近红外-言语流畅任务”应用的研究文章的言语流畅任务任务范式及其分析方法学上的差异,并进一步从神经语言学角度分析言语流畅任务设计(语音对比语义)、刺激方式(听觉对比视觉)以及语言类型学的影响。

结论 专注于中国和日本是至关重要的,因为它提供了言语流畅任务在不同语言环境中的激活差异。通过探讨这些特定研究,我们的综述强调了根据语言和文化背景定制言语流畅性的重要性,从而增强了言语流畅性任务在跨文化精神病学评估中的有效性和实用性。

绵阳市城乡居民心理健康素养现状调查

王静 沈雪梅*

四川省精神卫生中心（绵阳市第三人民医院）

目的 了解绵阳市城乡居民心理健康素养现状及影响因素，为提升居民心理健康水平提供理论依据。

方法 于 2021 年 8—10 月采取分层多阶段抽样的方法，随机抽取绵阳市常住成年居民 28 264 人为研究对象。采用一般资料调查表调查一般情况，使用国民心理健康素养问卷进行心理健康素养调查。采用 SPSS 26.0 进行 χ^2 检验和多因素 logistic 回归分析。

结果 绵阳市城乡居民心理健康素养达标率为 19.0%（5 383/28 264）。多因素 logistic 回归分析结果显示，女性（OR=0.910）、农村居民（OR=0.903）、老年人（与 18~29 岁组相比，60~69 岁 OR=0.843，70~79 岁 OR=0.745、 ≥ 80 岁 OR=0.635）、婚姻状况为离婚或丧偶（OR=0.809）、离退休人员（与工人或农民相比 OR=0.277）、其他类型工作（OR=0.620）、患 1 种（OR=0.611）及 2 种及以上慢性病（OR=0.469）的居民心理健康素养水平更低；高学历人群（与不识字相比，高中或职高或中专 OR=1.344，大专 OR=1.430，本科及以上 OR=1.430）、家庭月收入高（与 0~2 999 元相比，3 000~5 999 元 OR=1.866、6 000~9 999 元 OR=2.363、10 000~19 999 元 OR=1.87）、 $\geq 20 000$ 元 OR=1.671）、职业为公职或技术人员或军人（与工人或农民相比 OR=1.241）的居民心理健康素养水平更高，均有统计学意义（ $P < 0.05$ ， $P < 0.01$ ）。

结论 绵阳市城乡居民心理健康素养水平较低，应重点关注女性、农村、老年、低学历、低收入、患慢性病种类多、离婚或丧偶以及离退休人员的心理健康素养水平。

耗散结构理论在精神康复治疗中的一些思考

李迎振*

云南省煤矿精神病医院

目的 耗散结构理论概括为一个远离平衡态的开放系统，通过不断地与外界交换物质和能量，在系统内部某个参量的变化达到一定的阈值时，通过涨落，系统可能发生突变，由原来的无序状态转变为一种有序状态。分析精神分裂症的康复过程与耗散结构的形成过程找出共同点，寻找严重精神障碍康复的至关重要的因素。

方法 比较精神发病和康复过程与耗散结构形成过程。

结果 精神分裂症的病前性格以及疾病表现首先破坏了机体作为耗散结构的开放系统，使机体成为了亚孤岛系统，从而使患者渐渐熵增到无序状态。精神康复就是从一种精神无序状态向有序状态的转化过程，耗散结构理论认为，“开放”是所有系统向有序发展的必要条件，在临床工作中发现在所有促进精神分裂症康复的举措中，“开放”氛围的营造、病人能够与外界进行能量信息的交换是促进病人走向康复的必要的条件，耗散结构的形成过程对精神康复学具有指导意义。

结论 在精神分裂症的康复工作中，社区康复效果总体好于院内康复，院内康复举措中开放的环境的构建是精神病患者康复的重要前置条件，然而基层严重精神疾病患者仍住与传统的、毫无生气的、全封闭的病区环境中，病人与社会存在不同程度的隔离，不利于患者的精神康复；而近来社会办医的民营精神卫生机构正在迅速扩张，使得更多的重性精神障碍被关于病房内，严重精神障碍的回归社会之路变得曲折与漫长。

关键词：耗散结构， 开放系统， 精神障碍院内、社区康复

方法 病例介绍：患者女，63岁，离异，无放射物、毒物接触史，无毒品接触史，查体：可引出幻触、幻视，近2年感到周围有虫钻进全身皮肤，从头到脚无处不在，虫子有20多种，钻入时有痛感或虫爬感，在皮肤下吸血，有的虫子在皮肤下产卵，在房间里能看到虫子飞来飞去，指着物品上的霉点说是黑色虫子，且虫子会进入皮肤沿着血管逐渐长进身体，非常担心害怕，外出购物时带厚厚的手套，担心手上的虫子跑到别人的东西上面。为了杀掉体内的虫子，患者常用洗衣粉和84消毒液泡澡、抓烂皮肤后用酒精兑浓盐水涂擦、或用电蚊拍靠近或挨到皮肤，皮肤烫出水泡。颅脑MRI+DWI+MRA检查示两侧脑室旁及额顶叶皮质下多发性缺血性脑白质病变，皮肤检查未见虫卵及活虫。

综合性护理措施：1.心理护理：建立良好信任的护患关系，从言语上不否认患者所描述的虫子，表示认同获得信任。2.采用心理暗示护理，告诉病人这种虫子不厉害很容易治疗，应用“特效杀虫药”可治愈，举例说明曾治愈好转病例给予治愈信心，心理暗示可每日执行，3.给予抗精神病治疗控制精神症状。4.皮肤护理：患者因抓伤、烫伤及自己“杀虫”的灼伤皮肤，做好消毒和药膏涂擦，并告知患者为“专业杀虫药”。5.放松疗法和工娱治疗：放松及转移注意力。

结果 皮肤问题完全修复，虫爬感、担心虫子问题明显改善，未因“虫子”再住院。

结论 目前报道的寄生虫病妄想多存在明显的社会心理因素，本病例也为老年离异女性，笔者认为在抗精神病药物治疗的同时辅以综合护理非常有必要，认真听取患者主诉，建立良好信任的护患关系，采取暗示、疏导、转移注意力及减轻皮肤不适感等综合护理对改善症状是有益的。

1 例寄生虫妄想综合护理

付慧 张兵* 周节 周小念 谢霜

中国人民解放军联勤保障部队第九二三医院

目的 寄生虫病妄想 1946年由Wilson等报道并予以命名，是一种较罕见的精神心理疾患，报道1例于我科住院治疗的寄生虫妄想病历，探讨寄生虫妄想的有效护理。

A Study of The Effects of Physical Activity on Depression Anxiety and School Attendance Based on Adolescents' Self-Reports

Liqiang Dou^{1,2}, Ping Sun³

1.Qingdao University Medical college

2.Pingdu Mental Health Center

3.Qingdao Mental Health Center

Objective School study is crucial to students' knowledge accumulation and ability cultivation, and a necessary part of personal growth and entry into society; this paper explores the correlation between physical activity and adolescent depression, anxiety, and School Attendance Problems

Methods Self-reported information including regular physical activity, school attendance problems, and demographics were collected from 392 adolescents attending an outpatient clinic. The PHQ-9 and GAD-7 were applied to assess the severity of depression and anxiety symptoms. Data processing was performed by SPSS25 to analyze the effects of physical activity on depression and anxiety as well as school attendance in adolescents

Results Grouped by whether or not regular physical activity was practiced, the differences between the two groups were highly statistically significant in terms of whether or not there was a school attendance problem, PHQ-9 scores, GAD-7 scores, depression severity, and anxiety severity. Grouped by the presence of school attendance problems, the difference between the two groups was highly statistically significant in terms of whether they exercised regularly, PHQ-9 scores, GAD-7 scores, depression severity, and anxiety severity

Conclusion Daily physical activity has a significant impact on adolescents' depression and anxiety and school attendance problems. Daily physical activity has a positive impact on adolescents' depression and anxiety symptoms. Depression and anxiety may lead to adolescents' loss of interest in school, and their attention, memory, which affects their ability to memorize and process information, as well as their lack of self-confidence. Depression and anxiety may lead to a decrease in adolescents' social interaction skills, which can lead to feeling disconnected from their peers and affect their sense of inclusion in school, and dropping out of school may become a way for adolescents to escape from these symptoms if they are not properly supported and treated

抑郁对自杀自伤行为的影响——焦虑的部分中介作用

黄志恒¹ 何红波²

1.深圳市康宁医院

2.广东省人民医院

目的 焦虑、抑郁及自杀自伤行为是心理健康领域中的重要问题,而了解它们之间的关系对于预防和干预自伤自杀行为具有重要的意义。

方法 本研究采用横断面调查的方法,在广东省4家精神专科医院的精神疾病门诊/病房连续招募13~25岁的抑郁发作的青少年,并依据国际疾病与相关健康问题统计分类第十版(The International Statistical Classification of Diseases and Related Health Problems 10th Revision, ICD-10)临床诊断为单相/双相抑郁发作,采用汉密尔顿焦虑量表(HAMA)、汉密尔顿抑郁量表(HAMD)、哥伦比亚-自杀严重程度评定量表等量表来评估受试者焦虑和抑郁与自杀自伤行为之间的关联,并检验焦虑在抑郁与非自杀性自伤(non-suicidal self-injury, NSSI)之间的中介作用。

结果 焦虑和抑郁与自杀自伤行为呈负相关。具体来说,焦虑症状的加重与自杀意念($r = -0.311$),自杀尝试($r = -0.265$)及NSSI($r = -0.206$)相关;抑郁症状的加重也与自杀意念($r = -0.355$),自杀尝试($r = -0.307$)及NSSI($r = -0.208$)相关。进一步的中介效应分析发现,焦虑在抑郁与NSSI之间起到部分中介作用。

结论 本研究结果支持了焦虑、抑郁与自杀自伤行为之间的负相关性,这提示了焦虑和抑郁在自杀自伤行为中的促进作用。此外,焦虑在抑郁与NSSI之间的中介作用也值得关注。因此,针对焦虑和抑郁的干预可能有助于降低自杀自伤行为的风险。

青少年心理健康问题污名化现状分析

崔龙^{1,2} 孙平³

1.青岛大学医学院,青岛,266071

2.东营市人民医院,东营,257091

3.青岛市精神卫生中心,青岛,266034

目的 分析了解青少年心理健康问题污名化的现状,明确青少年心理健康污名化的主要原因,探索污名化对青少年的影响,引起人们对于青少年心理健康污名化问题的关注并提出可行的建议,希望能够有效改善青少年的心理健康状况。

方法 采用整群抽样法,于2024年4月选取东营市6730名初中生作为研究对象,进行一般社会资料问卷、心理健康污名化问卷等问卷调查,为期2周,对结果进行分析。

结果 (1) 纳入有效问卷5437份,其中被调查学生总体平均年龄 12.93 ± 0.95 岁,男生约占学生总体的一半。(2) 公众污名化得分为 22.83 ± 7.47 分(总分=45分),自我污名化得分为 25.95 ± 5.91 分(总分=50分),分值越高,心理健康问题污名化程度越高。根据每个维度的污名化得分范围将其分别划分为很低、较低、较高、很高四段,其中约18%的学生公众污名化程度较高或很高,约14%的学生自我污名化程度较高或很高。

结论 目前青少年心理健康问题出现了较强的污名化现象,使得许多青少年在面临心理健康问题时选择隐瞒、回避,不愿意主动寻求专业帮助,甚至进一步加剧了心理健康问题的恶化,对患者的社会功能产生严重的负面影响。全社会应真正重视青少年的心理健康问题,建立更完善的心理健康监测体系,加强家庭、学校、医院、社会各界的合作,建立有效联动机制,采取积极的干预措施来积极调整青少年对污名化的错误认知,改善其应对污名化的方式,促进其心理健康,有效提升青少年的心理健康状况。

联合VR认知训练改善青少年抑郁症认知症状的临床探究

费艳艳^{1,3} 孙平²

1. 东营市中医院
2. 青岛市精神卫生中心
3. 青岛大学医学院

目的 本研究旨在探讨虚拟现实(VR)认知训练对改善青少年抑郁症患者认知症状的效果。

方法 本研究纳入了60名确诊为抑郁症的青少年患者(年龄12-18岁),他们被随机分配到实验组和对照组。实验组接受为期12周的VR认知训练,每周5次,每次30分钟;对照组则进行等时长的传统计算机认知训练。使用蒙特利尔认知评估量表(MoCA)、贝克抑郁量表(BDI)和认知功能缺陷自评问卷(PDQ-D)等标准化心理测评量表评估患者的认知功能和抑郁症状。

结果 干预前,3组认知功能分数差异无统计学意义(均 $P>0.05$)。通过12周的训练,结果显示,从训练前的基线到训练后的评分,VR认知训练组的蒙特利尔认知评估量表(MoCA)和认知功能缺陷自评问卷(PDQ-D)的结果显著优于对照组($p<0.05$)。VR认知训练组在记忆力、注意力、反应速度、执行功能和总体认知干预前后比较差异有统计学意义($p<0.01$),而传统计算机训练组的改进幅度较小。此外,与基线相比,VR训练组的BDI得分显著下降,提示其抑郁症状有所缓解。

结论 本研究证实了VR认知训练通过高度仿真的环境和互动性的任务,有效提升了青少年抑郁症患者的认知功能。相比传统训练,VR技术提供了更多的感官刺激和更高的参与度,这可能是其效果更佳的原因之一。本研究结果为VR技术在抑郁症综合治疗中的应用提供了坚实依据。作为一种新兴的治疗工具,VR技术有望成为抑郁症综合治疗方案中的重要一环,提供患者全新的康复路径。

关键词: 虚拟技术,青少年抑郁症,认知症状

低频重复经颅磁刺激联合盐酸舍曲林治疗老年抑郁症的疗效

胡广玲^{1,2} 孙平³

1. 青岛大学青岛医学院
2. 临沂市精神卫生中心
3. 青岛市精神卫生中心

目的 研究低频重复经颅磁刺激联合盐酸舍曲林治疗老年抑郁症的临床疗效。

方法 本研究选取临沂市精神卫生中心2023年3月-2024年3月住院的76例年龄 ≥ 60 岁的老年患者作为研究对象,所有患者均符合ICD-10诊断标准中抑郁症的诊断,按照随机化数字表法将其分为

对照组 (N=38, 给予患者盐酸舍曲林口服治疗, 两周内缓慢加量至 150mg/日) 和治疗组 (N=38, 给予盐酸舍曲林联合刺激频率为 1Hz 的重复经颅磁刺激, 每日一次, 每周五次), 对比两组治疗效果。利用汉密尔顿抑郁量表 17 项版 (HAMD-17) 和抑郁自评量表 (SDS) 评定抑郁症的严重程度, 汉密尔顿焦虑量表 (HAMA) 评定焦虑症状的严重程度。以 HAMD、SDS、HAMA 的减分情况来评定其治疗效果, 分别在治疗的第 0、1、2、3、4 周末将两组的量表评分作为对比来评估其临床疗效。

结果 治疗前 HAMD、SDS、HAMA 评分在对照组和治疗组中无显著性差异 ($P>0.05$); 治疗后两组的量表评分分数均较前下降, 但治疗组优于对照组 ($P<0.05$); 对照组和治疗组其 HAMD、SDS、HAMA 评分差异具有统计学意义 ($P<0.05$)。

结论 盐酸舍曲林联合低频重复经颅磁刺激和盐酸舍曲林均能在老年期抑郁症的治疗中发挥良好的作用, 但在盐酸舍曲林治疗的基础上加上低频重复经颅磁刺激对治疗老年抑郁症会取得更好的疗效。

关键词: 重复经颅磁刺激, 盐酸舍曲林, 老年抑郁症

沙盘治疗在青少年抑郁中的应用及治疗效果研究

刘乘洋¹ 孙平²

1. 淄博市精神卫生中心
2. 青岛市精神卫生中心

目的 本研究旨在深入研究沙盘治疗在青少年抑郁干预中的具体应用及其治疗效果。

方法 研究共选取了 88 例青少年抑郁情绪患者, 年龄在 14-18 岁, 随机分为对照组 (n=44) 和试验组 (n=44)。对照组: 接受常规的心理咨询和药物治疗。试验组: 在对照组的基础上, 增加团体沙盘游戏治疗。沙盘游戏治疗由经验丰富的心理治疗师引导, 每周进行 2 次, 每次持续 1 小时, 连续进行 8 周。分别在在治疗开始前和治疗 4 周后、治疗结束后, 对所有患者进行 SDS (抑郁自评量表)、HAMD (汉密尔顿抑郁量表)、BDI (贝克抑郁量表) 的基线评估, 同时结合患者的自我报告、观察记录以及治疗师的反馈进行质性分析。

结果 试验组治疗后 SDS 量表平均分在第 8 周末较治疗前显著降低 ($P<0.01$), 对照组 SDS 平均分变化前后无明显差异。试验组在 HAMD 和 BDI 量表上的得分均较治疗前明显下降 ($P<0.01$), 对照组在治疗前后量表上的得分前后无明显差异。质性分析显示, 大部分试验组患者表示沙盘游戏为他们提供了一个表达情感、分享困扰和寻找解决方案的平台, 有效减轻了抑郁症状。

结论 本研究证实了沙盘治疗在青少年抑郁干预中的显著治疗效果。这种非言语性心理治疗方法不仅能够有效缓解青少年的抑郁症状, 还能够提高他们的自我认知能力和促进情感表达。

线上失眠认知行为治疗与面对面失眠行为治疗对抑郁障碍患者睡眠质量的影响研究

尹连艳^{1,2} 孙平³

1. 青岛大学医学部
2. 临沂市精神卫生中心
3. 青岛市精神卫生中心

目的 在一项随机对照实验中, 我们比较了使用线上失眠认知行为治疗与面对面进行失眠认知行为治疗的抑郁障碍患者的睡眠质量在治疗前、治疗后和治疗结束 3 个月的效果对比。

方法 选择我院睡眠医学科门诊就诊病人和住院病人在 2022 年 1 月-2023 年 1 月期间收治治疗的 60 例符合 ICD-10 抑郁障碍的诊断标准并伴有失眠的患者。按照随机数字表法分组治疗, 对照组 30 例患者行面对面的失眠认知行为治疗, 观察组 30 例患者使用线上失眠认知行为治疗。两组分别进行了 6 次失眠认知行为治疗。两组患者在治疗前、治疗后及治疗结束后 3 个月进行了失眠严重程度指数 (ISI)、汉密尔顿抑郁量表 24 项 (HAMD)、汉密尔顿焦虑量表 (HAMA) 的评估。应用 SPSS 软件包进行统计学处理并分析。

结果 治疗前, 两组患者各项量表评分无显著差异。治疗后以及治疗结束 3 个月后两组参与者的失眠严重程度指数 (ISI)、汉密尔顿抑郁量表 24 项 (HAMD)、汉密尔顿焦虑量表 (HAMA) 较治疗前均有显著下降, $P<0.05$, 且两组之间没有显著差异

($P>0.05$)

结论 线上失眠认知行为治疗与面对面失眠行为治疗均对抑郁障碍患者睡眠质量有明显改善, 对患者的抑郁情绪及焦虑情绪也有一定的缓解, 两者疗效相当。

关键词: 线上失眠认知行为治疗 ; 抑郁障碍 ; 睡眠质量

精神障碍患者疾病进展恐惧量表的编制及信效度检验

李婉婷*

北京回龙观医院

目的 编制精神障碍患者疾病进展恐惧量表, 并进行信效度检验。

方法 通过文献回顾、质性访谈、德尔菲专家函询法形成量表初稿。于 2024 年 3 月-2024 年 6 月采用便利抽样法选取北京、哈尔滨和厦门 3 所三甲精神专科医院收治的 235 例精神障碍患者进行正式调查, 检验量表信效度。

结果 量表最终包含 17 个条目, 探索性因子分析提取出 3 个公因子, 累计方差贡献率为 77.29%; 验证性因子分析显示, X^2/df 为 2.314, $TLI=0.94$ 、 $IFI=0.95$ 、 $CFI=0.95$ 、 $RMSEA=0.07$, 量表结构模型拟合良好; 条目水平的内容效度指数为 0.80~1.00, 量表水平的平均内容效度指数为 0.94; 总量表的 Cronbach's α 系数为 0.95, 各维度的 Cronbach's α 系数分别为 0.945、0.920 和 0.942; 重测信度为 0.888, 各维度的重测信度分别为 0.825、0.775 和 0.943(均 $P<0.001$), 表明量表的稳定性好; 校标关联度分析显示, 量表得分与健康焦虑量表得分具有相关性(均 $P<0.05$), 且相关系数均 >0.4 , 表明校标关联效度理想。

结论 编制的精神障碍患者疾病进展恐惧量表具有较好的信效度, 可用于精神障碍患者疾病进展恐惧现状的评估。

关键词: 精神障碍; 疾病进展恐惧; 量表; 信度; 效度

The Influence of Family Function on Mobile Phone Addiction in College Students: The Parallel Mediating Role of Self-control and Interaction -emotion Regulation

Zijian Zhang*

The influence of family function on mobile phone addiction in college students: the parallel mediating role of self-control and interaction -emotion regulation

Objective to investigate whether self-control and interpersonal emotion regulation can act as parallel mediators between family function and mobile phone addiction

Methods Family function could negatively predict the level of mobile phone addiction ($r = 0.43$, $p<0.01$). Family function could positively predict self-control level ($r = -0.22$, $p<0.01$). Family function could positively predict the level of interpersonal emotion regulation ($r = -0.36$, $p<0.01$). There was no significant correlation between interpersonal emotional regulation and mobile phone addiction ($r = 0.086$, $p>0.01$). Self-control could negatively predict the level of mobile phone addiction ($r = -0.17$, $p<0.01$). Furthermore, the relationship between the scores of the four sub-dimensions of interpersonal emotional regulation (negative emotional tendency, negative emotional efficacy, positive emotional tendency, positive emotional efficacy) and other variables was investigated. The results showed that, except for the negative emotional tendency, which could negatively predict mobile phone addiction ($r = -0.64$, $p<0.01$), the other dimensions were not significantly correlated with mobile phone addiction. Family function positively predicted interpersonal emotional regulation ($r = -0.46$, $p<0.01$). The direct effect of family function on mobile phone addiction was significant: Bootstrap 95% confidence interval was [0.062, 0.207], excluding 0; The mediating effect of negative emotional tendency and self-control is also significant: The 95% confidence intervals of Bootstrap were [-0.049, -0.004] and [0.095, 0.199] respectively, excluding 0, indicating that family function could not only directly predict the level of mobile phone addiction, but also could predict

the level of mobile phone addiction through the mediating effect of negative emotional tendency and self-control, which belonged to a partial mediating effect

Results Function, mobile phone addiction, self-control and interpersonal emotion regulation were correlated in pairs. The direct effect of family function on mobile phone addiction is significant; The parallel mediating effect of variable of self-control and variable of interpersonal emotional regulation between variable of family function and variable of mobile phone addiction is significant

Conclusion Family function can directly affect mobile phone addiction; It can also be influenced by the parallel mediating effect of self-control and interpersonal emotion regulation

关键词: Family function; Mobile phone addiction; interpersonal emotion regulation; self-control

精神病医院医务人员线上开展精神障碍患者居家感控对医院感控管理的价值分析

张玉良*

如皋市精神病防治医院

目的 实施创新赋能管理, 探讨精神病医院医务人员线上开展精神障碍患者居家(院外)感染智慧防控管理, 即“互联网+”模式(微信、微信群、公众号、视频号等), 远程指导科普居家防控细菌病毒感染、提高抵御感染、安全合理用药的健康知识、基本卫生操作技能、身体自我免疫素质后, 对患者降低携带病毒细菌等感染源进入医院、及在门诊和住院治疗期间发生院内感染几率、对院感管理影响的实践价值和效果分析。

方法 随机选取门诊治疗、居家服药的精神病患者共有 300 例, 在 2020 年 4 月~2024 年 5 月期间, 对其中的 150 例患者为对照组, 进行门诊窗口常规感染防控处置不良反应等指导, 另外的 150 例患者为观察组, 在门诊窗口常规指导外, 再借助微信(群)公众号朋友圈视频号等给予强化居家防控细菌病毒等院外抗感染和处置不良反应等远程指导、智慧防控管理。对比两组中部分患者因精神病发作住院期间发生院内感染情况。

结果 观察组患者在线上获得医务人员的居家(院外)防控感染强化指导干预后, 感控知识提升、病情发作住院期间发生院内季节性病毒性感冒、细菌性感染比例、感染后病程等都明显降低, 相比于对照组, 具有明显的优势, $P < 0.05$ 。

结论 医务人员开展智慧防控管理, 院外感控宣传、线上强化防控感染指导, 能够大大降低患者发生院内感染的风险几率! 院外感染智慧防控管理, 能够有效降低医院感控管理压力, 具有创新性、实用性, 值得借鉴推广、持续开展。

社会支持在内蒙古在职干部积极应对方式与抑郁间的中介作用

陈敏 陈丽霞 刘永义 王峥 马军*

内蒙古自治区脑科医院(第三医院)

目的 在职干部作为特殊群体, 掌握着公共利益, 对社会管理和社会服务负有特殊责任, 他们的心理健康状况与政府执政能力建设和社会稳定发展密切相关, 与人民群众利益息息相关。因此调查内蒙古自治区在职干部的心理健康状况, 并探讨社会支持和应对方式对内蒙古自治区在职干部抑郁情绪的影响。

方法 采用自编量表、症状自评量表(SCL-90)、社会支持评定量表(SSRS)和简易应付方式问卷(SCSQ), 以分层按比例分配、简单随机抽样和按规模大小成比例抽样的方法选取内蒙古自治区 12 个盟市 2000 名在职干部进行问卷调查, 最终回收有效样本 1996 例。

结果 社会支持与在职干部抑郁因子分呈显著负相关($P < 0.01$), 表明社会支持越好, 抑郁程度越低, 感受到的抑郁情绪越少; 应对方式的积极维度分与在职干部抑郁因子分呈显著负相关($P < 0.01$), 表明应对方式越积极, 心理健康水平越高, 抑郁程度越轻; 积极应对方式对内蒙古自治区在职干部抑郁的直接效应显著($P < 0.05$), 积极应对方式通过社会支持对内蒙古自治区在职干部抑郁的间接效应显著($P < 0.01$)。

结论 社会支持在内蒙古自治区在职干部积极

应对方式与抑郁间发挥部分中介作用, 在职干部的心理健康受应对方式和社会支持的影响, 通过对心理健康影响因素和作用机制的探讨, 为内蒙古在职干部心理健康工作提供借鉴。

关键词: 在职干部 社会支持 应对方式 抑郁

青少年首发精神分裂症代谢异常、炎性因子与认知功能相关性研究

许亚琼*

临沂市精神卫生中心

目的 本研究为在青少年首发精神分裂症治疗前进行代谢指标、炎性因子检测, 进一步探讨代谢异常、炎性因子对青少年首发精神分裂症的认知功能的影响

方法 选择 2022 年 9 月至 2023 年 12 月来我院就诊的符合《ICD-10 精神与行为障碍分类》精神分裂症诊断标准的首发青少年患者(包括门诊患者、住院患者)(≤ 18 岁) 100 例。分别在治疗前进行血生化、血常规、C-反应蛋白和甲状腺功能八项测定。据检查结果进行分组其中伴发代谢综合征(MS)的患者 57 例(MS 组), 不伴发代谢综合征患者 43 例(非 MS 组), 炎性因子升高的患者有 39 例, 炎性因子正常的有 61 例。同时伴有代谢综合征和炎性因子升高的患者有 27 例, 其余 73 例。分别对入组患者使用韦氏记忆量表、韦氏智力量表评定认知功能。应用 SPSS 软件包进行统计学处理并分析。

结果 伴发代谢综合征组的患者的记忆和韦氏智力水平低于不伴发代谢综合征组, 差异有统计学意义($P < 0.05$)。炎性因子升高组患者的记忆和韦氏智力水平低于炎性因子正常组, 差异有统计学意义($P < 0.05$)。同时伴有代谢综合征和炎性因子升高组患者的记忆和韦氏智力水平较单独伴发代谢综合征患者或者炎性因子升高患者的指标更低, 差异有统计学意义($P < 0.05$)。

结论 伴有代谢综合征或炎性因子升高的青少年首发精神分裂症患者的认知功能的损害和生活能力下降比较明显, 同时伴有代谢综合征和炎性因子升高的青少年首发精神分裂症患者的认知功能的损害和生活能力下降会更加明显。

关键词: 青少年 ; 首发精神分裂症 ; 代谢异常 ; 炎性因子; 认知功能

非自杀性自伤青少年家庭抗逆力现状及其影响因素

蔡敏仪* 孙春艳 谢美香 王黎 刘小玉 覃柳叶 陈瀚熙

广东省人民医院

目的 本次研究调查非自杀性自伤青少年家庭抗逆力现状, 并分析其影响因素。

方法 选择 2023 年 3 月-2024 年 1 月在广州某三甲医院精神科收治的 268 例非自杀性自伤青少年的父母作为研究对象, 采用患者及其父母的一般资料调查表、家庭坚韧性量表、反刍思维量表、述情障碍量表、广泛性焦虑量表、抑郁症筛查量表进行横断面调查。观察并分析这一群体家庭抗逆力现状, 分析其影响因素。

结果 家庭抗逆力总分 58.21 ± 6.03 分, 责任维度 27.40 ± 3.29 分, 控制维度 16.62 ± 2.60 分, 挑战维度 14.19 ± 1.88 分。女性家庭抗逆力得分显著低于男性, 父母离异或其他不稳定的婚姻状况的青少年家庭抗逆力得分显著低于父母稳定的青少年, 不同家庭平均月收入 and 抑郁程度者家庭抗逆力得分存在差异, 差异有统计学意义($P < 0.05$)。家庭坚韧性总分与反刍总分($r = -0.285$)、述情障碍得分($r = -0.572$)、GAD-7 总分($r = -0.433$)、PHQ9 总分($r = -0.398$)均呈负相关, 家庭抗逆力各维度与量表得分相关性分析, 除责任维度与反刍总分无统计学意义外, 其他指标均呈负相关($P < 0.05$)。多元线性回归分析结果显示: 青少年 NSSI 的家庭抗逆力影响因素有抑郁程度($t = -5.662$)、家庭月收入($t = 2.975$)、述情障碍得分($t = -8.442$)、GAD-7 得分($t = -4.023$), 差异均有统计学意义($P < 0.05$)。

结论 家庭抗逆力得分与个体消极思维、述情障碍、焦虑程度、抑郁程度呈负相关, 家庭平均月收入、抑郁程度、焦虑程度、述情障碍是青少年 NSSI 家庭抗逆力的重要独立危险因素, 青少年 NSSI 家庭抗逆力处于中等水平, 提高家庭成员的自我调节能力、减轻疾病家庭负担、调动社会支持系统, 可以提高其家庭抗逆力。积极关注学生的 NSSI 情况, 针对

性开展干预措施, 从而取得良好效果。

TREM2 Regulates BV2 Microglia Activation and Influences Corticosterone-induced Neuroinflammation in Depressive Disorders

Jingjing Shi¹, Jian Hu²

1. Harbin First Specialized Hospital

2. Department of Psychiatry, The First Affiliated Hospital of Harbin Medical University

Objective Depressive disorders is a serious mental illness, and its underlying pathological mechanisms remain unclear. The overactivation of microglia and neuroinflammation are thought to play an essential role in the occurrence and development of depressive disorders. TREM2, an immune protein mainly expressed in microglia, is an important part of nerve cells involved in inflammatory response. Corticosterone (CORT) is often referred to as a stress hormone and plays a role in the immune system and stress response. Therefore, this study investigated the role of TREM2 in CORT-induced BV2 cell damage and preliminarily analyzed the effects of TREM2 on JAK2/STAT3 signaling pathway and microglia polarization

Methods The cell model of CORT-induced depression in vitro was established, and the effect of CORT on the activity of BV2 microglia was detected by CCK8. Plasmid transfection was used to overexpress and interfere with TREM2 in BV2 cells cultured by CORT. Western blotting, PCR, and ELISA analyzed the expression of related proteins and inflammatory factors

Results The results showed that CORT could affect BV2 cell proliferation and TREM2 levels. In the presence of CORT, overexpression of TREM2 decreased the levels of TNF- α , IL-1 β , and IL-6 and increased the levels of IL-10. Interference with TREM2 increased the levels of TNF- α , IL-1 β , and IL-6 and decreased the levels of IL-10

Conclusion TREM2 can affect the release of inflammatory factors through the JAK2/STAT3 signaling pathway and regulate the M1/M2 phenotypic transformation of microglia. TREM2 plays a role in regulating CORT-induced inflammatory responses, revealing the influence of TREM2 on the neuroinflammatory pathogenesis of depressive disorders and suggesting that TREM2 may be a new target for the prevention and treatment of depressive disorders

关键词: TREM2; Corticosterone; Microglia polarization; Neuroinflammation; Depressive disorders

某精神专科医院 1045 例医疗不良事件的回顾性分析及对策研究

王魁元 黄丹*

赣州市第三人民医院

目的 分析精神专科医院医疗不良事件发生情况及变化趋势, 剖析医疗不良事件发生原因, 以期探索可靠便捷的医疗不良事件预警机制及防范措施, 为降低不良事件发生率, 保障医疗安全, 提高医疗质量, 提供参考依据。

方法 应对赣州市某三级甲等精神专科医院 2021 年-2023 年上报的 1045 例医疗不良事件数据进行回顾性分析, 双人将数据录入 Excel, 用频数与构成比进行描述性统计, 回顾梳理不良事件报告例数、类别分布、事件分级及各科室分布情况。

结果 ①2021 年-2023 年, 其中 2023 年上报的不良事件例数呈显著上升趋势, 为 455 例, 占比 43.35%。2021 年及 2022 年不良事件上报例数相对持平。可能与疫情期间病源单一且收治病患数较少, 而 2023 年疫情高峰期结束后, 全国心理、睡眠病人就诊人数呈井喷式发展有关。

②医疗不良事件类别共 18 种, 以药物不良反应事件为主, 占比 40.57%, 与精神心理类药物的药理毒性与疾病的诊治方式有关; 其次是自杀自伤事件 (14.35%) 和伤人事件 (14.07%), 与收治病种有关。

③医疗不良事件分级情况: 其中 III 级 (非后果事件) 最多, 为 893 例, 占比 85.45%。

④医疗不良事件各科室分布情况: 精神科上报

例数最多, 占比 61.63%, 其次是心理睡眠科(22.58%)和老年医学科(6.32%), 与精神心理疾病的病情特点与诊疗环境有关。

结论 精神专科医院收治患者的复杂性及封闭的工作环境, 相较于综合性或其他专科医院具有更高医疗不良事件发生率, 如何保障医疗质量, 提高医患满意度, 完善医疗安全管理是精神专科医院改革发展之中亟需解决的关键问题。健全医疗不良事件管理模式, 提高研判医疗风险意识, 构建医疗安全文化等措施可以有效防范不良事件发生的。

关键词: 精神专科医院; 医疗不良事件; 医疗质量; 对策

The Association of Sun Sensitivity, Sun Protective Behaviors and Depression in Both Genders

Hongfei Mo*

Shanghai Medical College of Fudan University

Objective The aim of this study was to comprehensively analyze the association between sun sensitivity, common sun protective behaviors (such as staying in shade, wearing long sleeves, and using sunscreen), and depression in both genders. By adjusting for each other as potential confounders, we sought to disentangle the independent effects of these factors on depression

Methods Data from the National Health and Nutrition Examination Survey (NHANES) 2017-2018 cycle were utilized in this study. Participants' sun sensitivity and sun protective behaviors were assessed through the dermatology questionnaire, while depression was measured using the 9-item Patient Health Questionnaire, with a score greater than 4 indicating depression. Gender-specific logistic regression analyses were performed to examine the relationships between sun sensitivity, sun protective behaviors, and depression

Results A total of 2606 participants, with a mean age of 39.99 ± 1.57 years, were included in the analysis. Among them, 1227 (47.1%) were males, and 1378 (52.9%) were females. Our findings revealed no significant association between sun sensitivity and depression.

However, staying in shade was positively associated with depression (OR=1.27, 95% CI: 1.03-1.57). In contrast, using sunscreen was negatively associated with depression (OR=0.69, 95% CI: 0.53-0.90). Gender-specific analyses showed that in males, there were no associations between sun protective behaviors and depression. However, in females, both wearing long sleeves (OR=0.65, 95% CI: 0.42-0.99) and using sunscreen (OR=0.71, 95% CI: 0.52-0.97) were negatively associated with depression

Conclusions Our study found no significant association between sun sensitivity and depression. However, staying in shade appears to be a potential risk factor for depression, while using sunscreen may serve as a protective factor. Interestingly, we observed gender differences in the relationships between sun protective behaviors and depression. In males, there were no associations between these behaviors and depression, whereas in females, wearing long sleeves and using sunscreen were negatively associated with depression, suggesting they may be protective factors against depression in this group. These findings underscore the importance of understanding and promoting sun protection strategies, while considering potential gender differences in their psychological implications.

山东省基层精防人员工作满意度分析

胡丽丽* 王延祜 李奇

山东省精神卫生中心

目的 了解山东省基层精防人员的配置基本情况与工作满意度及影响因素, 为相关部门制定政策、合理配置资源提供参考。

方法 本研究为横断面调查, 采用自编的人口学特征问卷与明尼苏达满意度量表, 在全省 16 市所有开展严重精神障碍管理治疗项目的基层医疗卫生机构进行调查。一般人口学资料包括性别、年龄、婚姻状况、受教育程度、是否正式员工、年资、每日工作时间、每周工作天数、月收入、收入满意度等。

工作满意度采用明尼苏达满意度量表, 测量工作者的内在满意度、外在满意度及一般满意度。

结果 1.全省共有 2685 家基层医疗卫生机构开展严重精神障碍管理治疗项目, 共有 6491 名基层精防人员, 每 10 万人中有 6.39 名基层精防人员。平均每名精防人员随访管理 81 名患者, 最高的市平均为 326 人, 工作负荷较大。基层精防人员近 45%没有编制, 75%为初级职称, 收入水平不高。除了干本职工作以外, 90%的精防人员仍需要承担基本公共卫生服务的其他工作, 每周工作时间在 6 天以上。

2.基层精防人员总体满意度为(2.60±0.91)分, 整体处于满意和基本满意的状态。其中内部满意度得(2.52±0.91)分, 外部得分为(2.72±0.98)分。内部满意度好于外部满意度。基层精防人员最不满意的条目为“我的收入与我的工作量”, 最满意的条目为“能够为其他人做些事情的机会”。不同婚姻状况、年龄段、每年参加的培训的次数和管理患者人数这几个维度方面, 各组精防人员工作满意度得分不同, 并且差异具有统计学意义($P<0.05$)。

3.分别以工作总体满意度得分作为因变量, 将所有维度作为自变量, 进行多重线性回归分析。结果显示, 管理患者人数($t=2.094$, $P<0.05$)、是否兼职负责其他工作($t=-3.527$, $P<0.05$)、月收入($t=-5.135$, $P<0.05$)与基层精防人员工作总体满意度存在统计学关联。管理患者人数较多、兼职负责其他工作是工作总体满意度的负面因素, 而月收入高和参加县级以上培训是基层精防人员工作总体满意度的积极因素。

结论 山东省基层精防人员对工作总体满意度评价得分低于 3 分, 属于“满意和基本满意”的水平。管理患者人数数量、是否兼职负责其他工作、收入和每年参加县级以上培训的次数是基层精防人员工作总体满意度的影响因素。

关键词: 基层精防人员、满意度

The Family Doctor in Patients with Mental Illness The Role of Community Management and The Practice

Yanzhang Wang Xiang Luo*

China People's Liberation Army Joint Logistics Support

Force No.923 Hospital

Abstract: With the continuous development of community mental health services, family doctors, as an important part of the medical service system, play an increasingly important role in the management and care of patients with mental disorders. This article summarizes the development history, service model and characteristics of family doctors, analyzes the current status and challenges of community management of patients with mental disorders, and focuses on the multiple roles played by family doctors in community management of patients with mental disorders, including as the first contact and continuous care provider, and the key role in patient education and psychological support. At the same time, this article also discusses how family physicians can effectively collaborate with multidisciplinary teams to improve the overall effectiveness of patient management. Family doctors play an indispensable role in community management of patients with mental disorders. By continuously optimizing the family doctor system, strengthening professional training and incentive mechanism, the effectiveness of family doctors in mental illness management can be further improved, so as to better meet the medical needs of patients and promote the comprehensive development of community mental health services. This paper not only provides a new perspective and ideas for community management of patients with mental disorders, but also provides a useful reference for relevant policy making and practice.

空气颗粒物大小对孤独症谱系障碍儿童发病风险的研究进展

李凯欣¹ 李晏^{1,2} 赵越¹ 肖锋¹ 彭俊歌¹

1.郑州大学

2.郑州大学第二附属医院, 郑州大学第二临床医学院

孤独症谱系障碍 (autism spectrum disorder, ASD) 是一种复杂的大脑神经发育障碍, 其病因受到遗传和环境因素的共同作用。我国约有 300 万儿童受此疾病影响, 给社会和家庭带来沉重负担。研究表明, 空气颗粒物 (particulate matter, PM) 可能通过干扰神经发育和大脑功能, 增加 ASD 的发病风险。研究发现, 不同大小的颗粒物通过多种途径和机制影响神经系统健康。PM₁₀ 和 PM_c 主要在呼吸道上部引发局部炎症, 释放炎性介质, 通过血液循环对大脑造成影响。较小的颗粒物如 PM_{2.5} 和 PM₁ 能够深入呼吸道并穿透肺泡进入血液, 直接影响中枢神经系统, 破坏血脑屏障, 引起神经炎症和细胞凋亡。DPM 含有大量有毒化学成分 (如多环芳烃、重金属等), 通过多种机制损害神经系统, 增加 ASD 风险。此外, 空气颗粒物对神经发育的影响存在敏感窗口期。孕期特别是妊娠早期及儿童早期是大脑发育的关键阶段, 此时暴露于高浓度空气颗粒物, 可能导致大脑结构和功能的异常发育, 增加 ASD 的发病风险。基于此, 本系统评价综述了不同粒径的空气颗粒物 (包括 PM₁₀、PM_c (PM_{2.5-10})、PM_{2.5}、PM₁ 及尾气颗粒物 [diesel particulate matter, DPM]) 与 ASD 之间的关联, 并比较了不同粒径颗粒物的效应差异。

关键词: 孤独症谱系障碍; 空气颗粒物; 敏感窗口期; 发病机制

我国社区心理健康服务体系建设的现状

陈良梅* 刘晓凤
西安市精神卫生中心

目的 探讨当前我国社区心理健康服务体系建设的现状, 并提出相关建议。

方法 目前, 我国正在积极推进社区心理健康服务体系建设。由于起步较晚和发展不均衡等原因, 该体系仍存在诸多不足。本文通过对国内外相关文献的研究及对国内现状的调查, 以及对国内几个典型城市的案例分析, 展示我国社区心理健康服务体系建设的进展与挑战, 并就如何完善这一系统提供参考意见。

结果 截至 2020 年底, 在全国范围内已建立了超过 4 万个心理咨询室或心理服务中心, 并有近 5

万名专业人员提供了相应服务。在政府政策的支持下, 目前我国已初步建立了心理健康服务体系, 但仍存在诸多不足之处, 整体来看: 首先, 资源仍然相对稀缺且分布不平衡是一个显著问题; 其次, 公众对心理健康的重要性认识不足也是阻碍体系发展的因素之一。业内专家普遍认为需要从以下几个方面入手进行改善: 加大政策支持, 提升服务能力, 强化公众意识, 完善信息平台。

结论 虽然中国在心理健康服务体系建设方面已经取得了一定的成绩, 从中央到地方各级政府部门都在逐步加大对社区心理健康服务业的扶持力度, 这预示着未来行业的良好发展态势, 但我们还有很长的路要走, 要实现全面而高效的心理健康服务体系还需各方面的共同努力。我们应该继续优化资源配置, 促进公平性和可及性的提升; 同时也要加强对公民心理健康的宣传教育, 普及科学知识, 消除偏见和歧视, 形成关注心理健康、重视社区服务的良好氛围。我们期待看到一个更加成熟和完善的服务网络在未来形成。

关键词: 社区服务, 心理健康, 体系建设

The Relationship Between Career Adaptability, Decent Work, Job Satisfaction and Burnout Among Psychiatrists: A Cross-Sectional Study

Huaineng Wu Hong Luo Bowen Xue*
Hangzhou Seventh People's Hospital

Background The COVID-19 pandemic has increased the demand for mental health services globally, exacerbating the shortage of psychiatrists. This has led to decreased job satisfaction and perceived decency of work, along with increased burnout among them. Understanding the career adaptability of psychiatrists is crucial for addressing these issues

Methods The study used a cross-sectional research design and convenience sampling in February 2024. The 516 psychiatrists working in public hospitals located in Zhejiang Province and the Xinjiang Uygur Autonomous Region were assessed using demographic characteristics, the Career Adapt-Abilities Scale

(CAAS), the Decent Work Perceptions Scale (DWPS), the Minnesota Satisfaction Questionnaire (MSQ), and the Maslach Burnout Inventory-General Survey (MBI-GS)

Results The study found that career adaptability significantly influences burnout, job satisfaction, and decent work. Job satisfaction and decent work have negative effects on burnout, while decent work positively affects job satisfaction. Furthermore, mediation analysis highlights the role of decent work in mediating the relationship between career adaptability and burnout, explaining 50.74% of the total effect

Conclusion This study underscores the importance of career adaptability among psychiatrists, highlighting the mediating role of decent work and job satisfaction. Thus, management in psychiatric hospitals should take measures to enhance physicians' personal career adaptability, uphold the concept of decent work, improve job satisfaction, alleviate burnout, and safeguard physicians' professional well-being.

关键词: Career Adaptability; Decent Work; Job Satisfaction; Burnout; Psychiatrists; Mediation analysis.

医护人员对非自杀性自伤患者管理体验质性研究的 Meta 整合

孙春艳^{1,2} 李惠平^{1,2} 蔡敏仪^{1,2} 刘小玉^{1,2} 谢美香^{1,2}
王黎^{1,2} 覃柳叶^{1,2}

1. 广东省人民医院
2. 广东省精神卫生中心

目的 整合医护人员对非自杀性自伤 (non-suicidal self injury, NSSI) 患者的态度及照护体验的质性研究, 为探索非自杀性自伤管理方案并制订干预策略提供参考。

方法 计算机检索 PubMed、Embase、Web of Science、Cochrane Library、EBSCO、CINAHL、中国知网、万方数据库、维普数据库、中国生物医学文献数据库中关于医护人员对管理 NSSI 患者的体验的质性研究, 检索时限为建库至 2023 年 7 月。使用澳大利亚乔安娜布里格斯研究所循证卫生保健中心质性研究质量评价标准 (2016) 评价文献质量, 采用

Meta 整合方法对结果进行整合。

结果 共纳入 11 篇文献, 提炼出 35 个研究结果, 归纳出 15 个类别, 最终综合为 4 个整合结果
1. 医护人员负性情感反应突出, 包括 (1) 面对伤情的恐惧感以及担忧潜在的风险; (2) 束手无策导致的沮丧和挫败感; (3) 同情心降低及对患者进行标签化。
2. 医护人员对 NSSI 管理的多元应对, 包括 (1) 建立良好的治疗关系; (2) 应用多种自伤替代疗法; (3) 加强风险评估及安全管理; (4) 采取个体化的护理; (5) 回避性照顾。
3. 医护人员在 NSSI 管理实践中的困境, 包括 (1) 限制性干预时机的分歧; (2) 自我效能低下; (3) 治疗关系的破坏; (4) 工作环境对高质量护理的限制。
4. 医护人员对 NSSI 管理的期待: (1) 加强相关知识培训; (2) 完善心理健康服务体系; (3) 提高社会公众整体认知。

结论 医护人员在照护 NSSI 患者时存在情绪压力和心理负担, 因此建议对照护 NSSI 的医护人员提供心理支持和情感关怀。医护人员的专业技能和知识决定了对患者的准确评估和有效干预的能力, 持续的专业培训和知识更新对提高照护质量至关重要。此外, 呼吁完善心理健康服务体系, 以便更好地满足患者的心理健康需求。

The Mediating Role of Depression in The Relationship between Anxiety and Psychosomatic Symptoms in Nursing Internship Students after COVID-19 Policy Lifted in China: A Cross-sectional Study

Yihan Zhang Wenhao Jiang Yonggui Yuan Xiaoyan Wang*
Southeast University

Objective The medical system has gradually resumed in China since early 2023. However, the existing pandemic threats and potential healthcare burden still stress out the medical personnel in major cities. Notably, nursing students are a vulnerable and highly stressed group, which can significantly impact their health and careers. Clinical internship is an important phase for

nursing students that helps them develop nursing abilities as they apply theory to practice and transition from the role of a student to that of a professional nurse. However, to reduce the proportion of infected persons during the pandemic, the clinical internship for nursing students was instead of online courses. Since December 5, 2022, the COVID-19 policy (a preventive policy that uses rigorous quarantine regulations and extensive testing to control any outbreak before it spreads) in China was lifted, and the clinical internship resumed in-person learning. A surge in COVID-19 incidence and hospitalizations poses psychosomatic challenges to nursing internship students. The term "psychosomatic" refers to the interaction in which psychological and biological variables are connected to health and illness, and the factors affecting people's psychosomatic health including age, gender, education, occupation etc. Most nursing students were concerned with higher infection risks, late graduation, the long-term impact on their future careers, and other stressors after the COVID-19 pandemic, which may result in severe psychosomatic problems. Previous studies showed that nursing internship students experienced considerable psychosomatic problems after the COVID-19 pandemic. Psychosomatic symptoms, alongside various forms of negative emotions such as anxiety and depression, may impact the health of healthcare workers and the daily care of patients, leading to unfavorable health outcomes for patients. For nursing students in internship, it may even shake their belief in pursuing a nursing career. While numerous studies have highlighted the presence of psychosomatic problems among nursing internship students in the early stages of the pandemic between 2020 and 2022, the psychosomatic health of nursing internship students after COVID-19 policy lifted are mainly unknown. Anxiety, depression and stress are the most common psychosomatic problems among nursing students. However, the underlying mechanisms and correlations between psychosomatic symptoms and negative emotions among nursing internship students are scarcely studied. Thus, we aim to investigate the prevalence of psychosomatic symptoms, anxiety, depression and perceived stress in nursing internship students after COVID-19 policy lifted, and explore the the underlying

mechanisms and correlations between them, which may serve as vital evidence to guide nursing internship students in promoting psychosomatic health

Methods A cross-sectional study with convenience sampling was conducted among nursing internship students at a grade-A tertiary hospital in Nanjing in early 2023. The inclusion criteria for this study were: (a) nursing students in internship; (b) those voluntarily participating in this research. The exclusion criteria were: (a) nursing interns on sick leave during investigation; (b) those who are unable to complete the questionnaire for personal reasons or other circumstances; (c) diagnosed with depression or other mental illnesses. All invitees completed the questionnaire online via the platform Questionnaire Star (<https://www.wjx.cn>) for questionnaire design and data gathering. The questionnaire included a demographic questionnaire, psychosomatic symptom scale (PSSS), generalized anxiety disorder 7-item (GAD-7), and patient health questionnaire-9 (PHQ-9), chinese perceived stress scales (CPSS). In this study, IBM SPSS 26.0 software was used to analyze the data. Descriptive statistics are the first step in analysis, the continuous variables that met the normal distribution were described as mean and standard deviation, whereas for the non-normal distribution, they were expressed as median and quartile. The categorical variables were described by the number and percentage. The chi-square tests were used to test the differences in categorical variables for the psychosomatic symptoms of nursing internship students, the Kruskal-Wallis H rank-sum test and Mann-Whitney U-test were used to compare the differences in total scores and psychosomatic symptoms for anxiety, depression, and stress. Multiple linear regression analysis was used to explore the influencing factors of psychosomatic symptoms among nursing internship students during the post-pandemic era. Finally, PROCESS 3.3 was utilized to analyze the mediating effect of influencing factors with psychosomatic symptoms in nursing interns. The P-value less than 0.05 (2-tailed) was considered statistically significant.

Results The prevalence of psychosomatic symptoms, anxiety, depression, and stress were 53.3%, 17.3%, 35.5%, and 66.5% respectively. Multiple linear regression analysis revealed that anxiety and depressive

symptoms were significant predictors of psychosomatic symptoms, which could explain 61.4% of the total variance of psychosomatic symptoms ($P < 0.05$). Further correlation analysis showed that psychosomatic symptoms was positively correlated with anxiety, depression ($P < 0.01$). The mediation model confirmed a significant association between anxiety and psychosomatic symptoms (total effect $c = 2.044$, Standard Error = 0.144, total effect share = 72%). We observed a significant mediating effect of depression on the association between anxiety and psychosomatic symptoms (effect value = 1.471, Standard Error = 0.298, Bootstraps 95% CI = 0.896 to 2.062).

Conclusion After the Chinese COVID-19 policy lifted, this is the first study that investigates the psychosomatic symptoms and associated factors of nursing internship students. We found that the prevalence of psychosomatic symptoms, anxiety, depression, and stress among nursing internship students were 53.3%, 17.3%, 35.5%, and 66.5% respectively. Furthermore, we found depression played a mediating role between anxiety and psychosomatic symptoms, which play an important role in making strategies to predict and intervene in the psychosomatic symptoms of nursing internship students. Clinical internship is a challenging and stressful experience for nursing internship students, even under normal circumstances. Notably, compared to the investigations in the early pandemic period, our study shows that nursing internship students have a lower incidence of negative emotions after the COVID-19 policy lifted. This may indicate that anxiety and depression among nursing students have been alleviated compared to the pandemic lockdown period. Sufficient understanding of the coronavirus infection, long-term adjustment to the pandemic and regulations related quarantine may be important for this reasons. However, the results of our survey and previous studies suggest that after the policy of COVID-19 lifted, nursing internship students nearing graduation may still experience this anxiety and depression due to the pressures of entrance examinations, employment, and nursing licensure exams. Therefore, the psychosomatic health of nursing internship students after COVID-19 policy lifted deserves attention. Possible interventions should target the monitoring and timely

treatment of anxiety and depression in nursing interns, as these symptoms are closely related to psychosomatic symptoms.

情绪及自尊、亲子关系、负性生活事件对青少年抑郁障碍患者非自杀性自伤行为的影响

李隽逸 张兰 董强利*
兰州大学第二医院

目的 调查青少年抑郁障碍患者非自杀性自伤(NSSI)行为的情况,分析相关影响因素,为NSSI的防治提供理论基础及参考。

方法 选取 95 例青少年抑郁障碍患者,根据 DSM-5 关于 NSSI 的诊断标准,将患者分为伴有 NSSI 行为组(NSSI 组)和不伴有 NSSI 行为组(nNSSI 组)。采用青少年非自杀性自伤行为问卷(ANSAQ)、抑郁自评量表(SDS)、焦虑自评量表(SAS)、罗森伯格自尊量表(RSES)、亲密关系体验-关系结构量表(ECR-RS)、青少年生活事件量表(ASLEC)对患者进行评估,比较 NSSI 组与 nNSSI 组两组的组间差异,并使用二元 Logistic 回归分析探究 NSSI 行为的影响因素。

结果 95 例青少年抑郁障碍患者中有 59 例存在 NSSI,检出率为 62.11%。NSSI 组在抑郁自评量表、焦虑自评量表、对父亲的依恋焦虑、对母亲的依恋焦虑及依恋回避、ASLEC 总分、受惩罚、人际压力、学习压力、适应方面的评分均高于 nNSSI 组,而在罗森伯格自尊量表的评分较 nNSSI 组低 ($P < 0.05$)。二元 Logistic 回归分析提示,高焦虑水平、对母亲的依恋回避、受惩罚是青少年抑郁障碍患者 NSSI 行为发生的危险因素 ($P < 0.05$)。高自尊是青少年抑郁障碍患者发生 NSSI 行为的保护因素 ($P < 0.05$)。

结论 本研究提示青少年抑郁障碍患者 NSSI 发生率较高,高焦虑水平、对母亲的依恋回避、受惩罚是青少年抑郁障碍患者发生 NSSI 行为的危险因素,而高自尊是保护因素。临床中除了改善患者的抑郁、焦虑情绪外,还需注意关注患者的自尊水平、亲子关系及负性生活事件,以减少 NSSI 行为的发

生。

An Investigation on Mental Health Literacy in A Prefecture-Level City of China

Hong Lin^{1,2,3}, Junjing Hua⁴, Kun Meng¹, Hao Tong¹, Shuang Zhang¹, Xinyi Zhou⁴, Tian Xiang⁴, Ling Huang^{3,4}

1.Yichang Mental Health Center

2.Yichang Clinical Research Center for Mental Disorders

3.Institute of Mental Health, China Three Gorges University

4.College of Medicine and Health Sciences, China Three Gorges University

Background Mental Health Literacy (MHL) is a prerequisite for early identification and prevention for mental problems. China listed MHL as a national health policy indicator to achieve the goal of "Healthy China". But estimates of MHL from coordinated general population surveys were not published. This survey was set up in 2023 to investigate the Level of MHL (MHLL), analyse their social and psychological risk factors in a prefecture-level city of China.

Methods Multi-stage random sampling and Kish selection table were applied to get the sample who responded through a face-to-face-administered questionnaire through a community-based cross-sectional survey. National MHL Questionnaire (NMHLQ) was applied to conduct the survey. Analyses included descriptive statistics, Chi-square test and logistic regression were used

Results A total of 6970 people participated (effective rate: 98.8%), of whom a 51.4% were girls. The respondent aged from 15 to 80 years (52.9±12.6). Results showed that only 23.5% (n=1638) of respondents reached the qualified MHLL in total. High MHLL were observed among high years of education (OR=2.087, 95% CI:0.984-0.996, P<0.001), and good self-rated health

(OR=0.990, 95% CI:0.984-0.996, P=0.002), while increasing age was a risk factor for MHLL (OR=4.014, 95%CI:1.589-10.140, P=0.003)。

Conclusion Residents' MHLL is 23.5% (95% CI:22.6%-24.4%), which meets the relevant requirements of the Healthy China Action (2019-2030) and Municipal Health Commission. Corresponding countermeasures should be given to vulnerable people with high stigma

精神疾病患者出院后死亡原因调查

裴卫萍*

临汾锦冉心理康复医院

目的 为了解精神疾病患者出院后的死亡原因,做到及早预防,以减少或避免死亡的发生。

方法 采用通过电话回访的方式,向2020年5月至2024年5月经临汾锦冉心理康复医院治疗出院的精神疾病患者直系亲属进行调查,分别对患者性别、年龄、病程、出院诊断、合并躯体疾病、院外服药情况、家庭支持、死亡原因进行分析。

结果 自2020年5月到2024年5月出院后死亡的14例患者中,均未定期复查,未按时服药,其中男性13例,女性1例,年龄25-82岁,病程2年—20年,出院诊断:精神分裂症6人,脑器质性精神障碍4人,双相情感障碍3人,伴有精神症状的重度抑郁1人。其中:自杀6人(服药4人,服农药2人),阿尔茨海默症死亡4人,外走溺水1人,车祸1人,猝死1人。

结论 精神疾病患者康复出院后男性死亡率明显高于女性占93%,其中自杀占最大比例43%,其次是脑器质性精神障碍占29%,外走溺水7%,车祸7%,肺癌7%,猝死7%。

精神疾病患者康复出院,回归家庭,回归社会后,家庭护理非常重要。需要医院、家庭、社会三方共同努力,构建完善的精神疾病康复体系,提高他们的社会适应能力,同时让他们能够认识到自己的价值,增强生活的信心,从而减少因为自卑、悲观而自杀的发生。

同时也有相当一部分老年精神疾病患者为脑器质性病变引起,因此要加强对老年患者的原发性疾病的及早治疗,通常原发性疾病治疗好后,伴随的相关精神障碍会减轻或消失。

孤独症谱系障碍学龄前儿童血浆内源性大麻素含量降低

贾鑫磊 刘佳佳*
北京大学护理学院

目的 内源性大麻素系统是一个与突触可塑性和神经调节相关的细胞信号系统,其起作用的分子为内源性大麻素(endocannabinoid, eCB)。eCB的失调可能与孤独症谱系障碍(autism spectrum disorder, ASD)相关。越来越多临床研究逐渐关注到ASD儿童eCB的失调,以及eCB水平与ASD症状的相关性。然而目前证据较少,尤其是学龄前儿童相关证据,并且缺乏一致性。本研究旨在测试学龄前ASD儿童与同龄正常神经发育儿童血浆当中eCB含量变化,探究ASD儿童血浆eCB水平变化及其与症状严重程度度的关联。

方法 使用LC-MS/MS法对71例学龄前ASD患儿(年龄=3.79±1.09岁;82%男童)和75例神经正常发育儿童(年龄=4.25±2.50岁;100%男童)血浆中主要eCB进行了测定,包括2-花生四烯酰基甘油(2-arachidonoylglycerol, 2-AG), N-花生四烯酰乙醇胺(N-arachidonylethanolamine, AEA), N-棕榈酰乙醇胺(N-palmitoylethanolamine, PEA)和N-油酰乙醇胺(N-oleoylethanolamine, OEA)和。将测试结果与性别、年龄、体重指数和ASD患者症状严重程度度相关联,症状严重程度使用的是儿童孤独症评定量表(The Childhood Autism Rating Scale, CARS)进行测评。

结果 相比正常对照,ASD儿童具有更低水平的AEA(0.06±0.035 vs 0.11±0.04, P<0.01), PEA(1.23±0.88 vs 2.26±1.29, P<0.01), OEA(1.42±0.53 vs 2.01±0.66, P<0.01)和2-AG(0.90±0.90 vs 1.88±1.26, P<0.01)。ASD儿童血浆中2-AG水平与症状严重程度呈显著负相关(r=-0.252, P=0.034)。血浆AEA、OEA、PEA和2-AG水平与ASD儿童的年龄、性别、BMI、无显著相关。

结论 我们发现相比健康儿童,ASD儿童的血浆AEA、2-AG、PEA和OEA水平较低。较低水平的2-AG与更高的ASD症状严重程度度相关。但ASD作为一种神经发育障碍疾病,未来需要进一步的研究来确定外周与中枢的关联性以及中枢中eCB的变化,同时探究外周eCB变化对症状产生影响的机制,找到可能有效的干预靶点。

关键词:孤独症,内源性大麻素系统

成人注意缺陷多动障碍(ADHD)诊断现状和挑战

覃艳华*
浙江大学医学院附属邵逸夫医院

目的 了解中国成人ADHD人群分布特点和诊断的挑战。

方法 收集首次就诊于浙江大学医学院附属邵逸夫医院成人注意缺陷多动障碍专病门诊患者的临床资料(性别、年龄、教育水平、合并症和ASRS评分)进行回顾性分析。诊断采用DSM-5成人ADHD诊断标准。统计采用方差分析方法和卡方检验。

结果 收集了从2022年3月至2024年3月因怀疑自己是ADHD而首次就诊的患者共301例,最小年龄为17周岁,最大年龄为47岁,其中男性100名,占33.2%,女性为201名,占66.8%。27名(8.97%)患者无法联系到12岁之前的照料者,导致儿童时期的病史缺失。剩下的274名患者中,符合ADHD诊断标准的有99人,不符合的为175人。99例被确诊的患者中,男性38人(38.4%),女性61人(61.6%),平均年龄为25.88±6.19岁,教育年限为15.19±2.13,成人ADHD自评量表评分为34.62±7.29,共病焦虑症13例、抑郁症9例、双相障碍6例、睡眠障碍6例、抽动障碍4例、创伤后应激障碍1例。ADHD和不符合ADHD两组人群在年龄、性别和教育年限方面均无统计学差异。

结论 成人ADHD诊断最大挑战来自于12岁之前的病史的获取困难,减少回忆偏倚及客观的病史是诊断的前提;其次是共病其他精神疾病容易遗漏或误诊。

Neurobiological Differences in Early-Onset Obsessive-Compulsive Disorder: A Study of The Glutamatergic System Based on Functional Magnetic Resonance Spectroscopy

Yuqing Xiao^{1,2}, Huirong Zheng^{1,2,3}, Cigui Huang^{1,2}, Jian Wang^{2,3}, Yuqiao Lin^{2,4}

1.Southern Medical University

2.Guangdong Provincial People's Hospital

3.South China University of Technology

4.Guangdong Provincial People's Hospital (Guangdong Academy of Medical Sciences)

Objective In this study, we aimed to investigate the dissimilarities and associations between the anterior cingulate cortex (ACC) neurometabolites and inhibitory functions in three groups: early-onset OCD (EO-OCD) with onset in adolescence (age of onset ≤ 14 years), non-early-onset OCD (age of onset > 14 years), and a healthy population. We used functional magnetic resonance imaging combined with cognitive tasks and conducted subgroup analyses on early-onset OCD (EO) and non-early-onset OCD (non-EO). Our focus was on examining the influence of the glutamatergic system on the different OCD subtypes

Methods 66 OCD and 29 healthy controls (HCs) underwent clinical evaluation and were further divided into subgroups with EO (n=22) or non-EO (n=41). The research included collecting both resting state (rMRS) and functional state magnetic resonance spectroscopy (fMRS) data. The focus was on the ACC as the region of interest. Reaction times and response error rates during the Go-Nogo task were recorded during scanning. Quantitative analysis of the MRS data yielded absolute neurometabolic concentrations in the ACC, which were then subjected to statistical examination. The results were adjusted for the impact of the disease course using multiple linear regression analysis

Results The EO group demonstrated significantly lower functional GSH than the non-EO group. There is a correlation between Glx levels and cognitive function in OCD patients. A unique correlation between

GSH levels and Y-BOCS scores was found in the EO group. Opposite correlations were found between the EO and non-EO group in terms of Go task reaction time and functional state Glx levels

Conclusion The concentration of Glx in the ACC may serve as a biomarker for OCD. There is neurobiological heterogeneity in OCD, and early-onset OCD should be viewed as a subtype. This is evidenced by the differences in changes in ACC concentrations of Glx and GSH between early-onset and non-early-onset OCD patients. Moreover, Early-onset OCD exhibits a unique and distinct correlation between glutamate metabolites and inhibitory function

Using Network Analysis To Identify Central Symptoms of Depression and Anxiety in Different Profiles of Infertility Patients

Fang Liu¹, Wei Qiao¹, Wenju Han², Xueming Fan¹, Yingbo Chen¹, Ruonan Lu¹, Yujie Zhai¹, Tianci Pan², Xiuxia Yuan¹, Xueqin Song¹, Dongqing Zhang¹

1.The First Affiliated Hospital of Zhengzhou University

2.Dalian Women and Children's Medical Group

Objective The enormous pressure substantially affects the psychological well-being of infertility patients, resulting in prevalent depression and anxiety. The current study endeavors to define distinct depression and anxiety profiles of infertility patients and identify central symptoms within different subgroups to facilitate targeted interventions.

Methods The research employed K-means Clustering to delineate the depression and anxiety profiles, followed by a repetition of the analysis using Latent Class Analysis (LCA). Furthermore, network analysis was utilized to identify central symptoms within the various subgroups

Results K-means Clustering identified Cluster 1 (16.15%), Cluster 2 (37.08%) and Cluster 3 (46.77%),

while LCA yielded the low-risk group (47.23%), the mild-risk group (34.46%) and the high-risk group (18.31%). A majority of patients in the three clusters were predominantly in a single LCA-derived patient class (88.38–100%). Network analysis revealed that connections within each symptom in PHQ-9 and GAD-7 were stronger than those between symptoms. Furthermore, PHQ 2 (“sad mood”), GAD 1 (“nervousness”) and GAD 2 (“uncontrollable worry”) were identified as the central symptoms in Cluster 1. GAD 3 (“excessive worry”), GAD 2 (“uncontrollable worry”) and GAD 5 (“restlessness”) emerged as the central symptoms in Cluster 2. Additionally, PHQ 4 (“fatigue”), GAD 6 (“irritability”) and GAD 3 (“excessive worry”) were identified as the central symptoms in Cluster 3

Conclusion We defined three distinct depression and anxiety profiles among infertility patients and pinpointed central symptoms within each subgroup. These findings underscore the importance of directing research towards those central symptoms within each subgroup in order to develop targeted intervention strategies

2021年宁夏严重精神障碍患者管理治疗现状分析

徐学兵* 江洪

宁夏回族自治区宁安医院

目的 分析 2021 年宁夏严重精神障碍患者管理治疗情况, 为有关部门制定下一步精神卫生政策提供决策依据。

方法 采用描述性分析方法, 对 2005 年宁夏实施严重精神障碍管理治疗项目以来的患者登记、管理、治疗等情况进行分析。

结果 截至 2021 年底, 宁夏登记在册严重精神障碍患者 29787 例, 报告患病率 0.43% (29787/6946540); 在管患者 28195 例, 管理率 94.66% (28195/29787), 规范管理患者 26924 例, 规范管理率 90.39% (26924/29787); 服药患者 24283 例, 服

药率 81.52% (24283/29787), 规律服药患者 19761 例, 规律服药率 66.34% (19761/29787); 病情稳定患者 25663 例, 病情稳定率 97.05% (25663/26444)。与 2020 年相比, 在册患者增加 901 例, 规范管理率、规律服药率、精神分裂症患者服药率、病情稳定率分别增加 3%、8.36%、1.14%、1.19%。山区县在册患者规律服药率显著低于市辖区和川区县 ($F=3.672$, $P=0.045$)。

结论 近年来登记在全民健康保障系统-精神卫生子系统的患者人数持续增长, 患者管理和治疗水平有所提高。山区县应针对当地精神卫生服务的薄弱环节制定救助救治政策, 以提高患者的治疗率。

重复经颅磁刺激治疗儿童抽动障碍

张楠* 蔡启霞

吉林省神经精神病医院

目的 重复经颅磁刺激 (rTMS) 是在经颅磁刺激的基础上发展起来的新的神经电生理技术, 已应用于多种神经精神疾病治疗, 并取得一定疗效。本研究旨在深入探讨 rTMS 在治疗儿童抽动障碍中的应用效果及其安全性。

方法 研究选取了 30 名确诊为抽动障碍的儿童作为研究对象。这些孩子被随机分为两组, 其中一组仅接受常规药物治疗, 而另一组则在常规药物治疗的基础上增加了重复经颅磁刺激治疗。rTMS 作用于辅助运动区 (SMA), 给予低频治疗, 共 1000-1200 次脉冲, 一次性连续刺激, 5 次/周, 整个疗程持续了 4 周, 共治疗 20 次。每次治疗时间为 20 分钟。为了评估治疗效果, 研究使用了耶鲁综合抽动严重度量表 (YGTSS)。

结果 经过 4 周的治疗, 接受 rTMS 治疗的患儿在耶鲁综合抽动严重度量表 (YGTSS) 评分上比仅接受药物治疗的儿童有了显著的降低, 这一差异具有统计学意义 ($P<0.05$)。此外, rTMS 治疗组中并未观察到明显的不良反应。

结论 药物联合重复经颅磁刺激治疗儿童抽动障碍较单一药物治疗疗效更佳, 联合治疗对儿童抽动障碍症状改善效果更好, 且能明显提升患儿自我

意识及生活质量,治疗时的不良反应风险更低。重复经颅磁刺激技术在治疗儿童抽动障碍方面是安全的、无痛的、有效的,更容易被抽动障碍的患儿及家属接受。

关键词: 经颅磁,儿童,抽动障碍

精神科不配合静脉采血患者的护理体会

高山妹*

西安市精神卫生中心

目的 总结交流精神科患者静脉采血的护理特点及经验体会,来者可鉴。

方法 通过问题访谈形式就不配合采血患者表现形式、处理措施及临床经验教训等问题对某三甲精神专科医院门诊 27 人、住院病房 70 名工作人员(涉及各层级人员)进行访问,总结归纳结果。

结果 精神科患者常见不配合采血情形及处理归纳如下

1.已表现出冲动、伤人、毁物、自伤行为的患者:采血前患者已有严重的以上行为,工作人员、家属均无法与其进行沟通,取得配合,为保障众人安全,与家属沟通,请主诊医生开具约束性保护,在急诊留观病房安全采血。家属也可提前寻求 110、120 等社会支持。医院开通绿色通道,缩短等候时间,保证及时治疗。

2.出于紧张、恐惧、顾虑、排斥心理的患者:存在恐惧、害怕疼痛心理的患者,多见于儿童、青少年及女性患者,给予鼓励性支持性心理护理,讲解检查意义,用榜样法、奖励法、转移注意力等方法,尽可能由高技术人员操作。对检查有顾虑、排斥者,如质疑检查的必要性,排斥抽血,对抽血存在错误认知。运用专业知识排忧,增加信任、安全感。

3.对于情感淡漠、老年痴呆症重度阶段、木僵状态、精神发育迟滞、缄默不语等问而不答,问而错答,认知障碍的无法配合,与家属、工作人员做好核对沟通,共同协助患者在合适体位下安全采血,避免意外及错误发生。

4.对违拗、易激惹、兴奋、冲动、被动接触、敌对、理性活动少、有意识拒绝检查等受疾病影响,间歇性不配合但能沟通诱导的患者,耐心沟通中了解患者状态,不与患者争论,不生硬拒绝患者无理要

求,避免激惹,安抚诱哄,转移注意力,与亲属、医生、保卫科等其他工作人员做好配合,协力完成采血。

5.采血过程中突发拔针抢针、攻击毁物、自伤等情形,立即终止采血,收起危险物品如利器、易扔砸物品,保障自身安全前提下安全安抚控制住患者,寻求家属帮助,必要时通知保卫科协助,保障周围人群安全。精神障碍患者做出各种突发危险行为并不少见,工作人员在采血中要与家属的沟通,根据患者言行表情,高度警觉、洞察预判可能的突发状况,做好应急与防范。对此,精神科采血窗口设计并投入使用针对患者不配合状态下的有保护性能的采血操作台、操作床、椅等非常有必要。门诊与病房都应在采血前后核对采血对象及用物。

结论 精神科采血工作的顺利开展不仅需要专业的知识、技能,沟通技巧,心理护理,还需要敏锐的洞察预判,应急处理能力,在保障全员安全的前提下保质保量完成采血工作。

关键词: 精神科,静脉采血,不配合患者,护理体会

Exploration on Facial Action Unit Features in Depressive Episodes Recognition Based on Multiple Contexts

Tingting Qu Yuping Cao*

The Second Xiangya Hospital of Central South University

Objective This study explored the facial action unit (AU) features of patients with depressive episodes across three different contexts: naturalistic, resting, and task-based. It compared the recognition models based on AU features of depressive episodes in each context, aiming to provide insights for the clinical assisted identification and intervention research of depressive episodes based on artificial intelligence (AI)

Methods A total of 65 inpatients with depressive episodes were enrolled as the case group and matched with 65 healthy controls. The self-rating depression scale (SDS) and Hamilton depression scale (HAMD) were administrated and frontal videos were recorded by

two groups during naturalistic, resting and task context, respectively. Support Vector Machine (SVM) classifier was used to construct recognition models for depressive episodes and the performance of different models was compared

Results The model constructed based on effective AU features in the naturalistic context performed the best, with an accuracy of 80.0%, F1=0.810, AUC=0.880. In contrast, the model constructed in the task context was with an accuracy of 72.5%, F1=0.732, AUC=0.782

Conclusion This study suggests that the communication situation based on doctor-patient face-to-face interaction remains the predominant approach for early identifying and intervening in patients experiencing depressive episodes

关键词: depressive episode; facial action unit; recognition model; support vector machine

呼和浩特市社区精神分裂症患者服药依从性调查及原因分析

刘乐 白银霞*

内蒙古自治区精神卫生中心

目的 调查呼和浩特市社区精神分裂症患者近1个月的服药依从性状况,从社会人口学资料、疾病治疗情况、患者对服药的主观态度及家属态度等方面探究影响服药依从性的因素,为提高呼和浩特市社区精神分裂症患者的服药依从性、减少疾病的复发、改善患者的预后提供依据。

方法 本研究采用单纯随机抽样方法,从内蒙古自治区严重精神障碍信息管理系统中抽取512名呼和浩特市社区精神分裂症患者作为研究对象,调查工具参考北京大学研究的“精神分裂症患者服药依从性及家属态度”调查问卷后自行设计,于2023年7月至2023年11月对门诊及社区患者进行面对面调查。

结果 512名被调查者中,遵医嘱服药394人(77.0%),低量服药105人(20.5%),超量服药13人(2.5%)。患者所服药物中,第一代抗精神病药使用率为15.7%,第二代抗精神病药使用率为84.3%,

服用第二代抗精神病药的患者中,使用率居前3位的药物为氯氮平(33.7%)、利培酮(26.1%)及奥氮平(11.2%)。影响服药依从性的单因素分析中,婚姻状况($\chi^2=19.457$, $P=0.001$)、患者有无停药($\chi^2=117.852$, $P<0.001$)、谁决定停药($\chi^2=10.056$, $P=0.039$)、首次发病与首次系统药物治疗年龄差值($F=4.441$, $P=0.012$)、服药方式($\chi^2=124.965$, $P<0.001$)差异均具有统计学意义。在患者对服药的主观态度方面,遵医嘱服药组中,97.7%的患者认为精神疾病需要服药并长期维持治疗,92.6%的患者按照医生的建议坚持服药;低量服药组中,60.0%的患者认为病情稳定便可减药停药,56.2%的患者因为有时无意忘记导致无法按时服药;超量服药组中,100.0%的患者认为症状加重,自行调药即可,15.4%的患者以为多吃药会更快痊愈。家属对患者的态度中,85.4%的家属认为应该听从医生的治疗建议,32.8%的家属将精神病人视为负担。影响服药依从性的多因素分析中,患者有无停药($\beta=-2.240$, $P<0.001$)、服药方式($\beta=-0.903$, $P<0.001$)是服药依从性的独立危险因素。

结论 (1)呼和浩特市社区精神分裂症患者服药依从率为77.0%,高于2016年全国服药依从性调查结果(70.4%)。(2)婚姻状况、患者及家属对疾病和治疗的认知、患者对医生的信任、家属管理及经济支持是服药依从性的影响因素,其中,患者及家属对疾病和治疗的认知、患者对医生的信任、家属管理及经济支持能够提高患者服药依从性。患者不愿主动服药、有过停药行为是影响服药依从性的独立危险因素。

关键词:精神分裂症,服药依从性,社区,影响因素

童年创伤对大学生抑郁症状的影响:压力知觉和焦虑症状的中介作用以及情绪调节策略的调节作用

郑文凯^{1,2} 谭云龙²

1.内蒙古医科大学

2.北京回龙观医院

目的 探讨童年创伤对大学生抑郁症状的影响以及压力知觉和焦虑症状的中介作用和情绪调节策

略的调节作用。

方法 于2023年12月-2024年2月,采用童年创伤问卷、抑郁自评量表、压力知觉量表、焦虑自评量表和情绪调节策略问卷对1320名大学生进行调查。

结果 (1)童年创伤与大学生抑郁症状呈显著正相关($r=0.527, p<0.001$)。(2)童年创伤显著正向预测压力知觉($\beta=0.319, SE=0.027, t=11.816, p<0.001$)、焦虑症状($\beta=0.408, SE=0.023, t=17.621, p<0.001$)和抑郁症状($\beta=0.143, SE=0.020, t=7.162, p<0.001$);压力知觉显著正向焦虑症状($\beta=0.359, SE=0.026, t=15.972, p<0.001$)和抑郁症状($\beta=0.143, SE=0.020, t=7.162, p<0.001$);焦虑症状显著正向预测抑郁症状($\beta=0.514, SE=0.022, t=23.935, p<0.001$)。(3)在童年创伤→压力知觉→焦虑症状→抑郁症状的中介模型中:①压力知觉在童年创伤和抑郁症状之间起部分中介作用,间接效应值为0.095(95%CI:0.077~0.115),效应占比为18.74%;②焦虑症状在童年创伤与抑郁症状之间起部分中介作用,间接效应值为0.210(95%CI:0.178~0.243),效应占比为41.42%;③压力知觉和焦虑症状在童年创伤与抑郁症状之间起链式中介,间接效应值为0.059(95%CI:0.048~0.071),效应占比为11.64%。(4)认知重评策略调节了压力知觉与抑郁症状之间的关系。具体而言,大学生的认知重评策略水平越高,压力知觉对抑郁症状的预测作用越低($\beta=-0.038, SE=0.016, t=-2.384, p<0.05$)。

结论 童年创伤与抑郁症状之间存在有调节的中介效应,压力知觉和焦虑症状是二者关系的中介变量,并且认知重评策略能弱化压力知觉对抑郁症状的影响。

关键词:童年创伤;压力知觉;焦虑症状;情绪调节策略;抑郁症状;大学生

重症精神疾病患者未成年子女的支持需求和行为情绪问题

白春兰*

绵阳市第三人民医院(四川省精神卫生中心)

目的 了解重症精神疾病患者子女的支持需求、行为和情绪问题并探究其影响因素,为学校、社会

对重症精神疾病患者子女的心理支持与干预提供参考。

方法 对四川省精神卫生中心登记在册并长期管理的重症精神疾病患者及其子女采用《支持需求问卷》和《长处与困难问卷》进行线下问卷调查。

结果 共有63名未成年子女、60名父亲、54名母亲参与本次调查。其中23名父亲、43名母亲为四川省精神卫生中心登记在册并长期管理的重症精神疾病患者。参与调查的父母中服药者53人、精神残疾者52人、精神疾病呈痊愈或病情轻度者47人、自杀未遂者9人。63名未成年子女平均年龄为12.94岁,男性26名、女性37名,平均上学年限为6.7年。未成年子女对父母发病时有效的帮助途径、经济资助、社会支持、学习或升学辅导有较高的支持需求;未成年子女整体情绪行为处于异常水平,其中情绪症状和亲社会行为处于异常水平,品行问题处于边缘水平。子女的情绪行为问题与父亲的文化程度、精神疾病、相处情况,父母的主动沟通情况呈相关关系;情绪症状与父亲的文化程度、对父母精神疾病的担心相关;品行问题与父亲的文化程度,父母的精神疾病、相处情况有关。

结论 社会、院校、社区应需更加重视父亲为重症精神疾病患者、父母需长期服药、家庭支持较少需照顾父母的未成年子女,对其提供相应的帮助支持,同时重视其心理健康问题。

机器学习与深度学习方法在应激识别中的应用:基于心率变异性的研究

谭江¹ 罗禹¹ 舒燕萍² 梁力凡³ 张继元¹ 韩宇¹ 张禹¹

1.贵州师范大学

2.贵州省第二人民医院

3.贵州商学院

目的 应激与多种精神疾病(如焦虑、抑郁等)的发生密切相关,且严重影响患者的日常功能,准确、非侵入地评估和识别应激对于精神疾病的早期预防、诊断和治疗具有重要意义,因此开发精确有效的应激评估工具至关重要。心率变异性(Heart

Rate Variability, HRV) 是一个常用、易获取的指标,但其特征数量繁多。现有结合机器学习 (Machine Learning, ML) 的研究大多仅使用单一或数量有限的 HRV 特征和少数传统 ML 模型,导致最佳 HRV 特征组合和模型的选择尚不明确一致。此外,在众多 HRV 特征中,极低频 (Very Low Frequency, VLF) 特征的生理意义及其与应激的关系仍不完全清楚,可能由于传统特征提取方法过于粗糙,简单线性计算会丢失数据的时变和非线性信息。

方法 研究一采用特里尔社会应激任务诱发应激,纳入 41 名被试,测量应激任务下的心电图、正负性情绪和唾液皮质醇水平,并以正负性情绪和皮质醇反应作为应激的客观指标。从心电图记录中提取 27 项 HRV 特征,初步测试 23 个传统 ML 模型,再从中筛选 5 个性能最优的 ML 模型进行参数调优。随后通过 500 次 4 折交叉验证和参数调优提升结果稳健性,减少随机性影响。研究二基于研究一纳入 38 名被试,测量应激任务下的心率和状态焦虑水平。采用连续小波变换技术对 VLF 成分进行时频图提取,并输入卷积神经网络模型 (Convolutional Neural Network, CNN) 进行应激识别。

结果 结果表明,特里尔社会应激任务有效诱发被试的应激反应 (所有 $p=0.001$)。包含平均 RR 间期、心率标准差、最大心率、分形维度、样本熵、极低频和低频的 7 个 HRV 特征组合是应激识别的最优特征集。在所有 ML 模型中,随机森林模型性能表现最佳,平均准确率、灵敏度、特异度和 AUC 分别为 98.27%、99.30%、97.13% 和 0.999。此外,VLF 是识别应激的一个有效特征,基于 VLF 时频图构建的 CNN 模型在应激分类任务中达到 95% 的优秀性能。

结论 机器学习和深度学习方法,尤其是基于图像的 CNN 模型,是开发应激识别系统的有效方法。此外,采用随机森林算法对心电信号进行学习,能够更有效识别和诊断应激。使用更全面的特征集构建的模型,其性能优于仅使用单一或少量特征构建的模型。特别地,VLF 成分是一个与应激密切相关的 HRV 特征,具有重要的生理和心理意义。

关键词: 应激识别, HRV, VLF, 时频分析, 机器学习, 卷积神经网络

联: 躯体化症状的中介效应和情绪调节困难的调节效应

张胜楠 严惠茹 吴超*
北京大学护理学院

目的 非自杀性自伤 (Non-Suicidal Self-Injury, NSSI) 已发展为严重的公共卫生问题,与未来自杀风险密切相关。研究发现睡眠质量差会增加 NSSI 患者自伤的风险,且 NSSI 患者存在躯体化症状,合并躯体化问题的 NSSI 患者表现出更严重的情绪调节缺陷,同时睡眠质量差也会对躯体化症状带来负性影响。目前尚缺乏研究在同一 NSSI 样本中探讨睡眠质量、躯体化症状、情绪调节困难及 NSSI 间的相互作用关系。本研究尝试构建中介模型和调节模型,探讨躯体化症状在睡眠质量和 NSSI 间的中介作用及情绪调节困难在其中的调节作用。

方法 筛选符合精神障碍诊断与统计手册第五版 (DSM-5) 中 NSSI 诊断标准的大学生为研究对象,采用匹兹堡睡眠质量指数、患者健康问卷躯体症状群量表、情绪调节困难量表和青少年非自杀性自伤行为功能评估量表对睡眠质量、躯体化症状、情绪调节困难及 NSSI 行为进行调查。采用 Pearson 相关分析各量表得分之间相关性;采用 Hayes 编制的 PROCESS 程序进行中介效应和调节效应检验,并进行简单斜率分析。

结果 研究纳入 165 例 NSSI 大学生,平均年龄 20.84 ± 1.46 ,其中男性 102 例 (61.8%)。NSSI 严重程度得分 31.23 ± 1.61 ,睡眠质量得分 8.81 ± 0.24 ,躯体化症状得分 13.25 ± 0.44 ,情绪调节困难程度得分 111.41 ± 1.59 。睡眠质量差、躯体化症状、情绪调节困难和 NSSI 严重程度之间呈现两两显著正相关 (相关系数 r 范围 0.30~0.58)。中介效应检验结果显示,睡眠质量越差, NSSI 个体的躯体化症状越严重 ($\beta=0.54, P<0.001$);躯体化症状越严重,个体在过去一年内的 NSSI 严重程度越高 ($\beta=0.41, P<0.001$),躯体化症状完全中介了睡眠质量差对 NSSI 严重程度的影响 (中介效应 0.22,解释了 64.7% 的方差)。调节效应检验结果显示,躯体化症状和情绪调节困难的交互项与 NSSI 严重程度显著关联 ($\beta=0.15, P=0.02$)。简单斜率分析显示情绪调节困难高的个体躯体化症状对 NSSI 严重程度的关联显著 ($\beta=0.44, P<0.001$),但情绪调节困难低的个体躯体化症状与 NSSI 严重程度的关联不显著;控制焦虑抑

非自杀性自伤个体睡眠质量和自伤行为的关

郁水平后,结果保持稳健。

结论 NSSI 个体中睡眠质量差和 NSSI 严重程度间的关联与躯体化症状有关。情绪调节困难程度调节了躯体化症状与 NSSI 严重程度之间的关联,在情绪调节困难高的个体中,躯体化症状与 NSSI 严重程度显著关联,但在情绪调节困难低的个体中关联不显著。

精神科一线医护人员基于可穿戴设备的压力状况研究

曹桐¹ 丁夏齐² 朱俊¹ 陈小红¹ 唐蕴¹ 吴书超¹ 丁玲¹ 王建红¹

1.深圳市康宁医院

2.深圳大学管理学院

目的 本研究通过可穿戴设备收集精神科一线医护人员压力相关生理指标和知觉压力量表资料,在一般人口学资料的基础上,对比医护两个群体在压力水平是否存在差异,并探索压力相关生理指标与知觉压力量表结果是否具有关联性,为精神科医护人员减少压力提供依据。

方法 收集精神科一线医护人员的一般人口学资料、中文版知觉压力量表(Chinese Perceived Stress Scale, CPSS),采集工作现场时点压力相关生理指标,包括:血压、心率和压力值,采用 t 检验和 χ^2 检验对各变量进行医护组间差异性统计分析;采用 Pearson 相关分析对变量间进行相关性分析

结果 共纳入 172 人,医生和护士两组间性别、学历、职称、班次、平均月收入 and 人事关系的构成比均存在统计学差异 ($\chi^2=4.293, P=0.038$; $\chi^2=67.691, P=0.000$; $\chi^2=17.042, P=0.001$; $\chi^2=99.413, P=0.000$; $\chi^2=40.495, P=0.000$; $\chi^2=6.271, P=0.012$), 两组间年龄、舒张压、失控感、知觉压力总分的差异均具有统计学意义 ($t=2.857, P=0.005$; $t=2.009, P=0.046$; $t=-3.701, P=0.000$; $t=-3.057, P=0.003$)。剔除高血压、冠心病病史后,167 人进入最后的分析,其知觉压力量表总分 19.69 ± 7.01 ,其中大于临界值(25 分)共 32 人,占比 19.16%。相关性分析未发现压力相关生理指标与知觉压力总

分存在相关关系。提示精神科一线护理人员的压力水平高于医生,本研究中未发现压力相关的生理指标与知觉压力量表之间存在相关性。

结论 精神科一线医护人员压力状况不容乐观,护理人员更为严重。单一时点获得的压力相关生理指标尚无法体现精神科一线医护人员压力水平,其与心理评估结果关联性需进一步验证。

关键词: 精神科;医护人员;生理指标;知觉压力;心率变异性;压力值

精神压力和慢性肾脏疾病发病的关联

李宇轩¹ 何雨¹ 张俊¹ 张继辉² 梁燕²

1.中山大学附属第三医院

2.广州医科大学附属脑科医院

目的 精神压力被认为是心血管代谢疾病的一个重要风险因素。然而,精神压力与慢性肾脏病(CKD)是否存在关联仍不清楚,本研究旨在阐明精神压力和 CKD 发病的关联,从而通过加强关注人群社会精神降低 CKD 发病率。

方法 研究对象包括英国生物库中的 462,699 名参与者。精神压力的定义通过社交隔离程度来决定,后者通过自我报告问卷进行测量。CKD 病例通过医院或死亡记录确定。我们采用多变量 Cox 比例危险模型来评估社会隔离与突发 CKD 之间的独立关联。此外,我们还使用了倾向得分匹配(PSM)分析来排除混杂因素的干扰,加强结果可信度。

结果 中位随访期为 12.6 年,共记录了 25,486 例慢性肾功能衰竭病例。与社会隔离程度最低的参与者相比,社会隔离程度最高的参与者罹患慢性肾功能衰竭的风险更高(模型 1, HR, 1.33; 95% CI, 1.28-1.38),在考虑了孤独感和遗传风险等混杂因素后,这种关联有所减弱。而在使用 PSM 的回归模型中,这种关联仍然是稳健的。

结论 精神压力与 CKD 风险的增加有关联,尤其是独居和更少的成人教育。这些发现强调了加强关注人群精神压力可能有助于维护肾脏健康。

新冠疫情期间医护人员孤独感流行率的 meta 分析

欧梦喜¹ 张晓慧¹ 甘爱华² 吴雨茜³ 周鑫³

1. 惠州市第二人民医院

2. 惠州市医学研究所

3. 惠州市卫生健康局

目的 分析医护人员在新冠疫情期间孤独感流行率及相关影响因素, 为未来类似公共卫生事件发生时提供相应的理论依据。

方法 检索时间从2020年1月至2024年4月, 计算机检索 PubMed、Embase、Scopus、APA/PsycInfo、Proquest、中国知网、维普数据库、万方数据库等有关新冠疫情期间医护人员孤独感流行率的相关文献, 文献的筛选、数据提取以及质量评价由2位评审员独立完成, 然后双方相互查验。若有分歧, 由第3位评审者评定。对文献去重后阅读题目及摘要进行初筛, 对照纳入标准和排除标准阅读全文, 最终决定文献是否纳入。对纳入文献进行偏倚风险评价, 横断面研究采用美国卫生保健质量和研究机构 (Agency for Healthcare Research and Quality, AHRQ) 质量评价表, 而队列研究采用纽卡斯尔-渥太华量表 (Newcastle-Ottawa Scale, NOS) 评价。使用 Begg's 检验及 Egger's 检验方法评价本研究的发表偏倚。通过逐一剔除单个研究的方法进行敏感性分析。

结果 通过检索各数据库, 共获得文献 1019 篇。经层层筛选, 最终纳入 11 篇文献, 包括英文 10 篇, 中文 1 篇, 总样本量 8472 例, 共计 3019 例医护人员在疫情期间发生孤独感。纳入文献质量评价结果均为中、高质量文献, Begg's 检验结果 $Z=0.93$ 、 $P=0.350$, Egger's 检验结果 $t=1.31$ 、 $P=0.223$, 提示无明显发表偏倚。敏感性分析得出的点估计值均在总效应量的 95%CI 以内, 提示本研究的 Meta 分析结果具有较好稳定性。Meta 分析结果显示, 新冠疫情期间医护人员的孤独感流行率为 42.5% [95%CI (29.2%, 55.8%), $P<0.001$], 亚组分析结果显示, 发达国家和发展中国家的医护人员孤独感流行率分别为 47.2% 和 39.0%; 医师和护士的孤独感流行率分别为 44.8% 和 53.1%; 2020 年和 2021-2022 年的医护人员孤独感流行率分别为 47.3% 和 30.1%。

结论 在新冠肺炎疫情期间医护人员的孤独感流行率较高, 且随着时间发展呈现出动态变化趋势,

且在不同区域及不同岗位之间存在明显差异。因此建议从本次疫情中汲取经验与教训, 重视医护人员的孤独感等心理问题并制定相应的干预策略。

童年创伤直接或由家庭相关因素和性格介导间接影响抑郁症的快感缺失

刘忠纯* 王薇

武汉大学人民医院精神卫生中心

目的 快感缺乏是抑郁症的核心症状之一, 是难治性抑郁症和抑郁症残余症状的紧迫问题。快感缺乏对抑郁症患者的生活质量有严重影响。然而, 家庭相关因素和人格特质在影响快感缺失方面的相互作用没有得到很好的描述。基于这些发现, 我们认为儿童虐待、养育方式、家庭功能和人格特质共同作用, 导致抑郁症的快感缺乏症状。我们的研究目的是探索低快感缺乏和高快感缺乏组的儿童虐待、养育方式、家庭功能和人格特质是否不同; 进一步探讨某些人格特质是否可能是快感缺乏严重程度的独立危险因素; 童年虐待是否直接或通过家庭相关因素和人格中介影响快感缺乏。

方法 武汉大学人民医院共招募了 373 例抑郁症患者。我们通过使用自制的一般信息问卷、儿童创伤问卷、父母养育方式量表、家庭评估设备、艾森克人格问卷和快乐体验量表来评估患者的一般状况、家庭相关因素、人格特质和快感缺乏症状。采用 Logistic 回归和结构方程模型探究快感缺乏的影响因素及其中介关系。

结果 高快感缺乏和低快感缺乏组之间的特定人格特质、童年虐待、养育方式和家庭功能存在显著差异。其中, 精神病、外向性以及母亲的排斥和否认甚至可能是快感缺乏严重程度的独立危险因素。SEM 表明, 童年时期的情绪忽视可能直接或间接地影响快感缺乏, 通过精神病、外向性、家庭功能以及母亲的排斥和否认的中介。

结论 童年创伤可以通过养育方式、家庭功能和人格特征直接或间接影响抑郁症患者的快感缺乏症状。

Development and External Validation of A Suicidal Ideation Prediction Model for HIV-negative/unknown Men Who Have Sex with Men in China

Zhenwei Dai^{1,2}, Shu Jing², Xiaoyou Su²

1.Peking University Sixth Hospital, Peking University Institute of Mental Health, NHC Key Laboratory of Mental Health (Peking University), National Clinical Research Center for Mental Disorders (Peking University Sixth Hospital)

2.School of Population Medicine and Public Health, Chinese Academy of Medical Sciences & Peking Union Medical College

Objective Due to the high HIV infection rate and social-cultural factors such as stigmatization towards sexual minorities, lack of social acceptance towards men who have sex with men (MSM) is widespread, which could result in mental disorders such as suicidal ideation (SI) in this population. However, few studies focused on the influencing factors of SI among HIV-negative/unknown MSM. This study aims to develop and validate an SI prediction model in HIV-negative/unknown MSM

Methods Participants in this two-wave cross-sectional study were recruited from a gay social networking app in China. Data were collected on demographics, SI, depressive symptoms, and perceived social support by relative scales. The 1st wave data was divided into train and internal validation sets, and the 2nd wave data was used as an external validation set. Random forest and logistic regression models were used to determine the predictors. An optimal model was selected by comparing the values of area under the receiver operating characteristic curve. Receiver operating characteristic curve analysis, Hosmer and Lemeshow goodness of fit test and calibration curve, and decision curve analysis were used to evaluate the selected

prediction model and perform internal-external validation

Results Respectively 1394 and 620 HIV-negative/unknown MSM were enrolled in the 1st wave and 2nd wave of the study. Respectively 25.68% and 18.71% had SI in the two waves of the survey. Age, education level, HIV test, perceived social support, and depressive symptoms were predictors of SI. A nomogram and an online program were developed to visualize the prediction model. The model showed good discrimination, calibration, practical utility, internal validity, and temporal external generalizability

Conclusion This study developed an SI prediction model to predict the suicidal risk among HIV-negative/unknown MSM. The model could be employed in practice to screen and prevent the occurrence of SI among HIV-negative/unknown MSM. Tailored intervention on alleviating depressive symptoms, improving perceived social support, and enhancing HIV testing should be considered to reduce SI among HIV-negative/unknown MSM in China

关键词: Men Who Have Sex with Men, Suicidal Ideation, Prediction model, External validation

社区居民住房特征与抑郁症之间的关联：NHANES 的实证研究

李凯欣¹ 肖绛¹ 赵越¹ 彭俊歌¹ 李晏²

1.郑州大学

2.郑州大学第二附属医院, 郑州大学第二临床医学院

目的 抑郁情绪,是一种普遍的心理行为问题,其发生率正逐年攀升,我国被诊断为抑郁症的人数约为9500万,对社会和家庭构成了重大负担。由于住房用地紧张、资源稀缺,导致居民住房压力增加,同时也加剧了居民生存压力,这可能是导致抑郁情绪发生风险增加的重要原因之一。本研究旨在利用美国国家营养与健康调查(NHANES)数据库,探索住房特征与抑郁情绪之间的关系,为抑郁情绪的发生机制研究提供科学依据。

方法 本研究选取了NHANES 2017-2018年的

人口学资料(包括年龄、性别、种族、婚姻状况等)、住房特征和抑郁状况数据,采用9项患者健康问卷抑郁量表(Patient health questionnaire, PHQ-9)评估受试者的抑郁状况;根据NHANES家庭等级访谈评估住房情况,划分为拥有、租赁和其他三类。数据分析采用SPSS 28.0统计软件,用卡方检验比较各组之间的差异;使用多因素Logistic回归分析居民住房特征与抑郁情绪的关系。

结果 1)本研究共纳入受试者5143人(男2489、女2654,平均年龄 51.00 ± 17.49 岁)。根据PHQ-9将受试者分为抑郁组($n=1317$)和非抑郁组($n=3826$),有抑郁情绪者占25.6%;2)在人口统计学特征中,不同性别、种族、婚姻状况、BMI的参与者抑郁情绪检出率差异均有统计学意义($\chi^2=37.959, P<0.001$; $\chi^2=24.075, P<0.001$; $\chi^2=70.435, P<0.001$; $\chi^2=17.192, P<0.001$),不同年龄参与者抑郁情绪检出率差异没有统计学意义($\chi^2=1.918, P=0.383$)。3)住房特征与抑郁情绪存在关联($OR=1.230, 95\%CI: 1.122\sim 1.347, P<0.001$)。

结论 美国成人住房特征的不同可能会影响抑郁情绪发生的风险,拥有个人房产者较租赁及其他安排者的抑郁情绪发生风险低,以此为研究抑郁情绪的发生机制提供新思路。

探究大学生体质健康信念与锻炼拖延的关系:基于潜在剖面分析

赵越 彭俊歌 肖锋 李凯欣 莫鸿飞 李晏*
郑州大学

目的 随着大众对体育锻炼益处的认知增强,锻炼拖延成为改善身体健康的阻碍之一,在大学生群体中,锻炼拖延在一定程度上同样影响大学生运动积极性与良好习惯的养成。体质健康信念是个体对自身体质健康状况的一种心理感知,个人对自身健康状况的错误认知可能会导致其对锻炼行为的拖沓,从而造成身体素质不断下降。本研究旨在通过潜在剖面分析探索大学生锻炼拖延程度的潜在类别,以及与体质健康信念之间的关系,为提高大学生体育健康意识和增强体质健康提供依据。

方法 本研究通过随机抽样选取河南某高校的

大学生。调查工具:(1)自编一般状况调查问卷:包括性别、年龄、民族、身高、体重、是否独生子女、家庭收入情况以及父母锻炼习惯等内容;(2)体质健康信念基于大学生体质健康信念量表评估测量;

(3)通过大学生锻炼拖延量表评估大学生锻炼拖延的程度。使用Mplus 8.3软件对锻炼拖延程度进行潜在剖面分析(Latent Profile Analysis, LPA);使用SPSS21.0软件采用Spearman秩相关分析探究大学生锻炼拖延与健康体质信念的关系,采用单因素方差分析和卡方检验探究不同锻炼拖延组别大学生的人口学特征差异以及体质健康信念差异,其中检验水准 α 取0.05。

结果 (1)本研究共发放问卷1546份,回收率99.74%,有效率99.48%,最终纳入自然科学和人文社科专业的大学生共1538人(男744,女794;自然科学1011,人文社科527);(2)通过潜在剖面分析得出BIC值在第4次分类时虽仍在减小,但Entropy值处于最高(Entropy=0.884)将大学生锻炼拖延分为低锻炼拖延行为组(13.1%)、中锻炼拖延行为组(20.2%)、中高锻炼拖延行为组(20.8%)及高锻炼拖延行为组(45.9%)4个潜在类别,其中高锻炼拖延人群占比最大;(3)通过卡方检验分析得出,大学生锻炼拖延行为在性别、专业类别、独生子女、健康状况及父母锻炼习惯等方面的差异具有统计学意义(P 值均 <0.001);(4)大学生体质健康信念与锻炼拖延存在正相关($r=0.384, P<0.001$);(5)不同锻炼拖延程度的大学生体质健康信念评分差异具有统计学意义($F=66.423, P<0.001$),锻炼拖延行为更严重的人群,其体质健康信念评分越高。

结论 本研究大学生中女性、自然科学专业、非独生子女、自觉身体健康以及父母很少锻炼的人群其锻炼拖延行为更严重;体质健康信念与锻炼拖延有关,同时可针对性的对锻炼拖延严重人群采取宣教,在其体质健康信念坚定的基础上,加强大学生对于锻炼的价值认同,激发锻炼意愿和行为。

关键词:锻炼拖延;体质健康信念;潜在剖面分析;大学生

有氧运动干预对错失焦虑大学生睡眠拖延行为的影响研究

肖锋¹ 李凯欣¹ 彭俊歌¹ 赵越¹ 张梦莹¹ 李晏²

1. 郑州大学

2. 郑州大学第二附属医院, 第二临床医学院

目的 本研究通过流行病学调查及干预研究, 了解大学生睡眠拖延行为和错失焦虑的分布特征, 分析大学生睡眠拖延行为与错失焦虑之间的关系, 并进一步探讨有氧运动对大学生睡眠拖延行为和错失焦虑的干预效果。

方法 选取来自河南省某高校的 1030 名在校大学生进行横断面调查, 采用自编一般状况调查问卷、睡眠拖延行为量表、错失焦虑量表进行测评; 依据睡眠拖延行为量表与错失焦虑量表的筛查结果, 在被试自愿的基础上, 选取具有睡眠拖延行为问题的大学生作为运动干预的对象, 进行为期 12 周的有氧运动干预, 并在干预后进行心理评估。使用 Epidata3.1 录入数据, SPSS21.0 进行数据分析, 包括描述性统计、独立样本 T 检验、方差分析、Pearson 相关分析、二元 Logistic 回归分析大学生睡眠拖延行为和错失焦虑的分布特征、影响因素、探究大学生睡眠拖延行为与错失焦虑的关联, 检验水准 $\alpha=0.05$ 。

结果 问卷共发放 1116 份, 回收率 100%, 有效率 92.29%。最终共纳入样本 1030 人 (男生 510 人、女生 520 人), 平均年龄 21.250 ± 2.592 岁。干预样本共纳入 22 人。(1) 大学生睡眠拖延行为评分为 2.887 ± 0.468 , 睡眠拖延检出人数 517 人, 检出率 50.194%; 错失焦虑评分为 20.780 ± 6.370 , 错失焦虑检出 540 人, 检出率 52.427%; (2) 采用独立样本 T 检验, 结果表明, 大学生错失焦虑在性别 ($P=0.022$)、年级 ($P=0.001$) 上存在差异, 且具有统计学意义; (3) 采用单因素方差分析法, 结果表明, 大学生睡眠拖延行为在专业 ($P=0.039$)、健康状况 ($P=0.000$) 和父母关系 ($P=0.011$) 上存在差异, 错失焦虑在年龄 ($P=0.042$)、健康状况 ($P=0.001$) 上存在差异, 且具有统计学意义 (4) 根据相关分析结果显示, 大学生睡眠拖延行为及错失焦虑之间呈正相关 ($r=0.220, P=0.000$); 回归显示, 错失焦虑正向预测睡眠拖延行为 ($\beta=0.016, P=0.000$), 且具有统计学意义; (5) 采用配对样本 T 检验, 结果表明, 大学生干预后睡眠拖延行为 ($t=2.277, P=0.036$)、错失焦虑 ($t=2.748, P=0.014$) 评分降低, 且差异性具有统计学意义。

结论 (1) 大学生群体中存在睡眠拖延行为, 其错失焦虑整体处于偏高水平; (2) 错失焦虑正向

预测睡眠拖延行为, 大学生错失焦虑程度越高, 其睡眠拖延行为越严重; (3) 12 周有氧运动有利于改善大学生睡眠拖延行为, 也可缓解错失焦虑, 有利于促进个体身心健康的发展。

关键词: 有氧运动; 睡眠拖延行为; 错失焦虑; 大学生

大学生锻炼拖延行为与广泛性焦虑的关系分析

肖绛¹ 李凯欣¹ 赵越¹ 彭俊歌¹ 莫鸿飞¹ 李晏²

1. 郑州大学

2. 郑州大学第二附属医院, 第二临床医学院

目的 本研究通过流行病学调查, 了解大学生锻炼拖延的分布特征, 同时探讨广泛性焦虑与大学生锻炼拖延的相互关系。

方法 通过随机抽样选取河南省某高校在校大学生进行现况调查。调查工具: (1) 自编一般状况调查问卷: 包括性别、年龄、民族、身高、体重、是否独生子女、家庭收入情况以及父母锻炼习惯等内容; (2) 采用大学生锻炼拖延量表评估大学生锻炼拖延的程度; (3) 通过广泛性焦虑量表评估大学生焦虑状况。使用 SPSS 21.0 进行数据分析, 包含单因素分析、Pearson 相关分析、二元 Logistic 回归分析和 R 语言绘制限制性立方条样 (Restricted Cubic Spline, RCS) 曲线四个部分, 分析锻炼拖延的分布特征、影响因素、探究广泛性焦虑与锻炼拖延的关联, 观察预测广泛性焦虑与大学生锻炼拖延的非线性关系, 进一步判断潜在危险因素与保护因素, 检验水准 α 取 0.05。

结果 (1) 共发放问卷 1546 份, 回收率 99.74%, 有效率 99.48%。最终共纳入样本 1538 人 (男生 744 人、女生 794 人), 平均年龄 20.67 ± 2.74 岁, 其中, 无焦虑者 829 人 (53.90%), 轻度焦虑 576 人 (37.45%)、中度焦虑 90 人 (5.85%)、重度焦虑 43 人 (2.80%); (2) 将大学生锻炼拖延分为两组, 其中, 低拖延行为组 781 人 (50.78%) 和高拖延行为组 757 人 (49.22%); (3) 单因素方差分析结果表明, 不同焦虑程度大学生的锻炼拖延存在统计学差异 ($F=11.385, P=0.01$); (4) Pearson 相关分析结果显示, 广泛性焦虑与锻炼拖延没有相关关系 ($r=0.010$,

$P=0.694$); (5) 二元 Logistic 回归分析结果显示, 广泛性焦虑是锻炼拖延的潜在危险因素, 具有焦虑情绪者出现高拖延行为的风险相对于无焦虑情绪者高 ($OR=1.202$, $95\%CI:1.044-1.384$, $P=0.019$); (4) 限制性立方条样结果显示, 广泛性焦虑评分与锻炼拖延呈倒 U 型非线性关系, 总体 $OR>1$, 表明广泛性焦虑与高锻炼拖延相关联, 是锻炼拖延的潜在危险因素。

结论 在大学生群体中存在锻炼拖延行为, 不同焦虑程度影响大学生的锻炼拖延行为, 广泛性焦虑是大学生锻炼拖延行为的潜在危险因素。通过采取有效措施缓解广泛性焦虑情绪, 从而减少大学生的锻炼拖延行为。

关键词: 锻炼拖延行为; 广泛性焦虑; 大学生

精神科医护人员心理资本在职业认同与知觉压力之间的中介作用研究

姚明洋 韩笑宇 邵丽影 王秀珍 栾燕*
沈阳市精神卫生中心

目的 精神疾病患者的表现复杂多样, 患者可能随时出现冲动伤人或自伤等行为, 医护人员需时刻处在紧张防备的状态, 增加其压力水平。本研究从积极心理学与积极组织行为学出发, 探讨精神科医护人员职业认同、心理资本及知觉压力三者之间的关系, 为降低其压力水平提供重要科学依据。

方法 采取方便抽样方法, 于 2024 年 1-4 月抽取沈阳市精神卫生中心 615 名医护人员进行问卷调查, 包括知觉压力量表 (PSS-10)、心理资本问卷 (PCQ) 和职业认同量表进行调查, 有效问卷 543 份 (88.29%)。应用分层多元回归分析探讨精神科医护人员职业认同和心理资本对知觉压力的影响, 渐进再抽样策略检验心理资本在职业认同与知觉压力关系的中介作用。

结果 职业认同感 ($\beta=-0.423$, $P<0.01$) 和心理资本 ($\beta=-0.350$, $P<0.01$) 是知觉压力的重要影响因素, 分别解释了知觉压力变异量的 17.1% 和 6.6%。心理资本在职业认同与知觉压力之间的中介效应显著 ($95\%CI [-0.315, -0.159]$)。

结论 精神科医护人员的职业认同和心理资本与知觉压力密切相关, 心理资本在职业认同与知觉

压力之间起到不完全的中介作用, 提示医院管理者应重视精神科医护人员心理资本建设, 降低其知觉压力水平, 进一步提高医疗工作效率及质量。

关键词: 精神科医护人员, 职业认同, 心理资本, 知觉压力, 中介效应

荆州市小学学生非自杀性自伤行为的相关因素分析

周烈^{1,2,3} 刘波^{1,2,3} 邓小鹏^{1,2,3} 周丽芳^{1,2,3} 盛娟^{1,2}
盛娟³ 张新风^{1,2,3}

1. 长江大学精神卫生研究所
2. 长江大学精神卫生中心
3. 荆州市精神卫生中心

目的 本研究旨在探讨荆州市小学学生中的非自杀性自伤 (NSSI) 分布情况, 并分析与之相关的行为特征。

方法 2023 年 9 月-2023 年 11 月, 采用自行整编《“阳光少年”调查问卷》调查工具, 内容包括一般人口学资料问卷及一些标准化问卷, 采用方便整群抽样在线上用问卷星对荆州市内 31 所小学的 5-6 年级学生进行调查, 以 6 个月内是否存在 NSSI 为标准。本研究共收集 8016 份问卷, 筛选出有效数据 6953 份, 样本有效率 86.74%。

结果 本次调查小学学生的平均年龄 11.1 ± 0.7 岁, 其中男生 3655 人、女生 3298 人, 5 年级 3261 人、6 年级 3692 人。共检出六个月内存在自伤行为人群共 276 人, 检出率为 3.97%, 其中男生 136 人 (3.72%), 女生 140 人 (4.24%)。单因素分析显示, NSSI 检出率高与以下单因素存在统计学显著意义 ($P<0.05$), 在业余时间较少参加集体活动、近 1 个月饮食习惯与以前相比有改变、近 1 个月日常饮食追求吃饱而已、近 1 个月较多宵夜、每天业余上网总时长大于 4 小时、存在网瘾、存在失眠、无午休习惯、一般晚上 10 点后入睡、积极看待自己的生命、心理压力高、新冠疫情流行后对现在身心健康有影响、新冠疫情流行后对现在同伴关系有影响、新冠疫情流行后对学习有影响、家庭为单亲、重组、留守家庭及其他、父母的婚姻状况为非已婚。多因素分析结果显示, 在小学阶段, 消极看待自己生命 ($OR=9.58$)、有失眠 ($OR=2.77$)、心理压力高 (OR

=2.70)、近1个月饮食习惯与以前相比有改变(OR=2.11)、新冠疫情流行后对现在同伴关系影响较多(OR=2.59)及较少(OR=1.47)、新冠疫情流行后对学习有较多影响(OR=2.19)及较少影响(OR=1.44)、家庭组成为其他(未与父母共同生活、非单亲、重组、留守家庭)(OR=1.73)的小学生的NSSI发生风险显著增加。

结论 单因素分析和多因素 Logistic 回归模型的结果揭示了多个与 NSSI 行为显著相关的因素,特别值得注意的是,消极看待自己生命的学生 NSSI 发生的风险是最高的,这强调了心理健康干预的重要性。此外,新冠疫情对学生心理和社交关系的负面影响也与 NSSI 行为有显著关联,提示我们在疫情后期仍要特别关注学生的心理健康。未来的工作应该集中在开发针对性的预防策略和干预措施,特别是针对那些处于高风险群体的学生。

高中生学习压力与网络成瘾的关系:抑郁情绪的中介作用

袁贤明¹ 袁贤明^{2,3}

1.长江大学精神卫生中心

2.荆州市精神卫生中心

3.长江大学精神卫生研究所

目的 探讨高中生学习压力、抑郁情绪和网络成瘾的关系。

方法 采用整群取样,以湖北省荆州市 4568 名高中生为研究对象。采用自编“阳光少年”中学生心理健康调查问卷,包含陈树林、郑全全编制的中学生应激源调查问卷中的学习压力分问卷(Cronbach's $\alpha=0.88$), Kurt Kroenke 等人编制的 9 项抑郁自评量表(Cronbach's $\alpha=0.92$)和 Young 等人编制的网络成瘾量表(Cronbach's $\alpha=0.92$)进行测试,使用 SPSS22.0 软件和 SPSS process 插件进行统计分析。

结果 本研究结果表明:(1)4568 名高中生中,男生 2295 人(50.2%),女生 2273 人(49.8%),年龄 16.09 ± 0.87 岁,高一 1329 人(29.1%),高二 1824 人(39.9%),高三 1415 人(31.0%);(2)女高中生的学习压力分数和抑郁情绪分数显著高于男高中生(均 $P<0.01$),高三学生学习压力分数和抑郁情绪分数显著

高于高二和高一学生(均 $P<0.01$),高三学生网络成瘾分数显著高于高二学生($P<0.05$);(3)高中生学习压力(5.55 ± 4.05)、抑郁情绪(5.02 ± 5.45)和网络成瘾(38.42 ± 13.37)均呈显著正相关关系($r=0.38\sim 0.55$,均 $P<0.01$);(4)中介作用分析结果显示,抑郁情绪在高中生学习压力与网络成瘾间起中介作用,中介效应占总效应的比例为 61.42%。

结论 本研究发现:(1)与男高中生相比,女高中生的学习压力情况和抑郁情绪情况更加糟糕;(2)高中生学习压力和抑郁情绪随年级上升而逐渐严重,在高三阶段达到最高峰;(3)高中生网络成瘾趋势呈“√”字型,即高一至高二略有下降,而高二至高三出现大幅上升;(4)高中生的抑郁情绪会随着学习压力的提升而增强,且网络成瘾会随着学习压力和抑郁情绪的提升而增强;(5)本研究使用中介作用分析进一步发现,高中生的学习压力会通过抑郁情绪的中介作用对网络成瘾产生影响,即当高中生在学习过程中感知到学习压力时,受学习压力影响较大的抑郁情绪是使其出现网络成瘾的重要原因。

综上所述,学校、教育部门与医疗机构有必要对高中生的网络成瘾问题加以关注,尤其要重点关注其学习压力情况与抑郁情绪情况,以预防网络成瘾问题在高中生群体发生。在针对有网络成瘾问题的高中生进行心理干预时,学校教师和心理工作者可以从性别和年级角度出发,有针对性地降低不同性别和年级高中生的学习压力与抑郁情绪,以避免网络成瘾问题的出现。

关键词:高中生;学习压力;抑郁情绪;网络成瘾

沈阳市社区老年人经济地位轨迹与心理健康相关性研究

姚明洋 韩笑宇 邵丽影 陈春武*

沈阳市精神卫生中心

目的 经济地位与心理健康之间存在密切联系,经济地位的下降会增加老年人心理健康问题的风险。了解不同轨迹对心理健康的影响至关重要。本研究探讨沈阳市社区老年人的社会经济地位轨迹及其与心理健康状态之间的关系,旨在为制定老年人心理健康干预措施和社会经济支持政策提供依据,在制

定老年人支持政策时以实现更加精准和有效的干预。

方法 本研究采用随机抽样方法,于2023年12月-2024年4月对沈阳市13区县市的常驻60岁以上老年人进行问卷调查,共收到14914份问卷,其中有效问卷14414份(96.65%)。调查内容包括个人基本情况、生活质量评价、心理健康状态(抑郁症状、焦虑症状、睡眠状况、认知功能)、自评社会经济地位(SES)、未来担忧、应对方式和退休适应。使用项目反应理论(IRT)构建社会经济地位潜变量评分,并运用组轨迹模型(GBTM)分析不同社会经济地位轨迹。

结果 研究发现沈阳市老年人社会经济地位轨迹可分为8种类型,包括较高稳定型、轻微下降型、明显下降型、明显上升型、极高稳定型、轻微上升型、较低稳定型和极低稳定型。不同轨迹组的构成比例存在显著差异。心理健康状态与社会经济地位轨迹类型相关,较低社会经济地位轨迹的老年人存在更高的心理健康风险。

结论 沈阳市社区老年人的社会经济地位轨迹与其心理健康状态密切相关,处于较低或下降型经济地位轨迹的老年人更易受到抑郁、焦虑等心理问题的困扰。

关键词:老年人,社会经济地位轨迹,心理健康

心理弹性在公交驾驶员压力知觉与工作投入间的中介作用

王格¹ 王格² 沈焱华²

1.皖南医学院研究生学院

2.首都医科大学附属北京安定医院芜湖医院

目的 探究心理弹性在公交驾驶员压力知觉和工作投入间的中介作用。

方法 方法 在2023年6月,使用方便抽样方法在安徽省某公交公司抽取628名驾驶员,进行心理弹性、压力知觉和工作投入量表问卷测试;对数据采用SPSS 25.0进行描述性统计、Pearson相关分析,使用Amos 24.0构建结构方程模型,采用Bootstrap法检验中介作用。

结果 心理弹性、工作投入和压力知觉量表的总分分别为(30.63±5.22)、(83.07±10.67)和(41.86±9.55)分。Pearson相关分析表明,工作投入

与心理弹性呈正相关($r=0.35, P<0.01$),与压力知觉呈负相关($r=-0.31, P<0.01$)。中介效应检验表明,压力知觉对工作投入的直接预测作用显著($\beta=-0.15, P<0.01$);心理弹性在压力知觉和工作投入的关系中起部分中介作用(效应值=-0.325, 95%CI: -0.398~-0.258),中介效应占总效应的53.85%。

结论 压力知觉不仅可以直接影响公交驾驶员工作投入,也可以通过心理弹性的中介作用间接影响工作投入。公交公司应注重提高驾驶员的心理弹性水平,从而压力知觉对驾驶员工作投入带来的消极影响

关键词:压力知觉;心理弹性;工作投入;中介作用

建设精神专科联合应急处置机制的研究

杜菊梅* 徐璐

宜昌市优抚医院

目的 构建高效、响应快速的区域性精神卫生应急协同处置体系,提升在应对突发精神卫生事件时的干预能力和服务质量。

方法 收集宜昌市120指挥中心2023年派诊给宜昌市优抚医院“120”急救中心院前急救患者的资料进行回顾性分析。统计分析“120”急救中心院前急救相关疾病种类的构成及其发展趋势。

结果 2023年院前急救649例患者实施应急处置,有危险行为452例,占处置人数的69.66%,药物不良反应78例,占处置人数的12.12%。伴有其他疾病的需救治的52例,占处置人数的8.01%。严重精神障碍患者出现危险行为时,由及时联系社区、公安、医院联合应急医疗处置干预,对维护社会安全非常必要。

结论 配备不同专业的医务人员进行联合诊治已成为当下医院发展的趋势。加强对院前急救人员的培训,如常规心电图机,除颤仪、呼吸机的使用,同时加强心理疏导技巧的培训,以便医护人员能够快速并准确地应对突发情况。与综合医院建立协同机制,合作转诊关系,为救治患者提供更多更快捷的渠道,更大程度地确保医务人员的安全与患者的心理健康。为社区、医院解决难题。

关键词:精神专科;院前急救;协同机制

心理健康素养水平影响因素分析

张秀莉* 蔡启霞

吉林省神经精神病医院

目的 了解群体的心理健康状况, 识别潜在问题, 分析影响心理健康素养水平的因素, 以便为制定有效的心理健康教育和干预措施提供依据, 从而针对性的采取有效措施降低其负面影响。这有助于提升个体和群体的心理健康水平, 这不仅对个人的心理健康有着深远的影响, 也对整个社会的和谐稳定与发展具有积极作用。

方法 心理健康素养是一个跨学科领域, 涉及心理学、社会学、医学、教育学等多个学科。通过查找相关文献和研究报告、政策文件、调查资料等, 综合分析不同年龄、性别、职业和文化背景的人群多维度的影响因素, 包括个体、家庭、社会、环境、政策和制度等多个层面。

结果 心理健康素养水平受到多种因素的影响, 包括遗传与自然因素、社会与经济环境、个体因素、生活习惯与行为、教育与培训、心理健康服务以及心理创伤等。这些因素相互作用, 共同影响个体的心理健康素养水平。

结论 心理健康素养水平的影响因素可以归纳为多个方面, 这些因素共同作用于个体的心理健康素养, 影响其心理健康水平。提高心理健康素养需要综合考虑这些因素, 需要从多个层面入手, 采取综合性的干预措施, 针对不同群体运用多样化、个性化措施来降低负面影响。从而提高人群整体心理健康素养水平, 为个体和社会的健康发展提供有力保障。

The Prevalence and Risk Factors for Suicide Attempts in Youth Depressive Inpatients Within Month After Discharge in China

Yingying Zheng¹, Bin Sun¹, Yarong Ma¹, Shuai Yuan¹, Xue Zeng¹, Robert Rosenheck³, Hongbo He²

1.The Affiliated Brain Hospital of Guangzhou Medical University

2.Guangdong Mental Health Center, Guangdong Provincial People's Hospital (Guangdong Academy of Medical Sciences), Southern Medical University

3.Department of Psychiatry, Yale University School of Medicine

Objective Suicide prevention has become increasingly important, especially for those with depression. Global depression cases have risen sharply, leading to a high number of suicides, particularly affecting youth aged 15-29. Most suicide attempters have mental disorders, with depression being the highest risk. Hospitalized depressed youth have a surprisingly high suicide attempt rate of 53.8%, emphasizing the urgent need for targeted interventions

Suicide risk monitoring and research among post-discharge depressed youth in China, especially during the first month, remains limited. This gap hinders suicide prevention efforts. Our study in southern China aims to fill this void, assessing suicide risks and identifying effective interventions for this critical period.

Methods A cohort study was performed in Guangdong Province, China, from July 2022 to July 2023, involving depressed inpatients from five hospitals. Comprehensive assessments were done at admission and discharge, with a follow-up after one month to track post-discharge suicide attempts. 250 young depressed inpatients aged 13-25 were included based on specific criteria. Demographics, clinical traits, and psychosocial features were evaluated using standard scales. Statistical tests, including Mann-Whitney U, covariance analysis, and logistic regression, were used to pinpoint risk factors for post-discharge suicide attempts, utilizing SPSS 22.0

Results Logistic regression analysis identified several risk factors for suicide attempts after discharge, including “Actual suicide attempts on admission(OR=3.227; 95% CI=1.035–10.062; p=0.043)”, “Actual suicide attempts at discharge” (OR=2.835; 95% CI=1.242–6.473; p=0.013), total Toronto Alexithymia Scale scores(OR=1.054; 95% CI=1.054–1.095; p=0.007), and a lower reduction in “Sleep disorders”

factor scores during hospitalization(OR=0.792; 95% CI=0.656–0.957; p=0.016)

Conclusion Our study identified a high prevalence (22.4%) of suicide attempts in young depressed inpatients 1 month after discharge. Post-discharge suicide attempts are associated with various social, psychological, and clinical factors, most importantly “Suicide attempts” before and during hospitalization since they are easily identified by clinicians as well as, sleep disorders, which may be treatable, and alexithymia

关键词: Youth depression; Inpatients; Post-discharge suicide; Risk factors

加强精神专科医院信访投诉管理 着力构建和谐医患关系

马丽*

宁夏宁安医院

目的 本文将对精神专科医院信访投诉管理的重要性和现状进行分析,并探讨如何加强管理,促进医患关系的和谐发展。

方法 (一)健全投诉渠道,医院可以设置专门的投诉受理部门或者投诉热线,为患者和家属提供便捷的投诉途径。同时,还可以通过互联网平台、邮件等多种形式设立投诉通道,让患者能够方便地进行投诉和意见反馈;(二)加强沟通与解释,在医院信访投诉管理中,加强沟通与解释是至关重要的一环。要改善公众对精神障碍患者和医生、医院的认知,突出公益性,下沉社区,促进人群心理健康,提高精神卫生社会声量,提升社会影响力;(三)建立投诉处理机制,医院可以设立专门的投诉处理部门或者委员会,负责接收、调查和处理患者的投诉。同时,应建立快速响应的投诉处理流程,确保投诉能够得到及时、公正、有效地处理,并及时回应患者的诉求,增强患者对医院的信任感。(四)强化医疗质量管理。医院还可以引入第三方评估机构对医疗质量进行评估,借鉴国际先进的医疗管理经验,不断提升医院的整体医疗质量水平,减少医疗事故和纠纷的发生,从根本上改善医患关系。

结果 综上所述,在医患关系日益凸显的当下,加强精神专科医院信访投诉管理,构建和谐医患关

系已成为当务之急。通过建立健全的信访投诉管理机制,增进医患沟通与理解,提高医疗服务质量和医疗安全水平,我们可以期待医患双方能够更加理性、平等地协商解决问题,共同促进医患关系的良性发展。

结论 未来医院信访投诉管理工作能够更加完善,医患之间能够建立起更加和谐、稳定的关系,为社会各界提供更加优质的医疗服务,造福人民群众。

关键词: 精神专科医院管理; 信访投诉; 医患关系

虚拟标准化病人有效性评估研究进展

喻佳龙 徐勇*

山西医科大学第一医院

目的 虚拟标准化病人是特定类型的计算机程序,能够精确地模拟真实的临床场景,已成为重要的教学工具。本文旨在综述虚拟标准化病人(virtual standard patient, VSP)的评估方法,探讨现有研究中用于VSP评估的工具和方法,以及这些方法在提高VSP评估效果方面的潜力。

方法 以“virtual patient”、“virtual standard patient”、“virtual simulation”以及“standard patient”为关键词,检索了中国知网、万方、维普、生物医学文献、PubMed、EMBASE和Scopus等数据库从建库至2024年3月1日发表的关于虚拟标准化病人的文献,按照纳入、排除标准严格筛选后对文献进行综述。

结果 虚拟标准化病人有效性评估主要包括学习效果评估和系统评估。学习效果评估中的效标评估能提供一致的评估标准,增强了结果的可比性,使研究结果更具可靠性,并减少了主观偏见,研究者能更准确的评估所要研究的特定方面,但难以捕捉互动细节;专家评估能提供专业的反馈,但存在主观偏差;以及基于凯恩框架(Kane's framework)的新手—专家比较评估模式和引入了生理学数据的其它评估方法。此外,分别介绍了系统评估的主要维度,包括技术设计、模拟现实性和学习实用性,并归纳了相应的评估工具,包括使用卡片分类法(card sorting)评估技术设计的易用性;《马斯特里赫特标准化病人评定工具》(The Maastricht Assessment of a

Simulated Patient, MaSP)可以用来评估 VSP 的技术设计的满意度、模拟现实性的真实性和学习实用性;模拟现实性能够通过《威特默存在感量表》(Witmer's-Presence-Questionnaire, PQ)测量;以及作用于学习实用性的 Kirkpatrick 四级评估模型。

结论 本文为理解和改进 VSP 的评估方式提供了一定的参考。然而,任何评估方法都有其局限性,因此在选择评估方法时,需要根据具体的研究目的和场景进行综合考虑。同时,期待未来有更多的研究能够开发出新的评估工具和方法,以进一步提高 VSP 评估的效果。

关键词:虚拟标准化病人;有效性;评估;综述

某市中高考考生考前心理状况及健康宣教服务需求调查分析

夏博呈^{1,2} 蒋伶俐^{1,2} 魏作霖^{1,2} 黄金金²

1.川北医学院

2.四川省精神卫生中心

目的 调查分析西南地区某市中、高考考生考前心理健康状况及心理健康宣教服务需求。了解考生对不同健康宣教服务形式以及内容的接受程度,为中高考考生健康干预提供依据。

方法 本研究采用整群随机抽样法。通过西南地区某市的教育局,在中高考考前向当地的学校的中高考考生发布了电子问卷。问卷通过“问卷星”平台进行分发,中高考生在充分知情同意的前提下自愿填写问卷。通过凯斯勒心理疾患量表6项版本(The Kessler Psychological Distress Scale,K6)量表(中文版)评估考生考前情绪问题,自编问卷评价考生睡眠状况、心理健康服务需求及其对不同健康宣教服务形式、内容的接受程度。

结果 在接受调查的10641名中高考生中,K6阳性率8.99%;54.61%的考生睡眠时长出现了变化;53.74%考生认为自己有健康宣教服务的需求。健康宣教服务形式接受程度从高到低分别是:视频动画、科普文章、心理健康知识讲座、现场心理咨询、心理热线或线上咨询服务。健康宣教服务内容的接受程度从高到低是:如何应对考试压力、考前睡眠保健知识、饮食营养、用眼卫生。

结论 西南地区某市中高考生情绪问题阳性率

高于普通青少年人群,中高考生中睡眠问题发生率较高。中高考生对健康宣教服务的需求较大,最为接受的宣教方式为视频动画,最受欢迎的内容为如何应对考试压力。

关键词:考生;情绪问题;睡眠;心理服务

中国人群习惯性午睡与健康结局的关联性分析

杨英博¹ 郑永博² 张朝辉¹ 鲍彦平² 陆林²

1.新乡医学院第一附属医院

2.北京大学第六医院

目的 随着社会的发展,人们的工作及学习压力也随之增加,午睡成为了大多数人缓解疲劳的一种习惯。在中国,午睡通常被认为是一种健康的生活习惯,但长时间的午睡、不良睡姿等也可能对健康造成负面影响。习惯性午睡对身心健康的影响尚存在争议。本研究旨在探索中国人群中习惯性午睡与健康结局之间的关联性,为进一步指导午睡人群改善身心健康提供现实依据。

方法 采用横断面研究的方法,通过线上问卷收集京东注册用户的午睡健康等信息。探索中国人群习惯性午睡与健康结局的关系,同时根据夜间睡眠分组,分析午睡与夜间睡眠时长、夜间睡眠质量共同对健康结局的影响。

结果 本研究纳入41,061名参与者,分析发现:1)在中国人群中,午睡与躯体疾病(OR=0.90,95%CI=0.85-0.96)和精神障碍(OR=0.81,95%CI=0.70-0.94)的低风险相关。2)对于夜间睡眠较短的人群,午睡会降低躯体疾病的风险(OR=0.83,95%CI=0.75-0.91),对于夜间睡眠较长的人群,午睡则会增加躯体疾病的风险(OR=1.48,95%CI=1.05-2.08)。3)在睡眠质量较差(PSQI \geq 7)的人群中,午睡与慢性躯体疾病(OR=0.88,95%CI=0.82-0.96)和精神障碍(OR=0.79,95%CI=0.67-0.93)低风险显著相关,而在睡眠质量较好的人群中未见午睡对健康结局有明显影响。

结论 本研究提示习惯性午睡可能是一些慢性躯体疾病和精神障碍的风险因素,但同时也可以减少夜间睡眠不足、夜间睡眠质量较差带来的负面影响,为有午睡习惯的人群作息安排和疾病预防提供

了一些启发。

Gender Difference in Clinical Features of Youth with Major Depressive Disorder

Xiaoxi Liu Jin Chen Yingyi Xu Yu Xu Jie Zhang*

School of Mental Health, Guangzhou Medical University/The Affiliated Brain Hospital of Guangzhou Medical University

Objective The prevalence of depressive disorders in youth is on the rise and has become a serious public health issue. Previous research has shown that there are gender differences in the prevalence, clinical symptoms, and response to antidepressant treatment of youth depression. These findings may help in the individualization of treatment for patients. To evaluate gender differences in the clinical characteristics of youth depression from multiple perspectives, this study included sociodemographic data as well as assessments of clinical symptoms, sleep characteristics, suicide risk, and family functioning

Methods This cross-sectional study included 461 youths (13–25 years old) with major depressive disorder recruited from January 2022 to May 2023, including 333 females and 128 males. The Hamilton Anxiety Scale and the Hamilton Depression Scale were used to assess the anxiety and depression symptoms; the Columbia-Suicide Severity Rating Scale was used to assess the patients' suicidal ideation, suicide attempts and non-suicidal self-injury behaviors; the Epworth Sleepiness Scale and the Athens Insomnia Scale were used to assess the sleep characteristics of the patients; and the Interpersonal Communication Ability Scale and the Family Adaptability and Cohesion Evaluation Scales were used to assess the interpersonal competence and family functioning. The patients' interpersonal skills and family functioning were evaluated using the Interpersonal Skills Scale and the Family Intimacy and Adaptability Scale. The data were statistically analyzed

by gender

Results Female patients had a younger age of onset than male patients ($P < 0.05$), and male patients smoked more ($P < 0.05$). There was no statistically significant difference between the two patient groups in terms of education level, BMI, employment status, marital status, family history, and alcohol drinking history ($P > 0.05$). Female patients had more depressive symptoms than male patients ($P < 0.05$), especially anxiety/somatization symptoms ($P < 0.05$), a higher severity of suicidal ideation ($P < 0.05$), and a higher proportion of patients who had suicide attempts ($P < 0.05$) and non-suicidal self-injury behaviors ($P < 0.05$). There was no significant difference in the total Hamilton Anxiety Scale score between the two groups of patients. However, women had a significantly higher somatic anxiety factor score than men ($P < 0.05$). There were no statistically significant differences between the two groups of patients in the four characteristics of the Epworth Sleepiness Scale total score, Athens Insomnia Scale total score, Interpersonal Communication Ability Scale total score, and Family Adaptability and Cohesion Evaluation Scales total score ($P > 0.05$). Female patients had significantly more severe sleepiness symptoms while reading ($P < 0.05$) and watching TV ($P < 0.05$) compared to male patients. Females had more severe interpersonal skills symptoms than males, including difficulty asking for help ($P < 0.05$), nervousness when speaking in front of leaders and teachers ($P < 0.05$), and fear of embarrassment when socializing ($P < 0.05$)

Conclusion Female youth with depressive disorders have a younger age and more severe depressive and somatic anxiety symptoms than male patients. Female youth patients have more severe suicidal ideation, non-suicidal self-injury behaviors, and suicide attempts than males. These findings imply that gender differences should be considered in the treatment of youth depression to offer patients individualized treatment

心理援助热线专业人员胜任力评价指标体系

的构建

陈静宁¹ 邓咏妍¹ 阳波² 梁红³ 陈旭东⁴ 黄悦勤¹
王靖伊² 王翠玲³ 韩琳⁴ 刘肇瑞¹ 王钢²

1.北京大学第六医院,北京大学精神卫生研究所,国家卫生健康委员会精神卫生学重点实验室(北京大学),国家精神心理疾病临床医学研究中心(北京大学第六医院)

2.国家心理健康和精神卫生防治中心

3.北京回龙观医院

4.中南大学湘雅二医院精神科,中南大学湘雅二医院精神卫生研究所,国家精神疾病医学中心,国家精神心理疾病临床研究中心

目的 构建心理援助热线咨询员的专业胜任力评价指标体系,为培训与考核提供科学参考,提高心理热线的服务规范和服务质量。

方法 通过文献综述初步拟定心理援助热线专业人员胜任力评价指标体系,选取全国不同地区的16名专家使用德尔菲法进行专家咨询,整理和筛选指标,通过层次分析法确定各级指标的权重,得出较科学的心理援助热线专业人员胜任力评价指标体系。

结果 专家咨询法所选专家来自全国东、中、西部地区,专家咨询问卷回收率100%,两轮咨询专家权威系数分别为0.92和0.90。经过两轮专家咨询构建了包括4项一级指标、9项二级指标、34项三级指标在内的心理援助热线专业人员胜任力评价指标体系,一级指标包括理论知识、专业技能、职业态度和个人特质。采用层次分析法确定了各指标的权重,两轮专家咨询中各级指标的肯德尔和谐系数分别为0.159~0.179和0.165~0.250。

结论 本研究构建的心理援助热线专业人员胜任力评价指标体系不仅关注理论知识、专业技能等外在表现,同时也注重职业态度和个人特质等内在特征,较全面地描述了心理热线专业人员的胜任力特征。构建的心理援助热线专业人员胜任力评价指标体系科学、系统,可以为心理热线咨询员专业能力的优化提供参考。

生活方式对非自杀性自伤行为影响研究进展

张梨^{1,2,3} 邓小鹏^{1,3} 刘波^{1,3} 张新风^{1,3}

1.长江大学精神卫生研究所

2.长江大学精神卫生中心

3.荆州市精神卫生中心

目的 本综述旨在探讨不同的生活方式对NSSI行为发生的影响及其潜在的心理社会机制,总结非自杀性自伤研究的当前状态、趋势和问题。

方法 本文基于PubMed数据库,对近五年内相关的英文文献进行了系统检索和分析。使用以下主题词“Healthy Lifestyles”、“Eating Behaviors”、“Exercises”、“Internet Addiction”、“Sleeping Habits”、“Pet”与“Non-suicidal self-injury”组合检索相关文献。

结果 (1) 饮食方面:不健康的饮食习惯,如高糖、高盐、高脂肪食物的过度摄入以及营养物质的缺乏,可能与心理健康问题如抑郁、焦虑等有所关联,并可能间接增加发生NSSI行为的风险。

(2) 运动方面:中等强度运动如快走、慢跑、游泳等,每次运动时间在30-60分钟能更好的预防NSSI行为。

(3) 网络依赖行为方面:网络依赖可能增加NSSI的风险,而NSSI行为也可能进一步加剧网络依赖。研究数据显示,每天使用手机长达3小时的人群心理问题的风险增加,而超过6小时的使用者患抑郁症等心理问题的风险则显著上升78%。

(4) 饲养宠物方面:童年时期与高度依恋的宠物狗或猫的累积接触与青少年心理健康障碍的风险降低有关。与宠物建立亲密关系的人可能拥有更强的社会支持和更健康的社交关系,这进一步降低了NSSI的风险。与宠物相关的压力或冲突等可能成为触发NSSI的应激事件。

(5) 睡眠方面:睡眠中断、睡眠质量差、频繁的噩梦的人群发生NSSI的风险更高。睡眠不规律与NSSI病史以及NSSI冲动的严重性有关。具体表现在10天内睡眠不规律程度越高,则每日NSSI冲动的严重程度越高。周末睡眠时间少于7小时的个体,其NSSI行为的发生风险增加,而工作日睡眠时间达到或超过9小时的个体,发生NSSI行为风险降低。

结论 饮食失调、缺乏体育锻炼、严重的网络依赖行为、睡眠质量差以及睡眠时间不足等均可能增加青少年发生非自杀性自伤行为的风险。因此,

维持健康的生活习惯,包括均衡饮食、适度运动、合理使用网络、与宠物建立亲密关系以及保持良好的睡眠质量,对于促进心理健康和预防 NSSI 行为具有重要意义。

荆州市高三年级学生校园欺凌行为的相关因素分析

苏雪健^{1,2,3} 邓小鹏^{1,2,3} 张新风^{1,2,3}

- 1.荆州市精神卫生中心
- 2.长江大学精神卫生研究所
- 3.长江大学精神卫生中心

目的 本研究旨在探讨荆州市高三年级学生在校园欺凌行为中扮演不同角色的分布情况,并分析与之相关的行为特征。

方法 2023年9月-2023年11月,采用自行整编《“阳光少年”调查问卷》调查工具,内容包括一般人口学资料、心理认知、家庭生活、校园欺凌等方面。采用 SPSS 22.0 软件对所得数据进行统计分析,使用 X² 检验与多元 logistic 回归分析影响学生是否涉入校园欺凌事件、在其中处于何种角色的因素。以 $P < 0.05$ 作为差异有统计学意义的界值。

结果 (1)高三年级同学共收集 1415 份调查问卷,收集有效问卷 1235 份,有效率 87.28%。其中男生 589 人,平均年龄 17.01 ± 0.52 岁;女生 646 人,平均年龄 16.95 ± 0.50 岁。(2)通过问卷中第 51 题:“我曾经欺负过其他同学(例如:给其他同学起绰号、嘲笑、孤立、殴打、离间同学等)”与 52 题:“我曾经被其他同学欺负(例如:被其他同学起绰号、嘲笑、孤立、殴打、离间同学等)”的作答情况,把这部分学生在校园欺凌中扮演的角色分为:欺凌者、受害者、欺凌-受害者、不涉入欺凌事件中四类。分类后发现在这个样本中:欺凌者有 34 人,占 2.7% (男生 26 人,占 4.4%;女生 8 人,占 1.2%);受害者有 138 人,占 11.2% (男生 59 人,占 10.0%;女生 79 人,占 12.2%);欺凌-受害者有 96 人,占 7.8% (男生 63 人,占 10.7%;女生 33 人,占 5.1%);不涉入欺凌事件者有 967 人,占 78.3% (男生 441 人,占 74.9%;女生 526 人,占 81.4%)。(3)多元 logistic

分析,结果显示:1.男性 ($OR=3.99$)、经常或每天吃宵夜 ($OR=2.78$) 的荆州市高三年级学生成为欺凌者的风险显著增加;2.过去半年内发生过自伤行为 ($OR=2.40$)、焦虑 ($OR=2.20$)、失眠 ($OR=2.00$)、经常或每天吃宵夜 ($OR=1.69$) 的荆州市高三年级学生成为受害者的风险显著增加;3.网瘾 ($OR=4.24$)、过去半年内发生过自伤行为 ($OR=2.84$)、男性 ($OR=2.59$)、焦虑 ($OR=1.91$) 的荆州市高三年级学生成为欺凌-受害者的风险显著增加。

结论 在荆州市高三年级学生中,经常吃宵夜的学生,更容易涉及到校园欺凌事件中;而男性更容易成为欺凌者;女性、网瘾、半年内发生过自伤行为的学生,更容易成为受害者,往往伴有焦虑、失眠的特点出现。应重点关注常吃宵夜、半年内曾发生过自伤行为,患有网瘾、焦虑、失眠等特点人群,普及健康的人际交往模式理念,并为弱势群体制定、完善保护措施。

关键词:荆州市;高中三年级;校园欺凌;相关分析

荆州区初中生网络成瘾影响因素调查研究

许俊峰^{1,2,3} 涂哲明^{1,2,3}

- 1.荆州市精神卫生中心
- 2.长江大学精神卫生中心
- 3.长江大学精神卫生研究所

目的 调查荆州区初中生网络成瘾现状及分析其相关影响因素,为正确引导初中学生合理利用网络资源及开展心理健康服务提供参考依据。

方法 于 2023 年 9 月 18 日至 11 月 8 日采用整群抽样的方法,选取荆州区十所中学的初中生作为研究对象,采用问卷星线上调查的方式,内容包括一般人口学资料、家庭生活情况、网络成瘾量表(IAT)等问卷进行相关心理健康状况和网络成瘾情况调查。采用 SPSS 27.0 统计软件对收集的数据进行分析,分类变量之间的差异采用 X² 检验,采用二元 logistic 回归分析有无影响网络成瘾的因素。以 $P < 0.05$ 作为差异有统计学意义的界限值。

结果 共收集 12343 份问卷,有效问卷 10938 例,有效率 88.6%。初中生网络成瘾量表(IAT)(总分 ≥ 50 分)阳性率为 11.1%;分类变量的单因素方差

分析中,影响因素为年级、父母婚姻状况、兄弟姐妹情况、参加集体活动情况、平均每天业余时间上网时长、睡眠情况在初中生网络成瘾情况有统计学差异($P<0.05$),性别情况在网络成瘾情况中没有统计学差异。二元 logistic 回归分析:以初中生是否发生网络成瘾分别作为因变量,将单因素分析中有统计学意义的因素作为自变量,进行多因素 Logistic 回归分析,结果显示,霍斯默-莱梅肖检验显著性 0.180,大于 0.05,表明本次数据二元 logistic 回归模型拟合度良好。在所有初中生中:初二学生 $OR=1.662(1.409-1.960),P<0.001$;初三学生 $OR=1.648(1.397-1.945),P<0.001$;平均每天业余时间上网总时长 1-2 小时 $OR=1.775(1.505-2.095),P<0.001$;2-4 小时 $OR=2.875(2.392-3.456),P<0.001$;4-6 小时 $OR=6.075(4.472-7.782),P<0.001$;大于 6 小时 $OR=11.716(8.960-15.320),P<0.001$;主动或被动参加集体活动 $OR=1.436(1.246-1.655),P<0.001$;睡眠情况为失眠 $OR=3.890(3.400-4.451),P<0.001$;父母婚姻状况为非已婚状态 $OR=1.362(1.163-1.595),P<0.001$ 。

结论 荆州区初中生网络成瘾问题应引起家长、学校和政府相关部门的重视,重点关注高年级、父母为非已婚家庭、很少或几乎不参加集体活动、长期失眠、每天花费较多业余时间上网的初中学生的心理健康状况和网络使用问题,引导他们合理正确利用网络资源,助力学习与身心健康发展。

关键词:初中生;网络成瘾;心理健康状况

Job Burnout and Mental Health Outcomes Among Primary Mental Health Service Medical Professionals: A Cross-sectional Study in Shanghai, China

Yi Wang¹, Qiang Wang¹, Yi Yang¹, Yiyang Sun¹, Hongyun Qin¹, Siqi Wang², Qing Shen^{1,2,3}

1. Shanghai Pudong New Area Mental Health Center
2. Laboratory of Mental Health Research, Tongji University School of Medicine
3. Institute for Advanced Study, Tongji University

Objective Studies have reported high prevalence

of mental health outcomes, such as high levels of anxiety and depression, in relation to job burnout among health care providers, including primary care general practitioners. Since a group of primary health care medical professionals are working specifically with the routine care towards patients with severe mental illness in China, little has been known on the level of job burnout, and its association with mental health outcomes for this group. Therefore, this study aims to explore prevalence of job burnout among this special group of medical professionals in primary care setting working with severe mental illness (PMP-MH), and its relationship with mental health outcomes of these professionals, i.e., anxiety and depressive symptoms

Methods This is a cross-sectional study with self-report data collected electronically between February 14, 2023 to August 31, 2023 from medical professionals as PMP-MH in Shanghai, China ($N=402$). Levels of job burnout was evaluated by using the Chinese version of the Maslach Burnout Inventory General Survey (MBI-GS), which consists of three dimensions: emotional exhaustion (EE), depersonalization (DP), and reduced personal accomplishment (PA). The cutoff score of burnout was 1.49 according to the criterion of the weighted average score suggested by previous studies. Severity of anxiety and depressive symptoms were measured by the General Anxiety Disorder 7-items (GAD-7) and the Patient Health Questionnaire 9-items (PHQ-9) scales, respectively. We contrasted prevalence of anxiety and depressive symptoms (categorized variables) among medical professionals as PMP-MH with a high level of job burnout to those with a low level, by applying robust (modified) Poisson regression model. Subgroup analyses were performed to explore the modification effect from demographic and occupational factors on this relationships

Results A total of 371 medical professionals were included in the analysis, with 306 (82.5%) reported having a high level of job burnout. Compared with workers having a low level of job burnout, those with a high level of job burnout exhibited a higher prevalence of anxiety symptoms (prevalence ratio [PR] 6.90 [95% CI 3.21-14.87]) and depressive symptoms (3.53 [95% CI 2.04-6.12]). When further classifying high

level of burnout into moderate-high and severe-high level of burnout, we found workers with severe-high level of job burnout showed the highest prevalence of anxiety symptoms (9.25 [4.30-19.92]) and depressive symptoms (5.16 [2.97-8.98]). Burned-out individuals with a high level of EE, DP and a low level of PA were at higher risks of anxiety and depressive symptoms compared with those without burnout. Subgroup analyses showed that those who were male, in younger age group, doctors, perceive their workload as heavy, satisfied with their job, having a higher education level, having a permanent employment contract and poorly cooperated with the community mental health service team were more likely to suffer from excessive anxiety and depressive symptoms

Conclusion Medical professionals working with patients with severe mental illness in primary care setting entails an extremely high level of job burnout. High level of job burnout is associated with a higher prevalence of mental health outcomes, especially for anxiety symptoms. The positive relationship between job burnout and mental health outcomes were moderated by demographic and occupational factors. The findings highlight the need for heightened awareness regarding mental health outcomes among burned-out medical professionals working in the primary care, particularly those working routinely with severe mental health patients

关键词: burnout, anxiety symptoms, depressive symptoms, relationship, primary mental health service medical professionals

大学生领悟社会支持、生命意义感与感戴关系及其团体心理干预研究

田悦¹ 李伟¹ 宋丹¹ 王彩芳² 梁晓亮¹

1. 开滦精神卫生中心

2. 开滦总医院

目的 本次研究主要为了解当代大学生领悟社会支持、生命意义感与感戴关系实际情况,并探究心理干预的应用价值,为提高大学生的心理健康水平提供科学依据。

方法 在中国某大学内部采用随机数表法选择有 300 名大学生,并对所有大学生发放有领悟社会支持问卷、生命目的量表以及大学生感戴量表问卷,在收集全部问卷后进行有效性筛选并进行匹配,并从中筛选出 100 例得分较为相近的大学生,并按照随机数表法结合大学生的自身志愿分为两组。其中一组为实验组,实施团队心理干预基础上进行有社会意义和生命目的的感受;一组为对照组,进行分组后自行接受社会意义和生命目的的感受。在实验组接受 8 次团体心理干预后对两组患者再次进行问卷调查,并对比两组大学生的相关评分。

结果 两组大学生在进行意义感受后领悟社会支持问卷、生命目的量表、心理弹性问卷评分均出现显著改善,组内结果对比具有统计学意义 ($p < 0.05$);不过在治疗后的评分结果中,实验组的评分要显著优于对照组,组间结果对比具有统计学意义 ($p < 0.05$)。

结论 在领悟社会支持、生命意义感与感戴关系较差感受的大学生中辅助采用团体心理干预,有利于大学生的正确价值观的树立,值得应用与推广。

Barriers and Facilitators To Help-seeking Behavior Among Young Adults at High Risk for Depression and Anxiety: A Qualitative Study

Rui Wang^{1,2,3,4,5}, Liang Zhou^{1,2,3,4,5}, Shaoling Zhong^{1,2,3,4,5}, Jiali Wang⁶, Jiali Wang¹, Yuqing Yang^{1,2,3,4,5}, Zijin Wu^{1,2,3,4,5}, Jianing Bai^{1,2,3,4,5}

1. Department of Social Psychiatry, the Affiliated Brain Hospital, Guangzhou Medical University

2. School of Mental Health, Guangzhou Medical University

3. Institute of Psychiatry and Psychology, Guangzhou Medical University

4. Key Laboratory of Neurogenetics and Channelopathies of Guangdong Province and the Ministry of Education of China, Guangzhou Medical University

5. Guangdong Engineering Technology Research Center for Translational Medicine of Mental Disorders, Guangzhou Medical University, Guangzhou, China

6.Crown Family School of Social Work, Polity, and Practice, the University of Chicago

Objective Despite the availability of effective treatments, most people suffering from psychological distress choose not to seek professional help. This study aimed to explore the barriers and facilitators to help-seeking among young adults at high risk for depression and anxiety

Methods College students who experienced depression and anxiety symptoms but did not meet a diagnosis of depression or anxiety were recruited between Oct 2022 and Dec 2022. Semi-structured interviews were conducted in a medical university. Thematic analyses were used to identify key themes that influenced participants' barriers and facilitators related to seeking help for their psychological distress

Results A total of 24 participants with an average age of 19 were included. Many young adults preferred to deal with psychological distress on their own rather than seeking help from people they trusted. They would only seek professional help when symptoms were obvious or had dysfunction. Nine themes were identified concerning barriers to help-seeking: (a) poor experiences with help-seeking, (b) fear of burdening others, (c) lack of trusting and committed relationship, (d) negative attitudes and beliefs related to seeking help, (e) lack of emotional competence, (f) lack of accessibility, (g) stigma, (h) lack of confidentiality and trust, (i) unaffordability. Four themes were identified about facilitators for help-seeking: (a) perceived severity, (b) trust and having a committed relationship, (c) past-positive experiences, and (d) perceived helpfulness

Conclusion Strategies for improving help-seeking by young adults at high-risk for depression and anxiety should focus on improving emotional competence, increasing mental health literacy and social support, reducing stigma, and improving accessibility of mental health resources in educational and supportive systems

关键词: Barriers, Facilitators, Psychological distress, Help-seeking, Young adults, High-risk

重大公共卫生事件与感染者心境障碍、情绪调节能力之间的关联：一项大规模前瞻性队列研究

谢意 夏叶 付佩彩 杨渊*

华中科技大学同济医学院附属同济医院

目的 在现代社会中，心境障碍的发病率逐年升高，对患者的心理与生理健康都造成了严重负担。各种重大公共卫生事件（public health emergencies, PHE）的突发对于个体心理健康可能产生不同程度的影响。本研究旨在全面性阐述公共卫生事件与心境障碍发生的可能因果关系，并探索其所致的核心心理症状以及调节因素。

方法 本研究的大样本前瞻性队列共纳入 1442 名来自全国各地的参与者，这些参与者在过去 3 个月内均感染了 SARS 冠状病毒 2 型(SARS-CoV-2)。我们通过在在线问卷收集了参与者的社会人口学特征、PHE 期间心理生理状态（包括自我报告的感染严重程度、对再感染的恐惧等）。此外，我们还使用心理量表评估了参与者的各类心理健康以及情绪调节能力（包括表达抑制与认知重评）。采用 Mann-Whitney U 检验比较参与者 PHE 发生前后的心理健康状况，以及多变量 logistic 回归探讨 PHE 期间心理生理状态与各类心境障碍之间的关系。此外，还应用调节效应模型来检验情绪调节在上述因果关系中的潜在调节作用。

结果 相对于基线水平，在突发 PHE 期间更多参与者表现出明显的焦虑（35.4% Vs 29.6%, $P < 0.001$ ）、抑郁（49.1% Vs 37.5%, $P < 0.001$ ）、失眠（26.7% Vs 17.0%, $P < 0.001$ ）和躯体障碍（49.1% Vs 31.8%, $P < 0.001$ ）。多变量 logistic 回归结果表明，参与者自我报告的严重感染（OR=1.973, $P = 0.002$ 及 OR=1.895, $P = 0.004$ ），对再感染的恐惧（OR=3.170 及 OR=2.248, P 均 < 0.001 ），对收入影响（OR=1.935, $P = 0.005$ 及 OR=1.657, $P = 0.009$ ），对疫情未来趋势的消极态度（OR=7.339 及 OR=2.019, P 均 < 0.001 ）等，都是焦虑障碍和抑郁障碍的显著且独立的危险因素。此外，PHE 期间具有负向心理生理状态的参与者最容易产生“紧张感”、“兴趣缺失”、“睡眠问题”和“自我否定”等具体心理症状。调节效应分析发现表达抑制正向调节了 PHE 期间负向心理生理状态与焦虑障碍之间的因果关联（ $\beta = 0.041$, $P < 0.01$ ）。

结论 本研究表明，SARS-CoV-2 相关的公共卫

生事件显著加剧了感染者的焦虑、抑郁、睡眠以及躯体障碍等心境障碍的发生。在 PHE 期间, 早期且准确地识别感染者, 尤其是那些表达抑制程度高的个体的负向心理症状, 对于心境障碍疾病的预防与治疗至关重要。

Depressive Symptoms Among Teochew People in Teoswa Region of Guangdong Province, China: Prevalence and Associated Factors

Jun Huang Wenwang Rao*

Department of Preventive Medicine, Shantou University Medical College, No.22 Xinling Road, Shantou, 515041, Guangdong province, China.

Objective Depression is a mental disorder with an increasingly high incidence and heavy burden. However, no study has explored the prevalence and associated factors of depressive symptoms in Teochew people. This study aims to analyze the prevalence of depressive symptoms in Teochew people and explore the relationships between depressive symptoms and demographic characteristics, lifestyle, and chronic diseases

Methods This cross-sectional survey was conducted between September and December 2022, using a multistage stratified equal volume random sampling method. The Patient Health Questionnaire-9(PHQ-9) was used to detect depressive symptoms. Based on Guangdong Province's population data obtained from the Seventh National Population Census in 2020, the data was weighted by sex, region, age and city to improve the representativeness of the study sample. Univariate and multivariate logistic regression of the complex sampling method were used for statistical analysis

Results A total of 8256 Teochew participants were included in this study, with the response rate of 83.00%. The prevalence rate of depressive symptoms in Teoswa region was 4.5% [95%confidence interval(95%CI): 3.9%-5.1%]. The highest prevalence rate of depressive symptoms in Shantou city was 6.1%

(95%CI:5.1%-7.3%), followed by Jieyang city at 4.4% (95%CI:3.4%-5.6%), Chaozhou city at 4.1% (95%CI:3.2%-5.2%), and Shanwei city at 3.0% (95%CI:2.3%-3.9%). Teochew people who were women, unmarried, overweight or obese, and had less frequent physical exercise, were more likely to experience depressive symptoms (all $P<0.05$). Teochew people who maintained regular three meals a day and had lower education level, were less likely to experience depressive symptoms (all $P<0.05$). Compared with Teochew people without chronic diseases, Teochew people with multimorbidity were more susceptible to depressive symptoms [Odds ratio (OR):6.528, 95%CI:3.885,10.970; $P<0.05$]

Conclusion The prevalence rate of depressive symptoms in Teoswa region was relatively high but lower than figures in Guangdong province. Health professionals should pay more attention to depressive symptoms of high-risk group

关键词: Teoswa region, depressive symptoms, prevalence, lifestyle, chronic diseases.

宁夏三市妊娠期妇女抑郁症状现状与影响因素分析

黄玮* 刘媛

宁夏回族自治区宁安医院

目的 了解宁夏三市妊娠期妇女抑郁症状的发生情况, 并对其危险因素进行分析。

方法 采用随机抽样方法, 随机抽取于 2023 年 1 月—2023 年 12 月在宁夏区银川市、石嘴山市、固原市参与孕产期抑郁症筛查防治项目的 487 例妊娠期妇女为调查对象, 运用自行设计的一般资料调查表、抑郁症自我评估量表 (PHQ-9) 进行调查, PHQ-9 量表 0—4 分为正常组 (399 人)、5—9 分为轻度抑郁症状组 (60 人)、10—14 分为中度抑郁症状组 (22 人)、 ≥ 15 分为重度抑郁症状组 (6 人), 其中轻度抑郁症状组、中度抑郁症状组、重度抑郁症状组合为抑郁症状检出组, 对调查数据进行统计分析, 了解妊娠期妇女抑郁症状现状及其影响因素。

结果 抽样调查的 487 例妊娠期妇女中有 88 人

存在抑郁症状, 检出率为 18.07%, 经过追踪调查, 确诊抑郁症 7 人, 确诊率为 1.44%。Logistic 回归分析显示, 妊娠期年龄、妊娠阶段、妊娠期合并症、孕产次、不良孕产史等因素与妊娠期抑郁症状的发生有关, 差异具有统计学意义($P < 0.05$)。

结论 宁夏三市妊娠期妇女抑郁症状的检出率较高, 受多种因素影响。建议将妊娠期抑郁症状筛查纳入常规产检中, 早筛查、早干预可以降低产后抑郁的发生, 关注高危人群, 开展针对性的心理健康保健服务。

医疗美容门诊咨询者的焦虑症状和人格障碍

黄俊捷¹ 孙艺谋² 徐沛琳¹ 刘肇瑞¹ 张婷婷¹ 黄悦勤¹ 李比²

1. 北京大学第六医院

2. 北京大学第三医院

目的 描述医疗美容门诊咨询者焦虑症状和人格障碍阳性率, 探讨医疗美容咨询者焦虑症状的相关因素。

方法 选取 2021 年 11 月-2023 年 7 月期间在北京某三甲医院成形外科针对各部位进行医疗美容手术咨询的 788 名来访者, 采用人格诊断问卷第 4 版 (PDQ-4) 和焦虑自评量表 (SAS) 作为调查工具, 分别以 42 分和 50 分为阳性界值筛查其是否存在人格障碍和焦虑症状。采用方差分析、 χ^2 检验、多重线性回归和 logistic 回归的方法进行统计分析。

结果 本研究中医疗美容门诊咨询者焦虑症状阳性率为 15.23% (120/788), 人格障碍阳性率为 3.50% (28/788)。年龄与 SAS 量表得分负关联 ($\beta = -0.82, P = 0.009$), PDQ-4 量表得分与 SAS 量表得分正关联 ($\beta = 0.15, P < 0.001$), 眼整形、面部轮廓整形、微创整形与 SAS 量表得分正关联 ($\beta = 2.00 \sim 3.64, P < 0.05$)。

结论 医疗美容门诊咨询者年龄越小和人格偏离越突出, 焦虑症状越严重。眼整形、面部轮廓整形、微创整形的咨询者焦虑症状更严重。

关键词: 医疗美容, 焦虑症状, 人格障碍

双相障碍患者照料者的静息-活动模式改变: 一项家系研究

雷彬斌¹ 封洪亮² 张继辉²

1. 广东省人民医院

2. 广州医科大学附属脑科医院

目的 精神障碍患者的照料者承受沉重的精神负担, 前人研究报告了双相障碍患者照料者的精神症状和睡眠症状。然而, 主观报告或存在回顾性偏倚, 双相障碍患者照料者的静息-活动模式尚未经过系统性客观测量。本研究旨在探索双相障碍患者照料者的客观睡眠、活动和昼夜节律改变。

方法 本研究收集了先证者和配偶的资料, 先证者接受基于 DSM-IV 的神经精神病学临床访谈, 结合临床访谈和医疗记录, 应用最佳估计策略获取临床数据。终身罹患双相障碍的先证者的配偶被定义为照料者; 终身未患有双相障碍的先证者的配偶被纳入对照组。照料者和对照被试在非利手佩戴 1 周连续监测的体动记录仪进行静息-活动模式测量。采用 t 检验和协方差分析对数据进行统计。

结果 本研究纳入被试 87 名, 年龄均值为 43.72 岁, 75.86% 为女性, 其中照料者 42 名, 对照被试 45 名。校正年龄性别等人口学变量后, 与对照被试相比, 照料者休息时间 (7.28 ± 1.54 vs. 7.33 ± 1.29 , hours, adjusted $p = .004$) 和睡眠时间 (6.03 ± 1.45 vs. 6.22 ± 1.16 , hours, adjusted $p = .01$) 较短, 夜间轻度 (5.37 ± 3.42 vs. 4.05 ± 2.62 , min, adjusted $p = .04$) 和剧烈 (0.04 ± 0.10 vs. 0.01 ± 0.03 , min, adjusted $p = .01$) 的运动持续时间较长, 日间活动水平较高 (41.00 ± 15.65 vs. 36.58 ± 9.92 , millis-g, adjusted $p = .01$)。

结论 双相障碍患者照料者表现出静息-活动模式改变。本研究增进了对双相情感障碍照料者影响的理解, 突出了静息-活动模式管理在双相障碍家庭中的重要性。

关键词: 双相障碍, 照料者, 家系研究, 静息-活动模式

女大学生外貌负面评价恐惧、限制性饮食与进食障碍倾向的关系及干预研究

龙文清* 曹晓华
山西医科大学第一医院

进食障碍 (Eating Disorder) 是以进食行为异常为显著特征的一组综合征, 近年来, 随着网络社交媒体的不断发展和受社会文化的影响, 女大学生进食障碍的现象不断增多。而网络社交媒体中“容貌焦虑”“白幼瘦审美”盛行加剧了女性对自己外貌的严苛控制, 困扰女性身心健康。其中的原因之一就是女性的外貌负面评价恐惧。外貌负面评价恐惧(fear of negative appearance evaluation)指个体担心会出现负面的关于外貌的人际评价, 从而刻意回避可能会被评价的行为。外貌负面评价恐惧会加剧女大学生对自己外貌控制的行为, 为了跟到“以瘦为美”的社会潮流从而做出限制饮食的行为, 增加进食障碍倾向的风险。进食障碍是具有高死亡风险的心理疾病, 因此探讨女大学生外貌负面评价恐惧和进食障碍倾向的关系, 为临床干预、治疗及进一步研究提供依据。本研究通过使用外貌负面评价恐惧量表、限制性饮食量表、进食障碍量表等量表与问卷对女大学生被试进行实测, 了解当前该群体在负面评价恐惧与限制性饮食的现状; 通过实证研究分析女大学生外貌负面评价恐惧、限制性饮食与进食障碍倾向三者之间的关系及其在人口学变量上的关联; 并且为研究二中对女大学生开展团体心理辅导干预提供基础。

关键词: 外貌负面评价恐惧; 进食障碍; 限制性饮食

通辽市社区居民老年期痴呆流行病学调查的设计和实施

李媛媛¹ 张林峰² 徐广明³ 田霄翌¹ 孙洪军² 张婷婷¹ 于红梅² 徐沛琳¹ 乌吉斯古楞² 贾娜·木海¹ 崔颖² 黄俊捷¹ 睦任² 雷桂芳² 黄悦勤¹ 刘肇瑞¹

1. 北京大学第六医院, 北京大学精神卫生研究所, 国家卫生健康委员会精神卫生学重点实验室 (北京大学), 国家精神心理疾病临床医学研究中心 (北京大学第六医院)

2. 通辽市第三人民医院

3. 天津市安定医院

目的 描述通辽市社区居民老年期痴呆流行病学调查的抽样设计、权重计算、调查工具、现场执行及质量控制方案。

方法 采用三阶段不等概率抽样设计在内蒙古自治区通辽市调查 65 岁及以上的常住居民, 采用 10/66 老年期痴呆系列研究(10/66 Dementia Research Group, 10/66 DRG) 评估工具获得老年期痴呆的疾病诊断, 以计算机辅助个人访谈模式开展调查, 并实施调查全程及时质量控制措施。

结果 在通辽市 9 个旗/县/市/区的 166 个嘎查/村/居中共调查老人 4 345 人, 应答率为 96.2%。计算抽样设计权数、无应答调整权数和事后分层调整权数后, 将上述权数相乘并进行极值调整和标化调整, 从而获得最终权数。10/66 DRG 评估工具是通过社区痴呆筛查表 (Community Screening Interview for Dementia, CSI-D) 和老年精神状况检查 (Geriatric Mental State Examination, GMS) 收集相关信息, 结合社会人口学和危险因素问卷、躯体和神经系统检查、知情人访谈问卷, 分别以 10/66 DRG 老年期痴呆诊断标准和美国精神医学学会精神障碍诊断与统计手册第 4 版 (Diagnostic and Statistical Manual of Mental Disorders, Fourth Edition, DSM-IV) 为诊断标准, 利用计算机诊断程序获得老年期痴呆的诊断结果。171 名访员接受培训, 考核合格后开展入户调查, 并采用计算机数据核查、录音核查和电话核查等质量控制措施, 保证调查的真实性。

结论 本调查采用严格的抽样设计和质量控制措施实施调查, 并采用国际效度和信度满意的 10/66 DRG 评估工具作为调查工具, 具有国际跨文化可比性, 可以为国内其他地区开展老年期痴呆流行病学调查提供方法学参考。

Treatment Received and Related Factors Among Chinese Adults with Mood and Anxiety Disorders

Tak-Ching Tai¹, Xiaofei Hou², Yueqin Huang¹, Tingting Zhang¹, Zhaorui Liu¹

1. Peking University Sixth Hospital

2. Tianjin Anding Hospital

Objective To provide the latest nationally representative data on service utilization and the factors related to mood and anxiety in China

Methods Data are from the China Mental Health Survey. This cross-sectional epidemiological survey was conducted across China using a consistent research protocol and assessment instrument between 2013 and 2015. As representative household samples, 32,552 participants aged 18 or above were interviewed face-to-face in the community. The diagnosis of mood and anxiety disorders, treatment received in the past year, and associated sociodemographic/clinical factors were assessed by the Chinese version of the Composite International Diagnostic Interview (CIDI) 3.0. Standard errors of prevalence estimates were calculated using the Taylor series linearization method, which accounted for sampling weights and sample clustering. Additionally, two-stage sampling weights were used to adjust for different selection probabilities. Poststratification weights were based on age, gender, and residence distribution data from the 2010 China census population survey. Multivariable logistic regression analysis was performed to examine the associations between diverse sociodemographic and clinical factors and health services utilization across different sectors. All statistical analyses were conducted using SAS version 9.4

Results Among the individuals with mood or anxiety disorders in this study, 10.9% (95% CI, 8.77-12.99) received treatment from the healthcare sector in the past year. Only 1.10% (95% CI, 0.45-1.75) received minimally adequate treatment. Significant factors associated with treatment receipt included location, with rural (Odds ratio, 0.54; 95% CI, 0.37-0.80) and central region residents (OR, 0.57; 95% CI, 0.36-0.88) showing lower odds, and sleep disturbances (OR, 3.46; 95% CI, 1.67-7.10) and comorbid mood and anxiety disorders (OR, 2.52; 95% CI, 1.37-4.62) showing higher odds. Male patients (OR, 0.35; 95% CI, 0.17-0.73) and those with minimal education (OR, 0.45; 95% CI, 0.21-0.96) had lower odds of seeking help from mental health specialists, while chronic pain patients (OR, 6.78; 95% CI, 2.68-17.14) had higher odds

Conclusion The finding reveals a potentially significant, underestimated disease burden in China. The results highlight the need for targeted strategies to improve equitable service access, promote evidence-based treatments, and address underserved populations

基于 logistic 回归和决策树模型对青少年抑郁障碍患者非自杀性自伤行为危险的分析

陈果 周欢* 罗薇 林桂燕 何云丽 汤丽敏
广州医科大学附属脑科医院

目的 对青少年抑郁障碍患者非自杀性自伤 (non-suicidal self-injury, NSSI) 行为的影响因素进行分析, 并构建 logistic 回归模型和决策树风险模型。

方法 回顾性选取 2022 年 7 月至 2023 年 6 月广州某三甲精神专科医院收治的 156 例青少年抑郁障碍患者作为研究对象, 根据是否发生 NSSI, 将其分为 NSSI 组和非 NSSI 组, 收集 2 组临床相关资料, 采用单因素及多因素 logistic 回归分析青少年抑郁障碍患者 NSSI 的危险因素, 并采用决策树法与 Logistic 回归算法构建其风险预测模型, 并比较两种模型对 NSSI 的预测价值。

结果 156 例青少年抑郁障碍患者中有 34 例发生 NSSI, 其发生率为 21.79%; 多因素 logistic 回归分析结果显示, 网络成瘾、在校受欺凌、自杀意念、自杀未遂史、抑郁情况以及自我接纳能力为青少年抑郁障碍患者 NSSI 的危险因素 ($P < 0.05$); 根据危险因素构建决策树模型, 模型选择了网络成瘾、在校受欺凌、自杀意念、自杀未遂史、抑郁情况以及自我接纳能力等 6 个解释变量, 合计 5 层, 共 15 个节点, 其中网络成瘾为青少年抑郁障碍患者 NSSI 最为重要的影响因素; 决策树模型预测青少年抑郁障碍患者 NSSI 的 AUC 为 0.867 (95% CI: 0.804~0.916), Logistic 回归模型预测青少年抑郁障碍患者 NSSI 的 AUC 为 0.847 (95% CI: 0.781~0.900), 两种模型的 DeLong 检验结果为 $Z=1.007$, $P=0.3138$, 决策树模型的预测效能虽高于 Logistic 回归模型, 但两者比较无差异 ($P > 0.05$)。

结论 网络成瘾、在校受欺凌、自杀意念、自杀

未遂史、抑郁情况以及自我接纳能力是青少年抑郁障碍患者 NSSI 的危险因素,决策树风险预测模型的预测效能虽高于 Logistic 回归模型,但 2 组比较无差异。因此在实际应用中,需要综合考虑多种因素,如数据的可用性、模型的复杂性、预测结果的解释性等选择合适的模型。

关键词: logistic 回归模型, 决策树模型, 青少年抑郁障碍, 非自杀性自伤行为, 影响因素

动物辅助治疗对中国青少年的焦虑情绪和体像状态的积极影响——一项前-后对照干预型研究的小样本预实验

刘子涵¹ 吴起² 温盛霖¹

1.中大五院

2.上海智宠宠物服务有限公司

目的 动物辅助治疗 (Animal-Assisted Therapy, AAT) 是一种将某些符合特殊条件的动物纳入治疗的整个过程中,通过人与动物的直接和有目的的互动,来舒缓人的压力、改善情绪与身体机能、提高社交能力、促进社会化的干预手段。青少年在学业考试和人际关系挑战的双重压力下,常常出现焦虑情绪、体像困扰等心理问题。本研究旨在探究 AAT 对我国青少年的焦虑情绪和体像状态的影响,为促进我国青少年心理健康和社会化提供客观、可靠的实证依据。

方法 本研究为前-后对照的干预型研究的前期预实验。研究对象:上海某实验高中的 AAT 学生社团的 11 名高中生。研究地点:上海闵行实验高中的一楼活动室。研究时间:2024 年 6 月 1 日上午 10:00。干预方法 在活动室内,由研究者组织学生入场围成弧形就坐,由动辅师牵引治疗犬入场,在动辅师引导下,研究对象依次记住治疗犬的名字、年龄、性别及性格特征。将研究对象平分为两组,每组与治疗犬和动辅师互动 30 分钟,互动内容包括在动辅师的引导下抱或抚摸治疗犬,与其对话,与其合影和听动辅师讲述治疗犬的生平故事。整个干预过程持续 60 分钟。评估项目和工具:时点焦虑情绪:采用情景特质焦虑量表-情景焦虑部分 (STAI-S) 测量;时点体像状态:采用体像状态量表 (BISS) 测量;过程体验:采用“数字评分表” (NRS) 的方式评

估轻松感。评估过程: AAT 干预开始前,每个研究对象独立完成“干预前问卷”。AAT 干预后,研究对象再次完成“干预后问卷”。统计方法 所有定量数据采用 SPSS 进行录入和分析,采用配对样本 t 检验的方式比较干预前后的测量变量。所有统计检验均采用双侧检验,以 $P < 0.05$ 代表差异有统计学意义。

结果 本预实验共纳入 11 名研究对象,收集到 11 份有效数据。包括 5 名男生,6 名女生。年龄分布于 15-17 岁之间,平均年龄为 16 ± 0.45 岁,干预前的平均焦虑水平为 32.36 ± 8.86 分,干预后的平均焦虑水平为 25.73 ± 5.83 分,配对样本 t 检验显示 $t = 2.53$ ($P = 0.03$),提示 AAT 对青少年的时点焦虑情绪有显著的有统计学意义的缓解作用。干预前研究对象的平均体像满意度为 28.55 ± 11.49 分,干预后的平均体像满意度水平为 31.09 ± 12.00 分,配对样本 t 检验显示 $t = -3.37$ ($P = 0.007$),提示 AAT 对青少年的时点体像满意度有显著的有统计学意义的提高作用。干预后的放松感评分为 9.4 ± 1.075 分,提示 AAT 给研究对象带来了很高的放松体验。

结论 本研究发现,一次 60 分钟的 AAT 干预可有效降低青少年的时点焦虑情绪、提高体像满意度,并为其提供了极高的放松体验。

无抽搐电休克治疗患者首次治疗与术后发热的相关性分析

林桂燕*

广州医科大学附属脑科医院

目的 探究无抽搐电休克治疗患者首次治疗对术后发热的影响。

方法 采用回顾性横断面分析的方法,利用病历系统采集 256 例住院行无抽搐电休克治疗患者的基本资料与临床资料,包括年龄、性别等基本资料,病程、疾病类型、发热时间、发热程度、是否首次治疗、治疗次数、第几次治疗后出现发热等临床资料。其中,发热的判断标准采用临床工作中的标准,以腋温测量结果为准,体温在 $37.5^{\circ}\text{C} \sim 37.9^{\circ}\text{C}$ 为低热,体温在 $38^{\circ}\text{C} \sim 38.9^{\circ}\text{C}$ 为中度发热,体温在 $39^{\circ}\text{C} \sim$

39.9°C时为高热,40°C以上为极高热;依据体温是否在37.5°C以上分为发热组和无发热组,分析首次治疗与术后发热的相关性。

结果 45例(17.6%)在治疗后出现了发热现象,发热程度以低热和中度发热为主,低热占68.8%,中度发热占20.0%,高热占11.1%。第一次治疗后出现发热20例,占比44.4%。发热组和无发热组在年龄($t=0.566$, $P=0.005$)、病程($\chi^2=1.162$, $P=0.006$)、是否首次MECT治疗($\chi^2=9.932$, $P=0.002$)有统计学差异。logistic回归提示无抽搐电休克治疗患者首次治疗与术后发热相关($OR=3.214$, $P=0.002$)。

结论 首次治疗是无抽搐电休克治疗患者术后发热的相关影响因素,针对此类患者,需要个体化地进行发热的预防和治疗,以提高治疗的安全性和有效性。

关键词:无抽搐电休克治疗,发热,首次治疗

A comparison of psychological resilience, self-esteem, and related factors in Chinese Firstborn and Second-born children

Chennan Wang¹ Shichang Yang² Morgan Timothy¹
Huan Yang¹ Yuping Cao¹

1.The Second Xiangya Hospital of Central South University

2.Second Affiliated Hospital of Xinxiang Medical University

Objective This is a study of comparing psychological resilience, self-esteem, and related factors between the firstborn children and the second-born children in China

Methods The methods used include the Chinese Adolescent Resilience Scale, the Chinese Self-Esteem Scale, the perceived parental rearing patterns scale Chinese version, and the Chinese screen questionnaire of child abuse

Results The results showed that there were no significant differences in the total psychological resilience, the self-esteem score, perceived parenting styles, and the prevalence of child abuse between the firstborn

and second-born children ($P>0.05$). The severe punishment, excessive interference, and overprotection of the father and the over interference and over protection of the mother of males were significantly higher compared to females (all $P_s<0.05$). In the firstborn children, the emotion control of females was significantly lower, and interpersonal assistance was significantly higher compared to those of males ($P_s<0.05$). In the second-born children, the self-esteem score and the emotion control of females were significantly lower compared to those of males ($P_s<0.01$). In the females, the severe punishment and excessive interference of the father of the firstborn children were significantly higher compared to the second-born children (all $P_s<0.05$). There were no significant differences between the firstborn and second-born children

Conclusion Equal attention and care may be a more suitable way of rearing. But there were some differences in gender. Gender prejudice still exists and it's recommended to give males and females the same way of upbringing

关键词: firstborn,second-born,resilience,self-esteem,parenting style,child abuse

棕榈酸帕利哌酮长效针剂和奥氮平治疗社区精神分裂症患者疗效比较

孙国英*

闵行区精神卫生中心

目的 比较和探讨棕榈酸帕利哌酮长效针剂和奥氮平对社区精神分裂症患者的临床效果、社会功能及不良反应。

方法 选取2021年3月到2022年3月本院门诊符合精神与行为障碍分类第10版(ICD-10)精神分裂症诊断标准的患者83例进行分组,分为观察组(42例)与对照组(41例),治疗组应用棕榈酸帕利哌酮长效针剂药物治疗,对照组则单用奥氮平药物治疗,进行为期1年的治疗观察,于治疗前,治疗3月,治疗6月及治疗12月末统计分析两组患者阳性与阴性症状量表(PANSS)、个人和社会功能量表(PSP)、自知力与治疗态度问卷(ITAQ)及不良

反应发生率, 评定患者的精神症状、社会功能、不良反应发生率及对药物的可接受度。

结果 1、与治疗前比较, 研究组和对照组治疗前后 PANSS 及各因子分均低于治疗前, PSP、ITAQ 总分评分两组均有改善, 但研究组和对照组治疗后评分对比差异有统计学意义 ($P<0.05$)。2、与对照组比较, 研究组治疗前后 PANSS、PSP、ITAQ 总分及各因子分对比差异均有统计学意义 ($P<0.05$); 研究组不良反应发生率较对照组低 ($P<0.05$)。3、两组药物不良反应发生率比较: 两组治疗观察期间均统计了两组药物不良反应的发生例数, 研究组与对照组比较, 其中低血压、嗜睡、肝功能异常、体重增加不良反应的发生例数对照组多于研究组; 研究组药物不良反应发生率较对照组低, 两组对比差异有统计学意义 ($P<0.05$)。

结论 本研究比较棕榈酸帕利哌酮长效针剂和奥氮平药物治疗社区慢性精神分裂症患者, 结果表明, 棕榈酸帕利哌酮长效针剂和奥氮平均可改善精神分裂症患者的精神症状, 但棕榈酸帕利哌酮长效针剂组在社会功能改善及自知力和治疗态度方面优于奥氮平组, 取得满意的疗效, 本研究结果与文献基本一致。帕利哌酮长效针剂改善精神症状, 提高治疗疗效, 且能提高患者自知力水平和监护人管控能力, 也降低带给患者家属的心理压力, 故药物治疗接受度高, 药物依从性好。

青少年抑郁症患者营养状况的影响因素

张晓语 王文丽 翁穗芸 张翠玲 余敏* 江妙玲 张杰
广州医科大学附属脑科医院

目的 探讨青少年抑郁症患者营养状况的影响因素。

方法 选取 2023 年 9 月-2024 年 3 月在广州医科大学附属脑科医院门诊就诊的 142 例青少年抑郁症患者作为研究对象, 采用身体成分评估患者的营养状况, 收集数据包括基本资料、精神症状情况等。对不同人口学资料 and 不同严重程度的青少年抑郁症患者身体成分指标进行比较分析, 并采用多元线性

回归的方式分析青少年抑郁症患者营养状况的影响因素。

结果 纳入的 142 名患者, 单因素结果分析显示, 饮酒情况、吸烟情况、病程持续时间、运动次数均会影响患者营养状况变化。其中病程 ≤ 6 个月、无吸烟饮酒史、运动次数集中在 4-6 次的青少年抑郁症患者身体成分评分更高, 差异具有统计学意义 ($P<0.05$)。依据 PHQ-9 量表得分, 按照抑郁程度进行分组, 共计分成四组。将不同严重程度抑郁症患者身体成分指标进行比较, 其中肌肉量、蛋白质、骨骼肌、细胞内水分比较后差异具有统计学意义 ($P<0.05$)。组间比较结果显示轻度抑郁组肌肉量、骨骼肌含量、细胞内水分、身体细胞量比较均高于中度抑郁组、中重度抑郁组和重度抑郁组。重度抑郁组蛋白质含量低于其他三组, 差异具有统计学意义 ($P<0.05$)。多元线性回归结果显示, 青少年抑郁症患者营养状况的影响因素包括饮酒情况 ($\beta=0.159$, 95% CI 0.563~5.597, $P=0.017$)、病程时间 ($\beta=-1.90$, 95% CI -2.389~-0.257, $P=0.015$)、每周运动次数 ($\beta=0.214$, 95% CI 0.397~2.928, $P=0.01$)、社会性人格焦虑量表 (SPAS) 的体格自我表现不合适维度 ($\beta=-.209$, 95% CI -.772~-0.0710, $P=0.019$)、中文版荷兰进食行为问卷 (DEBQ) 外因性饮食维度 ($\beta=-0.207$, 95% CI 0.253~-0.030, $P=0.014$)。

结论 青少年抑郁症患者的营养情况受饮酒情况、病程时间、每周锻炼次数、体格不满、外因性饮食的重视度的影响。饮酒情况影响患者的营养状况, 饮酒情况越严重, 患者营养功能越差。青少年抑郁症患者的对自身体格不满程度越高且对外因性饮食重视度越高, 身体成分得分越低, 营养情况越差; 然而, 每周锻炼次数越多, 身体成分得分越高。病程持续时间长, 患者的营养状况越差。同时随着抑郁水平的升高也会导致青少年抑郁症患者蛋白质等相关营养指标含量下降, 导致青少年抑郁症患者易疲劳、抵抗力低下、记忆力减退影响其学习与生活, 加重患者的心理负担产生抑郁焦虑等负面情绪。因此应正确引导青少年接纳自身身体的变化, 采取真正有效的减压方式帮助青少年形成健康心理。

关键词: 青少年, 抑郁症, 身体成分, 营养状况

临床护士职场暴力应激与情感性精神障碍风险

刘笑昆* 李蕾
海南医科大学

目的 医疗暴力问题显著影响和制约着我国医疗卫生事业的可持续发展；本研究调查床护士工作场所暴力应激现状，探索临床护士职场暴力应激与情感性精神障碍风险的危险因素和保护因素。通过多角度梳理人类暴力行为发生机制，为未来构建有效的医疗暴力预防和治理策略提供理论与实践思考。

方法 于2023年1月30号—3月15号在海南省二级三级医院进行横断面现状调查。采用医务人员职业应激量表（Medical staff occupational stress scale,MSOSS）之职场暴力应激子量表、神经质人格量表(CBF-PI-B-N)、病人健康问卷（Patient health queatinal-9, PHQ-9）、广泛性焦虑量表（Generalized Anxiety Disorder 7-item scale, GAD-7）、社会支持量表（Social support rating scale, SSRS），应对方式评估对临床护士进行调查。采用 SPSS27.0 软件进行统计分析。

结果 本次调研的临床护士来自二级医院 1638 名，来自三级医院 1350 名。20-29 岁的临床护士 1373 名；30-39 岁的年龄段护士 1159 名；大于等于 50 岁的临床护士 456 名。专科学历 1656 名占调研人数的一半以上，其次是本科及以上学历 1332 名。三级医院临床护士遭受语言形式暴力发生率最高，其次是患者恶意传播病毒。二级医院临床护士遭受患者恶意传播病毒发生率最高，其次是语言形式暴力。职场暴力应激（OR=1.028; 95%CI: 1.022-1.033）神经质人格（OR=1.075;95%CI: 1.063-1.086）是临床护士焦虑症风险的危险因素；社会支持（OR=0.939;95%CI: 0.929-0.949）是焦虑症风险的保护因素。职场暴力应激（OR=1.023; 95%CI: 1.018-1.029）与神经质人格（OR=1.066; 95%CI: 1.055-1.077）是临床护士抑郁症风险的危险因素；社会支持（OR=0.938; 95%CI: 0.928-0.948）是抑郁症风险的保护因素。

结论 各个等级医院临床护士遭遇工作场所暴力情况不容忽视；有效预警和防治职场暴力可以降低临床护士情感性精神障碍的风险。有效管理医疗场所中患者及其家属对临床护士实施暴力行为需要综合运用社会学和心理学理论以及医工联合的技术建立起全面且有效的预警策略。

国内重复经颅磁刺激联合胆碱酯酶抑制剂对阿尔茨海默病认知功能影响的 Meta 分析

李建峰*
河北省第六人民医院

目的 通过 Meta 分析方法，系统评价国内重复经颅磁刺激联合胆碱酯酶抑制剂对阿尔茨海默病认知功能的影响。

方法 通过文献检索中国知网、中国万方医学、中国生物医学文献数据库等中文数据库，检索时间均为 2008 年 1 月至 2024 年 6 月，使用“经颅磁刺激”、“重复经颅磁刺激”、“rTMS”“胆碱酯酶抑制剂”、“多奈哌齐”、“卡巴拉汀”、“加兰他敏”、“认知功能”作为检索词并同时结合自由词和各数据库的主题词进行检索，再通过手工方式筛查纳入文献的参考文献，最后纳入随机对照试验，提取有关资料。采用在 Cochrane 系统评价中质量评价标准 Jadad 量表，对所纳入的随机对照试验进行质量评价。采用 Cochrane 协作网提供 RevMan 5.3 软件及 Stata15.0 软件进行统计分析。

结果 最终纳入 14 个研究，共 1068 例患者。重复经颅磁刺激联合胆碱酯酶抑制剂治疗阿尔茨海默病的总有效率比较[OR=2.88, 95%CI(1.70, 4.90), Z=3.91, P<0.0001]，有统计学意义；重复经颅磁刺激联合胆碱酯酶抑制剂治疗阿尔茨海默病结束时 ADAS-cog 评分比较[MD=-5.25, 95%CI (-7.25, -3.24), Z=5.13, P<0.00001]，有统计学意义；重复经颅磁刺激联合胆碱酯酶抑制剂治疗阿尔茨海默病结束时 MMSE 评分比较 [MD=3.56, 95%CI (2.74, 4.38), Z=8.49, P<0.00001]，有统计学意义；重复经颅磁刺激联合胆碱酯酶抑制剂治疗阿尔茨海默病结束时 MoCA 评分比较[MD=3.58, 95%CI (2.47, 4.69), Z=6.32, P<0.00001]，有统计学意义；重复经颅磁刺激联合胆碱酯酶抑制剂治疗阿尔茨海默病结束时 P300 潜伏期比较[MD=-45.41, 95%CI (-87.64, -3.19), Z=2.11, P=0.04]，有统计学意义；重复经颅磁刺激联合胆碱酯酶抑制剂治疗阿尔茨海默病结束时 P300 波幅比较[MD=2.65, 95%CI (2.19, 3.11), Z=11.33, P<0.00001]，有统计学意义；重复经颅磁刺激联合胆碱酯酶抑制剂治疗阿尔茨海默病的不良

事件发生率比较[OR=1.08, 95%CI (0.63, 1.87), Z=0.78, P=0.78], 无统计学意义。

结论 重复经颅磁刺激联合胆碱酯酶抑制剂治疗阿尔茨海默病的可有效改善临床症状, 同时还能改善认知功能, 治疗过程中的不良事件发生较少, 治疗安全性较高。

976 例首次就诊的儿童青少年抑郁发作的临床特征分析

高鉴兴 尹胜健 柯晓燕 方慧*
南京医科大学附属脑科医院

目的 探讨首次就诊的儿童青少年抑郁发作的临床特征。

方法 本研究对 2020 年 1 月至 2023 年 12 月首次至南京医科大学附属脑科医院就诊的抑郁发作儿童的临床资料进行分析, 了解儿童青少年首发抑郁发作的临床特点及可能的心理社会因素。

结果 共纳入分析首次就诊的抑郁发作儿童青少年 976 例(13.2±1.4 岁), 其中男性 219 例(13.3±1.6 岁), 女性 757 例(13.3±1.4 岁)。就诊儿童中当下就读年级初二的有 287 例(29.4%); 初一的有 237 例(24.3%); 初三的有 210 例(21.5%); 高一的有 83 例(8.5%); 六年级的有 77 例(7.9%)。情绪低落开始出现的年龄为(12.2±1.6 岁), 其中男性(12.2±1.7 岁), 女性(12.2±1.6 岁)。

867 例(88.8%) 患儿病程中存在消极观念, 669 例(68.5%) 患儿当下仍存在消极观念。649 例(66.5%) 患儿有自伤行为。401 例(41.1%) 患儿查体皮肤存在疤痕等。405 例(41.5%) 存在食欲不佳, 80 例(8.2%) 患儿存在其他饮食问题。在睡眠问题中, 574 例(59.0%) 患有一种睡眠问题, 123 例(13.0%) 患儿有两种睡眠问题, 7 例(0.7%) 患儿患有 3 种睡眠问题; 在所有患儿中, 有 515 例(53.0%) 的患儿存在入睡困难, 143 例(15.0%) 患儿存在睡眠浅的问题, 182 例(19.0%) 患儿则存在其他睡眠问题。

起病前存在心理社会因素者为 823 例(84.6%), 其中, 657 例(67.3%) 的患儿起病前有一种生活事件; 229 例(23.4%) 患儿有两种生活事件, 29 例(3%)

患儿有三种生活事件。505 例(52.0%) 的患儿起病前感受到学业压力大, 334 例(34.2%) 患儿同伴关系受挫, 203 例(21.0%) 患儿存在亲子关系不佳, 48 例(5.0%) 则存在师生关系的困扰。

结论 首次我院门诊就诊的儿童青少年抑郁发作的女性多于男性, 以初中学生占比更多, 初次就诊年龄为 13.2±1.4 岁。开始出现情绪低落的年龄为 12.2±1.6 岁。首次就诊的抑郁发作的儿童青少年人群中消极观念、自伤行为、进食问题较常见, 且起病前有更多的学业压力、同伴关系、亲子关系和师生关系的困扰。

关键词: 儿童, 青少年, 抑郁发作, 临床特征

大学生偶像参照效应实证研究

王丽霞*
丽水市第二人民医院

目的 为探究大学生是否存在偶像参照效应, 即大学生的自我概念中是否存在偶像, 从而为将来在临床对存在偶像崇拜的个体进行干预提供实证支持。

方法 以 106 名吉林省大学生为被试, 通过实验法, 以 3 (参照对象) × 2 (词性) 双因素被试内实验设计选用记忆的 R/K 范式进行实验。参照对象指被试在 R/K 任务中所参照的对象, 即“请判断下方呈现词汇是否符合用于形容你自己/你的偶像/鲁迅先生”, 分为自我、偶像、他人(鲁迅)三个水平; 词性指 R/K 任务中, 判断阶段中需要判断的词汇的性质, 分为正性和负性两个水平。以自编的 150 个特质词作为实验用词, 实验过程分为学习阶段(记忆阶段)以及测验阶段。学习阶段要求被试判断呈现出来的词汇是否用于形容某一参照对象, 测验阶段则要求被试判断呈现出来的词汇是否在学习阶段出现过。如若被试判断某一词汇出现, 则要求被试在此基础上继续判断是“清晰记得(R)”还是“模糊知道(K)”。其中的“R”指的就是“remember”, 意味着明确记得出现过该词汇, 并且对于该词汇出现的情景有着相关的记忆; 而“K”指的则是“know”, 意味着知道出现过该词汇, 但是对此该词汇出现时候的情景没有什么印象, 更多反映地是对词汇的一种熟悉感, 知道感。该范式基于自我记忆参照指出, 个体对

于符合自我概念的词汇的记忆正确率更高、判断反应时更短。因此,因变量为 R/K 任务的正确率以及反应时,用于判断自我概念中是否存在偶像。

结果 (1) 参照对象主效应显著,自我参照组 R 判断任务的正确率和反应时与偶像参照组 R 判断任务的正确率和反应时之间没有显著差异;(2) 自我参照组 R 判断任务的正确率和反应时显著优于他人组 R 判断任务的正确率和反应时;(3) 词性的主效应显著,正性词汇 R 判断任务的正确率显著高于负性词汇 R 判断任务的正确率,而在 R 判断任务的反应时上二者没有差异。

结论 (1) 大学生存在自我参照效应,同时大学生存在积极自我偏好;(2) 大学生存在偶像参照效应;(3) 偶像进入大学生的自我概念中。

关键词: 自我参照效应 偶像参照效应 R/K 范式

孕妇职业特点与孕期心理问题关系的研究

王宁¹ 张蕾² 王晓茜²

1.北京回龙观医院

2.清华长庚医院

目的 本研究旨在探讨孕妇职业特点与孕期心理问题之间的关系,以便为孕妇提供精准心理支持。

方法 本研究采用问卷调查法,选取了 3216 名孕妇作为研究对象。问卷内容包括孕妇的基本信息(如年龄、学历、职业等)、孕期基本情况(如孕周、是否有并发症等),以及孕期心理状况评估。心理评估采用国际通用的孕期心理评估量表,包括焦虑自评量表(SAS)、抑郁自评量表(SDS)等。数据收集后,使用 SPSS 统计软件进行描述性统计、方差分析、相关分析和回归分析等。

结果 1.职业类型与心理问题:医护人员(512 名):SAS 平均分为 56.3,SDS 平均分为 53.1,中度以上抑郁焦虑为 29%。教育工作者(783 名):SAS 平均分为 52.2,SDS 平均分为 49.5,中度以上焦虑抑郁比例为 25%。金融从业者(435 名):SAS 平均分为 54.8,SDS 平均分为 50.9,28%的孕妇有中度及以上焦虑抑郁比例。IT 从业者(326 名):SAS 平均分为 53.5,SDS 平均分为 48.7,中度及以上焦虑抑郁比例为 24%。其他职业(如销售人员、服务业

等,共 1160 名):SAS 和 SDS 平均值分别为 49.3 和 45.8,中度及以上心理问题的比例平均为 21%。2.工作压力与心理问题:高工作压力职业(包括医护人员、金融从业者):SAS 和 SDS 的平均分普遍较高;低工作压力职业(如部分服务业职业):SAS 和 SDS 的平均分相对较低。3.工作稳定性与心理问题:稳定职业(如教育工作者、公务员等):SAS 和 SDS 平均分相对较低,表明工作稳定性可能对孕妇心理健康有积极影响。不稳定职业(如临时工作、自由职业者等):SAS 和 SDS 平均分普遍偏高。4.收入水平与心理问题:中高收入职业(如金融从业者、高级管理职位等):SAS 和 SDS 平均分也相对较高。中低收入职业:SAS 和 SDS 平均分普遍较低。

结论 本研究发现,孕妇的职业特点与其孕期心理问题之间存在密切关系。医护人员、公务员、金融 IT 从业等职业孕妇更容易出现孕期焦虑和抑郁等心理问题。因此,为了维护孕妇的心理健康,家庭、社会和单位应共同努力,为孕妇提供更为宽松的工作环境、合理的工作时间以及必要的心理支持和帮助。同时,孕妇自身也应学会调节情绪,保持积极乐观的心态,合理安排工作和生活。

青少年抑郁症患者中自伤行为与睡眠特点分析

曹延筠*

北京回龙观医院

目的 调查分析伴自杀行为青少年抑郁症睡眠障碍的特点,探讨伴自杀行为的青少年抑郁症患者的睡眠障碍特点。

方法 选取 2022 年 1 月至 2023 年 12 月在北京回龙观医院某病区住院的符合《国际疾病分类精神与行为障碍分类(第 10 版)》(ICD-10)诊断标准的青少年抑郁症患者(年龄 12-18 岁)122 例为研究对象。根据患者近 1 年是否伴有自伤行为分为两组,即伴有自伤行为组与不伴有自伤行为组。其中伴有自伤行为组共 90 例、不伴有自伤行为组 32 例。采用汉密尔顿抑郁量表调查青少年抑郁情况以及抑郁严重程度,同时用匹兹堡睡眠质量指数量表(Pittsburgh Sleep Quality Index, PSQI)评估青少年

抑郁症患者的睡眠情况，并进行统计分析。

结果 青少年抑郁患者中伴有自伤行为组的PSQI总分明显高于不伴有自伤行为组。两组比较，差异有统计学意义 ($P < 0.05$)；青少年抑郁症患者的睡眠问题与自伤行为呈正相关，青少年抑郁症患者的睡眠问题以睡眠节律紊乱最突出。

结论 青少年抑郁症患者存在睡眠障碍，伴有自伤行为的青少年抑郁症患者睡眠问题较为严重，其中以失眠、睡眠节律紊乱、问题最为突出，日间功能障碍更明显。伴有自伤行为的青少年抑郁症患者睡眠问题需要更多关注。

河北省成年居民中重度失眠现状调查

孙建华 王海龙 刘波*

河北省第六人民医院

目的 调查河北省成年居民中重度失眠的现状，并剖析其影响因素。

方法 调查对象为河北省 18 岁及以上常住居民，抽样方法为多阶段分层随机法，共抽取了 9959 人。采用失眠严重程度量表 (ISI) 进行失眠情况调查，根据量表得分，分为无失眠组、轻度失眠组及中重度失眠组。采用 χ^2 检验进行差异性分析，影响失眠因素采用无序多分类 Logistic 回归分析。

结果 154 份问卷不完整剔除，回收问卷 9805 份。被调查的 9805 名居民中，中重度失眠者 410 名 (4.2%)，轻度失眠者 1279 名 (13.0%)，无失眠者 8116 名 (82.8%)。比较三组一般资料，结果显示两组患者在性别、婚姻状况、职业、学历、个人月收入、家庭月收入、饮酒、锻炼时间、锻炼强度、慢性病、年龄等方面存在差异，均有统计学意义 ($P < 0.05$)，回归分析结果显示，性别、婚姻、职业、饮酒、锻炼时间、是否患慢性病是轻度失眠及中重度失眠的影响因素，中重度失眠的影响因素还有学历、家庭月收入、锻炼强度、年龄 ($P < 0.05 \sim P < 0.01$)。

结论 河北省成年居民存在失眠症状人群偏高，女性、非婚状态、非农民、饮酒、长时间锻炼、患有慢性病均是居民患轻度及中重度失眠的危险因素；年龄小、中等学历、中等家庭月收入、适当锻炼强度

是居民中重度失眠的保护性因素。

关键词：中重度失眠；现状调查；河北省；成年居民

无性恋案例报告及分析

过斌 王宁*

北京回龙观医院

目的 无性恋是指一个人对他人几乎没有或根本没有性感的状态，它涉及到个人情感体验、人际关系和自我认知的许多方面，通过 3 例无性恋案例报告，分析其心理特征，为无性恋提供健康心理建议。

方法 病例报告 3 例，病例 1：一名 30 岁男性，从小对性不感兴趣，从未对任何人产生过性吸引。他不知道自己是无性恋，交友甚多，与家人关系密切。曾经谈恋爱，却发现自己对性毫无兴趣，这导致了缺乏亲密感，就医过程中认识类似情况者获得归属感。案例 2：一名 25 岁女性，对性关系漠不关心，从未主动追求过性伴侣。她很清楚自己是无性恋。与家人和亲密的朋友保持良好的关系。在一段短暂的关系中，她的性欲很低，最终她选择了分手。她的家人对她的选择表示困惑，并敦促她尽快找到一个伴侣。她找到一些无性恋朋友分享彼此的生活经历和感受。案例 3：一名 45 岁的男性，他在中年时意识到自己对性的需求极低。因对性毫无兴趣而离异。离婚后与女性朋友无性同居。他以自己的方式关心和支持孩子的发展，并与孩子保持良好的关系。离婚后开始重视无性恋群体的活动和信息，形成了一个新的社交圈。

结果 无性恋者在某些方面与其他群体存在显著差异。在情感体验上，无性恋者往往对浪漫爱情的需求较低，更注重友情和亲情。在人际关系上，他们更倾向于与同样是无性恋者的人建立深层次的关系，而对于性取向不同的个体则可能感到难以理解和接受。

结论 针对无性恋者的心理特点和需求，提出以下健康建议：社会应加强对无性恋者的认识和了解，消除对他们的误解和偏见。通过性教育帮助青少年正确认识并接纳不同性倾向。为无性恋者提供专业的心理支持和咨询服务，帮助他们建立健康的自我认知和情感关系。

关键词：无性恋；临床心理学；案例分析；性倾向

高中生网络游戏障碍的异质性表现类型及其与儿童期不良经历的关系

王娟^{1,2} 郭万军² 郭万军¹

1.浙江大学医学院附属精神卫生中心（杭州市第七人民医院）

2.浙江大学医学院脑科学与脑医学学院

目的 以网络游戏障碍（Internet Gaming Disorder, IGD）的9项症状标准为特征，在高中生群体中识别IGD的异质性表现类型，并探究其与儿童期不良经历的关联。

方法 2024年2月于杭州市某中学招募1746名15至20岁的高中生（平均年龄为 16.97 ± 0.95 岁，女生占比55.6%）参与研究，分别使用自编一般资料问卷、儿童期不良经历问卷修订版（Revised Adverse Childhood Experience Questionnaire, ACEQ-R）、网络游戏障碍简短版本量表（Internet Gaming Disorder 9 items Short Form, IGDS-SF9）收集高中生的社会人口学资料、儿童期不良经历暴露情况及IGD相关症状严重程度。使用潜在剖面分析识别高中生IGD的异质性表现类型，并使用多分类Logistic回归分析探讨儿童期不良经历与高中生IGD表现类型的关系。

结果 高中生中识别出3种异质性的IGD表现类型，分别是：“规范/健康游戏者”（1066人，占61.1%，该类别在9项IGD标准上的得分均最低）、“中度IGD风险者”（549人，占31.4%，该类别在9项IGD标准上的得分均高于平均值，但小于平均值+1个标准差）及“高IGD风险者”（131人，占7.5%，该类别在9项IGD标准上的得分均最高，高于平均值+1个标准差）。多分类logistic回归分析结果显示：即使在控制社会人口学资料后，ACEQ-R得分与高中生被归类于“中度IGD风险者”或“高IGD风险者”而非“规范/健康游戏者”的可能性、及高中生被归类于“高IGD风险者”而非“中度IGD风险者”的可能性呈显著正相关，且与未曾暴露于儿童期不良经历的高中生相比，暴露于1种、2种、3种及以上儿童期不良经历的高中生被归类为“中度IGD风险者”或“高IGD风险者”而非“规范/健康游戏者”的可能性显著

增加（趋势性检验 $P < 0.001$ ）。但在控制社会人口学资料后，仅暴露于3种及以上儿童期不良经历的高中生（相比于未曾暴露于儿童期不良经历）被归类于“高IGD风险者”而非“中度IGD风险者”的可能性显著增加。

结论 高中生中异质性的IGD表现类型与儿童期不良经历暴露情况显著相关，提示IGD的早期预防和干预工作应重点针对有儿童期不良经历暴露的个体，并考虑其IGD表现类型。

网络精神病学组

中药复方联合网络认知行为治疗在恶劣心境患者中的应用效果

徐阳 陈建荣*
沈阳市精神卫生中心

目的 探讨中药复方联合网络认知行为治疗 (ICBT) 在恶劣心境患者中的应用效果。

方法 选取 2018 年 1 月至 2023 年 12 月就诊于沈阳市精神卫生中心的 120 例恶劣心境患者作为研究对象, 采用随机数字表法将其分为中药组、对照组和联合治疗组各 40 例。中药组采用中药复方口服治疗、对照组采用 ICBT 治疗、联合治疗组同时采用中药复方和 ICBT 治疗, 治疗 8 周。比较三组治疗后汉密尔顿抑郁量表(HAMD)、抑郁自评量表(SDS)评分变化。

结果 三组患者治疗后的量表评分低于治疗前, 差异有统计学意义 ($P < 0.05$)。多组间有效率的比较经 Bonferroni 校正, 治疗后, 联合治疗组有效率高于中药组, 差异有统计学意义 (均 $P < 0.0167$); 治疗后, 联合治疗组有效率高于对照组, 差异有统计学意义 (均 $P < 0.0167$); 治疗后, 中药组和对照组有效率比较, 差异无统计学意义 (均 $P > 0.0167$); 治疗后, 联合治疗组 HAMD、SDS 量表评分低于中药组, 差异有统计学意义 ($P < 0.05$); 治疗后, 联合治疗组 HAMD、SDS 量表评分低于对照组, 差异有统计学意义 ($P < 0.05$); 中药组和对照组治疗后 HAMD、SDS 量表评分比较, 差异无统计学意义 ($P > 0.05$)。

结论 中药复方联合 ICBT 治疗对恶劣心境患者的抑郁情绪有明显的改善作用, 优于单一治疗, 且副作用小, 易于患者接受, 值得临床推广。

医务人员开展远程 MTM 服务 对重性精神病居家患者的实践价值

张玉良*
如皋市精神病防治医院

目的 进行创新赋能、培育新时代“智慧精防”医疗服务领域“新质生产力”的探索。探讨医务人员借助“互联网+重性精神病居家患者”模式 (微信或微信群、公众号、视频号等), 远程科普, 线上开展药物治疗管理 (MTM) 的实践价值。

方法 医务人员选取 116 例长期居家服药的重性精神病门诊患者为研究对象, 在 2023 年 1 月至 2024 年 5 月间, 依据指导方式不同分为对照组和观察组, 各 58 例。对照组采取常规用药指导, 观察组采取常规用药指导后, 再开展远程药物治疗管理 (MTM) 药学服务, 比较两组效果。

结果 观察组患者通过医务人员远程药物治疗管理 (MTM), 不良反应发生后的总处置率、对医嘱药物治疗方案知晓率、对药学服务满意度均明显高于对照组, 组间比较, 差异均具有统计学意义 ($P < 0.05$); 观察组患者用药不合理发生率、病情加重重复发生率均明显低于对照组, 组间比较, 差异具有统计学意义 ($P < 0.05$)。

结论 医务人员借助“互联网+”模式开展远程药物治疗管理 (MTM) 服务, 具有实践价值, 可减少患者不合理用药现象、提高不良反应处置率、提升患者满意度、提升患者用药依从性、降低病情加重重复发生率等, 值得所有医务人员借鉴、推广应用。

Association between IGF-1 Levels and MDD: A Case-control and Meta-analysis

En Zhang*
Wuhu Fourth People's Hospital

Objective Insulin-like growth factor-1 (IGF-1) has a variety of neurotrophic effects, including neurogenesis, remyelination and synaptogenesis, and is an effective regulator of neuronal plasticity. Although multiple studies have investigated IGF-1 in depression-related disorders, few studies have focused on patients with a first episode of clearly diagnosed depression who had never used antidepressants before. Therefore, this

study investigated first-episode and drug-naïve patients with depression to supplement the current evidence around IGF-1 levels in depressive disorders

Methods This study consisted of two parts. In the first part, 60 patients with first-episode and drug-naïve depression and 60 controls matched for age, sex, and BMI were recruited from the outpatient department of the Fourth Hospital of Wuhu City, and the community. The case-control method was used to compare differences in serum IGF-1 levels between the two groups. In the second part, 13 case-control studies were screened through the database for meta-analysis to verify the reliability of the results

Results Results of the case-control study demonstrated that serum IGF-1 levels are significantly higher in patients with first-episode and drug-naïve depression compared to healthy controls ($p < 0.05$), although there was no significant difference between men and women with diagnosed MDD, there was no significant correlation between serum IGF-1 level and age in patients with depression and no significant correlation between IGF-1 level and the severity of depression. The meta-analysis corroborates these findings and demonstrated that IGF-1 levels are significantly higher in MDD patients than in healthy controls

Conclusion Patients with first-episode and drug-naïve depression have higher IGF-1 levels, but the exclusion of confounding factors in studies of IGF-1 as it relates to depressive disorders must be taken into consideration strictly, and additional research is needed to fully understand the critical role of IGF-1 in depression

关键词: IGF-1, depressive disorder, first-episode and drug-naïve, case-control, meta-analysis

比较电休克与磁休克治疗对精神分裂症患者杏仁核体积的影响

李金 张晓斌*
苏州市广济医院

目的 确定在没有电休克副作用的情况下进行与电休克治疗(ECT)临床疗效相匹配的脑刺激的方

法是精神病学的一个重要目标。磁性癫痫治疗(MST)是一种潜在的替代疗法,已显示出相当大的疗效,但有轻微的认知障碍。

方法 NCT 编号: NCT02746965; 注册日期: 2017 年 3 月 1 日; 研究 URL: <https://clinicaltrials.gov/study/NCT02746965>. 本研究比较了 ECT 和 MST 的临床疗效和认知副作用。此外,我们还研究了皮质厚度变化对治疗反应的可能贡献。34 名确诊的精神分裂症患者随机接受 ECT ($n=16$) 或 MST ($n=18$) 治疗,为期 4 周。通过 PANSS 测量精神症状,通过神经心理状态评估可重复电池组(RBANS)测量认知,并使用 FreeSurfer 比较治疗前后皮质厚度的变化。

结果 两种治疗均能降低 PANSS 评分,疗效相当,而 MST 在保留 RBANS 语言评分方面更为优越。在这项研究中, MST 组和 ECT 组在治疗后杏仁核体积均未出现显著变化。本研究检查了 ECT 或 MST 治疗后精神分裂症患者的 MRI、临床改善和认知量表数据集。采用了 FreeSurfer 图像分析工具。在治疗前后,测定左侧和右侧杏仁核的体积。我们打算研究认知改善、治疗效果和杏仁核体积变化之间的联系。提取每个受试者的杏仁核体积数据。为了确定治疗前后杏仁核体积是否发生了变化,我们进行了重复测量方差分析(RT-ANOVA)。两组的杏仁核体积都没有明显变化。因此,我们搁置了该计划的相关分析。

结论 MST 与 ECT 一样,能有效缓解精神分裂症症状,但认知功能保持得稍好。

关键词: 杏仁核体积; 神经心理评估; 电休克治疗; 磁性癫痫治疗; 精神分裂症

通过电子问卷冬季奥运会崇礼赛区中的医疗团队职业倦怠评价

朱瑜¹ 朱晓昱¹ 边云¹ 杨宗纬² 谭云龙¹

1.北京回龙观医院
2.北京大学第三医院

目的 本文介绍了通过手机电子问卷形式对 2022 年 1 月至 4 月在张家口市崇礼地区举行的冬季奥运会期间的医疗保障团队的职业倦怠的评估,旨在讨论使用手机问卷在未来的大型公共活动时更好

的监测工作人员的职业状态。

方法 通过手机问卷星的形式建立职业倦怠电子问卷,在2022年01月至2022年04月第24届冬季奥运会期间对崇礼赛区医疗保障团队成员的职业倦怠评估6次,其中包括医疗服务团队人员146名(63男,83女)。使用混合效应模型对引起职业倦怠的因素进行分析,采用SPSS Version 20.0统计软件进行分析,以 $P \leq 0.05$ 为差异具有统计学意义。

结果 共完成问卷职业倦怠问卷645份,全部使用手机问卷星完成,平均每份完成时间141.3秒。职业倦怠问卷的五个维度中,困倦疲劳(系数1.14, $P=0.01$)、情绪不安(系数1.42, $P<0.01$)、躯体疼痛或钝痛感(系数1.16, $P<0.01$)均在第8周时显著的高于基线水平,并均在医疗保障结束后的第12周时,恢复至与基线无显著差异。不快感、视觉疲劳情况在保障期间的12周中与基线水平的变化无统计学差异。在医疗、医技、工勤、行政的不同类型岗位间,仅有情绪不安呈现出岗位间差异,在行政岗位的工作人员情绪不安的情况更为明显(系数1.21, $P=0.05$)。五个维度中仅有困倦疲劳呈现隔离区闭环内外的差异,在闭环外的工作人员,困倦疲劳情况较轻(系数-0.79, $P=0.03$)。

结论 通过对第24届冬季奥运会崇礼赛区医疗保障团队成员的职业倦怠评估,显示在重大群体活动下的医疗保障团队承受着职业倦怠的挑战。疲劳、情绪问题、躯体不适的情况通常在第8周开始明显恶化。通过在手机终端进行问卷式健康情况监测可以高效的将工作人员健康状态进行汇总。同时在此类保障活动中设置不同的工作团队轮替工作或许是保持医疗保障团队整体状态的有效方法。

关键词:手机问卷;职业倦怠;大型公共活动;医疗保障;精神健康

阿立哌唑与二甲双胍治疗抗精神病药引起的高泌乳素血症的真实世界研究

肖乐*

首都医科大学附属北京安定医院

目的 抗精神病药物治疗引起的高泌乳素血症对女性患者影响很大,可导致月经不调、月经缺乏、溢乳、性功能障碍、骨密度降低和乳腺癌症,从而影

响女性患者的生存质量,甚至寿命。还导致服药依从性差。因此监测泌乳素和治疗高泌乳素血症对于精神分裂症女性患者至关重要。本研究比较了阿立哌唑与二甲双胍在女性精神分裂症患者中治疗抗精神病药物诱导的高泌乳素血症的疗效。

方法 本研究从在北京安定医院住院记录数据库中筛选了2010年至2020年住院的女性精神分裂症患者。所有患者均因抗精神病药物治疗而出现高泌乳素血症,并记录了血清泌乳素水平。我们使用了医疗记录中的数据,包括抗精神病药物的类型、高泌乳素血症的治疗用药,基线和干预后多次的泌乳素检查结果。采用Cox回归和工具变量用于确定第30、60和180天缓解率的风险比。

结果 最终纳入了652名服用抗精神病药物出现高泌乳素血症的女性患者,366人(56.1%)接受阿立哌唑治疗,286人(45.9%)接受二甲双胍治疗。第30天,阿立哌唑组泌乳素水平显著下降,缓解率为73.6%,二甲双胍组的缓解率为15.0%。在180天的随访期内,阿立哌唑组的最终缓解率显著高于二甲双胍组,分别是77.6%和23.1%。低剂量组(阿立哌唑 ≤ 5 mg)的效果明显更明显,治疗30天缓解率达到80%。

结论 相比二甲双胍,阿立哌唑治疗高泌乳素血症的效果更优,起效更快、缓解率更高。相较10mg及以上剂量组,5mg剂量组可以获得更高疗效。

关键词:精神分裂症;女性;高泌乳素血症;阿立哌唑;二甲双胍

中医药服务与技术 in 康复科的应用现状与管理对策

陈添泉 王孟璞 唐伟*

温州医科大学附属康宁医院

目的 探讨中医药服务与技术 in 康复科的应用现状与管理对策。

方法 分别选择在2年的时间里在医院康复科连续工作的护理人员18人以及随机抽取在2年的时间里在康复科住院治疗的250例患者的数据资料回顾性分析。依据是否实施中医药特色护理干预技术分组,以2018年1月~12月的患者数据作为对照组,以2019年1月~12月的患者数据为观察组。对

比干预前、后的患者的焦虑以及抑郁程度[焦虑自评量表(SAS)、抑郁自评量表(SDS)]。对比2组患者对于科室中医护理技术的满意程度。对比干预前、后护理人员自身的满意度情况。

结果 在干预之后,2组患者的SDS以及SAS的评分均降低,但观察组患者的评分均低于对照组患者($P<0.05$)。干预后,观察组患者对于科室中医护理技术的满意程度评分在各个维度均高于对照组的患者($P<0.05$)。干预后,科室内护理人员对于自身的满意度评分在各个维度均明显增高($P<0.05$)。

结论 患者个体在疾病的治疗过程中能够通过疾病的变化和身体感受到中医药各种措施所带来的好处,而护理人员也可以在中医药策略的实施过程中达成自我水平的改善和提升,并且也提供给了护理人员一个更好的展示自我的平台,为工作人员提供了一个今后发展的方向,这对于保证以及提升工作积极性具有重要的意义。将中医特有的护理技术应用到医院康复科就诊病人的护理工作中,可以帮助提高病人满意度和护士本身的满意度,同时也可以改善就诊患者的负性情绪状况。

关键词:中医药;技术;康复科;艾灸;负性情绪

1 例脑积水术后分流管堵塞引发精神障碍病案报道

吴晶晶 刘兰英* 李伟
上海市精神卫生中心

目的 目前精神科医师对脑器质性病变的鉴别诊断存在不足,为增加临床医师对脑器质性病变精神症状的认识,拓宽精神科医师对器质性病变的鉴别,提高诊断精准性。

方法 本文通过报道1例脑积水行脑室-腹腔分流术后因引流不畅引发精神障碍,以情绪低落、兴趣下降、认知障碍为起始症状,就诊精神科且经抗抑郁药治疗无效的患者,分析其误诊原因,加强临床医生对此类容易误诊误治的脑器质性病变的认识,提高鉴别诊断能力。

结果 脑室-腹腔分流术是目前治疗脑积水的常用手术方式,但其术后并发症发生率24%~52%。

分流失败是最常见的术后并发症之一,术后10年发生率在60%以上,分流管堵塞最为常见,导致脑积水症状复发,部分患者再次出现头痛、眩晕、步态不稳、意识障碍等症状。正常压力脑积水患者的临床症状主要以步态障碍、认知功能障碍和排尿功能障碍较多。精神症状表现不一,变化也大,临床并无特异性,但多数是以淡漠、焦虑和抑郁症状等精神症状为首发或主要症状,故临床容易与精神分裂症、抑郁障碍混淆。

结论 神经精神症状是近年来脑器质性病变临床特征研究的一个热点,可能更早于影像学检查病变之前。淡漠、焦虑和抑郁症状是正常压力脑积水患者中较为常见的精神症状,精神科医师在临床接诊时,应注意鉴别,避免混淆诊断,耽误病情或错误用药,加重病情。

关键词:脑积水;精神障碍;脑器质性病变;奥氮平

精神科常用中成药说明书中问题分析与管理建议

唐伟*

温州医科大学附属康宁医院,浙江省精神心理疾病临床医学研究中心

目的 本研究旨在对精神科常用中成药的说明书进行系统的调查与统计,深入分析其中存在的问题,并提出相应的改良和管理建议,以期提高中成药使用的安全性和规范性,保障患者的用药安全。

方法 本研究收集了我院精神科在2023年1月至6月期间使用的114种常用中成药的说明书,并对这些说明书进行了详细的整理和分析。具体统计项目包括规格、功能主治、用法用量、用药禁忌、药物不良反应、注意事项、特殊人群、警示语、证据分级等方面的内容。同时,研究还对说明书的语言表述进行评估,重点关注表述的准确性和一致性,分析说明书中存在的问题,并探讨这些问题的成因,最后提出针对性的解决策略。

结果 通过对114种精神科常用中成药说明书的调查统计,我们发现所有说明书在规格、功能主治及用法用量方面的内容都较为完善,涵盖率达到100%。然而,在涉及药物安全信息的项目上,具体

情况有所不同: 药物不良反应、注意事项、特殊人群、贮藏等内容的注明比例均超过 50%, 但仍存在改进空间。其中, 证据分级的注明比例最低, 仅为 27.19%, 并且有 42.11% 的中成药说明书缺少这项内容。在语言表述方面, 说明书中存在的一些问题尤为突出。最主要的问题是中西医表述混用, 这一问题在说明书中占比高达 56.14%。其次, 表述不清晰的问题也较为严重, 占比为 39.47%。这些问题的存在不仅影响了说明书的可读性和准确性, 也可能对临床医生和患者的理解造成困扰, 从而影响用药效果和安全性。

结论 研究表明, 尽管精神科常用中成药说明书在规格、功能主治及用法用量等方面内容较为完善, 在语言表述方面, 应尽量减少中西医表述混用的情况, 保持说明书语言的统一和规范, 确保用语的精确度和准确度。为此, 建议加强中成药说明书的编写标准和指南的制定, 并对相关人员进行系统培训, 提升他们的编写能力和水平。

The Resting EEG Power Spectrum and Correlated Cognitive Impairments in First-episode and Drug-naïve Patients with Major Depressive Disorder with Or without Suicide Ideation

Yun Yi¹, Yuanyuan Huang², Yuhua Wei¹, Fengchun Wu²
1.The Brain Hospital of Guangxi Zhuang Autonomous Region
2.The Affiliated Brain Hospital of Guangzhou Medical University

Objective Accumulating evidence indicates that resting-state brain oscillations are altered in patients with major depressive disorder (MDD). However, the neurophysiology and neuropathology of patients with MDD with or without suicidal ideation (SI) are poorly understood. The purpose of this cross-sectional study was to determine whether altered resting-state oscillations are associated with cognitive impairment (CI) in patients with MDD with or without SI

Methods Ninety first-episode and drug-naïve

patients with MDD patients were recruited for this study. The Beck Scale for Suicide Ideation (BSSI) was used to assess suicidal ideation. The MATRICS Consensus Cognitive Battery (MCCB) was used to assess neurocognitive function. Resting-state electroencephalography (EEG) was performed for 10 minutes with the eyes closed

Results A decrease in the relative alpha band in the occipital region was observed in patients with MDD with or without SI compared to healthy controls. An increased FAA was observed in patients with MDD with SI and healthy controls. Furthermore, a partial correlation revealed negative correlations between the relative alpha power of each ROI and attention (LF-alpha: $r=-0.535$, $FDRp=0.01$; RF-alpha: $r=-0.494$, $FDRp=0.01$; LP-alpha: $r=-0.6$, $FDRp<0.001$; RP-alpha: $r=-0.566$, $FDRp=0.01$; LT-alpha: $r=-0.554$, $FDRp=0.01$; RT-alpha: $r=-0.602$, $FDRp<0.001$; LO-alpha: $r=-0.665$, $FDRp<0.001$; RO-alpha: $r=-.676$, $FDRp<0.001$) in patients with MDD without SI. There were no correlations between EEG features and CI in patients with MDD with SI or healthy controls

Conclusion Our findings indicate that brain oscillations were altered regardless of suicidal ideation in patients with first-episode and drug-naïve MDD. Compared to those with SI, MDD without SI is characterized by a distinct pattern in FAA. Moreover, CI and the related relative alpha power band alterations may be state-like markers of MDD without SI

神经炎症在精神分裂症发病机制中的研究进展

张廷开 王梁梁 徐楷 唐劲松*
浙江大学医学院附属邵逸夫医院

目的 精神分裂症是一种病因复杂的重性精神疾病, 其高发病率和致残率给社会带来了沉重的负担。近年来, 越来越多的研究揭示了神经炎症在精

精神分裂症的病理生理中扮演的关键角色。本文综合来自遗传学、动物模型和临床研究等方面的证据,旨在阐释神经炎症与精神分裂症之间的联系。

方法 以“精神分裂症”和“神经炎症”为关键词,进行文献搜索。

结果 神经炎症可通过 Toll 样受体 (TLR) 和氧化应激参与到精神分裂症的发病过程中。

TLR 参与神经炎症,且与精神分裂症的发病相关,特别是在认知功能的损害方面。孕期或童年期的应激性事件诱发 CNS 的氧化应激,使得神经细胞受损并释放内源性的损伤相关分子模式,后者与小胶质细胞上的 TLR 结合后,使小胶质细胞激活并释放细胞因子,抑制神经元的轴突和树突的发育,以及造成突触可塑性的下降。

氧化应激和神经炎症是一组相互影响、相互促进的关系,氧化应激可介导神经炎症的发生,反之亦然。氧化应激引起的组织损伤,可能直接导致免疫应答和神经炎症。过量的 ROS 会损伤细胞膜上的磷脂和单胺类神经递质的膜受体,导致单胺类神经递质的功能紊乱。核因子 κ B (NF- κ B) 是一个转录因子家族,调控着大量参与炎症反应的基因。氧化应激可通过 NF- κ B 诱导神经炎症的发生,同时也可以通过其产生更多的自由基。另一方面,免疫系统是氧化应激的来源之一。如活化的小胶质细胞可通过 NADPH 氧化酶产生超氧化物,以起到免疫作用,但这同样可能损伤自身的神经元。

结论 神经炎症在精神分裂症发病机制中的重要作用,早期应激性事件通过小胶质细胞的 TLR 影响到神经元的发育;神经炎症和氧化应激的相互作用造成的恶性循环,同样会促成神经元的损伤。深入研究神经炎症与精神分裂症的关系,有助于理解这一复杂疾病的发病机制,并为临床的诊断和干预提供理论基础。

国外关于数字倦怠的研究进展

李涵贵 王娜*

深圳市精神卫生中心 / 深圳市康宁医院

目的 随着信息和通信技术的发展,日常生活中各种形式和功能的数字设备得到广泛使用。特别

是,COVID-19 大流行加速了日常生活数字化转型,通过应用数字技术将传统的面对面互动转变为非面对面方式,例如远程办公,远程教学,远程医疗等。但是,数字设备的密集使用也威胁着数字用户的心理健康,加剧了数字用户的压力,焦虑和数字倦怠的状态。本文对国外关于数字倦怠研究进行综述,为下步开展数字倦怠相关临床工作和科研工作提供理论借鉴。

方法 以“digital burnout”、“digital fatigue”、“digital exhaustion”等为关键词在 Pubmed、Web of Science、ScienceDirect、Google scholar 等数据库检索总结最近 5 年国外关于数字倦怠方面的英文研究。

结果 数字倦怠是指通过数字技术不断连接工作、生活和学习而造成数字用户身心疲惫,从而对数字用户的心理健康产生重大影响,导致个体满意度、效率和整体幸福感下降。通过回顾国外关于数字倦怠的最近 5 年的英文文献,综述发现:目前有关数字倦怠群体的研究主要集中在医护群体、教师和学生群体。已有研究发现医护人员的数字倦怠水平高于平均水平,这受到每天平均上网时间、压力水平、身心健康和经济状况的影响。在线教学中,教师的自我效能感、网络教学能力、情绪调节等因素对数字倦怠有重要影响。在线学习中,学生的电子设备使用时长、电子设备类型、性别和学习领域等因素影响学生的数字倦怠程度。此外,数字倦怠还与知觉压力水平、情绪劳动、额外的行政职责等方面相关。

结论 当前关于数字倦怠的研究虽然较少,但是也取得一定的进展,特别是在概念界定、影响因素分析方面。然而,该领域仍存在一些挑战,如缺乏跨文化比较研究、跨群体比较研究、有效的干预措施、统一的评估标准和长期跟踪研究等。未来的研究需要进一步探索数字倦怠的机制,开发有效的预防和干预措施,并考虑不同文化背景下的适应性策略,以应对数字化时代下的心理健康挑战。

Altered Mitochondrial Lymphocyte in Overweight Schizophrenia Patients Treated with Atypical Antipsychotics and Its Association with Cognitive Function

Wei Tang Ke Zhao*

The Affiliated Kangning Hospital of Wenzhou Medical University

Objective Increasing evidence indicated that schizophrenia and obesity are associated with altered mitochondrial and immune function. In this study, we investigated the levels of CRP (C-reactive protein) and mitochondrial lymphocyte in chronically treated schizophrenia patients with atypical antipsychotic medications, and further explored the relationship between mitochondrial lymphocyte count and weight gain as well as cognitive function in these patients

Methods We evaluated the mitochondrial lymphocyte count of 97 patients (53 overweight, 44 non-overweight) and 100 healthy controls using mitochondrial fluorescence staining and flow cytometry (Novo-Cyte, Agilent Technologies, US). The serum CRP was measured by high-sensitivity enzyme-linked immunosorbent assay (ELISA). Clinical symptoms and cognitive function of the patients were assessed using the Positive and Negative Syndrome Scale (PANSS) and the Repeatable Battery for the Assessment of Neuropsychological Status (RBANS)

Results The results showed that mitochondrial lymphocyte counts of CD3+ T, CD3+CD4+ T, and CD3+CD8+ T cells in schizophrenia patients were higher than in the control group ($p < 0.05$). Additionally, overweight patients had significantly higher mitochondrial lymphocyte counts of CD3+ T and CD3+CD4+ T cells compared to schizophrenia patients with normal weight. Stratified analysis by gender revealed that there was a statistically significant difference ($p = 0.014$) in CD3+CD4+ mitochondrial lymphocyte count in male patients, and a marginal trend toward significance ($p = 0.058$). Furthermore, the mitochondrial lymphocyte counts of CD3+ T and CD3+CD4+ T cells, as well as CRP levels, were positively correlated with BMI in schizophrenia patients, but the mitochondrial lymphocyte counts of CD3+CD4+ T cells were negatively correlated with the language scale in the RBANS

Conclusion Our study results provide evidence for the association between altered mitochondrial T

lymphocyte and weight gain as well as cognitive impairment in schizophrenia patients treated with atypical antipsychotic medications

关键词: schizophrenia, atypical antipsychotic medications, mitochondrial lymphocyte count, overweight, cognition

The Relationship between Attention and Suicidal Ideation Among Patients with Adult-onset Chronic Schizophrenia

Wei Tang Ke Zhao*

The Affiliated Kangning Hospital of Wenzhou Medical University

Objective Patients with chronic schizophrenia have a high risk of suicide, and their cognition function is impaired. We aimed to explore the relationship between attention and suicidal ideation among patients with adult-onset chronic schizophrenia

Methods A total of 416 patients with adult-onset chronic schizophrenia were enrolled in this study. We divided patients into suicidal ideation group and non-suicidal ideation group according to the evaluation results of the Beck Scale for Suicide Ideation. Psychotic symptoms were measured by the PANSS, and cognitive function was measured by the RBANS. Insomnia symptoms were measured by the ISI

Results Age was significantly different (44.28 ± 10.58 vs. 48.46 ± 12.23 , $t = 10.64$, $P = 0.001$) between the two groups, and the patients with suicidal ideation were younger than patients without suicidal ideation. The positive symptom scores of the PANSS, the scores of ISI and attention scores of RBANS were higher in patients with suicidal ideation than patients without suicidal ideation (17.30 ± 5.67 vs. 15.58 ± 4.90 , $t = 9.633$, $P = 0.002$; $3.00(1.00-6.00)$ vs. $2.00(1.00-3.50)$, $Z = -2.048$, $P = 0.041$; 81.80 ± 14.99 vs. 76.91 ± 13.88 , $t = 10.101$, $P = 0.002$). In the logistic regression analysis, age (OR, 0.973; 95%CI, [0.955-0.992]; $P = 0.005$), positive symptom scores of PANSS (OR, 1.063; 95%CI, [1.019-1.109]; $P = 0.005$), ISI scores (OR, 1.098; 95%CI,

[1.037-1.163]; $P = 0.001$) and attention scores of RBANS (OR, 1.029; 95%CI, [1.013-1.047]; $P = 0.001$) were independently associated with the occurrence of suicidal ideation among patients with adult-onset chronic schizophrenia

Conclusion High attention scores of RBANS was a risk factor for suicidal ideation among patients with adult-onset chronic schizophrenia

关键词: Adult-onset, Cognitive impairment, Positive symptoms, Schizophrenia, Suicidal ideation

经颅直流电刺激对青少年网络成瘾疗效及认知功能影响研究

孙凌敏 何孔亮*
安徽医科大学

目的 网络成瘾是一种个体过度使用网络而导致的精神行为障碍, 具体表现为对网络依赖度高, 减少网络使用时会出现戒断反应, 严重者会伴有精神症状。以往研究表明网络成瘾不仅与抑郁、强迫、人际关系敏感、焦虑、敌意、偏执观念等多种精神症状之间存在显著相关性, 还会影响正常的社会交际活动能力。经颅直流电刺激(transcranial direct current stimulation, tDCS)作为一种无创脑刺激的治疗方式, 近几年被证实对成瘾行为和物质成瘾有较好的疗效。本研究拟探究网络成瘾个体认知情绪调节策略特点, 并探索 tDCS 治疗是否对网络成瘾个体成瘾程度及其伴发的抑郁、焦虑、社交障碍等情绪问题是否有改善作用以及其对患者睡眠状况的影响。

方法 本研究共招募青少年网络成瘾个体 60 名, 所有参与者随机分配到治疗组 ($n = 30$) 以及伪刺激组 ($n = 30$), 研究一采用问卷调查方式在青少年群体中进行测试, 探究认知情绪调节策略的不同维度与网络成瘾的相关性。研究二采用 tDCS 刺激的治疗方法, 使治疗组接受 tDCS 干预 (2 mA, 20min, 连续 14 天, 每天 1 次)、并在第一天刺激前和最后一天刺激后收集各项量表, 分别评定患者的成瘾程度、抑郁、焦虑及社交困难程度和睡眠状况。通过比较刺激前后的量表得分来评估 tDCS 治疗的作用。

结果 研究一结果显示: 网络成瘾与消极认知情绪调节呈显著正相关, 随着网络成瘾评分的增加,

个体认知情绪调节策略中接受、关注计划、视角转换评分不断降低, 责备他人评分不断升高。研究二结果显示: 治疗组患者在接受 tDCS 干预后上网时间及上网次数比伪刺激组显著降低, 其焦虑、抑郁、社交回避及睡眠评分显著降低, 四项评分皆低于伪刺激组。

结论 认知情绪调节策略与网络成瘾密切相关, 积极的认知情绪调节方式可通过缓冲生活事件的不良影响在一定程度上防止青少年网络成瘾。tDCS 治疗可有效减少患者上网时间及上网次数, 减轻患者网络成瘾程度及伴发的抑郁、焦虑以及社交回避和苦恼程度, 改善伴发睡眠困难的患者的睡眠质量。

门诊 2012-2023 年拒绝上学青少年心理病理症状发展情况分析: 一项回顾性研究

朱智佩^{1,2} 朱智佩³ 赵晗² 周依依² 孙莉² 谢红涛² 李春波^{1,3}

1. 上海交通大学医学院附属精神卫生中心
2. 上海市普陀区精神卫生中心
3. 上海交通大学心理学院

(基金项目: 2021 年普陀区公共卫生重点学科, ptgw202101, 临床心理专科(儿童青少年方向); 上海市卫生健康委员会科研课题面上项目, 202140196; 普陀区临床特色专病能力提升项目, 儿童青少年情绪障碍, 2021tszb04)

目的 了解门诊“拒绝上学”青少年的主诉、社会心理功能水平、接受治疗变化, 且探讨青少年在就诊期间病程发展过程、影响因素等来理解和预测青少年的康复和转归。

方法 在上海某区专科医院门诊系统里检索 1967 名儿童青少年门诊信息, 进行一项回顾性研究。整理门诊就诊数据信息表, 检阅门诊 2012-2023 年门诊病历, 筛选出主诉出勤困难、不想/拒绝上学青少年, 描述其心理病理特征、个人功能及相关环境和家庭生活因素, 独立双人提取关键信息, 第三方审核。对家长进行半结构式电话随访, 内容包括: 门诊药物治疗、心理治疗、转学/复学/就业等, 及门诊后学校出勤情况、就诊和学校之间的困难和建议、

目前存在的问题。

结果 1. 人口学资料: 最终有 271 名拒绝上学青少年患者 (平均年龄 14.76, $SD=2.323$), 占比 15.85%, 其中 61% 拒绝上学; 通过病例回顾, 青少年的应激事件占比最大的是学业受挫 (25.83%)、人际关系冲突/同辈压力欺负 (19.19%)、家庭氛围差 (15.18%); 诊断为情绪和心境障碍是最多的 (占 87.8%), 就诊时病程时长平均 12.16 月, 儿童青少年用药率高, 占比 69%, 复诊期间稳定服药占比 40.2%; 接受过门诊心理咨询的占比 58.67%, 复诊次数平均 7 次, 复诊频率 1 月/次。2. 采用单因素对比分析, 显示性别在拒绝上学程度上差异有统计学意义 (卡方=7.580, $p=0.023$), 女性 60%; 自伤/自杀念头在拒学程度上差异有统计学意义 (卡方=10.709, $p=0.098$); 3. Logistic 回归分析等多因素统计分析寻找门诊青少年拒绝上学程度及是否复学危险因素, 探索建立 logistic 回归模型, 通过向 148 位家长的电话随访, 复学成功率低 35.79%, 拒学程度与复学是否成功没有显著性, 接受心理咨询和无自伤/自杀念头是复学的保护性因素。

结论 门诊儿童青少年拒绝上学情况愈加严重, 提示拒绝上学儿童青少年的心理病理症状更加复杂, 强调重视外化症状与家庭养育、社会环境压力有紧密的负面影响。今后进一步开展前瞻性跟踪/纵向研究的必要性和意义, 加强医院、学校、社会的“三位一体”协作机制。

基于大数据分析的抑郁症蛋白组学研究

马思梦 刘忠纯*
武汉大学人民医院

背景 抑郁症的诊断缺乏客观标志物, 单一的生物标志物不太可能改善抑郁症的临床诊断。一种可行的替代方法是开发生物标志物组合, 有可能将灵敏度和特异性提高到诊断所需的水平。

方法 这项研究在英国生物银行 (UK Biobank) 中构建了两个蛋白质组学数据集: Cox 数据集 ($N=42,712$) 和诊断数据集 ($N=37,038$)。首先, 使用

Cox 比例风险回归模型在 Cox 数据集中筛选出抑郁症潜在的生物标志物。随后, 在诊断数据集中验证了这些潜在生物标志物的诊断准确性。采用五种不同的机器学习算法来识别最优的抑郁症生物标志物组合, 通过五倍交叉验证和受试者工作特征曲线下面积 (AUC) 评估模型的性能。

结果 在平均 14 年的随访中, 调整混杂因素后, 筛选出 144 种血浆蛋白与抑郁症发病风险显著相关。这些抑郁症相关蛋白参与细胞因子受体相互作用和 MAPK/PI3K-Akt 信号传导等途径。当与传统的风险因素相结合时, 本研究中确定的 9 种血浆蛋白生物标志物对抑郁症的诊断准确率达到 75.8%, 与使用 144 种 (AUC 最高 76.5%) 和 2923 种 (AUC 最高 75.9%) 蛋白的诊断准确率相似。

结论 研究结果表明, 蛋白组学生物标志物可以作为基于人群的抑郁症筛查的补充信息, 具有潜在的临床应用价值。通过机器学习算法筛选的 9 种抑郁症相关蛋白可以替代蛋白质组学, 作为抑郁症的生物标志物组合。未来还需要进一步研究这些蛋白在抑郁症的病理机制中的作用。

Resting-state EEG As A Potential Indicator To Predict Sleep Quality in Depressive Patients

Shanshan Lin Yiwei Du Yujie Xia Ling Xiao Gaohua Wang*

Department of Psychiatry, Renmin Hospital of Wuhan University

Objective Impaired sleep, observed in many depressive patients, is often the chief complaint of depression and is also a risk factor for the development of depression. Previous researches have reported their bidirectional relationship. For instance, depressive patients with sleep disturbance are more prone to show severe symptoms and have difficulties in treatment. Furthermore, persistent insomnia is thought to be a vital predictor of depression relapse and may contribute to unpleasant clinical outcomes. In addition, insufficient sleep may activate the sympathetic nervous system, leading to

an increase in inflammatory markers which are involved in the pathophysiology of depression. However, currently, we still lack convenient and quick tools to assess sleep quality for MDD patients in clinical work

Electroencephalogram (EEG) is an approach used in psychiatric research, which focuses on analyzing broad frequency bands in the EEG power spectrum termed delta, theta, alpha, beta and gamma. When it comes to sleep monitoring, sleep EEG, also called polysomnography (PSG) can accurately reflect every stage during sleep. Typical sleep-EEG changes in MDD patients include impaired sleep continuity (prolonged sleep latency, early morning awakenings), disinhibition of REM sleep (shortened REM latency or sleep onset REM periods) and changes of NREM sleep (decrease of slow wave sleep, slow wave activity and sleep stage two). Although PSG has been considered as the “gold standard” for the objective assessment of sleep disorder, there are still several limitations, including excessively long examination duration and relatively low efficiency.

Most of the previous studies only discussed band power changes of resting-state EEG (rsEEG) in MDD patients, few of them have focused on its potential application in sleep quality assessment. Considering quantitative EEG measures exhibit higher stability than traditional PSG parameters, we chose to analyze quantitative EEG measures of MDD patients during wakefulness, intending to find a more accessible and time-saving tool to assess their sleep quality. To this end, we first measured HRV and rsEEG in both MDD patients and healthy controls during wake and compared their differences. We further investigated the correlations between subjective measures of sleep quality and HRV. Finally, we examined whether absolute power of rsEEG predicted sleep quality in depressive patients.

Methods Fifty patients diagnosed with major depressive disorder were recruited from the clinic and inpatient unit, as well as an equal number of healthy control subjects from the college or community. The exclusion criteria for the MDD group were the comorbidity of any other psychiatric disorder or cardiovascular disease; the history of central nervous system disease, head injury, alcohol or drug abuse or electroconvulsive therapy; or current pregnancy and breastfeeding. All patients

were drug-naïve or did not take medication regularly for more than two weeks. And the inclusion criteria of healthy controls were as follows: neither had a history of mood disorder nor currently meet criteria for any psychiatric disorder; the history of central nervous system disease, head injury, alcohol or drug abuse or electroconvulsive therapy; or current pregnancy and breastfeeding. Our study finally included a total of 91 subjects (46 healthy controls and 45 MDD patients)

Hamilton Rating Scale for Depression (HAM-D-24) and Pittsburgh Sleep Quality Index (PSQI) were used to assess the severity of depressive symptoms and their sleep quality. EEG data were collected with an active EEG-system with 64 scalp electrodes positioned in accordance with the 10–20 system. EEG data were analyzed offline in MATLAB. In power spectra analysis, four frequency bands were studied: delta (from 1 to 4 Hz), theta (from 4 to 7 Hz), alpha (from 8 to 13 Hz), and beta (from 13 to 30 Hz).

Multi-factor analysis of variance (MANOVA) was conducted for different frequency bands with group (HC and MDD) as the independent variable and channel as dependent variable. All channels were chosen from each brain region including frontal (F3, F4, Fz, FC3, FC4, FCz), central (C3, Cz, C4, CP3, CPz, CP4), parietal (P3, Pz, P4, PO3, PO4, POz), and occipital (O1, O2, Oz). Significant interactions were followed up by simple effect analyses to compare the power of each electrode, in which *p*-values were corrected with FDR. Finally, we established regression models to examine whether spectral power could predict the sleep quality in MDD patients.

Results The HAM-D-24 score of MDD group was significantly higher than healthy controls ($t = 18.89$, $p < 0.001$). With regard to the PSQI score, the depressive patients had a higher level of the average total score (5.35 ± 2.57 vs. 11.84 ± 2.15 , $t = 13.09$, $p < 0.001$), indicating more serious sleep issues in depressed patients. Moreover, MDD patients showed a worse all-around sleep quality in the seven aspects of PSQI

MANOVA revealed significant main effects of group in delta, theta and alpha band. All the three band power were stronger in MDD patients than the HC group [$F_{\text{delta}}(1,89) = 21.99$, $p < 0.001$, $\eta^2_p = 0.20$;

$F_{\theta}(1,89) = 8.635, p = 0.004, \eta^2p = 0.09$; $F_{\alpha}(1,89) = 4.502, p = 0.037, \eta^2p = 0.05$]. But no significant main effect of group was found in beta band [$F_{\beta}(1,89) = 1.753, p = 0.189, \eta^2p = 0.02$]. MANOVA further revealed a significant group \times channel interaction in theta and beta band [$F_{\theta}(20,1780) = 2.429, p = 0.013, \eta^2p = 0.03$; $F_{\beta}(20,1780) = 3.305, p = 0.001, \eta^2p = 0.04$]. Simple effect analyses showed significantly stronger theta band (F3, F4, Fz, FC3, FC4, FCz, C3, C4, CP3, CPz, P3, Pz, POz, PO4, P4) and beta band (FC3, Fz, C3, Pz, P4) power in the MDD group.

The stepwise regression model showed TP8 delta power contributed unique variance to the model, and a positive association existed between PSQI score and TP8 delta power ($\beta = 0.39, p = 0.009$). This model accounted for 13% of the variance in PSQI score [Adj R² = 0.13, $F(1,43) = 7.49, p = 0.009$]. The regression model of theta and alpha band respectively accounted for 17% [Adj R² = 0.17, $F(1,43) = 10.16, p = 0.003$] and 20% [Adj R² = 0.20, $F(1,43) = 12.30, p = 0.001$] of the variance, with the absolute power of AF3 ($\beta_{\theta} = 0.44, p = 0.003, \beta_{\alpha} = 0.47, p = 0.001$) emerging as the significant predictor. For beta band, the model accounted for only 11% [Adj R² = 0.11, $F(1,43) = 6.18, p = 0.017$] of the variance, with absolute power of AF3 as a significant predictor ($\beta = 0.35, p = 0.017$).

Conclusion Our results found an increase in the absolute power in delta, theta, and alpha bands. Despite no significant main effect of group in beta band, subsequent simple effect analyses also showed significantly stronger beta band power (FC3, Fz, C3, Pz, P4) in MDD group. Multiple linear regression showed that theta, alpha and beta band power of frontal electrode (AF4) as well as delta band power of temporal electrode (TP8) were potential predictors of MDD patients' sleep quality. Increased theta power during wakefulness is associated with sleepiness and decreased cognitive performance, which may mark sleepiness and fatigue and reflect worse sleep quality in MDD patients. With regard to elevated alpha and beta band power, they are considered as indicators of cortical hyperarousal. In the current study, we find a positive correlation between alpha, beta and PSQI total score, which supports that the higher level of hyperarousal during wakefulness reflects more

severe sleep issues in depressed patients. Our findings replicate increased absolute delta, theta, alpha band power in MDD individuals, indicating the co-existence of sleepiness and hyperarousal during the resting state is also associated with worse sleep quality. Compared with the time-consuming process of PSG, our results support that with just several minutes of waking EEG recording, we can preliminarily evaluate sleep quality in MDD patients

述情障碍在大学生抖音使用强度与社交退缩间的中介作用

王格² 沈棫华¹ 沈棫华²

1.皖南医学院研究生学院

2.首都医科大学附属北京安定医院芜湖医院

目的 探究述情障碍在大学生抖音使用强度和社交退缩间的中介作用。

方法 在2023年10—12月,使用方便抽样方法在安徽省芜湖市2所高校抽取935例大学生,进行多伦多述情障碍量表(the twenty-item Toronto alexitimia scale,TAS-20)、抖音使用强度量表和社交退缩量表问卷测试;对数据采用SPSS 25.0进行描述性统计、Pearson相关分析,使用Amos24.0构建结构方程模型,采用Bootstrap法检验中介作用。

结果 述情障碍、社交退缩和抖音使用强度量表的总分分别为(56.36±8.11)、(49.71±10.86)和(17.89±5.79)分。Pearson相关分析表明,抖音使用强度与社交退缩呈正相关($r=0.18, P<0.01$),与述情障碍呈正相关($r=0.23, P<0.01$)。中介效应检验表明,抖音使用强度对社交退缩的直接预测作用显著($\beta=0.19, P<0.01$);述情障碍在抖音使用强度和社交退缩的关系中起部分中介作用(效应值=0.114, 95%CI:0.032~0.094),中介效应占总效应的57.58%。

结论 音使用强度不仅可以直接影响社交退缩,也可以通过述情障碍的中介作用间接影响社交退缩。学校应注重降低大学生的述情障碍水平,从而缓解抖音使用强度对大学生社交退缩带来的消极影响

关键词: 抖音使用强度; 社交退缩; 抒情障碍;

中介作用

TRPV1受体在中枢神经系统中的双重作用及其与精神分裂症相关研究

徐诗林 王惠玲*

武汉大学人民医院

目的 精神分裂症是一组以阳性症状、阴性症状、精神运动性障碍及现实检验能力严重受损为特征表现的精神障碍，其发病机制尚未完全阐明。最近的研究表明，瞬时感受器电位香草酸受体 1(transient receptor potential vanilloid 1, TRPV1)，对精神分裂症有促进和抑制作用，并在精神分裂症的发生发展过程中发挥重要作用。因此，本文综述了 TRPV1 在中枢神经系统中的双重作用，以及 TRPV1 和精神分裂症相关研究，为后续研究提供理论基础。

方法 使用生物医学文献数据库 Pubmed 输入以下关键词"TRPV1"或"schizophrenia"; "TRPV1"和"central nervous system"，进行检索。

结果 TRPV1 与精神分裂症的发生发展关系密切。近年来对 TRPV1 在中枢神经系统中的功能研究的文献有很多，本综述从氧化应激、神经炎症、神经凋亡、突触可塑性方面进行了归纳总结，以期能更好地解释 TRPV1 与精神分裂症之间的关系。TRPV1 在中枢神经系统中的功能复杂且具有双重性，但至今未有成熟理论解释其如何调控这种双重效应。既有研究说明使用辣椒素、大麻二酚等 TRPV1 激动剂可以改善精神分裂症动物模型的症状，也有研究说明 TRPV1 通道打开造成了钙超载导致线粒体损伤、ROS 积累、神经凋亡这一对中枢神经系统有害的连续生物学过程。此外，精神分裂症发生还可能与 TRPV1 介导的神经发育相关。TRPV1 在中枢神经系统中所起的效应可能和其所处的环境和细胞因子相关。TRPV1 的激动所带来的更大的益处有可能是由于持续的激动导致的受体脱敏随后下调。不同类型和不同剂量的 TRPV1 激动剂所产生的效应有所不同，其中可能涉及 TRPV1 的不同亚型。

结论 目前 TRPV1 和精神分裂症之间直接的相关研究较少，并且都集中在动物研究中。对于 TRPV1 在精神分裂症中所起的保护和损伤机制，以及如何调控这一双重效应都尚未完全阐明。未来需

要更多的临床研究相关证据来证明 TRPV1 和精神分裂症之间的关系。

虚拟标准化病人在精神医学教学中的应用

汪国栋^{1,4} 李月^{2,4} 秦建星³ 徐勇^{1,5}

1.山西医科大学人文社会科学学院

2.山西医科大学第一医院精神卫生科

3.北京大学第一医院太原医院

4.精神障碍人工智能辅助诊疗山西省重点实验室

5.山西医科大学精神卫生学系

目的 随着社会的日益发展，精神健康问题越来越被广泛关注。面对日益严重的精神障碍形势，我国精神卫生专业人才的需求与供给之间存在较大缺口，而虚拟标准化病人(Virtual Standardized Patient, VSP)有望成为精神医学教学的一种有效途径。因此，本文旨在综述虚拟标准化病人在精神医学教学中的研究情况，探讨其应用现状，并指出未来研究思路与方向，为培养精神卫生专业人才提供新的视角和解决方案。

方法 以“virtual patient”、“virtual standard patient”、“virtual simulation”、“psychiatry virtual patients”以及“standard patient”为关键词，检索了中国知网、万方、维普、生物医学文献、PubMed、EMBASE 和 Scopus 等数据库从建库至 2024 年 3 月 1 日发表的关于虚拟标准化病人的文献，按照纳入、排除标准严格筛选后对文献进行综述。

结果 VSP 在精神医学教学领域取得了显著效果。在病史采集和诊断教学方面，VSP 能提高医学生的诊断技能和自信心；在共情能力培养方面，VSP 通过提供即时反馈，有效提升医学生的共情沟通能力；在药理学教学方面，VSP 为精神科住院医师提供了真实、互动的药理学知识培训平台；在动机性访谈技能培训方面，VSP 促进了动机性访谈技能的传播。然而，现有 VSP 在语言和情感表达方面存在限制，交互性有待提高，且种类有限。

结论 精神卫生领域的 VSP 应用已经取得了显著的进展。众多研究表明，VSP 在提高医护人员的精神疾病诊断技能、药理学知识和共情能力方面具有明显效果。然而，现有 VSP 在情感表达方面和评

估体系等方面也存在一些局限性。未来研究应关注跨学科合作,增加交互性和沉浸感。同时,应开发个性化的学习内容,以更好地满足不同学生的需求。总的来说,随着虚拟现实和人工智能技术的发展,VSP系统有望实现更真实、更智能的交互,为精神医学领域提供更高效、个性化的培训平台。

新时代精神卫生领域的新质生产力发展路径研究

新昕* 王秀珍

沈阳市精神卫生中心

目的 本研究旨在探索新时代背景下精神卫生领域的新质生产力发展路径,基于习近平总书记在《发展新质生产力是推动高质量发展的内在要求和重要着力点》一文中提出的高质量发展理念,提出了科技创新、产业创新、绿色发展、体制机制创新和人才机制创新等五个方面的具体发展路径,旨在提升精神卫生服务的质量与效率,推动行业整体升级。

方法 本文通过文献综述和案例分析的方法,综合国内外相关研究成果和实践经验,系统探讨了科技创新(包括人工智能、虚拟现实技术、大数据与云计算)、产业创新(如远程医疗技术和服务体系现代化)、绿色发展(包括在线心理咨询服务、绿色医院建设和生态疗法)、体制机制创新(医保政策改革和“互联网+精神卫生”服务模式)和人才机制创新(联合培养机制和高层次专业技术人才队伍建设)等方面的具体应用与前景。

结果 研究表明:科技创新在提升精神卫生服务质量和效率方面具有显著优势,特别是人工智能和虚拟现实技术的应用;产业创新通过远程医疗技术和现代化服务体系的推动,显著扩大了服务覆盖范围和便捷性;绿色发展通过在线心理咨询和绿色医院建设,实现了环保目标 and 高质量服务的双重目标;体制机制创新通过医保政策改革和“互联网+精神卫生”服务模式,提高了服务的普及性和效率;人才机制创新通过联合培养机制和高层次专业技术人才队伍建设,显著提升了专业人才的培养质量和队伍素质。

结论 本文提出的五大方面的发展路径,不仅显著提升了精神卫生服务的质量与效率,推动了行业整体升级,也为新时代精神卫生领域的发展提供了全面指导。通过科技创新、产业转型、绿色发展、体制机制改革和人才培养的协同推进,我们有望实现精神卫生服务的精准化、个性化和智能化,全面提升精神卫生服务的高质量发展,为建设健康中国作出更大贡献。

炎症因子在抑郁症自伤与自杀行为中的研究现状

章震东¹ 李荷花¹ 黄园园¹ 吴凯^{2,3} 黄东嫦⁴ 吴逢春^{1,2}

1.广州医科大学附属脑科医院

2.广东省精神疾病转化医学工程技术研究中心

3.华南理工大学广州国际校区

4.东莞市大朗镇实验小学

目的 自伤与自杀行为是抑郁症(Major Depressive Disorder, MDD)常见且严重的并发性行为,已成为全球性的公共卫生问题。MDD与自伤自杀行为强相关,自伤和自杀行为有交互作用,且炎症因子很可能参与了这一过程,并表现出不同的炎症种类水平表达升高。为了深入理解MDD患者自伤和自杀行为的机制,本文主要从炎症因子及其是如何通过影响犬尿氨酸通路和下丘脑-肾上腺-皮质醇(HPA)轴参与自伤和自杀行为进行探究。这为MDD患者的自伤和自杀风险提供早期识别和干预的新视角,以期临床实践提供有价值的参考。

方法 本文使用中国知网(CNKI)、PubMed、Web of Science数据库,对相关文献进行检索并综合分析,收集并整理了炎症因子在具有自伤和自杀行为的MDD中的研究。综述了近年来四种常见的炎症因子(IL-6、IL-1 β 、CRP和TNF- α)在MDD患者自伤和自杀行为关系的研究结果,并讨论了炎症因子通过犬尿氨酸通路和HPA轴影响自伤和自杀行为的机制。

结果 一、四种炎症因子在MDD自杀与自伤行为中的变化

IL-6 是证据最多的炎症因子,与自杀意念、自杀未遂和自杀死亡都有关联,较多的证据表明 IL-6 水平的升高与自伤行为和自杀意念有关。基线水平的 IL-1 β 在具有自伤自杀行为的 MDD 患者中显著升高,而其降低可能提示自伤自杀行为近期的发生。CRP 水平的升高可能提示抑郁症状加重和自伤行为频率的增加,进而发展为更严重的自杀行为。TNF- α 失调可能提示了患者的冲动性特质和认知功能损害,并于 MDD 患者自伤自杀行为密切相关。

二、炎症因子在 MDD 自伤与自杀行为中的机制

炎症因子通过影响血清素和犬尿氨酸代谢通路,导致血清素水平下降和犬尿氨酸水平上升,从而影响 MDD 和自杀行为的发展。慢性化的炎症状态可能使 HPA 轴反应钝化,减弱对自伤冲动的抑制;而短期的炎症水平升高则可能激活 HPA 轴,增加皮质醇的反应,引发短暂的自杀意念。此外,睡眠障碍引起的炎症因子水平升高还可能通过降低血清素代谢物水平,促使自伤行为向自杀行为转变。

结论 MDD 患者自伤和自杀行为与炎症因子(IL-6、IL-1 β 、CRP 和 TNF- α)水平密切相关。炎症因子不仅是自伤自杀行为的关联因素,还可能作为预测未来自杀行为的生物标志物。对于降低 MDD 患者的自伤和自杀风险具有重要意义。

脑电技术在抑郁症非自杀性自伤行为和自杀意念中的研究进展

何宇航¹ 黄园园^{1,2,3}

1. 广州医科大学附属脑科医院
2. 广东省精神疾病转化医学工程技术研究中心
3. 广东省神经科学疾病研究重点实验室

目的 非自杀性自伤行为和自杀意念是抑郁症患者自杀的重要危险因素,目前多采用临床问诊或量表评估的方式,带有一定的主观性,缺乏客观检测方法或神经生物学标志物。脑电作为非侵入式的神经电生理检查手段,在抑郁症脑功能研究和临床中被广泛应用。本综述将概述抑郁症患者非自杀性自伤行为和自杀意念相关的脑电研究进展,旨在为

脑电技术在抑郁症自杀的早期预测提供参考。

方法 本文通过中国知网(CNKI)和 PubMed 外文数据库,对相关文献进行检索并综合分析,收集并整理了抑郁症患者非自杀性自伤行为和自杀意念相关的脑电技术研究。

结果 伴非自杀性自伤行为或自杀意念的抑郁症患者在静息态分析和任务态分析均存在有意义的结果。一、脑电功率谱分析:伴非自杀性自伤行为或伴自杀意念的抑郁症患者静息状态下的脑电功率谱,在 Alpha、Beta、Gamma、Theta 节律表现出与抑郁症患者的特征差异性。二、脑电微状态:部分微状态的贡献率、发生率、覆盖率以及微状态之间的转换率可作为自杀意念的一种潜在的神经生理标志物。三、脑电功能连接分析:脑电相干性指标可能是抑郁症自伤自杀行为的特异性表现,甚至是提示自伤发展至自杀行为的脑电特征。四、任务态分析:伴非自杀性自伤行为或伴自杀意念的抑郁症患者在目标刺激下的事件相关电位特征,可为抑郁症患者产生自伤自杀行为的发展机制研究提供可靠的神经电生理活动依据。

结论 以上研究表明脑电技术可作为早期预测抑郁症自杀的有意义的生物标志物,但非自杀性自伤行为和自杀意念作为自杀行为的重要危险因素也存在差异,能否探索出非自杀性自伤行为发展至自杀意念的脑电特征趋势,防止病情发展至自杀行为,具有重要的临床意义。本综述主要归纳了传统且单一的脑电成分研究,对于综合性实验、脑电与磁共振等技术联合运用的研究总结欠缺,期待未来能结合脑电节律、事件相关电位、脑网络及其他技术等进行分析。

关键词: 抑郁症,非自杀性自伤行为,自杀意念,脑电

睡眠质量对医学生自杀风险的影响:抑郁的中介作用和学业压力的调节作用

刘娇 阮铭君 莫艳明 赵云欢 吉丽娟 陈松婷 程宇琪*

昆明医科大学第一附属医院

目的 本研究主要试图构建一个有调节的中介模型,以探讨睡眠质量对医学生自杀风险的影响,

以及抑郁和学业压力在二者关系之间的作用,为医学生这一特殊群体自杀行为的早期预防提供理论依据。

方法 采用整群抽样法,结合一般人口学调查表、匹兹堡睡眠质量表(PSQI)、病人健康问卷抑郁量表(PHQ-9)、贝克自杀意念量表(BSI)以及学业压力评分对昆明医科大学第一临床医学院 3579 名在校生进行问卷调查。采用 SPSS.26.0 软件对数据进行统计分析,使用 PROCESS 宏程序进行有调节的中介效应分析。

结果 (1)睡眠质量、抑郁、自杀风险及学业压力均两两显著相关;(2)睡眠质量指数正向预测自杀风险($\beta=0.12, P=0.005$);(3)抑郁在睡眠质量与自杀风险之间起部分中介作用($\beta=0.35, P<0.001, 95CI%$ 为 $[0.29, 0.42]$),中介效应占总效应的 72.92%;(4)学业压力调节了中介模型的前半路径,即调节了睡眠质量对抑郁的影响($\beta=0.21, t=9.85, P<0.001$)。

结论 本研究发现睡眠质量通过影响抑郁从而增加医学生的自杀风险;降低学业压力可以降低睡眠质量对医学生抑郁情绪的影响。因此,医学院校的心理健康教育可以重点集中于帮助医学生更好地处理学业压力。同时要注重筛查和识别有睡眠问题和抑郁情绪的学生,这可能是降低医学生自杀风险,预防自杀行为的有效途径。

舍曲林药物浓度与剂量校正浓度的影响因素分析

李若茗 谭云龙*

北京大学回龙观临床医学院 北京回龙观医院

目的 舍曲林作为临床上最常用的抗抑郁药物之一,其不同患者群体中的剂量和血药浓度存在显著差异,并受到多种因素的影响。本研究旨在探索影响舍曲林血药浓度及其剂量校正浓度的相关因素,以期为舍曲林的个体化用药方案制定提供参考。

方法 回顾性收集舍曲林治疗药物监测数据,以及用药剂量、年龄、性别、合并疾病、合用药物、肝肾功能等信息,采用单因素和多因素广义线性回归分析的方法,探索舍曲林血药浓度及剂量校正浓

度(C/D)的影响因素。

结果 研究共纳入 1080 例患者的数据资料,其中男性 369 例(34.2%),儿童青少年(6-17 岁)患者 478 例(44.3%),主要诊断为抑郁障碍的患者 588 例(54.4%)。舍曲林的日剂量、血药浓度和 C/D 比值的中位数(第 25 百分位数,第 75 百分位数)分别为 100.0(100.0, 150.0) mg/d, 53.15(31.18, 87.65) ng/mL, 0.4715(0.3175, 0.7080) ng/mL/mg/d。在 1080 例患者中,有 50 例(4.6%)患者舍曲林血药浓度偏低,75 例(6.9%)患者血药浓度偏高。对于舍曲林血药浓度,经单因素广义线性回归分析,将舍曲林日剂量、性别、年龄、民族、合并肾脏疾病、丙氨酸氨基转移酶(ALT)水平、天冬氨酸氨基转移酶(AST)水平、 γ -谷氨酰转肽酶(GGT)水平、中性粒细胞计数、淋巴细胞计数纳入多因素回归,结果显示舍曲林药物浓度受舍曲林日剂量($P<2e-16$)、性别($P=2.63e-05$)、年龄($P=0.000636$)、AST 水平($P=0.001358$)的显著影响。对于 C/D,经单因素广义线性回归分析,将性别、年龄、合并肾脏疾病、AST 水平、淋巴细胞计数及合用 CYP 酶(CYP2B6、CYP2D6、CYP2C19)抑制剂纳入多因素回归,结果显示 C/D 受性别($P=6.19e-05$)、年龄($P=0.04689$)、AST 水平($P=0.00028$)的显著影响。

结论 研究探索了舍曲林药物浓度与剂量校正浓度的影响因素,以期为舍曲林的合理使用和制定个性化给药方案提供参考。

关键词: 舍曲林; 治疗药物监测; 剂量校正浓度; 个体化用药

Associations of Pro-inflammatory Factors and IL-10 Levels with Degree of Suicide Risk in Adolescents with Depression

Wenyuan Liu^{1,2}, Hui Zhong¹

1.Department of Child and Adolescents Psychology, Anhui Mental Health Center, Hefei

2.School of Mental Health and Psychological Sciences, Anhui Medical University, Hefei, China

Objective Depression and suicidal behavior are

associated with pro-inflammatory status in adults. However, differences in inflammatory levels among adolescents with depression at different suicide risk levels are unclear, and the connection between anti-inflammatory factors, which play an important role in the immune system, and suicide needs to be explored

Methods This study recruited 111 adolescent patients with depression aged 13-18 and 23 healthy controls. Patients were divided into three subgroups: (1) High suicide risk (n = 45): suicidal ideation within the past week and history of suicide attempts; (2) Medium suicide risk (n = 44): suicidal ideation within the past week but no history of suicide attempts; (3) Low suicide risk (n = 22): no suicidal ideation and no history of suicide attempts. Severity of depression, suicidal ideation, and suicide risk were assessed using the Hamilton Depression Scale-17 (HAMD-17) and the Chinese version of the Beck Suicide Ideation Scale (BSI-CV). Plasma levels of IL-6, TNF α , IFN γ , IL-1 β , and IL-10 in all participants were measured

Results Plasma levels of IL-6, TNF- α , IFN- γ , and IL-10 differed between the suicide risk subgroups, and the differences remained significant after controlling for severity of depressive symptoms using covariance analysis. Pairwise comparison indicated that plasma levels of these four cytokines in the high suicide risk group were higher than those in the low suicide risk group (all $p < 0.05$), among which the level of IL-10 was significantly higher than that in the medium ($p = 0.028$) and low risk groups ($p = 0.001$). IL-10 was positively correlated with the total score of the HAMD-17 ($r = 0.210$, $p = 0.027$), BSI-CV ($r = 0.241$, $p = 0.011$), and suicidal ideation ($r = 0.301$, $p = 0.001$); the other four cytokines were also somewhat correlated with suicidal ideation (all $p < 0.05$), but not significantly correlated with depressive symptoms (all $p > 0.05$). IL-10 correlated positively with these four pro-inflammatory factors. Multiple linear regression analysis showed that Ln IL-10 levels significantly affected BSI-CV ($\beta = 0.270$, $t = 2.897$, $p = 0.005$) and HAMA-17 ($\beta = 0.285$, $t = 3.041$, $p = 0.003$) total scores. In binary logistic regression, after controlling for depressive symptoms, gender, age, BMI, and duration of illness: Ln IL-10 level remained a risk factor for suicidal behavior (OR = 3.224, 95% CI

1.571-6.619 $p = 0.001$)

Conclusion Adolescents with different suicide risk levels differed in plasma levels of pro-inflammatory factors and the anti-inflammatory factor IL-10. These differences were independent of depressive symptoms; high IL-10 levels may be a risk factor for suicidal behavior in depressed patients. Further research is needed to explore the relationship between anti-inflammatory factors and suicide

关键词: suicide risk, depression, adolescence, pro-inflammatory state, anti-inflammatory factors, IL-10

静息态功能磁共振网络连接在抑郁症认知损害中的研究进展

陈冰鑫¹ 黄园园^{1,2,3} 易芸⁴ 李荷花^{1,2,3} 冯仕轩¹ 吴凯⁵ 吴逢春^{1,2,3}

1. 广州医科大学附属脑科医院
2. 广东省精神疾病转化医学工程技术研究中心
3. 广东省神经科学疾病研究重点实验室
4. 广西壮族自治区脑科医院
5. 华南理工大学

目的 抑郁症(Major Depressive Disorder, MDD)是一种高患病率、高复发率的精神疾病, 认知损害(cognitive impairment, CI)作为其核心症状之一, 严重影响患者的生活质量和社会功能, 以及增加MDD患者的复发风险。抑郁症认知损害的评估多基于临床问诊或量表测评, 缺乏客观、精准的评估手段。基于静息态功能磁共振(resting-state functional magnetic resonance imaging, rs-fMRI)的研究发现MDD患者认知损害与脑功能网络连接异常密切相关。因此, 本文主要围绕rs-fMRI的脑网络功能连接(functional connectivity, FC)及拓扑属性对伴有CI的MDD的相关研究展开综述, 为伴有CI的MDD发病机制提供客观的影像学依据。

方法 本文通过PubMed及Web of Science等数据库, 对相关文献进行检索, 整理并综合分析有关脑网络分析在抑郁症认知损害中的研究。

结果 对于伴有CI的MDD患者, 其默认模式网络(default mode network, DMN)、中央执行网络(central executive network, CEN)、突显网络(salience

network, SN)等脑网络存在 FC 及拓扑属性异常, 且与患者的神经认知表现有一定的相关性。而 MDD 患者的认知功能, 需要多个参与认知行为的脑区及脑网络相互协调。以 DMN、CEN、SN 三个核心认知网络构建的三重网络模型, 三者之间的 FC 异常, 可能会导致 MDD 和 CI 的发生, 以及与 CI 的持续不缓解有关。其中, SN 在三重网络模型中起着至关重要的作用, SN 的功能活动异常, 可能会导致 DMN 和 CEN 之间的动态转化失衡, 从而引起 MDD 及 CI 的发生。

结论 基于 rs-fMRI 的脑网络分析, 抑郁症认知损害存在脑网络内部及脑网络之间的功能连接及拓扑属性异常。然而, 目前对于抑郁症认知损害的网络连接研究结论并不一致, 因此建立样本数量大的数据库, 将有助于减少样本量不同带来的误差, 使得研究结果更趋于准确, 对于了解抑郁症认知损害的发病机制, 精准定位致病位点, 具有重要意义。

关键词: 抑郁症, 认知损害, 静息态功能磁共振, 脑网络

应用“甲状腺稳态结构参数”评价精神障碍患者甲状腺稳态的范围综述

翟德胜^{1,3} 赵莹^{2,3} 张瑞岭³

1. 新乡医学院公共卫生学院

2. 新乡医学院药学院

3. 新乡医学院第二附属医院

目的 范围综述--应用“甲状腺稳态结构参数”评价精神障碍患者甲状腺稳态。

方法 本研究根据范围综述方法标准 (PRISMA-ScR) 进行。通过检索 Medline, Web of Science 和 PsycInfo 数据库, 筛选并确定应用“甲状腺稳态结构参数”评价精神障碍患者甲状腺稳态的研究文献。“甲状腺稳态结构参数”包括甲状腺分泌能力 (SPINA-GT)、外周活化性脱碘酶的总活性 (SPINA-GD) 和评估甲状腺垂体功能和甲状腺稳态中枢设定点参数: 促甲状腺激素指数 (TSHI) 和基于分位数甲状腺反馈指数 (TFQI)。文献包括“甲状腺稳态结构参数”的纵向测量, 或包括相关的比较组: 精神疾病患者与对照组、不同的精神病、疾病不同状态 (首次发作与复发与缓解、抑郁发作与躁狂发

作) 的比较, 和精神药物是否暴露 (vs. drug-naive 或 drug-free)、以及不同的精神药物之间的比较。

结果 本范围综述最终共纳入 5 项研究进行综合分析。根据文献公布的信息类型对文献分为两类: 1. 与精神疾病 (精神分裂症、抑郁症或双相情感障碍) 相关的甲状腺异常研究; 2. 精神药物对“甲状腺稳态结构参数”的影响。综合分析确定了与精神疾病 (精神分裂症、抑郁症或双相情感障碍) 相关的甲状腺异常的特征, 和精神药物对甲状腺稳态的影响。在急性发作的 drug-free 或 drug-naive 的精神分裂症患者中, 甲状腺异常反应主要归因于较高的甲状腺稳态中心设定点 (TSH 指数和 TFQI 指数)。与健康对照组相比, drug-free 的抑郁症和双相情感障碍的患者具有共同的甲状腺异常特征: 活化性脱碘酶活性 (SPINA-GD) 受损和甲状腺激素的血清蛋白结合 (T4/游离 T4 和 T3/游离 T3) 降低, 但甲状腺稳态中心设定点 (TSH 指数和 TFQI 指数) 没有显著变化。此外, 躁狂发作患者的甲状腺分泌能力 (SPINA-GT) 升高。药物对“甲状腺稳态结构参数”的影响研究显示: 喹硫平、米氮平和奥卡西平暴露降低甲状腺稳态中心设定点。

结论 “甲状腺稳态结构参数”作为基于系统的评价参数, 从甲状腺稳态中枢设定、外周甲状腺分泌功能和代谢三个层面, 为精神疾病患者的甲状腺稳态评估提供了新的维度, 特别是提供了促甲状腺激素 (TSH) 水平正常的下丘脑-垂体-甲状腺功能紊乱患者的识别方法。“甲状腺稳态结构参数”在精神疾病领域的应用仍处于初始阶段, 开展相关研究应充分考虑影响下丘脑-垂体-甲状腺轴稳态的因素。需要进一步研究来探讨甲状腺异常的动态变化及其临床相关性, 特别是对患者的长期影响, 以明确“甲状腺稳态结构参数”评价精神障碍患者甲状腺稳态在临床决策中的实用性。

关键词: 精神障碍, 下丘脑-垂体-甲状腺, 甲状腺稳态结构参数, 范围综述

复发性抑郁障碍患者自杀行为的危险因素以及与认知功能的关系

王蕾蕾 邓虎* 杨欣悦 李伟
北京回龙观医院

目的 探讨抑郁症患者自杀行为的发生率、自杀行为的危险因素以及自杀行为与认知功能的关系。

方法 采用横断面调查方法, 纳入符合 ICD-10 符合复发性抑郁障碍的患者 250 例。采用面对面访谈的方式确定复发性抑郁障碍患者的自伤行为。采用自杀意念自评量表 (SIOSS) 评估自杀意念, 采用成套神经心理状态评估工具 (RBANS) 评估认知功能, 采用卡方检验比较两组的人口学及临床资料的差异, 采用独立样本 t 检验比较 SIOSS、RBANS 在伴不伴自杀行为组得分的差异, Logistic 回归分析复发性抑郁障碍患者自杀行为的危险因素。

结果 复发性抑郁障碍患者自杀行为的发生率为 41.2%。伴有自杀行为的复发性抑郁障碍患者中伴精神症状的比例高于不伴有自伤行为组 (40.8% vs 19.0%)、女性比例高于不伴有自杀行为组 (73.8% vs 53.5%)。伴有自杀行为的复发性抑郁障碍患者的受教育年限高于不伴有自杀行为组, 总病程短于不伴有自杀行为组。伴有自杀行为的复发性抑郁障碍患者的 SIOSS 总分、绝望因子、乐观因子、掩饰因子得分高于不伴有自杀行为组。在认知功能方面, 伴有自杀行为的复发性抑郁障碍患者的 RBANS 言语功能得分低于不伴自杀行为组。Logistic 回归分析显示, 起病年龄小是复发性抑郁障碍患者自杀行为的危险因素, 首次住院年龄小、即刻记忆、言语功能是复发性抑郁障碍患者自杀行为的保护因素。

结论 复发性抑郁障碍患者自杀行为的发生率较高, 认知功能, 尤其是即刻记忆、言语功能是自杀行为的保护因素, 可能减少自杀行为的发生。

可穿戴技术在抑郁症领域的应用现状

李楠茜 丰雷 王刚*

首都医科大学附属北京安定医院

人工智能驱动的可穿戴技术正逐渐形成为抑郁症等精神疾病识别监测的新工具, 可穿戴设备提供了一种非侵入式、连续且客观的数据收集方式, 通过监测和分析用户的生理信号、行为模式以及环境数据等, 能够用于识别抑郁症患者的情绪状态和行为活动。可穿戴设备的显著优势包括: (1) 持续监测: 与传统的自我报告或间歇性的临床评估相比,

可穿戴设备能够提供连续性的生理参数和行为模式数据, 这对于理解患者的日常活动具有重要价值, 持续的数据监测对于抑郁症患者疾病管理、减少复发复燃尤为重要。例如, 通过连续监测心率和睡眠模式的变化, 可以帮助识别抑郁症状变化的早期迹象, 从而实现风险预警。(2) 客观数据支持: 基于可穿戴设备收集的数据具有较高的客观性, 例如对睡眠模式、心率变异性以及活动量等数据的客观记录分析, 能够为医生提供了更加详细和精确的数据支持。这种客观数据的获取有助于医生更准确地理解和评估患者的状况, 进而有助于评估疗效、制定和及时调整个性化治疗方案。(3) 促进患者参与: 一些研究表明, 将可穿戴设备的数据展示给患者本人, 可以提高他们对自身状况的理解, 并可能激励患者共同参与疾病治疗与管理。

然而, 尽管可穿戴技术存在诸多潜在优势, 但在临床实践中实现广泛应用仍面临一些挑战。首先, 目前大多数研究较少结合其他维度数据进行综合分析, 限制了可穿戴设备数据用于抑郁症评估的全面性和准确性。其次, 目前研究间存在较高异质性, 不同的可穿戴设备、机器学习算法都影响了研究结果, 因此开发普适性强且结论稳定的工具体系是需要解决的技术困难。再次, 虽然可穿戴设备提供了方便且连续的监测手段, 但过度依赖这些设备可能会忽视专业人员的临床判断, 抑郁症的评估治疗不仅需要关注生理、行为指标的变化, 还需要综合考虑患者的心理和社会因素。最后, 虽然人工智能技术提供了个性化反馈和干预的可能性, 但如何将这些技术与临床专业知识有效结合, 以改善患者的治疗效果, 仍然是一个重要的问题。

综上所述, 人工智能驱动的可穿戴技术在抑郁症领域展现了巨大的潜力, 但在技术与临床深度应用方面仍然有需要攻克的难题。通过不断完善技术并结合临床专业知识, 我们有理由相信人工智能驱动的可穿戴技术将在抑郁症等精神疾病领域扮演越来越重要的角色。

肠道谷氨酸代谢在抑郁症中的研究进展

吴静萍¹ 李荷花^{1,2} 李荷花³ 黄园园^{1,2,3} 张子韵¹
吴凯⁴ 黄东嫦⁵ 吴逢春^{1,2,3}

1. 广州医科大学附属脑科医院
2. 广东省精神疾病转化医学工程技术研究中心
3. 广东省神经科学疾病研究重点实验室
4. 华南理工大学广州国际校区
5. 东莞市大朗镇实验小学

目的 抑郁症是一种常见且危害极大的精神疾病,其患病率逐年上升、复发率高以及疾病负担重已成为全球的关注热点。目前一线抗抑郁药物主要有起效慢、疗效有限且副作用大等不足,增加了抑郁症的治疗难度。研究表明肠道菌群失调与抑郁症密切相关,尤其谷氨酸代谢发挥了重要作用,已成为研究抑郁症病理生理机制的重要代谢通路之一。因此,本文将对肠道菌群以及谷氨酸代谢参与抑郁症的作用机制进行综述。

方法 本文通过 PubMed 及中国知网 (CNKI) 数据库,对相关文献进行检索并分析,对关于肠道谷氨酸代谢在抑郁症中的相关研究性文章进行系统综述,在多种假说基础上探讨肠道谷氨酸代谢参与抑郁症的可能机制,包括肠道菌群改变对谷氨酸稳态、转运和代谢的可能的作用机制进行综述。

结果 抑郁症的谷氨酸代谢假说认为中枢神经系统谷氨酸能信息传递障碍,发病机制主要是通过提高中枢和外周谷氨酸浓度水平以及下调 N-甲基-D-天冬氨酸受体和谷氨酸转运蛋白等方式起作用,同时以肠道谷氨酸为中心的谷氨酰胺-谷氨酸- γ -氨基丁酸-中枢的代谢通路障碍与抑郁症也有一定的联系。但目前关于肠道谷氨酸代谢对抑郁症确切的调控机制的动物和人体试验研究较少,在肠道菌群和谷氨酸代谢的相关性研究中,很多问题仍然没有得到很好的阐明。

结论 谷氨酸作为中枢神经系统的兴奋性神经递质以及肠道的重要代谢物,与其相关的 N-甲基-D-天冬氨酸受体、谷氨酸转运蛋白及谷氨酰胺和 γ -氨基丁酸等代谢产物异常均会可能引起中枢神经系统谷氨酸信息传递及代谢发生障碍,这可能是谷氨酸参与抑郁症发病的重要关键点。

脑源性神经营养因子相关信号通路在抑郁障碍共病代谢综合征中的研究进展

王丽娜¹ 王思远^{1,2}

1. 山东省精神卫生中心
2. 济宁医学院

目的 抑郁障碍与代谢综合征共病不仅显著提高患者的死亡风险和自杀倾向,还导致巨大的经济负担和生活质量的显著下降。本文旨在探讨脑源性神经营养因子 (BDNF) 及其相关信号通路在抑郁障碍与代谢综合征共病中的作用机制,并分析其作为生物标志物和治疗靶点的潜在可能性。

方法 通过综述近年来关于 BDNF 及其相关信号通路在抑郁障碍和代谢综合征共病中的研究进展,分析其在神经生长、分化、存活和突触可塑性中的作用,特别关注 BDNF-TrkB 和 BDNF-p75NTR 信号通路在这两种疾病共病中的双向作用,结合流行病学研究和实验数据,对 BDNF 的作用机制进行了系统分析。

结果 研究表明,BDNF 水平在抑郁障碍和代谢综合征患者中显著降低。BDNF 与高亲和力受体 TrkB 结合后,激活 PI3K/Akt/mTOR、MAPK 和 PLC γ /IP3/CaMKII 等信号通路,促进神经元生长、存活和突触可塑性。而与低亲和力受体 p75NTR 结合的 proBDNF 则通过激活 JNK、NF- κ B 等通路,诱导神经元凋亡和炎症反应。此外,BDNF 及其下游信号途径的激活状态还可调节糖皮质激素受体 (GR) 的多个磷酸化位点,通过其受体 TrkB 激活的信号通路,包括 PI3K/Akt、PLC γ 和 ERK/MAPK 通路,能够影响 GR 的磷酸化状态,这不仅影响神经元的生存和突触可塑性,而且参与调控炎症反应和氧化应激,在抑郁障碍与代谢综合征的共病性中起着关键的桥梁作用。

结论 BDNF 可通过调节包括 PI3K/Akt/mTOR 在内的多个信号通路,在抑郁障碍和代谢综合征的共病发展中起到关键作用。此外,BDNF 信号通路在调节糖皮质激素受体磷酸化过程中的作用,为理解抑郁障碍与代谢综合征共病中的应激反应和炎症机制提供了新的视角。未来的研究应着眼于探索 BDNF 信号通路在不同生理和病理状态下的具体机制,并开发出针对这一信号通路的精准干预措施。

Effect of Non-Enzymatic Antioxidants on Cognitive Function in First-episode Drug-naïve Patients with Major Depressive Disorder

Ziyun Zhang¹, Yuanyuan Huang^{1,2,3}, Sumiao Zhou¹, Hehua Li^{1,2,3}, Fengchun Wu^{1,2,3}

1.The Affiliated Brain Hospital of Guangzhou Medical University

2.Guangdong Engineering Technology Research Center for Translational Medicine of Mental Disorders

3.Key Laboratory of Neurogenetics and Channelopathies of Guangdong Province and the Ministry of Education of China

Objective Cognitive dysfunction is a symptom that persistent and difficult to treat in major depressive disorder (MDD), receiving increasing attention. A balanced state of oxidative stress is essential for the normal function of brain including learning capacity, emotional regulation and cognitive function. The correlation between cognition and oxidative stress might change in patients with mental diseases. Thus, this study aims to explore the relation between serum antioxidants and cognition of MDD patients

Methods Collecting and matching cognitive performance with MATRICS Consensus Cognitive Battery (MCCB), serum antioxidants, demographic and clinical characteristic of 105 first-episode drug-naïve MDD patients and 53 healthy controls (HC) before we analyzed the differences between the two groups. Serum non-enzymatic antioxidants, including albumin (ALB), uric acid (UA), superoxide dismutase (SOD) and C-reactive protein (CRP), were measured to detect the level of oxidative stress of participants and its correlation with cognitive function. Then we used the 1.5 standard deviations below the mean of the standard score as the threshold for cognitive impairment to divided MDD participants into two groups to detect the relevant elements of five different domains of cognitive dysfunction in MDD

Results ALB was significantly lower in MDD group ($p=0.001$), while CRP were higher than HC ($p=0.017$), after adjusting for education years. All five dimensions of cognitive function were significantly

lower in the MDD group than HC ($p<0.001$). Speed of processing (SOP) in MDD group correlated with ALB ($r=0.281$, $p=0.004$) and UA($r=0.325$, $p=0.001$) excluding the effect of years of education between the two groups. We also explore the significant correlation between attention/vigilance (AV) domain and UA ($r=0.272$, $p=0.005$). The regression effect model for levels of UA and ALB associated with the SOP domain was significant ($F=7.322$, $p=0.001$) and this model was able to explain 12.6% of the variance in the SOP results. A regression effect model for UA in relation to the AV dimension was also present ($F=6.941$, $p=0.01$). In MDD group, ALB($r=0.257$, $p=0.008$) and UA($r=0.298$, $p=0.003$) were correlated with SOP scores. UA was a protective factor against impairment of the SOP, with a 0.006-fold reduction in the risk of SOP impairment for each 1-unit increase of UA

Conclusion As non-enzymatic serum antioxidants, ALB and UA may be prospective biomarkers of cognitive function in patients with MDD. Our findings contribute to understanding the ability of serum antioxidants to predict cognitive decline in individuals and provide new targets for treatment of cognitive impairment of MDD patients

关键词: major depression disorder, cognitive function, albumin, uric acid

精神卫生法在司法鉴定中的实施现状综述

颜涵春 刘忠纯*

武汉大学人民医院精神卫生中心

目的 《精神卫生法》自修订以来,促进了司法鉴定的法律依从与可信用度,使得鉴定有法可依、有据可循。但在实施过程中,仍存在鉴定程序的不规范、鉴定机构的不规范导致“被精神病”等问题。精神司法鉴定应承担起保障刑事诉讼公平、正义的责任,在施行中遵循程序正义,在鉴定中谨遵鉴定准则,鉴定人员应竭尽所能去查证,令有罪者伏法,无辜者免受伤害。

方法 21世纪以来,人口数量逐步增长,现代人的生存压力随之剧增,精神相关疾病的发病率逐

渐增高。如何依法进行精神疾病鉴定，如何保障精神患者的相关权益，仍是值得深思和探究的问题。本文从《精神卫生法》立法的目的、内容与现行实施案例入手，考虑《精神卫生法》的内容与意义，并与美国精神卫生制度的并行比较；同时简要评述我国精神卫生法在实施中给予鉴定的参考意义，包括涉刑精神病强制医疗与非刑精神病强制医疗。结合校园犯罪与精神疾病的关系，浅析精神卫生法。

结果 我国第一部精神相关法律是《中华人民共和国精神卫生法》，于2012年确立，2013年实施，2018年重新修订并施行。这一版本完善了前一版本的不足，但在保障精神疾病患者权利方面仍有一定缺陷。但不可否认的是，它对于推动我国精神卫生事业的健康发展，保障精神患者的合法权益，促进司法精神鉴定的合理规范化有着重大影响。被精神病现象的产生，其实根本原因在社会与道德问题期待于法律来解决是不可行的。《精神卫生法》在如何具体明确强制医疗的人员方面仍存在漏洞，应与国情适应、与国际接轨，从而更好地保障人权等一系列问题。而对于校园犯罪，应加强高校危机干预，将精神疾病从小处预防，减少校园犯罪的发生率。

结论 在国家层面，立法者应更注重严重精神疾病患者得不到强制医疗的现象，行政部门应努力解决财政投入短缺、资金不够、人员不足等一系列问题，加强违法犯罪人员的精神鉴定。同时，应进一步修缮以“高校—心理咨询机构—班级—寝室”为核心的四级心理危机干预制度。而当学生处于高危状况时，学校应及时将学生送往医院进行抢救与治疗，并同时通知其家长，先保证学生的生命安全，再寻求学生的心理修复，从而减少精神疾病的发生，降低校园犯罪率。

Video Gaming During Coronavirus Pandemic in Adolescents: Disorder Or Self-medication?

Zipeng Deng Zhongchun Liu*

Renmin Hospital of Wuhan University

Objective The purpose of this article is to ex-

plore the interaction between video games and adolescents during the pandemic

Methods Retrieve relevant studies on Internet-and-Mobile-Based Interventions (IMIs) from databases such as Pubmed and Cochrane Library, including reviews, systematic reviews, meta-analyses, and various current studies and prospective studies

Results The results indicate a significant increase in gaming among adolescents during the pandemic, associated with both positive outcomes (e.g., enhanced well-being and social connections) and negative consequences (e.g., addiction, social dysfunction, and exacerbation of psychiatric disorders)

Conclusion In concluding this review, we explore the nuanced interplay between video games and adolescents in the context of the COVID-19 pandemic, highlighting the potential of video games to serve both as beneficial tools and sources of risk. The pandemic has undeniably increased gaming among adolescents, which has been linked to positive outcomes such as improved well-being and social connections, as well as negative consequences like addiction, social dysfunction, and the aggravation of psychiatric disorders. We argue for the importance of recognizing video games' dual nature and the necessity of fostering balanced gaming practices. It is imperative to raise awareness among adolescents, their families, and educators about the risks of excessive gaming, while also acknowledging and leveraging the positive aspects of gaming. By promoting healthy gaming habits, we can help ensure that video games serve as a force for good in the lives of adolescents, particularly in challenging times like these

发病年龄对女性抑郁症患者大脑功能连接的影响

聂昭雯 刘忠纯*

武汉大学人民医院

目的 抑郁症是一种病因复杂的、造成极大疾病负担的精神疾病，其患者的性别差异十分显著。青春期起病和成人起病的抑郁症具有不同的临床特点，因此有研究认为是不同的抑郁症亚型。本研究将的主要目的是探索早发女性抑郁症和晚发女性抑郁症在大脑功能连接上的差异。

方法 研究对象为2019年4月至2022年10月就诊于武汉大学人民医院精神卫生中心门诊的抑郁症患者，所有的参与者由两名有经验的精神科医生根据DSM-5诊断为抑郁症。使用自制一般信息调查问卷收集患者年龄、性别、受教育程度、童年是否与父母分离等一般人口学信息及起病年龄、病程、复发次数、门诊次数、病程中是否有自伤行为及消极想法等临床信息。汉密尔顿抑郁量表(HAMD-17)、9项患者健康问卷(PHQ-9)、汉密尔顿焦虑量表(HAMA)、广泛性焦虑量表(GAD-7)用于评估患者的抑郁及焦虑严重程度。斯奈斯-汉密尔顿快感量表(SHAPS)评估患者快感缺失严重程度。童年创伤问卷(CTQ)评估患者16岁前发生的创伤事件。参与者在完成量表1周内进行核磁共振扫描。根据首次发病年龄将起病年龄 ≤ 19 岁分为早发组(85人)，将起病年龄 > 19 岁分为晚发组(人)。基于matlab2013b，在网际FC计算之前，对所选RSN的时间过程执行了以下额外的后处理步骤：(a) 去趋势线性、二次和三次趋势；(b) 对检测到的异常值进行尖峰化处理；(d) 截止频率为0.15 Hz的低通滤波。然后提取每个受试者每个IC的平均时间过程。网际FC估计为每个受试者所有IC对的平均时间过程之间的Pearson相关系数，为每个参与者生成 $C \times C$ 相关矩阵。随后，使用Fisher的r-to-z变换将r值转换为z值，以提高正态性。

结果 在多个RSN中，两组受试者的FC存在显著差异(体素阈值为 $p < 0.001$ ，GRF校正阈值为 $p < 0.05$ ，图3)。与AOS组相比，EOS组受试者在AN左舌回、DAN右舌回、RFPN右颞上回(Temporal_Sup_R)、SN左中央后回、VN右舌回(Frontal_Inf_Tri)FC升高，VN左额下回FC降低。

结论 童年期情感虐待与抑郁症的早发存在相关，早发的抑郁症可能影响大脑功能连接效率。

HIV 阳性男男性行为者睡眠障碍及影响因素

郑一雄¹ 陈汝彬¹ 郑彩霞² 曾建勇²

1.厦门市精神卫生中心=厦门市仙岳医院

2.厦门大学附属第一医院

目的 本研究调查福建省厦门地区HIV阳性男男性行为者(MSM)群体的睡眠障碍发生率，并探讨其影响因素。并为降低睡眠障碍的发生率，提出建设性建议。

方法 运用“问卷星”平台对就诊于厦门大学附属第一医院感染科接受治疗的HIV感染者进行横断面研究，对500例HIV感染者的社会人口统计学变量进行收集，其中包括年龄、月收入、住房条件、吸烟和饮酒等基本信息，采用匹兹堡睡眠质量指数(PSQI)问卷、广泛性焦虑量表(GAD-7)和患者健康问卷-9(PHQ-9)等自评工具，评估其睡眠质量以及焦虑和抑郁等心理健康状况。

结果 本研究调查HIV阳性男男性行为者共280例，福建省厦门地区HIV阳性男男性行为者睡眠障碍的检出率为43.9%，要显著高于一般人群19.6%，logistics回归分析显示，其中的风险因素包括：饮酒量超过3瓶啤酒(330ml)且每周饮酒超过5天(OR=3.076; 95%CI: 1.165~8.121, $p=0.023$)；存在焦虑症状(OR=2.946, 95%CI: 1.067~8.138, $p=0.037$)；存在抑郁症状(OR=4.966, 95%CI: 2.610~9.448, $p=0.001$)。

结论 HIV阳性男性同性恋者群体中，睡眠障碍的患病率较高，其主要影响因素包括高酒精摄入量以及显著的焦虑和抑郁症状。饮酒量大的感染者睡眠质量较差，焦虑和抑郁症状严重的感染者睡眠质量也较差。因此，应更加关注HIV阳性男性同性恋者群体的睡眠与情绪问题，制定更具针对性的心理和生理干预措施，营造更包容的环境，以全面提升其生活质量。

Network Analysis of Insomnia and Cognitive Performance Among Medical Staff

Qinge Shen^{1,2}, Jian Cui¹, Yang Wu^{1,2}, Xiaochi Yuan¹,

Min Chen¹, Jingjing Zhou³

1. Shandong Daizhuang Hospital

2. Jining Medical University

3. Capital Medical University

Objective This study aimed to elucidate the network structure of the co-morbidity between cognitive deficits and insomnia symptoms within hospital medical staff

Methods The investigation spanned from September 13 to 19, 2022, across Jining and Qingdao regions, recruiting 657 medical staff participants. The study employed the Perceived Deficits Questionnaire for Depression (PDQ-D) and the Athens Insomnia Scale (AIS) to assess cognitive function and insomnia symptoms, respectively. A regularized partial correlation network analysis scrutinized the symptomatology, emphasizing the centrality and predictability of the items. Statistical analysis and network visualization were conducted using R software

Results The network analysis identified PDQ items 13 ("absent-mindedness") and 17 ("difficulty remembering numbers shortly after viewing them") as central within the Cognitive Functioning-Insomnia network. Additionally, AIS items 6 ("daytime emotional disturbances") and 8 ("daytime sleepiness"), along with PDQ item 13, emerged as pivotal bridging symptoms linking cognitive deficits to insomnia. Gender did not significantly influence network global strength, edge weight distribution, or individual edge weights

Conclusion The findings indicate that "absent-mindedness" and "difficulty remembering numbers shortly after viewing them" represent the principal symptoms of concurrent cognitive impairment and insomnia among hospital medical staff. Interventions focusing on these symptoms could potentially ameliorate the co-morbidity of cognitive dysfunction and insomnia in this population

Bipolar Disorder with Borderline Personality

Disorder Comorbidity: Insights Into Cognitive and Personality Impairments

Qilin Zhong Yanbin Jia*

First Affiliated Hospital, Jinan University, Guangzhou 510630, China

Objective Despite the recognized prevalence of cognitive and personality impairments in bipolar disorder (BD), the specific impact of comorbid borderline personality disorder (BPD) on these domains remains insufficiently understood. The purpose of this study is to investigate the impact of comorbid BPD on cognitive and personality impairments in patients with BD and to identify independent risk factors for this comorbidity

Methods We assessed 38 unmedicated with BD-II and BPD comorbid, 47 with BD-II patients, and 30 healthy controls using the Chinese version of the MATRICS Consensus Cognitive Battery (MCCB), and the Minnesota Multiphasic Personality Inventory (MMPI). Statistical comparisons across groups were made using one-way ANOVA or Kruskal-Wallis tests, correlation analyses were performed with Pearson or Spearman methods, and binary logistic regression identified independent risk factors

Results Comorbid patients showed significant cognitive deficits in attention/vigilance, verbal learning, and social cognition, and composite scores, with elevated MMPI scores in hypochondriasis, depression, psychasthenia, paranoia, and schizophrenia scales. Independent risk factors identified in BD patients for BPD comorbidity include non-suicidal self-injury, MCCB composite scores, hypochondriasis, and masculinity-femininity

Conclusion The study emphasizes the importance of early detection and tailored interventions for BD patients with BPD comorbidity. Addressing cognitive and personality impairments is crucial for improving treatment outcomes

缺氧诱导因子-1 调节抑郁症的机制研究进展

吴澜 王高华*
武汉大学人民医院

目的 总结探讨缺氧诱导因子-1 调节抑郁症的机制研究进展

方法 第一作者在 2024 年 3 月至 2024 年 6 月于中国知网学术期刊数据库、万方学术期刊数据库、PubMed 及 Web of Science 检索国内外文献；其中检索项为：主题词+关键词；中文检索式为“抑郁症”and“缺氧诱导因子”；英文检索式为#1：“depressive disorder” OR “depression” OR “MDD”；#2：“hypoxia inducible factor 1” OR “HIF-1”；#3：“vascular endothelial growth factor” OR “VEGF”；#4：“erythropoietin” OR “EPO”；#5：“energy metabolism”；#6：“neuroinflammation”；#7：“oxidative stress”；#8：“#3 OR #4 OR #5 OR #6 OR #7”；#9：“#1 AND #2”；#10：“#1 AND #7”；#11：“#2 AND #7”。检索文献时间限制为 2013 年至 2024 年，共检索出 348 篇相关文献。纳入标准：研究主题为 HIF-1 与抑郁症的文献；研究对象为啮齿类动物或人类的文献；近 10 年公开发表的中文或英文文献。排除标准：案例报道、会议论文、专家论述等文体；重复文献；无法获取全文的文献。根据文献纳入排除标准，最终筛选并引用文献 46 篇。

结果 抑郁症是以持续而显著的心境低落为主要特征的一类精神障碍，病因复杂且复发率高，现阶段仍需要更加精准有效的诊疗方式。越来越多的研究表明，缺氧诱导因子-1 (hypoxia inducible factor 1, HIF-1) 及相关通路参与调节抑郁症的发展与恢复。HIF-1 表达的增加可以激活下游众多靶基因，如血管内皮生长因子、促红细胞生成素、脑源性神经营养因子、葡萄糖转运蛋白等，促进神经发生，提高突触可塑性，调节神经炎症反应，改善大脑能量代谢，减轻氧化应激。此外，间歇低氧训练和促进 HIF-1 表达的相关药物在临床前研究中已证明其抗抑郁效果。

结论 本文将国内外相关研究进展总结归纳，从神经可塑性、神经炎症、能量代谢、氧化应激等方面论述 HIF-1 对抑郁症的调节作用及可能机制，并探讨针对 HIF-1 水平调节的抗抑郁治疗前景，或可为抑郁症发病机制及治疗研究点亮新思路。

新型冠状病毒疫情密接人员心理状态的分析

郑一雄* 陈汝彬 聂小伟 李宏凌 董学体 陈志敏 庄彦
厦门市精神卫生中心=厦门市仙岳医院

目的 了解疫情对于民众的心理健康状况及其影响因素，在为针对民众的健康教育和心理支持提供参考和依据。

方法 选取在 2021 年 9 月 11 日~2021 年 10 月 7 日厦门市同安区新型冠状病毒爆发期间，民众面对突然发生的重大公共卫生事件的心理应激状况，我们利用问卷星软件，要求密接人员进行在线问卷填写。经筛查分析获取有效问卷 1025 份，有效问卷占比为 81.3%，使用 ISI 失眠严重程度指数量表、PHQ-9 抑郁症筛查量表、GAD-7 焦虑症筛查量表，比较密接人群包括居住酒店、年龄、性别、学历、婚姻情况。运用二元 logistic 回归分析；以 $P < 0.05$ 为差异有统计学意义。

结果 年龄是独立与焦虑症高风险相关的因素 $P < 0.001$ ，与总体心理问题风险增加独立相关 $P = 0.026 < 0.05$ 。

结论 其中年龄是焦虑、整体心理问题的独立危险因素。这提示我们年龄增高会导致更严重的焦虑和总体心理问题，这一现象可能与中老年人群在日常生活中拥有较多空闲时间可以关注疫情变化和进展，加上媒体的渲染，以及面对周围街坊邻里相继被感染的对于病情的恐惧会加重激反应。这些种种原因可能会加重这类人群的焦虑和总体心理问题，因此关注年龄较大人群的心理健康问题，提高他们面对这类突发事件的应急处理能力，缓解他们的心理压力，帮助梳理疫情期间面临的心理问题，提供必要的心理指导治疗，及时发现并给予干预处理。

大学生学业倦怠结构及其与抑郁症状关系的网络分析

王显阳¹ 杨梦圆¹ 任垒² 武圣君¹

1.空军军医大学军事医学心理学系

2.武警后勤学院基础部

目的 本研究旨在验证倦怠的维度结构,以及倦怠与抑郁症状是否存在概念重叠。通过网络分析的建模,为解决理论问题提供网络视角的证据。

方法 我们使用马斯拉赫职业倦怠量表(学生调查)和病人健康问卷抑郁量表(PHQ-9)分别评估了1096名大学生学业倦怠和抑郁症状的严重程度。我们采用网络分析的方法,通过R软件构建倦怠症状网络、抑郁症状网络和倦怠-抑郁共现网络,并计算网络中节点的预期影响(expected influence, EI)和桥预期影响(bridge expected influence, BEI)。

结果 去个性化症状“对学习越来越不感兴趣”具有最高的预期影响(EI=1.255),是学业倦怠网络中最为核心的症状。在共现网络中,抑郁症状“快感缺失”(BEI=0.161)、“疲劳”(BEI=0.109)和倦怠症状“怀疑学习的意义”(BEI=0.107)具有最高的桥预期影响,是导致倦怠-抑郁共现的最重要症状。社团检测结果表明,倦怠症状网络中有三个社团,分别符合其因子分析确定的三个维度。此外,倦怠和抑郁社团之间没有症状的重叠。

结论 当前研究结果支持倦怠的多维度理论,并为倦怠作为一个独立于抑郁障碍的构念提供了网络视角的证据。同时,去个性化症状而不是情绪耗竭,在倦怠以及倦怠与抑郁症状的共病中起最重要的作用。

关键词:倦怠;抑郁;网络分析;共病

精神分裂症和重性抑郁障碍患者感觉门控P50抑制缺陷与认知功能损害的特征分析

郎小娥* 兰宇

山西医科大学第一医院

目的 本文旨在分析首发精神分裂症(SZ)患者与首发重性抑郁障碍(MDD)患者感觉门控P50抑制缺陷程度与其认知功能损害程度之间的差异和交互关系,验证是否感觉门控P50比值越大则其认知功能损害程度越严重,并建立诊断预测模型。

方法 收集符合DSM-5诊断标准和排除标准的102例首发SZ患者和83例首发MDD患者作为受试对象。收集其一般人口学资料,检测其P50成分,并采用重复性成套神经心理状态测验量表(RBANS)评估其认知功能。采用R 4.3.0对数据进行统计学分析。

结果 (1)首发SZ患者的S1潜伏期小于首发MDD患者($P<0.05$),而S2波幅和P50比值均大于首发MDD患者($P<0.05$)。(2)首发SZ患者认知功能的即刻记忆、视觉广度、言语功能、注意力和延时记忆等5个维度分值和认知功能总分值均低于首发MDD患者($P<0.05$)。(3)首发SZ患者的S2波幅与其即刻记忆、延时记忆、视觉广度和认知功能总分值均呈显著负相关(均 $P<0.01$),P50比值与其4个维度(除言语功能外)和认知功能总分值均呈负相关($P<0.05$),经FDR校正后,上述负相关关系依然存在($P<0.05$);而首发MDD患者的S2波幅、P50比值与其认知功能各维度分值以及认知功能总分值之间均不存在相关性($P>0.05$)。(4)以受试者的S2波幅、P50比值、认知功能的即刻记忆和言语功能维度分值和认知功能总分值分别作为预测因素构建诊断预测模型,曲线下面积(Area Under Curve, AUC)值分别为0.654、0.653、0.851和0.803。本研究还同时以P50比值与即刻记忆和言语功能维度分值、以P50比值和认知功能总分、以S2波幅和认知功能总分、以S2波幅和认知功能的即刻记忆和言语功能维度分值分别作为预测因素构建了4个综合诊断预测模型,AUC值分别为0.849、0.798、0.789和0.846。在上述8个诊断预测模型中,以认知功能的即刻记忆和言语功能维度分值为预测因素构建的模型AUC值最大,为0.851,其预测效果最好,可作为SZ和MDD患者诊断的预测因素,其校准曲线和临床决策曲线表明该模型具有很好的校准度和临床决策效用。

结论 首发SZ患者感觉门控P50抑制缺陷程度和认知功能损害程度均较首发MDD患者更加严重。此外,首发SZ患者感觉门控P50抑制缺陷越严重,其认知功能损害程度也越严重。基于感觉门控P50成分、P50比值和认知功能评分构建的诊断预测模型可作为首发SZ患者和首发MDD患者诊断和鉴别的生物学标志物,具有较高的临床应用价值,值得被推广。

A Network Analysis Study of Anxiety and Depression Among College Students Before and After The COVID-19 Pandemic Lockdown Lift: A Focus on The Transition Period

Guifang Chen* Jiali Liu Wanting Ran

Department of Psychiatry, Affiliated Hospital of Zunyi Medical University, Zunyi, Gui Zhou, 563000, China

Objective With the development of the COVID-19 pandemic, symptoms of depression and anxiety have increasingly manifested themselves in Chinese college students. Most existing studies are cross-sectional, and the longitudinal study of anxiety and depression symptoms at the symptom level are rarely described. The purpose of this study is to clarify the changes and interrelationships of anxiety and depression symptoms in Chinese college students before and after the lifting of the COVID-19 pandemic lockdown by network analysis

Methods The symptoms of the same population during the lockdown and unlockdown period were taken as nodes, the partial correlation coefficient between the two nodes was taken as the edge, and the connection between depression and anxiety symptoms was taken as a bridge, so that the relationship between symptoms was mapped as a visual graph. To explore the relationship and change characteristics of anxiety and depression symptoms in college students during lockdown period and after lockdown

Results the strongest positive edge was between “STAI3: I am tense” and “STAI4: I feel strained”, with the correlations of 0.38. followed by between “STAI15: I am relaxed” and “STAI16: I feel content”, with the correlations of 0.34; and between “BDI5: Guilty feelings” and “BDI6: Punishment feelings”, with the correlations of 0.32. only one connections were negative. the strongest edge was between “STAI10: I feel comfortable” and “STAI14: I feel indecisive”, with the correlations of -0.004; The positively correlated edges at T2 are the same as T1. The same edge between “STAI3: I am tense” and “STAI4: I feel strained” with the correlations

of 0.41, between “STAI15: I am relaxed” and “STAI16: I feel content”, with the correlations of 0.38 and between “BDI5: Guilty feelings” and “BDI6: Punishment feelings” with the correlations of 0.33. Compared with the positive correlations, only one connections were negative, but the negative correlation edge was different. The different edge in the T2 network were between “STAI17: I am worried” and “BDI19: lost much weight”, with the correlations of -0.017

In the top 10 % of bridge symptoms Nodes were “BDI1: Sadness”, “STAI17: I am worried”, “STAI11: I feel self-confident”, “BDI2: Pessimism” at T1(0.15, 0.09, 0.06, 0.06). In the top 10 % of bridge symptoms Nodes at T2 are differences. The bridges were “STAI14: I feel indecisive”, “STAI9: I feel frightened”, “BDI13: Indecisiveness” and “BDI6: Punishment feelings” (0.16, 0.15, 0.09 0.08). In the top 10 % of expected influence symptoms during the T1 period, the node of “STAI16: I feel content” was strongest, followed by “STAI18: I feel confused”, “STAI4: I feel strained”, “STAI20: I feel pleasant”. (1.00, 0.99, 0.93, 0.91). In the top 10 % of expected influence symptoms during the T2 period, the node of “STAI15: I am relaxed” was strongest, followed by “STAI10: I feel comfortable”, “BDI20: Agitation or worried about my physical problems”, “STAI9: I feel frightened” (1.07, 0.93, 0.91, 0.90). The strongest positive predictions in the CLPN were from “STAI13: I am jittery” to “STAI7: I am presently worrying over possible misfortunes”; from “STAI13: I am jittery” to “STAI18: I feel confused”; and from “BDI6: Punishment feelings” to “STAI9: I feel frightened” (0.18, 0.18, 0.13). While the edges from “BDI18: Changes in appetite” to “BDI8: Self-criticalness”; from “STAI11: I feel self-confident.” to “BDI16: Changes in sleeping pattern” and from “STAI11: I feel self-confident” to “BDI21: Loss of interest in sex” showed the stronger negative predictions (-0.11, -0.10, -0.07).

Conclusion This study is the first to use network analysis and cross-lag analysis to investigate the relationship between anxiety and depression symptoms from the horizontal and longitudinal perspectives of the COVID-19 outbreak and lockdown period and the COVID-19 lockdown period, and explore the core

symptoms, the changes of symptom nodes, and the interaction between different symptoms in the anxiety and depression symptom network of college students, suggesting the possible causal relationship between symptoms, and the important bridge symptoms in the network. We found that anxiety and depression during the lockdown period were significantly higher than those unlockdown period

关键词: College students; Depression; Anxiety; Comorbidity; Network analysis; Cross-lagged panel network analysis

精神分裂症和重性抑郁障碍患者 fNIRS 脑血流动力学改变与其认知功能损害的特征研究

郎小娥* 李文昕

山西医科大学第一医院

目的 本文旨在探讨精神分裂症 (Schizophrenia, SZ) 和重性抑郁障碍 (Major Depressive Disorder, MDD) 患者的功能性近红外光谱成像技术 (Functional Near-Infrared Spectroscopy, fNIRS) 脑血流动力学改变和其认知功能损害之间的交互关系, 并构建诊断预测模型。

方法 收集符合 DSM-5 诊断标准和排除标准的 62 例 SZ 患者与 43 例 MDD 患者作为受试对象。收集其一般人口学资料, 检测其脑血流动力学改变数据, 采用 RBANS 评估其认知功能。采用 SPSS 26.0 软件对数据进行统计学分析。

结果 (1) SZ 患者的即刻记忆、延时记忆、视觉广度、言语功能和注意力等 5 个认知维度的分值均低于 MDD 患者 ($p < 0.05$)。 (2) SZ 患者额叶任务态重心值 (CV)、双侧颞叶任务态 CV 均高于 MDD 患者 ($p < 0.05$)。 (3) SZ 患者的言语功能维度分值与额叶静息态积分值 (IV) 和双侧颞叶静息态 IV 均呈正相关 ($p < 0.05$)； (4) MDD 患者其即刻记忆维度分值与其前额叶静息态 CV 呈正相关 ($p < 0.05$)、与其双侧颞叶静息态斜率值呈负相关 ($p < 0.05$)、与其双侧颞叶任务态 CV 呈显著负相关 ($p < 0.01$)； MDD 患者的延时记忆维度分值、认知总分值均与其双侧颞叶任务态 CV 呈显著正相关 (均 $p < 0.01$)。

(5) Logistic 回归分析结果表明能够区分 SZ 和

MDD 的主要参数包括即刻记忆、言语功能以及额叶任务态 CV。以即刻记忆、言语功能、额叶任务态 CV 分别作为预测因素构建 SZ 和 MDD 诊断预测模型, 曲线下面积 (AUC) 分别为 0.778、0.741 和 0.687。说明预测模型对于 SZ 和 MDD 的诊断和鉴别诊断价值较大: 即随着即刻记忆、言语功能得分增加, 患者被诊断 SZ 的风险减小, 被诊断 MDD 的风险增大, 随着额叶任务态 CV 的增加, 诊断 SZ 的风险增大, 诊断 MDD 的风险减小。

结论 (1) 与 MDD 患者相比, SZ 患者更易表现出额叶和双侧颞叶任务态重心值增高和更差的认知功能。(2) 受试者额颞叶脑血流动力学减慢可能影响其认知功能。(3) 即刻记忆、言语功能以及额叶任务态 CV 有望成为预测 SZ 和 MDD 患者的生物学诊断参数。

Psycho-Social Factors Associated with Recent Suicide Attempts Among 12–25-Year-Old High-Suicide-Risk Callers To A Suicide Prevention Hotline in China

Jianlan Wu Yongsheng Tong*
Beijing Huilongguan Hospital

Objective This study explores the differences in demographic and psychosocial characteristics between high-suicide-risk AYA callers with serious suicide plans and recent suicide attempts, investigating potential factors related to recent suicide attempts in this specific population. These findings are expected to facilitate the development of more indicated suicide prevention measures for high-suicide-risk AYA callers.

Methods This study was conducted at the Beijing Psychological Support Hotline. All AYA callers assessed as having a high-suicide risk (defined as intending to carry out suicidal acts within 72h or reporting suicide attempts occurring within the last two weeks or ongoing), were recruited from January 2017 to December 2018. They were categorized into two groups: a suicide plan group (with serious suicide plans to be carried out within 72h) and a suicide attempt group (with recent suicide attempts, ongoing, or within the last 2 weeks). Psychosocial characteristics such as the severity of depression, alcohol or substance misuse, suicide attempt history, and acute and chronic life events were assessed using a structured interview during the calls. Chi-square tests and logistic regression analysis were employed to explore the differences between the two groups and associated psychosocial factors with recent suicide attempts.

Results From January 1, 2017, to December 31, 2018, 2,345 high-suicide risk calls from AYAs were identified. Among these, 345 calls were duplicates, resulting in 2,000 individual high-suicide risk AYA sampled for this study. There were 1,130 (56.5%) individual AYA callers in the suicide attempt group and 870 (43.5%) individual AYA callers in the suicide plan group.

Among all the recruited participants, there were 1,210 females (60.5%) and 790 males (39.5%). The average age was (19.5±3.4), with 655 adolescents (12–17 years old) and 1,345 young adults (18–25 years old). In terms of educational level, 2.5% were in elementary school or below, 23.1% in middle school, 35.5% in high school, and 37.2% were at university or above. Regarding marital status, 96.4% were unmarried and 3.4% were married or cohabiting.

In terms of psychosocial characteristics, 728 individuals (36.4%) experienced severe depression in the last two weeks, 226 individuals (11.3%) experienced alcohol or substance abuse, 1,007 individuals (50.4%) had chronic life events, 927 individuals (46.4%) experienced acute life events, 184 individuals (9.2%) had severe physical illnesses, 355 individuals (17.8%) had a history of being abused, 421 individuals (21.1%) feared of being attacked, 781 individuals (39.1%) had a history of suicide among relatives or acquaintances, and 1,055 individuals (52.8%) had a history of suicide attempts.

Compared with the suicide plan group, the callers in the suicide attempt group were more likely females (69.6% v 48.7%, $\chi^2 = 88.9$, $P < 0.001$) and were less likely young adults (61.2% v 75.1%, $\chi^2 = 42.6$, $P < 0.001$). There was a statistically significant difference in the educational level of callers between the two groups (elementary school and below 2.83% v 2.07%, middle school 26.2% v 19.0%, high school 35.3% v 35.7%, and university and above, 34.2% v 41.0%; $\chi^2 = 18.4$, $P < 0.001$). The proportion of callers with a suicide attempt history was higher in the suicide attempt group than in the suicide plan group (59.7% v 43.7%, $\chi^2 = 32.8$, $P < 0.001$), while other variables showed no statistically significant difference between the two groups.

After adjusting for sex and age, a history of prior suicide attempts (OR = 1.53) and alcohol or substance abuse (OR = 1.37) were associated with recent suicide attempts.

Conclusions Consistent with previous research on general callers, our findings showed that a history of prior suicide attempts is the main correlate of recent suicide attempts among high-suicide risk AYA callers. Callers with a history of suicide attempts may exhibit certain cognitive biases, such as dichotomous thinking

or irrational beliefs that impede rational self-guidance, potentially leading them to cope with stressful life events using hazards or other extreme measures. Moreover, they may have acquired a maladaptive problem-solving approach, that is, addressing adverse conditions through suicide attempts. Therefore, it may be crucial to emphasize the improvement in coping skills of high-suicide-risk AYA callers, especially those reporting prior suicide attempts.

Our findings indicated that alcohol or substance misuse was also associated with recent suicide attempts among high-suicide risk AYA callers, consistent with previous research findings. Previous studies have indicated that for individuals with impulsive and risk-taking traits, chronic alcohol abuse could exacerbate maladaptive coping behaviors, impair self-regulation, and consequently elevate the risk of suicide. Moreover, prolonged use of opioid drugs may lead to neurobiological changes that contribute to the elevation of negative emotions, which confers suicide risk to individuals with alcohol misuse. Therefore, it is imperative to pay attention to callers with alcohol or substance misuse, educate them on the detrimental effects of alcohol or substance misuse, and refer them to professional facilities.

Previous studies have indicated that depression was a key risk factor for suicide attempts; however, our findings indicated that for high-suicide risk AYA callers, a higher level of depression did not necessarily lead them from having serious suicidal plans to actually making suicide attempts. A potential explanation is that among AYA callers with high suicide risk, depression is no longer sensitive enough to differentiate those with recent suicide attempts from those with serious suicide plans only. Undoubtedly, depression is a key risk factor for suicidal behavior; however, it might not be an essential pathway from ideation to planning to implement such behaviors.

These results indicated that among AYA callers at high suicide risk, relatively older callers were less likely to report recent suicide attempts ($OR = 0.53$) and female callers were more likely to report recent suicide attempts ($OR = 1.96$), similar to previous studies. Compared with adolescents, young adults may have an increased ability to alleviate negative emotions and solve

practical problems owing to their higher levels of education and increased social experiences. Additionally, previous reports have suggested that females are more likely to attempt suicide than males, especially with impulsive or low intent in the general population and youth.

While receiving calls from high-suicide risk AYA callers, hotline counselors should focus more on callers with previous suicide attempts and alcohol or substance misuse, and implement indicated suicide prevention measures via hotline.

腹侧被盖区多巴胺能神经元参与调控焦虑样行为研究进展

张逸¹ 张逸² 王三旺³ 杨璐^{1,2} 彭劲涛^{1,2} 孙丰蛟² 崔明湖²

1. 滨州医学院
2. 滨州医学院附属医院
3. 北京大学第六医院

目的 为深入探讨关于腹侧被盖区 (ventral tegmental area, VTA) 多巴胺能神经元参与调控焦虑样行为的研究进展, 本文分别综述生理及病理状态下, VTA 多巴胺能神经元参与的神经环路对焦虑样行为的调控作用、VTA 神经递质与焦虑样行为的关系以及相关影像学研究进展, 从而为未来的治疗发展提供路线图。

方法 本文通过查阅大量相关文献, 对 VTA 多巴胺能神经元参与调控焦虑样行为进行综合分析和归纳, 全面了解 VTA 多巴胺能神经元参与调控焦虑样行为的研究动态和进展。

结果 动物研究结果表明 VTA 多巴胺能神经元参与侧隔、伏隔核、脚间核、中央杏仁核等多条神经投射环路, 这些环路可分别对生理或病理状态下的焦虑样行为起调控作用; 多巴胺是 VTA 主要神经递质, 可通过多巴胺 D1 和 D2 受体调控焦虑; 此外, VTA 中的谷氨酸、 γ -氨基丁酸、乙酰胆碱在调控焦虑中也起到直接或间接作用。临床影像学研究发现焦虑障碍组多巴胺能 VTA 结构完整性低于健康对照组。

结论 本文对生理及病理状态下 VTA 参与调节焦虑样行为的神经环路及相关神经递质进行总结, 这为明确焦虑障碍的发病机制提供了路线图。新兴的影像研究使得 VTA 定向分析可视化成为可能, 为焦虑障碍的诊断提供了新的辅助标准。

Associations of Social Isolation and Loneliness with Incident Cardiovascular Disease Among Individuals with Severe Mental Illness

Weijie Zhang Yu He Jihui Zhang Yan Liang Yuping Ning*

The Affiliated Brain Hospital of Guangzhou Medical University

Objective The present study aimed to investigate the associations of social isolation and loneliness with CVD among individuals with SMI and assess the extent to which intermediate risk factors explained the associations

Methods A total of 69,813 participants with SMI (32.1% male; mean age=55.0 years) were included from the UK Biobank. Social isolation and loneliness were assessed using self-reported questionnaires. Cardiovascular diseases were identified by linking hospital records and death registries

Results In the multivariate-adjusted model, loneliness was associated with an increased risk for incident of CVD (yes vs. no: HR: 1.05; 95% CI: 1.01-1.10). No significant associations were observed for social isolation (most vs. least: HR: 0.97; 95% CI: 0.93-1.00). Loneliness ranked higher in relative strength for predicting CVD as other traditional lifestyle risk factors, such as poor diet and physical inactivity. The association between loneliness and CVD was mainly attributed to psychological factors and health behaviors

Conclusion Among individuals with SMI, loneliness, but not social isolation, was independently associated with a higher risk for incident CVD, which was

largely explained by psychological stress and subsequent unhealthy lifestyles. These findings highlight loneliness as novel modifiable risk factor for predicting CVD

关键词: Severe mental illness; social isolation; loneliness; cardiovascular disease.

Causal Association between Gut Microbiota and Self-harm in Past Year: A Two-sample Mendelian Randomization Study

Yi Zhong¹, Jiahao Ding², Lin Lu¹

1.Peking University Sixth Hospital

2.Shandong First Medical University(Shandong Academy Of Medical Sciences)

Objective Several recent observational studies have reported that gut microbiota composition is associated with self-harm. However, the causal effect of gut microbiota on self-harm is unknown

Methods A two-sample Mendelian randomization analysis was conducted utilizing summary statistics of gut microbiota-derived from the largest extant genome-wide association study meta-analysis, encompassing 18,340 participants, facilitated by the MiBioGen consortium. Summary statistics pertaining to incidences of self-harm over the previous year were procured from the UK Biobank, involving 591 cases and 6,243 controls. To explore the putative causal link between gut microbiota composition and self-harm occurrences, several analytical methods were employed, including inverse variance weighting, MR-Egger, weighted median, weighted mode, and simple mode. Additionally, reverse Mendelian randomization was applied to those bacterial taxa previously identified as causally related to self-harm in the forward analyses. Cochran's Q statistics were utilized to assess the heterogeneity among the instrumental variables

Results Inverse variance weighted estimates indicated a protective association of Methanobacteria (odds ratio = 0.965, 95% confidence interval: 0.936-0.995, P=0.024) and Ruminococcaceae (UCG014 group,

OR=0.938, 95% CI 0.887-0.992, P=0.025) against self-harm. Conversely, Mollicutes (RF9 group, OR=1.054, 95% CI 1.004-1.107, P=0.034) and Rikenellaceae (RC9 group, OR=1.038, 95% CI 1.009-1.069, P=0.011) demonstrated suggestive associations with increased risk of self-harm. Results from reverse Mendelian randomization analysis revealed no significant causal impact of self-harm on the composition of gut microbiota. Additionally, analyses did not detect significant heterogeneity among the instrumental variables, nor evidence of horizontal pleiotropy

Conclusion This two-sample Mendelian randomization study identified a causal association between Methanobacteria, Ruminococcaceae UCG014, Rikenellaceae RC9, and instances of self-harm in the preceding year. To elucidate the protective effects of probiotics against self-harm and to delineate their specific mechanisms of action, further randomized controlled trials are imperative

中小学生学习心理健康自评及影响因素分析

孙晓花*

浙江大学医学院附属精神卫生中心(杭州市第七人民医院)

目的 了解杭州市中小学生学习心理健康自评情况及相关影响因素及心理需求。

方法 采用随机分层整群抽样的方式,依据小学、初中、高中三个层次,抽取杭州市30所学校,其中小学5-6年级、初中三个年级、高中三个年级的各一个班的在读学生作为调查对象,共调查学生3460名,了解他们对自身心理健康状况的自评情况,分析相关影响因素,同时调查学生对家长及老师的期待。

结果 3460名学生中,小学5-6年级773人,初中1583人,高中1104人,平均年龄 14.3 ± 2.1 岁。69.5%的学生自评心理健康状况好,一般的占23.3%,不好的占7.3%;不同学段学生心理自评有统计学差异(卡方值=46.69, $p < 0.05$),随着学段的增加,学

生自评心理健康状况下降,年龄段与心理健康自评相关;学生心理健康自评与家庭关系、父母交流频率、成绩满意度均成正相关;与父母或与父母(外)祖父母共同居住的学生心理状况自评好于其他居住形式(卡方值=25.53, $p < 0.05$)。遇到困惑倾向向母亲和同学倾诉(36.7%和32.1%),向老师倾诉的最少,只有0.6%,其次为心理医生,只有1.0%。在心理需求方面,对家长期待排在前三位的是理解信任,包容支持,关系和睦,对老师的期待排在前三位的是:理解信任,减少作业,平等对待。

结论 需要关注中小学生的心理状况,关注家庭的影响,营造和谐家庭氛围,鼓励寻求专业的心理支持。学生对家长和老师,理解信任的心理需求均排在第一位,需要家长和教师关注。

磷脂酰丝氨酸介导的小胶质细胞修剪突触参与小鼠抑郁样行为发生的机制研究

李素霞* 冯雪竹 谭璇 赵誉煜 吴博为 李鑫 朱维莉

北京大学

目的 阐明磷脂酰丝氨酸(PS)作为“吃我”信号,介导小胶质细胞修剪突触,参与小鼠的抑郁样行为发生。

方法 首先研究PS参与慢性社交挫败应激所致抑郁样行为发生。具体包括:(1)采用慢性社交挫败应激(Chronic social defeat stress, CSDS)构建小鼠抑郁模型,10天应激结束后依次进行小鼠焦虑、抑郁样行为学检测;(2)使用免疫印迹检测应激组 and 对照组小鼠内侧前额叶皮层(medial prefrontal cortex, mPFC)TLRs表达及炎症因子IL-10, IL-1 β , IL-6, TNF- α 表达水平;(3)采用免疫荧光染色检测mPFC脑区小胶质细胞激活水平以及ATP11C、CDC50A的表达, pSIVA-IANBD染色检测PS暴露水平;(4)采用高尔基染色检测神经元树突棘形态和数量变化;(5)采用激光共聚焦断层扫描以及三维立体重建检测小胶质细胞对神经元突触吞噬情况。其次,干预PS在神经元表面的暴露,研究其对抑郁样行为的影响。具体包括:(1)使用药理学方法阻断内质网钙离子通道以及PKC α 通路,阻断ATP11C

从胞膜向胞内转移,观察 PS 暴露水平、翻转酶表达、突触修剪情况及小鼠抑郁样行为;(2)采用小鼠脑立体定位微注射敲低 mPFC 脑区 Atp11c 基因,观察小鼠抑郁样行为变化。

结果 CSDS 导致小鼠发生显著的焦虑样和抑郁样行为及 mPFC 脑区小胶质细胞高水平激活的炎症反应;CSDS 导致 mPFC 脑区神经元上 ATP11C 表达以及 CDC50A 表达显著降低,神经元上 PS 外翻水平显著增加;CSDS 导致 mPFC 脑区神经元树突成熟型棘突数量显著降低,被修剪的树突棘数量显著增加,以及小胶质细胞对突触的吞噬显著增加;小鼠腹腔注射内质网钙离子通道阻断剂 R-卡维地洛和选择性 PKC α 通路抑制剂 Go6976 可以显著逆转上述表型,挽救 PS 暴露及小鼠抑郁样行为;mPFC 脑区 Atp11c 基因表达的敲低导致小鼠显著的抑郁样行为。

结论 本研究首次证实了 PS 作为小胶质细胞吞噬突触的“吃我”信号分子参与小鼠抑郁样行为发生的神经机制。其中,翻转酶 ATP11C 在调节 PS 暴露中发挥重要作用。该研究为 PS 介导的小胶质细胞突触修剪参与抑郁发病提供了科学证据,为研发新型快速抗抑郁药物提供了科学依据。

Liraglutide-associated Depression in A Patient with Type 2 Diabetes A Case Report and Discussion

Yangliuqing He¹, Yiming Wang^{1,2}

1.Clinical Medicine College of Guizhou Medical University

2.Department of Psychiatry, Affiliated Hospital of Guizhou Medical University

Objective To investigate the potential association between liraglutide, a glucagon-like peptide-1 receptor agonist (GLP-1RA), and the development of depressive symptoms in patients with type 2 diabetes

Methods A case study of a 39-year-old male with type 2 diabetes who presented with depressive symptoms shortly after initiating liraglutide therapy for

glycemic control and weight reduction. Clinical assessments, including mood evaluations and diagnostic criteria for depression, were employed to track symptom progression and treatment outcomes

Results Following the initiation of liraglutide, the patient experienced a range of depressive symptoms, including poor mood, irritability, decreased interest and energy, progressing to sadness, low self-esteem, and physical discomfort. A clinical diagnosis of a depressive episode was made concurrently with the introduction of liraglutide. Upon discontinuation of liraglutide and initiation of antidepressant therapy, there was a rapid improvement in depressive symptoms within a week, suggesting a potential link between liraglutide use and the onset of depression

Conclusion This case study underscores the importance of recognizing potential psychiatric side effects, particularly depression, associated with GLP-1RAs like liraglutide. Mechanisms such as GLP-1RA effects on glucose fluctuations, dopamine modulation, and influence on the brain reward system are discussed as potential contributors to mood disturbances. Further research is essential to elucidate the underlying mechanisms and clarify the clinical implications of GLP-1RA therapy on mental health outcomes

关键词: depression1 ,liraglutide2, GLP-1 receptor agonists (GLP-1RA)3 , case report4

父母教养方式与注意缺陷多动障碍儿童异常行为的相关性研究

巫江丽 陈明霞 李晓晶*

浙江大学医学院附属精神卫生中心&杭州市第七人民医院(杭州 310013)

目的 比较注意缺陷多动障碍(Attention Deficit Hyperactive Disorder, ADHD)儿童与正常发育儿童在父母教养方式方面的差异,以及这些差异如何与儿童的行为问题相关联。

方法 回顾性收集 209 例 ADHD 儿童青少年的父母教养方式量表(Egna Minnen Beträffande Uppfostran, EMBU)和 Conners 儿童行为量表数据,

比较 ADHD 儿童在 EMBU 各因子得分与常模的差异, 并分析父母教养方式与 Conners 行为量表各维度得分之间的相关性。

结果 在 ADHD 儿童中, 父亲的情感温暖理解 ($t=-8.710$, $PFDR<0.001$) 得分和母亲的情感温暖理解 ($t=-6.159$, $PFDR<0.001$) 得分显著低于常模水平。ADHD 儿童父亲的惩罚严厉 ($t=8.658$, $PFDR<0.001$) 得分和拒绝否认 ($t=6.849$, $PFDR<0.001$) 得分, 母亲的惩罚严厉 ($t=7.336$, $PFDR<0.001$) 得分和拒绝否认 ($t=4.256$, $PFDR<0.001$) 得分均显著高于常模水平。与常模相比, ADHD 儿童的父母在过分干涉和过度保护方面的得分显著降低 (父亲过分干涉: $t=-2.170$, $PFDR=0.031$; 父亲过度保护: $t=-6.888$, $PFDR<0.001$; 母亲过分干涉: $t=-5.567$, $PFDR<0.001$)。父亲的特定教养方式与 ADHD 儿童行为问题之间存在显著的正相关关系。具体而言, 父亲的惩罚严厉、过分干涉和过度保护与儿童的多动指数得分呈正相关 (惩罚严厉: $r=0.216$, $PFDR<0.05$; 过分干涉: $r=0.198$, $PFDR<0.05$; 过度保护: $r=0.236$, $PFDR<0.05$)。ADHD 儿童的品行问题得分与父亲的惩罚严厉 ($r=0.278$, $PFDR<0.001$)、过分干涉 ($r=0.215$, $PFDR<0.05$)、拒绝否认 ($r=0.189$, $PFDR<0.05$) 和过度保护 ($r=0.229$, $PFDR<0.05$) 得分呈正相关。ADHD 儿童的冲动/多动得分与父亲的惩罚严厉 ($r=0.222$, $PFDR<0.05$)、拒绝否认 ($r=0.187$, $PFDR<0.05$) 和过度保护 ($r=0.244$, $PFDR<0.001$) 得分呈正相关。

结论 ADHD 儿童在家庭环境中经历较少的情感支持和较多的惩罚性教养方式。相比于母亲, 父亲的特定教养方式 (惩罚严厉、过分干涉、拒绝否认和过度保护) 更倾向于导致 ADHD 儿童的行为问题 (多动指数、品行问题和冲动/多动)。

父母教养方式影响儿童注意缺陷多动障碍的神经电生理机制研究

陈明霞 巫江丽 李涛*

浙江大学医学院附属精神卫生中心&杭州市第七人民医院 (杭州 310013)

目的 通过比较注意缺陷多动障碍 (Attention Deficit Hyperactive Disorder, ADHD) 儿童与正常发育儿童在父母教养方式和静息态脑电特征的差异, 以及差异与儿童行为问题的相关性来探讨父母教养方式影响 ADHD 儿童行为相关问题的神经电生理机制。

方法 纳入 2023 年 7 月至 12 月于杭州市第七人民医院儿童心理科门诊就诊的 ADHD 患儿 46 例 (ADHD 组) 以及与之年龄和性别相匹配的 25 例健康对照 (Healthy Controls, HC) 儿童 (HC 组)。比较 ADHD 组在父母教养方式量表 (Egna Minnen Beträffande Uppfostran, EMBU) 得分和 Conners 儿童行为量表得分与 HC 组的差异。采集两组儿童静息闭眼状态下 5~10 分钟脑电图。采用倾向性得分方法控制分组不平衡因素, 采用协方差分析对两组的脑电功率谱密度 (Power Spectral Density, PSD) 和相位锁定指数 (Phase Locking Index, PLI) 进行比较。采用偏相关分析两组差异具有统计学意义的脑电信号特征与 EMBU 得分、Conners 儿童行为量表得分的相关性。

结果 ADHD 组的父母在情感温暖理解方面的得分显著低于 HC 组 (父亲: $t=5.793$, $PFDR<0.001$; 母亲: $t=4.154$, $PFDR<0.001$), 在惩罚严厉方面的得分显著高于 HC 组 (父亲: $t=-4.236$, $PFDR<0.001$; 母亲: $t=-2.996$, $PFDR<0.01$)。ADHD 组的品行问题 ($Z=-5.680$, $PFDR<0.001$)、学习问题 ($Z=-6.599$, $PFDR<0.001$)、心身障碍 ($Z=-3.033$, $PFDR<0.01$)、冲动/多动 ($Z=-6.135$, $PFDR<0.001$)、焦虑 ($Z=-3.330$, $PFDR<0.01$) 和多动指数 ($Z=-6.278$, $PFDR<0.001$) 得分显著高于 HC 组。ADHD 儿童顶区的 β 功率值显著低于 HC ($PFDR<0.05$); PLI 这一功能连接指标显示 ADHD 儿童在大脑额-顶区之间 δ 频段的交互性较 HC 显著减弱 ($PFDR<0.05$)。相关性结果显示, ADHD 儿童顶区的 β 功率、额区-顶区的 δ 频段 PLI 与父母教养方式、行为问题得分之间均未发现具有统计学意义的相关性 (P 均 >0.05)。

结论 神经电生理结果提示脑区功能激活和网络连接受到影响可能是 ADHD 的潜在发病机制之一。

抑郁和焦虑症状在青年群体失眠症状与自伤行为之间的中介作用

阙建宇¹ 陈斯婧² 陈骁¹ 韦炜³ 吴素英¹ 续稳稳¹
张晨昀¹ 黄育云¹ 刘发荣¹ 师乐⁴

- 1.厦门市仙岳医院
- 2.香港中文大学
- 3.厦门医学院
- 4.北京大学第六医院

目的 越来越多的研究证据提示失眠症状与自伤行为密切相关。然而,有关失眠症状与自伤行为之间潜在机制尚不明确。本研究旨在探索青年群体失眠症状与自伤行为之间的潜在心理学机制。

方法 2022年12月至2023年5月期间,邀请厦门地区12-25岁青年群体参与本次线上调查。应用青少年健康相关危险行为问卷中2个相关条目对自伤行为进行评估。失眠、抑郁和焦虑症状的评估分别通过失眠严重程度指数量表(ISI)、患者健康问卷-9(PHQ-9)和广泛性焦虑量表(GAD-7)。应用结构方程模型探索抑郁和焦虑症状在失眠症状和自伤行为之间的中介作用。

结果 最终有3436名青年(平均年龄:18.12[2.26]岁,女性2006名)完成本调查并纳入分析,其中707名研究对象(20.6%)自我报告过去一年内有过自伤行为。与无自杀行为相比,有自伤行为的青年失眠、抑郁和焦虑症状的严重程度评分更高。相关分析显示失眠症状与自杀行为显著相关($\beta = 0.343, p < 0.001$)。此外,抑郁($\beta = 0.096, p < 0.001$)和焦虑($\beta = 0.026, p = 0.001$)症状在失眠症状和自伤行为之间起到中介作用。抑郁和焦虑两者总的间接效应占失眠症状与自伤行为之间总效应中79.33%。敏感性分析将PHQ-9中睡眠和自杀自伤相关的条目移除,得到相似的研究结果。

结论 本研究发现抑郁和焦虑症状在失眠症状与自伤行为之间起到了中介作用,这一研究结果提示治疗失眠、抑郁和焦虑症状将有利于促进自伤行为的有效干预。

新冠疫情期间大学生 NSSI、失眠、PTSD 症

状及性别差异的网络分析

周烈^{1,2,3} 刘波^{2,3} 杨轶越¹ 冉茂盛¹

- 1.四川大学华西医院心理卫生中心
- 2.长江大学精神卫生研究所
- 3.荆州市精神卫生中心

目的 了解新冠疫情期间荆州市学生的非自杀性自伤行为(Non-Suicidal Self-Injury, NSSI)、失眠、创伤后应激障碍(Post-Traumatic Stress Disorder, PTSD)症状及关联性,并探索其网络特征中的性别差异。

方法 本研究在2021年6月至2022年1月期间,采用《青少年学生心理健康状况调查问卷》作为调查工具,包括一般人口学资料以及标准化量表(青少年自我伤害行为问卷、ISI、PCL-5等),通过方便整群抽样的方式,使用问卷星平台对大学生进行调查。共回收8672份问卷,有效问卷7247份(有效率83.57%)。研究使用R软件包中的bootnet、qgraph和networktools,应用IsingFit方法构建了NSSI、失眠和PTSD症状的混合图模型,对模型中的边缘权重和症状的中心性指数进行了稳健性和显著性分析。使用NetworkComparisonTest对不同性别的网络模型进行了差异性检验。

结果 参与本研究者中,男生2970人、女生4277人,平均年龄 20.25 ± 1.21 岁。NSSI检出率15.84%(1148/7247),失眠检出率28.41%(2059/7247),PTSD检出率5.00%(362/7247)。在NSSI、失眠和PTSD症状网络中,最主要的症状是“PTSD-避免想起或谈论过去的那段压力性事件经历,或避免产生与之相关的感觉”和“PTSD-注意力很难集中”,而“PTSD-入睡困难或易醒”、“ISI-入睡困难”是桥接强度最强的症状。NSSI桥接强度最强的症状是“PTSD-感觉和其他人疏远或脱离”和“PTSD-有冒险行为或者做一些可能伤害自己的事情”。男性和女性网络模型存在差异,男性的主要症状是“PTSD-避免想起或谈论过去的那段压力性事件经历,或避免产生与之相关的感觉”“PTSD-记不起压力性事件经历的重要内容”,女性的主要症状是“PTSD-避免想起或谈论过去的那段压力性事件经历,或避免产生与之相关的感觉”“PTSD-注意力很难集中”。网络的中心强度和桥接强度稳定性良好。

结论 本研究揭示了荆州市大学生在COVID-19疫情期间,NSSI、失眠和PTSD症状之间的复杂

关联,主要表现为回避和记忆相关症状、注意力和认知相关症状,以及睡眠相关症状。社会及学校应加强学生心理健康教育,注意防范学生的自伤行为,开展睡眠管理课程和活动,改善睡眠质量,根据学生性别差异,制定不同的干预服务策略。

数字化认知测验的开发与信效度验证

李佳佳¹ 李佳佳³ 范宏振¹ 姜荣环² 谭淑平^{1,3}

1.北京回龙观医院

2.中国人民解放军总医院(301医院)

3.华北理工大学

背景与目的 在第十四届全国人大常委会第七次会议上,《国务院关于精神卫生工作情况的报告》中提出要“深入开展科学研究,开发本土化测评工具”。目前强有力的证据表明,精神疾病发生率在增长,老龄化趋势也进一步突显,随之产生的认知功能障碍发生率也在增长,因此开发认知功能的本土化测评工具是必要的。而目前的认知测评工具多是纸笔测验或基于电脑、平板运行,并且需要专业人员辅助评估。支持自评的、基于智能手机的数字化认知测验尚未得到开发与验证。

本研究旨在开发一种基于移动手机的、支持多人同时进行的自评认知测验,并通过探索其因子结构、内部一致性信度、重测信度、效标效度、天花板效应和地板效应来检验其质量。

方法 160名被试现场或远程完成数字化认知测验。86名被试完成了中文版神经心理状态评定量表(RBANS)以验证效标效度。54名被试参与了两次认知测验。使用项目分析、探索性因子分析、信效度分析方法检验认知测验的可靠性与稳定性。

结果 数字化认知测验 e-Cog 共有 9 个任务,分为 4 个因子:逻辑记忆、工作记忆、言语记忆和视空间记忆,共解释了 71.949%的变异。间隔三周的重测信度为 0.777,内部一致性信度为 0.670,效标效度为 0.806,无天花板效应、地板效应。

结论 这项研究表明,认知测验 e-Cog 是一种科学、有效并且可靠的工具,能够客观、远程地在手机的 Android 和 iOS 操作系统上进行认知功能的评

目的 本研究以新疆与上海两所高校的大学生群体为样本,严谨地运用了艾克森人格问卷简式量表中国版进行了一项大规模的调查。该调查旨在深入探究上海与新疆两地高校青少年的人格特质与心理状态,揭示地域文化、性别差异对大学生人格特征与心理健康之间的潜在联系,旨在为高等教育心理辅导提供科学、实证的支撑依据。

方法 本研究随机抽取了新疆与上海两所高校的大学生为样本,分别收集了 594 名学生的数据。数据收集基于艾克森人格问卷简式量表中国版指导,通过问卷星平台进行在线问卷调查,保证数据质量和成本效益。问卷发放前,研究团队进行了严格审阅和测试,确保内容清晰准确、符合伦理。使用 SPSS26.0 软件进行数据清洗和标准化,剔除无效问卷,确保数据完整可靠。首先进行描述性统计分析,了解样本特征。随后,探究人格维度间的相关性及地域文化、性别等影响。回归分析采用多种模型确保结果稳健可靠。同时,检查共同方法偏差,确保结果精确。

结果 根据统计分析,上海与新疆地区的大学生在人格特质上呈现出显著的差异,这一差异在一定程度上反映了地域文化的影响。在开放性特质方面,上海学生得分较高,这可能与上海作为国际化大都市的开放氛围密切相关,使得他们更易于接受新观念。相较之下,新疆学生在宜人性特质上得分较高,表现出温暖友善的性格特点。在尽责性特质上,上海学生普遍得分较高,这可能与上海高竞争的社会环境有关,使得他们更加注重责任感和使命感。而新疆学生虽然得分稍低。在外倾性特质上,两地学生的得分相近,但上海学生的外倾性特质相对更高,这可能与上海快节奏的生活方式有关;而新疆学生可能更倾向于内省和自我反思。在神经质特质上,上海学生的得分略高,这可能与上海高压

力的生活环境相关。此外,性别因素也在一定程度上影响了学生的人格特质。在上海地区,女性学生可能展现出更强的外向性特质,这可能与上海社会期望和女性角色定位有关。

结论 通过对研究结果的深入讨论,我们揭示了地域文化及性别差异对大学生人格特质的影响,这些发现对于优化教育资源配置、提升教育质量和区域平衡发展具有实际指导意义。同时,我们的研究结果为进一步探究地域文化对个体心理发展的影响提供了实证基础,对于深化人格心理学在跨文化背景下的应用研究具有深远影响。未来的研究可以进一步探索其他地域、文化背景下的大学生人格特质,以构建更全面的跨文化心理学理论框架。

关键词:大学生;人格特质;新疆;上海;性别

音乐疗法联合药物治疗抑郁症睡眠质量的初步分析

程月红*

河北医科大学第一医院

目的 探讨音乐疗法联合药物对抑郁症患者睡眠质量的作用。

方法 选取2018年9月至2019年9月在河北医科大学第一医院精神卫生中心住院的102例抑郁症患者作为研究对象,采用随机数字表法分为对照组和研究组,每组各51例。研究组采用音乐疗法联合SSRIs药物治疗,对照组单独SSRIs药物治疗,音乐治疗仪采用脑波体感放松治疗仪,采用团体治疗的形式,每日上午7:00-7:30治疗,每次治疗30分钟,连续治疗28天(4周)。采用PSQI量表对患者睡眠问题进行评估,采用HAMD量表对患者抑郁情绪进行评估。采集患者的人口学资料:年龄、性别、职业、文化程度、婚姻状况、家庭经济状况等。在治疗前、治疗第一周、第二周、第四周分别评估患者的睡眠状况及抑郁情绪。

结果 (1)在第一周和第二周PSQI减分差异有统计学意义,组别与时间点间无交互作用。不同时间点HAMD差异有统计学意义($F_{时间}=1033.961$, $P_{时间}<0.001$),组别与时间点间存在交互作用($F=4.405$, $P=0.014$)。进一步分析单独的效应,第三和第四时间点研究组的HAMD的减分率均高于

对照组($P<0.05$) (2)不同特征患者PSQI评分比较,男性PSQI得分高于女性($t=2.248$, $P=0.027$ 。

(3)治疗前PSQI高分($t=2.018$, $P=0.047$)为失眠的独立风险因素。

结论 音乐疗法联合SSRIs治疗抑郁症的失眠优于SSRIs单药治疗,睡眠质量在初期治疗得到明显改善。

关键词:音乐疗法;抑郁症;睡眠质量;随机对照实验

手机依赖与人际信任关系的研究

刘冬玲 季乐新*

抚顺市第五医院

目的 了解北联大本科生手机依赖的基本特点与人际信任关系的关系。

方法 采用随机抽样的方法,在河北联合大学大一~大四总共300名被试,获得有效问卷284份,其中男生71人,女生213人;城市107人,农村177人;独生子女89人,非独生子女195人。用大学生手机依赖指数量表和人际信任量表(Interpersonal Trust Scale IT)进行测查。采用SPSS13.0对实测数据进行描述统计、相关分析

结果 应用spss系统对284人的大学生手机依赖量表的总分进行探索性分析,其中偏度系数 >0 ,峰度系数 <0 ,数据呈正偏态分布,曲线比较平坦。最高分为115分,最低分为27分,平均分为62.76分。以均值为界,有141人(占49.6%)有手机依赖倾向。应用spss系统对284名大学生的人际信任量表总分进行探索性分析,其中偏度系数和峰度系数均大于0,说明数据呈正偏态分布,曲线比较陡峭。最高分为125,最低分为65,平均分为85.47分。量表得分越高,人际信任度越高。应用spss对大学生手机依赖量表总分与大学生人际信任量表总分进行非参数检验,结果显示两者之间无显著相关。

结论 本调查结果显示,在河北联合大学接受调查的学生中,所有人都拥有手机,其中89.1%的大学生经常随身携带手机,45.7%的大学生晚上睡觉也要开着手机,23.6%的大学生会害怕手机自动关机。本次研究的数据显示在大学生中对手机的依赖倾向比较普遍,这与国内相关研究的结果基本一

致。手机对于大学生已成为一项不可或缺的必需品。但是手机依赖对大学生的身心健康有着不可忽略的危险性。有 24.3% 的大学生更喜欢与人手机交流而不是面对面，26.8% 的大学生当自己没有手机时与别人交流有困难，这显示如果不解决手机依赖问题，长此以往会对大学生的交往能力会产生负面的影响。

大学生这一年龄阶段正处在自我统一性确立的时期，其内心充满成长过程中的冲突与不安，尤其当发现自我设计的理想人生与现实难以达成一致时，痛苦和迷茫使他们需要释放精神压力，需要情绪迁移。如果情感宣泄的途径受到阻碍时，极可能将这些负面情绪发泄在手机上，用手机寻求解脱、排遣郁闷。本次研究显示大学生手机依赖倾向与大学生人际信任情况无显著相关，对于大学生手机依赖的研究可以考虑其他因素进行研究，如孤独感、家庭关系等。

关键词：手机依赖；人际信任度；大学生

间歇性 θ 爆发刺激的机制研究进展

马添佩*

贵州医科大学附属医院

目的 间歇性 θ 爆发刺激(Intermittent Theta Burst Stimulation, iTBS)是高频经颅重复磁刺激(High-frequency Repetitive Transcranial Magnetic Stimulation, HF-rTMS)治疗模式的一种，可有效改善抑郁症相关症状，其具有高效，低成本特点，较为适合在社区环境进行推广。本研究旨在阐述关于 iTBS 机制的最新研究进展，以及这些进展在临床工作中可能的最新应用方向以及利用这些新发现改善现有治疗的可能方案。当前 DD 复发较高，特别是单一药物治疗复发率较高。故将物理治疗引入 DD 患者日常是迫在眉睫的。iTBS 因其相对低成本与高效率特点，是最有希望的物理治疗之一，故针对其机制的研究与应用，有利于建立低成本且高效的抑郁症社区治疗机制。

方法 检索中国知网、万方数据库、维普数据库、pubmed 和 google scholar，收集国内外关于 iTBS 治疗抑郁症机制相关文献及 iTBS 对于脑源性神经营养因子(Brain Derived Neurotrophic Factor, BDNF)机制相关文献，最终纳入 49 篇文献，并对其进行治

疗评价，因文献质量较好，同质性较差故进行定性分析。

结果 结果显示 BDNF 系统在 iTBS 的抗抑郁作用中具有关键作用，BDNF 系统会对 iTBS 的疗效以及相关联合治疗方案产生一定程度影响。

结论 间歇性 θ 爆发刺激对 BDNF 系统影响可能是抑郁症相关症状改善的原因之一，且其影响 iTBS 的机制可通过多种方式完善 iTBS 治疗，如增效剂应用，rTMS 多模式联合应用，iTBS 的个体化治疗等方向。

青幼期食蟹猴抑郁模型伏隔核单细胞转录组学研究

滕腾 周新雨*

重庆医科大学附属第一医院

目的 儿童青少年抑郁症是造成该年龄段疾病负担的主要原因，与成年抑郁不同具有独特的临床特点和发病机制。近年来有大量研究证实神经元-神经胶质细胞的相互作用参与了抑郁症的发病机制，因此在神经细胞水平研究儿童青少年抑郁症的特异性改变可能为该人群的有效诊断和治疗提供新的线索。

方法 青幼期 CUMS 组食蟹猴表现出典型的抑郁样行为，即蜷缩样行为显著增加、笼内移动移动显著减少、苹果渴求行为显著减少、人类入侵者测试中的焦虑样行为显著增加。根据既往文献报道的经典的 marker 基因，我们将伏隔核的细胞粗分为 5 类(神经元、小胶质细胞、星形胶质细胞、少突胶质细胞、少突胶质细胞前体细胞)。我们发现 CUMS 组伏隔核的细胞特异性转录水平改变，其中星形胶质细胞改变最为明显。激活的 GABA 能突触和抑制的 D-谷氨酰胺和 D-谷氨酸代谢基因组也被发现与表达 D1 和 D2 中棘神经元以及星形胶质细胞亚型的抑郁样行为有关。星形胶质细胞与 D1 和 D2 中棘神经元(如 BMP6 和 ERBB4)在抑制状态下的细胞间通讯也出现异常。此外，我们发现 FKBP5 在抑郁食蟹猴的四种神经胶质细胞中显著升高，而在神经元中没有改变。基于整块组织样本的转录组测序和蛋白

组测序也发现了与单细胞转录组一致点的结果。

结论 上述结果揭示了儿童青少年抑郁伏隔核的细胞类型特异性改变,并可能为这一特殊患者人群揭示新的潜在抗抑郁药物靶点。

基于多重信息筛选的人格种子词典构建

李雨辰 蒋静文 廖晓 冯原 贾雨歌 张伟*

四川大学华西医院

目的 人格是心理健康的重要影响因素,使用便捷方式快速了解人格可方便我们促进大众心理健康。丰富的人类语言信息(包括词汇、语法等)与人格之间存在很强的关联性且获取便捷,由此利用语言信息构建人格预测模型是人格研究的热点问题。但是,人格标注十分困难,有必要建立一个时兴的、有效的且通用的人格种子词典作为语言信息的基础人格标签或人格先验信息,为语言预测人格的模型构建或大语言模型调优打下基础。

方法 本研究的人格种子词来源于三个方面:人格测评工具、情感词典或词库以及人格与语言的相关研究。对于人格测评工具,如大五人格量表(NEO系列),迈尔斯-布里格斯类型指标(Myers-Briggs Type Indicator, MBTI)等,研究邀请专业心理人员提取量表中的种子词,即量表题目中描述人格的词汇。对于与人格相关的情感词库或词典,通过查阅相关文献,研究采纳了Linguistic Inquiry and Word Count(LIWC)词典中的词汇。对于人格与语言相关的研究,通过文献筛查,研究提取了相关文献中明确了人格维度的词汇。将以上方法收集到的词汇汇总,得到人格种子词及其维度和侧面。然后,以专家投票的形式对初始词汇进行修正,形成初版人格种子词典。最后,对初版的人格词汇库在18-50岁的健康人群中进行检验(共200人),采用问卷调查的方式,同时测评标准大五人格量表以及人格种子词典中词汇的使用偏好调查问卷,统计标准人格维度和侧面与词典中词汇的维度和侧面的匹配度,仅筛选出标准人格与种子词使用偏好匹配度大于80%的词汇,形成终版的人格词汇库。

结果 通过以上步骤构建了5个维度的人格种

子词典,包括外倾性:1277个词汇,严谨性:1109个词汇,开放性:1038个词汇,宜人性:1456个词汇,神经质:984个词汇,其中每个维度均有6个侧面

结论 本研究构建了一个较为丰富的人格种子词典,可适用于一般正常人群,可以作为各类采用语言信息探索人格的模型/大模型提供基础人格标注和先验信息,为方便快捷了解大众人格打下基础。

COVID-19 感染对中国儿童青少年心理健康的长期影响

虞越男^{1,2} 王菲^{1,2}

1.南京脑科医院

2.南京医科大学

目的 COVID-19感染对儿童和青少年的长期心理健康影响尚不明确。本研究调查了中国取消动态清零政策后,COVID-19感染对儿童和青少年心理健康的影响,重点关注了症状特异性和社会家庭风险因素对心理健康问题的影响。

方法 本研究为期6个月,从2022年9-10月(T1)到2023年4-5月(T2)。研究对象为8348名年龄在10至18岁的青少年,进行了两次评估。我们比较了COVID-19感染组(COVID+, n=4108)和未感染组(COVID-, n=4240)之间的心理健康变化($\Delta=T1-T2$)。在使用逆概率加权平衡T1时的社会家庭混杂因素后,采用多元logistic回归评估COVID-19感染与心理健康症状发生/恶化之间的关联。我们还进行了多元logistic回归分析,探讨COVID+组中与心理健康症状发生/恶化相关的特定急性COVID-19症状和社会家庭风险因素。

结果 与COVID-组相比,COVID+组的整体心理健康改善(Δ)较低。COVID+组与抑郁恶化(OR 1.20, 95% CI 1.04-1.39)、焦虑恶化(OR 1.30, 95% CI 1.15-1.47)、压力恶化(OR 1.23, 95% CI 1.03-1.46)、失眠恶化(OR 1.21, 95% CI 1.05-1.39)以及情绪症状恶化(OR 1.72, 95% CI 1.27-2.33)的风险增加相关。中度到重度思维困难、气短和胃肠症状是与各种心理健康结果恶化相关的特定COVID-19症状。此外,学业困难、家庭经济困难、家庭矛盾、食物成

瘾和饮酒被确定为感染 COVID 青少年心理健康症状恶化的社会家庭风险因素。

结论 COVID-19 感染对青少年的心理健康留下了长期影响,甚至超越了急性感染期带来的影响。认知功能障碍和呼吸/胃肠不适等特定的新冠急性期症状对后期心理健康问题的发生和恶化起着重要作用。与此同时,社会家庭因素进一步调节了这些影响,强调了需要综合干预,同时解决生物学和心理社会方面的问题。

关键词: 心理健康;COVID-19 感染;急性症状;儿童和青少年

(OR [95% CI] 1.83 [1.05–3.21])。中度至重度急性 COVID-19 症状,包括睡眠障碍(2.20 [1.17–4.14]),注意力/记忆力下降(2.47 [1.02–6.00]),胸闷(2.05 [1.08–3.85])和对病毒的恐惧(2.23 [1.11–4.48])是 COVID-19 感染后长期失眠的危险因素。保持规律的运动(0.54 [0.33–0.88])被发现是预防失眠的保护因素。

结论 COVID-19 感染与医学生心理健康状况变差有关,增加了医学生失眠的风险,促进规律运动是预防和治疗长期 COVID-19 感染后失眠的有效措施。

关键词: COVID-19, 医学生, 失眠

新冠急性期症状对医学生长期失眠影响研究

秦笑阳¹ 秦笑阳² 王菲^{1,2}

1.南京脑科医院
2.南京医科大学

目的 在新冠肺炎疫情期间,情绪与失眠症状显著增加,而新冠感染急性症状和生活及行为方式对医学生的长期心理健康的影响尚未明确。本研究旨在确定 COVID-19 感染是否是医学生抑郁、焦虑和失眠的风险因素,并探讨与 COVID-19 急性症状和生活及行为方式相关的风险因素。

方法 本研究在 2020 年 3 月至 2022 年 3 月 (T1) 和 2023 年 8 月 (T2) 进行了两次心理健康评估。其中 T1 时期被试均无 COVID-19 感染,在 T2 时期调查 COVID-19 感染情况。比较了两次调查之间感染和未感染 COVID-19 学生抑郁、焦虑和失眠症状的变化差异。使用倾向得分加权法控制人口统计和生活方式等混杂因素,构建逻辑回归模型评估 COVID-19 感染对医学生抑郁、焦虑和失眠症状的发生风险。以 COVID-19 急性期症状和日常生活方式为独立变量,使用逻辑回归寻找 COVID-19 感染后出现心理健康症状的风险因素。

结果 本研究纳入了 2359 名参加过两次调查的医学生,他们的平均年龄为 22.23 岁 (标准差 2.49 岁),1485 (62.95%) 为女性,根据 T2 时期 COVID-19 调查结果分为 COVID-19 阳性组 (n=2021) 和 COVID-19 阴性组 (n=338)。COVID-19 阳性组的抑郁和失眠症状显著高于 COVID-19 阴性组,并且 COVID-19 阳性组与感染后失眠的发生呈正相关性

关于强迫症患者全脑静息态功能磁共振改变的荟萃分析

郭美岐¹ 张红星^{1,2}

1.新乡医学院
2.新乡医学院第二附属医院

目的 强迫症患者某些大脑区域的活动和功能存在异常,静息态功能核磁揭示了这种复杂的差异。然而,既往研究是孤立的,且结果存在异质性。本文通过荟萃分析,探讨静息态下强迫症患者全脑的功能磁共振(包括局部功能一致性,Reho; 低频振幅,ALFF; 低频振幅分数, fALFF; 功能连接, FC) 的一致性特点。

方法 本综述的方法已在 PROSPERO (CRD42024524648) 中注册。自 2024 年 1 月 3 日起,对英文数据库(PubMed、Web of Science、Embase)和中文数据库(中国知网、万方)进行了系统的文献检索,检索策略如下:(强迫症)和((磁共振成像)或(MRI))。提取一般信息包括第一作者、研究出版日期、样本量、性别分布、平均年龄、教育水平、平均患病时间、耶鲁-布朗强迫症量表 (Y-BOCS) 平均总分、药物治疗状态及扫描仪场强。提取了强迫症患者相对于健康对照者的异常峰值坐标及其效应大小,并采用激活似然估计 (ALE) 算法进行基于坐标的荟萃分析,以确定强迫症患者在静息状态下大脑活动的异常区域。使用 GingerALE (v2.3.5) 计算大脑坐标以生成激活概率图。

结果 (1) 共 8037 条记录导入文献管理器,后经对标题、摘要初筛及后续阅读全文复筛,最终

纳入文献 101 篇, 其中 ReHo 共 17 篇, ALFF 共 23 篇, fALFF 共 13 篇, FC 共 55 篇。(2) 与健康对照相比, 强迫症患者未发现一致性的 ReHo 差异; 患者左额中回、左额下回和右顶下小叶的 ALFF 值增加, 右腹侧核和双侧内侧额回中表现出 ALFF 值降低; 患者左小脑后叶 fALFF 值增加。(3) 对进行 FC 描述性统计时未发现较为一致的种子点, 但按其解剖结构进行汇总发现存在较为一致性的异常。

结论 强迫症患者存在一致性的脑区活动异常, 这些异常揭示了强迫症患者存在执行功能异常、意志行为缺陷且无法打破强迫行为(或强迫思维)与焦虑情绪之间的恶性循环的可能原因。

关键词: 强迫症; 静息态; 功能磁共振成像; 荟萃分析

失眠对生活满意度的影响: 一个有调节的中介模型

谢璐欣 李月 喻佳龙 王姝懿 洪家龙 刘莎*
山西医科大学第一医院

目的 考察 COVID-19 感染实施“乙类乙管”近 1 年后, COVID-19 感染者失眠、认知、生活满意度的水平, 探讨失眠与生活满意度的关系, 以及认知失败、神经质在其中的作用。

方法 2023 年 12 月采用方便抽样的方法有效回收 956 份问卷。采用认知失败问卷、失眠严重指数量表、生活满意度量表、大五人格简式量表对个体进行评估。采用独立样本 t 检验和方差分析进行不同人口学特征量表得分的差异性检验; 采用回归分析研究变量之间的关系; 通过 Bootstrap 法进行中介效应检验, 采用简单斜率法分析失眠与神经质的交互效应。

结果 1) COVID-19 感染实施“乙类乙管”近 1 年后, COVID-19 感染者中 8.3% 的被试表现出中等及以上程度的失眠; 23.4% 的被试表现出经常及以上频率的认知失败; 52.6% 的被试对自己的生活达到基本满意及以上的程度, 26~50 岁比 50 岁以上的被试表现出更高层次的认知失败; 2) 在控制人口学变量后, 失眠显著负向预测生活满意度 ($\beta = -0.302, p < 0.001$); 失眠显著正向预测认知失败 ($\beta = 0.357, p < 0.001$), 且失眠和神经质交互项显著负向预测认

知失败 ($\beta = -0.087, p < 0.01$); 认知失败显著负向预测生活满意度 ($\beta = -0.236, p < 0.001$)。简单斜率分析的结果表明相比高神经质个体 ($\beta = 3.659, p < 0.001$), 失眠对认知失败的预测作用在低神经质个体中更大 ($\beta = 5.380, p < 0.001$)。

结论 失眠不仅对生活满意度有直接预测作用, 同时还通过认知失败的中介作用预测生活满意度, 且该中介作用的前半段受到神经质水平的调节。

关键词: 失眠; 认知失败; 神经质; 生活满意度; COVID-19

The Association Between Exercise and Transversal Skill Level of Medical Students: The Mediating Role of Personality Traits

Shu Yan¹, Ye Zhao¹, Yang Yu², Tengfei Liu¹, Haishui Shi¹

1. Neuroscience Research Center, Institute of Medical and Health Science, Hebei Medical University, Shijiazhuang, China; Hebei Key Laboratory of Neurophysiology, Hebei Medicinal University, Shijiazhuang, China; The Key Laboratory of Neural and Vascular Biology, Ministry of Education, Hebei Medicinal University, Shijiazhuang, China;
2. Hebei Medicinal University

Objective This study aimed to explore the impact of physical exercise on the transversal skill level of medical students and to analyze the mediating role of personality traits in this process

Methods Using an online questionnaire, the study assessed 509 medical students' basic information, exercise intensity, professional identity, social and emotional competence, creativity, and personality traits. The tools used included the Physical Activity Rating Scale-3 (PARS-3), the Medical Students' Professional Identity Scale (MSPI-S), the Social and Emotional Competence Questionnaire (SEC-Q), the Williams Creativity Aptitude Test (WCAT), and the Big Five Inventory-2 (BFI-2). Independent samples t-tests were employed to delineate differences in transversal skill levels among medical students with varying exercise volumes. Pearson

correlation analysis was utilized to clarify the relationship between exercise and the transversal skill levels of medical students. The PROCESS macro developed by Hayes was applied to test the mediating and moderating roles of personality traits between exercise and transversal skill levels

Results The results indicated that medical students with moderate and high volumes of exercise scored significantly higher on professional identity, social awareness and prosocial behaviour, social and emotional competence, creativity, and openness than those with low exercise volumes ($p < 0.05$). Additionally, openness fully mediated the effects of PARS-3 on MSPI-S ($a*b$: Bootstrap SE=0.014, 95%CI=0.009-0.062), SEC-Q ($a*b$: Bootstrap SE=0.019, 95%CI=0.137-0.149), and WCAT ($a*b$: Bootstrap SE=0.022, 95%CI=0.080-0.170). Concurrently, neuroticism partially mediated the effects of PARS-3 on SEC-Q ($a*b$: Bootstrap SE=0.014, 95%CI=0.006-0.062, Effect ratio=25.97%) and WCAT ($a*b$: Bootstrap SE=0.012, 95%CI=0.004-0.052, Effect ratio=13.33%)

Conclusion Moderate physical exercise positively influences the transversal skill levels of medical students. It positively impacts their transversal skills by enhancing openness and reducing neuroticism, thereby strengthening social and emotional competence and creativity. These findings provide empirical evidence for the beneficial role of exercise in medical education, underscoring the significance of integrating physical activity into medical student training to support the holistic development of advanced medical professionals

后疫情时代大众神经质人格特质对生活满意度的影响: 基于焦虑与抑郁的链式中介作用

王姝懿² 王姝懿¹ 李月¹ 李月³ 喻佳龙⁴ 喻佳龙¹ 谢璐欣¹ 谢璐欣⁴ 洪家龙⁴ 洪家龙¹ 刘莎¹ 刘莎³

1.山西医科大学第一医院精神卫生科

2.山西医科大学医学科学院

3.精神障碍人工智能辅助诊疗山西省重点实验室

4.山西医科大学人文社会科学学院

目的 后疫情时代的到来引发了社会、心理健康和生活方式等多方面的深刻变革, 探讨后疫情时代大众人格特质、生活满意度与焦虑、抑郁之间的关系, 为提升大众心理健康提供有价值的参考。

方法 采用问卷调查法进行数据收集, 使用中国大五人格问卷(CBF—PI)、病人健康问卷(PHQ-9)、广泛性焦虑量表(GAD-7)、生活满意度量表(SWLS)作为测量工具, 使用 Pearson 相关分析探讨各量表评分之间的相关关系。采用 Process 进行中介效应检验, 分析焦虑和抑郁在神经质与生活满意度之间的中介作用。

结果 共收回有效问卷 1010 份, 其中男性占比 33.9%, 平均年龄为 33.04 岁 ($SD=11.736$), 城镇占比 65.4%。神经质与焦虑 ($r=0.608$, $p < 0.01$)、抑郁 ($r=0.579$, $p < 0.01$) 呈显著正相关, 与生活满意度 ($r=-0.278$, $p < 0.01$) 呈显著负相关。神经质可显著负向预测生活满意度 ($\beta=-0.083$, $P < 0.05$), 正向预测焦虑 ($\beta=0.434$, $P < 0.001$) 与抑郁 ($\beta=0.122$, $P < 0.001$); 抑郁可显著负向预测生活满意度 ($\beta=-0.398$, $P < 0.001$)。神经质对生活满意度的直接效应为 -0.083 , $P < 0.001$, 占总效应的 32.81%, 抑郁在神经质与生活满意度之间起部分中介作用, 效应值为 -0.048 , 95% CI: $[-0.077, -0.024]$, 占总效应的 18.97%; 神经质通过焦虑和抑郁对生活满意度存在间接效应, 效应值为 -0.132 , 95% CI: $[-0.176, -0.092]$, 占总效应的 52.17%。

结论 后疫情时代大众的焦虑与抑郁在神经质人格与生活满意度之间存在链式中介作用, 神经质人格可以直接影响生活满意度, 也可以通过焦虑和抑郁的链式中介作用间接影响生活满意度。

关键词: 神经质、生活满意度、焦虑、抑郁、心理健康

团体正念认知疗法对抑郁症患者的认知功能的研究

郭琳* 任传波 从文

大连市第七人民医院

目的 分析团体正念认知疗法(MBCT)对抑郁

症患者认知功能的影响。

方法 选取在本院心理科诊治的 200 例抑郁症患者为研究对象,选取年限为 2020 年至 2021 年。采用随机数表法将 200 例抑郁症患者分为对照组(100 例)和观察组(100 例),其中对照组患者实施常规心理治疗方案联合药物进行治疗,观察组患者实施团体正念认知疗法联合药物进行治疗。观察并比较两组患者的自主神经认知功能。

结果 与治疗前比较,两组患者治疗后的神经功能均有所改善($P<0.05$);与对照组比较,观察组患者的自主神经功能评分明显更优($P<0.05$)。

结论 团体正念认知疗法在抑郁症患者中的临床效果明显,能有效改善患者的自主神经认知功能,值得推广。

关键词:团体正念认知疗法;抑郁症;认知功能

团体正念认知疗法对焦虑型抑郁症患者的临床应用

任传波* 郭琳 丛文
大连市第七人民医院

目的 探讨团体正念认知疗法(MBCT)在焦虑型抑郁症患者中的临床应用效果。

方法 选取 2018 年至 2020 年在本院心理科住院的 200 例焦虑型抑郁症患者为研究对象,采用简单化随机表法将 200 例患者分为对照组和干预组,每组各 100 例。其中对照组每周进行 2 次模拟心理治疗(安静的坐在同样的治疗室差不多时间,但中间不给予任何治疗)联合药物治疗,干预组患者每周进行 2 次团体正念训练联合药物治疗。观察并比较两组患者的汉密尔顿焦虑抑郁(HAMD-17)量表和 PHQ-15 量表评估患者的焦虑和抑郁程度。

结果 与对照组比较,干预组患者的 HAMD-17 评分和 PHQ-15 评分均明显更好($P<0.05$)。

结论 团体正念认知疗法在焦虑型抑郁症患者中的应用效果显著,能有效改善焦虑型抑郁症患者的临床症状,值得临床推广应用。

医学专科学校学生马克思主义信仰对心理因素影响的网络分析

刘乙霖^{1,2} 冯瑞彬¹ 冯瑞彬² 罗欣宇¹ 罗欣宇² 陈媛玲³ 曾勇²

1.昆明医科大学

2.昆明医科大学第二附属医院

3.曲靖医学高等专科学校

目的 利用心理网络分析医学专科学校学生心理状况,以及马克思主义信仰对学生心理健康的作用影响。为学校进行马克思主义教育、培养学生正确观念、引导学生思想认知的同时注重学生的心理健康状况提供理论指导。

方法 对云南省 706 名医学高等专科学校学生进行问卷调查,问卷内容包含马克思主义信仰水平量表、心理弹性量表、大学生积极幻想问卷、同伴欺凌问卷、网络欺凌问卷、青少年非自杀性自伤行为评定问卷、抑郁症筛查量表和焦虑自评量表等。研究采用 R 语言对数据进行统计分析、网络模型构建和结果可视化。

结果 网络期望值和突现强度为 0.75,具有讨论的意义。马克思主义信仰水平通过对中国特色社会主义道路确信、理论确信、制度确信等三个维度的程度进行评估。发现在医学高等专科学校学生中,制度确信与理论确信与心理弹性正相关,与积极幻想的控制感正相关。道路确信与制度确信与网络欺凌的攻击行为存在潜在的负向相关关系。制度确信、理论确信与非自伤性自伤存在潜在负性相关关系。道路确信、制度确信与抑郁情况存在潜在的负性相关关系。

结论 医学高等专科学校学生的马克思主义信仰水平与其当前不同心理因素密切相关,这种信仰对学生的心理健康产生了积极的影响。学校应该进一步加强对学生的马克思主义教育,帮助学生提高心理素质。

Objective Mental, neurological, and substance use (MNS) disorders stand as the foremost contributors to disease burden among young people globally

Methods Data were obtained from the 2021 Global Burden of Disease study. Prevalence, disability adjusted life years (DALYs), years lived with disability (YLDs), and years of life lost (YLLs) with 95% uncertainty intervals (UIs) were reported. The data was further stratified by age, sex and region

Results A total of 279.0 million, 750.9 million and 29.7 million prevalent cases of mental, neurological and substance use disorders was identified in people aged 10-24. Among MNS disorders, NDs exhibited the highest prevalence, MDs caused the most disabling cases, and SUDs contributed most to mortality in the 10-24 age group. The study also revealed sex-based disparities in mental and neurological disorders across age groups, with higher prevalence of internalizing disorders

such as anxiety and depression in females, and externalizing disorders like conduct disorder, substance use disorders and ADHD in males. Depressive and eating disorders exhibited a notable increase from ages 10-14 to 15-19, whereas schizophrenia, multiple sclerosis, drug use disorders and alcohol use disorders showed further increases from ages 15-19 to 20-24

Conclusion Generally, high-income countries according to the World Bank exhibited the highest prevalence and DALYs rates for MNS disorders. Specifically, Australia and New Zealand had the highest prevalence rates for MDs, Norway and Italy for NDs, and the United States and Canada for SUDs

关键词: Mental disorders, Substance use disorders, Neurological disorders, depression, anxiety

精神病专科医院前急救护理人员工作压力分析及对策

徐璐* 张奇 谭昆
宜昌市优抚医院

目的 分析精神病专科医院院前急救工作者心理压力的根因分析、及对应急处置工作和救助患者、家属的影响,探讨院前急救护理人员工作压力和相应对策。

方法 通过对 65 名院前急救工作人员的心理问卷调查、心理访谈和对应急处置中严重事件压力的因果关系进行调查。分析院前急救护理人员存在的工作压力。

结果 院前急救人员 90%的压力来自于自身不良心理因素。78%的压力来自现场急救隐患、转运途中安全隐患。35%压力来自急救护理技术和设备问题。还有患者不配合,家属情绪影响,人际关系等。

结论 精神专科医院救治患者的特殊性,院前急救人员的工作具有高度的复杂性和挑战性,不仅要应对患者的精神症状,还要处理突发的紧急情况,在双重压力下给院前急救人员带来较大的心理压力。另外,精神科护理人员普遍缺乏系统的急救相关专业培训,综合急救素质偏低;导致在院前应急处置中存在一些困难和问题,充分了解院前急救护理人员的工作压力源,有助于帮助他们缓解不良心理

压力。提出对策及时有效地控制急救医护人员心理压力,能提高急救医护人员的专业技术和风险评估能力,促进护理人员的身心健康和积极工作态度,这对于提高护理质量,保障患者权益具有重要的意义。

蛋白质 O-GlcNAc 糖基化参与青春期小鼠抑郁共病肥胖的机制研究

杨东铸^{1,2} 丁增波² 冯雪竹² 谭璇² 赵誉煜² 陆林³ 时杰² 李素霞² 朱维莉²

- 1.北京大学基础医学院医学神经生物学系
- 2.北京大学中国药物依赖性研究所&药物依赖性研究北京市重点实验室
- 3.北京大学第六医院

目的 青少年抑郁症的发病率显著上升,给家庭和社会带来了沉重的负担。开展青少年抑郁症的发病机制和治疗方法研究具有重要的社会意义和经济价值。青春期肥胖与抑郁症之间具有密切联系,二者可能互为因果关系。本研究旨在探讨蛋白质 O-GlcNAc 糖基化修饰在应激诱发的青春期小鼠抑郁样行为与肥胖共病中的作用,为青少年抑郁症与肥胖共病的治疗提供新的策略。

方法 研究采用 4 周龄的青春期雄性小鼠,通过给予高脂饮食的肥胖模型与长期束缚应激模型模拟抑郁与肥胖的共病状态。根据行为学指标、体重和血糖观察高脂饮食喂养的青春期小鼠是否出现加重或缓解的抑郁样症状,利用免疫荧光技术关注在抑郁与肥胖共病小鼠中 O-GlcNAc 糖基化富集程度和神经元活性出现显著差异的脑区,并分析两者之间的相关性。

结果 行为学检测结果显示,在高脂饮食和束缚应激模拟青春期抑郁与肥胖共病的小鼠模型中,相对于高脂饮食喂养并经历应激的小鼠,正常饮食喂养的小鼠受到长期应激后出现了显著的体重下降和抑郁样行为,此表征预示着在青春期阶段,高脂饮食有可能缓解应激造成的抑郁样行为。此外,通过观察以夜食综合征为代表的小鼠饮食失调模型中,经历社交挫败应激后的小鼠更容易发生进食量增加、

体重增长以及抑郁和焦虑样行为。进一步通过免疫荧光染色技术,我们发现在小鼠的内侧前额叶皮层、杏仁核等脑区糖基化 O-GlcNAcylation 和 c-fos 水平显著增加,提示其在抑郁和肥胖共病的发生中可能发挥调节作用。

结论 青春期小鼠给予高脂饮食可能缓解长期应激导致的抑郁样行为,蛋白质 O-GlcNAc 糖基化可能参与了应激诱导的抑郁样行为和肥胖共病机制。

关键词: O-GlcNAc 糖基化, 应激, 抑郁症, 肥胖, 青春期, 小鼠

神经质人格特质的功能连接梯度研究及其与认知功能和转录组学的关系

李婧 刘莎*
山西医科大学第一医院

目的 神经质这一人格特质被认为是精神病理学中的一个重要风险因素,可以预测如重度抑郁症、广泛焦虑症和精神分裂症等一系列疾病。然而,神经质的神经生理机制尚不清楚,目前还未有研究探究不同神经质水平人群的功能连接梯度差异,及其与认知功能和转录组学的关系。

方法 本研究收集了 319 名受试者的艾森克人格问卷(109 名低神经质、210 名中高神经质)和静息态功能磁共振数据,并计算了所有受试者基于体素的功能连接梯度。然后,分析了低神经质组和中高神经质组的主梯度模式差异及其与元分析认知术语、神经递质的关联,并采用偏最小二乘回归(partial least squares regression, PLS)算法基于艾伦人类脑图谱探究差异 Z 图与精神疾病的相似性、功能富集、神经细胞、皮质层和发育富集的关系。

结果 研究发现,与低神经质组相比,中高神经质组在视觉网络(Cohen's $d=-0.574$, $P<0.001$)、边缘网络(Cohen's $d=0.363$, $P=0.006$)和默认网络(Cohen's $d=0.646$, $P<0.001$)的主功能梯度模式存在差异,并且这种差异与多种高阶认知功能(社会认知、决策制定、情感等)和神经递质(五羟色胺、多巴胺等)有关。另外,差异 Z 图与基于基因表达图谱的 PLS1 分数显著正相关。与功能梯度差异相关的 PLS1 基因与孤独症、精神分裂症的失调基因显著相关,与星形胶质细胞的失调基因显著重叠,

主要富集在神经发育、突出信号传导以及免疫系统反应等生物学通路，并且上调基因主要富集在 L1、L2 和 L5 皮质层，以及婴幼儿期至儿童期的丘脑和杏仁核区域，而下调基因主要富集在 L3 和 L4 层，以及幼年期至青少年期的小脑区域。

结论 这些结果为阐明不同神经质人格特质的功能连接梯度改变及其与认知功能、神经递质和微观转录组学的复杂相互作用提供了重要的理论基础。

MindUp 正念课程的本土化实施与对青少年总体幸福感提升及焦虑、抑郁情绪改善的研究

王晓坤 栾燕* 谢丽娜 韩笑宇 李璞鸥 高柏慧 苏荣坤 王冠文 王怡萱 王鹤凝 张凡 朱睿明 姚明洋
沈阳市精神卫生中心

2003 年公益组织霍恩基金会 (The Hawn Foundation) 联合神经科学家、教育家和心理学家共同创立研发 MindUP (心升) 课程。MindUP 课程已在五大洲四十八个国家推广实施。迄今为止，世界各地已有超二十万名教师参与 MindUP 课程培训，帮助了 1000 多万儿童青少年。

MindUP 正念团体课程是一个循证课程，以认知神经科学、正念、积极心理学和社会情感学习四大领域为核心支柱，促进儿童和青少年形成积极的情绪认知、情绪情感、意志品质、行为反应，提升其亲社会性、幸福感、心理抗压力和社会情感能力。MindUP 课程有着扎实的理论基础，以认知神经科学、正念、积极心理学及社会情感学习为四大支柱，分别对应课程的 4 个单元，即“集中注意力”、“强化感知力”、“态度决定一切”、“正念地采取行动”。在课程目标的设计上，整体上立足于认知、情感、意志、行为四个方面帮助学生提升亲社会性、幸福感及社会情感能力。这与我国德育课程设计知情意行合一的思想颇为相似，这为 MindUP 课程在我国的本土化实践提供了天然土壤。

自 2022 年以来，我国引进了 Mindup 团体课程的师资培训，开始了本土化的教学实践，但目前没有研究者对本土化教学实践进行实证研究。

目的 旨在首先通过访谈、专家论证的方法，对 Mindup 课程进行本土化的设计与实施。其次，采用实证研究的方法，验证 Mindup 课程对青少年总体幸福感的提升，及焦虑、抑郁情绪的改善有显著的效果。

方法 访谈法，量化研究，标准化心理评估，问卷调查法，随访研究。在门诊就诊的 12-18 岁、诊断为焦虑或抑郁的青少年患者 (且处于康复期) 中，选取实验组 40 人，实施 Mindup 团体课程，选取 40 人为对照组，不实施 Mindup 团体课程。在团体课程前、课程实施四周后、课程结束后、课程实施 3 个月后、课程实施 6 个月后、课程实施 12 个月后进行问卷调查。调查工具：总体幸福感量表 (GWB)、焦虑自评量表 (SAS)、抑郁自评量表 (SDS)。

结果 实验组的总体幸福感数值显著高于对照组，实验组的焦虑自评量表数值显著低于对照组，实验组的抑郁自评量表的数值显著低于对照组。

结论 Mindup 团体课程适于本土化实施，并且实证研究表明，此团体课程可以提升青少年的总体幸福感，对焦虑、抑郁的情绪改善有显著效果。形成适用于我国本土化的 Mindup 团体课程。

关键词：Mindup 正念团体课程，标准化心理评估，问卷调查法，总体幸福感，焦虑，抑郁

德性践行对生活满意度的影响：责任心和抑郁的链式中介作用

洪家龙*
山西医科大学第一医院

目的 德性践行 (Moral Practice) 是指以善为本，通过善行善念面对生活，通过感恩施舍奉献自己，以获得道德觉悟包括以善为本和感恩利他。德性践行是灵性应对 (Spiritual Coping) 的核心维度之一。研究表明，灵性应对与个体的人格特质和生活满意度之间存在一定关联。本研究旨在进一步细化灵性应对中的四个维度，研究作为灵性应对核心维度之一的德性践行与责任心、抑郁和生活满意度之间的关系，并研究其与生活满意度之间的关系。

方法 采用网络发放问卷的方式进行数据收集，问卷由五部分组成，包括基本人口学信息、大五人格简式量表 (Chinese Big Five Personality Inventory

Brief Version, CBF-PI-B)、病人健康问卷 (PHQ-9)、灵性应对量表 (Chines Spiritual Coping Scale, CSCS)、生活满意度问卷 (Satisfaction With Life Scale, SWLS)。采用 SPSS 26.0 对数据进行统计学分析, 使用 Harman 单因素共同方法偏差检验; 对各变量进行描述性统计和相关分析; 运用 PROCESS 4.2Model6 和 Bootstrap 法进行链式中介路劲分析和检验, 以 $P < 0.05$ 为差异有统计学意义。

结果 德性践行显著正向预测生活满意度和责任心, 责任心和抑郁在德性践行和生活满意度间发挥链式中介作用。

结论 本研究通过中介效应检验, 探究了灵性应对、大五人格特质、抑郁与生活满意度的关系。发现灵性应对中的德性践行维度与生活满意度之间存在显著的正向预测关系, 为理解灵性应对这一包含一点宗教与哲学意味的概念以及运用灵性应对提高人们生活满意度的实践提供了一定的理论支撑。

关键词: 灵性应对; 德性践行; 大五人格特质; 责任心、抑郁; 生活满意度

基于多模态语音特征的内化外化多分类模型研究

李进宇 王菲*
南京脑科医院

目的 本研究旨在通过比较不同机器学习模型和语音特征维度组合在分类内化、外化及其共病中的性能, 确定最有效的语音特征维度组合和最佳分类模型。

方法 采用了三种机器学习模型: 随机森林 (RF)、支持向量机 (SVM) 和逻辑回归 (LR)。语音特征分为韵律特征 (Prosodic Features)、声源特征 (Source Features)、谱特征 (Spectral Features) 和时域特征 (Temporal Features) 四个基准维度, 并生成这些基准维度的所有可能组合。使用方差阈值法和相关性分析进行特征选择。应用 SMOTE 技术处理数据不平衡问题。通过随机搜索进行超参数调优, 以加权 F1 分数为主要评估指标。通过 10 倍交叉验证和显著性测试比较不同特征维度组合和模型的性能。分别对男性和女性数据集进行了实验。

结果 通过 15 种不同的特征维度组合进行实

验。对于男性声音, SVM 模型在使用谱和时域特征维度组合时取得最高的加权 F1 分数, 为 0.7007; RF 模型在使用谱特征维度时取得次高的加权 F1 分数, 为 0.6983。对于女性声音, RF 模型在使用谱特征维度时取得最高的加权 F1 分数, 为 0.6817; 其次是 SVM 模型, 加权 F1 分数为 0.6771。LR 模型在两个数据集上的表现均较差, 加权 F1 分数分别为 0.4099 (男性) 和 0.4337 (女性)。在内化、外化及其共病分类任务中, 谱特征维度表现出最强的预测能力。对于男性声音, 结合谱和时域特征维度组合显著提高了 SVM 模型的性能。对于女性声音, 使用谱特征维度即可达到最佳性能。声源特征和韵律特征的贡献相对较小。显著性测试结果表明, 不同特征维度组合间的模型性能存在显著差异 ($p < 0.0001$), 每种特征维度组合的三种模型间的性能也存在显著差异 ($p < 0.0001$)。

结论 优先使用谱特征维度组合, 并采用支持向量机和随机森林模型, 可以显著提高内化、外化及其共病分类的准确性和可靠性。未来研究应继续改进数据平衡技术和优化谱特征维度的提取和处理, 以进一步提升分类性能。

高中生领悟社会支持、应对方式对焦虑、抑郁的影响

姜华东¹ 樊珍¹ 苏倩² 宁雅童¹ 张燕¹ 苏艳丽¹
1. 西安市精神卫生中心
2. 汉中市南郑区精神专科医院医院办公室

目的 探究领悟社会支持对高中生焦虑、抑郁症状的影响以及应对方式在其中的作用机制。

方法 2023 年 3 月-4 月采用一般资料调查问卷表、广泛性焦虑量表 (GAD-7)、抑郁症筛查量表 (PHQ-9)、领悟社会支持量表 (PSSS) 和简易应对方式量表 (SCSQ), 对来自陕西省某高中的 1473 名高中生进行调查, 通过偏差矫正的 Bootstrap 法进行中介效应检验。

结果 高中生 GAD-7 平均得分为 (5.02±3.88) 分, 检出焦虑症状者 709 人 (48.13%), PHQ-9 得分为 (5.95±4.70) 分, 检出抑郁症状者 776 人 (52.68%);

性别、年级、是否为班干部、应对方式在高中生 GAD-7 得分差异均有统计学意义 ($P < 0.05$)；性别、年级、是否为班干部、父母是否离异、应对方式在高中生 PHQ-9 得分差异均有统计学意义 ($P < 0.05$)；高中生的 GAD-7 得分与 PHQ-9、SCSQ 消极维度得分呈显著正相关 ($r = 0.749, 0.302$, 均 $P < 0.01$)，与 PSSS 得分、SCSQ 积极维度得分呈显著负相关 ($r = -0.350, -0.248$, 均 $P < 0.01$)；高中生的 PHQ-9 得分与 PSSS、SCSQ 积极极维度、SCSQ 消极维度得分呈显著负相关 ($r = -0.452, -0.304$, 均 $P < 0.01$)，与 SCSQ 消极维度得分呈显著正相关 ($r = 0.330$, $P < 0.01$)；积极应对方式和消极应对方式在领悟社会支持对焦虑、抑郁影响中的平行中介效应有统计学意义，中介效应占比分别为 31.97% 和 26.19%。

结论 高中生中焦虑和抑郁症状的检出率较高，提高高中生对社会支持的认知和理解，积极鼓励他们采取积极的应对方式，减少消极应对方式的使用，可以有效降低他们的焦虑和抑郁水平。

关键词：焦虑；抑郁；高中生；领悟社会支持；应对方式

Effects of Transcranial Direct Current Stimulation on Response Inhibition: A Meta-analysis of Stop Signal Task Performance

Qiuxuan Yu Jiahui Deng* Tingting Wu Ximei Zhu Mingyue Zhang Yinjiao Li
Peking University Sixth Hospital

Objective Response inhibition is a hallmark of executive control. Response inhibition dysfunction has been identified as the main maintenance mechanism of a series of mental disorders, such as attention-deficit-hyperactivity-disorder, binge eating disorder and addiction. In recent years, many studies have reported the effect of transcranial direct current stimulation (tDCS) on response inhibition. Given the different large parameter spaces in the study design, tDCS types, and task procedures, it is essential to make a quantitative analysis of the existing literature in this field. So, the main purpose of this meta-analysis was to explore whether tDCS

could improve the response inhibition function. In addition, several moderator variables were investigated

Methods We performed a comprehensive literature search for studies published from data inception to June 2024 including the PubMed/MEDLINE database, Web of Science, PsychInfo and Embase. In order to focus on the ability to interrupt an already initiated reaction, only studies that assessed response inhibition in the stop-signal task (SST) were included. Hedges 'g' was used to quantify the effect size of stop-signal reaction time (SSRT) changes before and after tDCS intervention. Due to the difference in mechanism, the influence of tDCS polarity was first investigated, and then other moderator variables were analyzed respectively

Results A total of 68 effect sizes involving 1939 participants were extracted from the 34 included studies, with 50 effect sizes for anodal tDCS stimulation and 18 for cathodal tDCS stimulation. The results of meta-analysis showed that anodal tDCS had a modest to moderate and significant overall effect on response inhibition ($g = 0.39$, $CI [95\%] = 0.27 \sim 0.50$, $P < 0.0001$), while cathodal tDCS had a weak and insignificant effect ($g = 0.07$, $P = 0.32$). Further moderator and subgroup analysis on the study of anodal tDCS indicated that target electrode placement performed as a significant moderator

Conclusion Based on the studies included, our results revealed that anodal tDCS elicit a modest to moderate effect on improving the response inhibition. And we further substantiated previously observed differences between brain regions, i.e., involvement of the right inferior frontal gyrus (rIFG), the right dorsolateral prefrontal cortex (rDLPFC) and the motor-related cortex (M1 and pre-SMA) in inhibitory control. Overall, our findings quantitatively demonstrate the potential of anodal tDCS to improve response inhibition function and provide quantitative evidence for the application of anodal tDCS in precise treatment of diseases characterized by response inhibition dysfunction

关键词：Stop-signal task, Response inhibition, Meta-analysis, Inhibitory control, Transcranial direct current stimulation, tDCS

中国大学生对跨性别者的态度调查

张月倩^{1,2} 牛雅娟²

1.承德医学院

2.北京回龙观医院

目的 了解大学生对跨性别者的态度及影响因素。

方法 于2024年3月—4月,在线招募全国大学生3115名,通过网络平台发放《跨性别态度与信念量表》对大学生进行问卷调查,该量表包括人际关系舒适性(IC)、性别信念(SGB)和人类价值(HV)3个维度,总分在26—182之间,得分越高,表示对跨性别者的态度越包容。

结果 (1)中国大学生在跨性别者信念与量表上的得分为 128.73 ± 31.93 ; (2)相比于男生,女大学生在跨性别者态度与信念量表上的得分更高($t=-3.892, p<0.001$); (3)相比于家庭居住地为农村的学生,家庭居住地为城市的大学生性别信念(SGB)与人类价值(HV)维度的得分更高($t=-2.328, p<0.05$; $t=2.423, p<0.05$); (4)相比于生活中无跨性别者朋友的大学生,生活中有跨性别者朋友的大学生量表得分更高($t=-2.685, p<0.01$); (5)相比于其他学历学生,本科生量表得分更高($F=5.302, p<0.01$); (6)相比于其他专业,法学、文学和教育学专业的大学生性别信念(SGB)与人际关系舒适性(IC)维度的得分更高,医学生人类价值(HV)维度得分更高($F=1.881, p<0.05$; $F=2.163, p<0.05$; $F=5.476, p<0.001$); (7)父母亲文化程度为硕士及以上的大学生在跨性别者态度与信念量表上的得分更高($F=9.889, p<0.001$; $F=6.870, p<0.001$)。

结论 (1)中国大学生对跨性别者持包容态度; (2)女大学生、家庭居住地为城市、生活中有跨性别者朋友、本科生、父母亲文化程度高的大学生对跨性别者的态度更包容。

关键词: 大学生,跨性别者,态度

四川省青少年及青年学生的体育锻炼与心理健康

慕云菲 王聪 周烈 杨轶越 罗建军 蔡佳 冉茂盛*

四川大学华西医院

目的 体育锻炼对心理健康有积极的影响作用,这种影响因锻炼类型、频率、持续时间而不同。本研究旨在探索青少年及青年学生群体的体育锻炼状况和心理健康问题之间的关系,为学生心理健康的预防干预提供工作。

方法 采用方便抽样,发放线上问卷。受访者为四川省的初、高中和大学生。内容包括:基本信息,体育锻炼信息(是否锻炼,单次锻炼时长,锻炼频率,锻炼方式),以及精神健康问题量表(PHQ-9、GAD-7)。采用卡方检验比较不同体育锻炼状态下学生的心理健康问题。采用逻辑回归探索不同运动方式、时长、频率对有体育锻炼的学生心理健康问题的影响。

结果 共55773名学生参与。近一年有体育锻炼习惯的学生有34272名(61.4%),有体育锻炼的学生出现抑郁(31%)和焦虑(26.9%)的率显著低于无体育锻炼的学生(46.8%, 39.8%, $P<0.001$)。从时长来看,单次运动时间为 ≤ 30 分钟,30-60分钟,60-90分钟, ≥ 90 分钟的学生发生抑郁(31.6%, 29.9%, 32.6%, 32.2%)和焦虑(26.8%, 26.2%, 28.2%, 28.3%)的率显著低于无体育锻炼的学生(46.8%, 39.8%, $P<0.001$)。从频率来看,每周运动 ≤ 1 次,2次,3次,4次, ≥ 5 次的学生发生抑郁(31.4%, 31.0%, 30.4%, 31.7%, 31.2%)和焦虑(27.3%, 26.6%, 26.7%, 27.1%, 27.3%)的率显著低于无体育锻炼的学生(46.8%, 39.8%, $P<0.001$)。从锻炼方式来看,从事任何形式(散步、有氧、健身房运动、骑行、挥拍类、其他球类、水上运动、家务劳动、活动、慢跑,其他)的体育锻炼,学生的抑郁和焦虑的率都更低($P<0.001$)。与单次运动时间 ≥ 90 分钟相比,30分钟及以下,30-60分钟的学生出现抑郁($OR=0.908, 0.863, P<0.05$)和焦虑($OR=0.851, 0.851, P<0.001$)的风险更低。与“其他类型”的运动相比,散步、骑行、挥拍类运动的学生出现抑郁($OR=0.596, 0.602, 0.621, P<0.001$)和焦虑($OR=0.608, 0.639, 0.643, P<0.001$)的风险更低。

结论 青少年及青年学生的心理健康问题与其体育锻炼显著负相关,任何时长、频率、类型的体育锻炼对学生心理健康都有积极意义,但适度的运动时长、适宜的运动方式效果更佳。

关键词: 青少年学生,青年学生,体育锻炼,心理健康

童年创伤对青少年学校适应的影响：边缘人格特征与社会支持的中介作用

牛笑笛 钱丽菊*
山东省戴庄医院

目的 探讨童年创伤对青少年学校适应的影响,以及边缘人格特征和社会支持在二者之间的作用机制。

方法 采用童年创伤问卷(CTQ-SF)、学校适应量表(SAS)、边缘人格特征量表(BPF5-C)以及社会支持量表(SSS),对2616名青少年学生进行问卷调查,使用SPSS进行相关分析,PROCESS进行链式模型分析。

结果 (1)相关分析表明,童年创伤与社会支持和学校适应显著负相关($r = -0.37, -0.41, P < 0.01$),与边缘人格特征呈显著正相关($r = 0.37, P < 0.01$)。边缘人格特征与社会支持、学校适应呈显著负相关($r = -0.40, -0.55, P < 0.01$)。社会支持与学校适应显著正相关($r = 0.53, P < 0.01$)。(2)边缘人格特征在童年创伤与学校适应之间起部分中介作用,效应量为33.33%;社会支持在二者之间中介效应量为20.51%;边缘人格特征与社会支持的链式中介效应量为7.70%,三条路径中介效应占总效应的61.54%。

结论 童年创伤既能直接负向影响青少年学校适应,也可以通过三条路径间接影响学校适应:一是边缘人格特征的单独中介作用,二是社会支持的单独中介作用,三是边缘人格特征与社会支持的链式中介作用。

关键词: 童年创伤; 学校适应; 边缘人格特征; 社会支持

音乐会的不同形式对有音乐训练者与无音乐训练者情绪反应差异研究

章莹² 朱玥¹ 王菲¹

1.南京医科大学
2.南京医科大学附属脑科医院

目的 听音乐可激发人类情绪体验,音乐会作

为一种常见的音乐表演形式常见于人类的日常生活中。然而,有无音乐训练的不同人群对现场音乐会实时的情绪体验研究较少。本研究基于智能手机生态瞬时评估(ecological momentary assessment, EMA)探讨不同音乐训练背景人群对音乐会不同形式下情绪体验的差异性。

方法 音乐会形式包含沉浸式音乐聆听(上半场)与互动式音乐体验(下半场)两个环节,每个环节各60分钟。共招募97名成年在校大学生,其中有音乐训练者(Music Trainer [MT组], $n=46$)和无音乐训练者(Non-Music Trainer [NMT组], $n=51$)。每名被试均在音乐会开始前,上半场结束后,和下半场结束后分别进行3次EMA评估,评估内容为对当下情绪的愉悦度、精力状态和紧张度。

结果 MT组与NMT组在沉浸式音乐聆听与互动式音乐体验下情绪愉悦度与精力状态存在差异。MT组愉悦度和精力状态在沉浸式音乐聆听后有显著性提升,而NMT组愉悦度和精力状态在互动式音乐体验后有显著性提升,紧张度则在两组间无差异无显著差异。

结论 音乐训练造成的音乐感知差异提升了对聆听音乐的情绪体验,但无音乐训练者也可通过互动式音乐体验改善情绪。本研究也进一步提示,音乐治疗作为干预手段是应考虑来访者音乐训练背景,提供合适的治疗方案尤为重要。

关键词: 现场音乐会, 音乐训练, 生态瞬时评估, 情绪反应

适应不良完美主义对青少年情绪和行为问题的影响：基于个体中心的潜在剖面分析

徐珊¹ 徐珊² 祖梦兰² 祖梦兰¹ 朱小林² 谭淑平²
1.承德医学院
2.北京回龙观医院

目的 负性完美主义水平高者易出现情绪障碍和行为问题。本研究以个体为中心的视角,通过调查青少年情绪和行为问题的亚群体及剖面特征,探讨适应不良完美主义对青少年情绪和行为问题的影响。

方法 采用长处和困难问卷(Strengths and Difficulties Questionnaire, SDQ)、中文版Frost多维完美

主义量表 (Chinese Frost Multidimensional Perfectionism Scale, CFMPS), 在线收集 12-18 岁在校生成数据, 有效问卷 1115 例, 男: 女=1.33, 平均年龄 14.97 ± 1.50 岁。采用潜在剖面分析 (LPA) 和 Logistics 回归等方法进行数据分析。

结果 (1) Pearson 相关: SDQ 总分、困难总分及 SDQ 除亲社会行为的维度都与适应不良完美主义及所含维度呈显著正相关 ($p < 0.05$), 而 SDQ 中亲社会行为与适应不良完美主义总分、父母期望、个人标准、行动的疑虑三个维度显著负相关 ($r = -0.10, p < 0.001$; $r = -0.15, p < 0.001$; $r = -0.17, p < 0.001$; $r = -0.12, p < 0.001$)。 (2) 情绪和行为问题存在三类最佳剖面: C1 无风险 (5.83%)、C2 轻度风险 (69.42%) 和 C3 中高度风险组 (24.75%) (AIC=22221.23, BIC=22331.59, aBIC=22261.71, Entropy=0.88, LMR ($p < 0.01$), BLRT ($p < 0.001$))。 (3) 单因素方差分析: 三组成员在适应不良完美主义及各维度上均差异显著 ($p < 0.001$), 事后检验发现 SDQ 的 3 种剖面在适应不良完美主义中 (除担心错误维度): $C3 > C2 > C1$, 担心错误维度: $C3 > C2, C3 > C1$ 。 (4) 多项式 logistics 回归: 适应不良完美主义中, 担心错误 (CM)、父母期望 (PE)、个人标准 (PS)、行动的疑虑 (DA) 维度都对 C2 组有显著预测作用, 以 C1 组为参照, PE、PS、DA 因子得分高者更易进入 C2 组 ($OR = 1.13, p < 0.05$; $OR = 1.26, p < 0.01$; $OR = 1.27, p < 0.01$), CM 维度每升高一单位, 其属于 C1 组的发生比降低 27% ($OR = 0.73, p < 0.001$); C3 组中 PS、DA 维度得分高者比例更高 ($OR = 1.21, p < 0.05$; $OR = 1.49, p < 0.001$)。

结论 青少年情绪和行为问题存在群体异质性, 轻度风险占比最高, 且各剖面在适应不良完美主义上存在组间差异。适应不良完美主义的个人标准、行动的疑虑维度可能是预测青少年情绪和行为问题风险上升的潜在指标。

医学生自杀自伤行为风险预测模型的构建与评估

杨宇晴¹ 金金¹ 王芳^{2,3} 曾庆枝¹ 李春波^{1,3}

1. 交通大学医学院附属上海市精神卫生中心

2. 上海交通大学医学院心理咨询中心

3. 上海学校心理健康教育名师 (李春波) 工作室

目的 探究医学生自杀自伤行为的特征和影响因素, 构建 Logistic 回归风险预测模型。

方法 2022 年 3 月至 2024 年 4 月, 经过知情同意后, 使用电子版人口学信息调查表、患者健康问卷 (Patient Health Questionnaire, PHQ-9)、广泛性焦虑量表 (Generalized Anxiety Disorder, GAD-7)、社会支持评定量表 (Social Support Rating Scale, SSRS) 和压力感受量表 (Perceived Stress scale, PSS-10) 对某高校的 4406 名医学生进行网络调查, 并使用由简明国际神经精神访谈 (Mini-International Neuropsychiatric Interview, MINI) 改编的自评量表评估医学生的自杀自伤行为。根据问卷收集时间, 将 2022 年 3 月至 2023 年 12 月采集的数据作为训练集 ($n = 2626$), 将 2024 年采集的数据作为测试集 ($n = 1780$)。使用卡方检验和 t 检验和进行单因素分析。基于单因素分析结果筛选变量, 对训练集数据使用多元 Logistic 回归分析构建医学生自杀自伤风险模型。使用 ROC 曲线下面积、特异度、灵敏度和约登指数对模型效果进行评价。

结果 调查期间, 医学生自杀自伤行为自我报告检出率为 3.3%。单因素分析显示, 自杀自伤行为报告者的抑郁症状评分、焦虑症状评分、压力感知评分显著高于未报告自杀自伤者, 社会支持水平显著低于为报告自杀自伤者 (t 值为 -15.322、-13.440、-13.265 和 7.814, P 值均 < 0.001)。女性、有心理疾病史、家庭经济情况自评为差或较差的医学生, 自杀自伤行为自我报告率更高 (χ^2 值为 10.743、37.585 和 8.287, P 值均 < 0.05)。多元 Logistic 回归分析显示, 抑郁情绪 ($OR = 1.33$)、使用烟酒 ($OR = 3.18$)、心理疾病史 ($OR = 5.17$) 和家庭经济情况差 ($OR = 3.71$) 是医学生自杀自伤的主要危险因素 ($P < 0.05$)。在验证集中使用风险评分模型, ROC 曲线下面积为 0.870 (95% 置信区间为 0.833~0.908, $P < 0.001$)。取最佳截断值时, 灵敏度 83.7%, 特异度 87.6%, 约登指数 71.3%。

结论 医学生自杀自伤行为的影响因素较多。基于 Logistic 回归的风险评估模型对医学生自杀自伤行为具有一定的预测价值。高校应关注自杀自伤行为的预测因素, 及时对高风险个体开展心理干预措施。

苯二氮卓类药物的滥用、误用和依赖的患病率及危险因素：一项 Meta 分析和系统评价

李书航¹ 陆林² 袁凯² 鲍彦平² 张朝辉¹

1.新乡医学院第一附属医院

2.北京大学第六医院

目的 本研究旨在系统评估苯二氮卓类药物的滥用率，并探讨其主要危险因素，为公共卫生政策的制定和临床干预措施提供科学依据。

方法 我们检索了截止到 2024 年 5 月 8 号的 PubMed、Embase、Cochrane、PsycInfo、web of science 五个数据库，从中筛选出关于苯二氮卓类药物滥用的研究。纳入标准包括：报告苯二氮卓类药物滥用率的原始研究，并包含至少一个潜在危险因素的数据。使用随机效应模型对滥用率进行 Meta 分析，并通过亚组分析探讨危险因素的影响。

结果 目前暂纳入 6 项研究，涉及样本总数为 1383212 人。综合分析显示：在一般人群中，苯二氮卓类药物的总体滥用率为 1.92% (95% CI: 1.84%-2%)。亚组分析发现，女性 (OR=1.68, 95% CI: 1.58-1.79)、未婚 (OR=1.28, 95% CI: 1-1.62)、独居 (OR=1.42, 95% CI: 1.23-1.64)、低收入 (OR=1.21, 95% CI: 1.12-1.3)、重度抑郁 (OR=4.19, 95% CI: 3.88-4.52)、有自杀意念 (OR=3.41, 95% CI: 3.12-3.72) 等是主要危险因素。

结论 苯二氮卓类药物的滥用在不同人群中差异显著，女性、未婚、独居、低收入、重度抑郁症及存在自杀意念的个体是主要的高危人群。针对这些高危人群的干预措施应加强，以降低苯二氮卓类药物的滥用风险。本研究存在局限性，比如目前纳入研究暂时较少；研究人群为一般人群，可能无法代表特定高危人群等，未来的研究应重点关注精神疾病人群，并进一步探讨其他潜在的危险因素。

关键词：苯二氮卓;滥用;依赖;患病率;危险因素

目的 抑郁症是影响儿童青少年的第二大精神障碍，但是目前其药物治疗效果差，根本原因在于其发病机制不清，而目前的抗抑郁药物主要针对成人抑郁症发病机制。亟需探究儿童青少年抑郁症的发病机制，优化其治疗。在目前抑郁症发病机制中，炎症假说和细胞因子假说中，活性氧 (ROS) 在其中发挥重要作用，升高可能导致抑郁症。而铁死亡是 ROS 在亚铁离子催化下氧化脂膜上的多不饱和脂肪酸，导致脂质过氧化物堆积，最终导致细胞死亡。进来研究表明铁死亡在抑郁症中也发挥重要作用，但是其具体作用和机制还未阐明，尤其在儿童青少年中未有研究。因此本研究的目的是探究铁死亡在儿童青少年抑郁症患者中的表达情况与其作用，为儿童青少年抑郁症的治疗提供新的见解

方法 收集儿童青少年抑郁症患者与健康对照组受试者全血，以分离血清；采用 Elisa 与生化检测试剂盒验证铁死亡通路——谷胱甘肽 (GSH)、谷胱甘肽过氧化物酶 4 (GPX4)、铁蛋白 (Ferritin)、丙二醛 (MDA)、转铁蛋白受体 1 (TFR1)、亚铁离子 (Fe²⁺) 在血清中的表达情况。

结果 Elisa 结果显示，与健康对照组受试者相比：Ferritin 与 TFR1 在儿童青少年抑郁症患者中表达明显升高，GPX4 在儿童青少年抑郁症患者中表达明显降低。生化检测结果显示，与健康对照组受试者比较：GSH 在儿童青少年抑郁症患者中表达明显降低，MDA 在儿童青少年抑郁症患者中表达明显升高，亚铁离子在二者中的表达无差异。

结论 Elisa 结果与生化检测结果显示，儿童青少年抑郁症患者血清中还原性物质明显降低，而其铁死亡产物 MDA、铁代谢途径 Ferritin 与 TFR1 的表达明显升高，血清检测结果提示在儿童青少年抑郁症患者确实发生了铁死亡。但是具体机制还需要进一步探究

关键词：儿童青少年；抑郁症；铁死亡

铁死亡在儿童青少年抑郁症中的作用与机制研究

大学生心理健康与人格结构的关系及其中介因素

李一杰 余慧慧*
天津市安定医院

目的 D型人格作为一种人格特质倾向对大学生心理健康有着重要影响,大学生在学业过程中会面临诸多挑战,有D型人格特质的学生易体验到消极情绪,并长期处于这种情绪中。本文旨在探讨大一新生D型人格特质与快感缺失的关系,分析应对方式和心理韧性在其间的中介作用。

方法 2021年9月,采用便利抽样法选择无锡某高校的864名大一新生为研究对象,采用一般人口学问卷、中文版时间体验愉悦量表(Temporal Experience of Pleasure Scale, TEPS)、D型人格量表(DS-14)中文版、简易应对方式问卷及心理韧性量表(CD-RISC)中文版对其进行调查。

结果 大一新生D型人格特质检出率为42.8%,快感缺失得分为(86.57±13.46)分。大一新生D型人格与快感缺失呈负相关($r=-0.161$, $p<0.01$),心理韧性和积极应对方式在D型人格与快感缺失间起完全中介作用。

结论 D型人格特质对大学生的心理健康状态具有一定预测作用,具有D型人格特质的大学生倾向于通过积极应对方式和心理韧性调节其快感缺失,学校需重点关注大一新生的D型人格特质,充分利用应对方式和心理韧性的可干预性,缓解其快感缺失。

关键词: 大学生; D型人格; 快感缺失; 心理韧性

Effectiveness of Plant-based Biophilic Interventions on Depressive Symptoms Among People with Mental Disorders: Protocol for A Systematic Review and Meta-analysis of Randomized Controlled Trials

Kunyi Lan Jiajia Liu*
School of Nursing, Peking University

Objective Biophilic interventions, stemming from the concept of biophilia, which hypothesizes human have innate connection with nature, has become a new approach to incorporate the positive experiences of

nature into the design of the environment. Biophilic interventions include natural sounds, aromatherapy, green plants, views of nature and so on. Biophilic interventions can be organized into three categories (i.e., nature in the space, natural analogues, and nature of the space), and plants are often the momentous elements. Plant-Based biophilic interventions (PBIs) have been utilized to reduce stress, improve cognitive function and creativity, improve psychological conditions and expedite healing, which is essential for providing people opportunities to live and work in healthy places and spaces with less stress and greater overall health and well-being. Previous studies have reported their effectiveness on depression symptoms in heterogeneous groups of mental disorders. Despite growing interest, there is no comprehensive and systematic synthesis of the evidence on the characteristics and effectiveness of various PBIs in the literature. To address the aforementioned knowledge gaps, this systematic review and meta-analysis aims to examine the empirical evidence concerning the effectiveness of PBIs in mitigating depressive symptoms across diverse mental disorders

Methods The conduct and reporting of the review will follow the Preferred Reporting Items for Systematic Reviews and Meta-Analyses (PRISMA) guidelines. We have registered our systematic review and meta-analysis with PROSPERO. We will conduct a comprehensive search for randomized controlled trials studies of interventions published from database inception until Jun 16, 2024 in MEDLINE, Embase, Cochrane Central Register of Controlled Trials (CENTRAL), PsycINFO, CINAHL, Scopus and Google Scholar (first 200 records). In addition, we will manually search the first 200 records on Google Scholar and browse the reference lists of included studies and relevant reviews. Only English-language articles were included. The quality of RCTs was assessed using the version 2 of the Cochrane tool for assessing risk of bias in randomized trials (RoB 2). We will provide a narrative overview of the findings from eligible studies. With sufficient data, a meta-analysis will be conducted

Results We anticipate that participants receiving PBIs will exhibit a significant reduction in depressive symptoms in between-group comparisons. And effect

sizes will be significantly associated with the length of intervention sessions

Conclusion To our best knowledge, this systematic review is the first to provide an overview of PBIs, including intervention characteristics and their effects on related mental health outcomes. If successful, this study will provide critical evidence that the PBIs are efficacious for alleviating depressive symptoms in individuals with mental disorders, potentially leading to the adoption of PBIs as a novel and effective intervention approach in conjunction with other treatments in clinical settings

The Impact of COVID-19 Related Trauma Memory on Long-term Mental Symptoms

Sizhen Su¹, Jiahui Deng¹, Le Shi¹, Yanping Bao², Lin Lu^{1,2}

1.Peking University Sixth Hospital, Peking University Institute of Mental Health, NHC Key Laboratory of Mental Health (Peking University), National Clinical Research Center for Mental Disorders (Peking University Sixth Hospital), Beijing, 100191, China.

2.National Institute on Drug Dependence and Beijing Key Laboratory of Drug Dependence, Peking University, Beijing, 100191, China

Objective Coronavirus disease 2019 (COVID-19) can be traumatic in terms of the threatened personal safety and intrusive experience of guilt, which may lead to mental health problems and undermine mental well-being. This study aims to investigate the association between COVID-19 related trauma memory and long-term mental symptoms

Methods This study recruited community populations who had normal or corrected-to-normal vision and aged 15 years or older. We collected the demographic characteristics, including age, gender, education, marital status, occupation, monthly family income,

COVID-19 vaccination status and time, history of physical diseases, history of mental disorders and family history of mental disorders. The acute and chronic physical symptoms among participants with COVID-19 were assessed by the symptom questionnaire. Chronic mental health included depression, anxiety, insomnia, acute stress, and PTSD symptoms. The participants were instructed to focus on neutral and trauma-related pictures, and to provide fear, valence and arousal ratings of each picture. The mean fear scores ≥ 6 were defined as fear of trauma cues. Relationships were examined between mental symptom scores and picture ratings

Results A total of 641 volunteers were included in this study, with 212 feeling fear of trauma cues (Fear group) and 429 participants feeling no fear of trauma cues (No-fear group). No difference in the history of physical diseases, history of mental disorders, and family history of mental disorders was found between Fear group and No-fear group. However, the prevalence of any of mental symptoms was higher in Fear group than No-fear group (67.5% vs 49.9%; $P < 0.001$). Compared with No-fear group, Fear group had higher prevalence rates of anxiety (28.7% vs 43.4%; $P = 0.002$), depression (41.0% vs 52.4%; $P = 0.038$), insomnia (30.3% vs 48.6%; $P < 0.001$), and acute stress/PTSD symptoms (5.8% vs 14.2%; $P < 0.001$). The result of partial correlation analysis showed that the fear of trauma cues was significantly correlated with increased prevalence of anxiety, depression, insomnia and acute/PTSD symptoms after adjusting for potential confounders

Conclusion The fear of trauma cues was associated with risk of any of mental symptoms and specific mental symptoms, including anxiety, depression, insomnia and acute/PTSD symptoms. These findings demonstrate the significance of comprehensive evaluation and management of trauma memory during the pandemic

关键词: Trauma memory, mental symptoms, correlation

短期焦点解决治疗在城市留守儿童认知偏向干预中的应用研究

叶友才*

丽水市第二人民医院

目的 随着我国城镇化进程的加速,大量农村劳动力涌入城市,导致城市中留守儿童数量日益增多。这些儿童由于缺乏父母直接的关爱和教育,容易产生一系列心理问题,其中认知偏向尤为突出,表现为对自我价值的低估、对未来期望的消极以及对社会关系的过度敏感等。本文旨在探讨短期焦点解决策略在干预城市留守儿童认知偏向方面的有效性。

方法 研究采用准实验设计,将64名城市留守儿童随机分为实验组和对照组,每组32人。实验组接受为期四周的短期焦点解决干预,内容包括自我效能感提升、积极情绪培养等;对照组则维持常规学校教育。干预前后,通过标准化的心理测量工具评估两组儿童的认知偏向水平,包括自我概念、感知社会支持和社会适应能力等方面。

结果 经过短期焦点解决干预后,实验组儿童的认知偏向有显著改善,具体表现在自我评价更加积极、对未来持乐观态度以及社会交往能力增强。与对照组相比,实验组在上述各项指标上均有明显提升,且差异具有统计学意义。

结论 短期焦点解决策略能够有效纠正城市留守儿童的认知偏向,促进其心理健康和全面发展。

本研究为城市留守儿童的心理干预提供了新的视角和方法,强调了短期、集中、目标导向的干预模式在解决这一群体特定心理问题上的潜力。未来研究可进一步探索该策略在不同年龄、性别及文化背景下的适用性和效果,以期为更多城市留守儿童提供有效的心理支持。

新型神经营养因子 MANF 通过内质网应激 PERK/ATF4 通路调控神经元铁死亡在抑郁症中的机制研究

党若之^{1,2} 周新雨^{1,2}

1.重庆医科大学附属第一医院

2.重庆医科大学

目的 抑郁症是医学研究领域的难点,对其机制的研究需要寻找新的突破点,神经元铁死亡在抑郁症中发挥重要作用。新型神经营养因子 MANF 是抑郁症中调控神经元铁死亡的关键分子,本研究拟研究 MANF 在抑郁症中的作用及其下游调控机制。

方法 建立小鼠 CSDS 抑郁模型,采用社会交互、糖水偏好、旷场、悬尾和强迫游泳等实验评估小鼠抑郁样行为学表现;使用 Western Blot 和 RT-PCR 技术,比较 CSDS 抑郁敏感组和对照组小鼠抑郁相关脑区(mPFC 和海马)MANF 的表达,筛选 MANF 调控抑郁的脑区;采用免疫荧光技术,观察 MANF 与神经元(NeuN)、小胶质细胞(Iba-1)、星形胶质细胞(GFAP)和少突胶质细胞(Olig2)的共定位情况;采用 CSDS 抑郁模型,向小鼠双侧海马注射 MANF 过表达病毒,阐明小鼠海马上调 MANF 对抑郁样行为的影响;借助 MANF 敲减病毒,向小鼠双侧海马注射 MANF 敲减病毒,探明敲减海马 MANF 对小鼠应激敏感性的影响;采用高尔基染色技术,观察过表达或敲减小鼠海马 MANF 蛋白对神经元形态的影响,并借助脑片膜片钳技术,探究 MANF 对海马神经元兴奋性的影响;采用免疫共沉淀技术,观察 MANF 和 PERK 的交互作用。

结果 1.CSDS 抑郁敏感小鼠海马脑区 MANF 表达上调;2.小鼠海马脑区特异性敲减 MANF 增加对应激的敏感性;3.小鼠海马脑区敲减 MANF 导致神经元铁死亡和树突棘形态改变;4.小鼠海马脑区过表达 MANF 改善抑郁样行为;5.PERK-ATF4 通路可能是抑郁症中 MANF 调控神经元铁死亡的下游通路。

结论 在 CSDS 抑郁模型中,小鼠海马 MANF 的表达上调,激活 PERK/ATF4 内质网应激通路,促进神经元铁死亡,最终导致抑郁症的发生。

关键词: 抑郁症;MANF;铁死亡;内质网应激

内蒙古赤峰地区高中生睡眠问题现状调查

李琼蔚 孙伟*

北京大学第六医院

目的 为调查高中生的睡眠情况,探究失眠与

情绪状态间的相关性,本研究在内蒙古赤峰地区高中生中进行睡眠情况调查,针对不同性别及年级学生睡眠情况进行了统计。采用焦虑自评量表对学生的心理状态进行评估,并通过心理复原力量表对学生的心理弹性进行衡量,对导致睡眠问题的心理因素进行探索,为探寻改善学生的睡眠状况和提高学生心理健康水平的干预措施提供参考。

方法 采用失眠严重程度指数量表、Epworth嗜睡量表、焦虑自评量表、心理复原力量表以及睡眠呼吸暂停初筛量表对2021年4月~5月内内蒙古赤峰地区3所中学1770名高中生进行睡眠、情绪及心理弹性进行调查分析,并运用Logistic回归以及分层回归等分析睡眠问题的影响因素。

结果 在接受睡眠情况调查的1770名高中生中,既往存在失眠情况的有565人(31.9%)。针对焦虑等心理状态的分析发现,失眠组的焦虑程度显著高于无失眠组($P < 0.001$),而心理复原力得分显著低于无失眠组($P < 0.001$)。平均睡眠时间在高二组最短,但是报告失眠的严重程度在高一组最高。Logistic回归分析发现焦虑水平($OR = 1.074, P < 0.001$)和心理复原力水平($OR = -0.971, P < 0.001$)与失眠情况显著相关。通过该两种量表评分可以对受试者是否出现失眠进行预测($AUC = 0.724, P < 0.001$)。

结论 焦虑以及心理复原力程度都与睡眠情况显著相关,随着焦虑情绪增加,睡眠质量明显下降,而较好的心理复原力则是失眠的保护因素。

客观睡眠参数与非痴呆人群脑内 β -淀粉样蛋白负荷之间的关系:一项荟萃分析

崇杉 赵海涯 陆林 师乐*
北京大学第六医院

目的 淀粉样蛋白级联假说认为, β -淀粉样蛋白($\text{amyloid-}\beta, A\beta$)沉积会导致tau蛋白过度磷酸化并聚集成神经纤维缠结,引起炎症反应、突触功能障碍、神经元凋亡,导致认知功能下降和行为紊乱,与包括阿尔兹海默病、帕金森病等的神经退行性疾病相关。因此,挖掘与 $A\beta$ 负荷有关的相关因素(尤

其是可变因素)非常重要。大脑淀粉样蛋白积累与睡眠紊乱之间的相互影响,我们设计一项荟萃分析来探索其中的关联,以求有助于神经退行性疾病的早期识别和管理。

方法 该研究方案可在PROSPERO平台通过注册号CRD42023387435查阅。我们在三个数据库(PubMed、Embase、PsycINFO)分别进行了全面的检索,检索策略的设计基于关键词"Amyloid And ((Sleep*) OR (Insomnia*))",分析了脑内 $A\beta$ (基于CFS或PET报告)与一般睡眠参数以及睡眠分期(基于多导睡眠监测或体动记录仪)之间的关系。数据的荟萃分析使用随机效应模型,合并效应量以及95%置信区间以皮尔逊相关系数的形式报告,同时进行了敏感性分析和回归分析探索结论的稳健性。

结果 共22篇文章被纳入荟萃分析。在一般睡眠参数中,睡眠效率与 $A\beta$ 负荷呈负相关($r = -0.104, 95\% CI(-0.168, -0.040)$),而入睡后觉醒时间($r = 0.0095, 95\% CI(0.030, 0.161)$)、入睡后觉醒次数($r = 0.0135, 95\% CI(0.083, 0.186)$)、呼吸暂停低通气指数($r = 0.280, 95\% CI(0.073, 0.464)$)、氧减指数($r = 0.567, 95\% CI(0.053, 0.844)$)与 $A\beta$ 负荷呈正相关。未发现总睡眠时间、睡眠潜伏期、非快眼动1,2,3期睡眠和快眼动气睡眠与脑内 $A\beta$ 负荷存在显著关联。敏感性分析表明,脑内 $A\beta$ 负荷与睡眠效率、入睡后觉醒时间、觉醒次数、呼吸暂停低通气指数的显著相关具有稳健性。单因素荟萃回归分析显示,调整呼吸暂停低通气指数不影响睡眠效率、入睡后觉醒时间和次数与 $A\beta$ 负荷之间的关,睡眠碎片化和夜间缺氧与脑 $A\beta$ 负荷的关系也不受年龄、性别因素影响。

结论 夜间睡眠碎片化和缺氧可能是脑内淀粉样物质沉积的预警信号。客观睡眠监测或有助于与 $A\beta$ 沉积相关神经退行性疾病的早期识别和管理。

关键词: β -淀粉样蛋白负荷,睡眠,神经退行性疾病,睡眠障碍,客观睡眠参数

经颅交流电刺激治疗抑郁的疗效及机制探索:一项前瞻性随机对照研究

崇杉 祝喜梅 陆林 邓佳慧*
北京大学第六医院

目的 抑郁障碍是当前全球疾病负担的第二大原因,然而,5%~55%患者对抗抑郁药物反应不佳或难以耐受,药物难治性抑郁患者生活质量严重降低,自杀风险极高,亟需新的治疗方法以作为新的治疗选择。脑刺激技术(电休克、经颅磁刺激)可以改善抑郁情绪,对于部分难治性抑郁患者也有疗效,经颅交流电刺激是一种新型的低强度非侵入性脑刺激,通过影响神经细胞的同步化和去同步化来调节皮质兴奋性和自发脑电活动,被证明可以改善抑郁情绪。我们设计了一项随机对照研究,探索经颅交流电刺激改善抑郁患者情绪的疗效及其潜在机制。

方法 该研究方案通过北京大学第六医院伦理委员会审核。根据既往研究计算样本量,纳入48名符合DSM-5诊断标准而未接受过其他脑刺激治疗重性抑郁障碍患者,治疗期间保持患者的精神科药物不变。分别随机给予连续5天、每天2次、每次40分钟的6Hz,2mA的真/伪经颅交流电刺激,刺激位点为双侧背外侧前额叶。治疗前后分别评估患者的抑郁情绪、焦虑情绪,采集静息态脑电图。使用MatLAB软件及eeglab插件进行脑电图数据预处理,借助Cartool工具包对治疗前后的脑电图进行微状态分析。通过一般线性模型重复方差测量比较真、伪刺激组治疗前后的差异。

结果 根据随机对照研究方案,重性抑郁障碍患者各有24名分入真/伪刺激组,1名伪刺激组受试者首次治疗感头晕退出。两组的基线人口学和抑郁症状信息无显著差异。真刺激组治疗后汉密尔顿-24抑郁量表评分平均降低-12.33分,显著优于伪刺激组-6.52分($F=9.791, P=0.003$),真刺激组治疗后汉密尔顿-14焦虑量表评分平均降低-10.04分,显著优于伪刺激组-4.04分($F=12.859, P=0.001$)。以经典的4种微状态比较真伪刺激两组受试者治疗前后的脑微状态特征,真刺激组患者治疗后微状态A的平均持续时间($F=6.988, P=0.013$)、覆盖率($F=7.728, P=0.009$)和频率($F=5.283, P=0.028$)均与伪刺激组有显著差异。斯皮尔曼相关性分析显示,微状态A覆盖率($R_s=0.382, P=0.026$)和频率($R_s=0.399, P=0.019$)与汉密尔顿-24抑郁评分变化相一致。

结论 经颅交流电刺激结合药物治疗对抑郁患者的疗效显著优于伪刺激与药物联合方案,抑郁症状的额外改善可能与对大规模脑网络的神经调控有关。

高中生同伴欺凌与师生关系、非自杀性自伤行为:交叉滞后分析

刘乙霖¹ 刘乙霖² 李昕睿¹ 李昕睿² 方源² 方源¹
秦付怡¹ 秦付怡² 文佳² 文佳¹ 曾勇²

1.昆明医科大学

2.昆明医科大学第二附属医院

目的 同伴欺凌是高中生中普遍存在的现象。本研究旨在调查影响这一人群中同伴欺凌的因素,以及它们与师生关系和NSSI的关系。此外,本研究旨在提出有效的预防措施,以缓解这些问题。

方法 采用青少年同伴欺凌量表、师生关系量表、非自杀性自伤量表,对云南省1329名高中生(男生521人,女生808人)进行为期1年、两阶段(T1、T2)的追踪问卷调查。使用Amos构建结构方程模型进行交叉滞后分析,采用Bootstrap方法对中介效应进行检验。

结果 两阶段的同伴欺凌、非自杀性自伤性别差异皆显著,男生得分高于女生。T2时间点上师生关系性别差异显著,男生得分低于女生(均 $P<0.05$)。高中生同伴欺凌与师生关系具有跨时间稳定负相关($r=-0.257\sim-0.171$,均 $P<0.01$)。交叉滞后分析显示,非自杀性自伤T1对师生关系T2具有显著负向预测作用($\beta=-0.076, P<0.05$),师生关系T1对同伴欺凌T2具有显著负向预测作用($\beta=-0.129, P<0.001$),同伴欺凌T1对师生关系T2同样具有负向预测作用($\beta=-0.068, P<0.05$)。Bootstrap检验显示,非自杀性自伤行为会通过师生关系的完全中介作用而间接影响高中生同伴欺凌的发生,且无性别差异。

结论 高中生同伴欺凌、师生关系和非自杀性自伤存在性别差异。同伴欺凌、师生关系和非自杀性自伤存在因果关系,高中生非自杀性自伤行为的增多会增加同伴欺凌的发生,良好的师生关系可以降低这一情况。师生关系在高中生非自杀性自伤与同伴欺凌的影响机制中起完全中介作用。

关键词: 高中生;同伴欺凌;师生关系;非自杀性自伤;交叉滞后分析

Prevalence and Risk Factors of Fatigue after SARS-CoV-2 Infection in Children and Adolescents: A Systematic Review and Meta-analysis

Nan Gao^{1,2}, Xiaoxing Liu², Xuan Chen^{1,2}, Yuetong Huang², Shihao Huang², Sizhen Su², Yongbo Zheng^{2,3}, Yanping Bao^{4,5}, Lin Lu^{2,3,4}

Introduction There has been a gradual rise in the prevalence of long coronavirus disease (COVID) symptoms among youngsters, especially fatigue. In this study, we performed a meta-analysis to estimate the prevalence of fatigue among children and adolescents following COVID-19 infection, and also to identify the associated risk factors.

Methods The present study conducted a systematic search in PubMed, Embase, Web of Science, Cochrane, MedRxiv, and BioRxiv databases to identify relevant studies published from inception to April 11, 2023. The pooled prevalence of fatigue was estimated using a random effects model. Subgroup analyses and meta-regression were conducted to assess the estimated prevalence of fatigue during the whole clinical progression, especially during long COVID.

Results A total of 39 articles were included in the study. The prevalence of persistent fatigue was 11.0% (95% CI: 8.1-14.8%) from the onset of first symptom of

COVID-19. At 6 months post-recovery from COVID-19, the prevalence decreased to 8.5% (95% CI:0.04-17.2%), and further declined to 2.7% (95% CI:0.01-13.0%) after a period of 12 months. Subgroup analyses and meta-regression showed that the prevalence of fatigue or persistent fatigue was higher in patients with moderate to severe COVID-19 and older age.

Conclusion The present study systematically evaluates and discusses the prevalence of fatigue in children and adolescents after SARS-CoV-2 infection. It is recommended that long-term surveillance and early intervention strategies should be implemented to improve the mental well-being of children and adolescents after infection and facilitate their long-term recovery.

中国一般人群中睡眠卫生与慢性疾病的相关性分析

张智博¹ 谢婷婷² 王育梅² 鲍彦平³ 陆林^{1,3}

1.北京大学第六医院

2.山东第一医科大学附属省立医院

3.北京大学药物依赖性研究所

目的 了解中国一般人群睡眠卫生现况, 探究睡眠卫生与慢性疾病间的关系

方法 采用横断面研究的方法, 使用网络调查平台, 对中国 34 个省级行政区的 41061 名居民进行了问卷调查, 调查内容包括一般人口学信息、睡眠卫生情况 (SHI), 主观睡眠质量 (PSQI)、既往疾病史等信息。根据睡眠卫生指数的四分卫间距将人群划分为睡眠卫生较差、一般和良好。使用描述性统计对调查对象一般情况及睡眠卫生情况进行差异性分析。满足正态分布的连续变量采用均值±标准差进行描述, 不满足正态分布的连续变量则采用中位数和四分位数进行描述。使用 Logistic 回归探究睡眠卫生指数与慢性疾病的关系以及主观睡眠质量和睡眠卫生的交互作用。

结果 在本研究中, 共有 8872 (21.6%) 人睡眠卫生习惯较差, 睡眠卫生差是心血管疾病、呼吸系统疾病、内分泌疾病、神经系统疾病和精神疾病的

危险因素 (均 $P < 0.001$)。此外, 交互作用分析等结果显示, 在相同的主观睡眠质量人群中, 睡眠卫生较差的人群发生各类慢性疾病的风险明显增加, 表明睡眠卫生差是独立的危险因素。

结论 研究表明, 睡眠卫生与多种慢性疾病的有关, 重视并提高睡眠卫生可能减少慢性疾病的发生。

Glymphatic System Dysfunction and Sleep Deprivation May Contribute To The Pathogenesis and Progression of Cognitive Impairment

李佩佩 陆林*

Peking University Sixth Hospital

The glymphatic system functions most optimally to remove extracellular brain solutes during sleep; therefore, sleep deprivation may be a crucial progression factor and a risk factor. This study aimed to look at how the glymphatic system functions in relation to sleep deprivation-induced cognitive impairment. In this investigation, we first employed electroencephalography (EEG) to confirm that sleep deprivation had been successfully established. Then, by identifying aquaporin-4 (AQP4), a crucial component of glymphatic system activity, we confirmed the functional relevance of the glymphatic system in cognitive impairment brought on by sleep deprivation. Finally, we altered the AQP4 to see if the sleep-deprived mouse's cognitive function had changed. The modulation of AQP4 may play a role in the loss of cognitive performance that sleep deprivation causes. In light of this, we hypothesize that sleep deprivation impairs the glymphatic system by lowering AQP4, which has an impact on cognitive behavior, particularly learning and memory. we conclude that the glymphatic system plays a very important functional role in cognitive impairment caused by sleep deprivation. To determine whether AQP4 might be regarded as a risk factor for cognitive impairment and to understand the regulatory mechanisms of this protein better, more

research is nevertheless required.

Reconstruction of Visual Information From Cortical Activity: A Systemical Review

李明哲^{1,2} 苏思贞² 郑永博^{1,2} 陆林^{1,2}

1. 北大-清华生命科学联合中心

2. 北京大学第六医院

Objective The brain is the most complex and mysterious organ in the human body, and researchers have been diligently working to unravel the secrets of this fascinating realm. As part of the field known as "brain decoding" or "brain-computer interface" (BCI), decoding visual activity from brain signals involves utilizing neuroimaging techniques to interpret the patterns of neural activity associated with visual perception.

Methods and Results In 2012, T. Horikawa et al. conducted a study in which subjects were asked to sleep during an MRI scan. These individuals were periodically awakened, approximately every 6 minutes, and asked to report their visual experiences prior to awakening. The researchers performed over 200 repeated experiments on each volunteer and created a database based on the objects described in their dreams, which were then meticulously categorized. By examining the patterns of brain activity during dreaming and comparing them to responses to visual stimuli during wakefulness, the researchers successfully predicted the visual experiences during dreams using machine-learning models. However, a complete interpretation of one's dreams still remains a distant goal, as does the ability to interpret the dreams of multiple individuals with a single machine. More recently, a method called "CEBRA" has gained attention. Scientists recorded multicellular electrophysiological data from the hippocampus area using intracranial electrodes and discovered that CEBRA could capture complex kinematic features, providing highly accurate visual decoding of videos directly from the brain. However, it is important to note

that both of the aforementioned studies are considered "matching" rather than "pixel-level reconstruction." This means that the models rely on contrastive learning to find the best match rather than generating the images themselves.

Conclusion In conclusion, significant attention has been directed towards decoding visual activity from brain signals, and previous achievements have highlighted a promising future. Our next goal is to employ multiple imaging methods, such as magnetoencephalography (MEG), to obtain more accurate results

Sex Differences in Acute and Chronic Symptoms During Omicron Wave in China: A National Online Survey

苏思贞¹ 李明哲³ 师乐¹ 鲍彦平^{3,4} 陆林^{1,3}

1.北京大学第六医院, 北京大学精神卫生研究所, 国家卫生健康委员会精神卫生学重点实验室(北京大学), 国家精神心理疾病临床医学研究中心(北京, 100191)

2.北京大学中国药物性依赖性研究所(北京, 100191)

3.北京大学公共卫生学院(北京, 100191)

Objective Sex differences is known as a crucial factor to impact the health outcomes of SARS-CoV-2 infection. Following a strategic shift in late 2022, there was a sharp increase in COVID-19 cases in China. However, there remains a dearth of knowledge regarding the sex differences of acute and chronic symptoms during this surge.

Methods and Results We found that females (82.0%) reported higher the prevalence of symptomatic infection than males (71.6%, $P < 0.001$). The proportion of severe outcomes and abnormal CT of the chest was higher in females than males. Similarly, females reported higher prevalence of any chronic physical (48.7% vs 32.6%; $P < 0.001$) and mental (45.3% vs 33.4%; $P < 0.001$) symptoms than males. Multivariable logistic regression analyses showed that females were associated

with 42% increased risk of any acute symptoms (adjusted OR = 1.42, 95% CI = 1.33-1.53, $p < 0.001$), 63% higher risk of any chronic physical symptoms (adjusted OR = 1.63, 95% CI = 1.52-1.74, $p < 0.001$), and 50% increased risk of any chronic mental symptoms (adjusted OR = 1.50, 95% CI = 1.40-1.61, $p < 0.001$) compared with males after adjusting for potential confounders. This nationwide cross-sectional study, enrolling a total of 33,050 participants from 32 provinces in China, was conducted through an online survey from January 15 to February 9, 2023 to examine the acute and chronic physical and mental symptoms in male and female patients with omicron infection.

Conclusion Our findings reveal that females constitute a notable risk factor for both acute and chronic manifestations after omicron infection, including physical and mental symptoms. Future studies that link data on epidemiology, clinical presentation, pathophysiology, and management of omicron infection between males and females are encouraged to product comprehensive evidence for providing sex-specific pharmaceutical and nonpharmaceutical interventions

关键词: omicron, sex difference, acute symptoms, chronic symptoms, prevalence, risk

物质依赖医学学组

高频重复经颅磁刺激对酒依赖患者情绪及认知功能的影响分析

唐旭*

台州市第二人民医院

目的 探究高频重复经颅磁刺激对酒依赖患者情绪及认知功能的影响。

方法 选取我院 2022-2023 年间收治的酒依赖患者作为研究对象, 接受常规戒酒治疗的患者纳入对照组 (N=36), 常规治疗基础上接受高频重复经颅磁刺激治疗的患者纳入到观察组 (N=36), 比较两分组的蒙特利尔认知评估量表 (MoCA) 评分。

结果 在治疗前, 两分组的 MoCA 评分不存在显著差异, 治疗后, 观察组的整体情况好于对照组 ($P<0.05$), 体现如下: 观察组的地点定向 (4.74 ± 0.45) 和时间定向评分 (4.68 ± 0.46 分) 高于对照组 (4.53 ± 0.42 分)、(4.47 ± 0.43 分), 差异显著 ($P<0.05$); 另外, 注意计算 (4.25 ± 0.46 分) 和总分 (27.26 ± 1.63 分) 也均高于对照组 (4.01 ± 0.40 分)、(26.34 ± 1.45 分), 差异显著 ($P<0.05$)。治疗一段时间后, 观察组的情绪状况也较对照组改善显著 ($P<0.05$), 主要表现为, 观察组患者抑郁、焦虑各 1 例, 占比分别为 2.78%, 躁郁症和精神问题分别为 2 例、1 例, 占比分别为 5.56%、2.78%; 而对照组抑郁、焦虑、躁郁症和精神问题共 15 例, 占比共计 41.76%。两分组差异显著 ($P<0.05$)。

结论 对酒依赖患者采取高频重复经颅磁刺激可以较好的改善患者的情绪和认知功能, 值得临床推广。

Consumption Habits, Emotions, and Personality Traits of Bubble Tea Addicts: A Cross-sectional Study

Qiongyao Yang Kai Zhang*

Chaohu Hospital of Anhui Medical University

Objective In recent years, bubble tea has gained popularity worldwide, especially among youths. The primary objective of this study was to explore the potential relationship between bubble tea addiction and consumption habits, emotions, and personality traits in China

Methods We send the questionnaire and collected data through the online survey tool Questionnaire Star. The questionnaire included demographic data, bubble tea consumption habits survey, General Anxiety Disorder-7 (GAD-7), Patient Health Questionnaire-9 (PHQ-9) and Eysenck Personality Questionnaire-Revised, Short Scale for Chinese (EPQ-RSC). According to Bubble Tea Addiction Questionnaire score, participants were divided into addiction group and non-addiction group

Results A total of 511 participants completed the online survey, 45(8.81%) were in the addiction group and 466 (91.19%) were in the non-addiction group. The frequency and expenditure of drinking bubble tea were higher in the addiction group. It is noteworthy to observe that the addiction group with higher proportion of drinking bubble tea as a means of socializing. The anxiety and depression levels of the addiction group were significantly higher than the non-addiction group. The results showed that neuroticism and psychoticism scores of the addiction group were significantly higher than non-addiction group. There was no statistical difference in the score of extroversion and lie

Conclusion Our study found that a high proportion of young people were addicted to bubble tea. Bubble tea addiction was related to high consumption and negative emotions. Psychotic and neurotic personality traits were associated with bubble tea addiction. Bubble tea is tasty but should be consumed in moderation

关键词: Addiction; Bubble tea; Consumption; Emotion

酒精使用障碍治疗药物的研究进展

张雪娟 杨梅 贾晓健*

深圳市康宁医院, 深圳市精神卫生中心, 深圳大学医学部

目的 系统地梳理对酒精使用障碍 (alcohol use disorder, AUD) 具有治疗作用的药物, 尤其重点关注有可能将 AUD 治疗作为新适应症的“老药”的最新研究进展, 为临床医生全面认识具有 AUD 治疗作用的药物提供借鉴, 以便更有效地选择治疗方案。

方法 我们检索了 PubMed 数据库中 2019 至今发表的与 AUD 药物治疗有关的文献, 主要从药理机制、治疗作用、研究进展等几个方面探讨了纳曲酮、双硫仑、纳美芬、托吡酯、巴氯芬、加巴喷丁、普瑞巴林、昂丹司琼、异丁司特、N-乙酰半胱氨酸、哌唑嗪、螺内酯、司美格鲁肽以及马钱子碱氮氧化物等在 AUD 治疗中的作用。

结果 目前我国暂无批准专门用于 AUD 治疗的药物, 国际上批准用于临床的 AUD 药物也寥寥无几。其中, 纳曲酮可降低酒依赖患者的酒精消耗并改变酒精主观体验, 减少复饮的风险; 纳美芬对在预后因素方面表现良好的患者更有效; 双硫仑与氯氮平联合有增效作用。然而, 这些药物均未得到充分利用, 这可能提示 AUD 患者存在不同的临床亚型。处于临床前和临床试验阶段的具有 AUD 治疗潜力的“老药”多达 9 种以上。如高剂量托吡酯可降低饮酒水平, 巴氯芬可对酗酒者的奖赏系统脱敏, 加巴喷丁可降低饮酒天数, 普瑞巴林安全性高。异丁司特、哌唑嗪、螺内酯、司美格鲁肽和马钱子碱氮氧化物等也在治疗 AUD 中表现出潜力。但这些药物的临床治疗效果尚需进一步的临床研究进行确认, 他们的作用机制和安全性也同样需要进一步研究。

结论 目前用于治疗 AUD 的药物主要聚焦于缓解戒断症状, 对于更好地降低对酒精的渴求尚无更多研究证据。未来应该对有 AUD 治疗潜力的“老药”开展更大规模的临床研究以进一步验证其安全性和有效性, 同时对其机制进行深入研究, 以促进 AUD 更加规范有效地治疗。

关键词: 酒精使用障碍, 药物治疗, 复饮, 渴求

High-intensity Transcranial Alternating Current Stimulation Reduced The Inter-brain Synchronization in The Ventrolateral Prefrontal Cortex and Temporoparietal Junction

in Gaming Disorder

Chuanning Huang Min Zhao* Haidi Shan
Shanghai Mental Health Centre

Objective Disrupted interpersonal interaction is a significant feature of gaming disorder. This study aims to develop a targeted intervention to modulate disrupted inter-brain synchronization and verify its effectiveness

Methods Sixty male individuals with gaming disorder were recruited from a university in Hunan Province. Participants in pairs underwent functional near-infrared hyperscanning, randomly assigned to the intervention group (n=30) and the control group (n=30). Both groups received high-intensity transcranial alternating current stimulation intervention. During the intervention, participants in both groups simultaneously completed cognitive training tasks such as puzzle-solving. The primary outcome measures were scores on the Gaming Disorder Screening Scale and inter-brain synchronization

Results There was a significant time-by-group interaction difference for gaming craving ($F = 5.72, p = 0.021$): the control group showed increased gaming craving after the intervention ($t = -2.02, p = 0.049$) compared with the intervention group. After the intervention, there were significant time-by-group interaction differences for inter-brain synchrony in LVL PFC ($F = 11.86, p = 0.028$) and RTPJ ($F = 10.56, p = 0.021$) in the competitive task (Hbo): the intervention group showed decreased IBS in LVL PFC after the intervention ($t = 4.54, p = 0.001$) compared with the control group did not ($t = -1.77, p = 0.111$); the intervention group showed decreased IBS in RTPJ after the intervention ($t = 2.13, p = 0.043$) compared with the control group ($t = -2.40, p = 0.024$). In the competitive task (Hbr), there was a significant time-by-group interaction for IBS in LVL PFC ($F = 12.18, p = 0.016$): the control group showed increased IBS after the intervention ($t = -2.45, p = 0.029$) compared with the intervention group ($t = 1.76, p = 0.102$). There was also a significant time-by-group interaction for average IBS in the LVL PFC region ($F = 11.40, p = 0.040$): the control group showed increased LVL PFC IBS after the intervention ($t = -2.57, p = 0.040$), while

the intervention group showed decreased LVL PFC IBS ($t = 2.71, p = 0.027$)

Conclusion High-intensity electrical stimulation of the whole brain can to some extent reduce gaming craving in individuals with gaming disorder and decrease the inter-brain synchronization of the LVL PFC and RTPJ during a competitive task, thus reducing the competitiveness of the participants

关键词: hyperscanning, high-intensity tACS, clinical trial, TPJ, gaming disorder

大学生心理控制源与职业决策自我效能感的相关研究

马瑞麟 焦东亮*
蚌埠医科大学

目的 探究大学生心理控制源与职业决策自我效能感之间的关系。

方法 采用龙燕梅修订的《大学生择业效能感量表》(Career Choice Self-efficacy Scale of College Students)和Levenson编制的“内控性、有势力的他人及机遇量表”(IPC量表)。通过问卷星施测,一共回收问卷332份。使用spss21.0分析软件对其结果进行了数据分析与综合处理,描述统计用于整体描述数据分布概况,独立样本t检验用于检验两组变量之间是否存在差异性,单因素方差分析用于检验多组变量之间是否存在差异性,之后对两两变量进行相关分析的处理。

结果 大学生心理控制源与职业决策自我效能感之间存在显著性相关。

结论 大学生职业决策自我效能感总体处于中等以上水平;大学生心理控制源的内源性水平高于外在性水平(有势力的他人、机遇)。以大学生职业决策自我效能感为因变量,心理控制源的内外源为预测变量来进行回归分析,其中,内控性(Internality)可以正向预测职业决策自我效能感,而有势力的他人(Someone else with power)与机遇(Locus of control)的预测作用并不显著。

关键词: 大学生,心理控制源,职业决策自我效能感

A Latent Class Analysis of Internalized Stigma Among The Methamphetamine Users in China

Ma Yuejiao Jianping Lu*

深圳市康宁医院

Objective Internalized stigma is a process that individuals see themselves negatively, feeling isolated by others, which is prevalent among patients with mental illnesses, such as schizophrenia and depression, linking with poor psychological outcomes, symptoms, and social functions. To the best of our knowledge, there are few studies investigating the internalized stigma in Chinese Methamphetamine(MA)users. Given the high MA prevalence in China over the past two decades and the lack of research on investing in internalized stigma, it is necessary to explore internalized stigma among Chinese MA users. Additionally, in order to divide the sample into different groups of internalized stigma, the present study used Latent class analysis (LCA) to categorize potential latent classes among MA Users on internalized stigma. Unlike traditional variable-centered statistic methods, LCA is a typical person-centered approach to model population heterogeneity and identify distinct subpopulations a priori unknown. The assessment of typologies in internalized stigma can help us better understand the different classes of internalized stigma among Chinese MA users as a valuable reference for future studies

Methods Seven hundred and thirty-one MA users were recruited and completed a series of self-report questionnaires including their demographics, the Substance Use Stigma Mechanisms Scale (SU-SMS), the Multidimensional Scale of Perceived Social Support (MSPSS), the Centre for Epidemiologic Studies Depression Scale (CES-D), the General Self Efficacy Scale (GSES), and Rosenberg's Self-Esteem Scale (SES). R software was used to organize and clean up data sets, and a latent class analysis was analyzed

Results The results showed three classes of in-

ternalized stigma (severe, moderate, and mild), suggesting that MA users are a heterogeneous population on this matter. The percentage of severe internalized stigma and moderate accounted for 21%(n=155) and 39% (n=291) respectively among the Chinese MA users. One-way ANOVA analyses showed that there were significant differences in the three classes on age, education level, the composition ratio of gender, income, self-efficacy, depressive symptoms, and self-esteem. In addition, multinomial regression analysis showed that depressive symptoms depression symptoms (OR= 1.07, 95% CI 1.04~1.10), self-esteem (OR= 1.35, 95% CI 1.25~1.47), age (OR= 1.04, 95% CI 1.01~1.07), education (OR= 1.40, 95% CI 1.21~1.62) were risk factors for severe internalized stigma

Conclusion Substance Use Disorder (SUD) is a special health issue in China, considering as both a mental disorder and an ethical problem, which has caused SUD patients to experience severe internalized stigma comparing with other mental illnesses. To the best of our knowledge, this was the first study in China to categorized MA users into three varying classes of internalized stigma groups with LCA and compared the three classes to further explore the different characteristics of participants with different internalized stigma classes. We found that 21% of MA users have sever internalized and 31% experienced moderate internalized stigma, which means that internalized stigma prevents among MA users in China. Furthermore, results of this study supported those of previous research that depressive symptom is a risk factor for internalized stigma. At the same time, one unanticipated result was that self-esteem was a risk rather than a protective factor for severe internalized stigma

美沙酮维持治疗患者 N/OFQ-NOP 通路基因多态性与其焦虑状态的相关关系

曹鹏辉 范妮*

广州医科大学附属脑科医院

目的 本研究通过对美沙酮维持治疗 (MMT) 患者孤啡肽-孤啡肽受体通路 (N/OFQ-NOP 通路) 基因多态性进行检测, 探究 MMT 患者 N/OFQ-NOP 通路基因多态性与其焦虑状态的相关性。

方法 在广州医科大学附属脑科医院美沙酮治疗点进行 MMT 受试者的招募工作。共有 197 名 MMT 患者符合入组标准, 并被纳入到本研究中。以面对面访谈的形式对所有受试者进行资料收集, 内容包括: 一般个人信息及美沙酮维持治疗情况。运用《贝克焦虑自评量表 (BAI)》对受试者进行焦虑状态评估。对所有的受试者进行血液样本采集, 并运用血液基因组 DNA 提取试剂盒对所采集到的血液样本进行全血 DNA 提取, 随后运用 Sequenom MassARRAY®SNP 检测方法进行基因多态性的检测。

结果 (1) 197 名 MMT 受试者均为汉族人。

(2) 本研究共检测了 6 个与 N/OFQ-NOP 通路相关的 SNP 位点, 分别为: rs13931、rs76786693、rs189594057、rs145840163、rs34874539 和 rs61742883。

(3) 本研究检测的 6 个 SNP 位点中, MMT 受试者仅 rs13931 和 rs76786693 存在基因多态性, 且两个位点符合哈迪-温伯格平衡 ($p_{H-W} > 0.05$)。 (4) 在 rs13931 位点基因型分布频率方面, 有焦虑 MMT 受试者与无焦虑 MMT 受试者之间存在显著差异 ($p=0.001$)。而在 rs13931 位点等位基因分布频率方面, 有焦虑 MMT 受试者 rs13931-C 等位基因的分布频率显著高于无焦虑 MMT 受试者的 ($p < 0.001$)。

(5) 而 rs76786693 位点, 无论是在基因型分布频率方面还是等位基因分布频率方面有焦虑 MMT 受试者与无焦虑 MMT 受试者之间均不存在统计学差异 ($p > 0.05$)。 (6) 与 rs13931 CC 基因型的受试者相比, rs13931 AC 基因型 (OR=0.407, $p=0.006$) 和 rs13931 AA 基因型 (OR=0.140, $p=0.011$) 的受试者出现焦虑的风险更低。 (7) 携带 rs13931-C 等位基因与 MMT 受试者焦虑发生风险的增加相关 (OR=5.425, $p=0.024$), 而携带 rs13931-A 等位基因与 MMT 受试者焦虑发生风险的降低相关 (OR=0.347, $p < 0.001$)。

结论 N/OFQ-NOP 通路 rs13931 位点基因多态性与 MMT 受试者焦虑状态相关。携带 rs13931-C 等位基因的 MMT 受试者出现焦虑的风险更高, 而携带 rs13931-A 等位基因的 MMT 受试者出现焦虑的风险更低。

Analysis of The Use of Second-class Psychotropic Drugs in Outpatient Clinics of A Tertiary Psychiatric Hospital

Yanhong Sun*

Hefei Fourth People's Hospital

Objective To understand the application of Class II psychotropic drugs in outpatient clinics of a tertiary psychiatric hospital from 2020 to 2022, and to provide reference basis for scientific management and standardization of the rational use of Class II psychotropic drugs

Methods The PASS software was used to extract the drug names, specifications, units, consumption, sales amounts, etc. of the second class psychotropic drugs in the outpatient department of Hefei Fourth People's Hospital from 2022 to 2022. The defined daily dose system (DDD) and average daily cost (DDC) were statistically analyzed

Results The sales volume and DDDs of the second type of psychotropic drugs have been increasing year by year, with the highest and fastest growing sales volume of oxalazepam and the highest dosage of clonazepam (0.5mg). The top three drugs in DDDs are dexzopiclone, estazolam, and alprazolam. Oxazepam and zaleplon have higher DDC values in all second class psychotropic drug varieties. Clonazepam (2mg) has a sequence number ratio of 1 and good synchronization

Conclusion The second type of psychotropic drugs in our hospital are mainly benzodiazepines, and their structure is not reasonable. Psychiatrists and pharmacists need to pay attention to the rational and standardized use of benzodiazepines to reduce drug dependence and abuse

关键词: Class II psychotropic drugs; sales volume; Defined daily dose system; Average daily cost

The Association of Serum Levels of S100B and BDNF and Cognitive Function in Alcohol Dependence Patients

Yanhong Sun*

Hefei Fourth People's Hospital

Objective To explore the relationship between cognitive impairment and S100B, BDNF levels in patients with alcohol dependence

Methods Serum calcium binding protein (S100B) and brain-derived neurotrophic factor (BDNF) were detected by enzyme-linked immunosorbent assay in 35 patients with cognitive impairment and alcohol dependence (cognitive impairment group), 33 patients without cognitive impairment and alcohol dependence (non cognitive impairment group) and 32 healthy controls. The cognitive function was evaluated by repetitive neuropsychological state test (RBANS)

Results (1) The concentration of S100B in cognitive impairment group and non cognitive impairment group was higher than that in healthy control group [$(5.46 \pm 0.05) \pm 0.92$] ng/mL, (4.04 ± 0.85) ng/mL, (2.05 ± 1.09) ng/mL,] ($P < 0.05$); The concentration of BDNF in cognitive impairment group and non cognitive impairment group was lower than that in the control group [(62.10 ± 8.28) ng/mL, (63.83 ± 9.10) ng/mL, (69.76 ± 16.61) ng/mL] ($P < 0.05$); (2) The concentration of S100B in cognitive impairment group was higher than that in non cognitive impairment group [(5.46 ± 0.92) ng/mL, (4.04 ± 0.85) ng/mL] ($P < 0.05$). The scores of immediate memory, attention and delayed memory in cognitive impairment group and non cognitive impairment group were lower than those in healthy control group ($P < 0.01$). Immediate memory, attention and delayed memory in cognitive impairment group were higher than those in non cognitive impairment group ($P < 0.01$). The speech function in the cognitive impairment group was higher than that in the healthy control group ($P < 0.01$), and there was no significant difference in speech function between the cognitive impairment group and the non cognitive impairment group ($P > 0.05$). S100B concentration in cognitive impairment group was negatively correlated with attention and

delayed memory in RBANS ($r = -0.459$, $r = -0.458$, $P < 0.05$); BDNF concentration was positively correlated with immediate memory, attention and delayed memory in RBANS ($r = 0.368$, $r = 0.375$, $r = 0.379$, $P < 0.05$), but not in the group without cognitive impairment

Conclusion Serum S100B and BDNF levels are related to some cognitive impairment in alcohol dependent patients, and there is a relationship between the imbalance of nerve injury and neuroimmune abnormalities

关键词: alcohol dependence; cognitive impairment; S100B; BDNF

大学生不同负性情绪对道德判断能力的影响

王盈 焦东亮*
蚌埠医科大学

目的 了解大学生在不同的负性情绪下的道德判断能力水平, 探讨大学生不同负性情绪(包括厌恶、愤怒和悲伤)对道德判断能力的影响差异, 以及探究三种负性情绪中哪一种对道德判断能力的影响最为显著, 即在何种负性情绪占主导时道德判断水平最低。

方法 加入不同的视频材料诱导相应情绪, 采用道德判断测验量表(Moral Judgment Test, MJT)中文版和正性负性情绪量表(The Positive and Negative Affect scale, PANAS)改编版进行测量评定。本实验将 104 名大学生分为四组, 其中三组观看相应情绪诱导材料——视频后进行道德情境判断, 剩下一组作为对照组——不诱导情绪直接进行道德情境判断, 以上四组均在道德情境判断前使用正性负性情绪量表改编版测量情绪。运用 SPSS23.0 软件对所得数据进行处理分析。

结果 四组的情绪得分具有显著差异, 在厌恶、愤怒和悲伤的不同负性情绪下, 大学生的道德判断水平没有显著差异; 与对照组(没有进行情绪诱导)($M=13.34$, $SD=7.767$)相比, 愤怒情绪($M=14.61$, $SD=8.389$)、悲伤情绪($M=14.62$, $SD=10.215$)和厌恶情绪($M=17.49$, $SD=10.261$)的道德判断水平的差异不显著。

结论 (1) 大学生在不同负性情绪下的道德判

断能力没有显著差异; (2) 与没有诱导负性情绪产生的情况相比, 大学生产生不同负性情绪时的道德判断能力的差异也不明显。

关键词: 大学生; 负性情绪; 道德判断能力

边缘人格特质与双相障碍自杀风险及生存质量的关联研究

杨倩¹ 刘铁桥²

1. 中山大学附属中山医院

2. 中南大学湘雅二医院

目的 了解双相障碍(bipolar disorder)患者中边缘型人格特质(borderline personality traits, BPT)的发生率, 探索 BPT 的严重程度与双相障碍临床变量的相关性以及每种 BPT 对双相障碍患者自杀未遂史及生存质量(quality of life, QOL)的影响。

方法 本研究基于 DSM-5 (Diagnostic and Statistical Manual of Mental Disorders, Fifth Edition, DSM-5) 诊断工具, 通过方便抽样的方法从湘雅二医院精神科病房招募符合双相障碍诊断标准的住院患者, 并以调查问卷的形式对其进行调查研究。调查的内容包括一般人口学资料, BPT, 抑郁、焦虑、躁狂、精神病性症状, 童年创伤经历, QOL 及自杀风险, 并在 3 个月后对 QOL 进行复测。采用独立样本 T 检验、Wilcoxon 非参数检验、卡方检验、偏相关分析、logistic 回归分析、多重线性回归分析对数据进行统计分析。

结果 基线时共纳入 346 份有效调查问卷, 成功随访到 252 人, 随访率为 72.83%。①97.98% 的双相障碍患者至少存在 1 种 BPT, 77.5% 的患者存在 5 种及以上 BPT; ②BPT 的严重程度与双相障碍患者的抑郁、焦虑、躁狂、精神病性症状及自杀风险呈显著正相关($r=0.178-0.482$, $P < 0.05$), 与基线时和三个月后患者的 QOL 呈显著负相关($|r|=0.445-0.468$, $P < 0.001$); ③BPT 中害怕被遗弃($OR=2.201$, $95\%CI=1.292-3.750$, $P=0.004$) 和情感不稳定($OR=3.110$, $95\%CI=1.100-8.789$, $P=0.032$) 对既往自杀未遂史的影响有统计学意义, 慢性的空虚感($B=-5.974$, $\beta=-0.176$, $95\%CI=-9.214 \sim -2.735$, $P < 0.001$) 对 QOL 的影响有统计学意义。

结论 1. 双相障碍患者中 BPT 的发生率高, 且

BPT 越严重, 则双相障碍患者的临床症状越严重、自杀风险越高和 QOL 越差; 2. BPT 中害怕被遗弃和情感不稳定是既往自杀未遂增加的危险因素, 而慢性的空虚感是 QOL 低的危险因素。

基于接纳承诺疗法对网络游戏成瘾者执行功能的干预效果研究

李翔宇^{1,2} 夏玲玲^{1,2} 焦东亮^{1,2}

1. 蚌埠医科大学

2. 蚌埠医科大学精神卫生学院

目的 本研究基于接纳承诺疗法核心理念, 针对网络游戏成瘾的大学生群体, 设计并实施了基于接纳承诺疗法心理自助课程干预并探讨了这一干预方案在改善网络游戏成瘾者执行功能方面的应用效果, 旨在为相关研究和临床实践提供有益的参考。

方法 1. 干预方案的构建: 在前期查阅文献结合前期调查结果分析的基础上, 通过专家会议法, 最终形成基于接纳承诺疗法心理自助课程。

2. 干预实施阶段: 根据样本量计算最终确定 58 名研究对象, 其中干预组 30 人, 对照组 28 人。对照组给予常规护理, 干预组进行基于接纳承诺疗法心理自助课程干预。两组受试者予以心理学评估 (包括 IGD-20、PHQ-9、心理灵活性以及执行功能等) 和任务态脑电评估 (任务态脑电选择 Go/Nogo 任务), 按照要求完成所有干预后再次进行前述的评估项目。心理学评估中按评分在 SPSS 25.0 软件进行处理; 脑电数据在 MatLab 软件中进行处理。

结果 对照组和干预组的各项基线指标无统计学差异 ($p>0.05$)。(1) 量表结果 干预前, 干预组 IGD-20 得分明显较高, 干预后, IGD-20、PHQ-9、心理灵活性以及执行功能量表得分明显改善下降 ($p<0.05$)。(2) 行为学结果 干预前, Go/Nogo 范式, 干预组和对照组对中性背景和游戏背景 Go 反应时和 Nogo 正确率进行自身配对检验, 均无统计学差异 ($p>0.05$); 干预后, Go/Nogo 任务中 Go 任务反应时间缩短, Nogo 任务正确率提高, 具有统计学意义 ($p<0.05$); (3) 任务态脑电: 干预前, 干预组和对照组的 N200、P300 波幅之间没有统计学差异

($p>0.05$)。干预后, 干预组的 N200、P300 波幅较干预前的 N200、P300 波幅增大, 差异具有统计学意义 ($p<0.05$)。

结论 在阅读文献及前期调查结果的基础上, 通过专家会议法形成基于接纳承诺疗法心理自助课程。通过对网络游戏成瘾大学生进行干预, 提高了大学生的执行功能和心理灵活性, 增强心理适应能力。但本研究的研究对象只针对于在校大学生, 是否同样适用于其他群体, 结果还有待验证。在数据收集方面, 本研究结合大学生的自我评价与客观的行为学测量指标, 确保数据更为全面、客观, 旨在为提升网络游戏成瘾大学生的执行功能提供更为坚实和有价值的依据。

关键词: 网络游戏成瘾, 执行功能, 接纳承诺疗法, 事件相关电位

物质成瘾的脑功能磁共振影像网络拓扑特征与功能连接的改变

韩伟 李晓婷 杨梅 贾晓健*

深圳市精神卫生中心/深圳市康宁医院

目的 功能磁共振成像是成瘾医学研究的有力工具, 本研究期望通过全脑尺度的功能网络分析探究物质成瘾的神经影像机制, 并为成瘾疾病的临床治疗探索新的有效的治疗靶点。

方法 本研究纳入 21 名酒精成瘾受试者及同期招募的 21 名健康对照受试者; 纳入 23 名甲基苯丙胺成瘾受试者及同期招募的 23 名健康对照受试者。研究采集受试者静息态功能磁共振成像数据, 利用图论和功能连接法分析酒精和甲基苯丙胺成瘾患者脑功能磁共振影像的网络拓扑特征和功能连接的变化。

结果 第一、图论分析发现, 两种物质成瘾患者的脑网络发生了功能重组, 节点之间的信息传输能力受损。其中, 酒精成瘾者受损最显著的脑区是双侧脑岛, 其节点局部效率、节点效率、度中心性显著降低; 与之不同, 甲基苯丙胺成瘾者受损伤最显著的脑区是左侧上顶回, 其节点效率、度中心性、介数中心性相对于健康对照显著降低。第二、网络水平的功能连接分析发现, 酒精成瘾者突显网络内部连接减弱, 而甲基苯丙胺成瘾者默认模式网络内部

连接增强。第三、全脑体素功能连接分析发现,两种物质成瘾者的扣带回和小叶皮层与脑岛/左侧上顶回的连接均显著减弱,但它们的全脑功能连接模式不同。

结论 研究表明,不同成瘾物质对大脑的影响模式存在差异,突显网络和感觉运动网络分别在酒精、甲基苯丙胺成瘾的脑影像机制中扮演重要角色,脑岛和左侧上顶回是受损伤最显著的脑区。本研究的结果可能为未来成瘾患者精准的脑刺激治疗提供了一定的依据,并未不同物质成瘾者的个性化治疗提供了初步参考。

酒精使用障碍背景下的失眠治疗进展

胡晋云*

玉溪市第二人民医院

目的 失眠和酒精使用障碍息息相关,失眠不仅是酒精戒断的常见症状,其持续存在也会导致复饮等问题出现。在酒精使用障碍患者需要注重失眠的治疗,本文根据近年来国内外相关文献,简述酒精使用障碍背景下失眠的药物治疗和心理治疗,了解酒精使用障碍背景下的失眠治疗研究进展,以期临床干预提供参考。

方法 通过查阅并总结相关文献,对近年来国内外针对酒精使用障碍患者进行失眠治疗的研究进展进行综述,在此基础上探讨了酒精使用障碍与失眠的双向关系,以及药物对酒精使用障碍与失眠产生不同影响的情况,讨论针对酒精使用障碍患者失眠的治疗方法。

结果 酒精使用与失眠之间存在双向关系,酒精使用可能直接导致失眠等睡眠问题,而失眠可能是酒精使用障碍复发的危险因素。双硫仑、阿坎酸、纳曲酮和纳美芬被美国食品药品监督管理局批准用于治疗酒精使用障碍,其中双硫仑会导致REM睡眠的减少,阿坎酸会改变酒精使用障碍患者的睡眠结构及连续性,而纳曲酮和纳美芬会对睡眠产生不良影响。镇静催眠类药物已被广泛用于治疗睡眠问题以及急性酒精戒断,但由于具有诱导依赖的潜力可能不适合酒精使用障碍患者。褪黑素受体激动剂阿

戈美拉汀和雷美替胺以及食欲素受体拮抗剂能够改善酒精使用障碍患者的失眠症状。失眠的认知行为治疗 CBT-I 是联合失眠和 AUD 的推荐一线治疗(高水平证据)。第三,如果反应不足或 CBT-I 不可用,可以增加药物治疗。

结论 对酒精使用障碍合并失眠的患者而言,失眠的认知行为治疗应被视为一线治疗,可有效减轻失眠症状,而且失眠的改善可能对酒精相关问题产生下游影响,可以将失眠的改善作为酒精使用结果改善的预测指标。

关键词: 酒精使用障碍;失眠;双向关系

Priority To Substances in Drug Users: The Essential Role of Non-Human Primates in Modeling Drug-Choice Behavior

CHENG TANG¹, Wenlei Zhang¹, Xiaotian Wu¹, Haifeng Jiang¹, Min Zhao¹, Rongwei Zhai²

1.Shanghai Mental Health Center

2.Lingang Laboratory

Objective Substance Use Disorders (SUDs) present a long-standing global public health issue, significantly impacting individuals and society. One of the core symptoms of SUDs, as identified in the International Classification of Diseases (ICD-11), is the increasing prioritization of drug use over other aspects of life, despite negative consequences. This review aims to investigate why drugs become such a dominant priority in individuals with SUDs and to explore the neural mechanisms underlying this preference. By examining animal models, particularly non-human primates (NHPs), the review seeks to bridge the gap between pre-clinical findings and clinical applications, providing insights into the decision-making processes in addiction.

Methods The methodology involves a comprehensive search of peer-reviewed articles, books, and conference papers using databases such as PubMed and Google Scholar, with keywords including "priority of drug use," "drug choice behavior," "neural mechanisms," "addiction models," "rodent models," "non-hu-

man primate models," and "decision-making in addiction."

Results Human studies using paradigms such as drug-money choice have shown that drug-dependent individuals frequently choose drugs over substantial monetary rewards. Several theories have been proposed to explain this drug preference, including habit theory, cognitive impairment theory, neurobiological theory and so on. Further specific underlying mechanisms still require animal research. Early studies with rodents revealed important insights but showed limitations, as rodents often prioritize non-drug rewards over drugs, suggesting they might not fully capture the human condition of drug preference. In contrast, non-human primates (NHPs) like rhesus monkeys and baboons exhibit decision-making behaviors more similar to humans. Studies using the discrete choice procedure in NHPs demonstrated a significant preference for drugs over food, particularly under conditions of drug withdrawal. The differences between rats and NHPs can be explained by drug reward delay hypothesis. The studies of choice models in rats reveals that orbitofrontal cortex (OFC) is involved in assigning economic value to rewards. The central amygdala (CeA) and infralimbic cortex (IL) to nucleus accumbens shell (NAshell) pathways also play critical roles. Lower GABA levels in the CeA are associated with alcohol preference, and alterations in the IL-NAshell circuit affect heroin preference

Conclusion In this review, we propose that the study of the drug-specific mechanisms underlying drug choice may provide new therapeutic directions for addiction. The preclinical drug choice model, which is gradually receiving attention in recent years because it better reflects the complex decision-making processes involved in real-world drug use and is able to capture the competition between drug-seeking and other rewarding behaviors, provide this opportunity. Given the conflicting behaviors observed in rodents compared to human drug users and the involvement of more complex cognitive processes, non-human primates are an important model to complement rodent studies

基于授权理论下知信行健康教育对男性酒精依赖患者的应用研究

胡俊* 黄书才 关春兰 鲍丽萍
首都医科大学附属北京安定医院芜湖医院

目的 探讨基于授权理论下知信行健康教育对男性酒精依赖患者康复的应用效果。

方法 招募 2021 年 1 月~2023 年 6 月于我院住院治疗的 70 例男性酒精依赖患者为研究对象,随机分为对照组和实验组,每组 35 人。两组患者在年龄、文化程度、饮酒量上无明显差异,对照组执行常规护理干预。包括严密观察病情,进行精神科风险评估、执行医嘱治疗及护理,落实日常生活卫生护理,常规健康宣教,一般心理护理等。实验组在常规护理的基础上实施基于授权理论下知信行健康教育。干预过程主要包括:明确问题、表达感情、制订目标、制订计划、效果评估。干预前、干预 3 周末、6 周末时,分别使用一般自我效能感量表(GSES)及住院精神病人社会功能评定量表(SSPI)评估两组患者一般自我效能感和社会功能指标,采用重复方差分析检测两组指标在干预前、干预 3 周末、干预 6 周末的变化,并进行比较。

结果 随着干预时间的延长,两组患者自我效能存在显著的时间、分组及交互效应($P<0.05$)。通过对同一时间点两组自我效能进行 t 检验,发现干预 6 周末时,实验组自我效能评分要明显高于对照组。差异有统计学意义($P<0.05$)。日常生活能力、活动与交往情况、社会性活动技能和总分均存在显著的时间效应($P<0.05$),活动与交往情况、社会性活动技能和总分存在显著的分组效应和交互效应($P<0.05$)。通过对同一时间点两组总分进行 t 检验,发现干预 3 周、6 周末时,实验组社会功能总得分要明显高于对照组,差异有统计学意义($P<0.05$)。

结论 给予基于授权理论下知信行健康教育能提高男性酒精依赖患者的自我效能,有效改善其社会功能。

大麻二酚抑制大脑皮层发育的作用机制研究

冯振东 高书敏 陆林 时杰 刘佳佳 魏雅槟*
北京大学中国药物依赖性研究所

目的 目前全球范围内大麻的使用率在不断增加,部分国家正在将其移除管控名单。已有研究表明,孕期使用大麻会影响子代的发育以及认知功能等,这主要是由于大麻中的精神活性成分四氢大麻酚导致的,但是大麻中的另一种非精神活性成分大麻二酚(Cannabidiol, CBD)对胎儿的影响目前并不十分清楚。临床研究表明, CBD 可缓解孕妇的呕吐焦虑等症状,其在孕妇中的使用率呈升高趋势。动物实验表明, CBD 具有亲脂性,其可以通过胎盘进入胎儿体内蓄积;孕期 CBD 摄入会影响子代体重,在不同物种中会产生不同的影响,这些证据都对孕期使用 CBD 的安全性提出质疑。因此本研拟通过体外培养人大脑皮层类器官,模拟胎儿大脑发育的过程,探索孕期 CBD 暴露对胎儿大脑发育的影响。

方法 本研究主要通过免疫荧光实验、Western-Blot 实验、实时荧光定量 PCR 实验以及单细胞测序等实验,深入研究 CBD 对皮层类器官发育的影响。

结果 初步研究结果表明,孕期 CBD 暴露会抑制皮层类器官生长。孕期 CBD 暴露改变了皮层类器官放射状胶质细胞的增殖分化过程,对中间祖细胞以及神经元的数目、比例构成产生影响,最终使神经元成熟后结构与功能发生异常改变。

结论 本研究发现 CBD 抑制大脑皮层发育,孕期不应摄入 CBD。

The Relationship between Sleep Profiles and Anxiety and Depression in Addicted Patients: A Latent Profile Analysis

Zhaoyang Xie¹, Zheng Dai², Jiang Du¹

1. Shanghai Mental Health Center

2. The Fifth People's Hospital of Xiangtan City

Objective Researchers are increasingly focusing on the differences in sleep patterns, but there is little research on the specific characteristics of sleep in addicted

population. Moreover, limited studies investigated the link between sleep patterns and anxiety and depression among addiction patients. The objective of this study is to analyze sleep patterns in Chinese individuals with addiction in order to potentially inform clinical interventions aimed at improving the mental health outcomes of this population

Methods A total of 438 addicted patients from a Mental Hospital of Shanghai China were recruited. Latent profile analysis and logistic regression were used to explore the relationship between these patterns and anxiety and depression symptoms

Results Four profiles were identified among addicted population: Healthy sleepers (HS; 42.92%), Medicated Maladaptive Sleepers (MMS; 12.56%), Efficient but dysfunctional sleepers (EBDS; 26.71%), and Inefficient and dysfunctional sleepers (IADS; 17.80%). Then, patients with substance addiction are more likely to be the MMS, and patients with behavioral addiction are more likely to be the EBDS and IADS. Finally, the IADS reported the highest levels of anxiety and depression, had significant differences with the HS and MMS, but not the EBDS

Conclusion Clinicians and other workers should prioritize the assessment of the unique sleep patterns of addicted patients and tailor treatment plans accordingly. Caution should be exercised when prescribing sleep medications to patients with substance addiction. For individuals with addiction who exhibit specific sleep patterns, it may be necessary to further assess and address their symptoms of anxiety and depression

关键词: sleep profiles, depression, anxiety, latent profile analysis, addicted patients

Impact of Sexual Debut Age on Marijuana Consumption in U.S. Residents

Hongfei Mo*

Shanghai Medical College of Fudan University

Objective The present investigation aims to rigorously explore the intricate relationship between the

age of sexual debut and the subsequent experimentation with, as well as the regular use of, marijuana. By analyzing the data, we seek to identify potential associations that may exist between these variables

Methods The study employed data from the National Health and Nutrition Examination Survey (NHANES) conducted between 2015 and 2016. The cohort comprised 3,414 participants, including 48.39% males and 51.61% females, with a mean age of 37.81 ± 12.25 years. The age of sexual debut was ascertained through the Mobile Examination Center (MEC) Interview, which is a standardized questionnaire designed to gather information on various lifestyle factors. Marijuana experimentation and regular use were evaluated using the Drug Use Questionnaire, a validated tool for assessing substance use patterns. Logistic regression analysis was performed to assess the strength and direction of the associations, while restricted cubic spline (RCS) curves were utilized to visually represent the relationships

Results Among the participants who reported experimentation with marijuana, a notable proportion of 50.76% transitioned to regular users, with an average onset age of 18.01 ± 5.13 years. Following the adjustment for potential confounding factors, positive associations were discerned between sexual debut and both marijuana experimentation (OR=11.911, 95% CI: 6.604-21.744) and regular use (OR=10.012, 95% CI: 4.335-23.124). Conversely, a negative association was observed between the age of sexual debut and both marijuana experimentation (OR=0.770, 95% CI: 0.748-0.793) and regular use (OR=0.734, 95% CI: 0.706-0.763) after accounting for covariates. The RCS curves further corroborated these findings, revealing an inverse proportional relationship between the age of sexual debut and the likelihood of marijuana experimentation and regular use

Conclusion This study underscores the early age at which individuals commence regular marijuana use and highlights the potential correlation between sexual behaviors and marijuana consumption. Specifically, our findings indicate that a delayed age of sexual debut is associated with lower rates of marijuana experimen-

tion and regular use. These results provide valuable insights into the complex interplay between sexual development and substance use patterns, which may have significant implications for prevention strategies and intervention programs aimed at reducing the risks associated with early marijuana use

关键词: Marijuana, Sexual Debut Age, Experimentation, Regular Use

Gantenerumab 治疗阿尔兹海默症有效性及安全性: 一项 meta 分析

黄小宇 姚旭东 严国建* 赵米娜
成都市第四人民医院

目的 运用 meta 分析研究 Gantenerumab 治疗阿尔兹海默症的有效性及其安全性。

方法 计算机检索 Pubmed、Embase 及 Cochrane 数据库有关 Gantenerumab 治疗阿尔兹海默症的研究。

结果 纳入 4 个研究, 总病例数 2848 例, Gantenerumab 较安慰剂可降低 ADAS-Cog13 评分 (MD -0.99, 95% CI: -1.68 到 -0.29, $p=0.005$); Gantenerumab 组较安慰剂组 CDR-SB 评分改变无差异 (MD -0.08, 95% CI: -0.26 到 0.11, $p=0.40$); FAQ 评分无明显影响 (MD -0.36, 95% CI: -1.12 到 0.41, $p=0.36$); MMSE 评分无明显影响 (MD 0.11, 95% CI: -0.32 到 0.54, $p=0.61$); Gantenerumab 较安慰剂可明显降低淀粉样蛋白水平 (SMD -10.22, 95% CI: -11.70 到 -8.75, $p<0.00001$); Gantenerumab 较安慰剂发生所有不良事件无明显差异 (OR 1.07, 95% CI: 0.70 到 1.65, $p=0.74$); Gantenerumab 较安慰剂发生严重不良事件降低 19% (OR 0.81, 95% CI: 0.66 到 0.99, $p=0.04$)。

结论 Gantenerumab 较安慰剂可降低 ADAS-Cog13 评分, 淀粉样蛋白水平以及严重不良事件; 但 CDR-SB 评分/FAQ 评分/MMSE 评分以及所有不良事件无明显差异。

催产素对甲基苯丙胺致小鼠认知障碍的作用

成英杰 赵敏*

上海市精神卫生中心

目的 探究催产素对甲基苯丙胺致小鼠空间记忆和工作记忆障碍的作用及作用机制。

方法 1.借助 Y 迷宫自发交替实验和新物体识别测试实验,构建 METH 致认知障碍的小鼠模型。

2.利用经鼻给药方式,探讨外源性 OXT 施用对 METH 致小鼠认知障碍的作用。

3.采用化学遗传激活方式,探讨内源性 OXT 系统激活对 METH 致小鼠认知障碍的作用。

结果 1.连续 7 天 10 mg/kg 的 METH 持续暴露引起小鼠显著的工作记忆和认知记忆损害,表现为 Y 迷宫自发交替实验中正确交替的比例和次数减少,返回相同臂的错误率上升,以及在新物体识别测试实验中对新物体的偏好和对新旧物体的区分下降。

2.在认知记忆测试前 30 min 给予小鼠 2.5 $\mu\text{g}/\mu\text{l}$ 的 OXT 滴鼻可显著改善 METH 引起的小鼠认知功能损害。

3.在测试前通过腹腔注射 CNO (3 mg/kg) 激活 METH 小鼠 PVN 中的 OXT 神经元可有效阻断 METH 引起的认知功能减退。

结论 1.长期 METH 暴露可严重损害小鼠的空间记忆和工作记忆。

鼻滴 OXT 或化学遗传激活 PVNOXT 神经元均可改善 METH 所致小鼠认知记忆损害。

自我控制在酒依赖患者自我效能感中的中介效应及注意偏向的眼动研究

司昱琪¹ 陈天真¹ 王立卉³ 赵敏^{1,2}

1.上海市精神卫生中心

2.上海市重性精神病重点实验室

3.上海交通大学心理与行为科学研究院

目的 研究探讨了自我控制在自我效能感预测酒精成瘾的中介作用,同时通过成瘾的行为学范式

结合眼动监测技术,探究酒精依赖患者对酒精相关线索注意偏向的眼动特征,并分析眼动指标和自我效能感间的相关性。

方法 采用一般自我效能感量表 (General Self-Efficacy Scale; GSES)、自我控制量表 (Self-Control Scal; SCS) 和密西根酒精依赖调查量表 (Michigan Alcoholism Screening Test; MAST) 对 48 名酒依赖患者和 52 名健康人群进行调查,对自我控制在自我效能感与酒依赖的关系中的中介效应进行检验。同时采用 2 (线索类型:酒精图片、情绪图片) \times 2 (探测点和线索相对位置:同侧、异侧) \times 2 (组别:酒依赖组、健康对照组) 三因素混合设计。通过使用经典点探测范式和眼动技术监测被试对酒精线索注意偏向的特征。通过使用成瘾的点探测范式和 EyeLink Portable Duo 便携式眼动监测探究被试线索注意偏向特征 (行为学指标:点探测任务的正确率和反应时;眼动指标:注视点位移,瞳孔大小以及注视时间)。

结果 研究发现,酒依赖患者对酒精图片的注视点位移 ($p < 0.05$)、对酒精和情绪图片的瞳孔大小 ($p < 0.01$) 均显著大于健康对照组。酒依赖的自我效能感与酒精成瘾呈负相关 ($\beta = -0.173, p < 0.01$),酒精成瘾和自我控制呈负相关 ($\beta = 0.148, p < 0.01$),自我效能感与自我控制呈正相关。中介效应检验显示自我控制在自我效能感与酒依赖之间起完全中介作用,中介效应值 = -0.095, 95% 置信区间为 [-0.175, -0.017]。与此同时,酒依赖患者的对酒精和情绪图片的瞳孔大小和自我效能感呈负相关 ($p < 0.05$)。

结论 结果表明,酒依赖表现对酒精相关线索存在注意偏向;酒依赖的自我效能感能够负向预测酒程度;自我效能感通过提高自我控制水平进而降低酒依赖患者的成瘾程度;研究还提示了基于眼动的注意偏向矫治训练对降低酒依赖患者的成瘾程度及复饮风险的有效性可能来自于提高了自我效能感。

关键词: 酒依赖,注意偏向,自我效能感,自我控制

Smartphone Video Games Effectively Improve Cognitive Function in Middle-aged and Elderly Patients with Chronic Schizophrenia: A Randomized Controlled Trial

Miaomiao Zhang Kai Zhang*
Chaohu Hospital of Anhui Medical University,

Objective This study explores whether free video games can improve the cognitive function of middle-aged and elderly patients with chronic schizophrenia, and the effect of video games on blood factors in middle-aged and elderly patients with chronic schizophrenia

Methods We used a randomized controlled trial method to randomly divide the participants into two groups (control group and game group). The control group watched TV for 1 hour a day, five days a week for six weeks, and the game group played video games for 1 hour a day, five days a week for six weeks. The whole project lasted for 12 weeks, and the patients were measured and peripheral blood was collected at baseline, 3 weeks, 6 weeks, 9 weeks and 12 weeks. We used Repeatable Battery for the Assessment of Neuropsychological Status (RBANS), Stroop Color and Word Test (SCWT), Positive and Negative Syndrome Scale (PANSS), General Functional Assessment Scale (GAF), General Self-Efficacy Scale (GSE), Problematic Mobile Game Questionnaire (PMGQ) and Patient Health Questionnaire-9 (PHQ-9) to evaluate the cognitive function, psychiatric symptoms and mobile phone addiction of participants. blood factors GDNF, Tau, MIP-1 and MIP-4 were quantitatively detected

Results The total score of RBANS and the score of RBANS delayed memory in the game group were significantly increased. The negative symptoms were significantly improved in the game group. The PMGQ scores of the two groups were lower than the critical value at each time point. There was no significant difference in PHQ-9, GAF and GSE scores between groups. The level of GDNF in the game group was significantly increased, and the levels of Tau, MIP-1 and MIP-4 were decreased. GDNF level was positively correlated with RBANS total score and RBANS delayed memory score. MIP-1 level was negatively correlated with RBANS total score and RBANS delayed memory score

Conclusion This study demonstrates that free video games can improve the cognitive function of mid-

dle-aged and elderly patients with chronic schizophrenia. GDNF, TauMIP-1 and MIP-4 have the potential to become serum markers for predicting cognitive function

关键词: Schizophrenia, Cognitive function, Smartphone video games, GDNF, MIP-1, Tau

Chinese South Oaks Gambling Screen(C-SOGS): A Reliability and Validity Study

Yiyi Zhou¹, Yuhao Cui¹, Siyao Shi¹, Jingyang Liu¹, Xi-yuan Zhang¹, Yicheng Wei¹, Dongli Fan¹, Gangliang Zhong¹, Jiang Du^{1,2}

1.Shanghai Mental Health Center, Shanghai Jiao Tong University School of Medicine

2.Shanghai Key Laboratory of Psychotic Disorders

Objective This study aims to translate the South Oaks Gambling Screen(SOGS) into Chinese and to verify the reliability and validity of the scale in the mainland Chinese population

Methods Based on the Brislin translation model, the South Oaks Gambling Screen was adapted to Chinese. This study collected 283 cases from October 2023 to May 2024, divided into a general population sample (N = 159) recruited from the community and a gambling treatment sample (N = 124) recruited from a gambling cessation center in Shanghai. SPSS 20.0 was used for data analysis. Item analysis, internal consistency, split-half reliability, test-retest reliability, factor analysis, content validity, structural validity, and convergent validity were used to test the reliability and validity of C-SOGS

Results The scale demonstrated high internal consistency ($\alpha = 0.97$), test-retest reliability (0.80), and split-half reliability (0.98). Factor analysis resulted in a two-dimensional solution accounting for 70.98% of the total variance: a first factor composed mainly by questions related to the problems and consequences caused by gambling, a second factor encompassing questions related to the sources of gambling funds. Its content validity was over 0.80 and 0.90 in I-CVI and S-CVI respectively. The scale had a hit rate of 0.95, sensitivity of

1.00, a specificity of 0.91, a false-positive rate of 0.10, and a false-negative rate of 0.00 when screening the gambling population

Conclusion The C-SOGS exhibits strong reliability and validity in identifying individuals with gambling disorders, making it a valuable clinical tool for the effective screening of such patients

关键词: South Oaks Gambling Screen (SOGS), Localization, Reliability, Validity

物质依赖病房不良事件上报的综合性评估与对策研究

黄杏笑* 朱洁英 林俊艺 梅秀群 胡卓威
广州医科大学附属脑科医院

目的 运用综合性评估方法对某三甲专科医院物质依赖病房上报 15 例不良事件进行深入分析,制订相关护理对策,促进病房管理,以保证患者安全。

方法 回顾性分析物质依赖病房 2021 年 1 月至 2023 年 12 月不良事件上报共 15 例住院患者的临床资料,针对不良事件的分级、事件种类、入院后发生事件时天数、发生地点、发生原因、时间特点、损伤结果、发现人、发现人工作年限、事件发生前护理风险评估等级等进行分析。

结果 (1)发生的不良事件分级主要为Ⅲ级不良事件共 9 例;Ⅳ级不良事件共 5 例;Ⅱ级事件共 1 例。(2)主要发生原因为专科疾病患者存在的风险综合性评估不足。(3)事件发生时间段以白天班时间为主:白天班 10 例、小夜班 3 例、大夜班 2 例。(4)发生入院后 7 天内的不良事件共 6 例,占比 40% (其中 1 例出现缝针,伤害性最大)。

结论 为减少物质依赖住院患者不良事件发生,保障医疗护理质量安全,不仅要优化科室人力资源配置,特别在白天班工作繁忙时期,加强巡视并与患者沟通,提高风险评估能力和不良事件处置能力;加强对护理人员的专科疾病观察与评估的培训,尽早识别戒断症状,及时处理;还要加强有效的医护患沟通,尽快详细获取患者的准确病史;医生、护士、心理治疗师、护工及家属等进行综合性评估,动态观察患者病情变化,及时进行心理疏导,给予关注,提供患者有希望解决的方案,满足其合理需求,

保障患者安全,减少意外事件的发生。

关键词: 物质依赖,护理不良事件,综合性评估

酒精依赖伴抑郁患者脑结构和静息态脑功能特征研究

孙丰伟 张义 贾晓健 杨梅*

深圳市精神卫生中心/深圳市康宁医院

目的 酒精依赖与抑郁障碍共病的神经机制尚未明确。本研究基于磁共振成像技术研究酒精依赖伴抑郁患者脑结构和静息态脑功能特征,为探索两种疾病的共病机制提供一定依据和参考。

方法 本研究纳入了酒精依赖伴抑郁组 24 例,酒精依赖不伴抑郁组 24 例和健康对照组 31 例。采集三组研究对象磁共振数据。基于 SPM12、CAT12、DPABI、DPARSF 5.3 及 xjView 等工具包对磁共振数据进行预处理和脑灰质体积(GMV)、低频振幅(ALFF)、局部一致性(ReHo)等指标的计算及统计分析。研究差异显著脑区 GMV、ALFF 及 ReHo 值与酒精依赖量表(ADS)、9 项患者健康问卷(PHQ-9)得分的相关性。

结果 与健康对照组相比,酒精依赖伴抑郁组在右颞下回、左小脑 8 区、左颞中回、左楔前叶、左/右顶下缘角回、右背外侧额上回、左/右额中回的 GMV 值减少。与酒精依赖不伴抑郁组相比,酒精依赖伴抑郁组 GMV 值无显著差异。与健康对照组相比,酒精依赖不伴抑郁组在左/右舌回、右梭状回、左辅助运动区的 GMV 值减少。与健康对照组相比,酒精依赖伴抑郁组在左距状裂周围皮层、左中央后回、右颞极:颞上回、左补充运动区的 ALFF 值降低;左豆状苍白球、右小脑 9 区、右颞上回、左颞极:颞中回的 ALFF 值升高。与酒精依赖不伴抑郁组相比,酒精依赖伴抑郁组右小脑 8 区的 ALFF 值升高。与健康对照组相比,酒精依赖不伴抑郁组在左楔叶、右中央后回、左后扣带回、左缘上回、左角回、左枕中回的 ALFF 值降低;右小脑 7b 区、右尾状核、Vermis_7 区的 ALFF 值升高。与健康对照组相比,酒精依赖伴抑郁组在左/右中央后回、左距状裂周围皮层、右颞中回、右脑岛、左小脑 4_5 区的 ReHo 值降低,左丘脑的 ReHo 值升高。与酒精依赖不伴抑郁组相比,酒精依赖伴抑郁组的 ReHo 值无

显著差异。与健康对照组相比,酒精依赖不伴抑郁组在左/右中央后回、右颞横回、左内侧和旁扣带回的 ReHo 值降低;右丘脑、右小脑 8 区的 ReHo 值升高。酒精依赖伴抑郁组的右颞上回 ALFF 值与 PHQ-9 得分呈正相关,右颞中回 ReHo 值与 PHQ-9 得分呈负相关。酒精依赖不伴抑郁组的右丘脑 ReHo 值与 ADS 得分呈负相关。

结论 酒精依赖伴抑郁患者额叶、顶叶、颞叶、小脑多脑区的灰质体积减少,表明上述脑区可能参与酒精依赖伴抑郁患者的发生发展。酒精依赖患者静息状态下存在右侧小脑功能活动的增强和中央后回功能活动的减弱,而酒精依赖伴抑郁患者右小脑 8 区的 ALFF 值较酒精依赖不伴抑郁患者增高更加显著,这表明酒精依赖伴抑郁患者静息状态下右侧小脑自发神经活动的异常增高可能是酒精依赖共病抑郁障碍的重要神经机制。

关键词: 酒精依赖;抑郁;灰质体积;低频振幅;局部一致性。

Differential Expression Profiling of tRNA-Derived Small RNAs and Their Potential Roles in Methamphetamine Self-administered Rats

Qingxiao Hong Yun Zhou Huifen Liu*

Affiliated Kangning Hospital of Ningbo University

Objective The objective of this study was to elucidate the roles of transfer RNA-derived small RNAs (tsRNAs), including tRNA-derived fragments (tRFs) and tRNA halves (tiRNAs), in the pathophysiological processes induced by methamphetamine. Given their established roles in gene expression regulation, protein translation, cellular activity, immune responses, and stress reactions, we aimed to uncover how these tsRNAs contribute to methamphetamine-related pathogenesis

Methods We employed small RNA sequencing, quantitative reverse transcription-polymerase chain reaction (qRT-PCR), bioinformatics analysis, and luciferase reporter assays to profile and functionally characterize tRFs and tiRNAs in the nucleus accumbens (NAc) of methamphetamine self-administering rat models. Our

approach included the identification and differential expression analysis of tsRNAs following 14 days of methamphetamine exposure. We validated changes in specific tsRNAs using qRT-PCR and conducted bioinformatic analysis to predict their biological functions in methamphetamine-induced pathogenesis. The luciferase reporter assay was utilized to confirm the targeting relationship between selected tsRNAs and brain-derived neurotrophic factor (BDNF)

Results Our analysis identified a total of 461 tRFs and tiRNAs in the NAc post-methamphetamine administration, with 132 showing significant differential expression—59 upregulated and 73 downregulated. Notably, the expression levels of tiRNA-1-34-Lys-CTT-1 and tRF-1-32-Gly-GCC-2-M2 decreased, while tRF-1-16-Ala-TGC-4 increased in the methamphetamine group compared to controls. Bioinformatics analysis suggested potential roles for these tsRNAs in methamphetamine's pathogenic mechanisms. Specifically, tRF-1-32-Gly-GCC-2-M2 was found to target BDNF, implicating it in the pathophysiological changes induced by methamphetamine.

Conclusion The study revealed a significant alteration in tsRNA expression patterns in response to methamphetamine, with specific tsRNAs like tRF-1-32-Gly-GCC-2-M2 playing a role in the drug's pathophysiological effects through targeting BDNF. These findings offer novel insights and pave the way for future research into the mechanisms and potential therapeutic targets for methamphetamine addiction.

关键词: transfer RNA-derived small RNAs, methamphetamine, addiction, tRF-1-32-Gly-GCC-2-M2, BDNF

早期酒精依赖停药后再入院风险相关因素

姜玉飞*

金华市第二医院

目的 探究早期酒精依赖患者停药后再入院风险的相关因素。

方法 选取 2020 年 5 月到 2021 年 5 月在金华市

第二医院诊断及治疗的早期酒精依赖患者 134 例,根据随访期(12 个月)内是否因酒精依赖再次入院将患者分为再入院组及对照组,比较两组一般资料,并在患者出院时使用强制性饮酒问卷(obsessive compulsive drinking scale, OCDS),认知功能成套测验及社会支持量表(social support rating scale, SSRS),应用 Logistic 回归分析再入院发生的独立危险因素,应用受试者工作曲线(receiver operating characteristic curve, ROC)评估不同指标对再入院的预测效能。

结果 本研究再入院患者 47 (43.12%) 例,再入院组男性比例、身体质量指数(Body Mass Index, BMI)、日均饮酒量、吸烟比例、接受教育时间显著高于对照组($P < 0.05$),再入院组 OCDS 得分显著高于对照组($t=16.984, P=0.000$),再入院组认知功能中空间广度(space span, SS)、低水平语言记忆(hopkins verbal learning test, HVLT)及 SSRS 中主观支持得分显著小于对照组($t=4.295, 4.673, 8.250; P=0.000, 0.000, 0.000$),高水平 BMI (OR=2.046, $P=0.038$)及 HVLT (OR=0.065, $P=0.033$)是再入院发生的独立危险因素, BMI、HVLT 预测再入院发生的 AUC 分别为 0.824 及 0.848,两者联合预测的 AUC 为 0.942,显著优于单独诊断($Z=3.848, 3.064; P=0.000, 0.002$),且联合诊断可有效提高诊断准确率、特异性及阳性预测值($P < 0.05$)。

结论 高水平 BMI 及低水平 HVLT 是再入院发生的独立危险因素,并对患者再入院情况具有较好预测作用。

关键词: 酒精依赖;再入院;危险因素;认知障碍

甲基苯丙胺使用障碍者短期戒断后睡眠质量分析

黄书才¹ 吴成聪² 湛红献³

1.首都医科大学附属北京安定医院芜湖医院(芜湖市第四人民医院)

2.蚌埠医科大学

3.中南大学湘雅二医院

目的 探讨甲基苯丙胺使用障碍者短期戒断后的睡眠质量。

方法 本研究共有 552 名戒断一个月的甲基苯

丙胺使用障碍者参与,采用匹兹堡睡眠指数(PSQI)调查参与者的主观睡眠状况;随机抽取 220 名参与者使用心肺耦合睡眠监测仪(CPC)对睡眠进行数据监测,并进行睡眠日记评估。

结果 PSQI 的结果显示,54.2%的参与者存在较差的主观睡眠质量($PSQI > 5$),33.3%的参与者存在较为严重的主观睡眠质量问题($PSQI > 8$)。存在较为严重的主观睡眠质量问题的个体更可能为女性、更大的年龄、更长的毒品使用时间和对 MA 更高的渴求。CPC 睡眠结构分析显示,存在较为严重的主观睡眠质量问题($PSQI > 8$)的个体可能存在更短的睡眠总时间($p < 0.001$)、熟睡时间($p < 0.001$)和更好的睡眠效率($p < 0.001$)。以及更长的浅睡时间($p < 0.001$)、快速眼动睡眠时间($p < 0.001$)和睡眠潜伏期($p < 0.001$)。渴求($p < 0.012$)和吸烟频率($p < 0.028$)可以预测甲基苯丙胺使用障碍者的客观睡眠时间。

结论 甲基苯丙胺使用障碍者在戒断一个月后存在主观睡眠质量问题的比例仍较高,并且这种异常的主观睡眠体验与客观睡眠指标的异常相关。

关键词: 甲基苯丙胺,戒断,匹兹堡睡眠指数,心肺耦合睡眠监测

男性酒依赖患者复饮行为的相关影响因素分析

董瀚文^{1,2} 张月倩^{1,2} 王若飞^{1,2} 刘艳² 杨可冰² 杨清艳² 赵荣江² 牛雅娟²

1.承德医学院

2.北京回龙观医院

目的 分析男性酒依赖(alcohol dependence, AD)患者戒断后复饮行为的相关影响因素。

方法 选取 2018 年 1 月至 2023 年 9 月在北京回龙观医院就诊的男性酒依赖患者为研究对象。所有患者均给予常规急性脱瘾治疗,并在治疗后的 6 个月随访患者的复饮情况。根据患者是否复饮分为复饮组 56 例(63.64%)和未复饮组 32 例(36.36%),比较两组的人口学和临床特征,并使用有序二分类 Logistic 回归探讨男性酒依赖患者复饮的相关影响因素。

结果 单因素分析结果显示,复饮组与未复饮

组在癫痫发作史, 日均饮酒量, GGT, DSQ-1, DSQ-2, MAST-4 方面的差异具有统计学意义 ($P < 0.05$)。进一步二分类 Logistic 回归分析显示, 日均饮酒量 ($OR = 1.36$, $95\%CI: 1.09-1.70$), DSQ-1 不成熟的防御机制 ($OR = 2.51$, $95\%CI: 1.34-4.70$) 是男性酒依赖患者的危险因素; DSQ-2 成熟的防御机制 ($OR = 0.42$, $95\%CI: 0.22-0.78$) 是男性酒依赖患者复饮的保护因素。

结论 日均饮酒量、不成熟的防御机制可能增加男性酒依赖患者复饮的风险; 成熟的防御机制可能减少男性酒依赖患者复饮的风险。

Circulating Plasma and Exosome Levels of The MiR-320 Family As A Non-invasive Biomarker for Methamphetamine Use Disorder

Wenjin Xu^{1,2,3}, Huifen Liu^{2,3}, Huifen Liu¹

1. Department of psychiatry, Affiliated Kangning Hospital of Ningbo University, Health Science Center, Ningbo University, Ningbo 315201, Zhejiang, PR China

2. Department of psychiatry, Ningbo Kangning Hospital, Ningbo 315201, Zhejiang, PR China

3. Key Laboratory of Addiction Research of Zhejiang Province, Ningbo 315201, Zhejiang, PR China

Objective The neurobiological mechanism of methamphetamine(MA) use disorder was still unclear, and no specific biomarkers exist for clinical diagnosis and treatment. Recent studies have demonstrated that microRNAs (miRNAs) are involved in the pathological process of MA addiction. The purpose of this study was to identify novel miRNAs as biomarkers for the diagnosis of MA user disorder

Methods First, members of the miR-320 family, including miR-320a-3p, miR-320b, and miR-320c, were selected and analyzed in the circulating plasma and exosome by microarray and sequencing. Secondly, miR-320 in plasma was quantified by real-time quanti-

tative reverse transcription polymerase chain reaction(RT-qPCR) in eighty-two patients exhibiting MA use disorder and fifty age-gender-matched healthy controls. We also analyzed miR-320 expression in the exosome of thirty-nine patients exhibiting MA use disorder and twenty-one age-matched controls. Subsequently, diagnostic power was evaluated using the area under the curve (AUC) of the receiver operating characteristic (ROC) curve

Results The results showed that miR-320 was significantly increased in MA use disorder plasma and exosome compared with controls. The AUC of the ROC curves of miR-320 in MA use disorder plasma and exosome were 0.751 and 0.962, respectively. The sensitivities of miR-320 in MA use disorder plasma and exosome were 0.900 and 0.846, respectively, whereas the specificities of miR-320 were 0.537 and 0.952, respectively. Among the increases in miR-320 in MA use disorders patients, the increase in miR-320 in the plasma was positively correlated with smoking, age of onset, and daily use. Target prediction with miR-320 identified pathways implicated in MA addiction, including cardiovascular disease, synaptic plasticity, and neuroinflammation

Conclusion Our findings indicated that plasma and exosome associated miR-320 might be used as a potential blood-based biomarker for diagnosing MA use disorder

VR 线索暴露治疗酒精使用障碍的疗效研究

金钦黎*

广州医科大学附属脑科医院

目的 本研究旨在探索 VR 线索暴露疗法对降低酒精使用障碍患者渴求、防止复饮的治疗效果。

方法 96 例符合 DSM-5 中重度酒精使用障碍诊断的住院患者被随机分配到 VR-CET 组(N=47)和对照组(N=49)。对照组仅接受常规临床治疗和 VR 场景放松治疗, VR-CET 组接受常规临床治疗以及 VR

线索暴露治疗,包括饮酒情境的暴露,观看厌恶视频进行渴求的反调节治疗,最后进行场景放松。在两周内均完成5次治疗。治疗前后均使用OCDS、AUQ和酒精图片诱发下的VAS评估主观渴求。AUD出院后使用时间线回访法(Timeline Follow back, TLFB)对患者进行4周一次的电话随访,共随访24周,记录出院后复饮的情况。首要结果指标为随访期重复入院率、8周内的完全戒酒率、总酒精消费量。次要结局指标为渴求改善情况,首次饮酒时间、重度饮酒天数。所有结局指标采用意向性分析的方式,使用协方差统计分析VR-CET组与对照组治疗前后渴求改善情况。随访期结局指标使用Logistics回归分析和广义估计方程进行分析。

结果 本研究探讨了VR线索暴露治疗酒精使用障碍的临床疗效。在首要结局指标中,VR-CET组在随访期内的重复入院率较低($P=0.030$, $OR=0.25$, $95\% CI 0.07-0.88$)。出院后8周内的完全戒酒率较高($P=0.022$, $OR=2.91$, $95\% CI 1.16-7.26$)。在酒精消费中,两组间差异接近显著(Wald卡方值=3.33, $P=0.068$, $Cohen's d=0.38$),且分组与时间的交互效应差异显著(Wald卡方值=12.53, $P=0.028$),多重比较发现在随访第8周(Wald卡方值=4.54, $P=0.033$, $Cohen's d=0.45$)、第12周(Wald卡方值=6.68, $P=0.01$, $Cohen's d=0.54$)和第16周(Wald卡方值=3.85, $P=0.05$, $Cohen's d=0.40$)两组差异显著。在次要结局指标上,渴求改善方面,VR-CET组与对照组的VAS诱发、OCDS、AUQ评分治疗前后差值上,差异未显示出统计学意义($p>0.05$),重度饮酒天数和首次复饮时间VR治疗组与对照组没有显著统计学差异($p>0.05$)。

结论 VR线索暴露治疗对AUD出院后饮酒结局具有改善作用,可以提升AUD出院后早期的完全戒酒率,减少再住院风险,并且减少出院后的酒精消费。

关键词: 线索暴露疗法,虚拟现实,酒精使用障碍,渴求,复饮

苯二氮草类镇静催眠药超说明书用药的现况调查

李华新 范妮*

广州医科大学附属脑科医院

目的 当前临床指南普遍建议苯二氮草类药物(BZDs)应“短期、小剂量”使用,以降低潜在的依赖和副作用风险。然而,实际临床应用中“长期、大剂量”使用BZDs的情况较为普遍,这与推荐指南存在显著差异。为了解BZDs在实际临床中的使用情况及其背后的影响因素。本研究于一家大型三甲精神专科医院门诊进行了一项详细的处方用药调查。

方法 通过收集2022年7月1日至7日一周时间内门诊的BZDs处方数据,全面分析了BZDs的使用模式,包括用药频率、剂量、以及与特定诊断相关的用药情况。

结果 本研究共纳入2812名患者的BZDs用药信息,其中女性占比60.2%,男性占39.8%。平均年龄为45.91岁。男性患者的BZDs日均使用剂量显著高于女性患者。而且随着年龄的增加,苯二氮草类镇静催眠药日均使用剂量也逐渐增加,且不同年龄段之间BZDs的日均使用剂量存在显著性差异。睡眠障碍患者的BZDs日均使用剂量中位数最高,其次为精神分裂症、双相情感障碍、抑郁症、焦虑症、心境[情感]障碍,且不同疾病诊断之间BZDs的日均使用剂量也存在显著性差异。BZDs的超适应症用药现象普遍,77%的患者存在超说明书用药,主要以超适应症为主,同时超剂量的情况也较为常见。精神分裂症的患者超说明书用药发生率最高,其次为双相情感障碍、心境[情感]障碍、抑郁症、焦虑症、睡眠障碍。我们还发现阿普唑仑、劳拉西泮和奥沙西泮是使用频率最高的三种BZDs。发生超说明书用药最常见于咪达唑仑,其次为氯硝西泮、劳拉西泮、奥沙西泮、阿普唑仑、艾司唑仑、硝西泮。年龄小、使用多种BZDs、联合使用多种精神科药物是发生超说明书用药的危险因素。

结论 BZDs的使用普遍而超说明书用药现象显著,这提示临床医生在使用BZDs时需更加注意药物的适应症与剂量控制。合理的超说明书用药在一定程度上可能填补了现有药品说明书与临床实践之间的差距,但对于显著的超大剂量用药情况,需要行政部门、医疗机构和临床医生共同努力,以完善管理措施,保证用药的安全性和合理性。

A Study on Cognitive Function Impairment in Chronic Ketamine Users

Jun Zhong*

The Affiliated Brain Hospital of Guangzhou Medical University

Objective Over the past two decades, ketamine has emerged as a major substance of abuse in many regions worldwide. Neuroimaging studies have revealed significant brain atrophy in chronic ketamine users, particularly in areas associated with cognitive functions. This study aims to investigate the extent of cognitive impairment in chronic ketamine users and its relationship with patterns of ketamine use

Methods The study included 28 chronic ketamine users and 30 healthy controls. Cognitive function was evaluated using the MATRICS Consensus Cognitive Battery (MCCB), which assesses seven cognitive domains: working memory, visual learning, verbal learning, speed of processing, reasoning and problem-solving, attention/vigilance, and social cognition. Correlation analyses were performed to examine the relationship between cognitive performance and characteristics of ketamine use

Results Chronic ketamine users demonstrated significantly lower performance in speed of processing, visual learning, working memory, and overall MCCB scores compared to healthy controls. Significant negative correlations were observed between estimated total ketamine consumption and cognitive performance in speed of processing and overall cognitive function

Conclusion Chronic ketamine users exhibit impairments in working memory, visual learning, and speed of processing. Chronic ketamine use may lead to reduced information processing speed and overall cognitive function. These cognitive impairments may be indicative of structural and functional damage in multiple brain regions

关键词: Ketamine, Chronic Ketamine Use, Cognitive Impairment, Speed of Processing

针对酒精使用障碍的虚拟成瘾康复治疗师的开发与有效性验证

李硕 桑维聪 陈天真 赵敏*

上海市精神卫生中心

目的 酒精是滥用最为严重的精神活性物质之一,既往研究提示心理治疗干预有效,然而心理服务资源严重不足导致许多患者未能接受相应干预。为了应对该现实困境,本研究对已有虚拟成瘾康复治疗师系统针对酒精使用障碍进行优化开发,并验证虚拟成瘾康复治疗师对酒精使用障碍患者的疗效。

方法 虚拟成瘾康复治疗师系统是一个由临床医生、心理治疗师和计算机专家组成的团队针对酒精使用障碍开发的评估和康复程序,具有电脑移动端及网页移动端两种入口模式。评估方面主要针对成瘾的核心特征,如情绪、冲动性、治疗动机和渴求程度。在治疗方面系统提供了 10 个治疗单元,包括动机增强、情绪调节、冥想等。

开发完成后,共有 93 名酒精使用障碍患者随机接受基于虚拟成瘾康复治疗师系统的康复心理治疗联合常规治疗或单纯常规治疗。在基线期、干预后使用量表收集患者的临床结局指标,包括渴求和睡眠情绪状态等。干预一月后简单随访患者的复饮、情绪和睡眠情况。研究采用重复测量方差分析和独立样本 t 检验对两组受试者在接受治疗前后的疗效指标进行比较。运用卡方检验比较两组患者在治疗后一个月的随访结局。为了进一步确定对干预疗效可能存在影响的受试者临床特征,我们使用探索性亚组分析和线性回归来探究人口学因素和临床特征对于酒精渴求变化的影响。使用 logistic 回归探究认知和情绪因素对两组受试者临床结局的影响。

结果 在前期开发基础上,本研究针对酒精使用障碍患者,系统进一步丰富了数字人的形象和治疗内容。在认知评估模块搭载上,针对成瘾患者核心认知损害特点——主要表现在注意、记忆、抑制控制、执行功能等多个认知维度的功能障碍,以及对物质相关线索刺激的认知偏向——包括注意偏向、趋向偏向以及药物相关记忆偏向,本研究亦构建了脑电、肌电等客观生理指标同步采集下的认知评估方案。

干预后一个月随访结果表明,在 93 名受试者中,有 13 名受试者失访,43 名受试者复发,37 名受试者未复饮。卡方分析比较两组患者的复饮结局结果

表明, 两组患者的干预后一个月随访的结果有显著差异。独立样本 *t* 检验的结果表明两组受试者对于酒精渴求的前后测差值有显著差异, 两组受试者在 PHQ-9 抑郁量表得分的后测有显著差异, 两组受试者在 PSQI 睡眠质量指数的后测差值有显著差异。

结论 本研究开发了一套基于心理治疗师虚拟形象治疗酒精使用障碍的系统, 该系统结合了认知行为治疗工具, 预防复发的正念音频指导和酒精使用障碍相关知识。对照试验提示基于心理治疗师虚拟形象开发系统对酒精使用障碍治疗具有优于常规成瘾治疗方案的临床疗效, 并有潜力能降低受试者酒精使用障碍的复发率, 结合其具有扩大应用的一定价值, 值得向各级医疗机构推广干预。

The Severity of Gambling in Clinical Samples of Gamblers: Profiles and Prediction of The Impulsivity and Emotions

Nannan Hu¹, Gangliang Zhong², Jiang Du², Ping Dong², Jingyang Liu², Yicheng Wei², Jing Zhai²

1. Hangzhou Seventh People's Hospital

2. Shanghai Mental Health Center

Objective Impulsivity and emotion impairments have been noted in individuals with gambling disorder (GD). However, little research has investigated the influence of impulsivity and emotions on the severity of gambling in clinical populations. This study aimed to examine: (i) differences in emotions and impulsivity traits according to the severity of gambling in individuals with GD, (ii) the mediating effects of emotion in the relationship between impulsivity traits and gambling severity, and (iii) the predictive effects of emotion and impulsivity traits on GD severity

Methods The study included 214 participants seeking treatment for GD who completed assessments for emotions (Patient Health Questionnaire-9 [PHQ-9], 7-item Generalized Anxiety [GAD-7]), impulsivity traits (Barratt Impulsiveness Scale [BIS], Self-control Scale [SCS]), and GD severity (DSM-5)

Results Participants were categorized into mild ($n = 78$), moderate ($n = 63$), and severe ($n = 73$) gambling severity groups. Significant differences in emotions and impulsivity traits were observed across these groups. The severe GD group exhibited higher levels of depression, anxiety, and impulsivity traits, along with lower self-control, compared to the moderate and mild groups. Mediation analyses demonstrated that negative emotions mediated the association between impulsivity traits and the severity of gambling. More specifically, the indirect effects of impulsivity traits through PHQ-9 and GAD-7 were found to be significant, indicating a mediating role of emotions. Moreover, a predictive model incorporating emotion and impulsivity traits showed moderate accuracy in predicting the severity of gambling, with an area under the receiver operating characteristic curve of 0.714

Conclusion This study highlights the distinct pathways through which impulsivity traits operate and emphasizes the need for prevention and treatment strategies that consider impulsivity traits and emotions for different levels of gambling severity

关键词: gambling disorder, emotion, impulsivity, gambling severity

Public Stigma Towards People with Alcohol Use Disorders in China

Qingyan Yang¹, Nicolas Risch N², Kebing Yang¹, Yajuan Niu¹, Yanxia Xiao¹, Yanfang Zhou¹, Yunlong Tan¹, Yi Zhang³, Patrick W. Corrigan P⁴, Ziyang Xu⁵

1. Peking University Huilongguan Clinical Medical School, Beijing Huilongguan Hospital, Beijing, China

2. Department of Psychiatry and Psychotherapy II, University of Ulm and BKH Günzburg, Germany

3. Tianjing Binhai New District Anding Hospital, Tianjin, China

4. Department of Psychology, Illinois Institute of Technology, Chicago, USA

5. Department of Psychiatry and Psychotherapy III, University of Ulm, Germany

Objective Research from Western societies indicates pervasive public stigma against people with alcohol use disorders (AUDs). However, there is a lack of knowledge about the interactions between different components of stigma and their contribution to discriminatory behaviour towards individuals with AUDs within the Chinese cultural context. The aim of the present study was therefore to investigate the relationships of (mis-)conceptions, stereotypes, emotional reactions, perceived public stigma and their contribution to the desire for social distance among the Chinese adults

Methods (Mis-)conceptions, stereotypes, emotional responses, willingness to help and avoid, perceived stigma, and the desire for social distance from individuals with AUDs were assessed via a cross-sectional online survey with a sample of 1,100 adults from the Chinese population

Results Three-fourth of the participants recognised AUDs as mental illnesses, though 70% of the sample did not support health insurance coverage for the treatment of AUDs. A stronger desire for social distance was associated with increased perceived public stigma, greater recognition of alcohol use disorders as mental illnesses, heightened perceptions of personal responsibility, increased fear, and more willingness to avoid and withhold help, controlling for age, gender, education, employment, and alcohol consumption

Conclusion Culturally tailored anti-stigma programmes are needed to address stigma associated with mental illnesses in general, highlight the multifaceted cause models of alcohol use disorders, reduce perceptions of personal responsibility, and involve people with lived experience of alcohol use disorders

关键词: alcohol use disorders, public stigma, stereotype, discrimination, China, stigma change

The Impact of Childhood Misbehavior on Drinking Behavior Among Non-medical College Students in Beijing: The Mediating Effect of Positive Alcohol Expectations

Yanxia Xiao¹, Mengying Ma¹, Yanfang Zhou¹, Yunli

Fan², Qingyan Yang¹, Keping Yang¹

1.Beijing Huilongguan Hospital

2.Shandong Mental Health Center

Objective This study preliminarily explores the mediating effect of positive alcohol expectations in the process by which childhood misbehavior before the age of 12 affects drinking behavior among non-medical college students in Beijing

Methods Using convenience sampling, 214 non-medical college students were recruited from two universities in Beijing between January 2014 and December 2015. The Ethanol Dependence Syndrome Scale (EDSS) was employed to assess the severity of the participants' drinking behavior. Information on general demographics, drinking expectations, and behaviors before the age of 12 was collected. Correlation analysis, multiple regression analysis, and Bootstrap tests were utilized to analyze survey results

Results Significant positive correlations were found among drinking behavior, childhood misbehavior before the age of 12, and positive alcohol expectations. Multiple regression analysis showed that childhood misbehavior before the age of 12 significantly positively predicted positive alcohol expectations ($\beta=1.269$, $P<0.01$) and the severity of drinking behavior ($\beta=0.091$, $P<0.01$). Positive alcohol expectations also significantly predicted the severity of drinking behavior ($\beta=0.02$, $P<0.01$), while negative alcohol expectations did not show the significant predictive effect ($\beta=-0.082$, $P=0.1$). Both direct and mediating effect from childhood misbehavior before the age of 12 to the severity of drinking behavior were significant, with their 95% confidence intervals not including "0". The direct effect of childhood misbehavior before the age of 12 on drinking behavior was 0.091, with a 95% CI of (0.009-0.167), accounting for 79.77% of the total effect. The total indirect effect was 0.023, with a 95% CI of (0.008-0.046), accounting for 20.23% of the total effect. Drinking expectations significantly mediated the impact of childhood behavior on the severity of drinking behavior

Conclusion The childhood misbehavior before the age of 12 of college students can indirectly influence

their drinking behavior through individual drinking expectations. It is suggested that more attention should be paid to college students with childhood misbehavior before the age of 12, and intervention strategies could be developed to reduce positive alcohol expectations and the occurrence of drinking behavior

The Changes of Substance Use Patterns and Its Association with Health Risk Behaviors Among Adolescents: Trends Analysis From 2007 To 2019

Zijing Wang¹, Tianzhen Chen¹, Tingyu Rong², Jiayi Zhu¹, Na Zhong¹, Jiang Du¹, Guanghai Wang³, Min Zhao¹

1.Shanghai Mental Health Center

2.Children's Hospital of Soochow University

3.Shanghai Children's Medical Center

Objective Understanding the evolving characteristics and profiles of adolescent substance use is essential for designing effective interventions, and continuous monitoring of trends is vital for public health initiatives. The aim of this study was to determine the polysubstance use patterns among the adolescents and to explore the dynamic association between substance use and health risk behaviors during the long-term period (i.e., 2007 to 2019)

Methods The current study used biennial data from the US nationally representative Youth Risk Behavior Survey(YRBS) from 2007 to 2019. Crude prevalence rates were calculated for self-reported lifetime use of 11 substances, including cigarettes, alcohol, marijuana, cocaine, glue, heroin, methamphetamine, ecstasy, steroids, hallucinogenic drugs, and injected illegal drugs. Prevalence rates were determined for six theoretical domains, including sexual risk behaviors, suicide-related behaviors, physical and mental health safety, electronic use, safety, and violence-related behaviors, for the overall sample. Joinpoint regression models

were used to estimate biennial percent changes (BPCs) and average BPC (ABPC) of substance use and health risk behaviors from 2007 to 2019. Latent category analysis was used to identify substance use patterns, and logistic regression analysis with year-by-group interactions assessed dynamics and disparities from 2007 to 2019

Results Three stable substance use patterns—Low (the group with low probabilities of using cigarettes, alcohol, and marijuana, and almost no use of illegal substances), Moderate (the group with moderate probabilities of using cigarettes, alcohol, and marijuana, and low probabilities of using illegal substances), and High Polysubstance Groups (the group with moderate to high probabilities of using cigarettes, alcohol, marijuana and illegal substances)—were identified from 2007 to 2019. There was an increasing trend in the Low Polysubstance Group(BPC=1.60% [95%CI:0.35%, 2.87%]), a decreasing trend in the Moderate Polysubstance Group(BPC=-3.21% [95%CI:-5.85%, -0.51%]) and a steady trend in the High Polysubstance Group from 2007 to 2019. Compared to Low Polysubstance Group, the High Polysubstance Group presented higher risk in most health-risk behaviors. The changes in the risk of most health risk behaviors of three substance use subgroups-based disparities were not significant, or narrowed from 2007 to 2019. Sexual risk behaviors and violence-related behaviors are more sensitive to the trend changes in polysubstance use. It was found that the disparity in the risk of these two kinds of behaviors increased over time in the Moderate Polysubstance use group. Although health-risk behavior disparities between legal substance users and non-users were smaller or unchanged, the prevalence of marijuana was still high, with an increasing risk disparities in engaging in sexual risk and violence-related behaviors associated with it from 2007 to 2019. Meanwhile, disparities in nearly all health risk behaviors between illegal substances users and non-users widened, with sexual risk behavior and violence-related behaviors showing the most pronounced differences

Conclusion From 2007 to 2019, the proportion of the High Polysubstance Group remained unchanged, with consistently high levels of health risk behaviors.

The trends in risk of engaging in health risk behaviors differed between legal and illegal substances. These findings underscore the need for multifaceted and adaptable strategies to address adolescent substance use and related behaviors

Exploration of The Therapeutic Effects and Impact on Neuroplasticity of Sequential Bilateral Transcranial Magnetic Stimulation (TMS) Treatment for First-Episode Depression Patients

Li Pu Hongmei Yan Jiang Wu Guojian Yan* Shan Huang Dandan Liu

The Clinical Hospital of Chengdu Brain science institute, MOE Key Lab for Neuroinformation, School of life science and Technology, University of Electronic Science and Technology of China, Chengdu, China

Objective 1. To investigate the efficacy of bilateral sequential treatment with left intermittent theta burst stimulation (ITBS) combined with right low-frequency repetitive transcranial magnetic stimulation (rTMS) in improving sleep and mood in patients with first-episode depression. 2. To explore the impact of this treatment modality on brain neuroplasticity in patients with first-episode depression through event-related potentials

Methods A total of 42 patients who met the diagnostic criteria for depression in the International Classification of Diseases, 10th Edition (ICD-10) for mental and behavioral disorders were studied. They were divided into a first-episode group of 21 patients and a non-first-episode group of 21 patients. Both groups received antidepressant treatment with escitalopram oxalate alone, supplemented with ITBS on the left dorsolateral prefrontal cortex (L-DLPFC) combined with low-frequency rTMS (LF-rTMS) on the right dorsolateral prefrontal cortex (R-DLPFC). Both groups completed 10 treatment sessions (5 days/week). Additionally, PSQI

was used to assess sleep quality, and HAMD-17, SAS, and SDS were used to assess mood improvement before and after treatment. The Japanese MEB-23120 electromyography/evoked potential instrument was used to measure MMN latency, P300 latency, and amplitude

Results After the sequential treatment with left DLPFC ITBS combined with right DLPFC LF-rTMS, both first-episode and non-first-episode depression patients showed a decrease in HAMD-17, SDS, and PSQI scores compared to before treatment (all $P < 0.05$). The MMN latency and P300 latency were shortened in both groups after treatment (all $P < 0.05$). Among them, the decline in HAMD-17, SDS, and PSQI scores was more significant in first-episode depression patients compared to non-first-episode depression patients. In the first-episode depression population, there was a positive correlation between changes in PSQI and HAMD after TMS treatment. The results suggest that earlier TMS intervention leads to better therapeutic effects when depression occurs. At the same time, this study provides evidence that the combined treatment of iTBS and LF-rTMS can improve brain neurophysiological indicators

Conclusion This rTMS stimulation protocol can effectively improve sleep and depression status in individuals with depressive disorders. The improvement trend is more significant in individuals with first-episode depression, and there is a correlation between the degree of sleep improvement and the degree of depression improvement. rTMS can significantly improve advanced brain function electrophysiological indicators related to automatic processing and active control processing, suggesting that rTMS may have a plastic effect on the brain, maintaining dynamic stability and balance of brain function

Acknowledgments: This work was supported by STI 2030—Major Projects+2022ZD0208500。

Therapeutic Effect of Escitalopram Oxalate on Functional Gastrointestinal Disease in The Elderly

Qiao Tang*

West China Hospital of Sichuan University

Objective Functional Gastrointestinal Disorder is a kind of functional disease which can not be explained by organic disease. There are more and more evidence suggests that the disorders of gut-brain axis are related to it, and the variety and abundance of intestinal microbes are also closely related to it. Previous studies have shown that psychiatric drugs may be effective in the treatment of this disorder. In view of this, a randomized, single-blind, controlled study was conducted to investigate the effect of escitalopram oxalate on the improvement of clinical symptoms in elderly patients with functional gastrointestinal disorder. At the same time, the intestinal microbes were analyzed to explore whether the changes of variety and abundance of microbes are consistent with the changes of clinical symptoms

Methods A total of 83 subjects were recruited. General demographic data, anxiety and depression scales scores, and gastrointestinal symptom scales scores of the subjects were collected during enrollment, and stool samples were obtained. All patients were treated with routine drugs of gastroenterology, while the patients in the experimental group were also treated with escitalopram oxalate 10 mg/d for 12 weeks. At the end of Week 12, anxiety and depression scales and gastrointestinal symptom scales were re-evaluation. At the end of 12 weeks, stool samples were obtained again. Two stool specimens were analyzed by 16S Amplicon Sequencing

Results There was no statistically significant difference in the general demographic data and symptom scale scores of the subjects. After 12 weeks of treatment, both the experimental group and the control group showed significant improvement, and the improvement in the experimental group was more significant than that in the control group, with a statistically significant difference

The results of 16S Amplicon Sequencing analysis showed that the variety and abundance of intestinal microbes increased both in the experimental group and the

control group after the treatment. The results were statistically different ($p < 0.05$). Significant changes were observed in four genera and two species in the experimental group. Among them, the abundance of *Blutia*, *Eubacterium-hallii*-group, *Prevotellaceae-UCG-003*, *Streptococcus-salivarius* and *Parabacteroides-merdae* decreased and the abundance of *Butyricoccus* increased.

The correlation analysis showed that the abundance of *Butyricoccus* was negatively correlated with the scores of 3 scales. The abundance of the other 4 kinds of microbes was positively correlated with the scores of 3 scales. The results of bivariate logistic regression analysis showed that the abundance of *Butyricoccus* had regression relationship with the scores of Gastrointestinal Symptom Rating Scale and Zung Self-Rating Depression Scale. The P values were 0.006 and 0.026 respectively.

Conclusion In this study, a randomized controlled intervention trial showed that adding escitalopram oxalate tablets on the basis of symptomatic treatment had a more significant clinical effect on the treatment of functional gastrointestinal disorder in the elderly than symptomatic treatment alone. After 12 weeks of treatment, the variety and abundance of the intestinal microbes changed significantly, and the increased abundance of *Butyricoccus* was closely related to the improvement of clinical symptoms

非自杀性自伤群体生理疼痛和社会疼痛研究进展

魏义承 杜江*

上海市精神卫生中心

目的 非自杀性自伤(Non-Suicidal Self-Injury, NSSI)是指个体在没有自杀意图的情况下,故意对身体组织进行破坏的行为(Nock, 2010),其主要目的是通过疼痛或流血来缓解情绪上的痛苦或压力(Liu et

al., 2022)。尽管已有诸多研究关注 NSSI 发生机制、影响因素和干预措施(Qu et al., 2023), 但从生理和社会疼痛加工异常的角度关注 NSSI 群体仍有不足, 因此本综述拟回顾当前 NSSI 群体生理和社会疼痛的研究进展, 以期制定科学的预防和治疗策略提供依据(Kao et al., 2024)。

方法 本综述采用文献分析法, 回顾了关注 NSSI 生理疼痛和社会疼痛的实证研究, 总结出 NSSI 群体在这两方面的研究进展。

结果 NSSI 群体在生理上的疼痛敏感性更低(Lalouni et al., 2022)。来自行为学的证据表明, NSSI 组在热痛刺激和压力痛刺激下都表现出更高的疼痛阈值和疼痛耐受。来自神经机制的证据表明, NSSI 组在热痛刺激下, 相比 HC 在初级感觉皮层(S1)和次级感觉皮层(S2)表现出更高程度的激活。来自纵向数据的证据表明, 在 1 年的时间里, 疼痛阈值的降低与 NSSI 的减少有关(Kao et al., 2024)。

NSSI 群体可能经历更多的社会排斥, 同时也对社会疼痛更加敏感(Cheek et al., 2020)。来自日记法的研究表明, NSSI 组相对对照组, 在经历社交压力源后报告了更强烈的痛苦体验(Haliczer & Dixon-Gordon, 2023)。来自神经机制的证据表明, NSSI 群体在考察社会疼痛的经典范式赛博传球任务中(Cyberball), NSSI 青少年比对照组表现出更高的腹侧前扣带回(vACC)激活, 这提示了 NSSI 青少年对社会排斥的反应更高(Brown et al., 2017)。

有研究者认为, 两类疼痛在敏感性上存在相耦合的模式, 即对生理疼痛更敏感的个体在社会排斥中也报告更多的社会疼痛(Eisenberger et al., 2006)。但是基于健康群体得到的两类疼痛的关系, 不一定适用于 NSSI 群体。在 NSSI 群体中梳理和探索两类疼痛的加工机制尤为重要。

结论 相比健康群体, NSSI 群体的生理疼痛敏感性更低, 社会疼痛敏感性更高。在健康群体中, 两类疼痛敏感性存在耦合关系, 但 NSSI 群体存在潜在的失耦合模式, 这种异常模式可能是与症状相关的特异性表现。未来研究应同时纳入生理疼痛和社会疼痛范式, 揭示 NSSI 群体在两类疼痛加工过程中的神经基础, 最终为心理和物理干预的有效性提供支持。

基于单细胞核 RNA 测序解析海洛因成瘾大鼠边缘下皮层转录变化

王雨婷 周老师*
宁波大学

目的 海洛因是一种强效的合成阿片类药物, 会作用于呼吸中枢神经元上的 μ 阿片受体引起呼吸抑制。近二十年来, 美国因吸食海洛因致死的人数超 47 万。根据《2023 年中国毒情形势报告》, 滥用海洛因人数高达 30.5 万名, 是我国滥用率最高的阿片类毒品。然而, 由于海洛因成瘾分子机制复杂以及脑区网络多样, 因此对海洛因成瘾关键靶点基因的全基因组关联研究仍有待完善。本实验通过建立海洛因自身给药成瘾大鼠模型, 将成瘾大鼠与空白组大鼠边缘下前额叶皮层(infralimbic cortex, IL)的转录组进行对比, 揭示海洛因成瘾行为的分子机制, 为药物成瘾的靶点研究提供理论基础。

方法

1)、海洛因自身给药模型的建立

成年雄性 SD 大鼠(280g-320g)进行海洛因自身给药训练 14 天后, 形成稳定的强迫性觅药行为后, 同时使用生理盐水训练另一批大鼠作为对照。

2)、单细胞核 RNA 测序(snRNA-seq)实验

将海洛因自身给药大鼠与盐水训练大鼠最后一次训练结束后取 IL 近行基于 10×Genomics 平台的 snRNA-seq, 使用 fastp、UMI-tools 进行数据质控和建库。

3)、数据分析

Seurat 进行数据矩阵的筛选和 UMAP 非线性降维聚类; 通过人工注释根据已知标记基因鉴定细胞类型。对海洛因自身给药和盐水进行差异基因分析以揭示模型转录特征。GO、KEGG 富集分析评价行为学差异涉及的特定功能改变。差异表达基因的蛋白质-蛋白质相互作用网络(PPI)构建发现关键基因网络。

结果

海洛因自身给药大鼠 IL 出现细胞类型特异性转录变化。其改变主要集中于兴奋性神经元(Excitatory)中。Excitatory 特异性 DEGs 功能富集结果显示海洛因自身给药诱导中枢神经系统突触的损伤以及神经元自噬。对神经元细胞转录反应进一步研究神经元细胞中下调的 DEGs 包括即早表达基

因 (IEGs), 如 Fos 和 Arc。PPI 构建发现 Excitatory 中关键基因为 Ptk2b, Dusp1 和 Dusp6。

结论 本研究发现海洛因自身给药主要通过介导神经突触可塑性改变进行强迫性觅药行为。随后找寻出关键基因, 为药物成瘾提供新靶点。

注意力缺陷/多动障碍的不同治疗模式: 一项随机对照试验的 Meta 分析

姚旭东 刘芳*

成都市第四人民医院

目的 注意缺陷多动障碍 (ADHD) 是一种常见的神经发育障碍以多动/冲动的症状为特征, 注意力不集中, 或两者兼而有之。近年来, 基于大脑可塑性的特点, 国内外学者日益关注重视药物联合执行功能康复对 ADHD 儿童进行培训, 以实现有针对性的干预神经缺陷。ADHD 可以通过药物和非药物治疗方法来缓解症状和功能损害。兴奋剂和非兴奋剂药物治疗可以迅速改善 ADHD 症状, 但即便是长期使用药物, 社会功能和学习能力也不会显著提高。因此, ADHD 的非药物治疗, 包括物理治疗、行为干预、社交技能培训, 以及认知行为疗法等, 已经引起了相当大的关注。目前, 国内外仍有许多关于多动症治疗方法的争论。本研究旨在通过对近年的相关研究进行系统回顾, 以探讨目前最有效的治疗 ADHD 的方法。

方法 对于 2010 年 1 月 1 日至 2021 年 1 月, 发表在 PUBMED、EMBASE、WOS, 和 Cochrane 图书馆数据库中, 针对多动症的药物与非药物治疗研究进行系统综述。

结果 在 ADHD 的分析中共纳入 12 项研究。药物治疗与安慰剂的联合疗效比较为 $SMD=-6.84, 95\%CI (-10.48, -3.21)$ 。根据哌甲酯与哌甲酯联合其他疗法治疗多动症的亚组分析, 发现在多动/冲动亚型中, 哌甲酯联合其他疗法治疗多动症优于单独用药 ($SMD=-2.02, 95\%CI, -3.61-0.43; I^2=37\%$)。它揭示了药物治疗和物理治疗两组之间没有显著差异 ($SMD=-7.41, 95\%CI, -16.31-1.48; I^2=95\%$)。

结论 多动症儿童需要多模式治疗, 在药物治

疗的同时, 应提供心理健康教育, 并根据特定功能和行为的治疗目标, 结合采取非药物干预措施, 以促进儿童社会功能的全面恢复。

赌博障碍患者冲动特征与赌博严重程度相关性探索 ——基于 SST 的一项研究

吴成聪¹ 吴成聪³ 黄书才¹ 杜江² 钟刚亮² 魏涵宇² 刘静洋² 薛超²

1.首都医科大学附属北京安定医院芜湖医院(芜湖市第四人民医院)

2.上海市精神卫生中心

3.蚌埠医科大学

目的 赌博障碍是指个体由于环境和遗传因素导致反复和持续性的赌博模式。随着互联网的发展, 线上赌博日益严重, DSM-5 也首次将赌博障碍归为成瘾性疾病。作为一种成瘾行为, 冲动特质是导致患者赌博行为发生、发展、以及影响预后的关键行为。既往研究发现赌博障碍与高冲动特质相关, 但是冲动特质及状态, 以及冲动的不同维度与赌博障碍之间的关系尚缺乏深入探讨, 本研究针对上述问题开展进一步研究, 以期验证冲动性的两个方面(冲动特质和冲动运动反应)是否可以共同预测 GD 组的赌博严重程度。

方法 本研究从某自愿戒赌中心纳入 77 名寻求治疗的 GD 患者和社会招募 32 名健康对照, 参与者完成了赌博严重程度的评估: 中国版赌博筛查表 (SOGS)、赌博症状评估量表 (G-SAS)、耶鲁布朗强迫症量表 (PG-YBOCS-C); 冲动特质: 巴瑞特冲动性人格问卷第 11 版 (BIS-11); 冲动运动反应采用停止信号反应任务 (SST) 进行评估。

结果 根据 DSM-5 诊断条目把 GD 组 (a) 分为轻中度组 (满足 4-7 条) 和重度组 (满足 8-9 条) 与健康对照组 (HC) 组比较。结果显示, 在冲动特质方面, 轻中度组和重度组比 HC 组表现的更强, 强弱顺序为: 重度组 (①) > 轻中度组 (②) > 对照组 (b), 且差异有统计学意义 ($P_{ab} < 0.001, P_{①②} = 0.005, P_{①②b} < 0.001$); 在冲动运动反应方面, GD 组的 go 试次和 target 试次反应时比 HC 组短的多, 冲动运动反应更强, 抑制能力更弱 ($P = 0.015$,

$P=0.015$), 但是 GD 组的两个分组并未发现此种结果($P=0.205$)。在 GD 组中发现了不同冲动性之间的关联, 冲动特质与冲动运动反应成显著负相关($P<0.01$), 其中冲动特质(非计划冲动)对赌博严重程度(G-SAS; PG-YBOCS-C)有预测作用($P=0.016$, $P=0.006$)。

结论 研究证实了冲动性的不同纬度与赌博严重程度有关, 并且在临床样本中, 冲动特质可以预测赌博严重程度。未来的研究可以通过针对冲动性的某方面治疗改善赌博症状的有效性进而证明冲动性对赌博严重冲动的影

关键词: 赌博严重程度, 冲动性, 停止信号任务

精神科 1 例马德龙病病例报告并文献回顾

黄明阳^{1,2} 曹文韬^{1,2} 陈晓明^{1,2}

1. 咸宁医学院附属第二医院

2. 湖北科技学院附属第二医院

目的 介绍马德龙病的诊疗

方法 结合我院收治的一例病例, 及国内外各项数据研究, 详细描述马德龙病的临床症状、诊断和治疗过程。

结果 马德龙病在中年男性中普遍存在; 其中绝大多数均有长期酗酒史, 典型的临床表现以及 CT、MRI 等辅助检查较易诊断此病; 手术治疗效果理想

结论 全面了解马德龙病的发病机制和临床管理。

内容:

马德龙病是一种罕见的脂肪代谢障碍性疾病, 其特征是面部和颈部、躯干和上肢皮下脂肪组织弥漫性、对称性沉积; 特征表现: 颈部外观类似 "马颈圈"; 患者常因颈部、躯干畸形影响美观来就诊, 病情持续进展可导致活动受限、压迫气道以致呼吸困难, 甚至窒息。中年男性更容易患上这种疾病, 大多数患者都有酗酒史。

患者, 男, 55 岁, 身高 175cm, 体重 75kg; 因 "长期饮酒后出现乱语、行为异常、情绪不稳 10 年余" 入院; 患者饮酒史二十余年, 患者发现上肢、躯干、颈部出现肿物一年, 因尚未影响个人生活, 无痛, 便未行特殊处理。院外表现饮酒后明显乱语, 行为冲动、怪异, 眠差, 拿刀恐吓家人, 不能自控饮

酒, 入院查体: 患者双上肢上臂内侧、腹部、耳后、颈前可见对称性肿物, 质软有弹性, 边界尚清, 无明显压痛, 皮肤表面无异常分泌物。患者双上肢 MRI 可见: 双上肢弥漫性脂肪堆积, 结合患者酗酒病史及查体情况, 住院诊断: 1. 酒精所致的精神和行为障碍 2. 酒精依赖综合征 3. 马德龙病; 患者多部位组织肿物因患者未感不适, 暂不影响个人生活, 对于马德龙病未予特殊处理, 住院期间予以戒酒, 并使用奥氮平抗精神病药物治疗并联合心理治疗及物理治疗。

马德龙病目前发病原因仍不明确, 几乎所有的患者都存在长期的酗酒史。本例患者曾长期过度饮酒, 已经有二十多年的酗酒史。

目前马德龙病的诊断和治疗的意见基本一致, 这种疾病通常很容易诊断, 除特殊的症状和体征之外, 病史、B 超、CT 和针吸细胞学的检测也可以帮助进一步确诊。

由于马德龙病的恶变率低、复发率高, 而且多发性对称性脂肪瘤缺乏完整的包膜, 经常沿着周围组织结构的间隙生长, 因此要完全切除相当困难。因此, 手术切除并不需要全部切除, 主要目的是改善外观。

综上, 马德龙病虽然在生活当中比较罕见, 发病机制不明确, 常因颈部及躯干的外形改变或影响个人生活就诊。临床医生通过了解病史、进行体格检查和辅助检查不难诊断此病。该病容易并发其他躯体疾病, 极少发生恶变, 无明显症状或不影响个人生活可暂不予以特殊处理, 常见治疗手段为手术治疗; 结果往往与手术的精确度和酒精摄入量直接相关。减肥和控制饮食很少会产生大的影响。戒酒有助于延缓病程, 降低复发几率。

Two-hour Nicotine Withdrawal Improves Inhibitory Control Dysfunction in Male Smokers: Evidence From A Smoking-cued Go/No-go Task ERP Study

Lou Hou¹, Jing Zhang², Zhenhe Zhou¹

1. The Affiliated Wuxi Mental Health Center of Nanjing Medical University

2.Huaian Third People's Hospita

Purpose Nicotine withdrawal is a multifaceted physiological and psychological process that can induce a spectrum of mood disturbances. Gaining a more nuanced understanding of how pure nicotine withdrawal influences cognitive control functions may provide valuable insights for the enhancement of smoking cessation programs. This study investigated changes in inhibitory control function in smokers after 2-hour nicotine withdrawal using the event-related potential (ERP) technique

Methods 28 nicotine dependence (ND) patients and 28 health controls (HCs) completed a smoking-cued Go/No-go task containing two different types of picture stimuli, smoking-cued and neutral picture stimuli. We analyzed the behavioral and ERP data using a mixed model Repeated Measure Analysis of Variance (ANOVA)

Results No-go trials accuracy rate (ACC) at baseline (time 1) was lower in the ND group compared to HCs with smoking-cued stimuli, and No-go trials ACC after 2-hour nicotine withdrawal (time 2) was not lower in the ND group compared to HCs. When confronted with smoking-cued stimuli, the No-go trials ACC was higher in time 2 than in time 1 in the ND group. For the ERP component, the No-go N2 amplitudes in the ND group with smoking-cued stimuli were lower than that of HCs, whereas after 2-hour nicotine withdrawal, the ND group's No-go N2 amplitudes higher than that at time 1, and did not differ from that of HCs. No-go P3 amplitudes were not significantly different between the two groups

Conclusion Evidenced from ERP data, ND patients have an inhibitory control dysfunction in the face of smoking cues, which is mainly manifested in the early stage of response inhibition rather than in the late stage. Two-hour nicotine withdrawal improves inhibitory control dysfunction in ND patients. The No-go N2 component is an important and sensitive neuroelectrophysiological indicator of inhibitory control function in ND patients

Cognitive Impairment and Association with Hypertension in Male Patients with Alcohol Dependence: A Cross-sectional Study

Wenhao He Xiangjuan Kong Di Mu Zhonghua Su*
Shandong Daizhuang hospital

Objective To explore the differences in Complete Blood Count (CBC) and Comprehensive Metabolic Panel (CMP) indexes between alcohol-dependent (AD) patients and AD patients with hypertension, as well as the correlation between each index and cognitive function, and to find the risk factors leading to hypertension in AD patients

Methods The participants were hospitalized in the Department of Alcohol Dependence, Shandong Daizhuang hospital, China, from January 2024 to June 2024, including 124 AD patients(control group) and 106 AD patients with hypertension (study group). Homocysteine (Hcy), D-dimer(D-D), Folate acid, Cholesterol, hemoglobin (Hb), and Mean Corpuscular Volume (MCV) were measured, all participants were assessed with Montreal Cognitive Assessment (MoCA), and were measured with the Event-related Potential (ERP) evoked by the two-stimulus auditory Oddball paradigm

Results The study group was older than the control group (44.02 ± 10.24 vs. 47.36 ± 8.95 , $p < 0.05$); The drinking duration of the study group was higher than that of the control group [12.5 (8.25, 20) vs. 17 (9.5, 24.25), $p < 0.05$]; The auditory P3b amplitude(P3b-amp) of the study group was lower than that of the control group [$7.32 \pm 4.99 \mu V$ vs. $5.89 \pm 4.21 \mu V$, $p < 0.05$]; The MoCA score of the study group was lower than that of the control group [21 (20, 24) vs. 19.5 (17, 22), $P < 0.01$]; The MCV of the study group was higher than that of the control group ($96.80 \pm 6.95 \text{fl}$ vs. $100.20 \pm 7.48 \text{fl}$, $P < 0.01$). The MoCA score of AD patients was negatively correlated with age, years of drinking, daily smoking amounts and MCV ($P < 0.01$), and positively correlated with education and P3b-amp ($P <$

0.05; $P < 0.01$). P3b-amp was negatively correlated with age and years of drinking ($P < 0.01$; $P < 0.05$); Folate was negatively correlated with Hcy ($P < 0.01$). MCV and MoCA scores were risk factors for hypertension in alcohol dependent patients after adjusting for confounding factors (OR=1.05, $P=0.01$; OR=0.86, $P < 0.01$)

Conclusion AD patients with hypertension have lower MoCA score, P3b-amp, and higher MCV. MCV and MoCA scores are risk factors for hypertension in patients with AD, which can be used as effective clinical indicators for early monitoring

上海市闵行区中小学生学习网络成瘾现状调查分析

张艳欣 许银珠*

上海市闵行区精神卫生中心

目的 调查上海市闵行区青少年网络成瘾现状, 并分析各学段及不同性别青少年的网络成瘾现状。

方法 选取 2023 年 4 月至 5 月上海市闵行区 3 所小学三年级和(或)四年级、1 所初中二年级、1 所高中一年级的学生为研究对象。收集青少年一般资料, 采用中文网络成瘾量表修订版(CIAS-R)比较不同学段、不同性别青少年网络成瘾情况的差异。采用单因素及多因素 Logistic 回归分析青少年网络成瘾的影响因素。

结果 本研究线下共发放问卷 1 284 份, 回收有效问卷 1 044 份, 问卷有效回收率为 81.3%。青少年群体中, 网络依赖总检出率为 5.9% (62/1 044), 网络成瘾总检出率为 2.9% (30/1 044)。其中中小学生的网络依赖检出率为 4.0% (27/672), 网络成瘾检出率为 1.6% (11/672); 中学生的网络依赖检出率为 9.4% (35/372), 网络成瘾检出率为 5.1% (19/372), 小学生网络成瘾程度比较, 差异有统计学意义 ($\chi^2=23.816$, $P < 0.001$); 不同性别青少年网络成瘾程度比较, 差异无统计学意义 ($P > 0.05$)。不同学段及不同性别青少年各自 CIAS-R 总分、“网络成瘾核心症状”分量表得分、“网络成瘾相关问题”分量表得

分及 4 个因子得分比较, 差异均有统计学意义 (均 $P < 0.05$)。小学生群体中, 不同性别青少年网络成瘾程度、CIAS-R 总分、两分量表得分及 4 个因子得分比较, 差异均有统计学意义 (均 $P < 0.05$); 男生群体中, 不同学段青少年 CIAS-R 总分、两分量表得分及 4 个因子得分比较, 差异均有统计学意义 (均 $P < 0.05$); 女生群体中, 不同学段青少年网络成瘾程度、CIAS-R 总分、两分量表得分及 4 个因子得分比较, 差异均有统计学意义 (均 $P < 0.05$)。单因素及多因素 Logistic 回归分析显示, 学段为中学是青少年网络成瘾的危险因素 (OR=2.852, 95%CI=1.842~4.410, $P < 0.001$); 在小学生群体中, 性别为男性是网络成瘾的危险因素 (OR=3.593, 95%CI=1.622~7.956, $P=0.002$); 在女生群体中, 学段为中学是网络成瘾的危险因素 (OR=7.106, 95%CI=3.152~16.023, $P < 0.001$)。

结论 上海市闵行区中小学生学习网络成瘾程度在中学男、女生中水平最高, 其次是小学男生, 小学女生网络成瘾程度水平最低。

关键词: 青少年; 学生; 网络成瘾; CIAS-R; 性别

Genome Variation in Alcohol Use Disorder by Whole-exome Sequencing

Bo Zhang*

Shandong Provincial Hospital Affiliated to Shandong First Medical University

Objective Alcohol use disorder is closely related to genetic and environmental factors. However, the contribution of coding variation to alcohol use disorder susceptibility remains poorly understood. We aimed to identify genetic mutations in alcohol use disorder by whole exon sequencing

Methods

We performed whole exome sequencing in 83 patients with alcohol use disorder and compared it with exome sequences of healthy controls were collected from the 1000 Genomes Project; At the same time, alcohol use disorder patients were grouped and tested in the smoking group versus the non-smoking group; the

relapse group versus the non-relapse group; and the group with brain damage versus the group without brain damage, We also compared whole-exome sequencing data for alcohol use disorder with morphine dependence. GO and KEGG enrichment analysis and protein interaction analysis were performed for the mutated genes in each group. Three online protein function prediction sites were used to predict whether SNPs/InDels cause protein coding changes. Further, we conducted a rare variant exploration.

Results We identified 106,525SNV and 19,826 Indel gene mutations in alcohol use disorder. In the healthy and alcohol use disorder groups, mutations in CNTNAP3, ZNF683, ALDPH2, CCHCR1, ZNF45, and ESRRA loci were found to be deleterious mutations in all three sites; OR4C11 was found to be a potentially deleterious mutation in the relapse and non-relapse groups

Conclusion CNTNAP3, ZNF683, ALDPH2, CCHCR1, ZNF45, ESRRA, OR4C11 may be potential targets for future precision treatment of alcohol use disorders, and further provide new ideas for drug development

神经元 TLR4 激活调节甲基苯丙胺的奖赏与复吸

刘慧珍¹ 周文华² 周文华¹

1. 宁波大学医学部

2. 宁波大学附属康宁医院精神科

目的 探讨神经元 TLR4 激活在甲基苯丙胺 (Methamphetamine, METH) 奖赏和复吸中的调控作用。

方法 建立雄性成年大鼠甲基苯丙胺自身给药的成瘾模型, 将训练成功的 24 只成瘾大鼠随机分为 METH 组、静脉注射 3mg/kgTLR4 抑制剂 TAK242 组、Vehicle 组、内侧前额叶皮层注射 1ug/0.5ul/sideTLR4 抑制剂 TAK242 组。甲基苯丙胺

奖赏效应的测试程序采用 FR1, 训练时长 4 小时。奖赏动机的测试程序采用累进比率 (Progressive ratio, PR), 其通过提高大鼠获得药物的难度来观察奖赏动机和渴求, 即大鼠需要付出呈指数式上升的有效触碰次数才能获得 1 针甲基苯丙胺注射。12 只大鼠在建立稳定的甲基苯丙胺自身给药模型后, 停止训练, 放回饲养笼戒断 14 天, 继而进行消退训练, 消退结束后进行甲基苯丙胺复吸测试。免疫荧光法检测大鼠内侧前额叶皮层 TLR4 的定位及表达量的变化、细胞凋亡、小胶质细胞的激活情况。Western blot 检测内侧前额叶皮层 TLR4 - MyD88 - NFκB 信号通路蛋白分子水平的变化。ELISA 检测血清白细胞介素 (IL) -1β、IL-6、肿瘤坏死因子 α (TNF-α) 的变化。

结果 静脉注射 3mg/kgTLR4 抑制剂 TAK242 显著限制甲基苯丙胺成瘾大鼠的奖赏行为, 但不影响奖赏动机。于内侧前额叶皮层注射 1ug/0.5ul/sideTLR4 抑制剂 TAK242 显著限制甲基苯丙胺成瘾大鼠的奖赏行为。静脉注射 3mg/kgTLR4 抑制剂 TAK242 显著限制甲基苯丙胺成瘾大鼠的复吸行为。甲基苯丙胺成瘾大鼠的内侧前额叶皮层小胶质细胞激活、神经元和小胶质细胞上 TLR4 过表达, 且 TAK242 处理可逆转上述结果。甲基苯丙胺成瘾大鼠的内侧前额叶皮层中 TLR4、MyD88、HMGB1 蛋白表达水平增高, 且 TAK242 处理可逆转上述结果。

结论 甲基苯丙胺成瘾大鼠的内侧前额叶皮层发生神经炎症, 可能由 TLR4-MyD88-NFκB 信号通路调控, 使用 TLR4 抑制剂 TAK242 可限制甲基苯丙胺成瘾大鼠的奖赏和复吸行为、减轻甲基苯丙胺诱导的神经炎症。

关键词: 甲基苯丙胺、TLR4、神经炎症

Exploration of The Role of ELANE in Alcohol Use Disorder

Bo Zhang*

Shandong Provincial Hospital Affiliated to Shandong First Medical University

Objective Alcohol use disorder is a serious public health problem; however, the specific mechanisms

remain unclear. Our previous studies have identified "ELANE" as the Hurb gene in alcohol use disorder. However, its role in the clinical practice of alcohol use disorders has not been confirmed

Methods Ninety patients with alcohol use disorder and 53 healthy controls were recruited. Clinical variables were collected and follow-up was conducted for 12 months for relapse. ELANE protein expression was studied by immunohistochemistry

Results ELANE concentrations were significantly elevated in the alcohol use disorder group than in healthy controls ($P < 0.001$). According to the median value of ELANE expression level in alcohol use disorder group, patients were divided into high ELANE (≥ 2.7651 pg/mL, $n = 46$) and low ELANE groups (< 2.7651 pg/mL, $n = 44$). Binary logistic analysis indicated that SERPINA3 was statistically significant ($P = 0.007$) Kaplan-Meier survival analysis did not indicate any difference in event-free survival between patients with low and high ELANE levels ($P = 0.568$) after 12 months of follow-up. Receiver characteristic curve analysis revealed that ELANE had an area under the curve of 0.8683 ($P < 0.0001$), with a sensitivity and specificity of 65.6% and 92.5%, respectively. Cox regression analysis revealed that Marital status was a negative predictor of relapse ($\beta = -0.661$; hazard ratio = 0.516; $P = 0.038$)

Conclusion ELANE level was remarkably elevated in patients with alcohol use disorder than healthy controls, indicating a potential role of ELANE in the pathogenesis of alcohol use disorder. However, ELANE may not be a potential predictive marker of relapse with patients in alcohol use disorder

关键词: alcohol use disorder, ELANE, relapse biomarkers

The Relationship between Binge Drinking and Incidence of Intentional Injury Events-A Study Based on The Data of Emergency Room

Shuli Xu¹, Chuanjun Zhuo², Qinggang Chen²

1. The First Affiliated Hospital of the Air Force Military Medical University

2. Tianjin Anding Hospital

Objective Investigate the relationship between binge drinking and incidence of intentional injury events

Methods This project is a survey performed per 10 years which sponsored by the National Institute of Alcohol Abuse and Alcoholism (NIAAA) commissioned by the International Health Organization (WHO). Tianjin was selected as the site which to conduct the survey by NIAAA in China. According to the requirements of NIAAA, 521 injured patients in the emergency room was enrolled in the study. WHO handbook for collaborative research on alcohol and injury was adopted to assess subjects' drinking patterns. Logistic regression analysis was used to estimate the association between drinking patterns and the incidence of intentional injury

Results Within 6 hours before injury, the incidence of intentional injury events among 12+ standard drinks each time was 7.61 folds (OR=7.61, CI=3.90-11.86) for induce the intentional injury events, the incidence among the 5-11 standard cup drinks was 3.56 folds (OR=3.56, CI=1.08-6.08). Within the past 12 months, the incidence of intentional injury events among 12+ standard drinks each time was 3.46 folds (OR = 3.46, CI = 2.07-5.78) for induce the intentional injury events, the incidence among the 5-11 standard cup drinks was 2.86 folds (OR= 2.86, CI = 1.68-4.87)

Conclusion The drinking pattern of binge drinking can increase the risk of the incidence of intentional injury

关键词: Paroxysmal binge drinking, drinks, intentional injury, risk factors

Internet Gaming Disorder and Suicidal Behaviors Mediated by Sleep Disturbance: A Large-scale School-based Study in 135,174 Chinese Middle School Students

Pu Peng¹, Zhangming Chen², Yanhui Liao¹

1. Department of Psychiatry, Sir Run Run Shaw Hospital, Zhejiang University School of Medicine, Hangzhou,

Zhejiang, P. R. China

2.Zigong Mental Health Center

Objective Emerging research suggests a positive association between Internet Gaming Disorder (IGD) and suicidal behaviors. However, existing studies predominantly focus on suicidal ideation rather than suicide attempts and often do not adequately control for potential psychological confounders. The mechanism linking IGD to suicidality remains unclear. This study aims to assess the independent association between IGD and suicidal behaviors and to examine the mediating role of sleep disturbances among Chinese adolescents.

Methods We recruited 135,147 middle school students from Zigong city using cluster sampling. Data on demographics, suicidal ideation, and suicide attempts were collected. IGD was assessed using the Internet Gaming Disorder Scale-Short Form. Mental distress, including depression, anxiety, hyperactivity, conduct problems, sleep problems, and psychotic experiences, was evaluated using standardized questionnaires. Multiple logistic regression models and mediation analysis were conducted.

Results The prevalence rates of IGD, suicidal behaviors, suicidal ideation, and suicide attempts were 1.6%, 16.7%, 11.9%, and 9.8%, respectively. Adolescents with IGD showed a significantly higher risk for suicidality: nearly 60% reported suicidal behaviors, 50% reported suicidal ideation, and 40% reported suicide attempts. Both IGD and gaming usage were independently linked to suicidal behaviors. Sleep disturbances partially mediated the relationship between IGD and suicidal behaviors, accounting for 47.0% of the total effect

Conclusion IGD is closely associated with suicidal behaviors, with sleep disturbances mediating this relationship. Timely and regular assessments for suicidality and sleep disturbances are vital in IGD cases. Targeted interventions addressing sleep disturbances might reduce suicidal risk among adolescents with IGD

关键词: Internet gaming disorder, suicidal behavior, sleep disturbance, adolescents

男性冲动特质与心理渴求的相关关系及对酒依赖复发的预测作用

张顺*

开滦精神卫生中心

目的 探索酒依赖患者的冲动特质和心理渴求相关关系及对复发的预测作用。

方法 2017年8月至2018年2月收集符合DSM-IV酒精依赖诊断标准的男性患者109例。在完成急性戒断期后进行基线测查,包括一般资料、焦虑自评量表(SAS)、抑郁自评量表(SDS)、密歇根酒依赖筛查量表(MAST)、Barratt冲动量表(第十一版)(BIS-11)和饮酒迫切性量表(AUQ)。在基线测查后第三个月进行电话随访。

结果 ①复发率与预测因素:三个月内复发率为65.14%;年龄、教育年限、婚姻状况、MAST、SAS、SDS、BIS-11在复发组和未复发组间差异均无统计学意义($P>0.05$);而AUQ评分对三个月内复发有预测作用($OR=1.05, P=0.047$);②冲动与心理渴求的关系:AUQ评分与BIS-11总分($r=0.30, P<0.01$)、注意冲动评分($r=0.25, P<0.01$)、运动冲动评分($r=0.21, P<0.01$)、无计划冲动评分($r=0.19, P<0.05$)均成正相关关系。

结论 AUQ评分可以作为三个月内复发的预测因素,而冲动特质对复发没有预测作用;酒依赖患者冲动特质(BIS-11评分)与其心理渴求(AUQ评分)成正相关关系。

关键词:酒依赖,复发,心理渴求,冲动特质

A Network Analysis of The Structural and Individual Patterns of Anxiety in Pediatric Patients with NSSI

Chen Chen Jing Li*

west china hospital of sichuan university

Objective Non-suicidal self-injury (NSSI) behavior is correlated with anxiety, which influences and exacerbates self-injurious behaviors in children with NSSI, thereby constituting a significant risk factor for

recurrent episodes. However, the patterns of individual heterogeneity in NSSI within the context of precision medicine remain inadequately understood. The primary objective of this study is to examine the core characteristics of anxiety and the explicit manifestations of anxiety in diverse NSSI patients

Methods We gathered scale results from a sample of 10,781 primary and secondary school students in Chengdu and Karamay, with 10,501 students completing the survey. Participants were categorized into three groups—NSSI (Non-Suicidal Self-Injury), subthreshold NSSI (sNSSI), and healthy—based on the frequency of self-injurious behaviors reported in the past year. Subsequently, a network analysis was performed on the explicit anxiety data of participants exhibiting NSSI and sNSSI symptoms. Based on the measurement results obtained from the Revised Children's Manifest Anxiety Scale (RCMAS), explicit anxiety networks and individual differential anxiety networks were constructed for each group. The findings indicate that the two types of non-suicidal self-injury (NSSI) are associated with distinct core impulsivity traits

Results The overall network strength in patients with Non-Suicidal Self-Injury (NSSI) is significantly higher compared to other groups. Additionally, physiological anxiety, worry or hypersensitivity, and social-related connections exhibit distinct differences from those observed in other cohorts. Based on the impulse network of individual differences, subjects were categorized into three distinct types, each demonstrating deviations from the control group. These three deviation patterns are associated with the type of NSSI, age, education level, and the duration of self-injurious behavior

Conclusion The research findings suggest that individuals exhibiting various types of non-suicidal self-injury (NSSI) demonstrate distinct core anxiety traits. Furthermore, the explicit anxiety patterns of these individuals exhibit specificity. These insights support the potential for improved anxiety management through personalized pharmacological interventions in clinical practice

关键词: NSSI, anxiety, network analysis, clustering.

缅北移交涉诈吸毒人员成瘾及心理特征

王兴民 湛红献*

湘雅二医院

目的 近年来, 缅甸北部地区的电信诈骗活动和毒品问题日益严重, 毒品流通加快, 且可获得性显著增加, 导致许多从事电信诈骗的人员可能接触毒品。随着中国加大对电信诈骗的打击力度, 越来越多的缅北涉诈人员被移交回国, 了解这些人员的毒品成瘾严重程度及其精神心理状态变得尤为重要, 这不仅有助于评估毒品对他们的影响, 还能为制定更有效的政策和预防措施提供坚实依据。

方法 本研究共包括缅北移交涉诈人员 246 人, 其中包括整群抽样的中部某省会城市所有毛发检测呈阳性的涉诈人员 166 人和随机抽样的毛发检测呈阴性的涉诈人员 80 人。所有人员均通过访谈及填写量表的方式完成一般资料采集和心理评估, 采用《精神障碍诊断与统计手册》第五版 (DSM-5) 评估受试人员是否达到“物质使用障碍”和“反社会型人格障碍”的诊断标准; 采用患者健康问卷-9 (PHQ-9) 对抑郁情绪进行评估; 采用广泛性焦虑量表 (GAD-7) 对焦虑情绪进行评估; 采用匹兹堡睡眠质量指数量表 (PSQI) 评估睡眠质量; 采用社会支持问卷 (SSRS) 评估社会支持水平; 采用冲动量表 (BIS-11) 测量冲动特质; 最后使用创伤后应激障碍筛查量表 (PCL-5) 来对涉诈人员进行创伤后应激障碍的筛查。

结果 涉诈吸毒人员以文化程度较低的年轻男性为主, 与入缅前不同, 该群人员在国内吸食最多的毒品类型是冰毒麻古, 在缅期间则是氯胺酮的比例最大, 其中约 50% 在缅期间规律吸毒, 40% 达到了物质使用障碍的疾病诊断标准, 且吸毒涉诈人员的反社会型人格障碍占比显著高于非吸毒涉诈人员 ($p < 0.01$)。与非吸毒涉诈人员相比, 吸毒涉诈人员在缅时间更长、在缅收入更高, 且留守和服刑经历更多。在情绪、睡眠等心理状态上, 吸毒涉诈人员在缅期间的抑郁量表 (PHQ-9) 和焦虑量表 (GAD-7) 的得分均显著低于非吸毒人员的得分 ($p < 0.001$)。在缅期间, 吸毒涉诈人员在睡眠质量指数量表 (PSQI) 的得分显著低于非吸毒组 ($p < 0.001$)。吸毒涉诈人员的社会支持问卷 (SSRS) 总分明显高于非吸毒组, 尤其是在客观支持上 ($p < 0.001$)。在创伤后应激障碍症状上, 非吸毒组的 PCL-5 总分显著高于吸毒组

($p < 0.01$)。

结论 在缅时间长、留守经历及既往有过违法犯罪经历是导致涉诈人员吸毒行为发生的高危因素。涉诈人员均面临着较多的精神心理问题，如焦虑、抑郁、创伤后应激障碍和反社会人格障碍等，尤其需要关注非吸毒涉诈人群的抑郁、焦虑、创伤后应激障碍、睡眠障碍和社会支持；注意对吸毒涉诈人群反社会人格障碍及毒品成瘾的筛查与诊治。

Efficacy and Safety of Prophylactic Use of Benzhexol after Risperidone Treatment in MK-801-induced Model Mice

Yongjie Zhong*

Chaohu Hospital affiliated to Anhui Medical University

Objective The purpose of this experiment is to explore efficacy and safety of prophylactic use of benzhexol after risperidone treatment and the mechanism in the process

Methods C57/BL mice were randomly divided into 4 groups ($n=8$): control group MK-801 group, MK-801+ Ris group, MK-801+ Ris + Ben group. Three groups of mice with schizophrenia model were intraperitoneally administered 0.5mg/kg dose of MK-801 once a day for two weeks. Open field test (OFT) and new object recognition test (NORT) were carried out after injection. The two groups of mice were treated with risperidone (3mg/kg) and risperidone (3mg/kg) + benzhexol (10mg/kg) once a day for four weeks. After the treatment, the inclined screen test (IST), rotarod test (RT), open field test (OFT), new object recognition test (NORT) and morris water maze test (MWM) were conducted successively. The expression of BDNF, p-Tau and Tau in hippocampus was detected by Western blot assay

Results Benzhexol could significantly attenuated risperidone-induced motor coordination impairments. Benzhexol increased the time in bars of risperi-

done-treated MK-801 mice in the Rotarod test. Benzhexol significantly shorten the latency time of Ris+Ben group in the inclined screen test. Prophylactic use of benzhexol did not affect the total distance of the risperidone threated mice in the open field test. In the Morris water maze test and the novel object recognition test, the prophylactic use of benzhexol reduced the spatial learning memory and discrimination ratio of novel objects in MK-801-induced model mice after risperidone. Benzhexol impairs cognitive function in risperidone threated MK-801-induced model mice by increasing the ratio of p-Tau/Tau and decreasing BDNF expression levels in the hippocampus

Conclusion In this study, we found that prophylactic use of benzhexol can reduce the occurrence of EPS and does not affect the efficacy of risperidone in the treatment of positive symptoms. Benzhexol may impaired cognitive function by increasing the ratio of p-Tau/Tau and decreasing the expression of BDNF in hippocampus, but the use of benzhexol and risperidone did not cause further deterioration of cognitive function in MK-801 mice

In conclusion, This study suggests that prophylactic use of benzhexol is beneficial to patients. In order to prevent the deterioration of the patient's cognitive function, it is necessary to monitor the patient's cognitive function during the use of benzhexol.

青少年非自杀性自伤成瘾的心理机制：焦虑-动机网络分析

徐佳淇¹ 徐佳淇² 徐佳军^{1,2} 李静^{1,2}

1. 四川大学华西医院

2. 四川大学

目的 近年来，非自杀性自伤 (non-suicidal self-injury, NSSI) 行为在青少年中大量涌现，已成为严重的公共精神卫生问题。习惯性、重复性的自伤行为被认为具有成瘾特征；然而，并非所有重复自伤

的患者都展现出成瘾倾向。另一方面,焦虑症状在NSSI青少年中广泛存在,是驱动自伤的主要诱因之一。本研究旨在探讨成瘾性与非成瘾性NSSI青少年之间,焦虑症状与自伤功能构成的焦虑-动机网络是否存在差异,以揭示自伤成瘾的潜在心理机制。

方法 本研究采用横断面设计,在成都和克拉玛依的10-18岁青少年中展开问卷调查。使用蓄意自我伤害清单、渥太华自伤量表和儿童焦虑表现量表分别评估青少年的自伤情况、成瘾特征及焦虑水平。数据分析采用偏相关网络分析和网络间比较。

结果 共10,479人完成调查,其中22.8% (n=2,393)报告过去一年中至少发生过一次NSSI,2.5% (n=261)报告具有成瘾特征的NSSI行为。与非成瘾组相比,成瘾组表现出更高的焦虑水平和自伤动机。在NSSI成瘾组青少年的焦虑-动机网络中,寻求快感和社交相关顾虑起到重要的桥梁及中介作用,网络的平均可预测性为0.55;而在非成瘾组中,内/外部情绪调节动机与过度敏感起到桥梁作用,网络的平均可预测性为0.63。对两组网络的节点中心性进行比较,非成瘾组的各症状节点强度均低于成瘾组。

结论 本研究首次揭示了成瘾性和非成瘾性NSSI青少年中焦虑-动机网络的差异,为理解自伤成瘾的潜在心理机制提供了新的视角,并为临床干预提供了实证依据。研究结果显示,成瘾性NSSI青少年更倾向于通过自伤寻求快感和应对社交相关压力,而非成瘾性NSSI青少年主要通过自伤来调节情绪。这一发现提示,临床干预策略应针对不同类型的NSSI青少年制定个性化方案。

精神疾病的脑电标记及精准电刺激干预研究进展

田竞 陈天真 江海峰*
上海市精神卫生中心

目前对于精神疾病的诊疗评估多依靠临床医师的主观判断,为寻求更敏感稳健的手段,近年对于脑电这一生物标记的研究逐步深入,发现其在诊断、疾病分型、干预等方面的重要潜力。另一方面,经颅

电刺激等神经调控技术基于脑电标记形成的个体化精准调控方案也开辟了新的治疗方向。为此,本综述拟回顾近十年来各种精神心理疾病的脑电生物标记主要进展,并分析相应的优化电刺激调控策略。脑电通常指神经元在一定条件下的周期、节律性放电经由头皮表面记录到的神经振荡信号,通过分析可以进一步了解大脑内部神经生理活动。已有研究发现脑电生物特征能表征基本大脑功能、精神疾病易感性及其严重程度等临床特征。如频谱特征 γ 振荡被认为与专注和记忆等高级大脑功能有关,许多研究认为其反映兴奋性谷氨酸能神经元和抑制性 γ -氨基丁酸能中间神经元的相互作用,基于此的研究发现 γ 振荡具有区分抑郁症患者与正常人的潜能。而基于相干性和锁相值(PLV)进行的相位同步性分析是反映脑功能连接常用的方法,其利用不同脑区的脑电信号在特定频段相位差的一致性来衡量脑区同步性。各种精神疾病中均发现不同类型功能连接异常,尤其对于精神分裂症患者的诊断、分型等的研究展现出巨大的临床价值。

脑部电刺激包括经颅直流电刺激(tDCS)和经颅交流电刺激(tACS),通过在头皮上放置电极施加直流或正弦交流电影响神经细胞的活动,能够产生改善局部脑血流、诱导突触可塑性改变和调节神经递质等延迟效应;而tACS还可能通过神经夹带作用调节内源性神经振荡进而影响大脑功能状态。电刺激疗效可以被脑电生物指标敏感捕捉,如失匹配负波(MMN)为精神分裂症的推定生物标志物之一,在一项随机对照临床实验中发现阳极额叶tDCS提高的认知任务表现与MMN振幅的提高存在显著相关。与传统刺激模式不同,近年来基于患者脑电生理活动进一步开发精准调控方案展现了更强的治疗潜力。如基于阿尔兹海默病患者异常 γ 振荡的楔前叶tACS家庭治疗策略已被证实可改善认知能力、提高伽马振荡并增强功能连接性。

然而,脑电作为精神疾病生物标记的可靠性和稳健性仍有待完善,经颅电刺激的原理机制也尚未完全明了,尽管存在许多研究得出了乐观的结果,但也有一些不同结果。其原因可能有很多,如:不同疾病涉及相同的电生理活动过程、同一疾病涉及多种电生理过程杂糅、疾病的EEG特征改变无法通过现有的技术手段进行完整细分等。因此脑电及电刺激技术想要走上临床正式应用还需进行大量研究探索进行验证。

治疗

酒精戒断综合征新技术应用及多层次治疗

原伟* 李瑞华

山东省精神卫生中心

目的 酒精戒断综合征是酒精依赖患者突然停药或减量后出现的一系列神经、精神症状，严重者（如酒精戒断性癫痫，震颤谵妄）可能危及生命。本文旨在探索酒精戒断综合征新技术应用及不同严重程度酒精戒断综合征治疗方法。

方法 通过检索国内医学期刊数据库“万方、中国知网”，国外医学期刊数据库“Pubmed、Web of Science、Science Direct”，对酒精戒断综合征治疗进行文献复习。在临床实践中逐步形成输液泵控制下地西洋静脉点滴给药、右美托咪定静脉泵入两大治疗新技术。通过对年龄、饮酒史、躯体状况、既往酒精戒断表现、当前酒精戒断症状 5 个方面，对酒精戒断综合征患者进行风险及严重程度评估，采用不同治疗方式治疗酒精戒断综合征。

结果 对于单纯性酒精戒断反应，宜采用口服地西洋或奥沙西洋替代治疗。对于既往曾发生过酒精戒断性癫痫或震颤谵妄的患者，可考虑采用输液泵控制下地西洋静脉点滴给药预防严重酒精戒断综合征。对于已经出现震颤谵妄的患者，宜采用输液泵控制下地西洋静脉点滴给药控制震颤谵妄，严重者可合并采用右美托咪定静脉泵入辅助镇静，改善震颤谵妄；同时可联合使用氟哌啶醇注射液改善激越状态及精神病性症状。静脉给药（地西洋、右美托咪定）时需进行心电监测及血氧饱和度监测，特别关注患者呼吸、血压、血氧饱和度变化情况。

结论 根据酒精戒断综合征不同症状表现及风险及严重程度评估结果，对酒精戒断综合征患者应采用不同治疗方案尽快控制症状，预防震颤谵妄的发生，或尽早改善震颤谵妄症状。

关键词：酒精戒断综合征；替代治疗；地西洋；震颤谵妄；右美托咪定

Characteristics and Influencing Factors of

Non-suicidal Self-injury (NSSI) Behaviors in Adolescents

Mengyi Shen Leping Huang* Meimei Jiang Yuxin
Huang Yang Liu Jianxing Chen Junmei Li
Shanghai Hongkou Mental Health Center

Objective To identify the characteristics and influencing factors of non-suicidal self-injury (NSSI) behaviors in adolescents

Background Non-suicidal self-injury (NSSI) is garnering increasing attention due to its high prevalence and strong association with suicide. A comprehensive understanding of the individual and household characteristics related to NSSI is essential for effective prevention and intervention strategies.

Methods Forty adolescents with NSSI and their parents were recruited by convenience sampling from outpatients of Shanghai Hongkou Mental Health Center. NSSI behaviors of the adolescents, anxiety symptoms and depressive symptoms of both the adolescents and parents as well as family functions were evaluated

Results The peak onset of first NSSI centered at age of 13 (24%) and 16 (20%), corresponding to the first and last year of secondary school. Majority of the adolescents with NSSI were female (92%), and attended key secondary school (72%). Approximately 60% of them ranked in the upper 50% at school examinations, with 28% in the upper 25%. Privately performed NSSI was reported by 88% of adolescent, with punching objects (76%) and self-cutting with a knife (68%) being the most common methods. The primary reasons for NSSI were “because it feels good” (88%) and “to relief stress” (76%). All adolescents with NSSI experienced depression and anxiety, with 50% exhibiting severe depression and 55% experiencing severe anxiety. The frequency of NSSI in the last month was significantly associated with depression severity. Additionally, both adolescent depression and anxiety correlated with overall family functioning and specific subscales related to family roles. Adolescent depression was also linked to family problem-solving abilities

Conclusion Our study revealed a critical role of

family function and affective mental health in the involvement of NSSI. Additionally, academic pressure emerges as a potential risk factor for NSSI. Therefore, effective strategies to manage stress and negative emotions, coupled with a supportive family environment might be essential to preventing and mitigating NSSI

酒精相关认知障碍诊疗进展

邢笑萌* 田璐 程永莹 祁娜
首都医科大学附属北京安定医院

目的 酒精相关认知障碍在酒依赖患者中极为常见, 尽管它会给治疗效果带来负面影响, 但在临床中常未能得到充分诊疗。本文旨在调查关于酒精相关认知障碍的最新理论模型、测评工具和干预方法。

方法 对国内外近十年发表的酒精相关认知障碍领域的文献进行复习。

结果 在过去 10 年中成瘾的双重过程理论模型逐步完善, 关注冲动系统和控制系统之间的相互作用, 神经生物学理论也开始强调前额叶皮质区在觅药行为中的作用及与中脑系统间的相互作用。研究较多的认知领域包括注意偏向、执行功能和工作记忆。除常规的自我报告问卷、神经心理功能评估量表外, 脑电图、磁共振功能成像、眼动追踪技术也被用于相关研究。相关的认知训练可分为认知偏差修正和抑制控制训练、工作记忆干预两大类。基于虚拟现实技术的严肃游戏比传统的计算机认知训练更有助于训练效果的远转移。在药物干预方面, 维生素 B1、哌甲酯、美金刚产生了统计学上显著的认知改善。但维生素 B1 治疗剂量和持续时间的数据仍然不足, 也缺少对哌甲酯、美金刚治疗效果的复制。经颅直流电刺激与认知训练的联合使用是有效的, 但效果的持续时间仍需做进一步研究。当前关于酒精相关认知障碍的研究多存在异质性强、样本量少、干预特异性低的局限。

结论 目前已有初步的研究证明酒精相关认知障碍可以通过相应干预得到改善, 进而延长禁欲时间或减少饮酒量, 但该领域研究尚不充分, 需要基

于有前景的策略(如数字干预、维生素 B1)做进一步探索。

Sociodemographic and Environmental Correlates of Climate Change Anxiety in Shanghai

Ruihua Li¹, Chuanning Huang², Beier Guan², Jiang Du², Min Zhao², Shuyan Liu³

1. Shandong Mental Health Center

2. Shanghai Mental Health Center

3. Charité – Universitätsmedizin Berlin (Campus Charité Mitte)

Objective Climate change anxiety (CCA) is a global concern, extensively studied in Western countries. Yet, there remains a lack of research on how social and environmental factors influence CCA, particularly in large cities from non-Western countries like China. This study aims to investigate the CCA level among general population in Shanghai and its Sociodemographic and environmental correlates

Methods We conducted an anonymous online survey with 1817 adults in Shanghai, using the climate change anxiety scale (CCAS) to measure CCA. In addition, we assessed their sociodemographic characteristics and acquired air quality data on particulate matter (PM_{2.5}) from the Shanghai Municipal Bureau of Ecology and Environment. We analyzed the distribution of CCAS and PM_{2.5} across Shanghai's 16 districts and constructed multivariate multiple linear model to examine the effect of PM_{2.5} on CCAS

Results We found that 16.6% of participants reported experiencing CCA more often than “sometimes”, with 18.1% and 18.6% reporting cognitive-emotional impairment and functional impairment, respectively, at a frequency higher than “sometimes”. The multivariate multiple linear model revealed that increased PM_{2.5} levels was associated with heightened cognitive emotional impairment ($b = 0.0078$, 95% CI: 0.001, 0.01) and functional impairment ($b = 0.01$, 95% CI: 0.003, 0.017).

Moreover, being male, having fewer years of education, low income, and residing in an urban area were associated with an increase in both cognitive-emotional and functional impairments

Conclusion A significant proportion of participants in Shanghai reported frequent CCA. Elevated PM2.5 concentration and sociodemographic factors were correlated with an increase CCA. Therefore, efforts to address CCA should consider social and environmental factors

关键词: Cognitive-emotional impairment, Functional impairment, Eco-anxiety, Social and environmental factors, Air quality

青少年网络和现实社会联结对网络使用问题与焦虑的影响：一项横断面研究

徐佳淇^{1,2} 徐佳军^{1,2} 李静^{1,2}

1.四川大学华西医院

2.四川大学

目的 本研究旨在探索中国青少年中现实社会联结和网络社交联结在问题性网络使用(problematic internet use, PIU)与焦虑之间的作用。我们假设现实社会联结对于减轻PIU青少年的焦虑具有更大影响,相比于网络社会联结。

方法 本横断面研究从2022年9月至2023年3月,在中国福建、江苏、四川和新疆的四个省份进行。采用Young网络成瘾量表(IAT-20)、修订版社交联系量表(SCS-R)、DSM-5-TR Level-2焦虑量表进行测量。数据分析采用SPSS 26.0进行基本特征描述、回归和相关分析,使用Mplus 8.0进行结构方程模型(SEM)分析。

结果 在调查中,共有9,407名中国青少年参与,平均年龄为14.90岁,其中21.8%存在PIU,25.0%表现出临床显著焦虑。多变量逻辑回归分析显示性别、居住地、父母教育水平、网络社会联结和现实社会联结与焦虑显著相关。斯皮尔曼相关分析显示网络使用问题与焦虑呈正相关,现实社会联结和网络社会联结分别与网络使用问题和焦虑呈负相关。SEM显示现实社会联结和网络社会联结在PIU与焦虑之间的显著中介作用,其中现实社会联结占总效

应的29.1%,网络社会联结占1.8%。

结论 PIU严重程度正向预测青少年的焦虑症状,而增加的社交亲密性对PIU青少年起到保护作用。进一步的,网络虚拟世界的社会联结尽管也带来了保护作用,但现实社交联结的中介效应占比更大。本研究强调了增强现实社交联结,即现实社会的社交亲密性,对于在互联网时代避免青少年过度网络使用导致病理性焦虑表现的重要意义。

Plasma Exosomes in Methamphetamine Addicts During Acute Withdrawal Induce Anxiety and Depression-like Symptoms in Mice

Yanhui Liao* Yehong Fang

Sir Run Run Shaw Hospital, Zhejiang University School of Medicine

Objective Methamphetamine (MA) addiction is a complex brain disease with a high relapse rate due to the underlying mechanism remains largely elusive. Recently, exosomes are involved in the pathophysiology of neuropsychiatric diseases, but the role of exosomes in MA is unclear. The aim of this study was to investigate the pathomechanism of MA addiction and withdrawal through plasma-derived exosomes

Methods A combination of approaches was employed. Animal behavior assays, neuron and glial cell co-culture systems, and immunofluorescence staining were utilized

Results The transplantation of plasma exosomes in MA addicts during acute withdrawal induced anxiety and depression-like behavior in mice. In addition, in vitro experiments validate exosome treatment changed neuronal morphology with dendrite branch number and length were reduced and induced astrogliosis and an A1-like reactive astrocyte phenotype. The following proteomic analysis in MA addicts undergoing withdrawal, revealed differential expressed proteins involved in immunity and inflammation. Of these, amyloid A-1 (SAA1) and amyloid A-2 (SAA2) were upregulated in

acute withdrawal (AW) stage but rapidly declined in protracted withdrawal (PW) stage, compared to healthy controls (HCs). Further experiments verified the key role of SAA1 and SAA2 in inducing anxiety and depression-like behavior, astrogliosis and neurotoxic

Conclusion This study may provide a potential animal model and further understanding of the pathogenic mechanisms of withdrawal symptoms for MA

关键词: Methamphetamine, Withdrawal; Exosomes, SAA1

耶鲁-布朗赌博强迫量表的汉化及信效度检验

范东篱² 张茜媛³ 钟刚亮¹ 杜江³

1.上海交通大学

2.阜阳市第三人民医院

3.上海市精神卫生中心

目的 关注赌博行为的强迫特征及准确评估赌博障碍的严重程度对赌博障碍群体的早期干预尤为重要,但目前仍缺乏切合于中国大陆的中文版耶鲁-布朗赌博强迫量表。本研究旨在对这一他评工具进行汉化修订并检验其在中国赌博障碍患者中的信度和效度。

方法 本研究对耶鲁-布朗赌博强迫量表进行标准化的翻译和文化适应,包括翻译、回译、专家评审及预试验,形成中文版耶鲁-布朗赌博强迫量表(PG-YBOCS-C)。研究选取符合 DSM-5 赌博障碍诊断标准的 116 名上海市精神卫生中心及某戒赌中心的赌博障碍患者作为研究对象,以 Barratt 冲动性人格量表(BIS-11)、中文版自我控制量表(SCS)及赌博渴求程度量表(VAS)作为效标工具,并进行探索性因子分析及信度分析。2 周后,共有 55 位患者完成了量表重测。

结果 修订后的 PG-YBOCS-C 共有 10 个条目,项目分析结果显示 PG-YBOCS-C 的区分度良好,能够有效地区分患者的症状严重程度。Kaiser-Meyer-Olkin (KMO) 与 Bartlett 球形检验结果显示 KMO=0.93, Bartlett 球形检验统计值 $X^2=1123.86$, $P=0.000<0.01$,说明 PG-YBOCS-C 适合进行因子分析。探索性因子分析得出一个主成分因子,可解释总方差的 72.8%,表明 PG-YBOCS-C 具有稳定的单

因子结构。同时效标效度结果表明 PG-YBOCS-C 总分与冲动水平($r=0.31$, $p<0.001$)和赌博渴求程度($r=0.38$, $p<0.001$)均呈显著正相关,与自我控制能力($r=-0.32$, $p<0.001$)呈显著负相关。信度分析结果显示 PG-YBOCS-C 的 Cronbach's α 系数是 0.965,量表具有极高的内部一致性;重测信度为 0.722,量表在跨时间维度上稳定性高。

结论 本研究结果表明 PG-YBOCS-C 具有良好的信效度,可作为评估中国赌博障碍患者症状严重程度的可靠他评工具。

虚拟现实结合眼动追踪及动作捕捉技术在酒精使用障碍的应用研究

陈明 邓红都 张俊俊 王超军 李佳祯 王世林 王传升*

新乡医学院第二附属医院

目的 本研究将虚拟现实(virtual reality,VR)技术与眼动追踪测量和动作捕捉记录结合,在进行 VR 暴露疗法的过程中,实时评估酒精使用障碍(alcohol use disorder,AUD)患者酒精相关的注意偏差及渴求严重程度,探究该技术能否便捷准确地反映 AUD 患者的心理状态,构建治疗与评估一体化的综合应用体系。

方法 选取新乡医学院第二附属医院精神五科住院治疗的 AUD 患者 49 例,采用随机数字表法将其分为患者治疗组 27 例和患者对照组 22 例,并招募本院或附近工厂的健康男性职工 30 名为健康对照组。试验借助 HTC VIVE Focus3 头戴式 VR 设备(内置眼动追踪程序)及 Noitom Hi5 动作捕捉手套进行,所有受试者均进行基线检测,采集在酒精线索相关 VR 环境下的眼动追踪数据(主要包括关注酒精线索及非酒精线索的总用时及总次数)和动作捕捉记录(酒精线索物品和非酒精线索物品拾取的总时长及总次数)。患者对照组仅接受常规临床治疗,治疗组在常规临床治疗基础上另加 8 次基于 VR 的线索暴露治疗,每次 10 分钟,每周 2 次(间隔 2 日),为期 4 周,患者组完成所有治疗后再接受同前述基线一致的检测。

结果 3组间差异使用方差分析比较眼动/动作捕捉数据和VAS、PACS评分,结果显示患者对照组($P<0.05$)和患者治疗组($P<0.05$)的初次酒精线索关注时间、次数比率均显著大于健康对照组,说明在酒精线索相关VR环境下,患者组呈现出更明显的关于酒精线索的注意偏向和饮酒渴求;患者对照组与治疗组的各项数据均无显著差异($P>0.05$)。使用配对样本T检验比较两患者组治疗前后各项数据差异,结果显示患者治疗组治疗前后PACS评分($P<0.05$)、VAS评分($P<0.05$)均降低,患者对照组所有数据前后两次评估均无差异($P>0.05$);使用独立样本T检验比较治疗前后各项数据差值,结果显示患者治疗组的PACS评分差值差值($P<0.05$)、VAS评分差值($P<0.05$)、酒精线索关注时间比率差值($P<0.05$)(初次-末次)均显著大于对照组,说明VR暴露治疗能有效降低患者的主观渴求感,同时也能降低其对酒精线索注意偏向的程度。

结论 虚拟现实结合眼动追踪及动作捕捉技术有助于高效便捷地反映AUD患者的渴求相关临床特征,有潜力构建实用性强、易于推广的治疗评综体系。

关键词:酒精使用障碍;虚拟现实;眼动追踪;动作捕捉

重复经颅磁刺激的精准干预:突触可塑性效应、双靶点及闭环调控

赵伟 苏杭 赵敏*

上海市精神卫生中心

目的 重复经颅磁刺激(rTMS)作为突触可塑性效应的非侵入性调节手段,其在认知和神经精神疾病治疗中的潜力受到广泛关注。本综述重点探讨了rTMS诱导长时程增强(LTP)和长时程抑制(LTD)效应的影响因素,以及双靶点rTMS和闭环神经调控的干预效果。

方法 LTP和LTD作为神经突触连接强度变化的生物学基础,对学习和记忆的重要性。传统上,低频rTMS用于诱导LTD样效应,而高频rTMS用于诱导LTP样效应。然而,实际研究显示这一效应可能受到刺激频率、强度、时间间隔、刺激部位、持续时间、个体差异、状态依赖性和闭环干预等多种因

素的影响。

结果 NMDA受体和mGlu5受体在LTP和LTD的诱导中发挥关键作用,而CaMKII激活则在LTP和LTD诱导中具有双重功能,既可以增强也可以减弱突触连接。精确控制rTMS参数,包括频率、强度、时间间隔、刺激部位和持续时间,对于优化LTP和LTD样效应的产生至关重要。

在双靶点rTMS的刺激条件下,我们讨论了刺激时序、协同性以及神经解剖连接对LTP和LTD效应的影响。双靶点rTMS通过同时或顺序刺激大脑两个不同区域,可能影响皮层间的相互作用和网络连接性。适当的时序和协同性对于增强rTMS效果至关重要,而个体差异和大脑网络特性在个性化治疗方案中起着核心作用。

此外,我们强调了闭环干预方案的重要性,这是一种根据实时大脑活动或行为反馈调整刺激参数的策略,以提高治疗效果和减少副作用。闭环干预通过个性化和精确性、提高效率、增强治疗效果、适应性和灵活性,以及减少刺激治疗次数和副作用,提供了一种新的治疗模式。

结论 我们强调,通过精确控制rTMS参数,特别是双靶点rTMS的时序和协同性;而个性化和闭环干预则依赖于敏感和特异性的生物标志物。未来的研究需要进一步探索双靶点rTMS的刺激脑区以及最佳干预方案,以及如何结合多模态的生物标志物实现个体化、精准的闭环神经调控。

关键词:长时程增强;长时程抑制;重复经颅磁刺激;双靶点刺激;突触可塑性;闭环干预

伴或不伴烟草依赖的酒精使用障碍患者急性戒断期特征

史云凤¹ 李瑞华² 张艺³ 原伟²

- 1.烟台市莱州荣军医院
- 2.山东省精神卫生中心
- 3.上海市精神卫生中心

目的 部分酒精使用障碍患者同时合并烟草依赖。本研究旨在探讨伴或不伴烟草依赖的酒精使用障碍患者急性戒断期临床特征。

方法 本研究纳入符合DSM-5中酒精使用障碍诊断标准的住院患者。收集患者性别、年龄、受教

育年限、近 1 个月饮酒量、戒酒次数等一般资料。在酒精戒断急性期使用宾夕法尼亚酒精渴求量表 (PACS)、尼古丁依赖检验量表 (FTND)、贝克抑郁问卷 (BDI-21)、贝克焦虑问卷 (BAI)、匹兹堡睡眠质量指数 (PSQI) 评估工具评估酒精使用障碍患者的饮酒心理渴求、抑郁情绪、焦虑情绪、睡眠质量。根据 FTND 值分为伴烟草依赖组 (FTND \geq 4) 及不伴烟草依赖组 (FTND $<$ 4)。运用 SPSS (27.0.1) 软件进行统计学分析,探讨两组患者急性戒断期临床特征差异。

结果 40 例患者中, 18 例 (45%) 伴烟草依赖。所有患者均为男性。伴烟草依赖组平均年龄 40.72 ± 8.74 岁, 不伴烟草依赖组平均年龄 44.09 ± 10.0 岁, 无显著性差异 ($p > 0.05$)。两组患者受教育年限相仿 (12.72 ± 4.50 年 VS 12.09 ± 3.89 年, $p > 0.05$)。伴烟草依赖组近一个月饮酒量较不伴烟草依赖组更大 (5679.17 ± 3505.86 g VS 3720.45 ± 2276.73 g, $p = 0.04$)。伴烟草依赖组与不伴有烟草依赖组患者在戒酒次数 (2.67 ± 1.78 次 VS 1.95 ± 0.899 次)、饮酒渴求 (11.00 ± 5.03 分 VS 10.45 ± 6.32 分)、抑郁情绪 (9.72 ± 6.76 分 VS 8.91 ± 6.47 分)、焦虑情绪 (30.56 ± 3.96 分 VS 28.95 ± 3.46 分)、睡眠质量 (9.33 ± 2.79 分 VS 9.50 ± 2.57 分) 方面无显著性差异 (p 均 > 0.05)。

结论 伴有烟草依赖的酒精使用障碍患者饮酒量可能更高。尽管伴烟草依赖的酒精使用障碍患者戒酒次数、饮酒渴求、抑郁、焦虑等评分高于不伴烟草依赖者, 但本研究未见显著性差异。

关键词: 酒精使用障碍, 烟草依赖, 渴求, 临床特征

双相障碍患者中分离症状的发生率及相关因素

许蕙雪¹ 李泽钧¹ 伍敏¹ 杨倩² 刘铁桥¹

1. 中南大学湘雅二医院

2. 中山市人民医院

目的 越来越多的研究发现分离症状 (Dissociation symptom, DS) 在双相障碍 (Bipolar disorder, BD) 患者中非常常见。然而, 对于我国 BD 患者中 DS 的发生率和临床相关性仍知之甚少。本

研究旨在初步探索 BD 患者中 DS 的发生率及相关因素。

方法 通过方便抽样的方法从湘雅二医院精神科门诊及病房招募符合《美国精神障碍诊断和统计手册 (第五版)》BD 诊断标准的患者, 以线上问卷调查及线下访谈的方式进行研究。我们调查了患者的 DS、抑郁症状、焦虑症状、躁狂发作次数及严重程度、精神病性症状、童年创伤经历、边缘型人格特质、自杀风险、生活质量和人口学等特征。采用独立样本 T 检验、曼-惠特尼秩和检验、卡方检验、斯皮尔曼相关性分析、单因素回归分析、多重线性回归分析对数据进行统计分析。

结果 本研究共招募 BD 患者 517 人, 有效率 85.30%, 发现: ① BD 患者中 DS 的发生率为 53.50% (236/441), 伴 DS 的患者多见于女性、学生、未婚、住院患者, 具有更严重的临床症状 (抑郁症状、躁狂症状、焦虑症状、精神病性症状), 更高的自杀风险, 更可能具有童年创伤经历、边缘型人格特质和更差的生活质量等特征; ② 相关分析显示, DS 与抑郁症状、焦虑症状、躁狂症状、精神病性症状、边缘型人格特质、自杀风险、童年创伤经历均呈正相关 (P 均 < 0.001); 与生活质量呈负相关 (P 均 < 0.001); ③ 回归分析发现, 抑郁症状 ($\beta = 0.173$, 95% CI = 0.069-0.277, $P = 0.002$)、躁狂症状 ($\beta = 0.117$, 95% CI = 0.021-0.213, $P = 0.013$)、精神病性症状 ($\beta = 0.131$, 95% CI = 0.029-0.233, $P = 0.003$)、童年创伤经历 ($\beta = 0.114$, 95% CI = 0.075-0.153, $P = 0.01$) 和边缘型人格特质 ($\beta = 0.198$, 95% CI = -0.102-0.498, $P < 0.001$) 对 DS 的影响具有统计学意义。

结论 本研究作为第一个在国内 BD 群体中探索 DS 发生率及相关因素的研究, 得出以下结论 1. BD 患者中 DS 的发生率高; 2. BD 患者 DS 的程度越严重, 临床表现的抑郁症状、焦虑症状、躁狂症状及精神病性症状更严重、有更高的自杀风险、更多的童年创伤经历、更强的边缘型人格特质和更差的生活质量; 3. 抑郁症状、躁狂症状、精神病性症状、童年创伤经历和边缘型人格特质是 BD 患者中 DS 的独立危险因素。

预防酒精成瘾复发的药物治疗研究进展

陈瑶 周旭辉*
湖南省脑科医院

酒精成瘾问题日益突出, 不仅严重损害了人们的身体健康, 还破坏了家庭的和谐以及社会的安宁。预防复发是酒精成瘾治疗的重点与难点, 治疗措施主要包括心理社会干预和药物治疗。本文主要基于药理作用、临床循证、药物副反应、适应人群等方面系统阐述酒精成瘾预防复发的药物治疗策略。讨论的药物包括现代医学中适应症用药的双硫仑、纳曲酮(口服和缓释注射制剂)和阿坎酸, 超说明书范围用药的托吡酯、纳美芬、加巴喷丁和哌唑嗪, 传统医学中的单药葛根、贯叶连翘、常山和马钱子以及方剂黄连温胆汤和安神方。总结了两种药物的联合疗法和心理治疗与药物治疗的联合疗法, 此外本文还提供最新的临床指南作为指导, 说明在哪些情况下使用哪种药物。总结: 本文回顾的数据支持使用纳曲酮来降低酗酒的风险和减少大量饮酒, 使用阿坎酸来维持戒酒, 而双硫仑适用于有戒酒动机的患者, 不是那些以减少酒精摄入为目标的患者。对于超说明书使用的药物而言, 在治疗酒精成瘾方面有一定的效果, 但是因其副作用或其疗效一般的原因, 并不推荐它们作为酒精成瘾患者的一线用药。目前具有戒酒功效的单味中药的戒酒疗效也并不明确, 中药复方仍然是现今运用于酒精成瘾研究的重点。总体而言, 本综述中讨论的药物显示了临床有效性和对未来酒精成瘾治疗的希望。重要的是, 这些药物也为异质性的酒瘾人群提供了个性化的治疗方案。

决策风格在青少年抑郁、焦虑情绪对笑气成瘾影响中的中介效应分析

吴成聪^{1,2} 李慧^{1,2} 黄书才¹

1. 芜湖市第四人民医院

2. 蚌埠医科大学

目的 “笑气”学名一氧化二氮(Nitrous Oxide)。近些年来, “笑气”等替代毒品物质滥用现象逐渐引起我国社会关注。吸食“笑气”损害个体的神经系统, 甚至还会引发个体的精神症状, 对身心健康危害极

大。“笑气”虽在禁毒实践层面列为毒品, 但因其价低、易得和难以检测的特征在青少年中流行率较高。本研究想要探索青少年抑郁、焦虑情绪对笑气成瘾的影响并检验决策风格在其中的中介作用。

方法 本研究采用随机抽样的方法在线上发放问卷, 回收有效问卷 979 份。采用一般情况问卷、一般决策风格量表(GDMS)、广泛焦虑障碍量表(GAD-7)和抑郁自评量表(PHQ-9)进行调查, 使用 SPSS 26.0 进行统计描述、单因素 χ^2 检验、二元 Logistic 回归分析和中介效应分析。

结果 979 名青少年网友中, 吸食笑气占 5.72%, 知晓笑气的为 67.52%。二元 logistics 回归分析可知, 学历、恋爱经历、吸烟情况以及出入酒店和 KTV 的频率是吸食笑气的影响因素。其中小学学历 OR 值 7.681, 恋爱对象有过社会人士 OR 值 4.689, 吸烟 OR 值 3.941; 焦虑水平和决策风格总分和五种风格类型(理智型、逃避型、依赖型、冲动型和直觉型)都呈现显著正相关(P 值均 <0.05), 抑郁水平和决策风格总分以及五种风格类型都呈现显著负相关(P 值均 <0.05)。中介分析显示, 逃避型(效应值=0.043, 95%CL:0.021~0.068)、依赖型(效应值=0.048, 95%CL:0.027~0.076)、冲动型(效应值=0.035, 95%CL:0.018~0.058)和直觉型(效应值=0.051, 95%CL:0.025~0.085)决策风格在抑郁情绪对笑气成瘾影响中起部分中介作用。理智型(效应值=-0.044, 95%CL:-0.071~-0.022)决策风格在焦虑情绪对笑气成瘾影响中起部分中介作用。

结论 抑郁、焦虑情绪对笑气成瘾有负面影响, 且这种影响一部分会通过影响决策风格进而影响笑气成瘾。

关键词: 笑气成瘾, 决策风格, 抑郁, 焦虑, 青少年

Cortical Activation and Functional Connectivity During The Verbal Fluency Tasks in Individuals with Methamphetamine Use Disorder in Withdrawal: A Multichannel Near-Infrared Spectroscopy Study

Huiting Luo¹, Huiting Luo², Dan Luo², Dan Luo¹, Jiajun Xu¹, Jiajun Xu², Jing Li^{1,2}

1. West China Hospital of Sichuan University

2. Mental Health Center, West China Hospital

Objective The globally abused illicit drug Methamphetamine (MA) causes significant physical and psychological harm to its users and places a substantial burden on healthcare systems. Research indicates that individuals with Methamphetamine Use Disorder (MUD) exhibit impaired executive functions, which are often associated with poor treatment outcomes. Poor executive function performance is related to damage or dysfunction in the frontal cortex. This study aims to investigate the impairment of executive functions and the associated cortical hemodynamic changes in individuals with MUD through the combination of verbal fluency tasks and functional near-infrared spectroscopy (fNIRS) technology, providing a basis for the diagnosis and treatment of MUD patients.

Methods This study recruited MUD patients and demographically matched healthy controls (HCs) from Chengdu Compulsory Drug Rehabilitation Center, the Mental Health Center of West China Hospital of Sichuan University, and the community. Based on inclusion and exclusion criteria and data quality control, 111 MUD patients and 51 healthy controls were included. Clinical characteristics were assessed using the Visual Analog Scale for craving (VASc). Other clinical self-report scales included the Alcohol Use Disorders Identification Test (AUDIT), the Fagerstrom Test for Nicotine Dependence (FTND), the Beck Depression Inventory (BDI), the Beck Anxiety Inventory (BAI), the Social Support Rating Scale (SSRS), the Chinese Perceived Stress Scale (CPSS), and the Pittsburgh Sleep Quality Index (PSQI). After completing the clinical characteristic assessments, all participants underwent behavioral data recording and functional near-infrared brain imaging data collection during the Verbal Fluency Task (VFT). The collected data were then processed and statistically analyzed to explore the differences in oxyhemoglobin (HbO) concentration changes and functional connectivity matrices in the frontal and temporal cortices during the VFT between groups, as well as their relationships with clinical characteristics and task-related behavioral performance.

Results 1. Analysis of Differences in Demographic and Clinical Data Between Groups: Compared

to HCs, MUD patients had significantly fewer years of education, a higher proportion of smokers, and greater perceived stress.

2. Analysis of Differences in VFT Performance and Related fNIRS Data Between Groups: Compared to HCs, MUD patients generated significantly fewer words during the VFT. In channels (CH) involving the frontal pole of the prefrontal cortex (CH6, CH7, CH8, CH10, CH11), the triangular part of the inferior frontal gyrus (CH22), the pre-motor cortex and supplementary motor cortex (CH38), the dorsolateral prefrontal cortex (CH23, CH24, CH26, CH27, CH30, CH40), and the frontal eye field (CH41), MUD patients showed significantly lower changes in oxyhemoglobin (HbO) concentration, indicating decreased activation. The functional connectivity matrix revealed that MUD patients had significantly higher connectivity strength between CH5-CH20 (triangular part of the inferior frontal gyrus - primary motor cortex). All these results were statistically significant after FDR correction.

3. Correlation Analysis Between VFT Performance and Differential Brain Regions: After controlling for smoking status, years of education, and CPSS scores, partial correlation and stepwise regression analyses of the changes in HbO concentration in the 14 differential channels with word generation during VFT revealed that greater changes in HbO concentration in CH38 were significantly associated with higher word generation.

Conclusion 1. MUD patients began using MA at an earlier age, reflecting a trend of younger initiation in the MA-using population, which warrants attention.

2. MUD patients exhibited poorer behavioral performance on the Verbal Fluency Task (VFT), along with reduced activation in brain regions such as the dorsolateral prefrontal cortex and abnormal functional connectivity between the triangular part of the inferior frontal gyrus and the primary motor cortex. These findings suggest impairments in verbal processing functions.

3. Additionally, this study found that activation in channels primarily located in the pre-motor cortex and supplementary motor cortex was correlated with behavioral performance, providing evidence for the use of fNIRS technology as a more sensitive method to detect

executive function impairments.

The Associations between Social Support, Depressive Symptoms, and New Psychoactive Substance Use Among Men Who Have Sex with Men: A Cross-sectional Mediation Study

Xin Liu¹, Shu Jing¹, Zhenwei Dai², You Xin¹, Xiaoyou Su¹

1.Peking Union Medical College

2.Peking University Sixth Hospital, Peking University Institute of Mental Health, NHC Key Laboratory of Mental Health (Peking University), National Clinical Research Center for Mental Disorders (Peking University Sixth Hospital), Beijing, China

Objective The use of new psychoactive substances (NPS) is very common among men who have sex with men (MSM) and represents a maladaptive coping strategy for dealing with stress and integrating into their community. This study aims to explore the prevalence and determinants of NPS use among MSM in China and to investigate the potential mediating effects of mental health between perceived social support and NPS use. It provides data support for the development of targeted intervention measures to reduce NPS use among MSM in China

Methods This study recruited MSM and sent an online questionnaire via the Blued App from March 17 to May 28, 2023. The questionnaire includes the social demographic characteristics, psychoactive substance use characteristics, the Center for Epidemiologic Studies Depression Scale (CES-D), and the perceived Social Support Scale (PSSS). Univariable and multivariable logistic regression were conducted to explore the influencing factors of NPS use. Mediation analysis was performed to assess the potential mechanisms between social support and NPS use

Results A total of 686 MSM were included in this study, with 28.9% of participants reporting the use of NPS. The most frequently used NPS was Rush Popper, followed by Capsules Zero, sedatives, hypnotics, and anxiolytics, amphetamine synthesis substances, and hallucinogens. The study identified several factors associated with NPS use among MSM, including student status, high income, depressive symptoms, HIV positivity, multiple sexual partners, and history of PrEP use. Mediation analysis showed that depressive symptoms fully mediated the relationship between social support and NPS use

Conclusion NPS use is prevalent among MSM in China, underscoring the necessity for improved awareness of the health risks associated with NPS use, particularly regarding mental health impacts and its increased risks on HIV infection. Targeted educational and publicity strategies should be adopted among those MSM NPS users. Furthermore, it is crucial for policymakers and community organizations to actively engage in creating a more supportive social environment to bolster their social networks and improve their mental health well-being. This comprehensive strategy will be promising to reduce NPS use, promote safer sexual behaviors, and decrease the risk of HIV infection among MSM

White Matter Neural Substrates in Alcoholism with Genic Risk and Their Role in Pathological Reward Process

Fei Wu*

Peking university sixth hospital

Objective Significant evidence of brain white matter (WM) microstructural and network connectome abnormalities have been revealed in alcohol dependence (AD). We aim to explore the neuroimaging characteristics of AD with high genic risk and the role of these

changes in pathological craving

Methods The study recruited 51 patients for AD, 21 patients with family history positive (FHP), 30 patients with family history negative (FHN), and 25 healthy controls (HC). We compared fractional anisotropy (FA) and mean diffusivity (MD) of striatal circuits and topological properties of reward system between the three groups. Then covariates of alcohol use characteristics were controlled between FHP and FHN. In addition, whether genic load neural organization abnormalities were associated with self-reported craving were explored in AD

Results We found abnormal WM microstructural of striatal circuits and topological properties of hippocampus in AD with FHP compared to HC. After controlling covariates of alcohol use characteristics, there was still disruptions of topology organization in FHP compared to FHN, such as lower nodal betweenness, nodal degree and higher shortest path of right hippocampus. The nodal topological properties of right hippocampus were significantly correlated with self-reported craving in AD

Conclusion We provide robust evidence for WM neural abnormalities in AD with high genic risk. We also found the disrupted topological properties of the right hippocampus associated with craving level

关键词: Alcohol dependence; Reward system; Genic risk; white matter microstructure; Topological organization

Intervention and Mechanism of Anhedonia in Depression Based on Intermittent Theta Burst Transcranial Magnetic Stimulation

Jiang Wu Hongmei Yan* Li Pu Jing Zhang Xinyuan Cheng Guojian Yan

The Clinical Hospital of Chengdu Brain Science Institute, MOE Key Laboratory for Neuroinformation, School of Life Science and Technology, University of Electronic Science and Technology of China, Chengdu, 611731, China

Objective Major depressive disorder (MDD) is a prevalent psychiatric disorder with core symptoms including low mood, anhedonia, and cognitive slowing. Anhedonia has been identified as a key endophenotypes of depression, linked to dysfunction within reward-related neural circuits. Intermittent Theta Burst Stimulation (iTBS) has the advantages of shortening the duration of treatment and improving the utilization of clinical instruments. Therefore, this study aims to investigate the effect of iTBS on patients with depression and anhedonia

Methods Twenty-five patients diagnosed with depression and anhedonia, according to the International Classification of Diseases (ICD-10) criteria for mental and behavioral disorders, were recruited for a study. All patients were treated with Escitalopram oxalate alone in addition to iTBS in the left dorsolateral prefrontal (L-DLPFC) (treatment regimen: 100% resting motor threshold, stimulation target on the L-DLPFC, and single stimulation number of 1800). Patients were treated twice daily (The interval between two treatments was set at 54 minutes.) and completed a total of 10 sessions (5 days/week). In addition, clinical symptoms, behavioral and electroencephalogram (EEG) assessments were performed on the baseline, fifth and tenth day of treatment. The clinical assessments included the Snaith-Hamilton Pleasure Scale (SHAPS), Hamilton Anxiety Rating Scale (HAMA-14), Hamilton Depression Rating Scale (HAMD-17), Self-rating Depression Scale (SDS) and Self-rating Anxiety Scale (SAS). Additionally, behavioral and EEG data were collected using the Money Delay Incentive (MID) paradigm

Results In terms of clinical symptom intervention, the scores of HAMD-17, HAMA-14, SDS, SAS and SHAPS were significantly decreased after treatment compared with baseline ($P < 0.05$). Regarding the behavioral experiment, with the increase of regulation days, the response time of patients under different rewards continuously decreased, and the accuracy rate continuously increased. In MID task EEG, a negative correlation was observed between the average amplitude difference of CNV component before and after regulation and Δ HAMD-17, which was significant in both no reward and big reward conditions ($P < 0.05$). Furthermore,

the average amplitude difference of Cue-P3 component before and after regulation positively correlated with Δ SHAPS, and this correlation was significant in conditions with small reward

Conclusion The findings indicate that the proposed iTBS treatment protocol effectively mitigates the clinical symptoms of depression and anhedonia among patients. This provides valuable insight into the potential mechanism underlying the response to iTBS in patients with depression and anhedonia

Cortical Activation and Functional Connectivity During The Stroop Color Word Task in Individuals with Methamphetamine Use Disorder in Withdrawal: A Multichannel Near-Infrared Spectroscopy Study

Huiting Luo^{1,2}, Dan Luo^{1,2}, Qiao Tang^{1,2}, Jiajun Xu^{1,2}, Jing Li^{1,2}

1. West China Hospital of Sichuan University

2. Mental Health Center, West China Hospital

Objective Methamphetamine (MA), widely abused globally, is one of the most prevalent and harmful illicit drugs in China, causing significant physical and psychological damage. Research indicates that individuals with Methamphetamine Use Disorder (MUD) experience impaired inhibitory control. Studies have linked the addiction of MA to weakened inhibitory control functions, highlighting the critical role of inhibitory control in treatment outcomes and preventing relapse. This study aims to investigate the impairment of inhibitory control functions in MUD patients and the associated cortical hemodynamic changes using a combination of the Stroop Color Word Task and functional near-infrared spectroscopy (fNIRS) technology, providing a basis for the diagnosis and treatment of MUD patients.

Methods This study recruited MUD patients and demographically matched healthy controls (HCs) from Chengdu Compulsory Drug Rehabilitation Center, the Mental Health Center of West China Hospital of Sichuan University, and the community. Based on inclusion and exclusion criteria and data quality control, 111 MUD patients and 51 healthy controls were included. Clinical characteristics were assessed using the Visual Analog Scale for craving (VASc). Other clinical self-report scales included the Alcohol Use Disorders Identification Test (AUDIT), the Fagerstrom Test for Nicotine Dependence (FTND), the Beck Depression Inventory (BDI), the Beck Anxiety Inventory (BAI), the Social Support Rating Scale (SSRS), the Chinese Perceived Stress Scale (CPSS), and the Pittsburgh Sleep Quality Index (PSQI). After completing the clinical characteristic assessments, all participants underwent behavioral data recording and functional near-infrared brain imaging data collection during the Stroop Color Word Task (STROOP). The collected data were then processed and statistically analyzed to explore the differences in oxyhemoglobin (HbO) concentration changes and functional connectivity matrices in the frontal and temporal cortices during the STROOP between groups, as well as their relationships with clinical characteristics and task-related behavioral performance.

Results 1. Analysis of Differences in Demographic and Clinical Data Between Groups: Compared to HCs, MUD patients showed statistically significant differences with lower levels of education, a higher proportion of smokers, and greater perceived stress.

2. Analysis of Differences in STROOP Performance and Related fNIRS Data Between Groups: Compared to HCs, there was no statistically significant difference in behavioral performance related to the STROOP task among MUD patients. However, MUD patients exhibited smaller changes in oxyhemoglobin (HbO) concentration in 17 channels (CH) primarily located in the frontal pole of the prefrontal cortex (CH6), middle temporal gyrus (CH13, CH15), superior temporal gyrus (CH16), triangular part of the inferior frontal gyrus (CH12, CH22, CH29, CH31), dorsolateral prefrontal cortex (CH23, CH26, CH27, CH28, CH30,

CH32, CH40, CH43), and frontal eye field (CH44). Additionally, weaker functional connectivity was observed between CH2-CH29 (superior temporal gyrus - triangular part of the inferior frontal gyrus), CH4-CH8 (dorsolateral prefrontal cortex - frontal pole of the prefrontal cortex), and CH4-CH29 (dorsolateral prefrontal cortex - triangular part of the inferior frontal gyrus), which are primarily located in the dorsolateral prefrontal cortex and triangular part of the inferior frontal gyrus. All these results were statistically significant after false discovery rate (FDR) correction.

Conclusion In the Stroop Color Word Task, no significant differences were found in behavioral performance among MUD patients, possibly indicating partial recovery of inhibitory control abilities in patients who have been abstinent for a longer period. However, during withdrawal, MUD patients still exhibit impaired activation primarily in the dorsolateral prefrontal cortex and weakened functional connectivity in this region.

- 2.上海市重性精神病重点实验室
- 3.安徽省阜阳市第三人民医院

目的 本研究旨在对赌博症状评估量表 (Gambling Symptom Assessment Scale, G-SAS) 进行汉化, 并验证其中文版在我国赌博障碍患者中的信效度。

方法 根据使用 Brislin 翻译模型对量表进行翻译与回译, 经过跨文化调试、预调查后最终形成中文版 G-SAS。2023 年 9 月至 2024 年 3 月, 采取便利抽样法从上海市精神卫生中心和上海某戒赌中心选取了 121 名符合 DSM-5 赌博障碍诊断标准的赌博障碍患者作为研究对象, 采用一般资料表、G-SAS 中文版、耶鲁-布朗赌博强迫量表(Pathological Gam-

bling Adaptation of the Yale-Brown Obsessive Compulsive Scale, PG-YBOCS)、南橡树赌博筛查量表(South Oaks Gambling Screen, SOGS)等进行资料收集。通过 Cronbach's α 系数进行内部一致性检验, 2 周后复测进行重测信度检验, 采用专家咨询法评价量表的内容效度, 采用探索性因子分析进行结构效度检验, 以 PG-YBOCS 和 SOGS 为校标工具进行校标关联效度检验。

结果 中文版 G-SAS 共 12 个条目, 各条目的 CR 值范围为 4.36~10.73; 量表的 Cronbach's α 系数为 0.926, 重测信度系数为 0.896; 内容效度指数 S-CVI 为 0.960。KMO 值为 0.821, Bartlett 球形检验 $p < 0.01$, 探索性因子分析共提取 2 个因子, 分别为赌博冲动与思想控制和赌博相关的情感体验, 累计方差贡献率为 71.71%。中文版 G-SAS 的得分与 PG-YBOCS 得分呈正相关 ($r = 0.661, p < 0.01$), 与 SOGS 得分的相关性无统计学意义($r = 0.070, p > 0.05$)。

结论 中文版 G-SAS 具有良好的信效度, 可以作为评估我国赌博障碍患者的赌博症状严重程度的有效测量工具。

Prevalence and Risk Factors of Substance Use Behavior Among College Students: A Cross-sectional Survey

Chang Liu^{1,2}, Huan Mei^{1,2}, Na Zeng^{1,2}, Xiaokun Wang^{1,2}, Ziwei Zhang^{1,2}, Shuilin Wu^{1,2}, Xin Chen^{1,2}, Lin Lu^{2,3,4}, Jie Shi², Yanping Bao^{1,2}

- 1.School of Public Health, Peking University, Beijing, China
- 2.National Institute on Drug Dependence, Peking University, Beijing, China
- 3.Peking University Sixth Hospital, Peking University, Beijing, China
- 4.Peking-Tsinghua Centre for Life Sciences and PKU-IDG/McGovern Institute for Brain Research, Peking University, Beijing, China

Objective In recent years, there are some report of substances use such as nitrous oxide, "smart drug",

and synthetic drug vapes among adolescents and young adults. College students are generally characterized by a lack of personal precautionary awareness and tend to ignore the knowledge of potential health harms of these substances due to curiosity or social needs. This study was conducted to investigate the awareness, usage, and risk factors of substance use among college students.

Methods From 19 June 2023 to 26 November 2023, an online cross-sectional survey was conducted in 10 colleges in Wuhan City, Hubei Province. All participants were investigated to collect the demographic characteristics, substance use and related risk factors of the college students. Logistic regression was used to explore the risk factors for substance use behaviors.

Results A total of 10,952 participants completed the questionnaires. The average age of the participants was 18.92 years old, of which 49.81% were male, 6.25% are ethnic minorities, and the percentage of medical students was 0.37%. The awareness of various substances was as follows: nitrous oxide (63.83%), cough syrup (36.76%), "smart drug" (37.56%), synthetic drug vapes (2.78%), synthetic cannabinoids (32.72%), and etomidate (11.81%). Regarding substance usage, 3.10% of the participants (n=385) reported the use of any substance. The usage of specific substances was distributed as follows: nitrous oxide (0.68%, n=74), non-medical use of cough syrup (1.72%, n=188), "smart drug" (0.47%, n=52), synthetic drug vapes (0.77%, n=84), synthetic cannabinoids (0.51%, n=56), and etomidate (0.24%, n=26). Additionally, 1.46% of the participants (n=160) reported the use of other substances. Of those who reported substance use, the mean age was 19.31 years, 67.27% (259) were male, 18.18% (10.71% of those without substance use) had average monthly expenditures of more than 2,000, and 30.88% (24.07% of those without substance use) had monthly household incomes of more than 10,000. Logistic regression analyses showed an increase in age (OR=1.086, 95%CI: 1.019-1.158), males (OR=1.397, 95%CI: 1.104-1.766), drinking (OR=1.919, 95%CI: 1.483-2.484), smoking (OR=2.726, 95%CI: 2.081-3.572), anxiety (mild, OR=1.473, 95%CI: 1.124-1.931; moderate and severe, OR=2.135, 95%CI: 1.575-2.895) and internet addiction (problematic internet use, OR=1.783, 95%CI: 1.382-

2.299; internet addiction, OR=3.503, 95%CI: 2.350-5.220) were associated with substance use.

Conclusion There is a risk of various substance use in the college students. Except for nitrous oxide, less than 40% of participants have heard of other substances, among which the percentage who have heard of synthetic drug vapes is only 2.78%. We should enhance the training and education on substance identification skills and harm prevention abilities among college students. Substance use college students have better economic conditions, which is an objective condition to support their use of substances. On the other hand, college students face problems such as anxiety and Internet addiction. It is necessary for families and schools to pay attention to the stress and mental health problems and substance use behaviors in order to improve the physical and mental health wellbeing of college students

数字疗法(移动医疗应用程序)在酒精使用障碍早期干预中的研究进展

谭曾悦 杨梅* 贾晓健
深圳市康宁医院成瘾医学科

背景 酒精使用障碍是全球性公共卫生问题, 过量饮酒是导致死亡率上升、健康恶化和社会问题加剧的重要危险因素之一。目前, 针对酒精使用障碍的新型数字疗法(移动医疗应用程序)正在变得越来越受欢迎。它所具有的广泛覆盖性、便利性和低成本等特点能够克服许多传统医疗手段的不足。

目的 本研究系统综述了国内外利用数字疗法干预酒精使用障碍的理论基础和有效证据, 对相关软件的开发、优化具有一定的借鉴意义, 也为软件市场的规范化提供了参考。

方法 检索了截至 2024 年 6 月的 PubMed、Science Direct、中国知网 CNKI、万方数据、维普资讯和中华医学期刊全文数据库内相关的国内外文献。纳入了样本量大于 50, 并报告了饮酒量结局的移动应用程序临床研究, 并对其干预过量饮酒的神经心理学机制、相关随机对照试验(RCTs)结果进行归

纳和总结。

结论 研究显示,与没有干预的受试者相比,接受移动医疗应用程序早期干预的高危饮酒人群饮酒量更少。这表明,数字疗法可有效干预酒精使用问题,其潜在应用前景广阔。遗憾的是,这些文章并未详细讨论具体是哪个模块在干预过程中起到了关键性作用。此外,这些数字疗法干预酒精使用问题的潜在副作用和伦理风险的研究仍需进一步研究。同时需要特别指出的是,现有的这些数字疗法在治疗已明确诊断酒精使用障碍的患者时影响很小或没有影响。针对这些患者,面对面且持续的心理治疗、药物支持仍是最主要治疗手段。对于这类人群而言,探索数字疗法与药物治疗、心理治疗等治疗方法的联合方案或许是更好的选择。

网络成瘾的流行病学综述

丁毅 范妮*

广州医科大学附属脑科医院

目的 了解网络依赖的流行病学特点。

方法 以“Internet Addiction, Game Disorder, Internet dependence、Epidemic, Prevalence”等在为关键词在 PubMed 上检索英文文献,以“网络依赖、网络成瘾、游戏障碍、流行病、患病率”等为关键词在中国知网、万方数据库和维普数据库上分别检索中文文献,阅读摘要后筛选符合目的文献,继续阅读全文。

结果 网络依赖的患病率在大学生、中学生甚至小学生中均发现逐年升高趋势。男生网络成瘾检出率高于女生。在不同国家和地区的报告的未经分类的网络依赖的患病率差异较大,在 1.6%-38.9%之间,但总体随着时间变化呈上升趋势。总体来说东亚文化报告的网络成瘾患病率高于西方文化。这一差异性在广泛性网络成瘾中更加突出。游戏障碍的患病率在不同文献中报告的差异不大,且随着时间变化的差异性相对较小。

结论 网络依赖的问题日益严峻,患病率在上升,需要重视。同时网络依赖的异质性比较突出,不同类型的网络依赖表现出差异较大的流行病学特点,

提示基于网络依赖的不同类型去看待和研究这个疾病的可能更有意义。提示我们以后对网络依赖的研究需要重视疾病分类。

酒精使用障碍患者血清氨基酸代谢组学与心理渴求关系的研究

李琳 夏炎*

哈尔滨医科大学附属第一医院

目的 酒精使用障碍(alcohol use disorder, AUD)是一种慢性复发性疾病,其发病机制仍不明确,缺乏具有敏感性和特异性的生物标志物。既往研究表明, AUD 患者存在氨基酸代谢异常,且与心理渴求水平有关。本研究对 AUD 患者血清进行靶向代谢组学检测,筛选可能的生物标志物,并分析了氨基酸代谢物与酒精使用情况和心理渴求的相关性。

方法 本研究纳入男性 AUD 患者 38 名,健康男性 30 名,采集一般资料和饮酒情况。使用宾夕法尼亚酒精渴求量表(Penn Alcohol Craving Scale, PACS)和视觉模拟评分量表(Visual Analogue Scale, VAS)评估入组者对酒精的心理渴求水平。采集入组者的血清,进行氨基酸靶向代谢组学分析。采用 T 检验法($P < 0.05$)和倍数变化法($\text{Fold Change} \geq 1.2$ 或 ≤ 0.83)筛选差异代谢物。

结果 与健康对照组相比, AUD 患者血清 D,L- β -氨基异丁酸、L-谷氨酸、 γ -氨基丁酸浓度显著升高, β -丙氨酸、L-精氨酸、谷氨酰胺浓度显著降低。AUD 患者血清谷氨酸水平与每周饮酒量呈正相关($r=0.328, P=0.045$),血清谷氨酰胺与心理渴求评分呈负相关(PACS: $r=-0.484, P=0.002$; VAS: $r=-0.333, P=0.041$)。

结论 持续饮酒可导致外周氨基酸代谢异常,可能与 AUD 患者酒精使用情况和心理渴求有关。谷氨酸相关代谢物改变可能是 AUD 发展的辅助因素,或可成为早期干预的潜在靶点。

关键词: 酒精使用障碍,靶向代谢组学,谷氨酸代谢,心理渴求

酒精使用障碍的动态脑功能连接改变

李冰¹ 李冰² 王洁^{1,2} 龙帅宇^{1,2} 张云淑^{1,2} 栗克清^{1,2}

1.河北省第六人民医院

2.河北省精神卫生中心

目的 基于静息态 EEG 信号的功率谱和动态脑功能连接分析方法,结合临床特征探究酒精使用障碍特征性的脑功能连接改变。

方法 收集并分析了 25 例酒精使用障碍患者组和 26 例健康对照组 64 导静息态脑电生理信号,酒精使用障碍患者评估了酒精使用障碍筛查量表(AUDIT)、强迫性饮酒量表(OCDS)、简易饮酒期望问卷(AEQ)和饮酒动机问卷(DMQ-R)。结合滑动窗口分析技术与加权相位延迟指数(wPLI)分析大脑功能连接,并应用 k-means 聚类方法分析个体水平脑功能的时空动态变化,探索酒精使用障碍患者脑功能特征性改变及其与疾病临床特征的相关性。

结果 功率谱分析发现,在睁眼静息态 EEG 数据 low-beta (13-20Hz) 频段中, F1、FCz、FC1 (三个电极都位于内侧额叶)和 C3 (左侧中央回)的功率升高。使用 DynamicBC 工具箱,对各通道对之间功能连接随时间的变化进行聚类,得到的 S1、S2 和 S3 三个大脑状态。酒精使用障碍患者组与健康对照组相比:(1) S1 状态出现频率降低, S2 状态出现频率升高;(2) 状态转移次数升高;(3) S1 状态到 S1 状态的转移概率降低, S1 状态到 S2 状态都转移概率升高。并且,在酒精使用障碍患者中,动态脑功能指标差异与临床特征存在相关性:积极饮酒期望与 S1 状态的出现频率成负相关、与 S2 状态的出现成正相关;状态转换次数与 AUDIT 总分、OCDS 总分及强迫性饮酒想法成正相关; S1 状态到 S1 状态的转移概率与 AUDIT 总分、OCDS 总分及强迫性饮酒想法成负相关,而 S1 状态到 S2 状态的转移概率与积极饮酒期望、社交性饮酒动机成正相关。

结论 酒精使用障碍患者内侧额叶、左侧中央回在静息状态下大脑活动增强,不同脑区之间的动态功能连接存在特征性改变。而且,这些改变与酒精使用程度、强迫性饮酒、饮酒期望修改。这些结果提示, low-beta 频段下频谱功率和动态功能连接特征性改变可能反映了酒精使用障碍潜在的病理基础,有望作为疾病诊断及评估的生物标记,为早期诊断

和评估提供新思路。

15 MA 高强度经颅交流电刺激治疗赌博障碍的探索性研究

钟刚亮 刘静洋 魏义承 张茜媛 崔煜昊 杜江* 赵敏

上海交通大学医学附属精神卫生中心

目的 经颅交流电刺激(transcranial alternating current stimulation, tACS)技术通过对受试者头皮施加 1-2 mA 的交流电刺激,被证明能够调节赌博障碍者的病理性大脑神经活动及赌博行为。然而,人类颅骨对 tACS 刺激电流的巨大衰减作用,导致进入颅骨内的刺激电流往往只能调节赌博障碍者的大脑局部皮层,难以有效调节病理性神经网络,使得临床治疗效果有限。最近一种采用 15 mA 刺激电流幅值的高强度 tACS (high-intensity tACS, Hi-tACS) 被证明是干预大脑神经网络的有效技术,且被证明是治疗抑郁症、焦虑症等精神障碍的有效策略,有望干预赌博障碍的病理性神经网络并改善赌博症状。

方法 在这项开放标签试验中,17 名(男性)被《精神障碍诊断与统计手册》第五版(DSM-5)诊断为赌博障碍的受试者接受了 Hi-tACS 的临床治疗。没有对照组。在连续的 10 天内,受试者每天接受 2 次 Hi-tACS 治疗,每次治疗持续 40 分钟,总共完成 20 次治疗。刺激电流强度为 15 mA,刺激频率为 77.5 Hz。主要结局指标是治疗前后评估的临床总体印象-严重性量表(Clinical Global Impressions-Severity scale, CGI-S)评分变化。次要结局指标是通过问卷量表评估的赌博严重程度、心理渴求、赌博症状、情绪状态及赌博行为的改变。

结果 Hi-tACS 治疗能够显著降低赌博障碍者的临床严重程度,且未观察到明显副作用。赌博严重程度、心理渴求、赌博症状、情绪状态及赌博行为在治疗后显著改善,虽然治疗后三个月内的随访评估结果显示略有增加,但三个月随访结果仍显著低于治疗前基线水平。

结论 Hi-tACS 在减少赌博障碍患者的临床严重程度、赌博严重程度、心理渴求、赌博症状、情

绪状态和赌博行为方面是有效的,且改善在治疗后三个月内持续存在,提示了 Hi-tACS 治疗赌博障碍的可行性、耐受性、安全性和有效性。

Transdiagnostic Neuromodulation of Impulsivity: Current Status and Future Trajectories

Gangliang Zhong Tianzhen Chen Na Zhong Haifeng Jiang Hang Su Tifei Yuan Trevor William Robbins Jiang Du Min Zhao*

Shanghai Mental Health Center, Shanghai Jiao Tong University School of Medicine

Impulsivity, increasingly perceived as a transdiagnostic characteristic, significantly influences diverse psychiatric conditions and emanates beyond the boundaries defined by traditional classification systems. Transdiagnostic research has shed light on the complex clinical manifestations of impulsivity, and the underpinning neural circuitry. The pressing challenge now is to translate this enhanced understanding into precise and potent interventions tailored to these different aspects of impulsivity. Recent advancements in neuromodulation, specifically targeting brain circuits, have provided encouraging evidence for improvements in clinical symptoms, and neural circuitry across various psychiatric conditions, signposting a transformative phase in crafting interventions that tackle impulsivity from a transdiagnostic perspective. However, the field continues to ascertain a universally embraced framework that effectively amalgamates these discoveries into a unified clinical methodology. The Research Domain Criteria (RDoC) delivers a neuroscientifically informed framework that aims to reconcile the neurobiological underpinnings with clinical symptoms, thereby facilitating targeted neuromodulation strategies. In this context, we have traversed the landscape from the rudimentary conceptualisation of impulsivity to the sophisticated techniques being developed to modulate its underpinnings. The journey has uncovered the intricate web of neural

circuitry associated with impulsivity and highlighted the pivotal role that neuromodulation techniques could play in future interventions. The heterogeneity of impulsivity poses significant challenges, which we have addressed by considering advancements in neuromodulation technologies and the unification of research efforts facilitated through the RDoC framework. By moving towards a model that regards impulsivity as a transdiagnostic trait, we can begin to tailor interventions that are as complex and nuanced as the disorders they aim to ameliorate. As research paradigms evolve and new technologies emerge, we are moving toward an age where interventions for impulsivity will be far more dynamic and precisely aimed at modulating the brain's complex circuitry. The hope is that this progress will catalyze more profound insights and effective interventions, markedly enhancing the quality of life for those affected by impulsivity and related psychopathologies.

关键词: impulsivity, transdiagnostic, neural circuits, neuromodulation, RDoC

依托咪酯的成瘾潜力及戒断前后外周血皮质醇、ACTH 改变情况

赵天舒 王艳艳 向小军* 严悦心 邓映雪 罗依凡
中南大学湘雅二医院

目的 依托咪酯是一种短效静脉全身麻醉药物,作为新型毒品,目前尚未有研究对依托咪酯吸食后的主观效应及滥用潜力进行定量评估。本研究以依托咪酯滥用患者为研究对象,通过对其吸食后的精神活性效应、渴求程度、戒断效应进行量表评估以描绘依托咪酯使用的成瘾潜力。

方法 患者在自愿戒毒机构内进行为期 4 周的药物戒断,在刚入院 24 小时内使用成瘾研究中心量表 (ARCI)、阿片戒断症状评价量表 (OWS)、以及视觉模拟量表 (VAS) 分别评估依托咪酯使用的成瘾潜力、戒断反应及渴求程度,并对戒断前后依托咪酯滥用患者的成瘾 ARCI、VAS 评分及血 ACTH 及皮质醇含量进行样本 T 检验分析。

结果 本研究共纳入依托咪酯滥用患者 67 例,本研究纳入的依托咪酯滥用患者以男性 (82.1%)、

未婚(58.2%)、初中学历(43.3%)为主,平均年龄(27.75±7.28)岁,97%的患者伴有烟、酒及其他成瘾物质的使用;在23个产生强烈渴求的患者中,使用依托咪酯至产生强烈渴求次数的中位数为4次;使用总次数的中位数为6次,其中有20.9%的患者使用依托咪酯超过30次。OWS总评分5.86±8.31,其中戒断症状主要包括疲惫(40.9%)、烦躁不安(34.8%)、口干(33.3%)、全身软弱无力(31.8%)、无食欲(25.8%)、哈欠(25.8%)、昏睡(25.8%)、失眠(22.7%)、手颤抖(19.1%)、抑郁(19.1%);戒断前后VAS结果表明渴求度显著降低($p<0.05$);戒断前后ARCI量表得分分别为20.63±7.44(MBG:3.48±3.31、PCAG:9.69±3.29、LSD:7.48±2.43)vs15.77±3.94(MBG:10.00±4.17、PCAG:2.80±1.77、LSD:2.98±1.49), $p<0.0001$;血皮质醇前后水平391.12±178.32 vs 433.50±130.13(皮质醇正常值:85.3-618.0nmol/L, $p<0.05$);ACTH前后水平102.85±110.62 vs 42.99±20.88(ACTH正常值:0.0-46.0ng/L), $p<0.001$ 。

结论 量表结果初步提示依托咪酯吸食具有一定的成瘾潜力(欣快、镇静、拟精神效应),符合精神活性物质的使用特征,经过戒断后,患者的ARCI评分显著性降低。此外,依托咪酯戒断反应与阿片戒断症状具有一定程度相似性(疲惫、烦躁不安、口干、全身软弱无力等)。患者戒断前后皮质醇及ACTH的对比结果提示,依托咪酯使用能够轻度降低血皮质醇水平、升高ACTH水平,且在四周的戒断后足以恢复。

关键词:物质滥用,依托咪酯,成瘾潜力,皮质醇、ACTH

男性酒精依赖患者血浆氧化应激标志物水平与认知功能的相关性研究

穆迪 苏中华* 刘悦翔 孔祥娟
山东省戴庄医院

目的 研究男性酒精依赖患者体内氧化应激标志物水平与认知功能之间的关系,探讨氧化应激反应在认知功能损害中的作用。

方法 随机选取2024年1月~2024年4月于

山东省戴庄医院酒精依赖科住院的206例酒精依赖患者,运用蒙特利尔认知功能量表(MoCA)将患者分为认知功能正常组(30例)和认知功能障碍组(176例)。测定并比较两组酒精依赖患者血浆氧化应激标志物总胆红素(TBIL)、直接胆红素(DBIL)、间接胆红素(I-BIL)、白蛋白(ALB)、尿酸(UA)、甘油三酯(TG)、总胆固醇(TC)、同型半胱氨酸(Hcy)、超氧化物歧化酶(SOD)水平。分析血浆氧化应激标志物水平与临床认知功能评分的相关性。

结果 入院的酒精依赖患者认知障碍的发生率为85.44%。酒精依赖患者的认知功能与受试者年龄及受教育年限、嗜酒年限显著相关(均 $P<0.05$)。与认知功能正常组相比较,认知功能障碍组血浆TG、TC和Hcy平显著升高、SOD水平显著降低(均 $P<0.05$)。认知功能障碍组血浆TG水平与MoCA总分、视空间与执行功能、语言、抽象思维和延迟记忆呈负相关($P<0.05$);血浆TC水平与MoCA总分、语言、延迟记忆呈负相关($P<0.05$);血浆Hcy平与MoCA总分、视空间与执行呈负相关($P<0.05$);血浆SOD水平与血MoCA总分呈正相关($P<0.05$)。甘油三酯预测认知功能障碍的AUC值为0.656。

结论 男性酒精依赖患者普遍存在认知功能损害。酒精依赖患者的血浆氧化应激标志物在认知功能正常组和认知功能障碍组存在差异性表达,血浆甘油三酯、总胆固醇、同型半胱氨酸水平升高提示可能存在认知功能损害,血浆超氧化物歧化酶水平较高提示认知功能可能较好。其中血浆甘油三酯水平可作为评估酒精依赖患者是否发生认知功能障碍的潜在预测指标。

纳曲酮治疗病理性赌博1例

王怀坤*
广州医科大学附属脑科医院

目的 了解病理性赌博的诊断、临床表现及治疗方法。

方法 回顾性分析1例28岁男性患者病理性赌博患者的临床资料,并结合文献复习予以讨论。

结果 患者病理性赌博6年,临床上表现为赌博依赖,并情绪低落,失眠等精神症状。既往门诊予

心理治疗合并氟西汀等药物治疗,但疗效欠佳,因加重来院住院治疗,入院时以难以控制的赌博行为为主要表现,伴有抑郁及焦虑情绪,入院视觉类量表评定为8分。入院后开始给予氟西汀、阿普唑仑等治疗,后逐渐停用,换为纳曲酮治疗,同时合并认知行为的心理治疗及足够的重复经颅磁刺激治疗,患者症状逐渐好转,出院时精神症状基本消失,赌博依赖明显减轻。出院后一直予纳曲酮维持治疗,同时合并家庭治疗,出院后随访半年,患者无复赌行为。

结论 病理性赌博为慢性复发性脑病,目前机理原因不清楚,其中中脑边缘系统研究较多,而关于阿片类受体拮抗剂治疗病理性赌博的研究较多,结合本病例,在一些对于系统心理治疗合并药物治疗效果欠佳的病例,治疗上,可选择住院治疗,早期给予规范的心理治疗,药物治疗,重复经颅磁刺激等综合治疗方法,药物治疗可选择纳曲酮,后期予纳曲酮合并家庭维持治疗,疗效较好,无再发生赌博行为,同时精神症状控制较平稳。

关键词: 纳曲酮; 病理性赌博

BZRAs Use Status in China-Perspectives From Psychiatrists: A Cross-sectional Study

Yujian Ye Na Zhong Min Zhao*

Shanghai Mental Health Center

Objective Benzodiazepine receptor agonists (BZRAs), which include benzodiazepines and Z-drugs, are the most commonly prescribed psychotropic drugs worldwide, and their inappropriate use places a significant burden on public health. Given the widespread use of BZRAs in psychiatric settings, we conducted a cross-sectional survey study to understand the status of Benzodiazepine Receptor Agonists (BZRAs) use status in China, and thus lay down the foundation for further improvement in rational use of BZRAs

Methods To understand the current state of sedative-hypnotic drug use and its influencing factors, we conducted a nationwide questionnaire survey across various regions of China, including the eastern, central, and western areas. Participants were administered a

self-devised 47-item questionnaire on the cognition of BZRAs prescription behavior, a 14-item questionnaire on attitudes towards sedative-hypnotic drugs, and an 8-item questionnaire on adverse reactions to BZRAs to explore the current state and influencing factors of BZRAs. The collected questionnaires were analyzed using SPSS version 24.0

Results A total of 190 questionnaires were collected, including 156 from tertiary hospitals and 164 from psychiatric specialty hospitals. The three most commonly prescribed BZRAs are alprazolam, lorazepam, and zopiclone; the three most commonly diagnosed disorders are anxiety disorders, insomnia, and addictive diseases. The three most common adverse reactions are drowsiness, dizziness, and fatigue. In prescription practices, the behavior of prescribing based on the previous prescription or at the request of the patient exceeds the prescription behavior for therapeutic purposes. In actual use, more than 60% of respondents believe they have deficiencies in relation to guidelines, laws and regulations, and the use of BZRAs in special populations. Approximately 60% to 90% of the respondents believe that the most common situations of exceeding the treatment course and dosage occur in the aforementioned three types of disorders. 56% of the respondents consider the standard for exceeding the treatment course to be consistent with the guidelines, and 84% would allow the use of BZRAs for more than one month in clinical practice. 84% of the respondents believe that the use of BZRAs beyond the recommended course or dosage is common, and 92% consider it harmful to patients. 81% of the respondents believe they have the ability to identify addiction to BZRAs, but 48% believe they lack the skills to manage such addictions. 62% of the respondents believe that psychiatrists have incomplete knowledge of the use of BZRAs, and 87% of the respondents believe it is necessary to receive training related to the use of BZRAs

Conclusion This survey objectively reflects the current state of BZRAs from the perspective of psychiatrists in China. The majority of physicians believe that the current usage is not rational enough, and there is a significant need to improve the situation of over-dosing

and over-treatment duration. It is imperative for psychiatrists to receive training related to rational drug use

关键词: BZRAs, survey, inappropriate use

PAI-1 水平增高与酒精使用障碍患者高凝状态的相关性研究

谢欣城 赵丹丹 杨致蓉*

金华市第二医院

目的 临床中发现酒精使用障碍患者更容易出现血栓相关性事件, 从而导致酒精使用障碍患者缺血性中风的发病率增加。纤溶酶原激活物抑制剂-1 (PAI-1) 水平升高可导致纤溶活性降低, 从而增加血栓的形成, 是血栓性疾病的独立危险因素。分析 D-二聚体 (检测凝血和纤溶系统激活的标志物) 的水平, 以评估酒精使用障碍患者是否有高凝状态的证据。为了确定 PAI-1 与 D-二聚体是否具有相关性, 以发现酒精使用障碍患者多发血栓事件的证据, 对以上指标进行评估。

方法 选取 2021 年 6 月-2023 年 6 月住院的 15 例酒精使用障碍患者, 20 例不饮酒的健康对照组, 用 ELISA 检测血浆 PAI-1 及 D-二聚体的表达量水平。

结果 ①与对照组对比, 酒精使用障碍组 PAI-1、D-二聚体含量显著高于正常对照, P 值均小于 0.05。②对两组 PAI-1 与 D-二聚体水平进行相关性分析, 显著性水平 P 值小于 0.05, 显示两者具有显著相关性。

结论 1.酒精可能与 PAI-1、D-二聚体显著升高有关, 酒精使用障碍患者多发血栓相关性时间可能与长期大量饮酒相关。2.PAI-1 水平与 D-二聚体水平之间存在显著的正相关关系, 这表明两者在生理和病理过程中可能具有相似的变化趋势。3.这种相关性可能揭示了 PAI-1 和 D-二聚体在凝血和纤溶系统中的作用是相互关联的, 共同参与了血栓形成和溶解的过程。

Characteristics of Online Mental Health Care Services From Haoxingqing Platform: Cross-sectional Survey Study

许添男^{1,2} 倪睿梅^{1,2} 吴宏焯^{1,2} 张凯²

1.安徽医科大学精神卫生与心理科学学院

2.安徽医科大学附属巢湖医院

Objective This study aims to describe the demographic characteristics of registered-professionals and medical service data on the Haoxingqing platform, and explore the impact of registered-professionals on the medical service data

Methods We analyzed the 11333 professionals in Haoxingqing platform over the past 5 years

Results Our statistical results focus on the relationship between the volume of patients/volume of prescriptions/total volume of patient consultations/consultation volume of three different consultation methods and the gender/professional titles of registered professionals, and the results showed that gender and title had significance differences on the above results; meanwhile, the gender of the registered professional also affects the consultation method ($P=0.025; P<0.012; P<0.015$), the professional titles also had a significant impact on the above four factors ($p<0.01$)

Conclusion This study aims to infer the distribution and preference of patients through the correlation analysis of online professional-side data, so as to provide a basis for balanced medical resources

关键词: eHealth; internet hospital; China; online mental health care services; digital health; app; online consultation

团体心理治疗对酒依赖患者复饮率及生活质量的影响分析

黄丹*

赣州市第三人民医院

目的 评价团体心理治疗对酒依赖患者复饮率

及生活质量的影响

方法 研究设定起止时间为2021年10月~2023年2月,从我院收治的酒精依赖患者中抽选出72例以随机双盲法分组,对照组常规药物治疗,观察组接受团体心理治疗,每组36例,比较各组患者的复饮率、生活质量、心理状态以及自我效能

结果 相较于对照组,观察组患者治疗后的复饮率显著偏低,其各方面生活质量评分显著升高,差异有统计意义($P<0.05$);治疗前两组心态和自我效能感评分差异无意义,治疗后观察组患者的焦虑和抑郁评分显著低于对照组,其自我效能评分显著高于对照组,组间差异有意义($P<0.05$)

结论 采取团体心理治疗能从患者心理上改变对饮酒的看法并保持乐观、积极的态度面对,深刻让患者意识到酒瘾的危害,帮助患者分析酒瘾原因,提供有效的戒酒方法,促使患者解除心理依赖,循序渐进的减轻戒酒症状,促使其从内心克服戒酒痛苦,逐渐恢复正常生活,走出酒瘾心理障碍,本研究显示,观察组患者的复饮率和不良情绪评分比对照组低,其生活质量和自我效能评分均高于对照组,差异证实了团体心理治疗对成功戒酒和改善患者生活水平的重要性。团体心理治疗既能够帮助酒依赖患者成功戒酒,还能引导其乐观、积极生活,值得临床借鉴。

关键词: 团体心理治疗;酒依赖;复饮率;生活质量

线索暴露疗法联合重复经颅磁刺激治疗对酒精依赖患者心理状态及复饮率的影响

谢贤炜*

赣州市第三人民医院

目的 探讨线索暴露疗法联合重复经颅磁刺激治疗对酒精依赖患者心理状态及复饮率的影响

方法 80例酒精依赖患者随机分组各40例,对照组用线索暴露疗法,观察组用线索暴露联合重复经颅磁刺激疗法,比较施治前后HAMD评分、施治前后MAST评分、施治后复饮率。对照组行线索暴露疗法:收集患者与酒精相关的线索信息,例如,什么情境、什么感受、什么想法会诱发患者想要饮酒,通过深入了解这些线索,患者能够更好地了解

与其酒精依赖有关的心理和情绪因素。进入线索暴露阶段,引导患者逐渐面对与酒精相关的线索,在治疗师的监督 and 指导下,练习不去饮酒并应对触发的欲望和情绪。在逐渐增加线索的复杂度和难度后,患者能够建立更好的应对机制和控制能力,从而减少饮酒的冲动。

结果 未施治阶段各项评分没有差异,施治后2、4、6、8周观察组HAMD、MAST评分都更低($P<0.05$),同时施治后4、12、24周复饮率,观察组更低($P<0.05$)。

结论 线索暴露法是一种常用于治疗酒精依赖的认知行为疗法方法,通过线索暴露法的实践,患者可以逐渐减少对饮酒相关线索的情绪和生理反应,提高自我控制能力,以更好地抵制饮酒的诱惑和维持戒酒状态。同时,线索暴露法也促进了对饮酒观念和行为的认知重建,帮助患者建立更健康的生活方式和思维模式,重复经颅磁刺激(rTMS)疗法可以通过调节和改变大脑神经回路、增强前额叶皮层活动、调整脑化学物质水平等多种机制来治疗酒精依赖,两者联合应用可协同提高患者的自控能力,对降低其酒精依赖度有积极意义。

关键词: 线索暴露联合重复经颅磁刺激疗法;酒精依赖;心理状态;复饮率

时间洞察力对问题性游戏使用的预测作用：一项长期追踪随访研究

单海迪 黄川宁 王粤 王紫盼 钟娜* 赵敏*

上海交通大学医学院附属精神卫生中心

目的 过度游戏行为会对心理健康、身体和社会功能造成负面影响。时间洞察力的不同维度(过去积极、过去负性、现在命运、现在享乐和未来)在游戏成瘾行为的出现、维持和康复方面发挥着重要作用。但目前研究多以横断面为主,难以推论因果关系,无法明确时间洞察力对发展成为游戏障碍的预测作用。同时,不同类型结构的时间洞察力人群出现出现游戏障碍的风险可能存在差异,是否也存在特异性的干预方式,但目前尚没有研究对此进行探讨。如果知道时间洞察力的不同维度是如何与游戏症状、游戏障碍的其他风险因素相互作用,我们就能够设计出更好的针对性的干预策略,进而期待

有更好的结果。

方法 纳入了 4356 名大一学生, 完成津巴多时间洞察力问卷(ZTPI)、抑郁量表 (PHQ-9)、焦虑量表 (GAD-7)、自尊量表 (RSES) 和网络游戏障碍筛查量表 (GDSS), 并在半年后进行随访, 再次填写相应量表, 共 3159 名被试完成随访。针对有随访数据的被试, 使用 ZTPI 的 5 个分量表 (过去积极、过去消极、现在冲动、现在命运和未来) 得分为聚类指标, 进行聚类分组, 并将聚类组别进行临床资料的对比分析和网络模型对比分析, 并追踪其半年后的问题性游戏行为的转归情况。

结果 经过聚类分析, 发现了时间洞察力三种类型, 未来取向人群 (n=1189)、负性取向人群 (n=1601) 和退缩取向人群 (n=355)。半年后随访, 以 GDSS 的得分前 20% 为界, 划分为问题性游戏使用和非问题性游戏使用, 发现三个类别中, 负性取向和退缩取向人群出现问题性游戏使用的比例显著高于未来取向人群, 两组人群的相对风险比率值是未来取向人群的 1.99 倍和 2.36 倍。在干预策略上, 负向取向人群和退缩取向的干预侧重点也存在差异。

结论 我们的结果表明不同的时间洞察力的类型发展出问题性游戏的风险不同, 负性取向和退缩取向类型更加不具有适应性, 在资源有限的情况下, 可以此两类型人群优先干预。

Correlation of Perceived Stress with Clinical Features in Individuals with First-episode Schizophrenia

Yanfang Zhou Kebing Yang*

Beijing HuiLongGuan Hospital

Objective Schizophrenia is a debilitating disorder and is among the top ten global causes of disability. Most patients experience recurrent or persistent symptoms in a chronic course of the disease, placing a substantial burden on the patients, families, and society. Early and effective treatment in first-episode schizophrenia (FES) is important for better outcomes. Accumulating evidence suggests that stress is associated with the pathophysiological mechanisms of schizophrenia. Stress functions as a catalyst that sets in motion a systemic change to cope with or avoid future stress. Retrospective studies supported that life events may sometimes "trigger" episodes of schizophrenia, the sensitivity to stress or perceived stress may be more predictive of symptom severity and treatment outcomes than self-reported exposure to life events in patients with schizophrenia. Our study aimed to explore the features of perceived stress in people with FES and to compare its differences in FES and healthy controls, and to explore the relationships between perceived stress and clinical features in FES, which may contribute to further longitudinal studies focus on stress interventions and specific clinical outcomes in schizophrenia patients with early onset

Methods Ninety patients with FES (mean age: 28.26 years old, female: 49%) and 111 healthy controls (mean age: 28.88 years old, female: 51%) were included in the study. Patients were enrolled during their first hospitalization at Beijing HuiLongGuan Hospital. Schizophrenia diagnosis was established by two independent and experienced psychiatrists using the International Classification of Diseases-10 (ICD-10) criteria or the Structured Clinical Interview for DSM-IV-TR Axis-I Disorders (SCID). Healthy controls were recruited

through advertisements. Perceived Stress Scale-14 (PSS-14) was used to assess the subjective perceived stress in FES group and healthy controls. In individuals with FES, the Positive and Negative Syndrome Scale (PANSS) was administered to assess psychopathological symptoms, and the severity of depressive symptoms was assessed by the Calgary Depression Scale for Schizophrenia (CDSS). We used Student *t* or χ^2 tests for group comparison of continuous and categorical variables, respectively. Stress-related findings are often sex-specific, thus we compared sex-specific differences in PSS score in individuals with FES and healthy controls. Pearson's or Spearman's correlation analysis was used to explore the correlation between demographic information and PSS in each group. Partial correlation analysis was used to explore relationships between PSS and clinical characteristics by adjusting for age, sex, and education years. All tests were two-tailed, with significance set at $p < 0.050$

Results Individuals with FES and healthy controls were age- and sex-matched ($p = 0.477$ and $p = 0.728$, respectively), while patients had fewer years of education than controls (13.52 ± 3.34 vs. 14.39 ± 2.61 , $t = -2.01$, $p = 0.046$). The PSS score was higher in the FES group than in controls (26.79 ± 8.81 vs. 19.42 ± 7.14 , $t = 6.34$, $p < 0.001$). There was no sex difference in PSS scores in either the patient ($t = 0.46$, $p = 0.645$) or the control group ($t = -0.53$, $p = 0.599$). The PSS score was negatively associated with age in healthy controls ($r = -0.22$, $p = 0.023$), while the relationship was not significant in the FES group ($r = -0.08$, $p = 0.464$). The PSS score was not related to years of education in either the FES or control group ($r = -0.12$, $p = 0.281$; $r = -0.06$, $p = 0.520$, respectively). In the FES group, the PSS score was negatively associated with the chlorpromazine equivalent dose ($r = -0.25$, $p = 0.018$) but not with the age at onset ($r = -0.05$, $p = 0.620$) or duration of illness ($r = -0.09$, $p = 0.431$). In individuals with FES, the PSS score was positively correlated with the general psychopathology scale score of PANSS ($r = 0.22$, $p = 0.043$). As most items of the general psychopathology scale are components of the depressive domain defined by the five-factor model of the PANSS, we explored the relationship between stress and depressive symptoms,

which were assessed using the CDSS. Partial correlation analysis with age, sex, and education as covariates indicated that the CDSS score was positively correlated with the PSS score ($r = 0.28$, $p = 0.012$), suggesting that perceived stress is accompanied by more severe depressive symptoms in patients with FES

Conclusion Individuals with FES may have elevated perceived stress than that in healthy controls. Reports of sex differences in stress sensitivity among those with psychiatric disorders or in the general population have been inconsistent, the current study showed that perceived stress was comparable between males and females in both FES and healthy control groups at a mean age of 28 years. In the general population, aging may be associated with a better capacity to cope with psychological stress and lower perceived stress, while this age-related effect may not hold in patients with schizophrenia. Perceived stress is a feeling of unpredictability, uncontrollability, and being overwhelmed by one's life, which may be related to direct emotional experiences. The present research suggest perceived stress may be more related to the severity of depressive symptoms in the FES group. Longitudinal studies are needed to explore the relationships between interventions for stress and clinical outcomes, which may contribute to the development of new treatment strategies to improve the prognosis of FES

关键词: First-episode schizophrenia, perceived stress, depressive symptoms

2 型糖尿病共病抑郁障碍认知功能损害与 MS4A4A、STREM2 和 P-tau181 的相关研究

李娜* 李建雄
昆明医科大学第一附属医院

目的 研究 2 型糖尿病共病抑郁障碍患者的临床特征及认知功能与 MS4A4A、sTREM2 和 P-tau181 的相关关系, 探索 2 型糖尿病共病抑郁障碍认知功能的相关病理机制

方法 MDD 组 37 例, T2DM 组 37 例, 2 型糖

尿病共病抑郁障碍组(TD)36例, 招募健康对照组(HC)37例。采用RBANS评估认知功能, 采用HAMD-17和HAMA评估抑郁和焦虑情绪, 采用ELISA法检测外周血MS4A4A、sTREM2和P-tau181水平, RT-qPCR检测PBMC中MS4A4A mRNA水平。

结果 TD组空腹血糖、糖化血红蛋白、果糖胺显著高于MDD组和HC组, T2DM组空腹血糖、糖化血红蛋白显著高于MDD组和HC组, 胰岛素抵抗指数显著高于HC组和MDD组。TD组RBANS总转换、即刻转换低于HC组, 注意力转换、视空间转换低于T2DM和HC组, MDD组注意力转换低于T2DM。TD组MS4A4A mRNA表达高于HC组和T2DM组, sTREM2、P-tau181表达高于HC组和MDD组。TD组RBANS总转化与空腹C肽、糖化血红蛋白呈负相关。延迟转化与空腹C肽、糖化血红蛋白呈负相关。注意力转化与年龄、空腹C肽、MS4A4A呈负相关, 与HAMA评分呈正相关。语言转化与腰臀比、P-tau181呈负相关, 与MS4A4A、MS4A4A mRNA呈正相关。视空间转化与腰臀比、空腹血糖、空腹胰岛素、糖化血红蛋白与呈正相关, 与HAMA、MS4A4A呈负相关。

结论 2型糖尿病共病抑郁患者空腹血糖、糖化血红蛋白水平升高, 胰岛素抵抗指数升高和胰岛β细胞分泌指数降低。2型糖尿病共病抑郁障碍患者的RBANS总转化水平下降, RBANS总转化水平与焦虑程度呈负相关。2型糖尿病共病抑郁障碍患者血清MS4A4A mRNA、sTREM2、P-tau181水平升高, MS4A4A mRNA、sTREM2、P-tau181的水平升高与认知功能的下降有正相关关系。

Study on The Relationship between Vascular Growth Factor Expression and Cognitive Impairment in Comorbid Major Depressive Disorder of Type 2 Diabetes

Na Li* Mei Yang

The first hospital affiliated kunming medical university

Objective To study the relationship between the

serum levels VEGF, bFGF, ANG1 and ANG2 and cognitive function impairment in patients of comorbid MDD of T2DM

Methods A total of 169 participants were included 32 patients in the healthy control (HC) group, 46 patients in the MDD group, 49 patients in the T2DM group, and 42 patients in comorbid major depressive disorder of type 2 diabetes (TD) group

HAMD-17, HAMA, and RBANS were to assess anxiety, depression and cognitive function. Serum expression levels of VEGF, bFGF, ANG1 and ANG2 were measured by ELISA.

Results The total RBANS scores, delayed memory scores, attention scores, language scores and the immediate memory scores were extremely lower in TD group than in HC and T2DM groups, serum VEGF levels were higher in TD group than in HC group

Serum bFGF, ANG1, ANG2 levels in TD group were higher than those in HC group and MDD group. AUC of serum VEGF for the diagnosis of TD was 0.66, with cut-off point of 159.74 pg/ml. The AUC of serum bFGF for the diagnosis of TD was 0.718, with cut-off point of 209.23 pg/ml. The AUC of serum ANG1 for the diagnosis of TD was 0.793, with cut-off point of 303.43 pg/ml.

Conclusion the serum levels bFGF, ANG1 and ANG2 are higher in patients of comorbid MDD of T2DM. There is relationship between VEGF, bFGF, ANG1 and ANG2 and cognitive function impairment in patients of comorbid MDD of T2DM

关键词: VEGF, bFGF, ANG1, ANG2, T2DM, MDD

早发型双相障碍认知功能损害的研究进展

冯浩轲 孙静*

南京医科大学附属脑科医院

目的 早发型双相障碍发作频繁、情绪不稳定、对药物反应差, 常伴有精神病性症状或/和混合特征等, 具有较频繁的自杀企图和自杀行为, 相较于成年发病的双相障碍具有更多的快速循环倾向和认知损害。儿童和青少年双相障碍的诊断误诊率高, 具

有较大的挑战性,如治疗延误或治疗效果不佳,导致疾病反复波动及预后不良。本文就早发型双相障碍患者认知功能改变及其相关影响因素的研究进展做一综述。

方法 通过查阅和筛选国内外文献,综述早发型双相障碍患者认知功能改变及其相关影响因素。

结果 早发型双相障碍起病于儿童和青春期,这一时期是大脑发育的关键时期,也是个人学习和成长的关键期,大脑结构和功能的变化贯穿整个阶段,尤其涉及认知功能的相关区域,因而认知功能损害是早发型双相障碍患者常见的临床表现。患者病程越长、住院次数越多,与之相对应的工作记忆、注意转移能力和执行能力更差。早发型患者认知功能的影响因素涉及临床(疾病本身、药物使用)和生物学(神经影像、遗传学、神经生化、炎症反应)多方面。

结论 针对早发型双相障碍高危人群早期识别与诊断是目前难点,早期评估双相障碍认知功能、给予恰当的干预措施,可早期防止该疾病的进展、提高患者生活质量、恢复社会功能。

Association between The Systemic Immune-inflammatory Index and Female Sexual Dysfunction As Measured by Low Sexual Frequency in Depressive Patients: Results From NHANES 2005-2016

Guangwei Qing^{1,2}, Hao He^{1,2}, Minghao Lai¹, Xue Li¹, Yan Chen^{1,2}, Bo Wei¹

1.Jiangxi Mental Hospital

2.Third Clinical Medical College of Nanchang University

Objective Sexual dysfunction, particularly in females, is a complex issue influenced by various factors, including depression and inflammation. The Systemic immune-inflammation index (SII), an inflammatory biomarker, has shown associations with different health conditions but its relationship with female sexual dys-

function (FSD) remains unclear. This study aimed to investigate the association between SII and FSD in the context of depression, utilizing low sexual frequency as an assessment indicator

Methods Data from NHANES 2005-2016, involving 1,042 depressed female participants, were analyzed. FSD, indicated by low sexual frequency, and SII, derived from complete blood count results, were assessed. Logistic regression and subgroup analyses were conducted, considering demographic and health-related factors

Results A total of 1,042 individuals were included in our analysis; 11.51% of participants were categorized as having FSD and decreased with the higher SII tertiles (tertile 1, 13.83%; tertile 2, 13.54%; tertile 3, 7.18%; p for trend <0.0001). A multivariate linear regression analysis showed a significant negative association between SII and FSD [0.9993 (0.9987, 0.9999)]. This negative association in a subgroup analysis is distinctly and significantly present in the Mexican-American subgroup [0.9959 (0.9923, 0.9996)], while it does not reach statistical significance in other racial categories. Furthermore, the association between SII and FSD was nonlinear; using a two-segment linear regression model, we found a U-shaped relationship between SII and FSD with an inflection point of 2100 (1,000 cells/ μ L)

Conclusion In summary, in depressed individuals, higher SII is independently associated with a decreased likelihood of FSD, emphasizing the potential role of inflammation in female sexual health

关键词: Female sexual dysfunction, Sexual frequency, Sexual health, Systemic immune-inflammatory index.

重性精神疾病妊娠期及哺乳期用药与管理

廖腊梅 孙静*

南京医科大学脑科医院

目的 精神分裂症、双相障碍等是临床常见的重性精神障碍,这些疾病大多需要长期治疗。女性

患者妊娠期和哺乳期治疗一直面临重要抉择, 用药与否关联胎儿、婴儿和孕产妇近期与远期身心健康。该时期治疗涉及伦理和安全问题, 相关研究匮乏且多为小样本或个案报道。本文就近年来妊娠期与哺乳期治疗相关报道进行综述, 以期安全管理重性精神患者的妊娠期与哺乳期。

方法 通过查阅和筛选国内外文献, 综述近年重性精神疾病在妊娠期及哺乳期用药相关的研究、临床试验、指南和专家意见, 分析和综合了关于各种药物的安全性和有效性, 以及对母亲和发育中的胎儿或婴儿潜在风险和益处的相关数据。

结果 遵循妊娠原则和治疗安全性原则至关重要。孕早期, 胎儿发育的关键时期, 应尽量避免药物治疗。孕中期, 如果病情需要, 可以在征得患者和家属同意情况下, 根据循证医学报道谨慎使用药物。孕晚期, 需要考虑新生儿撤药反应, 根据孕妇病情酌情减少药物剂量。此外, 整个孕期尽可能使血药浓度维持在相对稳定的水平, 避免较大血药浓度波动对胎儿生长发育的影响。需要特别注意的是妊娠期药物治疗中, 某些药物相对不安全, 例如抗精神病药物中氯氮平可能导致婴儿软弱症, 抗抑郁药物中帕罗西汀和氟西汀风险性较大, 可能导致胎儿心脏中膈缺陷, 应慎用。此外, 心境稳定剂中丙戊酸钠和卡马西平使用需慎重, 因为可能导致神经发育异常。苯二氮卓类药物最好在整個孕期都避免使用。对于长效抗精神病药物注射液, 尽管在临床使用中尚未有较大危害报告, 仍需更多临床实践以确认其安全性。在确定最适合的治疗方案时, 应考虑母亲疾病的严重程度、未治疗精神疾病的潜在风险以及个体患者特征等因素。

结论 基于当前证据, 需要仔细权衡重性精神疾病在妊娠期及哺乳期用药的潜在风险和益处。应与患者共同制定个性化的治疗计划, 考虑到每种情况的特定需求和情况。还需要进一步的研究来更好地了解在妊娠期和哺乳期使用药物对母婴结果的长期影响。

青少年中学生昼夜节律改变与心理健康水平的关系及其影响因素

刘道力 李恒芬*

郑州大学第一附属医院

目的 探讨青少年中学生昼夜节律紊乱与焦虑抑郁情绪的关系, 并了解青少年中学生昼夜节律紊乱的危险因素。

方法 采用整群抽样法, 选取某中学初中及高中部 10 个班进行调查, 共获得有效样本 381 名。分别采用清晨型与夜晚型问卷 (Morning and Evening Questionnaire 5, MEQ-5)、汉密顿抑郁量表 (Hamilton Depression Rating-Scale-24-item version, HAMD)、汉密顿焦虑量表 (Hamilton Anxiety Scale, HAMA)、社会功能缺陷筛选量表 (Social Disability Screening Schedule, SDSS)、国际体育活动问卷简版 (Te International Physical Activity Questionnaire Short Version, IPAQ-SF) 及匹兹堡睡眠质量指数 (Pittsburgh Sleep Quality Index, PSQI) 进行心理健康评估; 利用 MEQ-5 问卷将中学生分为晚间型 (≤ 11 分, $n=140$)、中间型 (12-17 分, $n=166$) 及晨间型 (≥ 18 分, $n=75$)。本研究采用 SPSS 25.0 软件进行数据分析, 方法包括 χ^2 检验、Kruskal-Wallis 检验、Spearman 秩相关分析及多元 logistic 逐步回归分析。

结果 (1) 昼夜节律类型分布情况: 中学生晚间型节律占 36.7%, 中间型节律占 43.6%, 晨间型节律占 19.7%。(2) 三组心理健康水平比较: 三组比较发现晚间型在抑郁情绪的比率 (32.1%) 较高 ($\chi^2=13.35$, $P=0.001$); 晚间型的焦虑情绪比率 (38.6%) 高于其他两型 ($\chi^2=11.70$, $P=0.003$); 晚间型睡眠质量差的比率 (61.4%) 高于其他两型 ($\chi^2=21.36$, $P<0.001$); 社会功能缺陷的比率 (57.9%) 较高 ($\chi^2=10.69$, $P=0.005$); 晚间型呈现出较低的运动水平比率 (44.3%) ($\chi^2=19.73$, $P=0.001$)。(3) 晚间型影响因素相关性分析: Spearman 秩相关分析发现晚间型 MEQ-5 总分与 PSQI 总分呈负相关 ($r=-0.19$, $P=0.027$)。(4) 多元 logistic 回归分析发现, 母亲性格、个性特征及运动水平是晚间型昼夜节律的相关因素。

结论 晚间型昼夜节律类型可能与中学生的焦虑抑郁情绪及睡眠质量降低有关, 并可导致其学习、社交等社会功能受损, 另外, 运动水平低可能是晚间型发生的危险因素。

精神专科医院个性化手卫生设施改造对患者手卫生依从性及医院感染的影响的对照研究

潘轶竹* 罗凤琪 丁卉 宋琳楠
首都医科大学附属北京安定医院

目的 通过设计并增设个性化手卫生设施, 增加精神专科医院手卫生设施可及性, 提高精神科患者手卫生依从性, 降低医院感染发生风险。

方法 选取北京市某三级甲等精神专科医院 12 个病区, 设计个性化手卫生设备并按照可及性原则增设于病区相应位点。采用手卫生依从性直接观察法, 以手卫生设施安装日 (2024 年 2 月 1 日) 为节点, 分别对设备增设前 (2023.10-2024.01) 及设备增设后 (2024.02-2024.05) 期间住院患者手卫生依从性及医院感染情况进行调查, 评价增设手卫生设施前后患者手卫生依从性及医院感染情况。

结果 手卫生设备增设前共调查患者手卫生时机 3383 次, 手卫生依从率为 51.85%, 正确率为 34.49%; 设备增设后共调查患者手卫生时机 3392 次, 手卫生依从率为 59.96%, 正确率为 46.26%; 设备增设后患者手卫生依从率和正确率高于设备增设前 ($P < 0.05$)。手卫生设备增设前各病区患者手卫生依从率在 15.09%-84.77% 之间, 正确率在 2.42%-57.66% 之间, 设备增设后各病区患者手卫生依从率在 42.41%-91.50% 之间, 正确率在 18.10%-59.02% 之间; 不同病区患者手卫生依从率和正确率存在统计学差异 ($P < 0.05$); 手卫生设备增设前各时机患者手卫生依从率在 38.06%-94.20% 之间, 正确率在 25.00%-43.75% 之间, 设备增设后各时机患者手卫生依从率在 32.43%-89.67% 之间, 正确率在 33.33%-52.29% 之间; 设备增设后进食前后、大小便前、离开病房前后、接触公共用品前后、接触其他患者或物品前后患者手卫生依从率均较增设前高 ($P < 0.05$); 不同性别患者手卫生依从率存在统计学差异 ($P < 0.05$), 女性患者依从率高于男性, 设备增设后男女患者手卫生依从率和正确率均高于设备增设前 ($P < 0.05$)。设备增设前共出院患者 3737 例次, 医院感染率 4.09%; 设备增设后共出院患者 4559 例次, 医院感染率 2.46%, 设备增设后住院患者医院感染率低于设备增设前 ($P < 0.05$); 其中下呼吸道感染设备增设后医院

感染率低于设备增设前 ($P < 0.05$)。

结论 精神专科医院手卫生设施可及性低, 患者手卫生依从率和正确率差。通过增设个性化手卫生设施, 可提高患者手卫生依从率和正确率, 有效降低患者医院感染风险。

精神专科医院手卫生设施及患者手卫生依从性现状分析

潘轶竹* 宋琳楠 罗凤琪 丁卉
首都医科大学附属北京安定医院

目的 落实国家手卫生规范及 WHO 手卫生设施可及性要求, 了解精神专科医院病区手卫生设施可及性及患者手卫生依从性现状, 为推进精神科医院落实手卫生措施提供依据, 保证患者医疗安全, 促进医疗质量提升。

方法 通过问卷调查和现场查看相结合的方式, 对某三级甲等精神专科医院 12 个病区手卫生设施配置及完善情况进行调查; 运用手卫生依从性直接观察法, 通过自行设计患者手卫生依从性观察表, 设立、培训手卫生观察员, 对 2023 年 9 月-2024 年 1 月期间住院患者手卫生依从性进行调查, 评价患者手卫生依从性现状。

结果 共调查住院病区内病室、治疗室、护士站、医生办公室、餐厅等诊疗区域 201 个, 洗手池的总设置率为 36.82%; 其中治疗室、护士站、医生办公室的洗手设施配置完备率为 91.35%, 速干手消毒剂的配置率 100%; 病室相关洗手池欠完备, 未设置洗手液和干手设施; 病室内和病区走廊未配置速干手消毒剂; 75.00% 的病区工作人员认为病区手卫生设施配置不充足, 认为精神科患者利用手卫生设施进行自伤等安全隐患是影响手卫生设备配置的主要原因。共调查患者手卫生时机 3383 个, 总体依从率为 51.85%, 正确率为 34.04%; 不同性别患者手卫生依从性及正确性无统计学差异 ($P > 0.05$), 其中男性患者依从率为 46.83%, 正确率为 30.82%, 女性患者依从率为 50.54%, 正确率为 31.79%; 不同时机手卫生依从性不同 ($P < 0.05$), 排名前三位分别为进食前 (94.20%)、大小便后 (74.35%)、接触伤口、管

路后(57.14%);后三位分别为接触其他患者或他人物品前(16.08%)、接触公共用品前(15.42%)、接触其他患者或他人物品后(15.09%);导致手卫生不正确性的原因主要为揉搓步骤不完整(65.27%),其次为揉搓时间不够(58.75%)。

结论 精神专科医院病区手卫生设施配置率及完备率较低,可及性不足,精神科患者手卫生依从性和正确性较低,仅在医务人员要求和指导下执行。现有手卫生设施对精神科患者造成的自伤、自杀等安全隐患是影响手卫生设备配置的主要原因,亟需配置适用于精神专科患者的手卫生设施,加强患者手卫生知识宣教,促进手卫生工作落实,降低医院感染风险。

产后抑郁症患者血清神经递质和甲状腺激素水平与抑郁状况的相关性分析

叶乐*

丽水市第二人民医院

目的 分析产后抑郁症患者血清神经递质、甲状腺激素水平与抑郁状况的相关性。

方法 选取2021年2月—2022年3月丽水市第二人民医院收治的产后抑郁症患者75例为研究组,另选取同期55例健康产妇作为对照组。采用爱丁堡产后抑郁量表(EPDS)、汉密顿抑郁量表(HAMD)评价产妇抑郁状况,检测两组产妇神经递质[5-羟色胺(5-HT)、多巴胺(DA)、去甲肾上腺素(NE)、孤啡肽(OFQ)]水平,甲状腺激素[三碘甲状腺原氨酸(T3)、甲状腺素(T4)、促甲状腺激素(TSH)]水平。采用Pearson相关性分析法分析产后抑郁症患者血清神经递质、甲状腺激素水平与抑郁状况的相关性,采用多因素logistic回归分析模型分析产后抑郁症患者的危险因素。

结果 研究组5-HT、DA、NE、T3、T4、TSH水平分别(0.99±0.22) μmol/L、(2.17±0.43) μmol/L、(28.49±5.14) ng/ml、(2.15±0.32) nmol/L、(124.67±11.03) nmol/L、(1.49±0.24) nmol/L,显著低于对照组的(2.48±0.53)

μmol/L、(3.54±0.87) μmol/L、(44.86±10.59) ng/ml、(2.77±0.41) nmol/L、(133.54±12.87) nmol/L、(2.26±0.39) nmol/L,差异均有统计学意义(均P<0.05)。研究组OFQ水平为(25.16±5.34) ng/L,明显高于对照组的(10.86±2.79) ng/L,差异有统计学意义(P<0.05)。

结论 产后抑郁症患者的血清神经递质、甲状腺激素水平与其抑郁状况密切相关,孕期合并症、母乳喂养不顺利、家庭不和睦、5-HT水平是产后抑郁症的独立危险因素,临床应加强产妇的早期神经递质、甲状腺激素水平检测,加强母乳喂养、孕期并发症等相关临床干预,以降低产后抑郁症发生。

关键词:甲状腺激素;产后抑郁症;

大脑白质网络异常在精神分裂症患者及其未发病的遗传高危亲属中的比较研究

王帅*

山东第二医科大学

目的 精神分裂症是一种会造成沉重疾病负担的重性精神疾病。研究显示脑白质网络异常可能是其一项重要生物学基础,并具有遗传倾向。对患者及未发病直系亲属的白质网络属性比较有助于我们了解其发病机制。本研究比较精神分裂症患者、未发病的遗传高危人群及健康对照组间的白质网络局部效率均值差异。

方法 对三组被试对被试行T1加权扫描和DTI扫描,用PANDA软件和图论分析法计算Eloc,比较三组被试间的异同,应用PANDA软件构建白质网络,并测量他们的简明精神症状量表得分,用GRETNA软件计算局部效率均值,用SPSS分析三组被试间的差异、局部效率均值异常与精神病性症状的关系。

结果 (1)三组被试间的网络局部效率均值存在显著差异(p=0.006),事后比较表明患者显著低于健康对照和遗传高危人群;(2)网络局部效率与简明精神症状量表总分呈负相关(r=-0.39, p=0.014, FDR校正后),与缺乏活力因子分(r=-0.49, p=0.002, FDR校正后)、敌意因子分(r=-

0.33, $p=0.041$, FDR 校正后)、思维障碍因子分 ($r=-0.32$, $p=0.038$, FDR 校正后) 呈负相关。

结论 白质网络局部效率均值下降可能是精神分裂症的一项神经生理学异常, 与精神症状总体严重程度及缺乏活力、敌意、思维障碍等多个症状有关。

关键词: 精神分裂症; 遗传高危患者亲属; 白质网络

心因性非痫性发作患者人格特质与临床特征的分析

冷海霞 王红星*

首都医科大学附属宣武医院

目的 研究心因性非痫发作患者的人格特点及临床特征

方法 本前瞻性研究纳入 2021 年 1 月-2023 年 12 月就诊中国北京宣武医院神经内科年龄 14-34 周岁的 PNES 患者 41 例。收集患者人口学信息, 临床病例记录, 使用明尼苏达多项人格测验 (MMPI) 评估患者人格特点。研究 PNES 患者的人口学资料, 临床特征及人格特点。

结果 本研究 PNES 组 MMPI 中的 Hs 疑病 [(66.35±1.82) 分比 (61.18±1.78) 分]、Hy 癔病 [(65.62±1.36) 分比 (50.79±1.49) 分]、N 神经质 [(69.15±1.70) 分比 (61.00±1.75) 分] 分数高于癫痫患者 ($t=2.040$ 、 3.371 、 3.348 ; $P<0.05$)。人口学信息 PNES 患者女性占 58.5%, 男性 41.5%, 多子女家庭占 61%, 独生子女家庭占 39%, 居住在农村占 51.2%, 居住在城市占 48.8%。PNES 症状影响学习、工作者占 63.4%, 能坚持学习、工作者占 36.6%。PNES 发作频率以重度每天发作为主, 发病时间为几分钟到几小时差异较大。共病癫痫 9 例, 共病焦虑 8 例, 共病失眠 7 例, 共病抑郁 6 例, 其中接受抗癫痫药物及其它治疗 30 例。将所有 PNES 发作症状分为 5 类, 包括运动症状 41.3%, 感觉症状 21.7%, 无反应 17.4%, 异常行为 10.9%, 内脏症状 8.7%。将发作因素分为易感因素 9 件, 其中疾病遗传素质 6 件, 诱发因素 40 件, 其中学习及工作困境 22 件, 维持因素各种慢性压力 12 件。

结论 我们的研究表明 PNES 具有特殊的人口

学特征, 人格具有高疑病、癔病、神经质的特点。运动性 PNES 是最常见的发作类型, 症状持续时间和频率差异较大。癫痫被认为是 PNES 最常见的共病, 患者接受药物治疗比例较高。

从高唤醒角度探索失眠简明行为治疗对失眠患者的疗效

孙晓宇 陈科宇 常翼*

大连医科大学附属第一医院

目的 与正常人相比, 失眠患者会表现出一系列的高唤醒特征。失眠简明行为疗法 (BBTI) 关注行为要素, 干预时间较短, 对失眠患者的疗效可靠。然而, 目前没有从高唤醒的角度探索 BBTI 对失眠的疗效研究。本研究目的是比较失眠患者与健康对照组在日间静息状态下的心理生理唤醒水平。并探讨失眠患者在 BBTI 治疗前后的心理生理唤醒水平的变化。

方法 通过标准化的入组访谈纳入失眠患者 (Insomnia Disorder 组, ID 组), 匹兹堡睡眠质量指数量表 (PSQI) 得分 ≤ 5 和失眠严重程度指数量表 (ISI) 得分 ≤ 7 招募为健康对照组 (Health Control 组, HC 组)。两组被试均需完成 PSQI、ISI、Epworth 嗜睡量表 (ESS)、睡眠信念与态度量表 (DBAS-16)、焦虑自评量表 (SAS)、抑郁自评量表 (SDS)、高唤醒量表 (HAS), 并记录日间静息态生理指标。生理唤醒水平包括皮肤电导水平 (SCL)、心率 (HR)、心率变异性 (HRV)。ID 组在记录基线睡眠日记后, 接受为期四周的 BBTI。在治疗结束时和治疗结束后两个月时, ID 组完成睡眠日记的记录和相关量表的填写。睡眠日记中获得的主要参数包括入睡潜伏期 (SOL)、夜间觉醒次数 (NOA)、夜间觉醒时长 (WASO)、总睡眠时长 (TST)、卧床时间 (TIB)、睡眠效率 (SE)。在治疗后两个月, ID 组需要再次记录日间静息态生理指标。

结果 1. 将 ID 组和 HC 组的数据进行比较发现 ID 组在 HAS 得分上高于 HC 组。ID 组在 HR、SCL 上显著高于 HC 组; 而在 HRV 频域指标 LFlog、HFlog=显著低于 HC 组。

2. 对 ID 组在 BBTI 治疗前、治疗后、治疗后两

个月的数据进行分析,在 ISI、PSQI 上变化显著;在 TST、SOL、SE 等睡眠日记临床指标上均有改善。BBTI 对 HAS 得分有显著影响;ID 组在生理唤醒水平后测上 HRV 时域指标 SDNN 治疗后显著上升;频域指标 HFlog 治疗后显著上升;SCL 显著下降,其他指标与前测差异不显著。

3.将 BBTI 前后临床指标动态变化和基线高唤醒水平进行相关分析,ΔSOL 和 HR、HRV 时域指标 RMSSD、频域指标 LF (n.u.)、HF (n.u.)、LF/HF ratio 显著相关。ΔPSQI、ΔSE 和 HAS 的反应得分显著相关。其他相关关系不显著。

结论 1.失眠患者与健康受试者相比存在异常的高唤醒特征。

2.BBTI 可以改善失眠患者的主观失眠严重程度和睡眠质量,并且可以减少睡眠潜伏期,提高睡眠效率。

3.BBTI 治疗后的失眠患者高唤醒水平降低,并且发现干预效果与其高唤醒水平相关。

杏仁核牛磺酸水平与女性广泛性焦虑障碍之间的关联:7T 的质子磁共振波谱研究

魏雨寒 王艺明*

贵州医科大学附属第一医院

目的 通过质子磁共振波谱在 7T 处测量患者脑内牛磺酸 (MRS) 浓度,探索人脑中的牛磺酸浓度与广泛性焦虑障碍的发展之间存在关联。广泛性焦虑障碍 (GAD) 的特征是过度担心或非理性的恐惧或躯体不适感。一般来说,女性患焦虑症的可能性是男性的两倍或更多。牛磺酸 (MRS) 是一种氨基酸,在神经元生成、分化、树突化和突触连接形成中起着关键作用。有动物实验证明,牛磺酸对小鼠具有抗焦虑作用。然而,目前尚没有体内证据表明。

方法 招募患有 GAD 的未服药女性(18-40 岁) 60 名和健康对照参与者 60 名。参与者由有执照的临床心理学家通过 DSM-5 的结构化临床访谈进行评估和诊断。使用广泛性量表 (GAD-7) 测量焦虑水平。使用质子磁共振波谱在 7T 处测量 GAD 组和健康对照组 (HC 组) 的杏仁核、海马体、蓝斑和前额

叶皮层中的牛磺酸浓度。

结果 预期 GAD 组杏仁核、海马体、蓝斑和前额叶皮层中的海马牛磺酸浓度低于健康对照组。观察不同脑区内牛磺酸是否存在差异。GAD 组的广泛性焦虑量表评分显著高于 HC 组。GAD 组与健康对照组参与者的年龄或体重指数没有统计学上的显著差异。

结论 广泛性焦虑的女性患者的人脑牛磺酸浓度可能较低,且人脑中较低水平的牛磺酸浓度可能提供了 GAD 的新特征。

失眠简明行为疗法干预新冠后失眠的疗效研究

柴宝佳 李晨 常翼*

大连医科大学附属第一医院

目的 新型冠状病毒感染后失眠是新冠后症状中最常见的精神健康问题之一,严重影响了患者的健康状况和生活质量,加重社会经济负担。本研究针对此类人群,探索失眠简明行为疗法 (BBTI) 对新冠后失眠的疗效,验证其对失眠严重程度、睡眠质量、日间功能、焦虑抑郁情绪、疲劳程度等的改善效果及镇静催眠药物减量情况,为此类患者的治疗提供实施参考依据,并探究新冠病毒影响程度与失眠严重程度的关系。

方法 纳入 43 名新冠后失眠持续至少 3 个月的患者,随机分为 BBTI 组(22 例),睡眠卫生教育 (SHE)组(21 例)。BBTI 组接受 4 周失眠简明行为治疗,SHE 组接受 4 周睡眠卫生教育。所有患者在基线、四周干预后、三个月随访时均需完成一周睡眠日记的记录(SOL、NOA、WASO、TST、TIB、SE 及目前正在服用镇静催眠药物的种类和剂量。)及相关量表的评估(ISI、PSQI、ESS、SAS、SDS、FS-14、CIS)。将患者镇静催眠药物的使用剂量换算成口服近似等效地西洋的剂量,以统计药物使用剂量的变化。使用 SPSS 26.0 进行数据分析。

结果 1. 四周干预后:重复测量方差分析显示,两组在 TIB、SOL、WASO、SE、ISI、PSQI、药物使用剂量上均存在显著的时间×组别的交互效应。

post hoc 分析表明,与 SHE 组相比,BBTI 组 TIB、SOL 显著缩短,SE 显著升高,ISI 量表得分显著降低。此外,BBTI 组用药剂量显著小于基线水平,两组用药剂量组间差异不显著。

2. 三个月随访:重复测量方差分析显示,两组在 TIB、WASO、SE、ISI、PSQI 上均存在显著的时间×组别的交互效应。post hoc 分析表明,与 SHE 组相比,BBTI 组 TIB 显著缩短,SE 显著升高。此外,两组在药物使用剂量上存在显著的时间主效应。

3. 将新冠指标和基线量表得分、BBTI 组新冠指标和量表得分变化分别进行 Spearman 相关性分析。结果发现,年龄与 PSQI 呈显著正相关、与 ESS 呈显著负相关。新冠后失眠病程与 ESS、FS-14 总分呈显著正相关。新冠前睡眠情况与新冠急性期症状、PSQI、SDS 呈显著正相关。CIS 与 ISI、ISI 四周变化呈显著正相关。文化程度与 ISI 三个月变化呈显著负相关。

结论 1. 与 SHE 相比,BBTI 能够明显缩短新冠后失眠患者的无效躺床时间、入睡潜伏期,提高睡眠效率,降低失眠严重程度。三个月随访时,其缩短无效躺床时间、提高睡眠效率的优势仍然持续。

2. BBTI 能够减少新冠后失眠患者镇静催眠药物的使用,且长期疗效仍然保持。

3. 受新冠影响越大,患者感染后失眠越严重,BBTI 改善失眠的效果越显著。

草酸艾司西酞普兰治疗产后抑郁的效果研究进展

陈名捷 王艺明*
贵州医科大学

目的 产后抑郁是女性围产期常见的精神障碍性疾病,不利于产妇身心健康,也直接影响了全家的生活质量。其典型症状主要表现为:易激惹,愤怒,焦虑,沮丧、哭泣及困倦,通常丧失看护婴儿的能力。产后抑郁作为围产期自杀的首要病因,及早识别和治疗会降低围产期抑郁女性自杀率。目前认为产后抑郁症的发生与患者的心理、性激素变化等具有相关性。5-羟色胺再摄取抑制剂(SSRI)

是近年临床上广泛应用的抗抑郁药,而草酸艾司西酞普兰是现代药物中选择性最强的 SSRI 类药物,其不良反应明显小于其它 SSRI 类药物,而且起效快,副作用小。而产妇涉及哺乳问题,药物基本的治疗原则是其疗效与安全性,所以,探讨艾司西酞普兰对产后抑郁的诊疗效果是很有必要的。

方法 采用检索中国知网和 PubMed 数据库 2018 年至 2024 年相关文献,检索词为“产后抑郁;焦虑;艾司西酞普兰;影响”和“Postpartum Depression; Anxiety; Escitalopram; The effect”。排除旧的、重复的观念,对检索的文献整理归纳,总共纳入 30 篇文献进行分析讨论。

结果 艾司西酞普兰通常与其他药物或疗法联合使用治疗产后抑郁,如与米氮平联合治疗,可有效改善患者睡眠质量和心理状态,促使患者泌乳量增加,确保产妇和婴儿健康。与中药制剂如乌灵胶囊联合治疗产后抑郁可有效提高患者的神经递质水平,降低雌激素水平,缓解临床症状。

结论 目前针对症状、程度不同的 PPD 患者,虽有不同治疗措施可供选择,但无论是药物、物理、心理治疗,还是中医药治疗,均缺少足够 RCT 证据。由于 PPD 病理机制复杂,寻找针对 PPD 潜在病理生理学新疗法,以加强现有疗效,提高患者生活质量十分必要。此外,中西医在治疗 PPD 方面各有特点,值得进一步研究。物理治疗、心理治疗单独或与其他措施联合治疗 PPD 是同样值得探索的方向。总之,针对不同的 PPD 患者,需要根据生物、社会、家庭和心理等因素综合考虑,以提供个体化的最佳治疗方案。

非限制性的 5:2 轻断食联合代餐干预对重性精神障碍合并超重或肥胖患者肠道菌群影响的研究

祝福 吴小立* 叶志业
中山大学附属第三医院

目的 通过前瞻性、开放、非随机对照的临床干预试验,观察非限制性 5:2 轻断食联合代餐干预及未进行轻断食干预的合并超重或肥胖的重性精神障碍患者的体重、BMI、腰围、臀围、代谢指标、肠

道菌群及功能的变化。

方法 本研究依据纳排标准最终确定 63 名重性精神障碍合并超重或肥胖患者,根据患者意愿(是否接受非限制的 5:2 轻断食联合代餐的方式控制体重)非随机分为试验组及对照组,试验组患者进行为期 3 个月(12 周)的非限制性 5:2 轻断食联合代餐干预(在 12 周内的每周需按照 5 个正常饮食日+2 个连续或不连续的轻断食日进行轻断食),对照组不进行任何干预。收集受试者的一般人口学信息及临床病理资料,采集受试者干预前后粪便样本进行肠道菌群宏基因组测序,采集患者干预前后的血液样本进行代谢指标检测。采用多种统计学方法及生物信息学分析方法对受试者粪便肠道菌群数据进行分析,比较两组患者干预前后组内及组间的肠道菌群特征、并探索其与体重、腰围、臀围、BMI、代谢指标等的关联。

结果 1、试验组终点的体重、BMI、腰围、臀围较基线相比显著降低($p<0.05$);对照组终点的 CHOL、LDL-C 水平与基线时对比有显著升高($p<0.05$);试验组与对照组相比,体重、腰围、臀围有明显降低。

2、试验组与对照组在基线时的肠道菌群对比,在属水平,存在 2 个差异菌属,终点时两组组间存在 7 个差异菌属;在种水平,基线时两组比较,存在 3 个差异菌种,终点两组间存在 9 个差异菌种。

3、试验组与对照组肠道菌群差异基因所对应的功能的基线、终点两两相比,试验组肠道菌群的编码限制修饰系统功能增强,对照组编码嘌呤核苷酸生物合成、水解糖苷化合物功能增强。

4、干预后的差异菌群,在属水平, *Bacteroidetes* *Phascolarctobacterium* 丰度与腰围($p=-0.008$)、CHOL ($p=-0.002$)、TG($p=-0.036$)、LDL-C($p=-0.039$)呈负相关,与 BMI 呈正相关($p=0.002$);在种水平, *Parabacteroides distasonis* 丰度与 TG 变化呈正相关,与 CHOL 变化呈负相关。

结论 1、12 周的非限制性 5:2 轻断食联合代餐干预可降低合并超重或肥胖的重性精神障碍患者的体重、BMI、腰围、臀围,并可能具有优化其血脂代谢的作用;上述变化可能与部分肠道菌群的丰度变化有关

2、12 周的非限制性 5:2 轻断食联合代餐干预可能影响合并超重或肥胖的重性精神障碍患者部分菌群的丰度;肠道菌群差异基因所对应的功能变化可能与人体的免疫功能、尿酸代谢水平、脂肪分解

相关。

关键词: 重性精神障碍,肠道菌群,超重或肥胖,5:2 轻断食

卧床不起半年分离性运动障碍病例治疗分析

孙飞*

唐山爱欣精神康复医院

目的 通过分离转换障碍病例分析,个性化理解、掌握当代此种疾病的有效临床诊治方法。

方法 对分离性运动障碍病例的诊疗经过进行分析、归纳,总结当代分离转换障碍病例的个性化有效临床诊治方法。病例是 1 女性患者,21 岁,大专毕业生,学习成绩一般,性格开朗,随和,胆小。身体状况好,无烟酒等不良嗜好。母亲为当地医院医生,父亲为当地学校老师。患者的外祖母有抑郁病史。2023 年 7 月初患者因数次考试结果不理想(专接本考试未通过、护士资格考试未通过、事业编考试未通过),家人觉其没精神,走路时显得疲累,与家人交流少,情绪一般。同年 8 月中旬患者表妹考入“北师大”办升学宴,邀请患者参加。患者自觉跟妹妹差距很大,丢面子,强烈拒绝参加宴会。同年 8 月 25 日父母让其报名专升本的培训班,患者强烈拒绝,后出现头痛、心烦。同年 8 月 27 日早晨患者称自己不能动了,不能起床,但是具体哪里不舒服患者说不上来。同年 8 月 30 日患者自称脑袋里出了很多血,自己的瞳孔都变大了,要求家人拨打 120 电话。此后患者一直卧床至入院时,吃饭需家人喂食,在床上自主排便,很少与家人交流,日常躺在床上看手机视频,困了就睡觉。同年 10 月份,患者自称“脑子里有棵大树,有很多树枝和树叶,压得她不能起床”。2024 年 2 月份患者母亲找过算命先生,患者异常表现无改善,遂入院求治。神经系统检查等查体未见异常。头颅、颈部 CT 及腰椎 CT、胸部 DR 及血常规、生化、肝肾功能、甲功五项等未见异常。精神检查:意识清,定向力可,接触欠合作,平卧于床,眼神灵活,头颈部活动受限,简单交流可,不愿与医生深入交谈,表现的有些害羞、紧张。称就想父母陪着她,不想再与医生交谈,患者不认为目前的状态为异常。诊断分离性运动障碍。给予 MECT 治疗 6 次,阿立哌唑片(日高量 10mg)联合文拉法辛

缓释胶囊（日高量 225mg）治疗。经支持性、解释性、暗示性心理治疗，森田疗法治疗，住院环境行为治疗。

结果 患者病情明显改善，疗效较好。

结论 分离性运动障碍是一种不符合中枢或外周神经系统的解剖学或生理学的躯体功能紊乱，常发生在应激之后，可表现为肢体瘫痪、不随意运动、异常运动、共济失调、失用症、运动不能症、构音困难、抽搐等。治疗多以心理治疗为主、药物治疗为辅。心理治疗包括：暗示疗法、催眠疗法、行为疗法等。药物治疗多在抗精神病药物基础上联合使用心境稳定剂或抗抑郁剂、抗焦虑剂等。

孤独谱系障碍患儿适应能力与母亲养育压力的中介模型研究

翟天妤¹ 闫文洁¹ 杜亚松¹ 李焱¹ 江文庆¹ 林裕雄¹ 张喜燕²

1.上海交通大学医学院附属上海精神卫生中心

2.同济大学附属精神卫生中心

目的 分析孤独谱系障碍（ASD）患儿适应性能力与养育压力的关系，尝试建立母亲养育压力、焦虑情绪和家庭功能的中介模型，以期探究 ASD 患儿适应性能力对母亲和家庭的影响方式，为改善孤独谱系障碍患儿母亲心理健康和家庭功能提供科学依据。

方法 ①收集 ASD 患儿和其母亲的一般情况信息、儿童适应性行为评定量表第二版（ABAS-II）及母亲焦虑自评量表（SAS）、抑郁自评量表（SDS）、养育压力指数量表简版（PSI-SF）、家庭功能评定量表（FAD），使用 Excel 软件建立数据库。②使用 IBM SPSS 26.0 软件对一般情况进行描述统计，各量表得分进行夏皮洛-威尔克（S-W）正态性检验，各量表得分间进行皮尔逊（Pearson）双尾相关性检验和线性回归分析，使用 Process 插件中的模型 4 建立中介模型。

结果 ①截至目前招募 20 例 ASD 患儿和母亲；儿童平均年龄 13.69±2.85 岁，男女性别比为 2.33:1，儿童 ABAS-II 一般适应综合平均值为 82.95±14.84、母亲 SAS 标准分平均值为 41.10±9.39、SDS 标准分

平均值为 43.05±10.71、PSI-SF 总分平均值为 99.70±23.53、FAD 总的功能得分平均值为 2.18±0.47。

②患儿 ABAS-II 一般适应综合和母亲 PSI-SF 总分（ $p=0.015$ ）及 FAD 总的功能得分（ $p=0.024$ ）的相关性有统计学意义，母亲的 SAS 标准分与 SDS 标准分、母亲 PSI-SF 总分及 FAD 总的功能得分的相关性有统计学意义（ $P<0.001$ ）。③检验家庭功能（FAD 总的功能得分）在母亲养育压力（PSI-SF 总分）与母亲焦虑情绪（SAS 标准分）间的中介效应，母亲养育压力对母亲焦虑情绪的直接效应为 0.2724，家庭功能的中介效应为 0.0619，直接效应和中介效应分别占总效应的 81.51%、18.49%。④以患儿适应能力（ABAS-II 一般适应综合得分）为自变量，母亲养育压力（PSI-SF 总分）为因变量进行二元一次线性回归分析，标准化系数为 -0.45（ $t=-2.14$ ， $P<0.05$ ）。

结论 ①患儿适应能力与母亲养育压力负相关，与家庭功能正相关；母亲焦虑水平与抑郁水平正相关，与母亲养育压力负相关，与家庭功能正相关。②家庭功能在母亲养育压力与母亲焦虑情绪间的中介效应显著，为部分中介效应。③患儿适应能力可以预测母亲的养育压力，患儿适应能力越强，母亲养育压力越小。

关键词：孤独谱系障碍；儿童；适应能力；母亲；养育压力；中介模型

基于网络分析探讨孕妇抑郁的核心症状

王强¹ 汤思语² 杨海龙¹

1.南京大学医学院附属南京鼓楼医院医学心理科

2.南京河海大学出版社有限公司

目的 孕期对于女性的心理健康影响非常明显，其中抑郁症状是孕妇常见的心理问题之一。本研究将深入探究孕妇抑郁症状的网络特征，识别其核心症状，从而为临床更精准有效的干预提供潜在靶点。

方法 本研究选取了 760 名孕妇作为研究对象，以健康问卷抑郁症状群量表评估其抑郁症状。使用软件 R qgraph 包进行网络分析，核心症状使用中心性指标（中介性（betweenness）、接近性（closeness）和强度（strength）进行衡量，中心性指标越高，表明症状越核心。选取中心性整体排名前 4 位的症状作为核心症状。网络的准确性和稳定性评估由 R 包

bootnet 实现。

结果 研究结果显示,疲倦(Bet=3, Clo=0.01477, Str=1.01735),心境抑郁(Bet=6, Clo=0.016659, Str=0.964862),内疚/无价值感(Bet=9, Clo=0.016812, Str=0.950173),烦躁不安(Bet=6, Clo=0.01572, Str=0.906003)是孕妇抑郁症状网络中的核心症状。症状网络节点强度、接近性、中介性的相关稳定性系数分别为 0.595、0.439、0.128,表明其具有较高的稳定性。

结论 本研究首次运用网络分析法研究了孕妇抑郁症状的网络特征,结果表明“疲倦”、“心境抑郁”、“内疚/无价值感”、“烦躁不安”是抑郁网络的核心症状,在网络中具有较高的地位和影响,表明它们对整体抑郁症状网络的严重程度起着关键作用。临床医师可以考虑以这些关键症状为主要干预靶点,可能会最大程度地降低整个抑郁症状网络的严重程度,从而更有效地改善孕妇的抑郁程度。

负性情绪图片处理中的显著性别效应: 基于抑郁症及 fNIRS 的研究

冉琴 李清伟*

上海市同济医院

目的 本研究作为寻找抑郁症客观生物标志物研究的一部分,旨在探究不同性别的抑郁症患者和健康对照组在不同情绪图片被动注视任务中前额叶皮质(prefrontal cortex, PFC)激活情况,为女性和男性之间不同精神病理过程提供线索。

方法 2023年4月-11月招募到抑郁症患者20例,健康受试者20例,其中女性25例,男性15例。使用22通道日立ETG-4100功能近红外光谱(functional near-infrared spectroscopy, fNIRS)成像仪采集被试被动观看正性、中性、负性情绪图片时的fNIRS数据。采用MATLAB2013及NIRS_SPM处理fNIRS数据,使用SPSS25进行两因素方差分析, $P < 0.05$ 被视为有统计学显著性。

结果 对于负性图片,抑郁症和健康对照组激活强度所有通道均无统计学差异($P > 0.05$),但一半通道(通道1、4、5、6、11、15、16、17、19、20、21)显示出显著的性别主效应($P < 0.05$),且女性激

活强度均值大于男性。对于正性图片,两组激活强度在通道10有统计学差异($P < 0.05$);对于中性图片,两组激活强度在通道9、18有统计学差异($P < 0.05$),对于这两种情绪图片未显示出性别上的激活差异($P > 0.05$)。

结论 男性和女性对于负性情绪图片处理存在fNIRS可检测到的激活差异,且在前额叶皮层女性对于负性情绪图片的反应强度大于男性;在正性和中性图片中未见这种性别上的差异,但对于这两种图片抑郁患者及健康对照部分通道存在激活强度差异。

围产期妇女失眠障碍及生活质量现况调查

杨源¹ 曾瑾¹ 李文高²

1.广东省人民医院

2.中国人民解放军南部战区总医院

目的 鉴于失眠对围产期妇女的健康状况和生活质量的负面影响,本文旨在探究中国围产期妇女失眠障碍的患病率、影响因素及与生活质量的关系。

方法 采用线上问卷调查法,选择2020年6月-2020年9月期间我国围产期妇女作为研究对象,使用基于DSM-IV精神疾病诊断手册的三个标准化失眠诊断条目来评估被试的失眠症状,并使用世界卫生组织生活质量问卷(WHOQOL-BREF)来评估其生活质量。采用单因素分析、多因素逻辑回归方法进行数据分析。

结果 共有1,226名围产期妇女参与研究,最终有1,060名(86.46%)完成了全部心理量表评估。研究发现,共有116名女性(10.94%, 95%CI=9.06%-12.83%)报告过去一个月内存在失眠症状。其中,69人(6.51%, 95%CI=5.02%-8.01%)报告了入睡困难,53人(5.00%, 95%CI=3.69%-6.31%)报告睡眠维持困难,48人(4.53%, 95%CI=3.27%-5.78%)报告了早醒症状。逻辑回归分析发现,具有较高教育背景(大学或以上, OR=0.587, 95%CI=0.379-0.907, $P=0.016$)的女性报告失眠症状的可能性较小,而报告躯体共病(OR=2.250, 95%CI=1.386-3.651, $P=0.001$)的女性则更容易报告失眠症状。此外,失

眠与健康相关的生活质量受损显著相关 ($F=14.332$, $P<0.001$)。

结论 本研究发现, 约十分之一的围产期妇女在近一个月内报告了失眠症状。鉴于失眠对健康和生活质量的负面影响, 医护人员应定期对该人群进行失眠筛查。对于怀孕期间和怀孕后失眠的女性, 应提供适当的干预措施, 如睡眠卫生教育、放松技巧和失眠的认知行为治疗等干预手段改善其失眠状况。有针对性的失眠治疗将有利于提高患者的睡眠质量和生活质量。

The Gut Microbiota As A Potential Biomarker in Methamphetamine Use Disorder: Evidence From Two Independent Datasets.

Linzi Liu Yanqing Tang*

Shengjing Hospital of China Medical University

Objective Methamphetamine use disorder (MUD) poses a considerable public health threat, and its identification remains challenging due to the subjective nature of the current diagnostic system that relies on self-reported symptoms. Recent studies have suggested that MUD patients may have gut dysbiosis, and gut microbes may be involved in the pathological process of MUD. We aimed to examine gut dysbiosis among MUD patients and generate a machine-learning model utilizing gut microbiota features to facilitate the identification of MUD patients

Methods Fecal samples from 78 MUD patients and 50 sex- and age-matched healthy controls were analyzed by 16S rDNA sequencing to identify gut microbial characteristics that could help differentiate MUD patients from healthy controls. Based on these microbial features, we developed a machine learning model to help identify MUD patients. Besides, we used public data to verify the model, which were downloaded from a published study conducted in Wuhan, China (with 16 MUD patients and 14 HCs). Furthermore, we explored the gut microbial features of MUD patients within the first three months of withdrawal, and try to identify the

withdrawal period of MUD patients by microbial features

Results The results revealed that MUD patients exhibited significant gut dysbiosis, including decreased richness and evenness and changes in the abundance of certain microbes, such as Proteobacteria and Firmicutes. Based on the gut microbiota features of MUD patients, we developed a machine learning model that demonstrated exceptional performance with an AUROC of 0.906 in identifying MUD patients. Additionally, when tested using an external and cross-regional dataset, the model achieved an AUROC of 0.830. Moreover, MUD patients within the first three months of withdrawal exhibit specific gut microbiota features, such as Actinobacteria significantly enrichment. The machine learning model had an AUROC of 0.930 in identifying the withdrawal period of MUD patients

Conclusion In conclusion, the gut microbiota is a promising biomarker for identifying MUD. Our study presents a potential approach to improving the identification of MUD patients. Future longitudinal studies are needed to validate these findings

基于概率学习的空间注意偏向任务探讨抑郁症注意抑制功能及 iTBS 模式的调控作用

胡兰^{1,2} 邱男^{1,2} 刘芳¹ 陈勇^{1,2}

1.成都市第四人民医院

2.电子科技大学成都脑科学研究院临床医院

目的 注意力功能损伤是抑郁症发作期及缓解期的主要症状之一, 然而具体机制并不清楚。本研究旨在通过神经认知心理学范式联合神经电生理分析系统地研究抑郁症患者的空间注意抑制功能, 并探讨 iTBS 刺激模式对抑郁症患者注意认知功能的潜在调控作用及相关电生理机制, 为未来的抑郁靶症状调控研究提供依据。

方法 本研究共纳入 16 名符合 DSM-5 重性抑郁障碍诊断标准的疾病被试和 16 名健康被试。采用

基于概率学习的空间注意抑制任务评估两组被试干预前后的反应时间,同步采集64导联脑电信号并分析偏侧化事件相关脑电成分(N1pc、N2pc、Pd)。干预时采用Brainsight神经导航系统对两组被试的左侧背外侧前额叶皮层(dLPFC)进行定位并予以单日2次iTBS模式调控,比较两组被试经过单日精准调控后的行为学表现及神经电生理指标的差异。

结果 基线水平下,行为学指标显示患者组完成空间注意偏向任务的反应时间比健康组更长($t=2.49, p<0.05$)。基线水平下,神经电生理指标显示,健康组在高概率学习位置所诱发的注意抑制Pd成分潜伏期早于低概率学习位置($t=3.56, p<0.05$),提示健康组存在概率学习相关的干扰物抑制效应;然而,患者组并不存在这样的学习效应,表现为患者组在高低概率两个学习位置诱发的Pd成分无差异($t=1.54, p=0.15$),并且,患者组在各条件下均诱发出N1pc成分,提示任何特征突出的物体均能捕获抑郁症患者的注意力。单日调控后,两组被试在低概率位置上反应时间均较基线水平显著减少($t_s>2.10, p_s<0.05$),且抑郁组在低概率位置上诱发出更大振幅的N2pc($t=3.03, p<0.05$),经过调控后的抑郁组出现延迟Pd成分,且在低概率条件下诱发出的Pd成分早于高概率学习位置($t=2.82, p<0.05$),提示iTBS可能对低概率位置有调控作用,且可能改善抑郁患者的空间概率学习抗干扰能力。

结论 抑郁症患者可能存在基于概率学习的空间注意抑制功能损伤,iTBS经颅磁刺激可能有助于改善抑郁症患者对于干扰物体的抑制能力,并通过对低概率位置的调控作用从而整体上改善了患者的注意认知功能。

老年抑郁症的中医体质研究进展

徐春燕*

北京回龙观医院

目的 老年抑郁症是老年人群最常见的精神疾

病之一,通常指的是60岁及以上首次发作的原发性抑郁。随着社会人口快速老龄化,老年抑郁症的患病率将不断增长,给老年人群身心健康带来巨大危害。老年抑郁症的发生是生物、社会心理等多种因素所致,因此其病因病机也错综复杂。基于“辨病-辨证-辨体”三位一体的中医诊疗思维,从老年抑郁症的中医体质出发,把老年抑郁症的诊疗和中医体质结合起来进行研究,通过探讨老年抑郁症患者的中医体质特征,加深对老年抑郁症患者中医体质的认识,为进一步深入研究老年性抑郁症病因病机及临床辨证论治提供思路,以期对老年性抑郁症的预防及治疗提供新的参考依据。

方法 通过文献检索的方法,查阅近年来关于老年抑郁症中医体质的相关文献,总结近年来老年抑郁症患者从中医体质方向出发研究的成果。

结果 多数研究显示老年性抑郁症患者体质以偏颇体质为主,其中气郁质、气虚质、阳虚质、阴虚质多见,尤其以气虚质、气郁质最为突出。

结论 老年抑郁症与患者体质密切相关,气郁质、气虚质、阳虚质、阴虚质是老年抑郁症患者的重要致病特质,临床对老年抑郁症防治的辨体调护应重视这一点,辨证用药方面在梳理气机的同时,要重视扶助正气、顾护阳气及滋阴润燥的补益方法。中医治疗老年抑郁症,在治疗疾病的同时,从不同维度改善体质,体现中医标本兼治的核心理念及治疗优势。

Comparative Safety of Antipsychotic Medications During Pregnancy: A Systematic Review and Network Meta-Analysis

Enhui Wang Yanqing Tang*

Department of Psychiatry, Shengjing Hospital of China Medical University

Background A network meta-analysis were performed to evaluate the risk of congenital malformations and other prenatal outcomes in fetuses after exposure to antipsychotics during pregnancy

Methods We searched the PubMed, EMBASE,

and Cochrane CENTRAL databases up to December 15, 2023, to identify observational studies comparing anti-psychotic treatment with control treatment (no exposure). The data were extracted and assessed for risk of bias. We used R and Stata software to conduct analysis using Bayesian network meta-analysis methods

Results The literature search identified 28,434 potentially relevant records; ultimately, 32 studies covering 3,042,997 pregnant women were included. Compared to that in the unexposed group, the risk of congenital malformations was significantly greater in the aripiprazole, olanzapine, risperidone and lithium groups. Network meta-analysis revealed that lurasidone was the safest medication among the included drugs, followed by ziprasidone and quetiapine, while carbamazepine posed a greater risk. However, the results should be interpreted with caution, and further studies are needed to provide more evidence

Conclusion The evidence from this analysis suggests that lurasidone, ziprasidone, and quetiapine are less teratogenic and safer for use by pregnant women. However, it is important to use lurasidone and ziprasidone with caution, and additional clinical studies are necessary.

Risk Factors for Cognitive Function in Elderly Residents of Rural Northeast China: A Real-World Study

Enhui Wang Yanqing Tang*

Department of Psychiatry, Shengjing Hospital of China Medical University

Background Cognitive impairment and dementia are major challenges faced by the elderly population during aging. However, the cognitive status of the elderly in rural Northeast China remains to be investigated. Therefore, we utilize cross-sectional data and Mendelian randomization (MR) analysis of the elderly population in rural Northeast China to reveal the risk

factors affecting their cognitive function

Objective This study first utilizes data on the epidemiological characteristics of cognitive function and related risk factors collected in Beizhen City, Liaoning Province, in 2023 to explore the influencing factors of cognitive function in the rural elderly population through Lasso regression and multiple linear regression

Results After Lasso regression and multiple stepwise regression analysis, the results showed that educational level, body fat percentage, social support, albumin, systolic blood pressure, snoring, age, depression level, reading, household income, and waist-to-hip ratio are the main influencing factors of cognitive function

Conclusions This study provides updated data on the prevalence of cognitive impairment among the elderly population in rural northeastern China and offers new insights into the underlying mechanisms. To prevent cognitive decline in the elderly, efforts should focus on improving education, enhancing social support, managing chronic health conditions, and improving sleep quality, thereby enhancing the quality of life and well-being of the elderly

Association between Acne Vulgaris and Premenstrual Disorders: A Cross-sectional Analysis of College Students in China

Yuchen Li* Qing Pan Jiantong Sun Nuo Zhou Liu Donghao Lv

West China Hospital, Sichuan university

Objective Premenstrual disorders (PMDs) are prevalent among women of reproductive age and have negative impacts on their physical and mental well-being. Previous studies have demonstrated a close association between acne and psychological issues. However, the relationship between acne and PMDs remains inconclusive. Hence, we conducted this cross-sectional study to explore the potential association between acne and PMDs

Methods This cross-sectional study involved young female adults recruited from the Care of Premenstrual Emotion (COPE) prospective cohort study in China. PMDs were assessed using the Calendar of Premenstrual Experiences, and the acne status was evaluated using a standard questionnaire, which contains four levels: 1. No obvious acne, 2. Mild acne, 3. Moderate acne, 4. Severe acne. Participants are divided into two groups based on the severity of acne: group I.no/ mild; group II.moderate/ severe.Multivariate regressions, adjusted for potential confounders, were conducted to investigate the associations between PMDs and acne status. Furthermore, the associations of acne status with PMD subtypes of different onset time and severity were explored

Results The study included 1507 participants (mean age= 20.0 [standard deviation 2.00]), of whom 366 (24.3%) reported having PMDs. 616 (40.88 %) and 424 (28.24 %) students reported have mild acne and moderate/ severe acne, respectively. The mild acne and moderate/ severe acne status showed an association with a increased incidence of PMDs (OR=1.30[95% Confidence interval 0.95–1.79] and 1.51(1.08-2.13), respectively; P for trend=0.017). No significant differences were observed in the associations between the acne status and different PMD subtypes

Conclusion Acne status is significantly associated with an increased risk of PMDs, though the causal relationship between acne and PMDs need to be explored

微生物-肠-脑轴在双相障碍治疗中的研究进展

郭振波¹ 郭振波⁴ 桑文华^{2,3} 桑文华¹

1.河北省精神卫生中心

2.河北省重大精神与行为障碍疾病研究重点实验室

3.河北大学第六临床医学院

4.华北理工大学研究生学院

目的 双相障碍 (Bipolar disorders, BD) 具有疗效差、复发率高等特点, 其病理生理学机制仍不清楚, 肠粘膜和大脑之间的双向沟通系统, 即肠脑轴, 在维持身体和大脑功能之间的稳态方面发挥着重要作用, 几项研究表明, 肠道微生物群改变肠脑轴活动, 这一概念现在被广泛接受为微生物-肠-脑 (Microbiota-Gut-Brain, MGB) 轴。MGB 轴影响机体的基因调控与表达、氧化应激、全身慢性炎症与神经炎症、神经递质调控等诸多方面。本文将从 MGB 轴的角度分析双相障碍的病理生理学机制及其治疗干预效果, 以期对双相障碍的诊治提供新思路。

方法 作者于 2024 年 5 月在中国知网、万方数据知识服务平台、PubMed, 使用检索词“双相情感障碍/bipolar affective disorder”或“双相障碍/bipolar disorder”、“脑肠轴/brain-gut axis”、“微生物群-脑-肠轴/microbiota-gut-brain axis”、“双相障碍/bipolar disorder (BD)”AND“肠道微生物/gut microbiota”、“益生菌/probiotics”AND“双相障碍/bipolar disorder (BD)”进行文献检索, 纳入国内外数据库建库至 2024 年发表的相关研究文献。纳入标准: 文献中患者的诊断符合双相障碍的标准; 与微生物群-肠-脑轴或双相障碍治疗或治疗机制相关的中文或英文文献。排除标准: 文献语言为非中英文文献; 重复文献; 研究设计不合理或期刊质量较低的文献; 文章评述, 会议论文等。通过文献纳入及排除标准对文献进行全面的审阅, 最后纳入参考的文献共 47 篇。

结果 人体的肠道是一个复杂的微生态系统, 其中生存着大量的微生物, 目前的研究主要集中在肠道菌群上, 除此之外还有病毒、真菌及古生菌等。这些肠道微生物相互作用, 共同影响 BD 的病理生理学机制。其中肠道微生物血清代谢物是值得注意的, 多项研究都发现了短链脂肪酸的抗炎作用及情绪稳定作用, 它还参与肠道屏障的维持。常用的 MGB 轴干预包括口服益生菌干预、菌群移植干预、饮食干预、迷走神经刺激治疗, 均展现出了积极的治疗效果。

结论 肠道微生物群及其代谢物和肠道通透性可能在 BD 的发生发展中起到重要的作用, 但各种假说并不能完全解释目前的发现。MGB 轴干预在 BD 的治疗上具有相当的潜力, 但对于肠道生态的干预大多停留在菌群上。其中口服益生菌或益生元是一种不错的选择, 然而在这些研究中, 其疗效并不确切, 因此, 进一步研究可以针对菌株及给药方式

的选择,以更好的改善肠道微生态,这或许还需要其他学科共同参与。

Family Cohesion and Adaptability in Teachers with Depression in Liaoning, China

Mengxue Li Lingtao Kong Yanqing Tang*

Department of Psychiatry, The Shengjing Hospital of China Medical University,

Objective We aimed to research how depression affects family cohesion, family adaptability, and family function among teachers

Methods We surveyed teachers in Liaoning Province, China ($n = 2944$) through questionnaires using Family Adaptability and Cohesion Evaluation Scale (FACES II-CV) and Patient Health Questionnaire-9 (PHQ-9). We compared family function between teachers with and without depression

Results We detected that 21.5% of teachers suffered from depression. The mean cohesion score of teachers with depression was higher than teachers without depression (65.06 ± 5.54 vs. 63.35 ± 4.86), whereas the mean adaptability score of teachers with depression was lower (44.13 ± 7.11 vs. 46.94 ± 6.03). When we adjusted the possible confounders, including sex, age, the current work situation, grade, and previous insomnia or emotional disorders in the logistic regression analysis, the odds ratio (OR) for balanced family function decreased significantly compared with the midrange family function when we compared teachers with and without depression (OR: 0.563; 95% CI: 0.461 to 0.688), whereas the OR for extreme family function did not increase significantly (OR: 1.116; 95% CI: 0.733 to 1.699)

Conclusion Significant differences existed in family cohesion, adaptability between Chinese teachers with and without depression and conducting appropriate family interventions is crucial

关键词: Depression, Teacher, Family cohesion and adaptability,

FK506 结合蛋白 5 基因在心境障碍治疗中的应用进展

张家恺^{1,4} 桑文华^{1,2,3} 郭振波^{1,4} 张振宇^{1,2,3}

1.河北省精神卫生中心

2.河北省重大精神与行为障碍疾病研究重点实验室

3.河北大学第六临床医学院

4.华北理工大学研究生院

目的 下丘脑-垂体-肾上腺轴 (HPA) 的功能失调与心境障碍的发生相关, FK506 结合蛋白 5 (FKBP5) 是一种糖皮质激素受体 (GRs) 伴侣蛋白, 通过调节 GR 敏感性进而调节 HPA 功能。将 FKBP5 基因及其在心境障碍药物治疗、电休克治疗、FKBP5 拮抗剂中的应用进行综述并展望, 总结 FKBP5 基因在心境障碍治疗中的进展。

方法 以 FKBP5 基因、心境障碍作为检索词, 检索中国知网、Pub Med 数据库, 检索时限为 2018 年至 2023 年中涉及 FKBP5 基因与心境障碍的药物治疗、电休克治疗及 FKBP5 拮抗剂的相关文献及其中涉及参考文献并进行总结分析。

结果 其中共选入 40 篇相关研究, 其中涉及 FKBP5 机制文献共 18 篇, 抗抑郁药物文献 6 篇, 情绪稳定剂文献 4 篇, 电休克治疗文献 6 篇, FKBP5 拮抗剂文献 4 篇, 其中抗抑郁治疗对 FKBP5 基因表达影响结果不一致, FKBP5 基因多态性有望成为预测锂盐治疗反应的生物标记物, 而电休克治疗能够改变情感障碍患者的 FKBP5 基因表达水平, 且 FKBP5 基因有望成为抗抑郁治疗的新靶点。

结论 FKBP5 基因与情感障碍疾病的疗效具有一定的相关性。目前, 尽管相关研究证明了 FKBP5 基因与情感障碍疾病治疗之间的关系, 但研究结果并不相同, 仍然存在矛盾。因此, 在临床实践及研究中应注重于 FKBP5 基因与治疗疗效的关系。另外, FKBP5 基因的相关检测在不同的生物样本中的结果不同, 建议在进一步的研究中选择合适的生物学样本。未来的研究应侧重于 FKBP5 基因与临床常用治疗方案的疗效及预后的相关性。

童年创伤对女性双相情感障碍患者认知功能、焦虑症状、社会功能的影响及相关性分析

刘晓平^{1,2} 陈春武² 王大海²

1.沈阳医学院

2.沈阳市精神卫生中心

目的 童年创伤与女性双相情感障碍患者之间的关系一直备受关注,过去的研究表明,女性更容易经历童年创伤。然而,目前对于童年创伤对女性双相情感障碍患者认知功能、社会功能和焦虑水平影响的研究还相对较少。因此本研究深入探讨童年创伤对双相情感障碍女性患者的认知功能、焦虑症状及社会功能的影响及相关性。

方法 入组 2024 年 3 月至 2024 年 6 月于沈阳市精神卫生中心住院的稳定期双相情感障碍女性患者 53 名,采用童年期创伤问卷(CTQ-SF),将患者分为 2 组,伴童年创伤组(n=28),不伴童年创伤组(n=25)。采用蒙特利尔认知评估量表(MoCA)评估患者的认知功能;采用汉密尔顿焦虑量表(HAMA)评估患者焦虑症状;采用社会功能缺陷筛选量表(SDSS)评估患者社会功能。两组间比较采用独立样本 T 检验,相关性分析采用 spearman 相关分析。统计软件采用 SPSS23.0。

结果 1.两组患者年龄,文化程度无显著差异; 2.伴童年创伤组比不伴童年创伤组蒙特利尔认知评估量表得分显著降低($t=-3.211, P<0.05$);汉密尔顿焦虑量表评分显著增高($t=2.688, P<0.05$);社会功能缺陷筛选量表评分显著增高($t=2.955, P<0.05$); 3.伴童年创伤组童年期创伤问卷得分与认知功能呈负相关($r=-0.530, p<0.05$);躯体忽视与抽象能力呈负相关($r=-0.451, p<0.05$);情感虐待、情感忽视与定向力呈负相关($r=-0.405, r=-0.415, p$ 均 <0.05);性虐待与焦虑症状呈正相关($r=0.683, p<0.05$)。

结论 童年创伤可能是女性双相情感障碍患者认知水平、焦虑症状、社会功能的影响因素,童年创伤与女性双相情感障碍患者的认知功能和焦虑症状有相关性,其中躯体忽视与抽象能力呈负相关;情感虐待、情感忽视与定向力呈负相关;性虐待与焦虑症状呈正相关。因此,探究童年创伤对女性双相情感障碍患者的心理影响,可能为双相情感障碍女性患者个体化治疗及早期干预提供理论支持。

关键词:童年创伤 双相情感障碍 女性 认知功能 焦虑症状 社会功能

The Benefits and Therapeutic Effects of Handcrafting on Women's Mental Health

Zengyan Sun*

China Medical University First Affiliated Hospital

Objective This study aims to explore the positive and therapeutic effects of handcrafting activities, such as knitting, crocheting, quilting, and paper quilling, on women's mental health. The research seeks to understand the underlying mechanisms that make these activities appealing to women despite their busy schedules, and to investigate why they are willing to sacrifice valuable time to engage in handcrafting. This study aims to fill the gap in current mental health research by providing empirical evidence on the mental health benefits of handcrafting, which is underrepresented in the academic literature.

Methods This study employs a mixed-method approach, combining quantitative surveys, qualitative interviews, and neuroimaging techniques. A sample of 200 women aged 25-50 years who regularly participate in handcrafting activities will be recruited from community groups and online forums.

Quantitative data will be collected using standardized questionnaires measuring levels of stress (Perceived Stress Scale), anxiety (Generalized Anxiety Disorder 7-item scale), depression (Patient Health Questionnaire-9), and overall well-being (WHO-5 Well-being Index) at baseline and after a six-month period of regular handcrafting.

Qualitative data will be obtained through semi-structured interviews with a subset of participants, exploring their experiences, motivations, and perceived benefits of handcrafting. The interviews will be audio-recorded and transcribed verbatim for thematic analysis.

Neuroimaging data will be collected using functional magnetic resonance imaging (fMRI) and other brain imaging techniques. Neuroimaging assessments

will be conducted before the participants begin their handcrafting activities, during the activities, and after completing a session. These assessments will measure changes in brain activity and connectivity associated with stress, relaxation, and emotional processing.

Results Preliminary findings suggest that repetitive handcrafting activities induce a state of mindfulness, similar to meditation, which significantly reduces stress and promotes relaxation. Neuroimaging data is expected to show increased activation in brain regions associated with relaxation and decreased activation in regions associated with stress. Additionally, social interactions during group crafting sessions provide emotional support, reduce feelings of isolation, and foster a sense of community. The creative process and the sense of accomplishment from completing projects enhance self-esteem and contribute to overall mental well-being. Engagement with colors and patterns during crafting activities also stimulates positive emotional responses and enhances aesthetic appreciation

Conclusion Handcrafting has significant therapeutic potential for enhancing women's mental health by providing stress relief, promoting social support, facilitating creative expression, and enhancing mindfulness. This study contributes empirical evidence, including neuroimaging data, to support the incorporation of handcrafting activities into holistic mental health strategies for women. By filling the gap in the current literature, this research underscores the importance of integrating handcrafting into mental health interventions, promoting a multifaceted approach to improving women's mental well-being

关键词: Handcrafting Women's Mental Health Therapeutic Effects Stress Relief Creative Expression Mindfulness, Social Support, Neuroimaging, fMRI

女性强制戒毒人员精神病态与毒品渴求关系: 抑郁症状中介作用

毛富强* 王玲
天津医科大学

目的 探究女性强制戒毒人员精神病态、抑郁症状和毒品渴求间的关系。

方法 采用整群抽样的方法, 将天津市女子强制戒毒所 309 名女性强制戒毒人员作为研究对象。纳入标准: ①完成生理脱毒期且无戒断反应; ②认知功能正常; ③在知情同意的基础上自愿参加本次调查; ④无严重躯体或精神疾病。研究者将她们分为 6 组, 每组 50 人左右, 以团体无记名的形式分段施测。现场发放问卷, 现场收回。本次共发放问卷 309 份, 剔除无效问卷(漏答, 人口学信息不完整) 获得有效问卷 305 份, 回收有效率为 98.71%。采用莱文森精神病态自评量表(LSRP)、流调中心抑郁量表(CES-D)、毒品渴求视觉模拟标尺(VAS)对天津市 305 名女性强制戒毒人员进行调查, 用 SPSS 25.0 进行数据分析。

结果 (1) 初级精神病态与毒品渴求存在显著正相关, 次级精神病态、抑郁症状与毒品渴求之间存在显著正相关。(2) 结果显示, 次级精神病态影响毒品渴求的总效应为 0.23 (SE=0.06, 95%CI=[0.12,0.34]), 抑郁症状在次级精神病态与毒品渴求关系间的间接效应为 0.10 (SE=0.03, 95%CI=[0.04,0.16]), 占总效应的比例为 43.48%。采用偏差校正的百分位 Bootstrap 法对抑郁症状在次级精神病态与毒品渴求关系间的中介作用进行检验, 以上 Bootstrap 95% 置信区间均不包含 0, 表明抑郁症状在次级精神病态与毒品渴求关系间的中介效应显著。

结论 本研究结果发现抑郁症状在天津市女性强制戒毒人员精神病态和毒品渴求之间起部分中介作用, 次级精神病态可以正向预测毒品渴求, 也可以通过抑郁症状间接预测毒品渴求。

关键词: 女性, 强制戒毒人员, 精神病态, 毒品渴求, 抑郁症状

55~79 岁人群下肢皮下脂肪率与认知功能的关系

王蕾 汤艳清*

中国医科大学附属盛京医院

目的 了解 55~79 岁人群下肢皮下脂肪率与

认知功能及不同维度的关系相关性,从而提高人们的身材管控意识,降低成年人出现认知障碍风险以及为更精细化的干预和治疗认知障碍提供理论依据。

方法 采用多中心横断面调查方法纳入 2023 年 7 月~8 月在北镇市各乡镇招募 55~79 岁人群 762 人。采用多频生物电阻抗测定法(BIA)得到下肢皮下脂肪率。根据简易精神状态评估(MMSE)评定认知功能。MMSE 主要评估定向力、记忆力、注意力和计算力、回忆能力和语言能力五个维度。使用 SPSS 26.0 进行多重线性回归分析, R4.3.3 进行桥接网络分析。

结果 多重线性回归分析显示,在控制了年龄、性别、受教育程度、吸烟、喝酒、抑郁情况、血糖、血脂和血压等协变量后,下肢皮下脂肪率与整体认知功能和语言能力呈正相关($P<0.05$),下肢皮下脂肪率与定向力、记忆力、注意力和计算力、回忆能力之间没有显著性。在下肢皮下脂肪率与认知的桥接网络模型中,回忆、语言和下肢皮下脂肪率是最核心的领域。

结论 在这项研究中,下肢皮下脂肪率是认知功能的保护因素,特别是与语言能力有关的认知功能,因此,我们可以通过控制下肢皮下脂肪率来提升以语言能力为主的认知功能。

关键词: 认知功能,下肢皮下脂肪率,桥接网络

Correlation Between Life Satisfaction and Symptoms of ADHD in Dental Students: The Mediation of Resilience

Yuwei Sun Yanqing Tang*

Shengjing Hospital of China Medical University

Objective Given the increasing socioeconomic burden of ADHD, existing studies on ADHD symptoms are significantly underrepresented among dental students. We conducted this research to (1) analyze the morbidity of ADHD symptoms in dental students in China, (2) explore the relationship between life satisfaction and two ADHD symptoms among dental students, and (3) explore the mediation between life satisfaction and ADHD symptoms

Methods The research was a cross-sectional investigation. It was carried out in May 2023 at a medical university in China. "Wenjuanxing," a well-known professional online survey platform, was used to conduct questionnaire surveys and collect data. Authors can access information that identifies individual participants during or after data capture. A stratified cluster sampling method was used to recruit participants based on academic years. Initially, 75 students were recruited from each academic year. The inclusion criteria were as follows: major in stomatology, full-time undergraduate, and a negative screening on the Self-Rating Depression Scale (SDS) and Self-Rating Anxiety Scale (SAS). The exclusion criteria were as follows: non-stomatology major, part-time undergraduate, master, PhD, MD, and a positive screening on the SDS and SAS. All students participated voluntarily and were informed of the study's purpose before answering the questionnaire. At the beginning of the questionnaire, we included a link for informed consent. The participants who answered the questionnaire were considered to have signed a written informed consent agreement before answering the questionnaire. The Medical Ethics Committee of China Medical University authorized the study. We surveyed 297 dental students. A total of 291 completed a self-report scale consisting of the Adult ADHD Self-Report Scale, Wender Utah Rating Scale (WURS), Life Satisfaction Scale, and Conner-Davidson Resilience Scale. The study used hierarchical linear regression analysis, resampling, and asymptotic strategies for data processing

Results A total of 297 questionnaires were distributed, of which 291 were valid (effective rate 98.0%). Four of the six invalid questionnaires required less than 1 second per question, on average, and the remaining two could not be answered in full. A total of 120 male and 171 female participants provided valid responses

On the WURS, 91 students scored 46 or more. They were evaluated using the ASRS scale. Participants were assigned to the ADHD symptom positive screening group if the scores of questions 1 to 3 in Part A (the first six) were greater than or equal to three, the scores of questions 4 and 5 were at least four, and more than four of the six questions met the above standards. A total

of 20 people matched the above conditions. In the positive and negative screening groups. The positive rate among women was lower than that reported by men ($p = .025$). The three groups differed significantly in paternal educational level ($p = .046$). Significant differences were not detected between the two groups in age ($p = .794$), race ($p = .216$), place of residence ($p = .830$), academic year ($p = .652$), only child status ($p = .865$), and maternal education level ($p = .520$). The asymptomatic group had significantly higher ranks of life satisfaction ($p < .05$) and resilience ($p < .05$) than the symptomatic group.

Both hyperactivity and inattention were negatively associated with life satisfaction (hyperactivity: $r = -.190$, $p < .05$; inattention: $r = -.121$, $p < .05$) and resilience (hyperactivity: $r = -.258$, $p < .05$; inattention: $r = -.177$, $p < .05$). Life satisfaction was significantly positively correlated with resilience ($r = .752$, $p < .05$).

Hyperactivity and inattention explained 4% of the differences in life satisfaction. A significant negative correlation was detected between hyperactivity and life satisfaction after controlling age and gender ($\beta = -.26$, $p < .05$). Resilience strongly and positively affected life satisfaction. ($\beta = .75$, $p < .05$). It explains 53% of the variable of life satisfaction.

Resilience has a significant mediating effect between student life satisfaction and inattention. ($a \times b = -0.199$, $p < .05$). Resilience significantly moderates the correlation between life satisfaction and hyperactivity ($a \times b = -0.159$, $p < .05$).

Conclusion This study's results show that the positive screening rate for ADHD symptoms in general adult populations is lower than that among Chinese dental students. Paternal education level is related to the positive screening rate for ADHD symptoms. Of the two ADHD symptoms, only hyperactivity was significantly associated with life satisfaction. Distinct mediation of resilience was found between life satisfaction and ADHD symptoms. The findings of the study can ensure the early detection of ADHD symptoms in dental students to enhance the mental health level of future dentists to a certain extent. Resilience intervention programs can improve dental students' life satisfaction, especially for students with ADHD symptoms

关键词: dental students, resilience, life satisfaction, ADHD symptoms

合并自杀行为的重性抑郁障碍患者的静息态脑影像学研究

刘宇昂 周一芳 汤艳清*

中国医科大学附属盛京医院

目的 探讨有无自杀行为史的重性抑郁障碍患者静息态大脑活动的异同,寻找合并自杀行为的重性抑郁障碍患者脑区的特异性改变。

方法 本研究共纳入合并自杀行为的重性抑郁障碍患者 76 名,不合并自杀行为的重性抑郁障碍患者 100 名以及健康志愿者 100 名。所有被试均排除核磁共振禁忌症,头部外伤史。所有被试均完成临床和人口学信息访谈、使用 DSM-5 障碍定式临床检查 (Structured Clinical Interview for DSM-5 Disorders, SCID-5), 24 项汉密尔顿抑郁量表 (Hamilton ratingscale for depression, HAMD-24), 汉密尔顿焦虑量表 (Hamilton ratingscale for anxiety, HAMA), beck 自杀意念量表 (BSI), 简明精神病量表 (Brief Psychiatric Rating Scale, BPRS), 杨氏躁狂量表 (Young Mania Rating Scale, YMRS) 进行症状的评估。使用 GE Signa HDX 3.0T scanner with an 8-channel headline circle 完成静息态头部核磁共振影像数据的采集,使用 dpabi 软件对采集的影像数据进行预处理和统计分析。使用分数 ALFF (fALFF) 来比较各组之间脑区的差异。fALFF 是对原始 ALFF 方法的改进,它检查低频范围内每个频率的功率与整个频率范围的功率之间的比率。

结果 经过 GRF 校正后,合并自杀行为的重性抑郁障碍患者与无自杀行为的重性抑郁障碍患者相比,在左脑额中回 (Frontal_Mid_L) 的活动增强,左脑背外侧额上回 (Frontal_Sup_L), 右脑梭状回 (Fusiform_R) 活动降低。合并自杀行为的重性抑郁障碍患者与健康对照者相比,右侧丘脑内侧背核 (THAL_MDm_R) 活动升高,左脑内侧额上回 (Frontal_Sup_Medial_L) 活动降低。而无自杀行为的抑郁症患者与健康人相比,右脑颞中回 (Temporal_Mid_R)、左脑梭状回 (Fusiform_L) 活动增强;左脑中央后回 (Postcentral_L) 的活动降低。

结论 合并自杀行为的重性抑郁障碍患者与无自杀行为的重性抑郁障碍患者相比,其在静息态的左脑额中回活动增强,这可能与自杀行为的增加有关。

关键词: 重性抑郁障碍,自杀行为,脑功能静息态,左脑额中回,右脑梭状回

青少年抑郁障碍伴复杂性应激障碍患者下丘脑体素相关性研究现状

撒欣宇 汤艳清*

中国医科大学附属第一医院

目的 本综述旨在探讨青少年复杂性应激障碍(C-PTSD)伴抑郁障碍患者地下丘脑体素的MRI变化,评估其在病理机制中的作用,并分析现有研究的局限性和未来研究的方向。

方法 本文通过系统检索相关文献,选取近年来在青少年C-PTSD和抑郁障碍患者中应用MRI技术研究地下丘脑体素变化的研究。重点关注研究设计、样本特征、MRI技术参数、地下丘脑体素变化的测量方法及其与临床症状的相关性分析。

结果 1. 下丘脑体积变化:多项研究表明,C-PTSD和抑郁障碍患者的下丘脑体积显著减小。研究结果显示,体积减少与患者的应激水平、病程长短和症状严重程度密切相关。例如,某项研究对比了40名C-PTSD伴抑郁障碍青少年患者与40名健康对照组,结果显示患者组的下丘脑体积显著小于对照组。

2. 灰质密度变化:下丘脑的灰质密度变化也是研究的热点。部分研究指出,C-PTSD和抑郁障碍患者的下丘脑灰质密度显著降低,这可能与神经元丢失或突触密度减少有关。例如,使用高分辨率3T MRI对50名患者进行研究,发现患者下丘脑灰质密度显著低于健康对照组。

3. 功能连接性变化:fMRI研究还发现,C-PTSD和抑郁障碍患者下丘脑与其他大脑区域(如杏仁核、前额叶皮层)的功能连接性发生改变,这可能解释了情绪调节和应激反应的异常。例如,研究表明,C-PTSD伴抑郁障碍患者下丘脑与杏仁核的功能连接性增强,而与前额叶皮层的连接性减弱。

结论 下丘脑在青少年复杂性应激障碍伴抑郁

障碍中的作用越来越受到关注。通过MRI技术研究下丘脑体素的变化,为理解C-PTSD和抑郁障碍的神经生物学机制提供了重要线索。具体结论如下

1. 下丘脑体积减小:C-PTSD和抑郁障碍患者的下丘脑体积显著减小,提示下丘脑结构受损可能是疾病的关键病理特征之一。

2. 灰质密度降低:下丘脑灰质密度的降低可能反映了神经元丢失或突触密度减少,与情绪调节功能受损有关。

3. 功能连接性改变:下丘脑与其他脑区的功能连接性变化,特别是与情绪调节相关区域的连接性异常,可能解释了患者的情绪和行为症状。

认知功能对农村老年女性抑郁症状的影响——家庭经济收入的调节效应分析

邓蔚 汤艳清*

中国医科大学附属盛京医院

目的 随着人口老龄化的持续加剧,老年抑郁症成为全球范围内的重要公共卫生问题。抑郁症在老年人中的发病率较高,给患者及其家庭带来了巨大的心理、社会和经济负担,而农村老年女性是其中容易被忽视的群体。多项研究表明农村老年女性抑郁与认知功能之间存在密切关系,认知功能障碍在老年女性中不仅预示着潜在的神经退行性疾病,同时也与抑郁症状的发生和发展有着密切联系。认知受损的老年个体在执行功能、记忆、注意力等方面的问题可能导致日常活动受限,从而增加抑郁发生的可能性。在全球老龄化进程加快的社会背景下,家庭经济收入成为影响老年人身心健康的重要社会经济指标之一。研究发现,家庭经济收入与老年人抑郁症状的发生和发展密切相关,低收入往往与更严重的抑郁症状呈现正相关。本文主要通过统计模型评估农村老年女性认知功能、抑郁与家庭经济收入的关系,并分析与验证家庭经济收入对农村老年女性认知功能与抑郁症状关系产生的调节作用,从而进一步了解这三个变量之间的关系。

方法 以农村老年女性抑郁症状、认知功能以及家庭经济年收入之间的关系作为研究对象,采用心理测量法并使用老年抑郁量表 GDS-15 和简易精神状态检查(MMSE)两个量表对抑郁症状情况以及认知功能情况进行研究。本文所使用的研究数据来自于 2023 年 7-8 月在辽宁省北镇市农村地区开展的抑郁症队列研究项目所收集的年龄在 55 岁以上农村老年女性的基线数据。描述其基本人口学特征,探究认知功能、家庭经济年收入和抑郁症状间的相关关系,采用 SPSS26 的 PROCESS 插件的模型 1 分析验证家庭经济年收入的调节作用。

结果 本研究共纳入 652 名农村老年女性,平均年龄为 64.37 ± 6.02 岁,认知正常的有 532 人(81.6%),认知功能下降的有 120 人(18.4%)。不考虑抑郁的 548 人(84.0%),提示抑郁倾向的 92 人(14.1%),提示抑郁症的 12 人(1.9%)。农村老年女性抑郁症状与认知功能情况呈显著负相关($r = -0.177, p < 0.01$),与家庭年收入呈显著负相关($r = -0.160, p < 0.01$)。家庭年收入在农村老年女性认知功能与抑郁症状的关系中存在调节作用($\text{coeff} = 0.111, 95\% \text{CI}: 0.013 \sim 0.210$)。

结论 农村老年女性认知功能情况与家庭经济年收入对老年人抑郁症状产生了非常显著的负向预测作用。家庭经济年收入削弱了认知功能情况对抑郁症状的负向影响关系。本研究的结果可能有助于提供一个新的框架来理解生理和社会等因素与农村老年女性心理健康之间的关系,从而为制定针对抑郁症状的个性化预防与干预策略提供新的视角和理论依据,促进该群体的心理健康与生活质量。

关键词: 认知功能,抑郁,经济收入,调节效应

Objective Bipolar disorder (BD) has been associated with an increase in suicidal behavior. Neural features of suicidal behavior, including suicide attempts (SAs) and suicidal ideation (SI), in mood disorders may help prevent suicidal behavior

Methods We enrolled 23 BD patients with a history of SAs, 18 BD patients with a history of SI, 34 BD patients without suicidal behavior, and 60 healthy controls (HCs). All participants underwent structural magnetic resonance imaging. The brain activity was assessed using the dynamic amplitude of low-frequency fluctuations (ALFFs)

Results Significant differences were found in dynamic ALFFs in the caudate region among the four groups. The post-hoc analysis showed that BD patients with SAs had significantly increased dynamic ALFFs in the caudate region compared to the others. BD patients with SI or without suicidal behavior had significantly increased dynamic ALFFs in the caudate region compared to HCs. However, there were no significant differences in dynamic ALFFs in the caudate region between BD patients with SI and BD controls

Conclusion Abnormal dynamic ALFFs in the caudate region may be associated with SAs in BD. Further investigations are warranted to determine whether dynamic ALFFs in BD patients with SI are different from those in BD patients with SAs

雌激素与抑郁症研究概况

何思怡 任中玉 王高华*

武汉大学人民医院

目的 本文对雌激素水平在抑郁症发病机制及治疗等方面的研究进展进行综述,探讨女性生理周期中的雌激素波动引起抑郁症发病率出现性别差异化的原因,为抑郁症的研究和治疗提供依据和参考。

方法 检索知网、万方、维普、中国生物医学文献数据库、Pubmed、Embass 等数据库查阅文献,对

过往雌激素治疗抑郁症的基础实验和相关临床研究进行梳理和总结,分析目前雌激素治疗抑郁症的相关机制、临床疗效和具体进展,进一步对该方向进行归纳总结。

结果 雌激素在女性不同年龄段的波动规律以及雌激素作用于雌激素受体、HPA轴,以及通过调控神经炎症、神经细胞表观遗传学、神经发生和能量代谢参与抑郁症发生。激素替代疗法(Hormone replacement treatment, HRT)可用于抑郁症治疗, HRT在对围绝经期和绝经后妇女情绪的不同研究中呈现出不同的影响结果。

结论 动物实验和临床研究表明雌激素在抑郁症发生过程中发挥重要作用。临床研究还需进一步深入和细化研究,在开展卵巢激素对围绝经期抑郁症的影响及潜在机制的研究时,应重点关注激素水平的变化,并增加雌激素浓度的测量频次。同时,外源性植物雌激素补充以及药物载体雌激素对抑郁症患者进行有效防治也将成为未来的研究重点。

重性精神疾病患者暴力攻击行为相关因素的研究进展

姜春玲*

抚顺市第五医院

目的 为预防及干预重性精神疾病患者暴力攻击行为的发生提供理论依据和支撑;对未来相关的研究方向做一探讨。

方法 对国内外有关重性精神疾病暴力攻击行为的文献做一综述。

结果 重性精神疾病患者发病期间发生暴力攻击的行为较为常见,行为具有突发性、无目的性等特点,预防有困难,严重的后果给家属和社会带来沉重负担,危害到公共安全。重性精神疾病患者发生暴力攻击行为有明显的人口学特征;大脑结构和功能的变化能预测暴力攻击行为的发生,杏仁核与暴力攻击行为关系密切,精神分裂症患者攻击行为可能与其动态脑功能连接异常有关,双相情感障碍患者攻击行为与DRD4 exonIII48 bp VNTR之间可能存在关联;重性精神疾病患者有情绪不稳定,易激

惹等特点,或在幻觉、妄想的影响下导致暴力攻击行为的发生率增加;重性精神疾病患者的暴力攻击行为与精神病性症状有紧密的联系,阳性症状突出,认知水平下降以及患者童年的创伤均是精神疾病共病后发生暴力攻击的危险因素。

结论 重性精神疾病患者暴力攻击行为是一项公共卫生问题,需要全社会的努力和协调;重性精神疾病患者暴力攻击行为的发生与很多因素相关,是社会、心理及生物等因素共同作用的结果。以后我们可以把研究放在‘如何综合评估这些患者的暴力攻击行为并加以预防’及‘探讨这些患者发生暴力攻击行为的保护因素’两个方面。

关键词: 重性精神疾病,暴力攻击行为

中国传统产后实践与产后抑郁的关系

曹珊^{1,2} 徐佳军³ 康玉坤³ 王鹏² 金敏^{1,2}

1.川北医学院精神卫生学院

2.四川省精神卫生中心(绵阳市第三人民医院)

3.四川大学华西医院

目的 本研究通过探索中国传统产后实践与产后抑郁的关系,旨在为中国传统产后实践观念和行为的改变提供依据。

方法 本研究共纳入240名产后妇女。采用自编一般情况调查问卷收集产妇人口学资料,采用中文版爱丁堡产后抑郁量表(EPDS)、社会支持评定量表(SSRS)、躯体症状群量表(PHQ-15)、“坐月子”一般依从性问卷(ADP)、“坐月子”行为认可度调查问卷分别评定产后抑郁症状、社会支持程度、躯体症状的严重程度、产妇对坐月子行为的依从性及认可度,并分析其关系。

结果 EPDS与ADP总分、ADP-社交限制、ADP-饮食禁忌、ADP-避免劳动、ADP-卫生维度呈负相关($r=-0.228$ 、 $r=-0.146$ 、 $r=-0.184$ 、 $r=-0.275$ 、 $r=-0.168$, $P<0.05$ 或 0.01),与A值(ADP与其认可度的差值)呈正相关($r=0.161$, $P<0.05$)。EPDS评分阈值为9/10时,二元Logistic回归分析显示:ADP-避免劳动维度是产后抑郁的保护因素($OR=0.930$, $P<0.01$);EPDS评分阈值为12/13时,二元Logistic回归分析显示:产妇A值是产后抑郁的危险因素($OR=2.233$, $P<0.01$)。

结论 产妇对中国传统实践的践行及认可度可能影响产后抑郁的发生。

脑瘫患儿照料者的心理状况调查

宇淑涵¹ 邵春红¹ 赵怀银²

1.复旦大学附属华山医院

2.上海禾滨康复医院

目的 脑瘫患儿的照料者负担过重, 可能会影响其心理健康。本研究旨在探究脑瘫患儿照料者的心理健康状况, 并提高医疗保健提供者的认识。

方法 入组 2022 年 7 月至 2024 年 5 月就诊于上海禾滨康复医院的确诊为脑瘫儿童的照料者 60 名, 使用患者健康问卷-9 (Patient Health Questionnaire-9, PHQ-9), 广泛性焦虑障碍量表 (Generalized Anxiety Disorder-7, GAD-7)、心理压力感知度量表 (Perceived stress scale, PSS) 以及匹兹堡睡眠质量指数量表 (Pittsburgh Sleep Quality Index, PSQI) 来评估照料者的情绪、压力及睡眠。

结果 研究样本包括 60 名照顾者, 其中 70% 是母亲。根据量表评分, 13% 的照顾者具有中度抑郁评分, 12% 显示极度重度抑郁, 11% 显示中度焦虑。此外, 分别有 13.5%、15.9% 和 8.7% 的照顾者被评定为中度、重度和极重度压力水平。照料者的抑郁、焦虑和压力、睡眠质量评分与受脑瘫患儿的智力影响、躯体残疾程度和频繁住院显著相关 ($p \leq 0.05$)。

结论 目前, 中国脑瘫患儿照顾者的压力和焦虑抑郁程度及其与儿童依赖程度的关系没有得到很全面的研究。脑瘫儿童的照顾者报告称, 他们面临着与儿童所需的长期治疗与照顾相关的心理健康挑战。医护人员应该采用以家庭为中心的方法, 为脑瘫儿童及其家庭提供早期和积极的医疗帮助和社会支持。

关键词：脑瘫；照料者；抑郁；焦虑；压力；睡眠

目的 探讨职业高校学生的心理健康现状, 并从人口学特征探究其影响因素, 为促进职业技术学院学生心理健康制定科学干预措施提供理论依据。

方法 采用方便抽样的方法于 2022 年通过自媒体平台在线发放心理健康自评工具, 包含患者健康问卷抑郁症状群量表 (Patient Health Questionnaire, PHQ-9)、广泛性焦虑量表 (Generalized Anxiety Disorder Scale, GAD-7), 对江西赣州三所职业高校 9140 名学生进行心理健康状况调查和评估, 以阳性检出率作为结局指标, 采用 logistic 回归分析探究影响因素。

结果 在线共回收有效问卷 9140 份。三所职高学生 PHQ-9 阳性检出率为 57.4% (5246/9140), 其中轻度 34.6%, 中度 14.7%, 中重度 5.9%, 重度 2.2%; GAD-7 阳性检出率为 39.6% (3616/9140), 其中轻度 28.1%, 中度 8.6%, 重度焦虑 2.9%。Logistic 回归分析显示, 女性、城镇地区、父母一方长期在外及单亲家庭为职业高校学生抑郁、焦虑情绪出现的危险因素。

结论 职业高校部分学生存在不同程度的抑郁或焦虑情绪, 且与多项因素如性别、居住地区、养育方式密切相关。学校、家庭和社会应共同采取针对性的措施进行预防和干预, 促进身心健康。

关键词：职业高校；抑郁；焦虑；心理健康

产后抑郁症的心理指导

胡莹莹*

阜新市精神病防治院

目的 对于妇女产后抑郁的心理指导

方法 1.心理治疗

(1) 支持性心理治疗 支持性心理疗法又称支持疗法。是指在执行医护过程中, 医护人员对患者的心理状态合理地采用劝导、鼓励、同情、安慰、支持以及理解和保证等方法, 可有效消除患者的不良

职业高校学生心理健康现状及其相关因素分析

情绪,使其处于接受治疗的最佳心理状态,从而保证治疗的顺利进行,使疾病早日康复。

(2) 人际心理治疗 这项抑郁症心理治疗方法主要用于治疗成人抑郁症急性期发病,旨在缓解抑郁症状,改善抑郁患者的一些社交问题。抑郁症患者常见的人际问题包括四方面:不正常的悲伤反应、人际冲突、角色转变困难和人际交往缺乏等。

- (3) 音乐疗法。
- (4) 焦点转移。
- (5) 行为调整法。
- (6) 倾诉宣泄法。
- (7) 角色交替法。
- (8) 自我鼓励法。
- (9) 自我实现法。

2. 药物治疗

- (1) 抗抑郁药物。
- (2) 激素。

3. 物理治疗

- (1) 颅微电流刺激疗法。
- (2) 电休克治疗。
- (3) 其他 研究显示中医穴位按摩可改善产后抑郁患者的心理状态和生活质量。

结果 1. 加强围生期保健

利用孕妇学校等多种渠道普及有关妊娠、分娩常识,减轻孕妇对妊娠、分娩的紧张、恐惧心情,完善自我保健。

2. 密切观察

对有精神疾患家族史的孕妇,应定期密切观察,避免一切不良刺激,给予更多的关爱、指导。

3. 充分关注

分娩过程和疼痛对产后抑郁有较大影响,尤其对产程长、精神压力大的产妇,更应给予充分关注。

4. 心理疏导

对于有不良分娩史、死胎、畸形胎儿、孕期情绪异常等高危因素的产妇,应给予她们更多的关心,及早进行心理疏导。

结论 加强孕期的保健,对产妇进行健康教育、指导产妇相关的保健知识及母婴的心身变化;讲解相关正确的母乳喂养技巧;关心爱护孕妇消除产妇紧张不安焦虑以及低落的情绪,关心产妇的家庭与个人之见的联系。让产妇更为了解产后抑郁症的概念并更好地改善情绪。

关键词: 产后抑郁; 心理指导; 关心爱护

抑郁症主客观睡眠障碍对疗效影响的对照研究

杨春燕*

大连市第七人民医院

目的 研究抑郁症主客观睡眠障碍特征和对疗效的影响的分析。

方法 1. 一般资料

选取 2022 年 2 月-2023 年 2 月我院就诊的 50 例抑郁症患者作为研究对象,采用匹兹堡睡眠质量问卷的测量,汉密尔顿抑郁量表评估,以及多导睡眠图的检查,将匹兹堡睡眠治疗问卷中第 6 项选项 AB 设置为主观睡好组(26 例),将选项 CD 设置为主观睡眠差组(24 例)。主观睡眠好组中,男 12 例,女 14 例,年龄 18~55 岁,平均年龄(36.5±18.5)岁。主观睡眠差组中,男 11 例,女 13 例,年龄 18~56 岁,平均年龄(37.0±19.0)岁;两组基线资料对比结果 $P>0.05$,具有可比性。

2. 方法

所有的研究对象均进行匹兹堡睡眠质量问卷的测量,汉密尔顿抑郁量表评估,以及多导睡眠图的检查。

2.1 匹兹堡睡眠质量问卷测量

研究对象入组时采用匹兹堡睡眠质量问卷表对其近 1 个月睡眠质量进行评定。共 7 个因子,19 项自评条目,每个 0~3 分,总分 0~21 分,得分越高睡眠质量越差。

2.2 汉密尔顿抑郁量表评估

由经过专业训练的评定员(两名)对所有研究对象进行汉密尔顿抑郁量表评估,通过观察、交谈的方式进行检查,检查完毕后两名评定员独立完成对研究对象的评分。采用 5 级评分法,0~4 分,得分越高抑郁越严重。

2.3 多导睡眠图检查

安排研究对象在睡眠实验室睡两晚,第一个夜晚主要让其适应环境,第二个夜晚开始对其整夜进行多导睡眠图检查,对研究对象睡眠进程、睡眠结构、睡眠指标等进行分析。

2.4 治疗方法

睡前 20min 开始进行肢体放松疗法,右下至上,轻声引导研究对象放松脚趾、小腿、大腿肌肉,深呼

吸、缓慢吐气，再次引导其放松臀、腹胸、背部肌肉，深呼吸、缓慢吐气，放松肩、颈、头部肌肉，放松面部肌肉保持微笑，手指放松、手臂放松、大脑放松，一次将全身、心放松。

3.疗效评价与观察指标

分析两组研究对象治疗 4 周后客观睡眠效率、睡眠进程（睡眠总时间、觉醒次数等）、睡眠结构（REM 睡眠时间、觉睡比等）、REM 睡眠指标以及抑郁情况。

4.统计学方法

将本研究两组数据纳入 SPSS21.0 分析，使用 ($\bar{x} \pm s$) 表示、t 对比检验，当 $P < 0.05$ 时表示差异有统计学意义。

结果 两组研究对象客观睡眠效率、睡眠进程、睡眠结构以及 REM 睡眠指标均无明显差异 ($P > 0.05$)；主观睡眠好组汉密尔顿抑郁量表减分率高于主观睡眠差组，结果，差异有统计学意义， $P < 0.05$ 。

结论 抑郁症患者的主观睡眠质量差于客观睡眠质量，患者在治疗的过程中往往高估了自己的睡眠障碍，因此对治疗产生了一定的抑制作用。

关键词：抑郁症,主客观睡眠障碍,特征

经颅直流电刺激联合文拉法辛治疗抑郁症的临床效果分析

王鹏举*

阜新市精神病防治院

目的 分析抑郁症患者采用经颅直流电刺激进行治疗的临床可行性。

方法 以本院 60 例抑郁症患者为研究对象，对照组($n=30$)单纯施予文拉法辛治疗，研究组($n=30$)施予文拉法辛+tDCS 治疗。

对照组患者给予文拉法辛(怡诺思, 惠氏制药有限公司, 批准文号: 国药准字 J20120039, 药品规格: 150mg x 7sx2 板)进行治疗: 以 75mg/d 的初始给药剂量按照 3 次/d 的用量服用, 观察患者的病情转变, 并在 <7d 内将剂量调整至 150mg/d 进行治疗。

研究组在对照组患者治疗的基础上给予 tDCS 治疗, 以患者左侧前额叶皮层背外侧为主要刺激部位, 经颅直流电刺激仪(IS200 型, 北京飞宇星电子

科技有限公司生产)的阳极和阴极分别放置在患者的头部和对侧肩部, 形成 5cm x 7cm 的刺激电极面积, 确保皮肤与电极接触充分。设置经颅直流电刺激仪的强度为 1.4mA, 并将刺激剂量控制在 <0.057ma/cm² 范围内, 电极以弹力绷带进行固定, 刺激时间控制在 20~30min/次, 按照 1 次/d 的频次连续治疗 5d。

研究组患者的治疗总有效率 93.3%显著高于对照组 73.3%, 差异显著($P < 0.05$);研究组患者的并发症发生率 20.0%显著低于对照组 46.7%, 差异显著 ($P < 0.05$);且治疗后研究组患者的 HAMA、HAMD 评分均优于对照组, 差异显著($P < 0.05$)。

结论 在抗抑郁药物基础上联合经颅直流电刺激治疗抑郁症患者, 可显著提高临床疗效, 缓解患者的症状并减少不良反应。

关键词：抑郁症、经颅直流电刺激、临床治疗、可行性

抚慰孩子的心灵

孙泮泮*

阜新市第四人民医院

目的 来提高心理健康意识, 用科学的方法缓解压力, 预防心理问题。

中国科学院心理研究所曾经发布的调研显示, 约 14.8%的青少年存在不同程度的抑郁风险, 其中 4.0%的青少年属于重度抑郁风险群体。其实相比成人, 情感发育尚未成熟的青少年更容易出现情绪问题乃至抑郁障碍。这是因为, 大脑中负责感知情感的杏仁核在 15 岁时就发育成熟, 而负责控制情感的前额皮质要到 25 岁左右才会成熟, 成熟状态不一致的生理结构, 使发育中的青少年可以像成人一样感知情绪, 却无法控制情绪和行为, 而青春期受激素影响, 更增加了青少年抑郁障碍的风险。

方法 第一, 多关注孩子的情绪, 倾听他们行为背后的动机、情绪。

第二, 适当与孩子沟通交流, 通过谦虚真诚的心态, 站在孩子的角度理解、倾听他们的感受。

第三, 要更加关注青少年睡眠、运动与心理健康之间的相互影响, 更充足的睡眠和运动有助于降低青少年的抑郁、孤独和手机成瘾。

结果 愿我们以奋发有为的态度,唤起社会各界的高度重视和合力担当,为全国青少年心理健康保驾护航,让更多青少年向阳而生、健康成长。

结论 而作为医疗机构的工作人员,如何针对青少年群体的心理健康状况更好服务,我有以下四点建议:一是建立医校共联体,进一步完善青少年心理健康筛查和检测机制;二是加强宣讲活动,着力青少年的心理健康工作;三是倡导青少年健康使用手机,减少手机成瘾风险;四是加强对高风险群体心理健康的精准预防和干预工作。

关键词:青少年,抑郁症,空椅技术,手机成瘾

浅谈青少年自残

安凯*

阜新市第四人民医院

目的 旨在通过分析其背后的心理、家庭和社会因素,提出有效的应对措施和忠告,以减少自残行为,促进青少年的健康成长

方法 研究中,首先本文详细描述了青少年自残的具体表现和潜在危害,强调了这一问题的严重性和紧迫性。随后,本文从心理层面剖析了青少年自残的心理动机,包括挫败感、无助感、自我认同问题等;从家庭层面探讨了家庭环境不稳定、亲子关系紧张等因素对青少年自残行为的影响;从社会层面分析了学校压力、网络暴力等社会因素对青少年心理健康的负面作用。在应对措施方面,本文提出了包括心理疏导、家庭支持、社会关注在内的多维度策略。首先,强调了对青少年进行心理疏导的重要性,通过专业的心理咨询和教育,帮助他们建立健康的心理防御机制,提高应对挫折的能力。其次,家庭作为青少年成长的重要场所,其支持作用不可忽视,建议家长加强与孩子的沟通,关注他们的情绪变化,提供必要的支持和帮助。最后,社会应加强对青少年自残问题的关注,通过制定相关政策、加强宣传教育、完善心理健康服务体系等方式,为青少年创造一个更加健康、积极的社会环境。除了应对措施外,本文还给出了对青少年的忠告:鼓励青少年珍惜生命,以积极的心态面对生活中的挑战和困难;同时,倡导他们建立良好的人际关系,通过与他人交流、分享,减轻心理压力,提高自我认同感和

归属感。这些忠告有助于青少年树立正确的价值观和人生观,提高心理素质,从而更好地应对自残等心理健康问题。

结果 为了预防和减少自残行为,需要家长、学校、社区和政府等多方面的共同努力。通过加强心理疏导、提供家庭支持、关注社会环境和制定相关政策措施等多维度策略的实施,可以为青少年创造一个更加健康、积极的成长环境,促进他们的全面发展。同时,呼吁全社会加强对青少年心理健康问题的关注和支持,共同为青少年的健康成长贡献力量。

结论 青少年自残是一个需要引起全社会关注的问题

关键词:青少年自残;心理疏导;家庭支持;社会关注;生命教育;心理健康

Inflammatory Factors Can Serve As Good Biological Markers for The Diagnosis of Depression in Adolescents

Yanmei Liang Yanling Zhou*

The Affiliated Brain Hospital, Guangzhou Medical University

Objective In recent years, an increasing number of studies have found that inflammation is associated with major depressive disorder (MDD). To explore the relationship between inflammation and MDD, we proposed the hypothesis that inflammatory factors may be biomarkers of MDD

Methods 210 participants were recruited in this study, including healthy controls (n=88) and first-episode adolescents with MDD (n=132). Plasma samples were analysed using the Luminex Magpix-based assay system (Luminex Corporation) to assess the expression levels of inflammatory factors. Potential biomarkers were screened by covariance and ROC analyse.

Results In using roc analysis to differentiate between adolescent depressed and healthy subjects, the AUC was observed for TNF- α (AUC=0.729), IL-4 (AUC=0.724), IFN- γ (AUC=0.714) and the joint diagnosis (AUC=0.772) of these three inflammatory factors.

In the male group, the highest AUC was observed for TNF- α (AUC=0.811) but for IFN- γ in the female group (AUC=0.764)

Conclusion TNF- α , IFN- γ , and IL-4 effectively identified adolescents with depression. TNF- α and C-4 accurately differentiated male patients from healthy subjects, while IFN- γ distinguished female patients. The combined diagnostic approach significantly enhanced identification of depressive disorders in adolescents. This suggests promising avenues for developing targeted diagnostic and therapeutic strategies for adolescent depression

关键词: Major depressive disorder, TNF- α , IFN- γ , IL-4

基于深度学习的精神分裂症及其高危人群局部脑年龄预测

邓才就 汤艳清*

中国医科大学附属盛京医院

目的 探索精神分裂症患者及其高危人群在结构 MRI 的高分辨率下的脑年龄差异

方法 本研究共招募被试 280 例, 其中精神分裂症 (schizophrenia, SZ) 患者 80 例、SZ 患者的一级亲属即 SZ 遗传高危人群 (Genetic High Risk, GHR) 被试 78 例以及年龄性别匹配的健康 (Healthy Control, HC) 被试 122 例, 年龄范围为 18-55 岁。344 名被试均使用同一台磁共振扫描仪完成扫描, 并获得结构相磁共振成像数据。利用深度学习 Unet 模型, 对预处理产生的灰质和白质作为输入特征, 获得每个被试的体素水平的神经影像预测年龄 (脑龄) 和实际年龄之间差异的信息, 计算每个被试的 ROI 水平的脑龄差, 最后通过方差分析以及事后检验进行组间的比较。

结果 对三组的所有 ROI 脑龄差进行方差分析, FDR 校正后仍存在差异的脑龄差进行 HSD 检验。结果显示, 与 HC 相比, SZ 与 GHR 均主要在颞叶存在显著差异 (颞横回、颞上回、左侧颞下回, 左侧颞中回, 校正后均 $p < 0.001$, Cohens'd 均 > 0.8 ; 海马旁回, 校正后 $p < 0.05$, Cohens'd 均 > 0.8 ; 梭状回, 校正后 $p < 0.05$, Cohens'd 均 > 0.4)。SZ 与 HC 相比, 在右

侧杏仁核、丘脑侧后核、距状裂、黑质致密部与网状部, 左侧中央沟盖、海马、尾状核、缘上回、丘脑腹侧外核、丘脑垂体核外侧核、红核存在差异 (校正后 $p < 0.05$, Cohens'd 均 > 0.3)。而 SZ 与 GHR 相比均无显著差异。

结论 1. 利用深度学习 Unet 模型, 发现 SZ、GHR 与 HC 在脑龄差中均有显著差异。

2. SZ 与 GHR 主要在颞横回、颞上回、左侧颞下回, 左侧颞中回存在脑龄差的显著差异。

关键词: 脑龄; 深度学习; 精神分裂症; 遗传高危人群

认知衰老的前因与保护机制的范围综述

张雨宸^{1,2} 崔界峰²

1. 陕西中医药大学

2. 北京回龙观医院

目的 随着老年人在世界人口占比的趋势逐年上升, 认知老化对老年人生活、心理健康方面的负向影响也被越来越多的研究者广泛关注。本文结合前人研究, 探究认知衰老的前因变量并阐明其因果机制, 为认知衰老的保护提供可行性建议。

方法 以 JBI 小组发布的 PRISMA 指南为指导, 在 Google Scholar 进行文献检索, 以 cognitive aging, latent growth model, psychology, longitudinal 为关键词对文献进行检索, 并将时间设定为 2010-2013 年发布。本综述采用范围综述的方式 (scoping review) 解决研究结果可视化的问题, 并全部纳入纵向研究且以潜变量增长模型 (latent variable growth curve modeling, LGM) 为统计方法的文章, 以支撑变量之间的因果关系, 除此之外对文章的来源、样本、研究方法和研究结果进行分析, 将检索到的文章进行审核。

结果 最终纳入 8 篇文献, 发布时间均在 2010 年之后, 研究方法均采用以潜变量增长模型 (LGM) 的纵向研究。认知衰老从 50-55 岁以后发生, 孤独、社会隔离、与配偶或子女同居、经验的开放性、社会参与、生活方式、受教育程度、休闲活动和中年时期的体重指数对认知的截距具有预测作用。而社会隔离、与配偶或子女同居、减少抑郁情绪、提升社会参与、丰富生活方式、较长的教育年限, 较高

收入水平、控制休闲活动和中年期的体重指数可能对认知衰老的下降有保护作用。

结论 本研究罗列了有关认知衰老的可能的保护因素,且这些因素已经在实证研究中被证实,这可以为日后对于认知衰老的干预和防护提供视角。这是一篇基于潜变量增长曲线模型的综述,即是一篇对于纵向研究的综述,相比于横断研究,这保证了因果关系的真实性。且取样的研究来源于不同的国家,这使得研究结果具有跨文化比较的意义。综上,对于老年认知的保护,在结果的讨论部分,我们将保护措施分为三个部分,认知训练、社会参与、收入与健康,事实上,三者并非只独立发挥作用,除了直接对认知衰老产生影响外,自身也存在着紧密联系,认知训练与社会参与亦可能促进收入与健康的发展,早年认知训练的参与也可能调节社会参与的类型,因此我们应当从系统的观点理解老年认知保护的作用。

关键词: 认知衰老, 认知训练, 潜变量增长模型, 心理学

炎症因子影响青少年非自杀性自伤的研究进展

郭嘉伦^{1,2} 刘志芬^{1,2}

1.山西医科大学

2.山西医科大学第一医院

目的 非自杀性自伤(nonsuicidal self-injury, NSSI)是指个体在没有自杀意念的情况下,故意、反复、直接地损伤自身组织,造成轻度或中度损伤的行为。青少年是NSSI的高危人群。炎症因子的中细胞因子(如白细胞介素、肿瘤坏死因子)和趋化因子在炎症反应和免疫调节中发挥关键作用,可能与NSSI密切相关。本文从炎症因子的角度探讨青少年非自杀性自伤的发病机制,并研究其预防和干预措施,为青少年非自杀性自伤的早期识别和干预提供科学依据。

方法 本文围绕“炎症”“细胞因子”“青少年”“非自杀性自伤”“NSSI”在中国知网、万方数据知识服务平台、PubMed、Web Of Science等中英文数据库中检索,筛选出有关炎症因子与青少年非自杀性自伤的研究,综述当前的研究进展并为之后的治疗

和干预指明方向

结果 (1)青少年NSSI患者在炎症因子水平上显示显著的异常表达。具体而言,青少年NSSI患者在血液或唾液中的炎症因子如IL-1 β 、IL-2、IL-6、IL-10、IL-15、TNF- α 和CCL2等表达水平显著增高,而IL-4和IL-13的表达水平则显著降低。(2)炎症因子的异常释放通过降低多巴胺和5-羟色胺水平,影响神经递质系统,增加青少年抑郁和焦虑的风险,进而引发自伤行为,同时还可能干扰神经发育和突触形成,影响情绪调节和行为控制,并导致神经元损伤和凋亡,进一步加剧青少年的自伤倾向。(3)早期预防策略包括心理教育、建立支持性社会环境和心理健康促进计划。治疗手段包括认知行为疗法(CBT)、心理支持治疗、家庭治疗、药物治疗及支持性环境和康复计划。

结论 综合研究显示,青少年NSSI与炎症因子如IL-1 β 、IL-2、IL-6、IL-10、IL-15、TNF- α 、CCL2、IL-4和IL-13的异常表达密切相关。这些炎症因子可能通过影响神经递质系统和神经发育,加剧抑郁情绪和自伤行为。早期预防和多种治疗策略如CBT和家庭治疗,有望有效降低炎症因子水平,减少NSSI行为的发生与严重程度。

关键词: 非自杀性自伤,细胞因子,炎症,青少年,NSSI

高龄产妇心理健康影响因素分析

宋晋*

武汉市精神卫生中心

目的 随着社会经济的高速发展,女性生育年龄明显推迟,高龄产妇比例上升。相应的身体机能下降,妊娠并发症风险增加,高龄孕产妇面临更大的精神心理压力。为全面了解高龄产妇的心理健康状况及相关心理社会诱发因素。分析围生期孕产妇家庭功能与焦虑症状之间关系,探讨变化趋势及影响因素。

方法 依汉密尔顿焦虑量表、汉密尔顿抑郁量表、阿森斯失眠自评量表和家庭功能评定量表,于2023年6月至2023年12月对武汉市某三甲医院妇产科门诊125例初产妇,分四个时间点进行随访调查(孕8月产检、孕9月产检、分娩当天、产后42

天), 测量其家庭功能、睡眠状况及产后焦虑症状, 基于潜变量增长混合模型, 描绘发展轨迹并识别其潜在亚组, 构建广义相加模型及进行中介效应分析变量关系, 绘制工作特征曲线以预测效能。

结果 本研究收集 125 例初产妇 (57 例适龄初产妇, 68 例高龄初产妇), 高龄产妇焦虑的检出率 23.7%, 远高于适龄孕产妇, 其压力主要来自对母婴健康的担心, 对家庭支持不足的担心, 对分娩疼痛的担心等。家庭功能是影响孕产妇焦虑症状的重要因素之一。高龄产妇的家庭功能存在异质性, 同时家庭的结构、子系统、角色和沟通等多方面也会受到焦虑症状的影响。

结论 加强个性化的随访管理和心理保健服务, 提高高龄产妇家庭功能, 可以减轻焦虑和失眠, 进而寻求改善孕产妇心理健康的有效方法。

关键词: 高龄产妇, 心理健康, 家庭功能, 支持

性别烦躁者的心理健康

甘明远 汪毅*
北京回龙观医院

目的 性别烦躁正在上升。许多性别烦躁者生活在社会的边缘, 面临耻辱、歧视、排斥、暴力和健康状况不佳。尽管对性别恐惧症(GD)人群的社会接受度有所提高, 但这些人仍然承受着高度的情绪压力, 这凸显了了解他们精神疾病诊断的重要性。

方法 采用 MEDLINE/PubMed、SciELO、Cochrane、EMBASE、PsychINFO 数据库和手动检索系统评价该人群终生 Axis I 精神障碍的发生率, 对 1980 年以后发表的文章进行检查。搜索使用关键词: ('transgender' OR 'gender identity disorder' OR 'gender dysphoria' OR 'transsexualism' OR 'gender dysphoric patients' OR 'gender incongruence') AND ('mental disorder' OR 'axis I' OR 'psychiatric disorders') AND ('comorbidity' OR 'comorbid' OR 'prevalence')。 (“跨性别者”或“性别认同障碍”或“性别障碍”或“跨性别主义者”或“性别障碍患者”或“性别不一致”)和 (“精神障碍”或“I 轴”或“精神障碍”)和 (“合并症”或“合并症”或“患病率”。

结果 性别烦躁正在上升, 人口调查显示成年

人的患病率在 0.2-0.6% 之间, 日本一项评估性别烦躁 (gender dysphoria GD) 患病率的横断面研究结果 GD 的患病率高于先前估计的, 在出生时被归类为男性或女性的受试者中, 有 0.87% (95%CI 0.69-1.1) 和 1.1% (95%CI 0.86-1.3) 报告了广泛的性别烦躁。与顺性别者相比, 跨性别者的精神疾病诊断率更高。与同龄人相比, 性别相关青少年 (Gender-referred adolescents GR) 表现出相当大的精神症状。但在 GR 青少年中, 40.9% 在青春期没有接受任何精神病学诊断。受性别影响的儿童谈论自杀的可能性比未受影响的儿童高出 5.1 倍, 自残/企图自杀的可能性也高出 8.6 倍。跨性别者中非自杀性自残 (NSSI) 的发生率以及过去一年 NSSI 的相关性调查研究。53.3% 的参与者报告一生中曾有过自伤。22.3% 的样本报告了过去一年的 NSSI。研究发现, 青春期阻滞剂并不能缓解性别恐惧症儿童的负面想法。性对于大多数顺性别者和跨性别者都很重要, 并且是生活质量的一个重要方面。

结论 识别并为诊断为 GD 的人群制定心理健康公共政策十分迫切。

关键词: 性别烦躁, 性别认同障碍, 易性症, 心理健康

White Matter Abnormalities and Cognitive Impairment in Bipolar I Disorder: A Multi-State Investigation

Ting Sun Yanqing Tang*
Shengjing Hospital of China Medical University

Objective Bipolar I disorder (BD-I) presents a formidable challenge to modern psychiatry, characterized by recurrent manic episodes and depressive states, often accompanied by cognitive dysfunction. Despite its clinical significance, the mechanistic underpinnings of cognitive impairment in BD-I remain obscure. Structural brain changes have been implicated as potential contributors to this cognitive burden. In this study, we examined the relationship between cognitive impairment and white matter abnormalities in distinct states of BD-I, shedding light on the neurobiological basis of cognitive deficits in this population

Methods Our investigation involved 119 participants aged 18 to 45, comprising 66 healthy controls (HC) and 53 BD-I patients: 28 remission (r-BD), 10 manic (m-BD), and 15 depressive (d-BD). Comprehensive assessments were conducted, encompassing clinical evaluations, cognitive testing utilizing the MATRICS Consensus Cognitive Battery (MCCB), and diffusion tensor imaging (DTI). Subsequently, we performed intergroup comparisons, statistical analyses, and correlation studies to unravel the complex relationships within this paradigm

Results Our findings revealed compared to HC, r-BD individuals exhibited significant disparities in attention, processing speed, working memory, and executive function. Similarly, m-BD patients displayed cognitive deficits in processing speed, visuospatial memory, and executive function, and d-BD individuals in emotional intelligence. Notably, our DTI analyses demonstrated a shared neuropathological feature across all BD-I states, revealing a common decrease in fractional anisotropy (FA) within the corpus callosum trunk (CCT). Moreover, our analyses identified distinct correlations between cognitive performance and the FA values of the CCT in specific BD-I states. In r-BD, the CCT FA values correlated with various cognitive functions, such as Trail Making Test A ($r=-0.586$, $p=0.001$), Symbol Coding ($r=0.434$, $p=0.021$) and Maze Test ($r=0.426$, $p=0.024$). In d-BD, the CCT FA values were negatively associated with Mayer-Salovey-Caruso Emotional Intelligence Test ($r=-0.672$, $p=0.006$). In contrast, no such correlations were observed in m-BD. When all BD-I patients were considered together, emotional intelligence was inversely correlated with CCT FA values ($r=-0.396$, $p=0.00$)

Conclusion In conclusion, this study highlights the nuanced nature of cognitive impairment in BD-I across different states, with the most severe deficits observed during remission. Notably, white matter abnormalities within the corpus callosum trunk appear to be a consistent feature of BD-I, possibly contributing to the cognitive challenges faced by these individuals. Our findings offer valuable insights into the neural substrates of cognitive dysfunction in BD-I, with potential implications for targeted interventions to ameliorate

cognitive deficits in this population

关键词: Bipolar disorder type I, White matter integrity, MATRICS Consensus Cognitive Battery.

基于 Q 方法追踪团体关系会议中参会成员学习体验的演变

辛哲琦 王旭梅*

中国医科大学附属盛京医院

目的 团体关系会议 (GRC) 是一项体验式学习活动, 参与成员能够在其构建的团体环境中研究自身行为和感受团体动力。然而国内未有研究就 GRC 中参会成员学习体验的发展性进行分析。因此, 本研究旨在采用 Q 方法, 通过追踪研究, 探索 GRC 后一年内参会成员学习体验的演变过程。

方法 GRC 前基于目的性抽样方式来选取被试, 招募 21 名被试进行预访谈 (2 名) 和正式半结构化访谈 (19 名), 每次约 30-45 分钟。通过提取访谈中描述学习体验的语句作为 Q 陈述来构建 Q 样本, 以是否有新的编码或主题出现为判断依据来进行资料饱和检验。研究招募 27 名 2022 CATWGRC 的国内参会成员组成 P 样本, 被试在会后 (T1)、3 个月 (T2)、6 个月 (T3)、9 个月 (T4) 和 12 个月 (T5) 后分别进行了 5 次 11 级迫选 Q 排序和排序后访谈 (10-20 分钟)。通过 KADE 软件, 采用主成分分析法进行 Q 因子分析。在因子解释阶段, 根据每个因子的典型排布和区别陈述进行因子命名, 并结合排序后访谈资料对不同时间点的 Q 因子进行进一步定性分析。同时, 通过分析被试的极端 Q 陈述随时间的变化来确定学习体验不断发展的轨迹。

结果 通过访谈构建了由 52 条 Q 陈述构成的 Q 样本, 内容包含会议体验、会议评价和会议影响三个方面。在 GRC 会后每个时间点均发现了 4 个 Q 因子, 每个时间点中 Q 因子累计变异解释率分别为 51%、47%、48%、46%、46%, 均 >40%。根据各因子典型排布与区别陈述进行命名: T1: 迷茫观察者、主动体验者、寻求保护者、自我反思者; T2: 边界维护者、消极体验者、能力提升者、认知提升者; T3: 积极实践者、边界束缚者、寻求指导者、反对权威者; T4: 会议肯定者、团体观察者、关注差异

者、体验转化者；T5：表达困难者、积极探索者、勇于表达者、行动受限者。结合排序后访谈资料对每个因子进行进一步的定性解释，最终得到 GRC 参会成员学习体验随时间的变化过程为：对会议的评价和感受（T1）→关注自身学习和改变（T2）→将会议学习体验与现实团体实践相联系（T3）→关注个体学习向关注团体学习的转变（T4）→学习体验的持续发展（T5）。

结论 GRC 中参会成员的学习体验包括会议体验、会议评价和会议影响三个方面，并受到个人特征（性别、职业、参会次数）和文化教育背景因素的影响。GRC 后 1 年内，参会成员学习体验的演变趋势包括以下三个方面：①从对会议的评价和体验到对现实团体的实践和感悟，②从个人层面的学习到团体层面的学习，③从主观感受到付诸行动。

关键词：团体关系会议，体验式学习，Q 方法，学习体验，追踪研究

突触囊泡蛋白 2A 在认知障碍发病机制中的研究进展

贾艺 周一芳 汤艳清*

中国医科大学附属盛京医院

目的 目前的证据表明，阿尔茨海默病患者在出现首发症状前几十年就开始出现病理变化和脑损伤。因此，AD 的早期干预是延缓疾病进展的重要策略。突触缺失被认为是 AD 的早期病理表现，与 AD 的病理性认知能力下降密切相关，突触囊泡蛋白 2A (SV2A) 位于突触前末端的突触囊泡中，被认为是突触密度的第一个体内标志物。研究 SV2A 功能障碍与 AD 的关系有助于为 AD 的早期识别及靶向治疗提供新思路。

方法 以“Synaptic vesicle glycoprotein 2 A”“SV2A”“synaptic density”“synaptopathy”“cognitive impairment”“Alzheimer’s disease”“AD”等为关键词，查阅近 5 年文献，了解 SV2A 与认知障碍的关系及其具体机制。

结果 在最新的研究中，SV2A 被证明与既往的 AD 生物标志物(如 A β 42/A β 40、p-tau、NfL 和 GFAP)相比，在 AD 早期诊断中具有更高的灵敏度。血清 SV2A 在 AD 早期筛查中的高效性，加上血液检测

的易用性和非侵入性，使血清 SV2A 成为健康人群筛查的优秀生物标志物。目前有研究表明，SV2A 的缺乏与 A β 和 Tau 过度磷酸化有关，SV2A 的过表达与 APP 裂解酶和载脂蛋白 E 基因的下调有关。并且 SV2A 对 AD 发生和发展的调节可能由磷脂酰肌醇 3-激酶 (PI3K) 信号通路介导，SV2A 的过表达抑制 PI3K 信号通路。此外，有研究表明，小胶质细胞可能在突触丢失中发挥积极作用。

结论 SV2A 与认知障碍有关，未来需要更深入的研究来阐明 SV2A 导致 AD 发病的具体机制。这有利于通过靶向 SV2A，为 AD 的早期诊断和治疗提供一种新的策略。

关键词：突触囊泡蛋白 2A,阿尔兹海默症,认知障碍,突触密度

运用 Q 方法探究精神科医生产生高职业倦怠感的原因

张凤^{1,2} 王旭梅¹

1.中国医科大学附属盛京医院

2.辽健集团抚矿总医院

目的 职业倦怠是一种由“未成功管理的工作场所压力”引起的综合征，影响着各种从业者的身心健康，尤其在医生这种群体当中。精神科医护人员中产生倦怠感的比例越来越高，但是目前的研究整体集中在精神科医生职业倦怠感的现状、职业倦怠感带来的危害等，对于精神科医生产生倦怠感的原因尚不明确。本研究使用 Q 方法探讨来源不同的精神科医生产生倦怠感的原因，从精神科医生角度出发，来了解其主观想法。了解来自专科医院与综合性医院的医生倦怠原因的不同，来帮助精神科医生本人更好地认识倦怠感、提前预防，或者为管理者制定减少倦怠感的发生发展的措施提供一定的参考。

方法 本研究选取了来自沈阳、抚顺、长春、哈尔滨的 5 家医院的精神科医生，运用马斯勒职业倦怠感量表-服务版初步筛选出高倦怠水平（情绪衰竭 ≥ 27 分、人格解体 ≥ 10 分、降低的个人成就感 ≤ 33 分）的研究对象。然后使用 Q 方法来寻找产生职业倦怠感的原因。先通过查阅文献、对 20 名被试者针对职业倦怠感的原因进行半结构化访谈（寻找不同背景资料的，遵循样本量饱和性的原则，经过饱和

性检验直至在访谈中不出现新的观点后确定的被试者的数量)等,得到了65条描述职业倦怠感原因的语句的Q母体,再经过消除重复的、简化整合及专家审阅修改后,形成了一个由35条倦怠感原因描述语句构成的Q样本。再次招募来自专科医院15名、综合医院14名总计29名被试者作为P样本,运用35条Q样本制作成的Q-sort表格排序工具,让来源不同的P样本做9级排序,并就排序结果进行访谈。运用Q方法统计软件进行分别数据分析,经过主成分分析、因子旋转等步骤,得到不同职业倦怠原因的因子分类,最后对因子解释并命名。

结果 在分发150份有效问卷中,62份问卷达到了高水平倦怠,本研究的精神科医生整体倦怠水平为41.3%。职业倦怠感的因子:专科医院,医生产生倦怠感的因子可分为4种:工作量的繁多和工作回报的不平衡;工作性质的特殊和医患关系的摩擦;个人特质的差异和职业规划的冲突;社会环境的影响和预期期望的矛盾。综合医院,医生产生倦怠感的因子可分为3种:医院制度不合理和工作任务的繁多;人际关系的不良和职业价值的未果;个人要求过高和医疗环境的分配不均。

结论 本研究将来自专科医院的精神科医生职业倦怠感的产生原因分为四类,来自综合医院的分为三类;原因有相似之处,比如医院制度和分配资源、医患关系等;有不同之处,比如工作量、工作任务、职业期望、个人特征等;通过研究我们也可以了解到Q方法是一种独特的研究主观性的方法,在职业倦怠感的研究上体现了其独到的优势。

关键词:倦怠,职业倦怠感,精神科医生,原因

围绝经期抑郁障碍卵巢功能变化与神经类固醇激素和下丘脑-垂体-肾上腺轴失调

傅焱 李清伟*
上海市同济医院

目的 本文主要围绕围绝经期抑郁障碍发病机制中神经内分泌机制理论假说,围绝经期女性卵巢功能失调、雌激素水平下降,激活体内应激反应变化,引起皮质醇、促肾上腺皮质激素等神经类固醇激素变化,导致下丘脑-垂体-肾上腺(LPA)轴紊乱,产生抑郁症状。

方法 本文回顾了围绝经期抑郁障碍的相关文献,包括流行病学研究、预测因素研究、相关性分析和雌激素治疗研究等方面。结合动物模型、临床研究的数据和结论,综合论述了围绝经期抑郁障碍发病的神经内分泌假说和机制。

结果 围绝经期是女性必经的过渡期,期间抑郁症状的发生率或抑郁障碍的患病率增加2-3倍。虽然雌激素水平影响情绪的机制尚不清楚,但越来越多的基础和临床研究证据表明,女性卵巢激素及其衍生的神经类固醇激素的波动导致下丘脑-垂体-肾上腺(HPA)轴的GABA能神经调节改变。对于一部分女性来说,面对神经类固醇激素水平的变化,GABA-A受体无法调节GABA能神经活性,可能会导致HPA轴功能障碍,从而增加对压力的敏感性,导致抑郁障碍的发生。

结论 神经内分泌机制假说为女性围绝经期激素水平变化与更年期社会心理环境因素相互作用,从而导致围绝经期抑郁障碍发生的风险机制提供了重要的理论依据。此外,为将来围绝经期抑郁障碍的治疗和干预方法、新药开发等提供必要的理论基础。

关键词:围绝经期抑郁障碍,雌激素,下丘脑-垂体-肾上腺轴,应激反应

基于扎根理论探究影响“慢性化”精神分裂症患者预后的社会心理因素

付睿^{1,2} 王旭梅¹

- 1.中国医科大学附属盛京医院
- 2.辽健集团抚矿总医院

目的 本文通过扎根理论探索精神分裂症患者“慢性化”的社会心理因素,可以深入地了解到患者等人的内心的真实想法,使我们在临床治疗、家庭支持及社会支持方面可以精准切入问题的关键点。可以帮助我们更好地理解其“慢性化”过程中所面对的困境,为临床治疗和家庭照护提供指引。

方法 本文运用扎根理论研究方法。经入组及排除筛选,访谈了15名精神分裂症患者和7名精神科医生。对访谈所得的原始数据进行深入编码与分析,提取并形成子类属,对子类属进行了进一步的编码分析,按照一定的逻辑顺序对它们进行归类和

整合,最终提炼出核心类属。核心类属与理论基础进行对比,提炼出精神分裂症患者“慢性化”的社会心理因素作用模型。最后运用解释结构模型,对核心类属进行编号,根据各因素之间的相关关系列出邻接矩阵,将数据录入 SPSSPRO 进行数据分析,得到可达矩阵。将社会心理因素划分为不同的层级,构建出层级结构模型,解析各影响因素的作用路径。

结果 以原始数据资料的语句编码,提炼出原始语句的初始概念,形成 50 个子类属。之后对初始编码得到的 50 个子类属进一步归纳和整合,得到 13 个核心类属,分别是自我领域功能低下、低自尊、病耻感、基因文化性别、家属的态度和行为、家属的经济和照顾负担、较少的情感支持、社会政策的改善、增订和落实、社会认同和群体压力、社会偏见、媒体影响、医生的态度和行为及精神卫生服务的易得性。对核心范畴进行进一步的精练,提取出 4 个轴心类属,分别是个人支持、家庭支持、社会支持和医疗卫生支持。最后建立层级结构模型,将精神分裂症“慢性化”社会心理因子体系分为七个等级递阶结构。媒体影响力与基因文化性别在层级结构中是最基本、最深层次的。最深层有许多因素影响或通过作用于其他层次因素来传递其影响效应,对其他层次的各种因素及预防精神分裂症“慢性化”有深远的影响,需要长期的研究与突破。低的自我领域功能、病耻感、家庭成员的态度与行为,家庭经济照料负担与家庭成员的情感支持,改善、更新与实施社会认同与群体压力,社会偏见,社会情绪支持,医生的态度与行为,在精神分裂症患者中扮演“承上启下”的角色,通过直接作用于第一层因素,间接影响精神分裂症患者的“慢性化”,并将深层因素的影响传递到“慢性化”。

结论 个体支持是影响精神障碍患者“慢性化”的内在因素。精神分裂症“慢性化”社会心理因子体系可分为七个等级递阶结构,媒体影响力与基因文化性别是最基本、最深层次的因素;其他因素扮演“承上启下”的角色,间接影响精神分裂症患者的“慢性化”并传递深层因素的影响。

基于 Q 方法探索东北某专科医院精神科医生的职业认同

孟广源^{1,2} 王旭梅¹

1.中国医科大学附属盛京医院

2.辽健集团抚矿总医院

目的 职业认同可以反映从业者对职业的看法、态度、满意度以及认识程度。积极的职业认同有助于稳定人才队伍,缓解职业倦怠,降低离职倾向。本研究旨在应用 Q 方法探究东北某专科医院精神科医生的职业认同,从精神科医生的角度出发,运用主客观相结合的方法更好的展现其内心真实的想法。深入的、有目的性的了解到专科医院精神医生对职业认同的不同看法,可以对未来专科医院人才的管理培养和发展提供一定的参考。

方法 本研究采用 Q 方法探究精神科医生不同的职业认同,具体的操作步骤如下: 1. 构建 Q 样本: 采用半结构式访谈法,最终访谈了 8 名精神科医生,系统性地提炼出 32 条反映精神科医生职业认同各层面的陈述语句,形成研究的 Q 样本。2. 选择 P 样本: 设计一套调查参与者背景信息的调查问卷,采用非随机、有目标的选择方式,挑选具有不同背景特征的 18 位精神科医生作为参与排序的 P 样本。3. Q 排序: 为受试者提供 9 等级的正态分布表格,受试者在专业人员的指导下完成由“最同意”、“模糊不确定”、“最不同意”的顺序进行强迫排序。4. 数据分析: 本研究应用 KEN-Q 软件进行处理分析 Q 排序结果,对收集到的 Q 排序数据进行深入处理与分析,其中包括主成分分析法以提取关键因子,并采用因子旋转技术(如 Varimax 旋转)来优化因子结构,提高解释力。

结果 在本项研究中,我们成功地识别出了四个关键因子,并对其特征值和所解释的变异量进行了如下统计: 第一个因子的特征值为 6.4619,它能够解释总体变异量的 36%; 第二个因子的特征值为 2.0159,其对变异量的解释贡献率为 11%; 第三个因子的特征值是 1.5299,其所解释的变异量占比为 8%; 而第四个因子的特征值为 1.3634,同样也解释了 8%的变异量。四个因子的特征值均大于 1,累积解释变异量为 63%。专科医院精神科医生的职业认同分为四个类型,具体命名为“期望提高福利待遇的精神科医生”;“重视职业幸福感的科医生”;“期望精神卫生发展稳健前行的科医生”;“青睐管理岗位的精神科医生”。

结论 本研究中专科医院的精神科医生职业认

同感主要分为以下 4 个类型：“期望提高福利待遇的精神科医生”；“重视职业幸福感的精神科医生”；“期望精神卫生发展稳健前行的精神科医生”；“青睐管理岗位的精神科医生”。

关键词：精神科医生，职业认同，精神卫生，Q 方法

抑郁症患者就医延迟的影响因素：一项质性研究

杜冬阳^{1,2} 王旭梅¹

1. 中国医科大学附属盛京医院

2. 辽健集团抚矿总医院

目的 抑郁症不仅会导致个体功能受损和生活质量下降，还会带来巨大的经济损失和沉重的社会负担。尽管目前已有有效的治疗方法，但抑郁症患者寻求专业治疗的情况并不理想，绝大多数患者往往经过长时间拖延才前往医院就诊，为了进一步理解导致患者就医延迟的因素，探索患者的观点至关重要。本研究旨在通过质性研究方法深入探讨抑郁症患者就医延迟的影响因素，以便提供合理化建议促进患者及时就医，提高精神卫生服务的有效利用率。

方法 采用目的抽样法，以研究者本人为研究工具，对 16 名符合纳入和排除标准的抑郁症患者进行一对一结构化访谈，在访谈结束后 48 小时内及时将录音转换为文字稿并进行校对，共获得了大约 5 万字的有效文字稿，并以此作为第一手的研究资料。将整理的有效文字稿导入 Nvivo12 软件，运用质性研究中的程序化扎根理论方法对访谈资料进行规范化的处理与编码分析，提取抑郁症患者就医延迟的影响因素，在此基础上利用解释结构模型方法，解析各影响因素间的层次关系，进而构建抑郁症患者就医延迟影响因素的多级递阶结构模型。

结果 从访谈资料提取出导致抑郁症患者就医延迟四个因素：个人因素(认知水平、疾病发展、个人感知、信息素养、求助偏好、个人态度)、人际网络因素(亲朋支持、工作关系)、医疗资源因素(实际成本、专业水平)、社会环境因素(传统观念、网络媒体)，这些因素通过解释结构模型方法可进一步分为四个层级，归纳为表层、中层和深层三个层次。

结论 抑郁症患者就医延迟行为受个人因素(认知水平、疾病发展、个人感知、信息素养、求助偏好、个人态度)、人际网络因素(亲朋支持、工作关系)、医疗资源因素(实际成本、专业水平)和社会环境因素(传统观念、网络媒体)的影响。影响抑郁症患者就医延迟的 12 因素通过解释结构模型可划分为四个层级，并归纳为表层、中层和深层三个层次。第一层因素包括个人感知、求助偏好与个人态度，也是影响抑郁症患者就医延迟的表层因素；第二、三层因素包括认知水平、实际成本、信息素养、亲朋支持、工作关系与专业水平，属于中层因素。第四层因素包括疾病发展、传统观念与网络媒体，是影响抑郁症患者就医延迟的深层因素。表层因素对就医延迟的行为产生直接影响，中层因素既受到深层因素的影响，又对表层因素产生直接影响，深层因素是影响抑郁症患者就医延迟的根本因素，对其他因素的影响面较广，可直接或间接影响表层和中层因素，并且深层因素中的传统观念和网络媒体之间也有影响作用。

关键词：抑郁症，就医延迟，影响因素，质性研究，扎根理论，解释结构模型

高原躯体症状障碍患者的躯体症状与负面情绪的关系

张嘉熙 李静*

四川大学华西医院

目的 躯体症状障碍的特点为存在一种或多种躯体症状以及过度的感受、想法和行为，在一般人群中的发病率较高，对社会造成了较大的医疗负担。临床上发现躯体症状障碍在高原地区的发病率较高，且很多伴随着各种形式的负面情绪，如焦虑、抑郁、压力及述情障碍。但这些负面情绪在高原患者中的关系尚不明确。

方法 本研究纳入 85 例高原躯体症状障碍患者以及 90 例性别、年龄相匹配的高原地区的健康被试，所有被试均接受了自评量表的评估。在躯体症状障碍方面使用了 SSD-12(躯体症状量表 12 条目)、PHQ-15(健康问卷躯体症状群量表 15)评估躯体症状的严重程度，在负面情绪方面使用了 PHQ-9(患者健康状况问卷-9)评估抑郁、GAD-7(患者健康状

况问卷-7)评估焦虑、TAS-26(多伦多述情障碍量表-26)评估述情障碍、CPSS(压力知觉量表)评估压力程度。

结果 本研究发现,高原地区躯体症状障碍患者的两项躯体症状量表评分以及焦虑、抑郁、压力水平显著高于健康对照。在患者组中,躯体症状的严重程度与多种负面情绪(焦虑、抑郁、压力)呈正相关。

结论 高原地区躯体症状障碍患者除了呈现出躯体症状相关的症状外,还常伴随着多种负面情绪,如焦虑、抑郁、压力等。在临床上针对躯体症状进行治疗的同时,也应当针对其负面情绪采取一定的治疗措施,如抗抑郁药,以期从多方面缓解患者的多种症状。

儿童青少年边缘特质量表中文简化版的修订及信效度检验

王佳媛 王旭梅*

中国医科大学附属盛京医院

目的 本研究引进儿童青少年边缘特征量表(BPFSC-11)中文简化版,旨在为我国儿童青少年边缘人格特质的探索、评估及治疗提供依据。

方法 通过翻译、回译、文化调试、预实验后形成了 BPFSC-11 中文版,采取随机整群抽样法,于 2023 年 7 月选取西安市、朔州市、廊坊市三个地区的 3 所中学的在校中学生进行线上问卷调查。研究工具包括一般情况调查问卷、BPFSC-11 中文版、情绪调节困难量表(DERS)、故意自残量表简版(DSHI-9)、加州大学洛杉矶分校的孤独量表(UCLA)、90 项症状清单(SCL-90)中的偏执和人际关系敏感分量表。最终回收问卷 1126 份,三周后,随机抽取 100 人接受重测。使用 SPSS27.0 软件进行项目分析、探索性因子分析、信度检验、构想效度检验及一般人口学差异分析,使用 AMOS28.0 软件进行验证性因子分析。

结果 中文版 BPFSC-11 的项目分析符合心理测量学要求($P < 0.001$),探索性因子分析和验证性因子分析结果显示中文版 BPFSC-11 为一维结构,单因子的模型拟合度良好, $\chi^2 / df = 2.433$;

RMSEA=0.051 ; GFI=0.973 ; AGFI=0.950 ; RMR=0.032; NFI=0.974; IFI=0.984; TLI=0.976; CFI=0.984。中文版 BPFSC-11 的内部一致性信度 Cronbach's α 系数为 0.908,重测信度为 0.807。中文版 BPFSC-11 得分与 DERS ($r=0.645$)、DSHI-9 ($r=0.288$)、UCLA ($r=0.632$)、SCL-90 偏执及人际关系敏感分量表 ($r=0.599$, $r=0.625$) 等得分均存在正相关 ($P < 0.01$)。中文版 BPFSC-11 得分在男生 (23.28 ± 9.42) 与女生 (24.43 ± 10.45) 之间无显著差异;有年龄中存在显著差异,其中 16 岁及 17 岁得分最高,且两个年龄得分差异不显著;非独生子女得分显著高于独生子女;农村样本得分显著高于城市样本;高中组得分显著高于初中组;父母婚姻不稳定的青少年得分显著高于父母婚姻稳定的青少年 (均 $P < 0.01$)。

结论 本研究完成了 BPFSC-11 在中国文化背景中的修订及信效度研究,表明中文版 BPFSC-11 具有良好的信度和效度,是一种可靠有效、简洁方便的边缘人格特质测量工具,可用于中国儿童青少年边缘人格特质的评估。

关键词: 边缘人格特质,青少年,儿童,信效度,量表

孕妇孕次与孕期心理问题关系的研究

王宁¹ 王晓茜² 张蕾²

1.北京回龙观医院

2.清华长庚医院

目的 本研究旨在探讨孕妇的孕次(怀孕次数)与孕期抑郁之间的关系,为其预防和干预提供策略。

方法 本研究为横断面研究,共纳入了 3626 名在某三甲医院产科接受产前检查的孕妇,采用标准化的问卷调查法收集数据。问卷内容包括孕妇的基本信息(如年龄、职业、婚姻状况、文化程度及家庭收入等)、孕次信息,以及孕期抑郁的评估量表。孕期抑郁的评估采用抑郁自评量表(SDS)。数据分析采用 SPSS25.0 统计软件,通过描述性统计、卡方检验和逻辑回归分析等方法,对孕次与孕期抑郁之间的关系进行了详细分析。

结果 1. 孕次:在参与研究的 3626 名孕妇中,孕次范围为 1-5 次,平均孕次为 1.7 次。其中,初孕

妇(孕次为1)共有1486名,占比41%;经孕妇(孕次大于1)共有2140名,占比59%。

2. 孕期抑郁发生率:根据SDS量表评分,本研究发现孕期抑郁的总发生率为21%,即共有765名孕妇在孕期表现出抑郁症状。

3. 孕次与孕期抑郁的关系:随着孕次的增加,孕期抑郁的发生率逐渐升高。在初孕妇中,抑郁症状的发生率为5.4%(80/1486);孕次为2的孕妇中抑郁的发生率为7.2%(86/1195),孕次为3的孕妇中抑郁的发生率为7.7%(62/808),而孕次大于或等于4的孕妇中抑郁的发生率最高,达到了12.1%(53/437)。卡方检验显示,不同孕次组间的抑郁发生率存在显著差异($\chi^2=27.1$, $df=3$, $p<0.001$)。

4. 逻辑回归分析:为了进一步探究孕次与孕期抑郁之间的关系,本研究进行了逻辑回归分析。结果显示,孕次是孕期抑郁的独立危险因素。随着孕次的增加,孕妇出现抑郁的风险逐渐增加($\beta=0.12$, $p<0.001$)。这一结果意味着,相比于初孕妇,经孕妇更容易在孕期出现抑郁症状。

结论 本研究发现,孕妇的孕次与孕期抑郁之间存在显著的正相关关系,即孕次越多,孕期抑郁的危险越高。这一结果提示我们,对于孕次较多的孕妇,应给予更多的心理健康关注和支持。通过加强健康教育、减少无效妊娠以及建立社会支持网络等措施,可以帮助预防和减少孕期抑郁的发生。

关键词:孕妇;孕次;孕期抑郁;逻辑回归分析

基于Q方法探究专科医院精神分裂症和双相情感障碍患者服药不依从的自陈原因

赵迪^{1,2} 王旭梅¹

1.中国医科大学附属盛京医院

2.辽健集团抚矿总医院

目的 多数严重精神障碍属于慢性疾病范畴,药物治疗是治疗的关键,而在临床工作中发现几乎一半的精神疾病患者不能坚持服药。服药不依从性会导致精神症状加重,增加疾病复发率、再住院率以及经济负担。本研究应用Q方法探究精神疾病患者服药不依从的自陈原因,并提出相应的干预措施,为解决精神疾病患者服药不依从问题提供一定的参考。

方法 本研究采用Q方法探究专科医院精神分裂症和双相情感障碍患者服药不依从的自陈原因。首先,对研究对象进行面对面半结构式访谈,收集Q语句,当没有新的语句出现时,资料达到饱和,停止访谈。然后对收集到的Q语句进行审核、修正,形成最终的Q陈述语句;其次,挑选P样本,应选择背景不同,对研究主题可能有不同建设性意见的受访者进行Q排序,P样本的数量小于Q样本中陈述的数量;最后运用PQ method软件对相关数据进行主成分分析、因子旋转等运算步骤,其中因子提取时要求因子特征值 >1 ,并且必须有两个以上Q排列映射到该因子才能予以保留。因子旋转时应保留因子载荷量的绝对值大于 $2.58 \times (1/\sqrt{Q})$ (样本数量) ($P < 0.01$),且不存在跨因子情况的Q排列,各因子累计可解释变异量需 $>40\%$ 。

结果 本研究选取了8名符合纳入及排除标准的精神疾病患者进行面对面半结构式访谈,结合文献进行整理,形成56条Q陈述集合,最后经过审核、修正形成35条Q陈述语句。邀请了21名精神疾病患者参与Q排序过程,依据服药不依从自陈原因,将其分为5种类型:“家庭和社会支持不足”、“对治疗信息了解不足”、“自我感知药物疗效不明显”、“病耻感”、“无法耐受副作用”。因子1的特征值为4.1983,因子2的特征值为2.4456,因子3的特征值为1.9577,因子4的特征值为1.8557,因子5的特征值为1.5995,累积解释率为57%。

结论 本研究从患者的角度进行分析将专科医院精神分裂症和双相情感障碍患者服药不依从的自陈原因归为5类,为专科医院精神分裂症和双相情感障碍患者服药不依从行为的干预与治疗提供新思路,有助于提高服药依从性。

关键词:Q方法,服药依从性,自陈原因,精神分裂症,双相情感障碍

正念认知疗法对围产期抑郁症患者的疗效

邵春红* 宇淑涵

复旦大学附属华山医院

目的 由于药物治疗对围产期抑郁症患者及胎儿可能得不良影响,心理治疗成为围产期抑郁患者的一线选择。本研究探索正念认知治疗

(Mindfulness based cognitive therapy, MBCT) 对围产期抑郁症患者的疗效。

方法 本研究为纵向研究,患者来自于2023年2月至2024年2月在复旦大学附属华山医院精神医学科就诊的42位门诊患者。采用随机数字法,将患者随机分配进入MBCT及心理健康教育组(Psychoeducation, PED),共进行八周治疗。在治疗前、治疗4周及治疗8周采用患者健康问卷-9(Patient Health Questionnaire-9, PHQ-9)和17项汉密尔顿抑郁量表(17-Hamilton Depression Scale, HAMD)评估患者基线及治疗4周及8周时抑郁症状的程度。

结果 进行全分析集分析(Full-analysis-set, FAS), MBCT组及PED组均为21人。与基线相比,治疗4周及8周后, MBCT组及PED组患者的自评及他评抑郁量表评分均较基线降低(均 $P<0.001$),但MBCT组抑郁量表的减分率在治疗4周及8周时,均明显高于PED组,差异具有统计学意义($p<0.05$)。

结论 MBCT对围产期抑郁具有良好的疗效,由于无药物不良反应,结构化,短程,患者接受度更高。

关键词: 基于正念的认知治疗(MBCT); 心理教育; 围产期抑郁;

(SDS)分别评估患者的抑郁程度、焦虑程度、快感缺失程度、睡眠质量、社会功能。所有入组的患者均完成外周血IL-6及CRP的检测。通过多元线性回归模型分析了快感缺失症状与IL-6和CRP等炎症因子,以及匹兹堡睡眠质量指数(PSQI)、席汉残疾评定量表(SDS)之间的关系。

结果 本研究中70%的抑郁症患者存在快感缺失症状,快感缺失量表与IL-6及CRP等炎症因子具有相关性,IL-6和CRP数值越高,快感缺失症状越严重;快感缺失越严重,睡眠越差,社会功能越差,差异具有统计学意义($P<0.05$)。

结论 快感缺失是抑郁症患者的核心症状之一,严重影响患者的睡眠及社会功能,白介素-6和C反应蛋白等炎症因子可能参与了对快感缺失症状的介导。

关键词: 抑郁症; 快感缺失; 白介素-6; C-反应蛋白

抑郁症患者快感缺失症状与白介素-6和C反应蛋白的相关性

邵春红* 宇淑涵

复旦大学附属华山医院

目的 快感缺失是抑郁症患者的核心症状之一,严重影响患者的症状恢复及社会功能,本研究旨在探讨抑郁症患者快感缺失症状与睡眠、社会功能以及炎症因子白介素-6(IL-6)和C反应蛋白(CRP)之间的关系。

方法 本研究为横断面研究,患者来自于2023年5月至2024年3月在复旦大学附属华山医院精神医学科就诊的126位门诊患者,符合《精神障碍诊断与统计手册》第5版成人抑郁症的诊断标准。采用汉密尔顿抑郁量表(HAMD)、汉密尔顿焦虑量表(HAMA)、斯奈思-汉密尔顿快感量表(SHARPS)、匹兹堡睡眠质量指数(PSQI)、席汉残疾评定量表

司法精神病学组

100 例法医精神病司法鉴定重新鉴定案例调查分析与对策

撒兰梅*

新疆安宁法医精神病司法鉴定所

目的 探讨有争议的法医精神病司法鉴定中重新鉴定案例,分析其在初次鉴定中存在的问题,提出解决问题方法。

方法 收集 2013 年——2023 年在法医精神病司法鉴定重新鉴定案例 100 例进行调查,自制调查表,将数据进行统计学分析。

结果 初次鉴定案项目与重新鉴定结论间均无相关性 ($P>0.01$)但初次鉴定与重新鉴定组法律关系一致性比较有显著差异,有统计学意义 ($X^2=8.819$, $P<0.05$)

结论 初次鉴定鉴组司法鉴定程度受理、资料、精神检查、讨论分析环节存在问题导致司法鉴定意见中法律关系前后不一致,应该从规范执业行为,提高司法鉴定人专业技能,完善鉴定标准等问题亟待规范和解决。

法医精神病司法鉴定涉及医学和法学的许多方面,其结论常常引起的争议,随着我国社会主义法制的日趋完善和《精神卫生法》完整,以及精神卫生知识的逐渐普及,有关对精神病人的行为与法律的关系也日益重视,要求重新鉴定的案例也日益增多[1]。本文对 100 例 2013 年至 2023 年法医精神病司法鉴定重新鉴定案例进行调查分析,采用自行设计调查表进行逐个登记,分为初鉴组和复鉴组,从初鉴组鉴定程度、鉴定过程、鉴定意见书等方面存在问题与重新鉴定意见的一致性行分析,与复鉴组鉴定意见、法律关系进行对比。采用 SPSS10.0 统计软件进行统计分析,采用 t 检验和 X^2 检验。有利于提高法医精神病司法鉴定质量,并对在法医精神病司法鉴定中存在问题,提出法医精神病司法鉴定程序规范的具体措施及对策。

关键词: 法医精神病 司法鉴定 重新鉴定 调查分析

司法精神病重新鉴定 1 例报告

撒兰梅*

新疆安宁法医精神病司法鉴定所

目的 关于司法鉴定一些法律规定的出台使司法鉴定工作增加了风险,尤其是司法精神病鉴定,目前尚缺乏客观的生物学指标,大多还只能依据调查所得及鉴定经验去得出结论,因此在司法鉴定实践活动中,重复鉴定的案例会经常出现,同样一名被鉴定对象,两个鉴定单位可得出截然相反的鉴定结论,某些案件当事人被追究的责任也不同,这些问题却是值得我们思考的,现将一例重复鉴定案件报告如下

方法 被鉴定人杨××,男,64岁,汉族,为退休干部×年×月×日涉嫌猥亵幼女被×公安局羁押×年×月×日曾在××司法鉴定所进行法医精神病司法鉴定,结论为酒精所致的精神障碍(缓解期);有刑事责任能力,同年×月×日被逮捕,因故亲属不服要求重新鉴定,××年×月×日委托我所对其进行重新鉴定,经对案件情况全部审讯记录对有关人员的调查记录、关押期间的表现调查以及被鉴定人住院病历、辅助医学检查、精神状态检查后发现被鉴定人

结果 从此例司法鉴定重新鉴定案件中,我们可以看出引起这样结果的原因虽有一定的客观原因,但大多数还是我们鉴定中的问题,包括有认识上的问题,很重要的还有司法鉴定的基本技巧问题,对此案本人谈些看法,以作共勉

1.精神病司法鉴定有很大不同,调查材料的收集会影响鉴定结论的客观性,资料必须公正、可靠、全面。

2.精神病司法鉴定时有的被鉴定人精神症状变化快,要调查过去的事,这样有助于全面了解被鉴定人精神症状。

3.精神病司法鉴定要求司法鉴定人要有严谨的科学作风,公平公正,对法律负责,加强风险意识,充分认识到“错误”鉴定后果不仅涉及鉴定人的安全,使当事人权益受到损害,更严重的在刑事案件中“错鉴”造成“错判”会导致无法挽回的不良后果。

4.每做完一份鉴定书,就要想到由此可能产生的后果,要认真斟酌再三。还要把握分寸,包括充分调查,全面检查及掌握诊断标准等。

因此,司法精神病鉴定工作是一项时间长、任务重、要求高的特殊工作,我们作为司法鉴定人必

须要有扎实的精神病学功底，高度认真态度以及一些不苟的严谨作风，才能更好地服务于司法鉴定。

结论 综上：被鉴定人长期饮酒，酒依赖，酒后出现精神病性症状，××年颅脑外伤后出现明显的额叶内侧面综合症作案动机为满足性的快乐，对自己的危害行为认识“是一种犯罪行为”，故而在脑器质性人格改变，自我克制能力受损的基础上为满足性快感而实施的危害行为，应评定为混合动机，鉴定意见为 1.脑器质性精神障碍；酒精所致的迟发性精神障碍；酒依赖；2.××年 4 月 5 日猥亵幼女是由于脑器质性精神障碍，辨认能力，控制能力削弱下实施的，责任能力评定；限制刑事责任能力，后法院采信我所鉴定意见，对被鉴定人从轻处罚，判被鉴定人有期徒刑六个月。

涉案抑郁症定量脑电图生理机制研究

张开红 郑云哨*
山东省精神卫生中心

目的 为了明确涉案抑郁症脑电活动特征，为应用脑电图客观评价涉案抑郁症严重程度提供依据。

方法 首先，符合 CCMD-3 抑郁症诊断标准，并且 Beck 抑郁自评量表 (BDI) >15 分的涉案抑郁症 30 例，选择 30 例健康者作为对照组。然后，对入组样本进行定量脑电图检测 (δ 、 θ 、 α 、 β) 功率值。采集记录两组被试静息态 (清醒、睁眼、安静、坐位) 脑电各 9 分钟，运用 Matlab 软件对脑电数据进行离线处理，以短时傅里叶变换 (STFT) 的方法，选取额区 (F3、FZ、F4)、中央区 (C3、CZ、C4)、顶区 (P3、PZ、P4) 以及枕区 (O1、OZ、O2) 的电极，分别计算各个频段 δ (1-3.5Hz)、 θ (4-7Hz)、 α (8-13 Hz)、 β (13-30 Hz) 的能量信息，并绘制出平均脑地形图；另外选取额区 FP1、FP2、F7、F8 作为计算额区脑电 α 波不对称性 (Frontal alpha asymmetry, FAA) 的特征电极。

结果 1. 静息态脑电 β 波功率组间差异显著 ($t=3.726, p<0.05$)，表现为涉案抑郁症组脑电 β 波功率显著高于健康对照组。

2. 静息态脑电 δ 波功率组间差异显著 ($t=2.25826, p<0.05$)，表现为涉案抑郁症组脑电 δ 波功

率显著低于健康对照组。

2. 涉案抑郁症组脑电 α 波功率均显著低于静息状态 ($t=2.0536, p<0.05$)。

3. 两组间静息态 FAA 值无显著差异，无其他主效应或交互相应。

4. 涉案抑郁症组被试四个波段功率值、FAA 值与其 BDI 评分均无显著相关。

结论 本研究结果表明涉案抑郁症组脑电活动四个波段存在差异，可以作为评定抑郁的指标，FAA 值组间无显著差异。

关键词：抑郁症 定量脑电图 额区脑电 α 波不对称性

精神分裂症患者刑事责任能力评定相关因素分析

周雅君*
宁夏宁安医院

目的 探讨精神分裂症患者刑事责任能力评定相关因素

方法 资料与方法

1.1 一般资料

选择宁夏精神疾病鉴定所 2020~2023 年鉴定的 50 例具有凶杀行为的精神分裂症患者 (观察组) 与 50 例具有凶杀行为的无精神障碍嫌疑人 (对照组) 作为研究对象，观察组均符合《中国精神障碍分类与诊断标准第三版 (精神障碍分类)》中关于精神分裂症的诊断标准，对照组均无精神障碍，每个案例均由至少 3 名精神科主治医师以上职称且具有司法鉴定资格的鉴定人进行鉴定。

1.2 方法

回顾性分析和对比两组研究对象的一般人口学资料、犯罪特征，统计精神分裂症患者的刑事责任能力评定结果。一般人口学资料包括年龄 (≥ 40 岁、 < 40 岁)、性别 (男、女)、文化程度 (文盲、小学、初中、高中及以上)、婚姻状态 (未婚、已婚、离异或丧偶) 等指标，犯罪特征包括案发前思维障碍 (有、无)、情绪状态 (稳定、不稳定)、社会功能 (正常、受损)、攻击行为史 (有、无)、作案先兆 (有、无)、诱因 (有、无)、预谋 (有、无)、作案动机 (现实动机/混合动机、病理动机)、作案对象 (陌生人、亲友)、

环境辨认(好、差)、自我保护(有、无)。

根据刑事责任能力评定结果将 50 例精神分裂症患者分为有刑事责任能力组与无刑事责任能力组,采用多因素 Logistics 回归分析法对具有凶杀行为的精神分裂症患者刑事责任能力评定结果的影响因素进行分析。

结果 精神分裂症患者的作案与案发前思维障碍、情绪状态、社会功能、攻击行为史、作案先兆、诱因、预谋、作案动机、作案对象、环境辨认、自我保护等方面有比较均有显著差异($P<0.05$),而在年龄、性别、文化程度、婚姻状态方面比较均无显著差异($P>0.05$)。

结论 具有凶杀行为的精神分裂症患者在接受刑事责任能力评定时需谨慎,应综合考虑其精神障碍因素、作案特征对其评定结果的影响,以提高刑事责任能力评定的准确性。

关键词:精神分裂症,动机,作案特征,相关因素

甲基苯丙胺成瘾者初吸年龄和吸毒时间对心理健康影响状况的研究

梁凤霞*

安徽省蚌埠强制隔离戒毒所

目的 研究甲基苯丙胺成瘾所导致的心理健康状况,并分析影响甲基苯丙胺患者心理健康状况的相关因素。

方法 选取蚌埠强制隔离戒毒所 106 名男性甲基苯丙胺成瘾者作为观察组,当地社区 76 名健康男性作为对照组。采用一般情况问卷收集成瘾者一般人口学资料和相关吸毒情况,采用 SCL-90 量表评估受试者心理健康状况。并采用 Pearson 相关性分析和多元逐步回归方法分析心理健康状况的影响因素。

结果 两组一般人口学资料无显著差异($P>0.05$);心理健康状况分析结果显示,除敌对因子外,甲基苯丙胺组 SCL-90 各因子得分及总分均显著高于对照组($P<0.01$);相关分析显示,初吸年龄与躯体因子($r=-0.275$)、抑郁因子($r=-0.182$)、焦虑因子($r=-0.228$)、恐怖因子($r=-0.207$)、偏执因子($r=-0.170$)、精神病性因子($r=-0.178$)和 SCL-90 总分($r=-0.182$)呈负相关;累计吸毒时间与焦虑因子

($r=0.179$)、恐怖因子($r=0.215$)和 SCL-90 总分($r=0.192$)呈正相关;逐步回归分析显示躯体因子、抑郁因子、偏执因子、精神病性因子的主要影响因素是初吸年龄,焦虑因子、恐怖因子和 SCL-90 总分的主要影响因素是初吸年龄和累计吸毒时间。

结论 甲基苯丙胺使用导致成瘾者出现较严重的心理健康障碍,这种心理健康障碍的发生与较早的吸毒年龄和累计吸毒时间呈正相关,本研究为戒毒工作者更好的了解戒毒人员的心理健康状况,对不同状况吸毒人员提供有针对性的干预方案提供参考。

关键词:甲基苯丙胺成瘾;心理健康状况,影响因素

宁夏地区涉酒法医精神病鉴定案例资料分析

徐学兵*

宁夏回族自治区宁安医院

目的 探讨宁夏地区 2022-2023 年涉及饮酒而行法医精神病鉴定的案例特征。

方法 对 200 年-2023 年在宁夏精神疾病鉴定所委托鉴定的 483 例鉴定的案例进行整理,将其中涉及到饮酒的 83 例鉴定资料采用自制调查表收集诊断、病程、年龄文化程度、涉酒原因、酒精类型、饮酒量等相关资料,进行回顾性分析,并与 2020-2021 年因涉酒鉴定进行对比。

结果 83 例涉酒法医精神病鉴定中,精神分裂症最多(21/83,25.34%),酒精所致精神障碍次之(17/83,20.48%),未发现精神病性障碍为三(11/83,13.25%);危险驾驶最多(46/83,55.42%),伤害案次之(6/83,7.2%);完全刑事责任能力最多(34/83,40.96%),限定刑事责任能力次之(31/83,37.35%),无刑事责任能力最少(18/83,21.68%)

结论 近 2 来,因涉酒委托法医精神鉴定量较 2020-2021 年的 21 例明显增加(增长率 66.26%),鉴定仍以精神分裂症为主体,以危险驾驶为案由居多,以完全刑事责任能力居上;也有未见精神病性障碍的对象提请委托。要加强对精神病患者的管理,特别是“病驾”和“酒驾”。

Workplace Violence Impact Correctional Officers' Mental Health Via Overwork

Yan Li Huijuan Guo Jizhi Wang Ying Huang Jiansong
Zhou Xiaoping Wang*
The Second Xiangya Hospital, Central South University

Objective China's correctional officers face widespread workplace violence and the resulting overwork that can profoundly damage their physical and mental health. This study aims to investigate the mediating role of overwork in the relationship between workplace violence and the manifestation of physical and mental health issues among correctional officers

Methods This study enlisted 472 eligible participants. Cross-sectional data were obtained using the Chinese version of the Workplace Violence Scale (WVS), while the physical and mental health of correctional officers was evaluated through relevant scales. Analysis involved descriptive statistics, correlation analyses, and tests for mediation models

Results Workplace violence and overwork significantly affected the physical and mental health of correctional officers ($p < 0.001$). Mediation analyses indicated that workplace violence indirectly influences the physical and mental health of correctional officers through overwork ($p < 0.05$), establishing overwork as a mediating factor in the health challenges faced by correctional officers due to workplace violence

Conclusion Workplace violence and overwork significantly contribute to the physical and mental health challenges faced by correctional officers. Overwork acts as a mediator in the relationship between workplace violence and these health issues. The study suggests addressing workplace violence and mental health issues among correctional officers by increasing their numbers, improving the work environment, and implementing enhanced welfare policies

关键词: Correctional officers, Workplace violence, Overwork, physical and mental health

Disrupted Brain Functional Asymmetry at Rest in Patients with Major Depressive Disorder Associated with Sleep Disturbances

Dan Lv Yangpan Ou Wenbin Guo*
The Second Xiangya Hospital of Central South University, Changsha 410011, Hunan, China.

Objective Sleep disturbances (SD) are common in major depressive disorder (MDD) patients. Brain functional asymmetry is crucial for understanding MDD pathophysiology. Previous studies using the parameter of asymmetry (PAS) approach have found brain functional asymmetry disruption in MDD. However, this has not been explored in MDD patients with SD

Methods This study examined 26 MDD patients with SD, 34 MDD patients without SD, and 34 healthy controls using resting-state functional magnetic resonance imaging scans. SD symptoms were quantified using the 17-item Hamilton Rating Scale for Depression. PAS approach was used to evaluate functional asymmetry

Results MDD patients with SD displayed increased PAS in the left middle frontal gyrus (MFG)/inferior frontal gyrus (IFG) and decreased PAS in the left parahippocampal gyrus (PHG) compared to MDD patients without SD. Increased PAS in the left MFG/IFG was positively correlated with SD severity, and a negative correlation was found between decreased PAS in the left PHG and SD scores in all MDD patients. Receiver operating characteristic analysis indicated that increased PAS in the left MFG/IFG and decreased PAS in the left PHG may serve as potential neuroimaging markers to differentiate MDD patients with SD from those without SD with Area Under Curve values of 0.8157 and 0.8068, respectively

Conclusion These results highlighted that increased PAS in the left MFG/IFG and decreased PAS in the left PHG may be considered a prominent feature associated with SD symptoms of MDD patients, potentially serving as imaging markers to discriminate between MDD patients with and without SD

Research Protocol for Systematic Review of Forensic Psychiatric Assessment in Adolescents Aged 12 To 14 Years

Wen Li*

Academy of Forensic Sciences

In 2021, the minimum age of criminal responsibility in China has been edged down to 12 years old according to Amendment XI to the Criminal Law. Adolescents between the ages of 12 and 14 who commit eight types of serious crimes, including intentional homicide, intentional injury causing serious injury or death, rape, robbery, drug trafficking, arson, and explosion or releasing dangerous substances, and are prosecuted with the approval of the Supreme People's Procuratorate, shall bear criminal responsibility. In China, there is a lack of child psychiatrists, and forensic psychiatry research pertaining to children and adolescents is uncommon. Additionally, the majority of forensic psychiatrists do not possess a profound understanding of child psychiatry. The lowering of the minimum age of criminal responsibility will increase the challenge in forensic psychiatric assessment. Crimes committed by children aged 12 to 14 years old have been reported since the implementation of Amendment XI to the Criminal Law, each of them sparking extensive societal debate and discussion. The significance of conducting a precise and unbiased forensic psychiatric evaluation is paramount in the administration of justice within legal organizations. This research aims to conduct a systematic review of existing literature related to the criminal responsibility of adolescents aged 12 to 14 years old and suffering from mental disorders.

This protocol adheres to the guidelines of the Preferred Reporting Items for Systematic Review and Meta-Analyses (PRISMA). Two investigators will conduct a thorough and independent search of major inter-

national databases using relevant terms of “criminal responsibility” and “adolescents”. The inclusion criteria will follow the PICOS acronym: Participants (adolescents aged between 12 and 16 years old), Intervention (not applicable), Control (not applicable), Outcomes (criminal responsibility), and Study design (case reports, comments, cross-sectional studies). Two investigators will independently select eligible studies, extract data, as well as assess study quality. The extracted data will include study and participants' characteristics, primary and secondary outcomes, and expert consensus and viewpoints. The study quality will be assessed using the CASP Appraisal Checklists.

The objectives of this systematic review are to address the following inquiries in adolescents aged 12 to 14 years: (1) Explore the differences in crime characteristics between targeted population and adolescents aged 14 to 16 years. (2) Analyze the distribution of mental disorders among adolescents committing crimes. (3) Analyze the influence of diverse mental disorders on criminal behaviors. (4) Identify the primary risk factors that contribute to criminal behaviors in adolescents with mental disorders. (5) Explore the variations in crime types among adolescents with different types of mental disorders. (6) Discuss the criminal responsibility of adolescents with conduct disorders. (7) Investigate the role of culture and religion in shaping judgments of criminal responsibility for adolescents with mental disorders.

关键词: systematic review, minimum age of criminal responsibility, adolescents, forensic psychiatric assessment

108 例受处罚能力鉴定案例分析

何建锋 乔屹*

上海市精神卫生中心

目的 探讨上海地区受处罚能力评定案件的特点及一般规律,为精神障碍患者的防控工作及预防违法行为提供一些参考数据。

方法 对2023年1月~2023年12月在上海市精神卫生中心司法鉴定所实施受处罚能力评定的案

件 108 例进行资料收集。

结果 108 例案件中, 男性占 70.4%, 平均年龄 (38.08±12.19) 岁, 高中及以上文化占 61.1%, 未婚及离异者占 63.9%, 无业者占 42.6%。作案类型中, 殴打或故意伤害他人身体的行为占比最高, 为 32 起 (29.6%), 其次为扰乱公共秩序的行为 27 起 (25.0%), 猥亵他人和在公共场所裸露身体 16 起 (14.8%), 盗窃、诈骗、哄抢、抢夺、敲诈勒索、损毁公私财物行为 12 起 (11.1%), 寻衅滋事 9 起 (8.3%)。鉴定诊断前 5 位依次是精神分裂症、分裂型障碍和妄想性障碍 (F20-F29) 44 例 (40.7%), 心境障碍 (F30-F39) 21 例 (19.4%), 成人人格与行为障碍 (F60-F69) 10 例 (9.3%), 器质性精神障碍 (F00-F09) 8 例 (7.4%), 使用精神活性物质所致的精神和行为障碍 (F10-F19) 7 例 (6.5%)。鉴定意见为无受处罚能力 47 例 (43.5%), 限定受处罚能力 21 例 (19.4%), 完全受处罚能力 40 例 (37.0%)。

结论 上海市精神卫生中心司法鉴定所 2023 年受处罚能力评定的案件中, 以青壮年、高中及以上文化、未婚的无业人员为主。鉴定诊断前 5 位的是精神分裂症、分裂型障碍和妄想性障碍, 心境障碍, 成人人格与行为障碍, 器质性精神障碍, 使用精神活性物质所致的精神和行为障碍。

涉案抑郁症认知功能与事件相关电位的相关研究

于晓东*

山东省精神卫生中心

目的 为了明确涉案抑郁症神经心理认知功能特征 (事件相关电位 P300、N400、MMN 特征), 为应用事件相关客观评价涉案抑郁症的认知功能提供依据。

方法 首先, 符合 CCMD-3 抑郁症诊断标准, 并且 Beck 抑郁自评量表 (BDI) >15 分的涉案抑郁症 30 例, 选择 30 例健康者作为对照组。然后, 对入组样本进行事件相关电位检测, 分析指标为 P300、N400、MMN 峰潜伏期及波幅, 电极位点 Pz、Cz、fz。

结果 涉案抑郁症基线水平 P300 (电极位点 Pz、

Cz、fz) 潜伏期明显长于对照组 (Pz:t=8.267, P<0.001; Cz:t=10.620, P<0.001; fz:t=7.745, P<0.001), 波幅明显低于对照组 (Pz:t=7.208, P<0.001; Cz:t=7.064, P<0.001; fz:t=8.466, P<0.001)。涉案抑郁症基线水平 N400 (电极位点 Pz、Cz、fz) 潜伏期明显长于对照组 (Pz:t=10.659, P<0.001; Cz:t=7.569, P<0.001; fz:t=8.180, P<0.001), 波幅明显低于对照组 (Pz:t=8.562, P<0.001; Cz:t=9.869, P<0.001; fz:t=7.583, P<0.001)。涉案抑郁症基线水平 MMN 潜伏期及波幅在频率偏离无统计学差异 (潜伏期: t=0.644, p>0.05; 波幅: t=1.887, p>0.05), 时间偏离无统计学差异 (潜伏期: t=0.644, p>0.05; 波幅: t=1.413, p>0.05)。

结论 本研究结果表明者存在神经心理认知功能障碍, 主要表现在识别、比较、判断、记忆、决断、期待、语言认知加工、无意识注意状态等心理活动异常, 具体表现在事件相关电位 P300、N400、MMN 出现异常。

关键词: 抑郁症; 神经心理认知; 事件相关电位

71 例恶性案件司法精神疾病鉴定进行相关分析

李宁 胡忠心*

丹东市第三医院

目的 对 71 例恶性案件司法精神疾病鉴定进行相关分析。一是对 69 例被鉴定人在案发时的精神状态及责任能力评定进行分析, 2 例被鉴定人目前是否有精神疾病鉴定做一简述; 二是按照五部 (检) 联合制定颁布的《关于办理死刑案件审查判断证据若干问题的规定》对因故意杀人、抢劫致人死亡等恶性案件的犯罪嫌疑人可能处以死刑, 按照“规定”对此类案件的犯罪嫌疑人刑事责任能力进行司法精神疾病鉴定, 对于此类 44 例被鉴定人在“案发时无精神病具有完全刑事责任能力”通过采用艾森克人格测试 (简称 EPQ) 对其人格特质进行分析。

方法 依据《中国精神障碍分类与诊断标准 (第三版) CCMD-3》或《ICD-10 精神与行为障碍分类》、《司法鉴定技术规范-精神障碍者刑事责任能力评定指南 SF/Z JD0104002-2011》或重新修订的《SF/Z JD0104002-2016》以确定案发时段的精神状

态及刑事责任能力。同时对犯罪心理形成的因素,包括内在、外在因素进行剖析,采用艾森克人格测试(简称EPQ)对被鉴定人的人格特质进行分析。

结果 可发现能明确诊断为具有精神疾病的被鉴定人(不涉及刑事责任能力),在此71例“恶性案件”中仅占38%;如果加入限定和无刑事责任能力者不足17%。2例中1例为东北亚某国人员在华期间因浏览“黄色网站”被发现,恐其回国受到严惩而杀害其国同事(囿于我们对其国的“意识形态”的认知);另1例为我国公民在东盟某国枪杀同胞疑似与“毒品”有关(案发后逃逸,未能及时做“血、尿毒品检测”;后经做“毛发毒品检测”证实),仅做“目前精神状态”的评定,此2例目前均无“精神病”。对有现实动机44例“无精神病”的被鉴定人的“人格特质”分析可见,在此类“恶性案件”中抑郁质倾向者占63.6%。

结论 通过上述分析,精神病人在此类“恶性案件”中,其占比并不比常人高,其原因与国家“重症精神病人”的严格监管有关,也可能与精神病人的社会退缩行为或在被害妄想下的个体防御而不是攻击行为等有一定关联。这与高北陵论著^①中的阐释基本一致。对有现实动机44例“无精神病”的被鉴定人的“人格特质”分析可见,在此类“恶性案件”中抑郁质倾向者占63.6%,这与陈和华论著^②认为“多为胆汁质的人”的观点相左。其现实动机为久拖未决的土地房屋纠纷、离异后交友的情感“积怨”、多次讨要欠款未果、罹患严重的躯体疾病后砍杀仇家、被人反复敲诈等因素。从这些案例可以看出,社会的各种冲突、职业和婚姻稳定性、低文化程度、物质和精神层面诱惑及毒品滥用等外部环境因素,与被鉴定人的内在的人格特质共同触发了犯罪行为的发生。

关键词:精神病人,刑事责任能力,人格特质

论司法鉴定的规范性

朱明霞*

首都医科大学附属北京安定医院

目的 探讨如何通过规避风险,确保司法鉴定的规范性

方法 从主体资格、鉴定程序、认证认可等方面规避风险,确保司法鉴定的规范性

结果 鉴定主体必须合法,严守法定程序鉴定,

通过机构认可或资质认证等手段多措并举,确保司法鉴定规范化

结论 一、鉴定主体必须合法

1、鉴定机构:出具鉴定结论的鉴定机构必须具有法定资格。

2、鉴定人员:必须具备法定的鉴定资格,符合一定的任职标准,如具有精神病学相关专业的中级职称,通过精神病司法鉴定人资格考试,取得司法鉴定人资格证书,并有一定实践经验的人员方能从事鉴定工作。

二、严守法定程序鉴定

1、鉴定人应根据有关回避制度予以回避:依据《北京市精神病司法鉴定管理办法》予以回避。针对重新鉴定,《检察院诉讼程序规则》及《公安机关办理刑事案件程序规定》规定了特别回避制度,即应当另行指派或者聘请鉴定人。

2、鉴定人员应达到法定鉴定人数:《司法鉴定程序通则》第十九条规定:司法鉴定机构对同一鉴定事项,应当指定或者选择二名司法鉴定人共同进行鉴定;对疑难、复杂或者特殊的鉴定事项,可以指定或者选择多名司法鉴定人进行鉴定。目的防止鉴定过程中出现弊端,既起到相互监督制约的作用,又可以弥补一个人知识能力、经验的不足,相互补充。

3、鉴定文书格式规范、内容全面:符合司法部于2007年12月1日起施行的《司法鉴定文书规范》的要求,内容上做到依据充分、重点突出、逻辑严密、简洁流畅。

4、鉴定材料必须真实全面:包括通过直接或间接手段调查的被鉴定人的案情经过(重点是案前、案中、案后的精神状况材料)、审讯材料、羁押期间的表现、病史情况等,调查材料要具体、详细、真实、客观,应注明调查对象及来源,并有调查对象签字。其中调查资料必须通过合法程序提取收集,而且调查资料的内容不得与判决所依据的主要证据的内容相矛盾。

三、通过机构认可或资质认证

开展检查机构质量管理体系的运作是提高司法鉴定人员整体素质的重要途径,一是强化规范运作的理念,鉴定人员必须按照规范文件开展鉴定工作,人员的整体素质和鉴定规范水平会逐步提高;二是质量管理有统一的模式、规范的技术标准、完备的记录档案,能够做到每一步操作都有据可查,结果可以重现,可以通过实验室间比对、方法确认等措

施来促进技术发展；三是通过建立一套全面系统规范的管理体系文件使机构管理水平达到国际通用标准（ISO），可以获得相关国际实验室的认同，有利于国际间交流；四是机构管理体系文件规定了鉴定工作质量有一个监督、审查、纠错、预防的运作机制，促使鉴定机构不断自查自纠，可以保证质量管理处于一个高水平。目前司法精神病鉴定机构认可及资质认证工作尚未广泛开展，任重道远，需要不懈努力。

再犯罪风险评估工具研究现状

陈琛*

司法鉴定科学研究院

再犯罪，特别是暴力再犯罪问题，不仅是社会关注的焦点，更是影响公众安全的重要议题。再犯罪率在高收入国家中持续处于较高水平，英格兰和威尔士被释放不到12个月的成年人再犯率为56.1%，美国两年内再监禁率为29%，澳大利亚为39%。我国再犯率多年来一直保持在6%至8%的水平，但这仍是一个值得警惕的数字。

自20世纪90年代起，风险评估工具的开发与应用便成为了国际刑事司法研究的热点。这些工具已在全球范围内得到广泛应用，成为司法实践中的关键要素。在欧美国家的司法体系中，风险评估贯穿了量刑、假释、缓刑、释放时机、释放条件以及释放后的监管治疗等多个环节，为司法决策提供了有力的量化依据。我国《刑法》在缓刑和假释的条件中均提到“没有再犯罪的危险”，但如何评价再犯罪风险则过于笼统，缺少可操作性。故而有必要研发预测准确率高的再犯罪风险评估工具，进而有效识别高风险人群，并及时干预和管控，这将对公众健康和安全做出重要贡献。

在使用精算评估工具前，法官等决策者做出缓刑、假释等决定常依赖于自己的经验判断或咨询精神病学专家，这种传统评估方法容易因个体主观判断造成偏差。随着精算评估方法的出现，其在再犯罪风险评估领域展现出显著的优势，这种方法基于统计模型和数据分析，通过计算得出个体的再犯罪风险等级。然而近年来精算评估方法也遭受诟病，

如工具泛滥，准确度不高，评分者一致性低，研发、验证过程透明度不足，评估工具昂贵，需培训，评估时间长，缺少外部验证，预测指标单一等。

我国自主研发的工具还比较少，在这方面的研究和实践相对比较落后，仍处于初级阶段，且研究设计及统计方法也存在大量问题。刘崇亮研发了中国罪犯风险等级评估量表，但该研究缺乏外部验证，无法得知该工具的预测准确性，组间比较的实验设计方法也不合理。邬庆祥编制了《刑释人员个人人身危险性测评量表》，并进行了外部验证，但该研究预测指标算法不合理，未报道区分度和校准度，也未纳入人格障碍、是否患有精神疾病这类与再犯罪密切相关的因子。

以上研究存在着普遍的问题，即研究设计不合理、缺乏外部验证、有效预测因子缺失、涉及了过多的主观和含糊的预测因子、未报道评估者内部一致性、样本量不合理、统计分析过于简单等，这些必定会导致算法缺乏科学性，进而影响评估结果的准确性。故而，有必要以科学严谨的方法研发和验证一套适合我国国情的再犯罪风险评估工具。

反馈相关隐藏信息测试在时间延迟情景下的测谎及脑网络研究

邱玉凤¹ 谌霞灿¹ 张钰舒¹ 王菊¹ 陈娇¹ 蒋潇逸²
韩一玮¹ 胡峻梅¹

1. 华西基础医学与法医学院，四川大学

2. 华西公共卫生学院，四川大学

目的 基于脑电信号（EEG）探索时间延迟情景下反馈相关隐藏信息测试（fCIT）中有罪者、无辜知情者、无辜者的脑功能连接（BFC）。

方法 招募被试57名，将所有被试随机分为有罪延迟组（20名）、无辜知情延迟组（22名）、无辜组（15名）。有罪延迟组模拟盗窃，无辜知情延迟组观看案件新闻，无辜组对案件一无所知，7-10天后进行测谎。测谎实验中，被试需辨认是否见过六种刺激物。有罪组需隐瞒见过探测刺激，无辜知情组和无辜组均如实回答。每一次辨别后，被试将收到电脑的反馈（“+4”诚实和“-2”撒谎）。脑电数据预处理后，计算三组被试脑电信号各电极对间的相锁值

(PLV), 构建各组被试在刺激呈现阶段及反馈阶段的脑功能连接, 并对有罪延迟组-无辜知情延迟组、有罪延迟组-无辜组的 PLV 进行 t 检验, 得出差异电极对的头皮分布位置。

结果 刺激呈现阶段, 有罪延迟组与无辜知情延迟组在 P3-Fz、P3-F3、Oz-P3 等 12 个电极对的 PLV 差异具有统计学意义 ($P < 0.05$), 差异电极对主要分布在左顶叶、中央区。有罪延迟组与无辜组在 Pz-Fz、P3-F3、P3-F7 等 31 个电极对的 PLV 差异具有统计学意义 ($P < 0.05$), 差异电极对主要分布在左前额叶、左顶叶、中央区、枕叶。反馈阶段, 有罪延迟组与无辜知情延迟组在 Pz-Fz、Oz-Fz、Cz-O1、F8-O1 这 4 个电极对的 PLV 差异具有统计学意义 ($P < 0.05$), 差异电极对主要分布在中央区、左枕叶。有罪延迟组与无辜组在 Pz-FP1、Pz-Fz、Pz-F3 等 11 个电极对的 PLV 差异具有统计学意义 ($P < 0.05$), 差异电极对主要分布在左前额叶、左顶叶、中央区、左枕叶。

结论 在时间延迟情景下, fCIT 中有罪者、无辜知情者、无辜者脑电信号的脑功能连接存在差异, 脑功能连接具有测谎潜力。

当前性自卫能力评定的困惑与应对

李学武¹ 高北陵²

1. 深圳市精神卫生中心/深圳市康宁医院
2. 广东中一司法鉴定中心

目的 以当前性自卫能力鉴定案例为线索, 引出鉴定人在当前性自卫能力的司法鉴定的困惑, 并针对这些困惑简要阐述应对方法与伦理思想, 以供同道参考。

方法 通过当前 3 例在案件的复杂性、女性在案件中所处的地位、司法机关对鉴定意见的依赖性、鉴定风险等方面, 均不同于过去鉴定案件的性自卫能力鉴定案件, 探讨鉴定人在这类案件的司法鉴定中沿用过去的鉴定模式的困惑, 找出应对办法。

结果 在这些案例的鉴定过程中, 存在以下困惑: 女性有精神障碍 (含智力障碍, 以下统称“精神障碍”), 同时也表达出性本能的需求, 然而, 本学科通常将“主动参与”作为精神障碍者缺乏性自我保护

的评定依据之一; 女性有精神障碍的同时, 也具有一定的性知识及对性行为的辨认能力; 女性的性观念转变与当前我国对女性的性权益保护的现状形成反差, 也导致这类女性“对自身性不可侵犯权利的认识能力”的概念产生了与专业的偏差; 女性有精神障碍的同时, 其自身也存在某些品行问题, 本学科通常将“未索取、也未得到好处”作为缺乏性自我保护的判断主要依据之一。

结论 鉴定人应改变过去僵化固定的思维模式, 全面了解并澄清与被鉴定人的性自卫能力相关的情况和嫌疑人的涉案特征, 即在考察辨认能力受损程度时, 需要结合案件的具体特征进行综合判断。

愤怒面孔下暴力精神分裂症反应抑制的事件相关电位研究

尹肖彤 胡峻梅* 谌霞灿 翟金辉 邱玉凤
华西基础医学与法医学院, 四川大学

目的 发现暴力精神分裂症 (SCZ) 反应抑制的神经电生理特征, 探究愤怒面孔对暴力精神分裂症反应抑制功能的影响。

方法 按照纳入、排除标准筛选被试, 最后纳入 90 名被试, 其中暴力 SCZ 组、非暴力 SCZ 组与健康对照组各 30 名。采用事件相关电位技术对所有被试进行情绪双选择 Oddball 任务实验, 并同时收集反应抑制行为学数据和脑电数据。使用 BIS 冲动性量表第 11 版 (BIS-11)、Buss-Perry 攻击性量表-中文版 (BPAQ)、一生攻击史量表 (LHA) 评估被试的冲动性、攻击性及暴力行为。使用阳性及阴性症状量表 (PANSS) 评估 SCZ 精神症状。

结果 与健康对照组相比, 暴力 SCZ 组及非暴力 SCZ 组在进行双选择 Oddball 任务时反应时更长, 额-中央区偏差刺激的 P3 潜伏期更长; 时频分析结果显示, 暴力 SCZ 组和非暴力 SCZ 组额区/额-中央区/中央区的 θ 频段 N2d 功率及 δ 频段 P3d 功率要显著低于健康对照组 ($P < 0.05$)。暴力 SCZ 组监测到更大的冲突, 其额区/额-中央区/中央区/中央-顶区的 N2d 波幅显著高于非暴力 SCZ 组及健康对照组 ($P < 0.05$)。所有被试额区/额-中央区/中央区/中央-顶区愤怒面孔的 N2d 波幅显著大于中性面孔的 N2d

波幅 ($P < 0.05$)。健康对照组顶区的愤怒面孔偏差刺激的 P3d 波幅显著大于中性面孔偏差刺激的 P3d 波幅 ($P < 0.05$)，暴力与非暴力 SCZ 组的 P3d 波幅差异无统计学意义 ($P > 0.05$)。SCZ 阳性症状与愤怒面孔准确率代价存在显著正相关 ($r = 0.270, P < 0.05$)。

结论 精神分裂症患者存在反应抑制缺陷，暴力精神分裂症患者的反应抑制缺陷主要表现为冲突觉察增强。愤怒情绪面孔使反应抑制认知过程的冲突觉察增强。

构建性自我防卫能力评定“技法衔接”机制初探

樊慧雨*

司法鉴定科学研究院

摘要 作为法医精神鉴定中重要的内容之一，对受到性侵犯的精神障碍者进行性自我防卫能力评定是保障其性不可侵犯权利的重要手段，为保障精神障碍者的合法权利提供重要的法律依据。然而，在我国现行法律法规中，对精神障碍者性自我防卫能力的司法认定与评定的技术方法存在不契合情形，具体表现为性自我防卫能力评定等级划分方法不一致、性自我防卫能力削弱司法鉴定意见在证据采信过程中缺乏法律依据等，导致在法医精神病鉴定过程中及司法实务中出现诸多问题，给办案人员带来困扰，严重影响司法实践。案件处置的混乱，不仅是鉴定意见无法被科学、依法运用的结果，更是对案件当事人权利保障的缺失。随着我国以审判为中心的诉讼制度改革不断推进，如何保障司法鉴定的科学性、客观性、公正性，保障司法鉴定的意见的合法性、证据性及适用性已成为一项重要研究课题。因此，本文将从法学研究、法律实践、司法鉴定等多角度进行分析讨论，以我国立法精神、立法原则、立法规范为前提，综合立法要求、法律修订、诉讼制度、法律公共信息平台建设等内容，吸收国外法律内容，借鉴我国以往经验，探究构建性自我防卫能力评定“技法衔接”机制，促进技术方法与法律法规的契合，推进专业技术标准与司法鉴定的发展。

The Effects of Subjective Family Status and Subjective School Status on Depression and Suicidal Ideation Among Adolescents: The Role of Anxiety and Psychological Resilience

Shurui Chen Zhan Shu Xiaoping Wang*

Department of Psychiatry, National Clinical Research Center for Mental Disorders, and National Center for Mental Disorders, The Second Xiangya Hospital of Central South University, Changsha, Hunan, China.

Purpose This cross-sectional study aimed to examine the impact of subjective family status and subjective school status on depression and suicidal ideation among adolescents through a moderated mediation model and to explore the mediating and moderating effects of anxiety and psychological resilience on family status, school status, depression, and suicidal ideation

Methods 1,190 secondary school students aged 13 to 17 years (mean age: 13.57 ± 2.02 years) were evaluated depression, anxiety, and suicidal ideation using the PHQ-8 and GAD-7 questionnaires. Subjective family and school status were also assessed. Data analysis was conducted using Mplus, SPSS's Process, and the RSA 3.0 plugin

Results Subjective family/school status, anxiety, psychological resilience, depression, and suicidal ideation were significantly correlated. Anxiety played a partial mediating role in the influence of subjective family status and subjective school on depression and suicidal ideation, and psychological resilience moderated the impact of anxiety on adolescent depression and suicidal ideation ($\beta_{\text{depression}} = -0.05, p < 0.01$; $\beta_{\text{suicidal ideation}} = -0.06, p < 0.05$)

Conclusion Subjective family status and school status played important roles in depression and suicidal ideation in adolescents, and anxiety and psychological resilience played mediating and moderating roles.

关键词：Depression, Anxiety, Suicidal ideation, Subjective family status, Subjective school status

评估 ICD-11 人格障碍维度模型: SASPD 和 PiCD 中文版在中国社区和临床样本中的表现

冯韵孜 邵阳* 常心怡 乔屹
上海市精神卫生中心

目的 司法精神案件中人格障碍的身影屡见不鲜。ICD-11 人格障碍诊断从分类模型转变为维度模型,但中国目前还缺乏相关评估工具。标准化人格障碍严重程度评估量表(Standardised Assessment of Severity of Personality Disorder, SASPD)和 ICD-11 人格测验(The Personality Inventory for ICD-11, PiCD)分别评估了人格障碍的整体严重程度和特质风格,并在多地区样本中表现出良好的信效度。本研究对 SASPD 和 PiCD 进行了中文版修订并检验其在中国普通人群和临床患者中的信效度,考察 ICD-11 新维度模型跨文化的适用性,为中国 ICD-11 新维度系统诊断提供实践工具。

方法 644 名社区被试和 150 名临床患者完成了中文版 SASPD 和 PiCD、人格功能量表简版(LPFS-BF2.0)、人格障碍严重程度量表(PDS-ICD-11)、DSM-5 人格量表简要版(PID-5-BF)、人格障碍诊断问卷(PDQ-4)及大五人格量表(BFI-2)。随机抽 40 名社区被试在两周后完成了重测。采用相关和回归检验 SASPD 和 PiCD 的内部一致性、重测信度、校标效度,通过探索性因子分析和验证性因子分析确定了最适合中国地区的因子模型。

结果 社区和临床样本中两个量表均表现出良好的信度, SASPD 的 Cronbach's α 分别为 0.80 和 0.73,重测信度为 0.82。PiCD 五个维度的平均 Cronbach's α 为 0.84 和 0.8,平均重测信度为 0.90。探索性因子分析显示, SASPD 呈现出一个包含自我和人际两个维度的两因子结构,而 PiCD 则支持理论对应的五因子结构。 SASPD 与 LPFS、PDS-ICD-11 及 PiCD 存在显著意义上的相关, PiCD 的各维度与 PID-5-BF 和 BFI-2 的相应维度均呈现出预期的相关模式,支持其良好校标和构念效度。具体表现为 PiCD 的负性情感、脱抑制、去依恋、去社会和强迫分别和 PID-5-BF 中的负性情感、脱抑制、分离、对抗敌意和脱抑制,以及 BFI-2 中的神经质、尽责性、

外向性、宜人性和尽责性密切相关。

结论 SASPD 和 PiCD 在中国展现出良好的信效度,能够可靠地评估中国人群的人格障碍严重程度和特质领域,为 ICD-11 维度模型提供了支持证据。

精神损伤类法医精神病鉴定中伤病关系评定路径分析

张钦廷*
司法鉴定科学研究院

2020 年 5 月 14 日,司法部印发《法医类司法鉴定执业分类规定》(司规[2020]3 号),对法医类司法鉴定执业范围进一步规范管理。该规定第四章对法医精神病鉴定进行规范,将法医精神病鉴定项目分为九个大项目,其中第二十九条界定了精神损伤类鉴定,“对因伤或因病致劳动能力丧失及其丧失程度,对各类致伤因素所致人体损害后果的等级划分,及损伤伤情的严重程度进行鉴定。包括劳动能力,伤害事件与精神障碍间因果关系,精神损伤程度,伤残程度,休息期(误工期)、营养期、护理期及护理依赖程度等鉴定。”该类鉴定中,蕴含了大量的伤病评定内容,不仅有直接列明的伤害事件与精神障碍之间的因果关系评定,而且在精神损伤程度、伤残程度、休息期(误工期)、营养期、护理期及护理依赖程度等的评定中,也内含了伤病关系评定的要求,伤病关系评定成为该部分鉴定重点,甚至成为疑难问题;但该类鉴定中的伤病关系评定仅有框架式的原则性规定,缺乏进一步的可操作性强的实施细则,容易导致不同鉴定人思路不一致,出现鉴定意见不一致的情形,引发对法医精神病鉴定的质疑。本文以思维导图形式,清晰界定精神损伤类法医精神病鉴定各项目之间的内在联系,重点勾勒其中蕴含的伤病关系评定路径,结合现行有效地司法鉴定相关规定,以精神伤残程度评定为重点,辅以法医精神病伤残程度能力验证中的伤病关系考核点分析,旨在厘清精神损伤类法医精神病鉴定中伤病关系评定思路,有助法医精神病鉴定人统一认识,提高鉴定意见的一致性,切实增强法医精神病鉴定的公信力。

深圳市无刑事责任能力精神障碍者强制医疗解除因素的回顾性研究

陆伟哲 吕晶 李学武*

深圳市精神卫生中心/深圳市康宁医院

目的 无刑事责任能力精神障碍者的强制医疗是指为保障个体权益及公众安全而对经鉴定依法不负刑事责任的精神障碍者实施强制隔离和医学治疗的措施。目前司法机构对强制医疗的判决、执行等程序已趋于规范，但对强制医疗的解除流程及相关评估标准仍存在不足。本文通过对深圳市 2019 年以来已解除强制医疗的无刑事责任能力精神障碍者相关临床资料进行整理和回顾性分析，为强制医疗精神病人的解除强制医疗评估标准提供了部分依据，同时深入探讨影响无刑事责任能力精神障碍者强制医疗解除的相关评估因素及流程不足。

方法 采用自制调查表对 2019 年 1 月至 2024 年 6 月已由人民法院批准解除强制医疗的 33 例无刑事责任能力精神障碍者进行调查及临床资料统计，对强制医疗时间、首次犯罪、物质滥用、人格障碍、精神症状、自知力、病情稳定情况、强制医疗期间表现、社会支持等因素进行比较。

结果 解除强制医疗的精神障碍者在解除时精神症状疗效均为好转或显效，病情稳定不小于 6 个月，强制医疗期间无危险性行为，拥有部分或完整的危险性认知及良好的社会支持（监护条件），同时暴力危险性评估表低或部分中风险亦为解除强制医疗的充分条件，而年龄、强制医疗时长和案发前精神病史之间并没有明显的相关性。

结论 强制医疗精神障碍者的精神科病情改善程度、社会支持系统的完善程度以及相关法律法规的规定仍是影响其强制医疗解除的重要参考指标。其中，病情改善程度是决定是否解除强制医疗的最直接和核心的因素，而精神科医生的专业评估则为其提供了科学依据。同时，社会支持评估亦是核心参考因素之一，家属或监护人的意见也反映了患者家庭环境和社会支持的实际情况，对于判断患者出院后是否能够得到有效照护具有重要意义。

孤独症谱系障碍影响性自我防卫能力分析思路

唐勇*

南京医科大学附属脑科医院

目的 结合相关案例，探讨如何依据孤独症谱系障碍临床特征，提炼其影响性自我防卫能力的分析要点，促进对此类被鉴定对象的准确评估。

方法 女，29 岁，中专肄业。2 年前两次被公公性侵，提请性自我防卫能力鉴定。10 年前被其母前男友性侵，当地曾鉴定为边缘智力，有完全性自我防卫能力。本次审查中，被鉴定人称自己平时脑子记不得事情，公公侵害自己当时有反抗，事后没告诉任何人，只是躲着公公。1 年前因三胎事与公婆矛盾回娘家，觉憋屈，遂将被公公侵害事告诉母亲并报警。母亲为教师，反映女儿只是说话口齿不清，易健忘。自幼不合群，易遭同学霸凌。小学考 60-70 分，初中更差。15 岁上幼师学校，无法学会弹钢琴。17 岁转学护理，实习时无法独立完成操作而退学，至此母亲才考虑女儿可能有智力问题，之前只认为其较同龄人幼稚。鉴定精神检查无明显智能障碍，未查及精神病性症状。脑电图正常，韦氏智商 91。

结果 本次鉴定初期，鉴定人分析思路仍沿用智能发育维度，诊断边缘智力。并依据其被公公强奸时知道不应该，有明显反抗，具有辨别是非能力，依据指南评定为完全性自我防卫能力。

该案疑点在于，身为教师的母亲，本应对精神发育迟滞较一般百姓更为敏感，为何直至女儿护校实习不顺才意识到其“智力低下”？鉴定人对于发育障碍的理解，是否过于局限在智能维度？邀请儿童精神科专家会诊，进一步追溯发育史，其自幼语言发育较同龄儿童慢，不合群。之后表现社交互动和社交交流能力欠缺，对社交互动不能做出恰当回应，对各种社交情境适应欠缺，情感表达幼稚；对环境和常规改变适应性欠佳，对噪音敏感。孤独症诊断观察量表及孤独症诊断访谈量表均提示明显异常。根据病史及临床检查和评估，诊断广泛性发育障碍（CCMD-3）。

被鉴定人患广泛性发育障碍，其社交互动和社

沟通交流能力欠缺,对环境和常规的改变适应性欠佳,情感表达幼稚,受其所患精神疾病影响,其对自身性不可侵犯权利的认识与维护能力明显削弱,依据指南评定为性自我防卫能力削弱。

结论 广泛性发育障碍(DSM-5 孤独症谱系障碍)是一组存在不同程度典型孤独症功能缺损“三联症”(社会交流、语言交流、重复刻板)的发育障碍性疾病。目前法医精神病学教材对其缺乏介绍,鉴定人对此类障碍的诊断识别及其如何影响法律能力的分析经验不足,易漏诊误判。

关键词: 性自我防卫能力,孤独症谱系障碍,广泛发育障碍,精神发育迟滞

Neurolaw in Forensic Psychiatry

Xiumin Sun¹, Guangquan Guo¹, Hu Zhao²

1.Guangdong Provincial People's Hospital

2.Sun Yat-sen University

Neurolaw, as an interdisciplinary field linking the brain and law, provides a way to better understand human behavior by combining the research results of neuroscience. Since 1990's, this emerging field provided a more precise interpretation of human behavior in modifying legal rules and decisions through the study of the human nervous system as a new dimension of legal phenomena. This paper seeks to provide a in-depth elaboration of the application of neuroscience evidence in the forensic psychiatry practice, as the following aspects:

1) The type of technology is accepted or excluded as legal evidence, such as (e.g., psychological testing, functional neuroimaging)

2) As neuroscience technologies develop, the questions arose regarding their use and societal impact.

3) Discusses ethical issues related to forensic psychiatrists' claimed expertise in neuroscience, formulate medical opinions based on neuroscience, and consider its relevance to criminal responsibility.

4) What should be aware of when forensic psychiatrists use the neuroscientific evidence rendering diagnoses and explaining behavior.

Neuroscientific technology is an auxiliary tool in

forensic identification. Neurolaw aims to understand and promote the integration of neuroscience in civil, criminal, correctional, and other areas of law. We strive to find the objective basis of mental injury, understand the structural and functional neuroimaging and its use and limitations in the legal system; Evaluate empirical evidence that purportedly links neurobiology and criminology. that can provide more basic-data and research direction for forensic psychiatric identification.

关键词: Neurolaw, Forensic Psychiatry, psychological testing, functional neuroimaging

A Meta-analysis of The Relationship between Voyeurism and Affective Disorders

Bin Guo Ning Wang*

BEIJING HUILONGGUAN HOSPITAL

Objective This study conducted a meta-analysis of the literature on the relationship between voyeurism and mood disorders from 1954 to 2022. By searching multiple databases, we synthesized and analyzed data from relevant studies during this period, aiming to gain a deeper understanding of the association between voyeurism and affective disorders

Methods In this study, PubMed, Embase and CNKI were used to search 46 articles published between 1954 and 2022 with the keywords of“Voyeurism” and“Affective disorder”. After rigorous literature screening and evaluation, 12 eligible studies were finally included. The data were extracted and analyzed by SPSS software, including descriptive statistics, correlation analysis and regression analysis

Results The results of meta-analysis showed that patients with voyeurism had common symptoms of affective disorder. Among them, about 75.7% of patients with voyeurism accompanied by anxiety symptoms, 61.9% of patients with depressive symptoms. Correlation analysis showed that there was a significant positive correlation between voyeurism and affective disorder ($R = 0.63, P < 0.01$). Regression analysis further

confirmed this relationship, indicating that affective disorder is an important predictor of the initiation of voyeuristic behavior in voyeurism

Conclusion In this study, a meta-analysis found a close relationship between voyeurism and mood disorders. It is suggested that the emotional state of the patients should be taken into full consideration and comprehensive treatment measures should be taken. At the same time, it also suggests that we should strengthen mental health education and emotional disorders screening to reduce the occurrence and harm of voyeurism

关键词: Voyeurism; affective disorder; meta-analysis; sexual psychological disorder; clinical treatment

交通肇事案件法医精神病鉴定

汤涛*

司法鉴定科学研究院

目的 交通肇事案件发生在顷刻之间, 案件发生存在多种可能, 此类案件法医精神病鉴定难度较大, 本文通过鉴定实践经验总结, 试图为该类药物鉴定提供一种实用有效的解决方案。

方法 可将此类案件分成在意识清晰状态下作案或在意识障碍状态下作案两类, 对不同类型采取不同的责任能力评定分析方法。

结果 1、如果车祸发生时处于意识清晰状态, 涉嫌故意犯罪的, 按一般案件鉴定原则鉴定, 鉴定分析不应局限于案件发生顷刻间精神状态及辩控能力, 而应分析整个驾驶过程及心理活动过程, 结合其既往病史、案发前后精神状态以及与作案行为关系等因素, 综合分析是正常作案还是精神病理症状导致。2、如果车祸发生时处于意识障碍状态, 如果车祸系癫痫发作导致意识障碍所致, 因其患癫痫驾驶与之后危害结果发生之间存在明显相关性, 故不能因癫痫发作致行为辩控能力丧失即评无刑事责任能力。而应分析其是否能预见患癫痫开车存在社会危害可能性, 若对该危险驾驶行为具有辨认和控制能力, 应评有刑事责任能力; 如属于不能预见的突发疾病, 可评无刑事责任能力。3、鉴定需注意驾驶失控存在多种可能, 如: 疲劳驾驶、注意力不集中、过度紧张、错踩油门或因疾病发作导致意识障碍等,

当事人大多表示“脑子一片空白”, 对事发经过不能回忆, 而正常人在极度紧张状态下也可“脑子一片空白”。4、通过驾驶特征分析, 如有无主动制动或变向避让等避险驾驶动作, 可以分析其当时是否存在意识障碍, 但要肯定或否定车祸系癫痫发作所致大多缺乏充分依据。该情形鉴定意见宜作客观描述, 如: “案件发生存在多种可能”, “不能排除癫痫发作导致可能”, 而不宜作出肯定性意见, 如有确凿证据证明, 则另当别论。

结论 该类案件鉴定需要谨慎, 论证要恰如其分, 鉴定意见要留有余地。

强制医疗患者住院期间心理体验的质性研究

龚艳琳 黄平 杨波*

重庆市精神卫生中心

目的 由于强制医疗患者通常面临法律、伦理和医疗三者交织的复杂情形, 其心理状态与自愿就医患者存在显著差异, 本研究旨在深入探讨强制医疗患者在住院期间的心理感受, 以便为改善其心理健康、推动解除强制医疗提供参考。

方法 2024年4-6月期间, 以目的抽样法对重庆市某医院的15名强制医疗患者进行半结构式访谈, 对他们在住院期间的个人感受、思想变化、人际互动及对治疗体验等方面进行了全面的数据收集。借助Nvivo软件编码整理, 并采用Colaizzi七步法对资料进行系统分析。

结果 共提炼四个核心主题。①环境适应, 涵盖了患者对强制医疗环境的初步反应及适应过程, 包括对限制性环境的压力和随之而来的适应策略; ②情感波动, 患者情感起伏较大, 常见由初期的否认、愤怒到后期的妥协或接受; ③社会支持需求, 强调了来自家庭、朋友以及医护人员的社会支持对患者心理健康的重要性; ④自我认知变化, 部分患者在经历了一系列心理斗争后, 对自我、疾病及生活有了新的认识和反思。

结论 强制医疗患者在住院期间经历复杂的心理变化, 其中环境适应、情感波动、社会支持需求和自我认知变化是影响他们心理感受的主要因素。医

疗团队需加强对这类患者心理状况的关注,通过提供心理咨询服务、加强社会支持网络、优化治疗环境等措施,帮助患者更好地应对住院期间可能遇到的心理挑战。此外,研究建议开展进一步的定量研究以验证这些质性研究结果的普遍性,并在临床实践中探索具体的心理干预方案,以促进患者的整体福祉和治疗合作。

2023年宁夏地区精神、智力残疾状况分析

郭宇鑫¹ 毕盛² 周雅君¹

- 1.宁夏回族自治区宁安医院
- 2.宁夏社会福利院

目的 分析宁夏回族自治区2023年精神和智力残疾的现状,包括患病率、影响因素、现有服务体系及未来发展趋势。通过对宁夏地区残疾人登记数据的统计分析,结合实地调研和专家访谈,揭示精神、智力残疾人群的基本特征及其面临的挑战。提出针对性的改进措施和政策建议,以期为宁夏地区精神、智力残疾人群提供更好的支持和服务。

方法 随着社会经济的发展和人民生活水平的提高,精神、智力残疾问题逐渐受到重视。宁夏回族自治区作为中国西北地区的重要省份,其精神、智力残疾状况对于当地社会稳定和经济发展具有重要意义。首先,通过文献综述了解国内外精神、智力残疾的研究现状和发展趋势。其次,对宁夏地区残疾人登记数据进行统计分析,并收集于2023年1月至2023年12月期间于宁夏回族自治区宁安医院完成精神、智力残疾鉴定患者1192例,这些患者不同程度的存在情感、认知和行为障碍,病程时间超过一年,精神障碍不同程度的影响了日常生活和社会活动。采用《世界卫生组织残疾量表I》(WHO-DASII)、《社会功能缺陷筛选量表》(SDSS)进行评分及残疾等级评定,对精神疾病诊断、残疾鉴定等级、患者年龄等相关因素进行统计分析。以揭示精神、智力残疾的分布情况和影响因素。最后,通过定性研究,包括实地调研和专家访谈,收集第一手资料,深入了解精神、智力残疾人群的实际需求和面临的困境。

结果 1. 患病率分析: 与全国平均水平相比,

宁夏地区精神、智力残疾的患病率略高,可能与当地经济发展水平和文化背景有关。2. 影响因素分析: 遗传因素: 研究发现,精神、智力残疾在一定程度上受遗传因素影响,家族中有类似病史的患者患病风险较高。环境因素: 不良的生活习惯、长期暴露于有毒物质、营养不良等环境因素也可能导致精神、智力残疾。社会因素: 社会压力、家庭矛盾、教育水平低等社会因素也可能增加精神、智力残疾的风险。3. 服务体系评估: 医疗资源: 宁夏地区精神、智力残疾的医疗资源相对不足,专业医师数量有限,且分布不均。康复服务: 康复机构较少,康复设施不完善,康复服务覆盖面有限,无法满足所有患者的需求。社会支持: 社会对精神、智力残疾的认知度不高,存在一定程度的歧视和偏见,患者及其家属在社会融入和心理支持方面面临较大困难。

结论 宁夏地区精神、智力残疾的患病率较高,且存在明显的影响因素。现有服务体系无法满足患者的需求,需要进一步加强和完善。

睡眠障碍研究协作组

社区环境下失眠障碍中西医结合不同治疗路径的比较研究

吴鑫雨 郑永亮*
江苏医药职业学院

目的 观察中医外治法联合失眠的简化行为疗法(BBT-I)对失眠障碍的疗效和依从性。

方法 2021年3月至2022年12月选取盐城市多家社区卫生服务中心门诊就诊的98例失眠障碍患者为研究对象。将受试者随机分为实验组(49例)和对照组(49例)。实验组给予中医五禽戏练功、中药浴足等个性化融入BBT-I治疗,对照组给予BBT-I联合盐酸曲唑酮片(25-150mg/日)治疗4周,之后进行三个月的随访。以失眠症严重程度指数作为治疗比较的主要终点,并观察不同联合方案对行为治疗依从性的影响。

结果 将失访患者按无效纳入统计,治疗4周后实验组有效率26.53%,缓解率53.06%,对照组22.45%,缓解率24.49%,差异有统计学意义($p<0.05$);随访3个月后实验组有效率4.08%,缓解率53.06%,对照组有效率8.18%,缓解率30.61%,差异无统计学意义($p>0.05$);对睡眠限制治疗依从性问卷调查中,实验组高依从的比率98.23%,对照组67.79%, $P<0.05$,差异有统计学意义,其他各行为治疗的依从性组间比较未见统计学差异, $P>0.05$ 。

结论 中医外治法联合失眠的简化行为治疗模式作为失眠的社区首诊治疗方案是有效的,中药浴足可显著提高睡眠限制的依从性,与联合盐酸曲唑酮比,依从性更高、疗效更好。

高校生睡眠和精神心理健康状况及影响因素

熊娜娜 范滕滕*
北京大学第六医院

目的 从多维度了解我国高校生睡眠和精神心

理健康状况,并探讨生活质量的影响因素。

方法 本研究采用方便取样法,通过网络平台招募全国高校生(大学生和研究生)。分别使用失眠严重程度指数(ISI)、患者健康问卷(PHQ-9)、广泛性焦虑量表(GAD-7)、压力知觉量表(PSS-10)、情绪调节困难量表(DERS-16)和生活质量问卷(SF-12)等自评问卷评估其抑郁、焦虑、失眠、压力、情绪调节能力和生活质量水平。

结果 共纳入高校生1423人,平均年龄 22.86 ± 4.74 岁;其中男性462人(32.5%),女性961人(67.5%);大学生805人(56.6%),研究生618人(43.4%)。根据自评量表,该样本中高校生失眠症状的检出率为50.6%,中重度失眠为14.4%;存在中重度抑郁(PHQ-9 ≥ 10 分)的比例为46.4%,中重度焦虑(GAD-7 ≥ 10 分)的比例为36.5%,精神生活质量受损(SF-12中MCS < 50 分)比例达81.7%。良好的家庭经济水平是精神生活质量的独立保护因素($P=0.015$),压力、抑郁、情绪调节困难和焦虑是精神生活质量的显著独立危险因素(均 $P<0.001$)。

结论 失眠、抑郁和焦虑等精神心理症状在高校生非常常见,针对压力、抑郁焦虑水平和情绪调节能力的干预可能有利于改善高校生精神生活质量。

伴失眠症状的双相障碍维持治疗期患者睡眠模式与生物节律的体动记录研究

肖春兰 汪作为* 郭向晴
上海市虹口区精神卫生中心

目的 探讨双相障碍维持治疗期患者的睡眠模式与生物节律特征研究。

方法 采取病例对照的研究方式,对45例双相障碍维持治疗期患者和50例健康志愿者进行对照研究,比较两组间匹兹堡睡眠质量指数量表(PSQI)、中文版神经精神科生物节律评估访谈(BRIAN-C)、体动记录仪监测的差异。

结果 双相障碍维持治疗期患者和健康对照组在家族史、服用情感稳定剂,服用非典型抗精神病药、PHQ-9总分、MDQ总分差异均有显著统计学意义($P<0.01$);两组间服用镇静催眠药差异有统计学

意义($P<0.05$); 两组间比较, PSQI 总分、睡眠质量、入睡时间、睡眠效率、睡眠障碍、催眠药物、日间功能障碍差异均有显著统计学意义($P<0.01$); BRIAN-C 总分、睡眠、活动、饮食习惯差异均有显著统计学意义($P<0.01$); 社交($t=2.482, P=0.015$) 差异有统计学意义($P<0.05$)。体动记录仪的起床时间、卧床时间、睡眠总时间差异均有显著统计学意义($P<0.01$); 上床时间, 差异有统计学意义($P<0.05$)。

结论 双相障碍维持治疗期患者与健康人群比较有明显的睡眠紊乱和生物节律异常, 具有不同程度的生物节律紊乱。

关键词: 双相障碍; 失眠; 睡眠模式; 生物节律; 体动记录仪

抑郁患者述情障碍在手机成瘾和睡眠障碍的中介作用

郑明明* 朱道民
合肥市第四人民医院

目的 探讨重度抑郁患者述情障碍和抑郁程度在智能手机成瘾和睡眠质量间的中介作用。

方法 采用匹兹堡睡眠质量量表、手机成瘾指数量表、抑郁自评量表和述情障碍量表对 114 名符合国际疾病分类(International Classification of Diseases, ICD)-10 标准的重度抑郁发作患者进行问卷调查。所有数据采用 SPSS22.0 统计软件进行分析。

结果 在 114 名重度抑郁发作患者中, 本研究中年龄分布显示 58.77% 的抑郁症患者年龄在 20-39 岁; 在性别方面, 70.17% 的人是女性, 29.82% 是男性。性格上, 41.22% 为中间性格, 38.59% 为内向。同时, 73.68% 的人是独生子女。在家庭类型方面, 39.47% 为核心型家庭; 家庭月收入主要集中在 5 千-1 万元区间; 有子女的比例为 55.26%; 婚姻状况显示 53.5% 为未婚, 37.71% 已婚。职业分布中, 33.33% 是学生, 工人和农民的比例分别为 10.52% 和 14.91%。手机成瘾检出率为 72.7%, 睡眠障碍的检出率为 72.2%。睡眠障碍与述情障碍、手机成瘾、抑郁程度呈正相关, 均满足。中介效应分析结果显示, 生理性症状和认识和区分情感与躯体感受的能力在手机成瘾和睡眠质量之间的中介作用显著, 总间接效应为 0.0459, 占总效应的 57.45%。

结论 抑郁程度和述情障碍在重度抑郁发作患者的手机成瘾和睡眠质量之间存在中介效应。

关键词: 重度抑郁发作; 手机成瘾; 睡眠障碍; 述情障碍

穴位贴敷治疗抑郁伴失眠的临床对照研究

陈建荣 李丹* 都弘
沈阳市精神卫生中心

目的 本研究旨在评估穴位贴敷疗法在治疗抑郁伴失眠患者中的临床疗效和安全性, 并与常规药物治疗进行比较。

方法 本研究纳入了 100 例符合入组标准的抑郁伴失眠患者, 随机分为两组, 每组 50 例。实验组接受穴位贴敷治疗, 对照组接受常规抗抑郁药物治疗。穴位贴敷选择百会、神门、内关等主要穴位, 贴敷频率为每周三次, 每次贴敷时间为 2 小时。对照组患者每日口服常规抗抑郁药物。治疗周期为 8 周。在治疗的第 0、4、8 周, 通过汉密尔顿抑郁量表 (HAMD) 和匹兹堡睡眠质量指数 (PSQI) 对患者的抑郁症状和睡眠质量进行评估。

结果 经过 8 周的治疗, 两组患者的抑郁症状均有明显改善, 但实验组的 HAMD 评分下降幅度显著高于对照组 ($P<0.05$), 表明穴位贴敷在缓解抑郁症状方面具有更优的效果。实验组的 PSQI 评分也显著低于对照组 ($P<0.05$), 显示穴位贴敷能够有效改善患者的睡眠质量。此外, 实验组患者未出现明显不良反应, 而对照组有 15% 的患者报告了不同程度的药物副作用, 如头晕、恶心等。

结论 穴位贴敷治疗对抑郁伴失眠患者具有显著的临床疗效, 不仅能够有效改善抑郁症状, 还能显著提高睡眠质量。同时, 该治疗方法安全性较高, 不良反应少, 具有良好的患者依从性。因此, 穴位贴敷作为一种替代或辅助治疗手段, 值得在临床上进一步推广应用和深入研究。

关键词: 穴位贴敷, 抑郁, 失眠, 临床对照研究

我国青少年精神障碍患者家庭亲密度与适应性的调查

周冰洁^{1,2} 李玖菊¹ 朱嘉琪^{1,2} 于悦³ 李丽⁴

1.北京回龙观医院

2.承德医学院心理系

3.山东第二医科大学

4.上海交通大学医学院附属精神卫生中心

目的 全球青少年精神障碍患病率逐年增长,本研究探讨我国青少年精神障碍患者的家庭亲密度与适应性状况,为青少年精神障碍患者的治疗提供理论依据。

方法 于2023年6月至11月在全国8个省进行整群分层抽样,根据诊断标准对诊断为抑郁症、焦虑症、精神分裂症及睡眠障碍的10-19岁患者,使用一般资料调查表和家庭亲密度与适应性量表分别进行调查,有效调查者2026人,对数据进行单因素分析与多因素分析。

结果 本次调查人群平均年龄 15.38 ± 2.04 岁,14岁发病率最高(16.8%),女性占比70.7%,男女比例约1:2.4;病情复发率高(65.6%);疾病诊断中占比最高为抑郁症合并其他精神疾病(31.8%),其次是抑郁障碍(26.7%);青少年精神障碍患者现实家庭亲密度与适应性得分分别为 56.49 ± 13.20 和 37.36 ± 12.48 ,远低于理想相应得分($66.34\pm 13.79, 49.37\pm 13.87$);主要照顾者平均年龄 45.43 ± 0.97 岁,文化程度初中最多(31.4%),家庭经济情况一般最多(68.2%),家庭结构以核心家庭为主(54.8%);单因素与多因素分析结果均显示不同性别、第一照顾者文化程度、家庭经济状况、家庭结构在家庭亲密度与适应性得分上差异显著($P < 0.05$)。

结论 (1)我国青少年精神障碍患者女性比男性多;疾病复发率高,抑郁情绪障碍与抑郁症合并其他精神疾病是常见的精神障碍;青少年精神障碍患者现实家庭亲密度和家庭适应远低于理想家庭亲密度和适应性;(2)家庭经济状况越好、第一照顾者文化程度越高、照顾者为女性和三代同堂的家庭类型的患者,家庭亲密度和适应性更好。

关键词: 我国青少年;精神障碍;家庭亲密度与适应性

同伴支持服务模式在失眠障碍患者中的应用

秦瑗 杨波*

重庆市精神卫生中心

目的 探讨同伴支持服务模式在改善失眠障碍患者睡眠质量与睡眠障碍的认知和态度,缓解焦虑、抑郁情绪方面的效果,为建立科学、有效的护理干预方法提供基础依据。

方法 选取2023年11月1日~2024年5月30日在重庆市某三级精神卫生中心收治的34例失眠障碍患者为研究对象作为试验组,采用前后对照研究,通过成立同伴支持研究小组、培训同伴支持者、实施同伴支持服务模式,最终比较试验组睡眠质量状况、睡眠障碍的认知和态度、焦虑状况、抑郁状况的变化。

结果 实验过程中,脱落2例,最终试验组纳入32例。干预后匹兹堡睡眠质量指数(PSQI)评分低于干预前,差异有统计学意义($P < 0.05$)、睡眠障碍信念和态度量表(DBAS)评分高于干预前,差异有统计学意义($P < 0.05$)、焦虑自评量表(SAS)评分低于干预前,差异有统计学意义($P < 0.05$)、抑郁自评量表(SDS)评分低于干预前,差异有统计学意义($P < 0.05$)。

结论 将广泛应用于慢性疾病患者的同伴支持服务模式推广应用于失眠障碍患者群体中,有助于改善患者睡眠质量,提高睡眠障碍的认知和态度,缓解焦虑、抑郁情绪,可作为失眠障碍患者护理管理的新模式加以推广应用。

关键词: 失眠障碍;睡眠障碍;同伴支持

孔圣枕中丹改善失眠伴发认知障碍的疗效和机制探索

陈碧清* 张玮光

江苏省中医院

目的 建立强迫失眠的小鼠模型,并探究中医传统古方孔圣枕中丹对失眠小鼠模型的认知能力的影响及作用机制。

方法 将24只小鼠随机分为正常组、模型组、孔圣枕中丹组和阳性对照(地西洋)组。用改良的多平台水环境睡眠剥夺箱对模型组、孔圣枕中丹组和

地西洋组进行连续睡眠剥夺。建模后,分别给正常组和模型组灌胃生理盐水,孔圣枕中丹组灌胃孔圣枕中丹,阳性对照组灌胃地西洋,1次/天。实验期间观察并记录各组小鼠一般状态、体重及行为学实验指标,包括旷场实验中小鼠水平运动总格数、直立次数, Morris 水迷宫定位航行实验中小鼠逃避潜伏期时间、轨迹路线和空间探索实验中小鼠第一次抵达平台时间、在目标平台区域总时间、穿越平台次数,悬尾实验中小鼠不动时长。ELISA 测定小鼠血清 γ -氨基丁酸 (γ -aminobutyric acid, GABA) 含量。

结果 建模结束后,模型组小鼠毛色变暗、行动迟缓、睡眠时间减少、精神萎靡、体重减轻,成功构建了强迫失眠小鼠模型。在旷场实验中,与空白组相比,模型组水平运动格数和直立次数减少;与模型组相比,孔圣枕中丹组水平运动格数和直立次数显著增加 ($P<0.05$)。与空白组相比,模型组小鼠在 Morris 水迷宫实验中逃避潜伏期极显著增加 ($P<0.01$),第一次抵达平台区域时间极显著增加 ($P<0.01$),在目标平台区域总时间、穿越平台次数有减少的趋势;与模型组相比,孔圣枕中丹组逃避潜伏期极显著减少 ($P<0.01$),孔圣枕中丹组和地西洋组第一次抵达平台区域时间均极显著减少 ($P<0.01$),孔圣枕中丹组和地西洋组在目标平台区域总时间极显著增加 ($P<0.01$),孔圣枕中丹组穿越平台次数显著增加 ($P<0.05$)。在悬尾实验中,与空白组相比,模型组不动时长显著增加 ($P<0.05$);与模型组相比,孔圣枕中丹组和地西洋组不动时长极显著减少 ($P<0.01$)。与空白组相比,模型组小鼠血清 GABA 浓度略微升高,孔圣枕中丹组与模型组相比 GABA 浓度极显著降低 ($P<0.01$)。

结论 孔圣枕中丹可以改善失眠模型小鼠的认知能力,作用机制可能与减少失眠小鼠血清内 GABA 含量有关。

关键词:孔圣枕中丹,失眠,认知障碍,GABA

重力毯对抑郁伴失眠的干预效果研究

吕全¹ 王育梅²

1.河北省中医院

2.山东省立医院

目的 本研究旨在评估自制重力毯对抑郁障碍

合并失眠患者的疗效,特别是其对失眠症状、日间嗜睡、疲劳感及抑郁症状的改善效果。

方法 2019年9月至2020年9月,在某三级甲等医院精神卫生科选取了69例中度和重度抑郁障碍并伴有失眠的患者。患者随机分配至干预组(使用自制重力毯)和对照组(使用1Kg空毯),每晚进行9小时的干预,连续7天。研究采用多种量表和睡眠日记来评估患者的失眠严重程度、日间嗜睡、疲劳程度、抑郁症状及睡眠质量。

结果 最终有64名患者完成了研究。结果显示,干预组在使用自制重力毯后,其失眠严重程度指数(ISI)、日间嗜睡时间量表(ToDSS)、疲劳严重度量表(FSS)和抑郁自评量表(SDS)的评分均显著下降,表明睡眠质量和日间功能得到了改善。特别是,干预组的睡眠潜伏期缩短、夜间觉醒时间减少、睡眠效率提高,这些改善在统计上均优于对照组。此外,干预组的抑郁症状也得到了显著缓解。

结论 自制重力毯作为一种安全有效的非药物干预手段,对改善抑郁障碍合并失眠患者的睡眠质量、减少日间嗜睡和疲劳、以及缓解抑郁症状具有积极作用。研究结果为临床提供了新的治疗选择,但同时也指出了研究的局限性,包括依赖患者自评量表、样本量较小、干预时间较短等,建议未来的研究在这些方面进行改进,并探索重力毯在其他疾病中的应用及其作用机制。

在 OSA 中,高觉醒阈值与代谢综合征相关

杜佳虹^{1,2} 李韵^{1,2}

1.汕头大学精神卫生中心

2.汕头大学医学院睡眠医学中心

目的 阻塞性睡眠呼吸暂停(OSA)患者由于夜间反复间歇性低氧及睡眠片段化,导致代谢综合征高发。觉醒阈值作为 OSA 病理过程中的非解剖因素之一,对于 OSA 的临床治疗具有重要的指导意义。低觉醒阈值患者频繁出现觉醒,导致睡眠片段化,而高觉醒阈值患者夜间存在较长的阻塞时间以及较严重的阻塞事件,这可能是代谢综合征高发的原因。我们的目的是探讨在 OSA 患者中,高觉醒阈值与代

谢综合征的关系。

方法 我们对汕头大学精神卫生中心睡眠门诊的 112 例 OSA 患者(平均年龄 43.50 ± 11.64 岁, 89.29%为男性)进行了横断面研究。觉醒阈值是根据多导睡眠图参数来预测, 高唤醒阈值占以下情况 ≤ 1 个: 睡眠呼吸暂停低通气指数 < 30 次/小时, 最低血氧饱和度 $> 82.5\%$ 和低通气事件占总呼吸事件的比例 $> 58.3\%$ 。代谢综合征的诊断根据国际糖尿病联盟的新定义。逻辑回归用来探索高觉醒阈值与代谢综合征之间的关系。

结果 112 例患者中, 有 51 例 (45.54%) 有代谢综合征, 68 例 (60.71%) 有高觉醒阈值。逻辑回归结果显示, 在控制混杂因素后, 有高觉醒阈值的患者, 出现代谢综合征 (OR = 4.31, 95% 置信区间 = 1.63-11.42, $p = 0.003$), 中心性肥胖 (OR = 5.78, 95% 置信区间 = 1.95-17.16, $p = 0.002$), 高甘油三酯血症 (OR = 2.84, 95% 置信区间 = 1.11-7.28, $p = 0.030$) 的风险高于低觉醒阈值的患者。此外, 较高的觉醒阈值水平与较高的腰围 (p -for-trend < 0.001)、甘油三酯 (p -for-trend = 0.042) 和收缩压 (p -for-trend = 0.037) 相关。高唤醒阈值组有更多的阻塞性事件、更高的睡眠呼吸暂停低通气指数、更高的氧减指数和更低的氧饱和度。

结论 在 OSA 中, 与低觉醒阈值相比, 高觉醒阈值与代谢综合征患病率增加有关。高觉醒阈值是 OSA 患者心脏代谢合并症严重程度的标志。

Effects of Reducing South and Supplementing North on Sleep Structure and Inflammatory Factors in Patients with Insomnia after COVID-19

Yi Liu* Shengdong Wang Guanglie Chen Youdan Wei Taisong Cui

Affiliated Mental Health Center & Hangzhou Seventh People's Hospital, Zhejiang University School of Medicine

Objective To observe the clinical effect of re-

ducing south and supplementing north on insomnia patients after COVID-19, and explore its possible mechanism from the aspects of sleep structure and inflammatory factors

Methods A total of 104 patients with insomnia after COVID-19 were randomly divided into treatment group and control group, with 52 cases in each group. The treatment group took the decoction of reducing south and supplementing north (Liuwei Dihuang Pill combined with Jiaotai Pill), 1 dose per day; The control group was given oral lorazepam tablets, 1mg each time, once a night. Both groups were treated for 4 weeks. Insomnia Severity Index (ISI), Fatigue Assessment Scale (FAS), General Anxiety Disorder-7 (GAD-7), Patient Health Questionnaire-9 items (PHQ-9), and TCM symptom score were evaluated before treatment and 4 weeks after treatment to evaluate clinical efficacy. The sleep structure related indexes [non-rapid eye movement stage 1 (N1), non-rapid eye movement stage 2 (N2), non-rapid eye movement stage 3 (N3), rapid eye movement stage (REM), sleep latency (SL), wake time after sleep (WASO), total sleep time (TST) and sleep efficiency (SE)] and inflammatory factors related indexes [Interleukin-2 (IL-2), interferon- γ (IFN- γ), interleukin-4 (IL-4), interleukin-10 (IL-10) levels and Th1/Th2 (IFN- γ /IL-4) ratio] were recorded; Treatment Emergent Symptom Scale (TESS) assessed and recorded the occurrence of adverse events

Results Finally, 101 cases were completed, including 51 cases in the treatment group and 50 cases in the control group. The total effective rate of treatment group (90.20%) was higher than that of control group (74.00%), and the difference was statistically significant ($P < 0.05$). Before treatment, there were no significant differences in scale assessment, sleep structure and inflammatory factors between the two groups ($P > 0.05$). After 4 weeks of treatment, ISI, FAS, GAD-7, PHQ-9, symptom score in the treatment group and the control group ($P < 0.01$) were significantly lower than before treatment; ISI, FAS, GAD-7, PHQ-9 and symptom scores in the treatment group were significantly lower than those in the control group ($P < 0.01$ or $P < 0.05$). In the treatment group, N1, N2, SL and WASO were de-

creased ($P < 0.01$), while N3, REM, TST and SE were increased ($P < 0.01$). In control group, N1, SL and WASO decreased ($P < 0.01$), while REM, TST and SE increased ($P < 0.01$ or $P < 0.05$). Compared with control group, N1, N2 and WASO in treatment group were decreased ($P < 0.01$), while N3 and REM were increased ($P < 0.01$). In the treatment group, IL-2, IFN- γ and IFN- γ /IL-4 were decreased ($P < 0.01$), while IL-4 and IL-10 were increased ($P < 0.01$). In control group, IL-2, IFN- γ and IFN- γ /IL-4 were decreased ($P < 0.01$), while IL-4 and IL-10 were increased ($P < 0.01$). IL-2, IFN- γ and IFN- γ /IL-4 in the treatment group were lower than those in the control group ($P < 0.01$), while IL-4 and IL-10 were higher than those in the control group ($P < 0.01$)

Conclusion Reducing south and supplementing north may improve the clinical efficacy of patients with insomnia after COVID-19 by regulating sleep structure and the balance of inflammatory factors

关键词: reducing south and supplementing north, COVID-19, insomnia disorder, sleep structure, inflammatory factor

八段锦和健步走对改善伴有睡眠问题的女大学生的睡眠质量、心肺功能及疲劳感的研究

胡令明¹ 刘宁宁² 戴兴鸿³

1. 山东第一医科大学附属省立医院

2. 济宁医学院

3. 湖南大学

目的 探讨八段锦和健步走对睡眠障碍女大学生睡眠质量、心肺功能和躯体疲劳的疗效, 为改善女大学生睡眠质量提供新的视角和干预措施。

方法 于 2023 年 9 月至 2024 年 1 月在湖南大学进行招募, 通过问卷筛查的形式选出 90 名睡眠障碍女大学生为研究对象, 按照随机数字表法分为对照组、健步走组和八段锦组, 每组各 30 名。八段锦组和健步走组进行每周 5 次、每次 45min, 持续 10 周的运动干预, 对照组不施加干预手段, 依习惯自行锻炼; 三组在相同时间内保持原有的学习生活习惯, 不额外增加体力活动。采用匹兹堡睡眠质量量表 (PSQI)、心肺功能指标、疲劳量表 (FS-14) 对

三组受试者的睡眠质量各项指标、心肺功能指标以及躯体疲劳状况进行效果评定。

结果 八段锦组在干预后 PSQI 得分、心肺功能指标和疲劳量表得分方面较基线得分改善, 且差异具有统计学意义 (P 均 < 0.05)。健步走组在干预后入睡时间得分、心肺功能指标较基线水平改善且差异具有统计学意义 (P 均 < 0.05)。在干预 10 周后, 八段锦组在 PSQI 总分、入睡时间、睡眠时间得分方面均优于健步走组和对照组且差异具有统计学意义 (P 均 < 0.05); 八段锦组和健步走组在心肺功能指标方面均优于对照组, 差异具有统计学意义 (P 均 < 0.05); 八段锦组在心肺功能指标、躯体疲劳度和疲劳总分优于健步走组, 差异具有统计学意义 (P 均 < 0.05); 此外, 八段锦组在日间功能障碍得分和疲劳量表得分方面优于对照组, 差异具有统计学意义 (P 均 < 0.05); 健步走组的躯体疲劳度和疲劳总分较对照组明显改善, 差异具有统计学意义 (P 均 < 0.05)。

结论 八段锦能显著提高睡眠障碍女大学生睡眠质量、心肺功能以及降低疲劳程度。健步走可在一定程度上提高睡眠障碍女大学生的心肺功能和缓解疲劳程度。

Effects of Noninvasive Brain Stimulation (NIBS) on Excessive Daytime Sleepiness: A Brief Review

Mengmeng Li Yu Zhao Shigeng Gao Ying Liu Xueli Zhao Wen Pan Lingfang Feng Xiaobin Zhang Xiangdong Du Zhe Li*

The Affiliated Guangji Hospital of Soochow University

Objective Excessive daytime sleepiness (EDS) is a major public health concern worldwide, leading to poor performance in family and professional roles, as well as an increased risk of motor vehicle accidents and fatalities. Noninvasive brain stimulation (NIBS) techniques, which can increase or decrease cortical excitability, have garnered renewed interest in recent years as a potential treatment for EDS. However, there is currently no systematic review available on the potential

use of NIBS as a treatment for EDS

Methods A comprehensive literature search was conducted using PubMed and Web of Science, covering publications prior to 1 September 2023, to gather information on noninvasive brain stimulation in the treatment of excessive daytime sleepiness, as discussed in this paper

Results To date, only a few studies have been conducted on the subject, and sample sizes are consistently small. The available literature shows that anodal transcranial direct current stimulation (tDCS) (FP1/FP2/F3/F4, 1-2mA) or high-frequency transcranial alternating current stimulation (tACS) has been found to reduce sleepiness and increase vigilance in cases of EDS caused by a variety of disorders. Additionally, anodal tDCS has been shown to decrease total sleep time in healthy individuals. High-frequency repetitive transcranial magnetic stimulation (rTMS) (10HZ) over the left DLPFC or low-frequency rTMS (1HZ) targeting the right posterior parietal cortex has demonstrated significant positive effects in the treatment of daytime sleepiness. Furthermore, low-frequency (1HZ) rTMS over the right DLPFC might be effective in improving EDS in patients with Parkinson's disease. Moreover, NIBS has been found to provoke a net gain of cortical arousal, which is linked to the modulation of cortical activity by reducing slow-frequency (δ and θ) activity while enhancing faster frequencies (β_1 and β_2)

Conclusion In summary, the use of various neuromodulation techniques through NIBS in the treatment of EDS shows promise. Despite the small number of studies, the mechanism underlying the efficacy of NIBS in modulating sleepiness is likely related to its ability to act on neural networks that regulate arousal and sleep through a top-down (cortico-thalamic) pathway. However, further research and additional data are needed to fully investigate the potential of NIBS as a treatment for EDS. This includes the use of larger sample sizes, testing different protocols, and setting appropriate parameters for stimulation

magnetic stimulation (rTMS), Top-down (cortico-thalamic) pathway

Associations between Insomnia and Cardiovascular Diseases: A Meta-review and Meta-analysis of Observational and Mendelian Randomization Studies

Xuejiao Zhang Yujing Sun Sizhi Ai*

The First Affiliated Hospital of Xinxiang Medical University

Objective Observational studies suggest associations between insomnia and cardiovascular diseases (CVDs), but the causality remains unclear. We aimed to investigate the potential causal associations between insomnia and several CVDs by a combination of systematic meta-review and meta-analysis of the observational and Mendelian randomization (MR) studies

Methods We searched PubMed, Web of Science, and Embase for English-published articles from inception to July 11, 2023. Two reviewers independently screened the articles to minimize the potential bias. We summarize the current evidences for the associations between insomnia and the risks of coronary artery disease (CAD), atrial fibrillation (AF), heart failure (HF), myocardial infarction (MI), hypertension (HTN), and stroke by combining the meta-analyses of observational studies and MR studies

Results A total of 4 meta-analyses of observational studies and 9 MR studies were included in the final data analysis. Systematic meta-review of observational studies provides strong evidence supported that insomnia is an independent risk factor for many CVDs, including AF, MI, and HTN. Meta-analysis of MR studies showed that insomnia may have a potentially causally relationship with CAD (odd ratio (OR) = 1.14, 95% confidence interval (CI) = 1.10-1.19, I² = 97%), AF (OR = 1.02, 95% CI = 1.01-1.04, I² = 94%), HF (OR = 1.04, 95% CI = 1.03-1.06, I² = 97%), HTN (OR = 1.16, 95% CI = 1.13-1.18, I² = 28%), large artery stroke (OR = 1.14, 95% CI = 1.05-1.24, I² = 0%), any ischemic

stroke (OR = 1.09, 95% CI = 1.03-1.14, I² = 60%), primary intracranial hemorrhage (OR = 1.16, 95% CI = 1.05-1.27, I² = 0%). No evidence suggested that insomnia is causally associated with cardioembolic and small vessel stroke

Conclusion Our results provide strong evidence supported a possible causal association between insomnia and CVDs risk. Strategies to reduce insomnia may be one of the promising targets in the prevention of CVDs

Polysomnographic Characteristics of Patients with Heart Failure Combined with Sleep Apnea: A Systematic Review and Meta-analysis

Feng Yu Sizhi Ai* Yujing Sun Shuo Ye Zhexi Li
The First Affiliated Hospital of Xinxiang Medical College

Objective Patients with heart failure (HF) often report sleep disordered breathing (SDB), which seriously affect the prognosis of HF patients. However, most previous studies assessed sleep quality based on subjective reports, which may not accurately reflect actual sleep structure and could potentially lead to misinterpretation of the relationship between sleep parameters and HF progression. The purpose of this meta-analysis was to evaluate polysomnographic characteristics in HF with SDB and after different treatments. We also explored the potential mechanism that SDB aggravate HF, so as to provide for sleep management and treatment of clinical HF patients

Methods We searched PubMed, Embase, and Web of Science databases from July 21, 2022, to July 23, 2023. Observational studies and experimental treatment studies (controlled or uncontrolled) were included. The experimental interventions included automatic servo ventilation (ASV), continuous positive airway pressure (CPAP), and other therapies. The main subjects were HF combined with SDB and healthy. The primary

outcome was objective sleep parameters from standard polysomnography. Secondary outcomes self-reported sleep quality through valid instruments

Results 40 eligible articles were included in the meta-analysis, with effect sizes calculated as mean differences, and pooled using a random effects meta-analysis model. Compared with healthy people, wake time after sleep onset (WASO) of HF patients increased by 23.54min, sleep efficiency (SE) decreased by 7.45%, and the percentage of slow wave sleep (SWS) decreased by 3.16%, suggesting poor sleep quality. HF patients combined with SDB, the percentage of N1 sleep increased by 6.64%, the percentage of SWS decreased by 3.3%, and the percentage of REM sleep decreased by 3.71% suggesting that the sleep structure was disorganized after the combination of SDB

Conclusion Our findings suggest that HF patients showed decreased SE, reduced SWS, and increased WASO, indicating impaired sleep continuity. HF with SDB leads to a further decline in sleep quality, and HF with CSA has a more severe disturbance in nighttime sleep than HF with OSA. The results of our meta-analysis showed that CPAP improves SWS, suggesting that it may improve the prognosis of HF patients, but large-sample RCTs are still needed to determine its long-term effects on cardiovascular function

加味酸枣仁汤与艾司唑仑治疗慢性失眠障碍的认知功能及临床疗效

姚萍¹ 吕东升¹ 崔龙彪² 郭兴燕¹ 郭治国¹ 林武宏¹ 刘敏¹ 陈敏¹ 李洁¹

1.内蒙古自治区精神卫生中心(内蒙古自治区第三医院、内蒙古自治区脑科医院), 睡眠医学中心
2.第四军医大学

目的 本研究旨在探索加味酸枣仁汤与艾司唑仑治疗慢性失眠障碍患者(chronic insomnia disorder, CID)的认知功能及临床疗效

方法 共纳入 80 例符合诊断标准的 CID 患者,

受试者根据随机数字表法分为两治疗组, 分别给予加味酸枣仁汤及艾司唑仑治疗(4周), 采用匹兹堡睡眠质量指数(Pittsburgh sleep quality index, PSQI)、失眠严重程度指数量表(Insomnia severity index, ISI)、汉密尔顿焦虑量表(Hamilton anxiety scale, HAMA)、汉密尔顿抑郁量表(Hamilton depression scale, HAMD)、多导睡眠监测(Polysomnography, PSG)、重复性成套神经心理状态测验(Repeatable battery for the assessment of neuropsychological status, RBANS)观察主客观睡眠、情绪及认知功能的变化。对两组治疗前量表评分、PSG采用独立样本t检验, 各自前后采用配对样本t检验, 对两组间治疗前后疗效比较采用混合线性效应模型进行分析。

结果 (1) 加味酸枣仁汤与艾司唑仑治疗后的PSQI ($Z=-6.16, P<0.001$; $Z=-4.56, P<0.001$)、HAMD ($Z=-5.96, P<0.001$; $Z=-4.23, P<0.001$)、HAMA ($Z=-5.97, P<0.001$; $Z=-4.40, P<0.001$) 分数分别与治疗前比较, 差异有统计学意义, 且加味酸枣仁汤组治疗后PSQI总分显著低于西药组 ($Z=-2.78, P=0.006$); (2) 两组总有效率比较差异无统计学意义 ($\chi^2=0.37, P=0.543$); (3) 两组CID患者治疗后RBANS总分 ($Z=-4.87, P<0.001$; $Z=-3.21, P=0.001$)、即刻记忆方面 ($Z=-4.90, P<0.001$; $Z=-2.62, P=0.009$)、延时记忆方面 ($Z=-4.27, P<0.001$; $Z=-3.19, P=0.001$) 均得到明显的改善。(4) 两组间治疗前后PSG相关指标均无明显统计学差异, 但酸枣仁汤组治疗后患者REM期持续时间 ($Z=-2.39, P=0.017$)及N3期持续时间 ($Z=-2.32, P=0.020$) 较治疗前增加, 差异有统计学意义。

结论 加味酸枣仁汤与艾司唑仑治疗CID患者的临床疗效相当, 对CID患者临床症状、情绪、认知功能(尤其即刻记忆、延时记忆)方面均有改善, 但与艾司唑仑治疗相比, 酸枣仁汤治疗在改善主观睡眠质量方面效果更好。

关键词: 加味酸枣仁汤, 艾司唑仑, 临床疗效, 认知功能

南通市青少年睡眠质量及影响因素水平分析

张丽媛 朱海骄*

南通市第四人民医院

目的 了解南通市青少年睡眠质量状况及其影响因素, 对改善儿童青少年心理健康有重要意义, 同时为南通市青少年维持睡眠质量提供理论依据,

方法 选取南通市中学生进行匹兹堡睡眠质量指数量表(PSQI)和患者健康问卷抑郁量表(PHQ-9)问卷调查, 采用描述性统计对中学生睡眠质量进行现况分析, 多因素 Logistic 回归分析中学生睡眠障碍的影响因素。

结果 南通市中学生PSQI平均得分(4.43 ± 2.70), 睡眠障碍人数为398人(12.25%), 中重度抑郁的学生睡眠障碍检出率为50.53%。南通中学生轻微抑郁的人数为610人, 中重度抑郁的人为180人, 与无抑郁的人相比, 轻度抑郁的人发现睡眠障碍是无抑郁的人的3.68倍, 中重度抑郁的人发现睡眠障碍是无抑郁的人的13.61倍。不同性别、年龄段、家庭情况、运动时间以及抑郁状态的学生之间的PSQI平均得分差异有统计学意义($P<0.05$)。不同运动时间和抑郁状态的睡眠障碍率之间存在差异($P<0.05$), 运动时间在2-3小时之间的PSQI平均得分(3.71 ± 2.59)和睡眠障碍率(7.46%)最低。多因素 Logistic 回归分析显示, 不同运动时间、抑郁状态对中学生的睡眠水平会产生影响($P<0.05$), 轻度抑郁(OR:3.68, 95%CI: 2.87~4.71), 中重度抑郁(OR: 13.61, 95%CI: 9.83~18.85)是睡眠质量的危险因素, 运动时间1小时~2小时(OR:0.513, 95%CI: 0.41~0.64), 2小时~3小时(OR:0.41, 95%CI:0.25~0.69)是保护因素

结论 南通市中学生的睡眠障碍检出率较低, 学生的抑郁状态以及运动时间可能是其睡眠质量的影响因素。

Lemborexant for The Treatment of Insomnia in Chinese Patients: Four Cases

Weiying Jian* Minyan Feng Jin Li Yifan Zhao

Guangzhou United Family Hospital

Objective Lemborexant is a competitive antagonist of dual orexin receptors indicated for the treatment of adult patients with insomnia characterized by difficulties with sleep onset and/or sleep maintenance. There

has been no published study of its efficacy and safety in treating Chinese patients with insomnia. In this case report, we present 4 Chinese patients with insomnia who were treated with lemborexant

Methods All of the 4 patients were outpatients in department of Mental Health, Guangzhou United Family Hospital. Patient-reported (subjective) outcomes were recorded at baseline and each followed-up visit. The primary outcomes were sleep quality evaluated by Insomnia Severity Index (ISI) after 4 weeks of treatment. Depression and anxiety were also evaluated by Patient Health Questionnaire-9 (PHQ-9) and General Anxiety Disorder-7 (GAD-7), respectively

Results Case 1 was a patient with insomnia for 4 months who direct transited from zolpidem to lemborexant. Case 2 was a patient with insomnia for 3 years who had taken 2 sedatives with unsatisfactory treatment with lorazepam. Case 3 was a patient with insomnia for 12 years accompanied by depression and anxiety at a time and who had taken 3 different drugs. Case 4 was a patient with recurrence of depression accompanied with insomnia for a month. After 4-week treatment, all of the 4 patients' sleep quality was improved by add-on Lemborexant or switching from benzodiazepines or Z-drugs to Lemborexant while their ISI scores were all decreased. Most of the patients' PHQ-9 and GAD-7 scores were improved. None of the 4 patients experienced any discomforts related to lemborexant use

Conclusion This is the first report of using lemborexant to treat Chinese patients with insomnia. Lemborexant treatment was effective and safe in treating 4 Chinese patients with insomnia. This could provide basis for future studies on this topic

目的 探讨基于互联网数字技术的失眠认知行为治疗对广泛性焦虑障碍患者焦虑、睡眠质量的影响。

方法 选取 2023 年 4 月-2023 年 10 月在湖州市某三级甲等精神专科医院确诊为广泛性焦虑障碍的 82 例患者为研究对象, 随机分为干预组 41 例和对照组 41 例。在干预组中, 患者接受了药物治疗和数字失眠认知行为治疗, 而在对照组中, 患者则接受了药物治疗和睡眠护理门诊的线下失眠认知行为治疗, 共干预 6 周。分别于干预前、干预 6 周后测评汉密尔顿焦虑量表 (HAMA)、匹兹堡睡眠质量指数 (PSQI)、睡眠个人信念与态度简化量表 (DBAS-16)。在进行干预前和干预后, 都需要记录睡眠日记, 日记主要涵盖了入睡潜伏期 (SOL)、夜间觉醒次数 (NOA)、入睡后觉醒时间 (WASO)、总睡眠时间 (TST) 以及睡眠效率 (SE) 等方面的内容。

结果 与基线相比, 干预组治疗六周后, HAMA、PSQI、DBAS-16 均有显著改善 ($P < 0.05$)。经过治疗后, 干预组的焦虑水平明显低于治疗前, 其社会功能也得到了提升, 差异具有统计学意义 ($P < 0.05$)。与对照组相比, 干预组在睡眠质量以及个人对睡眠的信念和态度上的改进更为明显, 差异具有统计学意义 ($P < 0.05$)。干预后, 两组患者在 HAMA、PSQI、DBAS-16 评分干预前后差异都具有显著的统计学意义 ($P < 0.05$)。患者睡眠日记结果显示, 两组患者入睡潜伏期、入睡后觉醒时间、睡眠总时间、睡眠效率均有改善, 干预组改善更显著, 但两组患者夜间觉醒次数均改善不明显 ($P > 0.05$), 与广泛性焦虑障碍患者高度觉醒特质有关。

结论 数字失眠认知行为治疗能有效缓解广泛性焦虑障碍患者的焦虑情绪, 改善失眠症状, 提升患者主观睡眠体验感, 提高睡眠质量, 缩短入睡时间, 增加睡眠总时长。

失眠障碍与焦虑抑郁共病失眠障碍患者的临床特征研究

王晓菲 黄慧*

武汉市精神卫生中心

目的 比较原发性失眠患者、焦虑障碍共病失眠患者、抑郁障碍共病失眠患者的睡眠特征，以期为临床诊疗提供参考依据。

方法 2022年8月至2023年10月期间，以方便采样的方式，在武汉市精神卫生中心睡眠障碍病区招募新收治入院的慢性失眠患者共99例。根据DSM-5诊断标准，将受试者分为失眠障碍组（简称失眠组， $n=24$ ），焦虑障碍共病失眠组（简称焦虑组， $n=33$ ），抑郁障碍共病失眠组（简称抑郁组， $n=42$ ）。利用福特应激失眠反应测试量表（FIRST）、简式睡眠功能失调信念与态度量表（DBAS-16）、睡眠卫生习惯量表（SHPS）、睡前觉醒状态量表（PSAS）评估患者的睡眠认知、睡前觉醒和睡眠习惯，利用广泛性焦虑障碍量表（GAD-7）、9项患者健康问卷（PHQ-9）评估患者的焦虑、抑郁情绪，利用多导睡眠监测（PSG）评估患者的客观睡眠结构及质量，并比较三组各参数的差异。

结果 量表：焦虑组DBAS-16评分低于失眠组（ $P=0.016$ ），PSAS评分高于失眠组（ $P=0.035$ ）。失眠组GAD-7评分低于焦虑组（ $P=0.032$ ）及抑郁组（ $P=0.014$ ）。失眠组PHQ-9评分低于焦虑组（ $P=0.002$ ）及抑郁组（ $P<0.001$ ）。抑郁组GAD-7评分低于焦虑组（ $P=0.026$ ）。PSG：焦虑组的觉醒总时间、入睡后清醒时间、觉醒次数、主客观入睡潜伏期差值低于失眠组（ P 值依次为0.041、0.012、0.029、0.040）；焦虑组的睡眠效率、主客观总睡眠时间差值、主客观睡眠效率差值高于失眠组（ P 值依次为0.044、0.044、0.028）；抑郁组的入睡潜伏期高于焦虑组（ $P=0.012$ ）。抑郁组入睡后清醒时间低于失眠组（ $P=0.007$ ）；抑郁组入睡潜伏期、REM潜伏期高于失眠组（ $P=0.029$ 、0.021）。

结论 1.焦虑共病失眠患者存在更多错误睡眠认知、更高的睡前觉醒。2.焦虑共病失眠患者存在更多的主观性失眠。3.抑郁共病失眠患者存在特殊睡眠结构紊乱。本研究提示早期识别、正确区分患者的失眠障碍类型与情绪问题具有重要的临床意义。

失眠伴阻塞性睡眠呼吸暂停患者睡眠监测指标和脑电功率频谱与认知功能损害的相关性

梁峰 李忻蓉 刘莎 徐勇*
山西医科大学第一医院

目的 探讨失眠伴阻塞性睡眠呼吸暂停（OSA）患者睡眠监测指标和脑电功率频谱与认知功能损害的相关性。

方法 收集失眠患者74例，根据是否合并OSA将患者分为失眠组和失眠伴OSA组。采用多导睡眠监测仪测两组睡眠指标，使用脑电功率频谱分析软件分析睡眠脑电功率频谱；采用蒙特利尔认知评估量表（MoCA）、记忆与执行筛查量表（MES）评估认知功能；采用Pearson相关法分析失眠伴OSA患者睡眠指标、脑电功率频谱与认知功能的相关性。

结果 REM期睡眠与MoCA中延迟回忆评分呈正相关（ $r=0.331$ ， $P<0.05$ ），NREM2期睡眠与MES总分呈正相关（ $r=0.352$ ， $P<0.01$ ），AHI与MES总分呈负相关（ $r=-0.335$ ， $P<0.05$ ），入睡后觉醒时间与MoCA中命名、定向评分呈正相关（ $r=0.445$ ， $P<0.05$ ； $r=0.452$ ， $P<0.05$ ），入睡潜伏期和AHI与MoCA中命名评分呈负相关（ $r=-0.415$ ， $P<0.05$ ； $r=-0.360$ ， $P<0.05$ ）。NREM2期theta脑电功率频谱与MES总分呈正相关（ $r=0.334$ ， $P<0.05$ ），NREM1期alpha脑电功率频谱与MoCA中注意评分呈负相关（ $r=-0.679$ ， $P<0.05$ ），NREM1期beta脑电功率频谱与MoCA中抽象评分呈负相关（ $r=-0.585$ ， $P<0.05$ ）。

结论 失眠伴OSA患者的睡眠监测指标和脑电功率频谱表现为NREM2期睡眠减少，睡眠中与缺氧相关的指标增加，NREM2期theta脑电功率频谱减少，NREM1期theta、alpha脑电功率频谱减少，并且睡眠的改变与认知功能具有相关性。

睡眠质量对女性精神分裂症患者认知功能影响分析

陆由虎*
安庆六院

目的 精神分裂症是一种以意志行为障碍及精神活动不协调为主要症状的重性精神障碍性疾病，

患者普遍存在广泛的认知功能损害和睡眠障碍,我国是精神分裂症高发国家,调查数据显示,我国的精神分裂症发病率约为 6.55%,尤其近年来随着生活压力的不断增加,精神分裂症的发病率也随之升高,对我国社会经济发展造成了严重的经济损害。及早发现并干预以延缓疾病进展、改善预后是临床诊疗精神分裂症的业内共识。而既往研究显示,睡眠参与记忆巩固过程,睡眠障碍可能影响记忆功能,最终导致认知功能受损。此外,大量前瞻性队列研究也发现睡眠质量下降是老年人认知障碍的危险因素。认知功能损害是精神障碍的核心症状,关系到患者的治疗、预后和社会功能的康复。基于此,本研究以我院就诊的 95 例精神分裂症患者为研究对象,分析睡眠质量对精神分裂症患者认知功能影响。

方法 采用匹兹堡睡眠指数问卷(PSQI)评估其主观睡眠质量,根据 PSQI 得分将患者分为高睡眠质量组(n=41)、低睡眠质量组(n=54),根据睡眠时间分为睡眠时间<7h 组、睡眠时间≥7h~<9h 组、睡眠时间≥9h 组。采用重复性成套心理状态测验(RBANS)评估患者的认知功能,Pearson 相关性分析睡眠质量对精神分裂症患者认知功能影响。

结果 高睡眠质量组精神分裂症患者的即刻记忆、注意力、视觉广度、认知总分均高于低睡眠质量组($P<0.05$),睡眠时间≥7h~<9h 和睡眠时间≥9h 精神分裂症患者的即刻记忆、注意力、视觉广度、认知总分均高于睡眠时间<7h($P<0.05$)。精神分裂症患者 PSQI 评分与 RBANS 评分的相关性呈显著负相关性($r=-0.526$, $P<0.05$)。

结论 精神分裂症患者的睡眠质量和认知功能呈负相关性,低睡眠质量可能加重精神分裂症患者认知损害。

社会时差对老年睡眠障碍患者糖脂代谢相关性研究进展

吴昱晴 熊真真*

成都医学院护理学院

目的 国家统计局第七次人口普查数据显示,我国人口老龄化趋势正在日益加深,60 岁及以上人口超过 2.6 亿人。随着年龄的增长,老年人睡眠习

惯和睡眠结构将发生变化,睡眠问题愈发普遍,研究显示,中国老年人睡眠障碍总患病率为 35.9%,而睡眠障碍与糖脂代谢紊乱、糖尿病等多种代谢性疾病的发生发展有关。近年来,昼夜节律紊乱与糖脂代谢的关系备受关注。研究发现,昼夜节律紊乱会导致血液中葡糖及甘油三酯水平升高。社会时差(Social Jetlag, SJL)是现代生活方式影响下反应慢性昼夜节律紊乱的新兴指标,是由昼夜节律钟决定的生物节律与工作安排和社交活动强加的睡眠和起床时间之间的不一致导致。一些证据指出, SJL 对老年睡眠障碍患者的糖脂代谢有显著影响,但仍存在争议,且内在机制尚未阐明。因此,本文将对社会时差与老年睡眠障碍患者糖脂代谢的关系及内在机制进行综述,以期推动社会时差与糖脂代谢的基础和临床研究,为改善睡眠障碍提供指导。

方法 通过计算机分别检索发表于 CNKI、万方、PubMed 等数据库中关于该主题的研究,共检索到 113 篇,剔除无关文献 86 篇,选取相关度最高 27 篇文献进行分析和总结。

结果 现有研究中关于老年睡眠障碍患者 SJL 与糖脂代谢的关系尚存在争议,多数研究认为其与 HbA1c 水平升高、肥胖、血脂异常相关,少数研究尚未发现其关联性。此外, SJL 与糖脂代谢的相关性可能受到年龄、职业、生活习惯和环境因素的影响。关于 SJL 影响糖脂代谢的可能机制,主要概括为以下几点:1.体内激素分泌异常: SJL 作为一种慢性昼夜节律紊乱,与人体激素的分泌失调密切相关。昼夜节律系统的核心,即下丘脑视交叉上核(SCN),对多种激素的分泌起着精细调节作用,包括褪黑素、皮质醇、瘦素和胃泌素等,这些激素在葡萄糖和脂质代谢中发挥着关键作用。2.生物钟基因的时序调控异常: SJL 的出现通常会改变个体的作息时间,从而影响生物钟系统。3.光周期的改变:随着 SJL 的增加,人们更多地暴露于夜间人工光源下,光周期随之延长。光周期过长已被证实会干扰昼夜节律。4.体力活动水平降低:多项研究发现 SJL 可能会降低体力活动水平,从而影响代谢。5.进食时间和饮食模式的改变:多项研究证实, SJL 越大的人对健康饮食模式的依从性越低。

结论 老年睡眠障碍患者 SJL 与糖脂代谢的关系尚存在争议,内在机制尚未阐明。且针对该主题的研究较少、层次较浅,样本量较少,混杂因素矫正不足,大部分研究都是横断面研究,使得因果关系证据不足。因此,未来应开展更大规模的前瞻性研

究, 以更深入地探索这一主题。

COVID-9 疫情期间青少年抑郁症患者睡眠障碍及相关影响因素

张勇* 王家悦
天津市安定医院

目的 疫情对青少年睡眠质量影响显著, 且与学习任务显著相关。本研究了解 COVID-9 疫情期间青少年抑郁症患者的睡眠状况、学习情况以及与抑郁焦虑情绪、学习倦怠的关联, 旨在探索青少年抑郁症患者睡眠障碍的影响因素。

方法 本研究针对 142 名青少年抑郁症患者, 363 名青少年健康对照, 完成一般资料情况以及网络学习情况调查, 使用阿森斯失眠量表 (Athens Insomnia Scale, AIS) 评估睡眠情况, 使用青少年学习倦怠量表 (Adolescent Student Burnout Inventory, ASBI) 和情绪自评量表 (DASS-21) 评估学习倦怠及抑郁焦虑和压力等症状。

结果 1) 患者组 AIS 得分显著高于健康对照组 ($F=20.66, p<0.001$); 在学习和使用网络时长方面, 对照组每日学习时长 ($>6h$) ($X^2=61.87, p<0.001$) 比例高于患者组; 患者组学习效率 ($X^2=86.22, p<0.001$) 和网络学习的满意度更差 ($X^2=54.87, p<0.001$); 2) 以 AIS >7 分为临界, 抑郁症患者分为伴有和不伴有睡眠障碍两组。不伴睡眠障碍的患者组每日使用网络学习的时长 ($>6h$) 的比例 (54.7%) 高于伴有睡眠障碍的患者组 (41.6%) ($X^2=7.84, p=0.020$); 3) 在学业倦怠各因子中, 伴有睡眠障碍的患者身心损耗 ($F=2.81, p=0.028$) 和低成就感 ($F=2.58, p=0.040$) 的评分显著高于不伴有睡眠障碍的患者; 4) 伴有睡眠障碍的患者焦虑症状的评分显著高于不伴有睡眠障碍的患者 ($F=3.82, p=0.006$); 5) ASI 总分与 DASS-D ($r=0.29, p=0.001$)、DASS-A ($r=0.32, p<0.001$) 和 DASS-S ($r=0.26, p=0.002$) 均成正相关, 而 ASI 总分与 ASBI 各因子未发现显著统计学差异; 6) logistic 回归分析结果显示: 居住在农村的抑郁症患者睡眠障碍发生的可能性是居住当地在城市的 7.580 倍 ($OR=7.580, 95\%CI 1.800-$

31.912), 已休学患者睡眠障碍发生的可能性更高 ($OR=0.342, 95\%CI 0.142-0.825$), 焦虑症状越重的患者发生睡眠障碍的概率越大 ($OR=1.241, 95\%CI 1.052-1.463$)。

结论 疫情期间, 青少年抑郁症患者更容易出现睡眠障碍和学习效率的下降, 居住在农村、已休学及共病焦虑是青少年抑郁症患者睡眠障碍的危险因素。

综述: 大鼠睡眠剥夺模型的应用

刘亚坤 徐勇* 李忻蓉 刘莎
山西医科大学第一医院

目的 由于睡眠机制及其影响因素 (性别, 年龄, 遗传, 生活方式等) 较多, 具有较多的混杂因素, 且研究多涉及中枢神经系统调节, 对于研究取样具有一定的限制。啮齿类动物虽然属于低等哺乳动物, 但其睡眠稳态模式及其相对应的神经生化调节机制相似, 因此, 大鼠睡眠剥夺模型作为一种重复性较好 (可通过选择相同品种、品系、性别、年龄、体重、活动性、健康状态等方面严加控制的各种等级的标准实验动物), 操作性高, 成本较为低廉, 研究方式可控, 成为研究睡眠剥夺相关机制的重要研究模型。例如, 大鼠睡眠剥夺模型可用于研究个体应对失眠不足的能力差异及其内在机制, 以及睡眠不足导致的神经调节变化等。目前, 在不同研究中, 研究者根据自己的研究要求, 大鼠睡眠剥夺模型的具体参数也有着很大的差异。研究模型的设计差异一方面为了我们揭示了不同睡眠剥夺模型可能产生的神经或机体的影响; 另一方面, 由于缺乏统一的标准, 也导致了不同研究结果差异大, 甚至是相互矛盾, 缺乏一致性的缺点。因此, 本文回顾了关于大鼠睡眠剥夺模型在调节睡眠免疫相互调节的文献, 进行总结思考, 提出目前研究中取得的成绩, 存在的局限性, 并提出未来研究的问题。

方法 以“睡眠剥夺, 物理造模法, 化学造模法, 光遗传学造模法”等为关键词组合查询 2009-2024 年 2 月在中国知网, 万方数据库、pubmed、ovid、embase、MD Consul、Medline 等数据库中的相关文

献,大鼠睡眠剥夺模型的在失眠导致免疫调控异常的应用进行综述。

结果 睡眠剥夺大鼠模型分类,根据睡眠剥夺暴露总时间,可将睡眠剥夺分为急性睡眠剥夺(<4 天)和慢性睡眠剥夺(≥ 4 天)[14]。根据睡眠剥夺程度的不同,可将睡眠剥夺分为完全睡眠剥夺(连续24小时无法获得睡眠);部分睡眠剥夺,选择性单一睡眠阶段剥夺。根据造模方式不同可分为化学造模法,物理造模法(水平台造模法,轻柔刺激法,强迫运动法),光遗传学造模法,每种方法各有优缺点,可根据实验要求进行选择。

结论 目前,睡眠剥夺模型已日渐完善,且在科研工作者的不断努力之下,逐渐减少睡眠剥夺造模过程中产生的压力、强迫运动、居住环境等对实验动物造成的影响,减少了混杂因素的发生。同时睡眠遥测脑电记录技术的发展,也逐渐增加了对睡眠剥夺模型成功与否的评估,增加了实验可靠性。

伽玛感觉闪烁治疗失眠的研究

刘亚坤 徐勇* 李忻蓉 刘莎

山西医科大学第一医院

目的 失眠障碍发病率高,严重影响人类生活质量。研究表明,使用40 Hz的光刺激会引起最大的广泛夹带。伽玛波感觉闪烁刺激是治疗多种疾病的,在小型临床试验中,伽玛感觉闪烁治疗刺激的治疗没有显著的安全性或依从性问题。磁共振成像和脑脊液蛋白质组学显示了闪烁影响神经系统中神经网络和免疫因子的初步证据。值得注意的是,一些研究表明,40 Hz的光闪烁可能会改善阿尔兹海默症(Alzheimer's disease, AD)相关的昼夜节律紊乱。最近已经证明,伽玛感觉刺激疗法可以改善AD患者的睡眠质量。伽玛(Gamma)振荡因其在大脑皮层信息传递、代谢调节的积极作用而成为非药物治疗精神疾病的热点。本文拟通过对伽玛波感觉闪烁治疗失眠障碍的依从性,治疗效果及不良反应等方面进行研究,对伽玛感觉闪烁刺激治疗慢性失眠提供一定的参考。

方法 这项前瞻性观察性研究招募了37名慢

性失眠患者。在为期8周的时间里,参与者每天通过伽玛感觉闪烁进行一小时的治疗。治疗前后给与睡眠日记记录睡眠情况。

结果 在研究的主要阶段,依从率平均为92.21%。只有三名参与者的依从率低于85%。因此,患者的依从性总体良好。此外,闪烁治疗未报告严重不良事件。对睡眠日记的分析表明,40 Hz的闪烁可以通过减少睡眠开始延迟和增加总睡眠时间来提高睡眠质量。参与者未经历任何与闪烁相关的严重不良事件。最常见的不良事件是头晕和头痛,分别发生在6名参与者身上。闪烁治疗可能会出现轻度不良事件,包括头晕、耳鸣、头痛、心悸、眼部不适和月经不调。根据睡眠日记现实,第一周的平均睡眠时间($H=4.59$, $SD=1.20$)低于第八周的睡眠时间($E=5.03$, $SD=1.29$),这一差异具有统计学意义($p=0.009$)。治疗第一周($H=57.86$)的睡眠潜伏期比治疗第八周($H=44.29$)长,这一差异具有统计学意义($p=0.016$)。这表明40 Hz的闪烁可以改善睡眠质量。

结论 在为期八周的研究中,每天连续1小时40 Hz的声音和光刺激增加了失眠障碍患者的总睡眠时间,减少了睡眠开始的潜伏期。因此,伽玛感觉闪烁能够改善慢性失眠障碍患者的睡眠质量。

重复经颅磁刺激治疗孤独症谱系障碍患者失眠障碍的随机对照双盲研究

焦建 张焯 任蓉 谭璐 李桃美 唐向东*

四川大学华西医院睡眠医学中心

目的 探究重复经颅磁刺激(rTMS)治疗孤独症谱系障碍(ASD)患者失眠障碍的疗效

方法 对共病失眠障碍并愿意参加本研究的ASD儿童,利用计算机生成的随机数表,以1:1的比例分配到真刺激(rTMS)组和假刺激(sham)组,由rTMS治疗师采用低频rTMS刺激受试者大脑右侧背外侧前额叶皮质区,治疗参数如下:1 Hz, 50%的运动静息电位,每次30个脉冲,50次,每次间隔3s。ASD儿童将在4周内进行20次治疗,Sham组的操作流程与rTMS治疗组一样,采用假

刺激线圈产生与真刺激相同的声音和感觉,但没有磁场穿过颅骨。在基线期、4周治疗结束后及8周后的随访期使用PSG(每次连续两晚,共六次)对受试者进行睡眠质量评估。将测量时间作为重复测量,将组别(sham组和rTMS组)作为组间因素,利用重复测量方差分析及广义估计方程等方法分析治疗前后睡眠参数及临床症状变化情况。

结果 30名共病失眠障碍的ASD儿童被纳入随机、对照、双盲干预,男女比例为5:1,年龄范围为 6.6 ± 2.6 岁。rTMS组(N=15)与Sham组(N=15)在基线期一般人口学数据、睡眠参数以及临床症状量表总分差异均无统计学意义($P>0.05$);在4周治疗结束后,发现rTMS组PSG参数(总睡眠时间和快速眼球运动期睡眠占总睡眠时间比值)显著高于sham组($P<0.05$);且仅rTMS组总睡眠时间显著高于基线期($P<0.05$)。比较两组在基线期与4周治疗结束后总睡眠时间和快速眼球运动期睡眠占总睡眠时间比值均数变化,发现rTMS组分别平均增加68.5分钟和1.9%,而sham组分别平均降低25.9分钟和0.9%。

结论 低频rTMS(1Hz)治疗可以显著增加共病失眠障碍的ASD儿童总睡眠时间和快速眼球运动期睡眠占总睡眠时间比值,改善ASD儿童的睡眠质量。

标准化认知行为治疗方案对慢性失眠障碍患者的疗效

闫灵钊 徐亚辉*

新乡医学院第二附属医院

目的 以慢性失眠障碍患者为研究对象,使用失眠认知行为治疗系统(CBT-I)对其进行6个阶段的标准化治疗,探索其对慢性失眠障碍患者睡眠质量、认知功能影响,为慢性失眠障碍患者提供更有有效的治疗,使患者早日重新回归正常生活。

方法 招募60例符合条件的慢性失眠障碍(CID)患者(依据ICSD-3),被随机分配到认知行为治疗(CBT-I)组和药物治疗(DT)组。CBT-I包括6个阶段,分别为:了解失眠与治疗方法、认知

识别与放松训练、睡眠卫生与限制疗法、情景体验与专家解析、矛盾意向疗法与刺激控制疗法、预防复发6个阶段,此标准化方案通过新乡医学院第二附属医院睡眠医学科的计算机(失眠认知行为治疗系统CBT-I)提供。慢性失眠障碍患者通过简单的随机化方法随机分到两个治疗组,确保患者随机分配到两组的机会为50/50。CBT-I组提供药物治疗与认知行为治疗,DT组只提供与认知行为治疗组同样的药物治疗。所有患者均在治疗前收集人口学信息,并进行多导睡眠监测,排除其他睡眠障碍(比如睡眠呼吸暂停),并评估失眠严重程度指数(ISI)、匹茨堡睡眠质量指数量表(PSQI)、睡眠个人信念和态度量表(DBAS)、汉密尔顿焦虑量表(HAMA)、汉密尔顿抑郁量表(HAMD)。

结果 两组患者在基线人口学特征及临床特征均无统计学差异,并且在为期6周的治疗后,所有临床特征均有改善。治疗6周时,与DT组相比,CBT-I组在PSQI、ISI、DBAS和HAMD评分改善更明显,HAMA评分改善无统计学差异。

结论 目前的研究结果表明,与单用药物治疗相比,联合认知行为治疗治疗可以更加有效改善慢性失眠障碍患者的睡眠质量、改变不合理的信念与态度、改善抑郁情绪。

关键词: 慢性失眠障碍,认知行为治疗,标准化方案

慢性失眠症患者静息态大脑功能连接变化研究

孟雪 闫灵钊 郭亚楠 贺荣杰 徐亚辉*

新乡医学院第二附属医院

目的 探讨慢性失眠症(CID)患者治疗前静息态全脑功能连接(FC)改变模式和治疗后FC的变化,为阐明CID的发病机制及治疗提供影像学依据。

方法 纳入符合标准的31例CID患者(CID组)和35名健康对照者(对照组)。两组均进行静息态全脑功能磁共振成像扫描。CID组在药物治疗4周后再次进行静息态全脑功能磁共振成像扫描。以海马、杏仁核、丘脑、前扣带回为种子点,分别比较治疗前两组间这些种子点区域与全脑FC的变化,以及CID组治疗前后上述种子点区域与全脑FC的

变化。另外,根据 CID 患者治疗后失眠严重程度指数 (ISI) 评分将其分为反应缓解组和反应未缓解组,比较两组治疗前后上述种子点区域与全脑 FC 的变化。

结果 CID 组较对照组左侧海马与右侧辅助运动区、左侧顶上回、左侧中央前回和右侧中央后回之间 FC 减弱;右侧海马与左侧中央前回之间 FC 减弱;左侧杏仁核与左侧中央前回和左侧额下回三角部之间 FC 减弱;右侧杏仁核与左侧中央后回和左侧辅助运动区之间 FC 减弱 (均 $P < 0.05$, GRF 校正)。与治疗前相比, CID 组治疗后左侧海马与右侧梭状回之间 FC 增强,右侧海马与右侧颞下回之间 FC 增强,左侧杏仁核与右侧梭状回之间 FC 增强,右侧丘脑与左侧后扣带回和左侧楔前叶之间 FC 增强,双侧前扣带回与左侧楔叶之间 FC 增强 (均 $P < 0.05$, GRF 校正)。反应缓解组治疗后较治疗前左侧海马与左侧角回、双侧颞中回之间 FC 增强,右侧海马与右侧颞上回之间 FC 增强左侧前扣带回与右侧枕中回、左侧楔叶之间 FC 增强 (均 $P < 0.05$, GRF 校正)。

结论 CID 组较对照组海马、杏仁核与多个脑区之间 FC 发生改变; CID 组治疗前后海马、杏仁核、丘脑和前扣带回与多个脑区之间 FC 发生改变;反应缓解组治疗后较治疗前左侧海马与左侧角回、双侧颞中回之间 FC 增强,右侧海马与右侧颞上回之间 FC 增强,左侧前扣带回与右侧枕中回、左侧楔叶之间 FC 增强,这些脑区之间 FC 增强可能与疗效有关。这些发现为阐明 CID 的发病机制及治疗提供了影像学依据。

慢性失眠患者相关基因的 DNA 甲基化分析

李笑 徐亚辉*

新乡医学院第二附属医院

目的 采用目的区域甲基化水平测序 (MethylTarget) 分析失眠相关基因 BDNF、PAX8、LHX6 基因在慢性失眠患者与健康对照中的 DNA 甲基化水平差异,探讨慢性失眠患者与健康人群相关基因的甲基化变化,从而寻找与慢性失眠相关的 DNA 甲基化分子标志物。

方法 1.根据严格纳入和排除标准,招募在新乡医学院第二附属医院住院的慢性失眠患者及同期的健康志愿者。对慢性失眠患者采用多导睡眠监测 (Polysomnography, PSG) 分析失眠患者客观睡眠情况,监测指标包括:睡眠总时间、睡眠潜伏期、快速动眼 (REM) 期睡眠时间 & 睡眠效率。收集所有样本的一般相关信息,并以匹兹堡睡眠质量指数 (Pittsburgh sleep quality index, PSQI) 量表和失眠严重程度指数 (Insomnia Severity Index, ISI) 量表评估睡眠质量和失眠严重程度,汉密顿抑郁量表 (Hamilton Rating scale for Depression, HAMD) 和汉密顿焦虑量表 (Hamilton Anxiety Scale, HAMA) 评估抑郁和焦虑症状。

2.对 30 例慢性失眠患者和 30 例健康对照进行 MethylTarget, 分析失眠相关基因 BDNF、PAX8、LHX6 基因启动子的甲基化水平在慢性失眠患者与健康对照中的差异。

3.统计分析采用统计学软件 SPSS 22.0 进行, $P < 0.05$ 时认为差异具有统计学意义。

结果 采用 MethylTarget 分析 BDNF、PAX8、LHX6 基因启动子区域甲基化水平,三者慢性失眠组和健康对照组的甲基化水平差异均无明显统计学意义 ($P > 0.05$)。

结论 慢性失眠患者中 BDNF、PAX8、LHX6 基因启动子区域甲基化水平未发生显著变化。

关键词:慢性失眠; DNA 甲基化; 基因; 表观遗传

以精神病性症状为主的癫痫个案报告

薛坚* 李燕 张朕龙

国药同煤三医院

目的 报道一例以幻觉和情绪不稳为主要临床表现,最终诊断为癫痫的病例。

方法 回顾一例 40 岁男性汉族患者,详细采集患者的现病史、既往史、个人史、家族史,进行详细的体格检查和精神检查,记录患者的入院前后的辅助检查及相关检验结果、诊疗经过及患者的病情变化。

结果 本文报道一例 40 岁男性汉族患者,以间断反复发作的幻觉、情绪不稳 5 年余,反复就诊精

神病专科医院,先后诊断为“抑郁障碍、双相情感障碍、精神分裂症”,期间给予“碳酸锂、舍曲林、奥氮平”抗精神科药物治疗后,症状波动,控制不稳定,仍反复发作。入院后经完善脑电图检查可见持续的慢波、棘波;头颅MRI提示:左侧额叶及额叶皮层下异常信号,最终拟诊断为癫痫。经给予抗癫痫药治疗3天后症状即明显改善。出院后随访4个月精神及情绪症状控制稳定,未再复发。以此更加支持癫痫的诊断。

结论 临床中以幻觉、情绪不稳为主要临床表现的癫痫较为少见,容易误诊为精神分裂症、双相情感障碍等精神疾病。临床工作中,应通过详细询问病史,对患者的症状特点以及既往诊疗过程进行回顾总结,提出鉴别诊断,并及时完善脑电图、脑影像等相关辅助检查确定正确诊断,才能制定正确有效的治疗方案。从该案例中可学习到怎样识别癫痫相关的精神障碍,避免临床误诊误治。

内侧前额叶部位经颅磁刺激治疗失眠的疗效观察:一项随机、双盲、伪刺激对照的临床试验

孙静静* 徐文悦 张碧丹 张丹伟 李盼盼 骆思 赵蓓 汪周兵
镇江市精神卫生中心

目的 失眠是最常见的睡眠障碍。重复经颅磁刺激(rTMS)治疗失眠症(ID)安全有效。越来越多的证据表明,内侧前额叶皮层(mPFC)可能在皮质水平上参与睡眠和觉醒的调节,并可能作为 rTMS 治疗 ID 的潜在靶点。本研究的目的是观察 mPFC-rTMS 治疗 ID 的疗效和安全性。

方法 对62名ID患者进行了一项试点、双盲、随机、伪刺激对照试验。进行10次mPFC部位低频rTMS治疗或伪刺激治疗。主要结局指标是治疗4周的反应率,次要指标是治疗4周后匹兹堡睡眠质量指数(PSQI)总分及各因子分变化、缓解率和不良反应。所有的统计分析基于随机分配患者的意向治疗原则。对于真伪刺激组间疗效差异比较采用广义估计方程,独立固定变量为时间(T0、T1和T2)、刺激组(真刺激和伪刺激)和相互作用项。当相互作用

显著时,采用Bonferroni校正对多重比较进行事后比较。

结果 53名患者完成了试验(真刺激组T1脱落2例,伪刺激组T1脱落7例),保留率为85.5%(53/62)。治疗4周后,真刺激组反应率为51.7%(15/29),伪刺激组反应率为20.8%(5/24)(RR=2.48,95%置信区间[1.05,5.84];P=0.037)。治疗4周后,真刺激组缓解率为44.8%(13/29),假手术组缓解率为16.7%(4/24)(RR=2.69,95%可信区间[1.01,7.17];P=0.048)。广义估计方程结果显示,PSQI评分及PSQI2、PSQI5、PSQI7分量表时间和组别存在显著的交互作用,PSQI1、PSQI3、PSQI4、PSQI6分量表在不同治疗时间的主效应显著。事后分析结果显示,在治疗4周后,除了PSQI3和PSQI4外,真刺激组PSQI、PSQI1、PSQI2、PSQI5、PSQI6、PSQI7评分低于伪刺激组,差异有统计学意义。2组不良反应发生率无统计学差异。

结论 mPFC部位rTMS在治疗4周后,患者失眠严重程度改善,睡眠潜伏期缩短,白天功能障碍和睡眠障碍改善,催眠药物使用频率降低。

Cerebral Activation and Network Connectivity in Chronic Insomnia Patients During A Verbal Fluency Task: Insights From Multi-Channel Near-Infrared Spectroscopy

Qi Zhou^{1,2}, Chang Li^{1,2}, Haihang Yu^{1,2}, Dongsheng Zhou^{1,2}

1.Ningbo Kangning Hospital

2.Affiliated Kangning Hospital of Ningbo University

Objective Patients with chronic insomnia exhibit varying degrees of cognitive dysfunction. Dynamic functional connectivity helps us understand potential cognitive processes in the cerebral cortex. However, this has not yet been studied in patients with chronic insomnia. This study aimed to elucidate the differences between brain activity patterns in patients with chronic insomnia and healthy controls (HCs) using a verbal fluency task (VFT)

Methods We recruited 84 patients with chronic

insomnia and 81 HCs. Oxy-haemoglobin (Oxy-Hb) concentrations in the brains of the participants were monitored using functional near-infrared spectroscopy (fNIRS) while performing the VFT

Results During the task period, no significant difference was observed between the VFT results of the two groups; patients with chronic insomnia showed significantly less cortical activation in haemodynamic responses of oxy-Hb at channels and brain regions mainly located in the prefrontal cortex compared to HCs (false discovery rate-corrected $p < 0.05$). Moreover, the average channel-to-channel connectivity strength of patients in the chronic insomnia group was lower than that of those in the HC group ($t = -6.717, p < 0.001$)

Conclusion Our study provides neurological evidence for the dynamic detection of executive function in patients with chronic insomnia. Compared to HCs, patients with chronic insomnia exhibit weaker levels of brain activity and reduced task-related functional connectivity

关键词: Chronic insomnia; Verbal fluency task; Cognitive dysfunction; Oxy-haemoglobin; Functional near-infrared spectroscopy

间歇性禁食通过调节肠道菌群及代谢物抑制 OSAS 诱导认知功能障碍小鼠的炎症反应

殷青青^{1,2} 吕仁君²

1. 山东第一医科大学附属省立医院

2. 山东第一医科大学(山东省医学科学院)脑科学与类脑研究院

目的 间歇性禁食(Intermittent Fasting, IF)是一种在特定时间段内控制饮食的方法,以达到控制体重、提高健康状况和延缓衰老的目的,可以预防神经退行性疾病。然而,IF对睡眠呼吸暂停引起的认知功能障碍的影响及其机制尚不清楚。

方法 使用间歇性缺氧(CIH)培养箱干预小鼠,模拟OSA病理。给与间歇性禁食干预。评估认知功能功能和海马神经元。大脑、血浆和结肠组织的炎症也被测量。粪便样本通过16S rDNA基因测序和非靶向代谢组学进行评估。

结果 使用间歇性缺氧(CIH)培养箱干预小鼠,模拟OSA病理。给与间歇性禁食干预。评估认知功能功能和海马神经元。大脑、血浆和结肠组织的炎症也被测量。粪便样本通过16S rDNA基因测序和非靶向代谢组学进行评估。我们发现IF对CIH小鼠OSA模型的认知功能障碍、神经元丢失和炎症有保护作用。16S rDNA测序显示,CIH显著增加了Citrobacter, Desulfovibrio和Ruminococcus,并减少了Dubosiella,而IF治疗逆转了生态失调。同时,IF调节CIH诱导的组胺、n-乙酰腐胺、d-天冬氨酸等代谢产物。使用抗生素预处理的CIH小鼠粪便进行粪便微生物群移植可减轻认知功能损伤和神经元丢失。

结论 IF可能是通过微生物-肠道-大脑轴介导的抗炎机制对CIH诱导的认知功能障碍小鼠发挥保护作用。IF可能是预防CIH认知障碍发病并减缓认知障碍进展过程的潜在治疗方式。

慢性失眠障碍对精神警觉性、风险决策以及反应抑制功能的影响:基于长时程睡眠特征分析

陈品琪¹ 雷彬斌^{2,3} 张继辉^{4,5} 潘集阳¹

1. 暨南大学附属第一医院

2. 南方医科大学附属广东省人民医院 广东省医学科学院 广东省心血管病研究所

3. 南方医科大学附属广东省人民医院 广东省医学科学院 广东省精神卫生中心

4. 广州医科大学附属脑科医院 睡眠与昼夜节律医学中心

5. 广州医科大学 神经遗传学与通道病教育部重点实验室

目的 本研究旨在对慢性失眠障碍患者的精神警觉性、风险决策和反应抑制能力三个认知功能进行客观检测,以揭示慢性失眠障碍对认知功能影响的作用机制以及通过长时程密集的睡眠监测,探求慢性失眠障碍患者睡眠结构的变异性,挖掘慢性失眠障碍与个体认知功能之间的潜在机制。

方法 本研究是一项多中心实验研究,通过结

构化临床会晤,收入样本共计 60 名,样本包含健康对照组 30 名以及通过简单随机取样方法在失眠研究队列中纳入符合标准的 30 名慢性失眠障碍患者。两组被试在基线期间收集社会人口统计学资料、自评问卷、数字化认知测试(精神运动警觉性任务、气球模拟风险决策任务和 Go/No-Go 任务)以及进行额贴式睡眠记录仪(UMindSleep)的使用教学,所有被试将连续 7 天佩戴额贴式睡眠记录仪,以此评估参与者连续 7 天的各项睡眠指标。

结果 研究发现慢性失眠障碍组的失眠严重程度指数量表(Insomnia Severity Index, ISI)、爱泼沃斯嗜睡量表(The Epworth sleep scale, ESS)、病人健康问卷抑郁量表 (Patient Health Questionnaire-9, PHQ-9) 及广泛性焦虑量表(Generalized Anxiety Disorder-7, GAD-7)分值均高于健康对照组;慢性失眠障碍组在精神运动警觉性任务上的主要评估指标与健康对照组无显著差异;在气球模拟风险决策任务中,慢性失眠障碍组被试在爆炸气球个数和 BART(Balloon Analogue Risk Task, BART) 值上与健康对照组有显著差异;在 Go/No-Go 任务中,慢性失眠障碍组患者在犯错误率、遗漏率均与健康对照组显示明显差异,而在 Go 目标平均反应时及错误率上与健康对照组没有显著差异;比较两组睡眠参数发现,慢性失眠障碍组患者睡眠效率和睡眠维持率下降,睡眠结构紊乱,主要表现平均清醒时长(分钟)延长、平均清醒占睡眠百分比增加、平均深睡占睡眠百分比下降;在睡眠特征与部分认知功能之间关系方面,首先,睡眠效率越差,精神运动警觉性功能越差。其次,个体风险决策偏好水平与各项睡眠参数没有显著影响关系。最后,睡眠效率下降及睡眠结构紊乱,都可能造成了个体执行功能和反应抑制能力的缺陷。

结论 本研究通过长时程密集睡眠监测发现,慢性失眠障碍患者主要表现出睡眠结构紊乱和睡眠效率下降,同时在认知功能上也存在风险寻求和反应抑制能力受损情况,但精神警觉性功能未见异常。此外,本研究发现个体的风险决策偏好水平可能与各项睡眠参数无关,而睡眠结构紊乱可能会造成个体反应抑制能力和精神运动警觉性功能的缺陷。

不同失眠严重程度患者脑功能差异的多通道近红外光谱研究

罗鑫 苑成梅* 魏燕燕 吕洞宾 钱瑞仪 刘俞彤 王杨 张洁 张毓 王婉莹 谭颖婷
上海交通大学附属精神卫生中心

目的 失眠障碍严重影响患者的生活质量和心理健康。虽然已有研究表明失眠患者与健康对照组的大脑功能活动存在显著差异,但不同失眠严重程度患者的脑功能差异研究相对较少。本研究旨在探讨不同失眠严重程度患者组间的大脑功能差异及其与心理社会因素的相关性。

方法 本研究共纳入 154 例失眠障碍患者,按照失眠严重程度、病程和用药情况进行分组,采用近红外脑功能成像(functional near-infrared spectroscopy, fNIRS)设备测量言语流畅性任务期间氧合血红蛋白(oxy-Hb)浓度的相对变化。使用 PSQI、HAMD-17 和 HAMA 评估睡眠质量和情绪状态,使用 RRS、PSS 和 FIRST 评估心理社会因素。数据分析采用 Homer2 软件包和 SPSS 26.0,进行单因素方差分析、t 检验和 Pearson 相关分析。

结果 失眠障碍患者右侧额下回 oxy-Hb 浓度在不同失眠严重程度组间存在显著差异($F=3.21, P<0.05$)。右侧额叶 oxy-Hb 浓度与反刍思维量表($r=0.233, P<0.05$)及压力知觉量表($r=0.225, P<0.05$)呈显著正相关,右侧额叶功能活动与失眠压力反应量表($r=-0.253, P<0.05$)呈显著负相关。

结论 失眠障碍患者的大脑功能活动与其心理状态和压力感知存在密切关联。右侧额下回、额叶和额叶的功能活动与失眠相关心理特征显著相关,这提示在治疗失眠时需综合考虑这些因素,以期实现更为有效的干预和治疗。

关键词:失眠障碍;近红外;失眠严重程度;右侧额下回

失眠障碍执行功能受损研究现状

胡培娜*
山西医科大学

目的 近年来,我国失眠障碍患病率呈显著上升趋势,普通人群失眠患病率为 29.2%,其中 18~60 岁人群的患病率为 15.11%。《睡眠障碍国际分类》第

三版将失眠障碍定义为尽管有充足的睡眠机会和环境,仍然存在入睡困难、睡眠维持困难或早醒,通常伴有较为明显的日间功能紊乱。失眠障碍患者常主诉记忆力下降、注意力难以集中、执行功能受损等,表现为认知功能受损,严重影响患者的日常生活。特别是执行功能受损,严重影响患者工作学习效率。执行功能是指个体对思想和行为进行有意识控制的心理过程,包括反应抑制、工作记忆和认知灵活性三个成分,是高级认知功能的重要组成部分。因此,本综述旨在对近十年失眠障碍执行功能相关的研究进行系统综述,系统论述失眠障碍患者执行功能受损的研究现状。

方法 本综述在中国知网和 Pubmed 数据库检索近十年研究失眠障碍执行功能的文献。

结果 对以往研究进行归纳发现:(1)失眠患者进行停止信号任务时,发现患者反应时更长,抑制控制能力较差,但是在准确性方面未发现差异;另有研究发现,伴客观短睡的失眠患者反应抑制功能受损更明显。失眠患者难以控制夜间侵入性认知,入睡困难,可能与失眠患者的反应抑制能力受损有关。(2)失眠患者在工作记忆任务中表现较差,主要表现为正确率下降。(3)一项失眠患者认知灵活性的研究发现,患者认知灵活性未受影响。但在另一项研究中发现,失眠患者认知灵活性下降,主要表现为反应时延长。

结论 失眠患者执行功能受损,主要表现在反应抑制、工作记忆和认知灵活性方面。目前对失眠患者在反应抑制、工作记忆受损的研究结果较为一致,但是对认知灵活性的研究结果尚未得出一致的结论。因此,未来可以进一步研究失眠患者反应抑制受损的机制,探讨失眠发生发展的深层机制,进一步关注失眠患者认知灵活性变化。

Comparative Analysis of EEG Power Changes in Non-Organic Insomnia Patients Before and After Treatment with Healthy Controls

Qiang Chen¹, Shaohong Zou²

1.Xinjiang Mental Health Center

2.People's Hospital of Xinjiang Uygur Autonomous Region

Objective Insomnia is a common sleep disorder that significantly impairs the quality of life of patients. This study aims to analyze the EEG power in different frequency bands at various electrode sites before and after treatment in first-time visiting patients with non-organic insomnia. Comparisons will also be made with a healthy control group. Through this study, we aim to explore the neuroelectrophysiological changes associated with insomnia treatment, providing a scientific basis for EEG evaluation of insomnia

Methods The study involved 33 patients with non-organic insomnia and 17 healthy controls. Resting-state EEG signals were collected for 5 minutes from 16 electrode sites (Fp1, Fp2, F3, F4, C3, C4, P3, P4, O1, O2, F7, F8, T3, T4, T5, T6) before and after treatment. EEG signals were preprocessed and analyzed using Matlab R2023a and EEGLAB v2023.1. Power spectral analysis was performed to extract absolute and relative power values across five frequency bands (δ , θ , α , β , γ). Independent sample t-tests and paired sample t-tests were used to compare EEG power changes before and after treatment and with the healthy control group

Results Comparison within insomnia patients: No significant differences were observed in the absolute or relative power values across the five frequency bands at any of the 16 electrode sites before and after treatment

Pre-treatment: Compared to the healthy controls, insomnia patients showed significantly increased absolute power in the θ band across most electrodes (except O2 and T3). In the α band, relative power was significantly reduced in several electrodes (except C3, C4, P3, P4, O2, F7, T3, T4, T5, and T6). For the γ band, some electrodes exhibited significantly reduced relative power (except Fp1, Fp2, F4, O1, O2, F7, F8, and T4). There were generally no significant differences in the absolute or relative power values for the other bands.

Post-treatment: In the δ band, most electrodes showed a significant increase in absolute power post-treatment (except F4, C3, O1, F7, and T5). In the β band, some electrodes showed increased absolute power (except Fp1, F3, P3, P4, O1, O2, F7, T3, T4, and T5). No

significant differences were found in most other bands' absolute or relative power values.

Conclusion The study suggests that treatment has a regulatory effect on EEG activity, positively influencing brain function. This provides further evidence from an EEG perspective for understanding the neurobiological mechanisms of insomnia. Additionally, the study indicates that different brain regions corresponding to different electrode sites show varied EEG responses after insomnia improvement. This suggests that modulating the EEG power in specific brain regions could potentially enhance the quality of sleep in patients

关键词: Non-Organic Insomnia, EEG Power, Before and After Treatment, Healthy Controls

大学生失眠与抑郁症状的关系：情绪调控的中介作用

于也^{1,2,3} 邓小鹏^{1,2} 张新风^{1,2}

1.荆州市精神卫生中心

2.长江大学精神卫生研究所

3.长江大学精神卫生中心

目的 本研究旨在探讨情绪调控在失眠与大学生抑郁水平之间的中介作用。

方法 采用自行整编《“长江大学大学新生心理普查”调查问卷》调查工具，内容包括一般人口学资料问卷及失眠严重程度指数表(ISI)、病人健康问卷(PHQ-9)、广泛性焦虑障碍量表(GAD-7)及青少年上网成瘾自评量表(IAT)，情绪调控使用《大学生心理健康量表》的情感调控维度，采用方便整群抽样在线上进行调查。本研究共收集 8498 份问卷，筛选出有效数据 7353 份，样本有效率 86.53%。研究中所有的数据分析均使用 SPSS 21 处理，采用 PROCESS 插件分析中介效应。

结果 (1) 本次调查大学新生的平均年龄 19.3 ± 3.0 岁，其中男生 3788 人、女生 3565 人。共检出存在抑郁症状人群共 2836 人，检出率为 38.57%，其中男生 1438 (19.56%) 人，女生 1398 (19.01%) 人。(2) 失眠得分与抑郁症状得分呈正相关($r=0.631$, $P<0.01$)、情绪调控得分与抑郁症状得分呈负相关($r=-0.514$, $P<0.01$)。(3) 失眠症状对抑郁症状的直接

作用显著，并通过情绪调控的中介产生间接效应，中介作用效应值为 0.119，占总效应的 19%。

结论 大学生失眠可以直接影响抑郁症状，也可以通过负向影响情绪调控能力影响抑郁症状，提示可以通过增强失眠大学生情绪调节能力以预防和缓解抑郁症状。

发作性睡病患者的心理状况分析及其干预策略

丁仕珍*

绵阳市第三人民医院

目的 研究发作性睡病患者心理状况分析及其干预策略。**方法** 研究选取时间为 2022 年 1 月~2023 年 12 月，诊断为发作性睡病的患者 50 名作为研究对象，评估患者的焦虑、抑郁情绪、嗜睡程度、生活质量，通过 logistic 回归分析法评估发作性睡病患者焦虑抑郁情绪的影响因素，通过 Spearman 相关性分析法评估患者贝壳焦虑抑郁量表与嗜睡程度及生活质量的相关性。

方法 研究选取时间为 2022 年 1 月~2023 年 12 月，诊断为发作性睡病的患者 50 名作为研究对象，评估患者的焦虑、抑郁情绪、嗜睡程度、生活质量，通过 logistic 回归分析法评估发作性睡病患者焦虑抑郁情绪的影响因素，通过 Spearman 相关性分析法评估患者贝壳焦虑抑郁量表与嗜睡程度及生活质量的相关性。

结果 50 名发作性睡病的患者贝壳焦虑评分为 (48 ± 4.532) 分，贝壳抑郁评分为 (14 ± 2.342) 分。单因素分析结果显示，日间嗜睡程度、社会支持、病程均于发作性睡病患者焦虑和抑郁情绪有关，(P 均 <0.05)。多因素 Logistic 分析结果显示，日间嗜睡程度 >12 分，病程 >1 年，家庭/学校不理解支持是发作性睡病患者焦虑抑郁的影响因素(P 均 <0.05)。Spearman 相关性分析结果显示，发作性睡病患者患者的嗜睡量表总分与贝壳焦虑评分呈正相关 ($r = 5.152$, $P = 0.008$)，与贝壳抑郁评分呈正相关 ($r = 4.116$, $P = 0.007$)，嗜睡量表总分与生活质量总分呈负相关 ($r = -5.345$, $P = 0.007$)，生活质量总分与

贝壳焦虑评分呈负相关($r = -5.433, P = 0.005$), 与贝壳抑郁评分呈负相关($r = -5.520, P = 0.006$)。

结论 日间嗜睡程度、社会支持、病程均是发作性睡病患者焦虑和抑郁情绪影响因素, 焦虑抑郁情绪与患者的日间嗜睡程度正相关和生活质量负相关, 日间嗜睡和生活质量负相关。临床应从改善发作性睡病的日间嗜睡程度和生活质量出发予以对应策略, 从而改善患者的焦虑抑郁情绪。

关键词: 发作性睡病, 日间嗜睡, 生活质量, 焦虑抑郁

青少年抑郁障碍患者抑郁症状和认知缺陷的关系: 焦虑和睡眠障碍的链式中介作用

石竹¹ 乞盟¹ 周冰洁² 张晨娇³ 朱嘉琪² 高焕琴¹ 陈景旭¹

1. 北京回龙观医院/北京大学回龙观临床医学院

2. 承德医学院

3. 蚌埠医科大学

目的 探讨青少年抑郁障碍患者抑郁症状与认知缺陷之间的关系, 分析焦虑和睡眠障碍的链式中介作用。

方法 纳入 141 名青少年抑郁障碍患者为研究对象。通过儿童版简明国际神经精神访谈(MINI-KID), 采用病人健康问卷(PHQ-9)、认知缺陷问卷-抑郁(PDQ-D)、广泛性焦虑量表(GAD-7)、匹兹堡睡眠质量指数(PSQI)评估患者的抑郁焦虑、睡眠和认知情况。采用 χ^2 检验、独立样本t检验、单因素ANOVA检验、Mann-Whitney U检验、Kruskal-Wallis H检验比较不同特征青少年抑郁、认知情况。采用Spearman相关分析青少年抑郁障碍患者抑郁症状、认知缺陷、焦虑情绪及睡眠障碍的相关性。采用SPSS PROCESS宏程序偏差校正的非参数百分位Bootstrap法进行中介效应检验。

结果 认知缺陷与抑郁症状、焦虑、睡眠障碍两两之间呈正相关($r=0.525\sim 0.625$, 均 $P<0.001$)。焦虑和睡眠障碍在抑郁症状与认知缺陷之间存在链式中介作用, 中介效应值为0.136, 效果量为13.68%。

结论 青少年抑郁障碍患者抑郁症状可以直接导致认知缺陷, 也可以通过焦虑和睡眠障碍的链式中介作用间接影响认知缺陷。

关键词: 青少年, 抑郁症状, 认知缺陷, 焦虑, 睡眠障碍, 链式中介效应

正念减压结合针灸对慢性失眠患者焦虑情绪和睡眠质量的改善作用

张凡 栾燕 谢丽娜 栾燕* 韩笑宇 李璞鸥 苏荣坤 高柏慧 王晓坤 王冠文 王怡萱 姚明洋
沈阳市精神卫生中心

目的 探索正念减压(MBSR)音频练习结合针灸治疗慢性失眠的疗效。

方法 选取我院 2021 年 1 月-2022 年 1 月门诊就诊患者 44 名, 采用随机数字表法分为 2 组, 观察组应用 MBSR 音频同时结合针灸的疗法治疗, 对照组仅应用右佐匹克隆治疗, 治疗前后进行汉密尔顿焦虑量表(Hamilton Anxiety Scale, HAMA)、匹兹堡睡眠质量指数量表(Pittsburgh Sleep Quality Index, PSQI)评估, 并用 spss22.0 进行统计分析。

结果 治疗后观察组临床疗效高于对照组, 观察组精神焦虑, 睡眠质量及日间功能改善显著优于对照组($P<0.05$), 不良反应方面观察组低于对照组。

结论 正念减压音频练习结合针灸改善慢性失眠患者焦虑情绪和睡眠质量疗效显著。

关键词: 慢性失眠; 正念减压音频; 针灸; 右佐匹克隆

青少年磨牙症与睡眠质量、焦虑抑郁情绪的关系

王蕾蕾 陈景旭* 周双棠 李红娟 乞盟 李玖菊
北京回龙观医院

目的 探讨青少年磨牙症的发生率, 磨牙症与睡眠质量、焦虑抑郁情绪之间的关系。

方法 采用横断面抽样调查, 共纳入 6780 名 12-18 岁的青少年。采用改编的磨牙症量表评估磨牙症。采用失眠严重指数(ISI)评估青少年的失眠症状, 采用青少年日间嗜睡量表(CADSS)评估日间嗜睡程度, 采用噩梦烦恼问卷-中文版(NDQ)评估睡

眠中的噩梦情况,采用广泛性焦虑障碍量表-2(GAD-2)和2条目患者健康问卷(PHQ-2)评估患者的焦虑抑郁情绪。采用卡方检验比较两组的人口学及临床资料的差异,采用独立样本t检验比较青少年有无磨牙症组的ISI、CADSS、NDQ、GAD-2、PHQ-2得分的差异,Logistic回归分析青少年磨牙症的危险因素。

结果 青少年磨牙症的发生率为22.8%。在一般资料方面,高中生磨牙症发生率高于初中生,男生、女生之间没有差异。有磨牙症的青少年在失眠症状、日间嗜睡症状、噩梦痛苦总分、噩梦一般痛苦、噩梦现实感知、焦虑症状、抑郁症状方面的得分显著高于无磨牙症组。Logistic回归分析显示,日间嗜睡症状、噩梦痛苦总分、噩梦一般痛苦是青少年磨牙症的危险因素。

结论 青少年磨牙症的发生率较高,有磨牙症的青少年的睡眠质量较差,有着更严重的焦虑抑郁情绪,日间嗜睡症状、频繁噩梦是其发生的危险因素,我们要重视对青少年磨牙症的评估及相关危险因素的干预。

关键词:青少年,磨牙症,睡眠质量,焦虑抑郁

噩梦频率、噩梦困扰与中学生非自杀性自伤的关系

方崧颖^{1,2} 陈景旭² 宋伟洁^{1,2} 迟咏涵² 周冰洁^{1,2}

1.承德医学院

2.北京回龙观医院

目的 本研究对中学生非自杀性自伤、噩梦频率和噩梦困扰的关系进行研究,有助于了解中学生非自杀性自伤、噩梦的流行特征及性别差异、分析中学生非自杀性自伤与噩梦频率和噩梦困扰的关联和分噩梦困扰在噩梦频率与中学生非自杀性自伤间的中介作用。

方法 于2022年5月采用患者健康问卷(Patient Health Questionnaire-4, PHQ-4)、青少年非自杀性自伤行为评定问卷(Adolescent Non-suicidal Self-injury Assessment Questionnaire, ANSAQ)、噩梦困扰问卷-中文版(Chinese Version of Nightmare Distress Questionnaire, NDQ-CV)、中国青少年日间嗜睡量表(Chinese Adolescent Daytime Sleepiness

Scale, CADSS)、失眠严重程度指数(Insomnia Severity Index, ISI)等对山东省日照市五所高中和五所初中的学生进行问卷调查。用SPSSAU 21.0在线统计软件进行数据分析。

结果 有效问卷总计6773份,问卷有效回收率为99.9%。研究对象年龄中位数为16(15, 17)岁,女性占总样本的53.37%。中学生过去一年非自杀性自伤(Non-suicidal Self-injury, NSSI)的发生率为38.62%,女性高于男性(40.17% vs 36.86%)但NSSI发生率的性别差异仅在初一和初二年级的中学生中有统计学意义。女性ANSAQ行为问卷得分显著高于男性。45.12%的中学生近一个月有过至少1次噩梦,近一个月内频繁噩梦(噩梦频率≥每周1次)的发生率为13.29%。女性的噩梦困扰高于男性,存在频繁噩梦的个体中女性的占比高于男性(63.67% vs 36.33%),且频繁噩梦的性别差异在除高一之外的各个年级的样本中均存在。过去一年有NSSI的中学生有噩梦困扰和频繁噩梦的比例更高。不论是在总体样本还是在分性别样本中,噩梦困扰在噩梦频率与非自杀性自伤间的中介效应都是显著的,且中介效应百分比在女性样本中高于男性样本(35.78% vs 27.10%)

结论 频繁噩梦、噩梦困扰和NSSI在中学生群体中比较常见,且发生率在不同性别之间存在差异。中学生的噩梦频率和噩梦困扰均与NSSI相关。噩梦频率不仅直接预测了NSSI,还可以通过噩梦困扰的中介作用间接预测NSSI;这种中介效应在分性别样本中依旧存在。

关键词:中学生,噩梦频率,噩梦困扰,中介作用,非自杀性自伤

快动眼睡眠行为障碍合并创伤后应激障碍:一例病例报告

雷镇榕^{1,2} 王浩怡² 王浩怡¹ 张淑芳^{1,2}

1.武汉大学人民医院

2.中国地质大学(武汉)心理科学与健康研究中心

目的 快速眼动睡眠行为障碍(REM sleep behavior disorder, RBD)是在快速眼动睡眠期患者出现异常行为,且通常伴随梦境出现的一种快速眼动睡眠障碍。创伤后应激障碍(Post-Traumatic Stress

Disorder, PTSD)是一种由强烈的精神应激引起的应激障碍,患者可能会做跟创伤事件相关的噩梦,是一种创伤的入侵性体验。拟探讨快速眼动睡眠行为障碍及创伤后应激障碍的合并诊断和治疗方案。

方法 2022年一男性患者因反复噩梦伴梦中异常行为三年而入院,该患者自诉自2019年下半年无原因逐渐开始出现反复噩梦,噩梦栩栩如生,且在梦中伴随较多异常行为,心情差时更容易出现噩梦和梦中异常行为。入院初,患者的多导睡眠监测的检查结果提示患者夜间睡眠期间存在肌张力迟缓。结合患者的临床特点,诊断为RBD。但在详细了解患者的创伤经历后,结合明尼苏达多项人格测试、SCL-90、创伤后应激障碍问卷等检查结果,进行病案讨论后,最终诊断修订为:1.RBD; 2.PTSD。患者的药物治疗单用氯硝西泮 1mg,因考虑到患者的创伤性经历,提供针对创伤的行为认知治疗。

结果 住院 20 余天患者临床痊愈出院。

结论 睡眠问题可能是患者外在的一个症状,患者的诊断可能并不只局限在睡眠障碍疾病上。

关键词: 快速眼动睡眠行为障碍 创伤后应激障碍 心理治疗 以创伤为中心的认知行为治疗

The Efficacy of Microelectrical Pulser in Primary Insomnia: A Randomized Controlled Clinical Trial

Shuli Xu* Di Wu

The First Affiliated Hospital of Air Force Military Medical University

Objective Exploring the effectiveness and safety of microelectrical pulser in the treatment of primary insomnia

Methods 40 primary insomnia patients were randomly divided into a control group and a treatment group, with 20 patients in each group. The treatment group was treated with the micro-pulse stimulator, and the control group was treated with the pseudo-stimulation of the micro-pulse stimulator. The Pittsburgh Sleep Quality Index Scale (PQIS) was used to assess the subjective insomnia symptoms before treatment, after 2

weeks of treatment and after 4 weeks of treatment respectively, and the smart bracelet was used to assess the daily sleep of the patients

Results (1) PQSI scores decreased in both groups after 4 weeks of treatment compared with baseline scores, and the daytime dysfunction score was lower in the treatment group (0.11 ± 0.32) than in the control group (0.25 ± 0.55), with a statistically significant difference ($P < 0.05$). (2) In the treatment group, after 4 weeks of treatment, the average daily sleep time (7.03 ± 1.08) was prolonged compared with the baseline (6.58 ± 0.86) in terms of objective sleep time, and the difference was statistically significant ($P < 0.05$)

Conclusion Microelectrical pulser is safe and effective in the treatment of primary insomnia

关键词: Microelectrical pulser; primary insomnia; Pittsburgh Sleep Quality Index scale

夜间低睡眠质量和日间嗜睡对精神分裂症患者自杀行为进展的影响

陈云¹ 李朝伟¹ 张绿凤² 张洪乐³ 胡思帆¹ 倪照军¹ 孙新宇¹ 孙洪强¹

1.北京大学第六医院

2.驻马店市第二人民医院

3.聊城市第四人民医院

目的 精神分裂症患者的自杀意念常见,部分会转化为自杀未遂行为。控制这种进展是自杀预防的关键环节之一。睡眠紊乱是精神分裂症自杀的重要风险因素,然而其对自杀不同阶段的影响并不明确。本研究旨在探究睡眠紊乱症状在精神分裂症自杀进展的作用。

方法 本研究从中国四省(直辖市)的9家医院招募精神分裂症住院患者。使用简明国际神经精神访谈自杀模块评估患者是否有近1月自杀意念和自杀未遂。睡眠紊乱症状包括夜间低睡眠质量和日间嗜睡,分别采用匹兹堡睡眠质量指数和Epworth嗜睡量表进行评估。采用多因素 Logistic 回归模型明确睡眠紊乱症状对于自杀意念的影响程度,及其在自杀意念者发生自杀未遂中的作用。回归模型均纳入一般人口学信息、病史信息和精神症状(患

者健康问卷评估的抑郁症状、广泛性焦虑障碍量表评估的焦虑症状、简明精神病量表中的缺乏活力、思维障碍、敌对猜疑和激活性因子)因素进行协变量调整。

结果 本研究共纳入 672 例精神分裂症住院患者,近 1 月自杀意念率为 10.9% (95%CI: 8.7%~13.4%),自杀未遂率为 3.3% (95%CI: 2.2%~4.9%)。自杀未遂者均有自杀意念,自杀意念者存在自杀未遂行为的比例为 30.1% (95%CI: 20.8%~41.4%)。在整体样本中,夜间低睡眠质量(OR: 3.56, 95%CI: 1.79~7.06, $p < 0.001$)是自杀意念的独立相关因素,日间嗜睡未表现出显著相关。在自杀意念进展为自杀未遂行为的相关因素中,日间嗜睡(OR: 4.15, 95%CI: 1.13~15.24, $p = 0.032$)是关键的睡眠紊乱症状,夜间低睡眠质量未表现出显著相关。

结论 精神分裂症患者自杀行为不同阶段的影响因素存在差异。夜间低睡眠质量是自杀意念形成的关键睡眠紊乱症状,日间嗜睡则对自杀意念进展为自杀未遂具有重要作用。存在日间功能损害的睡眠紊乱对于自杀的影响是更深入的,会加重自杀进展,需要进行重点评估和关注,将有助于自杀风险的分级预防。

Objective To explore the underlying neural mechanism of functional difference between non-rapid eye movement sleep stage 2 (N2) and N3

Methods We tested discrepancy in spindle-related brain activation between N2 and N3 within healthy, non-sleep-deprived college students (dataset 1: $n = 27$, 59% females, median age 23 years), using simultaneous electroencephalography-functional magnetic resonance imaging (EEG-fMRI). To assess the replicability of the finding, we repeated the analysis among healthy, non-sleep-deprived adults (independent dataset 2: $n = 30$, 50% females, median age 32 years). Furthermore, correlation analysis was performed to explore the association between spindle-related brain activation of which with significant inter-stage difference and total sleep time (TST) during EEG-fMRI. We conducted the correlation analysis in N2 and N3, respectively

Results The finding from dataset 1 indicated significantly increased blood-oxygen level-dependent signal in the right middle temporal gyrus during N2 compared with N3, which was well replicated in dataset 2. Negative association between spindle-related brain activation in the right middle temporal gyrus and TST were only observed in N2

Conclusion Our findings emphasize the unique role of N2 spindle in human information processing during sleep at the expense of shortening TST

关键词: Sleep spindles; NREM; Brain activation; EEG-fMRI

Investigating Alterations in Gut Microbiota Associated with Insomnia Disorder: A Focus on Arousal-promoting Neurotransmitters

Jingjing Lin Jiyang Pan* Yixian Cai Yaxi Liu Xian Shi
Department of Psychiatry, The First Affiliated Hospital of Jinan University

Objective The present study aimed to investigate the alterations of gut microbiota in patients with insomnia disorder and to identify objective diagnostic biomarkers for insomnia disorder. Additionally, we explored the relationship between arousal-promoting neurotransmitters and the abundance of species in the gut microbiota

Methods A total of 40 patients with insomnia disorder and 38 healthy controls were included in this study. Metagenomic sequencing was used to detect changes in gut microbiota, while enzyme-linked immunosorbent assay (ELISA) was used to measure the serum levels of arousal neurotransmitters (histamine and orexin-A). Moreover, we used Spearman's correlation analysis to explore the correlation between the abundance of species and arousal-promoting neurotransmitters

Results Our findings showed significant increases in peripheral serum levels of arousal neurotransmitters (histamine and orexin-A) in the patients with insomnia disorder ($P<0.001$). Significant differences in beta diversity at the genus and species levels were noted between the two groups ($P<0.001$), while there was no significant difference in alpha diversity ($P>0.05$). MetagenomeSeq analysis identified 33 differentially abundant microbial species; LEfSe analysis identified four potential biomarkers for insomnia disorder, including increased expression of Bacteroidaceae, Phocaeicola, Phocaeicola gatus, and decreased expression of Prevotella copri. Additionally, a positive correlation was found between Bacteroides thetaiotaomicron and histamine ($r=0.606$, $P=0.010$), and between Bacteroides sp. HMSC067B03 and orexin A ($r=0.641$, $P=0.006$)

Conclusion Patients with insomnia disorder exhibited elevated levels of serum histamine and orexin-A. The gut microbiota, predominantly represented by Bacteroidaceae, served as a biomarker for distinguishing insomnia disorder. Changes in the microbiota-gut-brain axis may play a crucial role in the onset and development of insomnia disorder, suggesting that targeting the arousal-promoting neurotransmitters within the microbiota-gut-brain axis could be a potential therapeutic approach for insomnia disorder

关键词: Insomnia disorder; Gut microbiota; Neurotransmitters; Histamine; Orexin-A.

青少年抑郁障碍患者自我同情和非自杀性自伤: 元认知的中介作用

朱嘉琪^{1,2} 陈景旭¹

1.北京回龙观医院

2.承德医学院

目的 探讨青少年抑郁障碍自我同情对非自杀性自伤行为的影响, 以及元认知的中介作用, 为青少年抑郁障碍患者的非自伤性自伤行为的干预提供依据。

方法 本研究于2023年5月至2024年1月期间, 采用方便取样于北京市某精神专科医院应用自我同情量表12项简版(SCS-SF)、渥太华非自杀性自伤量表中文修订版(OSI)、元认知问卷(MCQ-30)对103名12-18岁的青少年抑郁障碍患者进行问卷评估。采用SPSS 26.0进行差异检验及Spearman相关分析; 采用PROCESS v4.1宏程序偏差校正的非参数百分位数Bootstrap方法进行中介效应显著性检验。

结果 (1) 青少年抑郁障碍患者自我同情、元认知及非自杀性自伤在性别、年级及家庭居住环境中均存在显著差异($P<0.05$); (2) 相关分析结果显示, 青少年抑郁障碍患者自我同情与NSSI原因($r=-0.424$, $P<0.01$)、NSSI实际情况($r=-0.413$, $P<0.01$)元认知($r=-0.402$, $P<0.01$)呈负相关, 元认知与NSSI原因($r=-0.380$, $P<0.01$)、NSSI实际情况($r=-0.409$, $P<0.01$)呈正相关; (3) 中介效应分析显示, 青少年抑郁障碍患者中自我同情可负向预测NSSI($\beta=0.324$,

$P < 0.01$), 直接效应占总效应的 76.60%; 元认知的中介效应显著($\beta = 0.101, P < 0.01$), 占总效应的 23.71%。

结论 青少年抑郁障碍患者的自我同情可负向预测到青少年非自伤性自伤行为, 同时青少年自我同情可减弱青少年元认知对非自杀性自伤行为的正向预测作用。

关键词: 青少年 抑郁障碍 自我同情 非自杀性自杀 元认知

中国普通人群睡眠卫生、健康结局和性别差异之间的关系:一项横断面研究

谢婷婷² 王育梅² 张智博¹

1.北医六院

2.山东第一医科大学附属省立医院

目的 中国普通人群睡眠卫生、健康结局和性别差异之间的关系:一项横断面研究。

方法 采用横断面研究的方法, 对中国 34 个省级行政区的 41061 名居民进行了网络问卷调查, 调查内容包括一般人口学信息、睡眠卫生情况(sleep hygiene index, SHI), 主观睡眠质量(PSQI)、既往疾病史等信息。根据睡眠卫生指数的四分卫间距将人群划分为睡眠卫生较差、一般和良好。使用描述性统计对调查对象一般情况及睡眠卫生情况进行差异性分析。二元 logistic 用于检验睡眠卫生在慢性健康结局中性别差异, 使用 R 语言 mediation 包检验睡眠卫生对性别和健康结局的中介效应。

结果 在睡眠卫生情况方面, 男性在睡前相关行为维度的睡眠卫生习惯相对较差, 女性在上床后进行更多与睡眠无关的活动。在 15 岁以上的人群中, 3456 名男性(20.55%)和 3,658 名女性(15.09%)自我报告至少患有一种慢性疾病。二元 logistic 回归发现, 睡眠卫生情况较差的男性患病神经系统疾病的几率更高: 男性(OR: 4.058, 95% CI: 3.066-5.366), 女性(OR: 2.611, 95% CI: 2.143-3.182)。中介效应显示, SHI 和患病率之间的关系存在性别差异, 男性的患病率高于女性 (p for interaction < 0.001)。

结论 本研究表明, 睡眠卫生可能是加剧或延续慢性疾病的重要因素, 睡眠卫生和健康结果之间的性别特异性关联, 在进行认知行为治疗(CBT)时, 应根据疾病种类和目标人群进行个体化评估和治疗。

中国青少年睡眠质量相关影响因素的研究进展

冯稳*

清镇市第一人民医院

目的 睡眠质量的好坏与青少年心理健康关系密切。然而, 在当今社会, 青少年的睡眠问题日益严重, 成为一个迫切需要解决的公共卫生问题。因此, 本综述基于家庭、学校、行为习惯和心理健康四个角度, 通过系统回顾影响中国青少年睡眠的因素, 以期改善青少年的睡眠质量提供科学参考。

方法 通过检索中文数据库(知网和万方), 从家庭因素、学校因素、行为习惯因素和心理健康因素四个维度, 检索与睡眠相关的影响因素, 并进行概括。

结果 (1) 家庭因素: 家庭环境对青少年的睡眠有重要影响, 家庭因素主要包括留守儿童、父母不稳定的婚姻状况、家庭经济状况差、父亲和/或母亲打鼾、家庭氛围紧张、亲子关系差、家庭作息不规律等因素会导致青少年睡眠问题。

(2) 学校因素: 学习压力较大、教师粗暴行为、同伴侵害等因素都可能降低睡眠质量。

(3) 行为习惯因素: 手机成瘾、问题性网络使用、睡前使用电子产品、缺少体力活动、烟草和电子烟的使用、短视频使用等不良的生活习惯都会对青少年的睡眠质量产生不良影响。

(4) 心理健康因素: 青少年低心理韧性、较高的生活事件、抑郁情绪、焦虑情绪、认知功能下降等心理因素对青少年的睡眠产生不良影响。

结论 青少年睡眠问题是一个复杂而严峻的问题, 对于青少年的睡眠问题的干预需要从家庭因素、学校因素、行为习惯因素和青少年心理健康四个维度考虑和分析, 并制定合理的方案来改善青少年的睡眠问题。

关键词: 青少年; 睡眠质量; 影响因素; 研究进展。

认知行为疗法治疗失眠障碍的神经影像学研究

魏婉婷 吕东升* 刘敏

内蒙古自治区精神卫生中心

目的 随着社会经济快速发展,社会竞争压力也不断加大,失眠障碍的发生率日益增加。失眠障碍不仅影响患者的生活质量,更是罹患其他精神障碍的危险因素。认知行为疗法(Cognitive Behavioral Therapy for Insomnia, CBT-I)作为失眠障碍的有效治疗办法,本研究探究 CBT-I 治疗失眠障碍可能的神经机制,为临床医生针对失眠障碍选择治疗方案时提供参考。

方法 纳入 40 例符合《精神障碍诊断与统计手册(第五版)》(Diagnostic and Statistical Manual of Mental Disorders, Fifth Edition, DSM-5)诊断标准失眠障碍患者,患者接受为期 6 周的 CBT-I 治疗,失眠障碍患者在经 CBT-I 治疗前后行静息态功能磁共振扫描,此外纳入 40 例与之匹配的健康对照者,进行 1 次静息态功能磁共振扫描。应用 DPARSF5.3 和 spm12,以脑岛、扣带回为感兴趣区,进行全脑的功能连接分析,比较对照组与患者组脑区功能连接差异,以及患者经 CBT-I 治疗前后脑区功能连接强度的变化。将功能连接强度变化与临床疗效相关性分析。

结果 失眠障碍患者经 CBT-I 治疗后匹兹堡睡眠质量指数量表、失眠严重程度量表、汉密尔顿抑郁量表、汉密尔顿焦虑量表评分等均低于治疗前,睡眠监测显示入睡后清醒时间低于治疗前、睡眠效率均高于治疗前($P<0.05$)。失眠障碍患者与健康对照者相比,右侧脑岛与右侧距状裂周围皮层功能连接升高,左侧内侧和旁扣带回与右侧豆状苍白球、右侧前和扣带旁回、左侧楔叶功能连接升高,右侧内侧和旁扣带回与右侧额中回功能连接降低。患者经 CBT-I 治疗后与治疗前相比,左侧脑岛与左侧额中回、右侧内侧和旁扣带回与左侧顶上回功能连接降低;后扣带回与右侧脑岛、前扣带回与右侧额中回及右侧内侧和旁扣带回功能连接升高(均采用 GRF 校正,voxel $P<0.01$, cluster $P<0.05$)。相关性分析结果 匹兹堡睡眠质量指数量表减分率与左侧脑岛与左侧额中回功能连接降低($P<0.05$, 相关系数 $=-0.39$)、前扣带回与右侧内侧和旁扣带回功能连接升高($P<0.05$, 相关系数 $=-0.37$)呈负相关。

结论 失眠的认知行为疗法治疗失眠障碍疗效明确,与脑岛、扣带回相关的功能连接可能是 CBT-I 治疗起效的潜在机制。

关键词: 失眠障碍,认知行为疗法,磁共振,功能连接

抑郁症患者的童年创伤和认知情绪调节策略与抑郁症状的关系

雷威*

西南医科大学附属医院

目的 探究抑郁症患者的童年创伤和认知情绪调节策略与抑郁严重程度之间的关系,并考察其性别差异。

方法 选取 2021–2024 年西南医科大学附属医院心身医学科的抑郁症患者 238 名进行问卷调查。采用汉密尔顿抑郁量表(HAMD)评估患者抑郁严重程度,采用儿童创伤问卷(CTQ)和认知情绪调节量表(CERQ)了解患者的童年创伤类型和认知情绪调节策略。采用 Spearman 相关分析考查不同性别条件下 HAMD 得分与各量表得分之间的相关性。同时,构建逐步线性回归模型,预测抑郁症发病的危险因素。

结果 所有患者的抑郁程度与情感虐待、自责、反刍和灾难化呈正相关。此外,女性患者的抑郁严重程度还与身体虐待、理性分析呈正相关,而与情感忽视、积极重新关注和积极重评呈负相关。线性回归分析表明,灾难化可正向预测男性组的 HAMD 评分,而自责、理性分析可正向预测女性组的 HAMD 评分,情感忽视和积极重评则可负向预测女性组的 HAMD 评分。

结论 所有患者的抑郁程度与情感虐待、自责、反刍和灾难化呈正相关。此外,女性患者的抑郁严重程度还与身体虐待、理性分析呈正相关,而与情感忽视、积极重新关注和积极重评呈负相关。线性回归分析表明,灾难化可正向预测男性组的 HAMD 评分,而自责、理性分析可正向预测女性组的 HAMD 评分,情感忽视和积极重评则可负向预测女性组的 HAMD 评分。

A Holistic Model of Music Therapy for Sleep Disorders in Adolescents: Theoretical Foundations and Clinical Applications

Yulin Wang Qihui Zhao Yanqing Xu*
Children's Hospital of Fudan University

Objective Sleep disorders are common among adolescents and significantly impact their quality of life, academic performance, and overall well-being. While pharmacological treatments can be effective, they often come with side effects and the risk of dependency, which is particularly concerning in younger populations. Music therapy, as a non-pharmacological intervention, has gained increasing attention due to its safety and lack of side effects. By clarifying the distinctions between “music therapy,” “music medicine,” and “music healing,” this study aims to develop a holistic model of music therapy for sleep disorders in adolescents, providing a theoretical foundation and practical guidance for clinical application

Methods This study employs a comprehensive review of literature, examining various research studies, clinical reports, and expert opinions to identify the definitions and applications of “music therapy,” “music medicine,” and “music healing” in clinical settings with different populations. Music Therapy, as a clinical and evidence-based practice, involves a certified music therapist using music interventions, such as music-assisted progressive muscle relaxation, to accomplish individualized goals within a therapeutic relationship. Music Medicine refers to the use of pre-recorded music by healthcare professionals to improve patient outcomes and enhance the medical environment, while Music Healing is typically practiced in non-clinical settings by individuals without any type of formal training. Within this population, a qualified music therapist assesses adolescents’ needs from physical, emotional, cognitive, behavioral, and social perspectives, focusing on achieving specific therapeutic outcomes, such as facilitating relaxation, reducing anxiety, and enhancing coping strategies. Various benefits have been observed through

live music delivered by a professional music therapist, including the regulation of the autonomic nervous system, hormone levels, brain wave activity, sleep routines, sleep patterns, and sleep habits

Results Through reviewing of the literature, a holistic model of music therapy for sleep disorders in adolescents is recommended. The model includes psychological interventions where music therapy functions as a safe container to alleviate anxiety and stress, thereby improving emotional stability and sleep quality. Physiologically, music therapy affects the autonomic nervous system by reducing sympathetic nervous activity and increasing parasympathetic activity, promoting physical relaxation. Additionally, music therapy can modulate hormone levels by lowering cortisol levels and increasing melatonin secretion, facilitating the onset of sleep. Behaviorally, when music therapy is combined with behavioral therapies such as sleep hygiene education, establishing bedtime routines, and reducing screen time before bed, it helps young patients develop healthy sleep habits, reduce nighttime awakenings, and decrease difficulties in falling asleep

Conclusion Music therapy, as a non-pharmacological intervention, demonstrates significant potential for improving sleep disorders in adolescents. The development of a holistic model of music therapy for this population highlights the importance of professional music therapy interventions across psychological, physiological, and behavioral domains to achieve optimal therapeutic outcomes. Specifically, music therapy can enhance sleep quality by alleviating psychological stress, regulating physiological functions, and improving behavioral habits. This model provides new insights and methods for clinical practice and holds great potential for widespread application in the treatment of sleep disorders in adolescents. Future research should further validate the effectiveness of this model and explore personalized music therapy protocols to meet the diverse needs of young patients

脑活素在治疗阿尔茨海默症诱发的睡眠紊乱中的作用

霍嘉欣 张钟玉 郑恩雨 陈玟君 李家立* 时杰*
北京大学中国药物依赖性研究所

目的 阿尔茨海默症是一种常见的神经退行性疾病，其诱发的睡眠异常严重影响患者的生活质量。脑活素是一种 GABA 受体激动剂，并用于临床治疗阿尔茨海默症，但其是否能改善阿尔茨海默症诱发的睡眠异常尚不明确。因此，本研究旨在探究阿尔茨海默症小鼠中睡眠异常的发生发展过程，并进一步明确脑活素在治疗阿尔茨海默症诱发的睡眠异常中的作用，以期为临床改善阿尔茨海默症患者的睡眠异常提供有效的治疗手段。

方法 (1) 建立阿尔茨海默症小鼠模型；(2) 采用睡眠脑电记录监测并比较野生型小鼠和阿尔茨海默症小鼠的睡眠结构；(3) 探究慢性腹腔注射脑活素对阿尔茨海默症小鼠睡眠结构的影响。

结果 (1) 3xTg 小鼠病理结果显示 A β 沉积和 tau 蛋白异常磷酸化，符合阿尔茨海默症诊断标准(2) 与野生型小鼠相比，3xTg 小鼠在疾病早期 REM 睡眠减少、觉醒增加，疾病晚期 NREM 睡眠与 REM 睡眠均显著减少、觉醒增加；(3) 脑活素注射可以显著增加 3xTg 小鼠的 NREM 与 REM 睡眠，减少觉醒。

结论 本研究发现 3xTg 阿尔茨海默症小鼠在疾病早期 REM 睡眠减少、觉醒增加，晚期出现 NREM 睡眠减少，而脑活素可以显著改善 3xTg 阿尔茨海默症小鼠的睡眠异常，为临床治疗阿尔茨海默病患者的睡眠异常提供了新的理论依据。

Major Depressive Disorder and Perceived Social Support: Moderated Mediation Model of Security and Brain Dysfunction

Qianyi Luo Liwen Zhu Jiyun Liao Qing Xu Jinrou Xia Xiaohui Lin Hongjun Peng*

The Affiliated Brain Hospital of Guangzhou Medical University

Objective Low social support increases the risk of Major depressive disorder (MDD), yet its effects on brain function are unclear.

Methods We recruited 32 MDD patients with low social support, 52 with high social support, and 54 healthy controls. Using degree centrality (DC), regional homogeneity, amplitude of low-frequency fluctuations, and fractional amplitude of low-frequency fluctuations measures, we examined regional brain activity in MDD patients with low social support. Abnormal regions identified in these analyses were selected as regions of interest for functional connectivity (FC) analysis. We then explored relationships among social support, brain dysfunction, MDD severity, and insecurity using partial correlation and moderated mediation models.

Results Our findings reveal that MDD patients with low social support show decreased DC in the right superior temporal pole and right medial geniculate nucleus, coupled with increased FC between the right superior temporal pole and right inferior temporal gyrus, and the right supramarginal gyrus compared to those with high social support. Furthermore, the DC of the right medial geniculate nucleus positively correlates with social support, while the FC between the right superior temporal pole and right supramarginal gyrus negatively correlates with both social support and subjective support. Additionally, a moderated mediation model demonstrates that the FC between the right superior temporal pole and right supramarginal gyrus mediates the relationship between social support and depression severity, with security moderating this mediation.

Conclusion These findings underscore the impact of low social support on brain function and depression severity in MDD patients

关键词: Major depressive disorder; Social support; Security; Degree centrality; Functional connectivity

Regional Brain Activity and Connectivity Disruptions in Major Depressive Disorder: The Role of Low Social Support

Qianyi Luo Liwen Zhu Jiyun Liao Xiaoyu Liang Jinrou Xia Xiaohui Lin Hongjun Peng*

The Affiliated Brain Hospital of Guangzhou Medical University

Objective Low social support increases the risk of Major Depressive Disorder (MDD), but its impact on brain function is unclear

Methods We recruited 32 MDD patients with low social support, 52 MDD patients with high social support, and 54 healthy controls. Regional brain activity was assessed using amplitude of low-frequency fluctuation (ALFF), fractional ALFF (fALFF), degree centrality, and regional homogeneity. Abnormal regions identified were used for functional connectivity (FC) analysis. Partial correlation and moderated mediation models explored relationships between social support, brain dysfunction, MDD severity, and childhood maltreatment

Results Compared to high social support patients, low social support MDD patients showed decreased fALFF in the right superior temporal pole and increased fALFF in the left postcentral gyrus, with reduced FC between the right superior temporal pole and the right middle occipital gyrus. fALFF of the left postcentral gyrus correlated positively with physical abuse and negatively with social support. FC between the right superior temporal pole and right middle occipital gyrus was positively with social support. Furthermore, the moderated mediation model revealed that FC between the right superior temporal pole and the right middle oc-

cipital gyrus mediated the relationship between subjective support and depression severity, with physical abuse moderating this mediation effect

Conclusion These findings underscore the impact of low social support on brain function and depression severity in MDD patients

关键词: Major depressive disorder; Low Social support; Childhood maltreatment; fractional amplitude of low-frequency fluctuation; Functional connectivity

Genetic Causal Effects of Multi-site Chronic Pain on Post-traumatic Stress Disorder: Evidence From A Two-sample, Two-step Mendelian Randomisation Study

Shuyu Hou¹, Zuxing Wang², Hongru Zhu¹

1. Mental Health Center, West China Hospital of Sichuan University

2. Sichuan Provincial Center for Mental Health, Sichuan Provincial People's Hospital

Objective To determine if the correlation between multi-site chronic pain and post-traumatic stress disorder (PTSD) is causal and to identify the direction of causation

Methods We applied a two-sample Mendelian randomisation (MR) analysis using data from genome-wide association studies of European ancestry populations. The inverse variance weighted (IVW) method was used for MR analyses, accompanied by various sensitivity and validation analyses. Additionally, multivariable and mediation MR analyses were conducted to assess the mediating effects of 13 lifestyle factors or diseases on the causal relationship between multi-site chronic pain and PTSD

Results The MR analysis revealed that multi-site chronic pain significantly increases the risk of developing PTSD (ORIVW = 2.39, 95% CI = 1.72-3.31, $p = 2.10 \times 10^{-7}$). Conversely, the absence of pain significantly reduces the risk of developing PTSD (ORIVW = 0.12, 95% CI = 0.05-0.30, $p = 3.14 \times 10^{-6}$). Multivariable MR analysis indicated that 13 potential confounding

factors do not influence the causal effect of multi-site chronic pain on PTSD. Mediation analysis showed that body mass index (BMI) (6.98%), educational attainment (8.79%), major depressive disorder (MDD) (36.98%), and insomnia (27.25%) mediate the causal connection between multi-site chronic pain and PTSD

Conclusion Individuals with multi-site chronic pain are at a higher risk of developing PTSD, and this risk is partially mediated by pathways involving BMI, educational attainment, MDD, and insomnia. These findings underscore the need for effective preventive and therapeutic strategies for PTSD in patients suffering from multi-site chronic pain

关键词: Multi-site chronic pain, Post-traumatic stress, Mendelian randomisation, Mediation analysis, Genetics

24 小时活动行为特征与自杀倾向的关联研究

肖绛¹ 莫鸿飞^{1,2}

1. 郑州大学

2. 复旦大学上海医学院

目的 本研究旨在分析全年龄段人群 24 小时活动行为特征与自杀倾向的关联。

方法 本研究通过横断面流行病学调查, 采用多级分层抽样法, 设置样本权重, 以调查美国全年龄段人群 24 小时活动行为特征和自杀倾向。研究共纳入样本 3941 人, 其中男性 1919 (48.69%) 人, 女性 2022 (51.31%) 人, 平均年龄 51.23 ± 17.51 岁。24 小时活动行为特征包括中高强度体力活动 (MVPA)、不同类型体力活动 (工作体力活动 WPA、通勤体力活动 TPA、娱乐体力活动 RPA)、久坐 (SB) 和睡眠障碍 (SD)。MVPA、不同类型体力活动和 SB 通过全球体力活动量表 (GPAQ) 评估, 睡眠障碍通过慕尼黑时型问卷 (MCTQ) 评估。自杀倾向通过病人健康问卷 (PHQ-9) 第 9 个条目评估。协变量包括性别、年龄、种族、调查季节、兵役、学历、婚姻状况、贫困、家庭人数、BMI、健康状况。统计分析采用 SPSS26.0 进行描述性统计、组间差异检验、Logistic 回归分析, 检验水准 $\alpha=0.05$ 。

结果 样本中有 143 (3.63%) 具有自杀倾向。

将样本分为“自杀倾向组”(n=143)和“无自杀倾向组”(n=3798), 检验自变量和协变量在两组间的差异, 发现自变量和种族、学历、婚姻、贫困、健康状况在两组间差异具有统计学意义。建立两级 Logistic 回归模型, 排除协变量干扰, 加权后发现: MVPA (OR=0.990, 95%CI: 0.988-0.992)、TPA (OR=0.940, 95%CI: 0.938-0.942) 和 RPA (OR=0.682, 95%CI: 0.681-0.683) 与自杀倾向负向关联; WPA (OR=1.180, 95%CI: 1.178-1.182)、SB (OR=1.007, 95%CI: 1.006-1.008) 和 SD (OR=2.201, 95%CI: 2.197-2.205) 与自杀倾向正向关联。

结论 在 24 小时活动行为中, 中高强度体力活动、通勤体力活动和娱乐体力活动是自杀倾向的潜在保护因素, 其中娱乐体力活动保护性较强; 工作体力活动、久坐和睡眠障碍是自杀倾向的潜在危险因素, 其中工作体力活动危险性较强、睡眠障碍危险性高。

关键词: 24 小时活动行为, 自杀倾向, 体力活动, 久坐, 睡眠障碍

创伤与解离 —— 被低估的临床症状

薛飞*

西安市精神卫生中心

目的 创伤性事件对个体心理健康的影响已被广泛研究, 但解离作为创伤后的重要症状, 常常被低估和忽视。本文旨在探讨创伤与解离之间的关系, 强调解离症状在临床上的重要性, 并评估其对诊断和治疗的影响。

方法 本研究通过文献综述的方法, 系统回顾了心理学和精神病学领域中关于创伤与解离的主要研究。重点关注解离性身份障碍(DID)、解离性失忆、解离性恍惚状态等各种形式的解离症状。文献检索范围涵盖了 PubMed、心理学数据库(PsycINFO)、Cochrane Library 等数据库。检索关键词包括“创伤”、“解离”、“解离性障碍”、“解离症状”等。此外, 通过案例分析的方法, 对若干临床病例进行详细探讨, 包括症状表现、诊断过程和治疗效果。

结果 文献综述结果显示, 创伤与解离症状之间存在高度相关性。大量研究表明, 经历重度创伤事件 (如性暴力、自然灾害、战争等) 的人群中, 解

离症状的发生率显著增加。例如,有研究发现,约30%至50%的创伤幸存者在某个时期会经历不同程度的解离症状,如记忆缺失、身份混乱和情感的脱离。此外,临床案例分析表明,解离症状不仅影响患者的日常生活和社会功能,还可能导致误诊和治疗延误。解离症状的隐蔽性和复杂性,使得很多临床医生未能及时识别,并错将其归因于其它精神疾病,如抑郁症、焦虑症或精神分裂症。

结论 解离作为创伤后的常见而复杂的心理现象,在临床上应受到更多的重视和研究。本文呼吁临床医生在面对创伤患者时,系统评估和识别解离症状,基于精准的诊断,制定个性化的治疗方案。未来研究应进一步探索解离机制及其与创伤的相互影响,开发有效的干预措施,以提高患者的生活质量和康复效果。

关键词: 创伤, 解离, 解离性障碍, 解离症状, 临床诊断, 心理治疗。

自杀危机干预: 氯胺酮的应用及作用机制-综述

高存友*

上海交通大学医学院附属同仁医院

自杀行为是世界范围内的一个重大公共卫生问题,每年约发生1600万起自杀未遂事件和80万起自杀死亡事件。关于抗抑郁药、锂盐、抗精神病药和抗焦虑药(苯二氮卓类药物)对自杀意念与自杀行为影响的研究较多,但结果并不一致。

1 普通药物干预的短板

尽管抗抑郁药、锂盐、抗精神病药和抗焦虑药被广泛用于治疗自杀危机相关疾病,但它们主要针对致自杀疾病,不能快速起效缓解自杀意念,显然不是自杀危机的最佳干预药物。

2 氯胺酮的优势

氯胺酮能快速改善重度抑郁症患者的快感缺乏,并能迅速缓解自杀意念,与目前临床常用的抗抑郁药物的延迟效应形成鲜明对比,这一点在自杀危机干预中尤为重要。氯胺酮不但能快速缓解患者抑郁症状,消除自杀意念或行为,而且效果可持续数周,为进一步心理危机干预提供了足够“窗口期”。对突发自杀意念有益 氯胺酮不仅可减少重度抑郁症和

双相情感障碍患者自杀意念,对于突发自杀意念或行为等紧急情况也有重要的临床价值。

3 氯胺酮的局限性

鼻用艾司氯胺酮与静脉给药的氯胺酮有相似的不良反应,包括拟精神、拟交感神经、前庭症状和成瘾性。禁忌症包括动脉瘤性血管疾病或动静脉畸形、脑出血以及对艾司氯胺酮、氯胺酮或其任何剂型过敏。除上述情况限制了氯胺酮临床使用外,还有一种情况也需引起重视,即应用氯胺酮后自杀念头的迅速消退并不等同于自杀行为风险的完全消失,尤其是氯胺酮有效时间窗消失后,自杀意念可能会转土重来,甚至更为猛烈并付诸行动。

4 氯胺酮的作用机制

氯胺酮的作用机制的假说较多,但并不是相互排斥的,在发挥药物的抗抑郁作用方面可能是互补的,因为所有的假设都提出突触可塑性的急性变化,导致兴奋性突触的持续加强,这是改善抑郁症状、缓解心里痛苦所必需。事实上,所有这些过程的最终结果是皮质-中脑边缘脑回路中参与维持情绪和应激反应的兴奋性突触的持续增强,从而快速缓解抑郁症状与自杀意念。另外,氯胺酮对单胺能系统的影响及抗炎作用也可起到抗抑郁作用。

Prevalence and Influencing Factors of Sleep Disorders in Medical Students after The COVID-19 Pandemic

Jiao Liu¹, Guoshuai Luo², Baozhu Li², Ran Zhang², Daliang Sun²

1.Tianjin Medical University

2.Tianjin Anding Hospital

Objective The prevalence of sleep disorders among medical students was high during the COVID-19 pandemic. However, there have been fewer studies on sleep disorders among medical students after the COVID-19 pandemic. The objectives of the current research include: 1) To investigate the prevalence of sleep disorders among medical students two months after the

COVID-19 outbreak. And 2) to explore the factors influencing sleep disorders in medical students after the COVID-19 pandemic

Methods 1,194 medical students were recruited from all over China. The Self-administered scale was used to collect the demographic characteristics. The Self-rating Depression Scale (SDS), the Self-rating Anxiety Scale (SAS), and the Pittsburgh Sleep Quality Index (PSQI) were used to assess subjects' depression, anxiety, and sleep disorders, respectively. The chi-square test and binary logistic regression were used to identify factors influencing sleep disorders. The receiver operating characteristic (ROC) curve was used to assess the predictive value of relevant variables for sleep disorders

Results We found the % prevalence of sleep disorders among medical students after COVID-19 was 82.3%. According to logistic regression results, medical students with depression were 1.151 times more likely to have sleep disorders than those without depression (OR=1.151, 95% CI 1.114 to 1.188). Doctoral students were 1.908 times more likely to have sleep disorders than graduate and undergraduate students (OR=1.908, 95% CI 1.264 to 2.880). In addition, the area under the ROC curve for depression is 0.689

Conclusion The prevalence of sleep disorders among medical students is high after COVID-19. In addition, high academic levels and depression are risk factors for sleep disorders. Therefore, medical colleges and administrators should pay more attention to sleep disorders in medical students after the COVID-19 pandemic. Regular assessment of sleep disorders and depression is essential

COVID-19 大流行期间和之后护士严重抑郁症的患病率和影响因素: 一项大规模多中心研究

刘娇¹ 罗国帅² 杨媛² 张冉² 丁玉² 孙达亮²

1.天津医科大学

2.天津市安定医院

目的 在 COVID-19 流行期间,护士面临着巨大的心理压力。然而,目前对 COVID-19 流行之后护士严重抑郁及其相关因素的研究较缺乏。本研究的主要目标是 1. 比较 COVID-19 大流行期间和流行结束之后中国护士严重抑郁症的患病率; 2. 探讨影响护士严重抑郁的因素。

方法 本研究在疫情期间和疫情结束后在中国共招募了 1522 名一线护士。本研究分别采用抑郁自评量表、焦虑自评量表和匹兹堡睡眠质量指数来评估受试者的抑郁、焦虑和睡眠障碍。并采用了卡方检验、t 检验和二元逻辑回归来确定影响严重抑郁症的因素。用 ROC 曲线来评估影响严重抑郁的相关变量的预测价值。

结果 研究发现,疫情过后护士的重度抑郁症发病率(4.9%)明显高于疫情期间的发病率(1.7%)。并且,在 COVID-19 流行结束后,我们发现学历、健康状况、每周运动频率、焦虑和睡眠障碍也与护士的严重抑郁有关。此外,ROC 曲线分析表明,在 COVID-19 流行结束后,SAS 评分和 PSQI 评分对护士的严重抑郁均具有良好的预测价值。

结论 在 COVID-19 流行结束之后,护士严重抑郁的发生率要比流行期间更高。而且,尽管 COVID-19 流行已经结束,但护士仍面临着严重的心理压力。因此,在 COVID-19 流行结束后,要及时为护士提供相应的心理支持,并要完善相应的心理健康支持系统来保护护士的健康。

PTSD 小鼠模型炎症小体的表达与髓鞘变化的研究

李吉鑫¹ 张桂青²

1.石河子大学

2.石河子大学第一附属医院

目的 探究创伤后应激障碍(PTSD)小鼠模型海马组织和前额叶皮质 NLRP3 炎症小体的表达以及髓鞘的变化。

方法 将雄性 C57BL/6J 小鼠随机分为 4 组:对

照组、PTSD-3 d 组、PTSD-7 d 组和 PTSD-14 d 组,造模组采用改良性单一连续应激 (SPS&S) 来制备 PTSD 动物模型。通过旷场实验和高架十字迷宫试验来检测小鼠模型焦虑和抑郁反应。通过避暗实验系统建立记忆和记忆能力测试。通过苏木精-伊红染色法 (HE) 染色、髓鞘染色、免疫组织化学染色和免疫荧光染色来观察模型海马组织和前额叶皮质的形态学变化、髓鞘变化以及 NLRP3 炎症小体的表达。通过 Western Blot 检测 NLRP3 炎症小体的蛋白表达。

结果 与对照组相比,造模组的体质量下降,出现焦虑和抑郁样行为,学习记忆能力下降。HE 染色和髓鞘染色显示,与对照组相比,造模组海马 CA1 区和前额叶皮质的神经元细胞发生一定程度的损伤,出现脱髓鞘现象。Western Blot、免疫组织化学染色和免疫荧光染色结果显示,与对照组相比,PTSD-3 d 组海马组织和前额叶皮质的 NLRP3 炎症小体被激活,且差异具有统计学意义 ($P<0.05$)。

结论 SPS&S 诱导的 PTSD 小鼠模型海马组织和前额叶皮质 NLRP3 炎症小体激活,产生脱髓鞘现象。

关键词: 创伤后应激障碍; NLRP3; 髓鞘; 认知障碍; 小鼠

情绪及应对方式、亲子关系、童年创伤对青少年抑郁障碍患者非自杀性自伤行为的影响

李隽逸 张兰 董强利*
兰州大学第二医院

目的 调查青少年抑郁障碍患者非自杀性自伤 (NSSI) 行为的情况,分析相关影响因素,为 NSSI 的防治提供理论基础及参考。

方法 选取 95 例青少年抑郁障碍患者,根据 DSM-5 关于 NSSI 的诊断标准,将患者分为伴有 NSSI 行为组 (NSSI 组) 和不伴有 NSSI 行为组 (nNSSI 组)。采用青少年非自杀性自伤行为问卷 (ANSAQ)、抑郁自评量表 (SDS)、焦虑自评量表 (SAS)、简易应对方式问卷 (SCSQ)、亲密关系体验-关系结构量表 (ECR-RS)、儿童期创伤问卷简表 (CTQ-SF) 对患者进行评估,比较 NSSI 组与 nNSSI 组两组的组间差异,并使用二元 Logistic 回归分析探究 NSSI 行为的影响因素。

结果 95 例青少年抑郁障碍患者中有 59 例存在 NSSI, 检出率为 62.11%。NSSI 组在抑郁自评量表、焦虑自评量表、SCSQ 消极应对、对父亲的依恋焦虑、对母亲的依恋焦虑及依恋回避、CTQ-SF 总分、情感忽视、躯体忽视、情感虐待、性虐待方面的评分均高于 nNSSI 组 ($P<0.05$)。二元 Logistic 回归分析提示,焦虑、消极应对、对母亲的依恋回避、情感虐待是青少年抑郁障碍患者 NSSI 行为发生的危险因素 ($P<0.05$)。

结论 本研究提示青少年抑郁障碍患者 NSSI 发生率较高,焦虑、消极应对、对母亲的依恋回避、情感虐待是青少年抑郁障碍患者发生 NSSI 行为的危险因素。临床中除了改善患者的抑郁、焦虑情绪外,还需注意关注患者的应对方式、亲子关系及童年创伤经历,以减少 NSSI 行为的发生。

关键词: 青少年,抑郁障碍,非自杀性自伤,影响因素

The Impact of Positive and Traumatic Experiences on Symptoms of PTSD, Depression and GAD in Early Adolescents: Mediating Roles of Negative Appraisals and Dissociation

Jian Wang¹, Fulei Geng²

1. Shenzhen Mental Health Center/Shenzhen Kangning Hospital

2. Jiangxi Normal University

Objective Positive experiences has been suggested to be associated with decreased risks of post-trauma psychopathology. However, psychological mechanisms underlying the protective effects are unknown. This study aimed to examine the mediating roles of negative appraisals and dissociation in paths from positive and traumatic experiences to symptoms of emotional disorders

Methods A total of 956 trauma-exposed adolescents (mean age 12.79 years, SD = 0.68, range from 11.00 to 16.00; 54% male) were surveyed two times (T1 and T2) interval one year. Positive and traumatic experiences, negative appraisals, dissociation, and symp-

toms of posttraumatic stress disorder (PTSD), depression, and generalized anxiety disorder (GAD) were measured by self-administered structured questionnaires. Path analysis was used to examine hypothesized associations for PTSD, depression, and GAD, independently

Results Positive experiences at T1 had persistent protective effects on T2 PTSD symptoms and depression, even after controlling for T1 symptom levels, negative appraisals, and dissociation. The effects of T1 traumatic experiences on emotional symptoms at T2 were totally mediated by T1 clinical symptoms, negative appraisals and dissociation. Negative appraisals and clinical symptoms at T1 also played mediating roles between positive experiences and all three kinds of emotional problems at T2. Interestingly, dissociation at T1 mediated development of T2 PTSD, but not depression and GAD, from both positive and traumatic experiences

Conclusion Positive experiences has an important role in youth's adjustment to Abstract trauma. It contributes to the development of cognitive appraisals, dissociation and subsequent emotional disorders. Cognitive models of posttrauma psychopathology apply to the protective factor

关键词: positive experiences, appraisal, dissociation, PTSD, psychopathology, adolescence

中职生童年创伤与非自杀性自伤的关系: 思维反刍与情绪调节困难的链式中介效应

夏雅康^{1,2} 钟艳^{1,2} 邱模宇^{1,2} 刘典英¹ 刘旺林¹

1. 赣州市第三人民医院赣州市精神心理健康重点实验室

2. 赣南医科大学人文社会科学学院

目的 探索童年创伤对中职生非自杀性自伤的影响, 及思维反刍和情绪调节困难是否在童年创伤与非自杀性自伤间存在链式中介效应。

方法 采用童年创伤量表 (Childhood Trauma Questionnaire, CTQ)、青少年非自杀性自伤行为问卷、思维反刍量表-10 简表 (Ruminative Responses Scale, RRS-10)、情绪调节困难量表 (Difficulties in Emotion

Regulation Scale, DERS) 对赣州市某中职学校学生进行心理调查。使用 SPSS 23.0 和 SPSS PROCESS V4.0 插件进行统计分析, 应用 Mann-Whitney U 检验、独立样本 t 检验、Spearman 相关分析、双变量 Logistic 回归分析, 及 SPSS PROCESS 中介效应模型检验对数据进行分析。

结果 (1) 中职生非自杀性自伤行为检出率为 22.98%; (2) 伴非自杀性自伤青少年童年创伤 [39(34, 44) 分 vs. 45(39, 53) 分, $z = -20.68$]、思维反刍 [16(13, 20) 分 vs. 20(17, 25) 分, $z = -23.07$] 与情绪调节困难 [85(75, 93) 分 vs. 97(87, 111) 分, $z = -24.03$] 量表总分均显著高于无非自杀性自伤中职生 (均 $p < 0.01$);

(3) 童年创伤 ($r = 0.363$)、思维反刍 ($r = 0.413$)、情绪调节困难 ($r = 0.431$) 与非自杀性自伤总分两两均呈显著正相关 (均 $p < 0.01$); (4) 中介效应模型检验显示, 童年创伤既可直接影响非自杀性自伤 ($\beta = 0.514$, 95% CI: 0.460 - 0.569), 又能通过思维反刍 ($\beta = 0.155$, 95% CI: 0.130 - 0.183) 和情绪调节困难 ($\beta = 0.039$, 95% CI: 0.116 - 0.164) 的单独中介与链式中介 ($\beta = 0.071$, 95% CI: 0.058 - 0.085) 作用影响非自杀性自伤, 总间接效应占总效应的 41.6%。

结论 中职生非自杀性自伤行为发生率高, 思维反刍与情绪调节困难是童年创伤影响个体非自杀性自伤的重要因素。社会应广泛提升对童年期创伤经历的重视, 尤其使家庭正确关注儿童青少年教育与心理健康状态。在临床中可应对思维反刍、情绪调节困难进行有效干预, 缓解童年不良经历对青少年非自杀性自伤的影响。

优质护理在精神科病区的应用

朱建秋* 姜莹 崔海峰

鸡西市精神病医院 (鸡西市铁路地区中心医院)

目的 精神病患者由于疾病的原因可能出现各种各样的精神症状, 给社会和家庭带来不同程度的危害, 多数自知力不完整, 对住院反感, 住院期间增加了护理的难度, 开展优质护理服务, 可展示人性化的关爱, 为病人创造良好的治疗环境, 既保证护理安全、促进护患关系和谐, 又减少了护患纠纷,

提高护理服务满意度。

方法 1、转变护理观念、强化护理技能，从以往的被动护理转为主动护理。组织护士进行有关“优质护理服务示范工程”知识的学习及培训，领会优质护理精神，通过模拟演练等方式明确护理工作内容。从患者角度来评价自身的工作行为，分析患者需求，学会换位思考。

2、创建病区文化、美化病区环境。采取每季度评选一次优秀护士，将优秀护士的名字、行为公示，树立明星效应。营造温馨的病区环境，病区设有软面镜子、爱心座位、读书角、图画展示栏、心愿墙等，充分利用墙面对常见疾病的相关知识进行宣传。病区环境设置充分体现人文关怀，使患者感受到爱心和温暖。

3、转变工作模式。对科室进行护理工作模式的调整，实行责任制整体护理，责护在岗期间负责患者的全面护理，其他时间由值班护士负责在岗包干，实现人人管床、互为辅助的效果，为患者提供无隙的护理服务。一对一的形式加深了护患沟通，促进了护患关系的和谐。

4、每月组织护患座谈会，旨在收集患者住院期间的感受，畅所欲言，提供更多、更好的建议。对患者提出的建设性意见虚心采纳，从而有效地提升护理服务质量，营造健康、和谐的护患关系。

5、丰富宣教方式及工娱活动，改变传统口头宣教模式，转为多模式宣教，根据护理工作情况制定健康教育手册，采用类似护理路径的方式按照时间排序，认真执行宣教内容。科室制定每日工娱课程表，定期组织各类比赛，成立各类康复小组以及手指操、八段锦、绘画等活动，让患者在住院生活中感受到生活的乐趣，从而更好的恢复社会功能。

结果 通过在精神科病房开展优质护理服务后精神科患者及家属的护理满意度可达到百分之 98% 以上，基础护理、专科护理、健康宣教等护理质量均显著提升。充分调动了护理人员的积极性，提高了护理人员自身素质，有效地保证了护理安全。建立了和谐的护患关系，减少了护患纠纷，提高了患者服药的依从性，增强了战胜疾病的信心。

结论 更新护理理念是提高护理服务质量的前提，传统的护理服务是以疾病治疗为中心，而优质护理服务则要求护士以患者需求为中心。优质护理的开展必须先完成护士工作理念的转变，要求护士学会换位思考，能够在工作中发现、理解患者的心理需求，从而有针对性的实施护理措施，提高护理

服务质量，有效提高患者的护理满意度及患者的生活质量，全面推进了护理事业高质量发展，

关键词：优质护理服务 患者生活质量

难治性精神分裂症合并创伤后吉兰-巴雷综合征 1 例合并文献复习

张震中¹ 袁彩彩² 竺飞燕¹ 聂磊²

1.浙江省立同德医院

2.浙江中医药大学第二临床医学院

目的 探讨难治性精神分裂症合并创伤后吉兰-巴雷综合征（Guillain-Barres syndrome, GBS）的临床表现、辅助检查结果、治疗及短期预后等临床特征，为临床诊治提供参考。

方法 回顾性分析 1 例难治性精神分裂症合并创伤后 GBS 患者的临床特点及诊治经过，并结合文献复习和探讨其相关特点及精神疾病出现创伤后与神经免疫疾病之间的关系，提高临床医生对该疾病的认识。

结果 患者因“四肢无力 3 周，加重伴言语含糊 5 天”入院。既往患有精神分裂症，抗精神病药物治疗效果差，故多次行电休克治疗，3 周前患者行休克治疗后发生摔倒，当时感觉四肢乏力，并出现活动减少，4 天后出现行走不能，伴发热，近 5 天来患者四肢无力加重，出现四肢运动不能，伴有言语含糊，吸肌麻痹、吞咽困难及进食后有恶心、呕吐，二便难解，并且精神分裂症的症状逐渐加重。检查肌电图提示：四肢多发性对称性感觉运动型周围神经病，以轴索病变为主；头颅 MRI 未见明显异常，脑脊液呈蛋白-细胞分离现象及寡克隆 IgG 区带阳性，行多学科联合会诊，最终结合其病史和检查结果，诊断为精神分裂症伴发创伤后 GBS，遂予抗精神药物、丙种球蛋白、呼吸机支持及针灸康复等多学科综合性治疗后，患者精神状态及四肢无力等症状明显改善。

结论 难治性精神分裂症患者若存在手术或外伤等诱发因素，出现运动功能障碍、肌肉萎缩、显著的颅神经症状，并发生呼吸衰竭，四肢无力程度严重等临床表现，脑脊液蛋白-细胞分离现象，神经电生理提示周围神经损害，则应考虑难治性精神分裂症合并创伤后 GBS。研究显示，创伤后患者发生 GBS

的相对发病风险明显增高,早期予以免疫干预可显著改善患者预后,提高患者生活质量。本例患者予免疫球蛋白、无创呼吸机、抗精神药物、针灸康复等综合性治疗后症状缓解。目前难治性精神分裂症与创伤后 GBS 共病的报道不多,也没有资料表明电休克治疗和创伤后 GBS 存在一定的因果关系,但是临床我们需要提高对精神分裂症患者的神经功能障碍的认识,及时诊断和积极治疗是关键。

关键词:难治性精神分裂症;电休克;吉兰-巴雷综合征;创伤

青少年家庭关系与网络游戏障碍:非适应性认知和脑自发活动的中介作用

郎艳* 张艺博
郑大一附院

目的 研究表明青少年家庭关系与网络游戏障碍(internet gaming disorder, IGD)密切相关,同时非适应性认知在家庭关系对 IGD 的影响路径中发挥着关键作用,以及家庭关系与 IGD 之间的脑自发活动存在着相关神经机制,因此本研究探究非适应性认知和脑自发活动在青少年家庭关系与 IGD 之间的作用。

方法 本研究根据入组标准和排除标准筛选后共招募 IGD 组 52 例及 HC 组 51 例,采用 Young 网络成瘾量表(Young Internet Addiction scale, YIAS)评估青少年的网络成瘾严重程度,采用中文版家庭环境量表(the Chinese version of Family Environment Scale, FES-CV)和非适应性认知量表(the Chinese Adolescents' Maladaptive Cognitions Scale, CAMCS)分别评估家庭关系和非适应性认知水平,采用静息态功能磁共振评估脑自发活动,即 mALFF 和 FC,分析各量表之间以及量表与脑自发活动的相关性,并进一步分析非适应性认知和脑自发活动在青少年家庭关系与 IGD 之间的作用。

结果 IGD 组大脑的右侧顶上回、右侧顶下缘角回、右侧中央前回、右侧缘上回、右侧中央后回、右侧背外侧额上回、右侧补充运动区及右侧额中回(middle frontal gyrus, MFG)区域的 mALFF 值显著高于 HC 组,左侧小脑上脚、双侧回直肌、左侧梭状回、左侧颞极、左侧海马旁回、左侧眶部额上回及

左侧眶内额上回区域的 mALFF 值显著低于 HC 组。2 家庭关系中的矛盾性与 IGD 呈正相关,非适应性认知在家庭关系(矛盾性)与 IGD 之间具有中介作用;家庭关系中的亲密度与 IGD 呈负相关,脑自发活动(MFG)在家庭关系(亲密度)与 IGD 之间具有中介作用。

结论 本研究结果表明青少年家庭关系与 IGD 有关,非适应性认知与脑自发活动(MFG)在家庭关系与 IGD 之间具有中介作用,表明非适应性认知与脑自发活动可能是家庭关系与 IGD 之间联系的相关因素,同时 IGD 组 MFG 到右侧脑岛的 FC 值与家庭关系中的矛盾性呈正相关,表明 MFG 可能是青少年家庭关系与 IGD 之间联系的神经生物学标志物。

关键词:青少年;家庭关系;网络游戏障碍;非适应性认知;脑自发活动;额中回

重性抑郁障碍患者海马表面形状的改变

伍龙海 吴枫*
中国医科大学附属第一医院

目的 海马体在情绪处理过程中起着重要作用,主要涉及情绪产生、情绪调节、情感记忆等。重性抑郁障碍(MDD)患者海马结构及功能的异常是神经影像学中较为常见的发现。相比于海马整体体积的测量,本研究测量海马表面形状更有益于发现 MDD 患者海马的局部的、早期的改变。

方法 本研究招募了 61 名重性抑郁障碍患者(MDD)和 65 名年龄和性别匹配的健康对照(HC)。使用 FSL 6.0.7 中的 FIRST 模块对海马进行自动化分割、配准。使用 FSL 顶点分析脚本(first_utils)计算形状指数,该脚本可计算基于 MNI 空间中每一个参与者海马形状偏离所有被试海马的平均形状与表面网格的垂直距离,正指数表示海马表面结构向外变形膨胀,负指数表示海马表面结构向内萎缩。并运行单变量逐顶点分析方法评估海马形状的组间差异,所有结果使用无阈值聚类增强(TFCE)以及错误发现率(FEW)校正, $p < 0.05$ 。

结果 MDD 组和 HC 组在右前海马体形状上存在显著差异。相对于 HC 组, MDD 患者右前海马体局部出现明显的向外变形 ($p < 0.05$, FWE-&TFCE 校正)。MDD 组和 HC 组在左侧海马体未发现表

面形状的差异。

结论 海马局部区域表面形状的改变,可能发生在重性抑郁障碍病理进展的早期。

关键词:重性抑郁障碍 海马体 海马表面形状

伴应激事件抑郁障碍患者肠道菌群特征及相关性研究

徐云帆^{1,2,3} 刘鹏鸿^{1,2,3} 张爱霞^{1,2} 李剑虹^{1,2} 胡晓东^{1,2} 李建英^{1,2} 杨春霞^{1,2} 孙宁^{1,2,3}

1.山西医科大学第一医院精神卫生科

2.山西医科大学第一临床医学院

3.精神障碍人工智能辅助诊疗山西省重点实验室

目的 重性抑郁障碍(Major Depressive Disorder, MDD)严重危害人类身心健康,部分MDD患者在发病前曾经历应激性生活事件,但生活事件导致MDD的可能机制目前尚不清楚。既往研究提示应激事件会引起肠道菌群改变,肠道菌群与抑郁症状密切相关。本研究以肠道菌群为切入点,探究经历应激性生活事件的MDD患者肠道菌群特征,以及生活事件、肠道菌群与抑郁症状之间的相关性。

方法 招募符合纳入及排除标准的MDD患者和健康受试者(Healthy Control, HC),使用汉密尔顿抑郁量表24项(Hamilton Depression Scale-24, HAMD-24)评估抑郁症状的严重程度,生活事件量表(Life Event Scale, LES)评估是否受生活事件影响及影响程度,并根据LES量表总分是否超过32分,将MDD患者分为未经历生活事件的MDD患者(LES-0)组和经历生活事件的MDD患者(LES-1)组,最后通过使用16S rRNA基因测序技术对上述三组受试者的粪便样本肠道菌群进行检测。

结果 三组受试者在性别、年龄、受教育年限、BMI四个方面差异无统计学意义; α 多样性分析发现,HC组的Simpson和Pielou's evenness指数显著高于MDD组,LES-0组的Chao 1、Faith's PD和Observed species指数显著高于LES-1组; β 多样性分析发现,LES-1组和LES-0组存在显著差异。通过线性判别分析在不同分类水平上鉴定出33种细菌,在属水平上,HC组中粪杆菌属、罗斯氏菌属、拟杆菌属、巨单胞菌属、小杆菌属、萨特氏菌属相对丰度较高,LES-0组中嗜血杆菌属、颗粒链菌属、

Pseudoramibacter Eubacterium、毛梭菌属、鞘鞍醇单胞菌属相对丰度较高,LES-1组中布洛特菌属、粪球菌属、SMB53、多尔氏菌属、乳杆菌属相对丰度较高。相关性分析提示,LES总分与HAMD-24总分呈显著正相关,布洛特氏菌属、粪球菌属、链球菌属与HAMD-24及LES总分呈显著正相关,而拟杆菌属、粪杆菌属、罗斯氏菌属与HAMD-24及LES总分呈显著负相关。

结论 经历生活事件的MDD患者具有特殊的肠道菌群,这些菌群不同于健康人及未经历生活事件的MDD患者,生活事件、肠道菌群、抑郁障碍之间存在相关性。

关键词:重性抑郁障碍,生活事件,肠道菌群

阿司匹林通过花生四烯酸代谢-神经炎症轴改善青春期肥胖诱发抑郁样行为的机制研究

赵斌斌 范雅娟 马现仓*

西安交通大学第一附属医院

目的 西方化饮食引起青春期肥胖的儿童青少年是抑郁症的高发人群,但青春期肥胖诱发抑郁症的具体机制尚不清楚。近几年,能量代谢和免疫炎症在抑郁症病理机制中的作用引起了学界的关注。因此,本研究拟以动物行为学为基础探索阿司匹林通过影响花生四烯酸代谢-神经炎症轴来改善青春期肥胖诱发抑郁样行为的机制,为青春期肥胖相关抑郁症的治疗提供了新的理论和实验依据。

方法 本研究通过给予3w雄性C57BL/6J小鼠喂食高脂饮食模拟青春期肥胖,评估体重和脂肪含量以及葡萄糖和总胆固醇水平,并结合口服葡萄糖耐量实验和腹腔注射胰岛素耐量实验综合评估肥胖模型。SPT、FST、SIT、TCT、OFT和EPM评估小鼠的抑郁样行为。对高脂饮食引起肥胖诱发抑郁样行为的小鼠进行阿司匹林干预,观察小鼠的行为改变,并通过氧化脂质靶向代谢组和免疫荧光染色分析阿司匹林干预后血浆代谢谱和神经炎症的变化。此外,通过花生四烯酸和阿司匹林与BV2小胶质细胞共培养24h,采用qRT-PCR和ELISA检测IL-6、TNF- α 和MCP-1的表达水平。

结果 (1)高脂饮食小鼠的体重、脂肪含量、血浆葡萄糖和总胆固醇水平显著增加,并出现葡萄

糖耐量减退和胰岛素抵抗。青春期肥胖诱发了小鼠抑郁样行为和社交认知功能障碍。(2) 血浆代谢组学分析提示抑郁样小鼠的亚油酸代谢和花生四烯酸代谢通路出现明显改变, 且花生四烯酸代谢中促炎性代谢介质显著升高, 而抗炎性的代谢介质显著下降, 这些代谢介质与高脂饮食引起肥胖诱发的抑郁样行为和社交认知功能密切相关。此外, 高脂饮食引起肥胖诱发抑郁样小鼠大脑炎症因子(如 IL-6、TNF- α 和 MCP-1) 表达显著升高, 小胶质细胞呈现明显的激活状态。(3) 阿司匹林可以显著改善青春期肥胖诱发的小鼠抑郁样行为及社交认知功能损伤, 并降低血浆花生四烯酸代谢谱中促炎性介质的水平和小胶质细胞的活性。细胞实验进一步证实, 花生四烯酸引起 BV2 小胶质细胞 TNF- α 和 MCP-1 的表达显著升高, 而阿司匹林可以显著降低这些炎症因子的水平。

结论 高脂饮食引起青春期肥胖小鼠血浆中花生四烯酸代谢紊乱以及神经免疫激活导致抑郁样行为和社交认知障碍, 阿司匹林通过降低花生四烯酸代谢产生的促炎性代谢介质和神经炎症, 从而改善青春期肥胖诱发的抑郁样行为和社交认知功能障碍。

关键词: 抑郁症, 肥胖, 花生四烯酸代谢, 神经炎症, 阿司匹林

分裂型人格特质、亚临床抑郁与对照个体的特质和状态心智游移的比较

杜天骄¹ 王亚² 李天虹¹ 康一瓴¹

1. 中国医科大学医学人文学院

2. 首都师范大学心理学院

目的 心智游移是思维偏离当前任务的情况, 是日常生活中常见的现象。心智游移可以用问卷调查或者思维抽样任务实验进行测量, 一般认为, 通过问卷测量反映了心智游移特质水平, 而实验室心智游移反映了状态水平。前人研究表明心智游移在不同亚临床人群中的表现和认知相关性仍不清楚。本研究在具有分裂型人格特征的个体和具有抑郁症状的个体(即精神分裂症和抑郁症患者的亚临床人群)中开展相关探索。

方法 在完成分裂型人格问卷(Schizotypal Personality Questionnaire, SPQ) 和贝克抑郁量表

(Beck Depression Inventory, BDI) 的样本中, 招募了 42 名具有分裂型人格特征的个体(SPQ 得分 ≥ 41 且 BDI 得分 ≤ 6)、42 名亚临床抑郁症患者(BDI 得分 ≥ 14 且 SPQ 得分 < 41) 和 42 名对照者(SPQ 得分 ≤ 26 且 BDI 得分 ≤ 6), 完成心智游移思维采样任务(状态水平)和心智游移问卷(特质水平), 参与者还完成了反刍思维和认知功能(注意力、抑制和工作记忆)的测量。

结果 两个亚临床组都比对照组表现出更多的状态和特质心智游移。结果显示具有分裂型人格特征的个体比亚临床抑郁症患者表现出更多的特质心智游移。反刍思维、持续注意力和工作记忆与心智游移有关。此外, 亚临床抑郁症患者的心智游移可以用反刍思维或注意力来解释, 而高分裂型人格特质患者的心智游移则不能用反刍思维、注意力或工作记忆来解释。

结论 分裂型人格特质和亚临床抑郁症患者在日常生活和实验室情境中表现出更多的心智游移行为, 分裂型人格特质患者在日常生活中心智游移行为比亚临床抑郁症患者更明显。亚临床抑郁症患者的心智游移行为可用反刍思维或注意力来解释, 而分裂型人格特质患者的心智游移行为不能仅用反刍思维、注意力或工作记忆来解释。这些发现表明, 分裂型人和亚临床抑郁症患者的心智游移行为模式不同, 潜在机制也不同, 需要进一步研究如何增加这些患者的适应性心智游移行为, 并减少适应不良的心智游移行为。

关键词: 分裂型人格特质, 抑郁, 心智游移

Tryptophan-kynurenine Metabolites Involved in Cognitive Impairment in Bipolar Disorder

Zhiyang Qi Qingyan Ma Min Jia Yajuan Fan Xiancang Ma*

The First Affiliated Hospital of Xi'an Jiaotong University

Objective Tryptophan affects neuroendocrine, immune, and inflammatory processes through its downstream metabolic pathways. It also contributes to signal transduction within the brain. In this study, we exam-

ined changes in serum tryptophan and its associated metabolites in patients with bipolar disorder (BD) and analyzed their effects on cognitive functions and mood symptoms

Methods We used liquid chromatography-tandem mass spectrometry to measure tryptophan metabolite levels in 74 patients with BD and 61 healthy volunteers. The correlations between diagnosis, sex, age, body mass index, and various inflammatory factors with tryptophan metabolites were assessed using the Mantel test. Pearson's correlation analysis determined the relationship between tryptophan metabolite levels and cognitive function

Results Compared to the healthy control (HC) group, individuals with BD generally exhibited lower serum TRP levels and reduced levels of its downstream metabolic pathways, including kynuridine (NFK, KYN, KYNA, and XA), indole (ILA, MeOAA, IGA, and ICAId), and 5-HT metabolites. Notably, the level of the 5-HT secondary metabolite 5-HIAA was significantly increased. Notably, diagnosis is the primary factor influencing changes in the tryptophan spectrum, followed by immunoinflammatory status. Metabolites of the tryptophan-kynurenine/indole pathway were significantly associated with cognitive functions, although their associations with depressive symptoms were comparatively weaker. However, metabolites related to the 5-HT pathway exhibit a significant association with the emotional symptoms of BD

Conclusion Deficiency in tryptophan-kynurenine/indole metabolite may contribute to cognitive dysfunction in patients with BD, with its decrease potentially linked to reduced tryptophan levels. Therefore, targeted tryptophan supplementation or consumption of tryptophan-rich foods may improve patients' cognitive functions

唾液链球菌损伤肠道干细胞致小鼠认知障碍症的肠-脑轴的机制研究

于璐 刘怡昕 杨再 寻御风 朱峰 马现仓 郭熠洁*
西安交通大学第一附属医院

目的 精神分裂症 (Schizophrenia, SCZ) 是一种慢性且高度致残性的重型精神障碍, 影响了全球近 1% 的人口。流行病学调查和遗传学分析表明, SCZ 患者发生炎症性肠病 (IBD) 的风险增加, 且患 IBD 疾病风险随着精神分裂症控制不充分而增加。在我们前期分析人群肠道宏基因组研究中发现, 唾液链球菌在精神分裂症患者体内显著增加。因此我们进一步开展小鼠的单菌移植实验, 揭示肠道微生物在精神分裂症中的作用机制。

方法 本研究采用 6 周龄的雄性 C57BL/6J 小鼠, 连续给与抗生素 10 天, 随后实验组灌胃临床分离的精神分裂症相关唾液链球菌 (*Streptococcus salivarius*, 108 cfu / 200ul), 对照组给与 BHI200 ul。连续灌胃 14 天后, 观察小鼠行为学 (旷场、高架十字迷宫、三箱社交、条件恐惧和前脉冲抑制实验), 收集小鼠结肠样本, 进行免疫染色, 判断肠道损伤; 采用体外类器官培养方法, 确定类器官分化增殖的能力; 对脑组织进行切片染色, 确定参与细菌调节的脑区。

结果 行为学结果显示唾液链球菌 (SS) 定植小鼠出现精神运动兴奋性增加和社交能力下降等精神分裂样行为, 并伴有肠道炎症。小鼠肠道类器官培养发现, SS 菌定植导致类器官出芽率降低, 细胞干性受损。脑部染色观察发现, 小鼠 SS 菌定植导致海马和眶额叶 c-fos 表达升高。

结论 精神分裂症相关细菌---唾液链球菌可能影响肠道干细胞发育, 导致肠道受损, 诱发肠道炎症, 最终导致相关脑区活动性的变化, 影响了小鼠的认知功能。

Identification of Critical Signature in Post-traumatic Stress Disorder Using Bioinformatics Analysis and in Vitro Analyses

Liu Lifen Rui Li Houxin Zhou Wenhan Yan Xiaofei Guo Lin Sun*
Shandong Second Medical University

Objective Post-traumatic stress disorder (PTSD) is a complicated psychiatric disorder after experiencing trauma that affects people's natural lives. As such, the objective of the study was mining related pathways and key genes of PTSD validated through *in vitro* experiments

Methods Retrieving RNA sequencing (RNA-seq) datasets from the Gene Expression Omnibus (GEO) database. The differentially expressed genes (DEGs) were screened using GEO2R. Weighted gene co-expression network analysis (WGCNA) was used to describe patterns of correlation between genes. Gene ontology (GO) was used for gene function annotations, and KEGG pathway assessment was carried out for enrichment analysis. The plugin MCODE from Cytoscape software was utilized to analyze the protein-protein interaction (PPI) network. Assessment of anxiety and depression in a mice model of stress was carried out by the open-field test (OFT) and elevated plus maze test (EPMT). Subsequently, Real-Time quantitative PCR (qRT-PCR) was used to verify these key genes in stress-exposed models

Results A total of 157 common upregulated DEGs and 53 common downregulated DEGs were identified between the amygdala (AMY) and the hippocampus (HIP). Notably enriched pathways (Neuroactive ligand-receptor interaction, mTOR signaling pathway, Nicotine addiction and dopaminergic synapse, etc.) were screened by Gene functional annotations and enrichment analysis. The PPI network identified the 4 hub genes, finding that the closely related pathways were Nicotine addiction and dopaminergic synapse. qRT-PCR was used to confirm these four genes and the expressing trends were consistent with the microarray analysis. The results of the OFT and the EMPT were remarkable changes

Conclusion Using bioinformatic analysis and *in vitro* experiments, we explored a variety of genes and pathways that may represent key mechanisms in the development of PTSD

团体认知行为治疗对强迫症认知灵活性的临床干预研究

廖建芬¹ 程明¹ 贾艳滨²

1.湖南省第二人民医院(湖南省脑科医院)
2.暨南大学附属第一医院

目的 通过采用量表联合神经心理测验评估,探究团体认知行为治疗(Group cognitive behavioral therapy, GCBT)对 OCD 患者认知灵活性改变的干预效果,以及 GCBT 的疗效,从而为临床实践提供治疗指导。

方法 采用随机对照试验,将 66 例符合 DSM-5 诊断标准的 OCD 患者,随机分为研究组 31 例与对照组 35 例,同时招募 33 例健康人群作为健康对照组(Healthy Control, HC)。研究组接受 8 周的 GCBT 联合 SSRI 类药物治疗;对照组接受 SSRI 类药物治疗,观察 8 周。在治疗前,对三组均进行量表和神经心理测验测评,采用 Y-BOCS、强迫信念问卷(Obsessive Belief Questionnaire, OBQ-44)测量强迫症状严重程度及强迫信念;使用认知灵活性量表(Cognitive Flexibility Inventory, CFI)、Stroop 色词测验(Stroop Color and Word Test, SCWT)、连线测验(Trail Marking Test, TMT)、威斯康辛卡片分类测验(Wisconsin Card Sorting Test, WCST)评估主客观认知灵活性功能表现;治疗后研究组与对照组再次进行量表及神经心理测验。干预前后采用重复测量方差分析方法分析组别和时点的交互作用;最后比较两组疗效。

结果 (1) 干预前,研究组、对照组和 HC 在性别、年龄、教育程度上均无统计学差异(均 $p > 0.05$);而健康组与研究组、对照组在 Y-BOCS、OBQ-44、主客观认知灵活性上差异具有统计学意义($p < 0.05$);(2) 干预后,研究组与对照组进行重复测量方差分析结果显示:研究组强迫信念分维度 RT 平均得分上显著低于对照组,在组别与时点交互作用具有显著统计学意义($p = 0.015$);在强迫症状严重程度, Y-BOCS 及分维度强迫思维、强迫行为平均得分上显著低于对照组,在组别与时点上的交互作用具有统计学意义(均 $p < 0.05$)。(3) 在认知灵活性方面,干预后结果显示,CFI 分维度可控性在组别与时点的交互作用具有显著统计学意义($p = 0.001$)。(4) 在疗效方面,研究组总体疗效优于对照组($p < 0.01$)。

结论 (1)GCBT 能有效改善 OCD 患者的认知灵活性并且能够改善其强迫症状及强迫信念, 建议临床上可联合 GCBT 法对 OCD 患者的认知灵活性进行心理干预, 改善其总体强迫症状。(2) GCBT 联合药物治疗的总体有效率优于单纯药物治疗。

关键词: 强迫症, 认知灵活性, 团体认知行为疗法, 药物治疗, 随机对照试验

The Sexually Divergent CFos Activation Map of Fear Extinction

Jianli Yang* Kai Zhang

Tianjin Medical University General Hospital

Objective Post-traumatic stress disorder (PTSD) is a neuropsychiatric disorder that can develop after experiencing or witnessing a traumatic event. Exposure therapy is a common treatment for PTSD, but it has varying levels of efficacy depending on sex. In this study, we aimed to compare the sexual dimorphism in brain activation during the extinction of fear conditioning in male and female rats by detecting the c-fos levels in the whole brain

Methods Total thirty-two rats (sixteen males) were randomly separated into the extinction group as well as the non-extinction group, and then underwent fear conditioning as well as extinction. Subsequently, brain sections from the sacrificed animal were performed immunofluorescence and the collected data were analyzed by repeated two-way ANOVAs as well as Pearson Correlation Coefficient

Results Our findings showed that most brain areas activated during extinction were similar in both male and female rats, except for the reunions thalamic nucleus and ventral hippocampi. Furthermore, we found differences in the correlation between c-fos activation levels and freezing behavior during extinction between male and female rats. Specifically, in male rats, c-fos activation in the anterior cingulate cortex was negatively correlated with the freezing level, while c-fos activation in the retrosplenial granular cortex was positively correlated with the freezing level; but in female

rats did not exhibit any correlation between c-fos activation and freezing level. Finally, the functional connectivity analysis revealed differences in the neural networks involved in extinction learning between male and female rats. In male rats, the infralimbic cortex and insular cortex, anterior cingulate cortex and retrosplenial granular cortex, and dorsal dentate gyrus and dCA3 were strongly correlated after extinction. In female rats, prelimbic cortex and basolateral amygdala, insular cortex and dCA3, and anterior cingulate cortex and dCA1 were significantly correlated

Conclusion These results suggest divergent neural networks involved in extinction learning in male and female rats and provide a clue for improving the clinical treatment of exposure therapy based on the sexual difference

关键词: Auditory fear conditioning, Extinction, Sexual dimorphism, c-fos mapping

磷酸二酯酶 5 抑制剂作用靶点与抑郁症风险的孟德尔随机化研究

黄东苗 王相兰* 吴玥琳

中山大学附属第五医院

目的 既往观察研究发现磷酸二酯酶 5 (phosphodiesterase 5, PDE5) 抑制剂可能具有预防抑郁症 (MDD) 的作用, 但 PDE5 靶点与抑郁症风险之间的因果关系并未充分证实, 故本研究拟采用孟德尔随机化方法分析 PDE5 靶点与抑郁症风险之间的因果关系。

方法 遗传代理以舒张压为替代生物标志物, PDE5 相关数据来自英国生物样本库 (UK BioBank, UKBB) 的全基因组关联分析 (GWAS), 舒张压数据来自国际血压联盟和 UKBB 荟萃分析, 抑郁症数据来自 iPSYCH。选择 5 个单核苷酸多态性 (SNPs): rs10050092, rs12646525, rs17355550, rs66887589, rs80223330 作为 PDE5 抑制的工具变量 (IV), 主要结果采用反向方差加权方法 (IVW) 分析, 同时采用 MR-Egger 法、加权中值法和 MR-PRESSO 方法检验结果的异质性、敏感性和多效性。统计分析使用 R 软件进行。数据收集时间为 2024 年 6 月。

结果 本研究数据来自 77 个队列,纳入 757601 名欧洲男女被试。F 统计值平均值 >10 。遗传代理的 PDE5 抑制与抑郁症风险无显著关联: $OR=0.32$, $95\%CI: (-8.62-6.35)$, $P=0.76$ 。异质性检验: $P=0.30$; 水平多效性检验: $P=0.52$; MR-PRESSO: $P=0.36$ 。

结论 PDE5 靶点与抑郁症风险之间可能不存在因果关系, PDE5 抑制剂预防抑郁的效果及其机制需要更为严格的研究进行验证。

关键词: 孟德尔随机化, 抑郁症, 磷酸二酯酶 5 抑制剂, 药物靶点

青少年抑郁症患者冲动性人格与自杀风险的关系研究—反刍性思维和安全感的链接中介作用

王燕* 海洋

新疆维吾尔自治区人民医院

目的 探讨冲动性人格对青少年抑郁症患者自杀风险的影响, 以及反刍性思维 and 安全感在冲动性人格与自杀风险的中介效应。

方法 采用反刍思维量表 (RRS)、安全感量表 (SQ)、Barratt 冲动性量表 (BIS-II) 和中文版 Beck 自杀意念量表 (BSI-CV) 对 211 例青少年抑郁症患者进行测评。采用 Pearson 分析反刍性思维、安全感、冲动性人格与自杀风险之间的相关关系, 采用 Amos 软件构建结构方程模型 (SEM) 并进行中介效应检验。

结果 211 例青少年抑郁症患者自杀风险评分为 (24.65 ± 3.27) 分, 冲动性人格评分为 (107.65 ± 14.16) 分, 反刍性思维评分为 (57.28 ± 7.14) 分, 安全感评分为 (40.26 ± 6.22) 分。青少年抑郁症患者自杀风险与冲动性人格、反刍性思维之间呈正相关性, 与安全感之间呈负相关性 (均 $P<0.05$); 冲动性人格与反刍性思维、安全感之间呈负相关性 (均 $P<0.05$)。反刍性思维与安全感之间呈负相关性 ($P<0.05$)。反刍性思维和安全感在冲动性人格与自杀风险之间的总间接效应为 49.28%, 其中反刍性思维的中介作用占 23.25%, 安全感的中介效应占 18.04%, 反刍性思维-安全感的链式中介效应占 7.99%。

结论 反刍性思维和安全感在冲动性人格与自杀风险之间的链式中介效应成立, 证实冲动性人格

可以通过调节反刍性思维 and 安全感, 间接影响青少年抑郁症患者自杀风险。

精细化护理措施在精神分裂症与躁狂症伴糖尿病患者中的应用效果探究

吴玲*

新疆维吾尔自治区人民医院

目的 探讨并分析精细化护理措施在精神分裂症与躁狂症伴糖尿病患者中的应用效果。

方法 选择 2022 年在我院被确诊为精神分裂症与躁狂症并伴有糖尿病的患者 40 名为研究对象, 观察其精细化护理前后的各项指标变化。这些指标包括生理机能、血糖指标、综合能力、情绪状态、ESCA 评分及生活质量等。研究组在患者空腹及餐后血糖、糖化血红蛋白、饮食控制、服药行为、生活依从以及理解能力等方面增加护理力度。

结果 经精细化护理后, 患者的空腹血糖、餐后 2h 血糖以及糖化血红蛋白均显著降低 ($P<0.001$), 患者的饮食控制、服药行为、生活依从和理解能力也有显著提高 ($P<0.001$)。患者的焦虑情绪和抑郁情绪均得到缓解 ($P<0.001$), 同时综合护理各阶段 ESCA 评分均有显著提高。生活质量在生理机能、生理职能、躯体疼痛、健康状况、精力状态、社会功能、情感职能和精神健康等方面均得到显著改善 ($P<0.001$)。

结论 精细化护理措施在处理患者情感困扰及社会功能障碍方面具有优势, 并在患者健康状况及生理功能恢复方面也发挥了积极的作用。对精神分裂症与躁狂症伴糖尿病患者进行精细化护理措施, 可以有效改善患者的血糖控制、综合能力、情绪状态和生活质量, 提高患者的精神健康及生理状态, 表明其在临床护理中具有高度的应用价值。

Hydrogen Relieves Depression-like Mood in

PTSD Rats by Ameliorating Neuroinflammation

Lanxia Wu Congwen Yang Yuan Gao Hao Zheng Yiqin
Ding Xinru Liu Xue Li Haolin Zhang Hao Sun Han Lin
Guohua Lu Yingshuai Wang Lin Sun*
Shandong Second Medical University

Objective This study aims to investigate whether hydrogen can relieve depression-like mood in PTSD model rats by ameliorating neuroinflammation

Methods Post-traumatic stress disorder (PTSD) model was established through the Single prolonged stress and electric foot shock (SPS & S) procedure. Then, magnesium silicide nanosheets (MSNs) were fed for seven days. Behaviors related to depressive mood were assessed by Open-field test (OFT) and Elevated plus maze test(EMPT). The level of neuroinflammation was assessed by western blot and by real-time quantitative reverse transcription polymerase chain reaction (qRT-PCR)

Results Rats exposed to SPS&S showed decreased open arm entries in the elevated plus maze test and reduced distance traveled in the center zone in the open field test, significantly different from the control group. Treatment with hydrogen reversed these changes. Furthermore, SPS&S triggered exacerbated neuroinflammation in the prefrontal cortex. Post-SPS&S administration of hydrogen therapy increased the time spent in the center zone of the OFT and the distance traveled in the open arms of the EMPT. Additionally, hydrogen therapy was observed to lower levels of neuroinflammation

Conclusion Hydrogen can correct depressive-like behaviors and neuroinflammation induced by SPS&S in rats. These findings collectively suggest that hydrogen is a promising therapeutic agent for alleviating depressive symptoms in post-traumatic stress disorder, with its potential mechanisms possibly related to improving neuroinflammation

关键词: PTSD,depressed mood,Hydrogen,neuroinflammation

The Effect of Professional Psychological Help-seeking Self-stigma on Post-traumatic Stress Symptoms: The Mediating Role of Psychological Resilience

Yiming Zhang^{1,2}, Fuchun Zhou^{1,2}

1.Beijing Key Laboratory of Mental Disorders, National Clinical Research Center for Mental Disorders & National Center for Mental Disorders, Beijing Anding Hospital, Capital Medical University, Beijing, China
2.Advanced Innovation Center for Human Brain Protection, Capital Medical University, Beijing, China

Objective This study aims to investigate the influence of professional psychological help-seeking self-stigma on post-traumatic stress symptoms (PTSS) among students with potential psychological problems, examining the mediating role of psychological resilience

Methods Students initially screened for potential psychological issues at a comprehensive university mental health center in Beijing were randomly given questionnaires. Screening tools included the Patient Health Questionnaire-9 (PHQ-9), Generalized Anxiety Disorder-7 (GAD-7), Suicide Behavior Questionnaire-Revised (SBQ-R), and Mood Disorder Questionnaire-13 (MDQ-13). We assessed professional psychological help-seeking self-stigma, PTSS, and psychological resilience using the Self-Stigma of Seeking Help Scale (SSOSH), PTSD Checklist-Civilian Version (PCL), and Connor-Davidson Resilience Scale (CD-RISC), respectively. Structural equation modeling (SEM) was employed to explore the mediating effects of psychological resilience

Results Data from 287 students (mean age: 22.28 ± 3.17 ; female: 36.93%) were available for subsequent analyses. The results showed that there was no serious common method bias problem in this study. The scores of SSOSH, CD-RISC and PCL were skewed distribution, so the correlation test using Spearman rank correlation analysis, it showed that professional psychological helpThe mediation model demonstrated a good fit ($\chi^2/df = 30.87$, SRMR = 0.028, CFI = 0.982, TLI =

0.966). Bootstrap tests (5000 samples) showed that the indirect effect of self-stigma on PTSS through resilience was -0.274 ($p < 0.005$), and the direct effect was 1.036 ($p < 0.005$), indicating a partial mediating effect of resilience

Conclusion This study elucidates how professional psychological help-seeking self-stigma influences PTSS, directly and indirectly through psychological resilience, with a stronger direct effect. These findings underscore the importance of addressing stigma to enhance the utilization of professional mental health services and alleviate PTSS

关键词: Professional Psychological Help Self-stigma, Post-traumatic Stress Symptoms, Psychological Resilience, Mediation Model, Structural Equation Model

恐惧消退 cFos 激活地图的性别差异

杨建立* 张凯

天津医科大学总医院

目的 创伤后应激障碍 (PTSD) 常见于患者在经受或目击极度危险甚至毁灭性事件之后, 患者饱受事件相关恐惧记忆 (fear memory) 折磨是这一疾病的典型特征。其发病率和病程的转归及预后均存在明显的性别差异。恐惧条件反射 (Fear Conditioning) 作为恐惧记忆及恐惧相关疾病研究的经典范式已经得到广泛的探索, 其优点是可以模拟 PTSD 恐惧记忆 (fear memory) 形成以及暴露疗法 (exposure therapy) 治疗恐惧相关疾病时恐惧记忆消退 (extinction) 过程。但是以往的研究大多数都局限于啮齿类动物, 关于 PTSD 和暴露疗法 (exposure therapy) 两性差异的研究较少。本研究旨在填补这一空白, 利用分子手段探究条件恐惧消退 (extinction) 过程中的两性差异。

方法 选取 8~10 周龄的雄雌大鼠各 16 只, 随机分为消退与未消退共 4 组。按照分组对所有动物进行行为学训练后取脑并 c-fos 免疫荧光染色, 随后比较 15 个热门脑区的 c-fos 表达情况及行为及脑区间皮尔逊相关性分析 (Pearson Correlation Coefficient)。

结果 消退后, 雄鼠和雌鼠的僵直度水平 (freezing level) 均降低到 40% 以下, 且分子实验发现消退过程中激活的脑区大部分相同, 仅 Re 和腹侧海马 (ventral hippocampus) 存在差异。随后的相关性分析实验发现, 雄鼠的 IL 与僵直度水平 (freezing level) 呈显著正相关, BLA 和 dDG 与僵直度水平 (freezing level) 呈显著负相关, 而雌鼠仅 vDG 与僵直度水平 (freezing level) 呈强正相关性。最后, 脑区间相关性分析表明消退后雄鼠的 PrL、RSC 和 dDG 间具有较强的相关性, IC 与 vCA1 呈强正相关性而与 Re 呈强负相关性, CeA 与 ACC 间存在强正相关性而 BLA 则与 dDG 间存在强正相关性。雌鼠则是 CeA、RSC、En 间存在强相关性, PrL 与 BLA 间具有较高相关性, 此外, 雌性大鼠的海马 (hippocampus) 与 Re 和 ACC 间也表现出较高的相关性。

结论 本研究评估了大鼠在消退学习中的两性差异, 结论如下: (1) 雌雄大鼠在恐惧消退习得过程中差异不大; (2) 但脑区的激活方式可能存在两性差异。

关键词: 恐惧记忆, 消退, 性别差异, c-fos

A Review of Propranolol Blocking Memory Reconsolidation To Treat Post-traumatic Stress Disorder

Chaochao Lu Weihui Li*

The Second Xiangya Hospital

Posttraumatic stress disorder (PTSD) is regarded as a debilitating and complex psychiatric disorder, which develops after exposure severe trauma. The symptoms of PTSD cause great distress to patients, but also bring great challenges to their interpersonal relationships and professional work. Due to the increasing prevalence and severity of symptoms, treatment for PTSD is critical. Recent studies have demonstrated that reconsolidation—a time of re-stability—occurs after consolidated memories are reactivated, returning them to a reliable state. Memories are prone to change in this unstable state. Consequently, medications that influence

memory reconsolidation might represent a novel therapeutic approach.

Propranolol has been found to hinder memory reconsolidation as well as memory development and memory dissociation during emotional reactions. By selectively suppressing protein synthesis, propranolol prevents the reconsolidation of fear memories while having no negative effects on declarative memories.

When given after a brief period of memory reactivation, propranolol effectively prevented reconsolidation in rodents. Furthermore, this outcome is repeatable, offering more proof that propranolol, when given following short-term memory reactivation, can lessen fear. What's more, propranolol has been shown through numerous clinical studies to be effective in the treatment of PTSD by preventing memory reconsolidation.

Propranolol seems to be an effective treatment for PTSD. Propranolol exhibits a distinct advantage by preventing memory reconsolidation. In addition, for kids with PTSD, propranolol medication looks to be a potentially secure and efficient therapeutic choice. The advantage of using propranolol to treat PTSD in children is its safety, and different studies in child populations have shown that propranolol has no significant side effects and is safe to use.

关键词：PTSD; Propranolol; Reconsolidation; Fear

高中生童年期创伤与非自杀性自伤的关系：以冲动系统为中介

刘乙霖^{1,2} 方源¹ 方源² 李昕睿² 李昕睿¹ 罗欣宇¹ 罗欣宇² 冯瑞彬^{1,2} 曾勇²

1.昆明医科大学

2.昆明医科大学第二附属医院

目的 高中生正处于成长和转变的年龄阶段，但恰好也是非自杀性自伤行为的高发群体之一。而童年期创伤被认为是影响非自杀性自伤的重要因素。冲动系统作为自我控制的一个维度，被认为在个体应对压力事件时发挥重要作用。本研究旨在探讨冲动系统在童年期创伤和非自杀性自伤之间的跨时间

中介作用，以揭示三者间的动态心理机制。

方法 通过为期一年、两个阶段的问卷调查，对云南省两所中学的 1309 名高中生进行横向和纵向研究，重点分析童年期创伤对非自杀性自伤的影响路径及冲动系统在其中的中介作用。

结果 童年期创伤、冲动系统与非自杀性自伤存在两两相关关系。在即时模型和延时模型中，童年期创伤可以通过冲动系统的中介作用对非自杀性自伤产生影响，冲动系统的中介作用机制具有跨时间的稳定性。童年期创伤通过影响个体的情绪调节和自我控制能力，从而增加非自杀性自伤的发生率。冲动系统作为自我控制能力的一部分，能够在童年期创伤和非自杀性自伤之间起到重要的中介作用。提高高中生的自我控制能力，特别是冲动控制能力，可以作为减少非自杀性自伤行为的干预策略。

结论 本研究通过横向和纵向研究，验证了童年期创伤对非自杀性自伤的显著影响及其通过冲动系统的中介作用，强调了提高青少年自我控制能力在心理干预中的重要性。

关键词：童年期创伤,冲动系统,非自杀性自伤,中介效应

表达性艺术治疗对创伤后应激障碍(PTSD)患者干预效果的初步研究

高柏慧 栾燕 谢丽娜 栾燕* 苏荣坤 张凡 李璞鸥 王晓坤 韩笑宇 王冠文 王鹤凝 朱睿明 王怡萱 姚明洋

沈阳市精神卫生中心

目的 研究表达性艺术治疗对创伤后应激障碍(PTSD)患者减轻症状、缓解情绪、恢复功能的干预作用。进一步探讨表达性艺术治疗对创伤后应激障碍(PTSD)中创伤再体验症状、警觉性增高症状以及回避或麻木症状的干预效果是否有差异性。

方法 创伤后应激障碍(PTSD)是一种由非同寻常的威胁或灾难性事件所引发的强烈的恐惧感、无助或厌恶等严重的心理反应,创伤后应激障碍(PTSD)可引起明显的职业、心理和社会功能丧失,对个体的社会功能、家庭生活和身心健康造成长期的破坏性影响。表达性艺术治疗是一种以非言语为主的心理治疗技术,其特点在于通过非言语的形式

来传达治疗信息、舒缓情绪、促进交往,尤其适用于那些难以用言语表达情感或经历的患者。研究调查50例诊断或合并诊断创伤后应激障碍(PTSD)的住院或门诊患者,有针对性的实施表达性艺术心理干预。在心理治疗干预前后分别采用 PTSD 症状筛查量表,社会功能量表,生活质量评定量表评估,统计分析症状缓解,社会功能恢复情况。

结果 通过有效的表达性心理治疗干预,患者在治疗后再体验症状、警觉性增高症状以及回避或麻木症状有统计学差异,症状不同程度减轻,社会功能有一定程度的恢复。

结论 表达性艺术治疗可有效缓解创伤后应激障碍患者的临床症状,在恢复社会功能中有重要作用。

心理援助热线自杀者亲友自杀意念的危险因素

刘梓康² 刘梓康¹ 李星雪¹ 李星雪² 郎俊莲^{1,2} 赵丽婷^{1,2} 王若飞^{1,2} 魏子达³ 梁红¹

1.北京回龙观医院

2.承德医学院研究生学院

3.喀什大学教育科学学院

目的 探索心理援助热线因亲友自杀问题来电者自杀意念的危险因素。

方法 将2009-2023年北京市心理援助热线中因亲友自杀问题的来电者纳入本研究,通过询问自杀者亲友两周内是否有自杀想法来评估当下是否有自杀意念。收集自杀者亲友的一般人口学资料,评估自杀者亲友的痛苦感、希望感、抑郁程度以及自杀危险因素。采用多元 logistic 回归分析,探索自杀者亲友自杀意念的危险因素。

结果 本研究总共纳入360例因亲友自杀问题的来电者。50.3%(181例)来电者报告该次来电前2周内自杀意念。受教育年限10-16年(OR=0.38, 95%CI: 0.19~0.75)、受教育年限>16年(OR=0.16, 95%CI: 0.05~0.51)、高希望感(OR=0.18, 95%CI: 0.11~0.31)是来电者自杀意念的保护因素;而既往自杀未遂史(OR=2.10, 95%CI: 1.25~3.53)、高痛苦

感(OR=2.46, 95%CI: 1.50~4.05)、高抑郁程度(OR=1.73, 95%CI: 1.05~2.85)是来电者自杀意念的独立危险因素。

结论 自杀者亲友的既往自杀未遂史、高痛苦感、高抑郁程度是自杀意念的危险因素。

A Systematic Review of Clinical Applicability of ICD-11 CPTSD Assessment in Multiple Populations

Yan Ren* Jiahui Duan

Shanxi Provincial People's Hospital

Objective In 2018, the World Health Organization introduced the distinction between post-traumatic stress disorder (PTSD) and complex post-traumatic stress disorder (CPTSD) in the main diagnostic system for the first time. ICD-11 clearly positioned CPTSD as an independent diagnosis of PTSD. The International Trauma Questionnaire (ITQ) was designed for self-report of CPTSD. Considering the upcoming implementation of ICD-11 in clinical practice, this study aimed to examine whether the ITQ has cross-cultural clinical application value for different populations

Methods A systematic literature search was performed in PubMed, EMBASE, Cochrane Library Databases, and Web of Science databases using the keywords "CPTSD," "ITQ," "assessment," "clinical utility," and "cross-cultural" for all published studies in English, French and Spanish from January 2010 to May 30, 2024. The performance of the ITQ on different clinical samples was retrospectively analyzed

Results In both children and adults, the ITQ has been studied to prove its validity. A large number of questionnaires have been studied in Western countries, focusing on groups such as refugees, foster children, and veterans. Evidence suggests that in clinical practice, CPTSD can be effectively distinguished from similar diagnoses such as bipolar disorder and borderline personality disorder (BPD). Although ITQ has been translated

into multiple languages, such as French, Spanish, and Chinese, the scale currently lacks strong cross-cultural evidence to support it. In addition, there is almost no research on the factor validity, internal consistency, and convergent validity of ITQ in Chinese samples

Conclusion First, more ITQ results from different types of samples are needed to verify the validity of CPTSD assessment. Second, although the ITQ has been used in different countries, the factor validity, internal consistency, and convergent validity of the translated ITQ have not yet been determined, and therefore the ITQ is not widely used clinically in these countries. Especially in my country, ITQ is rarely used in clinical practice to identify or diagnose CPTSD, as currently this area can only rely on clinical wisdom

关键词: complex PTSD, The International Trauma Questionnaire, ICD-11 trauma, clinical applicability

高频重复经颅磁刺激联合帕罗西汀治疗创伤后应激障碍的疗效

关可文*

台州市第二人民医院

目的 探讨高频重复经颅磁刺激(rTMS)联合帕罗西汀治疗创伤后应激障碍(PTSD)患者的疗效及对认知功能的改善。

方法 将符合 DSM-5 诊断标准的 PTSD 患者随机分为两组, 联合组给予帕罗西汀联合右侧前额叶背外侧部 rTMS 治疗, 对照组给予帕罗西汀联合假 rTMS 治疗, 每组 25 例, 治疗 4 周共 20 次。在治疗前后评定创伤后应激障碍检查表(PCL)、威斯康星卡片分类测验(WCST)和不良反应量表, 并进行血常规、生化功能、心电图、脑电图、头颅 CT 等检查。

结果 与对照组相比, 联合组在治疗后 PCL 评分显著下降, WCST 评分显著上升, 不良反应发生率无显著差异。两组间血常规、生化功能、心电图、脑电图、头颅 CT 等指标无明显异常变化。

结论 rTMS 联合帕罗西汀治疗 PTSD 患者具有较好的疗效和安全性, 能够有效改善患者的 PTSD 症状和认知功能。

心理韧性与社会支持在灾后救援人员中对缓解创伤事件后精神症状的作用差异: 症状网络分析

程鹏 李卫晖*

中南大学湘雅二医院

目的 经历创伤事件的个体后续患上精神症状的风险显著增加, 主要包括创伤后应激障碍(PTSD)、焦虑和抑郁, 这些精神症状会显著影响其整体生活质量。因此, 探索可能对心理健康具有保护作用的因素至关重要。先前的研究已经确定了两大类保护因素: 分别是“主观”因素(如心理韧性)和“客观”因素(如社会支持)。尽管心理韧性和社会支持被广泛认为可以有效缓解创伤事件后患者的精神症状, 但目前缺乏对它们在不同创伤后精神疾病症状中干预效果的比较分析。此外, 先前的研究大多未能控制不同创伤事件可能引起的潜在混杂效应。

方法 本研究采用新的网络分析方法, 旨在探讨心理韧性和社会支持对创伤后精神症状的不同调节作用, 并有效控制不同创伤事件的混杂效应。因此, 本研究招募了 264 名经历同一创伤事件的一线救援人员。采用量化边缘权重和桥梁预期影响(BEI)方法, 比较了心理韧性和社会支持的缓解效果。

结果 研究发现, 在一线救援人员中, 社会支持与心理症状的负相关性显著, 尤其在抑郁网络中的疲劳和 PTSD 网络中的睡眠障碍表现出更为显著的影响, 而心理韧性的相关性较弱。BEI 的定量分析显示, 心理韧性更有效地抑制抑郁和焦虑症状网络, 而社会支持则更显著地减轻 PTSD 症状网络的激活。

结论 本研究首次在真实世界的灾后救援人员中探索了心理韧性和社会支持对创伤后结果的不同影响, 并有效控制了不同创伤事件可能引起的混杂效应。我们的研究结果为未来精准有效的创伤后心理干预提供了理论参考。

心理咨询师心理弹性、情绪调节和共情能力对替代性创伤的影响：有调节的中介模型

杜洋 季益富* 杨静月 谢思思
安徽省精神卫生中心

目的 替代性创伤是指心理治疗师在与精神疾病患者的长期接触中，在咨访关系的双向相互作用而不由自主地受到影响的現象，其往往出现在残酷和破坏性的灾害面前，其损害程度超过心理和情感承受能力，并间接导致各种心理异常。心理咨询师的替代性创伤发生率开始增高，心理咨询师因所接触到的创伤或高风险的个案日渐增多，对其负面影响的可能性也增高。本研究通过对 790 名心理咨询师替代性创伤、心理弹性、情绪调节和共情能力的研究，明确心理咨询师的替代性创伤情况及影响因素。

方法 采用网络问卷调查法，选取安徽省合肥市、安庆市、六安市、蚌埠市共 790 名心理咨询师进行问卷调查。采用治疗者信念量表、心理弹性量表、情绪调节方式问卷和中文版人际反应指针量表进行测评；采用独立样本 t 检验和 χ^2 检验进行 2 组间差异性检验；采用 Pearson 相关分析进行各量表得分之间的相关分析；采用 Hayes 编制的 PROCESS 宏程序进行中介模型分析。

结果 1.790 名心理咨询师中，43.2% (341/790) 存在替代性创伤。

2.有无替代性创伤的心理咨询师在共情能力各因子分和总分、情绪调节方式总分和各因子得分、心理弹性总分和各因子得分上差异有统计学意义。

3.中介分析显示：共情能力显著正向预测情绪调节 ($\beta=0.56, P<0.001$)；情绪调节显著正向预测替代性创伤 ($\beta=0.59, P<0.001$)；情绪调节和心理弹性的交互项对自杀意念的预测作用显著 ($\beta=-0.05, P<0.001$)。

结论 情绪调节在共情能力对替代性创伤的影响中起部分中介作用，心理弹性在共情能力对替代性创伤的影响中起调节作用。

Acceptance Commitment Therapy for Post-traumatic Stress Disorder: A Systematic Review and Meta-Analysis

Qiannan Zhao¹, Xiaoyan He¹, Li Zhang², Lifeng Tan¹, Da Li¹

1.Wuxi Mental Health Center

2.Second Xiangya Hospital of Central South University

Objective To systematically evaluate the intervention effect of Acceptance Commitment Therapy (ACT) on post-traumatic stress disorder (PTSD)

Methods We searched the following electronic databases: Medline, PubMed, Scopus, Embase, ScienceDirect, CNKI, WANGFANG and Technology Journal Database. The final search was conducted on January 31st, 2024. When searching the English electronic database, the search themes we used include (PTSD OR Post-Traumatic Stress Disorder OR posttraumatic OR post-traumatic OR posttraumatic stress disorder,) AND (ACT OR Acceptance and Commitment Therapy). In searching the Chinese electronic databases, we used the “Chuangshanghouyingjizhangai OR chuangshanghouyingji” AND “jienachengnuoliaofa OR jienayuchengnuoliaofa” search strategy

Results Through systematic search and quality assessment, nine articles of randomized controlled trials (RCTs) involving ACT interventions for PTSD were ultimately obtained and used as a systematic review and meta data sources for the analysis. The nine randomized controlled studies included 729 study participants, 374 in the experimental group and 355 in the control group. Meta-analysis results showed that compared with conventional interventions, ACT had a significant improvement effect on PTSD symptoms, and the combined Hedges' g -value was 1.765, (95% CI: 0.886-2.664, $Z=3.935, P < 0.001$), and subgroup analyses showed that in the veteran population, there was no significant difference in PTSD symptoms between ACT and conventional interventions (3 studies, $N=196$, combined Hedges' g -value was 1.042, (95% CI: -0.083 to 2.166, $Z=1.816, P=0.069$), and in the other populations, ACT compared to conventional interventions improved PTSD symptoms more (6 studies, $N=533$, combined

Hedges' s g-value of 2.191, (95% CI:0.933 to 3.450, Z=3.412, P=0.001). Meanwhile, individuals still maintained a stable effect of ACT over conventional interventions at 3months post-intervention, and the combined Hedges' s g-value was 1.186, (95% CI:0.314 to 2.058, Z=2.665, P=0.008)

Conclusion Acceptance commitment therapy is effective in improving PTSD symptoms and the intervention is relatively stable

睡眠过程中声音闭环刺激可促进恐惧记忆消退

孙玉静¹ 艾思志¹ 赵宗亚² 赵晨昊¹

1.新乡医学院第一附属医院

2.新乡医学院医学工程学院

目的 本研究旨在探索声音闭环刺激技术在睡眠期间对恐惧情绪记忆消退的影响及其作用机制,为创伤后应激障碍(Post-Traumatic Stress Disorder, PTSD)患者提供一种新型的干预方法。恐惧记忆的形成和维持是 PTSD 等焦虑障碍的核心问题,而睡眠期间的慢振荡波(Slow oscillation, SO)活动与记忆巩固密切相关。本研究采用靶向记忆激活结合听觉恐惧条件反射范式,以期揭示声音闭环刺激在睡眠中对恐惧记忆消退的促进作用。

方法 研究对象为 30 名健康大学生,所有受试者在实验前签署知情同意书,并通过问卷量表评分排除可能影响睡眠及情绪的生理、心理及身体因素。实验采用 NeuroScan64 导脑电系统和 MP150 多通道生理记录仪同步采集受试者的脑电及皮肤电导反应(Skin Conductance Response, SCR)指标。实验分为三个阶段:恐惧记忆学习、声音闭环刺激干预(90 分钟的小睡)以及恐惧记忆表达测试。在小睡期间,当受试者处于慢波活动上升期时,进行声音线索暴露,并随机呈现空白对照刺激。

结果 行为学结果显示,睡眠过程中的声音闭环刺激显著降低了恐惧记忆的表达。电生理学结果进一步揭示,在声音线索暴露后的 800ms 时间窗内,诱发了明显的负向波活动,且脑电地形图分析显示,

这些诱发的脑电活动主要集中在额叶区域。此外,相关分析发现声音线索诱发的 Delta 波活动与恐惧记忆的消退存在显著的正相关。

结论 综上所述,本研究证实了睡眠期间声音闭环刺激可以有效降低恐惧记忆的表达,并且这种降低与声音线索暴露诱发的 Delta 波活动密切相关。这一发现不仅为理解睡眠中记忆处理的神经机制提供了新的视角,而且为开发针对 PTSD 等恐惧相关疾病的新型干预策略提供了科学依据。

童年创伤影响人格特质的皮层下神经机制

储召松 王欣 沈宗霖 许秀峰*

昆明医科大学第一附属医院

目的 童年创伤和人格特征是影响精神疾病的重要社会心理因素。童年创伤会影响人格特质的发展,而皮层下脑结构的改变可能是潜在的神经基础。然而,目前尚不清楚三种因素之间的确切联系。本研究旨在探讨儿童创伤、人格特质和皮质下结构之间的关系。

方法 研究纳入 171 名健康受试者,所有受试者均完成童年创伤问卷(CTQ)和五因素人格问卷(NEO-FFI),并接受了 T1 加权 MRI 扫描。使用 FreeSurfer6.0 软件计算皮层下脑结构的灰质体积(GMV)。利用线性回归分析探究童年创伤、大五人格特质与皮层下 GMV 两两之间的关系,并利用 SPSS 插件 PROCESS 进行中介分析探究三者之间的潜在联系。

结果 多元线性回归分析显示不同类型童年创伤与五大人格特质之间存在复杂关系。总体而言,不同形式的虐待或忽视与神经质正相关,与外向性、开放性、宜人性和尽责性负相关。对于皮层下 GMV 与人格特质之间的关系,我们发现右侧海马 GMV 与神经质之间呈负相关。此外,宜人性与双侧丘脑、左侧苍白球和右侧壳核 GMV 呈正相关。对于童年创伤与皮层下 GMV 之间的关联,结果显示不同类型童年创伤与皮层下 GMV 间呈负相关。根据上述多元线性回归分析结果,我们纳入 4 个潜在模型进行进一步的中介分析。中介分析结果显示,右侧海马

GMV 部分介导了童年创伤（情感虐待、躯体忽视和 CTQ 总分）对神经质的影响。

结论 童年创伤会影响五大人格特质的发展，而皮层下结构的改变可能与这一过程密切相关。右侧海马 GMV 的改变可能是童年创伤导致神经质水平升高的关键神经机制。

PTSD 小鼠模型海马组织和前额叶皮质铁死亡相关分子表达的探究

李吉鑫¹ 张桂青²

1.石河子大学

2.石河子大学第一附属医院

目的 探究创伤后应激障碍（PTSD）小鼠模型海马组织和前额叶皮质铁死亡相关分子的表达以及神经细胞凋亡的表达。

方法 将雄性 C57BL/6J 小鼠随机分为 4 组：对照组、PTSD-3 d 组、PTSD-7 d 组和 PTSD-14 d 组，造模组采用条件性足部电击（CF）和单次-持续应激（SPS）来制备 PTSD 动物模型。通过旷场实验和高架十字迷宫试验来检测小鼠模型焦虑和抑郁反应。通过尼氏染色和普鲁士蓝染色来观察模型海马组织和前额叶皮质的神经元受损情况与铁离子含量情况。通过蛋白质免疫印迹（Western Blot）和免疫组织化学染色检测模型海马组织和前额叶皮质的谷胱甘肽过氧化酶 4(GPX4)与铁蛋白轻链(FTL)的蛋白表达。通过 TUNEL 染色检测海马组织和前额叶皮质神经细胞凋亡的情况。

结果 与对照组相比，造模组出现焦虑和抑郁样行为。尼氏染色提示造模组神经元受损。普鲁士蓝染色显示，与对照组相比，造模组海马 CA1 区和前额叶皮质的铁离子含量增多。Western Blot 和免疫组织化学染色结果显示，与对照组相比，PTSD-3 d 组海马组织和前额叶皮质的 GPX4 蛋白表达增多，且差异具有统计学意义（ $P<0.05$ ）；与对照组相比，PTSD-3 d 组海马组织和前额叶皮质的 FTL 蛋白表达减少，且差异具有统计学意义（ $P<0.05$ ）。TUNEL 染色结果显示造模组海马组织和前额叶皮质的神经细胞存在凋亡现象。

结论 PTSD 小鼠模型海马组织和前额叶皮质出现铁死亡现象，并且神经细胞发生凋亡。

Gender Differences in Cognitive Deficits in Drug-na?ve Schizophrenia Patients with Hyperprolactinemia: A Retrospective Study

罗国帅 孙达亮 李洁*

天津市安定医院

Objective Cognitive deficits in schizophrenia have been extensively studied. However, there are few studies on schizophrenia with hyperprolactinemia. This study investigated gender differences in cognition in schizophrenia with and without hyperprolactinemia.

Methods A total of 93 schizophrenia patients and 69 healthy controls were enrolled. The Positive and Negative Syndrome Scale (PANSS) was used to assess clinical symptoms. The MATRICS Consensus Cognitive Battery (MCCB) was used for cognitive assessment. Demographic characteristics were collected, and serum prolactin levels were measured.

Results 71% ($n=66$) of drug-na?ve schizophrenia (DNS) patients met the diagnostic criteria for hyperprolactinemia. DNS patients had significantly worse cognitive functions in all domains than healthy controls (all $P<0.001$). In DNS patients with hyperprolactinemia (DNSH), male patients had an earlier age of onset, lower rates of marriage, and higher rates of smoking and drinking than females (all $P<0.05$), while female patients scored significantly higher than males in verbal learning and social cognition (all $P<0.05$). In addition, prolactin levels were positively correlated with TMT scores in males DNSH ($r=0.593$, $P=0.006$). Multiple regression analysis found the following variables independently associated with MCCB total score: gender ($\beta=0.223$, $t=2.260$, $P<0.05$), age ($\beta=-0.307$, $t=-3.044$, $P<0.01$), education ($\beta=0.290$, $t=3.080$, $P<0.01$), and negative symptom subscale ($\beta=-0.279$, $t=-3.008$, $P<0.01$). Together, these factors predicted 57.3% of the

variance in MCCB total score.

Conclusion DNS manifests cognitive deficits in all aspects. In DNSH, males have worse cognitive functions than females in verbal learning and social cognition

Prevalence and Correlates of Burnout Among Frontline Nurses in China During and after The COVID-19 Epidemic: A Multicenter Survey

罗国帅 刘娇 孙达亮*
天津市安定医院

Objective This multicenter survey aimed to investigate the prevalence and correlates of burnout among frontline nurses in China during and after the COVID-19 epidemic.

Methods The study recruited frontline nurses from 27 provinces of China in November-December 2022 and April-July 2023. Assessment measures included demographic questionnaire, PSQI for sleep quality, SAS for anxiety, SDS for depression, and MBI-HSS for burnout. Statistical analysis involved chi-square tests, t-tests, logistic regression, and ROC analysis.

Results Among 775 nurses during the pandemic and 693 post-pandemic, burnout prevalence was significantly higher during the pandemic (94.7% vs. 71.3%, $P < 0.001$). Emotional exhaustion prevalence did not differ significantly (33.8% vs. 33.3%, $P = 0.848$), while depersonalization and reduced personal achievement were higher during the pandemic ($P < 0.001$). Scores for SAS, SDS, PSQI, emotional exhaustion, and depersonalization were significantly lower post-pandemic ($P < 0.001$), while reduced personal achievement scores were higher ($P < 0.01$). Logistic regression revealed high financial stress as a protective factor during the pandemic (OR = 0.443, 95% CI 0.222-0.883), while post-pandemic, frequent exercise (OR = 0.506, 95% CI 0.290-0.880), SDS scores (OR = 1.031, 95% CI 1.002-1.061), and PSQI

scores (OR = 1.058, 95% CI 1.034-1.083) were associated with burnout. ROC analysis showed good predictive value for SDS and PSQI scores.

Conclusion Burnout prevalence among frontline nurses was significantly higher during the COVID-19 pandemic. High financial stress was protective during the pandemic, while frequent exercise post-pandemic was protective against burnout. Assessment and management of psychological stressors are crucial for nurse well-being, particularly during and after public health crises like COVID-19

Nuclear Magnetic Resonance Analysis Implicates Sex-specific Dysregulation of The Blood Lipids in Alzheimer's Disease: A Retrospective Health-controlled Study

罗国帅 李研哲 刘娇 孙达亮*
天津市安定医院

Objective This retrospective health-controlled study explores the sex-specific dysregulation of blood lipids in AD, employing nuclear magnetic resonance (NMR) spectroscopy, a novel approach in AD research.

Methods Enrolling 35 AD patients and 35 healthy controls, this investigation scrutinizes lipid metabolism levels in plasma samples. Notably, we assess distinct sex-associated differences in plasma lipid metabolism levels, focusing on high-density lipoprotein (HDL) and low-density lipoprotein (LDL) subfractions.

Results Our findings reveal significant sex-specific alterations in plasma lipid metabolism levels, particularly in HDL and LDL subfractions. Disease-specific sex disparities underscore the complexity of lipoprotein metabolism in AD. ROC curve analysis demonstrates promising diagnostic values for lipid metabolites, especially when combined with other lipid markers.

Conclusion This study enhances our understanding of the intricate interplay between sex, lipid metabolism, and AD pathogenesis
