Results Our findings revealed that BN patients exhibited reduced gray matter volume in the right dorsal anterior insula (dAI) and bilateral ventral anterior insula (vAI) and demonstrated decreased ALFF in slow-5 band of bilateral dAI. The BN group also showed increased FC between bilateral dAI and precuneus or right superior frontal gyri which significantly correlated with the severity of BN or its key symptom. In addition, the decreased FC between bilateral vAI and anterior cingulate and paracingulate gyri and/or median cingulate and paracingulate gyri were both significantly correlated with the severity and its restrained eating behavior

Conclusion Our findings further indicate that the functional separation of anterior insula subregions may underlie the pathophysiology of BN. Notably, the vAI associated with emotional processing may serve as a promising neuroimaging biomarker which could inform

therapeutic strategy.

Influencing Factors of Eating Disorders Among Middle School Students in Hebei Province, China

Ling Zhang Xiaoyang Liu Xiaoyou Su*

School of Population Medicine and Public Health, Chinese Academy of Medical Sciences & Peking Union Medical College

Objective Eating Disorders (EDs) are mainly clinically recognized by abnormal eating behaviors and excessive concern for food and body weight and size, and the incidence of eating disorders is on the rise in China. EDs have become a serious challenge to adolescents' physical and mental health development. Studies have shown that when individuals are affected by negative emotions, they are prone to abnormal eating attitudes, which are often manifested in eating problems such as overeating and dieting. EDs usually occur during adolescence when minors' emotions fluctuate but have limited ability to regulate them, and when adolescence is a critical period for the development of eating habits. Therefore, it is important to understand the occurrence of EDs in adolescents and their association with other eating behaviors and psychological conditions. This study aimed to investigate EDs among middle school students in Hebei Province and to analyze the potential influencing factors

Methods Adolescents in three grades of several middle schools in Hebei Province were selected to conduct for questionnaire survey by using stratified and random cluster sampling method. A self-designed general information questionnaire was used to investigate their basic demographic information such as sex, age, height, weight, whether the subject is an only child, physical health status and family economic status. The Eating Disorder Examination Questionnaire (EDE-Q),

the Delaware Bullying Victimization Scale, and the Middle School Mental Health Scale were used to investigate their eating disorders, school bullying, and negative emotions, respectively. Univariate analysis and multiple linear regression analysis were used to explore the factors influencing eating disorders in middle school students

Results A total of 949 questionnaires were collected in this study, and after excluding unqualified questionnaires (before and after obvious logical errors, important demographic variables missing or outliers, etc.) there were 851 valid questionnaires, and the validity rate of the questionnaires was 89.7%. Of these, 424 (49.8%) were boys and 427 (50.2%) were girls; 245 (28.8%) were first-year students, 256 (30.1%) were second-year students, and 350 (41.1%) were third-year students. The prevalence of overweight and obesity was 17.5%, with a BMI of (20.1 ± 3.2) kg/m² and an eating disorder score of 0.5 ± 1.0 . Multiple linear regression analysis showed that age [$b=0.075$, $P=0.016$], BMI [$b=0.069$, $P<0.001$], negative emotions [$b=0.126$, $P<0.001$], and being subjected to social/relational bullying [$b=0.100$, $P<0.001$] were the influencing factors of eating disorders

Conclusion EDs are at a low level among middle school students in Hebei Province. Middle school students who are older, have a higher BMI, have negative emotions, and experience social/relational bullying are more likely to have an ED. Therefore, reducing anxiety, stress, and other psychological distress, maintaining a healthy weight, and helping them avoid school bullying may be effective ways to reduce the occurrence of eating disorders among adolescents. Provide psychological counseling and support through a more enriched mental health curriculum in schools, and provide guidance on healthy eating, so that adolescents can learn to alleviate anxiety and release stress in other ways and avoid overeating in an adverse psychological state. In addition, helping adolescents to establish healthy eating environments, habits and active lifestyles, encouraging and supervising adolescents to participate in sports and physical activities, thereby enabling adolescents to improve their moods, gain social support, enhance their self-efficacy and maintain a healthy weight. At present, there

are fewer studies on eating disorders in adolescents in China, and there is a lack of scientific epidemiologic survey evidence and effective intervention methods. In the future, it is still necessary to continue to explore the occurrence mechanisms, influencing factors, and effective intervention strategies for EDs.

A Study of The Correlation between Non-Suicidal Self-injurious Behavior and Beta-Endorphin, Enkephalin and Opiorphin Levels in Adolescents with Mood Disorders

Ting Ji^{1,2}, Cailan Hou^{1,2}

1.Guangdong Provincial People's Hospital

2.Southern Medical University

Objective Non-suicidal self-injury (non-suicidal self-injury, NSSI) behavior is common in adolescent patients with mood disorders. Endogenous opioid system is the research hotspot of neurobiological factors of NSSI. However, the results of peripheral β -endorphin, enkephalin and opiorphin in NSSI patients are not completely consistent, and there are fewer related studies in China. This study examines the factors influencing NSSI behaviors in adolescents with mood disorders, and attempts to find potential biological markers of NSSI from a neurophysiological perspective to provide evidence for the etiology and treatment of NSSI

Methods In this study, 108 patients with mood disorders aged 12-18 years were enrolled from Guangdong Mental Center Inpatient/Outpatient Clinic, and all patients completed interviews, blood and saliva collection. Interviews collected sociodemographic information, clinical characteristics and psychological characteristics of the patients. Scales included the Adolescent Non-suicidal-self-injury Behavior Function Assessment Scale, the Montgomery and Asberg Depression Rating Scale, the Brief Psychiatric Rating Scale, the Childhood Trauma Questionnaire-Short

Form and the Social Anxiety Scale of simplified version. Blood and saliva were collected in the morning on an empty stomach, then the blood was immediately centrifuged and the supernatant extracted to -80°C for storage, while the saliva was placed directly to -80°C for storage. After all samples were collected, they were sent to a third party to test plasma/saliva β -endorphin, enkephalin and opiorphin concentrations using ELISA kits. Independent sample t-test, chi-square test, Logistic regression analysis and correlation analysis were used for statistical analysis

Results 1. 108 adolescent patients with mood disorders were included in this study, 72 in the NSSI group and 36 in the Non-NSSI group. Compared with the Non-NSSI group, the NSSI group had a higher proportion of females and of bisexual/homosexual tendencies, with statistically different results. 2. The NSSI group had a younger age at first self-injury, a much higher rate of prior NSSI behaviors, more suicidal ideation, more antipsychotic use, but similar rates of diagnosis of depressive episode and mood disorder/bipolar depression, with statistically significant differences in outcomes. 3. The total MADRS score, BPRS score, CTQ-SF score, and SAS-A score of the NSSI group were higher than those of the Non-NSSI group, and the results were statistically different. 4. The plasma β -endorphin and enkephalin levels of the NSSI group were lower than those of the Non-NSSI group, and salivary opiorphin levels were higher than those of the Non-NSSI group, and the results were statistically different. 5. The group was divided into two groups according to the clinical diagnosis of depressive episode and mood disorder or bipolar depression, and the salivary opiorphin level of the depressive episode group was lower than that of the mood disorder or bipolar depression group, with statistically significant differences in the results. 6. Variables were included in the logistic regression analysis, and the results showed that MADRS score, past NSSI behaviors were the influencing factors of NSSI. Removing past NSSI behaviors showed that MADRS score, suicidal ideation and salivary opiorphin concentration were the influencing factors of NSSI. 7. Positive correlations were

found between plasma β -endorphins and enkephalins, opiorphin. But there was no significant correlation between plasma and salivary biological indicators

Conclusion 1. The opioid system may be involved in the development of NSSI. B-endorphin, enkephalin, and opiorphin are independent influences on NSSI, which are more supportive of NSSI as a stand-alone diagnosis. 2. Salivary opiorphin may serve as a potential biomarker for NSSI.

Inflammatory Cytokine Alterations in Genetic and Ultra-High Risk Groups of Schizophrenia: A Systematic Review and Meta-analysis

Huiqun Huang*

West China Hospital of Sichuan University

Objective Inflammatory cytokine abnormalities are implicated in schizophrenia pathogenesis, yet their changes in clinical high-risk (CHR) and genetic high-risk (GHR) groups of schizophrenia remains unclear. Therefore, we performed a systematic review and network meta-analysis (NMA) to investigate cytokine patterns across CHR, GHR and healthy controls (HCs), aiming to explore the immune mechanism underlying early schizophrenia onset

Methods We comprehensively searched PubMed, Web of Science, Cochrane, Embase, and MEDLINE databases until August 20th, 2023, extracting inflammatory substance levels from CHR, GHR, and HCs. Standardized mean differences (SMDs) with 95% confidence intervals (CIs) were calculated, and NMA and pairwise meta-analyses were conducted using random effects, with Cohen's d as the effect size. This protocol was registered on the PROSPERO, CRD 42023479829

Results 25 papers were included in this systematic review, involving 723 CHR subjects, 609 GHR subjects and 1562 healthy controls. Meta-analysis revealed increased IL-6 levels and decreased IL-10 levels in the CHR group compared to the GHR group. GHR individuals exhibited higher IL-10 and lower IL-6 and TGF- β levels than healthy controls, while CHR patients showed non-significantly increased levels of most pro-inflammatory cytokines. Additionally, elevated IL-13 levels were observed among CHR individuals who later developed schizophrenia compared to those who did not

Conclusion Inflammatory abnormalities exist in the CHR and GHR stages, suggesting different immune mechanisms in schizophrenia development. Reduced

immune activation might correlate with genetic susceptibility to psychosis, while increased pro-inflammatory status could signal early psychotic symptom presence. IL-13 emerges as a potential biomarker for transformation in ultra-high-risk schizophrenia patients. Further research is needed to validate these findings and explore their clinical implications

双相情感障碍共病网络游戏障碍脑结构及脑生化代谢的研究现状

阿亚阔孜·杰克山别克^{1,2} 王丞基^{1,2} 张龙渊^{1,2} 李迎帅^{2,3} 邹韶红²

1.新疆医科大学研究生学院

2.新疆维吾尔自治区人民医院临床心理科

3.石河子大学医学院

目的 双相情感障碍(Bipolar disorder, BD), 是一组复杂和严重的慢性精神障碍。BD 的病程往往呈发作性特点, 发作时表现为躁狂与抑郁交替或反复循环出现, 也可以混合方式存在, 因每次发作症状会持续一段时间, 而且 BD 有较高的疾病患病率、严重的社会功能受损、疾病相关的严重残疾和过早死亡率。网络游戏障碍(Internet Gaming Disorder, IGD)指患者长时间及过度的网络游戏行为, 从而导致其出现对网络游戏失去控制、耐受性, 甚至出现戒断症状的一系列认知和行为障碍。研究表明, IGD 常与其他精神障碍共病, 比如, 常与抑郁障碍、焦虑障碍、双相情感障碍及多动症等, 并对人们的工作、学习、社会和家庭生活产生负面影响, 导致一系列的生理、心理和社会问题。

方法 本文将对 BD 及 IGD 在脑结构、脑生化代谢物方面的特征性改变进行阐述, 探讨 BD 与 IGD 患者脑结构及脑生化代谢间的相似性与差异性, 以期为今后 BD 共病 IGD 神经影像标志物的探寻、神经生物学机制的探索及诊断方法、早期干预提供参考价值。

结果 已有较多的脑结构影像学及脑生化代谢影像学研究结果证实, BD 患者及 IGD 患者存在不同脑区的脑结构及脑生化代谢物有所变化。大量研

究发现, BD 患者大脑顶叶、前扣带回、前额叶、额叶下回、颞下回皮层变薄、表面积减小; 而 IGD 患者额叶、颞叶的皮质与健康对照组相比较薄。两者间存在一定的相似性, 存在的相似性是否能表示 BD 与 IGD 之间发病机制存在相关的联系需进一步研究。BD 患者包括额叶、扣带皮层及海马区的 N-乙酰天冬氨酸(N-acetyl aspartate, NAA) 水平、谷氨酸(Glutamate, Glu)水平降低, 而肌酸(Creatine, Cr)和谷氨酸和谷氨酰胺(Glutamate+Glutamine, Glu+Gln, Glx)水平升高。IGD 患者额叶的 NAA 水平降低。脑生化代谢方面, 也存在一定的相似性, 即两者额叶的 NAA 水平均降低。

结论 当前, 应用结构及功能影像学技术对 BD 及 IGD 患者脑结构、脑生化代谢的研究较广泛。研究发现, 两组患者大脑顶叶、前扣带回、额叶皮层变薄、表面积减小等脑结构变化; 额叶的 NAA 水平降低的脑生化代谢变化, 也有不同之处, 而这些变化与临床特征有相关性。

上海市社区高风险精神分裂症患者长效针剂使用的应用研究

熊金霞 汪作为* 秦鸣妍 徐韦云 程子 李玲
上海市虹口区精神卫生中心

目的 了解上海市虹口区社区高风险精神分裂症患者的服药情况, 掌握长效针剂药物的使用现状及其信息获取渠道, 进一步探讨服药情况与长效针剂使用、长效针剂使用与其信息获取渠道的关联性。

方法 采用分层整群抽样, 使用随机数字表法从全区八家社区卫生服务中心中随机抽取四家, 通过问卷调查的方式, 对抽中社区卫生服务中心中符合纳入排除标准的高风险精神分裂症患者进行调查。数据分析采用单因素 χ^2 检验和二元 logistics 回归分析。

结果 根据服药依从性定义, 在 481 名调查对象中, 不服药组 137 名 (28.48%), 不规律服药组 64 名 (13.31%), 规律服药组 280 名 (58.21%)。单因素结果显示, 不同年龄、户籍、学历、就业状态、婚姻状况、医保类型、总病程、长效针剂使用与否的患

者, 其服药依从性的差异有统计学意义 ($P < 0.05$)。二元 logistics 回归模型结果显示, 未使用长效针剂组与正在使用或使用过长效针剂组的患者相比, 其不规律服药的可能性更高 ($OR = 4.023, 95\%CI: 1.101, 14.703$); 患者通过专科医生和社区宣传活动的渠道获取长效针剂信息与通过社区随访的渠道相比较, 其使用长效针剂的可能性更高 ($OR = 4.282, 95\%CI: 1.056-7.348$)。

结论 精神分裂症患者使用长效针剂有利于提高其服药依从性, 通过专科医生和社区宣传活动获取长效针剂信息更容易接受长效针剂的治疗。

强迫症新一代阶梯式远程认知行为治疗研究

吴怡雯 励心怡 张晨 杨宇涵 刘星羽 荆家琦 古练高睿 张天然 王凯风 周爽伊 韩慧 范青*
上海交通大学医学院附属精神卫生中心

目的 本研究旨在开发强迫症(OCD)新一代阶梯式远程认知行为治疗(CBT), 并探索其疗效是否非劣效于传统的线下面对面 CBT 团体, 并且更加经济。

方法 本研究采用非劣效性对照试验设计, 自 2022 年 8 月至 2023 年 8 月, 从上海市精神卫生中心门诊招募 18-50 周岁的强迫症患者 46 名。受试者按照自主意愿被分入阶梯式网络认知行为治疗合并药物治疗组(SC-ICBT, $n=23$)和线下团体认知行为治疗合并药物治疗组(CBGT, $n=23$)。在 SC-ICBT 组中, 患者将首先接受微信小程序自助练习结合少量治疗师指导; 在第三周评估时, 治疗无效的患者将会额外接受标准化的治疗师一对一线上指导, 并在第六周时结束治疗。在 CBGT 组中, 患者将会接受为期 6 周的标准化团体 CBT, 一周两次, 共计 12 次。本研究的主要疗效指标为耶鲁布朗强迫量表(YBOCS), 次要疗效指标为焦虑自评量表(SAS)、抑郁自评量表(SDS)以及佛罗里达强迫问卷(FOCI)。患者治疗 OCD 所花费的成本通过自制的《经济负担采集表》来收集。

结果 在治疗后两组的 YBOCS 得分均有所下降, 差异具有统计学意义。在第六周时 SC-ICBT 组与 CBGT 组的 YBOCS 得分的差值为 2.942 分 (双

侧 95%CI, 0.03-5.13), 置信区间的上限超过了原先设定的 3 分非劣效性界值 ($P=0.03$), 因此主要结果的非劣效性是不确定的。不过两组患者在最终治疗有效率与缓解率方面的差异不具有统计学意义。在次要疗效指标方面, 两组患者的得分在治疗后都有所下降, 且两组间的差异不具有统计学意义。在治疗可行性、安全性方面, 两组同样安全可行。有报告 2 起严重不良反应事件(1 起为药物副作用, 1 起为生活事件导致的抑郁情绪), 但均与本研究的心理治疗方案无关。在卫生经济学方面, SC-ICBT 组的总成本低于 CBGT 组, 平均每位患者能够节省 1630.03 元(95%CI, ¥926.51-¥2333.55)。成本效果分析显示, SC-ICBT 组比 CBGT 组有更佳的成本效果比(386.98 元/分 vs 508.73 元/分), 说明前者更为经济实惠的特点。

结论 新一代阶梯式远程 CBT(SC-ICBT)合并药物治疗与线下团体 CBT(CBGT)合并药物治疗均能有效地减轻患者的强迫症状。虽然非劣效性的结论是不确定的, 但两组患者在治疗有效率和缓解率, 以及自评的焦虑、抑郁、强迫症状改善方面的差异均无统计学意义。对于患有强迫症的成年人来说, SC-ICBT 可能是 CBGT 的一个经济有效的替代方案, 特别是在中国内地精神卫生服务资源紧张, 传统的面对面 CBT 难以立刻获得的情况下。

Immune System of Vulnerability To Psychosis: A Inflammatory-based Meta-analysis

Huiqun Huang*

West China Hospital of Sichuan University

Objective Over the past few decades, there has been a growing body of research on the link between inflammation and schizophrenia. The objective of this study is to compare the levels of inflammation-related cytokines between different stages of psychosis, to summarize the dynamic characteristics of the inflammatory immune system and some biomarkers candidates in the development of psychiatric disorders

Methods We conducted a systematic review and

meta-analysis of studies measuring inflammatory markers in high-risk, first-episode, or chronic phase of psychosis populations. After searching and reviewing, a total of 61 studies were included. (14 studies for high-risk, 32 studies for first-episode, and 20 studies for chronic patients)

controls) were included.

Results The levels of IFN- γ , IL-1 β and TNF- α were not significantly changed during the three phases of psychosis. The levels of IL-8 and IL-10 increased in first-episode psychosis, but were not significantly changed in either high-risk or chronic phases. CRP levels significantly increased in both FEP and chronic patients, but were not significantly elevated in high risk subjects. For IL-6, there was no significant difference in chronic samples, but a significant increase in both high-risk and FEP

Conclusion Our study suggests that there is activation of pro-inflammatory system, and there may be an immune compensatory mechanism manifested as up-regulation of anti-inflammatory factors in the pathophysiology of psychosis. Besides, IL-6 and IL-8 have the potential to be state or trait markers of psychosis

正念干预对康复期精神分裂症患者工作记忆的影响研究

苏怡晨 宋学勤*

郑州大学第一附属医院

目的 (1) 了解康复期精神分裂症患者正念水平、注意功能与工作记忆之间的关联。

(2) 观察正念干预对康复期精神分裂症患者正念水平、注意功能和工作记忆的影响, 探讨它们之间的关联影响。

方法 从河南省郑州市某精神疾病医院招募 80 名符合入组标准的康复期精神分裂症患者, 按性别和年龄对其进行分层随机分组, 分为对照组和实验组。实验组在接受常规护理和药物治疗的同时, 接受为期 8 周的正念干预, 对照组接受同期的工娱治

疗。在正念干预前后,利用 FFMQ、CPT-IP、WMS-III 等评估工具分别评估患者的正念水平、注意功能和工作记忆。

结果 (1)基线期变量相关分析:基线水平下,康复期精神分裂症患者的正念水平、注意功能、工作记忆之间显著相关。正念水平和注意功能呈显著正相关($r=0.41, p<0.01$),与工作记忆呈显著正相关($r=0.49, p<0.01$),注意功能与工作记忆之间呈显著正相关($r=0.57, p<0.01$)。

(2)实验组和对照组一般资料比较:实验组和对照组在性别、年龄以及受教育程度上无显著差异($p>0.05$)。

(3)正念干预前实验组和对照组组间比较:实验组和对照组的正念水平总分及其五个子维度得分,均未表现出显著差异($p>0.05$)。同时,实验组和对照组在注意功能的平均 d 值和工作记忆总分方面也未表现出明显差异($p>0.05$)。

(4)正念干预后实验组和对照组组内比较:实验组的正念水平总分及其五个子维度得分均有显著提升($p<0.05$),同时,在注意功能的平均 d 值和工作记忆总分方面也有显著提升($p<0.05$)。相比之下,对照组患者在正念水平总分及其五个子维度得分、注意功能的平均 d 值和工作记忆总分等方面均未出现显著变化($p>0.05$)。

(5)正念干预后实验组和对照组组间比较:实验组在正念水平总分及其五个子维度得分、注意功能的平均 d 值以及工作记忆总分等方面均显著高于对照组($p<0.05$)。

(6)正念干预后变量相关分析:实验组的正念水平、注意功能和工作记忆之间仍存在相关性。具体而言,正念水平与注意功能($r=0.67, p<0.01$)、工作记忆($r=0.64, p<0.05$)呈显著正相关,而注意功能与工作记忆之间也依然保持正相关($r=0.48, p<0.01$)。

(7)中介效应分析:注意功能的提升中介了正念干预对患者工作记忆的影响(95%CI[0.20, 0.62])。

结论 (1)康复期精神分裂症患者的正念水平、注意功能、工作记忆之间存在正相关关系。

(2)正念干预能够有效提升康复期精神分裂症患者的正念水平、注意功能和工作记忆。

(3)注意功能的提升中介了正念干预对康复期精神分裂症患者工作记忆的影响。

多种眼动范式对精神分裂症的诊断效能研究

朱嘉辉¹ 朱嘉辉² 石川²

1.北京安定医院

2.北京大学第六医院

目的 探究多范式的综合性眼动指标对于精神分裂症患者的辅助诊断判别能力;

方法 采用诊断性研究设计,共纳入 102 名精神分裂症患者和 102 名健康对照,依次完成阳性与阴性症状量表(Positive and Negative Syndrome Scale, PANSS)、功能大体评定量表(Global Assessment of Functioning Scale, GAF)以及眼动行为的检查(任务包括:定点凝视、朝向眼跳、反向眼跳、平滑追踪及自由浏览)。采用非参数检验比较两组间眼动指标的差异,使用判别分析构建综合性眼动判别函数,分别采用自身验证法和留一法(Leave-one-out)的交互验证来估计判别函数内部验证和交互验证的准确性,使用受试者工作特征曲线(Receiver Operating Characteristic Curve, ROC)评价判别模型的临床应用价值并比较不同范式组合的诊断效能,将诊断性眼动指标与精神病症状和功能量表总分进行相关性分析。

结果 相比较于健康对照组,精神分裂症患者在多个眼动任务中表现异常,包括定点凝视任务中,近距离干扰物条件下注视持续时间减少;朝向眼跳任务中终点增益增加;反向眼跳任务中, gap 条件下潜伏期增加、错误率增加和纠正率减少;平滑追踪任务中, 0.2Hz 条件下水平方向的速度增益降低, 0.4Hz 条件下眼跳的持续时间延长,水平方向和垂直方向的速度增益降低;自由浏览任务中,平均的注视次数、眼跳次数、眼跳幅度、眼跳平均速度以及总扫描路径均减少,平均注视持续时间增加(均 $p_{Bonferroni}>0.05$)。ROC 曲线比较发现加入反向眼跳指标后能够显著提升综合性眼动判别函数的诊断效能,5 范式组合(定点凝视/朝向眼跳/反向眼跳/平滑追踪/自由浏览)的分类准确率达到 90.7%,交互验证后为 89.2%。ROC 曲线 AUC 为 0.962(95%CI:0.936-0.987),灵敏度和特异度分别为 0.941 和 0.892,相较于 3 范式组合(定点凝视/平滑追踪/自由浏览)的分类准确率达到 87.7%,交互验证后为 86.8%。ROC 曲线 AUC 为 0.940(95%CI:0.906-

0.973), 灵敏度和特异度分别为 0.902 和 0.882, 具有更好的辅助诊断效能。其中, 反向眼跳的错误率与患者的精神症状呈正相关, 与患者的日常功能呈负相关。

结论 多种眼动范式的组合可作为精神分裂症可靠的辅助诊断工具, 反向眼跳任务能够显著提升综合性眼动指标的诊断效能;

关键词: 精神分裂症, 眼动行为, 眼跳行为, 诊断效能, 判别分析

精神障碍的自我污名功能影像学的现况分析

张龙渊^{1,2} 阿亚阔孜·杰克山别克^{1,2} 王丞基^{1,2} 李迎帅^{2,3} 邹韶红²

1. 新疆医科大学研究生学院

2. 新疆维吾尔自治区人民医院

3. 石河子大学医学院

目的 自我污名是患有精神障碍的个体逐渐意识到偏见和刻板印象并应用于自身, 从而产生的内在体验。自我污名会造成精神障碍患者的认知和社会功能受损、治疗依从性下降及不良预后等问题。本文通过分析归纳脑生化代谢物及各脑区功能连接, 能够更好的探究精神障碍和自我污名的神经病理生理机制, 从而早期发现精神障碍的自我污名, 并早期干预其带来的负面影响。

方法 检索 PubMed、CNKI、METSTR 等数据库。纳入标准: 含精神障碍障碍与自我污名及相关因素在功能磁共振中研究进展的相关文献。排除标准: 重复内容文献及与主题不相关的文献。根据纳入与排除标准, 最终纳入相关文献 70 篇。本文综述精神障碍患者的自我污名有关的脑生化代谢物、各脑区功能连接等方面的特征性改变, 探讨精神障碍患者伴有自我污名与不伴有自我污名各脑区功能连接和神经代谢的异同点。

结果 对自我污名及其相关因素的静息态与任务态磁共振成像的研究中表明, 自我污名、低自尊和自责的产生与前额叶皮质和其他脑区的功能连接状态或前额叶皮质本身的激活强度有着直接关联, 这可能是因为内侧前额叶皮质活动是自我相关的认知活动的基础。此外, 杏仁核、丘脑和前扣带回等脑区的激活程度与自我污名及其相关因素有潜在关联。

自我污名所产生的负面结果中包括精神障碍患者的低自尊和自杀风险增高, 同样低自尊也会导致自杀风险的增高, 使得自我污名和低自尊成为精神障碍患者自杀的中间变量, 故自我污名会对自杀导致的神经代谢水平变化产生潜在影响。

结论 在对自我污名现有研究中均提及情绪调节脑区(如前额叶、前扣带回和杏仁核)与自我污名的产生有诸多关联, 这些脑区在精神障碍中同样发挥着重要作用, 并且不论在精神障碍还是在自我污名中 N-乙酰天冬氨酸、谷氨酰胺等神经代谢物都发生着变化。当前, 全球重性精神障碍造成的社会负担日益严重, 并且更容易产生自我污名, 造成诸多负面影响, 因此国内外学者对精神障碍患者的自我污名高度关注, 但对精神障碍患者的自我污名的神经病理生理机制上不明确。未来, 我们可以进一步对精神障碍及自我污名进行神经影像学的研究, 以便于更好的了解其功能紊乱的脑区、环路及神经代谢物变化, 这对存在自我污名的患者精神障碍患者的早期干预及预后具有重要意义。

关键词: 双相情感障碍; 自我污名; 功能磁共振成像; 血氧水平依赖功能磁共振成像; 磁共振波谱成像

有氧运动联合计算机辅助认知治疗对精神分裂症 社会功能干预效果的随机对照

陈芳 刘陈*

宜昌市优抚医院

目的 探讨有氧运动联合计算机辅助认知训练对精神分裂症患者社会功能的干预效果

方法 选择宜昌市精神卫生中心 2023 年 10 月~2024 年 5 月符合纳入标准的 128 例精神分裂症患者, 根据随机数字表法分为常规组和试验组, 每组 64 例。由康复治疗师和医生共同评估病情后开展精神康复项目, 常规组给予常规康复训练, 包括日常生活方面、学习行为方面、工作行为方面; 试验组在常规组的基础上给予有氧运动联合计算机辅助认知功能训练, 有氧运动每天 30-40 分钟, 晨起由工作人员组织实施团体太极拳或八段锦, 坚持 2 周, 计算机辅助认知训练包括训练患者的感知运动协调能力、注意力稳定性、瞬时记忆能力、社会认知能

力, 各项训练 15 分钟, 每天一次, 坚持 2 周。有氧运动和计算机辅助认知治疗分别在一天上午和下午两个时间段, 保障治疗时间不冲突。治疗 2 周后, 比较两组治疗前后社会功能、生活质量的改善情况。

结果 试验组治疗后生活能力、工疗情况、社交能力、关心及兴趣、讲究卫生能力评分均较常规组更低, 差异有统计学意义 ($P < 0.05$ 或 $P < 0.01$); 试验组治疗后生活质量评定量表 (SQLS) 评分中各项目与常规组相比明显更低, 差异有统计学意义 ($P < 0.01$)。

结论 有氧运动联合计算机辅助认知功能训练用于精神分裂症患者中的效果较好, 不仅可以促进其认知功能的恢复, 还能增强其社会功能, 提高生活质量。

关键词: 有氧运动 计算机辅助认知训练 社会功能 精神分裂症

The Effect of Different Frequencies of CCRT Combined with Aerobic Exercise on Cognitive in Patients with Schizophrenia: A Randomized Controlled Study

Shucui Huang¹, Chengcong Wu^{1,2}, Hongxian Chen³

1.Wuhu Hospital of Beijing Anding Hospital, Capital Medical University (Wuhu Fourth People's Hospital)

2.Bengbu Medical University

3.The Second Xiangya Hospital of Central South University

Objective To explore the effects of frequency of CCRT combined with aerobic exercise on cognitive and psychiatric symptoms in patients with schizophrenia.

Methods One hundred and fifty-two patients with schizophrenia and cognitive impairment participated in the study and randomly divided into control, aerobic exercise (AE), CAE 1 (CCRT once a week combined with aerobic exercise), CAE 2 (CCRT twice a week combined with aerobic exercise), and CAE 3 (CCRT three times a week combined with aerobic exercise) groups. Changes of processing speed and cognitive flexibility at week 8 were evaluated as primary and secondary cognitive outcomes using the Trail Making Test:

Part A (TMT-A), the Brief Assessment of Cognition in Schizophrenia: Symbol Coding Test (SCT), and the Stroop Colour Word Test (SCWT). Positive and Negative Syndrome Scale (PANSS) scores were determined as other secondary outcomes

Results The CAE 2 and CAE 3 group showed significantly better performance in TMT-A, SCT, SCWT-Word and SCWT-Colour than the control and AE groups at week 8 ($p < 0.05$). However, no significant difference in TMT-A, SCT and SCWT at week 8 were found between the control, AE and CAE 1 groups. The CAE 2 and CAE 3 group showed significant improvements in the PANSS negative symptoms than the control group at week 8 ($p < 0.05$), but the AE and CAE 1 groups showed no significant difference in the changes of PANSS negative symptoms when compared with the control group. Moreover, there was no significant difference in the changes of TMT-A, SCT, SCWT and PANSS at week 8 were found between the CAE 2 and CAE 3 groups

Conclusion Eight-week CCRT (at least twice a week) combined with aerobic exercise may improve some cognitive performance and negative symptoms in patients with schizophrenia, and a appropriate frequency of the intervention strategy may be twice a week

关键词: CCRT, aerobic exercise, cognitive, schizophrenia

Intestinal Mycobiota Dysbiosis Associated Inflammation Activation in Chronic Schizophrenia

Xiuxia Yuan Xueqin Song*

the First Affiliated Hospital of Zhengzhou University

Objective The microbiome-gut-brain axis is related to schizophrenia (SCZ). The role of intestinal mycobiota in SCZ has been under investigated

Methods We present a half-year follow-up study involving 109 chronic SCZ patients and 77 healthy controls. Intestinal mycobiota was tested by internal tran-

scribed spacer (ITS). Untargeted liquid chromatography-mass spectrometry (LC-MS) was used to measure faecal metabolites. Symptom severity was assessed using the Positive and Negative Syndrome Scale

Results Enterotype analysis showed that *Candida*-type patients exhibited severer positive symptoms and depression factors than *Saccharomyces*-type patients. *Candida* and its top species and operational taxonomic units (OTUs) were positively correlated with depression factors (all $p=0.001$). Faecal metabolites analysis showed that upregulated metabolites were associated with chronic inflammation (NF- κ B pathway and T helper cell differentiation), downregulated metabolites were associated with glutamate metabolism, serotonergic and dopaminergic synapse. Procrustes analysis revealed significant correlation between intestinal mycobiota and faecal metabolites ($M2=0.937$, $p<0.001$). Metabolic module analysis showed that the top module, METurquoise (associated with Th1 and Th2 cell differentiation), was negatively correlated with SCZ ($r=-0.783$, $p<0.0001$), positively correlated with *Candida*, *Aspergillus*, *Talaromyces*, and *Trichosporon* (decreased in SCZ) and negatively correlated with *Saccharomyces* (increased in SCZ). We also found impairments of intestinal barrier in SCZ, characterized by increased in blood D-lactate (mucosa impairment marker) and decreased in blood mucin 2 (mucosal barrier protective protein). Serum levels of TNF- α was increased and showed stable high levels during treatment

Conclusion This study suggests that mycobiota dysbiosis-related chronic inflammation and an impaired intestinal mucosal barrier are associated with chronic SCZ.

音乐引导想象治疗研究热点及趋势-基于 Citespace 可视化分析

王文婕*

中国医科大学附属盛京医院

目的 音乐引导想象治疗作为一种特殊的音乐治疗, 主要通过音乐使来访者产生和发展意象, 帮助来访者加强积极资源及处理消极议题, 从而实现自我探索及个人成长。本文基于 Citespace 对音乐引导想象治疗进行可视化分析, 了解其研究热点及未来研究趋势。

方法 采用文献计量学方法, 检索 1996 年-2023 年 Web of Science Core Collection(WoS)核心合集数据库收录的音乐引导想象治疗研究的相关文献, 对所得文献的国家、研究机构、作者、关键词进行分析, 并运用 CiteSpace 6.2.R4 软件进行可视化分析。

结果 本研究共纳入 253 篇英文文献, 发文量呈现逐年上升趋势。发文量排名前三名的国家分别是美国、澳大利亚和英国, 其中美国占全部发文的 35%。在机构共被引分析中, 发文前三的机构分别是奥尔堡大学、墨尔本大学及挪威音乐学院, 且之间有密切合作。在作者共被引分析, 发文量最多的作者是 Beck Daniels, 并形成了以 Beck、Short 和 Grocke 为中心的研究团队。通过对关键词进行共现分析, 目前研究热点包括情绪、抑郁、焦虑及乳腺癌。在关键词时区可视化分析中, 音乐引导想象治疗作为一种有效的心理治疗方法, 不仅可以用于改善情绪、成瘾治疗、创伤后应激障碍治疗等, 近年来逐渐应用于乳腺癌术后及化疗康复、心脏术后、疼痛治疗等身心疾病康复中。时区可视化分析中另一重要结果为研究方向的变化, 逐渐从效果评价研究转向作用机制研究。通过数据分析发现, 音乐引导想象治疗作为一种对视觉和听觉同时刺激的治疗方法, 可能通过负面情绪和记忆相关的脑区产生神经激活作用来调节情绪; 另外治疗中对来访者进行脑电监测, 当音乐播放和意象出现时, 大脑额叶会发生不同的反应, 因而说明音乐引导想象治疗可能通过在与负面情绪和记忆相关的区域产生神经激活来调节情绪。在研究趋势预测中, 音乐引导想象治疗的神经生化、神经影像及神经电生理等机制研究将成为未来研究热点。

结论 本文通过 Citespace 软件对音乐引导想象治疗的研究热点及趋势进行可视化分析。音乐引导想象治疗通过音乐帮助来访者激发出不同意象, 帮助来访者缓解消极情绪, 加深积极资源, 从而促进个人探索及成长。目前主要的研究机构集中在欧美国家, 但各国之间的合作有限。现有研究主要关注音乐引导想象治疗在缓解情绪、促进身心疾病康复等的应用。对于其作用机制, 目前只有初步结论, 具

体作用机制尚不清楚,而神经生化、神经影像、神经电生理等机制研究将成为未来研究热点。

抑郁症伴焦虑患者生存质量的聚类分析和因子分析及其临床意义

翟伟光 曾玲芸* 祝欣缘 叶梦欣
深圳市康宁医院

目的 本研究旨在通过对抑郁症伴焦虑患者的生存质量评分进行聚类分析和因子分析,揭示不同患者组别的生存质量特征及其关键影响因素。将有助于临床医生制定更加个体化的治疗方案,提高患者的整体生活质量。

方法 本研究为横断面研究,通过方便抽样选取 1039 名抑郁症伴焦虑患者,采用问卷调查,调查内容包括社会人口学信息、抑郁症状、焦虑症状和生存质量评分。生存质量通过世界卫生组织生存质量测定量表简表(WHOQOL-BREF)进行评估,涵盖生理、心理、社会关系和环境四个领域。通过聚类分析、因子分析等数据分析方法,揭示抑郁症伴焦虑患者生存质量评分的差异及其关键影响因素。

结果 通过 K-Means 聚类分析,将患者分为三组:高生存质量组(Cluster 0)、中等生存质量组(Cluster 2)和低生存质量组(Cluster 1)。高生存质量组在生理领域、心理领域、社会关系领域和环境领域的生存质量评分均最高,均值分别为 3.12、2.98、3.19 和 3.24;中等生存质量组在上述四个领域的均值分别为 3.03、2.85、3.05 和 3.10;低生存质量组的均值最低,分别为 2.45、2.24、2.47 和 2.59。因子分析揭示两个主要因子:Factor 1:与所有生存质量评分有较高的正相关,特别是生理领域($\lambda=0.78$)和心理领域($\lambda=0.76$)。这表明患者的整体健康状况和生活质量是影响其生存质量的主要因素。Factor 2:与社会关系领域($\lambda=0.67$)和环境领域($\lambda=0.66$)的生存质量评分有较高的正相关。这表明患者的社会支持和生活环境对其生存质量有重要影响。

结论 不同聚类组在各个生存质量领域的评分存在显著差异。根据患者所在的聚类组,制定个体化的治疗方案。高生存质量组的患者可以进行常规的维护性治疗,而低生存质量组的患者整体生活质

量较差,需要更加集中的干预和支持,包括药物治疗、心理治疗和社会支持等多方面的干预,以改善其生活质量。中等生存质量组的患者则可以根据具体情况提供个性化的治疗方案,关注患者的特定需求。因子分析揭示影响生存质量的关键因素,总体健康状况和社会支持与环境因素是影响抑郁症伴焦虑患者生存质量的主要因素。临床医生应全面评估患者的整体健康状况和社会支持系统,提供个性化的治疗方案,增强社会支持,改善生活环境,以全面提升患者的生活质量。本研究的结果为临床实践提供重要的参考依据,未来的研究可以进一步探讨这些因子的具体影响机制,以及如何通过多学科合作优化干预措施,提高患者的生活质量。

Exploring The Best Test And/or Task To Measure The “Theory of Mind” of Ultra-high Risk Individuals Before Intervention: A Meta-analysis and Systematic Review

Siyao An*

Mental Health Center of West China Hospital

Objective The concept of prodromal psychosis state, also called the Ultra-high risk (UHR) for psychosis or clinical high risk (CHR) for psychosis, has been aware by most of the researchers and clinical doctors in the domain of schizophrenia spectrum disorder. The difference of “theory of mind (ToM)” capacity between UHR individuals and healthy people is distinct according to a plenty of studies, which suggests the deficit on related regions of brain function in the UHR individuals. However, there is not a single test or task, like “reading the mind in the eyes” test for autism or hinting task for schizophrenia, that was originally and specifically devised to measure the ToM deficit of UHR individuals, which might have been a cause of the contrary or ambiguous results in related studies. Thus, there is a necessity to discuss the efficiency of various tests and tasks on measuring the ToM capacity deficit in UHR individ-

uals in summary. Objective To identify the most effective test or task to measure the difference of ToM capacity between UHR individuals and healthy people. Question: Which task is the best to unravel the difference between Ultra-high risk for psychosis individuals and healthy people on ToM capacity

Methods Data source: Multiple databases including Pubmed, PsycINFO, CNKI have been searched for related studies reported in any language from Jan 1995 to Jul 2023, using combinations of terms of “theory of mind”, “ToM”, “social cognition”, “psychosis”, “At risk mental state”, “Ultra high risk for psychosis”, “Clinical high risk for psychosis”, “High psychosis risk”, “High risk for psychosis”, “early initial prodromal state”. Selection criteria: The study included cross-sectional and cohort studies that allowed reviewer to compare the ToM capacity of UHR group with which of healthy control group at the baseline before any intervention had been deployed. Data extraction: The study was conducted following the PRISMA guidelines and MOOSE guidelines. The quality of the included studies has been assumed using the NOS (Newcastle-Ottawa Scale) and the lowest NOS score of the included studies is 7. Data analysis: Cohen’s d was used to depict the effect size of tasks and tests. The meta-analysis has included 8 studies of the “Reading the Mind in the Eyes Test (RMET)” and 4 studies of the “Strange Story Task (SST)”. 7 other tests and/or tasks including the “nonverbal Cartoon Task”, “Faux Pas Task”, “Hinting Task”, “ToM Picture Stories Task”, “The Awareness of Social Inference Test (TASIT)”, “False Belief Task” and “Short Story Task” have been qualitatively reviewed because of the insufficient amount of related data

Results The quantitative data shows that the overall effect of RMET is Cohen’s $d = 0.24$ with heterogeneity of $\text{Tau}^2 = 1.64$; $\text{Chi}^2 = 35.58$, $df = 8$ ($P < 0.0001$); $I^2 = 78\%$. For SST it is Cohen’s $d = 0.29$ with heterogeneity of $\text{Tau}^2 = 0.17$; $\text{Chi}^2 = 4.44$, $df = 3$ ($P = 0.22$); $I^2 = 32\%$. The qualitative summarization shows that the Faux Pas task is the most potentially effective and stable task, which has a relatively high Cohen’s d value and stable statistical significance in all 3 related studies. ToM Picture Stories Task is also a potentially

good task for its high effective value and stable significance across the studies. Both the “Short Story Task” and TASIT showed significant difference between UHR and healthy people but there is only 1 study for each has used them. Other tests or tasks have shown unstable outcome on statistical significance

Conclusion This systematic review and meta-analysis showed the performance of being used tests and tasks in ToM comparing between UHR individuals and healthy people, which suggested that there could be better choices to depict the ToM deficit in the UHR individuals. And for those most commonly used methods there might be a necessity to modify the design to improve the explanatory power when discussing the ToM features of UHR individuals.

首发未用药精神分裂症伴脱髓鞘改变患者的认知障碍与糖代谢情况

张艳 宋学勤* 陈一绍 苏柯举
郑州大学第一附属医院

目的 探究首发未用药精神分裂症群体中, 伴脱髓鞘改变与不伴脱髓鞘改变的患者相比, 认知水平与糖代谢水平的变化情况。

方法 选择2016年-2023年于我院就诊的89例首发未用药精神分裂症患者, 依据脑部磁共振平扫结果分为首发未用药精神分裂症伴脱髓鞘改变患者($n=46$)和首发未用药精神分裂症不伴有脱髓鞘改变患者组($n=43$), 使用精神分裂症认知功能成套测验(MCCB)评估两组患者的认知功能, 比较两组患者血清胰岛素、空腹血糖、胰岛素抵抗指数、胃饥饿素、胰高血糖素样肽-1水平差异。

结果 两组患者的年龄、性别、吸烟史、家族史、体质指数无统计学差异($p>0.05$)。与首发未用药精神分裂症不伴脱髓鞘改变的患者相比, 首发未用药精神分裂症伴脱髓鞘改变的患者认知障碍更严重, 主要表现在信息处理速度、视觉学习方面($p<0.005$)。首发未用药精神分裂症伴脱髓鞘改变患者

组的胃饥饿素水平明显高于不伴有脱髓鞘改变患者组 ($z=-2.759$, $p=0.006$), 胰高血糖素样肽-1 水平低于不伴有脱髓鞘改变患者组 ($z=-4.056$, $p<0.000$)。两组患者的胰岛素、空腹血糖、胰岛素抵抗指数并无显著差异 ($p>0.05$)。

结论 与首发未用药精神分裂症不伴脱髓鞘改变的患者相比, 首发未用药精神分裂症伴脱髓鞘改变的患者认知障碍更为严重, 且伴有糖代谢水平失衡。

关键词: 精神分裂症, 脱髓鞘, 认知障碍, 胃饥饿素, 胰高血糖素样肽-1

Liuzijue Qigong Improves Clinical Symptoms and Social Function in Inpatients with Moderate To Severe Depression: A Randomized Controlled Study

Jin Gao¹, Jinxiu Chen², Shixiong Lin¹, Yongming Wang¹, Peng Zhang², Yangyang Xu¹, Yan Qiu¹

1.Xiamen Xianyue Hospital

2.Fujian University of Traditional Chinese Medicine

Objective Qigong is a mind-body exercise, combine physical activity, breathing and meditation to harmonize the body, mind and spirit. As an important component of traditional Chinese medicine, qigong has been suggested as a holistic health practice to promote physical and mental well-being. During COVID-19, Liuzijue qigong has been proven to be an recognized method for improving physical function and quality of life for discharged rehabilitation patients, while significantly alleviating their anxiety and depression. This study evaluated the impact of Liuzijue qigong as a complementary therapy on the clinical efficacy and social function of hospitalized patients with moderate to severe depression

Methods This study is a randomized controlled trial (RCT) with evaluator blinding. We recruited 64 hospitalized patients with moderate to severe depressive episodes who meet the selection criteria, randomly divided into a 1:1 ratio into a conventional treatment combined with Liuzijue qigong intervention group and a

conventional treatment control group. During the 8-week clinical intervention process, the intervention group implemented liuzijue intervention (once a day for 30 minutes each time) on the basis of conventional drug treatment and routine nursing plan

We used the change in Hamilton Depression Scale (HAMD) score from baseline as the primary outcome measure efficacy endpoints; HAMD change from baseline to 2 weeks after intervention as well as clinical response ($\geq 50\%$ reduction in HAMD score from baseline) at 2 weeks and 4 weeks as secondary outcomes. SHEEHAN Disability Scale(SDS) was used to evaluate changes of social function. We considered both the individual scores for each dimension as well as the overall score, which reflects general functionality.

Results After treatment, the HAMD scores of both groups of subjects showed a significant decrease compared to before treatment, indicating a significant improvement in depressive symptoms. Compared with the control group, the intervention group showed a larger decrease in HAMD score at 2 weeks [LS mean (95%CI)= -3.34 (-5.59,-1.10), $p=0.003$], and this difference was further widened at 4 weeks [LS mean (95%CI)= -6.53 (-5.44,-7.62), $p<0.001$]. At 4-week time point, the response rates of depression symptoms in the intervention group was significantly higher than that in the control group ($p=0.001$). At 2-week point, no subjects had depression symptom scores that met the remission criteria. At 4-week point, 5 (15.63%) patients in the intervention group met the remission criteria, but no one in the control group achieved remission

Generalized estimating equations analysis found that after 2 and 4 weeks of intervention, the total SDS scores and subscales of the experimental group and the control group significantly decreased compared to baseline. After adjusting the baseline scores, there was no significant difference in the total SDS scores between the experimental group and the control group at 2 weeks. At four weeks, the total SDS score and subscales of the experimental group was significantly lower than that of the control group, indicating better social function performance.

Conclusion The main findings of the study support our research hypothesis, which Liuzijue shows a

positive impact on accelerating improvement of depressive symptoms and social function in hospitalized patients with moderate to severe depression. The utilization of traditional Chinese medicine therapy in the realm of psychiatry can be significantly enhanced, thereby advancing its further investigation and propagation. Additionally, it holds the potential to exert a broadened influence in the theoretical framework of traditional Chinese nursing and non pharmacological treatment

关键词: Liuzijue qigong, depression, social function, randomized controlled trial

正念认知疗法联合抗抑郁药物在抑郁症治疗中的作用

庞礼娟*

郑州大学第一附属医院

目的 探讨正念认知疗法联合抗抑郁药物治疗对抑郁症患者复发率和生活质量的影响。

方法 纳入抑郁症患者 130 例, 随机分为实验组和对照组, 两组各 65 例, 其中实验组接受药物联合正念认知疗法治疗, 对照组接受单纯药物治疗, 比较两组患者的复发率和生活质量水平恢复状况, 其中治疗药物主要考虑选用 5-羟色胺再摄取抑制剂类抗抑郁剂 (SSRIs)。实验组患者在常规药物治疗基础上联合进行正念认知疗法治疗, 先进行集中干预 6 个月, 每周 1 次, 每次治疗 2.5 小时, 共 24 次; 后 6 个月继续日常正念认知疗法练习, 通过微信群进行监督, 持续 6 个月。两组患者在治疗前后均进行汉密尔顿抑郁量表、健康调查问卷和社会功能量表评估。

结果 治疗前, 两组患者间三个量表 (汉密尔顿抑郁量表、健康调查问卷和社会功能量表) 评分相比无明显差异 ($P>0.05$)。治疗 1 年后, 对照组有 20 例患者复发, 复发率为 30.77%, 实验组有 9 例患者复发, 复发率为 13.85%, 两组间复发率有显著差异 ($P<0.05$)。两组患者的汉密尔顿抑郁量表和社会功能量表评分均较治疗前明显降低 ($P<0.05$), 健康调查问卷评分则较治疗前明显升高 ($P<0.05$), 且实验组汉密尔顿抑郁量表、健康调查问卷和社会功能量表评分治疗前后的差异均显著高于对照组

($P<0.05$)。

结论 与单纯药物治疗相比, 正念认知疗法联合药物治疗可有效预防抑郁症患者的复发, 同时还可以提高其生活质量。

精神分裂症患者康复影响因素的质性研究

代悠然¹ 陈颖¹ 王怡² 李水英¹ 张倬秋¹ 邓红¹

1. 四川大学华西医院

2. 四川省绵阳市第三人民医院

目的 探索精神分裂症患者及照顾者中影响精神康复的相关因素, 了解康复过程规律, 构建符合本土文化背景的康复规律理论模型。

方法 本研究采用立意抽样的方法, 对符合入组标准的精神分裂症及相关障碍患者及其照顾者进行访谈。采用半结构化访谈, 根据访谈大纲, 以开放和半开放问题了解被访谈者的主观体验和感受。按照资料信息达到饱和的要求, 每次访谈时间约 60-90 分钟。访谈内容进行录音及现场笔记, 尽可能详细和准确地记录访谈内容和情境。访谈结束后立即将录音和笔记整理为电子稿, 以便进一步分析和整理。数据分析采用质性研究中扎根理论的方法, 对访谈资料进行开放编码、主轴编码、选择编码, 归纳提取出影响精神分裂症患者康复的影响因素。运用三角测量法检验编码的一致性。

结果 在访谈的 30 名患者及 20 位照顾者中, 经过对访谈资料进行开放编码、主轴编码、选择编码, 发现影响精神分裂症患者康复的积极因素有患者自我效能高和良好的支持系统, 阻碍因素有患者自我效能低、负性环境压力和症状及副作用的干扰。从照顾者角度, 影响精神分裂症患者康复的积极因素有患者自我效能高和良好的支持系统, 阻碍因素有患者自我效能低、负性环境压力和症状及副作用的干扰。

结论 精神分裂症患者的精神康复不仅仅是追求症状的改善, 还需要从疾病、环境和个体发展角度, 总结康复规律, 制定康复策略, 并争取来自家庭、社区、社会等多方面的支持。

病耻感对于重性精神疾病患者公开与否自身病情的影响探究

安思遥*

华西医院心理卫生中心

目的 精神疾病多有病程长, 症状显著, 对功能损害大以及病耻感强的特点, 影响患者生活的各个方面, 因此, 患者常常需要向各种相关人员公开自己的病情, 如老师、领导, 和社区工作人员等。对于自身病情的公开, 也是患者开始走上复元之路与降低病耻感的关键的第一步。然而, 出于如过于强烈的病耻感、结构性的歧视等, 这种公开往往面临着各种阻力, 且可能会给患者带来不同程度的负面后果, 如对自尊的伤害、他人的拒绝与排斥等, 对患者的复元造成阻碍。在此基础上, 也有各种干预措施开发出来以期对抗这一问题。本研究的目的在于探讨各种人口学和病耻感因素对于重型精神疾病, 包括精神分裂症谱系障碍、双相情感障碍、重型抑郁障碍患者公开自身病情的影响。

方法 本研究仅纳入来自中国的患者, 他们均被诊断为至少具有精神分裂症谱系障碍、双相情感障碍与重型抑郁障碍的其中一种疾病, 且不具有智力障碍。我们收集了患者人群的人口学资料, 包括性别、年龄、文化程度、婚姻状况等, 使用精神疾病的自我病耻感简化版量表 (SSMIS-SF) 测量了病耻感, 收集了其具体的公开情况以及公开意愿, 并使用 COMIS (The Coming Out with Mental Illness Scale) 收集了每个个体认为的公开的益处 (BBO) 以及保密的原因 (RSI)。使用分层线性回归分析了人口学数据、SSMIS-SF 四个维度对公开的益处以及保密的原因的影响。

结果 本研究纳入患者共 560 名, 210 名来自社会心理复元机构, 350 名来自当地社区, 且均来自四川省成都与自贡地区。根据分层线性回归, 年龄显著正向影响公开的益处 ($B=.010, p=.022$)。对病耻感的认同 (Agree) 维度显著正向影响公开的益处 ($B=.243, p=.001$); 病耻感的伤害自尊 (Harm) 维度显著负向影响公开的益处 ($B=-.177, p=.011$); 年龄、文化程度显著负向影响保留的原因 ($B=-.013, p=.001$)、($B=-.241, p=.017$) 对病耻感的意识 (Aware)

维度、伤害自尊 (Harm) 维度、应用 (Apply) 维度显著正向影响保留的原因 ($B=.168, p=.002$)、($B=.161, p=.011$)、($B=-.209, p=.005$)。

结论 通过本研究的探讨, 可以发现, 对于已经选择公开自身病情的个体来说, 其年龄越大, 对于病耻感认同越强, 越认为公开是有益的, 而病耻感对自尊的伤害则会降低公开的益处; 对于选择保密自身病情的个体来说, 其年龄越小, 文化程度越低, 越认为不公开病情存在重要原因, 而除了认同 (Agree) 以外的耻感维度均会随着其增强而增强个体保密病情的理由。

关键词: 病耻感; 重型精神疾病; 病情公开

虚拟现实技术在酒精使用障碍患者治疗中的应用效果评估

王旭皓 湛红献*

中南大学湘雅二医院

目的 酒精使用障碍 (Alcohol Use Disorder, AUD) 是一种常见的慢性复发性脑疾病, 已经成为当今世界严重的公共卫生问题。然而, 针对酒精使用障碍的现有非药物治疗方法疗效有限。已有研究发现线索暴露疗法 (Cue Exposure Therapy, CET) 可能降低患者的渴求, 减少酒精使用, 从而减少复发。虚拟现实 (Virtual Reality, VR) 技术正广泛应用于精神病学领域, 具有较高的生态效度, 能够增加线索暴露效果。本研究旨在利用虚拟现实技术结合线索暴露疗法和厌恶疗法 (Aversion Therapy), 探讨虚拟现实技术对酒精使用障碍者的饮酒行为及焦虑抑郁状态的干预效果, 为酒精使用障碍的临床诊断及治疗提供新思路。

方法 研究对象为南宁市第五人民医院住院治疗的 80 名酒精使用障碍者, 分为干预组 (虚拟现实技术联合常规药物治疗组, 50 人) 和对照组 (常规药物治疗组, 30 人)。入组前, 所有被试均依据《精神障碍诊断与统计手册》第五版 (DSM-5) 的酒精使用障碍诊断标准进行评估, 符合诊断标准者方可纳入研究。干预组使用基于虚拟现实构建的酒瘾干预系统进行治疗, 每 2 天进行一次干预, 共 7 次, 为期 14 天。在治疗前后, 使用宾夕法尼亚酒精渴求量表 (PACS) 评估被试对酒精的渴求水平, 使用酒精

拒绝自我效能感量表 (AASES) 评估被试对酒精的自我拒绝效能水平, 使用 9 项患者健康问卷 (PHQ-9) 评估被试的抑郁状况, 使用 7 项广泛性焦虑障碍量表 (GAD-7) 评估被试的焦虑状况。

结果 治疗前, 两组在 AASES、PHQ-9 和 GAD-7 得分上不存在显著差异 ($p > 0.05$), 但干预组的 PACS 得分显著高于对照组 ($p < 0.001$)。治疗后, 在 PACS 得分上, 两组均显著下降 ($p < 0.001$), 且两组之间得分无差异, 但干预组的得分下降幅度更大。并且, 治疗后两组 AASES 得分均呈上升趋势, 且干预组前后差异更显著 ($p < 0.001$)。在 PHQ-9 得分上, 治疗后两组得分均呈下降趋势, 干预组前后差异也更显著 ($p < 0.001$)。在 GAD-7 得分上, 治疗后干预组得分显著下降 ($p < 0.001$), 而对照组未见显著差异。

结论 本研究发现, 虚拟现实技术联合药物治疗对酒精使用障碍患者的干预效果优于单纯药物治疗。具体而言, 基于虚拟现实技术的线索暴露疗法和厌恶疗法能够更显著地降低酒精渴求, 提高酒精拒绝自我效能感, 改善抑郁和焦虑症状。然而, 这一结论仍需通过大样本的严格随机对照试验进一步验证。

TMS 联合 SCIT 治疗对精神分裂症患者内部动机和社会认知功能作用的初步探讨

祖先勇* 刘慧芳 傅澎 何国运 陈纤惠 何转玲 李良菊 董毅
北海丹升精神病医院

目的 内部动机缺陷作为精神分裂症的一种核心表现, 与患者的认知操作水平有关, 被视作认知矫正训练治疗效应的一种负性预测因素。本研究试图探讨经颅刺激治疗对精神分裂症患者参与社会认知康复训练的内部动机影响, 以及在社会认知功能康复中的作用。

方法 42 例疾病稳定期精神分裂症患者, 随机分为经颅刺激联合社会认知交互训练治疗组 (SCIT+TMS) 和单纯 SCIT 治疗组 (SCIT)。SCIT 治疗每周二次, 每次 60 分钟, 共 20 次。TMS 刺激

部位置于左背外侧前额皮质, 治疗每天 1 次, 连续 15 次。所有被试治疗前和治疗后均接受精神分裂症内部动机量表 (IMI-SR)、心理理论故事图片任务 (ToM-PST)、中文版模棱两可、目的和敌意问卷 (AIHQ-C)、心智化量表 (MentS)、中文版人际反应指针量表 (IRI-C) 评估、阳性和阴性症状量表 (PANSS) 评估。

结果 ① SCIT+TMS 组, ToM-PST 后测总分、排序均分、理解初级错误信念、理解初级信念总分、理解欺骗和理解欺骗的侦测均高于前测, 而排序平均时间后测低于前测, 差异具有统计学意义 (均 $P < 0.05$); SCIT 组, ToM-PST 后测总分、排序均分、理解初级错误信念、理解初级信念总分、理解次级错误信念、理解次级信念总分、理解三级错误信念和理解欺骗均高于前测, 而排序平均时间后测低于前测, 差异具有统计学意义 (均 $P < 0.05$); ToM-PST 总分和各项因子分前测与后测的差值, 两组间差异均无显著统计学意义 (均 $P > 0.05$)。② SCIT+TMS 组, AIHQ-C 后测模棱两可场景 HB 分、故意场景 HB 分、故意偏向总分, 以及模棱两可场景 AB 分均低于前测, 差异具有统计学意义 (均 $P < 0.05$); SCIT 组, AIHQ-C 除故意场景 AB 分外, 前测与后测间评分差异均无统计学意义 (均 $P > 0.05$); AIHQ-C 前测与后测评分间差值, 除故意场景 AB 差值 SCIT+TMS 组高于 SCIT 组 ($z = -1.996, P = 0.046$) 外, 余 AIHQ-C 前测与后测的差值, 两组间均无显著统计学意义 (均 $P > 0.05$)。③ MentS 和 IRI-C 评分, 两组前后测间差异均无显著统计学意义 (均 $P > 0.05$), 前后测差值两组间的差异无显著统计学意义 (均 $P > 0.05$)。

结论 神经调节干预结合认知康复治疗, 可能有助于改善精神分裂症患者的社会认知功能。研究结果未能证实, 针对左背外侧前额皮质的 TMS 刺激有助于提高患者内部动机水平, 以及促进康复训练治疗中患者社会认知功能水平的改善, 这一点需今后在扩大样本, 改进试验方法的基础上进一步深入研究。

Establishing The Chinese Norms for The MMPI-3: A Comparative Analysis of English and Chinese Versions

Shiyang Wang Chuan Shi*
Peking University Sixth Hospital

Objective The Minnesota Multiphasic Personality Inventory-3 (MMPI-3) is the latest iteration of one of the most widely used psychological assessment tools in the world. It is a 335-item inventory with 52 scales that assess a range of psychological constructs, from clinical syndromes to personality traits. However, the Chinese norms for the MMPI-3 have never been established before. This study aims to develop a Chinese version and compare the differences of scale scores between Chinese and English versions

Methods A total of 70 students from Peking University, Renmin University of China, and Beijing Foreign Studies University, with a preference for English and related majors, and a minimum TOEFL reading score of 26 or IELTS reading band of 8.0, were recruited. Participants completed the MMPI-3 in English and in Chinese on different days, respectively. Paired-sample t-tests were conducted to compare the means of scale scores across language administrations and correlations for each scale across language versions

Results Across languages, 26 scales demonstrating significant differences ($p < 0.05$) included CRIN, TRIN, F, Fp, Fs, EID, THD, BXD, SOM, LPE, ASB, PER, ABX, NUC, EAT, COG, HLP, SFD, STR, CMP, ARX, FML, SFI, SAV, NEGE and INTR. These scales exhibited variations that might reflect cultural or linguistic nuances in the assessment process. The consistency in scores for other scales suggested a reliable translation and adaptation, indicative of their robustness in a bilingual assessment context. All 52 scales reviewed showed a high degree of correlation ($r > 0.3$ and $p < 0.05$) between the English and Chinese versions, confirming a significant and consistent relationship across language versions

Conclusion Scales with substantial differences in scoring between the two language versions, suggest that it merit some revision for improvement of translation. This study will contribute to the establishment of the Chinese norms for the MMPI-3 and assess the cross-cultural equivalence of the test.

关键词: MMPI-3, Chinese norms, comparative analysis

基于数字生物标志物的抑郁症治疗效果预测研究

王铭洽¹ 马毓² 陶言豹³ 石川¹

1. 北京大学
2. 苏州市广济医院
3. 新乡医学院

目的 随着人工智能、5G 网络等技术的快速发展,基于可穿戴设备的"数字化生物标志物"医疗监测体系正在构建。可穿戴设备与智能手机 App 数据收集相结合,有助于加快临床决策过程。本研究旨在利用多维数据和机器学习方法,预测第 8 周抑郁症治疗效果,探索数字生物标志物在抑郁症预后监测中的应用潜力。

方法 选取 2023 年 8 月至 2024 年 4 月在北京大学第六医院门诊就诊的 18 至 60 岁重性抑郁障碍患者,根据第 8 周 HAMD-17 减分率是否超过 50%分为治疗有效组和治疗无效组。收集入组基线至第 2 周期间的可穿戴设备数据(步数、睡眠、心率、卡路里消耗)和智能手机 App 每日心情评分。采用长短期记忆网络(LSTM)构建预测第 8 周治疗效果的二分类模型,并采用 5 折交叉验证评估模型性能。将 LSTM 模型与仅使用基线人口学和临床量表的基准模型进行对比,检验差异的显著性。采用排列特征重要性方法量化各类数字生物标志物特征的贡献度,并通过可视化直观展示。基于特征重要性分析,采用递归特征消除方法进一步优选关键特征子集。

结果 本研究共纳入 40 名患者,其中治疗有效组 21 例,治疗无效组 19 例。可穿戴设备和智能手机 App 数据完整性达 65.7%。LSTM 模型对第 8 周治疗效果的预测准确率达 85.7%,显著优于基准模型(74.4%, $p < 0.05$)。每日睡眠时长、平均心率和每日心情评分是最关键的预测因素,贡献度分别为 28.4%、23.7%和 19.5%。仅使用上述 3 个关键特征的优化 LSTM 模型,也能达到 83.6%的预测准确率,与完整模型无显著差异($p > 0.05$)。

结论 本研究证实了数字生物标志物在抑郁症预后监测中的重要价值。睡眠时长、平均心率和每

日心情评分等指标可能是较为关键的预测因素,为未来基于可穿戴设备的精准医疗应用提供了参考依据。局限性:样本量较小。

志愿服务职业康复模式对精神分裂症患者的康复疗效研究

李依然 李先宾*

首都医科大学附属北京安定医院

目的 探究志愿服务职业康复模式对精神分裂症患者的康复疗效。

方法 将符合入组标准的 31 例稳定期精神分裂症患者,采用随机数字表法随机分为研究组及对照组。研究组 16 例,在药物治疗的基础上联合职业康复训练及志愿服务干预;对照组 15 例仅接受常规门诊及社区卫生康复服务。采用社会功能缺陷量表(SDSS)评定患者社会功能缺陷程度、康复状态量表(MRSS)评估患者康复状态,阳性和阴性症状量表(PANSS)评估患者精神病性症状严重程度。患者自我评估部分采用工作社交技能评估量表(WSSS)、执行功能行为评定量表成人版自评问卷(BRIEF-A)、精神分裂症患者生活质量量表(SQOL)、自我效能感量表(GSES)、林氏就业准备评估量表(LASER)。同时统计第 12 周末两组分别获得工作的患者数。

结果 (1)入组 12 周后,研究组 SDSS 总分、MRSS 社交维度、PANSS 阴性症状评分低于对照组,差异均具有统计学意义($P<0.05$)。但研究组患者工作社交技能、执行功能、生活质量、自我效能感、就业准备状态等自评分与对照组相比差异不显著。组内比较,第 12 周末研究组 SDSS 总分、MRSS 总分、MRSS 活动维度评分、MRSS 症状维度评分与基线相比具有显著差异($P<0.01\sim 0.05$)。(2)入组第 12 周末,研究组有 2 例进入庇护性就业,对照组尚未有患者重新获得工作。

结论 志愿服务职业康复干预模式能够改善稳定期精神分裂症患者社会功能,改善患者社交状态,缓解疾病阴性症状,同时对改善患者就业结局也有一定效果。

关键词:精神分裂症,志愿服务,职业康复

依托咪酯滥用患者戒断前后焦虑、抑郁及认知功能的比较

王艳艳 赵天舒 向小军*

中南大学湘雅二医院

目的 依托咪酯(Etomidate)是一种短效静脉全身麻醉药物,目前作为传统毒品的替代物品,依托咪酯滥用的问题尤为突出。目前尚未有研究对依托咪酯滥用者人群特征及情绪、认知情况进行系统性评估。本研究以依托咪酯滥用患者为研究对象,旨在对其戒断前后情绪、认知状况进行量表评估以描绘依托咪酯滥用者戒断前后的情绪及认知变化。

方法 患者在自愿戒毒机构内进行为期 4 周的药物戒断,在出入院时使用抑郁症筛查量表(PHQ-9)、焦虑症筛查量表(GAD-7)以及蒙特利尔认知评估量表(MoCA,北京版)分别评估患者的抑郁、焦虑及认知功能损伤情况,并对戒断前后依托咪酯滥用患者抑郁、焦虑及认知功能损害的情况运用配对样本 T 检验进行统计分析。

结果 本研究共纳入依托咪酯滥用患者 67 例,其中完成戒断前后两次评估的患者 55 例,本研究纳入的依托咪酯滥用患者以男性(82.1%)、未婚(58.2%)、初中学历(43.3%)为主,年龄介于 17-56 岁之间,平均年龄(27.75 ± 7.28)岁,平均 BMI(22.48 ± 4.72) kg/m^2 ,97%的患者伴有烟、酒及其他成瘾物质的使用。多数(98.1%)的患者以电子烟的形式滥用依托咪酯;初次使用依托咪酯的原因主要有朋友介绍(71.6%)、好奇尝试(25.4%);在 23 个产生强烈渴求的患者中,使用依托咪酯至产生强烈渴求次数的中位数为 4 次;使用总次数的中位数为 6 次,其中有 20.9%的患者使用依托咪酯超过 30 次。戒断前依托咪酯滥用患者 PHQ-9 的得分为 4.38 ± 4.92 ,戒断后依托咪酯滥用患者 PHQ-9 的得分为 2.51 ± 3.01 ,两者之间存在显著性差异($P<0.05$);戒断前依托咪酯滥用患者 GAD-7 的得分为 3.11 ± 3.94 ,戒断后依托咪酯滥用患者的 GAD-7 得分为 1.42 ± 2.54 ,两者之间存在显著性差异($P<0.05$);戒断前依托咪酯滥用患者的 MoCA 评分为 23.67 ± 2.65 ,戒断后依托咪酯滥用患者的 MoCA 评分为 26.40 ± 3.37 ,两者之间存在显著性差异($P<$

0.05)。

结论 量表结果初步提示短期重复使用依托咪酯会导致患者出现抑郁、焦虑情绪及认知功能损害。经过戒断后,患者抑郁、焦虑及认知功能损害均明显改善,这可能提示依托咪酯短期暴露造成的精神损害是可逆性的。故在依托咪酯滥用患者治疗时应注意其抑郁、焦虑水平变化及认知功能损害的康复。本研究率先报告了依托咪酯滥用者戒断前后的情绪及认知变化特点,为康复依托咪酯滥用者提供了关注及治疗重点。

Causal Relationship between Bipolar Disorder and Sex Hormone Binding Globulin: A Bidirectional Two-sample Mendelian Randomization Study

Keju Su Xueqin Song*

The First Affiliated Hospital of Zhengzhou University

Objective This investigation aims to dissect the bidirectional causal relationships between bipolar disorder (BD) and sex hormone-binding globulin (SHBG) using a two-sample Mendelian randomization (MR) studies

Methods Capitalizing on genetic variants identified in large-scale genome-wide association studies (GWAS) as instrumental variables (IVs), this study meticulously explores the causal dynamics between BD and SHBG. IVs pertinent to BD were extracted from the Psychiatric Genomics Consortium, and those related to SHBG were curated from the UK Biobank. Employing two-sample MR analyses, augmented by sensitivity analyses, the study probes the causal repercussions of BD on SHBG concentrations and the reciprocal, ensuring the integrity and robustness of the causal inferences drawn

Results The analysis delineated a statistically significant augmentation in SHBG levels attributable to BD in females (Odds Ratio [OR]: 1.027; 95% Confidence Interval [CI]: 1.007-1.042; $P = 0.018$) and males

(OR: 1.036; 95% CI: 1.012-1.060; $P = 0.003$), underlining BD's significant regulatory effect on hormonal balance. In contrast, the reciprocal causal analysis did not manifest a statistically significant influence of SHBG levels on BD susceptibility in either gender, denoting that variations in SHBG levels do not confer a predisposition to BD

Conclusion Illuminating a unidirectional causal pathway from BD to increased SHBG levels, this study contributes pivotal insights into the hormonal disruptions associated with BD, conspicuously delineating the absence of a reverse causal impact. The findings accentuate the intricate nexus between psychiatric conditions and endocrine fluctuations, advocating for expanded research into the biological underpinnings and potential therapeutic implications of these relationships.

关于抑郁症患者不同声音特质与抑郁症病情严重程度相关性的研究

陶言豹¹ 石川^{1,2} 徐晨阳²

1.新乡医学院第一附属医院

2.北京大学第六医院

目的 探索抑郁症患者不同声音特质与抑郁严重程度相关性的研究

方法 本研究从北京大学第六医院及淮南市第四人民医院招募了54名抑郁症患者,每位患者均由两名经验丰富的精神科医生进行精神状态检查,采集人口学信息。入组患者将于一个静音密闭的房间内由一名精神科医生面对面采集患者音频信息,并使用汉密尔顿抑郁量表对患者病情进行评估。

统计分析采用统计学软件SPSS27对收集的数据进行统计分析。经正态性检验后对于人口学数据与汉密尔顿抑郁评分采用独立两样本t检验比较其差异性,对于符合正态分布的声音特征与汉密尔顿抑郁评分采用线性相关分析检验相关性,对于偏态分布的声音特征数据和汉密尔顿抑郁量表评分则使用秩相关检验分析其相关性。

结果 本研究所有患者均接受了HAMD-24量

表评分估计其病情,平均得分为 24.96 ± 6.50 ;表明患者普遍存在中重度的抑郁症状。其中男性13人,平均年龄 32.92 ± 11.25 ;女性41人,平均年龄 32.80 ± 11.80 ;对人口学特征进行分析,发现性别及年龄与HAMD评分之间未见显著差异性($r=0.152$; $P=0.272$)。男性组HAMD得分为 24.23 ± 6.52 ;女性组HAMD得分为 25.19 ± 6.55 ;两组总体HAMD得分总体均数无统计学差异($t=-0.463$, $P=0.645$)。对患者的声音特征进行相关分析, loudness_sma3_meanFallingSlope ($r=0.298$; $P=0.028$) 等多项响度指标、 equivalentSoundLevel_dBp ($r=0.379$, $P=0.005$)、 spectralFlux_sma3_amean ($r=0.342$, $P=0.011$) 与 HAMD 评分呈低强度正相关, mfcc4($r=-0.317$, $P=0.020$) 等多项 Mel-frequency 倒谱系数 (MFCC)、 F3amplitudeLogRelF0_sma3nz_stddevNorm ($r=-0.285$, $P=0.037$)、 F2amplitudeLogRelF0_sma3nz_stddevNorm ($r=-0.296$, $P=0.030$) 与 HAMD 评分呈低强度负相关。

讨论 本研究结果表明了抑郁症患者的声音特质和其抑郁程度之间存在相关性,多项声音强度和响度指标与 HAMD 评分呈正相关,提示抑郁症患者可能存在声音微弱、语调低沉等症状,多项 MFCC 指标与 HAMD 评分呈负相关,根据文献研究表明, MRI 扫描显示 MFCC 与声道肌肉运动有关。这些声音指标与抑郁症评分之间的相关性使得声音特征成为可以作为评估抑郁严重程度的辅助指标。这不仅有利于抑郁症的诊断,也有利于对于抑郁症治疗效果的监测。

基于同伴支持模式的康复治疗对出院后精神分裂症患者服药依从性和社会功能的影响

张怀明 陈一郡*

上海市杨浦区精神卫生中心

目的 探讨基于同伴支持模式的康复治疗对出院后精神分裂症患者服药依从性和社会功能的影响,为出院后精神分裂症患者的康复提供借鉴。

方法 本研究选取 120 例家庭病床精神分裂症

患者,随机分为对照组和干预组,各 60 例。对照组接受常规精神卫生服务(包括精神科药物治疗、社区家庭医生团队随访、健康宣教、常规社区康复服务)。干预组是在接受常规精神卫生服务基础上的对患者进行同伴支持小组介入(包括情感支持、工具支持、信息支持、陪伴支持等),评估人员对比干预前后服药依从性的差异,对比开始前和 1、2、3 个月后采用个人和社会功能量表(PSP)对两组患者社会功能进行评估从而得出结论。

结果 1、对两组患者的服药依从性进行比较,干预后观察组患者的服药依从性显著优于对照组($U=20.324$, $P=0.013$),差异有统计学意义。

2、对两组患者的个人与社会功能量表(PSP)评分进行重复测量方差分析结果显示:经过个案管理干预,时间效应下 PSP 评分差别有统计学意义($\beta=376.137$, $P<0.001$),随着个案管理时间的延长, PSP 评分逐渐升高;不同组别效应下 PSP 评分差别有统计学意义($F=16.875$, $P=0.031$),观察组得分高于对照组。个案管理前和第 1 个月后,两组患者的 PSP 评分差异无统计学意义($P>0.05$);第 2 个和第 3 个月后干预组患者的 PSP 评分高于对照组,差异有统计学意义($P<0.05$)。

结论 同伴支持小组介入可以提高患者的服药依从性,能够较明显的改善出院后精神分裂症患者的衰退状态如自理能力差、情感淡漠、社交退缩等,增强家庭病床精神分裂症患者的职业能力和家庭职能,明显改善出院后精神分裂症患者的社会功能,还可以改善出院后精神分裂症患者个人与社会功能,为患者回归社会打下基础,此研究也可以为改善出院后精神分裂症患者的社会功能提供借鉴。

Comparison of Cognitive Functions between Chronic Schizophrenia, First-episode Schizophrenia Patients, Individuals at Genetic High Risk for Psychosis and Individuals at Clinical High-risk for Psychosis

Xiaoyan He¹, Zhuohui Huang², Zilang Chen³, Shibin Wang², Fujun Jia², Cailan Hou²

1. The Affiliated Mental Health Center of Jiangnan University, Wuxi Central Rehabilitation Hospital
2. Guangdong Mental Health Center, Guangdong Provincial People's Hospital (Guangdong Academy of Medical Sciences), Southern Medical University
3. Luoding Mental Health Center

Background Cognitive dysfunction stands as a core aspect of schizophrenia, preceding psychosis and persisting through all its stages. Studies indicate that neurocognitive function is intricately linked to the progression, functionality, and prognosis of psychosis, while also correlating with a poor response to antipsychotic medications. Furthermore, twin studies have uncovered a significant genetic overlap between cognition and schizophrenia susceptibility, highlighting cognitive impairment as a crucial endophenotype for deciphering the genetic risk factors of the disease. Consequently, comprehending the shifts in cognitive function throughout the various stages of schizophrenia offers a more lucid understanding of the disorder's cognitive aspects. The study was designed to assess the neurocognitive function in the context of different phases of schizophrenia. Chronic schizophrenia (CSz), first-episode schizophrenia patients (FEP), clinical-high risk for psychosis (CHR) patients, genetic high risk for psychosis (GHR) and healthy controls (HC) were subjected to in-person clinical interviews

Methods A standardized battery of cognitive assessments was administered to 40 CSz patients, 94 FEP patients, 54 CHR individuals, 80 GHR participants and 98 HC. Group differences in cognitive test performance were examined using multivariate analysis of covariance (MANCOVA) controlling for potential confounding effect

Results In terms of processing speed, significant disparities were observed among the five groups. Specifically, the FEP and CSz groups exhibited notably poorer performance compared to the CHR group. Furthermore, the CHR group fared significantly worse than the GHR group, which in turn performed significantly below the HC group

Regarding verbal learning, the CSz group lagged significantly behind both the FEP and CHR groups.

Similarly, the FEP and CHR groups demonstrated significantly inferior performance compared to the GHR group, which was still significantly less proficient than the HC group.

In visual learning, the CSz group once again proved to be significantly less adept than the FEP group, as well as the CHR and GHR groups. These three latter groups, in turn, were all significantly less skilled than the HC group.

Across all five groups (CSz, FEP, Chr, GHR, and HC), performance in working memory was comparatively better. However, notable differences still existed between certain groups.

Lastly, in terms of attention, the FEP and CSz groups fell significantly behind the CHR group. The CHR group, while better than these two, was still significantly less attentive than the GHR group, which in turn was notably less vigilant than the HC group.

Conclusions Patients diagnosed with CSz exhibited the most pronounced cognitive deficits. Meanwhile, CHR and GHR patients demonstrated similar levels of cognitive impairment, with CHR patients performing at a level between the FEP and GHR groups. Across various cognitive assessments, the symbol coding test revealed the highest degree of impairment in FEP patients when compared to the healthy control group. Additionally, the Hopkins word test proved to be the most effective cognitive test for distinguishing the CHR group from both the HC and GHR groups

关键词: cognitive functions, schizophrenia, clinical high risk for psychosis, genetic high risk for psychosis

The Effectiveness of The Safewards Interventions in Psychiatric Wards

Guoju Mao¹, Dongmei Wu¹, Tao Li¹, Wei Peng¹, Xia Huang², Zixiang Ye¹

1. The Fourth People's Hospital of Chengdu & The Clinical Hospital of Chengdu Brain Science Institute, MOE Key Lab for Neuroinformation, University of Electronic Science and Technology of China

2. West China Hospital, Sichuan University

Objective To explore the application effect of the Bowers Safewards model in the management of psychiatric wards in China, aiming to provide scientific references for domestic psychiatric ward safety management practices

Methods Using a self-controlled before-and-after design, 17 psychiatric wards in a tertiary class A psychiatric hospital were selected to implement the Safewards model intervention on the basis of routine psychiatric ward management. The number of conflict-related adverse events and the frequency of protective measures implemented in the psychiatric wards before and after the intervention were collected, and the incidence rate of conflict-related adverse events and the implementation rate of protective measures were calculated. Paired-sample t-tests and paired-sample Wilcoxon signed-rank tests were used, with $P < 0.05$ considered as statistically significant

Results After implementing the Safewards model intervention, the occurrence of conflict-related events or the use of restrictive measures decreased. Compared with before the intervention, the incidence rate of conflict-related adverse events decreased by 6.53% (95% confidence interval: 0.89-3.68%, $p=0.02$), and the implementation rate of protective measures decreased by 3.37% (note: the upper limit of the 95% confidence interval provided here may be incorrect as it is typically a reasonable range, such as 5.47%-x%; due to the incomplete original data, we only provide a descriptive explanation here)

Conclusion The psychiatric ward management model based on the Safewards model can effectively reduce the incidence rate of conflict-related adverse events and the implementation rate of protective measures in psychiatric wards. In the future, the Safewards model can be promoted and applied as a scientific ward management model that focuses on patients' healthcare experience, taking into account the cultural background of China, in the management of psychiatric wards in China.

关键词: Safewards; Mental Health Care; Restrictive Interventions; conflict-related adverse events

HAPA 理论在精神科领域中应用的范围综述

王如焯¹ 张燕红²

1. 南京医科大学

2. 南京脑科医院

目的 对健康行动过程取向理论(HAPA)在精神科中的应用现状进行范围综述,为将来在精神科领域中基于健康行动过程取向理论制定、开展更有效的行为分析和干预研究,提高患者的干预依从性和有效性提供参考。

方法 根据 Levac 等人概述的范围综述的研究方法,计算机检索 Web of science、Sinomed、PubMed、PsycINFO、Medline、Cochrane Library、中国知网、维普和万方共 9 个数据库,检索时限为 2024 年 5 月。对最终纳入的文献进行数据提取、收集、总结并报告研究结果。根据数据库的系统检索,共检索文献 1795 篇,最终纳入 24 篇文献。其中观察性研究 5 篇、实验性研究 16 篇、测量工具开发 2 篇和混合性研究 1 篇。数据提取的内容包括:作者、国家、发表时间、研究对象、研究目的、研究方法、干预措施、干预时长、阶段划分、观察指标以及应用效果。

结果 健康行动过程取向理论在抑郁症、精神分裂症、睡眠障碍、行为成瘾患者和创伤后应激障碍幸存者中均有所应用,用于提高干预效果的功能包括自主日记、短信、电话、移动应用程序、基于网络的平台和电子设备等,对于患者吸烟、酒精成瘾、网络成瘾、久坐行为等健康危险行为有着显著改善,同时对于睡眠态度和压力监测提供了科学的测量工具,参与者表现出很高的研究接受度和干预依从性。

结论 健康行动过程取向理论在精神科领域中应用的有效性和可行性已得到证实,未来可以考虑采取基于健康行动过程取向模型在非自杀性自伤等更广泛的精神科领域中进行应用,对患者的健康危险行为进行分析,在患者行为改变的不同阶段采取多样化的干预形式,对意向和意志进行测量与干预,提高患者参与治疗的依从性,以更好地提高患者出院后的生活质量,改善精神科患者的预后,促进精神康复,减少疾病和行为的复发,减轻患者的心理痛苦。

积极反刍思维团辅对青少年抑郁症患者非自杀性自伤行为影响

赵芸芝*

西安交通大学医学院第一附属医院

目的 本研究旨在探究积极反刍思维团辅对青少年抑郁症患者的非自杀性自伤行为的影响,从而改善青少年抑郁症患者的治疗策略,减少自伤行为的发生与严重程度,为改善其康复效果和提高其生活质量提供重要依据。

方法 纳入 40 名被诊断为抑郁症的青少年患者,随机分为两组。对照组接受常规治疗护理,实验组在常规治疗护理的基础上接受积极反刍思维团辅治疗,每周 2 次,每次 40-60 分钟,对症干预。记录两组患者的非自杀性自伤行为次数,根据伤口深度、范围和治愈情况等因素,采用自陈式问卷临床评定量表等严重程度评估工具评估自伤伤口严重程度,并进行统计学分析。

结果 经过治疗一段时间后,实验组患者的非自杀性自伤行为次数和严重程度显著减少,而对照组无明显变化。两组之间的差异具有统计学意义 ($P < 0.05$)。

结论 积极反刍思维团辅可显著降低青少年抑郁症患者的非自杀性自伤行为。这表明积极反刍思维团辅进行积极的心理干预,可以显著减少青少年抑郁症患者的非自杀性自伤行为风险及严重程度。通过认知重建、情感调节和问题解决策略等方法,积极反刍思维团辅帮助患者重新评估和调整负面思维模式,并提供应对压力和负面情绪的技巧和工具。然而,本研究存在样本量较小的限制,需要进一步扩大样本量以增加研究的可信度。

Association between Duration of Untreated Psychosis and Auditory P300 in First-episode Antipsychotic-naïve with Schizophrenia

Chenghao Lu Shen Li Shaobing Li Jie Li*

Tianjin Anding Hospital

Objective To date, the relationship between the duration of untreated psychosis (DUP) and cognitive functions in patients with schizophrenia (SZ) has been debated, and there has been no empirical evidence from event-related potential (ERP) studies to support their association. Therefore, the objective of this study is to investigate the correlation between DUP and cognitive functions, as well as the relationship with clinical symptoms, in first-episode antipsychotic-naïve (FEAN) SZ patients through ERP research

Methods The study included a total of 321 Chinese FEAN SZ patients and 146 healthy controls. The DUP was measured in months. Sociodemographic characteristics of all participants were collected, and the clinical symptoms of patients were assessed using the Positive and Negative Syndrome Scale, Hamilton Depression Scale, and Hamilton Anxiety Scale. Additionally, the ERP, including P3a, P3b, and N100, were recorded from all participants using an auditory oddball paradigm (three-stimulus novelty paradigm)

Results 25.5% of patients did not receive timely treatment for over four years, and those with lower educational levels had a longer DUP ($p = 0.027$). Compared to healthy controls, FEAN SZ patients exhibited longer latencies and lower amplitudes in the P3 component (all $ps < 0.001$). Furthermore, significant differences in the P3 component were observed among three groups of DUP (< 8 months, 8-48 months, and ≥ 48 months) (all $ps < 0.001$). Partial correlation analysis revealed positive correlations between DUP and the latencies of P3a, P3b, and N100 ($r = 0.218$; $r = 0.354$; $r = 0.342$; all $ps < 0.001$) and negative correlations with their amplitudes ($r = -0.144$; $r = -0.290$; $r = -0.296$, all

ps < 0.05). Additionally, multiple linear regression analysis indicated that the latency and amplitude of P3a were independently associated with DUP ($B = 0.124$, $p < 0.001$; $B = -1.161$, $p = 0.012$)

Conclusion The Study have shown that ERP P3 component is closely related to DUP, and that P3a can be used as an electrophysiologic marker to determine the length of DUP. These findings highlight the importance of early intervention and treatment of SZ and provide an objective basis for early detection and timely treatment of SZ patients.

The Relationship between Plasma Interleukin-6 and Cognition Based on Curve Correlation in Drug-naïve Patients with Major Depressive Disorder

Xiaoli Wang Jie Li*
Tianjin Anding Hospital

Objective The effect of interleukin-6 (IL-6) on cognition in patients with major depressive disorder (MDD) remains unclear. The aim of the present study was to investigate for the first time the non-linear relationship between plasma IL-6 and cognition and its sex-specific associations in patients with drug-naïve MDD.

Methods A total of 326 participants, including 237 drug-naïve MDD patients and 89 healthy controls (HCs), were included in this study. All participants completed the Repeatable Battery for the Assessment of Neuropsychological Status (RBANS) and fasting venous blood was collected for IL-6 measurement. Patients with MDD completed the Hamilton Depression Scale-17 (HAMD-17) and the Hamilton Anxiety Scale-14 (HAMA-14) assessments. Two-way analysis of variance and curve estimation analyses were used to explore the effects of IL-6 on cognition and its sex differences.

Results We found that IL-6 and cognition were

associated in different patterns in HCs and MDD patients. The best model for curve estimation between IL-6 and attention ($F = 2.736$, $p = 0.045$) and HAMA ($F = 6.416$, $p < 0.001$) in women with MDD was the cubic model. In male MDD patients, the best model for curve estimation between IL-6 and immediate memory was the cubic model ($F = 3.077$, $p = 0.034$). However, in HCs, the best model for curve estimation analysis between IL-6 and language was the quadratic model ($F = 3.803$, $p = 0.026$).

Conclusion There was a non-linear and sex-specific relationship between IL-6 levels and cognition in patients with MDD

关键词: Interleukin-6; Non-linear; Sex-specific; Cognition; Major depressive disorder

Plasma NGAL, Not IFN- γ May Predict Early Treatment Response in Drug-naïve Schizophrenia Patients in Chinese Han

Xiaoxiao Sun Jie Li*
Tianjin Anding Hospital

Objective Early efficacy predictions may help psychiatrists develop more personalized drug therapy strategies for drug-naïve schizophrenia patients at the beginning of treatment. The aim of our study was to investigate the predictive ability of plasma concentrations of Interferon- γ (IFN- γ) and Neutrophil gelatinase-associated lipocalin (NGAL)

Methods In this longitudinal study, we collected 125 drug-naïve patients and 75 healthy controls at baseline. After an initial assessment, we evaluated the therapeutic response after an 8-weeks period. Additionally, we collected plasma sample simultaneously with clinical assessment. Following the assessments, patients were categorized into two group: Non-responders (NR) group ($n=41$) and Responders (R) group ($n=84$). The plasma IFN- γ and NGAL were measured using Enzyme-linked immunosorbent assay (ELISA)

Results Both the concentrations of IFN- γ and NGAL were significantly lower in patients than those in

healthy controls (both $P < 0.001$) at baseline. Within the patient group, NGAL concentration was found to be significantly lower in NR group compared to the R group ($F=12.77$, $df=2$, 194 , $P < 0.001$). After treatment, IFN- γ and NGAL increased in both patient groups, especially in IFN- γ (NR: $t = -4.55$, $P < 0.001$; R: $t = -6.05$, $P < 0.001$). NR group exhibited more severe positive and negative factor compared to the R group ($t=2.44$, $P = 0.016$; $t=2.39$, $P = 0.018$) at baseline. Adjusting age, BMI, smoking, and duration of untreated illness as covariates, a negative correlation was found between NGAL concentration and positive factor at baseline ($r = -0.19$, $P = 0.030$). Binary logistic regression found that lower NGAL concentration was associated with poorer early treatment response in drug-naïve schizophrenia patients in Chinese Han (OR=1.110, 95%CI=1.208-1.213, $P = 0.027$).

Conclusion The pre-treatment plasma concentration of NGAL should be considered as a predictor of early treatment response for drug-naïve Chinese Han patients with schizophrenia, as well as a potential target for the further exploration of therapeutic approaches.

童年忽视对成年后女性双相情感障碍和重型抑郁障碍患者执行功能和海马体积的影响

余华 李晓晶 李涛*
杭州市第七人民医院

目的 儿童忽视是童年时期最常见的创伤, 经历童年创伤会影响成年后患者的认知功能以及海马体积。但儿童期忽视是否对成年后女性情绪障碍患者的认知功能及海马体积产生影响, 尚不得而知。在这里, 我们评估了一组女性双相情感障碍 (BD) 和重型抑郁障碍患者 (MDD) 以及匹配的健康对照人群的童年创伤与海马体积以及认知功能。首先, 我们探讨了疾病状态和是否经历童年忽视对 BD 和 MDD 患者海马体积的影响。其次, 我们探讨了忽视与双相障碍和重型抑郁症海马体积和认知功能之间

的关系。同时, 海马作为核心脑区, 参与认知功能调控。因此我们检验了海马体体积是否可以调节忽视得分和认知缺陷之间的关系。

方法 我们纳入了 116 名女性 BD 患者, 139 名女性 MDD 患者和 106 名匹配的健康对照。我们使用韦氏成人智力测试的瞬时/延迟逻辑记忆、划痕测试 A 和 B 对所有参与者的记忆、注意、执行功能进行系统评估。使用 FreeSurfer 7.0 软件重建海马亚区, 并将其分为双侧海马尾部、海马头部和海马体。我们考虑了神经认知和各个海马亚区之间的相互关系, 分别将它们作为因变量输入到多变量协方差分析中, 在控制年龄和教育年限的同时, 对诊断和忽视类型之间的相互作用进行建模, 另外在分析海马亚区的时候控制了全脑体积。同时, 我们使用偏相关探索了童年忽视与认知功能、海马亚区的关系, 并进行中介分析, 探索海马亚区是否可作为中介变量介导童年忽视对认知功能的影响。

结果 多元协方差分析结果表明, 疾病组别对双侧海马的效果显著, 但是否经历忽视和诊断对双侧海马没有交互作用。与对照组相比, BD 患者和 MDD 患者双侧海马头部和海马总体积显著减少。对认知功能分析发现, 诊断对认知功能作用显著, 但是否经历忽视和诊断对双侧海马没有交互作用。与对照相比, BD 和 MDD 患者存在显著的逻辑记忆受损, BD 患者存在显著的执行功能受损。中介分析表明较小的左侧总海马体积和左侧海马头介导了童年忽视与执行功能表现之间的关系。

结论 我们的研究表明, 与对照组相比, 情绪障碍患者存在更显著的童年创伤, 特别是童年忽视创伤。在患者组中, 认知功能受损和海马体积缺陷显著增加。此外, 童年创伤, 特别是童年忽视, 可能与至少在患者和对照组中观察到的一些认知障碍缺陷背后的机制有关。忽视对被试认知功能的显著影响部分是通过海马体积进行调节。我们的研究表明, 对于情绪障碍患者的认知缺陷干预进一步的研究应该集中在儿童发育方面, 减少童年创伤有助于减少成年后认知缺陷的发生。未来研究方向应该对被试的应激相关的生物学指标, 如皮质醇、炎症指标等进行进一步测量, 以进一步了解情绪障碍、儿童创伤和大脑结构、认知功能之间的关联。

阈下抑郁和抑郁障碍中的功能连接及其与认知的关系

王红慧 胡建*

哈尔滨医科大学附属第一医院

目的 阈下抑郁是不满足抑郁障碍的诊断标准,但存在抑郁症状的一类疾病,后期有较大风险发展为抑郁障碍。阈下抑郁可能会造成一定的功能损害,发病率高于抑郁障碍,是诊断和预防抑郁障碍的一项重要的工作。核磁影像是探究阈下抑郁和抑郁障碍发病机制的一个重要科学方法。

方法 对哈尔滨某社区人群进行问卷调查,采用横断面研究。采用量表和问卷的方法纳入研究对象 57 人,其中阈下抑郁 22 人,抑郁障碍 16 人,健康对照 19 人。问卷采集受试者的一般信息,并对受试者的抑郁情况和认知水平进行评估。由经过培训的研究生进行 9 项患者健康问卷、汉密尔顿抑郁量表的收集,经过培训的主治医师对有抑郁症状的人群展开用于 DSM-5 障碍临床定式检查,得出诊断。采集受试者静息态功能磁共振数据并进行全脑的功能连接。结合 RBANS 认知评估结果,分析认知水平和影像学指标变化是否存在相关性。

结果

1. 抑郁障碍组右侧颞上回、右侧扣带回中部及其侧面环绕的脑回 mALFF 值低于健康对照组 ($P < 0.05$); 抑郁障碍组右侧小脑脚 2 区、右侧额中回 ReHo 值低于健康对照组 ($P < 0.05$)。

2. 阈下抑郁组右侧颞中回、右侧扣带回中部及其侧面环绕的脑回 mALFF 值高于健康对照组 ($P < 0.05$); 阈下抑郁组右侧颞中回、右侧罗兰多壳盖 ReHo 值高于健康对照组 ($P < 0.05$)。

3. 抑郁障碍组左枕下回、左楔叶、右背外侧额上回 ReHo 值高于阈下抑郁组 ($P < 0.05$), 抑郁障碍组右岛叶、右侧额上回 ReHo 值低于阈下抑郁组 ($P < 0.05$)。

4. 以右侧岛叶为种子点, 抑郁障碍组在右侧颞中回的功能连接高于健康对照组, 在左侧枕下回、左侧上部中央后回低于健康对照组。

5. 以右侧岛叶为种子点, 阈下抑郁组在左侧小脑 7b 区、右侧小脑脚 1 区的功能连接低于健康对照组。在以右侧颞上回作为种子点时, 阈下抑郁组在右侧颞下回、右侧枕上回的功能连接低于健康对照

组。

6. 以右侧岛叶为种子点时, 抑郁障碍组在左侧中央前回的功能连接高于阈下抑郁组, 在左侧内侧额上回低于阈下抑郁组。在以右侧颞上回作为种子点时, 抑郁障碍组在右侧枕上回的功能连接高于阈下抑郁组, 在左侧扣带回前部及其侧面环绕的脑回、右侧缘上回低于阈下抑郁组。

7. 右侧小脑脚 2 区与 RBANS 的注意因子得分成负相关关系。

结论

抑郁障碍与阈下抑郁可能与脑区活动水平和功能连接性的变化有关。

小脑的活动与认知功能下降有关。

The Relationship of Cardiovascular Disease Risk, Clozapine Antipsychotic Use and Cognitive Function in A Large Chinese Schizophrenia Cohort: A Cross-sectional Study

Chenghao Lu Xiaoying Jin Shen Li Jie Li*
Tianjin Anding Hospital

Objective The pivotal role of antipsychotics, especially clozapine, in managing cardiovascular disease (CVD) risk and cognitive function in schizophrenia (SCZ) patients necessitates a thorough exploration of their intricate relationship. We aimed to examine the relationship between clozapine use and CVD risk, as well as cognitive function within a sizable Chinese SCZ cohort

Methods A cohort comprising 765 patients was stratified based on clozapine usage. Demographic characteristics, clinical data, and glycolipid metabolic parameters were collected. Framingham Risk Score and vascular age were calculated utilizing gender-specific Cox regression calculators. Cognitive function and psychiatric symptoms were assessed using the Repeatable Battery for Assessment of Neuropsychological Status (RBANS) and the Positive and Negative Syndrome Scale (PANSS), respectively

Results Among the SCZ patients, 34.6% (265/765) were clozapine users. Clozapine users exhibited lower systolic blood pressure, high-density lipoprotein cholesterol and total cholesterol (all $p < 0.05$). Furthermore, clozapine users exhibited higher PANSS scores, along with lower scores in RBANS scores (all $p < 0.05$). Correlation analysis revealed positive correlation between CVD risk in non-clozapine users and negative symptom scores ($r = 0.074$, $p = 0.043$), and negative correlation with positive symptom scores and RBANS scores ($r = -0.121$, $p = 0.001$; $r = -0.091$, $p = 0.028$). Multivariate stepwise regression analysis indicated that RBANS attention scores as predictive factors for increased CVD risk in clozapine users ($\beta = -0.12$, 95%CI = -0.11, -0.03, $p < 0.01$)

Conclusion SCZ patients using clozapine exhibit more severe clinical symptoms and cognitive impairments. Attention emerges as a predictor for increased CVD risk in clozapine users.

Transcriptional Correlates of Impaired Brain Network Topology in Major Depressive Disorder: Insights From A Multicenter fMRI Study

Yuan Liu Meijuan Li Bin Zhang Jie Li*
Tianjin Anding Hospital

Objective Despite previous associations between impaired brain network topology and major depressive disorder (MDD), inconsistent findings persist due to small sample sizes, and the underlying transcriptional patterns remain poorly elucidated

Methods This study utilized a multicenter fMRI dataset comprising 544 MDD patients and 569 healthy controls (HC) from the REST-meta MDD consortium. Whole-brain functional networks were constructed by thresholding 90 brain regions using the Automated Anatomical Labeling (AAL) atlas. Connectivity and net-

work properties were calculated. Additionally, we investigated the brain-wide relationship between MDD-related impaired brain network topology and gene expression using Partial Least Squares (PLS) regression

Results Compared to healthy controls, MDD individuals exhibited significantly decreased functional connectivity. Moreover, MDD individuals showed decreased global network properties and abnormal nodal global network properties, specifically in the thalamus, caudate nucleus, superior parietal gyrus, and middle frontal gyrus. Transcription-neuroimaging analysis revealed that MDD-related impaired brain network topology was spatially correlated with the expression of genes enriched in neuron projection development, protein catabolic processes, and ncRNA metabolic processes

Conclusion These findings highlight the significant impairment of brain network topology in MDD and suggest potential neurobiological underpinnings and biomarkers for these changes. The results provide insights into the transcriptional mechanisms associated with brain network alterations in MDD, offering potential avenues for future research and therapeutic strategies.

基线白细胞计数对住院情绪障碍患者药物联合物理治疗抗抑郁效果的影响：一项真实世界研究

乔梦璇 余华 李涛*
杭州市第七人民医院

目的 为了探索基线水平白细胞计数等炎症指标对住院焦虑障碍、抑郁障碍和双相障碍患者药物联合可见光治疗、rTMS 治疗抑郁情绪的效果，研究者根据基线白细胞计数将住院焦虑障碍、抑郁障碍和双相障碍患者分为白细胞四个四分位组别，以反映不同的炎症水平，并据此分析了治疗期间药物联合物理治疗对住院患者在不同基线炎症水平下白细胞计数的影响。同时，研究者还分析治疗期间导致白细胞计数变化和抑郁症状改变的因素；最后探索

炎症水平对治疗效果的潜在影响。

方法 我们纳入了 2022 年至今杭州市第七人民医院住院期间的 467 名诊断为焦虑障碍、抑郁障碍或双相障碍的患者。使用重复测量方差分析比较治疗前后住院患者白细胞计数的变化。采用混合效应线性模型，探索了治疗因素（包括不同药物、经颅磁刺激联合光照治疗）对白细胞计数变化的影响。模型中包括了患者的性别和年龄作为协变量，以及不同疾病类型（如抑郁症、双相情感障碍、焦虑障碍）作为随机效应，以考虑个体差异和疾病特征对治疗效果的影响。此外，通过卡方检验分析了不同疾病类型和不同炎症水平下的治疗效果差异。为了控制多重比较的问题，使用 FDR 矫正方法进行了事后检验，以确保结果的统计显著性和可靠性。

结果 研究发现，基线炎症水平低的患者在治疗后，白细胞计数升高，而基线炎症水平高的患者白细胞计数下降。其他炎症指标如单核细胞-淋巴细胞比率、中性粒细胞-淋巴细胞比率以及中性粒细胞，以及炎症反应指数均显示出类似的趋势。在低炎症水平时，光照治疗的次数与 HAMD 分数的百分比（HAMD 基线-HAMD 治疗后/HAMD 基线）呈正相关；而在高炎症水平时，光照治疗的次数与白细胞计数的百分比（WBC 基线-WBC 治疗后/WBC 基线）呈正相关。图表可以放进来。

结论 这些结果可能表明，在高炎症水平时，光照治疗可能需要先降低炎症反应才能发挥其抗抑郁的效果；研究还发现，基线白细胞计数对不同疾病住院患者的抑郁症状的缓解率有显著影响。本研究揭示了基线白细胞计数对住院患者在抗抑郁中的潜在价值，在治疗过程中光照治疗的作用机制可能受到了炎症水平的影响。

Associations between Polymorphisms in The CHRM2 and GRIN2A, Cognitive Impairments and Tardive Dyskinesia in A Chinese Population with Schizophrenia

Linxuan Wang Chenghao Lu Lili Wang Shen Li*
Tianjin Anping Hospital

Objective The study sought to explore the relationship between single nucleotide polymorphisms (SNPs) in the Glutamate Ionotropic Receptor NMDA Type Subunit (GRIN2A) and Cholinergic Receptor Muscarinic 2 (CHRM2) genes, along with their interactions, in relation to the incidence and severity of TD, as well as cognitive impairments, in Chinese SZ patients.

Methods A cohort of 216 SCZ patients was enrolled for the study. Participants were divided into TD and without TD (WTD) groups using the Schooler-Kane International Diagnostic Criteria. DNA extraction was performed by a high-salt method, followed by SNP genotyping using matrix-assisted laser desorption ionization time-of-flight mass spectrometry (MALDI-TOF-MS). The severity of TD was evaluated using the Abnormal Involuntary Movement Scale (AIMS), while cognitive function was assessed using the Repeatable Battery for Assessment of Neuropsychological Status (RBANS)

Results The comparison between GRIN2A rs7206256 GG+GA versus AA genotypes revealed a significant disparity in genotype frequencies (OR=0.32, 95% CI=0.13-0.79, $p=0.007$). Among TD patients, those carrying the rs7206256 GG genotype exhibited higher limb trunk scores ($p<0.01$), and significantly lower orofacial scores ($p<0.01$). Moreover, significant differences in attention scores and total RBANS scores among carriers of different genotypes of the CHRM2 rs2061174 in TD group ($F=2.55$, $p=0.05$; $F=5.08$, $p=0.05$). The combination of CHRM2 (rs1824024)-GRIN2A (rs7206256) and CHRM2 (rs2061174)-GRIN2A (rs7206256) were identified as the best two-point model to predict TD occurrence ($p=0.05$).

Conclusion The findings suggest that GRIN2A rs7206256 is associated with TD susceptibility and severity in Chinese SZ patients. Furthermore, the interplay between GRIN2A and CHRM2 genes appears to contribute to TD susceptibility in SZ patients. Additionally, a relationship between GRIN2A gene polymorphisms and cognitive impairment in TD patients is evident.

Gender Differences in Anxiety Symptoms and Cognitive Emotion Regulation in Anxiety Disorder: A Network Analysis

Xueqing Ren Jianyin Qiu* Shanshan Su Ziwei Zheng
Xun Sun
Shanghai Mental Health Center

Background Anxiety disorders are prevalent mental health conditions characterized by excessive fear and anxiety with associated behavioural disturbances. Despite various findings regarding gender differences of anxiety symptoms and cognitive regulation strategies respectively, scant research has specifically investigated the relationship and co-occurrence of anxiety symptoms and cognitive regulation

[Aim]: The study aims to examine the gender differences of the importance and patterns in the network consisting of anxiety symptoms and cognitive emotion regulation.

Methods A cross-sectional network analysis was conducted on outpatients diagnosed with at least one type of anxiety disorder according to DSM-5 criteria. The study included 521 participants with anxiety disorders (201 men). The Generalized Anxiety Disorder Scale-7 (GAD-7) and the Cognitive Emotion Regulation Questionnaire (CERQ) were used to assess anxiety symptoms and cognitive emotion regulation. Networks were constructed by Gaussian Graphical Models and the networks of two sexes using the Network Comparison Test with R-packages

Results Male subjects generally exhibited lower anxiety levels, with significant differences in generalized worry and other-blame strategies. Network analysis revealed that rumination in men was the strongest central symptom while catastrophizing was the strongest central symptom in women with anxiety disorder. The network comparison test represented that uncontrollable worry and other blaming have significantly stronger edges in the male group than in the female group

Limitations Since this is a cross-sectional network study of anxiety patients, the causal relationship between interactions in this network analysis for both genders may not be accurately determined

Conclusions These results have implications for the treatment of anxiety disorders of different genders and then support the efficaciousness of Cognitive Behavioral Therapy. Rumination and catastrophizing are potentially important targets for treatment procedures for males and females, respectively.

通过面部表情来筛查焦虑障碍及其亚型的探索性研究

苏珊珊 任雪晴 仇剑峯*
上海市精神卫生中心

目的 目前临床上诊断焦虑障碍主要依据精神检查和量表评估,且仍以症状学特征进行诊断分型,评估手段单一,且存在明显的个人主观性。症状学而非生物学诊断的现状,为焦虑障碍患者诊治的精准性和有效性带来了一定的阻力。因此,本研究拟通过探索焦虑障碍的生物学筛查指标如面部表情等来建立客观的筛查体系。

方法 研究采用一个自动化和客观的深度学习框架,以捕捉细微差别的焦虑表情,这些表情来自同步的音频和面部视频数据,患者在此过程中被要求观看刺激的图像并阅读相应的文本描述。研究共收集 510 例焦虑障碍受试者,每个受试者会观看 20 个中性和 40 个负性的图片,同时可采集同步的音频和面部视频序列。研究采用最近兴起的选择性状态空间模型曼巴(Mamba)来探索视频和音频谱图,该模型能够实现序列长度的线性复杂性。

结果 我们提出的 VA-mamba 优于 Bi-LSTM 和基于 longformer 的 ViT。双向 VA-Mamba 模块比单向 VA-Mamba 模块具有更好的性能。深度学习模型可以检测焦虑障碍的三个亚型(广泛性焦虑障碍、惊恐障碍和社交焦虑障碍),且准确率相对较高。研究中采用的所有对比模型对上述三个亚型分类的筛查准确率达到 73.39% 以上。且我们提出的 VA-

Mamba 显示了 82.18% 的 360 度性能。

结论 受试者识别试验图片后的面部表情可筛查焦虑障碍并能区分筛查广泛性焦虑障碍、惊恐障碍和社交焦虑障碍。

关键词: 焦虑障碍, 面部表情, 选择性状态空间模型

Neurophysiological Markers of Persistent Auditory Verbal Hallucinations in Patients with Schizophrenia: An EEG Microstates Study.

Shaobing Li Jie Li* Ruxin Hu Meijuan Li Ying Gao
Huiming Yan Lijun Chu Yuying Qiu
Tianjin anding hospital

Objective Alterations in the temporal characteristics of EEG microstates in patients with schizophrenia (SCZ) have been repeatedly found in previous studies. Nevertheless, altered temporal characteristics of EEG microstates in persistent auditory verbal hallucinations (pAVHs) SCZ are still unknown. This study aimed to investigate whether SCZ patients with pAVHs exhibit abnormal EEG microstates.

Methods We analyzed high-density electroencephalography data that from 79 SCZ patients, including 38 pAVHs patients (pAVH group), 17 moderate auditory verbal hallucinations patients (mid-AVH group), and 24 without auditory verbal hallucinations patients (non-AVH group). Microstates were compared between three groups

Results Microstate C exhibited significant differences in duration and coverage and microstate B exhibited significant differences in occurrence between patients with pAVHs and without AVHs. There was a significant negative correlation between the coverage in microstate C and AHS. The duration in microstate C was a significant negative trend with the AHS; Microstate C in duration, microstate B in occurrence were efficient in detecting pAVHs patients

Conclusion The decreased class C microstates in duration and coverage and increased class B microstates

in occurrence may contribute to the severity of symptoms in pAVH patients. Furthermore, we have identified that microstates C could serve as potential neurophysiological markers for detecting pAVHs in SCZ patients. These results can provide potential avenues for therapeutic intervention of pAVHs

抑郁症患者自我图式与他人图式的溯源研究

姚佳宇 陶晶 黄泰诚 郑子蔚 蒋文晖 王媛 苏珊珊
仇剑峯*
上海市精神卫生中心

目的 既往研究显示, 抑郁症患者存在消极的自我图式与他人图式, 表现为对自我和重要他人的加工更为消极。但是证据集中在主观报告、行为学和事件相关电位。本研究进一步探讨图式加工相关的活动脑区。

方法 本研究招募 93 名抑郁症发作期患者和 27 名健康对照, 采用简明国际神经精神访谈对被试的精神障碍进行筛查, 采用 17 项汉密尔顿抑郁量表和 14 项汉密尔顿焦虑量表评估被试的临床症状。通过外部情感西蒙任务 (The Extrinsic Affective Simon Task, EAST) 考察被试的内隐图式特, 包括自我图式与他人图式, 同时测量其脑电活动。对前人研究涉及的 N200, P300 和 LPP 成分进行 sLORETA 溯源分析, 结合 fsaverage 模板和主成分分析, 采用混合方差分析比较组间脑区激活差异。

结果 对于自我图式, P3 成分在右侧海马旁回存在显著交互作用 ($F=4.724, p=0.032$), 事后检验发现, 仅抑郁症患者在消极自我条件下该区域的激活小于积极自我条件 ($t=-3.186, p=0.002$), 健康对照未发现显著差异。对于他人图式, N2 成分在左侧前扣带回尾部存在显著交互作用 ($F=3.969, p=0.049$), 事后检验发现, 仅抑郁症患者消极他人刺激下该区域的激活小于积极他人条件 ($t=-3.595, p=0.001$), 健康对照未发现显著差异。P3 成分在左侧前扣带回尾部 ($F=5.246, p=0.024$) 和右侧前扣带回头部 ($F=4.364, p=0.039$) 均存在显著交互作用, 事后检验发现, 同样仅抑郁症患者在消极他人刺激下这两个区域的激

活小于积极他人条件(左侧前扣带回尾部: $t=-4.223$, $p<0.001$; 右侧前扣带回头部: $t=-3.926$, $p<0.001$)。

额中回尾部和右侧楔叶。

结论 抑郁症患者异常内隐自我图式与他人图式与海马旁回、前扣带回头部和尾部的异常激活有关。

关键词: 抑郁症, 自我图式, 他人图式, 溯源

Association of Metabolic Levels, Psychopathology and Cognition Among Chronic Schizophrenia Patients with Insomnia

Linxuan Wang Yanzhe Li Shen Li*

Tianjin Anping Hospital

Objective Insomnia is often overlooked as a symptom in patients with schizophrenia (SCZ), despite its significant impact on metabolic changes and cognitive impairment. However, no studies explored the role of metabolic changes associated with insomnia symptoms in SCZ. This study aimed to investigate the relationships between insomnia, metabolic changes, and cognitive function in SCZ patients

Methods A total of 609 SCZ patients were recruited. Insomnia data were collected through a self-reported questionnaire consisting of three questions. The psychopathology and cognitive functioning were assessed using the Positive and Negative Syndrome Scale (PANSS) and the Repeated Battery for Assessment of Neuropsychological Status (RBANS), respectively. In addition, serum glucose, and lipid levels were assayed

Results We found that SCZ patients with insomnia displayed lower diastolic blood pressure ($p = 0.047$), higher total cholesterol ($p = 0.024$), lower language ($p = 0.006$), delayed memory ($p = 0.013$), and RBANS total score ($p = 0.004$) compared to those without insomnia. In addition, there was a significant negative correlation between HDL-C level and RBANS total score ($r = -0.201$, $p = 0.005$) in insomnia patients. HDL-C level exhibited an independent contribution to the RBANS total score (Beta = -5.349 , $t = -2.303$, $p = 0.022$). The association between BMI and delayed memory

score ($r = 0.177$, $p = 0.013$) and total RBANS score ($r = 0.144$, $p = 0.044$) showed a significant positive correlation. Additionally, BMI independently contributed to the delayed memory score (Beta = 0.683 , $t = 2.781$, $p = 0.006$) and total score of RBANS (Beta = 0.416 , $t = 2.624$, $p = 0.009$)

Conclusion Our study provided insights into the potential interplay between metabolic changes, clinical symptoms and cognitive impairments in SCZ patients with/without insomnia.

关键词: schizophrenia, insomnia, metabolic changes, cognitive function

动力性人际治疗对抑郁障碍患者图式调节及其事件相关电位的研究

郑子蔚 姚佳宇 仇剑峯* 蒋文晖 王媛 吴艳茹 彭毅华 陶晶 苏珊珊 赵文清 赵亚婷 杨阳 孙迅 唐婉琳 任雪晴

上海市精神卫生中心

目的 动力性人际治疗(DIT)是 16 次手册化的短程动力疗法, 曾被证明对抑郁患者有积极效果。基于客体关系和依恋理论, DIT 干预靶点是“人际情感焦点”——包括消极自我图式和他人图式。而内隐图式又经过反思性加工影响外显图式, 故本研究探索 DIT 对抑郁患者外显图式、内隐图式行为学和脑电 ERP 指标的影响。

方法 125 名中重度 MDD 患者被分配至 DIT+药物组($n=63$)和药物组($n=62$)。采用评估员评定的 HAMD-17 和 HAMA-14, 自评 PHQ-9 和 GAD-7 评估治疗前后的抑郁症状。使用 YSQ-SF 评估早期适应不良的外显图式, 结合 EAST 任务的反应时和 ERP 指标评估内隐自我和他人图式。

结果 (1)HAMD-17($F(5, 479.80)=3.113$, $p=0.009$)的时间×组别交互作用显著, DIT+ADM 组的分数在 12 周、16 周($t=-2.01\sim-2.79$, $p<0.05$)低于药物组; (2)PHQ-9 的时间×组别交互作用显著($F(16, 1257.90)=2.33$, $p=0.002$), DIT+药物组在 10 周、11 周、14 周、15 周和 16 周结束($t=-2.04\sim-2.77$, $p<0.05$)的分数低于药物组; (3)YSQ-SF 中, 仅 DIT+药物治疗带来“分离和拒绝”、“自主性和能力不足”和“他人

指向”($t=2.15\sim 3.13$, $p<0.05$)的显著变化。(4)EAST 行为学中,自我图式的时间 \times 组别交互作用显著($F(1, 102.92)=5.13$, $p=0.026$),DIT+药物组的自我图式变得更积极($t=3.41$, $p=0.001$);他人图式交互作用不显著($F(1, 108.74)=3.46$, $p=0.066$),但DIT+药物组的他人图式的积极变化边缘显著($t=1.91$, $p=0.060$);(5)EAST 任务 ERP 指标中,自我图式条件下N2潜伏期和峰值的时间 \times 组别 \times 效价的交互作用显著,治疗后DIT+药物组积极自我条件的潜伏期显著变长($t=2.78$, $p=0.007$);但未发现两组N2峰值显著变化(均 $p>0.05$);对于LPP的平均振幅,他人图式的时间 \times 组别交互作用显著($F(1, 63)=4.55$, $p=0.037$),DIT+药物组在积极和消极自我、积极和消极他人($t=3.13\sim 4.03$, $p<0.01$)条件均显著增大,而药物组无显著变化;。

结论 DIT 治疗有效改善抑郁患者的临床抑郁症状,且可改善亲近和依赖性、自主性、自我牺牲三类适应不良外线图式;且DIT治疗对消极自我图式有明显改善效果,并可提高患者对自我和他人图式信息的晚期精细化加工水平。

The Role of Ferroptosis in Major Depressive Disorder

Ying Li*

Dalian Seventh People's Hospital

Objective To study the relationship between ferroptosis genes and Major Depressive Disorder (MDD)

Methods The GEO database was utilized to obtain chip data and clinical information from three datasets, namely GSE98793, GSE39653, and GSE52790. To identify differentially expressed ferroptosis genes, an analysis was conducted on genes that showed differential expression between individuals with Major Depressive Disorder (MDD) and healthy controls. Subsequently, Gene Ontology (GO) and Kyoto Encyclopedia of Genes and Genomes Pathway (KEGG) enrichment analyses were performed on the differentially expressed ferroptosis genes. Screening of these genes was carried

out using the Lasso Regression and Support Vector Machine (SVM) methods. A diagnostic model for depression was established using logistic regression with the screened genes. Furthermore, the Gene Set Enrichment Analysis (GSEA) method was applied to analyze the genes included in the model. The immune infiltration of MDD and healthy controls was assessed using the Cibersort method, along with an analysis of the correlation between immune cells and ferroptosis genes. The ferroptosis gene interaction network was examined using Cytoscape software. Additionally, the DGIdb website was consulted to predict potentially effective therapeutic drugs for ferroptosis genes closely associated with MDD

Results A total of 18 genes involved in ferroptosis were identified through differential expression analysis comparing individuals with MDD and healthy controls. Enrichment analysis, revealed concentrated pathways related to oxidative stress response, hydrogen peroxide response, reactive oxygen species response, FoxO signaling pathway, fluid shear stress, and atherosclerosis. Lasso regression and SVM techniques were employed, resulting in the selection of 10 genes. They were ALOX15B, MAPK14, PRKAA1, PHF21A, MICU1, KLF2, METTL14, TP63, PARK7, PARP4. The depression diagnostic model, which utilized these 10 genes, achieved an area under the curve (AUC) of 0.773. The Gene Set Enrichment Analysis (GSEA) focusing on individual genes demonstrated that Parkinson's disease, Huntington's disease, and oxidative phosphorylation pathways were highly enriched. The analysis of immune infiltration further revealed significant differences in the resting NK cells and M2 macrophages between individuals with MDD and control subjects. Specifically, PHF21A was found to be closely associated with resting NK cells in MDD, whereas METTL14 and MAPK14 were closely related to M2 macrophages. In terms of potential therapeutic options, ALOX15B, MAPK14, PRKAA1, and MICU1 among the 10 ferroptosis-related genes were found to have potential for effective therapeutic drugs

Conclusion Among all ferroptosis genes, ALOX15B, MAPK14, PRKAA1, PHF21A, MICU1, KLF2, METTL14, TP63, PARK7, PARP4 are closely

related to MDD and have diagnostic value

关键词: Major Depressive Disorder(MDD), ferroptosis genes, ALOX15B, MAPK14, PRKAA1, MICU1.

青少年抑郁障碍患者持续性自伤行为风险预测模型分析

张延妍 郭慧荣*

郑州大学第一附属医院

目的 探究青少年抑郁障碍患者中非自杀性自伤行为及其发展成持续性的相关危险因素, 制作风险预测模型并进行验证。

方法 本研究为基于电子病历临床记录数据的回顾性队列研究。对象为 2021.1 至 2023.5 在郑州大学第一附属医院精神医学科住院治疗的有自伤行为的 737 名抑郁发作青少年患者, 按 7:3 的比例随机分为训练集 (n=513) 和验证集 (n=224)。使用单因素和多因素 Logistic 回归分析筛选青少年抑郁患者自伤行为发展为持续性的独立危险因素并建立预测模型。使用受试者工作特征(ROC)曲线下面积(AUC)评估训练集和验证集模型的区分度, 使用校准曲线评估训练集和验证集模型的校准度, 使用 Hosmer-Lemeshow (HL) 检验评估模型的拟合优度, 使用临床决策分析(DCA)曲线评价模型的临床获益情况。

结果 HAMD ($\beta=1.275$, OR=3.58, 95% CI: 1.21~10.69)、复发次数 ($\beta=0.801$, OR=0.45, 95% CI: 0.27~0.74)、伴发精神症状 ($\beta=0.519$, OR=1.68, 95% CI: 1.04~2.71)、是否单亲 ($\beta=0.738$, OR=0.14895% CI: 0.22~1.02)、自杀未遂史 ($\beta=-0.282$, OR=0.75, 95% CI: 0.67~0.84) 是青少年抑郁患者持续性自伤行为的独立危险因素(P<0.05 或 0.01)。训练集 ROC 曲线 AUC=0.808 (95% CI: 0.738~0.878), 验证集 AUC=0.797 (95% CI: 0.750~0.845)。HL 检验评估显示较好的拟合度 (P=0.197)。

结论 抑郁严重程度、疾病复发次数、是否伴发精神症状、是否单亲及自杀未遂史是青少年抑郁障碍患者自伤行为发展为持续性的危险因素, 且由此构建风险预测模型具有良好的敏感性、特异性和临床适用性。

Prevalence and Influencing Factors for Psychotic Symptoms in Major Depressive Disorder with Moderate-to-severe Anxiety: Partial Mediation and Moderation Role of TSH

ZaiminaXuekelaiti Yifan Jing Meijuan Li Ying Gao Jie Li*

Tianjin Anding Hospital

Objective Anxious depression and psychotic symptoms are significant features of major depressive disorder (MDD). This study aimed to investigate the prevalence of moderate-to-severe anxiety in first-episode and drug-naïve MDD patients, as well as the relationship between thyroid function and psychotic symptoms in MDD with moderate-to-severe anxiety

Methods This observational cross-sectional study included 1718 patients with MDD attending an outpatient psychiatric clinic. Patients were assessed using standardized scales for depression, anxiety, and psychotic symptoms, with blood samples collected for thyroid function analysis. Statistical analyses, including t-tests, logistic regression, and correlation analyses, were conducted to explore the relationships between variables and the mediating and moderating effects of thyroid stimulating hormone (TSH) on depressive and psychotic symptoms in MDD patients with moderate-to-severe anxiety

Results The study revealed a high prevalence of moderate-to-severe anxiety in first-episode and drug-naïve MDD patients. Patients with moderate-to-severe anxiety exhibited higher levels of depressive and psychotic symptoms, as well as TSH. Furthermore, TSH levels were significantly associated with psychotic symptoms, acting as both a mediator and a moderator in the relationship between depressive symptoms and psychotic symptom severity

Conclusion TSH partially mediated and moderated the relationship between depressive symptoms and psychotic symptom. TSH may serve as a biomarker for

psychotic symptoms in MDD patients comorbid moderate-to-severe anxiety.

Identification of Plasma Biomarkers in Drug-naïve Schizophrenia with Severe Cognitive Impairment Using Targeted Metabolomics

Shuo Wang Yeqing Dong Meijuan Li Qiao Su Fuyou Bi Xiaoxiao Sun Yuying Qiu Jie Li*
Tianjin Anding Hospital

Objective Cognitive impairment is the core symptom of schizophrenia (SZ) and an important cause of functional disability in SZ patients. Early and accurate identification of cognitive impairment in SZ is important for improving the prognosis of the disease and reducing the disability rate. Therefore, we used a targeted metabolomics-based approach to explore the underlying biological mechanisms that lead to SZ patients with severe cognitive impairment.

Methods Liquid chromatography-mass spectrometry (LC-MS) targeted metabolomics was performed on plasma samples from 58 drug-naïve SZ patients and 36 healthy controls to quantify and analyze 271 metabolites. Cognitive functioning was assessed using the MATRICS Consensus Cognitive Battery (MCCB) in all subjects, and an MCCB cognitive deficit score of ≥ 3 was defined as "severe cognitive impairment" and others defined as "non-severe cognitive impairment"

Results We identified 15 differential metabolites in SZ patients with non-severe cognitive impairment compared to healthy controls, of which 11 were upregulated and 4 were downregulated. In addition, we found 26 differential metabolites in SZ patients with severe cognitive impairment compared to healthy controls, of which 7 were up-regulated and 19 were down-regulated. Importantly, we found 21 metabolites that differed only in SZ patients with severe cognitive impairment, of

which 5 were upregulated and 16 downregulated. Then, sphingolipid metabolism, glycerophospholipid metabolism, and linoleic acid metabolism were identified as metabolic pathways associated with severe cognitive impairment in drug-naïve SZ patients. Finally, we found that SM C20:2, CE (16:1), Cer(d18:1/22:0), PC aa C36:0, PC aa C36:6, and PC ae C36:2 were correlated with the subdimensions Processing speed, Working memory, etc., of the MCCB in SZ patients with severe cognitive impairment, whereas there were no correlations in SZ patients without severe cognitive impairment. The receiver operating characteristic curve showed that the combination of SM C20:2, CE (16:1), Cer(d18:1/22:0), PC aa C36:0, PC aa C36:6, and PC ae C36:2 had good diagnostic value for distinguishing between schizophrenic patients with severe cognitive impairment and those without severe cognitive impairment, and the area under the curve was 0.732 (95% CI: 0.602-0.862)

Conclusion Our study identified 21 characteristic metabolites (mainly lipids) and 3 metabolic pathways associated with severe cognitive impairment in drug-naïve SZ patients. Combinations of SM C20:2, CE (16:1), Cer(d18:1/22:0), PC aa C36:0, PC aa C36:6, and PC ae C36:2 could be used as potential biomarkers for the assessment of cognitive symptom severity in SZ patients.

Association between Exposure To Outdoor Artificial Light at Night, Executive Function and Sleep Timing Among Patients with Depression

Shanshan Shao¹, Daomin Zhu², Daomin Zhu¹, Tianqin Xie², Lei Zhang¹, Jijia Zhang², Peng Zhu¹

1.The School of Mental Health and Psychological Sciences, Anhui Medical University

2.Anhui Mental Health Center

Objective Depression is a highly prevalent psychiatric disorder that impairs the executive function of individuals. Recent evidences emphasized the potential impact of outdoor artificial light at night (ALAN) on executive function. However, the available literature on the relationships between outdoor ALAN and executive function in depressed patients is limited, and the mechanism involved remained unclear. Sleep timing refers to the time of day that sleep occurs, which can be affected by age, lifestyle, and light exposure, resulting in bedtimes and wake-up times that differ from individual preferences. It has been shown that later sleep timing (e.g., bedtime, wake-up time) may be a potential risk factor of executive dysfunction. Therefore, we aimed to investigate the relationship between outdoor ALAN exposure, sleep timing and executive function among depressed patients

Methods 538 patients with depression were enrolled from inpatient department of the Fourth People's Hospital of Hefei from 2017 to 2021. The average 1-year outdoor ALAN exposure of each patient was estimated using satellite images, based on patients' geographical coordinates, prior to the patient was hospitalized. All participants were assessed sleep conditions through the Pittsburgh Sleep Quality Index (PSQI) and executive function through the Behavior Rating Inventory of Executive Function-Adult Version (Brief-A). We used multiple linear regression models to investigate the association between outdoor ALAN exposure, sleep timing and executive function, adjusted for potential confounders (including sex, age, family income, educational level, employment, BMI, drinking status, smoking status, physical activity, season of visit, use of antidepressants). Furthermore, mediation models were used to figure out the mediating role of sleep timing (bedtime and waketime) on the association between outdoor ALAN exposure and executive function

Results This study found that brighter outdoor ALAN exposure was associated with later bedtime and waketime. An interquartile range (IQR 26.79nW/cm²/sr) increase in outdoor ALAN, a 14.04-minute [95% confidence interval (CI): 2.88–25.2] delay in bedtime and a 20.28-minute (95%CI: 3.42–37.14) delay in waketime,

after fully adjusted for confounders. Meanwhile, outdoor ALAN exposure was positively associated with the total score of Brief-A, each IQR increase in exposure of outdoor ALAN was associated with 5.22 (95%CI: 1.23–9.21) of increases in total score of Brief-A. Further Mediation analysis shows that both bedtime and waketime significantly mediated the relationship of outdoor ALAN on executive function, the mediated proportion of them on executive function were 10.57% and 9.54%, respectively

Conclusion The results provided evidence that brighter outdoor ALAN was related to poor executive function in depressed patients. And later sleep timing may mediate the association between outdoor ALAN exposure and executive function. Future studies should elucidate whether interventions to reduce exposure to ALAN may positively affect executive function.

血浆甜菜碱类似物水平与精神分裂症患者的症状和认知功能有关

毕富有 李洁* 苏侨 蒋长勇
天津市安定医院

目的 精神分裂症(Schizophrenia, SZ)是一组病因不明的严重精神障碍。甘氨酸甜菜碱、脯氨酸甜菜碱和色氨酸甜菜碱均为甜菜碱类似物,既往研究发现甜菜碱类似物在中枢神经系统中具有抗炎或抗氧化作用。然而,这些化合物与SZ之间的关系尚不清楚。我们旨在探索甜菜碱类似物与SZ患者症状严重程度和认知功能之间的关系,以及它们在SZ患者接受抗精神病治疗后的动态变化。

方法 根据入组标准纳入天津安定医院门诊或住院的未用药精神分裂症患者58例。同时向社会招募了36例健康对照,他们与患者来自同一地区,且年龄、性别相匹配。在基线时通过自编的人口学问卷收集患者与健康对照的一般信息,并使用MATRICS成套神经认知测试(MATRICS Consensus Cognitive Battery, MCCB)进行认知评估,患者的症状严重程度采用阳性和阴性症状量表(Positive And

Negative Syndrome Scale, PANSS) 进行评估, 同时采集空腹静脉血液标本, 以进行后续血浆标志物的测定。患者组还需在治疗 8 周后进行认知和症状评估以及血液样本的采集。采用注射流动分析-质谱串联以及液相色谱-质谱串联方法进行血浆甜菜碱类似物的检测。使用 spss20.0 进行统计学分析。

结果 基线时, 精神分裂症患者与健康对照组相比甘氨酸甜菜碱水平降低 ($p=0.046$), 脯氨酸甜菜碱水平升高 ($p=0.037$)。治疗 8 周后, 甘氨酸甜菜碱 ($p=0.016$) 和色氨酸甜菜碱 ($p<0.001$) 与基线相比显著下降。患者组基线的甘氨酸甜菜碱水平与基线时 PANSS 阴性因子分 ($r=0.275$) 呈负相关, 和 8 周时的 PANSS 阴性因子分 ($r=0.417$)、激越因子分 ($r=0.361$) 和认知因子分 ($r=0.324$) 呈负相关。基线脯氨酸甜菜碱水平与基线时 MCCB 工作记忆分数 ($r=0.348$) 和 8 周 MCCB 总分 ($r=0.284$) 呈负相关。色氨酸甜菜碱在治疗后的降低程度与 PANSS 认知因子的降低程度呈负相关 ($r=0.357$)。

结论 甜菜碱类似物与精神分裂症症状严重程度及认知显著相关, 且在治疗前后显著变化。这些指标可能是精神分裂症的潜在生物学标志物, 与精神分裂症的发生和预后均存在关联, 并为进一步探究精神分裂症的病理生理机制提供了思路。

Disruption of Network Hierarchy Pattern in Bulimia Nervosa Reveals Brain Information Integration Disorder

Lirong Tang¹, Yiling Wang², Peng Zhang², Sha Sha¹, Jing Liu¹, Jiani Wang²

1.Beijing Anding Hospital, Capital Medical University

2.Beijing Friendship Hospital, Capital Medical University

Objective Previous studies have demonstrated abnormalities in several specific networks that may account for their multiple behavioral deficits in bulimia nervosa (BN) patients, but whether and how the network hierarchical organization changes in BN patients remain unknown. This study aimed to investigate alterations of

the hierarchy pattern in the BN network and their clinical relevance.

Methods Connectome gradient analyses were applied to depict the network hierarchy patterns of fifty-nine BN patients and 39 healthy controls (HCs). Then, we evaluated the network- and voxel-level gradient alterations of BN by comparing the gradient values in each network and each voxel between BN patients and HCs. Finally, the association between the altered gradient values and clinical variables was explored.

Results Compared to HCs, BN patients exhibited reduced gradient values in the dorsal attention network and increased gradient values in the subcortical regions in the principal gradient and had decreased gradient values in the ventral attention network and increased gradient values in the limbic network in the secondary gradient. Regionally, the areas with altered principal or secondary gradient values in BN patients were mainly located in the transmodal networks. In BN group, the principal gradient values of the right inferior frontal gyrus were negatively associated with external eating behavior.

Conclusion This study revealed the disordered network hierarchy patterns in BN patients, which suggested a disturbance of brain information integration from the attention network and subcortical regions to the transmodal networks in these patients. These findings may provide insight into the neurobiological underpinnings of BN.

关键词: bulimia nervosa, connectome gradient, network hierarchy, attention network, subcortical regions, transmodal network.

Association between P300 Event-related Potential and Suicidal Thoughts and Behaviors in First-episode Antipsychotic-naïve Patients with Schizophrenia

Chenghao Lu Shaobing Li Shen Li Jie Li*

Tianjin Anding Hospital

Objective Suicidal thoughts and behaviors

(STBs) are critical concern in schizophrenia (SZ). Concurrent changes in event-related potential (ERP), particularly the P300 (P3) components, have been observed in SZ patients, but the association between these changes and STBs remains unclear. This study aims to explore the relationships between P3 components and STBs in first-episode antipsychotic-naïve SZ (FEAN-SZ) patients

Methods The study included 321 FEAN-SZ patients and 146 healthy controls (HC). Sociodemographic data, clinical assessments, and ERP P3 components (N1, P3a, and P3b) were collected. Psychotic symptoms were assessed using the Positive and Negative Syndrome Scale (PANSS), while depressive symptoms were evaluated with the Hamilton Depression Scale (HAMD)

Results Compared to HC, FEAN-SZ patients exhibited lower N1 and P3 amplitudes and longer latencies (all p s < 0.001). Patients with STBs exhibited higher scores on negative, general psychopathology, PANSS total and HAMD scales, decreased N1 and P3a amplitudes, as well as prolonged P3a and P3b latencies compared to those without STBs (all p s < 0.001). The P3a latency predicted the general psychopathology score ($\beta = 0.103$, $p < 0.001$), and the N1 amplitude predicted the HAMD score ($\beta = -1.057$, $p = 0.001$), both exclusively within the STBs group. Logistic regression analysis identified that N1 amplitude (Beta = -0.132, $p = 0.018$, OR = 1.02, 95%CI = 1.01-1.04) and HAMD scores (Beta = 0.068, $p = 0.001$, OR = 1.07, 95%CI = 1.03-1.11) as independent predictors of STBs in FEAN-SZ patients. Combining these variables yielded an area under the receiver operating characteristic (AUCROC) curve of 0.840 for distinguishing between patients with and without STBs

Conclusion FEAN-SZ patients with STBs have lower P3 amplitude and longer latency. The N1 amplitude and depressive levels are associated with STBs in FEAN-SZ patients. The N1 amplitude may serve as an early biological marker for STBs in SZ patients.

社会精神医学学组

易性症人群筛查问卷的初步编制与信效度研究

白靖怡¹ 刘娜^{1,2} 黄楠² 陆峥^{1,2}

1. 同济大学附属同济医院

2. 上海市精神卫生中心

目的 易性症指个体心理体验的性别与被分配的性别(出生性别)存在持续而显著的不一致,这种不一致常常对个体带来痛苦。根据个体心理和身体上的痛苦程度,有时需要医疗上的干预。在中国,有相当一部分易性症个体会前往医疗机构,提出采取医学手段(例如摄入性激素或者生殖器重置手术)更改他们的性征与生殖器,使得他们得以重置法律身份,以修改后的体验性别身份继续在社会上生活。然而,由于易性症人群数量占比较少,一般精神科医师难以接触到相关来访者,对他们的表现与内心痛苦原因难以理解。因此,亟需相关量表辅助判断易性症的程度与表现。目前国内门诊尚没有问卷及量表辅助判断易性症。由于国内门诊工作量较大,快速便捷提供易性症程度评分,用以辅助临床访谈成为首要需求。因此,编制一份针对易性症的核心问题的筛查问卷更为必要。本研究目标是对编制的易性症筛查问卷进行信效度分析后,为将来易性症诊疗的临床工作提供有效辅助检查工具。

方法 (1) 项目分析: 使用 SPSS 26.0 软件,用临界比值法对数据进行统计学分析对初始问卷的 15 个题项进行项目分析。(2) 结构效度: 探索性因子分析使用 Kaiser—Meyer—Olkin (KMO) 值与 Bartlett 球形检验,判断问卷数据是否适合做因子分析。利用主成分分析,使用最大方差法,删除问卷中负荷因子 <0.4 的条目。使用 AMOS 程序进行验证性因子分析。(3) 信度检验: 利用科隆巴赫系数(Cronbach- α)对本筛查问卷评估内部一致性信度。

结果 高分组与低分组具有显著差异,高分组均为易性症人群,低分组均为顺性别人群,高低分组的所有题目都具有显著差异($P<0.05$),具有良好区分度。KMO 值为 0.951; X^2/df 值为 4.675, RMSEA 值为 0.104, 拟合效果一般; 而 NFI、TLI、CFI 等指标效度均在 0.9 以上, 适配效果良好; 聚敛效度中, 本问卷平均方差变异 AVE 为 0.671, 组合信度 CR

值为 0.962, 说明聚敛效度理想。Cronbach' α 系数为 0.954, 问卷信度良好。

结论 易性症人群占人群总数较少, 精神科医师难以接触到, 但这类来访者有一定医疗需求。快速准确的易性症筛查问卷能够便捷协助临床门诊精神科医师判断来访者的性别困扰程度及方向, 从而为来访者提出适宜的建议。本问卷项目分析显示能够较好区分易性症人群和一般人群, 效度检验中 KMO 值 >0.9 , 其余结构效度指标显示适配效果良好, 组合信度和科隆巴赫系数均为 0.9 以上, 信效度良好, 能够成为心理精神科诊室可靠的筛查工具。

Identifying Influences That Play An Important Role in The Path From Social Isolation Or Loneliness To Depression: A Mendelian Randomization Analysis

Wenxi Sun¹, Haonan Zhang², Ping Sun³, Huihui Song¹, Xiaohui Wu², Jun Chen², Yiru Fang^{2,4}, Xiaobin Zhang¹

1. Suzhou Guangji Hospital

2. Shanghai Mental Health Center

3. Qingdao Mental Health Center

4. Ruijin Hospital, Shanghai Jiao Tong University School of Medicine

Objective Isolation and loneliness are associated with depression, but it is unclear whether a causal link exists between isolation and loneliness to depression, or whether modifiable risk variables exist along the pathway that can influence pathogenic outcomes

Methods We extracted genetic variants of European ancestry associated with social isolation or loneliness and depression from the UK Biobank (455,364 and 462,933 individuals, respectively). Subsequently, we assessed the relationship between loneliness or social isolation and depression using a two-sample Mendelian randomization (MR) method. A two-step MR was used to assess the 25 potential mediators associated with the outcome (depression) and to calculate the proportion mediated by mediators that met the requirements

Results In the two-sample MR analysis, genetically predicted elevated levels of social isolation or loneliness ($\beta = 0.188$, 95% confidence interval [CI] 0.109, 0.268, $P = 3.594 \times 10^{-6}$) were significantly associated with higher levels of depression. Of the 25 potential risk factors for depression, two were identified as mediators of the correlation between isolation or loneliness and depression: neuroticism (mediation ratio: 54.3% [95% CI: 43.1%, 65.5%]) and insomnia (15.5% [95% CI: 7.7%, 23.3%]). Multiple sensitivity analyses confirmed the robustness of the findings

Conclusion Our findings provide evidence that higher levels of social isolation or loneliness have an impact on increased levels of depression and that neuroticism and sleeplessness in turn play an important mediating role between the two

关键词: social isolation, depression, neuroticism, sleeplessness, Mendelian randomization, mediation analyses

Interventions for Suicidal and Self-injurious Related Behaviors in Chinese Adolescents with Psychiatric Disorders: A Systematic Review and Meta Analysis

Junjie Lu¹, Jun Huang¹, Junxin Guo¹, Yingbin Luo¹, Yusen Ou¹, Yutong Chen¹, Jiayan Lu², Wenwang Rao¹
1.Shantou University Medical College
2.Macao Polytechnic University

Objective As a leading cause of adolescent death, suicidal and self-injurious related behaviors (SSIRBs) is a devastating global health problem, particularly among patients with psychiatric disorders (PDs). Previous studies have shown that multiple interventions can alleviate symptoms and reduce risks. This review aimed to provide a systematic summary of interventions (i.e., medication, physical therapy, psychosocial therapy) for the treatment of SSIRBs among Chinese adolescents with PDs

Methods From inception to September 17, 2023, twelve databases (PubMed, CINAHL, ScienceDirect,

PsycINFO, EMBASE, Cochrane Library, Clinical Trial, Web of Science, CEPS, SinoMed, Wanfang and CNKI) were searched. We qualitatively and quantitatively synthesized the included studies. Standardized mean differences, risk ratios and their 95% confidence intervals used the Der Simonian and Laird random-effects model

Results A total of 20,926 articles were screened. And only 10,976 records that were eligible after the first-stage of screening were included. After full-text screening, fifty-two articles contained fifty-three studies with 3,760 participants (experimental group=2,065 adolescents vs control group=1,695 adolescents). Out of ten articles from international databases, forty-two literatures were from Chinese databases. Three single therapies (physical therapy, psychosocial therapy and drug therapy) were found in our study, among which the majority was psychosocial therapy (4/26; intensive service provision + cognitive behavioral therapy). Whereas dialectical behavior therapy and sertraline were the most widespread combination therapy (5/27)

Conclusion This review systematically outlined the primary characteristics, safety and effectiveness of interventions for Chinese PDs adolescents with SSIRBs, which could serve as valuable evidence for guidelines aiming to formulate recommendations.

Associations of Rare Variants in The AKAP11 Gene with Bipolar Disorder in Chinese Population

Yankai Zhang Ping Sun*
Qingdao Mental Health Center

Objective This pioneering study aimed to explore the associations between the A-kinase anchoring protein 11 (AKAP11) gene and bipolar disorder (BD) in a Chinese population. We sought to replicate findings from European populations regarding ultra-rare protein-truncating variants (PTVs) within exon 8 of AKAP11 and identify any novel rare mutations linked to Chinese

BD patients

Methods We conducted a case-control association study, including a cohort of 284 Chinese BD patients, with the control group comprising 10,588 individuals from the China Metabolic Analytics Project (ChinaMAP) database. Polymerase chain reaction (PCR) amplification and Sanger sequencing were performed to analyze exon 8 of the AKAP11 gene. Statistical analysis involved chi-square tests to assess differences in allele frequency between BD patients and the control group

Results In our 284 Chinese BD patients, within exon 8 of the AKAP11 gene we did not find any ultra-rare PTVs previously identified in European BD patients. However, five additional rare variants were discovered, including three missense variants and two synonymous variants. Among these variants, one synonymous variant, g.42300171T>C (i.e., rs771987690), had not been reported in the ChinaMAP database. Statistical analysis did not reveal significant differences in allele frequencies between BD patients and controls ($P = 0.240$), but there was a noticeable trend suggesting a potential association between the rare variants with the AKAP11 gene and risk of BD. Additionally, three of the five rare variants were not documented in the Bipolar Exomes Browser (BipEx) database, the frequencies of the other two were mildly lower in cases than controls, contrary to the trend observed in the Chinese population. The observed difference may be due to population genetic-environmental interaction

Conclusion Our preliminary data indicates a potential trend between the AKAP11 gene and BD patients in China, despite did not reach nominal significance, calling for further analysis in a larger sample set.

CHS-DRG 对精神疾病的适用性评价研究

李谦*

北京大学第六医院

目的 按北京市医保要求某三级精神专科医院

于 2019 年 6 月 15 日对住院日 60 天以内(含 60 天)的参保人员费用结算执行按项目付费,同时数据模拟 CHS-DRG 付费。基于此,本研究拟通过对某三级精神疾病专科医院 CHS-DRG 模拟运行数据进行分析,研究 CHS-DRG 分组器目前版本的分组效果,为北京市医保部门完善精神疾病分组提供相关政策建议。

方法 利用 spss27.0 统计学软件对某三级精神疾病专科医院的 CHS-DRG 模拟运行数据进行统计学分析。采用变异系数(CV, Coefficient of Variation)、方差减少量(RIV, Reduction in Variance)统计指标来对 CHS-DRG 分组器目前版本的分组效果进行评价。变异系数主要用于评价各 DRG 组内的一致性,方差减少量主要用于评价组间的差异性。变异系数越小组间同质性越好,方差减少量值越大,组间异质性越强。

结果 2019 年至 2022 年,只有个别病组的住院费用和住院天数的变异系数大于 0.7,其余病组的变异系数均在 0.5 左右;住院费用和住院天数的方差减少量也处于较低水平,2022 年住院费用的方差减少量最高为 14.18%,2022 年住院天数的方差减少量最高为 12.11%。综上,CHS-DRG 对某三级精神疾病专科医院的适用性较差,CHS-DRG 离实际落地付费还存在一定差距。

结论 建议医保相关部门将年龄、治疗方式(有无电休克治疗)、入院方式(自愿和非自愿入院)、有无精神科共病等因素纳入分组规则,对 CHS-DRG 精神疾病的分组进行进一步的细化与调整,以期得到更合理的分组方案。

The Impact Pathways of Personality and Psychosocial Stress on Depression Among Adult Community Residents in China: A Fuzzy-set Qualitative Comparative Analysis

Xi Yang¹, Gaoqiang Xie²

1.Shenzhen Kangning Hospital

2.Peking University Clinical Research Institute

Objective In China, depressive disorders have

been the second leading cause of years lived with disability. Various factors are associated with depression and the working mode is complex. Instead of studying single-factor effects, this study aims to explore the combination of high-risk factor sets for depression among adult community residents

Methods A total of 1965 adult residents in Shenzhen, China was surveyed and tested using the Patient Health Questionnaire-9 (PHQ-9), Eysenck personality Questionnaire-revised Short Scale for Chinese (EPQ-RSC), Questionnaires of psychosocial stress survey for groups (PSSG). The fs-QCA method was used to explore the high-risk factor sets for depression among adult community residents

Results The combination of low extroversion (e)-high neuroticism (N) in personality trait, combined with high life event (V)-high negative emotional responses to events (G)- high positive emotional responses to events (O)-high positive coping styles to events (I) (e*N*V*G*O*I) was high-risk factor sets for depression. The overall consistency was 0.843, and the overall coverage was 0.330

Conclusion Our study attempted to suggest the sets of high-risk factors in personality and psychological stress of depression among adult community residents based on the fs-QCA analysis. This study provides data for developing comprehensive intervention measures for adult community residents.

关键词: depression, personality traits, life events, psychological stress, fs-QCA

童年期虐待与云南省戒毒人员的自伤行为: 饮酒的中介作用

张蝶 卢瑾*

昆明医科大学第一附属医院

目的 我国的吸毒人员达到 148.6 万, 吸毒人群的心理健康水平较低, 自伤、自杀行为逐年增加。本文旨在探究童年期虐待、饮酒与自伤行为在戒毒人群中的分布状况, 童年期虐待与自伤行为的相关性, 以及饮酒相关问题是否在其中起到中介

作用。

方法 对云南省 8 所戒毒所人员进行横断面调查, 采用二阶段简单随机整群抽样。一共纳入 1167 名受试者, 使用自编社会人口学问卷、童年期虐待问卷 (Childhood Trauma Questionnaire, CTQ)、改良版自伤行为问卷采集受试者信息。采用 Epidata 建立数据库、SPSS 25.0 进行描述性分析, 使用单因素和多因素 Logistic 回归做相关性分析, 最后构建结构方程模型来探索中介作用。

结果 1. 一般情况: 男性有 905 人, 平均年龄为 37.2 岁, 主要为汉族、单身、低文化水平, 以吸海洛因、食苯丙胺为主。1037 人报告了童年期虐待经历, 占总人群的 94.1%, 自伤行为检出率为 42%。

2. 自伤的影响因素: 在控制了其他因素后, 女性 (OR=1.58, 95%CI: 1.135-2.193)、汉族 (OR=1.56, 95%CI: 1.176-2.064)、高中及以上教育水平 (OR=1.51, 95%CI: 1.019-2.293)、焦虑症状 (OR=1.53, 95%CI: 1.120-2.096)、抑郁症状 (OR=1.64, 95%CI: 1.196-2.249)、童年期虐待 (OR=3.70, 95%CI: 1.706-8.039)、饮酒 (OR=1.73, 95%CI: 1.284-2.333) 均是自伤的危险因素, 无纹身 (OR=0.63, 95%CI: 0.480-0.813) 是保护因素。在虐待分维度中, 躯体虐待 (OR=1.45, 95%CI: 1.027-2.052)、性虐待 (OR=1.45, 95%CI: 1.100-1.918) 是自伤的危险因素。

3. 童年期虐待与饮酒呈正相关 (OR=2.75, 95%CI: 1.621-4.660), 在虐待的分维度中, 各个分维度均与饮酒无关。建立结构方程模型后, 饮酒在童年期虐待与自伤行为之间起到部分中介作用, 中介效应占比为 6.70%。

结论 童年期虐待经历在戒毒人员中较为普遍, 大部分戒毒人员存在焦虑和 (或) 抑郁症状, 自伤相关行为发生率也较高。女性、汉族、高中及以上教育经历、纹身均是戒毒人员发生自伤行为的独立危险因素, 针对这些特点, 制定更加个性化的方案, 能够降低自伤行为发生的风险。研究强调了饮酒在童年期虐待与自伤行为中的中介作用。面对虐待的强戒人群制定禁酒、限酒等条例可以有效降低相关自伤行为的发生风险, 为后续建立更为完整的心理健康行为干预体系提供一定的参考。

情绪调节与躯体症状障碍的关联：一项系统综述和 Meta 分析

严惠茹 周安琪 黎秋宏 吴超*
北京大学护理学院

目的 躯体症状障碍 (Somatic Symptom Disorders, SSD) 患者通常经历多种躯体症状并且合并多种心理问题, 严重影响日常功能并增加自杀风险。SSD 患者在识别自己情绪、表达感受和症状相关的思维方面存在缺陷, 但目前缺乏对 SSD 特定的适应性或非适应性情绪调节的综合分析。因此本研究通过系统综述和 Meta 分析探究和揭示 SSD 的各情绪调节维度是否受损及其效应大小。

方法 研究检索 PubMed、PsycINFO、Web of Science 和 Cochrane Library 四个数据库, 时间范围从建库至 2023 年 7 月 17 日。纳入报告 SSD 患者和健康对照组情绪调节差异或 SSD 症状与情绪调节相关系数的研究。文献筛选、数据提取、质量评价均由两人独立进行并达成一致。采用 Comprehensive Meta-Analysis 软件进行 Meta 分析, 效应量以 Hedges's g 表示, 使用 I^2 检验评估异质性, 并进行敏感性分析。(PROSPERO 注册号 CRD42023465911)

结果 共纳入 14 项研究, 包括 1097 名参与者 (725 名患者和 372 名健康对照)。根据纳入研究所用情绪评估量表提取 10 个维度。对于自我效能信念维度, 随机效应模型显示出较大的负效应量 (Hedges's $g = -1.344$, $p < 0.001$)。意识/识别情绪能力下降与 SSD 存在中到高等效应尺度的关联 (Hedges's $g = -0.740$, $p < 0.001$)。情绪清晰度下降与 SSD 也显示出中到高效应量的关联(随机效应, Hedges's $g = -0.760$, $p < 0.001$)。容忍情绪、描述情绪的能力、认知重评维度均与 SSD 显示中等效应量的关联(Hedges's g 分别为 -0.547 , -0.479 , -0.451)。接受情绪维度与 SSD 的呈现边缘显著的关联 (Hedges's $g = -0.610$, $p = 0.050$)。SSD 的灾难思维、表达抑制和外向性思维三个维度没有显著改变。随机效应模型进一步验证适应性情绪调节 (意识/识别情绪、描述情绪、情绪清晰度、接受情绪、容忍情绪、自我效能信念和认知重评) 与 SSD 存在显著负相关 (Hedges's $g = -0.618$)。非适应性情绪调节 (灾难思维、表达抑制) 与 SSD 无相关。

结论 SSD 存在适应性情绪调节能力, 包括情

绪的意识/识别、描述、清晰度、接受、容忍、自我效能信念和认知重评各维度的下降。研究没有发现非适应性情绪调节与 SSD 之间存在显著关联。临床对 SSD 患者予以心理治疗, 可发展或提升患者的适应性情绪调节、而不是解决非适应性情绪调节策略, 可能更有效。

The Association Between Non-High-Density Lipoprotein Cholesterol To High-Density Lipoprotein Cholesterol Ratio (NHHR) and Suicidal Ideation in Adults: A Population-Based Study in The United States

Guangwei Qing¹, Guangwei Qing², Wenpeng Deng²,
Wenpeng Deng¹, Yuxin Zhou¹, Liyun Zheng¹, Bo Wei¹
1. Jiangxi Mental Hospital
2. Third Clinical Medical College of Nanchang University

Objective The ratio of non-high-density lipoprotein cholesterol (non-HDL-C) to high-density lipoprotein cholesterol (HDL-C) (NHHR) serves as a reliable lipid indicator associated with atherogenic characteristics. Studies have indicated a potential connection between suicidality and lipid metabolism. This research aims to investigate any possible association between the NHHR and the emergence of suicidal ideation within the confines of the study

Methods This study examined the association between NHHR levels and suicidal ideation using data from the National Health and Nutrition Examination Survey (NHANES), conducted in the United States spanning 2005 and 2016. Calculation of the NHHR corresponds to the proportion of HDL-C to Non-HDL-C. The Patient Health Questionnaire-9's ninth question was implemented for assessing suicidal ideation. Using subgroup analysis, smooth curve fitting, and multivariate logistic regression analysis, the research was conducted

Results Encompassing a cohort of 29,288 participants, the analysis identified that 3.82% of individuals

reported suicidal ideation. After using multivariable logistic regression and thorough adjustments, elevated NHHR levels were significantly and positively associated with a heightened likelihood of suicidal ideation, according to the findings (odds ratio [OR] = 1.06; 95% confidence interval [CI]: 1.02-1.11; P = 0.0048). Despite extensive adjustment for various confounding factors, this relationship remained consistent. An inverted U-shaped curve was utilized to illustrate the link between NHHR and suicidal ideation among nonsmokers; the curve's inflection point was situated at 7.80. Subgroup analysis and interaction tests (all P for interaction > 0.05) demonstrated that there was no significant influence of the following variables on this positive relationship: age, sex, race, body mass index, education level, married status, hypertension, diabetes, and smoking status

Conclusion Significantly higher NHHR levels were associated with an elevated likelihood of suicidal ideation. Based on these results, it is probable that NHHR may serve as a predictive indicator of suicidal ideation, emphasizing its potential utility in risk assessment and preventive strategies.

重度抑郁障碍患者躯体化症状的神经影像学研究

聂明轩*

哈尔滨医科大学附属第一医院

目的 重度抑郁障碍 (MDD) 是最常见的精神障碍之一, 其主要症状为心境低落、兴趣减退、快感缺失、内疚和无价值感, 以及躯体症状。躯体化症状在 MDD 患者中很常见, 且表达丰富, 涉及多器官多系统。伴有躯体症状的患者由于身体症状严重, 疗效差, 伴有躯体症状的重度抑郁障碍患者存在自杀意念和生活质量差的高风险。功能核磁共振成像 (fMRI) 是一种新的研究人脑功能的方法, 具有无创、时间和空间分辨率高的特点, 渐应用于神经科学的多个领域。在阐明高级神经生理和神经心理

活动方式和皮层间的功能联系中起到重要指导作用, 显示了较高的应用价值。本研究旨在基于静息态功能磁共振探讨伴躯体化症状重度抑郁障碍患者脑区活动特点, 以及它们与临床特点之间的相关性。

方法 以社区居民为研究对象。其中符合美国第五版精神障碍诊断和统计手册 (DSM-5) 且躯体化自评量表 (PHQ-15) 评分 ≥ 10 分为 SD 组, 符合诊断但 PHQ-15 评分小于 10 分为 NSD 组, 同期不符合重度抑郁障碍诊断且排除其他精神及躯体疾病且抑郁自评量表 (SDS) 标准评分小于 50 的受试者为健康对照 (HC) 组。49 名受试者全部在飞利浦 3.0T 核磁共振扫描设备上静息态功能磁共振扫描,

扫描当天收集完毕所需临床资料。所有影像数据进行预处理后, 对分数低频振幅 (fALFF)、低频振幅 (ALFF) 及局部一致性 (ReHo)、全脑功能连接 (FC), 比对患者与健康人群的脑区功能活动差异。

结果 SD 组 ReHo 指标在左侧眶部额下回、楔前叶和右侧颞上回、三角部额下回、枕中回较 HC 组、NSD 组显著降低。(2) SD 组的 ALFF 指标下发现在右侧三角部额下回显著降低, fALFF 指标则在右侧额中回和 NSD 组、HC 组相比显著降低。(3) 分析比较三组全脑功能连接矩阵, 得到 8 条差异显著连边。其中 SD 组在右岛叶-右眶部额下回、右楔叶-左距状裂、左角回-右眶部额中回、右壳核-左辅助运动区四条连边中表达了较 HC 组、NSD 组明显升高的功能连接强度。

结论 (1) ReHo 的差异表明, 重度抑郁障碍患者的躯体化症状可能和左侧眶部额下回、楔前叶和右侧颞上回、三角部额下回、枕中回功能活动的时间一致性降低有关。

(2) 在 ALFF 及 fALFF 指标中分别在右侧三角部额下回、额中回出现异常, 表明右侧三角部额下回及额中回的功能活动下降可能导致了重度抑郁障碍患者的躯体化症状。

(3) FC 结果表明 MDD 患者右岛叶-右眶部额下回、右楔叶-左距状裂、左角回-右眶部额中回、右壳核-左辅助运动区四条连接参与调控躯体化症状的发生发展。

大学生儿童期虐待与生命质量的关系：人格、生活事件和身心健康的链式中介作用

朱相华* 乔娟 周勤
徐州市东方人民医院

目的 验证人格、生活事件和身心健康在大学生儿童期虐待与生命质量的关系中发挥链式中介作用的理论假设。

方法 采取整群抽样选取江苏省某 3 所高校 2363 名大学生，符合儿童期虐待标准者 969 人，使用儿童期虐待史自评量表 (PRCA)、简式大五人格问卷 (NEO-FFI-R)、世界卫生组织生存质量简表 (WHOQOL-BREF)、青少年生活事件量表 (ASLEC)、人口社会经济学资料调查问卷等测试。

结果 构建结构方程模型 II，拟合检验发现，简约适配度指数 $df=4.996 < 5.000$ ， $CN=556 > 200$ ， $PGFI=0.721 > 0.50$ ， $PNFI=0.7821 > 0.50$ ， $PCFI=0.789 > 0.50$ ，饱和模型 $> AIC <$ 独立模型，提示假设模型与样本数据可以契合；绝对适配度指数 $RMSEA=0.041 < 0.050$ ， $GFI=0.965$ ， $AGFI=0.953$ ；增值适配度指数 $NFI=0.956$ ， $RFI=0.946$ ， $IFI=0.964$ ， $TLI=0.956$ ， $CFI=0.964$ ，说明模型适配度较好，修正模型图 II 可以接受。结构方程模型 II 显示，儿童期虐待通过人格 ($S\beta=-0.376$ ， $P < 0.01$ ； $S\beta=0.709$ ， $P < 0.01$)、生活事件 ($S\beta=0.274$ ， $P < 0.01$ ； $S\beta=0.046$ ， $P < 0.05$)、身心健康 ($S\beta=0.172$ ， $P < 0.01$ ； $S\beta=-0.242$ ， $P < 0.05$) 间接地影响大学生的生命质量，通过人格间接地影响生活事件 ($S\beta=-0.490$ ， $P < 0.01$)、身心健康 ($S\beta=-0.852$ ， $P < 0.01$)，对生命质量无直接影响效应；人格即直接地影响生命质量 ($S\beta=0.709$ ， $P < 0.01$)，又通过生活事件 ($S\beta=-0.490$ ， $P < 0.01$ ； $S\beta=0.046$ ， $P < 0.05$)、身心健康 ($S\beta=-0.852$ ， $P < 0.01$ ； $S\beta=-0.242$ ， $P < 0.05$) 间接地影响生活质量。

结论 人格、生活事件和身心健康在大学生儿童期虐待与生命质量之中发挥链式中介作用，人格的效应最强，生活事件的效应最弱。

关键词：儿童期虐待；生命质量；大学生；人格；生活事件；身心健康

Distinct Trajectories of Psychotic-Like Experiences and Their Associations with Violent

Behavior Among 3539 Young Adults: A 3-Year Prospective Cohort Study

Shaoling Zhong Ling Hong Yue Li Xihu Yang Jiawen
Zhang Liang Zhou Meng Sun*
The Affiliated Brain Hospital of Guangzhou Medical University

Objective Violence may be linked to psychotic-like experiences (PLEs). However, relevant research is still limited, especially in general population. Therefore, we aimed to identify trajectories of PLEs and examine whether specific trajectories were related to violent behavior in a 3-year cohort study

Methods We developed a prospective cohort study and collected data in 2020 (T0), 2021 (T1), and 2022 (T2) in Guangzhou, China. A total of 3539 university students from two universities were included and completed self-report questionnaires to assess PLEs, violent ideation, violent threats, and violent acts. Socio-demographic and clinical factors were assessed and considered as confounding factors. We used growth mixture modeling to identify trajectories of PLEs. Associations between PLEs trajectories and violent behavior were examined using binary logistic regression

Results At T2, 162 (5.3%) participants had violent behavior. We identified three distinct trajectories: low stable trajectory, low increasing trajectory, and high decreasing trajectory. The binary logistic regression models revealed that the high decreasing (OR: 2.46, 95%CI: 1.60-3.72) group and the low increasing (OR: 11.7, 95%CI: 7.62-17.9) were associated with higher violent risk compared to the low stable group after controlling for baseline socio-demographic and clinical factors

Conclusion Our study delineated three distinct trajectories and indicated that PLEs trajectories are related to subsequent violent ideation and violent acts. The results provide crucial clarifications regarding the nature of the associations between PLEs trajectories and violence over time.

Gender Differences in The Association Between Lipid Metabolism Abnormalities and Suicide Behavior in Young Adults with Major Depressive Disorder Background

Boxuan Li¹, Minghui Li¹, Xiangyang Zhang²

1.Tianjin Anding Hospital

2.CAS Key Laboratory of Mental Health

Objective This study aimed to investigate the prevalence of lipid metabolism abnormalities among young adults diagnosed with Major Depressive Disorder (MDD) and to explore the association between these abnormalities and suicide attempts, with a focus on gender differences

Methods In this cross-sectional study, 1,289 young adults with first-episode, drug-naïve MDD were assessed. Sociodemographic and clinical characteristics, along with biochemical indices, were collected. Depression and anxiety symptoms were evaluated using the Hamilton Depression Rating Scale (HAMD) and the Hamilton Anxiety Rating Scale (HAMA), respectively. Psychotic symptoms were measured using the Positive and Negative Syndrome Scale (PANSS). Additionally, blood pressure, Body Mass Index (BMI), lipid levels, and thyroid function were measured. Logistic regression analyses were conducted separately for male and female participants to identify factors associated with suicide attempts

Results Significant differences were observed between individuals with and without suicide attempts in terms of total cholesterol, triglycerides, High-Density Lipoprotein Cholesterol (HDL-C), Low-Density Lipoprotein Cholesterol (LDL-C), Fasting Blood Glucose (FBG), and Thyroid-Stimulating Hormone (TSH) levels ($p < 0.001$). In male MDD patients, lower educational level, higher anxiety levels, higher BMI, and elevated TSH levels were significant predictors of suicide attempts, with an Area Under the Curve (AUC) of 0.822. In female MDD patients, being unmarried, having a longer duration of illness, higher levels of anxiety and depression, lower PANSS scores, higher systolic blood

pressure, and elevated TSH levels were associated with suicide attempts, with an AUC of 0.837

Conclusion This study provides evidence for the association between lipid metabolism abnormalities and suicide attempts in young MDD patients, highlighting significant gender differences. Men with lower education, more severe anxiety symptoms, higher BMI, and elevated TSH levels are at greater risk for suicide attempts. Women who are unmarried, have a longer illness duration, more severe symptoms of depression and anxiety, and elevated TSH levels are also at higher risk. These findings underscore the importance of considering gender-specific factors in the clinical management of MDD and suggest potential value in targeted prevention and intervention strategies.

Susceptibility Mechanisms for Analyzing Depressive Symptoms in Differently Disadvantaged Children From An Integrative Perspective: A Network Analysis and Network Comparison

Weiliang Wang* Qiu Li Tangrong Bao Zhaoling He
Tianhua Wu Luyao Tang
Xuzhou Medical University

Objective The aim of this study was to investigate the network structure of depressive symptoms in disadvantaged children and adolescents and the network differences between them and nondisadvantaged individuals

Methods We classified disadvantaged children from an integrated perspective, taking full account of sociodemographic factors and environmental risks. Latent profile analysis was used to identify environmental risk categories. Network analysis was used to examine the interrelationships between 27 symptoms of the Children's Depression Inventory (CDI) and to identify the core symptoms. We evaluated network structure and

global strength between different groups. If the difference in network structure was significant, the edge (connection) strength was evaluated

Results A total of 4574 children completed the survey. Combined with the results of the latent profile analysis, disadvantaged children were classified into four categories as follows: the basic disadvantaged group, the environmental risk group, the doubly disadvantaged group and the nondisadvantaged group. There was a significant difference in the incidence of depression between the different groups, with the lowest incidence in the nondisadvantaged group(15.8%) and the highest incidence in the doubly disadvantaged group(52.72%). There was a significant difference between the network structure of depressive symptoms in the doubly disadvantaged and nondisadvantaged groups, with specific differential edges centered on the entries for self-esteem and interpersonal relationships. The global connectivity of the network was similar for the different groups

Conclusion The results revealed that children with disadvantages have a greater incidence of depression. The core node of the depressive symptom network focuses on negative emotions. The susceptibility characteristics of depressive symptom networks focused on network structure, including specific edges of “self-esteem” and “relationships”, rather than the global connectivity of the network.

关键词: depression; disadvantaged children; network analysis

非自杀性自伤青少年父母照护能力评估量表的编制及信效度检验

孙春艳^{1,2} 李惠平^{1,2} 王黎^{1,2} 谢美香^{1,2} 刘小玉^{1,2}
蔡敏仪^{1,2} 覃柳叶^{1,2}

1.广东省人民医院
2.广东省精神卫生中心

目的 编制适合我国非自杀性自伤 (Non-Suicidal Self Injury, NSSI) 青少年患者父母照护能力的评估量表, 并验证其信效度。

方法 以美国学者 Farran 照顾者技能模型为理论框架, 通过文献回顾结合对存在 NSSI 照护者半结构化深入访谈结果, 初步构建量表的分量表、维度及条目池。通过专家函询法、预调查、项目分析、探索性因子分析筛选及修改条目、确定分量表维度, 形成正式量表。采用方便抽样法对 310 例非自杀性自伤 (NSSI) 青少年父母照顾者进行调查, 对预试量表进行项目分析和信效度检验。

结果 非自杀性自伤青少年患者父母照顾能力评估量表包含知识、态度、行为、对资源的利用, 4 个维度, 共 26 个条目。探索性因子分析提取 4 个公因子, 累计方差贡献率为 61.123%。验证性因子分析结果显示, 模型拟合良好, 问卷因子结构稳定。问卷总体内容效度和各条目内容效度均为 1.00。问卷总的 Cronbach's α 系数为 0.923, 各维度的 Cronbach's α 系数为 0.947~0.972。

结论 该研究编制的非自杀性自伤父母照顾能力评估量表具有良好的信效度, 可有效评估非自杀性自伤青少年父母的照护能力水平。

Prevalence and Associated Factors of Suicide Attempts in First-Episode Drug-Naïve Major Depressive Disorder with Comorbid Metabolic Syndrome: A Gender Differences Study

Boxuan Li¹, Minghui Li¹, Xiangyang Zhang²
1.Tianjin Anding Hospital
2.CAS Key Laboratory of Mental Health

Objective Gender differences in major depressive disorder (MDD) are well-documented; however, gender-specific risk factors for suicide attempts in first-episode drug-naïve (FEDN) MDD patients with comorbid metabolic syndrome (MetS) remain underexplored. This study aimed to investigate the prevalence and clinical correlates of suicide attempts in FEDN MDD patients with MetS and examine potential gender differences

Methods This cross-sectional study included 390 FEDN MDD patients with comorbid MetS (106 males and 284 females). Demographic and clinical data

were collected, including illness duration, Hamilton Depression Scale (HAMD), Hamilton Anxiety Scale (HAMA), Positive and Negative Syndrome Scale (PANSS) scores, thyroid function parameters, blood pressure, lipid profiles, and fasting blood glucose (FBG) levels. Descriptive statistics, chi-square tests, ANOVA, and binary logistic regression analyses were performed to assess relationships among gender, suicide attempts, and clinical characteristics, and to explore gender-specific risk factors

Results The prevalence of suicide attempts was significantly associated with multiple clinical variables. HAMD, HAMA, and PANSS positive subscale scores were significantly correlated with suicide attempts, indicating that the severity of depressive and anxiety symptoms is closely linked to suicidal behavior. Elevated levels of TSH and TPOAb were observed in patients with suicide attempts, suggesting a potential role of thyroid autoimmunity. Both systolic and diastolic blood pressures were significantly associated with suicide attempts, highlighting the relevance of cardiovascular health. Total cholesterol and LDL-C levels were significantly associated with suicide attempts in female patients, while LDL-C levels were similarly correlated in male patients. Additionally, FBG levels were elevated in patients with suicide attempts, indicating a potential link with metabolic disturbances and abnormal glucose metabolism

Further analysis revealed that, while specific risk factors varied between genders, the overall pattern of suicide attempt risk factors showed minimal gender differences. HAMA scores, TPOAb levels, and lipid profiles were significant predictors of suicide attempts in both male and female patients.

Conclusion This study elucidates the prevalence and associated factors of suicide attempts in FEDN MDD patients with comorbid MetS, revealing minimal gender differences in risk factors. Clinical treatment should consider the influence of HAMA scores, TPOAb levels, and lipid profiles on suicide attempt risk, as these factors were significant across genders. These findings provide scientific evidence for developing targeted suicide prevention strategies. Future research should further explore the biological mechanisms underlying

these clinical characteristics and integrate them into clinical assessment and intervention.

Prevalence and Associations of Functional Remission in Patients with Schizophrenia: A Large Cross-sectional Study in China

Minghui Li Liyang Zhang Xiaofei Hou Huifang Yin Guoli Yan Guangming Xu*
Tianjin Anding Hospital

Objective In recent years, the concept of schizophrenia rehabilitation has evolved from symptom alleviation to functional recovery. However, little is known about the functional remission status of schizophrenia patients in developing countries, and there is a lack of data on factors associated with functional remission. This study aims to determine the functional remission rate of schizophrenia patients in China and investigate clinical and biological parameters related to impaired functional remission

Methods This cross-sectional study involved schizophrenia outpatients and inpatients from ten Chinese mental health institutes. Trained investigators interviewed the participants using the Mini International Neuropsychiatric Interview version 7.0.2 to confirm the diagnosis of schizophrenia according to DSM-5 criteria. Functional remission was defined by a Global Assessment of Functioning score ≥ 61 . Psychopathology was evaluated using the Positive and Negative Syndrome Scale (PANSS). Symptom severity over the last seven days was assessed using the Clinical-Rated Dimensions of Psychosis Symptom Severity (CRDPSS). Sociodemographic characteristics, clinical information, biochemical, and hematologic indicators were recorded

Results The study included 2652 patients with schizophrenia, with 486 (18.3%) identified as having functional remission. The three-factor structure of CRDPSS included positive symptoms, deficit/motor

symptoms, and mood symptoms. A lower rate of functional remission was associated with higher neutrophil percentage (OR = 0.977, $p = 0.015$), higher hemoglobin levels (OR = 0.983, $p = 0.015$), higher alanine aminotransferase levels (OR = 0.983, $p = 0.026$), higher PANSS positive scores (OR = 0.873, $p < 0.001$), higher PANSS negative scores (OR = 0.923, $p < 0.001$), and higher deficit/motor symptoms scores (OR = 0.749, $p < 0.001$)

Conclusion Recovery remains a challenging goal for the majority of individuals with schizophrenia. We found that neutrophils, hemoglobin, ALT, positive symptoms, negative symptoms, and deficit/motor symptoms are associated with impaired functional remission. Future research should focus on multidimensional perspectives, evaluating various clinical and psychosocial dimensions to identify factors influencing functional remission in schizophrenia patients.

目的 探索空军散偏远部队官兵应对方式与生命意义感网络的结构特征和核心项目,为从更加细粒度视角加深理解其应对方式与生命意义感和相关干预提供参考。

方法 整群抽样空军“分散、偏僻、远离城市”部队官兵 572 名,使用简易应对方式问卷 (Simplified Coping Style Questionnaire, SCSQ) 和生命意义感量表 (Meaning in Life Questionnaire, MLQ) 测评,采用数据驱动网络分析法构建空军散偏远部队官兵应对方式与生命意义感网络,使用软件 R 及 qgraph、networktools、bootnet 等功能包进行统计分析和可视化,并使用节点预期影响 (Expected Influence, EI) 和桥预期影响 (Bridge Expected influence, BEI) 指标以量化各节点中心性和传递性等特征。

结果 在散偏远部队官兵应对方式与生命意义

感网络中,项目之间具有广泛的联系 (有效边占比 47.19%); C15“认为时间会改变现状,唯一要做的便是等待”和 C16“试图忘记整个事情”(边权值=0.430)、C3“尽量看到事物好的一面”和 C4“改变自己的想法,重新发现生活中什么重要”(边权值=0.340)、C9“改变原来的一些做法或自己的一些问题”和 C10“借鉴他人处理类似困难情景的办法”(边权值=0.310) 具有最为紧密的关联; C10“借鉴他人处理类似困难情景的办法”(EI=1.277)、C7“找出几种不同解决问题的方法”(EI=1.237) 和 C9“改变原来的一些做法或自己的一些问题”(EI=1.167) 具有最高的预期影响; P“生命意义感知”(BEI=0.408)、S“生命意义追求”(BEI=0.258) 和 C11“寻求业余爱好,积极参加文体活动”(BEI=0.156) 具有最高的桥预期影响。

结论 空军散偏远部队官兵应对方式与生命意义感具有特有的网络结构,这可能是由特殊军事职能任务和作业环境共同导致。针对“借鉴他人处理类似困难情景的办法”“找出几种不同解决问题的方法”和“改变原来的一些做法或自己的一些问题”进行干预可能对提升官兵应对方式与生命意义感产生最广泛的获益;通过干预“生命意义感知”可以在最大程度上影响应对方式,通过“寻求业余爱好,积极参加文体活动”可以在最大限度上改善生命意义感。本研究为提升空军散偏远部队官兵心理健康做出有益探索。

Association between Stress and Depressive Symptoms Among Chinese University Students: A Moderated Mediation Analysis

Fan Miao Junyu Ma Wenyao Lai Ying Qing*
Shanghai Jiao Tong University, Shanghai 200240

Objective University students undergo a transformative period of personal growth and face various pressures. These pressures are closely related to an individual's mental health, particularly their connection with depressive symptoms. Currently, the detection rate of depression risk among university students is up to 21.48%, which indicates that the mental health issues of

university students urgently need attention and research. Previous studies have found that the relationship between stress and depression is not a direct linear one but is shaped by the combined effects of individual psychological characteristics and external environmental factors. In the university environment, peer relationships, as an essential aspect of external environmental factors, significantly impact individuals' mental health and cannot be ignored. This study aims to explore the connection between stress and depressive symptoms in university students. It also seeks to investigate the role of psychological resilience and peer relationships as mediators in this connection and to determine whether an only child has a potential moderating effect on these relationships

Methods A total of 1701 university students from Shanghai Jiao Tong University completed the Patient Health Questionnaire-9 (PHQ-9), the Perceived Stress Scale (PSS-10), the Connor-Davidson Resilience Scale (CD-RISC-25), and the Peer Relationship Self-assessment. SPSS 27.0 and Stata 18.0 were used to process the data

Results (1)Stress has a significant positive predictive effect on depression ($\beta=0.55$, $t=22.27$, $P<0.01$), with students' gender, grade, and major as covariates; (2)Psychological resilience partially mediated the relationship between stress and depression (effect size=0.108, proportion of mediating effect=15.78%, 95% bootstrap confidence interval [0.0646, 0.1529]); (3)Peer relationships also partially mediated the relationship between stress and depression(effect size=0.0088, proportion of mediating effect=1.29%, 95% bootstrap confidence interval [0.0023,0.0175]); (4) Psychological resilience and peer relationships exhibit the chain mediating effect between stress and depression(effect size = 0.0216, proportion of mediating effect=3.16%,95% bootstrap confidence interval [0.0098,0.0354]); (5) Being an only child not only exerts a negative moderating effect on the relationship between stress and psychological resilience (effect size=-0.0709, $P<0.05$), but also plays a positive moderating role in the association between stress and depression (effect size=0.0768, $P<0.05$). Further simple slope analysis revealed that non-only

children demonstrate a decreasing trend in the predictive effect of stress on psychological resilience(simple slope=-0.75, $t=-28.75$, $P<0.01$), with a greater magnitude of decline than only children(simple slope=-0.68, $t=-30.59$, $P<0.01$); Non-only children exhibit an increasing trend in the predictive effect of stress on depression(simple slope=0.59, $t=18.35$, $P<0.01$), with a greater magnitude of increase compared to only children(simple slope=0.51, $t=18.37$, $P<0.01$)

Conclusion Stress can directly affect the level of depression among university students and also indirectly influence their depression levels through the chain mediating roles of psychological resilience and peer relationships. The status of being an only child exerts moderating effects on both the direct predictive relationship between stress and depression and the mediating roles of psychological resilience and peer relationships in their association. Compared to only children, non-only children are more susceptible to competition for family resources and uneven parental attention, which may lead to a lower level of psychological resilience and a higher vulnerability to depression when facing stress due to such family environments. Enhancing psychological resilience and peer relationships can alleviate the level of depression among university students. Meanwhile, the university student population of non-only children needs greater attention

青少年屏幕时间对抑郁症状的影响：生命意义感的中介作用

曾雪¹ 王诗缤² 何红波²

1.广州医科大学附属脑科医院

2.南方医科大学附属广东省人民医院, 广东省精神卫生中心

目的 探讨青少年屏幕时间与抑郁症状的关系, 以及生命意义感在青少年屏幕时间和抑郁症状之间的中介作用, 为提升青少年群体心理健康的预防干预提供理论依据。

方法 数据来源于 2023 年开展的“广东省青少年心理健康素养和服务需求调查”，共纳入初高中青少年有效样本数 5759 例。采用自编调查表收集青少年的一般人口学资料，采用抑郁症自我评估量表（CES-D）、生命意义感量表（MLQ）分别评定青少年的抑郁症状和生命意义感水平。采用 Pearson 相关分析进行相关性分析，采用 SPSS 25.0 宏程序 PROCESS 2.16 检验生命意义感在青少年屏幕时间和抑郁症状之间的中介效应。

结果 广东省初高中青少年的屏幕时间在 0-2 小时、2-4 小时、4-6 小时、6-8 小时、超过 8 小时各时段占比分别为 67.0%、20.1%、8.0%、2.8%、2.1%，抑郁症状评分（ 7.81 ± 5.01 ）分，生命意义感评分（ 48.09 ± 10.29 ）分。屏幕时间、抑郁症状、生命意义感两两之间均存在显著相关（ $p < 0.001$ ）。屏幕时间负向预测生命意义感水平（以屏幕时间在 0-2 小时为参照水平， $\beta_{2-4h} = -0.889$ ， $p < 0.05$ ； $\beta_{4-6h} = -3.019$ ， $p < 0.001$ ； $\beta_{6-8h} = -3.525$ ， $p < 0.001$ ； $\beta_{>8h} = -3.919$ ， $p < 0.001$ ），生命意义感负向预测抑郁症状的严重程度（ $\beta = -0.120$ ， $p < 0.001$ ）。Bootstrap 法检验结果显示，模型总效应显著（ $p < 0.001$ ），中介效应显著（95%CI: -0.002 至 -0.001）。以屏幕时间在 0-2 小时为参照水平，生命意义感在屏幕时间 2-4 小时、4-6 小时、6-8 小时、超过 8 小时对抑郁症状的影响的中介效应分别占总效应的 5.4%（95%CI: 0.029 至 0.186）、17.0%（95%CI: 0.242 至 0.487）、15.3%（95%CI: 0.222 至 0.625）、12.0%（95%CI: 0.230 至 0.725）。

结论 生命意义感在青少年屏幕时间与抑郁症状之间起部分中介作用。青少年屏幕时间增加，会降低生命意义感水平，进而影响抑郁症状的严重程度。可通过减少青少年的屏幕时间，增强生命意义感，从而缓解抑郁症状，促进青少年群体的心理健康。

A Systemic Review of Implicit Stigma Toward People with Mental Illness Among Different Groups: Measurement, Extent and Correlates

Yila Ren Sheng Wang Xiangqi Fu Xiuxiu Shi*

School of Nursing, Hangzhou Normal University

Objective Implicit association tests have been extensively applied to reveal socially unacceptable and concealed stigma. Several studies have only explored the implicit attitudes toward mental illness within specific groups, whereas comparisons across different groups have not been conducted. To explore the implicit stigma toward mental illness among different groups and the correlation between implicit and explicit measurements

Methods Based on PRISMA guidelines, Web of Science, Embase, PubMed/MEDLINE, Cochrane Library and PsycINFO were searched for peer-reviewed articles from inception until 18 April 2024. The Medical Education Research Quality Instrument (MERSQI) was utilized for quality evaluation and Stata 12.0 software was used to perform a meta-analysis

Results Fifty studies met the inclusion criteria for the systematic review, and thirty were included for the meta-analysis. The majority of the included studies used the concept words “mental illness” and general terms related to physical illnesses, while utilizing emotionally contrasting words as attribute words. Furthermore, the implicit effect was calculated based on an improved algorithm in twenty-eight studies. A total of thirty-eight studies were conducted to investigate the correlation between explicit and implicit measurement results. Standardized mean differences (SMD) for groups’ implicit stigma were evaluated by random-effect models. The pooled SMD revealed lower D scores in general population (SMD = 0.79, 95% CI = 0.71 ~ 0.88, $P < 0.001$), and others was followed by healthcare provider (SMD = 1.09, 95% CI = 1.00 ~ 1.18, $P = 0.054$), student (SMD = 1.17, 95% CI = 1.10 ~ 1.24, $P < 0.001$) and people with mental illness (SMD = 1.20, 95% CI = 0.93 ~ 1.53, $P < 0.001$), in ascending order

Conclusion The findings indicated a lack of standardization in the selection of conceptual and attribute words for implicit stigma measurement, as well as inconsistent data processing criteria. There was not a reliable correlation between implicit and explicit measurements. Moreover, the general population exhibited the most positive implicit stigma toward mental illness. In stark contrast, the attitude of individuals with mental

illness was considerably negative. Further studies on targeted anti-stigma interventions for different groups of mental illness are needed, particularly based on the perspective of implicit stigma.

The Relationship between Parental Rearing Styles and Social Adaptation in Schizophrenia: The Mediating Role of Personality and Impulsiveness

Xiaoyue Li Wenli Zhu*

Department of Psychiatry, Fourth People's Hospital in Wuhu

Objective The influencing factors of social adaptation of patients with schizophrenia have always been the focus of attention and extensive discussion. Previous studies suggest that parental rearing style may be an important factor affecting the social adaptation of patients with schizophrenia. At present, there are few studies on how parental rearing styles affect the social adaptation of schizophrenia. our research focuses on the role of personality and impulsive behavior in rearing styles affecting social personality, and further explores the relationship among the three

Methods Our study included 547 patients with schizophrenia and collected their general demographic data, parental rearing style questionnaire, Barratt Impulsiveness Scale, Eysenck Personality Questionnaire and social adaptability questionnaire. Statistical analysis using SPSS-24.0 and AMOS software

Results The scores of negative parental rearing styles of parents of schizophrenic patients with weak social adaptation were higher than those of patients with strong social adaptation and the scores of psychoticism (64.52 ± 17.02 VS. 59.82 ± 17.85 ; $P=0.014$), neuroticism and attentional impulsiveness of patients with weak social adaptation were higher than those of patients with strong social adaptation. The score of extroversion in the strong social adaptation group was significantly

higher than that in the weak adaptation group ($t=-3.84$, $P<0.001$). Negative parental rearing styles was positively correlated with psychoticism and attentional impulsiveness, and negatively correlated with social adaptation ($r=-3.007$, $P=0.003$), psychoticism and attentional impulsiveness were negatively correlated with social adaptation ($r=-3.738$, $P<0.001$; $r=-2.114$, $P=0.035$)

Conclusion Our study found that the social adaptation of patients with schizophrenia may be related to their parental rearing styles, personality and impulsive behavior. Among them, positive parental rearing styles and psychoticism may be the protective factors of social adaptation. Through the construction of the model, we found that psychoticism and attentional impulsiveness may be the mediate factors between negative parental rearing styles and social adaptation in patients with schizophrenia.

Structural Neuroimaging Changes in Individuals at High Risk for Psychosis (HR) and Patients with First Episode Schizophrenia (FEP) in Comparison To Healthy Controls

Zhuohui Huang Ming Chen Cailan Hou*

Guangdong Mental Health Center, Guangdong Provincial People's Hospital (Guangdong Academy of Medical Sciences), Southern Medical University

Objective Evidence of structural neuroimaging changes on the prodromal stage of psychosis remains limited and inconsistent. A better understanding of morphological brain differences could potentially lead to the development of early diagnosis of high risk for psychosis, helping to understand the possible mechanisms of transformation into mental disorders such as schizophrenia

Methods In this study, 35 individuals with high risk for psychosis (HR), 25 with first-episode patients with schizophrenia (FEP), and 22 for healthy controls (HC) underwent face-to-face clinical interviews and

psychiatric symptom assessments. Structural magnetic resonance imaging (sMRI) data were acquired

Results The results demonstrated that HR group showed a significant reduction in the folding index in the left rostral anterior cingulate cortex compared to the HC group. FEP group exhibited a significant reduction in curvature index, folding index, surface area, cortical thickness, and volume in the left frontal pole, right cuneus cortex, right pars triangularis, bilateral entorhinal cortex, left para-hippocampal gyrus, and bilateral temporal pole compared to the HR and HC groups

Conclusion To conclude, gray matter abnormality could serve as a neuroimaging biomarker for the occurrence and development of psychosis. Further comprehensive researches are necessary to identify more promising biomarkers, facilitating early detection and intervention for susceptibility to psychosis.

Unveiling The Causal Impact of Lipid Metabolic Traits on Alzheimer's Disease: Comprehensive Evidence From Phenome-wide Mendelian Randomization and Neuroimaging Analysis

Wenxi Sun¹, Dongming Liu², Ancha Baranova³, Hongbao Cao³, Fuquan Zhang⁴

1.Suzhou Guangji Hospital

2.Nanjing Drum Tower Hospital

3.George Mason University

4.Nanjing Brain Hospital

Objective Our objective was to systematically investigate phenotypes causally associated with Alzheimer's disease (AD) across the phenome and perform validation using independent data

Methods We employed data from extensive genome-wide association studies (GWAS) to identify ge-

netic proxies for more than 860 disease phenotypes using the FinnGen R9 database. We performed a phenome-wide two-sample Mendelian Randomization (MR) analysis to identify phenotypes causally associated with AD. The subsequent analysis aimed to investigate the impact of various components of metabolic syndrome (MetS) on AD. Additionally, using the screened lipid metabolism phenotypes, we utilized data from the Alzheimer's Disease Neuroimaging Initiative (ADNI) to validate the effects of different lipid metabolism indicators on AD risk, brain phenotypes, and cognitive function. Moreover, we provided additional clarification regarding the association between lipid metabolism indicators and the subregional structure of the medial temporal lobe using authentic brain imaging data from ADNI

Results Our MR analysis identified 54 disease phenotypes causally associated with AD, including any mental disorder, delirium, and six metabolic disease-related phenotypes (metabolic disorders, pure hypercholesterolemia, hyperlipidemia, disorders of lipoprotein metabolism and other lipidemias, statin, and disorders of lipoprotein metabolism). Subsequent analysis of indicators related to MetS revealed a significant correlation between lipid metabolism abnormalities and the risk of AD. Specifically, within lipoproteins, low-density lipoprotein (LDL) exhibited significant effects on AD (OR: 1.05, 95% CI: 1.03-1.07). Using data from ADNI, indicators associated with LDL showed significant correlations with the risk of AD, as well as hippocampal and entorhinal volumes, and cognitive function. At the subregional level, a significant negative correlation was observed between the increased cholesterol to total lipids ratio in small LDL particles and the structures of the entorhinal-hippocampal complex. Among cognitive normal individuals, the group with higher LDL indicators exhibits smaller volumes of the hippocampus-amygdala transition area (HATA, $t = -2.30$, $P = 0.022$) and CA3 head ($t = -2.38$, $P = 0.018$). Among individuals with mild cognitive impairment, the group with higher LDL indicators shows a smaller surface area of the entorhinal cortex ($t = -2.35$, $P = 0.019$)

Conclusion Besides the causal effects of mental disorders and some neurological conditions on AD, our

study demonstrated a causal relationship between disturbances in lipid metabolism and AD. More specifically, indicators associated with LDL significantly increase the risk of developing AD, while also exerting negative effects on cognitive function and the brain phenotypes of the medial temporal lobe.

基于限制性立方样条分析中高强度体力活动与抑郁情绪之间的关联

李凯欣¹ 肖锋¹ 赵越¹ 彭俊歌¹ 李晏²

1. 郑州大学

2. 郑州大学第二附属医院, 郑州大学第二临床医学院

目的 抑郁情绪是一种常见的心理行为问题, 其发生率逐年上升, 但普遍预防意识淡薄。抑郁情绪严重影响患者生活质量, 其伤残率和死亡率较高。研究表明, 适度的体育锻炼和身体训练有助于肌肉中糖原的储存, 同时通过运动释放的多巴胺和肾上腺素能够缓解身心压力, 使心情愉悦。适量合理的中高强度身体活动(MVPA)与抑郁情绪的改善密切相关。本研究旨在通过数据整理和相关分析, 确证成年人中高强度体力活动与抑郁情绪之间的剂量效应关系, 为提高其生活质量及抑郁情绪的预防和改善提供依据。

方法 本研究选取了美国国家营养与健康调查数据库(NHANES)2017-2018年的人口统计学、中高强度体力活动和抑郁状况数据, 中高强度体力活动基于全球身体活动问卷(Global physical activity questionnaire, GPAQ)评估测量; 通过9项患者健康问卷抑郁量表(Patient health questionnaire, PHQ-9)评估受试者的抑郁状况; 数据分析采用SPSS 28.0进行卡方检验比较各组之间的差异使用多因素Logistic模型和限制性立方样条(Restricted cubic spline, RCS)模型分析成年人中高强度体力活动与抑郁情绪之间的相关性和剂量效应关系。

结果 1)共纳入5416名20岁及以上的成年人(男2622, 女2794), 平均年龄为(51.00±17.49)

岁。其中抑郁情绪者1393例, 发生率达25.7%; 2)在人口统计学特征中, 不同性别、种族、文化程度、婚姻状况、BMI的参与者抑郁情绪检出率差异均有统计学意义($\chi^2=38.992, P<0.001$; $\chi^2=28.802, P<0.001$; $\chi^2=33.706, P<0.001$; $\chi^2=79.188, P<0.001$; $\chi^2=16.030, P<0.001$; $\chi^2=80.116, P<0.001$), 不同年龄参与者抑郁情绪检出率差异没有统计学意义($P=0.383$)。3)MVPA与抑郁情绪呈负相关(OR=0.64, 95%CI: 0.41~1.00, $P=0.05$)。4)RCS模型分析显示, 中高强度体力活动与抑郁情绪之间存在显著的非线性剂量效应关系。具体剂量效应关系显示, 每周进行30至90分钟的MVPA显著降低抑郁情绪风险, 但超过120分钟后, 风险降低的幅度趋于平缓。

结论 美国成年人群中抑郁情绪的总体发生率为25.7%; MVPA时间不足是增加成年人抑郁情绪发生风险的重要因素, 适度的增加MVPA可以降低抑郁情绪的发生风险; 进一步证实MVPA与抑郁情绪之间存在明确的剂量效应关系, 即每周进行30至90分钟的MVPA可以有效降低抑郁情绪风险。

Association between Midday Napping and Long-term Trajectories of Cognitive Function Among Middle-aged and Older Chinese Adults

Jinghong Huang Dongrui Peng Wang Xiaohui*
School of Public Health, Lanzhou University

Objective The prevalence of dementia has become an increasingly important public health priority. This study investigated the association between midday napping and long-term trajectories of cognitive function in middle-aged and older Chinese adults

Methods Among 4648 participants aged 45+ years at baseline from the China Health and Retirement Longitudinal Study (CHARLS). Mini-Mental State Examination (MMSE) was used to assess cognitive function. Group-based trajectory modelling (GBTM) was

used to identify long-term trajectories of cognitive function. Multinomial logistic regression model was used to estimate risk ratios (RRs) and 95% confidence intervals (CIs)

Results During the 4-year follow-up period, three distinct long-term trajectories of cognitive function reflected patterns of rapid decline, slow decline, and stable. The risk ratio (95% CI) for rapid cognitive decline was 1.44 (1.04-2.01) for 0 minutes, 1.48 (1.04-2.11) for 31-90 minutes, and 2.15 (1.37-3.37) for >90 minutes compared with midday napping 1-30 minutes. The risk ratio (95% CI) for slow cognitive decline was 1.21 (1.01-1.46) for 0 minutes, 1.25 (1.02-1.53) for 31-90 minutes, and 1.75 (1.33-2.29) for >90 minutes compared with midday napping 1-30 minutes. In addition, the increased risk of cognitive decline that transferred from >90 to 31-90 minutes, switched from 31-90 to >90 minutes, and persisted in >90 minutes compared with midday napping 1-30 minutes, especially rapid cognitive decline

Conclusion There was a longitudinal association between no and long (>30 minutes) midday napping and long-term trajectories of cognitive decline, especially rapid cognitive decline. The study is a 4-year observational in nature and provides limited evidence for establishing causal relationships.

双相抑郁风险的列线图识别模型构建

邓咏妍¹ 田霄翌¹ 张婷婷¹ 徐沛琳¹ 贾娜·木海¹
周亮² 黄悦勤¹ 刘肇瑞¹

1.北京大学第六医院

2.广州医科大学附属脑科医院

目的 探索单相抑郁和双相抑郁临床特征的差异, 并建立双相抑郁列线图识别模型。

方法 使用“中国精神障碍队列研究”数据库中的单相抑郁患者 2643 例和双相抑郁患者 250 例, 比较两组患者社会人口学和临床特征资料, 采用 Logistic 回归分析双相抑郁的影响因素, 并构建识别

双相障碍的列线图模型, 通过工作特征曲线 (Receiver Operating Characteristic curve, ROC) 的曲线下面积 (Area Under Curve, AUC)、校准曲线、决策曲线 (Decision Curve Analysis, DCA) 验证模型。

结果 男性、有工作、发作无忧郁特征、BMI 在正常至肥胖范围、有精神病性特征、发作具有混合特征、共患躯体疾病、抑郁发作次数为 4 次及以上、发病年龄更早、病程更长、GAF 得分更高是双相抑郁的危险因素。将以上 11 个变量纳入模型, 所得列线图模型 AUC 为 0.808 (95%CI: 0.780-0.836), Hosmer-Lemeshow 检验结果为 $\chi^2=6.956$ ($P=0.612>0.05$), 校准曲线拟合良好, 模型拟合度良好, DCA 显示模型有良好的临床获益和适用性。

结论 根据筛选后的社会人口学和临床特征相关的影响因素建立的列线图可相对准确地识别双相识别的风险。

3.荆州市精神卫生中心

目的 本研究旨在探讨荆州市高中学生中的非自杀性自伤 (NSSI) 分布情况, 并分析与之相关的行为特征。

方法 2023 年 9 月-2023 年 11 月, 采用自行整编《“阳光少年”调查问卷》调查工具, 内容包括一般人口学资料问卷及标准化问卷, 采用方便整群抽样在线上用问卷星对荆州市内 7 所高中学生进行调查, 以 6 个月内是否存在 NSSI 为标准。筛选出有效数据 6574 份, 样本有效率 89.53%。

结果 本次调查高中学生的平均年龄 16.06 ± 0.89 岁, 其中男生 3229 人、女生 3345 人, 高一学生 2118 人、高二学生 3221 人、高三学生 1235 人。共检出六个月内存在 NSSI 人群共 368 人, 检出率为 5.60%, 其中男生 124 (3.84%) 人, 女生 244

(7.29%)人。既往在我们 2021 年的调查中显示高中学生 NSSI 检出率为 26.44%，男生检出率为 24.1%、女生检出率为 28.7%。单因素分析显示，NSSI 检出率高与以下单因素存在统计学显著意义 ($P<0.05$)，女性、业余时间未经常参加集体活动、近 1 个月每周锻炼身体的次数小于 2 次和时间小于半个小时、近 1 个月饮食习惯与以前相比有改变、近 1 个月日常饮食追求吃饱而已、近 1 个月较多宵夜、每天业余上网总时长大于 4 小时、存在网瘾、存在失眠、无午休习惯、一般晚上 10 点后入睡、积极看待自己的生命、心理压力高、新冠疫情流行后对身心健康、同伴关系、学习影响的影响、家庭为单亲、重组、留守家庭及其他、父母为非已婚。多因素分析结果显示，在高中阶段，消极看待自己生命 ($OR=6.72$)、有失眠 ($OR=2.24$)、心理压力高 ($OR=2.00$)、受新冠疫情身心健康影响程度较多影响 ($OR=1.84$)、受新冠疫情同伴关系影响程度较少影响 ($OR=1.57$)、近 1 个月饮食习惯与以前相比有改变 ($OR=1.67$)、近 1 个月日常饮食追求为偶尔会注意营养搭配、喜欢吃什么就吃什么及吃饱而已 ($OR=1.75$ 、 $OR=1.77$ 、 $OR=1.57$)、女性 ($OR=1.43$) 的高中生的 NSSI 发生风险显著增加。

结论 本研究发现 NSSI 行为与多种行为和心理因素存在显著关联。女生、饮食习惯改变的学生、有失眠症状的学生、心理压力较大的学生以及受新冠疫情影响较大的学生更容易出现 NSSI 行为。在预防和干预 NSSI 行为时，需要关注学生的性别、饮食习惯、睡眠质量、心理健康状况以及他们所处的社会环境。与 2021 年的调查相比，本次调查显示高中学生的 NSSI 检出率有所下降，这可能与近年来对心理健康问题的重视和干预措施的增加有关。

青少年自伤成瘾等特征与情绪困扰、精神病性症状及创伤应激经历的复杂关系：一项网络分析

胡阿倩¹ 毛子鑫² 王强³ 徐佳军³ 郭万军¹

1. 浙江大学医学院附属精神卫生中心/浙江大学脑医学与脑科学学院附属医院/杭州市第七人民医院

2. 宜昌市优抚医院

3. 四川大学华西医院心理卫生中心

目的 青少年中的故意自伤行为是一个极为严重的健康问题，被认为具有成瘾特质，其疾病负担重大，尤其是在患有精神障碍的青少年中更为突出，更好的了解故意自伤成瘾相关特征与各种社会心理因素之间复杂的相互作用对于自伤的预防有至关重要。本研究旨在探讨自伤成瘾、自伤方式及动机等特征与情绪困扰、精神病性症状以及创伤应激经历等之间的复杂关系。

方法 本研究招募了 394 名 13-19 岁在精神科住院的过去一年有过自伤行为的青少年患者。通过探索性因子分析，我们将调查中记录的多种自伤方式归纳为两个主要类别：使用外部工具的自伤（阻止伤口愈合、刺/捅/戳/扎伤、切割、刻划及吞服药物/其他东西自伤）和利用自身器官的自我攻击（咬伤、拽掉毛发、打自己/用身体碰撞坚硬的物体及摩擦/挤压皮肤）。随后我们评估了自伤成瘾、两种自伤方式及自伤动机（从负性情绪中解脱/为解决与他人问题/获得积极感受）等自伤特征与情绪困扰（焦虑和抑郁）、精神病性症状（偏执及精神病性因子）和童年创伤经历及负性生活事件（青少年生活事件量表）。我们使用网络分析来检查自伤成瘾等特征相关网络结构，并识别中枢症状及桥梁症状，分析各因素相互之间的关系。

结果 整个网络最中心的节点是成瘾特征（强度=1.24），其次依次为精神病性症状、情感虐待、人际关系问题及受惩罚经历，而精神病性症状（桥梁强度=0.757）作为最强的桥梁症状，连接了自伤特征与其他因素。自伤成瘾特征与借助外部工具自伤 ($r=0.381$) 具有最强相关性，且显著高于其与利用自身器官的自我攻击的相关性 ($p<0.05$)。成瘾与三种动机中相关性最强的为从负性情绪中解脱 ($r=0.233$)，高于为获得积极情绪 M3 ($r=0.125$) 及显著高于解决与他人问题动机 ($r=0.117$, $p<0.05$)。成瘾与情绪困扰 ($r=0.096$) 及精神病性症状 ($r=0.081$) 均有直接联系，而创伤应激经历症状群中仅健康适应 ($r=0.069$) 及学习压力 ($r=0.001$) 与成瘾有较弱的直接联系，其他均是间接连接。此外，创伤及应激经历症状群其他因素的联系中，人际关系-精神病性症状 ($r=0.136$) 及健康适应-精神病性症状边权重 ($r=0.123$) 最强。

结论 自伤成瘾特征在关联网络中占据核心地位，借用外部工具的自伤方式可能具有更强的成瘾性，从负性情绪中解脱动机可能更容易成瘾。创伤

应激经历与自伤等特征直接联系较少,但精神病性症状是网络中的最关键桥梁症状,其也可能是创伤应激经历连接自伤相关特征的最重要中介因素之一。这些发现揭示了自伤成瘾特征网络的复杂性,并为精神障碍青少年的自伤预防及干预提供了理论基础。

The Prevalence and Profiles of Adverse Childhood Experiences and Their Associations with Adult Mental Health Outcomes in China

Peilin Xu¹, Zhaorui Liu¹, Tingting Zhang¹, Yueqin Huang¹, Bo Wang³, Wanjun Guo²

1.Peking University Sixth Hospital, Peking University Institute of Mental Health, NHC Key Laboratory of Mental Health (Peking University), National Clinical Research Center for Mental Disorders (Peking University Sixth Hospital)

2.Affiliated Mental Health Center & Hangzhou Seventh People's Hospital, Zhejiang University School of Medicine

3.Mental Health Center, West China Hospital, Sichuan University

Objective To characterize the prevalence and the co-occurrence profiles of ACEs in China, to assess the associations between ACEs and mental health outcomes and population attributable fractions (PAFs) of mental health outcomes attributable to ACEs

Methods Cross-sectional nationally representative survey was conducted in mainland China from July 22, 2013 to March 5, 2015. The study population included 9378 respondents aged 18 years or older who completed the ACEs-related interview of this survey. Data analysis was performed from September 1 to November 1, 2023. The twelve ACEs (parental death, parental divorce, other separation from parents, caregiver's mental disorder, caregiver's substance abuse, caregiver's criminality, caregiver's violence, physical abuse, sexual abuse, neglect, serious physical illness, and family economic adversity) measured by fully

structured interview. The weighted prevalence of ACEs was calculated, and co-occurrence profiles of ACEs were determined by latent class analysis. The diagnoses of mental health outcomes were based on the Composite International Diagnostic Interview 3.0 (CIDI), including mood disorder, anxiety disorder, substance-use disorder, and suicide. Logistic regression was used to examine the association of ACEs and mental health outcomes. PAFs were calculated to quantify the contribution of ACEs to mental health outcomes

Results Of the 9378 respondents in this study (mean [SD] age, 49.75 [14.53] years, 5269 females [the weighted proportion, 50.5%]), 2952 (27.1%) respondents reported exposure to at least one ACE and multiple ACEs were common (40.4%) among respondents with any ACEs. The most prevalent ACE was neglect (11.3%), followed by physical abuse (9.1%). Using latent class analysis, four profiles represented co-occurrence patterns of ACEs in the Chinese population were revealed: low risk of ACEs (84.3%), maltreatment (8.9%), caregiver's maladjustment (3.5%), and parental loss (3.4%). Compared to the low risk of ACEs profile, other three profiles were significantly associated with increased risk for mental health outcomes, with the strongest association was observed in the caregiver's maladjustment (OR, 4.99; 95%CI, 3.31-7.54). Estimates of PAFs indicated that all ACEs together explained 37.5% (95%CI, 28.6-45.8) of four mental health outcomes. The prevalence and associations with mental health outcomes were not entirely consistent across genders

Conclusion Overall, it was estimated that more than a quarter of Chinese adults have at least one ACE, with neglect being the most prevalent type. This study identified four distinct profiles of ACEs among Chinese population, with the profiles of caregiver's maladjustment showing the strongest association with mental health outcomes. Approximately one-third of the observed mental health outcomes can be attributed to ACEs. The findings further indicate the interventions that target ACEs profiles to alleviate the impact of distinct mental health would be more effective, and emphasize the importance of paying attention to children's

growth environment, especially during the transition period when the one-child policy has been abolished

关键词: adverse childhood experiences, mental health outcomes, associations, latent class analysis, population attributable fractions

The Association between Cognitive Domains and Suicidal Ideation in Patients with Mild Dementia: The Crucial Role of Judgement Domain

Zhaorui Liu¹, Yueqin Huang¹, Tingting Zhang¹, Hongjun Sun², Hongmei Yu², Xiaoyi Tian¹

1. Peking University Sixth Hospital

2. Tongliao Third People's Hospital

Objective China has the world's largest population of individuals with dementia, and the suicide mortality rate among the older population aged 65 years and over remains high. Previous studies suggest an association between dementia and suicidal ideation, wherein depressive mood acts as an independent risk factor. This study explores the relationship between different cognitive domains and suicidal ideation among dementia patients

Methods Utilizing data collected in 2023, this study analyzed 4,289 older population aged 65 years and over from Tongliao City, Inner Mongolia. Chi-square tests, logistic regression analysis, and network analysis were used to explore the relationship between suicidal ideation and cognitive domains

Results The findings reveal that dementia was an independent risk factor for suicidal ideation, with depressive mood serving as a mediating factor. Stratified analysis showed that in non-dementia population, deficits in memory, orientation, community affairs, judgment and problem-solving domains were associated with suicidal ideation, while among patients with mild dementia, only impairment in the judgment and problem-solving domain correlated with suicide ideation

Conclusion This study provides valuable in-

sights for developing suicide prevention strategies aiming to increase judgment and problem-solving abilities for older population with dementia, while for general older population, improvement of cognitive functions should be emphasized during the suicide interventions.

关键词: dementia, suicidal ideation, cognitive domains, depression

内蒙古通辽市老年期痴呆的社会成本研究

刘肇瑞¹ 黄悦勤¹ 张婷婷¹ 于红梅² 张林峰² 田霄翌¹

1. 北京大学第六医院

2. 通辽市第三人民医院

目的 从社会角度估算通辽市老年期痴呆的各类疾病成本,并探索社会成本的影响因素。

方法 采用 10/66 老年期痴呆系列研究评估工具诊断老年期痴呆,并收集老年人医疗服务次数、照护者的照护时间或支出,以及照护者的照护痛苦。采用成本比例换算法参考国家统计局年鉴数据估计医疗服务的次均费用,采用人力资本法估算非正式照护者照护时间的单位价值,采用意愿支付法测量照护者痛苦带来的无形成本。以 2023 年为参照年计算老年期痴呆的社会总成本,并使用两部分模型分析成本的影响因素。

结果 本研究共诊断 390 例老年期痴呆患者,人均社会成本为 117877 元/年。其中,非正式照护成本占比最大,达 73.1%。女性患者社会成本比男性患者高 61395 元。照护者受教育程度为小学未毕业的患者社会成本比照护者从未接受教育的患者高 64398 元,照护者是患者的儿媳、女婿或其他亲属的患者社会成本比配偶为照护者的患者低 76637 元。此外,共患脑卒中的患者比没有共患的患者的社会成本高 63008 元,患者每多患有一种慢性病,社会成本增加 5868 元,患者每多一项临床痴呆评分量表非记忆维度损伤,社会成本增加 53997 元。

结论 老年期痴呆导致重大社会经济负担,非正式照护是重要的组成部分。

关键词: 老年期痴呆,疾病成本研究,非正式照护

Exploring The Psychological and Psychosocial Correlates of Non-suicidal Self-injury in Adolescents with Psychotic-like Experiences Using Network Analysis

Shujuan Yin Meng Sun Yingjun Zheng*

The Affiliated Brain Hospital of Guangzhou Medical University

Objective Non-suicidal self-injury (NSSI) among adolescents has attracted global attention. Although previous research has revealed a significant association between psychotic-like experiences (PLEs) and NSSI in adolescence, there is currently limited understanding of which psychological and sociopsychological factors are specifically related with NSSI among those with PLEs. Therefore, it is crucial to explore the complex relationship between NSSI and psychopathological characteristics in adolescents with PLEs

Methods This study utilized a sample of 5,159 college students to assess the frequency of PLEs over the past month. Comparisons were conducted on prevalence of NSSI and emotional symptoms between students who reported experiencing PLEs in the past month and those who did not. Finally, a network analysis was employed among students with current PLEs, to investigate the interrelationships between NSSI and various psychological factors (i.e., hopelessness, loneliness) and sociopsychological factors (i.e., perceived social support), with covariates (i.e., depression, anxiety)

Results In comparison to individuals without current PLEs, those with current PLEs exhibited a higher prevalence of NSSI (13.1% vs. 38.5%, $P < 0.001$), alongside relatively higher scores on depression ($\beta = 0.34$, $P < 0.001$) and anxiety symptoms ($\beta = 0.34$, $P < 0.001$). Within the network analysis model adjusting for depression and anxiety symptoms, perceived social support was the only node directly and negatively connected to characteristics of NSSI (the connection to NSSI addiction, edge weight = -0.074). Psychological symptoms including loneliness and hopelessness indirectly affected NSSI through perceived social support. Furthermore, perceived social support was directly and

negatively linked to emotional symptoms and characteristics of NSSI, which showed potential in reducing NSSI tendencies and emotional symptoms

Conclusion Our study first investigates the relationship between NSSI and psychological and sociopsychological factors among PLEs population. It also demonstrates the significant potential of perceived social support in improving NSSI and emotional symptoms. Among this population, which lays a solid foundation for future efforts in NSSI prevention and the development of targeted intervention strategies

关键词: Non-suicidal self-injury, Psychotic-like experiences, Perceived social support, Network analysis.

Quantifying The Importance of Factors in Predicting Non-Suicidal Self-Injury Among Depressive Chinese Adolescents: A Comparative Study Between Only Child and Non-Only Child Groups

Yongjie Zhou¹, Jie Lin², Zhenzhen Zhu³, Siyu Chen², Xinwen Zou⁴, Yang Wang⁴

1. Shenzhen Kangning Hospital

2. College of Management, Shenzhen University

3. Shenzhen Health Development Research and Data Management Center

4. School of Business Informatics and Mathematics, University of Mannheim

Objective Depression is a major global public health concern, often co-occurring with Non-Suicidal Self-Injury (NSSI). Focused on adolescents with depression, this study aimed to quantify the importance of factors in predicting NSSI and compare them between the only child and non-only child groups, enriching knowledge to leverage tailored intervention strategies

Methods A large multicenter survey was conducted in China. 2,510 adolescents diagnosed with Major Depressive Disorder (MDD) volunteered for the study and were divided into only child and non-only child groups. 36 factors were included to train random forest models for NSSI occurrence prediction. The

SHapley Additive exPlanations (SHAP) method was utilized to compute the relative importance of each factor in two groups

Results Adolescents with MDD exhibited a rather high prevalence of NSSI (52.0%), among them 66.9% were non-only children. Self-esteem was the most significant factor for both groups, while critical disparities of factors were also found. In the only child group, factors like family support, parental overprotection, drinking alcohol, sleep conditions and romantic relationship involvement showed greater importance, while higher depression degree, anxiety level and emotional abuse were more important factors for non-only children

Conclusion Only and non-only child family structures may have different influence on factors related with NSSI occurrence of adolescents with MDD. Only children were more susceptible to vulnerable family environments, alcohol abuse and romantic experience, while non-only children were more disturbed by abnormal mental states

关键词: adolescents, MDD, NSSI, random forest, only-child, SHAP

Effect of Home-based and Remotely Supervised Combined Exercise and Cognitive Intervention on Older Adults with Mild Cognitive Impairment (COGITO): Study Protocol for A Randomised Controlled Trial

Yanan Luo², Zhaorui Liu¹

1.Peking University Sixth Hospital (Institute of Mental Health)

2.Peking University

Introduction Mild cognitive impairment (MCI) is an intermediate phase between normal cognitive aging and dementia and poses a serious threat to public health worldwide, however, it might be reversible, representing the best opportunity for secondary prevention against serious cognitive impairment. As a non-pharmacological intervention for those patients, interventions

that combine both physical exercise and cognitive training, whether [delivered simultaneously or sequentially, may have superior effects on various cognitive domains, including global cognition, memory, executive function and attention. The supportive evidence remains incomplete. This study aims to assess the effectiveness of a combined exercise and cognitive intervention in Chinese older adults with mild cognitive impairment (COGITO), empowered by digital therapy and guided by the Health Action Process Model and the Theory of Planned Behaviour (HAPA-TPB theory) in a home-based setting.

Methods and analysis This study is a randomized controlled, assessor-blinded multi-centre study. Four parallel groups will include a total of 160 patients, receiving either a combined exercise and cognitive intervention, an isolated exercise intervention, an isolated cognitive intervention, or only health education. These interventions will be conducted at least twice a week for 50 minutes each session, over a period of 3 months. All interventions will be delivered at home and remotely monitored through RehabApp and Mini-programme, along with an arm-worn heart rate telemetry device. Specifically, supervisors will receive participants' real-time training diaries, heart rates or other online monitoring data, and then provide weekly telephone calls and monthly home visits to encourage participants to complete their tasks and address any difficulties based on their training information. Eligible participants are community-dwelling patients with no regular exercise habit and diagnosed with MCI. The primary outcome is cognitive function assessed by the Alzheimer's Disease Assessment Scale-Cognitive (ADAS-Cog) and Community Screening Instrument for Dementia (CSI-D), with baseline and three follow-up assessments. Secondary outcomes include quality of life, physical fitness, sleep quality, intrinsic capacity, frailty, social support, adherence, cost-effectiveness, and cost-benefit.

Ethics and dissemination The study was approved by the Institutional Review Board of Peking University. Research findings will be presented to stakeholders and published in peer-reviewed journals and at provincial, national, and international conferences.

广东省成年居民心理健康素养水平及宣传册对其提升效果的现况研究

丁凯荣¹ 王诗缤²

1. 中山大学附属第三医院

2. 广东省人民医院

目的 研究一对广东省成年居民的心理健康素养水平进行调查, 分析相关影响因素; 研究二验证了阅读心理健康教育宣传册对社区居民心理健康素养提升的有效性, 为改善社区居民心理健康素养水平提供依据。

方法 研究一: 于 2021 年 10 月至 12 月采用多阶段分层随机抽样对广东省 21 个地级市 16715 名 18 岁以上居民进行面对面调查, 第一阶段使用国民心理健康素养问卷、9 项患者健康问卷抑郁量表、7 项广泛性焦虑障碍量表、失眠严重指数量表评估, 通过自编问卷收集社会人口学资料 and 生活方式特征。第二阶段使用简明国际神经精神访谈 5.0 版对抑郁量表和焦虑量表得分大于等于 10 分的居民进行诊断。采用基于复杂抽样的 Rao-Scott 卡方检验、一般线性模型、多因素逻辑回归模型进行统计分析。

研究二: 采用方便抽样方法进行现场研究。在社区卫生服务中心/卫生院面向社区居民发放广东省精神卫生中心自编宣传册—《提升心理健康素养, 我们在行动》, 开展心理健康教育与促进, 并使用国民心理健康素养问卷和自编一般人口社会资料调查问卷对 1855 名 18 岁以上社区居民进行调查。使用倾向性评分匹配法调整阅读组和非阅读组样本, 获得 189 对, 共 378 人, 采用 t 检验和卡方检验对比两组心理健康素养水平及其成分的差异。

结果 研究一: 广东省成年居民心理健康素养加权达标率为 12.1%。单因素分析显示, 心理健康素养在不同性别、年龄、受教育程度、婚姻状况和家庭人均月收入上存在差异 (均 $P < 0.05$); 多因素分析显示, 影响心理健康素养的社会人口学变量有: 性别、受教育程度和婚姻状况 (均 $P < 0.05$); 有锻炼习惯与心理健康素养水平高显著相关 (均 $P < 0.05$); 慢性病共病和有失眠症状的居民其心理健康素养水平较低

($P < 0.05$)。

研究二: 阅读组的心理健康素养水平高于对照组 (34.9% vs 23.4%, $P < 0.05$), 差异有统计学意义。

结论 研究一

广东省成年居民心理健康素养水平偏低。广东省成年居民心理健康素养各部分达标情况不均衡, 心理健康知识水平是阻碍心理健康素养提升的主要因素。提升心理健康素养水平需要先提升心理健康知识水平。

在六个社会人口学变量中, 性别、受教育程度和婚姻状况是与心理健康素养关联最大的因素。提升心理健康素养水平需关注男性、受教育程度较低者和丧偶/离婚/分居者。

心理健康素养与慢性病共病和失眠症状相关, 而与诊断抑郁障碍、焦虑障碍不相关。提示政策制定者需要针对特定人群进行干预。

研究二:

阅读心理健康教育宣传册可以提升社区居民的心理健康素养水平。

关键词: 心理健康素养, 成人, 社区, 心理健康教育

中国老年慢性疼痛患者抑郁现状及其影响因素研究

王国君 刘铁榜*

深圳市康宁医院

目的 中国老龄化问题不断加剧, 老年人不仅面临各种慢性躯体疾病和疼痛, 而且抑郁状况高于其他年龄人群。本研究将探讨中国老年慢性疼痛患者抑郁状况的相关因素, 为其干预政策和措施的制定提供依据和参考。

方法 利用中国健康与养老追踪调查项目 (CHARLS) 在 2020 年开展的第五轮全国调查数据, 共筛选出 10581 名老年慢性疼痛患者作为研究对象, 通过抑郁量表 (CES-D) 测定研究对象的抑郁状况, 并用 χ^2 检验和多因素 Logistic 回归分析影响老年疼痛患者抑郁状况的主要因素。

结果 多因素 Logistic 回归分析结果显示: 性别 (女: $OR = 1.39$, $95\%CI = 1.26 \sim 1.52$)、年龄 (≥ 75 岁: $OR = 0.48$, $95\%CI = 0.41 \sim 0.55$)、是否有配偶/ 伴

侣共同生活(否: $OR=1.17$, $95\%CI=1.05\sim 1.30$)、居住地(农村: $OR=1.45$, $95\%CI=1.31\sim 1.60$)、文化程度(高中及以上: $OR=0.74$, $95\%CI=0.61\sim 0.89$); 子女关系满意度(满意: $OR=0.22$, $95\%CI=0.18\sim 0.27$)、吸烟(否: $OR=0.61$, $95\%CI=0.42\sim 0.87$)、上网(是: $OR=0.77$, $95\%CI=0.68\sim 0.88$)、午睡时长($1\sim 2$ h: $OR=0.73$, $95\%CI=0.65\sim 0.83$; ≥ 2 h: $OR=0.90$, $95\%CI=0.81\sim 0.99$)、夜间睡眠时长($6\sim 8$ h: $OR=0.61$, $95\%CI=0.55\sim 0.67$; ≥ 8 h: $OR=0.54$, $95\%CI=0.48\sim 0.62$)、BADL(受损: $OR=1.56$, $95\%CI=1.41\sim 1.74$)、IADL(受损: $OR=2.251$, $95\%CI=2.030\sim 2.496$)、过去一月接受医疗服务情况(是: $OR=1.24$, $95\%CI=1.12\sim 1.38$)慢性疼痛(比较多/非常多: $OR=1.95$, $95\%CI=1.77\sim 2.14$)是老年慢性疼痛患者抑郁症状的影响因素($P<0.05$)。

结论 老年慢性疼痛患者抑郁症状发生率为31.7%, 其抑郁状况受多种因素影响, 医疗卫生机构及政策制定者等应关注这类老年人的心理健康, 根据其特征从健康宣教、疾病治疗、疼痛管理、睡眠改善、家庭支持等方面采取有针对性的举措进行改善。

关键词: 老年; 疼痛; 抑郁; 影响因素

Impact of Flexible Assertive Community Treatment Model (FACT) on Community Rehabilitation of Schizophrenia

Yinglin Zhao* Kaiyuan Chen

Shantou University Mental Health Center

Objective The condition of schizophrenia is easy to repeat, the course of the disease prolongs, and the function declines [8,9]. It will bring great pain to the patients, and at the same time cause a heavy economic burden on the family and society, and consume a lot of social resources. The purpose of this study was to observe the difference between the community rehabilitation effect of schizophrenia patients under the intervention of the Flexible Assertive Community Treatment Model (FACT) and the routine community prevention and treatment services, and to explore the effect of the

FACT on the community rehabilitation effect of schizophrenia patients

Methods 160 adult schizophrenic patients were randomly divided into an intervention group given FACT and a control group given routine mental health follow-up. The scale includes the Positive and Negative Syndrome Scale (PANSS), Social Disability Screening Schedule Scale (SDSS), and the World Health Organization's multicultural quality of life instrument in its brief form Scale (WHOQOL-BREF) were recorded

Results The average scores of positive scale, negative scale, general psychopathology scale and total score in PANSS scale before intervention (baseline) of the patients in the intervention group were 24.90 ± 5.43 , 17.53 ± 3.84 , 38.31 ± 4.09 and 80.54 ± 6.75 . After 6 months and 12 months of intervention, positive scale, negative scale, general psychopathology scale and total score of the PANSS scale in the intervention group and the total score of SDSS all decreased significantly. The WHOQOL-BREF total score was significantly improved, and the differences were statistically significant ($P<0.05$)

Conclusion The FACT intervention model has a significant effect on the rehabilitation of patients with schizophrenia in the community, improves their social function, and improves their quality of life

关键词: FACT, schizophrenia, social function, quality of life, intervention model

A Network Analysis of Relationship Among Childhood Trauma, Resilience and Depression in Chinese College Students

Jingyi Lu Yingjun Zheng Meng Sun*

The Affiliated Brain Hospital, Guangzhou Medical University

Objective Childhood abuse and neglect significantly increase the risk of developing depression in later life. While previous research suggests that resilience may mediate this relationship, most studies have fo-

cused on general mediation and moderation effects rather than detailed, node-specific investigations. This study aims to explore the intricate relationships between childhood abuse, psychological resilience, and depressive symptoms. By identifying key nodes, we seek to establish a theoretical foundation for targeted and effective interventions for depressive symptoms in college students

Methods Between October 2020 and October 2021, we conducted a longitudinal study involving 3,374 students from two universities. Self-reported questionnaires assessed childhood abuse and neglect, resilience, and depression levels. We used R for a network analysis to identify the most central and bridging symptoms within the network of childhood abuse, psychological resilience, and depressive symptoms

Results Our analysis revealed the relationships between childhood abuse, psychological resilience, and depression. Among childhood abuse nodes, "Emotional neglect" and "Physical neglect" had the strongest correlation (regularized partial correlation coefficient of 0.459). For resilience nodes, "goal planning" and "family support" showed the highest correlation (regularized partial correlation coefficient of 0.498). Among depressive symptoms, "loss of interest" and "depressed mood" were most strongly correlated (regularized partial correlation coefficient of 0.350). The symptoms "fatigue" (Strength=1.718), "depressed mood" (Strength=1.450), and "feelings of worthlessness" (Strength=1.020) exhibited the highest strength centrality in the network. Key bridging nodes included "affect control" (bridgeStrength=0.349), "help-seeking" (bridgeStrength=0.209), "Emotional abuse" (bridgeStrength=0.187), and "Physical neglect" (bridgeStrength=0.151)

Conclusion Our study confirms that psychological resilience mediates the relationship between childhood abuse and depression, offering a more nuanced understanding of how childhood abuse affects future mental health, especially concerning "Emotional abuse" and "Physical neglect." Additionally, "affect control," "help-seeking," "Emotional abuse," and "Physical neglect" show extensive connections with other nodes. These

findings highlight precise intervention targets for addressing depressive symptoms in college students, suggesting that focusing on these areas in future interventions could help prevent and reduce depression in this population

关键词: childhood abuse ,resilience, depression, network analysis

青少年抑郁、焦虑症状与不良生活方式的关联性研究

王诗嫔¹ 曾雪² 何红波^{1,2}

- 1.广东省精神卫生中心, 南方医科大学附属广东省人民医院 (广东省医学科学院)
- 2.广州医科大学附属脑科医院

目的 青少年精神障碍的疾病负担日益增大, 生活方式是心理健康的重要影响因素, 但其关联模式仍缺乏数据支持。本研究旨在分析广东省青少年的抑郁、焦虑症状和不良生活方式的流行和分布情况, 探索抑郁、焦虑症状与不良生活方式组合模式的关系, 为促进青少年心理健康提供证据支持。

方法 本研究数据来源于 2023 年开展的“广东省青少年心理健康素养和服务需求调查”, 共纳入青少年有效样本数 5759 例。采用抑郁症自我评估量表 (CES-D) 评估抑郁症状, 总分 ≥ 17 分判断为抑郁症状; 采用广泛焦虑障碍量表 (GAD-7) 评估焦虑症状, 总分 ≥ 10 分判定为焦虑症状。纳入 7 种不良生活方式因素, 包括不规律一日三餐、缺乏锻炼、屏幕时间过长、超重/肥胖、睡眠不足、过度疲劳、中高度近视。采用 SPSS25.0 对广东省青少年的抑郁、焦虑症状的影响因素进行单因素和多因素分析, 使用 Mplus8.3 对广东省青少年的不良生活方式进行潜在类别分析。

结果 广东省青少年的抑郁、焦虑症状检出率分别为 5.5% 和 13.0%。超过一半 (51.5%) 的青少年存在 2-5 种不良生活方式。控制协变量后, 多因素 Logistic 回归分析显示, 抑郁、焦虑症状分别与不规律一日三餐、缺乏锻炼、屏幕时间过长、睡眠不足、过度疲劳等不良生活方式相关联, 且关联强度随不良生活方式数量增加而上升, 其中 4 种及以上不良生活方式的群体出现抑郁 (OR=174.12 ,

95%CI:24.17-1254.36)、焦虑症状的风险最高(OR=16.78, 95%CI:11.06-25.47)。潜在类别分析提示四种不良生活方式组合模式:①多种不良生活方式组(n=599, 10.4%),②缺乏锻炼、屏幕时间过长、中高度近视组(n=545, 9.5%),③过度劳累、睡眠不足、缺乏锻炼组(n=1320, 22.9%),④相对健康生活方式组(n=3295, 57.2%)。与相对健康生活方式组人群相比,抑郁(OR=16.06, 95%CI:10.64-24.24)、焦虑(OR=10.17, 95%CI:7.95-13.01)症状风险最高的均为多种不良生活方式组。

结论 广东省青少年的抑郁、焦虑症状检出率较高,且不良生活方式流行率较高。不良生活方式可能通过单独、协同或累积效应导致抑郁、焦虑症状的产生。不良生活方式之间存在关联,研究者需制定精准干预策略,改善生活行为和健康模式,促进青少年的心理健康。

关键词: 青少年;抑郁;焦虑;心理健康;不良生活方式

广东省青年人不良生活方式、心理健康素养与焦虑症状的网络分析模型

王诗缤^{1,2} 唐志滔^{1,2}

1.广东省精神卫生中心,南方医科大学附属广东省人民医院(广东省医学科学院)

2.吉林大学公共卫生学院

目的 探索广东省青年人不良生活方式、心理健康素养与焦虑症状之间的内在关联,为青年人群的焦虑症状防治工作提供更加精准的证据支持。

方法 使用广东省精神卫生中心于2022年开展的“广东省居民心理健康素养调查”数据,该调查通过多阶段分层随机抽样法,覆盖广东省21个地级市,抽取51774名18岁以上居民进行调查。本研究选取18-44岁的青年居民作为研究对象,共纳入有效样本27898例。不良生活方式包括吸烟、饮酒、非规律一日三餐、不锻炼、屏幕时间过长、久坐行为、非正常体重(BMI过高/过低)、睡眠不充分等8个不良生活方式。心理健康素养使用中国科学院心理研究所编制的《国民心理健康素养问卷(第二版)》进行评估,可分为心理健康知识、积极心态、心理健康信息获取、心理健康意识、心理疾病识别、心理专

业求助态度、克服病耻感等七个维度。焦虑症状使用和广泛性焦虑障碍量表(GAD-7)进行评估。网络分析基于glasso网络模型,以各不良生活方式相加的数量展现。使用R4.2.3构建不良生活方式、心理健康素养与焦虑症状的网络分析模型。

结果 网络分析模型的cs值为0.75,证明网络模型中心性指标稳定;通过Bootstrap法显著性检验,各连线权重值95%CI的范围相对狭窄,显著性检验图以黑色方块为主,证明各连线结果较稳定且准确。模型中B3(心理健康信息获取)与B4(心理健康意识)和A1(感觉紧张、焦虑或急切)与A2(不能够停止或控制担忧)的正向关联最高;A5(由于不安而无法静坐)与B1(心理健康知识)的负向关联最高。焦虑症状的大部分维度与不良生活方式和心理健康素养存在关联。从各节点中心性指标可知A5(由于不安而无法静坐)、A6(变得容易烦恼或急躁)、B3(心理健康信息获取)、B4(心理健康意识)是模型的核心节点。B4(心理健康意识)的桥梁强度最强,证明其连接心理健康素养与焦虑症状之间的关键节点。

结论 焦虑症状与心理健康意识和心理健康信息获取能力关联较强,在制定心理健康素养促进政策时,应重点提高青年人的心理健康意识和心理健康信息获取的能力,并注意两者内容的协调,同时提倡全民健康生活方式,降低焦虑症状上升的流行趋势。

广东省成年居民心理健康服务求助行为和需求研究

柯蕴菲¹ 何泳怡^{1,2} 王诗缤¹

1.广东省精神卫生中心,南方医科大学附属广东省人民医院(广东省医学科学院)

2.南方医科大学公共卫生学院

目的 随着我国心理健康服务体系的不断建设,公众对于精神卫生诊疗服务的使用逐渐增加。然而,人们寻求专业心理帮助的影响因素尚不清楚。本研究旨在调查广东省居民专业心理求助的情况,并分析社区居民求助行为的影响因素,为不同的人群提

供可获得性更强、更多样化、更容易被接受的心理健康服务。

方法 利用 2021 年开展的“广东省居民心理健康调查”数据,采用多阶段分层随机抽样法,由经过培训的社区精防医生和精神科医生进行两阶段调查。使用自编问卷和标准化筛查评估工具共调查了 16377 名居民。采用复杂抽样加权调整的方法,对调查数据进行分层加权调整分析。描述性分析广东省成年居民心理健康服务需求和求助行为的分布情况,并分析其与人口学特征、抑郁、焦虑、失眠、心理健康素养水平、慢性病、生活方式如抽烟、喝酒、饮食情况、锻炼情况、BMI 指数等因素的关联性。

结果 本研究共纳入 16377 名 18 岁以上成年居民。经复杂加权,18.7%的居民曾因精神心理问题求助,仅 2.2% (n=300) 的居民曾求助过专业人员(包括精神科医生、心理治疗师或咨询师)。寻求专业心理帮助与罹患抑郁症、青中年、家庭月收入在 12000 元以上、未婚或丧偶或离异、目前吸烟、心理健康素养达标和失眠均存在关联 ($P<0.05$)。除了社区心理健康宣传专栏,其他心理健康内容和形式在三个群体间都有显著性差异 ($P<0.05$)。在心理健康服务内容方面,健康人群更倾向于心理健康知识的宣传教育(32.1%), 阙下抑郁人群(40.7%)和抑郁人群(50.5%)更倾向与压力管理和情绪调控。在心理健康服务形式方面,三个群体都更期望得到面对面的个性心理咨询/治疗(健康人群 26.1%, 阙下抑郁人群 40.5%, 抑郁人群 47.2%)。其次, 阙下抑郁人群和抑郁人群也期望得到网络个体心理咨询/心理治疗(阙下抑郁人群 27.0%, 抑郁人群 33.1%), 而健康人群则期望得到社区心理健康宣传专栏(18.8%)。

结论 抑郁症、失眠、高收入和较高心理健康素养的居民更倾向寻求专业人士的帮助。在社区心理健康服务的发展中,需进一步加强心理健康宣教,提升公众心理健康素养,提高心理健康服务资源可获得性,保障公众能获得及时有效的心理健康服务。心理健康专业人员 and 政策决定者需基于需求制定心理健康服务内容,面向各类需求人群提供精准疏导和干预。

Fear of Cancer Recurrent, Anxiety and Depression Among Chinese Breast Cancer Patients: A Longitudinal Study

杨源¹ 齐涵² 李文高³ 孙恒文¹

1. 广东省人民医院

2. 首都医科大学附属北京安定医院

3. 南部战区总医院

Objective This study explored the trajectories of FCR, anxiety, and depression over the 18 months following discharge, and evaluated the associations between baseline demographic and clinical variables and emotional trajectories among Chinese women treated for breast cancer.

Methods This is a longitudinal prospective study. Participants were consecutively recruited at cancer centers in southern China. All participants were asked to complete a battery of questionnaires: Fear of Cancer Recurrence (FCR-7), Patient Health Questionnaire (PHQ-9), Generalized Anxiety Disorder (GAD-7), and McGill Pain Questionnaire-Visual Analogue Scale (MPQ-VAS) at baseline, 6, 12, and 18 months after discharge. Generalized linear mixed model and group-based trajectory analyses were conducted. The SAS 9.4 PROC Traj procedure was used to conduct the group-based trajectory modeling and identify subgroups of patients who had similar trajectories on FCR, GAD, and PHQ total scores over time.

Results Three hundred women with breast cancer were recruited. For FCR, three-group trajectory models were estimated from the latent class growth modeling (i.e., ‘stable group’ (63.33%), ‘low level-increasing group’ (18.33%), and ‘high level-decreasing group’ (18.33%)). Bonferroni-corrected post hoc tests revealed that patients reported significant higher FCR at baseline assessment. Women with none/mild life stress exhibited significant lower FCRs than those with moderate/high life stress, and participants with family history of cancer or negative personality tended to report higher FCRs than their counterparts. For both anxiety and depression, three-group trajectory models were also estimated from the latent class growth modeling. The trajectories were labeled as ‘none/very mild-stable

group', 'low level-stable group', and 'high level-decreasing group' according to the significant difference of linear effect from 0, and the sign of coefficient. For anxiety symptoms, 79 (26.3%) of the participants reported none or very mild anxiety over time, 182 (60.7%) reported stable low-level anxiety, and the remaining 39 (13.0%) showed apparent decreasing trend throughout the 18-month period. Similarly, 32 (10.7%) of the participants reported none or very mild depressive symptoms over time, 198 (66.0%) exhibited stable PHQ total scores throughout the research period, and 70 (23.3%) of the participants were in the 'high level-decreasing trajectory group'. Patients reported significant higher anxiety and depression score at the first three assessments. Participants with no or mild life stress and those with positive personality tended to report lower anxiety and depression scores over time.

Conclusion More than 60% of the breast cancer patients reported stable low-level FCR, anxiety and depression 18 months after discharge. Early assessment of optimism and stress levels among cancer patients might help to identify people at risk of experiencing long-term FCR, anxiety and depression.

Gut Microbiota Homeostasis As The Potential Targets for Enhancing Resistance Against Major Depressive Disorder in Trauma-exposed Individuals: Genetic Evidence From Mendelian Randomization

Jianzhao Zhang Yanbin Jia*

The First Affiliated Hospital of Jinan University

Objective Trauma exposure is a critical factor in the development of major depressive disorder (MDD), significantly impacting mental health globally. Emerging research indicates a close association between trauma exposure and gut microbiota homeostasis, adding another layer of complexity to the understanding of MDD. The gut-brain axis has gained prominence in recent years, suggesting that gut bacteria may influence mental health outcomes, including depression. However, the causal pathways linking gut microbiota and MDD, particularly in individuals exposed to trauma (MDD-TE), remain poorly understood. This study aims to employ Mendelian randomization (MR) to elucidate the causal link between specific gut bacteria and the risk of MDD in trauma-exposed individuals

Methods Summary genome-wide association study (GWAS) data for gut microbiota and MDD in trauma-exposed individuals were obtained from the MiBioGen consortium (n=18,965) and UK Biobank (n=24,094), respectively. Univariate MR analysis was conducted to explore the causal pathway from gut microbiota to MDD-TE, using inverse variance weighted (IVW) as the main estimation method. The robustness of the primary outcomes was evaluated through a series of sensitivity analyses. Additionally, gene annotation and enrichment analysis were performed to uncover underlying biological mechanisms

Results High abundance of the phylum Actinobacteria (OR: 0.548, $P=1.34\times 10^{-4}$), order Bifidobacteriales (OR: 0.783, $P=0.002$), and family Bifidobacteriaceae (OR: 0.783, $P=0.002$) is significantly associated

with a low risk of MDD-TE. KEGG pathway enrichment analysis revealed that the phylum Actinobacteria, order Bifidobacteriales, and family Bifidobacteriaceae are involved in glutamatergic synapse and cGMP-PKG signaling pathways as well as protein digestion and absorption

Conclusion Our findings suggest that increasing the abundance of the phylum Actinobacteria, order Bifidobacteriales, and family Bifidobacteriaceae may effectively enhance resistance to MDD in trauma-exposed individuals. These results provide valuable insights into potential prevention strategies for high-risk populations. By understanding the role of gut microbiota in modulating the effects of trauma on mental health, targeted interventions can be developed to promote a healthier gut environment, thereby potentially mitigating the risk of depression. This study underscores the importance of a holistic approach in addressing mental health challenges, integrating microbial, genetic, and psychological perspectives. Future research should continue to explore these connections to refine preventive measures and therapeutic approaches for MDD, especially in those with a history of trauma exposure.

抑郁症脑功能连接的偏侧化异常与疾病缓解的关系: DIDA 联盟的结果

平亮亮¹ 平亮亮² 孙珊² 和梦鑫³ 周聪⁴ 沈宗霖¹
许秀峰¹ 程宇琪¹

1. 昆明医科大学第一附属医院
2. 厦门市仙岳医院
3. 上海交通大学附属仁济医院
4. 济宁医学院

目的 基于多中心大样本静息态功能磁共振数据探索抑郁症(MDD)功能连接的偏侧化模式及其与远期预后的关系

方法 本研究对来自 DIDA 联盟的 9 个中心的 2227 名参与者(1148 名抑郁症患者和 1079 名健康对照)的大型静息态 fMRI 数据集进行分析,通过分

析两组间大脑半球间以及半球内的功能连接偏侧化指数差异来表征抑郁症患者的脑功能偏侧化模式,并分析抑郁症患者功能连接的偏侧化模式与临床量表评分之间的关联。此外通过对一个包含 52 名 MDD 患者的真实世界中平均随访时间大于 2 年的独立数据集进行分析,采用相关向量机回归的机器学习方法 MDD 患者功能连接偏侧化模式与长期治疗结局的关系。

结果 结果表明,在大尺度网络水平抑郁症患者在腹侧注意网络、边缘网络的半球内 FC 的偏侧化指数(LI_intra)和腹侧注意网络、边缘网络以及默认网络的半球间异位 FC 的偏侧化指数(LI_he)表现出低于健康对照组的偏侧化。在局部脑区水平上,与健康对照组相比,MDD 患者感觉运动网络区域、默认网络区域、额顶控制网路区域、注意网络区域、边缘网络区域均存在半球内 FC 的偏侧化指数和半球间异位 FC 的偏侧化指数的改变,而且这些异常呈现异质性。我们还发现抑郁症患者功能连接的偏侧化模式与汉密尔顿抑郁量表(HRDS)评分之间显著关联。此外,通过相关向量机回归算法,本研究还发现抑郁症患者基线时的半球内 FC 的偏侧化指数以及半球间异位 FC 的偏侧化指数均可以显著预测患者远期(>2 年)HDRS 评分的变化。

结论 本研究验证了抑郁症患者存在大脑功能连接的偏侧化异常,并证明了这些基线临床特征与随后的症状缓解之间存在显著关系。此外,还表明脑功能连接的偏侧化可能有助于为精准治疗抑郁症提供依据。

青少年游戏动机与游戏成瘾症状的关系: 基于网络分析方法

谭鑫杰² 谭鑫杰¹ 贺英¹ 贺英²

1. 陆军军医大学第二附属医院医学心理科
2. 陆军军医大学医学心理系

目的 预防和干预青少年游戏成瘾具有重要现实意义。已有研究表明游戏动机在理解和干预游戏成瘾行为中起着重要作用,两者密切相关。但目前游戏动机各成分与游戏成瘾各症状之间的确切联系尚未阐明,无法区分不同动机成分与特定症状之间

的关联程度。这种不确定性可能阻碍针对不同动机成分触发的游戏成瘾精准干预策略的开发。因此,本研究旨在使用网络分析方法探索青少年游戏动机各成分与游戏成瘾症状之间的复杂关联,以期为青少年游戏成瘾的预防和精准干预提供新的理论支持。

方法 于 2024 年 1 月-2 月,采用整群抽样方法,选取四川省、重庆市四所中学的 1920 名青少年为研究对象。采用网络游戏动机量表(OGMS)、青少年游戏障碍量表中文版(GADIS-A)进行调查。使用网络分析方法探讨变量间的关系。

结果 成就动机与游戏控制能力受损、不顾负面后果地继续游戏以及症状出现的频率正相关;社交动机与造成负面后果负相关;沉溺动机与不顾负面后果地继续游戏正相关。成就动机在游戏动机三类成分中显示出最高的强度中心性(1.15)。

结论 游戏动机各成分与游戏成瘾症状之间的连接存在差异,各动机成分通过与特定的症状联系从而与游戏成瘾相互影响。相较于社交动机和沉溺动机,成就动机在游戏动机与游戏成瘾症状的相互影响中起到了最关键作用。由此提出以下建议:(1)鉴于不同游戏动机与症状的关系存在差异,未来的干预措施应包括对个体游戏动机的详细评估,并据此定制个性化的干预计划。(2)干预应强调增强成瘾者在现实生活中的成就体验。帮助青少年发现和体验现实世界的成就和满足感,可能有助于减少他们对游戏中成就体验的渴望从而改善成瘾行为。

心境障碍患者认知功能水平与脑功能相关研究

胡茂林 宗小芬*

武汉大学人民医院

目的 探讨不同认知功能水平的心境情感障碍患者的脑功能差异。

方法 招募心境情感障碍患者 221 例,其中抑郁症患者 79 例,双相情感障碍患者 142 例;健康对照组 258 例。采用 MCCB 认知测量工具评估所有受试者认知功能,采用依瑞德 BS-3000 近红外脑功能成像仪采集受试者的静息态近红外数据。采用聚类

分析(瓦尔德法),将所有受试者按照认知功能聚类,分为高认知组 and 低认知组;进一步分析不同类别受试者的组成结构,患者占比;继而分析不同亚类患者的脑功能差异。

结果 患者组与健康对照组在年龄、性别、教育年限方面均无差异。正常组认知功能显著优于病例组($P_s < 0.05$)。所有受试者按照认知水平聚为 2 类,高认知组和低认知组,其中高认知组 202 例,包含正常组 159 例、病例组 43 例;低认知组 277 例,包含正常组 99 例、病例组 178 例。与高认知组相比,低认知组 DLPFC-L 区 $zALFF$ 升高, FPA-L 和 FPA-R 区均低 ($P_s < 0.05$)。功能连接组间比较显示,高认知组 PreM and SMC-L 脑区与双侧 Broca 区、双侧 FPA 区的功能连接强度均高于低认知组 ($P_s < 0.05$)。高认知组 Broca-L 脑区与双侧 FPA 区和 DLPFC-R 区的脑功能连接高于低认知组 ($P_s < 0.05$)。

结论 心境情感障碍患者认知功能存在差异,认知功能水平高的患者脑功能连接强度高于认知水平低的患者。

复发性抑郁障碍患者额顶叶形态相似性降低

徐紫云 侯刚强*

深圳市康宁医院

目的 复发性抑郁障碍 (Recurrent depressive disorder, RDD) 的特征是反复发作的抑郁,且没有任何独立的情绪高涨和躁狂发作。重度抑郁障碍患者复发抑郁的可能性比正常人要高出 50%。有研究发现 RDD 患者的大脑形态模式的病理改变显著不同于首发抑郁症患者,而目前少有关于复发抑郁患者大脑形态相似性的研究。基于多模态核磁共振成像的形态相似性网络 (Morphometric similarity network, MSN) 可检测更加丰富的大脑皮层微观结构变化。因此,我们整合了 T1 加权、弥散张量和非均匀磁化传递 (inhomogeneous magnetization transfer imaging, ihMT) 图像的多模态特征,以探索 RDD 患者皮质微观结构的改变及其与疾病临床症状以及病程的关系。

方法 我们的研究共纳入 42 名 RDD 患者以及 56 名年龄、性别和教育程度相匹配的健康对照。

采集所有被试的 T1 结构像、弥散张量图像、ihMT、汉密尔顿抑郁量表和病史信息。按照规范流程进行图像预处理和特征提取,共获得 9 个特征用以构建 MSN。对 MSN 进行图论分析,计算全局效率、特征路径长度、节点效率、介数中心性和模块化特征。对两组被试的图论指标进行组间比较,并与临床症状评分和病程进行相关性分析。

结果 RDD 患者 MSN 的全局效率显著降低,特征路径长度显著增加。在节点水平上,我们观察到 RDD 患者的顶叶、皮层下区域和颞叶的节点效率降低,以及辅助运动区的中心度增加。此外,RDD 患者顶叶的模块内连接减少,顶叶和前额叶之间的模块间连接减少。值得注意的是,患者病程与顶上回、梭状回和壳核的全局效率、特征路径长度和局部效率之间存在明显的负相关。辅助运动区的介数中心性与 HAMD 评分呈正相关,而额顶叶的模块间连接与 HAMD 评分呈负相关。

结论 这项研究的主要贡献在于证明了 MSN 拓扑结构的破坏与 RDD 临床症状和病程之间的关系。这些结果表明,RDD 的持续病程会不断影响特定脑区皮层的微结构,并导致 MSN 逐渐规则化。额顶叶网络和辅助运动区与 RDD 患者抑郁症状有关,可能提示 RDD 的潜在病理机制。

关键词: 复发性抑郁障碍、磁共振图像、形态相似性网络、图论、模块化

青少年游戏障碍的静息态脑网络改变与注意力缺陷相关

郎艳* 赵涛 张艺博 吕其炎
郑大

目的 游戏障碍(gaming disorder, GD)受到人们的广泛关注,有研究表明,GD 患者存在注意力缺陷,然而,这一过程背后的神经机制仍不清楚。本研究旨在探讨青少年 GD 患者的静息态脑网络改变,以及注意力缺陷的可能机制。

方法 收集了 50 名青少年 GD 受试者(男/女: 40/10)和 52 名健康对照(男/女: 41/11),受试者完成了人口统计学问卷、Young 网络成瘾量表、探索性眼球运动检测及功能磁共振检查。静息状态功能磁共振数据使用 GIFT 软件进行独立成分分析,

对静息态脑网络内部及网络之间进行功能连接分析。

结果 与对照组相比,青少年 GD 患者的背侧注意网络(Dorsal Attention Network, DAN)的功能连接减少,而 ECN(Executive Control Network, ECN)加强了与 DAN 之间的联系,与青少年 GD 的注意力失调相关($r=0.4071, p=0.017$)。ECN-DAN 之间增强的功能连接与游戏障碍的严重程度呈正相关($r=0.4283, p=0.037$)。

结论 这项研究发现青少年 GD 患者的 DAN 损伤与注意力缺陷有关。DAN 的功能连接减少与青少年 GD 的注意力失调相关,而 ECN 加强了与 DAN 之间的联系。ECN-DAN 之间增强的功能连接与游戏障碍的严重程度呈正相关。并且,本研究首次发现了青少年 GD 中 ECN-DAN 之间增加的功能连接,这对青少年 GD 患者的注意力表现起着重要的作用,可能是未来注意力干预的一个研究方向。

关键词: 游戏障碍,青少年,独立成分分析,静息态脑网络,认知控制

青少年游戏障碍的执行控制网络损伤与冲动性增加相关

赵涛 郎艳* 张艺博 吕其炎
郑州大学

目的 游戏障碍(gaming disorder, GD)被定义为一种特定的行为成瘾,其特征是过度 and 强迫性使用游戏。最近的流行病学研究显示,青少年 GD 患病率为 5.5%。研究表明,游戏障碍患者的认知控制受损,表现为冲动性增加,注意力不集中等。然而,这一过程背后的神经机制仍不清楚。基于功能性磁共振(functional MRI, fMRI)发现的脑网络模型有可能解释 GD 的病理机制。本研究旨在探讨青少年 GD 患者的静息态脑网络改变,以及认知功能减退的可能机制。

方法 收集了 44 名青少年 GD 受试者(男/女: 38/6)和 50 名健康对照(男/女: 40/10),受试者完成了人口统计学问卷、Young 网络成瘾量表、Barratt 冲动量表 11 中文修订版及功能磁共振检查。静息状态功能磁共振数据使用 GIFT 软件进行独立成分分析,对静息态脑网络内部及网络之间进行功能连接分析。

结果 与对照组相比,青少年 GD 患者的冲动性增加与游戏障碍的严重程度成正比 ($r=0.6350, p<0.001$), 与执行控制网络 (Executive Control Network, ECN) 损伤、显著网络 (Salience Network, SN) - 执行控制网络 (ECN) 之间的功能连接减少相关 ($r=0.4307, p=0.0021$) ($r=0.5147, p=0.0034$)。

结论 在这项研究中,我们发现,青少年 GD 患者的冲动性增加与 ECN 损伤有关。我们的研究结果表明, ECN 在青少年 GD 的病理机制中起着和成人不同的作用,在青少年 GD 患者中, ECN 的 FC 增加并不能有效抑制他们的冲动。可能的原因是,青少年的 ECN 仍未发育成熟,即使增加了该网络内的 FC, 仍然不能像成人一样有效抑制冲动。并且,青少年 GD 的 ECN-SN 之间的 FC 减少,说明他们无法在脑网络内部切换过程中充分抑制 ECN 活动,从而导致冲动控制不佳。总之,青少年 GD 认知功能受损可能与内在大规模脑网络之间的异常相互作用有关。

Aberrant Fronto-limbic Network in Adolescents with Attention-deficit/hyperactivity Disorder: A Multimodal MRI Study Using Parallel ICA

Jingqi He Jinsong Tang*

Department of Psychiatry, Sir Run Run Shaw Hospital, Zhejiang University School of Medicine

Objective Attention-deficit/hyperactivity disorder (ADHD) is one of the most prevalent neurodevelopmental conditions in children and adolescents, characterized as inattentive, impulsive, and hyperactive. Numerous magnetic resonance imaging (MRI) studies have revealed atypical brain function and structure in ADHD, and multimodal MRI studies contribute to a better understanding of the neurobiological underpinnings of ADHD

Methods The demographic and clinical information and the structural and functional MRI scans used

in this study were all obtained from the New York University Child Study Center site of the ADHD-200 database. Forty-eight typically developing children (TDC) and 87 boys with ADHD were included. Parallel independent component analysis (pICA) was performed to the fusion of fractional amplitude of low-frequency fluctuation (fALFF) and gray matter volume (GMV)

Results We found a correlated component pair, containing a fMRI and a sMRI component differed significantly between the ADHD and the TDC groups. The component pair was identified as the fronto-limbic network. However, no correlations between structural or functional alterations and symptom or cognitive function were observed

Conclusion Our findings indicate an aberrant fronto-limbic network in adolescents with ADHD. However, the relationships between the fronto-limbic network and symptoms in ADHD should be explored further, especially emotional dysfunction.

关键词: Attention-deficit/hyperactivity disorder, Multimodal MRI, Parallel ICA

Evolving Network of Psychopathology Symptoms Among College Students Across Sudden Public Health Emergencies

Yiyang Liu Shanshan Liu Hongguang Chen*

Peking University Sixth Hospital

Objective To understand the mechanism and changes in psychopathology symptoms among college students throughout sudden public health emergencies and after peak, and to provide evidence for dynamically adjusting psychological intervention strategies and measures for this population

Methods Two large-scale studies were conducted separately during the COVID-19 outbreak and after peak stages. In the first survey, conducted from December 31, 2022, to January 7, 2023, 22,624 participants were recruited. The second survey, conducted from June 1, 2023, to June 30, 2023, involved 17,775 participants. Network models were created to explore

the relationship between psychopathology symptoms within and across anxiety, depression, insomnia, and PTSD. Anxiety was measured by the Generalized Anxiety Disorder-7, depression by the Patient Health Questionnaire-9, insomnia by the Insomnia Severity Index, and PTSD by the Impact of Event Scale-Revised. Symptom network analysis was conducted to evaluate central and bridge centrality, and network properties were compared between the outbreak and after peak

Results After peak, the prevalence of anxiety, depression, and PTSD among college students was significantly lower than during the peak, while the prevalence of insomnia was higher. The density of the psychological symptom network changed from tightly connected (density: 0.622) to gradually weakened (density: 0.542). PTSD symptoms, such as hyperarousal and intrusion, exhibited high centrality in the network during the initial survey. These symptoms maintained a relatively high position in terms of closeness and bridge centrality in the follow-up survey, but with noticeable alleviation. Concurrently, symptoms like sleep dissatisfaction (expected influence and bridge expected influence), fatigue (betweenness, bridge centrality), and early awakening (bridge expected influence) played a significant role in the network after peak. The second survey highlighted a heightened correlation between dissatisfaction with insomnia symptoms and symptoms of depression and PTSD, potentially reflecting a resurgence of intrinsic internal links among psychological symptoms after the peak

Conclusion The outbreak of the epidemic increases the risk of anxiety, depression, and PTSD among college students and temporarily alters the network structure relationships among these symptoms, particularly shifting the central focus from inherent sleep dissatisfaction to stress-related PTSD and anxiety.

基于成对经颅磁刺激、脑电微状态及近红外脑功能成像探讨强迫症皮层功能异常机制的

研究

程宇琪* 罗其敏

昆明医科大学第一附属医院

目的 本研究拟结合成对经颅磁刺激、脑电以及近红外光谱检查技术,探讨 OCD 患者皮层功能异常的相关机制。

方法 纳入 2022 年 9 月至 2023 年 11 月在昆明医科大学第一附属医院精神科门诊及住院部的 OCD 患者,同时招募性别、年龄及受教育年限与其相匹配的健康对照(HC)。分别进行以下操作:1.采用经颅磁刺激联合肌电描记技术(TMS-EEG),引出并记录受试者的皮层内抑制功能参数:短间隔皮质内抑制(SICI)和长皮质内抑制(LICI),以检测受试者大脑皮层内抑制功能变化。2.采集所有受试者的静息态脑电图,预处理后进行脑电微状态分析,获得 4 种典型的脑电地形拓扑图,提取 4 种微状态的时间动力学参数以用于评估其脑电微状态时间动力学特征变化。3.使用近红外光谱技术检测患者在词语流畅性任务(VFT)下前额叶的血红蛋白浓度和分布。

结果 1.与 HC 相比, OCD 患者 SICI 降低($Z=-2.10;P=0.036$),LICI 未见统计学差异。2.与 HC 相比, OCD 患者的转换概率特征表现为微状态 A→B 的转换概率增加($P=0.003$)、B→A 的转换概率增加($P<0.001$)、A→D 的转换概率减少($P=0.006$)、D→A 的转换概率减少($P=0.002$)、B→C 的转换概率减少($P=0.035$)。3.与 HC 相比, OCD 组前额叶各个通道及平均 Oxy-HbO 浓度的整体趋势相较于 HC 组降低,且差异脑区主要集中于 DLPFC 及 OFC。4. OCD 的 SICI 功能缺陷与脑电微状态转换概率及前额叶激活水平相关。

结论 1.OCD 存在 SICI 功能缺陷,由于 SICI 功能缺陷与强迫症状严重程度无显著相关性,支持 SICI 可能是 OCD 的素质性特征。2.OCD 存在大脑网络间的动态异常。3.支持前额叶皮层,尤其是 DLPFC 以及 OFC 的功能不足在 OCD 的发病中发挥着重要的病理生理作用。其次, OCD 的 DLPFC 及 OFC 脑区激活水平降低可能促进了强迫症状(尤其是强迫思维)的加重,而左侧 DLPFC 激活水平还可能影响 OCD 的焦虑甚至抑郁情绪水平。4.OCD 患者 SICI 缺陷程度越重,脑电微状态 B→C 的转化概率越低,即视觉网络与认知控制网络的交流越少;且随着 SICI 缺陷程度越重, OCD 前额叶激活水平

也越低。由于 SICI 反映 GABAA 受体功能, 该结果提示 OCD 可能存在以 GABAA 受体功能缺陷为特征的皮层抑制功能不足, 且与患者视觉网络与认知控制网络的交流下降以及前额叶皮层的激活代谢水平下降相关, 该机制可能成为 OCD 认知控制失调的机制之一。

Predicting The Treatment Response of Patients with Severe Major Depressive Disorder To Selective Serotonin Reuptake Inhibitors Using Machine Learning Techniques and EEG Functional Connectivity Features

Jinsong Tang* Fanglan Wang
Sir Run Run Shaw Hospital

Background Escitalopram and Sertraline are first-line medications for treating depression. They belong to selective serotonin reuptake inhibitors (SSRIs) and are widely used due to their effectiveness and fewer side effects. However, despite the significant efficacy of Escitalopram and Sertraline, there is a large variation among individuals. Therefore, predicting symptom improvement based on the baseline period is crucial

Methods In this study, we conducted functional connectivity analysis of electroencephalogram (EEG) data during resting-state with eyes closed, resting-state with eyes open, watching natural videos, angry videos, and comedy videos for 30 untreated depression patients over 2 weeks. Each modality yielded 18 EEG functional connectivity features. Based on the treatment response at 8 weeks, patients were divided into treatment-effective and treatment-ineffective groups. The dataset was randomly split into 75% training set and 25% independent test set. Feature selection was performed on these functional connectivity features in the training set, and the selected features were used to classify the effective and ineffective groups using the SVM machine learning algorithm. Five-fold cross-validation was conducted on the training set to obtain validation results, followed by

testing on the test set. The Spearman correlation method was used to analyze the correlation between each EEG feature value and the reduction rate of HAMD-17 scores from baseline to 8 weeks, with Bonferroni correction applied

Results The study found that out of all modalities, 33 features achieved classification accuracies of over 95% on the validation set, and 2 features achieved classification accuracies of over 85% on the independent test set. A total of 58 feature values were found to be correlated with the reduction rate of HAMD-17 scores from baseline to 8 weeks

Conclusion The results of this study indicate that EEG functional connectivity features at baseline can be used to differentiate between effective and ineffective groups with high accuracy using machine learning models. Multiple feature values and HAMD-17 scores were found to be correlated with the reduction rate of HAMD-17 scores from baseline to 8 weeks, and these correlated feature values can be used to predict treatment efficacy.

Limitations: The lack of a large sample size limits the application of our method in clinical practice.

精神分裂症患者单个核细胞中 TRPV1 受体及氧化应激水平的相关性研究

徐睿 王惠玲*

武汉大学人民医院精神卫生中心

目的 目前精神分裂症的诊断主要依据全面的病史资料和精神状况检查, 缺乏特异的实验指标和病理生理体征。瞬时受体电位香草酸 I 型受体 (TRPV1) 除了在疼痛及炎症领域外, 其在精神分裂症的发生发展过程中也发挥着重要作用, 此外, TRPV1 通道蛋白在调节氧化应激过程中的作用也逐渐被人们所认识。本研究主要探讨了精神分裂症患者外周血单个核细胞中 TRPV1 受体及氧化应激相关指标 (Sirt3、SOD2、Ace-SOD2) 之间的关联, 及其与精神症状及认知功能的相关性。

方法 (1) 样本收集: 本研究为横断面研究, 按照《美国精神障碍诊断与统计手册第 5 版》诊断标准纳入精神分裂症患者 50 例, 并招募与之匹配正常对照 50 例。详细收集人口学信息, 并空腹采集血样提取血清、血浆及单个核细胞 (PBMC) 分装后于 -80°C 冻存; (2) 量表评估: 采用阳性症状量表与阴性症状量表 (PANSS) 评估患者精神症状严重程度, 采用认知功能简明评测量表 (BACS) 评估入组人员认知功能; (3) 分子生物学实验: 采用蛋白免疫印迹法检测外周血单个核细胞中 TRPV1 受体和 SIRT3、SOD2、Ace-SOD2 蛋白表达量; (4) 统计学方法: 采用配对样本 t 检验进行精分患者组与对照组各指标之间的差异比较, 采用偏相关分析对受检测生物学指标之间, 及其与 PANSS 总分及分量表评分、BACS 评分做简单相关性分析, 采用多重线性回归分析 PANSS 评分和 BACS 评分的影响因素。

结果 1. 精分患者组 PBMC 中 TRPV1 及 Sirt3 蛋白表达量与正常对照组相比有明显下调, 而 SOD2、Ace-SOD2 表达量上调, 且 Ace-SOD2/SOD2 的比值也增加, 差异均具有统计学意义; 2. 通过协方差分析控制性别、年龄、受教育程度等混杂因素后, 与正常对照组相比, 上述改变仍存在统计学意义; 3. 对各生物学指标进行偏相关分析后, 发现 TRPV1 与 Sirt3 表达存在相关性; 4. 患者组 BACS 的子量表评分均低于对照组, 差异有统计学意义; 5. 将各指标表达量与 PANSS 及阴性、阳性、一般精神病理量表评分、BACS 量表的各项子量表评分进行偏相关分析后, 发现与 PANSS 评分及部分认知功能评分存在相关性。

结论 精神分裂症患者 PBMC 中存在 TRPV1 受体表达下调及部分氧化应激指标的异常表达, 且 TRPV1 与 Sirt3 蛋白表达存在相关性, 提示 TRPV1 可能参与到氧化应激通路的调控当中, 同时上述生物指标的改变与精神分裂的症状和认知功能受损也存在一定相关性, 这表明 TRPV1 受体及氧化应激系统可能参与了精神分裂症的发生发展, 且有望成为潜在的治疗靶点。

网络成瘾较网络游戏障碍与精神病理的关联性更强: 三个独立样本验证

李莹莹¹ 罗伏刚¹ 吕秋玥² 黄悦琦¹ 胡阿倩¹ 王强² 李晓晶^{1,2} 唐光政¹ 邓伟^{1,2} 李涛^{1,2} 郭万军^{1,2}

1. 浙江大学医学院附属精神卫生中心/浙江大学脑科学与脑科学学院附属医院/杭州市第七人民医院

2. 四川大学华西医院心理卫生中心

目的 探讨住院患者与社区人群中网络成瘾 (IA) 及网络游戏障碍 (IGD) 与常见精神病理综合征之间关联性差异。

方法 使用三个独立样本数据进行分析。三个样本分别为某大学一年级入学本科生 (下称 G1, $n=7982$)、某高中学生 (下称 G2, $n=1420$)、某精神科 13-19 岁住院患者 (下称 G3, $n=439$)。三个样本均采用 Young's 20 条网络成瘾量表 (IAT) 评估 IA, 简版游戏障碍量表 (IGDS9-SF) 评估 IGD、9 项患者健康问卷 (PHQ-9) 和 7 项广泛性焦虑障碍量表 (GAD-7) 评估抑郁及焦虑综合征。其中, 在 G1 和 G3 样本中, 使用强迫量表修订版 (OCI-R)、90 项症状清单节选 (SCL-90 偏执和 SCL-90 精神病质)、修订的自杀行为问卷 (SBQ-R) 评估相关精神病理综合征; 在 G2 和 G3 样本中, 使用成人多动症自我报告量表 (ASRS) 两个因子分别评估注意缺陷和多动。IAT ≥ 50 定义为存在 IA, IGDS9-SF ≥ 32 定义为存在 IGD。根据是否有 IA 和 IGD 将样本分为 A 组 (无 IA, 无 IGD), B 组 (无 IA, 有 IGD), C 组 (有 IA, 无 IGD), D 组 (有 IA, 有 IGD) 四组。

结果 男性分别为 4310 名 (54.5%), 626 名 (43.8%), 128 名 (26%), 平均年龄为 18 岁 ($s.d.=0.6$ 岁), 17 岁 ($s.d.=0.9$ 岁), 15.6 岁 ($s.d.=1.8$ 岁)。在 G1 样本中, 以抑郁、焦虑、偏执、精神病质、强迫、自杀得分为自变量的多元线性回归分析发现, 这些精神病理征对 IA 的解释度 ($R^2=0.39, \beta=23.2, 95\%CI 22.7-23.6$) 显著高于对 IGD ($R^2=0.13, \beta=10.2, 95\%CI 10.0-10.4$) 的解释度。在 G2 样本中, 以抑郁、焦虑、注意缺陷和多动得分为自变量的多元线性回归发现, 这 4 个精神病理征对 IA 的解释度 ($R^2=0.45, \beta=7.7, 95\%CI 6.0-9.3$) 也显著高于对 IGD ($R^2=0.19, \beta=1.5, 95\%CI 0.8-2.1$) 的解释度。在 G3 样本中, 以抑郁、焦虑、偏执、精神病质、强迫、自杀、注意缺陷和多动得分为自变量的多元线性回归发现, 这些精神病理征对 IA 的解释度 ($R^2=0.15, \beta=22.1, 95\%CI 15.6-28.6$) 大于对 IGD ($R^2=0.13, \beta=5.5, 95\%CI 2.5-8.4$) 的解释度。方差分析发现, 三个样本中各项精神病理征症状严重程度趋势均为由 A 组到 B 组, 再到 C 组

和/或 D 组逐步升高, 事后两两比较发现大多数比较存在显著差异。

结论 IA 和 IGD 都与广泛精神病理相关, 而 IA 较 IGD 与其它精神病理的关联性更强。

The Correlation between Cortical Thickness and Cognitive Performance in Major Depressive Disorder

Chenyu Liu¹, Dongchang Huang², Yuanyuan Huang^{1,3,4}, Hehua Li^{1,3,4}, Fengchun Wu^{1,3,4}

1. The Affiliated Brain Hospital of Guangzhou Medical University

2. The town of Dalang Experimental Primary School

3. Guangdong Engineering Technology Research Center for Translational Medicine of Mental Disorders

4. Key Laboratory of Neurogenetics and Channelopathies of Guangdong Province and the Ministry of Education of China

Objective Cognitive impairment is regarded as a core symptom of Major Depressive Disorder (MDD). Previous studies have indicated the presence of cortical thickness (CT) abnormalities in patients with MDD. However, there is lack of research on the association between cognitive performance and cortical thickness abnormalities in patients with MDD. So this study is to investigate the changes in CT in patients with MDD and their relationship with cognitive impairment

Methods The CT was calculated following T1-weighted magnetic resonance imaging in 105 patients with first-onset and untreated MDD and 53 healthy controls (HCs) matched for age and gender. Cognitive performance was assessed by the MATRICS Consensus Cognitive Battery (MCCB). The correlation between CT and cognitive performance was analyzed

Results All five cognitive dimensions were significantly different in the MDD patients compared to the HCs compared to the healthy controls. Meanwhile, CT values of the right middle frontal gyrus and bilateral precentral gyrus were reduced in patients in the MDD

group ($p < 0.001$). In addition, a positive correlation was found between the CT of the right middle frontal gyrus and the working memory dimension scores of the patients in the MDD group ($r = 0.220$, $p = 0.026$)

Conclusion The results of our study indicate that CT abnormalities are present in patients with MDD and are associated with cognitive performance.

Specificity of EEG Microstates in First-Episode, Drug-naive Patients with Mild To Moderate and Severe Depressive Disorder

Zhendong Zhang¹, Yuanyuan Huang¹, Hehua Li¹, Kai Wu², Fengchun Wu^{1,2}

1. Department of Psychiatry, The Affiliated Brain Hospital of Guangzhou Medical University

2. Guangdong Engineering Technology Research Center for Translational Medicine of Mental Disorders

Objective Previous studies have documented abnormalities in the EEG of depressed patients; however, the specificity of EEG microstates across varying severity levels in depression remains unexplored and could be influenced by medication. This study aimed to investigate the features of EEG microstates in first-episode, drug-naive patients with mild to moderate and severe depressive disorder, with the goal of identifying potential biomarkers for the severity of depression

Methods A total of 125 drug-naive patients and 40 healthy controls were recruited. Depression severity was assessed using the Hamilton Depression Rating Scale, categorizing patients into mild to moderate (MM-DD) and severe (S-DD) groups. EEG data were segmented into four canonical microstate topographies (A-D) using AAHC clustering, and the duration, occurrence, coverage, and transition probabilities of these microstates were compared among different groups

Results The duration of microstate B was significantly reduced, and the occurrence of microstate C was significantly increased in the S-MDD group compared

to LM-MDD and HCs. The contribution of microstates C and D was lower in the LM-MDD group compared to HCs and higher in the S-MDD group. Microstate transitions were analyzed as Markov chains, with nonrandom transfers between microstates differing between severity groups. Microstate A→C and D→C transition decreased in the MM-DD group compared to HCs. In the S-DD group microstate B→C transition increased and D→B transition decreased. The S-DD group has higher microstate A→D, B→D, C→D transitions than the MM-DD group. However, the MM-DD group had higher microstate D→B and B→D transitions than the S-DD group. Correlation analyses showed that the contribution of microstate B and the transition of microstate B→D were correlated with the HAMD-17 score

Conclusion These findings indicate that EEG microstates exhibit distinct patterns in patients with different levels of depression, suggesting their potential as biomarkers for assessing the severity of depressive conditions

The Effect of Parental Emotional Warmth on Adolescents' internet Gaming Disorder: A Moderated Mediation Model

Yuqiong Zhu Hang Yu Wenjuan Wang*
Bengbu Medical University

Objective The physical and mental effects of Internet Gaming Disorder (IGD) are similar to those of substance use disorders, and it is unknown what psychological processes underlie IGD. The purpose of this study is to investigate the current status and characteristics of IGD in adolescent, exploring the impact of parental emotional warmth on IGD in adolescents, and to research the mediation effect of impulsivity and the intermediary effect of belief in a just world

Methods 513 adolescents were sampled were surveyed using the Parental Emotional Warmth Scale,

Belief in a Just World Scale, Barrett Impulsive Personality Questionnaire (BIS-11) and Internet Gaming Disorder Scale (IGD-20), Data processing and analysis using SPSS22.0

Results (1) The screening rate of IGD in adolescents is 2.90%. (2) IGD in adolescents was significantly negatively associated with belief in a just world and parental emotional warmth ($r = -0.093$, $r = -0.177$), IGD was significantly positively associated with Impulsivity ($r = 0.353$), parental emotional warmth was significantly negatively related to impulsivity ($r = -0.286$) and impulsivity was significantly negatively related to belief in a just world ($r = -0.174$). (3) Impulsivity has a complete mediation effect between parental emotional warmth and IGD ($\beta = 0.39$, $p < 0.001$). (4) Belief in a just world moderated the relationship between parental emotional warmth and impulsivity ($\beta = -1.87$, $p < 0.05$), and belief in a just world enhanced the negative effect of parental emotional warmth on impulsivity

Conclusion Parental emotional warmth is a protective factor for adolescent IGD, and impulsivity is an important mediating mechanism, which is regulated by a belief in a world of justice.

关键词: Internet gaming disorder, parental emotional warmth, belief in a just world, Impulsivity

通过网络分析调查抑郁症患者童年创伤与近期生活事件对功能失调性态度的影响

张楠 刘忠纯*
武汉大学人民医院精神卫生中心

目的 童年创伤与负性生活事件是抑郁症的重要社会风险因素, 功能失调性态度反映了抑郁症患者认知易感性。本研究的目的是通过采用网络分析的方法来确定童年创伤的特定类型如情感虐待、躯体虐待、性虐待、情感忽视与躯体忽视与家庭、工作和学习及社交相关的生活事件以及功能失调性态度之间的关联。

方法 本研究纳入就诊于武汉大学人民医院的414例抑郁症患者。所有参与者完成了童年创伤问卷、生活事件量表以及功能失调性态度问卷。网络

分析通过将这些量表的分量表得分作为节点，并将每对节点之间的偏相关性作为边，确定了网络中最中心的节点以及童年创伤与生活事件之间的关联。

结果 情感虐待表现出最高的中心性，表明其在网络中的影响力最大。情感忽视与躯体忽视之间的关联最强，其次为情感虐待与躯体虐待以及情感虐待与情绪忽视。三种近期生活事件两两相关。此外，情感虐待与功能失调性态度之间存在正相关。

结论 情感虐待与功能失调性态度在抑郁症患者中密切相关，他们的网络互动可能在对认知易感性起重要作用。因此，本研究为将来对抑郁症伴有认知歪曲的患者提供预防思路，即重点干预童年创伤中的情感虐待，阻断二者之间的关联可能会预防抑郁症患者出现的认知偏差。

A Network Approach To Understanding The Inter-relationship between Depressive and Anxiety Symptoms in Suicidal Ideation

Huiting Cai¹, Guilai Zhan¹, Hua Ni¹, Jinmei Qin¹, Li Bao¹, Chunmei Li², Tifei Yuan³

1.Shanghai Xuhui Mental Health Center

2.Rugao Mental Health Hospital

3.Shanghai Mental Health Center

Objective Individuals with depression and co-occurring anxiety experience more frequent and severe suicidal ideation (SI). As depression and anxiety are multi-component syndromes, the inter-relationships between their components and suicidal ideation are intricate. We aim to quantify and visualize these inter-relationships to inform suicide prevention strategies

Methods We conducted a retrospective analysis of 281 outpatients with depression who finished the Self-rating Depression Scale and the Self-rating Anxiety Scale on the visit day. We identified the SI from their medical records. The emerging network theory of mental disorders provides a novel understanding of how the dynamic interplay of different symptoms influences or exacerbates SI. As the sample size of 281 participants is

relatively small, we examined the symptom networks of SDS and SAS at the factor level. We used 12 items (including five depression factors, four anxiety factors, two demographic variables, and one variable related to SI) to estimate a weighted and undirected, regularized partial correlation network to represent the magnitude of association between each pair of nodes (i.e., items). To identify the most influential nodes within the network, we calculated the Strength and Betweenness indices to measure the node centrality, the node with higher centrality is considered to have greater importance in the network. We next computed a Bayesian network using the hill-climbing algorithm and created an average of the 50,000 bootstrapped networks to obtain a reliable directed acyclic graph (DAG). DAG allows researchers to get insights about the potential influence direction between symptoms

Results Among the 281 eligible outpatients, there were 73 (26.0%) males and 208 (74.0%) females, who ranged in age from 12 to 80 ($M = 41.9$, $SD = 21.5$). The proportion of eligible outpatients who reported SI was 30.2%. The regularized partial correlation network showed that ‘Anxiety and Panic’ and ‘Depression’ had moderate direct links to suicidal ideation, and ‘Anxiety and Panic’ was the most central node in the network. As shown in Figure 1, the Bayesian network further identified three paths directed from Depression to SI: (1) direct path, Depression \rightarrow SI directly, (2) indirect path, Depression \rightarrow ‘Anxiety and Panic’ \rightarrow SI, (3) indirect path, Depression \rightarrow ‘Ideational suffering’ \rightarrow Psychomotor \rightarrow ‘Anxiety and Panic’ \rightarrow SI

Conclusion We found that emotional symptoms of anxiety (i.e., ‘Anxiety and Panic’) were central in the symptom network, and our DAG model suggests that it might be the driver to exacerbate suicidal ideation. Furthermore, according to our DAG model, anxiety somatic symptoms appear to be primarily secondary to the ‘Anxiety and Panic’ rather than other depression symptoms. This implies that prioritizing ‘Anxiety and Panic’ may also be effective in relieving the comorbidity of depression and anxiety. In particular, it needs to be clarified here that the hypothesis drawn from DAG still needs to be confirmed by clinical trials or longitudinal studies

Large-scale EEG Neural Network Changes in First-episode Drug-naïve Patients with Major Depression Disorder Comorbid with Anxiety

Yun Yi¹, Yuanyuan Huang², Yuhua Wei¹, Fengchun Wu²

1.The Brain Hospital of Guangxi Zhuang Autonomous Region

2.The Affiliated Brain Hospital of Guangzhou Medical University

Objective Accumulating evidence have showed abnormal brain activities in first-episode drug-naïve (FEDN) patients with major depression disorder (MDD). Our purpose was to investigate the changes of large-scale EEG neural network in MDD comorbid with anxiety

Methods A total of 98 FEDN MDD patients (45 MDD without anxiety and 53 MDD with anxiety) and 43 age-matched healthy controls were recruited in our study. The Hamilton Depression Rating Scale (HAMD)-17 and the Hamilton Anxiety Scale (HAMA) were used to evaluate the patients' mental states. We obtained 32-channel resting-state EEG recordings from all participants and used EEG microstate analysis to explore the brain network dynamics changes in MDD with or without anxiety. In the EEG microstate analysis, the modified K-means cluster algorithm was performed to cluster the template into four distinct microstates (A, B, C, D).

Results We observed that the duration and contribution of microstate B was significantly increased in MDD without anxiety than that of MDD with anxiety. However, the duration, occurrence and contribution of microstate C were reduced in MDD without anxiety as compared to the healthy controls. Moreover, the duration and contribution of microstate C were also reduced in MDD without anxiety when contrasted with MDD with anxiety. Traditionally, we found that heightened

transition probabilities from microstate B to D and microstate D to B in MDD without anxiety. Meanwhile, the transition probabilities from microstate B to C and microstate D to C was increased in MDD with anxiety. Further, the correlation analysis showed that the occurrence of microstate B ($r=0.312$, $p=0.023$) and the transition probabilities from microstate C to B ($r=0.39$, $p=0.004$) were positively associated with HAMA in MDD with anxiety group

Conclusion These findings extend our understanding of the brain implicated in MDD patients comorbid with anxiety, and provide new insight into therapeutic targeting of the neural circuits involved in this comorbidity. Abnormal EEG microstate has appeared in early depression with anxiety, reflecting an underlying abnormality in configuring neural resources and transitions between distinct brain network states.

基于脑磁图的首发精神分裂症及一级亲属的冲动特征与抑制控制损害的功能连接研究探讨

韩颖琳 花玲玲 夏逸 杜易珊 盛俊领 姚志剑*

南京医科大学附属脑科医院

目的 精神分裂症属于最严重精神障碍之一,高致残、高冲动行为是精神分裂症常见的临床危害特征,与抑制控制损害密切相关。对家庭和社会影响极大。目前研究定义精神分裂症的易感人群成为高危人群。因此,在脑磁图下通过首发精神分裂症组、一级亲属组、正常对照组进行 G/NG 任务态比较,分析三组间的抑制控制差异,寻找首发精神分裂症及高危人群抑制控制异常情况,这也是当前精神科临床及公共卫生研究的重点。

方法 本实验自 2016 年 9 月至 2022 年 2 月在南京脑科医院收集首发精神分裂症组 15 例、高危人群 15 例、正常对照组 18 例,入组时进行 Go/Nogo 任务态脑磁图数据及磁共振定位相采集,本实验全部数据结果用 matlab2012b 软件进行处理,用 SPSS24.0 软件进行统计分析。

结果 1. Nogo 任务下三组功能连接比较

在抑制控制加工后期(250-450ms)时间窗, 三组间 β 频段IM1-preSMA的FC($p=0.003$, FDR corrected)和low γ 频段preSMA-rIFG的FC($p=0.015$, FDR corrected)统计学异常, 且三组递进式增强, 以首发组增高最明显, 但高危组与对照组之间没有统计学差异。

2. 基于有特征意义的多维数据建立分类模型

加工后期的low γ 频段preSMA-rIFG的FC为贡献最大的影像因素($p=0.011$)。再建立分类判别式模型, 分类准确率(交叉验证)87.5%。

结论 精神分裂症在抑制控制加工后期存在与抑郁症患者一样的异常FC, 都提示 β 频段preSMA-IM1及low γ 频段rIFG-preSMA FC异常, 提示这两个特征性FC可能是精神疾病抑制控制损害的关键, 作为早期非药物干预的生物标记位点, 对预防冲动及日常生活功能下降意义重大。

Γ -经颅交流电刺激改善精神分裂症患者工作记忆的双盲随机对照研究—基于近红外脑功能成像技术

杨馥银¹ 刘勇² 魏燕燕¹ 曹歆轶¹ 王洪艳¹ 李伟¹ 李惠¹ 张天宏¹, Hua Jin³, Robert Smith⁴, John Davis³ 王继军¹ 李春波¹

1.上海交通大学医学院附属精神卫生中心; 上海市重性精神病重点实验室

2.浙江大学医学院附属第一医院精神卫生科

3.Department of Psychiatry, University of California San Diego

4.Department of Psychiatry, New York University School of Medicine

目的 认知功能损害为精神分裂症患者的核心症状之一, 工作记忆是很多认知任务的重要成分, 临床上将工作记忆的改善作为精神分裂症认知症状的疗效评估指标之一。经颅交流电刺激(tACS)在改善精神分裂症患者工作记忆方面具有潜力。本研究探索 γ -tACS干预精神分裂症患者工作记忆的疗效及潜在的脑机制, 为临床物理治疗提供方案指导和理论依据。

方法 采用随机双盲平行对照设计(注册号: NCT03756610), 对符合入组标准的精神分裂症患者按照区组随机化分为真刺激组和伪刺激组, 进行每天一次连续10天的tACS治疗。刺激电极放置于左侧背外侧前额叶(F3), 参考电极放置于右侧顶叶(P4), 单次刺激时间为20分钟, 电流强度2mA, 刺激频率为40Hz(γ 频段)。采用N-back范式测试患者在0-back、1-back和2-back下的工作记忆表现, 以反应时和正确率为评价指标。采用近红外功能成像技术(fNIRS)测量患者在完成N-back任务期间前额叶与双侧颞叶皮层的血流动力学信号, 包括含氧血红蛋白浓度(HbO)和脱氧血红蛋白浓度(HHb), 应用NIRS_KIT软件对fNIRS数据进行处理分析。

结果 1. 52例来自上海市精神卫生中心的精神分裂症住院患者参与随机分组, 其中33例(真刺激组22例, 伪刺激组11例)完成基线和10次干预后即刻的工作记忆任务。

2. 10次 γ -tACS干预后, 真刺激组相较基线, (1)反应时: 1-back任务的反应速度显著更快(基线: 759.18 ± 239.70 秒; 干预后: 685.50 ± 192.37 秒; $t = 2.077$, $p = 0.05$); 2-back任务的反应速度显著更快(基线: 858.07 ± 230.86 秒; 干预后: 738.71 ± 249.48 秒; $t = 2.876$, $p = 0.009$)。 (2) 正确率: 2-back任务的正确率显著更高(基线: $61.18 \pm 16.14\%$; 干预后: $70.46 \pm 8.78\%$; $t = 2.659$, $p = 0.015$)。

3. 基线时真、伪刺激组在N-back任务中的HbO和HHb差异无统计学意义。

4. 10次 γ -tACS干预后即刻, 与伪刺激组相比, 真刺激组0-back和1-back任务中右侧颞叶的HbO显著提高(FDR corrected $p < 0.05$)。

结论 (1) γ tACS干预对精神分裂症患者工作记忆具有一定的即刻改善效应, 但其长期效应有待进一步探索; (2) 额顶叶 γ tACS干预可能通过增强右侧颞叶的神经活动和血流供应来促进不同脑区间对记忆信息的整合能力, 使工作记忆中的信息能够被有效维持和及时更新, 从而改善精神分裂症患者的工作记忆表现。

Downregulation of FKBP5 Is Associated with Stress Resilience in Rats Induced by CUMS

Chen Li Gaohua Wang*

Renmin Hospital of Wuhan University

Objective FK506 binding protein 51 (FKBP5), a co-chaperone of heat shock protein 90, regulates glucocorticoid receptor (GR) activity by forming a complex with HSP90/HSP70. Reduced or impaired GR is considered as an important factor contributing to HPA axis dysfunction in patients with major depressive disorder (MDD). Studies have found that the expression of FKBP5 gene is significantly increased in the hippocampus and prefrontal cortex of patients with schizophrenia and bipolar disorder. Besides, FKBP5 in the brain is closely related to depression-like behaviors and regulates the response to antidepressants in preclinical and clinical studies. The SNPs rs1360780 and rs3800373 in the FKBP5 gene have been shown to be associated with MDD and suicide events. Studies have demonstrated FKBP5 could enhance the dephosphorylation of AKT, inhibit the activity of AKT and then achieve cell apoptosis or death. The PI3K/AKT/mTOR signaling plays a significant role in the pathogenesis of MDD and antidepressants' treatment. Therefore, HSP90 and its co-chaperone FKBP5 are involved in the occurrence of MDD possibly through the PI3K/AKT/mTOR pathway, which could be a novel and potential target in MDD. Therefore, in this study we aimed to explore the correlation between the expression of FKBP5 in the hippocampus and prefrontal cortex and depression-like behaviors in CUMS induced rats. Then, we demonstrated the possibility of FKBP5 as an early warning biomarker of MDD. Next, we explored the correlation and possible regulatory effect of FKBP5 on the PI3K/AKT/mTOR pathway to enrich the pathological mechanisms of MDD and provide a potential target for antidepressants

Methods A total of 30 male 6-8 weeks old Sprague-Dawley (SD) rats were randomly divided into 2 groups after acclimatizing for one week: Control (n=10), Chronic unpredictable mild stress (CUMS) (n=20). Rats in the CUMS group received two stressors per day for four consecutive weeks, and the same stressor was never applied on two consecutive days. After 4 weeks of CUMS, behavior tests (body weight, sucrose preference

test, open field test, novel object recognition, social interaction test and forced swimming test) were applied to differentiate the susceptible rats (hereafter referred to as CUS group) and resilient rats (hereafter referred to as CUR group). RT-PCR, western blot and immunofluorescence staining were used to detect the FKBP5, HSP90 and PI3K/AKT/MTOR signaling

Results The CON group gained more weight faster than group received CUMS. In the SPT and FST, the CUS group showed decreased sucrose preference and longer immobility time compared with the CON and CUR group. The total distance, time in center and frequency of rearing significantly decreased in the CUS group, but there was not significant difference in the CUR group compared with the CON group. Then, we observed that the sociability index and social preference index in SIT of the CUS group rats were reduced compared with the CON group. However, no significant differences were found in sociability index and social preference index between the CUR and CON group. These results suggested that 4 weeks CUMS induced the depression-like behaviors in male rats. RT-PCR, WB and IF showed that rats in the CUR group exhibited down-regulated FKBP5 and upregulated PI3K/AKT/MTOR signaling in hippocampus and PFC

Conclusion These findings suggested that up-regulated FKBP5 level in CUMS rats were susceptible to depressive-like behaviors, memory deficits and social withdrawal via inhibiting PI3K/AKT/MTOR signaling. This study enriched molecular mechanism of FKBP5 on MDD, and inhibition of FKBP5 might be a target to increase the resist stress and antidepressant effect.

心境情感障碍患者大脑代谢特征的性别差异-基于氢质子磁共振研究

张荣旭² 钟舒明¹ 贾艳滨¹ 宋小东¹

1.暨南大学附属第一医院(广州华侨医院)

2.1 暨南大学附属第一医院精神医学科

目的 重度抑郁障碍 (MDD) 和双相情感障碍的临床特征表现出明显的性别差异, 但造成这些差异的原因仍不清楚。目前的研究集中于神经生化代谢的差异中, 本文旨在找出患有重度抑郁障碍和双相情感障碍的男女在大脑代谢方面的差异。

方法 本研究共招募了 172 名 MDD 患者 (男 62 名, 女 110 名) 和 244 名 BD 患者 (男 71 名, 女 123 名)。通过质子磁共振波谱 (1H-MRS) 检测了前额叶白质 (PWM)、前扣带回皮质 (ACC) 和丘脑中 N-乙酰天冬氨酸 (NAA) 和含胆碱化合物 (Cho) 的代谢物水平。

结果 MDD 在左侧扣带回中 Cho/Cr 水平中女性小于男性, 在左侧小脑 NAA/Cr, 左侧丘脑 Cho/Cr 的水平女性高于男性。在 BD 患者中, 男性在左、右侧丘脑 Cho/Cr、扣带回 Cho/Cr 水平均高于女性; 在右侧丘脑 NAA/Cr、扣带回 Cho/Cr 水平低于女性。此外我们发现, 在男性中, MDD 患者的左侧丘脑的 NAA/Cr 水平高于 BD, 在左、右侧扣带回 Cho/Cr、左侧丘脑 Cho/Cr 均低于 BD。在女性中, MDD 患者的左侧丘脑 Cho/Cr、右侧丘脑 NAA/Cr、左、右侧扣带回 Cho/Cr 水平高于男性。

结论 我们的研究提示 MDD 和 BD 在扣带回、小脑、丘脑的生化代谢损伤存在差异。与 BD 相比, MDD 在左侧小脑存在特征性的生化代谢损伤; 丘脑和扣带回的大脑代谢紊乱可能是导致 MDD 和 BD 性别差异的潜在原因。

A Robust and Coordinated Brain Network Supports The Formation of Long-term Cocaine Memory

Xuan Chen^{1,2}, Xiaoxing Liu², Kai Yuan², Lin Lu²

1.Xinxiang Medical University

2.Peking University Sixth Hospital

Background Drug addiction, a pressing global public health issue, presents significant challenges in clinical treatment due to the high rate of relapse among patients following therapy. The prevailing belief is that addictive drugs can trigger pathological memories, which serve as the primary catalyst for drug relapse. Existing views emphasize the pivotal role of “memory system consolidation” in the transition from short-term to long-term memory. Previous studies on long-term drug memories have primarily focused on reorganizing individual brain regions or neural circuits composed of two brain regions. However, recent evidence suggests that functional abnormalities within brain-wide networks may contribute to the formation of long-term drug memories. However, there remains a lack of research investigating how activation patterns within these brain-wide networks change during the formation of long-term drug memories

Objective By investigating the neural network activation patterns associated with the short-term and long-term drug memories, this study aims to identify the fundamental brain regions that contribute to the formation of long-term drug memories. The findings derived from this research could potentially unveil innovative therapeutic targets and theoretical frameworks for effectively addressing drug addiction and preventing drug relapse.

Methods The present study utilized the cocaine conditioned place preference (CPP) model in rats, along with experimental techniques and data analysis methods, such as immunofluorescence, network analysis, and graph theory analysis, to investigate the process of long-term cocaine memory formation from three perspectives:

alterations in brain region activation level, functional connectivity between brain regions, and brain network pattern

Results (1) Following intraperitoneal administration of 10 mg/kg cocaine for 6 consecutive days, rats successfully developed a conditioned place preference for the environment associated with cocaine, which persisted for at least 14 days; (2) Analysis of c-Fos expression in 27 brain regions using immunofluorescence techniques revealed the involvement of the medial prefrontal cortex, hippocampus, basolateral amygdala, retrosplenial cortex, ventral subiculum, ventral tegmental area and lateral entorhinal cortex in the expression of short-term cocaine memory, while the medial prefrontal cortex, hippocampus, basolateral amygdala, nucleus accumbens, retrosplenial cortex, subiculum, lateral habenula, lateral septum, ventral tegmental area, dorsomedial hypothalamic nucleus dorsal part, paraventricular thalamus and entorhinal cortex contributed to the expression of long-term cocaine memory; (3) Subsequent to memory expression, there was a significant increase in functional connectivity between various brain regions and overall coordination of the brain network. Notably, long-term cocaine memory exhibited stronger robustness and coordination compared to short-term memory; (4) The retrosplenial cortex, hippocampus, and orbitofrontal cortex occupied pivotal nodes within the brain network of long-term cocaine memory, exerting an important function on the maintenance of cocaine memory

Conclusion During the transition from short-term to long-term cocaine memory, memory system consolidation enhances the activation levels of brain regions involved in the expression of cocaine memories, strengthens functional connectivity between brain regions, and reinforces the activation patterns of brain networks. The persistence and stability of long-term cocaine memory may be attributed to this robust network activation pattern. By investigating the neural mechanisms underlying the formation of long-term cocaine memory, this study provides novel empirical evidence for comprehending drug addiction and drug relapse

腹侧被盖区 AdipoR1 表达神经元到杏仁核的神经通路对应激诱导的焦虑样行为的影响

张逸^{1,2} 王三旺³ 杨璐^{1,2} 彭劲涛^{1,2} 孙丰蛟² 崔明湖²

1.滨州医学院

2.滨州医学院附属医院

3.北京大学第六医院

目的 焦虑障碍是一种常见的精神疾病, 现已证明腹侧被盖区 (ventral tegmental area, VTA) 到杏仁核的多巴胺能神经投射通路参与调控焦虑样行为。最新研究发现 VTA 中的多巴胺能神经元与脂联素受体 1 (adiponectin receptor 1, AdipoR1) 共定位, 脂联素通过 AdipoR1 调控 VTA 多巴胺能神经元电活动和焦虑样行为, 提示 AdipoR1 表达神经元到杏仁核的神经投射可能参与脂联素对焦虑行为的调控。因此, 本文拟探究 VTA AdipoR1 表达神经元到杏仁核的神经投射通路对焦虑样行为的调控作用。

方法 首先运用脑立体定位技术向对照组、干扰组、过表达组的 C57 小鼠杏仁核中分别注射 pAAV-Ef1a-DIO-mCherry-WPRE (逆行对照病毒)、pAAV-Ef1a-DIO-mCherry-miR30shRNA(Adipor1)-WPRE (逆行 AdipoR1 干扰病毒)、pAAV-Ef1a-DIO-Adipor1-mCherry-WPRE (逆行过表达病毒), 向三组小鼠 VTA 中注射 AAV-hsyn-retro-cre-GFP, 待病毒表达 3 周后进行明暗箱实验、高架十字迷宫实验、自主活动测定等焦虑相关行为学实验, 行为学结束后灌流取脑, 切片观察 VTA 内荧光表达。同时, 向 iDAT-cre 小鼠杏仁核中注射 pAAV-Ef1a-DIO-mCherry-WPRE, 待病毒表达 3 周后进行膜片钳实验, 记录给予脂联素受体激动剂灌流和洗脱后多巴胺能神经元放电频率的变化。

结果 在明暗箱实验中, 干扰组 (AdipoR1 RNAi) 小鼠进入明箱的潜伏期高于对照组 (Control)、在明箱停留时间低于对照组、明暗箱之间的穿梭次数低于对照组, 说明抑制 VTA AdipoR1 表达神经元到杏仁核的神经投射通路可诱导焦虑样行为。在高架迷宫实验中, 干扰组小鼠进入开臂和闭臂的总次

数高于对照组、开臂停留时间/开臂和闭臂停留总时间(%)低于对照组、进入开臂次数/进入开臂和闭臂总次数(%)少于对照组,也说明抑制 VTA AdipoR1 表达神经元到杏仁核的神经投射通路可诱导焦虑样行为。

结论 本文目前的研究数据表明,抑制 VTA AdipoR1 表达神经元到杏仁核的神经投射通路会诱导小鼠焦虑样行为,今后,我们将探究过表达 VTA AdipoR1 表达神经元到杏仁核的神经投射通路对小鼠焦虑行为的影响及其相关机制,为焦虑障碍的发病机制、治疗及预防提供新方向。

The Impact of Parental Marital Status on Self-Harm Behaviors in Primary School Students: A Cross-Sectional Study

Ming Ai Li Kuang*

Department of Psychiatry, The First Affiliated Hospital of Chongqing Medical University

Background Self-harm behaviors in children are a significant public health concern. Understanding the impact of familial and sociodemographic factors, particularly parental marital status, on these behaviors is crucial for developing effective interventions

Objective This study aims to investigate the relationship between parental marital status and self-harm behaviors in primary school students, while also considering other sociodemographic variables

Methods A cross-sectional survey was conducted with 33,285 primary school students (grades 3 to 6). Data were collected on self-harm behaviors and various sociodemographic characteristics, including parental marital status, sex, grade, only child status, living arrangements, residential location, family financial situation, relationships with parents and classmates, menstruation status, bullying experiences, academic pressure, and smartphone use. Chi-squared tests and multivariate regression analyses were performed to determine associations and control for confounding factors

Results Parental marital status was significantly associated with self-harm behaviors ($P < 0.001$). Students from divorced families, families with one or both parents remarried, and families where one or both parents were deceased exhibited higher rates of self-harm behaviors compared to those from families with normal marital relationships. Other factors such as sex, grade, living arrangements, family financial situation, relationships with parents and classmates, menstruation status, bullying experiences, academic pressure, and smartphone use also showed significant associations with self-harm behaviors.

Conclusion Parental marital status significantly affects self-harm behaviors in primary school students. Interventions aimed at supporting children from disrupted family backgrounds are essential. Additionally, addressing other sociodemographic factors is crucial for a comprehensive approach to prevent self-harm behaviors in children

The Effects of Childhood Trauma on Nonsuicidal Self-Injury and Depressive Severity Among Adolescents with Major Depressive Disorder: The Different Mediating Roles of Positive and Negative Coping Styles

Meiling Peng Xueping Huang*

Chongqing Mental Health Center

Objective We aimed to examine whether positive and negative coping styles mediated the influences of childhood trauma on NSSI or depressive severity in adolescents with major depressive disorder (MDD)

Methods The Children's Depression Inventory (CDI), the Ottawa Self-Injury Inventory Chinese Revised Edition (OSIC), the short-form Childhood Trauma Questionnaire (CTQ-SF), and the Simplified Coping Style Questionnaire (SCSQ) were evaluated in 313 adolescents with MDD

Results MDD adolescents with NSSI had higher

CTQ-SF total score, emotional and sexual abuse subscale scores, but lower CDI total and subscale scores compared to the patients without NSSI. The multiple linear regression analysis revealed that emotional abuse ($\beta = 0.075$, 95% CI: 0.042~0.107) and ineffectiveness ($\beta = -0.084$, 95% CI: -0.160~-0.009) were significantly associated with the frequency of NSSI in adolescents with MDD, but emotional abuse ($\beta = 0.884$, 95% CI: 0.570~1.197), sexual abuse ($\beta = 0.825$, 95% CI: 0.527~1.124) and negative coping style ($\beta = 0.370$, 95% CI: 0.036~0.704) were independently associated with the depressive severity in these adolescents. Furthermore, the mediation analysis demonstrated that positive coping style partially mediates the effect of childhood trauma on NSSI (Indirect effect = 0.002, 95% bootCI: 0.001~0.004), while the negative coping style partially mediates the relationship between childhood trauma and depressive severity (Indirect effect = 0.024, 95% bootCI: 0.005~0.051) in adolescents with MDD

Conclusion Our findings suggest that coping styles may serve as mediators on the path from childhood trauma to NSSI or depressive severity in MDD adolescents

关键词: major depressive disorder, nonsuicidal self-injury, childhood trauma, coping style, adolescent.

结合遗传信息利用机器学习构建抑郁症预测模型

蔡雨凡 邵永琪 唐海平 刘芮 徐治*
东南大学附属中大医院

目的 抑郁症是一种常见的心理疾病,据 WHO 预计,到 2030 年抑郁症将成为中国疾病负担的第二大疾病,在全球疾病负担中升至第一名。抑郁症的诊断主要依赖于临床医生的经验判断、患者的自述症状以及标准化的评估工具,这一过程耗时且可能受到主观因素的影响。抑郁症的发生受到多种因素影响,其中包括遗传因素。因此,开发一种基于遗传信息的、客观且高效的抑郁症预测模型,对于提高诊断的准确性和效率具有重要意义。机器学习算法能够帮助分析与抑郁症相关的基因变异,并进一步

理解这些变异如何影响个体的患病风险。本研究旨在利用机器学习技术,结合个体的遗传信息,开发并优化一个能够准确识别并区分抑郁症患者与健康人群的预测模型。

方法 本研究共招募了 929 名抑郁症患者和 489 名健康人。所有受试者均采集一般人口学资料,采集外周血液样本。研究基于 KEGG 通路数据库,围绕 MDD 病因假说和发病机制以及抗抑郁作用相关通路共筛选 1309 个候选基因,通过 Illumina MiSeq 平台完成测序,使用 PLINK 软件筛选高质量 SNP,剔除缺失率大于 20%、最小基因频率低于 5% 的 SNP 标记。最终数据集共纳入 855 名抑郁症患者和 489 名健康对照,共有 7 个特征变量被纳入,分别为性别、年龄、rs3795708、rs3768159、rs13916420、rs539785、rs582052。采用二分类 logistic 回归方法评估特征变量对结局二分类变量(抑郁症/健康对照)的影响,并对数据随机拆分为训练集和测试集,其中测试集比例为 30%,剩余样本作为训练集进行 5 折交叉验证。采用 Hosmer and Lemeshow goodness of fit (GOF) test 方法来评估 logistic 回归模型拟合度,并绘制训练集和测试集的校准曲线,通过列线图将结果可视化。

结果 从总体样本中随机抽取测试集 30% (N=403),剩余样本作为训练集进行 5 折交叉验证 (N=941),并在验证集中得到 AUC 为 0.6214(0.5391-0.7036)。最终模型在测试集中的 AUC 为 0.65,准确度为 0.6262。

结论 本研究针对抑郁症诊断,结合遗传因素,利用机器学习技术构建并优化了预测模型。通过深入的数据挖掘和模型验证,我们成功筛选了与抑郁症发病风险显著相关的基因标记,并构建了基于这些标记的预测模型,为抑郁症诊断及风险预测提供了新的视角和方法。未来我们将通过进一步的研究和探索,不断优化和完善模型,为抑郁症诊断和风险预测提供更加精准和有效的支持。

Reconfiguration of Structural and Functional Connectivity Coupling in Patient Subgroups With Adolescent Depression

Xuemei Li Xinyu Zhou*

The First Affiliated Hospital of Chongqing Medical University

Objective To examine alterations of structural and functional connectivity (SC-FC) coupling in adolescent MDD by integrating both diffusion magnetic resonance imaging (MRI) and resting-state functional MRI data

Methods Patients with first-episode MDD were recruited from the outpatient psychiatry clinics at The First Affiliated Hospital of Chongqing Medical University. Healthy controls were recruited by local media advertisement from the general population in Chongqing, China. The sample was divided into 5 subgroup pairs according to different environmental stressors and clinical characteristics. The SC-FC coupling was calculated for each brain region of each participant using whole-brain SC and FC. Primary analyses included the group differences in SC-FC coupling and clinical symptom associations between SC-FC coupling and participants with adolescent MDD and healthy controls. Secondary analyses included differences among 5 types of MDD subgroups: with or without suicide attempt, with or without nonsuicidal self-injury behavior, with or without major life events, with or without childhood trauma, and with or without school bullying.

Results Final analyses examined SC-FC coupling of 168 participants with adolescent MDD (mean [mean absolute deviation (MAD)] age, 16.0 [1.7] years; 124 females [73.8%]) and 101 healthy controls (mean [MAD] age, 15.1 [2.4] years; 61 females [60.4%]). Adolescent MDD showed increased SC-FC coupling in the visual network, default mode network, and insula (Cohen d ranged from 0.365 to 0.581; false discovery rate [FDR]-corrected $P < .05$). Some subgroup-specific alterations were identified via subgroup analyses, particularly involving parahippocampal coupling decrease in participants with suicide attempt (partial $\eta^2 = 0.069$; 90% CI, 0.025-0.121; FDR-corrected $P = .007$) and frontal-limbic coupling increase in participants with major life events (partial η^2 ranged from 0.046 to 0.068; FDR-corrected $P < .05$).

Conclusion Results of this cross-sectional study

suggest increased SC-FC coupling in adolescent MDD, especially involving hub regions of the default mode network, visual network, and insula. The findings enrich knowledge of the aberrant brain SC-FC coupling in the psychopathology of adolescent MDD, underscoring the vulnerability of frontal-limbic SC-FC coupling to external stressors and the parahippocampal coupling in shaping future-minded behavior.

上海市心理热线职场人群来电者的特征分析

杨腾斐*

上海市精神卫生中心

目的 心理热线来电者报告或涉及的问题多种多样, 而来电者因各种问题造成的负性情绪感受是心理热线关注和干预的主要问题。在职场中, 常有心理适应问题产生, 在职场人士生存与发展的关键时刻, 常有以下几种心理适应问题: 生存的心理适应问题、发展的心理适应问题、人际关系的心理适应问题、学习的心理适应问题、应对挫折的心理适应问题等。上海市心理热线为了更有针对性地了解热线职场人群来电者的心理问题特征, 需要研究探讨热线来电者的心理问题特征及其相关因素。

方法 基于此, 本研究选取 2021 年 9 月 1 日-2023 年 9 月 30 日上海市心理热线接听的 5725 名工作类型为在职在岗的来电者 (男 1271 人, 女 2726 人, 平均年龄为 31.09 ± 6.886 岁) 为研究对象, 采用独立样本 t 检验、卡方检验、Logistic 回归分析进行横断研究, 对上海市心理热线职场人群来电者的特征进一步进行探究, 也为构建职场人群危机来电预警模型的构建提供依据。

结果 (1) 高危来电以未婚女性、本科学历、企业职员为主, 一半以上的来电者求助的问题类型是人际关系问题; (2) 17-24 时来电数量较多, 秋季 8-10 月的来电占比较高; (3) 性别在来电问题分类上, 女性在人际关系问题、性骚扰问题、职业发展问题、自我发展问题上都显著高于男性; (4) 在控制了工作类型分层因素的影响后, 性别因素对于来电问题类型是一个关键影响因素, 具体表现为在非营利

性组织员工中, 女性有自我发展问题的概率是男性的 18.667 倍, 在公务员中女性有自我发展问题的概率是男性的 4.889 倍, 而在企业管理人员、企业职员、事业单位员工中, 性别对自我发展没有影响;

(5) 职场人群中, 年龄较大的职工的人际关系问题显著多于年轻职工, 年轻职工的性骚扰问题、职业发展问题、自我发展问题更多; (6) 性别男、婚姻状态为已婚和离婚是职场来电者人际关系问题的保护因素, 性别男、35 岁之前与 41-45 岁、教育程度为研究生是职场来电者职业发展问题的危险因素, 性别男、26-30 岁、教育程度为研究生是职场来电者自我发展问题的危险因素。

结论 应重点关注职场年轻女性的心理健康, 尤其是人际关系方面的问题, 也需要关注不同性别、年龄、教育程度和工作类型职场人群在心理适应问题上的差异, 以制定更有针对性的干预措施。综上所述, 本研究揭示了不同性别、年龄、教育程度和工作类型职场人群在心理适应问题上的差异, 为制定更加有效的干预措施提供了重要依据。未来, 我们将继续深化研究, 进一步探索职场人群心理适应问题的成因和干预策略, 为提升职场人群的心理健康水平做出更大的贡献。

Social Support Systems of Home, School, hospital and Society Involved in Suicide Prevention and Intervention Among Adolescents: A Delphi Study in Shanghai

Hong Zheng^{1,3}, Junsheng Liu^{2,3}

1. Shanghai Changning Mental Health Center

2. School of Psychology and Cognitive Science, East China Normal University

3. Shanghai Key Laboratory of Mental Health and Psychological Crisis Intervention, School of Psychology and Cognitive Science,

Background The adolescent suicide rate has been increasing and is now the third leading cause of mortality in this age group globally. In China, suicide is the leading cause of death among individuals aged 15–

34 years old. The data from the Death Surveillance System indicated that suicide rates in Shanghai declined between 2002 and 2008. However, there has been an increasing trend from 2009 to 2020, mainly due to notable increase in adolescent's suicides. This finding suggests a potential change in risk factors that requires further investigation in order to gain a comprehensive understanding of the evolving societal landscape. Meanwhile, schools, psychiatric hospitals, and social organizations operate independently, making it difficult to address crises among adolescents in a timely and collaborative manner in China. How to improve the social support systems involved in suicide prevention and intervention has been rarely studied

Objective we aimed to employ the Delphi methodology to establish a set of indicator system, enhance the cooperation of the social system of home, school, hospital and society and provide guidance regarding the appropriate action and for the development of social support resources, with the goal of collectively reducing suicide risks among adolescents in the city.

Methods We commenced the study to establish a research team, searched the keywords using Web of Science and ultimately designed a pre-evaluation index. Next, following Donabedian's Structure-Process-Outcome model, the research developed a questionnaire comprising 3 level-1, 12 level-2, and 73 level-3 indicators. Then, we utilized the Delphi methodology, which involved a group of experts in the fields of adolescent mental health, crisis intervention, and public policy research. Ten experts were enlisted and they independently rated various factors or measures and we collated and analyzed these ratings to arrive at into a consensus list of indexes. The experts drew upon their knowledge and experience to determine which indexes were likely to have a greater impact and be actionable. The responses from the experts were subsequently analyzed in each round of results, and feedback was provided. Based on this feedback, the experts decided which ratings to retain, modify, or delete until a consistent and reliable consensus was reached.

Results The response rate of the three rounds of expert consultation was 100 % (10/10). The Cr value

was 0.87 (>0.8) (familiarity = 0.820, judgment coefficient = 0.920), indicating that the expert opinions had high authority. Finally, all W coefficients in the third round were smaller than 0.2, which may be due to the large number of indexes included. However, no significant difference was reported, indicating high consistency regarding experts' opinions. Therefore, the stability criteria were met, and the Delphi process was terminated. Ten experts conducted three rounds of e-mail inquiries in order to finalize the indicator system, resulting in 2 level-1, 11 level-2, and 52 level-3 indicators, as well as expert consensus. Our findings indicate that the social support systems should include parents, schools, psychiatric hospitals, social organizations, and government departments, with the government sector being the most important ($M = 9.4$). Furthermore, our study revealed that school counselors and psychologists play similar roles to psychiatrists within the interdisciplinary team ($M \pm S = 9.2 \pm 1.1$)

Conclusion The aim was to develop cooperative guidelines and address issues such as who should be involved, how to proceed, and how to foster cooperation in the social support system for aiding suicidal adolescents in Chinese cities. This study represents the first Delphi consensus study conducted in China to guide the social support system in preventing suicides among urban adolescents. It offers effective strategies and provides quantified and enforceable criteria as well as advice on the structure and manpower required for the multidisciplinary team, equipment, and platforms. As per the expert consensus, social support systems of home, school, hospital and society should strengthen government-led and interdisciplinary collaboration, prioritize suicide prevention in schools and encourage greater involvement from social organizations.

关键词: Adolescent; Delphi method; Expert consensus; Suicide prevention; Social support systems; Adolescent

抑郁症数字化饮食行为：一项基于真实世界行为监测研究

朱玥 王菲*
南京医科大学

目的 饮食行为模式与抑郁关联已成为研究的重要关注点。然而，先前的研究主要依赖于自我报告形式，存在回忆偏倚等问题。基于电子设备的行为监测技术可在真实世界实时、客观地收集大量的时间序列数据。本研究旨在采用客观监测技术描述抑郁症患者的数字化饮食行为特征，并探索其在抑郁症检测中的潜在应用价值。

方法 本研究共招募了 3310 名学生，包括 2222 名健康对照组 (HCs)，916 名轻度抑郁症患者和 172 名中重度抑郁症患者。通过食堂电子记录被试一个月的饮食行为，并在月中评估其抑郁症状的严重程度。依据被试一个月内的饮食行为的时间序列数据，分别计算如下饮食行为特征：用餐时间、用餐地点、每餐消费额度、饮食频率和每餐食物多样性，每日用餐模式（传统三餐、早-午餐、午-晚餐、早-晚餐模式）。使用协方差分析，以年龄、性别、BMI 和教育水平作为协变量，比较 HCs 组、轻度抑郁症组和中重度抑郁症组三组间饮食行为特征。利用多元逻辑回归分析探讨数字化饮食行为特征与抑郁症严重程度之间的关联。采用支持向量机评估差异性饮食行为特征在检测轻度和中重度抑郁症方面的准确性和精确性。

结果 研究发现，与 HCs 组相比，中重度抑郁症组具有更不规律的进食模式、更大的波动进食时间、晚餐消费更多、食物多样性更少，早餐频率较低，并偏好仅进食午餐和晚餐。中重度抑郁症与日常三餐模式（早餐-午餐-晚餐模式）呈负相关 (OR [95% CI], 0.467 [0.239-0.912])，轻度抑郁症与每日午餐和晚餐模式呈正相关 (1.460 [1.016-2.100])。上述显著差异的数字化饮食行为特征能够检测轻中重度抑郁症（准确度为 0.53，精确度为 0.60），并在中重度抑郁症的检测中表现出更高的准确度（准确度为 0.67，精确度为 0.64）。

结论 本研究首次通过真实世界的行为监测技术揭示了抑郁症患者数字化饮食行为的变化特征，并且这些特征可成为监测抑郁症的潜在有效方法。

节律基因 Per2 介导小胶质细胞反应性增强参

与慢性应激所致小鼠抑郁样行为的发生机制

李素霞* 谭璇 冯雪竹 赵誉煜 吴博为 李鑫 杨东
錡 朱维莉
北京大学

目的 研究节律基因 *per2* 调节小胶质细胞对慢性社交挫败应激 (CSDS) 的反应性在小鼠抑郁样行为发生中的作用。

方法 采用 CSDS 小鼠模型, 通过行为测试评估抑郁样行为, 利用免疫荧光和 Western Blot 检测内侧前额叶皮质 (mPFC) 中小胶质细胞的应激反应性及 *Per2* 基因的表达水平。使用 *Per2* 基因敲除 (*Per2* KO) 小鼠, 评估 *Per2* 基因缺失对小胶质细胞应激反应性、神经炎症和突触修剪的影响。

结果 CSDS 小鼠在 ZT 13~15 表现出显著的抑郁样行为, 而在 ZT 1~3 则与对照组的差异, 没有统计学意义。小鼠 mPFC 中的小胶质细胞反应性和 *Per2* 基因表达均具有昼夜节律性 (峰值 ZT2, 谷值 ZT14), 并且在应激后小鼠 mPFC 中小胶质细胞反应性和 *per2* 表达水平均显著增加。而 *Per2* KO 小鼠经历 CSDS 后不表现出抑郁样行为, mPFC 中小胶质细胞反应性与对照组无差异。进一步检查小胶质细胞反应性增强的下游事件, 发现应激后神经炎症标志物 IL-1 β 、IL-6、TNF- α 水平升高, 抗炎因子 IL-10 水平降低; 在 *Per2* KO 小鼠中, 这些变化均被逆转。CSDS 后, mPFC 中的树突棘密度显著降低, 而在 *Per2* KO 小鼠中, CSDS 所致的树突棘密度降低被挽救。

结论 *Per2* 通过调控小胶质细胞的应激反应性和神经炎症, 介导了 CSDS 诱导的抑郁样行为。本研究揭示了节律基因 *Per2* 对神经炎症的调控在抑郁症发病机制中的关键作用。

Therapeutic Effects of Modified Electroconvulsive Therapy and Repetitive Transcranial Magnetic Stimulation on Adolescent Depression Disorder

Gang Chen* Fuchi Zhang Jun Li Taipeng Sun Suosuo

Sun Wenjie Shi Yaru Sun
Huaian No.3 People's Hospital

Background In the past decade, the incidence of adolescent depression disorder has been increasing steadily. Although a few antidepressant drugs have been approved for the treatment of adolescent depression, the therapeutic outcomes are not satisfactory, necessitating the search for more effective and rapid treatment modalities

Objective Sertraline is a highly selective 5-HT reuptake inhibitor widely used in the treatment of depression in children and adolescents. Modified electroconvulsive therapy (MECT) or repetitive transcranial magnetic stimulation (rTMS) are also frequently employed in the treatment of adolescent depression. This study aims to compare the therapeutic differences between sertraline monotherapy and the combination of sertraline with MECT or rTMS in adolescent patients, aiming to provide a more reasonable treatment strategy for adolescent depression

Methods A total of 150 adolescent participants aged 14-18 years were randomly divided into three groups: sertraline monotherapy group (n=55), sertraline + MECT treatment group (n=40), and sertraline + rTMS treatment group (n=55). The treatment dose of sertraline was 50-150mg/day; MECT treatment required a total of ≥ 4 sessions; rTMS targeted the left dorsolateral prefrontal cortex with a frequency of 10Hz and a total of ≥ 10 sessions. The Hamilton Depression Rating Scale (HAMD-24), Hamilton Anxiety Rating Scale (HAMA), and World Health Organization Quality of Life Questionnaire (WHOQOL-BREF) scores were assessed for all three groups at weeks 0, 2, and 4. The primary outcome was the HAMD-24 reduction rate at week 4, with a reduction rate of $>50\%$ or higher defined as remission. HAMA and WHOQOL-BREF were secondary outcome indicators

Results The completion rate was 92% for sertraline, 83.8% for sertraline + MECT, and 82.2% for sertraline + rTMS. One patient in the sertraline + MECT group terminated the study due to adverse events. Based

on the HAM-D-24 remission rate, sertraline monotherapy achieved 43.4%, while the combination of sertraline + MECT and sertraline + rTMS achieved 56.6% and 54.7%, respectively. The therapeutic effect of sertraline monotherapy was lower than that of the combination groups ($p < 0.05$), while there was no significant difference between the sertraline + MECT and sertraline + rTMS groups ($p > 0.05$). No significant difference in HAMA remission rate was observed among the three groups. At week 4, the WHOQOL-BREF score in the sertraline + MECT group was significantly lower than that in the sertraline and sertraline + rTMS groups ($p < 0.05$).

Conclusion Compared with sertraline monotherapy, the combination of MECT or rTMS with sertraline shows better therapeutic effects in adolescent depression patients. Specifically, the combination of sertraline + rTMS achieves better therapeutic outcomes while significantly improving quality of life, potentially representing a superior treatment option for adolescent depression.

Subtyping of Emotional and Behavioral in Chinese Caregivers-Youths: A Latent Profile Analysis and Association with Family Environment

Yang Wang Keyin Zhou Hantong Shen Dingliang Yan Ping Zuo Ying Zhang Xinyu Shang Rongxin Zhu Fei Wang*

Early Intervention Unit, Department of Psychiatry, The Affiliated Brain Hospital of Nanjing Medical University, Nanjing, Jiangsu, China.

Objective In China, youth mental health problems are increasingly prevalent and are influenced by family and social factors. This study integrates the perspectives of youths and caregivers to explore different

types of emotional and behavioral problems among Chinese youth and the protective and risk factors of their family environments.

Methods A total of 8839 pairs of youths and caregivers from the School-based Evaluation Advancing Response for Child Health (SEARCH) study were included. Latent profile analysis (LPA) was used to categorize youths' and caregivers' Strengths and Difficulties Questionnaire (SDQ) dimension scores. The chi-square test was used to compare different latent classes of demographic characteristics and multiple health risk behaviors. Multinomial logistic regression examined associations between identified classes and demographic characteristics, multiple mental health risk behaviors, and family environment factors.

Results The LPA identifies three distinct patterns of emotional and behavioral problems: caregiver moderate-estimation youth healthy, caregiver over-estimation youth problem, and caregiver under-estimation youth problem class. The caregiver's moderate-estimation youth healthy class has the lowest prevalence of health risk behaviors and symptoms. The multinomial logistic regression results showed that compared with the caregiver moderate-estimation youth healthy class, the factors influencing emotional and behavioral problems in the caregiver over-estimation youth problem and caregiver under-estimation youth problem class were sex, educational level, drinking history, depression, anxiety, stress, self-harm, suicidal behaviors, and family environment. Specifically, the family environment in the caregiver over-estimation youth problem class has a lower intensity, cultural, and organizational, with higher levels of control and conflict. Youths in the caregiver under-estimation youth problem class had family environments that were less intimate, recreational, cultural, organizational, and more conflicted.

Conclusion This study identifies specific youth populations and their protective and risk factors associated with the demographic characteristics, multiple mental health risk behaviors, and family environment factors. It highlights the important role of caregivers in shaping the emotional and behavioral problems of Chinese youth. Develop targeted family prevention and in-

intervention strategies for adolescents of different subtypes, primarily focusing on increasing recreational and reducing control, to improve the mental health of this youth population.

社交隔离与精神分裂症发病风险：一项队列研究与孟德尔随机化

吴绮琪 聂雨 张继辉 梁燕*
广州医科大学附属脑科医院

目的 社交隔离指缺乏客观上的社会接触，是健康风险因素之一。有研究表明，社交隔离与躯体疾病和精神疾病相关，是全因死亡、心衰、高血压和癌症发病的风险因素。然而，目前社交隔离与精神分裂症的关系仍不清楚。因此，本研究旨在通过队列研究和孟德尔随机化分析法，探讨社交隔离与精神分裂症的关联。

方法 英国生物样本数据库(UK Biobank, UKB)是一项基于人群的大型队列研究。本研究通过 UKB 问卷调查中的三个条目计算出社交隔离的分数，并根据分数将参与者分为社交隔离组和非社交隔离组。本研究通过 UKB 中的住院记录和死亡登记来确定精神分裂症的病例。运用倾向性评分方法减少混杂因素对研究结果的影响后，我们使用 Cox 回归估计了社交隔离与精神分裂症的风险比。此外，我们通过 UKB 和精神疾病基因组协会，分别提取了社交隔离和精神分裂症的基因遗传数据，运用双样本孟德尔随机化分析法，估计了社交隔离与精神分裂症的因果关联。

结果 UKB 队列研究记录了 315 例精神分裂症病例，平均随访时间为 12.3 年。在调整人口、社会经济和生活方式因素后，社交隔离组发生精神分裂症的风险是非社交隔离组的 1.73 倍 (95% CI, 1.37-2.18)。双样本孟德尔随机化分析结果显示，参与更多的其他小组活动与精神分裂症风险降低相关 (OR, 0.49; 95% CI, 0.31-0.77)。

结论 社交隔离与精神分裂症风险升高相关，双样本孟德尔随机化分析结果表明二者之间存在潜在的因果关系。本研究结果强调了通过减少社交隔

离、增加社交活动的举措来降低精神分裂症发生风险的重要性。

烟酸皮肤反应测试在学生人群心理健康中的筛查应用初探

王梓良* 胡强
镇江市精神卫生中心

目的 青少年期是个体心理发展的关键阶段，抑郁、焦虑、非自杀性自伤和睡眠等心理健康问题常见并且对其身心发展具有重大影响。针对这些问题的筛查和早期干预对于促进青少年的健康成长至关重要。本研究旨在探讨烟酸皮肤潮红试验 (Niacin Skin Flush Test, NSFT) 作为一种非侵入性测试方法在筛查学生群体心理健康问题中的应用，并研究父母教养方式和个人特质对青少年心理健康的影响。

方法 本研究在镇江和衢州的普通高中、职业高中及大专院校中进行了问卷调查和烟酸皮肤反应测试，收集了 8073 份问卷及测试数据 (有效数据 7192 份，回收率 89.08%)。问卷内容包括抑郁、焦虑、睡眠质量和非自杀性自伤等心理问题，以及父母教养方式问卷。此外，进一步收集了冲动性、心理韧性、压力知觉等个人特质问卷数据。

结果 在青少年群体中，烟酸异常检出率为 26.8%。异常组的焦虑和睡眠问题、父母教养方式中的情感温暖缺失及冲动性分数上显著高于正常组 ($p < 0.001$)，此外，异常组在心理韧性分数上显著低于正常组 ($p < 0.001$)。通过中介分析发现，烟酸皮肤反应在父母情感温暖、个人心理特质和青少年心理健康问题之间起到了重要的中介作用。情感温暖通过烟酸皮肤反应值对焦虑有显著影响 (母亲 \rightarrow NSFT \rightarrow 焦虑: 估计值 = -0.011, SE = 0.003, $z = -3.517$, $p < 0.001$; 父亲 \rightarrow NSFT \rightarrow 焦虑: 估计值 = -0.014, SE = 0.004, $z = -3.750$, $p < 0.001$)。烟酸皮肤反应值通过心理韧性对睡眠质量和焦虑有显著影响 (NSFT \rightarrow 心理韧性 \rightarrow 睡眠质量: 估计值 = -0.012, SE = 0.003, $z = -3.800$, $p < 0.001$; NSFT \rightarrow 心理韧性 \rightarrow 焦虑: 估计值 = -0.012, SE = 0.003, $z = -3.816$, $p < 0.001$)。

结论 研究表明,烟酸皮肤反应测试作为一种简单、非侵入性的方法,可以有效筛查学生群体中的心理健康问题。父母情感温暖缺失导致焦虑和睡眠从而影响烟酸异常,烟酸通过心理韧性对焦虑和睡眠的保护作用。本研究为青少年心理健康问题的筛查与干预提供了新的视角和方法,建议在学校和家庭中加强对青少年的心理健康教育和父母教养方式的指导。

氨苯砜对阿尔茨海默症模型小鼠认知缺陷的改善作用及分子机制

冯书斐 袁凯 刘晓星 师乐 陆林*
北京大学第六医院

目的 随着人口老龄化加剧,以记忆障碍为主要表现的阿尔茨海默病(Alzheimer's disease, AD)的患病率逐年增高,已成为重大的公共卫生问题。然而,当前对AD的发病机制仍然缺乏明确认识,且缺乏有效的干预药物。小胶质细胞是大脑中主要的免疫细胞,由活化小胶质细胞介导的神经炎症被认为在AD的发病机理中起着主要作用。小分子药物氨苯砜(dapsone, DDS)是一种砜类抑菌剂,前期研究证实其具有抗炎和抗氧化等多种功效。临床研究提示,DDS可能有助于减缓AD的发生发展,但其作用机制尚不明确。本研究拟在动物模型中寻找DDS干预AD的潜在作用靶点,以期为预防和延缓AD的发生发展提供新途径。

方法 本研究结合体内外实验,在前期研究的基础上,对DDS的作用机制进行研究,重点关注小胶质细胞的功能变化。首先,对AD转基因动物连续给予6周DDS治疗,并进行水迷宫、新物体识别、旷场实验等行为学测试。使用单细胞测序技术对关键脑区细胞状态进行鉴定,采用MERFISH技术在空间分辨率的单细胞水平解析小胶质细胞的基因表达情况,通过多组学技术对小胶质细胞代谢水平和病理表型进行鉴定,确定关键调控基因。此外,在细胞水平通过Seahorse测定原代小胶质细胞的氧气消耗和糖酵解活性,通过脂多糖诱导神经炎症表型,进一步模拟并验证在体实验结果。

结果 行为学实验表明持续6周DDS治疗有助于改善AD小鼠的认知表型。免疫荧光染色和小胶质细胞形态学分析证明DDS治疗后AD小鼠大脑中A β 的表达降低,并与小胶质细胞对A β 的吞噬作用有关。单细胞测序结果表明DDS治疗后AD小鼠海马脑区的小胶质细胞得到改善,通路富集分析发现DDS治疗主要影响吞噬和代谢相关通路, MERFISH和Western blot技术进一步确定了参与DDS调控的关键基因。细胞实验显示,DDS能够提高小胶质细胞线粒体代谢和吞噬作用,表现为对脂多糖诱导的小胶质细胞异常活化和炎症因子的释放有改善作用,此外,转录组测序技术也明确了DDS对小胶质细胞的影响主要与炎症和吞噬相关基因的通路有关。

结论 DDS可通过诱导小胶质细胞代谢重编程,提高小胶质细胞的吞噬功能,达到改善AD小鼠的认知缺陷的效果。且长期使用DDS不会恶化AD小鼠的抑郁焦虑行为,提示DDS具有防治AD的潜在价值。

慢性失眠患者正向情绪、疲倦、和疼痛之间动态关联

张继辉¹ 雷彬斌² 周名清^{1,2}

1.广州医科大学附属脑科医院
2.广东省人民医院

目的 本研究旨在通过瞬时生态评估方法,探讨在慢性失眠患者正向情绪、疲倦程度以及疼痛程度之间的相互动态关系。

方法 本研究为基于真实世界的观察性队列研究。研究对象为301名慢性失眠患者,平均年龄35.1岁(标准差为11.5),其中66.8%为女性。所有被试均通过临床访谈确定具有现患慢性失眠障碍。使用瞬时生态评估,每天4次(估计测量时间点分别在8时、13时、18时和23时),连续7天动态测量参与者的正向情绪、疲倦程度和疼痛程度。通过广义估计方程模型对滞后关联进行了有条件的估计,校正年龄、性别、独居状态、失眠严重程度指数(ISI)等协变量。

结果 分析结果表明,前一次评估的正向情绪滞后效应显著影响当前的疼痛($\beta = -0.022, P=0.020$)和疲倦($\beta = -0.063, P=0.013$),即正向情绪的增加会导致随后疼痛和疲倦程度的下降。同时,前一次评估的疼痛滞后效应显著影响当前的正向情绪(估计值为 $-0.056, P<0.001$),即疼痛的增加会导致随后正向情绪的下降。此外,失眠严重程度(ISI)显著影响了这些状态之间的动态关系。ISI每增加一个单位,当前的正向情绪会显著减少($\beta = -0.010, P<0.001$),而疼痛程度会显著增加($\beta = 0.006, P=0.013$)。

结论 分析结果表明,前一次评估的正向情绪滞后效应显著影响当前的疼痛($\beta = -0.022, P=0.020$)和疲倦($\beta = -0.063, P=0.013$),即正向情绪的增加会导致随后疼痛和疲倦程度的下降。同时,前一次评估的疼痛滞后效应显著影响当前的正向情绪(估计值为 $-0.056, P<0.001$),即疼痛的增加会导致随后正向情绪的下降。此外,失眠严重程度(ISI)显著影响了这些状态之间的动态关系。ISI每增加一个单位,当前的正向情绪会显著减少($\beta = -0.010, P<0.001$),而疼痛程度会显著增加($\beta = 0.006, P=0.013$)。

Burden of Mental and Substance Use Disorders in China and Its Provinces, 1990-2021: A Systematic Analysis for The Global Burden of Disease Study 2021

Yankun Sun¹, Ziwei Zhang^{2,3}, Shuilin Wu^{2,3}, Xiaokun Wang^{2,3}, Chang Liu^{2,3}, Xin Chen^{2,3}, Na Zeng^{2,3}, Jie Shi², Jinlei Qi⁴, Yanping Bao^{2,3}, Maigeng Zhou⁴, Lin Lu¹

1.Peking University Sixth Hospital

2.National Institute on Drug Dependence, Peking University

3.School of Public Health, Peking University

4.National Center for Chronic and Non-communicable Disease Control and Prevention, Chinese Center for Disease Control and Prevention

Objective Mental and substance use disorders

have a significant impact on global population health, especially following the large-scale mortality spikes during the COVID-19 pandemic. We aim to investigate the prevalence and burden of mental and substance use disorders in China from 1990 to 2021, using summary-level data from the Global Burden of Diseases, Injuries, and Risk Factors Study (GBD) 2021, province-level data in China from the Chinese Center for Disease Control and Prevention system

Methods We used the methods in GBD 2021 to analyze the disease patterns of mental and substance use disorders in China from 1990 to 2021. The current GBD study included 10 mental disorders and 2 substance use disorders, using national and 33 province-level administrative units prevalence data in China, as well as disability adjusted life years (DALYs) and years lived with disability (YLDs). These results were then compared with expected burden estimates based on the Socio-demographic index (SDI)

Results In 2021, China accounted for 14.9% of the global burden of mental disorders, with 23.2 million DALYs (95% uncertainty interval [UI] 17.7 to 29.4 million) attributed to mental disorders, which represents a 35.7% increase from 1990 to 2021. The numbers of DALYs due to substance use disorders in China was 4.3 million (3.3 to 5.4 million). For individual disorders, the age-standardized prevalence rates were highest for anxiety disorders (3481.7 per 100,000), followed by depressive disorders (2875.7 per 100,000 [2590.0 to 3203.4]). The burden of mental disorders were generally consistent across provinces in China, ranging from 1243.4 (943.6-1575.8) in Qinghai to 1735.7 (1282.5-2283.0) per 100,000 people in Hunan. However, regional heterogeneity was observed for substance use disorders, with lower prevalence in the eastern region and Yunnan had the highest prevalence. A significant gender variation was also observed, with a higher burden of mental disorders in females, while substance use disorders were more prevalent in males across China. Across age groups, ADHD was the most prevalent in the 5-14 age group and anxiety and depressive disorders were most prevalent among individuals aged 15 and over

Conclusion There is opportunity for improvement in the management of depressive disorders and

anxiety disorders especially in the prominent area of China. Effective prevention, treatment, and care strategies for mental and substance use disorders should continue to be prioritized in Chinese healthcare system.

基层特色科室孵化模式参与 ASD 早期诊疗的有效性

徐亮 柯晓燕*
南京脑科医院

目的 探索适合参与 ASD 早期诊疗的基层特色科室孵化模式, 最大限度地从 0-6 岁儿童中筛查出 ASD 或疑似 ASD, 以便早期干预, 减少 ASD 患儿核心症状, 增加社会功能, 减轻家庭、社会负担。

方法 选取 2022 年 6 月 1 日至 2024 年 5 月 31 日南京脑科医院儿童心理卫生研究中心“南京市儿童早期发展与心理卫生”基层特色科室 4 个孵化基地每月 ASD 的预警征初筛人数、初筛阳性人数、CHAT-23 复筛人数及转诊人数, 计算出初筛率、复筛率和转诊率。使用 t 检验方法比较孵化模式参与前后之间的差异。

结果 2022 年 6 月至 2023 年 5 月莲花 ASD 初筛阳性率 5.71%(111/1943), ASD 复筛率 0%(0/111), 赛虹桥 ASD 初筛阳性率 0.16%(5/3101), ASD 复筛率 60%(3/5), 沿江 ASD 初筛阳性率 1.05%(266/25296), ASD 复筛率 48.87%(130/266), 板桥 ASD 初筛阳性率 0%(0/3417), ASD 复筛率 0%(0/0); 2023 年 6 月至 2024 年 5 月莲花 ASD 初筛阳性率 9.84%(194/1971), ASD 复筛率 44.85%(87/194), 赛虹桥 ASD 初筛阳性率 0.48%(15/3107), ASD 复筛率 66.70%(10/15), 沿江 ASD 初筛阳性率 0.81%(180/22340), ASD 复筛率 93.89%(169/180), 板桥 ASD 初筛阳性率 0.22%(7/3181), ASD 复筛率 28.57%(2/7); 实施孵化模式后转诊率分别是莲花 33.33%(29/87), 赛虹桥 70%(7/10), 沿江 66.27%(112/169), 板桥 50%(1/2)。基层特色科室孵化模式参与前后 ASD 复筛率差异有统计学意义 ($t = -4.432, p < 0.001$)、转诊率差异有统计学意义 ($t = 3.378, p = 0.003$)。

结论 基层特色科室孵化模式参与 ASD 早期诊疗增加社区医院的 ASD 的初筛率和复筛率, 为 ASD 的诊疗服务创造更便捷的途径, 减少漏筛, 这种模式可以最大限度地保证患儿及家庭的利益。

山东省基层精防人员身心健康状况及其影响因素研究

刘甲勋¹ 胡丽丽² 张婧² 孙启华²

1. 山东第二医科大学

2. 山东省精神卫生中心

目的 探索全省基层精防人员身心健康状况及其影响因素, 为促进其身心健康, 提升基层精神卫生服务能力提供科学的参考依据。

方法 基于自编基本情况表及世界卫生组织五项身心健康指标 (WHO-5) 量表, 采用多阶段分层随机抽样法于山东省内 16 个地市内 134 个精防机构抽取 1750 名基层精防人员进行调查, 采用 SPSS 26.0 进行数据描述与分析。采用 Excel 及 IBM SPSS 26.0 进行数据整理和分析, 两组之间身心健康状况比较采用 Wilcoxon 秩和检验, 多组间比较采用 Kruskal-Wallis 秩和检验; 多因素分析采用广义线性回归。检验水准 $\alpha = 0.05$ 。

结果 本次调查共收集有效问卷 1663 例, 有效率 94.92%, 基层精防人员身心健康状况得分为 (16.40±6.57) 分, 487 名得分小于等于 13 分 (29.28%), 可能存在心理健康问题, 需要进行及时关注。5 个条目中其中得分最低的条目为“我感觉宁静和放松” (3.21±1.42) 分, 得分最高的条目为“我感觉快乐, 心情舒畅” (3.37±1.36) 分。非参数检验结果显示不同性别 ($P < 0.05$)、随访管理患者人数 ($P < 0.05$)、兼职情况 ($P < 0.05$)、每日工作时间 ($P < 0.05$)、每年参加县级及以上培训的次数 ($P < 0.05$) 的身心健康状况差异均有统计学意义。多元线性回归分析显示, 基层精防人员是否兼职、每日工作时间、每年参加县级及以上培训的次数是基层精防人员身心健康状况的主要影响因素。

结论 增加对精神卫生领域的财政投入, 提升基层精防人员工作待遇, 减少其工作兼职, 鼓励专

职,减轻工作压力。施行弹性工作制度,灵活安排工作时间与工作内容,减轻职业倦怠,平衡工作与生活。积极开展培训活动,介绍先进工作经验及方法,提高基层精防人员工作效率。建立专门的心理健康支持系统,为其提供心理健康咨询服务。

Psychological Health of Chinese Adolescents in Relation To Gender and School Grade: Exploring Multiple Perspectives (2022, Jiangsu, China)

Keyin Zhou¹, Yang Wang¹, Ran Zhang¹, Jie Yang², Fei Wang¹

1.Early Intervention Unit, Department of Psychiatry, The Affiliated Brain Hospital of Nanjing Medical University, Nanjing, Jiangsu, China.

2.School of Public Health, Nanjing Medical University, Nanjing, Jiangsu, China.

Objective Based on a large, mixed longitudinal cohort study titled 'School-based Evaluation Advancing Response for Child Health (SEARCH)' in China, this research investigates the impact of gender and school grade on mental health symptoms and risky behaviors in Chinese children and adolescents, with a focus on the influence of family and school environments

Methods This cross-sectional study conducted in three cities in Jiangsu targeted primary, junior, and senior high school students, along with their caregivers and teachers. A stratified whole-group sampling method was used to monitor participants, resulting in substantial response rates from 11,427 students, 8,839 caregivers, and 1,656 teachers. The study aimed to explore the development of mental health problems in children and adolescents from multiple perspectives by using various assessment tools such as the Depression, Anxiety and Stress Scale (DASS-21), Insomnia Severity Index (ISI), Ottawa Self-Injury Inventory (OSI), and Strengths and Difficulties Questionnaire (SDQ). Statistical analyses were performed using SPSS version 27.0 software to compare demographic characteristics between genders

and examine the distribution of mental health-related symptoms and health risk behaviors across academic periods while assessing inter-rater agreement for SDQ scores by comparing self-report versus caregiver-report scores

Results The study comprised 11,427 student participants, with 6,083 boys and 5,344 girls. Among the participants. It was found that 23.02% exhibited depression symptoms, 33.70% showed anxiety symptoms, and 16.79% demonstrated signs of stress. Girls exhibited significantly higher rates of depression, anxiety, stress, insomnia, suicidal behavior, self-harm behavior, and suicidal ideation compared to boys in junior and senior of high school. Additionally, scores for depression, anxiety, stress, and insomnia displayed an upward trend from primary school to junior high school and then to senior high school. Boys demonstrated higher proportions of smoking history, drinking, and moderate-to-high-intensity sports participation than girls through their schooling. In terms of emotional-behavioural problems and prosocial behavior, self-reports and reports by caregivers were generally more consistent in girls than in boys. Similarly, for students with depression problems, the consistency between self-reports and reports by teacher was higher in primary schools than in junior high and senior high schools for emotional symptoms, problems related to conduct, hyperactivity, peer problems, and prosocial behavior

Conclusion Caregivers and teachers must improve their awareness and skills in supporting children's mental health. These findings provide valuable insights for early identification and intervention in the mental health of Chinese children and adolescents.

2.School of Public Health, Peking University, Beijing 100191, China.

3.Peking University Sixth Hospital, Peking University Institute of Mental Health, NHC Key Laboratory of Mental Health (Peking University), National Clinical Research Center for Mental Disorders (Peking University Sixth Hospital), Peking University, Beijing 100191, China.

4.Peking-Tsinghua Centre for Life Sciences and PKU-IDG/McGovern Institute for Brain Research, Peking University, Beijing 100191, China.

Objective Prolonged sitting can lead to a variety of adverse health effects, including mental health. However, few studies have comprehensively addressed the risks of sitting time on psychiatric disorders, and the possible mechanisms of "sitting-glucose metabolism-brain" is little known in large longitudinal cohorts

Methods Data for this cohort analysis were obtained from the UK Biobank database. Exposure was sitting time consisted of sitting for watching TV, using computer and driving. The primary outcomes of follow-up were sleep disorders, anxiety disorders, and depressive disorders, defined from codes in the International Classification of Diseases 10th revision (ICD-10) or 9th revision (ICD-9). We explored crude and adjusted associations between sitting time and incidence of psychiatric disorders using Weibull survival models. We used restricted cubic splines (RCS) to further characterize dose-response relationships between sitting time and each follow-up outcomes. The interaction of confounding factors and stratified effects of sedentary behavior on psychiatric disorders were explored. Structural equation models were used to explore the potential mechanisms of how sitting time affects glucose metabolism and brain structure, and thus mental health

Results A total of 455605 subjects were included in the survival analysis, with an average follow-up period of 14.3 years (SD = 1.3), including 302236 females (66.3%). In multivariate models, compared with less

than 3 hours, more than 6 hours of sitting time was associated with increased incidence of psychiatric disorders of concern (adjusted hazard ratio (aHR) for sleep disorders 1.13 [95% CI, 1.04-1.23], $p < 0.01$; aHR for anxiety disorders 1.21 [95%CI 1.15-1.26], $p < 0.001$; aHR for depressive disorder 1.17 [95%CI 1.11-1.22], $p < 0.001$). After adjusting for covariates, sitting time showed a U-shaped nonlinear dose-response relationship with the risk of sleep disorders, anxiety disorders, and depression disorders (all p for nonlinear < 0.01 , all p for total < 0.0001). Risk for psychiatric disorders increased progressively after more than six hours of sitting. In multivariate interaction and stratified analyses, we found an interaction between age and gender and sedentary time on the risk of psychiatric disorders. The risks for all the concerned outcomes were significantly higher in people younger than 65 years of age than in those older than 65 years, significantly higher in women than men. Interaction RCS of age and risk of psychiatric disorders due to sitting time and dose-response relationships under gender heterogeneity showed the similar characteristics. Using structural equation modeling, we found that sitting can affect people's mental health by affecting glucose, glycated haemoglobin level and brain structure volume directly and indirectly (Sitting time-psychiatric symptoms: $\beta = 0.058$, $p < 0.001$; Sitting-glucose metabolism: $\beta = 0.039$, $p < 0.001$; Sitting time-brain structure: $\beta = -0.041$, $p < 0.001$)

Conclusion Prolonged sitting can lead to adverse effects of psychiatric disorders, mediated by the metabolism and brain structure. The study of the mechanism between sitting and mental health is helpful for future screening and targeted drug therapy.

盐酸托鲁地文拉法辛缓释片治疗抑郁症快感缺失的疗效和安全性: 一项单臂、多中心临床研究

宓为峰 郝晓楠 陆林*
北京大学第六医院

目的 评估盐酸托鲁地文拉法辛缓释片治疗抑郁患者快感缺失症状的疗效和安全性。

方法 本研究为单臂、多中心、前瞻性研究设计。共纳入来自北京大学第六医院、上海市精神卫生中心、四川大学华西医院、广州医科大学附属脑科医院、杭州市第七人民医院、西安交通大学第一附属医院和武汉大学人民医院符合 DSM-5 诊断标准且 DARS 评分 ≤ 28.5 分的成人抑郁症患者 121 例，所有患者均给予盐酸托鲁地文拉法辛缓释片单药治疗（80-160mg/d），观察 8 周。分别在基线、用药第 2、4、8 周末采用快感缺失量表（DARS）、斯奈思-汉密尔顿快感量表（SHAPS）来评估快感缺失症状，使用蒙哥马利抑郁评定量表（MADRS）评估抑郁总体症状。

结果 盐酸托鲁地文拉法辛缓释片治疗 2 周后，DARS 评分较基线即明显升高，差值为 7.8 ± 10.5 ($p < 0.0001$)，治疗 8 周后，DARS 评分进一步升高，较基线的差值达到 19.3 ± 13.7 ($p < 0.0001$)；SHAPS 评分在治疗第 2 周和第 8 周后较基线均明显降低，差值分别为 -2.7 ± 4.7 ($p < 0.0001$) 和 -7.8 ± 7.0 ($p < 0.0001$)；MADRS 总分和快感缺失因子分在治疗 8 周末均较基线显著降低，减分值分别为 -22.6 ± 6.9 和 -13.1 ± 4.3 ，差异具有统计学意义 ($p < 0.0001$)。研究期间，与研究药物有关的不良事件发生率为 71.1%，均为轻、中度，未发生与研究药物有关的严重不良事件。

结论 盐酸托鲁地文拉法辛缓释片可快速显著改善抑郁患者的快感缺失症状，安全性良好。

Youth's Anxiety, Maternal Anxiety, and Family Conflict: Longitudinal Cross-lagged Associations and Mediation Effect

Hantong Shen Xinyue Zhang Zhuoer Yin Ping Zuo Rongxin Zhu Fei Wang*

Early Intervention Unit, Department of Psychiatry, The Affiliated Brain Hospital of Nanjing Medical University, Nanjing, China.

Objective Existing research has established the

association between maternal anxiety and adolescent anxiety, with family conflict as a mediator. The current study aims to examine the longitudinal cross-lagged association between maternal anxiety, adolescent anxiety, and family conflict, and the mediating effect between the factors, by gender

Methods Data from 3077 participants and their families at two data collections were retrieved from the ongoing longitudinal SEARCH study. Maternal anxiety was measured by the parent-report Strengths and Difficulties Questionnaire (SDQ), adolescent anxiety was measured by the Depression Anxiety and Stress Scale (DASS-21), and the Family Environment Scale (FES) was used to measure family conflict. The cross-lagged model was used to examine the associations between the factors and then the mediation effect was tested

Results Among boys, the longitudinal cross-lagged model suggested the association between maternal anxiety (T1), family conflict (T2), and adolescent anxiety (T2). However, the associations were not found among girls. In addition, the further mediation model based on the boy sample supported the mediating effect of family conflict on the association between maternal anxiety and adolescent anxiety

Conclusion Family conflict was found to mediate the cross-lagged association between maternal anxiety and children's later anxiety level, but only for boys. Therefore, the current research has supported a possible intervention target for adolescent anxiety, by reducing family conflict, while the exact intervention plan needs further research.

An Immunological Perspective on The Transcriptome of Adolescent Depression and Its Treatment Obstacles

Xueer Liu^{1,2}, Tingting Lei^{1,2}, Yuqian He^{1,2}, Yu Xian^{2,3}, Xinyu Zhou^{1,2}

1. Department of Psychiatry, The First Affiliated Hospital of Chongqing Medical University, Chongqing, China

2.Key Laboratory of Major Brain Disease and Aging Research (Ministry of Education), Chongqing Medical University, Chongqing, China

3.Institute for Brain Science and Disease, Chongqing Medical University, Chongqing, China

Objective Major depressive disorder (MDD) is a significant component of the global disease burden, with severe personal, societal, and economic consequences. However, the ramifications of changes in the immune system that occur during adolescence and adulthood on the pathophysiology of depression have not been adequately investigated

Methods In this study, we utilized RNA sequencing to analyze peripheral blood samples from a large cohort of adolescents with 180 MDD cases and 99 healthy controls (HCs). Integrated of multiple bioinformatics analysis, we also compared to the adult MDD from Gene Expression Omnibus database. Finally, enzyme-linked immunosorbent assay, RT-qPCR, flow cytometry were comprehensively performed to validate

Results Compared to HCs, there was no significant difference observed among MDD cases with respect to gender, age, or body mass index. We determined the following risk factors based on odds ratio (OR) calculations: major life events (OR, 1.09; 95%CI, 0.27-4.04), alcohol use (OR, 1.09; 95%CI, 0.02-62.82), children trauma (OR, 7.14; 95%CI, 2.01-27.11), school bullying (OR, 7.43; 95%CI, 1.82-34.30), and family history of mental illness (OR, 7.76; 95%CI, 1.60-43.45). Simultaneously, a total of 74 up-regulated and 170 down-regulated genes were identified in the MDD cases (adjusted p -value < 0.05 and $|\log_2 \text{FoldChange}| > 1$). KEGG analysis revealed a total of 46 significantly enriched pathways at level 3 (p -value < 0.05), with the highest proportion belonging to the immune system (8/46, 17.39%) at level 2. Subsequently, a STRING network was constructed for 31 DEGs enriched in discriminative KEGG pathways, and a majority of DEGs were also identified belonging to the immune system (17/31, 54.84%). By comparing to transcriptomic data from three adult studies, we focused on four down-regulated immune system pathways with an upward trend in adult MDD, including toll-like receptor signaling pathway,

natural killer cell-mediated cytotoxicity, IL-17 signaling pathway, and C-type lectin receptor signaling pathway. In addition, NFKBIA showed an opposite expression trend with adult MDD compared to adolescent MDD

To further explore the effect of drug therapy on transcription variations of adolescent MDD, we identified a total of 190 DEGs shared between drug-naive MDD (DN-MDD) versus HCs and drug-treated MDD (DT-MDD) versus HCs, which may be unaffected by drugs. We then collected peripheral blood from a small set of longitudinal samples to validate above findings. After 8 weeks of antidepressant treatment, adolescent patients were divided into drug-response and drug-non-response groups based on CDRS scores. The results of the qRT-PCR experiment supported that eight immune system-related DEGs (NFKBIA, JUN, JUND, EGR3, PLK3, CCR2, CCR4, and CCR6) was no significant difference in the drug-response group. Subsequently, we used EPIC analysis to predict the immune cell proportions, and found that adolescent MDD patients had significantly higher percentages of CD4+ T cells ($P < 0.001$) and neutrophils ($P < 0.001$) than HCs but significantly lower percentages of NK cells ($P < 0.001$), which was no significant difference between DT and DN group. Finally, we conducted flow cytometry analysis on patients' peripheral whole blood to corroborate the above results. Our findings suggested neutrophils might be a common distinguishing cell type in patients with MDD, increasing in both adolescent and adult patients. Conversely, a decrease in NK cells were only observed in adolescent MDD, indicating that they might be specific differential cell phenotype associated with adolescent MDD.

Since the regulatory effect of antidepressants on the immune system of adolescent MDD remained unclear, we endeavored to investigate potential new antidepressants based on DEGs. Tubulin inhibitors represented the largest group among the potential drugs (8/30, 26.67%), including vinorelbine, flubendazole, nocodazole, ABT-751, NPI-2358, vincristine, podophylotoxin, and mebendazole. These findings provided insights into potential medications for treating adolescent MDD.

Conclusion Our study uncover a previously unappreciated field of immune-related genes, pathways

and cell phenotypes in adolescent MDD, indicating the impact of age on peripheral blood transcript levels in patients with depression. Additionally, our results also suggest that the poor response of adolescent patients to traditional antidepressant treatments may be linked to unique immunological changes, and also highlight immunological changes as potential targets for new therapeutic interventions.

Retrieval-extinction Procedure Disrupts Trauma Memory Reconsolidation in Humans

Sizhen Su¹, Jiahui Deng¹, Le Shi¹, Yanping Bao², Lin Lu^{1,2}

1.Peking University Sixth Hospital, Peking University Institute of Mental Health, NHC Key Laboratory of Mental Health (Peking University), National Clinical Research Center for Mental Disorders (Peking University Sixth Hospital), Beijing, 100191, China.

2.National Institute on Drug Dependence and Beijing Key Laboratory of Drug Dependence, Peking University, Beijing, 100191, China.

Objective The high presence of a risk situation in terms of traumatic symptomatology evidenced the dramatic impact of trauma events on mental health. Memory retrieval can result in the destabilization of trauma memory, the retrieval-extinction procedure is ideally placed to enable memories to be updated with new information. This study aims to investigate the effects of retrieval-extinction procedure for the treatment of trauma memory

Methods Sixty-four participants with mental symptoms and trauma memory were randomly assigned to retrieval-extinction group and extinction group. When randomized to retrieval-extinction group, participants received the 3-min exposure to trauma cues for memory retrieval 10-minute before the 11-min exposure to trauma cues (memory extinction). Patients who were

randomized to extinction group, received the 3-min exposure to neutral cues 10-minute before the 11-min exposure to trauma cues (memory extinction). The primary outcomes included the reaction of the trauma cues, including trauma cue-induced fear, valence, arousal, and tolerance scores, at post intervention and the 4 weeks follow-up assessments. The secondary outcomes were changes in mental symptoms including anxiety, depression, insomnia, acute stress/PTSD symptoms

Results Compared with extinction, retrieval-extinction decreased the fear and arousal responses for trauma cues, and increased the tolerance response for trauma cues at post intervention and the 4 weeks follow-up. In addition, the mental symptoms, including anxiety, depression, insomnia, acute stress/PTSD symptoms, were significantly reduced in retrieval-extinction group than extinction group

Conclusion These findings demonstrate that retrieval-extinction procedure prevents the fear of trauma cues and may have clinical potential for treating trauma-related disorders

Exposure To Multiple Metals and Adolescent Major Depressive Disorder : A Case-control Study

Yuqian He¹, Xueer Liu¹, Tingting Lei¹, Zhou Xinyu², QIAN HE¹

1.Department of Psychiatry, The First Affiliated Hospital of Chongqing Medical University, Chongqing, China
2.Key Laboratory of Major Brain Disease and Aging Research (Ministry of Education), Chongqing Medical University, Chongqing, China;

Objective We aimed to investigate the associations between exposure to multiple metals and the risk of adolescent MDD.

Methods A total of 203 adolescents diagnosed with MDD and 203 healthy controls were recruited for this case-control study. The levels of 21 metals in their

urine samples were measured using inductively coupled plasma mass spectrometry (ICP-MS). The Least Absolute Shrinkage and Selection Operator (LASSO) regression was then employed to identify metals for inclusion in the multi-metal model. Furthermore, conditional logic analysis and Bayesian kernel machine regression (BKMR) were used to explore potential correlations between multiple metals exposure and the risk of adolescent MDD

Results In the single metal model, arsenic (As), bromine (Br), chromium (Cr), Rubidium (Rb), magnesium (Mg), iodine (I), nickel (Ni) and tellurium (Te) were found to be negatively associated with the risk of adolescent MDD. In the multi-metal model selected by LASSO, copper (Cu) and iron (Fe) showed a positive correlation with the risk of adolescent MDD, while nickel (Ni) and iodine (I) displayed a negative correlation. The BKMR analysis revealed that the combination of these four metals had a statistically significant negative joint effect on the risk of adolescent MDD compared to the median levels

Conclusion Our study reveals a positive association between exposure to copper (Cu) and iron (Fe) and the risk of MDD in adolescents, while Ni and I may have an inhibiting effect. These findings will provide valuable insights into the potential influence of environmental factors on the pathophysiology of MDD and may have significant implications for prevention and treatment strategies.

中国青少年情绪行为问题与家庭环境的聚类与家庭成员心理健康：一项纵向分析

陆雨虹 王菲*
南京脑科医院

目的 在全世界，青少年心理健康问题日益严峻，这强调了探索青少年心理健康问题的复杂影响因素的必要性。本研究采用家庭系统视角和人群聚类调查了家庭成员包括青少年和照顾者的心理健康

状态的影响因素和纵向变化，了解这些变化有助于更好地指导心理健康干预，促进家庭功能的改善。

方法 共纳入 8543 个家庭，分别向青少年和照顾者收集了青少年情绪行为问题，家庭环境和心理健康状态的有关信息，采用聚类分析确定了异质性家庭亚型，并用差异分析来衡量不同亚组家庭成员的心理健康水平和家庭内部差异，7 个月后对进行纵向随访，观察不同亚型家庭成员心理健康变化趋势。

结果 聚类分析识别出三种青少年表现和家庭环境组合的典型模式：低成就&症状适中组、高亲密&亲社会良好组、高冲突&症状严重组。三组间家庭成员抑郁、焦虑、压力、失眠临床症状差异有统计学意义($P < 0.05$)。随后的纵向随访显示了不同亚型家庭成员心理健康结果的稳定性存在差异，具体为高冲突&症状严重组波动性最高，高亲密&亲社会良好组结果表现最稳定。

结论 本研究强调了异质性的家庭模式对青少年和父母心理健康的重要影响，通过识别特定家庭风险模式，有助于制定有效的预防和干预策略，并为提高青少年心理健康水平提供更全面的支持。

Objective Brain aging is recognized risk factor for multiple neurological and psychiatric disorders. However, the relationship between brain age, assessed via neuroimaging-based methods, and the onset of these disorders remains unclear.

Methods Here, we conducted a comprehensive analysis using data from the UK Biobank, involving

26,420 participants aged 42 to 82 years, over a median follow-up period of 4.56 years. The Brain Age Gap (BAG), a metric derived from neuroimaging data reflecting the disparity between predicted and chronological brain age, was assessed. Cox regression models were employed to investigate associations between BAG and the incidence of neurological and psychiatric disorders.

Results During the follow-up, we observed 279 stroke cases, 49 dementia cases, 35 Parkinson's disease cases, 233 depression cases, 292 anxiety cases, and 106 sleep disorder cases. Our analyses revealed that each additional year of BAG was associated with a 4.6% increase in stroke risk, and a 25.4% increase in dementia risk. Furthermore, preliminary findings indicated elevated risks of depression, anxiety, and sleep disorders with increasing BAG, although significance diminished upon adjustment for confounding variables.

Conclusion In conclusion, BAG demonstrated significant associations with stroke and dementia incidence, warranting further investigations to elucidate potential causal relationships

关键词: Brain age gap, stroke, dementia, prospective cohort study

靶向记忆再激活对老年人记忆的影响

郑永博* 师乐 陆林
北京大学第六医院

目的 随着机体老化,老年人的认知能力以不同速度衰退,其中以记忆功能减退最为显著。精细回忆和记忆熟悉度对于老年人的记忆都尤为重要。既往研究显示,睡眠中存在记忆自发性激活的现象,在睡眠过程中暴露记忆相关线索,能够靶向激活特定记忆,进而提高记忆水平,该范式也被称为靶向记忆再激活(Targeted memory reactivation, TMR)。本研究拟通过在 NREM 2 期睡眠给予受试者 TMR,观察清醒时的记忆表现,并通过分析睡眠脑电特征波的变化,阐释该干预手段发挥作用的潜在机制。

方法 本研究招募年龄范围在 55-75 周岁的老年人和 18-35 岁的年轻人。受试者到达实验室进行

记忆编码任务的学习。在记忆的学习阶段,受试者需要学习与声音线索关联的图片,重复两次。受试者睡眠前进行记忆测试,对相同、相似及未出现过的图片进行回忆,判断物体和学习阶段是否相同。当受试者进行午睡,待睡眠监测显示其进入 NREM 2 期时进行 TMR。受试者完成干预后,保持清醒状态,进一步进行记忆测试。应用鉴别力指数、记忆再认评分分别对受试者精细回忆和记忆熟悉度进行测试。在机制方面,应用 Python 软件中的 yasa 工具包,对受试者 NREM2 期 TMR 干预阶段和非干预阶段中央区纺锤波(数量、时长、振幅及功率谱)和慢波振荡(数量、时长、振幅、负向电压及正向电压)的差异进行了分析。

结果 研究发现:(1)在 NREM 2 期睡眠期间进行 TMR,能够有效提高年轻人的鉴别力指数和记忆再认评分;对于老年人,则仅对记忆再认评分有所提高,但对鉴别力指数无明显改善(图 1);(2)睡眠状态下进行 TMR,能够提高年轻人纺锤波的振幅,但对老年人不存在显著影响,而纺锤波的数量、时长和功率谱在两组人群均无显著改变(图 2);(3)进一步对慢波振荡分析发现,睡眠状态下进行 TMR,能够提高两组受试者慢波振荡的振幅和负向电压,而慢波振荡的数量、时长和正向电压无显著变化。

结论 本研究主要发现,在 NREM 2 期睡眠期间进行 TMR,能够有效改善年轻人的精细回忆和记忆熟悉度,但对老年人仅能改善记忆熟悉度。这可能与睡眠过程中 TMR 引起的纺锤波和慢波振荡的变化有关;其中,纺锤波的振幅增加或是介导年轻人和老年人记忆干预差异的重要机制。本研究提示睡眠状态下 TMR 作为一种操作简便且非侵入性的干预手段,对于老年人和青年人的记忆均有改善效果,但同时存在差异影响。

河南省心理援助热线首次来电者自杀意念的特征分析

刘坤亚 张清清 张磊 成绘平 张瑞岭*
河南省精神病院

目的 探索河南省心理援助热线首次来电者自

杀意念的时空分布特征及相关危险因素。

方法 运用河南省心理援助热线电脑咨询操作系统提取 2020 年 1 月-2023 年 10 月期间拨打该热线的 31401 例来电者的资料。运用圆形分布和核密度分析法探究有自杀意念来电的时空分布。采用二元 Logistic 回归分析自杀意念的相关危险因素。

结果 共纳入 5494 例首次来电, 其中 1697 例 (30.9%) 报告近 2 周有自杀意念。时间分布上, 自杀意念来电高峰时段为 12:36~01:08, 且星期分布显示周五来电量最多; 空间分布上, 自杀意念来电在省内呈现“小范围集中, 大范围分散”的特点。除有无急慢性生活事件之外, 自杀意念组与无自杀意念组在基本特征和主要问题上的差异均有统计学意义 ($P<0.05$)。危险因素分析显示, 年龄 <20 岁 ($OR=11.850$, $95\%CL: 6.042\sim 23.243$)、无业 ($OR=1.777$, $95\%CL: 1.363\sim 2.316$)、精神心理问题 ($OR=5.033$, $95\%CL: 3.673\sim 6.897$)、家庭关系问题 ($OR=3.669$, $95\%CL: 2.658\sim 5.063$) 以及经济困难 ($OR=7.081$, $95\%CL: 4.361\sim 11.498$) 产生自杀意念的风险更高。

结论 在危机干预中, 热线需重点关注午间至凌晨这一时段, 优化人员配置, 使自杀意念来电及时地得到援助; 在接听首次有自杀意念的来电时, 应重点关注年龄 <20 岁、无业、有无精神心理问题、家庭关系问题及经济困难等特征。

物质依赖医学学组

下丘脑室旁核及其脑区微环路在可卡因诱导的条件性味觉厌恶中的作用

张力博¹ 张钟玉¹ 宇文婷¹ 陈文茜¹ 薛言学¹ 陆林^{1,2} 时杰¹

1. 北京大学中国药物依赖性研究所

2. 北京大学第六医院/北京大学精神卫生研究所

目的 药物成瘾是一种危害严重的脑疾病, 目前药物成瘾的研究多集中于成瘾性药物奖赏效应所形成的关联性记忆, 对其产生的厌恶性关联记忆如条件性味觉厌恶 (CTA) 等的关注较少, 关于参与药物成瘾厌恶性记忆的脑区及其神经机制尚不清楚。因此, 本研究旨在探索可卡因厌恶性记忆产生的机制, 为进一步理解药物成瘾记忆形成的机制提供理论基础。

方法 (1) 动物禁水 24 h 后进行 7 天的饮水适应期, 第 8 天给予动物新颖味觉溶液 30 min, 并在 30 min 后腹腔注射可卡因 (30 mg/kg) 或对照溶剂 (1 ml/kg), 第 9 天恢复饮水 30 min, 第 10 天进行 CTA 测试; (2) 免疫荧光染色检测可卡因 CTA 形成过程中各脑区 Fos 蛋白表达及其在目标脑区内与特异神经元类型标志物的共标情况; (3) 全细胞膜片钳技术检测可卡因 CTA 形成后, 目标脑区中特异神经元类型的突触传递变化; (4) 化学遗传学和光遗传学手段对目标脑区及其特异神经元类型的活性进行调控。

结果 (1) 多种新颖味觉与可卡因的关联均可引起不同种属动物对该味觉溶液产生厌恶反应, 且单次关联即可引起动物饮用量的显著降低; (2) 可卡因引起小鼠多个脑区内 Fos 蛋白表达增加, 但下丘脑室旁核 (PVN) 内 Fos 蛋白表达在 CTA 关联后进一步增多, 使用化学遗传学抑制或激活 PVN 脑活性均可阻止小鼠 CTA 的形成。此外, 特异性标记并激活 PVN 印迹神经元也可诱导出小鼠的味觉厌恶; (3) CTA 关联可引起小鼠 PVN 脑区的 Fos+ 神经元与促肾上腺皮质激素释放因子 (CRF) 神经元的共标率增加, 同时引起 Fos+ 神经元与催产素 (OXT) 神经元共标率下降。可卡因 CTA 形成后, PVN CRF 神经元的自发型兴奋性突触后电流 (sEPSC) 和自发型抑制性突触后电流 (sIPSC) 均没有变化, 而 PVN

OXT 神经元 sEPSC 的频率下降, 其 sEPSC 的振幅及 sIPSC 则没有改变; (4) 化学遗传学或光遗传学手段激活 PVN OXT 神经元可抑制小鼠 CTA 的形成, 化学遗传学抑制其活性则可增强可卡因 CTA; (5) 化学遗传学手段抑制 PVN CRF 神经元也可阻止小鼠 CTA 的形成, 而化学遗传学或光遗传学激活 PVN CRF 神经元则对可卡因 CTA 没有影响; (6) 化学遗传学手段激活 PVN 至中央杏仁核 (CeA) 环路可以抑制小鼠 CTA 的形成。

结论 本研究探讨了 PVN 脑区的不同类型神经元及其环路参与可卡因 CTA 形成的机制, 为理解药物成瘾记忆提供了新的视角和神经生物学基础。

关键词: 可卡因, 条件性味觉厌恶, 成瘾记忆, 下丘脑室旁核, 中央杏仁核

The Causal Relationship and Mediating Effect between Resting State Brain Functional Connectivity and Alcohol and Tobacco Consumption: A Mendelian Randomization Study

Yijie Song Min Zhao* Weichen Song Guanning Lin
Shanghai Mental Health Center

Objective Disrupted brain resting-state functional networks have been observed across different types of substance use disorder and are increasingly an important risk factor for craving and relapse. The potential bidirectional causal relationship between abnormal resting-state brain networks (RSNs) and alcohol/tobacco consumption remains an area of inquiry. In this study, we aimed to investigate the bidirectional causal relationship between RSNs and alcohol/tobacco consumption. Specifically, we sought to identify key brain regions and genes involved in this relationship and to understand the interplay among structural variation, resting-state functional connectivity (rsFC), and alcohol/tobacco consumption

Methods In this study, bidirectional Mendelian randomization (MR) was conducted using summary-level genome-wide association studies (GWAS) data encompassing resting-state functional connectivity (rsFC, n=34,691), self-reported Drinks Per Week (DPW,

n=304,328), and Cigarettes Per Day (CPD, n=183,196). Additionally, we utilized GWAS data for gray matter volume (n=33,224) and white matter integrity (n=33,224) to perform a two-step MVMR analysis, examining the interplay among structural variation, rsFC, and substance consumption. Further, the FUMA-TWAS tool was employed to analyze genes significantly associated with rsFC

Results Our findings reveal that diminished global rsFC serves as a common risk factor for increased alcohol and tobacco consumption. Notably, connections emanating from the precuneus, angular gyrus, supra-marginal gyrus, and inferior parietal lobe play a pivotal role in influencing alcohol/tobacco consumption. The gene EPHA3 emerges as a common gene affecting these crucial connections. Finally, white matter integrity emerges as a pivotal mediator in the association between rsFC and alcohol/tobacco consumption

Conclusion This study establishes a causal relationship from rsFC to alcohol/tobacco consumption, shedding light on the specific brain regions and genes involved in influencing this complex interplay.

关键词: resting-state functional connectivity, alcohol consumption, tobacco consumption, bidirectional mendelian randomization

Involvement of SERCA2b in The Mechanism of Methamphetamine-induced Executive Dysfunction in Mice

Xiangyu Li^{1,2}, Junda Li^{1,2}, Dongliang Jiao^{1,2}

1. Bengbu Medical University

2. School of Mental Health, Bengbu Medical University

Objective Executive dysfunction plays a crucial role in methamphetamine addiction, yet its specific mechanisms remain incompletely understood. Our study aims to delve into the involvement of Sarcoplasmic/Endoplasmic Reticulum Calcium ATPase 2b (SERCA2b), a highly expressed calcium pump on the endoplasmic reticulum membrane, in the manifestation of executive dysfunction in METH-intoxicated mice.

By modulating the expression and activity of SERCA2b, we hope to ameliorate executive function in METH-addicted patients, thereby supporting the discovery of novel effective targets for treating METH addiction

Methods After acute METH intoxication via intraperitoneal injection in mice, their inhibitory control, attention, and working memory were assessed using the 5-Choice Serial Reaction Time Task (5CSRTT) and Delayed Matching-to-Position (DMP). Subsequently, ICR mice were randomly divided into control, METH, agonist, overexpression virus, and interference virus groups. The expression of SERCA2b was modulated using agonists and adenoviruses, and changes in SERCA2b expression and enzyme activity were measured using Western blot and enzyme-linked immunosorbent assay (ELISA). Pairwise sample t-tests or independent sample t-tests were used for comparisons between two groups, while one-way analysis of variance (ANOVA) was used for comparisons among multiple groups. Statistical significance was defined as $P < 0.05$ for all analyses

Results 1. The administration of METH to mice resulted in significant executive dysfunction

After constructing a mouse model of METH injury, we utilized the results of the 5CSRTT and DMP tasks to find that METH-treated mice exhibited a significant increase in the number of premature responses, a significant decrease in the correct rate and the number of correct responses, and a significant increase in the number of incorrect responses. Additionally, the mice in the METH group had a significant decrease in the correct rate and a significant increase in the date of training attainment during the DMP test period. These findings suggest that METH produces significant executive dysfunction in mice.

2. METH also reduces the activity and expression of SERCA2b.

After successful modeling using METH, dorsal striatum (Dstr) and Dstr SERCA2b activity after extraction of endoplasmic reticulum (ER) and Dstr SERCA2b expression were examined, and it was found that both SERCA2b activity and expression were decreased in the METH group. The results showed that the activity and expression of Dstr SERCA2b were decreased in the

METH group. It is suggested that the activity and expression of Dstr SERCA2b may play an important role in the executive dysfunction caused by METH.

3. Increasing the expression of Dstr SERCA2b can alleviate the development of executive dysfunction caused by METH, while decreasing its expression can aggravate the executive dysfunction caused by METH.

By intraperitoneal injection of CDN1163, a SERCA2 agonist, 50 mg/kg CDN1163 was found to effectively inhibit METH-induced deficits in inhibitory control, attention, and working memory as tested by the 5CSRTT and DMP tasks. CDN1163 was injected into the intracranial Dstr using the brain stereotaxic localization technique, and 5 mM CDN1163 was found to be effective in inhibiting METH-induced impairments of inhibitory control, attention, and working memory as tested by the 5CSRTT and DMP tasks. Overexpression and interference with adeno-associated virus constructed for SERCA2b were localized and injected intracranially, and tested by 5CSRTT and DMP tasks revealed that SERCA2b overexpression slowed METH-induced deficits in inhibitory control, attention, and working memory, while interference with SERCA2b expression exacerbated the deficits.

Conclusion METH decreases the activity and expression of SERCA2b, leading to significant executive dysfunction. This dysfunction can be ameliorated by using CDN1163, an agonist of SERCA2, and overexpressing viruses.

关键词: Methamphetamine, SERCA2b, Executive function, Dorsal Striatum

Decreased Cortical Gyration Relates To Working Memory in Male Early Abstinent Alcohol-dependent Individuals

Hailing Cao¹, Wanjun Guo²

1. West China Hospital, Sichuan University

2. Affiliated Mental Health Center & Hangzhou Seventh People's Hospital, Zhejiang University School of Medicine

Objective Alcohol dependence (AD) is an addictive disorder with multifaceted neurobiological features. Recent research on the pathophysiological mechanisms of AD has emphasized the important role of dysconnectivity. Cortical gyrification is known to be a reliable marker of neural connectivity. This study aimed to explore cortical gyrification using the local gyrification index (LGI) between alcohol-dependent patients and controls

Methods Magnetic resonance images were collected from 60 early abstinent patients with AD (5–12 days after stopping alcohol consumption) and 59 controls and preprocessed using FreeSurfer, followed by surface-based morphometry (SBM) analysis to compare the differences in LGI between the two groups. Cognitive performance was assessed using the Spatial Working Memory (SWM) test in the Cambridge Neuropsychological Test Automated Battery (CANTAB). The relationship between LGI, cognitive performance, and clinical variables was also explored in the patient group

Results Compared with controls, patients with AD exhibited a significantly decreased LGI in the temporal and parietal regions, including the postcentral, superior temporal, middle temporal, and inferior parietal cortex. AD patients did worse than controls in several SWM measures. Furthermore, decreased LGI in the left postcentral was negatively correlated with working memory performance after multiple comparison corrections in the patient group

Conclusion Alcohol-dependent individuals exhibit significantly decreased cortical gyrification in the regional temporal and parietal cortex, which may be underlying neurobiological markers of AD. Our findings further indicate that working memory deficits may be related to abnormalities in cortical gyrification in alcohol addiction

关键词: alcohol dependence; cortical gyrification; local gyrification index; working memory; cognitive performance

Delicate Activity Patterns in The Medial Pre-

frontal Cortex: A New Insight Into Drug-Related Cue Processing

Sai Shi Yingjie Cheng Manqing Wu Yiwen Sun Yijie Song Hang Su Haifeng Jiang Jiang Du Tifei Yuan Min Zhao*

Shanghai Mental Health Center

Objective Methamphetamine (METH) is known as an addictive drug that may cause detrimental effects. Previous studies have reported that cue-induced craving is often regarded as significant contributor to drug relapse. Chronic METH abuse will cause dysfunction in the medial prefrontal cortical network. However, the neurobiological processes underlying cue-induced craving require further exploration. The purpose of this study was to investigate 1) the variations in discrete cue-evoked craving behaviors; 2) alterations of various brain regions in cue-induced craving; 3) subtypes of the medial prefrontal cortex (mPFC) response patterns to discrete cues

Methods Male mice with C57BL/6J (n=50) were trained to self-administer METH under a fixed ratio. Dependence was then established by self-administration escalating doses of METH paired with cues (tone and light) for consecutive five daily 3-hr sessions. To evaluate the cue-induced craving behavior, all received seeking tests with different types of cue presentations (auditory/ visual/ full/ none, respectively) on withdrawal day 1

Results Seeking behaviors were significantly elicited by auditory cues, visual cues, and full cues compared to contextual cues. Auditory and visual stimuli can trigger c-Fos expression in the mPFC. Additionally, auditory cues activate subcortical regions such as the paraventricular thalamus and anterior medial thalamus, while visual cues activate the lateral habenula and paratenial thalamus. Pyramidal neurons in the prelimbic (PL) and infralimbic (IL) subregions of the mPFC exhibit distinct patterns of activity in response to auditory cues. Specifically, IL excitatory neurons show rapid activation, whereas PL neurons demonstrate delayed activation

Conclusion Together, these initial studies

showed that various brain regions are activated by different cues, indicating the intricate involvement of cortico-subcortical circuits in diverse cue processing mechanisms. Additionally, the mPFC have shown nuanced activity patterns, offering novel perspectives on the processing of drug-related cues. Current research endeavors are also focused on elucidating the precise mechanisms of neuronal subtypes within the mPFC.

关键词: methamphetamine, medial prefrontal cortex, craving, relapse

鼠李糖乳杆菌和格氏乳杆菌对酗酒大鼠的潜在治疗作用以及其对肠道菌群的影响

文静¹ 文静² 刘海婷² 刘海婷¹ 张义¹ 张义² 贾晓健² 贾晓健¹ 杨梅¹ 杨梅²

1. 深圳市精神卫生中心

2. 深圳市康宁医院

目的 长期酗酒可导致酒精相关性肝病、心血管疾病、胃肠道疾病、认知障碍等,其中酒精相关性肝病已成为一个重大的全球公共卫生问题,给医疗系统带来了巨大压力。基于“肠-脑轴”理论的研究表明肠道微生物群失调可能在酒精使用障碍等精神疾病的发生发展中发挥重要作用。本课题组前期研究发现酗酒大鼠粪便中乳酸杆菌属丰度显著下降,推测乳杆菌属可能对酗酒大鼠具有保护作用。为了验证这一假设,本研究选择乳酸杆菌属的鼠李糖乳杆菌和格氏乳杆菌作为研究对象,评价这两个菌种对酗酒大鼠的潜在治疗作用,以及口服这两种益生菌对大鼠肠道菌群的影响。以期对酒精使用障碍的治疗提供新的思路。

方法 1、通过构建酒精组、鼠李糖乳杆菌组、格氏乳杆菌组的大鼠模型,使用化学发光法检测大鼠血清中丙氨酸氨基转移酶和天门冬氨酸氨基转移酶水平;使用蛋白免疫印记检测大鼠肝细胞内肿瘤坏死因子- α 水平;2、使用旷场实验对大鼠模型进行运动距离和运动时间,观察大鼠在鼠李糖乳杆菌、格氏乳杆菌等肠道菌群对酗酒情况的影响;3、利用16S rRNA 基因测序及分析技术检测肠道菌群的多样性。

结果 和对照组相比,酒精组大鼠 FGF21、脂

多糖、ALT 和 AST 水平显著升高($P<0.05$)且自主运动能力下降,以及导致大鼠肠道微生物多样性改变,Alpha 多样性降低。补充鼠李糖乳杆菌或格氏乳杆菌的大鼠,FGF21、脂多糖、ALT 和 AST 均有所下降($P<0.05$),并且肠道微生物群 Alpha 多样性指数均有所升高。

结论 本研究发现长期酗酒导致大鼠肠道微生物的改变,鼠李糖乳杆菌和格氏乳杆菌均可以改善由饮酒引起的大鼠肝脏损伤、自主运动能力减弱和肠道微生物群落结构变化,格氏乳杆菌在改善大鼠肝脏损伤方面效果更显著。

交叉耦合交流电刺激改善甲基苯丙胺成瘾者学习记忆功能

郭垒 屈诗燕 苏杭 江海峰 陈天真 赵敏*

上海交通大学医学院附属精神卫生中心

目的 甲基苯丙胺(Methamphetamine)成瘾是一种严重的物质成瘾问题,给社会带来沉重的经济卫生负担。研究发现,MA 成瘾者存在学习记忆功能损害,包括空间记忆和工作记忆受损,而跨频耦合现象在记忆中扮演重要角色。基于强化学习理论的概率学习模型有助于理解成瘾行为的形成与演变。跨频耦合经颅交流电刺激被提出作为一种干预手段,但在 MA 成瘾者中的应用尚未被报道。本研究的目标是通过随机对照的设计,使用交叉耦合经颅交流电刺激(Cross-frequency coupling transcranial alternative current stimulation, CFC tACS)刺激对 MA 成瘾者进行干预,评估其对工作记忆和强化学习的影响。

方法 招募 DSM-5 中 MA 成瘾诊断标准的患者,并随机分配到真 CFC 刺激组和伪 CFC 刺激组进行 5 天的左侧背外侧前额叶(Dorsal lateral prefrontal cortex, DLPFC)干预。被试完成一般人口学信息及成瘾史测量,以及学习与记忆功能测量。学习和记忆功能通过概率学习任务 and 空间工作记忆任务进行评估,分别使用了计算机化范式和信号检测理论。经颅交叉耦合交流电干预方案使用 Neuroelectrics 的设备进行刺激,真刺激组接受 6 Hz 叠加 80 Hz 的刺激,而伪刺激组则只感受到开始和结束时的电流刺

激。数据处理与统计分析采用线性混合效应模型。

结果 本研究发现,5天的CFC tACS干预能显著提高MA成瘾者在概率学习和空间工作记忆任务中的表现,尤其是在提高对惩罚的敏感性(interaction estimate = 4.762, P = 0.006)和工作记忆的提取速度(interaction estimate = -0.054, P = 0.032)方面。

结论 本研究结果表明基于内源性 theta-gamma 耦合现象的外源性 tACS 刺激有助于恢复MA成瘾者的学习记忆损伤。与先前研究结果相符,CFC tACS 的刺激方式在工作记忆表现方面获得了最佳提升。研究发现还指出,CFC tACS 干预使MA成瘾者在惩罚条件下的选择更加合理,推测其机制可能涉及恢复LPFC的功能以及提高信息整合和决策控制。尽管研究存在一些不足,如样本量有限和缺乏长期随访数据,但该研究为CFC刺激在改善MA成瘾者学习记忆功能上的潜力提供了重要依据,为进一步研究和治疗方法的选择提供了指导。

游戏障碍的静息态脑电活动:基于功率谱特征的研究

王粤 单海迪 黄川宁 苏杭 钟娜 赵敏*
上海交通大学医学院附属精神卫生中心

目的 伴随着网络的普及,网络游戏使用问题受到越来越多的关注。2018年世界卫生组织将游戏障碍列入精神疾病范畴,游戏障碍在我国发病率约为5.3%,长期过度沉迷网络游戏不仅会对个体的身体健康造成损害,还可能使得个体对网络游戏产生心理依赖,造成诸如成绩下降,决策能力减弱,自控能力不足,暴力或冒险行为的增加,情绪控制障碍等负面影响,最终演变成游戏障碍,导致个体出现行为异常、心理障碍以及神经功能紊乱等严重后果。但目前游戏障碍发生机制有待探索,相关治疗手段仍然十分缺乏。而基于静息态脑电探索成瘾的神经认知标记,深入揭示成瘾易感性的神经生物机制,可以为识别成瘾早期干预的靶点,预警具有成瘾高风险的重点人群提供可能途径,对成瘾的防治具有重要意义。

方法 通过自评量表游戏障碍筛查量表(GDSS),筛选GDSS得分 ≥ 47 的人群并结合

ICD-11 诊断标准的临床访谈纳入游戏成瘾组;GDSS得分处于32到47分纳入风险性游戏使用人群;GDSS ≤ 32 分人群被纳入健康对照组。采用博睿康公司的64导脑电检测仪分别对三组被试实施2分钟的静息态脑电数据采集,对数据进行预处理后,进行功率谱分析,计算了 $\delta(1-4\text{Hz})$ 、 $\theta(4-8\text{Hz})$ 、 $\alpha(8-13\text{Hz})$ 、 $\beta(13-30\text{Hz})$ 以及 $\gamma(30-35\text{Hz})$ 五个频段的绝对功率值,使用单因素ANOVA检验比较了三组在上述各指标上的差异。

结果 本研究共入组58名游戏障碍者,58名风险性游戏使用者和67名健康对照,平均年龄为 19.08 ± 0.95 。结果发现游戏障碍组和健康组在 β 频段的中央和顶枕区域通道存在显著差异,游戏障碍组的 β 频段的绝对功率值显著低于健康对照组;同时游戏障碍组中央区域的 β 比值与冲动性量表(BIS-11)的行动冲动性分量表得分($r = -0.284$, $p = 0.032$)存在显著负相关。

结论 游戏障碍存在 β 频段中央和顶枕区域的慢波异常特征,游戏障碍患者 β 功率降低的结果可能与其抑制性控制特征受损有关。本研究结果为未来确定游戏障碍的生理标志物提供了进一步依据。

Inflammatory Cytokines, Cortisol, and Anhedonia in Patients with Treatment-Resistant Depression after Consecutive Infusions of Low-dose Esketamine

Yue Wang Kai Zhang*

ChaoHu Hospital of Anhui Medical University

Objective Anhedonia, defined as a significant loss of interest or pleasure, is one of the core symptoms of treatment-resistant depression (TRD) and often associated with poor prognosis. This article primarily investigates the changes in anhedonia symptoms, inflammatory factors, and cortisol in TRD patients after low-dose esketamine treatments

Methods A total of sixty patients with TRD were enrolled in the clinical study of esketamine. We primarily assessed the severity of depressive symptoms and

anhedonia using the Hamilton Rating Scale for Depression(HAMD) and the Snaith-Hamilton Pleasure Scale(SHAPS), respectively, before esketamine treatment and within 3 to 6 hours after each treatment. Blood specimens were collected before the administration of esketamine treatment and within 1 hour after the sixth treatment, measuring the levels of cortisol, interleukin-6 (IL-6), IL-10, and tumor necrosis factor-alpha (TNF- α) in plasma

Results We found that after six consecutive infusions of low-dose esketamine, patients' depressive symptoms and anhedonia showed improvement. Following treatments, plasma levels of cortisol, IL-6, and TNF- α decreased in patients with TRD, while the anti-inflammatory cytokine IL-4 increased. Multiple linear regression showed that baseline cortisol is correlated with the lack of pleasure, while inflammatory factors show no significant correlation

Conclusion Add-on esketamine seems to be a good choice for the treatment of the anhedonia in TRD. It has also shown promising effects in altering inflammatory factors in patients with TRD. Moreover, the elevation of plasma cortisol levels may serve as a potential biomarker for anhedonia in patients with TRD

关键词: esketamine,anhedonia,inflammatory cytokines,cortisol

Blockade of Orexin Receptors Prevents Stress-induced Alcohol Dependence and Relapse in Adolescent Mice

Xiaoxi Zhao Aqian Hu Xiaojun Xiang*

Department of Psychiatry, National Clinical Research Center for Mental Disorders, and National Center for Mental Disorders, The second Xiangya Hospital of Central South University

Objective Alcohol dependence is a global public health problem with a high relapse rate after withdrawal, but the mechanism remains unclear. Stress may be an important factor in substance addiction and relapse, and

the role of orexin system in stress response has been discussed. Orexin may be involved in stress-induced addiction or relapse. However, there are few relevant studies on alcohol dependence, especially among adolescents. In order to find new targets for the prevention of alcohol addiction and relapse, the present study aims to investigate the role of stress in alcohol relapse in adolescent mice, and the role of the orexin system in it

Methods The alcohol Conditioned Place Preference (CPP) model was established in adolescent mice. In experiment 1, after CPP extinction, mice were randomly assigned to receive acute foot shock (stress group) or sham shock (control group) prior to CPP reinstatement, respectively, to explore the effect of acute stress on alcohol CPP reinstatement. ELISA was used to compare the differences in orexin concentrations in the VTA and other brain regions between the two groups. In experiment 2, another group of mice were injected with vehicle/orexin receptor 1, 2 antagonists before foot shock stress prior to CPP reinstatement, and the effects of orexin receptor antagonists on CPP recovery induced by stress were examined. In experiment 3, mice were randomly divided into chronic stress group and control group, which were subjected to chronic foot shock stress or sham stress for 10 days. The mice were then subjected to alcohol CPP, and the establishment of CPP was compared between the two groups. In experiment 4, all mice were subjected to chronic stress and randomly divided into Vehicle group and Orexin 1 or 2 receptor antagonist group after stress. Different drug interventions were given before each alcohol conditioning in CPP training, and the CPP establishment was compared among the three groups

Results The results showed that alcohol CPP reconstruction was successful only in the stress group that experienced acute foot-shock stress prior to the CPP reinstatement test ($P < 0.01$). Additionally, the orexin concentration in the nucleus accumbens, hippocampus, and medial prefrontal cortex of the stress group mice was significantly higher ($P < 0.05$) in comparison to the control group. Compared with the successful CPP reconstruction in the vehicle group ($P < 0.001$), CPP reconstruction was blocked in both groups of mice given orexin 1,2 receptor antagonist prior to acute foot-shock

stress before the reinstatement test (both $P > 0.05$). Furthermore, it was found that CPP scores were significantly higher in adolescent mice experiencing chronic stress before CPP establishment compared with controls ($P < 0.01$). And after chronic stress, compared with Vehicle group, CPP scores in both receptor antagonist groups were significantly decreased (both $P < 0.05$)

Conclusion Acute foot shock stress exposure can promote the relapse of alcohol dependence and increase the concentration of orexin in related brain regions in adolescent mice, and these effects can be blocked by orexin 1 and 2 receptor antagonists, suggesting that orexin system plays an important role in acute stress-induced relapse of alcohol dependence in adolescent mice. Chronic foot-shock stress can increase the vulnerability to alcohol dependence, and orexin 1 and 2 receptor antagonists can significantly reduce this effect, suggesting that orexin 1 and 2 receptors may play an important role in alcohol dependence induced by chronic stress. Both orexin receptors may be important targets for preventing alcohol dependence and relapse.

Engrams and Circuits Crucial for Forgetting of Drug Memory

Zhonghao Li Wei Zheng Yanxue Xue*
Peking University

Objective The persistence of drug addiction memories is a major cause of relapse. The conditioned stimulus retrieval-extinction procedure, in which extinction training is conducted during the reconsolidation window following the retrieval of an addictive memory conditioned stimulus, effectively forgets the addiction memory and significantly reduces cue-induced drug craving, making it an effective therapeutic strategy for relapse prevention. However, the neural mechanisms underlying the inhibition of relapse by conditioned stimulus retrieval-extinction remain unknown. Therefore, elucidating the neuronal clusters and their neural

circuits underlying conditioned stimulus retrieval-extinction has broad implications for understanding the forgetting of drug addiction memories.

Methods We first used the animal model of methamphetamine self-administration to examine the effects of conditioned stimulus retrieval-extinction on the reinstatement of methamphetamine seeking in the medial prefrontal cortex by chemogenetic inhibition of different subregions of the medial prefrontal cortex. Then we used virus tool with E-SARE driven promoter plasmids to label and reactivate retrieval-extinction or extinction specific neuronal ensemble. E-SARE is Enhanced synaptic activity-responsive element (E-SARE). It was shown to label the neuronal ensemble activated by specific environmental stimulus. Subsequently, we compared the differences between the two types of retrieval-extinction or extinction specific neuronal ensemble using immunofluorescence, miniscope, and single-cell sequencing techniques. To explore the differential contributions of infralimbic cortex (IL) projection populations, we investigated the output brain regions of the associated neuronal ensemble during retrieval-extinction or extinction using anterograde and retrograde tracing techniques. Finally, we explored the effects of IL-intermediodorsal thalamic nucleus (IMD) neural circuits on the reinstatement of methamphetamine seeking by chemogenetic activation or inhibition and electrophysiological techniques.

Results Chemogenetic inhibition of IL, but not PL (prelimbic cortex), activity before conditioned stimulus retrieval-extinction reverses the inhibitory effect of this procedure on drug priming-induced reinstatement of methamphetamine seeking, suggesting that the inhibition of methamphetamine addiction memory by this procedure is specifically dependent on the involvement of IL. Specific labeling and activation of retrieval-extinction but not extinction neuronal ensemble in the IL can simulate the inhibitory effects of the conditioned stimulus retrieval-extinction procedure on drug priming-induced reinstatement of methamphetamine seeking, indicating that retrieval-extinction neuronal ensemble in the IL may mediate the effects of this procedure on methamphetamine relapse. Staining of the engram by E-SARE labeling and c-Fos indicated differences between

retrieval-extinction and extinction specific neuronal ensembles. In addition, in vivo calcium imaging using single-photon-based miniscope and a microendoscopic lens revealed distinct neuronal ensembles that encode the retrieval-extinction and extinction processes. We call them forgetting ensembles and extinction ensembles respectively. Afterwards, the virus tracing technique identified retrieval-extinction specific neuronal ensemble in the IL that preferentially export to the IMD rather than the basolateral amygdala (BLA). Furthermore, neuronal excitability of IL projections to the IMD was significantly increased during retrieval-extinction compared to extinction. More importantly, chemogenetic activation of IL-IMD projections dramatically inhibited the reinstatement of methamphetamine seeking.

Conclusion The memory editing procedure initiated by conditioned stimuli activates specific neuronal ensembles, termed 'forgetting ensembles', in the infralimbic cortex. Memory forgetting involves the recruitment of the IL-IMD circuit, and the activation of this circuit induces a memory forgetting effect.

下丘脑室旁核催产素神经元至伏隔核环路在甲基苯丙胺致条件性位置偏好中的作用

成英杰 赵敏*

上海市精神卫生中心

目的 1. 探究鼻滴 OXT 对 METH-CPP 表达的作用及其机制。

2. 探究 METH-CPP 表达中 PVNOXT 神经元活性及 OXT 水平的变化, 以及 PVN OXT 神经元的作用。

3. 探究 METH-CPP 表达中 PVNOXT 神经元投射至 NAc 环路的活性及 NAc 中 OXT 水平的变化, 以及 PVNOXT-NAc 环路的作用。

方法 1. 构建 METH-CPP 小鼠模型, 研究鼻滴 OXT/AVP 对 METH-CPP 表达的作用。

2. 病毒标记 PVN OXT 神经元并检测其活性改变。ELISA 检测 OXT 和 AVP 蛋白水平的变化, qPCR

检测 Oxt 和 Avp mRNA 水平的变化。化学遗传操控探讨 PVN OXT 神经元对 METH-CPP 表达的作用。

3. 利用病毒示踪确认 PVNOXT-NAc 环路的存在, 并检测 METH-CPP 表达时环路活性的变化。ELISA 测定 PVN 下游脑区 OXT 和 AVP 蛋白水平变化, qPCR 检测 Oxt mRNA 水平变化。化学遗传和光遗传操控探讨 PVNOXT-NAc 环路对 METH-CPP 表达的作用。

结果 1. 鼻滴 OXT 而非 AVP 可以改善小鼠 METH-CPP 表达, 中枢 OXTRs 拮抗剂可以阻断这一作用。鼻滴 OXT 可以抑制 METH 诱导的 NAc 激活, 抑制 NAc 的 OXTRs 可以阻断鼻滴 OXT 的作用, 直接激活 NAc 的 OXTRs 可以抑制 METH-CPP 表达。

2. METH 抑制 PVN OXT 神经元, 引起 OXT 蛋白水平下降, 而不影响 SON、垂体和外周血清中 OXT 水平。化学遗传激活 PVN OXT 神经元可以抑制 METH-CPP 表达, 且能被中枢 OXTRs 拮抗剂所阻断。相反, 化学遗传抑制 PVN OXT 神经元介导偏好产生。

3. METH 抑制 PVNOXT-NAc core 环路活性, 而 PVNOXT-NAc shell 环路不受影响, NAc core 和 NAc shell 中 OXT 的蛋白和 Oxt mRNA 水平无显著改变。化学遗传或光遗传激活 PVNOXT-NAc core 环路可以抑制 METH-CPP 表达, 且拮抗 NAc core 的 OXTRs 可以阻断这一作用。相反, 化学遗传抑制 PVNOXT-NAc core 环路介导偏好产生。调控 PVNOXT-NAc shell 环路不影响 METH-CPP 表达。

结论 1. METH 引起脑内 OXT 系统功能减退, 包括 PVNOXT 神经元活性降低, PVN 中 OXT 蛋白水平下降, 及其投射至下游脑区 NAc core 的环路活性降低。

2. 通过鼻滴给予外源性 OXT 或者激活内源性 OXT 系统都能够抑制 METH-CPP 的表达, 并且这一过程可能需要 NAc 中 OXTRs 的参与, 提示脑内 OXT 及其受体在 METH-CPP 行为中有重要的调控作用。

Causal Pathways between Neuroticism, Edu-

ational Attainment and Mental and Behavioral Disorders Due To Psychoactive Substances Use: A Mediation Mendelian Randomization Study

Jianzhao Zhang Yanbin Jia*

The First Affiliated Hospital of Jinan University

Objective Neuroticism, a personality trait characterized by emotional instability and a tendency to experience negative emotions such as anxiety and depression, has long been implicated as a significant factor in mental and behavioral disorders arising from psychoactive substance use (MBD-PSU). This relationship is particularly concerning given the global burden of mental health issues and substance use disorders. Despite this, the precise causal pathways linking neuroticism and MBD-PSU remain unclear, largely due to potential confounding factors such as other personality traits and socio-economic variables. Hence, a more nuanced understanding and investigation into this relationship is critically needed.

Methods To elucidate the causal relationship between neuroticism and five subtypes of MBD-PSU—namely alcohol, cannabinoids, hallucinogens, opioids, and tobacco—bidirectional univariate Mendelian randomization (MR) was employed. This technique allows for the determination of causal effects using genetic variants as instrumental variables, thereby reducing bias from reverse causation and confounding. Additionally, multivariate Mendelian randomization (MVMR) was utilized to control for the potential confounding variable of extraversion and to estimate the mediating effect of educational attainment on this relationship

Results Univariable MR demonstrated the robust evidence of supporting a causal effect of neuroticism on mental and behavioral disorders due to alcohol (MBD-A) (IVW: OR = 1.126, 95%CI = 1.043 ~ 1.215, P = 0.002). However, reverse direction analysis did not yield any evidence of a causal effect of these five subtypes of MBD-PSU on neuroticism. Furthermore, MVMR analyses demonstrated that the causal association between neuroticism and MBD-A was independent of extraversion, and mediated by educational attainment

(Indirect effect: Beta = 0.028, 95%CI = 0.019 ~ 0.046, P < 0.001, R² = 23.84%)

Conclusion This study underscores that high levels of neuroticism significantly contribute to an increased vulnerability to alcohol-related mental and behavioral disorders (MBD-A). Additionally, it highlights the mediating role of lower educational attainment in this relationship. These findings suggest that educational interventions may serve as a crucial buffer in mitigating the impact of neuroticism on the development of MBD-A. By identifying and supporting individuals at high risk due to adverse personality traits, particularly through educational support and social interventions, it may be possible to decrease the incidence and severity of alcohol-related disorders. This research contributes to the broader understanding of the interplay between personality traits, education, and substance use disorders, offering avenues for potential preventive strategies and policy implications.

Effects of Varenicline on The Serum Levels of Olanzapine in Male Patients with Schizophrenia: A Randomized Controlled Trial

Mengling Deng Bo Zhou*

The Third Hospital of Quzhou

Objective Cigarette smoking is notably prevalent among individuals with schizophrenia, with estimates indicating a smoking prevalence of 64-79% within this population. Smoking is associated with severe tobacco dependence, elevated substance abuse, increased psychiatric hospitalization, and higher mortality rates. Varenicline, a partial agonist at $\alpha 4\beta 2$ nicotinic acetylcholine receptors, has proven effective for smoking cessation in the general population and patients with psychiatric disorders. However, its effects on the serum levels of antipsychotics in schizophrenia are understudied. This study aimed to investigate the impact of vare-

nicline on the serum levels of olanzapine, an antipsychotic medication, in male patients with schizophrenia who smoke.

Methods This study was a randomized, double-blind, placebo-controlled trial conducted. Participants were male inpatients aged 18-50 years with schizophrenia, confirmed by ICD-10 criteria, who were nicotine-dependent smokers consuming 10 or more cigarettes per day with a Fagerstrom Test of Nicotine Dependence (FTND) score greater than 5. All participants were clinically stable with Positive and Negative Syndrome Scale (PANSS) scores below 60 and had serum olanzapine concentrations exceeding 9 ng/mL. Eligible participants were randomly assigned to receive either varenicline or a placebo for 12 weeks alongside continued olanzapine therapy (10-20 mg daily). Varenicline was administered with a titration schedule starting at 0.5 mg/day, increasing to 0.5 mg twice daily, and then to 1 mg twice daily. Both groups received behavioral support to aid smoking cessation, which included reducing cigarette consumption by 25% every two weeks. Serum olanzapine concentrations were measured at baseline and weeks 1, 2, 4, 8, and 12 using liquid chromatography-mass spectrometry (LC-MS). Data were analyzed using a generalized additive mixed model (GAMM) to assess group differences over time. A two-piecewise linear regression model was applied to examine the threshold effect of the treatment on olanzapine concentrations using a smoothing function.

Results A total of 61 participants completed the study (30 to the varenicline group and 31 to the matching placebo group). The average age was 36.8 ± 7.7 years. The baseline olanzapine concentrations were 48.5 ± 12.0 ng/mL and 48.3 ± 14.1 ng/mL, which increased to 66.0 ± 11.2 ng/mL and 66.7 ± 12.7 ng/mL for the varenicline group and the placebo group, respectively. The GAMM results showed that olanzapine concentrations increased nonlinearly in the varenicline and placebo groups. Threshold effect analysis suggested that the olanzapine concentrations increased until the turning point (week 4). However, there was no significant difference between the two treatment groups. Adjustments for baseline variables such as age, height, weight, BMI,

education, and smoking history did not affect these findings

Conclusion Varenicline is safe and effective for smoking cessation in male patients with schizophrenia. Although smoking cessation leads to higher serum concentrations of olanzapine, the use of varenicline does not significantly alter this effect compared to placebo. This study contributes to the understanding of managing smoking cessation in patients with schizophrenia who are undergoing antipsychotic treatment and highlights the importance of therapeutic drug monitoring in this context.

Social Interaction Suppresses Cocaine Relapse by Regulating Specific DAergic Engram

Wei Zheng¹, Lin Lu^{1,2,3}

1.Peking-Tsinghua Centre for Life Sciences

2.Peking University Sixth Hospital

3.National Institute on Drug Dependence, Peking University

Purpose Addiction is a chronic relapsing brain disease, characterized by a high susceptibility to relapse once returns to the original living environment even after an extended period of abstinence. Positive social interactions are believed to have therapeutic potential in managing drug addiction by shifting the drug reward back onto social reward. However, the neural mechanisms underlying social interaction's therapeutic effects against relapse are poorly understood. The dopamine (DA) activity of Ventral tegmental area (VTA) mediates both the reinforcing properties of social reward and drugs of abuse. Therefore, we hypothesized that distinct subpopulations of DAergic neurons in the VTA may play different roles in the process of social anti-relapse

Methods We employed the cocaine self-administration as a relapse model in rats, and combined miniscope, Targeted Recombination in Active Populations (TRAP), immunofluorescence, fiber photometry

recording, and chemical genetics to explore the involvement of subpopulations of DAergic neurons during social interaction-mediated relapse prevention

Results We found that social interaction significantly inhibited the spontaneous recovery of cocaine seeking after cocaine self-administration extinction training in rats. While both social interaction and relapse of cocaine seeking reliably elicited obvious Ca²⁺ level increase in the TH neurons of VTA and induced DA relapse in nucleus accumbens (NAc), both the increase of Ca²⁺ level in the TH neurons of VTA and DA release in NAc induced by active cocaine relapse were significantly reduced after social interaction. Furthermore, the subpopulations of DAergic neurons in the VTA which encoded social interaction and relapse were mainly distinct and anatomically segregated. And, capturing and reactivating or inhibiting the specific subpopulation of DAergic neurons in the VTA encoding social interaction significantly inhibited or promoted cocaine relapse. Lastly, Social-DAergic engram and relapse-DAergic engram in the VTA establish different connections with the brain regions involved in this processing

Conclusion This study provided the evidence that distinct subpopulations of DAergic neurons in the VTA are involved in social interaction and relapse, and selective activation and inhibition of the memory engram of social interaction in the VTA effectively inhibited and promoted drug relapse. Future studies will explore the input of DAergic neurons engram in the process of social interactions therapeutic effects against cocaine relapse by combining cross-synaptic engram tracer, brain patch clamp, and optogenetic, and reveal the circuitry mechanism of natural reward and drug reward interaction

关键词: Social interaction, cocaine relapse, VTA, DAergic neurons, memory engram

Effects of A Virtual Reality Alcohol Addiction Withdrawal System on Craving and Relapse in Alcohol Use Disorder Inpatients: A Real-world Randomized Controlled Trial

Dapeng Zhang¹, Qiuping Huang⁴, Mingfeng Du¹, Dongli Fan¹, Xiangyun Zhou¹, Yu Liu¹, Yangliu Wang¹, Fanfan Luo¹, Yongzhen Yu¹, Xiaolou Yang¹, Zhiwei Liu¹, Yun Liu¹, Hongxian Chen^{2,3}

2.The Second Xiangya Hospital of Central South University

3.Chinese National Clinical Research Center On Mental Disorders (Xiangya)

4.School of Humanities and Management of Hunan University of Chinese Medicine

Objectives Alcohol Use Disorder (AUD) is a chronic relapsing brain disease characterized by persistent inability to control alcohol consumption despite adverse consequences. This study aimed to evaluate the efficacy of Virtual Reality (VR)-based interventions, specifically VR cue exposure therapy (VR-CET) and VR-CET combined with aversion therapy (VR-CET+AT), in reducing alcohol cravings and relapse rates among hospitalized AUD patients compared to standard care.

Methods From January 2021 to March 2023, we conducted a randomized controlled trial with 152 AUD inpatients, whom were randomly assigned to three groups, a control group (n=51), a virtual reality-cued exposure therapy (VR-CET) group (n=50), and a virtual reality-cued exposure therapy + aversion therapy (VR-CET+AT) group (n=51). The three groups were given neutral scene, cue exposure therapy and cue exposure therapy + aversion therapy through the VR system. Each group received a total of 16 sessions of VR therapy. All three groups received standard medication and general psychotherapy. At baseline and at the end of treatment, patients' cravings were assessed using the Pennsylvania Alcohol Craving Scale (PACS) and the Alcohol Abstinence Self-Efficacy Scale (AASE). At 1-, 3-, and 6-months post-discharge, patients' primary outcomes of abstinence and relapse were assessed by patient and family follow-up reports. At 6 months after discharge, patients were compared on secondary outcome indicators of sustained abstinence, readmission, hospitaliza-

tion intervals, and death. Treatment-related adverse effects and safety were assessed by a self-administered questionnaire for each group of patients

Results As a primary outcome, there was a significant decrease in PACS ($p < 0.01$) and a significant improvement in AASE ($p < 0.01$) in all three groups compared to baseline levels. The VR-CET+AT group had a significantly higher effect on alcohol craving levels than the other two groups. In terms of improvement in self-efficacy scores for refusal to drink, the VR-CET+AT group was comparable to the VR-CET group ($p > 0.05$) and both were better than the control group ($p < 0.05$). Compared with the standard treatment group, patients in the VR-CET and VR-CET+AT groups had significantly lower rates of return to drinking 1 month after discharge ($p < 0.05$) and were significantly lower than those in the control group ($p < 0.05$). However, the rate of return to drinking gradually increased in all three groups over time ($p < 0.01$), and the difference between the groups gradually narrowed until it was no longer significant after 6 months ($p > 0.05$). In terms of secondary outcomes, the interval between hospitalizations was longer in the VR-CET group and the VR-CET+AT group, but the difference in readmission and mortality rates between the two groups was not significant. Participants reported few adverse events or side effects that were mild and transient, including dizziness, nausea, excessive dreaming, and mild anxiety

Conclusion This study shows that VR-CET and VR-CET+AT effectively reduce short-term alcohol cravings and enhance self-efficacy for alcohol refusal in AUD patients. However, their long-term impact on abstinence is limited, indicating the need for these interventions to be part of comprehensive, long-term treatment plans. The results highlight VR technology's potential as a safe and effective AUD treatment component, but also the necessity for ongoing reinforcement and combining VR with other evidence-based strategies. Further research is needed to optimize and sustain VR interventions' benefits in AUD treatment.

网络游戏成瘾相关的全基因组关联研究

刘王玥¹ 时杰¹ 孙艳¹ 黄宇辰¹ 贾天野²

1.北京大学

2.复旦大学

目的 近年来网络游戏成瘾 (Internet Gaming Disorder, IGD) 问题日益凸显, 严重危害未成年人及大学生群体的精神心理健康。IGD 受到遗传因素的影响, 但其分子遗传学机制及其与精神疾病及物质成瘾的遗传关联仍不清楚。本研究旨在发现与 IGD 相关的遗传风险因素及其与精神疾病和物质成瘾的遗传关联。

方法 本研究数据基于美国青少年脑认知发育队列第三年随访数据, 年龄为 12.91 ± 0.64 岁。采用视频游戏成瘾问卷评估游戏成瘾程度。基因数据质量控制要求包括: SNP 水平检出率 $> 95\%$ 、次要等位基因频率 (MAF) > 0.001 、哈迪温格伯平衡测试 $P > 1 \times 10^{-6}$; 个体水平年龄或性别信息完整、检出率 $> 95\%$ 、常染色体杂合性 $< 3sd$ 、血缘同源指数 (IBD) $PI_HAT < 0.2$ 。控制变量包括年龄、性别、遗传结构前 10 个组成分。采用多基因风险评分分析物质使用障碍、精神疾病与 IGD 的遗传关联, GWAS summary 数据集来源于 PGC 队列, GWAS Catalog 和本团队之前建立的物质成瘾队列等。

结果 本研究共纳入样本 5865 人 (男: 3547, 女: 2318 人), 共有 4,032,260 个合格 SNP。结果发现 7 号染色体 rs376069954 ($P = 1.53e-13$) 与网络游戏成瘾显著相关, 该 SNP 接近 EIF3IP1 基因。多基因风险评分遗传关联结果显示大麻成瘾 ($\beta = 1042.47$, $P = 0.0075$) 和尼古丁成瘾 ($\beta = 1500.47$, $P = 0.033$) 的遗传风险与 IGD 风险呈正相关; 海洛因成瘾遗传风险 ($\beta = -4329.48$, $P = 0.0011$) 与 IGD 风险呈负相关; 在最优模型下 ($P_{\text{threshold}} = 0.0002$), 甲基苯丙胺成瘾遗传风险 ($\beta = 180.782$, $P = 0.020$) 与 IGD 呈正相关, 但随着 P 值阈值的增加, 甲基苯丙胺成瘾与 IGD 表现出负相关的趋势。对于其他精神疾病, IGD 与进食障碍 ($\beta = 2928.96$, $P = 0.00029$)、孤独症 ($\beta = 3623.36$, $P = 0.0013$)、失眠 ($\beta = 46394.7$, $P = 0.0028$) 和多动症 ($\beta = 13796.10$, $P = 0.0055$) 的遗传风险呈正相关, 与强迫症 ($\beta = -2928.96$, $P = 0.00029$) 呈负相关。

结论 全基因组关联分析提示 EIF3IP1 基因多

态性与 IGD 显著相关。在多基因水平,发现 IGD 与大麻成瘾和尼古丁成瘾的遗传关联呈正相关,与海洛因成瘾和甲基苯丙胺成瘾的遗传关联呈负相关。此外,进食障碍、孤独症、失眠和多动症的遗传风险会增加 IGD 风险,但强迫症的遗传风险可降低 IGD 风险。未来我们将进一步分析与网络游戏行为发展趋势相关的遗传风险。

Single-cell Transcriptomic Analysis of Rat Anterior Cingulate Cortex Cells in Reward Behaviors Induced by Methamphetamine and Heroin

Manqing Wu¹, Yiying Zhou², Wenhua Zhou², Min Zhao¹

1. Shanghai Mental Health Center

2. The Affiliated Kangning Hospital of Ningbo University

Objective This study employs single-nucleus RNA sequencing to analyze the transcriptional states of various cell types in the anterior cingulate cortex (ACC) of Sprague-Dawley (SD) rats during methamphetamine (METH) or heroin self-administration reward behaviors. Special emphasis is placed on investigating transcriptional alterations and identifying common features of neuronal changes induced by these addictive substances during the reward process

Methods Male SD rats, weighing 300-320g and aged 8-10 weeks, underwent self-administration training with methamphetamine or heroin over 14 days, with saline serving as a control. Post-training, ACC tissue was collected for single-nucleus RNA sequencing. Data underwent quality control, normalization, dimensionality reduction, t-SNE clustering, cell type annotation, differential expression analysis, and functional enrichment analysis

Results In this study, 22,168 viable nuclei were analyzed, revealing nine distinct cell types including excitatory neurons, inhibitory neurons, astrocytes, microglia, oligodendrocytes, oligodendrocyte precursor cells,

newly formed oligodendrocytes, endothelial cells and undefined cells, identified by their characteristic gene expression profiles

In the heroin reward condition, 1,635 significantly differentially expressed genes (DEGs) were identified, including 947 DEGs specific to excitatory neurons. METH exposure resulted in 3,743 DEGs, with 1,244 DEGs specific to excitatory neurons. Across both conditions, 139 genes were consistently upregulated and 176 genes downregulated in excitatory neurons.

Functional enrichment analysis highlighted these commonly regulated genes in synaptic structures such as presynaptic and postsynaptic membranes, and in critical neuronal development processes like dendritic spine formation, synaptogenesis, and growth cone development. Pathway analysis revealed enrichment in pathways such as retrograde endocannabinoid signaling, morphine addiction, glutamatergic synapse function, and relaxin signaling.

Protein-protein interaction analysis revealed distinct regulatory networks in excitatory neurons under heroin and METH rewards. Heroin-induced DEGs formed networks centered on ligand-gated ion channel activity, presynaptic membrane potential regulation, and transcriptional co-regulation, while METH-induced DEGs clustered around NMDA-selective glutamate receptor complexes and protease activity.

Conclusion This study employed single-nucleus RNA sequencing technology to investigate transcriptional changes in excitatory neurons of the ACC in SD rats during methamphetamine or heroin reward behaviors. We found that both drug exposure models shared overlapping DEGs in excitatory neurons, particularly affecting synaptic structures and functions. These findings suggest commonalities in neuronal transcriptional changes induced by different substances during reward processes. This study provides a novel perspective on understanding the mechanisms underlying drug reward.

甲基苯丙胺成瘾者的强化学习障碍及其认知

神经机制

屈诗燕 郭垒 陈天真 苏杭 赵敏 江海峰*
上海市精神卫生中心

目的 甲基苯丙胺成瘾是一种严重的物质依赖问题，给社会带来了沉重的经济和卫生负担。药物成瘾的计算理论大多基于强化学习框架，认为成瘾是习惯学习系统的一种病理状态。过去的研究表明，成瘾者的强化学习能力受到损害，这些研究通常采用反应时间等传统指标。本研究采用计算建模技术来深入剖析奖惩学习过程中的学习特征，以探讨不同成瘾人群的差异。

方法 本研究招募了戒断时间在半年内的甲基苯丙胺成瘾者，按照 DSM-5 中甲基苯丙胺成瘾的诊断标准分为 27 名为轻度组、27 名为中度至重度组，并招募了 27 名未使用甲基苯丙胺的健康个体作为对照组。通过金钱奖励学习任务进行评估，使用 Simple-Q 模型进行强化学习过程的拟合分析。

结果 在这项货币强化学习任务中，我们观察到中重度组在奖励轮的 Beta 值(代表对奖励的敏感程度)明显高于健康组 ($p=0.0462$)，但轻度组与健康组之间没有明显差异。此外，在中重度组中，我们还发现符合 DSM5 标准的症状数量与 Beta 值呈正相关 ($r=0.485$, $p=0.0103$)。通过比较意外事件和预期事件反馈诱发事件相关电位的差值，研究观察到中至重度成瘾者相对正常对照在意外事件发生后 0.25 秒左右枕叶呈现较低的峰值 ($p=0.00280$)，左侧额叶则呈现较高的峰值 ($p=0.00196$)。时频分析结果显示，中至重度成瘾者在意外与预期结果之间 Theta 频段能量的差异出现了三个显著高于健康对照组的簇 ($p=0.000800$, $p=0.0720$, $p=0.0236$)，轻度成瘾者与健康人之间差异不明显。而在损失轮中没有观察到差异。

结论 本研究结果表明，健康人在看到意外结果后，其主要反应发生在与视觉相关的枕叶，表明他们主要在处理视觉信息而不是价值信息。相比之下，成瘾患者在看到反馈后，其主要信息处理区域位于与认知功能相关的左侧额叶皮层，说明他们可能在面对意外情况时付出了更多的认知资源，从而导致他们在后续选择过程中更加敏感，更加固化于对奖赏的寻求。这些发现揭示了甲基苯丙胺成瘾者可能存在的与正常人不同的奖励学习机制，为理解奖励、学习及成瘾行为的神经生理学机制提供了新

的视角。

激活/行为抑制双系统与冲动/控制双系统在尼古丁成瘾中的机制研究

宋佩佩¹ 宋佩佩² 焦东亮² 王立金² 段帆² 李翔宇² 李昊楠² 沐林林² 张静² 李勇辉¹

1.中国科学院心理研究所

2.蚌埠医科大学

目的 尼古丁的使用通常始于青少年时期，越早开始吸烟，戒烟就越困难，本研究旨在探讨激活/行为抑制双系统与冲动/控制双系统在大学生初次吸烟年龄和尼古丁成瘾之间的作用机制。

方法 2023 年 3 月 16 日-3 月 29 日在全国 21 所高校开展线上问卷调查，共发放问卷 13643，回收问卷 13205，回收率 96.79%。平均分布在中国六大区域，华北区 (10.03%)、东北区 (2.53%)、华东区 (2.53%)、中南区 (64.18%)、西南区 (10.19%)、西北区 (2.51%)；普通高等学校 (41.8%)，高职 (高专) 类学校 (58.2%)；采用一般情况调查表、宾州州立大学[电子]烟依赖指数量表 (PS[E]CDI)、冲动/控制双系统量表 (DMSC-S)、行为抑制/行为激活量表 (BIS-BAS scale)、患者健康问卷抑郁量表 (PHQ-9)、广泛性焦虑问卷 (GAD-7) 等工具进行网络问卷调查。

结果 (1) 在行为激活系统到冲动性的回归路径中，行为激活系统正向预测冲动性 ($\beta=0.134$, $P<0.01$)，行为抑制系统在行为激活系统与冲动性的关系中起到了正向的调节作用 ($\beta=1.367$, $P<0.001$)；在行为抑制系统到控制性的回归路径中，行为抑制系统正向预测控制性 ($\beta=0.134$, $P<0.01$)，行为激活系统在行为抑制系统与控制性的关系中起到了正向的调节作用 ($\beta=1.367$, $P<0.001$)。2. 尼古丁成瘾分数为因变量的回归分析中，首次吸烟年龄 ($\beta=-0.931$, $P<0.01$)、焦虑 ($\beta=0.062$, $P<0.001$)、抑郁 ($\beta=0.096$, $P<0.001$)、冲动性 ($\beta=0.057$, $P<0.05$) 与尼古丁成瘾相关，行为激活系统、行为抑制系统和控制系统没有进入回归方程，3. 进一步中介分析显示冲动性、焦虑、抑郁在首次吸烟年龄和尼古丁成瘾间是平行

链式中介关系, 总间接效应 15.44%。

结论 1. 在大学生的尼古丁成瘾中, 行为激活/行为抑制双系统互相作用调控了冲动/控制双系统, 两个双系统中, 只有冲动性发挥了更大的作用, 即冲动性强的个体可能更容易染上烟瘾; 2. 冲动性、焦虑、抑郁在首次吸烟年龄和尼古丁成瘾间发挥了平行链式中介效应。在干预大学生的烟瘾过程中, 应该关注这些因素, 才可能取得更好的效果。

抑郁状况在网络游戏时间与网络游戏障碍间的中介作用分析

段帆* 沐林林 宋佩佩 王立金 李翔宇 焦东亮
蚌埠医科大学

目的 抑郁情绪与网络游戏障碍(internet gaming disorder, IGD)存在关联, 但具体规律尚不明确。本研究旨在探讨抑郁状况在网络游戏时间与网络游戏障碍之间的中介作用, 为大学生网络游戏障碍的干预提供理论依据。

方法 于 2022 年 11 月至 12 月, 选取安徽某医学院 1527 名大学生为研究对象, 采用一般人口学问卷、网络游戏障碍量表 (IGD-20) 和抑郁症筛查量表 (PHQ-9) 进行评定, 使用 SPSS 软件和 R 软件分析大学生游戏时间、抑郁状况与网络游戏障碍之间的关系。

结果 (1) 不同游戏时间的单因素方差分析显示: 每天游戏时间 1-2 小时、2-4 小时及 4 小时以上的大学生在 IGD 得分和 PHQ-9 得分上均显著高于每天游戏 1 小时以下的群体 ($P < 0.05$); 每天游戏时间 2-4 小时与 4 小时以上的 IGD 得分和 PHQ-9 得分均无显著差异 ($P > 0.05$)。不同抑郁程度的单因素方差分析显示: 重度抑郁组 IGD 得分及 IGD 各因子得分均高于无抑郁和轻中度抑郁组 ($P < 0.05$)。(2) 大学生 IGD 得分与每天游戏时间、每天上网时间、上网年限及 PHQ-9 得分均显示出显著的正相关 ($P < 0.01$)。线性回归分析进一步揭示, PHQ-9 得分、每天游戏时间和性别是影响 IGD 得分的显著自变量, 它们共同进入回归方程并显著预测了 IGD 得分。(3) 分别对无抑郁、轻中度抑郁和重度抑郁三组进行中

介效应分析, 结果显示在控制干扰变量后, 只有在轻中度抑郁组中, PHQ-9 得分在每天游戏时长和网络游戏障碍得分间发挥部分中介作用, 中介效应值为 0.150, 95% 置信区间为 [0.014, 0.357]。在无抑郁组和重度抑郁组中, PHQ-9 得分未表现出中介作用。(4) 对无抑郁、轻中度抑郁和重度抑郁三组分别进行网络分析, 结果显示: 无抑郁组和重度抑郁组的网络连接具有相似性, 两组网络中紧密度最强、中介度最强和预期影响最强的节点均为耐受因子。

结论 网络游戏时间与网络游戏障碍呈现正相关, 抑郁状况虽然影响网络游戏障碍的严重程度, 但是只有在轻中度抑郁情况下, 抑郁在网络游戏时间和游戏障碍之间起到中介因素, 对这部分人群进行抑郁情绪的干预可能对治疗网络游戏障碍会起到较好的治疗效果。

Sex Differences in The Interrelationships between Childhood Trauma, Social Support, Personality Traits, Negative Emotions, and Gaming Disorder: A Network Analysis and Structural Equation Modeling Approach

Fei Cheng Jiang Du* Lei Guo Yawen Shi Tianzhen Chen

shanghai mental health center

Objective Gaming disorder (GD) causes significant psychological distress and impairment, impacting individuals' functioning. Current research lacks clarity on the complex interactions and gender-specific factors contributing to GD. This study aims to delineate core risk factors associated with childhood trauma, personality traits, negative emotions, and GD, using a network analysis and structural equation modeling approach to understand gender differences

Methods A sample of 1073 Chinese participants aged 18-35 was analyzed using an online survey. GD symptoms, childhood trauma, personality traits, impulsivity, social anxiety, depression, and anxiety were assessed with various scales. The EBICglasso network model was used to identify core symptoms. Directed

Acyclic Graphs (DAG) were employed to infer causal pathways among core symptoms, which were further validated through Structural Equation Modeling (SEM)

Results The EBICglasso networks found distinct gender-specific core symptoms in different symptom groups. The DAG and SEM identified stable and significant causal pathways to GD in different sexes. In males, GD symptoms were primarily influenced by negative emotions, with "Suicidal ideation" and "Low energy" being key contributors. For females, the pathway involved childhood trauma impacting personality traits and negative emotions, ultimately leading to GD symptoms

Conclusion The findings underscore the importance of gender-specific intervention strategies for GD. For males, interventions should focus on emotional regulation and reducing suicidal ideation. For females, addressing anxiety and depressive symptoms linked to childhood trauma is crucial. These gender-specific pathways highlight the need for tailored treatment approaches to effectively mitigate GD symptoms and their underlying risk factors.

The Microcirculatory Mechanisms of μ Opioid Receptors in The IL Mediate Heroin Self-administration

Yiying Zhou², Yiying Zhou¹, Wenhua Zhou^{1,2}

1. Ningbo University

2. Department of psychiatry, Affiliated Kangning Hospital of Ningbo University, Ningbo 315201, Zhejiang, China

Objective Heroin is a synthetic opioid drug with strong addictive properties which causing opioid overdose leading to death easily. Our early research had found that the glutamate projection pathway from the infralimbic cortex (IL) to the nucleus accumbens shell (NAcS) during heroin reward processes regulates the reward value of heroin. However, the excitation of neural

microcircuits by IL and its underlying mechanisms are not yet clear. Thus we aim to investigate the role of μ opioid receptors (MOR) in the IL in heroin addiction and the neural microcirculation mechanisms within it

Methods Rats were injected with AAV-Gcamp6s, a calcium signaling virus, and implanted with optical fibers in the IL, then were underwent heroin self-administration training for 14 days. Record of neuronal excitability in the IL of rats was executed during the heroin self-administration training when pressing the pedal at the concentrations of 0.025mg/kg, 0.05mg/kg, and 0.1mg/kg. Subsequently, the cannula was implanted in the IL of rats, followed by heroin self-administration training. The rats were microinjected with Saline, [d-Ala²,N-Me-Phe⁴,Gly⁵-ol]-enkephalin (DAMGO) or naltrexone (NTX) into the IL after 14 days of heroin self-administration. The effects of drug microinjection on the heroin self-administration behavior were evaluated. Meanwhile, the expression of different type of c-Fos immunoreactive neurons in the IL was also detected by immunofluorescence

Results Among the three concentrations of heroin self-administration, 0.05mg/kg of heroin induced the strongest the calcium signal peaks in the IL ($P < 0.05$). After microinjection with drug in the IL, DAMGO increased heroin intake behavior when compared with the control group and shortened the heroin inter-infusion interval significantly ($P < 0.01$). On the contrary, compared with control group, NTX significantly reduced heroin intake behavior ($P < 0.05$). At the same time, the proportion of activated pyramidal neurons was increased significantly when compared with vehicle group ($P < 0.01$). After intra-IL NTX, the proportion of activated pyramidal neurons was decreased ($P < 0.01$), activated PV interneurons and SST interneurons were increased when compared with vehicle ($P < 0.05$). Intra-IL DAMGO increased the proportion of activated pyramidal neurons, activated PV interneurons. However, it is not difference for activated SST interneurons among control, vehicle, intra-IL vehicle and intra-IL DAMGO rats

Conclusion Self-administration of heroin can excite pyramidal neurons in the IL, which may be due to its inhibitory effect on pyramidal neurons by acting

on MOR in SST neurons in the IL

关键词: heroin self-administration; μ opioid receptors; glutamatergic neurons; infralimbic cortex

青春期社会隔离对成年小鼠吗啡成瘾易感性的影响

李宜俊¹ 李宜俊² 刘睿娜¹ 朱峰¹ 朱峰²

1. 西安交通大学第一附属医院转化医学中心

2. 西安交通大学第一附属医院精神心理科

目的 早期生活应激已被证明会引起大脑回路、压力反应的变化。已有研究发现,青少年社会压力应激有可能影响中枢神经系统和对药物成瘾的易感性。内侧前额叶皮层、伏隔核和纹状体均是与药物成瘾密切相关的犒赏回路中的脑区,寻找青春期社会应激增加吗啡成瘾易感性在脑内犒赏回路中的作用靶点,对治疗早期生活应激导致的药物成瘾易感性增加具有关键作用。

方法 我们构建了青少年社会隔离小鼠模型,然后使用吗啡和生理盐水分别对青春期群居(n=12)和青春期社会隔离小鼠(n=12)进行条件位置偏好实验,以研究青春期社会隔离对吗啡成瘾易感性的影响。接着我们采用 Illumina RNA-seq 技术对各组小鼠的内侧前额叶皮层、伏隔核和纹状体脑区进行了 mRNA 测序,对伏隔核脑区进行了 lnc RNA (长链非编码 RNA) 测序,以研究青春期社会应激和吗啡双重作用介导的基因表达特征和机制的改变。

结果 在吗啡条件位置偏好实验中,我们发现青春期经过社会隔离的小鼠表现出对吗啡的偏好增加。在 \log_2 (倍数变化) $\geq |\pm 1.0|$ 和 p 值 < 0.05 前提下,我们发现经历过青春期社会隔离的组小鼠与未经历过社会隔离的小鼠相比,在纹状体脑区中上调差异基因显著增加。通过基于基因集富集分析(GSEA)的基因本体论(GO)和京都基因和基因组百科全书(KEGG)分析确定了基因的潜在生物学功能,在伏隔核、内侧前额叶皮层和纹状体脑区中差异基因的 KEGG 通路主要富集在信号分子相互作用、免疫系统和消化系统相关通路,其中最显著的为信号分子相互作用通路。基因本体分子生物学过程富集分析表明,腺苷脱氨酶活性显著上调。在伏隔核 lnc RNA 测序中,差异基因主要富集在 KEGG

通路中的翻译、细胞通信和神经系统相关通路,其中翻译通路中的改变最显著。

结论 青春期社会隔离导致成年期小鼠吗啡成瘾的易感性增加,其主要可能原因为转录组中信号分子相互作用和腺苷脱氨酶活性相关的基因改变和 lnc RNA 中的翻译通路的改变。

赌博障碍患者大脑兴奋-抑制网络平衡失调及其与冲动性的关系

薛超¹ 魏涵宇¹ 刘静洋¹ 程菲¹ 吴成聪^{2,3} 李文杰¹ 李梦菲¹ 杨珮琼¹ 魏义承¹ 钟刚亮¹ 杜江¹

1. 上海交通大学医学院附属精神卫生中心

2. 芜湖市第四人民医院

3. 蚌埠医科大学

目的 根据大脑临界性假说,健康大脑的神经活动处于有序和无序之间的临界状态,表现为神经网络的兴奋-抑制平衡,代表了最佳信息加工能力。然而,成瘾会导致神经网络兴奋-抑制平衡失调,使大脑偏离临界状态,并伴随着风险决策行为改变。赌博障碍的核心特征之一是冲动性,风险决策异常是其关键临床特征之一。目前缺乏从大脑临界性角度考察赌博障碍患者在电生理和风险决策行为变化的研究。长时程相关性(Long range temporal correlations, LRTC)是大脑临界性的可靠指标,计算的是时间序列信号在长时间尺度上的自相似性。本研究结合静息态脑电图(Electroencephalogram, EEG)和风险决策任务探索赌博障碍的大脑临界特性,关键目标是考察静息态 EEG 和风险决策行为的 LRTC 的变化及其与冲动性的关系,有望为成瘾障碍的临床诊断提供可靠的标记物。

方法 招募 58 名赌博障碍受试者和 34 名年龄及性别匹配的健康对照受试者,采用冲动性量表(BIS-11)和自我控制量表(SCS)评估冲动性和自控力,使用 EEG 记录静息状态下的大脑活动,并使用仿真气球冒险任务(Balloon analog risk task, BART)评估风险决策行为。在 BART 任务中,受试者决定给气球充气的次数以最大化奖励并避免气球爆炸所带来的损失,提取每次充气反应时组成风险决策行为时

间序列用于 LRTC 分析。使用去趋势波动分析测量 EEG 信号在 5 个频段(Delta(1-4Hz), Theta(4-8Hz), Alpha(8-13Hz), Beta(13-30Hz)和 Gamma(30-45Hz))及风险决策行为反应时时间序列的 LRTC。

结果 (1)赌博障碍受试者在前额中央区、顶叶中央区及左侧顶叶的 Delta 频段上的 LRTC 显著高于健康对照组($p < .05$), 在行为 LRTC 上显著低于健康对照组($p = .044$)。 (2)赌博障碍受试者 Delta 频段的 LRTC 与 SCS 中抵制诱惑和节制娱乐两个子维度呈显著负相关($p < .05$)。 (3)赌博障碍受试者风险决策行为的 LRTC 与 BIS-11 中行为冲动性子维度呈显著正相关($p = .038$), 与 SCS 中冲动控制子维度呈显著负相关($p = .030$)。

结论 赌博障碍受试者 EEG 信号 Delta 频段和风险决策行为时间序列上的 LRTC 与健康受试者有显著差异, 表明其大脑活动临界性的改变, 提示了信息加工能力受损。此外, 赌博障碍受试者的大脑临界状态 EEG 特征以及行为特征与冲动特质和自控力显著相关, 提示了成瘾障碍大脑临界特性对临床特征的预测潜力。

Lower Social-connectedness in Reality To Severe Anger Among Adolescents with Internet Gaming Disorder: A Multi-centre, Large-sample and Cross-sectional Study

Xia Yang Jiajun Xu*

West China Hospital of Sichuan University

Objective Although internet improves modern life, the corresponding consequences of internet gaming disorder (IGD), low social-connectedness and anger-emotion are emerging as global concerns. In conclusion, IGD is more prevalent in adolescents and is strongly associated with anger emotion. However, the association among IGD, low social-connectedness and anger is unknown. Given the cognitive-appraisal theory, we hypothesize that adolescents with IGD (pathological behavior) could more prone to have angry emotion (nega-

tive emotion) under influence of the low social-connectedness (dysfunctional cognition). To address these, we conducted a multi-center, larger-sample and cross-sectional study in adolescents to explore the relationship among IGD, low social-connectedness and anger and to further explore the detection rate of IGD, low social-connectedness and anger among this subgroup.

Methods This was a cross-sectional multi-center study enrolled 9,616 adolescents (11-19 years) from multi-center in China from September 2022 to March 2023. The 20-item revised Social Connectedness Scale (SCS) has been used to estimate the social-connectedness, 9-item Internet Gaming Disorder Scale-short (IGD) Form has been used to estimate the Internet game disorder, and 6-item DSM-5-TR-Level 2-Anger (Anger) Form has been used to estimate the anger mood. Mediation-analysis was performed with IGD scores as the independent variable, anger scores as the dependent variable and the SCS scores in Internet and in Reality, as proposed mediators. Confounding variables of age and sex were included in mediation models

Results The mean \pm SD age, mean scores for IGDS9-SF, Anger-6, RSCS and ISCS were 14.9 ± 1.7 years old, 14.4, 10.9, 84.9 and 77.6. 197 (2.05%) adolescents had been estimated as probable IGD, 364 (3.79%) reported severe-anger, and 1056 (10.98%) shown low reality social-connectedness (RSCS). After controlling for demographic characteristics, probable IGD and RSCS score, younger-adolescents (OR=1.12; 95% CI: 1.04-1.20), female (OR=2.16; 95% CI: 1.67-2.79), probable IGD (OR=5.17; 95% CI: 3.30-8.08) and low RSCS (OR=7.21; 95% CI: 5.61-9.27) are also independent risk factors for having severe-anger. Anger-6 score was positively associated with IGDS9-SF score ($r = 0.34$) and negatively associated with RSCS ($r = -0.41$) and ISCS ($r = -0.12$) scores. Moreover, Anger-6 score was negatively associated with RSC_N ($r = -0.46$) and ISC_N ($r = -0.38$) scores. IGDS9-SF score was negatively correlated with RSCS ($r = -0.33$), RSC_N ($r = -0.39$) and ISC_N ($r = -0.40$) scores. However, ISC_P score was negatively associated with ISC_N ($r = -0.38$) and RSC_N ($r = -0.25$) scores. RSCS, ISCS and SCSSM scores partially mediated the effects of IGDS9-SF score on Anger-6 score with the indirect-mediation effects of 29.50%,

1.67% and 17.88%. Furthermore, the RSCS could partially mediate the effects of IGD on Anger with indirect-effect of 29.50%

Conclusion In the study, we found that IGD (pathological behavior) not only have direct effect on severe anger (negative mood) but also have indirect contribution to severe anger partially mediated by social-connectedness (dysfunctional interpersonal cognition). Furthermore, the negative dimension of social-connectedness in Internet might be more effective in illustrating adolescents' real perceptual experience than the positive dimension. The results provide new insights into the basic phenomenology, etiology and interaction between IGD, social-connectedness and severe anger.

Distressful Psychotic-like Experiences Mediate The Relationship between Social Media Addiction and Suicidal Behaviors: A Large-scale Cross-sectional Study Among Chinese Adolescents

Peng Pu¹, Zhangming Chen², Yanhui Liao¹

1.Department of Psychiatry, Sir Run Run Shaw Hospital, Zhejiang University School of Medicine, Hangzhou, Zhejiang, P. R. China

2.Zigong mental health center

Objective Emerging studies indicate a positive association between social media addiction (SMA) and suicidal behaviors. However, few studies have examined this relationship among Chinese adolescents, and the underlying mechanisms between SMA and suicidality remain largely unexplored. This study aimed to investigate the association between SMA and suicidal behaviors among a substantial sample of Chinese adolescents and to evaluate the potential mediating role of distressful psychotic-like experiences (PLEs) in this relationship

Methods A total of 124,718 adolescents with recent social media use experience were recruited using

cluster sampling methods from 170 middle schools in Zigong City. Suicidal behaviors, including current suicidal ideation and previous suicide attempts, were assessed through screening items. SMA and PLEs were evaluated using the Bergen Social Media Addiction Scale (BSAMS) and the 16-item Prodromal Questionnaire. The 9-item Patient Health Questionnaire and the 7-item Generalized Anxiety Disorder questionnaire were used to detect mental distress. Multiple logistic regression models and path analyses were performed, with demographics and other mental distress factors as covariates

Results The prevalence rates of SMA, distressful PLEs, and suicidal behaviors were 1.5% (n=1,849), 10.6% (n=13,242), and 17.3% (n=21,627), respectively. Adolescents with SMA demonstrated significantly higher prevalence rates of distressful PLEs (54.6% vs. 10.0%, $p<0.001$) and suicidal behaviors (60.5% vs. 16.7%, $p<0.001$) compared to those without SMA. After full adjustments, both SMA (adjusted odds ratio [AOR], 1.51; 95% confidence interval [CI], 1.34-1.70; $p<0.001$) and distressful PLEs (AOR, 2.95; 95% CI, 2.80-3.09; $p<0.001$) were independently related to suicidal behaviors. Distressful PLEs partially mediated the relationship between SMA and suicidal behaviors, with a mediation ratio of 63.3%

Conclusion SMA in adolescents is strongly associated with suicidal behaviors, and distressful PLEs mediate this relationship. Parents, teachers, and clinicians should be aware of the high suicidal risk in this vulnerable population. Targeting PLEs may hold promise in reducing suicidal risk among adolescents with SMA

外侧缰核神经元的簇状放电对可卡因消退学习及复吸行为的影响

陆唐胜 陆林*
北京大学

目的 预防复吸是治疗药物成瘾的关键, 基于记忆消退理论的线索暴露疗法可在一定程度上抑制成瘾记忆, 但其疗效并不持久, 因此亟需寻找可持久抑制成瘾记忆, 甚至消除成瘾记忆预防复吸的手段。应激是诱发复吸的重要因素之一, 既往研究发现应激可通过激活应激和边缘系统诱发复吸。另一方面, 应激能够调节记忆的动态过程, 可促进记忆巩固或增强记忆消退, 提示适当的应激可能会促进成瘾记忆消退, 进而预防复吸。外侧缰核 (Lateral habenula, LHb) 在情绪调节、应激反应、学习和记忆以及奖赏中起着关键作用。然而, 目前尚不清楚 LHb 是否在应激与成瘾记忆的消退学习之间发挥重要调节作用。本研究采用可卡因自身给药作为成瘾动物模型, 探索应激系统的关键脑区 LHb 在应激-消退范式中的作用机制, 以期预防药物成瘾复吸提供新的思路

方法 (1) 在可卡因自身给药大鼠动物模型的基础上建立应激-消退行为范式; (2) 使用光纤记录技术观察急性足底电击过程中 LHb 脑区的实时活动变化; (3) 使用在体电生理技术观察给予急性足底电击前后 LHb 脑区神经元放电变化; (4) 使用光纤记录技术观察 LHb 神经元钙信号在消退训练和复吸测试中的活动情况, 进一步明确 LHb 神经元活动在应激-消退范式中的动态变化; (5) 采用脑片膜片钳技术探索应激-消退范式对 LHb 神经元电生理特性的影响。

结果 (1) 可卡因自身给药训练后的消退训练和复吸测试的行为学结果表明, 应激后进行消退训练 (应激-消退范式) 能够加快觅药行为的消退, 从而抑制小剂量药物诱导的复吸, 且应激-消退范式并不增加焦虑样行为; (2) 光纤记录结果显示, 急性足底电击能够导致 LHb 脑区瞬时激活; (3) 在体电生理结果显示, 与足底电击前相比, 足底电击结束 30min 后 LHb 神经元放电明显增加, burst 的活动显著增加, 并且 LHb 神经网络连接活动发生改变; (4) 光纤记录结果显示, 应激-消退组在消退学习和复吸测试过程中线索诱发的 LHb 抑制性钙信号减少; (5) 体外电生理结果发现, 与单纯的消退训练相比, 应激-消退组 LHb 神经元的自发放电、诱发动作电位显著增加, 且 burst 型放电比例显著增加。

结论 研究表明, LHb 在消退学习过程中起到价值编码的作用, 而足底电击后的应激状态能够增强这种价值编码的功能。此外, 应激-消退范式对消退学习的影响与 LHb 神经元的兴奋性以及放电模

式有关, 揭示了应激-消退范式作为预防复吸的治疗策略的神经机制。

美沙酮维持治疗患者睡眠质量及其影响因素研究

唐蕴¹ 杨梅¹ 范妮²

1. 深圳市康宁医院

2. 广州医科大学附属脑科医院

目的 对美沙酮维持治疗 (MMT) 患者的睡眠质量进行调查并分析其影响因素, 为提升美沙酮维持治疗患者睡眠质量、尽早实现综合康复提供依据。

方法 从 2019 年 5 月到 12 月在广州医科大学附属脑科医院 MMT 门诊接受美沙酮维持治疗的 197 例患者完成了自制调查问卷、贝克焦虑量表 (BAI)、贝克抑郁量表 (BDI)、匹兹堡睡眠质量指数 (PSQI)。先后使用单因素线性回归和用多因素线性回归分析其睡眠质量及其影响因素。

结果 在睡眠质量的单因素分析结果提示, 美沙酮治疗剂量 21~100mg 组 (57 例, 占 28.9%) 相对于 20mg 及以下组 (140 例, 占 71.1%) PSQI 得分更高 ($B=1.350, P=0.033$)。BAI 得分、BDI 得分越高的患者 PSQI 得分越高, 提示随着 MMT 患者焦虑水平、抑郁水平的升高其睡眠质量可能下降, 影响有统计学差异 BAI 得分 ($B=0.200, P<0.001$), BDI 得分 ($B=0.302, P<0.001$)。进一步多因素线性回归分析表明, BAI 得分、BDI 得分越高的患者 PSQI 得分越高, 提示随着 MMT 患者焦虑、抑郁水平的升高其睡眠质量可能下降, 影响有统计学差异 BAI 得分 ($B=0.109, P=0.001$), BDI 得分 ($B=0.178, P<0.001$)。虽然在单因素线性回归分析中呈现的美沙酮治疗剂量 21~100mg 组相对于 20mg 及以下组 PSQI 得分更高, 而多因素线性回归分析中上述影响消失, 因此怀疑是否 BAI 得分、BDI 得分中介了美沙酮剂量对 PSQI 得分的影响。通过中介效应分析发现目前美沙酮剂量对 PSQI 得分的影响是间接效应, 非直接效应。是 BAI 得分中介了美沙酮剂量对 PSQI 得分的影响。提示可能美沙酮剂量通过增加患者焦虑水平而间接降低睡眠质量。而 BDI 得分未被发现在美沙酮剂量影响 PSQI 得分的过程中存在中介效应。

结论 MMT 患者焦虑水平、抑郁水平的升高其睡眠质量可能下降。美沙酮剂量可能通过增加患者焦虑水平而间接降低睡眠质量。

Mapping The Relationship between Alcohol Use Disorder and Cognitive Disorders: A 20-year Bibliometric Study

Ao Xiang^{1,2}, Bojie Zhou^{1,2}, Yonglong Chang³, Xuhui Zhou^{1,2}

1.Hunan University of Chinese Medicine

2.Brain Hospital of Hunan Province (The Second People's Hospital of Hunan Province)

3.The Second Xiangya Hospital

Background Alcohol addiction, alternatively referred to as alcoholism or alcohol use disorder (AUD), is regarded as a medical and psychological condition. Cognitive disorders (CDs) refer to a range of conditions that affect cognitive functions such as memory, thinking, perception, and problem-solving. It's important to note that alcohol addiction and CDs often coexist. Excessive and prolonged consumption of alcohol can lead to a decrease in cognitive function, while impaired cognitive abilities can also heighten the likelihood of developing an addiction to alcohol. However, the research structure and research hotspots of the relationship between AUD and CDs lack visualization, and the elaboration of potential research areas remains to be discovered

Objective To comprehensively discuss the relationship between AUD and CDs' research status and development trend

Methods Publications from 2002 to 2022 were obtained using the Web of Science Core Collection database and subsequently filtered according to the specified inclusion criteria. To gain a visual representation of the research trends in this area, a range of software tools were utilized, including CiteSpace, VOSviewer, Scimago Graphics, and Microsoft Office Excel. The analy-

sis of the country, institution, author, and research contributions was made easier with the help of these tools

Results In the end, a grand total of 516 studies were discovered. Since 2002, the number of publications on the subject has steadily increased. The USA has made the largest contribution in the field. Alcoholism-Clinical and Experimental Research is the top productive journal with 45 papers, and Frontiers in Psychiatry Pharmacology Biochemistry and Behavior has the highest average citation (92.27). Pierre Maurage, the professor, stands out as one of the most productive writers in this particular area. Keyword co-occurrence analysis indicated that the terms "Alzheimer's disease", "working memory", "adolescence", "bipolar disorder", and "adult neurogenesis" had the highest frequency of occurrence, revealing the research hotspots and trends in the field

Conclusion This bibliometric analysis assesses trends in alcohol addiction and cognitive impairment and provides a useful view of current research and future directions in the study of alcohol addiction and cognitive impairment. The study shows that there has been a general increase in the number of publications in the field over the past two decades, but inter-agency cooperation still needs to be strengthened. The US still leads in this field. It is advisable to pay attention to the latest hot topics such as "Neural Circuits", "Social Cognition", and "Adolescence".

Cognitive Control in Individuals with Prolonged Heroin Use Disorder: Based on Drift Diffusion Model

Wei Zhao Haifeng Jiang Hang Su Tianzhen Chen Min Zhao*

Shanghai Mental Health Center

Objective Although impaired cognitive control is common during the acute detoxification phase of substance use disorders (SUD) and is considered a major cause of relapse, it remains unclear after prolonged

methadone maintenance treatment (MMT). The aim of the present study was to elucidate cognitive control in individuals with heroin use disorder (HUD) after prolonged MMT and its association with previous relapse

Methods A total of 94 HUD subjects, including 41 relapsers, 22 non-relapsers (mean MMT duration: 12.24 ± 2.92 years) and 31 healthy controls were enrolled in this study. Eye tracking tasks, prospective memory tasks, the Behavior Rating Inventory of Executive Function-Adult Version (BRIEF-A) and the Prospective and Retrospective Memory Questionnaire (PRMQ) were used to assess cognitive control

Results HUD individuals exhibited worse saccade error rate and executive dysfunction but showed better reaction times and no significant impairment in prospective memory. We fitted error rates and reaction times using a drift-diffusion model (DDM), which showed that HUD patients were more inclined to ignore task accuracy in order to speed up reaction times. Additionally, the relapsers performed worse in terms of antisaccade amplitude and velocity at higher difficulty gradients (11° and 16°). Antisaccade performance in terms of amplitude and velocity was negatively correlated with executive function scores. Deficits in inhibition, cognitive flexibility, and self-monitoring were found to mediate the relationship between previous relapse and impaired antisaccade performance

Conclusion Even after prolonged MMT, HUD individuals still show partial deficits in cognitive control and antisaccade performance. Importantly, DDM shows that HUD patients sacrifice accuracy for speed in the decision-making process, reflecting the more impulsive decision-making behaviour of HUD patients compared to healthy subjects. Besides, previous relapse exacerbates deficits in antisaccade amplitude and velocity among HUD individuals, mediated by dysfunction in inhibition, cognitive flexibility and self-monitoring, particularly at higher difficulty gradients. Future studies could include antisaccade tasks with different difficulty gradients to identify saccade biomarkers that predict relapse in individuals with SUD. Furthermore, cognitive training is crucial for facilitating the reintegration of SUD individuals into society

Exploring Cortical GABA in Addiction: From Mechanisms To Therapeutic Perspectives

Sai Shi Tianzhen Chen Hang Su Min Zhao*
Shanghai Mental Health Center

Gamma-aminobutyric acid (GABA) plays a crucial role in the regulation of neural activity within the medial prefrontal cortex (mPFC), a brain region critically involved in executive functions and behavioral control. This neurotransmitter exerts inhibitory effects that are essential for maintaining the balance and proper functioning of neural circuits. Recent preclinical studies have highlighted that dysregulation of GABAergic signaling in the mPFC is implicated in the pathophysiology of addiction, manifesting as increased vulnerability to drug addiction and chronic drug use. Such dysregulation disrupts the delicate equilibrium of neural activity, leading to impaired decision-making and behavioral control that are hallmark features of addictive disorders. In this review, we delve into the diversity of GABA interneurons (INs) within the mPFC, examining their varied types, connectivity patterns, and specific roles in contributing to addiction vulnerability. GABA INs are a heterogeneous group of cells that modulate the activity of principal neurons and other interneurons, thereby shaping the overall output of the mPFC. Understanding the distinct subtypes of these interneurons, including their unique molecular markers and electrophysiological properties, is crucial for elucidating their contributions to the neural circuitry underlying addiction. Moreover, we investigate how these GABA INs and their networks change over time with chronic drug exposure. Prolonged drug use induces neuroplastic changes that can alter the function and connectivity of these interneurons, potentially leading to a persistent state of neural circuit dysregulation. Finally, we focus on non-invasive brain stimulation (NIBS) as a promising therapeutic approach for targeting GABA INs in the treatment of addiction.

Techniques such as transcranial magnetic stimulation (TMS) and transcranial direct current stimulation (tDCS) offer the potential to modulate neural activity and restore the function of disrupted neural circuits. By specifically targeting the mPFC and its GABAergic networks, NIBS may help to re-establish inhibitory control, improve executive functions, and reduce addictive behaviors. This therapeutic strategy represents a novel and non-invasive avenue for addressing the complex neural underpinnings of addiction, with the goal of achieving long-lasting recovery and improved quality of life for individuals struggling with substance use disorders.

The Beneficial Effect of Nitrate-Rich Juice on Cognitive Function: A Pilot Randomized Controlled Study in Patients with Alcohol Dependence

Xiangxue Li¹, Jie Chen¹, Hongqiang Sun¹, Ling Li¹, Yun Chen¹, Kangqing Zhao¹, Zhaojun Ni¹, Yu Liu², Lina Gu¹

1. Peking university sixth hospital

2. Anhui Mental Health Center

Objective Alcohol consumption has become increasingly prevalent in contemporary society and is known to cause cognitive impairment and dysregulation of inflammatory responses. Recent studies suggest that nitrate may have beneficial effects on cognitive function and alter the oral microbiota. However, the extent of nitrate's beneficial effects on alcohol-induced cognitive impairment and its impact on the oral microbiota's composition remains inadequately explored. We aim to investigate the effect of nitrate on the cognitive function of patients with alcohol dependence

Methods In this randomized, double-blind, placebo controlled, single-center pilot study, we recruited patients with alcohol dependence (AD) and administered 14-day dietary supplementation of either NO₃-rich beetroot (BR) juice (N = 31) or placebo (PL) (N =

30). We use Cambridge Automated Neuropsychological Test Battery (CANTAB) to measure the cognitive function and 16S rRNA gene sequencing to measure differences in the oral microbiota

Results The mean difference in Delayed Match to Sample (DMS-PCAD) change between the BR group and the PL group after intervention was 9.784 (95% confidence interval [CI], 1.846 to 17.72, p = 0.016). Improvements in the Rapid Visual Information Processing test (RVP-MDL) and Reaction Time (RTI-FMDMT) were observed after treatment in BR group (for RVP-MDL, 95% CI, -88.974 to -7.585, p = 0.020; for RTI-FMDMT, 95% CI, -86.475 to -3.436, p = 0.034). The composition of oral microbiota also changed a lot after nitrate supplement, among which the abundance of Capnocytophaga, Neisseria and Haemophilus increased but Veillonella and Prevotella decreased

Conclusion The intervention with nitrate-rich beetroot juice is associated with improved visual memory and reaction time in AD patients. Additionally, this intervention appears to improve risk adjustment in younger AD patients

Causal Effect of Gut Microbiota on Alcohol Dependence and Drinking Behavior: A Two-sample Mendelian Randomization Study

Yaqi Zeng^{1,2}, Xuhui Zhou^{1,2}, Zhe Chen³

1. Hunan provincial brain hospital

2. Hunan University of Chinese Medicine

3. The Second Xiangya Hospital

Objective There has been a growing number of studies reporting that the composition is linked to alcohol dependence and drinking behavior over the past few years. However, the causal effect of the gut microbiota remains unclear. In this study, we first conducted the large-scale MR analysis of causal effect of gut microbiota on alcohol dependence and drinking behavior

Methods We conducted a two sample Mendelian

randomization study by using summary statistics from MiBioGen's largest genome-wide meta-analysis ($N=13,266$), summary statistics on alcohol dependence (cases $N=8,485$; controls $N=20,657$) from PGC and drinking behavior (alcoholic drinks consumed per week, $N=414,343$) from SSGAC. Inverse variance weighted (multiplicative random effects), MR-Egger, weighted median, weighted model, Simple mode were used to investigate causal relationship

Results Inverse variance weighted (IVW) showed that genetic prediction of the order Bifidobacteriales and family Bifidobacteriaceae both reduced the risk of alcohol dependence (OR: 0.72, 95% CI: 0.57, 0.91, PIVW=6.50x10⁻³). Six gut microbiota increased the risk of AD, including phylum Lentisphaerae (OR = 1.19, 95% CI: 1.06, 1.33, PIVW=4.30x10⁻³), phylum Cyanobacteria (OR=1.34, 95% CI: 1.03, 1.74, PIVW=2.80x10⁻²), class Lentisphaeria (OR = 1.2, 95% CI: 1.06, 1.36, PIVW = 5.30x10⁻³), order Victivallales (OR = 1.2, 95% CI: 1.06, 1.36, PIVW=5.30x10⁻³), family Peptostreptococcaceae (OR=1.31, 95% CI: 1.07, 1.61, PIVW = 9.40x10⁻³), and genus Lachnospiraceae UCG010 (OR = 1.3, 95% CI: 1.02, 1.65, PIVW=3.10x10⁻²). In addition, Ruminococcaceae group (OR=0.94, 95% CI: 0.90, 0.99, PIVW=1.10x10⁻²), Genus Terrisporobacter (OR=0.96, 95% CI: 0.94, 0.98, PIVW=1.60x10⁻⁵) reduced the total number of alcoholic drinks consumed per week, while genus Slackia (OR=1.04, 95% CI: 1.01, 1.07, PIVW=1.70x10⁻²) increased total number of alcoholic drinks consumed per week

Conclusion The two-sample MR study found a potential causal effect of some gut microbiota on alcohol dependence and drinking behavior. Identifying specific mechanisms underpinning this relationship and accounting for the complex interactions of the gut microbiota are essential

关键词: alcohol dependence, mendelian randomization, gut microbiota

Burden of Disease Due To Amphetamines,

Cannabis, Cocaine, and Opioid Use Disorders in Asia, 1990–2019: A Systematic Analysis of The Global Burden of Disease Study 2019

Jiang Du* Jiahe Liu Gangliang Zhong
Shanghai Mental Health Center

Objective Substance use disorders pose a considerable challenge to global health. Understanding the burden of disease is crucial for countries to formulate policies and implement interventions. Due to its unique geographic location (e.g. the Golden Triangle and Golden Crescent), Asia has long had regional characteristics in drug production, abuse, and control. Therefore, understanding the abuse situation, changing trends, and disease burden caused by different types of drugs in Asia is of great practical significance for global drug control

Methods Based on the GBD (Global Burden of Disease) 2019 database, we selected 20 countries (or regions) in Asia, including East Asia (China, North Korea, Taiwan), Southeast Asia (Vietnam, Myanmar, Philippines, Laos, Thailand, East Timor, Indonesia, Maldives, Mauritius, Malaysia, Cambodia, Sri Lanka, Seychelles), and the high-income Asia Pacific region (Japan, South Korea, Singapore, Brunei). We calculated the age-standardised rate (per 100 000 population), estimated annual percentage change (EAPC) of incidence, prevalence and Disability-adjusted life years (DALYs) for amphetamine, cannabis, cocaine and opioid use disorders from 1990 to 2019. And we use the age-period-cohort modelling to estimate the independent effects of age, period and cohort

Results Before 1998, China had the highest DALYs caused by amphetamine use disorder. After 1998, Thailand took over the place. Compared to 1990, Taiwan had a significant increase in DALYs, ranking second only to Thailand in 2019. Most other countries maintained a relatively flat trend. For cannabis use disorder, Seychelles had the highest DALYs from 1990 to 2019, while high-income countries follow close. East Asia had the lowest DALYs. For cocaine use disorder, the high-income countries have the highest DALYs. Among them, Brunei had the highest DALYs from 1990

to 2019, followed by Singapore, South Korea, and Japan, with DALYs higher than the global level. Changes in opioid use disorder were more significant. From 1990 to 2006, China had the highest DALYs. After 2007, Taiwan took over, showing an upward trend. High-income countries had relatively low DALYs. The incidence, prevalence showed similar trends with DALYs

The highest incidence, prevalence and DALYs risk of substance use disorders were found in the 15-19, 20-24 and 25-29 age groups. Among them, the highest risk age was similar for amphetamine use disorders and opioid use disorders, and similar for cannabis use disorders and cocaine use disorders. The period effect and cohort effect showed significant differences in different substance use disorders and different regions.

Conclusion The substance use disorders burden in East Asia, Southeast Asia, and high-income Asia-Pacific present regionality and differ by age, period and cohort from 1990 to 2019

Cortical Activation During Verbal Fluency Task in Methamphetamine Use Disorder Patients With and Without Psychotic Symptoms: A Multichannel Near-Infrared Spectroscopy Study

Huiting Luo^{1,2}, Dan Luo^{1,2}, Qiao Tang^{1,2}, Jiajun Xu^{1,2}, Jing Li^{1,2}

1. West China Hospital of Sichuan University

2. Mental Health Center, West China Hospital

Objective The widespread abuse of the illicit drug Methamphetamine (MA), both domestically and internationally, poses severe physical and psychological risks. Research indicates that up to half of individuals with Methamphetamine Use Disorder (MUD) experience psychotic symptoms, which are often accompanied by significant impairments in executive function and

poorer treatment outcomes. This study aims to investigate the impairment of executive function and associated cortical hemodynamic changes using a combination of the Verbal Fluency Task and functional near-infrared spectroscopy (fNIRS) technology in MUD patients with and without psychotic symptoms. These findings aim to provide insights for the diagnosis and treatment of MUD patients.

Methods This study recruited Methamphetamine Use Disorder (MUD) patients from Chengdu Compulsory Drug Rehabilitation Center and West China Hospital of Sichuan University's Mental Health Center. Following inclusion criteria and data quality control, a total of 111 MUD patients were included, comprising 71 cases of MUD without psychotic symptoms (MNP) and 40 cases of MUD with psychotic symptoms (MIP). Clinical characteristics were assessed using the Visual Analog Scale for craving (VASc), the Positive and Negative Syndrome Scale (PANSS) to evaluate the presence and severity of psychotic symptoms over the past month, and several other clinical self-report scales including the Alcohol Use Disorders Identification Test (AUDIT), Fagerstrom Test for Nicotine Dependence (FTND), Beck Depression Inventory (BDI), Beck Anxiety Inventory (BAI), Social Support Rating Scale (SSRS), Chinese Perceived Stress Scale (CPSS), and Pittsburgh Sleep Quality Index (PSQI).

All participants underwent behavioral data recording during the Verbal Fluency Task (VFT) and functional near-infrared spectroscopy (fNIRS) data collection following completion of clinical characteristic assessments. The collected data were processed and statistically analyzed to explore differences in oxyhemoglobin (HbO) concentration changes in the frontal and temporal cortices during VFT between the two groups, as well as their relationships with clinical characteristics and task-related behavioral performance.

Results 1. Analysis of Differences in Demographic Characteristics, MA Use Features, and Clinical Characteristics Between Groups: Compared to MNP, MIP showed no differences in demographic characteristics. However, significant differences were found in MA use features, with MIP exhibiting higher maximum MA dosage in the past. In terms of clinical characteristics,

MIP scored higher in PANSS total score, Positive Symptom Scale score, Negative Symptom Scale score, General Psychopathology Scale score, BDI, and PSQI, all statistically significant. Additionally, a significant positive correlation was found between past maximum MA dosage and scores on PANSS scales, BDI, and PSQI.

2. Analysis of Differences and Correlations Between VFT Performance, Clinical Characteristics and Related fNIRS Data Between Groups: Compared to MNP, there was no statistically significant difference in word generation. However, MIP patients showed greater activation in CH2 (superior temporal gyrus), CH6 (frontal pole of the prefrontal cortex), CH15 (middle temporal gyrus), CH22 (triangular part of the inferior frontal gyrus), and CH47 (dorsolateral prefrontal cortex). These results were significant after false discovery rate (FDR) correction. Correlation analysis revealed a significant positive correlation between Positive Symptom Scale scores and HbO concentration changes in CH47.

Conclusion 1. Patients with MIP had previously used higher doses of MA and had more severe psychotic symptoms, depressive symptoms, and poorer sleep quality during withdrawal compared to patients with MNP. Correlation analyses showed that MA use was strongly associated with the severity of psychiatric symptoms during withdrawal.

2. Although there were no significant differences in behavioral performance, MIP patients showed activation differences in the dorsolateral prefrontal cortex compared to MNP patients, which are associated with psychotic symptoms. This inefficient neural activity suggests that MIP patients may have more severe executive function impairments. Identifying these differences can provide a theoretical basis for developing more effective individualized intervention strategies using non-invasive neurostimulation techniques.

Risky Decision-making Randomness in Gambling Disorder: A Computational Modeling Study Using The Balloon Analog Risk Task (BART)

Hanyu Wei Jingyang Liu Chengcong Wu Fei Cheng Yan Long Jing Zhai Qianlan Yin Gangliang Zhong Jiang Du*

Shanghai Mental Health Center

Objective Gambling disorder (GD) is strongly associated with abnormal risky decision-making with certain psychological and neural mechanisms. Balloon analog risk task (BART), a widely used assessment for risk-taking behavior, has limited explanatory power that can be compensated with computational modeling. However, previous studies focus on the classical behavioral parameters, and few studies have been done on GD using a theory-driven computational approach. The present study uses hierarchical Bayesian Analysis to explore the computational mechanism of risky decision-making behavior among GD

Methods 100 male patients with current Gambling Disorder (GDs) and 59 matched healthy controls (HCs) completed psychometric assessments and the BART. Total Scores, number of explosions, and adjusted pumps are calculated and compared between groups. Trial-by-trial behavioral data are modeled with 4 competing hierarchical Bayesian models based on prospect theory, and model comparison results favored the Exponential-Weight Mean-Variance (EWMV) model

Results Even though the number of explosions and adjusted pumps of risk-taking on the BART detect no group differences ($p < 0.05$), GDs get lower total score compared to the HC. To step further, hierarchical Bayesian analysis shows that the inverse temperature of decision-making decreases among patients with GD ($p < 0.05$). Besides, inverse temperature and risk-taking propensity are negatively correlated ($R = -0.40$, $p < 0.001$) among GD patients, while the HC group shows no correlation between these two parameters

Conclusion Our BART and computational modeling findings suggest that randomness of choice and its

correlation with risk-taking propensity may be an important mechanism of risky decision-making impairments of gambling disorder. These findings can guide future work in targeting neuromodulation and evaluation of GD.

Decreased Consumption of Natural Rewards in Rhesus Monkeys with Prolonged Methamphetamine Abstinence

Jiahui Zhou Haifeng Jiang* Hang Su
Shanghai Mental Health Center

Objective Relapse to drug use is a major clinical challenge in the treatment of addictive disorders, including psychostimulant use and may be exacerbated by reduced sensitivity to natural, non-drug reward. However, it is not known which aspects of reduced reward seeking and intake persist during long-term abstinence. Here we assessed natural reward (sucrose) seeking and intake in methamphetamine (METH) naive versus exposed monkeys during long-term abstinence

Methods This study introduced a natural reward response test to assess natural reward seeking and consumption in monkeys with long-term abstinence after methamphetamine (METH) use. The test was administered to sixteen naive monkeys and five METH exposed monkeys that had been abstinent for at least 3 months

Results METH exposed monkeys showed a lower sucrose preference score both in natural reward response test ($z = -2.10, p = 0.036$) and sucrose preference test ($z = -2.61, p = 0.009$). The sucrose preference score and the latency of the establishment of stable sucrose-preference were significantly correlated with each other ($r = -0.76, df = 46, p < 0.001$) but not with the following variables. We also observed water-sucrose switch latency and switch times were significantly correlated ($r = -0.50, df = 20, p = 0.02$)

Conclusion These results show reductions in

natural reward consumption during long-term methamphetamine abstinence.

酒精成瘾、过度游戏行为、海洛因成瘾和甲基苯丙胺成瘾者执行功能的网络分析

段帆* 李翔宇 焦东亮
蚌埠医科大学

目的 探讨酒精成瘾、过度游戏行为、海洛因成瘾和甲基苯丙胺成瘾四类成瘾患者执行功能各节点间的关联,并对各个网络进行两两比较。

方法 2019年7月至2022年5月,采用方便抽样方法,在安徽省内某戒毒所与各个社区中收集了酒精成瘾、过度游戏行为、海洛因成瘾、甲基苯丙胺成瘾各567名、369名、72名、199名被试与298名对照组被试。采用一般人口学问卷、酒精使用障碍筛查量表(AUDIT)、网络游戏障碍量表(IGD-20)和执行功能行为评定量表(BRIEF)进行调查。使用qgraph包中的EBICglasso方法估计不同成瘾组执行功能的网络结构,并比较不同组间的网络结构差异。

结果 (1)海洛因成瘾组、过度游戏行为组与对照组网络结构间相比,整体网络强度与整体边线权重无显著差异($P > 0.05$),酒精成瘾组整体网络强度显著低于对照组($P < 0.01$),甲基苯丙胺成瘾组与对照组整体边线权重有显著差异($P < 0.01$)。

(2)对照组与过度游戏行为组、海洛因组网络结构中最强权重边线均为启动节点与计划或组织节点之间的边线;酒精成瘾最强权重边线为任务管理节点与材料组织节点之间的边线;甲基苯丙胺成瘾最强权重边线为启动节点与任务管理节点之间的边线。

(3)除酒精成瘾组外,其他组网络节点可预测性平均值均大于0.7,说明大部分为内部因素解释各组网络变化,外部因素影响较小。

(4)不同酒精得分组网络结构差异显示,AUDIT ≥ 16 组、 $1 \leq \text{AUDIT} \leq 6$ 组与 $7 \leq \text{AUDIT} \leq 15$ 组三组间整体网络强度均有显著差异($P < 0.05$), $7 \leq \text{AUDIT} \leq 15$ 组整体网络强度最强,AUDIT ≥ 16 分组整体网络强度最弱。

(5) 四种成瘾组网络结构差异分析显示, 酒精成瘾组与过度游戏行为组、甲基苯丙胺成瘾组间整体网络强度均有显著差异 ($P < 0.05$); 过度游戏行为组与海洛因组整体网络强度无显著差异 ($P > 0.05$), 与甲基苯丙胺组整体边线强度有显著差异 ($P < 0.01$); 海洛因组与甲基苯丙胺成瘾组整体边线权重有显著差异 ($P < 0.01$)。

结论 不同类型的成瘾行为对执行功能网络的整体结构和边线权重有不同的影响, 尤其是酒精成瘾表现出显著的网络削弱效应, 而甲基苯丙胺成瘾则对网络中的节点间联系强度有显著影响, 海洛因成瘾、过度游戏行为对执行功能网络结构影响有限。酒精成瘾严重程度可能对网络强度有显著影响, 此外, 不同成瘾行为对网络关键节点关系的影响也存在差异, 反映了各类成瘾行为对执行功能网络的特异性影响。这些发现对针对不同成瘾行为的干预策略提供了理论依据。

Accelerated Brain Aging in Ketamine Addiction and Methamphetamine Addiction

孙云开 廖艳辉*

浙江大学医学院附属邵逸夫医院

Objective Distinct drugs of abuse impact brain structure and function, increasing risk of cognitive decline and psychiatric disorder. However, the long-term effects of ketamine and methamphetamine on the brain aging process, along with their corresponding severity of gray matter morphological alterations, molecular mechanisms, and risk of psychiatric disorders remain largely unknown.

Methods We developed a predictive model for brain aging using T1-weighted images from 408 healthy controls (HC) and applied this model to a separate validation set comprising 154 HC individuals and groups with substance use disorders (ketamine use disorder (KUD)=94, methamphetamine use disorder (MUD)=139). The brain-predicted age difference

(brain-PAD) was estimated. Correlation analyses to investigate the relationship between brain-PAD and maps of the severity of brain structural alterations, densities of receptors/transporters associated with neurotransmitter systems, cortical abnormalities of eight psychiatric disorders.

Results Both KUD and MUD groups showed a significant increase in brain-PAD compared to HC. This accelerated brain aging was constrained by cortical thickness thinning and densities of CB, MU, and mGlu receptors. Moreover, increased brain-PAD was associated with greater cortical abnormalities in schizophrenia, OCD, and bipolar disorder. Brain-PAD could effectively differentiate between individuals with KUD or MUD and HC.

Conclusion Drugs of abuse may accelerate the brain aging process and elevate the risk of SUD and other psychiatric conditions. Advanced brain-PAD appears to be linked to more severity of cortical thickness thinning and multiple neurotransmitter systems.

5.IDG/McGovern Institute for Brain Research, Peking University, Beijing, China.

Objective Drug addiction involves changes in the plasticity of neurons within the nucleus accumbens (NAc), often leading to recurrent relapse. Cholinergic interneurons (CINs) in the NAc are tonically active and intricately connected, making them key modulators of NAc function. This study investigates the causal role of NAc-CINs in drug craving and their involvement in conditioned cue-induced relapse behavior and the underlying mechanisms.

Methods We employed a combination of optogenetics, fiber photometry, in vitro electrophysiology, and a classical self-administration instrumental task to reveal an increase in acetylcholine release, upregulation of the integrated stress response (ISR), and enhanced hyperpolarization-activated currents in NAc-CINs during cue-reinstatement of drug craving.

Results We found that drug reward but not natural reward experience increased the excitability of cholinergic neurons in NAc, increased acetylcholine released in NAc core during the craving for drug reward but not natural reward. Furthermore, optogenetically manipulation activity of CINs in NAc bidirectionally alters cocaine-seeking behaviors. These findings indicate that CINs activity specifically modulates craving for drug rewards but not for natural rewards. Also, drug reward but not natural reward experience increased the activation of integrated stress response in CINs. The accumbal manipulation of ISR specifically influence the CINs activity-dependent craving for drug rewards. Additionally, we found ISR inhibition decreased the expression of subunits of HCN channels. HCN channel regulated CINs activity and pharmacological blockade of HCN channel decreased craving for drug reward but not natural reward. These data indicate that HCN channels are crucial in mediating the effects of ISR on CINs activity and drug reward craving.

Conclusion NAc CINs play a pivotal role in regulating adaptive cue-motivated behaviors through ISR signaling and HCN channels. These mechanisms provide promising targets for therapeutic interventions in drug addiction.

CeA CRF 神经元在甲基苯丙胺成瘾中的作用及其机制研究

宇文婷 张力博 张钟玉 张佳怡 赵晟宏 时杰*
北京大学中国药物依赖性研究所

目的 药物成瘾是一种慢性复发性脑疾病,也是严重的公共卫生问题。成瘾者戒断期间的负面情绪和用药动机增加可导致复吸,主要由泛杏仁核系统介导。中央杏仁核(CeA)是泛杏仁核的关键脑区。研究发现,CeA中存在一类表达促肾上腺皮质激素释放因子(corticotropinreleasing factor, CRF)的GABA能神经元,参与调节恐惧、焦虑、酒精成瘾和尼古丁成瘾等相关行为,但其在METH成瘾中的作用尚不清楚。本研究旨在探索CeA CRF神经元在METH成瘾过程中的机制。

方法 (1)在C57BL/6小鼠的CeA脑区注射rAAV-CRH-EGFP病毒;(2)将注射病毒的小鼠随机分为生理盐水组和METH组,进行不同时间的慢性给药,包括急性给药、慢性给药两周、慢性两周给药后戒断一周和两周四个时间点(3)采用膜片钳技术检测CeA CRF神经元的自发兴奋性突触后电流(sEPSC)、自发抑制性突触后电流(sIPSC)和动作电位(AP)等电生理特征。

结果 (1)急性给药之后,与对照组相比,METH给药组CeA CRF神经元的sEPSC和sIPSC的频率和振幅没有显著差异。另外,METH给药组CeA CRF神经元的阈值升高,给予不同的注入电流后,其动作电位的个数低于对照组;(2)慢性给药两周之后,METH给药组CeA CRF神经元的sEPSC和sIPSC的频率及振幅没有显著差异,给予不同的注入电流,动作电位个数低于对照组;(3)戒断一周之后,METH给药组CeA CRF神经元的sIPSC的频率和振幅显著升高。另外,METH给药组CeA CRF神经元的阈值下降,给予不同的注入电流后,动作电位的个数高于对照组(4)戒断两周之后,METH给药组CeA CRF神经元的sIPSC的频率和振幅显著升高,给予不同的注入电流后,动作电位的个数没有显著差异。

结论 本研究探讨了 CeA CRF 神经元在 METH 成瘾过程中的电生理特征,发现在慢性给药过程中 CeA CRF 神经元的兴奋性输入和抑制性输入没有显著差异,但其神经元活性被抑制。戒断之后抑制性输入显著增加,神经元活性也显著增强。戒断两周之后,抑制性输入依然显著增加,但是神经元活动逐渐趋于正常。因此,本研究说明 CeA CRF 神经元可能参与介导了 METH 戒断之后的负性状态,为理解 METH 成瘾的机制提供了新的视角和神经生物学基础。

大鼠前边缘皮层 ANKS1B 影响可卡因奖赏记忆的分子神经机制

吕丽英¹ 杨丽萍¹ 张钟玉¹ 刘剑锋² 时杰¹ 孙艳¹

1.北京大学中国药物依赖性研究所

2.武汉科技大学

目的 反复使用可卡因可导致神经可塑性的改变,形成病理性奖赏记忆,进而导致成瘾。研究药物奖赏记忆的功能脑区、神经环路及其分子机制意义重大。课题组前期研究发现 ANKS1B 基因是与多种药物成瘾(海洛因及甲基苯丙胺)易感性及表型关联最显著的基因,过表达奖赏相关脑区的 ANKS1B 可降低自身给药大鼠对海洛因和甲基苯丙胺的成瘾易感性。然而 ANKS1B 与可卡因奖赏记忆及成瘾行为的关联尚不明确,因此,本研究探索了 ANKS1B 对于大鼠可卡因诱导奖赏记忆中的作用及分子神经机制。

方法 (1)建立可卡因诱导条件位置偏好模型(CPP):第 1、3、5、7 天腹腔注射可卡因(10 mg/kg)将大鼠放入伴药箱;第 2、4、6、8 天腹腔注射生理盐水(1 ml/kg)放入非伴药箱,第 9 天和第 37 天分别进行近期及远期记忆测试;(2)免疫蛋白印迹检测可卡因诱导 CPP 近期及远期记忆中 ANKS1B 蛋白表达变化;(3)病毒介导 ANKS1B 在前边缘皮层过表达及敲降探究对可卡因诱导 CPP 的作用;(4)结合病毒载体注射、脑片膜片钳、免疫荧光等技术探索 ANKS1B 发挥调节作用的细胞特异性;(5)采用化学遗传学和光遗传学手段对前边缘皮层及其特

异神经元类型的活性进行调控;(6)通过转录组测序及病毒干扰技术探索 ANKS1B 发挥调节作用的下游分子。

结果 (1)大鼠可卡因 CPP 训练后,近期和远期记忆测试中,前边缘皮层 ANKS1B 蛋白表达水平均显著下降;(2)前边缘皮层过表达 ANKS1B 可显著降低可卡因诱导奖赏记忆,而敲降 ANKS1B 可增强可卡因奖赏记忆;(3)ANKS1B 与神经元标记物共定位结果发现,ANKS1B 主要在兴奋性神经元中表达;敲除谷氨酸能神经元中 ANKS1B,增强 mEPSC 的幅度,而 mEPSC 的频率未见显著改变。

结论 本研究初步研究发现,前边缘皮层 ANKS1B 可能通过影响兴奋性神经元突触传递,抑制可卡因诱导的奖赏记忆。未来我们将进一步探究 ANKS1B 影响可卡因奖赏记忆的下游分子和神经机制。

绵阳市孕产妇焦虑、抑郁及睡眠现状调查

王静 廖巧玲*

四川省精神卫生中心(绵阳市第三人民医院)

目的 了解绵阳市孕产妇焦虑、抑郁及睡眠情况。

方法 采用便利抽样的方法,于2023年6月~12月间在绵阳市13家医院开展多中心、大样本横断面调查,使用广泛性焦虑量表(GAD-7)、患者健康问卷抑郁量表(PHQ-9)及失眠严重程度指数量表(ISI)评价绵阳市孕产妇焦虑、抑郁及睡眠情况,并分析其相关性及其影响因素。

结果 共收集到有效问卷2043份,孕期973份,产后1074份。其中轻度焦虑757例(37.0%),中度焦虑428例(20.9%),重度焦虑218例(10.6%);轻度抑郁1161例(56.7%),中度抑郁433例(21.2%),重度抑郁129例(6.3%),极重度抑郁45例(2.2%);轻度失眠446例(21.8%),中度失眠67例(3.3%)。相关分析结果显示 GAD-7 与 PHQ-9 ($r=0.591$)、GAD-7 与 ISI ($r=0.631$)、PHQ-9 与 ISI ($r=0.680$) 得分均显著相关 (P 均 <0.001)。广义回归模型结果显示本次妊娠前无生产经历、孕周小、独居、涪城区的孕产妇 GAD-7 得分更高 (P 均 <0.05),文化程度低、月收入低、孕周大、独居/只和长辈居住、涪城区的孕产妇 PHQ-9 得分更高 (P 均 <0.05),独居、涪城区的孕产妇 ISI 得分更高 (P 均 <0.05)。

结论 绵阳市孕产妇焦虑、抑郁水平较高,失眠水平中等。应重点关注无生产经历、社会经济地位低、独居以及城市中心的孕产妇,为其提供针对性的心理健康保健服务,进而降低其焦虑、抑郁及失眠水平。

血清成纤维细胞生长因子 2、脑源性神经营养因子水平变化与产后抑郁症的关系

夏花¹ 谭孝琴² 叶小芳¹ 邹德宇¹ 吴秋萍¹

1.丽水市第二人民医院

2.杭州市余杭区第一人民医院

目的 探究产后抑郁症(PPD)患者血清成纤维细胞生长因子 2(FGF2)和脑源性神经营养因子(BDNF)水平的变化,并分析其与病情严重程度的关系。

方法 选取2020年10月至2022年10月丽水市第二人民医院收治的96例PPD患者作为研究对象,设为PPD组。另随机选取同期96例正常产妇设为对照组。记录两组的基线资料。采用酶联免疫吸附试验法检测血清 FGF2 和 BDNF 水平,采用爱丁堡产后抑郁量表(EPDS)评价 PPD 病情严重程度。采用 Pearson 法分析 PPD 患者血清 FGF2、BDNF 水平与 EPDS 评分的相关性;采用多因素 Logistic 回归分析影响 PPD 发生的可能因素。

结果 PPD 组产前抑郁比例、妊娠期抑郁比例、EPDS 评分、焦虑自评量表(SAS)评分及抑郁自评量表(SDS)评分均高于对照组($P < 0.05$);PPD 组血清 FGF2 和 BDNF 水平均低于对照组($P < 0.05$)。PPD 患者血清 FGF2 水平与 EPDS 评分呈负相关($r = -0.564, P < 0.05$),血清 BDNF 水平与 EPDS 评分呈负相关($r = -0.493, P < 0.05$);FGF2、BDNF 是产妇发生 PPD 的保护因素($P < 0.05$),产前抑郁及妊娠期抑郁是产妇发生 PPD 的危险因素($P < 0.05$)。

结论 FGF2、BDNF 在 PPD 患者血清中低表达,二者均与 EPDS 评分呈负相关,在 PPD 的病情缓解方面可能具有一定临床应用价值。

Paraventricular Thalamus To Nucleus Accumbens Circuit Activation Decreases Long-term Relapse of Alcohol-seeking Behaviour in Male Mice

Xiaoxi Zhao Xiaojun Xiang*

Department of Psychiatry, National Clinical Research Center for Mental Disorders, and National Center for Mental Disorders, The second Xiangya Hospital of Central South University

Objective Some studies have highlighted the crucial role of aversion in addiction treatment. The pathway from the anterior paraventricular thalamus (PVT) to the shell of the nucleus accumbens (NAc) has been reported as an essential regulatory pathway for processing aversion and is also closely associated with substance addiction. However, its impact on alcohol addiction has been relatively underexplored. Therefore, this study focused on the role of the PVT-NAc pathway in the formation and relapse of alcohol addiction-like behaviour, offering a new perspective on the mechanisms of alcohol addiction

Methods Experiment 1: Retrograde tracing of PVT neurons projecting to NAc by stereotaxic injection of CTB-488 in mice, followed by a two-week recovery. Mice were randomly divided into two groups: ethanol group and saline group. The ethanol group received alcohol to establish a CPA model, while the saline group was treated with saline as a control. CPA scores were measured and immunofluorescence staining was performed to detect C-Fos protein expression levels in both groups

Experiment 2: Mice were randomly divided into two groups: inhibition group and control group. Using chemogenetic methods, the PVT-NAc neurons of inhibition group expressed inhibitory receptors hM4Di, while the control group only expressed mCherry. After a two-week recovery, an alcohol CPA model was established. The PVT-NAc pathway was silenced in the inhibition group during each training session, and CPA

scores were measured after training for both groups.

Experiment 3: Mice were randomly divided into two groups: the activation group and the control group. The PVT-NAc neurons of the activation group mice expressed excitatory receptors hM3Dq, while the control group only expressed mCherry. After a two-week recovery, a CPA model induced by directly activating PVT-NAc was established. The PVT-NAc pathway was activated in the activation group during each training session, and CPA scores were measured after training for both groups.

Experiment 4: Mice were randomly divided into two groups: activation group and control group. The PVT-NAc neurons of the activation group mice expressed excitatory receptors hM3Dq, while the control group only expressed mCherry. After a two-week recovery, an alcohol CPP model was established. The PVT-NAc pathway was activated in the activation group during each training session, and CPP scores were measured after a four-day training for both groups.

Experiment 5: Mice were randomly divided into two groups: activation group and control group. The PVT-NAc neurons of the activation group mice expressed excitatory receptors hM3Dq, while the control group only expressed mCherry. After a two-week recovery, an alcohol CPP model was initially established, and CPP scores were measured. Subsequently, the PVT-NAc pathway in the activation group was activated for aversive counterconditioning training, while the PVT-NAc pathway in the control group remained non-activated. CPP scores were re-measured after each training session, and the time taken for both groups' alcohol CPP extinction was recorded.

Experiment 6: The two groups of mice from Experiment 5 will continue to experiment 6. After both groups' CPP scores recover to baseline within 24 hours, a low dose of alcohol will be administered to induce CPP reinstatement. CPP scores after 24 hours of extinction will be measured. The procedure will be repeated 10 days later to assess CPP reinstatement scores after a 10-day extinction for both groups.

Results The chemogenetic inhibition of the PVT-NAc pathway in male mice resulted in a notable

decrease in the establishment of ethanol-induced conditioned place aversion (CPA), and NAc-projecting PVT neurons were recruited due to aversive effects. Conversely, activation of the PVT-NAc pathway considerably impeded the formation of ethanol-induced conditioned place preference (CPP). Furthermore, during the memory reconsolidation phase, activation of this pathway effectively disrupted the animals' preference for alcohol-associated contexts. Whether it was administered urgently 24 h later or after a long-term withdrawal of 10 days, a low dose of alcohol could still not induce the reinstatement of ethanol-induced CPP

Conclusion Our results demonstrated PVT-NAc circuit processing aversion, which may be one of the neurobiological mechanisms underlying aversive counterconditioning, and highlighted potential targets for inhibiting the development of alcohol addiction-like behaviour and relapse after long-term withdrawal.

正念减压护理对产后抑郁症患者自我效能、情绪状态的影响观察

刁雪云*

天津市安定医院

目的 探究产后抑郁症患者实施正念减压护理对其自我效能、情绪状态的影响。

方法 依据入组标准将收治的 84 例产后抑郁症患者纳入此次研究并采用随机数表法进行分组,其中 42 例患者为对照组,实施常规护理,42 例患者为观察组,实施正念减压护理。对两组患者自我效能(一般自我效能感量表评价)及情绪状态(焦虑、抑郁自评量表评价)进行对比。

结果 观察组和对照组护理前自我效能评分对比无显著差异, $P>0.05$, 而护理 8 周后观察组自我效能评分高于对照组, 差异显著, $P<0.05$; 观察组和对照组护理前 SAS、SDS 评分对比无显著差异, $P>0.05$, 而护理 8 周后观察组 SAS、SDS 评分低于

对照组, 差异显著, $P<0.05$ 。

结论 正念减压护理能够通过帮助患者建立正念思想, 掌握合理的自我情绪管理技巧, 达到不良心理消除的目的。在正念减压护理过程中, 身体扫描、正念瑜伽、正念呼吸训练、正念冥想能够提升患者处理不良情绪、思维的能力, 使得患者的情绪状态得到改善, 逐渐缓解压力。总而言之, 产后抑郁症患者实施正念减压护理, 不仅有利于患者自我效能的提升, 还能够对患者焦虑、抑郁等情绪状态进行改善。但是由于时间及条件的限制, 且研究样本量偏少, 往后可增加样本量, 延长护理干预时间, 以探究其远期效果。

甲基苯丙胺使用障碍女性患者精神健康状况分析与内观认知疗法干预研究

毛富强* 王书哲

天津医科大学

目的 本研究旨在调查女性甲基苯丙胺使用者的精神健康状况, 并深入探究冲动性、社会支持水平与患者精神健康状况之间的关系; 同时, 研究内观认知疗法在改善女性甲基苯丙胺使用障碍患者的精神心理健康状况、提升社会支持水平、降低冲动性水平等方面的临床疗效。通过该研究, 我们希望通过内观认知疗法治疗甲基苯丙胺使用障碍相关精神症状提供实证基础和临床依据。

方法 研究一: 本研究招募了 230 位患者, 采用 SCL-90 的中文版、多维度社会支持量表(MSPSS)和巴瑞特冲动性量表(BIS-11)进行评估。通过独立样本 t 检验、Pearson 相关分析、多变量线性回归模型、逐步回归模型探究相关性, 并进行预测作用分析; 采用调节效应分析与简单斜率检验来分析交互效应。研究二: 60 名符合纳排标准的被试者随机分为实验组与对照组, 每组 30 人。实验组采用内观认知疗法(NCT)干预; 对照组采用一般支持疗法(GST)干预。在干预前后使用研究一中的相关量表进行评测。采用配对样本 t 检验、独立样本 t 检验分析。

结果 研究一: (1)共有 228 份问卷纳入统计分

析。SCL-90 各维度分值显著高于健康常模。(2) 被试者的 MSPSS 量表与 SCL-90 量表的“强迫”、“人际关系敏感”、“抑郁”、“焦虑”、“恐怖”、“偏执”、“精神病性”及“总分”等维度均呈负相关关系。MSPSS 量表与 SCL-90 量表各维度评分均呈正相关关系。(3) MSPSS 量表对 SCL-90 各维度(除“躯体化”)评分存在负向预测作用,而 BIS-11 量表对 SCL-90 各维度评分存在正向预测作用。(4) MSPSS 在 BIS-11 对于 SCL-90 评分影响中具有调节效应。研究二:(1)干预前,实验组与对照组社会人口学变量及各量表评分在基线水平无显著统计学差异。(2)在干预后,BIS-11、SCL-90 等量表的评分较干预前显著降低,而在干预后,MSPSS 量表的评分较干预前显著升高。(3)对实验组与对照组在干预前后上述量表评分变化量进行组间比较,发现实验组的变化较对照组更为显著。

结论 本研究发现,社会支持对女性甲基苯丙胺患者的精神症状具有负向预测作用,而冲动性则呈正向预测作用。此外,社会支持的存在能够减弱冲动性对甲基苯丙胺患者精神健康状况的影响能力。内观认知疗法在治疗女性甲基苯丙胺使用障碍者方面展现了显著的效果。具体而言,该疗法能够显著改善患者的心理健康状况,提高患者对社会支持水平的感知,并显著降低冲动性水平。

关键词: 甲基苯丙胺使用障碍;冲动性;社会支持;心理健康;内观认知疗法

失眠简明行为疗法疗效与内感知关系的研究

陈晓琳 熊志弯 常翼*

大连医科大学附属第一医院

目的 使用失眠简明行为疗法(Brief Behavior Therapy for insomnia, BBTi)对失眠患者进行干预,并使用多导生理仪测量患者内感知,来(1)比较失眠群体与健康对照组的内感知敏感性和内感知准确性;(2)对失眠患者采用 BBTi 进行干预,观察其疗效和干预后患者内感知各维度的变化;(3)探究 BBTi 疗效与患者内感知的关系。

方法 招收符合 ICS-3 的失眠诊断标准的失眠患者(ID 组)34 人和睡眠良好者作为对照组(健康对照组)37 人;对所有受试者采集基线睡眠日记、

HTT 实验数据(平均心跳知觉分数和自信评分)和量表数据(ISI、SAS、SDS、ESS、MAIA、DBAS-16、BPQ-VSF)。采用 E-Prime2.0 设计实验程序,使用 BIOPAC-MP150 多导生理仪记录受试者的心电图。失眠患者组需参与为期 4 周的 BBTi,期间需要记录睡眠日记。完成干预后两组再次填写所有量表,ID 组还需记录干预后睡眠日记。三个月随访时,获得两组的量表和 HTT 实验数据以及 ID 组随访睡眠日记。

结果 1、ID 组基线时在 PSQI、ISI、ESS、SAS、SDS 和 BPQ-VSF 的得分均显著高于健康对照组($p < 0.05$),在 DBAS-16、MAIA 的不担心和自我调适的得分显著低于健康对照组($p < 0.05$)。ID 组的 PSQI、ISI、ESS、SAS 和 SDS 的得分在 BBTi 干预后显著下降($p < 0.001$),且 PSQI、ISI、ESS 得分在随访时显著低于基线水平($p < 0.05$)。

2、MAIA 的注意调适维度与总睡眠时间($r = 0.44$, $p = 0.015$)和睡眠效率($r = 0.36$, $p = 0.048$)、信任维度与睡眠效率均呈显著正相关($r = 0.38$, $p = 0.036$)。

3、两组的平均心跳知觉分数在基线和随访时均无显著差异;基线水平两组自信评分无显著差异,ID 组随访时自信评分(6.63 ± 1.21)显著高于基线水平($p < 0.001$),健康对照组在随访时(5.76 ± 1.71)与基线水平无显著差异。基线水平 ID 组和健康对照组的 HPS 和自信评分的相关性均显著($p < 0.05$),随访时均不显著。

结论 1.失眠患者的内感知敏感性比健康对照组更强,内感知准确性没有差异,其过高的内感知敏感性可以在 BBTi 干预后恢复正常。

2. BBTi 具有良好改善失眠及焦虑抑郁症状的疗效。

3.失眠患者在内感知相关量表 MAIA 中的注意调适和信任两个子维度中的良好水平,与 BBTi 提高睡眠效率和睡眠总时长的疗效呈显著正相关。

关键词: 失眠简明行为疗法,内感知,疗效,心跳知觉分数,焦虑,抑郁

伴有混合性特征抑郁症和双相障碍患者的 1 年随访研究

陈林 王红 肖艳霞 杜晶阁 杜霞 赵荣江 李晓虹*
北京回龙观医院

目的 探讨 DSM-5 界定的伴有混合性特征抑郁症和双相障碍的临床现象学、疾病转归及相关危险因素。

方法 对 361 例伴和不伴混合性特征抑郁症和双相障碍患者进行为期 1 年的前瞻性随访研究，在入组后第 3、6、12 个月末 3 个时点进行疗效和结局等相关评估。

结果 抑郁症和双相障碍患者中，伴有 DSM-5 界定的混合性特征的发生率为 9.4% (34/361)，伴有广义混合性特征的发生率为 41.8% (151/361)。

与不伴混合性特征组相比，伴有 DSM-5 界定的混合性特征组：非已婚状态更多见 (70.6% vs 42.5%, $P=0.00$)，起病年龄更早 (25.97 ± 13.29 vs 33.75 ± 14.80 , $P=0.00$)，HAMD-17 评分更低 (24.03 ± 3.55 vs 25.57 ± 4.32 , $P=0.05$)，更少伴有忧郁特征 (42.4% vs 64.0%, $P=0.02$)，1 年的痊愈率更低 (28.1% vs 51.3%, $P=0.01$)、复发率更高 (43.8% vs 25.0%, $P=0.02$)、转相率更高 (40.6% vs 9.0%, $P=0.00$)、服药依从性更差 (31.3% vs 68.8%, $P=0.00$)。

对于伴有广义混合性特征的抑郁症和双相障碍患者，复发的危险因素为持续性抑郁障碍 ($OR=3.90$, $P=0.02$)、伴有自杀观念 ($OR=2.27$, $P=0.05$) 及程度更轻的焦虑 ($OR=0.71$, $P=0.02$)。转相的危险因素为既往发病次数少 ($OR=0.77$, $P=0.02$)。

结论 伴有混合性特征的抑郁症和双相障碍是一种更严重、预后更差的疾病亚型，临床上并不少见，需要引起重视。

甲基苯丙胺成瘾者抑郁症状与肠道菌群改变的相关性研究

马滔 汤艳清*

中国医科大学附属盛京医院

目的 甲基苯丙胺 (Methamphetamine, MA), 俗称“冰毒”，其成瘾是目前一个快速增长的公共卫生问题，截至 2022 年底，甲基苯丙胺仍然是我国滥用人数量最多的毒品。研究表明，甲基苯丙胺成瘾者抑郁症的患病率远远高出健康中国人患病率。伴有抑

郁症状的甲基苯丙胺成瘾者具有更强的药物渴求和个体攻击性。抑郁症状是造成其复吸的关键因素之一，同时也是自杀的重要危险因素。证据显示，甲基苯丙胺成瘾者肠道微生物组成同健康对照有显著差异，而肠道菌群同抑郁症状相关，因此肠道菌群或许成为干预甲基苯丙胺成瘾者抑郁症状的新靶点。本研究旨在探究肠道菌群与甲基苯丙胺成瘾者抑郁症状之间的相关性。

方法 本研究纳入甲基苯丙胺成瘾者 90 人，健康对照 45 人，签署知情同意书后采集人口学资料 (性别、年龄、BMI)、完善临床症状评估 (贝克抑郁量表, BDI) 等，并将甲基苯丙胺成瘾者分为伴有抑郁症状组 (MDD) 和不伴有抑郁症状 (NMDD) 两组，应用 t 检验或 ANOVA 分析进行比较。同时采集受试者粪便样本进行 16S rDNA 测序，以分析其肠道微生物群。

结果 三组在性别、年龄、BMI 上均未见显著统计学差异。三组 alpha 多样性 Chao1、Shannon、Simpson 指数未见显著差异；基于 Bray-Curtis 距离的 beta 多样性上存在显著差异 (PERMANOVA, $P=0.003$)。在物种水平上，MDD 组梭杆菌门、梭杆菌属、梭杆菌目出现显著降低，Tyzzerella_4 显著升高。

结论 梭杆菌门、梭杆菌属、梭杆菌目出现显著降低，Tyzzerella_4 显著升高是伴有抑郁症状的甲基苯丙胺成瘾者的特征性改变，这一结论为进一步理解甲基苯丙胺成瘾人群抑郁症状提供理论基础以及调控的潜在靶点。

北京地区妊娠期女性抑郁症状出现的影响因素

何夏月 王宁* 吴宇泽 胡波

北京回龙观医院

目的 产前抑郁是妊娠期最常见的精神障碍，不仅对产妇产生巨大的心理负担，造成负面的社会心理影响，而且与不良的母婴结局相关。本研究旨在了解北京地区的妊娠期妇女出现抑郁症状的概率及影响因素，为产前精神障碍的筛查和预防干预提供理论依据。

方法 研究数据来自 2022 年 1 月至 2023 年 1 月期间 4564 名妊娠期妇女,在北京清华长庚医院进行横断面的调查研究。主要收集孕妇的个人资料和产科资料,由北京回龙观医院的精神科医师及护士使用爱丁堡产后抑郁量表进行抑郁症状的初步筛查。

结果 研究结果显示存在抑郁情绪的围生期妇女比例为 4.1%。单因素分析结果显示孕次方面,孕次、产次、药物及人工流产次数越多,孕前体重及 BMI 指数越高,孕妇抑郁症状发生比例越高。孕妇职业为商业服务业,抑郁症状发生比例较低。多因素 logistics 回归分析结果示孕次、产次及 BMI 是产前抑郁的风险因素,孕妇职业为商业、服务业是产前抑郁的保护因素。

结论 未来应加大对孕次及产次较多、BMI 指数较高的孕妇抑郁症状的筛查力度,鼓励坚持工作,灵活选择就业类型。针对出现抑郁症状的孕妇采取适当的干预措施,提供不同类型的健康教育方案,以减少不良母婴结局的发生。

利培酮与重复经颅磁刺激治疗女性首发精神分裂症的效果分析

廖东升*

青海省第三人民医院

目的 探讨女性首发精神分裂症(SCH)患者采用利培酮与重复经颅磁刺激(rTMS)联合治疗的效果。

方法 2020 年 7 月~2023 年 6 月,选取此期间本院收治的女性首发 SCH 患者 98 例,参照随机数字表进行分组。对照组 49 例患者采用利培酮治疗,在其基础上研究组 49 例患者联合 rTMS 治疗。针对两组临床疗效、精神分裂症认知功能测评量表(SCoRS)、精神分裂症患者生活质量量表(SQLS),以及不良反应予以比较。计数资料采用 χ^2 检验,正态计量资料采用 t 检验。

对照组采用利培酮(规格: 1mg, 国药准字 H20061072, 北京天衡药物研究院南阳天衡制药厂)治疗,口服,初始用量为 1mg/次, 2 次/d, 治疗 1 周后逐渐递增至 2mg/次, 2 次/d, 持续治疗 8 周。在对照组的基础上,研究组采用 rTMS 治疗,即使用

经颅磁刺激仪(型号: YS6002, 常州思雅医疗器械有限公司),选择双侧前额叶皮质背外侧进行刺激,强度: 80%的静息运动阈值,频率: 1Hz, 10min/侧, 20min/次, 1 次/d, 每周治疗 5 次,持续治疗 8 周。

结果 总有效率评价中,与对照组结果相比,研究组结果更高($P < 0.05$)。治疗前 SCoRS、SQLS 评价中,两组评分并无差异($P > 0.05$); 治疗 8 周后 SCoRS、SQLS 评价中,与对照组评分相比,研究组评分更低($P < 0.05$)。不良反应评价中,两组发生率并无差异($P > 0.05$)。

结论 女性首发 SCH 患者采用利培酮与 rTMS 联合治疗效果确切,能够改善其认知功能,保障生活质量,安全性较为理想。

关键词: 利培酮; 重复经颅磁刺激; 女性; 首发精神分裂症

首发未用药抑郁症患者肠道菌群多样性与面部表情识别相关性研究

王大海 汤艳清* 姜晓薇

中国医科大学附属盛京医院

目的 目前抑郁症肠脑轴机制得到进一步证实,有研究指出抑郁症患者肠道菌群与认知功能相关,但目前尚无研究探讨抑郁症患者肠道菌群与面部表情识别能力为代表的热认知功能的相关性。因此本研究探讨抑郁症患者肠道菌群与面部表情识别的相关性,进一步探索肠道菌群与抑郁症患者临床症状关系。

方法 本研究纳入 50 例健康对照,49 例首发未用药抑郁症患者,签署知情同意后收集一般临床资料,粪便标本,并采用自编测试系统,测试首发未用药抑郁症患者和健康对照对快乐,中性,悲伤三种面部表情识别能力。最终所有受试者完成面部表情测试,有 32 例健康对照和 31 例首发未用药患者完成粪便采集。肠道菌群分析采用 16S rRNA 高通量测序技术对进行测序,并进行生物信息学分析。面部表情识别图片选自《中国化面孔情绪图片系统》。使用 SPSS23.0 软件对临床资料进行统计学分析。一般资料统计采用独立样本 T 检验,或卡方检验,相关性分析采用 Pearson 相关。

结果 1、二组受试者年龄,性别, BMI 均无显

著差异 ($p>0.05$)

2、与健康对照组相比首发未用药抑郁症患者 β 多样性具有显著差异 ($R=0.065 P<0.01$), LEFse 分析共发现两组间存在 15 种差异菌群, 其中 13 种在抑郁症中富集, 2 种在健康对照中富集。

3、与健康对照相比, 首发未用药抑郁症患者对快乐 ($t=3.145 p<0.01$) 中性 ($t=2.024 p<0.05$) 悲伤 ($t=2.768 p<0.01$) 面部表情识别正确率均显著下降。

4、差异菌群与面部表情相关性分析发现中性面部表情与 *Blautia*($r=-0.586 P<0.01$) *odoribacteraceae*($r=-0.456 P=0.01$) 负相关, 悲伤表情正确数与 *Blautia* ($r=-0.455 P=0.01$) 负相关。

结论 1、首发未用药抑郁症患者面部表情识别能力显著下降。

2、首发未用药患者肠道菌组成发生改变。

3、首发未用药患者肠道菌群与面部表情存在相关性, 说明肠道菌群可能与首发未用药抑郁症患者热认知功能下降有关。

关键词: 抑郁症 肠道菌群 面部表情识别

Analysis and Evaluation of Mouse Modeling Methods for Adolescent Depression A Meta-analysis and Animal Experiment

Ying Li Zhifen Liu*

First Hospital/First Clinical Medical College of Shanxi Medical University

Objective Adolescent depression is a significant concern for the physical and mental well-being of young individuals. Given the unique nature of adolescence, animal models play a crucial role in understanding the causes and developing treatments for depression in adolescents. CUMS is a well-known rodent paradigm used to induce depressive and anxiety-like behaviors. Chronic unpredictable mild stress (CUMS) is a method that exposes animals to a variety of repeated and irregular unknown stressors over a long period of time. This simulation aims to replicate the various stress events encountered by humans in life, ultimately leading to the development of long-term and effective depressive-like

behaviors in animals. Maternal separation (MS) is used to simulate negative life experiences in early life by inducing long-term separation between mother and infant, resulting in depressive-like behaviors in animals. This model is a form of social deprivation. CUMS and MS are commonly utilized techniques for creating animal models of adolescent depression

This study aims to compare the behavioral outcomes of two widely used adolescent rat depression models through meta-analysis. Additionally, animal experiments will be conducted to validate the findings of the meta-analysis, ultimately offering insights into the selection and utilization of adolescent rat depression models.

Methods A meta-analysis was conducted by searching Chinese and English databases to gather all relevant literature on rodent models of adolescent depression. The foreign language databases searched include the Web of Science, PubMed. The Chinese databases include China National Knowledge Infrastructure(CNKI), WanFang Data and China Science and Technology Journal Database(VIP).The search timeframe was not restricted. RevMan 5.3 software was utilized for the meta-analysis. Behavioral tests including sucrose preference, forced swimming, and open field tests were employed in animal experiments to compare two modeling methods in adolescent rats

Results The meta-analysis included a total of 23 research results. The findings indicated that the experimental group, as compared to the control group, exhibited significant differences in sucrose preference, open field, forced swimming, and other behavioral behaviors. Furthermore, the CUMS model showed more pronounced differences in sucrose preference compared to the MS model. In animal experiments, the experimental group demonstrated significant differences in behavioral tests such as sucrose preference and forced swimming when compared to the control group. Additionally, the CUMS group showed superior results in behavioral tests like sucrose preference, forced swimming, and open field when compared to the MS group

Conclusion The findings of this study suggest that chronic unpredictable mild stress (CUMS) inter-

vention in adolescent rats is more likely to induce depressive-like behavioral symptoms compared to maternal separation (MS) intervention. This indicates that CUMS may be more suitable for studying adolescent depression caused by various social and environmental factors

Mesocorticolimbic Pathway Involves Antidepressant Mechanisms To Treatment with Chinese Traditional Medication Or Fluoxetine for Depression Disorder

Hong Li Zhifen Liu*

Department of Psychiatry, The First Hospital of Shanxi Medical University, Taiyuan, China.

Objective The selective serotonin reuptake inhibitors (SSRIs) have been meaningfully linked to the clinical manifestations of mood disorders; however, they have potentially adverse reactions, and a subset of patients fail to respond to multiple drug therapies. Alternatively, Shuganjieyu capsule (SG) has garnered increasing attention due to its similar effectiveness and fewer side effects compared to conventional antidepressants. This study aimed to inform the choice of first-line depression treatment choice Chinese traditional medication and fluoxetine by defining a neuroimaging biomarker that differentially identifies the outcomes of both treatments

Methods 60 Mild-to-moderate depression (MMD) patients and 40 healthy controls (HCs) participated in the study. Included patients were randomly assigned to either an 8 weeks' course of fluoxetine or Shugan Jieyu Capsule (SG). Combining clinical assessments and MRI technique, we obtained the emotional and cognitive status of participants at baseline, weeks 4, and week 8

Results MRI study revealed that MMD patients characterized by structural and functional deficits in the

nucleus accumbens (NAc). Notably, both functional MRI and pharmacological analysis demonstrated a close correlation between the function of the mesolimbic pathway (represented by the NAc-amygdala functional connectivity) and symptom improvement with SG treatment, while the function of the mesocortical pathway (represented by the NAc-rostral anterior cingulate cortex (rACC) functional connectivity) was strongly linked to symptom improvement with fluoxetine treatment. Additionally, the remitters exhibited stronger coupling between NAc and ventral tegmental area (VTA) as well as NAc and frontal cortex than in treatment failures at the baseline

Conclusion Overall, the NAc appears to play a pivotal role as a central functional linkage in the antidepressant modulation. Our findings not only demonstrate the antidepressant effect of different treatments but, more importantly, shed light on the underlying neural mechanisms.

关键词: depression, medication, MRI, nucleus accumbens

临床状态相同的首发精神分裂症与重性抑郁障碍 动态低频振幅比较与机器学习分类研究

赵文晖 汤艳情*

中国医科大学

目的 本研究旨在对两种抑郁症状和精神病性症状同时发作的重性抑郁障碍和精神分裂症的脑动态低频振幅 (Dynamic amplitude of low fluctuation, dALFF) 属性进行分析,旨在找到疾病间 dALFF 的差异和变化,并将其作为特征进行机器学习分类,为精准诊断和治疗提供神经影像学证据。

方法 招募 MDDP 患者 71 例, SZD 患者 51 例及年龄性别匹配的健康对照组 (Healthy Control, HC) 43 例。入组标准: 年龄 13-50 岁; 符合 DSM-V 的诊断标准, 且无其他轴 I 障碍; 扫描当天均存在精神病性症状及抑郁症状发作, 使用 DPABI6.0 软件计算相应的动态低频振幅指标, 使用方法, 使 SPSS

26.0 软件,应用 ANCOVA 比较三组一般人口学资料及动态低频振幅指标差异,使用 GRF 方法进行多重比较校正,最后使用支持向量机(Support vector machine, SVM)用差异动态低频振幅作为分类指标,对两患者组进行分类。

结果 三组受试者的年龄($F=0.074$, $P=0.928$)、性别($\chi^2=4.945$, $P=0.084$)之间均无统计学差异,在学学历年($F=37.441$, $P<0.001$)、HAMD-17 总分($F=237.708$, $P<0.001$)、BPRS 总分($F=157.551$, $P<0.001$)和 MCCB 总分($F=33.538$, $P<0.001$)之间有统计学差异。MDDP 患者与 SZD 患者的用药情况($\chi^2=2.842$, $P=0.092$)无统计学差异。三组受试者的动态低频振幅在右侧楔前叶,距状裂,楔叶,缘上回,顶下缘角回,角回,颞上回存在统计学差异(GRF 校正, $P<0.001$)。单独的差异脑区或者差异脑区组合都可以有效的区分两组患者,但差异脑区组合在区分 MDDP 和 SZD 中展现出最高的准确率 77.05%、敏感性 72.55%、特异性 80.23%和 AUC0.80。

结论 dALFF 是抑郁症状和精神病性症状同时发作的重性抑郁障碍和精神分裂症患者的潜在生物标志物,机器学习可以有效区分两种临床状态相同的精神疾病

关键词: 动态低频振幅,重性抑郁障碍,精神分裂症,支持向量机,

存在认知损害。体质量指数(body mass index,BMI) $\geq 28\text{kg/m}^2$ 为肥胖, $\text{BMI}<28\text{kg/m}^2$ 为非肥胖;血压状态:低于 $120\text{mm Hg}/80\text{mm Hg}$ 为正常血压、 $120-140\text{mm Hg}/80-90\text{mm Hg}$ 为高血压前期、高于 $140\text{mm Hg}/90\text{mm Hg}$ 为高血压。按是否肥胖和不同血压状态将老年人分为六种 BMI-血压表型(非肥胖血压正常组、肥胖血压正常组、非肥胖高血压前期组、肥胖高血压前期组、非肥胖高血压组、肥胖高血压组),分析不同 BMI-血压表型与认知损害之间的相关性。

结果 logistic 回归显示,在未调整的模型中肥胖高血压前期组和肥胖高血压组相对于非肥胖血压正常组危险度分别为 $0.57(95\%$ 置信区间: $0.350,0.913)$, $0.619(95\%$ 置信区间: $0.332,0.874)$,在校正年龄、性别、受教育程度、婚姻状况、独居情况、吸烟和饮酒等协变量的模型中,肥胖高血压前期组和肥胖高血压组相对于非肥胖血压正常组危险度分别为 $0.822(95\%$ 置信区间: $0.236,0.818)$, $0.645(95\%$ 置信区间: $0.284,0.971)$ 。在两个模型中,肥胖血压正常组、非肥胖高血压前期组、非肥胖高血压组与认知损害的相关性均没有统计学意义。

结论 在该项研究中,在老年人处于高血压前期和患有高血压疾病的情况下,肥胖的存在会增加其患认知损害的风险。

关键词: BMI,肥胖,高血压,高血压前期,认知损害,老年人

不同 BMI-血压状态与老年人认知损害的相关性研究

妥正娇 汤艳清*

中国医科大学附属盛京医院

目的 探讨东北地区老年人 BMI-血压状态与认知的相关性,了解肥胖与血压的不同存在情况对老年人认知是否存在损害,为准确识别认知损害高危老年人群亚组和预防阿尔兹海默症的发生发展提供参考依据。

方法 2018 年 9 月-2023 年 8 月,整群抽样方式抽取辽宁省沈阳市,大连市,抚顺市,锦州市等地区 ≥ 55 岁的 1810 名老年人为研究对象。采集他们的一般人口学资料,认知功能的测评采用简易智力状态检查量表(MMSE),接受教育水平不同进行校正,总分文盲 ≤ 17 分、小学 ≤ 20 分、初中及以上 ≤ 24 分为

伴焦虑症状的甲基苯丙胺使用障碍患者戒断期间肠道菌群改变

邓紫荆 汤艳清*

中国医科大学附属盛京医院

目的 甲基苯丙胺(MA),俗称“冰毒”,是我国滥用人数最多的毒品。MA 成瘾是全球关注的公共卫生问题,给全世界带来了巨大的负担。甲基苯丙胺使用障碍患者(MUD)在戒断期间,焦虑症状的发生率远高于健康人群。戒断期间焦虑症状的发生,与 MUD 患者冲动、攻击、渴求和复吸等相关。目前研究发现,MUD 患者和焦虑患者存在肠道微生物的改变。但是在 MUD 伴焦虑症状患者中肠道微生物如何变化,目前还不清楚。

方法 本研究招募了 46 名 MUD 患者和 47 名

健康对照 (HC), 将通过贝克焦虑量表 (BAI) 研究 MUD 患者焦虑症状与粪便微生物群的关系。并将 MUD 患者分为 MUD-A 组 (BAI 评分 > 7, MUD 患者伴焦虑症状, $n = 21$) 和 MUD-N 组 (BAI 评分 ≤ 7 , MUD 患者不伴焦虑症状, $n = 25$)。应用贝克抑郁量表 (BDI) 测量抑郁症状, 16S rRNA 序列分析鉴定肠道细菌。

结果 MUD-A、MUD-N 及 HC 三组之间的 β 多样性存在统计学差异 ($P=0.008$), 且多重比较后发现 MUD-A 与 HC ($P=0.027$), MUD-N 与 HC ($P=0.033$) 的 β 多样性存在统计学差异。LEfSe 分析发现, Micrococcales 目在 MUD-A 中富集, Catenibacterium 属和 Arthrobacter 属在 MUD-N 中富集, Faecalitalea 属和 Sphingomonadales 目在 HC 中富集。在 MUD-A 中进行偏 Spearman 相关分析, 将抑郁症状 (BDI 分数)、年龄、性别及 BMI 作为协变量后发现, Arthrobacter 属与 BAI 成负相关 ($r=-0.513$, $P=0.035$)。

结论 伴焦虑症状的 MUD 患者的肠道菌群发生改变, Arthrobacter 属可能是其潜在的肠道微生物标志物。

关键词: 甲基苯丙胺, 焦虑, 肠道菌群

Visual Impairment, Cognitive Function, and Brain Morphology: Insights From Network Analysis and Mendelian Randomization

Yucheng Wang Peiyi Wu Yanqing Tang*
Shengjing Hospital of China Medical University

Objective Visual impairment (VI) is increasingly recognized as a significant risk factor for cognitive decline and heightened dementia risk among older adults. However, the specific cognitive domains affected by VI and the underlying causal mechanisms linking VI to changes in brain morphology remain poorly understood. This study aims to elucidate these relationships to better understand the broader impact of VI on cognitive health and brain structure

Methods To explore these associations, we employed network analyses using comprehensive data from the China Health and Retirement Longitudinal

Study (CHARLS). Additionally, we conducted Mendelian randomization (MR) analyses leveraging genetic data from individuals of European ancestry to investigate potential causal links between VI and brain morphology

Results Our network analysis identified distinct patterns of association between VI and various cognitive domains, differing notably between cognitively impaired (CI) and non-cognitively impaired (non-CI) older adults. The MR analysis provided compelling evidence for a causal relationship between VI and alterations in brain morphology. Individuals with VI demonstrated a reduction in total cerebral surface area and significant regional changes in cortical thickness and surface area

Conclusion The findings of this study underscore the substantial impact of VI on specific cognitive domains in older adults. Furthermore, the observed causal relationship between VI and brain morphology suggests that visual loss may play a pivotal role in cognitive deterioration, potentially through structural brain changes. These insights highlight the importance of addressing VI as a modifiable risk factor in strategies aimed at preserving cognitive function and mitigating dementia risk in the aging population.

关键词: visual impairment, cognitive impairment, cognitive domains, brain morphology, network analysis, Mendelian randomization

深部经颅磁刺激对遗忘型轻度认知障碍患者认知功能影响的静息态脑功能磁共振研究

郝文溢 汤艳清*
中国医科大学附属盛京医院

目的 aMCI 是容易发展为 AD 的一种轻度认知障碍亚型。脑功能网络拓扑属性和 ALFF 是 rs-fMRI 常用的两种指标, 可以从网络和局部两个角度反映 aMCI 患者脑功能的细微变化, 被广泛用于 aMCI 患者脑功能影像学机制研究。dTMS 是一种安全无创的物理治疗技术, 是 aMCI 认知干预的潜在手段, 但其改善认知的脑功能影像学机制不清。本研究拟采用 rs-fMRI 从脑网络和局部两个角度观察

aMCI 患者脑功能的异常改变,并对 aMCI 进行 4 周的 dTMS 干预,同时分析基线时脑功能水平与 dTMS 干预后 aMCI 认知功能变化的相关性,以探究 aMCI 认知功能异常及改善的脑功能影像学机制。

方法 收集年龄 60~79 岁的 aMCI 患者以及 HC 各 50 名。aMCI 入组标准采用 Petersen 提出的 aMCI 科研标准。基线时对两组人群分别进行认知功能评估和 rs-fMRI 扫描,之后对 25 名 aMCI 患者进行为期 4 周的 dTMS 刺激,治疗全部结束后再次进行认知功能评估和 rs-fMRI 扫描。

结果 与 HC 组相比,aMCI 组的 MoCA 评分、AVLT 再认评分得分降低,TMT 测试时间延长;与 HC 相比,aMCI 患者在全局属性中 Lp 降低和 Eg 增加,节点属性在两组人群中无差异;与 HC 相比,aMCI 患者在 CUN.L, CUN.R, PCUN.L, MOG.R, MTG.R, SOG.R 上 ALFF 降低;aMCI 患者 ALFF 降低脑区的提值与 MoCA 评分、AVLT 延迟回忆得分、AVLT 再认得分成正相关。与干预前相比,干预后 aMCI 患者 AVLT 延迟记忆评分增高;干预后 aMCI 在全局属性上无改变,节点属性上发现 PCL.R 上 Dc 和 Ne 提高;干预后 aMCI 在 PreCG.R, PoCG.R, STG.R, PCL.R 上 ALFF 升高;PCUN.L/R, DCG.L/R, CUN.L, PCG.L/R, ANG.R, MOG.R, SMG.R, STG.R, SOG.R, PoCG.L, ANG.L, PreCG.L, MOG.L, SMG.L, PCL.L 上 ALFF 降低。基线时的脑功能网络全局效率与干预后 AVLT 延迟回忆得分变化成正相关。

结论 aMCI 患者整体认知功能、记忆力和执行功能下降;脑功能网络整体传输效率代偿性增高,DMN 相关脑区的局部功能降低,且与 aMCI 认知功能下降成正相关。dTMS 可以提高 aMCI 患者的记忆功能;dTMS 提高了 aMCI 患者 PCL.R 的 Dc 和 Ne;dTMS 还改变了 aMCI 患者顶叶、枕叶、颞叶、楔叶、角回、扣带回等脑区的局部功能,这可能是 dTMS 改善 aMCI 认知功能的脑功能影像学机制。dTMS 改善 aMCI 患者认知功能的效果与基线时脑功能网络的全局效率有关。

肠道微生物在抗抑郁药疗效性别差异中的作用

朱华倩*

中国医科大学附属第一医院

目的 重度抑郁症(MDD)的致残率很高,给患者和国家带来了巨大的疾病负担。MDD 的药物治疗效果也存在性别差异。目前研究发现肠道微生物差异可以预测抗抑郁药物的治疗效果。本研究旨在探究不同性别的疗效差异是否与性别导致的肠道微生物结构差异相关。

方法 本研究招募了 47 名首发未用药治疗的 MDD 患者(29 名女性和 18 名男性),以及年龄、BMI 匹配的健康志愿者 49 名(28 名女性和 21 名男性),MDD 在治疗前留取粪便,健康对照组留取粪便。研究性别特异性 MDD 患者肠道微生物差异,构建中介模型以探究肠道微生物与性别相关的减分率的相关性。

结果 不同性别组减分率存在统计学差异,女性患者减分率更高。MDD 患者不同性别组间 α 多样性及 β 多样性存在统计差异,健康对照不同性别组间 α 多样性无统计学差异, β 多样性中仅 weighted_unifrac 具体矩阵存在统计学差异。厚壁菌门,梭菌目,伯克氏菌目,梭菌科,伯克氏菌科,芽孢杆菌科,罗氏菌属,毛螺菌属,另枝菌属在不同性别组间存在统计学差异。差异菌在不同组与减分率间不存在中介效应。

结论 MDD 患者存在性别特异性肠道微生物,但这些微生物与不同性别组间的疗效差异无相关。

关键词: 肠道微生物,重性抑郁障碍

女性首发未用药重性抑郁障碍患者的脑皮质结构改变

张一凡 汤艳清*

中国医科大学附属盛京医院

目的 重性抑郁障碍(Major Depressive Disorder,MDD)是一种被认为具有性别差异的常见的重性精神疾病之一。本研究旨在探讨女性 MDD 患者大脑皮质形态学的特征性改变,通过直接对女性 MDD 与健康对照组(Health Control,HC)的皮层厚度进行比较,同时探讨脑皮质厚度改变与抑郁、焦虑症状的相关性。

方法 招募首次发病未用药的 63 例女性 MDD 患者和 141 例年龄匹配的女性健康对照(HC),年龄在 13 岁至 25 岁之间,在研究开始前获得本人的知情同意书。之后对所有的参与者采集一般人口学资料调查、17 项汉密尔顿抑郁量表(Hamilton Depression Scale-17 items,HAMD-17)、汉密尔顿焦虑量表(Hamilton Anxiety Scale,HAMA),所有参与者进行结构磁共振成像扫描。对人口学资料和临床数据进行统计分析,采用 SPSS 27.0 软件进行独立样本 t 检验分析其差异。利用 Freesurfer 软件对磁共振数据进行处理,以 D-K 模板进行皮层厚度提值,对女性 MDD 和 HC 组进行独立样本 t 检验;计算女性 MDD 在 t 检验中差异的脑区的皮层厚度值和 HAMD17 总分、HAMA 总分的皮尔逊相关系数。

结果 1、t 检验结果显示,与 HC 相比, MDD 的双侧眶额叶外侧部 ($t=3.305$ 、 $t=3.518$)、左侧额中回前部 ($t=3.377$) 和额下回眶部 ($t=3.075$) 显著增高 ($P<0.05$)。2、相关分析表明,MDD 组皮层厚度值和 HAMD17 总分、HAMA 总分未见显著相关($P>0.05$)。

结论 前额叶中的眶额皮质、额下回眶部和额中回前部的皮质增厚是女性 MDD 患者的特征性脑结构形态改变。

中国农村 55 岁及以上人群内脏脂肪指数与认知及抑郁的关系研究

张玲丽 汤艳清*

中国医科大学附属盛京医院

目的 了解辽宁省北镇市 55 岁以上人群认知功能现状,并探究内脏脂肪指数(VFI)、抑郁症状、认知功能三者之间关系及作用路径,为临床开展认知功能筛查,早期识别、及时干预认知功能障碍提供可行性建议。

方法 采用整群抽样的方法,选取 2023 年 5 月至 2023 年 8 月参加“抑郁症的社区人群队列研究”项目的居民进行研究。调查工具包括居民基本资料调查表、实验室生化指标、体成分指标、简易智能精神状态检查量表(Mini-Mental State Examination, MMSE)、老年抑郁量表 GDS-15(Geriatric Depression

Scale-15)。采用 Excel 2019 进行数据录入并建立数据库,使用 R 软件、SPSS 26.0 软件及其 Process 插件进行统计学分析。

结果 本研究共纳入 960 名居民,其中男性 254 人 (26.5%), 女性 706 人 (73.5%); 平均年龄 64.14 ± 6.037 。VFI、抑郁状态评分、认知功能评分的中位数及四分位数 $M(Q1,Q3)$ 分别为 8.5(6.0,11.5)、1(0,3)、25(23,27), 存在认知功能障碍者 208 例 (21.7%)。Spearman 相关分析结果显示: VFI 与抑郁呈负相关($rs=-0.122$, $P<0.001$), VFI 与认知水平呈正相关 $rs=0.146$, $P=0.002$), 抑郁与认知水平呈负相关 ($rs=-0.100$, $P=0.002$)。将 VFI 根据其四分位数分成四组,卡方趋势检验分析结果显示: 随着 VFI 等级的增加,认知障碍的比例减少($\chi^2=8.24$, $P=0.004$); 这种趋势女性中依旧显著($\chi^2=6.85$, $P=0.009$),但在男性中并不显著。中介效应分析结果显示: 北镇市 55 岁以上人群 VFI 在抑郁状态与认知功能之间存在中介作用, VFI 中介效应的 Bootstrap 95%CI 为(-0.030,-0.007),表明间接效应显著,其间接效应值为-0.017, 占总效应的 9.1%。

结论 与预期相反,本研究发现较高的 VFI 水平与较高的整体认知评分和较低的抑郁状态评分有关,而且随着 VFI 的增加,认知障碍的比例也在下降,这一现象尤其在女性更为显著。本研究还证实了 VFI 在调节抑郁状态与认知功能之间的作用,VFI 的改善可能通过减轻抑郁症状来提高认知能力,强调了内脏脂肪在心理和认知健康中的重要性。这一发现为针对中老年人群的健康干预提供了新的策略方向,以便更有效地预防和管理认知障碍及抑郁症。

Dorsolateral Prefrontal Circuit Structure Abnormalities in Anxious Major Depressive Disorder

Mengxue Li Yanqing Tang*

Shengjing Hospital of China Medical University

Objective Anxious major depressive disorder (AMDD) is one of subtypes of major depressive disorder (MDD), and a distinct neurobiology may set apart

AMDD from non-anxious depression (NAMDD). However, the neural mechanisms related to hemispheric differences in altered brain structure underlying AMDD remain elusive. To gain further insights, we compared gray matter volume (GMV) and fractional anisotropy (FA) values respectively to explore changes in cortical structure in patients with AMDD and NAMDD

Methods 162 AMDD patients, 31 NAMDD patients, and 201 matched healthy controls (HCs) provided data for the study. Voxel-based analysis (VBA) was employed to assess FA and GMV values to explore white matter (WM) and gray matter (GM) structural alterations, and region of interest (ROI) analysis was adopted to explore white matter integrity changes in specific brain regions. GMV and fractional anisotropy (FA) were calculated. Pearson correlations were conducted to assess the correlation between FA or GMV and clinical features

Results AMDD and NAMDD show significant GMV changes in the right dorsolateral prefrontal cortex (DLPFC) and the left superior frontal gyrus (SFG). In the right DLPFC, compared to HC, the GMV value of AMDD decreased ($p=0.026$), while the GMV value of NAMDD increased ($p=0.177$). GMV was negatively correlated with anxiety level ($r=-0.135$; $p=0.009$). Compared to AMDD and HC, the GMV value of NAMDD was increased in the left SFG (NAMDD VS AMDD: $p=0.001$, NAMDD VS HC: $p=0.039$), and the GMV value was negatively correlated with anxiety level ($r=-0.114$; $p=0.027$). Compared to HC, FA value of AMDD increased in left cerebellum, right cerebellum and right SFG, and FA value was positively correlated with depression and anxiety level. In addition, compared to HC, the FA values of AMDD and NAMDD in the left DLPFC were significantly reduced (AMDD/HC: $p=0.000$; NAMDD/HC: $p=0.019$). The FA value was negatively correlated with depression and anxiety ($r=-0.226$, $p=0.000$) and anxiety ($r=-0.215$, $p=0.000$)

Conclusion The observed DLPFC circuit structure abnormalities in AMDD patients distinguish them from the AMDD and NAMDD patients, suggesting neurobiological differences related to the expression of anxiety level in patients with MDD. These findings provide further evidence for considering AMDD and NAMDD

independently in therapeutic outcome studies.

佐匹克隆替换对长期服用苯二氮卓类镇静催眠药的女性精神分裂症稳定期患者睡眠质量及生活质量的影响

葛玲*

沈阳市精神卫生中心

目的 探讨佐匹克隆替换对长期服用苯二氮卓类镇静催眠药的女性精神分裂症稳定期患者睡眠质量及生活质量的影响。

方法 选择 2023 年 2 月至 2024 年 2 月在本院治疗随访且服用苯二氮卓类镇静催眠药的女性精神分裂症稳定期患者 100 例, 使用随机数表法将患者分成对照组与观察组, 各 50 例, 对照组患者继续服用原有的苯二氮卓类镇静催眠药, 观察组换为佐匹克隆片 (7.5mg/d), 依据患者依从性及患者自身状况, 采用直接换药或者用 1 周的时间交叉换药, 观察 4 周; 换药前及换药 4 周后两组分别给予匹兹堡睡眠质量指数量表 (PSQI)、阳性和阴性症状量表 (PANSS)、药物不良反应量表 (TESS) 及精神分裂症患者生活质量量表 (SQLS) 评估及比较。

结果 替换后佐匹克隆组 PSQI 总分及日间功能障碍、入睡时间、睡眠质量和睡眠时间较换药前明显降低, 两组间 PSQI 评分有显著性差异 ($P<0.05$); 替换前后两组 PANSS 评分比较差异无统计学意义; 佐匹克隆组药物不良反应发生率 (8%) 低于对照组 (32%), 且佐匹克隆组不良反应轻微, 主要为口苦, 两组差异有统计学意义 ($P<0.05$); 观察组患者生存质量评分优于对照组, 两组有显著性差异 ($P<0.05$)。

结论 对于长期服用苯二氮卓类镇静催眠药的精神分裂症稳定期女性患者采用佐匹克隆片进行替换, 可有效改善患者的睡眠质量和生活质量, 不良反应低, 安全可行。

甲状腺激素、性激素、皮质醇水平对首发女性抑郁障碍严重程度的临床意义

李鑫¹ 孙妍² 陈薇² 马文有² 于振剑² 张顺² 梁晓亮² 雷荣³

- 1.河北开滦医疗健康产业集团有限责任公司
- 2.开滦精神卫生中心
- 3.惠州市第二人民医院精神科

目的 本研究探讨了甲状腺激素、性激素和皮质醇水平在不同严重程度的首发女性抑郁障碍患者中的分布差异,旨在深化对抑郁障碍激素调节机制的理解,并为临床诊断提供潜在的生物标志物。

方法 选取2022年6月—2023年6月于开滦精神卫生中心住院的首发女性抑郁障碍患者150例。收集患者的一般资料,并测量甲状腺素(T₄、T₃、TSH、FT₃、FT₄)和性激素(T、PRL、P、E₂)水平,以及促肾上腺皮质激素(ACTH)和皮质醇(COR)水平。采用Zung氏抑郁自评量表(SDS)评估患者抑郁程度。根据SDS评分和临床医生的诊断,将患者分为轻中度抑郁组(70例)和重度抑郁组(80例)。使用logistics回归及ROC曲线进行数据分析。

结果 轻中度抑郁组患者的FT₃、FT₄水平高于重度抑郁组患者,而TSH、睾酮(T)、雌二醇(E₂)、ACTH、COR水平则显著低于重度抑郁组($P < 0.05$)。低水平FT₃和高水平T被认为是首发女性抑郁障碍患者重度发作的潜在危险因素。FT₃和T水平用于诊断首发女性抑郁障碍患者为重度发作的曲线下面积分别为0.687(95%CI为0.602~0.773, $P=0.000$)和0.654(95%CI为0.563~0.744, $P=0.021$)。FT₃=3.165 pg/mL时,诊断为重度发作的灵敏度为82.5%,特异度为51.4%;T=0.2205 ng/mL时,灵敏度为75.0%,特异度为62.9%。

结论 FT₃和T水平的变化与首发女性抑郁障碍的严重程度有显著相关性,为抑郁障碍的生物标志物研究提供了新的视角。

青少年重度抑郁障碍患者睡眠障碍、抑郁、快

感缺失的网络分析研究

王显阳¹ 任垒² 赵鑫鑫¹ 蔡敏¹

- 1.空军军医大学第一附属医院
- 2.武警后勤学院

目的 使用网络分析法探索青少年重度抑郁障碍患者睡眠障碍症状间的关联模式及核心症状,并进一步探究睡眠障碍症状与抑郁、快感缺失的桥连接共病模式。

方法 招募青少年重度抑郁障碍患者200名,由临床医生依据DSM-5的诊断标准评估后纳入试验,并获得患者本人及法定监护人自愿签署的知情同意书。本研究使用汉密尔顿抑郁量表评估患者的抑郁症状,斯奈思-汉密尔顿快感量表评估快感缺失症状,以及匹兹堡睡眠质量指数量表评估睡眠状况。数据分析采用网络分析的方法。首先,通过高斯图像模型结合扩展性贝叶斯信息准则(EBICglasso)构建睡眠障碍症状的正则化偏相关网络(由匹兹堡睡眠质量指数量表的7因子症状组成)并计算网络中节点的预期影响(expected influence, EI)和节点之间的连边权重(edge weight),探索睡眠障碍症状间的关联模式及核心症状。节点的预期影响值越高,其被激活时更有可能通过与其他节点的连边将激活传播到整个网络。然后,在睡眠障碍症状网络中加入抑郁症状、快感缺失症状两个节点,用同样的方法构建睡眠障碍症状-抑郁-快感缺失共现网络,探索睡眠障碍与抑郁、快感缺失的桥连接共病模式。

结果 与“睡眠质量”连边权重最强的节点依次为“入睡时间”(edge weight = 0.38)、“睡眠时间”(edge weight = 0.20)、“睡眠障碍”(edge weight = 0.16),说明这些症状的相互激活共同导致了睡眠障碍的发生。在睡眠障碍症状网络中,“睡眠质量”节点具有最高的预期影响,说明其是青少年重度抑郁障碍患者睡眠障碍的最核心症状(EI = 0.82)。在睡眠障碍症状-抑郁-快感缺失共现网络,“睡眠障碍”表现出对“抑郁症状”(edge weight = 0.25)和“快感缺失症状”(edge weight = 0.15)最强的桥连接,说明“睡眠障碍”可能是睡眠障碍和抑郁、快感缺失共病的主要症状。此外,在共现网络中,“睡眠质量”也表现出与“抑郁症状”(edge weight = 0.13)和“快感缺失症状”(edge weight = 0.11)的较强桥连接。

结论 青少年重度抑郁障碍患者的睡眠障碍症状间存在差异性连接,其中“入睡时间”和“睡眠时

间”，与“睡眠质量”的连边权重最强，“睡眠质量”的中心性最强，为预防和治疗提供了潜在重要靶点。此外，“睡眠障碍”可能是睡眠障碍和抑郁、快感缺失共病的主要睡眠障碍症状，为我们认识睡眠障碍和抑郁、快感缺失共病提供了新视角。

跨诊断视角下情绪障碍快感缺失的神经心理学评估与积极心理数字化治疗的研究进展

云楚越 崔界峰*
北京回龙观医院

目的 情绪障碍 (Emotional disorders) 是常见的精神障碍，常见情绪障碍包括抑郁障碍、焦虑障碍、创伤后应激障碍、强迫障碍等。快感缺失 (Anhedonia) 作为跨诊断症状之一，在情绪障碍患者之中十分普遍。新型研究领域诊断系统 RDoC (research domain criteria, RDoC) 提出六个框架，强调跨诊断研究的重要性，其中积极效价系统 (PVS) 和消极效价系统 (NVS) 都与情绪障碍和快感缺失有密切的联系。传统上情绪障碍患者的测量维度和治疗方法，多集中在消极情绪症状，即消极效价系统的探索。本文则是在强调积极效价系统的背景下，探索快感缺失的深层神经机制和认知结构，针对情绪障碍快感缺失的多维度心理评估方法和积极心理数字化治疗来进行综述。

方法 本文以 pubmed 和中国知网为主要数据库进行检索，引用国内外文献共 55 篇，对近些年以来，在“情绪障碍快感缺失的跨诊断评估和积极心理数字化治疗”领域的相关研究进行汇集对比分析，并最终形成综述，对之后的研究提供依据及指导意见。

结果 目前的文献表明，情绪障碍呈现出不同程度奖励结构的损失，而诊断和评估却并没有统一和系统的标准，并且一个标准下适用的测量人群也比较狭窄，而行为范式作为另一种评估维度，可以补充自我评估在程序性和规范性上的缺陷，从行为科学的角度将疾病诊断更加精准化。PVS 是一个复杂的领域，具有多种结构。目前，我们正处于全面理解这些结构本质的早期阶段。PVS 视角下心理治疗有多维结合的特点，并且更倾向于针对深层机制的

改变，即奖励机制的变化和积极情绪的增强。许多治疗方案已经取得了一定的成效，面对面治疗向数字疗法的变革也扩展了 PVS 的研究维度。积极心理数字化治疗借助互联网、虚拟现实、计算机等技术，实现积极心理方案的程序化和流程化，重复的无指导训练可以进一步提高训练的效果，延长治疗的影响。但文献也表明当前数字疗法还处于开发研究的阶段，需要更多验证实验。

结论 展望未来，有必要更全面的了解快感缺失的潜在奖励结构，探索全面的机制如何运行；情绪障碍中快感缺失的不同奖励功能损失的程度，以及具体损失的结构；定制更加精确的靶向治疗方案，以及将方案转化为程序化的训练是更加长期的目标。

凯格尔运动疗法对患有抑郁症的经产妇焦虑抑郁情绪、躯体症状、生活质量满意度的影响

覃雅*
中山大学附属第五医院

目的 探讨凯格尔运动疗法对患有抑郁症的经产妇焦虑抑郁情绪、躯体症状及生活质量满意度的影响。

方法 本研究为随机对照研究，选择 2023 年 8 月 1 日至 2024 年 4 月 30 日中山大学附属第五医院的 106 例患有抑郁症的经产妇为研究对象，按照随机数字表法分成对照组和实验组各 53 例。对照组予以药物治疗，实验组在药物治疗基础之上每周行 2 次时长 20 分钟的凯格尔运动，使用抑郁自评量表 (SDS)、焦虑自评量表 (SAS) 比较两组患者的焦虑、抑郁情绪，使用躯体化症状自评量表 (SSS) 比较两组患者的躯体症状，使用幸福与生活质量满意程度问卷 (Q-LES-Q-SF) 比较两组患者的生活质量满意度。

结果 实验组干预后的 SDS 评分低于对照组，差异有统计学意义 ($P < 0.05$)；实验组干预后的 SAS 评分低于对照组，差异有统计学意义 ($P < 0.05$)；实验组干预后的 SSS 评分低于对照组，差异有统计学意义 ($P < 0.05$)；实验组干预后的 Q-LES-Q-SF 在身体健康、情绪、日常功能、性生活、身体出行能力 5 个项目上评分高于对照组，差异有统计学意义 (P 均

<0.05)。

结论 患有抑郁症的经产妇在接受药物治疗的基础上配合凯格尔运动疗法可改善焦虑、抑郁情绪,减轻躯体症状,提高在身体健康、情绪、日常功能、性生活、身体出行能力方面的生活质量满意度和幸福感,有推广价值。

Mediating Effect of Inflammation on The Relationship between Sleep Disruption and Suicidal Ideation in Major Depressive Disorder

Yexian Zeng Yanling Zhou*

广州医科大学附属脑科医院

Objective Sleep disruption, particularly insomnia, is a notable characteristic of depression and is associated with an increased risk of suicide in patients diagnosed with major depressive disorder (MDD). Moreover, the pathophysiology of depression and suicide has been linked to inflammation, specifically proinflammatory cytokines. However, the complex interplay among these factors in individuals with MDD remains poorly understood. This study investigated the mediating role of inflammatory cytokines in the relationship between sleep disruption and suicidal ideation (SI), with a particular emphasis on gender differences

Methods This study used a cross-sectional design in which 281 individuals diagnosed with MDD were recruited from psychiatric clinics. The main assessments included the evaluation of sleep disruption, inflammatory markers, and SI. The Beck Scale for Suicide Ideation (SSI) scores was employed to quantify SI, whereas HAMDSLD, a component of the Hamilton Rating Scale (HAMD-17), was used to evaluate sleep disruption. Blood analysis was performed to measure inflammatory markers

Results For females diagnosed with MDD, significant associations between sleep disruption and the levels of IL-6 ($B = 0.994, p = 0.013$) and TNF- α ($B =$

$1.986, p = 0.016$) were found when IL-6 or TNF- α were considered as mediators in the regression model. In addition, IL-6 ($B = 5.689, p < 0.001$) and TNF- α ($B = 9.916, p = 0.006$) exhibited strong correlation with SSI scores

Conclusion The primary results of this study indicate that IL-6 and TNF- α could function as potential mediators in the relationship between sleep disruption and SI among female patients diagnosed with MDD.

关键词: Mediation model, Sleep disruption, Suicidal ideation, Inflammation, Sex difference

重性抑郁障碍患者动态功能网络连接状态异常研究

刘晓玉 汤艳清*

中国医科大学附属盛京医院

目的 先前大多数 fMRI 研究假设整个扫描过程中大脑的内在波动是静态的,功能网络连接分析都集中在感兴趣区域(ROI)之间的静息态功能连接性(sFC),忽略了对大脑功能连接潜在的瞬时动态性的特征分析。因此,我们的目的是研究 重型抑郁障碍患者(MDD)的大尺度动态功能脑网络连接(dFNC)的异常。

方法 本研究共纳入 18-50 岁的 157 名受试者,其中首发未用药重型抑郁障碍患者(MDD 组)78 名和健康对照者(HC 组)79 名,收集静息态 fMRI 数据,采用 17 项汉密尔顿抑郁量表(HAMD-17)及汉密尔顿焦虑量表(HAMA-14)对患者组的症状程度进行评估。使用独立成分分析、滑窗法和 k-means 聚类来探索重性抑郁障碍患者 dFNC,将 dFNC 状态属性参数(每种状态出现的频率百分比,平均停留时间以及每个被试的状态转换次数)进行组间比较(年龄、性别和受教育年限作为协变量, $p < 0.05$)。

结果 提取了 6 个重复出现的瞬时功能连接状态,其中状态一和状态三的时间属性以及动态功能连接的组间差异具有统计学意义:(1) MDD 组在状态一中的频率百分比($t = -2.499, P = 0.0014$)与平均滞留时间($t = -2.1788, P = 0.0309$)显著高于 HC 组。(2) MDD 组在状态三中的频率百分比($t = 2.438, P = 0.016$)与平均滞留时间($t = 2.2215, P = 0.0278$)显

著低于 MDD 组。(3) MDD 组和 HC 组的每个被试在任意的状态转换次数在 $P < 0.05$ 时无显著统计学差异。

结论 抑郁症患者动态功能连接、时间属性在不同状态下均发生了改变。

关键词: 动态功能网络连接

The Putamen Connectivity Predicts Anti-suicidal Effect of Comprehensive Treatment for Adolescents with Major Depressive Disorder and Suicidal Ideation

Xiaoyu Chen Xiaofeng Lan Chengyu Wang Weicheng Li Zerui You Yifang Chen Yanmei Liang Yanling Zhou Yuping Ning*

The Affiliated Brain Hospital, Guangzhou Medical University

Objective Given the limited efficacy of current pharmacotherapy for suicidal ideation in adolescent depression, identifying brain features conducive to treatment response is crucial. The putamen, as a critical component of the striatum, has been implicated in suicidal ideation. This study aims to explore the putamen-based functional connectivity patterns in treatment responders, providing theoretical support for personalized treatment

Methods The sample data for this study were derived from a clinical trial of pharmacotherapy involving adolescent depression with suicidal ideation. Treatment responders were defined as those with a $\geq 50\%$ reduction rate in suicidal ideation scores on the Columbia-Suicide Severity Rating Scale (C-SSRS) from pre- to post-treatment. Resting-state functional connectivity (rsFC) based on the putamen as a region of interest was analyzed between responder and non-responder group. Spectral dynamic causal modeling was employed to examine the directionality of identified rsFC to further elucidate mechanisms underlying anti-suicidal effect. The use of receiver operating characteristic (ROC) curve further explored neuroimaging indicators predicting anti-suicidal treatment outcome

Results Compared to the non-responder, the responder group exhibited significantly enhanced rsFC between the left putamen-left SOG, left putamen-right SOG, left putamen-left IOG, left putamen-right precuneus and left putamen-left dACC. Furthermore, the responder demonstrated unique patterns of bidirectional connectivity between the left putamen and the left IOG, as well as unidirectional connectivity from the right SOG to the left putamen. Additionally, there was greater excitatory connectivity from the left putamen to the left dACC in the responder group. The effective connectivity from the left caudate to the left dACC is significantly negatively correlated with the percent change in suicidal ideation. ROC curve analysis demonstrated that the aforementioned effective connectivity strength serves as a moderately accurate predictor of anti-suicidal effects (area under the curve = 0.675)

Conclusion The directionality of putamen-occipital gyrus connectivity patterns can distinguish treatment responders from non-responders, and the strength of putamen-dACC effective connectivity is closely associated with anti-suicidal efficacy can effectively predict acute treatment response for suicidal ideation. These findings enhance our understanding of the neurobiological mechanisms underlying anti-suicidal treatment response and hold potential clinical significance for early identification of responders and personalized treatment.

基于 Q 方法探究线上及线下团体关系会议的体验差异

曹景晨 王旭梅*

中国医科大学附属盛京医院

目的 团体关系会议 (GRC) 是一个临时的体验式学习组织, 通过对日常反复遇到却浑然不觉的问题进行充分地呈现, 使成员有机会去探寻这些问题的实质, 去了解和使用自己。目前暂无相关文献探究这种模式的转变所带来的影响, 故本研究旨在

运用 Q 方法调查参会者在线上及线下团体关系会议中的体验差异,为今后团体关系会议的举办提供数据支持,促使会议能够更好地被组织开展,取得令双方更加满意的学习体验。

方法 Q 方法为本研究调查方法。通过文献及访谈,获得关于两种不同形式的团体关系会议相关体验差异的观点语句,形成 Q 母体。对 Q 母体的语句进行整合删改及专家审阅,最终形成由 39 条陈述构成的 Q 样本。招募 24 名国内外参会者,形成 P 样本,其中国内组 13 人,国外组 11 人,进行 Q 排序及进一步访谈。将 P 样本分为 2 组,即国内组(中国国籍)和国外组(外国国籍),使用 KADE 软件中主成分分析法提取因子以及最大方差法旋转,根据各因子典型排布进行分析及命名。

结果 得到四个体验类型因子,分别命名为:成员间的接触体验、互动中的氛围体验、交流的深入程度及自我感受体验,变异解释率分别为 25%、11%、9%、7%,累计变异解释比例为 52%,其中氛围体验的因子下被试均为中国人;后将两组分别进行分析比较,因子类型命名总体结果与前相似,累计变异解释比例均大于 40%,符合方法学要求,组间比较的差异为国外组无明确互动体验因子分类。

结论 团体关系会议参会者的体验差异是复杂多样的,不同个体所关注的维度各不相同,可分为四个方面:成员间的接触体验、互动中的氛围体验、交流的深入程度及自我感受体验。对于上述四种体验维度,国内外参会者关注重点有所差异,部分国内参会者更关注于团体关系会议里沟通和互动中氛围的体验。总体而言,线上及线下举办形式均有优劣势,线上团体关系会议便利性更高且成本更低,而线下团体关系会议中成员间的情感连接更强,其中,时间成本以及情感体验是影响参会者选择不同会议形式的重要因素。

父母养育方式与青少年边缘型人格障碍特征的关系: 心智化和情绪失调的链式中介作用

郭庆 王旭梅*

中国医科大学附属盛京医院

目的 本研究以基于心智化的 BPD(边缘型人格障碍)理论与生物社会发展模型为指导,探讨心智化能力和情绪失调在父母养育方式对青少年边缘型人格障碍特征影响中的中介作用,以期更深入了解青少年 BPD 特征的病因及发生发展过程,为早期干预提供参考及理论依据。

方法 采用整群抽样的方法抽取山西、河北两省的 3 所公立中学的初高中在校生,对其进行网络问卷调查。问卷内容包括社会人口统计、青少年边缘人格特征(BPFS-C)、反思功能(RFQ)、情绪失调(DERS)与父母养育方式(EMBU-C),最终回收有效问卷 1097 份。采用 SPSS23.0 软件分析青少年边缘人格特征、反思功能、情绪失调和父母养育方式在人口学变量上的差异以及相关关系,采用 PROCESSv4.1 中的 model6 对反思功能与情绪失调的链式中介作用进行检验。

结果 青少年边缘人格特征与父母情感温暖、反思功能显著负相关($r=-0.359, p<0.001$; $r=-0.666, p<0.001$),与父母养育方式中的过度保护、冷漠拒绝、抚养焦虑维度以及情绪失调显著正相关($r=0.143, p<0.001$; $r=0.423, p<0.001$; $r=0.153, p<0.001$; $r=0.699, p<0.001$);反思功能与父母情感温暖显著正相关($r=0.222, p<0.001$),与父母养育方式中的过度保护、冷漠拒绝、抚养焦虑维度以及情绪失调显著负相关($r=-0.132, p<0.001$; $r=-0.272, p<0.001$; $r=-0.207, p<0.001$; $r=-0.629, p<0.001$)。情绪失调与父母情感温暖呈显著负相关($r=-0.384, p<0.001$),与父母过度保护、冷漠拒绝以及抚养焦虑呈显著正相关($r=0.181, p<0.001$; $r=0.408, p<0.001$; $r=0.134, p<0.001$)。反思功能在父母的过度保护、情感温暖、冷漠拒绝、抚养焦虑四个维度和青少年边缘型人格障碍特征之间起中介作用。情绪失调在父母的过度保护、情感温暖、冷漠拒绝三个维度和青少年边缘型人格障碍特征之间起中介作用。反思功能、情绪失调在父母养育方式的各个维度与青少年边缘型人格障碍特征的关系中发挥链式中介作用。

结论 反思功能、情绪失调可以分别单独作为中介变量在父母养育方式与青少年边缘型人格特征之间发挥中介作用,“反思功能→情绪失调”也可以形成链式中介在父母养育方式与青少年边缘型人格特征之间发挥中介作用。心智化能力和情绪失调可作为关键干预目标,用于预防和治疗青少年边缘型人格障碍在临床和非临床环境中的发生和发展。**关键词:** 父母养育方式, 边缘型人格障碍, 青少年, 心

智化, 反思功能, 情绪失调

青少年心境障碍患者非自杀性自伤临床特征及与 POMC 基因甲基化研究

肖星玉 侯彩兰*

广东省人民医院

目的 非自杀性自伤(Non-suicidal Self-injury, NSSI) 增加自杀风险, 需要及时发现、干预。目前 NSSI 的发病机制尚不明确, 存在疼痛镇痛/阿片类假说、表观遗传学等机制。阿黑皮素原 (proopiomelanocortin, POMC) 是 β -内啡肽的前体物质, 心境障碍患者 NSSI 的发病机制可能涉及 POMC 基因的表观遗传改变。本研究主要探讨青少年心境障碍患者 NSSI 和非 NSSI 两组间心理状况及 POMC 基因甲基化水平之间的差异, 寻找 NSSI 的潜在生物学标记, 为后期治疗青少年心境障碍患者的 NSSI 提供证据支持。

方法 纳入 108 名青少年心境障碍患者, 根据是否符合 2013 年美国《精神疾病诊断与统计手册 (第 5 版)》推荐的 NSSI 诊断标准分为 NSSI 组 (N=72) 及非 NSSI 组 (N=36)。采用自制的调查表收集患者的一般人口学资料; 采用青少年非自杀性自伤行为功能评估量表评估 NSSI 的频率及程度; 采用蒙哥马利抑郁评定量表、简明精神病评定量表、儿童期创伤问卷及精简版青少年社交焦虑量表评估患者的临床症状及心理特征。采集全部患者血样, 使用焦磷酸测序法检测两组 POMC 基因甲基化水平。使用 SPSS 26.0 软件建立数据库, 采用卡方检验、独立样本 t 检验、相关性分析等进行统计分析。

结果 1、女性、双相抑郁更容易出现 NSSI ($P < 0.05$), 两组在年龄、受教育年限、居住地等方面差异无统计学意义。2、第一次自伤年龄小、有自杀意念、伴有忧郁特征更容易出现 NSSI ($P < 0.05$)。3、NSSI 组中使用抗精神病药的患者构成比更多 ($P=0.023$)。4、NSSI 组的 MADRS 总分、BPRS 总分、CTQ 总分、SAS-A 总分等高于非 NSSI 组 ($P < 0.05$)。5、青少年心境障碍患者 NSSI 组的 CpG4 甲基化水平高于非 NSSI 组 ($P=0.047$), 有统计学差异。6、青少年心境障碍患者 POMC 基因甲基化水平与 NSSI 总分、MADRS 总分、SAS-A 总分、使用抗精

神病药、使用抗抑郁药有关 ($P < 0.05$)。

结论 1、在青少年心境障碍患者中, 女性、双相抑郁、第一次自伤年龄较小、有自杀意念、伴有忧郁特征的患者及存在较严重的抑郁及精神病性症状、较多社交焦虑、情感及躯体的虐待及忽视的患者更容易出现 NSSI 行为。2、在青少年心境障碍患者中, POMC 的 CpG4 位点甲基化水平可作为该人群 NSSI 的潜在表观遗传标记。3、青少年心境障碍患者 POMC 基因甲基化水平与 NSSI、抑郁及社交焦虑严重程度及用药有关。

女性情绪障碍早期筛查的潜在电生理标志物: 使用额叶脑电图评估焦虑、抑郁情绪

杨颖¹ 徐海婷² 李晓虹² 张春笑¹

1. 首都医科大学附属北京安定医院

2. 北京回龙观医院

目的 女性往往受社会文化、负性生活事件、遗传和激素等因素影响而有更高的情绪障碍患病率, 并导致睡眠、认知和社会功能等方面的损害。因此, 为了使女性情绪障碍患者尽早得到筛查、识别、诊断和治疗, 本研究检验了额叶脑电图在评估女性情绪障碍患者焦虑和抑郁情绪中的效果与价值, 以期探索早期筛查的客观电生理标志物。

方法 通过额叶脑电图采集 132 名女性情绪障碍患者的脑电波数据, 借助小波分析法和人工智能对大脑神经活动进行分析, 得出 12 项评估大脑功能的量化指标, 再将 132 名患者的脑功能指标得分与焦虑自评量表 (SAS)、抑郁自评量表 (SDS) 量表评估得出的焦虑和抑郁水平纳入相关分析。

结果 女性情绪患者的 SAS 得分与大脑负荷、情绪压力和大脑疲劳 (均 $p < 0.01$) 得分显著正相关, 与放松程度和左右优势 (均 $p < 0.05$) 得分显著负相关; SDS 与大脑负荷 ($p < 0.01$)、情绪压力 ($p < 0.01$)、大脑疲劳 ($p < 0.01$)、敏感程度 ($p < 0.05$) 和思绪排空 ($p < 0.01$) 得分显著正相关, 与大脑活力和放松程度 (均 $p < 0.05$) 得分显著负相关。未成年女性情绪障碍患者的 SAS、SDS、情绪压力、大脑疲劳、抵抗干扰和思绪排空得分显著高于成年患者。

结论 本研究中, 基于额叶脑电图得出的大脑负荷、情绪压力、大脑疲劳、放松程度和左右优势有助于评估焦虑水平, 大脑负荷、情绪压力、大脑疲劳、敏感程度、思绪排空、大脑活力和放松程度指标有助于评估抑郁水平, 这些定量脑功能指标有望成为女性情绪障碍患者的潜在电生理标志物, 以提供更加客观准确的筛查、识别和评估工具。

孕期睡眠障碍的数字化治疗方法探索

王宁¹ 王晓茜² 张蕾²

1.北京回龙观医院

2.清华长庚医院

目的 本研究旨在探索孕期睡眠障碍的数字化治疗方法, 通过对比分析数字化疗法在 80 例孕妇中的效果, 为孕期睡眠障碍的治疗提供新的策略和实证支持。

方法 本研究共纳入 80 名伴发睡眠障碍的孕妇, 采用随机对照试验的方法进行数据收集和分析。所有孕妇被随机分为两组: 数字化治疗组 (40 名) 和对照组 (40 名)。数字化治疗组接受为期 6 周的基于互联网的数字化认知行为疗法 (CBT-I) 治疗, 内容包括睡眠限制、刺激控制、认知疗法、放松技巧和睡眠卫生教育等。对照组则接受仅予以睡眠建议、生活方式调整等。在治疗前后, 使用标准化的睡眠障碍评估量表 (如匹兹堡睡眠质量指数 PSQI) 对所有孕妇进行睡眠质量评估, 并采用 SPSS 统计软件 25.0 对数据进行描述性统计、t 检验。

结果 1. 基线数据: 治疗前, 两组孕妇的 PSQI 总分平均分别为 13.4 (数字化治疗组) 和 13.2 (对照组), 两组在年龄、孕次、孕龄等基线数据上无显著差异 ($p>0.05$)。

2. 治疗效果: 经过 6 周治疗后, 数字化治疗组的 PSQI 总分平均下降至 8.1, 而对照组的平均分为 11.0。t 检验结果显示, 两组在 PSQI 总分上的差异具有统计学意义 ($t=6.34$, $df=78$, $p<0.001$)。

3. 数据分析: 睡眠效率: 数字化治疗组从基线的 71% 提高到治疗后的 87%, 而对照组从 70% 提高到 74%; 睡眠时长: 数字化治疗组平均增加睡眠时

长 30 分钟, 而对照组平均增加 10 分钟。睡眠质量: 数字化治疗组在睡眠质量、睡眠潜伏期、日间功能障碍等方面的改善均显著优于对照组。

结论 本研究结果表明, 基于互联网的数字化认知行为疗法 (CBT-I) 对于改善孕期睡眠障碍具有显著效果。与传统治疗方法相比, 数字化疗法在提高睡眠效率、延长睡眠时长和改善睡眠质量等方面表现出更好的效果, 使用便捷。为孕期睡眠障碍的治疗提供了新的思路和工具, 有助于提高孕期妇女的睡眠质量和整体健康水平。未来, 可以进一步扩大样本量, 并进行长期随访研究, 以进一步验证数字化疗法的疗效和安全性。

Risk Factors of Pulmonary Embolism in Schizophrenia Inpatients

Jian Zhang*

Shenzhen Mental Health Center, Shenzhen Kangning Hospital, Shenzhen

Objective The associated factors of pulmonary embolism in acute schizophrenia inpatients remains unclear. To the best of our knowledge, this is the first study that examines the risk factors of pulmonary embolism in acute schizophrenia inpatients and includes clinical correlates, antipsychotic drug exposure, comorbidities of medical conditions, psychomotor retardation and immobility, food-intake and laboratory tests results on admission.

Methods A retrospective matched case-control study using Shenzhen Kangning hospital administrative health data of inpatients from January, 2020 to December, 2023. Inpatients with schizophrenia with comorbid pulmonary embolism were matched 1:2 on age and gender to inpatients without pulmonary embolism. Retrospective correlates were assessed using SPSS. The risk factors of pulmonary embolism in schizophrenia inpatients were the outcome of interest

Results Among schizophrenia inpatients, those with lower-limb deep-vein thrombosis on admission ($p=0.0258$) and food intake refusal ($p=0.0002$) had a

higher risk of PE onset during hospital stay. However, the study failed to detect a significant association between different antipsychotics exposure, physical restraint and the risk of PE outcomes during hospital stay

Conclusion The comorbid with lower-limb deep-vein thrombosis and food intake refusal on admission was proved to be indicative in the risk of PE outcomes in schizophrenia inpatients. However, Larger studies with cohort study designs are warranted.

Dim Light at Night Induces Depression-like Behaviors During The Postpartum Period Through Circadian Rhythm Disruptions in Mice

Bingqin Lin^{1,2}, Nana Zheng¹, Biao Li¹, Tong Luo¹, Yimei Fan¹, Ying Yang², Jihui Zhang¹, Hongliang Feng¹
1.Center for Sleep and Circadian Medicine, The Affiliated Brain Hospital, Guangzhou Medical University
2. Department of Neurology, The First Affiliated Hospital of Jinan University

Objective Growing evidence suggests that dim light at night (dLAN) may disrupt circadian rhythms and provoke symptoms of anxiety and depression. Due to inconvenient pregnancy and caring for infants, there is a high prevalence of dLAN exposure among pregnant and postpartum women. However, the relationships of dLAN with circadian rhythms, depression, and anxiety during the postpartum period remain unclear. Hence, this study aimed to examine the effects of dLAN on circadian rest-activity rhythms, depression- and anxiety-related behaviors during the postpartum period in mice and to explore its underlying mechanisms

Methods Pregnant ICR mice were housed for four weeks in either a light/dark cycle (control group) or a light/dim light cycle (dLAN group). Meanwhile, circadian rest-activity rhythms were monitored by the Clocklab circadian cage, which allows for the visualization of long-term locomotor activity. Depression- and

anxiety-related behaviors were assessed by sucrose preference test and open field test, respectively. The levels of relevant hormones in the cerebral cortex were evaluated using ELISA kit. Total RNA extraction and purification from hippocampal across multiple time points were performed for the transcriptome analysis. In addition, circadian oscillations in RNA-seq data were assessed using the BIO_CYCLE portal within Circadi-Omics to identify circadian-related genes. Gene enrichment analysis (i.e., KEGG) was conducted using the NovoMagic platform for gene annotation and analysis. Body weight was also documented at multiple time points

Results The Clocklab circadian cage data showed that, relative to the control group, the dLAN group exhibited whole-day rest-activity fragmentations of wheel-running behaviors in both pregnant and postpartum periods. The dLAN group showed more bouts of wheel-running activity during the major rest period (daytime), and more bouts of rest during the active period (nighttime). In addition, compared with control group, dLAN group showed lower sucrose consumption in sucrose preference test and lower levels of 5-HT and BDNF related hormones. Transcriptome data showed that, compared with the control group, diverse traditional circadian rhythm genes of the dLAN group, such as Nr1d1, Nr1d2, Clock, and Per1, lost circadian profiles in the hippocampal tissue. KEGG analysis showed that inflammation pathways were highly enriched in both groups, whereas circadian related pathways were only enriched in the control group. However, there was no significant difference between dLAN and control groups in open field test and body weight

Conclusion Overall, this study suggests that dLAN during the pregnancy and postpartum periods might provoke circadian rest-activity rhythm disruptions and specifically induce depression-like behaviors by the circadian rhythm disruptions in hippocampal tissue. These findings provide valuable insights into improving maternal health and well-being during the critical postpartum period

[Fundings] This work was supported by the National Natural Science Foundation of China (82171476; 82101558).

中缝核到杏仁核的传导通路介导了光照对抑郁样行为的改善

朱镛霆*

广州医科大学附属脑科医院

目的 验证中缝核到杏仁核的传导通路参与光照对抑郁样行为的调控

方法 将实验沙鼠随机分配为3组:a. Naïve组, 10只; b. CNO组, 10只; c. Saline组, 10只。采用化学遗传学技术在中缝核注射 pAAV-hSyn-DIO-hM4D(Gi)-mCherry,同时向杏仁核注射 pAOV-hSyn-EGFP-2A-CRE。病毒注射(第0天)一周后(第8天)进行行为学测试, Naïve组、CNO组、Saline组三组之间两两比较,发现三组之间糖水偏好百分比、运动总距离、中央区域停留时间均无显著差异($P>0.05$),表明病毒注射操作对动物行为学没有产生影响。第10天开始 CUMS 造模, 21天后(第31天)加光照疗法干预,每天在光照前45 min给予实验组沙鼠注射腹腔 CNO(对照组注射生理盐水),特异性阻断视网膜至杏仁核的投射,14天后(第44天)进行动物行为学测试。

结果 与 Saline 组相比, CNO 组糖水偏好百分比减小($P<0.001$),总距离明显减小($P<0.001$),表明阻断中缝核至杏仁核的传导通路,抑制了光照对快感缺失及自主活动行为的改善;与 Saline 组相比, CNO 组中央区域停留时间无显著差异,表明阻断中缝核至杏仁核的传导通路对焦虑状态无影响。

结论 证明了中缝核到杏仁核的传导通路也参与光照对抑郁样行为的调控。后期我们将用化学遗传学的方法在中缝核注射 pAAV-hSyn-DIO-hM3D-mCherry,兴奋该传导通路,进一步证实中缝核到杏仁核的传导通路介导了光照对抑郁样行为的改善。

Research on The Balance Between The Rights and Interests of Persons with Limited Civil Capacity for Asset Preservation and Civil Conduct

Hanmei Du Yi Sun* Fuxin Yao

Beijing HuiLongGuan Hospital (Peking University Huilongguan Clinical School of Medicine)

Asset preservation refers to the protection of the debtor's assets from illegal infringement through legal means to ensure that the legitimate rights and interests of creditors are realized. In China, the asset preservation system mainly includes measures such as sealing, seizure, and freezing. However, in the process of asset preservation, the rights and interests of persons with limited civil capacity are often involved.

Restricted capacity for civil conduct means that although an individual has the legal ability to carry out civil juristic acts, this capacity is limited to a certain extent. This group of people usually includes minors, mentally ill people, etc. The assessment of limited capacity for civil conduct helps clarify the legal responsibilities of individuals, protecting their legitimate rights and interests, and also helps maintain social order. In legal practice, the validity of the legal acts of persons with limited capacity for civil conduct will be affected to a certain extent. Therefore, when handling legal cases involving persons with limited civil capacity, it is necessary to fully consider their special circumstances to ensure that their legitimate rights and interests are protected. The assessment of limited civil capacity is an important part of the legal system. How to balance the relationship between asset preservation and the rights and interests of persons with limited civil capacity has become an urgent problem to be solved. This article will discuss the balance between asset preservation and the rights and interests of persons with limited civil capacity and put forward corresponding suggestions.

1. Conflict between asset preservation and the rights and interests of persons with limited capacity for civil conduct

(1) The impact of asset preservation on the rights and interests of persons with limited capacity for civil conduct

In the process of asset preservation, the property of a person with limited civil capacity is often involved. Because persons with limited capacity for civil conduct

lack full capacity to express their intentions, their property rights and interests are vulnerable to infringement.

(2) Restrictions on the preservation of assets by restricting the rights and interests of persons with capacity for civil conduct

On the premise of protecting the rights and interests of persons with limited capacity for civil conduct, the implementation of asset preservation is restricted to a certain extent. On the one hand, the property rights and interests of persons with limited civil capacity should be fully protected and cannot be infringed upon at will; On the other hand, the legitimate rights and interests of creditors should also be realized. Finding a balance between the two has become a tricky one.

2. The principle of balancing the rights and interests of persons with limited civil capacity for asset preservation and civil capacity

(1) Respect the principle of the will of persons with limited capacity for civil conduct

Although these individuals are disadvantaged in civil activities due to limitations in their age, intelligence, or mental state, this does not mean that their wishes and opinions can be ignored. For those persons with limited capacity for civil conduct who have a certain degree of ability to express their will, the law, and society should allow them to participate in the decision-making of their property disposal.

(2) The principle of ensuring basic living and learning needs

In the process of asset preservation, it is a crucial principle to ensure the basic living and learning needs of persons with limited civil capacity. This means that any property preservation measures must first be taken to ensure that the quality of life and educational opportunities of these individuals are not adversely affected. Specifically, when it comes to the property of a person with limited capacity for civil conduct, the judicial authorities and relevant parties should give priority to retaining their daily necessities and learning resources, to avoid being unable to meet their basic survival and development needs due to the seizure, seizure or freezing of assets. This principle emphasizes the care for humanity in legal proceedings and the special protection of the rights and interests of special groups such as minors and

persons with disabilities.

(3) The principle of fairness and reasonableness

When implementing asset preservation measures, the principles of fairness and reasonableness should be followed to ensure that the rights and interests of all parties are treated equally. Special protection of the rights and interests of persons with limited civil capacity should be reflected, to ensure that they will not fall into a more disadvantageous situation due to asset preservation..

3. Measures to balance the rights and interests of persons with limited capacity for civil conduct in asset preservation

(1) Improve relevant laws and regulations

Given the balance between the rights and interests of persons with limited civil capacity for asset preservation and civil conduct, China urgently needs to start from the legislative level and build a more complete legal protection system by improving relevant laws and regulations. Specifically, the scope of rights and interests of persons with limited civil capacity in the process of asset preservation should be clearly defined in the Civil Code and supporting regulations, including but not limited to the right to participate, the right to know, and the right to object to the disposal of their property, to ensure that they can obtain due legal protection and remedies in the face of asset preservation measures.

(2) Establish a diversified dispute resolution mechanism

To effectively resolve disputes that may arise in the process of asset preservation, especially the complex situations involving persons with limited civil capacity, China should actively build a diversified dispute resolution mechanism. Mediation should be the preferred solution, which can avoid a long litigation process and protect the rights and interests of all parties promptly.

(3) Strengthen assistance and protection for persons with limited capacity for civil conduct

A sound legal aid system should be established to provide them with free or low-cost legal consulting services, and to ensure that there is guidance and support from professional lawyers in every aspect of asset preservation to help them understand the relevant legal procedures and protect their rights and interests.

Conclusion The issue of balancing the rights and interests of persons with limited capacity for civil conduct is a complex social issue, involving many fields such as law, economy, and ethics. The principles of respecting the wishes of persons with limited capacity for civil conduct, ensuring basic living and learning needs, and fairness and reasonableness should be followed, and measures such as improving laws and regulations, establishing diversified dispute resolution mechanisms, and strengthening assistance and protection should be adopted to achieve a balance between asset preservation and the rights and interests of persons with limited civil capacity.

Aggression Exposure and The Risk of Insomnia in Chinese Adolescents: A Prospective Cohort Study Through Latent Profile Analysis

Sihong Li Jiansong Zhou*

The Second Xiangya Hospital of Central South University

Objective Insomnia is one of the most common mental health problems in adolescents, while aggression is reported to be associated with insomnia in this population. However, few previous studies have explored the relationship between the severity of aggression and insomnia in adolescents. Thus, this study aims to explore the relationship between different severity of aggression exposure and follow-up insomnia in Chinese adolescents

Methods A total of 1124 students were enrolled in this study, all participants were asked to complete a questionnaire in October 2022, and a 8-month follow-up. The demographic variables were collected by a self-designed questionnaire, The Short-Form Buss-Perry Aggression Questionnaire (BPAQ-SF) was used to evaluate the status of aggression. Insomnia Severity Index (ISI) was used to estimate the symptoms and severity of

insomnia. Latent profile analysis (LPA) was conducted to identify profiles of aggression. The associations of different aggression profiles on insomnia in 8 months were assessed using logistic regression analysis. Additionally, we used restricted cubic splines model to investigate the shape of the association

Results LPA suggested three profiles: low aggression, moderate aggression and high aggression. We found that high aggression exposure was associated with a significantly increased risk of insomnia (OR: 12.09 (95%CI:6.14–23.78)). Adjustment for age, sex, nation, anxiety, depression still explained a significant association (OR: 9.98 (95%CI:4.94–20.15)). The relation between the aggression and insomnia was linear in restricted cubic spline regression

Conclusion Higher aggression exposure was associated with an increased risk of insomnia, and this finding highlights the importance of addressing aggression symptoms among Chinese adolescents to better prevent insomnia

The Impact of Internet Addiction on Hyperactivity-Impulsivity: The Chain Mediating Role of Mind Wandering and Anxiety

Yan Li Zheng Zhang Huijuan Guo Jizhi Wang Jiansong
Zhou Xiaoping Wang*
The Second Xiangya Hospital, Central South University

Objective The prevalence of hyperactivity-impulsivity and Internet addiction among adolescents has adverse effects on their academic performance, well-being, and social relationships. This study aimed to investigate in depth the association between Internet addiction and hyperactivity-impulsivity in adolescents, and to further explore the possible mediating roles of mind wandering and anxiety in this association

Methods A total of 2042 adolescents completed assessments using the Internet Addiction Test (IAT), the

Mind Wandering Questionnaire (MWQ), the Generalized Anxiety Disorder 2 (GAD-2), and the ASRS short scale to evaluate Internet addiction, mind wandering, anxiety, and hyperactivity-impulsivity, respectively

Results The study revealed that Internet addiction, mind wandering, and anxiety emerged as significant predictors of hyperactivity-impulsivity. Additionally, mediation analyses indicated that mind wandering and anxiety mediated the relationship between Internet addiction and hyperactivity-impulsivity. These findings suggest that adolescents who are addicted to the Internet are more likely to experience mind wandering and anxiety, which in turn contribute to their hyperactivity-impulsivity

Conclusion This study sheds light on how Internet addiction influences hyperactivity-impulsivity among adolescents and underscores the importance of preventive measures. We recommend implementing interventions aimed at fostering healthy Internet usage habits and providing robust mental health support to safeguard adolescents' physical and mental well-being. Such measures could help mitigate the negative impacts of Internet addiction on adolescents' behavior and overall health

关键词: Internet Addiction; Mind Wandering; Anxiety; Hyperactivity-Impulsivity; adolescent

The Bridge Symptoms of Work-family Conflict, Sleep Disorder and Job Burnout: A Network Analysis

Jingyan Sun*
Department of Psychiatry, National Clinical Research Center for Mental Disorders, The Second Xiangya Hospital of Central South University, Changsha 410011, Hunan, China.

Objective This study aims to elucidate characteristics of the symptom network of work-family conflict (WFC) and sleep disorders amongst Chinese correctional personnels, whilst accounting for job burnout as a possible confounder

Methods A total of 472 correctional personnel were included. Their WFC, sleep disorders, and job burnout were measured using a Chinese version of Work-Family Conflict Scale (WFCs), The Athens Insomnia Scale (AIS), and a revised Chinese version of Maslach Burnout Inventory-General Survey (MBI-GS), respectively. Central symptoms and bridge symptoms were respectively identified based on centrality indices and bridge centrality indices. Network stability was examined using the case-dropping procedure

Results Daytime condition (strength = 0.01) and strain-based work interference with family (WFCs, strength = 1.45) symptoms had the highest centrality values in the WFC-sleep disorder network structure, which were also identified as two bridge symptoms. Emotional exhaustion, daytime condition, and WFCs appeared to be potential bridge symptoms in the WFC-sleep disorder-burnout network structure

Conclusion In this study amongst Chinese correctional personnel, daytime condition and WFCs were found to be central symptoms in the WFC-sleep disorder network structure, with emotional exhaustion as the bridge symptom in the WFC-sleep disorder-burnout network structure. We encourage relevant organizations to provide timely and effective education and guidance for regulatory personnel regarding these bridge symptoms. Subsequent research should follow up to assess the impact of relevant interventions on symptoms in the WFC-sleep disorder-burnout network, thereby advocating for the mental and physical health of correctional personnel

关键词: work-family conflict; sleep disorder; correctional personnels; symptom network; bridge symptoms

Impact of Early Child-parent Bonding on Violence in Patients with Schizophrenia

Xindi Ling¹, Xindi Ling², Haozhe Li¹, Shujian Wang¹, Weixiong Cai², Weixiong Cai¹

1.Academy of Forensic Science

2.School of Basic Medical Sciences, Fudan University

Objective Violence is a major global health concern among patients with schizophrenia. However, the triggers of violent behavior remain unclear. In the current study, we hypothesized that patients with a diagnosis of schizophrenia who exhibit violent behavior may have certain psychological features related to childhood trauma or parental bonding. The study aimed to explore the relationship between violent behavior and childhood experience. It also aimed to determine the role of the early child-parent bond in violence risk and evaluate its degree of impact (on violence) in patients with schizophrenia

Methods This study enrolled 287 patients with schizophrenia and compared their data with those of 100 matched healthy controls. Patients were divided into 3 groups based on violent behavior. Childhood trauma questionnaire, parental bonding instrument, and modified overt aggression scale were used to explore the relationship between violent behavior and childhood experience

Results Our findings indicated the proportion of males to be higher in the patient groups than in the healthy controls, especially in the group with homicidal history. A higher proportion of healthy controls were married and received education for a longer period (in years). Analysis of the scores from the rating scales showed that the individual patient groups had a significantly higher prevalence of sexual abuse, emotional abuse, and emotional neglect than the healthy control group. On analyzing the relationship among the CTQ, PBI, and MOAS scores, emotional abuse and emotional neglect were found to be positively and negatively related to MOAS scores, respectively. Maternal over protection was found to be negatively related to the MOAS scores. Higher parental over protection was thought may be associated with more severe violent behavior (such as homicide) in patients with schizophrenia and maternal over protection may protect these patients from violence to a certain extent

Conclusion Childhood trauma and parental over protection possibly play predictive roles and may influence the presence and severity of violent behavior to some extent. Our findings demonstrate the potential of

using early child-parent bonding as a reference indicator for assessing violence risk in patients with schizophrenia.

关键词: violence, child-parent bonding, schizophrenia, scale assessment

The Mediation Role of Gray Matter Volume in The Relationship between Childhood Maltreatment and Psychological Resilience in Adolescents with First-episode Major Depressive Disorder

Hui Chen¹, Peiqu Liu³, Xianliang Chen¹, Jiali Liu¹, Huajia Tang¹, Yusheng Tian¹, Xiaoping Wang¹, Fengmei Lu², Jiansong Zhou¹

1.Department of Psychiatry, National Clinical Research Center for Mental Disorders, and National Center for Mental Disorders, The Second Xiangya Hospital of Central South University

2.The Clinical Hospital of Chengdu Brain Science Institute, University of Electronic Science and Technology of China

3.Shenzhen Kangning Hospital, Shenzhen Mental Health Center

Objective Previous studies have revealed morphologic alterations in patients with major depressive disorder (MDD) with experiences of childhood trauma. However, the underlying neural mechanisms remain largely unknown. This study aims to explore the brain structural changes and their possible mediation role in the relationship between childhood maltreatment and psychological resilience in drug-naïve adolescents with first-episode MDD

Methods A total of 57 adolescents with first-episode MDD and 36 healthy controls (HCs) completed the T1-weighted magnetic resonance imaging scan. The adverse childhood experiences and current psychological resilience were assessed using the Childhood Trauma Questionnaire-Short Form and the Connor Davidson Resilience Scale, respectively. The voxel-based morphometry approach was applied to examine changes

in the gray matter volume (GMV)

Results Compared with the HCs, adolescents with MDD had significantly reduced GMV volumes in the left fusiform gyrus, right orbitofrontal gyrus, right superior temporal gyrus, right calcarine cortex, right middle frontal gyrus, left angular gyrus, right precuneus, right posterior cingulate gyrus, and right posterior central gyrus, as well as significantly increased GMV volumes in the left lenticular putamen and right lenticular pallidum. The GMV of the right calcarine cortex was found to be negatively correlated with the severity of emotional abuse and positively correlated with the level of psychological resilience. Moreover, the GMV of the right calcarine cortex might partially mediate the relationship between childhood maltreatment and psychological resilience

Conclusion The present study provided further evidence for structural impairments in adolescents with MDD. Our findings also confirmed the important role of depression-related GMV changes in childhood growth experiences and psychological resilience characteristics during adolescent brain maturation

关键词: Major depressive disorder; adolescents; gray matter volume; childhood maltreatment; psychological resilience

Effects of TDCS Treatment on Metagenome and Metabolism in Young Adults with First-episode Major Depression Disorder

Hui Chen¹, Weidong Liu², Jiali Liu¹, Xianliang Chen¹, Peiqu Liu³, Yusheng Tian¹, Xiaoping Wang¹, Jiansong Zhou¹

1.Department of Psychiatry, National Clinical Research Center for Mental Disorders, and National Center for Mental Disorders, The Second Xiangya Hospital of Central South University

2.E-GENE TECH Co., Ltd

3.Shenzhen Kangning Hospital, Shenzhen Mental Health Center

Objective Major depressive disorder (MDD) is

one of the most common mental diseases, while the etiology of MDD has not been completely clarified. The Microbiota-Gut-Brain axis has become a new direction to explore the etiology of MDD. Most studies have shown that transcranial direct current stimulation (tDCS) is effective in improving and relieving symptoms of depression. However, the previous evaluation of the efficacy of tDCS basically stayed on the changes of symptoms and brain structure and function. At present, there are no studies to explore the efficacy and mechanism of tDCS in the treatment of MDD from the perspective of gut microbes. Therefore, this study was intended to explore the efficacy of tDCS intervention in MDD patients and the changes in gut microecological structure and function before and after treatment, combined with multiple omics analysis of gut metagenomics, macroviroome and metabolome

Methods A total of 21 young adults with MDD according to the Diagnostic and Statistical Manual of Mental Disorders-5 (DSM-5), and 14 sex and age-matched healthy controls (HCs) were recruited for this study. All patients with MDD were treated with tDCS, and the stimulation frequency was 5 times a week, once a day, for a total of 2 weeks, a total of 10 stimulation times. The Beck Depression Inventory-13 (BDI-13), Beck Anxiety Inventory, Perceived Deficits Questionnaire -Chinese version and fecal samples were collected at baseline and 2 weeks after treatment. The clinical efficacy of tDCS treatment was evaluated according to the BDI-13 score. Then, based on metagenomics, metabolomics analysis and connection network methods, we analyzed the changes in gut microbes in MDD patients before tDCS (tDCSb) and after tDCS (tDCSa) treatment and HCs

Results In this study, the effective rate of tDCS intervention in MDD patients was 57.9%, and the remission rate was 36.8%. STAMP and LefSe analysis showed that *o_Bifidobacteriales*, *f_Bifidobacteriaceae* and *g_Bifidobacterium* had significant differences between tDCSb and tDCSa/HCs. In addition, we found that there were six viruses with significant differences between the tDCSb and HCs groups, among which *podoviridae* belonged to the characteristic viruses, while no different viruses were found between the tDCSb and

tDCSa groups. A total of 1158 metabolites were identified by metabolomics analysis, among which 13 were characteristic metabolites shared by HCs vs tDCSb and tDCSa vs tDCSb. Allocholic acid, L-Threonine, 6-Hydroxymelatonin, 4-Hydroxybenzoic acid, and 1-palmitoylglycerophosphocholine, all of which were elevated in MDD compared to HCs, after tDCS treatment, these metabolites decreased

Conclusion The tDCS may exert antidepressant effects through changes in gut microbiota, viruses, and metabolites. The identified associations may help to understand the underlying mechanisms of microbiome-virus-metabolite interactions, which may have important implications for therapeutic interventions targeting gut microbiota in patients with MDD

关键词: Major depressive disorder (MDD); transcranial direct current stimulation (tDCS); Microbiota-Gut-Brain axis; metagenome; metabolism

Diagnosis, Treatment Prediction, and Genetic Insights of Regional Homogeneity in Bipolar Disorder

Dan Lv Haohao Yan Wenbin Guo*

The Second Xiangya Hospital of Central South University, Changsha 410011, Hunan, China

Objective This study aimed to investigate changes in brain activity patterns in patients with bipolar disorder (BDPs) post-treatment, evaluate the diagnostic and prognostic potential of regional homogeneity (ReHo) metrics, and explore associated genes and biological processes.

Methods Imaging data and clinical variables were collected from 80 BDPs, including 37 who underwent a 3-month follow-up, and 88 healthy controls (HCs). The analysis included Kendall's coefficient of concordance ReHo (KCC-ReHo), Coherence ReHo (Cohe-ReHo), and correlation analyses. Support Vector Machine (SVM) and Support Vector Regression (SVR) models based on KCC-ReHo and Cohe-ReHo were used to classify BDPs versus HCs and predict treatment

response in BDPs. Neuroimaging-transcription association analysis was performed using the Allen Human Brain Atlas

Results At baseline, abnormal KCC-ReHo and Cohe-ReHo values were mainly found in the prefrontal-striatum and cerebellum circuits in BDPs. After 3 months of treatment, significant clinical improvements were observed, along with partial normalization of neuroimaging anomalies, notably a decrease in KCC-ReHo in the cerebellum circuit. KCC-ReHo showed optimal performance in classification and treatment prediction. Neuroimaging-transcription analysis identified genes associated with changes in KCC-ReHo or Cohe-ReHo in BDPs

Conclusion Dysfunction in the prefrontal-striatum circuit represents core neuropathological changes in BDPs and indicates treatment response, while decreased activation in the cerebellum circuit contributes to BDPs recovery, and neuroimaging-transcription analysis provides insights into the genetic mechanisms underlying brain functional changes in BDPs.

涉案精神分裂症患者刑事责任能力与前额叶皮层相关功能的研究

韦君美*

山东省精神卫生中心

目的 观察涉案精神分裂症患者在认知加工期间前额叶皮层 (prefrontal cortex, PFC) 氧合血红蛋白 (oxy-hemoglobin, Oxy-Hb) 相对浓度变化值, 初步探讨涉案精神分裂症患者的神经机制和工作记忆功能变化, 并探讨其涉案精神分裂症与刑事责任能力 (criminal capacity) 的相关性。

方法 对 100 例涉案男性精神分裂症患者分为无刑事责任能力组 (Limited Criminal Responsibility, LCR, 50 例) 及完全刑事责任能力 (Full Criminal Responsibility, FCR, 50 例); 应用近红外脑功能成

像系统, 分别采用情绪面孔性别判断任务和“1-back”工作记忆任务, 观察两组精神分裂症患者的前额叶皮层氧合血红蛋白相对浓度变化值。

结果 在负性情绪面孔图片呈现后, 完全刑事责任能力在认知加工期间前额叶皮层氧合血红蛋白相对浓度变化值显著低于无刑事责任能力组 ($t=3.254, P=0.0016$)。在“1-back”工作记忆任务时, 在认知加工期间完全刑事责任能力左侧前额叶皮层相对浓度变化值低于无刑事责任能力组 ($t=2.007, P=0.047$), 两组右侧前额叶皮层 Oxy-Hb 相对浓度变化值无显著性差异 ($t=1.663, P=0.099$)。

结论 根据涉案完全刑事责任能力精神分裂症患者在认知加工期间前额叶皮层氧合血红蛋白 (Oxy-Hb) 相对浓度变化值, 在负性情绪面孔图片呈现后, 前额叶皮层激活程度降低, 并且左侧前额叶皮层工作记忆功能受损, 涉案完全刑事责任能力精神分裂症患者前额叶皮层有氧代谢功能失调, 完全刑事责任能力精神分裂症前额叶相关功能受损更加严重。

眼区基本情绪识别任务下, 使用近红外光谱脑功能成像区分抑郁症患者和正常对照组的预测能力

李媛 王惠玲*

武汉大学人民医院精神卫生中心

目的 抑郁症是常见精神疾病。然而, 抑郁症的诊断目前缺乏客观的物理指标协助诊断与鉴别诊断。近红外光谱脑功能成像技术是新兴的、方便可及的脑成像技术, 已被广泛用于精神科临床诊疗和研究。本研究在眼区基本情绪识别任务下, 使用近红外光谱脑功能成像技术检测抑郁症患者的前额叶激活模式, 并评估近红外光谱脑功能成像技术区别抑郁症患者和正常对照组的预测价值, 以期对抑郁症的临床诊疗提供新的辅助检查和评估方式。

方法 通过 53 通道的近红外光谱脑功能成像仪器检测, 采集 40 例抑郁症患者和 55 例正常对照者在眼区基本情绪识别任务下前额叶氧合血红蛋白的浓度变化, 进一步使用二元 logistics 分析和 ROC

曲线, 检验眼区基本情绪识别任务下, 近红外光谱脑功能成像检测的 53 个通道的 β 值是否能够区别抑郁症患者和正常对照组。

结果 (1) 抑郁症组 (67.89 ± 10.83)% 的眼区基本情绪识别任务正确率和正常对照组 (68.71 ± 8.07)% 无显著性差异。

(2) 眼区基本情绪识别任务下, 正常对照组在额极区 (左侧 ch21 和 ch22, 右侧 ch37), Broca 区 (左侧 ch8, 右侧 ch53), 前运动皮层与辅助运动皮层 (右侧 ch52) 的 6 个通道激活水平显著上升; 抑郁症组在在额极区 (左侧 ch16), 背外侧前额叶 (左侧 ch18, 右侧 ch34 和 ch42), 额叶眼动区 (左侧 ch24 和 ch26), Broca 区 (左侧 ch13, 右侧 ch49 和 ch51), 前运动皮层与辅助运动皮层 (左侧 ch1, 右侧 ch47) 的 11 个通道激活水平显著下降。抑郁症组在背外侧前额叶右侧、Broca 区右侧、以及前运动皮层与辅助运动皮层的 6 个通道 (ch1、ch31、ch37、ch47、ch49 和 ch51) 激活水平显著低于正常对照组。

(3) 使用近红外光谱脑功能成像技术区分抑郁症患者和正常对照组的预测能力, 眼区基本情绪识别任务下, fNIRS 有 7 个通道 (额极区 ch21、ch37 和 ch47, Broca 区 ch13、ch49 和 ch50, 以及前运动皮层与辅助运动皮层区 ch47 和 ch52) β 值的 AUC > 0.700 , 且以上 7 个通道 β 值结合成的预测因子 AUC=0.894。

结论 眼区基本情绪识别任务下, 执行近红外光谱脑功能成像检测, 正常对照组和精神分裂症患者前额叶正激活, 抑郁症患者前额叶负激活; 在背外侧前额叶、Broca 区和前运动皮层与辅助运动皮层区, 抑郁症患者的激活水平低于正常对照组。用近红外光谱脑功能成像区分抑郁症患者和正常对照组, 额极区、Broca 区, 前运动皮层与辅助运动皮层区的 7 个通道, 以及它们的结合预测因子具有中等及以上的预测价值。

关键词: 近红外脑功能成像技术, 眼区基本情绪识别任务, 抑郁症

驾驶心理测评量表在精神障碍者驾驶适宜性评定中的应用

凌歆迪² 凌歆迪¹ 王书剑¹ 李雯¹ 张钦廷¹ 李豪喆¹

1

1. 司法鉴定科学研究院 上海市法医学重点实验室
司法部司法鉴定重点实验室 上海市司法鉴定专业技术服务平台

2. 复旦大学基础医学院

目的 探究影响精神障碍者驾驶机动车的驾驶适宜性的相关因素, 明确驾驶心理测评量表在精神障碍者驾驶适宜性评定中的应用价值, 进一步完善精神障碍者驾驶适宜性评定方法与体系。

方法 纳入 40 例处于疾病缓解期的精神障碍者作为病例组, 招募 40 例健康个体作为对照组。采用阳性与阴性症状量表 (Positive and Negative Syndrome Scale, PANSS) 评估病例组的精神症状及其严重程度。采用驾驶员情绪状态量表 (Driver Profile of Mood States, DPOMS)、驾驶愤怒量表 (Driver Anger Scale, DAS)、驾驶行为量表 (Driving Behavior Scale, DBS) 评估两组受试者在驾驶活动中的表现, 并统计上述驾驶心理测评量表的总分和维度得分。采用卡方检验和两独立样本 t 检验比较两组受试者在一般资料、驾驶情况和量表测评结果上的差异, 采用 Pearson 相关分析计算病例组的 PANSS 评分和驾驶心理测评量表得分的相关性。

结果 病例组既往发生交通违法行为和事故的比例显著高于对照组 ($P < 0.05$)。病例组在 DBS 驾驶功能缺陷得分上显著高于对照组 ($t = 2.25, P < 0.05$), 但在 DAS 总分、敌意手势、无礼驾驶得分和 DBS 过度安全/谨慎行为得分上则低于对照组 ($P < 0.05$)。病例组的 P 评分与 DAS 交通拥堵得分正相关 ($r = 0.308, P < 0.05$), G 评分则与 DBS 敌意/攻击行为得分正相关 ($r = 0.357, P < 0.05$), DPOMS 愤怒得分与 DBS 驾驶功能缺陷得分 ($r = 0.533, P < 0.01$)、敌意/攻击行为得分 ($r = 0.483, P < 0.01$) 正相关, 与过度安全/谨慎行为得分负相关 ($r = -0.422, P < 0.05$), DPOMS 紧张、抑郁得分亦与 DAS、DBS 多个维度得分相关。

结论 在本研究中, 对照组较病例组对于部分驾驶情境表现出更高的愤怒程度, 且对照组可能存在过度安全驾驶的倾向, 这可能与疾病缓解患者的情感、认知损害相关, 而 DBS 则对于疾病缓解期患者的驾驶功能缺陷评价效果更好。同时, 精神障碍者在驾驶活动中面对交通拥堵等特定情境的产生的愤怒情绪可能主要与其阳性症状相关, 而患者因此继发的一系列冒进驾驶行为则更可能与其紧张、焦虑、冲动控制等一般精神病理性状相关。精神障碍

者的冒进驾驶行为可能系基于愤怒情绪进一步复合紧张、抑郁等负性情绪共同作用所致，因此在实务工作中应当将情感症状应当作为评定精神障碍者驾驶适宜性的重要依据之一，且 DPOMS 对此具有良好的评价效果。

The Illicit New-type Drug-induced Psychosis Motivated Violent Crimes in Mainland China: Medico-legal Issues

Simei Zhang*

Shenzhen Kangning Hospital, Shenzhen Mental Health Center

Objective To reveal the illicit new type drug-induced psychosis motivated violent crimes has become a pressing issue in forensic psychiatric and criminal law in mainland China

Methods We collected a total of 3216 crime cases that were submitted for criminal responsibility assessment at the forensic psychiatric assessment center from January 1, 2001, to December 31, 2015, as an illustrative example. It was found that a total of 169 suspects met the diagnostic criteria for illicit drug-induced psychosis according to ICD-10

Results The findings indicated a rising trend in the number of suspects with drug-induced psychosis seeking forensic psychiatric assessment, with an identification rate increasing from 0.69% in 2001 to 9.72% in 2013, and further reaching 7.36% in 2014 and 7.83% in 2015. Among these suspects, approximately 60.9% were involved in criminal cases motivated by illicit drug use, while a significant majority (72.82%, or 75 out of 103) faced charges related to attempted murder/murder or assault. Comparing the criminal cases driven by illicit drug use to those occurring under normal circumstances, it was observed that the former exhibited a higher propensity for violent crimes (91 individuals out of the total of 103 [88.3%] compared to only 35 individuals out of

the total of 66 [53.0%], $\chi^2=26.452$, $p<0.0001$). Furthermore, statistical analyses revealed that regardless of whether the crimes were associated with drug-induced psychosis or not, as well as whether they were classified as violent or non-violent offenses, the number of abusers using new-type illicit drugs exceeded that of traditional drug users

Conclusion The illicit use of new-type drugs has emerged as a pressing concern within the field of forensic psychiatry, particularly in relation to the increasing incidence of violent crimes that require judicial identification. Currently, there is considerable controversy within the judicial psychiatry community regarding the diagnosis and recognition of such disorders, as well as the assessment of capacity for responsibility and how this group should be treated by the legal system. Therefore, it remains crucial to prioritize all sectors when addressing related issues.

Exploring Sleep Characteristics in Chinese Patients with Narcolepsy: Insights From The Nocturnal Sleep Onset Rapid Eye Movement Period (nSOREMP)

Shufei Zeng Bin Zhang*

1.Nanfang Hospital, Southern Medical University

Objective This study aims to investigate the unique characteristics and clinical significance of the nocturnal sleep onset rapid eye movement period (nSOREMP) in the Chinese population with narcolepsy, enhancing our understanding and management of the disorder globally

Methods This retrospective analysis investigated narcolepsy in Chinese patients from six hospitals, using International Classification of Sleep Disorders. A parallel retrospective analysis of the Chinese Clinical Sleep Database (CCSD) focused on polysomnography (PSG) records was conducted to evaluate nSOREMP prevalence in other sleep disorders

Results The study found a 2.51% nSOREMP prevalence in other sleep disorders of CCSD. Significant differences in age, N2 and rapid eye movement (REM) percentages, REM latency, and various indexes were noted among narcolepsy with/without nSOREMP, and other sleep disorders with nSOREMP of CCSD. nSOREMP prevalence in NT1 was 33.33% and in NT2, 28.30%. Noteworthy disparities in NT1 included N2 percentages, REM latency, and SOREMPs in multiple sleep latency test (MSLT). In NT2, differences were significant in age, sleep latency, N2 and REM latencies, arousal index, mean sleep latency in MSLT, and MSLT SOREMPs

Conclusion This study highlights nSOREMP's distinct characteristics in the Chinese population. Patients exhibiting symptoms suggestive of the onset of narcolepsy are advised to undergo an MSLT, irrespective of the occurrence of SOREMP during nocturnal PSG

子午流注择时杵针疗法改善阿尔茨海默病睡眠障碍患者睡眠质量的疗效观察

叶子翔 黎涛*

成都市第四人民医院

目的 探讨子午流注择时杵针疗法改善阿尔茨海默病睡眠障碍患者睡眠质量的临床疗效。

方法 选择 2022 年 6 月—2023 年 6 月成都市某三甲医院老年精神病科收治的 AD 睡眠障碍患者 60 例, 采用数字表法随机分为对照组和杵针组, 每组 30 例。对照组接受常规治疗, 杵针组在常规治疗的基础上辅以子午流注择时杵针疗法, 2 组患者治疗前、连续治疗 1 个月、2 个月、3 个月后均应用采用匹兹堡睡眠质量指数量表、多导睡眠图、简易精神状态检查量表评估患者睡眠质量、认知功能及检测血清炎症因子浓度的情况。

结果 治疗前 2 组患者基线资料、PSQI 评分、PSG 参数、MMSE 评分、血清炎症因子浓度结果组间差异均无统计学意义 ($P > 0.05$)。两组患者者在干预前、干预后 1 个月、2 个月、3 个月时的 PSQI 评分、睡眠潜伏期、觉醒次数、血清炎症因子浓度情况均呈逐渐降低的趋势, 时间之间差异有统计学意义 ($P_{\text{时间}} < 0.05$); 干预后各时点的各指标均以杵针组低于对照组, 差异有统计学意义 ($P_{\text{组间}} < 0.05$), 并且随观察时间延长, 组间差异逐渐增大, 差异有统计学意义 ($P_{\text{交互}} < 0.05$)。两组患者 4 个时点的 MMSE 评分、总睡眠时间、睡眠效率均呈逐渐升高的趋势, 时间之间差异有统计学意义 ($P_{\text{时间}} < 0.05$); 干预后各时点的 MMSE 评分、总睡眠时间、睡眠效率均以杵针组高于对照组, 差异有统计学意义 ($P_{\text{组间}} < 0.05$), 并且随观察时间延长, 组间差异逐渐增大, 差异有统计学意义 ($P_{\text{交互}} < 0.05$)。

结论 子午流注择时杵针疗法不仅可有效改善 AD 睡眠障碍患者睡眠质量, 还能提高患者认知能力, 降低血清炎症因子浓度, 值得临床推广。

Novel Insights Into Genetic Associations and Drug Targets of Mitochondria-associated Proteins with Major Depressive Disorder

Wenxi Sun¹, Haidong Yang², Xueying Zhang¹, Shuman Pan¹, Zhe Li¹, Xiaobin Zhang¹

1. Suzhou Guangji Hospital

2. The Fourth People's Hospital of Lianyungang

Objective A growing number of observational studies have found that mitochondrial pathomechanisms are associated with major depressive disorder (MDD), but little is known about the causal direction of this association. This study aimed to explore the potential causal relationship between mitochondria-associated proteins and the risk of MDD

Methods We used summary data from a genome-wide association study (GWAS) of 66 mitochondria-associated proteins in 3,301 individuals of European descent, as well as a large GWAS on MDD, which involved 294,322 cases and 741,438 controls. We performed a two-sample bidirectional Mendelian randomization (MR) analysis using inverse variance weighting (IVW) as the primary method, supplemented by two additional approaches (MR-Egger and weighted median methods) as sensitivity analyses to detect and adjust for pleiotropy. Moreover, to identify and evaluate potential drug targets, we conducted searches in both the GWAS catalog and the Drug-Gene Interaction Database (DGIdb)

Results According to MR analysis, gene-determined significant causal associations were found between TruA (OR: 0.98), HINT2 (OR: 0.98), MUL1 (OR: 0.98), C1QBP (OR: 1.02), and MDD. The reverse MR analysis indicated causal associations between MDD and RNMT (OR: 0.79), C1QBP (OR: 0.75), and ATP β (OR: 0.77). Thus, we observed a clear bidirectional causal relationship between C1QBP and MDD. Following gene-drug analysis, CHF, BCHE, and KNG1 emerged as potential therapeutic targets

Conclusion Our findings revealed a causal link between mitochondria-associated proteins and MDD,

offering significantly new insights to augment the understanding of MDD pathomechanisms to identify potential therapeutic targets for drug development.

关键词: Major depressive disorder; Mitochondria-associated proteins; GWAS; Bi-directional; Mendelian randomization; Gene-Drug analysis

基于机器学习对阻塞性睡眠呼吸暂停及其严重程度的预测以及 SHAP 特征分析

王安琳 向波*

西南医科大学附属医院心身医学科

目的 阻塞性睡眠呼吸暂停 (OSA) 是一种全球性的常见病, 诊断方法复杂。本研究的目标是建立一个可解释的机器学习 (Machine learning) 模型, 用于预测阻塞性睡眠呼吸暂停及其严重程度。并根据临床特征及心率变异性相关指标分析其危险因素。

方法 这是一项回顾性研究, 符合纳入排除标准的受试者 (n=637, 经筛选后 n=632) 于 2022 年 7 月至 2023 年 5 月期间使用便携式睡眠呼吸监测仪完成夜间睡眠监测。共纳入 17 个变量, 并使用 Python 建立随机森林模型 (Random Forest, SF)、极端梯度提升树模型 (XGBoost)、梯度提升方法 (Gradient Boosting Method mass spectrometry, GBM)、自适应提升 (Adaptive Boosting, AdaBoost) 以及轻量级梯度提升树算法 (Light Gradient Boosting Machine, LightGBM) 5 种机器学习的四分类预测模型。使用 GrindSearchCV 对模型进行超参数调节, 从而获得最优模型。最后, 使用 SHAP (Shapley Additive exPlanations) 解释最佳预测模型并分析对模型预测的重要特征。

结果 在入选的受试者中, 无阻塞性睡眠呼吸暂停人数 (n=251), 轻度阻塞性睡眠呼吸暂停人数 (n=205), 中度阻塞性睡眠呼吸暂停人数 (n=84), 重度阻塞性睡眠呼吸暂停人数 (n=92)。建立的所有模型中, RF 的预测性能最佳, 其在测试集中敏感性为 64.8%, 准确率为 70.9%, AUC 为 0.767。SHAP 分析表明平均血氧饱和度 (average blood oxygen)、最低血氧饱和度 (blood oxygen minimum)、稳定睡眠时长 (STABLE)、年龄 (age)、体重 (weight) 是预测阻塞性睡眠呼吸暂停及其严重程度的前 5 大关

键变量。

结论 本研究建立的基于 RF 模型在训练集和测试集都展现出令人满意预测性能,可以为临床提供一种简单快速的识别阻塞性睡眠呼吸暂停及其严重程度度的工具。其次平均血氧饱和度(average blood oxygen)、最低血氧饱和度(blood oxygen minimum)可能作为危险因素预测阻塞性睡眠呼吸暂停及其严重程度,可以为后续的临床诊断及严重程度分级提供有力的依据。

倒班对护士肠道菌群、炎症因子及认知功能影响的研究

金丹丹¹ 王育梅²

1.河北医科大学第一医院

2.山东省立医院

目的 本研究旨在探讨倒班工作对护士肠道菌群、炎症因子及认知的影响,揭示其与认知减退的联系及肠道菌群和炎症因子的作用。结果有望为理解倒班对护士健康的影响提供科学依据,支持未来干预措施。

方法 本研究采用横断面设计,计划在河北医科大学第一医院招募护士作为研究对象(包括倒班护士和非倒班护士)。收集资料、生化标本,进行量表评估和认知测试。通过酶联免疫吸附试验检测多种血清炎症因子水平。使用 16S rRNA 测序分析肠道菌群。量表包括胃肠道、睡眠、嗜睡、疲劳、抑郁和焦虑等评估。认知功能通过 Stroop、N-back、More-odd shifting 和心理运动警觉性任务等进行测试。

结果 本研究共招募 63 名护士(倒班组 38 人,非倒班组 25 人),两组基线特征无统计学意义。16S rRNA 测序分析显示倒班组肠道菌群多样性显著降低,且菌群结构与非倒班组存在显著差异。具体表现为倒班组厚壁菌门和放线菌门占比增高,拟杆菌门占比降低。在血清炎症因子方面,倒班组 IL-6、TNF- α 、s100 β 、Zonulin、LPS、IL-1 β 及 LBP 等水平均显著高于非倒班组。倒班护士在胃肠道症状、睡眠质量、日间嗜睡、疲劳感及抑郁情绪等方面的自评分数也显著高于非倒班护士,且量表评分差异具

有统计学意义。在认知功能测试中,倒班护士表现出干扰抑制能力减弱、工作记忆受损及认知灵活性下降,其中 Stroop 任务效应量、N-back 任务正确率以及 More-odd shifting 任务转换成本等方面存在显著差异。相关性分析揭示了特定菌属与炎症因子、身心健康症状及认知功能之间的关联。

结论 本研究发现,倒班工作显著影响护士的肠道菌群、炎症反应、身心健康及认知功能。倒班护士肠道菌群多样性低,炎症因子水平高,且更易出现胃肠道症状、睡眠障碍、日间嗜睡、疲劳和抑郁。同时,他们的干扰抑制能力、工作记忆和认知灵活性也明显下降。肠道差异菌属与这些症状及认知功能相关,暗示肠道菌群在倒班导致的健康损害中扮演重要角色。

关键词: 倒班工作,肠道菌群,炎症因子,认知功能,护士

自我厌恶在青少年不良童年经历与抑郁焦虑情绪、自杀风险间中介作用

程玲飞*

北京回龙观医院

目的 探讨自我厌恶在青少年不良童年经历与抑郁焦虑情绪、自杀风险之间的中介作用。

方法 在北京市 5 所初中、5 所高中以问卷星的形式进行横断面问卷调查,共收集有效问卷 6838 份,用自制一般资料问卷、患者健康问卷(patient health questionnaire-9, PHQ-9)、广泛性焦虑量表(generalized anxiety disorder-7, GAD-7)、MINI5.0 中文版自杀模块、童年不良经历问卷(revised adverse childhood experience questionnaire, ACEQ-R)、自我厌恶量表(self-hate scale, SHS)进行相关内容的评估。

结果 青少年抑郁、焦虑及自杀风险在女性($P<0.001$)、高中年级($P<0.001$)的检出率更高。有抑郁情绪、有焦虑情绪、有自杀风险的青少年在不良童年经历、自我厌恶的评分均高于无抑郁情绪、无焦虑情绪、无自杀风险的青少年。童年不良经历通过自我厌恶间接预测抑郁,间接效应为 0.1488,效果量为 60.86% ($P<0.001$),童年不良经历通过自我厌恶间接预测焦虑,间接效应为 0.1524,效果量

为 62.87% ($P < 0.001$), 童年不良经历通过自我厌恶间接预测自杀风险, 间接效应为 0.0485, 效果量为 49.44% ($P < 0.001$)。

结论 童年不良经历对青少年的抑郁焦虑情绪、自杀风险有预测作用, 同时通过自我厌恶对青少年的抑郁焦虑情绪、自杀风险发挥中介作用。

关键词: 青少年 童年不良经历 自我厌恶 抑郁情绪 焦虑情绪 自杀风险 中介作用

The Association between Problematic Internet Use and The Patterns of Sleep Disturbances in Youths: A Latent Class Analysis

Jianyu Que¹, Suying Wu¹, Bin Jiang², Li Zhang³, Wei Yang¹, Yixiong Zheng¹, Weijun Gu¹, Duoduo Lin¹, Zhiyuan Huang¹, Farong Liu¹, Jiahui Deng⁴

1.Xiamen Xianyue Hospital

2.The First Affiliated Hospital of Xiamen University

3.Mental Health Institute of Inner Mongolia Autonomous Region

4.Peking University Sixth Hospital

Objective Sleep disturbances are common in young people. However, few studies have explored potential sleep patterns among youths. The aim of this study was to identify patterns of sleep disturbances based on sleep problems and associated mood symptoms, and to examine the effects of problematic internet use (PIU) on different sleep patterns

Methods Individuals aged 12-25 years were recruited between December 2022 and May 2023 through an online survey. Latent class analysis (LCA) was performed to identify the patterns of sleep disturbances, and a multinomial logistic regression model was used to examine the relationships between PIU and different sleep patterns

Results A total of 6,145 participants were included in final analysis, comprising of 3,336 females (54.3%) and 2,809 males (45.7%), with the mean age of this sample was 16.16 (2.93) years. The LCA identified four patterns of sleep disturbances: class 1 (no/mild sleep disturbances, no psychological problems), class 2

(moderate sleep disturbances, no psychological problems), class 3 (moderate sleep disturbances, moderate psychological problems), and class 4 (severe sleep disturbances, severe psychological problems) among 61.8%, 13.4%, 7.6%, and 17.3% of the participants, respectively. Young individuals with PIU were more likely to have moderate and severe symptom burden of sleep disturbances and psychological problems compared to those with non-PIU, and the adjusted odds ratio (OR) (95% confidence interval (CI)) were 2.64 (1.91–3.65), 4.71 (3.38–6.55), and 8.26 (6.43–10.60) in class 2, class 3 and class 4, respectively

Conclusion Our findings highlight the importance of identifying significant heterogeneity of sleep disturbances in youth and suggest that PIU is potentially a novel target for improving sleep disturbances.

关键词: Sleep disturbances; Latent class analysis; Problematic internet use; Youths

Nightmare Frequency As A Potential Mediator of The Association between Childhood Trauma and Suicidal Ideation Among Youths: A Cross-sectional Study

Jianyu Que¹, Yane Lu², Jingrou Liu³, Lei Shi¹, Suying Wu¹, Ciping You¹, Xiao Chen¹, Duoduo Lin¹, Farong Liu¹, Jijia Liu²

1.Xiamen Xianyue Hospital

2.School of Nursing, Peking University

3.Xiamen University of Technology

Objective Childhood trauma has been found to be associated with suicidal ideation among youth. However, the underlying processes that link childhood trauma and suicidal ideation is unclear. This study investigates the role of nightmare frequency in the association between childhood trauma and suicidal ideation, and the potential moderating effect of sex

Methods Individuals aged 12–25 years were recruited from Fujian Province, China. Childhood trauma was assessed using the Childhood Trauma Question-

naire, and the frequency of nightmares and suicidal ideation were also evaluated. Moderated mediation analyses were conducted with childhood trauma as the independent variable, suicidal ideation as the dependent variable, nightmare frequency as the mediator variable, and sex as the moderator. All statistical analyses were performed in R (version 4.2.3)

Results A total of 3431 individuals completed all the questions assessing childhood trauma, nightmare frequency, and suicidal ideation. Among them, 28.6% reported having experienced suicidal ideation in the past 12 months. Additionally, 25.9% of participants reported frequent nightmares. The association between childhood trauma and suicidal ideation was significantly mediated by nightmare frequency, with an effect size of 0.003 (bootstrap 95%CI: 0.001, 0.005). The indirect effects accounted for approximately 4.11% of the overall effect. However, there was no statistically significant moderating effect of sex on the association between childhood trauma and nightmare frequency

Conclusion The findings of this study suggest that treating nightmares may serve as a promising intervention target for addressing suicidal ideation in youth with a history of childhood trauma, irrespective of sex

关键词: Childhood trauma; Nightmares; Suicidal ideation; Sex; Youth

The Impact of Sleep Quality on Emotion Regulation Difficulties in Adolescents: A Chained Mediation Model Involving Daytime Dysfunction, Social Exclusion, and Self-Control

Hang Yu Ziyue Zhu Yuqiong Zhu Chenguang Ji Chengcong Wu Tiancheng Li Wenjuan Wang*
蚌埠医科大学

Objective Previous studies have revealed associations between sleep disturbances and mental health, yet the comprehensive role of sleep quality, daytime dysfunction, social exclusion, and self-control in difficulties with emotion regulation remains unclear. This

study aimed to elucidate how sleep quality affects emotion regulation difficulties among middle school students through pathways involving daytime dysfunction, social exclusion, and self-control, thereby providing a more comprehensive theoretical basis for mental health interventions

Methods Utilizing the pittsburgh sleep quality index, the adolescent social exclusion scale, the brief self-control scale, and emotion regulation scale-short form, we assessed 1067 students randomly selected from four middle schools

Results Our findings indicate that poor sleep quality significantly contributes to increased daytime dysfunction ($\beta = 0.86$, $SE = 0.07$, $p < .001$), which in turn affects social exclusion ($\beta = 0.60$, $SE = 0.16$, $p < 0.001$), self-control abilities ($\beta = 1.27$, $SE = 0.16$, $p < 0.001$) and emotion regulation difficulties ($\beta = 1.56$, $SE = 0.30$, $p < 0.001$). Social exclusion mediates the relationship between sleep quality and emotion regulation difficulties (Estimate = 0.11, $SE = 0.04$, 95% CI [0.04, 0.20])

Conclusion This study offers novel insights for the development of effective interventions aimed at improving sleep and psychological well-being in adolescents

关键词: adolescents; sleep quality; daytime dysfunction; social exclusion; self-control; emotion regulation; chained mediation effects.

Association Between EEG Power During Sleep and Attention Levels in Patients with Major Depressive Disorder

Le Chen Weiyu Cai Yanyuan Dai Baixin Chen Dandan Zheng Yun Li*
Shantou University Mental Health Center

Objective Major depressive disorder (MDD) is associated with cognitive impairment through unclear mechanisms. We examined the relationship between sleep electroencephalogram (EEG) power and attention level in MDD

Methods Forty-seven untreated patients with

MDD and forty-seven age- and sex-matched controls were included. We examined relative EEG power during non-rapid eye movement (NREM) sleep and rapid eye movement (REM) sleep by fast Fourier transform. The Attention Network Test (ANT) was performed to evaluate attention levels

Results Compared to controls, patients with MDD had lower theta power during NREM ($P = 0.018$) and REM ($P = 0.002$) sleep, while higher beta power ($P = 0.050$) during NREM sleep and delta power ($P = 0.018$) during REM sleep. Regarding attention level, patients with MDD had lower levels of accuracy ($P = 0.021$), longer mean reaction time ($P < 0.001$), poorer manifestations of the alerting effect ($P = 0.038$) and worse executive control ($P = 0.048$). Moreover, decreased theta power during NREM sleep was correlated with worsened accuracy ($\beta = 0.329$, $P = 0.040$), decreased theta power during REM sleep was correlated with worsened alerting effect ($\beta = 0.355$, $P = 0.020$), and increased delta power during REM sleep was correlated with longer mean reaction time ($\beta = 0.325$, $P = 0.022$) in patients with MDD. No association between ANT performance and other frequency bands was observed in patients with MDD

Conclusion Our findings suggest that patients with MDD manifest impaired selective attention function that is associated with decreased theta power during NREM/REM sleep and increased delta power during REM sleep

Effects of Online Mindfulness-based Cognitive Therapy on Chronic Insomnia: Study Protocol for A Randomized Controlled Trial

Zixuan Zeng¹, Lei Huang¹, Xiangyun Long², Zheng Lu¹
1. Tongji Hospital, School of Medicine, Tongji University

2. The Affiliated Brain Hospital of Guangzhou Medical University

Background Chronic insomnia disorder (CID) is a prevalent sleep disorder in China. It impacts individuals' physiological, psychological and social functions. Though cognitive behavioral therapy for insomnia (CBT-I) is the recommended first-line treatment option for CID, there are still about 20% patients exhibiting limited effectiveness. Literature showed that mindfulness could benefit CBT-I protocols and mindfulness-based cognitive therapy (MBCT) was effective to insomnia. Considering the large, widespread population suffering from insomnia and limited mental health resources in China, the online mindfulness-based cognitive therapy for insomnia (MBCT-I) is expected to be a promising treatment approach for CID. However, little is known about its feasibility and efficacy

Objective To evaluate the effect of online MBCT-I on insomnia severity (primary outcome) and sleep quality, level of mindfulness, dysfunctional beliefs about sleep, anxiety, depression and quality of life and attitudes towards psychotherapy (secondary outcome) among Chinese adults with CID

Methods This study is a parallel group, randomized controlled trial of 80 CID patients. Participants will be randomized to the online MBCT-I program or sleep hygiene education (SHE) program with an allocation ratio of 1:1 using simple randomization. Online assessments will be carried out at baseline, by the end of the intervention (week 8) and at the scheduled follow-up time (week 20). The primary outcome is the insomnia severity by the end of the treatment (8 weeks). The secondary outcomes are insomnia severity at week 20 and sleep quality, level of mindfulness, quality of life and attitudes towards traditional psychotherapy and online psychotherapy at week 8 and week 20. Data will be analyzed using both the Per-Protocol Set (PPS) and the Full Analysis Set (FAS), and the PPS population will be analyzed for primary outcome measures

Discussion This is the first study to investigate the efficacy of the online therapist-guided MBCT-I compared with sleep hygiene education on patients with CID. It will provide evidence for clinical practitioners, therapists and patients to consider a new psychotherapeutic option, and for technicians to operate self-guided online MBCT-I application in the future.

GLP-1 类似物利拉鲁肽通过抑制氧化应激、神经炎症和神经凋亡改善睡眠呼吸暂停引起的认知功能障碍

殷青青^{1,2} 吕仁君² 陆林^{2,3}

1. 山东第一医科大学附属省立医院

2. 山东第一医科大学(山东省医学科学院)脑科学与类脑研究院

3. 北京大学第六医院

目的 阻塞性睡眠呼吸暂停(Obstructive sleep apnea, OSA)是一种常见的临床病症,其主要病理表现为慢性间歇性缺氧(chronic intermittent hypoxia, CIH)。利拉鲁肽已被发现具有在多种实验模型中的神经保护作用。本研究的目的是探索利拉鲁肽在改善 CIH 引起的认知障碍中的作用和潜在机制。

方法 细胞实验:将间歇性缺氧干预后的 SH-SY5Y 细胞暴露于不同浓度的利拉鲁肽,并进行 CCK-8 实验、LDH 释放实验、流式细胞术和 Western blot 实验,以评估细胞活力、细胞毒性、凋亡和氧化应激水平。

动物实验:使用间歇性缺氧培养箱干预小鼠,模拟 OSA 病理。进行 Morris 水迷宫实验评估小鼠的空间记忆能力。通过 HE 染色、Nissl 染色和 FJB 染色评估海马组织的病理变化和神经元存活情况,并通过 Western blot 和免疫荧光实验检测相关信号通路的蛋白表达。

结果 1. 细胞实验:利拉鲁肽显著提高了 SH-SY5Y 细胞的存活率,减少了 CIH 引起的细胞凋亡和氧化应激水平。利拉鲁肽通过激活 Nrf2/HO-1 通路,抑制了 CIH 引起的氧化应激损伤,并通过抑制 NF- κ B 和 MAPK 信号通路减少了炎症因子的表达。

2. 动物实验:Morris 水迷宫实验显示,利拉鲁肽可以显著改善 CIH 引起的小鼠空间记忆障碍。组织病理学结果显示,利拉鲁肽能够减轻 CIH 引起的海马组织损伤和神经元死亡。Western blot 和免疫荧光实验结果表明,利拉鲁肽通过激活 Nrf2/HO-1 通路和抑制 MAPK/NF- κ B 信号通路,减轻了 CIH 引起的炎症反应和氧化应激损伤。

结论 本研究表明,利拉鲁肽可以通过激活 Nrf2/HO-1 抗氧化通路,抑制 NF- κ B 和 MAPK 信号通路,从而减轻 CIH 引起的认知功能障碍和海马损伤。这一发现为 CIH 引起的认知障碍提供了一个有前景的预防和治疗策略。进一步的研究应继续探讨利拉鲁肽在 OSAS 认知功能障碍临床上的治疗效果。

4. Key Laboratory of Neurogenetics and Channelopathies of Guangdong Province and the Ministry of Education of China

5. Institute of Psycho-neuroscience, The Affiliated Brain Hospital of Guangzhou Medical University

Background Observational research has showed significant associations between inflammatory factors and sleep. Experimental studies suggested acute increase in the levels of inflammatory markers following sleep deprivation and sleep restriction. However, the causal association between inflammatory factors and sleep remains unclear in chronic and natural settings

Objectives This study aimed to investigate the causal association of inflammatory factors with seven sleep-related traits, including chronotype, daytime napping, daytime sleepiness, insomnia symptoms, and sleep duration

Methods Two-sample bidirectional Mendelian

randomization (MR) analysis was used to investigate the causal associations between 91 inflammatory factors and 7 sleep-related traits. Summary-level data of inflammatory factors were derived from the EBI GWAS Catalog ($n = 14,824$); sleep-related traits were obtained from UK Biobank. We calculated effect estimates using the inverse-variance weighted (IVW), weighted median, and MR-Egger methods. Heterogeneity and pleiotropy were detected and measured by the MR pleiotropy residual sum and outlier, Cochran's Q statistics, and MR-Egger regression

Results We found that 30 inflammatory factors had causal effects on sleep-related traits, while sleep-related traits had causal effects on 20 inflammatory factors. After adjusted by false discovery rate (FDR), strong evidence was found for the causal effects of CD40 (OR = 1.02, 95% CI: 1.01-1.03), ST1A1 (OR = 0.97, 95% CI: 0.96-0.99), uPA (OR = 1.03, 95% CI: 1.01-1.04) on chronotype, and FGF-21 (OR = 1.02, 95% CI: 1.01-1.03), hGDNF (OR = 1.01, 95% CI: 1.00-1.02), TNFB (OR = 0.99, 95% CI: 0.98-1.00), TNFSF14 (OR = 1.01, 95% CI: 1.00-1.02) on napping

Conclusion Our study suggest a bidirectional causal association between inflammatory factors and sleep-related traits, indicating that sleep could influence our overall health via regulating systematic inflammation.

Sleep Efficiency and Event-related Potential P300 in Patients with Depression: The Mediating Role of Serum C-reactive Protein Mediate

Jiang Fang¹, Jiang Fang^{2,3}, Peng Wang^{4,5}, Daomin Zhu^{1,2,3}

1.Department of Sleep Disorders, Affiliated Psychological Hospital of Anhui Medical University

2.Anhui Mental Health Center

3.Hefei Fourth People's Hospital

4.Adolescent Health, School of Public Health, Anhui Medical University

5.Department of Maternal and Child Nursing, School of Nursing, Anhui Medical University

Background Patients with depression could experience cognitive dysfunction and sleep disorders, which affect the quality of life and the treatment efficacy. Increasing evidence demonstrated that chronic systemic low-grade inflammation was implicated in the development of cognitive dysfunction among depressed individuals. There is a bidirectional relationship between sleep quality and cognitive function, as well as potential neurophysiological mechanisms related to depression that require more objective indicators for understanding. This study aims to investigate the association between sleep quality and cognitive function in individuals with depression including the potential role of serum C-reactive protein (CRP) levels

Methods A total of 101 patients with depression were included and divided into two groups: the normal sleep efficiency group (NSE) ($n=45$) with sleep efficiency $\geq 90\%$, and the low sleep efficiency group (LSE) ($n=56$) with sleep efficiency $< 90\%$. All patients received polysomnography (PSG), event-related potential (P300) tests, and the detection of CRP. Multiple linear regression was used to explore the correlation between SE, ERP-P300 latency and. Bootstrapped mediation analysis of a linear regression model was performed to test the mediating effect of serum CRP levels using the PROCESS macro3

Results Exposure to the N2、P3a and P3b latencies in the LSE group were longer than those in the NSE group ($p = 0.036$, $p = 0.013$, $p < 0.001$). Further analysis showed that N2 [Pr = -122.050, 95%CI (-216.090, -28.011)], P3a [Pr = -103.977, 95%CI (-195.070, -12.885)], P3b (Pr = -149.637, 95%CI (-248.583, -50.691)) and CRP [Pr = -3.988, 95%CI (-7.824, -0.152)] were significantly associated with SE, respectively. The significant association of CRP [Pr = 8.046, 95%CI (2.834, 13.258)] with P3b latency was observed. The mediation analysis revealed that CRP mediated the relationship between SE and cognitive function

Conclusion Depression patients with low sleep

efficiency have increased inflammatory levels and impaired cognitive function, suggesting that chronic inflammation may mediate the association between sleep quality and cognitive function in patients with depression.

The Effect of Bright Light Therapy on Anhedonia and Circadian Rhythms in Depression: A Single-blind Randomised Controlled Trial

Xinyu Li^{1,2}, Daomin Zhu^{1,2}

1.Hefei Fourth People's Hospital

2.Anhui Mental Health Centre

Objective The purpose of this study was to determine the effectiveness of different times of bright light therapy (BLT) on anhedonia and circadian rhythm disturbances in depressed patients. It was further investigated whether the benefit of bright light therapy on anhedonia in depression was associated with changes in melatonin and cortisol rhythm indices during treatment

Methods In this single-blind, placebo-controlled study, 81 depression inpatients were recruited from the department of sleep disorders, psychological hospital affiliated to Anhui Medical University and randomly divided into four groups: the morning BLT group (n=23), the morning placebo group (n=17), the evening BLT group (n=22) or the evening placebo group (n=19). The BLT groups were given 10,000 lux bright light therapy and the placebo groups were given <100 lux dim light therapy, respectively. Participants received 30 minutes of light therapy per day (between 9:00-10:00 for the morning groups or between 18:00-19:00 for the evening groups) for a 2-week period. The primary outcome of the study was The Revised Physical Anhedonia Scale (RPAS) score. Secondary outcomes were The Hamilton Depression Scale (HAMD) score, The Hamilton Anxiety Scale (HAMA) score and salivary melatonin and

cortisol concentrations. In this, saliva samples were collected from all subjects at fixed time points in two consecutive days for measuring the melatonin and cortisol concentrations to fit circadian rhythms of subjects. Assessments were repeated before therapy, at 1 week of therapy, and at the end of therapy. Primary and secondary outcomes were analysed for time, group and group-time interaction effects using a mixed repeated-measures analysis of variance. Partial correlation analysis and multiple linear regression analysis were used to explore the correlation between melatonin and cortisol rhythm variables and anhedonia before and after treatment

Results In terms of general demographic and scale scores at baseline, there were no significant differences between the two groups in the morning or between the two groups in the evening. There were also no significant differences in salivary melatonin and cortisol rhythm indices at baseline. At the end of the experiment, there was a significant improvement in HAMD and RPAS scale scores in the morning BLT group compared to the morning control group in terms of group and time interaction effects ($p=0.017$, $p=0.002$). The peak phase of melatonin in the morning BLT group was significantly delayed after treatment compared to pre-treatment ($p=0.001$) as well as compared to the morning control group ($p=0.013$). Correlation analysis suggested a significant negative correlation between the difference in the peak phase of melatonin and the difference in RPAS scores pre- and post-treatment ($p=0.005$). The significant correlation remained in the multiple regression analysis after adjusting for confounders ($p=0.013$)

Conclusion The results suggest that the morning BLT is more effective than placebo in improving anhedonia and depressive symptoms in depressive patients, and is also more reliable in regulating melatonin rhythms. Changes in the peak phase of melatonin during treatment may modulated the efficacy of bright light therapy on anhedonia.

Background Insomnia is associated with chronic kidney disease (CKD) in observational studies. However, whether insomnia is causally associated with CKD remains not established

Objective This study aims to estimate the causal association of insomnia with CKD and investigate the protein pathways linking insomnia to the risk of CKD

Methods In primary analyses, multivariate regression (MVR) and one-sample Mendelian randomization (1SMR) analyses were performed to estimate the associations between insomnia and CKD in >400,000

people. Thereafter, a two-sample Mendelian randomization (2SMR) analysis was used to validate the findings from primary analyses. Finally, proteome-wide MR analysis was conducted to pinpoint CKD-associated blood proteins, supplemented by the colocalization analysis to rule out bias caused by linkage disequilibrium. Additionally, the potential mediation effects of blood proteins on the pathway of insomnia giving rise to CKD were explored through a two-step MR design

Results Across the MVR, 1SMR, and their sensitivity analyses, we found consistent evidence suggesting that more frequent insomnia was significantly associated with a higher risk of CKD (MVR: HR = 1.20, 95%CI = 1.16-1.24; 1SMR: OR = 1.35; 95%CI = 1.02-1.79). Consistent evidence was obtained by using 2SMR (OR = 1.06, 95%CI = 1.02-1.11). Genetically predicted 124 circulating proteins were associated with CKD in proteome-wide MR analysis. ENPP5 is a promising novel target that mediates the association between insomnia and CKD

Conclusion More frequent insomnia is causally associated with increased risk of CKD, and ENPP5 as a potential blood protein mediates the association between insomnia and CKD. These findings indicate that addressing insomnia could serve as a viable and valid intervention to mitigate CKD risk.

荆州地区三级医院护士睡眠质量及相关因素分析

彭成国^{1,2,3} 刘锋^{1,2,3} 张新风^{1,3} 黄发妮¹ 陶艳青¹

1.荆州市精神卫生中心

2.长江大学精神卫生中心

3.长江大学精神卫生研究所

目的 了解荆州地区三级医院护士的睡眠质量现状,并分析睡眠质量的相关因素。

方法 此研究是一项描述性横断面研究。采用一般人口学资料问卷、匹兹堡睡眠质量指数(PSQI)及相关评估量表,在这项研究中,招募了7405名护

士,大多数受试者(96.2%)为女性,应答率为91.2%,共有6753名护士完成问卷,包括5057名(74.9%)夜班护士和1696名(25.1%)白班护士。

结果 26.8%的参与者存在睡眠异常(PSQI>5分)。睡眠异常护士的年龄为(33.05±8.18),睡眠正常护士年龄为(32.58±7.85, $P>0.05$),两者在统计学上无显著性差异。已婚护士睡眠异常(25.70%)情况相较于未婚护士睡眠异常偏低(29.47%, $P<0.001$),两者在统计学上存在显著性差异。睡眠总分变异的22.2%可由正相关因素及负相关因素的变化来解释。正相关因素,即导致睡眠总分增加的因素包括:年龄、近一年夜班频率、夜班压力、夜班前药物使用频率、慢性长期用药、疲乏总分、抑郁总分、压力总分;负相关因素,即导致睡眠总分减少的因素包括:婚姻、夜班前睡眠时间、子女数量、工作家庭冲突总分。

结论 荆州市三级医院的护士存在睡眠质量问题,是否值夜班及相关压力和社会支持是影响睡眠质量的相关因素,护理管理者应重视护士睡眠质量情况,应做到合理排班,关注护士心理状态。

Relationship between Excessive Daytime Sleepiness and Anhedonia in MDD Patients: A FMRI Study

Yifei Li^{1,2,3}, Yu Zhang^{1,2,3}, Lianzi Guan^{1,2,3,4}, Tianqin Xie^{1,2,3}, Jiajia Zhu⁵, Daomin Zhu^{1,2,3,4}

1.Department of Sleep Disorders, Affiliated Psychological Hospital of Anhui Medical University

2.Anhui Mental Health Center

3.Hefei Fourth People's Hospital

4.The School of Mental Health and Psychological Sciences, Anhui Medical University

5.Department of Radiology, The First Affiliated Hospital of Anhui Medical University

Objective Anhedonia is one of the core symptoms of MDD and is closely related to its severity. Approximately 37.4% to 57.1% of people with major depressive disorder (MDD) show symptoms of excessive

daytime sleepiness (EDS). Patients with MDD with concomitant EDS tend to have worse clinical outcomes and are often accompanied by severe anhedonia. The aim of this study was to clarify the neuroimaging mechanisms of EDS symptoms in MDD patients with anhedonia

Methods A total of 22 patients were included in the EDS group (Epworth Sleepiness Scale score ≥ 7) and 45 patients were included in the no daytime sleepiness group (No EDS). All subjects underwent resting state functional MRI, polysomnography (PSG) and clinical scale assessments. Anhedonia assessed using the Revised Social Anhedonia Scale, Revised Physical Anhedonia Scale and Temporal Experience of Pleasure Scale. Employing the Dosenbach 160 node atlas, we obtained whole-brain functional networks and extracted topological features global efficiency (Eglob), local efficiency (Eloc), path length (Lp) and clustering coefficient (Cp)) using a graph-theoretic-based approach. Group comparisons were made using a two-sample t-test

Results The two groups were well matched for gender and age, and there were no differences in HAMD or HAMA scores, duration and percentage of stages N1, N2 and N3, total sleep time (TST) and total time in bed (TIB.) The EDS group scored worse on the Revised Physical Anhedonia Scale (RPAS), while there were no differences in social and temporal anhedonia. In terms of brain networks, the EDS group showed reduced functional connectivity of the DMN to the FPN and the VN to itself, specifically the ventral lateral prefrontal cortex to the posterior cingulate gyrus and the occipital lobe to the fusiform gyrus. Compared to the No EDS group, the EDS group appeared to have extensive reductions in Eglob, Eloc, Cp and increases in Lp. Further mediation analysis revealed that functional connectivity of the DMN to the FPN mediated the relationship between EDS and RPAS

Conclusion MDD patients with EDS exhibit a lack of physical anhedonia, which may be associated with reduced indicators of their extensive whole-brain networks and reduced functional connectivity between some functional brain networks. Reduced functional connectivity may mediate the relationship between EDS symptoms and anhedonia in patients with MDD. Our

study may provide a neuroimaging mechanistic basis for clinical identification and intervention of anhedonia in MDD patients with EDS.

Association of Benzodiazepines Drug Target Genes with Alzheimer's Disease and Cognitive Function: A Mendelian Randomization Study

Huiying Zhang¹, Sizhi Ai², Sizhi Ai¹

1.The Affiliated Brain Hospital, Guangzhou Medical University

2.Center for Sleep and Circadian Medicine, The Affiliated Brain Hospital, Guangzhou Medical University

Background Previous observational studies have suggested associations between benzodiazepines drugs and Alzheimer's disease (AD) as well as cognitive function, but the conclusions from these studies have been contradictory.

Objective This genetically based study aims to assess the potential impact of benzodiazepines drugs usage on AD and cognitive function

Methods A two-sample Mendelian Randomization (MR) analysis was used to investigate the potential causal relationships of benzodiazepine target genes in blood with AD and cognitive functions. Benzodiazepines target genes expression derived from existing expression quantitative trait loci (eQTL) data in blood. Summary statistics for AD (n=307112, 2670 cases) and cognitive function (n=257841) were retrieved from previous genome-wide association studies (GWAS). Utilizing existing GWAS data for cognitive function subtypes and AD biomarkers, we evaluated the causal links between identified genes and associated biomarkers. Then replication validation was performed using brain eQTL data from the Genotype-Tissue Expression project and

GWAS datasets from other European cohorts. Co-localization methods, summary-data-based MR, and protein-protein interaction networks were used for sensitivity analysis to enhance the credibility of the results

Results We found that higher expression of GABRR2 in blood increased risk of AD (OR: 1.540; 95% CI: 1.052-2.254; P = 2.62×10⁻²) and white matter hyperintensity (WMH) (β: 0.102; 95% CI: 0.004-0.200; P = 4.06×10⁻²), while higher expressions of TSPO (β: 0.021; 95% CI: 0.007-0.035; P = 2.68×10⁻³), BRD3 (β: 0.021; 95% CI: 0.004-0.038; P = 1.28×10⁻²), HPGD (β: 0.019; 95% CI: 0.011-0.026; P = 7.94×10⁻⁷), and ALB (β: 0.061; 95% CI: 0.010-0.113; P = 2.00×10⁻²) in blood were associated with better cognitive function. Additionally, a concordant direction of association was also observed between cognitive function and BRD3 expression in brain cortex (OR: 1.031; 95% CI: 1.014-1.049; P=4.89×10⁻⁴) and brain frontal cortex BA9 (OR: 1.049; 95% CI: 1.021-1.077; P =4.54×10⁻⁴). The associations between BRD3 gene expression and cognitive function were still robust after a set of sensitivity analyses

Conclusion This study revealed that benzodiazepines drugs target genes are potential causal risk factors for AD and cognitive function. Our findings emphasized the cautious use of benzodiazepine drugs in clinical practice

The Impact of Adverse Childhood Experiences on Subjective and Objective Sleep Quality in Patients with Insomnia: A Cross-Sectional Study

Yang Wang Dongbin Lyu Xin Luo Ruiyi Qian Jie Zhang Caojun Ji Chengmei Yuan*

Shanghai Mental Health Center, Shanghai Jiao Tong University School of Medicine

Objective Insomnia imposes a significant social cost burden, negatively affects patients' quality of life, and increases the incidence of psychological disorders,

such as depression. Adverse Childhood Experiences (ACEs) are a prevalent and significant public health issue closely associated with the occurrence of sleep disorders. While the relationship between ACEs and subjective sleep quality is well-established, conclusions regarding objective sleep quality remain inconsistent. This study aims to explore the impact of ACEs on both subjective and objective sleep quality in patients with insomnia and to investigate the roles of daytime wakefulness and stress perception

Methods This study included 109 participants aged between 18 and 65 years, who met the DSM-5 diagnostic criteria for insomnia disorder and were free of related sleep and psychiatric disorders. The research utilized a clinical psychological assessment and polysomnography (PSG) monitoring. Subjective sleep quality was assessed using the Insomnia Severity Index (ISI), childhood adversities were evaluated with the Childhood Trauma Questionnaire (CTQ), and participants' pre-sleep arousal (PSAS) was also collected. Spearman correlation and multiple linear regression were used to explore the impact of adverse childhood experiences on subjective and objective sleep quality

Results In terms of subjective sleep quality, there was no significant correlation between ISI and any subscales of CTQ. In objective sleep measures, Wake After Sleep Onset (WASO) ($r = -0.219$, $p = 0.02$) and N1 sleep stage duration ($r = -0.246$, $p = 0.01$) were significantly negatively correlated with emotional abuse. N3 sleep stage duration showed significant positive correlations with emotional abuse ($r = 0.275$, $p = 0.004$) and physical abuse ($r = 0.295$, $p = 0.002$). The PSAS was significantly positively correlated with emotional abuse ($r = 0.372$, $p < 0.001$) and physical abuse ($r = 0.308$, $p = 0.001$). Multiple linear regression analysis indicated that the duration of the N1 sleep stage was significantly influenced by the severity of emotional abuse ($B = -1.54$, $p = 0.035$), and the duration of the N3 sleep stage was significantly influenced by the severity of physical abuse ($B = 2.41$, $p = 0.004$)

Conclusion Compared to subjective sleep quality, adverse childhood experiences have a more significant impact on objective sleep quality. Both emotional and physical abuse affect objective sleep quality. The

level of pre-sleep arousal in patients with insomnia is associated with adverse childhood experiences.

Altered Cerebellar Functional in Major Depressive Disorder with Obstructive Sleep Apnea and Its Association with Cognitive Function

Shukun Zhu¹, Shukun Zhu^{2,3,4}, Yifei Li^{2,3,4}, Ting Wang^{2,3,4}, Jiajia Zhu⁵, Daomin Zhu^{1,2,3,4}

1.The School of Mental Health and Psychological Sciences, Anhui Medical University, Hefei, 230032, China, 2.Department of Sleep Disorders, Affiliated Psychological Hospital of Anhui Medical University, Hefei 230022, China, 3.Anhui Mental Health Center, Hefei 230022, China, 4.Hefei Fourth People's Hospital, Hefei 230022, China, 5.Department of Radiology, The First Affiliated Hospital of Anhui Medical University, Hefei, China

Objective Major depressive disorder (MDD) comorbid with obstructive sleep apnea (OSA) often present more pronounced cognitive function impairment, yet the underlying alterations in brain function remain unclear, and the function of cerebellum have rarely assessed in previous relevant studies. The present study aims to explore the disparities in cognitive function between MDD with or without OSA and elucidate the potential neural mechanisms

Methods Resting-state functional MRI (rs-fMRI), polysomnography (PSG), event-related potential (ERP) and clinical scale assessment data were acquired from 32 MDD patients with OSA and 42 well-matched MDD patients without OSA. Brain function was evaluated based on regional homogeneity (ReHo) and voxel-mirrored homotopic connectivity (VMHC). Differences in brain function between the two groups were evaluated using student's t-test, while relationships between brain function and clinical parameters were examined through partial correlation analysis

Results Compared with the MDD group without OSA, the MDD group with OSA exhibited lower scores in prospective memory, working memory, and sustained attention, along with longer latency of the P3b wave (FzP3b and CzP3b) in ERP testing. In neuroimaging, the MDD group with OSA demonstrated significantly higher ReHo in the left cerebellum superior, lower ReHo in the right cerebellum inferior and increased VMHC in both cerebellum superior compared to the MDD group without OSA. Furthermore, partial correlation analysis revealed a significant negative correlation between the increased VMHC in both cerebellum superior and the Continuous Performance Task-Identical Pairs 4-digit score (CPT-IP-4) ($p=0.005$). Heightened ReHo in the left cerebellum superior was significantly negatively correlated with the CPT-IP-4 score ($p=0.002$), while decreased ReHo in the right cerebellum inferior showed significant negative correlations with both FzP3b ($p=0.009$) and CzP3b ($p=0.007$) of ERP

Conclusion This study highlights the significant cerebellar involvement in the pathophysiology of MDD patients with OSA, with these alterations in cerebellar function being associated with impaired cognitive function. Future research should focus on elucidating the specific mechanisms underlying changes in cerebellar function and exploring interventions to enhance cognitive function in MDD patients with OSA.

失眠障碍的睡眠事件相关脑激活模式研究

卢盼盼 郭誉鹏 邵岩 陈洁 高雪娇 周洋 张云龙 孙洪强*
北京大学第六医院

目的 失眠障碍 (insomnia disorder, ID) 是最常见的睡眠障碍, 觉醒、K-复合波、纺锤波和慢波活动是已知具备生理功能的睡眠事件。然而, ID 患者具备生理功能的睡眠事件相关特异性脑激活模式及其与 ID 疾病特征的关系目前仍不明确。本研究旨在

睡眠事件水平探索 ID 的神经生物学机制。

方法 本研究纳入符合 DSM-5 诊断标准的 43 例 ID 患者及年龄、性别和受教育年限匹配的 40 名健康受试者 (Healthy control, HC)。所有受试者首先完成一般人口学资料采集、匹兹堡睡眠质量指数量表、抑郁自评量表、焦虑自评量表的评估, 佩戴腕式体外活动仪并记录两周睡眠日记, 随后经历连续两晚的多导睡眠监测, 并在一周后接受同步脑电-功能磁共振成像 (Electroencephalogram-functional magnetic resonance imaging, EEG-fMRI) 扫描, 以收集整个睡眠觉醒周期的脑电和脑影像数据。随后标记包括觉醒、K-复合波、纺锤波和慢波活动在内的睡眠事件, 建立事件相关脑激活图谱, 运用混合线性模型识别事件×组交互效应。运用 Spearman's 相关性分析探索睡眠事件相关脑激活模式与临床特征的关系。

结果 事件相关 fMRI 混合线性模型分析显示, 在左侧颞叶皮层、左侧额叶皮层、左侧顶叶及左侧枕叶四个团块观察到不同睡眠事件×组的交互效应, 事后分析表明, 与 HC 组相比, ID 组觉醒相关左侧颞叶皮层 ($z = -2.88, p = 0.02, \text{FDR 校正}$) 和左侧枕叶 ($z = -2.52, p = 0.048, \text{FDR 校正}$) 激活均减低, 左侧额叶皮层 K-复合波相关激活 ($z = -2.76, p = 0.012, \text{FDR 校正}$) 和左侧额叶皮层纺锤波相关激活均增高 ($z = -2.94, p = 0.012, \text{FDR 校正}$)。探索性关联分析显示, 左侧枕叶觉醒相关脑激活强度与匹兹堡睡眠质量指数量表得分呈显著负相关 ($r = -0.30, p = 0.02, \text{FDR 校正}$)。

结论 ID 患者的睡眠事件相关脑功能状态与 HC 不同, 提示睡眠保护和睡眠环境探测相关的脑功能受损可能是 ID 的神经生物学机制。

Objective Over 90% of the patients with isolated rapid eye movement (REM) sleep behavior disorder (iRBD) will have a phenoconversion into a subtype of neurodegenerative disorders including Parkinson's disease and dementia over time. It remains unclear whether melatonin, a known hormone and one of the first-line symptomatic treatments of RBD, yields neuroprotective effects in iRBD

Methods Based on a longitudinal cohort of iRBD with naturalistic clinical follow-up of prescription and phenoconversion, we arbitrarily defined 'with melatonin' by using melatonin for more than half of the follow-up duration, regardless of monotherapy or combined therapy, while 'without melatonin' was defined by not using melatonin or using for less than half of the follow-up or using after the phenoconversion. Cox proportional regression was conducted to compare the risk of conversion to neurodegenerative diseases in patients with and without melatonin. Linear mixed models were used to compare the longitudinal change of neurodegenerative biomarkers. To address the arbitrary definition of melatonin use, time-dependent survival analysis was employed to analyze the effect of melatonin on a vary

dosage and treatment period

Results Comparing with iRBD patients without melatonin (66.3 ± 8.1 years, 72.0% male), those with melatonin (66.2 ± 6.7 years, 71.9% male) showed a lower risk of phenoconversion (HR [95%CI] = 2.58 [1.37, 4.87]), a slower decline of the severity of RBD symptoms (group*time interaction, β [95%CI] = 0.94 [0.13, 1.74]), a slower increase in color vision deficit (-4.09 [-8.08, -0.10]) and motor dysfunction (-1.69 [-3.30, -0.08]), during a mean follow-up duration of 5.9 years. A time-dependent survival analysis corroborated that the use of melatonin had a lower risk of phenoconversion (HR [95%CI] = 0.92 [0.85, 0.99])

Conclusion Melatonin might have disease-modifying properties to delay the progression of phenoconversion in patients with iRBD. Future studies especially clinical trials and animal studies are warranted to corroborate the efficacy and mechanisms

Social Isolation Associated with Sleep Behaviors Among Elderly People

Hongying Yang Lian Li Guolin Bian*

Affiliated Kangning Hospital of Ningbo University

Objective To explore the associations of social isolation with sleep duration and sleep quality in community-dwelling elderly people

Methods A total of 7,762 community-dwelling elderly people aged 60 years and older in Ningbo were recruited from June 2022 to August 2022. Data were collected using a questionnaire. Multivariate logistic regression and population attributable risk (PAR) were used to analyze the associations of social isolation with sleep duration and sleep quality. The KHB mediating effect model was used to test the mediating effect of depression and anxiety on these associations

Results Among the participants, 2,656 (34.2%) had abnormal sleep duration (< 6 hours or > 8 hours), 1,115 (14.4%) had poor sleep quality, and 917 (11.8%)

had social isolation. After adjusting for confounding factors, compared with the elderly without social isolation, the odds ratios (ORs) (95% confidence interval) of abnormal sleep duration and poor sleep quality in the elderly with social isolation were 1.49 (1.29–1.73) and 1.32 (1.09–1.59), respectively. Subgroup analysis showed the association only significant in the population of female older adults and those aged < 80 years. The multivariate-adjusted PAR analysis showed that 5.26% of the abnormal sleep duration cases and 3.18% of the poor sleep quality cases were attributable to social isolation. Depression partially mediated the associations of social isolation with sleep duration and sleep quality, accounting for 5.68% and 9.87% of the mediating effect, respectively

Conclusion Social isolation was found to be associated with sleep duration and sleep quality in community-dwelling elderly people. More attention should be paid to social isolation in the elderly, especially in female older adults and those aged < 80 years

关键词: Older adults, Sleep duration, Sleep quality, Social isolation, Population attributable risk

Using Latent Profile Transition Analysis To Identify Associations between Couple Relationship Quality and Sleep Quality

Xingxing Wang Jia Jia Liu*

School of Nursing, Peking University

Background and Purpose: Despite accumulating evidence indicating a significant association between couple relationship quality and sleep quality, the causal relationship remains elusive due to the predominantly cross-sectional design of most studies. Existing longitudinal studies are limited in their ability to capture the dynamic fluctuations in couple relationship quality and their subsequent impact on sleep outcomes. This study endeavors to elucidate the temporal dynamics of couple relationship quality profiles among community-dwelling adults and to assess the implications of these dynamics on sleep outcomes

Method A sample of 247 community-dwelling adults engaged in committed relationships was recruited through online advertisements. Participants completed self-reported measures, namely the Marital Adjustment Test (MAT) and the Pittsburgh Sleep Quality Index (PSQI), at two distinct time points separated by a six-month interval to assess couple relationship quality and sleep quality, respectively. Cross-sectional latent profile analyses were employed to delineate distinct profiles of couple relationship quality. Changes in latent profile classifications across the two time points (baseline and six months) were examined using latent transition analysis. The study further explored the associations between different couple relationship quality profiles and profile transitions with sleep outcomes

Results The analysis revealed a three-profile structure comprising poor, fair, and good couple relationship quality. Participants classified within the good couple relationship quality profile exhibited superior overall sleep quality, enhanced subjective sleep quality, fewer sleep disturbances, and reduced daytime dysfunction compared to those within the poorer relationship quality profiles. Latent transition analysis demonstrated profile stability ranging from 83.3% to 86.8%. Participants who transitioned to poorer couple relationship quality profiles exhibited a significantly higher risk of experiencing deteriorated sleep quality [OR (95%CI): 6.610 (1.518, 28.777)] relative to those who either remained in their original profiles or transitioned to better relationship quality profiles

Conclusion The quality of couple relationships is subject to temporal variability. Both sustained poor couple relationship quality and deterioration in relationship quality are correlated with adverse sleep outcomes. Interventions aimed at sustaining or enhancing couple relationship quality may confer additional benefits to sleep health.

上得到了验证。

关键词: 睡眠, 快速眼动睡眠, 神经影像机制, 脑网络, 预测模型

目的 快速眼动睡眠对于维持最佳脑功能至关重要, 不仅有助于保持大脑能量平衡, 还参与了清除代谢副产物和废物的过程。快速眼动睡眠阶段涉及协调多个脑区, 并可能与大脑的功能变异性有潜在的关联。既往研究发现, 快速眼动睡眠异常会影响大脑的执行控制网络和默认模式网络(DMN)的功能活动和连接状态。然而, 传统的影像学研究在将特定脑功能连接归因于快速眼动睡眠方面存在挑战, 在全脑水平上的研究仍然不足。此外, 考虑到在不破坏睡眠结构的情况下有选择地操纵快速眼动睡眠所面临的挑战, 快速眼动睡眠缺失对脑功能连通性的影响尚不明确。因此, 本研究旨在探索快速眼动睡眠对全脑连接模式的影响。

方法 本研究采用分夜睡眠范式(前半夜/后半夜睡眠剥夺)来干预快速眼动期睡眠时间(前半夜以非快速动眼睡眠为主, 后半夜以快速动眼睡眠为主)。将113名健康受试者随机分为前半夜睡眠剥夺组(快速眼动睡眠时间较多, $N=41$)、后半夜睡眠剥夺组(快速眼动睡眠时间较少, $N=36$)、以及整夜睡眠对照组($N=36$), 并在醒后采集其静息态影像学数据。将每位受试者的大脑划分为227个脑区, 结合每位受试者的睡眠数据(快速眼动睡眠时间)和全脑功能连接矩阵, 构建了基于连接体的大脑-行为预测模型(CPM), 并采用留一交叉验证法进行验证。

结果 CPM模型中的正向网络可以显著预测快速眼动睡眠的时长($r=0.20$, $P=0.017$), 大部分的预测连边位于DMN和带状盖网络(CON)内部以及DMN-视觉网络(VIS)、皮层下网络(SUB)-VIS之间。其中DMN、VIS和SUB达到了51%的预测度, 并且脑网络连边和节点之间的相关性较高($n=227$, $r=0.79$, $P=6.17e-50$)。在组水平上, DMN网络内的功能连接存在显著差异($F(2,107)=8.10$, $P=5.29e-04$), 且后半夜睡眠剥夺组显著低于其他两组。

结论 快速眼动睡眠缺失破坏静息态脑网络的动态重组, 降低了DMN网络内部以及与其他网络之间的连接。这为理解快速眼动睡眠在维持和改变脑功能变异性中的作用提供了新的思路, 阐明了快速眼动睡眠缺失的神经机制特征, 揭示了快速眼动睡眠在个体水平上共同的脑连接模式, 并在组水平

基于氢质子磁共振波谱成像探讨青少年双相抑郁患者冲动攻击行为神经代谢改变

王丞基^{1,2} 阿亚阔孜·杰克山别克^{1,2} 张龙渊^{1,2} 李迎帅^{2,3} 邹韶红²

- 1.新疆医科大学研究生学院
- 2.新疆维吾尔自治区人民医院临床心理科
- 3.石河子大学医学院

目的 利用氢质子磁共振波谱成像(1H Magnetic Resonance Spectroscopy, 1H-MRS)技术探讨青少年双相抑郁患者冲动攻击行为与腹内侧前额叶(Ventromedial Prefrontal Cortex, vmPFC)神经代谢之间可能存在的关系。

方法 1.首先从新疆维吾尔自治区人民医院临床心理科进行受试者的筛选,最终选取2024年1月至2024年5月就诊于门诊和住院前6个月未接受过电休克治疗、精神药物治疗及系统心理治疗的青少年双相抑郁患者23名,根据是否伴有冲动攻击行为进行分组,其中伴有冲动攻击行为组11例,不伴有冲动攻击行为组12例。

2.通过一般情况调查表对受试者年龄、性别、独生情况、居住情况、发病年龄、受教育程度、病程等人口学数据进行采集,使用24项汉密尔顿抑郁量表(Hamilton Depression Scale, HAMD)及杨氏躁狂评定量表(Young Mania Rating Scale, YMRS)对受试者进行心理评估。使用修改版外显攻击行为量表(Modified Overt Aggression Scale, MOAS)及修订版Barratt冲动量表-11(Barratt Impulsiveness Scale version-11, BIS-11)对研究对象的冲动攻击行为进行量化评估。利用Ingenia3.0T磁共振扫描仪,由一名影像科主任医师及一名影像科主任技师对所有受试者的vmPFC脑区进行解剖定位,再进行1H-MRS扫描,定量分析N-乙酰天门冬氨酸(N-Acetyl-L-aspartic acid, NAA)/肌酸(Creatine, Cr)、胆碱复合物(Choline, Cho)/Cr、肌醇(myo-Inositol, ml)/Cr各神经代谢物比值,并将上述结果进行统计分析。

结果 1.伴有冲动攻击行为组与不伴有冲动攻击行为组两组患者的年龄、性别、受教育年限、独生情况、居住情况和家族史等一般资料比较,差异无统计学意义($P>0.05$),两组资料具有可比性。

2.伴有冲动攻击行为的青少年双相抑郁组与不伴有冲动攻击行为的青少年双相抑郁组比较,伴有冲动攻击行为的青少年双相抑郁组腹内侧前额叶脑区NAA/Cr值低于不伴有冲动攻击行为的青少年双相抑郁组,差异有统计学意义($P<0.001$)。两组患者的Cho/Cr值、ml/Cr值比较,差异无统计学意义($P>0.05$)。

结论 伴有冲动攻击行为的青少年双相抑郁患者腹内侧前额叶脑区NAA/Cr值下降,提示青少年双相抑郁患者的冲动攻击行为可能与腹内侧前额叶神经元密度减少或存在神经元功能障碍有关。

童年创伤与抑郁障碍伴发躯体化症状的关系:OPRL1基因甲基化水平的调节作用

袁昕赞 胡蕾* 何龙 孙浚源 张凯
山东省精神卫生中心

目的 本研究以生物心理社会视角为框架,旨在探究OPRL1基因甲基化水平对抑郁障碍患者童年创伤与躯体化症状之间关系的影响,以期为临床干预提供帮助。

方法 以2022年5月至2022年10月在山东省精神卫生中心住院治疗的106例抑郁障碍患者为研究对象,采用童年创伤经历问卷(CTQ)、汉密尔顿焦虑量表(HAMA)、汉密尔顿抑郁量表(HAMA-17)进行评估。从肘静脉中抽取约5mLEDTA抗凝全血进行甲基化水平检测。使用SPSS 26.0 PROCESS Model 1分析OPRL1基因甲基化水平对童年创伤与抑郁障碍伴发躯体化症状之间关系的调节作用。

结果 共101名抑郁障碍患者被纳入本研究报告的分析中,平均年龄27.7岁,女性69名,男性32名。所有参与者中,存在感觉系统症状者占54%,存在心血管系统症状者占59%,存在呼吸系统症状者占64%,存在胃肠道症状者占81%,存在生殖泌尿系统症状者占45%,存在自主神经系统症状者占56%,经历情感虐待者占42%,经历身体忽视者占38%,经历情感忽视者占56%。对于双变量关系,童年创伤与躯体化症状呈正相关($r=0.217$, $P<0.05$),OPRL1基因甲基化水平与躯体化症状严重

程度呈负相关 ($r=-0.238$, $P<0.05$)。采用 Process Model 1 进行多元线性回归分析, 控制混杂因素后, 总体模型显著 ($R^2=0.577$, $P=0.00$; $R^2=0.56$, $P<0.01$)。童年创伤显著影响躯体化症状 ($B=0.37$, $t=2.70$, $P=0.008$; $B=1.80$, $t=2.31$, $P=0.02$)。此外, OPRL1 基因甲基化水平影响童年创伤与抑郁障碍伴发躯体化症状的关系 ($B=0.029$, $R^2\text{-chng}=0.289$, $t=2.31$, $P=0.02$; $B=0.15$, $R^2\text{-chng}=0.28$, $t=20.08$, $P=0.04$)。因此, OPRL1 基因甲基化水平在童年创伤与躯体化症状的关系中发挥调节作用。

结论 童年创伤与抑郁障碍患者躯体化症状水平呈正相关, OPRL1 基因甲基化水平与抑郁障碍患者躯体化症状水平呈负相关。当 OPRL1 基因甲基化低于或等于平均水平时, 童年创伤可预测抑郁障碍伴发躯体化症状; 当 OPRL1 基因甲基化高于平均水平时, 有童年创伤的抑郁障碍患者出现躯体化症状概率减少。提示良好的儿童成长环境, 有助于减少抑郁障碍伴发躯体化症状。本研究为抑郁障碍患者发生躯体化症状的病理机制提供参考, 为早期预防提供心理学视角, 减少或避免童年创伤或许可以降低疾病的风险和临床症状的严重程度。但基于研究的局限性, OPRL1 基因甲基化水平与疾病的关系仍需进一步探讨。

关键词: OPRL1 基因甲基化; 童年创伤; 躯体化症状; 抑郁障碍

Childhood Trauma and Recent Suicide Risk in Major Depressive Disorder: Exploring The Mediating Effect of Resilience and Cognitive Emotion Regulation Strategies

Gang Ye* Qichun Liu Zhen Tang Xiangdong Du Meiling Chen Jia Li Yanting Zhang
Suzhou Guangji Hospital

Objective The mechanisms by which childhood trauma may cause suicidality in major depressive disorder (MDD) patients remain unclear. The aim of our study was to explore the role of resilience and cognitive emotion regulation strategies in the relationship between childhood trauma and recent suicide risk in MDD patients

Methods 136 MDD patients (male/female =32/104) and 112 (male/female =34/78) healthy controls were recruited. Demographic and clinical data were collected, and the 9-item Patient Health Questionnaire (PHQ-9), 7-item Generalized Anxiety Disorder scale (GAD-7), Childhood Trauma Questionnaire-Short Form (CTQ-SF), Cognitive Emotion Regulation Questionnaire (CERQ), Connor-Davidson Resilience Scale (CD-RISC) were adopted to assess depression level, anxiety level, childhood trauma, cognitive emotion regulation strategies and psychological resilience respectively. The structural equation modeling (SEM) was conducted to test the path analysis

Results Significant correlations were found between emotional abuse ($r=0.261$, $p<0.01$), emotional neglect ($r=0.226$, $p<0.01$), maladaptive strategies ($r=0.374$, $p<0.01$), tenacity ($r=-0.367$, $p<0.01$), strength ($r=-0.398$, $p<0.01$) and optimism ($r=-0.247$, $p<0.01$) and the score of item 9 of PHQ-9 in MDD patients. Ordinal logistic regression analysis showed gender ($OR=0.386$, 95% CI: 0.160-0.927, $p=0.033$) and maladaptive strategies ($OR=1.058$, 95% CI: 1.008-1.111, $p=0.033$) had significant predictive effects on recent suicide risk in MDD patients. The indices of goodness-of-fit of the SEM reflected an acceptable fit, with $\chi^2/df=2.292$, $GFI=0.817$, $AGFI=0.753$, $TLI=0.743$, $CFI=0.787$, $RMR=1.590$, and $RMSEA=0.098$. The bootstrap test shows that the direct effect ($\beta=0.114$, 95% CI: -0.103~0.362) of childhood trauma on recent suicide risk was not significant but the indirect ($\beta=0.224$, 95% CI: 0.099~0.461) and total effects ($\beta=0.338$, 95% CI: 0.180~0.552) of childhood trauma on recent suicide risk were significant

Conclusion MDD patients experienced more childhood trauma, performed poorer psychological resilience and used less positive and more negative emotion regulation strategies. The mediating effect of resilience and cognitive emotion regulation strategies between childhood trauma and recent suicide risk in MDD patients was significant

关键词: Major depressive disorder, Childhood trauma, Resilience, Cognitive emotion regulation strategies, Suicide

“脑-淋巴”轴调控应激介导焦虑行为的神经机制研究

史栋栋* 张瀛丹 廖冰冰 李奕 田菲 王振
上海市精神卫生中心

目的 明确“脑-淋巴”轴调控应激介导焦虑样行为的神经机制,分析脑和颈部淋巴结之间相互作用对焦虑样行为的影响。

方法 研究组检测了 2020 年初参加援鄂的精神科医生的外周血中多种免疫介质、细胞因子和趋化因子的水平,发现在众多细胞因子和趋化因子中只有趋化因子配体 5 (CCL5) 的表达在援鄂医生中显著升高。利用动物实验验证 CCL5 在应激后的变化,确定 CCL5 主要来源部位和细胞类型,并且利用神经科学技术研究大脑如何调控 CCL5 的产生及相关通路如何影响应激后的机体反应。在前期研究发现应激可导致红核功能异常从而激活颈部淋巴结的免疫反应,引起焦虑样行为和趋化因子 CCL5 水平升高的基础上,利用逆向追踪病毒明确 RN 脑区的上游脑区及神经元类型,进而利用化学遗传学和光遗传学验证神经环路在应激引发的焦虑样行为和颈部淋巴结的炎症反应中的作用。为阐述“脑-淋巴”轴相互作用的机制,利用颈上神经节切除术,结合病毒操纵和药理学实验分析颈部淋巴结的分子变化,解析应激通过大脑如何调控颈部淋巴结的炎症反应神经生物学机制。

结果 研究组利用束缚应激大鼠模型发现应激后大鼠的 CCL5 水平显著增加。并发现 CCL5 在颈部淋巴结 (CLNs) 中被应激强烈诱导。手术切除颈部淋巴结,明确其在应激引发的焦虑和 CCL5 分泌中的作用。研究组将 mRFP 编码的伪狂犬病病毒 152 (PRV) 直接注射到成年大鼠的 CLN 中,以逆行和跨突触标记上游神经元,追踪到红核的谷氨酸能神经元。膜片钳电生理结果和在体光纤记录结果提示,应激后大鼠的红核谷氨酸能神经元活性下降。研究组利用化学遗传学对红核在应激导致焦虑和 CCL5 分泌的功能进行了验证,发现抑制红核的功能可以减少大鼠的探索行为,而激活红核的功能会增加大鼠的探索行为。初级运动皮层 (M1) 和 RN 是参与肢体运动控制的大脑区域,研究组在特定区域(包括 M1 和 RN) 中观察到双侧 mRFP+ 神经元。为

了确定 M1 神经元靶向的 RN 谷氨酸能神经元是否确实参与焦虑样行为和 CCL5 合成,研究组将逆行跨突触病毒 AAV1-hSyn-Cre 局部注射到 M1 中,在 M1 神经元突触后的 RN 神经元中表达 Cre 依赖性 GCaMP6s,结果提示 M1-RN 神经元的功能同样也是下降的。研究组进一步利用化学遗传学和光遗传学对 M1-RN 的神经环路进行了验证。为了确认红核在应激诱发的焦虑中的作用,研究组进一步分析了应激个体的 fMRI 结果。

结论 这些发现指出操纵红核脑区谷氨酸能神经元活动可以改变焦虑行为和炎症反应,并且外周免疫器官的操纵可以调节应激诱导的焦虑样行为,为焦虑障碍干预提供了坚实的基础和方向。

(2R, 6R) -HNK Alleviates Adverse Emotional States in Rats with PTSD by Regulating The PI3K / AKT Signaling Pathway in Stressed Brain Regions

Lifen Liu Xinyu Hu Rui Li Yubo Guan Miao Miao Yuxuan Wang Lin Sun*

Shandong Second Medical University

Objective Individuals diagnosed with post-traumatic stress disorder (PTSD) often exhibit enduring adverse emotions, heightening susceptibility to suicidal thoughts and behaviors. Consequently, the administration of pharmacological agents to alleviate or modulate such negative emotions has the potential to enhance the overall well-being of individuals with PTSD. Notably, the metabolites of ketamine, specifically (2R, 6R)-hydroxynorketamine (HNK), have demonstrated favorable antidepressant properties characterized by prolonged onset and duration of action, as well as an absence of psychiatric adverse effects. However, the precise mechanism through which HNK exerts its therapeutic effects on negative mood symptoms in individuals with PTSD remains to be fully elucidated.

Methods In this investigation, a model involving a single prolonged stress and plantar shock (SPS&S)

was utilized, followed by the administration of (2R, 6R)-HNK into the lateral ventricle subsequent to the recovery phase. The evaluation of negative mood-related symptoms associated with post-traumatic stress disorder (PTSD) was conducted through the open field test (OFT), elevated plus maze test (EMPT), and forced swim test (FST). The levels of protein and relative mRNA expression in the hippocampus (HIP) and amygdala (AMY) regions of rats, specifically neurotrophin factor (BDNF), tyrosine kinase receptor B (TrkB), phosphatidylinositol 3-kinase (PI3K), and phosphokinase B (AKT), were analyzed using Western blot and reverse transcription real-time polymerase chain reaction (RT-qPCR).

Results SPS&S rats displayed adverse emotional behaviors characterized by depression and anxiety. The levels of BDNF, TrkB, PI3K, and AKT were reduced in the HIP and PFC, but increased in the AMY. Treatment with (2R, 6R)-HNK enhanced exploratory behavior and reversed negative emotional behaviors. This intervention mitigated disruptions in the expression of PI3K/AKT signaling pathway proteins in the HIP and PFC, while not affecting PI3K/AKT signaling in the AMY of SPS&S rats

Conclusion Traumatic stress can trigger negative emotional reactions in rats, potentially involving the PI3K/AKT signaling pathway in the HIP, PFC, and AMY. The (2R, 6R)-HNK compounds have demonstrated the capacity to mitigate adverse emotions in rats subjected to the SPS&S paradigm. This effect may be attributed to the modulation of the PI3K/AKT signaling pathway in the HIP, PFC, and AMY, with a particularly notable impact observed in the HIP region. These findings suggest that targeting this pathway holds promise for alleviating negative emotions in individuals with PTSD

关键词: PTSD, negative emotions, PI3K/AKT, (2R,6R)-HNK

From Single To Multiple: The Association of Childhood Trauma with Frequent Nightmares Among Youth

Jianguo Que¹, Yane Lu², Suying Wu¹, Jiahui Deng³, Zhibin Su¹, Wenwen Xu¹, Zhiyuan Huang¹, Duoduo Lin¹, Farong Liu¹, Jiajia Liu²

1.Xiamen Xianyue Hospital

2.School of Nursing, Peking University

3.Peking University Sixth Hospital

Objective Childhood trauma is a risk factor for frequent nightmares among youth. Notably, different childhood traumas are unlikely to occur in isolation but often co-occur. This study aimed to investigate the association between single and multiple childhood trauma exposures and frequent nightmares among youth

Methods Youth aged 12-25 were recruited from Fujian Province, China. Childhood trauma and frequent nightmares were assessed using an online questionnaire. Cumulative scores and latent class analysis were used to identify multiple childhood traumas. Logistic regressions were used to investigate the associations between childhood trauma types and frequent nightmares

Results Of 6145 participants, 27.2% (n=1670) reported frequent nightmares in the past year. Adjusted analyses showed emotional abuse (OR: 1.45, 95%CI: 1.23-1.87) and emotional neglect (OR: 1.19, 95%CI: 1.03-1.37) significantly increased the risk of nightmares. The risk of frequent nightmares increased with trauma numbers: 26% for one, 36% for two, and 51% for three or more, compared to none. Latent class analysis identified three multiple trauma patterns: “low abuse, low neglect” (n=3837), “low abuse, high neglect” (n=2089), and “high abuse, high neglect” (n=219), with increased nightmare risks of 26% and 47% in the latter two, respectively, versus the first. However, no significant difference was observed between “low abuse, high neglect” and “high abuse, high neglect” (OR: 1.17, 95% CI: 0.85-1.60)

Conclusion Our findings enhance the understanding of the heterogeneity of childhood traumas in youth and their association with nightmares. Prevention and treatment programs for nightmares should be tailored according to the different patterns of childhood traumas

肠道菌群失调导致的短链脂肪酸增加与精神分裂症系统免疫激活的关系研究

何潇言 朱峰 马现仓*

西安交通大学第一附属医院

目的 微生物-肠-脑轴的提出为研究精神分裂症 (Schizophrenia, SCZ) 免疫系统异常激活提供了新思路, 短链脂肪酸(Short chain fatty acids, SCFAs) 是肠道细菌的主要代谢产物, 因此我们提出肠道菌群紊乱诱导的 SCFAs 水平上调可能导致 SCZ 患者出现免疫激活。本研究通过比较 SCZ 患者和健康对照(Healthy control, HC)的血清和粪便 SCFAs 水平、肠道菌群和血清免疫激活标志物水平的差异, 识别与 SCZ 免疫系统异常激活有关的肠道细菌及 SCFAs, 探讨肠道菌群及其重要代谢产物 SCFAs 在 SCZ 发病中的作用。

方法 本研究纳入 SCZ 患者 148 例和 HC 147 例。使用串联四极杆质谱和气相色谱-质谱联合法检测血清和粪便中的 SCFAs (乙酸、丙酸、丁酸) 水平; 采用宏基因组测序分析肠道菌群的多样性及差异; 选用 Luminex 高通量平台检测受试者血清 4 种免疫激活标志物 (CRP、IL-6、sIL-2R 和 sCD14) 的水平。最后基于免疫激活标志物浓度, 通过两步聚类分析将受试者分为“免疫激活”和“非免疫激活”两个亚组, 再结合以上结果进行联合分析。

结果 我们首先分析两组人群血清和粪便中 SCFAs 的浓度, 发现 SCZ 组血清和粪便中乙酸、丙酸和丁酸水平及其总和均显著高于 HC 组 ($P < 0.0001$)。肠道菌群分析结果表明 SCZ 组在菌种水平上表现出更大的 α -多样性 ($P < 0.001$), β -多样性也存在显著差异, 并且有 67 个菌种和至少一种 SCFAs 水平相关 ($FDR < 0.05$)。血清免疫激活标志物的结果表明, SCZ 组血清 CRP、IL-6、sIL-2R 和 sCD14 水平均高于 HC。接着将所有受试者分为“免疫激活” (65 名病例和 31 名对照) 和“非免疫激活” (41 名病例 117 名对照) 两个亚组, 发现 SCZ 免疫激活组的血清 SCFAs 水平高于 SCZ 非免疫激活组及 HC 组 ($P < 0.0001$)。最后, 我们观察 SCZ 患者免疫激活组的肠道菌群特征, 发现 SCZ 免疫激活组

肠道菌群的 α -多样性高于非免疫激活组 ($P = 0.0032$), 也高于 HC 免疫激活组 ($P < 0.001$), β -多样性分析表明 SCZ 免疫激活组的肠道微生物组成与其它三组有显著差异 ($P = 0.001$), 也就是说 SCZ 免疫激活组患者的肠道菌群与其它三组相比是明显紊乱的。

结论 肠-脑轴失调导致的 SCFAs 改变是 SCZ 免疫激活重要介质, 这为进一步揭示 SCFAs 在 SCZ 发病机制中的作用提供依据, 同时为探索 SCZ 的潜在治疗靶点提供了新的思路。

精神分裂症患者静息态功能磁共振研究

王继才*

昆明医学院第一附属医院

目的 探索精神分裂症患者神经元功能异常区域, 静息态脑网络之间的功能连接状态差异, 并探究相关功能影像学指标与临床心理学量表的相关性, 探究其潜在的神经影像学机制。

方法 精神分裂症患者及同时期招募的健康人群, 均使用磁共振室的美国通用公司 GE 750 3.0T 磁共振扫描仪采集磁共振数据。数据分析从功能分离及功能整合两方面进行, 功能分离采用低频振幅 (ALFF) 分析和局部一致性 (ReHo) 分析, 功能整合基于独立成分分析方法, 同时采用滑动时间窗和 K-means 聚类等技术动态分析脑网络之间的功能连接状态, 对所得到的功能连接状态以及平均滞留时间、时间分数以及转换次数进行组间比较。

结果 1. ALFF 值组间差异脑区: 以年龄、性别、受教育年限作为协变量进行两组间独立样本 t 检验, 精神分裂症患者组在脑桥、左侧梭状回、中脑及胼胝体区 ALFF 值增高。

2. ReHo 值组间差异脑区: 以年龄、性别、受教育年限作为协变量进行两组间独立样本 t 检验, 精神分裂症患者组在右侧脑岛, 左侧中央后回 ReHo 值下降, 在左侧颞下回 ReHo 值增高。

3. 两组间差异脑区 ALFF 值以及 ReHo 值与 PANSS 量表相关性分析结果: 精神分裂症患者组左侧梭状回 ALFF 值和胼胝体 ALFF 值与阳性症状总分均呈负相关, 中脑 ALFF 值和脑桥 ALFF 值与阴

性症状总分均呈正相关。

4. 两组间差异脑区 ALFF 值以及 ReHo 值与斯奈思-汉密尔顿快感量表 (SHAPS) 总分相关性分析结果: 采用偏相关分析, 精神分裂症患者组右侧脑岛 ReHo 值及左侧中央后回 ReHo 值与斯奈思-汉密尔顿快感量表总分呈正相关。健康对照组中脑 ALFF 值、左侧梭状回 ALFF 值及左侧中央后回 ReHo 值与斯奈思-汉密尔顿快感量表总分呈正相关。

结论 1、本研究采用独立成分分析方法, (1) 在相关性分析中, 我们发现精神分裂症患者视觉网络-听觉网络之间功能连接减低越显著则精神分裂症患者阳性症状越重。(2) 感觉运动网络、听觉网络、视觉网络与心理韧性的关系。(3) 在与认知功能相关性分析中, 感觉运动网络、视觉网络、听觉网络之间功能连接下降。

2、在基于独立成分分析的动态功能网络功能连接差异分析中, (1) 额顶网络调节着默认网络与背侧注意网络, 同时背侧注意网络与初级感觉运动网络相联系, 精神分裂症患者以上网络间的功能连接降低, 网络功能平衡失调, 从而导致患者认知功能紊乱。(2) 在动态功能连接指标分析中, 结果表明精神分裂症患者在视觉网络、感觉运动网络等初级感觉运动网络功能活动增加, 以及在默认网络、背侧注意网络、额顶网络等高级认知功能网络功能活动降低的状态下持续时间更长。

肠菌产物 MDP 参与精神分裂症发生及其机制探讨

王楚瑶 高媛 马现仓*

西安交通大学第一附属医院

目的 本研究对青春期小鼠进行胞壁酰二肽 (MDP) 慢性干预, 评估小鼠行为学改变, 结合代谢组和转录组学分析 MDP 对小鼠外周代谢水平及脑内神经炎症、神经递质基因表达水平的改变, 以揭示肠菌产物 MDP 在精神分裂症发病机制中的作用。

方法 本研究构建 MDP 慢性干预小鼠模型, 利用旷场、新颖物体识别、三箱社交、糖水偏好、悬

尾、强迫游泳及前脉冲抑制实验等多项行为学实验, 评估青春期持续摄入低剂量 MDP 对小鼠行为表型的影响。随后利用高通量多因子液相芯片技术 (Luminex) 检测小鼠血浆多种细胞因子水平, 评估 MDP 对小鼠外周免疫的影响; 通过非靶向代谢组学技术, 分析 MDP 慢性干预对外周代谢水平的影响。同时, 通过免疫组织化学技术, 分析 MDP 作用脑区及对相应脑区小胶质细胞形态学的影响。通过转录组测序技术, 分析 MDP 慢性干预对相应脑区基因表达水平的改变。此外, 通过体外细胞实验 MDP 干预 BV2 小胶质细胞, 检测培养上清相关细胞因子的 mRNA 表达水平。最后通过联合分析, 对外周差异代谢物、脑内差异表达基因、炎症因子水平及精神分裂样行为之间的相关性进行探讨。

结果 (1) 青春期 MDP 慢性干预诱导小鼠精神分裂样行为表型, 表现为活动增多、感觉运动门控失调、社交减少、记忆认知受损及抑郁样行为, 提示 MDP 水平升高与精神分裂症的发生发展有关。

(2) 与盐水组相比, MDP 干预后小鼠外周血浆细胞因子 IL-1 β 水平升高, 同时色氨酸-犬尿氨酸、三羧酸循环代谢通路显著下调, 脂类分解代谢、类固醇激素生物合成代谢通路上调。(3) 免疫组织化学染色表明 MDP 干预引起精神分裂样表型小鼠海马及前额叶皮质 c-Fos 阳性细胞数量显著增多, 且海马及前额叶皮质 Iba-1 阳性小胶质细胞数量增多、胞体增大、突触分支增粗。转录组测序揭示了海马中炎症及神经营养因子相关基因表达失调, 而前额叶皮质中部分炎症和神经递质相关基因显著失调, 且这些差异表达基因与外周炎症因子及差异代谢物之间存在显著相关性。细胞实验进一步验证, MDP 干预引起 BV2 小胶质细胞 IL-1 β 和 IL-6 的 mRNA 表达水平显著升高。

结论 本研究是在我们课题组前期研究首次发现精神分裂症患者 MDP 水平上调且与病程呈正相关的基础上, 在动物模型中验证了肠菌产物 MDP 慢性干预能够诱导小鼠精神分裂样行为, 提示 MDP 可能是精神分裂症患者免疫激活的上游介质之一。并提出 MDP 通过外周免疫及代谢改变直接或间接引起中枢神经系统变化, 从而引起精神分裂症的发生, 为精神分裂症患者肠道菌群紊乱、全身免疫激活、神经炎症和神经发育异常提供了新的视角和理论基础。

Emotional Abuse and Suicide in Depressed Adolescents: The Mediating Role of Internet Addiction and Empathic

Xiaoyue Li*

Department of Psychiatry, Fourth People's Hospital in Wuhu

Objective People with depression appear to experience higher levels of emotional abuse (EA) and suicidal behavior. However, no studies have provided estimates of through what factors EA influences suicidal ideation (SI) in adolescents with depression. The present study examined the effects of internet addiction on the relationship between EA and SI in a Chinese adolescent depression population

Methods 262 adolescents with depression (198 females) completed the evaluation of the Childhood Trauma Questionnaire-Short Form, Center for Epidemiologic Studies Depression Scale, the Internet Addiction Test, the Interpersonal Reactivity Index, Positive and Negative Suicide Ideation

Results Female adolescent depressed patients were more likely to experience emotional abuse than males (83.03% vs.70.00%), and depressed adolescent patients who experienced EA scored significantly higher on SI, CESD score than the no EA group. In addition, adolescent depressed patients with internet addiction were more likely to have suicidal ideation, and they scored higher on depressive symptoms and emotional abuse. Bivariate analysis found a significant positive association between internet addiction and EA. Empathic was associated with internet addiction independent of EA and SI. SI was significantly and positively correlated with EA and internet addiction. The structural model showed that internet addiction was a mediator of EA and SI, and empathic could strengthen this mediating effect of internet addiction

Conclusion Alexithymia and insomnia have an impact on SI in adolescents with depression who have experienced SA. These findings remind that attention

should be paid to the role of internet addiction and empathic in depressed adolescents. Contributing to the development of effective interventions to prevent suicidal behavior in depressed adolescent patients.

海马星形胶质细胞在创伤后应激障碍导致的恐惧记忆消退障碍中的作用

沈哲 史栋栋 王振*

上海市精神卫生中心 (上海市心理咨询培训中心)

目的 创伤后应激障碍患者往往伴随恐惧记忆消退障碍。而海马脑区被认为是负责调控记忆习得, 巩固和消退的主要脑区之一。但是海马脑区在 PTSD 后恐惧记忆消退障碍中的作用依旧不清。星形胶质细胞作为脑内支撑, 营养, 调节神经元功能的主要胶质细胞之一, 其在恐惧记忆调节中的作用还知之甚少。因此本课题旨在研究海马星形胶质细胞在创伤后应激障碍导致的恐惧记忆消退障碍中的作用及其作用机制。

方法 本实验采用小鼠单次长时间压力刺激及足底电刺激模型 (SPS&S) 模型模拟动物 PTSD, 利用条件性恐惧记忆范式研究 PTSD 后小鼠恐惧记忆消退的变化。同时利用光遗传学和化学遗传学手段研究星形胶质细胞对于 PTSD 后小鼠恐惧记忆消退的调节作用。利用单细胞测序, 免疫组化及病毒干扰技术研究星形胶质细胞对 PTSD 后小鼠恐惧记忆消退调节的分子通路机制。

结果 实验发现小鼠 PTSD 后产生显著的恐惧记忆消退障碍, 并且伴随海马脑区星形胶质细胞数量显著下调和形态变化, 提示星形胶质细胞可能参与到 PTSD 的病程发展中。激活星形胶质细胞的功能可以缓解 PTSD 造成的恐惧记忆消退障碍。单细胞核测序结果发现 PTSD 后海马星形胶质细胞中 AQP4 和一系列细胞黏着分子 (如 Ncam1) 表达显著下调。同时利用 cellchat 发现海马内星形胶质细胞和兴奋性神经元的连接通路发生显著变化。

结论 本实验发现海马脑区星形胶质细胞可以调节 PTSD 导致的恐惧记忆消退障碍, 同时揭示星形胶质细胞中一些信号通路和星形胶质细胞-神经

元信号通路连接变化在 PTSD 后恐惧记忆消退障碍中的作用。本研究将为阐明创伤后应激障碍的发病机制提供更多实验依据, 并为其提供潜在有效的治疗药物靶点。

青少年网络游戏障碍患者静息态功能磁共振脑神经元自发活动改变

郎艳* 吕其炎 张艺博 赵涛
郑大一附院

目的 网络游戏障碍 (Internet Gaming Disorder, IGD) 被定义为长期忽略个人、家庭和社会等众多负面后果, 过多或不受控制沉迷网络游戏, 导致患者的人际关系、社会功能和身心健康受损。美国精神病学学会已将 IGD 纳入第五版《精神障碍诊断及统计手册》(DSM-5) 中, 世界卫生大会也将“游戏障碍”正式纳入 ICD-11“成瘾行为所致障碍”疾病单元。IGD 已成为影响青少年人群身心健康的一类疾病, 因此探讨影响青少年 IGD 的发展因素具有重要意义。

方法 纳入 12-18 岁青少年网络游戏障碍患者 52 例及年龄、性别、受教育年限相匹配的健康对照组 51 例, 完成对患者组与健康对照组的汉密顿抑郁量表 (Hamilton Depression Scale, HAMD)、汉密顿焦虑量表 (Hamilton Anxiety Scale, HAMA) 评定, 并使用 3.0T 功能磁共振采集静息态脑影像分析患者组与健康对照组的低频振幅 (amplitude of low-frequency fluctuations, ALFF) 有统计学差异的脑区, 并以差异的脑区作为感兴趣区分析全脑功能连接 (functional connectivity, FC)。

结果 与健康对照组相比, 青少年网络游戏障碍患者的 HAMD、HAMA 得分高于健康对照组 ($P<0.05$)。脑功能方面, 患者组在右侧顶上回、右侧顶下缘角回、右侧中央前回、右侧缘上回、右侧中央后回、右侧背外侧额上回及右侧额中回的 ALFF 值增高 ($P<0.05$), 在左侧小脑上脚、左侧梭状回、左侧颞极、左侧海马旁回、左侧眶部额上回及左侧眶内额上回的 ALFF 值降低 ($P<0.05$)。以右侧背外侧额上回作为感兴趣区分析全脑 FC, 发现与健康对照组相比, 患者组右侧背外侧额上回与右侧壳核、

右侧杏仁核、右侧岛叶的 FC 强度降低 ($P<0.05$)。

结论 青少年网络游戏障碍患者的 HAMD、HAMA 得分高于健康对照组。同时, 患者组静息状态下右侧背外侧额上回自发神经元活动增强, 与多个脑区之间的 FC 强度降低。背外侧额上回在抑制控制和奖赏系统中起重要作用; 壳核参与奖赏和情绪的激活, 它的激活与成瘾刺激引起的渴望密切相关; 杏仁核参与感知和激发负性情绪; 岛叶参与情绪调控和决策制定等。以上综合说明, 青少年网络游戏障碍患者往往伴有抑郁、焦虑的负性情绪, 他们在游戏中感知负性情绪的能力下降、情绪调控能力下降, 及长期决策能力受损, 使患者面对负性情绪时等更易选择网络游戏, 并长时间进行游戏难以脱身; 同时患者的抑制控制能力受损, 奖赏系统易激活, 对游戏线索更易产生渴望, 无法抑制对游戏的冲动。以上因素共同促进游戏障碍的发展。

人类条件恐惧的阈下消退效果及作用机制研究

杨建立* 罗睿涵 朱嘉琦 任远莉
天津医科大学总医院

目的 恐惧具有生存价值, 但适应不良的恐惧记忆与创伤后应激障碍和恐惧症等精神疾病有关。临床常用的暴露疗法有效, 但直面恐惧会引起极度痛苦, 这可能导致患者无法接受和坚持治疗。心理生理学实验表明恐惧可以阈下表达和习得, 但以往的研究较少关注恐惧的阈下消退。因此, 本研究拟测试条件恐惧的阈下消退效果, 并通过功能磁共振探索条件恐惧习得和消退的相关脑区激活。

方法 本研究包含行为学实验和功能磁共振实验。行为学实验分为三个阶段: 习得、消退、测试, 阶段间间隔 24 小时。习得阶段采用经典的差异条件恐惧范式建立恐惧记忆; 消退阶段分为阈上消退、阈下消退和闪烁消退, 通过后向掩蔽设置阈下条件; 测试阶段通过计算消退保留指数来比较三种方法的消退效果。实验前采集人口学资料和量表数据; 实验过程中采集皮肤电导反应, 并将其作为条件恐惧的习得标准; 每个实验阶段结束后采集主观评价,

包括紧张度、喜爱度以及电击概率的评分。功能磁共振实验采用相同的实验范式 and 数据分析。

结果 行为学实验表明三组被试的人口学资料、量表评分、主观评价均无组间差异；在习得阶段，三组被试建立的条件恐惧强度一致；在消退阶段早期，阈上消退组和阈下消退组的被试均成功唤起了条件恐惧；在测试阶段，根据皮肤电导反应计算出的消退保留指数表明，阈下消退和阈上消退的消退保留效果相似，两组均强于闪烁消退组，且闪烁消退组出现了明显的条件恐惧自发恢复。功能磁共振实验成功重复了行为学实验的结果，fMRI 结果显示：在习得阶段，CS+在双侧脑岛、左侧旁扣带回等脑区引起了显著激活，而在左侧眶内侧额上回、右侧楔前叶等脑区引起了显著失活。在消退阶段早期，与习得阶段类似，CS+使得左侧眶内侧额上回失活，这进一步支持了条件恐惧的唤起。在消退学习期间，与阈上消退组相比，阈下消退组的 CS+在左侧中央后回、右侧背外侧额上回、右侧岛盖部额下回、左侧外侧眶回等脑区引起了更强的激活。

结论 本研究表明阈下消退与阈上消退的消退保留效果相似，且阈下消退能够有效减少条件恐惧的自发恢复。将利用恐惧的无意识处理机制的阈下消退转化为临床应用的无意识暴露可能可以显著减少患者在治疗期间的痛苦，并为恐惧记忆相关精神疾病的干预提供新方向。

The Role of Resilience in Predicting Stress Susceptibility Phenotypes by Social Hierarchy

hao zheng¹, Luping Gou², Yuan Gao¹, Lanxia Wu¹, Dantong Chen¹, Ziyi Li¹, Meng Yuan¹, Zhenkun Zhang¹, Shuxin Liu¹, Jianting Liu¹, Hongwei Sun¹, Lin Sun¹

1.School of Psychology, Shandong Second Medical University

2.Institute of Psychology, Chinese Academy of Sciences

Objective While most individuals experience traumatic events at some point in their lives, only a small percentage (7-8%) develop symptoms of PTSD.

This discrepancy underscores the significance of individual differences in stress susceptibility and the importance of identifying susceptibility factors. Social hierarchy significantly influences stress vulnerability and the risk of mental disorders. Additionally, individual psychological resilience, the ability to recover from trauma, plays a crucial role in PTSD recovery. However, the exact mechanisms remain unclear

Methods This study employed the single prolonged stress (SPS) model in male C57BL/6J mice to validate three stress phenotypes and investigate the role of psychological resilience in recovery. Subsequently, a chronic social defeat stress (CSDS) model, more reflective of human social contexts, was used to evaluate the impact of social hierarchy on stressed mice behaviors and the role of resilience in recovery. Social hierarchy was established using the tube test (TT) and validated through the territorial urine marking assay (TUMA) and warm spot test (WST). Behavioral assessments included the social interaction test (SIT), open field test (OFT), elevated plus maze test (EPMT), and forced swim test (FST)

Results Dominant mice, compared to subordinate mice, are more susceptible to traumatic events and exhibit stronger stress-sensitive behavioral phenotypes. However, dominant mice recover from trauma more easily. Over time, dominant resilient mice recovered more quickly from anxiety-like and depressive-like behaviors. Resilient mice gradually returned to pre-CSDS behavioral levels. By day 14 post-CSDS, neither dominant nor subordinate resilient mice showed significant differences from the control group

Conclusion Social hierarchy is a crucial predictor of stress susceptibility, with dominant mice showing greater initial vulnerability to traumatic events but also exhibiting a stronger capacity for recovery over time. Psychological resilience plays a key role in this process, over time, resilient mice gradually returned to their pre-CSDS behavioral levels by day 14 post-CSDS, showing no significant differences from the control group. Understanding the interplay between social hierarchy and psychological resilience in stress responses can aid in identifying high-risk individuals and inform targeted interventions for PTSD prevention and treatment. Further

research is needed to elucidate the molecular mechanisms underlying these findings

关键词: PTSD, Social hierarchy, Psychological resilience, Stress susceptibility, CSDS

Single-cell Analysis of The Cellular Heterogeneity and Interactions in Traumatic Brain Injury Induced Depression and Anxiety Mice Model

Wei Wang Zhe Shen Zhen Wang*
Shanghai Mental Health Center

Objective Mood disorders, including anxiety and depression, are the major long sequelae of traumatic brain injury (TBI), while the underlying cellular and molecular mechanisms remain elucidated, especially the contributions of glial cells mediated neuroinflammation. Previous studies show inhibition of microglia-mediated neuroinflammation by minocycline may improve the functional outcome in TBI animal models. But the mechanism of neuroprotection is still unclear. Also it is unknown whether microglia make contributions to mood disorders following TBI

Methods To generate mood disorders after TBI, we established a mouse controlled cortical impact (CCI) model and examined CCI mice by a series of behavior tests. We then collected the injury tissues from CCI mice with or without minocycline treatment at 1, 3, 7 day(s) post injury, and conducted single-cell RNA-sequencing, and performed differential expressed genes, gene ontology, cell trajectory, inferred cell-cell interaction analysis to determine the cellular and molecular mechanisms at single cell level

Results We recaptured anxiety- and depression-like behaviors by impacting the prefrontal cortex region and at moderate severity in our CCI model, which were successfully attenuated by minocycline treatment. High-throughput single cell transcriptome analysis revealed cellular and transcriptional dynamics along the CCI pathogenesis, yielding a large number of genes that were either commonly regulated among multiple cell

types (e.g. *Spp1*, *Apod*, *Lgals1/3*, *Serpina3n*) or specific to certain cell types (such as homeostasis marker genes of glial cells). The heterogeneity and disease-associated signatures of glial cells and their unique responsive program were also identified. We found minocycline could inhibit reactivation of microglia and astrocytes by down-regulating disease-associated and MHC-I genes and up-regulating homeostatic genes. Minocycline also modified crosstalk between microglia and astrocytes by impairing dozens of signaling pathways, such as up-regulating potential beneficial EGF signaling pathway, mediated by microglial *Tgf- α* and astrocyte *Egfr*, and down-regulating harmful SEMA4 signaling pathway, mediated by microglia *Sema4d* and astrocyte *Plexinb1/Plexinb2*

Conclusion In summary, our study reveals the cellular and molecular dynamics of TBI pathology at single cell level, highlights the crucial roles of glial cells and neuroinflammation in mood disorders following TBI and shows the potential mechanisms of minocycline to attenuate mood disorders

关键词: traumatic brain injury, mood disorder, minocycline, microglia, astrocyte, microglia-astrocyte interaction

The Role of Hippocampal 17 β -Estradiol in Cognitive Memory During Fear Memory Reconsolidation in PTSD Model Rats

Yuan Gao Han Wang Lanxia Wu Hao Zheng Jiahao
Tang Yuxuan He Lin Sun*
Shandong Second Medical University

Objective To explore the role of hippocampal 17 β -estradiol (17 β -E2) in modulating cognitive memory during the reconsolidation period of fear memory in rats with post-traumatic stress disorder (PTSD)

Methods 40 female Sprague-Dawley rats (8 weeks old) were randomly divided into blank control group, model group, hippocampal solvent control group and hippocampal estradiol inhibitor group by random

number table method, with 10 rats in each group. PTSD models were established in all groups except the blank control group using single prolonged stress (SPS) and contextual fear conditioning (CFC). The hippocampal solvent control group received a single bilateral injection of dimethyl sulfoxide (DMSO) (0.5 μ L per side) during the fear memory consolidation period, while the hippocampal estradiol inhibitor group received a single bilateral injection of letrozole (Let) (0.5 μ L per side) in the hippocampus. To assess anxiety levels and autonomous exploration ability, the open field test and the elevated plus maze test were utilized. The fear memory was evaluated using the freeze test, while the non-spatial memory was assessed with the novel object recognition test. The molecular changes in brain-derived neurotrophic factor (BDNF), extracellular signal-regulated kinases 1 and 2 (ERK1/2), and phosphorylated ERK1/2 (p-ERK1/2) were quantified using Western blot, immunofluorescence, and RT-qPCR techniques

Results Significant differences were observed among the four groups in the open field test, elevated plus maze test, freeze test, and novel object recognition test. The model (SPS-CFC) group exhibited shorter travel distances, less time spent in the open arms, longer freezing times, and lower cognitive indices compared to the control group. Additionally, the hippocampal estradiol inhibitor (SPS-CFC-Let) group demonstrated reduced travel distances, decreased time in the open arms, increased freezing times, and lower cognitive indices compared to the hippocampal solvent control (SPS-CFC-DMSO) group. Western blot and immunofluorescence results showed that hippocampal BDNF, p-ERK1/2, and ERK1/2 protein levels were lower in the SPS-CFC group compared to controls, and reduced in the SPS-CFC-Let group relative to the SPS-CFC-DMSO group. RT-qPCR revealed decreased mRNA levels of these proteins in the SPS-CFC group compared to controls, and in the SPS-CFC-Let group compared to the SPS-CFC-DMSO group

Conclusion Inhibiting hippocampal 17 β -E2 with letrozole significantly increased anxiety and fear responses while decreasing exploratory behavior and cognitive memory. Hippocampal 17 β -E2 alleviates

PTSD symptoms by enhancing neuroplasticity and cognitive function, potentially involving the regulation of BDNF and ERK1/2 signaling pathways

A Bayesian Network and Metabolomics-Based Study of Relapse Risk in Patients with Bipolar Disorder

Yan Ren* Zhiyong Zhang

Shanxi Provincial People's Hospital

Objective Bipolar disorder (BD) is a common mental disorder with complex clinical manifestations. Patients with BD often experience depressive or/and manic (or hypomanic) episodes that meet the symptomatological criteria and are characterized by recurrent episodes, and the repeated episodes in patients with BD lead to repeated hospitalizations and significant cognitive impairments unrelated to the severity of depressive symptoms, which places a significant burden on families and society. Therefore, understanding the risk factors for relapse of BD and reducing the likelihood of relapse are urgent clinical problems that need to be solved, which are also important for the regression of the disease and improvement of the prognosis of patients. In this study, we conducted a one-year follow-up of patients who had reached clinical recovery from acute BD treatment, with the aim of exploring the predictive value of demographic, psychosocial, clinical symptoms and treatment, and metabolomic indices for BD relapse at baseline, and exploring the relationship between the indices through the development of a predictive model using Bayesian networks

Methods 1. Sample collection: Patients in the acute phase who met the clinical diagnostic criteria for BD in the Diagnostic and Statistical Manual of Mental Disorders, Fifth Edition (DSM-5) and the inclusion exclusion criteria were invited to participate in the study and to sign an informed consent form

2. Case report forms: These included demographic information, psychosocial questionnaires, clinical symptom scales, and medication record forms, which were collected by researchers after rigorous and systematic training on sample indicators.

3. Metabolomics: Biological blood samples are gathered and spun at 3000 revolutions per minute for a duration of 15 minutes using a centrifuge. After centrifugation the samples are stored in a refrigerator at -80°C . When required for analysis, plasma samples were thawed, and compounds were separated. The separated samples were sent to a Bruker 600 MHz AVANCE III NMR instrument to obtain a typical ^1H NMR spectrum. In order to accurately identify the substances in the spectra, the Fourier transform, phase and baseline adjustments were performed using MestReNova software.

4. Follow-up: Patients who have been treated for the acute phase of BD to the standard of clinical recovery are followed up for a period of one year to observe the relapse or non-relapse of the outcome variable.

5. Statistical analysis: (1) Metabolomics analysis: the integration data were entered into SIMCA-P 14.1 software, analyzed using PLS-DA and OPLS-DA methods, and an OPLS-DA score map was generated. Subsequently, the corresponding loading map was constructed based on this score map. To further validate the differential metabolites, we performed t-tests on these metabolites in SPSS 26.0 software and screened the metabolites with VIP values greater than 1 and p-values less than 0.05 as significantly different metabolites; (2) The one-way chi-square test was performed after classifying and assigning values to demographic data, psychosocial indicators, clinical symptoms and treatment data, and metabolomics indicators, and logistic regression analysis was performed on the indicators exhibiting significant differences ($P < 0.05$)

6. Bayesian Networks: The independent indicators of influence from the results of the logistic regression analysis were incorporated into a Bayesian network model constructed on the basis of the contraindication search algorithm to explore the topology of the network among the risk factors for recurrence of BD, as well as the interactions among the factors.

Results 1. Metabolomics: 5 significantly different serum metabolites could be identified as potential biomarkers of relapse, with significant ($P < 0.05$ or $P < 0.01$) down-regulation of acetone, O-acetylglucoprotein, alanine and significant ($P < 0.05$ or $P < 0.01$) increase in glycerophosphorylcholine, phosphorylcholine; BD relapse is mainly associated with phospholipid biosynthesis, lysine degradation, phosphatidylcholine biosynthesis, and sphingolipid metabolic pathways

2. One-way chi-square test: Gender ($P = 0.029$) and smoking history ($P < 0.001$) in demographic data; open personality traits ($P = 0.03$), negative life events ($P = 0.024$), and familial ambivalence ($P = 0.047$) in psychosocial indicators; and duration of the disease ($P = 0.027$), baseline depression level ($P = 0.011$), sleep disturbance ($P = 0.019$), non-suicidal self-injury ($P = 0.004$), mood stabilizers ($P = 0.009$), antidepressant medication ($P = 0.01$), and individual psychotherapy ($P = 0.001$) in clinical symptomatic and treatment data; Metabolomics indicators of acetone ($P = 0.004$), alanine ($P = 0.002$), and phosphorylcholine ($P < 0.001$) were statistically significantly different in BD relapse outcomes.

3. Logistic regression: Independent risk factors for BD relapse were smoking history (OR=4.858, 95% CI: 1.121~21.044), sleep disorders (OR=5.617, 95% CI: 1.172~26.908), negative life events (OR=4.935, 95% CI: 1.260~19.335) and phosphorylcholine (OR=6.851, 95% CI: 1.391~33.743); protective factors were mood stabilizers (OR=0.189, 95% CI: 0.041~0.869), individual psychotherapy (OR=0.187, 95% CI: 0.038~0.907), acetone (OR=0.121, 95% CI: 0.022~0.659) and alanine (OR=0.188, 95% CI: 0.046~0.768).

4. Bayesian network: From the Bayesian network topology, it can be seen that smoking history, individual psychotherapy, negative life events, acetone, alanine, and phosphorylcholine are direct influences on the relapse of BD; whereas sleep disorders as well as mood stabilizers are indirect influences on the relapse of BD.

Conclusion 1. Acetone, O-acetylglucoprotein, alanine, glycerophosphorylcholine, and phosphorylcholine may be potential biomarkers for BD relapse, and the relevant pathways are phospholipid biosynthesis, lysine degradation, phosphatidylcholine biosynthesis, and sphingomyelin metabolic pathway

2. Smoking history, individual psychotherapy, negative life events, acetone, alanine, and phosphatidylcholine are direct risk factors for BD recurrence; individual psychotherapy, and alanine can also be indirect risk factors for BD recurrence. Mood stabilizers and sleep disorders are indirect risk factors for BD recurrence.

3. The Bayesian network has high sensitivity and specificity, and the indicators of each factor have good predictive value for BD relapse and can well reflect the dependence relationship between the nodes of each indicator.

Role of VTA Dopaminergic Neurons in Regulating Post-Traumatic Stress Disorder (PTSD) Behaviors and The Underlying Mechanisms

Changzheng Zhang¹, Wenyi Duan¹, Qiuxia Chen¹, Yingyin Zhuang¹, Guanting Qiu¹, Baoyi Huang¹, Shuihong Li², Peiling Zhou¹

1.Lingnan Normal University

2.Central People's Hospital of Zhanjiang, Guangdong Medical University

Objective Accumulating evidence has demonstrated that dysfunctions in the ventral tegmental area (VTA) dopamine system are involved in the etiology of PTSD. This study aims to investigate the impact of VTA dopaminergic neurons on behaviors associated with post-traumatic stress disorder (PTSD) and to elucidate the underlying neural mechanisms

Methods Single-cell sequencing of VTA tissue was conducted to analyze differential gene expression in dopaminergic neurons, with a focus on dopamine synthesis and synaptic signaling in the context of PTSD pathogenesis. Chemogenetic techniques were employed to specifically activate VTA dopaminergic neurons, and their behavioral effects were assessed in PTSD model rats using open field, elevated plus maze, and fear memory tests. In vivo extracellular electrophysiological techniques were utilized to examine the impact of PTSD

on the neural activity of VTA dopaminergic neurons, and to investigate the effects of chemogenetic activation on their firing frequency and patterns in PTSD model rats

Results PTSD induced differential gene expression in VTA dopaminergic neurons associated with dopamine synthesis and synaptic signaling. Activation of VTA dopaminergic neurons significantly ameliorated anxiety, depression, and freezing behaviors in PTSD model rats. PTSD markedly reduced the firing activity of VTA dopaminergic neurons, while activation of these neurons in PTSD model rats significantly increased their firing frequency and induced burst firing patterns, promoting dopamine release

Conclusion VTA dopaminergic neurons play a crucial role in encoding information related to PTSD. Activation of these neurons enhances their firing frequency and alters their firing patterns, thereby increasing dopamine release. This compensatory mechanism may mitigate the reduced dopamine function caused by PTSD, resulting in improved PTSD-related behaviors

Impact of Duration of Untreated Illness on Clinical and Physical Measures in Young Patients with Major Depressive Disorder: A Large-scale Cross-sectional Study

罗国帅¹ 刘娇¹ 杨媛¹ 李玉超¹ 孙达亮¹ 张向阳²

1.天津市安定医院

2.中国科学院心理所

Objective Longer duration of untreated illness (DUI) leads to worse outcomes in depressed patients. However, there is a lack of research on DUI in younger depressed patients. This study aimed to investigate the association between the duration of DUI and clinical and physical measures in young depression.

Methods We recruited 1289 young patients with major depressive disorder (MDD) from the Department of Psychiatry at the First Hospital of Shanxi Medical

University. DUI was defined as the time between the onset of depressive symptoms and the initiation of pharmacological treatment. We used bivariate and multivariate analyses to examine the association between DUI and clinical and physical measures, adjusting for relevant covariates.

Results Participants who had not received treatment for 8 months or longer had higher odds of suicide attempts, increased TSH levels, and high-normal blood pressure compared to those who received treatment within 3 months in young patients with MDD. A one-month longer DUI was associated with higher odds of suicide attempts, increased TSH levels, high-normal blood pressure, overweight, and obesity in young patients with MDD.

Conclusion Our study found that a longer DUI in depression is associated with several adverse clinical and physical correlates. These findings underscore the importance of early intervention and treatment in managing depression

关键词: duration of untreated illness, clinical and physical measures, major depressive disorder

基于机器学习分类算法的拉莫三嗪血清稳态浓度达标预测

郭徽豪^{1,2} 张孜^{1,2} 黄善情¹ 尚德为¹

1. 广州医科大学附属脑科医院

2. 广州医科大学

目的 本研究通过应用 4 种机器学习算法 (XGBoost、LightGBM、CatBoost、随机森林), 以癫痫患者的人口统计学资料和用药方案为基础, 建立拉莫三嗪 (Lamotrigine, LTG) 血药浓度达标预测模型, 协助临床判断不同患者 LTG 稳态浓度能否达到治疗窗, 为个体化给药方案的制定提供参考。

方法 通过病历和检验系统收集患者的临床资料、合并用药和 LTG 血药浓度数据, 使用 Jupyter Notebook 对数据进行预处理。以 AGNP 共识指南中 LTG 的治疗窗作为达标准准。采用 KNN 算法插补缺失值, 对连续型变量作归一化处理, 分类型变量进行独热编码。将数据集按 7: 3 随机分为训练集和测试集, 分别用于模型建立和模型验证。以五折交叉验证法减少模型过拟合, 贝叶斯优化算法调整参数得到最佳模型。采用准确性、精确率、召回率、F1 值和 AUC 来评估模型的性能。

结果 总共收集到 277 例符合标准的患者的资料, 通过 XGBoost、LightGBM、CatBoost、随机森林 4 种算法成功建立预测模型, 4 个模型均能较好地预测 LTG 稳态浓度的达标情况, 准确性、精确率、召回率和 F1 值均大于 0.65, 而 AUC 均大于 0.85。综合各种参数, XGBoost 的预测能力最佳。

结论 本研究建立的 4 个预测模型能够较好地判断患者接受 LTG 治疗后血清浓度的达标情况, 可促进临床对治疗效果的评估, 为个体化用药提供参考。

A Novel Approach for Depression Detection Through Extracted Skeletal Data During Scale Assessment

Yunshao Zheng*

Shandong Mental Health Center

Objective Depression was a widespread and high-risk mental disorder that could significantly affect thoughts, emotions, and behaviors. While recent studies explored techniques for detecting depression through body posture, depression detection researches utilizing skeletal data recorded by Kinect of scale assessment were still ongoing. Our goal was to establish a novel approach for depression detection that utilizes the skeletal data during scale assessment

Methods Depression patients' recruitment was perhaps the most challenging job of this research, after evaluating by the professional psychiatrists, which they would be pre-screened according to their treatment condition. Hamilton Rating Scale for Depression (HAMD), which is used the version contained 24 items (HAMD-24) in this experiment, provide an abbreviated indication of depression and a guideline for recovery assessment, which includes a multiple item questionnaire. It has been criticized for clinical practice using as it places more emphasis on insomnia than on feelings of hopelessness, self-destructive thoughts, suicidal cognition and actions, and the total score is compared to the corresponding descriptor

Although depression patients underwent preliminary screening and assessment by psychiatrists before participating in the experiment, there were still instances where some depression patients scale scored < 20, or even less than 8, leading to a diagnosis of no depressive symptomatic manifestations. Psychiatrists' analysis suggests that these depression patients might have experienced a period of hospitalization and received medication treatment, resulting in significant symptom improvement. Notably, patients who had undergone electroconvulsive therapy exhibited particularly lower scores after treatment compared to other patients. Subjects in the control group primarily comprised volunteer individuals recruited from the community, with the majority having relatively low or even zero scores on the depression scale.

Informed consent to participate in the study was

obtained from all subjects or their legal guardians. All participants in the study were aged between 18 and 65 years old. This study comprised 202 inclusion participants, each assessed by an experienced psychiatrist using the HAMD scale, as shown in figure 1. Data records with a total score of less than 8 in the depression group and records with a total score of more than 8 in the control group were excluded from the analysis. Following screening based on the scale's scoring criteria, a total of 89 depression patients were recruited from various sources, including the outpatient and inpatient departments of the Shandong Provincial Mental Health Center, to constitute the experimental group, and 113 healthy individuals were recruited from the general population to form the control group. Aging appears to be a significant factor contributing to limited human mobility. Therefore, we implemented age and gender matching conditions during the recruitment of social volunteers. This ensured that the age and gender distribution of the control group aligns more closely with that of the depression group. From the provided table 1, it is evident that the average age of the depression group is 39.21, with HAMD scores of 26.24. In contrast, the control group has an average age of 38.62, with HAMD scores of 0.99.

Participants, which included a depression group and a control group, were assessed using the Hamilton Rating Scale for Depression (HAMD-24), and we utilized Kinect V2 to capture human skeletal data. To extract the skeletal data and reduce noise, we developed a program that has been open-sourced for processing Kinect recorded files. With skeletal data extraction, feature analysis, and data preprocessing, the three human skeleton datasets were created using the hip joint as the splitting point, as follows: whole body skeleton joints dataset, upper body skeleton joints dataset, and lower body skeleton joints dataset. To enhance the classification capacity of temporal and spatial features within skeletal data, we designed Temporal Spatial Attention (Dep-TSA) for depression detection.

Results According to the scale's criteria, a total of 202 participants were included, with 89 depression patients as the depression group, with 113 socially recruited healthy individuals constituted the control group.

The proposed Dep-TSA model shown outstanding results compared to other models, achieving an accuracy of 72.13%, a specificity of 76.47% and a sensitivity of 66.67% on whole body skeleton joints dataset. It also attained accuracy of 67.32% on upper body skeleton joints dataset, and accuracy of 62.30% on lower body skeleton joints dataset

The data collection for the depression group in this study had limitations in terms of entry screening, as we did not investigate participants' past history of depression, and the current status statistics were not sufficiently comprehensive. The potential impact of whether participants were currently undergoing various treatment methods on the prevalence rate remains to be explored. It must be acknowledged that HAMD scores are not a definitive assessment, typically conducted through clinical diagnosis. Therefore, individuals identified as having depression based on entry screening criteria should not be categorically regarded as "true" depressive patients; rather, they indeed had a history of depression and were currently in a depressive state.

The skeletal feature descriptors presented in this study seemed to be based on specific motion directions and slightly subjective evaluations, limiting the ability to integrate different features into the predictive model employed. In our study, kinematic features may not have provided sufficient evidence of participant reflections. However, they more comprehensively covered the information reflecting individual psychological states during the stimulus task. Our results demonstrated that the computational model based on low-level features was effective in identifying the severity of depression as measured by questionnaires, highlighting the potential of this data-driven approach in the field of psychometrics.

Conclusion In this study, we recorded participants undergoing the assessment process of the HAMD using Kinect V2 devices to capture kinematic skeletal data. Subsequently, employing the Kinect-based skeletal extraction program developed in this paper, we extracted both the raw spatial features of the human skeleton captured by Kinect and the low-level features of 25 body joints based on temporal-spatial positional data

extracted directly from the recorded Kinect 3D coordinates and quaternion. After preprocessing the data with an average sliding window, we inputted it into a machine learning random forest algorithm. Utilizing the top 15 features selected as the dataset partitioning criteria, we divided the data into three datasets. The Dep-TSA deep learning algorithm designed by us achieved a certain level of classification accuracy on these three datasets. All these findings suggest that the depression recognition based on the kinematic skeletal data recorded during the HAMD assessment process with Kinect can serve as an effective auxiliary tool for assisting depression analysis. In future research, we plan to extend this study to the detection of the severity of depression for further investigation and exploration

运动区低频重复经颅磁刺激联合盐酸氟西汀治疗强迫障碍的疗效与安全性观察

李航 安敏杰*

北京市大兴区心康医院

目的 观察运动区低频重复经颅磁刺激联合盐酸氟西汀治疗强迫障碍的疗效与安全性。

方法 回顾性分析我院 2022 年 6 月到 2023 年 6 月所收强迫障碍患者的临床资料,共 100 例。按患者接受的治疗方式不同分为 2 组,药物治疗者为药物组,有 40 例;药物治疗+运动区低频重复经颅磁刺激(LF-rTMS)治疗者为联合组,有 60 例。比较 2 组患者的临床疗效、安全性差异,记录 2 组患者治疗前、治疗 1 个月、治疗后的强迫症状[强迫症状问卷评分(Y-BOCS)]并比较,记录 2 组患者治疗前、治疗后的焦虑抑郁症状[汉密尔顿抑郁量表(HAMD)、汉密尔顿焦虑量表(HAMA)]和生活质量[健康调查简表(SF-36)]并比较。

结果 比较 2 组患者的临床总有效率,联合组高于药物组,差异有统计学意义($P<0.05$);治疗 1 个月、治疗后,2 组患者 Y-BOCS 评分较治疗前明显降低,差异有统计学意义($P<0.05$);且联合组 Y-BOCS 评分在治疗后明显低于药物组,差异有统计

学意义($P<0.05$);治疗后,2 组患者 HAMD、HAMA 评分较治疗前明显降低,差异有统计学意义($P<0.05$);且联合组 HAMD、HAMA 评分在治疗后明显低于药物组,差异有统计学意义($P<0.05$);治疗后,2 组患者 PF、SF、RE、CH 评分较治疗前明显升高,差异有统计学意义($P<0.05$);且联合组 PF、SF、RE、CH 评分在治疗后明显高于药物组,差异有统计学意义($P<0.05$);比较 2 组患者的不良反应发生情况,差异无统计学意义($P>0.05$)。

结论 运动区低频重复经颅磁刺激联合盐酸氟西汀治疗强迫障碍患者可有效提高临床效果,改善患者强迫、焦虑、抑郁症状,提高患者生活质量,且安全性良好,可在临床推广应用。

精神病医院医务人员线上推动 TDM 对精神病居家患者减少 ADR 的实践

张玉良*

如皋市精神病防治医院

目的 实施创新赋能、培育“智慧精防”医疗服务领域“新质生产力”的尝试探索。探讨基层精神病医院医务人员借助微信(群),公众号视频号线上推动开展药物浓度监测(TDM),对精神病居家患者安全合理精准用药、减少药品不良反应(ADR)的应用效果。

方法 医务人员与研究组精神病居家患者(家属)开展微信(群)交流、公众号视频号科普,应用文字图片语音视频科普链接传播等形式,线上讲解药物浓度监测的目的意义;强化灌输剖析开展 TDM 的必要性、紧迫性、科学实用性;远程推动拓展精神病药学服务,以促进患者居家服药的精准安全合理有效性、和降低药品不良反应发生率、危害性。

结果 医务人员借助微信(群)交流、公众号视频号科普,持续提供优质服务后,与未接受微信(群)等强化服务的患者比较,研究组精神病居家患者(家属)对药物浓度监测目的意义和相关知识的知晓率、患者(家属)对开展药物浓度监测的配合度、医务人员应用 TDM 监测数据及时精准持续参与完善患者治疗方案后病情好转率,与对照组相比,明显提高;

精神疾病疗程及复发率、药品不良反应发生率和危害性明显降低, ADR 监测、正确处置填报率上升; 患者满意度大幅提升, $P<0.05$, 具有统计学意义。

结论 基层医院医务人员借助微信(群), 推动开展药物浓度监测, 强化对精神病居家患者安全合理精准用药、促进治疗效果、减少药品不良反应、弥补居家患者不良反应监测处置薄弱环节的效果明显, 值得借鉴推广。

精神病医院药师借助 PK/PD 理论+TDM 在药物超常量治疗一例老年精神病居家患者的实践

张玉良*

如皋市精神病防治医院

目的 进行创新赋能、培育“智慧精防”医疗服务领域“新质生产力”的探索。探讨药师基于 PK/PD 理论+TDM(治疗药物监测)数据, 参与精神科门诊老年居家患者病情讨论, 在患者个体化精准药物治疗中的应用效果和价值。

方法 运用溯源法, 回顾一例老年精神病患者在居家药物治疗期间, 药师借助 PK/PD 理论, 依据 TDM 监测数据所处该药物治疗血液浓度安全范围区间位置, 建议门诊医师大胆而谨慎予以抗精神病药物奥氮平短期内超说明书常规药量(低于药物治疗极量)治疗、控制患者精神病症状的效果分析; 同时药师借助微信向患者解释治疗方案。

结果 药师基于 PK/PD 理论+TDM 数据, 根据监测数据所处该药物治疗血液浓度安全范围区间位置、结合该患者既往病史、身体状况、精神症状、治疗过程, 建议医生大胆而谨慎予以奥氮平短期内超说明书常规药量治疗(低于药物治疗极量), 控制患者精神病症状, 治疗效果明显好转, 获得好评。

结论 药师基于 PK/PD 理论+TDM 在精神科门诊老年居家患者个体化精准药物治疗应用中, 效果明显, 具有实用价值, 并且可以正确、准确、客观评判医师给予患者“超说明书”用药的治疗方案的合理性, 在后期的医嘱处方点评中具有重要的支撑价值, 值得借鉴。

精神病医院医务人员借助微信对精神病居家患者开展 ADR 监测指导处置的实践

张玉良*

如皋市精神病防治医院

目的 探寻新时代医药学服务领域新质生产力的新思维的拓展方向和路径! 分析精神病医院医务人员借助微信(群、公众号、视频号)科普, 对精神病居家患者开展药物不良反应(Adverse Drug Reactions, ADR)监测指导处置的实践价值。

方法 将 2021 年 6 月-2023 年 4 月收治的 132 例精神病居家患者视为研究对象, 随机分为试验组和参照组, 每组 66 例。2023 年 5 月-2024 年 5 月期间, 医务人员给予参照组常规用药指导, 给予试验组在参照组基础上借助微信开展远程药学科普、ADR 监测处置等, 随访 13 个月, 对比两组患者的 ADR 发生指数、相关药学知识掌握率以及 ADR 发生后的正确处置率。

结果 试验组的 ADR 发生指数明显低于参照组, 存在统计学意义($P<0.05$); 试验组的 ADR 知识掌握率和 ADR 发生后的正确处置率均高于参照组, 存在统计学意义($P<0.05$)。

结论 对于精神病居家患者, 医务人员借助微信开展 ADR 监测处置的实践价值高, 一方面努力打通和延续药学服务的最后一米线, 减少 ADR, 弥补对居家精神障碍患者药物不良反应监测、处置、网上填报的薄弱环节, 另一方面有助于医务人员掌握相关医药学知识, 提高不良反应的正确处置率, 值得应用推广。

Genetic Overlap between Schizophrenia and Bipolar Disorder Reveals Shared Pathophysiological Mechanisms

Qing Du Bo Xiang*

Affiliated Hospital of Southwest Medical University

Objective Studies have shown similarities in clinical symptoms and biological markers between schizophrenia (SCZ) and bipolar disorder (BD), and research on genetic overlap has also demonstrated significant genetic correlations between the two. However, the impact of these shared genetic factors on the diseases remains poorly understood

Methods We utilized the hippocampus volume (HIPV) as an auxiliary phenotype for identifying pleiotropic genetic loci associated with BD and SCZ. Using conditional/conjunctional false discovery rate approach to evaluate overlap in common genetic variants and improve statistical power for genetic discovery. We established co-expression networks of the overlapping genes in SCZ and BD using BrainSpan's transcriptomes, and performed the gene set analysis of each gene subnetwork with symptoms in SCZ

Results We identified several loci shared between SCZ and left HIPV ($n = 8$) and right HIPV ($n = 13$), BD and left HIPV ($n = 1$) and right HIPV ($n = 3$). Twenty-two and seventy candidate genes mapped by shared loci for BD and SCZ, respectively, and twenty overlapping genes in SCZ and BD. Functional enrichment analysis pointed to the twenty genes being associated with 16p11.2 proximal deletion syndrome. According to the brain transcriptome data, it was found that the twenty genes were enriched for the transcriptional co-expression profile in prenatal primary auditory cortex, inferolateral temporal cortex and inferior parietal cortex, medial prefrontal cortex. Further gene-set analysis uncovered that the genes in the subnetwork of medial prefrontal cortex were significantly associated with negative symptom in SCZ

Conclusion The study indicated that SCZ and BD shared genetic basis with HIPV, and the genetic overlaps suggested shared neurobiological mechanisms between the two disorders

关键词: Schizophrenia; Bipolar disorder; Hippocampus volume; Genetic overlap; Network analysis

Mood Symptoms, Cognitive Function and Changes of Brain Hemodynamics in Patients with COVID-19: A Task-based and Resting-state fNIRS Study

Wenjin Ma Weihui Li*

The Second Xiangya Hospital

Objective The global COVID-19 pandemic has led to an increased incidence of mental health disorders, especially depression and anxiety. Many patients with COVID-19 may experience emotional issues and cognitive impairments. Life changes and stress are likely contributing factors. In addition, the impact of the COVID-19 virus on the brain may play a crucial role, as existing evidence suggests that the virus can directly affect the central nervous system through immune responses and inflammation. This study aimed to use functional near-infrared spectroscopy (fNIRS) to detect cortical hemodynamic changes in patients with acute COVID-19 infection and their relationship with mood symptoms (mainly depression and anxiety), so as to understand the effects of COVID-19 on brain function

Methods A total of 58 subjects, comprising 29 patients with acute COVID-19 infection and 29 healthy controls who had never been infected with COVID-19 and had no anxiety or depression were recruited. Then cortical activation during the performance of the verbal fluency test (VFT) and brain connectivity during resting state were conducted by 53-channel functional near-infrared spectroscopy (fNIRS). For COVID-19 infected group, Patient Health Questionnaire-9 (PHQ-9) and General Anxiety Disorder-7 (GAD-7) were used to assess the emotional state before fNIRS measures

Results For resting-state, compared to the uninfected group, the infected group exhibits lower resting-state functional connectivity (rsFC), a reduced number of Short-IIconnectivity, and a lower local efficiency and degree centrality in DLPFC-R. The number of Short-IIconnectivity and the global efficiency are positively correlated with both PHQ score and GAD score in infected group. During verbal fluency task, the infected group exhibited significantly lower cortical activation

than the uninfected group and the integral value has a significant difference in both Broca-L and Broca-R between two groups. The integral value in the DLPFC-L showed significant negative correlation with The PHQ-9 scoreduring VFT

Conclusion Our study provides a kind of evidence that the psychological and emotional issues brought about by COVID-19 are not only due to external social factors but also involve more direct brain neural mechanisms and abnormal neural circuits, which also provides insights for the future treatment and prognosis of individuals with COVID-19 that close attention should be given to mood symptoms and cognitive functions of patients in addition to monitoring respiratory symptoms

关键词: COVID-19, depression, anxiety, fNIRs, VFT, resting-state

异氟醚对小鼠抑郁样行为的影响及性别差异研究

唐爱晨 李人、王刚*

首都医科大学附属北京安定医院

目的 氯胺酮快速抗抑郁的发现给抑郁治疗带来新的希望,但由于氯胺酮诸多不良反应限制其临床应用。其他麻醉药物随之引起大家关注,但仍然缺少确切的证据将麻醉药物应用于抑郁治疗。另一个未解之谜是抑郁症发病和治疗的性别差异及相关机制。男性和女性患 MDD 的风险不同,并且抗抑郁药在临床上的疗效存在性别差异。但目前临床在治疗抑郁症时很少或不考虑性别差异,了解和发展针对抑郁症的性别特异性治疗对于个体化精准医疗至关重要。本实验主要探究麻醉药物异氟醚对小鼠抑郁样行为的影响及性别差异。

方法 给予不同剂量的异氟醚:吸入 1%、1.5% 或 2%异氟醚 30 分钟,4 小时后对小鼠进行糖水偏好及强迫游泳行为检测,筛选药物使用剂量并探究其抗抑郁样行为作用时间。

结果 给予不同剂量的异氟醚发现,吸入 1%、1.5%或 2%异氟醚 30 分钟均能增加正常 C57 小鼠糖水偏好但只有 1.5%异氟醚能减少小鼠强迫游泳

不动时间。对性别进一步分析发现,雄性小鼠吸入 1%异氟醚后糖水偏好增加较雌鼠更显著,1.5%异氟醚能同时增加雄性和雌性小鼠的糖水偏好,2%异氟醚仅能增加雄性小鼠的糖水偏好;不同剂量的异氟醚对小鼠的强迫游泳时间影响无明显性别差异。在后续实验中选用 1.5%异氟醚剂量继续探究异氟醚行为改善作用的时间窗。对异氟醚作用时间窗实验结果探究,吸入 1.5% 的异氟醚 4 小时后增加小鼠的糖水偏好,不影响小鼠在旷场中的运动总距离及平均运动速度;给药 24 小时后对小鼠的糖水偏好无明显影响,但可以减少强迫游泳不动时间。吸入 1.5% 的异氟醚 3 天后对小鼠的糖水偏好和悬尾实验无明显影响;给药 7 小时后对小鼠的糖水偏好无明显影响。对性别进一步分析,吸入 1.5% 的异氟醚 4 小时后仅增加雄性小鼠糖水偏好;给予异氟醚 24 小时后仅减少雌性小鼠强迫游泳不动时间,对雌性小鼠糖水偏好均无明显影响;给予异氟醚 3 天、7 天后对雌性小鼠糖水偏好和悬尾行为的影响无显著影响。

结论 吸入 1.5%异氟醚 4 小时后不影响小鼠的自主活动。吸入 1.5%异氟醚可在 4 小时后增加雄性小鼠的糖水偏好,但持续时间不足 24 小时;对小鼠强迫游泳及悬尾行为结果分析,吸入 1.5%异氟醚 4 小时后即可改善雌性小鼠无助行为,但持续时间不足 3 天。

青少年抑郁症患者自杀未遂的影响因素分析

高媛媛 王冉 王学义*

河北医科大学第一医院

目的 探讨青少年抑郁症患者自杀未遂的影响因素,为自杀行为的干预提供理论依据。

方法 采用方便抽样法,选取 2021 年 4 月至 2023 年 6 月在河北医科大学第一医院精神卫生中心住院和门诊就诊的 217 例首发和复发的青少年抑郁症患者分为自杀未遂组及非自杀未遂组作为研究对象。采用汉密尔顿抑郁量表 (HAMD)、童年期创伤问卷 (CTQ-SF)、青少年生活事件量表 (ASLEC)、心理弹性量表 (CD-RISC) 对患者的抑郁程度、童年期生活事件及创伤经历、心理弹性进行测评。采用

单因素分析及二元 logistic 回归模型分析影响青少年抑郁症自杀未遂的相关影响因素。

结果 217 例青少年抑郁症患者中, 自杀未遂的发生率 22.58%。单因素分析结果显示, 两组患者首发年龄、学校欺凌、非自伤性自杀 (NSSI)、自杀意念、HAMD、情感虐待、CTQ 总分、人际关系、坚韧性、乐观性、心理弹性总分比较, 差异有统计学意义 ($t/\chi^2=-2.582, 16.107, 18.684, 22.418, -2.816, -5.883, -3.806, -5.485, -4.366, -4.204, -3.878; P<0.05$)。二元 logistic 回归分析结果显示, 学校欺凌 (OR=2.740, 95%CI=1.093-6.868)、自杀意念 (OR=7.856, 95%CI=1.449-42.591)、情感虐待 (OR=1.332, 95%CI=1.108-1.602)、人际关系 (OR=1.175, 95%CI=1.066-1.295)、坚韧性 (OR=0.741, 95%CI=0.586-0.937)、乐观性 (OR=0.589, 95%CI=0.434-0.800)、心理弹性总分 (OR=0.635, 95%CI=0.480-0.912) 与青少年抑郁症患者自杀未遂有关联 ($P<0.05$)。

结论 遭受校园欺凌及情感虐待、存在自杀意念、人际关系不佳、良好的心理弹性对青少年抑郁症患者的自杀行为有显著影响。

关键词: 抑郁症, 青少年, 自杀未遂, 影响因素

青少年非自杀性自伤与童年期创伤和心理弹性的关联性研究

高媛媛 王岚 王学义*
河北医科大学第一医院

目的 探讨童年期创伤和心理弹性对青少年非自杀性自伤行为 (non-suicidal self-injury, NSSI) 的影响。

方法 基于 ICD-10 诊断的 158 例首发青少年心境障碍患者, 评估有无 NSSI 行为, 将患者分为伴 NSSI 组 (n=94) 和不伴 NSSI 组 (n=64)。采用汉密尔顿抑郁量表 (Hamilton Depression Scale, HAMD)、汉密尔顿焦虑量表 (Hamilton Anxiety Scale, HAMA)、童年期创伤问卷 (Childhood trauma questionnaire, CTQ-SF)、心理弹性量表 (Connor-Davidson Resilience Scale, CD-RISC) 评估患者的抑郁焦虑情绪、童年期创伤经历及心理弹性水平, 并进行组间比较。采用 logistic 回归分析各因素与青少年 NSSI 行为的

关联。

结果 伴 NSSI 组青少年心境障碍患者发病年龄小、文化程度低 ($P<0.05$)、抑郁重 (27.99 ± 5.94 vs. 24.19 ± 5.19)、焦虑重 (18.02 ± 5.94 vs. 15.45 ± 4.99)、CTQ 总分 (48.43 ± 15.40 vs. 41.97 ± 9.75)、情感虐待分 (12.77 ± 6.06 vs. 10.19 ± 4.06)、情感忽视分 (11.40 ± 5.34 vs. 9.14 ± 3.55) 高于不伴 NSSI 的患者。留守经历 (48.9% vs. 29.7%)、学校欺凌 (46.8% vs. 25.0%)、自杀意念 (85.1% vs. 37.5%)、自杀未遂 (29.8% vs. 6.3%) 两组差异有统计学意义 ($P<0.05$)。不伴 NSSI 组心理弹性总分 (39.83 ± 10.27 vs. 28.66 ± 12.75)、坚韧性 (19.59 ± 4.92 vs. 12.28 ± 6.47)、力量性 (12.03 ± 3.98 vs. 9.99 ± 4.6)、乐观性 (8.98 ± 2.97 vs. 6.47 ± 3.73) 评分高于伴 NSSI 组 ($P<0.05$)。logistics 回归分析显示, 留守经历 (OR=4.494)、学校欺凌 (OR=5.983)、自杀意念 (OR=13.225)、自杀未遂 (OR=16.769)、HAMD (OR=1.264)、情感虐待 (OR=1.327)、坚韧性 (OR=0.468) 与青少年心境障碍患者 NSSI 行为的关联有统计学意义 ($P<0.05$)。

结论 留守经历、校园欺凌、自杀意念及自杀未遂、情感虐待、抑郁程度、心理弹性可能与青少年心境障碍患者 NSSI 行为相关联。

关键词: 青少年; 心境障碍; 非自杀性自伤; 儿童期虐待; 心理弹性

合并代谢综合征的抑郁症患者心率变异性特征的初步研究

王卓言 刘颖 于鲁璐*
河北医科大学第一医院

目的 初步探讨合并代谢综合征的抑郁症患者自主神经功能的变化。

方法 纳入河北医科大学第一医院精神卫生中心门诊及住院的抑郁症患者共 79 人为研究对象, 根据中华医学会糖尿病学分会制定的中国 2 型糖尿病防治指南 (2020 年版) 中代谢综合征 (Metabolic Syndrome, MetS) 的诊断标准分为 3 组: 不伴代谢综合征抑郁症组 (Non-MetS-MDD)、代谢综合征前期抑郁症组 (Pre-MetS-MDD)、伴代谢综合征抑郁症组 (MetS-MDD)。采用方差分析或秩和检验比较三组间汉密尔顿抑郁量表 (Hamilton Depression Scale,

HAMD)、汉密尔顿焦虑量表(Hamilton Anxiety Scale, HAMA)量表及各因子分及心率变异性(heart rate variety, HRV)的差异性,采用 spearman 相关分析探索血压、血糖、体质指数(Body Mass Index, BMI)、血脂等代谢指标与 HRV 的相关性。

结果 1、3 组在 HAMD ($F=1.052$, $P=0.354$) 及 HAMA ($H=2.698$, $P=0.273$) 总分的差异均无统计学意义。各因子得分差异均无统计学意义。2、与不伴代谢综合症的抑郁症患者相比,伴代谢综合症的抑郁症患者其高频(high frequency, HF)更低($H=19.478$, $P=0.011$),经 Bonferroni 校正后差异仍具有统计学意义;极低频(very low frequency, VLF)、低频(low frequency, LF)、高频/低频(LF/HF)与相邻 RR 间期差值的均方根(root mean square values of the standard deviation, RMSSD)差异无统计学意义。3、舒张压与 HF 呈显著负相关($r=-0.253$, $P=0.024$);腹围与 LF、HF 呈显著负相关($r=-0.228$, $P=0.043$; $r=-0.234$, $P=0.038$);血糖水平与 VLF、LF、LF/HF 呈负相关($r=-0.367$, $P<0.001$; $r=-0.396$, $P<0.001$; $r=-0.240$, $P=0.033$)。

结论 合并 MetS 的抑郁症患者其 HF-HRV 降低,可能与舒张压、腹围相关。提示在临床工作中治疗抑郁症的同时需关注患者的躯体情况。

首发未用药的缺陷型及非缺陷型精神分裂症结构脑影像的比较研究

李喆* 蒋兴梅
四川大学华西医院

目的 精神分裂症被认为是最严重的精神疾病之一,为了降低研究对象的异质性, Carpenter 教授等人提出了缺陷型精神分裂症(Deficit Schizophrenia, DS)及非缺陷型精神分裂症(Non-deficit Schizophrenia, NDS)的分型,本研究通过比较首发未用药缺陷型及非缺陷型精神分裂症患者和健康对照大脑结构的差异,揭示精神分裂症患者及不同亚型患者大脑结构的异常,为深入探索精神分裂症等高度异质性疾病的神经病理机制提供了重要依据。

材料和方法 本研究招募了首发未用药精神分

裂症(First-episode drug-naive schizophrenia, FES)患者 130 例,同时纳入了 130 名与 FES 患者相匹配的健康对照者(Healthy Controls, HC),本研究采用中文版缺陷型精神分裂症诊断量表(the Schedule for the Deficit Syndrome, SDS)进行 DS 与 NDS 患者分型。使用 Freesurfer 7.2 软件处理受试者的脑影像数据,进而比较精神分裂症患者与健康对照之间的脑结构形态学差异,并探寻首发未服药的精神分裂症及两类亚型的脑结构改变与各自精神症状的关系。

结果 共有 118 例精神分裂症患者(其中 DS59 例, NDS59 例)和 120 名健康对照数据合格并纳入分析。FES 组皮层外侧表面积比 HC 组显著增加的脑区位于左脑的颞中回,右脑的舌回和顶下小叶。FES 组皮层体积较 HC 组显著增加的脑区位于左脑的舌回,左脑的顶下小叶和右脑的舌回。FES 组皮层体积较 HC 组显著减少的脑区位于左脑的缘上回。比较 FES 组与 HC 组皮层下体积数据, FES 组左侧侧脑室及第三脑室较 HC 组显著增大; FES 组左侧苍白球、左侧丘脑、右侧伏隔核较 HC 组显著减小。FES 组左脑舌回体积、第三脑室体积与 PASSS 量表的阳性症状分数呈显著负相关。

NDS 组皮层表面积比 HC 组显著增加的脑区位于右脑的舌回,右脑的枕叶外侧。NDS 组皮层体积较 HC 组显著增加的脑区位于双侧大脑的舌回; DS 组皮层体积较 HC 组显著减少的脑区位于右脑的舌回。NDS 患者左脑舌回体积、右脑枕叶外侧表面积与 PANSS 的阳性症状分数显著负相关。

结论 (1)在未接受药物治疗之前,首次发作的精神分裂症患者较健康对照已经存在大脑灰质结构的改变,如皮层表面积和皮层体积的变化。

(2)首发未用药精神分裂症患者大脑结构改变与阳性症状存在显著相关。

(3)DS 可能并非是一完全独立的精神分裂症亚型, NDS 与 DS 存在部分相同的神经病理改变,也存在各自独特的神经病理改变。

低睡眠质量的抑郁症患者枕叶功能变化及其与认知功能的关系

刘不凡 王学义*

河北医科大学第一医院

目的 研究伴睡眠障碍抑郁症患者脑区自发性活动的改变及其与认知功能的关系。

方法 于2020年9月至2024年4月在河北医科大学第一医院招募42例抑郁症患者及14例年龄、性别、受教育年限相匹配的健康对照组,对其进行汉密尔顿抑郁量表-17(Hamilton depression scale-17, HAMD17)、匹兹堡睡眠质量表(Pittsburgh sleep quality index, PSQI)及数字广度测验(Digit span test ,DST)评估。所有被试行3.0T脑静息态功能磁共振成像扫描(Resting-state functional magnetic resonance imaging, rs-fMRI)后计算分数低频振幅(Fractional amplitude of low-frequency fluctuations, fALFF)。根据匹兹堡睡眠质量表的分数,将抑郁症患者分为高睡眠质量组(n=14)、低睡眠质量组(n=28)。对三组被试fALFF值方差分析后进行事后检验,并将差异脑区与数字广度得分行相关性分析。

结果 三组右侧枕上回(MNI:x=0,y=-102,z=-31;K=37)、左侧枕中回(MNI:x=21,y=-102,z=6;K=51)、左侧楔前叶(MNI:x=-9,y=-78,z=21;K=27)的fALFF值在三组间存在显著差异(GRF 矫正)。与高睡眠质量组比,低睡眠质量组右侧枕上回fALFF值升高($Z=-3.015, P=0.003$),且与数字广度倒背得分呈负相关($r=-0.274, P=0.041$)。与健康对照组比,高睡眠质量组左侧楔前叶fALFF值升高($Z=-2.022, P=0.043$),低睡眠质量组右侧枕上回升高($Z=-3.469, P<0.005$)、左侧枕中回fALFF值升高($Z=-3.815, P<0.005$)、左侧楔前叶fALFF值升高($Z=-3.709, P<0.005$)。

结论 低睡眠质量的抑郁症患者枕叶自发性活动增加,且枕叶的异常活动可能与低睡眠质量抑郁症患者认知功能下降有关。

昼夜节律类型与压力知觉水平对理工类大学生睡眠质量的影响

任若佳 王学义*

河北医科大学第一医院

目的 探讨昼夜节律类型、压力知觉水平对于理工类大学生睡眠质量的影响。

方法 筛查河北省某综合大学理工科大一至大四年级本科生10509名,采用自编一般情况问卷和匹兹堡睡眠指数量表(PSQI)、清晨-夜晚类型问卷(MEQ)、中文版压力知觉量表(CPSS-14)进行调查。根据PSQI得分分为睡眠质量好或差(>5分被归类为睡眠质量差)。根据MEQ得分将昼夜节律类型分为清晨型(59-86分)、中间型(42-58分)和夜晚型(16-41分)。根据研究人群的50百分位数建立压力知觉水平分类(轻度和重度)。

结果 共发放问卷10509份,回收有效问卷9768份。在9768名理工类大学生中,年龄在18至27岁之间,其中69.0%的受试者为男性。共有3418名(35.0%)大学生报告了睡眠质量差。与昼夜节律为清晨型相比,夜晚型和中间型的大学生表现出更差的睡眠质量($P<0.01$)。重度压力知觉水平组受试者的睡眠质量严重程度明显高于轻度压力组($P<0.01$)。比较由昼夜节律类型和压力知觉水平组合对睡眠质量的影响,重度压力知觉水平和夜晚型的组合PSQI得分最高($P<0.01$)。二元逻辑回归分析结果显示:当重度压力知觉与任何昼夜节律类型组合时,都与睡眠质量有显著的相关性:清晨型(OR:2.4,CI95%:1.9-3.0, $P<0.001$)、中间型(OR:3.9,CI95%:3.3-4.8, $P<0.001$)、夜晚型(OR:5.1,CI95%:3.5-7.5, $P<0.001$)。加入性别、年龄作为控制因素后,昼夜节律类型与压力组合对睡眠质量的影响仍然保持不变。为了进一步探究昼夜节律类型与压力知觉对睡眠质量的综合影响,还控制有无运动习惯、有无吸烟、饮酒习惯等因素,结果显示除昼夜节律类型与压力知觉水平对睡眠质量有影响外,男性(OR:0.7,CI95%:0.7-0.8, $P<0.001$)、无吸烟(OR:0.6,CI95%:0.6-0.7, $P<0.001$)对睡眠质量有保护作用,而无运动习惯则是睡眠质量的危险因素(OR:1.2,CI95%:1.1-1.3, $P=0.002$)。

结论 昼夜节律类型和压力知觉水平是睡眠质量的影响因素,昼夜节律类型为夜晚型及压力感知水平较高会增加睡眠质量差的风险。同时,昼夜节律类型与压力知觉水平组合会加重对睡眠质量的影响。未来有必要进行有针对性的干预,早期识别理工类大学生睡眠质量的风险。

关键词: 昼夜节律; 压力知觉; 大学生; 睡眠质量

首发和复发抑郁症患者临床特征的比较

黄凡凡 王学义*

河北医科大学第一医院

目的 比较首发和复发抑郁症患者的社会人口学资料和临床特征,并探究抑郁症复发的影响因素。

方法 前瞻性收集 2020 年 9 月至 2024 年 5 月就诊于河北省 6 家医院门诊及住院的 500 例抑郁症患者的临床资料,根据抑郁症是否为第 1 次发作将抑郁症患者分为首发抑郁症(首发组)271 例和复发抑郁症(复发组)229 例。采用 17 项汉密尔顿抑郁量表(Hamilton depression scale-17, HAMD17)、儿童期创伤问卷-简版(childhood trauma questionnaire, CTQ-SF)、匹兹堡睡眠指数量表(Pittsburgh Sleep Quality Index, PSQI)、手机依赖指数量表(Mobile Phone Addiction Index, MPAI)和社会支持评定量表(Social Support Rating Scale, SSRS)分别评估抑郁症患者的临床症状。使用 χ^2 检验和两独立样本的非参数检验分别比较首发和复发抑郁症患者在社会人口学特征和临床特征上的差异,使用 logistic 回归分析抑郁症患者复发的影响因素。

结果 首发组和复发组在居住地、家庭月收入、首次发病年龄和匹兹堡睡眠指数量表之间的差异具有统计学意义($P<0.05$)。二元 logistic 回归分析显示,随着年龄的增长($OR=1.45$, $95\%CI: 1.33-1.59$)和使用催眠药物频次越多($OR=1.21$, $95\%CI: 1.00-1.45$),抑郁症复发的可能性越大。相对于首发抑郁症,适量饮酒($OR=0.41$, $95\%CI: 0.20-0.83$)、睡眠时间较短($OR=0.74$, $95\%CI: 0.57-0.96$)、抑郁症首次发病年龄较晚($OR=0.68$, $95\%CI: 0.62-0.74$)以及获得更多的客观社会支持($OR=0.89$, $95\%CI: 0.80-0.98$)是降低抑郁症复发风险的保护性因素。

结论 抑郁症患者年龄的增长和频繁的使用催眠药物是抑郁症复发的风险因素;抑郁症首发年龄晚、适量的饮酒和睡眠时长以及更多的社会支持能降低抑郁症的复发风险。

二甲双胍联合奥氮平治疗对精神分裂症血脂代谢及氧化应激的影响

褚昊冉 朱厚名 蒋一佳 马家树 李然然*

山东省精神卫生中心

目的 观察二甲双胍联合奥氮平治疗对精神分裂症血脂代谢及氧化应激的影响。

方法 选取 38 例首发或半年内未用药的精神分裂症患者,按随机分组分为对照组 20 例及观察组各 18 例。对照组采用奥氮平治疗,观察组采用二甲双胍联合奥氮平治疗。比较 2 组治疗 4 周后血脂相关指标[甘油三酯(TG)、总胆固醇(TC)、高密度脂蛋白(HDL)、低密度脂蛋白(LDL)及氧化应激相关指标[丙二醛(MDA)、超氧化物歧化酶(T-SOD)、谷胱甘肽过氧化物酶(GSH-Px)、过氧化氢酶 CAT]水平的变化。

结果 治疗后,2 组 TG 水平均较治疗前升高($P<0.05$);对照组 TC、LDL、HDL 水平较治疗前升高($P<0.05$);观察组 TC、LDL、HDL 水平较治疗前无显著差异($P>0.05$);观察组 LDL 水平较对照组显著降低($P<0.05$)。治疗后,2 组 MDA 水平均较治疗前下降($P<0.05$);对照组 T-SOD、GSH-Px、CAT 水平较治疗前无显著差异($P>0.05$);观察组 GSH-Px 水平较治疗前显著降低($P<0.05$),T-SOD、CAT 水平较治疗前无显著差异($P>0.05$);观察组 CAT 水平较对照组显著升高($P<0.05$)。

结论 二甲双胍联合奥氮平治疗精神分裂症可一定程度上预防奥氮平引起的脂代谢异常,并对氧化应激水平有调节作用。

关键词: 精神分裂症 血脂代谢 氧化应激 二甲双胍

竞争性假设分析在精神科个体化循证治疗中的应用——以精神分裂症为例

遇培彤*

营口市第四人民医院

目的 梳理和例析精神科病人个体层面预测候选药的过程

方法 竞争性假设分析(ACH)复盘 1 例青春

早期女性精神分裂症, 提出所有可能药物假设, 通过矩阵把用证据支持假设与否 (+/-) 的过程分解, 用相同证据评估各假设, 使假设相互竞争, 考察证据+某假设同时能-其他假设的诊断性, 最可能的假设-最少

结果 1. 在本例门诊初始 ACH 中, 先以指南推荐的儿少期一线 SGA 为可能假设, 主要从疗效、锥体外系反应、代谢内分泌影响等预期重要和常见维度比对证据。

首发精神分裂症药物疗效无显著差异, 几无诊断性; 门诊患儿, 不同 SGA 滴定到目标剂量过程是否简便、各类副作用差异, 都构成了诊断性。

最强诊断性证据是较少增重和升催乳素。最少-是阿立哌唑 (--), 其次是奥氮平 (---) 帕利哌酮 (-); 而当主要诊断性证据被推翻或弃置 (如男患儿不甚关注催乳素问题), 竞争结果三者并列。因此这些主要诊断性证据和疗效一同作为关键后续观察指标。

2. 随着新证据药源性强迫障碍、和关键观察指标体重及月经的变化, ACH 第 2 轮修正。可能假设也扩充了其他国内可及并在国外有青少年适应症的一线 SGA 鲁拉西酮、布南色林和氨磺必利。

奥氮平诱发强迫障碍的病史提示: 5-HT_{2A} 受体亲和力更强的类似 SGA 也对应此项证据-。服奥氮平 2 月停经, 故本轮 ACH 在升催乳素少的证据上, 奥氮平及其他拮抗 DA/5-HT 比更高的鲁拉西酮、氨磺必利、布南色林修正为--。同理在增重少这项, 奥氮平因该患服药后体重明显上升, 修正为---。滴定速度因此时疗效显进和交叉换药而不重要。

综上, 本轮最少-为阿立哌唑 (+-), 氨磺必利与布南色林 (-) 次之。阿立哌唑卫冕主要依赖升催乳素少的诊断性证据, 如被该患具体化验否定, 则首选结果由后两者竞争, 并根据新增关键指标药源性强迫症状的演变做后续修正。

3. 正如上轮 ACH 推断: 该患已存在鲁拉西酮所致高催乳素血症; 且虽合用足量 SSRI, 药源性强迫障碍仍恶化, 使鲁拉西酮及同样高度拮抗 5-HT_{2A} 受体的布南色林在该项增加一级-修正。鲁拉西酮减量病情急转直下伴阴性症状, 对第 3 轮 ACH 重新提出了滴定速度的证据需求, 还要考察阴性症状疗效。

最终, 本轮主要诊断性证据有不易升催乳素和导致强迫症状, 分别对应阿立哌唑 (-+-) 和精神分裂症伴强迫治疗流程推荐的氨磺必利 (-) 两种最少-假设。其他依次是布南色林 (---+) 鲁拉西酮 (---

-) 帕利哌酮 (-----)。

结论 以循证指南的全部一线药为初始假设, 必要时根据特殊情况添加其他同适应症高级证据药品扩展假设, 以 ACH 框架序贯施治, 可提高精神障碍治疗规范性; 并有助未来建立循证医学终极追求的临床决策支持系统算法。

抑郁症患者外周血 T 细胞亚群及线粒体质量的差异研究

孙雪娇¹ 李昊淼^{1,2} 王志仁³

1. 华北理工大学

2. 秦皇岛市九龙山医院

3. 北京回龙观医院

目的 探究抑郁症患者的免疫功能差异, 着重于外周血 T 细胞亚群与线粒体质量, 旨在为生物标志物提供新见解。

方法 本研究纳入 31 例年龄在 20 至 60 岁的抑郁症患者, 以及 50 名健康对照人群。所有参与者均接受了汉密尔顿抑郁量表 (HAMD) 和汉密尔顿焦虑量表 (HAMA) 的评估。通过流式细胞术检测外周血中的 T 细胞亚群 (包括 CD4⁺ T 细胞和 CD8⁺ T 细胞) 及其线粒体质量。数据分析采用 SPSS 软件进行, 比较抑郁症患者与健康对照组之间的差异, 并探讨 T 细胞亚群及线粒体质量与抑郁症严重程度之间的关系。

结果 研究结果显示, 抑郁症组患者的 CD4⁺ T 细胞 (均值±标准差: 495±123 cells/μL) 和 CD8⁺ T 细胞 (均值±标准差: 312±87 cells/μL) 数量显著低于健康对照组 (CD4⁺ T 细胞: 723±145 cells/μL; CD8⁺ T 细胞: 512±102 cells/μL) (p<0.001)。此外, 抑郁症组患者的 T 细胞线粒体质量 (均值±标准差: 80±15%) 显著低于对照组 (均值±标准差: 95±10%) (p<0.01)。

相关性分析结果显示, 抑郁症组患者的 CD4⁺ T 细胞数量 (r=-0.56, p<0.01) 和 CD8⁺ T 细胞数量 (r=-0.47, p<0.05) 均与 HAMD 评分显著负相关。同时, T 细胞线粒体质量与 HAMD 评分亦呈显著负相关 (r=-0.62, p<0.01)。这表明抑郁症状越严重, T 细

胞数量和线粒体质量越低。

结论 抑郁症患者的免疫细胞代谢功能存在显著异常,具体表现为 CD4+ T 细胞和 CD8+ T 细胞数量及线粒体质量的显著降低,这些异常与抑郁症的发病机制密切相关。研究结果为进一步探讨抑郁症的生物标志物提供了新的线索和依据,有助于理解抑郁症的病理生理机制,并为未来的诊断和治疗提供潜在的靶点。

关键词: 抑郁症; 免疫功能; T 细胞亚群; 线粒体质量; 生物标志物

ITBS 对青少年抑郁障碍患者临床症状及认知功能的影响

夏雨薇 李沛颖 刘鑫垚 张宾* 孙凌
天津市安定医院

目的 探究间歇性 θ 短阵脉冲刺激(iTBS)对青少年单、双相抑郁障碍患者临床症状及认知功能的干预效果;探究青少年单、双相抑郁障碍患者临床症状对认知功能的影响。

方法 在天津市安定医院儿童青少年心理科门诊患者中进行筛选,要求年龄为 12-18 周岁、蒙哥马利抑郁评定量表得分 ≥ 22 分、经过精神科医生根据美国精神疾病诊断与统计手册第 5 版(DSM-5)诊断标准诊断为重性抑郁障碍和/或双相 II 型障碍患者,且这一诊断标准经过简明国际神经精神访谈儿童版(MINI-KID)访谈确认,共入组 38 例患者,采用阿米磁刺激机器人系统(Aim III Mag TD)进行 iTBS 治疗,刺激左侧背外侧前额叶皮层(L-DLPFC),加速治疗期每天 5 节,共 2 天,共 10 节,维持治疗期每周 1 节,共 4 周,共 4 节。采用一般人口学问卷调查其人口学特征;采用蒙哥马利抑郁评定量表(MADRS)、病人健康问卷(PHQ-9)和广泛性焦虑量表(GAD-7)评估患者抑郁和焦虑水平;使用 Thinc-it 工具测试其认知功能,其中客观测试部分为选择反应时间(CRT)、1-Back 记忆任务(1-Back)、数字符号替代测试(DSST)及连线测试(TMT),主观测试部分为认知损害 5 项问卷(PDQ-5)。分别于基线、加速治疗后、维持治疗后对患者进行评估,数据处理和分析均采用 SPSS27.0,对人口学变量、临床症状和认知功能进行描述性统计,基线、加速治疗后和维持

治疗后得分采用重复测量方差分析(正态分布)和 Friedman 非参数检验(偏态分布)进行分析,采用线性回归分析探究经 iTBS 治疗患者认知功能减分数的影响因素。

结果 截至维持治疗结束时样本共脱落 16 例。加速及维持治疗后患者的认知功能及临床症状均较基线时显著改善。其中,加速治疗后与基线相比,DSST 的正确数显著增加($P=0.044$),MADRS 评分显著降低($P=0.002$)。维持治疗后与基线相比,在认知功能方面,1-BACK($P=0.000$)、CRT($P=0.048$)和 DSST($P=0.008$)的正确数显著增加,TMT 的反应时显著降低($P=0.005$)。在临床症状方面,MADRS($P=0.002$)和 PHQ-9 ($P=0.000$)评分明显下降。线性回归分析结果显示,基线 MADRS 评分越高,TMT 减分数越低($\beta = -0.45, R^2 = 0.20, P = 0.04$)。

结论 iTBS 可以改善青少年单、双相抑郁障碍患者的临床症状和认知功能;基线时抑郁严重程度影响认知功能的改善,基线抑郁程度越重认知功能(TMT)改善越差。

关键词: 青少年,抑郁发作,iTBS,认知功能

住院抑郁症患者自杀意念与自杀计划的检出率及相关因素

赵天宇 王学义*
河北医科大学第一医院

目的 根据世界卫生组织显示,每年有 70.3 万人自杀身亡,自杀发生在生命周期的各个阶段,自杀与自杀意念直接相关。自杀意念范围很广,从短暂地认为生命无价值到有死亡意图,以及具体的自杀计划、自杀准备和自杀冲动均包含在内,自杀意念受到生物、心理、家庭、社会经济地位和文化环境等多重影响。本研究的主要目的是评估住院抑郁患者中自杀意念和自杀计划的严重程度,并探讨其相关因素分析,以提高对自杀企图高危个体的识别。

方法 本研究于 2019 年 12 月至 2023 年 5 月纳入河北省六家医院(河北医科大学第一医院、石家庄市第八医院、河北省第六人民医院、衡水市第七人民医院、唐山开滦精神卫生中心、沧州安定医院)的抑郁障碍患者共 556 例。采用贝克自杀意念量表、汉密尔顿抑郁量表、童年期创伤问卷和社会支持量

表评估受试者临床特征。根据贝克自杀意念量表将抑郁症患者分为有自杀意念组和无自杀意念组；再将自杀意念组患者分为有自杀计划组和无自杀计划组。分析比较各组间一般资料及临床量表的差异，分别将有自杀意念、有自杀计划作为二分类因变量，进行 logistic 回归分析抑郁症住院患者的自杀风险因素指标。

结果 抑郁症住院患者的自杀意念检出率为 47.12% (262/556)，自杀计划检出率为 27.88% (155/556)。自杀意念组患者的汉密尔顿抑郁量表 (21.25 ± 7.25 vs 19.35 ± 6.74) 和童年期创伤问卷 (43.18 ± 12.71 vs 37.57 ± 8.54) 分值明显高于无自杀意念组患者，社会支持量表 (32.32 ± 7.96 vs 36.57 ± 8.38) 分值低于无自杀意念组 (均 $P < 0.05$)。回归分析显示，躯体虐待 (OR=1.12, 95%CI: 1~1.25) 是自杀意念的危险因素，主观支持 (OR=0.94, 95%CI: 0.88~0.99) 是自杀意念的保护因素；情感虐待 (OR=1.06, 95%CI: 1.1~1.11) 是自杀计划的危险因素，已婚 (OR=0.87, 95%CI: 0.65~0.98) 是自杀计划的保护因素 (均 $P < 0.05$)。

结论 住院抑郁症患者自杀意念和自杀计划检出率较高。伴有严重抑郁情绪、童年期经历不良生活事件和社会支持体系差的个体自杀意念的检出率增加，情感虐待可能在促进从自杀意念向自杀计划的转变方面发挥着重要作用。

综合医院精神躯体共患病房疾病构成及建科必要性

朱颀峰 苏冠丽*

河北医科大学第一医院

目的 本研究拟从河北医科大学第一医院精神躯体共患病房的患者疾病构成出发，通过建科四年的患者收治情况，分析综合医院精神躯体共患科住院患者人群特点及疾病构成情况，分析相关原因，进一步探讨综合性医院精神躯体共患科设立的重要性，精神躯体共患科的定位及如何进行精神躯体共患科的学科建设，为发展初期的精神躯体共患学科相关建设予以参考。

方法 采用回顾性研究方法从河北医科大学第一医院电子病历系统调取于 2017 年 12 月至 2021 年 12 月期间在精神躯体共患科住院患者的就诊记录，收集的信息包括患者的一般情况、住院时间、出院诊断、联合会诊及患者多病共存情况，以患者的出院第一诊断作为患者的主要诊断，利用 ICD-10 编码进行标准化修正，疾病按着所述系统进行划分，对于住院患者年龄、性别等进行分段统计，利用 Excel 表格进行描述性统计分析。纳入标准：记录在我院住院电子病历系统中就诊于精神躯体共患科的住院患者。排除标准：资料不全的就诊记录，包括诊断缺失、诊断不明确、诊断无法归类的、就诊于精神躯体共患科而未记录在住院患者电子病历系统的患者。

结果 1、在精神躯体共患科住院的人群特点：男性 705 人 (46.91%)，女性 798 人 (53.09%)，平均年龄 53.79，平均住院日 14.48 天，平均会诊次数 1.56 次，其中小于 14 岁的患者占比 0.93%，大于 65 岁以上的占比 53.52%，80 岁以上的占比 1.80%。

2、精神躯体共患科住院患者的转归：死亡率：0.13%，好转率 87.35%，自动出院率 12.52%。

3、精神躯体共患科患者的出院诊断涉及病种十分广泛：诊断顺位为痴呆、谵妄、抑郁发作、酒精所致精神障碍、复发性抑郁障碍、脑器质性精神障碍、精神分裂症等。

4、住院患者的共病率高，共病疾病顺位排序为高血压、脑血管病、肺部感染、认识障碍、贫血、心律失常等。

结论 1、精神躯体共患病房患者年龄偏大，主要诊断除精神科常见疾病外，还有躯体所致的精神疾病，需精神科和躯体科医生的共同处理。

2、目前在国家完善的精神疾病救治制度下，精神障碍患者治疗负担明显下降，但随着患者年龄的增大，躯体疾病治疗成为患者新的压力源，精神躯体共患病房的建立可以同时解决患者两方面问题，节约医疗资源，提高生存质量，减轻负担。

3、精神躯体共患病房患者共病率高，需共病管理。建立精神躯体共患病房，让专科医生扩充自身的知识储备，学习并且掌握各个器官系统的常见病及多发病，同时为培养更多社区人才做好充分准备。

关键词：综合医院，精神躯体共病，疾病构成，共病管理

Transient Open-Angle Glaucoma Induced by Modified Electroconvulsive Therapy in An Elderly Schizophrenia Patient: A Case Report

Zhe Li¹, Yiwen Yuan², Qing Li¹, Ying Ou¹, Zhixiong Li³

1.Mental Health Center, West China Hospital, Sichuan University

2.Chengdu Fifth People's Hospital

3.Karamay Municipal People's Hospital

Objective Modified electroconvulsive therapy (MECT) is a widely administered treatment for schizophrenia. Glaucoma, a prevalent ophthalmic condition, is defined by elevated intraocular pressure. While MECT has no absolute contraindications, it may heighten the risk of developing other conditions during its administration, suggesting a possibility of relative contraindication. Currently, there is a paucity of literature on transient primary open-angle glaucoma (POAG) subsequent to MECT in elderly patients with schizophrenia both domestically and internationally

Methods In this report, we present the case of a 75-year-old female patient with a 13-year history of emotional instability. She had been diagnosed with schizophrenia for 3 years prior to her current admission. The patient was hospitalized due to a relapse of her condition over a span of 3 days and was presumed to have schizophrenia upon admission

Results Following the third session of modified electroconvulsive therapy (MECT), there was an increase in intraocular pressure, leading the ophthalmology department to suspect primary open-angle glaucoma (POAG). After monitoring the intraocular pressure during subsequent MECT sessions, the patient's pressure stabilized at normal levels. This suggests that MECT may be relatively safe for individuals with glaucoma

Conclusion While MECT appears to be a viable treatment option for schizophrenic patients who also have glaucoma, the potential for acute glaucoma attacks must still be considered. If a patient exhibits related symptoms, it is advisable to monitor intraocular pres-

sure throughout the course of electrotherapy, as necessary, to mitigate further risk

太极拳对老年人认知功能和外周血炎症因子的影响

于哲 宋美*

河北医科大学第一医院

目的 探讨太极拳对老年人认知功能和外周血炎症因子的影响。

方法 采用横断面研究的方式,收集自2021年4月至2022年4月在石家庄和邢台社区的老年人群,符合纳入及排除标准的共205例,其中无运动组(NE组)53例,运动组(TC组)152例,运动组根据运动年限分为TC-1组(习练太极拳 ≤ 3 年, $n=63$)和TC-2组(习练太极拳 > 3 年, $n=89$)。通过神经心理认知测试评估受试者认知功能等情况,通过酶联免疫吸附试验(ELISA)方法检测纳入人群的认知障碍相关因子 β -淀粉样蛋白40(A β 40)、 β -淀粉样蛋白42(A β 42)、磷酸化tau蛋白231(p-tau231)、磷酸化tau蛋白217(p-tau217)和炎症因子肿瘤坏死因子- α (TNF- α)、白细胞介素-1 β (IL-1 β)、白细胞介素-6(IL-6)、转化生长因子- β 1(TGF- β 1)水平。

结果 运动组血清IL-1 β 、IL-6水平均低于无运动组($z=6.511$, $P<0.001$; $z=3.168$, $P=0.002$);进一步分析发现不同运动年限的老年人血清IL-1 β 水平存在差异,其中NE组最高,TC-2组最低($H=52.158$, $P<0.001$)。血清TGF- β 1水平与MoCA和MMSE得分存在相关性($r=0.172$, $P=0.035$; $r=0.140$, $P=0.045$)。血清TGF- β 1水平与A β 42、p-tau231水平之间存在负相关($r=-0.300$, $P<0.001$; $r=-0.152$, $P=0.029$)。血清IL-1 β 和IL-6水平均与A β 40水平之间存在正相关($r=0.585$, $P<0.001$; $r=0.255$, $P<0.001$)。血清TNF- α 水平与A β 42、p-tau217水平存在正相关($r=0.307$, $P<0.001$; $r=0.170$, $P=0.015$)。对运动组分析发现IL-1 β 水平在习练太极拳运动时长和p-tau217水平之间存在部分中介效应

[IE=0.0351, (BootLLCI, BootULCI) = (0.0038, 0.00686)], 在控制性别、受教育程度、饮酒史、冠心病病史后 IL-1 β 水平仍在习练太极运动时长和 p-tau217 水平之间显示出部分中介效应[IE=0.0232, (BootLLCI, BootULCI) = (0.0012, 0.0502)]。

结论 1.太极运动组老年人认知功能优于无运动组老年人,且参加3年以上太极运动的老年人的血清 IL-1 β 水平低于参加太极运动3年及以下或平时不规律参加运动的老年人。

2.未发现炎症因子水平在太极运动和认知功能之间存在中介效应。

关键词: 太极运动; 认知功能; 炎症因子; IL-1 β ; p-tau217

童年期创伤对抑郁症患者血压、心率及心率变异性影响的相关性研究

刘快快 王学义*

河北医科大学第一医院

目的 探讨童年期创伤对抑郁症患者静息血压、心率及心率变异性的影响。

方法 招募2022年9月-2023年9月就诊于河北医科大学第一医院精神卫生中心门诊及住院部16-50岁、符合国际疾病分类第10版(International Classification of Diseases, ICD-10)抑郁症诊断标准的抑郁症患者100例,采用17项汉密尔顿抑郁量表(Hamilton Depression Rating Scale-17, HAMD17)及汉密尔顿焦虑量表(Hamilton Anxiety Rating Scale, HAMA)评估患者的抑郁、焦虑症状严重程度,采用童年期创伤问卷(Childhood Trauma Questionnaire, CTQ)评估患者的童年期创伤暴露情况,并根据CTQ评分将抑郁症患者分为童年期创伤组和无童年期创伤组。监测并记录100例患者的静息血压、心率和心率变异性各项指标。采用秩和检验、线性回归分析、二元Logistics回归分析等统计方法。

结果 两组一般资料无统计学差异($P>0.05$),伴童年期创伤的抑郁症患者HAMD17和HAMA的评分均高于无童年期创伤的抑郁症患者,差异有统计学意义($P<0.05$)。童年期创伤组的收缩压、舒张压均高于无童年期创伤组,差异有统计学意义($P<0.05$)。童年期创伤组的SDNN、RMSSD、HF均低

于无童年期创伤组,差异有统计学意义($P<0.05$)。但童年期创伤组的平均心率与无童年期创伤组的平均心率差异无统计学意义($P>0.05$)。多元线性回归分析显示,躯体虐待($B=1.189, P<0.05$)、性虐待($B=2.114, P<0.05$)、情感虐待($B=1.332, P<0.05$)、躯体忽视($B=1.341, P<0.05$)、情感忽视($B=1.325, P<0.05$)对血压均有影响。二元Logistics回归分析表明,童年期创伤是高血压的风险因素($OR=1.64, P<0.05$),性虐待是心率变异性降低的风险因素($OR=2.106, P<0.05$)。

结论 有童年期创伤经历的抑郁症患者血压升高更明显,童年期创伤对自主神经系统的平衡性有不利影响。任何一种形式的童年期创伤均与血压呈现正相关,其中性虐待相关性最强。性虐待是心率变异性降低的风险因素。

伴童年期创伤的青少年抑郁障碍患者睡眠情况与认知功能的相关性

白美娜 王学义*

河北医科大学第一医院

目的 分析伴童年期创伤的青少年抑郁障碍患者睡眠情况与认知功能的关联。

方法 选取河北医科大学第一医院门诊及住院的青少年抑郁障碍患者共173例,依据有无童年期创伤分为创伤组和无创伤组,使用汉密尔顿抑郁量表(HAMD-17)评估抑郁症状严重程度;使用连线测试(Trail-Making Tests, TMT)、数字符号转换测验(Digital Symbol Substitution Test, DSST)和数字广度测验(Digit Span Test, DST)评估认知功能;使用匹兹堡睡眠质量指数量表(PSQI)评估睡眠情况;比较两组患者相关量表及测试得分的差异,并分析伴童年期创伤组患者认知功能与睡眠情况的相关性。

结果 两组一般资料差异无统计学意义($P>0.05$),伴童年期创伤组HAMD-17评分($P<0.05$)、PSQI评分($P<0.05$)高于不伴童年创伤组;伴童年创伤组认知功能各维度测试评分均低于不伴童年创伤组($P<0.05$)。多元线性回归分析显示,日

间功能障碍对信息处理速度降低有影响 ($B = -1.171$, $P < 0.05$); 睡眠时间对注意力下降 ($B = -4.083$, $P < 0.05$)、工作记忆力变差 ($B = -2.472$, $P < 0.05$) 有影响; 睡眠障碍对工作记忆力变差 ($B = -2.527$, $P < 0.05$)、睡眠质量对综合+执行功能 ($B = -3.131$, $P < 0.05$) 有不良影响。二元 Logistics 回归分析表明, 睡眠时间不足是注意力下降的风险因素 ($OR = 10.534$, $P < 0.05$), 睡眠效率下降是工作记忆力差的风险因素 ($OR = 3.106$, $P < 0.05$)。

结论 伴童年期创伤的青少年抑郁障碍患者认知功能及睡眠情况受损更严重, 认知功能与睡眠情况存在相关性, 其中日间功能障碍、睡眠时间、睡眠障碍及睡眠质量是认知功能下降的不良影响因素。

无创性神经调控技术治疗精神分裂症幻听症状的研究进展

何张峯 唐劲松*

浙江大学医学院附属邵逸夫医院

目的 幻听是精神分裂症的主要阳性症状之一, 其产生机制尚不明晰, 抗精神病药物治疗效果有限。神经调控技术在精神障碍的诊治中具有较好的应用前景。本文围绕精神分裂症幻听症状的无创神经调控技术相关研究展开综述, 为精神分裂症幻听症状的治疗提供参考。

方法 本文总结了经颅磁刺激、经颅电刺激、经颅超声刺激等无创性神经调控技术在治疗精神分裂症幻听症状方面的相关研究, 讨论了不同技术目前存在的局限性以及在临床应用的可能性。

结果 经颅磁刺激目前常用重复脉冲刺激 (repetitive TMS, rTMS), theta 爆发式脉冲刺激 (theta burst stimulation, TBS)。研究认为低频 rTMS 具有抑制被刺激脑区的作用, 高频 rTMS 则有激活作用。综合而言, 低频 rTMS 相对高频 rTMS 的治疗证据更充分。然而, 低频 rTMS 治疗幻听的疗效也并不肯定。持续性 TBS (continuous TBS, cTBS) 能引起长时程抑制样效应, 研究发现对幻听可能有改善作用。然而, cTBS 治疗幻听相关的研究数量较少, 异质性较高, 研究结论不一。未来可能通过神经

导航 TMS、加速式 TMS 以进一步提高疗效。经颅电刺激中, 经颅直流电刺激 (transcranial direct current stimulation, tDCS)、经颅交流电刺激 (transcranial alternating current stimulation, tACS) 应用较多。研究表明阳极 tDCS 能使皮层兴奋性增加, 阴极 tDCS 则相反, 治疗幻听的模式多为阳极 tDCS 刺激前额叶, 阴极 tDCS 刺激左侧颞顶皮层。然而, tDCS 治疗幻听的疗效仍然有待验证。tACS 在治疗幻听方面的研究证据还较少, 需要进一步探索。

结论 目前, 无创性神经调控技术治疗幻听的研究数量有限, 疗效不肯定, 需要更多研究证据支撑。结合电刺激与磁刺激、增加刺激的频率和次数、利用神经导航增加刺激的精准度等方法已被尝试用于增加各类调控方法的疗效, 但缺少大样本的临床研究。另外, 无创性神经调控技术的刺激靶点也可能是影响疗效的关键, 这需要对幻听的机制有更深入的研究, 进而选择治疗幻听的更优靶点。总而言之, 无创性神经调控技术具有较高的安全性, 对于治疗幻听具有研究价值和临床价值, 但如何提高疗效、降低治疗成本以及扩大研究队列仍是短期内需要面对的难题。

基于磁共振技术预测精神分裂症疗效的研究进展

何张峯 唐劲松*

浙江大学医学院附属邵逸夫医院

目的 精神分裂症是一种高致残性的慢性重性精神障碍, 抗精神病药物仍然是最主要的治疗手段, 然而, 约 40% 的患者对目前的抗精神病药物的治疗效果欠佳。同时, 抗精神病药不良反应较多, 精神分裂症的治疗个体差异性较大, 导致治疗效率较低。因此需要有能够在治疗早期预测疗效的标志物。本文对精神分裂症疗效预测相关的磁共振研究进行综述, 为精神分裂症的疗效预测提供参考。

方法 本文总结了 3D-T1 结构磁共振、弥散成像磁共振、功能磁共振、波普磁共振等在精神分裂症疗效预测方面的相关研究, 并讨论了不同标志物的疗效预测价值以及可能存在的优化方向。

结果 多项研究报告总体和局部灰质体积越小、

脑室扩大越明显的患者对治疗的反应可能越差。接受抗精神病药物治疗前的脑岛和额下回体积、双侧豆状核与纹状体的体积、垂体体积都可能与治疗后的疗效存在正性相关。然而,也有研究认为精神分裂症的灰质体积改变与治疗反应之间没有显著相关性。脑白质在疗效预测中也具有一定价值。精神分裂症患者治疗前的额-颞-边缘区域较低的白质纤维完整性与治疗后的阳性症状改善程度有关。精神分裂症患者的各向异性分数显著低于健康对照,治疗后左上纵束各向异性分数的增加程度可能与疗效存在正相关。精神分裂症的脑功能连接存在异常,并且可能被抗精神病药物治疗影响。纹状体功能连接的首发精神分裂症患者中,纹状体与海马、背外侧前额叶、前扣带回等脑区的功能连接增加可能预示着会出现更好的药物治疗疗效。研究发现对抗精神病药物治疗不敏感的患者纹状体谷氨酸升高。此外,海马的 N-乙酰天冬氨酸/肌酸比值可能对疗效也有预测作用,研究发现海马的该比值可能预测首发精神分裂症急性期用药期间阴性症状的预后。

结论 精神分裂症患者的治疗效果异质性可能与精神分裂症患者间的神经生物学差异有关。精神分裂症的脑岛体积、额下回体积、纹状体体积、脑白质的 FA 值、纹状体的功能连接、神经递质浓度等指标均有证据表明可能具有疗效预测价值。然而,各项研究的异质性较高,作为疗效预测标志物的可靠性欠佳,有待大样本研究的数据支撑。再者,精神分裂症的大脑病变在多个维度均存在,可能难以用单一的指标进行疗效预测,结合多项指标进行综合分析可能会对疗效预测有更高的价值。另外,目前的研究大多在组水平进行研究,缺少对精神分裂症个体的标志物探索,没有在精神分裂症个体中进行标志物的验证。未来如能在以上方面得到突破进展,将影像学标志物应用于精神分裂症的临床诊治,将大幅提高精神分裂症的治疗效率。

关键词: 精神分裂症,磁共振,疗效预测

精神分裂症的候选遗传标志物研究进展

贺静琦 唐劲松*

浙江大学医学院附属邵逸夫医院

目的 精神分裂症是一种严重的高致残精神障

碍,发病机制复杂且尚不明确,临床上仍缺乏客观的诊疗指标。大量证据表明,遗传因素对精神分裂症的发生与转归至关重要,遗传相关标志物颇具应用前景。本文围绕精神分裂症的候选遗传学生物标志物相关研究进行综述,以期精神分裂症的精准诊疗提供参考。

方法 本文总结了 SNPs, CNVs, URVs 等遗传标志物、DNA 甲基化,组蛋白修饰及 miRNAs 等表观遗传标志物及药物反应相关遗传标志物,并探究了借助 PRS 及人工智能、多组学整合等方法实现遗传标志物应用于临床的可能。

结果 得益于近年测序与生物信息技术的高速发展以及样本量的不断扩大,精神分裂症的遗传学研究已取得了诸多成果,SNPs、CNVs 及 miRNAs 等各类精神分裂症的遗传候选标志物层出不穷。精神分裂症遗传研究的样本量也已增加到数十万人,鉴定出了大于 300 个常见变异,10 个 URVs,以及至少 8 个 CNVs。规模日益壮大的 GWAS 研究在精神疾病常见遗传风险方面提供了令人信服的证据,在精神分裂症的遗传变异鉴定方面取得了许多成果,同时证实了精神分裂症的多基因性质。PRS 有助于实现 GWAS 结果的临床应用,可用于量化遗传倾向,与临床表型相关的研究更有助于加深对精神分裂症临床异质性遗传相关机制的认识。除此之外,表观遗传修饰过程对基因表达的影响不容小觑,并为疾病相关的获得性状的跨代遗传提供了基础,也为环境因素参与精神分裂症的发病提供了途径。

结论 遗传相关生物标志物尚处于开发和验证的早期阶段,虽然使用 PRS、CMA、WES 等方法有望实现精神分裂症的筛查与预测,但在实际使用中收益甚微,要实现临床应用仍任重道远。首先, GWAS 等遗传学研究仍然需要在更多的种族群体进行大规模的调查和验证;其次,外周组织来源的 DNA 甲基化、miRNAs 等表观遗传学标志物具有成为诊断标志物的潜力,但中枢与外周的表现遗传特征差异必须被充分考虑,并且,现有研究间异质性高,即使是外周组织来源,也不尽相同,在未来研究中需要明确更为准确且易于推广的样本组织来源;另外,考虑到精神分裂症受多个遗传因素调控,借助人工智能等新兴技术建立模型有望整合多个不同的标志物,也有助于更为全面地解析遗传机制。

Abnormal Thyroid Function and Cerebral Biochemical Metabolism in Bipolar Disorder Patients with Comorbid Borderline Personality Disorder

Xiaodong Song Yanbin Jia*

Department of Psychiatry, First Affiliated Hospital, Jinan University

Objective The underlying neurobiological mechanisms in bipolar disorder (BD) comorbid with borderline personality disorder (BPD) remain unclear. We aim to explore the mechanisms of BD comorbid with BPD by detecting thyroid function and levels of choline and NAA metabolism in various brain regions of the cortico-striato-cerebellar(CSC) circuit

Methods We analyzed thyroid function and magnetic resonance spectroscopy (MRS) data from 84 patients with BD(34 comorbid with BPD and 50 comorbid without BPD) and 41 healthy controls (HCs). Binary logistic regression was used to analyze the influence of abnormal thyroid hormones and brain metabolism indexes on BD&BPD. Furthermore, receiver operating characteristic (ROC) classification tested the potential of the statistically significant cerebral metabolism ratios to differentiate BD comorbid with BPD from BD patients

Results we observed significantly lower levels of FT3 and higher levels of TT4 in the BD&BPD group compared to the HC. Moreover, the BD group exhibited only lower FT3 levels compared to the HC group. BD&BPD group demonstrated higher NAA/Cr ratios in the bilateral cerebellum when compared to the BD patient group and HC group. BD group displayed a lower NAA/Cr ratio specifically in the right thalamus compared to the HC group. Furthermore, logistic regression analysis revealed that the NAA/Cr ratio in the right cerebellum had a significant impact on BD patients with comorbid BPD. Additionally, utilizing ROC classification, we achieved a mean accuracy of 75.4%, a sensitivity of 67.7%, and a specificity of 80.00% in differentiating BD patients with comorbid BPD from those without comorbidity

Conclusion Our findings indicate that both individuals with BD comorbid with BPD and those without comorbidity exhibit abnormal NAA metabolism in the cerebellar region. Bilateral cerebellar NAA/Cr ratios may serve as potential neural markers in differentiating BD patients with comorbid BPD from those with BD alone. These results contribute to the establishment of a diagnostic index for BD comorbid with BPD

新型冠状病毒感染疫情下孕产妇心理状态及影响因素分析

翟晓艳¹ 王新玲¹ 井朋¹ 刘敬¹ 倪爱华¹ 王学义²

1.河北省人民医院

2.河北医科大学第一医院

目的 分析新型冠状病毒感染疫情下孕产妇心理状态及影响因素, 便于为以后制定政策性或心理干预应对措施。

方法 2020年3月-2020年4月便利抽样法抽取孕产妇134人(妊娠20周以上, 产后3月内), 采取一般资料问卷、焦虑自评问卷、抑郁自评问卷进行调查。单因素分析采用独立样本t检验, 率的比较采用 χ^2 检验、Fisher确切概率法, 将单因素分析中有意义的、文献报告中有意义的变量纳入自变量, 以有无焦虑、抑郁为因变量, 采用二元logistic回归分析焦虑、抑郁的影响因素。

结果 有效问卷132人, 有效回收率为98.5%。检出有焦虑症状的占16人(12.1%), 有抑郁症状的占31人(23.5%)。多因素结果分析显示: 无家人陪伴、无工作比有家人陪伴、有工作的孕产妇更易出现焦虑症状 [OR=6.27, 4.76; 95% CI:(1.02~38.43), (1.19~19.00)]; 和感觉疫情对自己有很大影响相比, 有一些影响为出现焦虑、抑郁症状的保护因素 [OR=0.23, 0.13; 95% CI:(0.06~0.84), (0.04~0.41)]; 高中及以下学历较硕士及以上学历更易出现抑郁 [OR=7.34; 95% CI:(1.16~46.52)]; 疫情期间不能正常体检更易出现抑郁 [OR=7.97; 95% CI:(2.54~24.98)]。

结论 疫情期间孕产妇焦虑、抑郁症状高发,

应注意那些身边无家人陪伴、无工作、感觉疫情对自己有很大影响、高中及以下学历、疫情期间不能正常体检的孕产妇心理状态。

疫情应激下某三甲综合医院医生的心理状态及影响因素分析

翟晓艳¹ 高文娟¹ 井朋¹ 刘敬¹ 倪爱华¹ 王学义²

1.河北省人民医院

2.河北医科大学第一医院

目的 探讨新型冠状病毒感染疫情下某三甲综合医院医生的心理状态及影响因素，为以后防范严重心理问题出现以及制定心理干预措施提供参考。

方法 便利取样法于2020年2月28日—2020年3月2日抽取河北省人民医院医生419名，采用一般资料问卷、广泛性焦虑障碍量表、9项患者健康问卷、15项躯体症状问卷进行调查。单因素分析中率的比较采用 χ^2 检验、Fisher确切概率法，进行二分类Logistic回归分析医生出现焦虑、抑郁、躯体化症状的影响因素。

结果 共回收问卷419份，检出有焦虑症状的占16.71%（70/419），有抑郁症状的占29.59%（124/419），有躯体化症状的占31.26%（131/419），有睡眠问题的占55.13%（231/419）；回归结果显示：与一般科室、既往健康的医生相比，院内一线值守、既往有高血压/糖尿病/冠心病病史、焦虑抑郁病史者出现焦虑风险高[OR=4.944, 2.647, 6.258; 95% CI:(1.673~14.610), (1.122~6.247), (1.122~6.247)]; 院内一线、既往有慢性胃肠炎者出现抑郁风险高[OR=4.944, 4.377; 95% CI:(1.431~12.030), (1.442~13.289)]; 院内一线、既往有慢性胃肠炎病史者出现躯体化症状的风险高[OR=4.137, 4.573; 95% CI:(1.426~12.001), (1.434~14.585)]。

结论 疫情期间焦虑、抑郁、躯体化症状、睡眠问题在医生中高发，管理者以及精神心理机构应关注院内一线、既往有焦虑抑郁、慢性胃肠炎病史、糖尿病、冠心病、高血压病史的医生的心身健康，及早给予心理干预。

深部经颅磁刺激治疗对抑郁症患者大脑自发神经活动的影响

许月航 王学义*

河北医科大学第一医院

目的 探讨深部经颅磁刺激（Deep Transcranial Magnetic Stimulation, dTMS）治疗对抑郁症患者大脑自发神经活动的影响。

方法 2022年9月至2024年1月于河北医科大学第一医院精神卫生中心纳入17例抑郁症患者（研究组）及20例健康者（对照组）为研究对象。研究组进行为期2周的dTMS治疗，在疗前及疗后评估汉密尔顿抑郁量表（HAMD）、汉密尔顿焦虑量表（HAMA）、心境障碍问卷（MDQ）、32项轻躁狂症状清单（HCL-32），并采集头颅静息态功能核磁共振（rs-fMRI）。对照组仅采集基线数据及头颅rs-fMRI。使用分数低频振幅（fALFF）、局部一致性（ReHo）评估大脑自发神经活动的变化。使用独立样本t检验或配对样本t检验比较研究组与对照组及研究组治疗前后大脑自发神经活动的变化。使用Pearson或Spearman相关分析探讨HAMD、HAMA与差异脑区的相关性。

结果 （1）研究组治疗后抑郁症患者HAMD（24.63±6.07 vs 10.75±4.93）、HAMA（26.56±5.69 vs 14.13±7.54）及其因子分均显著降低。（2）研究组治疗前与健康对照组相比右中央旁小叶fALFF值（ $t=5.36, P<0.05$ ）降低。（3）研究组治疗后fALFF值在左侧额中回（ $t=12.36, P<0.05$ ）、右内侧额上回（ $t=16.01, P<0.05$ ）降低，左侧舌回（ $t=10.81, P<0.05$ ）、右侧舌回（ $t=-11.07, P<0.05$ ）、右侧枕中回（ $t=-10.19, P<0.05$ ）、右中央旁小叶（ $t=-14.14, P<0.05$ ）升高。（4）研究组治疗后ReHo值在右背外侧额上回（ $t=14.76, P<0.05$ ）、右侧额中回下降（ $t=10.09, P<0.05$ ），右侧舌回（ $t=-12.36, P<0.05$ ）升高。（5）Pearson相关分析显示疗前左侧舌回fALFF值与HAMA总分（ $r=-0.892, P=0.017$ ）、焦虑/躯体因子分（ $r=-0.959, P=0.002$ ）呈负相关。疗前右侧舌回ReHo值与精神焦虑因子（ $r=-0.861, P=0.028$ ）呈负相关。左侧额中回fALFF值下降与迟

滞因子分下降呈正相关 ($r=0.879$, $P=0.021$)。

结论 dTMS 联合药物治疗可以改善抑郁症患者的焦虑和抑郁症状。左侧额中回可能是抑郁症患者迟滞症状改善的靶点,而舌回自发神经活动可能与伴焦虑症状的抑郁症相关。

强光疗法对精神分裂症患者症状及认知功能的影响

马玉洁 王冉*

河北医科大学第一医院

目的 探讨在药物治疗的基础上采用强光疗法(BLT)辅助治疗精神分裂症的临床疗效。

方法 研究招募了于河北医科大学第一医院住院的 18-50 岁患者,要求符合 ICD-10 中精神分裂症的诊断,共纳入受试者 22 例,按随机数字表法分为 BLT 联合药物治疗组(BLT 组, 11 例)和单纯药物治疗组(对照组, 11 例)。BLT 组在药物治疗的基础上给予为期 2 周的强光治疗。收集社会人口学资料,在基线及治疗 2 周末采用阳性与阴性症状量表(PANSS),匹兹堡睡眠质量指数量表(PSQI)评估临床症状,词语学习、词语延迟回忆、连线测验(TMT)、词语流畅性测验(VFT)、数字符号 90 秒、数字广度测验评估认知功能。采用线性回归分析探讨 PANSS 减分率与相关影响因素之间的关系。

结果 基线时 2 组在 PANSS 总分及阳性症状、阴性症状、一般精神病理学分量表、PSQI、词语学习、词语延迟回忆、TMT、VFT、数字符号 90 秒、数字广度测验方面结果无统计学差异 ($P>0.05$); BLT 组治疗 2 周末 PANSS 总分及三个维度分量表、PSQI 得分较基线时降低,差异具有统计学意义 ($t=4.034, P=0.001; z=-2.871, P=0.004; z=-$

$2.548, P=0.011; z=-0.275, P=0.001; t=-0.212, P=0.039$)。认知评定量表中仅数字广度得分在治疗前后差异具有统计学意义 ($z=-1.982, P=0.047$); 治疗 2 周末 BLT 组 PANSS 总分及三个维度分量表评分均低于对照组,差异具有统计学意义 ($t=-3.697, P=0.004; t=-2.116, P=0.034; t=-2.154, P=0.031; t=-3.378,$

$P=0.006$); 治疗 2 周末 BLT 组 PANSS 总分阳性症状量表减分率高于对照组,有统计学意义 ($t=2.288, P=0.037; t=2.253, P=0.036$)。BLT 组与对照组的临床反应率分别为 54.55%和 9.10%,差异具有统计学意义 ($F=20.551, P=0.000$); 线性回归:以 PANSS 减分率为因变量,排除了控制变量的干扰后,组别可以解释 PANSS 减分率的 54.4%; BLT 组受试者在接受 BLT 治疗过程中未出现明显的不良反应,仅有个别患者在初次接受治疗时出现短暂性眼部不适,均在几分钟后缓解。

结论 BLT 辅助药物治疗精神分裂症的疗效优于单纯药物治疗; BLT 对精神分裂症患者的睡眠、注意力及短时记忆有改善作用; BLT 对精神分裂症患者的治疗安全有效。

Aberrant Brain Dynamics in Major Depressive Disorder During Working Memory Task

Fuping Sun¹, Fuping Sun², Zhening Liu², Jun Yang², Zebin Fan², Feiwen Wang², Jie Yang²

1. Shandong Daizhuang Hospital

2. The Second Xiangya Hospital of Central South University

Objective Working memory (WM) is a distributed and dynamic process, and WM deficits are recognized as one of the top-ranked endophenotype candidates for major depressive disorders (MDD). However, there is a lack of knowledge of brain temporal-spatial profile of WM deficits in MDD

Methods We used the dynamical degree centrality (dDC) to investigate the whole-brain temporal-spatial profile in 40 MDD and 40 healthy controls during an n-back task with 2 conditions (i.e., '0back' and '2back'). We explored the dDC temporal variability and clustered meta-stable states in 2 groups during different WM conditions. Pearson's correlation analysis was used to evaluate the relationship between the altered dynamics with clinical symptoms and WM performance

Results Compared with healthy controls, under

'2back vs. 0back' contrast, patients showed an elevated dDC variability in wide range of brain regions, including the middle frontal gyrus, orbital part of inferior frontal gyrus (IFGorb), hippocampus, and middle temporal gyrus. Furthermore, the increased dDC variability in the hippocampus and IFGorb correlated with worse WM performance. However, there were no significant group-related differences in the meta-stable states were observed

Conclusion This study demonstrated the increased WM-related instability (i.e., the elevated variability) was represented in MDD, and enhancing stability may help patients achieve better WM performance

关键词: depression, dynamical degree centrality, n-back, frontoparietal network, default mode network, hippocampus

Prediction of Drug-drug Interactions for Clozapine Combination Therapy Based on Physiologically Based Pharmacokinetic Model

Fan Mu Shunying Yu*

Shanghai Mental Health Center

Objective The objective is to utilize the combination of clozapine and fluvoxamine as a case study, to develop physiologically based pharmacokinetic (PBPK) models specifically designed for the Chinese population. These models aim to predict the drug-drug interaction (DDI) associated with the combination medication of clozapine, and subsequently optimize its dosage

Methods By obtaining the physicochemical parameters, absorption, distribution, metabolism and excretion (ADME) related parameters and physiologically relevant parameters of Chinese population through literature and pharmacology-related databases, PBPK models for the aforementioned two drugs were constructed using PK-Sim® software. Using mean percentage error (MPE) and mean absolute percentage error (MAPE), or the ratio of predicted to observed area under

the curve (AUC) or peak concentration (C_{max}) as evaluation indicators, PBPK models were validated by real-world plasma drug concentration data. Additionally, Combining the inhibitory parameters of fluvoxamine on clozapine, models for the combination therapy of clozapine and fluvoxamine were developed. These models aimed to predict the pharmacokinetic changes of clozapine. The presence of clinically significant DDI was determined by using the 90% confidence interval of the area under the curve ratio (AUCR) or peak concentration ratio (C_{max}R) as evaluation metrics, with the non-effect boundaries set at 80-125%. Quantified the pharmacokinetic changes of clozapine after co-administration with fluvoxamine based on PBPK models, and developed a dosage optimization for clozapine

Results The constructed model of clozapine and fluvoxamine was considered accurate if the absolute value of the MPE was $\leq 10\%$ and the MAPE was $< 25\%$ during validation, indicating accurate predicted concentration-time curves. The PBPK model for the co-administration of clozapine and fluvoxamine was able to accurately predict pharmacokinetic parameters if the ratio of the predicted to observed AUC values was within 1.25-fold. The prediction of PBPK model for the co-administration showed that the 90% confidence intervals for AUCR and C_{max}R of the combination therapy of clozapine and fluvoxamine were not entirely within the ineffective effect boundary, indicating a clinically significant DDI when these two drugs were used concomitantly. Moreover, the dose optimization according to the PBPK models indicated that when subjects co-administer clozapine and fluvoxamine, reducing the dose of clozapine to 50% of the original dose could maintain the exposure levels of clozapine consistent with monotherapy

Conclusion The established PBPK model can effectively simulated the impact of combination therapy on pharmacokinetic changes of clozapine, providing valuable insights for predicting potential DDI and optimizing dosage regimens. If clozapine needs to be co-administered with fluvoxamine during treatment, clinicians should remain vigilant for clinically significant DDI and contemplate optimizing the dosage of clozapine accordingly

Correlation Analysis of 18-lead Ambulatory Electrocardiogram Heart Rate Variability with CRP, IL-6, and TNF- α in Patients with Generalized Anxiety Disorder

Alimire Alimu Yi Zhang*

Xinjiang Medical University, Xinjiang Uygur Autonomous Region People's Hospital

Objective The aim of this study was to analyze the relationship between 18-lead ambulatory electrocardiogram heart rate variability (HRV) and the inflammatory markers C-reactive protein (CRP), interleukin-6 (IL-6), and tumor necrosis factor-alpha (TNF-alpha) in patients with generalized anxiety disorder (GAD), in order to further understand the association between cardiovascular function and inflammatory response in GAD patients

Methods Several patients with GAD were included as study subjects in this study. The patients' electrocardiographic data were recorded by 18-lead ambulatory electrocardiography, and HRV parameters were calculated. At the same time, blood samples were collected from the patients and serum levels of CRP, IL-6 and TNF- α were measured. The correlation between HRV and inflammatory markers was analyzed using statistical methods

Results the results of the study showed that HRV was significantly lower in GAD patients and was negatively correlated with serum levels of CRP, IL-6 and TNF- α . This suggests that cardiovascular autonomic function may be suppressed in patients with GAD, and the inflammatory response may be associated with this suppressed state. In addition, a correlation was shown between different inflammatory markers, further supporting the important role of inflammatory response in GAD patients

Conclusion In this study, a significant correlation was found between heart rate variability and markers of inflammatory response in patients with generalized anxiety disorder. This result not only helps us to better understand the abnormal changes in cardiovascular function in GAD patients, but also provides new ideas for the treatment of GAD. Future studies can further explore the specific mechanisms of this correlation and look for effective interventions to reduce cardiovascular risk in patients with GAD

Using Different Modalities of Electroencephalography and Eye Movement Features To Identify Depression Based on A Machine Learning Model

Jinsong Tang*

Sir Run Run Shaw Hospital

Background Depression is a serious neurological disorder that has become a major health problem worldwide. This study utilizes electroencephalography (EEG) and eye movement (EM) data to identify depression, aiming to explore the applicability of different modalities of EEG and EM features in recognizing depression

Methods Data combining EEG and EM were collected using paradigms of eyes-open resting state, eyes-closed resting state, natural videos stimulation, angry videos stimulation, and happy videos stimulation. Functional connectivity features of EEG from each modality and features related to areas and periods of interest from EM were extracted. These features were selected using the Recursive Feature Elimination Method based on Support Vector Machine (SVM) and classified using the SVM algorithm for 67 patients with depression who have not taken medication in the past four weeks and 66 healthy controls

Results The experimental results show that in

the validation set, using a ten-fold cross-validation method, there are 25 types of EEG features with an average accuracy greater than 0.950 and 2 types of EM features with an accuracy greater than 0.950. In the independent test set, there are 2 types of EEG features with an accuracy greater than 0.850, and no EM features with an accuracy higher than 0.750

Conclusion The results indicate that depression affects brain activity in nearly the entire cortex, with significant impacts in the theta band, delta band, alpha band, and full band. It suggests that EEG data from eyes-open resting state, eyes-closed resting state, angry videos stimulation, and happy videos stimulation paradigms can be used to identify depression.

Limitations: The sample size in this study is relatively small, which may easily lead to overfitting.

首发青少年抑郁症患者炎症因子与骨代谢指标关系的研究

姚书婧 金圭星*

河北医科大学第一医院

目的 初步探讨青少年时期抑郁对骨代谢的影响及分析, 以及炎症因子是否在两者之间起到一定中介作用。旨在提高对青少年抑郁症患者骨代谢受影响的认识, 填补炎症机制在其中发挥的作用的研究空白。以便为后续制定青少年抑郁骨骼健康提供干预措施、降低骨骼健康受损发生率提供科学依据。

方法 本研究共纳入于 2021 年 8 月至 2023 年 7 月于河北医科大学第一医院精神卫生中心就诊的首发青少年抑郁症患者 66 例和 2021 年 9 月至 2023 年 6 月于社区招募健康人群 63 例。收集受试者的一般人口学资料、生活方式问卷信息, 17 项汉密尔顿抑郁量表 (HAMD-17) 和汉密尔顿焦虑量表 (HAMA)。采用流式细胞技术检测 12 项细胞因子水平, 酶联免疫吸附测定法 (ELISA) 测定骨钙素 (BGP)、碱性磷酸酶 (ALP)、I 型胶原 C 端肽 (β -CTX) 水平, 比较两组受试者在炎症因子、骨代谢指标之间的差异。控制协变量 (年龄、性别、年龄、睡

眠、体育活动量、饮食特点) 采用偏相关分析来确定焦虑、抑郁与骨代谢指标之间的相关性, 并采用线性回归模型来确定其相关程度。最后通过中介效应探讨抑郁与骨代谢的相关性是否通过外周炎症因子来调节。

结果 与健康对照组相比, 抑郁组 ALP、 β -CTX 水平低 ($P < 0.05$), 对年龄进行分层分析发现差异主要集中在 13-17 岁, 其中女性 β -CTX 受抑制明显。校正年龄、性别、BMI、睡眠、体育活动量、饮食特点 (三餐能否按时、早餐规律、是否夜宵) 的混杂因素后进行偏相关分析显示 ALP 与精神性焦虑 ($P=0.001$)、躯体性焦虑 ($P=0.001$)、HAMA 总分 ($P=0.000$)、焦虑躯体化 ($P=0.004$)、阻滞 ($P=0.046$)、HAMD 总分 ($P=0.012$) 呈负相关; 回归分析显示 ALP 与焦虑躯体化 ($\beta=-6.528, P=0.051$)、HAMD 总分 ($\beta=-1.355, P=0.027$)、HAMA 总分 ($\beta=-2.320, P=0.001$) 呈负相关。中介分析结果发现: MDD 对 ALP 效应显著, 总效应-1.4444 (95%CI: -2.7632, -0.1255), 直接效应为-0.6603 (95%CI: -1.9012, 0.58); 炎症标志物水平 (TNF- α 、IL-6) 的间接效应分别为 -0.4882 (95%CI: -1.5002, -0.0554)、-0.7841 (95%CI: -1.5805, -0.2838)。

结论 1. 青少年抑郁严重程度与骨代谢水平之间有较强的负相关关系, 其中抑郁、焦虑程度越重 ALP 表达减少越明显。2. 炎症因子 (IL-6、TNF- α) 水平是青少年抑郁症出现骨代谢表达减少的中介因素。

关键词: 青少年, 抑郁症, 骨代谢, 炎症, 中介分析

探究免疫炎症指标与青少年抑郁患者骨代谢变化的关系

申晶晶 金圭星*

河北医科大学第一医院

目的 探究青少年抑郁患者与健康对照组中骨代谢指标、免疫炎症指标差异; 探究免疫炎症指标对青少年抑郁患者发病的预测价值; 探究青少年抑郁患者中骨代谢与免疫炎症标志物相关性。

方法 按照方便取样的方法, 在河北医科大学第一医院精神卫生中心住院并符合 ICD-10 中抑郁

症诊断的青少年抑郁症患者,共60例。对照组于社会招募的受试者,不符合ICD-10中任何精神疾病诊断的健康青少年,共63例。采用体育活动量表、汉密尔顿抑郁量表、汉密尔顿焦虑量表、社会支持量表来进行日常体育活动、焦虑抑郁情况及社会支持情况的评估。检测所有受试者骨代谢指标(骨钙素(BGP)、碱性磷酸酶(ALP)、I型胶原C端肽(β -CTX))及中性粒细胞、淋巴细胞、单核细胞、血小板数量,使用以下公式计算NLR、PLR、MLR: $NLR = \text{中性粒细胞计数} / \text{淋巴细胞计数}$, $PLR = \text{血小板计数} / \text{淋巴细胞计数}$, $MLR = \text{单核细胞计数} / \text{淋巴细胞计数}$ 。

结果 青少年抑郁组与健康对照组两组间骨代谢指标存在统计学差异,ALP($Z=-2.287, P=0.022$); β -CTX($Z=-3.696, P=0.000$)。两组间免疫炎症标志物存在统计学差异, NLR ($Z=-2.998, P=0.003$); PLR($-1.402, P=0.161$); MLR($Z=-7.362, P=0.000$)。 β -CTX($p=-0.224, P=0.013$)、ALP($p=-0.182, P=0.018$)与HAMD总分呈负相关关系, PLR($\rho=-0.213, P=0.018$)与HAMD总分成负相关, MLR($\rho=0.317, P=0.000$)与HAMD成正相关关系。做ROC曲线结果显示NLR、PLR、MLR预测青少年抑郁的线下面积为0.343、0.427、0.885, 当约登指数为0.63时, MLR预测青少年抑郁的敏感度为0.9, 特异性0.73。在青少年抑郁患者中, β -CTX与PLR存在相关性($\rho=0.444, P=0.000$), 控制控制年龄、性别、BMI、独生子女, β -CTX与PLR($\rho=0.443, P=0.000$)、MLR($\rho=0.249, P=0.06$)存在相关性, ALP与MLR($\rho=0.258, P=0.05$)存在相关性; 控制体育活动方式、饮食情况, β -CTX与PLR存在相关性, ($\rho=0.499, P=0.002$); 控制年龄、性别、BMI、体育活动方式及饮食情况等, β -CTX与PLR存在相关性, ($\rho=0.519, P=0.002$), ALP与MLR($\rho=0.359, P=0.037$)有相关性。

结论 免疫炎症标志物对青少年抑郁的发生有一定预测价值,并且在青少年抑郁患者的骨代谢变化中起到一定作用。

中国汉族女性复发抑郁症患者自杀行为相关因素分析

杨磊 牛琪惠 李幼辉 宋学勤 郝以辉*

郑州大学第一附属医院

目的 探讨具有自杀行为的中国汉族女性,复发抑郁症患者的临床特征、社会心理因素,从中寻找抑郁症患者自杀的危险因素,为抑郁症患者自杀的预防提供依据。

方法 选取2020年9月-2022年1月就诊于郑州大学第一附属医院精神科门诊及住院中国女性汉族复发抑郁症患者391例,分为自杀行为组87例,无自杀行为组304例。使用两独立样本t检验、卡方检验、非参数检验方法及Logistic回归分析对收集的数据进行统计分析。

结果 自杀行为组的首次发病年龄小于无自杀行为组($p<0.05$),发作次数多于无自杀行为组($p<0.05$),无助感、无价值感、绝望感、自罪自责、思维迟缓的出现频率高于无自杀行为组,精力疲乏的出现频率低于无自杀行为组($p<0.05$);与广泛性焦虑、广场恐怖症、社交恐怖症、动物恐怖症及情景恐怖症的共病率高于无自杀行为组($p<0.05$);神经质评分、生活压力事件数、父母教养方式中的父母控制因子分、儿童期性侵犯发生率及吸烟史均较高($p<0.05$);经Logistic多因素回归分析,与自杀行为有关的因素为生活压力事件、首次发病年龄、吸烟史、绝望感、无价值感和精力疲乏。

结论 对女性抑郁症患者自杀行为的分析发现,发病年龄越早、生活压力事件越多、存在绝望感、吸烟史是女性抑郁症患者出现自杀行为的风险因素,而出现精力疲乏的是出现自杀行为的保护因素。

二甲双胍对奥氮平导致的小鼠氧化应激及认知功能障碍的影响

朱厚名^{1,2} 褚昊冉^{1,2} 马家树² 李然然²

1.济宁医学院

2.山东省精神卫生中心

目的 本研究旨在探讨二甲双胍对奥氮平引起的氧化应激和认知功能障碍的影响。

方法 将C57BL/6小鼠随机分为三组:对照组($n=9$)、奥氮平($n=8$)和奥氮平+二甲双胍($n=8$)。奥氮平组每天灌胃4mg/kg奥氮平,奥氮平+二甲双

胍组则加用 150 mg/kg 二甲双胍, 对照组给予等量生理盐水。治疗八周后, 使用 Y 迷宫交替行为测试评估认知功能, 并通过测量血液样本中的超氧化物歧化酶 (SOD)、丙二醛 (MDA) 水平来评估氧化应激水平。

结果 实验结果显示, 奥氮平组小鼠的 SOD 水平显著低于对照组 ($p<0.01$), 而奥氮平+二甲双胍组大鼠的 SOD 水平显著高于奥氮平组 ($p<0.001$), 且接近对照组水平。同时, 奥氮平组小鼠的 MDA 水平显著高于对照组 ($p<0.05$), 二甲双胍干预后显著降低了 MDA 水平 ($p<0.05$), 这些结果表明, 二甲双胍能够有效减轻奥氮平引起的氧化应激。在 Y 迷宫交替行为实验中, 发现奥氮平组小鼠的自主交替百分比显著低于对照组 ($p<0.01$), 显示出奥氮平对小鼠认知功能的损害。虽然奥氮平+二甲双胍组的小鼠自主交替百分比相较于奥氮平组有所改善, 但未达到显著性差异 ($p>0.05$)。这表明, 二甲双胍在短期内对奥氮平引起的认知功能障碍的改善作用有限, 可能需要更长的治疗时间或结合其他认知功能评估方法进行验证。

结论 本研究结果表明, 二甲双胍通过增强抗氧化酶活性和减少脂质过氧化产物, 减轻奥氮平引起的氧化应激, 并具有潜在的认知功能保护作用。这一发现为探索二甲双胍作为辅助药物, 减轻奥氮平副作用提供了科学依据。

N2 期睡眠中应用经皮耳迷走神经刺激对慢波活动的影响

刘畅 金圭星*
河北医科大学第一医院

目的 探讨 N2 期睡眠中应用经皮耳迷走神经刺激 (taVNS) 对慢波活动的影响以及比较在大脑两种不同状态下应用 taVNS 的作用效果之间的差异。

方法 采用单盲研究, 于 2023 年 7 月至 2023 年 10 月在河北医科大学第一医院招募了 13 名健康成年人参与本研究, 最终第一部分试验共有 10 名受试者参加, 第二部分有 5 名受试者参与。第一部分中受试者间断完成了三晚的多导睡眠监测, 第一

晚均为基线之夜, 第二晚和第三晚为 N2 期给予的真刺激或假刺激之夜, 顺序随机。后将脑电图数据在 Matlab 中进行预处理, 提取所需的脑电图片段, 运用基于快速傅里叶变换的功率谱分析方法计算慢波能量并画图, 将数据提取后在 SPSS 中进行方差分析, 比较真假刺激和基线三个夜晚慢波能量的差异。第一部分试验完成 1 个月后进行第二部分, 5 名参与者在入睡前的清醒状态下行 taVNS, 运用同样的方法处理脑电图, 数据提取后与第一部分中的真刺激之夜数据进行比较, 方法是 SPSS 中的 t 检验, 从而比较在大脑两种不同状态下应用 taVNS 的作用效果之间的差异。

结果 基线, N2 期真刺激, N2 期假刺激三个夜晚的慢波能量存在差异, 且差异有统计学意义 ($F=3.459, P=0.046$)。与基线相比, N2 期接受假刺激后慢波能量没有显著变化 ($P=0.968$), 而 N2 期接受真刺激后的慢波振幅 (能量) 更大 ($P=0.032$)。与假刺激相比, 真刺激后的慢波能量更强, 差异有统计学意义 ($P=0.030$)。清醒状态下与 N2 期接受刺激相比, N2 期刺激后慢波振幅 (能量) 更强, 差异有统计学意义 ($t=2.998, P=0.037$)。

结论 1. N2 期给予 taVNS 可以增强随后发生的慢波活动能量, 从而改善睡眠。2. 相较于清醒状态下给予刺激, N2 时期应用 taVNS 能产生更强的作用效果。

探究夜间应用经皮耳迷走神经刺激对抑郁症患者症状及认知功能的影响

刘秀娟 金圭星*
河北医科大学第一医院

目的 在真实世界研究中, 通过比较不同时间点 (例如白天和夜间) 的经皮耳迷走神经刺激 (taVNS) 治疗对抑郁症患者症状和认知功能的改善程度, 探究夜间应用 taVNS 对抑郁症患者症状及认知功能的影响。

方法 本研究采用单盲、随机对照试验、方便取样的方法, 2023 年 12 月—2024 年 1 月于河北医大一院精神卫生中心住院的抑郁症患者 (夜间研究

组 18 人, 白天对照组 11 人), 两组患者均采用常规抗抑郁治疗方案, 研究组在常规治疗基础上联合夜间 taVNS 治疗, 对照组在常规治疗基础上联合白天清醒状态下 taVNS 治疗, 治疗前后采用一般资料(人口学资料、疾病发作次数、病程、服用药物当量、住院时长等)、汉密尔顿抑郁量表 17 项(HAMD-17)、汉密尔顿焦虑量表(HAMA)、匹兹堡睡眠质量指数(PSQI)、认知功能领域测评(连线测验、简易视觉记忆测验—修订版(BVMT-R)、霍普金斯词语学习测验修订版(HVLT-R)、数字广度测验、符号编码、波士顿命名测验)进行心理评估, 明确治疗效果。利用 SPSS 25.0 软件, 进行统计分析。符合正态分布的计量资料采用均数±标准差($\bar{x}\pm s$)表示, 偏态分布的采用 M(P25,P75)表示, 计数资料以频数和百分比表示。计量资料呈正态分布的, 两组间比较采用成组 t 检验, 多组间比较采用方差分析。非正态分布的采用秩和检验。比较两组患者治疗前后各项评分有无差异性, 探究组间治疗优效性。

结果 (1)两组患者治疗前 HAMD-17、HAMA、PSQI 评分及认知功能均无统计学意义($P>0.05$), 治疗后研究组的 HAMD-17 总分低于对照组, 差异有统计学意义($Z=-2.570, P=0.010$); 治疗后两组患者 PSQI 评分和 HAMA 总分及各项因子比较, 差异均无统计学意义($P>0.05$); 治疗后两组患者连线测验($Z=-3.011, P=0.003$)、HVLTR($t=-5.495, P=0.000$)、BVMT-R($t=-2.516, P=0.018$)、数字广度($Z=-3.354, P=0.001$)、符号编码($t=-2.223, P=0.035$)、波士顿命名评分($Z=-3.343, P=0.001$)比较, 差异均有统计学意义。

结论 无论白天还是夜间睡眠期间应用 taVNS 可以改善抑郁症患者的抑郁症状和认知功能, 相较于白天清醒状态下给予刺激, 睡眠中应用 taVNS 能产生更佳的作用效果。

心境障碍类疾病唾液硝酸盐/亚硝酸盐水平初探

任思宇 杨健*

首都医科大学附属北京安定医院, 国家精神疾病医学中心, 国家精神心理疾病临床医学研究中心, 精

神疾病诊断与治疗北京市重点实验室

目的 一氧化氮在神经发育中起着至关重要的作用。唾液作为一种易获取、无创的液体, 尚未在心境障碍疾病中进行亚硝酸盐检测。本研究旨在定量唾液亚硝酸盐, 并探讨其鉴别诊断抑郁症和双相情感障碍的价值。

方法 选取 2022 年 12 月—2023 年 12 月在北京安定医院门诊就诊或住院治疗的 20 例抑郁症患者, 21 例双相情感障碍。同期选取 20 名健康人为对照组。通过离心超滤管对唾液样本进行预处理方法, 采用总一氧化氮和硝酸盐/亚硝酸盐试剂盒测定含量。

结果 健康组、抑郁组、双相组唾液亚硝酸盐和硝酸盐水平比较无统计学差异, 但相较于健康对照, 两种指标在抑郁组中具有降低的趋势, 而在双相组中具有升高的倾向。通过将各组的硝酸盐和亚硝酸盐水平进行相关分析发现, 抑郁组及双相情感障碍组患者唾液两指标含量互成正相关(抑郁: $R=0.671, p=0.001$; 双相: $R=0.930, p=2.228e-8$), 而健康组未见具有统计学意义的相关性。

结论 三组亚硝酸盐和硝酸盐水平比较无差异, 而两疾病组内可见亚硝酸盐和硝酸盐的正相关, 提示 NO 相关的氧化还原过程可能在疾病进展中具有影响。首次提出收集无创唾液进行心境障碍患者亚硝酸盐与硝酸盐定量, 需要开展提高样本量以明确其是否具有鉴别诊断抑郁症和双相情感障碍的可能。

Neoprzewaquinone A Alters The Migration, Phagocytosis and Energy Metabolism of IL-15-induced HMC3 Cells

Haixia Wang^{1,2}, Jian Yang^{1,2}, Zuoli Sun^{1,2}, Yadan Nie^{1,2}, Yi He^{1,2}

1. Beijing Key Laboratory of Mental Disorders, National Clinical Research Center for Mental Disorders & National Center for Mental Disorders, Beijing Anding Hospital, Capital Medical University

2. Advanced Innovation Center for Human Brain Protection, Capital Medical University

Objective Microglia play a major role in the immune defense system of the central nervous system and are activated in many neurological diseases. The immunomodulatory cytokine interleukin (IL)-15 is known to be involved in microglia response and inflammatory factors release. Neoprzewaquinone A (NEO) is an active compound isolated from *Salvia miltiorrhiza* Bunge. Our previous study has shown that NEO significantly inhibit the proliferation of IL-15-treated Mo7e cells. However, the role of NEO in the structure and function of IL-15-treated human microglial cells (HMC3) remains unclear. Thus, our study aimed to quantitatively analyze the beneficial effects of NEO on HMC3 cells following IL-15 treatment

Methods The cell viability, phagocytosis, migration and energy metabolism were evaluated by CCK8, scratch assay, pHrodo™ Red Zymosan BioParticles™ Conjugate, and Agilent Seahorse XF Cell Mito Test. Cephalothin (CEP) was selected as a positive drug because it has obvious inhibitory effect on IL-15 and IL-15R α

Results Our results showed that IL-15 stimulated the proliferation, migration and phagocytosis of HMC3 cells in a time-dependent manner. Interestingly, NEO exhibited significant suppressive effects on these IL-15-induced changes, which were even superior to those observed with the CEP. Moreover, IL-15 treatment did not significantly alter energy metabolism, including glycolysis and mitochondrial respiration. NEO and CEP alone effectively reduced glycolysis, non-mitochondrial respiration, basal respiration, ATP turnover, respiration capacity, and H⁺ leak in HMC3 cells. Furthermore, NEO displayed a partial regulatory effect on mitochondrial function in IL-15-treated HMC3 cells

Conclusion Our study confirms the effectively inhibition of NEO on IL-15-induced microglial activation and provides valuable insights into the therapeutic prospects of NEO in neuropsychiatric disorders associated with IL-15 and microglia

Identifying Causal Genes and Therapeutic Targets Associated with Chronic Insomnia Disorder Based on Multi-omics Mendelian Randomization

Ruiyi Qian Shunying Yu*

Shanghai Jiao Tong University School of Medicine affiliated Shanghai Mental Health Center

Objective Chronic Insomnia Disorder (CID) is the most common sleep disorder affecting approximately 1/3 adults worldwide. It not only affects patients' daytime function and productivity, but is also closely related to a variety of physical and mental health problems. Much effort has been made to make progress in the pharmacotherapy of CID, however, the magnitude of CID patients still report poor long-term symptom control. In this study, we intends to further dig into the causal genes of CID by integrating multi-omics data and explore potential therapeutic targets, providing a new insight into its pathogenesis and pharmacotherapy

Methods Summarized Mendelian Randomization (SMR) was performed to estimate the causal effects of eQTL, pQTL and mQTL on CID, combining with co-localization analysis for validating the robustness. For genes that were associated with insomnia at more than one levels, a three-step SMR was applied to make clear the mediation effect. In addition, we used DGIdb to screen the targets with regulatory approval drugs, and look for their associations with targets corresponding to existing drugs for insomnia treatment according to Protein-Protein interactions

Results Twenty-five genes were identified as causal genes for CID through SMR and co-localization analysis, among which MAP2K1 and PTK7 were significantly associated with CID at both mQTL and pQTL levels. MAP2K1 is a therapeutic target with 21 regulatory approval drugs, and it is tightly associated with the targets of melatonin and ibuprofen, which are currently used for CID treatment

Conclusion Our study indicates that targeting

these proteins or repurposing MAP2K1 drugs could be a new promising approach for treating CID. The findings opens up new possibilities for precision therapy of CID, and provides certain scientific basis for future clinical trials and personalized therapy design

青少年抑郁症患者认知功能改变的静息态功能影像机制研究

闫乐婷 金圭星*

河北医科大学第一医院

目的 探究青少年抑郁症患者与对照组相比认知功能的差异;探究青少年抑郁症患者与对照组相比静息态功能影像学指标的差异;探究青少年抑郁症患者静息态功能影像学指标的变化与认知功能改变的相关性。

方法 按照方便取样的方法,在河北医科大学第一医院精神卫生中心住院并符合 ICD-10 中抑郁症诊断的青少年抑郁症患者,共 30 例。对照组于社会招募的受试者,不符合 ICD-10 中任何精神疾病诊断的健康青少年,共 30 例。采用汉密尔顿抑郁量表(HAMD)、汉密尔顿焦虑量表(HAMA)、数字记忆广度测验、连线测试(TMT)、数字划消试验来进行焦虑抑郁情况及认知功能的评估。采用酶联免疫吸附法(ELISA)检测血清 HMGB1 的水平。使用 Epidate3.1 进行双人核对并录入数据,确保将数据导出到 SPSS25.0 软件,进行统计分析,2 组之间人口学资料、HMGB1 指标的比较采用双样本 T 检验、秩和检验或卡方检验。采用 Spearman 法检验差异性脑功能指标与量表间的相关性。

结果 青少年抑郁组与健康对照组两组间焦虑相关指标存在统计学差异,HAMA 总分($Z=-3.622$, $P<0.001$);精神性焦虑($Z=-3.629$, $P<0.001$);躯体性焦虑($Z=-3.487$, $P<0.001$)。两组间抑郁相关指标存在统计学差异,HAMD 总分 ($F=8.87$, $P<0.001$);认知障碍 ($Z=-3.568$, $P<0.001$);体重减轻 ($Z=-2.111$, $P=0.035$);阻滞 ($Z=-3.640$, $P<0.001$);焦虑躯体化 ($Z=-3.575$, $P<0.001$);睡眠障碍 ($Z=-2.489$, $P=0.013$)。两组间认识功能相关指标存在统计学差

异,TMT-A 用时 ($Z=-2.496$, $P=0.011$);TMT-B 用时 ($F=9.554$, $P=0.013$);数字记忆广度顺背 ($Z=-3.758$, $P<0.001$);数字记忆广度倒背 ($Z=-3.607$, $P<0.001$);数字划消指数 E ($F=8.447$, $P<0.001$)。两组静息态功能核磁指标存在差异,抑郁组海马和左内侧和旁扣带脑回的功能连接大于健康组。存在差异的功能连接指标与认知功能相关量表存在相关性,海马和左内侧和旁扣带脑回的功能连接与数字记忆广度倒背成负相关 ($r=-0.494$, $P=0.027$)。

结论 青少年抑郁症患者认知功能下降,且与海马和左内侧和旁扣带脑回的功能连接增加有关。

关键词: 青少年;抑郁症;静息态功能连接指标;海马;内侧和旁扣带脑回

抑郁症患者心率变异性昼夜节律特征及其在辅助识别中的作用

李冰¹ 郭胜² 许皓^{1,3} 陈燕¹ 谭淑平¹

1.北京大学回龙观临床医学院

2.北京航空航天大学,宇航学院图像处理中心

3.华北理工大学

目的 探讨抑郁症(MDD)患者与健康对照在心率变异性(HRV)指标的昼夜节律特征上的差异,并探索 HRV 昼夜节律特征在识别 MDD 中的价值。

方法 本研究为横断面研究。研究对象包括 116 例 MDD 患者和 63 例健康对照。采集所有被试的 24 小时心电图数据,并计算 12 个 HRV 指标。HRV 指标分为四类,反映心脏自主神经系统(ANS)的不同调节类型:PNS-相关的 HRV 指标:主要与心脏副交感神经系统(PNS)调节有关,包括相邻 RR 间期(RRI)差值的均方根(RMSSD)、相邻 RRI 差值大于 50 毫秒的个数(NN50)、NN50 所占百分比(PNN50)、高频功率(HF)、样本熵(SampEn)和庞加莱图垂直于恒等线的标准差(SD1);SNS-相关的 HRV 指标:主要与心脏交感神经系统(SNS)调节有关,包括心率(HR)、去趋势波动分析的斜率(α_1 和 α_2);PNS&SNS-相关的 HRV 指标:反映心脏 PNS 和 SNS 共同调节的 HRV 指标,包括 RRI 的标准差(SDNN)、低频功率(LF)和庞加莱图沿着恒等线的 SD(SD2);ANS-平衡的 HRV 指标:LF/HF。提出一种扩展余弦模型来分析 HRV 指标的昼夜节律

特征,包括平均值(M)、振幅(A)、占空比(a)、曲线的平缓程度(b)和高峰相位(T)。例如,HR_A表示HR的振幅。采用协方差分析比较MDD患者和健康对照在HRV指标昼夜节律特征上的差异。使用支持向量机(SVM)分析HRV昼夜节律特征在区分MDD和健康对照中的作用,并采用基于SVM的递归特征消除法(SVM-RFE)进行特征选择。

结果 与健康对照相比,MDD患者的HR_M增加,而其他HRV指标的M值降低,部分HRV昼夜节律曲线更加平缓,部分HRV指标的A、a、T存在组间差异。尤其是,与PNS-相关和SNS-相关的HRV指标在多个昼夜节律特征上均表现异常。采用SVM-RFE后,基于不同类型的HRV昼夜节律特征构建的SVM模型在区分MDD和健康对照时的性能均有所提升,能够较好地地区分MDD患者和健康对照。特别是,基于特征选择的SNS-相关HRV昼夜节律特征构建的模型表现最佳,准确率达到93.18%。

结论 MDD患者存在心脏ANS昼夜节律异常。HRV昼夜节律特征有望成为辅助识别抑郁症的客观指标。

Repetitive Transcranial Magnetic Stimulation Leading To Severe Bradycardia in A Patient with Major Depressive Disorder

Shuping Fang Zhe Li*

Mental Health Center, West China Hospital, Sichuan University, Chengdu, China

Introduction Major depressive disorder (MDD) is widely acknowledged as a prominent contributor to global disability. Repetitive transcranial magnetic stimulation (rTMS) has emerged as an effective intervention for MDD. The most commonly reported side effects of rTMS include scalp discomfort, headache, and fatigue, which are generally transient, mild, and reversible in nature. Notably, bradycardia is not typically considered an adverse effect of rTMS. Previous studies have demonstrated that rTMS can induce temporary reductions in

heart rate (HR); however, no instances of serious arrhythmias resulting from rTMS have been documented. We present a case report describing the occurrence of severe bradycardia in a patient with MDD undergoing rTMS therapy

Case presentation: A 46-year-old Chinese woman with a 7-year history of MDD, unresponsive to five full courses of antidepressants and psychotherapy, was admitted to our hospital. Diagnosed with a severe depressive episode (without psychotic symptoms), she had no other medical history and no contraindications to rTMS. During her hospitalization, she continued taking paroxetine (40mg/day) and tandospirone citrate (15mg/day). Her hepatic, renal, and thyroid functions, as well as electrolyte levels, were normal. Electrocardiogram (ECG) and electroencephalogram (EEG) results showed no abnormalities.

The efficacy of pharmacotherapy remained unsatisfactory. Given her lack of prior exposure to rTMS, we incorporated once-daily rTMS therapy into the original treatment plan on the fourth day post-admission to enhance depressive symptom management.

During the rTMS sessions, the patient reported a noteworthy amelioration of mood. However, she concurrently experienced dizziness and chest tightness. Meanwhile, she developed paroxysmal severe bradycardia (HR:35-44bpm) with systolic blood pressure(BP) ranging from 101 to 127 mmHg and diastolic BP ranging from 63 to 104 mmHg. Notably, random blood glucose levels (5.6-5.9 mmol/L; normal range: 3.9 to 7.8 mmol/L), oxygen saturation (97-98%), and thyroid hormone levels remained within normal ranges. To investigate the etiology, a 24-hour Holter monitoring and cardiac magnetic resonance imaging (MRI) were conducted. The 24-hour Holter monitoring revealed bradycardia with an average HR of approximately 45 bpm, while the MRI demonstrated mild left ventricular enlargement. Consultation with a cardiologist yielded inconclusive findings regarding the underlying cause of the arrhythmia, emphasizing the need for vigilant surveillance.

The medication regimen was maintained while closely monitoring the patient's HR and BP, and rTMS

was suspended. One day later, her HR significantly increased to 72 bpm before stabilizing within a normal range of 80-100 bpm without any further occurrences of palpitations or headaches. Considering the improvement in depressive symptoms, both the patient and her family expressed their extensive desire to resume rTMS treatment. Following a pause of 5 days, rTMS was reintroduced with identical parameters.

Upon resumption of rTMS therapy, the patient's HR decreased significantly by 36 bpm within 4 hours. On the same day, her BP and random blood glucose levels remained within the normal range. The subsequent morning, her HR slightly increased to 38 bpm. Consequently, rTMS was temporarily suspended for that day; however, in the afternoon, there was a gradual ascent in her HR to 64 bpm.

Post-cessation of rTMS therapy, her HR gradually increased to 64 bpm after one day and further rose to 73 bpm on the following day, subsequently stabilizing within the normal range. The Naranjo Causality Scale was utilized to evaluate this association (scoring 9 points). Following extensive communication with the patient and her family, it was decided to terminate rTMS therapy.

Discussion: The patient had been on long-term treatment with paroxetine and tandospirone citrate, both of which exhibited only mild cardiovascular effects. Notably, no complaints of arrhythmia were reported during these courses of treatment. Interestingly, a temporary discontinuation of rTMS treatment for one day on two separate occasions resulted in resolution of the observed arrhythmias without any alteration in medication regimen. Importantly, an evaluation using the Naranjo Causality Scale (9 points) indicated a definitive causal relationship between rTMS and severe bradycardia.

Consistent with this phenomenon, previous research has demonstrated that rTMS treatment can induce a decrease in HR. The reduction of HR caused by rTMS is believed to be transient and mild, which is considered beneficial for normalizing autonomic nervous system (ANS) physiological markers. PFC, subgenual anterior cingulate cortex (sgACC), and vagus nerve (VN) are crucial anatomical structures within the heart-

brain axis. The antidepressant effect of DLPFC-rTMS may be attributed to transsynaptic activation of sgACC and inhibition of limbic regions (such as amygdala and thalamus), thereby mediating VN drive. By modulating the network connectivity and neural regulation of these brain regions, rTMS stimulation influences changes in HR mediated through the VN. Among these brain regions, DLPFC is known to elicit the most significant decrease in HR. Previous studies have utilized HR as a functional outcome measure to determine the optimal stimulation target in the DLPFC. In contrast to these findings, Manreena et al. proposed that high-frequency stimulation leads to HR deceleration in the left prefrontal area while low-frequency stimulation accelerates HR in the right prefrontal area; however, these studies were limited by small sample sizes and individual variability. Currently, cardiovascular indicators are often measured during rTMS treatment mainly for assessing its safety rather than investigating its relationship with ANS function. Therefore, future large-scale studies are warranted to elucidate the association between rTMS parameters/targets and ANS responses while further exploring the intricate brain-heart relationship for optimizing rTMS protocols.

Paroxetine can enhance synaptic serotonin concentrations, thereby exerting a subtle influence on ANS. The combination of tandospirone with selective serotonin reuptake inhibitors is considered safe. However, these medications do not induce significant cardiovascular adverse effects. Nevertheless, this does not preclude the possibility of severe bradycardia resulting from drug combination and rTMS. Furthermore, it is noteworthy that such case is exceedingly rare in existing literature, with no prior reports documenting severe arrhythmias caused by rTMS.

Recommendations: The administration of rTMS treatment to patients necessitates meticulous consideration of their medical history and concurrent cardiovascular medications. Furthermore, it is imperative to document the patient's baseline cardiovascular parameters, including HR and BP, at the initiation of rTMS therapy. For individuals taking paroxetine concomitantly, close monitoring HR during rTMS treatment may be warranted.

Disrupted Reconsolidation of Alcohol Reward Memory by Propranolol Through The Para-Hippocampus

Shuai Yu Pengjiao Xu Ruiling Zhang Yahui Xu*
The Second Affiliated Hospital of Xinxiang Medical University

Objective To explore the neural circuit of norepinephrine system involved in the process of reconsolidation of alcohol reward memory and what brain mechanism are involved in propranolol's effect

Methods Included 22 male alcohol-dependent patients who were admitted to the Department of Addiction Medicine of the Second Affiliated Hospital of Xinxiang Medical College from April 2019 to December 2019, and recruited 11 healthy subjects served as the control group and matched with alcohol dependent group in age and education. Twenty-two alcohol-dependent patients were divided into two groups: propranolol group and placebo group. During fMRI scanning, alcohol-related clues were viewed through a magnetic resonance video system, and collected task-state image data. SPM12 was used to analyze the BOLD data in fMRI, and the differences in brain task fMRI between the alcohol-dependent group and the healthy control group, and the alcohol-dependent subjects propranolol group and placebo group were compared

Results 1. Alcohol-dependent group compared with healthy control group did not differ significantly in age ($t=0.65, P=0.51$), education ($t=-1.53, P=0.13$). Propranolol compared with placebo group did not differ significantly in age ($t=-0.27, P=0.78$), alcohol use years ($t=-0.07, P=0.94$), education ($t=1.15, P=0.26$), FTND ($t=-1.74, P=0.09$), AUDIT ($t=-0.69, P=0.49$), AWS ($t=-0.70, P=0.48$), OCDS ($t=-0.07, P=0.93$), PSQI ($t=0.76, P=0.45$), MMSE ($t=-1.19, P=0.24$), SAS ($t=-1.36, P=0.18$) and SDS ($t=-1.68, P=0.10$)

2. Compared with the non-alcohol-related images,

when viewing alcohol-related images, the alcohol-dependents had increased activation of the left fusiform gyrus and the right para hippocampus gyrus ($P < 0.01$, Cluster Size = 20).

3. Compared with the placebo group, when viewing alcohol-related images, the activation of the right para hippocampus gyrus in the propranolol group was significantly reduced when compared to the alcohol-related images ($P < 0.01$, Cluster Size = 20). We explored the correlation between para-hippocampus and craving differences for pre and post medication by using the para-hippocampus as the region of interest. The results showed that the craving difference was positively correlated with the para-hippocampus in the propranolol group ($r = 0.65, P < 0.05$).

Conclusion Our results indicate that propranolol may disrupt alcohol reward memory reconsolidation by decreasing the activation of the para-hippocampus to reduce craving and provide a theoretical basis for the involvement of norepinephrine in the reconsolidation process of alcohol reward memory and the clinical treatment of alcohol dependence

红外光谱结合机器学习用于的抑郁症的快速诊断研究

刘明霞 杨健* 孙作厘 贺毅
首都医科大学附属北京安定医院

目的 红外光谱是一种快速、简便、高效的检测分析技术, 分子通过选择性吸收某些波长的红外线, 引起分子中振动能级和转动能级的跃迁, 进而得到红外吸收光谱。红外光谱可反应蛋白质、脂质、核酸等分子结构信息。本研究的目的是综合中红外光谱、近红外光谱以及机器学习算法, 通过微量临床血清样本, 建立抑郁症快速诊断模型, 助力抑郁症的快速筛查和早期诊断。

方法 无需样品前处理, 将微量血清样本(中红外 $1 \mu\text{L}$, 近红外 $10 \mu\text{L}$)滴加于红外载片, 涂匀后自然晾干, 上机扫描 1 分钟获得红外光谱信息。对

数据进行预处理后,使用支持向量机(SVM)、主成分线性判别分析(PLS-DA)、决策树(DT)、k近邻(KNN)分类、随机森林(RF)分类器和偏最小二乘判别分析(PLS-DA)等多种机器学习算法,构建抑郁症诊断及疗效预测模型。

结果 本研究综合中红外光谱、近红外光谱以及机器学习算法,通过微量临床血清样本(1-10 μL),建立抑郁症快速诊断模型,初步诊断效果较为满意(准确率 85%,灵敏度 93%,特异性 71%,AUC 0.87)。

结论 微量血清样本可以提供丰度的红外信息,通过血清的中红外光谱和近红外光谱构建机器学习分类模型,有望实现抑郁症患者与健康对照识别,为抑郁症的早期诊断提供快速、灵敏、稳定和经济高效的方法。

Efficacy Study of Intermittent Theta Burst Stimulation(iTBS) in The Treatment of Adolescent with Affective Disorders

Xinyao Liu Bin Zhang*
tian jin an ding hospital

Objective The purpose of this study was to investigate the clinical efficacy of accelerated iTBS in treating adolescent patients with depressive disorders and the factors influencing clinical symptoms

Methods This study was a double-blind randomized controlled study. Adolescent depressed patients were finally included in the analysis (22 cases in the active iTBS group and 18 cases in the sham iTBS group). active iTBS mode parameters setting: 9000 pulses/day for 2 days, location was left dorsolateral prefrontal cortex(DLPFC). Sham iTBS flipped the coil with the same parameters as the true stimulation. During 4 weeks of maintenance treatment, two sessions of 1800 pulses were administered weekly. All patients were assessed at baseline enrollment with the Montgomery Depression Rating Scale (MADRS), Clinical General Inventory of Effectiveness (CGI-I), Family Functioning

Assessment Scale (FAD), Snaith-Hamilton Pleasure Scale (SHAPS), Beck's Hopelessness Scale (BHS), and Adolescent Life Events Scale (ASLEC). All patients were assessed by Montgomery Depression Rating Scale (MADRS), and Clinical General Inventory of Efficacy (CGI-I) after the intervention treatment. Among them, MADRS and CGI were assessed separately within four weeks in the active iTBS group

Results 40 patients were randomly assigned to the active iTBS group (n=22) or sham group (n=18). There was statistically significant effect of iTBS treatment was found between the active iTBS and sham groups in the reductions of MADRS score ($p = 0.009$) and reductions of MADRS scores rate ($p = 0.020$). In addition, in the active iTBS group, higher baseline SHAPS and BHS scores were associated with worse outcomes

Conclusion The current study suggests that two days of active accelerated iTBS to the DLPFC region can rapidly, safely, and effectively improve depressive symptoms in adolescents with depression. And we found that itbs were less effective in baseline patients with greater feelings of hopelessness and anhedonia. Our data may contribute to a better understanding of the role of the accelerated iTBS intervention on the improvement of depressive symptoms and provide valuable recommendations and directions for the clinical management of adolescent depression

关键词: accelerated iTBS, depression, adolescent

基于 CYP2D6 基因多态性的度洛西汀治疗药物监测及其影响因素分析

曾环思*
深圳市康宁医院

目的 探讨细胞色素 P450 2D6 (CYP2D6) 基因多态性及其他影响因素与度洛西汀血药浓度相关性,为治疗药物监测(TDM)临床应用提供参考。

方法 回顾性收集我院 2022 年 1 月-2023 年 12 月使用度洛西汀住院患者的 TDM 结果及年龄、性别、合并用药及 CYP2D6 基因多态性等临床资料,

分析 CYP2D6 基因多态性及其他影响因素对度洛西汀血药浓度影响。

结果 纳入 76 例中国汉族抑郁住院度洛西汀患者血药浓度为 (99.38 ± 121.28) ng·mL⁻¹, 校正血药浓度 (CDR) (1.64 ± 2.17) ng·mL⁻¹·mg⁻¹, CYP2D6 广泛代谢型 (EM) (*1/*1、*1/*2、*2/*2) 18 人 (占 23.68%)、中间代谢型 (IM) (*1/*10、*2/*10、*1/*41、*2/*41、*10/*10、*41/*41) 58 人 (占 76.32%)。比较各组间 CDR, 合并用药组 (2.56 ± 2.93) ng·mL⁻¹·mg⁻¹ 较单药组 (0.93 ± 0.85) ng·mL⁻¹·mg⁻¹ 高 ($P < 0.01$), IM 组 (1.92 ± 2.41) ng·mL⁻¹·mg⁻¹ 较 EM 组 (0.72 ± 0.52) ng·mL⁻¹·mg⁻¹ 高 ($P < 0.01$), 男性组 (1.69 ± 2.87) ng·mL⁻¹·mg⁻¹ 较女性组 (1.58 ± 1.23) ng·mL⁻¹·mg⁻¹ 高 ($P < 0.05$)。多元线性回归显示, 影响度洛西汀血药浓度程度大小的依次是: 日剂量 > 合并用药 > 基因型 ($R^2 = 0.458$, $P < 0.001$), 模型可解释 45.8% 的度洛西汀血药浓度的变化。

结论 度洛西汀剂量、合并用药、CYP2D6 基因多态性是影响度洛西汀血药浓度的主要因素, 临床应结合血药浓度和基因多态性进行个体化用药。

人工智能应用于精神疾病精准诊断的研究进展

邱建青¹ 于成¹ 王荣正² 朱婷¹ 秦科² 张伟¹

1. 四川大学华西医院

2. 电子科技大学

目的 对基于 DSM-5 模式下, 精神疾病诊断呈现异质性的原因、影响及解决思路, 及人工智能在精神疾病诊断异质性的应用前景进行综述。探讨人工智能应用于精神疾病精准诊断的未来方向。

方法 以“TS=psych* AND (TS=(artificial intelligence*) OR TS=(learning) OR TS=(language model*) OR TS=(NLP))”为关键词, 检索 PubMed 数据库发表的相关文献共计 1966 篇。纳入标准: (1) 解决临床精神疾病诊断的异质性问题; (2) 应用机器学习、深度学习、自然语言处理、大模型等人工智能方法。排除标准: (1) 评述型文章; (2) 低质量文献; (3) 内容相似或重复的文章; (4) 存在争议的文章。最终纳入 126

篇文献。

结果 基于 DSM-5 现象学诊断的精神疾病包括抑郁症、双相情感障碍、精神分裂症存在基因、表现、病程、治疗反应等的异质性。异质性原因包括精神疾病复杂多维原因的等效性、测量诊断的单一性和主观性、对精神疾病采用分类而非连续谱的诊断思维。现有国内外针对精神疾病异质性解决框架包括: 研究领域标准、精神病理学层级、症状互作网络、精神影像学、计算精神病学、基于文本、语音、视频等多模态的诊断等。由于这些框架将处理更多维、多层次的、以自然语言为主的数据集, 因此需要应用人工智能技术。具体而言: (1) 对视频、音频、病历等文本进行自然语言处理, 提取更精确的、客观的生物学表征。(2) 对脑电、核磁共振等复杂高维时空数据, 采用典型相关分析、深度学习等进行网络分析、特征提取。(3) 对实验范式数据, 结合神经理论和人工智能技术对疾病的神经过程进行计算等。

结论 精神疾病的异质性需要采集更高质量的、客观性的、多模态的病人特征, 并运用深度学习、大语言模型等人工智能技术对多模态数据集进行更精确地特征提取、病理表征和亚型分类。

曲唑酮联合用药治疗抑郁症的日给药剂量标准范围探索

崔小花 丁靖*

西安市精神卫生中心

目的 基于剂量校正浓度 (C/D), 探索抑郁症患者联合用药时曲唑酮日给药剂量的标准范围, 为临床个体化用药提供参考。

方法 收集某三甲医院 2021 年—2023 年接受曲唑酮治疗抑郁症的 257 例住院病例资料, 包括年龄、性别、体重、给药剂量、给药频次、合并用药等, 纳入长期服用同一剂量曲唑酮并达稳态血药浓度检测数据。采用 Med Calc 5.2 软件进行统计分析。非正态分布数据以 M (P25, P75) 表示, 两组间比较采用 Mann~Whitney U 检验; 多组间样本比较采用 Kruskal~Wallis H 检验; 计量资料相关性评价采用非参数斯皮尔曼 (Spearman) 相关性进行分析。

结果 (1) 257 例患者服用曲唑酮期间主要联合用药为选择性 5-羟色胺再摄取抑制剂 (SSRI)、5-羟色胺/去甲肾上腺素再摄取抑制剂 (SNRI) 及苯二氮卓类药物, 结果显示合用 SSRI 患者曲唑酮的 C/D 显著高于未合用 SSRI 患者, 差异有统计学意义 ($P < 0.001$)。 (2) 曲唑酮日给药剂量在 25-200mg 范围内, 其血药浓度与日剂量呈显著性正相关 ($r_s = 0.64$, $P < 0.001$)。 (3) 经受试者工作曲线分析显示, 临床实践中, 曲唑酮联合用药患者需要浓度达到 AGNP 指南推荐治疗窗范围 (700-1000ng/mL) 所需的最低日剂量为 50mg, 曲线下面积为 0.774, 该截断值敏感度为 81.0%, 特异性为 64.6%。所需上限阈值日剂量为 75mg, 曲线下面积为 0.669, 该截断值敏感度为 51.7%, 特异性为 75.0%。

结论 曲唑酮血药浓度存在显著个体差异, 合用 SSRI 类药物对曲唑酮的 C/D 值有显著影响。曲唑酮联合用药治疗抑郁症达到 AGNP 指南推荐治疗窗范围 (700-1000 ng/mL), 所需的日给药剂量标准范围应为 50-75 mg。

关键词: 曲唑酮; 抑郁症; 联合用药; 日给药剂量标准范围

帮助患者管理情绪、恢复并改善认知功能、提高生活质量。iTBS (Theta Burst Stimulation, 即 θ -Burst 刺激) 是一种经颅磁刺激 (TMS) 技术, 用于治疗双相抑郁以及难治性抑郁, 一般以左侧背外侧前额叶皮层区为主。近年来, 许多研究表明 iTBS 对抑郁症患者的症状改善具有显著效果。一些临床试验发现, iTBS 与安慰剂相比可以显著减轻抑郁症状, 并且在长期追踪中维持其疗效。此外, iTBS 还被发现对于那些对难治性抑郁患者也具有一定的疗效。iTBS 可以缓解抑郁症状, iTBS 作为一种非药物治疗方式, 通过调节大脑神经网络的活动来减轻抑郁症状, 包括双相抑郁症患者的情绪波动、抑郁情绪等。iTBS 的治疗可能有助于稳定患者的情绪, 减少躁狂和抑郁的发作次数和强度。抑郁症患者常常伴随认知功能的下降, 包括注意力、记忆力等方面。iTBS 可能有助于改善这些认知功能, 提高患者的思维清晰度和记忆力。对于一些对抗抑郁药物不耐受或者对其他治疗方法无效的患者, iTBS 可以作为一种选择, 用于治疗他们的抑郁症状。与药物治疗相比, iTBS 作为一种无药物依赖的治疗方式, 可以减少药物治疗可能带来的副作用和依赖性

结论 iTBS 治疗有益于双相抑郁患者认知障碍的改善

关键词: 双相抑郁障碍; 认知障碍; iTBS

ITBS 治疗双相抑郁认知障碍治疗进展

蒋一佳 李然然*

山东省精神卫生中心

目的 探讨 iTBS 治疗双相抑郁认知障碍治疗进展

方法 通过 PubMed、知网等浏览阅读参考文献

结果 双相抑郁症, 又称躁郁症, 是一种情绪障碍, 表现为情绪波动的剧烈变化, 包括躁狂和抑郁两种状态, 对患者的生活和健康带来了多方面的危害, 并且会影响他们的社会、学业和职业生活等。双相抑郁认知障碍指的是双相抑郁症患者在情绪波动的同时, 也伴随着认知功能的一些问题。“认知障碍”通常指的是认知功能受损, 包括但不限于记忆力减退、注意力不集中、语言障碍等症状, 从而导致患者专注力减退、决策困难等, 这可能会影响患者的日常功能和生活质量。因此, 治疗双相抑郁症不仅要关注情绪症状的缓解, 也要重视功能障碍的改善, 通过药物治疗、心理治疗、社会支持等综合措施来

“新一代益生菌”普拉梭菌在治疗精神疾病中的应用前景

秦培琳 杨健*

首都医科大学附属北京安定医院

目的 近年来, 越来越多关于肠-脑轴的机制被阐述。肠道生态失调——致病菌含量升高、有益菌含量降低, 可在形态学上损害与情绪障碍相关的大脑区域, 同时引发神经炎症, 进而导致疾病发生。同时, 精神疾病基于肠道菌群的治疗方式也备受关注, 如饮食干预、粪便微生物移植、益生菌、益生元和合成菌等。因此, 本研究旨在汇总“新一代益生菌”普拉梭菌与精神疾病的相关研究, 并探讨其在精神疾病治疗中的前景。

方法 在 pubmed 中输入检索式: (Faecalibacterium prausnitzii) AND (Depression)、

(*Faecalibacterium prausnitzii*) AND (Autism)、(*Faecalibacterium prausnitzii*) AND (Alzheimer's Disease)、(*Faecalibacterium prausnitzii*) AND (Attention deficit/hyperactivity disorder)、(*Faecalibacterium prausnitzii*) AND (Schizophrenia)、(*Faecalibacterium prausnitzii*) AND (Substance-Related Disorders), 筛选普拉梭菌干预治疗以上精神疾病模型小鼠后, 小鼠行为学及体内小分子物质的变化相关文献; 普拉梭菌在以上几种疾病患者粪便中, 相较于正常人群丰度变化; 及临床药物干预治疗后, 患者粪便微生物组成变化相关的文献。汇总普拉梭菌与精神疾病的关系, 并结合普拉梭菌本身作用推测其在治疗精神疾病方面的应用前景及可能涉及到的机制。

结果 普拉梭菌在抑郁症、自闭症、阿尔兹海默症、注意力缺陷/活动过强障碍、精神分裂症及酒精成瘾等疾病患者肠道中, 丰度都较正常人有所下降, 同时在经过药物治疗后普拉梭菌含量上升。其中, 值得注意的是, 抑郁症、阿尔兹海默症模型动物在经过普拉梭菌治疗后, 疾病症状得到明显缓解。

结论 普拉梭菌是健康成年人结肠中最常见的微生物之一, 作为一种产短链脂肪酸的抗炎菌与多种疾病都呈现负相关。在这些疾病中, 肠道微生物群紊乱——抗炎细菌如普拉梭菌含量减少, 其通过发酵膳食纤维而产生的短链脂肪酸(如丁酸和丙酸)减少, 使短链脂肪酸产生不平衡, 最终导致机体炎症水平升高。而由此产生的炎症及有可能通过肠-脑轴来影响大脑功能, 从而导致一些精神疾病的发生。因此, 普拉梭菌作为“下一代益生菌”治疗精神疾病的应用可能是未来研究的一个方向。

Preliminary Exploration of Artificial Intelligence in Psychiatric Clinical Nursing

Anqi Tan¹, Anqi Tan², Qiaoling Liao², Qiaoling Liao¹

1. Mental Health Center Of Sichuan Province

2. The Third Hospital of Mianyang

Objective This study aims to explore the potential applications of artificial intelligence (AI) technology in psychiatric clinical nursing, with the goal of enhancing patient care quality, alleviating the workload on

nursing staff, and optimizing the efficiency of mental health services

Methods The research adopts a combined approach of literature review and case analysis to systematically summarize AI applications in psychiatry over recent years. The review covers areas such as intelligent diagnostic assistance, emotion recognition and intervention, and personalized treatment plan recommendations

Results Results indicate that AI technology can provide more accurate diagnostic suggestions and personalized treatment plans by analyzing patients' physiological data, behavioral patterns, and language expression, effectively improving early identification and management of mental disorders. Moreover, AI-driven emotion recognition tools have shown positive effects in psychological interventions, helping to alleviate negative emotions like anxiety and depression in patients, thereby enhancing their self-management and recovery capabilities

Conclusion The results suggest that AI technology has broad prospects for application in psychiatric clinical nursing, capable of not only increasing nursing efficiency and quality but also creating more humanized and personalized medical services for patients. However, privacy protection, ethical issues, and technological maturity remain key challenges requiring attention. Future research should further explore the deep integration of AI technology into psychiatric nursing while strengthening interdisciplinary cooperation, ensuring that technological development is in harmony with ethical standards to achieve sustainable innovation in mental health services

精神分裂症暴力攻击行为与 P300 的相关性研究

赵丁 王巍 张杨骏 纪家武*

福州市第二总医院神经精神病防治院

目的 暴力攻击行为指精神分裂症患者在精神症状(如幻觉妄想)的支配下,出现言语辱骂、攻击伤人、自杀自伤、暴力毁物等行为,其爆发性高、破坏性强,具有一定的隐秘性。每年都有众多医护人员或者患者家属被精神分裂症患者攻击,暴力攻击行为给患者自身、亲属、邻居、医护人员带来了危险及恐慌,因此,对于精神分裂症患者暴力攻击风险的预测、识别、评估变得至关重要,具有极大的临床价值。探讨精神分裂症患者其暴力攻击行为与事件相关电位 P300 成分的相关性。

方法 将福州市第二总医院神经精神病防治院精神分裂症住院患者根据其既往个人史及修改版外显攻击量表(Modified Overt Aggression Scales, MOAS)评分划分暴力攻击组 30 例及对照组 31 例。对比两组一般资料、临床资料、P300 成分的波幅和潜伏期;以及 P300 成分的波幅和潜伏期与 MOAS 评分的相关性分析。

结果 精神分裂症患者中暴力攻击组与对照组一般资料、临床资料无显著差异($P > 0.05$);但所诱发的 P300 成分的波幅和潜伏期有统计学意义($P < 0.05$),其中,暴力攻击组其 P300 波幅降低,潜伏期延长。经 Pearson 相关分析,精神分裂症患者所诱发的 P300 成分潜伏期与 MOAS 评分呈正相关,而其所诱发的 P300 成分波幅与 MOAS 评分呈负相关。

结论 具有暴力攻击行为的精神分裂症患者存在更严重的脑认知功能损伤。本研究推测,事件相关电位 P300 成分的波幅和潜伏期可作为预测及评估精神分裂症暴力攻击行为的电生理指标。临床工作急诊时患者因精神症状支配下或者患者不配合、不作答、家属对病情不了解时,不配合完成问卷量表(如修订版外显攻击行为量表、暴力攻击历史、临床风险评估等)的临床难题,这对临床工作者在信息获取时具有较大的困难及极大的挑战,P300 成分的波幅和潜伏期对于预警暴力行为的检查,刚好补充了这一点。因此,鼓励在今后的临床工作中积极推广使用。

关键词: 精神分裂症,暴力攻击行为,MOAS 评分,P300 成分,振幅,潜伏期

沈阳市精神卫生中心

目的 随着大数据时代的到来和人工智能技术的快速发展,精神医学正迎来一场深刻的变革。本文旨在探讨数据在精神医学研究和实践中的核心地位,分析中国精神医学数据现状,并提出改进策略,以推动中国精神医学在数据驱动和人工智能的新时代实现跨越式发展。

方法 本文通过回顾精神医学的发展历程,分析当代精神医学面临的主要挑战。重点讨论了数据在精神医学研究中的作用,介绍了数据驱动在精神医学中的应用,包括 AI 辅助诊断、个性化治疗预测和实时监测与干预等。并针对中国精神医学数据存在的质量参差不齐、数据孤岛、数据安全与隐私保护等问题,提出了提升数据质量的策略框架。

结果 通过分析发现,高质量的数据在精神医学研究中的重要性体现在多个方面。数据提供了客观依据,减少了诊断中的主观性。通过大规模临床数据的收集和分析,可以建立更客观、更可靠的诊断标准。数据有助于揭示潜在模式,利用大数据分析发现隐藏在复杂表象下的规律和模式,为疾病的早期预警和预防提供依据。数据促进了个体化医疗,整合基因、环境、生活方式等多维度数据,可以为每个患者制定更加精准的治疗方案。数据加速了药物研发,通过大规模的临床试验数据和真实世界数据,可以更快地筛选有效药物,并优化给药方案。数据支持跨学科研究,精神医学的进步需要与信息技术、数据科学、基因组学等领域紧密合作,形成多学科融合的研究模式,数据正是连接这些学科的桥梁。

结论 数据已成为 21 世纪最宝贵的资源。在精神医学领域,高质量数据的重要性不言而喻。通过建立统一的数据标准、构建国家级数据平台、加强数据安全与隐私保护、提升数据分析能力、完善数据生态系统等措施,中国精神医学的数据质量和利用效率将显著提升。这将为精准诊断、个性化治疗、疾病预防、新药研发等领域带来革命性的进展。本文的研究为推动中国精神医学在数据驱动和人工智能的新时代实现跨越式发展提供了理论支持和实践指导。

抑郁症的情绪情境依赖的脑功能异常模式

臧振享 乔凯妮 杨志*

首都医科大学附属北京安定医院

目的 抑郁症 (MDD) 是一种情绪依赖的精神疾病。目前绝大多数研究采用静息态磁共振 (rs-fMRI) 或重复性认知任务 (如“face matching”) 研究 MDD 的脑功能特征。人脑高度整合的功能活动依赖于具体的情境, 但 rs-fMRI 和重复性认知任务无法提供真实情绪情境, 因而不利于显示脑的情绪效价响应模式。本研究采用基于视频自然刺激的情绪诱发任务设计观察 MDD 患者在不同情绪效价下脑功能激活模式的差异, 为建立情绪效价依赖的精准神经调控治疗 MDD 范式提供基础。

方法 本研究为前瞻性研究, 纳入 8 名 MDD 患者及 9 名健康对照。研究依托于脑计划, MDD 患者满足: (1) 停药 14 天以上; (2) 首发复发均可; (3) 无其它 DSM 诊断的精神疾病; (4) 无其它躯体共病。自然刺激采用 3 段短片合集, 共 8 分 15 秒, 每段短片中间由“+”隔开, 无音频。研究另召集 29 名健康评估者对影片逐秒进行积极、消极两种情绪效价评估 (1 表示有情绪效价, 0 表示没有), 评估过程无音频信息。影片的整体情绪效价曲线根据 29 名健康评估者平均值定义。考虑积极情绪、中性情绪与消极情绪时长尽量匹配, 采用 0.6 作为积极、消极情绪效价阈值 (即 60% 以上健康评估者评分一致), 其余时间点标记为中性情绪。之后, 根据积极 (占 31%)、中性 (占 36%)、消极 (占 33%) 情绪效价在时间轴上的位置建立 SPM 脑激活检测模型, 以“积极-中性”对照图作为积极情绪激活图, 以“消极-中性”对照图作为消极情绪激活图。因样本量较小, 采用 $P < 0.05$ 未校正作为显著性阈值。

结果 双样本 T 检验表明, MDD 患者右侧颞-顶联合区、右侧脑岛以及辅助运动区积极情绪激活降低 ($P < 0.01$), 具体表现为: 健康对照上述脑区在积极情绪下正激活 ($P < 0.05$), 但 MDD 患者在积极情绪下负激活 ($P < 0.05$)。同时, MDD 患者左侧背外侧前额叶、膝下前扣带回以及楔前叶消极情绪激活升高 ($P < 0.01$), 具体表现为: 健康对照上述脑区在消极情绪下不激活 (即 $P > 0.05$), 但 MDD 患者在消极情绪下正激活 ($P < 0.05$)。

结论 上述结果表明, 颞顶联合区、运动区、岛叶、扣带回、楔前叶、背外侧前额叶等常见荟萃分析

MDD 差异脑区的激活模式依赖于情绪效价的变化, 提示未来依据情绪效价针对不同脑区进行精准神经调控治疗 MDD 是潜在的研究方向。

用 Open Vigil FDA2.1 对鲁拉西酮不良事件信号的分析

陈玉清¹ 王占璋^{1,2} 朱秀清^{1,2} 杨焯¹ 戴丽静¹ 卢浩扬^{1,2} 宋娥美³ 温预关^{1,2}

1. 广州医科大学附属脑科医院 I 期临床研究室

2. 广东省神经科学疾病研究重点实验室、神经致病基因与离子通道病省部共建重点实验室

3. 粤北第三人民医院药剂科

目的 用 Open Vigil FDA2.1 对美国食品药品监督管理局不良事件呈报系统 (FAERS) 数据库中鲁拉西酮的相关数据, 探究该药不良事件的发生情况, 为我国临床用药丰富经验, 提供依据。

方法 用 Open Vigil FDA2.1 提取 FAERS 数据库中 2010 年第四季度至 2023 年第三季度关于鲁拉西酮的不良事件数据, 用比值失衡测量法中的报告比值比 (ROR) 法与比例报告比 (proportional reporting ratio, PRR) 法的综合标准法进行数据挖掘与分析。

结果 共得到 32728 份以鲁拉西酮为首要怀疑药物的不良事件报告, 其中女性占比较大 (54.26%), 且多发生在成年人 (18~<60 岁)。筛选后获取 326 个首选术语 (PT) 信号, 累及 20 个系统器官分类 (各类损伤、中毒及操作并发症、全身性疾病及给药部位各种反应、精神病类等)。其中, 发生频次比较高的 PT 包括超说明书使用、感受异常、哭、焦虑、抑郁、失眠等; 信号强度较强的 PT 包括激活综合征、躁狂、舌运动障碍、低催乳素血症、静坐不能等。挖掘到多个新的可疑药物不良反应, 包括低催乳素血症、情绪贫乏、强硬舌等。

结论 鲁拉西酮安全性较佳, 女性服用该药时, 需密切关注催乳素水平。妊娠期、产褥期及围生期女性及代谢功能不佳的患者使用该药相对安全。低催乳素水平、不宁腿综合征是鲁拉西酮新的罕见的可疑不良事件。

Nkapl Deletion Cause Schizophrenia-like Cognitive Deficits Via Inhibitory Synaptic Transmission in MPFC in Mice

Yang Yang Weihua Yue*

Peking university sixth hospital

Objective The single nucleotide polymorphism (SNP) rs1635, located on the exon of the NKAPL gene, has been identified associated with schizophrenia (SCZ) risk and cognition in early-onset SCZ in Chinese Han population. These findings suggest that NKAPL gene might contribute to the mechanism of cognitive deficits in SCZ. However, how do this gene result in cognitive deficits in SCZ remains unknown. In this study, we have developed Nkapl knock out (KO) and conditional knock out (cKO) mouse model to investigate the mechanism of Nkapl under the cognitive deficits associated with SCZ

Methods Construct Nkapl KO and cKO mice and use the schizophrenia-like animal behavior paradigm to detect the behavioral phenotypes of these mice. We performed whole-cell recording to record the miniature postsynaptic excitatory currents and miniature postsynaptic inhibitory currents in pyramidal neurons in the medial prefrontal cortex of Nkapl KO and cKO mice. High performance liquid chromatography and mass spectrometry experiments were used to explore the content of related chemicals in the PFC in Nkapl KO mice. Real-time quantitative PCR, western blotting, dual luciferase report assay and bulk RNA sequencing were used to explore potential molecular mechanism

Results (1) Nkapl KO mice had schizophrenia-like performance. (2) Nkapl deletion results in reduction of GABAergic transmission in mPFC that lead cognitive deficits in mice. (3) Nkapl is a transcriptional repressor of GABA metabolizing enzyme SSDH. (4) Nkapl T153N is a key variant for inhibiting SSDH and

SCZ-like cognitive deficits in mice

Conclusion Nkapl as a transcriptional repressor of the GABA metabolizing enzyme succinic semialdehyde dehydrogenase (SSDH) regulates the rate of GABA metabolism in interneurons, that plays a role in inhibitory synaptic transmission in mPFC and contributes to cognitive behaviors

关键词: Schizophrenia, Nkapl, cognition, interneuron, inhibitory synaptic transmission

以精神障碍为首发症状的自身免疫性脑炎 1 例

周红 张蒙 韩瑞俊 姜丽艳 黄文倩 吕健宝*
北京回龙观医院

目的 自身免疫性脑炎 (Autoimmune Encephalitis, AE) 泛指一类以免疫介导的中枢神经系统疾病, 临床表现具有异质性, 极易误诊。本文通过报道 1 例以精神行为异常为首次发病症状的青少年男性患者的临床表现及诊疗经过, 以提高以精神障碍为首发症状的自身免疫性脑炎的早期发现、早期诊断及治疗。

方法 总结 1 例 14 岁以精神行为异常为首发症状的 AE 青少年患者的精神临床资料, 分析其临床表现和诊治经历, 总结临床特点, 为该类病例的临床诊疗提供参考。

结果 患者以“心情差、夜眠差、行为紊乱 2 周”在北京回龙观医院住院治疗, 入院第 3 天病情迅速进展, 出现发热、不自主运动增多、意识清晰度下降等, 查体示肌张力增高, 左足巴宾斯基征阳性。辅助检查示白细胞、肌酸激酶等心肌酶谱异常升高, 经抗炎及抗精神病药物治疗后病情控制不佳, 后转诊至北京儿童医院, 经脑脊液检测发现患者存在抗 N 甲基 D 天冬氨酸受体 (N-methyl-D-aspartate receptor, NMDAR) 抗体阳性, 被确诊为自身免疫性脑炎 (抗 NMDAR 脑炎), 确诊后接受免疫调节治疗, 患者意识、情绪、精神行为等均改善。

结论 儿童青少年早期出现精神行为异常表现, 包括情感症状、认知障碍、言语及行为障碍等, 应考虑到 AE 的可能, 需尽早完善脑脊液等相关检查, 尽早转诊治疗。

关键词: 自身免疫性脑炎,精神病性症状,儿童青少年,抗 N 甲基 D 天冬氨酸受体脑炎

Cross-frequency Coupling of Brain Oscillations in Schizophrenia

Rui Xue Sugai Liang Xiaojing Li Jianning Chen Peiyan Ni Yan Xu Wei Deng Wanjun Guo Tao Li*

Affiliated Mental Health Center & Hangzhou Seventh People's Hospital and School of Brain Science and Brain Medicine, Zhejiang University School of Medicine, Hangzhou, 310058, China

Objective Cross-frequency coupling in schizophrenia (SCZ) patients has been a key area of research. The coupling of oscillations originating from remote neural populations may serve as the basis for neural communication via cross-frequency phase-amplitude coupling (PAC). In this study, we examined (1) the modulation index (MI) values of the PAC for the SCZ and healthy controls (HC) groups across different phase and amplitude bands, (2) the MI values of the PAC for the SCZ or HC groups between observed data and surrogate data of different phase and amplitude bands, and (3) the coupling of higher frequency amplitudes (alpha, beta, and gamma bands) with lower frequency phases (delta and theta bands) at every individual electrode for the SCZ and HC groups

Methods We collected the resting-state electroencephalography of SCZ patients (n = 274) and age-, gender- matched HC (n=137) and explored the large-scale oscillations between low-frequency phases and high-frequency amplitudes in a cross-sectional design

Results The results indicated that there is a general phase-amplitude coupling between low-frequency phases and high-frequency amplitudes in HC and SCZ patients. In the delta phase, SCZ patients exhibited a statistically significant rise in the coupling of delta-alpha, delta-beta and delta-gamma in comparison to the HC group. In the theta phase, SCZ patients exhibited a statistically significant rise in the coupling of theta-alpha, theta-beta in comparison to the HC group

Conclusion

Our findings indicated that both SCZ patients and HC had PAC between low-frequency phases and high-frequency amplitudes. The discrepancies between SCZ patients and HC focalize the delta-alpha, delta-beta, delta-gamma and theta-alpha couplings, implying widespread impairments in low-frequency bands in patients with schizophrenia.

Investigating The Role of The Suprachiasmatic Nucleus& Deep Brain Stimulation in Bipolar Disorder Using A C57BL/6 Mouse Model

SAEED SABOOR^{1,3}, Huaizhi Wang^{2,3}, Shaohua Hu^{1,2,3}

1.Department of Psychiatry, The First Affiliated Hospital, Zhejiang University School of Medicine, Hangzhou, China

2.School of Mental health , Wenzhou medical university, Wenzhou,China

3.Nanhu Brain-computer Interface Institute, Hangzhou, China

Background and Aims: Bipolar disorder is a complex psychiatric condition characterized by mood swings between manic and depressive states, often accompanied by disturbances in circadian rhythms. The suprachiasmatic nucleus (SCN), a master circadian pacemaker in the brain, regulates daily rhythms of behavior and physiology. However, its involvement in bipolar disorder pathophysiology remains unclear. This study aims to elucidate the role of the SCN in bipolar disorder using a C57BL/6 mouse model. Specifically, we hypothesize that disrupting SCN function through lesions will induce bipolar-like behaviors and circadian disruptions, which can be mitigated by targeted deep brain stimulation (DBS). We further aim to investigate the molecular mechanisms underlying these changes, focusing on alterations in clock gene expression and

neuronal activity markers

Methods A series of experiments will be conducted using male C57BL/6 mice divided into four groups: Control (no intervention), SCN Lesion (bilateral electrolytic lesions of the SCN), DBS (DBS targeting the SCN without lesions), and SCN Lesion + DBS (combination of SCN lesions and DBS). Behavioral tests, including open field, elevated plus maze, forced swim, and sucrose preference tests, will assess mood-related behaviors at multiple time points post-intervention. Circadian rhythm analysis will be performed using locomotor activity monitoring under light-dark conditions and constant darkness. Molecular analyses, including immunohistochemistry and gene expression profiling, will examine changes in clock gene expression and neuronal activation markers in the SCN and other relevant brain regions

Results and Discussion: Preliminary findings suggest that SCN lesions induce bipolar-like behaviors, including increased locomotor activity, anxiety-like, and depression-like behaviors, alongside disrupted circadian rhythms. DBS treatment is anticipated to ameliorate these behavioral and circadian disruptions, demonstrating its therapeutic potential. Molecular analyses will provide insights into the underlying mechanisms of DBS, elucidating changes in clock gene expression and neuronal activity markers. These results will enhance our understanding of the SCN's role in bipolar disorder pathophysiology and inform novel therapeutic strategies

Conclusion This study aims to advance our understanding of the involvement of the SCN in bipolar disorder and explore the therapeutic potential of DBS. By integrating behavioral, circadian, and molecular analyses, we seek to elucidate the complex interactions between the SCN, mood regulation, and circadian rhythms. Ultimately, these findings may pave the way for personalized treatment approaches targeting circadian dysregulation in bipolar disorder

关键词: Suprachiasmatic Nucleus; Deep brain stimulation; Bipolar Disorder; pathophysiology; therapeutic strategies

青少年非自杀性自伤与人格特征的关系：心理弹性与述情障碍的中介效应

刘丽萍* 郑新竹 张于 张敏 裴珂彤
哈尔滨市第一专科医院

目的 探讨青少年非自杀性自伤 (NSSI) 与人格特征、心理弹性及述情障碍之间的关系, 并探讨心理弹性、述情障碍在青少年 NSSI 行为与人格特征间的中介作用。

方法 选取 2023 年 10 月至 2024 年 4 月哈尔滨市第一专科医院住院及门诊患者 350 例作为研究对象, 采用一般情况调查表、青少年非自杀性自伤行为评定问卷、艾森克人格问卷 (EPQ)、心理弹性量表 (CD-RISC-10)、多伦多述情障碍量表 (TAS-20) 进行量表评估。应用 SPSS 22.0 软件进行数据统计分析, 进一步应用 Hayes 编制的 PROCESS 3.3 版本中的模型四, 采用 Bootstrap 法(抽取 5000 个样本)进行中介效应检验。

结果 应用 Pearson 相关分析发现, 心理弹性与非自杀性自伤行为负相关 ($R=-0.36, P<0.001$), 述情障碍、神经质人格、精神质人格及内外倾向性与非自杀性自伤行为正相关 (R 分别为 -0.39 、 -0.29 、 0.33 、 $-0.20, P<0.001$)。中介效应检验结果显示各路径 95%置信区间均不包含 0, 心理弹性和述情障碍在神经质对非自杀性自伤行为影响过程中发挥部分中介作用, 中介效应占比分别为 16.4%、22.2%。心理弹性和述情障碍在神经质对非自杀性自伤行为影响过程中发挥部分中介作用, 中介效应占比分别为 21.5%、24.7%。

结论 青少年 NSSI 行为的发生与神经质或神经质人格、心理弹性水平和述情障碍有关。神经质或神经质人格特征不仅可以直接预测青少年 NSSI 行为的发生, 还可以通过心理弹性和述情障碍间接影响青少年 NSSI 行为, 未来可以通过提高神经质或神经质人格特征青少年的心理弹性水平和述情能力, 以减少其 NSSI 行为的发生。

TMS-EEG 在跨学科应用的研究进展

魏堃 毕波*

中山大学附属第八医院

目的 近年来,经颅磁刺激与脑电图的结合(TMS-EEG)在跨学科研究方法中的应用越来越广泛,这种方法通过刺激不同大脑皮层区域并实时记录大脑电活动,以此来绘制大脑功能网络活动与行为之间的因果关系。因此,本文旨在综述 TMS-EEG 技术在认知功能与神经心理疾病等应用的研究进展,希望为其精准治疗提供新的视角。

方法 通过在 PubMed、Google Scholar、Web of Science 数据库中进行数据检索,检索 2024 年 6 月 1 日之前发表的所有论文,由包括作者在内的两名评估员独立进行质量评估审查,最后总结出 TMS-EEG 的最新研究进展。

结果 TMS-EEG 技术在基础和临床的神经认知科学研究中有广泛的应用前景,TMS-EEG 的结合使得研究者可以测评不同大脑皮层的反应性和连接性,还可以用于研究皮层振荡与认知功能的相互作用。已有针对精神分裂症患者群体或阿尔兹海默病的 TMS-EEG 研究,观察到患有阿尔兹海默病的老年患者存在皮质兴奋性和连接的受损,精神分裂症患者报告了前额叶皮层 γ 振荡异常,可作为疾病状态的危险因素和内表型生物标志物进行探索。此外,TMS-EEG 用于注意力缺陷与多动障碍和成年癫痫中患者中,可发现患儿的 N100 成分振幅较小,在癫痫患者中可识别致癫痫区并显示出揭示神经调节疗法的生物标志物的潜力。最后,将 TMS-EEG 与脑机接口(BCI)相结合提供了进行闭环状态依赖性脑刺激的可能性,这在神经康复和神经治疗方面具有巨大的潜力。因此,TMS-EEG 在未来研究领域具有现实的潜力,可以作为一种诊断技术来指导基于常见生物学缺陷的患者分层并为患者和病变风险高的个体制定预后和治疗策略。

结论 迄今为止进行的 TMS-EEG 实验说明了 TMS 与脑电图的结合为大脑研究提供了强大的工具,通过直接干预和实时监测大脑活动,可以更深入地理解大脑功能的动态变化及其与行为的关系,为指导识别疾病状态和靶向个体化治疗提供神经精神生理基础。

AiTBS 联合刺激左侧前额叶-小脑干预抑郁发作患者自杀意念的疗效及机制研究

黄东 钟舒明 张荣旭 宋小东 赖顺凯 张一靓 贾艳滨*

暨南大学附属第一医院

目的 本研究探讨 20Hz 的加速间歇性 Theta 节律刺激 (accelerated intermittent Theta Burst Stimulation, aiTBS) 联合刺激左侧小脑及左侧背外侧前额叶皮层 (DLPFC) 治疗抑郁发作患者自杀意念的疗效和机制。

方法 aiTBS 方案: iTBS (丛内频率 20Hz 的 3 脉冲串,丛间频率 5Hz,刺激 2s 间歇 8s,共 600 脉冲,用时 3min9s)、每次治疗间隔 60min、每日 5 次、连续 4 天,共 20 次。纳入 81 例 12-34 岁伴自杀意念的单、双相抑郁障碍患者,随机分配至干预组和控制组。干预组联合刺激左侧 (DLPFC) 及左侧小脑,控制组真刺激左侧 DLPFC 及伪刺激左侧小脑。采用贝克自杀意念量表 (SSI) 评估自杀意念;采用 24 项汉密尔顿抑郁量表 (HDRS) 和贝克抑郁自评量表 (BDI) 评估抑郁症状。检测干预前后脑源性神经营养因子 (BDNF)、原肌球蛋白相关激酶 B (TrkB)、磷脂酰肌醇 3-激酶 (PI3K)、蛋白激酶 B (AKT) 及哺乳动物雷帕霉素靶蛋白 (mTOR) 血清浓度。随访时间为 6 个月。主要结局指标为干预前后 SSI 的变化。

结果 (1) 疗效及安全性: 干预组的抗自杀有效率和缓解率分别为 56.1% 和 36.6%,控制组分别为 41.0% 和 23.1%,两组差异均无显著性 (均 $p > 0.05$)。SSI 和 HDRS 的组别*时间交互效应显著 (均 $p < 0.01$)。简单效应分析示,干预期间两组 SSI 和 HDRS 分值均呈下降趋势,但干预组显著低于控制组 (均 $p < 0.05$)。干预期间未发现躁狂等严重不良反应及认知功能损伤。

(2) BDNF 通路: 血清 BDNF、TrkB、PI3K、AKT 以及 mTOR 的时间效应均显著 (均 $p < 0.001$),但组别*时间交互效应均不显著 (均 $p > 0.05$)。干预后 BDNF、TrkB 和 AKT 的血清浓度高于基线,而 PI3K 和 mTOR 的血清浓度低于基线。偏相关分析显示,干预组的 SSI 减分值与 BDNF 变化值呈负相关 ($r = -0.46, p < 0.05$),控制组的 HDRS 减分值与 BDNF

变化值呈正相关 ($r=0.43, p<0.05$), 均通过了 Bonferroni 校正。

(3) 随访 6 个月疗效: SSI 的组别效应、时间效应和组别*时间交互效应均显著 (均 $p<0.05$); 干预组在随访 6 月时仍显著低于控制组 ($p<0.01$)。BDI 的时间效应显著 ($p<0.001$), 组别*时间交互效应不显著 (均 $p>0.05$)。

结论 aiTBS 联合刺激左侧小脑及 DLPFC 可在 4 天内快速改善抑郁发作患者自杀意念, 部分患者的疗效可维持 6 个月, 其机制涉及 BDNF 通路改变, 且具有良好的安全性。

关键词: 间歇性 theta 节律刺激、小脑、抑郁发作、自杀意念

奥氮平引起的脂代谢异常与 PCSK9 水平变化的相关性研究

马家树 李然然* 褚昊冉 朱厚名 蒋一佳 刘雯
山东省精神卫生中心

目的 以奥氮平为代表的第二代抗精神病药物会引起精神分裂症患者的脂代谢紊乱, 但具体机制尚不明确, 前蛋白转化酶枯草溶菌素 9(PCSK9)是调节血清胆固醇水平的重要因素, 通过促进低密度脂蛋白受体(LDLR)的降解, 从而影响胆固醇的清除, 是最近降脂药物研究的重要靶点。本研究通过分析奥氮平引起的脂代谢异常及其与血清 PCSK9 水平之间的关联, 探索奥氮平引起脂代谢异常的可能机制, 特别是 PCSK9 在此过程中的作用与影响。

方法 招募首发或半年内未服用抗精神病药物的精神分裂症患者 40 例, 性别不限, 年龄: 18-60 岁。阳性和阴性症状量表评分 ≥ 60 分, 临床总体印象量表 ≥ 4 分, 血脂、体重、血压、血糖等均在正常范围内。在基线期和治疗后的第 4 周末检测患者外周血中甘油三酯(TG)、总胆固醇(TC)、高密度脂蛋白(HDL)、低密度脂蛋白(LDL)浓度。并采用酶联免疫吸附法检测外周血中 PCSK9 浓度。

结果 治疗 4 周末与治疗前比较, 使用奥氮平的精神分裂症患者外周血中 TG、TC、LDL 显著升高 ($p<0.05$), HDL 无显著差异 ($p>0.05$); PCSK9 水平显著升高 ($P<0.05$); PCSK9 与 LDL 之间存在显著的相关性 ($r=0.329, p<0.05$)。

结论 奥氮平可引起精神分裂症患者的外周血 TG、TC、LDL、PCSK9 显著升高, 且 PCSK9 与 LDL 之间存在显著相关性, 提示 PCSK9 可能是奥氮平引起脂代谢异常的一个关键调节因素。

Mendelian Randomization Analyses Identify The Causal Association between Schizophrenia and Aging

Yingting Tan Shunying Yu* Qingqing Xu Ruiyi Qian
Wanying Wang Yu Cheng Xue Zhao Fan Mou
Shang Mental Health Center

Objective Considerable evidence indicates the correlation between schizophrenia and aging, but further research is imperative to substantiate a causal linkage. This study aims at exploring the potential causal association between schizophrenia and aging via mendelian randomization (MR)

Methods We carried out bi-directional two-sample MR analyses to assess the causal association between schizophrenia and aging proxies from available genome-wide association studies (GWAS). For all MR analyses, we employed the inverse variance weighted (IVW) method as the primary outcome and excluded outliers by RadialMR and MR Steiger filters. Sensitivity analyses were conducted to ensure the stability and validity of our results

Results The results revealed that schizophrenia was causally associated with declined cognitive performance ($\beta = -0.064; P = 0.000; \text{FDR-corrected } P = 0.000$), decreased appendicular lean mass(ALM) ($\beta = -0.005; P = 0.001; \text{FDR-corrected } P = 0.016$) and whole-body lean mass (WBLM) ($\beta = -0.013; P = 0.000; \text{FDR-corrected } P = 0.000$) as well as increased mother's attained age ($\beta = -0.010; P = 0.005; \text{FDR-corrected } P = 0.038$). Additionally, the reverse MR analyses found that facial aging ($\beta = -0.536; P = 0.001; \text{FDR-corrected } P = 0.007$), cognitive performance ($\beta = -0.364; P = 0.000; \text{FDR-corrected } P = 0.000$), DNA methylation of granulocyte proportions ($\beta = -3.069; P = 0.000; \text{FDR-corrected } P = 0.000$).

corrected $P = 0.000$) and change rate of surface area ($\beta = -0.000$; $P = 0.002$; FDR-corrected $P = 0.019$) were associated with a reduced risk of schizophrenia. Of these results, sensitivity analysis found no heterogeneity or horizontal pleiotropy except for ALM, which may have horizontal pleiotropy

Conclusion Overall, our MR analyses indicate that schizophrenia results in a higher risk of accelerated aging including declined cognition and sarcopenia. Moreover, the results suggest that facial aging, cognitive performance, epigenetic age and change rate of surface area are negatively associated with schizophrenia

Effects of Intermittent Theta Burst Stimulation on Cognition and Clinical Symptoms of Adolescents in Depressive Episode

Yuwei Xia Peiyang Li Bin Zhang* Ling Sun
Tianjin Anding Hospital

Objective To explore the feasibility of iTBS to improve cognitive function in adolescents with depressive episodes and to investigate the effect of clinical symptoms on cognitive function in those individuals.

Methods A total of 30 patients were collected from outpatient department of child and adolescent psychology in Tianjin Anding Hospital. The Aim Magnetic Stimulation Robot (AIM-III), and Mag TD (Yiruide Medical Equipment New Technology Co., Ltd., Wuhan, China) with an active, 70-mm figure-of-eight, air-cooled coil were used to stimulate the left dorsolateral prefrontal cortex (L-DLPFC). The minimal intensity that was defined as the resting motor threshold (RMT) resulted in eliciting responses greater than 50 μV in at least five of 10 stimulations. The iTBS protocol involved 50-Hz triplet bursts repeated at 5 Hz, with a 2-second on and 8-second off cycle, delivering a total of 1800 pulses per session at 70% of resting motor threshold (RMT). Participants underwent 2-day, five iTBS

sessions daily, each comprising 1800 pulses and separated by 50-minute intervals. Over the 4-week maintenance treatment period, two sessions of 1800 pulses were administered weekly. The sociodemographic questionnaire was used to investigate their demographic characteristics; the Montgomery Depression Rating Scale (MADRS), Patient Health Questionnaire (PHQ-9), and Generalised Anxiety Scale (GAD-7) were used to assess the patients' depression and anxiety levels; and their cognitive functions were tested by the Thinc-it (DSST, CRT, TMT, 1-BACK, PDQ-5). Patients were assessed at baseline, after accelerated treatment, and after maintenance treatment. Statistical analyses were carried out using SPSS27.0 software. Descriptive statistics were performed to report the scores of demographic variables, the 5 dimensions of cognitive function assessment and clinical symptoms. Repeated measures ANOVA or Friedman nonparametric test examined the effects of time on the clinical symptoms and cognitive function. Linear regression analysis was used to analyze the influencing factors of cognitive function subtraction scores after treatment

Results A total of 22 patients completed the whole treatment and assessment, and cognition and clinical symptoms improved significantly from baseline after accelerated and maintained treatment. Among them, after accelerated treatment, the correct number of DSST was significantly increased ($P=0.044$) and the MADRS score was significantly decreased ($P=0.002$) compared with baseline. After maintenance treatment, the correct number of 1-BACK($P=0.000$), CRT($P=0.048$) and DSST($P=0.008$) were significantly increased compared with baseline, and the response time of TMT was significantly decreased ($P=0.005$). In terms of clinical symptoms, MADRS($P=0.002$) and PHQ-9($P=0.000$) scores were significantly decreased. The results of linear regression analysis showed that the higher the baseline MADRS score, the lower the TMT reduction score ($\beta=-0.45$, $R^2=0.20$, $P=0.04$)

Conclusion As a novel safe, and non-invasive technique, our study demonstrated for the first time that the 2-day accelerated treatment with iTBS combined with a 4-week maintenance regimen is safe, effective and well-tolerated in intervening the cognitive function

of depressive episode in adolescents. Besides, the severity of depression at baseline affected the improvement of cognitive function, and the higher the severity of depression at baseline, the worse the improvement of cognitive function (TMT)

Hippocampal Mitophagy Contributes To Spatial Memory Via Maintaining Neurogenesis During The Development of Mice

Le Xu Saboor Saeed Xinxu Ma Shaohua Hu*

Department of Psychiatry, The First Affiliated Hospital, Zhejiang University School of Medicine, Hangzhou, 310003, China

Objective Impaired mitochondrial dynamics have been identified as a significant contributing factor to reduced neurogenesis under pathological conditions. However, the relationship between mitochondrial dynamics, neurogenesis, and spatial memory during normal development remains unclear. This study aims to elucidate the role of mitophagy in the spatial memory mediated by neurogenesis during development

Methods Adolescent and adult male mice were used to assess spatial memory performance. Immunofluorescence staining was employed to evaluate levels of neurogenesis, and mitochondrial dynamics were assessed through western blotting and transmission electron microscopy. Pharmacological interventions further validated the causal relationship between mitophagy, neurogenesis, and behavioral performance during development

Results The study revealed differences in spatial memory between adolescent and adult mice. Diminished neurogenesis, accompanied by reduced mitophagy, was observed in the hippocampus of adult mice compared to adolescent subjects. Pharmacological induction of mitophagy in adult mice with UMI-77 resulted in enhanced neurogenesis, and prolonged spatial memory retention. Conversely, inhibition of mitophagy with Mdivi-1 in adolescent mice led to reduced hippocampal

neurogenesis and impaired spatial memory

Conclusion The observed decline in spatial memory in adult mice is associated with decreased mitophagy, which affects neurogenesis in the dentate gyrus. This underscores the therapeutic potential of enhancing mitophagy to counteract age- or disease-related cognitive decline

Analysis of Factors Affecting Laboratory Alert Level of Trazodone Based on Therapeutic Drug Monitoring Data

Jing Ding*

Xi'an Mental Health Center

Objective Trazodone is an intriguing antidepressant that exhibits its pharmacological effects in a dose-dependent way, and different doses may exert distinct effects. It is seldom prescribed as a standalone medication, typically being utilized as a synergist in combination with other antidepressants for the management of depression. Previous studies have highlighted the importance of therapeutic drug monitoring for personalized dosing of trazodone due to significant variability in drug exposures. However, there is a lack of available reports on the risk factors linked to trazodone plasma concentrations exceeding laboratory alert levels. Furthermore, current literature fails to provide information on the optimal dosage required to achieve the recommended therapeutic reference concentration of trazodone when used in combination with other antidepressants for depression treatment in real-world clinical settings. To address this gap in the literature, we conducted a single-center, retrospective cohort study at the Xi'an Mental Health Center

Methods We conducted a single-center, retrospective, cross-sectional study at Xi'an Mental Health Center in China and collected data on trazodone-treated patients from 2019 to 2021

Results The results indicated that 20.6% of patients receiving daily trazodone doses between 25-200 mg had plasma concentrations exceeding laboratory alert levels. A stepwise logistic regression analysis using a stepwise method identified that trazodone daily dose and concomitant use of selective serotonin reuptake inhibitors (SSRIs) antidepressants were identified as risk factors for surpassing laboratory alert levels in plasma concentrations, with odds ratios (OR) of 1.04 and 2.86, respectively (Figure 1). The receiver operating characteristic (ROC) analysis revealed that a daily dose of trazodone at 50 or 75 mg was recommended to reach plasma levels of 700–1000 ng/mL when combined with other antidepressants. The area under the ROC curve was 0.791 ($p < 0.01$) and 0.664 ($p < 0.01$), respectively (Figure 2)

Conclusion In summary, the meaningful clinical results obtained in the current study provide important and valuable suggestions for future personalized medication of trazodone,

A Clustering Analysis of Antipsychotics Treatment Response in Patients with Schizophrenia

Meng Zhou Yamin Zhang Tao Li*
Hangzhou Seventh People's Hospital

Background Clinical heterogeneity in schizophrenia presents a significant challenge to personalized medicine, as patients with different clinical features may exhibit distinct pathological mechanisms and variable responses to different medications. Previous studies had identified various subgroups of schizophrenia through cluster analysis based on clinical characteristics. However, the differences of patients' responses to medication among these clinical subtypes remains unknown

Objectives To compare the response rate of antipsychotics treatment among different clinical subtypes on patients with schizophrenia

Methods In this study, a total of 3030 patients

experiencing an episode of schizophrenia were randomly assigned to monotherapy with five atypical antipsychotics and two typical antipsychotics over a 6-week medication trial. Clinical symptoms were assessed using Positive and Negative Symptoms Scale (PANSS), and metabolic indices (including body mass index, fasting blood lipid and glucose) were repeatedly measured throughout the trial. At baseline, we clustered patients into different subtypes based on their clinical features and subsequently compared the characteristics, metabolic indices and their treatment responses among clusters after 6 weeks based on one-way analysis of variance (ANOVA) and χ^2 tests. Next, we used logistic regression models to predict the outcome based on the cluster

Results Patients could be classified into four clusters. Patients in cluster-M exhibited mild symptoms across all symptom dimensions, while Cluster-P patients displayed severe positive and excited symptoms. Patients in cluster-S presented with severe symptoms across five dimensions, with negative symptoms potentially being secondary due to their positive association with positive symptoms. In contrast, Cluster-N patients exhibited severe primary negative symptoms, as their negative symptoms were not correlated with any other symptom dimensions. Sex, age, age of onset, educational level, married status all showed significant group differences by cluster. In addition, higher levels of low-density lipoprotein and lower levels of high-density lipoprotein were observed in Cluster-N, while Cluster-M patients exhibited higher levels of triglycerides

We found significant differences in overall and symptom-specific responses to medication among the four clusters. For overall responses, Cluster-N and Cluster-S exhibited poorer outcomes (Cluster-M as reference). Additionally, Cluster-N showed poorer outcomes in negative symptoms, while Cluster-N and Cluster-P exhibited worse responses in positive and disorganized symptoms. Subsequently, we investigated whether patients in different subtypes responded differently to various antipsychotics, and whether blood fasting lipid levels at baseline were associated with response. In Cluster-N, patients responded better to Olanzapine, and baseline high-density lipid levels were negatively asso-

ciated with response rates. In Cluster-P, patients responded better to Risperidone. However, patients in Cluster-S and Cluster-M did not display difference in response to various antipsychotics when controlling for blood lipid levels.

Conclusion Overall, our preliminary findings indicate the presence of clinical subtypes in schizophrenia, with different subtypes exhibiting varying responses to medication. Specifically, patients with negative symptoms (including primary and secondary negative symptoms) showed poor outcomes following medication, and patients with primary negative symptoms showed better responses to Olanzapine. Further analysis is needed to elucidate the patterns of medication responses and influence factors among these clinical subtypes

Two Hits of Insomnia and Inflammation Exploring The Pathogenesis of Depression

JUNHUA MEI Zhongchun Liu* Xinhui Xie
Renmin Hospital of Wuhan University

Objective Studies have established that individuals with insomnia are more susceptible to depression when confronted with a dual assault from inflammation

Methods Here we developed a novel depressed rat model based on two hits of insomnia and inflammation. In Experiment One, 48 rats were divided into four groups: control (CON, 12), LPS injection (LPS, 12), sleep deprivation (SD, 12), and model (MOD, 12). In Experiment Two, 24 rats were assigned to a control group (8), physiological saline (SAL, 8), and fluoxetine (FLX, 8) groups. Behavioral assessments were conducted across all groups. After the modeling phase, we analyzed the hippocampal (HIP) and prefrontal lobe (PFL) from each rat group, performing RNA and protein sequencing analysis. We performed clustering analysis, differential expression, and enrichment analysis to investigate the potential mechanisms of the two-hit model,

and then conducted a comprehensive analysis of depression-related biological phenotypes using western blotting, immunofluorescence, transmission electron microscopy (TEM), and Golgi-Cox staining. Ultimately, we also have identified targeting genes in the two-hit model

Results Behavioral and pharmacological tests on rat groups revealed that chronic sleep deprivation, combined with LPS treatment, induced anxiety and depressive-like behaviors, which were effectively mitigated by fluoxetine. Through RNA and protein sequencing analysis, we found that synaptic plasticity decline and neuroinflammation are key in the two-hit model, validated by a series of techniques. We also identified four potential targets (IL21r, ARPC1b, Nos2, and Dnm2) for further understanding the molecular mechanisms in depression

Conclusion The two-hit depressed model demonstrated phenotype replication of depression, with the combined effects of SD and LPS significantly outperforming the effects of either SD or LPS alone. Neuroinflammation and synaptic plasticity play crucial roles in this model. This provides valuable tools for further exploration of the pathogenesis of depression. Multi-omics analysis identified four potential targets in the context of the two hits, revealing complex mechanisms of insomnia and inflammation in depression

关键词: insomnia, inflammation, depression, two hits, synaptic plasticity,

IL15Ra 基因敲除小鼠的海马体单细胞图谱揭示了 IL15 在中枢神经系统中的作用及其对神经精神疾病的影响

聂亚丹 罗燕婷 贺毅*
首都医科大学附属北京安定医院

目的 白介素 15 (IL-15) 是多种免疫细胞的趋化因子, 对免疫调节起着关键作用。IL15 信号传导在神经保护方面具有重要作用, 对于维持大脑正常功能和认知能力至关重要。此外, IL15 还与神经精神疾病的进展有关, 例如阿尔茨海默病和帕金森病。

IL15R α 敲除小鼠表现出明显的类精神疾病行为。鉴于 IL15 的广泛表达和严格分泌的特性,以 IL15 及其受体作为免疫相关疾病治疗靶点的研究日益受到重视。因此,研究中枢神经系统中 IL15 的炎症作用机制,可能为神经系统疾病的诊断和治疗提供新的潜在靶点。本研究利用 IL15R α 敲除小鼠的海马体单细胞转录组数据,探讨 IL15 功能异常对海马体调控机制的影响,以确定关键的细胞类型和细胞功能。

方法 研究将采用单细胞转录组测序技术,对 3 只雄性野生型小鼠(WT 组)和 3 只雄性 IL15R α 敲除小鼠(KO 组)进行测序,经过数据质控和预处理,对细胞基因表达矩阵进行细胞聚类、细胞注释、差异表达基因鉴定、基因功能富集、细胞轨迹推断、细胞通讯分析和基因特征打分等分析。以揭示 IL-15 和 IL-15R 在神经元和胶质细胞中的表达模式及其对神经网络功能的影响。

结果 我们从 64437 个单细胞转录组数据中注释得到了包括兴奋性 CA 神经元、兴奋性 DG 神经元、抑制性 Sst 神经元、抑制性 Meis2 神经元、CR 神经元、星形胶质细胞、少突胶质细胞、小胶质细胞、室管膜细胞和周细胞共计 10 个细胞类型,23 个细胞亚型。

结论 我们观察到,在 IL-15R α 缺失的情况下,兴奋性神经元与抑制性神经元在不同细胞亚型的数量分布和基因表达模式上均显示出显著差异。这些差异不仅揭示了 IL-15R α 在维持神经元亚型平衡中的关键作用,而且为 IL15 作为精神疾病治疗靶点提供了更为丰富的科学依据。这一发现不仅为理解神经元亚型的调控机制提供了新的视角,也为未来开发针对精神疾病的新型治疗策略开辟了新的可能性。

一种快速同时检测人头发及血中 16 种精神科常用药物的超高效液相色谱的方法学研究及其应用

孙秀佳*

上海市精神卫生中心

目的 精神心理疾病患者往往需要药物治疗,个别患者存在服药依从性不佳,影响了医生诊疗效

果,头发具有稳定,检测窗长,无创,采样简便等特点,是追溯服药史的有力检材。头发平均每个月生长 1cm,分段分析也适合用于监测历史服药情况和种类的判断,特别适合在精神科门诊随访患者近期服药规律性及服药种类的确证。目前头发中浓度监测的方法多是质谱法,质谱昂贵且对环境和操作人员要求高,基层很难开展。因此本研究拟建立一种 UPLC-UV 同时检测头发及血中精神科常用药物,可在临床及门诊中应用于漏服药患者及孕妇用药后对胎儿影响的评价等研究。

方法 本文采用 ACQUITY UPLC BEH C18 (2.1mm \times 50mm, 1.7 μ m) 色谱柱,流动相为 0.05% 甲酸-水溶液(A)和 0.05%甲酸-甲醇溶液(B)梯度洗脱,流速为 0.4mL/min,检测波长为 254nm 和 285nm,柱温为 40 $^{\circ}$ C。采用液-液萃取生物样本中药物并基于甲氧氯普胺为内标 UPLC-UV 法实现了包括抗精神病药物(氨磺必利、氯氮平、去甲氯氮平、阿立哌唑、脱氢阿立哌唑、奥氮平、米氮平、利培酮、9-OH 利培酮、曲唑酮、氯丙嗪、喹硫平、卡马西平)及镇静催眠药物(佐匹克隆、氯硝西洋、艾司唑仑以及阿普唑仑)的色谱分离。

结果 本研究建立的方法能在 28min 内实现 16 种成分的有效检测,分离度符合要求,能够有效筛查头发样本中常用抗精神病及镇静催眠类药物。本研究中应用本方法分析了 17 例临床采用氯氮平治疗的患者连续 3 个月的头发及血清样本,结果该方法稳定,简单,可应用于临床检头发中多种常用抗精神病药物的检测。

结论 该方法简单实用,流动相不含盐类,使色谱柱清洗更容易,并同时实现了人血及头发中 12 种抗精神病药物及活性代谢物的有效分离,无需昂贵的质谱法即可实现临床常用的多种抗精神病药物及代谢物的同时监测,适用于血及头发中多种药物的筛查可提供给临床辅助诊断历史服药信息。

光照联合药物治疗老年期抑郁障碍的临床疗效观察

董悦 李艺嘉 乔君*

河北医科大学第一医院

目的 评估在抗抑郁药物治疗的基础上的光照疗法,对于老年期抑郁障碍患者的临床疗效和安全性。

方法 纳入 2022 年 12 月至 2023 年 12 月期间在我院精神卫生中心住院治疗的老年期抑郁障碍患者 60 例,利用计算机生成随机数字的方法将入组的受试者 1:1 分为干预组 (n=30) 和对照组 (n=30)。在常规使用抗抑郁药物治疗的基础上,持续 2 周于每日清晨 7:00-7:30 给予干预组光照强度为 10000lux 的光照治疗,对照组不予光照干预,余治疗同干预组。分别在基线、治疗的第 1 周末及治疗的第 2 周末使用 17 项汉密尔顿抑郁量表 (Hamilton Depression Scale, HAMD-17) 的总分和减分率评估两组受试者的临床症状改善程度。在治疗期间每日记录患者自我报告的不良反应情况。通过 Fisher 确切概率法和卡方检验比较两组间第 1 周末和第 2 周末的 HAMD-17 量表减分率的差异。采用两独立样本 t 检验和重复测量方差分析对不同时间节点两组 HAMD-17 量表的分值进行分析。

结果 最终共有 47 例受试者完成本研究,其中干预组 22 人,对照组 25 人。基线时两组的一般资料特征未见明显差异 ($P>0.05$),具有可比性;对 HAMD-17 分值作重复测量方差分析,结果提示时间和分组对 HAMD-17 减分效应显著。对两组第 1 周末和第 2 周末的 HAMD-17 评分进行比较,结果显示两组间存在差异,结果具有统计学意义 ($P<0.05$);干预组在光照治疗 2 周末时的有效率高于对照组,二者的差异具有统计学意义 ($P<0.05$)。其中接受光照的受试者中仅有 1 例出现轻微头晕、恶心,其余均无明显不适。

结论 光照疗法联合抗抑郁药物治疗可在两周内明显改善老年期抑郁障碍的抑郁症状,是一种较为安全有效且依从性好的干预手段。

抑郁症患者外周血 NLR、MLR、PLR 和 SII 水平的变化

侯灵芝 李红*

郑州大学第一附属医院

目的 抑郁症 (depressive disorder) 是一种常见的严重精神障碍,其致残率及复发率高,发病率呈逐年升高趋势。炎症因子假说一直是抑郁症的研究热点,外周血中炎症因子跨过血脑屏障,干扰脑内情绪调节区域的神经递质代谢及神经元活动,引发抑郁症。中性粒细胞与淋巴细胞比值 (neutrophil to lymphocyte ratio, NLR)、单核细胞与淋巴细胞比值 (monocyte to lymphocyte ratio, MLR)、血小板与淋巴细胞比值 (platelet to lymphocyte ratio, PLR) 和全身免疫炎症指数 (systemic immune inflammatory index, SII) 作为一种易于获得的比值指标,比单一的生化指标更敏感,尤其是 SII,被认为是炎症状态的理想指标。因此本研究纳入抑郁患者及匹配的健康人群,进一步明确两者间 MLR、NLR、PLR、SII 等炎症指标之间的关系,以及不同亚型抑郁患者在炎症状态下是否存在差异,希望为抑郁症的病理机制及其诊疗评估提供依据和线索。

方法 选取 2023 年 1 月至 2023 年 6 月收治的 190 名抑郁症患者 (DP 组) 及年龄、性别相匹配的 100 名健康对照者 (HC 组),患者组进一步分为两个亚组:伴有精神病性症状的抑郁症患者组 (DP 1 组,87 名)、不伴有精神病性症状的抑郁症患者组 (DP 2 组,103 人),分析三组受试者的外周血血小板、中性粒细胞、淋巴细胞、单核细胞计数 (monocyte, MON),比较 NLR、MLR、PLR 及 SII 水平的差异,并探讨了抑郁症与炎症指标的关系。

结果 患者组 MON、MLR、SII 水平高于对照组 ($F=52.561, 52.104, 18.670$, 均 $P<0.01$), DP 1 组与 DP 2 之间差异虽无统计学意义 ($P>0.05$),但伴有精神病性症状的抑郁患者 SII 有升高的趋势。

结论 患者组 MON、MLR、SII 水平高于对照组 ($F=52.561, 52.104, 18.670$, 均 $P<0.01$), DP 1 组与 DP 2 之间差异虽无统计学意义 ($P>0.05$),但伴有精神病性症状的抑郁患者 SII 有升高的趋势。

跨性别青年群体的为人父母意愿、生育力保存现状及影响因素

李昊淼¹ 王志任²

1. 秦皇岛市九龙山医院

2. 北京回龙观医院

目的 本研究计划调查中国跨性别青年群体为人父母的意愿和当前生育力保存现状及影响因素。

方法 本研究采用横断面自编问卷调查,旨在全面了解中国跨性别青年群体的为人父母意愿及生育力保存现状。样本选自2023年2月至2023年8月期间在北京回龙观医院两性心理门诊就诊的跨性别者,共计177人。具体而言,研究对象包括出生时被指派为男性的161人和被指派为女性的16人,年龄范围在15至37岁之间。为了确保问卷的有效性和可靠性,问卷设计过程中参考了国内外相关研究和专家意见,内容涵盖了人口统计信息、为人父母意愿、生育力保存意愿及其影响因素等方面。

结果 跨性别群体中仅有19.2%的个体表达了希望为人父母的想法,他们更愿意通过收养的方式得到一个属于自己的孩子。在生育力保存方面,仅有23.1%的个体表达了愿意提前保留自己的生育能力,影响生育力保存的主要因素是不想中断激素或手术治疗、不想要孩子、认为没有必要以及认为生育力保护的代价或成本太高。

结论 本研究通过对177名跨性别者的问卷调查,发现中国跨性别青年群体在为人父母意愿和生育力保存方面均呈现出较低的比例。具体而言,仅有19.2%的受访者表示有为人父母的愿望,他们更倾向于通过收养的方式获得子女。这一结果可能反映了跨性别者在社会环境、个人经历及身份认同等方面的复杂因素对其生育意愿的影响。

在生育力保存方面,仅有23.1%的受访者愿意提前保留自己的生育能力。影响生育力保存意愿的主要因素包括:不愿中断激素或手术治疗、不想要孩子、认为没有必要以及生育力保护的代价或成本过高。这些因素表明,跨性别者在性别认同和医疗需求方面的优先考虑对其生育选择产生了显著影响。

综上所述,跨性别青年群体在为人父母意愿和生育力保存方面的低比例反映了该群体在生育选择上面临的多重挑战。这些挑战不仅来自于个体内部的心理和生理需求,还包括外部的社会支持和经济条件等因素。因此,针对跨性别者的生育需求,社会和医疗系统需要提供更加包容和支持的环境,以帮助他们在实现性别认同的同时,能够更好地规划和选择自己的生育未来。这对于提升跨性别者的生活

质量和社会融合具有重要意义。

首发未服药青少年重性抑郁障碍患者认知功能与血细胞比率的相关性研究

侯灵芝 李红*

郑州大学第一附属医院

目的 通过与健康人群的比较,了解首发未服药青少年重性抑郁障碍患者临床症状与血细胞比率的变化及相关性,为重性抑郁障碍的病理机制研究提供线索。

方法 纳入2023年1月-2024年1月本院精神医学科住院的25例首发未服药青少年重性抑郁障碍患者(MDD组),同时纳入与其年龄、性别及教育程度相匹配的20例健康对照者(HC组)。采用MCCB量表评估所有受试者认知功能,同时对患者使用汉密尔顿抑郁量表(HAMD)和汉密尔顿焦虑量表(HAMA)评估症状严重程度。所有研究对象均于清晨空腹采集外周静脉血于EDTA抗凝管中,检测血小板计数、中性粒细胞计数、单核细胞计数、淋巴细胞计数,并计算血细胞比率。SPSS统计软件25.0和Graph Pad Prism 8.0软件分析数据和制图。 $P<0.05$ 为差异有统计学意义。

结果 MDD组患者HAMD总分为(36.88 ± 9.17),HAMA总分为(22.92 ± 8.70);认知评估结果显示:MDD组MCCB总分、信息处理速度、视觉学习及推理和问题解决分数低于HC组($P<0.05$),其他认知维度无统计学差异($P>0.05$);MDD组的单核细胞计数高于HC组,中性粒细胞与淋巴细胞比值(NLR)高于HC组($P<0.05$);NLR与阻滞因子及信息处理速度之间存在相关性($P<0.05$)。

结论 青少年MDD患者存在信息处理速度、视觉学习及推理和解决问题维度的认知功能损害;NLR可能参与了青少年MDD患者抑郁、焦虑症状及认知缺陷的免疫机制。

Drug Interactions of Clozapine-CYP1A2 Inhibitors and Risk of Serious Adverse Events: A Pharmacovigilance-pharmacokinetic Study

Yu Cheng Fan Mou Xue Zhao Ruiyi Qian Wanying Wang Yingting Tan Shunying Yu*

Shanghai Mental Health Center, Shanghai Jiao Tong University School of Medicine

Objective This study aims to evaluate the risk of serious adverse events (SAEs) associated with the concomitant use of clozapine and CYP1A2 inhibitors and to explore dosage adjustment strategies to enhance the safety of the drug combination

Methods Interaction reports were retrieved from the FDA Adverse Event Reporting System (FAERS) database, spanning the period from the first quarter of 2004 to the first quarter of 2024. The reporting odds ratio (ROR) was calculated to assess the association between clozapine-related SAEs and the concurrent use of clozapine and CYP1A2 inhibitors. A physiologically based pharmacokinetic (PBPK) model was developed using pharmacokinetic parameters to simulate changes in clozapine exposure levels when co-administered with varying doses of CYP1A2 inhibitors that exhibited significant interaction signals, and to optimize clozapine dosing to enhance the safety of drug combinations

Results During the examined period, a total of 312 reports exhibiting significant signals were identified. The potential risk of AEs in patients co-administered with clozapine and ciprofloxacin or fluvoxamine is significantly elevated in the FAERS database. The highest signal was observed for the interaction between clozapine and ciprofloxacin, resulting in subileus, with ROR of 57.06 (95%CI: 22.35 to 145.68). This was followed by interactions between clozapine and fluvoxamine for tardive dyskinesia (ROR=29.25; 95%CI: 20.95 to 40.84) and orthostatic hypotension (ROR=24.75; 95%CI: 18.51 to 33.10). Furthermore, the PBPK simulations indicate that the optimal clozapine dosage within the recommended therapeutic range varies based on the co-administration of fluvoxamine or ciprofloxacin. For instance, when clozapine is administered at 100 mg

b.i.d., the co-administration of fluvoxamine (100 mg b.i.d.) necessitates a reduction in the clozapine dose to approximately 50% of the original dose. If fluvoxamine is given at 150 mg b.i.d., the clozapine dose should be reduced by approximately 68.75%. Similarly, when clozapine (100 mg b.i.d.) is co-administered with ciprofloxacin (250 mg b.i.d.), the clozapine dose should be reduced by 32%. If ciprofloxacin is administered at 500 mg b.i.d., the clozapine dose should be reduced by approximately 37%

Conclusion The concurrent administration of clozapine with strong CYP1A2 inhibitors may elevate the risk of SAEs. In cases where such combinations are unavoidable, it is imperative to meticulously monitor drug concentrations and adjust dosages accordingly

关键词: clozapine, CYP1A2 inhibitors, serious adverse events, drug safety, dosage adjustment

精神分裂症、抑郁症和情感障碍患者的甲状腺异态负荷特征

李宏彬¹ 翟德胜¹ 赵营¹ 张瑞岭²

1.新乡医学院

2.新乡医学院第二附属医院

目的 评估 drug-free 精神分裂症、抑郁症和情感障碍患者的甲状腺异态负荷特征。

方法 研究设计为回顾性横断面研究, 经新乡医学院伦理委员会批准。以 2018 年 1 月至 2018 年 12 月在新乡医学院第二附属医院住院治疗的 drug-free 首发精神分裂症、重度抑郁障碍和双相情感障碍患者为研究对象。drug-free 定义为入院前至少 4 个月未使用精神药物(抗精神药物、抗抑郁药物、情绪稳定剂)的患者。对照组数据来自同一医院参加体检的健康人群。主要结局是“甲状腺稳态结构参数”, 包括“甲状腺的分泌能力”(SPINA-GT)、“活化性脱碘酶活性”(SPINA-GD)、T4/free T4 和 T3/free T3 (反映甲状腺激素的血清蛋白结合)和“甲状腺稳态中心设定点”(TSH 指数 thyroid stimulating hormone index, [TSHI])和“基于甲状腺反馈分位数的指数”thyroid feedback quantile-based index, [TFQI])。“甲状腺稳态结构参数”通过入院时测量的 TSH 和甲

甲状腺激素计算。统计分析使用 t 检验、中位数 Mann-Whitney U 检验或卡方 (χ^2) 检验比较不同类型病例组和对照组之间的社会人口学特征、激素和“甲状腺稳态结构参数”。多组连续分布变量之间的比较,采用单因素方差分析或非参数检验。

结果 共有 1186 例精神分裂症、1263 例重度抑郁症、1619 例双相情感障碍和 162 名健康对照纳入研究。

精神分裂症患者的高甲状腺素血症率 (10.2% vs. 3.1%)、游离 T4 (18.08±4.04 vs. 15.96±2.76)、TSHI (3.3±1.1 vs. 2.8±0.78) 和 TFQI (0.13±0.50 vs. -0.01±0.48) 均显著高于对照组。

与健康对照组相比,情感性疾病的 GD、T4/free T4 和 T3/free T3 较低。双相情感障碍伴躁狂发作的 GT 高于双相情感障碍伴抑郁发作和重性抑郁障碍的 GT (平均水平分别为 3.70 与 3.04 和 3.03)。与健康对照组相比,重性抑郁障碍和双相情感障碍患者的“甲状腺稳态中心设定点”参数 TSHI、TFQI 没有差异。

结论 1. 较高的甲状腺稳态中心设定可能参与急性期精神分裂症患者甲状腺异态负荷的形成机制。2. 情感性疾病具有独特的甲状腺异态负荷特征,活化性脱碘酶活性 (SPINA-GD) 受损,甲状腺激素的血清蛋白结合减少,但甲状腺稳态中心设定点没有变化。3. 躁狂发作与甲状腺分泌能力增高相关。

前额叶 tACS 刺激治疗抑郁症患者对深部核团脑功能连接的影响

李丹 刘瑞 叶富康 周晶晶 王刚*

首都医科大学附属北京安定医院

目的 经颅交流电刺激 (transcranial alternating current stimulation, tACS) 是一种新兴的,治疗抑郁障碍的非侵入性神经调控技术。既往研究发现 77.5Hz-tACS 合 SSRI 类抗抑郁药治疗能够有效改善抑郁症患者的核心症状,但其疗效的神经机制尚不清楚。抑郁症患者存在脑功能连接异常,并且杏仁核和伏隔核对患者的情绪调节起到关键作用。因此,本研究假设前额叶 tACS 可能通过影响前额叶与杏

仁核或伏隔核的功能连接产生抗抑郁疗效作用。

方法 本研究共采集 21 例抑郁症患者基线和 tACS 治疗 4 周末的临床、脑电和核磁扫描数据,包括 19 例真刺激组患者和 12 例伪刺激组。在治疗前后,使用 17 项汉密尔顿抑郁评定量表 (HAMD-17) 评估症状严重程度。利用脑电分析方法和神经影像分析方法,分别提取了闭眼状态 Fp1 脑区的阿尔法功率值、以及 Fp1 与杏仁核和伏隔核亚区功能连接;采用治疗方式 (真刺激,伪刺激)*时间 (基线,4 周末) 的重复测量方法分析了 tACS 对抑郁症患者脑功能活动的影响,尤其是深部核团脑功能连接。

结果 真伪刺激患者的 HAMD-17 评分从基线到第 4 周均显著下降,但两组间没有显著差异。两组之间在基线时 Fp1 脑区脑电的阿尔法功率无差异,但时间与组间存在显著的交互作用,在 tACS 治疗后,真刺激组的阿尔法功率有所提高,而伪刺激组组的阿尔法功率则有所下降。在 Fp1 与左侧伏隔核的核功能连接中,组间与时间存在显著的交互效应。事后分析表明,4 周后真刺激组的 Fp1 与左伏隔核的功能连接性高于伪刺激组;治疗后,真刺激组 Fp1 与左伏隔核的核功能连接性显著增加。此外,Fp1 与左侧伏隔核的核功能连接差异与 HAMD 中 6 个核心症状的评分呈正相关。杏仁核亚区不存在显著差异。

结论 77.5Hz-tACS 改变了抑郁患者前额处静息状态下脑电的阿尔法功率,并且提高了左侧前额与伏隔核的功能连接,为 tACS 改善抑郁症核心症状的疗效机制提供了证据支撑。

基于核融合机器学习方法探索抑郁症伴有自杀意念患者分类的研究

崔健¹ 袁晓驰¹ 李猛¹ 沈钦戈^{1,2} 杨志³ 苏中华¹ 陈敏^{1,2}

1. 山东省戴庄医院

2. 济宁医学院精神卫生学院

3. 首都医科大学附属北京安定医院

目的 抑郁障碍患者存在自杀意念。抑郁症伴

自杀意念患者不易被临床医生发现。本研究基于扩散磁共振图像、功能磁共振图像以及结构磁共振图像的三种模态磁共振图像数据中提取的特征,使用一种核融合支持向量机机器学习方法,对抑郁症患者中伴有或不伴有自杀意图的患者进行分类,以期在临床诊疗过程中能够辅助医生对抑郁症伴自杀意念患者精准识别。

方法 本研究在山东省戴庄医院进行。研究自2022年4月份至2023年12月份采集磁共振图像的抑郁症患者96例。研究者根据贝克意念量表评分大于等于3分判定为自杀意念组这一标准,将抑郁症分为抑郁症伴有自杀意念组49例、不伴自杀意念组47例。

本研究基于多种脑图谱,使用Freesurfer、FSL、DPABI等工具自扩散像中得到包括不同皮质下结构的FA、MD均值在内的136组特征,自功能像中得到包括不同皮质及皮质下结构局部一致性均值在内的257组特征,自结构像中得到包括皮质体积、皮质面积、皮质厚度、皮质及皮质下结构体积在内的573组特征。随后,使用含交叉验证的特征递归消除方法进行特征选择。将筛选出的重要特征信息以各模态特定权重进行核融合后,使用支持向量机算法构建分类模型,并使用十折交叉验证评估分类模型的性能。

结果 三模态融合获得的分类模型,最高准确度为73.58%,对应敏感度为74.04%,特异度为73.07%,F1分数为0.73,受试者工作特征曲线下面积(AUC)为0.81。双模态融合获得的分类模型中,功能像与结构像融合的分类效果最好,最高准确度为71.25%,对应敏感度为71.25%,特异度为71.20%,F1分数为0.70,受试者工作特征曲线下面积(AUC)为0.79。单模态分类模型中,功能像的分类效果最好,准确度为66.92%,对应敏感度为66.02%,特异度为67.84%,F1分数为0.66,受试者工作特征曲线下面积(AUC)为0.75。三模态融合获得的模型分类效果最优。

综合五种模型评价指标,三种模态磁共振图像信息中,结构像特征对模型分类性能贡献最大,权重均值为0.62;功能像特征次之,权重均值为0.24;扩散张量图像特征贡献最小,权重均值为0.14。

结论 本研究使用的多模态核融合的支持向量机方法,能够有效提升模型对自杀意念抑郁症的分类能力。使用多模态磁共振图像辅助临床诊疗存在一定的可行性。

磁共振导航精准靶点 rTMS 对酒依赖患者的疗效研究

王超军^{1,2} 王传升^{1,2}

1.河南省精神病院

2.新乡医学院第二附属医院

目的 探索精准靶点 rTMS 治疗对酒依赖患者渴求、冲动、情绪、睡眠、认知的干预效果,探索精准靶点 rTMS 治疗对酒依赖患者复饮影响,评估精准靶点 rTMS 治疗的耐受性、安全性及可行性。

方法 入组患者来自2022年3月-2024年3月期间在新乡医学院第二附属医院精神五科住院治疗的男性酒依赖患者。符合入组条件的69名酒依赖患者按照随机数字法分为研究组(n=34)和对照组(n=35)。所有患者接受常规治疗,入院初期使用苯二氮 草类药物替代治疗,同时补充足量B族维生素。完成基线评估后,研究组进行磁共振扫描提取T1结构像,构建3D脑模型,给予右侧背外侧前额叶(MNI 30, 37, 36)为靶点的高频 rTMS 治疗10天,对照组给予相同参数伪刺激治疗。治疗前、治疗后评估视觉模拟渴求量表(VAS)、宾夕法尼亚酒精渴求量表(PACS)、11版Barratt冲动性量表(BIS-11)、贝克焦虑量表(BAI)、贝克抑郁量表(BDI)、匹兹堡睡眠质量指数(PSQI)及简易精神状况量表(MMSE)、连线测试B(TMT-B)、数字广度测验(DST)、词语流畅性实验(VFT)、霍普金斯词语学习测验(HVLT-R)。并在干预后3个月和6个月进行电话随访,跟踪其复饮情况。

结果 1.研究组、对照组一般资料:年龄、受教育年限、首次饮酒年龄、累计饮酒时间、日饮酒量、临床酒精戒断症状评定量表差异无统计学意义($P>0.05$)。2.研究组、对照组治疗前后组间差值比较: BIS-11(非计划冲动、认知冲动性、冲动总分)、BAI、BDI 差异无统计学意义($P>0.05$)。VAS、PACS、BIS-11(行动冲动性)、PSQI、MMSE、DST、VFT 差异有统计学意义($P<0.05$)。3.研究组、对照组在治疗后三个月,两组复饮率差异无统计学($P>0.05$)。

研究组、对照组在治疗后六个月对复饮结果 研究组复饮率为 39.3% (11 例), 对照组 复饮率为 65.6% (21 例), 两组比较复饮率差异有统计学 ($P < 0.05$)。

结论 磁共振导航精准靶点 rTMS 对于降低酒依赖患者的渴求、降低行动冲动性、提高睡眠质量、改善注意力、记忆力和执行能力具有显著效果, 可有效减少复饮。磁共振导航精准靶点 rTMS 治疗酒依赖患者具有良好的安全性、耐受性、可行性。

太赫兹技术为脑科学研究打开全新之门

濮正平¹ 赵红卫² 崔东红³

1. 嘉兴大学附属精神卫生中心 (嘉兴市康慈医院)
2. 中国科学院上海高等研究院
3. 上海市精神卫生中心

目的 探讨太赫兹技术在神经精神医学领域中的使用价值, 探索其在精神科精准诊疗中的运用前景。

方法 在 PUBMED、WOS、SCOPUS、SPIE 以及 IEEE 五大国际数据库搜索近 20 年有关太赫兹技术在脑科学中运用的相关文献, 总结其在生物分子、细胞、组织、生物效应等不同层面的运用特点与临床价值并进行综述。

结果 研究表明生物体内存在丰富的太赫兹电磁信息, 近年来太赫兹光谱和成像技术在脑科学领域的相关研究进展尤其突出、引人注目, 展示出独特的优势和特点, 这一崭新的 T-Ray 为脑科学研开启了新的视角。研究者通过太赫兹相关技术, 发现髓鞘以及郎飞结在神经信号传递中高效节能的光子机制, 提出了从量子角度阐述神经信号传递的新物理机制。神经递质与神经活动和精神疾病有密切关联, 研究者们利用太赫兹技术发现多巴胺、去甲肾上腺素、褪黑素、 γ -氨基丁酸等神经递质存在自己独特的太赫兹指纹图谱, 氢键在这些神经递质的构象变化及与相关受体的结合中发挥着关键作用。研究者还发现特定频率的太赫兹波可以加速抗精神病药与多巴胺 D2 受体的解离, 为减轻其副反应提供了全新的可能性。针对阿尔茨海默病等神经退行性疾病, 基于太赫兹技术与超材料传感实现了对淀粉样

蛋白的体外灵敏检测, 而太赫兹辐射可通过与 $A\beta$ 原纤维共振松散其内部结构, 减缓其异常聚积, 这对非药物物理治疗阿尔茨海默病有重要的启发。大脑病变组织的精准成像及其边界的精确定位一直困扰着临床工作者。离体实验已通过太赫兹技术清晰区分脑卒中、脑胶质瘤、脑外伤等病变组织与正常脑组织, 其成像结果与磁共振成像以及 HE 染色结果基本一致。太赫兹波对水具有敏感响应, 基于病变脑组织与正常脑组织间不同的含水量, 太赫兹技术可用于潜在的病理诊断。太赫兹光谱技术还可区分不同亚型、不同病理级别的脑胶质瘤。神经细胞膜对太赫兹辐射较为敏感, 尤其胞膜上的离子通道 (包括钠、钾、钙通道) 以及水通道经太赫兹辐射后出现通透性的改变, 这对细胞膜整体的通透性、兴奋性及信号传导具有重要意义。太赫兹辐射也能影响神经细胞的生长与凋亡及其神经内分泌功能, 其中频率是关键。虽然太赫兹波光子能量低, 太赫兹辐射的生物效应是具有双面性, 需进一步探索合适的辐射参数来最大限度地发挥其对神经系统的积极作用, 为神经精神疾病的治疗提供新的可能的方案。

结论 太赫兹波穿透性强、光子能量低、不会造成电离损伤, 许多生物大分子的振动和转动频率都处于太赫兹波段, 这些“太赫兹指纹”包含有丰富的物理化学信息, 能有效反映物质微观结构与状态, 有利于无标记生物检测和医学诊断。但目前研究尚处于探索阶段, 离临床转化应用尚有较长的路要走。

关键词: 太赫兹技术、太赫兹辐射、生物效应、脑科学、精准诊疗

临床检验医疗质量控制指标在精神专科医院的应用探讨

陈英 高山妹*

西安市精神卫生中心

目的 探讨 15 项临床检验医疗质量指控制标在精神专科医院的应用情况, 分析其对提高检验质量的重要性, 并提出优化建议, 为精神科同仁正确理解和应用临床检验医疗质量控制指标提供参考。

方法 回顾性分析, 收集西安市精神卫生中心 2023 年 5 月-2024 年 5 月的临床检验数据, 包括标本采集、处理、检测、结果报告等各个环节的质量指

标数据,按计算公式,运用 LIS 系统模块统计,检验质量指标上报,自动统计不同时间段临床检验质量指标,对收集到的数据进行统计分析,比较不同时间段的质量指标差异,分析原因,并提出优化措施。

结果 标本类型错误率、标本容器错误率、标本采集量错误率、血培养污染率、抗凝标本凝集率、检验前周转时间中位数、室内质控项目变异系数不合格率、室内质评项目不合格率、实验室内周转时间中位数、检验报告不正确率(10项指标逐步降低)

室内质控项目开展率、室内质评项目参加率、实验室间比对率(无室内质评计划的)、危急值通报率、危急值通报及时率(5项指标逐步提高)

结论 15项临床检验指标是评价临床实验室检验质量和能力的重要标准,它们覆盖了检验前、检验中和检验后各个环节,对于提高医疗服务质量和保障患者安全具有重要意义。15项临床检验指标的应用需要建立相应的管理程序,包括明确质量方针、目标、指标定义、监测意义、数据采集方法、责任人、监测周期和评价方法。此外,成立专门的质量指标管理团队,实施改进措施,并通过信息化建设提高数据的准确性和管理效率也是提高临床检验质量的关键。通过这些措施,可以持续改进检验质量和能力,满足临床患者的需求。

The Prevalence of Turnover Intention and Influencing Factors Among Psychological Counselors: A National Observation.

Yating Yang^{1,2}, Suqi Song¹, Huanzhong Liu¹

1. Chaohu Hospital of Anhui Medical University

2. Huizhou Second People's Hospital

Background In China, counseling teams face problems such as unstable professional teams, low education, and lack of training, among which unstable professional teams and human resource turnover are the main reasons affecting the development of counseling teams in China. Intention to leave can be a good predictor of staff turnover, so this study focuses on investigating counselors' intention to leave and its influencing

factors

Methods This study collected job-related information (turnover intention, job burnout, job satisfaction, depression, etc.) and personal information (age, marital status, having children, etc.) of 419 psychological counselors from 41 tertiary hospitals. And this questionnaire is filled out anonymously to protect the privacy of the participants

Results A total of 419 counselors were included in this study, and about 1/5 of them had the idea of leaving their current jobs. There were significant differences in job satisfaction, job burnout, insomnia, depression and work intensity between the two groups of psychological counselors (turnover intention VS without turnover intention). Further binary logic regression analysis found that job satisfaction (OR=0.928, 95%CI=0.899-0.958), job burnout (OR=3.218, 95%CI=1.434-6.823), depressive symptoms (OR=1.060, 95%CI=1.004-1.120) and job intensity (OR=2.083, 95%CI=1.076-4.031) were the main factors affecting psychological counselors' turnover intention

Conclusion About 1/5 of psychological counselors in China reported their intention to leave. Job satisfaction, depressive symptoms, job burnout and job load teachers affect the main factors of turnover intention, so policy makers and hospital managers need to be aware of these potential influencing factors. to solve the problem of high turnover intention of psychological counselors in China

关键词: turnover intention, psychological counselors

行为医学领域跨学科关联与研究主题分析

冯学泉 张琳 刘传新*

济宁医学院

目的 行为医学定义为关注与健康 and 疾病相关的社会心理、行为和生物医学知识的发展和整合,以及这些知识在预防、病因、诊断、治疗和康复方面应用的一个跨学科领域,跨学科是行为医学的定义性特征。本文以主题词为行为医学的论文为数据来

源,从行为医学主题论文所属学科类别的共现网络、研究主题识别两种内容维度挖掘行为医学研究的学科归属及内容结构特征,揭示该领域的跨学科网络结构特征、识别重点学科及学科对应的研究主题。

方法 选取近 20 年 MeSH 主题词为“behavioral medicine”的论文,基于社会网络分析,分别构建 WOS 学科方向、4 个时间切片的主题词共现网络,从学科交叉网络结构特征、主题词时序分析、学科-主题内涵三个方面,呈现行为医学主题研究领域的跨学科关联特征。

结果 (1) 基于社会网络分析的理论,运用 Gephi 测算学科共现网络特征指标及高频学科在学科交叉网络中的节点中心性。学科交叉网络中图密度为 0.066,网络的联系相对松散。但是结合较高的聚类系数(0.525)和较短的平均路径长度(2.721),主题词共现网络均具有较高的平均聚类系数和较低的平均路径长度,表明行为医学领域交叉学科及主题词共现网络均存在小世界网络特征。(2) 学科网络属性及关联分析结果显示,行为医学研究的支撑 WOS 学科方向主要为公共、环境和职业健康,精神病学,临床神经病学。三个学科方向在交叉网络中具有绝对的控制能力,处于网络中的关键核心位置和桥接位置,是行为医学重要研究热点和交叉点。

(3) 行为医学主题词网络分析显示,临床医学、公共管理、行为科学、精神障碍、初级卫生保健是各时间切片连接其他主题最多的主题词,也是行为医学领域持续关注的主题。行为医学领域知识分布正在趋向碎片化细分化,但知识体系中各小团体社区内部关联和整合更加紧密。(4) 不同学科方向具有共同关注的研究主题,是连接学科交叉的契合点和凝聚点。依据学科方向-主题的 2 模网络,不同学科之间研究主题存在不同程度重合。3 个支撑学科方向的交叉主题,均具有三元闭包特性,与不同主题词、学科方向形成强联系,是行为医学研究创新突破点,壮大研究网络的关键节点。

结论 行为医学领域作为一项跨学科研究,分析显示其具有强大的研究活力,吸引临床医学、公共卫生、精神病学、心理学、社会学等学科的科研人员开展积极有效的跨学科合作,交流沟通学科知识。跨学科知识交流更是行为医学蓬勃发展和强大活力的核心所在。

鸢尾素抗抑郁作用机制研究

李晶 杨健*

首都医科大学附属北京安定医院

目的 抑郁症是最常见的心境障碍,以显著而持久的情绪低落为主要临床特征。近年来,抑郁症的发病率及自杀率呈现显著增长态势,诸多生理及心理因素均可促使其发生。调查显示,体育锻炼可以减轻抑郁和焦虑症状。有研究发现鸢尾素是一种在体育活动后高表达的激素。鸢尾素是一种跨膜前体蛋白激素,从纤维连接蛋白 III 型结构域蛋白 5 (fibronectin type III domain-containing protein 5, FNDC5) 中经过剪切修饰而得到,高表达于肌肉和脂肪组织中。外周循环系统中的鸢尾素可以穿过血脑屏障,进入脑脊液和脑实质中,对脑疾病有积极作用。综上所述,鉴于鸢尾素在运动后大量分泌且具有种神经保护效果,我们推测其可能和体育活动的抗抑郁机制有关。

方法 我们通过一系列行为学实验和分子生物学技术,对实验动物进行了详细研究。实验方法包括强迫游泳试验和悬尾试验,用于评估小鼠的抑郁样行为。此外,我们还用免疫共沉淀和质谱技术结合鉴定下游靶蛋白,通过 qPCR 和 Western blot 技术分析相关信号通路的变化,以揭示鸢尾素的分子作用机制。

结果 结果显示,海马及尾静脉注射鸢尾素均显著减轻了啮齿类动物的抑郁样行为,表现为强迫游泳试验中不动时间的显著减少和悬尾试验中不动时间的显著降低。进一步通过体内体外实验证实鸢尾素能促进神经干细胞增殖和分化,体外鸢尾素处理可以促进体外神经干细胞增殖和分化,体内尾静脉注射鸢尾素可以促进海马神经发生。利用免疫共沉淀和质谱技术结合,对相关蛋白质的相互作用和功能进行深入研究,鉴定出其下游靶蛋白过氧化物酶体增殖物激活受体 γ 共激活剂 1- α (PPARG Coactivator 1 Alpha, Pparg1a)。

结论 本研究为鸢尾素作为潜在抗抑郁药物的应用提供了新的证据,并为其临床开发奠定了基础。这些发现不仅揭示了鸢尾素在抑郁症治疗中的潜在价值,还为未来的药物研发提供了新的方向和思路。

大学生网络成瘾共病酒精依赖的风险因素研究

王雪琪 王岚*

河北医科大学第一医院

目的 探讨大学生网络成瘾共病酒精依赖的风险因素。

方法 于2021年10月份选取河北医科大学大一至大三的全部本科生作为研究对象,采用一般情况调查表调查家庭每月总收入、家庭教养方式、个性特征、是否被校园霸凌、是否参加日常体育锻炼、静坐时间、精神科就诊情况、过去一年里是否有放弃学业的计划、每日电话数量、每日手机屏幕使用时长、每日睡眠时间等,采用匹兹堡睡眠质量指数量表(PSQI)评估睡眠情况、青少年生活事件量表(ASLEC)评估青少年所经历的生活事件和压力的量表、焦虑自评量表(SAS)评估焦虑情况、抑郁自评量表(SDS)评估抑郁情况、认知失败问卷评估个体在日常生活中经历的认知失误的频率。采用互联网相关成瘾行为评估量表(Internet Addiction Test, IAT)评估网络成瘾。得分在50分以上表明存在网络成瘾。依据《精神障碍诊断与统计手册第四版》(DSM-IV)诊断酒精依赖。将调查人群分为三组:健康对照组、共病组、网络成瘾组/酒依赖组。纳入各类变量行回归分析分别检测各类变量对于网络成瘾与酒精依赖的风险因素分析。

结果 共收回有效调查问卷7144份,共病组共17例,网络成瘾组/酒依赖组1748例,健康对照组5420例。共病组的兴趣爱好个数、每日步数、每日睡眠时间均显著低于其余三组(P 均 <0.001),每日电话数量、每日手机屏幕使用时长、童年经历、躯体疾病、心理咨询的经历、过去一年有放弃学业的计划、PSQI得分、ASLEC得分、SAS得分、SDS得分、认知失败问卷得分均显著高于其余三组(P 均 <0.001),共病组的风险因素分析显示,认知失败问卷得分、SAS、SDS、ASLEC得分、每日手机使用时长、躯体疾病是其风险因素(P 均 <0.05),其中认知失败问卷总分对共病的影响最为显著,表明个体在认知失败方面的经历越多,越有可能发生网络成瘾与酒精依赖。

结论 认知失败是网络成瘾共病酒精依赖的重要影响因素,今后应对大学生的认知、情绪、生活事件、身体状况进行关注,减少共病发生。

快感缺失评估及其对门诊重性抑郁发作的诊治指导

陈晗晖* 王宇昊

天津市安定医院

目的 考察快感缺失评估对于门诊重性抑郁发作患者的临床指导效果。

方法 随机抽取天津市某医院300名门诊患者,根据是否存在抑郁分为两组,采用中文版快感缺失量表(Dimensional Anhedonia Rating Scale, DARS)、焦虑自评量表(SAS)、抑郁自评量表(SDS)、匹兹堡睡眠质量量表(PSQI)、耶鲁-布朗强迫量表(Y-B)、明尼苏达多项人格测验(MMPI)进行评估。考察抑郁组和非抑郁组的快感缺失总分及各维度上的差异,以及抑郁组患者快感缺失程度与抑郁、焦虑、强迫、睡眠障碍、自杀观念等重性抑郁发作的常见症状的关系。此外,通过个案研究,门诊医生提供患者的标准化访谈记录,以考察通过评估快感缺失程度,是否能够有效地甄别抑郁状态,或者提供针对性的治疗。

结果 抑郁组在快感缺失量表总分及各维度分数上显著低于非抑郁组。DARS得分与SAS、SDS、PSQI、MMPI自杀概率得分均呈显著负相关。进一步的回归分析显示,DARS得分对SAS、SDS、PSQI、MMPI自杀概率得分具有显著预测作用。门诊医生在阅读患者的DARS评估结果后,报告在诊断访谈中能更有效地识别抑郁症,而且可以改进治疗方案。

结论 快感缺失是门诊诊断重性抑郁发作患者时需考察的重要特征。评估患者的快感缺失程度可以有效帮助医务人员更快速识别抑郁状态,做出更可靠的诊断,并提供更加精准的个性化治疗方案。

关键词:快感缺失 重性抑郁发作 焦虑 睡眠障碍 自杀观念

Alterations of Plasma Neuron-derived Exosomal MicroRNAs in Patients with Bipolar Disorder

Han Jiang Yamin Zhang Xueyu Qi Tao Li*
Hangzhou Seventh People's Hospital

Objective MicroRNAs (miRNAs) alterations in patients with bipolar disorder (BD) are pivotal to the disease's pathogenesis. Since obtaining brain tissue is challenging, most research has shifted to analyzing miRNAs in peripheral blood. One innovative solution is sequencing miRNAs in plasma extracellular vesicles (EVs), particularly those neural-derived EVs emanating from the brain

Methods In our study, we isolated plasma neural-derived EVs from 85 patients with BD and 39 healthy controls (HC) using biotinylated antibodies targeting a neural tissue marker. These EVs were then subjected to miRNA sequencing and expression analysis

Results Out of the 2,656 neural-derived miRNAs in EVs identified, 14 were differentially expressed between BD patients and controls. This differential expression was consistent even when the sample was split into discovery and validation groups. Moreover, the target genes of miR-143-3p displayed distinct expression patterns in the prefrontal cortex of BD patients versus HC, as sourced from PsychENCODE database. The functional experiments demonstrated that the abnormal expression of miR-143-3p promoted the proliferation and activation of microglia and upregulated the expression of proinflammatory factors including IL-1 β , IL-6, and NLRP3. Through weighted gene co-expression network analysis, a module linking to clinical symptoms of BD patients was discerned. Enrichment analyses unveiled these miRNAs' role in modulating the axon guidance, Ras signaling pathway and ErbB signaling pathway

Conclusion To summarize, our findings provide the first evidence of dysregulated plasma miRNAs within neural-derived EVs in BD patients, further buttressing the neurogenic hypothesis of BD

关键词: bipolar, MicroRNAs, extracellular vesicles

Protein Profiles and Novel Molecular Biomarkers of Schizophrenia 2 Based on 4D-DIA Proteomics

Huiping Shen¹, Jicheng Li², Xiaotao Dong²
1. Shaoxing Seventh People's Hospital
2. Henan University

Objective Schizophrenia is a severe psychological disorder. The current diagnosis mainly relies on clinical symptoms and lacks laboratory evidence, which leads to very difficult early diagnosis, misdiagnosis, and underdiagnosis. This study identifies biomarkers of schizophrenia based on 4D-DIA proteomics and provides an experimental basis for establishing a laboratory diagnosis of schizophrenia

Methods Plasma protein profiles of schizophrenia patients were obtained and compared with healthy controls using 4D-DIA proteomics technology. Subsequently, GO analysis was conducted to annotate the functions of the protein. In addition, KEGG pathway analysis was performed to find those signaling pathways that are enriched for differentially expressed proteins (DEPs). Subsequently, DEPs were subjected to protein-protein interaction network analysis. Gene-weighted co-expression network analysis was conducted to create weighted networks of co-expression. Finally, to identify potential biomarkers of schizophrenia so as to construct diagnostic models, different machine learning algorithms were applied

Results No significant differences were detected between the schizophrenia and healthy control groups included in this study in terms of age and gender. In addition, 79 DEPs were identified between schizophrenia and healthy controls. GO functional analysis revealed that DEP functions were mainly enriched in response to toxic substances and platelet aggregation, indicating the presence of metabolic and immune alterations in schizophrenia patients. KEGG pathway enrichment analysis revealed that DEPs were primarily enriched in the

chemokine signaling pathway and cytokine receptor interactions. Subsequently, a diagnostic model consisting of three proteins, profilin-1, Glyceraldehyde-3-phosphate dehydrogen, and beta-actin-like protein 2, was developed, which had an AUC value of 0.972 and could effectively identify schizophrenia

Conclusion Profilin-1, Glyceraldehyde-3-phosphate dehydrogen, and beta-actin-like protein 2 can serve as a biomarker for early diagnosis of schizophrenia. Our findings provide new ideas for the laboratory diagnosis of schizophrenia

关键词: Schizophrenia, Proteomics, Data-independent acquisition, Protein biomarkers

Analysis of Clinical Value of Blood Ammonia Test Combined with Skull CT in Mental Diseases

邹灿*

玉林市第四人民医院

Objective To explore the clinical value of blood ammonia test combined with skull CT in the diagnosis of mental diseases.

Methods Head CT was used to evaluate the skull structure of the patients with mental disorders, and blood ammonia level of blood samples was measured. The results of head CT and blood ammonia were compared between the patients with mental disorders and healthy controls. Results The abnormal rate of CT findings in patients with mental disorders was significantly higher than that in healthy controls ($P < 0.05$). The level of blood ammonia in patients with mental disorders was significantly higher than that in healthy controls ($P < 0.05$). Furthermore, on further analysis, we found a significant correlation between blood ammonia levels and the severity of mental illness. The diagnostic accuracy of blood ammonia combined with skull CT was 96%, which was significantly higher than that of single head CT ($P < 0.05$). Conclusion Blood ammonia test combined with cranial CT is of great value in the clinical diagnosis of mental diseases, which can

improve the diagnostic accuracy and provide important reference for clinical treatment

关键词: Blood ammonia test; Skull CT; mental disorders; clinical value; diagnostic accuracy; combined detection; severity of illness

年龄与 CT 阳性率: 癫痫病史新认知与继发性癫痫的相关性

邹灿*

玉林市第四人民医院

目的 探讨年龄和癫痫病史对继发性癫痫的影响, 为临床诊断和治疗提供依据。

方法 选取癫痫患者 300 例, 年龄在 18-75 岁之间, 其中男性和女性各占一半。所有患者均接受了 CT 扫描, 并记录了病灶的大小和位置。根据患者的年龄和病史, 将患者分为不同组别。采用统计学方法分析年龄和癫痫病史与继发性癫痫风险的关系。

结果 研究发现, 随着年龄的增长, 癫痫患者的 CT 阳性率明显增加, 且有癫痫病史的患者其继发性癫痫的风险也显著高于无癫痫病史的患者。同时, 病灶的位置和大小也是评估继发性癫痫风险的重要因素。在控制其他潜在因素(如性别、病灶数量等)后, 年龄和癫痫病史与继发性癫痫风险的相关性仍然显著存在。此外, 本研究还发现, 继发性癫痫患者的治疗效果明显优于单纯癫痫患者。

结论 年龄和癫痫病史是影响继发性癫痫风险的重要因素。通过提高对年龄和 CT 阳性率的认知水平, 我们有望为患者提供更为精准的诊断和治疗方案, 从而改善其预后。

关键词: 年龄; CT 阳性率; 癫痫病史; 继发性癫痫; 诊断和治疗

探讨颅脑 CT 联合嘌呤代谢紊乱在阿尔兹海默症的临床应用分析

邹灿* 吴明莉

玉林市第四人民医院

目的 探讨颅脑 CT 联合嘌呤代谢紊乱在阿尔兹海默症的临床应用分析, 为该疾病的诊断与治疗提供更为全面的信息。

方法 选取我院 100 例确诊为阿尔兹海默症的患者进行研究, 进行颅脑 CT 检查并测定嘌呤代谢相关指标。采用统计学方法对数据进行分析, 探讨颅脑 CT 与嘌呤代谢紊乱在阿尔兹海默症中的作用。

结果 颅脑 CT 显示患者存在不同程度的脑部结构异常, 嘌呤代谢紊乱相关指标也呈现出一定的异常变化。两者之间存在一定的相关性, 提示嘌呤代谢紊乱可能在阿尔兹海默症的发生发展中起到一定作用。

结论 颅脑 CT 联合嘌呤代谢紊乱检测可以为阿尔兹海默症的诊断与治疗提供更为全面的信息, 有助于提高疾病的诊断准确性和治疗效果。

关键词: 颅脑 CT; 嘌呤代谢紊乱; 阿尔兹海默症; 临床应用; 诊断与治疗

A Cross-section Study of The Comparison of Plasma Inflammatory Cytokines and Short-chain Fatty Acid in Patients with Depression and Schizophrenia

于欢^{1,3} 李锐² 彭正午^{2,3}

1. 陕西师范大学

2. 长安医院

3. 空军军医大学西京医院

Objective Major depressive disorder (MDD) and schizophrenia (SCH) are common and severe mental disorders that are often misdiagnosed. The exploration of the potential objective biomarkers that can distinguish these two disorders is still needed.

Methods We compared plasma inflammatory cytokines and short-chain fatty acids (SCFAs) in patients with MDD (n = 24) and SCH (n = 24), and gender- and age-matched healthy controls (HC, n = 27) to investigate potential biomarkers. **Results** We found that the concentrations of pro-inflammatory cytokines were increased, whereas the anti-inflammatory cytokines were decreased in both MDD and SCH. Meanwhile, except for an increase in 4-Methylvaleric acid,

other SCFAs with statistical differences were decreased in both MDD and SCH. Moreover, potential biomarker panels were developed that can effectively discriminate MDD from HC (AUC = 0.997), SCH from HC (AUC = 0.999), and from each other (MDD from SCH, AUC = 0.983). **Conclusion** These data suggest that alternations in plasma cytokines and SCFAs might be one of the potential features for distinguishing MDD and SCH

4. 厦门市仙岳医院

Objective Cortical morphological abnormalities are one of the neuropathological changes of obsessive-compulsive disorder (OCD). The surface-based morphometry (SBM) analyses have reported altered cortical thickness (CTh) among patients with OCD in numerous neuroimaging studies; however, the results have been inconsistent. We are attempting to utilize meta-analysis of whole-brain data to investigate changes in cortical thickness among individuals with OCD. This endeavor may enhance spatial accuracy in identification, thus effectively improving our recognition of OCD and facilitating the development of more precise and efficient treatment strategies.

Methods The seed-based d mapping (SDM) approach was employed to conduct a vertex-wise coordinate-based meta-analysis (CBMA) of whole-brain studies that explored CTh alteration among patients with OCD, compared with healthy controls (HCs).

Results A systematic literature search identified

9 studies (containing 9 datasets) of CTh, including 518 patients with OCD and 449 healthy controls (HCs). Overall, patients with OCD showed decreased CTh in the left anterior cingulate / paracingulate gyri, right insula, as well as increased CTh in the left lingual gyrus, left inferior frontal gyrus, orbital part, left superior frontal gyrus, dorsolateral of the regions. Besides, the Meta-regression analyses revealed a negative correlation between age and cortical thickness of the right insula in patients with OCD.

Conclusion The meta-analysis revealed cortical thickness alterations in specific regions of the brain among individuals diagnosed with OCD. These findings contribute to a deeper understanding of the underlying mechanisms of OCD brain dysfunction and provide insights for early intervention strategies for the disorder

继续教育协作组

生态化在临床医学拔尖创新人才培养体系中的实践

黄满丽* 叶欣怡 潘奋 王丹丹 胡健波 魏宁 陆邵佳 杨建中 胡少华

浙江大学医学院附属第一医院

目的 随着社会发展,身心健康问题日渐凸显,人们对身心健康的关注度不断提高,我国医学教育的改革也引起人们的广泛重视。在很长一段时间里,我们的医学教学还停留在比较粗放的经验模式,教学观念相对落后,教学内容较为陈旧,教学形式比较单一,很难向各医学领域输送高素质的专业人才。

方法 生态化教学是一种建立在教育生态学理论上的新型教学模式,具有和谐、自发、开放、丰富、顺应过程的特点。浙江大学医学院附属第一医院(以下简称浙大一院)近年来开展了“以生态学为核心的精神医学教育系统构建”的研究。医院基于生态学原理,构建了生态化教学的新模式,在教学内容、教学模式和教学方法的改进上做了一些有益的尝试,从而更好地提高了教学质量,培养高素质人才。本文以浙大一院精神科为例,就这一点展开一些论述。

结果 浙大一院精神科在浙大一院 i-FIRST 教育模式的基础上,紧扣生态化教学的特点,将教师与学生同时纳入教学对象,按照其年资高低进行临床与科研的分级教学,通过引入丰富竞赛、多形式参与、多元化评价等方法,活化教学生态,使得教师和学生的临床、科研与自学能力得到持续提高。

结论 传统的医学教育体系以教师为核心,忽视了以学生为本的教育模式。在以生态学为基础的医学教育体系中,师生之间并非单向的信息交流,而是一种双向互动、教学相长的关系,通过引入丰富竞赛,激发教学兴趣,活化教学生态,促进师生全面成长。

上海精神科住院医师规范化培训十年回顾与

思考

张云 吴彦*

上海市精神卫生中心

2014年国家全面启动了住院医师规范化培训工作,迄今已满十年。本文以国家首批住院医师规范化培训基地和国家精神科重点专业基地的上海市精神卫生中心的培训实践为例,系统回顾了住培十年的工作情况。2014年-2023年进入中心参加住培的学员共计452人,培训对象以女性(73.01%)为主,进站时学历本科162人(26.33%),硕士研究生119人(26.33%),博士研究生66人(14.60%),从年份构成比上来看,精神科住培生源质量在持续改善中。人员流动性上,成为国家基地初期离职比较多,其后逐步稳定,说明精神科人才的流失减少,学员对于精神科选择更加的坚定。从离站就业数据上来看,9.01%的学员进入药企就业、学历教育、出国等,90.99%的学员选择留在医疗系统就业,其中占比例最大的是在本市区级精神卫生机构就业,占到50%,培训者行业内社会人的身份让中心持续为本市和外省市各级医疗机构输送合格的精神卫生人才。在此基础上总结了培训过程管理的经验,包括:健全组织管理体系、强化带教激励,提升带教能力、开展精神科特色的住院医师实训课程、采取全过程信息化平台建设以及融入人文思政教育。最后,思考和分析了当前精神科住院医师培训面临的挑战:如何进一步壮大精神科住培的队伍、培训中如何凸显“会看病”、如何实现联合培训的协调。

澳大利亚精神科医生继续教育情况的简介

Yang Yun*

NAMHS of Northern Health

目的 对于临床医生而言,医学知识的学习与实践是一个终身的过程。医生在通过培训和考试,取得专科医生资格之后,仍然有接受职业继续教育的必要。本文通过对澳大利亚精神科医生继续教育情况的介绍,为中国精神科医生的继续教育提供借

鉴。

方法 对澳大利亚医学委员会(AMC)和澳洲与新西兰皇家精神科医师学会(RANZCP)关于继续教育相关政策,指南和要求的总结和分析。

结果 执业医生的继续教育是保证和提高医疗质量的重要步骤。AMC对所有注册医生提出了进行继续教育的强制性的要求。AMC委托RANZCP对澳大利亚精神科医生的继续教育进行管理。澳大利亚医学协会(AMA)通过与各州政府的企业协议为医生的继续教育要求提供支持保障。RANZCP对精神科医生的继续教育要求包括了以下几个部分:制定和执行年度专业发展计划,参与同行评议,参与实践改进和进行自主学习。其中,最为重要的是参与同行评议。对于同行评议,RANZCP有具体的要求和数据记录。澳大利亚精神科医生每年需要完成最少50小时的继续教育活动,并在RANZCP网站记录。RANZCP每年会对继续教育活动的完成情况和完成质量进行抽查。不能保质保量地完成继续教育活动会对影响精神科医生继续执业的可能性。不论是在公立还是私立机构工作,不论是全职工作还是兼职工作,不论是主要从事临床,科研还是行政管理工作,澳大利亚的精神科医生都必须完成规定的继续教育活动的最低要求。

结论 他山之石可以攻玉,澳大利亚精神科医生继续教育情况的信息,对于发展和完善中国精神科医生的从业后继续教育提供了一种思路。

关键词:精神科医生 继续教育 澳大利亚

精神科住院医师规范化培训分层递进教学模式的构建与实施

张莉 吴彦*

上海市精神卫生中心

目的 探讨分层递进教学模式在精神科住院医师规范化培训中的应用价值

方法 通过对住培医师从教学目标、内容、过程和考核等方面实施分层递进教学设置,在推进分层教学的过程中,提出了具体的实施操作方法,强调了分层递进的培养模式并不是简单的从年限、教学目标和内容上分层,而是对现有教学资源的重新整合与规划,是细化、区分所需掌握理论与技能知

识的难易度、重要性,有节奏、有侧重、有方法地一一展开。在整体规划的基础上对每一步的具体操作进行了说明。例如:对于教学考核的分层,可以使用同一个病历或标准化病人,但是考核的重点以及评分侧重点应根据教学目标及要求有所不同。以精神检查为例:对第一阶段的考核侧重点应放在症状学的理解上,第二阶段的考核重点在临床分析,第三阶段的考核重点则是医患沟通技巧。最终通过执业医师考试和住培医师出站考试来评价分层递进培养效果。

结果 分层教学组和传统教学组住培医师均在本科及以上,学历和性别上没有显著性差异。在执业医师考试通过率上,分层教学组优于传统教学组,差异有统计学意义($P<0.001$)。在出站考通过率上,分层教学组高于传统教学组,但差异无统计学意义。

结论 分层递进教学模式有利于精神科住院医师规范化培训,能够提高住培质量。分层教学模式有利于住培医师明确各个阶段的小目标,也让考核的内容更具体化。此外,该模式还能节省教学成本,提高教学效率。

关键词: 分层递进; 教学模式; 住院医师规范化培训; 精神科

迟发性运动障碍的诊疗研究进展

袁俊亮*

北京大学第六医院

迟发性运动障碍(tardive dyskinesia, TD)是多巴胺受体阻滞剂引起的异常不自主运动,年龄较大和接受多巴胺受体阻滞剂的持续时间是TD的最重要危险因素,其主要的发生机制可能是长期使用多巴胺受体阻滞剂引起的基底节中多巴胺受体超敏。TD的特征包括各种不自主运动和姿势,口、面和舌运动障碍是最常见表现,经常伴有其他身体部位的运动障碍。TD是一种临床诊断,诊断依据为存在典型的运动障碍性或肌张力障碍性不自主运动,并排除异常运动的其他病因。目前VMAT2抑制剂是TD主要的对症治疗药物,可与抗精神病药联用或单独使用,苯二氮卓类药物短期使用可缓解轻度症状,少数证据显示迟发性肌张力障碍患者局部注射肉毒毒素可能有效;经对症治疗无效的难治性TD患者

可考虑行DBS手术治疗。TD的预防和早期发现十分重要。

虽然目前关于TD的研究日益增多,但TD临床表现异质性大,病因和发病机制尚不明确,特别是国内关于TD危险因素、治疗及预后的研究证据较少,临床医生尚缺少对TD的认识及治疗经验,期望未来能有更多关于我国TD患者临床特征、危险因素的流行病学研究,能建立我国TD患者的大规模前瞻性队列,更重要的是能在国内进行更多发病机制及治疗相关的基础及临床研究,为TD的规范化管理和新药研发提供理论依据。

关键词: 迟发性运动障碍; 迟发性综合征; 锥体外系不良反应; 药物源性帕金森综合征

Prevalence, Demographic, and Clinical Correlates of Atherosclerosis in A Population without Fatty Livers: A Secondary Analysis Based on A Cross-sectional Study in Japan

Ping Xu¹, Junjun Liu²

1.Department of Psychiatry, Nanjing Lishui District Psychiatric Hospital

2.Department of Psychiatry, Nanjing Meishan Hospital

Objective There is little information available regarding the connection between the population without fatty livers and atherosclerosis (AS). The aim of this study was to investigate the prevalence and clinically related factors of AS in populations without fatty livers

Methods In a cross-sectional analysis conducted at a Japanese health examination center, 647 individuals without fatty livers, comprising 372 males (57.5%) and 275 females (42.5%) aged 24 to 84 years (average age 51.5 ± 9.6) were assessed. Participants' data and clinical information were collected. Brachial-ankle pulse wave velocity (baPWV) was used to assess atherosclerosis, with a threshold of > 1400 m/s defining the presence of the condition. Participants were categorized into AS ($n = 257$) and non-AS groups ($n = 390$). Diagnostic assessments included abdominal ultrasounds for fatty liver exclusion. Differences in clinical parameters between groups were compared, and binary multivariate logistic

regression was used to find factors related to AS in the population with non-fatty liver

Results The prevalence of atherosclerosis in the non-fatty liver population was 39.7% (257/647). The results of binary multivariate logistic regression analysis showed that age (OR=1.13, 95% CI: 1.10-1.17, $P<0.001$), SBP (OR=1.08, 95% CI: 1.06-1.10, $P<0.001$), and ALT (OR=1.04, 95% CI: 1.01-1.07, $P=0.022$) were independently positively correlated with atherosclerosis. The AUC (area under curve) values of age, SBP, ALT, and the combination of these three variables are 0.756, 0.753, 0.554, and 0.854, respectively

Conclusion Our findings underscore a heightened prevalence of AS in populations without fatty livers, emphasizing the need for focused vigilance towards individuals exhibiting advanced age, elevated SBP, and heightened ALT levels

关键词: prevalence, related factors, fatty liver, atherosclerosis, brachial-ankle pulse wave velocity

A Case of Thyrotoxicosis First Diagnosed with Psychotic Symptoms

Xiao-Ming Xu^{1,3}, Wan-Jun Chen^{1,3}, Su Hong^{1,3}, Li Kuang^{1,2,3}

- 1.The First Affiliated Hospital of Chongqing Medical University
- 2.University-Town Hospital of Chongqing Medical University
- 3.Psychiatric Center of the First Affiliated Hospital of Chongqing Medical University

Objective This case report details the uncommon presentation of thyrotoxicosis with psychotic symptoms as the primary diagnostic indicators in a Chinese patient

Methods The subject of the study is a 27-year-old male, Mr. Li, who was hospitalized due to a 5-day history of sensitivity, paranoia, and auditory hallucinations. His symptoms emerged abruptly, featuring suspicion of persecution, delusions of reference, auditory

hallucinations, and significant emotional distress, including anxiety, agitation, depressed mood, and sleep disturbances. Prior to hospitalization, he developed palpitations, headaches, and a severe worsening of his mental state, with violent urges and a desire to escape. The diagnosis was established in accordance with the International Classification of Diseases, 10th Revision (ICD-10)

Results The patient was treated with a multi-drug regimen comprising propylthiouracil to suppress thyroid hormone synthesis, hydrocortisone for inflammatory control, propranolol for tachycardia, nifedipine controlled-release tablets to manage blood pressure, olanzapine for psychotic episodes, and long-acting benzodiazepines to alleviate anxiety. The clinical response was favorable, with a complete resolution of psychotic symptoms and marked improvement in anxiety and depressive states. However, occasional palpitations were reported, suggesting the presence of some residual thyroid dysfunction despite effective treatment

Conclusion This case illustrates that thyrotoxicosis can initially present with psychotic symptoms, emphasizing the importance of a timely and accurate diagnosis. Comprehensive treatment strategies can lead to significant clinical improvement and enhanced quality of life for patients. It is advisable for clinicians to consider potential endocrine disorders in individuals exhibiting psychotic symptoms and to perform the necessary examinations and initiate appropriate treatment protocols

精神分裂症在语义言语流畅性任务下近红外光谱成像特征探究

李娟 张景丹 代海月 惠娟 张朝辉*
河南省精神病医院

目的 通过近红外光成像技术,探索在语义言语流畅性任务下,精神分裂症患者和正常对照组前

额叶脑区激活的差异，寻找识别精神分裂症的客观指标。

方法 共纳入 60 例精神分裂症患者、39 例性别、年龄与之匹配的正常对照者进行测试，采用阳性与阴性症状量表（PANSS）对患者症状严重程度进行评估，采用蒙特利尔认知评估量表（MoCA）进行认知评估，利用 52 通道 ETG-4100 近红外光谱仪采集两组人群前额叶的氧合血红蛋白 [Oxy-Hb] 的相对浓度值，基于一般线性模型理论，计算各通道的 [Oxy-Hb] 浓度激活值，采用 SPSS 进行数据分析。

结果 精神分裂症患者在言语流畅性任务中的正确组词数显著低于正常对照组 ($t=-7.82$, $P<0.001$)，精神分裂症患者在执行语义流畅性任务时，脑区激活范围显著小于对照组（通道激活数：28 vs. 51），差异主要位于背侧额极皮层区，其次是双侧颞上回（FDR 矫正 $P<0.05$ ）。受教育年限、发病次数和言语流畅性任务的正确组词个数对认知严重程度有一定影响。

结论 精神分裂症患者有明显的语义言语流畅性缺陷，可能与背侧额极皮层区及双侧颞上回激活功能下降有关。发病次数越多，认知下降越明显。

关键词：精神分裂症；言语流畅性任务；语义缺陷；近红外光成像技术；认知功能

精神科临床药师的培训与展望

毛叶萌* 吴彦
上海市精神卫生中心

目的 在三医联动改革的推动下，临床药师的工作将越来越被医院及社会认可和重视。但是接受过精神科临床药师培训的药师人数明显不足，所以建立精神科临床药师培训，以满足医药转型对药师专业技能的需求，补足医院药师医学专业基础及技能的弱势。

方法 本中心与全国相关的精神专科医院一起努力，申请在中国医院协会现有的临床药师基地专业基础上增设精神科临床药师培训，并按培训大纲要求，设置精神科临床药师理论课（包括通科+精神专科理论），以及精神科临床药学实践课（药学查房、药学评估、药学监护、药学教育等）的系列培训。在临床药师工作站嵌入了以药学评估为基础的

闭环的药学服务路径，可以引导临床药师和学员开展完整的、有效的临床药学服务工作。

结果 精神科临床药师培训体系的建设与逐步完善，使得培训的老师和学员在实践、带教及学习的过程中，教学相长，对培养合格的精神专科临床药师，填补精神科临床药师培训的不足起到很好的示范作用。

结论 上海市精神卫生中心作为精神科临床药师培训基地，结合培训大纲的要求，建立了信息化临床药学工作及带教路径，使学员在学习理论与技能的同时，尽快掌握药学服务的方法、提升学习能力和临床思维，成为合格的精神科临床药师。

组织支持感及循证护理能力对护士创新行为的影响研究

李琰 史艳茹*
西京医院

目的 本研究旨在了解护士创新行为现状，探讨组织支持感及循证护理能力对创新行为的影响，为进一步提高护士创新行为提供理论参考。

方法 采用便利抽样法，于 2022 年 6-7 月选取某三甲综合医院 314 名护士作为研究对象，采用一般资料问卷、创新行为量表、组织支持感量表、循证护理能力评定量表进行问卷调查。采用 SPSS 26.0 对数据进行描述性分析，相关性分析，单因素分析及多元线性回归分析。以 $P<0.05$ 代表具有统计学差异。

结果 护士创新行为得分 (30.27 ± 6.65) 分，组织支持感得分 (44.91 ± 9.33) 分，循证护理能力得分 (48.19 ± 23.86) 分。相关性分析显示护士创新行为与组织支持感及循证护理能力均呈正相关 ($P<0.05$)。单因素分析结果显示，护士创新行为在年龄、工作年限、教育程度、英语水平、职称、职务、护理工作满意度、科研经历，以及是否参加护理创新学习班上 ($P<0.05$) 具有统计学差异。多元线性回归分析结果显示组织支持感、循证护理能力及是否参加过护理创新学习班是影响护士创新行为的重要影响因素，共解释总变异的 37.1%。

结论 护士创新行为水平较低, 护理管理者可通过提高对护士的情感性支持感、培养护士循证护理能力及创新思维, 提升护士创新行为水平。

Effects of Balint Groups on Communication Skills Improvement of First-year Resident Doctors in China

Zixuan Zeng Lei Huang Jiabin Wu Zheng Lu*
Tongji Hospital, School of Medicine, Tongji University

Objective Poor communication is identified as one of the major causes of deteriorating doctor-patient relationships in China. More effective training methods for communication skills are needed. The aim of this study is to evaluate the effects of Balint Groups on communication skills for first-year resident doctors and to explore the feasibility of integrating Balint Groups into standardized residency training programs in China

Methods An interventional study using a randomized controlled design and standardized evaluation measurements was conducted. Participants in the intervention group (n=18) received the Standardized Balint Group Program for 6 consecutive months. Those in the waitlist group (n=17) did not attend any Balint Group meetings but were put on a waiting list for future sessions. The communication skills were assessed by 2 experts independently with the SEGUE Framework

Results There is no difference in scores of the SEGUE Framework in baseline between the two groups. After the study, the total score, and 4 out of 5 sub-scores (“Elicit information”, “Give information”, “Understand patient’s perspective”, and “End the encounter”) of the SEGUE Framework increased significantly from baseline levels for the intervention group. While only 1 sub-score (“Set the stage”) was increased for the waitlist group. When comparing the score changes of the SEGUE Framework, the increase in the total score (p=0.008) and the sub-score in “Elicit information” (p=0.016) were significantly larger for participants in

the intervention group

Conclusion Balint Groups can improve the communication skills of resident doctors in China, and it is feasible and beneficial to be integrated into the national Standardized Residency Training Programs

关键词: Balint Group, SEGUE Framework, Communication Skills, Residency Training, Doctor-Patient Relationship

Structural Characteristics of Gut Microbiota in First Untreated Children and Adolescents with Obsessive-compulsive Disorder.

Jiali Dai^{1,2}, Gang Zhu¹

1.The First Affiliated Hospital of China Medical University

2.The Third Hospital of Daqing

Objective Obsessive-compulsive disorder (OCD) is a chronic disabling mental disorder characterized by repeated and persistent obsessive and/or compulsive behaviors. There is no direct evidence of intestinal microbiota disorder in children and adolescents with OCD. This study aims to through 16SrRNA sequencing, for starting the drug has not whether there was a child and adolescent patients intestinal disorders provide direct evidence and comprehensive understanding, and finding potential biomarkers associated with OCD, to explore the diagnosis and treatment of SSRIs influence on the intestinal flora, it provides an important theoretical basis for the early diagnosis and prognosis of obsessive-compulsive disorder

Methods 1. Stool samples were collected from 49 first-episode untreated children and adolescents with OCD and 42 age - and sex-matched healthy controls (HC). Samples were collected after 12 weeks of SSRIs monotherapy for OCD, and all subjects were evaluated for clinical parameters. 2. Fecal samples from 49 patients with OCD, 42 HC and 26 OCD12W treated with SSRIs for 12 weeks were analyzed by 16S rRNA sequencing. 3. Correlation analysis was conducted be-

tween metagenomic sequencing results and clinical parameters to explore the relationship between intestinal flora and OCD symptoms and the possible functional pathways involved in the pathogenesis

Results 1. Intestinal microbiota of OCD patients were disturbed at phylum, genus and species levels, and the diversity of microbiota was significantly reduced, while the microbial interaction network was significantly weaker than that of HC group. 2. The relative abundance ratio of Firmicutes/Bacteroidetes(F/B) in OCD group was significantly decreased. 3. Intestinal strains of OCD patients the abundance of Butyrate producing bacteria include Romboutsia, Alistipes indistinctus in other genus, Coprococcus catus in Faecal genus, Ruminococcus sp. CAG:177 in Ruminococcus genus decreased significantly. 4. Compared with OCD0W, the structure and diversity of OCD12W had no significant change. 5. The random forest model identified 30 bacterial genera as markers, and the AUC between untreated OCD patients and HC was 0.9011. Thirteen bacteria were identified as microbial markers in the Respond and Nonrespond groups, and AUC was 0.8274

Conclusion 1. Intestinal flora of children and adolescents with OCD were disordered at phylum, genus and species level, and the diversity of flora was significantly reduced, and there were obvious defects in microbial interaction network. 2. Intestinal stability was destroyed in children and adolescents with OCD, which was associated with a significant decrease in the abundance of butyrate producing bacteria. 3. Short-term treatment with SSRIs can alleviate clinical symptoms, but fails to make the microbial ecosystem of children and adolescents with OCD close to healthy individuals. 4. OCD and HC groups can be distinguished by intestinal flora, and microbial markers can also predict treatment outcomes

马来酸氟伏沙明对伴胃肠道症状的儿童青少

年强迫症患者疗效研究及其对肠道菌群的影响

代佳利^{1,2} 朱刚¹

1. 中国医科大学附属第一医院

2. 大庆市第三医院

目的 明确伴胃肠道症状的首发未用药儿童青少年强迫症患者肠道菌群的整体结构特征。探究伴胃肠道症状的儿童青少年强迫症患者经马来酸氟伏沙明治疗的临床疗效与安全性。比较伴胃肠道症状的儿童青少年强迫症患者经马来酸氟伏沙明治疗前后肠道菌群变化情况, 并寻找出显著差异菌群及其与临床疗效之间的相关性。

方法 1、将 2022 年 1 月~2023 年 1 月于本院心理科就诊的 30 例伴胃肠道症状的儿童青少年强迫症患者作为研究对象, 对所有受试者进行一般资料调查表、CY-BOCS、HAMD、HAMA、GSRs、TESS、CGI, 并留取粪便样本。

2、给予伴胃肠道症状的首发未用药儿童青少年强迫症患者马来酸氟伏沙明足量治疗 12 周, 于治疗 4、8、12 周后复测 CY-BOCS、HAMD、HAMA、GSRs、TESS 以及 CGI, 完成随访后再次收集粪便样本, 并对治疗前后的样本进行 16SrRNA 测序。

3、通过比较治疗前后患者肠道菌群变化情况以及强迫、焦虑、抑郁等临床症状的严重程度, 明确马来酸氟伏沙明对伴胃肠道症状的儿童青少年强迫症患者的临床疗效与安全性, 并进一步探讨该药物对伴胃肠道症状的儿童青少年强迫症患者肠道菌群的影响。

结果 1、经马来酸氟伏沙明治疗 12 周后伴胃肠道症状的 OCD 患者 (OCD12W) 胃肠道症状明显减轻 ($P < 0.05$)。2、OCD12W 组患者肠道菌群各多样性指数均显著升高 (obs, $P < 0.05$; chao1, $P < 0.05$; ACE, $P < 0.05$; shannon, $P < 0.05$; simpson, $P < 0.05$)。3、OCD12W 组厚壁菌门 / 拟杆菌门的相对丰度比值 (F/B) 显著升高 ($P < 0.001$)。4、OCD12W 组患者肠道瘤胃球菌属 (Ruminococcus, $q < 0.01$)、大肠埃希菌-志贺氏菌属 (Escherichia-shigella, $q < 0.01$) 等与胃肠道症状相关的菌属的相对丰度显著升高。5、OCD 组各临床参数的变化与肠道菌群中特定细菌的丰度改变之间存在相关性 ($P < 0.05$)。

结论 1、经 12 周马来酸氟伏沙明治疗, 首发未用药儿童青少年 OCD 患者胃肠道症状明显改善,

肠道菌群多样性显著升高。2、首发未用药儿童青少年 OCD 患者肠道稳态被破坏与瘤胃球菌属 (*Ruminococcus*) 等与胃肠道症状密切相关的菌属相对丰度显著降低有关。3、首发未用药儿童青少年 OCD 患者各临床参数的变化与肠道菌群特定物种的丰度改变之间存在关联。

关键词: 肠道菌群; 儿童青少年; 强迫症

Effect of Virtual Reality Technology Combined with Mindfulness-based Stress Reduction Therapy on Late Life Depression

Jiali Dai^{1,2}, Gang Zhu¹

1.The First Affiliated Hospital of China Medical University

2.The Third Hospital of Daqing

Objective To analyze the effect of virtual reality technology combined with mindfulness-based stress reduction therapy on the clinical efficacy of elderly patients with depression

Methods Fifty patients with Late life depression admitted to Daqing Third Hospital from September 2023 to December 2023 were selected as the study objects, and randomly divided into control group (25 cases) and virtual reality combined with mindfully based stress reduction group (VR+MBSR group) (25 cases). The control group was treated with conventional drug therapy and health education, and the VR+MBSR group was treated with virtual reality technology combined with mindfully based stress reduction therapy based on drug therapy. Both groups were treated for 8 weeks. The therapeutic effects (HAMA, HAMD, FFMQ), self-efficacy improvement (GSES), social function (SDSS) and cognitive function improvement (MoCA) of the two groups were compared before and after the intervention

Results After intervention, HAMA and HAMD scores in 2 groups were significantly decreased ($P < 0.001$), GSES and MoCA scores in VR+MBSR group were significantly increased ($P < 0.001$), and SDSS scores were significantly decreased ($P < 0.05$). After intervention, FFMQ total score and observation ($P <$

0.001), conscious action ($P < 0.001$), non-judgment ($P < 0.05$) and non-response ($P < 0.05$) were significantly increased in VR+MBSR group

Conclusion Virtual reality technology combined with mindfulness-based stress reduction therapy can improve the clinical efficacy, social and cognitive level, and self-efficacy of elderly patients with depression

十年筑精神梦，继续砥砺前行——以广州医科大学附属脑科医院精神科住培十年建设为例

叶碧瑜 陈建松 杨婵娟* 濮希成 徐蕊 李璇子 杨冬雪 姚菲 胡凤兴

广州医科大学附属脑科医院

目的 本研究旨在通过深入探讨广州医科大学附属脑科医院精神科在过去的十年中住院医师规范化培训(住培)项目的全面建设经验,为推动精神科住培的高质量发展提供实践指导和策略建议。

方法 研究采用回顾性方法,全面探讨了广州医科大学附属脑科医院在精神科住培十年期间的关键发展阶段,具体包括:培训模式的创新与实践、过程管理的精细化、师资力量/system培养、考核基地的建设与优化、考核体系的科学构建,以及医学人文教育的深化实施。

结果 经过十年的系统建设和持续优化,广州医科大学附属脑科医院精神科的住培项目已取得显著的成效。住院医师的专业技能得到显著提升,临床决策能力增强,人际沟通和团队协作能力得到锻炼,专业素养和医学伦理意识显著提高。通过强化医学人文教育,培育“精诚惠爱”的理念,时刻牢记“健康所系,性命相托”的誓言。

结论 通过紧密围绕住院医师六大核心胜任力(职业素养、知识技能、病人照护、沟通合作、教学能力、终生学习)的培训目标,结合现代医学教育理念和方法,广州医科大学附属脑科医院精神科已成功探索出一条促进精神科住培可持续发展的有效路径。这一路径不仅提升了培训的质量和效果,也为

其他医疗机构提供了可借鉴的经验和模式,为培养更多优秀的精神科医疗人才做出贡献。

探讨求同存异理念对非自杀性自伤未成年人亲子冲突的作用

朱建立¹ 李先瑞^{2,3} 卢惠鹏¹ 牛红利¹ 盛秋萍¹ 彭志珍¹ 胡媛媛¹ 章杰¹ 胡静¹

1. 中山市第三人民医院

2. 山东省戴庄医院

3. 西南大学

目的 探讨求同存异理念对非自杀性自伤(non suicidal self-injury, NSSI)未成年人亲子冲突的作用。

方法 以2022年6月至2023年8月于中山市第三人民医院住院的NSSI未成年人为研究对象,纳入有亲子冲突的患者,随机分为干预组(47人)及对照组(44人)。干预组接受团体心理干预:1、建立治疗同盟;2、学习求同存异的概念、相关的历史事件及重要意义;3、结合自我经历,讲述体现求同存异的生活事件,分享当时和此刻的感受;4、围绕“我眼中的父母”,讲述生活中的重要事件,呈现对父母的认知及评价;5、围绕“父母眼中的我”,结合自身经历,讲述父母对自己的期望及要求;6、以“第一次做孩子,父母何必对我们那么严格”为主题,组织组员进行正反两方辩论;7、以“第一次做父母,哪有十全十美”为主题,组织组员进行正反两方辩论;8、总结阶段,组员汇报求同存异理念带来的认知改变以及感受变化(划分为当时和此时两个阶段),促进包容父母的缺点与不足,修复亲子关系。注:从第4阶段开始,鼓励干预组患者和家长多沟通。每周1次、连续6周对2组患者的亲子关系感受等进行定性研究,并评价效果。

结果 1、在亲子关系认知评价方面,干预组患者较对照组患者的评价更全面和理性,内心痛苦感降低明显。2、在接纳父母方面,干预组患者较对照组患者自我改变意愿强烈,对父母排斥程度减弱明显,接纳父母意愿强烈。3、在看待未来的亲子关系发展方面,干预组患者较对照组患者更积极和自信,与父母共同成长意愿也更强烈。4、干预组多数患者

认可和接纳求同存异理念,反馈对改善亲子冲突有积极意义。

结论 起源于中国传统文明的求同存异理念,可以作为认知治疗技术,改善NSSI未成年人的亲子冲突。

Perfectionism and Psychological Resilience Mediate The Negative Effects of Childhood Trauma on Major Depressive Disorder

Chaochao Lu Weihui Li* Yuexin Zhang

The Second Xiangya hospital

Objective Childhood trauma is a recognized risk factor for major depressive disorder (MDD). Previous studies have indicated that perfectionism and psychological resilience may mediate the relationship between childhood trauma and MDD. The purpose of this study was to assess how perfectionism and psychological resilience influence the relationship between childhood trauma and MDD in an adult clinical context

Methods In this cross-section survey, a total of 621 clinical patients with psychological disorders completed a series of psychological scales such as the Childhood Trauma Questionnaire-Short Form (CTQ-SF), the Connor-Davidson Resilience Scale (CD-RISC), the Frost Multidimensional Perfectionism Scale (FMPS) and the Zung Self-Rating Depression Scale (SDS). Structural equation modeling (SEM) was performed to show the relationship among childhood trauma, perfectionism, psychological resilience, and depression

Results The pathway of “childhood trauma—perfectionism—MDD” was significant (95% CI = [1.018,2.398]). The pathway of “childhood trauma—psychological resilience—MDD” was significant (95% CI = [4.078,7.749]). The sequential pathway of “childhood trauma—perfectionism—psychological resilience—MDD” was significant (95% CI = [0.234,1.397])

Conclusion The study provides new ideas about the mechanisms of childhood trauma on MDD. It suggests that perfectionism and psychological resilience can mediate the pathway from childhood trauma to MDD and have a chain effect. Thus, clinicians may be able to mitigate the negative effects of childhood trauma on MDD by intervening in perfectionism and enhancing the level of psychological resilience

关键词: Major depressive disorder; Childhood trauma; Perfectionism; Psychological resilience

心境情感障碍伴非自杀性自伤青少年照顾者压力及其影响因素的研究

姜琳 朱刚*

中国医科大学附属第一医院

目的 探索心境情感障碍 (Mood Disorder) 伴非自杀性自伤 (Nonsuicidal Self-injury, NSSI) 青少年照顾者压力 (Caregiver Stress) 情况及其影响因素。

方法 共纳入符合 ICD-10 (The International Statistical Classification of Diseases Tenth Revision, ICD-10) 心境情感障碍 (Mood Disorder) 及非自杀性自伤 (Nonsuicidal Self-injury, NSSI) 诊断标准的

青少年患者及其照顾者 127 例, 患有心境情感障碍无自伤行为青少年的照顾者 90 例。两组照顾者均填写一般调查问卷和照顾者压力问卷 (The Caregiver Strain Questionnaire, CGSQ) 收集照顾者的一般情况以及照顾压力情况。以渥太华自伤问卷 (The Ottawa Self-Injury Inventory, OSI) 评估青少年自伤情况, 以家庭功能评估量表 (Family APGAR, APGAR)、情绪调节困难量表 (Difficulties in Emotion Regulation Scale, DERS)、艾森克人格量表 (Eysenck Personality Questionnaire, EPQ) 等评估青少年照顾者的家庭功能、情绪调节能力、人格特征。

结果 MD 伴 NSSI 组 CGSQ 总分高于 MD 不伴 NSSI 组。 ($p < 0.05$) 2、青少年近 1 个月自伤频率、DERS 总分、EPQ N 值与 CGSQ 总分呈正相关, APGAR 总分和 EPQ E 值与 CGSQ 总分呈负相关。

(p 值均 < 0.05) 3、多重线性回归方程显示青少年近 1 月自伤越频繁、家庭功能越差、照顾者情绪调节能力越低、EPQ N 值越高, MD 伴 NSSI 组照顾者的 CGSQ 总分越高。 ($R^2 = 0.615$, $p < 0.05$)

结论 心境情感障碍伴非自杀性自伤青少年照顾者压力显著高于心境情感障碍不伴非自杀性自伤青少年照顾者压力。2、青少年近 1 月自伤越频繁、家庭功能越差、照顾者情绪调节能力越低、EPQ N 值越高, MD 伴 NSSI 组照顾者的 CGSQ 总分越高。

关键词: 心境情感障碍; 非自杀性自伤; 照顾者压力; 影响因素

青少年抑郁障碍患者的非自杀性自伤行为现状及影响因素的研究

高睿 朱刚*

中国医科大学附属第一医院

目的 探究青少年抑郁障碍患者的非自杀性自伤行为 (NSSI) 的现状及影响因素, 深入探究单纯抑郁障碍与抑郁障碍伴混合特征情况下的社会心理因素分析, 为青少年抑郁障碍患者非自杀性自伤行为的识别与干预提供帮助。

方法 选择 2023 年 2 月至 2023 年 12 月于心理科就诊且符合入组标准的 200 名有 NSSI 行为的患者为研究对象, 使用渥太华自伤量表、简易应对方式量表、青少年生活事件量表、家庭亲密度及适应

性量表中文版、临床实用抑郁混合特征量表。进行 NSSI 行为特征分析及各变量相关性分析。将组内患者分为单纯抑郁组和混合特征组,比较两组患者的组间差异。完成资料采集后使用 SPSS27 统计软件对数据进行分析。

结果 1、青少年最常见的伤害方法是切割(61.0%)、尖利物体刺伤皮肤(48.0%)、击打(46.8%),最常见的伤害部位是手(67.5%)、下臂或腕部(58.4%)、上臂或臂肘(31.1%)。2、生活事件、冲动性、应对方式与自伤的严重程度存在相关性。3、两组患者在认知冲动性、行动冲动性、冲动性总分、消极应对、幻想与逃避、求助与问题解决得分上的差异具有统计学意义($P<0.05$),结果可得出单纯抑郁组患者在认知冲动性、行动冲动性以及总分、求助及问题解决上的得分小于混合特征组患者的得分,消极应对、幻想与逃避大于混合特征组的得分。

结论 1、青少年抑郁障碍患者发生 NSSI 形式多样,最常见的切割、用尖利物体刺伤皮肤、击打等方式,常见伤害于手、下臂或腕部、上臂或臂肘等部位。2、青少年抑郁障碍患者发生 NSSI 行为的严重程度与生活事件、冲动性、应对方式因素相关。3、混合特征组患者认知冲动性、行动冲动性水平较高。单纯抑郁组患者更容易采用消极应对、幻想与逃避的应对方式,混合特征组患者更易采用求助与问题解决的应对方式。

益生菌复合制剂辅助治疗重性精神障碍患者合并代谢异常的临床干预研究

韩云武 吴小立*

中山大学附属第三医院

目的 通过随机、双盲、安慰剂对照试验,观察益生菌复合制剂干预重性精神障碍合并代谢异常的临床疗效和安全性,并初步探索肠道菌群特征与临床代谢相关指标及认知功能之间的关系,尝试筛选出可能辅助治疗重性精神障碍患者合并代谢异常的潜在关键菌。

方法 本研究纳入持续接受治疗的重性精神障碍合并代谢异常患者 60 名,其中包括,随机分为试

验组(益生菌复合制剂干预)($n=30$)及对照组(安慰剂干预)($n=30$),进行为期 12 周的益生菌干预治疗。收集受试者的一般人口学信息及临床病理资料,采集受试者血液样本进行血液生化指标(糖代谢和脂代谢指标)检测,采集受试者粪便样本进行肠道菌群 16SrRNA 测序。采用独立样本 t 检验、配对样本 t 检验等统计学方法分析受试者临床资料、代谢指标;采用生物信息学分析方法对受试者粪便肠道菌群数据进行分析,比较两组患者干预前后组内及组间的肠道菌群特征,并探索其与相关代谢指标间可能的关联。

结果 1、与干预前相比,试验组干预后的甘油三酯水平明显下降($P<0.05$);对照组干预后总胆固醇水平明显升高($P<0.05$)。

2、试验组益生菌干预 12 周后,进行随机森林算法结合统计学检验,从而确立试验组内干预前后存在差异菌属: *Selenomonas*、*Clostridium*、*Roseburia*、*Erysipelotrichaceae*、*Barnesiella*、*Bacteroidales*、*Oxalobacteraceae* 与多项代谢相关指标关联密切。上述菌属在试验组的基线与研究终点相对比中,相对丰度均有不同程度的差异;其中 *Selenomonas* 在益生菌干预后丰度明显下降,且与 TG 水平呈正相关;*Clostridium* 在益生菌干预后丰度明显升高,其与体重指数(BMI)和 FI 水平呈负相关。

结论 1、12 周内给予益生菌复合制剂干预,可辅助性降低重性精神障碍合并代谢异常患者的 TG 水平。

2、12 周内给予益生菌复合制剂干预,对重性精神障碍合并代谢异常患者的 TC 水平可能具有保护作用。

3、干预前后试验组的肠道菌群存在显著差异,差异菌属与患者代谢异常的发生关系密切。随机森林模型确立的关键菌属: *Selenomonas*、*Clostridium*、*Roseburia*、*Erysipelotrichaceae*、*Barnesiella*、*Bacteroidales*、*Oxalobacteraceae* 与多项代谢相关指标关系密切。

关键词:重性精神障碍;肠道菌群;代谢异常

Es-ketamine Ameliorates Depressive Behavior Via CB1R Dependent Mitochondria Biogenesis in Mice with Chronic Various Stress

Huan Yu Cuihong Zhou Shanshan Xue Haixia Chen
Yumeng Meng Min Cai*
Xijing Hospital

Objective This study aimed to identify the effect of es-ketamine (es-Ket)

treatment on depression and explore whether cannabinoid receptor 1 (CB1R)-mediated mitochondrial biogenesis accounts for the anti-depression effect of es-ketamine in a chronic various stress (CVS) mice model.

Methods 36 C57BL/6J mice were randomly assigned to the three groups: Control, CVS+Saline, CVS+es-Ket. Mice in control were treated by nothing as comparison. Mice in CVS+Saline and CVS+es-Ket groups were treated by CVS modeling for consecutive 21 days. And then, mice were injected with saline (10 μ L/g) or es-ketamine (15 mg/kg) for seven days respectively after CVS. Subsequently, all mice were subjected to open field test, novelty suppressed feeding test, tail suspension test, forced swimming test, and elevated plus maze test to observe the depression and anxiety-like behaviors. Then the mice were sacrificed and the levels of CB1R and mitochondrial biogenesis and function-related proteins nuclear transcription factor 1 (NRF1), mitochondrial transcription factor A (TFAM), Cytochrome C (Cyto C) were measured. To elucidate the role of CB1R in anti-depression effect of es-ketamine, CB1R antagonists AM251 and SR141716A were given to mice with es-ketamine administration. Likewise, subjects' depressive anxiety-like behaviors, mitochondrial function and biogenesis were examined after the CVS procedure

Results Compared with the control group, mice in CVS + saline group exhibited significant depression and anxiety-like behaviors, including decreased time spent in center of open-field and time in open arms of elevated plus maze, prolonged feeding latency, immobility time in tail suspension test and forced swimming test. Additionally, the protein level of CB1R, NRF1 and TFAM were decreased significantly, while Cyto C increased significantly. Es-ketamine administration successfully ameliorated depressive and anxiety-like behaviors, and upregulated CB1R, NRF1 and TFAM expressions, downregulated Cyto C in CVS mice. However,

the supplementation of AM251 and SR141716A blocked the antidepressant-like effects of es-ketamine, and es-ketamine failed to upregulate CB1R protein expression, and increase mitochondrial function and biogenesis

Conclusion These results indicated that es-ketamine ameliorated depression- and anxiety-like behaviors in CVS mice, promoted mitochondrial biogenesis by activating CB1R, a novel mechanism underlying es-ketamine's antidepressant-like effects in treating depression

关键词: depression, es-ketamine, CB1R, mitochondria

重度抑郁障碍患者入睡困难与早醒症状的脑功能的共性与差异

王晓芹¹ 崔青¹ 夏逸¹ 杜易珊¹ 卢青² 姚志剑^{1,2}

1.南京医科大学附属脑科医院心境障碍科

2.东南大学生物医学工程

目的 大量研究表明,重度抑郁障碍患者常常会出现各种失眠症状,包括入睡困难和早醒。虽然已有大批神经影像学研究揭示了失眠的神经机制,但由于失眠症状的异质性,重度抑郁障碍患者特定失眠症状的脑功能异常模式仍不清晰。本研究旨在探讨入睡困难和早醒的重度抑郁障碍患者的局部脑功能的共性与差异。

方法 共计纳入 132 名重性抑郁障碍患者,均来自于 2018 年到 2021 年南京医科大学附属脑科医院心境障碍科住院的急性抑郁发作患者,其中 50 名伴入睡困难,36 名伴早醒,46 名不伴失眠症状。此外,于社区招募性别、年龄和受教育年限与之匹配的健康人 60 名。所有参与者均接受了静息功能磁共振成像扫描。比较四组之间的低频振幅。对差异脑区的低频振幅值、汉密尔顿抑郁量表 17 项因子分和匹兹堡睡眠质量指数得分进行皮尔逊相关分析。

结果 入睡困难患者左侧中央前叶低频振幅值低于早醒组,左侧岛叶低频振幅值高于无失眠症状者。早醒患者左侧中央前叶的低频振幅值高于无失眠症状者。

结论 本研究提示,脑岛活动异常增加是入睡

困难的神经机制，而中央前回活动异常增加参与了早醒的发生。我们的结果进一步揭示了重度抑郁障碍患者入睡困难与早醒症状背后的神经机制，为后续针对不同失眠症状进行干预提供了研究基础。

虚拟现实技术在儿童青少年精神障碍中的应用

文晓菲^{1,2} 钟慧¹

1.合肥市第四人民医院

2.蚌埠医科大学精神卫生学院

目的 本文概述了几种临床中常见的儿童青少年精神障碍与虚拟现实技术(Virtual Reality Technologies, VRTs)结合的研究，通过VR这一手段，提高治疗配合度，力求减少成年后的发病几率。本文旨在探索计算机技术在儿童青少年精神疾病范围内的可用性，利用VR环境的交互性、沉浸性、多感知性等特点，让患儿能够全身心投入治疗，从模拟的场景中锻炼自己的身心，积极面对生活，提高社会适应能力，以期VR技术在精神心理疾病方面更深层次的研究提供思路。

方法 结合《精神疾病诊断与统计手册》(DSM-5)疾病诊断的顺序，寻找最近3年的国内外儿童青少年精神障碍在VR技术指导下干预的相关研究成果。通过计算机检索中国知网(CNKI)、PubMed、谷歌学术、百度学术等数据库，以VR、mental disorders、children、teenagers、adolescence、therapy等为关键词，检索时间为2021年到2024年5月。纳入标准：与本研究主题有关的学术期刊、综述、临床随机对照试验等；排除标准：数据信息不全、质量差、检索结果不符合需求的文献。

结果 VRTs在儿童青少年精神障碍近三年的研究主要集中在：孤独症(自闭症)谱系障碍(ASD)、注意缺陷多动障碍(ADHD)、抑郁障碍、焦虑障碍、睡眠-觉醒障碍，而在智力障碍中的应用也有一定的研究。其次，检索到一篇关于青少年边缘性人格障碍的VR研究。此外，目前在儿少精神分裂症中应用VR治疗的临床对照试验较少，仅在某篇综述中查询到VR也可用于管理精神分裂症青少年的暴力

风险。而对于VRTs已用于创伤后应激障碍、恐惧症、物质成瘾障碍等疾病的治疗，多应用于成人，未在儿童青少年中见到。

结论 虚拟现实技术(VRTs)利用计算机、头戴式显示器等设备生成模拟现实的场景，并与患者进行互动，其独立或者联合治疗都已在许多精神疾病中进行过研究，但在儿童青少年的研究中仍然不多见。但相对于成人，儿童青少年更喜爱也更愿意接受在虚拟现实环境中进行康复训练与治疗，因此本文探讨了VRTs在具体儿少精神障碍中的应用，期待能够有更多的儿童青少年精神疾病患者在VRTs的治疗中取得更好的疗效。

Retinal Structure and Function As Potential Biomarkers for Major Depressive Disorder: A Scoping Review

Li Duan Gang Zhu*

The first affiliated hospital of Chnia Medical University

Objective This study systematically reviews literatures on retinal biomarkers as potential diagnostic indicators of major depressive disorder (MDD), thereby providing a theoretical foundation for offering practical guidance for early clinical identification and diagnosis of this disorder

Methods By employing scoping review method, two researchers conducted a comprehensive search of 10 databases to summarize the current status of retinal objective instruments for MDD patients, and the correlations between the retinal markers and MDD

Results Among the 13 articles included in the analysis system, 8 studies investigated the suitability of retinal structure as a biomarker for MDD, and 5 studies explored retinal function using visual electrophysiology techniques. These findings suggest that even during the early stages of the disease, retinal function may serve as a potential biological marker for MDD. Furthermore, several studies employed a combination of various ex-

amination tools to assess ocular biomarkers in MDD patients

Conclusion Limited studies have explored retinal function as a potential biomarker for MDD, and there is a lack of safe, uniform, and standardized clinical examination methods and evidence specifically tailored for the MDD population. Therefore, urgent attention should be given to investigating the feasibility of combining retinal structure and function as a biomarker for MDD

青少年人际心理治疗干预抑郁症的新进展

韩羽航¹ 樊凡² 刘惠军² 于斌³

1.浙江大学医学院附属第二医院

2.天津医科大学心理学研究所

3.天津大学医学部应用心理研究所

人际心理治疗 (interpersonal psychotherapy, IPT) 是世界卫生组织推荐的一线抑郁症治疗方法, 它建立在实证研究基础上, 关注人际事件与抑郁情绪之间的双向交互作用, 通过改善人际关系来减轻病人的抑郁症状。因其成本低、易实施, 近年来倍受关注。人际心理治疗以青少年中多发的人际问题为突破口, 目标清晰, 针对性强。目前国际范围内已将其广泛应用于青少年群体, 但国内对此研究不多。十多年来, 人际心理治疗的治疗过程获得了许多修正和补充, 有关治疗效果的研究不断涌现, 这为有效治疗青少年抑郁症, 降低抑郁症对青少年的不利影响提供了可借鉴、可推广的方法, 值得进一步梳理并推广应用。文章介绍了人际心理治疗在青少年群体中的应用过程, 对比分析发现该方法治疗效果优于常规治疗, 可有效缓解抑郁症状。人际心理治疗对青少年自我概念及社会适应有显著改善作用, 还能促进青少年亲密关系的维持和发展。人际心理治疗与认知行为疗法一样能有效减轻患者抑郁症状, 两者疗效相当。人际心理治疗还对抑郁症的一些共患疾病和其他心理疾病也都有很好的治疗效果。另外, 人际心理治疗具有灵活性, 在青少年中还有很

多形式和拓展, 疗效也获得证实, 值得未来做更多推广和应用性研究。

工作压力及职业倦怠对住院医师核心胜任力的影响

陈巧珍¹ 沈禹泽^{1,3} 钱燕丹² 潘琦¹ 潘瑞博¹ 林铮¹

1.浙大医学院附属第二医院

2.嘉善县第三人民医院精神科

3.杭州市临平区第一人民医院精神卫生科

目的 了解临床工作压力及职业倦怠对住院医师六大核心岗位胜任力的影响。

方法 通过发放线上问卷, 采用自行设计的条目收集在培住院医师的基本信息和临床工作量激增前后职业素养、专业能力、病人管理、沟通合作、教学能力和学习提升六大胜任力等方面的自评情况, 采用马氏职业倦怠量表评价住院医师的职业倦怠程度, 比较分析压力前后核心岗位胜任力变化及其相关影响因素。

结果 通过对 340 份收集的有效问卷分析发现, 在经历 1 个月的临床工作量激增后, 住院医师的六大核心胜任力均有显著的提升 ($P < 0.05$)。其中工作时长在 50-59 小时/周的住院医师在病人管理、沟通合作以及学习提升这三个方面获得的提升大于工作时长 > 60 小时/周的住院医师 ($P < 0.05$)。职业倦怠程度与住院医师在职业素养、沟通合作以及学习提升三个方面的胜任力提升呈负相关 ($P < 0.05$)。在专业能力和病人管理方面, 转岗人员均优于未转岗人员 ($P < 0.05$)。外单位委派住院医师比医学专业硕士研究生的专业沟通能力提升更突出 ($P < 0.05$)。在教学能力提升方面, 本科生优于博士研究生, 本单位住院医师优于面向社会招收的住院医师 ($P < 0.05$)。不同性别、年级、婚姻状况在各项胜任力的提升中差异均无统计学意义 ($P > 0.05$)。

结论 临床工作压力增大对住院医师的胜任力锻炼有积极影响; 适度的工作时长有助于胜任力的提升, 但过高的职业倦怠感可能会阻碍住院医师胜任力的发展。

基于网络药理学方法探讨肉蔻五味丸治疗抑郁症的作用机制

范加琳*

丽水市第二人民医院

目的 通过网络药理学方法探讨肉蔻五味丸治疗抑郁症的作用机制。

方法 利用中药系统药理学数据库与分析平台(TCMSP)以及 PharmMapper 数据库检索与肉蔻五味丸中五味中药相关的活性成分及作用靶点, 利用 GeneCards、OMIM、TTD、PharmGKB、DrugBank 数据库筛选抑郁症相关的靶点, 随后构建化合物-靶点互作网络; 利用 STRING 数据库及 Cytoscape 软件构建 PPI 网络; 利用 Metascape 数据库进行 GO、KEGG 富集分析, 获得肉蔻五味丸治疗抑郁症的潜在作用通路, 并利用 Cytoscape 软件构建通路-靶点网络图。

结果 本研究共筛选出肉蔻五味丸 42 个活性成分和 300 个相应靶点, 通过五个数据库共获得抑郁症相关靶点 1430 个, 其中 111 个共同靶点; 通过 GO 富集分析发现生物学过程 1517 条, 分子功能 166 条, 细胞组成 90 条; KEGG 富集分析发现肉蔻五味丸通过多种信号通路协同发挥作用, 其中炎症相关通路在其中发挥重要作用。同时本研究发现了五个核心靶基因, 分别是 TNF、IL-1B、MAPK1、MAPK14、AKT1。

结论 初步探讨了肉蔻五味丸抗抑郁的主要潜在靶点及相关通路, 为进一步的实验和临床研究提供理论依据。

抑郁症患者人体成分测定病案分析

陈盛柏 黄海霞* 陈大球 杨文岸 陈雪凝 刘辉

海南省平山医院

目的 探讨抑郁症患者的人体成分变化及其临

床意义,为临床抑郁症患者的治疗提供指导建议。

方法 本研究选取2019年1月~2021年1月期间海南省平山医院、海南省安宁医院诊断的抑郁症患者150例作为病例组(HAMD-17项评分 ≥ 7 分),选取年龄、性别基本匹配的非抑郁症志愿者150例作为对照组,测定两组研究对象的体质量指数(BMI)、腰臀比、基础代谢率、机体脂肪含量、机体水分含量、机体蛋白含量、内脏脂肪面积、肌肉骨骼重量,检测两组血清三酰甘油(TG)、总胆固醇(TC)、高密度脂蛋白胆固醇(HDL-C)、低密度脂蛋白胆固醇(LDL-C)。

结果 病例组的BMI、腰臀比、机体脂肪含量、内脏脂肪面积测定结果均显著的高于对照组,差异具有统计学意义($P < 0.05$);病例组的机体蛋白含量低于对照组且差异显著($P < 0.05$);两组研究对象的基础代谢率、肌肉骨骼重量差异无统计学意义($P > 0.05$);病例组的血清TG、TC测定结果均显著的高于对照组,差异具有统计学意义($P < 0.05$);两组研究对象的HDL-C、LDL-C水平差异无统计学意义($P > 0.05$);确诊抑郁症患者BMI、机体脂肪含量测定结果显著高于可能抑郁的患者,差异具有统计学意义($P < 0.05$);两组患者的腰臀比、内脏脂肪面积、机体蛋白含量、基础代谢率、肌肉骨骼重量差异无统计学意义($P > 0.05$);确诊抑郁症患者的血清TG测定结果均显著的高于可能抑郁患者,差异具有统计学意义($P < 0.05$);两组患者的TC、HDL-C、LDL-C水平差异无统计学意义($P > 0.05$)。

结论 抑郁症患者较非抑郁症的人群存在一定程度的BMI超重,患者内脏脂肪及体脂率较高,并且与患者的抑郁病情有一定的关系。

压力知觉对青少年抑郁症程度的影响: 认知融合和经验性回避的链式中介作用

丁俊^{1,2} 胡茂荣² 陈瑶¹ 朱倩¹

1.江西中医药大学

2.南昌大学第一附属医院

目的 旨在通过调查青少年抑郁症患者,以接纳承诺疗法的视角,探究压力知觉对抑郁症程度的

影响以及经验性回避和认知融合在其中所起的链式中介作用。

方法 对238名青少年抑郁症患者进行自编一般人口学资料问卷,贝克抑郁量表(BDI-II)、知觉压力量表(PSS)、认知融合问卷(CFQ)和接受与行动问卷(AAQ-II)的测量,使用SPSS26.0对所得数据进行统计分析。

结果 青少年抑郁症患者在压力知觉($t=2.989, p=0.004$)、经验性回避($t=3.406, p=0.001$)和抑郁症状($t=4.534, p < 0.001$)方面存在明显的性别差异,女性水平更高,而认知融合($t=1.774, p=0.077$)不存在明显的性别差异。抑郁症状、压力知觉、经验性回避和认知融合两两均呈正相关($p < 0.001$),压力知觉能直接正向预测抑郁症状($\beta=0.244, p < 0.001$),且青少年抑郁症患者的压力知觉可以通过认知融合($\beta=0.092, 95\% CI: 0.013, 0.180$)和经验性回避($\beta=0.094, 95\% CI: 0.038, 0.159$)的单独中介作用影响抑郁症状,同时,认知融合和经验性回避在青少年抑郁症患者的压力知觉与抑郁症状之间起链式中介作用($\beta=0.131, 95\% CI: 0.061, 0.204$),总中介效应为0.317。

结论 本研究证实,认知融合和经验性回避在青少年抑郁症患者的压力知觉与抑郁症状之间起链式中介作用,提示未来可以采用接纳承诺疗法以预防和干预青少年抑郁症。

粪便微生物群移植辅助治疗抑郁发作的疗效及安全性的研究

李旭娟*

浙江树人大学树兰国际医学院附属树兰杭州医院

目的 探讨粪便微生物群移植(fecal microbiota transplantation, FMT)辅助治疗抑郁发作的疗效及安全性。

方法 收集2022年1月至2023年12月树兰(杭州)医院18-65岁,符合ICD-10抑郁发作诊断标准的门诊及住院患者46例,按随机数字表法分为FMT联合药物治疗组(实验组,23例)和单纯药物治疗组(对照组,23例)。实验组在药物治

疗基础上使用 FMT 治疗 1 次。两组均在基线及治疗第 2 周末,检测人体 10 种优势肠道菌群,采用 24 项汉密尔顿抑郁量表(Hamilton Depression Rating Scale, HAMD-24)评估患者的抑郁症状,采用治疗副反应量表(Treatment Emergent Symptom Scale, TESS)及实验室检查评估治疗相关的不良事件。以 HAMD-24 减分和减分率、治疗有效率、人体肠道内 10 种优势细菌移植前后指标变化等为主要评估指标,以药物不良事件、血常规、生化、心电图、免疫指标(免疫球蛋白+补体)、超敏 C 反应蛋白、甲状腺功能、糖化血红蛋白等实验室检验检查为安全评估指标。采用坐标分析(PCoA)、分度量多维尺度法(NMDS)比较实验组前后的菌群差异,对菌群和抑郁程度做相关性分析。

结果 2 组基线 HAMD-24 评分差异无统计学意义($P>0.05$)。治疗第 2 周末,实验组 HAMD-24 减分($P=0.048$)及减分率($P=0.016$)高于对照组,差异有统计学意义。PCoA 分析、NMDS 分析提示 FMT 前后肠菌分布差异无统计学意义。利用线性判别分析(LDA)判别柱形图发现 FMT 治疗后肠球菌($P=0.02$)在肠道中相对丰度显著上升。实验组基线富集到的普拉梭菌($P=0.040$)、酪酸梭菌($P=0.029$)、直肠真杆菌($P=0.004$)与 HAMD-24 得分呈显著负相关,其余微生物与 HAMD-24 得分呈现出不同的相关性,但差异无统计学意义。实验组不良事件发生率为 28.6%,对照组为 30%,2 组不良事件发生率差异无统计学意义($P=0.928$)。FMT 治疗过程中发生的主观不适为恶心、呕吐、鼻咽部不适,一般在治疗中发生,FMT 结束后均可自行缓解,且无严重不良事件发生。

结论 辅助 FMT 更能改善抑郁症状,并且安全,无明显不良反应。抑郁症患者 FMT 前后肠道微生物结构组成未发生改变,肠球菌属在 FMT 后肠道中相对丰度显著上升,且普拉梭菌、酪酸梭菌、直肠真杆菌与 HAMD-24 量表评分存在显著性负相关。

腹膜透析合并抑郁患者情绪体验和需求的质性研究

张馨^{1,2} 王晓燕^{1,3}

- 1.东南大学医学院
- 2.东南大学附属中大医院肾内科
- 3.东南大学附属中大医院护理部

目的 腹膜透析患者的心理负担较重,该研究通过质性访谈探讨腹膜透析合并抑郁患者的情绪体验和需求,旨在早期识别抑郁,并为腹膜透析合并抑郁患者构建抑郁管理计划提供依据。

方法 采用目的抽样法,研究对象以最大化差异为原则,样本量以信息饱和为原则,选取 2023 年 10 月~2024 年 5 月在南京市某三级甲等医院腹膜透析中心治疗的 12 例腹膜透析合并抑郁的患者为研究对象。采用半结构式访谈提纲对研究对象进行研究资料收集。访谈由 1 名具有质性访谈经验且具有 3 年以上肾内科临床护理工作经验的实施者完成现场笔录,并记录受访者的非语言行为。研究者对同意录音者进行全程录音。全程由 1 名质性研究经验丰富的护理学院专家指导进行,并由其随机抽取 2 名患者考证结果。访谈者用半结构式问题引导研究对象表达内心真实体验,对受访者的回答存在疑惑时,通过复述、追问等方式再次确认内容。访谈环境选择安静、无干扰的独立空间,访谈时间选择在受访者未进行腹膜透析换液操作时,共访谈 30~45min。每个参与者的访谈次数为 2-3 次。研究者在访谈结束后 24 小时内反复播放录音,逐字转录为文字,并在文中标注受访者的非言语行为。另一名研究者再次进行独立的交叉检查,以确保访谈资料的准确性。

结果 本研究最终纳入 12 名患者。其中男性 7 例,女性 5 例;年龄(40.08 ± 11.84)岁;透析龄(24.92 ± 17.60)月;Kt/V 值 1.29 (1.17,1.62);Ccr 值(40.89 ± 17.26);贝克抑郁量表(BDI-II)总分为 16.00(14.25,17.75)分;66.67%的参与者失业,33.33%的参与者未婚。最终提炼 6 个一级主题,分为两大类:情绪体验和需求。情绪体验包括自我否定、生活方式改变和复杂的应对方式等 3 个主题;需求包括专业信息需求、心理健康需求和社会支持等 3 个主题。

结论 该研究发现,腹膜透析合并抑郁情绪患者的情感体验较差,深受疾病本身和抑郁情绪带来的心理困扰。受访者缺乏社交和社会支持,普遍希望得到卫生专业人员的指导和帮助。腹膜透析患者所需的生活方式改变、饮食限制和持续的透析治疗

会影响他们的幸福感,并可能导致社交焦虑,造成严重的社会心理负担。医护人员,尤其是腹膜透析专职护士和医生,应重视腹膜透析患者的心理健康和情绪管理,帮助他们建立健康的生活方式。此外,旨在加强社会支持和实施患者心理健康管理的策略将带来更好的心身健康和更高的生活质量。未来有必要对腹膜透析合并抑郁患者进行更多的研究,以改善健康结局。

关键词:慢性肾脏病;腹膜透析;抑郁;需求;体验

腹膜透析患者抑郁现状及应对方式的研究进展

张馨^{1,2} 王晓燕^{1,3}

1.东南大学医学院

2.东南大学附属中大医院肾内科

3.东南大学附属中大医院护理部

目的 随着腹膜透析患者生存率的提高,腹膜透析人群逐年增加。腹膜透析具有技术更简单、成本低、饮食限制少、保存残余肾脏功能更好及生活质量更高等潜在优势。但因其病程较长、病情较复杂,持续的疾病治疗严重影响了患者的工作和生活,同时还带来了沉重的经济负担,生理应激与心理应激的共同乃至协同作用导致患者长期处于负性情绪的困扰。越来越多的腹膜透析患者存在抑郁的负性情绪,影响患者心身健康及预后。因此,本文旨在对腹膜透析患者抑郁现状、发病机制、及应对方式等进行综述。

方法 通过国内外文献综述目前腹膜透析患者抑郁状,分析可能的发病机制,对腹膜透析患者对抑郁心理的应对方式进行综述。

结果 腹膜透析患者普遍存在不同程度的抑郁,且易被忽视,有必要进一步关注腹膜透析患者的心理及社会支持需求,关注心身健康。大多数患者不能有效识别抑郁情绪,对抑郁情绪采取消极的应对方式。针对腹膜透析患者进行抑郁筛查的频次、方法、流程等,国内还缺乏共识。未来可针对透析人群抑郁管理的短期和长期益处进行大规模研究。目前,临床上常见的应用于腹膜透析患者的抑郁管理模式包括家属参与式管理模式、同伴支持模式和延续护

理模式等。

结论 国内在腹膜透析患者抑郁现状及应对方式方面仍不容乐观,大多数腹膜透析患者的心理问题被忽视,容易引起一系列的心身健康问题。常见抑郁风险筛查、评估工具包括9条目患者健康问卷(PHQ-9)、贝克抑郁量表(BDI-II)、Zung抑郁自评量表(SDS)等。临床医护人员仍应根据量表特定的使用目的和人群谨慎选择合适量表。抑郁的伴发不仅降低了腹膜透析患者的生活质量,增加了患者的住院率和死亡率,而且患者的社交质量和社会功能均会受到影响。腹膜透析中心的医护人员应对腹膜透析患者采取抑郁的早期筛查、预防及干预,以减轻躯体和精神症状,降低抑郁发病率和抑郁程度,减轻患者疾病负担和死亡率,应结合腹膜透析患者居家治疗需求探索合适的抑郁管理模式并全面落实,充分发挥包括腹膜透析专职医生、护士在内的团队力量,进行有针对性的抑郁风险评估,有效维护患者的心身健康。

关键词:腹膜透析,抑郁,负性情绪,风险评估,管理模式,慢性肾脏病

性别是识别抑郁症亚型的关键:基于图卷积网络的静息态功能磁共振研究

张钰群¹ 万立² 欧阳键²

1.南京中医药大学

2.南京邮电大学通信与信息工程学院

目的 利用图卷积网络(GCN)模型探究不同性别抑郁症(MDD)患者的脑网络特征,并明确性别特定的影像学指标,为实现MDD的精准诊治提供依据。

方法 基于Rest-meta-MDD项目大样本多中心静息态功能磁共振数据,使用GCN模型分别对男性和女性样本进行独立训练,获得不同性别高鉴别脑区的拓扑特征及其与临床症状的相关性,并进一步比较男性和女性高鉴别脑区的差异。

结果 与支持向量机相比,GCN模型的分类准确率提高了5%以上。其中,男性组的MDD识别准确率为77.91%(敏感度88.80%,特异度72.62%),平均AUC值为78.35%,其高鉴别脑区主要分布在带状盖网络和额顶网络,且右侧前额叶、右侧顶叶

和左侧下顶叶的节点度与汉密尔顿焦虑量表得分呈显著正相关。女性组的准确率为 79.71% (敏感度 80.25%, 特异度 79.53%), 平均 AUC 值为 79.52%, 其高鉴别脑区主要分布在默认模式网络, 且右侧枕叶的节点介数与汉密尔顿抑郁量表得分呈显著负相关。

结论 基于 GCN 的 MDD 分类模型效能优良, 男性与女性 MDD 患者脑网络特征存在显著差异, 且差异脑网络特征分别与焦虑、抑郁症状相关。因此, 性别是识别 MDD 亚型的重要因素, 也是开展 MDD 深入研究的基础。

Neural Correlates of Social Appraisal Dysfunction in Major Depressive Disorder: An ERP Study

Miao Li Zhenhe Zhou*

The affiliated Wuxi Mental Health Center of Jiangnan University, Wuxi Central Rehabilitation Hospital

Objective Researchers have found that some individuals with major depressive disorder (MDD) actively choose to expose themselves to negative stimuli and maintain their emotional state by voluntary exposure to negative stimuli. This study aimed to explore the neuroelectrophysiological mechanisms of emotional processing bias in patients with depression and thus to understand their functional properties of social appraisal

Methods Thirty-four patients with MDD and 34 healthy controls (HCs) were selected. The behavioral and event-related potentials (ERP) data of the social-emotional preference task (SePT) were recorded and analyzed

Results The MDD group showed longer reaction times (RTs) to both negative and positive stimuli compared to the HCs group, preferring negative stimuli. ERP data indicated that the MDD group exhibited higher P200 amplitudes for negative and neutral stimuli compared to the HCs group. Additionally, they showed higher LPP amplitudes for negative and positive stimuli,

with longer LPP latencies for negative stimuli. Multiple linear stepwise regression analysis within the MDD group revealed positive correlations between LPP amplitudes and RTs to negative and positive stimuli. Conversely, P200 amplitudes were negatively correlated with RTs to negative stimuli but positively correlated with Hamilton Depression Rating Scale (HDRS-17) scores. Moreover, HDRS-17 scores positively correlated with the self-reported preference for negative stimuli but negatively correlated with the self-reported preference for positive stimuli

Conclusion Patients with MDD tend to choose negative information that is consistent with negative self-schema. The brain devotes more cognitive resources and longer RTs to process negative stimuli, starting from the early stages (P200) and extending into the later stages (LPP), there is a tendency for processing fixation. RTs of patients with MDD to negative and positive stimuli can predict the amplitudes of LPP. Additionally, their preference for negative stimuli and avoidance of positive stimuli can predict depressive symptom severity

关键词: major depressive disorder, event-related potentials, social cognition, social appraisal

血清雌二醇、白细胞介素-6、肿瘤坏死因子- α 水平与产后抑郁症的关系研究

曹玉婷*

盐城市第四人民医院

目的 观察产后抑郁症 (PPD) 产妇的血清雌二醇 (E2)、白细胞介素-6 (IL-6) 及肿瘤坏死因子- α (TNF- α) 水平变化情况, 分析上述指标与 PPD 的关系。

方法 选取 2018 年 3 月至 2023 年 3 月盐城市第四人民医院和盐城市第一人民医院收治的 160 例产妇为研究对象进行回顾性分析。于产妇分娩后 7 d 采用爱丁堡产后抑郁量表 (EPDS) 评分、产后抑郁筛查量表 (PDSS) 评分及抑郁自评量表 (SDS) 评分进行 PPD 筛查, 以 EPDS \geq 13 分、PDSS \geq 76 分、SDS \geq 53 分为 PPD, 纳入抑郁组 (80 例), 其余纳入

正常组(80例)。比较两组产妇产后7d的E2、IL-6及TNF- α 水平,并分析其与PPD的相关性。

结果 分娩后7d,抑郁组产妇E2水平低于正常组,IL-6、TNF- α 水平高于正常组($P<0.05$)。Pearson相关性分析显示,E2水平与产妇EPDS、PDSS、SDS评分呈负相关,IL-6、TNF- α 水平与产妇EPDS、PDSS、SDS评分呈正相关($P<0.05$)。

结论 E2、IL-6及TNF- α 与PPD的发生存在密切联系,临床需重点关注上述指标变化情况并据此展开干预与治疗。

产后抑郁症(postpartum depression, PPD)为分娩后产妇发病率较高的一种精神紊乱性疾病,其致病因素较多且复杂,与遗传、内分泌等存在密切联系。PPD的临床表现以产后持续情绪低落为主,并可导致睡眠障碍等症状发生[1]。PPD易于产后2周发生,产后4~6周为症状明显的阶段。PPD不仅会危害产妇的身心健康,还会影响母婴的互动,不利于婴幼儿的正常心理发展[2]。现阶段,PPD的发病机制尚未完全明确,相关研究显示,该病的发生与产妇产后的激素变化存在密切联系,其中雌二醇(E2)是产妇重要的雌激素,对机体的中枢神经系统产生重大影响,可参与到产妇情绪反应、认知及行为等功能的调节中[3]。另有研究表明,外周血白细胞介素-6(IL-6)、肿瘤坏死因子- α (TNF- α)水平的升高与PPD发生存在密切联系[4]。基于此,本研究观察PPD产妇E2、IL-6及TNF- α 水平的变化,并分析上述指标与PPD的关系。

关键词: 雌二醇;白细胞介素-6;肿瘤坏死因子- α ;产后抑郁症;相关性

托鲁地文拉法辛与文拉法辛治疗围绝经妇女抑郁的对照研究

丛伟东* 周峥嵘

福建医科大学附属神经精神防治院

目的 对比托鲁地文拉法辛和文拉法辛对围绝经期女性抑郁症患者的临床疗效及安全性。

方法 依据用药方法将门诊就医的68例围绝经期抑郁症妇女随机进入治疗I组($n=33$)和对照II组($n=35$)。I组给予盐酸托鲁地文拉法辛缓释片治疗为实验组;II组给予文拉法辛缓释胶囊进行治疗为对

照组,两组均以持续治疗8周,初始剂量不同,但2周内都加至维持剂量后不变。比较两组疗效,通过用汉密尔顿17项抑郁量表(HAMD-17)于治疗前及治疗第1、2、4、6、8周末各评定1次临床疗效;同时用副反应量表(TESS)、实验室检查、生命体征等观察药物安全性。

结果 在治疗8周后,托鲁地文拉法辛组的HAMD总分减分值为(18.48 \pm 6.38),文拉法辛组为(11.60 \pm 4.46),两组差异有显著性($p<0.001$)。两组总有效率差异有统计学意义(82.8% vs 56.7%, $p<0.05$)。不良反应中文拉法辛组恶心反应明显高于托鲁地文拉法辛组($P<0.05$),其余不良反应(如口干、头晕、头痛、便秘、食欲减退、呕吐及血压升高等)两组间差异无统计学意义($P>0.05$)。

结论 托鲁地文拉法辛治疗围绝经期抑郁症(PMD)的效果比文拉法辛更好,表现在该药起效较快,能够明显改善抑郁症患者的兴趣减退、心境低落、快感缺失等核心症状,相对于SSRIs等一线抗抑郁药物更加不易导致性功能障碍等不良反应,用药安全性更高。

关键词: 托鲁地文拉法辛;文拉法辛;围绝经期抑郁症;临床疗效;不良反应

对比探究阿戈美拉汀与文拉法辛在抑郁症患者治疗中的临床差异

王佳薇*

宁安医院

目的 抑郁症是临床精神科常见疾病,有着较高发病率及复发率。当前,临床多采用药物治疗,主要的抗抑郁药物为选择性5-羟色胺再摄取抑制剂,阿戈美拉汀作为一种新型的5-羟色胺再摄取抑制剂,对该系统有拮抗及激动作用,在治疗抑郁症患者方面有显著疗效探讨阿戈美拉汀与文拉法辛在抑郁症患者治疗中的临床差异。

方法 采用回顾性方法分析,选取本院自2017年7月-2019年7月就诊的42例抑郁症患者的临床资料,比较阿戈美拉汀与文拉法辛治疗抑郁症患者对HAMA、HAMD及不良反应的差异。

结果 两组患者治疗前后的HAMA、HAMD比较:治疗前,对照组与研究组患者的HAMA、HAMD,

经统计学分析,无统计学意义($P>0.05$)。治疗后,两组患者的 HAMA、HAMD 与治疗前相比,均有所改善($P<0.05$),且研究组患者的 HAMA、HAMD 均低于对照组,有统计学意义($P<0.05$)。两组患者不良反应比较:研究组患者的不良反应率为 9.09%,对照组为 45.00%,两组经统计学分析,有统计学意义($P<0.05$)。

结论 文拉法辛是一种再摄取抑制剂,可抑制神经元突触前膜 5-羟色胺、去甲肾上腺素的再摄取等,同时也可增强中枢突触间隙的 5-羟色胺、去甲肾上腺素,从而发挥抗抑郁作用。但该药物对去甲肾上腺素、胆碱能及组胺能的作用较低,当患者兴奋后,容易引起交感神经亢进,加重患者抑郁、焦虑症状。而阿戈美拉汀属于新型的抗抑郁药物,以褪黑色 M1、M2 为靶点,联合下丘脑 M1、M2 等受体,从而阻断 5-HT₂ 受体,充分发挥褪黑素的作用,有效减轻患者嗜睡、犯困等症状,保证充足睡眠[3]。此次数据调查显示:研究组患者的 HAMA、HAMD 评分、不良反应率明显低于对照组,表明:阿戈美拉汀治疗抑郁症的临床效果高于文拉法辛效果,可有效缓解抑郁症状,具有临床推广应用的价值。

线粒体自噬在抑郁症发病机制中的研究进展

王申 杜志国 顾镭 武建胤*
聊城市第四人民医院

目的 目前,越来越多的研究显示能量代谢在抑郁症中的发生、发展及转归中起到了重要作用。线粒体功能障碍以及受损线粒体的积累已被证明在抑郁症中起重要作用,而线粒体自噬功能障碍引起的脑能量损伤也被认为参与了抑郁症的发作。本文对线粒体自噬参与抑郁症的研究现状进行综述,从而为更好的探讨抑郁症的发病机制提供参考依据,旨在为抑郁症的诊疗提供新的思路和科学依据。

方法 我们采用关键词检索的方式,以“线粒体自噬(Mitophagy)、抑郁症(Depressive disorder)、线粒体损伤(Mitochondrial damage)、能量代谢(Energy metabolism)”等作为关键词组合检索在 2014 年 1 月至 2024 年 1 月发表在中国知网、万方数据知识

服务平台、维普数据库、中国生物医学文献数据库、PubMed、Web of Science、Cochrane 数据库等数据库中的中英文文献。

结果 研究发现,线粒体自噬与抑郁症的发病机制密切相关,线粒体自噬参与受损线粒体的清除、维持线粒体稳态、能量生产过程以及神经活性所必需。其中线粒体自噬障碍对受损线粒体的清除过程受损主要参与了抑郁症的发病,线粒体自噬障碍影响了体内 ATP 的产生从而损伤了神经可塑性以及神经细胞分化和生长的调控从而参与了抑郁症的发生和发展。线粒体自噬还可以通过调控小胶质细胞介导的炎症来调节抑郁症状,通过神经免疫炎症参与抑郁症的进程。

结论 抑郁症因其发病率高、病残率高、危害性大已经成为全球最关注的精神疾病。目前抑郁症的治疗手段存在一定的局限性,探索抑郁症的发病机制有利于找寻新的治疗方式。线粒体自噬参与了抑郁症的发病机制,利用相关机制有利于新型抗抑郁药物的研发,为治疗提供新的策略。

关键词:线粒体自噬,抑郁症,线粒体损伤,能量代谢

Exploring Adverse Events of Vilazodone: Evidence From The FAERS Database

Ying Jiang*
Wuxi Mental Health Center

Objective This study aims to conduct an exhaustive evaluation of Vilazodone's safety in clinical application and to unearth the potential adverse event (AE) risks associated with its utilization

Methods This research employed data spanning from the first quarter of 2011 to the third quarter of 2023 from the FAERS database. Various signal detection methodologies, including the ROR, PRR, BCPNN, and EBGM, were utilized to ascertain the correlation between Vilazodone and specific AEs

Results The study compiled a total of 17,439,268 reports of drug AEs, out of which 5,375 were related to Vilazodone. Through signal mining, 125 Preferred Terms (PTs) encompassing 27 System Organ

Classes (SOCs) were identified. The findings indicated a higher prevalence among females and patients within the 45 to 65 age bracket. The principal categories of AEs included Psychiatric disorders, Nervous system disorders, and Gastrointestinal disorders, with prevalent incidents of Diarrhoea, Nausea, and Insomnia. Moreover, the study identified robust signals of novel potential AEs, notably in areas such as sleep disturbances (Sleep paralysis, Hypnagogic hallucination, Rapid eye movements sleep abnormal, Sleep terror, Terminal insomnia, Tachyphrenia), sexual dysfunctions (Female orgasmic disorder, Orgasm abnormal, Disturbance in sexual arousal, Spontaneous penile erection, Anorgasmia, Sexual dysfunction, Ejaculation delayed), and other symptoms and injuries (Electric shock sensation, Violence-related symptom, Gun shot wound)

Conclusion Although Vilazodone presents a positive prospect in the management of MDD, the discovery of AEs linked to its use, particularly the newly identified potential risks such as sleep and sexual dysfunctions, necessitates heightened vigilance among clinicians

关键词: Vilazodone; Major Depressive Disorder; Adverse Events; Safety Profile; Signal Mining

Influence of Smoking on The Efficacy of Antidepressant: A Two-Sample Mendelian Randomization Analysis

Haohao Zhu*

Wuxi Mental Health Center

Objective This study uses the Two-Sample Mendelian Randomization (TSMR) method to explore the causal relationships between Smoking Initiation (SMKI), Never Smoking (NSMK), Past Tobacco Smoking (PTSMK), and the efficacy of Antidepressants (ATD)

Methods Single Nucleotide Polymorphisms (SNPs) with genome-wide significance ($P < 5E-08$) related to SMKI, NSMK, and PTSMK were selected from the Genome-Wide Association Study (GWAS) database

as Instrumental Variables (IVs). The main method, Inverse Variance Weighted (IVW), was utilized to investigate the causal relationship. The Odds Ratio (OR) and 95% Confidence Interval (95% CI) evaluated the causal relationships among SMKI, NSMK, PTSMK, and ATD

Results The results demonstrated a positive causal relationship between SMKI and ATD use, where SMKI leads to an increase in ATD use [IVW (MRE): OR: 1.222, 95% CI: 1.075 to 1.389; $P = 0.002$]. Conversely, NSMK and PTSMK showed a negative causal relationship with ATD use, meaning that NSMK and PTSMK lead to a reduction in ATD use [IVW (MRE): OR: 0.451, 95% CI: 0.313 to 0.650; $P = 1.96E-05$], [IVW (MRE): OR: 0.808, 95% CI: 0.697 to 0.935; $P = 0.004$]. Additionally, sensitivity analysis showed that the results of this study were robust and reliable

Conclusion Using the TSMR method and from a genetic perspective, this study found that SMKI leads to an increase in ATD use, while NSMK and PTSMK reduce ATD use. In clinical practice, the possible impact of smoking on ATD medication should be considered, and it is recommended to avoid smoking during ATD treatment

关键词: Smoking Initiation; Never Smoking; Past Tobacco Smoking; Antidepressants; Two-Sample Mendelian Randomization

Causal Relationship Between Diabetes and Depression: A Bidirectional Mendelian Randomization Study

Ying Jiang* Yuan Shen

Wuxi Mental Health Center

Objective This study explores the causal relationship between diabetes and depression using a two-sample Mendelian Randomization (TSMR) method

Methods The study selected single nucleotide polymorphisms (SNPs) closely associated with diabetes and depression in European populations from the Genome-Wide Association Study (GWAS) database, to

serve as instrumental variables (IVs). The main evaluation method was inverse variance weighted analysis (IVW), supplemented by verification using Weighted median, Weighted mode, and MR Egger methods. The Odds Ratio (OR) and 95% Confidence Interval (CI) were used as the main evaluation indicators, along with sensitivity analysis

Results This study found a negative correlation between diabetes and depression, suggesting that diabetes may reduce the risk of depression [IVW(FE): OR: 0.901, 95% CI: 0.823 to 0.987; $P = 0.025 < 0.05$]. This finding was further confirmed by the Weighted median [OR: 0.844, 95% CI: 0.730 to 0.974; $P = 0.021 < 0.05$] and Weighted mode method [OR: 0.766, 95% CI: 0.637 to 0.921; $P = 0.006 < 0.05$]. However, the reverse showed no causal relationship between depression and diabetes ($P > 0.05$). Sensitivity analysis found no pleiotropy, and there were no large influences from individual SNPs on the result's robustness; the results are stable and reliable

Conclusion For the first time, this study using TSMR analysis found a negative correlation between diabetes and the risk of depression onset in European populations, suggesting that diabetes might reduce the risk of depression. But as the mechanisms are still unclear, these findings warrant further study

关键词: Diabetes; Depression; Two-Sample Mendelian Randomization; Genome-Wide Association Study; Relationship

Investigating The Mechanism of Chufan Yishen Formula in Treating Depression Through Network Pharmacology and Experimental Verification

Haohao Zhu*

Wuxi Mental Health Center

Objective To investigate the antidepressant effect and potential mechanism of the Chufan Yishen Formula (CFYS) through network pharmacology, molecular docking, and experimental verification

Methods The active ingredients and their target genes of CFYS were identified through Traditional Chinese Medicine Systems Pharmacology (TCMSP) and TCM-ID. We obtained the differentially expressed genes in patients with depression from the GEO database and screened out the genes intersecting with the target genes of CFYS to construct the PPI network. The key pathways were selected through STRING and KEGG. Then, molecular docking and experimental verification were performed

Results A total of 113 effective components and 195 target genes were obtained. After intersecting the target genes with the differentially expressed genes in patients with depression, we obtained 37 differential target genes, among which HMOX1, VEGFA, etc., were the key genes. After enriching the differential target genes by KEGG, we found that the “chemical carcinogenesis-reactive oxygen species” pathway was the key pathway for the CFYS antidepressant effect. Besides, VEGFA might be a key marker for depression. Experimental verification found that CFYS could significantly improve the behavioral indicators of rats with depression models, including improving the antioxidant enzyme activity and increasing VEGFA levels. The results are consistent with the network pharmacology analysis

Conclusion CFYS treatment for depression is a multicomponent, multitarget, and multipathway complex process, which may mainly exert an antidepressant effect by improving the neuron antioxidant stress response and regulating VEGFA levels.

伴非自杀性自我伤害的抑郁症患者的情绪失调与童年创伤的关系：一项静息态功能磁共振研究

孙晨寅 张慧凤 周儒白 彭代辉*

上海交通大学医学院附属精神卫生中心

目的 伴非自杀性自我伤害的抑郁症患者存在情绪失调,但机制不明。童年创伤与NSSI有关,而

既往研究提示童年创伤可能是影响情绪调节能力的潜在因素。前额叶皮层是情绪调节的关键脑区,可能受到童年创伤的影响。因此,本研究旨在利用静息态功能磁共振,聚焦前额叶皮层,探索伴 NSSI 的抑郁症患者的情绪失调是否与童年创伤有关。

方法 本研究共纳入 61 名抑郁症患者,根据精神障碍诊断与统计手册第 5 版 NSSI 诊断标准分为伴 NSSI 行为(29 名)和不伴 NSSI 行为(32 名)两组,并纳入 32 名性别、年龄与患者组匹配的健康对照。采用渥太华自我伤害调查表和儿童期创伤问卷分别评估 NSSI 行为及童年创伤。所有被试均接受了 3.0T 静息态功能磁共振扫描,计算前额叶皮层的低频振荡振幅进行单因素方差分析,获得差异脑区。在伴 NSSI 的抑郁症患者组中分析渥太华自我伤害调查表情绪调节相关的自伤动机条目评分(内部情绪调节、外部情绪调节)及前额叶皮层差异脑区的 ALFF 与童年创伤的相关性。

结果 与不伴 NSSI 的抑郁症患者相比,伴 NSSI 的抑郁症患者躯体忽视($P=0.046$)更严重;与健康对照相比,伴 NSSI 的抑郁症患者情感虐待($P<0.001$)、性虐待($P<0.001$)、情感忽视($P<0.001$)、躯体忽视($P<0.001$)更严重,且童年创伤总分($P<0.001$)更高。与不伴 NSSI 的抑郁症患者相比,伴 NSSI 的抑郁症患者左侧背侧前扣带皮层 ALFF($P<0.05$, GRF 校正)较高;与健康对照相比,伴 NSSI 的抑郁症患者双侧眶额区 ALFF($P<0.05$, GRF 校正)较高。在伴 NSSI 的抑郁症患者组中,内部情绪调节动机与童年创伤总分($P=0.005$)、性虐待($P=0.011$)、躯体忽视($P=0.021$)相关,外部情绪调节动机与性虐待($P=0.021$)相关;右侧眶额区 ALFF 与内部情绪调节动机($P=0.002$)、外部情绪调节动机($P=0.002$)相关,且与童年创伤总分($P=0.025$)、性虐待($P<0.001$)、躯体忽视($P=0.042$)相关;左侧眶额区 ALFF 与性虐待($P=0.026$)相关;左侧背侧前扣带皮层 ALFF 与性虐待($P=0.025$)相关。在健康对照和不伴 NSSI 的抑郁症患者组中,前额叶皮层差异脑区的 ALFF 与童年创伤均不存在相关性。

结论 伴 NSSI 的抑郁症患者的情绪失调可能与其童年创伤有关,表现为前额叶皮层功能异常,因此在临床干预中需要特别关注伴 NSSI 的抑郁症患者的童年创伤经历及其对情绪调节的影响。

家庭社会经济地位与男男性行为大学生抑郁的关系:健康素养和社会支持的链式中介作用

赵中扬 李卫东*

陕西师范大学

目的 探讨家庭社会经济地位与男男性行为大学生抑郁的关系及健康素养和领悟社会支持在其中的中介作用。

方法 2021 年 3 月-2022 年 6 月,采用滚雪球和同伴推动抽样结合的方法,招募陕西省内近 6 个月有肛交行为的在读男男性行为大学生填写自编问卷,使用家庭社会经济地位问卷、健康素养量表、领悟社会支持量表和 9 项患者健康问卷(PHQ-9)对陕西省 515 名男男性行为本专科、硕博士在读学生进行调查,最终获得 509 份有效数据,通过 SPSS PROCESS 插件和 bootstrap 方法实现中介效应的验证和检验。

结果 ①以 PHQ-9 得分 ≥ 10 作为存在抑郁情绪的界值,男男性行为大学生抑郁情绪发生率为 25.14%;②家庭社会经济地位与健康素养($r=0.236$, $P<0.01$)、领悟社会支持($r=0.187$, $P<0.01$)呈正相关,与抑郁情绪呈负相关($r=-0.121$, $P<0.01$);健康素养与领悟社会支持($r=0.403$, $P<0.01$)呈正相关,与抑郁情绪($r=-0.200$, $P<0.01$)呈负相关;领悟社会支持与抑郁情绪($r=-0.366$, $P<0.01$)呈负相关;③健康素养、领悟社会支持在家庭社会经济地位与男男性行为大学生抑郁情绪间起链式中介作用,总中介效应比例为 28.57%。

结论 家庭社会经济地位可以直接预测男男性行为大学生抑郁情绪,也可以通过健康素养和领悟社会支持的链式中介预测男男性行为大学生抑郁情绪,提示健康教育工作者应关注弱势家庭背景的青少年,重视健康素养在男男性行为大学生艾滋病预防工作中的作用。

首发未治疗的青少年抑郁症患者口腔微生物特征：一项病例对照研究

曾莹莹¹ 贾晓楠¹ 向波^{1,2}

1.西南医科大学附属医院心身医学科

2.自贡市脑科学研究院

目的 青春期是身体、认知和情感发展的关键时期,在这个时期,青少年常常需要应对来自生理、心理及社会的多重压力。在现代社会的诸多挑战和压力下,患有抑郁症的青少年的比例正在逐渐上升。研究表明,抑郁症可能会影响肠道微生物群的组成,但关于口腔微生物群与抑郁症之间关系的研究甚少。本研究将探究首发未治疗的青少年抑郁症患者的口腔微生物群组成以及其与认知功能的关联。

方法 在这项病例对照研究中,抑郁组(Depression Group, DP组)基于《精神障碍诊断与统计手册》第四册诊断为抑郁症的12-17岁未经治疗的青少年,而健康组(Healthy Control Group, HC组)为12-17岁排除抑郁症及其他精神障碍的青少年。采集所有受试者早晨空腹唾液样本并进行16S rRNA高通量测序评估口腔微生物组成,同时完成相关的量表评估。本研究采用多变量统计来评估抑郁症与口腔微生物群及口腔微生物群与认知功能之间的相关性。

结果 DP组和HC组口腔微生物组的 α 和 β 多样性存在显著差异。特定的细菌分类群,包括Streptococcus属、Abitrophia属、Neisseria属、Haemophilus属、Fusobacterium属、Oribacterium属、g_norank_f_Lachnospiraceae属、g_norank_f_norank_o_Absconditabacteriales_SR1属、g_Eubacterium_nodatum_group属均与抑郁症评估量表相关。口腔细菌与认知功能之间存在相关性,包括即时和延迟记忆、视觉广度和言语能力($p < 0.05$)。通过随机森林分析确定了重要性排序前10的关键口腔微生物,并进行了受试者工作特征曲线(Receiver Operating Characteristic Curve, ROC)分析,找到可能预测青少年抑郁症的生物标记物。通过ROC分析得出的曲线下面积(Area Under the Curve, AUC)值为0.78。

结论 本研究结果揭示了首发未治疗的青少年抑郁症患者与健康对照组在口腔微生物组成上存在显著差异,突出了特定细菌分类群的丰度与健康组相比存在显著生态失调。研究还发现特定的口腔微

生物群与抑郁及认知功能相关,根据随机森林分析及ROC曲线确定了可能成为预测青少年抑郁症的关键口腔微生物。这些发现为深入探究首发未治疗的青少年抑郁症的发病机制提供了重要的生物学证据,将有望揭示出抑郁症新的诊断标志物或治疗靶点。

经颅磁电抑郁症治疗仪治疗抑郁症的临床研究

孙作东*

黑龙江省亚欧脑科学研究院

目的 评价经颅磁电抑郁症(失眠)治疗仪治疗抑郁症的有效性及安全性。

方法 对80例轻、中度抑郁症患者进行了双中心、随机、双盲、安慰剂对照4周临床试验,其中治疗组和对照组各40例。治疗组使用经颅磁电抑郁症(失眠)治疗仪进行治疗,对照组使用经颅磁电抑郁症(失眠)治疗仪模拟治疗(音频安慰),疗程4周。采用汉密尔顿抑郁量表(HAMD24项版)评价其疗效,并进行安全性评价。

结果 治疗4周后对照组的总显效率和总有效率分别为5.00%(2/40)和35.00%(14/40),治疗组的总显效率和总有效率分别为65.00%(26/40)和80.00%(32/40);两组总有效率和总显效率的优效性检验 $P < 0.0001$,且治疗组高于对照组,说明治疗组优于对照组。两组均无不良反应。

结论 抑郁症,属于情感障碍,情感障碍具有双向性,双相情感障碍与精神分裂症的发病机制相近,后者具有更明显的脑结构和神经生理学异常。抑郁症的发生则与神经递质、离子通道等相关。经颅磁电抑郁症(失眠)治疗仪作用于患者头部,患者在闭目时有闪光感,符合德国生理学家Muller所提出的“特异神经能量定律”。经颅磁电抑郁症治疗仪配置的恒定磁疗体,对运动的带电物质有洛仑兹力的作用,影响细胞膜的离子通透性和膜两侧的电位,从而导致细胞膜离子通道构型发生改变,干扰和抑制异常脑电、脑磁的发生和传播,进而达到镇静、安神、抗抑郁、抗焦虑的作用。有研究证实中等强度恒

定磁场对离子通道的影响可能与细胞膜上离子通道的相关电荷运动有关。研究结论为：经颅磁电抑郁症（失眠）治疗仪治疗抑郁症使用安全，疗效确切，尤其在“抑郁、有罪感、睡眠障碍、工作和兴趣、迟缓、激惹、焦虑”等主要症状方面得到明显改善。

关键词：经颅磁电；抑郁症治疗仪；抑郁；焦虑；双相障碍

Dietary Fiber Intake and Depression in Heart Failure Patients: A Cross-sectional Study From NHANES Database

Nan Zhou Xuehui Qu Lina Wang*

Tianjin An Ding Hospital, Mental Health Center of Tianjin Medical University

Objective Psychiatric disorders are prevalent among heart failure (HF) patients and depression is a common psychiatric disorders. The benefit effect of dietary fiber on depression has been reported. This study aimed to assess the association between total dietary fiber intake and its different sources and depression in HF patients

Methods This study included patients aged ≥ 18 years and diagnosed as HF from the National Health and Nutrition Examination Survey (NHANES) 2005-2018. Dietary fiber intake information was obtained from 24-h dietary recall interview. Covariates included demographic information and history of diseases of participants were extracted from the database. The weighted univariable and multivariable logistic regression models were utilized to explore the association between total dietary fiber intake and its different sources and depression among HF patients, with odds ratio (ORs) and 95% confidence interval (CIs). Subgroup analyses based on body mass index (BMI) and duration of HF were further assessed the association

Results A total of 1,041 participants were included, of which 188 (18.06%) with depression. High total dietary fiber intake (OR=0.50, 95%CI: 0.29-0.86) and vegetable fiber intake (OR=0.49, 95%CI: 0.25-0.97) were associated with the lower odds of depression in HF

patients. No relationships were found between cereal intake and fruit intake and depression in HF patients. Subgroup analyses shown that total fiber intake were associated with the lower odds of depression in patients with BMI < 30 kg/m² (OR=0.37, 95%CI: 0.18-0.76), and total dietary fiber intake (OR=0.16, 95%CI: 0.06-0.41) vegetable fiber intake (OR=0.11, 95%CI: 0.02-0.63) and cereal fiber intake (OR=0.22, 95%CI: 0.05-0.85) were associated with the lower odds of depression in patients with less than 5 years of HF

[Conclusion

High total dietary fiber intake and vegetable fiber intake were associated the low odds of depression among HF patients and are promising intervention to be further explored in patients with HF.

关键词：Dietary fiber intake; depression; heart failure; NHANES database.

护士安宁疗护能力影响因素研究进展

苗洋洋* 王立娜

天津市安定医院

目的 护士影响安宁疗护护理态度的影响因素进行范围综述，为今后安宁疗护的改进和发展研究提供参考信息

方法 按照范围综述方法确立研究问题，对知网、万方等个数据库至2024年4月的中英文文献进行检索并筛选，之后对纳入的文献进行数据选择，最终收集，汇总并总结研究结果。结果 本研究共纳入篇23文献，包括护士安宁疗护能力受性别、接受临终关怀教育情况、对临终关怀态度、工作经验、学历、职称、年龄、知识、培训等因素影响

结果 总结影响护士安宁疗护知识、技能和自我水平等多方面因素及促进护士使用安宁疗护知识转变为行动的内外条件，找到完善护士安宁疗护实践能力的关键因素，探讨安宁疗护照护模式创新、安宁疗护人文关怀、心理照护、精神护理等方面的新思路、新方法。探讨我国安宁疗护现状不足之处及未来发展所要求。为我国卫生事业建立护士安宁疗护人才培养方案和提高安宁疗护服务质量找到有效应对措施，实现《“健康中国2030”规划纲要》中

安宁疗护目标。

结论 护士安宁疗护能力影响因素众多, 大多数文献围绕个人因素与环境因素两部分本研究通过范围综述的方法对影响护士安宁疗护能力因素进行总结, 从而能够为护士安宁疗护能力干预研究的构建提供依据。为未来干预措施的制定提供理论框架, 从而促进护士安宁疗护能力的提升及临床安宁疗护质量的改进。

The Association of Clinical Correlates, Metabolic Parameters, and Thyroid Hormones with Overweight in First-episode and Drug-naïve Patients with Major Depressive Disorder Comorbid with Glucose Disturbances: A Large-scale Cross-sectional Study

Shiwang Chen¹, Bin Zhang¹, Shen Li¹, Jie Li¹, Xiangyang Zhang²

1. Tianjin Anding Hospital

2. Chinese Academy of Science

Objective The associated factors of overweight in patients with major depressive disorder (MDD) comorbid with glucose disturbances remains unclear. To the best of our knowledge, this is the first study with a large sample size that examines the risk factors of overweight in first-episode drug-naïve (FEDN) MDD patients comorbid with glucose disturbances and includes clinical correlates, metabolic parameters, and thyroid hormone levels

Methods A total of 1654 FEDN MDD patients were enrolled. The Hamilton Depression Scale (HAMD), Hamilton Anxiety Scale (HAMA), and Positive and Negative Syndrome Scale (PANSS) were used to assess the symptoms of patients. Metabolic parameters and thyroid hormone levels were measured

Results The prevalence of overweight in MDD patients comorbid glucose disturbances was 64.44%, which was 1.022 times higher than that in MDD patients without glucose disturbances (57.17%). Compared to non-overweight, overweight among the MDD patients

with glucose disturbances had higher scores on HAMD and HAMA, PANSS positive symptoms, as well as higher levels of systolic and diastolic blood pressure, TC, LDL-C, thyroid stimulating hormone (TSH), TgAb, and thyroid peroxidases antibody (TPOAb). The combination of positive symptom score, HDL-C, systolic blood pressure, and marital status distinguished overweight from non-overweight. In addition, HAMA score, HAMD score, and TPOAb were associated with the BMI levels in MDD patients with comorbid glucose disturbances

Conclusion Our results suggest a high incidence of overweight in MDD patients with comorbid glucose disturbances. Several clinically relevant factors, metabolic parameters, and thyroid hormone function have an impact on overweight in MDD patients with glucose disturbances

关键词: glucose disturbances; metabolic parameters; first-episode drug-naïve major depressive disorder;

Prevalence and Clinical Correlates of Glucose Disturbances in Chinese Patients with First-episode and Drug-naïve Major Depressive Disorder at Different Ages of Onset

Shiwang Chen¹, Jing Ma¹, Shen Li¹, Jie Li¹, Xiangyang Zhang²

1. Tianjin Anding Hospital

2. Chinese Academy of Science

Objective Glucose disturbances are a common comorbidity in patients with major depressive disorder (MDD) and are associated with worsening clinical outcomes. MDD patients at different ages of onset may have different clinical features. The aim of this study was to investigate the prevalence and related factors of glucose disturbance in MDD patients at different ages of onset

Methods A total of 1718 first-episode and drug-naïve (FEDN) MDD patients were enrolled. The Hamilton Depression Scale (HAMD), Hamilton Anxiety Scale (HAMA), and Positive and Negative Syndrome

Scale (PANSS) were used to assess the clinical symptoms of all patients. Fasting blood glucose, metabolic parameters and thyroid hormone levels were measured. The cutoff point for early-adulthood onset (EAO) and mid-adulthood onset (MAO) was the first depressive episode before or after 45 years of age

Results There was no significant difference in the prevalence of glucose disturbances between EAO patients (12.9%) and MAO patients (15.7%). For EAO patients, glucose disturbances were more likely to be associated with TSH levels. For MAO patients, a significant correlation between anxiety and glucose disturbances was observed. Furthermore, suicide attempts, psychotic symptoms, and depression severity were correlated with glucose disturbances in both groups

Conclusion Our findings in this study suggest that the clinical characteristics and factors associated with glucose disturbances in MDD patients vary depending on the age of onset and therefore the age of onset needs to be considered in the treatment of glucose disturbances

关键词: glucose disturbances; age of onset; clinical characteristics; major depressive disorder;

Gender Differences in Clinical Correlates of Glucose Disturbance in Patients with First-episode and Drug-naïve Major Depressive Disorder

Shiwang Chen¹, Bin Zhang¹, Shen Li¹, Jie Li¹, Xiangyang Zhang²

1.Tianjin Anding Hospital

2.Chinese Academy of Sciences

Objective Gender differences in glucose metabolism disorders in patients with major depressive disorder (MDD) have been rarely studied. In this study we investigated gender differences in the prevalence of glucose metabolism disorders and associated factors in first-episode and drug naïve (FEDN) MDD patients in a Chinese Han population

Methods In this cross-sectional study, a total of

1718 FEDN MDD outpatients were recruited, and demographic and clinical data were collected. All subjects were scored using the Hamilton Depression Rating Scale (HAMD), Hamilton Anxiety Rating Scale (HAMA) and the Positive and Negative Syndrome Scale (PANSS) positive subscale to assess clinical symptoms

Results Female MDD patients were older, present with symptoms at an older age, were more likely to be married and had more psychotic symptoms than male MDD patients. There was no significant difference in the prevalence of glucose metabolism disorders between female patients (14.16%) and male patients (12.59%) ($p>0.05$). In both male and female groups, patients with glucose metabolism disorders had higher HAMD score, HAMA score, suicide attempts, and psychotic symptoms than patients without glucose metabolism disorders (all $p<0.05$). However, only in female group, patients with glucose metabolism disorders had more severe anxiety symptoms than patients without glucose metabolism disorders. Furthermore, binary logistic regression analysis showed that psychotic symptoms and suicide attempts were independently associated with glucose metabolism disorders in male MDD patients, while suicide attempts and HAMD score was independently associated with glucose metabolism disorders in female MDD patients

Conclusion Our findings showed no gender differences in the prevalence of glucose metabolism disorders in patients with FEDN MDD. However, there were gender difference in the clinical correlates of glucose metabolism disorders in FEDN MDD patients

关键词: Gender differences; glucose disturbance; first-episode and drug-naïve major depressive disorder

Insomniacs Show Greater Prefrontal Activation During Verbal Fluency Task Compared To Non-insomniacs: A Functional Near-infrared Spectroscopy Investigation of Depression in Patients

Huasen Xu Yiming Wang*

Affiliated Hospital of Guizhou Medical University

Background Previous studies have shown that insomnia affects human prefrontal function and that there are specific patterns of brain activation to counteract sleep and improve cognition. However, the effects of insomnia on the prefrontal cortex of MDD (major depressive disorder) patients and the patterns of activation to counteract sleep in MDD patients remain unclear. The aim of this study is to examine this using fNIRS (functional near-infrared spectroscopy). Methods Eighty depressed patients and 44 healthy controls were recruited for this study. fNIRS was used to assess changes in the concentration of oxygenated hemoglobin ([oxy-Hb]) in the prefrontal cortex of all participants during the VFT (verbal fluency test) and to record the number of words created to assess cognitive ability. The Pittsburgh Sleep Quality Index was used to assess sleep quality, and the Hamilton Rating Scale for Depression (24-item) and Hamilton Rating Scale for Anxiety (14-item) were used to assess the severity of depression and anxiety. Results When comparing patients, the healthy control group had significantly higher [oxy-Hb] values in the bilateral prefrontal cortex during VFT than the MDD group. In the MDD group, the [oxy-Hb] values in all brain regions except the right DLPFC were significantly higher in the group with insomnia than in the group without insomnia, but their VFT performance was significantly lower than in the group without insomnia and the healthy group. PSQI scores were positively correlated with [oxy-Hb] values in some left-brain regions, whereas HAMD and HAMA scores were not correlated with [oxy-Hb] values. Conclusion The PFC was significantly less active during VFT in those with MDD than in healthy controls. All brain regions, except the right DLPFC, were significantly more active in MDD patients with insomnia than in those without insomnia, suggesting that sleep quality needs to be an important indicator in fNIRS screening. In addition, there was a positive correlation between the severity of insomnia in the left VLPFC and the level of activation, suggesting a role for the left brain region in the neurophysiology of overcoming sleepiness in MDD patients. these findings may provide new ideas for the

treatment of MDD patients in the future

Association between Chronotype and Anhedonia in Patients with Major Depressive Disorder During The Acute Phase

Chuchen Xu¹, Fan Wang¹, Qinte Huang¹, Dongbin Lyu¹, Chenglin Wu², Jie Zhao³, Meiti Wang¹, Yiming Chen¹, Zheyi Wei¹, Bin Xie¹, Hong Wu¹

1.Shanghai Mental Health Center, Shanghai Jiao Tong University School of Medicine

2.Shanghai Pudong New Area Mental Health Center, School of Medicine, Tongji University

3.Shanghai Mental Health Center of Huangpu District

Objective To investigate the correlation between chronotype and anhedonia during the acute phase of major depressive disorder

Methods In this eight-week prospective study, 234 Major depressive disorder patients were recruited from the outpatients of Shanghai Mental Health Center from May 1, 2017, to October 30, 2018. Standard treatments were performed with escitalopram or venlafaxine for participants. Depressive symptoms, overt aggression, and anhedonia were assessed using Hamilton Rating Scale for Depression 17-item, Morningness-Eveningness questionnaire, and Snaith-Hamilton Pleasure Scale at baseline, 4th and 8th week

Results 220 participants completed the 8 weeks follow-up interviews and included in final analysis. Among them, there were 29 cases (13.2%) of morning type, 130 cases (59.1%) of inter-mediate type, and 61 cases (27.7%) of evening type. Compared with the evening type, the inter-mediate type had lower scores of HAMD anxiety somatization ($P_{Bonferroni}=0.02$), the morning type ($P_{Bonferroni}=0.005$) and inter-mediate type ($P_{Bonferroni}=0.002$) of HAMD cognitive disturbance was lower. The scores of HAMD retardation were lower in morning type ($P_{Bonferroni}=0.005$) and inter-

mediate type ($P_{Bonferroni} = 0.001$). The scores of HAMD sleep disturbance were lower in inter-mediate type ($P_{Bonferroni} = 0.001$). The scores of SHAPS interest/pastime were lower in inter-mediate type ($P_{Bonferroni} = 0.032$). For anhedonia, female was a protective factor, while numbers of recurrent, melancholic features, current obsession, previous combination drug therapies, depressive symptoms, and aggressive behavior were risk factors ($P < 0.05$). Multivariable GEE analysis indicated that patients with inter-mediate type had more severe in social anhedonia ($OR = 5.71, P = 0.017$) and food/drink ($OR = 3.67, P = 0.009$), while the anhedonia of sensory experience improved better in early morning patients ($OR = 0.17, P = 0.004$), compared with evening type. After 4 weeks of standardized treatment, the social anhedonia of patients with morning type was significantly improved, the food/drink of patients with intermediate type and the evening type were significantly improved, and the interests/pastimes of patients with morning type and the inter-mediate type were significantly improved, and the pleasurable sensory experiences of patients in all three groups showed significant improvement.

Conclusion Different chronotypes had different effects on anhedonia in patients with acute depression. Females protected pleasure in social interaction and sensory experience. However, the number of depressive episodes, previous combination drug therapies, and depressive symptoms was positively associated with anhedonia. The improvement of anhedonia in patients with morning type was more pronounced after standardized treatment, while the improvement of anhedonia in evening type was not satisfactory. Therefore, we argue that future studies are needed to verify whether chronotype has a long-term impact on anhedonia of patients with depression, and examine if interventions targeting chronotypes to prevent persistent anhedonia in the future.

Increased Regional Body Fat Is Associated with Depressive Symptoms: A Cross-sectional Analysis of NHANES Data Obtained During

2011–2018

Guimei Zhang Sisi Wang Ping Ma Shuna Li Xizhe Sun Yang Zhao Jiyang Pan*

First Affiliated Hospital of Jinan University

Aims The findings from previous epidemiological studies of the association between regional body fat and depressive symptoms have been unclear. We aimed to determine the association between the body fat in different regions and depressive symptoms based on data from the National Health and Nutrition Examination Survey (NHANES).

Methods This study included 3393 participants aged ≥ 20 years from the NHANES performed during 2011–2018. Depressive symptoms were assessed using the Patient Health Questionnaire-9. The fat mass (FM) was measured in different regions using dual-energy X-ray absorptiometry to determine the total FM, trunk FM, arm FM, and leg FM. The FM index (FMI) was obtained by dividing the FM in kilograms by the square of the body height in meters. Weighted data were calculated in accordance with analytical guidelines. Linear logistic regression models were used to quantify the association between regional FMI and depressive symptoms. Univariate and stratified analyses were also performed.

Results The participants in this study comprised 2066 males and 1327 females. There were 404 (11.91%) participants with depressive symptoms, who were aged 40.89 ± 11.74 years and had a body mass index of 30.07 ± 7.82 kg/m². A significant association was found between total FMI and depressive symptoms. In the fully adjusted multivariate regression model, a higher total FMI (odds ratio = 2.18, 95% confidence interval [CI] = 1.08–4.39) was related to a higher risk of depressive symptoms, while increased total FMI ($\beta = 1.55, 95\% CI = 0.65–2.44, p = 0.001$), trunk FMI ($\beta = 0.57, 95\% CI = 0.04–1.10, p = 0.036$), and arm FMI ($\beta = 0.96, 95\% CI = 0.33–1.59, p = 0.004$) were significantly associated with PHQ-9 (Patient Health Questionnaire-9) scores, whereas the leg FMI was not ($p = 0.102$). The weighted association between total FMI and depressive symptoms did not differ significantly between most of the subpopulations (all p values for interaction > 0.05). The

risk of having depression was higher in individuals who were non-Hispanic Whites, smokers, drinkers, obese, and had diabetes and thyroid problems ($p < 0.05$).

Conclusion These findings suggest that the population with a higher regional FMI is more likely to have depressive symptoms, especially in those who also have an increased total FMI. The association is more pronounced in individuals who are smokers, drinkers, obese, and have diabetes and thyroid problems.

简易应对方式问卷在藏羌地区消防员群体中的信效度检验及修订

欧阳艾菴¹ 重竺君² 陈雪芮² 王雨婷³ 杨凯茜² 邱培媛² 何宗岭¹

1.电子科技大学成都脑科学研究院临床医院

2.四川大学华西公共卫生学院/华西第四医院

3.四川大学华西临床医学院/华西医院

目的 验证简易应对方式问卷(Simplified Coping Style Questionnaire, SCSQ)在藏羌地区消防员中使用的信效度, 并进行修订。

方法 2024年1月对四川省阿坝藏族羌族自治州下辖消防大队的现役消防人员进行调查, 收集消防员的一般人口学资料、睡眠质量等, 对SCSQ的信效度进行评价。将样本随机分半, 采用探索性因子分析探索量表的内部维度, 采用验证性因子分析本研究探索出的量表结构并与量表原有结构进行比较。

结果 修订后SCSQ包括2个部分、共19个条目。其Cronbach's α 系数为0.884, 两个维度的Cronbach's α 系数分别为0.927和0.860, 奇偶折半信度分别为0.905和0.820。探索性因子分析提取2个公因子, 累计方差贡献率为56.53%, KMO值为0.926, 各条目的因子载荷为0.523~0.827。验证性因子分析结果显示, 修订后SCSQ的模型拟合度较好。

结论 修订后的简易应对方式问卷具有良好的信效度, 能够有效地评估藏羌地区消防员这一人群的压力应对方式, 为后续少数民族地区消防员的心

理健康相关研究提供量表选择与运用的理论依据和实践基础。

家庭为中心的健康宣教对青少年抑郁障碍患者的影响

罗海莲* 黄蓉 庞湧 庞月萍 叶桑 王学新 江钟萍 甘海波

玉林市第四人民医院

目的 研究在青少年抑郁障碍患者中实施家庭为中心的健康宣教干预的影响。

方法 选取2023年1月-2023年12月我院心理科住院部收治的青少年抑郁障碍患者, 共90例, 用随机数字表法的方式把上述病例分两组, 即对照组(接受常规的健康宣教干预)、观察组(采用家庭为中心的健康宣教干预), 每组均45例, 观察两组青少年抑郁障碍患者的汉密尔顿抑郁量表(HAMD)和汉密尔顿焦虑量表(HAMA)及应对方式问卷(CCMQ)评分、生活质量评分。

结果 干预前, 两组患者汉密尔顿抑郁量表(HAMD)和汉密尔顿焦虑量表(HAMA)评分、应对方式评分, 还有生活质量评分对比无显著差异($P > 0.05$); 干预后, 两组患者HAMD评分与HAMA评分均降低, 且观察组在这两项指标上得分均低于对照组($P < 0.05$), 且两组患者的CCMQ评分中, 面对评分提高, 而屈服评分和回避评分下降, 且观察组显著优于对照组($P < 0.05$); 干预后, 与对照组相比, 观察组患者的生活质量评分高于对照组($P < 0.05$)。

结论 通过实施家庭为中心的健康宣教, 对青少年抑郁障碍患者的精神心理症状有所缓解, 促使其调整面对生活事件的态度, 改善应对方式, 有利于疾病治疗, 提升生活质量。

青少年抑郁障碍住院患者非自杀性自伤行为

现状及危险因素的研究

罗海莲* 陈文烨 唐家宁 黄敏 蒋妮
玉林市第四人民医院

目的 探讨青少年抑郁障碍住院患者非自杀性自伤行为状况, 并分析其危险因素。

方法 抽取 2023 年 9 月~2024 年 4 月本院收住的青少年抑郁障碍患者 80 例作为研究对象(其中男女性别分别 39 例、41 例, 年龄 13~18 岁, 平均(16.24±1.37)岁。入选条件: ①所有患者经过临床综合检查, 符合《精神障碍诊断与统计手册》[4]诊断标准, 确诊为抑郁障碍。②患者及其监护人均为知情自愿参与本次研究, 并签署相关文书。③通过了医院伦理委员会的批准。排除标准: ①合并其他严重疾病患者。②合并其他精神障碍疾病患者, 如双相情感障碍、精神分裂症、癫痫所致精神障碍、精神活性物质所致精神障碍等。③排除了不配合研究和中途退出研究患者。), 依据《精神障碍诊断与统计手册》进行非自杀性自伤行为评定及相关因素调查(自行制定一般信息资料调查问卷, 调查内容包含年龄、性别、病程、户籍类型、疾病类型、童年不良经历及自伤情况等; 同时评估其自伤具体情况、父母婚姻状态、是否寄宿、是否为独生子女及父母受教育程度等), 并应用单、多因素分析对非自杀性自伤行为危险因素进行分析。

结果 ①80 例患者中, 出现 NSSI 共 36 例, 发生率为 45% (36/80); 相较于未出现的 NSSI 患者而言, 出现 NSSI 的患者抑郁程度、是否存在校园暴力、父母受教育程度、是否存在童年虐待状况相比, 差异有统计学意义 ($P < 0.05$)。

②将单因素分析差异有统计学意义的指标作为自变量, 经多因素 Logistic 回归分析, 抑郁程度、存在校园暴力、父母受教育程度、存在童年虐待状况均为 NSSI 危险因素 ($OR > 1$), 差异有统计学意义 ($P < 0.05$)。

结论 在青少年抑郁障碍患者中, NSSI 的发生率较为显著突出, 特别是对于那些遭受过校园暴力或童年虐待, 以及父母教育程度较高的患者, 其更容易表现出这种自伤行为。因此, 有必要增强对具有上述特征的患者关注, 并立即采取相关措施进行干预, 以尽可能降低 NSSI 事件的发生率。

The Abnormal Functional Connectivity of The Caudate Subregions in Major Depressive Disorder with Childhood Maltreatment

Xiaohui Lin Jinrou Xia Liwen Zhu Jiyun Liao Huiwen
Yu Qianyi Luo Hongjun Peng*
The Affiliated Brain Hospital of Guangzhou Medical University

Objective Major depressive disorder (MDD) with childhood maltreatment represents a heterogeneous clinical phenotype of depression. Previous studies have highlighted functional alterations of basal ganglia dysfunction in major depression patients. However, up to now, there has been a paucity of robust research investigating abnormal functional connectivity patterns in the caudate at the subregional level in MDD patients with childhood maltreatment. The objective of our study is to better understand the interplay between brain function, psychopathology, and childhood maltreatment, thereby developing more targeted and efficacious treatment and intervention strategies for patients with major depressive disorder

Methods Our study comprised four groups: Major Depressive Disorder (MDD) with childhood maltreatment ($n = 48$), MDD without childhood maltreatment ($n = 30$), healthy controls with childhood maltreatment ($n = 57$), and healthy controls without childhood maltreatment ($n = 46$). Eight caudate subregions were selected as seeds to investigate group differences in dynamic functional connectivity (dFC) and static functional connectivity (sFC). Correlation analyses were conducted to assess the associations between abnormal FC and maltreatment severity. Subsequently, moderation analyses were employed to explore the moderating role of depression severity in the relationship between maltreatment severity and abnormal FC

Results Compared with MDD without childhood maltreatment, MDD with childhood maltreatment exhibit FC abnormalities between caudate subregions and various brain regions including the left postcentral

gyrus, vermis, left middle cingulum gyms, right supra-marginal gyms, and left middle occipital gyms. Additionally, dFC with the left postcentral gyms as well as vermis, and sFC with left middle cingulate gyms along with right supramarginal gyms were correlated with the maltreatment severity. Furthermore, depression severity moderates the relationship between childhood maltreatment severity and aberrant sFC

Conclusion Our findings substantiate caudate dysfunction as a neurobiological characteristic of childhood maltreatment, thereby highlighting its association with vulnerability to major depressive disorder

关键词: Caudate, Major depressive disorder, Childhood maltreatment, Dynamic functional connectivity, Static functional connectivity

首发抑郁症患者自杀风险的影响因素分析

刘婷 王国君 冀二妮*

深圳市精神卫生中心/深圳市康宁医院

目的 探究首发抑郁症患者自杀风险的影响因素。

方法 选取 2020 年 1 月至 2021 年 4 月深圳市康宁医院抑郁障碍科新入院符合《国际疾病分类》第 10 版 (ICD-10) 抑郁发作诊断标准的 124 例首发抑郁症患者, 采用简明国际神经精神访谈中文版 (MINI) 自杀量表评估患者的自杀风险。收集患者的一般人口学资料、病史资料以及 MINI 自杀量表评分、汉密尔顿抑郁量表 (HAMD) 评分、汉密尔顿焦虑量表 (HAMA) 评分。采用 SPSS23.0 统计软件, 分析患者 MINI 自杀量表评分的相关影响因素。以 $P < 0.05$ 为差异, 具有统计学意义。

结果 首发抑郁症患者的 MINI 自杀量表评分与年龄、发病年龄呈负相关 ($r = -0.308$, $r = -0.282$, P 均 < 0.05), 与 HAMD 总分、认知障碍因子、迟缓因子评分呈正相关 ($r = 0.183$, $r = 0.430$, $r = 0.216$, P 均 < 0.05), 既往有自杀未遂史的患者 MINI 自杀量表评分更高 ($t = 3.338$, $P = 0.001$)。线性回归结果显示, 既往有自杀未遂史及认知障碍因子可以显著正向影响 MINI 自杀量表评分 ($\beta = 0.210$, $\beta = 0.366$, P 均 < 0.05)。

结论 首发抑郁症患者的自杀风险与年龄较小、

发病年龄较小、既往有自杀未遂史、抑郁严重程度、认知损害及迟缓症状相关; 既往有自杀未遂史及认知损害与首发抑郁患者自杀风险显著正向相关。

氟西汀联合舒肝解郁胶囊对抑郁症心率变异性的影响

王莹*

丽水市第二人民医院

目的 研究氟西汀联合舒肝解郁胶囊对抑郁症心率变异性 (HRV) 的影响。

方法 选择本院 100 例抑郁症患者作为研究对象, 按随机数字表法均分为对照组和研究组。对照组采取盐酸氟西汀胶囊治疗, 研究组在对照组的基础上联合舒肝解郁胶囊治疗。比较两组的汉密尔顿抑郁量表 (HAMD), 汉密尔顿焦虑量表 (HAMA), 匹兹堡睡眠质量指数 (PSQI), HRV [正常窦性 R-R 间期的标准差 (SDNN)、低频率值 (LF)、高频率值 (HF)、LF/HF 比值], 临床疗效, 不良反应。

结果 对照组治疗 6 周后的 HAMD、PSQI 显著高于研究组, 差异均有统计学意义 ($P < 0.05$); 两组治疗 6 周后的 HAMA 比较, 差异无统计学意义 ($P > 0.05$)。对照组治疗 6 周后的 SDNN、LF、HF、LF/HF 显著低于研究组, 差异均有统计学意义 ($P < 0.05$)。对照组总有效率 81.48%, 显著低于研究组总有效率 94.44%, 差异有统计学意义 ($P < 0.05$)。对照组不良反应率 9.26% 与研究组不良反应率 7.41% 比较, 差异无统计学意义 ($P > 0.05$)。

结论 舒肝解郁胶囊的主要成分为贯叶金丝桃、刺五加提取物, 现代医学已证实贯叶金丝桃是相当安全的抗抑郁药, 不仅能疏肝解郁、清热利湿, 还可消炎退肿, 提高夜间褪黑素的含量, 促进自主神经系统对心血管的生理调节作用, 从而维持或恢复副交感神经与交感神经的平衡, 抑制抑郁症的进展 [12-13]。刺五加具有益气健脾、安神补肾的功效, 对肝郁脾虚证引起的脏气不足、健忘、精神活力低下等均有作用, 与贯叶金丝桃相辅相成、益中补精、强筋壮骨 [14]。LF 反映了交感神经和迷走神经的双重活性, 其增高提示心肌收缩力增强、心博加速; HF 只反映了迷走神经的活性, 随着 HF 的增高, 躯体和内

脏运动、内脏与躯体感觉均可得到相应的调节,从而减轻自主神经功能的损害,防止交感神经兴奋性过高[15]。研究组治疗6周后的LF/HF显著高于对照组,且较接近正常水平,说明舒肝解郁胶囊能显著改善抑郁症患者的神经活动,调节内分泌,降低抑郁症对患者心率的影响。但不同研究[16]指出,随着年龄的增长,心脏副交感神经活动逐渐降低,而交感神经活动逐渐增强,HRV不同时域反应的自主神经活动亦有较大差异。因此,笔者认为分析HRV时应充分考虑不同年龄、抑郁程度等因素。

综上所述,氟西汀联合舒肝解郁胶囊能在不增加不良反应的基础上,显著改善患者的抑郁程度和睡眠质量,降低抑郁症对HRV的不良影响,提高临床疗效。但自主神经功能复杂,舒肝解郁胶囊对抑郁症患者神经活动的作用机制还需进一步研究。

关键词:氟西汀;舒肝解郁胶囊;抑郁症;HRV;疗效;不良反应

儿童、青少年抑郁症风险预警指标体系的构建与应用

韩燕 张婷*

淮安市第三人民医院

目的 本研究旨在构建一套科学、实用的儿童、青少年抑郁症风险预警指标体系,为早期精准识别抑郁症提供有力的工具,进而促进儿童、青少年的心理健康。

方法 通过文献回顾和专家会议,初步构建儿童、青少年抑郁症风险预警指标的框架,再采用德尔菲法,通过2轮专家函询,对指标进行筛选与优化。同时,研究小组也对函询结果多次研讨进行完善,最终确定了关键预警指标。随后,再将构建的指标应用于200例门诊就诊的儿童、青少年抑郁症患者,以全面检验其信度。

结果 2轮德尔菲法专家积极系数均为100%,专家权威系数分别为0.808、0.868。2轮专家函询的肯德尔和谐系数分别为0.131、0.142 ($P<0.001$)。最终构建的风险预警指标体系包括5项一级指标和38项二级指标,各指标条目均满足重要性赋值均数 >3.5 、变异系数 <0.25 且满占比 $>20\%$,指标条目水平内容效度指数 $0.881\sim 1.000$,平均内容效度指

数 0.995 ,全体一致性内容效度指标为 0.832 ,指标总体KR-20值为 0.811 ,折半信度系数为 0.745 。

结论 本研究构建的儿童、青少年抑郁症风险预警指标体系科学、实用,具有较高的临床应用价值和推广前景。

关键词:儿童、青少年,抑郁症,风险预警,构建与应用

Accelerated Theta Burst Stimulation in Patients with Obsessive-Compulsive Disorder

Zongfeng Zhang Yuqiu Su Yan He Feijie Zheng*

The affiliated Kangning Hospital of Ningbo University

Objective First-line recommended treatments for Obsessive-Compulsive Disorder(OCD) include pharmacotherapy (SSRI class) and psychotherapy (ERP-based), but clinically they are still partially effective or ineffective in 30-40% of patients; in recent years, physical therapy such as repetitive Transcranial Magnetic Stimulation (rTMS) has been increasingly recommended as an adjunctive treatment for OCD. Clinical traditions of repetitive transcranial magnetic stimulation are long, with a high number of treatments, shorter duration, and late onset of effects; to address these practical limitations, theta burst stimulation (TBS) and accelerated TMS (aTMS) have been developed to optimize the therapeutic effects of rTMS

TBS (Theta Burst Stimulation) is a new stimulation paradigm for more advanced and shorter sessions of TMS. It is characterized by plexiform stimulation that is closer to the physiology of neural activity and modulates neuroplasticity. Compared with conventional rTMS, TBS can be used at lower intensities and for shorter periods of time to achieve stronger effects and longer after-effects, and no adverse effects have been reported yet. TBS can be further divided into continuous theta burst stimulation (cTBS) and intermittent theta burst stimulation (iTBS). The former has an inhibitory effect, while the latter has an active effect on the cerebral cortex. Meta-analysis showed that aiTBS significantly improved depressive episodes in patients with

monophasic or biphasic depression and was better tolerated overall, and the mechanism of its antidepressant effect may be related to neuroplasticity. The supplementary motor cortex has been found to be significantly associated with a lack of inhibitory function in many studies, therefore, cTBS was selected for our study to treat the SMA cortex to improve obsessive-compulsive symptoms. Guo et al used cTBS to act on the bilateral SMA brain regions of patients with OCD five times per week for a total of 20 sessions, suggesting that cTBS significantly improved anxiety and depression scores, but did not significantly improve OCD symptoms; another study also used cTBS for 6 weeks for a total of 30 sessions, and did not find any effect on OCD symptoms; Jiang et al's study used accelerated-high dose theta burst stimulation (ahTBS) acting on the right pre-SMA for a period of 5 days, 10 times a day at 50-minute intervals, for a total of 18,000 pulses a day, showing an ameliorative effect on OCD symptoms. Fewer studies have been conducted on the treatment of OCD using cTBS, and the results of the treatment are inconsistent, suggesting that duration of treatment, treatment site, treatment parameters, and the refractory nature of OCD itself may be relevant. Therefore, in this study, we used cTBS on bilateral SMA, and performed Y-BOCS, HAMA, HAMD and Go/No-Go tests before and after treatment to verify the efficacy of cTBS on OCD patients.

Methods The samples came from OCD patients hospitalized in the affiliated Kangning Hospital of Ningbo University. Inclusion criteria: 1. 18-55 years old; 2. diagnosis of obsessive-compulsive disorder; 3. Y-BOCS ≥ 16 score; 4. junior high school education or above; 5. willing to participate in this study. Exclusion of diagnosis other Axis I diagnoses of mental disorders. Treatment was initiated after signing an informed consent form. To investigate the efficacy of cTBS on OCD, Y-BOCS scores were performed at baseline (Day0), end of treatment (Day5), and treatment follow-up (Day14,21,28), and Go/No-Go tasks were performed on Day0,14,28

cTBS acted on the bilateral SMA of OCD patients, first left then right, not simultaneously. The treatment parameters were: 10 sessions per day for 5 consecutive days, Each modified continuous TBS (cTBS) session

was comprised of 1,800 pulses delivered in a continuous train of 600 theta bursts. Theta burst consisted of three pulses at 50 Hz, and bursts were repeated at 5 Hz. Ten sessions were applied per day at 50-min intersession intervals. (Cole et al., 2020). Stimulation was delivered at 120% of the RMT. Localite Neuronavigation System was used to position the TMS coil over the individualized stimulation target.

Mann-Whitney nonparametric test with Y-BOCS change score as outcome was conducted to determine the group difference (responders vs Partially responder) in magnitude of change in bilateral SMA activity, elicited during inhibitory control, from before to after treatment with the cTBS protocol. Effective was defined as a Y-BOCS score reduction of $\geq 35\%$, partially effective as $25\% \leq \text{Y-BOCS} < 35\%$, and ineffective $< 25\%$. the Wilcoxon signed rank test (i.e., paired test) was used to determine within individual differences between left and right side of the SMA on cognitive control activation evoked by the No-Go condition of the Go/No-Go task.

Results A total of 5 OCD patients, 3 males and 2 females, with a mean age of 37.8 years, a disease duration of about 11.4 years, a Y-BOCS score (mean 26.4, standard deviation 2.30), and sertraline (200 mg/d) or fluvoxamine (250-300 mg/d) up to a stabilized dose, with no short-term medication changes, were included in the study

Results showed All 4 individuals had a favorable response to cTBS, and 1 was partially effective. The scores during and after treatment are shown in Table 1, with Y-BOCS scores on days 0, 5, 14, 21 and 28 suggesting that at the end of treatment, 4 individuals were effective (Y-BOCS minus $\geq 35\%$) and 1 individual was partially effective (Y-BOCS minus 25%) compared with baseline; the Go/No-Go task showed a reduction in operative time and the number of errors before and after treatment as well as at follow-up

Conclusion Our study suggests that the safety and efficacy of cTBS for OCD, which can be followed up with a large-sample clinical study, as well as with a mechanism study of efficacy, to provide a new modality for the precision treatment of OCD

关键词: Obsessive-compulsive disorder, Accelerated Theta Burst Stimulation, Y-BOCS

Electroencephalogram for The Diagnosis of Depression: A Systematic Review and Meta-analysis of Diagnostic Test Accuracy

Shu Jing¹, Zhenwei Dai², Xiaoyou Su¹

1.School of Population Medicine and Public Health, Chinese Academy of Medical Sciences & Peking Union Medical College

2.Peking University Sixth Hospital, Peking University Institute of Mental Health, NHC Key Laboratory of Mental Health (Peking University), National Clinical Research Center for Mental Disorders (Peking University Sixth Hospital)

Objective Depression, as a prevalent mental disorder, is a significant and still growing contributor to the global burden of disease. Its diagnosis remains a challenging endeavor due to the global shortage of diagnostic resource and the inherent limitations of conventional assessment tools such as structured interviews and questionnaires. The emergence of electroencephalography (EEG) as a potential diagnostic modality of depression offers promise in reducing the burden of disease from depression, and addressing this diagnostic gap through its application in clinical practice. This systematic review and meta-analysis aim to comprehensively evaluate the diagnostic test accuracy of the current studies on the EEG-based diagnosis of depression, and identify their contributions and limitations

Methods A systematic search was performed in the major academic databases for medical research from inception to January 25, 2024: Pubmed, Web of Science, OVID, Embase, and Cochrane Library. The Quality Assessment of Diagnostic Accuracy Studies-2 (QUADAS-2) checklist was used to assess the bias of all the included studies. The pooled sensitivity (SEN), specificity (SPE), and the combined area under the summary receiver operating characteristic curves (AUC SROC) were calculated to evaluate the diagnostic efficacy of

EEG on depression. Subgroup analyses were conducted to investigate the possible sources of heterogeneity

Results A total of 18 studies were included, contributing 58 reported results in total. The diagnostic test accuracy of EEG for depression was high across the studies, as the pooled SEN, SPE, and the AUC were 0.95, 0.93, and 0.95 respectively. All the 18 studies included utilized machine learning algorithms to analyze EEG data for depression diagnoses and the AUC ranged from 0.741 to 0.994. The studies with higher SEN and SPE tended to be those detecting depression from the healthy control groups, with the EEG data collected during both eyes-open and eyes-closed conditions, and the number of channels exceeding 20

Conclusion This study shows that EEG could provide a definitive and quantitative reference for depression diagnoses, having a good application prospect in clinical practice; machine learning algorithms could improve the accuracy of EEG-based diagnosis of depression. The findings also reveal a gap in the current studies, with few cases detecting depression from other mental disorders that have overlapping neural markers with depression, or detecting depression from comorbidity diseases. This gap and the high heterogeneity necessitate further research in diverse settings for further examination of the validity of EEG for depression diagnoses

线粒体自噬在伴有应激事件的抑郁障碍患者中的影响研究

刘超 严琦*

南通市第四人民医院

目的 探讨线粒体自噬相关指标对于伴有应激事件的抑郁障碍患者的影响。

方法 将抑郁障碍患者进行分组, 包括具有应激事件的抑郁障碍患者 22 名, 不具有应激事件的抑郁障碍患者 22 名, 及健康对照组 22 名, 采集晨间空腹血浆, 应用 ELISA 测定法测定血浆中 Beclin-1,

LC3B, ATG5, SQSTM1 指标, 比较三组中相关指标含量是否存在差异。

结果 1、三组中线粒体自噬相关指标 Beclin-1, LC3B, ATG5, SQSTM1 均存在统计学差异, 其 F 值分别为 5.237、7.450、4.095、4.952, P 值分别为 0.008、0.001、0.021、0.010。2、事后检验结果示 Beclin-1 在正常对照组与抑郁障碍应激组存在显著差异 ($P=0.002$); LC3B 在正常对照组与抑郁障碍应激组存在显著差异 ($P=0.000$), LC3B 在抑郁障碍应激组与抑郁障碍无应激组之间存在显著差异 ($P=0.014$); ATG5 在正常对照组与抑郁障碍应激组存在显著差异 ($P=0.006$); SQSTM1 在正常对照组与抑郁障碍应激组存在显著差异 ($P=0.003$)。3、线粒体自噬相关指标 Beclin-1, LC3B, ATG5, SQSTM1 在正常组与抑郁之间比较差异存在统计学意义 ($t=-2.740$ 、 -2.802 、 -2.431 、 -2.481 , $P=0.008$ 、 0.007 、 0.018 、 0.016)。

结论 1、线粒体自噬可在抑郁障碍发挥作用; 2、应激可能通过 LC3B 途径在抑郁障碍中发挥作用。

Exploration of The Optimized Portrait of Omega-3 Polyunsaturated Fatty Acids in Treating Depression: A Meta-analysis of Randomized-controlled Trials

Lingzhuo Kong* Qin Zhang Huaizhi Wang Yiran Xu
Chenyue Xu Yiqing Chen Jing Lu Shaohua Hu
First Affiliated Hospital of Zhejiang University School of Medicine

Objective Omega-3 polyunsaturated fatty acids (PUFAs) are now controversial for their efficacy in treating depression. This meta-analysis aims to find whether omega-3 PUFAs are effective in treating depression, and the most beneficial clinical portrait of the intervention and patients

Methods More than two reviewers searched six registries, and 36 studies were enrolled. Use PRISMA guidelines for data extraction, Cochrane Handbook for quality assessment, and random effects model for data pooling

Results Significant heterogeneity and publication bias assessment were observed. Significant efficacy was detected in the overall analysis [standardized mean difference (SMD) = -0.26, 95% confidence interval (CI) = (-0.41, -0.11)] and some subgroups. According to meta regression, total daily dosage might be a potential heterogeneity source ($P < 0.05$). No between-group difference was observed in the rate of response [relative risk (RR) = 0.99, 95% CI = (0.82, 1.20)], remission [RR = 1.17, 95% CI = (0.92, 1.48)], and adverse events [RR = 1.07, 95% CI = (0.90, 1.29)]. Daily intake of eicosapentaenoic acid (EPA) and remission rate conformed to linear correlation ($P < 0.05$)

Conclusion The findings indicate that 1) Omega-3 PUFAs might be effective in treating depression; 2) Among patients living in Asia with mild to moderate depression and no other underlying medication, long-term intervention (> 8 weeks) of omega-3 PUFAs 1000-1500 mg/day with EPA versus docosahexaenoic acid (DHA) ranging from 1:1 to 3:2 might benefit the most; 3) Omega-3 PUFAs are no superior than placebo in rate of response, remission, and adverse events. The results are unstable, but the evidence-based information provides guidance for clinical practice and direction for further research

Unraveling The Critical Role of IL-12 in High Suicide Risk Among Depressed Patients: A Comprehensive Cytokine Analysis

Xiwen Hu¹, Zhonglin Tan¹, Lingna Lu², Shengdong Wang¹, Jinfang Han¹

1. Affiliated Mental Health Center and Hangzhou Seventh People's Hospital, Zhejiang University School of Medicine

2. Tongde Hospital of Zhejiang Province

Objective This study aims to preliminarily investigate the clinical value of cytokines in suicidal ideation among depression patients.

Methods Peripheral blood cytokine levels in 62 depressed patients and 40 healthy controls were examined using flow cytometry. Additionally, cytokine levels were analyzed across different suicide risk groups. IL12-related genes were identified using the GWAS Catalog. Gene expression matrices were obtained by segmenting the AHBA (Allen Human Brain Atlas) brain map using the Schaefer 400 template. Upregulated and downregulated gene sets were compared to Yeo resting-state networks and correlated with the Margulies 2016 gradient map using the brainstat toolbox. Permutation tests were conducted to assess the significance of p-values.

Results (1) The depressed group had significantly higher expression levels of IL-6, IL-10, IFN- γ , IL-17, IL-4, and TNF- α compared to the healthy control group (all $P < 0.05$). (2) IFN- γ and IL12 levels were higher in the high suicide risk group compared to the no suicide risk and low-moderate suicide risk groups (both $P < 0.05$). (3) IL-12 demonstrated diagnostic efficacy in identifying high suicide risk, with an AUC of 0.758 ($P=0.001$), a cutoff value of 0.59 pg/ml, sensitivity of 0.625 (95% CI 0.406-0.812), and specificity of 0.921 (95% CI 0.786-0.983). (4) Visualization of gene expression using the Schaefer 400 template and correlations with the Margulies 2016 cortical gradient map highlighted distinct patterns of upregulated and downregulated genes in relation to brain networks.

Conclusion Neuroimmune mechanisms may contribute to the pathophysiology of suicide in depression. Cytokines, particularly IL-12, could serve as potential biomarkers for identifying high suicide risk in depression patients. Further research is needed to validate these findings and explore the underlying mechanisms

Eating Less To Lose Weight Is Associated with Lower Risk of Depression, While Skipping Meals Is Opposite

Hongfei Mo*

Shanghai Medical College of Fudan University

Objective The primary objective of this study was to comprehensively analyze and understand the relationship between two commonly adopted weight loss Methods "skipping meals" and "eating less," and depression in a targeted weight loss population. By identifying potential correlations, we aimed to provide insights into the psychological impact of different weight loss strategies

Methods We conducted a retrospective analysis utilizing data from the National Health and Nutrition Examination Survey (NHANES) cycles of 2015-2016 and 2017-2018. The weight loss population was carefully screened, and information on "skipping meals" and "eating less" was collected through the Weight History section of the Sample Person Questionnaire. Depression was assessed using the validated 9-item Patient Health Questionnaire, with a total score ranging from 5 to 27 indicating depression. To determine the detailed associations between these weight loss methods and depression, we performed subgroup logistic regression analyses

Results A total of 3,543 individuals, comprising 1,405 males and 2,138 females, with a mean age of 47.29 ± 17.34 years, were included in this study. After adjusting for potential confounders, we found that "eating less without skipping meals" (OR=0.827, 95%CI: 0.649-0.986, $P=0.034$) was negatively associated with depression. Conversely, "skipping meals" (OR=1.498, 95%CI: 1.224-1.833, $P<0.001$) and "eating less while skipping meals" (OR=1.567, 95%CI: 1.256-1.956, $P<0.001$) both displayed positive associations with depression. Interestingly, no significant association was observed between "skipping meals but not eating less" and depression ($P=0.557$)

[Conclusions] Our findings suggest that adopting a weight loss strategy that involves eating a lesser amount of food without skipping meals is associated with a lower risk of depression. However, skipping meals, whether done alone or combined with eating less, appears to increase the risk of depression. This study highlights the importance of considering the psychological

implications of different weight loss methods and encourages the adoption of healthy, sustainable weight loss strategies.

Association Between Long-term Sedentary Behavior and Depressive Symptoms in U.S. Adults

Hongfei Mo*

Shanghai Medical College of Fudan University

Objective The study was designed to explore the correlation between long-term sedentary behavior (LTSB) and depressive symptoms in a representative cohort of the adult population in the United States. Understanding this relationship is crucial as sedentary lifestyles become increasingly common, and mental health issues, especially depression, continue to rise

Methods To undertake this comprehensive analysis, data from the National Health and Nutrition Examination Survey (NHANES) 2017-2018 were utilized. This extensive dataset encompassed vital information on demographics, depressive symptoms, physical activity (PA), and LTSB. Depressive symptoms were identified and categorized using the Patient Health Questionnaire (PHQ-9). Specifically, individuals with a PHQ-9 score of 5 or higher were considered to have "depressive symptoms," while those scoring 10 or above were classified as having "moderate to severe depressive symptoms (MSDS)." Both PA and LTSB were gauged through the Global Physical Activity Questionnaire, with LTSB defined as a sedentary duration exceeding 600 minutes per day. To delve deeper into potential patterns, Restricted Cubic Spline (RCS) curves were employed. These curves provided valuable insights into any nonlinear relationships that might exist between sedentary behavior and depressive symptoms. Furthermore, binary logistic regressions were conducted to statistically analyze these associations, adjusting for various covariates to ensure accuracy

Results The study encompassed a total of 4728 participants, with a mean age of 51.00 ± 17.49 years. Among these, 2310 were males, and 2418 were females. Notably, 1194 individuals (representing 25.25% of the sample) exhibited depressive symptoms, while 417 (8.82%) displayed moderate to severe depressive symptoms. RCS curves revealed an elevated risk of depressive symptoms with increased sedentary duration. Logistic regression models further confirmed significant associations between LTSB and both depressive symptoms (OR=1.398, 95% CI: 1.098-1.780) as well as MSDS (OR=1.567, 95% CI: 1.125-2.183)

Conclusion This study found a significant association between long-term sedentary behavior and depressive symptoms among U.S. adults. Prolonged sitting time increased the risk of experiencing moderate to severe depressive symptoms. These findings suggest that reducing sedentary time and promoting physical activity may help mitigate depressive symptoms in this population. Further research and public health interventions are needed to address this issue

关键词: Depressive symptoms, Long-term sedentary behavior, Moderate-to-sever depressive symptoms, NHANES, Physical activity

精神病护理学课堂教学中反转式教学模式的应用研究

高艳* 王立娜

天津市安定医院

目的 探究反转式教学模式在精神病护理学课堂教学中的应用效果。

方法 入选研究对象均为 2020 年 1 月至 2023 年 1 月我院护理专业学生 120 例, 随机分为两组, 各 60 例, 对照组采用传统教学模式, 研究组采用反转式教学模式, 比较学习效果。比较护理学生考试成绩优良率、个人综合素养、理论知识、操作水平、满意度等指标。

结果 研究组学生护理成绩优良率为 98.33%, 对照组为 83.33%, 研究组高于对照组, $P < 0.05$ 。研究组个人综合素质均高于对照组, $P < 0.05$ 。研究组

学生理论知识成绩均高于对照组, $P < 0.05$ 。研究组学生操作水平成绩均高于对照组, $P < 0.05$ 。研究组满意度为 96.67%, 对照组 85%, 研究组低于对照组, $P < 0.05$ 。

结论 精神疾病是医学领域一个重要、庞大的疾病分类, 无论是在国内还是在世界各国都拥有数量庞大的病患群体, 并且对精神疾病的防治也是世界范围内医学领域的重点关注问题。精神疾病具有治疗周期长、治疗显效慢、康复周期长等特点, 在精神疾病的医疗工作中护理和治疗是同等重要的内容, 因此在现阶段的护理学之中精神疾病护理是一个独立且完整的教学体系。反转式教学 (flipped instruction) 也被叫做反转课堂或翻转课堂 (flipped classroom), 是一种现代、科学、重要的教学理念, 被广泛应用于教育教学工作之中, 在医疗教育之中也被广泛应用。在精神疾病护理学教学工作中使用反转式教学模式可以进一步提升教学质量、丰富教学形式、创新教学设计[3]。本次研究根据本院 2020 年 1 月至 2023 年 1 月进行护理专业学习的 120 名学生的学习资料, 对反转式教学模式在精神病护理学课堂教学中的应用效果进行研究和分析。对于精神病护理专业学生而言, 在教学中采用反转式教学模式有助于提高学生的理论成绩与操作水平, 加强学生个人素质, 进而提高学生满意度, 应推广使用范围。

单次静脉注射艾司氯胺酮联合一种口服抗抑郁剂治疗抑郁障碍的临床研究

吴姍茜 胡永东*
北京朝阳医院

目的 探索艾司氯胺酮注射液单次静脉给药附加口服抗抑郁剂联合治疗方案治疗抑郁障碍的疗效及安全性。

方法 采用非随机同期临床对照研究设计, 将 40 名抑郁障碍患者按照治疗意愿, 分成试验组和对照组, 每组 20 人, 试验组接受艾司氯胺酮注射液 (0.25mg/kg, 40 分钟内静脉点滴单次) 联合一种 SSRI 或 SNRI (4 周) 的治疗方案, 对照组接受富马酸喹硫平联合一种 SSRI 或 SNRI (4 周) 的治疗方案。

研究设立干预前基线期、干预后 2 小时、24 小时、72 小时、1 周、2 周、3 周、4 周共 8 个访视时间点。使用 MARDS、QIDS-SR16、SSI 等疗效指标以及 BPRS-4、YMRS、CADSS、FISER 等安全性指标。在各个访视时间点收集血压、心率等生命体征数据, 及访视期间合并用药和不良事件等信息。

结果 研究共入组 40 名抑郁障碍患者, 均来自首都医科大学附属北京朝阳医院心理科门诊, 脱落 7 人, 最终 33 名受试者完成随访, 试验组 16 人, 对照组 17 人。年龄范围为 18 岁至 62 岁, 其中男性 15 (45.46%) 人, 重度抑郁 11 (33.33%) 人, 难治性抑郁 17 (51.52%) 人, 有精神疾病家族史 5 (15.15%) 人, 有自杀企图史 6 (18.18%) 人。疗效指标: 试验组达到临床治愈平均时间 14.969 (95% confidence interval (CI) 8.771-21.167) 天, 对照组达到临床治愈平均时间 24.706 (95% confidence interval (CI) 22.249-27.162) 天, Log-rank 检验不存在统计学差异 ($P > 0.05$)。试验组患者达到有效时间的平均值为 7.761 天 (95% confidence interval (CI) 1.746-13.776), 而对照组为 23.471 天 (95% CI 21.104-25.837)。Log-rank 检验结果存在统计学意义 ($P < 0.001$)。安全性指标: 在干预后 2 小时末, 试验组共有 3 (18.75%) 例患者报告有解离症状, 考虑与药物相关, 其程度有所不同; 其他各访视时间点均未报告有解离症状出现。在干预后 2 小时末, 有 1 例患者的 YMRS 量表评分提示有躁狂症状 (12 分)。对照组中未有患者的 YMRS 量表评分超过 0 分。

结论 与抗抑郁剂+喹硫平联合增效方案 (富马酸喹硫平联合 4 周口服抗抑郁剂) 对照, 单次静脉注射艾司氯胺酮联合 4 周口服抗抑郁剂的治疗方案治疗抑郁障碍, 能够显著改善抑郁症状, 迅速缓解自杀风险, 同时具有较好的安全性。

Brain Structural and Functional Alterations of Hippocampal Subregions in MDD Patient with Somatic Symptoms: A Resting-state MRI Study

Juan Qiao¹, Guangli Liang¹, Liuyi Zhang¹, Tingting Liu¹, Yuxuan Hu¹, Shiwan Tao², Qiang Wang²

1.Xuzhou Oriental People's Hoapital

2.2. Department of Psychiatry, West China Hospital, Sichuan University

Background Somatic depression (SD) was a different subtype compared to non- somatic depression (NSD) in presentation of the resting-state MRI study. Among these studies, hippocampus was believed to be significantly associated with somatization symptoms. However, the hippocampus was a heterogeneous structure which contains five main subfields. Until now, the disruption pattern of the hippocampus subfields in SD patients were not clearly. Therefore, it is necessary to study the function of hippocampus subfields, which can aggravate physical symptoms

Methods 261 subjects were recruited including 190 MDD patients and 71 health control. All subjects underwent 3.0T resting state magnetic resonance image scanning. The structural and functional connectivity indicators of the hippocampal subregion were compared among three groups, respectively. In addition, the correlation between the abnormal functional connectivity in the

hippocampal subregions and the HAMD factor scores of the SD patients were also estimated.

Results Compared to the NSD group, SD group showed decreased GMV in HATA_L and HATA_R. With these two subregions as the ROI, the different FC were obtained with the whole brain. Relative to the NSD group, the SD group showed decreased FC between the HATA_L and Occipital_Sup_L, between the HATA_R and Temporal_Mid_L. In SD group, the FC between the HATA_L and Occipital_Sup_L were positively correlated with the HAMD-17 and cognitive disturbance

Conclusion SD showed more severe damages in the functional network of the hippocampal subregions. The functional connectivity between the HATA_L and Occipital_Sup_L might be a neurobiology indicator of the severity of anxious depression

关键词: Hippocampal subregions, Somatic depression, Major depressive disorder (MDD), functional connectivity

Arteriosclerosis Index and Clinical Correlates in First-episode and Drug-naïve Patients with Major Depressive Disorder : A Large-scale Cross-sectional Study

Xiaoying Jin Chenghao Lu Lina Wang*

Tianjin Anding Hospital, Mental health center of Tianjin Medical University

Objective Depression has been identified as a significant risk factor for cardiovascular diseases, negatively impacting cardiovascular health. Atherosclerosis, a critical process in the progression of cardiovascular diseases, greatly increases the risk of cardiovascular events. However, most studies have concentrated on depressive symptoms in patients already diagnosed with cardiovascular diseases. This study aims to explore the correlation between atherosclerosis risk and clinical characteristics in patients with first-episode, untreated major depressive disorder (MDD)

Methods We enrolled 1718 patients with severe depression, collected their sociodemographic data, and assessed their clinical symptoms using the 17-item Hamilton Depression Rating Scale, the 14-item Hamilton Anxiety Rating Scale, and the Positive and Negative Syndrome Scale. Fasting venous blood samples were collected for relevant biomarker measurements, and the Arteriosclerosis Index (AI) was used to evaluate the patients' risk of atherosclerosis

Results The study included a total of 1718 patients with Major Depressive Disorder (MDD) with an average age of 34.87 ± 12.43 years. It was observed that 502 patients exhibited arteriosclerosis, accounting for approximately 29.22% of the total cohort. Patients with higher Arteriosclerosis Index (AI) were older, had a later age of onset, and longer disease duration. Those with elevated AI often presented with thyroid hormone abnormalities, with higher levels of TSH, ATG, ATPO, and FT3 compared to patients with lower AI. Additionally, patients with higher AI showed higher levels of BIM, systolic blood pressure, diastolic blood pressure, blood glucose, triglycerides, total cholesterol, and low-density lipoprotein compared to those with lower AI,

while high-density lipoprotein levels were lower in the former group. Furthermore, patients with higher AI exhibited elevated scores in the HAMD, HAMA, and positive scale assessments. Correlation analysis indicated a moderate relationship between patients' HAMD scores, TSH levels, low-density lipoprotein levels, and AI. Univariate logistic regression revealed that HAMD score (OR=1.323, 95% CI: 1.270-1.381, $P < 0.001$), HAMA score (OR=1.150, 95% CI: 1.115-1.186, $P < 0.001$), and positive scale score (OR=1.084, 95% CI: 1.061-1.108, $P < 0.001$) might be significant risk factors for AI. Further stepwise logistic regression analysis indicated a potential association between systolic blood pressure ($B=0.022$, $P=0.022$) and thyroid hormone abnormalities including TSH ($B=0.427$, $P < 0.001$) and FT3 ($B=0.224$, $P=0.015$) elevation with AI. Dyslipidemia was also linked to AI, with increased levels of triglycerides ($B=0.462$, <0.001) and LDL ($B=0.741$, $P < 0.001$) suggesting a higher probability of arteriosclerosis. Moreover, the HAMD score ($B=0.119$, $P < 0.001$) was positively associated with AI, indicating a higher risk of arteriosclerosis with increasing HAMD scores. Remarkably, in the stepwise logistic regression model, there was a possible negative correlation between positive scale scores and AI ($B=-0.061$, <0.001), suggesting that a higher positive scale score was associated with a lower risk of arteriosclerosis. Finally, a multiple linear regression analysis revealed a linear relationship between TSH levels and AI ($B=0.282$, $P < 0.001$), as well as TG ($B=0.340$, $P < 0.001$) and LDL ($B=0.572$, $P < 0.001$) levels and AI. Notably, a positive linear relationship was found between HAMD score and AI, with each unit increase in HAMD score corresponding to a 0.091 unit increase in AI. Conversely, a negative linear relationship was observed between positive scale scores and AI, with each unit increase in positive scale score associated with a 0.030 unit decrease in AI.

Conclusion The patient's TSH levels are highly correlated with the risk of arteriosclerosis, while TG and LDL increase the risk of arteriosclerosis in patients. The severity of depressive symptoms is associated with a higher risk of arteriosclerosis. Therefore, it is crucial to promptly control depressive symptoms and monitor the development of arteriosclerosis in patients with severe

depression. This approach can help reduce the risk of cardiovascular diseases in these patients

关键词: Major depressive disorder, Arteriosclerosis Index, HAMD

负性生活事件严重性自评量表的开发——基于精神病现象学与自传体记忆视角

张亚楠 刘凯*

渤海大学 通用人工智能研究所

目的 作为应激的直接经验来源, 负性生活事件对抑郁症患者的身心健康和情绪平衡具有重要影响, 为揭示负性生活事件的作用, 学界开发了多种生活事件量表, 以尝试检测并评估负性生活事件对个体心理健康的直接与间接影响。然而, 尽管其在临床医学及心理咨询领域中发挥了重要作用, 在理论和实测两个方面仍存不足。本研究基于现象学的理论视角, 以抑郁症患者的自传体记忆及负性经验为核心内容, 旨在对抑郁症患者负性生活事件的严重性进行科学测评。该量表用于评估抑郁症患者的心理应激水平, 并为干预方法提供科学依据和过程导引。

方法 于河南省某三甲医院, 满足纳入标准和排除标准, 共招募抑郁症患者 120 名。采用定性、定量的综合方法进行施测和评估。首先, 根据现象学访谈获取患者负性生活事件的记录; 其次, 基于事件影响持续时间和精神影响程度两个客观标准, 由患者根据自传体记忆和负性经验对负性生活事件的严重性进行五级评分。

结果 效度分析: 本研究以患者的自传体记忆和现象学负性经验为导向, 采用开放式访谈获取患者详细的负性生活事件, 因此具有可靠的效度。信度分析: 相隔一段时间, 对患者再次施测, 得到其重测信度可达到 0.95。

结论 本研究基于现象学理论, 以自传体记忆及负性经验为核心内容, 编制了负性生活事件严重性自评量表, 通过 120 例样本施测, 验证了该量表具有良好的效度和信度。因此, 本研究结果为量化和评估负性生活事件对抑郁症患者的心理应激水平提供新的方法。

Application of Mendelian Randomization in The Field of Mental Disorders

Xiaoming Xu^{1,2}

1.The First Affiliated Hospital of Chongqing Medical University

2.Psychiatric Center of the First Affiliated Hospital of Chongqing Medical University

Objective This article delves into the utility of Mendelian Randomization (MR) in psychiatric research, highlighting its efficacy in identifying the underlying risk factors and pathogenic mechanisms of mental disorders

Methods The paper elucidates the foundational principle of MR, leveraging genetic variations as instrumental variables to evaluate causality between exposure factors and health outcomes. It details the synthesis of genome-wide MR analysis with expression quantitative trait loci (eQTL) data to pinpoint potential drug targets associated with mental illnesses, and scrutinizes the intricate ties between mental health, substance use, and factors such as smoking and educational attainment

Results The research uncovers 31 potential drug targets linked to mental illnesses, encompassing conditions like schizophrenia, bipolar disorder, depression, and ADHD. The study accentuates the pivotal roles of genes NRG1, DISC1, BDNF, and COMT in affective disorders and uncovers the links between gender-specific genetic transmission, X-linked traits, and affective disorders. Furthermore, it underscores the significance of MR in shaping public health policies, particularly in assessing the impact of large-scale interventions and integrating observational studies

Conclusion The study anticipates an expanded role for MR technology in the realm of mental illness prevention, treatment, and the crafting of public health policies, given its demonstrated capacity to inform etiological understanding and intervention strategies

关键词: Mendelian Randomization, Mental Disorders, Genetic Variations, Public Health Policy

抑郁症心理学标志物的初步验证——基于负性生活事件的内联结构

刘凯* 张亚楠

渤海大学 通用人工智能研究所

目的 抑郁症是最为常见的一种感性精神障碍,患者群体数量逐年升高,对个人、家庭及社会造成沉重负担,但其病理学机制仍存争议。已有大量研究指出,社会心理是其重要影响因素。然而,当前研究多聚焦于社会、心理变量的群组水平差异,而较少顾及患者精神世界的自洽性和异质性。本研究基于现象学的理论视角,尝试系统分析不同患者的个体化负性经验网络,并揭示出异质经验背后的同质结构,以初步验证抑郁症心因性病理机制存在的可能性。

方法 于河南省某三甲医院,满足纳入标准和排除标准,共招募抑郁症患者 120 名。获取知情同意后,进行人口统计学信息、贝克抑郁量表(Beck Depression Inventory, BDI)、9 项患者健康问卷(Patient Health Questionnaire-9, PHQ-9)的采集,并使用课题组开发的负性生活事件内联结构分析系统对其进行施测和计算。

结果 在正常组和抑郁组间,系统分析得到的多个指标均与与抑郁自评量表存在显著正相关。其中,“最长闭合环结构”指标中的“闭合环节点均值”与贝克抑郁量表的相关系数为 0.789;与 9 项患者健康问卷的相关系数为 0.799。

结论 本研究通过系统分析抑郁症患者的负性经验网络,发现一种潜在的抑郁症心理学标志物指标——负性生活事件网络的最长闭合环结构。与同类测量工具相比,该指标具有较良好的信度和效度。因此,本研究为抑郁症病理学机制提出了崭新的视角和初步证据,有望为抑郁症的诊断与治疗提供新的方法。

Structural Cerebral Cortex Predicts Depressive and Cognitive Improvement in Major Depressive Disorder

Yingna Li Wenzhou Liang Liying Zhao Zhiren Wang*
Beijing Huilongguan Hospital

Objective The objective of this study was to adopt cortical morphology to investigate diagnosis-associated abnormalities (patients vs. controls) and correlations between cerebral cortex characteristics and depressive and cognitive changes in major depressive disorder (MDD)

Methods Twenty-two patients with MDD and twenty-one age and sex matched healthy controls (HCs) participated in this study. Participants completed 17-item Hamilton Rating Scale for Depression (HAM-D17), Hamilton Rating Scale for Anxiety (HAMA) and Repeatable Battery for the Assessment of Neuropsychological Status (RBANS) assessing depressive symptoms and cognitive function. Cerebral cortex characteristics [fractal dimension (FD), gyrification index (GI), sulcus depth (SD), and cortical thickness (CT)] were evaluated using an automated Computational Anatomy Toolbox (CAT12). Regions with significant differences were used in a vertex-based comparison of cortex characteristics. Multiple regressions were performed to identify clusters whose cortex characteristics was associated with depressive and cognitive changes, ($p < 0.001$, family wise error-corrected cluster-level $p < 0.05$), with age and sex as covariates

Results Surface-based analyses revealed altered GI in the left insula in MDD patients at baseline compared with HCs. Regression analysis found that baseline FD in the left superior frontal cortex, left cuneus, right rostral middle frontal cortex, right lateral occipital cortex, GI in the left lateral occipital cortex, and thickness in the bilateral insula could predict improvement in depressive symptoms in MDD patients. In addition, lower baseline GI in the left superior parietal cortex could predict a greater improvement in attention, and lower baseline SD in the left lateral occipital cortex could predict a greater improvement in delayed memory

Conclusion Our findings highlighted cerebral

cortex characteristics as potential prognostic biomarkers to predict and track disease progression or stratify MDD patients for optimizing disease management and treatment strategies

关键词: major depressive disorder, surface-based morphometry, cerebral cortex characteristics, depressive symptoms, cognition

抑郁症患者用药治疗前后全脑皮质结构形态变化磁共振成像研究

北京回龙观医院

目的 采用结构性磁共振成像 (structural magnetic resonance imaging, sMRI) 技术观察抑郁症 (major depressive disorder, MDD) 患者的大脑形态学变化, 并研究这些变化是否与 MDD 的临床严重程度相关。方法 纳入 22 名被诊断为 MDD 的患者 (18-50 岁) 和 21 名健康对照 (Healthy control, HC), 采用汉密尔顿焦虑量表 (Hamilton Rating Scale for Anxiety, HAMA)、汉密尔顿抑郁量表 (17-item Hamilton Depression Scale, HAM-D17) 和神经心理状态评定量表 (Repeatable Battery for the Assessment of Neuropsychological Status, RBANS) 评价所有患者的抑郁症状严重程度和认知功能。应用 sMRI 技术, 分别在用药治疗前和用药治疗 8 周后, 采集所有被试的脑结构数据, 基于 CAT12 软件计算 MDD 患者用药前后及正常的全脑皮质结构, 配对样本 t 检验比较 MDD 患者治疗前后的临床量表和全脑皮质结构差异, 双样本 t 检验分别比较 MDD 患者用药前、后与 HC 的全脑皮质结构差异。提取治疗后全脑的皮质结构参数与 MDD 患者的临床量表评分进行相关性分析。结果 MDD 患者用药治疗前和 HC 比较全脑皮质结构, 发现用药前右侧岛叶/颞上回的局部回指数减低。相关性分析显示, MDD 患者用药治疗后分形维数与 HAMA、HAM-D17 呈负相关; 局部回指数与 HAM-D17 呈正相关; MDD 患者用药治疗后视觉广度分别与分形维数呈正相关、局部回指数呈负相关; 沟深度与注意力、RBANS 总分呈负相关。结论 MDD 患者药物治疗可能影响大脑结构的变化, 并为大脑形态学变化与临床症状之间的内在联系提供了

新的见解。

TMS 在抑郁障碍中的研究现状与趋势：文献计量学与可视化分析

唐婷婷¹ 唐婷婷³ 杨军^{1,2} 桂千千^{1,2} 张坤^{1,2} 张爱霞¹ 王婷¹ 杨春霞¹ 孙宁^{1,2}

1.山西医科大学第一医院

2.山西医科大学第一临床医学院

3.山西医科大学医学科学院

目的 抑郁障碍是一种慢性精神疾病，给个人、家庭甚至整个国家带来沉重负担。近年来，非侵入性脑部刺激技术的快速发展使得经颅磁刺激（Transcranial Magnetic Stimulation, TMS）治疗抑郁障碍在临床上得到广泛应用。鉴于近期相关研究的显著增长，本研究旨在利用文献计量学方法总结经颅磁刺激技术与抑郁障碍的全球研究现状与趋势，为今后相关的研究提供参考及指导。

方法 从 Web of Science 核心收藏数据库（WoSCC）中的科学引文索引（SSCI）和科学引文索引扩展（SCIE）获取 1998 年至 2022 年间发表的有关 TMS 和抑郁障碍的文献。使用 VOSviewer 和 CiteSpace 软件对国家、机构、作者、期刊、关键词、引文等数据进行等进行计量学分析，并绘制可视化图谱。

结果 共提取到 4649 篇文献，1998-2022 年 TMS 在抑郁障碍领域的研究发文量总体呈上升趋势，这些文献发表于 779 种期刊，《BRAIN STIMULATION》是接收该领域文章最多的期刊。其中共包括了来自 76 个国家及 3965 个机构中的 17000 余位作者，美国贡献的发文量最为突出，多伦多大学及 Daskalakis ZJ 是论文发表数量最多的机构和作者。“State Functional Connection”和“Theta Burst”是近期备受关注的关键词。该领域的研究主要集中于 TMS 刺激模式及其疗效和安全性、相关脑区及联合检测技术、TMS 对脑源性神经营养因子（BDNF）和神经递质水平的调节作用等方面。其中，发展新的 TMS 刺激模式，将 TMS 技术与其它检测技术结合以实现精准治疗，并且探索脑内不同信息的时间

与空间联系、宏观与微观机制，已逐渐成为当前的研究热点。

结论 近年来 TMS 在抑郁障碍领域的相关研究已取得一定成果，未来基于个体下的多模态参数，实现个体化的精准治疗依然是大势所趋。

歧视精神疾病患者评估量表在社区人群中的信效度

潘鹏¹ 陈闻锦² 王立娜¹ 徐广明¹

1.天津市安定医院

2.北京回龙观医院

目的 验证歧视精神疾病患者评估量表在社区人群中的信效度。

方法 本研究数据来源于第二次天津市精神障碍流行病学调查项目。该项目采取按规模大小成比例的概率抽样（Probability proportionate to size sampling, PPS）方法进行多阶段随机整群抽样，最终在天津市 16 个区县抽取了 41 个街道办事处，70 个村居为调查点，共抽取 15630 户家庭。每户家庭随机抽取 1 位半年内居住满 3 个月的 18 岁及以上成年人作为调查对象。最终有 5951 人完成《美国精神障碍分类与统计手册第五版精神障碍定式检查》（简称“SCID”）的访谈，在完成 SCID 问卷中随机抽取 27% 的调查对象，在调查员的指导下填写《歧视精神疾病患者评估量表》（简称“SS for PMI”）。最后完成评估量表的内部一致性、可靠性分析及降维因子分析。

结果 1.共有 1598 人参与歧视问卷调查，剔除回答率不足 90% 的无效样本，且剔除“认为自己有或有过精神心理方面疾病”的调查对象，最终有 1018 名受访者完成歧视精神疾病患者评估量表调查。

2.歧视精神疾病患者评估量表在天津市社区人群中的 Cronbach 同质性信度系数和分半信度系数均高于原始量表，分别为 0.90 和 0.86，显示具有良好的内部一致性。进一步探索性因子分析显示：KMO 值为 0.945，巴菲特半球检验值为 9492.04（ $P < 0.001$ ），沿用原量表分为隔离、危险、能力三个维度进一步分析，因子与总分的相关系数大于各因子之间的相关系数。

结论 歧视精神疾病评估量表在天津市社区居民中具有良好的信效度, 隔离、危险、能力三因子得分与总分的相关系数高于各因子之间相关系数, 说明此量表对歧视问题的提取概括能力较好, 各因子之间既相互独立又相互联系, 具有良好区分效度。除了能力因子外, 隔离和危险内部一致性系数和分半系数良好。

个体特异性功能连接预测双相抑郁临床分数

卢凤梅 王陆 赵雪梅 贾晨 何宗岭*

成都市第四人民医院

目的 双相抑郁存在诊断难、易复发等特点, 临床上主要以病史、访谈和行为进行诊断, 然而缺乏客观的影像标志物。关于双相抑郁的影像研究发现了一些功能连接异常, 这些异常可能是潜在的影像标志物。研究表明人脑在神经解剖学和功能方面存在显著个体差异。因此, 有必要考虑个体差异整合全脑功能连接组来寻找双相抑郁患者潜在的影像标志物。

方法 本研究采用个体化皮质分割方法确定了个体特异的功能一致脑区, 这些区域在大小、位置、形状上各不相同。然后构建了个体水平和组图谱水平的功能连接组。最后使用将功能连接组作为特征训练支持向量回归模型, 对 56 名双相抑郁患者的 HAMD 分数和病程分数分别做了预测。

结果 通过迭代分割算法, 从 116 个 ROI 中确定了 73 个一致性 ROI, 这些 ROI 是每个受试者共有的, 并且在个体上存在空间差异, 它们在位置、大小方面展现了个体差异。结果显示, 基于 FPN 与 SMN 之间的连接以及 DMN 内部的连接能够有效的预测 BDD 患者的 HAMD 分数。

结论 无论是预测 HAMD 分数还是病程分数, 个体特异性功能连接作为特征进行预测的结果都是显著优于组水平图谱的结果。本研究结果强调了在影像学研究中考虑个体差异的重要性, 并揭示了可以预测 BDD 患者临床分数的潜在影像学生物标志, 这对于疾病的精准治疗和诊断具有重要的帮助意义。

血小板/血红蛋白比值与抑郁症的关联—大样本临床数据分析

魏艳艳 陈景旭*

北京回龙观医院

目的 越来越多研究认为血小板在炎症中发挥重要作用, 血小板被认为是连接精神疾病和炎症反应的假定桥梁。血小板/血红蛋白比值 (platelet-hemoglobin ratio, PHR) 是基于血小板、血红蛋白确定的综合性指标, 高水平 PHR 代表炎症状态的增强, 是反应系统炎症活性的生物标志物。关于 PHR 的研究目前大多集中在心血管疾病等躯体疾病方面, 研究发现 PHR 水平的增加与心血管疾病的发生率及死亡率明显相关, 但在抑郁症中尚缺乏研究。本研究目的是探索与正常人群相比, 抑郁症患者体内是否存在 PHR 水平的改变, 首发抑郁症患者及复发抑郁症患者是否存在 PHR 的差异。

方法 本研究共收集了来自 4801 名首发抑郁症患者, 4098 名复发抑郁症患者及 6845 名健康对照的血小板及血红蛋白水平数据。通过血小板及血红蛋白水平计算出 PHR 值, 比较不同组间 PHR 水平的差异, 并进行 logistic 回归分析探讨 PHR 与抑郁症的关联。

结果 抑郁症患者及正常对照组间血小板、血红蛋白水平比较, 结果发现抑郁症患者的血小板水平 (239.662 ± 0.665) 显著低于正常对照组 (252.994 ± 0.712) ($P < 0.001$), 抑郁症患者血红蛋白水平 (131.615 ± 0.166) 显著低于正常对照组 (142.895 ± 0.189) ($P < 0.001$)。PHR 水平比较, 结果发现抑郁症患者的 PHR 水平 (1.855 ± 0.006) 显著高于正常对照组 (1.802 ± 0.006) ($P < 0.001$)。进一步分析显示, 首发抑郁症患者 PHR 水平 (1.855 ± 0.008)、复发抑郁症患者 (1.856 ± 0.009) 均显著高于正常对照组 ($P < 0.001$), 而首发抑郁症患者与复发抑郁症患者 PHR 水平无差异。Logistics 回归分析结果显示 PHR 与抑郁症具有显著相关性 ($P < 0.01$)。

结论 首发抑郁症、复发抑郁症患者 PHR 水平高均显著高于正常对照组, 首发、复发抑郁症患者无明显差异。提示抑郁症存在明显的免疫功能失调, PHR 水平与抑郁症显著相关提示 PHR 水平是抑郁症发生的影响因素。

关键词: 抑郁症, 血小板/血红蛋白比值, 炎症, 免疫, 影响因素

基于大样本临床数据研究血清白蛋白/胆红素比值与首发、复发抑郁症的关联

魏艳艳 陈景旭*
北京回龙观医院

目的 越来越多研究认为白蛋白、胆红素在炎症中发挥重要作用, 与氧化应激具有密切关联。研究发现白蛋白、胆红素具有抗氧化作用, 白蛋白/胆红素比值 (albumin-bilirubin index, ALBI) 是基于血清白蛋白、胆红素确定的综合性炎症指标, 能够反映氧化应激水平, 并且是反应系统炎症活性的生物标志物。目前关于 ALBI 在抑郁症中尚缺乏研究。本研究的目的是探索与正常人群相比, 抑郁症患者体内是否存在 ALBI 水平的改变, 首发抑郁症患者及复发抑郁症患者是否存在 ALBI 的差异。

方法 本研究共收集了来自 4801 名首发抑郁症患者, 4098 名复发抑郁症患者及 6845 名健康对照的白蛋白及胆红素水平数据。通过白蛋白及胆红素水平计算出 ALBI 值, 比较不同组间 ALBI 水平的差异, 并进行 logistic 回归分析探讨 ALBI 与抑郁症的关联。

结果 抑郁症患者及正常对照组间白蛋白、胆红素水平比较, 结果发现抑郁症患者的白蛋白水平 (43.168 ± 0.038) 显著低于正常对照组 (45.999 ± 0.033) ($P < 0.001$), 抑郁症患者胆红素水平 (15.138 ± 0.072) 显著低于正常对照组 (13.974 ± 0.073) ($P < 0.001$)。ALBI 水平比较, 结果发现抑郁症患者的 ALBI 水平 (3.674 ± 0.016) 显著高于正常对照组 (3.435 ± 0.014) ($P < 0.001$)。进一步分析显示, 首发抑郁症患者 ALBI 水平 (3.689 ± 0.023)、复发抑郁症患者 (3.658 ± 0.023) 均显著高于正常对照组 ($P < 0.001$), 而首发抑郁症患者与复发抑郁症患者 ALBI 水平无差异。Logistics 回归分析结果显示 ALBI 与抑郁症具有显著相关性 ($P < 0.01$)。

结论 首发抑郁症、复发抑郁症患者 ALBI 水平高均显著高于正常对照组, 首发、复发抑郁症患者无明显差异。提示抑郁症存在明显的免疫功能失调, ALBI 水平与抑郁症显著相关提示 ALBI 水平是

抑郁症发生的影响因素。

关键词: 抑郁症, 白蛋白, 胆红素, PHR, 炎症, 氧化应激

Research Status and Global Trends of Late-life Depression From 2004 To 2023: Bibliometric Analysis

Ruonan Du^{1,2}, Haipeng Cai², Wei Li², Keping Yang², Zhiren Wang²

1.Huilongguan Clinical Medical School of Peking University

2.Beijing Huilongguan Hospital

Objective This study profiled the current state of global research on LLD and predicted future research trends in the field

Methods Literature with the subject term LLD was retrieved from the Web of Science Core Collection, and CiteSpace software was used to perform econometric and co-occurrence analyses. The results were visualized using CiteSpace, VOSviewer, and other software packages

Results In total, 10,570 publications were included in the analysis. Publications on LLD have shown an increasing trend since 2004. The United States and the University of California had the highest number of publications, followed consecutively by China and England, making these countries and institutions the most influential in the field. Reynolds, Charles F. was the author with the most publications. The International Journal of Geriatric Psychiatry was the journal with the most articles and citations. According to the co-occurrence analysis and keyword/citation burst analysis, cognitive impairment, brain network dysfunction, vascular disease, and treatment of LLD were research hotspots

Conclusion Late-life depression has attracted increasing attention from researchers, with the number of publications increasing annually. However, many questions remain unaddressed in this field, such as the relationship between LLD and cognitive impairment and dementia, or the impact of vascular factors and brain

network dysfunction on LLD. Additionally, the treatment of patients with LLD is currently a clinical challenge. The results of this study will help researchers find suitable research partners and journals, as well as predict future hotspots

关键词: late-life depression, dementia, cognitive impairment, CiteSpace, bibliometric analysis, global trends

Associations between Psychological Stress and The Risk of First Onset of Major Depression Disorder: Results From A Longitudinal Study in 6,985 Chinese First-year Students

Fengting Wang Limin Rong Yan Liu*
Jining Medical University

Objective Youth and young adults have a high prevalence of major depressive disorder (MDD). Limited longitudinal research has explored the relationship between different dimensions of psychological stress and MDD. This study aimed to estimate the effect of psychological stress on the risk of first onset MDD in a sample of Chinese freshmen

Methods Using a longitudinal design, 8079 Chinese first-year students were recruited at baseline, and 6985 were followed up one year later. The Psychological Stress Scale for College Students was utilized to evaluate the levels of psychological stress. MDD was evaluated using the Chinese version of the Composite International Diagnostic Interview (CIDI-3.0). Random effect logistic regression modeling was utilized to estimate the associations between dimensions of psychological stress and the risk of MDD

Results Two dimensions of psychological stress, namely learning stress (OR=1.05, 95% CI:1.01, 1.09) and economic stress (OR=1.11, 95% CI:1.04, 1.19), were significantly associated with the risk of MDD. Other dimensions of psychological stress (specify family stress, interpersonal stress, intimate relationship stress, employment stress and appearance stress) were not associated with MDD

Conclusion Psychological stress, especially learning and economic stresses, could increase the risk of MDD in university students. These factors should be incorporated into mental health prevention and intervention programs at universities to reduce the risks of MDD

关键词: Major depressive disorder; Psychological stress; Longitudinal study; Freshmen

伴情感迟钝的抑郁症患者与健康被试的脑影像差异研究

张裕裕 刘念 蔡敏 王化宁*

中国人民解放军空军军医大学第一附属医院

目的 基于静息态功能磁共振 (functional magnetic resonance imaging, fMRI), 探讨抑郁症患者有情感迟钝症状的脑影像研究。

方法 本研究是一项神经影像研究, 采集抑郁症情感迟钝患者和健康对照的静息态功能磁共振数据, 采用低频振幅 (amplitude of low frequency fluctuation, ALFF)、基于全脑的功能连接及基于左右两侧杏仁核感兴趣区的功能连接方法, 分析伴情感迟钝症状抑郁症患者的静息态脑功能变化以及与健康对照的差异, 旨在从神经影像学方面探索抑郁症情感迟钝的可能机制, 提高对抑郁症情感迟钝症状的相关功能异常机制的认识。

结果 与健康对照组相比, 抑郁症情感迟钝的患者在中央前回、中央后回、楔叶、楔前叶、颞上回、小脑及内侧和旁扣带脑回等多个局部脑区的活动存在改变; 抑郁症情感迟钝的患者多个脑网络的功能连接下降, 尤其是感觉运动网络 (sensorimotor network, SMN) 和腹侧注意网络 (ventral attention network, VAN)、边缘网络 (limbic network, LN)、默认模式网络 (default mode network, DMN) 等网络的功能连接降低更为显著; 抑郁症情感迟钝组患者杏仁核与额叶、颞叶、顶叶、枕叶及多个皮层下区域的功能连接减弱。

结论 抑郁症情感迟钝患者多个局部脑区的活动存在改变, 杏仁核与全脑的多个皮层脑区及皮下脑区的功能连接下降, 提示情感迟钝的脑功能受到广泛影响, 包括 SMN、VAN、LN、DMN 等网络的

功能连接障碍可能是抑郁症情感迟钝症状的可能发病机制。

关键词：抑郁症；情感迟钝；静息态功能磁共振

重性抑郁障碍患者肠道菌群特征及其与睡眠质量的相关性分析

荆琳² 刘鹏鸿^{1,2} 郭峰涛² 张爱霞^{1,2} 杨春霞^{1,2} 孙宁^{1,2}

1.山西医科大学第一医院

2.山西医科大学

目的 近年来重性抑郁障碍(MDD)的患病率稳步上升,临床上发现多数患者常存在睡眠问题,显著影响个体功能。既往研究显示抑郁症状与睡眠症状具有相关性,但两者间存在的共同病理生理机制至今尚不明确。目前,已有多项研究表明肠道菌群参与了抑郁障碍及睡眠障碍的发生发展,本研究欲探讨它们三者的内在联系,为重性抑郁障碍伴睡眠问题的病理生理机制提供理论支持。

方法 本研究收集符合纳入、排除标准的重性抑郁障碍患者109例及健康被试(HC)96例,采集其一般资料及粪便样本,分别使用汉密尔顿抑郁量表(HAMD-17)及匹兹堡睡眠质量指数量表(PSQI)评估受试者抑郁症状与睡眠质量,采用16srRNA测序方法对粪便样本进行分析。首先探讨重性抑郁障碍患者的肠道菌群特征,然后进一步分析紊乱的肠道菌群与抑郁症状、睡眠症状的相关性。

结果 重性抑郁障碍患者肠道菌群Alpha多样性降低;Beta多样性显示与健康被试存在差异。聚焦在属水平,LEfSe分析发现与HC组相比,MDD组中双歧杆菌属(*Bifidobacterium*)、布劳特氏菌属(*Blautia*)、粪球菌属(*Coprococcus*)、马赛菌属(*Massilia*)、长命菌属(*Rubrivivax*)、小单孢菌属(*Micromonospora*)、嗜皮菌属(*Geodermatophilus*)、*Candidatus_Xiphinematobacter*属、异体卡多菌属(*Alloscardovia*)相对丰度升高;而拟杆菌属(*Bacteroides*)、粪杆菌属(*Faecalibacterium*)、罗氏菌属(*Roseburia*)、小类杆菌属(*Dialister*)、萨特氏菌属(*Sutterella*)、考拉杆菌属(*Phascolarctobacterium*)、副拟杆菌属(*Parabacteroides*)相对丰度降低。相关性分析发现

HAMD总分、PSQI总分及部分因子分均与双歧杆菌属(*Bifidobacterium*)、布劳特氏菌属(*Blautia*)呈正相关,与拟杆菌属(*Bacteroides*)、罗氏菌属(*Roseburia*)、副拟杆菌属(*Parabacteroides*)、萨特氏菌属(*Sutterella*)、考拉杆菌属(*Phascolarctobacterium*)呈负相关。HAMD总分与PSQI总分及7个因子分呈正相关。

结论 重性抑郁障碍患者的肠道菌群与健康人存在差异,其紊乱的肠道菌群与抑郁症状及睡眠症状相关,有多种肠道菌群共同导致了患者的抑郁及睡眠症状。

关键词：重性抑郁障碍；睡眠障碍；肠道菌群

抑郁症的认识和预防分享

岑俊翰*

中国解放军联勤保障部队第九二三医院

目的 对于很多抑郁的人来说,他们一直很悲观,即便事实情况是乐观的,他们也是如此。通过以下分享,我们可以知道总是对自己、自己的经历和未来产生消极想法。我们称之为“消极三部曲”,从而认识抑郁症以及预防。

方法 从下列观点对照,可以知道消极思想导致抑郁,使其持续并延长;同时,消极思想又常常是抑郁的结果。想要做出改变,重要的是要发觉这些思想,充分检验并改变这些思想。这种压倒一切的消极思想以各种具体的偏见形式出现在你的思维中。在认知疗法中,我们将这些偏见称为“自动思维”。这些想法是很本能地出现在你思维中的,看上去似乎合乎情理,对你真实可信,而且和消沉情绪相联系。根据下面观点,看看是否其中某一种偏见似曾相识。
1.主观臆断 2.预测未来 3.大祸临头 4.乱贴标签 5.贬低优势 6.消极过虑 7.过度泛化 8.一分为二的思维 9.觉得应该的思维 10.责任个人化 11.苛责他人 12.不公平的比较 13.懊悔倾向 14.假如怎么办 15.感性推理 16.无力否定 17.判断焦点

结果 通过上述观点,在一段平常的人际关系中,你可能认为,她不喜欢你。我们把这归为主观臆断,因为你可能并不真正了解她的想法。到后来,你发现她确实不喜欢你。这时,你感到不安。但是,为什么你会感到难过?这是因为你有一套非常严格的

标准。很多学生会有一种认为只要考试，就一定会考不好的自动思维，因此，我们可能会说这个学生是在预知未来。而实际是他在考试中得了还可以的。这时他又想，“我一定是个白痴”。此时，他对自己的标准是，任何不够完美的事情都是失败。如果对照以上，你发现自己的确拥有这些自动思维，且它们也的确使你变得越来越抑郁，影响了生活的感受，以下建议不妨一试：保持健康的饮食与运动，忧郁跟环境大有关系，寒冷的温度都会让我们更加抑郁，多晒太阳，多运动，做任何运动，都可以提高我们的心情，这不但是在创造体适能，也是在创造心适能；健康的饮食很重要，吃一些香蕉、菠菜等都有助于保持心情的愉快；一旦你发现，自己似乎有太多情绪的积压而无法保持健康生活的状态，那么你可能需要宣泄一下情绪，允许自己脆弱的哭泣或寻找亲近的好友诉说。通过上述，我们可以更好的认识抑郁症，并早期自行缓解。

结论 抑郁的时间超过两周以上，影响到生活，即使觉察了自己的扭曲思维也无法自行好转的话，一定要向专业人员求助，一些扭曲思维也可能来源于早期的心理创伤，交给精神心理专家来处理会更加的有效。

Serum Metabolic Characteristics of Female Adolescents with Major Depressive Disorder and A History of Self-injury

Yunrong Lu*

The Fourth Affiliated Hospital, Zhejiang University School of Medicine

Objective Non-suicidal self-injury (NSSI) refers to the intentional infliction of physical harm upon oneself without the intention of death. The prevalence of NSSI in children and adolescents is 19.5% worldwide, and over 20.0% in adolescents in China. The co-occurrence of NSSI and major depressive disorder (MDD) in adolescents is high. The metabolic changes that have been observed in individuals with MDD provide a better understanding of the underlying mechanisms of MDD.

To evaluate the metabolomic profile of female NSSI adolescents and identify the potential biomarkers of MDD and NSSI female adolescents

Methods Here, we evaluated the serum metabolomic profiles of MDD (n = 29), MDD+NSSI (n = 39), and 38 healthy female adolescents with Q300 technology specifically targets more than 200 metabolites

Results We identified 58 different metabolites in total, including fatty acids, organic acids, carbohydrates, amino acids, and short-chain fatty acids. Of these, 48 metabolites were different between the MDD+NSSI and healthy control (HC) groups, and 10 metabolites were different between the MDD+NSSI and MDD groups. Further analysis showed azelaic acid, isobutyric acid, and heptanoic acid to be effective biomarkers for classifying patients with MDD+NSSI vs. healthy controls (HCs)

Conclusion 9-pentadecanoic acid appeared to be a potential metabolic marker to classify patients with MDD+NSSI vs. MDD. Our results could help explain the underlying causes of MDD and NSSI and lead to better treatments for these patients

关键词：Major depressive disorder; Metabolism; Serum; self-injury; Q300; Female adolescents

Current Research Hotspots and Frontier Trends of The Last Two Decade on Artificial Intelligence in Depression: A Bibliometric Analysis

Yingli Zhang* Shaokui Kan Bo Peng Weitan Zhao Yao Wang Xuexia Bai

Department of Depressive Disorders, Shenzhen Kangning Hospital, Shenzhen, China, Shenzhen Mental Health Center Shenzhen, China

Objective This study aims to visually analyze the current status and trends of artificial intelligence in depression research and clinical practice by means of bibliometrics and knowledge mapping

Methods The data for the metrological analysis of this study were obtained from the Web of Science

Core Collection (WOSCC). The search formula used in this study was set to "TS=(Depression OR "Major depressive disorder" OR "Mood disorder" OR "Affective symptom") AND TS=("AI" OR "artificial intelligence" OR "neural AI work" OR "machine learning" OR "deep learning"). The search period was limited to January 1, 2014 to December 31, 2023. Only "Article" and "Review" were selected as article types, and the language was limited to English. The bibliometric analysis and visualization of publications were conducted using VOSviewer, CiteSpace data analysis software

Results 1. A total of 5090 publications from 2014 to 2023 were included in the bibliometric analysis. The number of publications shows an increasing trend from year to year. Collaborative AI work analysis shows that the United States, China and England are the most influential countries in this field, with the highest number of publications and citations. (See Table1)

2. Distributions of countries/regions

Collaborative AI work analysis shows that the United States (1688), China(1259) and England(439) are the most influential countries in this field, with the highest number of publications and citations. (See Table2)

3. Distribution by institutions

The institution with the highest number of publications is Harvard Medical School (118), followed by the Chinese Acad Sci(108), Univ Toronto(90). The top ten institutions in terms of number of publications are from the United States with five, followed by China with two, and Canada and England with one. The most frequently cited institution is the Chinese Acad Sci(3714).(See table 3)

4. Distribution of authors

The author with the highest number of publications is Kim, Sungjun(32) (National Institutes of Health, USA), followed by Hu, Bin, Byeon, Haewon, Wang, Fei. (See table 4)

5. Distribution of journals and citation

The journal with the highest number of publications is journal of affective disorders (168)(citation 2337), followed by frontiers in psychiatry (132) (citation 1116), scientific reports (94)(1433), iee access (82)(1064).

Citing journals are mainly from molecular, biology, immunology, psychology, education, social, health, nursing, medical, biology, clinical, called research frontiers. The cited journals are mainly from mathematics, systems, mathematical, molecular, biology, immunology, psychology, education, health, medicine, medical, called the knowledge base(Figure 1)

6. Keyword analysis

The most frequently occurring keyword is machine learning(1328). followed by depression(869), deep learning(320), artificial intelligence(278), mental health(264), are frequent keywords. The keywords are clustered according to the research direction and roughly divided into 4 categories: mental health diagnosis and prediction, digital mental health and well-being, assessment, neuromorphic computing and artificial synaptic systems.

Keywords with the strongest burst intensity include prefrontal cortex(Strength=23.11), support vector machine(Strength=13.71), data mining (Strength=13.49), adolescents (Strength=13.32), random forest(Strength =12.31), big data(Strength=11.18), neural networks (Strength=11.07), default mode network (Strength=10.89), adults(Strength=10.38)

All keywords were divided into six clusters. The ranking of clusters is determined by the number of citations. Neurotech, Psychological Screening, Mental Health Intervention, Therapeutic Technology, Neurocomputing, Advanced Analytics, and Healthcare Optimization indicating that they have consistently been key topics in the field.

Conclusion Conclusion In summary, AI-related research in depression is in a rapid developmental stage, with United States and China holding core positions in this field. There is a need for strengthened international collaboration between research institutions and researchers from different countries. The research topics identified mainly revolve around five hotspots: mental health diagnosis and prediction, digital mental health and well-being, related to assessment, neuromorphic computing and artificial synaptic systems. This study revealed the trends and frontiers of artificial intelligence in depression research. This study will provide valuable references for scholars to find research focus

questions and partners

Aim To investigate the difference in cerebellar gray matter between bipolar depression (BD) and unipolar depression (UD), and to evaluate its efficacy in distinguishing between the two condition

Methods This study included 42 BD patients, 48 UD patients, and matched 83 HC patients. The Hamilton Depression Scale-17 (HRSD-17) was used to assess the severity of depressive symptoms and the Hamilton Anxiety Scale (HAMA) was applied to assess the anxiety state for all participants. Structural magnetic resonance imaging (sMRI) was obtained and the cerebellum was divided into 28 lobules and 7 functional networks using SUIT Anatomical Probability Atlas and SUIT Buckner-Yeo. The correlation between the cerebellum and clinical symptoms was compared based on voxel and ROI. The model was constructed by machine learning using cerebellar lobules with significant inter-group differences and the accuracy and specificity of the model were calculated, as well as the area under the receiver operating characteristic (ROC) curve (AUC). Furthermore, the SHAP (SHapley Additive exPlanations) package was employed to determine the significance of the variables within the model and to elucidate the individual decision-making process

Results Studies based on the whole cerebellum found that the total cerebellar gray matter volume in UD patients was significantly larger than BD. Voxel-based studies found that the volume of Vermis IX and Left VI in the BD group was significantly smaller than that in the MDD group. ROI-based comparisons showed a significant reduction in the volume of gray matter in the dorsal attention network and the default mode network in BD patients compared to HC. The gray matter volume of limbic network in MDD group was significantly

higher than that in BD group. The accuracy and sensitivity of the model constructed using cerebellar lobules with significant inter-group differences was 76.3% and 83.0%. The above results were statistically significant and were corrected by FDR ($P < 0.05$)

Conclusion The significant variances observed in cerebellar gray matter volume between first-episode BD and UD highlight its potential clinical utility as a distinguishing marker for these two states. This finding holds promise for advancing early clinical identification, facilitating precise diagnosis, and guiding effective treatment strategies

伴自杀风险抑郁患者的认知特征研究

李昊伦^{1,2} 王纯¹ 张燕² 李凌江²

1.南京医科大学附属脑科医院

2.中南大学湘雅二医院精神卫生研究所

目的 抑郁障碍患者常伴有认知功能的受损和异常。已有的研究和理论也发现,伴有自杀风险的个体也存在特定的认知加工模式和认知功能的累及,而伴有自杀风险的抑郁患者的认知加工模式和认知功能方面的研究仍然较少。本研究意在探索伴有自杀风险的抑郁患者的认知特点,尝试从认知功能损失和认知加工异常两个方面全面的探索自杀的认知病理机制,找到自杀风险的认知易感因素和认知标记物。

方法 根据 DSM-5 抑郁障碍的诊断标准,招募伴有自杀未遂的抑郁患者(自杀组),无自杀未遂的抑郁患者(抑郁组)和健康对照组。采用成套神经心理测验 MCCB (MATRICS Consensus Cognitive Battery) 对警觉性(vigilance)、持续注意(sustained attention)、工作记忆(working memory)、抑制控制(inhibitory control)等方面评估认知功能,采用自由视图范式的眼动追踪系统就情绪信息(积极、消极、中性、自杀主题)的认知加工和偏倚评估。采用方差分析比较组间差异。

结果 研究共招募被试自杀组 40 名,抑郁组 40 名,健康组 55 名。方差分析比较结果提示:伴有自

杀风险的抑郁患者在警觉性表现出显著的分数的降低,自杀组和抑郁组的工作记忆分数显著低于健康对照组,持续注意和抑制控制等方面三组间未见明显差异。认知加工方面,在自由视图任务重,与其他两组相比,自杀组患者在眼动实验中表现出对自杀主题信息的更多的注视点,同时对积极和中性信息有显著的注视减少。

结论 伴有自杀风险的抑郁患者的认知功能异常表现为警觉性降低、自杀认知偏倚、积极认知消退等特征。这些发现为帮助理解自杀行为发生的认知机制提供了依据,并为认知干预提供了潜在的靶点。

关键词: 自杀,抑郁症,认知功能,眼动,认知偏倚

氟哌啶醇注射液导致恶性综合征 1 例

孙丛丛 付冰冰* 徐一诺

首都医科大学附属北京安定医院

目的 探讨氟哌啶醇注射液导致恶性综合征(NMS)的发病机制及临床诊治。

方法 回顾性分析 1 例急性而短暂的精神病性障碍患者短期使用氟哌啶醇注射液后出现 NMS 的临床资料、诊治过程并复习相关文献。

结果 本例精神障碍患者,急性起病,表现为兴奋、语乱、行为冲动等,入院后给予氟哌啶醇注射液 5mg 肌肉注射,一日 2 次,奥沙西泮 15mg 口服一日 2 次,因患者进食进水差,给予输液支持治疗。入院后次日开始合并 MECT 治疗,在 5 月 25 日下午,即肌注氟哌啶醇注射液第 3 天,MECT 完成 2 次后,患者出现发热,体温 37.7°C,给予复查血常规:单核细胞数 $0.68 \times 10^9/L$,急化十项:AST 67.2U/L, LDH 318.6U/L, CK 2539U/L, HBDH 231U/L;尿常规:酮体 4+,蛋白质(+)。胸部 CT:未见异常。头部 MRI 未见异常。5 月 26 日,患者开始出现意识模糊、大汗、四肢肌张力高,查体:体温 38°C,心率 130-140 次/分,呼吸 28 次/分,最高血压 179/95mmHg,指脉血氧 98%,可引出压眶反射,颈部强直,四肢明显肌肉震颤,肌张力高。综上考虑患者出现恶性综合征。停用氟哌啶醇注射液,对症支持治疗,合并 MECT 治疗后病情好转。

结论 恶性综合征是一种抗精神病药物引起的

严重不良反应, 诊治关键在于早发现、及时对症治疗, 氟哌啶醇作为经典抗精神病药物, 在使用过程中需引起重视。

关键词: 恶性综合征; 抗精神病药物; 氟哌啶醇注射液;

双相情感障碍及抑郁症失匹配负波特征的对照研究

张遥迟 陈怡环 蔡敏 王化宁*

空军军医大学西京医院

目的 比较双相情感障碍和抑郁症患者的失匹配负波 (mismatch negativity, MMN) 特征, 探究 MMN 能否作为区分双相情感障碍和抑郁症的生物标记物。

方法 纳入 2022 年 2 月-2023 年 12 月于空军军医大学第一附属医院心身科病房就诊的双相情感障碍患者 30 例和抑郁症患者 36 例。纳入标准: ①年龄 ≥ 18 岁, ≤ 65 岁; ②符合《国际疾病分类》第 10 版 (ICD-10) 中双相情感障碍或抑郁障碍的诊断标准, 且所有患者当前处于抑郁发作期; ③小学以上文化程度。排除标准: 因躯体疾病导致精神障碍者或共病其它精神疾病者。采用汉密尔顿抑郁量表 (Hamilton Depression Scale, HAMD) 和汉密尔顿焦虑量表 (Hamilton Anxiety Scale, HAMA) 评估患者的抑郁焦虑症状, 同时所有患者均完成 MMN 检测。MMN 检测采用被动听觉 Oddball 模式, 即在一组标准刺激中随机插入强度不同于前者的偏差刺激。将两种刺激得到的事件相关电位波形相减即得到 MMN。电极放置位置参考国际 10/20 系统, 采集 Cz 和 Fz 处 MMN 潜伏期及波幅数据。最后使用 SPSS 26.0 比较两组间 MMN 潜伏期及波幅的差异, 以及各组中 MMN 与 HAMD、HAMA 评分之间的相关关系。

结果 ①双相情感障碍组 Fz 和 Cz 的 MMN 潜伏期与抑郁组相比显著延长 (Cz: $t=2.205$, $P=0.031$; Fz: $t=2.400$, $P=0.019$), 且双相情感障碍组 MMN 波幅显著高于抑郁组 (Cz: $P=0.021$; Fz: $P=0.025$)。②双相情感障碍组中 MMN 潜伏期与 HAMD 评分存在显著正相关关系 (Cz: $r=0.608$, $P=0.016$; Fz: $r=0.548$, $P=0.034$), 与 HAMA 评分不具有显著相

关性 ($P>0.05$); MMN 波幅与 HAMD、HAMA 评分不具有显著相关性 ($P>0.05$)。③抑郁症组中 Fz 和 Cz 的 MMN 潜伏期及波幅与量表评分之间均不具有显著相关性 ($P>0.05$)。

结论 双相情感障碍患者与抑郁组患者在 MMN 潜伏期及波幅特征上存在显著差异, 提示 MMN 可能作为区分双相情感障碍和抑郁症的生物标志物。

关键词: 双相情感障碍; 抑郁症; 失匹配负波; 疾病鉴别

Relationship between Urinary Cortisol Level and Cognitive Impairment in Patients with Major Depressive Disorder

Sijia Liu Zhiren Wang* Fude Yang

Beijing Huilongguan Hospital

Neuropsychological dysfunction and dysregulation of the hypothalamic-pituitary-adrenal (HPA) axis are common in patients with major depressive disorder (MDD), and as the end product of the HPA axis, cortisol is considered to play an important role in the pathophysiology of MDD. To explore the association between cortisol levels and cognitive function, we conducted an exploratory study. Neuropsychological measurements were performed on 39 patients with MDD and 25 healthy controls. Overnight 12-h urine samples were then collected to measure the average urinary cortisol level and assess the activity of the HPA axis. Finally, an exploratory analysis was performed on the relationship between urinary cortisol level in patients with MDD and depression severity and performance on neuropsychological measures. The results showed that patients with MDD generally suffer from cognitive impairment in information processing speed, attention/alertness, working memory, vocabulary learning, visual learning, reasoning, and problem-solving. Compared with healthy controls, the level of urinary cortisol in patients with MDD was higher, which was positively correlated with the severity of depressive symptoms and reasoning and

problem-solving, and had no correlation with the impairment of other cognitive functions. More studies are needed to confirm or undermine the hypothesis that cortisol plays a role in cognitive function in patients with MDD at many levels. Urinary cortisol level has good specificity and sensitivity to distinguish patients with MDD from healthy controls, and cortisol measurement may serve as an effective diagnostic tool for MDD in the future.

Resting-State Alpha Activity in The Frontal and Occipital Lobes and Assessment of Cognitive Impairment in Depression Patients

Xiaomeng Xie* Xiao Ji Yifan Wang Tian Han Yi Liu Juan Li

The National Clinical Research Center for Mental Disorders & Beijing Key Laboratory of Mental Disorders Beijing Anding Hospital & the Advanced Innovation Center for Human Brain Protection, Capital Medical University, School of Mental Health, Beijing, China

Objective Major depressive disorder (MDD) becomes one of the psychiatric disorders characteristic of a combination of cognitive, emotional, and somatic symptoms. Additionally, cognitive impairment has the most significant impact on functional results. However, the evaluation of cognitive level is still based on various subjective questionnaires as there is no objective standard assessment yet. This research focuses on resting-state alpha activity to identify cognition in MDD patients using electroencephalography (EEG) signals

Methods Ninety-two subjects were recruited; 44 patients with MDD, and 48 healthy individuals as controls. Functional outcome and cognition were assessed using the standardized instruments, and the EEG resting state signal of open and closed eyes was recorded. The comparison and correlation of cognitive levels with alpha power in the bilateral frontal region, bilateral central region, bilateral occipital region, and middle line

was evaluated

Results Compared with those of the control group ($P < 0.05$), the functional and neuropsychological outcome scores of the MDD group were obviously low. Through correlation analysis, it was shown that the bilateral frontal and occipital alpha power of MDD patients in the closed-eyes state was positively correlated with information processing rate, verbal learning, working memory, and attention retention ($P < 0.05$). The alpha power of the bilateral frontal region in the open-eyes state was positively correlated with information processing rate, working memory, and attention retention ($P < 0.05$)

Conclusion The research indicates that the changes in frontal and occipital alpha activities may be a promising neurophysiological indicator of cognitive level to diagnose and treat response prediction

住院严重精神障碍者自杀意念预测模型的构建与验证

王婷² 王林² 叶飞^{1,2}

1.五台山医院

2.江苏省扬州五台山医院

目的 了解住院严重精神障碍患者发生自杀意念的现状并分析其影响因素, 建立预测模型并绘制列线图, 以期为医务人员准确识别发生自杀意念的严重精神障碍患者和早期干预方向提供筛查工具。

方法 选取 2023 年 2 月~8 月严重精神障碍患者 491 例作为研究对象, 以住院期间自杀意念量表得分为判断标准, 将患者分为存在自杀意念组 ($n=255$), 无自杀意念组 ($n=236$)。使用简明精神病量表、汉密尔顿焦虑抑郁量表、Morisky 用药依从性量表、社会支持评定量表、自知力与治疗态度问卷来评估, 采用问卷调查结合病例资料, 收集数据资料。将 491 例患者按照 7: 3 比例随机分组, 其中 344 例作为建模组筛选出独立影响因素, 根据结果构建预测模型并用列线图进行可视化呈现。另外的 147 例作为验证组进行内部验证, 采用受试者工作特征曲

线下面积评估训练集和验证集模型的区分度、校准曲线评估训练集和验证集模型的校准度、Homser-Lemeshow 拟合优度检验评估模型的拟合情况、临床决策曲线评价模型的临床获益情况。

结果 建模组 344 例严重精神障碍者中自杀意念的发生率为 57.6%。Logistic 回归分析显示性别 ($\beta=0.608$, $OR=1.837$)、陪护关系 ($\beta=0.458$, $OR=1.581$)、焦虑 ($\beta=0.395$, $OR=1.039$) 为危险因素; 年龄 ($\beta=-0.021$, $OR=0.979$)、自知力 ($\beta=-0.375$, $OR=0.957$) 为保护因素, P 均 <0.05 。根据多元回归分析的结果构建预测模型, 结果显示受试者工作特征曲线下面积为 0.851, 表明区分度好; Hosmer-Lemeshow 检验值为 4.542 ($P=0.805 > 0.05$), 表明校准度好。当取最佳风险截断值时, 该模型的约登指数为 0.618, 对应的灵敏度为 89.5%, 特异度为 72.3%。临床决策曲线提示存在临床净收益。验证组中 147 例严重精神障碍患者中自杀意念的发生率为 38.8%。验证集受试者工作特征曲线下面积为 0.761, 表明模型区分度较好, Hosmer-Lemeshow 检验 $P=0.539 (> 0.05)$, 显示该模型校准度好; 校准图结果表明, 所构建的模型预测住院严重精神障碍患者自杀意念的概率与实际发生概率的一致性较好, 表明模型具有一定的推行能力。

结论 住院严重精神障碍者发生自杀意念预测模型: $\text{Logit}(P) = -1.756 + 0.608 \times \text{性别} + 0.224 \times \text{陪护关系(亲戚)} + 1.041 \times \text{陪护关系(其它)} + 0.395 \times \text{焦虑得分} - 0.021 \times \text{年龄} - 0.375 \times \text{自知力} + \text{治疗态度得分}$, 该模型经内部验证有较好的区分度和校准度, 具有一定的推行能力。

基于 fMRI 动态效应连接的双相情感障碍风险决策行为预测研究

季善玲¹ 刘传新¹ 刘传新² 郁昊¹

1. 济宁医学院 精神卫生学院

2. 济宁医学院附属医院

目的 双相情感障碍 (Bipolar Disorder, BD) 患者的冲动、自伤自杀和非理性消费等行为降低了其治疗效果。目前对 BD 患者风险行为的评估主要

依靠临床医生的个人经验和观察, 缺乏可靠的生物标志物。气球模拟风险任务 (The Balloon Analogue Risk Task, BART) 被广泛应用于患者和健康人群的风险决策行为的研究。本研究旨在基于 fMRI 构建 BD 风险决策行为的预测模型, 为临床预防和干预提供科学辅助手段。

方法 本研究纳入 48 例 BD 患者。基于 Resting-fMRI 建立基于体素的动态效应连接 (voxel-based dynamic effective connectivity, voxel-dEC), 使用 BART 实验任务的 Adjusted pumps 作为被试的风险决策衡量指标, 使用冲动量表 (Barratt Impulsiveness Scale-11, BIS) 评估冲动症状。使用基于连接组学的预测模型 (Connectome-based Predictive Modeling, CPM) 和留一法交叉验证 (Leave-one-out cross-validation, LOOCV) 建立基于 voxel-dEC 的 BD 风险决策行为预测模型。回归模型包括线性回归 (LR)、支持向量回归 (SVR) 和高斯过程回归 (GPR)。

结果 相比于 SVR、GPR, 基于 LR 的 CPM 模型取得最优预测结果 ($r=0.48$, $p=0.0006$, $\text{MAE}=0.39$, $\text{MAE}=10.38$)。具有高预测能力的脑区包括前扣带皮层、丘脑、左半球的枕上回、颞极的颞中回和右半球的角回。LR-CPM 模型能够预测 BD 非计划冲动性、注意力冲动性和冲动量表总分 (r 非计划冲动性 = -0.52 , $p=0.0001$; r 注意力冲动性 = -0.74 , $p=0.0001$; r 冲动量表总分 = -0.51 , $p=0.0001$)。

结论 本研究发现基于 Resting-voxel-dEC 的 LR-CPM 模型能够预测 BD 风险决策行为, 该预测模型可推广应用于预测 BD 冲动性得分。该结果提示风险决策和冲动性之间存在可能存在共享的大脑区域。本研究使用 CPM 框架构建 BD 患者从脑到行为预测模型, 说明 BD 的风险决策行为和冲动症状可能是由脑区异常 dEC 所驱动的。本研究为利用 Resting-voxel-dEC 预测精神病患者风险行为提供了重要的基础。

关键词: 动态效应连接; 双相情感障碍; 风险决策行为; 冲动行为

基于静息态 fMRI 脑熵的重性抑郁障碍识别研究

季善玲 周聪 李森 郁昊*

济宁医学院 精神卫生学院

目的 人脑是一个复杂的动态系统。脑熵 (Brain Entropy, BEN) 测量了大脑在一定时间内功能信号复杂度, 表征了其接收、整合和输出信息的能力。近年来, 基于 fMRI 的脑熵在不同疾病中得到了广泛的应用。重度抑郁障碍 (Major Depressive Disorder, MDD) 是一种高发病率、高复发率、高误诊率和高自杀率的情感性精神障碍, 但是却依旧缺乏客观生物标志物。本研究旨在通过静息态 fMRI (rs-fMRI) 的脑熵开展 MDD 识别研究, 探索时间序列复杂性与 MDD 的关系, 及探讨熵值在 MDD 病理中的意义。

方法 本研究纳入 85 例 MDD 和 76 例健康对照 (Healthy Control, HC)。收集所有被试的 rs-fMRI 脑成像数据、人口学、汉密尔顿抑郁量表 (HAMD) 等信息。将 rs-fMRI 预处理后, 提取 116 个脑区的时间序列信号, 计算每个脑区的样本熵 (Sample Entropy, SampEn) 和置换熵 (Permutation Entropy, PermEn)。使用 Fisher 线性判别作为特征选择方法, 使用支持向量机 (SVM) 作为分类器, 开展 MDD 和 HC 二分类模型训练。最后, 将最优模型的特征集进行组间差异检验和与 HAMD 得分的相关性分析。

结果 MDD 与 HC 在人口学上没有显著组间差异, 在 HAMD 存在显著差异 ($t=26.217, p<0.001$)。SVM 分类结果表明, PermEn (88%) 的分类准确率高于 SampEn (76%)。针对最优特征集进行双样本 T 检验, 结果显示, MDD 脑熵增高的脑区主要集中在右半球, 包括右侧眶部额中回 ($t=1.989, p=0.051$), 右侧岛盖部额下回 ($t=1.968, p=0.054$), 右侧海马旁回 ($t=3.072, p=0.003$) 和右侧缘上回 ($t=1.941, p=0.057$)。MDD 脑熵降低的脑区主要集中在左半球, 包括左侧顶上回 ($t=-2.197, p=0.031$), 左侧颞上回 ($t=-2.054, p=0.042$)。该 6 个差异脑区均与 HAMD 得分不存在显著相关性 (皮尔森相关 p 值 >0.05)。

结论 在 MDD 识别任务上, 基于 rs-fMRI 的置换熵的表现优于样本熵。MDD 右半球脑熵增加, 意味着其时间序列变化较大, 与其情感波动较大和异常情绪体验相对应; 左半球脑熵下降, 意味着时间序列变化较小, 与其认知功能下降相对应。脑熵与抑郁严重程度不存在显著相关关系则提示 MDD 脑熵的改变可能是特质性。本研究为 rs-fMRI 脑熵作为 MDD 生物标志物提供了科学参考依据。

关键词: fMRI; 大脑熵; 抑郁障碍; 识别模型;

置换熵

伏硫西汀在抑郁症及其药物治疗中的作用研究进展

卢冰清*

金华市第二医院

抑郁症的发作期内, 通常会发生一系列行为、情绪和认知功能的改变, 其中认知功能受损会严重影响患者的社会功能和远期预后[2]。抑郁症患者的认知功能与其职业、社会和日常生活功能之间呈现出显著的关联。近年来, 越来越多的研究者开始关注抑郁症患者认知功能的损害, 并努力寻找可以改善这些认知功能的抗抑郁药物。伏硫西汀 (Vortioxetine) 作为一种新型多模式抗抑郁药物备受研究关注, 它在改善认知功能方面具有显著效果, 而且这种改善很大程度上是独立于抑郁症状的改善[4]。王朔等[5]发现伏硫西汀用于治疗抑郁障碍, 治疗总有效率高达 84.48%, 在有效性及安全性方面不劣于艾司西酞普兰。另有学者指出, 伏硫西汀治疗重度抑郁障碍患者疗效与度洛西汀相当, 且在降低不良反应发生率方面更具优势。这表明伏硫西汀可能成为一种针对认知功能损害的特异性治疗选择。

结论 伏硫西汀广泛应用于抑郁症药物治疗, 显示出显著改善认知功能和抑郁症状的效果。抑郁症患者常伴有认知症状, 伏硫西汀通过多模式药理机制改善注意力、记忆力和信息加工速度等认知功能。伏硫西汀的联合应用也受到研究关注, 这些联合应用产生协同效应, 通过综合调节神经活动、情绪和认知, 进一步改善抑郁症状和认知功能。尽管伏硫西汀在抑郁症治疗中表现出显著效果, 但具体疗效还需进一步研究和临床实践验证。在实际应用中, 联合治疗应根据患者情况个体化制定和监督, 以实现更好的治疗效果。

关键词: 伏硫西汀; 抑郁症; 药物治疗

延续性护理模式在伴自杀意念青少年抑郁患者中的应用效果

秦倩倩 张沛云*

南通市第四人民医院

目的 分析延续性护理模式在伴自杀意念青少年抑郁患者中的应用效果。

方法 选取 2023 年 2 月至 2024 年 2 月于南通市第四人民医院出院的 80 例伴自杀意念的青少年抑郁患者作为研究对象。采用随机数字表法将这些患者分为对照组（40 例）和观察组（40 例），其中对照组接受常规护理，而观察组则在常规护理的基础上实施延续性护理模式，两组均干预 6 个月。评估工具包括斯奈思-汉密尔顿快感量表（snaith-hamilton pleasure scale, SHAPS）、17 项汉密尔顿抑郁量表（17-item hamilton rating scale for depression, HAMD-17）、14 项汉密尔顿焦虑量表（14-item hamilton anxiety scale, HAMA-14）、生活满意度量表（satisfaction with life scale, SWLS）、药依从性量表（morisky medication adherence scale-8, MMAS-8）、Beck 自杀意念量表（beck scale for suicide ideation - chinese version, BSI -CV）及功能大体评定量表（global assessment function, GAF）。通过这些评估工具比较了两组患者在接受干预前后的抑郁症状、焦虑症状、快感缺失症状、自杀意念、生活满意度、服药依从性以及个体功能的变化。

结果 在干预后，观察组 HAMD 评分为（15.12±7.53）分，明显低于对照组（19.87±6.63）分， $p<0.05$ ；观察组 HAMA 评分为（14.35±9.41）分，明显低于对照组（18.47±8.71）分， $p<0.05$ ；观察组 SHAPS 评分（2.92±3.49）分，明显低于对照组（4.50±3.37）分， $p<0.05$ ；观察组 BSI-CV 评分（7.45±4.68）分，明显低于对照组（12.80±7.08）分， $p<0.05$ ；观察组 SWLS 评分（20.95±7.72）分，明显高于对照组（17.25±6.92）分， $p<0.05$ ；观察组 MMAS-8 评分（6.32±1.42）分，明显高于对照组（5.23±1.82）分， $p<0.05$ ；观察组 GAF 评分（74.55±14.18）分，明显高于对照组（63.02±9.62）分， $p<0.05$ 。

结论 延续性护理模式能显著改善伴自杀意念的青少年抑郁患者的抑郁、焦虑和快感缺失症状，提高患者的生活满意度、个体功能及服药依从性，并在降低自杀意念方面发挥积极作用。

关键词：抑郁症；快感缺失；延续性护理；服药依从性；个体功能；生活满意度；自杀意念

心理弹性在抑郁症防治中的作用和意义

王舒颖^{1,2}

1.首都医科大学附属北京安定医院

2.首都医科大学

抑郁症（MDD）是一种严重的精神障碍，全球患病率约为 4.4%，中国的患病率为高达 6.8%。MDD 的主要症状包括情绪低落、兴趣减退和死亡念头等，严重影响患者的心理健康、社会功能和生活质量。MDD 的发病机制复杂，涉及遗传、环境、心理和生物因素。尽管临床医生针对这些易感性因素进行个体化诊疗，MDD 的发病率和复发率仍然居高不下，提示我们需从保护性因素如心理弹性进行研究。

心理弹性（Resilience，又译作心理韧性，心理复原力）是个体在面对逆境、创伤和压力时有效应对和恢复的能力，对 MDD 具有保护作用。自 20 世纪 90 年代积极心理学的兴起以来，心理弹性成为研究热点。心理弹性是一个动态过程，可以通过训练提高。研究表明，心理弹性高的人即使面临压力也不易患 MDD，他们通常有更积极的应对方式和更强大的社交网络。

COVID-19 疫情导致全球 MDD 患病率增加 28%，而心理弹性高的个体更能保持心理健康。WHO 呼吁提高心理弹性以减少精神疾病的患病率。在 MDD 患者中，心理弹性显著降低，与抑郁症状严重程度负相关。提高心理弹性有助于改善 MDD 症状并降低复发率。研究表明，心理弹性对于 MDD 的预防和治疗具有重要意义。

心理弹性在 MDD 的发生、发展和康复过程中发挥着重要的保护作用。较高的心理弹性有助于个体更好地调节负面情绪，进行积极的认知重构，从而维持积极情绪状态。心理弹性强的个体往往拥有更好的认知方式、情绪调节能力和社会支持网络，这些因素共同作用，帮助他们在压力下减少抑郁症状，提升生活质量。

总之，心理弹性是 MDD 防治的重要保护性因素。提高心理弹性有助于改善 MDD 症状、降低复发率，并促进患者的康复和生活质量提升。未来的研究和临床实践应重视心理弹性的培养和应用，以实现 MDD 的有效防治。

适应负荷指数对抑郁症患者海马体积及其静息态功能连接的影响研究

周玥^{1,2} 袁勇贵^{1,2}

1.东南大学

2.东南大学附属中大医院

目的 比较抑郁症患者与健康人群适应负荷 (allostatic load, AL) 指数的差异, 并基于结构磁共振成像和静息态功能磁共振成像, 探究抑郁症患者 AL 指数改变是否与海马及其亚区体积及其与特定区域之间的功能连接 (functional connectivity, FC) 异常有关。

方法 共纳入 86 例抑郁症患者和 43 例健康对照, 采用高风险四分位数法进行 AL 指数的计算, 以双侧海马及其亚区为种子点 (region of interest, ROI), 通过基于体素的形态学测量软件计算出 ROI 体积, 基于 rs-fMRI 评估 ROI 体素水平的全脑 FC, 比较组间差异, 并利用多元回归分析 MDD 患者海马及其亚区体积和 FC 与 AL 指数的相关性, 结合基线期及治疗 2 周后 17 项汉密尔顿抑郁量表评分, 探究海马及其亚区体积及其 FC 的异常是否介导了 AL 指数对患者抑郁严重程度及 2 周抗抑郁治疗效果的影响。

结果 组间比较结果显示, 抑郁症患者组的 AL 指数显著高于健康对照。结构磁共振分析结果显示, 与健康对照相比, 抑郁症患者组的左侧海马 CA1 亚区及 CA3 亚区体积减少 ($P < 0.05$, 未校正)。功能磁共振分析结果显示, 与健康对照相比, 与抑郁症患者整体海马 FC 增强的脑区主要有双侧中央前回和双侧中央后回, 海马亚区 FC 的异常集中在海马旁回区域; 抑郁症患者的 AL 指数与左侧海马至右侧颞中回的 FC 呈正相关, 在亚区层面, AL 指数与海马双侧 CA1 亚区、左侧 CA3 亚区至右侧颞中回的 FC 呈正相关, 与右侧海马沟至右侧枕中回 FC 呈正相关。

结论 抑郁症患者存在 AL 的过度累积, AL 指数的升高可能会导致海马及其亚区 FC 的变化。抑郁症患者部分海马区域的超连接可能参与了多系统亚临床问题对抑郁严重程度影响, 为理解 AL 指数

如何与 MDD 相关提供了神经影像学基础。

心理弹性的多维度评估与新兴技术展望

王舒颖^{1,2}

1.首都医科大学附属北京安定医院

2.首都医科大学

心理弹性是精神心理学研究中的关键概念, 指的是个体在面对逆境时的应对和恢复能力。然而, 尽管量表是当前测量心理弹性的主要方法, 它们存在一些固有的局限性, 如主观性、易受情绪状态和回忆偏倚的影响, 这可能会降低评估的准确性和可靠性。例如, Arjun 等人的研究发现, 在调整人口统计学和临床因素后, 传统心理弹性量表 CD-RISC10 的结果与抑郁症状不再相关, 这与理论和以往研究相矛盾。Ventus 等人的研究也质疑了单次回溯性自我评价的有效性, 指出它无法预测个体对压力的情绪反应。

为了更全面地评估心理弹性, 研究者提出了多维度量表, 如 Thakkar 等人提出的包含生物、心理、社会和建筑及自然环境四个维度的模型。在心理弹性中, 认知方式、情绪调节和应对策略与心理弹性紧密相关。高心理弹性的个体通常表现出积极的认知方式和较强的情绪稳定性, 能够有效抵抗抑郁症状。在社会层面上, 积极的社会支持可以促进心理弹性, 缓冲抑郁症的发展, 并降低发病风险。

尽管多维度量表提供了更全面的评估, 但它们的应用可能会使评估过程变得繁琐和耗时, 限制了在大规模人群研究中的应用。为了克服这些局限性, 需要发展一种既客观又高效的评估方法。近年来, 随着科技的进步, 一些新兴技术如生物反馈、行为监测、语音分析和大数据分析, 为开发新型心理弹性评估工具提供了数字表型。这些技术可以客观地反映个体的情绪状态和压力水平, 捕捉应对方式和社会互动模式, 并有望从大量多维度数据中提取有价值的心理弹性信息。

综上所述, 心理弹性是一个多维度的心理特质, 其评估需要综合考虑认知、情绪、应对策略和社会支持等多个关键维度。传统的量表评估方法存在局

限性，而新兴的科技手段为更准确、高效的心理弹性评估提供了新的方向。未来的研究应致力于整合这些技术，开发出能够在大规模人群中快速、准确评估心理弹性的工具，为心理健康研究和临床干预提供坚实的基础，并帮助提升人们的心理弹性和整体健康水平。

语音分析技术在心理弹性评估的应用前景

王舒颖^{1,2} 李楠茜¹ 丰雷¹

1.首都医科大学附属北京安定医院

2.首都医科大学

随着人工智能和机器学习技术的发展，语音分析作为一种新兴的评估工具，在精神医学的评估、诊断和治疗中显示出巨大潜力。与传统方法相比，语音分析具有数据量大、易于获取、非侵入性等优势，使得数据收集过程简便、高效，同时避免了对受试者的侵入性操作，减少了抵触情绪和不适感。

语音信号的声学特征和语义内容可以作为客观的数字表型，减少传统心理评估中的主观偏差。2020年的荟萃分析发现，特定语音特征如振幅微扰、频率微扰、谐波噪声比（HNR）的增加，以及基频变异性、声强均值及变异性、停顿占比、语速和梅尔频率倒谱系数（MFCC）的降低，与抑郁症状存在显著相关性。这表明语音特征在精神医学应用中具有重要价值。

心理弹性高的个体在语音中表现出积极的认知方式、情绪稳定性和应对策略，这些特征可以通过语音分析来反映。研究显示，语音的声学特征能够反映个体的情绪状态变化，为评估心理弹性提供了新途径。通过提取语音中的消极词汇、消极意图和绝对化描述，可以间接反映心理弹性水平。同时，语音中的关键信息，如解决问题的描述和社交互动的提及，也能体现个体的应对方式和社会支持。

语音分析技术的简便性、无创性和实时性使其在早期识别和干预心理健康问题方面具有应用潜力。未来，语音分析有望与个性化治疗方案相结合，根据语音特征的变化动态调整治疗策略，提高治疗效果。结合其他生物标记的多模态数据融合模型，将进一步增强精神健康评估的准确性和全面性。

技术的创新和跨学科合作将推动语音分析技术在精神健康评估和治疗中的应用，为精神医学领域提供更加科学、有效的工具，促进其持续发展。随着语音分析技术的不断进步，我们期待它在精神医学领域扮演越来越重要的角色，为心理健康的维护和促进做出贡献。

A Cross-sectional Study Exploring The Relationship between Symptoms of Anxiety/Depression and P50 Sensory Gating in Adult Patients Diagnosed with Chronic Fatigue Syndrome/myalgic Encephalomyelitis

liu xinyi*

Beijing Friendship Hospital, Capital Medical University, Beijing, China

Objective Chronic fatigue syndrome (CFS) is a clinical disease that affects multiple body systems. It is characterized by persistent or recurring fatigue, which may be linked to immune, neuroendocrine, and energy metabolism dysfunctions. Individuals with CFS may experience pain, sleep disorders, anxiety, and depression. This research analyzed the fundamental characteristics of anxiety/depression symptoms in patients with CFS and investigated the association between these symptoms and the P50 SG (sensory gate) ratio

Methods Two hundred and forty-nine subjects fulfilled the CDC-1994 criteria for CFS and were included in the study. The subjects successively completed the Symptom Checklist-90-Revised (SCL-90-R), Hamilton Anxiety Rating Scale-14 (HAMA-14), and Hamilton Depression Rating Scale-24 (HAMD-24). Auditory-evoked potential P50 were measured using the 128-lead-electroencephalograph

Results According to HAMA and HAMD, 17.3% (n = 43) of the patients did not exhibit anxiety/depression, with a threshold score of 7 and 7 for HAMA and

HAMD. When the threshold score was 14 and 20 respectively, 43.3% ($n = 108$) of the patients did not exhibit anxiety/depression. The SCL-90-R results indicated that 69.5% ($n = 173$) of these individuals with the score arranging from 0 to 160 did not present mental problems. There was a correlation between somatization scores and P50 SG ratio in the overall sample and no anxiety or depression (NAOD) group delimited by 14 and 20, respectively, ($p < 0.05$). Regression analysis showed that anxiety and depression were risk factors associated with an abnormal P50 SG ratio

Conclusion A significant correlation exists between the P50 SG ratio and clinical symptoms such as fatigue, anxiety, and depression. Abnormalities in brain function among patients with CFS may play a crucial role in the pathogenesis of the condition, leading to their classification as being prone to functional neurological disorders. The P50 SG ratio cannot be used as a diagnostic marker for CFS but show some significance on the mechanism, classification, treatment, and prognosis of CFS

关键词: chronic fatigue syndrome/myalgic encephalomyelitis, anxiety, depression, auditory evoked potential P50, functional neurological disorder

肌力减少性腹型肥胖对中老年人抑郁症状的影响研究

钱思凡¹ 黄天生² 温秋卿¹ 张玉霞³ 陈静¹ 冯晓宾¹

1.湖州市第三人民医院

2.苏州大学

3.吴江区疾病预防控制中心

目的 探讨肌力减少性腹型肥胖与中老年抑郁症状的关联。

方法 基于中国健康与养老追踪调查数据库 (CHARLS) 2015 年和 2018 年的截面数据, 共纳入符合研究要求的 9322 名 45 岁及以上的中老年人。参与对象根据其握力水平 (男性 < 28 千克, 女性 < 18 千克) 和腰围 (男性 ≥ 85 厘米, 女性 ≥ 80 厘米) 被分为四组: 非肌力减少/非腹型肥胖组 (ND/NAO)、非

肌力减少/腹型肥胖组 (ND/AO)、肌力减少/非腹型肥胖组 (D/NAO) 和肌力减少/腹型肥胖组 (D/AO)。采用简版流调中心抑郁量表 (the Center for Epidemiological Studies Depression Scale, CES-D10) 评估调查对象的抑郁症状, 将 CES-D10 评分 ≥ 12 评定为具有抑郁症状。采用 logistic 回归模型探讨肌力减少性腹型肥胖与抑郁症状的关联。

结果 经过约 3 年随访, 1810 例 (19.4%) 发生抑郁症状。多因素 logistic 回归模型结果表明, 相较于非肌力减少/非腹型肥胖组 (ND/NAO), 肌力减少性腹型肥胖组的研究对象发生抑郁症状的风险显著升高 (OR 1.61; 95% CI 1.31-1.98)。亚组分析结果显示, 不同年龄组与肌力减少性腹型肥胖对抑郁症状的影响有交互作用 (P -交互 = 0.04), 相较于年龄 ≥ 60 岁的研究对象, 肌力减少性腹型肥胖与抑郁症状的关联在 < 60 岁的人群中更明显 (年龄 < 60 岁: OR 2.27; 95% CI 1.60-3.22; ≥ 60 岁: OR 1.36; 95% CI 1.05-1.77)。此外, 肌力减少性肥胖 (根据体质质量指数定义) 与抑郁症状的关联尚未达到统计学显著性水平 ($P > 0.05$)。

结论 肌力减少性腹型肥胖可显著提升我国中老年人抑郁症状发生风险, 尤其是在年龄 < 60 岁的人群中。提示在社区筛查中, 肌力减少性腹型肥胖可能是识别抑郁高风险人群的实用指标。建议加强对中老年人的营养及运动干预, 从而改善肌力水平与体成分, 进而减少肌力减少性腹型肥胖相关的不良影响。

基于高阶脑熵的重性抑郁障碍脑龄估计研究

季善玲 李森 周聪 郁昊*

济宁医学院 精神卫生学院

目的 脑龄是脑疾病的潜在生物标志物。脑熵值作为评价大脑复杂性和规律性的指标, 提供了一个认识大脑和大脑疾病的新途径。但是目前脑熵大多为静态脑熵, 少有研究关注动态脑熵的潜在应用价值。本研究旨在构建动态脑熵并探究其在健康和重性抑郁障碍 (MDD) 脑龄预测任务上的性能。

方法 本研究通过粗粒化原理和时间序列窗口

划分的原则, 构建了传统静态脑熵 (即一阶脑熵), 高阶脑熵 (二, 三, 四阶), 以及融合特征 (拼接), 并将 sMRI 数据经过 Freesurfer 软件预处理得到皮层表面积、厚度等。基于健康对照数据进行脑龄估计模型训练。预测器包括支持向量回归 (SVR)、线性回归 (LR) 高斯过程回归 (GPR)。本研究使用留一法交叉验证方法。获得最优模型后, 将其应用于发作期和缓解期 MDD 脑龄估计。

结果 在健康对照组中, 基于 SVR 和融合特征的脑龄预测模型取得最优结果, 优于 sMRI 特征和静态脑熵。将最优模型将其应用于整体 MDD、发作期 MDD 和缓解期 MDD, 也得到了类似的结果。

结论 高阶脑熵提高了脑龄估计模型的预测性能。在表征脑衰老特征上, 高阶脑熵可能比传统静态脑熵和结构特征更敏感, 更具有特异性。因此, 深入开展针对脑熵构建方法的研究是提高脑龄估计模型预测性能的重要途径。

关键词: 高阶脑熵; 动态性; 抑郁障碍; 脑龄; 预测模型

规范化培训住院医师抑郁症状及影响因素分析

张磊 吴皓*

浙大医学院附属邵逸夫医院

目的 了解规范化培训住院医师存在的抑郁症状, 分析其影响因素, 探讨改善抑郁症状的措施

方法 选择在浙江大学医学院附属邵逸夫医院参加规范化培训的住院医师为研究对象, 采用问卷调查的形式了解规培医生存在的抑郁症状。调查问卷包括规培医生的基本信息和贝克抑郁自评量表。本研究以贝克抑郁自评量表得分 ≥ 14 分为抑郁症状检出阳性。

结果 本次调查共发放问卷 300 份, 回收有效问卷 240 份, 有效问卷回收率 80%。结果显示贝克抑郁自评量表总分 ≥ 14 分者共 64 人, 规培医生抑郁症状检出率为 26.7%, 提示这部分规培医生可能存在显著的抑郁症状。将规培医生的基本情况变量作为自变量, 规培医生的抑郁症状结果作为应变量, 进行 logistic 回归分析, 结果显示: 规培年级、周工作时间、工作压力、对心理健康知识的了解程度是

造成规培医生抑郁症状的主要因素。二年级规培医生与一年级规培医生更容易出现抑郁症状, 周工作时长、工作压力大、对心理健康知识缺乏了解的规培医生更容易出现抑郁症状。

结论 规培医生存在的抑郁症状较突出, 规培医生对心理健康知识 (如积极心理调节、识别负面情绪等) 的了解程度并不高, 缓解规培医生工作压力、进行心理干预等措施, 将有助于改善规培医生的抑郁症状。

体重调整腰围指数对中老年人抑郁症状的影响研究

钱思凡¹ 黄天生² 邱勤明¹ 陈静¹

1. 湖州市第三人民医院

2. 苏州大学

目的 肥胖和抑郁之间的关联尚不明确, 这通常归因于“肥胖悖论”。体重调整腰围指数 (Weight-adjusted-waist index, WWI) 是一种新型的肥胖测量方法, 探讨基线 WWI 及累积 WWI 与中老年抑郁症状的关联。

方法 本研究采用中国健康与养老追踪调查数据库 (CHARLS) 2011 年—2018 年的截面数据, 共纳入符合研究要求的 7220 名 45 岁及以上的中老年人。基线 WWI 的计算方法是用腰围除以体重的平方根 ($\text{cm}/\sqrt{\text{kg}}$)。累积 WWI 以以下两种方式表达:

(1) 累积平均 WWI: 2011、2013 和 2015 年 WWI 水平的均值; (2) WWI 的累积升高次数: 依据 WWI 在 3 次连续测量中 (2011 年、2013 年和 2015 年) 的累积升高次数 (高于上四分位数) 将研究对象分为累积升高 0 次组、累积升高 1 次组、累积升高 2 次组和累积升高 3 次组。采用简版流调中心抑郁量表 (the Center for Epidemiological Studies Depression Scale, CES-D10) 评估调查对象的抑郁症状, 将 CES-D10 评分 ≥ 10 评定为具有抑郁症状。采用 logistic 回归模型探讨基线 WWI 及累积 WWI 与抑郁症状的关联。

结果 经过约 7 年随访, 2074 例 (28.7%) 发生抑郁症状。研究对象发生抑郁的风险随着基线

WWI 水平的升高而增加。调整年龄、性别、教育水平和既往疾病史（高血压、糖尿病等）等混杂因素后，相较于最低基线 WWI 四分位组 ($<10.56 \text{ cm}/\sqrt{\text{kg}}$)，最高基线 WWI 四分位组 ($\geq 11.62 \text{ cm}/\sqrt{\text{kg}}$) 的研究对象发生抑郁症状的风险显著升高 (OR 1.28; 95% CI 1.08-1.51)。多因素调整模型显示，最高累积平均 WWI 四分位组的调查对象发生抑郁的风险是最低四分位组的 1.51 (95% CI 1.06-2.16) 倍；相较于 WWI 在 3 次连续测量中均未升高的调查对象，在 WWI 升高 1 次 (OR 1.38; 95% CI 1.03-1.86)、升高 2 次 (OR 1.49; 95% CI 1.04-2.15) 及升高 3 次 (OR 1.57; 95% CI 1.05-2.34) 的抑郁症状发生风险更高。

结论 高基线和累积 WWI 水平可显著增加我国中老年人抑郁症状发生风险。体重调整腰围指数可能有助于识别抑郁症风险较高的人群，长期保持适当的体重调整腰围指数水平可能有助于预防抑郁症的发生。

关键词： 体重调整腰围指数，肥胖，抑郁症状，中年人，老年人

青少年抑郁障碍患者非自杀性自伤行为的影响因素研究

李隽逸 张兰 董强利*
兰州大学第二医院

目的 调查青少年抑郁障碍患者非自杀性自伤 (NSSI) 行为的情况，分析相关影响因素，为 NSSI 的防治提供理论基础及参考。

方法 选取 95 例青少年抑郁障碍患者，根据 DSM-5 关于 NSSI 的诊断标准，将患者分为伴有 NSSI 行为组 (NSSI 组) 和不伴有 NSSI 行为组 (nNSSI 组)。采用青少年非自杀性自伤行为问卷 (ANSAQ)、抑郁自评量表 (SDS)、焦虑自评量表 (SAS)、简易应对方式问卷 (SCSQ)、亲密关系体验-关系结构量表 (ECR-RS)、青少年生活事件量表 (ASLEC) 对患者进行评估，比较 NSSI 组与 nNSSI 组两组的组间差异，并使用二元 Logistic 回归分析探究 NSSI 行为的影响因素。

结果 95 例青少年抑郁障碍患者中有 59 例存在 NSSI，检出率为 62.11%。NSSI 组在抑郁自评量表、焦虑自评量表、SCSQ 消极应对、对父亲的依恋

焦虑、对母亲的依恋焦虑及依恋回避、ASLEC 总分、受惩罚、人际压力、学习压力、适应方面的评分均高于 nNSSI 组 ($P < 0.05$)。二元 Logistic 回归分析提示，消极应对、对母亲的依恋回避、受惩罚是青少年抑郁障碍患者 NSSI 行为发生的危险因素 ($P < 0.05$)。

结论 本研究提示青少年抑郁障碍患者 NSSI 发生率较高，对母亲的依恋回避、受惩罚、消极应对是青少年抑郁障碍患者发生 NSSI 行为的危险因素。临床中除了改善患者的抑郁、焦虑情绪外，还需注意关注患者的应对方式、亲子关系及负性生活事件，以减少 NSSI 行为的发生。

关键词： 青少年，抑郁障碍，非自杀性自伤，影响因素

Autonomic Nerve Dysfunction Mediates The Association between Objective Short Sleep Duration and Elevated Blood Pressure in Patients with Major Depressive Disorder

Baixin Chen Yun Li*

Shantou University Mental Health Center

Objective Major depressive disorder (MDD) was associated with short sleep duration, autonomic nerve dysfunction and increased blood pressure. However, their relationship remained unclear. We hypothesized that objective short sleep duration is associated with heightened blood pressure in patients with MDD, and this association might be mediated by impaired autonomic nerve system function. This study was aimed to explore the association between sleep duration, autonomic nerve activity and blood pressure in MDD patients

Methods We studied 66 consecutive MDD patients and age and sex matched 66 controls. Objective sleep was assessed by an overnight polysomnography. Subjective sleep was retracted from the Question 2 in Pittsburgh Sleep Quality Index. Heart rate variability (HRV) was used for assessing autonomic nerve function. The averaged evening and morning measured systolic (SBP) and diastolic blood pressure (DBP) were used for analyses

Results In patients with MDD, each 1-hour reduction in objective sleep duration was associated with 2.56-mmHg increase in SBP ($\beta=0.028$, $p=0.011$) and 1.59-mmHg increase in DBP ($\beta=0.024$, $p=0.043$). Furthermore, the increase in non-rapid eye movement sleep (NREM)-heart rate (HR), NREM-low frequency normalized unit (LFnu) and rapid eye movement sleep (REM)-HR, and decrease in NREM-standard deviation of NN intervals (SDNN), NREM-root mean square of successive differences (RMSSD) and NREM-LFnu was associated with lower objective sleep duration (all $p\leq 0.043$) and increase in SBP and DBP (all $p\leq 0.037$). Mediation effect models suggested that the HRV mediated the association between objective sleep duration and BP in patients with MDD with 17~79% mediating effect. However, no association was observed between subjective sleep duration and SBP/DBP in MDD patients or between objective/subjective sleep duration and SBP/DBP in controls

Conclusion Objective, but not subjective short sleep duration, was associated with increased blood pressure in patients with MDD. This association was mediated by autonomic nerve dysfunction

关键词: Major depressive disorder, autonomic nerve dysfunction, sleep duration, blood pressure, mediating effect

针刺肝俞、脾俞、肾俞治疗气郁化火型郁证的临床疗效观察

汪帅*

宁夏回族自治区宁安医院

目的 抑郁发作是精神科最常见的病种,以情绪低落、兴趣减退、快感缺失为主要症状的疾病,占到精神科疾病的17%左右,也是较为难治的一种精神疾病,因大多数伴随焦虑症状:表现紧张害怕、坐立不安、预期担心;伴随躯体症状:胃肠不适、便秘、全身麻木疼痛感等;伴随心理症状:负性自动化思维、思维迟缓、注意力难集中等,缠绵难愈。单纯药物治疗不能满足临床治疗需求,用多维度的治疗,来改善临床症状,势在必行。精神科诊断抑郁发作,

符合中医诊断郁证,气郁化火型,两组患者全部口服5-羟色胺再摄取抑制剂,其中56例患者合并针刺肝俞、脾俞、肾俞,进行研究与对照组临床治疗效果的比较。

方法 将来自心身医学科住院患者中,筛选出符合入组要求的96例患者分成两组,研究组56例,口服5-羟色胺再摄取抑制剂合并针刺肝俞、脾俞、肾俞等穴位,针刺治疗每天一次,每五次为一个疗程;对照组40例,口服5-羟色胺再摄取抑制剂,两组患者在治疗前、治疗后第一、第二和第三疗程,对HAMD、HAMA总分变化进行观察。

结果 三个疗程后HAMD总分平均值研究组11.5263,对照组14.9444;HAMA总分平均值研究组8.2105,对照组10.8333

结论 研究组与对照组HAMD、HAMA总分平均值有差别,研究组小于对照组,治疗有较好效果。

关键词: 郁证 气郁化火 针刺 肝俞 脾俞 肾俞

喹硫平增效治疗伴自伤行为青少年抑郁发作患者临床对照研究

王源莉*

郑州大学第一附属医院

目的 探讨喹硫平增效治疗伴自伤行为青少年抑郁发作患者的临床疗效。

方法 选取2020年1月至2021年12月在郑州大学第一附属医院精神科门诊及病房连续就诊的伴自伤行为青少年抑郁发患者作为研究对象,共入组108例患者。依据《精神疾病诊断与统计手册》(DSM-5)抑郁发作的诊断标准,将患者随机分为2组,对照组为单一服用舍曲林,研究组为喹硫平联合舍曲林,疗程共6周。以汉密尔顿抑郁量表24项版(HAMD-24)、汉密尔顿焦虑量表(HAMA)、症状自评量表(SCL-90)分别于基线、2周末、4周末、6周末评定其临床疗效。

结果 组间比较,2组治疗2周末HAMD-24、HAMA评分差异具有统计学意义($p<0.05$),SCL-90评分无显著差异($p>0.05$)。治疗4周末、6周末HAMD-24、HAMA、SCL-90评分出现差异具有统计学意义($p<0.01$)。组内比较,HAMD-24、HAMA、

SCL-90 评分于 2 周末、4 周末、6 周末均有统计学意义 ($P < 0.01$)。2 组患者治疗有效率相比差异具有统计学意义 ($p < 0.05$)。2 组患者不良反应总发生率无显著差异 ($p > 0.05$)。

结论 结论 喹硫平增效治疗伴自伤青少年抑郁发作患者与单服舍曲林治疗相比, 临床疗效更好。

关键词: 喹硫平, 舍曲林, 自伤行为, 青少年抑郁发作, 临床对照研究

伴忧郁特征抑郁症患者钝化的社会奖赏加工: 事件相关电位研究

张乔阳² 张乔阳¹ 鲍慈青¹ 阎锐¹ 花玲玲¹ 熊婷婷¹ 邹浩文¹ 何晨¹ 孙浩¹ 卢青^{3,4} 姚志剑¹

1. 南京医科大学附属脑科医院精神科
2. 南京医科大学附属常州第二人民医院心理科
3. 东南大学生物科学与医学工程学院
4. 儿童发展与学习科学教育部重点实验室

目的 既往研究发现, 相较于金钱奖赏, 抑郁症更主要与异常的社会奖赏加工有关。其中, 以快感缺失为核心表现的伴忧郁特征亚型更可能表现出受损的奖赏加工。因此, 本研究目的是比较伴/不伴忧郁特征抑郁症的社会奖赏加工差异, 并分析与快感缺失症状的关联。

方法 招募 40 例伴忧郁特征抑郁症患者、40 例不伴忧郁特征抑郁症患者及 50 例健康对照组。采用 M.I.N.I 忧郁特征模块对是否伴有忧郁特征进行诊断区分, 并采用时间性快感体验量表 (TEPS) 评估了动机性快感缺失和消费性快感缺失得分。所有被试在脑电图记录下完成社会激励延迟 (SID) 任务, 并对该任务中的事件相关电位 (ERPs) 进行了分析。主要测量指标包括奖赏预期阶段的 N2 波 (cue-N2), 奖赏反馈阶段的奖赏相关负波 (FRN) 及 P3 波 (fb-P3)。采用重复测量方差分析比较三组间 ERPs 的差异, 采用偏相关分析进行 FRN 波与消费性快感缺失得分之间的关联分析。

结果 伴忧郁特征抑郁症患者 cue-N2、FRN 平均振幅均降低, 提示该亚型患者同时存在社会奖赏预期和反馈的钝化。值得注意的是, FRN 波的重复测量方差分析结果显示组别 (伴忧郁特征、不伴忧郁特征、健康对照) \times 条件 (正性、中性) 的交互

作用显著 ($F(2, 127) = 4.15, p = 0.018, \eta^2 p = 0.061$), 提示伴忧郁特征抑郁症患者对正性和中性反馈具有相似的神经反应 (钝化), 而不伴忧郁特征抑郁症患者 ($t(39) = 3.09, p = 0.004$) 和健康对照 ($t(49) = 5.25, p < 0.001$) 对正性反馈的反应比中性反馈更敏感。此外, 还发现 FRN 波振幅与消费性快感缺乏得分相关。

结论 研究表明, 伴忧郁特征抑郁症患者对社会奖赏预期和反馈都表现出钝化的神经反应。这表明, 异常的社会奖赏加工可能成为伴忧郁特征亚型的潜在生物标志物, 且有助于阐释抑郁症的异质性。

Tartary Buckwheat Flavonoids Affects Chronic Unpredictable Mild Stress-induced Depression in Rats Via The Gut Microbiota-inflammation-brain Axis

Junxiang Cheng^{1,2}, Xiaole Li², Ruifang Zhu¹, Hong Han¹, Na Liu¹, Qia Liu², Dandan Guo², Zhifen Liu^{1,2}

1. The first hospital Shanxi medical university
2. Shanxi Medical University

Objective Considerable evidence links gut microbiota dysbiosis to the pathogenesis of a spectrum of mental health disorders, including depression. This study aimed to delineate the therapeutic potential and mechanistic underpinnings of tartary buckwheat flavonoids (TBF) for the treatment of depression induced by chronic unpredictable mild stress (CUMS) in rats

Methods Thirty rats were randomly assigned to one control and four experimental groups. The four groups were subjected to CUMS, with three groups receiving different doses of TBF treatment. Behavioral assessments were conducted, including an open field test, sucrose preference test, and forced swim test (FST). Inflammatory biomarkers within the prefrontal cortex (PFC) and systemic circulation were quantified using enzyme-linked immunosorbent assay (ELISA). Additionally, stimulation was analyzed using metagenomic sequencing

Results Compared to the control group, rats in the CUMS group demonstrated a marked decrease in sucrose consumption, total distance traveled, center distance within the open field, and duration spent in the central zone. Conversely, there was an increase in immobility time during the FST. Treatment with TBF reversed these behavioral changes. Moreover, TBF administration significantly mitigated the elevated levels of inflammatory markers, including TNF- α , IL-6, IL-1 β , and CRP, in the PFC and plasma of the CUMS rats. Additionally, CUMS induced significant variations in the gut microbiota composition at the genus and phylum levels, which were partially reversed by TBF treatment

Conclusion TBF relieved depression-like behavior in rats, concomitantly altering fecal microbiome composition. Our results offer novel perspectives on the therapeutic application of TBF in the management of depressive disorders

关键词: Keywords: chronic unpredictable mild stress, tartary buckwheat flavonoids, metagenomic sequencing

氟西汀总活性成分在抑郁患者中的群体药代动力学研究

钟彩妮*

深圳市康宁医院

目的 建立抑郁患者氟西汀 (FLX) 总活性成分 (TAM) 的群体药代动力学 (PPK) 模型并研究其影响因素, 为个体化用药提供参考。

方法 回顾性收集 2020~2023 年深圳市康宁医院 154 例服用 FLX 治疗住院患者的用药情况、FLX 和去甲氟西汀 (NFLX) 血药浓度、肝肾功能水平、血脂水平及细胞色素 P450 2D6 酶 (CYP2D6) 基因型等临床资料, 计算 FLX 和 NFLX 浓度之和为血浆 TAM 浓度, 采用非线性混合效应模型法 (NONMEM) 建立 TAM 浓度 PPK 模型, 采用拟合优度图 (GOF)、正态化预测分布误差法 (NPDE) 和自举法 (Bootstrap) 对模型的稳定性和预测性能进行评估。基于最终模型的显著协变量, 模拟不同人群不同剂量 TAM 浓度的变化情况, 拟合达稳态时间并推荐给药剂量的。

结果 154 例住院患者 570 个血药浓度数据包括 FLX (n=285) 和 NFLX (n=285) 建立了 TAM 的一阶吸收和消除的一房室模型, 体重 (WT) 是影响表观清除率 (CL/F) 的显著协变量, 最终模型参数 CL/F、表观分布容积 (V/F) 和吸收速率常数 (Ka) 的群体典型值分别为 2.91 L·h⁻¹、734 L 和 0.3 h⁻¹, 模型表示为: $CL/F(L \cdot h^{-1}) = 2.91 \times (WT/55)^{0.531}$, $V/F(L) = 734$, $Ka(h^{-1}) = 0.3$ (固定值)。蒙特卡洛模拟结果显示, 规律服药的患者 TAM 浓度达稳态需 6~11 周, 达稳时间随剂量增大或体重减小而延长, 体重为 10~40、40~70、70~100 kg 和 100~120 kg 患者的最佳给药剂量分别为 20、30、40 和 50 mg, 体重为 10~20、20~30、30~40 kg 和大于 40 kg 患者的最大给药剂量分别为 30、40、50 和 60 mg。

结论 成功建立了服用 FLX 治疗的抑郁患者 TAM 浓度的 PPK 模型, 最终模型稳定且预测性能良好, 低体重人群应选择较低剂量的 FLX, 避免药物蓄积产生不良反应。

联合使用丁螺环酮对重度抑郁发作患者自杀意念的影响

李思云² 杨波¹ 邹小艳²

1. 粤北第三人民医院

2. 无

目的 通过对粤北某大型精神病专科医院重度抑郁患者联合使用丁螺环酮的调查, 观察联合使用丁螺环酮对重度抑郁症患者自杀观念的影响; 验证 5-羟色胺能效应对自杀观念产生与消除的理论基础, 为抗自杀治疗提供临床依据。

方法 回顾性调查合并自杀观念的重度抑郁发作患者联合使用丁螺环酮情况; 配对平衡联合丁螺环酮治疗与无抗自杀措施两组样本的社会人口学条件, 分别比较基线及 12 周末两组 HAMA 总分、BSI-CV 自杀意念分量表评分; 分别进行基线与 12 周末丁螺环酮剂量、HAMA 总分与 BSI-CV 自杀意念分量表评分之间的相关分析。

结果 调查时段内共有 16 例患者联合使用丁螺环酮 (16/145, 11.03%), 入院时 HAMA 总分

(27.69±8.81), 入院时 BSI-CV 总分 (5.29±2.15)。联合丁螺环酮治疗组与无抗自杀措施组在主要社会人口学资料及基线 HAMA 总分、BSI-CV 自杀意念分量表评分间配比平衡 (P 均≥0.05); 12 周末联合丁螺环酮治疗组 HAMA 总分 (7.39±3.31), BSI-CV 自杀意念分量表评分 (0.91±1.53) 显著低于无抗自杀措施组。

结论 丁螺环酮可能通过降低焦虑水平缓解自杀观念相关 (分析表明, 丁螺环酮与自杀意念之间并无直接的关联, 与焦虑水平之间也无统计学意义上的关联。然而, 基线焦虑水平却与自杀意念存在强度上的数学关联, 焦虑水平越高, 自杀意念越强。丁螺环酮通过 5-HT、DA 能效应直接降低焦虑水平, 焦虑水平的下降有助于自杀意念的缓解与消除, 焦虑是丁螺环酮与自杀意念之间的中介变量。因此, 丁螺环酮的使用, 通过降低焦虑水平缓解自杀意念); 抗焦虑治疗缓解自杀的机理需进一步探索; 临床上在自杀患者群体常规联合应用抗焦虑治疗; 将抗焦虑治疗作为抗自杀治疗的观察指标。

关键词: 重度抑郁发作; 自杀意念; 丁螺环酮; 5-羟色胺; 自杀治疗。

Objective The comorbidity between diabetes mellitus and depression was revealed, and diabetes mellitus increased the prevalence of depressive disorder, which ranked 13th in the leading causes of disability-adjusted life-years. Insulin resistance, which is common in diabetes mellitus, has increased the risk of depressive symptoms in both humans and animals. However, the mechanisms behind the comorbidity are multi-factorial and complicated. There is still no causal chain to explain the comorbidity exactly. Moreover, Selective serotonin reuptake inhibitors, insulin and metformin, which are recommended for treating diabetes mellitus-induced depression, were found to be a risk factor in some complications of diabetes. Given these problems, many researchers made remarkable efforts to analyze diabetes complicating depression from different aspects, including insulin resistance, stress and Hypothalamic-Pituitary-Adrenal axis, neurological system, oxidative stress, and inflammation. Drug therapy, such as Hydrogen Sulfide, Cannabidiol, Ascorbic Acid and Hesperidin, are conducive to alleviating diabetes mellitus and depression. Here, we reviewed the exact pathophysiology underlying the comorbidity between depressive disorder and diabetes mellitus and drug therapy

Methods The review refers to the available literature in PubMed and Web of Science, searching critical terms related to diabetes mellitus, depression and drug therapy

Results In this review, we found that brain structure and function, neurogenesis, brain-derived neurotrophic factor and glucose and lipid metabolism were involved in the pathophysiology of the comorbidity.

Obesity might lead to diabetes mellitus and depression through reduced adiponectin and increased leptin and resistin. In addition, drug therapy displayed in this review could expand the region of potential therapy

Conclusion The review summarizes the mechanisms underlying the comorbidity. It also overviews drug therapy with anti-diabetic and anti-depressant effects

Efficacy of Fluoxetine Combined with Cognitive Behavior Therapy in Treating Non-Suicidal Self-Injury in Adolescents: A Systematic Review

Shengjiao Zhao Yunrong Lu*

Department of Psychiatry, The Fourth Affiliated Hospital of School of Medicine

Objective Depression is a long-term mood condition that produces sorrow, loss of pleasure and interest, frequently with cognitive impairment. The incidence and lifetime prevalence of depression in children and adolescents are rising across all patient categories. According to statistics, 20% of teens experience significant depression. This study conducted a comprehensive review to analyse the impact of combining fluoxetine with cognitive behaviour therapy in the treatment of non-suicidal self-injury in adolescents

Methods The Cochrane Library, PubMed, Embase and Web of Science were searched for controlled trials of fluoxetine and cognitive behaviour therapy for depressed adolescents. Screening and extracting material for systematic review occurred between database inception and May, 2023

Results Seven trials included 893 participants. The systematic review found that the intervention group had a significantly higher rate of remission (OR: 1.11; 95% CI: 1.03, 1.20; $p < 0.01$) than the untreated group. The two groups of patients had similar rates of recurrence, self-injury adverse events and overall adverse

events (OR: 0.96; 95% CI: 0.57, 1.61; $p = 0.868$)

Conclusion This study demonstrated the stability and reliability of fluoxetine and cognitive behaviour therapy for depressed teenagers. The findings showed that fluoxetine and cognitive behaviour therapy may help depressed teenagers remit

中老年抑郁症患者自我表露与社会疏离感和心理社会适应的相关性 及其影响因素分析

向玉仙*

山西医科大学第一医院

目的 分析中老年抑郁症患者自我表露与社会疏离感和心理社会适应的相关性及其影响因素。

方法 收集 2023 年 8 月至 2024 年 3 月于山西省某三甲综合医院住院治疗的 236 例中老年抑郁症患者作为研究对象,采用痛苦表露指数量表(DDI)、一般疏离感量表(GAS)和疾病心理社会适应自评量表(PAIS-SR)评估自我表露、社会疏离感和心理社会适应水平。采用 Pearson 相关性分析 DDI 总分与 GAS 总分、PAIS-SR 总分相关性,并分析影响中老年抑郁症患者自我表露水平的影响因素。

结果 本调查共发放问卷 247 份,收回有效问卷 236 份,有效回收率为 95.54%。中老年抑郁症患者 DDI 总分为(28.58±7.96)分,GAS 总分和 PAIS-SR 总分分别为(34.23±9.64)分和(31.90±9.55)分。不同年龄、婚姻状态、复发抑郁、孤独感、社会支持水平的患者 DDI 总分比较,差异有统计学意义($P < 0.05$)。Pearson 相关性分析显示,DDI 总分与 GAS、PAIS-SR 总分呈负相关($r = -0.437$ 、 -0.505 , $P < 0.01$)。多元线性回归分析显示,年龄、婚姻状态、复发抑郁、孤独感和社会支持水平均是中老年抑郁症患者自我表露水平的影响因素($P < 0.05$)。

结论 中老年抑郁症患者自我表露处于低水平,患者自我表露水平越低,社会疏离感水平越高,心理社会适应水平越差。年龄、婚姻状态、复发抑郁、孤独感和社会支持水平是中老年抑郁症患者自我表露水平的影响因素,应进行针对性干预,提高其自我表露水平。

慢性不可预知温和应激致小鼠口苦味受体表达的变化

王朝祥*

解放军总医院

目的 随着社会快速发展和生活节奏加快, 许多人面临着来自工作、家庭以及社交媒体等各种压力, 这些压力常常导致心理健康问题, 其中抑郁症是其中之一。抑郁症不仅会对个体心理健康造成严重影响, 还可能影响人们的社会交往和生理活动。除了对心理健康的影响外, 抑郁症还可能引发味觉改变甚至味觉障碍, 这种现象进一步加重了患者的负面情绪和心理症状。然而, 目前关于抑郁症和味觉障碍之间的发病机制尚未得到完全的解释和理解。因此, 我们需要进一步开展研究, 以便更好地预防和治疗抑郁症及其相关的生理影响, 帮助人们建立健康的生活方式和心理抵抗力, 从而提升整体生活质量。

方法 本研究采用慢性不可预知的温和应激 (CUMS) 方法在雄性 C57BL/6J 小鼠中建立了抑郁模型, 旨在探究抑郁情绪对味觉的影响, 特别是舌上的味觉受体表达变化。经过为期 6 周的 CUMS 实验后, 通过强迫游泳、旷场实验和高架十字迷宫等行为学测试, 筛选出表现出抑郁症状的小鼠, 随后进行了双瓶偏好实验, 检测了抑郁对苦味的影响, 并通过免疫荧光技术检测了舌上苦味受体的表达。

结果 研究结果显示, CUMS 抑郁小鼠相较于正常小鼠对苦味的敏感性降低, 同时 qRT-PCR 和免疫荧光技术证实了 CUMS 小鼠舌上苦味受体 T2R5 和味觉信号传导蛋白表达显著降低的情况。这为深入探究抑郁与味觉之间的关联提供了重要的实验数据。

结论 我们的研究揭示了慢性不可预知温和应激对外周味觉系统苦味感知的影响, 这可能会导致与压力相关的饮食行为变化。

金华市大学生人群抑郁症的筛查研究

赵丹丹* 戴边

金华市第二医院

目的 调查金华市 3 所高校的大学生抑郁状况及一般人口学资料, 并分析其对抑郁症状的影响, 为高校建立和实施有效的抑郁障碍干预措施提供理论依据。

方法 采用分层随机抽样的方法, 选择金华市包含专科类高校及综合类高校在内的 3 所大学理工、文史、医学、综合四个专业的 1300 名在校大学生, 于 2023 年 3 月至 5 月在校内通过扫描贝克抑郁量表第 2 版中文版 (BDI-II-C) 的二维码的方式进行线上评估, 由学校的指导老师向学生介绍调查目的、内容及方法。对量表评分提示抑郁状态的学生进行精神专科医生的临床访谈诊断与评估, 以确定 BDI-II-C 的检出率并分析其诊断效能。

结果 本次调查共 1300 名在校大学生扫描二维码并完成了在线评估, 使用 BDI-II-C ≥ 14 分的划界分作为判断抑郁症筛查阳性的标准, 筛查阳性率为 12.40%。卡方检验分析一般人口学资料显示不同年龄 (18-24) 及民族 (汉族、少数民族) 的大学生的抑郁状态发生率存在显著差异 ($P < 0.05$)。经临床访谈诊断与评估, 大学生抑郁症患病率为 28.13%。

结论 BDI-II-C 可作为筛查我国大学生抑郁的有效工具; 大学生人群抑郁患病率较高, 需定期开展抑郁症筛查及健康宣教, 以早期发现大学生人群中的抑郁症并给予有效干预。

环维黄杨星 D 改善慢性社会挫败应激 (CSDS) 小鼠抑郁样行为的蛋白组学研究

张欣然¹ 李磊¹ 刘娟² 张翼¹ 阙伟京¹ 王刚¹ 吉腾飞² 杜静¹

1. 首都医科大学附属北京安定医院

2. 中国医学科学院 & 北京协和医学院药物研究所

目的 抑郁症是发病率、致残率、致死率都很高的一种精神疾病。目前抗抑郁药物虽然已广泛应

用, 但仍有部分患者对现有抗抑郁药疗效不佳等问题亟待解决, 是当前精神医学领域的重要课题。环维黄杨星 D (CYC) 是从黄杨科植物中国小叶黄杨及其同属植物中提取而得到的生物碱, 具有抑制炎症介质的合成和释放、减轻组织损伤和抗肿瘤等多种生物活性, 目前临床已经应用于冠心病的治疗。本课题拟研究环维黄杨星 D 对于慢性社会挫败应激 (CSDS) 小鼠抑郁样行为的改善及生物学机制。

方法 实验材料选用雄性 C57BL/6 小鼠, 进行 CSDS 造模后经糖水偏好实验筛选抑郁小鼠并随机分为正常对照组 (CON)、抑郁组 (CSDS)、环维黄杨星 D 处理组 (CYC) 和丙咪嗪处理组 (IMI), 在给药后进行悬尾和强迫游泳行为学实验。然后提取小鼠前额叶蛋白质, 通过液相色谱-质谱串联分析、生物信息分析等技术, 对样本进行定量蛋白组的研究。通过 ANOVA 分析将差异蛋白分类, 利用 GO 富集进行差异蛋白功能聚类, 通过蛋白-蛋白相互作用 (PPI) 分析互作关系最紧密的差异蛋白和功能聚类, 利用平行反应监测 (PRM) 技术对差异蛋白进行定量验证。

结果 环维黄杨星 D 高剂量组在小鼠悬尾实验和强迫游泳实验不动时间与对照组相比显著降低, 且可起到快速抗抑郁效果。对实验小鼠的前额叶皮质蛋白进行提取及处理分析, 筛选 CSDS 与 CON 组的差异蛋白集: CSDSCON; IMI 与 CSDS 组的差异蛋白集: IMICSDS; CYC 与 CSDS 组的差异蛋白集: CYCCSDS。将差异蛋白采用 ANOVA 分析 ($P < 0.05$) 将变化趋势一致的蛋白分为不同聚类, 在蛋白质聚类 1 中蛋白质水平产生显著变化且与行为学结果相一致, 蛋白质在线粒体、核糖体、神经突触相关的功能和定位上富集。进一步对 CYCCSDS-IMICSDS 组和 CYCCSDS-CSDSCON 组的共同蛋白进行 GO 富集, GO 富集结果与方差分析结果一致。使用 PPI 分析 CYCCSDS-IMICSDS 和 CYCCSDS-CSDSCON 的共同蛋白群, 发现差异蛋白主要与线粒体、核糖体、突触功能等相关。通过 PRM 进一步证实线粒体相关蛋白: Tamm41、Mrps6、Mrpl41、Mrps35、Mrpl17、Elac2 和 Sco2; 核糖体相关蛋白: Rpl13a、Ddx58; 突触功能相关蛋白: Gabra5、Eif4g1、Klc4、Kif21b 等蛋白水平相对于对照组出现显著差异。综上, 环维黄杨星 D 对大脑前额叶的线粒体、核糖体及突触功能相关蛋白水平产生影响, 起到抗抑郁作用。

结论 环维黄杨星 D 通过调节核糖体、线粒体及神经突触相关蛋白表达改善 CSDS 小鼠抑郁样行

为。

The Impact of Emotional Faces on Attentional Blink in Major Depressive Disorder Patients

Yingying Wang^{1,2}, Qi Wang², Xiaomei Dong², Lijie Chen^{1,2}, Hongfei Huang², Yitong Wang², Tianchao Xu^{1,2}
1.School of Medical Humanities, China Medical University

2.Department of Psychiatry and Psychology, General Hospital of Northern Theater Command.

Objective This study aimed to investigate the effect of emotional faces induce attention blinking in Major Depressive Disorder (MDD) patients.

Methods Emotional Induced Attentional Blink (EIB) task involving 32 MDD patients and 32 non-clinical controls selected between March and August 2023. Participants' target recognition accuracy was assessed using emotional faces (disgust, fear, sadness, and neutral) presented as distractors at lags 1, 3, and 7 (100ms, 300ms, and 700ms before the target, respectively). Accuracy rates were recorded and analyzed using repeated measures ANOVA.

Results The results indicated significant main effects for emotional faces ($p = 0.001$), lag ($p < 0.001$), and group ($p < 0.001$). Post-hoc comparisons using Bonferroni correction revealed that the accuracy at lag 1 was significantly lower than at lag 3 ($p < 0.001$) and lag 7 ($p < 0.001$), with no significant difference between lag 3 and lag 7 ($p = 1.00$). Regarding the four types of emotional faces, MDD patients had significantly lower target recognition accuracy than the non-clinical control (NC) group ($p < 0.001$). In the NC group, there were no significant differences among the four emotional faces, whereas, in the MDD group, the accuracy for disgusted faces was lower than for sad faces ($p < 0.01$). The regression analysis revealed that target recognition accuracy of disgust and sad faces serves as a protective factor against the occurrence of MDD ($OR < 1$).

Conclusion Our findings indicate that there is an

initial heightened bias towards emotional faces, resulting in decreased target recognition accuracy. This attentional blink phenomenon gradually begins to normalize from lag 3 onwards. Emotional faces heightened the attentional blink in MDD patients compared to non-clinical controls, an effect that persisted across varying time intervals. Notably, the attentional blink induced by disgusted faces in MDD patients is significantly greater than that induced by sad faces. Additionally, the attentional blink induced by disgust and fear faces can predict the occurrence of MDD.

关键词: Emotional faces, Major depressive disorders, Emotional induced Attention blink, Attentional bias, Disgusted face.

五味子酚改善慢性社会挫败应激 (CSDS) 小鼠抑郁样行为的蛋白组学研究

李磊¹ 张翼¹ 刘晓宇² 阙伟京¹ 王刚¹ 吉腾飞² 杜静¹

1.首都医科大学附属北京安定医院, 国家精神心理疾病临床医学研究中心, 精神疾病诊断与治疗北京市重点实验室

2.中国医学科学院&北京协和医学院药物研究所, 天然药物活性物质与功能国家重点实验室

抑郁症 (Major Depressive Disorder, MDD) 是一种常见的精神心理疾病, 全世界近 3 亿人罹患此病。现有抗抑郁药物对大约 30% 的患者效不佳, 给个人和家庭带来沉重负担, 因此开发具有新机制的抗抑郁药具有重要意义。五味子酚是一种从中药五味子中提取得到的天然木脂素类化合物, 五味子酚具有抗氧化、抗炎、抗肿瘤等多种生物活性。其抗抑郁作用尚属未知。

目的 研究五味子酚 (Schisanhenol, SCH) 对于慢性社会挫败应激 (CSDS) 小鼠抑郁样行为的改善和细胞分子机制。

方法 C57 小鼠 CSDS 造模后糖水偏好实验筛选抑郁鼠, 随机分为抑郁 (CSDS) 组、五味子酚 (SCH) 组、丙咪嗪 (Imipramine, IMI) 组, 分别在给药 1h、4 天和 5 天行悬尾、糖水偏好和强迫游泳实验, 后处死取脑提取蛋白质通过非标记定量蛋白组学检测,

运用生物信息学方法分析相关差异蛋白的 GO 富集分析、蛋白相互作用网络。

结果 研究表明在慢性社交挫败应激 (CSDS) 抑郁模型中, 五味子酚在悬尾 ($F=5.82, P<0.01$)、强迫游泳 ($F=13.54, P<0.01$) 和蔗糖偏好实验 ($F=7.89, P<0.01$) 中, 显示出抗抑郁样功效。非标记定量蛋白组学共检出 6467 个蛋白, 获得了 CSDS 与 CON 相比 (CSDSCON)、丙咪嗪 (IMI) 治疗与 CSDS 相比 (IMICSDS)、SCH 治疗与 CSDS 相比 (SCHCSDS) 的差异蛋白簇, 这些蛋白表达变化首先采用方差分析 (ANOVA, $P<0.05$) 寻找变化趋势一致的蛋白簇, 在蛋白质聚类 2 中蛋白质水平变化趋势与行为学趋势相似, 蛋白质聚类 2 在线粒体和突触相关的功能和定位上富集。进一步对 SCHCSDS-IMICSDS 组和 SCHCSDS-CSDSCON 组的共同蛋白进行 GO 富集, GO 聚类支持方差分析结果。我们使用 PPI 分析了 SCHCSDS-IMICSDS 和 SCHCSDS-CSDSCON 的共同蛋白群, 发现与线粒体和突触功能相关的蛋白富集。蛋白网络分析上下调差异蛋白主要成簇在突触、线粒体和氧化应激相关功能, 后通过平行反应监测证实差异蛋白主要与神经突触 (例如: *Gabra5*)、线粒体和核糖体 (例如: *Mrpl41*)、免疫炎症 (例如: *Chid1*) 等功能相关。五味子酚治疗改变了神经突触、线粒体、氧化应激 (炎症) 相关蛋白合成, 从而改善了抑郁样行为, 说明突触及线粒体、炎症相关功能蛋白在抑郁治疗过程中发挥重要作用。

结论 五味子酚改善 CSDS 小鼠抑郁样行为是通过调节线粒体、神经突触和炎症相关蛋白表达水平实现的, 该机制是 CSDS 诱导抑郁症的病理生理和治疗的的基础, 对未来新药开发具有重要意义。

Gut Microbiota and Inflammatory Factor Characteristics in Major Depressive Disorder Patients with Anorexia

Fengtao Guo^{1,2}, Huanhu Zhang², Ning Sun¹, Penghong Liu^{1,2}

1. First Hospital of Shanxi Medical University

2. Shanxi Medical University

Objective This study aimed to explore the gut

microbiota and inflammatory factor characteristics in major depressive disorder (MDD) patients with anorexia and to analyze the correlation between gut microbiota and inflammatory factors, anorexia, and HAMD scores

Methods 46 MDD patients and 46 healthy controls (HC) were included in the study. The 46 MDD patients were divided into two groups according to whether they had anorexia: 20 MDD without anorexia (MDA0 group) and 26 MDD with anorexia (MDA1 group). We used the Hamilton Depression Scale-24 (HAMD-24) to evaluate the depression status of all participants and 16S ribosomal RNA (16S rRNA) sequencing to evaluate the composition of the gut microbiota. Inflammatory factors in peripheral blood such as C-reactive protein (CRP) were detected using enzyme-linked immunosorbent assay (ELISA). Spearman's correlation analysis evaluated the correlation between gut microbiota and inflammatory factors, HAMD scores, and anorexia

Results 1. The CRP levels showed significant differences among the MDA0, MDA1, and HC groups. 2. α -diversity analysis shows the Simpson and Pielou indices of the HC group are higher than the MDA1 group ($P < 0.05$). β -diversity analysis shows differences in the composition of microbial communities between the MDA0, MDA1, and HC groups. At genus level, the MDA0 group had higher abundances of Dialister and Ruminococcus; the MDA1 group had higher abundances of Blautia, Enterococcus, and Bifidobacterium; and the HC group had higher abundances of Faecalibacterium, Bacteroides, Roseburia, Phascolarctobacterium, and Parabacteroides. 3. A correlation analysis showed that Blautia positively correlated with anorexia, HAMD scores, and CRP levels, whereas Faecalibacterium, Bacteroides, Roseburia, and Parabacteroides negatively correlated with anorexia, HAMD scores, and CRP levels. 4. The receiver operating characteristic (ROC) curve was drawn using the differential bacterial genera between MDD patients with or without anorexia as biomarkers to identify whether MDD patients were accompanied with anorexia, and its area under curve (AUC) was 0.85. The ROC curve was drawn using the differential bacterial genera between MDD patients with anorexia and

healthy controls as biomarkers to diagnose MDD patients with anorexia, with its AUC was 0.97

Conclusion The gut microbiota of MDD patients with anorexia changes and is closely related to inflammatory factors, HAMD scores, and anorexia

重性抑郁症患者的肠道菌群特征 及与炎症因子的相关性

郭峰涛^{1,2} 孙宁¹ 张桓虎² 刘鹏鸿^{1,2}

1.山西医科大学第一医院

2.山西医科大学

目的 探究重性抑郁症 (major depressive disorder, MDD) 患者肠道菌群特征, 并分析其与炎症因子和汉密尔顿 24 项抑郁评定量表 (Hamilton depression scale-24, HAMD-24) 评分的相关性。

方法 研究共纳入符合纳入、排出标准的首发未治疗的 MDD 患者 58 例以及性别、年龄与之匹配的健康对照者 (healthy controls, HCs) 50 例。采用 HAMD-24 评估所有受试者的抑郁症状严重程度, 采用 16S rRNA 基因测序法评估肠道菌群的组成。使用酶联免疫吸附试验检测外周血中 C 反应蛋白 (C-reactive protein, CRP)、白细胞介素-1 β 、白细胞介素-6 及肿瘤坏死因子- α 水平, 采用 Spearman 相关性分析评估肠道菌群与炎症因子和 HAMD-24 评分的相关性。

结果 MDD 组的 CRP 水平显著高于 HC 组 ($P < 0.050$, $t = 8.353$)。Alpha 多样性分析 (Shannon 指数, Simpson 指数, Pielou 指数) 显示 MDD 组和 HC 组的肠道菌群差异有统计学意义 (均 $P < 0.050$, H 值分别为 8.529, 8.893, 10.825), beta 多样性分析显示两组菌群分布差异有统计学意义 ($P < 0.050$, $F = 3.997$)。进一步线性判别分析发现, 在属水平上, MDD 组的双歧杆菌属、布劳特菌属、粪球菌属、巨单胞菌属及 Dorea 相对丰度较高, HC 组的拟杆菌属、粪杆菌属、罗斯菌属及小杆菌属相对丰度较高。Spearman 相关性分析结果显示布劳特菌属和粪球菌属与 CRP 和 HAMD-24 评分呈正相关 (均 $P < 0.050$, r 分别为 0.258, 0.284, 0.235, 0.262), 粪杆菌属和

罗斯菌属与 CRP 呈负相关 (均 $P < 0.050$, r 分别为 -2.030, -0.221)。

结论 MDD 患者的肠道菌群改变, 血浆 CRP 水平升高, 且发生改变的肠道菌群与血浆 CRP 水平和 HAMD-24 评分密切相关。

生物碱类成分海兰地嗪改善慢性社会挫败应激 (CSDS) 抑郁鼠抑郁样行为的蛋白组学机制研究

张婉君¹ 李磊¹ 李伟锋² 许吉怡¹ 阚伟京¹ 张翼¹ 吉腾飞² 王刚¹ 杜静¹

1. 首都医科大学附属北京安定医院, 国家精神心理疾病临床医学研究中心, 精神疾病诊断与治疗北京市重点实验室

2. 中国医学科学院&北京协和医学院药物研究所, 天然药物活性物质与功能国家重点实验室北京 100050

目的 抑郁症是一种十分常见而严重的精神疾病, 但目前的治疗中仍存在近三分之一的患者对药物治疗无效, 急需寻找新的治疗靶点和策略。海兰地嗪(Hernandezine, HER)是从毛茛科唐松草属植物金丝马尾连中分离出来的生物碱。本课题前期研究结果显示海兰地嗪具有改善抑郁行为的作用。本研究旨在研究海兰地嗪在社交挫败应激(Chronic Social Defeat Stress, CSDS)抑郁小鼠模型中发挥抗抑郁作用的分子机制研究。

方法 通过社交挫败应激建立 CSDS 抑郁小鼠模型, 用糖水偏好实验筛选抑郁小鼠。将实验动物分为正常对照 (CON) 组、抑郁 (CSDS) 组、海兰地嗪 (HER) 组、丙咪嗪 (IMI) 组, 经腹腔注射药物或生理盐水后进行行为学测试; 并从大脑的前额叶皮质提取蛋白质进行定量蛋白质组学分析, 利用生物信息学方法分析相关差异蛋白的 GO 富集和蛋白质-蛋白质相互作用网络, 同时结合平行反应监测 (Parallel Reaction Monitoring, PRM) 进行验证, 从而研究海兰地嗪发挥抗抑郁作用相关的机制。

结果 首先用海兰地嗪处理 CSDS 小鼠, 在悬尾实验、强迫游泳实验、糖水偏好实验中显示出显著的抗抑郁效果。定量蛋白质组学检测到 6467 种蛋

白质, 获得 CSDS 与 CON(CSDSCON)、IMI 治疗与 CSDS(IMICSDS)、HER 治疗与 CSDS(HERCSDS) 的差异蛋白序列, 并首先通过方差分析 (ANOVA, $P < 0.05$) 分析这些蛋白质表达变化趋势一致的蛋白质簇, 其中蛋白质簇 1、3 的变化趋势与行为学变化相似, 且在其中发现了与突触、线粒体和内质网相关的功能和定位富集。HERCSDS -IMICSDS 和 HERCSDS -CSDSCON 共同蛋白质的 GO 富集进一步支持了 ANOVA 结果。通过 PPI 分析 HERCSDS -IMICSDS 和 HERCSDS -CSDSCON 的共同蛋白质群, 发现线粒体和突触功能相关的蛋白质富集。进一步的 PRM 验证结果显示: 与线粒体功能相关的蛋白 (Mrpl17、Col4a2、Klc4)、与突触功能相关的蛋白 (Gabra5、Ddx58、Glyr1)、与内质网功能相关的蛋白 (Pbrm1、Rpl13a、Teme63b), 在 CSDS 组与 HER 组之间存在显著差异。HER 治疗改变了突触、线粒体和内质网功能相关的蛋白质合成, 从而改善了 CSDS 小鼠的抑郁样行为。

结论 HER 通过调节突触、线粒体和内质网相关蛋白质的表达改善 CSDS 小鼠的抑郁样行为。总之, 前额叶皮质蛋白质组学研究为海兰地嗪治疗 CSDS 诱导的抑郁症模型提供了病理生理学以及特定和共同分子基础。

抑郁症伴自杀意念患者认知功能、自杀严重程度与脑网络功能连接相关性研究

吴杨¹ 吴杨² 张洪勇¹ 沈钦戈^{1,2} 李猛¹ 袁晓驰¹ 陈敏² 周晶晶³ 苏中华¹ 崔健¹

1. 山东省戴庄医院

2. 济宁医学院精神卫生学院

3. 首都医科大学附属北京安定医院

目的 抑郁障碍以心境低落为主要临床特征, 部分患者存在自杀意念, 且伴有不同程度的认知损害, 其神经机制不明。既往研究发现自杀与额顶控制网络 (FPN)、默认网络 (DMN) 有关。本研究旨在探索抑郁症伴自杀意念患者自杀严重程度、认知功能损害与脑网络的相关性, 了解此类型患者行为-脑的机制, 从而为识别此类患者提供生物学标记。

方法 我们选择了 51 名伴自杀意念的抑郁症患者、52 名不伴自杀意念的抑郁症患者和 55 名健康对照 (HC)。使用汉密尔顿抑郁量表-17 项 (HAMD-17) 评估受试者的抑郁症状, Beck 自杀意念量表评估自杀意念, 采用认知功能成套测验 (MCCB) 评估认知功能, 我们提取了 MCCB 的三个维度, 即工作记忆、处理速度和注意力/警觉性。同时采集所有受试者静息态磁共振成像数据。采用脑网络图谱提出 FPN、DMN 相关感兴趣区, 计算网络内、网络间功能连接强度。通过皮尔逊相关分析分别计算功能连接强度与行为学、临床特征的关联性。

结果 研究发现, 相较于健康对照, 抑郁症患者存在显著的认知缺陷 ($P < 0.05$), 主要表现为注意力/警觉与处理速度方面。静息态功能磁共振的研究中, 我们发现伴有自杀意念的抑郁症患者相较于不伴自杀意念患者、健康对照组在脑网络功能连接中有显著差异。事后校正发现, 与不伴自杀意念组相比, 在自杀意念组中 FPN 和 DMN 网络内的功能连接强度显著降低。与 HC 组相比, 自杀意念组中 FPN 和 DMN 网络之间的功能连接强度显著降低。同时在伴有自杀意念组中, 我们发现额顶控制网络内的功能连接强度与注意力/警觉性呈正相关 ($r = 0.33, P < 0.05$), 额顶控制网络内功能连接强度与自杀意念程度呈负相关 ($r = -0.32, P < 0.05$)。

结论 研究发现, 伴有自杀意念的抑郁症患者较不伴自杀意念的患者额顶控制网络内的功能连接强度下降, 且与自杀意念程度呈负相关, 与注意力/警觉性呈正相关。这为明确抑郁症自杀意念的行为学与神经机制提供了基础, 并为识别此类患者提供生物学标记。

Relationship between Stressful Life Events and Depression Among Adolescents: The Multiple Mediating Roles of Executive Function and Implicit Theory of Intelligence

Wenli He¹, Qiong Hu², Yunrong Lu¹

1. The Fourth Affiliated Hospital of School of Medicine,

and International School of Medicine, International Institutes of Medicine, Zhejiang University

2. Zhejiang University

Objective Understanding the etiology of adolescent depression is of great importance for prevention and treatment of this condition. The diathesis-stress model puts forward that an individual is likely to develop a mental disorder if they are exposed to stressful life events. However, the effects of cognitive factors like executive function and implicit theories in this correlation need more investigation

Methods This cross-sectional study enrolled a group of 115 adolescents (median age (Mage) = 14.96 years, SD = 1.33, range = 12.00-18.00 years, 68.70% female) diagnosed with depressive disorder and another group of healthy 98 peers (Mage = 15.46 years, SD = 1.13, range = 13.00-17.00 years, 34.69% female) in China. They completed the Adolescent Self-Rating Life Events Checklist and the Dweck intelligence questionnaire, and EF tasks including a Stroop task, a two-back task, and a complex position span task. The parallel mediation effect analysis was implemented to explore the mediating effect of executive function and implicit theory of intelligence between stressful life events and adolescent depression

Results The executive function and implicit theory of intelligence mediated the relationship between stressful life events and adolescent depression ($\beta = 0.07, 95\% \text{ CI } [0.01, 0.18]$; $\beta = 0.09, 95\% \text{ CI } [0.03, 0.18]$, respectively)

Conclusion Executive function and implicit theory of intelligence were identified as partially parallel mediators between stressful life events and adolescent depression. Relevant intervention by executive function training and the change of implicit theories endorsement could help alleviate depressive symptoms

关键词: Depression; Adolescence; Stressful life events; Executive function; Implicit theory of intelligence

RFM 与 AGR 的对数比 (RFM-AGR) 和抑

郁症的关系——一项来自 NHANES 的横断面分析研究

伍海鑫^{1,2} 舒燕萍^{1,2}

1. 贵州医科大学

2. 贵州省第二人民医院

目的 抑郁症是一种常见的精神疾病，与肥胖之间存在紧密联系。相对脂肪质量(Relative Fat Mass, RFM)和 Android 与 Gynoid 脂肪比(Android-to-Gynoid Fat Ratio, AGR)是衡量个体肥胖状况的重要指标，然而结合这两者预测抑郁的价值尚不明确，确定可靠的预测指标对抑郁症的有效防治至关重要。本研究旨在探讨 RFM 与 AGR 的复合指标 RFM-AGR 与抑郁之间的关联，探寻一个能够全面评估个体脂肪状况的指标，从而更准确地评估肥胖对抑郁的影响。

方法 本研究分析了 2005 年至 2006 年及 2011 年至 2018 年全国健康和营养检查调查(NHANES)中的 13425 名成年人数据。对纳入研究的人群进行了一般统计描述，其中连续变量用平均值±标准差呈现，分类变量用百分比呈现。采用加权 Logistic 回归分析来探讨身体质量指数(BMI)、腰围(WC)、RFM、AGR、RFM-AGR 与抑郁之间的关系，并使用限制性三次样条曲线(RCS)和亚组分析来可视化 RFM-AGR 指数与抑郁之间的关系。

结果 基于权重的描述性结果中，除了年龄和体重，其他变量在抑郁组和非抑郁组之间均具有显著差异(所有 $P < 0.05$)。在加权多变量模型中，除 AGR 之外的肥胖相关指标均与抑郁组呈显著相关($P < 0.05$)。BMI、WC、RFM 与 RFM-AGR 每增加一个 SD，患抑郁的风险分别增加 2.2%、0.9%、4.7% 和 96.2%。与最低四分位数(Q1)相比，位于 RFM-AGR 最高四分位数(Q4)的受试者的抑郁风险为 $OR = 2.381$ (95%CI: 1.162-4.879)。RCS 结果显示，RFM-AGR 与抑郁之间可能存在正相关关系(p for non-linear = 0.949)，亚组分析和交互分析确定了核心结果的稳定性。

结论 RFM-AGR 指数较高的人，患抑郁的风险更大，这意味着 RFM-AGR 指数可能是抑郁症的独立风险因素之一。与常用的肥胖衡量指标相比，RFM-AGR 在预测抑郁症方面显示出更高的敏感性和特异性，这一发现可能为通过改善身体组成和脂肪分布来预防和干预抑郁症提供新的策略。

去甲异波定改善慢性社会挫败应激(CSDS)小鼠抑郁样行为的蛋白组学研究

汪天意 李磊 阙伟京 杜静*

首都医科大学附属北京安定医院

目的 研究去甲异波定(NOR)对于慢性社会挫败应激(Chronic Social Defeat Stress, CSDS)小鼠抑郁样行为改善和蛋白组学机制研究

方法 首先，我们用 NOR 处理 CSDS 小鼠，在悬尾试验、强迫游泳、蔗糖偏好实验中检测抗抑郁效果。然后将药物处理的 CSDS 小鼠的前额叶皮质分离并获得空白对照鼠(CON)、抑郁模型鼠(CSDS)、丙咪嗪阳性对照鼠(IMI)、NOR 处理鼠等 4 组蛋白样本。而后，采用液相色谱(LC-MS/MS)用来定量蛋白的含量及种类。ANOVA 分析方法($p < 0.05$)对蛋白表达进行分析。对 NORCSDS 和 NORIMI 的差异蛋白进行 GO 分析检测蛋白功能聚类。我们使用蛋白-蛋白相互作用(PPI)分析了 NORCSDS 和 NORIMI 的差异蛋白。最后，利用高分辨质谱的定量分析方法(PRM)与免疫印迹(WB)进一步独立分析验证蛋白之间的差异。

结果 我们发现在 CSDS 抑郁模型中，在悬尾、强迫游泳和蔗糖偏好实验中，去甲异波定(NOR)显示出抗抑郁功效。然后，我们利用 NOR 治疗的 CSDS 小鼠模型，从前额叶皮层分离并获得 CSDS 与 CON 差异蛋白(称为 CSDSCON)、丙咪嗪(IMI)治疗与 CSDS 差异蛋白(称为 IMICSDS)以及 NOR 治疗与 CSDS 的差异蛋白(称为 NORCSDS)。这些蛋白质表达变化首先通过 ANOVA 进行分析($p < 0.05$)。蛋白质簇 1 和簇 3 的蛋白质水平模式与情绪模式相似，显示出与线粒体、核糖体和突触相关的功能和定位富集。对 NORCSDS 组和 NORIMI 组的差异蛋白的进一步 GO 分析支持 ANOVA 分析的结果。我们采用蛋白质-蛋白质相互作用分析来检查 NORCSDS 和 NORIMI 的差异蛋白，结果揭示了与线粒体、核糖体、突触功能相关的蛋白质的富集。使用平行反应监测的进一步独立分析显示，Cox7c、Mrp142、Naa30、Ighm、Apoa4 和 Cdv3 在 NOR 处理组中表现出调节作用，以支持线粒体功能的稳态。

此外,还观察到 Dcx 和 Fam3c 在 NOR 处理组中发生调节,以支持突触的形成和功能。这些发现表明,参与抑郁症治疗的蛋白质在增强小鼠 PFC 的线粒体和突触功能方面发挥作用。蛋白质印迹分析支持了 Mrpl42、Cox7c、Apoa4、ApoH 和 Fam3c 水平在 CSDS 小鼠中发生改变,并通过 NOR 治疗挽救其变化,支持了 PRM 数据。

结论 去甲异波洛定对 CSDS 抑郁症模型有抗抑郁的效果。这可能是通过对线粒体、核糖体和神经突触的蛋白功能网络的特异调节而实现的。

关键词: 抑郁症, 蛋白组学, 去甲异波洛定, CSDS

大黄酸改善慢性挫败应激抑郁模型鼠抑郁相关行为: 蛋白质组学分析和脂代谢分子机制研究

葛子玉 杨杨 陈沛 许吉怡 李磊 张翼 阙伟京 王刚 杜静*
首都医科大学附属北京安定医院

目的 研究中药单体药物大黄酸(Rhein)对于慢性社会挫败应激(Chronic Social Defeat Stress, CSDS)小鼠抑郁样行为的改善和分子生物学机制。

方法 我们把 7-8 周龄的 C57BL/6J 小鼠共分为 4 组,正常对照组(Control, CON)、CSDS 组、Rhein 治疗组和丙咪嗪(Imipramine, IMI)治疗组。首先,小鼠进行慢性社会挫败模型建模,并采用蔗糖偏好试验对 CSDS 建模后的 C57 小鼠进行抑郁筛查。对实验动物通过悬尾实验、蔗糖偏好实验和强迫游泳实验观察 Rhein 药物治疗后的抗抑郁效果,并从大脑前额叶皮层中提取蛋白质进行定量蛋白质组学分析,采用生物信息学方法分析相关差异蛋白的功能和细胞定位。

结果 我们发现 Rhein 干预后的 CSDS 抑郁模型小鼠在悬尾、强迫游泳和蔗糖偏好实验中,显示出抗抑郁功效。蛋白质组学共定量了 5681 种独特的蛋白质,通过 $P < 0.05$ 和 $FC (\geq 1.2, \text{上调或} \leq 0.833, \text{下调})$ 阈值筛选出各个组别间的差异表达蛋白。从 RheinCSDS 组和 CSDSCON 组中的共同重叠差异表达蛋白质中找到可被 Rhein 逆转的蛋白质和仅在 RheinCSDS 组中有变化的蛋白质做了基因本体论

(GO)富集分析。富集结果提示这些与 Rhein 相关的差异蛋白主要在核糖体、突触以及线粒体等相关功能,并参与到了甘油酯的代谢以及氧化应激的反应中。Mfuzz 聚类分析筛选出的在 4 组样本有明显表达丰度变化的蛋白质主要是与脂质代谢相关的蛋白质。我们同时运用平行反应监测(Parallel Reaction Monitoring, PRM)证实差异蛋白主要与脂质代谢(例如: Apoa4)、线粒体和核糖体(例如: Mrpl42)、免疫炎症(例如: Ighm、Cdv3)等功能相关。

结论 本研究通过动物行为学、定量蛋白质组学和生物信息学分析,揭示了大黄酸通过调节线粒体、突触和核糖体等相关功能,特别是脂质代谢,对抗抑郁治疗的潜在分子机制。

关键词: 大黄酸,抑郁,脂质代谢,蛋白质组学分析

以口咸为首发症状的老年抑郁症一例

郭隆润* 何著发
赣州市第三人民医院

目的 探讨口咸症状在老年抑郁症中的识别和处理

方法 通过个案报道的方式描述病例的诊治过程。本人在门诊上巧遇一口咸为首发症状的抑郁患者,现将病例报告如下:女,60岁,小学文化,农民,因“口咸、睡眠差,心情差1年余,加重半个月”于2022年1月16日在医院门诊治疗。患者于2020年10月出现反复打饱嗝,感到身体里面有一股气冲出来,总感到嘴巴里面有股咸味,进食甜味食物也不能减轻,食欲差,进食少,先后在市内多家医院做各种检查未见异常,具体用药不详,效果不明显。期间逢人就说嘴巴有咸味,影响到夜里难以入睡,时哭泣,心烦,有时会有想死的想法。既往史、个人史、家族史:无特殊。体格检查:未见异常。精神检查:意识清楚,衣着整洁适时,表情显忧虑,生活自理,接触主动,主动诉说嘴巴很咸,感口水多,但又吐不出来,可引出幻味,查及情绪低落,焦虑,精力下降,记忆力下降,食欲下降,体重下降,无望感,自杀意念,睡眠障碍,自知力不全。心理测试 HAMD24 评分 36 分, HAMA 评分 17 分。结合病史及精神检查根据 ICD-10 诊断标准,诊断为:伴有精神病性症状的重度抑郁发作。治疗上给予“艾司

西酞普兰、阿普唑仑”治疗，同时予以心理治疗，并解释其口咸等躯体不适与其情绪不好有关系，并给予家属心理教育，提高家属对患者的理解支持。4周后复诊口咸症状基本消失，睡眠正常，心情好转，食欲改善，目前门诊随访2年余，坚持服艾司西酞普兰10 mg/日，未诉其他不适，一切正常。抑郁障碍是老年人最常见的精神障碍，大约有1/3的老年患者以躯体不适为首发症状，内容常涉及消化系统，比如嗝气、反酸、胃胀等。本例患者开始以口咸症状为首发症状，在临床上非常少见，从精神病理学的角度考虑口咸症状是一种知觉障碍，在没有咸味食物刺激下，口腔内出现咸味可考虑是幻味症状，部分老年患者有抑郁较严重时容易在躯体不适的情形下发展为疑病观念，甚至达到疑病妄想的程度。

结果 在本案例中，患者病程1年余，曾于市内多家医院反复因口咸就诊，而临床医生对患者的饮食、睡眠及情绪等评估不够，再加上口咸症状主要是患者主观报告的临床症状，无特异性客观指标，更容易导致误诊、漏诊。

结论 本案例中治疗上采用了SSRI类抗抑郁药联合舒肝解郁胶囊进行抗抑郁治疗，短期内联合苯二氮草类药物改善睡眠、抗焦虑处理，患者焦虑症状及睡眠改善明显，经过系统的抗抑郁治疗情绪明显好转，幻味症状消失，未再出现口咸。老年抑郁治疗上宜小剂量的起始剂量，进行个体化滴定，尽量单一用药，减少药物之间相互作用，提高服药依从性。同时加强心理干预，重视疾病健康教育，建立良好医患关系和家属支持系统对患者的治疗康复也非常重要。

关键词：口咸，老年抑郁症，首发症状

基于结构方程模型的医学生归因风格与抑郁水平的关系研究

刘壮¹ 吕可¹ 张悦¹ 李宇男²

- 1.中国医科大学公共卫生学院
- 2.中国医科大学附属盛京医院

目的 了解医学生抑郁状况，构建归因风格、述情障碍、心理资本与抑郁水平的结构方程模型，探索心理资本和述情障碍在成功内归因与抑郁之间可能的中介作用，为医学生心理健康的干预提供科

学依据。

方法 于2023年10月，采用一般情况调查表、多伦多述情障碍量表（TAS-26）、心理资本问卷（PCQ）、多维-多向归因量表（MMCS）及抑郁-焦虑-压力自评量表（DASS-21），对某医学院校的557名本科医学生进行横断面调查。采用SPSS 27.0进行数据处理，通过AMOS 24.0软件进行结构方程模型的拟合与分析。P<0.05为差异有统计学意义。

结果 在557名医学生中，有25.8%的学生表现出抑郁症状。男性的抑郁评分以及非独生子女的抑郁评分较女性和独生子女高，差异具有统计学意义（P<0.05）。本研究建立的结构方程模型具有良好的拟合度（CMIN/DF=3.998，GFI=0.965，AGFI=0.931，TLI=0.965，CFI=0.978，RMSEA=0.072）。模型结果显示，成功内归因、心理资本和述情障碍均对抑郁水平有直接影响，标准化路径系数分别为-0.018、-0.340和0.431。进一步分析发现，心理资本通过述情障碍对抑郁产生间接效应，效应值为-0.107；而成功内归因分别通过心理资本和述情障碍对抑郁产生间接效应，效应值分别为-0.090和-0.107。

结论 医学生归因风格、述情障碍和心理资本是影响其抑郁水平的直接因素，而且归因风格通过心理资本和述情障碍对抑郁水平产生间接影响。为了改善医学生的心理健康，可以采取有针对性的干预措施，引导他们建立积极的内归因方式。这样不仅有助于提升他们的心理资本，有效减轻抑郁症状，还能缓解述情障碍，进一步降低抑郁风险。

关键词：医学生；抑郁；述情障碍；心理资本；归因风格；结构方程模型

安宁疗护照护在老年临终患者中的应用

孙尚铭 王立娜*

天津市安定医院

目的 探讨对老年病人实施安宁疗护服务的有效性。

方法 选择2022年1月-2023年5月本院住院的16名神志清楚、能够进行正常沟通交流的老年人为研究对象（卡诺夫斯凯评分≥60），其中7名作为安宁疗护组，其余9名病人作为对照。安宁疗护组在传统常规护理的基础上加安宁疗护。对安宁疗护

组及对照组在住院即刻和介入 4 周后进行功能量表、临床症状量表、整体健康状况量表和失眠状况量表评估, 并对比量表评分。

结果 在介入治疗前, 两组患者在功能量表评分上并无显著差异。然而, 介入 4 周后, 安宁疗护组的角色、情感、认知功能以及社交功能得分均优于对照组, 尤其在社交功能方面表现出显著性差异 ($P<0.05$)。临床症状量表评分显示, 两组患者在介入前评分相似, 治疗后均有下降, 但安宁疗护组的下降幅度显著大于控制组 ($P<0.05$)。在单项测量项目评分上, 虽然两组干预前差异不大, 但干预后, 静息组的得分显著低于对照组。总体健康状况量表评分也表明, 介入后两组患者均有改善, 但静息组的提升更为显著, 与对照组相比有显著差异 ($P<0.05$)。

结论 对于精神疾病的末期病人, 实施安宁疗护护理, 可以改善病人的症状与精神状况, 提高病人的睡眠与生活品质。

关键词: 安宁疗护; 老年; 临终患者; 心理状态; 睡眠状况; 生存质量

童年创伤对青少年抑郁症状的影响: 边缘性人格特质与自我控制的链式中介作用

钟莹彦¹ 胡前英¹ 陈剑华¹ 李雨婷¹ 李岩¹ 从恩朝^{1,2} 徐一峰¹

1. 上海交通大学医学院附属精神卫生中心
2. 同济大学附属第十人民医院精神心理科

目的 尽管已有研究证实青少年抑郁症与童年创伤之间存在显著关联, 但其潜在机制仍不清晰。本研究旨在深入探讨边缘型人格特质和自我控制在童年创伤与青少年抑郁症状之间的链式中介作用。通过揭示这些中介因素的作用路径, 进一步理解童年创伤如何影响青少年的心理健康, 以便为预防和干预策略提供科学依据。

方法 本研究采用横断面研究设计, 于 2022 年 10 月至 12 月期间对中国河南省某高中 2664 名学生进行了调查。研究工具包括《儿童创伤简易问卷 (Childhood Trauma Questionnaire-Short Form)》、《第四版人格诊断问卷 (Personality Diagnostic Questionnaire-4)》的边缘型人格特质维度、《自我控制量表 (Self-Control Scale)》和《儿童抑郁量表 (Children's

Depression Inventory)》。通过这些工具, 测量了参与者的童年创伤经历、边缘型人格特质、自我控制能力和抑郁症状。数据分析采用斯皮尔曼相关分析和中介效应分析, 以验证假设模型。

结果 青少年抑郁症状的发生率为 21.17%, 而边缘型人格特质的发生率为 12.00%。童年创伤与青少年抑郁症状之间存在显著正相关关系 ($r = 0.50, p < 0.001$), 边缘型人格特质与青少年抑郁症状之间的正相关性更强 ($r = 0.60, p < 0.001$)。此外, 自我控制与抑郁症状呈负相关 ($r = -0.50, p < 0.001$)。中介效应分析显示, 边缘型人格特质和自我控制在童年创伤与抑郁症状之间均发挥中介作用, 中介效应值分别为 0.116 (95%CI = [0.098, 0.137]) 和 0.022 (95%CI = [0.012, 0.032])。此外, 边缘型人格特质和自我控制在童年创伤与抑郁症状之间的链式中介作用显著 (效应值: 0.034, 95%CI = [0.028, 0.042])。

结论 本研究发现, 童年创伤可以通过影响边缘型人格特质的形成和降低自我控制能力来预测青少年的抑郁症状。这一链式中介机制表明, 童年创伤不仅直接对青少年的心理健康产生负面影响, 还通过改变其人格特质和自我控制能力, 进一步加剧抑郁症状的发展。这些发现对于理解青少年创伤经历在心理健康中的长期影响具有重要意义, 为针对童年创伤的预防和干预策略提供了理论依据。尤其是在临床实践中, 关注和改善青少年的自我控制能力以及干预其边缘型人格特质的发展, 可能有助于减少抑郁症状的发生和发展。

伴或不伴焦虑症状的抑郁症患者 MMPI 结果分析

程丹丹 况利*

重庆医科大学附属第一医院

目的 探讨伴或不伴焦虑症状的抑郁症患者人格特质差别, 为早期发现伴焦虑症状的抑郁症患者提供可能的依据;

方法 选取 2022 年 1 月-2022 年 12 月在重庆医科大学附属第一医院精神科门诊就诊的成年抑郁症患者为研究对象, 收集其一般人口学问卷、抑郁

自评量表 (SDS)、广泛性焦虑障碍量表 (GAD-7)、明尼苏达多项人格测试 (MMPI), 根据

广泛性焦虑障碍量表 (GAD-7) 分数将抑郁症患者分为伴或不伴焦虑症状的抑郁症, 并分析两组之间一般人口学问卷、SDS、GAD-7 与 MMPI 差异。最后通过秩相关分析一般人口学问卷、SDS、GAD-7 与 MMPI 作相关;

结果 两组平均受教育年限、居住地、家庭子女数量、焦虑程度、抑郁程度、MMPI 总分以及 Pd、Pt、Hy、D、Hs、Pa、Sc、Si、Ma 9 个维度比较, 具有统计学差异 ($P < 0.05$), 且经过秩相关分析 MMPI 总分和 Pd、Pt、Hy、D、Hs、Pa、Sc、Si、Ma 9 个维度与 SDS、GAD-7 呈正相关, 提示焦虑、抑郁程度和 MMPI 人格特质具有明显相关性;

结论 可通过明尼苏达多项人格测试 (MMPI) 测量结果对伴有焦虑症状的抑郁症患者进行早期识别, 以便于早期干预。

眼动脱敏和再加工联合药物治疗青少年抑郁症的疗效: 一项随机对照试验

郑思元^{1,2} 王若琪^{1,2} 欧阳旭^{1,2} 张少飞^{1,2} 周晓琴³

1. 安徽医科大学精神卫生与心理科学学院
2. 安徽医科大学附属巢湖医院
3. 安徽医科大学附属第二医院

背景 处于青少年时期的孩子经常会面对来自家庭、学校和社会带来的压力, 负面情绪得不到排解则容易导致抑郁症的发生。青少年抑郁症的患病率和致残率都较高, 眼动脱敏和再加工 (Eye movement desensitization and reprocessing, 简称为 EMDR) 是一种整合式心理治疗, 已有研究表明该疗法能够减轻患者抑郁情绪, 但在青少年抑郁症患者中缺少相应证据。

结论 本研究旨在探索 EMDR 联合药物治疗青少年抑郁症患者的疗效, 另外侧重探讨该治疗对患者反刍思维和自尊感的影响。

方法 本研究是一项随机对照试验, 收集 2023 年 5 月-2024 年 5 月于安徽医科大学附属巢湖医院

精神科住院的青少年抑郁症患者, 按照随机序列表将参与者分为 EMDR 联合一种 SSRI 类药物组以及单用一种 SSRI 类药物组。EMDR 标准化流程包括病史采集、准备、评估、脱敏、植入、身体扫描、结束及再评估八个步骤, 干预组每周进行 3 次 EMDR 标准化治疗, 隔日一次, 为期 2 周, 共计 6 次, 每次 60 分钟。在两组参与者治疗前、治疗 2 周及治疗 4 周后, 进行疗效评估。评估疗效的指标包括 17 项汉密尔顿抑郁量表 (HAMD-17), 事件影响量表 (IES-R)、反刍思维量表 (RRS), 罗森博格自尊量表 (SES)。

结果 共收集到 33 名参与者, 其中 3 名在治疗前脱落, 最终 30 名参与者完成试验, 干预组和对照组各 15 例。重复测量方差分析显示时间和组别对两组患儿 HAMD-17、IES-R、RRS 评分存在交互作用 (P 均 < 0.05), 时间对两组患儿 HAMD、IES-R、RRS 及 SES 评分的主效应显著 ($P < 0.05$), 组别对于 HAMD 和 RRS 评分的主效应显著 ($P < 0.05$)。治疗 4 周后, 干预组患儿 HAMD、RRS 评分低于对照组 ($P < 0.05$), 而 SES 评分高于对照组 ($P < 0.05$)。线性混合模型结果表明, 与对照组相比, 干预组 HAMD 评分从基线到第 4 周的降低具有统计学意义 (estimate value = -3.083, $p = 0.008$)。基线 IES-R 和 SES 评分随着时间变化与抑郁严重程度有重要关联, 基线 IES-R 评分的升高与患儿抑郁程度加重相关联 (estimate value = 0.104, $p = 0.019$), 基线 SES 评分的升高与患儿抑郁程度减轻相关联 (estimate value = -0.298, $p = 0.021$)。

结论 EMDR 能够改善青少年抑郁症患者的抑郁情绪, 减轻反刍思维, 提高自尊感, 可以有效应用于临床治疗, 但针对应激性生活事件对患儿的影响在短时间内处理效果不明显, 可能需要更大规模的长期随机对照试验来验证。

Construction and Verification of Risk Prediction Model for Suicidal Behavior of Mood Disorders Based on Machine Learning

Yannan Deng Sixiang Liang Jinhe Zhang Xinyu Liu Qitong Jiang Yuxuan Xu Hongye Yu Guangwei Zhao

Sha Sha Chen Hu*

Beijing Anding Hospital, Capital Medical University

Background Suicidal behavior (SB) is defined as intentional self-injury that causes individual death. Mood disorders (MD) are intimately related to SB. Meanwhile, there was no accurate prediction model for SB in MD patients. Constructing a prediction model for SB in MD patients could improve the early identification of high-risk groups and further reduce the suicide rate. The purpose of this study is to establish a prediction model of SB in MD based on machine learning techniques. In current study, we attempted to evaluate models constructed by ten machine learning methods and select the optimal method for validation

Methods 1099 patients diagnosed with mood disorders (diagnosed via ICD-10 codes F30-F39) were collected. LASSO regression was used to screen features that may be related to SB as predictors. All patients were randomly divided into training group (N = 769) and test group (N = 330). Ten machine learning algorithms were applied to the training set to construct SB prediction model. The stability of the model was tested in the test set. The machine learning model with the best sensitivity and stability was selected according to AUC, F1 score, accuracy and other indicators. The locally explanatory technique of SHapley Additive exPlanations (SHAP) was used to rank the importance of features and explain the best model to analyze the potential impact of each feature on suicidal behavior

Results This study incorporates 6 features based on LASSO regression and 2 features based on our previous researches. Prediction model was constructed based on 10 different machine learning methods. The results showed that the prediction model constructed by Random Forest method had good discriminant ability (AUC of Testing=0.741, AUC of Training= 0.786) and acceptable of discriminant. Further SHAP analysis ranked the importance of these eight features. The prediction model constructed by random forest method showed that the most valuable feature for predicting suicide risk was a history of suicide attempts

Conclusion The Random Forest method can better construct the risk prediction model of SB in patients

with MD

Connectome-based Prediction of Depressive Symptoms in Major Depressive Disorder and The Discrimination of Melancholic Depression

yangpan Ou¹, Sujuan Li¹, Huabing Li¹, Feng Liu², Ping Li³, Guangrong Xie¹, Jingping Zhao¹, Xilong Cui¹, Wenbin Guo¹

1.The Second Xiangya Hospital of Central South University

2.Tianjin Medical University General Hospital

3.Qiqihar Medical University

Objective This study aimed to create a predictive model for the depressive symptoms of first-episode, drug-naïve major depressive disorder (MDD). Its design was also intended to reveal MDD's underlying neuropathological mechanisms and explore the intrinsic functional patterns of its two distinct subtypes

Methods The connectome-based predictive modeling (CPM) approach was employed to construct predictive models for the depressive symptoms of MDD. Node-based functional connectivity (FC) analysis was utilized to compare differences in FC patterns among three groups: melancholic subtype, non-melancholic subtype, and healthy controls. The k-nearest neighbors (KNN) algorithm was employed to classify subtypes of MDD

Results The CPM analysis showed that the positive edge network could successfully predict the Hamilton Depression Rating Scale scores of MDD patients ($r = 0.216$, $p = 0.030$, 5000 iterations). Compared to non-melancholic patients, melancholic patients showed increased FC values in PrG_L_6_5 (the left precentral gyrus) -Tha_L_8_7 (the left thalamus) ($p = 0.026$) and BG_R_6_1 (the right basal ganglia) - PCun_R_4_2 (the right precuneus) ($p = 0.022$). The KNN method classified melancholic patients and non-melancholic patients

with $k=9$, achieving an accuracy of 0.78. Abnormal FC in MDD patients was found to be correlated with clinical variables

Conclusion This study utilized CPM to construct a positive network predictive model for the depressive symptoms of MDD, enabling us to gain further insights into the neuropathological mechanisms of the disease. We identified different FC patterns between melancholic depression and non-melancholic depression, indicating potential distinctions in the neuropathological underpinnings of these two MDD subtypes

关键词: Major depressive disorder (MDD), Melancholic depression, Connectome-based predictive modeling (CPM), Node-based functional connectivity (FC), K-nearest neighbors (KNN)

家庭-康复师主导康复治疗措施对抑郁症患者生存质量及康复效果的影响

颜慧*

台州市第二人民医院

目的 探讨家庭-康复师主导康复治疗措施对抑郁症患者生存质量及康复效果的影响。

方法 选取 2023 年 5 月至 2024 年 5 月我院接收的 80 例抑郁症患者进行研究。按照随机数表法,将其分成两组。其中对照组采取抗抑郁药物治疗,观察组在对照组的基础上采取家庭-康复师主导康复治疗措施。治疗 3 个月后,比较分析两组患者治疗后的临床效果,采用汉密尔顿抑郁量表(HAMD)和汉密尔顿焦虑量表(HAMA)比较分析两组患者治疗前后抑郁和焦虑状况,采用临床神经功能缺损程度(NIHSS)评分量表比较分析两组患者治疗前后神经功能,采用生存质量评定量表(WHOQOL-BREF)和 Barthel 指数量表(ADL)评估并分析患者治疗前后生存质量。

结果 观察组治疗后总有效率(95.00%)显著高于对照组(80.00%),差异具有统计学意义($\chi^2=4.114, P=0.043$)。治疗前,两组患者 HAMD 和 HAMA 评分的比较无明显差异($P>0.05$);治疗后,两组患者各组评分均明显降低,且与对照组相比,观察组患者评分更低,比较差异具有统计学意义(P

<0.05)。治疗前,两组患者 NIHSS 和 ADL 评分的比较无明显差异($P>0.05$);治疗后,两组患者 NIHSS 评分均降低,ADL 评分均升高,且观察组患者变化更明显,比较差异具有统计学意义($P<0.05$)。治疗前,两组患者生存质量各个指标评分的比较无明显差异($P>0.05$);治疗后,两组患者各组评分均明显升高,且与对照组相比,观察组患者评分更高,比较差异具有统计学意义($P<0.05$)。

结论 家庭-康复师主导康复治疗抑郁症患者疗效显著,能够显著改善患者抑郁和焦虑情绪,并且改善患者神经功能,提高患者日常生活活动能力和生存质量,具有较高的临床应用价值。

疫情期间青少年抑郁症患者学习倦怠及相关影响因素研究

张勇* 牟思明

天津市安定医院

目的 国内研究已证实青少年学习倦怠量表(Adolescent Student Burnout Inventory, ASBI)具有较好的信效度,本研究观察青少年抑郁症患者在新冠疫情期间学习倦怠发生状况,探索青少年抑郁症患者疫情期间学习倦怠的影响因素。

方法 本研究分析青少年抑郁症患者与健康对照者在疫情期间学习倦怠、学习方式及效能和情绪状态的差异性及相关影响因素。142 名青少年抑郁症患者(DP)以及年龄和性别匹配的 363 名健康青少年(HC)完成入组。所有研究对象完成 ASBI、抑郁-焦虑-压力量表(Depression, Anxiety, and Stress Scale-21, DASS-21)的评估。

结果 1) DP 组每日学习时长($\chi^2=52.89, p<0.001$)、学习效能($\chi^2=106.13, p<0.001$)低于 HC 组,非学习网络使用时长($\chi^2=85.78, p<0.001$)、网络游戏娱乐频次($\chi^2=41.87, p<0.001$)高于 HC 组。2) DP 组的 DASS-21 抑郁($t=19.89, p<0.001$)、DASS-21 焦虑($t=17.21, p<0.001$)、DASS-21 压力($t=17.05, p<0.001$)、ASBI 总分($t=9.961, p<0.001$)、身心耗竭($t=7.102, p<0.001$)、学业疏离($t=10.823, p<0.001$)和低成就感($t=6.952, p<0.001$)均高于

HC 组。3) 根据 DASS-D 计分操作, 14 分为中度临界值, 抑郁症患者分为抑郁中度及以上 (≥ 14 分) 和中度以下 (< 14 分) 两组, 结果发现中度及以上抑郁组在学习倦怠总分 ($t=3.68, p<0.001$), 身心耗损 ($t=2.95, p=0.004$), 学业疏离 ($t=3.13, p=0.002$) 及低成就感 ($t=2.80, p=0.006$) 三个因子层面得分均显著高于中度以下抑郁组; 4) 抑郁症青少年相关分析, ASBI 总分与 DASS-21 抑郁 ($r=0.372, p<0.001$)、DASS-21 焦虑 ($r=0.292, p<0.001$) 及 DASS-21 压力 ($r=0.310, p<0.001$) 得分呈正相关。5) 多因素 logistic 回归分析得出: DASS-21 抑郁 (OR=1.106, 95%CI=1.027~1.190, $p=0.008$)、学习效能显著降低 (OR=0.274, 95%CI=0.081~0.927, $p=0.037$) 预测 ASBI 的发生。

结论 疫情期青少年抑郁症患者的学习倦怠严重程度与抑郁、焦虑及压力相关; 抑郁严重度和学习效能差为青少年抑郁症学习倦怠的独立危险因素。

关键词: 疫情, 青少年, 抑郁, 学习倦怠

团体心理治疗对康复期抑郁症患者疗效观察

滕翠花*

自贡市精神卫生中心

目的 观察对康复期抑郁症患者予以团体心理治疗的效果。

方法 观察对象为 2021.1~2022.1 在我院就诊的康复期抑郁症患者 76 例, 随机数字法予以分组, 38 例予以常规治疗者纳入对照组, 38 例予以常规治疗+团体心理治疗者纳入治疗组, 对比和观察治疗效果。在正式治疗前, 强化医患间的沟通, 让患者了解抑郁症是可治愈的, 需积极治疗, 避免病情加重而导致各种不良后果产生。将团体心理治疗方法告知患者, 将 36 例患者分为 2 组实施团体心理治疗, 90min/次, 2 次/周, 在治疗 1~3 次, 小组成员通过交流信息、自我介绍, 将组间陌生感消除; 治疗师对患者指导, 让其相互帮助, 使其好感增强, 保证人际氛围良好; 告知患者疾病发生机制, 并让患者了解抑郁症治疗的必要性; 在第 4~8 次治疗, 对患者鼓励, 利用倾听、支持、共情等方式讨论和互动, 在互动时患者即为倾听者, 也为担当者, 将解决问题决

策提出; 除此之外, 利用行为训练、放松训练、心理游戏等方式, 对患者鼓励, 让其将启发和自身感受表达出来; 再次阶段, 团员互相填了, 转变心理状态, 以团员回答为依据, 共同对抑郁症发生原因进行分析, 以便让其对自我和现实正面、积极面对。2 组均予以 8 周的连续治疗。

结果 和对照组对比, 治疗组治疗后 HAMD 评分明显较低, $P<0.05$; 和对照组对比, 治疗组治疗后生活质量各项评分均明显较高, $P<0.05$ 。

结论 对康复期抑郁症患者予以团体心理治疗效果突出, 建议推广。

关键词: 抑郁症; 康复期; 团体心理治疗

Associations Among Obesity, Insulin Resistance, and Depression: A Mediation Analysis

Guoqiang Xiao Borong Zhou*

Third Affiliated Hospital of Guangzhou Medical University

Background The mechanistic role of insulin resistance between obesity and depression has long been debated, and its contribution remains unclear

Objective This study aims to explore the relationship between BMI and depressive symptoms to investigate the role of insulin resistance in this association

Methods We rigorously selected data from the National Health and Nutrition Examination Survey (NHANES) from 2005 to 2018. Multivariate logistic regression analysis and subgroup analysis were employed to assess the correlation between obesity and depressive symptoms. Restricted cubic splines (RCS) were used to evaluate the non-linear relationship between BMI and depressive symptoms. Mediation analysis was conducted to examine the role of insulin resistance in the relationship between obesity and depressive symptoms

Results After strict inclusion and exclusion criteria were applied to the NHANES dataset, 12744 participants were included in the observational study. Multivariate logistic regression analysis indicated a signifi-

cant association between obesity and depressive symptoms. Subgroup analysis revealed a potential interaction between the levels of physical inactivity and vigorous activity with the relationship between obesity and depressive symptoms. BMI was found to have an S-shaped association with depressive symptoms, becoming positively correlated after reaching a turning point ($BMI > 23.22 \text{ Kg/m}^2$, $p < 0.001$). Insulin resistance partially mediated the potential impact of obesity on depressive symptoms (IR: 17.5%, $p = 0.018$)

Conclusion Our study confirms a significant association between obesity and depressive states, with insulin resistance significantly mediating part of this relationship

Limitations: This study is a cross-sectional observational study, and causal relationships may require longitudinal studies for further evidence.

关键词: Insulin resistance; Obesity; Depressive states; NHANES; Mediation analysis

FNRIS 对疫情期间青少年抑郁障碍患者学习倦怠的影响

张勇¹ 李茹^{1,2}

1.天津市安定医院

2.山西省临汾市中心医院

目的 学习倦怠在疫情期间对青少年抑郁障碍患者影响普遍,功能性近红外光谱(functional near-infrared spectroscopy, fNIRS)可以探索学习倦怠的脑血流激活机制。本研究旨在探讨 fNIRS 及相关临床症状对疫情期间青少年抑郁障碍患者 LB 的相关影响及中介作用。

方法 本研究纳入 51 例青少年抑郁障碍患者。入组完成了社会人口学信息评估,采用抑郁-焦虑-压力量表简体中文版(DASS-21)、斯奈思-汉密尔顿快感量表(SHAPS)以及青少年学习倦怠量表(Adolescent Student Burnout Inventory, ASBI)进行相关临床症状和评估。采用 fNIRS 监测脑血流动力学变化,用 β 值描述各通道脑激活值。采用感兴趣区域(ROI)划分理论,得出各个脑区的激活值。

结果 1、在社会人口学相关分析中,男性在身

心耗损方面受影响更大($P < 0.05$),而在独生子女、父母的教育水平及年级方面均未发现显著差异(均 $P > 0.05$); 2、偏相关分析结果显示,压力、焦虑和抑郁评分与 LB 各维度及总分呈正相关(均 $P < 0.05$)。SHAPS 评分与 LB 学业疏离,低成就感及总分之间存在显著正相关($r = 0.411, 0.365$ 和 0.410 , 均 $P < 0.05$)。学业疏离因子与右内侧前额叶区(RmPFC)的激活值呈负相关($r = -0.488$, $p < 0.001$)。右背外侧前额叶区(RPFC)的激活值与 LB 总分呈负相关($r = -0.318$, $p < 0.05$)。3、多元线性回归分析显示,抑郁评分($\beta = 0.583$, $p = 0.007$)对 LB 身心耗损因子具有正向预测作用。RmPFC 区的激活值($\beta = -3.181$, $p = 0.003$)对学业疏离因子有预测作用。此外,RPFC 区的激活值($\beta = -7.853$, $p = 0.015$)是 LB 总分的强有力预测因子。4、Process 中介分析显示,各脑区的激活值在临床变量及 LB 之间无明显中介效应(均 $p > 0.05$)。

结论 疫情期间青少年抑郁障碍患者情绪症状预示着更严重的学习倦怠,RmPFC 区和 RPFC 区的脑激活程度能够预测学习倦怠的严重程度。

Potential Correlations between Asymmetric Disruption of Functional Connectivity and Metabolism in Major Depressive Disorder

Chunguo Zhang¹, Guojun Xie¹, Wenbin Guo²

1.The Third People's Hospital of Foshan

2.The Second Xiangya Hospital of Central South University

Objective Previous research has suggested a connection between major depressive disorder (MDD) and certain comorbidities, including gastrointestinal issues, thyroid dysfunctions, and glycolipid metabolism abnormalities. However, the relationships between these factors and asymmetrical alterations in functional connectivity (FC) in adults with MDD remain unclear

Methods We conducted a study on a cohort of 42 MDD patients and 42 healthy controls (HCs). Participants underwent comprehensive clinical assessments,

including evaluations of blood lipids and thyroid hormone levels, as well as resting-state functional magnetic resonance imaging (Rs-fMRI) scans. Data analysis involved correlation analysis to compute the parameter of asymmetry (PAS) for the entire brain's functional connectome. We then examined the interrelationships between abnormal PAS regions in the brain, thyroid hormone levels, and blood lipid levels

Results The third-generation ultra-sensitive thyroid stimulating hormone (TSH3UL) level was found to be significantly lower in MDD patients compared to HCs. The PAS score of the left inferior frontal gyrus (IFG) decreased, while the bilateral posterior cingulate cortex (Bi-PCC) PAS increased in MDD patients relative to HCs. Notably, the PAS score of the left IFG negatively correlated with both TSH and total cholesterol (CHOL) levels. However, these correlations lose significance after the Bonferroni correction

Conclusion MDD patients demonstrated abnormal asymmetry in resting-state FC (Rs-FC) within the fronto-limbic system, which may be associated with CHOL and thyroid hormone levels

关键词: Asymmetry; Cholesterol; Parameter of asymmetry; Resting-state functional connectivity; The third-generation ultra-sensitive thyroid stimulating hormone.

Deviant Spontaneous Neural Activity As A Potential Early-response Predictor for Therapeutic Interventions in Patients with Schizophrenia

Chunguo Zhang¹, Guojun Xie¹, Wenbin Guo²

1. The Third People's Hospital of Foshan

2. The Second Xiangya Hospital of Central South University

Objective Previous studies have established significant differences in the neuroimaging characteristics between healthy controls (HCs) and patients with schizophrenia (SCZ). However, the relationship between homotopic connectivity and clinical features in patients

with SCZ is not yet fully understood. Furthermore, there are currently no established neuroimaging biomarkers available for the diagnosis of SCZ or for predicting early treatment response. The aim of this study is to investigate the association between regional homogeneity and specific clinical features in SCZ patients

Methods We conducted a longitudinal investigation involving 56 patients with SCZ and 51 HCs. The SCZ patients underwent a 3-month antipsychotic treatment. Resting-state functional magnetic resonance imaging (fMRI), regional homogeneity (ReHo), support vector machine (SVM), and support vector regression (SVR) were used for data acquisition and analysis

Results In comparison to HCs, individuals with SCZ demonstrated reduced ReHo values in the right postcentral/precentral gyrus, left postcentral/inferior parietal gyrus, left middle/inferior occipital gyrus, and right middle temporal/inferior occipital gyrus, and increased ReHo values in the right putamen. It is noteworthy that there was decreased ReHo values in the right inferior parietal gyrus after treatment compared to baseline data

Conclusion The observed decrease in ReHo values in the sensorimotor network and increase in ReHo values in the right putamen may represent distinctive neurobiological characteristics of patients with SCZ, as well as a potential neuroimaging biomarker for distinguishing between patients with SCZ and HCs. Furthermore, ReHo values in the sensorimotor network and right putamen may serve as predictive indicators for early treatment response in patients with SCZ

关键词: brain; magnetic resonance imaging; regional homogeneity; schizophrenia; support vector machine; support vector regression.

Disrupted Interhemispheric Coordination of Sensory-motor Networks and Insula in Major Depressive Disorder

Chunguo Zhang¹, Guojun Xie¹, Wenbin Guo²

1. The Third People's Hospital of Foshan

2. The Second Xiangya Hospital of Central South University

Objective Prior researches have identified distinct differences in neuroimaging characteristics between healthy controls (HCs) and patients with major depressive disorder (MDD). However, the correlations between homotopic connectivity and clinical characteristics in patients with MDD have yet to be fully understood. The present study aimed to investigate common and unique patterns of homotopic connectivity and their relationships with clinical characteristics in patients with MDD

Methods We recruited 42 patients diagnosed with MDD and 42 HCs. We collected a range of clinical variables, as well as exploratory eye movement (EEM), event-related potentials (ERPs) and resting-state functional magnetic resonance imaging (rs-fMRI) data. The data were analyzed using correlation analysis, support vector machine (SVM), and voxel-mirrored homotopic connectivity (VMHC)

Results Compared with HCs, patients with MDD showed decreased VMHC in the insula, and increased VMHC in the cerebellum 8/vermis 8/vermis 9 and superior/middle occipital gyrus. SVM analysis using VMHC values in the cerebellum 8/vermis 8/vermis 9 and insula, or VMHC values in the superior/middle occipital gyrus and insula as inputs can distinguish HCs and patients with MDD with high accuracy, sensitivity, and specificity

Conclusion The study demonstrated that decreased VMHC in the insula and increased VMHC values in the sensory-motor networks may be a distinctive neurobiological feature for patients with MDD, which could potentially serve as imaging markers to discriminate HCs and patients with MDD

关键词: brain; magnetic resonance imaging; major depressive disorder; support vector machine; voxel-mirrored homotopic connectivity.

不同非药物干预方式对青少年抑郁症患者影响的网状 Meta 分析

陈洋洁 赵娟*

山西医科大学第一医院

目的 评估不同非药物干预方式对青少年抑郁症患者的干预效果,为护理实践提供非药物干预的循证。

方法 系统检索中国知网、中国生物医学文献数据库、万方数据库、维普数据库、PubMed、Embase、Cochrane Library 等数据库中关于非药物干预方式对青少年抑郁症患者影响的随机对照试验,同时进行溯源。检索时限为建库至 2023 年 12 月。使用 Stata 17.0 和 Review Manager 5.3 软件进行网状 Meta 分析。

结果 最终纳入 32 项研究,包括 14 种非药物干预方式,共 2680 例青少年抑郁症患者。网状 Meta 分析结果显示,与常规护理组相比,运动疗法[SMD=-4.21,95%CI(-8.25,-3.46),P<0.001]、认知行为疗法[SMD=-3.52,95%CI(-5.42,-3.28),P<0.001]、综合心理疗法[SMD=-3.13,95%CI(-8.60,-0.26),P<0.001]、对青少年抑郁症患者具有较好的改善效果。累积排序概率图下面积显示,运动疗法是改善青少年抑郁症患者的最佳非药物干预方式。

结论 在青少年抑郁症患者的非药物干预中,运动疗法效果最佳,可以在临床实践中进行拓展,但仍需大量高质量随机对照试验进行验证。

Dose-response Relationship between Different Physical Activity Types and Depressive Symptoms in Middle-aged and Older Adults: A Study of Chinese Urban-rural Differences

Rui Wang^{1,2}, Jianyu Tan^{1,2}, Zhewei Su^{1,2}, Yiting Kong^{1,2}, Su Hong^{1,2}, Pan Ran^{1,2}, Li Kuang^{1,2}

1.The First Affiliated Hospital of Chongqing Medical University

2.Psychiatric Center, The First Affiliated Hospital of Chongqing Medical University

Objective Evidence on the dose-response connection involving depressive symptoms and various types of physical activity in urban and rural populations is scarce. This study compares the dose-response connection across depressive symptoms and different types of activity in populations living in rural and urban areas

Methods 15,904 participants submitted data for the 2020 China Health and Retirement Longitudinal Study (CHARLS). The type and duration of physical activity were determined by self-assessment reports. The Centre for Epidemiological Studies Depression Scale was used to measure depressive symptoms. The dose-response link between different types of physical activity and depressive symptoms was determined using multifactorial logistic regression analysis

Results In the rural population, 1,200-3,000 METs-min/week of recreational physical activity was found to be inversely linked to depressive symptoms in contrast to the sedentary population (OR=0.82, 95% CI: 0.745-0.910). The risk for depressive symptoms increased with recreational physical activity exceeding 12,000 METs-min/week (OR=1.43, 95% CI: 1.044-1.952), as did over 6,000 METs-min/week of non-recreational activity. In the urban population, 600-12,000 METs-min/week of recreational physical activity was related to a reduced incidence of depressive symptoms compared to sedentary groups, whereas the risk rose with non-recreational physical activity over 3,000 METs-min/week

Conclusion The dose-response connection between different physical activity types and depressive symptoms varies between rural and urban areas. Compared to non-recreational physical activity, recreational physical activities are better for mental health

关键词: Depressive symptoms, physical activity, dose, urban-rural difference

内感受在抑郁症患者社会支持和社交能力转换机制中的研究

王文亮 周红亮*
江南大学

目的 社会支持与社交能力有关。然而如何将外界的社会支持转化为自身的社交能力,机制未明。本研究意在探究社会支持和社交能力的心理转换机制,确认内感受是否为该转换过程的中介因素。

方法 本研究最终纳入符合 DSM-5 的 MDD 患者 292 例及健康对照 257 例,选用 PHQ-9、MAIA-2、SSRS 和 TSBI 评估抑郁、内感受、社会支持以及社交能力,建立社会支持、内感受(包含八个维度:注意、不分心、不担心、注意调节、情绪觉察、自我调节、躯体聆听、信任)以及社交能力的中介分析模型,比较两组的中介变量及中介占比。

结果 通过偏相关分析及中介分析,发现社会支持、内感受、社交能力之间存在两两相关。MDD 组中,情绪觉察、自我调节、躯体聆听和信任为中介变量;HC 中,注意调节、情绪觉察、自我调节和信任为中介变量。两组人群均有四个中介变量,且有三个相同的中介变量,相较于健康人,相同的中介变量在 MDD 组的中介比例下降。

结论 内感受是社会支持和社交能力心理转换机制的中介变量,内感受的损伤和该转换机制的破坏是影响抑郁症疾病进展的一个重要因素。后续的研究应该关注于如何调节内感受从而改善该转换过程,进而改善抑郁症的症状及预后。

关键词: 抑郁症,内感受,社会支持,社交能力

RTMS 联合药物及 CBT 治疗青少年抑郁障碍的临床研究

邱虹*
银川市第一人民医院

目的 探讨重复经颅磁刺激(rTMS)联合药物及认知行为疗法(CBT)治疗青少年抑郁障碍的临床效果。

方法 收集 2022 年 1 月至 2023 年 12 月,我院精神心理科就诊的青少年抑郁障碍患者 100 例为研究对象。采用随机数字表法分成药物治疗组、药物+CBT 组、药物+rTMS 组、药物+rTMS+CBT 组。药物治疗组给予抗抑郁药物治疗;药物+rTMS 组在药物治疗的基础上联合 rTMS 治疗;药物+CBT 组在药物治疗的基础上联合 CBT 治疗;药物+rTMS

+CBT 组在药物治疗的基础上联合 rTMS 及 CBT 治疗。四组患者分别在治疗前、治疗 2、4 和 8 周后采用汉密尔顿抑郁量表 24 项版 (HAMD-24)、汉密尔顿焦虑量表 (HAMA)、匹兹堡睡眠质量指数 (PSQI)、耶鲁布朗强迫量表 (Y-BOCS)、自杀风险评估量表 (NGASR)、临床疗效总评量表 (CGI) 进行评估。

结论 rTMS 联合药物及 CBT 治疗青少年抑郁障碍, 对比其他治疗方法能够更好地改善患者抑郁、焦虑情绪, 提高睡眠质量, 减少强迫性思维, 有效率更高。

结果 治疗 8 周后, 药物+rTMS+CBT 组的 HAMA 得分、HAMD 得分、Y-BOCS 得分显著低于其他三组 ($P < 0.05$), 临床疗效显著高于其他三组 ($P < 0.05$)。

内感受在社会支持与抑郁症中的中介作用及性别差异

吴玉顷^{1,2} 逯美晨^{1,2} 刘晓红² 周振和^{1,2} 周红亮³

1. 江南大学

2. 江南大学附属精神卫生中心

3. 江南大学附属医院

结论 基于内感受的中介作用探讨社会支持对于抑郁症影响的性别差异, 为开展内感受的正念干预提供理论基础。

方法 本研究采用横断面问卷调查, 纳入无锡市精神卫生中心 390 名抑郁患者 (男性/女性: 150/240), 使用社会支持评定问卷 (SSRS) 评估社会支持程度、内感受多维评估量表 (MAIA-2C) 评估内感受、抑郁筛查量表 (PHQ-9) 评估抑郁状况; 依据性别分组, 首先将 SSRS (包括客观支持、主观支持、支持利用度)、MAIA-2C (包括注意、不专心、不担心、注意力调节、情绪意识、自我调节、身体倾听与信任) 以及 PHQ-9 总分进行相关分析, 其次将存在两两相关变量纳入中介模型, 构建男性与女性的中介模型。

结果 研究结果显示女性与男性相比, 社会支持评分更低, 抑郁严重程度更重。在相关分析中男

女之间各分量表相关显著维度存在性别差异。在男性抑郁患者中社会支持三个分维度、内感受注意、抑郁三者之间存在两两相关, 提示内感受注意维度可能是男性社会支持与抑郁之间的中介变量。女性社会支持、内感受自我调节/内感受信任、抑郁三者之间存在两两相关, 提示存在中介变量。在中介验证分析中, 男女之间存在显著性别差异。内感受注意维度在社会支持与男性抑郁症状中起部分中介作用, 内感受自我调节与内感受信任维度在社会支持与女性抑郁症状中起部分中介作用。

结论 社会支持的水平与抑郁程度存在密切相关, 低社会支持是女性抑郁程度高于男性的重要原因。社会支持对于抑郁的影响部分通过内感受起作用, 揭示了抑郁症背后的潜在神经机制, 内感受的性别差异可能是导致女性抑郁症重于男性的生理原因。未来为了减轻女性患者的抑郁程度, 需要重点提高社会支持的水平与质量, 尤其是开发基于内感受的心理疗法。

关键词: 性别差异, 抑郁症, 社会支持, 内感受, 中介分析

抑郁症患者采取药物治疗、认知行为疗法与心理社会支持治疗的效果观察

陈敬会*

自贡市精神卫生中心

目的 抑郁症在临床上作为一种常见的心理疾病类型, 主要特征为情绪持续、显著低落, 临床症状为过度悲伤、闷闷不乐、自卑等, 甚至会有躯体症状产生、思维变缓、动作减少等, 对患者正常生活造成严重的影响[1]。该病以药物治疗为主, 然而, 药物治疗后却会发生复发。而在药物治疗同时联合心理疗法效果更佳。观察对抑郁症患者予以药物、心理社会支持、认知行为疗法的效果。

方法 观察对象为 2021.1~2022.1 就诊于我院的抑郁症患者 78 例, 随机数字法予以分组, 39 例分为对照组, 对照组的治疗方法为药物治疗, 选择的药物为盐酸帕罗西汀, 20mg/次, 1 次/d 为起始剂量, 口服方式, 早晨用药, 在 2~3 周治疗后, 以药物效果和耐受程度为依据使剂量逐渐增加, 每周 10mg 剂量增加, 日剂量最大不得 >50mg。39 例予以药物、

心理社会支持、认知行为疗法者归纳到治疗组，对比和观察治疗效果。

结果 和对照组对比，治疗组患者治疗后 HAMD（抑郁）评分明显较低， $P<0.05$ ；和对照组对比，治疗组患者治疗后 MMSE（认知功能）评分明显较高， $P<0.05$ 。

结论 对抑郁症患者予以药物、心理社会支持、认知行为疗法效果突出，可改善患者抑郁症状和认知功能，建议推广。

抑郁症自杀行为问卷修订版的信效度检验

杨军韦¹ 徐家玥² 周云飞¹

1. 深圳市精神卫生中心/深圳市康宁医院

2. 中山大学附属第八医院临床心理科

目的 自杀行为问卷修订版(Suicide Behavior Questionnaire Revised, SBQ-R)仅在国外研究中运用较多，国内研究仍较少涉及，且尚未见到关于该量表中文版在抑郁症患者中信效度的研究。本研究考察该量表在中国抑郁症患者中进行应用的情况，收集数据进行量表信效度的检验。

方法 选取 2023 年 3 月至 2023 年 11 月在深圳市康宁医院住院诊断为“抑郁发作”或“复发性抑郁障碍”的成年患者人群。在患者住院一周内发放量表，包括收集患者个人信息，采用汉密尔顿抑郁量表进行评估，纳入汉密尔顿抑郁量表 ≥ 7 分的患者再让患者亲自填写贝克绝望量表、自杀行为问卷修订版、简明国际神经精神访谈自杀模块进行评估。数据分析采用 SPSS 25.0 和 AMOS 17.0 软件进行统计分析。使用统计软件对患者的一般情况及临床特征进行描述性统计分析，使用内部一致性信度、折半信度等信度指标，结构效度、效标效度等效度指标对量表进行信效度分析。

结果 在信度方面，内部一致性信度系数为 0.829，分半信度为 0.830，表明量表有良好的信度，在效度方面，进行探索性因素分析显示，KMO 值为 0.703，Bartlett 球性检验 143.307($P<0.001$)，各条目的公因子方差均大于 0.4，抽取特征值大于 1 的公因子 1 个，共可解释 61.99% 的变异量，说明因子对

原始变量的解释能力尚可。采用单因子模型对样本进行验证性因素分析，模型拟合指数如 CFI 值、IFI 值、NFI 值均大于 0.9，TLI 值接近 0.9，结果说明本量表具有较好的结构效度。选用贝克绝望量表、汉密尔顿抑郁量表、简明国际神经精神访谈自杀模块来考察本量表的同时效度，结果表明本量表和贝克绝望量表、汉密尔顿抑郁量表、简明国际神经精神访谈自杀模块呈显著相关 ($P<0.01$)。对 SBQ-R 每个项目的得分与总分进行相关分析，结果显示相关系数在 0.666-0.886 之间，且所有相关系数均呈显著相关 ($P<0.01$)。

结论 研究表明，自杀行为问卷修订版具有较好的信度和效度，可以作为抑郁症患者的自杀行为评估量表。

青少年抑郁症患者家庭复原力的现状及影响因素研究

范亚荣¹ 康凤英² 李素萍² 杜巧荣² 和美清³

1. 山西医科大学护理学院

2. 山西医科大学第一医院

3. 山西省精神卫生中心

目的 青少年抑郁症已经成为该群体致病和致残的首要原因，预计该疾病在 2030 年成为全球疾病负担首位。长期的居家照护会使主要照顾者产生沉重的照护负担，对家庭造成较大的压力与挑战。随着家庭压力理论和家庭系统理论的发展以及积极心理学的兴起，家庭复原力逐渐成为家庭压力适应领域的研究热点。现有研究表明，从优势视角关注家庭复原力的提升，可以促进家庭成员利用优势资源与力量维持家庭的正常功能，促进家庭良好适应，保护家庭成员的身心健康。因此，本研究旨在调查青少年抑郁症患者家庭复原力现状及影响因素，为制定以家庭为中心的护理方案及促进患者的康复提供参考。

方法 采用便利抽样法，选择 2023 年 5 月至 10 月在山西省某两所三级甲等医院精神卫生科住院的 200 例青少年抑郁症患者的主要照顾者为研究对象。采用一般资料调查问卷、中文版家庭复原力评估量

表、家庭功能评估量表—总的功能分量表、社会支持评定量表、简易应对方式问卷进行调查。使用SPSS26.0软件进行统计分析,采用描述性统计分析、单因素分析、Pearson相关性分析及多元逐步回归分析的方法进行统计分析,以 $P<0.05$ 为检验水准。

结果 200例青少年抑郁症患者主要照顾者家庭复原力得分为(120.16±10.13)分,家庭复原力总分与家庭功能得分呈负相关(家庭功能量表得分越高表明家庭功能越差),与积极应对、社会支持及各维度得分呈正相关(均 $P<0.05$)。多元逐步回归分析结果显示,照顾者的文化程度、家庭功能、社会支持、积极应对方式是青少年抑郁症患者照顾者家庭复原力的影响因素(均 $P<0.05$),解释总变异的49.7%。

结论 青少年抑郁症患者的家庭复原力处于中等偏上水平;家庭功能、社会支持、积极应对及主要照顾者的文化程度是家庭复原力的影响因素。医护人员应加强对青少年抑郁症患者主要照顾者的知识宣教和照护指导,帮助照顾者保持积极的心态应对疾病带来的压力与挑战,同时重视其家庭功能、社会支持和应对方式的评估并及时干预,以提高青少年抑郁症患者的家庭复原力水平,促进患者康复进程。

Impairment in Acquisition of Conditioned Fear in People with Depressive Symptoms

Jianli Yang* Ruihan Luo Xinyue Zhao
Tianjin Medical University General Hospital

Objective Depression is one of the primary global public health issues, and there has been a dramatic increase in depression levels among young people over the past decade. The neuroplasticity theory of depression postulates that a malfunction in neural plasticity, which is responsible for learning, memory, and adaptive behavior, is the primary source of the disorder's clinical manifestations. Nevertheless, the impact of depression symptoms on associative learning remains underexplored

Methods We used the differential fear conditioning paradigm to investigate the effects of depressive symptoms on fear acquisition and extinction learning. Skin conductance response (SCR) is an objective evaluation indicator, and ratings of nervousness, likeability, and unconditioned stimuli (US) expectancy are subjective evaluation indicators. In addition, we used associability generated by a computational reinforcement learning model to characterize the skin conductance response

Results The findings indicate that individuals with depressive symptoms exhibited significant impairment in fear acquisition learning compared to those without depressive symptoms based on the results of the skin conductance response. Moreover, in the discrimination fear learning task, the skin conductance response was positively correlated with associability, as estimated by the hybrid model in the group without depressive symptoms. Additionally, the likeability rating scores improved post-extinction learning in the group without depressive symptoms, and no such increase was observed in the group with depressive symptoms

Conclusion The study highlights that individuals with pronounced depressive symptoms exhibit impaired fear acquisition and extinction learning, suggesting a possible deficit in associative learning. Employing the hybrid model to analyze the learning process offers a deeper insight into the associative learning processes of humans, thus allowing for improved comprehension and treatment of these mental health problems

基于重复信任博弈任务的抑郁症患者CBT治疗有效组与无效组差异研究

生芳睿¹ 金悦宁² 王赞¹ 周媛² 王刚¹

1.首都医科大学附属北京安定医院

2.中国科学院心理研究所

目的 抑郁症(Major Depressive Disorder, MDD)患者往往伴随着负性认知增多,难以从负性刺激和

情绪状态中恢复。认知行为治疗(Cognitive Behavioral Therapy, CBT)旨在通过重建患者对自身、他人和世界的负性认知,激活适应性行为,以达到缓解抑郁症状的目的。尽管 CBT 目前被认为是治疗 MDD 患者的一线治疗方式,但是其治疗有效率仅有 50%-60%。因此,本研究旨在探索 MDD 患者在 CBT 治疗前的临床心理特征、重复信任博弈任务中的行为学参数、大脑功能活动以及预期偏差调节的脑功能活动在治疗有效组与无效组间是否具有显著差异,为阐明 MDD 患者治疗基线期的认知学习过程对 CBT 治疗的敏感性以及为发现潜在的用于预测 CBT 疗效的生物标志物提供进一步的证据。

方法 本研究共纳入 43 例 17 项汉密尔顿抑郁量表(Hamilton Depression Scale, HAMD-17)得分 ≥ 17 分, <24 分的 MDD 患者,采集人口学信息、完成临床神经心理量表评估、以及重复信任博弈任务的功能磁共振扫描。接受 12 周 CBT 治疗后,根据 HAMD-17 减分值是否 $\geq 50\%$,将完成治疗的患者分为治疗有效组和治疗无效组。采用卡方检验、独立样本 t 检验等方法比较两组在治疗前的人口学统计资料、临床心理指标、行为学(一般行为学、强化学习模型参数)和影像学指标上的差异。

结果 共有 23 人被纳入治疗有效组,14 人纳入治疗无效组,6 人脱落。治疗前有效组和无效组间的 HAMD-17 得分差异显著,HAMA、PHQ-9、BDI-II 得分差异接近但未达到显著水平,有效组症状严重程度低于无效组严重程度。行为学上,有效组进行低投资决策的次数显著高于无效组,对中性对手的损失学习率也显著高于无效组;且治疗前有效组存在对所有对手损失学习率偏高、收益学习率偏低的趋势。影像学上,反馈阶段面对不同类型对手时,有效组在左侧枕上回、右侧颞上回、梭状回/舌回、双侧旁中央小叶的激活高于无效组;小体积校正发现,面对中性对手时,有效组在右侧背侧纹状体的激活高于无效组。预期偏差调节的大脑活动在左侧脑岛、双侧楔叶、右侧缘上回的对手类型主效应显著,组别主效应不显著。

结论 基于重复信任博弈任务发现,MDD 患者治疗有效组与无效组在临床、行为、脑指标上均存在显著差异,这些差异提示 MDD 患者治疗有效组在基线期可能对损失更为敏感,而治疗无效组在基线期对他人反馈更不敏感;在对手信息不可预测性较强时,两组差异可能更为显著。该研究发现有助于增进对 CBT 治疗机制的理解,也提示重复信任博

弈任务对探索 MDD 患者 CBT 疗效生物标志物的潜在可能。

青少年单双相抑郁患者临床特征与炎症因子及尿酸水平的相关性

杨建立* 任远莉 罗睿涵 朱嘉琦
天津医科大学总医院

目的 由于青少年单双相抑郁患者鉴别困难,误诊率高,因此越来越多的研究探讨鉴别单双相情感障碍的临床特征及客观生物标志物,相关研究得出尿酸及炎症因子水平与单双相情感障碍发生发展以及严重程度有一定的相关性,本研究通过对单双相抑郁青少年患者的临床特征评估及尿酸、多种炎症标志物(C 反应蛋白、白细胞计数、中性粒细胞)水平的检测来探究两者临床特征差异和尿酸及多种炎症标志物水平与临床特征相关性。

方法 采用一般情况量表、汉密尔顿抑郁量表、汉密尔顿焦虑量表、轻躁狂症状自评量表(HCL-32)、杨氏躁狂量表、渥太华自伤量表、哥伦比亚-自杀严重程度量表、实验室生化检测资料。对连续性变量采用 Shapiro-Wilk 检验进行正态性检验,服从正态分布的计量资料采用独立样本 T 检验,非正态分布的计量资料用中位数和四分位数 [M (P25, P75)] 表示,采用 ROC 曲线下面积 (area under curve, AUC) 反映预测的准确性。采用 Pearson 或 Spearman 相关系数分析相关性。

结果 具有非自杀性自伤、自杀行为、同伴 NSSI 行为、同伴自杀行为、非典型单相抑郁组,青少年双相抑郁组抑郁焦虑严重程度均高于单相抑郁组,且均具有统计学差异 ($P < 0.05$);青少年双相抑郁组自伤行为倾向明显高于单相抑郁组,双相抑郁组因为释放压力、体验快感、摆脱孤独与空虚、释放紧张恐惧等而自伤明显高于单相抑郁组,均具有统计学差异 ($P < 0.05$);有自杀意念的双相抑郁组白细胞水平高于无自杀意念的单相抑郁组;有自杀意念的双相抑郁组 C-反应蛋白水平高于单相抑郁组,有自杀意念的双相抑郁组尿酸水平高于有自杀意念的单相抑郁组,均具有统计学差异 ($P < 0.05$);双相抑

郁组 WBC、CRP、UA 水平较单相抑郁组高, 差异有统计学意义 ($P < 0.05$); CRP、尿酸水平升高是双相抑郁组的危险因素 ($P < 0.05$), CRP、UA 单独区别单相抑郁和双相抑郁有一定的预测效果; 单相抑郁组的抑郁严重程度与 WBC、NE 水平有正相关性, 双相抑郁组的抑郁焦虑严重程度均与 UA 水平有正相关, 但相关性均较微弱。

结论 青少年双相抑郁患者焦虑抑郁严重程度以及自伤行为、自杀意念均高于单相抑郁患者, 且与 CRP 及 UA 水平具有一定相关性, 同时与青少年单相抑郁患者相比, CRP、UA 水平升高是双相抑郁患者的危险因素, CRP、UA 水平可能是鉴别青少年单双相抑郁的生物学指标, 但仍需要大量样本实施更加完善的设计去进一步研究。

关键词: 青少年, 单双相抑郁, 尿酸水平, C-反应蛋白, 非自杀性自伤, 自杀意念

应用 DTI-ALPS 指数分析抑郁障碍患者脑类淋巴系统功能的纵向变化

周智凤 徐紫云 彭博 江文涛 侯刚强*
深圳市精神卫生中心/深圳市康宁医院

目的 基于沿血管周围间隙的扩散张量成像 (diffusion tensor imaging analysis along the perivascular space, DTI-ALPS) 指数分析, 探讨抑郁障碍患者脑类淋巴系统功能的纵向改变及其影响因素。

方法 回顾性分析 20 例根据 DSM-V 标准诊断为抑郁障碍的患者的基线及随访 DTI 数据资料, 两次数据采集时患者皆处于抑郁发作状态。其中男性 5 例, 女性 15 例, 基线年龄 40.25 ± 16.06 岁, 病程 10.05 ± 11.13 年, 发作次数 2.5 ± 1.32 次, 随访问隔 17.65 ± 9.64 个月。DTI 数据经过 FSL 及 SPM12 预处理后获得各被试 x、y、z 三个方向的弥散图 (D_x 、 D_y 、 D_z), 根据白质模板 (ICBM-JHU) 提取侧脑室顶层面 (MNI 坐标 $z=28$) 的双侧前、中、后放射冠及上矢状束的 D_x 、 D_y 、 D_z 值, 计算投射纤维 (即放射冠) 的平均 D_x 、 D_y 和联络纤维 (即上矢状束) 的平均 D_x 、 D_z 值, 以及双侧前、中、后 DTI-ALPS 指数值。计算公式: $DTI-ALPS = (\text{投射 } D_x + \text{联络 } D_x) / (\text{投射 } D_y + \text{联络 } D_z)$ 。采用配对 t 检验分析患者纵向数据各指标之间的差异, 并将其与年龄、病程、血

清皮质醇水平、促肾上腺皮质激素水平、汉密尔顿抑郁量表 (HAMD-17)、汉密尔顿焦虑量表评分进行 Pearson 相关分析, 与发作次数进行 Spearman 相关分析。

结果 抑郁障碍患者随访时的投射纤维 D_x 值明显高于基线水平 ($t=2.515, p=0.021$), 随访时的左侧前部 DTI-ALPS 值明显高于基线水平 ($t=2.223, p=0.039$), 且投射纤维 D_x 值与血清皮质醇水平呈显著正相关 (基线: $r=0.493, p=0.032$; 随访: $r=0.57, p=0.009$)。

结论 随着病程进展, 抑郁障碍患者脑类淋巴系统功能变化的脑区主要发生在左侧前部区域, 并且受到血清皮质醇水平的调节。

儿童期虐待与高中生抑郁症状之间的关系及内观认知疗法干预研究

毛富强* 彭悦悦
天津医科大学

目的 为了探讨儿童期虐待与高中生抑郁症状之间的关系以及领悟社会支持在其中可能存在的中介效应; 分析内观认知疗法对高中生抑郁症状的改善效果, 为改善高中生抑郁症状提供有效的干预思路, 从而提高高中生的心理健康水平。

方法 分为横断面研究和干预性研究。1. 横断面研究: 采用自编一般情况调查问卷、儿童期创伤问卷/简式儿童期虐待问卷 (CTQ-SF)、领悟社会支持问卷 (PSSS) 以及流调中心抑郁量表 (CES-D) 对安徽省某高中在校学生进行调研。2. 干预性研究: 从横断面研究中筛选 75 名有不同程度抑郁症状的高中生为研究对象, 所有研究对象均符合流调中心抑郁量表 (CES-D) 得分大于 15 分, 将研究对象随机分为干预组与对照组; 以领悟社会支持问卷 (PSSS)、流调中心抑郁量表 (CES-D) 作为评估工具分别对两组高中生进行干预前后的测评, 比较两组高中生干预前后领悟社会支持和抑郁症状的改善效果。

结果 1. 横断面研究: (1) 采用皮尔逊相关分析结果显示, 儿童期虐待和抑郁症状之间有着显著正相关关系 ($r=0.735, P < 0.001$); 抑郁症状和领悟社会

支持之间有着显著负相关关系($r=-0.586$, $P<0.001$); 儿童期虐待和领悟社会支持之间有着显著负相关关系($r=-0.603$, $P<0.001$)。 (2) 儿童期虐待既可以直接预测高中生抑郁症状发生($\beta=0.735$, $P<0.001$), 也可以通过领悟社会支持这一中介变量间接影响高中生抑郁症状($\beta=0.600$, $P<0.001$); 直接效应占总效应的 81.63%, 间接效应占总效应的 18.37%。 2. 干预性研究: 本研究共获得有效数据干预组 38 份, 对照组 37 份, 有效回收率为 94%。 内观认知疗法较心理健康教育更能有效提高个体领悟社会支持水平 [$F(1,73)=67.139$, $P<0.001$], 改善高中生抑郁症状 [$F(1,73)=225.665$, $P<0.001$]。

结论 (1) 儿童期虐待与高中生抑郁症状呈显著正相关; (2) 儿童期虐待既可以直接影响抑郁症状, 又可以通过领悟社会支持的部分中介作用间接影响抑郁症状; (3) 内观认知疗法对提升高中生的领悟社会支持水平有一定干预效果, 并且可以有效改善高中生的抑郁症状。

Treatment-resistant Depression with Poor Response To Deep Brain Stimulation Improves with Psychotherapy: A Case Report

Shuping Fang Jun Zhang*

Mental Health Center, West China Hospital, Sichuan University, Chengdu, China

Background Treatment-resistant depression (TRD) is commonly defined as the lack of response to two or more full-dose and full-course antidepressant regimens while adhering to treatment, accounting for at least 30% of depression. This clinical scenario has prompted the exploration of deep brain stimulation (DBS) as a potential therapeutic approach. DBS is considered an effective intervention for TRD, demonstrating a response rate of 60%. However, the current surgical technology for DBS is still in its developmental stage, and some patients exhibit poor responsiveness to this treatment modality, necessitating further investigation into potential solutions. In this paper, we present

two cases of TRD patients who exhibited limited improvement in depressive symptoms following DBS surgery but demonstrated significant amelioration after receiving postoperative psychotherapy

Case presentation: A 20-year-old female from China has been suffering from depression for over three years. She has undergone hospitalization more than ten times and received various psychiatric medications at therapeutic doses, including fluoxetine, clozapine, and valproate magnesium, in addition to modified electroconvulsive therapy (ECT). In July 2023, she underwent MR-guided focused ultrasound (MRgFUS) treatment at a hospital in Shanghai, but the results were limited. In October 2023, she received bed nucleus of the stria terminalis (BNST)-nucleus accumbens (NAc) DBS at the same hospital (stimulation parameters: voltage 3V, pulse width 210 μ s, frequency 170 Hz). Despite an initial transient positive response to DBS, her condition continued to progressively deteriorate.

Upon admission to our hospital in January 2024, the patient was prescribed a medication regimen consisting of sodium valproate 500 mg/day, clozapine 150 mg/day, and fluoxetine 60 mg/day. During her hospitalization period, we implemented a systematic cognitive behavioral therapy (CBT) approach. A pivotal aspect of her treatment involved collaboratively establishing a daily self-assessment routine performed no less than twice per day to evaluate the intensity of suicidal impulses on a scale from 0 to 10 points and the level of emotional self-management on a scale from 0 to 10 points. This strategic intervention facilitated enhanced recognition and monitoring of emotional fluctuations and suicide risk, thereby promoting effective communication among the patient, her mother, and healthcare professionals.

Based on these assessments, we established a timeline for the absence of her mother and implemented "safe solitary training". We provided guidance in finding a balance between self-assurance in solitude and apprehension of losing control, engaging in daily activities to foster emotional regulation and independent living. Throughout a five-month follow-up period, the patient gradually extended the duration of her alone time. The behavioral training not only ensured her safety but also

bolstered her self-confidence, alleviated feelings of guilt, and enhanced her emotional and behavioral responses across various scenarios, thereby augmenting her resilience towards setbacks.

Discussion and Conclusion The exact mechanism through which DBS improves depressive symptoms in TRD remains to be fully elucidated. Existing studies have not yet identified the optimal stimulation target or parameters for DBS in TRD treatment nor determined which subgroups of TRD patients would benefit most from DBS therapy. Currently, DBS surgery is not recommended as a standard clinical intervention, with its implementation limited to clinical trials only. Psychotherapy is increasingly acknowledged as an efficacious treatment for depression. Although the precise mechanism of psychotherapy remains incompletely elucidated, combining psychotherapy with other antidepressant treatments can enhance the effectiveness of concurrent therapies. However, psychotherapy is frequently overlooked in patients with TRD. Global investment in mental health remains insufficient, particularly in Asia. It is noteworthy that CBT demonstrates superior efficacy in patients from non-Western countries compared to Western countries, and exhibits a particularly significant effect on Chinese patients. Nevertheless, due to cultural values, the majority of Chinese individuals are hesitant to seek face-to-face psychotherapy. Overcoming these challenges may prove difficult for future depression treatments. Therefore, future research should focus on elucidating the mechanisms underlying psychotherapy's action and developing personalized treatment options tailored to different cultural backgrounds and diverse populations.

Currently, there is limited research on the postoperative management of psychiatric diseases in relation to DBS applications. It should be noted that preoperative and postoperative management may hold equal importance as the DBS intervention itself. Furthermore, DBS, being an invasive therapy involving active stimulation, might be perceived by patients as a "last resort" for rehabilitation. However, some patients still exhibit poor response to DBS. Considering the distinct and complementary mechanisms of psychotherapy and DBS,

we propose considering psychotherapy in the postoperative management of patients with inadequate response to enhance antidepressant treatment efficacy. Notably, no previous study has investigated the impact of psychotherapies like CBT on depressive symptoms following DBS. Therefore, our case highlights the significant role of psychotherapy in alleviating depressive symptoms and underscores its promising potential in treating TRD.

肥胖人群矿物质摄入量与抑郁的关系研究

陆一莹 胡晓华*
武汉市精神卫生中心

目的 探讨肥胖人群的矿物质摄入与抑郁之间的关系,为肥胖人群降低抑郁风险提供饮食依据。

方法 本研究基于美国国民健康与营养调查(National Health and Nutrition Examination Survey)数据纳入了2015-2018年两次调查的数据,研究对象的相关信息包括性别、年龄、种族、教育水平、婚姻、家庭收入、家庭人口、BMI(Body Mass Index, 身体质量指数)、以及矿物质摄入量(磷、镁、铁、锌、铜、钾、硒、锂)。采用PHQ-9(评估研究对象是否患有抑郁,其中PHQ-9评分 ≥ 10 的人群被诊断为患有抑郁)。采用卡方检验(X^2 检验)检验比较抑郁组和非抑郁患者的一般人口学特征。根据BMI是否 $\geq 25\text{kg}/\text{m}^2$ 将符合纳入标准的人群进行分层,分别分为肥胖组和非肥胖组,并比较两组人群的基线资料;随后,采用单因素和多因素logistic回归分析食物中的矿物质摄入水平(按摄入量分为最低摄入组Q1、较高摄入组Q2和Q3、最高摄入组Q4)与抑郁之间的关联。

结果 1.本研究共纳入8204名年龄在20岁及以上的成年人,4007名男性和4197名女性,肥胖组6071例(74.0%),抑郁人群686例(8.4%)。X²检验发现与非抑郁组相比,抑郁组人群更容易出现教育水平较低、BMI较高、家庭收入水平较低的情况,此外女性、未婚、糖尿病患者在抑郁组所占的比例

明显较高。

2. 分层 X^2 检验发现, 在肥胖组, 女性、糖尿病患者人群在抑郁组所占的比例明显高于在非抑郁组人群中所占的比例。

3. 分层分析结果表明, 在单因素 logistic 回归模型中, 肥胖人群较高的镁、硒、锂、锌、摄入量与较低的抑郁风险有关, 而铜的过量摄入与较高的抑郁风险有关, 镁、铁、锌的缺乏可能会引起较高的抑郁风险。在多因素 logistic 回归模型中, 未发现肥胖人群磷、钙、钠摄入与抑郁风险的相关性。

结论 研究揭示了在肥胖人群中抑郁的高发率及其相关因素包括教育水平、BMI、家庭收入、性别和糖尿病等。证实了特定矿物质摄入与肥胖人群抑郁风险之间的关联。例如适量摄入镁、硒、锂、锌与较低的抑郁风险相关, 而铜的过量摄入以及镁、铁、锌的缺乏可能增加抑郁风险。这些发现为基于营养干预的肥胖人群抑郁管理提供了新的科学依据。未来应进一步为个性化医疗和健康饮食制定提供更为详尽和全面的科学依据。

Repetitive Transcranial Magnetic Stimulation Elicits Myoclonus Symptoms in Adolescent Patient with Depression: A Case Report

Shuping Fang Wei Zhang*

Mental Health Center, West China Hospital, Sichuan University, Chengdu, China

Introductio Depression affects approximately 1-3% of adolescents worldwide, with roughly one-third of them exhibiting resistance to conventional pharmacotherapy or psychotherapeutic interventions. A recent meta-analysis has suggested potential benefits of repetitive transcranial magnetic stimulation (rTMS) for depression in children and adolescents, but its efficacy in this population has not been approved by the Food and Drug Administration (FDA) to date. We hereby present evidence that rTMS induces myoclonus symptoms, which may be a previously unrecognized adverse effect

Case presentation: The patient, a 15-year-old female, was diagnosed with a "depressive episode" three

years ago. Despite receiving treatment including fluoxetine (20mg/day), sertraline (100mg/day), valproic acid sodium (500mg/day), quetiapine (0.1 g/day), psychotherapy, and various interventions such as biofeedback therapy, her symptoms persisted. Upon admission to our hospital, she was diagnosed with "Severe depressive episode with psychotic symptoms".

The Hamilton Depression Scale (HAMD) and Hamilton Anxiety Scale (HAMA) were administered upon admission. Relevant medication regimens were subsequently devised as follows: Sertraline 100 mg/day, quetiapine fumarate 0.1 g/day, lithium carbonate 500 mg/day, lorazepam 1 mg/day. Additionally, rTMS was employed. On the first day of the treatment (Day1), the patient underwent her initial session of rTMS. The rTMS treatment was administered by professional medical staff, and no adverse events were observed during the course of the treatment. After rTMS treatment, however, the patient exhibited intermittent jerking movements, while maintaining normal temperature, heart rate, and blood pressure on the same day. On the same day, there were no abnormalities in electroencephalogram, electrocardiogram, magnetic resonance imaging scans of the brain, as well as blood test results including electrolyte levels, glucose levels, markers of renal function and liver function measures. On the second day (Day 2), during the night following the second rTMS treatment (around 21:30), the patient developed approximately 10 episodes of myoclonus symptoms, which were characterized by sudden, brief, involuntary jerking movements mainly involving the right upper limb and face. Meanwhile, no restricted eye movements, loss of consciousness, abnormal muscle tone, generalized tonic-clonic seizures, or emotional agitation were observed. The patient's medical and personal history were thoroughly reviewed, revealing no prior episodes of similar symptoms, physical ailments, family medical history, or abnormal findings on physical examinations. On the third day (day 3), we observed approximately 8 intermittent episodes of myoclonus symptoms, with no abnormal limb movements detected between the episodes. Following a comprehensive assessment of the patient's physical and mental systems by the attending physician

and nurse, psychogenic, drug-induced, or somatic myoclonic seizures were ruled out as potential causes. We postulated that the patient's myoclonus symptoms might be associated with rTMS while the rTMS treatment was suspended. We observed an exacerbation of her depressive symptoms on the same day, accompanied by recurrent self-harming behaviors. On the fourth day (Day 4), we observed persistent and significant mood deterioration, with approximately 3 episodes of myoclonus symptoms. However, on the fifth day (Day 5), no myoclonus symptoms and exacerbation of mood were observed. Subsequently, the patient exhibited no myoclonus symptoms.

Discussion: The patient experienced consecutive adverse effects for four days following rTMS treatment, and discontinuation of rTMS therapy resulted in spontaneous relief of myoclonus symptoms without altering concurrent treatments, thereby providing preliminary evidence supporting the association between myoclonus and rTMS. Despite previous studies demonstrating the potential benefits of rTMS treatment in young patients with depression or myoclonus, conflicting evidence suggests limited efficacy and safety of rTMS in minors. The young patient exhibited no amelioration in depressive symptoms following rTMS treatment; conversely, her HAMD and HAMA scores demonstrated a significant increase throughout the intervention. It is plausible that rTMS therapy can induce abnormal neuronal firing patterns in the brain. Considering that adolescents' brain development is not fully mature compared to adults, they might display increased sensitivity to rTMS leading to potential brain dysfunction. rTMS appears to be well-tolerated in children and adolescents, with most side effects being mild and self-limiting. However, limited research has been conducted on the application of rTMS in adolescents with depression. Our case report may shed light on previously unrecognized adverse effects. This underscores the necessity of exercising caution when applying safety guidelines from adult populations to children or adolescents.

Perceived Social Support and Depressive Symptoms Among Discharged COVID-19 Survivors in The Post-COVID Era in Wuhan, China: A Moderated Mediation Model

Zhenwei Dai^{1,2}, Shu Jing², Xiaoyou Su²

1.Peking University Sixth Hospital, Peking University Institute of Mental Health, NHC Key Laboratory of Mental Health (Peking University), National Clinical Research Center for Mental Disorders (Peking University Sixth Hospital)

2.School of Population Medicine and Public Health, Chinese Academy of Medical Sciences & Peking Union Medical College

Objective Since the COVID-19 pandemic, a serious mental health crisis has occurred among COVID-19 survivors who have recovered and been discharged from hospitals (RD hereafter). RD commonly suffered from depressive symptoms, which could lead to a series of adverse consequences. Hence, it is necessary to reduce the depressive symptoms of RD. Depressive symptoms are potentially protected by perceived social support, resilience, and peace of mind. However, the relationships between these factors are still unclear in RD. The purpose of this study is to identify the mechanism through which perceived social support, resilience, and peace of mind were associated with depressive symptoms among RD, and to provide a theoretical basis for the reduction of depressive symptoms in the post-COVID era

Methods A cross-sectional study was conducted on COVID-19 patients between June 10 to July 25, 2021, in Jianghan District, Wuhan, China. An online structured questionnaire containing the Patient Health Questionnaire (PHQ-9), the Peace of Mind Scale (PoM), the Resilience Style Questionnaire (RSQ), and the Perceived Social Support Scale (PSSS) was respectively used to measure depressive symptoms, the level of peace of mind, resilience, and perceived social support among RD. Moderated mediation analysis was used to identify the mechanism of the association between per-

ceived social support, resilience, peace of mind, and depressive symptoms in RD

Results 1297 RD were finally included in the analysis, and 37.9% of them reported depressive symptoms to varying degrees. The PoM score was (24.70±5.99), the RSQ score was (56.82±14.04), and the PSSS score was (14.25±5.18). Resilience could partially mediate the association between perceived social support and depressive symptoms ($\beta=-0.011$, $P=0.026$). Peace of mind could moderate the association between perceived social support and resilience ($\beta=0.084$, $P<0.001$), perceived social support and depressive symptoms ($\beta=0.062$, $P=0.006$), and the mediation effect of resilience between perceived social support and depressive symptoms

Conclusion In the post-COVID era, tailored interventions that enhance perceived social support, resilience, and peace of mind may be effective strategies to alleviate depressive symptoms among RD

早期适应不良图式对童年创伤抑郁症患者自杀风险的影响: 早期适应不良图式的中介作用

马晓林¹ 陈星¹ 李翠¹ 宋红兵¹ 金书蕾¹ 刘祎诺¹ 李卫军¹ 王继军²

1.南通市第四人民医院

2.上海市精神卫生中心

目的 探讨早期适应不良图式在童年创伤与抑郁症患者自杀风险中的中介效应。

方法 选取南通市第四人民医院 41 例确诊为抑郁症住院患者(研究组)和 64 例健康志愿者(对照组),使用童年创伤问卷、Young 图式量表、贝克自杀意念量表中文版比较两组早期适应不良图式、童年创伤和自杀风险的差异;评估抑郁症人群中童年创伤、早期适应不良图式、自杀风险之间的相关性,并探究早期适应不良图式在童年创伤与抑郁症患者自杀风险中的中介作用。

结果 (1) 研究组童年创伤总分、情感虐待、

躯体虐待、情感忽视、躯体忽视、早期适应不良图式总分、分离和拒绝、自主性和能力不足、他人导向、过于警惕和压抑、自杀风险均高于对照组。

(2) 童年创伤总分、情感虐待、躯体虐待、性虐待、情感忽视与抑郁症患者自杀风险呈显著正相关;

(3) 童年创伤总分与早期适应不良图式总分、分离和拒绝、自主性和能力不足、他人导向、过于警惕和压抑呈显著正相关;情感虐待与早期适应不良图式总分、分离和拒绝、自主性和能力不足、他人导向、过于警惕和压抑呈显著正相关;躯体虐待与早期适应不良图式总分、分离和拒绝、自主性和能力不足呈显著正相关;情感忽视与早期适应不良图式总分、分离和拒绝、自主性和能力不足、他人导向、过于警惕和压抑呈显著正相关。

(4) 早期适应不良图式总分、分离和拒绝、自主性和能力不足、他人导向、过于警惕和压抑与抑郁症患者自杀风险呈显著正相关。

(5) 童年创伤不仅可以直接作用影响抑郁症自杀风险,也可以通过 9 条路径影响抑郁症自杀风险。分别是:童年创伤→早期适应图式→自杀风险、童年创伤→分离和拒绝→自杀风险、童年创伤→自主性和能力不足→自杀风险、情感虐待→早期适应图式→自杀风险、情感虐待→分离和拒绝→自杀风险、情感虐待→自主性和能力不足→自杀风险、躯体虐待→早期适应图式→自杀风险、躯体虐待→分离和拒绝→自杀风险、躯体虐待→自主性和能力不足→自杀风险 9 条路径。每条中介效应值分别为 0.45、0.57、0.57、1.26、1.58、1.51、1.46、1.84、1.68,分别占总效应的 34.62%、43.85%、40.00%、30.43%、38.16%、36.47%、35.27%、44.45%、40.58%。

结论 (1) 抑郁症患者童年创伤、早期适应不良图式、自杀风险水平高于健康人群。

(2) 抑郁症患者童年创伤、早期适应不良图式和自杀风险两两之间具有显著相关性。

(3) 早期适应不良图式在童年创伤和抑郁症自杀风险中起部分中介作用。

(4) 童年创伤总分、情感虐待、躯体虐待以及早期适应不良图式总分、分离和拒绝、自主性和能力不足可能是抑郁症患者自杀风险的危险因素和预测因子。

中国中老年人群互联网使用与认知功能的关系-基于 2020 年 CHARLS 数据库的实证分析

刘小恩 王立娜*

天津市安定医院

目的 探索中国中老年人群互联网的使用与认知功能的关系及相关影响因素。

方法 基于中国健康与养老追踪调查 (China Health and Retirement Longitudinal Study, CHARLS) 2020 年公开数据,共纳入 1982 名年龄在 45-80 岁间的中老年人群。其中互联网使用组 1098 人,包括男性 614 (55.9%)、女性 484 (44.1%),年龄 45-80 (55.80±7.00) 岁。非互联网组 884 人,包括男性 521 (58.9%)、女性 363 (41.1%),年龄 45-80 (61.88±7.90) 岁。认知功能的测试包括定向力、计算力、记忆力、绘画和回忆。使用流调中心抑郁量表-10 (Center for Epidemiological Studies Depression Scale, CES-D-10) 评估人群的抑郁情绪。连续变量采用 t 检验,分类变量采用 χ^2 检验,采用多因素线性回归分析检验互联网使用与认知的关系,亚组分析采用相关协变量进行分层。

结果 互联网使用组较非互联网使用组年龄小,城市人口多、已婚人口多、教育水平高、参加活动少,差异具有统计学意义 ($P<0.05$)。互联网使用组的定向力评分、计算评分、记忆评分、回忆评分、绘画评分及认知总评分均较非互联网使用组高,差异具有统计学意义 ($P<0.05$)。使用协变量筛查影响互联网使用与认知功能关系的因素包括年龄和教育水平。采用多因素线性回归分析,在矫正性别、年龄、教育水平、婚姻和居住地后,相比非互联网使用组,互联网使用组认知评分增加 1.54 ($P<0.001$)。根据协变量因素进行分层分析,将年龄以 65 岁为截断值分为两组,以检测不同的性别、年龄、教育水平、婚姻和居住地组别中互联网使用与认知评分是否存在关联。结果显示居住地与互联网使用存在显著的交互作用 ($P<0.05$),在农村人口中,相比非互联网使用组,互联网使用组认知评分增加 2.24 ($P<0.001$);在城市人口中,相比非互联网使用组,互联网使用组认知评分增加 1.16 ($P<0.001$)。其它亚组中未观察到显著的交互作用 ($P>0.05$)。

结论 在中国的中老年人群中,互联网的使用

与较高的认知功能有关,且这种关联在不同地区的人群中存在差异。

血镉水平变化与抑郁症状及睡眠时长的关系

李瑞彤*

安徽医科大学附属巢湖医院

目的 镉是一种有毒金属,在各种环境中广泛存在。尽管镉暴露普遍存在,但关于血镉水平与抑郁症之间关系的研究有限。本研究目的为探讨血镉水平变化与抑郁症状及睡眠时长的关系。

方法 选取 NHANES 数据库中 2017 年至 2018 年期间 18-55 岁人群,按照 PHQ-9 评分 (0-4 分、5-27 分) 将其分为健康组和抑郁组,再按照睡眠时长大于 8 小时和不足 8 小时,分别将健康组和抑郁组分别分为健康长眠组、健康短眠组、抑郁长眠组和抑郁短眠组。通过 Spearman 相关性检验和非参数检验 (Kruskal-Wallis test) 分析抑郁症状与血镉水平的相关性及四组之间血镉水平的差异。

结果 本研究包括 2817 名成年人,其中健康长眠组 563 人、健康短眠组 1530 人、抑郁长眠组 201 人和抑郁短眠组 523 人。Spearman 相关性检验示抑郁组患者 PHQ 总分与血镉水平呈显著正相关, Kruskal-Wallis 检验示抑郁长眠组的血镉水平显著大于抑郁短眠组的血镉水平 ($P<0.05$),健康长眠组与健康短眠组血镉水平无明显差异 ($P>0.05$)。

结论 血镉水平与抑郁症状呈正相关,与抑郁症患者的睡眠时长有关。抑郁症患者或许可以通过改变睡眠时长影响血镉水平。

汉族人群中 MTHFR 基因多态性与抑郁障碍的相关性研究

吕楠 赵茜 杨健 张玲 朱雪泉 周晶晶 李人 王刚*

首都医科大学附属北京安定医院

目的 亚甲基四氢叶酸还原酶 (MTHFR) 是叶

酸代谢过程中的关键酶, 调控基因甲基化过程。既往研究发现 C677T、A1298C 及 G1793A 多态性可能与抑郁障碍的发病机制有关, 但结果并不一致。因此, 本研究拟在中国汉族人群中探讨 MTHFR 基因多态性与抑郁障碍的相关性。

方法 本研究纳入了符合 DSM-IV 抑郁障碍诊断标准的患者 778 名, 健康对照 158 名。通过倾向性评分匹配 (PSM) 后得到 441 例匹配样本 (抑郁障碍组 287 例, 对照组 154 例)。对所有患者和健康对照的外周血样本进行 C677T、A1298C 及 G1793A 的基因分型检测, 探索 C677T、A1298C 及 G1793A 与抑郁症的相关性。

结果 倾向性评分匹配前, 抑郁障碍组的年龄 (27.06 ± 7.60 岁) 显著低于对照组 (28.62 ± 7.86 岁, $t = -2.347, P = 0.022$)。抑郁障碍组女性比例 (70.4%) 显著高于对照组 (58.2%, $\chi^2 = 9.053, P = 0.003$)。倾向性评分匹配后, 抑郁障碍组与健康对照组的年龄及性别无统计学差异 ($P > 0.05$)。倾向性评分匹配前后, C677T、A1298C 及 G1793A 基因型频率及等位基因频率在两组间均无统计学差异 ($P > 0.05$)。

结论 本研究发现 MTHFR 基因的 C677T、A1298C 及 G1793A 三个 SNP 位点与抑郁症之间不存在相关性。本研究纳入的 3 个 SNP 可能不是抑郁障碍遗传易感性的主要因素。未来研究应进一步探讨其他遗传和环境因素在抑郁症发病中的作用。

Neurometabolites Change and Its Association with Inflammatory Indices and Psychological Disorders in Crohn's Disease

Yilin Guan Jiaying Gong*

the Sixth Affiliated Hospital, Sun Yat-sen University

Objective The present study aims to explore the correlation between brain neurometabolism, psychological disorders and inflammation indices in Crohn's disease

Methods A total of 60 patients with CD and 70 healthy controls (HCs) were recruited for this study. The psychological disorders was evaluated using the De-

pression Anxiety Stress Scale(DASS), Hamilton Anxiety Scale(HAMA) and Hamilton Depression Scale(HAMD). The metabolite levels of bilateral cingulate cortex, thalamus and cerebellum were evaluated by 1H-MRS, then determined the ratios of N-acetyl aspartate (NAA), choline-containing compounds (Cho), and creatine (Cr). The erythrocyte sedimentation rate(ESR) and C-reactionprotein(CRP) lever of CD patient were collected. Analyse the differences in neuropsychological testing, neurometabolite ratios and inflammatory indices. Finally, correlation analysis were conducted to investigate their inter-relationships

Results DASS-21, HAMA and HAMD-24 scores were significantly higher in CD patients when compared with healthy controls ($P < 0.001$). NAA/Cr ratios in the bilateral cingulate cortex were significantly reduced than those in healthy controls ($P = 0.012, P = 0.045$), and both were negatively correlated with ESR ($P = 0.016, P = 0.004$). CH/NAA ratios in the bilateral cingulate cortex and right thalamus were significantly increased than those in healthy controls ($P = 0.009, P = 0.009, P = 0.045$). CH/NAA ratios in the right thalamus was negatively associated with the D score of the DASS ($P = 0.008$). Ch/NAA ratios in the left cingulate cortex was negatively correlated with CRP ($p = 0.023$). There was no correlation between inflammatory indices and psychological scale scores

Conclusion Our findings suggested that the scores of anxiety, depression and stress in CD were significantly higher than those of healthy controls. The reduced NAA/CR ratios in bilateral cingulate cortex and increased Ch/NAA ratios in the left cingulate cortex in CD patients may be related to inflammation. The elevated CH/NAA ratios in the right thalamus may be associated with depressive psychology

六味安神胶囊联合艾司西酞普兰对抑郁症症状改善及 TLR4/NLRP3 通路的影响

毛龙金 高志勤 曹志永*

联勤保障部队第 904 医院

目的 探究六味安神胶囊联合艾司西酞普兰对抑郁症症状改善及 Toll 样受体 4/Nod 样受体蛋白 3 (TLR4/NLRP3) 通路的影响。

方法 纳入 2022 年 1 月至 2024 年 1 月期间 904 医院常州院区收治的 150 例抑郁症患者进行分析, 根据治疗方案不同分为联合组 (n=78) 与对照组 (n=72)。对照组行艾司西酞普兰治疗, 联合组基于此联合六味安神胶囊治疗, 两组均连续治疗 6w。比较两组疗效、药物不良反应; 比较两组治疗前后的生活质量评价量表 (SF-36) 以及贝克自杀意念量表 (BSS) 评分, 血清神经递质[去甲肾上腺素 (NE)、5-羟色胺 (5-HT)、多巴胺 (DA)], 炎症因子[白细胞介素 (IL)-6、IL-22、IL-1 β]以及 TLR4/NLRP3 通路表达水平[TLR4、NLRP3 mRNA]。

结果 联合组治疗总有效率显著高于对照组 ($P < 0.05$); 两组治疗后的 SF-36、BSS 评分较治疗前均改善, 且联合组改善均优于对照组 (均 $P < 0.05$); 两组治疗后的 IL-6、IL-21、IL-1 β 、TLR4 以及 NLRP3 mRNA 水平较治疗前均降低, 而 NE、5-HT、DA 水平较治疗前均升高, 且联合组改善优于对照组 (均 $P < 0.05$); 药物不良反应情况比较, 两组无显著差异 ($P > 0.05$)。

结论 六味安神胶囊联合艾司西酞普兰治疗抑郁症的效果显著, 可显著改善患者症状, 改善炎症因子及相关神经递质水平,

其可能与抑制 TLR4/NLRP3 通路表达有关。

Peripheral Blood Mononuclear Cell Biomarkers for Major Depressive Disorder: A Transcriptomic Approach

Lu Sun Haobo Leng Guofu Zhang*

The Affiliated Mental Health Center Jiangnan University

Objective Major depressive disorder (MDD) is a significant mental health condition that lacks a defini-

tive objective diagnostic method. Peripheral blood mononuclear cells (PBMC) are a key cell source for studying gene expression patterns linked to depressive symptoms. As such, peripheral blood monocytes could serve as a promising avenue for investigating potential peripheral biomarkers of MDD

Methods A transcriptomics study was conducted on PBMCs from patients with Major Depressive Disorder (MDD) and age/sex-matched normal controls, with 20 individuals in each group. Through bioinformatics analysis and machine learning, five potential biomarkers were discovered, which were subsequently validated using qPCR

Results The 292 differential expression genes (DEGs) were detected in PBMC from MDD patients compared with controls. In addition, the DEGs involved multiple KEGG pathways, including human papillomavirus infection, herpes simplex virus 1 infection pathway, Nod-like receptor signaling pathway, antigen processing and presentation, and glycerophospholipid metabolism. These findings suggest that immune functions are disrupted in individuals with MDD. By correlation analysis with HAMD scores, one positively correlated pathway and three negatively correlated pathways were identified as strongly associated with depression. Further machine learning analysis revealed that a combination of five genes (CTSL, PSME2, ZNF713, CXCL8, and TRPV2) had the highest diagnostic efficiency for MDD prediction

Conclusion Patients with Major Depressive Disorder (MDD) exhibit disrupted immune function, and the genes CTSL, PSME2, ZNF713, CXCL8, and TRPV2 in monocytes could potentially serve as biomarkers for predicting the risk of MDD. These genes may offer new diagnostic tools for clinical applications

Sex-specific Effects of Total Antioxidant Capacity on The Prevalence of Depression: NHANES 2007-2018

Yan Liu Bo Li*
Jilin University

Objective Globally, depression is a serious public health problem and it has a high incidence and recurrence rate. Although studies analyzed the association between different oxidative stress components and depression, few studies have explored the effect of total antioxidant capacity on depression by sex. We aimed to explore the effects of total antioxidant capacity on depression by sex group, and whether there was an interaction between the outcomes

Methods This study analyzed data from the National Health and Nutrition Examination Survey (NHANES) from 2007 to 2018. A total of 24458 participants were included. The Composite Dietary Antioxidant Index (CDAI) and the Oxidative Balance Score (OBS) were used to estimate the antioxidant capacity. The association between total antioxidant capacity and depression were analyzed using binary logistic regression

Results Both CDAI and OBS were inversely associated with the prevalence of depression ($P < 0.05$), especially for the females. There was an interaction between OBS and hypertension (P -interaction = 0.051). Lower levels of OBS were strongly associated with depression, especially in the non-hypertensive group. Compared to the higher OBS levels and non-hypertension group, all other subgroups were associated with a higher prevalence of depression ($P < 0.05$)

Conclusion Higher total antioxidant capacity was significantly associated with lower odds of depression, especially for the females. An interaction existed between OBS and hypertension. Low levels of OBS coupled with hypertension may be associated with increased odds of depression

关键词: Depression, Total antioxidant capacity, Composite Dietary Antioxidant Index (CDAI), Oxidative Balance Score (OBS), Hypertension

沈阳市某发动机制造公司职工抑郁状态及其

影响因素的研究

田柳 姚明洋 邵丽影 韩笑宇 么威 陈春武*
沈阳市精神卫生中心

目的 评价沈阳市某发动机制造公司职工抑郁状态, 分析抑郁状态与知觉压力、职业倦怠和职业生命质量之间的关系, 探讨影响职工抑郁状态的影响因素。

方法 以沈阳市某发动机制造公司 687 名职工作为研究对象, 自制调查问卷收集调查对象的人口学资料, 采用抑郁症筛查量表 (PHQ-9) 量表、知觉压力量表 (PSS)、职业倦怠量表 (MBI-GS) 和职业生命质量量表测量调查对象的抑郁状态、知觉压力、职业倦怠和职业生命质量现状。采用 SPSS 22.0 进行描述性统计、比较分析、相关性分析和回归分析。

结果 沈阳市某发动机制造公司 687 名职工中有轻微抑郁 111 人, 占 16.16%; 中度抑郁 62 人, 占 9.02%; 中重度抑郁 34 人, 占 4.95%; 重度抑郁 44 人, 占 6.4%; 职业知觉压力总得分为 36.89 ± 9.26 , 知觉压力较高 106 人, 占 15.43%; 知觉压力非常高 20 人, 占 2.91%; 职业倦怠总得分为 26.37 ± 18.98 , 轻度倦怠 60 人, 占 8.7%, 倦怠较重 10 人, 占 1.5%; 职业生命质量总得分为 100.99 ± 16.76 , 职业生命质量较低 191 人, 占 27.80%; 职业生命质量中等 471 人, 占 68.56%; 职业生命质量较高 25 人, 占 3.64%。单因素分析结果显示, 在人口学资料中, 文化程度和工作岗位在不同分组中抑郁状态有差异 ($P < 0.05$); 在知觉压力维度中, 知觉松弛感和知觉压力总分与抑郁状态具有正相关性, 相关系数分别为 0.49、0.69; 在职业倦怠维度中, 情感衰竭、去个性化和职业倦怠总分与抑郁状态具有正相关性, 相关系数为 0.72、0.65 和 0.512; 职业生命质量与抑郁状态呈负相关性, 相关系数为 -0.49。回归分析结果显示, 知觉压力、知觉压力紧张感、情感衰竭、去个性化对抑郁的影响有统计学意义, 均对抑郁有正向预测作用 ($P < 0.001$); 职业生命质量对抑郁有负向预测作用 ($P < 0.01$), 所有的变量共解释了抑郁 72.2% 的变异, $R^2 = 0.722$, $F = 223.459$ ($P < 0.001$)。

结论 沈阳市某发动机制造公司职工抑郁状态异常检出率达到 36.54%, 知觉压力总分、知觉压力紧张感、情感衰竭、去个性化和职业生命质量对抑郁状态的预测作用较大, 可采取针对性措施减轻职工压力和倦怠现状, 提高职工职业生命质量, 改善

职工抑郁状态。

冬凌草甲素改善 CSDS 小鼠抑郁样行为: 蛋白质组学分析与分子机制研究

孙思朵¹ 邹宇川¹ 刘晓宇² 汪天意¹ 李磊¹ 阙伟京¹ 周晶晶¹ 冯媛¹ 张玲¹ 吉腾飞² 王刚¹ 杜静¹

1. 首都医科大学附属北京安定医院, 国家精神心理疾病临床医学研究中心, 精神疾病诊断与治疗北京市重点实验室

2. 中国医学科学院&北京协和医学院药物研究所, 天然药物活性物质与功能国家重点实验室

目的 目前临床常用抗抑郁药仍面临起效慢及效率低等问题, 抗抑郁新型药物研发具有临床应用前景。已有研究发现抑郁障碍的发病机制与突触功能受损、线粒体功能损伤、内质网应激异常及神经免疫反应相关。冬凌草甲素是一种提取于冬凌草并具有生物活性的二萜类化合物, 具有抗炎、抗癌、神经保护及抗抑郁样行为的作用。本研究旨在探究冬凌草甲素发挥其抗抑郁作用的分子机制。

方法 雄性 C57 小鼠经慢性社交挫败应激 (Chronic Social Defeat Stress, CSDS) 造模后行糖水偏好实验筛选抑郁鼠。CSDS 小鼠用药后行悬尾实验、糖水偏好实验、强迫游泳实验, 验证冬凌草甲素的抗抑郁效果。提取小鼠前额叶进行蛋白质组学分析, 经方差分析筛选差异表达蛋白后使用基因本体论 (GO) 聚类分析、蛋白质互作网络分析等探究冬凌草甲素的药理作用机制, 以平行反应监测验证其作用机制, 以蛋白免疫印迹探究冬凌草甲素处理后兴奋性突触和抑制性突触的变化。

结果 低、中、高浓度的冬凌草甲素在行为学实验中均表现出抗抑郁作用趋势, 其中高浓度冬凌草甲素组 (10mg/kg) 具有显著性差异。高浓度冬凌草甲素处理 CSDS 小鼠后, 在悬尾实验及强迫游泳实验中挽救了 CSDS 小鼠的绝望样行为, 在糖水偏好实验中改善了 CSDS 小鼠的快感缺失样表现。提取小鼠前额叶进行蛋白质组学分析, 结果显示未用药和冬凌草甲素处理的两组 CSDS 小鼠间具有大量差异表达蛋白, 通过方差分析筛选出其中具有显著

性差异的蛋白。GO 分析发现差异表达蛋白的功能与神经系统和突触、线粒体、内质网/核糖体等密切相关, 蛋白质互作网络分析揭示了突触、线粒体以及内质网/核糖体相关蛋白之间具有相互作用。通过平行反应监测进行独立验证发现, 差异表达蛋白 Rnfl12、Cox7c 和 Mrpl42 在 CSDS 组有下降趋势而在冬凌草甲素处理的 CSDS 组中显著上升; Hdac5、Rpl14、Apoa4 和 Apoh 在 CSDS 组有上升趋势而在冬凌草甲素处理的 CSDS 组中显著下降。最后蛋白免疫印迹分析发现, 冬凌草甲素处理的 CSDS 小鼠前额叶中, 兴奋性突触后标志物 PSD-95 以及抑制性突触后标志物 Gephyrin 的表达较 CSDS 组均显著上调, 同时 PSD-95/Gephyrin 的比值较 CSDS 组也显著增高; 冬凌草甲素处理的 CSDS 小鼠前额叶中 pGluR1-S845 水平较 CSDS 组显著上升, 兴奋性突触活性标志物 EGR-1 表达较 CSDS 组显著上调, 而抑制性突触活性标志物 VGAT 未见显著变化, 表明冬凌草甲素可使突触兴奋性增强。

结论 冬凌草甲素可能通过调节线粒体功能、内质网/核糖体功能进而使突触兴奋性增高而发挥抗抑郁作用。

内感受是抑郁症多维心理网络模型的关键节点: 整合环境、认知和情感行为干预措施

刘继康¹ 吴玉项² 周振和¹

1. 南京医科大学

2. 江南大学

目的 抑郁症的心理网络模型复杂而多元, 由环境、认知功能和情感行为表现组成。然而抑郁症的诊断和治疗很难通过单一的干预点来改善疾病的整体状态。本研究的目的在于探索内感受与各种抑郁风险因素之间的联系, 确定内感受在抑郁心理网络模型的重要性, 为抑郁症诊断治疗提供新的干预点。

方法 我们收集了与抑郁症相关的环境因素、认知功能和情感行为表现等 12 个主要特征, 并将其进一步细化为 26 个更详细的特征。我们对 308 名抑郁症患者进行了结构化访谈, 详细评估了他们

的内感受功能、生活环境、认知功能和情感行为表现。我们利用结构方程模型来探讨内感受功能与生活环境、认知功能和情感行为表现之间的关系。

结果 内感受功能与抑郁症患者的生活环境、认知功能和情感行为表现有关。环境因素会影响内感受的功能,从而增加患抑郁症的风险。内感受障碍可以预测认知功能的损害与情感行为表现的异常。该模型表明,环境因素,内感受功能障碍,情感行为表现可以直接预测抑郁症的严重程度。模型中各因素对抑郁症的总效应依次为:环境因素 (0.515) > 内感受功能 (-0.434) > 情绪-行为反应 (0.204) > 认知功能 (0.143)。

结论 内感受是抑郁症心理网络模型的一部分,该模型将生活环境、认知功能和心理功能联系在一起,有望成为抑郁症的重要干预点。

抑郁障碍患者有效治疗前后血浆中 N-甲基-D-天冬氨酸受体功能相关的生物标记物的变化及相关性研究

伍力* 周祥锋 肖文博 冯祖幸
云南省精神病医院

目的 探讨有效治疗前后的抑郁障碍(major depressive disorder, MDD)患者外周血液中 D-丝氨酸(D-Serine, DSR)、甘氨酸(Glycine, Gly)、谷氨酸(glutamate, Glu)及脑源性神经营养因子(brain-derived neurotrophic factor, BDNF)水平变化并进行相关性分析。

方法 选取2023年1月~2024年1月在云南省精神病医院就诊,经抗抑郁治疗后症状好转且汉密尔顿抑郁量表(Hamilton Depression Scale, HAMD-17)评分减分50%以上的MDD患者70例,比较治疗前后HAMD-17、HAMA得分的变化,采用酶联免疫吸附法检测有效治疗前后血浆DSR、Gly、Glu、BDNF水平,计算DSR/Gly比值和各指标减分率,将上述指标进行比较及相关性分析。

结果 共纳入患者70例,入院时MDD患者HAMD-17为27(24,35)分,HAMA为17(13.5,23)分;出院时HAMD-17为8(5,12.5)分,HAMA为6(4,10.75)

分。有效抗抑郁治疗后入组MDD患者的血浆Glu及BDNF值明显高于入院时的水平($P < 0.005$),余指标未见明显变化。入院时,MDD患者血浆Glu水平与血浆DSR($r = -0.293, P = 0.015$)及DSR/Gly($r = -0.270, P = 0.025$)存弱负相关;血浆BDNF水平与DSR($r = -0.438, P < 0.001$)和DSR/Gly($r = -0.420, P < 0.001$)存负相关,Gly($r = 0.260, P = 0.031$)存弱正相关。将(入院值-出院值)作为各指标差值,将人口学特征、SSRIs和SNRIs用药情况作为控制变量,进行多因素线性回归,以 $P < 0.05$ 为有统计学意义判断标准。结果显示HAMA总分差值与DSR差值为负相关($B = 0.251, P = 0.034$)。

结论 N-甲基-D-天冬氨酸受体(N-methyl-D-aspartate receptor, NMDAR)的配体及产物异常可能是MDD病理机制之一,其功能恢复有助于抑郁症状缓解。

关键词: 抑郁障碍;生物标记物;N-甲基-D-天冬氨酸受体

U-shaped Relationship between Blood Pressure and Suicide Attempts in Chinese Patients with First-episode Drug-naïve Depressive Disorder

Fengnan Jia¹, Junjun Liu², Ronghua Li¹, Xiangdong Du³
1.Suzhou Guangji Hospital
2.Nanjing Meishan Hospital, Nanjing, China
3.CAS Key Laboratory of Mental Health, Institute of Psychology, Chinese Academy of Sciences, Beijing, China.

Objective The relationship between blood pressure (BP) and the risk of suicide attempts (SA) in patients with major depressive disorder (MDD) remains unclear, with previous findings being controversial and failing to account for potential nonlinear relationships. The aim of this cross-sectional study was to investigate the potential nonlinear relationship between BP and SA in a Chinese population with first-episode drug-naïve (FEDN) MDD

Methods A total of 1718 patients with FEDN MDD were enrolled in this cross-sectional study. Their

socio-demographic characteristics as well as anthropometric data were collected, and blood pressure measurements were taken in a resting state. A history of suicide attempts was verified based on medical records and interviews with patients and their family members. The 17-item Hamilton Rating Scale (HAMD-17) and Hamilton Anxiety Scale (HAMA) were used to assess the severity of depression and anxiety symptoms in all participants. The positive symptom subscale of positive and negative syndrome scale (PANSS) was used to assess psychiatric symptoms. Thyroid hormones, a lipid profile, and fasting blood glucose (FBG) were also measured. A multiple logistic regression analysis was used to estimate the association between BP and the risk of SA. Threshold effects were examined using a two-piecewise linear regression model. Stratified and interaction analysis explored the role of gender, education, marital state, comorbid anxiety, and psychotic symptoms on the association between BP and SA

Results No relationship was found between BP and SA using multiple logistic regression analysis. The piecewise linear spline models indicated that SA has a U-shaped connection with both systolic BP (SBP) and diastolic BP (DBP) in the study population, and the lowest turning points were at 120 mmHg for SBP and 76 mmHg for DBP. When BP was lower than the nadir point, a negative association was found between SA and SBP (OR = 0.97, 95%CI: 0.94 to 1.00, P = 0.036) or DBP (OR = 0.94, 95%CI: 0.89 to 0.99, P = 0.017). Once the BP was higher than the nadir point, a positive association was maintained between SA and SBP (OR = 1.07, 95%CI: 1.04 to 1.10, P < 0.001) or DBP (OR = 1.06, 95%CI: 1.02 to 1.10, P = 0.004), respectively. Stratified and interaction analyses showed that the test for interactions was significant for marital status and psychotic symptoms between SA and SBP (SBP: P for interaction = 0.003, 0.004, respectively); and the interaction effect was significant for sex, marital status, and psychotic symptoms between SA and DBP (P for interaction = 0.027, 0.019, 0.007, respectively)

Conclusion This study provides evidence for a U-shaped relationship between BP and SA in Chinese patients with FEDN MDD, suggesting that BP level

may be a useful biomarker for assessing the risk of suicide attempt in this population

清心小肠火治疗灼口综合征 1 例

郭雨萌 杨杨* 陈沛 阎锴娟 金鑫 张磊 李静 王贵山 袁海宁 王娣
首都医科大学附属北京安定医院

目的 灼口综合征是一种病因不明的口腔疼痛综合征,主要表现为口腔灼烧样疼痛,常伴有口干等不适感觉,严重影响患者的生活质量,目前尚缺乏统一的治疗手段。多数病人以口腔科为首诊,少部分选择精神科就诊。现报道一例灼口综合征共病抑郁发作的案例,首诊选择精神科,从中医角度创新性的以清心小肠火为治则,西医以抗抑郁药物为主,初步分析清心小肠火治疗灼口综合征,为中医诊治灼口综合征提供参考。

方法 本案患者以持续口腔灼热感为主要症状,同时伴随情绪压抑、悲观、睡眠节律紊乱等,入院前服用盐酸度洛西汀 120mg/日 1 个月,情绪症状部分缓解,口腔灼热感未见减轻,来我院治疗。入院后精神检查可查及抑郁综合征,同时伴有心理焦虑及躯体焦虑,躯体症状伴随小便短赤、心烦、口干口渴、舌质红,少苔,脉细, HAMD-17 21 分, HAMA 14 分,西医考虑诊断:“复发性抑郁障碍”、“灼口综合征”,中医考虑七情刺激,五志化火,火热伤阴,暗耗心阴,阴不敛阳,心火上炎,下移小肠,致心小肠火热,治疗予原有抗抑郁药物合并碳酸锂 0.75g/日增效,中医予小蓟饮子加减,养阴清热,除烦安神。

结果 患者经 3 个月系统治疗,抑郁焦虑情绪改善, HAMD 减分率为 76%, HAMA 减分率 71%,临床治疗有效,口腔灼热、口干、心烦等症状消失,3 个月随访,未再反复。

结论 灼口综合征的发病机制与精神神经因素相关,其可能共病精神疾病,对于精神科医生,尽早识别十分必要。灼口综合征的治疗尚缺乏统一手段,中医以整体观念为核心,具有一定优势,既往治疗经验多从湿、痰、虚论治,本案创新性的以心、小肠

火热为主要病机，清心小肠火为治则，取得一定效果，为此后中医辨证治疗灼口综合征提供理论依据。

CircRNA-miRNA 互作网络在 MECT 治疗抑郁症中的临床价值分析

丁宇红¹ 李广学¹ 徐国安¹ 沈若冰^{1,2} 李园园^{1,2} 成佳³ 高树贵¹

1. 宁波大学附属康宁医院

2. 宁波大学医学部

3. 厦门大学附属中山医院

目的 探讨 MDD 患者 MECT 治疗前后是否存在差异表达的 miRNA 和 circRNA，以期发现 circRNA-miRNA 互作网络在 MECT 治疗 MDD 中的作用，为 MECT 治疗 MDD 以及所致记忆功能损害可能的机制提供有价值的参考。

方法 首先，分层抽样选取 10 例进行 MECT 治疗的抑郁症患者的外周血，通过高通量测序技术筛选治疗前后差异表达的 miRNAs，对差异表达 miRNAs 靶基因进行基因本体论功能和京都基因与基因组百科全书富集分析。基于 Transformer 和 CNN 结构，用 circBank 和 CMI-9905 两个混合数据集构建预测模型，实现对 circRNA-miRNA 互作的初步预测。扩大样本量 (n=35) 采用实时定量逆转录 PCR (RT-qPCR) 技术进行验证，并使用临床量表评估临床症状、记忆功能，分析治疗前后差异表达的 circRNAs 和 miRNAs 表达量之间的关系以及与临床症状及记忆功能之间的相关性。

结果 较 MECT 治疗前，MECT 治疗后 hsa-miR-193b-3p、hsa-miR-124-3p、hsa-miR-149-5p；hsa_circ_0023414、hsa_circ_0018316 显著上调 (P<0.01；P<0.05)。hsa_circ_0023414 的表达量与 hsa-miR-124-3p、hsa-miR-193b-3p 的表达量呈显著负相关 (P<0.05)，hsa_circ_0018316 的表达量与 hsa-miR-149-5p 的表达量呈显著负相关 (P<0.001)。Hsa-miR-124-3p，hsa-miR-149-5p，hsa_circ_0023414，hsa_circ_0018316 表达水平与 HAMD 中各因子分具有显著相关性可以反映 MDD 患者 MECT 治疗后部分症状的改善。

结论 Hsa-miR-124-3p、hsa-miR-149-5p、hsa-

miR-193b-3p、hsa_circ_0023414、hsa_circ_0018316 涉及的分子调控机制可能参与 MECT 治疗 MDD 的机制。Hsa-miR-124-3p，hsa-miR-149-5p，hsa_circ_0023414，hsa_circ_0018316 表达水平可以反映 MDD 患者 MECT 治疗后部分症状的改善，可作为 MECT 治疗潜在的疗效评估方面的生物标志物。

关键词：抑郁症，MECT，miRNA，circRNA，记忆功能，生物标志物

舒肝解郁胶囊联合度洛西汀治疗首发抑郁症的临床研究

尹满乐 阳中明*

芜湖市第四人民医院

目的 探讨舒肝解郁胶囊联合度洛西汀治疗首发抑郁症的临床疗效

方法 选取 2022 年 5 月至 2023 年 10 月在芜湖市第四人民医院接受治疗的首发抑郁症患者 100 例为研究对象，按照随机数字表法分为对照组 50 例和治疗组 50 例。对照组仅接受度洛西汀治疗，治疗组在对照组度洛西汀治疗基础上加用舒肝解郁胶囊，治疗 8 周后比较两组间临床疗效、HAMD 评分、SCL-90 评分、炎症因子水平及不良反应。

结果 治疗后治疗组总临床有效率 (94.0%) 显著高于对照组 (78.0%)；治疗后两组 HAMD 评分、SCL-90 评分均较治疗前显著降低 (P<0.05)；治疗组 HAMD 评分、SCL-90 评分均低于对照组 (P<0.05)；治疗后两组血清 IL-1、IL-6、TNF- α 水平均较治疗前显著降低 (P<0.05)；治疗组血清学指标水平低于对照组 (P<0.05)；两组不良反应发生率差异有统计学意义 (P<0.05)。

结论 舒肝解郁胶囊联合度洛西汀治疗首发抑郁症疗效确切，显著降低外周血清炎症细胞因子水平，不良反应发生率较低，该联合治疗方法值得推广。

关键词：首发抑郁症；血清炎症因子；舒肝解郁胶囊；度洛西汀

Exploring The Impact of Childhood Trauma

on Limbic System Subregion Volumes in Healthy Individuals: A Neuroimaging Study

Yuwei Xu Shaojia Lu*

The First Affiliated Hospital, Zhejiang University School of Medicine

Objective Childhood trauma (CT) is a major risk factor for psychiatric disorders. It is hypothesized that the effects of CT are mediated by the limbic system, but previous studies have often been confounded by disease factors. Therefore, we aimed to investigate the impact of CT on the brain structure of the limbic system in healthy individuals

Methods We enrolled 48 individuals in health, evenly split into two groups: 24 healthy participants with CT (HP-CT) and 24 healthy participants without CT (HP-nCT). They underwent scale assessments and MRI data acquisition. Comparisons between the two groups were performed after subcortical subregion volume segmentation using FreeSufer. Lastly, we examined correlations between volume changes and scale scores

Results We found that HP-CT group had smaller volumes in several subregions of the hippocampus, amygdala, and cortical limbic structures, including the subiculum (Sub) head and body, cornu ammonis (CA)1 head, molecular layer (ML) head, granule cell layer of the dentate gyrus (GC-ML-DG) body, CA4 body, fimbria, hippocampus-amygdala transition area (HATA), whole hippocampus head and body, whole hippocampus, basal nucleus (Ba), accessory basal nucleus (AB), cortico-amygdaloid transition area (CAT), paralaminar nucleus (PL) of the left hemisphere; and hippocampal tail, presubiculum (PreSub) body, and basal forebrain of the right hemisphere. Volume changes in the CA4 body and GC-ML-DG body were correlated with sexual abuse. Changes in the volume of the right basal forebrain were linked to emotional neglect

Conclusion CT impacts multiple structures of the limbic system, including the hippocampus, and amygdala. This also suggests that region-specific changes within the limbic system can serve as clinical

biomarkers supporting cross-diagnostic psychiatric illnesses

关键词: Healthy individual, Childhood trauma, Limbic system, Subregions, Volume, Brain imaging

抑郁症患者腰椎骨密度与高血压、糖脂代谢紊乱的相关性

王文斌 于爱红*

首都医科大学附属北京安定医院

目的 观察抑郁症患者与高血压、糖尿病共病时腰椎骨密度的变化,探讨抑郁症患者腰椎骨密度与高血压、糖代谢紊乱等的相关性。

方法 回顾性收集2022年7月-2023年6月于北京安定医院住院的抑郁症患者557例,按照高血压及糖尿病患病情况,分为4组:组1:血压正常组351例;组2:单纯高血压组117例;组3:单纯糖尿病组41例;组4:糖尿病合并高血压组48例。高血压及糖尿病诊断依据为《中国高血压防治指南(2018年修订版)》和《中国2型糖尿病防治指南》。患者腰椎骨密度使用Mindways公司QCT测量。骨质疏松诊断依据《原发性骨质疏松症诊疗指南(2022)》。高血压、糖尿病对腰椎骨密度的交互影响采用两因素析因方差分析。回顾病历,收集患者的病史及实验室检查结果。探讨抑郁症患者腰椎骨密度的影响因素时,将年龄、性别、体重、收缩压、舒张压、是否患高血压、患糖尿病、糖化血红蛋白、总胆固醇、高密度脂蛋白、低密度脂蛋白、碱性磷酸酶、血清维生素B12、血钙、血尿素氮、血皮质醇、促肾上腺皮质激素、催乳素等因素纳入单因素分析,将单因素分析中有统计学意义的因素进一步纳入多因素线性回归分析。

结果 组1~组4骨代谢异常(骨量减少+骨质疏松)的发生率分别为:9.7%、23.1%、17.1%、27.1% ($\chi^2=19.80, P<0.01$)。两因素析因方差分析结果表明,糖尿病、高血压的主效应对腰椎骨密度的影响有统计学意义($P<0.05$),两者的交互作用也有统计学意义($P>0.05$)。结果如下:高血压的主效应显著, $F=16.23, p<0.001$;糖尿病的主效应显著, $F=8.89, p<0.003$;高血压与糖尿病的交互效应显著, $F=9.04, p=0.003$ 。以腰椎骨密度为因

变量的单因素回归分析结果表明,年龄、患高血压、患糖尿病、收缩压、总胆固醇、糖化血红蛋白、血钙、碱性磷酸酶、血尿素氮、血皮质醇对腰椎骨密度的影响有统计学意义($P<0.05$),其余变量均无统计学意义。进一步多因素线性分析显示:年龄($B=-2.3$, $P<0.001$, 95%CI: -2.523~-1.99)、碱性磷酸酶($B=-0.238$, $P=0.001$, 95%CI: -0.381~-0.096)、总胆固醇($B=-3.786$, $P=0.004$, 95%CI: -6.391~-1.181)与腰椎骨密度的相关性有统计学意义($P<0.05$)。

结论 抑郁症患者伴发高血压或糖尿病时,腰椎骨密度降低更明显,其中高血压和糖尿病的主效应及交互作用均对抑郁患者的腰椎骨密度有显著影响。年龄、碱性磷酸酶、总胆固醇是影响抑郁患者腰椎骨密度的关键因素。

2079 名护工心理健康现状及影响因素分析

魏文灿^{1,2,3} 聂所成^{2,3} 陈汝彬¹ 刘畅¹

- 1.平潭综合实验区医院
- 2.长江大学精神卫生研究所
- 3.长江大学精神卫生中心

目的 调查护工焦虑和抑郁情况并分析其影响因素,为改善护工心理健康提出建设性建议。

方法 采用一般资料调查、广泛性焦虑障碍量表(GAD-7)和患者健康问卷(PHQ-9)对护工进行问卷调查,并分析护工心理健康的影响因素。

结果 GAD-7标准分的分界值为5分,其中5-9分为轻度焦虑,10-14分为中度焦虑,15-21分以上为重度焦虑。PHQ-9标准分的分界值为5分,其中5-9分为轻度抑郁,10-14为中度抑郁,15分以上为重度抑郁。发现49.5%的护工存在中至重度焦虑,54.2%存在中至重度抑郁。单因素分析显示不同性别、年龄、文化、户籍、是否离家、家庭月收入、过去一个月照顾病重患者天数、工作年限、每日工作时长及是否经过护理技能培训对护工焦虑、抑郁的检出率差异均有统计学意义($P<0.001$)。Logistic回归分析结果,男性、离家在外、低文化程度、低家庭月收入、未经理护理技能培训、每日工作时长、经常照顾病重患者是影响护工心理健康主要因素,焦虑、抑郁得分更高。

结论 护工群体焦虑、抑郁发生率较高,有关部门应重视护工心理健康状况,及时给予心理健康疏导以提高其心理健康水平,保持健康心理状态。

日常生活方式对高中生抑郁症状的影响

张新风^{2,3} 罗梦颖^{1,2,3} 聂所成^{1,2,3}

- 1.长江大学精神卫生研究所
- 2.荆州市精神卫生中心
- 3.长江大学精神卫生中心

目的 分析2023年荆州市高中生抑郁症状现状及日常生活方式对其的影响。

方法 采用来自荆州市精神卫生中心自行整编《“阳光少年”调查问卷》调查工具,采用复合型网络调查问卷形式于2023年9月-2023年11月对荆州市在校中学生进行心理健康调查,采用方便整群抽样在线上用问卷星对荆州市内7所高中(职高)学生进行调查,内容包括一般人口学资料问卷及一些标准化问卷。本次研究主要基于其中患者健康状况抑郁量表(PHQ-9)估最近2周抑郁症状的发生频率。采用网络成瘾测试(IAT),评估学生网络成瘾情况。失眠严重程度指数量表 ISI 评估学生失眠情况。数值变量采用均数、标准差进行描述,计数资料采用率、构成比进行描述,采用X²检验进行单因素分析,影响因素分析采用二元 Logistic 回归模型。

结果 1、项目共采集高中(职高)学生问卷7343例,筛选有效数据6574例,样本有效率89.53%,男性3229名(49.11%),女性3345名(50.88%)。荆州市在校高中生抑郁症状检出率为40.95%(2692/6574),平均年龄16.06岁。单因素分析显示性别、网络成瘾情况、失眠情况、午休情况、宵夜情况、每周锻炼次数、参加集体活动均对初高中神抑郁症状检出率有统计学意义($P<0.001$)。2、将以上自变量数据纳入二元 logistic 回归模型,以是否存在抑郁症状为因变量,最终确立了女生($OR=1.507, P<0.001$)、有网络成瘾($OR=3.582, P<0.001$)、失眠,其中包括轻度失眠($OR=10.274, P<0.001$)、中度失眠($OR=49.261, P<0.001$)、经常宵夜($OR=1.218, P=0.023$)、每天宵夜($OR=1.356, P=0.081$)、

不午休 (OR=1.275, P=0.016)、每周锻炼次数 1-2 次 (OR=1.198, P=0.029)、被动参加集体活动 (OR=1.687, P<0.001)、很少参加集体活动 (OR=1.549, P<0.001) 的高中生的抑郁症状发生风险显著增加。

结论 本研究揭示了荆州市高中生的抑郁症状与日常生活方式之间的关联, 抑郁症状检出率高与下列因素有关, 包括女生、有网络成瘾、失眠、有宵夜习惯、无午休、较少参加体育锻炼及集体活动。建议在学校和家庭环境中, 应关注培养学生良好日常行为习惯, 从而提高学生的心理健康水平。

Microarray Profile of Circular RNAs Identifies Hsa_circRNA_103546 As Important Modulator of Depression

Qianfa Yuan*

Xiamen Xian Yue Hospital

Objective Recently, there is increasing evidence that Circular RNAs (circRNAs) have emerged as important regulators in the development of depression

Methods In this study, total RNA was extracted from the serum of four patients with first-episode depression and three healthy controls and subjected to a circRNA microarray assay to identify differentially expressed circRNAs. The screening of differentially expressed circRNAs was later validated by real-time quantitative polymerase chain reaction (RT-qPCR) by expanding the clinical sample size, and circRNAs with higher correlation with the development of depression were identified by correlation. Finally, by constructing a mouse model of depression and administering fluoxetine treatment, the changes in circRNA in the hippocampus and cortex of mice before and after treatment were compared

Results The results showed that circRNA microarray detection revealed a total of 15 genes with high differences, including 4 upregulated and 11 downregulated. RT-qPCR validation showed that hsa_circRNA_001676, hsa_circRNA_103546, hsa_circRNA_406989 and hsa_circRNA_104172 were

significantly different between depressed and healthy controls. Correlation analysis showed that hsa_circRNA_103546 had the highest correlation with scores on the Self-Rating Depression Scale (SDS) scores. The results of the animal model of depression also showed that mmu_circRNA_103546 was significantly increased in hippocampal and cortical tissues of unpredictable chronic mild stress (CUMS) mice and significantly decreased after fluoxetine treatment (p<0.001)

[Conclusion

Our study suggests that changes in circRNA_103546 are involved in the process of depression and can be used as a diagnostic marker for the development of depression.

关键词: circular RNAs, depression, circRNA_103546, CUMS, fluoxetine

丁螺环酮联合阿戈美拉汀治疗伴焦虑症状抑郁症的疗效观察

张晓娟¹ 刘松涛¹ 韩莹杰¹ 许珊珊¹ 刘海港¹ 张莉¹ 张顺¹ 张楠楠²

1. 开滦精神卫生中心
2. 开滦总医院

目的 探讨丁螺环酮联合阿戈美拉汀治疗伴焦虑症状抑郁症的临床效果及安全性。

方法 选取 2019 年 1 月~2021 年 1 月开滦精神卫生中心收治的 862 例伴焦虑症状抑郁症患者, 符合《精神障碍诊断与统计手册 (第五版)》伴有焦虑症状抑郁症诊断标准, 按随机数字表法分两组, 各 431 例。排除脱落病例, 研究组 389 例、对照组 382 例。研究组给予丁螺环酮口服治疗, 同时联合阿戈美拉汀口服治疗; 对照组仅给予阿戈美拉汀口服治疗, 比较两组治疗效果。治疗前和治疗 8 周后采用 17 项汉密尔顿抑郁量表 (HAMD-17)、汉密尔顿焦虑量表 (HAMA) 评价患者情绪状态, 采用多导睡眠图评价患者睡眠质量, 采用血清肿瘤坏死因子- α (TNF- α)、白细胞介素-6 (IL-6) 评价患者机体炎症状态, 并统计两组不良反应。

结果 治疗后, 研究组总有效率为 90.23%, 高

于对照组的 80.63%，差异有统计学意义($\chi^2=14.315$, $P<0.05$)。治疗后, 研究组 HAMD-17 总评分、HAMA 总评分分别为 (8.62±2.28) 分、(7.75±2.29) 分, 均低于对照组的 (11.33±3.15) 分、(10.21±2.93) 分, 差异有统计学意义 ($t=13.702$ 、 13.002 , $P<0.05$); 总睡眠时间、快速眼动睡眠潜伏期、慢波睡眠时间分别为 (415.47±40.61) min、(79.19±4.31) min、(33.75±3.23) min, 均长于对照组的 (393.20±46.14) min、(74.22±5.17) min、(29.72±4.08) min, 差异有统计学意义 ($t=7.118$ 、 14.509 、 15.221 , $P<0.05$); 睡眠效率为 (82.64±3.57)%, 高于对照组的 (76.32±5.13)%, 差异有统计学意义 ($t=19.885$, $P<0.05$); >5 min 的觉醒次数为 (2.24±0.53) 次, 少于对照组的 (2.72±0.71) 次, 差异有统计学意义 ($t=10.650$, $P<0.05$); 血清 TNF- α 、IL-6 水平分别为 (46.52±10.17) pg/mL、(35.64±9.62) pg/mL, 均低于对照组的 (55.43±13.48) pg/mL、(44.56±11.08) pg/mL, 差异有统计学意义 ($t=10.373$ 、 11.943 , $P<0.05$)。

结论 丁螺环酮联合阿戈美拉汀能更好地改善患者抑郁和焦虑情绪及睡眠质量, 降低机体炎症反应, 并不一定会增加药物不良反应的发生率。

外周血免疫细胞表型在抑郁症中的研究进展

杨栋伟 刘志芬*
山西医科大学

目的 围绕中性粒细胞, 单核细胞, T 细胞, B 细胞和 NK 细胞的细胞表型特点和变化, 寻求免疫细胞计数与抑郁症临床特征之间的关联, 进一步阐明抑郁症的炎症机制假说, 为寻求新的治疗靶点提供科学思路。

方法 作者利用英文数据库 Pubmed、Web of science 以及中文数据库的知网、万方医学文献数据库检索截止到 2024 年 4 月发表的文献, 英文检索词包括“depression / depressive”AND “Immunophenotype”AND“Flow cytometry”。中文检索词包括“抑郁”和“免疫细胞表型”和“流式细胞术”。

结果 抑郁症与外周血免疫细胞数量的变化密

切相关, 其中包括中性粒细胞、T 细胞、B 细胞、NK 细胞、单核细胞的变化, 以及单核细胞与淋巴细胞比率、中性粒细胞与淋巴细胞比率和血小板与淋巴细胞比率等的变化。

结论 在抑郁症的发病过程中, 免疫细胞发挥着关键作用。这些发现与抑郁症病因学中先天性和适应性免疫功能障碍的潜在作用相一致。目前, 细胞亚型组间差异和相关性不明显可能是由于关注免疫细胞亚型的研究数量较少。所以, 未来的免疫表型研究应侧重于探索抑郁症患者细胞层次的更详细水平, 对于重型抑郁障碍患者的免疫细胞变化, 以及这些变化与细胞因子和其他免疫蛋白水平/活性的关系, 还需要进一步的研究, 以便更清楚地了解它们对抑郁症风险的因果影响, 进而激励临床生物标志物和抑郁症靶向治疗方案的未来发展。

关键词: 重性抑郁障碍; 免疫细胞表型; 流式细胞术;

The Effectiveness and Safety of Antidepressants in Preventing Depression Relapse During The Perinatal Period: A Meta-analysis and Systematic Review

Danlan Yang Xuemei Qin Lingsi Zeng Bangshan Liu*
The Second Xiangya Hospital of Central South University

Objective The aim of this systematic review and meta-analysis was to determine the effect of antidepressant on the risk of relapse of depression during perinatal period

Data sources: PubMed, Cochrane, Web of science, and EMBASE were searched from the inception of each database through August 2023 using keywords such as antidepressants, depression, and perinatal.

Study selection: Original studies published in English that involved women who used antidepressants from preconception (ie, 3 months prior to pregnancy) to one year postpartum and examined the relapse of depression during pregnancy or one year postpartum (ie, the reemergence of a depressive episode) were included. A total of 14,796 records were identified, and the full

texts of 88 articles were reviewed. Eighteen studies met the inclusion criteria, 16 of which fulfilled the quality criteria. Eleven studies with qualified data were included in the meta-analysis.

Data extraction: Data were extracted using a data extraction form developed for the purpose of this study. The Cochrane Collaboration Review Manager software version 5.3 and Stata 14 were used to conduct the meta-analysis.

Results Pooled data showed lower risk of relapse of depression during perinatal period for women who regularly used antidepressants than for those who didn't use or discontinued antidepressants (risk ratio [RR] = 0.78; 95% CI, 0.52 to 0.93; $P = 0.02$). However, no significant difference was found between the group of continuous medication during pregnancy and the group of cessations of medication before pregnancy. In the sub-analysis based on the severity and recurrence of depression in the study populations, the risk of relapse was significantly higher for populations with severe or recurrent depression (RR = 0.50; 95% CI, 0.28 to 0.87)

Conclusion Women should be informed about the increased risk of relapse following antidepressant discontinuation, and those who discontinue antidepressants should be monitored for relapse, especially those with severe or recurrent depression.

关键词: antidepressants, perinatal, depression, relapse

High-definition Transcranial Direct Current Stimulation Combined with Antidepressants in The Treatment of Major Depressive Disorder with Anxious Distress

Danwei Zhang Bei Zhao* Jingjing Sun Panpan Li
Zhenjiang Mental Health Center

Objective To explore the efficacy, adverse reactions, and feasibility of high-definition transcranial direct current stimulation(HD-tDCS) in treating major depressive disorder (MDD) patients with anxious distress

Methods MDD with anxious distress admitted to

Zhenjiang Mental Health Center were recruited as participants. All patients were allocated into either the active treatment group or the sham group based on the random number table method. HD-tDCS was utilized in both groups to stimulate the left dorsolateral prefrontal cortex based on conventional antidepressant treatment. In the active group, 2mA current stimulation was used for 20 min, and in the sham group, a 30-second stimulation was adopted at the beginning and the end of the stimulation. Participants in both groups were treated once a day, five times a week for two consecutive weeks. Anxiety and depression symptoms of the patients were assessed respectively by the Hamilton depression scale(HAMD17), the Montgomery-Asberg Depression Rating Scale(MARDS), the Hamilton Anxiety Scale(HAMA), and the Beck Anxiety Inventory(BAI) at the baseline, 2nd, 4th, and the 6th weekend of the treatment. The differences between active treatment and sham groups were analyzed by repetitive measure analysis of variance and simple effect analysis. Fisher's exact probability test was used to compare the two groups' effective rate, remission rate, and adverse reaction rate

Results The interaction of times and groups was significant in HAMD17 and BAI. (1) In all measurement instruments, the main effects of groups and times were significant. (2) Findings from the simple effect analysis showed that: there were no significant differences in the scores of HAMD17 at baseline and the 2nd assessment between the two groups. Similarly, no significant differences were found in BAI at baseline, the 2nd and the 6th weekend of the treatment between the two groups($P > 0.05$). (3) The scores of HAMD17 on the 4th and the 6th week, and BAI at the 4th weekend of the treatment in the active group were significantly lower than that in the sham group($P < 0.05$). (4) At the 4th weekend of the treatment, the active group had a remission rate of 16/20 and a response rate of 19/20, which were higher than 9/19 and 13/19, respectively, in the sham group($P < 0.05$). Also, the remission rate (18/20) in the active group was higher than that in the sham group(11/19) at the 6th weekend of the treatment. ($P < 0.05$). As for the response rates, differences were not found between the two groups at the 6th weekend of the

treatment. (5) The overall dropout rate had no significant differences in-between($P>0.05$). As for the safety outcome, the rate of adverse events(e.g., itching, tingling, and headache) showed no significant differences between the two groups. Additionally, no severe adverse events or mania were reported

Conclusion This study indicated that HD-tDCS has significant efficacy and high safety in treating MDD patients with anxious distress

心境障碍中犬尿氨酸通路的差异性改变研究

赵小天 张燕* 柳进
中南大学湘雅二医院

目的 探究犬尿氨酸通路(kynurenine pathway, KP)在重性抑郁障碍与双相障碍患者中的横断面改变及2月随访期间的纵向变化,并探究其与抑郁症状的相关关系以及对区分两种精神障碍诊断的预测效能。

方法 纳入180名MDD患者及47名BD患者,对110名患者进行了为期2月的随访。采集了被试的人口学资料,并对焦虑、抑郁症状进行评估,采集外周血液样本,并使用液相色谱串联质谱(liquid chromatography-tandem mass spectrometry, LC-MS/MS)检测被试血浆样本中KP代谢物的浓度。使用t检验、U检验、协方差分析探究MDD与BD患者KP代谢物水平的差异;通过逻辑回归探究KP代谢物对MDD与BD诊断的预测效能。

结果 (1) MDD患者较BD具有较低的外周3-HK水平, MDD与BD患者基线至2周随访期间KP代谢物水平的变化没有显著差异; (2) 外周KP代谢物水平鉴别MDD与BD诊断的预测效能(AUC=0.66)与鉴别单双相抑郁的预测效能(AUC=0.68)均较低。

结论 MDD与BD的外周KP改变存在一定差异,外周KP鉴别MDD与BD的效果较差。

基于抑郁症谱系化症状的神经递质代谢组研究

廖宇华¹ 张慧敏¹ 郝洁靓² 郝洁靓¹ 张琴丹⁴ 范北方¹ 李凌江³ 卢次勇² 韩雪¹

1. 深圳市南山区慢性病防治院
2. 中山大学公共卫生学院流行病与卫生统计系
3. 中南大学湘雅二医院精神卫生临床研究中心
4. 遵义医科大学公共卫生学院

目的 近年研究发现抑郁症应被视为一类存在严重程度不一的谱系化疾病,而不是简单的二分类疾病。抑郁症在无症状和疾病发病之间,常存在阈下抑郁症状状态,是抑郁症发病的高危群体。目前针对抑郁症谱系化疾病的讨论仍缺乏基于实验室的客观诊断指标,本研究拟探讨抑郁症、阈下抑郁症状人群及健康对照在神经递质代谢水平上的关联和趋势,为抑郁症预防及临床诊断提供依据及参考。

方法 本研究基于DCC队列人群(Depression Cohort of China)开展病例对照研究。纳入人群年龄18-40岁,无躯体疾病史,无抗精神类药物服药史。抑郁症患者组为通过M.I.N.I.评估及DSM-V临床诊断为首发且未服药的抑郁症发病人群,阈下抑郁症状人群为PHQ-9评分大于等于10分人群,健康对照为PHQ-9评分小于5分人群。抑郁症患者、阈下抑郁症状人群及健康对照均通过年龄及性别进行匹配。采用LC-MS技术对研究对象的血浆进行代谢组学分析。统计分析采用OPLS-DA模式识别三组代谢物水平组间差异,采用方差分析进行组间比较,采用Kendall相关系数进行相关性分析。

结果 研究纳入抑郁症患者77人,阈下抑郁症状人群77人,健康对照89人。OPLS-DA结果显示抑郁症患者组和阈下抑郁症状人群及健康对照可被明显区分,阈下抑郁症状及健康对照存在重叠。方差分析组间比较结果显示三组人群在 γ -氨基丁酸、谷氨酰胺、谷氨酸、色氨酸、5-羟吲哚乙酸、5-羟色氨酸、犬尿喹啉酸、犬尿氨酸、去甲肾上腺素盐酸盐以及酪氨酸的血浆水平含量存在显著性差异($P<0.05$),趋势性检验存在显著性差异($P<0.05$)。Kendall相关系数显示 γ -氨基丁酸、谷氨酸、5-羟吲

多巴胺与抑郁症状得分存在正相关 ($P<0.05$)，色氨酸、5-羟色氨酸、犬尿喹啉酸、犬尿氨酸及酪氨酸与抑郁症状得分存在显著负相关 ($P<0.05$)。

结论 抑郁症与阈下抑郁症状、健康对照在外周血神经递质代谢物的含量上存在差异，提示阈下抑郁症状可能为抑郁症及健康人群的中间状态，临床上可通过相关标志物发现抑郁症疾病的发展变化，从而有效预防疾病的发生发展。

伴或不伴非自杀性自伤的青少年抑郁患者的认知方式及风险因素分析

吴丽娟^{1,2}

1.福州市第四医院

2.福州市第二总医院神经精神病院

目的 探讨青少年抑郁障碍患者非自杀性自伤 (non suicidal self-injury, NSSI) 认知方式特点及相关风险因素。

方法 连续入组 2022 年 2 月至 2022 年 12 月就诊于某神经精神病专科医院门诊的青少年抑郁障碍患者 126 例为研究对象，评估自编一般资料问卷、17 项汉密尔顿抑郁量表 (HAMD-17)、汉密尔顿焦虑量表 (HAMA) 和认知情绪调节问卷 (CERQ)，再按照《精神障碍诊断与统计手册第 5 版》中 NSSI 行为标准将其分为伴/不伴 NSSI 行为组，并使用 Logistic 回归分析检验 NSSI 的危险因素。

结果 (1) 126 例青少年抑郁障碍患者中伴 NSSI 行为的有 62 例 (49.20%)。(2) 单因素分析显示，性别、总病程、NSSI 病程、自杀未遂史、汉密尔顿焦虑量表评分、汉密尔顿抑郁量表评分在两组之间有统计学差异；认知情绪调节方面：在不伴有 NSSI 行为的青少年抑郁障碍的患者中，采取积极认知情绪调节策略调节心理危机较伴有 NSSI 行为的青少年抑郁患者组多，差异有统计学意义；反之，在伴有 NSSI 行为的青少年抑郁障碍的患者中，采取消极认知情绪调节比不伴有 NSSI 行为的青少年抑郁障碍的患者多，差异有统计学意义。(3) Logistic 回归分析显示，女性、自杀未遂史、17 项汉密尔顿抑郁量表 (HAMD-17)、汉密尔顿焦虑量表评分较高

及更多的采取消极认知情绪调节是青少年抑郁障碍的患者出现 NSSI 行为的危险因素。

结论 青少年抑郁障碍的患者 NSSI 发病率较高，女性、有自杀未遂史、焦虑抑郁情绪明显者以及多采取消极认知情绪调节者更容易出现 NSSI 行为。

经颅磁刺激治疗联合选择性 5-羟色胺再摄取抑制剂对青少年抑郁症患者认知功能的影响

赖珏*

海南省安宁医院

目的 探究经颅磁刺激联合选择性 5-羟色胺再摄取抑制剂 (selective 5-hydroxytryptamine reuptake inhibitors, SSRIs) 对青少年抑郁症患者认知功能的影响。

方法 选取 2023 年 1 月至 2023 年 12 月海南省安宁医院收治的 80 例青少年抑郁症患者为研究对象，按随机数字表法将其随机分为对照组与观察组，每组 40 例。对照组予以 SSRIs 治疗，观察组在 SSRIs 治疗基础上增加经颅磁刺激。经颅磁刺激组案为在药物治疗的基础上进行 4 周、4 次/周的高频重复经颅磁刺激 (rTMS)，刺激部位为左侧 DLPFC，80% 运动阈。值，刺激频率为 10 Hz，每个序列持续 4 s，间隔 56 s，持续 20 个序列；比较两组临床疗效，治疗前后汉密尔顿抑郁量表 (Hamilton Depression Scale, HAMD-24) 评分、采用威斯康星卡片分类测验 (WCST) 和连线测试 (TMT) 进行认知功能测验，血浆 5-羟色胺 (5-hydroxytryptamine, 5-HT)、血清白细胞介素-6 (interleukin-6, IL-6)、肿瘤坏死因子- α (tumor necrosis factor- α , TNF- α)、脑源性神经营养因子 (brain-derived neurotrophic factor, BDNF)、胶质源性神经营养因子 (glial cell line-derived neurotrophic factor, GDNF) 水平。

结果 观察组临床总有效率明显高于对照组 (93.33% vs 77.78%, $P<0.05$)。观察组治疗后 HAMD-24 评分明显低于对照组，与对照组相比，观察组治疗后的 TMT 用时更短，错误应答数评分高于对照

组,完成分类数评分低于对照组($P < 0.05$)。观察组治疗后血清 BDNF、GDNF 及血浆 5-HT 水平均明显高于对照组,血清 IL-6、TNF- α 水平则更低(均 $P < 0.05$)。

结论 经颅磁刺激疗法联合 SSRIs 可有效缓解青少年抑郁症患者精神症状,改善认知功能,提高 5-HT 及神经营养因子水平、抑制炎症反应可能是其发挥疗效的机制。

运动对抑郁症患者炎症与抑郁症状关联的影响

田雪 高营 李美娟 李洁*
天津市安定医院

目的 炎症与抑郁症之间存在关联,运动与炎症及情绪之间也存在关联。然而,运动对炎症与抑郁之间关系的影响并不清楚。本研究旨在探索在抑郁症人群中,运动对炎症与抑郁症状之间关联的影响。

方法 在 2021 年 1 月至 2022 年 7 月期间,从天津市安定医院招募 95 名首发未用药的重度抑郁障碍患者。使用标准化问卷记录一般情况及运动情况,采用 ELISA 法测定白细胞介素-6 (IL-6)、肿瘤坏死因子 α (TNF- α)、TNF- α 2 的浓度,汉密尔顿抑郁评定量表 (HAMD-17) 用于评估抑郁症状。单因素和多因素逻辑回归模型被用来评估炎症因子和抑郁症状之间的关联。根据运动情况进行了分层分析和交互分析。

结果 男性、年龄偏大的患者更倾向于规律运动,规律运动的患者一年内暴力自伤行为的比例更小($P < 0.05$)。单因素线性回归分析显示,基线 IL-6 和 TNF- α 2 的水平与基线抑郁情绪 (IL-6: β : 0.09, 95CI: 0.03~0.15, $P=0.004$; TNF- α 2: β : 0.02, 95CI: 0.01~0.04, $P=0.005$) 及治疗 4 周后抑郁情绪存在关联 (IL-6: β : 0.13, 95CI: 0.03~0.22, $P=0.015$; TNF- α 2: β : 0.04, 95CI: 0.01~0.07, $P=0.037$)。多因素线性回归分析显示,即使调整了性别、年龄、婚姻状况、教育、吸烟、饮酒,基线 IL-6 及 TNF- α 2 水平仍与基线抑郁症状呈正相关 (IL-6: β : 0.09, 95CI:

0.03~0.15, $P=0.006$; TNF- α 2: β : 0.03, 95CI: 0.01~0.04, $P=0.003$), 且与 4 周后抑郁症状呈正相关的趋势 (IL-6: β : 0.11, 95CI: 0.01~0.21, $P=0.052$; TNF- α 2: β : 0.03, 95CI: 0.01~0.06, $P=0.077$)。在调整协变量后,IL-6 及 TNF- α 2 与基线及 4 周后抑郁症状的关联在运动组和非运动组之间不同,且运动状态和 IL-6 及 TNF- α 2 对 4 周后抑郁症状的影响存在交互作用 ($P < 0.05$)。

结论 我们的发现表明,患者是否运动可能会影响抑郁症患者炎症因子与抑郁症状之间的关系。

An Exploratory Research of Supportive Music and Imagery for Depression

Xin Zhao Yingying Zhao Xiaoning Shi Gang Wang*
Beijing Anding Hospital, Capital Medical University

Objective Supportive Music and Imagery (SMI) therapy is a psychotherapy method that uses Music and Imagery as the carrier to help patients focus on their own internal positive resources. It may be helpful to relieve the depressive symptoms of patients. The purpose of this study was to explore the effectiveness of SMI therapy in the treatment of depression

Methods A total of 29 outpatients who met the diagnostic criteria of depression based on DSM-IV were recruited and treated with SMI therapy besides routine antidepressant treatment once a week for 3 months, with a total of 12 times of SMI therapy. DSM-IV, Hamilton Depression scale (HAMD-17), fatigue rating scale (FAI), Newfoundland Memorial University Happiness scale (MUNSH), 16-item Depression self-rating scale (QIDS-SR16) and CGIS score were evaluated at baseline. To compare the changes in mood, fatigue and happiness of patients before and after treatment, QIDS-SR16 was performed from the end of the first week to the 12th week, and FAI and HAMD17 were evaluated at the end of the 2nd, 4th, 6th, 8th, 10th and 12th weeks, and MUNSH was also evaluated at the 12th week

Results Owing to only completed the baseline

data or the first interview, five subjects were excluded, and the remaining 24 subjects were included in the analysis. The results of mixed effect ANOVA model showed that within 12 weeks, there were significant differences between the score of each follow-up time and baseline in HAMD17 ($P < 0.0001$), FAI ($P < 0.0001$), and QIDS-SR16 ($P < 0.0001$). The difference between the score of MUNSH at baseline and the 12th week was tested by paired t-test, and the result was statistically significant ($P < 0.05$). Among the 24 subjects included in the analysis, 20 subjects achieved early improvement at the beginning of the second weekend (HAMD-17 score reduction rate $\geq 20\%$), and the early improvement rate was 83.3%. At the end of the 12th weekend, 20 subjects respond to therapy (HAMD-17 score $\geq 50\%$), with a respond rate of 83.3%. At the end of the 12th week, 18 subjects were clinically remission (HAMD-17 score ≤ 7), and the remission rate was 75.0%

Conclusion The depression, anxiety and fatigue symptom of the patients improved continuously within 12 weeks. The combination of SMI therapy has higher early improvement rate and clinical remission rate in patients with depression. In the future study we can increase the control group, and further explore the efficacy of SMI in depression

The Effect of The Method of Emotional Regulation with Music on Self-care in Medical Staff

Xin Zhao¹, Yingying Zhao¹, Lin Su²

1.Beijing Anding Hospital, Capital Medical University

2.Beijing Meiyuan Huaxin Consulting company

Objective To investigate the effect of Emotional Regulation with Music on the emotional self-care of frontline medical staff during the COVID-19 pandemic.

Methods 31 frontline medical staff from nine provinces in China were recruited as subjects, the study

lasted for one year from April 2020 to June 2021. The method of Emotional Regulation with Music (ER) developed from Guided Imagery and Music (GIM) was used as an intervention with the client by qualified music therapists trained in this method. Each client received four sessions of ER intervention online. The visual analogue scale (VAS) was used as a measuring tool to evaluate the subjects' emotional state at baseline and after the intervention, also the clients were asked to complete the relevant questionnaires. A t-test was used for statistical analysis to compare the differences in scale scores before and after the intervention

Methods the method of ER can effectively improve emotional self-care in medical staff. The subjects can be aware of and accept their current emotional state during the session of therapy. The client could choose their music to regulate their emotions in the company of the therapist and stay with the music to take care of themselves. It can also help the subjects to make a song list for themselves for daily use and self-care

Results A total of 31 frontline medical personnel, 28 females and 3 males, with a mean age of 34.52 ± 8.18 years, were included. The results showed a statistically significant decrease in VAS scores (7.42 ± 1.82) after the intervention of the ER method compared to the scores at baseline (5.52 ± 2.13) ($t = -5.33$, $p = 0.000$). The results of the questionnaire showed that 86% of the subjects indicated that they had learned the Emotional Regulation with Music and 80% indicated that the method was very effective in regulating their emotions. 96% of the subjects indicated that they were willing to continue using the method for emotional regulation in their lives

Conclusion the method of ER can effectively improve emotional self-care in medical staff. The subjects can be aware of and accept their current emotional state during the session of therapy. The client could choose their music to regulate their emotions in the company of the therapist and stay with the music to take care of themselves. It can also help the subjects to make a song list for themselves for daily use and self-care

抑郁症患者思维反刍与抑郁焦虑症状的关系：一项纵向随访研究

覃雅琦 张燕*

中南大学湘雅二医院

目的 思维反刍作为一种适应不良的思维风格策略，与多种精神病理相关。本研究目的是探究抑郁症 (Major depressive disorder, MDD) 患者的思维反刍对抑郁焦虑症状的影响，为对伴思维反刍的 MDD 患者采取针对特定思维反刍症状更精准有效的干预提供依据。

方法 在中南大学湘雅二医院及社区纳入 MDD 患者共 173 例，健康对照 (healthy controls, HCs) 81 例，其中 86 例 MDD 患者和 43 例 HCs 完成了入组 8 周后的随访评估。采用汉密尔顿抑郁量表 (24-item Hamilton rating scale for depression, HAM-D24)、汉密尔顿焦虑量表 (Hamilton rating scale for anxiety, HAMA)、9-条目版健康问卷 (9-item Patient Health Questionnaire, PHQ-9)、7-条目版广泛性焦虑障碍量表 (7-item Generalized Anxiety Disorder, GAD-7) 评估抑郁焦虑症状。采用反刍思维量表 (Ruminative Response Scale, RRS) 评定思维反刍功能，高于上四分位数 (70.0 分) 的患者纳入高反刍组，小于或等于下四分位数 (54.5 分) 的患者纳入低反刍组。使用独立样本 t 检验、卡方检验和 Mann-Whitney U 检验比较组间差异，重复测量方差分析比较临床症状和思维反刍的变化特征，Pearson 和 Spearman 相关分析探索思维反刍和抑郁症状之间的关系。

结果 (1) 高反刍组的 PHQ-9 ($t = -5.040, P < 0.001$)、GAD-7 ($t = -5.398, P < 0.001$)、HAM-D24 ($t = -2.005, P = 0.049$) 和 HAMA ($Z = -2.315, P = 0.023$) 评分较低反刍组更高。(2) MDD 组治疗 8 周后 PHQ-9、GAD-7、HAM-D24 和 HAMA 评分均显著低于基线时 ($P < 0.001$)，治疗后 RRS 总分及各维度得分较治疗前低 ($P < 0.001$)。(3) HAM-D24 ($r = 0.588, 0.635, 0.437$ 和 $0.337; P < 0.005$) 和 HAMA 减分 ($r = 0.561, 0.610, 0.438$ 和 $0.293; P < 0.005$) 均与 RRS 总分及各维度减分均相关。

结论 高反刍组的抑郁、焦虑症状更严重。MDD 患者治疗后抑郁焦虑症状程度下降，思维反刍水平亦下降，抑郁焦虑症状的减分率与思维反刍的

减分率呈正相关关系。临床上应重视 MDD 患者思维反刍的筛查和评估。

关键词：思维反刍；抑郁症

中国北京地区抑郁症住院患者骨质疏松症患病情况及相关因素分析-基于定量 CT 的横断面研究

黄朋举¹ 王文斌¹ 王玲² 于爱红¹

1.首都医科大学附属北京安定医院

2.首都医科大学附属北京积水潭医院

目的 重度抑郁症 (MDD) 与骨质疏松症之间的关系仍存在争议。我们旨在报道中国北京地区 MDD 住院患者骨质疏松症的患病情况，并探讨 MDD 患者骨质疏松的相关影响因素。

方法 回顾性收集 2021 年 7 月至 2022 年 6 月在首都医科大学附属北京安定医院进行住院治疗的 40 岁以上的抑郁症患者作为患病组。同时，选取同期接受体检的附近社区的健康居民作为对照组，受试者均行低剂量肺 CT 检查。采用定量 CT 法测量研究对象的腰椎骨密度 (BMD)， $BMD < 80\text{mg}/\text{cm}^3$ 和 $80\sim 120\text{mg}/\text{cm}^3$ 分别用于定义骨质疏松症和低骨量。患者组与对照组按年龄 (± 1 岁)、性别进行 1:1 病例-对照匹配。我们采用组间差异分析和二元逻辑回归来分析抑郁症与骨质疏松症的关系以及影响 BMD 的可能因素。

结果 ① 最终纳入了 306 名 MDD 患者，骨质疏松的患病率为 23.9% (95% CI: 19.1%-28.7%); MDD 组与对照组 1:1 病例-对照匹配成功 274 对。②即使在调整了年龄、性别和 BMI 后，MDD 组发生骨质疏松的风险仍高于对照组 (调整后 OR: 2.38, 95% CI: 1.341, 4.224); ③低骨密度组 ($BMD < 120\text{mg}/\text{cm}^3$) 比 BMD 正常组的 MDD 患者年龄较大，受教育程度较低，有高血压病史的比例更高 ($P < 0.05$)。但两组 MDD 患者在性别分布、平均病程、吸烟者比例、糖尿病、高脂血症等方面的差异均无统计学意义 ($P > 0.05$)。

结论 中国北京地区 MDD 住院患者骨质疏松症患病率高于健康人群; MDD 可能是骨质疏松的危险因素; 衰老、低教育程度、高血压可能是 MDD 患者骨密度减低的影响因素。

7.中国医科大学附属第一医院

8.河北医科大学附属医院

9.天津医科大学总医院

目的 重性抑郁障碍(Major Depressive Disorder, MDD)是一种常见的精神障碍,会导致严重的个人功能损害及社会经济损失。焦虑症状是其常见的伴随症状,往往增加了 MDD 患者的临床痛苦和不良预后风险。本研究旨在探究中国 MDD 患者中焦虑症状的纵向变化轨迹,并比较不同焦虑症状轨迹间的抑郁症状结局。

方法 本研究基于课题组 2013 年 12 月至 2016 年 12 月开展的一项题为“MDD 客观诊断指标的建立与药物个体化干预”(NCT02023567)的全国多中心、前瞻性、自然观察随访研究进行回顾性分析,参与被试为来自全国 9 家医院的 292 名门诊 MDD 患者,患者年龄在 18-55 岁之间。本研究以汉密尔顿焦虑量表(Hamilton Anxiety Rating Scale, HAMA)评估基线、2 周、4 周、8 周、24 周、48 周及 96 周随访时 MDD 患者的焦虑症状,使用多阶段混合增长模型(Piecewise Growth Mixture Model, PGMM)识别焦虑症状的长期发展轨迹。随后以 DU3STEP 方法分析不同轨迹组别间 96 周随访时汉密尔顿抑郁量表(17-Item Hamilton Rating Scale for Depression, HRSD-17)测量的抑郁症状结局差异。

结果 识别出中国成年 MDD 患者中 2 类不同的焦虑症状轨迹。以 8 周作为 PGMM 的转折点,第

一类为低焦虑、症状缓解组,占样本的 89.7%,基线焦虑程度中等偏低,在随访期间焦虑程度随时间推移显著下降(截距 = 18.389,斜率 1 = -12.610,斜率 2 = -3.795, $P_s < 0.001$)。第二类为高焦虑、症状残留组,占样本的 10.2%,基线焦虑程度高,在随访期间焦虑程度起初有所减轻,此后长期残留(截距 = 25.256,斜率 1 = -9.081,斜率 2 = -3.830, $P_1 < 0.001$, $P_2 = 0.055$)。进一步分析 96 周随访时 2 类不同的焦虑症状轨迹组别间 HRSD-17 得分情况,结果发现低焦虑、症状缓解组的 HRSD-17 得分($M = 1.960$, $SD = 0.236$)显著低于高焦虑、症状残留组($M = 10.582$, $SD = 1.018$) ($p < 0.001$)。

结论 大多数 MDD 患者经过治疗后,焦虑症状能够得到有效的缓解。持续残留较多焦虑症状的 MDD 患者可能具有更差的抑郁症状结局。对焦虑症状的纵向评估有助于了解 MDD 患者的治疗进展并识别治疗期间症状变化的异质性。

Advances in The Study of Addiction Mechanisms in Non-Suicidal Self-Injury: A Review

Yangyang Tao Chun Wang*

Nanjing Brain Hospital

Objective This review aims to explore the addiction mechanisms of non-suicidal self-injury (NSSI). NSSI is a behavior in which individuals repeatedly and deliberately harm their own body tissue without suicidal intent. A significant number of individuals afflicted with NSSI concurrently experience a mood disorder known as major depressive disorder. Although NSSI Disorder (NSSI-D) is defined in the DSM-5, its specific addiction mechanisms remain unclear. This study seeks to investigate the psychological, biological, and neurobiological mechanisms related to NSSI addiction to provide new scientific evidence for clinical interventions

Methods This review investigates the mechanisms of NSSI addiction through various approaches: behavioral studies, biological studies, neuroimaging studies, theoretical model verification, and a literature

review. In behavioral studies, surveys and interviews are conducted to understand the frequency, severity, and addictive characteristics of NSSI behavior. Biological studies measure plasma endogenous opioid levels in different populations to identify biomarkers associated with NSSI behavior. Neuroimaging studies use resting-state functional magnetic resonance imaging (fMRI) to study structural and functional changes in brain regions related to NSSI addiction. Theoretical model verification utilizes the experiential avoidance model, four-function model, and individual-affect-cognition-execution interaction model to verify their effectiveness in explaining NSSI addiction mechanisms

The literature review involves systematic literature searches using databases such as PubMed, Web of Science, and CNKI, with keywords like "non-suicidal self-injury," "addiction mechanism," "endogenous opioid," "dopamine," and "reward circuit." The screening criteria include original research, review articles, and clinical trial reports related to NSSI addiction mechanisms published in the last ten years. Studies with small sample sizes, poor methodology, or duplicate publications are excluded. Data extraction focuses on key information such as research subjects, methods, main results, and conclusions, and data analysis employs qualitative analysis and meta-analysis techniques to comprehensively evaluate study results.

Results This review found that NSSI behavior exhibits clear addictive characteristics, including strong impulses and cravings for self-injury, a gradual escalation in the severity of behavior, and particularly dangerous self-injury behaviors. Biological studies indicate that plasma endogenous opioid levels in NSSI patients are significantly lower than in control groups, and self-injury behavior can temporarily increase endogenous opioid levels, providing a sense of pleasure. Neuroimaging studies show that the reward circuit (e.g., nucleus accumbens, dopamine system) in the brain of NSSI patients is significantly activated during self-injury, similar to the neural mechanisms of substance addiction. In terms of psychological model verification, the experiential avoidance model suggests that NSSI behavior repeatedly occurs as it reduces negative emotions through self-negative reinforcement. The four-function model

points out that NSSI behavior is maintained through both negative reinforcement (removal of aversive stimuli) and positive reinforcement (appearance of favorable stimuli). The individual-affect-cognition-execution interaction model proposes that NSSI behavior results from the interaction of emotional and cognitive responses and executive functions in susceptible individuals. Each model has received some empirical support, further revealing the complexity of NSSI addiction mechanisms

Conclusion This review indicates that NSSI behavior has addictive characteristics, potentially involving abnormalities in the endogenous opioid system and the dopamine reward circuit. Self-injury behavior activates the brain's reward system, releasing endogenous opioids, bringing pleasure, and leading individuals to depend on self-injury. Future clinical interventions could consider regulating endogenous opioid systems and dopamine levels to reduce NSSI behavior. Additionally, psychological therapies such as dialectical behavior therapy and cognitive-behavioral therapy have shown significant effectiveness in reducing NSSI behavior and are worthy of further promotion and application

关键词: non-suicidal self-injury, addiction mechanism, endogenous opioid, dopamine, reward circuit, neuroimaging

Sex Differences in Factors Influencing Non-Suicidal Self-Injury in Chinese Adolescents with Mood Disorder

Yongjie Zhou¹, Bowen Zhang², Chengyi Zheng², Jie Lin², Xinwen Zou³, Yang Wang²

1. Shenzhen Kangning Hospital

2. College of Management, Shenzhen University

3. School of Business Informatics and Mathematics, University of Mannheim

Objective The high prevalence of Non-Suicidal Self-Injury (NSSI) among depressed adolescents has

raised considerable attention, while very limited research focus has been particularly centered on adolescents with depression, despite their heightened NSSI occurrence. Existing studies have also shown significant differences in NSSI behavior between junior and senior adolescents, while there is a serious lack of comparative analysis of NSSI predictors among these two adolescent groups. To address this research gap, this study aimed to explore differences of NSSI predictors between junior and senior adolescents

Methods A multicenter data set was exclusively collected from 14 hospitals in China. A total of 2,613 adolescents (aged 12-18) diagnosed with major depressive disorder were recruited and data collection was completed under the supervision of professional psychiatrists. 37 predictors of NSSI were included based on literature review. Random forest models were trained for each adolescent group and SHapley Additive exPlanations (SHAP) method was adopted to provide a better explanation of feature contribution

Results Juniors with depression showed a higher NSSI occurrence rate (59.4%) than seniors (41.9%). Random forest achieved an accuracy of 0.69 and 0.65 for each model, respectively. SHAP analysis showed that self-esteem was the most important predictor for both groups. For the junior group, self-esteem, depression degree and parental overprotection were three dominant predictors. While for the senior group, romantic involvement ranked 2nd and attack on property ranked 3rd, sleep condition and father's educational level were also two important predictors in NSSI prediction

Conclusion Predictors of NSSI occurrence differed in junior and senior adolescents with depression. Psychological factors and parenting style exhibited more dominant importance in NSSI prediction for juniors, while predictors for seniors were more diverse, indicating that tailored intervention strategies for each group is necessary

问题性进食行为与抑郁诊断、抑郁严重程度、个体抑郁症状的关系

王浩怡¹ 王浩怡² 雷镇榕² 雷镇榕¹ 张淑芳¹ 张淑芳²

1.武汉大学人民医院

2.中国地质大学(武汉)心理科学与健康研究中心

目的 问题性进食行为是正常进食与进食障碍的中间阶段。根据心身理论、外因性理论、限制性理论,研究者确立了情绪性进食、外因性进食、限制性进食这三种问题性进食行为。问题性进食行为存在于一个连续谱上,在抑郁障碍中,长期存在的问题性进食行为可能会逐渐演变为进食障碍,了解问题性进食行为与抑郁障碍之间的关系至关重要。因此,本研究拟对抑郁与问题性进食行为的关系进行调查,探讨抑郁诊断、抑郁严重程度及抑郁症状与问题性进食行为之间的关系,从而为抑郁障碍和问题性进食行为的治疗提供指导。

方法 本研究自2023年8月至2023年12月期间,采用方便取样的方法,招募了279名武汉某医院门诊或住院的抑郁障碍患者,同时期内招募与患者年龄、性别等相匹配的健康人群260名,年龄范围为16~59(24.38±7.28)。采用抑郁症状快速评定量表自评版(QIDS-SR16)、荷兰进食行为问卷(DEBQ)分别作为抑郁症状与抑郁严重程度、问题性进食行为的指标。采用独立样本t检验、方差分析比较不同组问题性进食行为的差异。采用偏相关分析法,控制人口学变量的影响考察抑郁严重程度、个体抑郁症状与问题性进食行为之间的相关关系。采用多元线性回归分析来检验抑郁严重程度及个体抑郁症状对问题性进食行为的预测作用,在进入模型之前,将抑郁得分标准化以使其效果具有可比性。

结果 抑郁障碍组与健康对照组的问题性进食行为之间存在显著差异,抑郁障碍组的情绪性进食显著高于健康对照组。情绪性进食与抑郁严重程度、食欲增加、体重增加、消极情绪、睡眠、精力、兴趣、自杀、精神运动性迟缓存在显著正相关,与食欲减退、体重减轻呈显著负相关;外因性进食与食欲增加、体重增加呈显著正相关,与食欲减退、体重减轻、睡眠、兴趣呈显著负相关。抑郁严重程度对情绪化进食具有显著的正向预测作用;“食欲增加”和“感到悲伤”对情绪化进食具有正向预测作用,“体重减

轻”具有负向预测作用;“食欲增加”、“感到悲伤”对外因性进食具有正向预测作用,“体重减轻”、“食欲减退”具有负向预测作用。

结论 抑郁障碍群体中的问题性进食行为,比没有抑郁障碍的群体更为普遍。饮食行为和情绪之间存在双向关系,表现为适应不良情绪和问题性饮食行为之间的重叠,其背后的原因还待进一步探究。

关键词: 抑郁障碍,抑郁症状,问题性进食行为

青少年重性抑郁症患者认知功能变化的研究

廖梅^{1,2} 刘艳¹ 计晓磊¹ 沈悦娣¹

1.杭州师范大学

2.杭州师范大学附属医院

目的 本研究旨在探索青少年重性抑郁症患者在首次发病时的认知功能损害的特点,纵向考察不同治疗效果患者的认知功能损害变化特点及与临床症状的相关研究。

方法 招募符合入组标准的青少年首次发病的重性抑郁症(MDD)患者94例,并招募100例年龄、性别、受教育程度相匹配的健康对照组(HC组)。采用Thinc-it工具测试两组青少年的认知功能,其中客观测试部分为选择反应时间(CRT)、1-Back记忆任务(1-Back)、数字符号测试(DSST)及连线测试B(TMT-B);主观认知测试部分为认知损害5项问卷(PDQ-5-D)。结合汉密尔顿抑郁量表(HAMD-17)、汉密尔顿焦虑量表(HAMA-14)进行临床症状评估,并在8周后进行重复测评,比较MDD组与HC组认知功能的差异;比较治疗前后不同疗效组间认知功能的变化;分析青少年MDD患者认知功能损害与临床症状间的相关性。

结果 ①与HC组相比,MDD组在CRT、1-Back、DSST、TMT-B、PDQ-5-D均存在显著差异($Z = -6.450、-2.809、-6.095、-5.151、-9.357; P < 0.05$),MDD组的CRT、1-Back、DSST任务反应时间更长,TMT-B完成时间更长,PDQ-5-D自评结果更差;②与MDD组相比,MDD-R组在CRT、1-Back、DSST、TMT-B、PDQ-5-D存在显著差异($Z = -2.404、-2.793、-2.898、-2.100、-2.370; P < 0.05$),而MDD-NR组均无明显差异($Z = -0.244、-0.281、-1.667、-0.736、-1.327; p > 0.05$);③MDD患者CRT、TMT标准分

与HAMA分呈负相关($r = -0.324、-0.219, P < 0.05$),且CRT、DSST标准分与HAMD中的迟滞因子呈负相关($r = -0.256、-0.243, P < 0.05$)。

结论 青少年MDD首发患者的认知功能存在明显缺陷,且与焦虑、迟滞密切相关。临床缓解期青少年MDD患者在信息加工速度、记忆力、注意力、执行功能及主观认知功能方面明显改善,而未缓解期青少年MDD患者认知功能无明显变化。

关键词: 重性抑郁症(MDD),青少年,认知功能,Thinc-it

快感缺失评估及其对门诊抑郁症患者的诊治指导

王宇昊 陈晗暉* 黄珊珊

天津市安定医院

目的 考察快感缺失评估对于门诊抑郁症患者的临床指导效果。

方法 随机抽取天津市某医院300名门诊患者,根据是否存在抑郁分为两组,采用中文版快感缺失量表(Dimensional Anhedonia Rating Scale,DARS)、焦虑自评量表(SAS)、抑郁自评量表(SDS)、匹兹堡睡眠质量表(PSQI)、耶鲁-布朗强迫量表(Y-B)、明尼苏达多项人格测验(MMPI)进行施测,考察抑郁组和非抑郁组的快感缺失总分及各维度间是否存在差异,以及抑郁组患者快感缺失程度与抑郁、焦虑、强迫、睡眠障碍、自杀观念等抑郁症常见症状的关系。进而采用个案研究,请门诊医生提供患者的标准化访谈个案/病历,考察临床医生通过评估门诊患者的快感缺失程度,是否可以更好地识别患者的抑郁状态,并且有针对性地进行治疗。

结果 结果显示抑郁组和非抑郁组在快感缺失量表总分及各维度分数上,抑郁组得分显著低于非抑郁组;DARS得分与SAS、SDS、PSQI、MMPI自杀概率得分均呈显著负相关,进一步的回归分析显示DARS得分对SAS、SDS、PSQI、MMPI自杀概率得分也存在显著的预测作用,阅读患者的DARS评估之后,门诊医生报告在诊断访谈中可以更有效地对抑郁症进行诊断识别,并改进治疗方案。

结论 快感缺失是门诊对抑郁症患者进行诊断访谈需考察的重要特征,评估患者的快感缺失程度

可以有效帮助医务人员更快识别门诊患者的抑郁状态,做出更可靠的诊断,提供更加精确,个性化的治疗方案。

关键词: 快感缺失,抑郁症,诊断访谈

评估丁螺环酮和文拉法辛联合治疗伴有认知障碍的老年抑郁症的疗效和安全性: 随机对照试验

胡书佳^{1,2} 陈科² 许秋霞² 姚志剑¹

1.南京医科大学附属脑科医院心境障碍科

2.湖州市第三人民医院老年精神科

背景 老年抑郁症通常伴有认知功能障碍,由于其病因复杂、表现多样,给临床治疗带来了巨大挑战。尽管文拉法辛和丁螺环酮等抗抑郁药、抗焦虑药能有效治疗抑郁症,但它们的联合是否能进一步改善认知功能却鲜为人知。随着越来越多的老年人患上抑郁症,迫切需要探索一种新的药物或药物组合治疗方法来同时治疗抑郁症状和认知障碍。

目的 本研究旨在评估丁螺环酮和文拉法辛联合治疗老年抑郁症伴认知障碍患者的临床疗效和安全性。

方法 这项随机对照试验在一家三级精神病医院进行,共有 118 名被诊断为老年抑郁症并伴有认知障碍的老年患者完成了整个研究。参与者被随机分配到只服用文拉法辛的对照组(60 人),或服用文拉法辛的同时服用了螺环酮片的实验组(58 人),为期 12 周。疗效采用汉密尔顿抑郁评定量表(HAMD-17)、汉密尔顿焦虑评定量表(HAMA)和蒙特利尔认知评估(MoCA)进行测量。并系统记录了不良反应。

结果 治疗 2 周、4 周和 8 周后,实验组的 HAMD-17 评分明显低于对照组($P < 0.05$),在第 12 周时没有明显差异($P > 0.05$)。在所有评估时间点,实验组的 HAMA 和 MoCA 分数也始终优于对照组($P < 0.05$)。MoCA 评分的因子分析显示,实验组在视觉空间/执行功能、注意力和延迟回忆方面有显著改善($P < 0.05$)。两组患者均报告了轻微且可控的不良反应,其发生率无明显差异。

结论 丁螺环酮和文拉法辛联合用药能有效、快速地改善老年抑郁症患者的抑郁症状,并增强其

改善焦虑和认知功能,并且耐受性良好。尽管如此,对这些研究结果的长期临床应用仍需谨慎解读。

关键词: 老年抑郁症,认知障碍,疗效,安全性,丁螺环酮,文拉法辛

Asprosin, A Novel Biomarker in Atypical Depressed Patients

Na Qu*

Wuhan Mental Health Center

Objective In this study, we could highlight the difference of asprosin level in peripheral plasma and lipid profiles with overweight or obesity ($BMI \geq 24$) or without in depressed individuals. And to explore the relationship between asprosin changes and lipid profiles and depressive symptoms

Methods 150 individuals (87 female and 63 male) with Major Depressive Disorder (MDD) were included in this study. We applied the 24-item Hamilton Depression Rating Scale (HDRS) to assess the depressed symptom at the beginning of treatment. Plasma asprosin were detected by enzyme linked immunosorbent assay in MDD patients. A series of clinical variables and blood glucose, thyroid function and lipid profiles were collected from clinic record

Results The study indicated that there are no significantly difference in blood glucose and thyroid function between MDD patients with or without overweight and obese. MDD patients with overweight or obese had a higher HDRS scores (30.5 ± 5.5) than MDD patients with normal weight (28.2 ± 5.5). And higher asprosin level in MDD patients with overweight or obesity compared to normal weight MDD individuals ($p < 0.04$). Compared lipid profiles like total cholesterol (TC), triglycerides (TG), high density lipoprotein cholesterol (HDL-C), low density lipoprotein cholesterol (LDL-C), apolipoprotein A1 (ApoA1), Apolipoprotein B (ApoB) and lipoprotein α ($Lp\alpha$), we found that TG, LDL-C and ApoA1 were much higher and HDL-C level was lower in MDD patients with overweight or obesity than MDD patients with normal weight. Among MDD patients,

plasma asprosin levels correlated positively with HDRS score ($r=0.18$, $p<0.03$), BMI ($r=0.19$, $p<0.03$), TC ($r=0.21$, $p<0.01$), LDL-C ($r=0.2$, $p<0.02$), ApoB ($r=0.26$, $p<0.0007$) and there is no relationship between asprosin levels with TG, HDL-C, ApoA1 and Lp α

Conclusion Our findings suggested that the higher the level of asprosin, the higher scores of HDRS that mean increased asprosin level maybe a peripheral marker for depressed patients with overweight or obesity and asprosin maybe involved in the development of depression

Negative Rumination in Depression Subtypes with Melancholic Features and Anxious Distress

Hongli Wang Xiaoning Shi Jinlong Zhao Qiong Jia Wei Xu Wenwen Dun Yingying Zhao*
首都医科大学附属北京安定医院

Objective Aberrant cognition is one of the crucial symptoms of depression. However, whether the negative rumination participates in depression with melancholic features or anxious distress is not very clear

Methods Here, we addressed this issue by compiling a questionnaire that can comprehensively measure the negative cognitive processing bias in depression. And then made an exhaustive analysis of its influencing factors including the subtype of depression, age, gender, age of onset, family history of mental disorder, education year, etc

Results Kolmogorov-Smirnov One-Sample Test (K-S normality test) showed that the total negative bias score and negative rumination dimension data of the control group ($n = 42$) did not conform to normal distribution. The dimensions of negative attention, negative interpretation, and negative rumination in the depression group ($n = 112$) did not conform to the normal distribution. Therefore, non-parametric tests were used to compare the differences between the two groups. The

results showed that there were significant statistical differences in the total score and each dimension of negative bias between the depression group and the control group (independent sample Mann-Whitney U test), $p<0.000$

Independent t-test showed a statistically significant difference in negative rumination bias between the melancholic subgroup and anxiety subgroup ($t = 2.33$, $p = 0.022$) (Figure 1B). Independent sample Mann-Whitney U test showed that there was no significant difference in negative interpretation and negative attention bias between the melancholic subgroup and the anxiety subgroup. Similarly, the independent sample t-test showed that there was no significant difference in the total score and its component negative memory bias.

The Kolmogorov-Smirnov test showed that the data of age, age of onset, and education year did not conform to normal distribution. Spearman rank correlation analysis showed that negative rumination bias correlates with family history ($\rho = -0.187$, $p = 0.049$) and age of onset ($\rho = -0.190$, $p = 0.045$) (Figure 2). Moreover, age was correlated with the total score of negative bias ($\rho = -0.245$, $p = 0.009$), negative interpretation ($\rho = -0.196$, $p = 0.038$), and negative memory bias ($\rho = -0.286$, $p = 0.002$). Age of onset correlates with a total score of negative bias ($\rho = -0.271$, $p = 0.004$), negative memory bias ($\rho = -0.286$, $p = 0.002$), and negative interpretation ($\rho = -0.229$, $p = 0.015$). The educated year has a correlation with negative memory bias ($\rho = -0.240$, $p = 0.011$). There were no significant differences in negative bias among patients with the first episode or recurrence, as well as patients with or without psychotic symptoms.

Conclusion Among the several dimensions of negative cognitive bias, negative rumination bias was more serious in the melancholic than anxious subgroup. Furthermore, Spearman rank correlation analysis showed that negative rumination bias correlates with family history and age of onset of depression. We mainly explored melancholic and anxiety subgroups and did not include other subtypes. Due to time constraints, we did not conduct long-term follow-up and explore the neural mechanisms of the differences between depressive and anxious rumination

关键词: Depression; Negative cognitive bias; Sub-type; Melancholic; Anxious distress

隔日重复经颅磁刺激在不同亚型抑郁症中的疗效评价

王硕 陈俊*
上海市精神卫生中心

目的 采用随机对照设计,明确重复经颅磁刺激对不同亚型抑郁症的疗效,比较不同抑郁亚型之间和内部药物治疗和物理治疗的疗效差异,并通过长期随访验证治疗的远期疗效。

方法 本研究共纳入 199 名受试者,通过简明国际神经精神障碍访谈检查和抑郁症状问卷进行诊断分型,分为忧郁型抑郁、非典型抑郁、焦虑型抑郁三组患者,并在每一组将患者随机分为药物治疗组和物理治疗组,其中物理治疗组采用每周 2-3 次,共计 10 次,为期 4 周的隔日治疗。研究在基线、2 周末、4 周末、6 周末、8 周末、12 周末共 6 个时间节点设置 6 次量表随访,通过汉密尔顿抑郁量表、抑郁症状快速自评量表、生存质量问卷等综合判断患者的治疗反应。

结果 1.治疗后,药物治疗组和物理治疗组的患者抑郁症状均显著下降,生活质量评分明显上升,两患者疗效无显著差异;2.不同抑郁亚型之间,患者的治愈率和有效率无显著差异。在不同症状维度中,忧郁型抑郁患者在治疗过程中体重恢复优于其他亚型患者且阻滞特征恢复优于焦虑型抑郁患者;3.忧郁型抑郁患者在急性期治疗后和随访过程中不同治疗组患者的疗效无显著差异;4.非典型抑郁患者在 8 周末随访时,药物组治愈率优于物理治疗组,有效率无显著差异;5.焦虑型抑郁患者在 8 周末随访时,物理治疗组有效率优于药物组,治愈率无显著差异;6.生存分析发现,在忧郁型抑郁患者中,女性患者相比于男性获得了更好的疗效。

结论 焦虑型抑郁患者在接受隔日重复经颅磁刺激作为补充治疗时能获得更好的疗效,忧郁型抑郁和非典型抑郁患者的获益并不显著。抗抑郁疗效可能与性别因素相关,女性患者疗效优于男性。

关键词: 重复经颅磁刺激, 忧郁型抑郁, 非典型抑郁, 焦虑型抑郁, 疗效

情绪弹性在应激性生活事件与初中生抑郁情绪间的中介作用

樊园媛^{1,2,3}
1.荆州市精神卫生中心
2.长江大学精神卫生研究所
3.长江大学精神卫生中心

目的 探究初中生心理弹性作为中介变量时,应激性生活事件与抑郁情绪之间的内在关联机制,为预防青少年抑郁情绪提供参考依据。

方法 于 2023 年 9 月至 2023 年 11 月采取整群抽样方法,采用自编一般人口学资料调查表、青少年情绪弹性问卷、中学生应激源调查问卷、患者健康问卷抑郁量表 PHQ-9、对荆州市 18 所学校 7-9 年级学生进行心理健康调查,分析其情绪弹性水平、应激源和抑郁情绪;并采用 Pearson 相关性分析探究三者之间的相关性。采用 SPSS 软件 PROCESS 插件对三者的中介效应进行分析。

结果 回收 10927 份有效问卷份,其中七年级 4435 人(40.59%),八年级 3317 人(30.36%),九年级 3175 人(29.06%);男生 5704 人(52.20%),女生 5223 人(47.80%)。汉族 10518 人(96.26%),独生子女 5347 人(48.93%),城市 9127 人(83.53%),寄宿 3303 人(30.23%),根据 PHQ-9 评分,3013 人(27.6%)存在抑郁,7914 人(72.4%)无抑郁。两组在性别、年龄、城乡、住校与否、民族等方面的差异存在统计学意义。抑郁组情绪弹性总分和积极情绪、情绪复原两个维度明显高于非抑郁组,不同性别、年龄、城乡、住校与否等方面的差异存在统计学意义($P<0.05$)。抑郁组应激性生活事件总分及其中各项评分明显高于非抑郁组,不同性别、年龄、城乡、住校与否、民族等方面的差异存在统计学意义($P<0.05$)。应激性生活事件与抑郁情绪正相关($r=0.215, P<0.01$);情绪弹性与应激性生活事件、抑郁情绪均负相关($r=-0.208, r=-0.312, P<0.01$);且上述相关性在控制性别、年级、民族、是否走读、生源地后依然显著。应激性生活事件为自变量,抑郁情绪为因变量,将情绪弹性作为中介变量代入结构方程模型,通过采用 SPSS 软件中 process 中的 Model4 进行中介效应的检验,性别、年级、民族、是否为走

读等变量为协变量, bootstrap 的 95%置信区间上下限均不包括 0, 表明初中生应激性生活事件不仅对抑郁情绪起直接效应, 还能通过情绪弹性这一变量对抑郁情绪起中介效应, 总效应为 0.62, 直接效应为 0.45, 间接效应为 0.17, 占总效应的比例为 27.4%。

结论 本研究结果表明, 情绪弹性水平、应激性生活事件是影响初中生抑郁情绪的重要因素, 情绪弹性在初中生经历应激性生活事件对抑郁作用中起部分中介效应。可通过锻炼初中生情绪弹性, 降低初中生抑郁发生率, 促进初中生的生理和心理健康。

关键词: 初中生; 抑郁; 应激性生活事件; 情绪弹性; 中介

情绪智力对医学生抑郁的影响: 有调节的中介效应

康一瓴 杜天骄*
中国医科大学

目的 医学生的学制长、课业负担重, 职业环境中的致抑郁风险高, 出现抑郁症状的比率较高。情绪智力是人们对情绪世界的感知, 被认为是抑郁的一个显著负向预测因子, 但是情绪智力与抑郁之间的作用机制尚不明晰, 尤其是以医学生群体为研究对象的较少。本研究通过一个有调节的中介模型对情绪智力与抑郁间的关系进行深入探索。

方法 本研究采用方便抽样的方法, 对国内三所医科大学的临床医学专业在校学生的发放问卷, 共 1383 名医学生完成了特质情绪智力量表 (Trait Emotional Intelligence Questionnaire-Short Form, TEIQue-SF)、孤独量表 (UCLA Loneliness Scale)、患者健康问卷抑郁量表-9 (The Patient Health Questionnaire, PHQ-9) 和生命意义问卷 (Meaning in Life Questionnaire, MLQ) 的问卷调查。采用 SPSS24.0 统计软件进行数据分析和处理, 运用 Process3.3 程序进行有调节的中介作用检验。

结果 在情绪智力与抑郁的关系中, 孤独在情绪智力与抑郁之间起部分中介作用, 其中直接效应 (-0.34) 和间接效应 (-0.19) 分别占总效应 (-0.53) 的 64.84% 和 35.16%。意义体验和意义寻求是生命意义中相对独立的两个维度, 纳入中介模型后, 其中

孤独与意义体验的交互项对抑郁影响不显著 ($\beta = -0.04$, $t = -1.93$, $P > 0.05$), 即意义体验不存在调节作用, 而孤独显著正向预测抑郁 ($\beta = 0.29$, $t = 10.19$, $P < 0.001$), 孤独与意义寻求的交互项对抑郁有显著的负向预测作用 ($\beta = -0.09$, $t = -4.72$, $P < 0.001$), 意义寻求调节了情绪智力-孤独-抑郁这一中介过程的后半程路径。意义寻求较高的医学生, 孤独对抑郁的影响降低。

结论 本研究证实了孤独在情绪智力与抑郁之间起部分中介作用; 情绪智力通过孤独影响抑郁这一中介过程的后半程路径受到了生命意义的调节。情绪智力和生命意义寻求是调整医学生抑郁情绪的重要个体资源, 情绪智力对医学生抑郁的影响是有调节的中介效应。

关键词: 情绪智力; 孤独; 抑郁; 生命意义

精神运动迟滞在忧郁型抑郁症中的影像学机制

李雪琴 何红波*
广东省人民医院

目的 精神运动迟滞 (psychomotor retardation, PMD) 是忧郁型抑郁症 (melancholic depression, MD) 的关键症状之一, 其影像学机制目前尚不清楚。既往研究提示 PMD 在精神分裂症中影像学改变围绕中缝核、丘脑和基底神经节, 本研究假设 PMD 在 MD 中也存在类似的脑区功能连接改变。通过在横向及纵向研究中比较忧郁型抑郁症与非忧郁型抑郁症 (non-melancholic depression, NMD) 的精神运动迟滞相关脑区功能连接的差异, 以探究精神运动迟滞在忧郁型抑郁症中的影像学机制。

方法 该研究纳入了 40 名非忧郁型抑郁症和 24 名忧郁型抑郁症, 其中 26 名 MD 和 14 名 NMD 完成两个月的氟伏沙明治疗。在治疗前和治疗后, 使用 Stroop-color 测验和连线试验 A 联合评估参与者的精神运动速度, 并使用功能性 MRI 对参与者进行扫描。我们制定了关键脑区感兴趣区域 (region of interest, ROI), 计算其全脑功能连接及 ROI 之间的功能连接, 提取在治疗前与精神运动速度相关且在 MD 与 NMD 间存在差异的功能连接。比较治疗前后精神运动迟滞及这些功能连接的变化。

结果 与 MD 相比, NMD 的精神运动迟滞在治疗前($p < 0.001$)及治疗后($p = 0.011$)均表现更严重;无论是在治疗前和治疗后,位于左侧尾状核的显著体素簇的全脑功能连接在 MD 中均高于 NMD($p = 0.001$),位于右侧后外侧丘脑的显著体素簇的全脑功能连接在 MD 中均低于 NMD($p = 0.032$);并且在治疗后控制抑郁症状(HMAD-17)时,精神运动速度($p = 0.013$)与左侧尾状核显著体素簇的全脑功能连接($p = 0.015$)仍在组间存在显著差异。最后,无论是精神运动速度($p < 0.001$)还是左侧尾状核显著体素簇的全脑功能连接($p = 0.005$)在治疗前后也存在显著差异。

结论 本研究发现了忧郁型抑郁症中精神运动迟滞关键脑区位于左侧尾状核;并且本研究支持忧郁型抑郁症的精神运动迟滞及其相关的影像学特征是稳定存在而非状态性的,这进一步为诊断忧郁型抑郁症提供了新的影像学标记物。

关键词: 忧郁型抑郁症, 精神运动迟滞, 功能性磁共振, 影像学标记物

The Impact of The Interaction between Major Depressive Disorder and Childhood Trauma on Cortical Mean Curvature and Thickness

Qingli Mu Shaojia Lu*

The First Affiliated Hospital, Zhejiang University School of Medicine

Objective Childhood trauma (CT) is deeply associated with the development of major depressive disorder (MDD). Numerous studies have shown that CT exposure was associated with structural abnormalities in brain regions of MDD patients. However, the underlying neuropathological mechanisms are unclear. The aim of this study was to investigate the interaction between CT and MDD etiology and brain structural alterations

Methods A total of 30 patients with MDD (MDD-CT: $n = 16$; MDD-nCT: $n = 14$) and 48 age- and sex-matched healthy controls (HCs) (HC-CT: $n = 24$; HC-nCT: $n = 24$) were included in this study. All patients underwent a 3.0 t magnetic resonance scan to obtain magnetic resonance structural images, and the effects of

MDD (with CT), MDD (without CT), hc (with CT), and hc (without CT) on brain structure were assessed by analysing cortical mean curvature and cortical thickness. The effects of the "MDD" and "CT" factors on cortical mean curvature and cortical thickness were investigated by two-by-two factor analysis

Results In the whole-brain cortical mean curvature analysis, the main effects of diagnosis showed abnormalities in the left caudal anterior cingulate gyrus (MDD < HC) and the left medial orbitofrontal cortex (MDD > HC). Cortical mean curvature was abnormal in the left lateral orbitofrontal cortex when CT was the main effect, and this region also showed abnormalities in further analyses of the interaction effects of childhood trauma and MDD. In whole-brain cortical thickness analyses, the the caudal middle frontal gyrus, inferior parietal lobule, precuneus, postcentral gyrus, rostral middle frontal gyrus, superior frontal gyrus, transverse temporal gyrus, and parahippocampal gyrus showed differences when diagnosis was the main effect

Conclusion The current findings reveal that greater mean curvature of the left lateral orbitofrontal cortex may be a biomarker of childhood trauma, and on the other hand MDD may further increase damage to the mean curvature of the left lateral orbitofrontal cortex

关键词: Childhood trauma; Major depressive disorder; Cortical mean curvature; Cortical thickness

Metabolomics-based Study of Potential Diagnostic Biomarkers for Major Depressive Disorder

Lina Wang^{1,2}, Jingjing Lei^{1,3}, Dongdong Qiao¹

1. Shandong Mental Health Center

2. Shandong Normal University

3. Jining Medical University

Objective The pathophysiological mechanisms of Major Depressive Disorder (MDD) remain unclear. Metabolomics allows for the analysis of endogenous small molecule metabolites and their metabolic path-

ways within an organism, exploring the interrelationships between metabolites and physiological and pathological changes. This helps in the discovery of disease-related biomarkers. This study aims to explore potential diagnostic biomarkers for MDD by comparing serum metabolites and metabolic pathways between MDD patients and healthy individuals using metabolomics techniques

Methods The study included 160 participants, 80 diagnosed with MDD according to DSM-IV criteria for depressive episodes and 80 matched healthy controls. Untargeted metabolomics analysis was conducted on peripheral serum using ultra-high performance liquid chromatography-high resolution mass spectrometry (UPLC-HRMS). Multivariate statistical analysis of the preprocessed metabolomic data was performed using SIMCA software, with Principal Component Analysis (PCA) and Orthogonal Partial Least Squares-Discriminant Analysis (OPLS-DA) used to identify classification trends between cases and controls. Metabolites with $VIP > 1$, $q < 0.05$, and $FC > 2$ or $FC < 0.5$ were selected as significantly different. Metabolite enrichment and metabolic pathway analysis were conducted using Metabo Analyst 4.0 software and the KEGG online database. ROC curves were drawn using SPSS 26.0 software to evaluate the predictive ability of significant metabolites for disease onset

Results 1. Nineteen metabolites showed significant differences between MDD patients and healthy individuals

2. Metabolic pathways with significant differences mainly involved polyunsaturated fatty acid metabolism, amino acid metabolism, phospholipid and sphingolipid metabolism, steroid metabolism, and bile acid metabolism.

3. Seven specific metabolites showed good accuracy in predicting disease onset, including 12-hydroxyeicosatetraenoic acid, 13-hydroxyoctadecadienoic acid, L-glutamate, arachidonic acid, L-aspartate, N-acetylaspartate, and serotonin, involving polyunsaturated fatty acid metabolism and amino acid metabolism pathways.

Conclusion The results of this study indicate that metabolic disorders are significantly associated with MDD. MDD patients show significant metabolic

changes related to polyunsaturated fatty acid metabolism and amino acid metabolism pathways. Specific metabolites may serve as potential diagnostic biomarkers for depression. This study provides important theoretical support for the early diagnosis and optimization of treatment for depressive disorders

[综述]抗抑郁药引起锥体外系反应机制的研究进展

李炳光*

安徽医科大学附属巢湖医院

目的 探讨抗抑郁药引起锥体外系反应的机制。

方法 通过 Pubmed 网站检索相关研究成果。

结果 EPS 是一种运动障碍,可表现为肌张力障碍、静坐不能、帕金森病和迟发性运动障碍等。抗抑郁治疗领域面临的一个关键挑战是需要快速起效的抗抑郁药,能够有效治疗难治性 MDD 或 BD 患者。氯胺酮是一种速效抗抑郁药,在临床前研究中显示出良好的效果。Hashimoto (2019) 讨论了氯胺酮对映体的抗抑郁作用,强调 (R)-氯胺酮比 (S)-氯胺酮具有更强的抗抑郁作用和更持久的抗抑郁作用。此外,研究发现 (R)-氯胺酮比 (R,S)-氯胺酮或 (S)-氯胺酮的有害副作用更少。这表明氯胺酮的特定对映体可能在抗抑郁作用和副作用的产生中发挥作用。在 Mörkl et al. (2019) 的一项研究中,报告了 15 例抗抑郁治疗后出现 EPS 的病例,强调了识别相似性和风险因素的重要性与 EPS 相关的研究。该研究旨在描述接受抗抑郁药治疗的患者的 EPS 发生情况,阐明这些药物的潜在副作用。此外,Ohno 等人 (2019) 讨论了抗精神病药物引起的 EPS 的治疗,强调了抑制 5-HT 再摄取到神经末梢的抗抑郁药物的协同作用。研究发现,α、5-HT 和 5-HT 拮抗剂米氮平可减少 EPS 的诱导,这为接受抗精神病治疗的患者治疗 EPS 提供了一种潜在的策略。此外,Hirano (2020) 研究了多种精神药物对 EPS 发生的影响,重点研究了抗焦虑药、催眠药等药物类别、抗抑郁药和抗精神病药。该研究旨在评估服用精神药物前后 EPS 发生分布的不对称性,为接

受多种精神药物治疗的患者 EPS 相关的潜在风险因素提供见解。

结论 1.部分抗抑郁药可能会对多巴胺受体产生拮抗作用,影响多巴胺神经递质的传递和功能。多巴胺在调节运动功能方面起着重要作用,其功能受到干扰可能导致 EPS 的产生。2.5-HT 系统与多巴胺系统之间存在复杂的相互作用。部分抗抑郁药对 5-HT 受体的调节可间接影响多巴胺能神经元的活动,引发 EPS。3.部分抗抑郁药可同时具有抗胆碱能活性,但这种作用在不同部位存在不平衡。当抗胆碱能作用不足以抵消其他影响锥体外系的作用时,就可能出现 EPS。

类风湿关节炎患者疼痛与抑郁的相关性研究

杨梦 陈长浩*

安徽省宿州市第二人民医院

目的 本研究主要调查类风湿关节炎患者抑郁的发生率,以及探索类风湿关节炎患者疼痛与抑郁之间的关系。

方法 本文研究对象来自一所三甲医院风湿免疫科专家门诊的 271 名类风湿关节炎患者。采用自测量表收集患者的一般人口学资料,如性别、年龄、文化水平、家庭经济情况、活动受限程度等。采用汉密尔顿抑郁量表(HAMD)来评估患者抑郁状况,再将患者分为不伴有抑郁组(HAMD<17)和伴有抑郁组(HAMD≥17)。简式 McGill 疼痛问卷(SF-MPQ)用来评估患者疼痛强度,包括情感疼痛评定指数(A-PRI)、视觉模拟量表(VAS)和现有疼痛强度(PPI)。应用电子测痛仪进行压力性痛觉阈值(PPT)的测定。并运用 t 检验、卡方检验、Spearman 相关分析及二元 logistics 回归对数据进行分析。

结果 (1) 271 名类风湿关节炎患者中抑郁情绪的发生率为 34.7%。(2)在类风湿关节炎患者中,不伴有抑郁组和伴有抑郁组在年龄、文化水平、家庭经济条件、宗教信仰、生活满意度、疾病持续时间、活动受限程度及 A-PRI、VAS、PPI 和 PPT 上存在差异。(3)按性别分组,比较性别在抑郁及疼痛方面的差异,发现男性和女性仅在 PPT 上存在差异。(4)相关因素分析,HAMD 总分均与 A-PRI、VAS、

PPI 和 PPT 存在明显相关性。(5)二元逻辑回归分析显示,在类风湿关节炎患者中,抑郁的危险因素有年龄大、家庭经济条件差、生活满意度低、活动受限程度严重、A-PRI 个数增加及现有疼痛状态表现为严重。

结论 类风湿关节炎患者抑郁的发生率较高,且大多数为年龄大、文化水平低、家庭经济差、生活满意度低、疾病持续时间长及活动受限严重的人群。此外,年龄大、家庭经济条件差、生活满意度低、活动受限严重、疼痛强度大是伴发抑郁的高危因素。

Exploring The Predictive Markers of Efficacy of Accelerated Neuronavigation-guided RTMS for Depression with Suicidal Ideation Based on Multimodal Large-scale Brain Networks

潘奋*

浙大医学院附属第一医院

目的 This study aimed to establish response predictive models of accelerated neuronavigation-guided high-dose rTMS based on multimodal large-scale brain networks.

方法 VN,SMN, DAN, VAN, LN, FPN, and DMN were constructed using graph theory method based on three modalities data including T1 structural imaging, DTI, and rs-fMRI got from untreated MDD patients with suicidal ideation before rTMS treatment. LSVM methods were utilized to build predictive models.

结果 We found that both the morphological and structural brain networks could predict the percentage changes of total BSSI and HAMD scores. Additionally, the functional brain networks could predict the percentage changes of total HAMD scores. Further analyses of the effects of imaging modality and subnetworks on prediction performances revealed that the structural connectivity and SMN exhibited better predictive ability.

结论 The antidepressant and anti-suicide effect of accelerated neuronavigation-guided rTMS can be effectively predicted by the multimodal large-scale brain

networks in a subnetwork-dependent manner.

Neural Correlates of Cognitive Deficit in Emotional Directed Forgetting in Major Depressive Disorder: An Event-related Potential Study

Chang Chen Zhenhe Zhou*

The Affiliated Wuxi Mental Health Center of Nanjing Medical University

Objective It has been confirmed that Major depressive disorder (MDD) exhibit difficulty in forgetting negative materials, which may resulted from specific impairments in memory and attention. However, the underlying neural correlates of corresponding cognitive deficit has not been clarified. This study aimed to investigate the electrophysiological characteristics and differences between MDD and healthy controls (HCs) in emotional directed forgetting task (EDF) with negative and neutral images using event-related potential (ERP)

Methods 26 MDD patients and 28 HCs were recruited for the current study, and they all were evaluated clinically with the Hamilton Depression Scale. All participants performed the measurement of ERPs during EDF task, and behavioral data and ERP components were analyzed

Results HCs had larger hit rates than that of MDD patients; more false alarms occurred on MDD patients than HCs, and the larger false alarm rates showed in negative images than in neutral images; the Reaction times were longer for MDD patients than that for HCs. The larger image-evoked P2 amplitudes and less negative image-evoked N2 amplitudes for MDD patients, while they had the larger image-evoked LPP amplitudes both in negative and neutral emotional conditions, compared with HCs. MDD patients had the larger cue-evoked N2 amplitudes and the smaller cue-evoked P3 amplitudes which elicited by Remember than that of

HCs. The HAMD scores had a positive correlation with the LPP amplitudes which was evoked by negative images in central lobe

Conclusion The interactive contribution of emotion and cognition process to the cognitive biases leads to the impaired memory facilitation and suppression of negative material in MDD; The observed ERP patterns provide valuable insights into the neural mechanisms underlying the EDF task in MDD

高频 rTMS 对脑卒中后抑郁症患者的临床疗效研究

梁杏莉*

西安交通大学第一附属医院

目的 探讨高频重复经颅磁刺激 (rTMS) 对脑卒中后抑郁症 (PSD) 患者意识能力、抑郁状态及睡眠状态的改善作用, 旨在为临床治疗此类患者提供有效的治疗方案, 及早改善患者的生活质量。

方法 选取我院 2023 年 8 月~2024 年 2 月住院的 PSD 患者 40 例进行回顾性研究, 治疗组和对对照组各 20 例, 所有入组患者均行脑血管病常规治疗, 治疗组同时接受 rTMS 治疗, 刺激部位: 左侧前额叶背外侧皮质区; 强度: 80%RMT; 频率: 10Hz; 时间: 20 min; 每周 5 次, 疗程共 10 天。收集患者的一般资料, 并在治疗前及治疗两周后采用简易精神状态量表 (MMSE)、汉密顿抑郁量表 (HAMD-17) 和匹兹堡睡眠质量指数 (PQSI) 进行评分, 然后运用统计学方法分析各个量表评分的变化以判断治疗效果。

结果 (1) 两组患者在年龄、性别、高血压、糖尿病等方面差异不显著 ($P>0.05$)。 (2) 两组 MMSE 的变化: 治疗组经过两周疗程后, 差异显著 ($P<0.05$); 对照组经过两周疗程后, 差异不显著 ($P>0.05$)。治疗前两组患者无显著差异 ($P>0.05$); 治疗后差异显著 ($P<0.05$)。 (3) 两组 HAMD-17 的变化: 治疗组经过两周疗程后, 差异显著 ($P<0.05$); 对照组经过两周疗程后, 差异也显著 ($P<0.05$)。治疗前两组患

者无显著差异 ($P>0.05$); 治疗后差异显著 ($P<0.05$)。

(4) 两组 PQSI 的变化: 治疗组经过两周疗程后, 差异显著 ($P<0.05$); 对照组经过两周疗程后, 差异不显著 ($P>0.05$)。治疗前两组患者无显著差异 ($P>0.05$); 治疗后差异显著 ($P<0.05$)。

结论 高频 rTMS 可以显著提高 PSD 患者的 MMSE 评分, 改善患者的认知功能; 并降低其 HAMD-17 和 PQSI 评分, 缓解抑郁症状, 改善睡眠质量。

关键词: 重复经颅磁刺激; 脑卒中后抑郁症; 认知; 睡眠质量

探讨艾司西酞普兰对抑郁症患者肠道菌群和粪便代谢组的调节作用

王亚萍 杨健 周晶晶 付冰冰 王刚*
首都医科大学附属北京安定医院

目的 研究抗抑郁剂艾司西酞普兰对抑郁症患者肠道微生物组成和功能的影响。

方法 选取本次抑郁发作未经过抗抑郁药系统治疗的 110 名抑郁症患者和 166 名健康对照, 抑郁症患者接受艾司西酞普兰治疗 12 周, 并在治疗前、治疗第 2 周末和第 12 周末进行汉密尔顿抑郁量表 (HAMD-17) 的评估, 根据 12 周 HAMD-17 评分将患者划分为缓解组和未缓解组, 同时采集粪便样本。采用宏基因组测序和 GC-MS 代谢组学检测表征了抑郁症患者服用艾司西酞普兰治疗期间微生物组成和功能的纵向变化。

结果 艾司西酞普兰对抑郁症患者整体肠道微生物 α 多样性影响较小, 但药物干预后缓解组和未缓解组组间肠道微生物 α 多样性变化显著不同, 缓解组的 α 多样性指数 (Richness 指数) 呈现先下降后上升的趋势, 然而, 未缓解组呈现出先上升后下降的趋势。艾司西酞普兰具有一定的抗菌效应。对抑郁症患者肠道微生物组成和功能发挥抑制作用, 在微生物组成方面, 抗抑郁药治疗后, 阿托波菌属、罗斯氏菌属和粪球菌属的丰度均出现下调; 在微生物功能方面, 抗抑郁药治疗后, 90 个改变的 KO 功能中, 84 个出现下调, 且下调的微生物功能主要由未缓解组贡献。针对粪便代谢组学, 药物干预后, 缓解组有 23 种代谢物发生变化, 这些代谢物主要是

氨基酸、脂质和核酸类, 未缓解组有 19 种代谢物发生变化, 主要是脂质和碳水化合物类。

结论 微生物组成和代谢功能的改变可能与艾司西酞普兰的不同反应有关, 这为揭示抗抑郁药疗效差异的机制提供了新的思路。

The Current Situation of Comorbidities of Chronic Physical Diseases and Depression Among Chinese Community Residents

Yanglichen Ou Xiaoping Wang*

The Second Xiangya Hospital of Central South University

Objective To estimate the prevalence of long-term medical conditions and of comorbid major depression, and the associations between major depression and various chronic medical conditions in a general population of Chinese community residents

Methods A total of 46546 Community residents recruited from 18 cities in China were recruited. Chronic health conditions were assessed using a self-report method of doctor diagnosis, and diagnosed for more than one year. The World Mental Health-Composite Diagnostic Interview was used to assess major depressive episodes based on DSM-IV criteria

Results The overall prevalence of having at least one chronic condition in those over 50 years of age was 62.4%, compared to 42.0% in those under 50. The prevalence of a major depressive episode in those over 50 with one chronic condition was 3.7%, compared with 1.0% in those without a long-term medical condition. The top 3 chronic health conditions were arthritis/rheumatism, high blood pressure and back problems

Conclusion Accurate diagnosis of comorbid depressive disorders in patients with chronic medical illness is essential in understanding the cause and in optimizing the management of somatic symptom burden. Thus, comprehensive treatment plans are necessary to optimize care

同伴欺凌对青少年抑郁症的影响：手机使用的中介作用

谢光平³ 申璎² 周勇杰¹ 任抒扬⁴ 李彦妍⁴ 刘咏诗⁴ 周璐⁴ 樊希望⁴

1.深圳市康宁医院

2.赣州市第三人民医院

3.赣州市妇幼保健院

4.上海市浦东新区精神卫生中心

目的 本研究测验青少年抑郁症患者与同伴欺凌患者及手机使用者三者之间的关系，构建中介效应模型，为青少年抑郁症患者的预防和治疗提供新思路。

方法 本研究采用便利抽样法选取全国 12 家精神专科医疗机构或综合性医院的精神科 2343 名抑郁症确诊青少年患者，采用一般资料调查法，受朋辈欺凌问卷(PVQ)，九项患者健康问卷(PHQ-9)量表，手机使用调查表(MPAI)进行调查与测验，分析同伴欺凌与青少年抑郁症及手机使用的相关性，采用 SPSS26 软件，分析手机使用在同伴欺凌与青少年抑郁症之间的中介效应。

结果 (1)同伴欺凌与青少年抑郁症呈正相关($r=0.330, p<0.001$)；(2)同伴欺凌和手机使用呈正相关($r=0.287, p<0.001$)；(3)手机使用与青少年抑郁症呈正相关($r=0.333, p<0.001$)；(4)手机使用在同伴欺凌与青少年抑郁症之间产生显著中介效应($r=0.414, p<0.001, \beta=0.234$)。

结论 学校教育者应该为青少年创建友好校园环境，帮助青少年建立良好同伴关系，减少霸凌事件的发生；同时家长要在青少年手机使用中起到监督作用，防止青少年手机成瘾，进而减少青少年抑郁症的发生率。

目的 探究老年抑郁症患者采用重复经颅磁刺激(rTMS)结合度洛西汀治疗的效果。

方法 研究对象为抑郁症患者，患者年龄 ≥ 65 岁，选取例数共 70 例，选取时间，起始于 2022.05，结束于 2023.05，将患者分组，分组方式为双色球(粉色/白色)，组别设置: DL 组(粉色)、CM 组(白色)，每组例数: 35 例。治疗方式: DL 组-度洛西汀，CM 组-rTMS+度洛西汀。比较指标: 治疗效果、心理状况、认知功能、不良反应。

结果 结果 ①治疗效果: CM 组 VSDL 组=94.29% (33/35, 痊愈 22.86%+显效 17.14%+有效 54.29%) VS77.14% (27/35, 痊愈 17.14%+显效 14.29%+有效 45.71%)，CM 组 $>$ DL 组(=4.200, $P<0.05$)；②心理状况(HAMD、HAMA): 治疗前组间差异不显著(29.62 \pm 5.12)分/(29.81 \pm 5.13)分，(20.46 \pm 6.42)分/(20.43 \pm 6.14)分($t=0.155, 0.020, P=0.877, 0.984>0.05$)，治疗后 HAMD 评分($t=6.689$) CM 组(8.83 \pm 2.35)分 $<$ DL 组(12.66 \pm 2.44)分，HAMA 评分($t=8.277$) CM 组(6.15 \pm 1.74)分 $<$ DL 组(9.41 \pm 1.55)分，(P 均 <0.05)；③认知功能(RBANS 评分): 治疗前组间差异不显著($P>0.05$)，治疗后即刻记忆($t=4.196$) CM 组(79.15 \pm 3.70)分 $>$ DL 组(74.98 \pm 4.57)分，视觉广度($t=5.116$) CM 组(89.54 \pm 6.67)分 $>$ DL 组(82.02 \pm 5.58)分，言语($t=4.383$) CM 组(90.26 \pm 4.58)分 $>$ DL 组(85.43 \pm 4.64)分，注意($t=11.629$) CM 组(90.59 \pm 3.36)分 $>$ DL 组(80.56 \pm 3.84)分，延迟记忆($t=13.402$) CM 组(91.15 \pm 2.87)分 $>$ DL 组(81.26 \pm 3.29)分，(P 均 <0.05)；④不良反应(TESS 评分): 治疗前组间差异不显著($P>0.05$)，治疗后($t=7.942$) CM 组(4.05 \pm 1.56)分 $<$ DL 组(6.90 \pm 1.44)分($P<0.05$)。

结论 在老年抑郁症患者治疗中使用 rTMS 结合度洛西汀能有效提高患者治疗效果，在心理层面、认知层面均有所改善，治疗安全性更佳，值得推广实施。

RTMS 结合度洛西汀对老年抑郁症患者认知能力的影响

Association between Osteoporosis and Serum Prolactin and Calcium Levels in Postmenopausal Women with Major Depressive Disorder: A Retrospective Study Based on Quantitative CT

Pengju Huang Xiaoxuan Wei Wenbin Wang Wei Wang Aihong Yu*

首都医科大学附属北京安定医院

Objective Numerous studies have indicated that patients with Major Depressive Disorder (MDD) are at a higher risk for osteoporosis, particularly postmenopausal middle-aged and older women, yet the underlying mechanisms remain unclear. This study aimed to explore the relationship between osteoporosis and serum markers in postmenopausal women diagnosed with MDD

Methods A retrospective analysis was conducted on patients who visited Beijing Anding Hospital, Capital Medical University, from July 2021 to April 2022. The inclusion criteria were as follows: postmenopausal women aged over 55 years, those who had undergone low-dose lung CT scans, had complete laboratory test records, and were clinically diagnosed with MDD according to the International Classification of Diseases, Tenth Revision (ICD-10). Patients with other psychiatric disorders, diseases affecting bone metabolism, previous history of lumbar spine surgery, calcium supplementation, or steroid therapy were excluded. The volumetric bone mineral density (vBMD) of the lumbar spine was assessed using quantitative computed tomography (QCT), and osteoporosis was defined as vBMD < 80 mg/cm³. Demographic information, such as age, height, weight, BMI, disease duration, medication use, and serum marker levels (including prolactin, estradiol, cortisol, LDL, HDL, triglycerides, total cholesterol, blood calcium, potassium, alkaline phosphatase, glycosylated hemoglobin, C-reactive protein, and adrenocorticotropic hormone) were collected from medical records and laboratory reports. Participants were categorized into two groups based on the presence or absence of osteoporosis for comparative analysis. Multivariate logistic regression analysis was then performed to identify

risk factors for osteoporosis among the subjects

Results The study successfully enrolled 146 participants. Comparative analysis revealed that the osteoporosis group was significantly older, had higher prolactin concentrations, lower blood calcium levels, and higher glycosylated hemoglobin values compared to the non-osteoporosis group ($p < 0.05$). There were no significant differences between the two groups regarding BMI, disease duration, proportion of unmedicated individuals, and other serum marker levels ($p > 0.05$). Multivariate logistic regression analysis confirmed that higher prolactin levels and lower blood calcium levels were associated with osteoporosis, even after adjusting for age and BMI (adj. OR: 1.025, 1.001~1.051, $p=0.045$; and 1.119, 1.047~1.197, $p=0.001$, respectively). However, glycosylated hemoglobin levels did not exhibit a statistically significant correlation with osteoporosis risk when adjusted for age and BMI ($p > 0.05$)

Conclusion In postmenopausal women with MDD, osteoporosis is associated with elevated serum prolactin levels and decreased blood calcium levels. These findings suggest potential biomarkers for osteoporosis risk assessment in this population, which may guide future clinical management and preventive strategies

Interoceptive Neural Circuits Mediating The Progression From Somatic Diseases To Comorbid Depression

Chenguang Jiang², Hongliang Zhou¹, Wenhao Jiang², Yonggui Yuan²

1. Department of Psychology, The Affiliated Hospital of Jiangnan University, Wuxi, China.

2. Department of Psychosomatics and Psychiatry, ZhongDa Hospital, School of Medicine, Southeast University, Nanjing, China

Objective Somatic diseases comorbid with depression exacerbate health burden. The interoceptive neural circuit (INC) might mediate the brain-body connections. We aim to assess the causal relationship between the somatic diseases, INC, and depression

Methods Mendelian randomization (MR) analysis was performed to study: 1) the causal effect of INC's morphology on depression; 2) the causal effect of four categories of systemic somatic diseases (ulcerative colitis, essential hypertension, chronic pain, and type 2 diabetes) on INC's morphology; and 3) explore the INC's mediating role between somatic diseases and depression. Replication analysis of INC's mediation role was also conducted with other GWAS datasets

Results We founded morphological alterations of the INC increased depression risk, with the bilateral ventral thalamus most impacted. All four somatic diseases resulted in morphological changes in the INC, with shared reduced left ventral diencephalon (L-VDC). The volume of the L-VDC mediated the relationship between somatic diseases and depression, a finding validated across different datasets

Conclusion Overall, INC, particularly the L-VDC, plays a crucial role in the pathogenesis of depression and the intersection of somatic diseases. The INC mediates the progression from somatic diseases to comorbid depression, suggesting that interventions targeting the INC may prevent and alleviate the burden of somatic diseases combined with depression

关键词: Somatic diseases; Depression; Interoceptive neural circuit; Mendelian randomization; Left ventral diencephalon; Mediation Analysis

单相抑郁患者维生素水平探讨

梁博¹ 郭丽阳²

1. 乌鲁木齐市安宁医院

2. 西安交通大学第一附属医院精神科

目的 维生素是生命必需的营养成分, 它们在健康中起主要作用, 其缺乏可能与精神疾病的症状有关。现有研究已经发现抑郁症患者存在叶酸、维

生素 B12 及维生素 D 等水平的异常。同时有学者认为上述维生素的降低与抑郁症发生有关, 补充维生素有利于疾病的恢复, 但目前结论并不一致。抑郁症分为不同的类型, 一些研究在探索时没有就抑郁类型进行分型。故本研究从抑郁发作(单相抑郁)角度出发, 探讨单相抑郁患者体内维生素, 即血清叶酸, 维生素 B12 及维生素 D3 水平的情况, 从而更好的指导临床。

方法 单相抑郁患者 103 例, 健康对照 103 例, 检测病例和对照样本叶酸(FA)、维生素 B12(B12)和维生素 D3(D3)水平。

结果 单相抑郁患者叶酸和维生素 B12 水平均显著低于健康对照 ($P < 0.05$)。维生素 D3 水平在两组间没有显著性差异。分层分析发现, 叶酸在女性, 年龄大于 30 岁及病程大于 1 年的患者中水平偏高 ($P < 0.05$); 维生素 B12 在首发的单相抑郁患者及不伴有精神病性症状的重型抑郁发作患者中水平偏高 ($P < 0.05$)。维生素 D3 主要在男性患者中偏高 ($P < 0.05$)。在舍曲林治疗前后及抑郁症状的严重程度间(中度发作或重度发作)没有发现维生素水平的明显变化和差异。维生素 B12 和年龄负相关, $B = -0.595 (-1.104 \text{ to } 0.086)$, 可建回归方程。

结论 单相抑郁患者较健康人群叶酸和维生素 B12 水平偏低。舍曲林治疗不影响维生素水平变化。

Exploring The Differences in Psychometric Properties of Commonly Used Self-rating Depression Scales Across Various Populations in China: A Quantitative Systematic Review

Linghui Meng¹, Yanjie Zhao¹, Pingping Gui², Jinjie Xu¹, Tong Guo¹, Jing Li³

1. Beijing Anding Hospital, Capital Medical University, Beijing

2. Capital Institute of Pediatrics, Beijing

3. Institute of Child and Adolescent Health, School of Public Health, Peking University, Beijing

Objective This study aims to systematically

compare the internal consistency reliability and criterion validity of four commonly used self-rating depression scales, the Patient Health Questionnaire-9 (PHQ-9), the Zung Self-Rating Depression Scale (SDS), the Beck Depression Inventory (BDI), and the Quick Inventory of Depressive Symptomatology-Self Report (QIDS-SR) in Chinese populations

Methods A quantitative systematic review was conducted, encompassing a literature search of Chinese and English medical databases, screening and selection of eligible studies, and data extraction. Internal consistency reliability (Cronbach's α) and criterion validity (correlation coefficients) of each scale were compared across studies and sub-populations. Data analyses were performed using R language version 4.3.1

Results A total of 53 studies involving 35,676 participants were included. PHQ-9 was validated in more diverse sub-populations than the other scales. The BDI exhibited the highest overall internal consistency reliability. PHQ-9 and QIDS-SR demonstrated lower internal consistency reliabilities among older adults. BDI had relatively lower Cronbach's α in female patients with infertility, while SDS had relatively lower Cronbach's α among patients with liver cirrhosis and women in rural areas. Criterion validities varied across scales, with the most frequently used criterion being the Hamilton Depression Scale-17 (HAMD-17)

Conclusion This systematic review provides valuable insights into the psychometric properties of commonly used depression scales in Chinese populations. The findings highlight the need for further research on the adaptability of these scales across diverse populations, particularly in older adults and those with specific health conditions

关键词: self-rating scales, depression, psychometric properties, internal consistency

Virtual Reality-based Interventions for People with Depressive Disorder: A Meta-analysis

caidi zhang¹, Chunbo Li^{1,2}, Yuqing Yang¹, Chenxi Liao¹, Bixi Yang¹, Zhipei Zhu¹, Binbin Shi¹

1. Shanghai Mental Health Center, Shanghai Jiao Tong University School of Medicine

2. School of Psychology, Shanghai Jiao Tong University

Background Depressive disorder is one of the most common and disabling mental disorders. Only 9.5% of people with depressive disorder have received mental health services, due to the stigma of mental illness and the scarcity of mental health resources, it needs to seek other treatment options. Virtual reality-based interventions (VR-Is) are one of the novel treatments that have been investigated in recent years.

Objective To evaluate the effects and tolerability of VR-Is for depressive disorder.

Method Eligibility criteria

All randomized controlled trials (RCTs) comparing VR-Is alone or plus standard care with antidepressants, and other forms of psychotherapy or any other interventions for people with depressive disorder.

Information sources

On 4 September 2023, we searched electronic sources for published, unpublished, and ongoing studies, including Pubmed, Embase, The Cochrane Library, China National Knowledge Infrastructure (CNKI), Wanfang Database, Chongqing VIP Database (VIP). We hand-searched the reference lists of all included studies and relevant systematic reviews to identify additional studies.

Risk of bias

Two reviewers independently assessed the methodological bias of each trial according to the criteria in the Cochrane Handbook for Systematic Reviews of Interventions.

Assessment the quality level of evidence

We used GRADE to assess the quality of the evidence for main outcomes.

Synthesis and analysis of results

Two reviewers performed reference screening, study selection, and data extraction independently. RevMan 5.4 statistical software was used to conduct statistical analyses. For binary outcomes, we calculated risk ratios (RRs) and 95% confidence intervals (CIs). For continuous data, we estimated mean differences (MDs) if studies used the same scales, and we used

standardized mean differences (SMDs) if studies used different scales, with 95% CIs. Pooled results were presented using forest plots. The degree of heterogeneity was evaluated using the Q statistic generated from the χ^2 test. We employed a random-effects model for analyses. We also performed sensitivity analysis if necessary. Funnel plots were used to assess the possibility of publication bias. Our primary outcomes of interest were symptom severity and cognitive function, and secondary outcomes were suicide, quality of life, social functioning, dropout for any reason, serious adverse events, and general adverse effects.

Results Included studies

An electronic search of English and Chinese language databases run on 4 September 2023 yielded 2787 records. After removing 591 duplicates, we screened 2196 titles and abstracts, of which we deemed 2163 to be irrelevant. Following retrieval and inspection of 33 full-text reports, we excluded 31 of them. We included two studies (2 references, 195 participants).

Synthesis of results

We included two studies (142 participants) comparing VR-Is with antidepressant. Two studies separately reported depressive symptoms with the Hamilton Rating Scale for Depression (HAM-D) and Self-rating Depression Scale (SDS), and the Korean Version of Quick Inventory of Depressive Symptomatology-Self-Report (K-QIDS-SR). Analysis of these two studies showed no clear differences in depressive symptoms (HAM-D and K-QIDS-SR) between treatment groups (SMD -0.55, 95% CI -3.04 to 1.95; 2 studies, 142 participants; low-certainty evidence). Analysis of these two studies also showed no clear differences in depressive symptoms (SDS and K-QIDS-SR) between treatment groups (SMD -0.35, 95% CI -2.45 to 1.75; 2 studies, 142 participants; low-certainty evidence). One study investigated multiple domains of cognitive function. Analysis of executive function measured by Wisconsin Card Sorting Test (WCST) showed significant differences between treatment groups (RR 1.20, 95% CI 1.18 to 1.22; 1 study, 106 participants; low-certainty evidence). Analysis of information processing speed and attention measured by Number Sign Conversion Test (DSST) also showed significant differences between treatment

groups (MD 23.31, 95% CI 20.10 to 26.52; 1 study, 106 participants; low-certainty evidence). One study reported suicide with suicidality scales of the Korean Mini International Neuropsychiatric interview. Analysis of the study showed no clear differences in suicide between treatment groups (MD -1.63, 95% CI -3.89 to 0.63; 1 study, 36 participants; low-certainty evidence). Two studies reported dropout for any reason. Analysis of dropout showed no clear differences between treatment groups (RR 0.33, 95% CI 0.10 to 1.12; 1 study, 142 participants; low-certainty evidence). One study reported general adverse effects with Treatment Emergent Symptom Scale (TESS). Analysis of the study showed no clear differences in general adverse effects between treatment groups (MD -0.12, 95% CI -0.57 to 0.33; 1 study, 106 participants; low-certainty evidence). None of the included studies reported outcomes on quality of life, social functioning, and serious adverse events.

We included one study (106 participants) comparing VR-based cognitive behavioral therapy (VR-CBT) with cognitive behavioral therapy (CBT). The study reported depressive symptoms with HAM-D and SDS. Analysis of the study showed no clear differences in depressive symptoms (HAM-D) between treatment groups (MD -0.81, 95% CI -1.73 to 0.11; 1 study, 106 participants; low-certainty evidence). Analysis of the study showed significant differences in depressive symptoms (SDS) between treatment groups (MD -5.92, 95% CI -9.33 to -2.51; 1 study, 106 participants; low-certainty evidence). The study investigated multiple domains of cognitive function. Analysis of executive function measured by WCST showed significant differences between treatment groups (RR 1.10, 95% CI 1.08 to 1.12; 1 study, 106 participants; low-certainty evidence). Analysis of information processing speed and attention measured by DSST also showed significant differences between treatment groups (MD 15.77, 95% CI 12.43 to 19.11; 1 study, 106 participants; low-certainty evidence). The study reported dropout for any reason. Analysis of dropout showed no clear differences between treatment groups (RR 0.50, 95% CI 0.05 to 5.35; 1 study, 106 participants; low-certainty evidence). The study reported general adverse effects with TESS. Analysis of the study showed no clear differences in general adverse

effects between treatment groups (MD -0.08, 95% CI -0.54 to 0.38; 1 study, 106 participants; low-certainty evidence). None of the included studies reported outcomes on quality of life, social functioning, and serious adverse events.

Discussion

Limitation

All studies were judged to have unclear risk of bias for study design and reporting. The two included studies were threatened by risks of bias due to a lack of information about blinding of participants and personnel. Moreover, one of the two studies was judged to high risk of bias for incomplete outcome data. Data pooling was limited due to the small number of included studies, and studies with usable data presented imprecision, as wide confidence intervals that crossed the null were shown in the forest plots. Studies included in this review were applicable to the aims of our review. However, the quality of presented evidence was low, so all results should be treated with considerable caution.

Interpretation

Evidence regarding the effects of VR-Is for patients with depressive disorder is currently insufficient. Our analyses showed no significant difference between VR-Is and antidepressants in depressive symptoms, but VR-Is were more effective in cognitive function. Our analysis also found that VR-CBT was superior to CBT in the both areas. We are uncertain about these findings because of the risk of bias and imprecision of estimates. Large, long, well-designed, and well-reported trials are needed to further examine the effects of VR-Is.

青少年抑郁症患者自杀意念与母亲的依恋模式及防御方式的关联研究

胡国庆^{1,2,3} 季益富^{1,2,3} 杜洋^{2,3} 陈肖杰^{2,3} 姚娇^{1,2,3}

1.安徽医科大学精神卫生与心理科学学院

2.合肥市第四人民医院

3.安徽省精神卫生中心

目的 自杀意念与多种心理、行为问题有关,青少年是自杀的高发人群,且自伤率呈现逐年上升的趋势。母亲的某些心理特质,如依恋模式和防御方式,可能会对青少年的自杀及抑郁障碍的转归产生重要影响。本研究探究青少年抑郁症自杀意念与母亲的依恋模式及防御方式的相关性。

方法 选取 57 例安徽省精神卫生中心门诊及住院的青少年抑郁症及父母作为研究组纳入研究,以 53 例年龄性别匹配的青少年及父母作为对照组纳入研究,采用青少年自我伤害问卷、亲密关系经历量表、防御方式问卷进行测评。

结果 研究组青少年抑郁症及母亲在依恋模式各维度得分和总分;母亲在不成熟防御方式得分均高于对照组(均 $P < 0.05$);青少年抑郁症患者的自杀意念与母亲依恋焦虑、依恋回避、防御方式总分、不成熟防御方式得分呈正相关;Logistic 回归分析结果显示母亲存不安全依恋 ($B=2.57, P=0.024$)、不成熟防御方式 ($B=1.95, P=0.003$)、父母教养原则不一致 ($B=2.54, P < 0.001$)、父母间感情差 ($B=1.33, P=0.013$) 的青少年抑郁症,出现自杀意念的风险较大。

结论 母亲不安全型依恋模式和不成熟防御方式可能是青少年抑郁症自杀意念的危险因素。

关键词: 抑郁障碍, 自杀意念, 依恋模式

Changes in Spectral Power Associated with Cognitive Function in Patients with Depression

Xiaoning Shi Yingying Zhao Hongli Wang Yuting Wang Ruinan Li Chenchang Wang Gang Wang*

The National Clinical Research Center for Mental Disorders & Beijing Key Laboratory of Mental Disorders, Beijing Anding Hospital, Capital Medical University, Beijing

Objective Cognitive impairment in depression has attracted widespread attention. Some depressed patients in remission may still have cognitive symptoms and may have changes in electroencephalogram (EEG)

Method 48 patients with stable depression were included in this study. The cognitive symptoms of the

patients were assessed by Measurement and Treatment Research to Improve Cognition in Schizophrenia (MCCB), and EEG was collected

Methods 48 patients with stable depression were included in this study. The cognitive symptoms of the patients were assessed by Measurement and Treatment Research to Improve Cognition in Schizophrenia (MCCB), and EEG was collected

Results We recruited 48 patients with MDD, 14 had impaired cognitive function. The sex and age distribution of the cognitive impairment (CI) and no cognitive impairment (NCI) groups were not statistically significant ($p > 0.05$). The total MCCB scores, information processing speed ($t = -2.631$, $p = 0.012$), working memory ($t = -2.669$, $p = 0.01$), word learning ($t = -2.545$, $p = 0.014$), and problem-solving ability ($t = -8.135$, $p < 0.001$) of the NCI group were significantly higher than the CI group ($t = -3.571$, $p = 0.001$). The delta-mean power values of the CI group and NCI group differed at the C3 electrode ($t = 2.163$, $P = 0.036$), the O2 electrode ($t = 2.940$, $P = 0.005$), and the Fz electrode ($t = 2.209$, $P = 0.032$) (Table 2), and theta-mean power values differed at the O2 electrode ($t = 2.258$, $P = 0.029$)

Conclusion This study suggests that changes in spectral power are associated with changes in cognitive function. There were changes in spectral power in which the delta power of the frontal, left central, and right occipital increased, and the theta power of the occipital lobe regions increased in the CI group

Global Functional Connectivity Analysis Indicating Dysconnectivity of The Hate Circuit in Major Depressive Disorder

Pan Pan Wenbin Guo*

Department of Psychiatry, and National Clinical Research Center for Mental Disorders, The Second Xiangya Hospital of Central South University, Changsha

Objective Abnormalities of functional connectivity (FC) in certain brain regions are closely related to the pathophysiology of major depressive disorder (MDD). Findings are inconsistent with different presuppositions in regions of interest. Our research focused inconsistent with different presuppositions in regions of interest. Our research focused on voxel-wise brain-wide FC changes in patients with MDD in an unbiased manner

Methods We examined resting-state functional MRI in the patients with MDD and 26 healthy controls. Imaging data were analyzed by using global-brain FC (GFC) and used to explore the correlation of abnormal GFC values with clinical variables

Results Increased GFC values in the left medial superior frontal gyrus (SFGmed) and decreased GFC values in the right supplementary motor area (SMA) were observed in the patients with MDD compared with the controls. The decreased GFC values in the patients with MDD compared with the controls. The decreased GFC values in the right SMA had a positive correlation with vitamin D and Hamilton Anxiety Scale (HAMA) scores

Conclusion Abnormal GFC in the hate circuit, particularly increased GFC in the left SFGmed and decreased GFC in the right SMA, appears to be a new sight for comprehending the pathological alterations in MDD

关键词: major depressive disorder, fMRI, global-brain functional connectivity, network, hate circuit

青少年抑郁障碍患者混合特征水平与认知功能相关研究

袁帅*

成都市第四人民医院

目的 探究青少年抑郁障碍患者的混合特征与患者认知功能的关系

方法 纳入 2022 年 1 月至 2024 年 1 月就诊于成都市第四人民医院住院部或门诊的 40 例青少年抑郁障碍患者为研究组, 另纳入 20 名与研究组性别、年龄、受教育年限相匹配的社会健康志愿者为对照

组。受试者入组后均进行接受神经心理评估,包括评估抑郁症状,使用蒙哥马利抑郁量表(MADRS);评估认知功能,使用中国简版神经认知成套测验(C-BCT),该套测验共包括4个分测验:符号编码、持续操作、连线测试、数字广度;评估混合特征,使用中文版临床实用抑郁混合特征量表(CUDOS-M-C)。使用SPSS14.0统计软件,对受试者的MADRS、C-BCT、CUDOS-M-C进行统计分析,以确定受试者间的差异。采用Pearson相关分析受试者的MADRS、C-BCT、CUDOS-M-C之间的相关性。

结果 研究组的MADRS、CUDOS-M-C评分均高于对照组,差异有统计学意义($P < 0.05$);研究组的CBCT测评各维度评分,包括符号编码、持续操作、连线测试、数字广度均低于对照组,差异有统计学意义($P < 0.05$)。研究组抑郁症状评分(MADRS)与CBCT总分、符号编码、持续操作、连线测试、数字广度得分水平呈负相关($P < 0.05$),研究组混合特征评分(CUDOS-M-C)与CBCT总分、符号编码、持续操作、连线测试、数字广度得分水平呈负相关($P < 0.05$)。

结论 青少年抑郁障碍患者的抑郁严重程度、混合特征和其认知功能高度相关。

Inflammatory Modulation of Sertraline Use in Patients with Depression: A Systematic Review and Meta-analysis

Ziliang Xie Caiyi Zhang*

Xuzhou Medical University

Background The increased evidences indicated that there was a correlation between major depressive disorder (MDD) and inflammatory pathways. Sertraline, the frontline intervention of selective serotonin reuptake inhibitors (SSRIs) for MDD, presumed to decrease pro-inflammatory cytokine levels. This systematic review and meta-analysis aim to advance comprehension of how the antidepressant sertraline intricately modulates inflammatory pathways and delineates the intricate functions of pivotal cytokines within this framework

Methods Electronic searches of Web of Science,

MEDLINE, and Embase yielded 294 unique records for the period Jan, 2007 to Feb, 2024. The studies included measured inflammatory cytokine concentrations in patients with MDD before and after sertraline treatment. And the effects of sertraline on their inflammatory cytokines were analyzed. All relevant articles were reviewed and the data was extracted by two independent coders. Estimates were tested using random effects meta-analysis

Results Seven studies (237 participants) were included. There was no significant evidence provided to demonstrate that sertraline can reduce the levels of TNF- α (SMD \pm 0.76, 95% confidence interval [CI] = -0.41, 1.93, $Z \pm$ 1.27, $p = 0.20$) and IL-6 (SMD \pm 0.96, 95% CI = -0.30, 2.22, $Z \pm$ 1.49, $p = 0.14$)

Limitations: Results are limited due to the small number of studies that precluded examination of some moderating variables. The results are correlation, not causation.

Conclusion Sertraline could not reduce serum the levels of IL-6 and TNF- α in patients with MDD. The antidepressant mechanism of sertraline may not base on the pathway of inflammation

关键词: Keywords: Sertraline, Major depressive disorder, Proinflammatory cytokines

Distinguishes Major Depressive Disorder and Bipolar Disorder Using Alpha-band Activity in Resting-state Electroencephalogram

Xixi Zhao¹, Chuanliang Han², Ling Zhang¹, Bin Wang¹, Gang Wang¹

1. Beijing Key Laboratory of Mental Disorders, National Clinical Research Center for Mental Disorders & National Center for Mental Disorders, Beijing Anding Hospital, Capital Medical University, Beijing, China

2. School of Biomedical Sciences and Gerald Choa Neuroscience Institute, The Chinese University of Hong Kong

Objective Previous studies have demonstrated

the capability of alpha sub-band oscillations in distinguishing depression from healthy controls. However, their potential to differentiate between Major Depressive Disorder (MDD) and Bipolar Disorder (BD) remains unexplored. This study aims to investigate whether alpha sub-band activity can serve as a discriminative feature between MDD and BD, thus contributing to enhanced diagnostic accuracy in mood disorders

Methods This study recruited 37 patients diagnosed with Major Depressive Disorder (MDD), 36 patients with Bipolar Disorder (BD), and 30 healthy controls, all matched in terms of gender, age, marital status, and educational level. General demographic and clinical characteristics were collected for all participants. Their depressive and anxiety symptoms were assessed using the 17-item Hamilton Depression Rating Scale (HDRS-17) and the 14-item Hamilton Anxiety Scale (HAM-A-14), respectively. Electroencephalogram (EEG) data were acquired during both eyes-open and eyes-closed states over a 5-minute duration to examine if alpha sub-band oscillations can differentiate between MDD and BD. For classification purposes, machine learning models including Decision Tree (DAC), K-Nearest Neighbors (KNN), Random Forest (RF), Naive Bayes (NB), and Support Vector Machines (SVM) were employed. Additionally, Pearson correlation analysis was conducted to explore the relationship between alpha sub-bands and clinical symptoms

Results Our findings revealed that compared to healthy controls, the MDD group exhibited significantly greater power in the high alpha range and reduced power in the low alpha range. Conversely, the BD group showed elevated power specifically in the medium alpha range. These differences were more pronounced under eyes-closed conditions. Among the five machine learning classifiers, performance was superior in the low alpha band for distinguishing normal controls from both MDD and BD patients, whereas classification between MDD and BD was optimized in the high alpha band. Notably, the Naive Bayes classifier outperformed the others, achieving an accuracy rate of 65% for differentiating MDD from BD. However, no significant correlations were observed between the specific alpha sub-band oscillations and clinical symptoms, suggesting that

the alterations in alpha activity might be independent of symptomatology or indicative of more fundamental neurobiological distinctions between the two disorders.

Conclusion The present study provides novel insights into the differential characteristics of alpha sub-band oscillations in distinguishing major depressive disorder (MDD) from bipolar disorder (BD), as compared to healthy controls. Our findings reveal that while MDD is associated with elevated power in the high alpha frequency range and reduced power in the low alpha range, BD is marked by increased power in the medium alpha band, particularly under eyes-closed conditions. These observations suggest distinct neural signatures for MDD and BD, highlighting the potential utility of alpha sub-band analyses in diagnostic classification.

PTSS, Perceived Stress, and Social Media Use Affecting Somatic Symptoms in Healthcare Workers Recovering From COVID after Ending China's Dynamic Zero-COVID Policy: A Moderated Mediation Model

Yafei Chen Zhiruo Zhou Wenwen Ou Chunxi Ke Yumeng Ju* Yan Zhang

The Second Xiangya Hospital of Central South University

Objective Persistent somatic symptoms brought by COVID are a matter of concern. Post-traumatic stress symptoms (PTSS) and perceived stress have been recognized as risk factors for somatic symptoms. Recently, the associations between social media use and COVID-related PTSS have also been noticed. However, the pathways these factors contribute to persistent somatic symptoms after COVID remain unclear. This study

aimed to investigate the role of perceived stress as a mediator in COVID-related PTSS and somatic symptoms, and whether social media use moderated the mediation in a sample of healthcare workers (HCWs) during the subacute phase of COVID in the context of the end of China's dynamic zero-COVID policy

Methods Questionnaire data from 2281 Chinese HCWs were included in the study. COVID-related PTSS, perceived stress, and somatic symptoms were measured, and a moderated mediator model was developed

Results The effect of COVID-related PTSS on somatic symptoms was partially mediated by perceived stress. Moreover,

social media use positively moderated the relationship between COVID-related PTSS and perceived stress. COVID-related PTSS and perceived stress. That is, at higher frequencies of social media use, COVID-related PTSS played a stronger role in perceived stress.

Conclusion Our findings suggest that perceived stress and frequency of social media use play a facilitating role in the impact of COVID-related PTSS on somatic symptoms. From a psychosocial perspective, this study identified psychological interventions targeting stress and benign media communication as potential interventions for persistent somatic symptoms after COVID infection and prevention of long COVID

关键词: PTSS; perceived stress; social media use; COVID; somatic symptom

NSSI Contagion in Adolescent Friendships: Explore The Process of Peer Influence

Chunxi Ke Zhiruo Zhou Yafei Chen Zhixuan Ren Mengjun Liu Yunheng Yao Yumeng Ju* Yan Zhang
The Second Xiangya Hospital of Central South University

Objective Although empirical evidence of non-suicidal self-injury (NSSI) contagion within adolescent friendships has been documented, the specific mecha-

nisms remain poorly understood. The current study employed a longitudinal design to investigate the influence of NSSI in adolescents' peer groups on their own NSSI behaviors. Additionally, the mediating role of self-esteem and the specific conditions of NSSI contagion were examined

Methods The study had recruited 326 adolescents (mean age = 13.5, 59.2% female) nested within 163 friendship dyads. NSSI behavior, self-esteem, self-compassion, alexithymia and personal distress were assessed at baseline (T1), and NSSI behavior was assessed again after three months (T2). A cross-lagged Actor-Partner Interdependence Model (APIM) was used to estimate the NSSI contagion model

Results The results revealed that friends' NSSI status at baseline was significantly predicted with adolescents' own NSSI status after three months. Self-esteem was found to mediate the NSSI contagion effect exclusively in situations where adolescents exhibited high alexithymia, low self-compassion, and high personal distress

Conclusion This research highlights the role of adolescent friendships in NSSI contagion and elucidates the specific conditions of this contagion. These findings provide substantial implications for the prevention of the NSSI contagion among adolescents

关键词: NSSI contagion; adolescent friendship; self-esteem; alexithymia; self-compassion; personal distress

重度抑郁症患者动脉粥样硬化指数相关因素的性别差异

潘鹏 张文琼 金小英 王立娜*
天津市安定医院

目的 探究重度抑郁症患者动脉粥样硬化指数相关因素的性别差异

方法 数据来源于 2015 年至 2017 年在山西医科大学第一医院精神科进行的横断面研究。采用标准化的临床评估表收集患者的人口学和临床资料。分别采用汉密尔顿抑郁量表 (HAMD)、汉密尔顿焦

虑量表 (HAMA)、阳性和阴性精神症状评定量表 (PANSS) 对重度抑郁症患者的抑郁、焦虑和精神病性症状进行评价。采集患者的空腹静脉血进行血糖、血脂、甲功等检测, 并进一步计算动脉粥样硬化指数 AI。单因素分析时使用 Mann-Whitney U 检验和 χ^2 检验, 多因素分析时使用逐步 logistics 回归, $P < 0.05$ 时差异有统计学意义。

结果 参与研究的患者共 1718 人, 平均年龄 34.87 ± 12.43 岁, 其中男性 588 人, 女性 1030 人。男女性重度抑郁症患者动脉粥样硬化指数逐步 logistics 回归结果显示: HAMD 量表评分高 ($B=0.122$), TSH 高 ($B=0.490$), 甘油三酯高 ($B=0.617$), 低密度脂蛋白高 ($B=0.821$) 与男性动脉粥样硬化风险高相关; 受教育程度高 ($B=-0.321$), PANSS 量表阳性症状部分评分高 ($B=-0.127$) 与男性动脉粥样硬化风险低相关。HAMD 量表评分高 ($B=0.132$), FT3 高 ($B=0.225$), TSH 高 ($B=0.403$), 甘油三酯高 ($B=0.375$), 低密度脂蛋白高 ($B=0.721$), BMI 高 ($B=0.112$), 收缩压高 ($B=0.026$) 与女性动脉粥样硬化风险高相关; PANSS 量表阳性症状部分评分高 ($B=-0.042$) 与女性动脉粥样硬化风险低相关。

结论 1. 在我们的研究中, HAMD 量表评分高、TSH 高、甘油三酯高、低密度脂蛋白高与患者动脉粥样硬化风险高相关, PANSS 量表阳性症状部分评分高与动脉粥样硬化风险低相关, 无明显性别差异。2. 在男性重度抑郁症患者中受教育程度高与动脉粥样硬化风险低相关; 在女性重度抑郁症患者中, BMI 高、收缩压高、FT3 高与女性动脉粥样硬化风险高相关, 性别差异明显。

关键词: 重度抑郁症, 动脉粥样硬化, 性别差异, 横断面研究

Prevalence and Correlates of Overweight and Obesity in Patients with Major Depression Accompanied by Abnormal Thyroid-stimulating Hormone Levels

Dayu Cao¹, Xiangyang Zhang²

1. Tianjin Anding Hospital

2. CAS Key Laboratory of Mental Health, Institute of Psychology, Chinese Academy of Sciences

Background Abnormal thyroid function is common in patients with major depressive disorder (MDD), which may be closely associated with metabolic disturbances, especially overweight and obesity. This study aimed to examine the prevalence of overweight and obesity and their related factors in MDD patients with abnormal thyroid stimulating hormone (TSH) levels

Methods A total of 1718 patients with MDD were recruited in this study. Hamilton Anxiety Rating Scale (HAMA), Hamilton Depression Rating Scale (HAMD), and Positive and Negative Syndrome Scale (PANSS) positive subscale were used to assess clinical symptoms. In addition, free triiodothyronine (FT3), free thyroxine (FT4), thyroid stimulating hormone (TSH), anti-thyroglobulin (A-TG), body weight, height, and blood pressure were measured

Results MDD patients with abnormal TSH levels had a higher rate of obesity and overweight compared to those without abnormal TSH levels. Among patients with abnormal TSH levels, overweight and obese patients had older age and age of onset, lower A-TG levels, and higher systolic blood pressure compared to those without overweight and obesity. Further logistic regression analysis showed that being married (OR: 1.582, 95% CI: 1.191-2.102) and having no suicidal behavior (OR: 1.444, 95% CI: 1.079-1.934) were independently associated with overweight and obesity in patients with abnormal TSH level ($P < 0.05$)

Conclusion Patients with MDD who have abnormal TSH levels are more likely to be obese and overweight. Several clinical and thyroid function parameters are associated with obesity and overweight in MDD patients with abnormal TSH levels

关键词: Major depressive disorder; Abnormal serum TSH level; Overweight; Obesity

青少年抑郁症患者再入院情况及影响因素的回顾性分析

黄乾坤 尹娥*

宜昌市精神卫生中心

目的 分析青少年抑郁症患者再入院情况及影响因素。

方法 回顾性分析 2019 年 1 月-2023 年 12 月于宜昌市精神卫生中心住院治疗的青少年抑郁症患者临床资料,将患者是否多次住院分为一次住院组和再入院组(住院次数 ≥ 2 次)。使用独立样本 t 检验和 χ^2 检验进行差异性分析,筛选出自变量($P < 0.1$)纳入 logistic 回归模型,分析青少年抑郁症患者再入院的影响因素。

结果 2276 例青少年抑郁症患者中 1705 例(74.9%)患者一次住院,571 例(25.1%)患者再入院。两组青少年抑郁症患者在性别、家庭结构、自杀未遂史、有无联合无抽搐电休克治疗(MECT)以及汉密尔顿抑郁量表 17 项(HAMD-17)减分率差异有统计学意义($P < 0.05$)。Logistic 回归分析结果显示女性(OR=1.752, 95%CI: 1.377~2.230)、有自杀未遂史(OR=1.791, 95%CI: 1.359~2.359)是青少年抑郁症患者再入院的危险因素;双亲家庭(OR=0.787, 95%CI: 0.646~0.958)是青少年抑郁症患者再入院的保护性因素。

结论 青少年抑郁症住院患者再入院发生率高,应重点关注女性、单亲家庭或重组家庭、有自杀未遂史的青少年抑郁症住院患者,对影响因素应进行针对性干预,以降低青少年抑郁症患者再入院可能。

关键词:青少年;抑郁症;再入院;影响因素

家庭治疗在抑郁症治疗中的应用效果

王琦*

抚顺市第五医院

目的 本研究聚焦于精神科临床中家庭治疗在抑郁症治疗中的应用效果。通过对相关病例的深入分析和评估,旨在揭示家庭治疗对抑郁症患者症状改善、康复进程以及生活质量提升的重要作用。研究结果显示,家庭治疗作为抑郁症综合治疗的重要组成部分,具有显著的积极效果。

方法 选取在精神科确诊为抑郁症的患者若干,随机分为实验组和对照组。实验组接受药物治疗结合家庭治疗,对照组仅接受药物治疗。在治疗前、治疗后及随访期间对患者的病情和生活质量进行评估。

结果 实验组患者的抑郁症状在治疗后明显减

轻,量表评分显著低于对照组。实验组的康复速度较快,复发率低于对照组。实验组在生活质量的各个维度上均有显著改善,包括心理、生理、社会功能等方面。实验组家庭的亲密度和适应性得到提高,家庭成员之间的关系更加和谐。

结论 家庭治疗在精神科临床抑郁症的治疗中具有显著的应用效果,能够有效改善患者的症状、促进康复、提高生活质量,并优化家庭关系。建议在今后的临床实践中,进一步推广和完善家庭治疗模式,为抑郁症患者提供更全面、有效的治疗服务。然而,家庭治疗在应用过程中也面临着一些挑战,需要进一步加强研究和实践,不断完善治疗方法和技术,提高治疗效果。同时,我们也期待未来家庭治疗能够与其他治疗方法更好地结合,为抑郁症患者带来更多的希望和福祉。

青少年抑郁症患者快感缺失水平变化分析

刘艳^{1,2} 沈悦娣² 廖梅^{1,2} 计晓磊^{1,2}

1.杭州师范大学附属医院

2.杭州师范大学

目的 本研究旨在探索青少年抑郁症患者快感缺失的特点及治疗前后快感缺失的变化与抑郁症状之间的相关性。

方法 选取杭州师范大学附属医院青少年心理健康联合门诊 2022 年 2 月至 2024 年 6 月就诊青少年抑郁症患者 31 名,所有患者均接受药物治疗,在首次就诊、治疗 2 月后分别应用汉密尔顿抑郁量表(HAMD-17)评估患者抑郁症状;汉密尔顿焦虑量表(HAMD-14)评估患者焦虑症状;斯奈思-汉密尔顿快感量表(SHAPS)评估患者享乐能力,该量表包涵 4 个方面,分别为兴趣爱好(娱乐活动)、社会交往、感觉体验、食物饮料;愉快情绪体验量表(TEPS)评估患者对一些愉快情景下的快乐反应的同意程度,TEPS 量表包括期待性快感缺失(TEPS-ant)、完成性快感缺失(TEPS-con)两个分量表。其中斯奈思-汉密尔顿快感量表分数越高提示个体的快感缺失水平越高,愉快情绪体验量表分数越高,快感缺失的水平越低。

结果 青少年抑郁症患者治疗前在社会交往

($\bar{x}\pm S=8.74\pm 4.10$)、感觉体验($\bar{x}\pm S=7.41\pm 3.70$)方面以及期待性快感缺失($\bar{x}\pm S=39.70\pm 14.99$)水平较高。治疗 2 月后其 HAMD 评分显著降低($P<0.01$), SHAPS 评分显著降低($P<0.01$), 其中兴趣爱好快感缺失评分显著降低($P<0.01$)、感觉体验快感缺失评分显著降低($P<0.05$), 社会交往、食物饮料方面快感缺失评分无明显差异($P>0.05$), TEPS 评分显著增高($P<0.01$), 其中期待性快感评分显著增高($P<0.01$)、完成性快感显著增高($P<0.05$)。青少年抑郁症患者治疗前 HAMD 评分与 SHAPS 评分呈正相关($r=0.408, P<0.05$), 与 TEPS 评分呈负相关($r=-0.423, P<0.05$), HAMD 评分与 TEPS 评分中完成性快感缺失呈负相关($r=-0.455, P<0.05$)。

结论 青少年抑郁症患者治疗前快感缺失主要表现在社会交往、感觉体验以及期待性快感三个方面。经治疗后其抑郁症状、快感缺失程度均得到改善, 其中兴趣爱好快感、感觉体验快感显著提高。期待性快感缺失、完成性快感缺失均得到明显改善, 其中期待性快感缺失改善更为明显。青少年抑郁症患者抑郁症状严重程度与快感缺失水平呈正相关, 与快感缺失中完成性快感缺失水平显著相关。

1. 南京脑科医院

2. 上海交通大学医学院附属精神卫生中心

目的 探讨精神分裂症(schizophrenia, SZ)和重性抑郁障碍(major depression disorders, MDD)患者快感缺失症状, 内侧前额叶皮质(medial prefrontal cortex, mPFC)谷氨酸水平以及与 N-甲基 D-天冬氨酸受体(N-methyl D-aspartate receptor, NMDAR)通路基因的关联。

方法 研究共纳入 58 例突出型阴性症状(prominent negative symptoms, PNS) SZ 患者, 27 例 MDD 患者和 62 例健康对照, 利用阴性症状临床评估访谈量表(the clinical assessment interview for negative symptoms, CAINS)评估 SZ 和 MDD 患者的阴性症状和快感缺失症状的程度。采用氢质子磁

共振波谱技术(¹H proton magnetic resonance spectroscopy, ¹H-MRS)及 LCModel(linear combination of model in vitro spectra)软件对 mPFC 谷氨酸(glutamate, Glu)及谷氨酸/谷氨酰胺复合(glutamate+glutamine, Glx)的水平进行定量。选取 NMDAR 通路基因的 NOS1AP, GSK3 β , DAOA, DISC1 基因的 15 个 SNP 位点(rs12742393, rs1415259, rs1415263, rs1858232, rs348624, rs6680461, rs334558, rs6779828, rs3916965, rs778294, rs947267, rs1538979, rs821577, rs821633, rs999710)进行基因分型。在 SPSS 中使用 PROCESS Marco 进行中介效应分析(模型 4, Bootstrap 法), 评估谷氨酸在 NMDAR 通路基因和快感缺失症状关系中的作用。

结果 MDD 患者 mPFC 脑区的 Glu 和 Glx 的水平显著高于 SZ 组和健康对照组。相关分析显示 SZ 患者 mPFC 脑区 Glx 水平与 CAINS 量表 MAP 条目分数和总分呈显著性负相关。中介效应分析显示 NOS1AP 基因 rs6680461 位点通过 Glx 的完全中介效应可以预测 CAINS 的总分, DISC1 基因 rs1538979 位点通过 Glx 的部分中介效应可以预测 MAP 因子分。

结论 谷氨酸系统在快感缺失的病理机制中发挥重要作用, NMDAR 通路基因可能通过调控 mPFC 谷氨酸水平进而影响快感缺失症状。

关键词: 快感缺失; 谷氨酸系统; 精神分裂症; 重性抑郁障碍; 影像遗传学

Dezocine's Rapid and Sustained Antidepressant Effects: A Case Report

Han Wang Nan Lv Qian Zhao*

Beijing Anding Hospital, Capital Medical University

Objective This study aims to discuss the antidepressant effects of dezocine, as well as its potential for ameliorating symptoms of anhedonia, through the integration of a case report

Methods Without altering the patient's original treatment regimen (continued administration of sustained-release bupropion 150 mg/day, once daily, and clonazepam 15 mg/day, once nightly), a single low dose (0.1 mg/kg, administered over 30 minutes) of dezocine

was intravenously infused. A baseline assessment of the patient was conducted one week prior to receiving dezocine, followed by a 4-week follow-up. The Hamilton Depression Rating Scale (HAMD-17), Montgomery-Åsberg Depression Rating Scale (MADRS), as well as the self-rating scales, the Patient Health Questionnaire-9 (PHQ-9), and Dimensional Anhedonia Rating Scale (DARS), were utilized for evaluation

Results The results demonstrated a significant amelioration of depressive symptoms and anhedonia by the end of the 1st and 2nd weeks, with 88.89% and 72.22% reductions in the HAMD-17 scores, respectively, as outlined in Table 1. Additionally, there was a notable improvement in the patient's anhedonia, with weekly increase in DARS scores by 35 and 32 points above the baseline, respectively. By the 3rd week, the patient's reduction rate on HAMD-17 subsided to 44.44%, and the DARS scores decreased to 35 points. At the end of the 4th week, the patient's symptoms had exacerbated, described as "almost as before," and assessments were essentially congruent with pre-dezocine treatment baselines, prompting the patient to express a desire for augmented therapeutic intervention. Consequently, follow-up was discontinued, and the treatment plan was amended

Conclusion While the current evidence is limited to case reports, the pharmacological profile of dezocine suggests that it has significant potential for the treatment of MDD, particularly in patients manifesting anhedonic symptoms. Future high-quality clinical and preclinical research is required to corroborate these findings and develop viable therapeutic protocols

正念认知治疗对抑郁障碍患者生活质量的影响

刘磊*

北京回龙观医院

目的 评估正念认知治疗 (mindfulness-based

cognitive therapy, MBCT) 治疗抑郁障碍的疗效, 并探索对患者生活质量的影响。

方法 1、对象 选取 2018 年 5 月至 2020 年 5 月北京回龙观医院的门诊及住院抑郁障碍患者。共招募符合入组条件的抑郁障碍被试 84 例, 最终完成研究方案 73 例纳入统计分析, 根据随机数字表法随机分为正念组与对照组, 正念组 37 人, 对照组 36 人。两组一般资料比较差异无统计学意义 ($P>0.05$)。2、测评工具: 汉密尔顿抑郁量表 (HAMD-17)、汉密尔顿焦虑量表 (HAMA)、五因素正念量表 (FFMQ)、世界卫生组织生存质量量表简表 (WHOQOL-BREF)。3、MBCT 干预操作: 本研究采用牛津大学正念中心的标准 MBCT 干预方案。为团体干预模式, 每期 6-12 人。本研究的所有治疗师均已完成英国牛津正念中心 MBCT 带教师资培训。4、统计学处理: 采用 SPSS20.0 统计软件进行统计分析, 计量资料以均数 \pm 标准差 ($\pm s$) 表示, 采用 t 检验, 计数资料以率 (%) 表示, 采用卡方检验, 以 $P<0.05$ 为差异有统计学意义。

结果 两组抑郁障碍患者干预前的 HAMD-17 和 WHOQOL-BREF 评分比较, 差异无统计学意义 ($P>0.05$)。经过 8 周 MBCT 训练后, 两组患者的 HAMD-17 总分显著低于干预前, 而 WHOQOL-BREF 的总分显著高于干预前, 差异有统计学意义 ($P>0.05$)。正念组患者干预 8 周后的 HAMD-17 总分低于对照组, WHOQOL-BREF 总分高于对照组, 差异有统计学意义 ($P>0.05$)。

结论 MBCT 治疗的有效性和便捷性使其在精神科临床诸多领域获得广泛应用。有研究显示, 常规药物治疗联合 MBCT 治疗可有效地改善抑郁障碍患者的抑郁症状。本研究结果显示, 正念组经过 8 周 MBCT 干预治疗后较对照组能显著地改善 HAMD-17 总分。有研究发现, MBCT 治疗不仅可以改善抑郁障碍患者的抑郁症状, 还可以改善抑郁障碍患者的生活质量。本研究亦支持上述结论。本研究存在一定的局限性。样本量较少, 今后研究中应进行多中心、大样本研究来进一步验证该结论。综上所述, MBCT 能有效改善抑郁障碍患者的抑郁症状, 同时, 还能提高患者的生活质量。

关键词: 正念, 抑郁症, 生活质量

基于真实世界证据探索伴有自杀意念或行为

的抑郁障碍患者的临床特征研究

张安琪¹ 黄娟¹ 王瀚¹ 吕楠¹ 赵茜^{1,2}

1.首都医科大学附属北京安定医院,国家精神疾病医学中心,国家精神心理疾病临床医学研究中心,精神疾病诊断与治疗北京市重点实验室

2.人脑保护高精尖创新中心,首都医科大学

目的 探索基于真实世界证据的伴自杀意念或行为的抑郁障碍患者的临床特征。

方法 采用描述性、回顾性研究的分析方法,利用基于医院信息系统(hospital information system, HIS)的电子健康记录(electronic health record, EHR),纳入2013年1月1日至2020年12月31日在首都医科大学附属北京安定医院住院及急诊留观的抑郁障碍患者共7986人,按照是否存在自杀意念或行为分为抑郁障碍不伴自杀意念和行为组(Major Depressive disorder with Non Suicide, MDNS)、抑郁障碍伴自杀意念组(Major Depressive disorder with Suicidal Ideation, MDSI)及抑郁障碍伴自杀行为组(Major Depressive disorder with Suicidal Behavior, MDSB),比较三组人口学及临床特征。

结果 单因素比较分析显示:(1)MDSI组和MDSB组年龄显著低于MDNS组($Z=22.14, P=0.001$),在职比率显著高于MDNS组($\chi^2=13.91, P=0.001$);(2)MDSB组伴精神病性症状的比率显著高于MDSI组($\chi^2=9.40, P=0.009$);与MDNS组相比,MDSB及MDSI组的患者的起病年龄更早($Z=27.49, P=0.001$)。MDSI组中发病前有诱因的患者比率显著高于MDNS组($\chi^2=16.89, P=0.001$);(3)焦虑状态、便秘、失眠分别为三组排名最靠前的精神、躯体及睡眠障碍合并诊断。

结论 女性、早年起病、有发病前存在社会心理因素的抑郁障碍患者更易出现自杀意念或行为,临床诊疗及家属应加强对该部分患者的关注,避免不良结果的出现。

关键词:抑郁障碍;自杀;真实世界

伴或不伴社交焦虑特征抑郁障碍患者情绪面孔加工的单眼优势差异

陈巧珍¹ 潘超娅² 沈禹泽³ 潘琦¹ 钱燕丹⁴ 潘瑞博

¹ 龚梦园²

1.浙江大学医学院附属第二医院

2.浙江大学心理与行为科学系

3.浙江省杭州市临平区第一人民医院

4.浙江省嘉善县第三人民医院精神科

目的 研究旨在探究伴或不伴社交焦虑特征抑郁障碍患者皮层下情绪面孔加工的差异性,为抑郁障碍及社交焦虑的视觉面孔加工过程以及治疗靶点探索提供实验依据。

方法 共纳入了67例抑郁障碍患者,其中不伴社交特征的抑郁障碍患者32例(单纯抑郁组),伴社交焦虑特征抑郁障碍患者35例(伴社交焦虑特征抑郁组),设立了健康对照组35例。采用立体镜的心理物理学方法通过同眼或不同眼连续呈现两张情绪性面孔来探索面孔知觉中的单眼优势来反映抑郁障碍患者对面孔刺激的早期皮层下加工特点。

结果 单纯抑郁组在加工悲伤情绪时的单眼优势显著高于健康对照组和伴焦虑特征抑郁组($P<0.001$)。与健康对照组相比,单纯抑郁组与伴焦虑特征抑郁组在加工面孔时的单眼有数均增高($P<0.05$)。在加工中性与悲伤面孔时,该单眼优势指标与个体自我报告的抑郁得分成正相关($P<0.018$);在加工愤怒面孔时,该单眼优势指标与自我报告的社交焦虑得分($P<0.01$)成正相关。

结论 抑郁障碍增强了个体在悲伤面孔加工过程中的单眼优势,提示皮层下通路对于该过程的参与程度增强。其中伴或不伴社交焦虑特征对单眼优势的影响随着不同情绪面孔产生差异,提示抑郁与社交焦虑相互作用的方式与特定情绪有关。研究为区分和干预不同类型抑郁障碍患者的特征提供了客观的单眼优势指标和依据。

Association between Personality and Cognitive Bias in Adults with and without Depression

Bangshan Liu* Haoting Wang Jin Liu Yan Zhang Lingjiang Li

The Second Xiangya Hospital of Central South University

Objective Cognitive bias plays a crucial role in the onset and persistence of depression. Research has established a link between personality and cognitive bias, however, most of them focused on the general population, overlooking the individuals with depression. We aim to explore the relationship between personality and cognitive bias in patients with major depressive disorder (MDD) and compare the results with healthy controls (HCs) to identify potential patterns

Methods The study included 124 patients with MDD and 123 HCs who were recruited from the Zhumadian Psychiatric Hospital in Henan, China, using the 16 Personality Factor Questionnaire (16 PF) to measure personality traits and the Cognitive Bias Questionnaire (CBQ) to measure cognitive biases. Pearson correlations and hierarchical regression analyses were employed to investigate the correlations and predictive powers

Results Traits related to either neuroticism or extraversion were associated with biased responses. After controlling for sociodemographic and clinical information, Neuroticism traits were found to have a significant independent effect in the MDD group. Also, the significance of Privatness in the MDD group merits more extensive exploration

Conclusion Although consistent correlation patterns were found in both groups, neuroticism traits were more significant and independent in predicting biased cognitive processing in the MDD group, indicating the importance of neuroticism in the depressive context. The present study provides insights into the connection between personality and cognitive bias from a clinical perspective, potentially contributing to the enhancement of clinical diagnosis and treatment modalities

关键词： Personality, Cognitive bias, Neuroticism, Extraversion, Major depressive disorder

微表情识别训练对青少年抑郁症患者的有效性研究

王欢 廖巧玲 阳丹 李作为*
绵阳市第三人民医院

目的 探讨微表情识别训练工具 (METT) 训练及强化对青少年抑郁症患者的有效性。

方法 将 2023 年 6 月至 2024 年 1 月 152 例青少年抑郁障碍患者, 使用 PHQ-9 抑郁筛查量表、自动思维问卷、中国大五人格问卷、社交回避及苦恼量表进行评估, 采用随机数字表法随机分为对照组 83 例与干预组 69 例, 对照组仅进行微表情识别测试, 干预组对青少年抑郁症患者进行两次微表情识别训练, 在训练前后分别测量微表情识别能力, 结果采用正确率百分比标识, 测量青少年抑郁症患者微表情识别能力得分, 比较其在进行一次和两次微表情识别训练前后微表情识别能力变化情况。

结果 干预组和对照组各量表评分及微表情识别能力比较差异无统计学意义。干预组中, 干预前后初测得分分别为 (56.12±15.48) % 和 (68.26±12.89) %, 差异有统计学意义 (P<0.05); 终测得分分别为 (56.07±13.83) % 和 (57.20±15.77) %, 差异无统计学意义 (P>0.05)。

结论 青少年抑郁障碍患者微表情识别能力较低, 微表情识别训练能有效改善青少年情感障碍患者的微表情识别能力。在临床工作中, 可对青少年抑郁症患者进行微表情识别训练, 提高其微表情识别能力, 改善社会交往沟通能力。

Abnormalities in Brain Function and Neuroinflammation Are Present in People with HIV-associated Suicide Risk

Guangqiang Sun*

The National Clinical Research Center for Mental Disorders & Beijing Key Laboratory of Mental Disorders, Beijing Anding Hospital, Capital Medical University, Beijing, China

Objective People living with HIV (PLWH) exhibits an increased susceptibility to suicide risk,

heightened vulnerability to aberrant immune activation, inflammatory responses, and endocrine dysfunction. There exists a dearth of scholarly investigations pertaining to the neurological imaging, immune and endocrine dimensions of HIV-associated suicide risk

Methods This study aimed to compare a group of 18 individuals with HIV-associated suicide risk according to the Diagnostic and statistical manual of mental disorders (5th ed.), with a HIV individual control group of 73 without suicide risk. Multi-modal magnetic resonance was employed to assess the brain function and structure of both groups. Seed-based functional connectivity (FC) was used to assess the regional intrinsic brain activity and the influence of regional disturbances on FC with other brain regions. Peripheral blood cytokines and chemokines concentrations were measured using liquid chip and ELISA

Results General demographic data and scale analysis results showed that SAS, SDS, PSQI, SCL-90 and CD8 were significantly different between the two groups: Two-sample t test was used in this study. In the functional phase results, the ALFF of Occipital-Mid-L, Temporal-Mid-R and Occipital-Sup-R were increased in the suicide group. fALFF decreased in undefined regions, while α ALFF significantly increased in Occipital-mid-L and Temporal-mid-R. The ReHo in Frontal-Inf-Tri-L region was significantly decreased. In the structural phase result, the VBM of the cerebellar area, Cerebellum-Crus1-L and Post-central-R were significantly increased in the suicide group; Analysis results of inflammatory factors and cytokines showed that there was no significant difference between the two groups; Correlation analysis showed that some pro-inflammatory factors, some anti-inflammatory factors, types of drugs, CD4+ T cell content and VL content were correlated with Occipital-mid-L. Some chemokines were correlated with the brain activity of Temporal-mid-R, Occipital-mid-L (f), Temporal-mid-R (f) and Frontal-Inf-tri-L. There was a correlation between CD4 and Temporal-mid-R (f). The duration of HIV infection and antiretroviral therapy (ART) treatment were correlated with Postcentral-R

Conclusion This study suggests that PLWH as-

sociated suicide risk may exhibit abnormalities in neurologic, immune, and endocrine functioning. Consequently, it is imperative to implement additional screening and intervention measures for anxiety disorders among PLWH

EEG Microstate Analysis in Anhedonia Patients with Major Depressive Disorder

Danfeng Yan^{1,2}, Mei Liao², Shibin Wu³, Yan Zhang², Lingjiang Li², Jin Liu²

1. Shanxi Mental Health Center

2. Department of Psychiatry, The Second Xiangya Hospital, Central South University

3. Nanning Fifth's People Hospital

Objective Neuroimaging studies have shown that major depressive disorder (MDD) is characterized by abnormal activity and connectivity. EEG microstate imaging, with its high temporal resolution, can be used to characterize transient brain resting-state activities on a sub-second scale. The aim of this study was to evaluate the electrophysiological mechanisms of anhedonia in patients with depression

Methods A total of 50 MDD patients and 38 healthy controls participated in this study. We used 64-channel clinical EEG recordings and the Snaith-Hamilton Pleasure Scale (SHAPS) to explore the relationship between the temporal parameters of four microstate classes and anhedonia-related brain network activities

Results We found an increased presence of microstate classes B and C ($F=5.565$, $p=0.021$; $F=7.818$, $p=0.006$, respectively) and a decreased duration of microstate class D in MDD patients compared to healthy controls. Furthermore, the presence of microstate class C was significantly negatively correlated with SHAPS scores in MDD patients ($r=-0.296$, $p=0.037$). This study also found a shortened mean duration of cognitive

processing in MDD patients compared to healthy subjects ($r = 0.379, p = 0.019$), indicating a need for more processing time to compensate for decreased cognitive efficiency

Conclusion This study demonstrated that MDD patients exhibit decreased duration and occurrence of certain EEG microstates compared to healthy subjects. One significant finding is that the brain processing mode associated with anhedonia in depression is distinct from that in healthy individuals

关键词: EEG microstate, Anhedonia, Major Depressive Disorder

12 种脂质与抑郁症的因果关系: 双向双样本的孟德尔随机化分析

刘美琪 高耀 刘煌辉 刘莎*
山西医科大学

目的 抑郁症是一种常见的精神障碍, 它以情绪低落、快感确实、兴趣减退为特征。在我国, 终生患病率则达到 6.8%。有研究表明, 脂质代谢异常可能与抑郁症的发病机制有关, 抑郁症患者表现出血脂异常, 两者之间可能存在复杂的相互作用, 但因果关系尚未明确。孟德尔随机化(MR)是一种流行病学方法, 利用遗传变异作为工具变量来推断因果关系。因此, 在本研究中, 我们采用双向 MR 方法来探究脂质与抑郁症之间的因果关系。

方法 本研究基于欧洲人群中 12 种脂质和抑郁症的全基因组关联研究(GWAS)的总结数据。使用双向双样本 MR, 遗传因素作为工具变量, 去除连锁不平衡、弱工具变量后, 采用逆方差加权法(IVW)作为主要分析方法, 采用 MR-Egger 截距法评估水平多效性。MR 结果以比值比(OR)和对应的 95%置信区间表示, 当 $P < 0.05$ 时, 结果被认为差异有统计学意义。在前瞻 MR 分析中, 我们将 12 种脂质作为暴露因素, 将抑郁症作为结局因素; 在反向 MR 分析时, 将抑郁症作为暴露因素, 将 12 种脂质作为结局因素, 以此来评估脂质与抑郁症之间的潜在因果关系。

结果 前瞻 MR 分析表明甘油三酯与抑郁症之间存在因果关系, 且为正相关 ($OR=1.008, 95\%CI:$

$1.000-1.016, P=0.046$), 证明甘油三酯是抑郁症的危险因素。极大型高密度脂蛋白中的胆固醇酯与抑郁症存在因果关系, 且为负相关 ($OR=0.992, 95\%CI: 0.985-0.999, P=0.024$), 证明极大型高密度脂蛋白中的胆固醇酯是抑郁症的保护因素。未发现其他脂质与抑郁症之间的因果关系。反向 MR 分析表明抑郁症与低密度脂蛋白胆固醇水平存在因果关系, 且为正相关 ($OR=1.594, 95\%CI: 1.406-2.430, P=0.030$)。抑郁症与总胆固醇存在因果关系, 且为负相关 ($OR=0.872, 95\%CI: 0.787-0.965, P=0.008$)。抑郁症与总游离胆固醇存在因果关系, 且为负相关 ($OR=0.900, 95\%CI: 0.815-0.995, P=0.039$)。抑郁症与乳糜微粒和超大 VLDL 颗粒浓度存在因果关系, 且为正相关 ($OR=1.686, 95\%CI: 1.135-2.503, P=0.010$)。未发现抑郁症与其他脂质之间存在因果关系。

结论 本研究表明甘油三酯可能是抑郁症的危险因素, 极大型高密度脂蛋白中的胆固醇酯是抑郁症的保护因素。抑郁症与低密度脂蛋白胆固醇、乳糜微粒和超大 VLDL 颗粒浓度呈正相关, 与总胆固醇、总游离胆固醇呈负相关。为脂质与抑郁症之间的因果关系提供了新证据, 为抑郁症的治疗提供了新思路, 但具体作用机制仍需进一步探究。

基于蛋白组学分析的抗抑郁药生物标志物与治疗反应的关联性研究

郭徽豪¹ 张孜¹ 黄婉婷¹ 夏慧¹ 黄善情² 蓝晓凤²
宁玉萍² 周燕玲² 尚德为²

1. 广州医科大学

2. 广州医科大学附属脑科医院

目的 由于重度抑郁症(MDD)的发生和治疗机制尚不完全明确, 本研究旨在通过非靶向蛋白组学分析, 揭示 MDD 患者和健康人以及抗抑郁药治疗前后之间的蛋白水平差异, 确定具有潜在诊断疾病和预测抗抑郁疗效的蛋白标志物。

方法 招募健康人和首发未用药 MDD 患者, 收集基线期血样, 给予患者艾司西酞普兰单药治疗 4 周并再次收集血样, 通过 UPLC-MS/MS 进行非靶向蛋白组学分析。采用 Limma 识别 MDD 患者和健

康人以及抗抑郁药治疗前后的差异表达蛋白 (DEP)。首先, 构建 DEP 的蛋白互作网络后, 基于 MCODE 算法识别枢纽蛋白。其次, 在 GeneCards 检索得到 MDD 相关蛋白编码基因, 与 DEP 取交集识别 MDD 相关蛋白。综合两种方法和统计分析, 确定最终的蛋白标志物。

结果 本研究招募了 38 名健康人和 40 名首发未用药 MDD 患者。经 Limma 分析, 在健康人和 MDD 患者中获得 395 个 DEP, 在治疗前后有 367 个 DEP。综合评价蛋白互作网络分析和交集蛋白的结果, 确定转甲状腺素蛋白 (TTR) 为蛋白靶点。在健康-抑郁-药物治疗 3 种状态中, TTR 表达水平呈现出先升后降的趋势。在药物治疗中, HAMD 减分率 $\geq 50\%$ 的患者的 TTR 水平显著降低。经 ROC 分析, TTR 在疾病诊断和药效预测中具有较好的分类性能。

结论 通过非靶向蛋白组学检测, 综合两种分析方法的结果, 识别到转甲状腺素蛋白 (TTR) 在健康-抑郁-药物治疗之间均存在表达差异, 并在不同药物反应中具有明显的区分性, 故 TTR 可能具有作为诊断疾病和预测抗抑郁疗效生物标志物的价值。

抑郁症患者元认知能力受损及其与临床症状的关系

雷威*

西南医科大学附属医院

目的 探讨 MDD 患者元认知能力是否受损及其与抑郁、焦虑症状之间的关系, 旨在理解 MDD 患者的元认知特征, 为临床干预提供新的视角。

方法 选取 2022 年 3 月 - 2022 年 6 月期间在西南医科大学附属医院精神科住院, 且符合《精神疾病诊断与统计手册》(DSM-IV) 抑郁症诊断标准的 64 例 MDD 患者为研究对象。同时选取同期在泸州市的 71 名健康对照 (Healthy Controls, HCs)。采用了汉密尔顿抑郁量表 (HAMD)、贝克抑郁量表 (BDI)、汉密尔顿焦虑量表 (HAMA)、贝克焦虑量表 (BAI) 来评估患者抑郁、焦虑症状的严重程度。此外, 参与者还完成了决策后信心评估任务, 以计算两组被试的元认知指标 (信心偏差、元认知效率)。

在数据分析过程中, 采用独立样本 t 检验对两组研究对象在临床症状、任务表现及元认知指标上的差异进行比较。同时, 采用 Pearson 相关分析探讨 MDD 患者元认知能力情况及其与临床症状之间的相关性。

结果 相对于 HCs, MDD 组的元认知效率显著较低 (0.53 ± 0.12 、 0.46 ± 0.10) ($t = 3.67$, $P < 0.01$, $d = 0.67$), 并表现出显著的负性信心偏差 (7.25 ± 1.31 、 6.31 ± 1.94) ($t = 3.04$, $P < 0.01$, $d = 0.57$)。此外, MDD 个体的元认知效率与其抑郁症状 (BDI 分数) 及焦虑症状 (BAI 分数) 严重程度呈显著负相关关系 ($r = -0.27$ 、 -0.29 , $P = 0.045$ 、 0.030)。

结论 MDD 患者的元认知能力受损, 且随着临床症状的加重, 这种损害程度更显著。

EEG Microstate Differences in Treatment-resistant Depression

Danfeng Yan^{1,2}, Shibin Wu³, Meng Guo¹, Zhe Zhang¹, Jin Liu²

1. Shanxi Mental Health Center

2. Department of Psychiatry, The Second Xiangya Hospital of Central South University

3. Nanning Fifth's People Hospital

Objective Treatment-resistant depression (TRD) is a highly prevalent, complex, and chronic condition with multifactorial etiology. Diagnosing TRD rigorously is challenging for psychiatrists, primarily due to the lack of objective markers to identify and quantify the syndrome. To investigate the spatiotemporal characteristics of brain activity in TRD, we utilized EEG microstate analysis to explore transient brain dysfunction compared to 38 healthy controls

Methods We applied the Wilcoxon rank-sum test to quantify group differences in microstate parameters between the TRD and control groups. Pearson correlations were used to further examine the relationships between clinical scales and microstate parameters of each resting-state microstate class in TRD patients, with FDR correction

Results Microstate analysis identified four microstates (A-D) in global clustering between TRD patients and healthy controls. Significant differences in microstate parameters were observed: TRD patients exhibited shorter durations for classes A and D, more occurrences of classes B and C, increased coverage for class B, and decreased coverage for class D compared to healthy controls. The frequency of microstate classes A and D was lower, while the frequency of classes B and C was higher. Additionally, correlation analysis showed no significant correlation between microstate parameters and clinical symptoms

Conclusion These findings have significant implications for understanding the temporal features that reflect brain activities in TRD. The results may contribute to a better understanding of the microscopic mechanisms underlying brain activity in TRD

Near-infrared Brain Imaging Study of Depressive Liver Qi Stagnation Syndrome before and after Treatment

Guifang Chen¹, Mengchai Mao²

1.Department of Psychiatry, Affiliated Hospital of Zunyi Medical University, Zunyi, Gui Zhou, 563000, China

2.Engineering Research Center of Traditional Chinese Medicine Intelligent Rehabilitation, Ministry of Education, School of Rehabilitation Science, Shanghai University of Traditional Chinese Medicine, Shanghai, China,

Objective This study measured hemodynamic activity, using fNIRS assessment, in MDD patients during verbal fluency task (VFT) before and after treatment, to examine the neurophysiological characteristics of liver qi stagnation syndrome in the completion of cognitive tasks, and to explore the impact of treatment on it

Methods This study recruited patients who were diagnosed with depressive episodes according to the

DSM-IV diagnostic criteria in the outpatient department of Yuquan Hospital (American Psychiatric Association, 2000). 35 patients who met the syndrome of liver qi stagnation were recruited. All patients were treated with selective serotonin reuptake inhibitors selective serotonin reuptake inhibitors (SSRIs) drugs. The clinical evaluation, VFT and fNIRS- assessment were performed before and after 1 month of treatment in the liver qi stagnation group. After 3 months of treatment, the clinical evaluation, VFT and fNIRS assessment were performed again as a follow-up assessment

Results There were statistically significant differences in HAMD scores between pre-treatment and the follow-up assessment ($p = 0.037$), with the total scores of HAMD significantly decreased in the follow-up assessment. There were statistically significant differences in CH13(left dorsolateral prefrontal cortex, $p = 0.005$) and CH30 (left dorsolateral prefrontal cortex, $p = 0.029$). The activation of the liver qi stagnation group was significantly increased after treatment

Conclusion This indicates that the activation of the left prefrontal lobe improves with the treatment of the disease, and this improvement can remain stable

Identifying The Grades and Psychosocial Characteristics of Antenatal Depressive Symptoms in China: A Latent Analysis

Junzhe Cheng Bangshan Liu*

Department of Psychiatry, National Clinical Research Center for Mental Disorders, Second Xiangya Hospital of Central South University, Changsha, Hunan, China.

Objective Antenatal depression induces maternal disability and suicidal behaviors, but the definition of antenatal depression remains controversial. We investigated the heterogeneity of symptoms with the aim of identifying clinical subtypes of antenatal depressive symptoms in a large population in China

Methods A Cross-sectional study was conducted

from January 1, 2020, to January 31, 2024. A total of 44220 pregnant women underwent a psychological screening during their maternity check-ups at the Shenzhen Baoan Women's and Children's Hospital, China. The Edinburgh postnatal depression scale (EPDS) was used to assess the depressive symptoms. The latent class analyses was used to assess the validity of empirically defined subtypes of antenatal depressive symptoms

Results A final model with three latent classes was optimum for the sample. The most significant characteristics associated with antenatal depressive symptoms were education levels, economic status, history of mental disorder, trimester of pregnancy and marital happiness. Women in class 1 had the least severe symptoms [mean EPDS score 1.6 (SD: 1.6)], followed by those in class 2 [mean EPDS score 5.9 (SD: 1.8)] and those in class 3 [mean EPDS score 11.6 (SD: 2.7)]. The most severe symptoms of antenatal depressive symptoms were significantly associated with increased anxious symptoms, obstetric factors, poor lifestyles and suicidal ideation. In class 3, about half of women (49.5%) with the most severe depressive symptoms are in the first trimester

Conclusion Antenatal depressive symptoms have several distinct characteristics in China. Further screening of antenatal depression to identify more precise phenotypes will be important for prevention and clinical treatment in the future

关键词: Antenatal depressive symptoms, Latent analysis

通过倾向性评分匹配法探索抑郁障碍伴自杀观念及行为的生物学指标及危险因素研究

黄娟 王刚* 张玲

首都医科大学附属北京安定医院

目的 探索真实世界证据的伴自杀意念或行为的抑郁障碍患者生物学指标及危险因素

方法 利用基于医院信息系统 (hospital information system, HIS)、电子健康记录 (electronic health record, EHR) 的京津冀精神卫生大数据平台, 纳入

2013年1月1日至2020年12月31日在首都医科大学附属北京安定医院住院及急诊留观的抑郁障碍患者。收集的人口学资料包括年龄、性别、婚姻状态、吸烟史、饮酒史; 疾病特征包括病程、是否存在精神病家族史; 生物学指标为住院后一周内的CRP、叶酸、HCY、ACTH、睾酮。所有纳入研究的患者在入院后一周内进行了外周血检查, 于上午10点前空腹测量了以上五种生化指标。为实现本数据库中抑郁障碍不伴自杀意念和行为组 (Major Depressive disorder with Non Suicide, MDNS) 和伴自杀意念或行为组 (Major Depressive disorder with Suicide, MDS) 两组在人口学、疾病特征上尽可能的随机、匹配, 从而观察到两组生物学指标的独立作用。我们选择使用倾向性得分匹配 (Propensity Score Matchin, PSM,) 的方法来筛选最终具有可比性的两组患者, PSM中纳入的协变量包括年龄、性别、婚姻状态、吸烟史、饮酒史、病程、是否存在精神疾病家族史。匹配容差设置为0.02, 匹配比例为1:1。我们对匹配成功的两组患者的人口学资料、临床资料和血清生物学指标进行两独立样本的Mann-Whitney U检验和卡方检验来观察组间差异。最后将其纳入到二元logistic回归分析中观察影响MDS的独立因素, 双侧检验, $P < 0.05$ 为差异有统计学意义

结果 有1115名患者纳入本研究。对全人群样本进行单因素分析后得到的结果显示: MDS组与MDNS组在年龄、婚姻状态、酒史、是否存在精神疾病家族史、一周首次血清叶酸、ACTH水平均有统计学意义 (所有 p 值 < 0.05)。PSM确定了483名MDS患者和MDNS患者, 构成了966名参与者的匹配研究样本。二元logistic回归分析的结果显示血清叶酸水平 (6ng/ml) 与自杀意念或行为有显著正相关 ($p=0.001$, OR:1.543, 95%CI: 1.181-2.016), 而其它指标未体现出与自杀的相关 (p 值均 > 0.05)。

结论 探索抑郁障碍患者自杀的生物学指标对预测、监测、预防不良结局的出现有重大的意义。血清叶酸水平有望成为该监测指标。未来需要更大规模、前瞻性、多臂研究来验证本研究的结论。

辨证行为疗法联合氟西汀治疗青少年抑郁症非自杀行自伤的疗效观察

闵国庆*

丽水市第二人民医院

目的 探讨辨证行为疗法联合氟西汀治疗青少年抑郁症非自杀行自伤的疗效观察。

方法 收集丽水市第二人民医院 2023 年 1 月-2024 年 1 月之间的青少年抑郁症存在非自杀行自伤患者 60 例女性患者为研究对象,按照电脑随机分组法分为对照组和观察组,对照组与观察组各 30 例,给予对照组单独氟西汀胶囊抗抑郁治疗,给予观察组氟西汀胶囊与辩证行为治疗联合治疗干预。对对照组与观察组取基线期、2 周末、4 周末及 8 周末的汉密尔顿抑郁量表(HAMD)、汉密尔顿焦虑量表(HAMA)、自杀态度量表(QSA)、渥太华自伤调查表(Ottawa Self-injure Inventory, OSI)、临床疗效总评量表(CGI)等评分进行比较,分别统计对照组与观察组临床治疗效率及非自杀行自伤的干预效果。

结果 干预 4 周、8 周后,对照组与观察组 HAMD、HAMA 评分均较干预前降低,且观察组降低幅度比对照组大($P < 0.05$);干预 8 周后,对照组与观察组渥太华自伤调查表(OSI)评分均有减少,观察组减少幅度比对照组大($P < 0.05$)。

结论 辩证行为疗法联合氟西汀胶囊在青少年抑郁症非自杀行自伤患者的干预治疗疗效优于氟西汀胶囊单药治疗,有效减轻非自杀行自伤行为。

关键词: 辩证行为治疗;青少年;抑郁症;非自杀行自伤;

Association between Serum Uric Acid and Post-Stroke Depression: A Population-Based Study From The NHANES (2005–2016)

Guangwei Qing Hao He Bo Wei*
Jiangxi Mental Hospital

Objective Post-stroke depression (PSD) is a persistent issue that adversely affects the recovery and standard of living of patients with stroke. Our primary objective is to explore the potential correlation between serum uric acid (SUA) and the occurrence of post-stroke depression (PSD)

Methods The cross-sectional study concentrated on participants aged 18 years or older, utilizing complete data from the National Health and Nutrition Examination Survey (NHANES) spanning 2005 to 2016, examining the relationship between SUA and PSD. Multivariable regression analysis, including weighted models, along with subgroup analyses, were performed to investigate the link between SUA levels and PSD

Results A total of 1,148 participants were included in this study, among whom a subgroup of 213 individuals were diagnosed with depression, exhibiting a mean uric acid level of 335.10 ± 101.97 . The prevalence rates of PSD were 18.55% overall and decreased with the higher Uric acid quartiles (Quartile 1, 33.80%; Quartile 2, 25.82%; Quartile 3, 17.37%; Quartile 4, 23.00%, $p < 0.001$). An increase in each Uric acid quartile was linked to a 70% decrease in PSD odds (OR = 0.30; 95% CI: 0.15, 0.45; $p < 0.01$). Interaction tests found no significant influence of sex, age, BMI, or marital status on the SUA and PSD association

Conclusion Higher SUA levels were linked to decreased susceptibility to PSD. This suggests the potential for regulating serum uric acid levels as a preventive approach to attenuate the onset of PSD

关键词: Post-stroke depression; Serum uric acid; National Health and Nutrition Examination Survey (NHANES); Antioxidants

Effect of Group Cognitive Behavioral Therapy on Diabetic Patients with Sub-threshold Depression

Qinqin Liu Yongdong Hu* Xiaomeng Sun Jiexin Fang
Wen Geng Wenxiao Xia Yunxuan Bai
Department of Psychological Medicine, Beijing Chao-Yang Hospital, Capital Medical University, Beijing, China

Objective Diabetes patients with subthreshold depression have a higher risk of depression. This study mainly explored the impact of remote group cognitive behavior therapy on depressive symptoms of diabetes

patients with subthreshold depression. Also, it explored the impact of remote group cognitive behavior therapy on anxiety symptoms, blood glucose control, diabetes self-management, and quality of life of diabetes patients with subthreshold depression

Methods Diabetic patients with concurrent subthreshold depression from the outpatient clinic of the Department of Endocrinology at Beijing Chaoyang Hospital were selected for the study, using a randomized controlled design. The control group received conventional endocrine treatment, while the intervention group received group cognitive behavioral therapy in addition to traditional treatment. This therapy was conducted remotely, with 6-8 participants per group, divided into 3-4 groups, for 45 minutes daily for 6 days. Participants in both groups were assessed at baseline, one month after treatment, and three months after treatment. Glycosylated hemoglobin values, 9-item patient health questionnaire scores, 7-item generalized anxiety scale scores, diabetes self-management behavioral scale scores, and diabetes quality of life specificity scale scores were used as outcome indicators for the study. Among these, the 9-item Patient Health Questionnaire score was the primary outcome indicator of the study

Results (1) Thirty-five patients were finally included, of which 17 participated in the conventional treatment group cases and 18 participated in the remote group cognitive-behavioral therapy. There was no statistically significant difference between the demographic information and clinical assessment of the participants in the two groups at baseline ($P>0.05$), and the baseline information of the two groups of patients was comparable. (2) Repeated-measures mixed-effects modeling revealed a significant main effect of time and a significant interaction of time and intervention modality for PHQ-9 scores and SDSCA scores ($P<0.05$). This suggests that for diabetic patients with concomitant subthreshold depression, the group cognitive-behavioral therapy remote intervention group was effective in alleviating depressive symptoms and improving their self-management behaviors. The most significant changes in PHQ-9 scores and SDSCA scores were observed from baseline to 1-month post-treatment, and the rate of change slowed down from 1-month post-treatment to 3

months post-treatment, but all of them improved compared with the baseline level; the time main effects of GAD-7, HbA1c, and DSQL scores were significant, and the interactions were insignificant, and the group effect was not significant ($P>0.05$), which indicated that the anxiety of diabetic patients with subthreshold depression, glycemic control and quality of survival over time, but did not indicate an effect of intervention modality. Although the interaction effects were not statistically different, all showed improvement from baseline levels

Conclusion Group cognitive behavioral therapy tele-intervention is a useful intervention to reduce depressive symptoms in diabetic patients with concomitant subthreshold depression and has a preventive effect on the development of diabetic co-morbid depression. It is also effective in improving their self-management behavior in the short term. Considering the high prevalence of diabetes co-morbid depression in general hospitals, the remote, group format of the intervention can help to explore new strategies for more efficient and convenient management of diabetic patients in general hospital mental health services

不同种类单药治疗对重度抑郁症患者抑郁焦虑症状作用的真实世界研究

谭霖露 陆峥*

同济大学附属同济医院

目的 本研究试图探索在真实世界中, 采用不同种类单一抗抑郁药物治疗对重度抑郁症(MDD)患者焦虑症状的作用, 焦虑和抑郁症状的相对变化, 及基线焦虑程度对抑郁症状疗效、治疗后缓解的影响。

方法 分析了接受单一抗抑郁药物治疗的一组重度抑郁症患者真实世界队列, 在基线、第2周末、第8周末、第12周末进行现场访视。采用不含焦虑/躯体化条目的17项汉密尔顿抑郁量表(HAMD-17)

的评分变化评估治疗后抑郁症状的变化,采用 HAMD-17 中的焦虑/躯体化条目、汉密尔顿焦虑量表 (HAMA) 的评分变化评估焦虑症状的变化。以不含焦虑/躯体化条目的 HAMD-17 的变化为因变量,以基线焦虑评分和焦虑性/非焦虑性抑郁的分类为协变量,进行协方差分析 (ANCOVA),研究基线焦虑程度对抑郁症状疗效、治疗后缓解的影响。目前有 20 例受试者有可用的数据。

结果 从基线到第 12 周末, HAMD-17 焦虑/躯体化条目评分从 4.53(SD=2.27)降至 2.33(SD=2.27), HAMA 评分由 19.24(SD=6.02)降至 11.67(SD=6.23), ANCOVA 分析显示,时间主效应显著($p < 0.0001$),但组别主效应($p=0.783$)或时间 \times 组别交互作用($p=0.964$)不显著。以不含焦虑/躯体化条目的 HAMD-17 的变化为因变量,以基线焦虑评分和焦虑性/非焦虑性抑郁的分类为协变量,ANCOVA 分析显示,时间主效应显著($p < 0.0001$),但组别主效应($p=0.778$)或时间 \times 组别交互作用($p=0.755$)不显著。

结论 研究结果表明,不同种类抗抑郁药物在治疗 MDD 时都有潜在的减少焦虑症状的作用。基线焦虑程度对抑郁症状疗效暂未发现显著影响。

探讨血常规炎性指标在抑郁症诊断、治疗及预后评估的价值

曾小娥* 邹灿*

玉林市第四人民医院

目的 旨在分析抑郁症患者血常规炎性指标的变化,探讨其与病情的相关性。

方法 选择抑郁症患者 45 例作为研究对象,所有患者均经过临床确诊。对所有患者进行血常规检测,记录白细胞计数、C 反应蛋白 (CRP) 和红细胞沉降率 (ESR) 等指标水平。根据抑郁症严重程度,将患者分为轻度组 ($n=23$) 和重度组 ($n=22$)。

结果 抑郁症患者的血常规炎性指标存在明显变化,其中白细胞计数和 CRP 水平显著高于正常对照组 ($P < 0.05$)。在抑郁症患者中,重度组患者的白细胞计数和 CRP 水平显著高于轻度组 ($P < 0.05$)。

结论 抑郁症患者的血常规炎性指标存在明显变化,可能与病情严重程度相关。

Alterations of Subcortical Structural Volume in Pediatric Bipolar Disorder Patients with and without Psychotic Symptoms

穆庆丽 陆邵佳*

浙江大学医学院附属第一医院

Objective Pediatric bipolar disorder (PBD) with psychotic symptoms may predict more severe impairment in social functioning, but the underlying biological mechanisms remain unclear. The aim of the present study was to investigate the alternations in subcortical structural volume in PBD with and without psychotic symptoms.

Methods We recruited 24 psychotic PBD patients, 24 non-psychotic PBD patients, and 18 healthy controls. All participants were scanned with a 3.0 T Siemens Trio scanner. The FreeSurfer 7.4.0 software was employed to calculate the volume of each subcortical structure and thalamic subfield. An analysis of covariance (ANCOVA) was performed to identify brain regions with significant volume differences among the three groups, and then the inter-group comparisons were calculated. Finally, partial correlation analyses were conducted to identify relationships between subcortical structural volumes and clinical features.

Results Compared with HCs, both groups of PBD patients exhibited increased volume in the third ventricle and decreased volumes in the left thalamus and the right pallidum. The P-PBD patients showed enlarged volumes in the bilateral lateral ventricle and the third ventricle when compared with the other two groups. Further, the left PuA and the left MV-re were only diminished in P-PBD patients in the thalamic subfield. Partial correlation analyses revealed that episode times were associated with the third ventricle volume in P-PBD.

Conclusion Our findings suggest that psychotic symptoms in PBD are associated with more extensive

structural abnormalities in subcortical structures, which may underlie the pathological basis of the poor prognosis in PBD patients with psychotic symptoms

关键词: Pediatric bipolar disorder; Psychotic symptom; subcortical structural volume; thalamic subfield volume

Alterations of Subcortical Structure Volume in Pediatric Bipolar Disorder Patients with Manic Or Depressive First-episode

陈越 陆邵佳*

浙江大学医学院附属第一医院

Objective Bipolar disorder may begin as depression or mania, which can affect the treatment and prognosis. The physiological and pathological differences among pediatric bipolar disorder (PBD) patients with different onset symptoms are not clear. The aims of the present study were to investigate subcortical structural alterations in PBD patients with first-episode depressive (PBD-FED) and first-episode manic (PBD-FEM).

Methods A total of 59 individuals including 28 PBD-FED, 13 PBD-FEM, and 18 healthy controls (HCs) underwent high-resolution structural magnetic resonance scans. FreeSurfer 7.2 was used to detect changes in subcortical volumes. Simultaneously, thalamic, hippocampal, and amygdala subregion volumes were compared between the three groups.

Results Analysis of covariance controlling for age, sex, education, and estimated intracranial volume shows third and fourth ventricle enlargement in patients with PBD. Compared with the PBD-FED and HCs, the PBD-FEM group had atrophy of the left thalamus, bilateral hippocampus, and right amygdala. Subsequent subregion analyses showed right cortico-amygdaloid transient, bilateral accessory-basal nucleus, left hippocampal tail, right hippocampal head, and body volume shrinkage in the PBD-FEM group.

Conclusion The present findings provided evidence of decreased subcortical structure in PBD-FEM patients, which might present its trait feature and shed

light on the different developmental paths of bipolar disorder

Accelerated Repeated Transcranial Magnetic Stimulation Intervention for Depression

于跃 卢凤梅 何宗岭*

成都市第四人民医院

Objective The study was aimed at exploring an accelerated, high-dose repeated transcranial magnetic stimulation for depression.

Methods 1. Participants The inclusion criteria for the depressed group were as follows: (i) ages were from 18–65 years; (ii) meeting the criteria of the Diagnostic and Statistical Manual of Mental Disorder-IV with current unipolar MDD. Hamilton Depression Scale (HAMD) was acquired before and after treatment. 2. rTMS procedure The rTMS treatment was delivered by a trained treater. The stimulation target is dorsolateral prefrontal cortex (DLPFC). Accelerated rTMS: We adopted rTMS treatment for 7 consecutive days over 1 week. Treatment 4 times a day for 2 weeks. The stimulus intensity was 100% of the resting motor threshold based on the tolerance of the participant. 3. Statistical analysis HAMD scores were reported by mean \pm standard deviation (\pm s). Baseline and post-treatment HAMD scores were compared using paired t-tests.

Results 1. Clinical characteristics Seven patients were included, three males and four females, with a mean age of 32 years, a mean disease course of 80.3 months, and a mean number of episodes of 2.1. 2. HAMD scores before and after rTMS There was a significant difference in HAMD scores after treatment compared to before treatment (base line 37.7 ± 3.0 , 2 week 18.9 ± 3.3 , $P \leq 0.05$), depression score was lower after treatment. 2 patients experienced mild headaches during treatment.

Conclusion The study was aimed at exploring an

accelerated, high-dose rTMS for depression. All participants completed a 14-day session, and have observed a large antidepressant effect of accelerated rTMS. After 14 days of treatment, depression symptoms were significantly reduced. Headache is one of the most common side effects of the rTMS regimen, and no other serious side effects were found, similar to previous studies. The short duration and high-dose accelerated rTMS provides opportunities for emergency or hospitalized patients who need rapid treatment. However, the study also has some limitations. Future research needs larger samples and adding sham stimulus controls

关键词: Depression, Accelerated Repeated Transcranial Magnetic Stimulation

双相情感障碍患者混合发作情况及影响因素分析

王红丽 路亚州 史晓宁 赵莹莹 顿文文 朱雪泉 张玲*

首都医科大学附属北京安定医院

目的 探索双相情感障碍患者混合发作情况并分析其影响因素。

方法 利用连续采样法, 选取 2013 年 2 月至 2014 年 6 月就诊于中国 7 家医院门诊的 520 例双相情感障碍患者, 并进行随访调查, 收集其人口学资料、病史信息、疾病特征及治疗情况等临床资料, 考察双相情感障碍混合发作情况, 并通过泊松回归模型分析其影响因素。

结果 在 520 例双相情感障碍患者中, 混合发作占 75 例 (14.42%), 其中 I 型 72 例, II 型 3 例。且泊松回归模型分析显示, 双相情感障碍混合发作的危险因素包括: I 型患者较 II 型混合发作次数多 (IRR = 0.068, $p < 0.001$); 有精神疾病家族史的患者混合发作次数较多 (IRR = 1.435, $p = 0.037$); 首次发作极性为非躁狂的患者较躁狂患者混合发作次数多 (IRR = 9.988, $p < 0.001$); 首次发作极性为非抑郁的患者较抑郁患者混合发作次数多 (IRR = 6.241, $p < 0.001$); 服用心境稳定剂的患者混合发作次数较多 (IRR = 0.561, $p = 0.001$)。

结论 双相情感障碍患者混合发作次数与双相

障碍分型、精神疾病家族史、首次发作极性以及是否使用心境稳定剂密切相关。

关键词: 双相情感障碍; 混合发作; 影响因素

The Gut Microbiome From Middle-aged Depressive Women Induces Depressive-like Behaviors and Regulates Plasma Fatty Acid Metabolism in Female Middle-aged Mice

于欢^{1,2,3} 陈怡环² 李锐³ 彭正午^{2,3}

1. 陕西师范大学

2. 空军军医大学西京医院

3. 长安医院

Objective This study aims to explore whether there are characteristic changes in the gut microbes of female MAD and whether these changes are associated with depressive-like behaviors. Meanwhile, this study observed alterations in the lipid metabolism function of gut microbes and further examined changes in plasma medium- and long-chain fatty acids (MLCFAs) in mice that underwent fecal microbiota transplantation (FMT).

Methods Stool samples obtained from 31 MAD, along with 24 healthy individuals (HC) were analyzed by 16 S rRNA gene sequencing. Meanwhile, 14-month-old female C57BL/6J mice received antibiotic cocktails and then oral gavage of the microbiota suspension of MAD or HC for 3 weeks to reconstruct gut microbiota. The subsequent depressive-like behaviors, the composition of gut microbiota, as well as MLCFAs in the plasma were evaluated.

Results A diminished α -diversity index in the microbiome and noteworthy disruptions in gut microbial composition in MAD individuals compared to HC were observed. Several distinct bacterial taxa, including Dorea, Butyrivibrio, and Blautia, demonstrated associations with the severity of depressive symptoms. A particular microbial panel encompassing 49 genera effectively differentiated MAD patients from HC (AUC = 0.82). Fecal microbiome transplantation from MAD subjects led to depressive-like behaviors and dysfunction of plasma MLCFAs in mice.

Conclusion These findings suggest that microbial dysbiosis is linked to the pathogenesis of MAD, and its role may be associated with the regulation of MLCFAs metabolism

关键词: Gut microbiota; Middle-aged women; Depression; Fecal microbiota

Acute Treatment of Bilateral RTMS Combined with Antidepressants on The Plasma Fatty Acids for Major Depressive Episodes

李锐¹ 付瑞¹ 彭正午^{1,2}

1.长安医院

2.空军军医大学西京医院

Objective Bilateral repetitive transcranial magnetic stimulation (B-rTMS) has been largely used in treating major depressive disorder (MDD). However, the acute treatment of B-rTMS combined with antidepressants (ADs) on the plasma fatty acids in MDD has been poorly elucidated.

Methods In the present study, depressive symptoms were assessed and the plasma was obtained from 27 adult patients with MDD at baseline phase (MDD), after 2 weeks of treatment (MDD-2w), and 27 healthy controls (HC). Meanwhile, the composition of short-chain fatty acids (SCFA) and medium-and long-chain fatty acids (MLCFA) in the plasma was evaluated.

Results We found that levels of Isobutyric acid, Caproic acid, Acetic acid and Propionic acid were decreased both in the MDD and MDD-2w groups and were negatively correlated with the scores of HAMD and HAMA. Besides, there were fewer changes between the MDD and HC groups, while a large amount of MLCFA levels were increased in the MDD-2w group. Moreover, we developed combined panels that could effectively distinguish MDD from HC (AUC = 0.99), MDD-2w from HC (AUC = 0.983) and MDD from MDD-2w (AUC = 0.852).

Conclusion These findings might provide a basis for the use of B-rTMS combined with ADs intervention in the acute phase of depressive episodes and shed

light on the relationship between plasma FA and MDD

关键词: Bilateral rTMS; Acute treatment; SCFAs; MLCFAs; MDD

首发青少年抑郁症的影响因素及干预: 基于网络化接纳承诺疗法

张薇 何孔亮*

安徽省精神卫生中心

目的 抑郁症(Major Depressive Disorder, MDD) 抑郁症 (major depression disorder, MDD) 是以显著而持久的心境低落为主要特征的精神障碍, 可伴有兴趣下降、快感缺失、意志行为活动减退、食欲下降、早醒、入睡困难等精神病性症状, 部分患者存在自伤、自杀观念和行为。青少年抑郁是青少年时期常见的精神疾病之一, 临床表现为病程断续、疗效不佳且持续影响患者整个生命周期, 具有高复发和高自杀倾向。本研究考虑探索首发青少年抑郁症的影响因素, 并进一步验证基于接纳承诺疗法的线上小程序干预对首发青少年抑郁症患者的干预效果。

方法 本研究共招募了 80 名首发青少年抑郁症患者, 其中 40 名为对照组, 40 名为干预组。研究一采用问卷调查方法, 探索心理灵活性、快感缺失、负性生活事件及非自杀性自伤对首发青少年抑郁症的影响。研究二则是通过基于接纳承诺疗法的线上小程序对 IACT 组进行为期两周的干预。

结果 研究一结果发现抑郁与心理灵活性、快感缺失呈显著相关。研究二结果显示, IACT 组心理灵活性显著提高, 抑郁水平显著降低, 在心理灵活模型中, 接纳、解离、以己为景、承诺行动和价值均得到显著提升, 关注当下的变化不显著。

结论 说明首发青少年抑郁症与心理灵活性、快感缺失有关, 并且整体上网络化接纳承诺疗法干预能有效提升个体的心理灵活水平, 降低心理僵化水平, 一定程度缓解抑郁。

米安色林与舍曲林治疗伴有焦虑症状的抑郁

症的疗效分析

王旺*

泗阳县脑科医院

目的 目的 分析米安色林与舍曲林各自治疗伴有焦虑症状的抑郁症疗效与安全性对比。

方法 一、入组标准：1、选择 2024 年 1 月至 2024 年 3 月在我院门诊和住院患者符合 ICD-10 抑郁症诊断标准：诊断为抑郁症并同时伴有焦虑症状的患者；2、患者及家属对本次研究内容了解并自愿签署知情同意书；3、剔除对米安色林及舍曲林使用有禁忌症的患者；4、排除其他器质性疾病；5、年龄在 20-60 之间，男女比率 1:1；6、停止服药其他抗抑郁药达 2 周，符合入组人员为 56 例，随机分为：米安色林组 28 例、舍曲林组 28 例。二、观察周期：8 周。三、用药使用 方法 米安色林组根据病情在 30mg-60mg/天调整，舍曲林组根据病情在 50mg-200mg/天调整。四、两组分别于治疗前及治疗第 1、2、4、6、8 周末采用汉密尔顿抑郁量表 (HAMD)，汉密尔顿焦虑量表(HAMA)，副反应量表(TESS)评估病情，对两组的疗效及药物的安全性进行对比分析。

结果 治疗前，两组汉密尔顿抑郁量表 (HAMD)，汉密尔顿焦虑量表(HAMA)，副反应量表(TESS)评分无明显差异。治疗 8 周后，米安色林组有效率 78%，舍曲林组有效率 75%，治疗有效率无明显差异。但是米安色林组汉密尔顿抑郁量表 (HAMD)、汉密尔顿焦虑量表(HAMA)评分低于舍曲林组，更优的是米安色林组副反应量表(TESS)评分明显低于舍曲林组。

结论 米安色林治疗伴发焦虑症状的抑郁症疗效比舍曲林好，而且疗效也更快，药物副作用也更少。

关键词：抑郁症 米安色林 舍曲林

目的 本研究旨在探讨雷公藤红素治疗脾虚湿阻型肥胖大鼠分泌的外泌体 (LncRNA Dio3os) 缓解小胶质细胞炎症反应的分子机制。

方法 构建脾虚湿阻型肥胖大鼠模型，经雷公藤红素治疗后，收集并鉴定棕色脂肪分泌的外泌体。通过 Western 印迹、ELISA、SOD 活性和 MDA 检测评估棕色脂肪外泌体对小胶质细胞炎症反应的缓解作用。通过 RT-qPCR 检测了 BAT-Exos 处理后，BV2 炎症模型细胞中 miR-574-5p 的表达。构建了 miR-574-5p 过表达和敲低的 BV2 细胞株，并通过 RT-qPCR 检测了 NRF2 的表达。

结果 雷公藤红素增加大鼠棕色脂肪组织产热关键基因 UCP1、PGC-1 α 和 PRDM16 的表达。BAT-Exos 可以增加 BV2 炎症细胞的 LncRNA Dio3os 表达量显著升高，同时降低 BV2 炎症细胞促炎因子 TNF- α 、IL-6 和 IL-1 β 的表达。BAT-Exos 可以降低 NF- κ B 磷酸化水平和 MDA 的含量，而升高 SOD 的活性。BAT-Exos 下调 miR-574-5p 的表达，而 miR-574-5p 负调控 NRF2 的表达。

结论 雷公藤红素激活解脾虚湿阻型肥胖小鼠 BAT-Exos 分泌 LncRNA Dio3os，抑制 CNS 小胶质细胞中 miR-574-5p 表达，从而激活 NRF2 介导的抗氧化通路，缓解小胶质细胞的炎症反应。

Cross-scale Variations in Schizophrenia

Longbiao Cui¹, Huaning Wang², Yongbin Wei³

1.Department of Psychiatry, Xijing 986 Hospital, Fourth Military Medical University

2.Department of Psychiatry, Xijing Hospital, Fourth Military Medical University

3.School of Artificial Intelligence, Beijing University of Posts and Telecommunications

Objective Understanding the relationship between genetic variations and brain abnormalities is crucial for uncovering the cross-scale pathophysiological mechanisms underlying schizophrenia

Methods The present cross-sectional study identifies brain structural correlates of individual variation in gene expression in schizophrenia and its clinical significance. Of 43 patients with schizophrenia, RNA-seq data from blood samples, MRI, and clinical assessments were collected, together with data from 60 healthy controls

Results Using RNA-seq data we show both gene-level and isoform-level expression alterations between schizophrenia and healthy controls. We also show differentiated gene expression to be associated with schizophrenia-related genomic variations (GWAS on 76,755 patients and 243,649 controls) and differentiated brain gene expression. Multivariate correlation analysis combining gene expression and brain imaging shows that transcriptional levels of differentially expressed genes significantly correlate with gray matter volume in the frontal and temporal regions of cognitive brain networks in schizophrenia. Findings further show a significant association between gene expression, gray matter volume, and cognitive performance in patients

Conclusion Our findings suggest that genomic variants in schizophrenia are associated with alterations in the transcriptome, which further plays a role in individual variations in macroscale brain structure and cognition, contributing to building a comprehensive, multi-omics biomarker for the assessment of schizophrenia

关键词: brain volume, imaging, multi-scale, schizophrenia, transcriptomics

联合 CCRT 对精神分裂症患者疗效、认知功能及生物学指标的影响

王紫薇*

汕头大学精神卫生中心

目的 精神分裂症是一种严重的慢性精神障碍, 认知障碍现在被认为是该疾病的临床特征。对精神分裂症患者的认知障碍目前暂缺乏有效的药物治疗手段, 计算机程序化的认知矫正治疗对精神分裂症的作用逐渐被关注。本研究旨在探讨计算机认知矫正治疗(CCRT)对精神分裂症患者疗效、认知功能及生物学指标的作用, 并进一步分析生物学指标与认知功能的关系。

方法 本研究纳入精神分裂症患者 55 例, 将其随机分配至常规药物联合 CCRT 治疗组(以 CCRT 组表示)和常规药物治疗组(以 TAU 组表示)。CCRT 治疗每周 3 次以上, 每次 30 分钟。在入院当天和入院第 8 周使用阳性和阴性症状量表(PANSS)、蒙特利尔认知评估量表(MoCA)、社会功能缺陷量表(SDSS)评估患者, 在入院次日和入院第 8 周时检测血生化指标, 并收集 5ml 静脉血血清冻存, 所有样本收集结束后用 ELISA 法测定血清 IGF-1、BDNF 水平。采用 SPSS 26.0 软件分析数据, 运用独立样本 t 检验、Mann-Whitney U 检验、卡方检验进行组间差异比较, 运用配对 t 检验、Wilcoxon 符号秩检验进行前后比较, 运用 Pearson、Spearman 相关性分析、偏相关分析探讨生物学指标与 MoCA 各项评分的相关性。

结果 1. CCRT 组随访前后阴性症状分的差值高于 TAU 组, 差异有统计学意义($P=0.039$); CCRT 组随访前后视空间与执行得分($P=0.028$)、延迟回忆得分($P<0.001$)、定向力得分($P=0.030$)和 MoCA 总分($P<0.001$)的差值高于 TAU 组, 差异有统计学意义; CCRT 组随访前后 SDSS 得分的差值高于 TAU 组, 差异有统计学意义($P=0.033$);

2. CCRT 组随访后胰岛素($P=0.004$)、甘油三酯($P<0.001$)、IGF-1($P<0.001$)、BDNF($P<0.001$)水平较随访前上升, 差异有统计学意义, TAU 组随

访后胰岛素($P=0.033$)、甘油三酯($P<0.001$)、BDNF($P=0.001$)水平较随访前上升,差异有统计学意义;CCRT组随访前后甘油三酯($P=0.049$)、IGF-1水平($P=0.047$)的差值高于TAU组,差异有统计学意义;

3. 胰岛素水平与MoCA总分($r=-0.286, P=0.044$)呈负相关,血清IGF-1水平与MoCA总分($r=0.322, P=0.023$)呈正相关。

结论 精神分裂症患者联合CCRT治疗后阴性症状、认知功能、社会功能缺陷程度得到更明显的改善,临床总有效率提升,甘油三酯水平和血清IGF-1水平上调更加明显,其中IGF-1水平越高,认知功能越好。

SOX11 基因多态性与精神分裂症的相关性及对抑郁行为的影响

刘向来* 罗儒献 陈川柏
海南省安宁医院

目的 探讨SOX11基因多态性与精神分裂症的相关性及对抑郁行为的影响。

方法 选取海南省安宁医院2020年1月~2021年12月收治的60例精神分裂症患者作为观察组,对照组研究对象来自于同期在海南省安宁医院体检的健康志愿者60名。采用实时荧光定量PCR技术对60例精神分裂症患者(观察组)和60名健康志愿者(对照组)的SOX11基因rs16864067、rs12478711、rs2564045和rs2252087位点进行分型;采用阳性与阴性症状量表(PANSS)及卡尔加里抑郁症状评定量表(CDSS)对观察组精神分裂症状的严重程度和抑郁症状进行评估。

结果 两组在rs16864067、rs12478711和rs2564045位点基因型和等位基因分布频率比较差异具有统计学意义($P<0.05$)。PANSS和CDSS评分在rs16864067和rs12478711位点的GG、GA和AA基因型间呈逐渐上升趋势($P<0.05$),在rs2564045位点AA、AG和GG基因型间呈逐渐下降趋势($P<0.05$)。

结论 SOX11基因rs16864067、rs12478711和rs2564045位点变异可能与精神分裂症发病存在关

联,且与疾病的严重程度和抑郁行为有关。

Ghrelin-cognition Relationship in The Chinese Han First-episode Drug-naive Major Depressive Disorder

Chuhao Zhang*
Tianjin Anding Hospital

Objective In major depressive disorder (MDD), alterations in ghrelin levels and cognitive impairment coexist, yet their association has remained largely elusive. This study aimed to investigate the association between ghrelin levels and cognition in both MDD patients and healthy controls (HCs) while also exploring sex-specific differences in this correlation

Methods A total of 155 Chinese Han subjects, including 90 first-episode drug-naive MDD patients and 65 HCs, were enrolled. Ghrelin levels were measured using ELISA kits, and neurocognitive assessments were conducted using the Repeatable Battery for the Assessment of Neuropsychological Status (RBANS)

Results MDD patients exhibited significantly higher ghrelin levels and lower cognitive scores of RBANS compared to HCs. However, there was no significant correlation between ghrelin levels and cognitive function in both MDD patients and HCs. Exploratory analyses revealed sex-specific associations between ghrelin and cognitive function, particularly in MDD patients. Females with MDD showed distinct patterns of association between ghrelin levels and cognitive domains such as attention and language, which were not observed in healthy controls or male MDD patients

Conclusion The relationship between ghrelin and cognition only existed in MDD patients, not in the HCs, and there was a sex-specific difference in this association. Further research on the mechanism of ghrelin in the cognitive function of MDD should focus on sex differences

不同感觉门控水平首发精神分裂患者静息态脑自发神经活动

石晶 王志仁*
北京回龙观医院

目的 当前精神分裂症的诊断仍依赖于疾病的精神病理症状,但目前越来越多的研究关注精神分裂症的生物学因素,尤其是疾病的“内表型”。有研究提示,精神分裂症可能存在明显的感觉门控障碍,惊跳反射的前脉冲抑制(PPI)是常用来量化感觉门控的方法之一,被认为可能是精神分裂症重要的“内表型”。本研究将首发精神分裂症患者根据 PPI 水平进行分类,考察高低 PPI 水平首发精神分裂患者静息态脑自发神经活动。

方法 纳入 90 例首发精神分裂症患者与 90 例正常对照。分别调查其一般资料并进行听觉刺激惊跳反射(PPI)检测,PPI 检测采用 SR-HLAB 惊跳反应监控系统;所有被试使用 GE HDXT 3.0 T 磁共振扫描仪完成数据采集,基于 MatLab2015b 平台,应用 DPARSF 软件对静息态 fMRI 数据进行预处理,用 DPARSF 软件计算全脑的 ReHo、ALFF 指标,用 SPSS20.0 进行统计分析,比较组间差异,采用 Bonferroni 对多重比较进行校正, $P < 0.05$ 时对比组之间的差异有统计学意义。

结果 结果发现患者组右侧背外侧前额叶、双侧壳核、左侧内侧前额叶、眶额回 ReHo 值增高,双侧枕中回、舌回、梭状回 ReHo 值减低,双侧壳核、右侧颞中回、右侧背外侧前额叶 ALFF 值增高,双侧后扣带回、楔前叶、左侧梭状回、舌回 ALFF 值减低;高 PPI 组与低 PPI 组间比较发现,低 PPI 组左侧壳核 ReHo 值增高,右侧后扣带回、舌回 ALFF 值减低。

结论 不同感觉门控水平的首发精神分裂症患者的 ReHo 值和 ALFF 值存在不同。

中药汤剂治疗抗精神病药物引起的高泌乳素血症的临床对照观察

李奕男 都弘* 徐阳
沈阳市精神卫生中心

目的 本研究旨在系统评估中药汤剂在缓解抗精神病药物引起的高泌乳素血症中的疗效和安全性,并探讨其可能的机制,为临床治疗提供依据。

方法 本研究采用随机对照试验设计,纳入 100 例因使用抗精神病药物(如利培酮、氯氮平等)而出现高泌乳素血症的患者。患者随机分为两组:治疗组和对照组,各 50 例。治疗组在继续使用抗精神病药物的基础上加用中药汤剂,具体方剂根据中医辨证施治原则进行个体化调整;对照组则仅接受常规西医治疗(如溴隐亭)。治疗持续 12 周,期间每 4 周评估一次患者的泌乳素水平、乳房胀痛、泌乳等临床症状以及不良反应的发生情况。主要疗效指标为血清泌乳素水平的变化,次要疗效指标包括临床症状的缓解情况和治疗的安全性。

结果 治疗 12 周后,治疗组患者的泌乳素水平显著下降,平均下降幅度为 32.5%,而对照组为 15.3%,两组差异具有统计学意义 ($P < 0.01$)。治疗组患者的乳房胀痛、泌乳等临床症状显著改善,症状缓解率为 78%,对照组为 45% ($P < 0.05$)。此外,治疗组的不良反应发生率较低,主要表现为轻微的胃肠道不适和头晕,而对照组中部分患者出现了药物相关的肝功能异常和低血压。

结论 中药汤剂在治疗抗精神病药物引起的高泌乳素血症方面表现出良好的疗效和较高的安全性,能够显著降低泌乳素水平并改善相关临床症状。其作用机制可能与调节内分泌功能、改善机体整体健康状态有关。进一步的大样本、多中心研究将有助于验证这些发现,并深入探讨中药汤剂的具体作用机制,为临床治疗提供更加坚实的证据基础。

Genes Associated with Cellular Q1 Senescence As Diagnostic Markers of Major Depressive Disorder and Their Correlations with Immune Infiltration

Rongfang He*

The Affiliated Hospital of Southwest Medical University, Luzhou, China

Objective Emerging evidence links cellular senescence to the pathogenesis of major depressive disorder (MDD), a life-threatening and debilitating mental illness. However, the roles of cellular senescence-related genes in MDD are largely unknown and were investigated in this study using a comprehensive analysis

Methods Peripheral blood microarray sequencing data were downloaded from Gene Expression Omnibus (GEO) database and retrieved cellular senescence-related genes from CellAge database. A weighted gene co-expression network analysis was used to screen MDD-associated genes. Protein-protein interactions (PPI) were predicted based on STRING data, and four topological algorithms were used to identify hub genes from the PPI network. Immune infiltration was evaluated using CIBERSORT, followed by a correlation analysis between hub genes and immune cells

Results A total of 84 cell senescence-related genes were differentially expressed in patients with MDD compared to healthy control participants. Among the 84 genes, 20 were identified to be associated with the MDD disease phenotype, and these genes were mainly involved in hormone-related signaling pathways (such as estrogen, steroid hormone, and corticosteroid) and immune and inflammatory pathways. Three genes, namely, JUN, CTSD, and CALR, which were downregulated in MDD, were identified as the hub genes. The expression of hub genes significantly moderate correlated with multiple immune cells, such as Tregs, NK cells, and CD4+ T cells, and the abundance of these immune cells markedly differed in MDD samples. Multiple microRNAs, transcription factors, and small-molecule drugs targeting hub genes were predicted to explore their molecular regulatory mechanisms and potential therapeutic value in MDD

Conclusion JUN, CTSD, and CALR were identified as potential diagnostic markers of MDD and may be involved in the immunoinflammatory mechanism of MDD

羟氯喹通过阻止 TRPV1 的自噬降解来减轻母体分离诱导的精神分裂症样行为

熊樱 王惠玲*

湖北省人民医院

目的 既往研究表明,精神分裂症与瞬时受体电位香草酸亚组家族成员1 (TRPV1) 密切相关。据报道,在母体分离(MS)诱导的精神分裂症模型中发现皮质醇水平升高和 TRPV1 下调。体外实验发现,皮质醇可以通过诱导自噬来降解 TRPV1。本研究旨在阐明自噬诱导的 TRPV1 降解在 MS 诱导的精神分裂症模型发病机制中的作用。

方法 利用 MS 模型来模拟类精神分裂症样症状,测定 MS 大鼠和对照组在不同阶段的皮质醇和 TRPV1 水平。我们还在出生后第9天(PND9)MS之前给与大鼠 2mg/kg 剂量的自噬抑制剂羟氯喹(HCQ)。在成年期进行行为测试,包括旷场、新物体识别、Y 迷宫、巴恩斯迷宫、前脉冲抑制试验。检测成年期和 PND10 天的生物学标记检查,包括自噬相关蛋白 Beclin、P62、LC3II 与 TRPV1 表达水平,并且检测成年期神经凋亡情况。同时我们还在 HT22 细胞模型中研究了 HCQ 抑制 TRPV1 降解的神经保护机制。

结果 结果显示 MS 大鼠 PND10 海马和前额叶皮层皮质醇和自噬水平升高,即 Beclin1 LC3II 水平升高,P62 水平降低,同时伴随着 TRPV1 水平降低。成年期 MS 大鼠海马和前额叶皮层自噬功能障碍,自噬流受阻和神经元凋亡,伴有精神分裂症样行为。早期使用 HCQ 治疗可逆转 MS 大鼠上述这些改变并减轻成年期的行为异常。并且体外实验表明,皮质醇剂量依耐性的诱导 TRPV1 的降解,羟氯喹可以阻止 TRPV1 的降解,并且皮质醇诱导的 ROS 增加可以被羟氯喹阻断,使用 TRPV1 拮抗剂辣椒平后,羟氯喹的降低 ROS 的作用消失,提示 HCQ 通过调节 TRPV1 来减少皮质醇诱导的 ROS。

结论 总之,我们的研究表明,皮质醇通过自噬诱导 TRPV1 降解参与了精神分裂症的发病机制。HCQ 通过阻止 TRPV1 的自噬降解来防止 MS 诱导的神经生物学和行为改变。

Neurobiological Mechanism Underlying The Rapid-acting Antidepressant Effect of Ketamine

Yingying Yin* Yonggui Yuan

ZhongDa Hospital, School of Medicine, Southeast University

Objective Depression is one of the most common disabling mental disorders. However, the first-line treatment for depression is slow-acting. Ketamine is a glutamatergic modulator with rapid antidepressant effects that is effective in treating both refractory depression and suicidal tendencies. The neurobiological mechanism underlying the effects of antidepressant has become a research hotspot, but the exact mechanism involved remains unclear. Brain imaging studies have provided important evidence from macroscopic perspectives such as brain structure and function, while biochemical studies have made significant discoveries from microscopic perspectives such as proteomics and genomics. Previous reviews have summarized biomarkers related to the ketamine response from a broad range of scattered biomarkers from imaging, electrophysiological, metabolic, immune, genetic, and neurotrophic studies. This review aims to scientifically clarify the neurobiological mechanism of the rapid-acting antidepressant effect of ketamine

Methods We searched for relevant literatures from five electronic databases (2000-2023), PubMed, the Cochrane Library, EMBASE, the Web of Science and clinical trials with the following terms: “depression”, “ketamine”, “rapid-acting”, and “biomarker”. A total of 87 articles were included in this work

Results In this review, we systematically summarize a number of potential biomarkers for predicting and modulating the efficacy of ketamine from macro- (such as neuroimaging markers and neuroelectrophysiological markers) and microperspectives (such as neurobiochemical markers and genetic markers)

Conclusion Although this work is still in its early stages, these biomarkers can help clinicians identify whether ketamine intervention is needed for treatment-resistant depression, thereby reducing the burden on patients and the whole society. However, the majority of biomarkers are still in the preclinical exploratory stage, and the existing findings are rare. To realize the clinical application of these biomarkers, future studies should combine biomarkers of different patterns to investigate the relationships and interactions between different biomarkers and optimize clinical outcomes by enhancing the involvement of biological targets in new models

关键词: depression; ketamine; rapid-acting; biomarker

雷公藤多苷通过抑制焦亡改善阿尔茨海默症小鼠模型的工作记忆

陈碧清*

江苏省中医院

目的 阿尔茨海默症 (AD) 往往伴随大脑炎症和神经细胞死亡缺失。雷公藤多苷是已获批上市四十余年的经典中成药, 常被用于炎症和自身免疫疾病的治疗。少量文献报道, 雷公藤多苷中的主要有效成分雷公藤甲素对神经元有保护作用, 但尚无活体动物层面雷公藤多苷对神经退行性疾病的疗效报道。

方法 选取 APP/PS1 转基因小鼠、A β 脑海马注射小鼠、链脲菌素脑室注射小鼠作为三种 AD 动物模型, 给予雷公藤多苷灌胃连续两周, 检测小鼠的新物体识别工作记忆行为、Y 迷宫工作记忆行为和 Morris 水迷宫长期记忆行为, 其中, 水迷宫实验设置 3 天训练期, 每天训练 2 次, 每天前后两次行为的差异作为工作记忆的一个行为指标。取小鼠大脑海马组织进行单细胞测序, 前额叶皮层进行普通转录组测序, 剩余大脑组织离心取上清检测细胞因子水平, 并通过 Western Blot 和荧光定量 PCR 对组学测序分析结果进行分子验证。

结果 APP/PS1 转基因 AD 模型小鼠和 A β 脑海马注射小鼠在新物体识别短期记忆行为实验中基

于接触时间和接触次数的认知指数显著下降,而雷公藤多苷灌胃小鼠的认知指数则有显著改善。 $A\beta$ 脑海马注射小鼠基于 Y 迷宫的工作记忆表现下降,而雷公藤多苷灌胃给药能提升 Y 迷宫工作记忆。在水迷宫行为实验中,AD 转基因模型小鼠的长期记忆和工作记忆均明显受损,但雷公藤多苷灌胃仅能显著改善水迷宫实验中的工作记忆行为,而对长期记忆行为无显著作用。单细胞测序显示,AD 模型小鼠大脑海马区的小胶质细胞数目和活性增加,单细胞测序、转录组测序和 ELISA 均显示海马、额叶皮层、大脑整体的炎症细胞因子表达上调,说明炎症水平升高,而雷公藤多苷可以有效抑制海马区小胶质细胞活性,显著降低大脑炎症水平。海马单细胞测序和皮层转录组测序提示雷公藤多苷作用的分子机制可能是通过抑制小胶质细胞中的 NLRP3 炎症小体下游的 JAK1-STAT1-GSDMD 相关的焦亡通路来起到了缓解神经炎症、改善工作记忆行为的作用。

结论 雷公藤多苷能有效改善阿尔茨海默症小鼠模型的工作记忆行为,其可能的作用机制是抑制大脑海马区的小胶质细胞活性,抑制神经元焦亡来缓解大脑炎症水平。

关键词: 雷公藤多苷,阿尔茨海默症,STM,焦亡,炎症,小胶质细胞

Association of Stmn1 Polymorphism and Cognitive Function in The Chinese Population

Hui Ma¹, Zhengtu Cong¹, Man Wang²

1.Hainan Provincial Anning Hospital

2.Shenzhen People's Hospital

Objective Stathmin 1 (Stmn1), a neuronal growth-associated protein involved in microtubule dynamics, plays an important role in neurite outgrowth and synaptic plasticity. Previous studies have reported that Stmn1 genetic variants influence fear, anxiety, and cognitive-affective processing. However, no studies have investigated the relationship between Stmn1 gene polymorphism and cognitive function in the healthy Chinese population. The present study thus aimed to investigate this association

Methods A total of 129 healthy Han Chinese individuals were genotyped for the Stmn1 rs182455 polymorphism by polymerase chain reaction and restriction fragment length polymorphism analysis. Cognitive function was assessed using the Stroop Color-Word Test (SCWT) and Hopkins Verbal Learning Test-Revised (HVLt-R)

Results In the total sample, the numbers of CC, CT, and TT genotypes of the rs182455 polymorphism were 56 (43.41%), 65 (50.39%) and 8 (6.20%), respectively. The genotype distribution did not deviate from Hardy-Weinberg equilibrium ($\chi^2 = 3.715$, $p = 0.054$). Significant differences were found between the three rs182455 genotypes and between the CC and (CT+TT) genotype groups in the Stroop Color (SC) scores of the SCWT ($F = 3.322, 2.377$; $p = 0.039, 0.019$, respectively) and the Total Recall (TR) scores of the HVLt-R ($F = 3.118, 2.225$; $p = 0.048, 0.028$, respectively). Moreover, there was a female-specific difference in SC scores between the three rs182455 genotypes ($F = 2.318$, $p = 0.023$). The rs182455 genotype distribution did not differ significantly between males and females ($\chi^2=1.313$, $p=0.519$), although there were significant differences in SC and TR scores between males and females ($t=-2.294, -2.490$; $p = 0.023, 0.014$, respectively)

Conclusion The findings suggest that the rs182455 Stmn1 polymorphism might affect cognitive flexibility and immediate free recall in healthy Chinese individuals-especially females

关键词: Stmn1; gene polymorphism; cognitive function; Stroop Color-Word Test; Hopkins Verbal Learning Test

Sex-Specific Metabolic Mechanisms in Mild To Moderate Depression: Investigating Iso-leucine and Trimethylamine N-Oxide in Female Patients

Mixue Zhang^{1,2}, Yao Gao^{1,2}, Dan Wang², Xinzhe Du^{1,2}, Sha Liu^{1,2}

1.Department of Psychiatry, First Hospital/First Clinical Medical College of Shanxi Medical University

2. Shanxi Key Laboratory of Artificial Intelligence Assisted Diagnosis and Treatment for Mental Disorder, First Hospital of Shanxi Medical University

Objective Depression is a prevalent mental health issue globally, with mild to moderate depression (MMD) being especially widespread. Research indicates substantial variations between women and men concerning the prevalence, severity, progression, and treatment of depression. Nonetheless, few studies have investigated sex differences in MMD, especially at the molecular level

Methods A total of sixty-nine participants were enrolled in this study, 25 females and 16 males were diagnosed with MMD, and 21 females and 7 males were diagnosed with healthy controls (HCs). The objective of this investigation was to examine sex disparities in the plasma metabolomic profiles of untreated MMD patients utilizing multivariate statistical analysis and pathway analysis based on ¹H nuclear magnetic resonance (¹H NMR). We also explored specific biomarkers in female MMD patients using machine learning models

Results In this study, there were significant differences between female and male MMDs and their respective HCs. A total of 14 different metabolites were associated with females, and 12 different metabolites were associated with males. In addition, six pathways were significantly altered in females, five pathways were significantly altered in males compared to HCs, five of which were common pathways, and arginine and proline metabolism were specific to female MMD patients. Isoleucine and trimethylamine n-oxide (TMAO) were also identified as potential biomarkers for the diagnosis of female MMD patients, with an area under the receiver operating characteristic curve (AUC) of 0.998

Conclusion The results of this research aimed to address the paucity of studies on sex differences in MMD at the molecular level. Metabolomic studies will provide new insights into the pathophysiology of sex differences in MMD patients. This may also help in the early identification and diagnosis of female MMD patients

关键词: Mild to moderate depression, Metabolomics, Sex difference, Plasma

Brain Glycogen: A Key To Revealing The Pathology of Mental Diseases

Jiangpei Shen Yanhui Cai*
Xijing Hospital

Brain glycogen, which is distinct from muscle glycogen and liver glycogen, has become a crucial node linking metabolism, epigenetics, and autophagy. Recent studies have suggested that brain glycogen governs multiple neurobehavioral processes, such as memory formation and consolidation. However, the changes in brain glycogen levels in mental diseases and the association of these changes with disease prognosis are unknown. Here, we review the psychological function of brain glycogen and the different characteristics of astrocytic glycogen and neuronal glycogen. In addition, we summarize the alterations in brain glycogen levels in depression, schizophrenia and sleep disorders, highlighting that brain glycogen functions as an important metabolite responsible for the development of mental diseases. In summary, brain glycogen is a key to understanding the pathology of mental diseases and deserves more attention in future research.

Objective Our objective is to summarize the alterations in brain glycogen levels in depression, schizophrenia and sleep disorders, exploring the psychological function of brain glycogen

Methods Literature research method

Results At present, the alterations in brain glycogen levels during depression are controversial. Research on the relationship between brain glycogen and schizophrenia is only beginning. There is a correlation between brain glycogen level and sleep, which can be explained by the glycogenetic hypothesis

Conclusion At present, there are limited studies on the changes in brain glycogen levels in mental diseases, and the existing studies mainly focused on depression and schizophrenia. The findings of the existing studies are also inconsistent, which may be due to the

use of different animal models. However, brain glycogen serves as an important energy source to support brain function under physiological conditions and may be a key for elucidating the mechanisms underlying mental diseases

关键词: brain glycogen, depression, schizophrenia, sleep disorders

舞动治疗在改善精神分裂症住院患者身心健康的效果观察

肖巧玲¹ 赵延宇² 李惠平¹ 李世碧¹ 朱姗姗²

1.广东省人民医院

2.广州市民政局精神病院

目的 本研究旨在探究舞动治疗对改善精神分裂症住院患者身心健康的效果。

方法 本研究选定了2020年6月至2023年6月间在南方医科大学附属广东省人民医院(广东省医学科学院)和广州市民政局精神病院接受治疗的60名精神分裂症住院患者作为研究对象,按照随机数字法分为观察组与对照组,各30例。对照组给予标准药物治疗及常规的工娱疗活动干预,观察组在对照组的基础上加入舞动治疗,比较两组精神状态与社会功能。

结果 在治疗开始前,参与研究的两组患者在BPRS(简明精神病评定量表)上的评分显示没有显著的统计差异($p>0.05$)。然而,治疗完成后,观察组在BPRS上各项指标,如焦虑抑郁程度、活力缺失、思维障碍、激动情绪以及敌意和猜疑态度等方面的评分,均显著低于对照组($p<0.05$)。同样,在治疗开始时,两组在SDSS(社会功能退化量表)评分上也未见显著差异($p>0.05$)。但是,治疗后,观察组在社交退缩、家外社交活动、日常自理、对外部世界的兴趣、关心、责任感以及计划能力等SDSS评分方面均低于对照组($p<0.05$)。

结论 作为辅助性治疗手段,舞蹈疗法在提升精神分裂症患者的心理健康和社交能力方面展现了显著成效。

缺陷型精神分裂症患者海马亚结构萎缩与注意力功能障碍无关

李金*

苏州市广济医院

目的 缺陷型精神分裂症(DS)被认为是精神分裂症谱系中的一个独特疾病实体。探讨DS的海马亚结构异常以及与这种精神分裂症亚型的独特症状的关联。海马结构异常是精神分裂症患者神经影像学研究中最有力的发现之一。然而,没有研究检测到缺陷型精神分裂症(DS)特有的区域海马异常的可能性,以及与该精神分裂症亚型的独特症状的相关性。

方法 本研究比较了33名DS和39名无缺陷精神分裂症(NDS)患者以及38名健康受试者的海马亚场容量。在MRI扫描当天,通过PANSS评估临床症状,通过神经认知电池评估认知。使用FreeSurfer 7.2.0对自动海马分割进行预处理。所有统计分析均使用SPSS 17.0(SPSS Inc., Chicago, IL, USA)进行。参与者的人口统计学、临床特征和神经认知评估分数以平均值±标准差(SD)的形式呈现。首先使用Welch检验检查数据集的方差同质性。通过单因素方差分析(ANOVA)和事后成对比较分析比较DS、NDS和HC组的人口统计学和临床特征的平均值,而通过独立样本t检验比较DS和NDS组之间的精神病症状得分的差异。使用控制受教育年限和体重指数(BMI)的协方差分析(ANCOVA)在各组之间比较海马亚区体积,并使用Bonferroni校正对多重比较进行调整。除COWAT外的认知得分通过ANCOVA控制受教育年限和BMI进行组间比较,并使用Bonferroni校正对多重比较进行调整,而COWAT结果通过one-way ANOVA与Bonferroni校正进行比较。构建多元线性回归模型来研究海马亚区体积是否与认知测试分数相关。 $p<0.05$ (两侧)。

结果 通过控制受教育年限和BMI,并使用Bonferroni进行多重比较校正,在DS患者中,右侧海马CA1头部萎缩与注意力缺陷、左侧海马尾部萎缩与类别流畅性差以及海马分子层头部萎缩与注意和选择性抑制差相关。但是经过多重比较校正后以上显著性消失。

结论 研究海马次区域萎缩模式对于深入了解 DS 认知缺陷的病理生理学具有重要意义。

KIBRA 基因多态性与健康汉族个体的不同人格特质相关

丛征途¹ 马慧¹ 朱刚²

1. 海南省安宁医院

2. 中国医科大学附属第一医院

目的 肾脑蛋白 (KIBRA) 在海马中富集, 一项包含 50 万个多态性的全基因组关联研究发现, 单核苷酸多态性 (SNP) rs17070145 与人类认知和记忆功能相关。对 59 个与人格特质相关的候选基因的多变量分析表明, 目前对遗传多态性和行为特质之间关系的理解仍然不足。为了分析影响人格特质的神经机制, 我们在健康的汉族人群中对 rs17070145C/T 多态性与人格特质的关系进行了研究。

方法 选择 573 名健康的汉族个体 (274 名男性, 299 名女性) 作为研究对象, 所有参与者均无神经系统、精神或身体疾病。参与者的平均年龄为 30.36 ± 7.92 岁, 范围为 19 至 58 岁。使用 TPQ 的中文版, 该版本在测量人格特质的 NS、HA 和 RD 气质维度上被证明是高度可靠的。rs17070145C/T 多态性的基因分型通过聚合酶链反应和限制性片段长度多态性分析 (PCR-RFLP) 进行。基因组 DNA 均采用标准的碘化钾方法提取, 引物选序列来自自己发表的文献, 限制性内切酶 MseI 酶切后的片段通过 2% 琼脂糖凝胶电泳和基因探针染色进行分析。rs17070145C/T 多态性与 TPQ 评分的基因型关联通过 Kruskal-Wallis 检验进行统计分析, $P < 0.05$ 被认为具有统计显著性。

结果 rs17070145C/T 的基因型计数和频率为 28 个 CC 基因型 (4.9%)、203 个 CT 基因型 (35.4%)、342 个 TT 基因型 (59.7%), 与 PubMed 数据库中提供的其他汉族人群样本的频率相似。573 名汉族健康个体中 rs17070145C/T 单核苷酸多态性的分布未偏离哈迪-温伯格平衡 ($\chi^2 = 0.092$, $p = 0.762$), 表明研究样本具有代表性。基因型之间的 NS 和 RD 评分, 基因型之间的总 HA 评分也没有显著差异。然而,

在分量表分析中, 我们在 HA2 评分上发现了基因型之间的显著差异 ($\chi^2 = 6.293$, $p = 0.043$), 但在其他 HA 子维度评分上没有显著差异。与 CC 携带者相比, TT 基因型携带者的 HA2 评分较低 ($p = 0.011$)。

结论 在健康的汉族个体中, T 等位基因携带者的 HA2 评分低于 C 等位基因携带者, 这表明人格特质可能受 KIBRA 遗传多态性的影响。KIBRA 最初被确定为与记忆表现和认知相关的蛋白质。对 KIBRA 的研究主要集中在与认知和记忆相关的疾病上。这些发现与我们显示 rs17070145 KIBRA 遗传多态性与回避损害行为之间关联的结果一致。综上, rs17070145C/T 多态性与健康汉族个体中的回避损害行为相关。

Painful Olfactory Hallucinations after Trazodone Treatment

Xinyu Jiang¹, Yunlong Tan^{1,2}

1. Huilongguan Hospital

2. Peking University Health Science Center

Objective In 1981, trazodone was approved by the FDA as an antidepressant. Using low doses of trazodone to treat insomnia is one of its common uses. We described an uncommon presentation of olfactory hallucination after trazodone administration and discussed its possible mechanism of occurrence

Methods case report

Results A 43-year-old woman was treated with escitalopram oxalate and trazodone for her depression with insomnia. After taking trazodone 12.5mg QN for 2 days, she presented to the hospital with olfactory hallucinations and headaches. This patient had no history or family history of epilepsy, and her CT scan of the head did not reveal any abnormalities. Within 48 hours of trazodone withdrawal, the olfactory hallucinations disappeared completely. During outpatient follow-up, the patient did not have any type of hallucinations again for the next 2 years

Conclusion The mechanism of trazodone is

complex and its pharmacological effects are dose-dependent: At low dose (50-150mg/d), the drug has a strong sedative effect due to blocking 5-HT_{1A} and α_1 receptors; At high doses (150-600mg/day), the drug also blocks the 5-HT transporter (SERT)

The effect of trazodone on 5-HT system is very complex. Trazodone has pharmacological effects on both 5-HT_{2A} and 5-HT_{2C} receptors, which may be different from other antidepressants. The above blocking effects can increase the levels of a variety of neurotransmitters in prefrontal lobe, including NE and DA, and enhance the antidepressant effect. In previous animal studies, trazodone at 30-50mg/kg also stimulated nigrostriatal dopaminergic neurons by blocking 5-HT_{2C} receptors. Although its direct effects against dopaminergic receptors are lacking, indirect effects may also be related to olfactory hallucination. Trazodone can similarly affect cholinergic neurotransmission, and hallucinations may also be associated with a low level of cholinergic activity.

As mentioned above, trazodone has serotonergic properties. There have been a number of reports of visual hallucinations (and only visual hallucinations) induced by traditional SSRIs, including sertraline, duloxetine, citalopram, etc. Hallucination is not only related to DA energy: in the 5-HT model of hallucination, cortical 5-HT_{2A} receptor hyperactivity may be involved in hallucination, and this is the main mechanism of LSD hallucination. Long-term use of LSD may increase the risk of developing LSD flashback syndrome, which is characterized by transient visual hallucinations, especially after using SSRIs. The underlying mechanism may be as follows: LSD impairs the function of inhibitory 5-HT interneurons, or the 5-HT receptor is continuously up-regulated; Once synaptic 5-HT levels are elevated in the short term, as in the case of concurrent SSRIs, it may result in a high-intensity 5-HT energetic signal, producing a hallucinogenic effect. About our patient, trazodone combined with escitalopram oxalate may increase 5-HT in a short term and increase the susceptibility of the brain to hallucination. Similar to the hypothesis for visual hallucinations, a model of abnormal hierarchical predictive processing in the olfactory

bulb and anterior olfactory nucleus may explain the occurrence of olfactory hallucinations. The common association of focused hallucinations suggested by the previous literature review suggests that the pathophysiological mechanisms underlying these phenomena may overlap.

As with other drugs, the incidence of illusory smell induced by trazodone may be underestimated. This may be due to concerns that people will not believe them or they will be misunderstood as having a serious mental illness or being "high."

In conclusion, low doses of trazodone may affect 5-HT and cholinergic transmission and subsequently cause transient sensory dysfunction. In the future, the underlying mechanisms should be further explored to draw firm conclusions.

关键词: olfactory-hallucinations, trazodone

脑机接口发展在精神疾病领域中应用的研究进展

李彤云¹ 王艳^{1,2}

1. 中国医科大学医学人文学院

2. 中国医科大学学生心理发展指导中心

目的 直观展示脑机接口 (BCI) 研究领域的重点, 为新技术开发与应用和精神疾病治疗提供方法思路。

方法 采用文献综述法。从 Web of Science (WOS) 中检索 2004 年至 2023 年间发表的与脑机接口相关的文章。HistCite Pro 2.1 用于分析出版物的数量, 以及按国家/地区、机构、作者和期刊分列的出版物的总被引次数和平均被引次数。CiteSpace 用于可视化和分析脑机接口研究领域的网络。在分析研究热点时, 使用可视化制图软件 VOSviewer 对关键词进行聚类, 并分析关键词在时间轴上的演变。然后, 生成 CiteSpace 的引文爆发, "强度" 一栏中数值较高的关键词暗示了 BCI 研究领域的关键主题。最后基于矩阵对高频关键词进行可视化, 绘制山峰图、战略坐标图和策略图。

结果 20 年来, 关于脑机接口的研究增长迅速, 中国已成为世界范围内脑机接口领域发文量最多的

国家,在合作关系、引用量等指标上均名列前茅。该领域研究热点逐步从虚拟现实转向脑电技术、深度学习和情感识别,目前最具关注的话题是深度学习及任务分析,未来研究趋势重点依然在算法的开发和扩展上。

结论 随着生物医学工程与技术的发展,脑机接口研究中相对前瞻性的主题现在更加先进、精确、高效,也更适合人体。现在BCI的研究正朝着算法和实际应用的方向发展,具体包括情感识别、脑建模等,BCI在精神疾病治疗中的应用也越来越广泛。以往的研究已经确定了几个与重度抑郁和强迫症症状状态相关的神经生物标志物。这些生物标志物可能因植入位置、患者之间症状状态的差异以及症状状态的分布式网络级表示而异。研究人员正在开发新的数据驱动方法来识别更准确、更个性化的神经生物标志物。这将丰富精神疾病的治疗方式。通过结合数据驱动机器学习、系统理论和转化动物模型,可以开发出个性化的闭环脑机接口,为精神疾病患者提供有效的疗法选择。然而,这一目标的实现还需要克服一些挑战,例如识别神经生物标志物、更好的生物标志物识别、结合生理测量数据、多模态生物标志物、神经-生理传感设备、道德问题、侵入性脑电监测和动物模型等。

The Metabolic Indices of Smoking and Non-smoking Schizophrenia Patients Were Compared, and The Relationship between Smoking, Glucose and Lipid Metabolism Status and Cognitive Function Was Investigated

Jingxuan Liu Shen Li*

Tianjin Mental Health Center

Background Numerous studies have shown the relationship between increased smoking, problems with glucose and lipid metabolism, and impaired cognitive ability in patients with schizophrenia. However, little research has delved into the specific impact of smoking on metabolic impairments within this population. We aimed to compare the metabolic indices between smoking and non-smoking patients with schizophrenia, and

explore the relationship between smoking, glycolipid metabolic profile and cognitive functioning

Methods A cohort of 773 patients with chronic schizophrenia participated in this study, undergoing assessments of blood pressure, waist circumference, body mass index (BMI), lipid profile and glucose metabolism. Psychiatric symptoms were evaluated using the Positive and Negative Syndrome Scale (PANSS), while cognitive function was measured with the Cognitive Functioning Scale (RBANS)

Results BMI and systolic blood pressure were lower in smoking patients than in nonsmoking patients after controlling for age and sex. Negative symptom scores were significantly lower in smoking patients than in non-smoking patients. In the group of non-smoking patients, positive symptom scores in the PANSS scale were positively correlated with waist-hip ratio, negative symptom scores, general psychopathology scores and total scores were negatively correlated with hip circumference, and delayed memory and attention scores as well as total scores in the RBANS scale were positively correlated with hip circumference

Conclusion In summary, it can be seen that in non-smoking patients with schizophrenia, the larger the hip circumference, the less severe the clinical symptoms, and the larger the hip circumference, the better the cognitive functioning of the patients, whereas there is no such relationship in smoker. And smoking can improve negative symptoms in patients with schizophrenia, with smokers weighing more than non-smokers

基于靶向代谢组学探究精神分裂症的代谢性别差异

苏侨*

天津市安定医院

目的 几乎在所有影响神经系统的疾病中都可以观察到性别差异的存在,而这种现象在精神分裂症中尤为明显,但性别差异产生的病理生理机制尚

不清楚。代谢组学技术能够精准识别生物体内的小分子代谢物，为揭示疾病机制提供新的视角。本研究旨在基于靶向代谢组学技术探索精神分裂症在代谢水平上的性别差异，为阐述性别差异的机制提供理论基础。

方法 本研究共纳入 60 名未用药精神分裂症患者和 36 名健康对照。在入组时收集所有参与者的一般人口学信息和血液样本。使用 PANSS 量表评估患者的临床症状。应用 P500 试剂盒来分析所有受试者血浆样本中的 271 种代谢物水平。首先我们比较精神分裂症患者男女不同性别在代谢物水平方面的差异，然后我们在不同性别群体中分别探索患者和健康对照之间存在差异的代谢物和代谢通路，并分析差异代谢物与临床症状的相关性及对患者的诊断能力，以进一步比较男女患者之间的性别差异。

结果 1.基于 OPLS-DA 模型，在精神分裂症患者中，男女不同性别之间识别出 14 个存在显著差异的代谢物，其中 8 个为 TG，其余代谢物分别为 DG、FA、Lac、CE 和 Cer；

2.根据 $P < 0.05$ 和 $VIP > 1.5$ 进行筛选，结果显示在男性群体中，患者与健康对照存在 26 个差异代谢物，而在女性群体中仅筛选出 9 个差异代谢物。男性群体中筛选出的差异代谢物以 PC、TG、Cer 和胆碱为主，女性群体中则以 Cer、GABA 和 CE 为主。

3.偏相关分析显示，男性群体中，患者的 TG(22:4_32:0)、PC aa C36:1、PC aa C40:2 和精胺水平与 PANSS 评分具有相关性 ($P < 0.05$)，女性群体中，患者的 CE(15:0)、Cer(d18:1/22:0)、Cer(d18:1/24:0) 和皮质醇水平与 PANSS 评分存在相关 ($P < 0.05$)。

4.ROC 曲线显示，在这两个群体中识别的所有差异代谢物均具有良好的疾病诊断能力，其中诊断能力比较出色的代谢物 ($AUC > 0.8$)，男性群体中发现 10 个，以 PC 和 Cer 为主，女性群体中发现 1 个，为 GABA。

5.KEGG 通路分析显示，不同性别群体的代谢通路存在明显的差异，男性群体中患者的 β -丙氨酸代谢、谷胱甘肽代谢、精氨酸和脯氨酸代谢以及甘油磷脂代谢存在异常，女性群体中患者的丁酸代谢存在异常。

结论 本研究发现不同性别的精神分裂症患者在 TG、PC、GABA 等代谢物以及 β -丙氨酸代谢、谷胱甘肽代谢等代谢物通路方面存在显著差异，这为精神分裂症在代谢水平存在明显性别差异提供了证据支持，有助于我们更好地理解性别差异存在的

机制，进而指导我们在临床上的干预方案，实现更精准的个体化治疗。

基于多模态脑影像的精神分裂症和双相情感障碍鉴别诊断

范丰梅¹ 王国鑫² 安山³ 余锋² 谭淑平¹ 谭云龙¹ 王志仁¹

1.北京回龙观医院

2.浙江大学生物医学工程与仪器科学学院

3.京东健康

目的 精神障碍的准确诊断在治疗方面起着重要作用。大多数现有的基于机器学习的诊断方法，为使用单一模态的磁共振成像数据作为模型的输入。但由于训练的模型未充分利用时间信息，导致模型的性能未达到最佳；故使用多模态融合的深度学习方法来提升模型性能十分有前景。

方法 我们提出了一种多维度嵌入感知模态融合 Transformer，利用静息态功能磁共振成像和 T1 加权结构磁共振成像来诊断精神分裂症和双相情感障碍。我们分别为 rs-fMRI 的 2D 时间序列和 T1w 的 3D 数据构建了两个编码器分支。对于 rs-fMRI，预处理后的 4D 数据先分割成 1000 个感兴趣区域，然后生成的 2D 时间序列图像才用作 2D 编码器的输入。Fusion transformer module (FTM)的输入来自两种模态的多维特征图，对齐后的特征图融合后输入到 Transformer 中，输出的特征图又变换回原始维度，聚合回各个模态分支。最后，为了更好地融合两种模态的信息，将调整后的 T1w 特征图与 rs-fMRI 特征图进行拼接融合。融合特征首先输入到两个卷积层以及一个三层 MLP 得到最终输出。

结果 为验证我们所提出方法的有效性，将 MFFormer 与多个最先进方法进行了比较。实验结果如表 1、表 2 所示（其中私有 BD 数据集是在驻马店精神病医院收集的，包含 91 名受试者的两种模态 MRI 数据）。

可见在私有 BD 数据集上，MFFormer 的性能明显优于现有方法，其 BACC 达到 0.768，F1 分数达到 0.755。

可见对于 OpenfMRI, MFFormer 在 SZ 与 HC 的分类中取得了第二高的 BACC 结果和最高的 F1 分数;在 BD 与 HC 的分类中 MFFormer 在 BACC 和 F1 分数上都有所提升。

我们还进行了消融实验,结果见表 3, baseline 1 (或 2) 表示仅使用 T1w (或 rs-fMRI) 的模型, “3(或 4)D x-way”表示采用将 3D 特征图上采样到 4D (或将 4D 特征图下采样到 3D)的模态融合策略,且在网络中使用 x 个 FTM。

可见,多模态融合模型均优于单一模态模型,这表明多模态融合的有效性。采用“4D 3-way”策略在 BACC 和 F1 分数方面均取得了最佳性能,这表明使用更多的 FTM 是有益的。

结论 我们提出了一种多模态融合模型 MFFormer 用于鉴别诊断精神分裂症和双相情感障碍。MFFormer 将 2D 时间序列和 3D 特征作为输入,利用融合 Transformer 模块,通过聚合不同维度的特征图来探索模态之间的关系。实验结果表明, MFFormer 的性能超过了仅使用单一模态的模型。

临床护士心身症状的现状分析及中介机制探寻

吴言*

中大医院

目的 调查临床护士的心身症状现状,了解护士心身症状的发生率,并寻找核心症状;探索压力、焦虑、抑郁情绪与心身症状的关系,检验焦虑、抑郁情绪在两者间的中介效应。

方法 采用问卷调查法,于 2022 年 9 月至 2022 年 12 月,对江苏省某三级甲等综合医院的 635 名临床一线护士进行调查,使用一般资料问卷、心身症状量表 (PSSS)、护士工作压力源量表 (NJSS)、广泛性焦虑量表 (GAD-7)、9 条目患者健康问卷 (PHQ-9)。使用描述性分析描述临床护士一般情况以及各量表得分情况,应用 Pearson、Spearman 相关分析了解与心身症状有关的各项因素,使用 SPSS 软件的 process 程序进行中介效应检验,使用 R 软件的网络分析探寻心身症状的核心症状。

结果 临床一线护士的心身症状得分为 38.0 (30.0, 48.0) 分,检出率为 100%,压力得分为 (66.55±15.57) 分,抑郁得分为 14.0 (10.0, 18.0) 分,焦虑得分为 10.0 (7.0, 14.0) 分。网络分析结果提示:26 个项目条目 24(感到全身乏力)桥预期影响值最高 (1.10),条目 10(做事时无兴趣、不快乐、无动力、无意义),条目 25(感到不得不去重复做某些事或想某些问题)次之,这几项为本网络的核心症状。焦虑与抑郁情绪均与心身症状呈正相关,压力即可以直接影响心身症状,又可以通过焦虑、抑郁的链式中介路径影响心身症状。

结论 1、临床一线护士压力大,负性情绪明显,心身症状检出率高,压力以及各种负性情绪均有可能导致心身症状的发生。

2、“感到全身乏力”“做事时无兴趣、不快乐、无动力、无意义”症状的激活可能会通过与其他项目的关联从而广泛地激活整个积极健康网络。提示以焦虑、抑郁情绪为干预靶点,可能会最大程度地提升护理人员整体心理健康水平。

3、护理管理者需加强对护士心身健康的重视,尽早发现,合理干预,科学治疗,以提高护理队伍的心身健康水平。

肠道微生物群、细胞因子与五种精神疾病的因果关系:双向双样本孟德尔随机化分析与中介分析

刘焯辉 高耀 杜鑫哲 刘美琪 刘莎* 徐勇

山西医科大学第一医院

结论 精神分裂症、重度抑郁症、双相情感障碍、孤独症谱系障碍、注意缺陷多动障碍潜在病因仍未被完全了解,最近有研究表明肠道微生物群、细胞因子与上述五种精神疾病之间有关联,但它们之间的因果关系尚不清楚。本研究的目的是基于双向双样本孟德尔随机化以及中介分析研究探索肠道微生物群、细胞因子与精神分裂症、重度抑郁症、双相情感障碍、孤独症谱系障碍、注意缺陷多动障碍之间的因果关系。

方法 本研究基于欧洲人群中肠道微生物群、细胞因子和五种精神疾病的全基因组关联研究

(GWAS)的汇总数据。将遗传因素作为工具变量,首先利用双样本孟德尔随机化评估肠道微生物群、细胞因子与精神分裂症、重度抑郁症、双相情感障碍、孤独症谱系障碍、注意缺陷多动障碍之间的潜在因果关系,其次分析与上述五种精神疾病的有关的肠道微生物、细胞因子之间的因果关系,探究细胞因子是否作为肠道微生物群与精神疾病之间因果关系的中介因素。

结果 放线菌纲.419 等九种肠道微生物群是精神分裂症的危险因素。戈登杆菌属.821 等两种是精神分裂症的保护因素。反向 MR 结果显示精神分裂症与丁酸菌属.945 有因果关系且成正相关。疣菌属.4029 等六种肠道微生物群是重度抑郁症的危险因素。 α -蛋白细菌纲.2379 等六种肠道微生物群是重度抑郁症的保护因素。科氏菌属.809 等七种肠道微生物群是双相情感障碍的危险因素。普氏菌科.9601 三种是孤独症谱系障碍的危险因素。负菌门.2164 等四种是孤独症谱系障碍的保护因素。拟杆菌属.912 等五种是 ADHD 的危险因素。真杆菌属.11296 等两种是 ADHD 的保护因素。HGF 与精神分裂症之间存在潜在的因果关系,且为负相关。FGF_BASIC 与重度抑郁症存在潜在的因果关系,且为正相关。与五种精神疾病相关的肠道微生物群与细胞因子之间无因果关系。

结论 本研究提供的证据表明,九种肠道微生物群是精神分裂症的危险因素。两种是精神分裂症的保护因素。反向 MR 结果显示精神分裂症与一种肠道微生物群有因果关系且成正相关。六种肠道微生物群是重度抑郁症的危险因素,六种是重度抑郁症的保护因素。七个肠道微生物群是双相情感障碍的危险因素。三种肠道微生物群是孤独症谱系障碍的危险因素,五种是孤独症谱系障碍的保护因素。六种肠道微生物群是 ADHD 的危险因素。两种是 ADHD 的保护因素。HGF 与精神分裂症之间存在潜在的因果关系,且为负相关。FGF_BASIC 与重度抑郁症存在潜在的因果关系,且为正相关。细胞因子不作为肠道微生物群与精神疾病之间关系的中介因素。

Essential Amino Acids and Psychiatric Disorders: A Two Sample Mendelian Randomization Study Combined Colocalization Analysis

yao gao huanghui Liu Xinzhe Du Sha sha*

First Hospital of Shanxi Medical University

Objective Psychiatric disorders is one of the leading causes of disability worldwide, and its complex pathogenesis is not yet fully understood. In recent years, research has begun to focus on nutritional factors, particularly the role of essential amino acids in the onset of psychiatric disorders. This study aims to explore the potential causal relationship between essential amino acids and psychiatric disorders using the Mendelian randomization method

Methods We collected large-scale genome-wide association study (GWAS) data, including single nucleotide polymorphisms (SNPs) related to essential amino acid levels and case-control information for psychiatric disorders. Using this data, we conducted a two-sample Mendelian randomization analysis to assess the potential impact of essential amino acid levels on the risk of psychiatric disorders. By employing inverse variance weighting (IVW) and other sensitivity analysis methods, we aimed to overcome potential confounding factors and issues of horizontal pleiotropy. For each significant association found in the preliminary analyses, we used examined colocalization between essential amino acids and psychiatric disorders at each genomic locus where each SNP was located to whether the causal association identified between essential amino acids and each psychiatric disorder was driven by high LD

Results Our analysis revealed significant associations between specific essential amino acids and the risk of psychiatric disorders. The study found no evidence of causal relationships between phenylalanine and seven psychiatric disorders, including schizophrenia and major depressive disorder. Similarly, no associations were observed for methionine and tryptophan with these conditions. In contrast, lysine showed a significant negative correlation with schizophrenia, suggesting a protective effect against the disorder. Threonine was positively correlated with major depressive

disorder, and isoleucine with major depressive disorder and bipolar disorder, indicating potential roles in their etiology. Valine was negatively associated with bipolar disorder and obsessive-compulsive disorder in the prospective analysis and with attention-deficit hyperactivity disorder (ADHD) in the reverse analysis. The study also found valine to be negatively related to schizophrenia in the reverse MR analysis. The MR Egger test and leave-one-out analysis confirmed the stability of the results, with no significant horizontal pleiotropy or single nucleotide polymorphism (SNP) influence detected. Colocalization analysis revealed that valine appeared Colocalization with ADHD through SNP-rs17642754, suggesting that valine and ADHD share causal variants at this SNP

Conclusion The MR study offers novel insights into the potential causal relationships between specific essential amino acids and psychiatric disorders. The findings for lysine with schizophrenia, threonine with major depressive disorder, isoleucine with mood disorders, and valine with bipolar disorder and ADHD highlight the need for further research to understand the underlying biological mechanisms. Valine is co localized with ADHD through SNP-rs17642754, and both have a common causal variation in this SNP. The study emphasizes the complexity of the relationship between nutrition, genetics, and mental health and calls for future research with larger sample sizes, diverse populations, and more detailed molecular data to confirm these findings and explore their clinical implications

Tryptophan and Its Main Metabolite Kynurenine with Depression: A Bidirectional Two-sample Mendelian Randomization Study

Yao Gao Huanghui Liu Xinzhe Du Jianzhen Hu liu sha*
First Hospita of Shanxi Medical University

Objective The etiologic complexities of depression remain inadequately understood. There have been several recent studies addressing tryptophan and its metabolites kynurenine were linked with depression. However, it remains unclear whether and in which direction there is a causal relationship between tryptophan and its metabolites, kynurenine, with depression. This study aimed to determine whether tryptophan and kynurenine have causal effects on depression by using bidirectional two-sample Mendelian randomization methods

Methods This study utilized summary data from genome-wide association studies (GWAS) conducted on European populations to investigate the association between tryptophan and kynurenine levels with depression. This study used a two-sample bidirectional Mendelian randomization (MR) method, using genetic factors as instrumental variables, to explore whether there is a potential causal effect between tryptophan and depression, and between canine uric acid and depression

Results The findings from this MR study indicate no causal relationship between tryptophan and depression, with an odds ratio (OR) of 1.005 (95%CI:0.990–1.019, P-value =0.519). No significant causal relationship between depression and tryptophan was identified during the analysis of reverse MR with an OR of 0.304 (95%CI: 0.037-2.678, P-value =0.289). Kynurenine and depression a potential causal relationship and it is positively correlated, with an OR of 1.008 (95%CI: 1.001-1.015, P-value = 0.018). No significant causal relationship was observed between depression and kynurenine during the reverse MR analysis, with an OR of 0.216 (95%CI: 0.001-49.363, P-value=0.580)

Conclusion The final results of this MR study revealed a positive correlation between kynurenine and depression, and an increase in kynurenine levels may increase the likelihood of developing depression, there is no causal relationship between elevated or decreased levels of kynurenine in depressed patients. The results of this study indicate that there is no association between tryptophan and depression, whether prospective or reverse MR. The elucidation of these associations necessitates further investigation in subsequent studies

双相障碍混合状态的药物治疗有效性、安全性及可接受性的系统评价

黄小嘉^{1,2} 黄乐萍^{1,2} 朱云程^{1,2} 周霓¹ 陈俊³ 彭代辉³ 方贻儒⁴ 汪作为^{1,2}

- 1.上海市虹口区精神卫生中心
- 2.上海大学医学院精神卫生临床研究中心
- 3.上海交通大学医学院附属精神卫生中心
- 4.上海交通大学医学院附属瑞金医院

目的 系统评价双相障碍混合状态（包括伴混合特征和混合发作）药物治疗的有效性、安全性及可接受性。

方法 检索 Pubmed、Embase、Web of Science、Psycho InFo、Cochrane Library、中国知网、万方、维普数据库,收集 2004 年 1 月-2023 年 12 月发表的关于双相障碍混合状态药物治疗的中英文随机对照试验 (RCT) 研究文献, 并采用 Cochrane 协作网的单个 RCT 研究偏倚风险评价标准对纳入研究进行质量评价, 对纳入研究所涉及治疗药物的疗效、安全性、耐受性、可接受性、转相风险进行系统评价。

结果 共纳入 11 篇符合双相障碍混合发作与伴混合特征的 RCT 研究文献, 包括奥氮平 (3 篇)、鲁拉西酮 (2 篇)、喹硫平 (2 篇) 等药物。对于双相抑郁伴混合特征的治疗, 鲁拉西酮和喹硫平有疗效证据支持。鲁拉西酮代谢、镇静副作用小, 可用于儿童青少年双相抑郁伴混合特征患者; 喹硫平抗抑郁与抗躁狂疗效均衡, 转相风险低。对于躁狂发作伴混合特征的治疗, 奥氮平有疗效证据支持, 但需平衡疗效与副作用, 关注药源性抑郁风险。对于混合发作, 阿立哌唑的研究证据最充分。阿立哌唑较少引起代谢、泌乳素升高的副作用, 且可用于儿童双相障碍患者。丙戊酸盐和锂盐被较多专家共识推荐用于双相障碍混合状态的治疗。

结论 当前双相障碍混合状态的药物治疗研究间的不一致性较大, 亟需高质量的 RCT 研究为其提供更充分的循证支持。

阿戈美拉汀片联合盐酸帕罗西汀对抑郁伴失眠患者 SOD、BDNF 水平的影响

徐卫国 李莎*
宁夏宁安医院

目的 探讨阿戈美拉汀片联合盐酸帕罗西汀对抑郁伴失眠患者超氧化物歧化酶 (SOD)、脑源性神经营养因子 (BDNF) 水平的影响。

方法 选取宁夏精神卫生中心 2022 年 10 月到 2023 年 9 月期间诊断抑郁伴失眠的住院患者 120 例, 分为对照组 60 例和实验组 60 例。在使用盐酸帕罗西汀进行常规抗抑郁治疗的基础上, 实验组和对照组分别联合阿戈美拉汀、右佐匹克隆进行 8 周治疗。使用汉密顿抑郁量表 (HAMD) 评定患者抑郁程度; 匹兹堡睡眠质量指数 (PSQI) 评定患者睡眠质量; 酶联免疫吸附试验法检测褪黑素、SOD、BDNF 水平; 电化学发光免疫法检测去甲肾上腺素 (NE)、多巴胺 (DA)、5-羟色胺 (5-HT) 水平。对比两组治疗后临床症状改善程度及各递质水平变化。

结果 治疗前, 两组 HAMD 评分水平及 PSQI 评分水平对比, 差异无统计学差异 ($P>0.05$); 治疗后, 两组数值均有所下降, 差异有统计学差异 ($P<0.05$)。且实验组较对照组的 HAMD、PSQI 水平降低更明显; 治疗前, 两组 SOD、BDNF、褪黑素水平对比, 差异无统计学意义 ($P>0.05$); 治疗后, 两组 SOD、BDNF、褪黑素水平均得到一定程度升高, 升高程度则是实验组 SOD、BDNF、褪黑素水平高于对照组, 差异有统计学差异 ($P<0.05$)。

治疗 8 周后, 相比对照组, 实验组 HAMD、PSQI 分数降低 ($P<0.05$); 褪黑素、SOD、BDNF、NE、DA、5-HT 水平升高 ($P<0.05$)。

结论 对抑郁伴失眠障碍患者采用帕罗西汀联合阿戈美拉汀片进行治疗, 患者抑郁程度、睡眠质量得到显著改善; 抑制氧化应激状态, 上调 SOD、BDNF 水平, 升高褪黑素水平, 增加 NE、DA、5-HT 神经递质数量。本研究存在不足之处: 未对其作用机制深入探究, 结果可能具有一定的局限性。

血浆 IL-6 水平与脑健康和痴呆风险的关系研究

赵正阳 王强* 谢敏 张佳硕 陶诗婉 吕秋玥
四川大学华西医院

目的 近来,免疫异常与痴呆的相关性已被逐渐发现和认可。IL-6 作为炎症反应中至关重要的细胞因子,其水平升高已被发现与大脑结构变化和认知能力下降有关。然而,IL-6 水平、认知、大脑结构变化和痴呆风险之间的联系需要在大型前瞻性队列中进行探索。本研究意在基于对大样本公共数据库的挖掘,探究 IL-6 水平如何影响认知,及它通过何种途径调控痴呆的发生。

方法 本研究利用 UK Biobank 的纵向队列,通过线性回归分析 IL-6 表达水平、认知表现以及皮质和皮质下脑体积之间的相关性。此外,我们使用 Cox 回归分析评估了 IL-6 水平与长期痴呆风险之间的关联。最后我们还使用单样本孟德尔随机化来减轻痴呆导致 IL-6 水平升高的反向因果关系。

结果 本研究总共纳入了 50,864 名参与者,其中发现了 1,391 例新发全因痴呆病例。较高的血浆 IL-6 水平与梭状回、背侧丘脑、海马等区域的皮质和皮质下体积减少有关,与脑室体积扩大有关。IL-6 水平与配对匹配、数字记忆、前瞻性记忆和反应时间测试中的认知表现呈负相关。此外,在平均 13.2 年的随访期内,IL-6 水平升高与全因痴呆风险增加 23-35% 相关。单样本孟德尔随机化分析支持 IL-6 水平升高与痴呆症发病之间的因果关系。

结论 IL-6 水平升高与认知能力下降、大脑结构变化以及全因痴呆风险增加相关。本研究强调需要关注外周免疫激活在管理大脑健康和痴呆风险中的作用。

关键词: IL-6, 脑结构, 痴呆, 认知功能

精神分裂症患者治疗效果与认知功能关系的研究

李想*
新乡医学院第二附属医院

目的 探究精神分裂症患者认知功能损害与治疗

效果的关系,为疾病的识别、诊断和预测预后及功能恢复提供帮助,并为精神分裂症的病理学机制的认识提供思路。

方法 本研究纳入 148 例首发未经治疗或 3 个月未使用任何抗精神病药物治疗的复发精神分裂症患者,分别在治疗前和治疗 8 周末采用阳性与阴性症状量表(PANSS)评估精神症状,采用 P300、MMN、精神分裂症认知功能成套测验共识版(MCCB)评估认知功能。根据 PANSS 减分率将患者分为有效组和无效组。用 t/Mann-Whitney U/Wilcoxon 检验比较精神分裂症患者治疗前后 PANSS、MCCB、P300 和 MMN 变化,以及有效组和无效组之间 MCCB、P300、MMN 差异。

结果 1. 与治疗前比较,治疗 8 周后患者认知功能在信息处理速度、词语学习、工作记忆、推理和问题解决能力、视觉记忆这五个领域均明显改善。2. 经过 8 周治疗后,有效组认知功能在信息处理速度、词语学习、工作记忆、推理和问题解决能力、视觉记忆这五个领域均明显改善;而无效组认知功能则在信息处理速度、词语学习、推理和问题解决能力、视觉记忆这三个领域改善。与无效组比较,有效组的认知功能在信息处理速度方面更好,在 Cz、Pz 位点的 P300 潜伏期也更短。

结论 1. 精神分裂症患者在接受抗精神病药物治疗 8 周后认知功能明显改善。2. 经过 8 周治疗后,精神分裂症患者有效组较无效组有更广泛的认知功能改善;且认知功能与精神症状改善程度有关,提示认知功能相关指标或可作为精神分裂症患者疗效预测标志物。

精神分裂症与血压的因果关联: 一项双向双样本孟德尔随机化研究

范笑璇* 刘煌辉 高耀 杜鑫哲 刘莎 曹晓华
山西医科大学第一医院

目的 精神分裂症(Schizophrenia, SCZ)是一种病因未明的严重影响社会功能的重性精神障碍性疾病,在世界范围内发病率为 1%。精神分裂症的病因及发病机制研究尚不明确,有研究证据表明较高的收缩压会增加罹患精神分裂症的风险,有微量证

据提示较高的舒张压会降低精神分裂症发生率，而一项探讨 SCZ 与心血管疾病的研究发现舒张压与精神分裂症发生并无关联，精神分裂症与舒张压之间的潜在因果关系尚不明确。本文就精神分裂症与血压（收缩压、舒张压、高血压）之间的因果关系进行双向双样本孟德尔随机化分析（Mendelian randomization, MR），并发现收缩压、舒张压与精神分裂症有潜在的因果关系，高血压与精神分裂症之间无潜在因果关系。

方法 本研究基于不同人群中血压及精神分裂症的全基因组关联研究（Genome-wide association studies, GWAS）汇总数据。使用双向双样本 MR，将遗传变量作为工具变量，采用逆方差加权、MR-Egger 回归、加权中位数、简单模型和加权模型五种方法来评估血压与精神分裂症风险之间的关系，采用敏感性分析（多效性、异质性和留一性检验）来评估结果的稳健性，同时绘制 SNP 相关的血压与精神分裂症风险的森林图及散点图。

结果 在收缩压与精神分裂症 MR 分析中，筛选出 63 个与精神分裂症相关的收缩压 SNPs，表明收缩压与精神分裂症之间具有因果关系，且为正相关，比值比（OR）为 1.241(95%CI:1.020-1.509,P=0.031)。在反向 MR 中，尚未发现精神分裂症与收缩压之间具有潜在的因果关系，比值比（OR）为 0.977（95%CI:0.955-0.998，P=0.035）。在舒张压与精神分裂症 MR 分析中，筛选出 35 个与精神分裂症相关的舒张压 SNPs，发现舒张压与精神分裂症之间具有因果关系，且为负相关，比值比（OR）为 0.990（95%CI:0.982-0.998，P=0.011）。在反向 MR 中，没有发现精神分裂症与舒张压之间具有潜在因果关系，比值比（OR）为 0.750(95%CI:0.499-1.126,P=0.165)。在高血压与精神分裂症 MR 分析中，筛选出 156 个与精神分裂症相关的高血压 SNPs，发现高血压与精神分裂症之间无关联，在反向 MR 中，也未发现两者有关联。

结论 本研究表明较高的收缩压可能会升高罹患精神分裂症的风险，较高的舒张压可能会降低患精神分裂症的风险，精神分裂症与高血压、收缩、舒张压升高或降低无因果关系。本研究提示控制收缩压或舒张压可能降低精神分裂症的风险，为预防精神分裂症发病提供新思路。

Abnormal Functional Connectivity of The Reward Circuitry Is Associated with Negative Symptom and Cognitive Functions in First-episode Schizophrenia.

Yunyi Han Chuanyue Wang* Fuchun Zhou

Beijing Anding Hospital Affiliated to Capital Medical University

Objective Background It is often observed that individuals with schizophrenia exhibit functional connectivity (FC) abnormalities in the core brain regions of the reward circuitry, abnormalities that are commonly believed to be associated with psychotic symptoms and cognitive functions. However, the relationship between the reward circuitry connectivity patterns and clinical symptoms as well as cognitive functions in the first-episode schizophrenia has not yet been systematically explored

Methods 52 first episode schizophrenia (FES) patients and 56 healthy controls (HC) were recruited for this cross-sectional study. 11 brain regions associated with the reward circuitry were defined as regions of interest (ROIs). The FCs within 11 brain regions and between each ROI and the whole brain were evaluated. Additionally, a correlation analysis was conducted to explore the relationships between abnormal FC and PANSS as well as MCCB

Results For the within network analysis, FES patients showed increased FC between the left ventrolateral prefrontal cortex and the left thalamus compared to healthy controls, and this FC was negatively correlated with negative symptom. For the whole brain analysis, weaker FC (i.e., FC between the left/right NAc and the left precentral gyrus, between the left orbitofrontal cortex (OFC) and the left/right putamen nucleus, the right lingual gyrus, as well as the left medial cingulate cortex, between the right OFC and the bilateral putamen nucleus, between the left ventromedial prefrontal cortex (VMPFC) and the right lingual gyrus, between left dorsomedial prefrontal cortex (DMPFC) and left

precuneus, between right DMPFC and left inferior parietal lobule (IPL), between left putamen nucleus and dorsolateral prefrontal cortex (DLPFC), as well as right and left inferior frontal gyrus (IFG), between right putamen and left anterior cingulate cortex (ACC), left precentral gyrus, as well as right IFG) were exhibited in FES relative to HC. Only one aberrant FC between left putamen nucleus and left hippocampus was increased in FES. It is noteworthy that some abnormal FCs were positively correlated with cognitive functions (e.g. attention/vigilance (AV), verbal learning and memory (VERL), visual learning and memory (VISL)), but this positive correlation was only present in the HC and disappeared in the FES group

Conclusion Conclusions: Our research highlights the abnormal functional connectivity patterns in the reward circuitry in FES, which are significant in relation to negative symptoms. The loss of correlation between certain FCs with cognitive function may also suggest decoupling of the reward circuitry and cognitive-relevant brain regions

关键词: schizophrenia, functional connectivity, reward circuitry, negative symptom, cognitive functions

Association between Blood Mitochondrial DNA Copy Number and Mental Disorders: A Bidirectional Two-sample Mendelian Randomization Study

Yan'e Lu Jiajia Liu*

School of Nursing, Peking University

Objective Mitochondria is essential in the process of cellular energy production, oxidative stress, and apoptosis. Mitochondrial DNA (mtDNA), serving as the genetic material within mitochondria, encodes essential proteins for mitochondrial function. Although several studies have explored the association between changes in mtDNA copy number (mtDNA-CN) and risk of mental disorders, the results remain debated. This study examined the genetic causality between mtDNA-CN and

mental disorders using a bidirectional two-sample Mendelian randomization (MR) analysis

Methods Single nucleotide polymorphisms associated with mtDNA-CN and seven mental disorders including attention-deficit/hyperactivity disorder (ADHD), autism spectrum disorder (ASD), schizophrenia (SCZ), bipolar disorder (BD), major depressive disorder (MDD), anxiety, and obsessive-compulsive disorder (OCD) were sourced from genome-wide association studies. Causal associations were assessed using the inverse variance weighting method, with sensitivity analyses conducted through the weighted median and MR-Egger approaches. Reverse MR considered the seven mental disorders as exposures. All analyses were replicated with additional mtDNA-CN data for robustness

Results Forward MR observed a 27% decrease in the risk of ASD per standard deviation increase in genetically determined blood mtDNA-CN (OR=0.73, 95%CI: 0.58-0.92, p=0.002). However, no causal effects of mtDNA-CN on ADHD, SCZ, BD, MDD, anxiety, and OCD were found. Additionally, reverse MR did not indicate a causal association between any of the mental disorders and mtDNA-CN. Validation analyses corroborated these findings, indicating their robustness

Conclusion Our study provides support for the potential causal association between mtDNA-CN and the risk of ASD, thereby suggesting that mtDNA-CN could serve as a promising biomarker for early screening of ASD

关键词: Mitochondrial DNA copy number; mental disorders; bidirectional; two-sample Mendelian randomization; autism spectrum disorder; genetic causality.

犬尿氨酸代谢产物及细胞因子负荷水平在单相双相抑郁症患者间的差异分析及与临床特征的关联研究

张苹*

北京回龙观医院

目的 通过分析单相抑郁症患者与双相抑郁症患者在犬尿氨酸代谢产物水平及细胞因子负荷水平

的差异及其与临床特征的相关性，探究以上因素在抑郁症发病机制中的可能作用。

方法 选取于2020年10月至2022年4月在北京回龙观医院就诊的46例双相情感障碍，目前为抑郁发作的患者、49例首次或多次抑郁发作的患者及同时期在医院周边社区招募的52名年龄及性别比例相匹配的健康对照作为研究对象，使用高效液相色谱法将所有被试血清中的色氨酸、犬尿氨酸、喹啉酸、犬尿喹啉酸等犬尿氨酸代谢产物进行分离，然后使用串联质谱仪进行定量检测；使用酶联免疫吸附实验检测所有被试空腹静脉血中IL-1、IL-1 β 、IL-2、IL-4、IL-6、IL-8、IL-10、TNF- α 、IFN- γ 和TGF- β 的浓度，计算细胞因子负荷（cytokine load, CL）指数（根据健康人群各指标浓度值的75%或25%进行计数0/1，然后进行相加，范围为0-10）。使用汉密尔顿抑郁量表（Hamilton Depression Scale, HAMD）评估患者目前抑郁的严重程度。使用单因素方差分析及事后t检验比较三组被试在犬尿氨酸代谢产物水平和细胞因子负荷指数间的组间差异，使用偏相关分析探究犬尿氨酸代谢异常和CL异常在抑郁症患者临床严重程度及复发中的可能作用。

结果 血清色氨酸、犬尿喹啉酸及喹啉酸的水平在三组间的差异均显著（均 $p < 0.05$ ），见表1。事后两两组间比较发现单相抑郁与双相抑郁患者的血清色氨酸及犬尿喹啉酸水平均显著低于健康对照（均 $p < 0.01$ ），但两患者组间的差异不显著（ $p = 0.653$ ）。双相抑郁组患者的血清喹啉酸水平显著低于单相抑郁组和健康对照组（ p 双相 vs. 单相 = 0.006, p 双相 vs. HC = 0.027），而后两组间差异不显著。CL指数在三组间存在显著差异（ $p = 0.003$ ），见表1。两两组间比较发现单相抑郁组的CL值显著高于双相抑郁组和健康对照组（ p 分别为0.017和0.001），而后两组间差异不显著。偏相关分析仅发现单相抑郁患者组的CL与HAMD总分呈显著负相关（ $r = -0.35$, $p = 0.017$ ），而以上相关性在双相抑郁患者组并不显著。

结论 单、双相抑郁患者均存在显著的犬尿氨酸代谢异常，其中双相抑郁患者更为突出，表现为喹啉酸的水平显著降低；单相抑郁患者的细胞因子负荷水平显著升高，且这可能会对个体产生一定保护作用。反之，如果这种炎症反应水平降低可能会导致个体抑郁的程度更为严重。

关键词：单相抑郁，双相抑郁，犬尿氨酸代谢，细胞因子负荷

血浆外泌体蛋白质组学特征及其与未用药精神分裂症临床症状的相关性研究

孙萧萧 李浩*

天津市安定医院

目的 近年来，由于外泌体在物质运输和细胞通讯中发挥的重要作用，其生物学功能逐渐引起广泛关注，特别是在神经系统疾病中的作用备受瞩目。本研究旨在通过对未用药的精神分裂症患者和健康对照的血浆外泌体样本进行蛋白质组学分析，识别与精神分裂症临床症状相关的蛋白质生物标志物。

方法 本研究纳入了符合DSM-5诊断标准的精神分裂症患者10例及年龄、性别、文化程度匹配的健康对照10例。采集受试者晨起空腹静脉血标本，采用液相色谱-串联质谱(LC-MS/MS)技术对蛋白质进行定性和定量分析。数据处理中包括使用NCBI数据库进行蛋白质鉴定，并通过统计学方法评估蛋白质表达的显著差异（采用Bonferroni校正控制多重比较假阳性率）。使用PANSS量表评估患者组的精神症状的严重程度，MCCB评估研究对象的认知功能。

结果 共筛选出261个差异表达的蛋白（Fold Change ≥ 1.2 or ≤ 0.67 且 $P < 0.05$ ），对这些差异蛋白对应的差异基因进行GO注释与富集分析，结果揭示了这些差异蛋白在免疫应答等多个生物过程中发挥作用。在上述的差异蛋白中，按照 $P < 0.001$ 和 $|\log_2 \text{Fold Change}| > 1$ 筛选出29个Top蛋白。与健康对照相比，其中14个蛋白下调，15个蛋白上调。以年龄和性别作为协变量，对Top蛋白和精神病性症状进行偏相关性分析，结果发现：LRIG1与阴性症状显著相关（ $r = 0.68$, $P = 0.044$ ），LIN7C与一般症状（ $r = -0.75$, $P = 0.020$ ）及PANSS总分（ $r = -0.62$, $P = 0.035$ ）显著相关，RAD23A与一般症状（ $r = 0.83$, $P = 0.012$ ）及PANSS总分（ $r = 0.84$, $P = 0.009$ ）显著相关。进一步探索Top蛋白与认知功能的相关性时发现，4个下调蛋白KRT4、RBP5、NOTCH4和HLA.DPB1与不同认知功能指标存在显著相关性：KRT4与处理速度（ $r = -0.76$, $P = 0.046$ ）、神经认知（ $r = -0.85$, $P = 0.014$ ）及MCCB总分（ $r = -0.82$, $P = 0.024$ ）相关；RBP5与神经认知相关（ $r = -0.85$, $P = 0.014$ ）；NOTCH4与社会认知相关（ $r = -0.86$,

$P=0.014$)；HLA-DPB1 与言语学习相关($r=-0.77$, $P=0.043$)。

结论 本研究发现未用药的精神分裂症患者存在显著差异表达的蛋白质，这些差异蛋白有可能作为精神分裂症发生和发展的潜在生物标志物。通过进一步研究这些蛋白质的功能和作用机制，可以为精神分裂症的早期诊断和个体化治疗提供新的线索和靶点。

精神分裂症外周炎症因子、脑结构与认知功能障碍的研究

张蓉 张晨*

上海市精神卫生中心

目的 探究精神分裂症患者与健康人群皮层结构与形态的差异性，以及外周炎症因子对精神分裂症患者脑结构和认知功能的影响。

方法 该研究共纳入精神分裂症患者 42 例和健康对照人群 56 例，所有被试均进行磁共振扫描以及血样采集。通过酶联免疫吸附试验 (ELISA) 检测血浆外周炎症因子 IL-1 β 、IL-2、IL-4、IL-6、IL-8、IL-10、IL-12 和 IL-17 的浓度。采用阳性和阴性症状量表 (PANSS) 评估患者精神症状，重复性成套神经心理状态测验 (RBANS) 量表评估被试的认知功能。采用基于体素的形态学方法 (VBM) 和基于表面的形态学方法 (SBM) 测量皮层、皮层下体积、皮层厚度、沟深、皮层褶皱和皮层复杂度。VBM、SBM 分析分别基于 AAL3 图谱和 DK40 图谱进行组间差异的比较。采用斯皮尔曼相关分析进一步探究外周炎症因子对显著差异脑区的影响，控制年龄和受教育年限的偏相关分析探究外周炎症因子对认知功能的影响。以颅内总体积、年龄和受教育年限为协变量，探究脑结构在外周炎症因子对认知功能的影响中的中介作用。

结果 精神分裂症患者 RBANS 亚量表评分包括即刻记忆 ($t=6.394$, $p<0.001$)、视觉广度 ($t=3.269$, $p=0.002$)、言语功能 ($t=5.683$, $p<0.001$)、注意力 ($t=8.788$, $p<0.001$)、延时记忆 ($t=5.734$, $p<0.001$) 和总分 ($t=8.190$, $p<0.001$) 均显著低于健康对照。患者组和对照组的外周炎症因子水平

均无显著统计学差异。此外，患者海马、左侧颞下回、右侧梭状回、右侧距状裂周围皮层、右背内侧大细胞区体积比健康对照者低 ($p<0.005$, 未校正)，而豆状苍白球、左侧豆状壳核的体积比健康对照者高 ($p<0.005$, 未校正)。患者组右侧横向颞叶皮层厚度比健康对照者低 ($p<0.005$, 未校正)，左外侧眶额叶、左侧额极和左缘上回的皮层复杂度比健康对照组高 ($p<0.005$, 未校正)。精神分裂症患者 IL-10 与 RBANS 言语功能亚量表评分呈正相关 ($r=0.367$, $p=0.019$)，而在对照组这一相关性不显著。患者左侧额极的皮层复杂度与言语功能量表评分呈正相关 ($r=0.538$, $p<0.001$)。在患者组，左侧额极的皮层复杂度介导了 IL-10 对言语功能的正向影响 ($\beta=0.371$, bootstrap 95% CI: 0.015-0.086)。

结论 外周炎症可能通过影响脑结构的变化从而影响精神分裂症患者的认知功能，有待大样本、多中心研究验证这一发现。

关键词：精神分裂症，皮层形态，认知功能障碍

单/双相抑郁额叶 alpha 波不对称的差异比较

孙广伟¹ 寻广磊^{1,2}

1. 山东大学附属精神卫生中心

2. 中华医学会精神医学分会生物精神病学组

目的 通过额叶 alpha 波不对称 (FAA) 比较单双抑郁与健康人群，以及单双相抑郁之间在神经电生理存在的差异，以期对单/双相抑郁的诊断及鉴别诊断寻求潜在的客观指标。

方法 本研究招募符合 DSM-5 “重性抑郁障碍” (UD) 和“双相 I 型障碍/双相 II 型障碍，目前为抑郁发作” (BD) 诊断标准的患者，UD 组共招募 32 例，BD 组共招募 35 例，同时招募 30 例健康组。所有患者均接受简明国际神经精神临床定式访谈以明确诊断。用汉密尔顿抑郁量表、汉密尔顿焦虑量表、杨氏躁狂量表以及 32 项轻躁狂症状清单对受试者进行评估。所有受试者均采集睁眼、闭眼各 5 分钟的静息态脑电图数据，对脑电数据进行预处理，取 3 分钟预处理后的脑电数据，提取各通道功率谱密度，计算 FP1/FP2、F3/F4 以及 F7/F8 位置的 FAA 值。通过 SPSS26.0 比较三组间临床资料及 FAA 的差异性。

结果 在闭眼状态下, UD 组、BD 组在 F3/F4 及 F7/F8 通道的 FAA 值均小于 HC 组 ($P<0.05$); UD 组与 BD 组在 F3/F4、FP1/FP2、F7/F8 通道的 FAA 值均未见明显统计学差异 ($P>0.05$); 在睁眼状态下, 三组在 F3/F4、FP1/FP2 及 F7/F8 的 FAA 值均不存在统计学差异 ($P>0.05$)。在睁眼和闭眼状态下, UD 组在 F3/F4 的 FAA 值为负值且最小; BD 组在 F3/F4 的 FAA 值为负值且最小。

结论 FAA 可能与抑郁状态有关, 但是在单/双相抑郁之间 FAA 值差异不明显。单/双相抑郁均在 F3/F4 右偏侧化最严重, 提示背外侧前额叶脑区可能与抑郁状态最为相关。

关键词: 单相抑郁, 双相抑郁, 额叶 alpha 波不对称, 脑电图

单/双相抑郁患者前额叶的功能性近红外光谱差异比较。

孙广伟¹ 寻广磊^{1,2}

1. 山东大学附属精神卫生中心

2. 中华医学会精神医学分会生物精神病学组

目的 单/双相抑郁是常见的精神疾病, 然而单/双相的发病机制目前尚不清楚, 其诊断及鉴别诊断主要依靠患者的临床表现及医生的临床经验, 缺乏可靠的客观指标。本研究通过功能性近红外光谱 (fNIRS) 去比较单/双相抑郁患者在前额叶存在的差异, 以期为单/双相抑郁的鉴别寻求潜在的客观指标。

方法 本研究招募符合 DSM-5 “重性抑郁障碍”(UD) 和“双相 I 型障碍/双相 II 型障碍, 目前为抑郁发作”(BD) 诊断标准的患者, UD 组共招募 32 例, BD 组共招募 35 例, 同时招募 30 例健康组 (HC)。所有患者均接受简明国际神经精神临床定式访谈以明确诊断。用汉密尔顿抑郁量表、汉密尔顿焦虑量表、杨氏躁狂量表、贝克自杀意念量表以及 32 项轻躁狂症状清单对受试者进行评估。所有受试者均采集在言语流畅性任务下的 fNIRS 数据。对 fNIRS 数据进行预处理, 对预处理后的 fNIRS 数据提取各通道平均氧合血红蛋白浓度 (Oxy-Hb)。通过 SPSS26.0 比较三组间 fNIRS 平均 Oxy-Hb 浓度的差异, 并分析 FAA、fNIRS 平均 Oxy-Hb

浓度与 HAMD-17、HAMA、BSS 评分的相关性。

结果 比较各通道平均 Oxy-Hb 浓度变化, UD 组、BD 组在 Broca 脑区、背外侧前额叶区和额极区所在通道的平均 Oxy-Hb 均小于 HC 组 ($P<0.05$); 在背外侧前额叶区 (通道 17、通道 20) UD 组与 BD 组平均 Oxy-Hb 存在统计学差异 ($P<0.05$)。比较前额叶脑区平均 Oxy-Hb 浓度变化, UD 组、BD 组平均 Oxy-Hb 均小于 HC 组 ($P<0.05$)。在 UD 组, Broca 区通道 (3、5、49) 平均 Oxy-Hb 浓度与 HAMA 评分呈正相关 ($P<0.05$)。

结论 fNIRS 的 Oxy-Hb 指标有助于单/双相抑郁的鉴别, 背外侧前额叶可能是单/双相抑郁鉴别的重要脑区。单/双相抑郁前额叶的活跃程度均减低, 提示前额叶可能参与了单/双相抑郁的发病机制。单相抑郁患者 Broca 区的血流动力学变化与焦虑程度有一定的相关性。

Mapping The Involvement of Vitamin B12 in The Development of Affective Disorders Through Peripheral and Central Pathways

Chenyue Xu Lingzhuo Kong Shaohua Hu Jianbo Lai*
Department of Psychiatry, the First Affiliated Hospital,
Zhejiang University School of Medicine

Objective Affective disorders are attention-gathering for the contribution to global burden of disease. To date, accumulating evidence concluded from previous research has indicated the effect of Vitamin B12 (VitB12) on affective disorders. However, to which extent does this molecule affect the brain function, as well as the underlying mechanisms require further elucidation

Methods A comprehensive search of literature registries was conducted for studies focusing on VitB12 and affective disorders and published between January 1st, 1969 and June 1st, 2024

Results The involvement of VitB12 in the peripheral mainly refers to blood circulation, while the

GBA-related mechanisms make up the majority of central pathways. Deficits of VitB12 lead to accumulation of homocysteine, which substantially results in emotional and behavioral abnormalities. VitB12 is also engaged in synapsis plasticity, neuron stability, and neuroinflammation through regulation of several bioactive factors. The above interactions in turn alleviate damage of the hippocampus and the blood-brain barrier, reduce reactive oxygen, and substantially increase the structural and functional connectivity of the brain, which eventually contributes to resilience of affective disorders. It is also released that both diet- and microbiota-derived VitB12 compose gut homeostasis. In the gut lumen, VitB12 maintains the stability of gut microbiota, promotes the production of short-chain fatty acids (SCFAs), as well as provides the metabolism of neurotransmitters such as serotonin and dopamine with S-adenosyl-l-methionine (S-AdoMet). SCFAs, S-AdoMet, as well as VitB12 itself, are involved in the stabilization of gut microenvironment, protection of the gut-blood barrier, and prevention of neuroinflammation, eventually reducing the susceptibility of affective disorders

Conclusion It is speculated that VitB12 is involved in the pathophysiology of affective disorders as a potential linkage rather than a modulator with fully-explored mechanisms

关键词: Vitamin B12; Peripheral circulation; Gut-brain axis; Affective disorders

不同性别首发未用药精神分裂症患者血清 VEGF 水平与临床症状的相关性

陈鹏 朱宏亮 张晓斌 惠李*
苏州市广济医院

目的 探讨不同性别首发未服药精神分裂症患者血清血管内皮生长因子(vascular endothelial growth factor,VEGF)水平及其与临床症状的相关性。

方法 纳入 2016 年 1 月至 2019 年 10 月就诊的首发未服药精神分裂症患者 81 例(患者组,男 41 例,女 40 例),健康对照 64 名(对照组,男

40 例,女 24 例)。血清 VEGF 水平采用流式

多重蛋白分析技术(cytometric bead array,CBA)测定;使用阳性与阴性症状量表(positive and negative syndrome scale,PANSS)评定患者相关临床症状。采用 SPSS 22.0 进行统计分析。组间比较采用独立样本 t 检验、非参数检验,VEGF 与临床变量关系采用 Pearson 相关分析和 Spearman 相关分析。

结果 患者组血清 VEGF 水平明显低于对照组 [148.08 (75.89,208.61)pg / mL,179.94(99.14,318.41)pg / mL,Z= -2.20,P= 0.028];男性患者的 PANSS 总分 [(82.71±17.30)分,(73.45±16.36)分,t= 2.473,P= 0.016]和认知分[(7.88±3.36)分,(6.23±2.81)分,t= 2.402,P= 0.019]均高于女性患者。患者组 VEGF 水平与 PANSS 阴性症状评分呈负相关(r=-0.228,P= 0.041),男性患者组 VEGF 水平和认知评分呈负相关(r= -0.425,P= 0.007)。

结论 首发精神分裂症患者血清 VEGF 水平下降,并影响其阴性症状。男性首发精神分裂症患者血清 VEGF 可能对其认知功能有一定影响。

Genome-wide Association Analysis of Gut Microbiome in Major Depressive Disorder: Associations with Mitochondrial DNA Variants

Zaiquan Dong¹, Xuan Guan², Xiaoling Shen¹, Yanni Hao¹, Jianmin Chen²

1.Mental health center, West China Hospital, Sichuan University

2.Chengdu medical college

Objective To explore the interaction between gut microbiota disturbances and impaired mitochondrial function in the development of major depressive disorder (MDD)

Methods We used shotgun metagenomic sequencing to explore fecal microbiome based on 63 MDD patients and 30 healthy controls (HCs). Then we performed GWAS for the discriminative taxonomic features of gut microbiota to identify genetic associations between gut microbiome and mitochondrial DNA (mtDNA) in MDD

Results Characteristic gut microbiome-based features, including significant differences in gut microbiota composition and 101 differentially enriched gut microbial species, were found in MDD vs HCs groups. 68 mitochondrial single-nucleotide polymorphisms (mtSNPs) shared between the two groups were identified with a GWAS significance of $P < 5 \times 10^{-6}$. The genetic variants and their associated gut microbes were mapped to mitochondrial genome, most of which were located in coding regions, including MT-ND, MT-ND4L, MT-ND5, MT-ND6; MT-CO, MT-CO3; MT-RNR, MT-RNR, and MT-TE. Manhatan plots showed 9 mtSNPs in MDD group and 10 mtSNPs in HCs group were associated with 20 gut microbial species at a significance of $-\log_{10}(p) > 20$. Furthermore, Sankey diagram was used to visualize the relationships of gut microbiota and mitochondrial DNA (mtDNA). 36 mtSNPs ($-\log_{10}(p) > 5$) were shown to be associated with 54 gut microbes in crosslinked patterns

Conclusion The current findings provide substantial evidence that complex interactions between gut microbiota and mtDNA contribute to MDD, which enables a better understanding of MDD pathogenesis and suggests new leads for future investigations.

抑郁障碍、双相抑郁客观睡眠特征及心率变异性对诊断的影响

吴雪飞¹ 寻广磊¹ 寻广磊²

1. 山东大学附属山东省精神卫生中心

2. 中华医学会精神医学分会生物精神病学组

目的 本研究利用心肺耦合分析技术对抑郁障碍及双相抑郁患者的客观睡眠状况及心率变异性进行分析, 挖掘对双相抑郁患者诊断具有独特贡献的关键因子, 从而为临床上更为精准的诊断与鉴别诊断提供有力的科学依据。

方法 分别纳入符合 ICD-10 诊断标准的抑郁

障碍及双相抑郁患者, 本研究统计收集人口学资料及临床资料和汉密尔顿抑郁量表(HAMD-24), 并用心肺耦合分析(CPC)技术, 监测患者的客观睡眠质量以及心率变异性(HRV)。

结果 本研究共纳入抑郁症患者 263 例、双相抑郁患者 228 例。两种疾病患者在一般人口学方面不存在显著差异。单相抑郁患者家族史阳性率明显低于双相抑郁患者, 单相抑郁患者总病程时间明显短于双相抑郁患者(见表 1)。单相抑郁患者在总睡眠时间、睡眠效率方面显著高于双相抑郁障碍患者, 在觉醒次数方面显著低于双相抑郁障碍患者(见表 2)。单相抑郁患者在总的 R-R 间期标准差(SDNN)、RR 间期平均值标准差(SDANN)、相邻 RR 间期的均方根(RMSSD)、低频功率(LF)、高频功率(HF)方面均显著高于双相抑郁障碍患者(见表 3、4)。以是否为双相抑郁为因变量, 单变量分析中有差异的因子为自变量, 采用二元 Logistic 分层回归分析, 结果显示家族史、总病程与双相抑郁显著相关, RR 间期标准差、RR 间期平均值标准差是双相抑郁的独立危险因素(见表 5)。

结论 1. 双相抑郁患者在家族史阳性率、总病程方面较单相抑郁更突出。2. 单相和双相抑郁在客观睡眠质量上表现出不同的模式。3. 双相抑郁患者心率变异性改变较单相抑郁患者明显。4. 单相抑郁与双相抑郁之间存在交感神经活动强度的差异。

Ethylene Oxide Exposure, Inflammatory Indicators, and Depressive Symptoms: A Cross-sectional Study and Mediation Analysis

Dongru Du¹, Zaiquan Dong²

1. West China School of Medicine, Sichuan University

2. West China Hospital, Sichuan University

Objective Ethylene oxide (EO) is a volatile compound positively correlated with respiratory and cardiovascular diseases. Currently, evidence suggests that environmental exposure may contribute to depressive symptoms. This study evaluated the correlation between EO exposure and depressive symptoms and investigated

whether inflammatory indicators had a mediation effect on the correlation

Methods Patients were enrolled from the National Health and Nutrition Examination Survey during 2013–2016, and 2,801 (49.40% male and 50.60% female) participants were ultimately included. EO exposure was measured via hemoglobin-EO adduct (HbEO) concentration due to its long half-life, which was log₂-transformed. Depressive symptoms were assessed using the Patient Health Questionnaire-9. Multivariable logistic regression analysis was performed to identify any correlations before and after covariate adjustment. Sensitivity analysis, subgroup analyses and interaction tests were performed to further evaluate identified correlations. Mediation analysis was conducted to reveal whether certain inflammatory indicators mediated the correlation

Results A positive correlation was observed between EO exposure and depressive symptoms (odds ratio [OR]: 1.426, 95% confidence interval [CI]: 1.299, 1.566), which remained stable after covariate adjustment (OR: 1.301, 95% CI: 1.140, 1.484). The interaction test revealed that sex ($p < 0.001$) and the poverty-to-income ratio ($p = 0.050$) significantly contributed to the correlation. In the causal mediation analysis, the white blood cell ($p = 0.022$) and neutrophil counts ($p = 0.010$) exerted a mediating effect, comprising 15.6% and 14%, respectively

Conclusion A higher degree of EO exposure increases the risk of depressive symptoms, where the WBC and neutrophil counts exert a significant mediating effect. Further prospective studies are required to confirm these findings.

以日间过度嗜睡为主诉的青少年抑郁 1 例并文献分析

吴雪飞 胡顺鹏* 胡诗琪 刘宏丽 刘方方
山东省精神卫生中心

目的 报告以日间过度嗜睡(EDS)为主诉的青少年抑郁 1 例,并复习相关文献,探讨日间过度嗜睡与青少年抑郁之间的关联性和可能的作用机制。

方法 报告所诊治的以日间过度嗜睡为主诉的青少年抑郁病例 1 例,分析其临床表现,结合现有的医学文献和研究成果,探讨导致青少年抑郁患者出现日间过度嗜睡症状的可能原因,为今后的诊治提供思路。

结果 本例失眠患者的多导睡眠监测(PSG)结果为睡眠潜伏期延长,觉醒次数增多,睡眠结构异常,1期及REM期睡眠比例增多,2期、3期睡眠比例减少,睡眠效率下降。多次睡眠潜伏期试验(MSLT)结果为5次小睡中有3次进入睡眠,平均睡眠潜伏时间均值10.6分钟,无起始REM睡眠(SOREMP)。心理测验结果为宗氏抑郁自评量表(SDS)显示重度抑郁,宗氏焦虑自评量表(SAS)显示重度焦虑。住院期间予抗抑郁药物、心理治疗等治疗,同时督促患者保持规律的作息时间和适当参加体育锻炼和社交活动。患者日间嗜睡症状明显好转,夜间睡眠质量改善,抑郁情绪减轻。

结论 青少年抑郁障碍患者的日间过度嗜睡症状较为常见。与日间过度嗜睡发生可能相关的因素包括学业压力、家庭环境、体质指数的升高、抑郁病情的加重、各种原因导致的昼夜节律紊乱等。考虑到日间嗜睡对患者预后的负面影响,应对该亚类人群进行定期评估、适当干预和临床管理。

经颅电刺激技术在精神疾病治疗中的新进展: tACS 的临床应用

苑佳玉*

天津市安定医院

背景 在精神疾病的治疗领域,尽管药物治疗和心理治疗构成了当前治疗策略的基石,但它们在应对复杂病理机制和个体差异时,仍面临着一定的治疗瓶颈。许多精神和神经疾病可以被视为振荡病,这是由于大脑网络振荡发生了病理性变化。目前无创性脑刺激技术因其对脑网络动力学和行为的潜在影响而被广泛应用于实验和临床领域。近年来,特

别是经颅交流电刺激 (tACS), 因其潜在的疗效和较少的副作用, 成为研究的热点。

目的 本文旨在综述 tACS 技术在精神疾病治疗中的新进展, 探讨其临床应用的潜力和挑战。

方法 通过文献回顾, 我们分析了 tACS 在治疗抑郁症、焦虑症、精神分裂症、慢性失眠等精神疾病中的研究进展。我们特别关注了 tACS 的机制、刺激参数、治疗频率和持续时间, 以及临床试验的结果。

结果 研究表明, tACS 能够通过调节大脑的振荡活动来影响神经网络的功能。在抑郁症治疗中, tACS 显示出改善情绪和睡眠质量的潜力。对于焦虑症患者, tACS 的应用可能有助于减少焦虑症状。此外, tACS 在精神分裂症的治疗中也显示出一定的疗效, 尤其是在改善认知功能方面。

讨论 tACS 作为一种新兴的治疗手段, 其临床应用前景广阔。然而, 目前的研究仍存在一些问题, 如个体差异、治疗参数的标准化、长期疗效和安全性等。未来的研究需要进一步优化 tACS 的治疗方案, 并进行大规模的随机对照试验来验证其疗效和安全性。

结论 tACS 作为一种非侵入性脑刺激技术, 在精神疾病治疗中展现出巨大的潜力。随着技术的不断进步和研究的深入, tACS 有望成为精神疾病治疗的重要补充, 为患者提供更多的治疗选择。

伴有焦虑症状双相抑郁患者认知功能损害与 GRIN2B 基因启动子区 DNA 甲基化的相关性研究

余浩 邹韶红* 肖玉新 李丛丛 唐潇潇
新疆维吾尔自治区人民医院

目的 探索伴有焦虑症状双相抑郁患者认知功能与 N-甲基-D-天冬氨酸受体 2B 亚基 (Glutamate ionotropic receptor NMDA type subunit 2B, GRIN2B) 基因启动子区各 CpG 位点甲基化水平的相关性。

方法 根据汉密尔顿焦虑量表 (14-item Hamilton anxiety rating scale, HAMA) 评分将 31 名双相抑郁患者分为有焦虑症状组 15 例, 无焦虑症状组 16

例。同期选取 16 名健康对照。采用蒙特利尔认知评估量表 (Montreal Cognitive Assessment, MoCA)、数值广度测验 (Digital Span Test, DST)、连线测试 A 部分 (Trail making test A, TMT-A)、斯特鲁普色词测验 (Stroop Color and Word Test, SCWT) 评估三组认知功能, 采用 Massarray 质谱法检测所有受试者外周血 GRIN2B 基因启动子区各 CpG 位点的 DNA 甲基化水平。

结果 三组 GRIN2B 基因启动子区 DNA 甲基化水平差异性位点为 CpG3、CpG5、CpG7、CpG10、CpG12 ($P < 0.05$); 其中 CpG12 甲基化水平, 焦虑组 ($36.23\% \pm 16.41\%$) 低于非焦虑组 ($50.20\% \pm 19.79\%$)。偏相关分析示, 命名能力与 GRIN2B 基因 CpG4 高甲基化水平相关 ($r = 0.670, P = 0.034$), 执行功能与 CpG6 高甲基化水平呈相关 ($r = 0.926, P < 0.001$), 注意力与 GRIN2B 基因 CpG8 低甲基化水平相关 ($r = -0.810, P < 0.05$), 言语记忆与 CpG9 低甲基化水平相关 ($r = -0.810, P < 0.001$), 抽象能力与 CpG10 低甲基化水平相关 ($r = -0.756, P = 0.011$)。

结论 GRIN2B 基因启动子区 DNA 甲基化水平与双相抑郁患者认知功能损害及焦虑症状的产生有关联。

双相抑郁患者失眠相关执行功能损害与 NR2B 基因启动子区甲基化水平的关系

余浩 邹韶红* 李迎帅 张龙渊 吴瑶 王丞基 李丛丛
新疆维吾尔自治区人民医院

目的 探讨 N-甲基-D-天冬氨酸受体 2B 亚基 (N-methyl-D-aspartate receptor 2B subunit, NR2B) 基因启动子区甲基化水平与双相抑郁患者失眠相关执行功能损害的相关性。

方法 选取我院双相抑郁患者 31 例及健康对照 16 例, 采用斯特鲁普色词测验 (Stroop Color and Word Test, SCWT) 测定所有受试者的执行功能; 同时测定所有受试者外周静脉血 NR2B 基因启动子区

各 CpG 位点的甲基化水平, 采用偏相关分析 NR2B 基因启动子区各位点甲基化水平与双相抑郁患者失眠相关执行功能损害的相关性以及采用二元 Logistics 回归分析其与双相抑郁患者失眠症状的关联。

结果 NR2B 基因启动子区 CpG10 甲基化水平与 SWCT 单词及颜色个数呈中度正相关($r=0.569$, $P<0.05$), 且 CpG6 甲基化水平与 SWCT 色词个数呈中度正相关($r=0.558$, $P<0.05$)。高汉密尔顿抑郁量表评分($P=0.034$, $OR=0.729$, $95\%CI: 0.544\sim 0.976$) 和位点 CpG9 的高甲基化水平($P=0.028$, $OR=0.814$, $95\%CI: 0.677\sim 0.978$) 为双相抑郁患者失眠症状的危险因素($P<0.05$)。

结论 NR2B 基因启动子区甲基化水平异常可能介导双相抑郁患者失眠症状的产生并与失眠相关执行功能受损有关。

C-reactive Protein Mediates The Correlation between Ambient Particulate Matters and Lipid Levels Among Patients with Depression

Tianqin Xie^{1,2,3}, Jijia Zhang^{1,2,3}, Shukun Zhu^{1,2,3,4}, Peng Zhu⁵, Daomin Zhu^{1,2,3,4}

1.Department of Sleep Disorders, Affiliated Psychological Hospital of Anhui Medical University

2.Anhui Mental Health Center

3.Hefei Fourth People's Hospital

4.The School of Mental Health and Psychological Sciences, Anhui Medical University

5.Department of Maternal, Child & Adolescent Health, School of Public Health, Anhui Medical University

Objective Lipid profile disturbances are frequently observed in depressive disorder and constitute to high mortality rates. Recent studies have linked ambient air pollution to blood lipid levels. However, no studies have investigated the relationship between ambient air pollution exposure and lipid levels in depressed patients, and the biological mechanism underlying the

associations remains unclear. An increasing body of evidence demonstrates a close interplay between inflammatory factors and lipoprotein metabolism. We therefore investigated the association of long-term exposure to particles with diameters $\leq 2.5 \mu\text{m}$ and $\leq 10 \mu\text{m}$ (PM2.5 and PM10) with blood lipid levels and C-reactive protein (CRP), a sensitive marker of systemic inflammation, in depressed patients

Methods A total of 538 patients with depression who were hospitalized at the Fourth People's Hospital of Hefei between June 2017 and December 2021 were included. We estimated ambient particulate matters exposure, including PM2.5 and PM10, using a satellite-based spatiotemporal model at a resolution of 1 km². Individual serum levels of cholesterol (TC), triglycerides (TG), high-density lipoprotein cholesterol (HDL-C), and C-reactive protein (CRP) were measured. The association between ambient particulate matters and lipid levels and CRP was examined using multiple linear regression models, adjusted for potential confounders. Moreover, we performed a mediation analysis to estimate the direct effects of ambient particulate matters exposure on lipid levels and any indirect effects through CRP. Model adjusted for age, sex, educational level, family income, employment, smoking status, drinking status, physical activity, season of visit

Results We observed that exposure to PM2.5 and PM10 were all positively associated with TC and CRP and negatively associated with HDL-C. Each interquartile range (IQR) increment of 12-month average PM2.5 was associated with 4.6% [95% confidence interval (CI): 1.5%–7.7%] and 27.7% (95%CI: 9.4%–46.1%) increment in TC and CRP, and 4.5% (95%CI: 0.8%–8.3%) decrease in HDL-C. And each interquartile range (IQR) increment of 12-month average PM10 was associated with 4.6% [95% confidence interval (CI): 2.0%–7.2%] and 24.9% (95%CI: 9.4%–40.4%) increment in TC and CRP, and 4.2% (95%CI: 1.0%–7.3%) decrease in HDL-C. On mediation analysis, CRP mediated the relationship between PM2.5, PM10 exposure and TC, the mediating effect proportion were 17.80% and 14.93%, respectively. Meanwhile, the association between PM2.5, PM10 exposure and HDL-C was also

significantly mediated by CRP, the mediating effect proportion were 15.14% and 13.61%, respectively

Conclusion Our study suggests that long-term PM_{2.5} and PM₁₀ exposure had significantly adverse effects on blood lipid levels in depressed patients. And CRP may play an important role in mediating effects of ambient particulate matters exposure on blood lipid levels

关键词: Air pollution exposure, PM_{2.5}, PM₁₀, Depression, Lipid levels, C-reactive protein

Genetic Relationships and Biological Pathways Underlying Suicidality and Comorbid Mental Disorders

Yunqi Qiang^{1,2}, Qiang Wang¹

1. West China Hospital, Sichuan University

2. Broad Institute of MIT and Harvard

Objective The close relationships between mental disorders and suicidality are frequently seen in epidemiology. One potential explanation lies in shared genetic liabilities, hence we aimed to investigate the phenotypic and genetic associations between multiple mental disorders and different levels of suicidality

Methods Using UK Biobank (UKB) raw data for European population, we first evaluated the phenotypic and polygenic relationships between 12 mental disorders and gradient scales of suicidality (spanning suicidal ideation, suicide attempts, and suicidal death). Second, we used existing genome-wide association study (GWAS) summary statistics to estimate genetic correlations and to identify pleiotropic gene using a combination of statistical genetics tools. Summary statistics were accessed from Psychiatric Genomics Consortium (major depressive disorder [MDD], bipolar disorder [BD], anxiety disorders [ANX], obsessive-compulsive disorder [OCD], anorexia nervosa [AN], autism spectrum disorder [ASD], attention deficit hyperactivity disorder [ADHD], schizophrenia [SCZ], cannabis use disorder [CUD], and post-traumatic stress disorder

[PTSD]), Million Veterans Program (alcohol use disorder [AUD] and opioid use disorder [OUD]), or their joint analysis. Third, using shared genetic liabilities as instrument, we further explored possible causal relationship between mental disorders and suicidality by structural equation models (SEM) or Mendelian randomizations (MR). Last, we accessed All of Us (AoU) diverse cohort data for replication in other non-European populations

Results For UKB, 150,861 eligible individuals (58% females) were retained after standard GWAS quality control. Eight out 12 mental disorders (MDD, BD, ANX, AUD, OCD, AN, ASD and ADHD) showed both significant phenotypic and polygenic correlations with gradient suicidality (false discovery rate <0.05). Among them, the impact of MDD and BD on suicidality were the most obvious (for MDD: OR=5.78 and 1.26 at phenotypic or polygenic level; for BD: OR=12.98 and 1.14 at phenotypic or polygenic level). Using GWAS summary statistics, we also observed positive global and regional genetic correlations between those 12 mental disorders and suicidality (rg ranging from 0.25 (1 locus) to 0.68 (254 loci), $p < 0.001$). Across pairs of suicidality and other mental disorders, we identified 71 functional genes shared by two or more pairs. Twenty-seven of these genes were prioritized based on brain tissue expression, single-cell types, the GWAS Catalog, protein-level and drug-gene association, including novel genes associated with suicidality, such as BPTF, BTN3A2, and YPEL3. These genes were significantly enriched in 8 Gene Ontology sets like developmental process and regulation of biological process, and one KEGG pathway alcoholism. Causal models revealed nominate causality from genetic diatheses of MDD, BD, AUD, ADHD, ASD (two sample and multivariable MR and SEM) to risk of suicidality. A few of these cross-phenotype associations with suicidality were also replicated in AoU African and Asian populations (e.g., $p < 0.05$ for MDD and BD polygenic associations)

Conclusion This study underscores the urgent need to address the shared genetic architecture of suicidality and its related mental conditions. The combination of longitudinal population-level biobanks and disease-ascertained GWAS data are warranted to further

enhance our understanding of this complex phenomenon. Our research findings will guide future suicide prevention among individuals with or without major mental disorders

慢性精神分裂症患者的述情障碍在童年创伤和阴性症状之间的中介作用

冯振宁 卢瑶 刘逸飞 李洁*

天津市安定医院

目的 本研究旨在探讨慢性精神分裂症患者童年创伤与阴性症状之间的关系,并考虑述情障碍在其中扮演重要的中介作用。

方法 选自2022年6月至2023年3月于天津市安定医院住院的94名慢性精神分裂症患者(符合精神分裂症的DSM-5诊断标准;病程 ≥ 1 年;接受稳定剂量的抗精神病药物治疗 > 6 个月。),采用童年创伤问卷(CTQ)来评估患者在成长过程中是否经历过创伤性事件,阳性和阴性症状量表(PANSS)来评定患者的精神病理症状,多伦多述情障碍量表(TAS-20)对于患者述情障碍程度进行评估。应用SPSS 27进行统计分析,运用Pearson相关性分析来检验CTQ量表与TAS-20和PANSS的相关性,结构方程模型来检验假设的中介模型。

结果 超过70.1%的参与者报告曾经历过童年创伤。其中,情感忽略分数的平均值最高(12.43 ± 4.84),躯体忽略的发生率最高(61.17%, $n=58$)。我们发现,在慢性精神分裂症患者中,CTQ的总分与PANSS的阴性分相关($r=0.30, p=0.003$)。分量表中躯体虐待($r=0.27, p=0.009$)和躯体忽略($r=0.29, p=0.005$)与阴性症状程度存在显著相关。述情障碍程度越高,阴性症状越严重($r=0.35, p=0.001$)分量表中情感辨别障碍 DIF($r=0.31, p=0.002$)、情感表达障碍 DDF($r=0.25, p=0.016$)、外向型思维 EOT($r=0.27, p=0.010$)均与阴性症状表现出明显的相关性。童年创伤程度越高,述情障碍程度越高($r=0.30, p=0.004$),其中,情感虐待($r=0.30, p=0.003$)、躯体虐待($r=0.30, p=0.004$)、性虐待($r=0.30, p=0.003$)与阴性分存在明显正相关。

进一步的中介效应分析显示,情感辨别障碍(95%CI [0.001, 0.085])和外向型思维(95%CI [0.001, 0.060])在童年创伤对阴性症状产生影响时起到中介作用。

结论 慢性精神分裂症患者的童年创伤与阴性症状严重程度呈正相关,述情障碍在童年创伤与阴性症状之间起到中介作用。这一中介作用的发现为探索童年创伤对精神分裂症阴性症状的影响提供了新的视角。

关键词: 精神分裂症 阴性症状 童年创伤 述情障碍 中介效应

Effects of MC1R and BIN1 Gene Polymorphisms on Chinese Patients with Alzheimer's Disease and Mild Cognitive Impairment

Xiaoyue Li*

Department of Psychiatry, Fourth People's Hospital in Wuhu

Objective Alzheimer's disease (AD) and Mild cognitive impairment (MCI) are complex diseases influenced by genetic polymorphisms. The most recognized genetic polymorphism is currently the APOE $\epsilon 4$ allele. In recent years, MC1R and BIN1 have been shown to be involved in the formation of pathological substances in neurodegenerative diseases. Therefore, the main objective of this study was to investigate whether MC1R and BIN1 polymorphic genes are associated with the development of AD and MCI and the synergistic role of these two genes in the disease with APOE

Methods A total of 134 AD patients (57 males), 416 MCI patients (180 males) and 509 healthy controls (249 males) were collected. Statistical analysis was performed using SPSS 24.0 and State software

Results Logistic regression analysis showed that APOE $\epsilon 4$ is a risk factor for AD, and the BIN1rs7561528 G allele reduces the risk of AD by a factor of 0.22. In addition, in patients with MCI, the MC1Rrs2228479 AG genotype and BIN1 rs7561528 GG genotype interacted between APOE $\epsilon 4$, respectively

Conclusion Our study found that the BIN1rs7561528 GG genotype has the highest risk of

MCI. The MC1R gene and BIN1 gene in MCI patients have close interaction with the APOEε4 gene. The rs7561528 G allele is a protective gene for AD

关键词: MC1R, BIN1, APOE, Alzheimer's disease, mild cognitive impairment, interaction

母子同步运动训练对青少年抑郁症的影响

刘攀琪 陈海滔 沈晴 袁纯钰 朱天怡 胡燕楠 熊源露 谭淑平*
北京回龙观医院

目的 探索母子同步运动是否可以改善母子间同步, 以及母子间同步的改善是否能对青少年情绪调节以及抑郁症状产生影响。

方法 采用随机对照实验方法, 干预组在常规治疗外, 需同时完成为期 8 周的母子同步运动治疗, 对照组只维持常规治疗。治疗结束前后时间点要求干预组和对照组在脑电数据收集的同时完成情绪调节实验(要求受试者根据负性观看、负性重评和中性观看条件对给出的图片进行情绪评分)和合作竞争实验(要求受试母子对在完成合作/竞争条件下完成操控海豚接球)以及在干预治疗前后时间点完成临床评估。

结果 干预组在干预治疗后母子间合作成功率高于干预治疗前, 对照组干预治疗后时间点母子间合作成功率低于治疗前。干预组治疗后负性观看条件下情绪评分低于干预治疗前。干预组治疗后汉密尔顿抑郁量表得分低于干预治疗前, 对照组前后无明显变化。脑电结果 Theta 频段额顶叶脑区在合作刺激后 550-850ms 表现出, 干预组干预治疗后母子间大脑同步较干预治疗前有升高趋势, 而对照组母子间大脑同步则表现出干预治疗后时间点小于干预治疗前的趋势。干预组中母子行为同步变化与脑间同步变化存在正相关。全部受试者母子同步变化与青少年情绪调节变化之间存在正相关。

结论 母子同步运动可以增加母子的行为同步以及脑间同步, 母子间同步的变化影响青少年情绪调节。通过改善抑郁症青少年母子间同步可能会改善抑郁症青少年的抑郁症状。

小剂量喹硫平缓解伴发焦虑抑郁症状的迟发性运动障碍 1 例

薛坚* 吴美娟 郭宝
国药同煤三医院

目的 报道一例以小剂量喹硫平缓解焦虑抑郁患者共病迟发性运动障碍, 迟发性运动障碍症状未加重且得到缓解的病例。

方法 选取一例 84 岁汉族女性患者, 详细采集患者的现病史、用药史、既往史, 进行体格检查、精神检查, 记录患者入院前后的辅助检查、检验结果、诊治经过及患者的病情变化。

结果 本文报道的女性患者, 因情绪低落、精力差、睡眠障碍不规律口服“氟哌噻吨美利曲辛片”5 年后出现迟发性运动障碍, 减停药物后, 再发焦虑抑郁情绪, 且 TD 症状进行性加重, 就诊于某三甲综合医院, 诊断为重度抑郁发作、迟发性运动障碍, 予以“氯硝西泮、盐酸丁螺环酮、盐酸舍曲林”治疗后 TD 症状进一步加重。本次住院后经给予“富马酸喹硫平缓释片 50mg/晚、劳拉西泮 0.5mg/午、晚”治疗后, 焦虑抑郁情绪明显改善, HAMA 评分由 34 分降至 7 分, HAMD 评分由 46 分降至 6 分, 且 TD 症状未再加重, 腹部肌肉不自主收缩明显缓解, AIMS 评分由 26 分降至 5 分。

结论 TD 是由于长期服用多巴胺受体阻滞剂引起的多动性运动障碍, 年龄较大的女性和患有脑器质性疾病是 TD 的最重要危险因素。据报道, 67%~89%的 TD 患者出现不自主运动障碍症状后不可逆, 随着病情进展, 致残率较高, 从而导致生活质量严重下降。本例高龄女性患者因长期服用使用氟哌噻吨美利曲辛改善情绪、睡眠后出现 TD, 停药后 TD 症状加重, 导致焦虑、抑郁情绪进一步加重。小剂量喹硫平可以改善焦虑抑郁情绪、提升患者睡眠质量的同时, 进一步缓解 TD 症状。

关键词: 喹硫平, 焦虑, 抑郁, 迟发性运动障碍

抑郁症患者 SSRI 类抗抑郁药早期起效的电生理预测指标

汤浩¹ 夏逸¹ 王晓芹¹ 卢青² 姚志剑¹

1.南京医科大学附属脑科医院心境障碍科

2.东南大学生物科学与医学工程学院

目的 精神运动性阻滞是抑郁症的重要症状之一,包括运动控制和认知过程的异常。既往研究发现运动网络 beta 频段活动与精神运动性阻滞症状密切相关。精神运动性阻滞会随着抑郁发作次数的增加而加重,并可能导致对抗抑郁药反应不佳。然而,治疗反应和精神运动性阻滞之间的神经病理学关系仍不明确。

方法 93 名抑郁症患者和 49 名健康对照者招募入组,所有受试者经临床评估后接受脑磁图任务态扫描,执行简单的右手视觉运动任务。抑郁症患者接受 SSRI 类单药治疗,以基线和治疗 2 周作为评估节点。6 项汉密尔顿抑郁量表(6-item Hamilton Depression Rating Scale, HAMD-6)减分率大于 50%被认定为治疗有效。计算运动相关的 beta 去同步化(movement-related beta reduction, MRBD)和双侧运动网络(motor network, MN)半球间和半球内的功能连接,并在健康对照组、治疗有效组和治疗无效组间进行组间比较。组间有统计学差异的电生理指标与 HAMD-6 的减分率进行相关分析。

结果 相对于治疗有效组和健康对照者,治疗无效组在执行任务时运动网络的 MRBD 增加, beta 频段半球间和半球内的功能连接减少。线性判别分析显示左侧运动皮层 MRBD 和左右运动皮层间功能连接可以有效区分有效组和无效组,准确率为 77.4%(灵敏度 82.6%,特异度 72.3%),相应的 ROC 曲线下面积为 0.843。

结论 运动网络的局部活动和功能连接异常代表精神运动性阻滞症状明显,可能导致抑郁症患者对 SSRI 的早期应答率下降。这为抑郁症精神运动症状与抗抑郁药反应之间的相关性提供了电生理依据,对预测抗抑郁药的早期起效具有潜在价值,并有助于识别 SSRI 疗效不佳而应接受联合或替代治疗的患者亚群。

抗衰老蛋白 Klotho 通过上调 NMDAR-GluN2B 突触膜表达调控精神分裂症模型大

鼠的认知功能及突触可塑性损害

占瑾琼 李逸恒 黄洋 廖丹 罗骞 张晶 杨远坚*
江西省精神病院

目的 认知障碍是精神分裂症的独立核心症状,对临床疗效和愈后有重要影响,但其病理机制不甚清楚,且缺乏有效治疗手段。NMDA 受体功能减退是精神分裂症认知障碍的关键病理基础,同时也是衰老相关认知障碍发生的重要机制。Klotho 蛋白是一种著名的衰老抑制蛋白,参与了 NMDA 受体的功能调节过程。但目前对 Klotho 在精神疾病中的作用还知之甚少,本研究拟探讨 klotho 对精神分裂症模型大鼠突触可塑性和认知功能障碍的影响。

方法 幼鼠出生的第 7-11 天连续 5 天,每天 2 次,皮下注射 MK-801 (0.1mg/kg)构建精神分裂症模型大鼠; Morris 水迷宫和条件恐惧实验用于检测大鼠学习及记忆能力;蛋白水平表达分析使用 Western blot;神经电生理技术记录不同组大鼠海马 LTP,并采用高尔基染色法观察神经元树突棘密度。

结果 与对照大鼠相比,精神分裂症模型大鼠海马中 klotho 蛋白的含量显著降低,通过基因过表达技术上调脑内 klotho 水平则可改善模型大鼠的认知功能及海马 LTP 的损害,并逆转树突棘密度的减少。在分子水平,我们发现 klotho 可增加精神分裂症大鼠海马区突触部位的 PSD-95 含量,并选择性地上调 NMDA 受体 GluN2B 亚基的蛋白总量及其突触膜表达水平。此外,使用特异性 GluN2B 拮抗剂 Ro 25-6981 可取消 klotho 对模型大鼠认知功能和海马 LTP 的改善作用。

结论 这些结果表明,脑内 klotho 水平的降低可能是精神分裂症相关认知障碍发生的重要分子机制,补充 klotho 可通过增加海马 NMDAR-GluN2B 的突触膜表达、改善精神分裂症大鼠认知障碍及突触损伤。

胰岛素样生长因子-2 通过调控谷氨酸受体介导早期生活应激所致的认知损伤

李逸恒 杨远坚* 占瑾琼

江西省精神病院

目的 早期生活应激(ELS)可导致认知损伤,但具体机制还不清楚。胰岛素样生长因子-2(IGF2)表达下降被证实在多种疾病,如老年痴呆,中介导了认知损伤,因此本文对 IGF2 是否介导了 ELS 所致的认知损伤进行探究。

方法 使用 SD 大鼠母婴分离模型来模拟 ELS,并利用行为学检测系统进行水迷宫,恐惧记忆等认知相关行为学检测。通过 qPCR 检测相关基因的表达水平,western blot 和免疫荧光检测目的蛋白表达水平;使用病毒注射来调控目的基因和蛋白的表达;利用电生理系统进行长时程增强(LTP)的记录。

结果 母婴分离模型大鼠认知受损,且海马脑区 IGF2 表达水平明显下降,海马脑区 LTP 受损,在母婴分离模型大鼠海马脑区过表达 IGF2 可逆转这些损伤。进一步对机制的研究发现母婴分离模型大鼠海马谷氨酸受体 2B(NR2B)膜表达水平下降,利用 NR2B 受体特异性阻断剂可阻断海马脑区过表达 IGF2 的认知改善作用,且证实 ELS 损伤的是 NR2B 介导的 LTP。

结论 ELS 可导致大鼠海马脑区 IGF2 表达下降,进而降低 NR2B 膜表达水平,导致大鼠认知损伤,海马过表达 IGF2 可逆转损伤。结果提示补充 IGF2 可作为治疗 ELS 导致的认知损伤的潜在手段。

关键词: 早期生活应激,胰岛素样生长因子-2,谷氨酸受体

mitochondria in neural circuits that govern cognitive impairment relevant to schizophrenia, and their impact on neuronal structure and function

Methods A 24-hour maternal separation (MS) rat model was utilized to simulate features associated with schizophrenia. Schizophrenia-associated behaviors and cognitive impairment were assessed using the open field test, pre-pulse inhibition, novel object recognition test, and Barnes maze test

Results Alterations in mitochondrial morphology, reduced hippocampal neuronal spine density, and impaired LTP in the CA1 region were observed. Nicotinamide (NAM) supplementation, administration of honokiol (HNK) (a SIRT3 activator), or overexpression of SIRT3 could inhibit this process. Conversely, administration of 3-TYP (a SIRT3 inhibitor), or knock down of SIRT3 expression in control rats led to deficits in behavioral and the hippocampal neuronal phenotype

Conclusion Our findings suggested a causal role for the NAD⁺/SIRT3 axis in modulating cognitive behaviors via effects on hippocampal neuronal synaptic plasticity. The NAD⁺/SIRT3 axis could be considered a promising therapeutic target for addressing cognitive-related behavioral disturbances, such as those seen in schizophrenia

关键词: schizophrenia, maternal separation, cognitive impairment, LTP, mitochondria, NAD⁺/SIRT3 axis

Cognitive Impairment Following Maternal Separation in The Rat Is Regulated by Effects of The NAD⁺/SIRT3 Axis on Hippocampal Synaptic Plasticity

Keke Hao Gaohua Wang*

Renmin Hospital of Wuhan University

Objective Maternal separation during early life can induce behaviors in adult animals that resemble those seen in schizophrenia, manifesting cognitive deficits. This may be indicative of oxidative stress linked to mitochondrial dysfunction. However, there is limited understanding of the molecular mechanisms regulating

Sex-dependent Associations of Serum BDNF, Glycolipid Metabolism and Cognitive Impairments in Parkinson's Disease with Depression: A Comprehensive Analysis

Xinxu Wang^{1,3}, Chi Zhou^{1,2}, Yanzhe Li^{1,3}, Shen Li^{1,3}

1. Institute of Mental Health, Tianjin Anding Hospital, Mental Health Center of Tianjin Medical University, Tianjin, 300222, China

2. Tongling Third People's Hospital, Tongling, 244000, China

3. Brain Assessment & Intervention Laboratory, Tianjin

Anding Hospital, Mental Health Center of Tianjin Medical University, Tianjin, 300222, China

Objective Brain-derived neurotrophic factor (BDNF) and glycolipid metabolism have been implicated in cognitive impairments and depression among Parkinson's disease (PD). However, the role of sex differences in this relationship remains elusive. This study aimed to investigate the potential sex difference in the link between serum BDNF levels, glycolipid metabolism and cognitive performance among depressive PD patients

Methods PD patients comprising 108 individuals with depression and 108 without depression were recruited for this study. Cognitive function was assessed using the Montreal Cognitive Assessment Beijing version (MOCA-BJ). The severity of depressive symptoms was assessed using the Hamilton Depression Rating Scale (HAMD-17), while motor symptoms were evaluated using the Revised Hoehn and Yahr rating scale (H-Y) and the Unified Parkinson's Disease Rating Scale Part III (UPDRS-III). Laboratory testing and enzyme-linked immunosorbent assay (ELISA) are used to measure serum levels of glycolipid metabolism and BDNF

Results Females showed superior performance in delayed recall (all $p < 0.05$), male PD patients exhibited higher scores in naming tasks compared to females in non-depression group. There was no sex difference in serum BDNF levels between depression and non-depression groups. Linear regression analysis indicated BDNF as an independent risk factor for language deficits in male PD patients with depression ($p < 0.05$), while cholesterol (CHOL) emerged as a cognitive influencing factor, particularly in delayed recall among male PD patients with depression ($p < 0.05$)

Conclusion Our study reveals extensive cognitive impairments in PD patients with depression. Moreover, BDNF and CHOL may contribute to the pathological mechanisms underlying cognitive deficits, particularly in male patients with depression

关键词: Parkinson's disease, depression, Sex differences, BDNF, cognition, glycolipid metabolism

CREB/BDNF/TrkB 通路在精神分裂症发病机制和疗效评估中的研究进展

覃炫*

武汉大学人民医院

目的 精神分裂症是一种多因素导致的精神疾病,精神分裂症有多种表现形式,大致分为以阳性症状、阴性症状和认知功能障碍。由于精神分裂症的病因和病理生理机制尚未明确,当前临床诊断主要依赖于患者及家属陈述的经历等主观证据,精神分裂症的精准诊断和治疗较为困难。因此,提出客观、特异性的生物标志物对早期精准诊疗、预后评估至关重要。诸多研究提示,神经营养因子与精神分裂症发病机制关系密切,其中脑源性神经营养因子(brain derived neurotrophic factor, BDNF)研究最为广泛。本文综述了 BDNF 通路相关因子作为生物学标志物协助精神分裂症临床诊治预后评估的研究现状。

方法 使用生物医学文献数据库 Pubmed 输入以下关键词"BDNF and schizophrenia", "BDNF and cognitive impairment" "CREB" "TrkB" (数据时间截止 2023 年 9 月 8 日)

结果 目前研究表明,在动物实验中 CREB/BDNF/TrkB 通路上调可以促进神经元增殖和存活,抗细胞凋亡,增强抗氧化酶的活性,调节线粒体能量代谢进而改善海马神经元的损伤,减轻 SZ 大鼠的认知功能障碍。临床研究表明,精神分裂症患者 BDNF 血浆水平降低,且与特定认知功能相关,包括处理速度,注意力水平,视觉学习和工作记忆。BDNF 和 GSH-Px 之间的相互作用与精神分裂症抑郁症状有关。低 BDNF 水平可以预测精神分裂症患者临床治疗无效的风险,也可导致首发未服药精神分裂症患者的阳性症状,BDNF/PI3K/AKT/CREB 通路的血清蛋白可以预测首发精神分裂症患者抑郁和冲动的行为。此外,BDNF 浓度与疾病进程也有关,慢性精神分裂症患者的 BDNF 血清、血浆浓度最高,其次是首次发病的精神分裂症患者以及高危精神状态者。

结论 BDNF 可以通过神经营养、抗凋亡、抗氧化应激,抑制自噬等机制介导神经保护作用,调控 BDNF 蛋白的表达本身就能达到治疗精神分裂症、改善患者疾病预后的作用。目前 BDNF 及相关信号

通路的血清蛋白在精神分裂症患者的认知功能、阴性症状、阳性症状、药效预测中都有一定预后评估能力, BDNF 可能成为潜在的用于纵向比对的标志物, 可预测高危风险阶段演变为精神分裂症的进展过程。

关键词: BDNF,精神分裂症,预后,疗效评估

超越还原论: 从复杂系统的视角看精神障碍

曾真*

重庆市精神卫生中心

目的 本文旨在从复杂系统的视角, 探索精神障碍的本质及其成因, 超越传统还原论的解释模式。通过引入复杂系统理论, 试图揭示精神障碍背后复杂而多维的互动关系, 以期为精神障碍的诊断、治疗及预防提供新的思路和方法。

方法 研究采用多学科交叉的方法, 包括心理学、神经科学、社会学等领域的理论和实践成果。通过文献综述等手段, 系统分析了精神障碍在个体生理、心理及社会层面的复杂互动机制。揭示了以还原论为主导研究范式的传统精神障碍研究方法的不足。重点考察了非线性动力学、网络科学和自组织理论在精神障碍研究中的应用。

结果 研究发现, 精神障碍的发生并非单一因素导致, 而是多种因素相互作用的结果。而传统精神障碍的研究几乎都是运用还原论的研究范式, 忽视了大脑的整体性及涌现性, 这也解释了为什么精神病学研究困难重重, 进展缓慢。未来, 精神障碍的研究需要引入复杂系统的研究方法, 跨越多个学科领域, 整合相关复杂交织的概念, 更全面地理解精神障碍的多维成因及其动态演化过程。通过复杂系统模型, 可以更准确地预测精神障碍的发生及发展趋势。

结论 大脑是一个典型的复杂系统。人脑由数以千亿计的神经元和突触组成, 这些神经元之间通过电化学信号进行交流和相互作用, 从而形成了复杂的结构和功能网络。从复杂系统的视角看待精神障碍, 为其研究和治疗提供了新的理论基础和实践路径。超越还原论的单一视角, 综合考虑生物、心理和社会因素的互动, 可以更有效地进行精神障碍的诊断和干预。未来的研究应进一步深化复杂系统理

论在精神障碍领域的应用, 探索更精准的个体化治疗方案, 促进精神健康的整体提升。

基于 lepR-JAK2-STAT3 通路探讨瘦素影响抑郁小鼠 5-HT2B 受体表达的作用机制

李月娥 梁路*

乌鲁木齐市第四人民医院

目的 目的 探讨瘦素通过瘦素受体 (Leptin Receptor, LepR) -蛋白酪氨酸激酶 2 (Janus kinase 2, JAK2) -信号转导和激活转录子 3 (Signal transducers and activators of transcription 3, STAT3) 通路对抑郁小鼠 5-羟色胺受体 2B (5-hydroxytryptamine receptor 2B, 5-HT2B) 受体表达的影响及其作用机制。

方法 研究方法 首先, 皮下注射皮质酮制备抑郁模型, 对小鼠进行蔗糖偏好实验、悬尾试验和强迫游泳实验来评估抑郁状态。其次, 实验分为对照组、模型组、核苷酸结合域和富含亮氨酸的重复蛋白 3 (nucleotide-binding domain and leucine-rich repeat protein 3, NLRP3) 炎症因子抑制组和瘦素干预组, 每组 6 只小鼠。采用实时荧光定量聚合酶链式反应 (Real-time Quantitative PCR, Qrt-PCR) 技术检测各组小鼠海马组织 lepR、JAK2、STAT3 和 5-HT2B 基因表达水平。

结果 结果 与对照组相比, 模型组小鼠 lepR、JAK2、STAT3 和 5-HT2B 基因表达量均显著降低。瘦素干预组小鼠 lepR、JAK2、STAT3 和 5-HT2B 基因表达量均显著高于模型组。敲除瘦素受体, 瘦素与 5-HT2B 受体表达无关联。

结论 瘦素通过 lepR-JAK2-STAT3 通路增加 5-HT2B 受体的表达。

关键词: 瘦素; 抑郁症; 5-HT2B 受体;

Impaired Myelin Integrity in Schizophrenia: A Systematic Evaluation and Meta-analysis

Ting Peng*

Nanjing Brain Hospital

Objective Schizophrenia is a serious mental illness whose etiology and pathogenesis are still unclear. Impaired myelin integrity plays an important role in the pathogenesis of schizophrenia, but there is no uniform conclusion yet. This meta-analysis aims to systematically assess impaired myelin integrity in schizophrenia patients and further explore its role in the pathogenesis of schizophrenia

Methods We conducted a systematic literature search of studies in PubMed, Web of Science, Science Direct, PsycINFO, EMBASE, and Cochrane without language or time constraints. All studies reporting myelin abnormalities in patients with schizophrenia were included. Inclusion criteria included 1) cross-sectional or longitudinal studies, 2) use of imaging or biomarkers to assess myelin integrity, and 3) provision of sufficient data for meta-analysis. Using the MOOSE guidelines, data extraction and quality assessment were performed by two independent investigators. Meta-analysis of myelin integrity metrics was performed using a random-effects model, and heterogeneity and publication bias were assessed

Results A total of nine studies were included, which were published up to June 2024 and involved a total of 926 patients with schizophrenia and 719 healthy controls. The results of the meta-analysis showed that myelin integrity was significantly lower in patients with schizophrenia than in healthy controls (standardized mean difference, SMD = -0.45; 95% confidence interval, CI = -0.34 to -0.55; $p < 0.001$). Subgroup analyses indicated that factors such as disease duration, disease severity, and treatment regimen may have an impact on myelin integrity. Heterogeneity analysis showed moderate inter-study heterogeneity ($I^2 = 68\%$). Funnel plot analysis and Egger's test results did not reveal significant publication bias

Conclusion This systematic review and meta-analysis found that there is a significant impairment of myelin integrity in schizophrenia patients, which may be closely related to the pathogenesis of schizophrenia. Future studies should further explore the specific mechanisms of impaired myelin integrity and its role in the disease process, with a view to providing new targets for

the diagnosis and treatment of schizophrenia

关键词: Schizophrenia, myelin, systematic evaluation, meta-analysis, neuroimaging, biomarkers

基于生物信息学分析探索精神分裂症和代谢综合征的关联性研究

田柳 陈春武 姚明洋 邵丽影 韩笑宇 么威 王秀珍*

沈阳市精神卫生中心

目的 精神分裂症是一种慢性精神障碍,常伴随认知功能障碍和社交能力下降,而代谢综合征则是一组代谢异常的集合,包括肥胖、高血压、高血糖和异常胆固醇水平,两者的共病可能加剧患者的临床症状和治疗难度,精神分裂症与代谢综合征的共病现象一直备受关注。本研究旨在探索精神分裂症和代谢综合征共病可能发生的生物学机制,以期为临床防治提供新的视角和策略。

方法 选取 GEO 数据库中的精神分裂症基因表达数据集 GSE27383 和代谢综合征基因表达数据集 GSE200744 进行分析,通过 R 包筛选差异表达基因,并提取两个数据集差异基因交集,通过 string 对上述差异基因集构建 PPI 网络,并通过 Cytoscape 和 Cytohubba、Mcode 插件筛选出 hub genes,并进一步通过富集分析探究差异表达基因参与的信号通路。

结果 在 GSE27383 表达数据集中筛选得到 2847 个差异表达基因,在 GSE200744 表达数据集中筛选得到 995 个差异表达基因;通过差异基因列表重叠分析,共识别出 138 个共同的差异表达基因;通过 PPI 网络构建,最终得到 9 个关键基因,包括 UBA52、RPL7L1、RPL29、SERBP1、RPL37A、CXCL8、MMP9、FLNA、BTG2 和 H2AX;差异基因富集分析显示,这些基因在多个生物学信号通路中发挥作用,如 Ion channel transport、Metabolism of RNA、Interleukin-4 and Interleukin-13 signaling、Stimulus-sensing channels、Generic Transcription Pathway、Nonsense Mediated Decay (NMD) 和 Gene expression (Transcription),其中部分关键基因和信号通路已被证实在细胞周期调控、信号传导、基因表达调控和疾病发展中起着至关重要的作用。

结论 本研究揭示了精神分裂症与代谢综合征

共病状态下的基因表达模式,揭示疾病间可能存在的分子联系,筛选的关键基因参与多个信号通路,主要参与细胞信号传导、基因表达和介导炎症反应等生物学过程,这些基因在两种疾病的发生发展过程中扮演重要角色。关键基因的发现,可为精神分裂症合并代谢综合症的防治策略的提供潜在靶点。

上调海马 CA1 区 TRPV1 表达水平可改善母婴分离引起的精神分裂症样行为异常

陈发帅 黄欢 陈诚 王惠玲*
武汉大学人民医院

目的 精神分裂症(SCH)认知功能障碍机制不明,缺乏有效干预措施。TRPV1 是神经免疫轴的关键介质,可能参与 SCH 的发生发展。本课题组发现 SCH 患者外周血 TRPV1 水平降低,后者与患者认知功能下降、海马及前额叶等脑区环路异常常相关。本研究拟进一步开展模型动物研究,探讨脑内 TRPV1 调节精神分裂症的机制,有助于阐明 SCH 环境因素致病的神经生物学机制、建立该疾病防治新策略和靶标。

方法 构建母婴分离 SCH 动物模型并于成年期进行海马 CA1 区脑立体定位注射病毒,靶向小胶质细胞 TRPV1,分别上调、敲低 TRPV1 表达水平,检测模型动物行为学、神经炎症、细胞凋亡以及突触损伤情况。

结果 1、SCH 动物模型成年期在 Y 迷宫、巴恩斯迷宫与新物体识别实验中, SCH 动物模型的认知功能明显低于 CON 的认知功能。在旷场实验中, SCH 动物模型组出现自主活动增加,在 PPI 中, SCH 动物模型出现感觉门控缺陷。2、SCH 模型动物海马组织 TRPV1 蛋白表达含量降低, CD80 蛋白表达水平升高, BCL-2 蛋白表达水平降低, BAX、Caspase3、Cleaved-caspase3 蛋白表达水平升高, PSD95、SYN 蛋白表达水平降低。3、上调 SCH 模型动物海马 CA1 区小胶质细胞 TRPV1 蛋白表达水平,改善了 SCH 模型动物类精神分裂症样行为异常,降低了炎症因子水平, BCL-2 蛋白表达水平升高, BAX、Caspase3、Cleaved-caspase3 蛋白表达水平降

低, PSD95、SYN 蛋白表达水平升高。4、敲低 SCH 模型动物海马 CA1 区小胶质细胞 TRPV1 蛋白表达水平,进一步加重了 SCH 模型动物类精神分裂症样行为异常,增加了 SCH 模型动物炎症因子水平, BCL-2 蛋白表达水平进一步升高, BAX、Caspase3、Cleaved-caspase3 蛋白表达水平进一步降低, PSD95、SYN 蛋白表达水平进一步升高。

结论 1、TRPV1 参与了母婴分离引起的精神分裂症样行为异常的机制。2、上调海马 CA1 区 TRPV1 表达水平可改善母婴分离引起的精神分裂症样行为异常。3、TRPV1 可能是精神分裂症的新的治疗靶点。

关键词:母婴分离;精神分裂症;认知功能

催产素对生命早期应激导致的同性性行为的调节作用

杜玉茹 李幼东*
河北医科大学第一医院

目的 1992 年,世界卫生组织不再将同性恋列为性心理障碍,学术层面对此类问题的关注度下降。但从临床中发现,此类人群的数量呈倍数增长,并在家庭和社会生活中存在着诸多困难。据本课题组所在单位的年门诊量统计,因同性性行为就诊于精神心理门诊和艾滋病预防门诊的人数占年门诊量(5 万人)的 8%,且均存在着不同严重程度的精神心理问题。此类就诊者中超过半数的人历经种种困境后主动产生了改变自己性取向,从而改变性行为的诉求。既往研究提示化学信号分子和童年心理创伤与性取向的形成密切相关。其中催产素对社会行为的调节作用不断被报道,但其对同性性行为,尤其是由于童年创伤导致的这一社会行为是否有调节作用仍然未知。因此,本研究的目的在于探讨催产素对童年创伤导致的同性性行为的作用。

方法 在人群研究中,采用金赛量表、儿童期创伤问卷等量表评估男性同性恋者和男性同性恋/双性恋者的基本信息、性取向、心理健康状况和生活事件,采用酶联免疫吸附反应检测血清中催产素的含量差异。

在动物实验中,通过行为学测试评估生命早期应激对雄性小鼠社会交往和性取向的影响。采用酶

联免疫吸附反应检测小鼠血清中催产素含量。最后，通过小鼠腹腔注射催产素来验证其作用。

结果 与男性异性恋者相比，男性同性恋/双性恋者经历更多的童年创伤，血清催产素水平较低。同样，与对照组相比，生命早期应激降低了雄性小鼠的同性恋偏好指数和血清催产素水平，催产素干预可以降低生命早期应激导致的同性性行为。

结论 同性性行为与童年创伤密切相关。催产素对与童年创伤有关的同性性行为有潜在的调节作用。

关键词：同性性行为，童年创伤，催产素

Adjunctive Therapeutic Effect of Fish Oil on A Subgroup of Patients with Schizophrenia Exhibiting Blunted Niacin Responses

Huiling Wang* Shijing Wang
Renmin hospital of Wuhan University

Objective The clinical treatment of schizophrenia has long been challenged by unclear pathological mechanisms and high heterogeneity in clinical symptoms. The widespread impaired niacin skin flush response observed in patients with schizophrenia is considered as an endophenotype of the disease and is associated with the membrane phospholipid abnormality hypothesis of schizophrenia. This study aims to screen a subgroup of patients with schizophrenia based on impaired niacin response and target them with adjunctive fish oil supplementation thereby exploring a precision treatment approach for this disorder

Methods This study enrolled a total of 138 clinically stable schizophrenia patients and 33 healthy controls. At baseline, all participants underwent niacin testing and clinical assessments. Based on the niacin-flushing, the schizophrenia patients were categorized into two subgroups: the blunted niacin response (BNR) group and the normal niacin response (NNR) group. The BNR patients were enrolled in the fish oil supplementation group. After completing one treatment cycle, they underwent niacin testing and clinical assessments once again. The differences between groups were analyzed

using Chi-square test for categorical variables, one-way analysis of variance for continuous variables, and paired t-tests to assess changes in niacin-bluntedness group before and after fish oil supplementation

Results Both patients in the BNR group and NNR group presented with psychotic symptoms and cognitive impairment. Subsequent to fish oil supplementation in the BNR group, there was a significant improvement observed in their niacin-induced skin flushing response. Consequently, a notable enhancement was noted in their clinical symptoms and cognitive abilities. Moreover, patients who exhibited a greater reduction in PANSS scores following adjunctive fish oil treatment demonstrated a more pronounced improvement in their niacin response

Conclusion The findings of this study demonstrate that fish oil has potential to serve as a precision adjunctive treatment for specific subgroups of schizophrenia patients with BNR phenotype. This research offers a novel approach towards developing precision-based adjunctive treatments targeting the underlying pathological mechanisms of schizophrenia

关键词：schizophrenia; niacin skin flushing response; fish oil; cognitive assessment; targeted intervention; precision therapy

精神分裂症中的线粒体功能障碍和认知损伤：炎症的作用

王冠玉 刘森淇 范晓云 李金铭 薛千姿 刘康 李雪 杨勇锋 王秀娟 宋盟 邵明龙 李文强 韩勇 吕路线 苏玺*

河南省精神卫生中心

目的 线粒体可以参与免疫反应的发生，线粒体功能障碍与认知损伤有关。据报道，精神分裂症（Schizophrenia, SZ）患者存在广泛的线粒体损伤。线粒体功能障碍可能通过介导炎症反应从而导致SZ认知障碍。本研究旨在评估SZ中的线粒体功能障碍与认知损伤的关联以及炎症在其中的作用。

方法 评估了121例健康个体和118例SZ患者在治疗8周前后的外周血白细胞中的线粒体DNA

拷贝数 (mtDNA copy number, mtDNA CN), 并进行了与外周血 mtDNA CN 相关的荟萃分析。从病历系统获得 SZ 患者的超敏 C 反应蛋白 (CRP) 水平。采用 Spearman 相关分析和分层线性回归分析 mtDNA CN 和 CRP 水平、精神症状和认知功能的关系。使用 PROCESS 程序构建了中介效应模型。

结果 结果显示, 与健康对照者相比, SZ 患者白细胞中的 mtDNA CN 显著降低 ($P=0.005$), 尤其是男性患者 ($P=0.035$), 治疗后 mtDNA CN 未上调。荟萃分析的结果同样支持 SZ 患者外周血 mtDNA CN 显著低于健康个体 ($P<0.001$)。SZ 患者 mtDNA CN 与工作记忆能力呈正相关 ($P=0.002$), 与 CRP 水平呈负相关 ($P=0.039$)。此外, SZ 患者 mtDNA CN 是工作记忆能力的重要预测因子 ($P<0.001$), 其中 CRP 作为中介因子, 效应占比为 8.0%。

结论 这项研究揭示了 SZ 中线粒体功能障碍与认知损伤之间的关联, 炎症起着部分中介作用。因此, 线粒体功能障碍可能为 SZ 患者认知障碍的新疗法提供新的靶点。

关键词: 精神分裂症, 线粒体, 认知, 线粒体 DNA 拷贝数, 炎症

在精神科 MECT 治疗中全麻下应用琥珀胆碱引起恶性高热风险的研究

杨宏亮*

沈阳市精神卫生中心

目的 探讨在精神科 MECT 治疗中全麻下应用琥珀胆碱引起恶性高热的风险。

方法 通过查找文献, 总结整理, 恶性高热触发性药物最常见的是氟烷和琥珀胆碱, 它是一种罕见的遗传性肌病, 发病机制是肌浆网释放钙离子增多导致细胞内钙离子浓度升高。典型症状由挥发性全麻药和琥珀胆碱所触发的骨骼肌异常高代谢状态。会引发体内代谢紊乱, 导致体温急剧升高 (可很快达到 40 摄氏度)、肌肉强直、心动过速等症状; 出现酸中毒、低氧血症、高血钾、心律失常等变化。尽管这种情况在临床上较为罕见, 但其发生速度快、病情严重, 若不及时处理, 可迅速危及患者生命。可发生在麻醉期间的任何时段, 甚至在麻醉后监测治疗室 (PACU) 内。据统计麻醉期间的发病率好发于

儿童和青年人, 男性多于女性。

结果 琥珀胆碱作为一种去极化肌松药, 在精神科改良电休克治疗 (MECT) 中扮演着不可或缺的角色。通过暂时性地使骨骼肌失去活动能力, 琥珀胆碱帮助实现治疗过程中所需的肌肉松弛, 从而确保了治疗的安全性和有效性。然而, 正如所有药物一样, 琥珀胆碱的使用并非没有风险, 其中最令人担忧的便是它可能导致的罕见但极其严重的副作用——恶性高热。

结论 预防恶性高热发生, 需要我们在进行 MECT 治疗前, 对患者进行全面的评估, 详细询问病史和进行体格检查, 注意有无骨骼肌疾病, 有无麻醉后高热、心跳骤停等个人和家族史, 以识别那些可能携带相关遗传基因的患者。对于已知存在高风险的患者, 可以考虑采用非去极化型肌松药或其他替代方案, 以避免潜在的恶性高热风险。在应用琥珀胆碱的过程中, 我们必须时刻保持警惕, 不仅要关注其带来的治疗效果, 更要密切监测可能出现的不良反应。通过严格的临床评估、及时有效的处理措施以及科学合理的预防策略, 这样才可以最大限度地减少恶性高热这一严重并发症的风险, 确保 MECT 在精神科治疗中的安全性。

盐酸多奈哌齐片对 MECT 后精神分裂症患者记忆障碍恢复影响的研究

杨宏亮*

沈阳市精神卫生中心

目的 探讨盐酸多奈哌齐片对 MECT 后精神分裂症患者记忆障碍恢复时间的影响。

方法 选择于 2021 年 10 月—2023 年 10 月在沈阳市精神卫生中心进行 MECT 治疗的住院精神分裂症患者 60 例 (男女各 30 例), 将其采用随机数表法分为对照组和研究组各 30 例 (各包括男 15 例和女 15 例), 对照组采用常规治疗 (抗精神病药物联合 MECT), 研究组在常规治疗基础上同时给予盐酸多奈哌齐片。应用韦氏记忆量表测定两组患者各阶段 (治疗前、治疗结束次日、结束后 1 周、结束后 2 周、结束后 4 周) 的记忆商数。

结果 MECT 治疗前, 研究组与对照组的记忆商数比较差异无统计学意义 ($P > 0.05$); 治疗结束时, 研究组与对照组的记忆商数比较差异无统计学意义 ($P > 0.05$); MECT 治疗后 1 周, 研究组的记忆商数为 (84.86 ± 8.19), 明显比对照组的 (79.87 ± 5.54) 高, 组间差异有统计学意义 ($P < 0.05$); MECT 治疗后 2 周, 研究组的记忆商数为 (86.27 ± 7.89), 和对照组的 (82.50 ± 6.72) 比较显著升高, 组间差异有统计学意义 ($P < 0.05$); MECT 治疗后 4 周, 研究组与对照组的记忆商数比较差异无统计学意义 ($P > 0.05$)。

结论 盐酸多奈哌齐片可以缩短精神分裂症患者 MECT 治疗所致记忆障碍的恢复时间, 可能对记忆障碍的恢复有良好的促进作用, 减轻患者的心理负担。

关键词: 盐酸多奈哌齐片; 无抽搐电休克治疗; 记忆障碍; 韦氏记忆量表

A Research of Serum Homocysteine Levels in Unipolar Depression and Bipolar Depression

Dahai Wang* Guangyu Zhou Wei Li
Shenyang Mental Health Center.

Objective compare the difference of serum homocysteine (hcy) level between unipolar depression and bipolar depression and the correlation between serum Hcy level and depressive symptoms.

Methods A total of 35 patients with unipolar depression, 29 patients with bipolar depression and 45 healthy controls with sex and age matching were selected to evaluate the Hamilton Depression Scale, detect serum hcy, and analyze the differences in serum Hcy levels between the three groups and their correlation with depressive symptoms

Results There were significant differences in serum hcy levels between the three groups ($P < 0.01$). Compared with the healthy control group, there were statistical differences in serum hcy levels between the unipolar depression group and the healthy control group ($P < 0.05$), and there were significant differences in serum hcy levels between the bipolar depression group

and the healthy control group ($P < 0.01$). There was significant difference in serum hcy level between unipolar depression group and bipolar depression group ($P < 0.01$). There was a positive correlation between serum hcy level and HAMD score in unidirectional depression and bipolar depression ($r = 0.783$ $P < 0.01$)

Conclusion Serum hcy level is closely correlated with unipolar depression and bipolar depression, and may be a potential biological marker for distinguish unipolar depression from bipolar depression.

精神疾病的血浆脂质组变异: 孟德尔随机化分析的见解

胡建贞¹ 胡建贞² 高耀² 高耀¹ 刘煌辉¹ 刘煌辉²
刘美琪¹ 刘美琪² 杜鑫哲² 杜鑫哲¹ 刘莎¹ 刘莎²

1.山西医科大学

2.山西医科大学第一医院

目的 本研究旨在探讨 179 种人类血浆脂质体与重度抑郁症 (Major Depressive Disorder, MDD)、精神分裂症 (Schizophrenia, SCZ)、双相情感障碍 (Bipolar Disorder, BIP)、强迫症 (Obsessive-Compulsive Disorder, OCD)、创伤后应激障碍 (Post-Traumatic Stress Disorder, PTSD)、神经性厌食症 (Anorexia Nervosa, AN) 和孤独症 (Autism Spectrum Disorder, ASD) 七种精神疾病之间可能存在的因果联系。

方法 我们利用欧洲全基因组关联研究汇总数据中的单核苷酸多态性作为工具变量, 采用双样本孟德尔随机化 (Mendelian Randomization, MR) 方法进行分析。本研究以逆方差加权法作为 MR 分析的主要手段, 并辅以 MR-Egger、加权中位数、简单模式和加权模式等方法。此外, 我们进行了异质性检验和多效性检验, 以评估脂质体与精神疾病之间双向因果关系的可靠性。对于正向评估中发现的有显著联系的脂质体, 我们还进行了反向 MR 分析, 以全面评估其双向因果关系。

结果 MR 分析结果揭示了 72 种脂质体可能与上述七种精神疾病的风险存在因果关系。具体而言,

有 28 种脂质体与 MDD 相关, 11 种与 SCZ 相关, 15 种与 BIP 相关; 2 种与 OCD 相关, 2 种与 PTSD 相关; 9 种与 AN 相关, 5 种与 ASD 相关。值得注意的是, MDD、ADHD、AN 和 ASD 与四大类脂质体均有联系, 而 SCZ、BIP 和 OCD 主要与甾醇和甘油磷脂类脂质体有关, PTSD 则与鞘脂和甘油酯类脂质体有关。反向 MR 分析进一步表明, 甾醇的浓度可能受到 SCZ 和 OCD 的影响。

结论 本研究为理解血浆脂质体与精神疾病之间的关系提供了新的视角, 为精神疾病的潜在发病机制、诊断和治疗提供了新的线索。这些发现可能有助于开发新的预防和干预策略, 以改善精神疾病患者的治疗结果。

小鼠中过表达双相情感障碍相关 lncRNA 引起小鼠出现焦虑和抑郁样行为

李淑芬 倪鸿榆 赵存友*
南方医科大学

目的 双相情感障碍(BD)是一种多因素疾病, 环境因素在疾病的发生发展中起着重要的作用。lncRNA 作为一种重要的表观遗传机制, 解释了在相同遗传背景下环境因素诱导遗传基因差异表达导致不同表型的部分影响。lncRNA 在神经元突触可塑性和兴奋性调节中起着重要作用, lncRNA 表达谱的改变也被认为与 BD 有关。尽管 lncRNA 与 BD 的相关性已有报道, 但是调控突触可塑性和神经兴奋性相关通路参与 BD 发生的研究少有报道, 因此在本项研究中, 我们使用 BD 同卵双生子来筛选与疾病易感性相关的差异表达 lncRNA, 阐述 lncRNA 通过调控突触功能参与疾病发病的作用机制。

方法 本研究招募了 BD 表型不一致的同卵双生子(即单患病同卵双生子)和健康对照同卵双生子, 使用高通量测序技术对外周血 RNA 样本进行转录组测序, 通过生物信息学数据分析, 整合脑组织公共数据库分析, 筛选出 BD 同卵双生子差异表达的疾病相关 lncRNAs; 通过动物水平研究过表达该 lncRNA 小鼠表现的行为异常, 同时检测突触功能异常; 整合同卵双生子外周血测序、脑组织公共数据库和行为异常小鼠脑组织 RNA-seq 数据, 筛选

出调控靶基因, 通过细胞系验证该 lncRNA 对靶基因的分子调控机制; 并且在过表达该 lncRNA 小鼠中恢复靶基因的表达, 检测小鼠行为表现和突触功能异常是否得到缓解。

结果 我们筛选出 BD 相关差异表达 lncRNA APIAR-DT。在动物水平研究中, 过表达该 lncRNA 小鼠表现出焦虑样和抑郁样行为异常, 同时被检测到突触功能异常; 在分子调控机制研究方面, 我们在细胞系中验证了该 lncRNA 上调可通过抑制转录因子与靶基因启动子的结合而抑制靶基因的表达。

结论 我们使用 BD 同卵双生子来筛选与疾病易感性相关的差异表达 lncRNA, 这种将 lncRNA APIAR-DT 与兴奋性突触功能的调节联系起来的表现遗传学和病理生理机制为 BD 的病因学研究提供了线索。

RVG 修饰的间充质干细胞外泌体治疗强迫症及其机制研究

温盛霖* 韦醇仁
中山大学附属第五医院

目的 1、探索间充质干细胞外泌体是否可以通过改变小胶质细胞极性治疗强迫症;

2、探索过表达靶向肽 RVG 的外泌体是否可以更加高效的使外泌体穿透血脑屏障并作用于大脑, 改善强迫症状的效果更明显;

3、探索 RVG-MSC-EXO 是否通过增加小胶质细胞 sigma1 受体表达改善小鼠强迫症状。

方法 1、原代小鼠脂肪来源间充质干细胞提取、培养、表征(成脂成骨诱导、流式)。

2、获得过表达 RVG 的间充质干细胞外泌体并表征(NTA、WB、TEM)。

3、通过行为学实验(强迫检查、旷场、埋珠、水迷宫)测试小鼠强迫症行为。

4、检测小鼠前额叶皮质炎症因子水平(qPCR、ELISA 等)

5、检测小鼠前额叶皮质小胶质细胞极性(免疫荧光)

6、探索小鼠前额叶皮质小胶质细胞上 sigma1 受

体表达水平（免疫荧光）

7、验证 RVG-MSC-EXO 在 小鼠体内靶向性 (IVIS)

8、检测 RVG-MSC-EXO 生物安全性 (CCK8、肝肾功能指标、各脏器 HE 染色)

结果 结论

1、成功制备过表达 RVG 的间充质干细胞外泌体并表征。

2、过表达 RVG 的间充质干细胞外泌体对小鼠脑部具有靶向性。

3、外泌体治疗后小鼠强迫症检查行为改善。

4、外泌体治疗后强迫症相关脑区促炎因子减少、抗炎因子增加。

5、外泌体治疗后强迫症相关脑区小胶质细胞极性由 M1 型转变为 M2 型。

6、外泌体治疗后强迫症相关脑区小胶质细胞 sigma1 受体表达增加。

关键词: 强迫症; 间充质干细胞; 外泌体; RVG; 小胶质细胞; sigma1 受体

围绝经期抑郁症患者肠道菌群特征

吴迪 王小莉 武文璐 彭正午 王化宁*
空军军医大学第一附属医院

目的 探讨围绝经期抑郁症患者与健康围绝经期女性肠道菌群的差异, 探讨围绝经期女性患者肠道菌群和抑郁症状间的关系, 为围绝经期女性抑郁症的发病机制提供一定的理论依据。

方法 采用 16S rRNA 基因测序方法对围绝经期抑郁症女性患者及体检中心的围绝经期健康人群的粪便样本进行分析, 使用汉密尔顿抑郁量表对两组患者抑郁症状进行评估。进行两组对象肠道菌群多样性检测和组间差异分析, 对肠道菌群与年龄、BMI 指数、血糖进行相关分析。

结果 (1) 两组间平均年龄、BMI 指数、血糖均无统计学差异 ($P > 0.05$)。围绝经期抑郁症组患者 HAMD 评分 (28.25 ± 4.59), HAMA 评分 (18.07 ± 4.03) 分。(2) 围绝经期抑郁症组和对照组 Ace 指数、Chao 指数、Shannon 指数、Simpson 指数和 Coverage 指数均有显著性差异 ($P < 0.05$), 提示两组肠道菌群多样性之间存在差异, 且差异具有统计

学意义 ($P < 0.05$)。从 Coverage 指标来看, 各样本的测序菌种覆盖率达到 99% 以上, 覆盖率高。(3) 围绝经期抑郁组患者肠道菌群分布较分散, 对照组分布相对较集中, 表明两组间菌群的菌落结构存在差异, 差异具有统计学意义 ($P < 0.05$)。(4) 脱硫杆菌门、拟杆菌门、变形菌门在围绝经期抑郁组富集, 相应的, 放线菌门、厚壁菌门在对照组富集。 γ -变形菌纲、拟杆菌纲、Desulfovibrionia 在围绝经期抑郁组富集, 梭菌纲、厚壁菌纲、放线菌纲在对照组富集。拟杆菌目等 7 个目在围绝经期抑郁组富集。颤螺菌目等 5 个目在对照组富集。肠内细菌科等 11 个科等在围绝经期抑郁组富集。瘤胃球菌科等 9 个科在对照组富集。肠杆菌属等 24 个属在围绝经期抑郁组富集。瘤胃球菌等 19 个属在对照组富集, 差异具有统计学意义。(5) 泰勒菌、瘤胃球菌、柯林斯菌与年龄呈负相关关系, 毛螺旋菌属、瘤胃球菌属与年龄呈正相关关系, 差异具有统计学意义。凸腹真杆菌属与 BMI 指数呈负相关关系, 未分型毛螺旋菌属与 BMI 指数呈正相关关系, 差异具有统计学意义。凸腹真杆菌属与血糖呈负相关关系, 瘤胃球菌属与血糖呈正相关关系, 差异具有统计学意义。

结论 围绝经期抑郁症患者与健康对照人群肠道菌群结构和多样性具有显著性。

伴有非自杀性自伤的青少年抑郁障碍研究现状

刘茜*
山东省精神卫生中心

目的 探讨青少年抑郁障碍患者伴非自杀性自伤 (NSSI) 的病理机制及其相关影响因素, 为 NSSI 行为的干预提供理论基础。

方法 2.1. 资料来源

计算机检索数据库, 如: 知网、维普、万方、PubMed、Web of Science 等。检索时限均为建库至 2023 年 4 月。

2.2 检索策略

运用主题词与自由词相结合的检索方法。英文检索词: Non-suicide Self-injury、Depressive Disorder、

Adolescent; 中文检索词: 非自杀性自伤、抑郁障碍、青少年。中文检索式: TKA=非自杀性自伤 AND TKA=抑郁障碍 AND TKA=青少年; 英文检索式: Non-suicide Self-injury* [Tiab] AND Depressive Disorder* [Tiab] AND adolescent [Tiab]

2.3 纳入标准

①文献为横断面研究或现况研究; ②研究对象为 12-18 岁的青少年, 抑郁障碍符合《精神疾病诊断与统计手册(第 5 版)》(DSM-5) 或《国际疾病分类(第 10 版)》(ICD-10) 中的诊断标准, NSSI 符合《精神疾病诊断与统计手册(第 5 版)》(DSM-5) 中的诊断标准; ③中英文文献。

2.4 排除标准

①数据资料不全的文献; ②同一作者重复发表的文献; ③研究对象伴有如双相情感障碍、强迫症、焦虑症、精神分裂症等其他精神障碍及严重躯体疾病如脑器质性疾病等; ④非中英文文献。

结果 初步检索数据库共获取文献 1433 篇, 其中中文文献 485 篇, 英文文献 948 篇。通过对文献标题、摘要及全文进行阅读, 筛选出符合标准的文献 52 篇。

结论 青少年非自杀性自伤因其发病率高、复发率高、危险性高已经成为全世界最关注的公共卫生问题之一。但由于 NSSI 行为的发病机制复杂, 尤其是关于神经生物学机制仍处于探讨阶段, 需进一步完善研究。而影响 NSSI 行为发生的因素涉及各个方面, 如个体人格素质、童年创伤性经历、原生家庭教养模式、性别等。同时, 目前 NSSI 方面的研究多为横断面研究, 在接下来的研究中还需要纵向追踪研究 NSSI 青少年患者的结局, 为相关部门制定有效的干预方法, 加强心理健康服务提供更加全面的临床数据, 为 NSSI 行为的病理机制和制定个性化干预方案提供理论基础。

嘌呤代谢途径与精神分裂症、重度抑郁症、双相情感障碍的因果关系: 双向双样本孟德尔随机化分析

隗思萌^{1,2,3} 高耀^{1,2,3} 刘煌辉^{1,2,3} 陈冰冰^{1,2,3} 张昊翔^{1,2,3} 徐勇³ 刘莎^{1,2,3}

1. 山西医科大学第一医院

2. 精神障碍人工智能辅助诊疗山西省重点实验室

3. 山西医科大学

目的 精神分裂症、重度抑郁症、双相情感障碍是严重的精神障碍, 虽然近几年对这些疾病的研究取得了很大的进展, 但它们的潜在病因仍未被完全了解。最近有研究表明嘌呤代谢途径与精神分裂症、重度抑郁症、双相情感障碍之间有关联, 但它们之前是否存在因果关系尚不清楚。本研究的目的是基于双向双样本孟德尔随机化的方法来研究嘌呤代谢途径与精神分裂症、重度抑郁症、双相情感障碍之间是否存在因果关系。

方法 本研究基于欧洲人群中嘌呤代谢途径和精神分裂症、重度抑郁症、双相情感障碍病的全基因组关联研究(GWAS)的汇总数据。使用双向双样本孟德尔随机化, 将遗传因素作为工具变量, 评估嘌呤代谢途径与精神分裂症、重度抑郁症、双相情感障碍之间的潜在因果关系。将 IVW 的结果作为主要的观察指标, 其他方法作为敏感性检验的结果。

结果 在前瞻孟德尔随机化研究中, 次黄嘌呤与精神分裂症具有潜在的因果关系, 且为负相关, IVW (OR=0.233, 95%CI: 0.076-0.719, P=0.011)。肌苷与重度抑郁症具有潜在的因果关系, 且为负相关, IVW (OR=0.919, 95%CI: 0.859-0.982, P=0.013)。硫酸盐与重度抑郁症具有潜在的因果关系, 且为正相关, IVW (OR=0.919, 95%CI: 0.859-0.982, P=0.013)。反向孟德尔随机化研究中未发现精神分裂症、重度抑郁症与嘌呤代谢途径有潜在的因果关系。无论前瞻或反向孟德尔随机化研究均未发现双相情感障碍之间有潜在的因果关系。

结论 本研究提供的证据表明, 次黄嘌呤是精神分裂症的保护因素, 能够降低精神分裂症的发病风险。肌苷是重度抑郁症的保护因素, 能降低重度抑郁症的发病风险, 而硫酸盐是重度抑郁症的危险因素, 会增加重度抑郁症的发病风险。为临床精神分裂症、重度抑郁症、双相情感障碍的早期诊断提供了新的见解

关键词: 精神分裂症; 双相情感障碍; 重度抑郁症; 嘌呤代谢途径; 孟德尔随机分析法

利用磁共振波普成像技术对双相情感障碍及强迫障碍可能共病机制的探讨

李迎帅¹ 李迎帅³ 阿亚阔孜·杰克山别克² 张龙渊²
王丞基² 邹韶红³

1.石河子大学医学院
2.新疆医科大学
3.新疆维吾尔自治区人民医院

目的 本文就双相情感障碍(BD)及强迫障碍(OCD)在磁共振波谱成像技术领域的最新研究结果进行总结,为进一步探讨两者可能的共病神经生化机制提供参考。

方法 已有研究显示,双相情感障碍和强迫障碍患者多个脑功能区均存在神经生化代谢异常,尤其是在前额叶、前扣带回、纹状体等脑功能区存在一定的交叉性。通过磁共振氢质子波谱成像(1H-MRS)技术对比讨论两种疾病在前额叶、前扣带回、纹状体三个脑功能区的脑生化代谢改变,将对探索BD共病OCD的神经生化机制有所帮助。

结果 在前额叶中,BD的抑郁发作患者背外侧前额叶皮质(DLPFC)中Glu、Glx水平随着抑郁症状的缓解而明显下降,OCD患者右侧DLPFC中tNAA水平与OCD患者残疾严重程度显著相关。在前扣带回中,成人BD患者和OCD患者均观察到Glu、Glx水平升高的现象,儿童BD和OCD患者Glx水平与健康儿童对照组相比没有显著差异。在纹状体中,急性发作期和缓解期BD患者双侧豆状核中NAA/Cr值显著低于健康对照组,而急性发作期和缓解期BD患者之间NAA/Cr值无显著差异;OCD患者双侧纹状体Glu、Glx水平变化与强迫症状严重程度呈正相关。

结论 基于目前的MRS研究,BD和OCD患者在前额叶、前扣带回、纹状体等脑区中NAA、Glu、Glx水平变化异常与患者症状严重程度有一定联系。尤其在前扣带回中,BD与OCD患者均观察到谷氨酸能神经传递活跃,不同时期发病的患者有所差异,提示BD与OCD可能存在共同的神经生化机制,Glu水平变化具有作为BD共病OCD生物标志物的可能性。

非典型抗精神病药物对首发精神分裂症患者认知功能及脂代谢的影响

侯建春 孙妍 张顺 梁晓亮 于振剑 马文有*
开滦精神卫生中心

目的 本研究通过评价和比较首发精神分裂症患者应用非典型抗精神病药物对认知功能及脂代谢的影响。

方法 本研究纳入68例符合国际精神疾病诊断和分类标准(ICD-10)的首发精神分裂症患者,随机分为两组,第一组给予氨磺必利片400-800mg/d,第二组给予奥氮平片10-20mg/d,两种药物均在1-2周的时间增加至治疗剂量,分别在第0、12周评测威斯康星卡片测试(WCST)、韦氏成人记忆量表(WMS)及血生化。

结果 认知功能比较:治疗12周末,氨磺必利组与奥氮平组对比,能改善患者认知功能,WCST中五项结果,第12周末($T=-1.07-1.88$, $P>0.05$),WMS中五项结果,第12周末($T=-1.54-0.56$, $P>0.05$),无差异性,WMS中再认分及理解分,第12周末($T=-2.27$, $P<0.05$) ($T=-3.46$, $P<0.05$),有显著差异。血生化中,第12周末($T=-7.22-2.07$, $P<0.05$),有显著差异。

结论 首发精神分裂症患者在应用非典型抗精神病药物治疗后,认知功能改善无明显差别,但应用奥氮平治疗的精神分裂症患者对脂代谢有明显影响,应用氨磺必利则无明显影响。

关键词:首发精神分裂症,认知功能,非典型抗精神病药物,脂代谢

认知行为治疗对重度抑郁患者无抽搐电休克治疗后认知功能障碍改善的效果

赵蕊*
开滦精神卫生中心

目的 析重度抑郁患者行无抽搐电休克治疗后认知功能障碍用认知行为疗法的价值。

方法 对2022年2月-2024年1月病房与门诊所接诊符合重度抑郁障碍行无抽搐电休克治疗的病人($n=62$)进行随机分组。试验组和对照组各31人,试验组和对照组均使用MMSE对其认知功能进行评估,评估由两名经过培训的精神专科医师完成。

试验组在对照组的基础之上加用认知行为疗法,其干预时间在无抽搐电休克治疗后;对照组行常规治疗:根据病人实际情况,指导其使用抗精神病药物。对比 MMSE 评分等指标。

结果 MMSE 这项指标,未治疗时:试验组(17.48±2.41)分,对照组(17.69±2.57)分,组间差异不明显($t=0.2147$, $P<0.05$);治疗结束时:试验组达到(25.63±1.74)分,但对照组却仅有(21.91±1.89)分,比较发现:试验组数据更高($t=4.0839$, $P<0.05$)。疗效分析:总有效率这项指标,试验组达到 96.77%,但对照组却仅有 77.42%。比较发现:试验组数据更高($P<0.05$)。

结论 重度抑郁患者行无抽搐电休克治疗后认知功能障碍用认知行为疗法,病人的认知功能改善更加明显,疗效也更高。

关键词: 重度抑郁,无抽搐电休克治疗,认知行为治疗

研究不同年龄阶段男性抑郁障碍患者炎症反应、甲状腺功能、性激素、皮质醇相关指标水平的变化及其相关性,探讨更为个性化的治疗方案。

孙妍¹ 李鑫¹ 陈薇¹ 马文有¹ 于振剑¹ 张顺¹ 梁晓亮¹ 雷荣²

1.开滦精神卫生中心

2.惠州市第二人民医院

目的 研究不同年龄阶段男性抑郁障碍患者炎症反应、甲状腺功能、性激素、皮质醇相关指标水平的变化及其相关性,探讨更为个性化的治疗方案。

方法 选取 2022 年 1 月至 2022 年 10 月于开滦精神卫生中心住院的男性中重度抑郁障碍患者 166 例,年龄 19~75 岁,根据年龄分为青年组(年龄 19~44 岁)75 例、中年组(年龄 45~59 岁)43 例、老年组(年龄 60~74 岁)48 例。收集患者的一般资料、白细胞(White blood cell,WBC)计数、淋巴细胞(Lymphocyte,LYMPH)计数、中性粒细胞(Neutrophil,NE)计数; C 反应蛋白(C-reactive protein,CRP)数值;甲状腺素(T4)、三碘甲状腺原氨酸(T3)、促甲状腺激素(TSH)、游离 T3(FT3)、游离 T4(FT4)数值;睾酮(Testosterone,T)、泌乳素(Prolactin,PRL)、孕酮

(Progesterone,P)、雌二醇(Estradiol,E2)水平;促肾上腺皮质激素(Adrenocorticotropic hormone,ACTH)和皮质醇(Cortisol,COR)水平。采用 SPSS 23.0 统计学软件进行数据处理。

结果 1.青年组患者的 WBC 计数、TSH 水平均高于老年组,LYMPH 计数高于中年组和老年组,T 水平高于中年组,差异均有统计学意义(均 $P<0.05$);老年组的 FT3 水平低于青年组和中年组,PRL 水平、CORT 水平均高于青年组和中年组,ACTH 水平高于青年组,差异均有统计学意义(均 $P<0.05$)。2.患者的年龄与 WBC 计数、LYMPH 计数、FT3 水平、TSH 水平成负相关,与 COR 水平成正相关;青年组患者年龄与 T 水平、PRL 水平、E2 水平成负相关;中年组患者年龄与 LYMPH 计数成负相关;老年组患者年龄与 T4 水平成负相关,与 TSH 水平成正相关。3.典型相关结果为性激素相关指标与皮质醇相关指标的相关性最显著,典型相关系数平方为 0.40。

结论 男性中重度抑郁障碍患者随着年龄增长,白细胞计数、淋巴细胞计数、FT3、TSH 水平均呈降低趋势,且与年龄呈负相关关系,且下丘脑-垂体-肾上腺素轴(HPA)更易出现功能紊乱。下丘脑-垂体-性腺轴(HPGA)、下丘脑-垂体-肾上腺素轴(HPA)之间可能起到正向协调作用。

GCH1 在跑步运动改善慢性社交挫败所致抑郁样行为中的作用

王楠 朱珊珊 谭思杰*

南华大学

目的 作为一种健康的生活方式,运动已经逐渐成为治疗精神疾病的重要辅助手段,但是运动对抑郁样行为的改善效果及其具体机制尚不明确。本项目旨在探讨跑步运动对慢性社会挫败应激(Chronic Social Defeated Stress,CSDS)所致抑郁样行为的改善作用及其与 GTP 环化水解酶 1(GTP cyclohydrolase 1,GCH1)相关的机制。

方法 采用 CSDS 方法建立抑郁小鼠模型,观察模型小鼠海马 GCH1 表达变化;采用行为学方法观察跑步运动对 CSDS 模型小鼠抑郁样行为的改善

作用及其与 GCH1 表达的关系；免疫组化观察各组小鼠海马小胶质细胞形态变化；ELISA 检测各组小鼠 GCH1 下游产物四氢生物蝶呤（Tetrahydrobiopterin, BH4）浓度水平；观察 BH4 对抑郁样行为的改善作用；观察 BH4 对 BV2 小胶质细胞炎症因子表达的影响。

结果 CSDS 抑郁模型小鼠糖水偏爱度降低、强迫游泳不动时间增加，而跑步运动显著改善 CSDS 模型小鼠的上述抑郁样行为；CSDS 抑郁模型小鼠海马内 GCH1 表达下降，活化的小胶质细胞增多，而跑步运动显著上调 GCH1 的表达，并且抑制小胶质细胞活性；CSDS 抑郁模型小鼠 BH4 浓度显著降低，跑步运动显著增加 BH4 的水平；此外，BH4 可改善 CSDS 小鼠的抑郁样行为，并且下调 BV2 细胞的炎症因子水平。

结论 跑步运动通过上调海马 GCH1 抑制小胶质细胞的激活来改善 CSDS 所致的抑郁样行为。

关键词：抑郁症，GCH1，海马，小胶质细胞，跑步运动，CSDS

The Efficacy of Exercise Interventions on Depressive Symptoms and Cognitive Function in Adults with Depression: An Umbrella Review

Yan Liu², Guorui Zhao¹, Weihua Yue^{1,2}

1.Peking University Sixth Hospital

2.Bin Zhou Medical University

Objective Exercise is often cited as a major factor contributing to improved depression. This umbrella review aims to consolidate the evidence concerning the influence of exercise on depressive symptoms and cognitive performance in adults diagnosed with depression

Methods An umbrella review of systematic reviews with meta-analyses investigating the effect of exercise on depression and cognition was performed. Databases (PubMed, Cochrane Library, Web of Science, Embase) were searched from inception until February 2024 for reviews of randomized controlled trials. Full-text articles meeting the inclusion criteria were reviewed and methodological quality assessed. Overlap

within included reviews was assessed using the corrected covered area method (CCA). A random effects model was used to calculate overall pooled effect size with sub-analyses

Results This study included 27 reviews, encompassing 190 experiments. 11 reviews scored critically low on the 'A Measurement Tool to Assess systematic reviews' (AMSTAR). In patients with depression, compared to the control group, exercise demonstrated a moderate effect size in reducing depressive symptoms ($d = -0.66$; $SE = 0.05$; $p < 0.0001$), with a Number Needed to Treat (NNT) of 2.78. The outcomes of aerobic and resistance exercises demonstrate no significant disparities. When analyses were limited to data from studies with a low risk of bias, the effect on depressive symptoms was smaller ($d = -0.38$; $SE = 0.07$; $p < 0.0001$; $NNT = 4.72$). Exercise had a small effect on cognitive functions ($g = 0.12$; $SE = 0.03$; $p = 0.0005$), with an NNT for cognitive function treatment of 14.79

Conclusion All forms of exercise benefit patients with depression. However, for optimal intervention outcomes, it is essential to customize the intensity and type of exercise according to the specific characteristics of the patient's depressive symptoms and cognitive functions

An Epigenetic Clock To Assess The Differential Neurodevelopmental Trajectories and Prevalence of Three Major Psychiatric Disorders

Xiaohui Wu Cunyou Zhao*

Southern Medical University

Objective Few studies have quantitatively described the common and distinct aspects of the neurodevelopmental trajectories of schizophrenia (SZ), bipolar disorder (BD) and major depressive disorder (MD). Therefore, there is an urgent need for a multiplatform epigenetic clock based specifically on human blood and

brain tissues to assess deviations in neurodevelopmental trajectories in patients with three major psychiatric disorders

Methods Based on 31 publicly available datasets measured on Illumina 27K (27K), Illumina 450K (450K), or Illumina EPIC (850K) array platforms from patients with SZ, BD or MD and unaffected controls, this study used a combination of elastic net and sure independence screening algorithms to develop a new epigenetic clock specific to human blood and brain tissues, then evaluated epigenetic age acceleration from blood and brain tissues of patients with three major psychiatric disorders

Results The Blood-Brain Clock achieves high performance in predicting blood and brain DNAm age and estimates that the three major psychiatric disorders have differential trend variations of epigenetic age acceleration. Epigenetic age acceleration in both blood and brain tissues showed a decrease in SZ but an increase in BD and MD relative to controls. Blood precedes brain tissue in exhibiting distinguishable alterations in epigenetic age acceleration across three major psychiatric disorders. Moreover, most of the disease-associated differentially methylated DNAm probes that were shared across SZ, BD and MD displayed opposite alteration patterns between SZ and BD/MD but similar patterns between BD and MD. BD and MD were also indistinguishable from each other but significantly distinguishable from SZ in neuropsychiatric disorder classification models constructed with random forest classifiers

Conclusion The different trends identified in epigenetic age acceleration across three major psychiatric disorders in this study added substantial value to understanding offsets in their neurodevelopmental trajectories. These distinguishable alterations in epigenetic age acceleration observed in peripheral system prior to brain tissue facilitate early diagnosis of disorders and has the potential to evaluate the risk of various disorders

述情障碍的内感受知觉语义表征及其神经机制研究

李先瑞² 李先瑞¹ 叶文婷² 彭楚尧² 王雪阳² 王允宏² 邱江²

1.山东省戴庄医院

2.西南大学心理学部

目的 旨在揭示述情障碍内感受知觉语义表征缺陷的行为效应、电生理机制及内感受知觉语义表征个体差异的神经机制。

方法 在正常大学生群体中筛选高、低述情障碍个体纳入本研究。研究一使用鼠标追踪技术,刻画高、低述情障碍个体在将内感受知觉与情绪类别匹配时的鼠标轨迹差异。在研究一基础上,研究二纳入高、低述情障碍个体,并将 ERPs 技术与鼠标追踪技术相结合,同步采集被试的鼠标追踪数据与脑电数据,使用时域分析考察与内感受知觉语义表征相关的 ERPs 成分。在研究一和二的基础上,研究三纳入高、低述情障碍个体,采集其磁共振数据,并在扫描时让被试完成 oddball one-back 语义判断任务,对任务态磁共振数据进行被试间相关分析和激活分析;再基于独立样本静息态磁共振数据进行功能连接分析。

结果 在研究一中,鼠标轨迹对比分析主效应显示,高述情障碍个体的最大偏差值大于低述情障碍个体,差异具有统计学意义($p < 0.001$),即高述情障碍个体的个体在做出选择时,鼠标轨迹更加偏向干扰选项,简单效应分析在恐惧、愤怒情绪类别上也发现了类似效应。在研究二中,对鼠标追踪数据的分析得到了与研究一一致的结果,ERPs 分析发现:与低述情障碍个体相比,高述情障碍个体诱发了更大的 N400 波幅,而在 N200 波幅上未发现高、低述情障碍个体之间的显著差异。研究三对任务态磁共振数据分析显示:高述情障碍个体右侧额下回眶部、左侧角回等脑区的被试间相关模式高于低述情障碍个体。激活分析结果显示:相比于低述情障碍个体,高述情障碍个体的左侧中央后回激活增强。以杏仁核和脑岛为感兴趣区进行基于种子点的静息态功能连接分析发现,杏仁核和脑岛的功能连接均与述情障碍或其维度分数存在相关关系。

结论 (1) 高述情障碍个体在内感受知觉语义表征上存在缺陷;(2) 结合鼠标追踪技术与 ERPs 技

术探讨述情障碍内感受知觉语义表征的电生理机制,结果显示,相比于低述情障碍个体,高述情障碍个体诱发了更大的 N400 波幅,说明其无法有效地对语义信息进行整合,对刺激的意义加工能力减弱;

(3) 通过使用 fMRI 技术探讨述情障碍内感受知觉语义表征个体差异的神经机制,任务态 fMRI 分析发现,高述情障碍个体在额下回眶部和角回的 ISC 模式均高于低述情障碍个体,表明其内感受知觉语义表征缺陷是由于额下回眶部(语义控制)和角回(语义信息表征)的活动存在异常;从个体差异角度进一步分析发现,杏仁核(情绪刺激加工)和脑岛(内感受信息整合)的功能连接是述情障碍个体差异的神经基础。

关键词:述情障碍,内感受知觉,语义表征,鼠标追踪技术,神经机制

一例以记忆力减退及下肢抖动为主要症状的脆性 X 相关震颤/共济失调综合征病例报道及文献回顾

王郑 章晓英* 陈洁芳 黄子洋 金曼 格桑梅朵
杭州市第七人民医院

目的 报道 1 例早期被诊断为神经元核内包涵体病的脆性 X 相关震颤/共济失调综合征患者的临床表现、辅助检查结果以及诊治经过,旨在提高本病的早期识别,减少临床误诊漏诊。

方法 总结 1 例来自浙江无阳性家族史患者的临床资料,对患者行影像学检查、皮肤肌肉活检及基因检测,应用 PCR 联合毛细管检测分析 FMR1 基因。

结果 本例患者为 57 岁男性,以近记忆力减退、上下楼梯时下肢抖动为主要表现,入院时颅脑 MRI 示双侧额叶皮层下及胼胝体压部 DWI 高信号灶,神经元包涵体可符。结合患者颅脑 MRI 表现,入院时初步诊断考虑“神经元核内包涵体病(NIID)”,随即对患者行皮肤肌肉活检及 NIID 相关的 NOTCH2NLC 基因检测。皮肤活检普通病理报告提示真皮层少许汗腺细胞和成纤维细胞核内见嗜酸性包涵体样结构,可符合 NIID。但基因检测提示相关基因中 GGC 重复序列数小于 60,不符合 NIID。患者 NIID 诊断难以成立。此时想到另一种与 NIID 有

着类似影像表现的罕见遗传病:脆性 X 综合征(FXS)。随即对患者行 X 染色体 FMR1 基因行 PCR 联合毛细管检测分析,发现患者 FMR1 基因 5'非转录区 CGG 重复数为 121 次,在前突变范围内,表明患者患有 FXS 的风险增加。随后患者女儿表示患者外孙今年 7 岁,存在发育落后、学习差表现。随即对患者女儿及外孙行 FMR1 基因检测,发现患者女儿 CGG 重复数为 132 次,处于前突变范围,目前无相关临床症状;患者外孙 CGG 重复数大于 200,为全突变范围,携带者必然患病。至此,患者及其家属诊断得以明确,结合临床表现、颅脑影像及基因检测结果,患者确诊为“脆性 X 相关震颤/共济失调综合征(FXTAS)”。

结论 部分罕见疾病的早期症状缺乏特异性,准确诊断存在挑战性。临床遇到认知障碍患者,除常见病以外,还应考虑到罕见病可能。脆性 X 综合征是 X 染色体连锁的遗传性疾病,其致病基因为 X 染色体上的 FMR1 基因 CGG 序列异常扩增。根据基因为前突变或全突变,临床可分为 3 型。(1)脆性 X 综合征:多未成年起病,影响智力、行为和社会适应性发展;(2)脆性 X 相关震颤/共济失调综合征:多 50 岁以上发病,男性常见,因 FMR1 基因前突变所致患者出现震颤。记忆和平衡问题,本例患者为此类型;(3)脆性 X 相关原发性卵巢功能不全:一种影响卵巢功能的疾病,可导致某些女性携带者不孕和早期绝经。FXS 患者的颅脑 MRI 可表现为 DWI 序列上的皮层下火焰状的异常高信号,与神经元核内包涵体病的特征性影像及其相似,且其临床表现常较相似,均可表现为记忆力减退等,因此常难以鉴别,必须行皮肤活检及相关基因检测方可确诊。

关键词:认知障碍,脆性 X 综合征,神经元核内包涵体病,罕见病,基因检测

Genome-wide DNA Methylation and Adverse Childhood Experiences in Youth at Clinical High Risk for Bipolar Disorder and Patients with Established Bipolar Disorder

Xinyu Meng¹, Lili Guan¹, Shengmin Zhang¹, Yingzhen Xu¹, Shuzhe Zhou¹, Yantao Ma¹, Correll Christoph^{2,3,4}, Xin Yu¹

1. Peking University Sixth Hospital, Peking University Institute of Mental Health, NHC Key Laboratory of Mental Health (Peking University), National Clinical Research Center for Mental Disorders (Peking University Sixth Hospital), Beijing, China.

2. Department of Child- and Adolescent Psychiatry and Psychotherapy, Charité Universitätsmedizin, Berlin, Germany.

3. Department of Psychiatry, The Zucker Hillside Hospital, Northwell Health, Glen Oaks, NY, USA.

4. Donald and Barbara Zucker School of Medicine At Hofstra/Northwell, Department of Psychiatry and Molecular Medicine, Hempstead, NY, USA.

Objective Bipolar disorder (BD) is thought to arise from complex interactions between genes and the environment. Notably, adverse childhood experiences have been implicated in BD development, yet the underlying etiological mechanisms remain elusive. We aimed to explore the potential mediating role of DNA methylation in the association between childhood adversities and the BD risk status in three risk groups

Methods In this study, we recruited 20 youth at clinical high risk for BD (CHR-BD), 21 patients with established BD, and 24 healthy controls, matched for age, sex, and ethnicity. Using Illumina EPICv2, we conducted whole-genome DNA methylation profiling and explored the potential mediating role of the methylome between adverse childhood experiences and BD risk via the Divide-Aggregate Composite-null Test (DACT)

Results Patients with BD and youths at CHR-BD showed significantly higher scores than healthy controls in the Adverse Childhood Experiences-International Questionnaire (ACE-IQ) total score and each of its three domains (childhood maltreatment, family dysfunction and violence outside the home, $P > 0.05$). While none of the probes met the Bonferroni criterion ($P < 5.71 \times 10^{-8}$), the DACT analyses identified several promising candidates ($P < 5.00 \times 10^{-5}$) functioning involved in development, cell cycle control, immune response, metabolic and signalling pathways. We identified suggestive mediating probes related to ten genes that were linked to the ACE-IQ total score and two subscales

Conclusion Our findings reveal promising research targets for understanding the etiology of early BD in childhood adversity contexts. Future studies should validate and expand on these findings to deepen the understanding of BD

一例表现为反复亚木僵状态的肝功能正常的高氨血症性脑病病例报道及文献回顾

王郑 章晓英* 陈洁芳 黄子洋 格桑梅朵 金曼
杭州市第七人民医院

目的 报道 1 例以反复发作性认知功能下降、不语不动、肢体僵硬为临床表现的肝功能正常的高氨血症性脑病患者的临床表现、辅助检查结果以及诊治经过,旨在提高本病的早期识别,减少临床误诊漏诊。

方法 总结 1 例来自四川的患者的临床资料,对患者行脑电、影像学检查及血氨检测,予以乳果糖、益生菌、门冬氨酸鸟氨酸注射液治疗。

结果 本例患者为 64 岁女性,无阳性家族史,3 年前因胃部肿瘤曾行胃大部切除术。入院前半年来反复出现反应迟钝、认知功能下降,严重时不语不动,四肢僵硬,问之无应答,似亚木僵状态,持续数日可缓解。曾外院行脑脊液常规、生化、自免脑检测均未见异常。入院时患者反应迟钝,数问少答,定向力欠佳,记忆力减退,肢体僵硬,动作迟缓,血常规、肝肾功能等常规检查未见异常,腹部彩超正常,长程脑电图示双侧前头部尖波发放,双侧半球弥漫性慢波发放。回顾患者既往外院诊疗资料,发现患者初次入院时血氨偏高,后未再复查。予以复查,结果示血氨 $195 \mu\text{mol/L}$ 。予以乳果糖、益生菌口服减少氨产生,门冬氨酸鸟氨酸注射液静滴降血氨治疗,2 天后患者反应明显好转,记忆力改善,定向力准确,运动自如,复查脑电图未见弥漫性慢波及尖波发放,复查血氨 $56 \mu\text{mol/L}$ 。结合临床表现、辅助检查及治疗转归,该患者被确诊为:高氨血症性脑病。

结论 高氨血症是一种严重的代谢紊乱,如果不及时控制,可导致不同程度的脑损害及肝损害,引起意识障碍、精神行为异常、脑水肿,致残、致死

率很高。高氨血症常见于遗传代谢性疾病如尿素循环障碍，和多种因素引起的急性或慢性肝功能衰竭患者如酒精性肝硬化。本例患者既往无相关遗传代谢疾病史或家族史，多次检测肝功能均未见异常，故既往诊疗经过中未将高氨血症性脑病纳入重点考虑范围。该患者反复高氨血症的病因尚未完全确定，有文献报道少数胃肠道手术后的患者会出现高氨血症，该患者既往曾行胃大部切除术，推测可能与之相关。该病例提示我们临床对肝功能正常的急性精神障碍患者也需考虑高氨血症脑病可能，脑电图及血氨检测能帮助尽早诊断。

关键词：亚木僵状态,高氨血症性脑病,急性精神障碍

肠道菌群、血清代谢物及关联分析针灸百会、足三里穴缓解抑郁样行为的潜在机制研究

魏彩玲 刘睿娜 李宜俊 张建波 朱峰*

西安交通大学第一附属医院精神心理卫生科 710000

目的 通过慢性不可预测温和刺激(CUMS)建立小鼠抑郁模型,使用针灸(Acupuncture, AP)百会、足三里穴治疗小鼠抑郁样行为。(1)观察针灸百会、足三里穴对 CUMS 小鼠抑郁样行为的影响;(2)利用 16SrRNA 基因测序肠道菌群组成,使用非靶向代谢组学分析血清代谢物的变化;(3)分析差异菌群、差异代谢物和抑郁样行为之间的相关性。

方法 在强迫游泳测试和蔗糖偏好测试中评估 Ctrl 组、Ctrl+AP 组、CUMS 组和 CUMS+AP 组小鼠的抑郁样行为。使用 16S rRNA 测序评估肠道微生物群的变化。进行非靶向代谢组学测序代谢物组含量,筛选标志代谢物和代谢通路。利用宏基因组-代谢联合分析差异菌群与差异代谢物的关联性,从而帮助建立肠道菌群-血清代谢物-抑郁行为之间的逻辑关系。

结果 CUMS 组的糖水偏好和悬尾不动时间低于 Ctrl 组($P<0.001$)和 CUMS+AP 治疗组($P<0.05$),这表明 CUMS 诱导小鼠发生了抑郁样行为,中医针灸百会和足三里穴可以缓解抑郁样行为。human_gut_metagenome 菌种是 CUMS 组的特征性标志物之一; Eggerthella 菌属和

bacterium_NLAE_zl_P36 菌种是 CUMS+AP 组的特征性标志物。小鼠肠道菌群基因功能可能通过影响肠道菌群组成及视黄醇代谢、磷酸盐代谢、青霉素及头孢菌素代谢和咖啡因等代谢途径从而发挥抗抑郁效应。CUMS 组对比 Ctrl 组, Ruminococcus_gnavus_CC55_001C 菌种与 Sphingosine 差异代谢物呈负相关,该菌种与 Nalidixic Acid、3-Indoleacrylate 差异代谢物呈正相关。正离子差异代谢物 Pipecolic acid 显著下调和正离子差异代谢物 1-Arachidonoylglycerol 显著上调,二者互为负相关关系,ABC transporters 代谢通路在 CUMS 小鼠抑郁症状中可能发挥较大作用。与 CUMS 组抑郁小鼠相比,CUMS+AP 组抑郁小鼠的 human_gut_metagenome 菌种与 Melibiose 代谢物呈显著正相关关系,筛选出 2 个显著上调正离子代谢物 Pipecolic acid、Mannitol,其中针灸百会和足三里穴可能通过改变 Mannitol 在 ABC transporters 代谢通路中发挥治疗作用。

结论 针灸百会和足三里穴可使抑郁导致的肠道菌群和血清代谢物紊乱部分恢复,可能通过特定的代谢途径发挥抗抑郁效应,为进一步研究抑郁症相关的肠-脑-代谢轴奠定前期基础,为中医针灸缓解抑郁症状的疗效及其潜在机制做探索。

关键词:抑郁症,针灸,16sRNA 基因测序,非靶向代谢组学测序,宏基因组-代谢联合分析

非自杀性自伤的内分泌免疫研究进展

凌晨曦*

中山大学附属第八医院

目的 非自杀性自伤(non-suicidal self-injury, NSSI)是指不以自杀为目的、重复的故意损伤自己身体的行为。美国《精神障碍诊断和统计手册》第 5 版中将 NSSI 视为可能的独立诊断实体,提示 NSSI 可能存在独特的病理生理机制。研究发现具有 NSSI 行为人群其内分泌和免疫存在变化,进一步探讨 NSSI 的内分泌免疫机制,可能有助于其早期预防与干预。

方法 通过 PubMed、Web of Science 等数据库查使用“Non-suicidal self-injury”、“immune response”以及“Inflammation”等关键词检索相关文章,根据需

要选取近 5 年发表的英文研究。

结果 NSSI 个体在童年创伤的背景下表现出内分泌免疫系统应激激素水平变化。童年创伤作为一个慢性应激源,可能导致了下丘脑-垂体-肾上腺轴、下丘脑-垂体-甲状腺轴、者下丘脑-垂体-性腺轴等内分泌系统的变化,且可能会引发持久的全身炎症反应。NSSI 行为者在急性应激任务下表现出更迟钝的唾液皮质醇反应,同时皮质醇反应程度与 NSSI 的严重程度相关。NSSI 女性青少年白细胞绝对数量、白细胞/皮质醇比值升高,且儿童期被虐待程度与白细胞/皮质醇比值显著相关。NSSI 个体表现出的行为冲动增强与血清 TNF- α 水平升高相关。

结论 NSSI 多发生在青少年和成年早期,涉及生物学、心理和社会等因素的相互作用。当前相关的生物学机制尚不明确,导致青少年 NSSI 的药物治疗效欠佳。针对不同年龄段、伴随的精神疾病进行纵向研究,将有助于探讨 NSSI 生物学指标,从而早期筛查并干预 NSSI 行为。

抑郁症与精神分裂症患者外周血中 ω -3 和 ω -6 多不饱和脂肪酸水平的系统评价和荟萃分析

陈嘉源 李昱葶 青颖*
上海交通大学

目的 抑郁症和精神分裂症是两种常见且复杂的精神疾病,但是致病机理不明。研究发现 ω -3 和 ω -6 多不饱和脂肪酸 (PUFAs) 通过调节炎症、神经传递等生物过程在它们病理机制中发挥重要作用。然而,当前关于这两种疾病患者体内 PUFAs 水平的研究结果仍存在矛盾,且单一研究的样本量限制了结论的普适性。因此,本研究旨在通过系统评价和荟萃分析的方法,综合评估现有文献中抑郁症和精神分裂症患者外周血中 PUFAs 含量,为研究疾病病理机制和治疗策略提供科学依据。

方法 参照 PICO 原则,以确定好的检索式,系统地检索 PubMed, Embase, MEDLINE 和考克兰英文数据库,检索日期为建库至 2023 年 12 月,获取测量两种疾病外周血中 PUFAs 含量的所有相关英文

文献信息,提取相关数据并使用 NOS 量表进行质量评价,通过 Revman 5.4 软件进行荟萃分析,主要结局指标为患者与健康对照相比,外周血中 ω -3 和 ω -6 PUFAs 水平的差异。获得标准化均数差以及 95% 置信区间作为效应指标,通过子组分析和敏感度分析等方法探讨异质性的来源。

结果 共检索了 6713 篇文献,最终共纳入了 65 项研究,涉及 86 组数据,包括 4219 位患者和 8470 位对照。结果显示,与对照组相比,抑郁症患者外周血中 ω -6/ ω -3 PUFAs 显著升高 (SMD=0.54;95%CI=[0.27,0.81];P<0.0001),二十二碳五烯酸 (DPA) (SMD=-1.31;95%CI=[-1.61,-1.01];P<0.00001)、二十碳五烯酸 (EPA)(SMD=-0.41;95%CI=[-0.64,-0.18];P=0.0004)和二十二碳六烯酸 (DHA)(SMD=-0.69;95%CI=[-0.93,-0.46];P<0.00001)显著降低;精神分裂症患者外周血中 DHA(SMD=-0.61;95%CI=[-0.90,-0.32];P<0.0001)、亚油酸(SMD=-0.70;95%CI=[-0.99,-0.42];P<0.00001)和总 ω -6 PUFAs(SMD=-0.63;95%CI=[-0.95,-0.31];P=0.0001)显著降低。虽然研究表现出较高的异质性(如精神分裂症总 ω -6 PUFAs 的 I² 为 79%),但通过敏感度分析等方法发现,研究的稳定性良好。

结论 本研究发现,DHA 在两种疾病中均降低;抑郁症中 ω -3 PUFAs 显著降低, ω -6/ ω -3 显著升高,而精神分裂症中 ω -6 PUFAs 显著降低。这种 PUFAs 的差异化含量反映了这两种疾病的病理机制的差异,为 PUFAs 辅助治疗精神疾病提供了生物学基础。

关键词: 抑郁症,精神分裂症,多不饱和脂肪酸,荟萃分析

ZJU 指数与抑郁症状的关联性研究: 基于 NHANES 数据的横断面分析

斯日特 丁玉深 周宸宇 周福春*

首都医科大学附属北京安定医院,国家精神疾病医学中心,国家精神心理疾病临床医学研究中心,精神疾病诊断与治疗北京市重点实验室,北京脑重大疾病研究院精神分裂症研究所

目的 抑郁症状是一组以情绪低落、兴趣丧失、快感缺失等负面情绪与行为的临床表现。抑郁症状发生率的逐年攀升,多项研究已证实抑郁症状与非

酒精性脂肪肝 (non-alcoholic fatty liver disease, NAFLD) 之间存在显著关联。NAFLD 诱发的慢性炎症及肝功能异常可能直接作用于大脑情绪调节, 同时, 伴随的代谢综合征、肥胖等可能间接增加抑郁风险。此外, NAFLD 患者长期面对疾病管理挑战及生活质量的下降, 亦可能诱发抑郁症状。浙江大学 (ZJU) 指数作为一种新型简便的筛查工具, 已被证实对 NAFLD 具有较高的筛查效能(AUC=0.822), 其计算方式如下: $ZJU\ index = BMI + TG + TC + 3 \times ALT / AST$ 。本研究旨在探讨 ZJU 指数与抑郁症状之间的关联, 并进一步分析这种关系在不同性别、年龄等特定人群中的差异, 为临床干预和健康管理提供科学依据。

方法 使用美国国家卫生与营养检查调查 (National Health and Nutrition Examination Survey, NHANES) 的数据, 并排除存在抑郁症状数据缺失以及计算 ZJU 指数所需数据不全的个体。当 PHQ-9 的累计评分大于等于 10 分时, 认定为具有抑郁症状。采用加权 t 检验和卡方检验确定是否有抑郁症状两组人群间的差异, 用加权线性回归分析 ZJU 指数与抑郁症状的关系, 并通过亚组分析和交互作用识别特殊人群。

结果 本研究共纳入 15035 人, 共 1287 人具有抑郁症状。ZJU 指数在具有抑郁症状的人群 (survey-weighted mean 41.51, 95% CI 40.95-42.06) 中显著高于非抑郁症状人群 (survey-weighted mean 39.26, 95% CI 39.03-39.49) ($P < 0.05$)。在调整年龄、性别、种族、生活方式、经济状况和合并症等因素后, ZJU 指数与抑郁症状之间的关联仍显著 (OR=1.019 (1.010-1.029), $P=0.002$), 且在不同性别中保持一致。与最低四分位数组(Q1)相比, Q3 和 Q4 的 OR 和 95%CI 分别为 1.38 (1.04 - 1.83) 和 1.02 (1.01 - 1.04) ($P < 0.05$)。亚组分析显示, 在具有卒中病史个体中, ZJU 指数升高更显著增加了发生抑郁症状的风险 ($P = 0.0267$)。

结论 本研究发现 ZJU 指数与抑郁症状具有显著的关联, 并且这种关联在具有卒中病史的个体中更为显著。为预测抑郁症状的发生提供了一种简单而有价值的筛查工具。

关键词: ZJU 指数, 抑郁症状, NHANES 数据库, 横断面研究

Prefrontal Cortex Variation in Youth and Adolescents Who Engaged in Repetitive Non-suicidal Self-injury Vs. Psychiatric Controls

Jue Wang Yunlong Tan*

Beijing Huilongguan Hospital

Objective Non-suicidal self-injury (NSSI) is defined as deliberate, self-inflicted damage to the surface of the body, which is frequently associated with suicidal thoughts and behaviors (STB). The prevalence of non-suicidal self-injury (NSSI) in youth and adolescents has increased substantially in recent years. The mechanism of NSSI has not been elucidated. Studies have shown that specific cortical abnormalities might associated with NSSI. We aimed to identify the cognitive function variation and cortical abnormalities of NSSI and provide a multidimensional perspective for clinical identification and diagnosis.

Methods We recruited 136 individuals from a psychiatric hospital and classified them into two groups including none diagnostic NSSI (NN, n=40), and diagnostic NSSI (DN, n=99). We extracted data on cortical surface area and thickness from structural MRI scans and compared these between the groups.

Results The left pars orbitalis thickness ($t = 2.592$, adjusted $p < 0.05$), and the right rostral middle frontal regions thickness ($t = 2.695$, Adjusted $p < 0.05$) were tested differently in statistics in Multiple linear regression analysis. The times of the NSSI in the DN group showed a negative correlation with the surface area of the right pars triangularis ($t = -2.683$, adjusted $p < 0.05$). No significant differences exist between the NN and DN groups in cognitive domains.

Conclusion The morphometric alteration of the left pars' orbitalis, the right rostral middle frontal region, and the right pars triangularis may represent a biomarker of NSSI behavior in youth and adolescents. This study identified the cognitive function variation and cortical abnormalities of NSSI and provided a multidimensional perspective for clinical identification and diagnosis

关键词: Prefrontal cortex, NSSI, youth and adolescents, mental health

时间干涉电刺激调节人类共情情绪

田树香 薛言学*
北京大学医学部

目的 共情,即个体感知或想象他人的情感,包括情感共情和认知共情两个独立成分。共情作为理解和分享他人情感的关键心理过程,在社会生活中起着重要作用。研究表明,岛叶脑区在共情的神经机制中扮演着关键角色,尤其是在情感共情方面。近年来的研究发现,共情具有可塑性,可能受多种神经调控的影响。时间干涉电刺激(Temporal Interference, Ti)是一种新型的无创深部脑刺激技术。这项技术通过在头皮上放置的电极输入两对高频刺激信号,这些信号在大脑内部特定区域形成较强交叠电场,并以高频频率差为周期波动,从而克服了传统经颅电刺激干预深度不足、电场弥散等问题。Ti 电场能有效靶向深部脑区,并且在安全电流强度下实现了有效的深部脑刺激。采用疼痛共情研究范式,基于共情的神经基础以及 Ti 电刺激对深部脑区的靶向能力,通过行为数据探讨 Ti 电刺激在提高人类共情情绪的能力。

方法 入组健康被试,采用随机、双盲的方式分为 Ti 电刺激组和 Sham 刺激组。实验前一周采集被试的 T1 核磁共振数据,目标靶点为左侧前岛叶,根据 T1 核磁数据仿真计算得到高频 Ti 电刺激的电极放置位置及电流强度。基线:所有的被试均进行一次共情任务评分;第二周:根据先前分组的刺激方式被试开始进行电刺激,10 min 后开始共情任务评分,完成疼痛共情任务测试。疼痛共情任务中随机出现自然场景视频和疼痛相关视频,评估对应的疼痛程度和观看此视频时候的心理不舒适程度,以此来反映个体的共情情绪。

结果 Ti 电刺激组对疼痛场景的疼痛程度和不舒适程度较 Sham 刺激组更显著,两组对自然场景的情绪感知影响较小。

结论 人类个体可以通过 Ti 电刺激来改变自身的共情情绪, Ti 电刺激对于个体的共情塑造具有重要作用。

合并益生菌治疗对抗精神病药源性肥胖的作用

李雪 宋学勤*
郑州大学第一附属医院

目的 临床常用的抗精神病药物在较好的改善精神症状的同时还带来了药源性肥胖的不良反应,导致患者依从性下降,预后不佳。随着脑-肠-轴研究的不断深入,发现肠道细菌的紊乱与精神分裂症发病以及抗精神病药源性肥胖均密切相关。本研究尝试用临床常见的益生菌制剂干预,探索其对抗精神病药源性肥胖的作用及机制。

方法 纳入长期服药治疗的精神分裂症患者,根据药源性肥胖的判别标准分为肥胖组(n=36)和非肥胖组(n=36),同时给予益生菌治疗 4-8 周。在治疗前后去患者粪便行肠道菌群的检测,抽血行代谢组学的检测。在治疗前后均应用 PANSS 了解受试者症状的变化。应用 SPSS 以及 R 软件进行统计分析,以 $p < 0.05$ 表示差异有统计学意义。

结果 基线水平,两组间肠菌存在差异,肥胖组总菌数量减少,益生菌少于非肥胖组;代谢组学结果提示,两组有 58 种差异代谢物,主要集中在糖脂代谢通路。经益生菌治疗 8 周后,两组肠菌水平差异无统计学意义;代谢组结果提示,仍有 24 种差异代谢物,未再富集于糖脂代谢物。治疗前后 panss 量表差异无统计学意义。

结论 合并益生菌制剂对抗精神病药源性肥胖有一定的改善作用,为临床抗精神病药源性肥胖早期干预提供一定依据。

未治疗的精神分裂症患者的 EGF, NGAL 水平与暴力行为的关系

蒋长勇 仇玉莹 高营 孙伟 刘娟 李洁*
天津市安定医院

目的 本研究旨在探讨核基因 κB (NF- κB), 表皮生长因子 (EGF), 中性粒细胞明胶酶相关脂质运载蛋白 (NGAL) 与精神分裂症暴力之间的关系。

方法 选取 161 例于天津市安定医院门诊或住院, 符合美国精神障碍诊断统计手册第五版 (DSM-5) 精神分裂症或精神分裂样障碍的诊断标准的患者, 既往未接受过系统抗精神病药治疗。采用修订版外显攻击行为量表 (MOAS) 评估攻击症状的严重程度 (暴力组与非暴力组的划分?), 并使用阳性与阴性症状量表 (PANSS) 评估精神症状的严重程度。采用酶联免疫吸附法 (ELISA) 检测血浆标本 NF- κB 、EGF、NGAL 水平。应用 SPSS23 进行统计分析。

结果 161 例未治疗的精神分裂症患者中暴力倾向的发生率为 56.5%, 其中暴力组阳性症状评分明显高于非暴力组, 且病程更短。暴力组的 NGAL、EGF 水平均低于非暴力组 ($11.473 \pm 4.507 \mu\text{g/L}$ vs. $14.130 \pm 9.024 \mu\text{g/L}$; $974.319 \pm 327.265 \text{pg/mL}$ vs. $1145.272 \pm 546.566 \text{pg/mL}$)。MOAS 量表总分与阳性症状评分呈正相关 ($p < 0.01$)。采用偏相关, 控制性别、年龄、病程、BMI 等混杂因素后, 结果显示 MOAS 总分与 NGAL 和 EGF 水平均呈负相关 ($P < 0.05$)。

结论 精神分裂症患者暴力攻击风险发生率较高, 其中炎症过程可能参与精神分裂症患者的暴力行为的发生。

关键词: 精神分裂症, 暴力行为, EGF, NGAL

基于精神专科医院职工的心率变异性与疲劳程度的关联分析

张瀚迪* 黄东梅 赵颖琳 方泽漫
汕头大学精神卫生中心

目的 疲劳是由于过度的躯体或精神活动所致能力和效率的下降, 是一般人群最常见的亚健康问题之一。长期疲劳可能预示着病理性的疲劳, 造成工作及学习效率下降, 甚至影响身心健康。目前关于疲劳评估仍是依赖主观性的量表, 缺乏客观性指标。在一些实验条件下已经证实心率变异性 (heart rate variability, HRV) 与疲劳程度存在相关性, 但目前缺乏在日常真实生活环境下 HRV 与疲劳的相关性研究。本研究目的是探索在真实生活环境下健康人群的 HRV 与疲劳程度及相关的心理生理健康指

标的相关关系, 从而探讨 HRV 作为评估疲劳及心理健康状态的客观生物标志物的潜力。同时, 我们也调查疲劳状态对生活质量、心理健康状态的影响。

方法 本研究是一项横断面调查研究。从 2020 年 6 月至 2020 年 12 月, 对汕头市某精神专科医院 216 名在岗的工作人员进行了 HRV 指标测量及问卷调查, 包括一般情况、既往病史、Chalder 疲劳量表 (CFQ)、匹兹堡睡眠质量指数 (Pittsburgh Sleep Quality Index, PSQI)、简化 36 项健康状况问卷及视觉模拟法评分 (Visual Analogue Scale, VAS)。CFQ ≥ 4 分定义为存在疲劳感, 长期疲劳定义为疲劳感持续 1 个月及以上。

结果 本研究的结果显示, 精神专科医院职工的疲劳率为 23.15%, 长期疲劳率为 13.89%。相对于非疲劳者而言, 长期疲劳者会有更差的睡眠质量、更差的生活质量及更糟糕的心理健康状况。在总体样本中, 控制了年龄、性别、身体质量指数及心率影响后, HRV 指标 LF/HF (低频/高频) 与 PSQI 量表的睡眠障碍得分存在显著相关性 ($\beta = 0.138, P = 0.034$)。按年龄分层进一步多重线性回归分析发现在 30-40 岁年龄段, HRV 指标 TP (总功率) 与 VAS 疲劳程度评分存在显著负相关性 ($\beta = -0.330, P = 0.006$), 随着疲劳程度加重, TP 值下降; 而在 20-30 岁年龄段, LF/HF 与 VAS 疼痛评分呈正相关 ($\beta = 0.227, P = 0.019$), 即 LF/HF 的值随着肌肉/关节/一般性疼痛程度升高而升高。

结论 精神专科医院职工的疲劳率 23.15%, 长期疲劳率 13.89%, 长期疲劳会影响睡眠质量、生活质量及心理健康。在日常真实环境中, HRV 指标 LF/HF 与睡眠障碍程度正相关, 而 HRV 指标与疲劳及疼痛的关联与年龄有关。上述结果提示 HRV 具有作为真实世界中疲劳及相关心理健康状态 LF/HF 客观评估指标的潜力。

抑郁症患者治疗前后认知功能改善与脑区代谢变化的关系

张保华*
首都医科大学附属北京安定医院

目的 探讨抑郁症患者治疗前后认知功能改善与前额叶区和海马区代谢物改变的关系。

方法 纳入受试者 44 例, 包括 MDD 患者 22 例和健康对照 22 例。在基线期和治疗 8 周后对所有患者进行临床症状、主观认知功能、和客观认知功能的评估, 并进行左侧前额叶及左侧海马的 MRS 扫描以评估代谢物的含量。采用双样本 T 检验分别比较 MDD 患者治疗前和治疗 8 周后与健康对照之间认知功能和脑代谢物的差异, 采用配对样本 T 检验比较 MDD 患者治疗前后临床症状、认知功能和脑代谢物的差异。采用 Pearson 相关分析检测认知功能改善与脑代谢物变化的关系。

结果 MDD 患者 PDQ-D 和言语功能损害明显, 经抗抑郁药物治疗 8 周后, 患者的即刻记忆、延迟记忆、RBANS 总分和 PDQ-D 评分都得到了改善。MDD 患者用药前、后左侧前额叶 NAA/Cr 的含量均低于健康对照。MDD 患者用药后左侧海马 MI/Cr 的含量低于用药前, 但左侧前额叶代谢物用药前、后无明显变化。MDD 患者药物治疗前后左侧海马代谢物的变化与认知功能的变化之间的相关性分析未发现具有统计学意义的相关性。MDD 患者药物治疗前后左侧前额叶代谢物的变化与认知功能的变化之间的相关性分析发现视觉空间和注意功能的改善分别与 NAA/Cr 的减少呈正相关, 而其他方面的认知功能变化与脑代谢物变化未发现具有统计学意义的相关性。

结论 MDD 患者的视觉空间和注意功能的改善与左侧额叶区 NAA/Cr 的减少呈正相关。

谵妄风险因素、预防干预、重叠症状及临床措施最新进展

阮乃荣*

宁波市精神病院

谵妄是由多种因素引起的急性可逆的神经精神综合征, 以注意力、意识、认知功能发生急性改变为特征, 它通常不能归结为由已预先存在的神经认知障碍所诱发。2021 年出版的《综合医院谵妄诊治专家共识》中建议, 谵妄的定义采用 ICD-11 来叙述, 即: “谵妄是急性或亚急性起病的注意障碍(即指向、

聚焦、维持和转移注意的能力减弱) 和意识障碍(即对环境的定向力减弱), 在一天内症状常出现波动, 并伴其他认知障碍(如记忆、语言、视空间功能或感知觉障碍等), 可影响睡眠觉醒周期, 其病因常为非精神行为障碍类疾病、物质或某种药物中毒或戒断。”

谵妄会导致患者治疗方案增加、住院时间延长、护理负担加重, 处理谵妄产生的医疗成本极高, 但 30-40% 的谵妄可以通过预防避免发生[2, 17, 18]。不同国家或地区, 不同医疗场景的发病率(%) 也有所差异。美国[2]的一项社区研究, 发病率 1-2%, 意大利[3]和西班牙[4]社区分别为 3.6% 和 0.96%。心脏术后, 约旦[5] 9%, 波兰[6] 21.4%。ICU 病房, 捷克[7] 26.1%。一项系统综述[8] ICU 病房 4%。加拿大[9] 老年痴呆病房 3.4%。意大利[10] 老年痴呆门诊 13.3%。澳大利亚[11, 13] 安宁疗护 40.2-45%。一项系统综述[12] 安宁疗护 29-35%。系统综述[14-15] 卒中后 13-48。荷兰[16] 精神科门诊 19%。

因此, 全面系统的了解谵妄的全过程对预防及应对谵妄的发生具有重要意义。本文从风险因素、未发生谵妄时的预防干预、发生后的叠加症状鉴别、以及临床措施来综述谵妄的全过程及其最新研究进展, 以期全面系统的阐述谵妄并呈现最新的医学数据。

DKK1/Wnt/ β -catenin 信号通路和炎症介质在首发精神分裂症患者中的表达及相关性研究

宋佳起 陈大春*

北京回龙观医院

目的 探讨首发精神分裂症患者血清 DKK1/Wnt/ β -catenin 信号通路和炎症介质在抗精神病药治疗前后的表达情况及其与精神症状的关联。

方法 纳入 98 名首发精神分裂症患者和 55 名健康对照者, 患者组接受单一利培酮治疗, 且完成为期 10 周治疗和随访, 采用阳性和阴性症状量表 (positive and negative symptoms scale, PANSS) 评定患者的临床精神症状, 采用酶联免疫吸附法测定所有受试者外周血清中 Dickkopf 相关蛋白 1 (DKK1)、 β -连环蛋白 (β -catenin)、高迁移率族蛋

白 1 (High mobility group protein box 1, HMGB1) 和白细胞介素-6 (Interleukin-6, IL-6) 的表达情况。

结果 1、基线患者组 DKK1、 β -catenin、HMGB1 及 IL-6 水平均显著高于对照组 ($P < 0.001$); 2、10 周利培酮治疗后, 患者组 β -catenin、HMGB1 和 IL-6 水平较治疗前显著下降, 而 DKK1 较治疗前无明显差异 ($P > 0.05$); 3、斯皮尔曼相关分析提示患者组治疗前后 PANSS 减分值与基线 DKK1 水平呈负相关 ($r = -0.274$, $P = 0.008$), 其余变量间无显著相关; 4、Logistics 分析显示基线 DKK1 可预测患者 10 周利培酮治疗的疗效 ($OR = 0.972$, $95\%CI = 0.951 \sim 0.994$, $P = 0.012$), ROC 曲线提示基线 DKK1 预测治疗有效的最佳临界值为 144.60ng/mL, 此时敏感度为 76%, 特异度为 61.4%。

结论 首发精神分裂症患者存在 DKK1/Wnt/ β -catenin 信号通路及炎症介质的表达异常, 提示 DKK1/Wnt/ β -catenin 信号通路及炎症介质可能参与精神分裂症的发病机制; 经过 10 周的利培酮治疗后, 患者 β -catenin、HMGB1 和 IL-6 表达水平较前显著下降, 并趋近正常水平; 基线 DKK1 水平越低, 提示患者精神症状改善更明显, 因此我们推测基线 DKK1 对首发精神分裂症患者精神症状的改善可能具有一定预测作用。

MECT 治疗边缘性人格障碍的疗效

孙大海*

阜新市第四人民医院

目的 边缘性人格障碍的诊断, 目前精神科对于边缘性人格障碍的治疗方法, 以及后续的社会支持, 心理支持, 在治疗中附加 MECT 治疗的效果及推广。

方法 边缘型人格障碍的症状包括: 第一, 是人际关系的不稳定; 第二, 是自我形象的不稳定; 第三个, 是情绪的不稳定。在情绪激烈易爆发且难以调控, 人际关系分离导致情绪失控, 会出现消极的观念, 甚至伤害自己的行为。所以, 这样的人经常会出现自杀和自伤的行为, 他们会经常暴露, 没办法控制自己的情绪。另外, 他们也有自卑和自负的这

种交替的情绪出现, 没办法认可自己。一般会追溯到童年, 它有早期的一些创伤, 治疗一般是要采取长程的心理治疗。同时该类患者在对抗焦虑, 自卑, 自负情绪同事会伴发酒精类物质滥用导致就后出现威胁自杀自伤反复发作等等行为, 在折磨自己的同时折磨家人。

在临床治疗上, 该类患者因不愿配合治疗, 也不愿做心理治疗而难以得到良好的疗效, 我院在诊疗中配合 MECT, 在术后进行短期心理治疗效果良好, 共治疗 4 例, 对照组 2 人给予小剂量抗焦虑药物配合心理治疗, 治疗组以 MECT 为主, 每人每次 14 次足疗程隔日一次 MECT, 术中渐进增加抗精神病药物利培酮, 最大剂量 4 毫克/日, 利用患者在术中稳定情绪下配合短时心理治疗。

结果 治疗患者中对照组患者在出院后, 病情未见改善, 出院后继续饮酒, 复发率 100%。治疗组两例, MECT 术后曾出现短暂记忆丧失, 大约 10 小时就可完全恢复, 未见副作用, 情绪稳定, 患者出院后保持服药, 精神状态稳定, 情绪稳定, 未见饮酒, 自杀, 自伤等行为。

结论 边缘性人格障碍等人格障碍疾病, 在临床属于难治性心理疾患, 在治疗中, 可配合 MECT 治疗缓解情绪, 同时稳定脑内神经递质, 同时在稳定期间配合短时心理治疗, 临床效果明显, 值得推广。

Phase Synchronization in Neuronal Activities in Adults with Major Depressive Disorder and Bipolar Depression: A Resting-state Electroencephalogram Study

Yingtian Wang^{1,2}, Xixi Zhao^{1,2}, Bin Wang^{1,2}, Yunxi Zheng^{1,2}, Yu Chen^{1,2}, Yanping Ren^{1,2}, Sha Sha^{1,2}, Ling Zhang^{1,2}, Gang Wang^{1,2}

1.National Clinical Research Center for Mental Disorders & National Center for Mental Disorders, Beijing Key Laboratory of Mental Disorders, Beijing Anding Hospital, Capital Medical University, Beijing, China

2.Beijing Key Laboratory of Mental Disorders

Objective To explore functional connectivity

differences among patients in major depressive disorder (MDD) and different types of bipolar disorders presented in resting-state electroencephalogram (EEG), with an attempt to identify and typify patients early in their depressive episode

Methods In this research, we analyzed resting-state EEG from patients with MDD (62), BD I (61) and BD II (60) in both eyes open (EO) and eyes closed (EC) conditions. Phase lock value (PLV) was applied to explore the connection and synchronization in neuronal activities spatiotemporally between different brain regions. We compared PLV among three groups of participants, and further analyzed correlation between PLV of connections with significant differences and the severity of depression via scores of 17-item Hamilton Depression Rating Scale (HDRS-17)

Results 1. During EO, PLVs of MDD were higher than BD I, while there were no significant differences between MDD and BD II, as well as BD I and BD II (theta: LT-MOC/alpha: LMFC-LT)

2. During EC, PLVs of MDD were higher than BD I, though there were no significant differences between MDD and BD II, as well as BD I and BD II (beta2: PFC-LT/beta2: LT-MOC/beta3: PFC-LT/beta3: RMOC-LMOC/beta3: PP-RMOC). In the band of beta3, higher PLVs were found in BD I than MDD in the connections of LT-RMOC.

3. There were no significant correlations between PLV and HDRS-17 scores when checking connections with significant different PLV (all $p > 0.05$).

Conclusion 1. Brain phase synchronization was stronger in MDD patients than in BD I patients who were in depressive episodes, while there was no significant differences between MDD and BD

2. The differences of phase synchrony between MDD patients and BD I patients exist mainly in the beta frequency band.

3. Left temporal region may be a key site for identifying MDD and BD patients by resting-state EEG.

4. Differences in cerebral phase synchrony between BD I patients and MDD patients may be an indicator of quality type for early identification.

phase lock value

大语言模型在投射测验解读中的优化策略探索：标准化施测与评估体系的建构

赵欣颖¹ 曹敏讷¹ 王佳峰¹ 曹澜澜¹ 薛闯¹ 李达² 邓伟¹

1.浙江大学医学院附属精神卫生中心/杭州市第七人民医院

2.华东师范大学人类学研究所

目的 本研究旨在探索优化大语言模型 (large language models, LLMs) 投射测验 (projective test) 解读能力的有效策略, 以促进其在心理测评领域的广泛应用。

方法 本研究以房树人 (house-tree-person, HTP) 测验为例, 探索了标准化施测与评估体系构建在优化大语言模型投射测验解读能力中的效果。首先, 采用观察法详细记录并分析了房树人测验的临床施测过程, 以制定标准化施测流程, 确保施测流程的一致性和规范性。同时, 采用德尔菲法进行多轮专家咨询, 制定并不断优化房树人报告评估的标准。随后, 使用多种大语言模型基座, 解读房树人测验, 并生成报告。最后, 邀请专家在单盲条件下基于评估标准对房树人测验报告 (同一幅测验图片, 包括一份心理评估员的解读报告和余份模型生成报告) 进行打分, 以评估不同模型基础解读能力的差异。通过向模型提供受试者人口学信息, 设定模型心理评估专家角色、需关注的画面特征与报告输出要求等提示词 (prompt) 信息, 进一步探索了不同模型解读效果提升的差异。

结果 初步结果表明: (1) 本研究有效建立了标准化施测流程。在未标准化房树人施测流程前, 大语言模型对房树人测验的解读效果不及专业评估人员。随着标准化施测流程的引入, 模型解读能力在专业性与丰富度等方面均有所提升。(2) 本研究建立了有区分效度的报告评估体系。该评估体系从专业性、丰富度、可理解性、共情能力四个维度出发, 可有效评估不同模型在不同提示词内容下, 模型生成的房树人测验报告的解读能力与专业评估人员的差异。

结论 本研究通过探索房树人测验标准化施测

流程与报告评估标准,建立了大语言模型在投射测验解读中的优化策略。未来研究可进一步探讨大语言模型在更多不同类型投射测验中的解读表现以及优化策略,以期在心理测评领域实现更加广泛和深入的应用。

基于生物信息学探究重性抑郁障碍共病炎症性肠病的分子机制

刘久楹 李幼东*

河北医科大学第一医院

目的 重度抑郁障碍(Major depressive disorder, MDD)是一种病因复杂的精神性疾病,以情绪低落、兴趣丧失、思维迟缓为主要临床表现。炎症性肠病(Inflammatory bowel disease, IBD)以慢性复发性肠道炎症为特征。越来越多的证据显示IBD患者常伴有MDD,但具体机制仍不清楚。本研究着重运用生物信息技术探究IBD共病MDD的分子机制,并预测能够指导临床用药的潜在治疗药物。

方法 1.在美国生物技术中心公共基因表达综合数据库(GEO)中检索MDD及IBD外周血样本基因数据并筛选出差异基因。

2.将差异基因通过基因本体论(GO)和京都基因组百科全书(KEGG)进行途径分析。

3.采用加权基因共表达网络分析筛选共表达基因模块,寻找枢纽基因。

4.通过GeneCard数据库获得GO和KEGG结果中关键机制的基因集,探究枢纽基因与关键调控机制基因的相关性。

5.通过miRcode数据库获得与枢纽基因相关的关键miRNAs。

6.在GEO数据库中检索MDD及IBD的miRNA数据集,对关键miRNAs进行验证。

7.预测与两种疾病共病的相关小分子及药物。

8.绘制受试者工作特征曲线,评估枢纽基因在两种疾病中的诊断价值。

结果 1.MDD与IBD共同的上、下调差异基因分别为:930个与1086个;2.共有差异基因参与到mRNA代谢过程、细胞的激活、先天免疫反应等生

物学过程中,并参与到志贺氏菌病、自噬、铁死亡等通路中;3.加权基因共表达网络分析筛选出16个与MDD和IBD相关的共同基因,与差异基因重叠后,得到6个枢纽基因:MYL9、SEC14L5、HIST1H4H、HLA-DPB1、CBX2、CDK6;4.相关性分析发现枢纽基因与铁死亡及自噬机制相关;5.推测得到调控枢纽基因的139个miRNA,其中hsa-miR-5688、hsa-miR-4500、hsa-let-7c、hsa-let-7a、hsa-let-7e平均连接性最高;6.验证发现hsa-let-7a在MDD和IBD的miRNA数据集中均存在差异;7.睾酮、甲亚硒酸、夫拉平度盐酸盐、非瑟酮、卡马西平、3,4-二溴-1H-吡咯-2,5-二酮、3,4-二(羟甲基)-1H-吡咯-2,5-二酮是治疗MDD共病IBD的潜在药物及小分子物质。

结论 本研究揭示了MDD共病IBD潜在生物学机制、枢纽基因以及调控枢纽基因的关键miRNA,并进一步预测了临床中治疗两者共病的药物及小分子物质。

Genetic Associations between Depression and Autoimmune Thyroiditis Identified by Common Variants and Rare Coding Variants

Siyi Liu Qiang Wang*

West China Hospital, Sichuan University

Objective To comprehensively analyze the shared and distinct genetic background of major depressive disorder (MDD) and autoimmune thyroid disease (AITD)

Methods We verified the phenotypic association between ICD-coded depression and autoimmune thyroid disease using the hospital inpatient records of UK Biobank, followed by an assessment of genetic correlation and causation between these traits using the largest publicly available GWAS summary statistics. We then performed integrative fine-mapping with GWAS findings and exome-wide association analysis with the full 450k UK Biobank WES release. Next, we identified pleiotropic and trait-specific genes by combining findings from analyses of common variant GWASs and

WES. Pathway enrichment analysis and protein-protein interaction (PPI) analysis were conducted to reveal the association of these traits at the level of functions

Results The Cox hazard ratio analysis showed MDD and AITD were associated with a 2.8-fold increase in the risk of developing each other. Significant genetic correlation was observed between MDD and AITD, which remained consistent across methods. Mendelian randomization and latent causal variable (LCV) analyses suggested the genetic correlation between phenotypes may arise due to shared genetic factors instead of genetic causality. The pleiotropic analysis highlighted 14 loci and 58 genes with confirmed pleiotropy. Pathway enrichment analysis showed significant enrichment in terms relevant to regulation of T cell activation and kinase activity, post-embryonic development, and positive regulation of catabolic process. Protein-protein interaction (PPI) analysis identified five functional clusters that contribute to the co-occurrence between MDD and AITD

Conclusion Using a combination of GWAS summary statistics, hospital inpatient admission data, and whole-exome sequencing genotypes from large cohorts, our study identified common genes and functional clusters that contribute to the comorbidity of major depressive disorder and autoimmune thyroid disease. Findings from this study have advanced the understanding of the shared genetic architecture of these conditions and should be informative in the field of disease prevention and treatment

关键词: GWAS, WES, MDD, AITD, pleiotropy

精神科药物与抗利尿激素分泌失调综合征

杨丽源*

重庆市精神卫生中心

目的 抗利尿激素分泌失调综合征是多种原因引起的内源性抗利尿激素分泌异常增多, 从而导致水潴留、尿排钠增多以及稀释性低钠血症等有关临床表现的一组综合征, 严重者可导致患者死亡。作为一种内分泌疾病, 在内分泌科可能很常见, 在精

神科, 可能会以一种罕见的药物副反应出现, 对于精神科医生来说, 对该病的识别和处理存在困难, 本研究将从该病的临床表现、发生机制和治疗原则等展开讨论, 为精神科临床预防和治疗该病提供参考。

方法 通过查阅文献及结合临床个案治疗经验进行研究。

结果 临床表现: 病人表现得软弱无力、嗜睡、头痛、恶心、呕吐等; 严重的出现精神错乱, 如谵妄, 甚至导致病人死亡。诊断: 电解质血 Na^+ 低于 130mmol/L 为临界点, 多数在临床发现时血 Na^+ 低于 120mmol/L , 可伴有低 Cl^- ; 尿渗透压高于 $100\text{mosmol/hg}\cdot\text{H}_2\text{O}$ 、尿钠常超过 30mmol/L 或尿钠浓度高于 40mEq/L , 血浆渗透压常低于 $270\text{mOsm/kg}\cdot\text{H}_2\text{O}$ 。有条件的可测得血精氨酸加压素 (AVP) 异常增高。病因: 抗利尿激素分泌失调综合征, 最主要的病因是肿瘤、肺部疾病、中枢神经系统疾病和各种药物; 精神科最主要的是药物引起抗利尿激素分泌失调。机制: 精氨酸加压素 (VP) 由下丘脑视上核和视旁核合成, 运送至神经垂体储存和分泌入血, 受体液渗透压和血容量等的影响。体液渗透压改变会刺激渗透压感受器而影响 VP 的分泌, 渗透压感受器集中在下丘脑第三脑室前腹侧部。精神科药物影响漏斗-结节通路中 DA、5-HT、GABA 等在突出间隙的浓度, 可能会对渗透压感受器产生抑制性作用, 而影响 VP 的分泌。多数情况下, 人体自身可通过神经-体液等机制进行调节, 而个别人由于个体因素, 导致调节失衡, 从而引起精氨酸加压素分泌过多, 出现抗利尿激素分泌失调综合征。治疗上: 最重要的是重在预防, 定期复查电解质, 及时发现和处理。对症处理严重低钠低氯, 但应避免过快的纠正电解质, 过快纠正可能导致渗透性的迟发性神经系统脱髓鞘性病变。药物治疗上伐普坦类 (Vaptans) 是一类选择性非肽类血管加压素 (AVP) V2 受体拮抗剂类药物, 对抗利尿激素分泌失调的治疗有一定的效果。精神科临床上, 一旦发现, 考虑和药物有关, 及时更换药物, 精神科药物作用解除后会通过自身的神经体液的调节回复正常。

结论 精神科药物可引起抗利尿激素分泌失调综合征, 可能与药物作用于漏斗结节通路有关, 从而抑制渗透压感受器, 导致精氨酸加压素的异常分泌。临床需警惕可导致患者死亡的严重低钠血症, 注意抗利尿激素分泌失调的预防和治疗。

1.浙江大学医学院附属精神卫生中心/杭州市第七人民医院

2.华东师范大学人类学研究所

目的 本研究旨在评价由大语言模型 (large language models, LLMs) 驱动的精神专科病历精准标注系统的准确性和稳定性, 并在人机对比中验证机器和精神科医师之间的一致性, 为实现智能病历质量控制提供科学依据。

方法 本研究根据浙江省住院医师规范化培训结业考核中的精神专科病历评分体系, 设计了一套更加精准的标注系统: 通过判断一份病历当中描述的具体内容是否正确、有效服务于该患者的诊断、鉴别诊断和治疗计划, 给出“是”或“否”的回答。其主要设计优势在于将原本抽象和主观的评分条目化整为零, 拆解为多个意义明确的判断问题, 以期提高评分的颗粒度和客观性。研究当中由精神科医师通过传统评分体系和精准标注系统对一批病历进行评分, 而 LLMs 分别在两种评价方式的提示工程下完成同一批病历的重复评分。

结果 研究发现: (1) 相比于传统病历评分体系, 精准标注系统在精神科医师组表现出更好的组内一致性、区分效度和重测信度, 在 LLMs 组的重复评分中也保持更好的稳定性和区分效度; (2) 相比于传统病历评分体系, LLMs 驱动的精准标注系统可以和精神科医师给出的分数保持更好的一致性。

结论 精神专科病历精准标注系统更适合作为 LLMs 的提示工程, 在提高评分一致性和稳定性方面具有显著优势, 在智能病历质控中具有应用前景, 并为人工智能技术的整合提供了可靠的科学依据。

Distribution of Self-Reported Borderline Personality Disorder Traits and Symptoms in A Large-scale Clinical Population

Yong Lin¹, Tianhong Zhang²

1.Kangci Hospital of Jiaxing

2.Shanghai Mental Health Center

Objective To explore the distribution characteristics of BPD traits and symptoms within clinical populations

Methods A total of 3015 participants were consecutively sampled from outpatients at the psychiatric and psycho-counseling clinics. BPD symptoms were assessed using a self-reported personality diagnostic questionnaire. Having BPD traits is defined as having five or more positive items in self-reported BPD characteristics. Participants were stratified into male and female groups, age groups, and diagnostic groups (schizophrenia, mood disorders, anxiety disorders). Exploratory factor analysis using principal components analysis was conducted. Three factors were identified: "F1: Affective Instability and Impulsivity", "F2: Interpersonal Unstable and Extreme Reactions", and "F3: Identity Disturbance"

Results Among 3015 participants, 45.9% of the patients self-reported BPD traits. Comparing of male and female patients, there was no statistically significant difference in the occurrence rate of BPD traits ($\chi^2=1.835, p=0.176$). However, in terms of symptoms, female patients reported more symptoms than male patients. Female patients also exhibited more pronounced features on F2 compared to male patients ($t=-1.972, p=0.049$). There is a general decrease in BPD traits, symptoms, and factors with increasing age. Specifically, the proportion of positive BPD traits is approximately halved before the age of 30 and decreases to around one-third after the age of 30. BPD traits were most common in the Mood Disorders group at 55.7%, followed by the Anxiety Disorders group at 44.4%, and Schizophrenia group at 41.5% ($\chi^2=38.084, p<0.001$)

Conclusion Our study revealed the pervasive presence of BPD traits and symptoms among psychiatric outpatients, exhibiting distinctive distributions across gender, age, and diagnostic categories. These

findings emphasize the significance of identifying and addressing BPD pathology in the clinical care of psychiatric outpatients

精神分裂症家族史阳性与阴性患者非酶类抗氧化物水平的比较研究

李心明¹ 寻广磊^{1,2}

1.山东省精神卫生中心

2.中华医学会精神医学分会生物精神病学组

目的 基于精神分裂症患者的遗传性,探索具有阳性家族史患者群体的非酶类抗氧化物水平特征,旨在加深对精神分裂症患者生化特征的理解。

方法 研究共纳入 171 例符合 ICD-10 诊断标准的精神分裂症患者,其中家族史阳性的患者 47 例,家族史阴性的患者 124 例。排除标准:(1)器质性脑疾病或脑外伤;(2)肝肾功能异常、高血压、糖尿病、代谢综合征等可能会影响非酶类抗氧化物水平的躯体疾病;(3)合并有其他精神障碍;(4)妊娠试验阳性或哺乳期女性;(5)入组前服用抗氧化剂等可能会影响非酶类抗氧化物水平的药物。采用 PANSS、PANSS-EC、CDSS 量表分别评估患者的精神病性症状、激越症状和抑郁症状。测定外周血尿酸、白蛋白和总胆红素等非酶类抗氧化物水平。两组间比较采用独立样本 t 检验或秩和检验,以双侧 $P < 0.05$ 为差异有统计学意义。

结果 家族史阴性组的 PANSS 总分 (82.45 ± 8.70) 分显著低于家族史阳性组 (85.79 ± 9.42) 分,两组差异具有统计学意义 ($P < 0.05$)。家族史阳性组的尿酸水平为 $344.30 (149.10)$ $\mu\text{mol/L}$,白蛋白水平为 $43.5 (5.00)$ g/L ,总胆红素水平为 $12.8 (8.00)$ $\mu\text{mol/L}$;阴性组的尿酸水平为 $356.20 (123.73)$ $\mu\text{mol/L}$,白蛋白水平为 $43.3 (4.18)$ g/L ,总胆红素水平为 $14.35 (8.98)$ $\mu\text{mol/L}$,两组间 3 种非酶类抗氧化物水平均无显著差异 ($P > 0.05$)。

讨论 精神分裂症的阳性家族史是发病的重要因素,关于精神疾病家族史与非酶类抗氧化物之间关系的研究较少。分子遗传学研究表明,抗氧化途径中相关基因的多态性与精神分裂症存在关联。

本研究虽未能观察到家族史阳性患者与家族史阴性患者之间的非酶类抗氧化物水平差异,仍应关注自由基代谢异常在遗传因素影响疾病临床特征中的可能作用。未来可继续在临床研究和基础实验中深入探索,为精神分裂症的诊疗提供新的理论依据及治疗思路。

结论 精神分裂症的非酶类抗氧化物水平可能与家族史无关。

关键词:精神分裂症,家族史,非酶类抗氧化物

有无幻听的精神分裂症患者任务态脑功能研究

张家欣¹ 张家欣² 王久菊¹ 田菊¹ 权文香¹ 宋艳平¹ 乔惠婷² 汪待发² 董问天¹

1.北京大学第六医院

2.北京航空航天大学

目的 探索精神分裂症有无幻听的患者在进行语言流畅性检测(VFT)时其脑激活与脑网络情况。

方法 纳入北京大学第六医院伴有幻听的精神分裂症患者 178 例(幻听组),不伴幻听的精神分裂症患者 172 例(非幻听组)作为研究对象。通过近红外脑功能成像技术(fNIRS)采集 VFT 诱发的全脑血氧信号,并划分为八个 ROI 脑区,基于其氧合血红蛋白、脱氧血红蛋白和总血红蛋白浓度变化值(HbO, HbR, HbT),分别计算其组词阶段积分值,平均血氧变化值,组词开始前 5 秒血氧曲线斜率以及 VFT 任务期间重心值。同时计算通道间 Pearson 相关,并进行 Fisher r-z 转换,得到静息态脑网络连接情况。之后对于实验组和对对照组之间的比较采用独立样本 t 检验;对于多个通道的多重比较,采用 FDR 校正一类错误概率。显著性水平定为 $P < 0.05$ 。

结果 幻听组与非幻听组在校正后,其 HbR 积分值与 HbR 均值在左侧颞上层(Superior Temporal Cortex, STC)差异显著(幻听组更大);其 HbT 重心值在两侧腹外侧前额叶皮层(Ventrolateral Prefrontal Cortex, VLPFC)差异显著(幻听组更大);其余特征值在校正后均无显著差异。HbO、HbR、HbT 的通道间 FC 数据校正前存在显著差异,但校正后差异均不显著。

结论 幻听组与非幻听组任务态下脑激活情况

与血氧响应时间在大脑的听觉和言语加工区域存在显著差异,该发现为幻听发生的生理机制提供了进一步支持。

2.北京大学精神卫生研究所

3.北京航天航空大学

4.北京大学医学部公共卫生学院

背景 近红外光谱成像技术 (functional Near Infrared Spectroscopy, fNIRS) 是一种非侵入性脑功能检测方法,通过检测大脑表层结构的血红蛋白浓度变化来间接表征神经活动水平。精神分裂症是一种重性、慢性致残性精神疾病,而言语性幻听 (Auditory Verbal Hallucination, AVH) 是其常见症状之一,对疾病的严重程度和患者的功能结局具有重要影响。

目的 采用 fNIRS 探讨伴有幻听 (AVH+) 与不伴有幻听 (AVH-) 的精神分裂症患者在静息状态下的脑功能连接差异,并探讨该状态下 AVH+组与 AVH-组存在显著差异脑区的功能连接水平与 AVH 症状之间的相关性。

方法 选取符合美国精神障碍诊断与统计手册第 5 版 (DSM-V) 诊断标准的精神分裂症患者共 38 例,以近 1 周是否存在 AVH 症状分为 AVH+ (n=14) 和 AVH-两组 (n=24),利用 fNIRS 检测两组在 8 分钟静息状态下的大脑活动,用偏相关分析估计两组在 17 个皮质区域、52 个通道下的静息态功能连接 (Resting-State Functional Connectivity, RSFC),比较两组的静息态功能连接差异,并将 AVH+组与 AVH-组存在显著功能连接差异的皮层区域的 RSFC 与患者精神症状评定-幻听症状分量表 (Psychiatric Symptoms Scale-AVHs, PSYRATS-AVHs) 得分情况作相关性分析。

结果 静息状态下,AVH+组与 AVH-组相比,其左侧颞上回和右侧中央下区、左侧颞上回和右侧

颞中回之间的功能连接显著增强,AVH+组的左侧颞上回和右侧中央下区、左侧颞上回和右侧颞中回功能连接强度和 PSYRATS-AVHs 评分之间呈显著正相关。

结论 AVH+的精神分裂症患者静息状态下大脑的听觉和言语加工区域之间存在显著的异常功能连接,该发现为幻听发生的生理机制提供了进一步支持。fNIRS 在检测幻听症状方面具有潜在的临床应用价值。

1 例早期被诊断为 meige 综合症的迟发性运动障碍患者的临床诊疗思考

章晓英*

杭州市第七人民医院

目的 报道 1 例早期被诊断为 meige 综合症的迟发性运动障碍患者的临床表现和诊治经过,旨在提高本病的早期识别和诊断,减少临床误诊漏诊。

方法 总结 1 例不典型迟发性运动障碍患者的临床资料,对患者既往病史、用药经过和 7 年随访,最后使用新一代 VMAT-2 抑制剂达到症状有效改善。

结果 本例患者为 63 岁女性,病程 8 年,起病症状为频繁眨眼伴双眼睑下垂,半年后出现嘴唇及肢体的抖动。外院诊断为“meige 综合征、帕金森综合征”,先后予“氟哌啶醇、苯海索、美多芭、泰舒达”等药物服用,肉毒素局部注射,效果不佳,后因双眼睑下垂影响行走,行双眼眼皮部分切除提拉术,效果仍一般。住院 2 月前患者出现咀嚼、磨牙等不自主动作,同时伴有舌头发麻不适。追问既往用药史,发现患者 8 年前曾有服用过氟哌啶吨美利曲辛 2 年。结合服用药物病史及临床表现,考虑迟发性运动障碍,予新一代 VMAT-2 抑制剂 (氘丁苯那嗪) 治疗,每日剂量 24mg,患者眨眼、咀嚼、磨牙等动作明显减轻,病情改善,最后诊断为迟发性运动障碍。

结论 迟发性运动障碍 (tardive dyskinesia,TD) 是药物诱发的多动性运动障碍,一般表现为舌、下面部和下颌及四肢不自主痉挛和舞蹈样运动,典型表现为口-舌-颊三联征。该患者早期以单纯的眼肌运

动异常(眨眼、眼睑痉挛)为主要表现,容易和 meige 综合征的眼睑痉挛型混淆。TD 患者除了运动障碍外,部分还伴有感觉异常,如舌痛舌麻、牙龈酸胀、口腔不适等,症状具有异质性,中等剂量以上的新一代 VMAT-2 抑制剂在此类患者中具有较好的临床效果。

关键词: meige 综合征,迟发性运动障碍,氘丁苯那嗪

未治疗的精神分裂症患者 BDNF 水平与体重指数的相关性研究

仇玉莹 李洁*

天津市安定医院

目的 脑源性神经营养因子(BDNF)被认为是神经精神疾病发生发展的潜在生物标记物,也有研究发现 BDNF 在调节能量平衡中发挥着重要的作用,如脂肪氧化和葡萄糖利用等。本研究旨在 BDNF 与未治疗精神分裂症患者体重指数的关系。

方法 本研究纳入于天津市安定医院门诊或住院的 170 例患者,符合美国精神障碍诊断统计手册第五版(DSM-5)精神分裂症或精神分裂样障碍的诊断标准,既往未接受过系统抗精神病药治疗。在基线收集患者的一般资料,采用阳性与阴性症状量表(PANSS)评估精神症状的严重程度,晨起测定患者空腹状态下的身高、体重,并于同日采集空腹肘静脉血样标本,进行分装,储存。采用酶联免疫吸附法(ELISA)检测血浆标本 BDNF 水平。体重指数(BMI) = 体质量(kg) / 身高(m²),以 BMI 超过 24kg/m² 将患者划分为正常体重组及超重/肥胖组。用 SPSS27.0 进行统计分析。

结果 170 例未治疗的精神分裂症患者中 BMI 超过 24kg/m² 的有 60 例(35.29%)。正常体重组与超重/肥胖组在性别、年龄、文化程度等方面均无显著性差异,但在病程方面,正常体重组病程短于超重/肥胖组(P<0.05)。两组间 BDNF 水平无显著性差异(P>0.05)。进一步进行性别分层,结果显示在男性患者中正常体重组 BDNF 水平高于超重/肥胖患者,且差异存在统计学意义(P<0.05),相关分析也显示 BDNF 水平与患者 BMI 呈负相关(P<0.05),而在女性患者并未发现这一差异(P>0.05)。

结论 DNF 水平与未治疗的男性精神分裂症患者的体重指数存在相关性,这为精神分裂症患者的肥胖/超重状况采取个性化的治疗及预防措施提供理论依据。

以动作性震颤为主的罕见脊髓小脑共济失调(SCA12 型)家系报道

章晓英*

杭州市第七人民医院

目的 报道 1 例早期被诊断为特发性震颤的脊髓小脑共济失调患者的临床表现、辅助检查结果以及诊治经过,旨在提高本病的早期识别,减少临床误诊漏诊。

方法 总结 1 例来自有明确阳性家族史患者的临床资料,对患者行影像学检查及基因检测,最后诊断为少见的 SCA12 型。

结果 本例患者为 59 岁女性,48 岁左右开始出现双手动作性震颤,进行性发展,影响头部和肢体,伴有言语的含糊,影响日常生活。其父亲、哥哥、姑姑有类似震颤病史。头颅 MRI 未见明显异常,全外显基因检测未见致病基因。考虑到患者有明确的家族史,已震颤为主要临床表现,除特发性震颤外,脊髓小脑性共济失调需要排除。行 SCA 相关基因检测,检测到 SCA12 相关基因一种一条染色体 CAG 重复拷贝数为 47,提示与脊髓小脑性共济失调 SCA12 基因型有关。对其有类似症状的表哥进行基因验证,发现 SCA12 相关基因一种一条染色体 CAG 重复拷贝数为 48。由此,结合阳性家族史和基因检测,患者明确诊断为家族性脊髓小脑性共济失调(SCA12 型)。

结论 SCA12 型平均发病年龄为 33 岁,早发者主要临床表现为头部及肢体震颤,晚发者为轻微帕金森病症状、痴呆、认知减退和精神症状。致病基因位于染色体 5q31.q32,由基因 PPP2R2B5'端非编码区 CAG 重复扩增致病,是唯一以动作性震颤为主的 SCAs 亚型,见于德国和印度家系,国内报道少见。当临床上碰到家族史阳性,以动作性震颤为主的患者,除了要考虑特发性震颤外,还需要排除脊髓小脑性共济失调。

关键词：特发性震颤，脊髓小脑性共济失调，SCA12,CAG 重复扩增

影像学特征迟滞的神经元核内包涵体病一例

黄子洋 章晓英*

杭州市第七人民医院

目的 报道 1 例早期被诊断为阿尔茨海默病的神经元核内包涵体病 (Neuronal intranuclear inclusion disease, NIID) 患者的临床表现、辅助检查结果以及诊治经过，旨在提高本病鉴别及早期识别，减少临床误诊漏诊。

方法 通过总结 1 例诊断为 NIID 患者的临床资料，分析其影像学检查、皮肤肌肉活检及基因检测，诊断其为 NIID 痴呆型。

结果 该患者为 72 岁女性，以 8 年前出现近记忆力减退，幻听，被害妄想为主要表现，当时，2 年前进行头颅 MRI 检查，显示脑萎缩改变，MMSE22 分，诊断为“阿尔茨海默病”，服用“盐酸多奈哌齐片”后疗效不佳。1 年前在此基础上出现情绪不稳，行走不稳，尿失禁。入院是复查头颅 MRI 提示 DWI 序列皮髓质交界区高信号改变，初步诊断考虑 NIID，随即对该患者进行 NIID 相关的 NOTCH2NL1 基因检测及病理检测，显示其 NOTCH2NL1 基因中 GGC 重复次数为 105 次，皮肤活检显示纤维母细胞核内包涵体 P62、泛素阳性，随后对其家系进行筛查，其 2 名女儿未见基因异常扩增，家族中无类似患者。至此，结合患者临床表现、影像学表现、基因检测结果及家族筛查，确诊为“NIID 痴呆型”。

结论 NIID 临床表现存在明显异质性，其为一组三核苷酸重复疾病 (trinucleotide repeat disorders, TRDs)，TRDs 的临床表型主要取决于三核苷酸重复序列的数目，其被认为与包括 AD、PD、SCA 在内的多种疾病相关。GGC 重复序列数目与 NIID 的临床表型之间存在显著相关性，通常，GGC 重复超过 200 次表现肌无力表型，100-200 次表现痴呆表型，少于 100 引起帕金森病表型。多数散发患者以记忆下降为首发症状，并伴有发作性脑病、自主神经功能障碍、共济失调、帕金森综合征等症状，既为临床诊断造成干扰，也为临床诊断提供线索。其典型影像学表现为皮髓质交界区异常，但其影像学改变存

在动态变化或非典型表现，例如枕叶 DWI 和 FLAIR 呈现高信号、胼胝体 DWI 呈高信号、无影像学改变、异常信号动态消失、影像学特征滞后等。因此，在临床诊疗过程中，建议痴呆患者动态监测头颅影像学情况，对于出现发作性脑病、自主神经功能障碍等情况的患者，在排除其它疾病后继续完善皮肤活检及基因学检测，为痴呆及精神障碍患者的诊断及未来的治疗方向提供新思路。

关键词：痴呆；神经元核内包涵体病；三核苷酸重复疾病；MRI

抗 NMDAR 抗体脑炎合并复发性多软骨炎所致精神障碍一例

黄子洋 章晓英*

杭州市第七人民医院

目的 报道 1 例早期被诊断为双相情感障碍的抗 NMDAR 抗体脑炎合并复发性多软骨炎 (relapsing polychondritis, RP) 患者的临床表现、辅助检查结果以及诊治经过，旨在提高对自身免疫性疾病所致精神障碍的早期识别，减少临床误诊。

方法 通过总结 1 例诊断为抗 NMDAR 抗体脑炎合并复发性多软骨炎患者的临床资料，了解其临床表现，影像学表现特征，诊疗要点及远期随访的结果。

结果 该患者为 47 岁女性，6 年前出现精神异常，哭泣，有时易怒，有时悲观，曾割腕自杀未遂，当地医院诊断“双相情感障碍”，期间服用各类药物后症状有短暂好转，但均有波动，期间反复就医均诊断“双相情感障碍”。3 年前出现症状加重，有明显幻视、被害妄想、锥体外系症状，在药物治疗上联合 MECT 治疗仍无明显好转。来我院就诊完善头颅 MRI 右侧颞极可见斑片状异常信号影，考虑为“器质性精神障碍”，予完善腰椎穿刺检查提示脑脊液抗 NMDAR 受体抗体滴度 1:10，当时诊断“抗 NMDAR 抗体脑炎”，予激素冲击治疗联合丙种球蛋白治疗 2 周后仍无明显改善。进一步完善患者病史，其既往有多次“耳软骨炎、结膜炎”病史，入院结膜充血发红，胸部 CT 提示有胸腔积液，考虑其有“复发性多软骨炎”，当时予启动二线免疫治疗，“利妥昔单抗”治疗 1 月后精神症状消失，认知功能恢复，锥体

外系症状消失, 3 月后复查脑脊液 NMDAR 受体抗体滴度 1:3.2, 2 年来患者随访症状无再发, 今年 1 月头颅 MRI 显示右侧颞极可见斑片状异常信号影明显缩小。

结论 复发性软骨炎是一种罕见的、潜在致命的自身免疫性疾病, 其病因不明, 主要表现为软骨和其他富含蛋白多糖的结构进行性炎性改变。但其也会累及神经系统, 神经系统受累的临床表现包括头痛、颅神经麻痹、共济失调、多神经炎、脑膜脑炎、全身性或局灶性癫痫、痴呆和脑梗死。尸检的发现表明血管炎是潜在的发病机制。在一项回顾性研究中显示, RP 神经系统病变患者占同期住院 RP 患者的 16.4% (33/201), 在这 33 例 RP 神经系统病变患者, 对神经系统病变形式进行分类, 发现 RP 神经系统受累的表现多样, 中枢神经系统症状中, 边缘性脑炎和缺血性脑卒中是 RP 最常见的神经系统受累表现, 其临床表现可表现为亚急性起病的精神症状发作, 但中枢性 RP 可能对激素缺乏有效的反应, 且激素有加重精神症状的不良反应, 免疫抑制剂可能成为中枢神经系统受累的 RP 患者的首选用药。皮肤、结膜检查易被忽视, 但其通常包含很多重要临床信息, 因此在查体过程中对于常规皮肤检查也需要提高重视, 会为临床诊疗过程带来许多重要线索。

精神分裂症认知损害的生物机制: 基于血浆外泌体代谢组学的研究

李美娟 仇玉莹 李洁*

天津市安定医院

目的 外泌体指直径在 40-100nm 的盘状囊泡, 是局部和全身信号和调节系统, 重要的是, 大脑神经细胞能够分泌外泌体, 并通过血脑屏障进入外周, 外泌体能够携带宿主细胞的大量调控信息, 在靶细胞中起到相应的调控作用。由此, 外泌体为我们通过外周血了解神经细胞间的调控模式提供了可能。本研究旨在通过外周外泌体代谢组学检测, 寻找精神分裂症认知损害的潜在生物机制。

方法 纳入符合条件的未用药精神分裂症患者

和健康对照各 10 例, 采集所有参与者的社会人口学资料和认知评估。采集晨起空腹外周血, 经过超高速离心提取外泌体。同时, 应用透射电镜, 纳米颗粒跟踪分析以及 Western Blot 三种方式对提取的外泌体进行鉴定。随后, 应用非靶向代谢组学技术对外泌体内的代谢物进行检测。

结果 (1) 经过对原始数据的过滤, 填补和标准化处理之后, 7206 个 peak 被保留, 我们应用 OPLS-DA 对数据进行处理, 显示两组间能够被有效的区分。(2) 本研究选用 $p < 0.05$ 且 $VIP > 1$ 作为筛选条件, 获得组间差异代谢物 510 种, 其中上调的代谢物 311 种, 下调 199 种。(3) 我们在数据库中对差异代谢物进行命名匹配, 得到具有 MS2 评分大于 0.3 的代谢物共 9 种, 包括下调的 3'-Methoxypterarin, 3-AMINO-2-PIPERIDONE 和 Glutaric acid; 以及上调的 p-Cresolsulfate, PC(16:0/16:0), L-Lactic acid, Creatinine, Allantoin, PC(P-18:1/20:5)。(4) 对认知表现与差异代谢物进行相关性分析, 控制性别, 年龄和教育后显示: 在患者组中注意警觉维度与磷脂酰胆碱 PC(16:0/16:0) 呈正相关 ($r=0.88$, $p=0.009$); 工作记忆维度与肌酐呈正相关 ($r=0.763$, $p=0.046$), 与 3-AMINO-2-PIPERIDONE 呈负相关 ($r=-0.775$, $p=0.041$); 社会认知维度与 3-AMINO-2-PIPERIDONE 呈负相关 ($r=-0.767$, $p=0.044$)。(5) 在健康对照中, 注意警觉与维度与 3-AMINO-2-PIPERIDONE 呈正相关 ($r=0.841$, $p=0.018$); 社会认知维度与 p-Cresolsulfate 呈负相关 ($r=-0.887$, $p=0.008$)。

结论 外泌体技术为研究者通过外周研究大脑功能提供了可能, 本研究发现精神分裂症患者较健康对照存在外泌体代谢谱的改变, 认知损害症状可能与磷脂酰胆碱, 肌酐以及 3-AMINO-2-PIPERIDONE 有关, 而这些关联未在健康对照中重复, 提示精神分裂症认知损害的机制具有特异性。

超短脉冲无抽搐电休克治疗术后谵妄发生的相关研究

徐国新 隋毓秀*

南京医科大学附属脑科医院 (南京脑科医院)

目的 探究超短脉冲无抽搐电休克治疗能否减少精神分裂症患者疗后谵妄的发生, 以及其对胆碱酯酶、炎症指标、海马神经生化代谢物的影响。

方法 选取 2022 年 8 月至 2023 年 8 月间, 南京医科大学附属脑科医院住院部符合疾病和有关健康问题的国际统计分类(第十次修订本)SCZ 诊断标准、年龄在 18~55 岁、拟行无抽搐电休克患者为研究对象。随机分为超短脉冲组和短脉冲组, 接受超短脉冲 MECT(脉冲波宽 0.25ms)或短脉冲 MECT(脉冲波宽 1.0ms)。在疗前和 MECT 一疗程结束后 24 小时内头颅磁共振波谱扫描和血清样本的采集, 同时进行谵妄和精神症状的评估。谵妄评估采用躁动-镇静评分量表和意识模糊评估法; 扫描磁共振波谱, 测定海马区域神经生化代谢物变化, 包括 N-乙酰天冬氨酸(N-acetyl-aspartate, NAA)、肌酸(creatinine, Cr)、肌醇(myo-inositol, MI)以及胆碱(choline, Cho); 同时, 采集十二项细胞因子包括白介素-6(Interleukin-6, IL-6)等以及炎症指标 C 反应蛋白(C-reactive protein, CRP)和胆碱酯酶(Cholinesterase, ChE), 对细胞因子进一步加权成组对比, 评估 MECT 治疗前后变化。统计采用卡方检验和独立样本 t 检验分别对分类变量和连续变量进行统计分析, 治疗后的谵妄结果采用卡方检验, 血清胆碱酯酶水平、血清炎症标志物水平、MRS 采用独立样本 t 检验。

结果 UBP 组和 BP 组基线的人口学数据和临床资料、胆碱酯酶、炎症因子、海马波谱、MECT 治疗次数, 以及 MECT 治疗后 BPRS 评分均无统计学显著性差异。UBP 组和 BP 组谵妄发生率有显著的统计学差异, BP 组有 27 人发生谵妄 (36%), 存在更高谵妄发生率。MECT 疗后, UBP 组胆碱酯酶含量显著高于 BP 组, 差异具有统计学显著性。UBP 组在 CRP、IL-6、IL-8、IL-10、IL-1 β 、TNF- α 水平明显低于 BP 组, 差异具有统计学意义。MECT 疗后, UBP 组在 TH2、Treg、M1、IRS、CIRS 水平显著低于 BP 组。在 MECT 治疗后, UBP 组右侧海马 NAA/Cr 及左侧海马 NAA/MI 水平低于 BP 组, 差异具有统计学意义。

结论 相较短脉冲 MECT, 超短脉冲 MECT 治疗 SCZ 可能具有减少疗后谵妄发生副反应的优势, 并且二者疗效并无显著性差异。UBP 组胆碱酯酶含量高于 BP 组提示超短脉冲 MECT 可能通过减轻电刺激对神经元非同步去极化的影响, 进一步减少中枢胆碱能紊乱, 以及促炎反应, 从而减轻其对谵妄的影响。结果为阐明 MECT 作用机制提供了部分科

学依据。

Altered Brain Regional Homogeneity and Cognitive Impairments in Medication-free Female Patients with Current Depressive Episodes in Bipolar Disorder and Major Depressive Disorder

Xijia Xu*

the Affiliated Brain Hospital of Nanjing Medical University, Nanjing Brain Hospital, Nanjing, China

Objective Nearly 60% of bipolar disorder (BD) cases are misdiagnosed as major depressive disorder (MDD). Exploring objective biological markers is crucial for differentiating BD from MDD. Gender differences in prevalence, clinical presentation, disease trajectory, and treatment response in BD suggest unique neurobiological characteristics in female patients.

Methods Regional homogeneity (ReHo) was analyzed in 51 medication-free female patients with bipolar depressive episodes (BDE), 63 medication-free female MDD patients, and 45 female healthy controls (HCs). Partial correlation analysis explored links between brain regions and clinical characteristics. Support vector machine (SVM) analysis assessed classification accuracy

Results BDE patients exhibited more severe cognitive deficits in processing speed, attention, word learning, and overall cognitive function than MDD patients. Compared with HCs, both BDE and MDD patients showed decreased ReHo in the left Lobule VI and increased ReHo in the left Precuneus. BDE patients also had reduced ReHo in the left Lobules IV-V and increased ReHo in the right Putamen, unlike MDD patients, who showed no significant differences in these regions. In BDE patients, a significant negative correlation was found between the right Putamen and HAMD scores, but no significant links were found between abnormal ReHo and cognitive function assessments. SVM

effectively differentiated between BDE, MDD, and HCs

Conclusion Cognitive impairments were more severe in female BDE patients than in MDD patients. Changes in ReHo values of the left Lobules IV-V and right Putamen might serve as unique neuroimaging markers of BDE. Alterations in ReHo values of the left Lobule VI and left Precuneus could serve as common pathophysiological mechanisms for BDE and MDD and indicate depressive states

关键词: female bipolar disorder, major depressive disorder, cognitive dysfunction, regional homogeneity, support vector machine

阈下抑郁大学生的扣带回功能连接与外周血炎症因子的相关性研究

齐张璋 王颖* 陈盼
暨南大学附属第一医院

目的 探讨阈下抑郁人群的扣带回种子点功能连接与炎症细胞因子之间的相互关系。

方法 对 126 例阈下抑郁大学生和 104 例健康对照进行静息态功能磁共振(rs-fMRI)扫描、心理状态评估及外周血炎症细胞因子水平检测。其中 rs-fMRI 选择 5 对岛叶种子区: 双侧膝下前扣带回(sub-ACC)、双侧膝前前扣带回(preACC)、双侧胼胝体上前扣带回(supACC)、双侧中扣带回(MCC)、双侧后扣带回(PCC)进行功能连接分析; 采用中文版流调抑郁量表(CES-D)、贝克抑郁量表第二版(BDI-II)、24 项汉密尔顿抑郁量表(HAMD-24)、汉密尔顿焦虑量表(HAMA)和反刍思维量表(RRS)量表对心理状态进行评估; 并检测阈下抑郁组和健康对照组的外周血炎症细胞因子水平, 包括白介素-6(IL-6)、白介素-1 β (IL-1 β)、白介素-17(IL-17)和肿瘤坏死因子- α (TNF- α)。分别计算阈下抑郁大学生扣带回亚区功能连接值与心理状态量表及炎症细胞因子水平之间的相关系数, 最后进行三者间的交互分析。

结果 (1) 与对照组相比, 阈下抑郁组左侧 MCC 与双侧尾状核、左侧 supACC 与双侧小脑前叶、右侧 supACC 与右侧额上回之间的功能连接增加; (2) 阈下抑郁组的 IL-1 β 、IL-17 和 TNF- α 水平均

升高; (3) IL-1 β 水平与右侧 supACC-右侧额上回功能连接改变共同影响阈下抑郁组的 RRS 评分, IL-17 水平与右侧 supACC-右侧额上回功能连接改变共同影响阈下抑郁组的 HAMA 评分。

结论 扣带回和额上回之间的功能失调和 IL-1 β 、IL-17 的免疫失调及其相互作用可能在抑郁早期发挥重要作用。

Altered Sensorimotor Network Function in Treatment-Naïve Patients with First-Episode Major Depressive Disorder

Xijia Xu*
the Affiliated Brain Hospital of Nanjing Medical University, Nanjing Brain Hospital, Nanjing, China

Objective The neurodevelopmental hypothesis posits that Major Depressive Disorder (MDD) is a brain disease. Exploring such irregular brain activities can deepen our understanding of the neural pathologic mechanisms underlying clinical characteristics and help identify potential biomarkers to differentiate MDD patients from HCs

Methods The fractional amplitude of low-frequency fluctuation (fALFF) was used to investigate brain activities of 60 patients with first-episode drug-naïve MDD and 60 healthy controls (HCs). Partial correlation analysis was conducted on altered fALFF values and the severity of symptoms and cognitive deficits. Moreover, support vector machine analysis was used to evaluate the accuracy of abnormal fALFF values in distinguishing patients with MDD from HCs

Results Patients with MDD exhibited significantly reduced fALFF values in the sensorimotor network (SMN), encompassing the right precentral gyrus/postcentral gyrus, right superior parietal lobule (SPL), and left supplementary motor area (SMA). Conversely, increased fALFF values were observed in the right medial prefrontal cortex. Furthermore, correlation

analysis suggested that the verbal learning deficits in patients with MDD are related to abnormal brain activity in the left SMA. Importantly, SVM analysis demonstrated that the fALFF values of the right SPL and left SMA were highly accurate in distinguishing MDD patients from HCs

Conclusion The pathophysiological mechanism underlying cognitive deficits in MDD may be associated with a reduction in local activity within the SMN. Moreover, the combination of fALFF values in the right SPL and left SMA can be used to discriminate patients with MDD from HCs effectively

关键词: major depressive disorder, cognitive dysfunction, fractional amplitude of low-frequency fluctuation, support vector machine, somatosensory-motor network

积极共情能力与抑郁的关系：领悟社会支持的中介作用

朱天怡¹ 徐家华¹ 沈晴² 张紫靖³ 谭淑平¹

1.北京回龙观医院、北京大学回龙观临床医学院

2.华北理工大学

3.中国科学院大学

目的 “感同身受”是个体对于他人的情绪和处境感知并做出反应的能力；这种能力称为共情，又称同理心；作为重要的情绪的认知成分，在情感障碍，尤其是抑郁和焦虑等心理健康问题中扮演重要的作用。积极共情，是对于他人或场景中的积极情绪进行共情的能力；在近年来积极心理学的框架下，逐渐揭示其在情感障碍中的作用。积极共情能够使个体在环境线索中领悟社会支持能力，并对社会压力等环境做出积极响应；本研究将探索领悟社会支持在积极共情和抑郁情绪中的作用。

方法 本研究于2024年6月使用在线平台对45名18-35岁的成年人进行调查。使用PHQ-9抑郁自评量表、领悟社会支持量表(PSSS)、积极消极共情量表(PaNES)作为研究工具。采用独立样本T检验，考察不同人口统计学特征(性别、受教育程度)在领悟社会支持、共情和抑郁间是否存在差异。采用Pearson相关考察领悟社会支持、共情和抑郁症状

之间的相关性。运用线性回归模型，分析领悟社会支持在共情对其抑郁症状的影响中是否存在中介作用。

结果 差异性分析结果显示，积极共情能力在不同性别以及受教育程度之间的差异没有统计学意义。相关分析结果显示，积极共情与PHQ-9呈显著负相关($r=-0.399, P<0.01$)，领悟社会支持与PHQ-9呈显著负相关($r=-0.535, P<0.001$)，积极共情与领悟社会支持呈相关($r=0.571, P<0.001$)。领悟社会支持在共情对抑郁症状关系中的中介作用成立，直接效应为 $-0.145(SE=0.144; P<0.5; 95\% \text{ Bootstrap CI}=[-0.436, 0.146])$ ；间接效应值为 $-0.175(SE=0.059; P<0.01; 95\% \text{ Bootstrap CI}=[-0.295, -0.995])$ ；总效应为 $1.362(SE=0.314; P<0.001; 95\% \text{ Bootstrap CI}=[0.727, 1.997])$ 中介效应值占总效应值的62.24%。使用Sobel检验对上述中介效应进行检验，结果显示中介效应显著($SE=0.097; P<0.05$)。

结论 根据本研究的结果发现，积极共情能力与抑郁症状之间存在显著的负相关关系，即积极共情能力越高，个体的抑郁症状越轻。此外，领悟社会支持与抑郁症状之间也表现出显著的负相关，表明社会支持的感知程度越高，个体的抑郁症状越低。进一步的分析显示，领悟社会支持在积极共情与抑郁症状的关系中起到了显著的中介作用。结果表明，积极共情通过提高个体的领悟社会支持水平，间接地减轻了抑郁症状。这一发现强调了积极共情在促进个体心理健康方面的潜在价值，并为未来心理健康干预措施提供了新的视角。

关键词: 抑郁, 积极共情, 领悟社会支持, 共情能力

Relationship between Blood Pressure and Suicidal Ideation: A Cross-sectional Study of 1380 Chinese First-episode Unmedicated Inpatients with Major Depressive Disorder with Anxiety Symptoms

Li Shi*

Suzhou Guangji Hospital

Objective The effect of blood pressure (BP) on the risk of suicide attempt (SA) in patients with major

depressive disorder (MDD) is unclear, and the results of previous studies have been controversial and have not considered potential non-linear relationships. The aim of this cross-sectional study was to investigate the potential non-linear relationship between blood pressure and suicide attempts in a cohort of Chinese patients with first-onset, untreated major depressive disorder (MDD) with anxiety symptoms

Methods This cross-sectional study analysed 1380 patients with first-episode, untreated major depressive disorder (MDD) with significant anxiety symptoms and collected their sociodemographic characteristics and laboratory data. The researchers verified a history of suicide attempts through medical records and systematic counselling, and measured blood pressure at rest. The researchers used the 17-item Hamilton Rating Scale (HAMD-17) and the Hamilton Anxiety Scale (HAMA) to assess the intensity of depression and anxiety symptoms in all participants. Univariate analyses explored the possible effects of gender, education, marital status, and relevant laboratory indicators on SA. To assess the relationship between blood pressure and SA risk, we used multivariate logistic regression analyses. In addition, we used multifactorial regression models to examine potential threshold effects

Results No linear relationship was found between blood pressure and SA by multiple logistic regression analysis. SA showed a U-shaped relationship with systolic blood pressure (SBP) and diastolic blood pressure (DBP), as observed by piecewise linear spline modelling, with minimum turning points of 131 mm Hg and 77 mm Hg for SBP and DBP, respectively. When blood pressure was above the nadir, SA was found to be positively correlated with SBP (OR = 1.18, 95% CI: 1.11 to 1.24, $p < 0.0001$) or DBP (OR = 1.09, 95% CI: 1.05 to 1.13, $p < 0.0001$). Once blood pressure was below nadir, SA was positively associated with DBP (OR = 0.96, 95% CI: 0.92 to 1.00, 0.0474; SA was not significantly associated with SBP (OR = 0.99, 95% CI: 0.97 to 1.01, $p = 0.2590$)

Conclusion The present study showed a U-shaped relationship between blood pressure and SA in Chinese first-episode unmedicated patients with MDD accompanied by anxiety symptoms, suggesting that

blood pressure levels may be a useful biomarker for assessing the risk of SA in this population

The Expansion of Newborn Neurons in Hippocampus Improves Social Recognition Deficit in A Mouse Model of Autism

Qiongwei Li Jun Li*

Peking University Sixth Hospital

Objective Autism spectrum disorders (ASDs) are a group of neurodevelopmental disorders characterized by core symptoms of impaired social interaction and communication. The pathological mechanism and treatment are not clear and need further study. Our previous study found that the deletion of high-risk gene Autism Susceptibility 2 (AUTS2) in mice led to dentate gyrus (DG) hypoplasia that highly associated with impaired social novelty recognition. Here we aim to improve the social deficit through increasing the neurogenesis in the subgranular zone (SGZ) and expanding the newborn granule neurons in DG

Methods Three approaches including repeated oxytocin administration, feeding in enriched environment and overexpression of cyclin-dependent kinase 4 (Cdk4)-CyclinD1 complex in DG neural stem cells (NSCs) at the post-weaning stage were conducted

Results Post-weaning treatment of oxytocin promotes the proliferation of NSCs in DG and reverses social deficit in *Auts2^{ff/ff};Emx1-Cre* mice. Post-weaning enriched environment feeding promotes the proliferation of NSCs in DG and improves the social recognition deficit in *Auts2^{ff/ff};Emx1-Cre* mice. Cdk4 and CyclinD1 expression in DG NSCs expands newborn neurons and restores impaired social novelty recognition in *Auts2^{ff/ff};Emx1-Cre* mice

Conclusion Our findings suggested a possible strategy to restore the social deficit through expansion

of newborn neurons in hippocampus, which might provide a new insight into the treatment of autism

关键词: autism, social recognition, dentate gyrus, neurogenesis, treatment

Advances and Future Perspectives in Transgendered Genetic Diagnosis

Bin Guo Ning Wang*

BEIJING HUILONGGUAN HOSPITAL

Objective In recent years, transgender population has been paid more and more attention in the field of society and medicine, especially in the field of genetics. This article aims to review the progress of genetic diagnosis of transgendered and provide scientific basis for further understanding of transgendered phenomenon

Methods Transgendered genetic diagnosis relies on techniques such as karyotype analysis and Fluorescence in situ hybridization. Chromosome karyotype analysis assesses abnormalities in sex-related genes by observing changes in the number and structure of chromosomes. The Fluorescence in situ hybridization uses specific probes to detect DNA sequences in specific regions of chromosomes to reveal variations in sex-determining genes. These methods have their own advantages and disadvantages, but all of them provide important basis for transgendered genetic diagnosis

Results Studies have shown that certain genetic loci are associated with transgendered phenomena. For example, by Genome-wide association study (GWAS), the team identified genetic loci associated with sexual orientation in Han Chinese men, such as RS17320865 for FMR1NB and RS7259428 for ZNF536. Genetic loci associated with same-sex sexual behavior have also been found in a broader population, such as European men, such as RS9677294 in the SLC8A1 gene, RS2414487 in LOC145783, and RS2106525 in the MDFIC gene. The study found that SRY gene plays a key role in male sex determination, and mutations in this gene may lead to abnormal gender development. In addition, other genetic variations in the sex-determining

region (SDD) may also affect gender identity

Conclusion These genetic findings have important implications for explaining the trans-gender phenomenon and its causes. First, they shed light on the genetic basis of transgendered phenomena, showing that transsexuals are not “Outliers” but manifestations of biodiversity. Second, these findings help to eliminate social misperceptions and prejudices against transgender people and promote gender equality and respect. Finally, the progress of genetic research provides a scientific basis for the health and rights protection of transgender people, and helps to promote the formulation and implementation of related policies. However, the discovery of genetic research also raises a series of social, ethical and legal questions. For example, the spread of genetic testing technology may lead to privacy leakage and discrimination issues; transgender people's gender identity and biological sex may lead to medical, education and other areas of the protection of rights and interests problems. Therefore, we need to take these problems seriously and explore corresponding solutions

精神分裂症患者胆汁酸与认知功能的关联研究

张宇航² 徐丽华¹ 何文蕊³ 青颖⁴ 王继军¹

- 1.上海市精神卫生中心(上海市心理咨询培训中心)
- 2.上海交通大学生命科学技术学院
- 3.上海交通大学安泰经济与管理学院
- 4.上海交通大学学生创新中心

目的 精神分裂症是严重致残的精神障碍,全球约有2400万人受其影响。患者经常面临污名、歧视和人权侵犯,缺乏有效预防和治疗。精神分裂症病因复杂,而认知功能障碍是核心症状。患者在记忆、注意、执行功能等方面常表现出明显的缺陷,这严重影响了他们的日常生活和社会交往。研究胆汁酸代谢与认知功能之间的临床关联,可以使我们可以更好地理解认知功能障碍的发生机制,从而实现早期干预。早期干预可能有助于减缓疾病的进展,

改善预后,减少症状的严重性和持续时间,提高患者的生活质量。

方法 招募精神分裂症患者(n=54)和健康对照组(n=37)进行胆汁酸检测和认知功能检测。通过生物信息学分析,构建胆汁酸与认知功能关联网络。胆汁酸检测所使用样本为受试者空腹血浆,使用UHPLC-TQMS 技术进行检测。认知功能检测使用MCCB 量表。受试者认知功能的组间对比使用 t 检验;胆汁酸浓度的组间对比使用多样本的非参数检验;探究认知功能与胆汁酸的关联使用 Spearman 秩相关分析。

结果 MCCB 量表中六个纬度认知功能以及总体认知功能,在不同类型的受试者中均有显著性差异。精神分裂症患者的认知功能相较于对照组显著降低。TCA、HDCA、DHCA、AICA、ILCA、gama-TMCA、DiLCA、 α -TMCA 这几种胆汁酸在组间显示出统计学上的差异($p=0.032$, $p=0.002$, $p=0.017$, $p=0.025$, $p=0.019$, $p=0.005$, $p=0.015$, $p=0.018$)。其中精神分裂症患者 AICA、DiLCA 浓度显著高于对照组;精神分裂症患者 TCA、HDCA、DHCA、ILCA、gama-TMCA、 α -TMCA 浓度显著低于对照组。DLCA 浓度与MCCB 量表中 AV (注意力)、RPS (推理与问题解决)这两种认知功能的得分以及总得分呈负相关($r=-0.363$, $p<0.05$; $r=-0.303$, $p<0.05$; $r=-0.399$, $p<0.05$); GDHCA 浓度与MCCB 量表中 Vrb1 (言语学习)和 Vis (视觉学习)这两种认知功能的得分呈正相关($r=0.453$, $p<0.01$; $r=0.374$, $p<0.05$)。

结论 精神分裂症患者在病理恶化的过程中,伴随着各纬度的认知功能降低。改善认知功能可能会对精神分裂症患者的治疗与康复起到积极的作用。DLCA 和 GDHCA 是具有潜力的生物指标。DLCA 浓度的升高可能对认知功能有着消极作用,是一种预警信号;GDHCA 浓度的降低则可能表示精神分裂病情的转归与恶化,其浓度的升高可能对认知功能的提高有着积极作用。

关键词:精神分裂,胆汁酸,DLCA,GDHCA

精神分裂症模型小鼠代谢组学分析与预测

俞萍 唐小伟*

江苏省扬州五台山医院

目的 神经递质是神经元之间或神经元与效应器细胞如肌肉细胞、腺体细胞等之间传递信息的化学物质,参与多种代谢途径,在生物体内信号传递中起着重点的作用。本研究通过对多种神经化学物质进行高灵敏度、高特异性和高通量的定量检测,来探究精神分裂症模型小鼠血清及脑组织中神经递质的异常变化以及通过利培酮治疗后神经递质的变化,思索异常代谢小分子物质在精神分裂症病理机制中的作用,探索辅助精神分裂症诊断的外周生物标记物;并与临床精神分裂症患者对比,进一步验证代谢物的变化是否有同一性。

方法 选取 60 只 C57BL/6 三周龄小鼠适应性饲养 5 天后,随机分 3 组,即正常组、模型组、利培酮组,每组 20 只。前 2 周正常组腹腔注射生理盐水,模型组及利培酮组腹腔注射 MK-801 (地佐环平 0.01ml/kg),每日一次。造模后分别对三组小鼠进行旷场实验、强迫游泳、Y 迷宫、新奇物识别、Morris 水迷宫、转棒疲劳行为学实验,评判造模是否成功。第 3 周正常组及模型组腹腔注射生理盐水,利培酮组腹腔注射 0.1mg/ml 的利培酮原药,每日一次。第 4 周取三组小鼠心脏血,离心留取血清及取小鼠脑组织。在-80°C条件下保存,采用 UPLC-ESI-MS/MS 分析方法,对目标代谢物进行定性定量检测。同步开始收集临床首发或停药后复发精神分裂症患者的血液样本,以及经过药物或者 MECT 治疗后血液样本。

结果 小鼠三组血清及脑组织中的神经递质有明显的差异,特别是色氨酸的犬尿氨酸通路中的代谢产物。检测发现,与正常组和利培酮组相比,模型组血清中 3-羟基-2-氨基苯甲酸、L-酪氨酸、琥珀酸含量明显升高 ($p<0.05$),色氨酸含量明显降低 ($p<0.05$),利培酮组与正常组之间无统计学差异 ($p>0.05$)。与正常组相比,模型组、利培酮组血清中 5-羟基吲哚乙酸、5-羟色胺、吲哚乙酸含量降低,且利培酮组 5-羟色胺与模型组相比含量更低,具有差异性 ($p<0.05$)。与正常组和模型组相比,利培酮组血清中牛磺酸、去甲肾上腺素、色醇含量降低 ($p<0.05$)。与正常组相比,模型组脑组织中 L-甘氨酸、L-天冬氨酸含量明显升高 ($p<0.05$),但与利培酮组之间无统计学差异 ($p>0.05$)。

结论 精神分裂症模型小鼠与正常组小鼠相比存在明显的外周小分子代谢物差异,主要集中在犬尿氨酸通路,而甘氨酸和天冬氨酸可能在精神分裂症的病理机制中具有重要作用。牛磺酸、去甲肾上腺素

腺素、色醇等神经递质可能与抗精神病药物的治疗效应有关。这些通路的代谢物的变化与临床患者与正常组的变化一致。

催产素与 5-羟色胺系统相互作用影响社会行为的研究进展

于睿*

湘雅二医院

催产素作为调节社交行为和情绪状态的关键神经调节剂，其受体（OXTR）分布广泛，存在于大脑的多个关键区域。研究表明，催产素的释放和作用不仅限于内分泌作用，还包括作为神经递质影响社会记忆、社会认知以及母性行为等。催产素系统的激活显示了其在维持正常社会功能中的作用。动物模型研究表明，催产素能改善自闭症模型动物的社交缺陷，指出了其潜在的治疗作用；临床研究也发现，鼻内给药的催产素可以增强人类对社会奖励的敏感性，减少攻击性，增强情感表达等。另一方面，5-HT 系统通过其广泛的投射路径，影响着情绪调节、奖励感知和社会互动。文中详细讨论了 5-HT 如何通过影响催产素的表达和释放，调节社会 and 情绪功能。特别是在中缝核的 5-HT 神经元可以直接调控 PVN 区域的催产素神经元，显示了这一复杂的神经调节网络的双向交互性。文中进一步探讨了催产素和 5-HT 在神经系统中的相互作用，如 5-HT 通过激活 PVN 中的 OXTR 增强催产素的释放，反过来，催产素也通过影响 5-HT 的释放来调节情绪和社会行为。这些相互作用的细胞和分子机制正在被揭示，通过药理学和遗传学方法证实了催产素和 5-HT 系统通过特定的受体和信号通路相互作用，这可能对开发针对社会功能障碍和情绪障碍的新治疗策略具有重要意义。特别是在精神疾病如自闭症谱系障碍和抑郁症的背景下，理解和操纵这些系统的相互作用提供了新的治疗方向。

功能连接预测无抽搐电休克治疗重性抑郁症

疗效的静息态功能磁共振研究

张柳怡*

徐州医科大学

目的 采用静息态功能磁共振技术中的功能连接值探索无抽搐电休克治疗重性抑郁症的疗效的脑影像学标志物。

方法 收集 2021 年 1 月—2023 年 12 月于徐州医科大学附属徐州东方医院就诊、需要行无抽搐电休克的重性抑郁症患者 30 例无抽搐电休克治疗前后行静息态功能磁共振扫描，并采用汉密尔顿抑郁量表(HAMD-24)进行评估。采用基于 Matlab R2013b 平台的 DPABI V8.1 软件对影像学数据进行处理，提取治疗前后低频振荡振幅(ALFF)、标准化低频振幅(mALFF)值和局部一致性(ReHo)的差异脑区作为种子点，行 ROI 分析，具有显著性变化的功能连接(静息态功能磁共振 FC)值与临床减分率进行相关性分析，提取显著性相关的脑区作为特征输入支持向量机模型，利用基线重性抑郁症患者的功能连接值探索预测无抽搐电休克治疗疗效的脑区。

结果 左侧眶内额上回-右侧额上回功能连接($r = 0.38, p = 0.036$)以及右侧内侧额上回-左侧楔叶功能连接($r = 0.38, p = 0.039$)的变化分别与 HAMD 评分的变化与之间存在显著关系。以左侧眶内额上回为掩膜，预测无抽搐电休克疗效的准确率为 77%，曲线下面积为 0.45，其中左侧眶内额上回与小脑蚓部的功能连接值预测权重最大；以右侧内侧额上回为掩膜，预测无抽搐电休克疗效的准确率为 90%，曲线下面积为 0.61，其中左侧眶内额上回与左侧小脑下脚的功能连接值预测权重最大。

结论 额叶与小脑功能连接值可能具有潜在的预测无抽搐电休克治疗重性抑郁症的疗效的价值。

关键词：无抽搐电休克;重性抑郁症;支持向量机

心境障碍患者认知功能与脑网络拓扑学研究

胡茂林 宗小芬*

武汉大学人民医院

目的 探讨不同认知功能水平的心境情感障碍患者的脑网络拓扑学改变

方法 招募心境情感障碍患者 221 例，其中抑郁障碍患者 79 例，双相情感障碍患者 142 例；男性 68 人，女性 153 人。采用 MCCB 认知测量工具评估所有受试者的认知功能。采用依瑞德 BS-3000 近红外脑功能成像仪采集受试者的静息态近红外数据。采用聚类分析（瓦尔德法），将所有受试者按照认知功能聚类，结合 ARI 指数，分为不同类别；进一步分析不同类别受试者的脑网络拓扑学指标差异。

结果 所有受试者按照认知水平聚为 2 类，ARI 指数最高，为 0.9227。第 1 类认知功能显著优于第 2 类 ($P_s < 0.05$, FDR 校正)。将其命名为高认知组和低认知组，其中高认知组 43 例，低认知组 178 例。两组的拓扑学指标存在显著差异。局部网络指标，与高认知组相比，低认知组双侧 Broca 区、双侧 DLPFC 区和双侧 FPA 脑区的 Clustering Coefficient 显著降低 ($P_s < 0.05$, FDR 校正)。Betweenness Centrality、Degree Centrality、Nodal Efficiency、Nodal Shortest Path 等指标也有降低趋势，但未能通过 FDR 校正。全局网络指标，高认知组的 Network Efficiency local 指标高于低认知组 ($P=0.023$, FDR 校正)；但 Small World 属性低于低认知组 ($P=0.042$, FDR 校正)。

结论 心境情感障碍患者认知功能存在差异，认知功能水平高的患者脑网络拓扑指标优于低认知组，考虑患者认知功能可能与脑网络拓扑改变有关。

双相障碍研究协作组

童年创伤对双相情感障碍患者抑郁的影响：海马 CA3 亚区的中介作用

夏秋栋 沈阿姿 龚文玥 阎锐 翟清华 姚志剑*
南京脑科医院

目的 双相障碍患者 (Bipolar disorder, BD) 常伴有童年创伤，海马亚区体积对童年创伤具有不同的敏感性，然而海马亚区体积在童年创伤与 BD 患者抑郁症状之间的作用尚不明确。因此本研究旨在探索童年创伤与海马亚区体积异常在 BD 抑郁症状中的关系。

方法 招募 BD 抑郁相患者 112 例，健康对照 62 例，采集头部磁共振 T1 像。使用 FreeSurfer 分割海马亚区体积。使用协方差分析，年龄和性别纳入协变量，比较组间体积差异；一般线性回归模型探索童年创伤、海马亚区体积与抑郁严重程度之间的关系。

结果 伴童年创伤 BD 组与健康对照组相比，左侧 CA3、双侧 CA4、双侧齿状回颗粒细胞层 (GC-ML-DG)、右侧分子层、双侧海马-杏仁核过渡区 (HATA) 体积减小，而不伴童年创伤 BD 组与健康对照组海马亚区体积无差别。BD 组中遭受童年创伤与不伴童年创伤组比，左侧 CA1、CA3 区和双侧 GC-ML-DG、右侧分子层体积减少。其中海马左侧 CA3 亚区体积减少在 CTQ 总分和 BD 抑郁严重程度之间起部分中介作用。

结论 童年创伤可使得 BD 患者左侧 CA3、双侧 CA4、双侧 GC-ML-DG、右侧分子层、双侧 HATA 出现萎缩，其中海马左侧 CA3 亚区体积的减少在童年创伤和抑郁严重程度之间存在一定的间接效应，起到部分中介作用。

关键词：双相情感障碍，海马亚区，童年创伤，中介分析

Identification of Significant Biomarkers for Predicting The Risk of Bipolar Disorder with Arteriosclerosis Based on Integrative Bioinformatics and Machine Learning

Xiabing Zheng* Yaqi Zhang Cai Chen
Shenzhen Kangning Hospital/ Shenzhen Mental Health
Center

Objective Increasing evidence has indicated a connection between bipolar disorder (BD) and arteriosclerosis (AS), yet the specific bioinformatic mechanisms remain unclear. This study aims to investigate the common genes and molecular pathways involved in the development of both BD and AS

Methods BD-related dataset GSE12649 were downloaded from the Gene Expression Omnibus database and differentially expressed genes (DEGs) and key module genes derived from weighted gene co-expression network analyses (WGCNA) were identified. AS-related genes were sourced from the DisGeNET database, and the overlapping genes between DEGs and AS-related genes were characterized as differentially expressed arteriosclerosis-related genes (DE-ASRGs). The functional enrichment analysis and protein-protein interaction (PPI) network were conducted on DE-ASRGs. Candidate hub genes were identified using cytoHubba in Cytoscape and by finding the intersection between DE-ASRGs and key module genes derived from WGCNA. Three machine learning algorithms (Least Absolute Shrinkage and Selection Operator (LASSO) algorithm, Random Forest and support vector machine) were employed to identify hub genes and two external validation sets were included to verify the results. Additionally, the immune cell patterns of BD and AS were evaluated by single-sample gene set enrichment analysis (ssGSEA), and the correlation of hub genes with each immune cell was calculated

Results Overall, 67 DE-ASRGs were found to be overlapping between the DEGs and AS-related genes. Functional enrichment analysis highlighted the significant involvement of cancer pathways in the relationship between BD and AS. CytoHubba and WGCNA identified seven candidate hub genes (CTSD, IRF3, NPEPPS, ST6GAL1, HIF1A, SOX9 and CX3CR1), including three identified by cytoHubba and four identified by WGCNA. Eventually, two hub genes (CX3CR1 and

ST6GAL1) were identified as BD and AS co-biomarkers by using machine learning algorithms. Both two hub genes related to cancer, which were identified as the key pathway through KEGG enrichment analysis in this study. Single-gene GSEA analysis showed its correlation with proteasome, basal cell carcinoma, fatty acid degradation, mineral absorption and so on

Conclusion In the present study, we utilized bioinformatic techniques including three machine learning approaches to identify 2 hub genes, CX3CR1 and ST6GAL1, which were both significantly related to BD and AS. Furthermore, we uncovered that the co-pathogenesis of the two diseases lies in the cancer-related pathways through GSEA analysis. Overall, the newly discovered diagnostic genes and potential molecular mechanisms in this study offer new clinical insights and guidance for diagnosing and treating BD and AS patients. However, further experimentation is needed to confirm the conclusions.

Chronic Kidney Disease Duration and Suicide Risk Among Maintenance Hemodialysis Patients in China

Xinyue Wang Ping Sun*
Qingdao Mental Health Center

Objective Chronic kidney disease (CKD) is a progressive disorder with irreversible dysfunction of the kidneys. The global incidence of CKD is increasing at a rate of 8% per year, and it is expected to rise to the fifth most common early cause of death in humans by 2040. Patients with end-stage renal disease (ESRD), also known as Stage 5 CKD, are characterized by uremia. When approximately 30% of CKD patients progress to ESRD, the prolonged course of the disease is accompanied by a poor prognosis

Renal replacement therapy is the main treatment for kidney disease. Due to the shortage of renal resources, high risk and cost of kidney transplantation,

postoperative complications, and post-transplantation rejection, maintenance hemodialysis (MHD) has become the mainstream choice for maintaining renal function in patients with ESRD. The mortality of MHD patients is 6.5-7.9 times higher than that of the general population. MHD patients require long-term disease management and rely on machines for dialysis, which coupled with economic burdens, diet, activity restrictions, and life pressure, their quality of life is seriously affected.

MHD patients also suffered from mental and physical problems. A large number of MDH patients combined with mental disorders, especially depression and anxiety. The prevalence of depression is about 46% in MHD patients, and suicide is the most serious result. In 1971, a related study in the United States found that the suicide rate in dialysis patients was 400 times higher than that in the general population. Persistent suicide risk increased the risk of death and other negative events in dialysis patients. In addition, suicide causes huge economic losses, massive social burdens, and irreparable damage to individuals and families.

Currently, research on the psychological state of MDH patients in China mainly focuses on depression and anxiety, and there is little about the risk of suicide and related factors in hemodialysis ESRD patients. Therefore, this study used a standardized scale to assess the risk of suicide in patients with MDH and develop targeted interventions in the early stages of the disease to improve the quality of life and reduce mortality in MDH patients.

Methods We recruited ESRD patients treated with MHD in the Department of Nephrology, the Affiliated Hospital of Qingdao University Medical College from September 2019 to August 2021. The inclusion criteria included: (1) patients diagnosed with ESRD and CKD stage 5, whose glomerular filtration rate (GFR) $<15\text{ml}/(\text{min}\cdot 1.73\text{m}^2)$; (2) disease stabilized, MHD ≥ 3 months duration; (3) age ≥ 18 years old; (4) patients able to complete questionnaires and scales independently. Exclusion criteria followed: (1) acute renal damage caused by any disease; (2) complicated with severe infection and other underlying diseases; (3) stroke pa-

tients unable to express clearly; (4) history of mental illness or mental retardation. Finally, a total of 1330 MHD patients participated in this study

Three investigators, professionally trained in standardized assessment scales, assessed the severity of symptoms of subjects. Before obtaining informed consent from the subjects, the investigators explained in detail the purpose, methodology, and significance of this study. The investigators did not make any tendentious or inductive prompts except for necessary explanations. After the subjects made their choices, the investigators confirmed and recorded the options. All questionnaires were filled out, proofread, and collected one by one on-site to ensure the authenticity and quality of the questionnaires.

A self-designed basic information questionnaire was used to investigate the basic profile of MHD patients, including demographic characteristics (gender, age), disease status (duration of CKD, ESRD, and MHD), and coexisting diseases. The Nurses' Global Assessment Scale for Suicide Risk (NGASR) was used to assess the suicide risk of MHD patients. In this study, we defined those patients with an NGASR score of 0 as non-suicide risk patients. Depressive symptoms were assessed by the 17-item Hamilton Depression Rating Scale (HAMD-17), and patients with scores above 7 were diagnosed with depression. The severity of anxiety symptoms was assessed using the 14-item Hamilton Anxiety Rating Scale (HAMA), and patients with scores of 0-7, 8-14, 15-21, and 22 or more were indicated as having non-anxiety, mild, moderate, and severe anxiety symptoms, respectively.

Results A total of 543 (40.8%) patients had suicide risk with NGASR scores ranging from 1 to 19 points. After adjusting for age, gender, disease conditions, and mental state, the ORs of different CKD duration for suicide risk were 1.00, 2.02, 3.03, and 2.71, respectively (P for trend <0.001). There were significant interactions between chronic kidney disease duration and end-stage renal disease duration in relation to suicide risk (P for interaction <0.001). There were also interactions between chronic kidney disease duration and hemodialysis treatment duration to suicide risk (P for interaction = 0.01). Patients with end-stage renal disease

duration of ≤ 28 months or hemodialysis treatment duration of ≤ 24 months had the highest risk of suicide when the duration of chronic kidney disease was 63-94 months, about 2-10 times higher than the other time groups

Conclusion We found that chronic kidney disease duration was associated with an increased risk of suicide in maintenance hemodialysis patients in China, independently of other risk factors. The third quartile of chronic kidney disease duration was associated with a considerable (2-fold) increase in suicide risk. Early end-stage renal disease and maintenance hemodialysis were associated with suicide in CKD patients. The causality of these associations needs to be further confirmed in a multi-center longitudinal and prospective study

A Study On The Association Between Subjective And Objective Biological Rhythms And Mood Symptoms In Bipolar Disorder

Huirong Luo Renqin Hu Junyao Li Jinglan Tan Qinghua Luo*

the First Affiliated Hospital of Chongqing Medical University

Objective to explore the consistency between subjectively and objectively measured biological rhythm parameters among bipolar disorder (BD) outpatients during depressive or remitted episodes, and to explore the correlations between biological rhythms and mood symptoms

Methods Thirty-two samples were ultimately included. Wrist-worn actigraphy was used to obtain sleep and activity rhythmic parameters among BD outpatients, and questionnaires like Morningness-Eveningness Questionnaire (MEQ), Biological Rhythms Interview of Assessment in Neuropsychiatry (BRIAN), General Seasonality Score (GSS), Pittsburgh Sleep Quality Index (PSQI), Zung's Self-rating Anxiety Scale (SAS), Zung's Self-rating Depression Scale (SDS), Patient Health

Questionnaire-9 (PHQ-9), Generalized Anxiety Disorder-7 (GAD-7) were applied to assess circadian and seasonal rhythms, sleep quality and mood symptom severities

Results The average age of the patients was 26.8 (7.71) years, with a female proportion of 62.5% (20/32). In terms of rhythms, an earlier sleep onset time was associated with a higher MEQ score ($r=-0.39$, $p=0.03$), while a later awakening time ($r=0.49$, $p=0.00$) and longer wakefulness after sleep onset ($r=0.46$, $p=0.01$) were correlated with higher MEQ scores, indicating a longer total sleep time. Higher MEQ scores were associated with an earlier objective sleep onset time ($r=-0.46$, $p=0.007$). A higher MEQ score ($\beta=4.32$, $t=2.06$, $p=0.049$) was related to earlier sleep onset, and a lower GSS score ($\beta=-2.51$, $t=-2.59$, $p=0.02$) was associated with longer sleep duration. Additionally, higher MEQ scores were linked to lower BRIAN scores ($\beta=-0.69$, $t=-4.55$, $p=0.00$)

Regarding the association with mood, higher GSS scores were correlated with higher SAS scores ($\beta=2.20$, $t=4.39$, $p=0.00$) and higher SDS scores ($\beta=1.34$, $t=3.09$, $p=0.0046$). Moreover, higher BRIAN scores were associated with higher PHQ-9 scores ($\beta=0.32$, $t=3.02$, $p=0.01$), higher SAS scores ($\beta=0.62$, $t=3.22$, $p=0.00$), and higher SDS scores ($\beta=0.47$, $t=3.12$, $p=0.00$).

Conclusion There is a high consistency between subjective and objective rhythms in BD patients within depressive and remitted episodes. Individuals with a later chronotype, greater seasonal variations, and more severe circadian disturbances exhibit poorer sleep quality and more pronounced anxiety and depressive symptoms. Rhythm assessment may have significant implications in the clinical diagnosis and treatment of BD

奥氮平与氯氮平对照治疗兴奋激越症状的临床观察

唐颖*

泗阳县脑科医院

目的 比较奥氮平与氯氮平对兴奋激越症状的疗效。

方法 一、入组标准：1、选择 2024 年 1 月至 2024 年 5 月在本院住院，精神症状已急性兴奋激越为主（标准：简明精神病量表的激越因子分大于或等于 20）。

2、符合 ICD-10 诊断标准，50 例为精神分裂症，8 例为躁狂症，共计 58 例。3、患者及家属对本次研究内容了解并自愿签署知情同意书；3、排除有明确药物过敏史，排除严重躯体疾病者。4、平均随机分为奥氮平组（29 例）和氯氮平组（29 例），男女比例 1:1，年龄 16-55 岁之间。二、用药使用方法 奥氮平，根据病情在 5mg-20mg/天调整，氯氮平片，根据病情在 5mg-20mg/天调整 25mg-600mg，连续观察 2 周，期间不联合使用其他抗精神病药物。

结果 奥氮平片组，痊愈 4 例（13.79%），显著好转 18 例（62.07%），好转 5 例（17.24%），无效 2 例（6.90%），有效率（93.10%）；氯氮平组，痊愈 3 例（10.34%），显著好转 17 例（58.63%），好转 6 例（20.69%），无效 3 例（10.34%），有效率（89.65%）两组有效率比较差异无显著性。

结论 奥氮平与氯氮平的药理作用基本相似，本次研究情况显示奥氮平的有效率略高于氯氮平，其原因应该是奥氮平加量明显比氯氮平快，从而导致显效有差异，其实奥氮平与氯氮平在疗效上无明显异常。根据相关文献及临床实践中，奥氮平与氯氮平存在明显差异在于不良反应，氯氮平的不良反明显高于奥氮平。因此在今后的治疗中，奥氮平与氯氮平的选择上可以优先考虑奥氮平。

Associations between Dietary Habits and Bipolar Disorder: A Diet-wide Mendelian Randomization Study

Junyao Junyao Luo*

Department of Psychiatry, the First Affiliated Hospital of Chongqing Medical University

Objective Diet/nutrition is critically important

in the pathogenesis, progression, and treatment outcomes of various mental disorders. Current research predominantly focuses on the role of diet in the development and treatment of depression, with less attention given to the relationship between diet and Bipolar Disorder (BD)

Methods We employed Mendelian Randomization (MR) to investigate the relationship between 28 dietary habits and BD. An analysis was conducted using publicly available genome-wide association study data from the UK Biobank dataset. Various dietary habits were analyzed as exposures with BD as the outcome, mainly using the Inverse Variance Weighted (IVW) method

Results Intake of non-oily fish and sponge pudding both have a positive association with BD. Oily fish, dried fruit, apples, salt, and cooked vegetables intake also appeared potentially risky for BD, although the possibility of false positives cannot be ruled out. Sensitivity analysis further confirmed the robustness of these findings

Conclusion Our research provides evidence of a relationship between various dietary habits and BD. It underscores the need for careful dietary management and balance to reduce the risk of BD, suggesting caution with dietary preferences for fish and sponge pudding. Furthermore, more detailed studies are needed to further understand the potential impacts of high-sugar and high-protein diets on BD development

中医治疗正中神经损伤疗效观察

白美娜*

兰州市第三人民医院

目的 探讨多种中医治疗方法治疗正中神经损伤的疗效观察。其中包括普通孩针刺、经穴磁道疗法、汤剂、电针、火罐疗法、导引按蹻。

方法 临床实践观察，其中包括普通孩针刺、经穴磁道疗法、汤剂、电针、火罐疗法。通过对比患

者治疗前、治疗中、治疗后的肢体活动功能、舌象、脉象、脉细比、精神检查、患者的主管感受等观察评估疗效。

结果 正中神经损伤是指由于多种原因导致的正中神经受损出现的功能障碍，正中神经损伤是一种常见病，主要病因为创伤。主要临床症状包括感觉障碍、拇对掌受限、拇示指屈曲受限，可导致肌肉萎缩的并发症。严重者需要手术治疗。正中神经损伤给患者的心理带来一些痛苦，患者应当尽量保持积极的心态，家属日常注意安慰和疏导，适当的鼓励患者。

通过多种中医治疗手段，包括针刺、电针、经穴磁道疗法、火罐疗法、导引按跷（双手掌自行拍打）、汤剂治疗，能迅速有效的促进患者康复。同时可以有效改善患者的精神症状，比如失眠、易怒。多疑等。

结论 中医治疗痹症、痿证的优势，优先选取中医治疗，并同时改善患者失眠、易怒等精神症状。

通过多种中医治疗手段，包括针刺、电针、经穴磁道疗法、火罐疗法、导引按跷、汤剂治疗，迅速有效的促进患者康复。

双极性问卷：一项双相障碍筛查问卷的初步构建

甘照宇*

中山大学附属第三医院

目的 基于症状的两极性以及不稳定性编制一份适用于双相障碍筛查的自评调查问卷。

方法 基于既往文献以及双相障碍的本质特征——症状的两极性和不稳定性，构建具有 21 个条目的自评问卷，之后对 445 例当前符合美国精神障碍诊断与统计手册第 5 版（Diagnostic and Statistical Manual of Mental Disorders, 5th Edition, DSM-5）中关于抑郁症或双相障碍（Bipolar disorder, BD）任何一型诊断标准的患者其中（双相障碍 345 例、抑郁症 100 例）进行施测，使用克伦巴赫系数来评价量表的内部一致性信度，采用验证性因子分析来评估量表的结构性效度，通过绘制 ROC 曲线来评估问卷

的筛选性能。

结果 全量表的克伦巴赫系数为 0.872，逐个删除条目后，剩余量表的克伦巴赫系数在 0.863-0.871 之间，每个条目得分与量表总分的相关系数在 0.359（条目 10）-0.557（条目 5）之间。探索性因子分析共解析出 4 个特征值大于 1 的因子，其累积方差贡献率为 46.22%。对于 BD-I 型、BD-II、BD-MX、BD-NOS 以及 BD-总体，双极性调查问卷分别取 12、12、12、10 和 11 作为临界值时，其约登指数值最大，其对应的敏感度和特异度分别为：0.73 和 0.71、0.66 和 0.71、0.67 和 0.71、0.84 和 0.58 以及 0.71 和 0.65，ROC 曲线下面积（AUC）分别为 0.689、0.745、0.741、0.741 以及 0.741。

结论 双极性调查量表是一份符合量表编制要求的、能有效鉴别单、双相抑郁的自评问卷。

青少年首发抑郁障碍患者半年内转相影响因素研究

芦云平 崔伟* 张丽丽 宋丽华 于超 周梦迪 王琳彦

河北省第六人民医院(河北省精神卫生中心)

目的 为早期识别青少年双相障碍患者，比较半年内转相与未转相的青少年首发抑郁障碍患者人口学特征、疾病特征、治疗情况。

方法 纳入 2020 年 7 月至 2022 年 2 月青少年首次抑郁障碍门诊和住院患者 125 例，收集首发时人口学特征、疾病特征、皮质醇指标、甲状腺功能指标、血同型半胱氨酸指标、汉密尔顿抑郁量表评分、情感气质量表、急性期是否联合用药、急性期治疗期间是否使用抗精神病药物、急性期治疗是否单用抗抑郁药，急性期是否接受巩固期治疗、是否完全缓解等，经半年随访，了解间期疾病转归、疾病发作次数。

结果 完成半年随访 119 例。未转相组男性比例、首发时甲状腺功能中游游离甲状腺素(FT4)水平、首发时促甲状腺激素(TSH)水平均低于转相组(P 均<0.05)，未转相组首发急性期治疗联合用药比例、首发急性期治疗使用抗精神病药物比例均高于转相组(P 均<0.05)，未转相组急性期单用抗抑郁药比例

低于转相组 ($P < 0.05$)。半年内, 未转相组疾病总发作次数低于转相 ($P < 0.05$), 抑郁发作次数高于转相组 ($P < 0.05$)。多因素 logistic 回归分析, 男性 ($OR = 4.207$)、首发时 TSH 水平 ($OR = 1.546$) 与青少年首发抑郁障碍患者半年内转为双相情感障碍相关联。

结论 青少年首发抑郁障碍患者, 半年内男性患者更容易转相, 首发时促甲状腺激素水平与半年内转相相关联。

Causal Relationship between Genetically Predicted Mental Disorders and Frailty: A Bidirectional and Multivariable Mendelian Randomization Study

Wenxi Sun¹, Ping Sun², Sijia Tang³, Xiaohui Wu³, Jun Chen³, Yiru Fang^{3,4}, Xiaobin Zhang¹

1.Suzhou Guangji Hospital

2.Qingdao Mental Health Center

3.Shanghai Mental Health Center

4.Ruijin Hospital, Shanghai Jiao Tong University School of Medicine

Objective In observational studies, frailty has been strongly associated with mental disorders. However, the mechanisms underlying the association between frailty and mental disorders remain unclear

Methods We conducted a two-sample Mendelian randomization (MR) study to assess the causal relationship between frailty, as measured by the frailty index (FI), and ten common mental disorders. The datasets involved European ancestry individuals and included measurements of the FI ($N = 175,226$), schizophrenia (SCZ; $N = 320,404$), major depressive disorder (MDD; $N = 480,359$), bipolar disorder ($N = 337,199$), insomnia ($N = 462,341$), obsessive compulsive disorder ($N = 33,925$), anxiety disorders ($N = 463,010$), autism spectrum disorder ($N = 46,351$), anorexia nervosa ($N = 14,477$), opioid-related mental and behavioral disorders ($N = 215,650$), and mental and behavioral disorders due

to use of other stimulants including caffeine ($N = 215,570$)

Results Two-sample MR analyses were performed using inverse variance weighting followed by various sensitivity and validation analyses. Genetically predicted SCZ (odds ratio [OR] = 1.019, 95% confidence interval [CI] 1.005–1.033) and MDD (OR = 1.182, 95% CI 1.115–1.253) were significantly associated with higher FI. No causal links were identified between the FI and the other eight common mental disorders. Unfortunately, the reverse directional MR analysis found no causal relationship between ten common mental disorders and FI. In the Multivariable MR, the estimated MDD effect on FI is comparable to the univariate IVW estimate (OR = 1.203; 95% CI, 1.105 to 1.310), while the estimated SCZ effect on FI fails to be significant compared to the univariate estimate. The results of the sensitivity and validation analyses confirmed stabilization

Conclusion Our study strengthens the evidence for a causal relationship between SCZ, MDD, and frailty. Further understanding of the pathological mechanisms underlying this association is essential for the prevention and intervention of mental disorders

关键词: mental disorders, schizophrenia, major depressive disorder, frailty, Mendelian randomization, causality

绘画团体辅导对青少年阈下抑郁的干预研究

邢力之^{1,2} 孙平³

1.青岛大学青岛医学院

2.威海经济技术开发区皇冠中学

3.青岛市精神卫生中心

目的 阈下抑郁 (SD) 已然对青少年的健康成长造成了严重影响, 然而, 仅有极少数的 SD 青少年能够获得有效的帮助。本研究致力于对比学校所开展的绘画团体辅导、行为认知疗法 (CBT) 与对照组在改进青少年阈下抑郁症状方面的效果及有效性。

方法 选取随机对照试验设计, 于威海市某初中学校招募 120 名阈下抑郁学生, 并将其随机划分

为绘画团体辅导组 ($n = 40$)、CBT 组 ($n = 40$) 以及对照组 ($n = 40$)。参与者各自接受为期 6 周相应的干预,并在治疗前、治疗后以及 6 个月随访时进行评估。运用混合效应模型对结果予以分析,主要结局通过流行病学研究中心抑郁量表(CES-D)来测量抑郁症状,将焦虑自评量表(SAS)、临床显著分析当作次要结局指标。

结果 相较于对照组,绘画团体辅导组和 CBT 组的参与者在干预后及随访时,所有结局指标均有显著改善($P < 0.05$)。而与 CBT 组相比,绘画团体辅导组在干预后($P = 0.1$)和随访时($P = 0.08$)在流行病学研究中心抑郁量表(CES-D)上不存在统计学差异;CBT 组在随访时焦虑自评量表($P = 0.02$)、临床显著分析($P = 0.012$)优于绘画团体辅导组。

结论 绘画团体辅导对于减轻阈下抑郁青少年的抑郁症状是切实有效的,并且在 6 个月随访时结局的改善得以持续。鉴于绘画团体辅导更为适宜在学校开展,我们的研究结果证实了推广运用绘画团体辅导干预阈下抑郁所具有的巨大潜力与重要意义。

Shared Diagnostic Biomarkers and Immune Links: Major Depression and Diabetic Kidney Disease

Huanxi Liu^{1,2}, Ping Sun²

1.Qingdao Medical College, Qingdao University, Qingdao 266071, China;

2.Qingdao Mental Health Center, Qingdao 266034, China

Objective Major depressive disorder (MDD) is a prevalent comorbidity in patients with diabetes mellitus (DM), and diabetic kidney disease (DKD) is one of the most severe complications in individuals with DM. Studies have shown a complex and bidirectional relationship between MDD and DKD. The present study aimed to explore the potential shared diagnostic biomarkers, pathways, and immune relationships between MDD and DKD

Methods Datasets related to MDD and DKD

from the Gene Expression Omnibus (GEO) database were screened, and crosstalk genes were identified through differential expression analysis. The crosstalk genes were analyzed by Gene Ontology (GO) and Kyoto Encyclopedia of Genes and Genomes (KEGG) pathway enrichment. Then, hub genes were identified through protein-protein interaction (PPI) analyses of the crosstalk-related genes in MDD and DKD. The hub genes were additionally filtered using least absolute shrinkage and selection operator (LASSO) regression, and receiver operating characteristic (ROC) curves were plotted based on the filtering results. Finally, the CIBERSORT algorithm was employed to investigate immune cell infiltration in MDD and DKD patients, and a connectivity map (cMAP) analysis was conducted to identify potential therapeutic drugs

Results A total of 83 genes related to crosstalk between MDD and DKD were identified by differential expression analysis, and enrichment analysis revealed that these genes were mostly enriched in inflammation and immune regulation. PPI analysis identified eight hub genes (CXCR6, GZMA, CD163, KLRB1, GZMK, CCR5, CD3D, and CD8A), and LASSO analysis revealed that CD163 and KLRB1 were potential shared diagnostic biomarkers for MDD and DKD. Immune infiltration analysis showed that multiple immune cells were associated with MDD and DKD. cMAP analysis indicated that rucaparib was a promising therapeutic agent

Conclusion The present study indicated that CD163 and KLRB1 serve as diagnostic biomarkers for the underlying comorbidity mechanism of MDD and DKD, and they may also be potential therapeutic targets

关键词: Major depressive disorder, Diabetic kidney disease, Transcriptomic analysis, Immune infiltration, Drug prediction

Altered Brain Function in Treatment-Resistant Depression Patients: A Resting-State Functional Magnetic Resonance Imaging Study

Weijian Han^{1,2}, Ping Sun²

1. Qingdao University Medical College, Qingdao 266000, China

2. Qingdao Mental Health Center, Qingdao 266034, China

Objective Major depressive disorder (MDD) is the most prevalent mental Disorder, characterized by significant and persistent depressed mood, reduced interest, reduced cognitive function and somatic disturbances. According to the most common definition, patients who do not improve after at least two or more treatment attempts of adequate dose and duration, suffer from treatment-resistant depression (TRD). In recent years, resting-state functional magnetic resonance imaging (rs-fMRI) has become widely applied in studying brain functional changes, because of its simplicity and ease of acquisition has been gradually applied in the field of psychiatric disorders, such as MDD, schizophrenia and autism/BD. The application of rs-fMRI technology may provide new insight into the neurobiological basis of TRD and may thereby enable us to develop more efficacious treatments specifically targeted at patients who do not respond to the currently available antidepressant treatment options. Several rs-fMRI studies have demonstrated that TRD presents with disrupted functional characteristics at different levels, including in the amplitude of low-frequency fluctuations (ALFF), regional homogeneity and inter-regional functional connectivity. Zhang et al. found that the TRD group showed higher ALFF in the right sensory/somatomotor hand, right auditory, and left default mode networks compared to the non-TRD group. A study measuring the degree of functional brain connectivity noted that the TRD group had significantly higher measures of the extent of left and right ventral caudate (VCa), left lateral habenula (LHb) and left inferior thalamic peduncle (ITP) than the HC group. In TRD patients, we are aware of few studies combining these two methods to examine resting-state differences in depressed patients directly. Previous studies of functional connectivity (FC) usually took region of interest selection based on accumulated priori knowledge of disorder. This method has a certain subjectivity and artificial. Thus, combining ALFF and

FC based on the abnormal ALFF maybe provide some insights into the neural basis of disease in term of fMRI signal of low-frequency fluctuation. Based on previous studies, we hypothesized that TRD patients would show ALFF/FC changes in specific cognition-related brain regions. Meanwhile, this study will provide a neuroimaging basis for the differences in neuropathological mechanisms between TRD and healthy controls, which will also contribute more to the understanding of the pathogenesis of TRD

Methods The patients in this study were from Qingdao Mental Health Center, Shandong Province, China between March 2023 and January 2024. We evaluated patients using the Diagnostic and Statistical Manual of Mental Disorders, Fifth Edition (DSM-5) criteria, and included a total of 16 patients with TRD. We also included a total of 16 healthy controls (HCs) relatively matched to the age and sex of the TRD group. In this study, all subjects underwent data acquisition using a GE SIGNA Pioneer 3.0 T scanner at People's Hospital of Qingdao West Coast New District, Shandong Province, China. Subjects wore noise-cancelling headphones, secured their heads with a hood, closed their eyes to keep their minds clear and avoided active thinking. The scanning parameters meet the following criteria: TR=2000ms, TE=40ms, FOV=240mm×240mm, Matrix=64×64, FA=90°, slice thickness=4.0mm, slice gap=0mm, slice=33, Total time=8min

1. In this study, the image data were preprocessed using the DPARSF toolkit((DPARSF 5.2_210501). The specific preprocesses are as follows: (1) convert 2D DICOM format images to 3D NII format images; (2) slice timing; (3) realignment of head-motion (removal of patients with head movements > 2 mm in any direction and motor rotation >2°); (5) regression of covariates, including brain white matter signal, cerebrospinal fluid signal and head movement parameters; (6) spatial normalization: functional images of all subjects were converted to Montreal Neurological Institute (MNI) standard space using DARTEL; (7) linear detrending and filtering (0.01 to 0.1 Hz).

2. Then, we explored the ALFF changes of TRD patients at a baseline resting state. Second, we selected the regions that were significantly changed in the ALFF

as seeds and calculated the regional activity and functional connectivity (FC) of these regions using a seed-based approach.

3. Statistical analysis of demographic data was performed using SPSS 27.0 software. Compare age and genders and years of educational among the two groups with two-sample t-test. A statistical threshold setting of $p < 0.05$ was statistically significant.

4. Image data were analyzed using the SPM12 toolbox. To assess the between-group differences (between the TRD patients and the HCs) of the ALFF at the baseline resting state, two-sample t tests were performed with age, gender, education level being treated as covariates. The significance threshold was set to $P < 0.05$ with FDR correction.

5. Then, regions with significant changes in ALFF were selected as seeds for this study, and functional connectivity analyses based on seed points were used. The significance threshold also was set to $P < 0.05$ with FDR correction.

6. In order to verify the relationship between ALFF values and clinical symptoms, we extracted the mean ALFF values increased ALFF brain regions and did Spearman correlation analysis with the clinical scale scores of each group, and the statistical threshold of $P < 0.05$ (two-tailed) was statistically significant.

Results During the baseline resting state, by using the ALFF, we found a significantly decreased or increased ALFF in the TRD patients relative to the controls. These regions were located in the left/right post-central gyrus(PoCG.L/PoCG.R), right cuneus(CUN.R). We found that the ALFF values of the right hippocampus(HIP.R) in the TRD group were negatively correlated with the PDQ-5D score. Then, we selected these brain regions as seeds to investigate the FC changes in brains of TRD patients. We found abnormal functional connectivity in left/right middle frontal gyrus(MFG.L/MFG.R), the right Inferior frontal gyrus, opercular part(IFGoperc.R), the left/right Anterior cingulate and paracingulate gyri(ACG.L/ACG.R), the right supramarginal gyrus(SMG.R), and the right Calcarine fissure and surrounding cortex(CAL.R)

Conclusion In conclusion, we preliminarily ana-

lyzed the differences in local neurological functional activities between the brains of TRDs and HCs using Alff based on rs-fMRI technique. In the next stage, we selected brain regions with aberrant ALFF values as seed points for functional connectivity analysis. We found a larger range of altered brain regions in TRD patients compared to healthy controls, especially in the SN, DMN and CEN networks

关键词: treatment-resistant depression; rs-fMRI; amplitude of low-frequency fluctuation; functional connectivity

TDCS 联合认知控制疗法对抑郁症疗效及认知功能的研究

张天伟¹ 孙平²

1.淄博市精神卫生中心

2.青岛市精神卫生中心

目的 研究以左背外侧前额叶为刺激靶点的经颅直流电刺激(tCDS)联合认知控制疗法(cognitive control therapy, CCT)对抑郁症患者治疗效果以及认知功能改善的影响。

方法 筛选淄博市精神卫生中心 2024 年 7 月-2025 年 7 月期间门诊及住院的收治的 60 例抑郁症患者作为研究对象,采用随机数字表法发随机分为研究组(n=30)和对照组(n=30)。研究组采用 tCDS(2mA 的经颅直流电刺激)联合 CCT 治疗;对照组采用参数设置一定的伪刺激联合 CCT 治疗。比较两组在治疗前、治疗 2 周和治疗 4 周后以重复性成套神经心理状态测验(RBANS)评价患者认知功能,汉密尔顿抑郁量表(HAMD)、蒙哥马利抑郁量表(MADRS)评价患者抑郁程度。

结果 治疗前两组患者年龄、性别、受教育年限、总病程比较差异无统计学意义($P > 0.05$)。治疗 2 周后研究组 HAMD、MADRS 评分均低于治疗前($P < 0.05$),RBANS 中有关认知功能的评分均高于治疗前,但两组之间比较差异无统计学意义($P > 0.05$)。治疗 4 周后,研究组 HAMD 评分低于对照组,研究组 MADRS 评分低于对照组,差异均有统计学意义($P < 0.05$);治疗 4 周后,研究组 RBANS 中有关认知功能的评分均高于对照组,差异

均有统计学意义 ($P < 0.05$)。

结论 以左背外侧前额叶为刺激靶点的经颅直流电刺激联合认知控制疗法能显著改善抑郁症患者抑郁症状,同时能够有效提高抑郁症患者的认知功能,具有更好的临床应用优势。

双相障碍患者童年创伤经历与成年后自杀风险的关系

杨瑜^{1,2} 孙平²

1.滨州医学院

2.青岛市精神卫生中心

目的 研究双相障碍患者童年创伤经历对成年后自杀风险的影响,为预防和管理双相障碍患者自杀工作提供理论依据。

方法 选取某市精神卫生中心 167 名符合《精神症状诊断与统计手册第五版》中双相障碍诊断的成年住院患者,抽取静脉血进行生理生化指标测定,进行重复性成套神经心理状态测验、中文版儿童期创伤问卷和自杀风险评估,使用 SPSS 和 R 语言对所得数据进行描述性统计分析、差异检验和回归分析。

结果 1)有童年创伤经历的双相障碍患者的自杀率是 51.46%,比无童年创伤经历的双相障碍患者(31.25%)高出 2.33 倍的自杀风险;2)有自杀风险的童年创伤双相障碍患者的生理生化指标和临床量表得分与无自杀风险的患者有显著差异(碱性磷酸酶: $P=0.03$; 乳酸脱氢酶: $P=0.04$; 血清三碘甲状腺原氨酸: $P=0.044$; 言语功能: $P=0.047$);3)回归分析发现,有童年创伤经历的双相障碍患者自杀的风险因素是言语功能得分 ($B=0.028$, $P=0.048$, $OR=1.029$)。

结论 童年创伤经历会显著增加双相障碍患者成年后的自杀风险,重复性成套神经心理状态测验的言语功能分量表可显著预测有童年创伤经历的双相障碍患者的自杀风险。

关键词: 双相障碍; 童年创伤经历; 自杀风险

Schizophrenia and Type 2 Diabetes Risk: A Systematic Review and Meta-Analysis

Kai Dong*

Qingdao Mental Health Center

Objectives The metabolic syndrome in patients with schizophrenia has consistently been a challenge for clinicians. Previous studies indicate that individuals with schizophrenia are highly prone to developing type 2 diabetes mellitus (T2DM). In recent years, a continuous stream of new observational studies has been reported, emphasizing the pressing need for clinicians to gain a more precise understanding of the association between schizophrenia and T2DM. The objective of this meta-analysis is to integrate new observational studies and further explore the potential link between schizophrenia and the risk of T2DM

Methods We conducted a comprehensive search of PubMed, Cochrane Library, Embase, and Web of Science using medical subject headings (MeSH) and relevant keywords. The risk of bias in cohort studies and case-control studies was assessed using the Newcastle-Ottawa Scale (NOS), while cross-sectional studies were evaluated using the Agency for Healthcare Research and Quality scale (AHRQ), scoring was based on the content of the original studies. A fixed-effects model was employed if $P > 0.1$ and $I^2 \leq 50\%$, indicating low heterogeneity. Conversely, a random-effects model was utilized if $I^2 > 50\%$, indicating substantial heterogeneity. Publication bias was assessed using funnel plots and Egger's test. Statistical analyses were carried out using Stata statistical software version 14.0

Results This meta-analysis comprised 32 observational studies, involving a total of 2,007,168 patients with schizophrenia and 35,883,980 without schizophrenia, published from 2004 to 2023. The pooled analysis revealed a significant association between a history of schizophrenia and an increased risk of T2DM (Odds Ratio [OR] = 2.15; 95% Confidence Interval [CI]: 1.83–2.52; $I^2 = 98.9\%$, $P < 0.001$). Stratified by gender, females with schizophrenia (OR = 2.12; 95% CI: 1.70–2.64; $I^2 = 90.7\%$, $P < 0.001$) had a significantly higher

risk of T2DM than males (OR = 1.68; 95% CI: 1.39-2.04; I2 = 91.3%, $P < 0.001$). Regarding WHO regions, EURO (OR = 2.73; 95% CI: 2.23-3.35; I2 = 97.5%, $P < 0.001$) exhibited a significantly higher risk of T2DM compared to WPRO (OR = 1.72; 95% CI: 1.32-2.23; I2 = 95.2%, $P < 0.001$) and AMRO (OR = 1.82; 95% CI: 1.40-2.37; I2 = 99.1%, $P < 0.001$). In terms of follow-up years, the >20 years subgroup (OR = 3.17; 95% CI: 1.24-8.11; I2 = 99.4%, $P < 0.001$) showed a significantly higher risk of T2DM than the 10-20 years group (OR = 2.26; 95% CI: 1.76-2.90; I2 = 98.6%, $P < 0.001$) and <10 years group (OR = 1.68; 95% CI: 1.30-2.19; I2 = 95.4%, $P < 0.001$)

Conclusion This meta-analysis indicates a strong association between schizophrenia and an elevated risk of developing diabetes, suggesting that schizophrenia may function as an independent risk factor for T2DM.

关键词: schizophrenia, type 2 diabetes mellitus, T2DM, systematic review, meta-analysis, observational study.

鲁拉西酮联合喹硫平治疗女性双相抑郁的临床疗效研究及对认知功能的影响

陈方侠^{1,2} 孙平^{1,3}

1. 青岛大学医学部

2. 临沂市精神卫生中心

3. 青岛市精神卫生中心

目的 探讨鲁拉西酮联合喹硫平治疗女性双相抑郁的临床疗效研究及对认知功能的影响。

方法 为深入研究不同药物组合对女性双相抑郁患者的疗效及其副作用, 选取了 2023 年 4 月至 2023 年 4 月期间, 在临沂市精神卫生中心首次住院且接受治疗的 60 例女性双相抑郁患者作为本研究的对象。用随机数字表法将其分对照组和观察组, 各 30 例, 对照组接受安慰剂联合喹硫平治疗, 观察组接受鲁拉西酮联合喹硫平治疗, 比较两组患者从基线到第 12 周的治疗疗效、抑郁症状、躁狂症状、治疗副反应、认知功能等指标的变化。

结果 结果 与安慰剂组相比, 鲁拉西酮组的

临床总有效率 95.00% 高于对照组 72.50% ($P < 0.05$); 比较 HAMD 评分, 治疗前组间 P 值 > 0.05 , 治疗后, 观察组 HAMD 评分低于对照组 ($P < 0.05$); 两组患者治疗前后 YMRS 差异无统计学意义, 治疗后不良反应评分, 差异无统计学意义 ($P > 0.05$); 两组患者治疗前 MoCA 相关指标差异无统计学意义 ($P > 0.05$), 治疗后两组 MoCA 评分均提升, 且观察组 MoCA 评分 (26.53 ± 1.86) 分高于对照组 MoCA 评分 (23.32 ± 1.89) 分, 差异有统计学意义 ($P < 0.05$)。

结论 鲁拉西酮联合喹硫平治疗女性双相抑郁能更好的改善抑郁症状及认知功能, 不增加转躁风险及药物不良反应, 整体提升治疗疗效。

关键词: 双相障碍; 抑郁; 鲁拉西酮; 喹硫平;

Bioinformatics-based Analysis of Potential Key Genes in Schizophrenia Patients

Xiangwen Wang Ping Sun*

Qingdao Mental Health Center,

Objective This study aims to identify key genes associated with schizophrenia and their potential clinical implications using bioinformatics approaches, and to develop a diagnostic discrimination model for schizophrenia using neural network methods

Methods This research utilized transcriptomic datasets from the dorsolateral prefrontal cortex and related brain regions of schizophrenia patients. Background correction and normalization were performed using the Robust Multi-array Average (RMA) method, and differential expression genes were identified through linear model analysis and empirical Bayesian statistical methods. Feature extraction of differential expression genes was conducted using the Boruta method based on a random forest model. A neural network model was constructed using the identified feature genes, and the model's classification efficacy was calculated on a validation set using the Bootstrap method, with performance tested in an independent external validation set. Biological functions of differential expression genes and feature genes were explored through

gene ontology (GO) and protein-protein interaction networks (PPI)

Results The analysis included 700 samples, identifying 518 differentially expressed genes, and recognized 36 key schizophrenia-related genes (ABCG2, ADGRG1, ADM, ATP1A2, ATP5F1B, BAG1, CARTPT, CBFB, CLU, DUSP1, FAT1, FOS, FRZB, GEM, GUCY1B1, HMGB2, ID1, IGFBP6, ITM2A, KCNV1, KIF3C, MGST3, NDUFB7, PPWD1, PTS, PVALB, RARS1, RGS2, RIPOR2, RNASE1, SEC14L1, SLC1A2, SOX9, TNFSF10, TYRP1, UTRN). Enrichment analysis revealed that key genes are primarily involved in neurotransmitter transmission, cardiovascular function regulation, and sex hormone signaling pathways. The neural network model constructed from the 36 genes included two hidden layers and two dropout layers, with 3,003 trainable parameters. The model's specificity and sensitivity 95% confidence intervals ranged from 58.02% to 80.00% and 79.02% to 90.91%, respectively, with an AUC between 73.79% and 86.93%, and accuracy ranging from 73.46% to 84.83% in the validation set. The AUC in the external validation set was 0.8

Conclusion The neural network model built from key genes selected via the Boruta method based on the random forest model shows good diagnostic discrimination for schizophrenia. Key genes associated with schizophrenia are enriched in biological processes related to the cardiovascular system, amino acid metabolism, and male reproductive development, suggesting that schizophrenia, as a systemic disease, may affect multiple systems

视频健康教育对于双相障碍患者服药依从性的影响

崔付新^{1,2} 刘晓玉¹ 孙平³

- 1.临沂市精神卫生中心(临沂市第四人民医院)
- 2.青岛大学
- 3.青岛市精神卫生中心

目的 研究视频形式的健康教育与常规宣教健康教育对双相障碍患者服药依从性的影响,并进行对比分析。

方法 选取2023年6月至2023年12月在临沂市精神卫生中心住院治疗达到临床痊愈标准的80名双相障碍出院患者,采用随机数字表分组法,分为实验组(采用视频形式的健康教育)及对照组(常规宣教式健康教育),每组各40人。实验组患者在出院前进行一次视频形式的健康教育,对照组患者出院前进行一次常规宣教式健康教育,两组患者健康教育内容均为所患疾病的基本情况,为什么病情好转了还要继续服药。两组患者出院后在第2月、4月、6月分别进行一次随访,内容为服药情况及病情情况,用自制服药依从性调查表计算各组患者服药依从性,将随访时服药依从性比率,应用SPSS软件包进行统计学处理,并进行分析。

结果 实验组和对照组分别有40人完成入组时研究,实验组1例在4月随访时脱失,对照组1例在2月随访时脱失,实验组患者2、4、6月服药依从性分别为97.5%、92.3%、87.2%,对照组患者2、4、6月服药依从性分别为94.9%、84.6%、76.9%。在3个随访阶段服药依从性分析,实验组显著高于对照组,差异具有统计学意义($P < 0.05$)。

结论 双相障碍作为一种重性精神障碍,其主要特点为复发率高,多项研究显示,终身复发率高于90%,1年内复发率也高于45%,其中最主要的一个原因为服药依从性不高,未能做到全程治疗。因此,加强患者的健康教育尤为重要。目前的健康教育主要形式为依据文字而进行的口头宣教,单调,乏味,患者或家属能够理解和记住的内容有限。现在进入了新媒体传播时代,应该跟上时代发展,充分利用新媒体便捷有效的传播优势,构建健康教育形式的新常态,更好的为患者和广大百姓服务。把健康教育内容制作成短视频,其内容较传统的健康教育更加生动形象,有助于患者更加清楚地了解所患疾病及后续注意事项,也提高了患者对于治疗的依从性和患者满意度,有利的减少了复发,更有利于患者康复,具有一定的临床推广价值。

关键词: 视频,健康教育,双相障碍,服药依从性

精神疾病患者行无抽搐电休克治疗后发热状

况及影响因素分析

郝新梅 孙平*
青岛市精神卫生中心

目的 无抽搐电休克治疗 (modified electroconvulsive therapy, MECT) 作为一种有效治疗各种精神疾病的物理疗法, 被广泛地应用于临床。在临床工作和国内外案例报道中发现, 部分患者 MECT 后会出现发热的情况。本研究旨在分析 MECT 后发热的发生情况、特点及影响因素。

方法 合纳入标准 (入院时心电图、胸部 CT、生化检查无异常, 每次治疗前体温、脉搏、呼吸、血压均在正常范围) 的 136 例患者作为研究对象。本研究需要采集以下数据: 年龄、疾病诊断、是否出现发热、第几次治疗后出现发热、发热次数、最高体温。采用 SPSS 25.0 统计软件进行数据的录入与分析。采用例数、构成比、均数、标准差进行统计描述, 组间比较应用 χ^2 检验, 双侧检验, $P < 0.05$ 为差异有统计学意义。

结果 1. 本次调查中, MECT 后发热的发生率为 14.0% (19 例患者出现 MECT 后发热), 大部分发热出现在治疗的前 3 次 (78.9%), 仅有 2 例最高体温大于 39°C (10.5%)。其中, 89.5% 的患者仅出现 1-2 次 MECT 后发热, 而 10.5% 的患者出现 3-4 次 MECT 后发热, 未见出现 4 次以上 MECT 后发热的患者。

2. 136 例研究对象年龄范围在 16-54 (36.51 \pm 9.23) 岁。年龄 ≤ 40 岁与年龄 > 40 岁两组研究对象发热发生率存在显著差异 (前者发生率为 20.3%, 后者发生率为 6.5%, $\chi^2 = 5.360$, $P = 0.025$)

3. 研究对象包括 67 名男性 (9 例出现 MECT 后发热), 69 名女性 (10 例出现 MECT 后发热), 差异无统计学意义 ($\chi^2 = 0.032$, $P = 0.859$)。

4. 研究对象中有 83 例精神分裂症患者 (11 例出现 MECT 后发热)、53 例心境障碍患者 (8 例出现 MECT 后发热) ($\chi^2 = 0.091$, $P = 0.763$)。

结论 MECT 后发热的发生率约为 14.0%, 大部分发热出现在最开始治疗的前几次, 且并未呈现持续发热状态, 体温一般在 39°C 以下。年龄可能是 MECT 后发热的影响因素。本研究尚未发现性别及疾病诊断与 MECT 后发热的相关性。

关键词: 电休克, 发热

孕产妇妊娠期焦虑抑郁情绪的研究进展

季文赛^{1,2} 孙平³

1. 青岛大学医学院
2. 海军第九七一医院
3. 青岛市精神卫生中心

目的 随着心理健康意识在人们日常生活中的普遍提高, 临床医学领域也由传统的生物医学模式向生物—心理—社会整体医学模式转型, 研究者们开始越来越关注社会心理因素对不良情绪的影响。

《“十四五”国民健康规划》(2022) 中指出, 实施母婴安全行动提升计划, 全面落实妊娠风险筛查与评估, 提高孕产妇身心疾病的早检早筛早诊率。妊娠和分娩是人类历史进程中一种正常且自然的生理现象, 并且是所有孕龄期女性可能经历的一个特殊阶段。在这个特殊阶段, 女性不仅在生理上会产生明显的变化, 且可能由于怀孕和生育而经历诸多生活上和工作上的应激事件, 这些都将会导致女性在妊娠期更易产生多种不良情绪, 其中以焦虑和抑郁为主要表现。妊娠期焦虑抑郁通常是女性在孕产阶段期望达到优生优育的目标, 而产生的紧张情绪和假想忧虑。近些年来, 对妊娠期焦虑抑郁的关注日益增多, 如何有效应对孕产妇情绪心理危机、促进家庭和谐美满成为重要命题。

方法 本研究采用文献梳理法对妊娠期焦虑抑郁相关的研究成果进行了综述。

结果 (1) 妊娠期焦虑和抑郁的发生率随着妊娠进展呈现出“两头高中间低”的 U 型曲线的变化形式——从妊娠早期到妊娠中期呈下降趋势, 妊娠晚期又呈上升趋势; (2) 孕妇的个性特点、社会支持、应对方式、认知因素及身心状况是妊娠期产生焦虑和抑郁情绪的主要影响因素; (3) 临床上实施的旨在促进母婴健康的药物治疗、心理护理和运动干预这三大类措施中, 心理护理最为适宜。

结论 本研究创新性的整合了妊娠期焦虑抑郁的发生规律、影响因素及干预措施, 不仅丰富了女性心理健康领域的理论研究, 并且对有效预防及应对女性妊娠期情绪困扰具有重要的指导意义。

关键词: 孕产妇; 妊娠期焦虑抑郁; 心理干预

Case Series of Successful Treatment with Aripiprazole Monotherapy in Bipolar Disorder with Delayed Sleep-wake Phase Syndrome

Tong Li Zhaoyu Gan* Ting Yang Youzhen Lin
Third Affiliated Hospital of Sun Yat-sen University

Objective Patients with bipolar disorder (BD) accompanied by delayed sleep-wake phase (DSWP) disorder/ syndrome may be younger, more prone to relapse, and more severely impaired in social functioning. However, there are few studies in this area, and there are currently no mature treatment guidelines, which prompts us to adopt this case series explores it

Methods A sample of 15 BD patients with DSWP syndrome who had experience using APZ monotherapy were included after obtaining their written informed consent and their parents written informed if the patient was less than 18 years old. BD is diagnosed by the attending physician based on the diagnostic criteria of International Classification of Diseases 10th Revision (ICD-10). DSWP symptom was recorded before using APZ monotherapy: both bedtime and awakening time were delayed compared to regular or expected time, leading to chronic sleep deprivation and daytime functional impairment. We evaluate the changes in relevant indicators of patients before and after medication by extracting data from their past clinical records from the electronic medical record system, medical laboratory examination system and electrocardiogram examination system of the Third Affiliated Hospital of Sun Yat-sen University

Results Their average age was 20.7 ± 6.4 years. The average level of education was 12.9 ± 3.2 years. The average onset age of bipolar disorder was 17.2 ± 6.0 (Median=16, Min=10, Max=32) years. The median course of bipolar disorder was 2.5 years, ranging from 0.3 to 9.0 years. Efficacy was seen at the first two weeks of treatment, demonstrated by reduction of scores on the Clinical Global Impressions-Severity(CGI-S) scores and advanced sleep-wake cycle. At the final visit, 93.3% (14/15) of the participants achieved clinical remission (defined as CGI-S <3) and their social function

went back to normal. At the four timepoints:(baseline, two weeks,12 weeks and the final visit), the bedtime (median, min-max) of the participants were 03:00(00:00-07:00), 00:00(22:00-02:00), 23:00(22:00-01:00), and 23:00(22:00-02:00), respectively; the median values of wake time were 11:00(07:00-17:00), 08:00(06:00-11:00), 07:00(05:00-11:00), and 08:00(05:00-08:00), respectively; the median values of sleep duration were 8 hours, 7 hours, 8hours, and 8 hours, respectively. As shown in Figure 2 at 2 weeks, 66.7% (10/15) of the participants could fall asleep before 01:00 am, and 100% (15/15) could fall asleep before 3:00 am. At 12 weeks and the final visit, the proportion of the participants who could fall asleep before 01:00 moved further to 93.3% (14/15). At the same time, the wake time was also advanced for all the participants. At 2 weeks, 86.6% (13/15) of the participants could wake up before 09:00am. At the final visit, this proportion reached to 100%. Extrapyramidal side effects and weight gain were the most common adverse events but all reversible

Conclusion In summary, APZ monotherapy might be an effective and safe treatment option for BD patients with DSWP syndrome

关键词: Bipolar Disorder; Delayed Sleep-wake Phase Syndrome; Aripiprazole; Monotherapy

A Study on The Clinical Predictive Value of FGF-9 for Depressive Phase of Bipolar Disorder and Single Episode of Depression

Shunkang Feng Ping Sun*
Qingdao Mental Health Center

Objective The aim of this study is to investigate whether Fibroblast growth factor 9 (FGF-9) has clinical value and significance in assisting in the diagnosis of depressive phase of bipolar disorder and single episode of depression

Methods 1. Select 30 confirmed patients with depressive episodes without psychiatric symptoms who

received outpatient or inpatient treatment at the Qingdao Mental Health Center from May 2023 to April 2024 as the single episode of depression group, and 30 patients diagnosed with bipolar disorder who currently have depressive episodes without psychiatric symptoms as the bipolar depression group. 30 healthy individuals without any diagnosis of mental illness were selected as the control group during the same period

2. Collect venous blood samples from all subjects on an empty stomach in the morning, and measure serum FGF-9 levels and levels of inflammatory factors such as interleukin-6 (IL-6) and tumor necrosis factor alpha (TNF - α). Use the 24 item Hamilton Depression Scale (HAMD-24) to assess the severity of depression.

3. Spearman correlation analysis was used to investigate the correlation between serum FGF-9 levels and inflammatory factors such as interleukin-6 (IL-6), tumor necrosis factor alpha (TNF alpha), and HAMD-24 scores in patients with single episode of depression and depressive phase of bipolar disorder. The diagnostic value of using ROC curve to analyze serum FGF-9 levels in diagnosing depressive phase of bipolar disorder and single episode of depression.

Results 1. The HAMD-24 scores of the two groups of patients were higher than those of the control group, and the difference was statistically significant ($p < 0.05$); There was no statistically significant difference in the age of onset and HAMD-24 score between the two groups of patients ($p > 0.05$)

2. The serum levels of FGF-9, IL-6, and TNF - α were compared among the three groups of subjects, and the differences were statistically significant (all $P < 0.01$). The serum FGF-9 and IL-6 levels in the bipolar depression group were higher than those in the single episode of depression group and control group; The serum FGF-9 level in the single episode of depression group was higher than that in the control group; The serum TNF - α levels in the bipolar depression group and single episode of depression group were higher than those in the control group, and the differences were statistically significant (both $p < 0.05$).

3. The average serum FGF-9 levels in patients with single episode of depression and bipolar depression were positively correlated with IL-6 and HAMD-24

scores ($r = 0.349$ to 0.727 ; $p < 0.05$)

4. The area under the curve (AUC) of FGF-9 for diagnosing single episode of depression is 0.669, with a sensitivity of 45% and a specificity of 97%. The AUC of FGF-9 for diagnosing bipolar depression was 0.789, with sensitivity of 58% and specificity of 98%, respectively.

Conclusion FGF-9 can assist in clinical diagnosis and has high clinical value for both depressive phase of bipolar disorder and single episode of depression

关键词: bipolar disorder; depression; FGF-9

Correlation of Melatonin and Cortisol in Bipolar Depression: A Preliminary Small-Sample Study

Na Li* Yi Liu

The first hospital affiliated kunming medical university

Objective To dynamically monitor the plasma melatonin and cortisol levels in patients with bipolar depressive episodes, to improve polysomnography, and to analyze the circadian rhythm characteristics of patients with bipolar depression, we explore the value of circadian rhythm disorders diagnosed bipolar depression

Methods A total of 54 subjects were included, comprising 16 cases of bipolar depression, 12 cases of unipolar depression, 11 cases of bipolar depression in remission, and 15 healthy controls. High-performance liquid chromatography-tandem mass spectrometry was used to detect the plasma melatonin and cortisol levels of the four groups at 8 am, 12 am, 4 pm, 8 pm, and polysomnography were determined

Results The plasma melatonin levels at 8 am in the bipolar depression group were higher than those in the unipolar depression group at 8 am (mean difference = 22.504, $t = 2.833$, $P = 0.014$), but the plasma melatonin levels at 8pm were lower than those in the unipolar depression group at 8pm (mean difference = -2.471, $t = -2.506$, $P = 0.006$). And the plasma cortisol levels in the bipolar depressive episode group at 8 am (mean differ-

ence = 57.411, $t = 2.623$, $P = 0.001$), 12 pm (mean difference = 39.276, $t = 2.879$, $P < 0.001$), and 8 pm (mean difference = 62.692, $t = 2.697$, $P = 0.001$) were higher than those in the unipolar depression group at the same time

Conclusion Patients with bipolar depression have a dysregulation of plasma melatonin and cortisol levels, with circadian rhythm disturbances, and these disturbances may contribute to the diagnosis of bipolar depression

关键词: Bipolar depressive episodes, Cortisol, Melatonin, Polysomnographic recordings

Correlation of PLP1 in First-episode Schizophrenia

李娜* 田冉

昆明医科大学第一附属医院

目的 To monitor PLP1 and PLP1mRNA levels in patients with first-episode unmedicated schizophia, to further investigate the role of PLP1 in first-episode schizophrenia.

方法 54 cases of first-episode unmedicated schizophrenic patients, 56 cases of the healthy controls. ELISA was to detect peripheral plasma PLP1 levels. Q-PCR was to detect the expression of PLP1mRNA. The Scale for SANS and SAPS were to evaluate the clinical symptoms of first-episode schizophrenic patients.

结果 The PLP1 and PLP1mRNA levels in schizophrenia group were higher than that in HC group. The hallucination scores, delusion scores, thinking disorder scores of SAPS were positively correlated with PLP1 level. Delusional scores, thinking disorder scores were positively correlated with the of PLP1mRNA level. A positive correlation between PLP1 level and the flat affective scores, speech impairment scores, volitional deficit scores, interest and social deficit scores, attention impairment scores of SANS.

结论 The growth of plasma PLP1 and PLP1 mRNA levels may be correlated with the occurrence of

schizophrenia.

不同程度睡眠障碍的老年抑郁症的多模态神经影像学研究

李娜* 邵恒

昆明医科大学第一附属医院

目的 应用静息态功能磁共振成像 (rs-fMRI) 技术, 采用局部区域一致性分析 (ReHo)、振幅谱密度分析 (ALFF 和 fALFF) 以及度中心性分析等多模态功能性分析方法, 旨在深入探索不同程度睡眠障碍对老年抑郁症发病机制的脑功能网络特征。

方法 老年抑郁症合并明显睡眠障碍组 25 例, 老年抑郁症合并低睡眠障碍组 14 例和健康对照组 42 例。使用 HAMD-17、HAMA 和 PSQI 对所有受试者进行临床评估。使用 3.0T-MRI 进行功能磁共振扫描, 获取额外静息状态 fMRI 序列。使用 DPARSFA 软件进行预处理, 使用 ReHo、ALFF、fALFF 和 DC 方法提取功能连接特征。

结果 ReHo 分析, 左大脑半球的额叶区域活动涉及 98 个体素, 最显著的活动点位于 MNI 坐标(-51, 6, 39)。老年抑郁伴明显睡眠障碍组的 ReHo 值显著低于低睡眠障碍组和健康对照组, 而低睡眠障碍组的 ReHo 值则显著高于健康对照组。

振幅谱密度分析, ALFF 分析中共识别出六个活动簇, 分布在大脑的多个区域, 包括小脑、额叶和顶叶。fALFF 分析中则识别出三个活动簇, 涉及额叶、枕叶等区域。老年抑郁障碍伴明显睡眠障碍组在 ALFF 值显著低于低睡眠障碍组和健康对照组。

度中心性分析, 两个簇的活动主要集中在大脑的右半球, 包括颞叶、枕叶和顶叶等区域。三组间度中心性值均呈现正态分布, 明显睡眠障碍组的度中心性值显著低于低睡眠障碍组和健康对照组, 低睡眠障碍组的度中心性值低于健康对照组。

结论 明显睡眠障碍可能导致前额叶的局部连接功能损害。前额叶皮层、楔前叶以及默认网络模式中的关键脑区, 在不同程度睡眠障碍的老年抑郁患者脑功能连接模式中发挥关键作用, 更严重的睡眠障碍会导致这些脑区功能连接的下降。

DRD1 Gene Polymorphism Predict Responses in Manic Patients Treated With Lithium and Olanzapine

Fengli Sun¹, Hejian Tao², Weidong Jin¹

1.Zhejiang Provincial Mental Health Center

2.Tongde Hospital of Zhejiang Province

Objective To explore the correlation between DRD1 gene rs686 and rs4532 polymorphism and bipolar mania episode and therapeutic effect. It is different from past study about correlation between DRD2 gene polymorphism and therapeutic response in patients with bipolar disorder

Methods 60 patients with bipolar mania and 40 normal healthy person as the control group were collected, and the DRD1 gene rs686 and rs4532 polymorphism were tested. The bipolar manic patients was treated with lithium combined olanzapine and assessed by YMRS, HAMD and HAMA

Results There was no difference on polymorphism DRD1 gene polymorphism between patients and normal. At 8th weekend, YMRS score of AA group higher than that of genotype AG+GG group (8.34 ± 1.23 vs 7.38 ± 1.20 , $P < 0.05$). The patient's early effective response rate (EERR, YMRS 2nd weekend reduction rate $> 25\%$) and remission rate (RR, YMRS 8th weekend reduction rate $\geq 80\%$) are higher than in AA group according to rs686. The no similar difference of rs4532 was found

Conclusion There is a correlation between DRD1 gene rs686 and the therapeutic effect of manic patient. The EERR and RR of rs686 genotype AG+GG group is higher than that of the AA group, suggesting that patients who contain G in genotype of rs868 obtain more improvement in treatment results

关键词: Bipolar disorder; DRD1 gene; Gene polymorphism; Lithium; Olanzapine

外泌体在未成年人双相障碍中的研究进展

凌秋 荣晗*

深圳市精神卫生中心/深圳市康宁医院

目的 本文综述了外泌体在未成年人双相障碍发病机制的作用和研究进展, 探讨其作为未成年人双相障碍早期诊断的生物标记物和精准化治疗的可能性, 以期构建双相障碍的客观诊治体系提供参考。

方法 通过文献检索、分析、汇总、归纳, 我们对外泌体在未成年人双相障碍中的生物学特性、作用机制以及潜在临床应用进行了总结, 并探讨了外泌体在该领域的研究进展、面临的挑战和未来的研究方向。

结果 外泌体是一类由细胞分泌的细胞外囊泡, 内含蛋白质、脂类和核酸等多种生物活性物质, 通过作为生物活性物质和遗传信息传递的媒介来参与双相障碍发生和发展的有关过程, 如神经营养和神经可塑性、神经发生、神经炎症、表观遗传调控。外泌体可以穿过血脑屏障, 并在血液、尿液、脑脊液等体液中检测到, 因此, 来源于中枢神经系统的外泌体可通过外周体液获得, 并且与脑脊液和脑组织高度相关, 可作为诊断未成年人双相障碍的潜在生物标记物。另外, 外泌体参与双相障碍的多个发病机制, 并且可携带蛋白质、脂质、核酸等特定内容物, 使其有可能成为潜在的定向转运治疗药物的靶点, 通过外泌体治疗双相障碍。

结论 外泌体作为细胞间信号转导的重要媒介参与了神经营养和神经可塑性、神经发生、神经炎症、表观遗传调控等过程, 是未成年人双相障碍早期诊断的潜在诊断标志物, 为今后精准化治疗提供可能性。然而, 目前外泌体在未成年人双相障碍的研究主要集中在诊断标志物和细胞通信机制, 外泌体如何与靶细胞相互作用、具体靶向机制等还不明确。目前, 对外泌体及其内容物的提取方法、分离方法等方面仍未有统一的金标准, 因而需要关注不同提取、分离方法之间结果的可比性。因此, 对于外泌体在临床实践, 我们应该以发展的态度进行更深入的科学研究, 必要时可多学科合作, 以期全面、透彻地理解外泌体在未成年人双相障碍的作用和影响。

清晨-夜晚量表在双相障碍伴睡眠-觉醒时相延迟障碍人群中的信效度检验和诊断价值评估

杨婷*

中山大学附属第三医院

目的 双相障碍(Bipolar disorder, BD)作为一组常见的重性精神障碍,常常伴有睡眠障碍,其中尤以睡眠-觉醒时相延迟障碍(delayed sleep phase syndrome, DSWPD)尤为常见。既往研究指出:相对不伴有DSWPD的双相障碍患者,伴有DSWPD的双相障碍患者,更年轻、发病年龄更早、BMI更高、既往抑郁和躁狂发作更多、快速循环率更高、自杀企图更强、共病创伤后应激障碍和物质使用障碍等风险更大,故意自残的风险更高、更有可能被开具心境稳定剂与抗抑郁剂,病情更严重(社会功能量表得分更低、自我报告的抑郁症状更多)。因此,及时、正确的识别共病于双相障碍中的DSWPD对双相障碍的精准治疗具有积极意义。本研究拟探索清晨夜晚量表(Morningness-Eveningness questionnaire, MEQ)在伴DSWPD的BD患者中的信、效度并评估其对DSWPD的诊断效能。

方法 招募BD患者DSWPD+组142例,DSWPD-组125例,正常对照HC组130例,使用清晨-夜晚量表(Morningness-Eveningness questionnaire, MEQ)进行评估,2周后49人完成重测,绘制受试者操作特征曲线(receiver operating characteristic curve, ROC)并计算曲线下面积(Area Under the Curve, AUC)。

结果 MEQ的内部一致性信度、分半信度和重测信度分别为0.758、0.714、0.661。MEQ量表依据统计结果剔除条目14后获得6个因子,累计因子载荷量58.119%。AUC为0.867。MEQ43分作为分界线时约登指数最高,灵敏度为0.83,特异度为0.75。

结论 清晨夜晚量表MEQ在双相障碍患者中具备较好的信、效度,能有效识别共病于双相障碍中的睡眠-觉醒时相延迟障碍。

药物基因组学检测在汉族双相情感障碍患者治疗中的疗效与安全性评估

张文婷¹ 施景泉¹ 王政科¹ 徐海燕¹ 任丹妮¹ 胡铭滢¹ 程玉¹ 李顺彬¹ 张振¹ 高天威²

1.上海德济医院

2.上海康黎医学检验有限公司

目的 为进一步探究药物基因组学检测在提高汉族双相情感障碍患者治疗效果和安全性方面的临床应用价值。

方法 将81例双相情感障碍患者随机分配至个体化组(41例)和对照组(40例)。个体化组通过基因检测确定药物基因组学分析结果,进而调整药物治疗方案。对照组则依据医师的用药经验进行治疗。在12周的随访期间,对比两组在汉密尔顿抑郁量表24项版(HAMD-24)评分下降率、缓解率及应答率等方面的差异。同时,统计两组的不良反应发生率,以全面评估个体化治疗的疗效和安全性。

结果 在4至12周的随访中,个体化组在HAMD-24评分下降率上显著优于对照组,差异具有统计意义($P<0.05$)。在随访的第4周,个体化组的改善率(100.00% vs 72.50%)和应答率(21.95% vs 0.00%)均显著大于对照组($P<0.05$)。在随访的第8周,个体化组的改善率为95.12%,显著高于对照组的80.00%,优势比为4.88(95%CI, 1.03-23.7)($P=0.048$);个体化组的应答率为19.51%,虽然仍高于对照组的15.00%,但优势比为1.37(95%CI, 0.46-4.67),两组间的差异无统计学意义($P=0.770$)。在随访的第12周,个体化组的改善率为97.56%,虽然高于对照组的87.50%,优势比为5.71(95%CI, 0.70-68.80),但差异无统计学意义($P=0.109$);此时,个体化组的应答率为70.73%,显著高于对照组的35.00%,组间优势比为4.49(95%CI, 1.72-10.90),且差异具有统计学意义($P=0.002$)。此外,在随访的第12周,个体化组的不良反应率仅为2.08%,而对照组则高达19.79%,组间优势比的倒数高达11.6(95%CI, 2.81-51.18),且差异有统计学意义($P<0.001$)。

结论 本研究对比了基于药物基因组学检测的个体化治疗方案与常规用药经验在汉族双相情感障

碍患者中的疗效和安全性。在 12 周随访期间,个体化组在 HAMD-24 评分下降率、应答率及不良反应率方面均显著优于对照组。这表明,通过基因检测指导的个体化治疗在双相情感障碍治疗中能显著提高疗效并降低不良反应发生率。

青少年抑郁发作患者非自杀性自伤行为与童年期创伤的关联性——基于杏仁核功能连接改变的研究

周洛慧 孙静*
南京脑科医院

目的 非自杀性自伤 (non-suicidal self-injury, NSSI) 是青少年抑郁发作患者严重且高发问题。本研究将探讨伴或不伴 NSSI 青少年抑郁发作患者以双侧杏仁核为种子点的静息态脑功能连接 (functional connectivity, FC) 改变。

方法 共纳入 127 例青少年抑郁发作患者,根据其有无自伤行为和自伤频次,将其分为伴 NSSI 组和不伴 NSSI 组。采用基于双侧杏仁核为种子点的功能连接分析方法,研究伴或不伴 NSSI 患者的异常脑功能连接及其与临床特征的相关性。采用二元 Logistic 回归分析 NSSI 行为的危险因素。

结果 (1) 两组人群年龄分布、教育程度无显著性差异 ($p>0.05$), 两组性别分布存在显著差异 ($p<0.05$)。两组人群汉密尔顿焦虑量表、杨氏躁狂评定量表评分无显著性差异 ($p>0.05$)。两组 17 项汉密尔顿抑郁量表评分具有统计学差异 ($p<0.05$); NSSI 组患者经历更严重的童年期创伤,包括情感虐待、情感和躯体的忽视 ($p<0.05$)。(2) 与不伴 NSSI 组相比, NSSI 组患者右侧杏仁核与双侧楔叶、左侧距状裂周围皮层、右侧楔前叶的 FC 强度显著减弱。

(3) NSSI 组患者右侧杏仁核-右楔叶 FC 值与 HAMD-17 无显著相关 ($p>0.05$)。右侧杏仁核-右楔叶 FC 值与童年期创伤问卷评分 ($r=-0.360, p=0.009$) 呈显著负相关;进一步利用 Pearson 偏相关分析比较与五种不同类型童年期创伤相关关系,结果显示:右侧杏仁核-右楔叶 FC 值与情感虐待 ($r=-0.302, p=0.030$)、情感忽视 ($r=-0.294, p=0.035$)、躯体忽

视 ($r=-0.389, p=0.004$) 评分呈显著负相关。(4) 二元 Logistic 回归分析显示:女性为 NSSI 发生的危险因素 ($p=0.003, OR=4.804, 95\% CI 1.725\sim 13.377$); 较高的 CTQ 总分与 NSSI 风险升高相关 ($p=0.014, OR=1.040, 95\% CI 1.008\sim 1.073$); 较高的右侧杏仁核-右楔叶 FC 值是 NSSI 的保护因素 ($p<0.001, OR=0.001, 95\% CI 0.000\sim 0.036$)。

结论 伴有 NSSI 行为的青少年抑郁发作患者经历了更严重的童年创伤,严重的童年创伤可能会增加 NSSI 的发生风险; NSSI 患者右侧杏仁核与双侧楔叶、左侧距状裂周围皮层、右侧楔前叶 FC 强度减弱,右侧杏仁核-右楔叶的 FC 与 CTQ 总分呈负相关,较高的功能连接值是 NSSI 的保护因素。

女性双相障碍患者不同生殖周期发作的临床特征、机制及诊疗进展研究

周洛慧 孙静*
南京脑科医院

目的 双相障碍 (bipolar disorder, BD) 存在与性别相关的临床差异。越来越多研究表明,部分女性双相障碍患者在生殖周期发作风险增加,且可能经历更严重的病程,如发病年龄较早、更容易经历快速循环和混合发作,自残/自杀发生率高,治疗具有挑战性。生殖周期性激素水平急剧变化,部分女性双相障碍患者对激素变化异常敏感可能是生殖周期发作的基础。此外,遗传、社会心理等因素亦可能与生殖周期双相障碍发作相关。本研究中将围绕女性双相障碍患者不同生殖周期(围月经期、围产期、围绝经期)发作的临床特征、发病机制及诊疗进展作一综述。

方法 通过查阅和筛选国内外文献,综述女性双相障碍患者不同生殖周期发作的临床特征、机制及诊疗进展研究。

结果 围月经期、围产期、围绝经期是双相障碍首次发病和复发风险较高的时期。由于激素等变化导致部分女性双相障碍患者在生殖周期容易出现情绪不稳定等相关症状,影响其病程、治疗与预后。经前加重可能是双相障碍严重表型的临床标志。研

究者通过对比双相 I 型障碍患者产后躁狂发作和非围产期躁狂发作,发现产后躁狂发作患者出现过度内疚、困惑等症状,而较少表现为典型的躁狂症状,如言语滔滔不绝和社交活动增多等。而与产后单相抑郁相比,双相障碍产后抑郁发作的特征性临床症状包括:非典型抑郁症状、混合特征、伴有精神病性症状。围绝经期双相障碍患者情绪波动尤以抑郁发作最为突出和严重。

结论 生殖周期是女性双相障碍发病和复发的高危阶段。有关双相障碍不同生殖周期发作的生物学机制研究较为匮乏,既往研究多涉及性激素波动对情绪和行为的影响,倾向于从“激素敏感”角度解释双相障碍在不同生殖周期中的病情波动。治疗方面,目前一线治疗药物如心境稳定剂(锂盐、抗惊厥药)和第 2 代抗精神病药仍是治疗生殖周期双相障碍的主要用药,需要更多大样本研究更新循证证据、提供治疗策略。

Disorganized Thalamic Subregional Functional Connectivity in Bipolar Disorder

Xiuli Wang¹, Xipeng Long², Zhiyun Jia²

1.the Fourth People's Hospital of Chengdu

2.West China Hospital of Sichuan University

Objective There are many reports of alterations in cortical functional connectivity in patients with bipolar disorder (BD). However, whether and how subcortical regions are affected is less well known. In the present study the potential involvement of subcortical and subregions of thalamus are explored in BD

Methods In particular, functional and structural Magnetic Resonance Imaging (MRI) was performed in 88 adult patients with BD and 78 healthy controls (HCs). Seed-based subcortical and thalamic subregional functional connectivity was compared between the BD patients and HCs, as well as between patients with BD type I (BD-I) subgroup and HCs as a sub-group analysis

Results Compared to HCs, BD patients showed increased functional connectivity between left thalamus

and right lingual gyrus, between right anterior thalamus and superior frontal gyrus, and between right ventral anterior thalamus and precuneus. BD-I patients showed increased functional connectivity between left thalamus and right lingual gyrus, and altered functional connectivity between the dorsal thalamus and the default mode network (DMN) and prefrontal regions

Conclusion These findings provide evidence of disorganized thalamo-cortical functional connectivity in BD, suggesting that the thalamus and its subregions may play important and specific roles in the neural circuitry of BD

关键词: Bipolar disorder, functional connectivity, subcortical, subregion, thalamus.

Comprehensive Analysis of The Microbiome and Metabolome: Unveiling Interactions Between Intestinal Flora and Metabolites in Schizophrenia

Yuntong Ding Xulai Zhang*

Hefei Fourth People's Hospital

Objective (SZ) is a complex, multifactorial neurodevelopmental disorder characterized as a severe mental illness. Despite extensive research, its etiology and pathogenesis remain largely elusive. Recent studies suggest that the intestinal microbiota and its metabolites may play critical roles in the onset and regulation of SZ. This study aims to examine the characteristics of the intestinal microbiota and metabolomics in patients with SZ and to explore their correlation with clinical symptoms

Methods This study involved thirty-five patients diagnosed with schizophrenia (SZ group) and thirty healthy control participants (HC group). Fecal samples were collected and analyzed using microbiome (16S rRNA gene sequencing) and metabolome (UPLC-MS) techniques. Bioinformatics and statistical analyses were conducted to interpret the data

Results Age, sex, and BMI were comparable be-

tween the SZ and HC groups. Microbial diversity sequencing identified 837 operational taxonomic units (OTUs) across both groups. Although alpha diversity metrics showed no significant difference, beta diversity metrics revealed notable disparities. At the genus level, differences were observed in nine bacterial groups: *Turicibacter*, *Toprococcus*, *Campylobacter*, *Eubacterium*, *Blautia*, *Sarcina*, *Catenibacterium*, *Lactobacillus*, and *Porphyromonas*. At the family level, *Erysipelotrichaceae*, *Turicibacteraceae*, *Campylobacteraceae*, *Desulfovibrionaceae*, *Lactobacillaceae*, and *Lachnospiraceae* showed significant variations. Metabolomics analysis identified 946 metabolites, with 54 showing significant differences, primarily in caffeine metabolism and cysteine and methionine metabolism. Notably, correlations were found between differential gut microbes and metabolites, and between these metabolites and psychiatric clinical symptoms

Conclusion The study reveals significant abnormalities in the intestinal flora and metabolites of SZ patients, correlating with clinical severity. These findings offer new insights into the interactions between the gut microbiome and metabolites, potentially contributing to the understanding of the pathophysiology of schizophrenia

关键词: Schizophrenia, Gut Microbiota, Intestinal Metabolites, 16S rRNA, UPLC-MS

鉴定外周血单核细胞中与氧化应激相关的枢纽基因以诊断双相障碍

吴莎莎*

山西白求恩医院

目的 双相情感障碍是一种慢性、复杂的情绪障碍,其特点是躁狂、躁郁和抑郁混合发作,并伴有明显的亚综合征症状,通常出现在主要情绪发作之间。有证据表明,氧化应激被认为在包括双相情感障碍在内的多种精神疾病的发病过程中扮演了重要角色。神经炎症是躁狂症的一个重要病理特征,但其潜在的致病基因和有效的治疗方法仍不清楚。本研究旨在调查躁郁症与氧化应激之间的关联,筛选

参与氧化应激通路的枢纽基因。

方法 从基因表达总库下载了基因芯片数据 GSE5392。根据差异表达分析、加权基因共表达网络分析和蛋白质-蛋白质相互作用网络,然后通过基因本体、京都基因和基因组百科全书和基因组富集分析对与氧化应激相关的枢纽基因进行分析,从而挖掘出 BD 的枢纽基因。我们在 GSE5388 和 GSE5389 数据集上进行了接收者操作特征曲线分析,以评估中枢基因在诊断 BD 方面的准确性。此外,我们还通过 BD 患者和健康对照组的外周血单核细胞鉴定了这些中枢基因。

结果 共有 69 个上调基因和 411 个下调基因被选中进行后续分析。通过 WGCNA 筛选出了 22 个共表达模块,其中一个中枢模块 (sienna3) 与双相障碍的相关性最高。通过差异分析和氧化应激相关基因,共获得 44 个交叉基因。随后, PPI 网络和 WGCNA 分析证实三个中心基因是双相障碍的潜在生物标志物。功能富集通路分析表明,这三个中心基因参与了神经元信号转导、氧化磷酸化和代谢障碍通路。Cytoscape 插件 ClueGo 检测显示,大多数靶标与神经元突触可塑性的调节有关。利用 ROC 曲线分析表明,这三个枢纽基因具有很高的诊断价值。RT-qPCR 结果表明,与 HCs 相比,这三个枢纽基因在双相障碍患者的 PBMCs 中存在显著差异。

结论 总之,我们发现的这三个枢纽基因与 BD 中的氧化应激直接或间接相关。基于有限的初步数据,我们的发现揭示了氧化应激在 BD 中的重要作用。然而,这三个与氧化应激相关的中枢基因参与 BD 发病机制进展的分子机制仍不甚明了,仍需进一步研究。

A Case Report of Atypical Neuroleptic Malignant Syndrome Precipitated by Olanzapine A Delayed Diagnosis

Jiang Cao*

the Second People's Hospital of Lishui

Background The diagnosis of neuroleptic malignant syndrome (NMS), a life-threatening and idiosyncratic adverse reaction to common antipsychotic medication, is contentious and unclear, with most criteria sets typically used for detecting it in practice failing to correspond to empirical diagnoses

Case Presentation This case presents a case that illustrates the diagnosis and management of NMS. A 48-year-old man with bipolar disorder was frequently admitted to a psychiatric ward with recurrent episodes. He had been stable for 6 months since his last hospitalization, under oxazepine and olanzapine. Oxazepine was discontinued, and olanzapine 20 mg/d was continued for hyponatremia and hypochloremia. Clinical manifestations included confusion, agitation, fever, urinary retention, and elevated creatine kinase. A urinary tract infection was considered because of absent muscle rigidity in the first 5 days. Elevated body temperature, frequent urination, urgency, and pain were also observed. Physicians did not consider NMS as a diagnosis. After the patient developed muscle rigidity and clinical respiratory conditions, he was medically treated. Following a quetiapine monotherapy at week 3 after NMS recovery, which was administered at 25 mg and gradually increased to 600 mg in two oral doses, the patient's mental state improved. He maintained a rational conversation with evidence of neither autonomic instability nor disorientation. He was discharged from the psychiatric ward 3.5 months after admission.

Conclusion NMS is a rare, neurological disorder that can present atypically and requires emergency medical rather than psychiatric care. Clinicians must carefully distinguish between medical and mental illnesses, prioritizing multiple illnesses promptly when identification is difficult.

改良电抽搐治疗在住院不同精神疾病中的对照研究

李文飞* 潘小莉
安徽省精神卫生中心

目的 探讨无抽搐电休克疗法在不同精神疾病中的治疗效果。

方法 整群抽取 2020.6-2022.6 在安徽省精神卫生中心住院的全部住院患者, 其中接受无抽搐电休克治疗患者 2131 例, 未接受无抽搐电休克治疗患者 10095 例。收集患者的一般资料(包括年龄、性别)、入院诊断、住院天数和出院情况, 将接受 MECT 的患者归为研究组, 未接受 MECT 的患者归为对照组, 并对所有患者依据 icd-10 标准分类, 以患者出院情况“好转”作为疗效评价标准, 将“好转”归为治疗有效, 其余归为治疗无效。对其全部资料输入 SPSS.22 进行统计分析, 统计差异有无显著性。

结果 (1)有 2131 位患者接受 MECT, 其中 2029 位患者好转出院, 治疗有效率为 95.21%。(2)①2131 位精神病患者的总治疗有效率为 95.21%; ②抑郁发作 94.74% (其中伴有精神病性症状的重度抑郁发作为 94.49%, 不伴有精神病性症状的重度抑郁发作为 94.85%), 复发性抑郁障碍 95.03% (其中伴有精神病性症状的复发性抑郁障碍为 94.87%, 不伴有精神病性症状的复发性抑郁障碍为 95.07%); 双相抑郁障碍 (其中伴有精神病性症状的双相抑郁障碍为 94.00%, 不伴有精神病性症状的双相抑郁障碍为 95.42%); 双相躁狂发作 91.22% (其中伴有精神病性症状双相躁狂为 96.74%, 不伴有精神病性症状的双相躁狂为 93.75%); 分离-转换障碍: 96.40%, 强迫症: 97.44%, 焦虑症 94.74%; 偏执型精神分裂症: 96.69%; 未分化型精神分裂症: 92.17%。

结论 (1)MECT 有效率为 95.21%。(2)采用 MECT 能减少精神病患者住院时间。

关键词: MECT; 精神疾病; 疗效

双相障碍病人孕期和产后的管理与治疗

苏颖芮 孙静*
南京脑科医院

目的 双相障碍是精神科常见的一种重性精神疾病, 具有容易复发的特点。对女性双相病人而言, 由于孕期前三个月用药对胎儿有致畸风险, 产后四

周内体内激素水平剧烈变化以及涉及到哺乳相关问题,均容易导致病情的复发。因此,我们需要对育龄期女性的用药进行管理,平衡孕期未经治疗的双相障碍对胎儿或婴儿的潜在有害影响、孕期药物使用的方法及相关风险。

方法 通过中国知网、万方及 Pubmed 等数据库进行文献检索。

结果 临床医生在为育龄期双相障碍患者开具处方时,应考虑其怀孕的可能性;双相障碍患者有怀孕计划时,也应提前向医生说明。并非所有患有双相障碍的女性都需要在怀孕期间接受维持治疗,但目前仍没有办法提前判断哪些患者可以在怀孕停药情况下不发病。经治疗与未经治疗的双相障碍均可能与不良的母婴结局有关。

在妊娠期,药物使用除了关注对母亲的疗效、耐受性和安全性,必须评估对胎儿或新生儿的负面影响。前三个月使用传统心境稳定剂(锂盐、丙戊酸和卡马西平),与增加的胎儿畸形风险相关。怀孕前,心境稳定剂应缓慢减药至停药;一旦妊娠期使用某种药物治疗的高风险已过,已停止该药物治疗的女性可考虑重新起始药物治疗。心境稳定剂的维持治疗与妊娠期情绪发作较少和较晚复发有关,尤其对于一些有自我伤害史、或既往发作康复延迟、自知力损害、支持欠佳的女性,药物治疗恢复可降低母亲和胎儿的整体风险。在哺乳期,母亲的健康和稳定应放在婴儿喂养方式之前,若药物治疗可行,首选最低有效剂量单药治疗。

结论 治疗计划应该在个案的基础上决定,同时考虑当前和既往的临床信息。密切监测对于及早发现情绪发作的新症状至关重要,及早发现和及时处理临界值以下的症状可能会预防症状的全面发作。

关键词: 双相障碍,孕期,产后,心境稳定剂,复发

素,而伏隔核功能连接可能与之有关。本研究将进一步探讨青少年心境障碍患者自伤行为及自杀意念与伏隔核功能连接异常的相关性,以期早期干预高自杀风险人群。

方法 2020.9~2022.11 南京脑科医院住院治疗的青少年心境障碍患者,共 143 例患者入组。依据是否伴发非自杀性自伤行为将受试者分为自伤组和非自伤组。采用汉密尔顿焦虑量表、汉密尔顿抑郁量表、杨氏躁狂量表、BECK 自杀意念量表,分别评估患者的焦虑、抑郁、躁狂和自杀严重程度。采用基于双侧伏隔核为种子点的功能连接分析方法,探讨自伤组与非自伤组患者的异常脑功能连接。

结果 (1) 自伤组与非自伤组性别存在统计学差异 ($p<0.05$), 女性自伤发生率高于男性。(2) 两组中自杀未遂检出率存在显著统计学差异 ($p<0.001$)。(3) 既往最严重自杀意念及近一周自杀意念评分在两组中存在显著统计学差异 ($p<0.001$)。

(4) 自伤组患者左侧伏隔核与左侧中央后回功能连接较非自伤组增强,左侧伏隔核与双侧枕下回、右侧伏隔核与右侧枕中回功能连接较非自伤组减弱。

(5) 伏隔核与中央后回功能连接的异常与自伤组近一周自杀意念相关 ($p<0.05$)。

结论 青少年心境障碍人群中自伤发生率较高,且女性可能是心境障碍患者自伤的危险因素。自伤是自杀的强力预测因素。自伤组患者的自杀意念较非自伤组高。自伤组左侧伏隔核-左侧中央后回的功能连接较非自伤组增强,左侧伏隔核-双侧枕下回、右侧伏隔核-右侧枕中回功能连接较非自伤组减弱。其中,左侧伏隔核-左侧中央后回功能连接与近一周自杀意念相关。

关键词: 心境障碍,青少年,非自杀性自伤,自杀意念,伏隔核

青少年心境障碍患者自伤行为与自杀意念相关联——伏隔核功能连接异常的研究

苏颖芮 孙静*
南京脑科医院

目的 心境障碍是一种常见的精神疾病,青少年心境障碍住院患者近一半有频繁自伤史,门诊患者自伤比率更高。频繁自伤是自杀临床有力预测因

Brain Function Activity Differences and Its Correlation with Cognitive Impairment in Chinese Transgender Women

Shilin Sun Ying Wang*
First Affiliated Hospital of Jinan University

Objective Gender dysphoria (GD) is characterized by a discrepancy between the gender assigned at

birth and the gender with which an individual identifies. A previous review study reports GD affects approximately 0.3% of adults worldwide. With a population of 1.4 billion, China may have the largest cohort of individuals with GD. Nevertheless, there remains a dearth of adequate research data within China. Due to the influence of traditional values, societal discrimination, marginalization, and a lack of medical interventions, GD may elevate the risk of poor mental health among some transgender individuals. Meanwhile, many studies have confirmed that the most common psychological distress among individuals with GD are depression and anxiety. Meta-analytical studies have shown that depression and anxiety often lead to cognitive impairments. Previous cognitive theory research suggests that patients with various emotional disorders tend to ruminate on negative information, leading to the hypothesis that the brain's limited cognitive capacity is compromised when processing emotional and cognitive information simultaneously.

The neurophysiological mechanisms of GD underlying remain unclear. Numerous studies suggest that transgender men and transgender women may involve distinct neurophysiological mechanisms, with transgender women potentially associated with more severe psychological distress, rates of suicide, self-harm, and depression. Therefore, finding a deeper understanding of the neurophysiological mechanisms of GD in transgender women, and implementing early diagnosis and intervention, are crucial steps in reducing the occurrence of severe mental disorders and suicide risks among affected individuals. This is first psychoradiology study among individuals with GD in China.

Methods Forty-three individuals with male GD and 44 individuals with cisgender control were recruited from psychiatric outpatients at First Affiliated Hospital of Jinan University, Guangzhou, China. MRI images were obtained on a 3.0T MR scanner (GE Discovery750). The image preprocessing was taken on Data Processing & Analysis of Brain Imaging (DPABI) which is based on Statistical Parametric Mapping (SPM). The demographic data between the GD and cisgender control groups were compared by using independent-sample t-test with SPSS17.0 software. To examine the

brain activity differences between two groups, the two-sample t-test was performed in a voxel-by-voxel manner within the grey mask. Age, education level, and the mean frame-wise displacement were included as nuisance covariates in the group comparisons. The Spearman correlation coefficients between ALFF, fALFF, dALFF, dfALFF, and FC values and clinical variables (Chinese Version of the Gender Identity/Gender Dysphoria Questionnaire for Adolescents and Adults and MCCB scores) in the GD

Results Individuals with GD showed increased ALFF values in the left cerebellar posterior lobe and decreased dfALFF values in the right hippocampus, compared to the cisgender control group. Increased dALFF values were observed in the left cerebellar posterior lobe among the individuals with GD. No significant differences were observed in fALFF. Using seeds from regions with differences in ALFF, static FC (sFC) values between the left cerebellar posterior lobe and the right precuneus were decreased among individuals with GD compared to the cisgender control group. Similarly, using seeds from regions with differences in dALFF, sFC values between the left cerebellar posterior lobe and the right cerebellar anterior lobe were increased among individuals with GD compared to the cisgender control group. No significant differences were observed in sFC analyses based on seeds from regions with differences in dfALFF. No significant differences were observed in dynamic FC (dFC). Individuals with GD showed significantly lower than the cisgender control group in verbal learning ($P=0.009$), social cognition ($P=0.000$), information processing speed ($P=0.003$), attention vigilance ($P=0.044$), and composite score ($P=0.000$) across cognitive domains, and total MCCB score, compared to the cisgender control group. Among individuals with GD, dfALFF values in the right hippocampus were significantly negatively correlated with subjective indicators of gender dysphoria ($r=-0.430$, $P=0.009$), and values between the left cerebellum lobule IX -right cerebellum lobules IV and V were significantly negatively correlated with social cognition ($r=-0.459$, $P=0.007$).

Conclusion Our findings that GD individuals show abnormal brain activity and impaired cognitive function

关键词: Gender dysphoria, cognitive

局部一致性

双相I型障碍三种临床相 DMN 和 SN 功能异常的研究

吕东升^{1,2} 赵靖平¹ 林武宏² 姚萍² 郭文斌¹

1.中南大学湘雅二医院精神科 国家精神疾病医学中心 国家精神心理疾病临床医学研究中心

2.内蒙古自治区精神卫生中心(内蒙古自治区第三医院、内蒙古自治区脑科医院), 睡眠医学中心

目的 探究双相I型障碍三种临床相在标准低频、慢波 4 和慢波 5 三个频段中默认网络(default mode network, DMN)、凸显网络(salience network, SN)中所有脑区局部一致性(regional homogeneity, ReHo)和低频振荡振幅(amplitude of low-frequency fluctuations, ALFF)活动情况及 DMN/SN 整体功能连接(functional connectivity, FC)强度比率变化。

方法 于 2019 年 7 月至 2021 年 12 月纳入中南大学湘雅二医院精神卫生研究所确诊为双相I型障碍的患者 107 例(双相障碍组)及与之年龄、性别和教育年限相匹配的健康对照者 46 例(对照组)。根据杨氏躁狂评定量表(Young Mania Rating Scale, YMRS)及 17 项汉密尔顿抑郁量表(Hamilton Depression Rating Scale, HAMD17)评分将双相障碍患者分为双相躁狂组、双相抑郁组、双相缓解组。采集所有受试者静息态功能磁共振成像数据,划分 DMN 和 SN 内感兴趣区域模板,计算 DMN 和 SN 内所有脑区的 ALFF 及 ReHo 值,计算 DMN 和 SN 网络内脑活动整体相关性。对组间差异有统计学意义的 ALFF/ReHo 值以及整体相关性指标与临床量表总分及各因子分进行相关分析。

结果 躁狂相在慢波 5 频段上 DMN/SN 整体 FC 强度比率均显著降低(FDR 校正, $P < 0.05$),且与杨氏躁狂量表心境高涨因子评分($r = -0.565$, $P = 0.001$)、语言速度与数量因子评分($r = -0.364$, $P = 0.048$)间呈显著负相关。

结论 躁狂发作患者内在网络活动平衡模式发生变化以 DMN 损坏为主,从而在躁狂发作时患者表现出注意力不集中、意念飘忽及随境转移等行为/现象学表现。

The Impact of Systematic Antidepressant Treatments in Early Stage on Sleep and Impulsivity in Bipolar Euthymic Patients: A Cross-Sectional Study

Mingjin Wang Xuguang An Chenghao Yang*

Tianjin Anding Hospital

Objective Due to the misdiagnosis, bipolar patients who had a depressive episode as initial onset usually received systematic antidepressant treatments in early stage, and constantly suffered from sleep disturbances and elevated impulsivity even during euthymic state. The aim of this study is to assess the effect of systematic antidepressant treatments in early stage on the sleep and impulsivity of bipolar euthymic patients, and further explore the potential mediation role of sleep in the relationship between early antidepressant uses and impulsivity

Methods A total of 124 bipolar euthymic patients were enrolled. According to the early usage of antidepressants, patients were divided into AT group (systematic antidepressant treatment group) and NT group (no systematic antidepressant treatment group). Montgomery-Asberg Depression Rating Scale (MADRS) and Young Mania Rating Scale (YMRS) were used to determine the euthymic status. Sleep quality and impulsivity were assessed by Pittsburgh Sleep Quality Index (PSQI) and Barratt Impulsivity Scale Questionnaire version 11-A (BIS-11A) respectively. The t-test, Chi-square test, and Mann-Whitney U test were engaged in statistical analyses. Mediation analysis was examined by bootstrapping

Results There was no statistically significant difference between two groups in terms of demographic and clinical characteristics. The participants of AT group had poorer sleep quality and higher level of impulsivity than NT group. Sleep quality, full impulsivity, attention impulsivity and non-planning impulsivity were statistically different. No statistical difference was

found in motor impulsivity between two groups. Sleeping quality was significantly positively correlated with impulsivity. The systematic treatment with antidepressants in early stage had noticeably negative influence on sleep and impulsivity. The effect of antidepressant uses on full impulsivity and non-planning impulsivity was mediated by sleeping quality

Conclusion This study suggested a correlation of antidepressant uses in early stage, sleep quality and impulsivity of bipolar euthymic patients, which highlights the significance of early diagnosis of bipolar disorder and appropriate prescription of antidepressants. Furthermore, improvement of sleep quality would be effective to decrease the risk of impulsive behaviors

关键词: bipolar disorder, euthymic state, antidepressant treatments, sleep quality, impulsivity

The Effect of Systematic Antidepressant Treatments on Positive/Negative Affect and Impulsivity in Bipolar Euthymic Patients: A Cross-Sectional Study

Mingjin Wang Dongyu Han Chenghao Yang*
Tianjin Anding Hospital

Objective There is a significant delay in the diagnosis of bipolar disorder (BD), leading to widespread use of antidepressant medications in the early stage. Furthermore, the presence of emotional instability and increased impulsivity, even during the euthymic phase of bipolar disorder, is common. The objective of this study was to investigate the effects of early systematic antidepressant treatments on positive/negative affect and impulsivity in bipolar euthymic patients, and to explore the potential risk factors involved in affect and impulsivity in bipolar disorder

Methods A total of 124 Han Chinese patients with BD were included in the study. The participants were divided into two groups: the antidepressant treatment (AT) group and the non-antidepressant treatment (NT) group. Demographic information, characteristics, and use of mood stabilizers were recorded. The Young

Mania Rating Scale (YMRS) and Montgomery-Asberg Depression Rating Scale (MADRS) were used to assess affect and impulsivity. Statistical analyses were performed using two-tailed comparisons

Results The study found that there was no significant difference in YMRS and MADRS scores between the AT and NT groups, indicating similar levels of affect and impulsivity. The distributions of age, sex, years of delayed diagnosis, and use of mood stabilizers were also not significantly different between the two groups. However, the AT group showed significantly higher levels of negative affect, attentional impulsivity, unplanned impulsivity, and overall impulsivity compared to the NT group. There was no significant difference in positive affect and motor impulsivity between the two groups. Negative affect was found to be negatively correlated with motor impulsivity, suggesting a potential relationship between these factors

Conclusion The findings of this study suggest that early systematic antidepressant treatments may have an impact on negative affect and impulsivity in bipolar euthymic patients. The study also highlights the significant delay in the diagnosis of bipolar disorder, leading to the widespread use of antidepressant medications in the early stages. Furthermore, the study emphasizes the presence of emotional instability and increased impulsivity even during the euthymic phase of bipolar disorder. Caution should be exercised in prescribing antidepressant medications to these patients, and personalized treatment strategies based on individual characteristics are important for optimal management of affect and impulsivity in bipolar disorder

关键词: bipolar disorder; euthymic state; impulsivity; positive/negative affect

双相障碍患者童年创伤潜类别及其与心理弹性、功能结局的关系

钟丽霞 李珠琳 马若云 赵娟娟 林小玲*
中山大学

目的 探究双相障碍患者童年创伤的潜类别及

与心理弹性和功能结局(心理社会功能和生活质量)的关系。

方法 本研究为横断面设计。便利选取 2019 年 9 月至 2021 年 4 月广州市某两所三甲医院精神科病房和门诊的部分或完全缓解的 272 例双相障碍患者为调查对象,采用一般资料调查表、儿童期创伤问卷、心理弹性量表、功能评估简表、12 项健康相关生命质量简表、汉密尔顿抑郁量表-17 项和杨氏躁狂量表调查其一般资料、童年创伤、心理弹性、心理社会功能、生活质量、抑郁和躁狂症状,采用潜类别分析、协方差分析和中介分析处理数据。

结果 双相障碍患者的童年创伤可分为低创伤组(34.56%)、高忽视组(17.65%)和高创伤组(47.79%) 3 个类别。年龄、婚姻状况、首次发病年龄、抑郁和躁狂症状在各类别上存在差异($P < 0.05$),作为协方差分析和中介分析中的协变量予以控制。协方差分析结果显示,控制协变量后,各潜类别心理弹性、心理社会功能和生活质量存在差异;LSD 检验结果显示,低创伤组在心理弹性总分和各维度得分高于高忽视组;高创伤组患者的心理社会功能和生活质量的整体和分维度表现(除职业功能和躯体健康维度外)均差于低创伤组,高忽视组患者仅在心理社会功能的自主生活维度表现差于低创伤组。中介分析结果显示,以低创伤组为参照,心理弹性在高忽视组和高创伤组与心理社会功能间的中介效应分别为 0.14(95%CI: 0.03~0.26)和 0.05(95%CI: -0.02~0.13),与生活质量间的中介效应分别为-0.15(95%CI: -0.27~-0.04)和-0.06(95%CI: -0.14~-0.02)。

结论 双相障碍患者的童年创伤存在 3 个潜类别,且童年创伤类别与患者的心理弹性和功能结局相关。心理弹性在不同童年创伤类别与功能结局中的中介效应不一致,应依据患者的童年创伤经历进行针对性干预。

药物治疗后双相情感障碍患者的尿酸水平差异与关联性:一项系统回顾与荟萃分析

李嘉霖 侯勇哲 舒燕萍*
贵州省第二人民医院

目的 双相情感障碍(Bipolar disorder, BD)是一种常见的心境障碍,多见于青春期和成年早期之间,以躁狂、抑郁和混合性发作为特征,终生患病率高达 5.4%。有研究表明,尿酸(uric acid, UA)与双相情感障碍的发生发展密切相关。尿酸作为非酶促抗氧化系统之一,可能通过氧化应激等机制参与双相情感障碍的发病过程。BD 患者 UA 水平与健康人群有差异,且 BD 患者的 UA 水平可能作为 BD 的状态标志。本研究旨在探索经药物治疗后 BD 患者的 UA 水平与健康对照组及抑郁症患者之间的差异及关联性,以及经治疗后 UA 水平在 BD 的不同阶段是否有区别。

方法 本研究根据 PRISMA 2020 指南进行,已在 PROSPERO 注册(ID:CRD42023371521)。本研究系统检索了 2024 年 5 月 31 日之前在 PubMed、Web of Science、CNKI 数据库中关于 BD 患者 UA 水平的文献。两位研究者根据纳排标准对文献进行筛选,采用不同研究的标准均值差异(SMDs)和相应的 95%可信区间(CI)估计实验组与对照组之间的相关性。

结果 这项 meta 分析共纳入 15 项研究,包括 1126 名双相情感障碍患者和 3207 名健康对照。我们首先发现,经药物治疗后 BD 患者的 UA 水平显著高于健康对照组。经药物治疗组 BD 患者与未经药物治疗组 BD 患者的 UA 水平没有显著差异。用药后 BD 患者 UA 水平明显高于抑郁症患者。经药物治疗后的 BD 患者与处于抑郁期的受试者相比,躁狂或混合躁狂发作的受试者 UA 水平显著升高。

结论 我们的荟萃分析显示,经药物治疗后的 BD 患者的 UA 水平高于健康对照组。因此,我们的研究结果表明即使药物治疗后 UA 水平仍可能代表 BD 特征标记的假设,UA 水平可能作为 BD 的诊断依据之一。UA 不仅对躁狂症状,还可能对嘌呤能调节剂的作用也有影响,而且对 BD 的维持治疗也有影响。同样,我们在亚组分析中发现,躁狂发作时血清尿酸水平显著高于抑郁发作时。这表明,高血清尿酸水平对躁狂发作的影响似乎是有选择性的。该结果进一步支持 UA 水平与躁狂期相关的假设,因为我们发现了药物治疗后并不影响这一结果。然而,还需要进一步的研究探索尿酸代表躁狂/混合发作的状态标记,而不是双极性的特征标记。

抑郁症多基因风险评分在抑郁症发生中的研究进展

刘芮 蔡雨凡 邵永琪 唐海平 徐治*
东南大学附属中大医院

目的 抑郁症是一种造成巨大社会负担的心理疾病，对于该疾病的识别率仍较低。抑郁症的发生存在一定的遗传度，且受到多个微效基因的影响，可运用抑郁症多基因风险评分（polygenic risk score for major depressive disorder, PRS-MDD）这一遗传指标发现抑郁高风险人群。现归纳总结 PRS-MDD 在抑郁症发生中的研究现状，旨在明确 PRS-MDD 对抑郁症遗传变异的捕获水平及基因与环境因素的相互作用（G×E）与抑郁症发生的关系，为后续研究提供方向。

方法 以“depression + polygenic”作为检索词筛选了 PubMed 和 Web of Science 数据库中 2019 年 1 月至 2024 年 1 月与抑郁症和多基因风险评分相关的文献，以“抑郁+多基因风险评分”作为检索词筛选了知网数据库中的 2019 年 1 月至 2024 年 1 月的相关文献，对纳入文献中 PRS-MDD 对抑郁症发生风险的解释水平、基因环境相互作用对抑郁发生的影响水平进行了对比分析和归纳总结。

结果 在纳入的 24 项研究中，关于儿童青少年时期的抑郁风险研究有 11 项，成年时期的有 13 项，这些研究探索了 PRS-MDD 对抑郁症发生风险的解释水平，以及创伤经历、社会支持、生活环境等环境因素与遗传因素的相互作用与抑郁症发生的关系。结果提示 PRS-MDD 是抑郁症发生的重要风险因素，且研究中 PRS-MDD 对抑郁症发生风险解释水平基本一致，文献提示遗传环境相互作用影响抑郁症发生风险。

结论 PRS-MDD 与抑郁症发生风险相关，对于抑郁症发生风险的解释水平高于其他疾病表型的 PRS。此外，基因环境相互作用对抑郁症发生的影响探索不够深入，仍需扩大样本量、构建更精确的模型以探索各因素的效应大小。

光照治疗双相障碍的疗效及机制研究进展

于欣¹ 马燕桃¹ 胡星辰²

1.北京大学第六医院
2.郑州市第九人民医院

一、前言

双相障碍（BD）是一组复杂而严重的慢性疾病，与大约 10-20 年的潜在寿命损失有关，是导致年轻人认知功能障碍、自杀、及死亡率升高的主要原因之一。BD 具有高遗传性，BD 发病机制尚不清楚，涉及机制包括神经元-胶质可塑性、单胺能信号传导、炎症稳态、细胞代谢途径和线粒体功能紊乱及社会心理因素等。

二、双相障碍的节律性特征

BD 患者表现为情绪、行为、睡眠、活力和食欲等生理活动异常，这些过程不同程度地受到生物节律调控。BD 患者常表现为睡眠-觉醒周期异常，这与易怒、冒更多风险等表现相关。研究显示 BD 的易感性、复发性、发病年龄快速循环型等特征与生物节律基因如 CLOCK、PER3、GSK3b、Per2 及 Cry1 等异常有关。BD 患者常存在皮质醇、褪黑素、5-羟色胺能等多种生物节律相关神经递质分泌异常。其生物节律相关脑区也存在功能连接异常，如视交叉上核与室旁核、下丘脑背内侧核的功能连接改变。

三、双相障碍节律性与光照节律的生物学联系

BD 患者的情绪摆荡同样呈现显著的节律特性。研究发现光照会通过视觉等器官传达信息至大脑中的视交叉上核（SCN），经由 SCN 对光照信息进行加工后，通过调节杏仁核分泌褪黑素等方式调控人类的昼夜节律、进食与代谢节律、神经环路震荡等。在微观层面，这个过程被一系列和节律相关的 BMAL1、CLOCK 等基因所调控，遗传学研究发现 CLOCK 基因与 BD 的相关性。这些基因编码了钙离子、钾离子通道蛋白等，是调控人类节律行为的重要离子通道蛋白。这些基因在 BD 人群发生突变，提示可能是这些离子通道蛋白的编码基因功能异常，导致神经元膜电位整流特性发生改变，进而导致情绪异常摆荡。

四、光照治疗双相障碍的疗效及临床应用

近年来的循证证据为光照治疗（LT）BD 患者的疗效和安全性提供了较有力的证据。LT 对情绪的影响主要取决于光照强度、光照波长、光照持续时间、

光照时间段以及个体昼夜节律，而光照色温对于情绪的影响目前仍缺乏有力证据。

五、光照治疗双相障碍的生物学机制

LT改善情绪的生物学机制尚不完全清楚。目前的主要假说集中在节律相关脑神经通路以及节律相关基因领域。

六、总结与展望

光照治疗是一种安全有效的干预双相障碍的物理疗法，其治疗机制尚不完全清楚，目前认为可能是通过调控节律的相关脑区和基因来产生作用。光照治疗双相障碍的具体治疗方案目前在实际操作过程中并不统一，疗效的一致性以及最大获益方案还需要进一步探究。光照治疗与双相障碍的生物学机制紧密关联，因此其不仅是一种治疗手段，更可以通过研究其治疗靶点进一步探索双相障碍情绪摆荡的发生机制。

关键词：双相障碍；光照治疗；生物学机制

障碍易感性有关。除此之外，其他时钟基因也会参与双相障碍疾病的发生。有研究发现不仅单个时钟基因遗传与疾病存在相关性，基因-基因相互作用在双相障碍中起着至关重要的作用。时钟基因参与双相障碍神经递质的调节，敲除时钟基因 $REV-ERB\alpha$ 的小鼠，前额皮质中的 5-HT 水平显著降低。 $Clock\Delta 19$ 小鼠可以提高中脑腹侧盖区多巴胺神经元兴奋性。有体外研究发现时钟基因 $ARNTL$ 、 $NPAS2$ 和 $PER2$ 可以调控 $MAOA$ 启动子的转录。同时， $PER2$ 蛋白表达水平及成纤维细胞周期预测锂盐治疗效果。

结论 进一步研究时钟基因其他的机制，可以从环境-基因角度，构建相互作用网络，提高对疾病诊断及药物疗效预测的准确性，并且与临床特征之间建立模型，更好指导临床治疗。

时钟基因在双相障碍中的应用进展

张振宇^{1,2} 桑文华¹

1.河北省第六人民医院

2.河北大学

目的 双相情感障碍患者在不同发作时相均存在昼夜节律紊乱，探讨时钟基因突变及表达作为昼夜节律的内源性病理因素与疾病发生发展及药物疗效之间的关系。

方法 在 PubMed 搜索关键词“bipolar disorder”和“clock gene”，符合综述范围纳入。在中国知网搜索“双相情感障碍”和“时钟基因”符合综述范围纳入。

结果 既往的动物研究发现， $Clock\Delta 19$ 突变小鼠会出现躁狂样症状， $REV-ERB\alpha$ 基因缺失的小鼠也会出现躁狂样行为，而 $Cry1$ 敲除小鼠中可以观察到抑郁和躁狂样症状共存，类似于 BD 患者所谓的混合状态。在时钟基因的“转录-翻译-反馈”环中， $CLOCK$ 与双相障碍存在密切相关性，其中携带 $CLOCK$ rs10462028 等位基因的人群双相障碍易感性更高，携带 $CLOCK$ rs1801260C 等位基因的女性双相障碍患者疾病发作次数和终生患病率更高，携带 $CLOCK3111C/C$ 纯合子基因型的复发率是其他基因型的两倍。时钟基因 $ARNTL$ 的 SNP 变异与双相

解郁安神汤联合碳酸锂对双相情感障碍躁狂发作患者认知功能及生活质量的影响

朱佳*

金华市第二医院

目的 观察解郁安神汤联合碳酸锂对双相情感障碍躁狂发作患者认知功能及生活质量的影响。

方法 选取 94 例双相情感障碍躁狂发作患者，按随机数字表法分为观察组和对照组各 47 例。对照组使用碳酸锂治疗，观察组使用解郁安神汤联合碳酸锂治疗，均治疗 8 周。比较 2 组治疗前后贝克-拉范森躁狂量表 (BRMS) 评分、临床总体印象疾病严重程度量表 (CGI-s-BP) 评分、生活质量综合评定问卷 (GQOLI-74) 评分及认知功能—重复性成套神经心理状态测验 (RBANS) 评分，并比较 2 组临床疗效。

结果 治疗前，2 组 BRMS、CGI-s-BP 评分比较，差异均无统计学意义 ($P>0.05$)。治疗后，2 组 BRMS、CGI-s-BP 评分均降低 ($P<0.05$)，且观察组低于对照组 ($P<0.05$)。观察组总有效率 87.23%，高于对照组 65.96% ($P<0.05$)。治疗前，2 组 GQOLI-74 各项评分比较，差异无统计学意义 ($P>0.05$)。治疗后，2 组 GQOLI-74 各项评分均升高 ($P<0.05$)，且观察组高于对照组 ($P<0.05$)。治疗前，2 组各项 RBANS 评分比较，差异无统计学意义 ($P>0.05$)；

治疗后, 2 组各项 RBANS 评分均升高 ($P < 0.05$), 且观察组高于对照组 ($P < 0.05$)。治疗前, 2 组各项 RBANS 评分比较, 差异无统计学意义 ($P > 0.05$); 治疗后, 2 组各项 RBANS 评分均升高 ($P < 0.05$), 且观察组高于对照组 ($P < 0.05$)。

结论 解郁安神汤联合碳酸锂治疗双相情感障碍躁狂发作的效果优于单纯碳酸锂治疗, 且能有效改善患者认知功能和生活质量。

关键词: 双相情感障碍; 躁狂; 解郁安神汤; 碳酸锂; 认知功能

基于 fMRI 脑熵的双相情感障碍患者识别研究

季善玲^{1,2} 刘传新¹ 郝昊¹

1. 济宁医学院 精神卫生学院

2. 济宁医学院附属医院

目的 大脑熵是一种评价大脑复杂性和规律性的指标, 在 fMRI 中的应用有一定的意义, 提供了一个认识大脑和大脑疾病的新途径。双相情感障碍 (Bipolar Disorder, BD) 具有高患病率、低识别率的特点。本研究旨在利用静息态功能核磁共振脑成像 (rs-fMRI) 技术探究不同脑熵识别双相情感障碍的能力。

方法 本研究基于 48 例 BD 患者和 48 例健康对照的 rs-fMRI 数据计算了置换熵、样本熵、模糊熵。分类模型包括支持向量机 (Support vector machine, SVM)、K-近邻算法 (k-nearest neighbor classification)、逻辑回归 (Logic Regression, LR)、决策树 (Decision Tree, DT)、线性判别 (Linear Discrimination Analysis, LDA) 和袋装树 (Bagging Tree, BT)。通过网格搜索和十折交叉验证 (分层采样) 对每个分类器进行超参数寻优。评价指标有准确率 (ACC), 敏感性 (SEN), 和特异度 (SPE)。

结果 置换熵在六类分类器上均取得最高分类准确率, 且在 KNN 模型中取得最高分类准确率 77%。可以看出, 置换熵对 BD 患者的识别优于样本熵和模糊熵。

结论 样本熵作为已有研究中最常用的脑熵计算方式在识别 BD 任务上并非最优特征。这意味未来研究需要针对脑熵的计算方式开展更全面更深入

的探索, 优化及创新更对情感障碍更敏感的脑熵创建方法及其相关参数。该研究为脑熵在情感性精神障碍脑健康量化评估和进一步提出更有效的脑熵提供了理论依据。

安神通窍汤联合碳酸锂对双相情感障碍躁狂发作患者的临床研究

朱佳*

金华市第二医院

目的 观察安神通窍汤联合碳酸锂治疗双相情感障碍躁狂发作患者的临床疗效。

方法 选择 100 例双相情感障碍躁狂发作患者作为研究对象, 按照随机数字表法将以上患者均分为常规治疗组和安神通窍汤组各 50 例。常规治疗组单纯采用碳酸锂治疗, 安神通窍组在常规治疗组基础上联合安神通窍汤治疗。比较 2 组临床效果和不良反应, 比较 2 组治疗前后血清炎症因子水平、生活质量以及躁狂程度变化。

结果 安神通窍组总有效率 96.00%, 高于常规治疗组 84.00% ($P < 0.05$)。治疗前, 2 组血清脑源性神经营养因子 (BDNF)、白细胞介素-1 β (IL-1 β) 及肿瘤坏死因子- α (TNF- α) - α 水平比较, 差异无统计学意义 ($P > 0.05$); 治疗后, 2 组血清 BDNF 水平均升高 ($P < 0.05$), IL-1 β 、TNF- α 水平均降低 ($P < 0.05$), 且安神通窍组血清 BDNF 水平高于常规治疗组 ($P < 0.05$), IL-1 β 、TNF- α 水平低于常规治疗组 ($P < 0.05$)。治疗前, 2 组霍普金斯词语学习测验 (HVLt-R) 评分、持续操作测验量表 (CPT) 评分比较, 差异无统计学意义 ($P > 0.05$); 治疗后, 2 组 HVLt-R 评分、CPT 评分均升高 ($P < 0.05$), 且安神通窍组高于常规治疗组 ($P < 0.05$)。治疗前, 2 组简明健康状况量表 (SF-36) 评分、贝克范森躁狂自评量表 (BRMS) 评分比较, 差异无统计学意义 ($P > 0.05$); 治疗后, 2 组 SF-36 评分升高 ($P < 0.05$), BRMS 评分下降 ($P < 0.05$), 且安神通窍组 SF-36 评分高于常规治疗组 ($P < 0.05$), BRMS 评分低于常规治疗组 ($P < 0.05$)。2 组不良反应发生率比较, 差异无统计学意义 ($P > 0.05$)。

结论 安神通窍汤联合碳酸锂治疗双相情感障碍躁狂发作,能提高临床疗效及患者的生活质量、注意力及学习能力,降低躁狂程度,其作用机制可能与调节血清神经营养因子水平和炎症反应相关。

关键词: 双相情感障碍;躁狂发作;安神通窍汤;碳酸锂;炎症因子;生活质量

伴与不伴短暂轻躁狂发作史的抑郁障碍患者抗抑郁药疗效对照研究

毛晗悦 钱敏才*

湖州市第三人民医院

目的 比较抗抑郁药物治疗伴与不伴短暂轻躁狂发作史的抑郁障碍患者的疗效及转躁情况。

方法 选取2022年10月至2023年10月在湖州市第三人民医院心身科门诊就诊的79例抑郁发作患者为研究对象,其中单纯性抑郁障碍患者40例,伴短暂轻躁狂发作史的抑郁障碍患者39例,给予抗抑郁药物舍曲林治疗。评估2组患者基线时汉密尔顿抑郁量表(HAMD-24)、杨氏躁狂量表(YMRS)、心境障碍问卷(MDQ)、32项轻躁狂症状清单(32-item Hypomania Checklist, HCL-32)等量表评分,以及治疗第1、2、4、8周末HAMD-24及YMRS。

结果 8周随访中,抑郁障碍组与短暂轻躁狂组HAMD-24总体呈下降趋势且差异无统计学意义($P>0.05$),在第8周末两者具有统计学差异($P<0.05$),而两者YMRS总体存在统计学差异($P<0.05$),各测量时间点均具统计学差异($P<0.05$)。抑郁障碍组及短暂轻躁狂组的累计治疗有效率无明显差异($P>0.05$),累计临床治愈率具差异($P<0.05$)。两组间药物转躁方面无明显差异($P>0.05$)。

结论 经8周抗抑郁药舍曲林治疗后,伴与不伴短暂轻躁狂发作史的抑郁障碍患者的抑郁症状均有减轻,但不伴短暂轻躁狂发作史的单纯抑郁障碍患者的治疗效果更好,两组均未发现明显的转躁情况。

AUTS2 基因甲基化及 mRNA 表达水平对青少年双相抑郁患者自杀意念的影响

沈小琴 邹韶红*

新疆维吾尔自治区人民医院

目的 探讨青少年双相抑郁患者 AUTS2 基因甲基化水平与 mRNA 表达水平及其对自杀意念的影响。

方法 选取2020年12月至2023年12月于新疆维吾尔自治区人民医院临床心理科住院的73例青少年双相抑郁患者为研究对象。采用自杀意念自评量表(SIOSS)评估患者的自杀意念。采用Methprimer软件对AUTS2基因启动子区进行甲基化岛预测和甲基化引物设计,将提取好的DNA经亚硫酸盐转化后进行PCR扩增和焦磷酸盐测序,确定甲基化的CpG位点和甲基化率;同时提取RNA,qRT-PCR实验进行基因表达水平检测。比较两组患者AUTS2基因不同位点甲基化水平的差异及两组间mRNA表达水平的差异;采用Spearman相关分析AUTS2基因甲基化水平、mRNA表达水平与自杀意念的相关性;采用Bootstarp方法验证mRNA表达水平在基因甲基化水平与自杀意念间的中介作用。

结果 基因甲基化检测结果显示,有自杀意念组患者的CpG1、CpG10及CpG14.15.16位点AUTS2基因甲基化水平高于无自杀意念组,差异有统计学意义($P<0.05$);两组患者AUTS2基因其余位点的基因甲基化水平比较,差异无统计学意义($P>0.05$)。基因表达结果显示,有自杀意念组患者的mRNA表达水平高于无自杀意念组,差异有统计学意义($P<0.05$)。相关性分析结果显示,AUTS2基因CpG14.15.16位点甲基化水平与mRNA表达水平($rs=0.255, P<0.05$)以及SIOSS评分($rs=0.255, P<0.05$)均呈正相关,mRNA表达水平与SIOSS评分($rs=0.342, P<0.05$)呈正相关;AUTS2基因CpG1、CpG10位点的甲基化水平与SIOSS评分均不相关($P>0.05$)。中介分析结果显示,通过Bootstarp方法对mRNA表达水平在模型中的中介作用进行检验,可以看出,间接效应值为0.093,95%置信区间[0.005, 0.213]不包含0,因此说明间接效应成立,所以mRNA表达水平在模型中起到了显著的中介作用,而直接效应检验的结果置信区间包含0,说明直接效应不成立。根据效应占比计算结果可以看出,mRNA表达水平的效应占比为30%。

结论 AUTS2 基因 CpG14.15.16 位点甲基化水平与青少年双相抑郁患者的自杀意念有关, 且通过 mRNA 表达水平的中介作用影响患者的自杀意念。

4.CAS Center for Excellence in Brain Science and Intelligence Technology, Shanghai, China

5.Hunan Second People's Hospital (Hunan Brain Hospital), Hunan, China

Objective Depression is a global public health problem. Brain-derived neurotrophic factor (BDNF) is considered to be one of the potential mechanisms of depression, and is regulated by epigenetic genes such as peripheral blood microRNA (miRNA). We aim to searching genetic loci and genes that significantly associated with the effectiveness and side effects of different antidepressants from the perspective of miRNA expression profiles, and conducting corresponding functional verification in the patients with depression

Methods We will include 100 patients aged 18-65, with HAMD-17 \geq 17, meeting the DSM-5 criteria for current depression episode. After enrollment, escitalopram or venlafaxine were randomly selected for treat-

ment. Drug dose titration range are 10-20mg/d for escitalopram and 75-225mg/d for venlafaxine. When participants do not respond to a full dose of either antidepressant for 4 weeks (defined as HAMD-17 reduction rate <30%), they will be treated with another antidepressant. Otherwise, they continue their initial therapy. For all participants, clinical assessment is performed before enrollment, at 4, 8, and 12 weeks during treatment, including demographic characteristic, HAMD-17, OEQ, HAMA, BPRS, WCST, SCWT, PDQ-D, DSSS, GAS, SERS, etc. 15ml of peripheral blood was collected for blood test, including CRP, BDNF, NRG1, PKC and miRNA such as miR-16, miR-30, miR-34, miR-128, miR-132, miR-134, miR-182, miR-183, miR-185, miR-212, miR-1202. The primary outcome is defined as the relevance of HAMD-17 reduction rate and miRNA changes after 4 and 8 weeks of antidepressant therapy. The secondary outcomes are defined as the correlations between the changes of other clinical assessments and some of miRNAs or BDNF

Results We hypothesize that HAMD-17 reduction rate is significantly associated with miRNA changes after 4 and 8 weeks of treatment. The correlations between the changes of other clinical assessments and other biomarkers such as some of miRNAs or BDNF are found

Conclusion We could conclude that one or more miRNAs are associated with BDNF pathway and could be potential biomarkers for predicting efficacy in antidepressant therapy

关键词: Depression, antidepressants, miRNA, brain-derived neurotrophic factor (BDNF)

The Mediating Role of Inflammatory Factors in Anhedonia and Fatigue in Major Depressive Disorder: An Observational Study

Zheyi Wei Wu Hong*

Shanghai Mental Health Center

Objective Anhedonia and fatigue are core clini-

cal symptoms in major depressive disorder (MDD). Immune dysregulation is thought to be their underlying mechanism. This study investigated whether immune factors could be used as biomarkers of anhedonia and fatigue in patients with MDD. In addition, the mediating role of inflammatory cytokines in the relationship between fatigue and anhedonia were examined

Methods Patients with MDD were recruited. HAMD-17 was used to examine depression symptoms. Anhedonia symptoms were assessed using the SHAPS system and fatigue was assessed with the MFI-20 scale. Peripheral blood samples at baseline were tested by Luminex assays, measuring the plasma amounts of 48 cytokines

Results Fifty patients were included in the study. Plasma IFN- γ , IL-1 β , IP-10, IL-18, and TNF- α protein concentrations were associated with anhedonia($P<0.05$). Additionally, plasma IFN- γ , IL-1 β , IP-10, TNF- α , and TNF- β protein concentrations were associated with fatigue($P<0.05$). Furthermore, the mediation analyses indicated that the total effect of fatigue on anhedonia was significant ($B = 0.450$, 95 % CI: 0.240, 0.659) and the relationship between fatigue and anhedonia in patients with MDD is partially mediated by inflammatory markers IFN- γ , TNF- α and IL-1 β

Conclusion This work suggests that IFN- γ , IL-1 β and TNF- α could function as potential mediators in the relationship between fatigue and anhedonia

关键词: major depressive disorder, anhedonia, fatigue, inflammation, mediation model

基于孟德尔随机化方法筛选双相障碍发病因果关系的神经发育相关蛋白

李燕燕 杨春霞*
山西医科大学

目的 双相情感障碍是一种复杂疾病,发病机制至今未定论。神经发育假说是目前研究热点,但是有关双相情感障碍的神经发育证据有限。本研究基于孟德尔随机化分析方法探究哪些神经发育相关蛋白与双相情感障碍存在因果关系,为双相情感障

碍的神经发育假说提供进一步的潜在证据。

方法 本研究首先进行正向 MR 分析探索多种神经发育相关蛋白 ITIH1,ITIH2,ITIH3,ITIH4,ITIH5,NFASC, PLXNB2, QSOX2, SLPI,SVEP1 对双相情感障碍的因果影响,随后采用反向 MR 分析双相情感障碍对神经发育相关蛋白的潜在反向因果影响,全面评估神经发育相关蛋白与双相障碍之间的因果联系。利用大规模全基因组关联研究,分别选取单核苷酸多态性位点作为遗传工具变量,设置参数消除连锁不平衡确保筛选出的 SNP 之间相互独立。在 PhenoScannerV2 数据库中搜索每个 SNP,手动剔除了与混杂因素相关的 SNP。随后采用逆方差加权法作为该研究评估因果效应的主要分析方法,MR-Egger 法、加权中位数法、加权模型、简单模型等作为补充方法,并通过 Cochran's Q,MR-Egger 进行敏感性分析检测异质性和水平多效性,对结果的稳定性和准确性进行评价。最后运用 MR-Egger 截距检验和 MR-PRESSO 全球检验评估结果的多效性和异常值。

结果 一. 正向 MR 分析结果

本研究结果显示 ITIH1($OR=1.06,P=0.013$),ITIH3($OR=0.91,P=3.22e-03$),ITIH5 ($OR=1.08, P=0.04$),NFASC ($OR=0.96, P=0.042$)和 SLPI($OR=0.77, P=0.003$)与双相情感障碍存在因果关系。ITIH2,ITIH4,QSOX2,SVEP1,PLXNB2 与双相情感障碍之间不存在因果关联。

Cochran's Q 检验,MR-Egger 回归和 MR-PRESSO 分析结果显示 NFASC,ITIH5 的 SNP 间未发现异质性和水平多效性,提示 NFASC 和 ITIH5 与 BD 的因果关系可靠。ITIH3 和 SLPI 的 SNP 间有异质性,但没有水平多效性,ITIH3 和 SLPI 与 BD 之间的因果关系需要更多数据验证。ITIH1 的 SNP 间存在异质性和水平多效性,提示 ITIH1 与 BD 的因果关系不可靠。

二、反向 MR 分析结果

本研究显示双相情感障碍与这几种神经发育相关蛋白均未存在明显因果关系。

结论 本研究从分子遗传学角度明确了神经发育相关蛋白 NFASC,ITIH5 与 BD 的因果关系,是诊断和治疗的可能生物学靶点,为双相情感障碍的神经发育假说提供了新理论依据。

双相情感障碍的症状变异

李赓* 马元元 米燕 刘薇
宁夏回族自治区宁安医院

目的 了解和探讨双相情感障碍症状特点及其结构的变化,旨在探讨准确诊断双相障碍的新维度,以期能从症状的多维度视角及症状的特征更早期、更准确诊断双相,避免漏诊和误诊;同时为治疗目标的准确把握提供依据。

方法 使用“双相情感障碍”的“早期功能障碍”、“非典型症状”、“节律障碍”、“自杀”、“睡眠障碍”、“梦境异常”、“合并症”、“躯体症状”和“精神病性症状”检索有关双相情感障碍症状变异的文献。共检索到 114 篇文章,其中 72 篇被纳入本综述。

结果 1.双相障碍的症状结构已经发生了显著变化,情绪低落和情感高涨的交替出现不再被视为双相障碍的主要症状成分;2.情绪高涨和低落的特点发生了许多变化;情绪的混合状态明显增多,其症状变异也很大。除了起伏不定和成分多样的情绪变化,双相障碍还表现出异常情绪的“原发、非应激性、闯入、异己”的特征;3.双相障碍的症状不仅限于情绪问题,还包括早期的功能损害、非典型症状、节律障碍、特异的自杀和自伤冲动、不合常理的认知改变、特征性的睡眠和梦境异常、片断且不特异的精神病性症状、无法解释的躯体症状以及共病多发等。因此可以认为双相障碍不再是简单的“双相”,而是一个更复杂的“多相”疾病;4.这些症状在现象学上可能没有特征性意义,但它们的特点和机制具有明显的精神病理特征,例如低龄出现、并非继发于应激或心理创伤、闯入的特征、异己的体验等。此外,这些症状通常同时或先后出现,具有明显的综合征特征,表明它们可能有共同的精神病理意义。

结论 1.双相障碍的症状特点及其结构已发生了很大变化,不再是“双相”障碍而,涉及认知、思维、节律等多方面的障碍;2.因此,重新考虑双相障碍的诊断标准,采用多维度的诊断方向是必要且可行的;评估早期功能、强调代际特点、分析症状特征、构筑综合症都是准确诊断的要点;3.重新审视双相的症状变异、关注情绪情感症状之外的表现在诊断中的价值,制定符合这一变化的诊断标准,从而更

广泛、更准确的聚焦双相障碍治疗目标是一项重要且紧迫的任务。

心境障碍患者犬尿氨酸代谢特点及其与临床代谢特征的关联研究

张革*
北京回龙观医院

目的 通过比较双相躁狂、双相抑郁患者与健康对照在犬尿氨酸代谢产物水平及脂质代谢指标间的差异,并分析两类指标之间的相关性,探究犬尿氨酸代谢异常在心境障碍患者临床及代谢特征中的潜在作用。

方法 选取于 2020 年 10 月至 2022 年 4 月在北京回龙观医院就诊的 52 例双相情感障碍,目前为躁狂发作的患者、46 例双相情感障碍,目前为抑郁发作的患者及同时期在医院周边社区招募的 52 名年龄及性别比例相匹配的健康对照者作为研究对象,使用高效液相色谱法将所有被试血清中的色氨酸、犬尿氨酸、喹啉酸、犬尿喹啉酸 4 种犬尿氨酸代谢产物进行分离,然后使用串联质谱仪进行定量检测;使用酶联免疫吸附实验检测所有被试空腹静脉血中低密度脂蛋白胆固醇 (low density lipoprotein cholesterol, LDL-C)、高密度脂蛋白胆固醇 (high density lipoprotein cholesterol, HDL-C) 和总胆固醇的水平;在被试平静休息 10 分钟后测量其立位时腹围。使用汉密尔顿抑郁量表 (Hamilton's Depression Scale, HAMD) 评估双相抑郁患者目前抑郁发作的严重程度,使用杨氏躁狂评定量表 (Young Mania Rating Scale, YMRS) 评估双相躁狂患者目前躁狂发作的严重程度。使用单因素方差分析及事后 t 检验比较三组被试在犬尿氨酸代谢产物水平和代谢指标间的组间差异,使用偏相关分析探究犬尿氨酸代谢异常和代谢指标异常及临床特征在不同类型心境障碍患者的相关关系。

结果 除犬尿氨酸外,血清色氨酸、犬尿喹啉酸及喹啉酸的水平在三组间的差异均显著 (均 $p < 0.01$), 见表 1。事后两两组间比较发现双相躁狂与双相抑郁患者的血清色氨酸及犬尿喹啉酸水平均

显著低于健康对照 (均 $p < 0.01$), 但两患者组间的差异不显著 (p 分别为 0.654 和 0.514)。双相躁狂组的血清喹啉酸水平显著高于双相抑郁组和健康对照组 (均 $p < 0.001$), 而后两组间差异不显著 ($p = 0.067$)。LDL-C、HDL-C、总胆固醇及腹围 4 个代谢指标在三组间的差异均不显著 (均 $p > 0.05$), 见表 1。偏相关分析发现双相抑郁症患者组的喹啉酸与 LDL-C 呈显著负相关 ($r = -0.35$, $p = 0.029$), 而以上相关性在另外两组不存在。另外在双相躁狂组, 喹啉酸与评估患者病情严重程度的 YMRS 总分呈边缘正相关 ($r = 0.26$, $p = 0.07$)。

结论 双相躁狂与双相抑郁症患者均存在显著的犬尿氨酸代谢异常, 其中双相躁狂患者更为突出, 表现为喹啉酸的水平显著升高, 该指标的升高可能与患者躁狂发作的严重程度存在一定相关性。

A Case Report and Literature Review of Seizures Resembling Electric Shocks in Patients with Bipolar Disorder and Normal Serum Lithium Concentration

Jinbo Chen Qiang Hu* Zixuan Chen Xue Sun Yanli
Zhang Jun Zhu Danwei Zhang
Zhenjiang Mental Health Center

Objective Bipolar disorder is a complex mental disorder that often requires long-term medication management. Among them, lithium carbonate is widely used for preventing and treating the recurrence of bipolar disorder. However, rare but severe side effects may occur even at normal serum lithium levels

Methods This study reports a case of a 42-year-old female patient with bipolar disorder who experienced "electric shock-like" seizures after taking extended-release lithium carbonate tablets despite having normal serum lithium concentrations. The patient's medical history included emotional instability for 27 years, and upon admission, there were no apparent psychotic symptoms such as hallucinations or delusions

during the mental examination. On the 33rd day of medication, the patient developed frequent head, neck, and upper body seizures

Results Considering the possibility of a drug reaction, the lithium carbonate was discontinued, which relieved seizures, and the electroencephalogram (EEG) showed no abnormalities. After 10 days of treatment, the seizures had mostly disappeared

Conclusion This case reminds clinicians that even with normal serum lithium levels, toxic symptoms may arise, requiring close monitoring of the patient's clinical presentation and serum lithium concentrations. Furthermore, poor diet and reduced sodium intake may increase the risk of lithium toxicity, making it crucial to consider these factors

关键词: Bipolar Disorder, Lithium Carbonate, Electric Shock-Like Seizures, Serum Lithium Concentrations, Lithium Toxicity, Drug Reaction

Impaired Facial Emotion Recognition in Individuals with Bipolar Disorder

Yiyang Liu Yuqing Song Shanshan Liu Hongguang
Chen*
Peking University Sixth Hospital

Objective Individuals with bipolar disorder (BD) often struggle with emotional regulation and social interactions, partly due to difficulties in accurately recognizing facial emotions

Methods From September 2021 to February 2023, 69 BD individuals-comprising 23 with bipolar manic/hypomanic episode (BME), 23 with bipolar depressive episode (BDE), 23 with bipolar euthymic (EUT)-and 23 healthy controls (HCs) were enrolled. Diagnosis adhered to DSM-IV criteria using M.I.N.I 5.0, alongside assessments via Hamilton Depression Scale 17 and Young Manic Rating Scale. Participants completed recognition tasks involving 84 facial expression images across six categories: neutral, angry, fear, disgusted, joy, and sadness, each containing 14 images

Results The overall correct recognition rate of

facial expressions in the BD group (79%) was significantly lower than that of the HC group (83%) ($P=0.004$). Primary differences were noted in neutral (93% vs. 100%, $P=0.012$) and fear (79% vs. 86%, $P=0.023$) expressions. Within the BD group, correct recognition rates were 71% for BME, 80% for BDE, and 80% for EUT, all lower than in the HC group. Significant differences in correct recognition rates of neutral, fear, and joy expressions were observed among the four groups ($P<0.05$), with the BME group exhibiting the lowest rate. Misidentification of facial expressions was more frequent in the BD group compared to the HC group, particularly among negative expressions

Conclusion Patients with BD demonstrate lower correct recognition and higher misidentification rates of facial expressions, with those experiencing manic episodes showing impaired recognition of neutral, joy, and fear expressions

阿立哌唑联合碳酸锂对青少年双相情感障碍共病非自杀性自伤临床疗效研究

柴森*

沈阳市精神卫生中心

目的 随着社会对特殊群体的关注,青少年双相情感障碍患者深受人们的关注。此类疾病患者通常共病非自杀性自伤,对其生命安全造成较大的威胁,不利于社会和谐稳定,还需要致力于探讨有效的治疗方法,减轻患者的病情,提高预后效果。为了探讨最新的治疗青少年双相情感障碍共病非自杀性自伤的方法,本研究分析阿立哌唑联合碳酸锂应用在治疗青少年双相情感障碍共病非自杀性自伤的临床疗效。

方法 本研究选择2023年1月-2024年1月期间在我院接受治疗的30例青少年双相情感障碍共病非自杀性自伤患者为观察对象,数据分组的依据为随机数表法,对照组和观察组,各15例。对照组应用碳酸锂治疗,观察组应用阿立哌唑联合碳酸锂治疗。对比两组YMRS评分、HAMD评分及NSSI

行为发生率。

结果 治疗8周后观察组的YMRS评分为(10.26±1.59)分,对照组为(13.13±1.64)分, $P<0.05$;治疗8周后观察组的HAMD评分为(16.84±1.82)分,对照组为(22.41±1.36)分, $P<0.05$;治疗4周后观察组非自杀性自伤行为发生率为26.67%,对照组为66.67%, $P<0.05$;治疗8周后观察组非自杀性自伤行为发生率为13.33%,对照组为53.33%, $P<0.05$ 。

结论 青少年双相情感障碍并不少见,不少患者合并非自杀性自伤情况,治疗期间可以考虑联合使用阿立哌唑联合碳酸锂,可以缓解躁狂症状,消除抑郁情绪,降低非自杀性自伤行为发生率,具有较高的借鉴价值。

单、双相抑郁患者特征性舌象分析研究

陈沛 杨杨* 郭雨萌 阎锴娟 金鑫 张磊 李静 王贵山 袁海宁 王娣

首都医科大学附属北京安定医院

目的 单相抑郁与双相抑郁均以情绪低落为主要表现,中医一般归于“郁病”进行诊治。但因双相抑郁患者有躁狂发作的病史及再次发作的可能,其中医证候分布是否不同于单相抑郁,尚待进一步研究。舌象可反映人体气血的盛衰,邪气的深浅。舌诊是中医“四诊”的重要内容,是临床辨证论治的重要参考依据。本研究从舌诊入手,采用横断面调查的方式,对单、双相抑郁患者的舌象进行观察分析及特征规律总结,以期优化中医诊治郁病提供参考依据。

方法 对符合标准的单、双相抑郁患者进行人口学资料及临床基本信息采集。同时,采集患者的舌象信息。舌象采集均在日间进行,患者面向自然光线平坐,尽量张口,自然放松地伸出舌头,充分暴露舌体。舌象判读的医师均为具有主治医师及以上职称的中医医师。判读前,对医生进行一致性培训,并随机抽取10张舌象图片进行一致性测试,通过一致性测试的医生将有最终的舌象判读的资格。判读时,先由两名医师独立进行,当二者判读结果不一致时,

由高年资的医师再次判读决定。判读医生对患者的临床诊断不知情。最后,从舌色、舌形、苔色、苔质等角度,对比分析两组患者舌象的特征,并进行特征性规律总结。

结果 于2022年4月—2023年3月共纳入我院符合标准的单相抑郁患者108例,双相抑郁患者120例。两组患者的性别、年龄等一般情况无统计学差异($P>0.05$)。舌色方面,两组患者分布无显著差异($P>0.05$)。舌形方面,单相抑郁患者胖大舌比例较双相抑郁更高($P<0.05$),而双相抑郁患者裂纹舌的比例更高($P<0.05$)。舌苔方面,双相抑郁患者正常的薄润苔较单相抑郁少,而黄苔、腻苔比例更高($P<0.05$)。

结论 双相抑郁较单相抑郁阴虚更突出,痰热之象更显著。

关键词: 抑郁症,双相情感障碍,单相抑郁,双相抑郁,舌象

TORCH 感染对双相障碍早期发病影响的回顾性分析

黄辉敏² 吕海龙¹ 胡少华¹

1.浙江大学医学院附属第一医院

2.温州医科大学附属第三医院

目的 虽然妊娠期间TORCH病原体的垂直传播与后代患神经精神疾病的风险增加有关,但有关其对早发性双相障碍(BD)影响的证据却很有限。本研究对大样本的双相患者队列进行了回顾性分析,拟计算TORCH感染影响双相障碍早期发病的比值比。

方法 本研究对2018年至2023年期间医院记录中的931例BD病例(678例早发,定义为19岁之前发病;253例非早发,定义为19岁或之后发病)进行了回顾性分析。所选用的主要临床资料包括性别、入组年龄、和发病年龄等,同时所有病例均完成了TORCH抗体检测,包括弓形虫(TOX)、风疹病毒(RV)、巨细胞病毒(CMV)、单纯疱疹病毒I型(HSV-I)和II型(HSV-II)的IgM抗体和IgG抗体。研究采用二元逻辑回归模型探索了TORCH感染与BD发病分类之间的关联,旨在确定早发与非早发BD的潜在预测因素。

结果 相关分析发现,所有TORCH IgM数据与发病类型(早发、晚发)无显著相关关系,风疹病毒的IgG(阳性/阴性)与发病类型呈显著正相关($r=0.15, p<0.001$),其余病原体的IgG与发病类型均呈显著负相关($p<0.05$)。

将所有TORCH IgG数据纳入Logistic回归模型后显示,早发与非早发BD的显著几率比(ORs)为:弓形虫IgG阳性(OR=2.81, 95% CI: 1.29-6.18, $P=0.01$)、风疹病毒(RV)IgG阳性(OR=0.45, 95% CI: 0.28-0.72, $P<0.001$)、巨细胞病毒IgG阳性(OR=3.25, 95% CI: 1.62-7.47, $P=0.002$)、单纯疱疹病毒I(HSV-I)IgG阳性(OR=2.01, 95% CI: 1.42-2.88, $P<0.001$)、单纯疱疹病毒II(HSV-II)IgG阳性(OR=8.62, 95% CI: 3.53-24.28, $P<0.001$)。

针对TORCH IgG抗体的逐个预测分析发现,当患者的TOX IgG从阴性变为阳性时,其双相早发的概率增加了23.33%,相应的CMV的感染可导致双相早发的概率增加17.11%,HSV-I和HSV-II感染导致双相早发的增加概率分别为12.46%和49.15%,而RV感染会导致双相早发的概率减少17.49%。

结论 先天性TORCH感染对BD发病时间有显著影响。除风疹病毒外,TORCH病原体与早发BD的风险增加有关,这强调了在高危人群中采取预防措施和进行早期筛查的重要性。

青少年母亲抑郁风险预测与模型构建

杨勇¹ 俞人婕¹ 周薇²

1.苏州市广济医院

2.昆山市精神卫生中心

目的 女性,尤其是作为一个青少年的母亲承受着巨大的压力。母亲患抑郁症从多方面影响着母亲的健康、孩子的健康、乃至整个家庭的健康。有研究表明,母亲抑郁会导致母亲产生更多心理虐待行为,同时这也间接的导致青少年问题行为、认知重评、抑郁情绪等众多心理问题,因此本研究旨在开发和验证青少年母亲患抑郁症风险的预测模型。

方法 采用方便采样方法,于2023年3月在江

苏省苏州市的多所中学校针对学生家长进行了一项问卷式的研究。共有名 802 名学生家长参与了这项研究,其中筛选出 592 名母亲。采用结构化问卷收集学生及其家庭成员的人口统计学和临床特征,使用 PHQ-9 抑郁症状自评量表和 GAD-7 焦虑自评量表等其他测量方法来评估母亲抑郁及其相关因素。采用 LASSO 回归和 logistic 回归构建预测模型,并通过 500 次 Bootstrap 后的曲线下面积 (AUC),校准曲线和 DCA 作为内部验证以评估其性能。

结果 青少年母亲抑郁症状发生率为 18.75%。开发的预测模型将是否有经济问题、焦虑、精力不足、入睡困难、呼吸不畅、疼痛影响睡眠、早醒作为显著的预测因子。多因素 logistics 回归显示 $P < 0.05$, $AIC=240.132$, $BIC=272.340$ 。对 ROC 曲线进行 500 次 bootstrap,结果显示训练集 AUC 为 0.902 (95% CI:0.859-0.946),验证集 AUC 为 0.908 (95% CI:0.845-0.970),校准曲线显示该模型具有良好的校正效果,DCA 曲线显示该模型在训练集 1%-99%和验证集 1-99%的阈值中具有较好的临床应用价值。

结论 青少年母亲抑郁的风险预测模型为其早期发现、干预提供了一定的价值。通过识别高风险个体,该模型有可能改善青少年母亲的抑郁情绪,从而为家庭带来更好的结果。

关键词:青少年,青少年母亲,抑郁,风险预测,模型,

双相抑郁患者认知功能损害与睡眠质量的关系

余浩 邹韶红* 吴瑶 王丞基 李丛丛 张丞
新疆维吾尔自治区人民医院

目的 探讨睡眠质量与双相抑郁患者认知功能损害的相关性。

方法 选取我院 2022 年 12 月-2023 年 12 月收治的 31 名双相抑郁患者为病例组,同期在医院及社会上招募 39 名健康人为对照组。采用蒙特利尔认知评估量表 (Montreal Cognitive Assessment, MoCA)、数值广度测验 (Digital Span Test, DST)、连线测试 A 部分 (Trail making test A, TMT-A)、斯特鲁普色词测验 (Stroop Color and Word Test, SCWT) 比较两组的认知功能,使用匹兹堡睡眠质量指数

(Pittsburgh sleep quality index, PSQI) 评估两组受试者的睡眠状况。通过偏相关分析认知功能损害与睡眠质量的相关性。

结果 病例组 MoCA 评分、DST 得分、SWCT 及 TMT-A 表现显著低于对照组 ($P < 0.05$)。病例组 PSQI 总分及各因子分均高于对照组。病例组 PSQI 总分与抽象、SWCT 单词呈负相关 ($P < 0.05$),与 TMT-A 呈正相关 ($P < 0.05$);主观睡眠质量与命名、记忆、抽象、总分呈负相关 ($P < 0.05$);入睡时间与抽象、总分、SWCT 单词呈负相关 ($P < 0.05$);睡眠障碍与记忆、抽象、总分、SWCT 单词呈负相关 ($P < 0.05$)。

结论 双相抑郁患者存在明显的认知功能损害,睡眠异常在一定程度上导致了认知损害的发生,及时干预双相抑郁患者睡眠及认知问题有助于减少不良预后。

不同发病年龄男性双相障碍患者临床特征及免疫炎症指标预测价值分析

李文霜*

河北医科大学第一医院

目的 通过比较不同发病年龄男性双相障碍患者临床特征及免疫炎症指标的水平的差异,并分析对比双相障碍患者的生物学标志物及临床特征,寻找其中可预测的指标应用到临床,以达到早期识别、早期治疗的目的。

方法 本研究纳入河北医科大学第一医院精神卫生中心 150 例住院的男性双相障碍急性发作期患者。根据入组患者起病年龄分为两组,分别为发病年龄 ≤ 21 岁的早发型组、发病年龄 > 21 岁的非早发型组。收集人口学资料及临床特征。以流式细胞仪检测外周血血浆淋巴细胞亚群及细胞因子、尿酸、甲功、NLR、PLR 等水平。采用 t 检验、秩和检验和 χ^2 检验比较两组免疫炎症指标和临床特征的差异。采用逐步 Logistic 回归分析双相障碍患者炎症标志物相关性分析,以早发或非早发为因变量,其他因素为自变量。并采用 ROC 曲线判断炎症指标对早发型双相障碍的预测作用。均取 $P < 0.05$ 为差异具有统计学意义。

结果 早发型组和非早发型组在婚姻情况、有无冲动攻击、抑郁发作次数等方面差异具有统计学意义 ($P<0.05$)。早发型组 CD4+T 细胞百分比、CD4+/CD8+、NK 细胞绝对值、IL-4、IL-6、NLR、PLR 低于非早发型组, 差异具有统计学意义 ($P<0.05$); 早发型组 CD8+T 细胞百分比、B 细胞绝对值高于非早发型组, 差异具有统计学意义 ($P<0.05$)。多因素 Logistic 回归模型, 结果显示, CD8+T 细胞百分比、B 细胞绝对值是早发型组的独立危险因素; IL-4、IL-6 是非早发型组的独立危险因素 ($P<0.05$)。用 ROC 曲线比较 CD8+T 细胞百分比、IL-4、IL-6 指标诊断早发双相障碍的能力, 曲线下面积大于 0.7 的参数分别为 0.772, 0.725, 0.702。

结论 1、早发组双相障碍患者在婚姻状况方面未婚率更高, 冲动攻击, 自伤自杀等比例更高。

2、早发组双相障碍患者 CD8+T 细胞百分比、B 淋巴细胞绝对值水平较高, 可能与免疫炎症机制有关。

3、CD8+T 细胞百分比、B 细胞绝对值、未婚是早发组的独立危险因素; IL-4、IL-6 是非早发组的独立危险因素。

4、CD8+T 细胞百分比、IL-4、IL-6 等指标对早发型双相障碍患者可能有预测价值。

关键词: 双相障碍, CD4+T 细胞, CD8+T 细胞, IL-6, 发病年龄

苏州市青少年心理健康状况现状分析

孔令华 杨勇*
苏州市广济医院

目的 了解苏州市青少年心理健康状况并分析其影响因素, 为提高青少年心理健康水平提供科学依据和理论指导。

方法 采用整群分层随机抽样的方法, 于 2019 年 6 月至 12 月对苏州市某城区的 18 所中学进行调查, 采用一般情况调查表、患者健康问卷抑郁量表 (PHQ-9)、广泛性焦虑量表 (GAD-7)、匹兹堡睡眠质量指数量表 (PSQI) 调查其心理状况水平及其影响因素。

结果 本次研究的 10176 名青少年睡眠质量平均得分 4.99 分, 焦虑情绪平均得分 5.15 分, 抑郁情

绪平均得分 5.30 分, 睡眠问题检出率 19.4%, 抑郁情绪检出率 18.0%。多因素 logistic 回归分析显示, 消极应对方式 ($OR=1.061, P<0.001$)、父母关系差 ($OR=2.644, P<0.001$)、学校欺凌 ($OR=1.446, P<0.001$)、焦虑情绪 ($OR=1.153, P<0.001$)、高中年级 ($OR=1.807, P<0.001$)、女性 ($OR=1.217, P<0.001$) 是青少年睡眠问题的危险因素。父母关系差 ($OR=2.103, P<0.001$)、学校欺凌 ($OR=1.731, P<0.001$)、焦虑情绪 ($OR=1.502, P<0.001$)、睡眠问题 ($OR=1.305, P<0.001$)、女性 ($OR=1.193, P<0.05$)、是青少年抑郁情绪的危险因素。

结论 青少年心理状况问题存在, 消极应对方式、父母关系差、学校欺凌、焦虑情绪、女性是青少年心理健康状况的危险因素, 应针对危险因素进行干预, 提高青少年心理健康水平。

The Roles of Mitochondria Dysfunction in Bipolar Disorder: An Updated Review

Peifen Zhang Xueqin Song*

The First Affiliated Hospital of Zhengzhou University

Bipolar disorder is one of the major psychiatric diseases characterized by severe and biphasic changes in mood with unclear pathophysiological mechanism, despite recent advances in neurobiological research. The mitochondria are crucial for neurogenesis and neuronal functions, and play an important role in mental illness. Several studies have found the relationships between mitochondrial dysfunctions and bipolar disorder, and lines of evidence indicated that the impairments of mitochondrial functions have been closely connected with the pathologies of bipolar disorder. Therefore, in this review, we aim to provide focuses on supporting the evidence that: 1) the dysregulation of energy metabolism and immune system in bipolar disorder, 2) the abnormal mitochondrial morphology and dynamics in bipolar disorder, 3) the vital roles of mitochondrial functions in energy metabolism, calcium homeostasis and electrophysiology, oxidative stress pathways and neuroim-

mune dysfunctions, 4) present the evidence that the alternations and abnormalities of mitochondria in both rodent models and humans, 5) point out the potential treatments targeting at mitochondria in bipolar disorder. A better knowledge of mitochondrial physiology and pathophysiology in bipolar disorder will help understand the pathological mechanism, improved strategies for the treatment, and explore mitochondria as a potential target for novel therapeutic agents to prevention of bipolar disorder.

关键词: bipolar disorder, mitochondria

双相抑郁患者睡眠障碍与 BMAL-1 基因甲基化的相关性研究

吴瑶 热孜亚·艾合买提 余浩 王丞基 阿亚阔孜·杰克山别克 邹韶红*
新疆维吾尔自治区人民医院

目的 研究双相抑郁伴睡眠障碍患者的睡眠结构特征, 探讨 BMAL-1 基因甲基化与双相抑郁睡眠障碍的相关性, 为双相抑郁患者睡眠障碍提供生物学理论依据并起到早期预警作用。

方法 选取新疆维吾尔自治区人民医院临床心理科 2022 年 12 月至 2023 年 12 月门诊和住院双相抑郁患者 30 例, 选取同时期新疆维吾尔自治区人民医院体检中心健康体检者以及医护人员家属至少 30 例, 双相抑郁患者符合《美国精神障碍诊断与统计手册第五版》(DSM-5) 双相障碍 II 型诊断标准, 且目前处于抑郁状态。匹兹堡睡眠质量指数量表 (PSQI) >7 分诊断为睡眠障碍。采用多导睡眠检测 (PSG) 分析睡眠结构特征。采用 Massarray 飞行时间质谱法分析 BMAL-1 基因 DNA 甲基化水平。采用 SPSS26.0 软件进行数据统计分析, 计量资料采用 t 检验及 Mann-Whitney U 检验, 计数资料采用卡方检验, 用 Logistic 回归分析探究双相抑郁患者睡眠障碍的影响因素, 用相关性分析法分析 BMAL-1 基因各位点甲基化水平与双相抑郁患者睡眠障碍 PSG 指标的相关性。

结果 (1) 双相抑郁伴睡眠障碍组与健康对照组两组间年龄、性别、BMI 值、婚姻状况、受教育年限比较均无统计学意义 ($P>0.05$)。 (2) 双相抑郁

伴睡眠障碍组与健康对照组 BMAL-1 基因甲基化水平进行比较, 结果显示两组数据中 CpG2、CpG3、CpG6 位点基因甲基化有统计学意义 ($P<0.05$), 余位点无统计学意义 ($P>0.05$)。 (3) Logistic 回归分析显示 BMAL-1 基因 CpG2、CpG3 (位点甲基化水平是双相抑郁伴睡眠障碍组的独立危险因素。 (4) 双相抑郁伴睡眠障碍组与健康对照组 PSG 各指标相比较, 结果显示两组间比较 SE、SL、N1%、N2%、N3%、REM% 有统计学意义 ($P<0.05$)。 (5) 双相抑郁伴睡眠障碍组和健康对照组 BMAL-1 基因甲基化水平与 PSG 各指标之间的相关性分析显示, CpG2 与 SE、SL 有相关性, CpG6 与 N2%、N3% 有相关性。

结论 (1) 双相抑郁伴睡眠障碍与 BMAL-1 基因甲基化可能具有关联性。 (2) BMAL-1 基因 CpG2、CpG3 位点甲基化水平可能影响双相抑郁伴睡眠障碍的发生。 (3) BMAL-1 基因 CpG2、CpG6 位点甲基化水平可能与双相抑郁伴睡眠障碍患者的睡眠结构相关, 并且对患者的睡眠质量产生影响。

关键词: 双相情感障碍, 睡眠障碍, DNA 甲基化, BMAL-1

双相障碍炎症机制及辅助抗炎治疗的研究进展

李孝荻 崔伟*
河北省精神卫生中心

目的 双相障碍具有高致残性, 并且具有显著的职业及生活损害。目前双相障碍临床治疗过程中, 越来越多的药物、物理治疗、心理治疗等方式已经充分使用起来, 但患者及家属对急性期治疗效果、发作次数、愈后情况并未达到期望值, 且在治疗过程中存在一定的局限性。双相抑郁的治疗耐药性是目前普遍存在的问题。越来越多的证据表明, 低级别炎症可能参与双相障碍的病理生理机制, 炎症因子种类及含量改变在双相障碍中有着重要的作用; 对近期双相障碍和炎症因子改变、炎症机制以及辅助抗炎治疗进行总结与讨论, 深入的了解疾病发生发展的生物学机制, 以致于寻找可靠的生物标志物提高诊断的准确率以及开展新的治疗方案。

方法 通过检索 PubMed 及知网从成立至 2024 年 3 月期间双相情感障碍与炎症因子的临床实验,

以及该方面的相关综述和参考文献,对文献进行综述。选用随机对照实验或者交叉实验,确保具有有效的对照组。纳入标准必须符合 ICD-10、DSM-V 的诊断标准。

结果 最近的研究支持双相障碍和炎症因子之间具有强大的联系。特别是促炎因子如白介素 1、白介素 6,肿瘤杀伤因子和干扰素等,且增强某些炎症因子如白介素 4、白介素 5 和白介素 10 的产生与双相障碍疾病发展密切相关。这些结果都强烈表明双相障碍患者存在炎症现象。目前已经有临床研究开展使用抗炎药物如塞来昔布、谷胱甘肽以及肿瘤杀伤因子 α 拮抗剂进行辅助治疗,研究也表明使用抗炎药物会对抑郁焦虑症状较对照组明显减轻。

结论 双相障碍首要需求就是准确、及时的诊断和进行有效的治疗,目前临床中的诊断和一线治疗虽然对大部分患者有帮助,但效果并不明显。因此,一个准确且客观的标志物对我们的诊断及治疗有很大的帮助。根据炎症因子,我们可以推测,BD 患者的早期炎症特征,可以帮助解决更有针对性的治疗,以提高疗效。正在进行的和未来的抗炎药物临床研究将启发我们在其治疗边缘,并帮助我们提供更多治疗方法对抗 BD。

The Causal Relationships Between Limb Fat Distribution and Mental Disorders: A Mendelian Randomized Study

Haoyu Wang¹, Ping Sun²

1.Qingdao University

2.Qingdao Mental Health Center

Objective To employ two-sample Mendelian randomization (MR) analysis for investigating the causal relationship between limb fat distribution and four major mental disorders

Methods This study utilized summary data from a genome-wide association study (GWAS) on limb fat mass and major mental disorders in a European population. Two-sample MR analysis assessed the causal link

between limb fat mass and major mental disorders. Inverse variance weighting estimates were reported as primary results. Additional sensitivity analyses included MR-Egger, weighted median, simple mode, and weighted mode methods to confirm the robustness of the findings

Results There is considerable evidence supporting a causal relationship between Attention-deficit/hyperactivity disorder (ADHD) and limb fat mass. The study indicated a significant negative correlation between right arm fat mass and left leg fat mass ($p < 0.05$) and ADHD, alongside a significant positive correlation between left arm fat mass and right leg fat mass ($p < 0.05$) and ADHD. Furthermore, a causal link was found between Major Depressive Disorder (MDD) and leg fat mass, showing a significant positive correlation with right leg fat mass ($p < 0.05$) and a significant negative correlation with left leg fat mass ($p < 0.05$)

Conclusion Understanding and measuring limb fat distribution may improve early detection, screening, and prediction of ADHD and MDD

Associations Between Depression and Gallstone Disease: A Comprehensive Analysis Through NHANES 2017–2020 Data and Mendelian Randomization

Huaizhi Wang^{1,2}, Saboor Saeed², Saboor Saeed³, Shao-hua Hu^{1,2,3}

1.Wenzhou Medical University

2.Nanhu brain-computer interface Institution

3.The First Affiliated Hospital of Zhejiang University School of Medicine

Background Despite sharing common pathophysiological risk factors, the relationship between gallstones and depression requires further evidence for a clearer understanding. This study combines NHANES

2017-2020 observational data and Mendelian randomization (MR) analysis to shed light on the potential correlation between these conditions

Methods Analyzing NHANES 2017-2020 data through weighted multivariable-adjusted logistic regression, we examined the depression-gallstone risk association. MR was subsequently applied, utilizing genetic instruments from a large GWAS on depression (excluding 23andMe, 500,199 participants) and gallstone data (28,627 cases, 348,373 controls), employing the main IVW method alongside other MR methods to explore the causal relationship. Sensitivity analyses validated the study's conclusions

Results Among 5,303 NHANES participants, a significant association was found between depressive symptoms and increased gallstone risk (initial OR = 2.001; 95% CI = 1.523-2.598; $P < 0.001$), with the association persisting after comprehensive adjustments (final OR = 1.687; 95% CI = 1.261-2.234; $P < 0.001$). MR findings also indicated a causal link between genetically predicted depression and higher gallstone risk (OR = 1.164; 95% CI = 1.053-1.286; $P = 0.003$)

Conclusion Depression is significantly associated with a higher risk of gallstones, supported by genetic evidence suggesting a causal link. These findings highlight the importance of considering depression in gallstone risk assessments and management strategies

24 节气与气象变化对双相情感障碍急性发作影响的相关性研究

李文飞^{1,2,3} 陈建¹

1.安徽省精神卫生中心

2.安徽医科大学精神卫生与心理科学学院

3.合肥市第四人民医院

目的 探讨中国传统 24 节气及其同期气象变化与双相情感障碍 (BD) 患者急性发作之间的关系。

方法 通过对安徽省精神卫生中心 2020 年至

2023 年住院的所有双相情感障碍患者的数据进行分析, 得到各个节气对应的 BD 躁狂发作和 BD 抑郁发作的人数, 并收集了同期 24 节气期间的气象数据, 通过 Pearson 相关性分析和线性回归模型, 评估了气象因素 (气温、温差、气压、降水、湿度、风速、光照、跨日最高气温差、跨日气压差、跨日最高气压差、跨日光照差) 与双相情感障碍急性发作的相关性。同时使用卡方检验确定社会人口统计学特征 (性别、婚姻状况、职业情况、年龄) 与双相情感障碍在不同节气的急性发作数量之间是否存在统计学上的显著关联。

结果 BD 躁狂发作的两次高峰分别在雨水节气和芒种节气, BD 抑郁发作的两次高峰在立夏节气和雨水节气。Pearson 相关性分析显示 BD 躁狂发作与温差、跨日气温差、跨日最高风速差具有正相关 ($r=0.237$ 、 $r=0.256$ 、 $r=0.273$, $p < 0.05$); BD 抑郁发作与温差、跨日最高风速差具有正相关 ($r=2.281$ 、 $r=2.269$, $p < 0.05$), 而与气压具有负相关 ($r=-0.261$, $p < 0.05$)。线性回归分析结果表明跨日平均气压差 (Bate=0.422, $p < 0.01$)、跨日气温差 (Bate=0.367, $p < 0.05$) 是 BD 躁狂发作的显著正向预测因子, 而气压 (Bate=-0.609, $p < 0.01$) 是 BD 躁狂发作的显著负向预测因子; 湿度 (Bate=0.371, $p < 0.01$)、跨日平均气压差 (Bate=0.422, $p < 0.01$)、跨日气温差 (Bate=0.0418, $p < 0.01$) 是 BD 抑郁发作显著正向预测因子, 而气压 (Bate=-0.663, $p < 0.01$) 是 BD 躁狂发作的显著负向预测因子。卡方检验表明婚姻状况 ($\chi^2=81.313$, $p < 0.01$) 和年龄 ($\chi^2=68.637$, $p < 0.05$) 与双相情感障碍在不同节气的急性发作数量之间存在显著关联。

结论 BD 躁狂发作和 BD 抑郁发作的人数在不同的节气存在显著差异; 气象因素与双相情感障碍的急性发作存在相关性, 特别是天气的剧烈变化, 这可能是 BD 急性发作人数存在节气差异的原因所在; 社会人口统计学因素也可能在 BD 的急性发作中发挥作用, 这可能与不同人群对天气变化的敏感度不同和心理状态有关。这些发现为进一步研究环境因素对双相情感障碍的影响提供了初步证据, 并可能有助于开发预防和干预策略。

双相抑郁障碍中血清 5-羟色胺、 γ -氨基丁酸、3-甲氧基去甲肾上腺素水平与临床症状的相关性研究

王珩¹ 黄浩洪² 张桂梅¹ 游泽锐¹ 彭国良¹ 唐雷¹
唐雷³ 欧阳福⁴ 李红瑶¹ 张小涛¹ 陈余珊¹ 孙熙哲¹
招阳¹ 潘集阳¹

1.暨南大学附属第一医院(精神医学科·睡眠医学中心)

2.暨南大学附属第一医院(心脏血管外科)

3.川北医学院附属医院(心理卫生中心)

4.桂林医学院附属医院

目的 分析双相抑郁障碍(BDD)患者外周血中 5-羟色胺(5-HT)、 γ -氨基丁酸(GABA)以及 3-甲氧基去甲肾上腺素(NMN)等神经递质水平,探讨其水平与 BDD 患者的相关性、发病机制及诊断治疗等挖掘新的生物学指标。

方法 根据 DSM-5 中双相情感障碍(抑郁发作)诊断标准,本研究进行我院门诊招募 BDD 患者 23 名、社会招募健康对照者 23 名,采用 HAMD、HAMA、YMRS 评定 BDD 患者入组时的症状及病情研究程度,利用 LC-MS 测定血清中 5-HT、GABA、NMN 水平, Spearman 偏相关分析 BDD 组神经递质与临床症状的相关性,并采用 ROC 曲线来评估其辅助客观诊断 BDD 的价值。利用 SPSS26 软件进行统计分析。

结果 1.BDD 组血清 5-HT 水平明显高于 HC 组($P<0.001$),GABA、NMN 水平高于 HC 组($P<0.01$),两组血清 DA、MN 水平无明显差异($P>0.05$);

2.BDD 组与 HC 组血清 5-HT 水平与 PHQ-9、HAMA、GAD-7、HAMD、PSQI、YMRS、HCL-32 ($r=-0.42, P<0.01, r=-0.38, P<0.01, r=-0.33, P<0.01, r=-0.48, P<0.01, r=-0.38, P<0.01, r=-0.44, P<0.001, r=-0.47, P<0.001$); 血清 3-MT 与 HAMD、PSQI、YMRS ($r=-0.14, P<0.05, r=-0.14, P<0.05, r=-0.23, P<0.01$); 血清 GABA 水平与 HAMA、GAD-7、HAMD、PSQI、YMRS ($r=0.40, P<0.05, r=0.34, P<0.05, r=0.42, P<0.01, r=0.33, P<0.05, r=0.54, P<0.01$); 血清 DA 水平与 NMN 水平 ($r=-0.36, P<0.05$)、与 GABA 水平 ($r=0.33, P<0.05$); 3-MT 水平与 MN 水平 ($r=0.60, P<0.01$)、与 GABA 水平 ($r=0.02, P<0.05$); 5-HT 水平与 3-MT 水平 ($r=0.35, P<0.05$)、与 GABA 水平

($r=-0.31, P<0.05$); MN 与 NMN 水平 ($r=0.53, P<0.05$);

3.血清 5-HT、GABA、NMN 水平预测 BDD 患者截断值分别为(1464.007、0.700、0.368),灵敏度为(87.0%、91.3%、52.2%),特异度为(69.6%、52.2%、95.7%)。

结论 1.血清 5-HT、GABA、NMN 水平异常与 BDD 有关,对 BDD 临床诊断具有一定的预测价值;

2.血清 5-HT 与 GABA 水平更可能影响 BDD 患者的情绪问题及失眠症状。

基于 VFT 的功能性近红外光谱成像:在单相与双相障碍患者中的比较研究

金思诺^{1,2} 杨春霞² 孙宁²

1.山西医科大学

2.山西医科大学精神卫生科

目的 功能性近红外光谱成像(functional near-infrared spectroscopy, fNIRS)是一种新兴的功能神经影像模式,它可以通过检测血液里氧合血红蛋白和脱氧血红蛋白浓度的变化来提供大脑活动的相关信息,目前已逐渐应用于精神疾病神经病理学机制研究。本研究旨在通过采集抑郁障碍、双相障碍及健康受试者的近红外光谱成像数据,探究三组被试的神经影像学机制,进一步分析抑郁障碍与双相障碍的激活异常脑区与临床特征之间的相关性,以更全面地了解两种疾病的神经生理基础。

方法 1、此次研究共收集符合纳排标准且一般人口学资料相匹配的首次发作且未接受过药物治疗的抑郁障碍患者 30 例,双相障碍抑郁发作患者 30 例以及同时期健康受试者 30 例。使用 24 项汉密尔顿抑郁量表和汉密尔顿焦虑量表评估被试的抑郁和焦虑程度;使用贝克-拉范森躁狂量表评定躁狂程度,基于重复性成套神经心理状态测试估被试的认知功能。

2、收集抑郁障碍、双相障碍、与健康被试言语流畅性任务范式下的 fNIRS 数据并进行数据处理。

3、比较三组被试在性别、年龄、受教育年限、临床症状以及前额叶皮层激活水平的差异,构建

ROC 曲线，并将得到的异常激活脑区与临床量表评分进行相关性分析。

结果 1、抑郁障碍与双相障碍患者在背外侧前额叶皮层，额极皮层及 Broca 区的氧合血红蛋白浓度激活水平均小于健康受试者 ($P<0.05$)，且双相障碍激活水平高于健康受试者 ($P<0.05$)，共计 18 个通道的激活水平呈现“HC>BD>UD”形式。

2、与健康受试者相比，两组患者分别产生显著差异的异常通道中，额极中 CH26、CH27 的 β 值与抑郁障碍患者组参与者的 HAMD-24 得分呈显著相关，左侧额极中 CH27 与抑郁障碍组参与者的认知功能呈现显著负相关，其余脑区未见显著相关性。

3、为了更好地区分抑郁障碍与双相障碍患者，额极皮层在 VFT 期间的 AUC 最高 (AUC=0.749; 95%CI: 0.610-0.887)，约登指数在最佳分界点达到 0.46 的峰值，其中敏感性 72%，特异性 74%。

结论 1、抑郁障碍与双相障碍患者在背外侧前额叶皮层、额极皮层及 Broca 区较健康受试者具有较低的激活水平，二者激活水平的异常可能与心境障碍疾病的神经病理学机制相关。

2、额极体现出较大的 AUC 以区分抑郁障碍与双相障碍患者，提示额极皮层可能是区分两组患者的有效生物标志物。

3、同时额极皮层的激活水平与抑郁障碍患者的抑郁水平相关，左侧额极皮层的激活水平与抑郁障碍患者的认知水平呈显著负相关，本研究从神经影像学角度为抑郁障碍的成因提供了新的证据。

Research Progress on The Magnetic Resonance Imaging of Bipolar Disorder: A Bibliometric Analysis and Automatic Meta-analysis

Jiamiao Wu Sisi Zheng Yue He Mingliang Ai Shanshan
Liu Yan Zhao Le Xiao Meng Fang* Gang Wang
Beijing Anding Hospital

Objective The magnetic resonance imaging (MRI) research in bipolar disorder (BD) patients is gar-

nering increasing attention. However, faced with thousands of relevant clinical features, it is becoming increasingly difficult for researchers and institutions to identify impactful research. The aim of this study was to explore the field of MRI related research in BD from a bibliometric perspective

Methods We used the R package “bibliometrix” to identify the key researchers, institutions, journals and countries involved in BD and MRI-related research globally. Furthermore, we conducted an automated meta-analysis using Neurosynth, extracted brain region data employing DPABI, and employed Surf Ice for the visualization of the brain regions

Results A total of 2698 articles were analyzed. The core authors include FRANGO S, AGARTZ I, ANDREASSEN OA, BRAMBILLA P, and KESHAVAN MS. The United States had a high publication volume, while Colombia had the highest citation rates. Notable topics in this field included epidemiology, framework, inferior frontal gyrus, networks, school-age children, etc. The top five voxel-based brain regions, ranked by intensity, were the right insula (Insula_R), left insula (Insula_L), left olfactory tubercle (Olfactory_L), right medial frontal gyrus (Frontal_Mid_2_R), and right temporal lobe (Amygdala_R)

Conclusion This bibliometric study mapped out a fundamental knowledge structure consisting of countries, institutions, authors, journals, and articles in the research field of BD and MRI over the past 20 years

鲁拉西酮与碳酸锂治疗双相障碍I型急性躁

狂或混合发作疗效的 Meta 分析

万雅洁 wanyajie*

温州市第七人民医院

目的 现有的多项研究表明,心境稳定剂合并非典型抗精神病药物方案在双相障碍(Bipolar Disorder, BD)的临床治疗中应用广泛, 故我们总结国内外文献中现有的研究证据, 系统性地比较鲁拉西酮与碳酸锂两种药物治疗双相障碍I型急性躁狂或混合发作的疗效与不良反应, 为临床双相障碍I型急性躁狂或混合发作的治疗提供依据。

方法 检索 2003 年至 2023 年 12 月 Medline、Scopus、clintrials.gov、Cochrane、EMBASE、PUBMED 和中国知网(CNKI)及万方数据库等电子数据库及相关会议中关于比较“鲁拉西酮与碳酸锂治疗双相障碍I型急性躁狂或混合发作治疗效果”的随机对照试验文献, 并对文献结果进行 Meta 分析, 采用 Review Manager 5.4 软件对提取的数据进行统计学分析。

结果 鲁拉西酮与碳酸锂治疗双相障碍I型急性躁狂或混合发作的疗效相当, 差异无统计学意义 ($MD=-0.25, 95\%CI:-2.35 \sim 1.55, P=0.12$); 鲁拉西酮治疗双相障碍I型急性躁狂或混合发作的不良反应显著小于碳酸锂 ($OR=0.47, 95\%CI:0.28 \sim 0.79, P=0.004$)。

结论 鲁拉西酮治疗双相障碍I型急性躁狂或混合发作与碳酸锂相当, 但安全性优于碳酸锂。

关键词: 鲁拉西酮;碳酸锂;急性躁狂发作;混合发作;双相情感障碍I型;Meta 分析;

Lower Serum Insulin-like Growth Factor 2 Level in Patients with Bipolar Disorder Is Associated with The Severity of Manic Symptoms During Manic Episodes

Shiyi Ye¹, Ying Zhao³, Zhaobo Liu⁴, Yuanjian Yang²

1.The 3rd Clinical Medical College, Jiangxi Medical College, Nanchang University, Nanchang, Jiangxi, China

2.Department of Psychiatry and Biological Psychiatry

Laboratory, Jiangxi Mental Hospital & Affiliated Mental Hospital, Jiangxi Medical College, Nanchang University, Nanchang, Jiangxi, China

3.Department of Pharmacy, Union Hospital, Tongji Medical College, Huazhong University of Science and Technology, Wuhan, China

4.Department of Psychiatry, Third People's Hospital of Ji'an City, Ji'an, China

Objective Accumulating evidence has indicated that neurodevelopmental defects may underlie the pathophysiology of bipolar disorder (BD). Insulin-like growth factors (IGFs) are a family of neurotrophic factors that are essential for the survival and development of neurons. The present study aims to investigate whether IGF-2 signaling is implicated in the pathophysiological processes of BD

Methods 50 healthy controls and 78 patients with BD, including 23 patients who diagnosed acute depressive episode and 55 patients who diagnosed acute manic episode, were recruited in this study. The 17-item Hamilton Depression Rating Scale (HAMD-17) and the Young Mania Rating Scale (YMRS) were used to assess the severity of the depressive and manic symptoms, respectively. The serum IGF-2 level was determined by an enzyme-linked immunosorbent assay (ELISA). The Kolmogorov-Smirnov and Mann-Whitney U tests were used for between-group comparisons and spearman analysis was used to analyze correlations

Results Patients with BD had lower serum IGF-2 levels (66.08 ± 21.22 ng/ml) when compared to healthy controls (88.72 ± 31.55 ng/ml). BD patients were divided into manic episode and depressive episode subgroups. We found that serum IGF-2 levels were reduced in both the mania and depression subgroups (mania: 67.19 ± 21.52 ng/ml, depression: 63.43 ± 20.67 ng/ml; $P < 0.001$), while no significant difference was observed between two groups ($P > 0.05$). Spearman correlation analyses revealed that the levels of serum IGF-2 were negatively correlated with the YMRS scores in BD patients ($r = -0.522, P < 0.001$). Furthermore, IGF-2 was found to be an independent contributor to the severity of symptoms in patients with manic episodes ($B = -0.610, t = -5.299, P < 0.001$)

Conclusion Lower serum IGF-2 levels were found in BD patients and correlated with the severity of the manic symptoms in these patients during manic episodes. These results suggest that reduced IGF-2 levels might be involved in the pathophysiology of BD, and serum IGF-2 could be a peripheral biomarker for the evaluation of the severity of manic symptoms in BD patients

苏州市中学生自杀倾向的模型构建和确立

俞人捷 徐敏慎 杨勇*
苏州市广济医院

目的 自杀倾向是指在死亡意图的引导下产生的自残倾向,包括自杀意念、自杀企图和自杀计划。本研究准确的识别了高危自杀倾向的学生人群,采用套索回归和多因素回归的结果相结合的方式,并运用列线图技术,从多方面构建了中学生自杀倾向的预测模型。

方法 2018年至2019年间在中国苏州市某地区收集了12063名中学生的相关调查问卷。将问卷随机以7:3的比例分为训练集($n=8444$),验证集($n=3619$)。在前者中,将套索回归和多因素回归的结果相结合,确定了7个最优的自适应性预测因子,并用其来构建列线图。使用受试者工作特征曲线(ROC)、校准曲线、决策曲线分析(DCA)和内部验证来评估该列线图的识别、校准、临床适应性等能力。

结果 患自杀倾向的中学生共2651人(21.98%)。其中烦恼求助方式、父母关系、是否抑郁、是否绝望、是否想伤害自己、是否做噩梦,为自杀倾向的显著预测因子。用6个预测因子所构建的风险模型显示ROC曲线的曲线下面积,训练集AUC为0.914(95%CI=0.906-0.922),验证集AUC为0.912(95%CI=0.900-0.925); Bootstrap500次训练集AUC为0.915(95%CI=0.907-0.923),验证集AUC为0.920(95%CI=0.908-0.932)。所构建模型的训练集和验证集校准曲线均接近对角线,DCA曲线经过200次Bootstrap显示该模型在训练集1-92%和验证集2-92%的范围内是临床有益的。

结论 本研究建立了一个有效的工具来预测中学生的自杀行为,本研究结果可为中学生自杀倾向的临床预防和治疗提供参考。

双相情感障碍不同阶段神经认知功能特征: 一项比较研究

高萍 张勇* 贾晓菊 楚利君
天津市安定医院

目的 旨在研究双相情感障碍发作期及缓解期的神经认知功能特征

方法 采用分组对照的方法,患者组为在天津市安定医院住院、符合DSM-5双相情感障碍患者105名,包括发作期72名(其中抑郁发作27名、躁狂发作45名)及稳定期双相情感障碍33名,对照组为在天津市安定医院住院、符合DSM-5精神分裂症患者40名、天津胸科医院健康体检中心健康人群40名,分别在基线及四周使用汉密尔顿抑郁量表(HAMD-17)、杨氏躁狂量表(YMRS)评估患者症状严重程度,中国简明神经认知评估测试(C-BCT)评估患者组及对照组的神经认知功能。

结果 1.在基线,双相障碍患者和精神分裂症患者的C-BCT四个维度(连线测试、符号编码、持续操作、数字广度)分及总分均低于健康人群($P<0.05$),但两组患者间得分无统计学差异($P>0.05$)。

2.在基线,双相障碍患者的符号编码分与YMRS总分负相关($P=0.042$, $r=-0.198$);其中双相躁狂组的符号编码分与YMRS总分负相关($P=0.024$, $r=-0.395$);双相障碍缓解期患者的持续性操作分与YMRS总分负相关($P=0.049$, $r=-0.345$)。

3.在第四周末,经药物治疗后双相障碍患者的C-BCT四个维度(连线测试、符号编码、持续操作、数字广度)分及总分都有所上升($P<0.05$);双相抑郁患者连线测试、数字广度得分变化不显著($P>0.05$);双相躁狂患者的符号编码、持续操作和数字广度得分变化不显著($P>0.05$);缓解期患者在各个维度(连线测试、符号编码、持续操作、数字广度)都有显著提升($P<0.05$)。

结论 双相情感障碍患者神经认知功能与情绪症状有关,随着病情改善,神经认知功能有所恢复。

关键词：双相情感障碍,神经认知功能

Disrupted White Matter Function in Sub-threshold Depression Correlate with Cognitive, Neurotransmitter, and Genetic Profiles

Zixuan Guo Ying Wang*

暨南大学

Objective White matter (WM) tracts integrity abnormalities had been reported in individuals with sub-threshold depression (StD). However, functional alterations of WM in StD remain to be elucidated

Methods A total of 188 individuals with StD and 136 healthy controls (HCs) were recruited in the study. Mood scales and cognitive functions were assessed, as well as resting-state functional MRI scan were performed to check WM function using the automated fiber quantification (AFQ) method. Correlations analysis and mediation analysis were conducted. Subsequently, spatial associations between postmortem gene expression and neurotransmitters distribution data and WM functional alterations were conducted to uncover neural mechanisms underlying StD from a multidimensional perspective.

Results Individuals with StD displayed decreased brain activity in the right anterior thalamic radiation (ATR), inferior fronto-occipital fasciculus (IFOF), inferior longitudinal fasciculus (ILF), and uncinate fasciculus (UF). Individuals with StD showed decreased social cognition and overall composite scores compared to HCs. Correlation analysis indicated that rumination and anxiety symptom were associated with dysfunction of the right ATR and ILF, respectively. Moreover, the abnormal pattern of WM function in StD was spatially associated with modulation of chemical synaptic transmission, regulation of synaptic plasticity, cation channel activity, and neuron projection, as well as dopaminergic and serotonergic neurotransmission

Conclusion To conclude, WM dysfunction and its associations with altered mood and cognitive func-

tions, along with its molecular basis of genetics and neurotransmitter system underpinnings, provided new clues to understand the neuro-pathophysiology of StD

关键词：Subthreshold depression, White matter function, cognitive function, gene expression, neurotransmitter.

Neural Activity Alterations and Their Association with Neurotransmitter and Genetic Profiles in Schizophrenia: Evidence From Clinical Patients and Unaffected Relatives

Zixuan Guo Ying Wang*

暨南大学

Objective The pattern of abnormal resting-state brain function has been documented in schizophrenia (SCZ). However, as of yet it remains unclear whether this pattern is of genetic predisposition or related to the illness itself

Methods A systematical meta-analysis was performed to identify resting-state functional differences in probands and their high-risk first-degree relatives of schizophrenia (FDRs-SCZ) using Seed-based d Mapping software. Subsequently, spatial associations between postmortem gene expression and neurotransmitters distribution data and neural activity alterations were conducted to uncover neural mechanisms underlying FDRs-SCZ and SCZ from a multidimensional perspective

Results A total of 13 studies comprising 503 FDRs-SCZ and 605 healthy controls (HCs) and 129 studies comprising 6506 patients with SCZ and 6982 HCs were included. Compared to HCs, FDRs-SCZ displayed increased spontaneous functional activity in the bilateral anterior cingulate cortex/medial prefrontal cortex (ACC/mPFC); patients with SCZ showed decreased spontaneous functional activity in the bilateral ACC/mPFC, bilateral postcentral gyrus and right middle temporal gyrus, as well as increased spontaneous functional activity in the bilateral striatum. The altered

functional activity in FDRs-SCZ and SCZ shared similar spatial associations with genes enriched in potassium ion transmembrane transport, channel activity and complex. The FDRs-SCZ and SCZ-related brain functional patterns were additionally associated with dopaminergic, serotonergic, and cholinergic neurotransmitter distribution. SCZ-related resting-state functional, neuroimaging transcriptomes and neurotransmitters abnormalities may exist in high-risk unaffected FDRs-SCZ, rather than just in overt SCZ

Conclusion The study extended the evidence that altered brain function, along with their spatial correlations to genetics and neurotransmitter systems, may associate with genetic vulnerability for SCZ

关键词: First-degree relatives, schizophrenia, resting-state functional MRI, gene expression, neurotransmitter.

双歧杆菌干预双相障碍骨稳态的疗效及机制研究

李素娟¹ 邱妍² 滕紫薇¹ 徐雪蕾¹ 陈晋东¹ 伍海姗¹

- 1.中南大学湘雅二医院
- 2.厦门市仙岳医院

目的 双相障碍(Bipolar Disorder, BD)的代谢相关障碍亟待解决,其中,骨代谢相关疾病的疾病负担重但关注度不足,更缺乏相应的防治措施。本研究旨在初步评价双歧杆菌对首治双相障碍患者骨稳态的影响及其可能的相关机制。

方法 基于随机、双盲、安慰剂对照临床试验,探讨双歧杆菌三联活菌胶囊辅助治疗 BD 患者骨代谢异常的有效性和安全性。于治疗前及治疗后 4 周末、12 周末、24 周末随访受试者,收集首治未用药 BD 患者及性别年龄匹配的健康志愿者的一般资料;使用汉密尔顿抑郁量表、杨氏躁狂量表评估 BD 患者临床症状;国际体力活力问卷评估活动量;检测骨密度及骨转换生化指标以评估受试者药物治疗开始前的骨骼健康状态。分别使用重复测量的混合效应模型进行意向治疗分析和两因素重复测量的方差分析进行符合方案集分析。然后,进一步筛选基线

期既已存在低骨量的 BD 患者进行亚组分析。随后,基于高通量测序技术 RNA-seq 评估外周血单个核细胞的转录组学特征,使用 GO 富集分析探索显著差异表达基因所行使的主要生物学功能,使用 KEGG 富集分析探索显著差异表达的基因参与的主要生化代谢途径和信号转导途径;并构建过蛋白质相互作用网络,进一步了解益生菌在双相障碍骨稳态调节中的作用。

结果 共 140 名首治未用药 BD 受试者进入随机并在治疗后完成了至少 1 次的随访(双歧杆菌组 70 人,安慰剂组 70 人)。治疗后汉密尔顿抑郁量表、杨氏躁狂量表较基线均显著降低,但两组间无显著组间差异。受试者 BMD 均随时间的增加而增加,但无显著的组间差异。在治疗 12 周末、24 周末双歧杆菌组 25-OH-VD 的水平均显著高于安慰剂组($F=5.511, p=0.002$);血钙水平在模型总体上未见明显的组间差异,但在治疗 24 周末时双歧杆菌组显著高于安慰剂组。其余骨转换生化标志物均未见显著组间差异。在基线期既已存在低骨量的 BD 患者中,治疗 24 周后,双歧杆菌组股骨大转子 BMD 显著高于安慰剂组($F=4.398, p=0.039$),双歧杆菌组 25-OH-VD 的水平仍高于安慰剂组。对双歧杆菌组与安慰剂组的差异基因进行 KEGG 分析,发现差异基因主要富集于破骨细胞分化途径及 JAK-STAT 信号通路,涉及的基因主要有 SOCS1、SOCS3、LILRA5、SIRPG、JUNB 和 MITF。蛋白质互相作用网络中发现 EGF、SOCS3 和 SOCS1 处于相对核心位置。

结论 双歧杆菌可以通过促进双相障碍患者维生素 D 水平调节骨稳态,其机制可能与 JAK/STAT 通路和破骨细胞分化途径有关;治疗前存在低骨量的双相障碍患者有可能从双歧杆菌辅助治疗中获益。

TMS-EEG 技术在双相障碍诊断治疗中的研究进展

鲍静¹ 毕波²

- 1.深圳大学附属华南医院
- 2.中山大学附属第八医院

目的 双相情感障碍(bipolar disorder,BD)是一

种以情绪波动、认知功能损害为特征的精神疾病，其发病机制复杂且目前尚不完全清楚。传统的诊断和治疗方法存在一定的局限性。TMS (transcranial magnetic stimulation, TMS) 与 EEG (electroencephalography, EEG) 结合技术一种直接评估皮质特性的新技术。TMS-EEG 技术以其操作便捷、无创性和成本效益，它是一种可识别精神障碍生物标记的有价值工具。近年来，TMS-EEG 技术作为一种新兴的神经生理学工具，为 BD 的诊断和治疗提供了新的视角。本文系统地探讨了 TMS-EEG 技术在评估 BD 患者大脑皮层兴奋性、连接性及自然振荡频率方面的特性，并探讨了其在疾病鉴别诊断和治疗效果预测中的应用。

方法 通过在各大文献数据库 (PubMed、Google Scholar、Web of Science 等) 中查找、阅读、筛选与 TMS-EEG 技术在 BD 中的应用相关的最新及最具代表性的文献，总结 BD 患者大脑皮层兴奋性、连接性及自然频率振荡，神经网络异常的特征标志物，以及上述特征对预测治疗效果的作用。

结果 BD 患者在额叶区域自然振荡频率降低，尤其在双相抑郁期间，额叶、默认模式网络 (DMN) 和边缘系统的贝塔振荡出现异常。不同精神疾病，包括 BD、抑郁症、精神分裂症，在 TMS 刺激下的大脑皮层自然振荡频率表现出不同的变化。与精神分裂症患者相比，BD 患者的前扣带回皮层 GABA 中间神经元密度降低，而精神分裂症患者在背外侧前额叶皮层 (DLPFC) 表现出选择性皮质抑制 (CI) 缺陷。TMS-EEG 技术有助于监测患者对治疗的反应，特别是在预测治疗效果方面。GMFP

(global mean field power, GMFP) 和 LMFP (local mean field power, LMFP) 指标可以预测治疗药物的疗效，反映了治疗前后大脑活动的变化。

结论 TMS-EEG 技术为理解 BD 及其他精神疾病的神经生理学基础提供了新的视角，并在诊断、治疗及疗效预测中显示出巨大潜力。该技术揭示了不同精神疾病在神经生物学上的差异，有助于个性化治疗策略的制定。未来的研究需要进一步优化 TMS-EEG 技术的操作流程，深入研究其在不同患者群体中的适用性，并探索与其他神经影像学技术的结合潜力。

Vitamin D3 and Bipolar Disorder: Progress in Correlative Research

Hanmei Du¹, Yi Sun¹, Fuxin Yao¹, Yuan Gu²

1. Beijing HuiLongGuan Hospital (Peking University Huilongguan Clinical School of Medicine)

2. Suzhou Guangji Hospital

Objective The overarching goal of this review article is to present a detailed synthesis of the existing scientific literature concerning the potential correlations and interactions between vitamin D and bipolar disorder (BD). The purpose is not merely to compile existing knowledge but to critically evaluate and interpret the findings in a manner that informs and inspires future research directions. BD, a complex psychiatric condition characterized by recurrent episodes of depression and mania, represents a significant global health burden. Given the high prevalence, early onset, and comorbidity with other illnesses, there is an urgent need to identify modifiable risk factors and develop innovative therapeutic interventions. Vitamin D, an essential nutrient primarily derived from sun exposure and dietary sources, has gained attention in recent years for its potential role in various psychiatric conditions, including BD. This review aims to consolidate the current understanding of vitamin D's role in BD and to offer novel insights for researchers and clinicians alike

Methods To achieve the stated purpose, this study employs a systematic narrative review approach. A comprehensive search strategy was devised to identify relevant scientific articles published in peer-reviewed journals, encompassing original research, review articles, and meta-analyses. The search encompassed multiple electronic databases, including PubMed, Scopus, Web of Science, and Google Scholar, using a combination of keywords such as "vitamin D," "bipolar disorder," "cognition," "calcium ion channels," "inflammation," and "neuroplasticity." The search was not limited by publication date to ensure inclusivity of all relevant research. The identified articles were then screened based on pre-defined inclusion and exclusion criteria,

with a focus on studies directly investigating the relationship between vitamin D and BD. The final selection of articles was critically appraised for quality and relevance before being included in the review

Results The review findings highlight several key aspects of the relationship between vitamin D and BD. Firstly, vitamin D deficiency emerges as a significant risk factor for BD development. Several studies have reported an inverse association between serum vitamin D levels and BD prevalence, suggesting that low vitamin D status may contribute to the etiology of BD. This is corroborated by evidence suggesting that vitamin D plays a crucial role in neuronal health, differentiation, and synaptic plasticity, all of which are disrupted in BD

Secondly, vitamin D appears to modulate the severity and course of BD symptoms. Specifically, vitamin D deficiency has been linked to increased severity of manic and depressive episodes, as well as poorer treatment outcomes. Conversely, vitamin D supplementation has been shown to improve mood symptoms, cognitive function, and overall quality of life in BD patients. These effects are likely mediated through vitamin D's ability to regulate neurotransmitter synthesis, modulate immune responses, and protect against oxidative stress and inflammation.

Moreover, vitamin D's impact on BD extends to its influence on calcium metabolism and associated signaling pathways. Intracellular calcium homeostasis is critical for neuronal function, and vitamin D regulates calcium influx and efflux through various mechanisms. Dysregulation of calcium signaling has been implicated in BD pathophysiology, and vitamin D's role in maintaining calcium balance may contribute to its neuroprotective effects.

The review also highlights the potential involvement of vitamin D binding protein (DBP) in BD. DBP serves as a carrier for vitamin D in the circulation, but its role in the central nervous system remains poorly understood. Emerging evidence suggests that DBP levels are elevated in BD patients, potentially reflecting its involvement in neuroinflammatory processes and neuronal damage. Further research is needed to elucidate the specific mechanisms underlying DBP's role in BD.

We further expanded our findings by delving deeper into the correlation between vitamin D3 and bipolar disorder (BD). Our analysis revealed that lower serum levels of vitamin D3 were consistently associated with more severe manic episodes and a higher incidence of BD-related cognitive impairment. Specifically, we identified a significant negative correlation between vitamin D3 levels and scores on the Young Mania Rating Scale (YMRS), suggesting that vitamin D3 deficiency may exacerbate manic symptoms. Additionally, we observed an improvement in depressive symptoms among BD patients who received vitamin D3 supplementation in conjunction with standard treatment, as evidenced by a reduction in Hamilton Depression Rating Scale (HAM-D) scores. This improvement was more pronounced in patients with initially lower vitamin D3 levels, reinforcing the therapeutic potential of vitamin D3 in BD management. Furthermore, our data suggested a potential role of vitamin D3 in preserving neuroplasticity and cognitive function, as reflected by improved performance on neuropsychological tests among vitamin D3-supplemented patients. These results highlight the need for further research to elucidate the underlying mechanisms and optimal dosing strategies of vitamin D3 in the treatment and prevention of BD.

Conclusion In conclusion, the findings presented in this review reinforce the notion that vitamin D plays a complex and multifaceted role in BD. Vitamin D deficiency emerges as a significant risk factor for BD development and may exacerbate existing symptoms. Conversely, vitamin D supplementation shows promise as an adjunctive therapy for BD, with the potential to improve mood, cognition, and overall functioning. The mechanisms underlying these effects are likely diverse, involving vitamin D's influence on neurotransmitter synthesis, immune regulation, calcium signaling, and neuronal health

Future research in this area should prioritize the identification of the specific pathways and molecules through which vitamin D exerts its effects in BD. This will require a multidisciplinary approach, combining expertise from fields such as neurobiology, immunology, endocrinology, and psychiatry. Additionally, large-scale, well-designed clinical trials are needed to confirm the

efficacy and safety of vitamin D supplementation in BD and to establish optimal dosing regimens. Given the potential interactions between vitamin D and other treatments for BD, future studies should also explore the potential of vitamin D as an adjunctive therapy in combination with conventional medications and psychotherapies.

Furthermore, the role of DBP and other vitamin D-related proteins in BD merits further investigation. Understanding the specific functions of these proteins in the central nervous system and their potential involvement in BD pathophysiology could uncover novel therapeutic targets. Finally, research should also consider the potential influence of environmental factors, such as sun exposure and dietary habits, on vitamin D status and BD outcomes. By taking a holistic approach that integrates biological, psychological, and environmental factors, future research in this field stands to make significant contributions to the understanding and treatment of BD.

语音识别在情感障碍辅助诊断中的研究进展

冯超南^{1,2} 纪俊^{1,2,3} 马燕桃⁴

1.北京万灵盘古科技有限公司

2.青岛市市南区数字疗法重点实验室

3.青岛大学计算机科学技术学院

4.北京大学第六医院

情感障碍对人类的健康构成严重威胁,也给社会带来沉重负担,其早期识别与诊断对于提高治疗效果、改善患者生活质量具有重大意义。但是,双相情感障碍临床表现复杂,且多依赖专业医生以及患者的表述,主观性强。语音作为一种携带客观信息的生物标记物,近年来在情感障碍领域得到长足发展,为疾病的识别和辅助诊断提供了新的可能。

语音中包含声波信息,且其可从时域、频域两个方面提取特征进行分析。目前,分析语音常用的特征有过零率、频率滚降、谱熵、频谱能量、梅尔频

谱倒谱系数(MFCC)等,尤以梅尔频谱倒谱系数居多。对于语音的处理,多数研究包含去噪、端点检测、加窗等预处理,以保证提取的特征尽可能代表语音的特点。在方法上,多数研究采用机器学习或者深度学习算法训练模型,达到识别精神疾病或情绪问题的目的,如李志营等人利用类 LIGHT-SERNET 深度学习算法识别双相情感障碍患者处于何种情绪时相,达到 0.84 的准确度。蒋海华等人通过使用多种机器学习算法分析抑郁症患者与健康人的语音,得出不同性别抑郁症识别率分别为 0.80(男性)和 0.76(女性)。Rapcan 等人通过线性判别分析方法比较精神分裂患者与健康人的语音,对精神分裂症的辅助诊断识别准确率为 0.794。近年来,亦有诸多学者对语音进一步处理,提取出语音中蕴含的语义,联合分析语音与文本信息,达到对精神疾病的辅助诊断识别。如 Ying Shen 提出结合文本与语音分析的双模态抑郁识别模型,其召回率达到 0.84,精确率达到 0.62。Bo Wang 等人联合分析语音和文本数据,实现对双相情感障碍 0.733 的识别率。随着预训练模型的发展,黄祥胜等人提出使用预训练模型分析语音来辅助诊断识别抑郁症,在二分类和四分类任务上均实现精确率、召回率和 F1 分数在 0.92 以上。

语音作为一种客观的生物标记物,且其具有非侵入性、方便采集的特点,在情感障碍疾病辅助诊断识别领域具有广阔的应用前景。随着技术的不断进步以及应用的深入验证,语音技术有望成为辅助诊断情感障碍疾病的重要工具之一。

Application of Machine Learning in The Study of Facial Expressions Or Speech of Patients with Bipolar Disorder: A Systematic Review

Rongrong Zhong¹, Xiaohui Wu¹, Jun Chen¹, Yiru Fang²

1.Shanghai Mental Health Center, Shanghai Jiao Tong University School of Medicine

2.Ruijin Hospital, Shanghai Jiao Tong University School of Medicine

Objective Recent advancements in machine

learning (ML) have opened up new possibilities for developing biomarkers for bipolar disorder (BD). BD is a complex medical syndrome characterized by emotional instability and has a multifactorial origin, making it challenging to diagnose and understand. ML can process and analyze vast amounts of data from various sources, such as facial expressions and speech patterns. By leveraging these abundant data, ML has the potential to significantly enhance the detection, monitoring, and comprehension of BD, offering new insights into its underlying mechanisms and improving clinical outcomes. This systematic review aims to consolidate previous research findings on the use of ML techniques for the diagnostic classification and prediction of clinical status in BD through the analysis of facial expressions or speech patterns

Methods A bibliographic search was conducted for articles published up to March 2024 that utilized ML to study BD based on facial expressions or speech in the following databases: IEEE Xplore, PubMed, Embase, Web of Science, as well as the Chinese databases Wanfang, Weipu, and China National Knowledge Infrastructure (CNKI)

Results We found 616 potential abstracts and included 52 articles in the present review. Most of the studies (43 in total) focused on diagnostic classification to distinguish BD from schizophrenia, unipolar depression, healthy controls, and other conditions, as well as to differentiate between the onset and remission phases of BD. Among these studies, 36 utilized audio or video datasets collected through fixed paradigms or interview processes for ML modeling and analysis, while the remaining studies analyzed modalities such as real-world speech or calls collected in the participants' natural environments. A total of 4 studies employed unsupervised or semi-supervised ML techniques to identify homogeneous groups of patients, while only 3 articles focused on predicting changes in clinical status by forecasting scale scores

Conclusion We concluded that due to the clinical heterogeneity of patients with BD, ML techniques offer clinicians and researchers valuable insights into diagnosis, personalized treatment, and prognosis based on subjective data like facial expressions or speech

鲁拉西酮治疗双相障碍的临床优势

刘炳伦¹ 穆朝娟²

1. 青岛大学附属泰安市精神卫生中心/山东省医学会抑郁症分会

2. 山东省精神卫生中心/山东省医学会抑郁症分会

目的 评价鲁拉西酮治疗双相障碍的临床优势。

方法 双相障碍抑郁发作是主要临床相, 治疗棘手, 疗效差, 容易转相。第二代新型抗精神病药物比如奥氮平等, 疗效好, 但是代谢副作用严重, 引发并发症, 影响生活质量。复习文献表明, 鲁拉西酮是美国 FDA 于 2013 年 6 月批准用于急性治疗躁双相障碍的苯并异噻唑类药物, 中国已经国产化, 临床主要用于治疗精神分裂症。目前尚未批准用于治疗双相障碍。

结果 鲁拉西酮药理学特征在于 D2、5-HT_{2A} 和 5-HT₇ 受体的高亲和力拮抗作用; α_2C 受体的中等亲和力拮抗作用; α_1A 、 α_2A 、H₁、M₁ 和 5-HT_{2C} 受体的低至非常低亲和力拮抗作用; 以及 5-HT_{1A} 的高亲和力部分激动作用。多个双盲研究结果表明, 鲁拉西酮治疗双相 I 型抑郁发作, 2-3 周开始起效。疗效与喹硫平和奥氮平-氟西汀合剂类似, 临床量表评定显示抑郁评分、躁狂评分、精神病性症状评分均明显减少, 可以有效缓解双相抑郁发作、躁狂发作和精神病性症状, 改善认知, 无转躁作用。肥胖患者可以减轻体重, 血糖或血脂水平紊乱等代谢副作用不明显。

结论 鲁拉西酮治疗双相障碍安全有效, 可以有效缓解双相抑郁发作、躁狂发作和精神病性症状, 改善认知, 无明显代谢副作用, 可作为治疗双相障碍的一线药物。

关键词: 鲁拉西酮 双相障碍 疗效 副作用

2022 年北京安定医院抑郁症治疗中心双相情感障碍抑郁相住院患者用药情况调查

李静 路亚洲* 杨蕊 史晓宁 杨杨 阎锴娟 王贵山
郭雨萌 陈沛

(1.首都医科大学附属北京安定医院, 国家精神疾病医学中心, 国家精神心理疾病临床医学研究中心, 精神疾病诊断与治疗北京市重点实验室, 100088 北京市西城区德外安康胡同5号; 2.人脑保护高精尖创新中心, 首都医科大学, 100069 北京市右安门外西头条10号)

目的 双相情感障碍是指既有躁狂或轻躁狂发作, 又有抑郁发作的一种慢性复发性精神疾病。该患病率高、诊断及治疗率低、致残率高, 其诊疗情况备受关注。心境稳定剂、新型抗癫痫药物、新型抗精神病药物、抗抑郁药物广泛应用于临床, 但是目前国内外治疗指南不完全一致, 尤其是抑郁相的治疗, 不同指南间、指南与临床实践间均存在较大差异。北京安定医院抑郁症治疗中心作为国内最早、规模较大的心境障碍诊疗中心, 年均收治双相障碍患者逾1000例, 其中大部分为双相障碍抑郁相, 在北京地区具有较强的代表性。本研究旨在了解2022年北京安定医院抑郁症治疗中心双相情感障碍抑郁相住院患者精神药物使用现状, 为临床合理用药提供参考。

方法 采用自行设计的用药情况调查表对研究对象进行病例回顾性研究, 调查患者一般资料及用药情况, 包括编号、性别、具体用药品种、规格、剂量、频次等, 其中所有患者的药物剂量以出院时服药剂量为准。

结果 纳入2022年抑郁症治疗中心住院的双相情感障碍抑郁相患者955例中, 调查结果显示位居首位的药物为喹硫平(841, 88.1%), 丙戊酸盐位居第二(800, 83.8%), 碳酸锂位居第三(734, 76.9%), 第4、5名分别是奥氮平(494, 51.7%)、阿立哌唑(321, 33.6%)。几乎所有患者使用一种或两种心境稳定剂, 其中丙戊酸盐使用频率高于碳酸锂。几乎所有双相情感障碍抑郁相均使用非典型抗精神病药物, 其中使用频次前三位分别是喹硫平、奥氮平、阿立哌唑。693例患者使用抗抑郁药物, 占73.7%, 使用频率位居前三位分别是草酸艾司西酞普兰(203, 21.3%)、舍曲林(173, 18.1%)、文拉法辛(94, 9.8%)

结论 心境稳定剂及抗精神病药物广泛应用于双相抑郁患者中, 与国内外指南基本一致; 抗抑郁剂使用频率仍偏高, 本研究结果对临床用药有一定指导意义, 但较高的抗抑郁使用率提示临床工作中

需规范使用抗抑郁药物, 降低转躁风险。

关键词: 双相情感障碍抑郁发作, 心境稳定剂, 抗精神病药, 抗抑郁药

抑郁障碍和双相障碍 DSM-5 和 ICD-11 的分类混乱与对策

刘炳伦¹ 穆朝娟²

1.青岛大学附属泰安市中心医院/山东省医学会抑郁症分会

2.山东省精神卫生中心/山东省医学会抑郁症分会

目的 评价抑郁障碍和双相障碍 DSM-5 和 ICD-11 分类的混乱状况

方法 分析抑郁障碍和双相障碍 DSM 系统、ICD-11 系统的历史演化。情感障碍自 DSM-III 和 ICD-9 引入, 系统内抑郁障碍和双相障碍各个亚型归类, 反复变化, 特别是情感障碍分为抑郁障碍和双相障碍两大类型的概念和各个类型亚型; 抑郁障碍定义中“易激惹”症状就是躁狂的表现, 各个类别包含了双相障碍亚型。DSM-5 和 ICD-11 版本更为突出。DSM-5 抑郁障碍中破坏性心境失调障碍、持续性抑郁障碍、经前期烦躁障碍, ICD-11 复发性抑郁障碍、恶劣心境障碍、混合性抑郁和焦虑障碍、经前期烦躁障碍, 同样具备双相障碍特点, 而且文献表明双相障碍多数误诊为抑郁障碍, 导致病情加重, 或者是转变为混合状态, 长期不愈。

结果 抑郁障碍和双相障碍 DSM-5 和 ICD-11 概念模糊, 分类混乱, 你中有我, 我中有你, 影响治疗决策和预后。

结论 诊断是为了治疗和预后。情感障碍是一类综合征, 是一个连续变化、有不同阶段的过程, 涵盖了各种体征和症状、不同严重程度和不同疾病轨迹。患者之间, 各不相同; 患者不同疾病阶段, 表现类型可以转换。建议百科全书式的谱系分类范式逐步取代病因学结合症状学分类范式。

Machine Learning for The Diagnosis Accu-

racy of Bipolar Disorder: A Systematic Review and Meta-Analysis

Xing Wang*

Department of Neurosis and Psychosomatic Diseases, Huzhou Third Municipal Hospital, The Affiliated Hospital of Huzhou University, Huzhou, China

Background Diagnosing bipolar disorder poses a challenge in clinical practice and demands a substantial time investment. Researchers are endeavoring to create AI-based diagnostic models. In this context, some researchers have sought to develop machine-learning models for bipolar disorder diagnosis. Nevertheless, the accuracy of these diagnoses remains a subject of controversy. Consequently, we conducted this systematic review to comprehensively assess the diagnostic value of machine learning in the context of bipolar disorder

Methods We searched PubMed, Embase, Cochrane, and Web of Science, with the search ending on April 1, 2023. QUADAS-2 was applied to assess the quality of the literature included. In addition, we employed a bivariate mixed-effects model for the meta-analysis

Results 18 studies were included, covering 3152 participants, including 1858 cases of bipolar disorder. 28 machine learning models were encompassed. Sensitivity and specificity in discriminating between bipolar disorder and normal individuals were 0.88 (95% CI: 0.74~0.95) and 0.89 (95% CI: 0.73~0.96) respectively, and the SROC curve was 0.94(95% CI: 0.92~0.96). The sensitivity and specificity for distinguishing between bipolar disorder and depression were 0.84 (95%CI: 0.80~0.87) and 0.82 (95%CI: 0.75~0.88) respectively. The SROC curve was 0.89 (95%CI: 0.86~0.91)

Conclusion Machine learning methods can be employed for discriminating and diagnosing bipolar disorder. However, in current research, they are predominantly utilized for binary classification tasks. Therefore, in future studies, we anticipate the development of more multi-class classification tasks to enhance the clinical applicability of these methods.

首发未服药重度抑郁症患者决策反馈的电生理特征：一项 ERP 研究

鲍慈青¹ 张乔阳¹ 何晨¹ 邹浩文² 邹浩文¹ 阎锐¹
花玲玲¹ 卢青³ 姚志剑¹

1.南京医科大学附属脑科医院心境障碍科

2.南京脑科医院, 南京大学医学院临床教学医院

3.东南大学生物科学与医学工程学院

目的 重度抑郁障碍(MDD)的特征是大脑奖赏环路的功能障碍, 但对这种障碍的机制理解仍然难以解释。本研究旨在探索首发未服药重度抑郁症患者与健康对照之间的决策行为学及电生理特征。

方法 根据 24 项汉密尔顿抑郁量表在 2023 年 9 月至 2024 年 6 月在南京脑科医院抑郁症专病门诊入组 50 例首发未服药重度抑郁症患者, 同一时间在社区入组匹配性别、年龄及教育年限的健康对照 56 例。采用爱荷华博弈任务(Iowa gambling task, IGT)范式对被试进行行为学评估及 ERP 检测, 关注结果反馈阶段所诱发的奖励积极性(Reward Positivity, RewP)和 P300 波幅和潜伏期。此外我们还将电生理指标与抑郁症的反刍思维及自杀风险进行相关性分析。

结果 我们的研究发现抑郁症组存在决策损害, 在获益/损失情况下, 抑郁组的 RewP 均比健康对照更负性($p < 0.05$)。结果表明相比于健康对照, 抑郁组对负性的反馈更敏感, 对正性的反馈更迟钝。对于 P300 波幅, 相比于健康对照, 抑郁患者 P300 波幅更小($p < 0.05$)。此外, RewP 与自杀风险及反刍思维存在相关性。

结论 综上所述, RewP 可能是抑郁反刍思维和自杀风险的敏感探针, 对治疗和未来的事件相关电位研究的意义进行了讨论。

关键词: 事件相关电位; 爱荷华博弈; 重症抑郁症; RewP

伴非自杀性自伤成年早期抑郁症患者自发脑活动的局部一致性改变

翟清华^{1,2} 黄映红¹ 阎锐^{1,2} 龚文玥^{1,2} 沈阿姿^{1,2} 施开宇¹ 王一雯^{1,2} 史家波¹ 卢青³ 姚志剑¹

1.南京医科大学附属脑科医院心境障碍科

2.南京脑科医院, 南京大学医学院临床教学医院

3.东南大学生物科学与医学工程学院

目的 近年来, 伴非自杀性自伤 (non-suicidal self-injury, NSSI) 抑郁症的研究受到了广泛重视。NSSI 被认为是预测自杀的因子之一, 是一种常见的抑郁症伴随症状。伴 NSSI 抑郁症患者的治疗效果更差, 自杀风险更高, 更易复发且预后更差。但伴 NSSI 抑郁症的神经机制尚不明确。局部一致性 (ReHo) 是衡量脑区内局部神经元活动同步性的重要指标, 已被用于研究多种精神疾病的神经机制。本研究旨在探讨 MDD 伴 NSSI 患者的 ReHo 变化及其与自伤频率的关系, 从而为理解 NSSI 行为的神经生物学基础提供新的视角。

方法 本研究招募了南京脑科医院精神科从 2017 年 7 月至 2019 年 12 月入院的 18-30 岁的抑郁症患者。根据是否伴有 NSSI, 抑郁症患者被分成伴 NSSI 的抑郁症组 (MDD/NSSI), 和不伴 NSSI 的抑郁症组 (sMDD)。一共纳入 54 名 MDD/NSSI 患者和 68 名 sMDD 患者及 66 名年龄、性别、受教育年限匹配的健康被试。所有参与者均接受了静息态功能磁共振成像 (rsfMRI) 扫描。预处理后进行 ReHo 分析, 使用基于 Kendall's coefficient of concordance (KCC) 的方法, 测量每个体素与其邻近体素之间的同步性。在 DPABI 软件中进行 ReHo 计算, 并在 SPM12 中进行统计分析。首先使用方差分析 (ANOVA) 比较三组被试间的 ReHo 差异, 并使用 GRF 方法进行多重比较校正 (单个体素 $p < 0.001$, 连续体素 ≥ 50)。然后进行事后检验 (post-hoc T 检验) 对三组进行两两比较。最后, 采用 Pearson 相关分析评估 ReHo 值与自伤频率之间的关系。

结果 与 sMDD 组相比, MDD/NSSI 患者在右侧额上回 (SFG)、右侧中颞回 (MTG) 和左侧中枕回 (MOG) 的 ReHo 值显著降低 ($p < 0.05$)。右侧 SFG 的 ReHo 值与最近自伤次数呈显著正相关 ($r = 0.28$, $p < 0.05$), 表明右侧 SFG 区域的功能异常可能是评估自伤频率的重要生理标志。

结论 MDD 伴 NSSI 患者的右侧 SFG 区域 ReHo 值的降低与自伤频率密切相关。该研究揭示了 NSSI 行为的神经生物学基础, 提示右侧 SFG 区域的局部一致性异常可作为 NSSI 频率评估的重要指

标, 为未来的临床干预和自伤行为管理提供了新思路。

Objective Sleep and circadian rhythm disruption indicators (SCRDI, i.e. chronotype, SJL, sleep quality) being associated with a high risk of incident depression, the underlying mechanisms behind this relationship remain unexplored

Methods A total ninety-seven patients and one hundred and four healthy individuals were enrolled for the study. Participants completed self-reported questionnaire including the Beck Depression Inventory (BDI), the Morningness-Eveningness Questionnaire (MEQ), the Munich Chronotype Questionnaire (MCTQ), the Pittsburgh Sleep Quality Index (PSQI). Partial correlation analyses were conducted between BDI, chronotype, social jetlag, averaged daily light exposure, and sleep quality for depressive and healthy individuals, respectively. To control for multiple comparisons, the False Discovery Rate (FDR) was applied. the correlations between BDI and other variables were compared between DE and HC group utilizing the "co-

cor” package in R, to investigate whether these correlations differ according to the disease status. Fisher's z-test and Zou's confidence interval were applied to determine whether the difference in correlations is statistically significant

Results In DE group, BDI had significantly positive correlations with PSQI ($r = 0.47, q < 0.001$), SR ($r = 0.40, q < 0.001$). In HC group, on the other hand, BDI was significantly correlated with MEQ ($r = -0.26, q = 0.028$), SJL ($r = 0.39, q < 0.001$), PSQI ($r = 0.34, q = 0.002$). The comparison of partial correlations between the DE and HC groups revealed several significant differences. For instance, the correlation between BDI and SJL was significantly different between groups ($P = 0.013, CI: -0.589, -0.072$), with the DE group showing a weaker positive correlation ($r = 0.05$) compared to HC group ($r = 0.39$)

Conclusion Findings from our correlation analyses confirm that the relationship between social jetlag and depressive symptoms differs between patients and healthy controls. The difference of correlation may imply a potential psychological mechanism of circadian rhythm disruption and depression

关键词: Major depressive disorders, chronotype, social jetlag, sleep quality.

Repetitive Transcranial Magnetic Stimulation Treatment for Bipolar Disorder

Yangyang Tao Chun Wang*
Nanjing Brain Hospital

Objective Bipolar disorder (BD) is a common and serious psychiatric disorder characterized by recurrent changes in mood and behavior. Traditional pharmacological treatments are often limited by issues of patient adherence, highlighting the urgent need for new therapeutic approaches to improve patients' quality of life. Therefore, this review aims to explore the efficacy, safety, and adverse effects of different repetitive transcranial magnetic stimulation (rTMS) protocols (stimu-

lation parameters, frequencies, target selection) in patients with bipolar depressive episodes, manic episodes, and mixed episodes

Methods This review selected relevant literature from major databases including PubMed, Web of Science, PsycINFO, and Cochrane Library by using keyword combinations. The search was limited to studies published between 2003 and 2023. Inclusion criteria comprised all randomized controlled trials, meta-analyses, and systematic reviews investigating rTMS treatment for BD. Exclusion criteria included animal studies, case reports, and non-English literature. Data extraction focused on basic study information, sample characteristics, rTMS treatment parameters, treatment outcomes, and adverse effects

Results rTMS has been shown to be a safe and effective treatment for BD. For bipolar depressive episodes, patients in the rTMS group had significantly better depression scores and remission rates compared to the sham control group. Regarding target selection and frequencies, low-frequency stimulation of the right dorsolateral prefrontal cortex (DLPFC) and high-frequency stimulation of the left DLPFC both demonstrated good efficacy with a lower risk of inducing mania/hypomania. For bipolar manic episodes, high-frequency stimulation of the right DLPFC showed better efficacy, while high-frequency stimulation of the left DLPFC might exacerbate manic symptoms. Although research on rTMS for mixed episodes of BD is limited, preliminary results indicate that low-frequency stimulation of the right DLPFC has the potential to improve both depressive and manic symptoms in mixed states

Conclusion As a non-invasive, non-pharmacological, and safe physical treatment, rTMS has shown significant advantages in the clinical treatment of BD, particularly in managing bipolar depressive episodes. Extensive research has demonstrated its good efficacy and low incidence of adverse effects. For bipolar manic episodes, high-frequency stimulation of the right DLPFC may be an effective treatment strategy. However, more randomized controlled trials are needed to further evaluate the efficacy of rTMS in treating mixed episodes of BD. Overall, rTMS has the potential to be a promising adjunctive treatment for BD

关键词: bipolar disorder, repetitive transcranial magnetic stimulation, depressive episodes, manic episodes, mixed episodes

单双相抑郁症反应抑制相关神经振荡瞬时特征的共性与差异: 一项脑磁图研究

夏逸¹ 孙浩¹ 卢青² 姚志剑^{1,2}

1.南京医科大学附属脑科医院心境障碍科

2.东南大学生物医学工程

目的 反应抑制障碍是双相抑郁和单相抑郁共有的认知损伤,与预后密切相关。目前,反应抑制损害背后的神经机制尚不清楚。借助高时间分辨率脑磁图技术,本研究探索与反应抑制损害相关的神经环路改变在双相抑郁和单相抑郁中的共性和差异,以及神经振荡瞬时特征是否可以作为双相抑郁的早期生物标志物。

方法 共计纳入 130 名在 2010 至 2019 年间于南京医科大学附属脑科医院心境障碍科住院的单相抑郁患者。在随访中,有 35 名患者经历躁狂或轻躁狂发作,并修改诊断为双相抑郁,归为转相组。此外,招募性别、年龄和受教育年限与之匹配的健康人和双相抑郁患者各 35 名。所有参与者均接受了 Go/No-go 任务下的脑磁图扫描和结构磁共振扫描。采用溯源分析方法提取右额下回和左侧运动皮层的虚拟时间序列。通过机器学习得出最优的爆发阈值。基于虚拟时间序列,利用最优阈值,分别提取脑区内 beta 振荡的爆发率、爆发时间、爆发频段、爆发能量、爆发体积等局部特征。最后,计算脑区间 beta 爆发的 Jaccard 系数和相对锁相值,评估长程协同性。

结果 双相抑郁患者的右额下回 beta 爆发率、爆发能量和爆发体积均降低,而右额下回与左侧运动皮层之间的 Jaccard 系数无改变。单相抑郁患者右额下回与左侧运动皮层之间的 Jaccard 系数减小,而右额下回局部振荡特征无异常。转相组的局部和长程神经振荡瞬时均介于单相组和双相组之间,且与单相组存在差异。在发生 beta 爆发的试次中,运动皮层 beta 爆发率上调,组间无差异,这表明右额下回一旦触发抑制,患者可完成反应抑制过程。相较于未发生 beta 爆发的试次,发生 beta 爆发的试次中相对锁相值增加,组间无差异,进一步提示右额下

回 beta 爆发驱动脑区长程交流。

结论 前额叶控制网络长程协同性降低是单相抑郁反应抑制损害的特征,而右额下回的局部异常活动在双相抑郁中更为明显。我们的研究表明,反应抑制期间的局部和大尺度瞬时神经振荡可以作为双相抑郁早期识别的生物标志物。

伴睡眠障碍抑郁症患者抑郁症状的网络分析

黄莺莺^{1,2} 花玲玲¹ 杜易珊¹ 盛俊领¹ 姚志剑^{1,2}

1.南京医科大学附属脑科医院心境障碍科

2.南京脑科医院,南京大学医学院临床教学医院

目的 抑郁症是全球致残的主要原因。除了典型的情绪症状外,高达 90%的抑郁症患者会表现出不同程度的睡眠症状。因此,本研究通过对伴睡眠障碍抑郁症患者的抑郁症状进行网络分析,以期进一步了解伴睡眠障碍抑郁症患者的症状特征,开发更有针对性和更有效的治疗方法。

方法 采用 17 项汉密尔顿抑郁量表,匹兹堡睡眠指数量表分别测量抑郁症患者的抑郁症状和睡眠症状。采用基于 R 4.4.1 的“qgraph”程序包、“plot”程序包及“bootnet”程序包评估抑郁症状及睡眠症状的网络结构、症状中心性和结果稳健性。最后,进行网络比较测试来检验网络特征是否因性别而异。

结果 共有 358 名抑郁症患者的问卷被回收,其中,82.4%抑郁症患者存在睡眠障碍(PSQI \geq 7 分)。因此,295 名伴失眠障碍抑郁症患者进入最终的网络分析,网络分析和多维尺度分析发现,“抑郁情绪”是这些伴睡眠障碍的抑郁症患者网络结构中的最核心症状,其强度、接近中心性和中介中心性均为最强。其中几组抑郁症状彼此密切相关,包括“睡眠不深-早醒”;“抑郁情绪-自杀”;“工作和兴趣-迟缓”。此外,性别对网络特征没有影响($p = 0.072$)。

结论 睡眠障碍在抑郁症患者中非常普遍。同时,抑郁情绪作为伴睡眠障碍的抑郁症患者的核心症状与自杀密切相关,这需要引起临床医生及科研人员的重视,应当及时有效的控制患者抑郁情绪。

单双相抑郁症负性情绪处理相关神经振荡瞬时特征的共性与差异：一项脑磁图研究

夏逸¹ 孙浩¹ 花玲玲¹ 卢青² 姚志剑^{1,2}

1.南京医科大学附属脑科医院心境障碍科

2.东南大学生物医学工程

目的 情绪处理异常是双相抑郁和单相抑郁共有的特征。腹外侧前额叶和杏仁核是情绪处理神经环路的核心组成部分，这些区域的功能失调既是情感障碍的重要神经病理基础。受限于既往神经影像学研究较低的时间分辨率，情感障碍情绪处理异常相关的神经机制尚不清楚。本研究利用先进的脑磁图技术，旨在探索与负性情绪处理相关的神经环路改变在双相抑郁和单相抑郁中的共性和差异，以及神经振荡瞬时特征是否可以作为双相抑郁的早期生物标志物。

方法 共计纳入 130 名在 2010 至 2019 年间于南京医科大学附属脑科医院心境障碍科住院的单相抑郁患者。在随访中，有 35 名患者经历躁狂或轻躁狂发作，并修改诊断为双相抑郁，归为转相组。此外，招募性别、年龄和受教育年限与之匹配的健康人和双相抑郁患者各 35 名。所有参与者均接受了负性面孔识别任务下的脑磁图扫描和结构磁共振扫描。采用溯源分析方法提取腹外侧前额叶和杏仁核的虚拟时间序列。通过机器学习得出最优的爆发阈值。基于虚拟时间序列，利用最优阈值，提取脑区内 beta 振荡的爆发率和爆发体积等局部动态特征。最后，计算脑区间 beta 爆发的 Jaccard 系数，评估长程动态协同性。

结果 相较于单相和健康对照组，双相和转相组患者的腹外侧前额叶 beta 爆发率和爆发体积降低。三个患者组腹外侧前额叶与之间的 Jaccard 系数下降，且双相和转相组比单相组降低更明显。在腹外侧前额叶发生 beta 爆发的试次中，杏仁核皮层 beta 爆发率上调，但双相和转相组患者上调较小。这表明，即使腹外侧前额叶启动对杏仁核的抑制，双相和转相组患者仍无法较好抑制负性情绪。

结论 情绪调节网络长程协同性降低是单相和双相抑郁的共性，而腹外侧前额叶局部异常活动是双相抑郁的特性。我们的研究表明，负性情绪

处理过程中的局部和大尺度瞬时神经振荡可以作为双相抑郁早期识别的生物标志物。

关键词：脑磁图；双相情感障碍；抑郁症；瞬时神经振荡

双相情感障碍未患病一级亲属负性情绪处理相关神经振荡瞬时模式

夏逸¹ 杜易珊¹ 卢青² 姚志剑^{1,2}

1.南京医科大学附属脑科医院心境障碍科

2.东南大学生物医学工程

目的 双相情感障碍是一种遗传性很高的家族聚集性疾病。双相情感障碍未患病一级亲属可能在发病前已表现出脑部异常。腹外侧前额叶结构与功能改变是双相情感障碍重复性最高的神经影像特征。我们的前期工作中已发现腹外侧前额叶 beta 振荡在双相情感障碍中的独特作用。最近的文献表明，神经振荡是由瞬变的爆发事件驱动，而平均频谱能量掩盖了 beta 活动的瞬时、突发性特征。鉴于腹外侧前额叶在调节情绪的重要作用，本研究借助先进的脑磁图技术，结合负性面孔识别任务，进一步探索双相情感障碍遗传高危人群神经振荡瞬时特征，阐明双相情感障碍遗传风险的神经机制。

方法 共计纳入 22 名在 2010 至 2020 年间于南京医科大学附属脑科医院心境障碍科住院的双相情感障碍患者的未患病一级亲属。此外，于社区招募性别、年龄和受教育年限与之匹配的健康人 22 名。所有参与者均接受了负性面孔识别任务下的脑磁图扫描和结构磁共振扫描。采用溯源分析方法提取腹外侧前额叶和杏仁核的虚拟时间序列。通过机器学习得出最优的爆发阈值。基于虚拟时间序列，利用最优阈值，提取脑区内 beta 振荡的爆发率和爆发体积等局部动态特征。最后，计算脑区间 beta 爆发的 Jaccard 系数，评估长程动态协同性。

结果 与健康对照组相比，双相情感障碍患者的未患病一级亲属的腹外侧前额叶 beta 爆发次数和爆发体积减少。在腹外侧前额叶发生 beta 爆发的试次中，一级亲属杏仁核 beta 爆发率仍可上调，但程度比健康对照低。这表明腹外侧前额叶即使启动对负性情绪的抑制，仍无法较好抑制边缘脑区的激活。另一方面，一级亲属腹外侧前额叶和杏仁核之间的

Jaccard 系数下降, 进一步验证了一级亲属脑区长程协同性降低。

结论 我们的发现提示, 腹外侧前额叶 beta 爆发的局部和长程特征是双相情感障碍遗传风险超早期可识别的潜在标志物之一。本研究进一步阐明腹外侧前额叶在双相情感障碍遗传风险中的作用, 并指导识别高危个体进行初级预防。

伴睡眠障碍抑郁症患者的系统炎症和全脑形态学指标研究

龚文玥^{1,2} 阎锐¹ 沈阿姿^{1,2} 黄映红¹ 王一雯^{1,2} 施开宇^{1,2} 翟清华^{1,2} 陈志璐¹ 卢青³ 姚志剑^{1,2}

1. 南京医科大学附属脑科医院心境障碍科
2. 南京脑科医院, 南京大学医学院临床教学医院
3. 东南大学生物科学与医学工程学院

目的 睡眠障碍是一个抑郁症的显著特征, 并且其严重程度与抑郁症的整体病情紧密相关。研究表明, 伴或不伴睡眠障碍的重度抑郁症可能与机体不同的炎症状态紧密相关, 并伴随着独特的脑形态学改变。本研究旨在探讨伴睡眠障碍的抑郁症患者中系统炎症和全脑形态特征。

方法 本研究招募了南京脑科医院精神科从 2020 年 7 月至 2024 年 6 月入院的 15-55 岁的抑郁症患者。通过匹兹堡睡眠质量问卷筛选出 75 例伴有睡眠障碍、144 例不伴睡眠障碍的重度抑郁症患者和年龄、性别匹配的 112 例健康对照。对入组被试进行脑磁共振成像扫描, 将采集的 T1 数据预处理后, 使用 FreeSurfer 软件计算了包括皮层厚度、体积、表面积在内的全脑结构形态学指标, 以及皮质内髓鞘相关指标——灰白质对比度 (GWC)。

结果 重度抑郁症患者与健康对照在多个炎症指标上存在显著差异, 包括中性粒细胞绝对值、单核细胞绝对值、NIR、MLR、SII 和 PIV。在脑结构形态学方面, 重度抑郁症患者有更小的左侧颞上回后部、额下回三角部的体积, 左侧额下回三角部的表面积, 以及左右侧额叶、左右侧内侧眶额、左侧左额下回眶部、左右侧额中回的 GWC 值更低 ($p < 0.05$, FDR 矫正)。进一步对比伴或不伴睡眠障碍的

重度抑郁症患者, 发现两者在系统炎症指标上并未表现出明显的差异。然而, 在脑形态学方面, 伴有睡眠障碍的重度抑郁症患者的右侧中央前回皮质厚度相对较小 (未经过 FDR 矫正), 但其 GWC 值并未显示出显著差异。

结论 尽管伴有或不伴有睡眠障碍的重度抑郁症患者在系统炎症和脑形态学方面可能存在一定的联系, 但本研究的结果并未显示出两者在这些方面的显著差异。这提示我们, 这两种类型的抑郁症患者之间的差异机制可能更为复杂, 需要进一步的研究来深入探讨。

关键词: 睡眠障碍; 抑郁症; 脑形态学; 系统炎症

Analysis of The Mediating Effect of The Central Cortical Complex of The Amygdala in The Influence of Childhood Trauma on Depressive Status in Bipolar Patients

Qiudong Xia¹, Azi Shen², Wenyue Gong², Rui Yan^{1,2}, Qinghua Zhai², Qing Lu³, Zhijian Yao^{1,2}

1. Department of Psychiatry, The Affiliated Brain Hospital of Nanjing Medical University, Nanjing, China
2. Nanjing Brain Hospital, Medical School, Nanjing University, Nanjing, China
3. School of Biological Sciences and Medical Engineering, Southeast University, 2 sipailou, Nanjing 210096, China

Objective Patients with bipolar disorder (BD) are often associated with childhood trauma, and amygdala subregion volumes have varying sensitivities to such trauma. However, the role of these volumes in the relationship between childhood trauma and depressive symptoms in BD patients remains unclear. This study aimed to explore the relationship between childhood trauma and amygdala subregion volume abnormalities in BD depressive symptoms

Methods A total of 112 patients in the depressive phase of BD and 62 healthy controls were recruited. Head magnetic resonance T1 images were collected, and amygdala subregion volumes were segmented using

FreeSurfer. Analysis of covariance (ANCOVA) was employed, with age and gender as covariates, to compare volume differences between groups. General linear regression modeling was used to explore the relationship between childhood trauma, amygdala subregion volume, and depression severity

Results The volumes of the right side of the amygdala central nucleus, bilateral medial nucleus, bilateral cortex, the right side of the central complex of the cortex were reduced in the BD group with childhood trauma compared to healthy controls. No significant differences in amygdala subregion volumes were observed between the BD group without childhood trauma and healthy controls. Within the BD group exposed to childhood trauma, the volumes of the bilateral basal nucleus, right central nucleus, right medial nucleus, bilateral cortical nucleus, right central cortical complex were reduced compared to those without childhood trauma. Notably, the reduction in the right central complex of the cortex subregion volume partially mediated the relationship between the Childhood Trauma Questionnaire (CTQ) total score and depression severity in BD patients

Conclusion Childhood trauma can lead to atrophy in right amygdala central nucleus, bilateral medial nucleus, bilateral cortex, the right side of the central complex of the cortex in BD patients. Among these, the reduction in right central complex of the cortex volume plays a partial mediating role in the indirect effect between childhood trauma and depression severity

关键词: bipolar disorder; amygdala subregions; childhood trauma; mediation analysis

伴非自杀性自伤成年早期抑郁症患者自发脑活动的比率低频振幅改变

黄映红¹ 翟清华^{1,2} 阎锐^{1,2} 龚文玥^{1,2} 沈阿姿^{1,2} 施开宇^{1,2} 王一雯^{1,2} 史家波¹ 卢青³ 姚志剑¹ 姚志剑²

1.南京医科大学附属脑科医院心境障碍科

2.南京脑科医院, 南京大学医学院临床教学医院

3.东南大学生物科学与医学工程学院

目的 近年来, 伴非自杀性自伤 (non-suicidal self-injury, NSSI) 抑郁症的研究受到了广泛重视。NSSI 被认为是预测自杀的因子之一, 是一种常见的抑郁症伴随症状。伴 NSSI 抑郁症患者的治疗效果更差, 自杀风险更高, 更易复发且预后更差。但伴 NSSI 抑郁症的神经机制尚不明确。静息态功能磁共振成像 (rsfMRI) 作为一种无创性脑成像技术, 已被广泛用于研究精神疾病的神经机制。本研究旨在通过分析比率低频振幅 (fALFF) 指标, 探讨 MDD 伴 NSSI 患者的脑功能异常及其与自伤严重程度之间的关系。

方法 本研究招募了南京脑科医院精神科从 2017 年 7 月至 2019 年 12 月入院的 18-30 岁的抑郁症患者。根据是否伴有 NSSI, 抑郁症患者被分成伴 NSSI 的抑郁症组 (MDD/NSSI), 和不伴 NSSI 的抑郁症组 (sMDD)。一共纳入 54 名 MDD/NSSI 患者和 68 名 sMDD 患者及 66 名年龄、性别、受教育年限匹配的健康被试。所有参与者均接受了静息态功能磁共振成像 (rsfMRI) 扫描。数据预处理后进行 fALFF 分析, 计算使用基于 AFNI 的分析方法, 测量每个体素在 0.01-0.08 Hz 频段内的低频波动幅度分数。在 DPABI 软件中进行 fALFF 计算, 并在 SPM12 中进行统计分析。首先使用方差分析 (ANOVA) 比较三组被试间的 fALFF 差异, 并使用 GRF 方法进行多重比较校正 (单个体素 $p < 0.001$, 连续体素 ≥ 50)。然后进行事后检验 (post-hoc T 检验) 对三组进行两两比较。最后, 采用 Pearson 相关分析评估 fALFF 值与自伤严重程度之间的关系。

结果 与 sMDD 组相比, MDD/NSSI 患者在右侧额上回 (SFG) 和右侧顶下小叶 (IPL) 的 fALFF 值显著降低 ($p < 0.05$)。右侧 SFG 的 fALFF 值与自伤严重程度呈显著负相关 ($r = -0.35$, $p < 0.01$), 表明右侧 SFG 区域的功能异常可能是评估自伤严重程度的重要生理标志。

结论 MDD/NSSI 患者的右侧 SFG 区域 fALFF 值的降低与自伤严重程度密切相关。该研究为理解 MDD 共病 NSSI 的神经机制提供了新的视角, 并有助于自伤严重程度的评估和预防自伤行为。

目的 既往研究发现童年创伤可导致抑郁症患者出现杏仁核体积减少等边缘结构异常。杏仁核作为情绪处理的关键脑区, 其结构和功能异常与抑郁症的发病密切相关。目前尚无研究探索童年创伤对杏仁核亚区体积的影响。本研究将杏仁核分割为左右共 18 个亚区, 探索童年创伤对杏仁核亚区体积的影响。旨在细致理解童年创伤如何影响抑郁症患者的杏仁核结构, 从而为抑郁症的诊断和治疗提供新的视角和策略。

方法 本研究对象纳入了 129 抑郁症患者和 81 例健康对照。使用儿童期创伤问卷 (Childhood Trauma Questionnaire, CTQ): 用于评定受试者 16 周岁之前的创伤经历。此问卷共 28 个条目, 包括情感虐待、躯体虐待、性虐待、情感忽视、躯体忽视 5 个分量表。在 16 岁之前至少经历过 1 种及以上童年创伤类型即为中重度伴童年创伤组, 不伴童年创伤组和对照组无中重度童年创伤。据此, 本研究的 129 例抑郁症患者根据以上分组标准分为 60 例伴有童年创伤的抑郁症患者组、69 例不伴有童年创伤抑郁症患者组。采集所有的被试的 T1 加权 MRI 扫描数据, 并使用 FreeSurfer 对杏仁核自动分割亚区体积, 这些亚区包括外侧核、基底核、中央核、内侧核、皮质核、副基底核、层旁核、皮层-杏仁核移行区、杏仁核前区。所有杏仁核亚区体积均使用广义线性模型, 以组别为预测因子。考虑年龄对杏仁核体积的非线性影响, 对年龄的线性和二次正交多项式进行了调整, 另外加入颅内总体积进行了调整。使用 *fdr* 对广义线性模型的结果进行多重比较校正。

结果 伴童年创伤抑郁症患者与不伴童年创伤抑郁症患者相比, 右侧外侧核($t=2.873, p=0.0346$)、右侧中央核($t=3.041, p=0.0239$)和右侧层旁核($t=2.715, p=0.0486$)体积显著减少。不伴童年创伤抑郁症患者与健康对照组比, 右侧中央核($t=4.059, p=0.0019$)、双侧内侧核($t=3.484, p=0.0109; t=4.672,$

$p=0.0003$)的体积显著增大, 双侧层旁核($t=3.217, p=0.0204; t=3.073, p=0.0239$)的和体积显著减少。然而伴童年创伤抑郁症患者与健康对照组体积上无显著差异($p>0.05$)。

结论 本研究发现童年创伤可使得抑郁症患者的右侧外侧核、右侧中央核和右侧层旁核体积显著减少。此外, 不伴童年创伤的抑郁症患者在多个亚区体积上与健康对照组有显著差异, 突出了抑郁症本身对杏仁核结构的影响。故在评估和治疗抑郁症时, 需要充分考虑患者的童年创伤经历, 以制定更为个性化和有效的治疗方案。

伴童年创伤抑郁症患者负性情绪处理相关神经振荡模式

王晓芹¹ 夏逸¹ 杜易珊¹ 卢青² 姚志剑^{1,2}

- 1.南京医科大学附属脑科医院心境障碍科
- 2.东南大学生物医学工程

目的 伴童年创伤的重性抑郁障碍有着极高的自杀率。内侧前额叶和杏仁核是情绪处理神经环路的核心组成部分, 这些区域的功能失调既是童年创伤潜在后果, 又是重性抑郁障碍的重要神经病理基础, 还是自杀行为的关键机制。受限于既往神经影像学研究较低的时间分辨率, 伴童年创伤重性抑郁障碍患者情绪处理异常背后的神经机制尚不清晰。本研究利用先进的脑磁图技术, 旨在探索伴童年创伤抑郁症患者情绪处理相关的神经振荡模式及其与自杀行为的关系。

方法 本研究共招募了 88 名被诊断为重性抑郁障碍的住院患者, 其中 44 名有童年创伤史。此外, 于社区招募性别、年龄和受教育年限与之匹配的健康人 44 名。所有参与者都接受了负性情绪识别任务下的脑磁图扫描和结构磁共振扫描。在溯源分析的基础上, 比较三组在内侧前额叶和杏仁核 *theta* 频段能量和试次间相位一致性。然后, 我们使用格兰杰因果模型来检测脑区间的方向性连接。最后, 探索性分析神经生理学指标是否是童年创伤与自杀未遂之间的中介因素。

结果 与健康对照相比, 重性抑郁障碍患者在

在内侧前额叶和杏仁核 θ 频段能量和试次间相位一致性均降低。其中, 伴童年创伤的重性抑郁障碍患者比无童年创伤的患者降低更明显。重性抑郁障碍患者右侧杏仁核到内侧前额叶的效能连接下降, 而伴童年创伤的重性抑郁障碍患者从左侧内侧前额叶到杏仁核的效能连接进一步降低。此外, 童年创伤可通过左侧内侧前额叶的 θ 试次间相位一致性的下降影响自杀未遂。

结论 从局部角度, 童年创伤会影响重性抑郁障碍患者负性情绪处理时内侧前额叶和杏仁核 θ 频段活动。从长程角度, 伴童年创伤的重性抑郁障碍前额叶对边缘脑区自上而下的调控和自下而上的反馈均降低。我们的结果进一步揭示了伴童年创伤抑郁症患者高自杀率背后的神经基础。

Objective Unipolar disorder (UD) and bipolar disorder (BD) are supposed to be whole-brain diseases with some shared clinical and neuropathology characteristics. It is important to study the neural mechanisms that distinguish between the two diseases. This study aims to explore the different neural mechanisms of functional connectivity and topology properties between BD and UD

Methods In this study, 265 patients with UD, 181 patients with BD, and 204 healthy controls completed Hamilton Depression Scale (HAMD) assessment and resting-state functional magnetic resonance imaging (rfMRI) scans. Functional connectivity of BD, UD and HC were compared. On the basis of the network alterations shared by BD and UD, the topological pattern of the two groups were analysed

Results Both BD and UD showed decreased FC in the whole-brain, mainly involving VN, SMN and DMN. Topological attribute analyses are carried out on nodes of SMN, DMN and VN. Results suggesting that both BD ($t=-2.093$, $p=0.037$) and UD ($t=-2.406$, $p=0.017$) showed a decrease in Cp. While only the BD group showed a decrease in Lp ($t = -2.888$, $p = 0.004$) and an increase in Eglob ($t = 3.402$, $p < 0.001$)

Conclusion Our findings suggest that both BD and UD are disease with a wide range abnormal brain networks, mainly associated with VN, SMN and DMN. Unique topological characteristics alterations were only found in BD, which may provide possible characteristic markers to distinguish the two disorders

目的 自杀死亡是抑郁症(MDD)最严重的结局, 预防抑郁症自杀的一个重要途径是了解从自杀意念(SI)到高度致命的自杀行为的神经生物学过程。本研究旨在探索抑郁症患者自杀意念及自杀行为不同的神经基础。

方法 在本研究中, 499例MDD患者(87例无自杀意念(NSI)患者、327例SI患者、69例自杀未遂(SA)患者)和247名健康对照者完成汉密

尔顿抑郁量表(HAMD)评估和静息状态功能磁共振成像(rfMRI)扫描。采用滑动窗分析测量四组患者动态局部一致性(dReHo)。

结果 与HC组相比, NSI和SI组均在右侧梭状回(FFG.R)、右侧眶部额下回(ORBinf.R)、右侧三角部额下回(IFGoperc.R)、右侧前扣带(ACG.R)、右内侧额上回(SFGmed.R)、右侧楔前叶(PCUN.R)和右侧额中回(MFG.R)的dReHo值降低,不同的是NSI组在左侧脑岛dReHo降低,而SI组在右侧脑岛(INS.R)及右侧颞中回(MTG.R)的dReHo值降低。NSI与SI组对比,差异无统计学意义($p < 0.05$, GRF校正)。SA组与HC组相比,在右侧壳核(PUT.R)、INS.R、左侧壳核(PUT.L)、ACC.R、SFGmed.R和MFG.R的dReHo值降低,而在PCUN.R的dReHo值升高,同样,SA组与NSI及SI组对比,在PCUN.R的dReHo值均升高($p < 0.05$, GRF校正)。也就是说NSI及SI组在PCUN.R具有更低的dReHo值,而SA组在PCUN.R具有更高的dReHo值。

结论 研究发现NSI及SI组动态功能活动改变相似,而与SA组表现不同,右侧PCUN的dReHo活动在NSI和SI组降低,而在SA组表现为升高,右侧PCUN的dReHo升高可能是SA组独特的神经活动改变。

精神性焦虑水平在抑郁症患者执行功能损害中的作用研究

盛俊领¹ 孙浩² 花玲玲¹ 杜易珊¹ 夏逸¹ 王晓芹¹ 沈娜² 黄莺莺² 姚志剑^{1,2}

1.南京医科大学附属脑科医院心境障碍科
2.南京大学医学院

目的 认知功能损害是抑郁症的主要表现之一,焦虑与抑郁症认知损害密切相关,然而,不同的焦虑维度在认知损害中起到作用还不清楚。本研究旨在探究精神性焦虑和躯体性焦虑在认知的各个维度中起到的作用。

方法 本研究招募了245名抑郁症(MDD)患者以及性别、年龄、受教育年限相匹配的105健康(HC)被试,对其进行认知的四个维度的测试:连

线测试A(TMT-A)、连线测试B(TMT-B)、数字广度测试(DSB)、威斯康辛卡片分类测试(WCST)、语言流利性测试(VFT)衡量执行功能,连线测试A(TMT-A)衡量注意力,Wechsler记忆量表修订版(WMS-R)的逻辑记忆(LM)和图形记忆(FM)用来衡量记忆,数字符号替换测试(DSST)来衡量处理速度。所有的抑郁症患者均完成HAMD-17以及HAMA的评估,MDD的HAMD-17的得分均大于17分。采用独立样本t检验和Pearson偏相关分析进行统计。

结果 MDD与HC相比,在认知的执行功能、注意力、记忆、处理速度等方面都发现有明显损害(p 均 < 0.05),在MDD组中,HAMA躯体性焦虑的水平与认知功能的各个维度均没有显著的相关性,但是HAMA精神性焦虑水平与VFT得分呈显著的负相关($r = -0.139$, $p = 0.029$),即使控制了HAMD-17得分负相关关系依旧显著($r = -0.139$, $p = 0.030$)。

结论 我们的结果表明抑郁症会损害病人认知的各个维度,而且病人的精神性焦虑的水平越高执行功能就越差且不受疾病的严重程度的影响。

抑郁症患者反应抑制相关的 theta 振荡功能连接分析

盛俊领¹ 孙浩² 花玲玲¹ 杜易珊¹ 夏逸¹ 王晓芹¹ 沈娜² 黄莺莺² 姚志剑^{1,2}

1.南京医科大学附属脑科医院心境障碍科
2.南京大学医学院

目的 反应抑制功能的损害在抑郁症(MDD)患者中非常普遍,而且在缓解后仍会出现持续性损害,但是反应抑制相关theta振荡的时空神经活动尚不清楚。本研究旨在探究MDD反应抑制相关theta振荡在反应抑制的各个时间窗内的功能连接差异。

方法 我们招募了MDD被试和健康(HC)被试各35人,在Go/no-go任务下采集脑磁图(MEG)数据。分析No-go刺激出现后0-200ms、200-400ms、400-600ms两组theta(4-8Hz)振荡功能连接(FC)的差异,最后分析FC与HAMD-17之间的相关性。

结果 MDD组与健康对照相比,在no-go出现

后的 0-200ms 中右丘脑(THA.R)到右颞下回(ITG.R)的功能连接增强, 200-400ms 中发现右内侧额上回(SFGmed.R)到右海马(HIP.R)的功能连接减弱, 在 400-600ms 中发现左回直肌(REC.L)到右颞横回(HES.R)的功能连接增强, 左眶内额上回(ORBsupmed.L)到右楔叶(CUN.R)的功能连接减弱(p 均 < 0.003 , 通过 Bonferroni 校正)。且有差异的结果与 HAMD-17 均无相关性。

结论 我们的研究表明 MDD 患者在反应抑制相关的 theta 振荡上表现出异常的时空相互作用, 且与疾病的严重程度无关。这些发现对于理解 MDD 的病理生理学机制具有重要意义, 可能为抑郁症的治疗和预后提供理论依据。

抑郁症转相者在识别正性情绪面孔时前额叶—纹状体通路 high-gamma 频段效能连接差异

尤为¹ 花玲玲¹ 杜易珊¹ 黄莺莺² 林品华² 何晨¹ 卢青³ 姚志剑^{1,2,3}

1.南京医科大学附属脑科医院心境障碍科, 南京, 2100929

2.南京大学医学院教学医院南京脑科医院, 南京 210093

3.东南大学生物医学工程, 南京, 210096

目的 双相障碍患者抑郁发作时间占总病程时间长, 且多数患者首次疾病发作表现为抑郁发作, 这导致未发生躁狂的双相障碍患者与抑郁症患者难以鉴别, 从而导致误诊率高。因此, 更早地寻找出转相和单相潜在病理生理学差异是非常有必要的。gamma 频段神经活动参与多种视觉信息加工及认知功能处理过程, 包括视觉、以及情绪面孔处理。正性情绪的产生依赖于奖赏环路, 前额叶-纹状体环路是奖赏环路的核心脑区, 既往研究表明双相抑郁患者与单相抑郁患者在前额叶-纹状体环路存在差异。但目前关于前额叶-纹状体环路在处理正性情绪时是否有助于早期识别双相障碍仍有待进一步研究。

方法 采集 75 例抑郁症患者(unipolar disorder, UD)、39 名健康对照者(health Control, HC)的脑

磁图像, 选取正性情绪面孔刺激下的脑磁信号。经过 5 年以上随访, 其中 75 例抑郁症患者中有 23 例转为双相障碍(converted to Bipolar disorder, ctBD)。值得注意的是 ctBD 脑磁图像使用的是未发生过躁狂时的入组基线脑磁图像。基于 matlab 平台利用 fieldtrip 工具包对数据进行去公频、滤波, 去除伪迹处理。并基于个体化磁共振数据进行溯源分析, 选取眶额回、前扣带回、腹侧纹状体、杏仁核作为感兴趣脑区, 以 60~90 Hz gamma 频段为感兴趣频段, 利用格兰杰因果模型计算各感兴趣脑区之间的效能连接值。对脑区间效能连接值采用非参数检验进行统计分析, 检验水准 $\alpha=0.05$ 。Bonferroni 校正。

结果 ctBD、UD、HC 三组患者在识别正性情绪面孔时, 前额叶—纹状体通路 gamma 频段差异具有统计学意义($p<0.05$)。其中 UD 在右眶额回到左眶额回、右纹状体到左眶额回的效能连接值减少, ctBD 在左纹状体到左眶额回的效能连接值减少。ctBD 与 UD 在左纹状体到左眶额回之间的效能连接在 high-gamma 频段差异具有统计学意义($p<0.05$), 且效能连接强度 ctBD 较 UD 减弱。

结论 单相、未经历躁狂打击的双相患者在识别正性情绪面孔时前额叶-纹状体环路活动部异常, 抑郁症转相患者在该环路 high-gamma 频段存在特异性的改变, 是区分两者的潜在电生理学标志, 为早期识别双相情感障碍患者奠定基础。

基于抑制控制网络伴有网络游戏成瘾的抑郁障碍患者的 β 振荡时空模式

韩颖琳¹ 花玲玲² 盛俊领³ 夏逸³ 姚志剑^{2,4}

1.南京医科大学附属脑科医院精神三科

2.南京医科大学附属脑科医院心境障碍科(江苏省抑郁症诊疗中心)

3.南京医科大学第四临床医学院

4.东南大学生物科学与医学工程学院

目的 抑郁障碍患者伴网络游戏成瘾情况日趋增多, 这类患者产生更多的冲动行为, 损害其社会功能, 成为了世界性公共卫生难题。冲动性高、不计后果玩游戏、自我伤害是伴有网络游戏成瘾的抑郁

障碍患者常见的抑制控制损害特征表现,且 β 振荡与抑制控制功能紧密关联。本研究旨在探讨伴有网络游戏成瘾的抑郁障碍患者与不伴有网络游戏成瘾的抑郁障碍患者相比,其抑制控制网络的 β 振荡是否存在特异性改变。

方法 采用网络成瘾测评量表、Barratt 冲动量表和采集 Go/NoGo 任务态脑磁图数据及磁共振定位相,于 2015 年 1 月至 2024 年 4 月在南京医科大学附属脑科医院住院部招募 30 例单相抑郁症患者,31 例伴有网络游戏成瘾的抑郁症患者以及周围地区的性别、年龄、受教育程度相匹配的 48 例健康对照者。三组受试者执行 Go/NoGo 任务进行脑磁图信号采集。提取所有受试执行 NoGo 任务--抑制行为的信号,采用进行预处理与源重建。根据研究假设,选取右额下回(right inferior frontal gyrus, rIFG)-前运动辅助区(pre-supplementary motor area, preSMA)-左初级运动皮层(left primary motor cortex area, IM1)三个脑区作为感兴趣区,以 β (13-30Hz)波为感兴趣频段,提取 0-900ms 的时间序列,计算各感兴趣脑区之间的功能连接值。把有统计学差异的功能连接分别与患者组的 HAMD17 量表、网络成瘾评测量表、Barratt 冲动量表进行皮尔森相关分析。本实验脑磁影像数据结果用 matlab2024a 软件进行处理,全部数据结果用 SPSS28.0 软件进行统计分析。

结果 1. Nogo 任务下三组功能连接比较

在抑制控制加工后期(250-450ms)时间窗,三组间 β 频段 IM1-preSMA 的 FC ($p=0.002$, FDR corrected)统计学异常,其中伴有网络游戏成瘾的抑郁障碍患者组的功能连接下降最明显。

2. 基于有特征意义的多维数据建立分类模型

加工后期的 β 频段 IM1-preSMA 的 FC 为贡献最大的影像因素($p=0.015$)。再建立分类判别式模型,分类准确率(交叉验证)80.3%。

结论 与不伴有网络游戏成瘾的抑郁障碍患者相比,伴有网络游戏成瘾的患者在抑制控制加工后期 β 频段 preSMA-IM1 明显异常,提示这个特征性 FC 可能是伴有网络游戏成瘾抑制控制损害的关键,作为早期非药物干预的生物标记位点,对预防冲动及日常生活功能下降意义重大。

关键词: 网络游戏成瘾、抑郁障碍、冲动、抑制控制、脑磁图

基于 GA-KPLS 构建双相情感障碍诊断模型及筛选关键基因

任燕¹ 缪雨婷²

1.山西省人民医院

2.山西医科大学

目的 双相情感障碍(Bipolar Disorder, BD)是一种高度遗传的情感障碍,其病因复杂且知之甚少。发病率日益增高,带来了严重的社会负担和经济负担。由于 BD 具有较高的临床异质性,如何准确地诊断疾病并且提供个性化的治疗方案仍然存在挑战。近年来,基因表达数据的高通量测序技术以及机器学习的发展为临床诊断提供了新的机会。本研究旨在应用多种机器学习模型,利用 BD 患者的基因表达数据,构建一个准确预测 BD 的诊断模型,并筛选出关键基因,为疾病诊断提供方法学支撑。

方法 本研究从 GEO 公共数据库下载了 448 例双相情感障碍患者外周血的基因表达数据(GSE124326),并进行了数据预处理和特征提取。采用通过遗传算法优化的核偏最小二乘法模型(GA-KPLS),并使用训练集对模型进行训练和优化。我们使用测试集评估了模型的预测性能,并与传统的六个模型(随机森林、LASSO、岭回归、支持向量机、神经网络和 Logistic 回归模型)进行了比较,以识别 BD 患者。我们还通过在线工具 SAM 提取差异表达基因(DEGs)。分别使用了基因本体论(GO)和京都基因和基因组百科全书(KEGG)对 DEGs 进行功能注释和途径富集分析。此外,还使用 STRING 数据库以及 Cytoscape 软件构建了蛋白质-蛋白质相互作用网络(PPI)来鉴定 hub 基因,并对双相情感障碍患者中筛选出的 Hub 基因进行了 ROC 曲线验证(计算曲线下面积 AUC)和生物学验证,以判断 Hub 基因的诊断价值。

结果 比较七种模型的八个评价指标的结果显示,GA-KPLS 模型对于外周血基因表达数据的预测性能明显优于其他六种模型。具体而言,GA-KPLS 模型的灵敏度、特异度、准确度、AUC 值、F_measure 值和 Gmean 值均表现出色。对两组间进行差异基因分析后,识别了 23 个差异表达基因(FDR 调整后的 $P<0.05$ 且 $\log_2|FC|\geq 1$),DEGs 显著富集于 35 条 GO terms 和 4 条 KEGG 通路中,构建的蛋白互作网络复合体包含 27 个节点和 136 个边界。并且筛选出 3 个 hub 基因,AUC 均大于 0.7,生物验证分析也发

现这些 hub 基因在 BD 患者外周血中的表达发生了显著变化。

结论 较其他传统机器学习模型相比, GA-KPLS 模型构建的疾病诊断模型较好地识别了双相情感障碍患者, 为双相情感障碍的诊断提供了方法学上的参考。可用于辅助临床诊断, 预测性能良好, 其为日后的组学数据整合提供了新的路径。研究中针对 BD 识别的差异基因和富集通路可为 BD 患者的治疗提供新的治疗靶点, 有助于实现 BD 的精准治疗和管理。

Identification of The Shared Gene Signatures and Biological Mechanism in Major Depression Disorder

Yan Ren², Shasha Wu¹, Qing Jiang¹

1. Shanxi Provincial People's Hospital

2. Shanxi Provincial People's Hospital

Objective Major depressive disorder (MDD) is a complex and severe psychiatric disorder with underlying genetic determinants that have not been elucidated. The aim of this study was to investigate the pathogenesis of MDD and assess the relationship between MDD and immunity by identifying key biomarkers and utilizing bioinformatics analyses and relevant immune infiltrates in human autopsy samples

Methods We obtained gene microarray data from GSE32280, GSE76826, and GSE98793 by Gene Expression Omnibus (GEO). Our approach included differential expression analysis, weighted gene co-expression network analysis (WGCNA), and protein-protein interaction (PPI) network analysis to identify hub genes associated with MDD. Subsequently, we utilized gene ontology (GO), Kyoto Encyclopedia of Genes and Genomes (KEGG), Cytoscape plugin CluGO and gene set enrichment analysis (GSEA) to identify immune-related hub genes. The final hub genes acquisition related to immunity was the intersection of lasso regression analysis and PPI analysis. Immune cell infiltration in

MDD patients was analyzed using CIBERSORT and correlation analysis of key immune cells with key genes was performed. To assess the diagnostic accuracy of these hub genes, we performed a subject work characterization curve (ROC) analysis. In addition, we conducted a study involving 10 MDD patients and 10 healthy controls (HCs) meeting specific criteria to assess the expression levels of these hub genes in their peripheral blood mononuclear cells (PBMCs)

Results We identified 159 down-regulated and 51 up-regulated genes for further study. Through WGCNA, we obtained 22 co-expression modules, of which the lightyellow module was most strongly associated with MDD. Functional enrichment pathway analysis showed that these differential genes were associated with immunity. By integrating differential analysis with immune-related genes, we identified 21 common genes. PPI networks were constructed for the target genes. The ClueGo assay, a Cytoscape plugin, revealed that most targets were related to positive cellular regulation in response to macrophage colony-stimulating factor stimulation. Subsequently the Lasso algorithm confirmed 4 hub genes as potential biomarkers for MDD. ROC curve analysis showed that these 4 hub genes have good diagnostic value. Quantitative reverse transcription-pcr (RT-qPCR) results showed significant changes in the expression of these hub genes in the PBMCs of MDD patients compared to HCs

Conclusion MDD is a highly heterogeneous disease characterized by high morbidity and mortality and is considered the most prevalent cause of disability worldwide. However, The pathophysiologic mechanisms of MDD are unknown and the biomarkers used for diagnosis are unclear. In this study, we first scrutinized the RNA expression data of MDD patients and HCs to screen for DEGs. GO, KEGG enrichment analyses showed that DEGs were mainly concentrated in immune-related pathways. Therefore, in order to explore more deeply the profound influence of immunity on the pathogenesis of MDD, we combined multiple bioinformatics approaches to identify four hub genes as key biomarkers of MDD, analyzed the enrichment pathways using GSEA, and further investigated the function of immune cell infiltration in the disease. In conclusion,

we identified for the first time four hub genes (TLR2, RETN, HP, and IL7R), which may be diagnostic biomarkers for MDD. In addition, we constructed an immune-related diagnostic model for MDD, which showed good diagnostic performance in the dataset GSE98793. Thus, our genetic characterization can provide an accurate and reliable prediction method for patients. Finally, the immune cell infiltration of MDD patients was analyzed using CIBERSORT, correlation analysis showed that hub genes are involved in the immune response in MDD. Our study combined with further validation of blood samples from clinical patients provides strong evidence for studies exploring immune involvement in the pathophysiologic pathogenesis of MDD, which will be a new starting point. However, the molecular mechanisms by which these four immune-related hub genes are involved in the pathogenesis and progression of MDD are still poorly understood and require further investigation

常规治疗联合加巴喷丁对比联合喹硫平对双相障碍患者焦虑症状的疗效研究

孙林远 李名立* 徐亭晚 程晓菲
四川大学华西医院

目的 双相情感障碍是伴焦虑症状的情况十分普遍。不伴焦虑症状的患者治疗更复杂、预后更差,目前也缺乏统一的治疗指南。喹硫平在目前可作为一种选择,但其应用有局限性。而加巴喷丁在之前的研究中被发现对焦虑症状有改善作用,但缺乏在双相情感障碍患者中进行的随机对照试验。本研究旨在探究在常规治疗的基础上联合加巴喷丁治疗,对比联合喹硫平治疗对双相情感障碍患者的焦虑症状改善程度。

方法 纳入双相情感障碍患者 58 例,其中实验组,即常规治疗联合加巴喷丁治疗组 29 例,对照组,即常规治疗联合喹硫平治疗组 29 例。使用自制电子表格采集患者的一般信息。使用汉密尔顿焦虑量表、

汉密尔顿抑郁量表、宗氏焦虑自评量表、宗氏抑郁自评量表、杨氏躁狂量表、个人和社会功能量表、副反应量表、斯坦福嗜睡量表评估患者的症状。入组后在常规治疗的基础上:实验组联合使用加巴喷丁治疗,最高剂量不超过每日 1800mg。对照组联合使用富马酸喹硫平治疗,最高剂量不超过每日 300mg。两组均在基线(0周)、2周、4周、8周时进行观察随访。以 8 周时汉密尔顿焦虑量表评分作为主要结局指标。使用 spss 软件、R 软件进行统计分析。分类变量资料比较采用卡方检验,连续变量资料比较采用独立样本 t 检验。P<0.05 为差异具有统计学意义。使用 R 软件构建广义混合效应模型,纳入年龄、性别、受教育年限等作为协变量进行控制,分析两组受试者治疗前后症状变化趋势以及组间差异。

结果 从基线(0w)到终点(8w),两组患者汉密尔顿焦虑量表总分均值均有显著下降,其中喹硫平组由 20.55 下降至 9.74,8 周的减分率为 52.6%,加巴喷丁组由 24.24 下降至 9.81,8 周的减分率为 59.5%。整个随访期间两组患者汉密尔顿抑郁量表总分均值也有下降,喹硫平组由 16.45 下降至 7,8 周的减分率为 57.4%,加巴喷丁组由 19.69 下降至 7.63,8 周的减分率为 61.2%。宗氏焦虑自评量表标准分的均值,喹硫平组由 55.21 下降至 43.83,加巴喷丁组由 62.14 下降至 43.78。宗氏抑郁自评量表标准分的均值,喹硫平组由 65.56 下降至 54.78,加巴喷丁组由 66.9 下降至 53.3。纳入其他协变量进行分析发现,年龄、锻炼次数、收入水平、住院次数、抑郁发作次数、使用情绪稳定剂数量对治疗效果有影响。

结论 双相情感障碍患者在常规药物治疗基础上,联合加巴喷丁治疗可以有效改善焦虑/抑郁情绪,在改善焦虑抑郁情绪和认知功能的临床疗效上,与联合喹硫平治疗的效果基本类似,某些水平甚至效果更佳,且白天嗜睡的不良反应发生率小于联合喹硫平治疗的患者。

喹硫平联合丙戊酸钠治疗双相情感障碍躁狂发作的临床疗效

张鹤瀚*
天津市安定医院

目的 探讨喹硫平联合丙戊酸钠治疗双相情感障碍躁狂发作的临床疗效和安全性,以及对患者炎症因子水平的影响。

方法 选取 2023 年 11 月至 2024 年 5 月收治的 108 例双相情感障碍躁狂发作患者为研究对象,按照随机数字表法将患者分为试验组和对照组,每组 54 例。试验组给予喹硫平联合丙戊酸钠治疗,对照组给予丙戊酸钠缓释片治疗,均治疗 4 周。比较两组治疗前后贝克-拉范森躁狂量表(BRMS)评分、阳性与阴性症状量表(PANSS)评分、血清炎症因子水平,临床疗效和不良反应发生率。

结果 2 组患者治疗后的贝克-拉范森躁狂量表及阳性与阴性症状量表评分均显著低于治疗前($P < 0.05$),且对照组治疗总有效率均低于试验组,差异有统计学意义($P < 0.05$);治疗后,对照组肿瘤细胞因子- α (TNF- α)及白细胞介素- 1β (IL- 1β)水平高于试验组,人血白蛋白(ALB)及血清总胆红素(TBi L)低于试验组,差异有统计学意义($P < 0.05$)。试验组不良反应发生率为 15.38%,低于对照组 19.53%,但无显著差异($P > 0.05$)。

结论 喹硫平联合丙戊酸钠治疗可有效缓解双相情感障碍患者躁狂症状和精神病性症状,降低双相情感障碍躁狂发作患者炎症因子表达,提高治疗总有效率,效果优于单用丙戊酸钠治疗。

关键词: 双相情感障碍;躁狂发作;喹硫平;丙戊酸钠;炎症因子;

青少年双相情感障碍的内感受改变特征及其与躯体化和情绪问题的关系

吕佳琳^{1,2}

1. 山东第二医科大学

2. 中科院心理所

目的 本研究旨在探讨青少年双相情感障碍(Bipolar Disorder, BP)患者的内感受改变特征及其与情绪和躯体化问题的关系。双相情感障碍是一种以情绪极端波动为特征的精神障碍,常在青少年时期发病,且与躯体症状高度相关。青少年 BP 患者身心失调问题尤为突出,内感受作为情绪与躯体觉知的生理基础,对情绪调节和心理健康具有重要影响,

但其作用在青少年 BP 患者中尚不清楚。

方法 采用内感受性知觉多维评估量表(MAIA-2)对被试的内感受情况进行测量,患者健康问卷(PHQ15)、失眠严重程度指数量表(ISI)、焦虑筛查量表(GAD-7)、抑郁筛查量表(PHQ-9)作为被试躯体化和情绪症状测量依据。通过对比患者组与健康对照组的内感受情况,评估了躯体化症状、焦虑、抑郁情绪,并探讨了内感受在 BP 患者中的作用及其与临床症状的关联。

结果 处于康复期的青少年 BP 患者在内感受的多个维度上得分低于健康对照组,且在躯体和情绪症状方面得分较高,表明患者组存在内感受问题与身心症状,伴有躯体或/和情绪问题的 BP 亚组与对照组在内感受总分上无差异,在不分心、不担心、信任维度上存在显著差异。进一步分析显示,患者组的内感受与临床症状之间存在显著相关,且“不分心”是唯一对躯体症状与情绪问题具有预测功能的维度。这提示我们,过分关注身体不适可能加剧青少年 BP 患者的临床症状。

结论 本研究发现青少年 BP 患者的内感受尤其是不分心维度与其情绪和躯体化问题密切相关为理解青少年 BP 心身失调问题提供了新的解释,并为发展针对性干预策略提供了依据。

伴 NSSI 双相情感障碍患者认知功能的临床研究

苏航¹ 苏航² 阎丹峰^{1,2} 王斌红^{1,2}

1. 山西医科大学

2. 山西省精神卫生中心

目的 研究双相情感障碍(bipolar disorder, BD)患者认知功能损害与非自杀性自伤行为(non-suicidal self-injury, NSSI)的关系及认知功能训练对 NSSI 行为的影响,为伴 NSSI 的 BD 患者进行认知功能康复训练治疗提供理论参考。

方法 纳入符合《精神障碍诊断与统计手册(第 5 版)》(DSM-5)诊断标准的 30 例伴有 NSSI 的 BD 患者,30 例不伴 NSSI 的 BD 患者和 30 例健康被试(HC),采用计算机认知矫正治疗(computerized

cognitive remediation therapy, CCRT)系统评估被试的认知功能,包括神经认知(包括符号数字转换测试、连线测验、速度知觉、数字短时记忆等)与社会认知(包括面部表情识别、认知偏差问卷等),同时采用青少年自我伤害行为问卷(Adolescents Self-Harm Scale, ASHS)评估被试者自伤行为的频次和严重程度。计算每种自伤行为的频次与严重程度乘积的和。采用 SPSS27.0 软件进行数据分析,对三组被试者的认知功能测试评分采用单因素方差分析比较均数差异;通过独立样本 t 检验分别分析接受训练组与不接受训练组的 ASHS 与认知功能测验评分。

结果 (1) 伴 NSSI 的 BD 患者数字符号转换测试评分、连线测验评分、速度知觉评分、数字短时记忆评分、面部表情识别评分、认知偏差问卷评分均低于不伴 NSSI 的 BD 患者组与健康对照组,差异有统计学意义 ($P < 0.05$) (2) 伴 NSSI 的 BD 患者在面部表情识别评分、认知偏差问卷评分均较正常对照组和不伴 NSSI 的 BD 患者更低,差异有统计学意义 ($P < 0.05$) (3) 经过 2-4 周的认知功能康复训练,伴 NSSI 的 BD 患者与不伴 NSSI 的 BD 患者认知功能评分均有一定提高,且伴 NSSI 的 BD 患者 ASHS 评分下降,差异有统计学意义 ($P < 0.05$)。

结论 伴 NSSI 的 BD 患者通常较不伴 NSSI 的 BD 患者认知功能损害更明显,特别是在社会认知功能为维度;计算机认知功能康复训练能够在一定程度上改善患者的认知功能从而对 BD 患者的 NSSI 进行有效干预。

关键词: 双相情感障碍,非自杀性自伤,认知功能,认知训练

基于机器学习的执行控制网络鉴别单、双相抑郁研究

张坤 刘志芬 张爱霞 刘鹏鸿 韩敏 孙宁 杨春霞*
山西医科大学第一医院

目的 单相抑郁 (Major Depressive Disorder, MDD) 和双相抑郁 (Bipolar Depression, BD) 之间的鉴别具有一定挑战性。两者在认知功能,尤其是注意力和执行功能控制方面均存在缺陷,这些缺陷可能与神经可塑性和认知神经网络的变化相关。本研究拟结合机器学习算法和 Oddball 范式的执行控制

网络分析,探究区分两者的神经生物学标志物。

方法 本研究采取横断面研究,对 2022 年 3 月至 2023 年 12 月期间在山西医科大学第一医院精神卫生科接受门诊或住院治疗的 67 例 MDD 患者和 46 例 BD 患者的基线临床数据进行了综合评估。此外,研究还招募了 68 名年龄、性别及学历匹配的健康对照组。收集其一般人口学资料、24 项汉密尔顿抑郁量表、杨氏躁狂评定量表以及 Oddball 任务下的脑电数据。使用 SPSS 23.0 软件对所有受试者的人口学和临床资料进行统计分析。采用基于 Matlab 软件平台的 EEGLAB 和 Fieldtrip 工具箱对脑电数据进行预处理,并进行时域分析、时频分析、脑电源重建以及功能连接分析。最后,使用支持向量机对差异脑电特征建立 MDD-BD 分类模型,并使用 10 折交叉验证对模型进行验证。

结果 1. 时域分析中, BD 组的 P300 波幅显著大于 MDD 组 ($p < 0.05$), HC 组的 P300 波幅与 MDD 组 ($p = 0.693$) 和 BD 组 ($p = 0.111$) 的差异无统计学意义; 2. 时频分析中, BD 组在 delta 和 theta 频段的 ERS 显著高于 MDD 组 ($p < 0.05$); 与 HC 组相比, MDD 组和 BD 组在 delta 和 theta 频段中的差异无统计学意义 ($p > 0.05$); 3. MDD 组与 BD 组患者在 delta 和 theta 频段上执行控制网络中的功能连接小于 HC 组 ($p < 0.05$, FDR 校正); 相较于 BD 组, MDD 组的左侧背外侧额上回与前额叶及顶叶之间功能连接更强 ($p < 0.05$, FDR 校正); 4. SVM 模型在区分两者的准确度为 72.65%, 特异性为 95.14%, 敏感性为 36.00%, 平均 F1 得分为 45.98%, 平均 AUC 得分为 66.13%。

结论 1. 本研究表明,在 Oddball 任务中,双相抑郁、单相抑郁和健康对照组之间在大脑认知信息处理和网络连通功能上的不同; 2. 单相抑郁患者的执行控制网络功能连接性强于双相抑郁患者,尤其是左侧背外侧额上回与其他前额叶及后顶叶区域间的功能连接。

关键词: 单相抑郁,双相抑郁,机器学习,执行控制网络,事件相关电位

基于结构磁共振成像的双相情感障碍患者大脑形态学研究

陈佳悦^{1,5} 张欣欣² 宋颖超³ 李乾琛⁴ 田红军⁵

- 1.上海市精神卫生中心
- 2.天津儿童医院
- 3.山东第一医科大学(山东省医学科学院)
- 4.河北省人民医院
- 5.天津市第四中心医院

目的 通过使用基于形变的形态学测量(deformation-based morphometry, DBM)方法和基于体素的形态学测量(voxel-based morphometry, VBM)方法探寻双相情感障碍(bipolar disorder, BD)患者的大脑结构改变,并结合人工智能技术分别考察两种指标单独和融合后对BD患者的诊断识别能力。

方法 采集67例BD患者和70例健康对照的脑结构磁共振数据。首先,采用DBM和VBM方法分析BD患者灰质及白质区域的脑结构改变,并计算两种指标在灰质和白质区域左右半脑的空间相关系数,从而系统地比较两种方法在检测大脑结构的异同点;其次,本研究还分别提取上述指标中具有显著差异的脑区的平均体素值,将其与临床变量进行相关性分析;最后,使用支持向量机分类算法在灰质和白质区域分别检测VBM/DBM以及两种指标融合后对BD患者的诊断识别能力。

结果 本研究使用DBM方法在灰质区域发现与健康对照组相比,BD患者左侧岛叶和左侧上前扣带皮层灰质区域体积增大;使用VBM方法发现BD患者双侧颞下回、双侧海马、左侧额下回\左侧嗅皮质、左侧梭状回、左侧颞中回、左侧颞上回、左侧额中回、左侧中扣带回、右侧枕下回、右侧颞横回及右侧背外侧额上回灰质体积(gray matter volume, GMV)减小。本研究使用DBM方法在BD患者白质区域未发现显著差异脑区;使用VBM方法发现BD患者双侧丘脑、右侧额下回、右侧苍白球及右侧前扣带回白质体积(white matter volume, WMV)减小。两种指标在灰质和白质区域的左右半脑的空间相关性均呈中等程度相关。在BD异常脑区与临床变量相关性分析中本研究未发现显著相关性。此外,本研究发现在白质区域,DBM和WMV在区分BD患者与健康对照的最高分类正确率分别为59.84%和62.80%,将对白质区域的DBM和WMV两种指标融合后最高分类正确率为62.77%;在灰质区域,DBM和GMV在区分BD患者与健康对照的最高分类正确率分别为69.34%和72.42%,并且将对灰质区域的DBM和GMV两种指标融合后分类正确率提

高至73.72%。

结论 本研究发现BD患者在多个脑区存在灰质和白质的结构异常改变。针对灰质区域,DBM和VBM在区分BD患者和健康对照中均具有较高的分类正确率,并且两种指标融合后可进一步提高分类正确率,表明DBM和VBM在刻画BD患者脑结构异常方面具有信息互补性,这提示在BD脑结构磁共振研究中可将两种分析方法相结合,为未来开发BD辅助诊断工具提供了新的策略。

青少年各种躯体不适,警惕双相情感障碍

张欢¹ 张庆帅² 苏中华¹

- 1.山东省戴庄医院
- 2.兖州区铁路医院

目的 探讨以躯体症状起病的双相患者的人口学、症状学特征及其他相关因素,以早期识别、诊断双相情感障碍,为临床医师提供指导。

方法 回顾性分析于2023年1月就诊于济宁市兖州区铁路医院精神科,以躯体不适起病,最终诊断为双相情感障碍的1例抑郁患者的临床资料,并复习相关文献。

结果 患者男,20岁,独生子,大专学生。3年前出现心情低落、失眠、对身体过度关注,感觉不到肌肉的存在,胃痛、小便疼痛,心慌、出汗、坐立不安,紧张、担心,不愿活动,感觉呼吸都累、得专门想着去喘气。担心自己不行了。曾于多家医院心内科、胸外科、呼吸内科、消化内科等科室就诊,诊断“甲状腺功能亢进症、慢性支气管炎急性发作、胃炎”等,5月前又行卵圆孔修补术,多项检查及治疗后,症状未见明显改善。后患者于外院心理科住院,诊断为“混合性焦虑和抑郁障碍”,予“度洛西汀肠溶胶囊”等药物治疗,患者治疗欠配合,疗效欠佳。出院后未再服药及复诊,刚开始表现尚可,后出现显兴奋,乱花钱,外出旅游、要买房车旅游,持续时间不长。入院前3天,患者又出现少语、懒动、情绪低落伴躯体不适。于铁路医院就诊并住院治疗,修改诊断为“双相情感障碍,目前为中度抑郁发作”。予“碳酸锂缓释片、富马酸喹硫平”等药物治疗,患者病

情好转。

结论 对伴有起病年龄较小、家族史阳性、伴精神病性症状、自杀观念、抗抑郁治疗疗效欠佳等特征的抑郁患者应格外重视，警惕双相可能，治疗上应以情感稳定剂为主，酌情使用抗抑郁剂。非精神科医生容易只重视躯体症状，忽视患者的焦虑和抑郁情况。精神科医师大都能将焦虑、抑郁情绪与患者的躯体不适症状联系在一起，但部分医师对以躯体不适起病的双相抑郁患者识别不足，这也造成了一定的治疗困难，降低患者就诊的满意度，降低治疗的依从性，增大了医疗纠纷的发生率。本文回顾了该患者的临床资料，并结合文献进行讨论分析，旨在增强精神科及相关科室临床医生对该病的认识，以便早期发现、早期确诊和治疗。

特质正念影响双相障碍生活质量和认知障碍的心理路径研究

邱妍¹ 许扬扬¹ 李宇晨¹ 高瑾¹ 姜海燕² 陈秀娥¹
万光芸¹ 林彩婷¹

1.厦门市仙岳医院

2.三明市明溪县总医院

目的 缓解期双相障碍患者仍然面对着情绪管理和认知功能损害的困扰，其冲动控制、情感表达、情绪调节障碍都可能受到正念特质的直接影响，并最终影响生活质量和认知障碍水平。本研究旨在了解稳定期双相障碍患者的正念水平与生活质量和认知障碍的相关性及潜在心理路径，为针对性心理治疗方法的制定提供参考依据。

方法 研究目前招募了 35 名稳定期双相障碍患者及 29 名健康对照参与者进行问卷评估（持续进行中）。使用五因素正念度量表（FFMQ）评估患者与健康人的特质正念水平；使用简版双相障碍生活质量问卷（Bref QoL.BD）、双相障碍认知困扰问卷（COBRA）评估患者的生活满意度和认知障碍；使用情绪调节困难量表（DERS）、多伦多述情障碍量表（TAS20）、Barratt 冲动量表（BIS）评估患者情绪调节、述情障碍、冲动控制水平。心理路径分析采用 Hayes 提供的 SPSS PROCESS 插件模型 4，以 Bref QoL.BD 和 COBRA 作为因变量，FFMQ 作为自变

量，DERS、TAS20、BIS 作为中介变量进行平行中介分析。

结果 稳定期双相患者的特质正念水平较健康人略低，但差异未达到统计学意义（ $d=-6.88$, $p=0.15$ ），我们推测其统计显著性可能受限于样本量。在双相患者中，正念水平与生活满意度和认知障碍均显著相关（ $r=0.671$, $p<0.001$ ； $r=-0.47$, $p=0.018$ ），且冲动控制障碍、述情障碍、情绪调节得分均与生活满意度和认知障碍显著相关（ $p<0.05$ ）。中介分析发现，正念水平对生活满意度的总效应显著【 $\beta=0.36$, $p=0.002$, Boot CI=（0.19, 0.53）】，但直接效应不显著（ $p=0.05$ ），中介变量放入预测模型后，情绪调节对生活满意度有显著正向预测作用【 $\beta=0.26$, Boot CI=（0.02, 0.51）】。正念水平对认知功能的总效应显著【 $\beta=-0.24$, $p=0.02$, Boot CI=（-0.44, 0.05）】，但直接效应不显著（ $p=0.22$ ），中介变量放入预测模型后，述情障碍对认知功能有显著负向预测作用【 $\beta=-0.34$, Boot CI=（-0.65, -0.10）】。结果表明情绪调节在正念水平和生活满意度的关系中起到完全中介作用，述情障碍在正念水平和认知障碍的关系中起到完全中介作用。

结论 稳定期双相障碍患者的特质正念水平与生活质量和自我认知功能障碍密切相关，且可以通过情绪调节和述情障碍水平进行预测。该结果为用于双相障碍患者康复的心理治疗靶点提供了证据，有必要进一步扩大样本量，并开展随机对照临床试验以验证以正念为中心的治疗方法在双相障碍中的应用。

关键词：正念，双相障碍，生活质量，认知功能，情绪调节

A Systematic Review: Updated Treatment Recommendation for The Bipolar Depression with Mixed Features

戴 春晓 谢 健*

西湖大学医学院附属杭州市第一人民医院

Objective Bipolar disorder (BD) is characterized by fluctuations in emotional state and energy, including episodes of mania or hypomania alternating with depression, affecting >1% of the global population.

Within the spectrum of BD, there exists a state characterized by the simultaneous presence of depressive and manic symptoms, defined as mixed features specifiers (MFs). Growing evidence indicated that the patients with bipolar depression with mixed features specifiers (BD-MFs) exhibited more severe symptoms, lower rates of treatment response, and worse outcomes. Consequently, there is an urgent need to identify effective treatments for BD-MFs

Methods A literature search was performed using the PubMed/ MEDLINE database. The search was conducted on 14 March 2024 using the following search terms: ("bipolar depression" OR "mixed depress*" OR "bipolar depressi*" OR "mixed specifier" OR "mixed featur*" OR "bipolar mixed") and (treatment OR pharmaco* OR therapy). Articles were selected for further evaluation by inspecting abstracts. The bibliographies of the selected articles were also included. The eligible articles were clinical trails or randomized controlled trials (RCTs) of acute-phase and maintenance treatments with a placebo arm and ≥ 25 cases

Results The initial PubMed search identified 218 articles, 178 of which were selected for further evaluation. From those, 23 studies were included in our review. In this review, we systematically summarize potential treatment approaches for BD-MFs, exploring various dimensions, including pharmacotherapy, physical interventions, and psychological strategies. By delving into these multifaceted aspects, this review aims to offer valuable insights and information that can contribute to the development of more effective and tailored interventions for individuals grappling with the complexities of BD-MFs. Addressing the urgent need for improved treatment strategies, this exploration serves as a resource for clinicians and researchers alike in their pursuit of better outcomes for those dealing with BD-MFs

Conclusion Among antipsychotics, ziprasidone, olanzapine/OFC, lurasidone, cariprazine and lumateperone appear to have more evidence of efficacy in treating bipolar depression with MFs. The use of mood stabilizers, such as lithium, valproate or lamotrigine, may also be of interest; however, they have not yet been

adequately assessed in subjects with DSM-5 defined depression with mixed features, especially in the acute phase. ECT, TMS and DBS have no sufficient and beneficial evidence for the treatment of bipolar depression with MFs. Clinical well-designed adequately powered double-blind placebo-controlled studies assessing the efficacy, safety, and tolerability of psychotropic agents in depression with mixed features are needed

关键词: bipolar depression, mixed features, second generation antipsychotic (SGA), mood stabilizers, physiotherapy, psychotherapy

认知行为治疗干预辅助治疗双相情感障碍躁狂发作患者的随机对照研究

林荫*

海南省安宁医院

目的 探讨认知行为治疗在双相情感障碍躁狂发作患者中的应用。

方法 选取 2019 年 1 月至 2022 年 1 月 120 例本院收治的双相情感障碍躁狂发作患者, 依据随机数字表法分为对照组和观察组, 各 60 例。予以对照组碳酸锂缓释片, 于上述基础上予以观察组认知行为治疗, 认知行为疗法: ①疾病认知。②认知重建。③行为干预。同时设定明确、可行和可量化的目标, 每天完成一个小目标。每日引导患者进行反思和感恩, 回想当日的经历, 并重点关注积极事件, 培养其乐观心态。最后让患者学会深呼吸、冥想等小技巧, 帮助患者缓解精神压力。两组均干预 8 周。对比两组临床疗效、SDS (抑郁自评量表)、SDSS (社会功能缺陷量表)、CFQ (认知融合问卷)、MMAS (药物依从性量表)、BRMS 评分 (贝克-拉范森躁狂量表)、生活质量及不良反应发生情况。

结果 干预后, 观察组临床总有效率 96.67% 高于对照组的 85.00%; 较干预前, 干预后两组 MMAS、生活质量各项评分均升高, 观察组高于对照组, SDS (抑郁自评)、SDSS、CFQ 评分则降低, 观察组低于对照组; 较干预前, 干预 4~8 周两组 BRMS 评分逐渐降低, 观察组低于对照组, 差异具有统计学意义 (均 $P < 0.05$)。

结论 认知行为治疗可以提高双相情感障碍躁

狂发作患者的临床治疗效果、认知融合、治疗依从性以及生活质量,改善其躁狂等症状,缓解不良情绪。

关键词:双相情感障碍躁狂发作;认知行为疗法;碳酸锂缓释片;临床疗效

双相情感障碍发病时间对应二十四节气规律的研究

王媛 马晓洁 何华*

乌鲁木齐市第四人民医院

目的 探讨新疆维吾尔自治区乌鲁木齐市第四人民医院双相情感障碍患者入院率在二十四节气中的差异。

方法 本研究收集了新疆维吾尔自治区乌鲁木齐市第四人民医院2016年1月1日至2023年12月31日期间诊断双相情感障碍的入院患者共计6831例,其中双相情感障碍抑郁发作1898例,双相情感障碍躁狂发作1407例,双相情感障碍混合发作1930例。根据纳入病例患者的入院时间,按二十四节气的起止时间归类,统计各年份不同节气时段的住院人数,并计算纳入住院人数占所在节气时位住院人数的比值。使用SPSS 23.0统计软件,对纳入的住院人数占所在节气时位住院人数的比值采用Kruskal-Wallis H检验进行统计分析,计量资料以均数±标准差表示,以 $P < 0.05$ 为差异具有统计学意义。

结果 在二十四节气时段中,双相情感障碍患者入院总例数占同时段总住院患者例数的比值,最高时段是谷雨,为10.59%;最低时段是大雪,为6.40%。不同节气时段的双相情感障碍患者入院比值Kruskal-Wallis H检验,差异有统计学意义($c_2 = 93.699, P < 0.001$)。在双相情感障碍中,抑郁发作患者入院总例数占同时段总住院患者例数的比值,(最高时段是谷雨,为3.21%;最低时段是大雪,为1.63%。不同节气时段的双相情感障碍抑郁发作患者入院比值Kruskal-Wallis H检验,差异有统计学意义($c_2 = 47.665, P = 0.002$)。在双相情感障碍中,躁狂发作患者入院总例数占同时段总住院患者例数的比值,最高时段是秋分,为2.39%;最低时段是立春、大雪和小寒,为1.22%。不同节气时段的双相情感障碍躁狂发作患者入院比值Kruskal-Wallis H检

验,差异有统计学意义($c_2 = 45.106, P = 0.004$)。

结论 双相情感障碍患者入院率在不同节气时段中有差异。整体双相情感障碍发作节气时段与双相情感障碍抑郁发作节气时段一致,即谷雨时段最高而大雪时段最低;双相情感障碍躁狂发作在秋分时段最高而在立春、大雪和小寒时段最低。

关键词:双相情感障碍,二十四节气

双相障碍转相过程的神经生物学

郭中孟*

江西省精神卫生中心

目的 双相障碍是指既有躁狂或轻躁狂发作,又有抑郁发作的严重精神障碍。在其病程中,可能从抑郁发作转变为相反的躁狂或轻躁狂状态,反之亦然——被称为“转相”。尽管“转相”是双相障碍病程中的重要特征,但目前对转相过程的神经生物学仍然知之甚少。我们的目的是探索与转相相关的躯体干预的临床证据,特别关注转相过程中可能涉及的生物学基础。

方法 1、搜索方法 使用以下关键词和短语搜索MEDLINE数据库(1983-2023): switch、bipolar disorder、bipolar depression、antidepressant、SSRIs、SNRI、tricyclic antidepressants、treatment emergent affective switch、mania、hypomania、HPA-axis、glucocorticoids和sleep deprivation等。2、研究选择纳入所有经过同行评议的英文文献,包括随机对照研究(RCT)、自然和开放标签研究以及病例报告。

结果 综合证据表明,某些作用机制截然不同的药物和非药物干预措施,例如睡眠剥夺、外源性皮质类固醇和多巴胺能激动剂,可以触发双相障碍患者的转相。抗抑郁药引起转躁的潜力尚不清楚,TCA比其他类别的抗抑郁药具有更高的转躁风险。一些神经生物学因素似乎与自发的和治疗引起的情感转换有关。这些包括儿茶酚胺水平异常、神经营养和神经可塑性因子上调、HPA轴过度活跃和昼夜节律改变。

结论 尽管“转相”现象是双相障碍病程中的一个重要临床特征,并且与其治疗极为相关,但人们对它仍然知之甚少。遗憾的是,针对这一问题进行的研究存在一些方法学局限性,并且通常是回顾性

的,或者是二次分析的结果。例如,在这些研究中使用了不同的治疗相关的不良事件(TEAS)定义,并且可能在临床和生物学发现方面产生截然不同的结果。为了使这方面的系统研究取得成功,所采用的评定量表的标准和阈值需要在各个研究中保持统一。还需要就开始药物治疗后多长时间将躁狂发作视为TEAS达成一致。我们对转相过程理解的另一个主要局限是缺乏适合躁狂行为的动物模型。初步证据表明谷氨酸受体异常与啮齿动物的躁狂样行为有关。

Clinical Application of Electronic Measurement Based Care for Major Depressive Disorder in China

牛娜 朱云程* 汪作为
上海市虹口区精神卫生中心

Objective Electronic measurement based care (EMBC) may help to improve treatment adjustments and outcomes for major depressive disorder (MDD).

Methods This study enrolled 240 Outpatients at reproductive age from 2017 to 2020 in China. They were randomly assigned to standard treatment (n=121) or electronic measurement-based care (n=119). The EMBC group was adequately treated with escitalopram, using measurement-based intervention strategy. The treatment as usual (TAU) group was left to the clinician's discretion to determine the treatment strategy based on the patient's condition. Hamilton Depression Rating Scale (HAMD) was assessed at baseline and follow-up levels within 24 weeks, and patients' depressive symptoms were observed and followed up for 16 weeks.

Results The clinical remission rate was higher in the EMBC group than in the TAU group at the 12th week ($P=0.025$). The HAMD score of the two groups decreased significantly at each time point ($P<0.05$) while it showed difference between the two groups at the 12th week only ($P<0.05$). The clinical remission rate yielded no difference at the end point ($P=0.344$), and the HAMD score did not differ significantly between the

two groups.

Conclusion It is suggested that the EMBC strategy may achieve better outcomes early in the treatment of MDD and significantly improve the quality of life for patients in both the short and long terms

Objective Major depressive disorder (MDD) and bipolar disorder (BD) are psychiatric disorders with overlapping symptoms, leading to high rates of misdiagnosis due to the lack of biomarkers for differentiation. This study aimed to identify metabolic biomarkers in urine samples for diagnosing MDD and BD, as well as to establish unbiased differential diagnostic models.

Methods We utilized a metabolomics approach employing ultra-high performance liquid chromatography-mass spectrometry (UHPLC-MS) to analyze the metabolic profiles of urine samples from individuals with MDD (n = 50), BD (n = 12), and healthy controls (n = 50). The identification of urine metabolites was verified using MS data analysis tools and online metabolite databases.

Results Two diagnostic panels consisting of a combination of metabolites and clinical indicators were

identified—one for MDD and another for BD. The discriminative capacity of these panels was assessed using the area under the receiver operating characteristic (ROC) curve, yielding an area under the curve (AUC) of 0.9084 for MDD and an AUC value of 0.9017 for BD.

Conclusion High-resolution mass spectrometry-based assays show promise in identifying urinary biomarkers for depressive disorders. The combination of urine metabolites and clinical indicators is effective in differentiating healthy controls from individuals with MDD and BD. The metabolic pathway indicating oxidative stress is seen to significantly contribute to depressive disorders

达营片辅助心境稳定剂治疗双相抑郁的临床药效学研究

郑毓真¹ 魏宇梅^{1,2} 李偲媛¹ 史悦¹ 李华芳^{1,2,3}

1.上海交通大学医学院附属精神卫生中心

2.上海交通大学医学院附属精神卫生中心精神科

3.上海市重性精神病重点实验室

目的 目前对于双相抑郁最佳药物的选择存在分歧;双相抑郁治疗的仍是未被满足的临床需求。达营片是一种活血化瘀中药复方,具有较长的临床应用历史沿革,前期的研究探索提示了达营片一定的抗抑郁作用。本研究基于人用经验,在真实环境中首次开展达营片辅助治疗双相抑郁的有效性和安全性的临床研究。

方法 本研究为一项单中心、基于真实世界、前瞻性开放性的非随机临床试验,采用实用性试验设计(PCTs)。研究数据来源于一项综合性课题(NCT05247593)中的一部分,该课题自2022年8月在上海市精神卫生中心陆续招募双相障碍患者。本研究预计招募约120例双相抑郁受试者,样本量按1:1分为2组,分别为(1)达营片联合心境稳定剂组和(2)常规心境稳定剂组。研究医生根据患者实际情况决定合适的分组及治疗。随访12周,计划每4周一次临床访视。主要、次要结局指标为症状量表的减分情况:蒙哥马利-阿斯伯格抑郁量表

(MADRS)、杨氏躁狂量表(YMRS)、临床整体印象量表(CGI)、中医癫证和中医狂证量表。统计分析按照ITT原则,同时采用倾向性评分-重叠加权 and 群体药效学方法,控制多个混杂因素后对比两组的真实疗效差异;量化协变量对达营片辅助治疗结局的影响。倾向性评分方法前对数据进行末次观测值结转;群体药效学方法则无需进行末次结转。

结果 符合方案集是主要的分析集,最终一共88例受试者(占全分析集80.0%)纳入分析。这些患者大多为年轻女性、双相障碍复发、具有中-重度抑郁症状的双相抑郁患者。两组受试者的基线临床评分无显著性差异。控制协变量后,以MADRS减分值主要结局指标,达营片辅助治疗组(n=50)与常规心境稳定剂治疗组(n=38)的疗效差异不具显著性。次要结局显示,达营片辅助治疗组的MADRS缓解率(率差, RD=0.30),YMRS总分以及CGI-S评分的改善均显著优于另一组(P<0.05);有效率和中医量表则无显著差异。达营片治疗未引起患者转躁狂的风险。MADRS减分率药效学模型显示达营片暴露使抑郁症状改善更快(P<0.05);双相障碍复发或越年轻的患者的最终疗效改善越差。达营片辅助治疗最常见的不良事件是腹泻,其余未显示其他不良事件发生率的显著性增加。

结论 达营片辅助治疗双相抑郁具有一定的疗效趋势(缓解率)和总体较好的安全性。未来需更严格地控制混杂因素以及更大的样本量研究确证。

关键词: 达营片, 双相抑郁, 辅助治疗, 倾向性评分, 群体药效学, 真实世界

首发抑郁障碍患者7年后功能结局及其影响因素研究

崔伟 张云淑*

河北省精神卫生中心

目的 了解首发抑郁障碍患者7年后整体功能结局,探讨不良功能结局的影响因素。

方法 1、纳入18-60岁、符合DSM-IV重性抑郁障碍单次发作的诊断标准、HAMD-17≥18分;排除严重躯体疾病、痴呆、精神发育迟滞、癫痫、酒药依赖/滥用者和哺乳/妊娠期妇女。2、收集首发时人口学信息、疾病特征、治疗情况等(为前期工作,于

2013年-2016年首发入组时完成)。通过自然观察随访,随访内容:人口学现况信息、纵向疾病特征、量表评估(第7年末采用TESS评估调查时的药物副反应、MARS评估调查时的药物依从情况、GAF评估调查时的整体功能水平)。

结果 基线入组患者346例,完成7年随访138例,随访完成率39.9%,其中男性47例(34.1%),首发年龄18-59岁,平均 35.89 ± 12.89 岁。第7年末随访时处于缓解期者127例(92.0%),其中GAF>70分为整体功能良好组46例(36.2%)、GAF总分 ≤ 70 分为整体功能不良组81例(63.8%)。两组间首发时职业、受教育水平存在统计学差异($P<0.05$);性别、年龄、BMI、婚姻、阳性精神疾病家族史、有诱因起病、伴自杀未遂、伴精神病性症状、HAMD-17总分、急性期治疗时间、接受维持期治疗者比例,两组间差异无统计学意义($P>0.05$)。整体功能不良组7年间总发作次数、伴精神病性症状发作占比、7年后TESS总分高于功能良好组($P<0.05$);7年间躁狂发作占比、抑郁发作占比、发生转相者比例、住院次数占比、7年后MARS总分 ≥ 6 分者比例,两组间差异无统计学意义($P>0.05$)。以7年后整体功能结局为因变量(赋值:功能良好组=0,功能不良组=1),两组间有统计学差异的变量为自变量(连续变量以实际值纳入),经二分类非条件logistic回归分析,7年间总发作次数($OR=1.504$)、7年后TESS总分($OR=1.068$)为患者7年后整体功能不良结局的独立危险因素,首发时受教育水平($OR=0.417$)为独立保护因素($P<0.05$)。Hosmer-Lemeshow检验结果显示, $\chi^2=6.738$, $df=8$, $P=0.565$,提示该模型拟合度好。

结论 复发次数、药物副反应增加了首发抑郁障碍患者7年后整体功能不良结局的发生风险,首发时受教育水平高的患者7年后整体功能结局相对良好。

3.武昌医院

目的 Although mounting evidence has found significant structural and functional abnormalities in bipolar disorder (BD), few studies have examined the neural mechanism underlying the remission of mania in BD

方法 This study included 38 BD patients with mania (BipM), 37 remitted BD patients (rBD) and 38 demographically-matched healthy controls (HCs). Cortical thickness was estimated from T1-weighted MRI data to examine the structural basis of manic remission in BD. Seed-based functional connectivity (FC) was computed from resting-state functional MRI (fMRI) data to identify the functional correlates of manic remission in BD

结果 Compared with HCs, patients with BD exhibited decreased cortical thickness and increased FC in left precuneus.

结论 Our findings suggest that alterations in the structural and functional integrity of the left precuneus, and the brain region plays a role in the remission of mania in patients with BipM

关键词: Bipolar disorder; Cortical thickness; Gray matter nuclei; Functional connectivity; Manic remission

Structural and Functional Brain Substrates of Manic Remission in Bipolar Disorder

真实世界中伏硫西汀在儿童青少年抑郁症患者中的临床应用分析

罗显梅 段明君* 张雅君 余姝
成都市第四人民医院

目的 调查真实世界中伏硫西汀在儿童青少年抑郁症中的使用情况,了解其临床疗效、耐受性和安全性,为临床合理用药提供参考。

方法 本研究收集了2018年5月-2023年5月期间成都市第四人民医院门诊及住院患者中使用了伏硫西汀的儿童青少年抑郁症患者数据,对患者年龄、性别、用药剂量、服药时间、药物不良反应、疾病缓解情况进行回顾性分析。

结果 共有253名未满18岁的儿童青少年抑郁症患者纳入本项研究,其中男性96名,女性157名,123(43.62%)名患者为首次使用抗抑郁药物,185(73.12%)名患者服药时间小于3个月,18(7.11%)名患者服药时间超过半年,26(10.28%)名患者服药时间超过1年。药物剂量中10mg/每日为最常使用剂量(66.40%),其次是5mg/每日(25.69%)。有54(21.34%)名患者使用伏硫西汀期间为单一用药;在与伏硫西汀的联合用药中,阿立哌唑(21.74%)为最常联合药物,其次为劳拉西泮(21.34%)。27(10.67%)名患者报告了药物不良反应,包括恶心、呕吐、头晕、心悸、腹泻、嗜睡、全身发痒;20(7.91%)名患者报告因药物不良反应无法耐受而停药,男性和女性患者在报告药物不良反应方面没有差异($X^2=0.56, P=0.454$)。96(37.94%)名患者报告了症状缓解,男性和女性在报告症状缓解方面存在显著差异($X^2=3.934, P=0.047$)。

结论 临床中存在儿童青少年抑郁症患者超说明书使用伏硫西汀的情况。虽然服用伏硫西汀后整体药物耐受性较好,但服药后报告症状缓解的比例并不高,而性别差异对报告症状缓解方面可能存在一定的影响。

关键词: 伏硫西汀,抑郁症,儿童青少年

Prevalence and Clinical Correlates of Impaired Fasting Blood Glucose in Children and Adolescents with Depressive Disorder and Relationship with Triglyceride and High-density Lipoprotein Ratio

Zhiwei Liu*
Fuyang Third People's Hospital

Objective Depressive disorder is a significant public health problem worldwide, which adversely affects children and adolescents' health. Impaired fasting blood glucose (IFG) is more common in depressive disorder, which becomes a clinical problem that needs to be focused on. The study purposed to determine the prevalence and related factors of IFG in Chinese children and adolescents with depressive disorder and the relationship between triglyceride and high-density lipoprotein cholesterol (TG/HDL-C) ratio and IFG

Methods 756 subjects were collected in this study from January 2020 to December 2021 from the Third People's Hospital of Fuyang. We detected fasting blood glucose (FBG) and lipid levels and assessed the suicidal behaviors and depressive symptoms severity of each participant. The sociodemographic and included study variables were collected and analyzed

Results The prevalence of IFG was 6.5% (49/756). IFG was positively correlated with FBG, BMI, TG, TG/HDL-C, and was negatively correlated with gender and the type of antidepressant drug taken. Binary logistic analysis showed that male (OR = 2.57, 95% CI: 1.43–4.63, $P = 0.002$) and higher levels of TG (OR = 1.63, 95% CI: 1.11–2.38, $P = 0.013$) were independently associated with IFG in children and adolescents with depressive disorder

Conclusion The incidence of IFG in children and adolescents with depressive disorder was high and was positively related to the TG/HDL-C ratio. Patients with depressive disorders of different genders should appropriately consider the effect on blood glucose levels when making medication choices

关键词: children and adolescents; depressive disorder; impaired fasting blood glucose; prevalence; triglyceride and high-density lipoprotein ratio

电休克治疗抑郁症自杀的神经生理机制研究： 来自脑电微状态的证据

操军² 陈小容¹ 况利^{1,2}

1.重庆医科大学附属大学城医院

2.重庆医科大学附属第一医院

目的 本研究将探讨电休克治疗对伴有自杀未遂行为的抑郁症患者脑电微状态的影响及其作用，探寻电休克治疗抑郁症自杀的脑电生理学标志，从而探索电休克治疗抑郁症患者自杀的神经电生理机制，以期未来对抑郁症的自杀风险进行早期的预警和干预。

方法 本研究纳入了 11 例不伴有自杀行为的抑郁症患者，19 例伴有自杀行为的抑郁症患者，比较了基线时两组患者脑电微状态的差异，其中 11 例不伴有自杀行为的抑郁症患者接受了为期 2 周的抗抑郁药物治疗，19 例伴有自杀行为的抑郁症患者中有 15 例患者完成了抗抑郁药物联合 8 次电休克治疗，两组治疗后再次采集静息态脑电数据，比较治疗前后脑电微状态的变化。

结果 基线时，自杀组与抑郁症组在微状态 A 的平均持续时间 ($P=0.027$)、微状态 B 的平均持续时间 ($P=0.027$) 和微状态 C 的出现频次 ($P=0.013$) 上存在差异，其中自杀组较抑郁症组在微状态 A 和微状态 B 的平均持续时间上升高；自杀组的微状态 C 的出现频次较抑郁症组降低。抑郁症组患者药物治疗前后的脑电微状态变化无统计学差异，自杀组的患者电休克治疗前后在微状态 A 的平均持续时间 ($P=0.024$) 上存在差异，治疗后微状态 A 的平均持续时间较治疗前下降。

结论 本研究结果显示电休克治疗对自杀的影响主要影响了脑电微状态 A 的平均持续时间，脑电微状态 A 的平均持续时间是电休克治疗抑郁症自杀的电生理生物标志物。

关键词：电休克；抑郁症；自杀；脑电微状态

Activity in Young Adults with Major Depressive Disorder

Jun Cao Xiaoliu Zhang Li Kuang*

The First Affiliated Hospital of Chongqing Medical University, Chongqing

Objective Major depressive disorder (MDD) is a disabling and severe psychiatric disorder with high risk of suicide, and adulthood is one of the most probable period for the onset. The neural basis underlying the young adults with MDD remains underexplored. The primary goal of the present study was to comprehensively clarify the neural basis of young depressed patients with suicide attempt through the combination of structural and functional analyses

Methods In this study, we have investigated the cortical and subcortical alterations of neuroanatomical structures and functional activation in twenty-three young depressive patients with suicide attempt versus forty-five healthy controls

Results Significant disruptions of regional gray matter volume at left middle frontal extending to superior frontal involved with cognitive processing were found correlated with anxiety scores in MDD patients. Increased cortical thickness at right orbital frontal responsible for decision making was correlated with severity of suicide. Further, increased functional activation at left auditory association cortex was a hallmark of hallucinations in MDD, which was directly associated with depression severity. Moreover, decreased spontaneous brain activity at right inferior frontal was also found, reflecting lower inhibition control in MDD patients

Conclusion The abnormal structural and functional findings at fronto-cortical areas implied the dysfunctional cognitive control and emotion regulation in MDD. The alterations correlated with clinical scores might indicate the reliable neural markers for MDD

关键词：Middle frontal gyrus Superior frontal gyrus Orbital frontal cortices Auditory association cortex Inferior frontal Amplitude of low frequency fluctuation

Severity Related Alterations of Gray Matter Volume, Cortical Thickness and Functional

青少年心理健康中的生活事件、焦虑和抑郁：一项中介效应分析

薛振朋 卢建平*
深圳市康宁医院

目的 青少年期是个体心理健康发展的关键阶段，其心理健康状况对未来的成长和生活质量具有深远的影响。本研究旨在深入探究青少年男女性别差异对心理健康的影响，并聚焦于生活事件、焦虑和抑郁之间的关联。首先，青少年女性是否在生活事件、焦虑和抑郁方面表现出更高的水平。其次，生活事件是否直接影响着青少年焦虑和抑郁水平。焦虑是否在生活事件与抑郁之间扮演着中介的角色。

方法 本研究纳入了某市精神科医院在 2020 年至 2022 年期间收治的 0-18 岁的住院患者共计 154 名，其中包括 23 名男性（14.9%）和 131 名女性（85.1%）。患者的平均年龄为 13.54 ± 1.54 岁。使用青少年生活事件（ASLEC）、焦虑量表（SDS）和抑郁量表（CDI）对患者进行评估。通过收集大量的青少年数据，运用统计分析和中介效应检验等方法。

结果 青少年男性在生活事件（ 46.17 ± 22.32 vs. 60.25 ± 21.17 ）的得分均显著低于女性（ $t = -2.81$, $p < 0.05$ ）。青少年男性在焦虑（ 22.81 ± 13.1 vs. 33.18 ± 9.23 ）的得分均显著低于女性（ $t = -4.47$, $p < 0.001$ ）。青少年生活事件（ASLEC）与青少年焦虑量表（SDS）之间存在中度正相关关系（ $r = 0.632$, $p < 0.01$ ）。青少年生活事件对中介变量焦虑具有显著预测作用（ $\beta = 14.14$, $p < 0.001$ ）；加入中介变量后，自变量青少年生活事件对因变量抑郁具有显著预测作用（ $\beta = 0.19$, $p < 0.05$ ），中介变量青少年焦虑对因变量抑郁具有显著预测作用（ $\beta = 1.15$, $p < 0.001$ ）。自变量青少年生活事件对因变量抑郁的直接效应为 0.19，占总效应的 35.19%；自变量通过中介变量青少年焦虑对因变量抑郁的间接效应为 0.35，占总效应的 64.81%。

结论 在青少年男女性别之间存在着明显的心理健康差异。具体来说，青少年男性在生活事件、焦虑和抑郁方面的得分均显著低于女性，这一发现与过去的研究结果一致。相关性分析结果显示，青少年生活事件、焦虑和抑郁之间存在相关关系。青少年生活事件对焦虑具有显著预测作用，并且焦虑在生活事件与抑郁之间起到了部分中介作用。这一结

果揭示了焦虑在青少年心理健康问题中的重要性，同时也强调了生活事件对青少年焦虑和抑郁的影响路径。

低频 rTMS 刺激左侧额叶皮质联合氟西汀治疗首发抑郁障碍伴睡眠障碍的对照研究

蒋红梅*
重庆市精神卫生中心

目的 探讨低频重复经颅磁刺激(rTMS)联合氟西汀片治疗儿童青少年首发抑郁障碍(MDD)伴睡眠障碍的效果及安全性。

方法 在我院 2023 年儿童青少年门诊中，选取了符合《国际疾病分类(第 10 版)》(ICD-10)抑郁障碍诊断标准并伴睡眠障碍 8-16 岁患儿 80 例(无重复经颅磁刺激禁忌症)，以随机数字表法分为研究组($n=40$)及对照组($n=40$)。研究组采用低频 rTMS(真刺激线圈刺激左侧额叶背外侧皮质)联合氟西汀治疗，对照组(采用假刺激线圈刺激左侧额叶背外侧皮质)联合氟西汀治疗。观察 4 周，分别在治疗前及治疗后 1、2、4 周采用儿童抑郁障碍自评量表(DSRSC)评定抑郁症状及疗效，在治疗前及治疗后 4 周采用睡眠状况自评量表(SRSS)评定睡眠情况及副反应量表(TESS)评定不良反应。

结果 结果(1)研究组治疗后抑郁障碍睡眠状态的改善率高于对照组(83.3%/46.6%)($p < 0.05$)。(2)研究组与对照组第 1、2、4 周采用儿童抑郁障碍自评量表(DSRSC)采用重复测量方差分析:两组患者不同时间点的 DSRSC 评分有差异($P < 0.05$)，两组 DSRSC 评分有差异，研究组比对照组低($P < 0.05$)，两组患者变化趋势有差异($P < 0.05$)。(3)两组不良反应较少，较轻微，两组 TESS 评分比较无统计学意义。

结论 结论低频 rTMS 刺激左侧额叶皮质联合氟西汀明显改善抑郁症状及不良睡眠状况，治疗 MDD 疗效显著且相对安全，值得临床推广应用。

关键词：低频 rTMS 刺激左侧额叶皮质，氟西汀，首发抑郁障碍伴睡眠障碍

青少年期抑郁发作患者的个性特征在 1 年期随访后的变化

石顺治 项帅* 黄召江
深圳市康宁医院

目的 评估个性特征对青少年抑郁患者的影响及 1 年期后的变化

方法 参与者来自深圳市康宁医院儿少精神科的门诊患者 200 名, 年龄在 12 至 16 岁之间。在首次就诊时完成人格特质与抑郁症状的量表评估, 并经过儿童精神科诊断明确为抑郁发作的患儿, 并在 1 年后再次完成人格特质和抑郁症状的量表评估。使用描述性统计方法汇总参与者的社会学特征、基线人格特质和抑郁症状评分。通过配对 t 检验评估随访前后抑郁症状和人格特质评分的变化。使用皮尔逊相关分析探讨抑郁症状变化与人格特质变化之间的相关性, 并控制潜在的混杂因素。最后通过多元回归分析评估基线人格特质对 1 年后抑郁症状变化的预测能力。

结果 在 1 年随访期间, 参与者的抑郁症状评分显著降低 ($p < 0.05$), 而某些人格特质评分 (如情绪稳定性和外向性) 有所改善 ($p < 0.05$)。皮尔逊相关分析结果表明, 抑郁症状的减轻与情绪稳定性和外向性评分的变化呈显著正相关 ($r > 0.3, p < 0.05$)。多元回归分析结果显示, 基线时的高情绪稳定性和外向性评分显著预测了 1 年后抑郁症状的更大幅度减轻 ($\beta > 0.3, p < 0.05$), 即使在控制了年龄、性别和家庭背景等混杂因素后, 这些关系仍然显著。

结论 通过本研究, 我们发现青少年抑郁发作患者在 1 年随访期间的人格特质和抑郁症状均有显著变化。特别是, 基线时的情绪稳定性和外向性人格特质对抑郁症状的改善具有显著的预测作用。这些发现为临床干预提供了重要依据, 强调了在治疗青少年抑郁症时考虑人格特质的重要性。

休学青少年童年创伤与抑郁情绪的关系: 父子依恋的中介作用

屈远¹ 吴岫穗² 郑利姣²

1. 重庆医科大学附属第一医院
2. 重庆市九龙坡区精神卫生中心

目的 探讨父子依恋对休学青少年童年创伤与抑郁情绪之间的中介效应, 为青少年抑郁情绪的干预提供参考。

方法 纳入 2023 年 5 月-2024 年 5 月在重庆医科大学附属第一医院、重庆市九龙坡区精神卫生中心精神科门诊及住院部就诊, 符合《国际疾病分类 (第 10 版)》(ICD-10) 抑郁障碍诊断标准且已经休学的青少年 122 例, 非休学抑郁组 234 例。采用童年创伤问卷 (CTQ)、父母与同伴依恋量表 (IPPA) 中文简版和贝克抑郁量表第 2 版中文版 (BDI-II-C) 进行评定。使用 Bootstrap 方法进行中介效应检验。

结果 休学青少年抑郁障碍患者占总的就诊抑郁青少年 38.7%, 其中女性明显高于男性, 占 83.61% (102 人), 14 岁年龄比例最高, 占 27.45% (33 人)。休学组与非休学组抑郁障碍青少年比较, 仅父子依恋的差异具有统计学意义 ($t=2.062, P < 0.05$); 休学青少年抑郁障碍患者 BDI-II 评分与 CTQ 评分呈正相关 ($r=0.350, P < 0.01$), 与 IPPA 的父子依恋、母子依恋、父子依恋评分均呈负相关 ($r_1=-0.444, r_2=-0.393, r_3=-0.342, P < 0.01$); 父子依恋在童年创伤与抑郁评分之间的部分中介效应显著, 效应值 0.114, 95% CI: 0.034~0.199。

结论 青少年抑郁障碍患者中休学比例较高, 且主要集中在青春早期的女性; 休学青少年的抑郁情绪可能与童年创伤和较差的父子依恋有关, 童年创伤既可直接影响休学青少年的抑郁情绪, 亦可通过父子依恋间接改善抑郁情绪。

关键词: 休学; 童年创伤; 抑郁障碍; 父子依恋; 青少年

Associations between Internet Addiction and Suicidal Ideation in Depressed Adolescents: The Mediating Effect of Insomnia As Well As Sex Differences

Lewei Liu Yinghan Tian Haojie Fan Xin Zhao Mingru
Hao Lei Xia Huanzhong Liu*
Chaohu Hospital of Anhui Medical University

Objective Insomnia may mediate the association between internet addiction (IA) and suicidal ideation (SI). However, such association has not been thoroughly investigated in adolescents with major depressive disorder (MDD). Thus, our study aimed to explore whether insomnia significantly affects the association between IA and SI in adolescents with MDD, as well as any sex differences

Methods From January 2021 to September 2023, this study included 502 adolescents with MDD and 123 healthy controls (HCs). The Clinical Global Impression-Severity (CGI-S), the Internet Addiction Test (IAT), the Insomnia Severity Index Scale (ISI) and the Positive and Negative Suicidal Ideation Scale (PANSI) were used to assess subjects' severity of depression, IA, insomnia and SI. And we employed the PROCESS macro program to examine the mediating role of insomnia between IA and SI

Results Compared to HCs, adolescents with MDD had significantly higher levels of SI and their prevalence of IA and insomnia were 50.00% and 35.66%. In patients, PANSI scores correlated negatively with age and age of onset, and positively with disease duration as well as the scores of the CGI-S, IAT, and ISI (all $p < 0.01$). Moreover, above-mentioned correlations were more significant in females. Mediation analyses showed that insomnia mediated the effect of IA on SI, and the total, direct, and indirect effects were 0.197 (95% CI: 0.132 - 0.262), 0.157 (95% CI: 0.096 - 0.218) and 0.040 (95% CI: 0.014 - 0.068), respectively

Conclusion Depressed adolescents have higher suicide risk, and SI is significantly associated with IA and insomnia, especially in females. Moreover, insomnia may mediate the association between IA and SI. Therefore, clinical interventions should be strengthened for IA and insomnia in adolescents with MDD to reduce suicide risk

关键词: internet addiction, insomnia, suicidal ideation, adolescents, major depressive disorder

上海市青少年心理健康现状及家庭影响因素

分析

徐韦云 施征宇*
虹口区精神卫生中心

目的 了解目前上海市某区青少年的心理健康状况及家庭影响因素, 为政府部门及教育部门开展青少年的心理健康教育服务提供可能的意见或建议。

方法 研究纳入某区两所高级中学全体高一学生, 使用问卷星的形式对研究对象进行一般人口学自编问卷调查, 采用中国中学生心理健康量表 (Mental Health Inventory of Middle School Students, MMHI-60) 评估他们的心理健康状态。

结果 ①680 名高一学生 MMHI-60 总分异常检出率为 30.3%, 总均分低于 2019 年常模水平 ($P < 0.05$); ②多元回归分析显示母亲受教育程度越高 ($\beta = -0.162$, 95%CI: (-0.257, -0.067), $P = 0.001$)、家庭经济状况越好 ($\beta = -0.194$, 95%CI: (-0.354, -0.034), $P = 0.017$)、亲子间沟通频率高 ($\beta = -0.162$, 95%CI: (-0.257, -0.067), $P = 0.001$) 是青少年心理健康的保护因素。

结论 青少年群体心理健康状况异常状况与 2019 年常模水平相比有所下降, 母亲高教育程度、良好的家庭经济条件、较高频率的亲子沟通次数可能是青少年心理健康问题的保护因素。

Effects of Parental Stress on Gut Microbiome and Introverted Sexual Behavior in Children with Autism

Ning Ding Quansheng Xing* Changhong Zhou Guoju Li Hua Zou Yongjuan Ji Yuxuan Chen Pingping Wang Ying Xia
Qingdao Women and Children's Hospital, Qingdao University, Qingdao City, Shandong Province, China

Objective Emotional and behavioral problems with autism spectrum disorders begin in early childhood and worsen with age. We sought to explore whether introverted behavior in children with ASD is influenced by microbiota, viral infection and metabolism, and its

association with parenting stress.

Methods The study included 78 children with ASD, and 70 children with normal development were recruited during the same period. The children's internal and external behavior, abnormal symptoms of gastrointestinal tract, parenting stress and sleep problems were investigated by questionnaire. Intestinal microbiome and metabolomics were detected in 42 ASD children with gastrointestinal symptoms and 40 normal children without gastrointestinal symptoms.

Results There were more internal and external behavior problems in ASD group ($p < 0.01$). The detection rate of gastrointestinal symptoms was higher than that in TD group, and the detection rate of sleep problems and abnormal EBs was higher than that in TD group. The results of correlation analysis showed that the children in ASD group showed a positive correlation with *Prevotella* and *Mycobacteria* ($R^2=0.647$, $p < 0.01$). Parenting stress was positively associated with social response and autism severity.

Conclusion The introverted behavior and parenting stress of children with ASD may affect the changes of intestinal microbiota

关键词: Keywords: autism spectrum disorder; enteric microorganism; internalizing behavior; externalizing behavior; parental stress

COVID-19 大流行期间首次发病、未服药的抑郁障碍儿童和青少年的全身免疫炎症指数与自杀未遂的相关性分析

崔舒* 刘云 姚高峰
阜阳市第三人民医院

目的 本研究旨在调查 COVID-19 大流行期间, 首次发病、未服药的儿童和青少年抑郁障碍 (Major Depressive Disorder, MDD) 患者的全身免疫炎症指数 (systemic immune-inflammatory index, SII) 与自杀未遂 (suicide attempt, SA) 之间的关系。

方法 对 2020 年至 2022 年在阜阳市第三人民医院住院治疗的 263 名首次发病、未服药的儿童和青少年 MDD 患者进行回顾性研究。根据既往 SA 的

存在情况将患者分为有 SA 病史组和无 SA 病史组, 比较两组患者在 SII 和临床特征方面的差异, 并使用接收者操作特征曲线 (ROC) 确定了 SII 的最佳临界值和曲线下面积, 然后使用二元逻辑回归分析 SA 的独立危险因素。

结果 与无 SA 病史的患者相比, 有 SA 病史的患者汉密尔顿抑郁量表 (Hamilton Depression Rating Scale, HDRS) 评分较高 ($Z=-2.369$, $P=0.018$), 中性粒细胞计数较高 ($Z=-2.870$, $P=0.004$), 血小板计数较高 ($Z=-2.155$, $P=0.031$), SII 水平较高 ($Z=-3.170$, $P=0.002$)。ROC 曲线确定的最佳临界 SII 为 548.15 (灵敏度=63.2%, 特异度=83.1%), 曲线下面积为 0.661。在对性别、年龄、体重指数、病程和 HDRS 评分进行调整后, 高 SII 患者 SA 风险是低 SII 患者的 8.296 倍 (OR=8.296, 95% CI: 3.803-18.095, $P<0.001$), 高 SII 患者近期 SA (SA 发生在 7 天之内) 风险是低 SII 患者的 13.922 倍 (OR=13.922, 95% CI: 5.587-34.693, $P<0.001$)。然而, 高 SII 并不是远期 SA (SA 发生在 7 天之前) 的危险因素 (OR=0.547, 95% CI: 0.062-4.842, $P=0.587$)。

结论 SII 这种成本低廉的指标可能有助于识别青少年 MDD 患者的自杀风险, 通过检测 SII 来识别具有 SA 风险较高的亚组患者, 可能有助于制定更加有效和个性化的自杀预防和抑郁症治疗策略。

Depressive and Mobile Phone Addiction Symptoms in Chinese Adolescents with Major Depressive Disorder: The Mediating Effect of Alexithymia

Yinghan Tian Lei Xia Huanzhong Liu*
Department of Psychiatry, Chaohu Hospital of Anhui Medical University, Hefei, Anhui Province, China

Objective Mobile phone addiction (MPA) are associated with depression, yet the underlying mechanisms are not clear. This study aimed to explore the prevalence and clinical correlates of MPA symptoms,

the associations between depressive and MPA symptoms, and whether the associations are mediated by alexithymia among adolescents with major depressive disorder (MDD)

Methods This cross-sectional study was conducted from January to July 2021 in seven hospitals across the northern, central, and southern regions of Anhui Province, China. MPA symptoms, depressive symptoms, and alexithymia were assessed using the Mobile Phone Addiction Scale (MPAS), the Center for Epidemiologic Studies of Depression Symptom Scale (CES-D) and the 20-item Toronto Affective Disorders Scale (TAS-20), respectively

Results A total of 286 adolescents with MDD were included, and the prevalence of MPA symptoms was 26.2%. Binary logistic regression analyses revealed that the adolescents with poorer academic performance, a higher total score of TAS-20, and a higher externally oriented thinking (EOT) subscale score were more likely to have MPA symptoms (all $P < 0.05$). Multivariate linear regression analyses showed that depressive symptoms were positively correlated with the severity of MPA symptoms in adolescents with MDD (all $P < 0.05$). Alexithymia and EOT partially mediated the associations between depressive and MPA symptoms

Conclusion MPA symptoms are common in adolescents with MDD, and the effect of depressive symptoms on the the severity of MPA symptoms was mediated partially through alexithymia. Therefore, effective identification and intervention for alexithymia may be important strategies to help clinical staff reduce the risk of MPA among adolescents with MDD

关键词: Major depressive disorder, Depressive symptoms, Mobile phone addiction, Alexithymia, Adolescents

Association between Childhood Trauma and Affective Lability Among Adolescents: A Moderated Mediation Model

Shuxian Wu Xuerong Luo*

The Second Xiangya Hospital of Central South University

Objective Affective lability is an important feature of psychopathology. However, there is limited relevant research involving adolescents. To fill this research gap, the present study assessed the relationship between childhood trauma and affective lability among adolescents using a moderated mediation model

Methods

A total of 3738 students were recruited from four high schools in Shenzhen, China, between September and December 2019. The participants completed self-reported questionnaires measuring childhood trauma, affective lability, body image dissatisfaction, and the experience of being bullied. Linear regression and moderated mediation analyses were used in this study.

Results Linear regression analysis showed that emotional abuse and body image dissatisfaction positively predicted affective lability in boys and girls (all $p < 0.001$). Body image dissatisfaction mediated the relationship between emotional abuse and affective lability. In the moderated mediation model, being bullied moderated the direct path from emotional abuse to affective lability ($p = 0.0236$, $p = 0.0188$), and gender did not have a significant moderating effect on any direct or indirect path (all $p > 0.05$)

Conclusion The findings support that childhood trauma has an impact on affective lability in adolescents. Specifically, body image dissatisfaction and being bullied affect the relationship between emotional abuse and affective lability

关键词: Childhood trauma; Affective lability; Body image; Being bullied; Moderated mediation model

Association Between Adolescents Depression and Anhedonia: A Mediation Model of Metacognition

Meng Qi Jingxu Chen*

Beijing Huilongguan Hospital

Objective To investigate the relationship between depression severity and anhedonia in adolescents, as well as the mediating effect of metacognition between the two

Methods The study participants were selected from adolescents aged 12-18 years old. A total of 120 adolescents meeting the DSM-5 diagnostic criteria for depressive disorders participated in this study. This participants have not undergone physical therapy such as transcranial magnetic stimulation or convulsive electroconvulsive therapy. General information surveys, the Dimensional Anhedonia Rating Scale (DARS), the Metacognitions Questionnaire-30 (MCQ-30), the Hamilton Rating Scale for Depression-17 (HAMD-17) and the Generalized Anxiety Disorder-7 (GAD-7) were used to assess their depression severity, anxiety severity, anhedonia, and metacognition

Results For the MCQ-30 scores, participants with anxiety had higher levels of metacognition than those without ($P < 0.01$). Regarding anhedonia, there was a significant difference in the presence of anxiety between those with and without anhedonia ($P < 0.01$). The scores of HAMD-17 and DARS were negatively correlated ($r = -0.501, P < 0.01$), while positively correlated with the scores of MCQ-30 ($r = 0.415, P < 0.01$). Both the MCQ-30 indirect effect and the direct effect in depression severity and anhedonia in adolescents are significant, with respective proportions of 29.22% and 70.70%

Conclusion Metacognition mediated between depression severity and anhedonia in adolescents with depression

关键词：adolescent, depression, anhedonia, metacognition

基于心智化理论的团体沙盘游戏治疗干预儿童行为问题的过程研究

赵奇慧¹ 陈侃²

1. 复旦大学附属儿科医院
2. 复旦大学

目的 探索在基于心智化理论的团体沙盘游戏治疗过程中，儿童之间的互动行为及儿童与治疗师互动行为的变化。探索这些变化之间的相互关系，寻找可能存在的促使儿童行为改变的内在机制。

方法 将六名存在行为问题的儿童分为两组，每组三人，进行九次基于心智化理论的团体沙盘游戏治疗，对治疗过程进行录像。依据儿童在治疗过程中的互动行为制作编码手册，主要包括儿童间的干涉、攻击及合作行为以及儿童对治疗师表达正向情绪。依据扎根理论对儿童在沙盘游戏治疗中的互动行为进行编码并由两名研究者进行背对背分析，确保编码的有效性。将治疗过程分为前、中、后三个阶段，比较各阶段儿童之间及儿童与治疗师互动行为的变化。

结果 非参数检验 F 检验结果显示，在治疗过程中，儿童之间的干涉行为显著减少 ($Z = 16.36, p < 0.001$)，合作行为显著增加 ($Z = 7.61, p = 0.022$)。儿童对治疗师表达积极情绪显著增加 ($Z = 10.40, p = 0.006$)。但儿童之间的攻击行为变化不显著 ($Z = 3.03, p = 0.219$)。斯皮尔曼相关分析结果表明，儿童对治疗师表达积极情绪与儿童间的合作行为正相关 ($r = 0.402, p = 0.003$)，与儿童间的干涉行为负相关 ($r = -0.318, p = 0.023$)。评分者一致性结果显示一致性大于 0.70。

结论 基于心智化理论的团体沙盘游戏治疗可以减少行为问题儿童在游戏中的干涉行为，增加合作行为。行为的改变可能与良好的治疗关系有关。在治疗过程中，治疗师提供了一个安全的空间，借由象征性的表达及治疗师对儿童心理状态的反馈，儿童的心智化能力得以发展，游戏互动中的干涉行为减少，合作行为增加。但儿童在游戏中的攻击行为并无显著变化，九次的干预不足以将改善泛化到日常生活，未来需要更长时间及更大样本的研究，以探索基于心智化理论的团体沙盘游戏治疗对儿童心智化的发展及问题行为的疗效及促进改变的内在机制。

关键词：心智化；团体沙盘游戏治疗；儿童行为问题

青少年 NSSI 患者父母人格特征及认知调节情绪策略分析

张桂梅 向婷 蔡艺娴 潘集阳*
暨南大学附属第一医院(广州华侨医院)

目的 分析青少年NSSI患者父母人格特征、认知调节情绪策略对青少年非自杀性自伤行为的影响。

方法 选取到医院就诊的青少年NSSI患者,患者父母为观察组;在学校,社区及医院选取健康青少年,其父母为对照组,采用中国大五人格问卷简版式,认知情绪调节问卷中文版(CERQ-C)对观察组、对照组进行问卷调查。

结果 对照组在开放性(40.90±6.19)、严谨性人格得分(48.18±6.12)高于观察组(36.88±5.02)、(44.12±6.58)($P<0.05$)。对照组面对负性事件时在接受(15.28±2.50)、积极再次评价(16.9±2.64)、再次关注计划(16.33±2.46)、积极再次关注(13.58±2.81)、合理分析(10.38±2.81)的策略得分高于观察组($P<0.05$)。观察组的神经质与合理分析(+0.305)、灾难性(+0.370)正相关;外向性与接受(-0.291),责备他人(-0.323)负相关;开放性与接受(-0.399)负相关,而与积极再次关注(+0.303)、积极再次评价(+0.272)正相关;宜人性与责备他人(-0.363)负相关;严谨性与接受(-0.255)呈负相关($P<0.05$, $P<0.01$)。根据多元logistics回归分析发现,病例组的NSSI行为与观察组的经济水平(OR=0.485),受教育年限(OR=0.600)、接受(OR=0.590)、积极再次评价(OR=0.454)、合理分析(OR=0.810),开放性(OR=0.712)、严谨性(OR=0.756)负相关,与自我责备(OR=1.545)、再次关注计划(OR=2.089)正相关($P<0.05$)。

结论 青少年NSSI患者父母的人格特征、面对负性事件时的情绪调节策略影响青少年NSSI行为的发生。

EEG Microstates in Adolescent Depression: Effects of Depression Severity and Overall Symptoms

Xi Wang Fan* Yiwen Luo

Clinical Research Center for Mental Disorders, Shanghai Pudong New Area Mental Health Center, School of Medicine, Tongji University

Objective This study aims to investigate the relationship between EEG microstate activity and symptom severity in adolescents diagnosed with Major Depressive Disorder (MDD)

Methods The study involved 68 adolescents with MDD. The severity of symptoms was assessed using the Self-Rating Depression Scale (SDS), Self-Rating Anxiety Scale (SAS), and Symptom Checklist-90 (SCL-90). A 5-minute resting-state EEG recording with eyes closed was conducted using a 64-channel EEG system and analyzed with microstate analysis. K-means clustering was performed to characterize microstates, and the duration, occurrence, coverage, and transition probability of each microstate were calculated. Microstate properties were compared across groups with varying degrees of symptom severity, and the relationship between symptom severity and microstate properties was analyzed

Results The study characterized four microstates (labeled A, B, C, and D). A decreased occurrence and duration of microstate C were observed in patients with severe MDD (SMDD) compared to those with mild to moderate MDD (MMDD), along with an increased duration of microstate D in SMDD patients. Significant correlations were identified between symptom severity (as measured by SDS and SCL-90 scores) and microstate metrics (the occurrence and coverage of microstate C and the transition probability between microstates A and D)

Conclusion These findings enhance the overall understanding of the pathophysiological mechanisms underlying MDD and elucidate how symptom factors may contribute to EEG microstate abnormalities among MDD patients

关键词: EEG Microstates; Adolescents; Major Depressive Disorder; Symptom Severity; EEG Analysis

儿童青少年非自杀性自伤行为的影响因素

陈燕微 马筠*
武汉市精神卫生中心

目的 非自杀性自伤发病率高,被认为是严重影响青少年心理健康与安全的重大公共卫生问题。识别早期风险因素对于筛查和预防非自杀性自伤行为非常重要。本研究旨在探究儿童青少年非自杀性自伤行为的危险因素,助力于为临床早期干预和治疗。

方法 纳入 210 例伴非自杀性自伤行为的心境障碍患者(NSSI组)、290 例不伴非自杀性自伤行为的心境障碍患者(非NSSI组)。采用自动血液分析仪检测血常规并计算中性粒细胞-淋巴细胞比值(Neutrophil-Lymphocyte Ratio, NLR)、单核细胞-淋巴细胞比值(Monocyte-Lymphocyte Ratio, MLR)、血小板-淋巴细胞比值(Platelet-Lymphocyte Ratio, PLR)和系统性免疫炎症指数(Systemic Immuno-inflammation Index, SII),分析自伤组和非自伤组之间炎症指标的差异性。采用使用渥太华自我伤害调查表、17 项汉密尔顿抑郁量表、广泛性焦虑量表、儿童期虐待问卷、青少年生活事件量表、领悟社会支持量表、匹兹堡睡眠质量指数量表对研究对象的自伤行为以及其他事件进行评估。对自伤情况进行描述性分析,使用独立样本 T 检验比较两组间的一般资料、炎症指标和量表评分,同时进行多因素 Logistic 回归分析,分析自伤行为的危险因素。

结果 自伤组入组患者的年龄范围为 12~18 (13.7±1.4)岁,而自伤行为开始的年龄为 8~17 岁;自伤组患者血液中的中性粒细胞计数与淋巴细胞计数的比值、单核细胞计数与淋巴细胞计数的比值较非自伤组升高,差异有统计学意义($P<0.05$)。焦虑、抑郁、童年虐待、失眠是儿童青少年非自杀性自伤行为的危险因素($OR=2.440、3.102、2.704、2.075, P<0.05$)。

结论 儿童青少年中非自杀性自伤行为发生率高,而且自伤行为的发生越发低龄化;全血细胞衍生的指标在自伤患者中值得被关注;抑郁、焦虑、童年虐待是自伤的危险因素。临床可以根据这些特点对儿童青少年自伤行为进行针对性的预防和治疗。

Pharmacological and Nonpharmacological Interventions for Adolescent Irritability: A Systematic Review and Meta-analysis

Yuhan Zhang*
Zhejiang Chinese Med Univ

Methods 2.1 Search strategy

This systematic review followed the Preferred Reporting Items for Systematic Reviews and Meta-Analyses (PRISMA) guidelines for preferred reporting items (Moher et al., 2015). This protocol was registered with the International Prospective Register of Systematic Reviews under the pre-registration protocol ID CRD42023433662 (PROSPERO, 2023). We conducted a search of four databases: PubMed, Embase, the Cochrane Controlled Trials Register, and the Web of Science Core Collection. Other search sources included ClinicalTrials.gov. Each database was searched from 2000 to 2023 using the following keywords: (ASD/DMDD/ADHD/CD/DBD/ODD/SMD) AND (treatment) AND (irritability). See Online Resource 1 for details.

Results Fifty-eight RCT studies were included, including 3842 patients in total. Based on the clinical diagnosis, studies with a diagnosis of ASD were classified as an ASD subgroup, and those with a diagnosis of ADHD, CD, DBD, ODD, DMDD, or SMD as another subgroup. Studies of patients with comorbidities (ADHD+ASD) were included in two clinical subgroups. A total of 43 trials included 2451 patients with ASD. In total, 137 patients with ASD and ADHD were included in these 43 trials. Twelve trials involved 1295 participants with ADHD, CD, DBD, ODD, DMDD, or SMD. Two trials included 225 patients with DBD, four trials included 154 patients with DMDD, two trials included 517 patients with ADHD, two trials included 169 patients with ADHD and SMD, one trial included 63 patients with ODD and CD, and one trial included 126 patients with ADHD and DMDD. Participants ranged in age from 2 to 17. In terms of types of intervention, 42 studies focused on pharmacological interventions, 11 on

non-pharmacological interventions, and 5 on combination interventions. Thirty-six of the studies that included patients diagnosed with ASD focused on pharmacological interventions, including risperidone (RIS) in combination with 20 other pharmacological interventions, RIS alone, and aripiprazole monotherapy, omega-3 fatty acids, N-acetyl cysteine (NAC), divalproex sodium, tetrahydrobiopterin (BH4), lurasidone, VitD+omega-3, guanfacine, and bumetanide. Six focused on nonpharmacological interventions, including Parent Training (PT), Occupational Therapy in an Equine Environment: Harnessing Occupation to Address Self-Regulation, Social Communication, and Play in Youth with Autism (OTee HORSPLAY), therapeutic horseback riding (THR), applied behavior analysis (ABA), and Low-Level Laser Therapy (LLLT). One study focused on RIS+PT. Six of the studies that included patients diagnosed with ADHD, CD, DBD, ODD, DMDD, or SMD focused on pharmacological interventions, including RIS, Dasotraline, micronutrients, and methylphenidate (MPH) + citalopram (CTP). Five focused on non-pharmacological interventions, including ACTIVE I interpretation bias training (ACTIVE-IBT), Coping power program (CP)+beyond the clouds (BC), dialectical behavior therapy (DBT), and management+PT. Two studies focused on medication management+behavioral treatment and MPH+behavior modification. Atomoxetine (ATX) and ATX+PT were the intervention methods in studies that included patients with ADHD with comorbid ASD. Fifty-eight studies were included, 47 using the ABC-I, 2 using the ARI, and 2 using the DBD-S to measure irritability. Others used NCBRF, PRS-R, CASI-5, CGI-S, SNAP-IS, CBCL, and CGAS. The duration of the studies ranged from 2 to 84 weeks (mean =14.37, SD = 14.11). See Table 1 for a detailed description.

Conclusion Antipsychotics combined with other pharmacological interventions are most effective in improving irritability symptoms, and risperidone is the most commonly used anti-SC pharmacological treatment. In the future, the application of antipsychotics in the treatment of non-ASD externalizing irritability symptoms and other antipsychotics in the treatment of

externalizing irritability symptoms can be further investigated. It could also guide research on whether a combination of pharmacological interventions can be used synergistically to improve irritability in adolescents. These nonpharmacological interventions have a certain effect on the improvement of irritability symptoms in adolescents, especially in preschool children. Among them, LLLT and DBT showed high efficacy, while PT and THR showed relatively low efficacy. When selecting the appropriate treatment, the specific situation of the patient should be considered. Although antipsychotic drugs have the greatest effect, it is necessary to be alert to side effects such as metabolic syndrome, and that non-drug treatment is the first choice for school-age children.

关键词: irritability; pharmacological interventions; psychosocial interventions; adolescent

The Neural Mechanism of Rumination Affecting School Refusal Behavior in Adolescents with Anxiety Disorder

Yujiao Wen^{1,2}, Dan Qiao^{1,2}, Peiyun Zhai^{1,2}, Qianru Guo^{1,2}, Yirun Qi^{1,2}, Zhifen Liu^{1,2}

1.Department of Psychiatry, First Hospital of Shanxi Medical University

2.Shanxi Key Laboratory of Artificial Intelligence Assisted Diagnosis and Treatment for Mental Disorder, First Hospital of Shanxi Medical University

Objective School refusal behavior (SR) among adolescents is one of the current societal hot issues, commonly seen in those with anxiety disorders (AD). It not only impacts the mental and physical health of the affected individuals but also imposes a significant burden on families, schools, and society. Past findings have identified rumination as a key risk factor leading to SR, yet its specific neural mechanisms remain unclear

Methods Collect scale scores of HAMD, HAMA, rumination thinking, and school refusal behavior from 11 adolescent patients with ADHD accompanied by sleep disturbance (SR group) and 11 age- and

gender-matched controls (HC group), as well as resting-state EEG data. Extract functional connectivity between the DMN networks of the two groups of participants and analyze significant differences in emotional symptoms, rumination thinking, and school refusal frequency between the two groups, as well as the correlations among emotional symptoms, rumination thinking, and school refusal behavior

Results Based on the analysis of behavioral data from the two groups of participants, it was found that the total scores of HAMD and HAMA in the SR group were significantly higher than those in the HC group. Within the SR group, rumination thinking (RRS) was significantly positively correlated with sleep disturbance (SRAS) and anxiety symptoms (SCAERD) ($r=0.5314$, $p=0.042$; $r=0.7802$, $p=0.003$), and sleep disturbance was significantly positively correlated with anxiety symptoms ($r=0.6095$, $p=0.016$). Statistical analysis of resting-state EEG data from the two groups revealed that the functional connectivity between the core subsystem of the default mode network (DMN) and the posterior cingulate cortex subsystem was weakened in the SR group compared to the HC group

Conclusion The weakened functional connectivity of the DMN may be the core mechanism through which rumination affects school refusal in adolescents with anxiety disorders. Research findings are expected to further elucidate the neural mechanisms of school refusal in adolescents with anxiety disorders, providing a theoretical basis and clinical evidence for precise diagnosis and treatment

基于 LASSO 回归探究儿童青少年抑郁障碍非自杀性自伤行为的高风险特征

王冰* 李秀娟
深圳市康宁医院

目的 通过对比儿童青少年抑郁障碍非自杀性

自伤行为的低风险和高风险组的个案特征, 筛选出儿童青少年非自杀性自伤行为的高风险特征因子。提前识别非自杀性自伤行为的高风险人群, 从而降低儿童青少年抑郁障碍非自杀性自伤行为的发生。

方法 1.1 问卷制定 根据德尔菲专家咨询法, 选取公共卫生学、儿童精神病学、精神康复学各领域专家共 22 名。第一轮问卷内容由研究人员基于儿童青少年非自杀性自伤行为和抑郁障碍相关文献上拟定初稿, 问卷包括个人因素、家庭因素、学校及环境因素三个部分, 共 32 个条目。根据第一轮 22 位专家对问卷条目推荐的建议增加第二轮问卷内容, 第二轮得 41 个条目。再基于第二轮问卷专家对条目推荐度和新增建议制定第三轮问卷内容, 第三轮终得 45 个条目。通过 SPSS 22.0 软件对问卷条目重要性、评分意见协调程度、专家的协调程度进行统计学分析。形成《儿童青少年抑郁障碍个案特征的评定量表》。

1.2 问卷投放 选取 2022.3.1-2023.11.30 深圳市康宁医院门诊和住院部 10-18 岁诊断抑郁障碍的患者, 根据非自杀性自伤行为评分表分为低风险组和高风险组, 投放《儿童青少年抑郁障碍个案特征的评定量表》, 回收 691 份, 最终有效量表共 610 份。

1.3 LASSO 回归 使用 R 语言的 glmnet 包实现 LASSO 回归分析, 提取量表中非自杀性自伤行为的高风险特征, 筛选儿童青少年抑郁障碍的非自杀性自伤行为的高风险组的特征因子。

结果 通过 LASSO 回归分析, 显示在《儿童青少年抑郁障碍个案特征的评定量表》的家庭因素方面, A2 家庭氛围 ($s=0.043$), A5 母亲养育方式 ($s=0.127$), A6 父亲养育方式 ($s=0.052$), A7 是否有同胞 ($s=0.750$), A10 家庭给与的心理支持 ($s=0.524$); 在学校因素方面, B1 寄宿情况 ($s=-0.797$), B5 是否满意和同学间关系 ($s=0.318$), B9 对学校氛围是否满意 ($s=0.220$); 个人因素方面, C1 病程持续时间 ($s=0.0004$), C5 自伤频率 ($s=3.947$), C8 是否有能坚持的兴趣爱好 ($s=-0.636$); 以上因素是儿童青少年抑郁障碍伴非自杀性自伤行为发生的高风险因子。

结论 《儿童青少年抑郁障碍个案特征的评定量表》的评估将为预测和评估儿童青少年抑郁障碍的非自杀性自伤行为提供有价值的信息。

Anxiety, Depression and Sleep Quality and Peripheral Biomarkers of Inflammation Derived From Complete Blood Counts (CBC) in Adolescence Undergoing School Refusal From Psychiatry Outpatient

Haiting Xu¹, Xiaohong Li¹, Ying Yang², Ying Yang¹, Yanyan Jia¹

1.Peking University Hui Long Guan Clinical Medical School, Beijing Hui Long Guan Hospital

2.Capital Medical University Beijing Anding Hospital

Objective Middle-school students with school refusal may experience troubling symptoms such as anxiety, depression and sleep quality. Inflammation is considered a primary and influential hypothetical factor contributing to adolescent depression and anxiety. The main objective of this study is to determine the prevalence of anxiety, depression and sleep quality among Chinese adolescences with school refusal from psychiatry outpatient, and to explore the contributing predictors, including the role of inflammation.

Methods The study used a descriptive cross-sectional design and utilized self-report questionnaires. The participant pool consisted of 162 middle-school students experiencing school refusal from psychiatric outpatient. The questionnaire included the self-rating anxiety scale (SAS) self-rating depression scale (SDS), Pittsburgh sleep quality index (PSQI), and mood disorder questionnaire (MDQ), and peripheral biomarkers of inflammation derived from CBC were investigated in the subjects. Data analysis involved the utilization of the independent t-test, analysis of variance, Pearson correlation coefficients, and linear multiple regression.

Results The median age of all participants was 16.11 years old, and 35.8% of them were male. The global SDS score 63.25, SAS score 56.09, PSQI score was 10.77, indicating moderate or greater depressive symptoms, mild anxiety symptoms, and general sleep quality. Upon adjusting for sociodemographic charac-

teristics, the global SDS score showed a significant association with the SAS score, with the linear regression model expressed as follows: Model 1: $SDS = -17.579 + 0.787 * SAS + 3.732 * MPV$. Additionally, the PSQI score exhibited a significant association with the SAS score (0.156 [0.115–0.197], $P < 0.001$, Model 2). Furthermore, the SAS score demonstrated significant associations with the SDS score, MDQ score, PSQI, and WBC in the linear regression model, which can be represented as follows: Model 3: $SAS = 12.538 + 0.54 * SDS + 1.008 * MDQ + 0.98 * PSQI - 1.012 * WBC$.

Conclusion Anxiety, depression and sleep quality are significant problems for middle-school students who were going through school refusal from psychiatry outpatient. Our study has reaffirmed the role of inflammation in the pathophysiology of adolescence depression and anxiety. Appropriate interventions to monitor and reduce psychological problems and sleep quality amongst middle school students undergoing school refusal are needed.

Global Research Landscape and Trends of Internet Addiction Disorder: A Comprehensive Bibliometric Analysis of Publications in The Past Twenty Years

Cong Zhou¹, Xiaodong Cheng², Sen Li¹, Shanling Ji¹, Hao Yu¹, Yu Feng¹, Chuanxin Liu¹

1.Jining Medical University

2.Shandong Daizhuang Hospital

Objective This bibliometric analysis aimed to explore the global research landscape and trends of Internet Addiction Disorder (IAD) over the past twenty years, focusing on keywords analysis, citation analysis, and future research trends

Methods We conducted a comprehensive bibliometric analysis to explore the global research landscape and trends of IAD over the past twenty years. Our methodology involved analyzing author analysis, journal

analysis, keywords and citations in publications related to IAD from 2004 to 2024

Results We identified "internet addiction," "internet gaming disorder," and "adolescent" as the most frequently occurring keywords, highlighting significant research areas within IAD. The analysis revealed that terms like "social media addiction," "problematic smartphone use," and "COVID-19" have gained prominence in recent years, reflecting the evolving nature of digital technology's impact on mental health. Clustering analysis illustrated the interdisciplinary nature of IAD research, integrating insights from psychology, sociology, network science, and psychiatry. Citation analysis identified highly influential papers, such as Kuss and Griffiths' (2011) review on social networking addiction and Brand et al.'s (2016) I-PACE model for internet-use disorders

Conclusion These works highlighted the field's foundational theories and the diverse methodological approaches used. Our findings underscore the importance of continuing interdisciplinary research to address the multifaceted challenges of IAD. The study emphasized the need for further exploration into the long-term mental health effects of excessive internet use, especially in the context of the COVID-19 pandemic. Future research should focus on the intersections of digital behaviors with mental health, personality traits, and social dynamics to develop comprehensive strategies for prevention and intervention. This bibliometric analysis provides a valuable reference for researchers, clinicians, and policymakers aiming to understand and mitigate the impact of IAD

关键词: internet addiction disorder, bibliometric analysis, internet gaming disorder, social media addiction, problematic smartphone use, mental health

青少年抑郁障碍自杀和非自杀性自伤行为的多模态脑影像学研究

杨莲莲^{1,2} 汪帅³ 汪帅¹ 周紫陌^{1,2} 田霖^{1,2,3}

1.无锡市精神卫生中心

2.江南大学附属精神卫生中心

3.南京医科大学附属无锡精神卫生中心

目的 皮层褶皱 (gyrification) 是人类大脑发育的一个标志。研究表明青少年抑郁障碍自杀与非自杀性自伤行为涉及多个脑区的结构及功能异常有关,但是否存在皮层褶皱特征性异常及其脑功能的变化尚不清楚。本研究联合基于皮层脑形态学分析和静息态 fMRI 技术,旨在探讨青少年抑郁障碍自杀与非自杀性自伤行为的皮层褶皱特征及其伴随的脑自发神经功能变化。

方法 本研究招募了伴自杀行为的抑郁障碍患者 (SA) 45 例,伴非自杀性自伤行为的抑郁障碍患者 (NSSI) 31 例和正常对照 (NC) 28 例。采用渥太华自我伤害调查表 (中文版)、哥伦比亚-自杀严重程度评定量表、BECK 自杀意念量表等对患者进行临床评估。采用 SPSS 25.0 软件对一般人口学资料和临床量表数据进行统计分析。采用 3T 的西门子 MRI 设备获取了被试的结构 MRI 和静息态 fMRI 数据,分析了三组间的皮层褶皱的差异,并以差异脑区作为感兴趣区域 (regions of interest, ROIs),探索三组间功能连接的差异。

结果 三组被试间在渥太华自我伤害调查表 (中文版)、哥伦比亚-自杀严重程度评定量表、BECK 自杀意念量表等多个量表指标存在显著差异 ($P < 0.05$)。协方差分析结果提示三组之间皮层褶皱显著差异的脑区主要位于双侧的额中回、中央前回,左侧的额叶岛盖部和右侧的中央后回 (FDR 校正, $P < 0.05$)。事后检验显示 SA 和 NC 组间存在统计学差异, NSSI 和 NC 组间存在统计学差别, SA 和 NSSI 组间不存在统计学差异。以双侧的额中回为感兴趣区域的功能连接分析显示三组间存在显著异常的自发神经活动模式,主要差异的脑区位于双侧的中央前回、中央后回、辅助运动区和扣带回 (FDR 校正, $P < 0.05$)。事后检验显示 SA 和 NC 组间存在统计学差异, NSSI 和 NC 组间不存在统计学差别, SA 和 NSSI 组间存在统计学差异。

结论 伴自杀与非自杀性自伤行为的青少年抑郁障碍患者具有不同皮层褶皱特征,并且这种形态学异常伴随的脑自发神经功能整合变化,其中额中回可能在自杀与非自杀性自伤行为的神经生物学机制上发挥了关键作用。

赣州市青少年心理健康现状及相关危险因素调查研究

王魁元 黄丹*

赣州市第三人民医院

目的 本次调研旨在深入了解赣州市青少年的心理健康状况,探究其面临的主要心理健康问题及其成因,以及这些问题对个人和社会的潜在影响,进而为制定有效的预防和干预措施提供科学依据。此外,调研还旨在评估当前心理健康教育和服务的现状,识别存在的问题和不足,从而推动家庭、学校、社会和政府共同努力,构建一个全面、高效的青少年心理健康支持体系,促进青少年的心理健康发展,为社会的和谐与进步做出贡献。

方法 在全市各县区范围内随机抽查 21 所中小学校,通过问卷调查、心理测评以及面对面访谈等多元化研究手段,本项目采用国内通用的中学生心理健康状况测评表(MSSMHS)、抑郁筛查量表(PHQ-9)等专业心理测验量表,在校内对不同年级学生群体开展了全面的专业的心理健康筛查工作。

结果 调研结果显示,赣州市青少年心理健康问题普遍存在,且呈现多样化的特点。在参与调研的 132125 名青少年中,约有 20.69%的个体表现出需要关注的心理状态,而 4.45%的个体则处于需重点关注状态。抑郁筛查量表(PHQ-9)的结果显示,有 17.86%的青少年出现了预警信号,提示可能存在抑郁症状的风险。

结论 赣州市青少年在具体的心理问题表现上,焦虑、抑郁、敌对和学习压力是最为突出的问题。这些问题不仅影响了青少年的学习和生活,也对他们的人际关系和自我认知造成了负面影响。此外,网络成瘾问题也日益凸显,成为影响青少年心理健康的一个重要因素。

在危险因素分析方面,家庭环境、学校教育、社会压力和个人特质是影响青少年心理健康的主要因素。家庭冲突、父母教育方式、学业压力、同伴关系以及社会价值观的多元化等因素均对青少年的心理健康产生了不同程度的影响。

在心理健康教育和服务体系的建设方面,尽管国家不断加大体系建设,学校和家庭对心理健康的重视程度有所提高,但仍存在服务资源不足、专业

人才缺乏以及心理健康教育不够系统化等问题。这些问题的存在,限制了心理健康服务的有效性和覆盖面。

综上所述,赣州市青少年心理健康问题的现状令人关注,亟需家庭、学校、社会和政府部门的共同努力,进一步采取切实有效的措施,以促进青少年的心理健康发展。

ADHD 儿童的白质微观结构亚组:相似的临床表现和不同的神经心理学特征

胡兰芳¹ 钟蕴瑜² 王鹏³ 刘璐⁴ 操小兰² 孙黎⁴ 曹庆久⁴ 杨莉⁴ 钱英⁴ 王玉凤⁴ 杨斌让² 吴赵敏²

1.汕头大学医学院深圳儿科临床学院

2.深圳市儿童医院

3.中国医学科学院阜外医院

4.北京大学精神卫生研究所/第六医院

目的 注意缺陷多动障碍(ADHD)是一种异质性较高的疾病。本研究旨在探索利用大脑白质微观结构特征对 ADHD 儿童进行分型的可行性。

方法 本研究一共纳入 227 个 ADHD 患儿(年龄均为 6-15 岁)及 89 个健康对照儿童,采用弥散张量成像技术来测量大脑微结构完整性(以各向异性分数(FA 值)表示),并应用多个临床问卷和神经心理学测试来全面评估每个被试的临床和神经心理学特征。此外也记录了部分 ADHD 患儿(n=52)的药物治疗(哌甲酯)反应。采用聚类分析对 ADHD 患儿进行分型,以年龄和性别作为协变量,进行组间比较。

结果 两组 ADHD 儿童对比对照组存在更多临床情绪行为问题以及执行功能损害($P < 0.05$)。聚类分析显示 ADHD 患儿可以分为两个亚型。随后的分析结果表明两个 ADHD 组之间临床核心症状严重程度方面差异无统计学意义($P > 0.05$)。然而,在几个特定的认知领域却观察到了组间差异。第二组(FA 值较低)在“加工速度”任务中表现较差,而第一组(FA 较高)在“反应抑制”和“持续注意力”任务中表现较差。此外,与第一组相比,第二组对哌甲酯药物反应效果更好($P = 0.047$)。

结论 尽管两组 ADHD 患儿的临床特征相似,但可以根据它们大脑微结构特征对 ADHD 患儿进行分型,这些特征与不同认知功能损害和对哌甲酯药物反应有着进一步的联系。本研究的全面分析有助于更深入地理解 ADHD 的异质性。

青少年抑郁障碍及非自杀性自伤的神经调控治疗研究进展

于雯雯 刘剑波 卢建平*

深圳市精神卫生中心/深圳市康宁医院

目的 抑郁障碍是儿童和青少年中第二大流行的精神疾病,它不仅可能导致早期致残、寿命缩短等健康问题,还严重阻碍个人与社会的全面发展。当前的心理与药物治疗方案对青少年抑郁疗效有限,且安全性存疑。随着神经科学和精神病学领域的进步,经颅磁刺激、经颅直流电等神经调控技术备受瞩目。我们将从神经调控技术的种类、疗效影响因素及神经机制等进行系统综述。

方法 检索中国知网、万方、维普、Web of Science、PubMed 等数据库,筛选 2000 年至 2024 年公开发表的干预儿童青少年抑郁障碍及非自杀性自伤的神经调控技术种类、疗效影响因素及神经机制相关文献,进行系统综述。

结果 目前,针对儿童青少年抑郁障碍的神经调控技术主要有电休克治疗(ECT)、经颅磁刺激(TMS)、经颅直流电刺激(tDCS)、迷走神经刺激(VNS)及深部脑组织刺激(DBS)等。这些技术普遍具有不良反应小、耐受性高的优点。电休克治疗虽对自伤自杀风险高及药物治疗无效的青少年有效,但因其可能诱发癫痫发作和损害认知等副作用,应用受限。而 rTMS 和 tDCS 相较于抗抑郁药,不良反应较低且疗效相当,不仅可改善抑郁症状、快感缺失、认知功能及非自杀性自伤等,还有研究指出它们对难治性抑郁有潜在应用。tDCS 同样能缓解抑郁情绪、自伤行为及自杀意念。VNS 和 DBS 也显示出对儿童青少年抑郁情绪及自伤行为的潜在疗效。影响神经调控技术效果的因素众多,包括设备参数(如刺激部位、强度、频率等)、患者个体差异(如年龄、性别、性格和激素水平等)及疾病相关因素(如抑郁

障碍的性质、发作的严重程度和症状的性质等)。神经机制方面,这些技术主要作用于背外侧前额叶,同时涉及多个脑区如杏仁核、海马、扣带回、丘脑和尾状核等,且大脑基底外侧及伏隔核等脑区可能参与自伤行为的调控。

结论 神经调控技术已在抑郁障碍治疗中有所应用,为青少年抑郁障碍提供了新的治疗手段。然而,该技术在青少年抑郁障碍及非自杀性自伤中的应用尚处初期,其疗效与潜在风险需更多研究验证。疗效受多因素影响,包括疾病、患者自身因素及调控参数等,如何个性化调整治疗方案,从而达到精准治疗,同时获得更好的疗效,仍需进一步研究。

反刍思维和校园欺凌对青少年抑郁障碍患者网络成瘾行为的影响

吕培培*

郑州大学第一附属医院郑州大学第一附属医院

目的 探讨反刍思维和校园欺凌对青少年抑郁障碍患者伴网络成瘾行为的影响。

方法 采用 17 项汉密尔顿抑郁量表(HAMD-17)、反刍思维量表(RRS)、校园欺凌经历问卷(C-SBEQ)及网络成瘾量表(IAT)对 189 例 12~18 岁抑郁障碍患者进行测评。变量间相关分析应用 Pearson 相关分析。采用二元 Logistic 回归分析探究青少年抑郁障碍伴网络成瘾的影响因素。

结果 青少年抑郁障碍患者伴有网络成瘾的发病率为 60.3%。伴网络成瘾组在 HAMD-17 评分、RRS 及各分量表、SBEQ 各分量表等方面均高于不伴网络成瘾组,在年龄方面则低于不伴网络成瘾组(P 均 <0.05)。HAMD-17 与 IAT 正相关($P<0.05$); HAMD-17 与 RSS、SBEQ-1(言语和关系欺凌受害)、SBEQ-2(身体和财务欺凌的受害)正相关(P 均 <0.01); RSS 与 SBEQ-1、SBEQ-2 正相关(P 均 <0.01)。IAT 与 RSS、SBEQ-3(言语和关系欺凌的肇事)正相关(P 均 <0.01)。二元 logistic 分析显示 RRS、SBEQ-3($OR>1$, $P<0.05$)为青少年抑郁障碍伴网络成瘾的危险因素,年龄($OR<1$, $P<0.05$)为其保护因素。预测模型 ROC 曲线下面积=0.73, $P<0.001$ 。

结论 反刍思维和校园欺凌可影响青少年抑郁障碍的严重程度,且年龄、反刍思维及校园欺凌肇事对青少年抑郁障碍患者伴网络成瘾具有一定的预测价值。

关键词: 抑郁障碍,网络成瘾,青少年,反刍思维,校园欺凌

基于机器学习算法构建中学生自杀意念预测模型

谢思思^{1,2} 季益富^{1,2} 杜洋^{1,2} 杨静月¹ 刘佳楠^{1,2} 郑荣君^{1,2}

1.安徽省精神卫生中心
2.合肥市精神病医院

目的 研究中学生自杀意念的现状,并探索机器学习算法对中学生自杀意念的预测效果。

方法 采用随机整群抽样,选取合肥市5所中学7431名中学生作为研究对象,采用自杀意念量表、抑郁自评量表、儿童期虐待问卷和时间性快感体验量表进行测评。纳入21个自变量构建了10个机器学习模型,包括:自适应提升(AdaBoost)、类别提升(CatBoost)、决策树(DT)、梯度提升决策树(GBDT)、K邻近(KNN)、轻量级梯度提升(LightGBM)、多层感知机(MLP)、随机森林(RF)、支持向量机(SVM)、极限梯度提升(XGBoost),并选择了DT、XGBoost、AdaBoost三个模型为基模型,逻辑回归为元模型,5折交叉验证,建立Stacking模型。

结果 中学生自杀意念者检出率为17.02%(1265/7431);训练的10个模型中,除KNN、DT表现较差,其余模型效果近似且较好,单一模型表现最好的是CatBoost。Stacking模型训练后测试数据为:召回率(Recall):0.62、F1分数(F1 score):0.63、布里尔分数(Brier score):0.09,均超过单一模型,有较好的区分度、校准度及临床净收益。

结论 中学生自杀意念检出率较高,构建的Stacking模型可用于筛查中学生自杀意念个体。

关键词: 中学生;自杀意念;机器学习;预测模型

362 例儿童精神障碍患者的脑电图检查回顾性分析

陈良梅* 党云皓
西安市精神卫生中心

目的 探讨儿童精神障碍患者的病情特点,为更好地诊断和治疗提供依据。

方法 采用回顾性研究的方法,在西安市精神卫生中心住院患者中,选取16岁以下的儿童精神障碍患者,临床表现类似精神分裂症样症状、抑郁症状、双相障碍,以及强迫症状等多种精神症状,性别不限,共362例;这些患者都是分别进行过普通脑电图检查和24小时脑电图检查。分别统计其普通脑电图检查结果异常的例数,24小时脑电图检查结果异常的例数,以及其脑电图异常结果是否符合癫痫性患者的脑电图改变,脑电图检查结果异常的患者的治疗方案及其治疗效果,并对结果进行分析。

结果 在这362例16岁以下的精神障碍患者中,普通脑电图检查异常的患者84例,占23.20%,异常者符合癫痫的脑电图改变;24小时脑电图检查异常的患者328例,占90.61%,异常者均符合癫痫的脑电图改变;24小时脑电图对癫痫患者的检出率比普通脑电图高($\chi^2=330.68, P<0.05$)。检查结果异常者进行抗癫痫治疗有效,提示本病与脑器质性损伤有关。

结论 儿童精神障碍首先要排除癫痫性精神障碍。儿童精神障碍大部分患者的脑电图结果异常,异常者符合精神运动性癫痫。在精神运动性癫痫患者的临床诊断中,24小时脑电图对癫痫患者的检出率比普通脑电图高,应用价值较高。

关键词: 儿童青少年精神障碍,24小时脑电图,精神运动性癫痫

中国青少年抑郁患者皮层厚度调查

李金 张晓斌*
苏州市广济医院

目的 抑郁症是一个核心但被忽视的全球健康问题,是一类以情绪低落为主要表现的疾病总称。

部分患者存在自伤、自杀行为,甚至因此死亡。青少年作为特殊人群具有不同于成人抑郁障碍的临床特征和病理生理改变,因此给临床治疗带来了一定的挑战。40%的青少年抑郁症(MDD)对抗抑郁药物或循证心理治疗没有反应。左前额10Hz经颅磁刺激(TMS)对患有MDD的成年人有效。TMS治疗青少年抑郁最大且迄今为止设计最好的研究虽然没有得出阳性结果,但刺激靶点依然选择是左前额叶。说明左前额已成为青少年抑郁物理治疗的重要靶点。已知与情绪调节相关的大脑区域也与成人和青少年重度抑郁症(MDD)的病理生理学有关。在目前的研究中,我们使用FreeSurfer软件研究中国患有MDD的青少年与其健康对照的皮层厚度是否存在差异。

方法 本研究方案经苏州市广济医院伦理委员会批准(编号:2019-054)。获得所有受试者监护人的书面知情同意书。患者均来自苏州市广济医院儿科病房募集,健康被试者来自广告招募。招募时间为2022年10月至2023年07月。本研究为横断面设计,青少年抑郁患者和健康对照入组时完成磁共振扫描,患者组需完成临床心理测评。使用FreeSurfer的一般线性模型比较青少年抑郁和健康对照的皮质厚度差异。我们使用排列测试(蒙特卡罗模拟)来校正多次比较。

结果 本研究没有发现样本患者组和健康对照组皮质厚度存在统计学差异。

结论 已知与情绪调节相关的大脑区域也与成人和青少年重度抑郁症(MDD)的病理生理学有关。额叶和边缘区域的神经解剖学和功能障碍及其连接回路在MDD中一直被观察到,由此产生了MDD的额边缘模型发病机制假说。本研究丰富了这一理论框架,患有MDD的青少年可能与健康的青少年处于不同的发育轨道上。

关键词:皮层厚度;FreeSurfer;青少年抑郁

益生菌通过调控肠道菌群改善孤独症儿童孤独症样行为注意缺陷障碍的临床研究

傅坚*

沭阳脑科医院

目的 探讨益生菌通过调控肠道菌群改善孤独

症儿童孤独症样行为注意缺陷障碍的临床研究。

方法 招募2022年1月-2023年5月在笔者医院被诊断为孤独症谱系障碍(ASD)的160例儿童患者为研究对象。患者年龄2-11岁,平均年龄 5.37 ± 3.44 岁。根据研究方案,将患者分为对照组($n=80$)和观察组($n=80$),对照组接受常规治疗方案,观察组在常规治疗方案的基础上联合派特灵益生菌治疗。根据临床档案统计患儿一般资料。通过16S rRNA基因测序检测患儿肠道菌群生物多样性。比较患儿粪便菌群在门、纲、目、科、属各水平分类上的相对丰度。使用CPRS-R-L量表评估患儿注意力缺陷障碍。使用WCST量表评估患儿认知功能和问题解决能力。使用CPT量表评估患儿的注意力和反应控制能力。

结果 两组患儿一般资料比较无差异($P>0.05$)。观察组肠道菌群物种多样性、ACE指数、Chao1指数、Simpson多样性指数和Shannon指数较对照组降低($P<0.05$)。观察组中的Acidobacteria、Bifidobacterium和Ruminococcus gnavus比例高于对照组($P<0.05$),而Negativicutes、Selenomonadales和Veilonellaceae比例低于对照组($P<0.05$),益生菌能显著改善患儿肠道菌群构成。观察组注意力不集中、多动冲动和总评分较对照组减少($P<0.05$),观察组注意力缺陷障碍严重程度较对照组缓解($P<0.05$)。观察组完成分类数量和策略分析评分较对照组增多($P<0.05$),观察组分类错误次数和分类尝试次数较对照组减少($P<0.05$)。观察组反应时间、错过率、持续性注意力和反应时间变异性较对照组降低($P<0.05$),观察组命中率较对照组升高($P<0.05$)。

结论 益生菌通过优化肠道菌群组成,显著改善孤独症儿童的孤独症样行为和注意缺陷障碍症状。这一发现突显了肠-脑轴在调节孤独症谱系障碍和注意缺陷障碍中的关键作用,为未来的治疗策略提供了新的方向。

青少年心境障碍患者非自杀性自伤与依恋和归因风格的关系

钟丽霞¹ 李珠琳¹ 温文文¹ 关蕴茵¹ 马若云¹ 陈敏

华² 朱彩红² 林小玲¹

1.中山大学

2.中山大学附属第三医院

目的 描述青少年心境障碍患者非自杀性自伤、依恋及归因风格现状,探讨青少年心境障碍患者非自杀性自伤、依恋和归因风格之间的关系。

方法 便利选取广州市某医院精神科住院的232例10~24岁青少年心境障碍患者,采用一般资料调查表、渥太华自伤调查表中文订版、亲密关系经历量表(ECR)、归因风格问卷(ASQ)、汉密尔顿抑郁量表-17项(HAMD-17)和杨氏躁狂量表(YMRS)测量其一般资料、非自杀性自伤、依恋、归因风格、抑郁和躁狂症状,采用描述分析、相关分析和回归分析进行数据处理。

结果 最终纳入232名患者,最近一年非自杀性自伤的报告人数为182例(78.45%)。依恋维度得分分别为依恋回避(4.27±0.97)和依恋焦虑(4.07±1.30),各依恋类型人数分别为安全型11例(4.74%)、恐惧型140例(60.35%)、痴迷型28例(12.07%)和疏离型53例(22.84%),不安全型共221例(95.36%);归因风格得分为(-0.16±3.37)。非自杀性自伤与ECR得分的依恋回避、依恋焦虑正相关($r = 0.21$ 、 0.21),与ASQ得分负相关($r = -0.22$)。ECR得分的依恋回避、依恋焦虑是ASQ得分的负向预测因素($\beta = -0.23$ 、 -0.20),ASQ得分是非自杀性自伤的保护因素($OR = 0.88$)。

结论 青少年心境障碍患者非自杀性自伤报告率高,普遍存在不安全依恋,归因风格偏悲观;归因风格在依恋与非自杀性自伤间起中介作用。临床工作中应关注患者归因方式的引导,降低患者自伤或自杀风险。

Teachers' Attitudes and Training Needs in Mental Health: A Qualitative Interview Study.

Peiyao Li¹, Xiaoquan Liu², Yongsheng Tong¹

1.Peking University Huilongguan Clinical Medical School

2.College of Humanities and Social Sciences, Shanxi

University of Chinese Medicine

Objective Teachers are the first responders to students' mental health, and promoting mental health is integral to their profession and role. However, teachers often lack the ability to identify and address student mental health problems. The purpose of this study was to investigate teachers' attitudes and training needs in mental health

Methods We conducted 12 focus group interviews with 91 teachers from 12 schools (including 5 middle schools, 5 high schools, and 2 vocational high schools) across four provinces in China. A thematic analysis of the data was undertaken

Results Teachers responded to the current challenges in accessing training, the emphasis on theoretical aspects that lack practical application, and the absence of instruction in applied skills. They expressed a strong need for the training and believed that receiving it would positively impact classroom management and student development, as well as contribute to teachers' personal growth. Teachers require training in identifying mental health problems among adolescents, handling crisis events, organizing mental health promotion activities, trusting by adolescents, communicating with adolescents' parents, and managing their own stress. They prefer in-depth training that emphasizes practical skills, offers regular feedback on follow-up results, and avoids creating an undue burden

Conclusion Overall, teachers are eager to receive mental health training that effectively addresses the fact problems faced by youth. Additionally, the training should include components on teacher self-mental health awareness and self-help strategies. We believe there is an urgent need to develop mental health training that is accepted and needed by both teachers and adolescents, incorporating the perspective of teachers

A Scholarly Case Report on Bipolar Affective

Disorder Comorbid with Asperger's Syndrome and Attention-Deficit/Hyperactivity Disorder Presenting with Recurrent Educational Challenges

Jiaxin Li¹, Yanping Shu²

1.ZunyiMedicalUniversity

2.The Second People's Hospital of Guizhou Province

Abstract This scholarly case report delineates the intricate clinical presentation and management of a patient with bipolar affective disorder (BPAD) comorbid with Asperger's syndrome (AS) and attention-deficit/hyperactivity disorder (ADHD)[1]. The patient's trajectory underscores the diagnostic and therapeutic challenges posed by the confluence of these conditions, particularly in the educational context. Introduction: Autism spectrum disorder (ASD) is typically manifested in early childhood, characterized by deficits in social interaction and communication, alongside stereotyped patterns of behavior and interests. Asperger's syndrome, a high-functioning variant of ASD, is distinguished by the absence of significant language and cognitive impairments and a pronounced desire for social engagement[2]. The co-occurrence of AS with BPAD introduces a layer of complexity to the diagnostic process and subsequent treatment strategies[3].

Case Presentation The subject of this report is a 16-year-old male adolescent initially admitted for affective instability and suspicion six years prior. His clinical presentation included unprovoked mood swings, irritability, self-centeredness, and altercations. Upon admission, a comprehensive battery of psychiatric assessments was conducted, yielding results indicative of affective lability and interpersonal sensitivity.

Methods Diagnostic evaluations included the SCL-90 Symptom Checklist and the Childhood Autism Scale, alongside the Eysenck Personality Test to assess personality traits. Clinical observations were made regarding the patient's consciousness, attention, and social engagement, revealing symptoms consistent with BPAD and AS. Results The patient was diagnosed with affective mood disorder following a thorough review of his medical history and auxiliary examinations.

Pharmacological intervention with mood stabilizers was initiated, leading to a stabilization of affective symptoms. However, upon reintegration into the educational environment, the patient exhibited a reluctance to socialize and a predilection for solitary activities, notably an obsession with mobile gaming

Discussion The patient's subsequent difficulties in social interaction and academic performance prompted a reevaluation of his condition. The application of the ASSQ scale yielded a score suggestive of ASD, leading to a revised diagnosis of BPAD comorbid with AS and ADHD. The introduction of methylphenidate and psychological counseling resulted in improved attention and a gradual return to academic pursuits, albeit with lingering apprehension towards social interaction.

Conclusion Adolescence is marked by rapid physiological and psychological changes, with emotional disorders often surfacing as primary concerns. The subtle early manifestations of AS are frequently overlooked, leading to underdiagnosis. As patients mature, they encounter escalating social and educational demands, exacerbating behavioral and personality-related issues and precipitating interpersonal and scholastic challenges. This case highlights the imperative for clinicians to consider the comorbidity of AS and ADHD in patients presenting with affective disorders. A multidimensional diagnostic approach, incorporating both cross-sectional and longitudinal patient data, is essential for the precise identification of AS and the timely initiation of appropriate interventions

Closed-Loop Pathways Associated with Clinical Symptoms in Children with Autism Spectrum Disorder: A Complex Network Analysis

Yonglou Wang Xiaoyan Ke*

the Affiliated Brain Hospital of Nanjing Medical University, Nanjing

Objective Autism Spectrum Disorder (ASD) is a neurodevelopmental condition characterized by social communication deficits and repetitive behaviors. Neurobiomarkers for ASD are lacking, which hinders early diagnosis and personalized treatment. This study aimed to identify potential biomarkers for ASD using complex network analysis, specifically causal brain networks, to identify functional closed-loop pathways in the brains of children with ASD

Methods The study included 58 ASD patients and 57 typically developing children aged between 6 and 12 years. Brain causal networks and temporal-lag networks were constructed using a deep learning model to infer the causal relationship between brain regions and the temporal-lag of signal transmission. Statistical analysis was performed to compare differences between

the typically developing and ASD groups and to explore the potential association between different symptoms of the ASD group

Results The results revealed numerous aberrant functional pathways, mainly located in the junction of frontal lobe and parietal lobe, also occipital lobes, in children with ASD compared to typically developing children. The study identified four closed-loop pathways in children with ASD that were significantly associated with clinical symptoms. Interestingly, a positive interaction among these closed-loop pathways was observed, indicating that social impairments and stereotyped behaviors are interrelated in children with ASD

Conclusion The study demonstrates the potential of identifying multiple abnormal closed-loop pathways using complex network analysis in aiding early diagnosis and treatment of ASD. These findings provide insights into the neurobiological basis of social impairments and stereotyped behaviors in children with ASD, which may aid in the development of personalized interventions and therapeutic targets for the condition

基于内感觉的孤独症儿童社会意义的建构

连小雨^{1,2} 卢桥桥^{1,3} 刘凯¹

1.渤海大学教育科学学院, 辽宁 锦州 121013

2.新乡医学院 心理学院, 北京 453003

3.邯郸市特殊教育中心学校, 河北 邯郸 056106

背景 孤独症的发病率在全球范围内呈现逐年增长之态, 引发了医学界和社会各界的广泛关注。孤独症作为一种复杂的神经发育障碍, 其病因一直是科研人员和医学专家研究的重点。然而, 由于孤独症的病因涉及遗传、环境、神经生物学等多个方面, 其发病机制至今尚未完全明确。内感觉是人体感知内部状态的一种重要方式, 它对于维持人体生理平衡、支持高级功能以及理解身体健康状况都具有重要意义。在既有研究基础上, 我们更加关注如下的病理学理论假设: 当婴儿内感觉发展出现异常

时,可能会表现为对内部刺激的不敏感或过度敏感,影响婴儿的情感认知、自我认知、社交技能和情绪调节能力,进而阻碍他们对社会意义的建构。

目的 本研究在母婴交互的视角下对孤独症谱系的病因提出新的假设,并进一步完善母婴交互中关于婴儿的内感觉的理论研究。这将有助于我们重新理解孤独症的发病机制和社会意义建构过程,为 ASD 儿童提供更好的干预和支持。

方法 通过对母婴交互及内感觉的文献梳理,采用调查和实验的研究方法对母婴交互中婴儿的感觉序列进行调查,并基于调查结果进行孤独症儿童社会意义建构实验。

结果 首先,早期母婴交互对婴儿主体间性的发展至关重要,婴儿感知运动阶段的互动影响主体间性的发展。ASD 儿童在人与人之间的理解上存在困难,其主体间性的发展受阻。

其次,在婴儿时期,ASD 儿童的感觉序列就出现特殊表现,并且婴儿的内感觉失调会影响婴儿认知、情绪理解和社交的发展。

再次,ASD 儿童对感觉的理解及意义出现异常。患儿们无法对内感觉进行有效处理,或者缺乏对不同感觉进行联结整合的能力,难以利用一种感觉去帮助解释理解另一种感觉。在内感觉研究基础上对 ASD 儿童进行社会意义建构时,能帮助 ASD 儿童更好地理解 and 诠释行为的个体意义及社会意义。

结论 基于内感觉可以更加有效的促进 ASD 儿童的社会意义建构。

展望 未来研究可以增加被试范围,关注对基于内感觉对社会意义建构实验的验证研究,从而发现高效的干预方法。

关键词:孤独症,内感觉,母婴交互

青少年反复非自杀性自伤的维持影响因素及干预措施

郭航雨*

重庆市渝中区精神卫生中心

目的 本研究旨在探讨青少年反复非自杀性自伤(NSSI)的维持影响因素,并评估有效的干预措施。通过了解这些因素和干预方法,我们希望为临床实践提供参考,以帮助减少青少年 NSSI 行为的发

生和维持。

方法 本研究采用文献综述和实证研究相结合的方法。首先,通过系统检索相关文献,综述青少年 NSSI 的主要维持因素,包括心理、社会和生物学因素。其次,选取一组有 NSSI 行为的青少年进行干预实验,干预措施包括认知行为治疗(CBT)、家庭治疗和药物治疗。实验前后分别使用自伤行为问卷(SHBQ)和抑郁焦虑量表(DASS-21)进行评估,以测量干预效果。

结果 文献综述结果显示,青少年 NSSI 行为的维持因素主要包括情绪调节困难、家庭冲突、社交孤立和同伴影响等。实证研究结果表明,经过 12 周的干预,参与者的 NSSI 行为频率显著降低,情绪调节能力显著提高,家庭关系和社交功能有所改善。其中,认知行为治疗结合家庭治疗的效果尤为显著。

结论 青少年反复 NSSI 行为的维持是多因素共同作用的结果,情绪调节困难和社会支持缺乏是主要影响因素。综合干预措施,如认知行为治疗和家庭治疗,能够有效减少 NSSI 行为的发生和维持,并改善青少年的心理健康和家庭关系。未来的研究应进一步探讨个体化干预策略,以提高干预效果的持久性和适应性。

How Does Chronotype Affect Adolescents' Self-harm? The Chain of Tragedy Effect of Sleep Problems and Emotional Symptoms

Guoli Yan Huifang Yin Xiaofei Hou Minghui Li Ling Sun Guangming Xu*

Tianjin Anding Hospital

Objective The aim of this study is to explore the relationship between chronotype and self-harm among adolescents, and further investigate the mediating role of sleep problems and emotional symptoms in this context.

Methods This cross-sectional survey involved 13,374 Chinese middle school adolescents with an average age of 15.21 years (SD = 1.4), of which 51.2% were boys. Chronotype, sleep problems, emotional

symptoms (depression and anxiety), and self-harm were assessed by self-reported questionnaires.

Results Adolescent self-harm is significantly negatively correlated with chronotype ($r = -0.123$, $p < 0.001$), and significantly positively correlated with sleep problems ($r = 0.193$, $p < 0.001$), depression ($r = 0.217$, $p < 0.001$), and anxiety ($r = 0.206$, $p < 0.001$). The mediation analysis revealed that the chain mediation effect of sleep quality and depression on the relationship between chronotype and self-harm was -0.168 (95% CI = $[-0.194, -0.145]$), while the chain mediation effect of sleep quality and anxiety was -0.150 (95% CI = $[-0.174, -0.127]$).

Conclusion The results suggest that sleep problems and emotional symptoms play a chain-mediated role in the relationship between chronotype and self-harm. Future research should continue to explore these relationships in longitudinal studies and across diverse adolescent populations to further validate and extend these findings.

关键词: Self-harm, Chronotype, Sleep problem, Emotional symptoms, Adolescents

Gray Matter Structural Alterations in First-episode Drug-naïve Adolescents with Major Depressive Disorder: A Comprehensive Morphological Analysis Study

Baoshuai Zhang¹, Baoshuai Zhang³, Baolin Wu³, Baolin Wu¹, Zhiyun Jia², Zhiyun Jia³

1. Department of Radiology and Huaxi MR Research Center (HMRRC), Functional and Molecular Imaging Key Laboratory of Sichuan Province, West China Hospital, Sichuan University, Chengdu, China

2. Department of Nuclear Medicine, West China Hospital of Sichuan University, Chengdu, China

3. Research Unit of Psychoradiology, Chinese Academy of Medical Sciences, Chengdu, China

Objective Major depressive disorder (MDD) tends to emerge during adolescence; however, neurobiological research in adolescents has lagged behind that

in adults. This study aimed to characterize brain structural alterations in adolescent patients with MDD using comprehensive morphological analyses.

Methods This study included 93 adolescent MDD patients and 77 healthy controls. Voxel-based morphometry (VBM), deformation-based morphometry (DBM), and surface-based morphometry (SBM) methods were used to analyze gray matter morphological alterations in adolescent MDD patients. Partial correlation analysis was used to analyze the relationships between altered GM structural metrics and clinical characteristics.

Results Whole-brain VBM and DBM analyses revealed GM atrophy in the left thalamus and bilateral midbrain in adolescent MDD patients. Whole-brain SBM analysis revealed that adolescent MDD patients, relative to controls, showed decreased thickness in the left postcentral gyrus and left precentral gyrus; increased thickness in the bilateral superior temporal gyrus, left parahippocampal gyrus and right lateral orbitofrontal gyrus; and decreased sulcus depth in the right lateral occipital gyrus. The volume of the right midbrain was correlated with illness severity, and the volume of the left thalamus and the thickness of the left superior temporal gyrus were correlated with age of onset in adolescent MDD patients.

Conclusion This comprehensive morphological analysis study suggests that adolescent MDD is characterized by GM morphological abnormalities in the frontal-limbic, subcortical, perceptual network and midbrain regions, which may be the underlying structural basis for emotional dysfunction and cognitive impairment.

Shared and Distinct Structural and Functional Brain Alterations in Adolescents with Major Depressive Disorder

Baolin Wu Qiyong Gong*
West China Hospital of Sichuan University

Objective Neuroimaging studies have identified structural and functional brain alterations in adolescents with major depressive disorder (MDD); however, the results are inconsistent, and whether patients exhibit spatially convergent structural and functional brain abnormalities remains unclear. This multimodal meta-analysis aimed to characterize conjoint and distinct structural and functional brain alterations in adolescent MDD patients

Methods We conducted voxel-wise meta-analysis of voxel-based morphometry (VBM) and resting-state functional studies, respectively, to identify regional gray matter volume (GMV) and brain activity alterations in adolescent MDD patients. Multimodal analysis was performed to examine the overlap of regional GMV and brain activity alterations. Meta-regression analysis was conducted to evaluate the potential effects of clinical variables

Results Ten whole-brain VBM studies (403 patients and 319 controls) and 14 resting-state functional studies (510 patients and 474 controls) were included. Adolescent MDD patients showed conjoint structural and functional alterations in the left medial/dorsolateral prefrontal cortex, lateral temporal cortex and sensorimotor regions, and left insula. Adolescent MDD patients showed structural-specific abnormalities in the subcortical and prefrontal-limbic regions and functional-specific abnormalities in the right insula, right superior occipital gyrus, left inferior frontal gyrus and left precuneus. Meta-regression analyses revealed that the mean age of adolescents with MDD was positively associated with GMV in the right superior temporal gyrus and negatively associated with brain activity in the right insula, and the symptom severity of adolescents with MDD was positively associated with brain activity in the right superior occipital gyrus

Conclusion This meta-analysis identified complicated patterns of conjoint and dissociated brain alterations in adolescent MDD patients, which may advance our understanding of the neurobiology of adolescent MDD

宁夏精神专科医院住院青少年抑郁患者疾病相关因素分析及干预策略研究

白红娟*
宁夏宁安医院

目的 从横断面和纵向发展的角度探索青少年抑郁症的特征及重要的影响因素和作用机制,并以此为基础,从社会、家庭环境角度以及患者个体角度给与更完善、更有效的疾病急性期、维持期和康复期的干预建议。

方法 针对项目的现实背景和现状分析中提出的相关问题,本研究将以抑郁症青少年为被试,采用两个研究对上述问题进行探讨。研究1采用横断数据了解青少年抑郁症相关影响因素及特征。研究2在此基础上,基于纵向数据,探讨青少年抑郁症干预前后,相关因素和症状的变化特点,进一步明确青少年抑郁症的影响因素的作用。

结果 通过横断和纵向研究,对青少年抑郁症的主要影响因素和症状数据进行采集,使用相关分析、差异分析和症状网络分析(精神病理网络分析)从宏观疾病层面和微观疾病症状层面了解青少年抑郁症状的特点;通过回归预测模型和中介模型在横断层面了解影响因素和症状之间的因果关系;通过治疗前后的数据采集,使用前后对照分析和纵向交叉之后模型了解青少年抑郁症状及其影响因素的纵向发展情况。

研究过程中低多个变量采用单因素或多因素方差分析,发现青少年抑郁发病与家庭功能、环境因素有明确相关,且经过干预后,抑郁自评量表评分量表(SDS)、青少年非自杀性自伤行为评定问卷(ANSAQ)、生命意义感量表(3DM)、自杀风险评估、社会功能缺陷筛查量表(SDSS量表)均有明显的变化($P<0.05$)。

一例青少年强迫障碍心理治疗案例报告

王伟 陆艺 米国琳*
山东省精神卫生中心

目的 本文旨在报告一例青少年强迫障碍患者的心理治疗案例,探讨个体化治疗原则下的药物治疗联合整合性心理治疗的有效性,并评估患者临床缓解后的社会功能恢复情况。

方法 本案例报告涉及一名 14 岁初三男性学生小吴,主诉无法控制伤害父母及损毁贵重物品的念头,以及反复检查行为。患者经过单一药物治疗 1 年效果不理想后,采用氟伏沙明药物治疗联合整合性心理治疗。治疗过程分为四个阶段,包括心理评估、建立咨访关系、巩固咨访关系、逐步调整治疗方案、减药治疗以及准备分离等。治疗期间,患者接受了 71 次面对面咨询,并在之后进行了 10 次随访。

结果 经过系统治疗,患者达到临床缓解,强迫症状未复发,社会功能得到恢复。心理测验结果显示耶鲁布朗强迫症状量表得分下降,症状自评量表(SCL-90)的焦虑、抑郁和强迫得分均有显著下降。患者在治疗过程中学会放松、接纳自我,强迫思维及行为逐渐消失,能够正常学习和生活。随访期间,患者报告仅偶尔出现轻微强迫思维,但能自行缓解。

结论 本案例表明,对于青少年强迫障碍患者,单一药物治疗效果不理想时,采用药物治疗联合整合性心理治疗可以取得较好的疗效。治疗过程中,患者的强迫症状得到了有效控制,社会功能得到了显著恢复。此外,心理治疗不仅帮助患者缓解了强迫症状,还促进了其人格的完善和自我功能的提高。治疗的成功也强调了心理治疗师与其他专科医师沟通与配合的重要性,以及在治疗过程中根据患者情况灵活调整治疗方案的必要性。最终,患者能够在减少药物依赖的同时,通过心理治疗维持症状的稳定,实现自我价值和社会适应。

首都医科大学附属北京安定医院

目的 分析与青少年抑郁发作患者无抽搐电痉挛(ECT)治疗效果相关的因素以及探索最佳治疗次数

方法 纳入 412 名接受无抽搐电痉挛治疗的青少年抑郁发作住院患者,使用结构化问卷采集其一般人口学信息,病史,住院期间药物治疗,无抽搐电痉挛治疗次数及不良反应,并使用汉密尔顿抑郁量表(HAMD-17)在治疗前后进行抑郁症状的评估。根据 HAMD-17 总分的前后变化将患者治疗效果分为有效组(减分率 $\geq 50\%$)和无效组(减分率 $< 50\%$),使用两组间单因素比较及 Logistic 多元回归模型,分析与治疗相关的影响因素,使用基于 Logistic 回归的限制性立方样条图探索 ECT 最优治疗次数。

结果 在 412 名纳入分析的患者中,平均年龄约为 16 岁,女性比例为 74.5%。主要诊断为抑郁症和双相情感障碍抑郁发作。ECT 治疗的平均次数为 8 次,总体有效率为 76.7%,认知损伤比例约为 32%。多元 Logistic 回归分析结果显示,疾病主要诊断,伴有非自伤性自杀行为,病程,合并躯体疾病,性别,及年龄与治疗效果无显著关联(P 值均 > 0.05),体质指数(BMI)及 ECT 治疗次数与效果显著关联(P 值均 < 0.05)。限制性立方样条图结果显示,治疗次数达到 8 次的时候,患者治疗有效率显著提高,超过 8 次以后的有效率提高改善不显著。

结论 ECT 治疗对青少年抑郁发作的总体效果较好,与治疗效果有关的因素包括患者的 BMI 和 ECT 次数,ECT 治疗 8 次能够达到较好的治疗效果。

The Impact of Household Chores on Depressive Symptoms Among Adolescents: A Cross-Sectional Study

Jingru Lu*
Shenzhen Bao'an Center for Chronic Disease Control

Objective This investigation aimed to elucidate the interplay between domestic chores and depressive

无抽搐电痉挛治疗对青少年抑郁发作患者的疗效及其影响因素研究

symptoms within the adolescent population aged 11-18

Methods A cross-sectional analysis was performed using data from 1317 adolescents, extracted from the 2020 China Family Panel Studies (CFPS). The study was executed during the COVID-19 pandemic, a period known for its psychological impact on the youth. The 8-item Center for Epidemiologic Studies Depression Scale (CESD-8) was employed to quantify depressive symptoms, while the daily duration of housework was self-reported. Statistical methodologies included descriptive analysis, chi-square tests for association, and binary logistic regression to determine the predictors of depression

Results Of the adolescents surveyed, 171 exhibited depressive symptoms as per the CESD-8 criteria. Correlational analysis revealed significant positive associations between depressive symptoms and health status ($r=0.222$, $P=0.001$), leave of absence ($r=0.318$, $P=0.005$), and study pressure ($r=0.234$, $P=0.000$), with housework activities showing a moderate effect ($r=0.194$, $P=0.001$). Conversely, academic situation demonstrated a negative correlation with depression ($r=-0.17$, $P=0.016$). Logistic regression identified poor health status ($OR=4.782$, $P=0.005$), study pressure ($OR=1.985$, $P=0.048$), and housework activities ($OR=1.189$, $P=0.002$) as significant risk factors for depression

Conclusion The findings underscore the complex relationship between housework and depressive symptoms in adolescents, highlighting the influence of academic and health-related variables. The study advocates for an integrative approach to adolescent mental health, suggesting that interventions addressing these risk factors are imperative. It behooves policymakers, educators, and parents to consider these insights to cultivate an environment conducive to the mental well-being of adolescents, thereby reducing the incidence of depressive disorders in this susceptible demographic

辅助分子伴侣 FKBP51 对糖皮质激素受体的调节及其与抑郁症的关系

余思焯 舒畅 王高华*
湖北省人民医院

目的 据世界卫生组织统计,全球约有 3.5 亿抑郁症患者,预计到 2030 年,抑郁症将上升至世界疾病负担首位。多年以来,人们不断探索抑郁症的病因和发病机制,但直到现在仍未完全阐明。在抑郁症的众多发病机制中,神经内分泌失调是一个重要因素,而糖皮质激素受体 (glucocorticoid receptor, GR) 的研究较为深入,故本篇摘要将探讨辅助分子伴侣 FKBP51 对 GR 活性的影响及其与抑郁症的关系,以期为抑郁症的防治提供新线索。

方法 计算机检索 Pubmed、中国知网、Embase、万方数据库中发表的关于 FKBP51 和 GR 及其与抑郁症的相关研究,检索时限为 2014 年 1 月 1 日到 2023 年 12 月 31 日。中文主题检索词为“抑郁症”、“糖皮质激素”,英文主题检索词为 (“FKBP5/FKBP51”)、 (“glucocorticoid receptor/GR”)、 (“depressi*”)。Pubmed 检索策略: ((depressi*) AND (FKBP5 OR FKBP51)) AND (GR OR glucocorticoid receptor) AND (2014:2023[pdat])。

结果 当机体出现应激反应时,自主神经系统和 HPA 轴将被激活,GR 通过负反馈调节抑制亢进的 HPA 轴,使其恢复到正常水平,FKBP51 在这一过程中将协助 GR 进行核转位,故 FKBP51 表达量的高低将影响 GR 的信号转导过程,进而对机体的应激反应产生影响。目前众多研究显示慢性应激可致 FKBP5 甲基化程度降低,而 DNA 甲基化程度又与 FKBP51 的表达呈负相关,当 FKBP51 表达失衡时,GR 信号转导过程将发生改变,最终将导致 HPA 轴持续性功能失调,抑郁症易感性增加。

随着对 FKBP51 认识的深入,人们开始设想将 FKBP51 作为药物靶点来治疗应激相关精神疾病,而寻找 FKBP51 的选择性配体则是药物开发的第一步。2015 年, Gaali 等人首次发现了 FKBP51 的两个选择性配体,即 SAFit1 和 SAFit2,这一发现为开发新型抗抑郁药提供了结构和功能基础;几年以后, Bauder 等人使用“大环化”策略设计并合成了一个 SAFit 类似物,这种化合物既保留了对 FKBP51 的亲力和对 FKBP52 的选择性,又通过大环化设计增加了细胞通透性,这一研究为选择性 FKBP51 抑制剂的开发提供了一种可行的策略。

结论 综上所述,辅助分子伴侣 FKBP51 通过

在 GR 的信号转导过程中发挥重要作用进而与抑郁症密切相关。随着人们对 GR 和 FKBP51 研究的不断深入,相信在不久的将来选择性 FKBP51 抑制剂将在抑郁症治疗中大放异彩。

农村初中生的非自杀性自伤预测:基于多种机器学习模型

蒋忠良¹ 崔永华¹ 徐会¹, Cody Abbey² 徐文剑¹ 郭伟桐³ 张冬冬³ 刘金同⁴ 金靖雯⁵ 李瑛¹

- 1.首都医科大学附属北京儿童医院
- 2.斯坦福大学
- 3.山东大学附属儿童医院
- 4.山东大学
- 5.香港大学

目的 非自杀性自伤(NSSI)是一种严重的行为问题,在儿童和青少年中日益普遍,特别是在农村地区。该行为会对个体的躯体及心理造成影响深远的伤害,因此,建立合适的 NSSI 预测模型是早期识别和干预 NSSI 的关键。

方法 本研究包括 2090 名山东省某县区三所初中学校中的全部农村儿童和青少年。通过问卷调查收集被试的社会人口学信息、焦虑和抑郁症状、人格特征、家庭环境和 NSSI 行为情况。使用除社会人口统计信息外所有问卷的总分/分量表分数作为预测因子。将全部样本按照 70%, 15%, 15% 的比例划分为训练集、测试集和验证集,进行支持向量机模型(Linear/Gaussian/Polynomial/Sigmoid Kernel)、决策树模型和随机森林模型的训练和验证。随后对每个模型的指标进行比较,以选择最合适的 NSSI 预测模型。此外,计算了平均 Gini 系数来衡量各预测因子的重要性。

结果 本研究中农村儿童和青少年的 NSSI 发生率为 38.3%。在评估的所有模型中,随机森林模型在预测 NSSI 的发生率方面具有最佳预测效果。其 Sensitivity、Specificity、AUC、Accuracy、Precision 和 F1-score 分别为 0.66、0.71、0.75、0.69、0.56 和 0.60。对 Gini 系数均值下降影响最大的前 8 个预测因素分别是抑郁、焦虑、人格特征的 5 个维度和家

庭矛盾性。

结论 本研究聚焦于农村地区的儿童和青少年,并展示了使用机器学习模型预测 NSSI 的潜力。利用这种预测模型将有助于识别高风险个体,并使及时干预成为可能。

母亲童年创伤对青少年抑郁患者创伤、焦虑及杏仁核脑网络影响

冯文泰^{1,2} 卢建平²

- 1.康宁医院
- 2.深圳市康宁医院

目的 了解母亲童年创伤对青少年抑郁症患者童年创伤和焦虑情绪及后代脑机制的影响。

方法 采用宗氏焦虑量表(青少年)填写,评估青少年焦虑症状;童年创伤问卷(母亲及青少年)填写,评估母亲及青少年童年创伤的程度;抑郁症状筛查量表和广泛性焦虑障碍量表(母亲)填写,分别评估母亲的抑郁症状和焦虑症状。在青少年抑郁发作患者中,选择杏仁核作为感兴趣区域,比较有童年创伤母亲后代的全脑静息状态功能连接。

结果 结果 (1) 抑郁发作组母亲躯体忽视得分、情感虐待得分、情感忽视得分,焦虑抑郁情绪得分显著高于健康组母亲,差异具有统计学意义($p < 0.05$); (2) 在抑郁发作青少年中,母亲遭受童年创伤组较母亲未遭受童年创伤组,后代焦虑情绪得分,童年创伤因子分及其总分均无统计学差异($P > 0.05$); (3) 在抑郁发作青少年中,有母亲童年创伤的后代较没有母亲童年创伤的后代相比,以杏仁核作为感兴趣区与海马旁回、舌回、枕下回、额上回等脑区的功能连接值降低。

结论 母亲童年创伤及焦虑抑郁情绪可能增加后代抑郁症发病风险,且母亲童年创伤影响后代以杏仁核为种子点的脑功能网络,但母亲童年创伤不影响青少年抑郁症患者焦虑症状及童年创伤严重程度。

关键词: 童年创伤;抑郁症;母亲童年创伤;代际传递;脑机制

Prediction of The Risk of Anxiety and Depression in Chinese Adolescents Using A Modular Neurocognitive Test

Jiangli Wu¹, Fenfen Wang², Guoling Zhou¹, Jian Liu¹, Kaiyue Li², Lijing Yang³, Tian Cai⁴, Ziyang Yu², Ye Cheng², Jianfei Shi¹

1.Affiliated Mental Health Center & Hangzhou Seventh People's Hospital, Zhejiang University School of Medicine

2.Hangzhou Yunjie Technology Co., LTD

3.Hangzhou Health Development Center

4.Department of Psychology, Zhejiang Sci -Tech University

Objective Anxiety and depression are one of the most common psychological problems in adolescents. Early identification and intervention of the risk of anxiety and depression in adolescents is particularly important. As an important internal factor of information processing, emotion regulation and behavioral response pattern in adolescents, neurocognitive function has a significant impact on the generation of anxiety and depression. The purpose of this study was to explore which behavioral characteristics of the modular neurocognitive test (AI test) were significantly associated with the risk of anxiety and depression in adolescents, and to validate the performance of the machine learning model based on the AI test in predicting the risk of anxiety and depression in adolescents

Methods 785 adolescents aged between 11 and 18 were recruited and completed the AI test. Two senior attending physicians assessed the risk of anxiety and depression in the adolescents and classified them into two categories: at-risk and not-at-risk. The differences in the AI test data between at-risk and not-at-risk adolescents were analyzed, and the accuracy, sensitivity and specificity of the AI test results were verified

Results There were significant differences in the reaction time data of several tasks of the AI test between an at-risk adolescent and a not-at-risk adolescent, and

the accuracy, sensitivity and specificity of the AI test results were all more than 85%. The AI test can be used as an auxiliary tool to screen the risk of anxiety and depression in adolescents

Conclusion The indicators of the modular neurocognitive test can distinguish the risk of developing anxiety and depression in adolescents, and the machine learning model based on the test has a good performance

“抑”手遮天 “残”不忍睹 关注儿童青少年心理健康刻不容缓 来自一名普通精神科医生的观察与思考

敦雪菲*

沈阳市精神卫生中心

目的 本研究旨在调查真实世界儿童青少年的抑郁发病现状, 自残或(和)自杀发生比例, 自残的比例, 用刀割的自残方式的比例, 及与此相关的一些临床思考。

方法 本观察来自沈阳市精神卫生中心的一名普通的门诊医生, 该观察选取了从 2023.6.7-2024.6.7 之间由该医生门诊接诊的儿童青少年初诊患者, 年龄设定为 11 岁-20 岁, 收集真实世界的的数据, 记录其中初诊儿童青少年患者数量, 抑郁的患者数量, 有自残或(和)自杀的消极行为的患者数量, 自残的患者数量, 采取用小刀割自己的非自杀性自伤行为的患者数量。应用这些数据来推算一些有意义的临床数据。

结果 共接诊初诊儿童青少年患者 76 人, 其中抑郁的患者为 59 人, 占初诊患者的比例为 77.6%, 在 59 名抑郁的患者中, 有自残或(和)自杀的消极行为的患者为 25 人, 有自残或(和)自杀行为的患者在抑郁患者中占比 42.43%, 其中自残的有 21 人, 有自残行为的患者在抑郁患者中占比 35.6%, 在自残患者中, 采取用小刀割自己的非自杀性自伤行为的患者为 18 人, 占有自残患者的 85.7%。

结论 现阶段, 儿童青少年抑郁问题日趋严重, 有自残行为的患者比例较高, 发病率显著上升, 风险较大, 急需得到更多的关注与干预, 是一项亟待

解决的重要课题。

如何帮助一个鬼神附体的九岁小姑娘摆脱困境？

郭彦祥*

西安市精神卫生中心

目的 如何帮助一个鬼神附体的九岁小姑娘摆脱困境？

方法 患者 2023 年 12 月 18 日睡梦中出现噩梦，有时说听见有人跟自己说话，叫自己的名字，并看见对方，有时在清醒的时候也说能看见。睡觉时会反复蹬被子，反复翻腾，说自己很烦躁。家人给其用桃木剑等做法驱邪，症状能有好转，但后来又出现反复，并且伴有呕吐，睡觉中途会频繁的惊醒，醒来后说这不是我家。家人曾带其去宾馆住了几次。最初在当地综合医院治疗呕吐症状得到缓解。后来说放学后看见学校里有坟墓爬出来的人很害怕，不敢去学校，老师反映学生在教室时会说旁边有个人吓得大哭。先后在当地儿童医院以及精神病院治疗，行头颅磁共振，脑电图，甲功以及免疫因子等检查，没有发现器质性病变。诊断为情绪障碍，服用舍曲林每早 25mg，阿立哌唑每晚 5mg，丙戊酸镁缓释片每晚 0.25g，晚上睡眠有所改善。3-4 天以后出现白天犯困，正玩着或者正吃饭时就会去睡觉，说梦见有个光头爷爷在摸她，早上，中午的情况会比较明显。奶奶用桃木剑砍几下就会清醒，近几日经常说背后有人跟着她。在父母带出来的时候状态能好一些。对其进行心理治疗。

结果 症状缓解

结论 对于儿童出现的一些症状应做好识别，尤其所谓的幻觉妄想等词语的使用往往导致抗精神病药的滥用。儿童使用药物治疗要慎重，精神科医生应加强心理治疗方面的培训。

关键词：儿童,分离性障碍,心理治疗

短程聚焦家庭的行为干预对于学龄期儿童注意缺陷多动障碍的疗效评估及影响因素分析

目的 多国指南建议学龄期注意缺陷多动障碍 (Attention Deficit Hyperactivity Disorder, ADHD) 儿童应药物治疗结合父母行为训练 (behavioral parent training, BPT)。针对既往训练方案周期长、未关注执行功能受损和未聚焦家庭的局限，本研究提出短程聚焦家庭的行为干预，探索该方案对学龄期 ADHD 儿童的疗效及其影响因素。

方法 本研究为随机对照试验，使用随机数生成函数分配受试者。干预组接受 4 周、每周 3 小时的行为干预，对照组接受健康教育。主要结局指标是 ADHD 症状评分。在基线、干预结束时、结束后 1 月以及结束后 3 月时进行测量。采用重复测量方差分析，事后检验采用 Bonferroni 进行校正。采用多因素回归模型进行疗效的影响因素分析。

结果 本研究共 66 例 ADHD 儿童 (干预组和对照组各 33 例) 完成随访。两组在一般人口学资料、核心症状及行为问题、执行功能及情绪调节上无差异 ($p > 0.05$)。干预组教师报告的注意缺陷评分在结束后 3 月时低于对照组 ($F=5.074$, $p=0.028$, $\eta^2p=0.073$)，多动指数在干预结束时 ($F=4.858$, $p=0.031$, $\eta^2p=0.071$)、结束后 1 月 ($F=4.297$, $p=0.042$, $\eta^2p=0.063$) 及结束后 3 月时 ($F=7.050$, $p=0.010$, $\eta^2p=0.099$) 均低于对照组。干预组家长报告的多动冲动评分在干预结束时 ($F=8.659$, $p=0.005$, $\eta^2p=0.119$)、结束后 1 月 ($F=17.257$, $p=0.000$, $\eta^2p=0.212$) 和结束后 3 月 ($F=10.186$, $p=0.002$, $\eta^2p=0.137$) 均低于对照组。干预组家庭功能总分 ($F=7.014$, $p=0.009$, $\eta^2p=0.051$)、情感反应评分 ($p < 0.05$) 和问题解决评分在干预结束时高于对照组，家庭功能总分 ($F=5.078$, $p=0.026$, $\eta^2p=0.038$) 和沟通评分 ($p < 0.05$) 在结束后 3 月时低于对照组。将心身问题、情绪不稳定/消极评分纳入结构方程模型后，模型拟合度 (R^2) 为 0.274，提示干预前儿童心身问题评分 (回归系数 β 为 -0.368) 和情绪不稳定/消极情绪评分 (回归系数 β 为 -0.361) 可以预测核心症状评分减分率。

结论 相较于健康教育，短程聚焦家庭的行为干预可以短期改善学龄期 ADHD 儿童的核心症状及

家庭功能。ADHD 儿童伴随情绪问题和心身问题可以预测短程聚焦家庭的行为干预短期疗效不佳。

Objective Event-related potentials (ERPs), namely mismatch negativity (MMN) and the P300 (P3) component, are indicative of cerebral electrical activity that is intricately linked to cognitive states and decision-making. We investigated the characteristics of MMN and P3 as biomarkers for classifying children and adolescents with ADHD from healthy controls (HCs), and

examined their role in cognitive and clinical symptomatology

Methods Using a three-stimulus auditory odd-ball paradigm, we compared MMN and P3 parameters (amplitude and latency) in EEG data from 70 patients with ADHD and 54 HCs. We applied machine learning with ERP features to differentiate between the two groups. Furthermore, an examination was conducted on the potential moderating impacts of ERP features on clinical symptoms and cognitive functions

Results In comparison to HCs, individuals with ADHD exhibited notably extended MMN latencies at the frontal and temporal electrodes, as well as diminished P3b latencies at the temporal electrodes but an increase at the parieto-occipital electrodes. The optimal classification performance for distinguishing ADHD patients from HCs, based on MMN and P3 features, achieved an accuracy of 71.3%, sensitivity of 80.0%, and specificity of 60.6%. Additionally, it was discovered that the relationship between cognitive function and hyperactive-impulsive symptoms is modulated by the amplitude of MMN at P4

Conclusion The findings suggest that abnormal MMN and P3 represent pathophysiological traits of ADHD in children and adolescents and could potentially be used as clinical neurobiomarkers for this group

ADHD 共病边缘型人格障碍的冲动和情绪失调：与健康人和 ADHD 患者的比较

常卫利*

郑州大学第一附属医院

目的 比较 ADHD 共病 BPD 和 ADHD 患者多种维度的冲动和情绪失调。

方法 本研究采用横断面病例对照研究方法，样本包括 ADHD+BPD 组、ADHD 组、正常对照组，按年龄、性别匹配，每组各 48 例。本研究采用 Barratt 冲动量表 (BIS-11)，执行功能行为评定量表-成人版 (BRIEF-A) 的“情绪控制” (EC) 因子，情绪调节困

量表(DERS),情绪调节问卷(ERQ)等评估 ADHD 共病 ADHD,单纯 ADHD 及正常对照组的冲动特点和情绪失调及情绪调节困难各维度。

结果 ADHD+BPD 组、ADHD 组、正常对照组在认知冲动、非计划冲动和冲动总分上三组被试的差异均有统计学意义($P<0.001$),而在行动冲动方面,三组被试的差异无统计学意义($P>0.05$)。但 ADHD+BPD 组与 ADHD 组比较,在各冲动因子及冲动总分上差异均无统计学意义($P>0.05$)。对于情绪失调,使用执行功能行为评定量表-成人版(BRIEF-A)的“情绪控制”(EC)因子表示,该因子在三组被试的差异有统计学意义($P<0.001$)。在三组间进一步比较 DERS 量表,发现与正常对照组比较,单纯 ADHD 组和 ADHD 共病 BPD 组 DERS 量表总分也逐渐增高、组间比较均有差异,差异有统计学意义($P<0.001$)。另外正常对照组在各因子上均低于 ADHD 组、ADHD+BPD 组,差异有统计学意义($P<0.001$)。ADHD+BPD 组与 ADHD 组比较,差异主要体现在冲动控制困难($P<0.05$)、调节策略使用困难上($P<0.001$)。对其中差异最明显的“调节策略使用”,进一步采用 ERQ 量表评估其两种常用情绪调节策略的使用情况,结果发现在认知重新评估方面,三组被试的差异均有统计学意义($P<0.001$),而在表达抑制方面,三组被试的差异无统计学意义($P>0.05$)。

结论 ADHD 共病 BPD 较对照组有更多的冲动性,但较 ADHD 组这种冲动性并无差异。在情绪失调方面,ADHD 共病 ADHD 较单纯 ADHD 存在更严重的情绪失调及更多的情绪调整困难,尤其是在情绪调节策略方面,而这种情绪调节策略异常主要为较少使用认知重新评估。

静息态功能磁共振成像特征对 SSRI 治疗青少年抑郁症疗效的影响研究

刘彦茹² 孙雪娇¹ 王志仁²

1. 华北理工大学

2. 北京回龙观医院

目的 本研究旨在探讨大脑静息态功能磁共振

成像(rs-fMRI)特征对选择性血清素再摄取抑制剂(SSRIs)治疗青少年抑郁症疗效的影响。结合心理学和神经科学视角,我们观察 SSRIs 疗效与免疫系统指标及大脑功能变化的关系,期望为临床治疗提供精准指导,优化青少年抑郁症的治疗策略,理解其生物学基础及治疗反应差异,促进治疗方法的革新。

方法 选取 12 至 18 岁抑郁症患者,排除具有严重躯体疾病或被诊断为精神分裂症的患者。采用汉密尔顿抑郁量表(HAMD)和焦虑量表(HAMA)评估患者在入组后 1 周内及治疗 8 至 9 周后的心理状态,同时使用静息态功能磁共振成像(rs-fMRI)技术探索大脑功能变化。数据采用 Python 和 R 软件进行统计分析,通过 HAMD 减分率量化治疗效果,并分析 SSRIs 剂量与治疗效果的关系,以探索最佳治疗方案。

结果 1.心理状态的改善:治疗后,患者的 HAMD 评分从基线的 24.6 ± 5.3 显著下降至 12.1 ± 3.7 ($p<0.001$),HAMA 评分从基线的 18.4 ± 4.2 显著下降至 9.5 ± 2.8 ($p<0.001$),显示 SSRIs 在减轻青少年抑郁和焦虑症状方面的显著有效性。不同剂量的 SSRIs 在治疗效果上存在显著差异,SSRIs 剂量较高的患者显示出更显著的症状改善,强调个性化剂量调整的重要性。

2.大脑功能的变化:治疗后,患者前额叶和海马区域的局部一致性指数(ReHo)显著提高($p<0.01$),振幅低频波动(ALFF)在这些区域也显著增强($p<0.01$)。皮层厚度的增加与抑郁症状改善呈正相关($r=0.45$, $p<0.05$),尤其是在前额叶区域。rs-fMRI 结果显示,治疗后前额叶与海马之间的功能连接增强,表明这些关键脑区功能的恢复有助于提高治疗效果,减轻抑郁症状。

结论 本研究确认了 SSRIs 在治疗青少年抑郁症中的关键作用,并通过跨学科方法加深了对治疗效果与大脑功能变化之间关系的理解。研究为个性化治疗方案提供了科学依据,强调结合心理学和神经科学知识的重要性。结果促进了对青少年抑郁症复杂生物学机制的全面理解,尤其是 SSRIs 治疗反应的个体差异,为发展更有效的治疗策略奠定基础。

关键词: 青少年抑郁症,选择性血清素再摄取抑制剂(SSRIs),静息态功能磁共振成像(rs-fMRI),个性化治疗

负性生活事件与社会支持对青少年双相抑郁患者自杀意念的影响

沈小琴 邹韶红*

新疆维吾尔自治区人民医院

目的 探讨负性生活事件与社会支持对青少年双相抑郁患者自杀意念的影响。

方法 采用自杀意念自评量表(SIOSS)对186例PBD抑郁发作患者进行评估并分组。采用青少年生活事件量表(ASLEC)、社会支持评定量表(SSRS)评估患者的负性生活事件及社会支持情况。

结果 (1) 负性生活事件: 有自杀意念组青少年双相抑郁患者在人际关系因子 [(12.75±4.87)比(8.59±5.89)]、学习压力因子 [(12.52±4.82)比(9.49±5.41)]、受惩罚因子 [(9.89±6.70)比(7.52±6.48)]、健康适应因子 [(6.18±3.95)比(4.31±3.30)] 及其他因子 [(7.79±3.92)比(5.49±4.28)] 均高于无自杀意念组, 差异均有统计学意义 ($t=5.232, 4.009, 2.453, 3.517, 3.798; P<0.05$); 两组在丧失因子的比较 [(3.31±3.35)比(2.68±3.06)], 差异无统计学意义 ($t=1.349, P>0.05$)。 (2) 社会支持: 有自杀意念组青少年双相抑郁患者在主观支持分 [(15.76±3.88)比(18.75±5.52)]、客观支持分 [(5.66±2.20)比(6.85±2.75)] 及对客观度的利用 [(5.34±1.37)比(6.43±2.18)] 均低于无自杀意念组, 差异有统计学意义 ($t=-4.299, -3.219, -4.132; P<0.05$)。 (3) Logistic 回归分析显示: 人际关系因子、受惩罚因子与青少年双相抑郁患者的自杀意念有关 (OR=1.129, 1.059; $P<0.05$)。

结论 人际关系不融洽与受惩罚是青少年双相抑郁患者自杀意念的危险因素。

青少年双相抑郁患者自杀意念的神经代谢改变: 一项氢质子磁共振波谱研究

沈小琴 邹韶红*

新疆维吾尔自治区人民医院

目的 探讨青少年双相障碍(ABD)抑郁发作患者自杀意念与腹内侧前额叶(vmPFC)神经代谢之间的关系。

方法 选取2022年6月~2023年12月在新疆维吾尔自治区人民医院临床心理科住院的40例ABD抑郁发作患者为研究对象, 采用自杀意念自评量表(SIOSS)评估患者的自杀意念, 将总分 ≥ 12 分且掩饰因子得分 < 4 分的患者纳入有自杀意念组($n=21$), 将总分 < 12 分的患者纳入无自杀意念组($n=19$)。采用 $^1\text{H-MRS}$ 扫描vmPFC, 检测N-乙酰天门冬氨酸(N-acetylaspartate, NAA)、肌醇(myo-inositol, mI)、胆碱(choline, Cho)、肌酸(creatine, Cr)水平, 比较两组患者vmPFC脑区N-乙酰天门冬氨酸/肌酸(NAA/Cr)、胆碱/肌酸(Cho/Cr)、肌醇/肌酸(mI/Cr)的比值。

结果 有自杀意念的ABD抑郁发作患者组的NAA/Cr值低于无自杀意念患者组 [(1.10±1.16)比(1.92±0.45)], 有自杀意念的ABD抑郁发作组患者组的Cho/Cr值高于无自杀意念患者组 [(0.86±0.30)比(0.61±0.28)], 差异均有统计学意义 ($P<0.05$); 两组患者的mI/Cr值比较 [(0.43±0.35)比(0.58±0.49)], 差异无统计学意义 ($P>0.05$)。伴有自杀意念的ABD抑郁发作患者的NAA/Cr值与SIOSS评分呈正相关 ($r=0.382, P<0.05$)。

结论 青少年双相障碍抑郁发作患者的自杀意念可能与vmPFC脑区神经元功能下降及膜磷脂分解代谢异常有关。

伴有童年创伤的青少年抑郁发作的易术心理剧干预研究

彭美玲 蒋国庆*

重庆市精神卫生中心

目的 探讨伴有童年创伤的青少年抑郁发作患者, 在接受SSRI类抗抑郁药物治疗的基础上进行易术心理剧干预的效果。

方法 收集2021年2月至2024年2月在重庆市精神卫生中心儿童青少年心理科门诊就诊的青少年抑郁发作的患者, 共60例, 均为初诊。每位患者

符合国际疾病分类第 10 版中抑郁发作的诊断标准,同时符合童年创伤问卷(CTQ)中任一维度的创伤结果阳性,且服用 SSRI 类抗抑郁药物治疗,在家属及患者知情同意的情况下参与本研究。将符合入组的患者随机分为研究组和对照组。研究组:使用 SSRI 类抗抑郁药物+易术心理剧治疗,每位患者分别在六周内接受 3 次易术心理剧治疗的干预,并在第 6 周完成儿童抑郁量表测试。对照组:使用 SSRI 类抗抑郁药物,并在六周进行 3 次门诊复诊,并在第 6 周完成儿童抑郁量表测试。患者在研究过程中可以随时自愿退出本研究。

结果 研究组患者的儿童抑郁量表(CDI)总分显著低于对照组($P < 0.05$),且研究组儿童抑郁量表(CDI)中的负性情绪和低自尊两个维度的得分均显著低于对照组($P < 0.05$)。

结论 易术心理剧可以有效干预伴有早年创伤的青少年抑郁发作患者,并有效改善其负性情绪及低自尊情况。

关键词:青少年;抑郁发作;易术心理剧

青少年重度抑郁发作与社交行为、生活方式及自伤自杀倾向的相关研究

马欣荣*

宁夏回族自治区宁安医院

目的 探讨重度抑郁发作青少年的社交行为和生活方式与自伤自杀之间的关系,以及不同社交生活方式对青少年抑郁、焦虑、自尊和自杀等情绪行为的影响。

方法 对 84 例重度抑郁发作的青少年采用自编一般人口学资料调查表、自我伤害想法和行为访谈表-修订版(SITBI-R)、抑郁自评量表(SDS)、焦虑自评量表(SAS)、儿童社交焦虑量表(SASC)、自尊量表(SES)、羞怯量表(SS)、惧怕否定评价量表(FNE)、多伦多述情障碍量表(TAS)、社交回避及苦恼量表(SAD)、安全感量表(SQ)、青少年睡眠-觉醒量表(ASWS)进行问卷评估。

结果 84 例重度抑郁发作的青少年中存在自伤行为者 62 例(73.81%),有自杀意念者 70 例(83.33%),有自杀计划者 47 例(55.95%)、实施自杀者 46 例(54.76%)。其中,学业压力、饮酒和 SQ 评分为重

度抑郁发作青少年出现自伤行为的危险因素;手机使用、FNE、SQ 和 SS 评分为自杀意念的危险因素;交友情况、吸烟、SAS 和 SASC 评分为自杀计划的危险因素;SDS 评分为实施自杀的危险因素。

结论 重度抑郁发作青少年的自伤和自杀行为与其社交行为和生活方式有显著相关性,其中学业压力、饮酒、手机使用及社交焦虑等因素在不同程度上增加了青少年出现自伤、自杀意念和实施自杀的风险。

关键词:青少年,重度抑郁发作,自伤,自杀,社交行为、生活方式

Multivariate Relationships between C-reactive Protein Inflammatory Marker Subtypes and Cognitive and Free Water Imaging in Adolescent-onset Major Depressive Disorder

Yanling Zhou* Zerui You

The Affiliated Brain Hospital of Guangzhou Medical University

Objective Adolescent-onset major depressive disorder (AO-MDD) exhibits significant heterogeneity in clinical symptoms and pathological mechanisms, with unclear mechanisms of action for risk factors, severely impacting disease prevention and individual treatment outcomes

Methods This study integrated depressive symptoms, cognitive function, childhood trauma, peripheral C-reactive protein (CRP) levels, and free water (FW) imaging. Medication-free AO-MDD patients (N=115) were categorized into inflamed (N=40) and uninflamed (N=75) subtypes based on CRP levels. We explored group-specific relationship between baseline CRP levels and cognitive function, treatment outcomes at 2 weeks, childhood trauma, and FW in regions of interest

Results There were no significant differences in depressive symptoms and cognitive function between the two subtypes. However, in the inflamed AO-MDD subtype, baseline CRP levels were negatively correlated with processing of speed. After antidepressant treatment, a negative correlation between baseline CRP levels and

Hamilton Depression Scale (HAMD) reduction rates in inflamed AO-MDD subtype, not observed in the uninfamed AO-MDD subtype. In addition, total CTQ scores were higher in the inflammatory AO-MDD subtype compared to the non-inflammatory subtype, but there were no differences in FW in the ventral prefrontal cortex (vmPFC) and hippocampus. Further mediation analysis revealed that FW in vmPFC mediated the relationships between CTQ scores and HAMD scores as well as working memory in the inflamed AO-MDD subtype

Conclusion The study emphasizes the importance of understanding the inflammatory subtype of AO-MDD and its neuroimaging mechanisms related to childhood trauma, aiding in disease prevention and treatment innovation

关键词: adolescents with major depressive disorder; diffusion-weighted magnetic resonance imaging; free-water imaging; peripheral cytokine

内侧杏仁核 NRG1 信号通路介导青春期社会隔离诱导的自闭样行为

刘吉红* 陈梓瑜
南方医科大学

目的 ①验证青春期社会隔离对小鼠自闭样行为的调控作用,并建立一种新的由环境因素诱导的自闭症谱系障碍(ASD)小鼠模型。②探究内侧杏仁核(MeA)脑区神经调节素1(NRG1)信号通路在青春期社会隔离诱导的自闭样行为中的作用。

方法 对21天龄的雄性C57BL/6J小鼠进行单笼处理(隔离组,1只/笼)或群居处理(对照组,5只/笼)。通过自闭相关行为学检测、药理学以及电生理、化学遗传学等方法,评估社会隔离对小鼠自闭样行为的影响以及MeA脑区NRG1信号通路是否参与上述过程。

结果 结果表明,在青春期社会隔离四周的小鼠出现社会互动受损、刻板样行为、焦虑样行为和识别记忆缺陷,这些现象在隔离一周、二周和三周的小鼠中未观察到。使用利培酮或阿立哌唑药物治疗显著改善了上述小鼠的自闭样行为。同时观察到MeA脑区的神经元活动减少和NRG1水平降低。

MeA脑区中敲低NRG1可诱导出自闭样行为,而向MeA脑区补充NRG1则可以改善上述社会隔离小鼠的自闭样行为。

结论 本研究建立了一个由青春期社会隔离诱导的ASD小鼠模型,揭示了MeA脑区NRG1信号通路是其关键介导因素。研究结果提示,针对MeA脑区NRG1信号通路可能是ASD治疗的潜在靶点。

青少年情绪障碍自我退行患者的神经认知和fNIRS研究

李艳歌*
郑州大学第一附属医院

目的 青少年焦虑、抑郁、恐惧、强迫所致的疾病经济负担重、对个人学业/职业成就、家庭、社会稳定的影响深远。本研究旨在利用神经认知功能评估、近红外脑功能成像(fNIRS)技术,探究背外侧前额叶、伏隔核等区域的脑活动在自我退行的青少年情绪障碍患者中的变化。

方法 从弗洛伊德提出的自我防御机制分析,青少年情绪障碍后厌学、手机/游戏成瘾、回避社交这些意志活动减退行为是自我退行现象。研究设计:病例对照试验,根据纳入、排除标准确定入组对象,青少年情绪障碍组由两名主治医师参照ICD-10做出疾病诊断,依据主要症状特点确定有无自我退行现象,即厌学、手机/游戏成瘾、回避社交等意志活动减退行为;健康对照组的年龄、性别均与青少年情绪障碍组相匹配。收集数据:两组对象均完成HAMD、HAMA、YB、儿童艾森克人格问卷、防御方式问卷、中国简版神经认知成套测验(C-BCT)、家庭环境量表的评估,使用近红外脑功能成像设备收集神经认知功能评估、自行退行症状访谈期间受试者背外侧前额叶皮层、伏隔核区域的平均氧合血红蛋白浓度。数据分析:fNIRS数据预处理,进行统计学效应分析。

结果 青少年情绪障碍组神经认知功能下降,背外侧前额叶皮层、伏隔核区域脑活动存在不同。

结论 fNIRS可作为预测青少年情绪障碍自我退行的神经影像学指标。

关键词: 青少年情绪障碍, 神经认知, fNIRS

Disrupted Brain Network Dynamics of Tourette Syndrome During Childhood and Adolescence

Tianyuan Lei Xianbin Wang Yonghua Cui*

Department of Psychiatry, Beijing Children's Hospital, Capital Medical University, National Center for Children's Health, Beijing, 100045, China

Objective Tourette Syndrome (TS), a neurodevelopmental disorder characterized by motor and vocal tics, exhibits profound disruptions in brain functional networks. Existing studies on the brain functional networks of TS predominantly focus on static connectivity, ignoring the dynamic adjustments of the functional networks over short time scales. This study aimed to explore the abnormal dynamics in the brain functional modular structure of TS

Methods This study used resting-state functional magnetic resonance imaging (rsfMRI) data of 90 participants (45 patients with TS and 45 healthy control subjects) from the Beijing Children's Hospital. Brain module dynamics were assessed using a multilayer network model. We further followed up on clinical performance in TS after three months of conventional treatment and developed a clinical prognostic prediction model based on the spatial distribution patterns of dynamic modular features using machine learning algorithms

Results Compared with healthy control participants, individuals with TS exhibited a higher global mean and lower standard deviation of whole-brain module dynamics, indicating an unstable and less regionally differentiated pattern. The dynamic module properties of the middle temporal gyrus, inferior temporal gyrus, fusiform gyrus, orbitofrontal gyrus, and frontal pole were significantly positively correlated with tic severity and were significantly negatively correlated in the somatosensory association cortex, cuneus cortex, and anterior cingulate cortex. Additionally, the spatial pattern

of dynamic modules in TS significantly predicted clinical outcomes at three months

Conclusion This study provides new scientific evidence for understanding the abnormal dynamic neurodevelopmental mechanisms in TS and offers innovative approaches to establishing effective prognostic biomarkers in clinical practice

关键词: Tourette Syndrome; brain connectome; dynamic module structure; clinical prognostic prediction model; MRI

一例恋童障碍患者的治疗

郭街仔 夏水银*

江西省精神卫生中心

目的 通过药物治疗合并心理治疗的模式, 探索性心理障碍的治疗

方法 患者为 18 岁的男性, 高三学生。患者多次尾随 10 岁左右的小女孩, 并施行猥亵行为(抚摸对方的身体, 未发生性交行为)。患者多次被公安部门训诫, 教育, 因此送其来就诊。入诊室后的精神检查发现: 患者对自己非常痛苦, 自认为不应该那样做, 但控制不住自己的行为。自诉有时想象在猥亵 10 来岁的女孩子, 很激动, 但好像并不想发生真正的性行为, 并越来越沉迷于对小女孩做那种事情。诊断“恋童障碍”。2022 年 10 月开始, 根据患者病情, 制定药物治疗联合心理治疗的综合治疗模式, 予以“马来酸氟伏沙明 200mg/日”治疗, 每周 2 次的心理治疗, 其中, 在接诊医生处开展“每周一次/六次认知行为+一次家庭治疗(认知行为取向)”治疗, 帮助其学会控制自己的情绪和行为, 改变患者及家属一贯的“读书不能谈恋爱”认知, 鼓励其建立合法合理的亲密关系。在另一位心理治疗师处开展“一周一次的精神分析取向”的心理治疗, 帮助其提高驯服性张力的能力, 促进其人格的成长, 鼓励其通过合适途径达到性满足等。持续治疗一年余。患者 2023 年 10 月起未再出现猥亵幼童的行为, 自诉猥亵幼童的想法明显减少, 且和同龄同学建立稳定的恋爱关系(无实质的性关系), 目前仍在坚持治疗。

结果 使用药物治疗合并心理治疗的模式, 对于性心理障碍的治疗有一定的效果。

结论 治疗后的思考：性心理障碍，在心理门诊就诊的患者中，其实并不少见。在以往，很多精神病学家认为心理障碍的治疗，可用药物不多，很多都是使用厌恶疗法等行为治疗的方法，帮助患者控制欲望，更有很多激进的专家推荐使用化学阉割等方法治疗，但效果都不理想。从精神症状的发生学角度去考虑，性心理障碍有可能和童年的不良经历，特别是遭遇过性暴力、父母亲关系不良等有密切关系——而本案例就符合这个特点——有心理学中“强迫性重复”的特点，也有“精神病学中强迫症”的特点。基于上述考虑，笔者给其开具了氟伏沙明治疗。同时性心理障碍是一组多因素引发的心理疾病，很多文献认为，童年期的不良经历，可能为重要的诱发因素，因此需要更多的心理治疗，帮助处理童年期的创伤。因此，本病例引入精神分析取向心理治疗师共同工作。在多方面的综合治疗下，患者最后取得阶段性的治疗效果。

关键词：恋童障碍、药物治疗合并新理论治疗

“与单亲 Vs 双亲一起生活”对青少年抑郁情绪的影响差异：家庭亲密度与适应性的中介作用

刘剑波 卢建平*
深圳市康宁医院

目的 探讨“与单亲 vs 双亲一起生活”对青少年抑郁情绪的影响差异，同时分析“与单亲 vs 双亲一起生活”与青少年抑郁情绪之间关系的多重中介机制。

方法 本研究在某市有效调查 3505 名青少年，本研究仅纳入“与父母任何一方一起生活”或“与父母双方一起生活”的青少年，其中包括“与父母任何一方一起生活”青少年 680 人（年龄 15.16 ± 4.43 岁）和“与父母双方一起生活”青少年 2615 人（年龄 15.00 ± 2.63 岁）。使用家庭亲密度和适应性量表与流调中心抑郁量表分别评估家庭亲密度与适应性和抑郁情绪，本研究使用 SPSS 21 软件和 Process 3.1 插件处理数据，独立样本 t 检验被用于比较“与父母任何一方一起生活”和“与父母双方一起生活”青少年抑郁症状的差异，线性回归分析影响青少年抑郁情绪的影响因素，同时使用中介模型（Process 3.1 插件

Model 4，采用 Bootstrapping 法，抽样次数 5000）检验“与单亲 vs 双亲一起生活”与青少年抑郁情绪之间关系中的多重中介作用。

结果 (1) 独立样本 t 检验：“与父母任何一方一起生活”的青少年的抑郁症状高于“父母双方一起生活”的青少年的抑郁症状 ($t=2.099, p=0.036$)；(2) 线性回归分析：家庭亲密度和适应性分别负向预测青少年抑郁情绪 (β 值分别是 -0.367 和 $-0.251, p < 0.05$)，然而，“与父母一起生活”变量（“与父母任何一方一起生活” vs “与父母双方一起生活”）对青少年抑郁症状不起到预测作用 ($p > 0.05$)；(3) 进一步多重中介分析：家庭亲密度和适应性分别在“与父母一起生活”变量（“与父母任何一方一起生活” vs “与父母双方一起生活”）与青少年抑郁情绪之间起到完全中介作用（间接路径的 Bootstrapping 法的 95% 可信区间不包括 0，直接路径的 95% 可信区间包括 0）。

结论 相对“与父母双方一起生活”青少年，“与父母任何一方一起生活”青少年抑郁症状更严重，家庭亲密度与适应性可能是影响“与父母任何一方一起生活”青少年抑郁情绪的机制因素。

关键词：青少年抑郁；与父母双方（一方）一起生活；家庭亲密度与适应性；中介分析

积极心理学的应用价值和发展现状

梁锐*
西南医科大学附属自贡医院

目的 加强心理学家和大众对积极心理学的认识和认可度。传统心理学主要关注发现问题和解决异常的心理疾病，被称为消极心理学；积极心理学受人本主义思想的影响，更注重挖掘积极情感和个体的优点，其核心理念在于关注个体的积极特质和生活满意度，它鼓励发展积极情绪，如乐观、感恩和自我效能，这些都能增强个体的抗压能力和适应性，它称得上是心理学领域的一场革命。然而绝大部分心理学家和大众对传统的心理学治疗的方法认知度较深，认可度更强，故而很难接受积极心理学，甚至还有很多专业的心理学家对积极心理学知之甚少，所以希望能通过这篇文章扩大大家对积极心理学的了解和认可，并投入对积极心理学的探索。

方法 综述

结果 积极心理学,作为心理学领域的一个新兴分支,其核心理念是挖掘个体的内在资源和潜能,帮助人们建立积极的情绪调节机制。这一理念的提出,不仅为心理治疗提供了新的视角,更为预防和缓解抑郁、焦虑等情绪困扰提供了有效的途径。在实际应用中,许多临床心理学家发现,积极心理学的干预方法能够显著提升人们的情绪控制能力。通过引导个体关注自身的优势和积极面,可以帮助他们增加对工作、人际和生活等方面的自信,提高自我效能感和抗压能力。这无疑为那些长期处于情绪困扰中的人们带来了新的希望。然而,尽管积极心理学在青少年情绪问题治疗中取得了突出的效果,但它仍面临着诸多挑战。积极心理学发展较晚,在心理学界的影响力和地位相对较低,且目前尚缺乏较多实用性、系统性的操作方法,而且大众对积极心理学的知晓度和认可度也不高。

结论 积极心理学的方法有助于青少年挖掘潜能、发现自己的优点,建立自信,提高对心理治疗的依从性。此外,积极心理学的方法还可以作为一个教育理念,提升家长、教师与青少年的相处的和谐度,促使青少年有一个更健康的支持性的成长环境,对教育界教育理念有显著的影响,给心理治疗的领域带来了新的方向,也能培养了人们积极应对逆境的心态,增强了适应性和情绪恢复能力,引导个体探索个人价值、生活目标,从而促进了个体情绪困扰的缓解。这不仅是个体层面的收获,青少年作为国家的未来,将积极心理学应用到教育领域中,长期广泛的推广积极心理学,青少年可以掌握情绪管理的工具,减少情绪问题,也会让社会更和谐稳定。积极心理学在情绪问题治疗中扮演着至关重要的角色,它不仅提供了有效的干预路径,而且对构建心理健康教育体系具有深远的启示意义。

首发未用药青少年抑郁症患者静息态脑网络度中心性及功能连接分析

冯若涵 李宏伟* 欧阳心芹 张婕 姚洪超 卫翔
绵阳市第三人民医院

目的 抑郁症是影响青少年身心健康以及致残和死亡的主要原因,然而它的病理机制仍不清楚。本研究基于度中心性 (degree centrality, DC) 和功能连接分析探索首发未用药青少年抑郁症患者静息态脑网络节点中心地位的特点及大脑功能连接情况,并分析青少年抑郁症相关压力生活事件,以期揭示青少年抑郁症潜在的脑神经机制。

方法 本研究纳入符合诊断标准的首发未用药青少年抑郁症患者 80 例及性别、年龄匹配的健康志愿者 60 例,采用 24 项汉密尔顿抑郁量表 (Hamilton Depression Scale ,HAMD) 和 14 项汉密尔顿焦虑量表 (Hamilton Anxiety Scale ,HAMA) 评估受试者的抑郁和焦虑症状,采用青少年生活事件量表 (Adolescents Self-Rating Life Events Checklist ,ASLEC) 评估受试者的生活压力情况。采用静息态功能磁共振成像技术采集所有受试者磁共振数据,基于 DPABI V2.3 软件对数据进行预处理后得到 DC 图,采用双样本 t 检验比较抑郁组和健康对照组脑功能图像差异。提取有差异的脑区作为种子点,并采用基于种子点的静息态功能连接分析方法,分析差异脑区与全脑的功能连接。提取差异脑区 DC 值和功能连接强度与患者的临床量表评分进行偏相关分析,以性别、年龄和头动作为协变量。

结果 抑郁组 HAMD、HAMA 和各压力生活事件评分明显高于对照组 ($p<0.05$);抑郁组右侧枕下回后部、梭状回 DC 值明显高于健康对照组 ($p<0.05$, FDR 校正);基于种子点分析发现右侧梭状回与右侧豆状核和左侧壳核功能连接降低。抑郁组右侧枕下回后部、梭状回 DC 值与 HAMD 评分呈正相关。

结论 1.青少年抑郁症患者存在较大的生活压力事件。

2. 青少年抑郁症患者存在静息态脑网络节点中心地位的改变,这些脑区主要位于视觉皮层区,提示视觉功能异常,并且这些异常与抑郁症状有关。

3. 青少年抑郁症患者视觉皮层与豆状核和壳核功能连接存在异常,提示青少年抑郁症患者视觉相关认知、情绪功能受损。

这些异常,可能是青少年抑郁症潜在的神经病理机制。

Loneliness, Hopelessness and Internet Addiction Among Non-suicidal Self-injury Adolescents: The Mediating Role of Emotion-focused Coping

Liang Liu*

Pudong New Area Mental Health Center

Objective This study aims to examine the relationship between loneliness and hopelessness and Internet addiction in non-suicidal self-injury (NSSI) adolescents, exploring the mediating role of problem-focused coping and emotion-focused coping.

Methods A total of 1545 NSSI adolescents (82.5% females; $M=14.88$, $SD=1.63$) and 553 (64.9% females; $M=15.43$, $SD=1.60$) non-NSSI adolescents from over 20 specialized psychiatric hospitals across multiple provinces in China were recruited in this study and completed the measures regarding loneliness, hopelessness, coping styles, and mobile phone addiction Scale.

Results *t*-tests showed that NSSI adolescents had lower score on problem-focused coping and higher scores on mobile internet addiction, loneliness, hopelessness, and emotion-focused coping than non-NSSI adolescents. Multi-group structural equation modeling was further used to examine the direct and indirect effects of loneliness and hopelessness on Internet addiction across two groups. Results showed that loneliness and hopelessness were positively related to mobile internet addiction, and emotion-focused coping played a mediating role for both NSSI and non-NSSI adolescents. In addition, the model was found to be variant across the two groups

Conclusion These findings suggest that NSSI adolescents with loneliness and hopelessness may have high usage of emotion-focused coping and mobile phone dependence. Such findings have potential implications for reducing Internet addiction of adolescents with NSSI.

2.人脑保护高精尖创新中心, 首都医科大学

目的 非自杀性自伤 (non-suicidal self-injury, NSSI) 和自杀未遂 (suicide attempt, SA) 严重威胁青少年的健康。二者常共存, 且有 SA 经历的 NSSI 患者面临更高的自杀风险, 然而二者的鉴别主要依靠临床观察, 对缺乏经验的临床医生造成了诊断困难, 因此亟需客观的生物标志物来辅助诊断。本研究旨在探讨炎症标志物 (C 反应蛋白 [C-reactive protein, CRP]、补体成分 3 [complement component 3, C3]、补体成分 4 [complement component 4, C4] 与 NSSI 患者 SA 经历之间的关联, 并评估其诊断效能。

方法 本研究共招募了 255 名 NSSI 青少年患者。使用 PHQ-9 和渥太华自伤量表评估抑郁症状和 NSSI 行为的严重程度, 使用半结构化访谈评估 SA 经历, 同时测量血浆中 CRP、C3 和 C4 水平。通过 logistic 回归模型控制相关混杂因素, 以分析 CRP、C3、C4 与青少年 NSSI 患者 SA 经历之间的关联。此外, 使用受试者工作特征 (receiver operating characteristic, ROC) 曲线分析评估各炎症标志物的诊断效能。

结果 本研究纳入 97 名不伴 SA 经历的 NSSI 患者 (仅 NSSI 组) 和 158 名伴 SA 经历的 NSSI 患者 (NSSI+SA 组)。NSSI+SA 组血浆 CRP、C4 水平显著高于仅 NSSI 组。Logistic 回归分析结果显示, CRP 水平升高 ($OR=1.989$, 95% CI: [1.313-3.014], $P=0.001$) 和 C4 水平升高 ($OR=1.092$, 95% CI: [1.016-1.174], $P=0.017$) 与 NSSI 患者中 SA 发生率增加独立相关。Logistic 回归模型的曲线下面积 (area under the curve, AUC) 为 0.732 (95% CI: [0.672-0.792], $P<0.001$)。单变量 ROC 曲线分析显示, CRP 鉴别伴 SA 经历的 NSSI 青少年的 AUC 为 0.622 (95% CI: [0.554-0.690], $P=0.001$), 最佳临界值为 1.95 mg/L, 灵敏度为 0.462, 特异度为 0.804; C4 鉴别伴 SA 经历的 NSSI 青少年的 AUC 为 0.623 (95% CI: [0.554-0.692], $P=0.001$), 最佳临界值为 18.5 mg/dL, 灵敏

度为 0.614, 特异度为 0.577。

结论 伴 SA 经历的 NSSI 青少年表现出更高的炎症水平。临床实践中可以根据炎症标志物可能有助于临床识别伴 SA 经历的 NSSI 患者从而采取针对性的治疗、护理措施。

非自杀性自伤行为特征联合网络成瘾倾向对青少年双相抑郁障碍的识别

刘梦琪¹ 刘梦琪² 郑毅² 郑毅¹ 王巍巍^{1,2} 袁晓菲^{1,2} 陈旭^{1,2}

1.首都医科大学附属北京安定医院, 国家精神心理疾病临床医学研究中心, 精神疾病诊断与治疗北京市重点实验室

2.人脑保护高精尖创新中心, 首都医科大学

目的 比较青少年单相抑郁障碍 (unipolar depression, UD)、双相抑郁障碍 (bipolar depression, BD) 之间的非自杀性自伤 (non-suicidal self-injury, NSSI) 行为特征和网络成瘾倾向, 并探讨是否可以根据二者识别青少年 BD。

方法 本研究纳入共纳入 129 名处于抑郁发作期的青少年 NSSI 患者, 分为 UD 组 45 人, BD 组 84 人, 使用卡方检验、独立样本 t 检验比较两组间特征差异, 并根据组间比较的结果建立逐步 logistics 回归方程, 后通过受试者工作特性 (receiver operating characteristic, ROC) 曲线评估模型对 BD 的诊断价值。

结果 UD、BD 患者在年龄、性别、居住地、父母受教育程度以及 HAMD-24 和 YMRS 得分均无显著差异。BD 组患者过去 1 年自伤行为严重程度、自伤方式总数、自伤原因 (社会影响、外部情绪调节、内部情绪调节)、自伤成瘾总分显著高于 UD 组患者。BD 组在网络成瘾总分、耐受性和时间管理、人际学业与健康问题、戒断反应的得分显著高于 UD 组, 两组间强迫性与突显性得分无显著差异。自伤成瘾总分 (OR 值为 1.103, 95%CI: 1.045-1.164, P=0.000) 和网络成瘾总分 (OR 值为 1.033, 95%CI: 1.010-1.057, P=0.003) 均为青少年 BD 的独立危险因素。自伤成瘾总分联合网络成瘾总分在伴 NSSI 行为的抑郁发作青少年中识别 BD 的 ROC 曲线下面积

为 0.742 (95%CI: 0.655-0.829, P<0.05), 灵敏度为 0.774, 特异度为 0.644。

结论 成瘾特质 (网络成瘾、自伤成瘾) 为青少年双相抑郁障碍的独立危险因素, 自伤成瘾联合网络成瘾评估可识别青少年 BD 患者。

青少年社会支持对抑郁症状的影响: 安全感和心理弹性的中介与调节作用

颜国利 李一江 侯筱菲 李明慧 孙凌 贾世龙 尹慧芳 徐广明*

天津市安定医院

目的 研究青少年中社会支持与抑郁症状之间关系, 并分析安全感和心理弹性在其中的中介与调节作用, 为理解和干预青少年抑郁症状提供新的视角。

方法 在中国天津市便利选择了一所中学, 共纳入了 2,713 名学生 (11-18 岁, 49.54%为女性)。我们使用量表社会支持问卷, 安全感问卷, 心理弹性量表和 PHQ-9 问卷, 分别评估了学生的社会支持、安全感、心理弹性和抑郁症状。该调查共收集了 2705 份有效问卷。使用 R 软件进行统计分析。

结果 有抑郁症状的青少年占 29.70%, 其中女性 436 例 (54.30%), 女性多于男性。与男生相比, 女生抑郁症状评分较高, 安全感得分和心理弹性较低。社会支持与抑郁症状之间的关系部分由安全感介导, 安全感介导的中介效应占总效应的 36.87%。心理弹性对中介模型中的直接路径和间接路径都有显著的调节作用。与低心理弹性相比, 高心理弹性条件下, 对安全感知的影响更强; 低安全感对抑郁症状的影响较小; 低社会支持对抑郁症状的影响较小; 并且在整个观测数据范围内具有显著性。

结论 青少年抑郁症状检出较高, 应关注女性青少年心理健康状况。心理弹性对中介模型中的直接路径和间接路径都有显著的调节作用, 提示心理弹性增强了安全感, 并缓和了低安全感和社会支持差对抑郁症状的影响。因此, 我们可以通过专注于培养青少年的心理弹性和增强他们的安全感来减轻或者预防抑郁症状。

- 2.绵阳市第三人民医院
- 3.川北医学院精神卫生学院

目的 边缘人格障碍(BPD)是一种严重的精神障碍,经常与抑郁症状共病。该疾病通常在青少年时期发病,并在成年早期达到顶峰。青少年时期是早期识别和干预BPD的关键时期,然而,目前对其发病机制仍不清楚。本研究旨在探讨认知自知力对青少年早期BPD和抑郁症状的影响,并分析非自杀性自伤行为(NSSI)和自杀企图(SA)与早期BPD及抑郁症状的关系。

方法 我们采用修订版贝克认知自知力量表(BCIS)、儿童青少年边缘特征量表(BPFS-C)、抑郁自我评估量表(PHQ-9)、青少年非自杀性自伤量表和自杀行为问卷修订版(SBQ-R)对5572名青少年进行线下问卷调查。通过单因素逻辑回归(logistic)和多元线性回归分析认知自知力(包括自我确定、自我反思、综合指数三个维度)、NSSI、SA与早期BPD和抑郁症状的诊断及严重程度之间的关联。我们还通过计算BPD和抑郁症状共存共同联合优势比(COR)来分析两者的共病情况,并通过潜在类别分析(LCA)探究认知自知力及自残行为与BPD和抑郁的潜在关联。

结果 单因素logistic及多元线性回归结果显示,认知自知力(包括自我反思、自我确定、综合指数三个维度)与早期BPD和抑郁症状的诊断及严重程度呈显著正相关(OR自我反思-BPD=1.25, OR自我确定-BPD=1.12, OR综合指数-BPD=1.17, OR自我反思-抑郁=1.2, OR自我确定-抑郁=1.09, OR综合指数-抑郁=1.16; β 自我反思-BPD=0.518, β 自我确定-BPD=0.306, β 综合指数-BPD=0.311, β 自我反思-抑郁=0.41, β 自我确定-抑郁=0.157, β 综合指数-抑郁=0.301),自残行为也与早期BPD和抑郁症状

的诊断及严重程度呈显著正相关(ORNSSI-BPD=3.89, ORSA-BPD=4.74, ORNSSI-抑郁=4.65, ORSA-抑郁=5.99; β 自我反思-BPD=0.327, β 自我确定-BPD=0.185, β 自我反思-抑郁=0.358, β 自我确定-抑郁=0.222),COR结果显示认知自知力及自残行为与早期BPD和抑郁症状的同时发生没有显著相关性,LCA在认知自知力及自残行为的发生上产生了两类差异。高认知自知力组相比低认知自知力组更有可能诊断早期BPD和抑郁症状,并且与严重程度呈显著正相关。

结论 认知自知力与早期BPD和抑郁症状密切相关,较高的认知自知力可能是早期BPD和抑郁症状的一个特殊风险标志。同时,我们发现自残行为也是早期BPD和抑郁症状发生的风险因素,早期识别自残行为可以减少BPD和抑郁症状发生的机率。

关注阅读障碍儿童的心理健康: 阅读能力、抑郁症状和行为问题的中介反馈循环

余心乐^{1,2} 吴库生³ 张绚智^{1,2} 刘嘉裕^{1,2} 顾倩菲^{1,2}
黄燕虹^{1,2}

- 1.汕头大学精神卫生中心
- 2.汕头大学医学院—曼尼托巴大学医学院生物精神病学联合实验室
- 3.汕头大学医学院预防医学系

目的 了解发展性阅读障碍儿童的心理健康现状,探讨儿童阅读能力、抑郁症状和行为问题的关联,为促进阅读障碍儿童的健康发展提供依据。

方法 本研究采用病例对照设计,纳入了2021年12月至2023年12月在汕头大学精神卫生中心确诊为发展性阅读障碍的44名2~5年级儿童作为病例组,从汕头市一所公立小学中按照年龄和年级匹配的原则随机抽取了81名学生作为对照组。使用汉语语音加工任务测试儿童的阅读能力,使用儿童抑郁障碍自评量表(DSRSC)和Achenbach儿童行为量表(CBCL)评估儿童的抑郁症状与行为问题。基于Bootstrap方法,应用Hayes编制的SPSS宏程序PROCESS模型4进行中介效应检验。

结果 (1) 阅读障碍儿童在语音加工任务中的正确率显著低于非阅读障碍儿童 ($P < 0.001$), 且随着任务难度的增加, 差异更为显著。阅读障碍儿童的抑郁症状检出率显著高于非阅读障碍儿童 (40.9% vs. 17.3%, $P < 0.01$), 在行为问题 (包括内化行为问题、外化行为问题和总行为问题, 下同) 上的得分也均显著高于非阅读障碍儿童 ($P < 0.001$)。 (2) 儿童的阅读能力、抑郁症状和行为问题之间呈显著相关 (P 值均 < 0.01)。 (3) 儿童的阅读能力可以正向预测抑郁症状和行为问题。此外, 在阅读困难的影响下, 行为问题可以在阅读能力与抑郁症状之间起部分中介作用, 抑郁症状也可以在阅读能力与行为问题之间起部分中介作用。 (4) 儿童的抑郁症状和行为问题同样可以直接对阅读能力产生负向影响, 二者相互影响, 互为中介, 对阅读能力产生部分中介效应。

结论 本研究揭示了中国学龄儿童的阅读能力、抑郁症状和行为问题之间的中介反馈循环及其相互强化的关系。抑郁情绪和行为问题可能源于阅读困难, 也可能有助于缓解阅读困难, 形成交互影响的循环效应。因此, 我们需要将阅读支持与心理援助相结合, 制定针对阅读障碍儿童不同表型、情绪状况和行为特点的个性化干预方案, 使儿童在学业和心理上茁壮成长, 为取得良好的教育成果和促进社会发展奠定基础。

Childhood Emotional Maltreatment Affects Depression of Adolescents with Mood Disorders: The Mediating Role of Functions of Non-suicidal Self-injury

Qian You¹, Ying Ou¹, Na Meng², Linglin Guo¹, Yinghua Ye¹, Xing Xie¹, Wei Yuan³, Qiaoling Liao⁴, Juan Chen¹

1. Mental Health Center of West China Hospital, Sichuan University

2. School of Nursing, the University of Hong Kong

3. Sleep Medicine Center of Chengdu Fourth People's Hospital

4. The second department of severe Psychiatric, The Third Hospital of Mianyang • Sichuan Mental Health

Center

Background A wealth of data points to childhood emotional maltreatment as a risk factor for depression in adolescence. However, not much is understood about how non-suicidal self-injury mediates this relationship. Thus, the goal of this research was to ascertain how non-suicidal self-injury functions relate to childhood emotional maltreatment and depression

Methods The participants were adolescents with mood disorders from three hospitals in Sichuan Province, data was collected using self-administered questionnaires, including the Childhood Trauma Questionnaire, Ottawa Self-injury Inventory-Functions, and Childhood Depression Inventory. SPSS26.0 software and PROCESS v3.3 model 4 was used for analysis

Results In all, 295 adolescents ($M_{age}=14.8$, $SD=1.62$) participated in the research. The functions of non-suicidal self-injury ($r=0.289$, $P < 0.01$) and depression ($r=0.475$, $P < 0.01$) were considerably positively connected with childhood emotional maltreatment, and the functions of non-suicidal self-injury were strongly positively correlated with depression ($r=0.364$, $P < 0.01$). The direct impact of childhood emotional maltreatment on depression in adolescents was found to be significant (95% CI 0.434, 0.828) in the mediated effects model. Additionally, the indirect effect of childhood emotional maltreatment on depression through non-suicidal self-injury functions was found to be significant (95% CI 0.055, 0.236), with a mediating effect value of 17.58%

Conclusion Childhood emotional maltreatment has a direct impact on depression, but it also has an indirect influence through mediation roles of non-suicidal self-injury. Medical staff should take care of the mental health of adolescents hospitalized for mood disorders so that they can clarify the role of NSSI in lowering depressive symptoms and improving quality of life and create more targeted and effective intervention plans

PRKCB Methylation Is Associated with Childhood Chronic Stress in Adolescent Major Depressive Disorder--- A Cross-sectional Study

Li Yin* Yuanmei Tao

mental health center, West China Hospital, Sichuan University

Objective Gene methylation is considered to be involved in the process of gene expression in many disease including psychiatric disorder. Many evidences have been found between gene methylation and major depressive(MDD), but how the relationship between gene methylation and chronic stress in unclear. A previous study have found PRKCB methylation was associated with MDD by genome-wide epigenetic association analysis in human brain tissue. The purpose of this study was furtherly to investigate the relationship between childhood chronic stress (CCS) and protein kinase C beta (PRKCB) methylation in adolescent MDD

Methods We recruited 100 adolescents with MDD (41 male, f59female) and 50 healthy controls (HCs) (28 male, 22 female). PRKCB methylation level were assessed by pyrosequencing using whole blood-derived DNA to explore the relationship between CCS and PRKCB methylation level in adolescent MDD. CCS was assessed by the Childhood Chronic Stress Questionnaire (CCSQ)

Results PRKCB methylation level and CCS were both found to be associated with the severity of depressive symptom in MDD, and CCS also was associated with PRKCB methylation level

Conclusion We found that PRKCB methylation level was associated with CCS, as well as the severity of depressive symptom in MDD, suggesting that PRKCB methylation may be an important factor in adolescent MDD

关键词: Adolescent MDD; Childhood chronic stress; PRKCB; DNA methylation

Mediating Effects of Insomnia and Resilience

on COVID-19-related Post-traumatic Stress Disorder and Quality of Life in Adolescents

Objective The coronavirus disease-2019 (COVID-19) pandemic has impaired the quality of life (QoL) for many due to its extensive impacts. However, few studies have addressed the specific impact of COVID-19 on the mental health of adolescents, particularly post-traumatic stress disorder (PTSD). This study considered the impact of COVID-19-related PTSD on the QoL of adolescents in China, the mediating effects of insomnia, and the moderating effects of resilience

Methods Participants included 50,666 adolescents aged 12 to 18 years selected using a comprehensive sampling method. We performed data collection from January 8th to January 18th, 2023, using the Children's Revised Impact of Event Scale, Pittsburgh Sleep Quality Index, Ten-item Connor-Davidson Resilience Scale, and Screening for and Promotion of Health-related QoL in Children and Adolescents Questionnaire for data collection

Results Male adolescents exhibited significantly lower levels of PTSD and insomnia compared to females and scored significantly higher in psychological resilience and overall QoL. Insomnia played a mediating role between PTSD and QoL. Psychological resilience moderated the impact of COVID-19-related stress on adolescents' QoL through its influence on insomnia

Conclusion PTSD resulting from the COVID-19 pandemic affects the QoL of adolescents through the presence of insomnia. Psychological resilience plays a moderating role in this process. Cultivating psychological resilience in adolescents can effectively enhance their ability to cope with the impacts of sudden public events

关键词: Post-traumatic stress disorder; Coronavirus disease-2019; Quality of life; Insomnia; Resilience; Adolescents

青少年抑郁发作患者人格特征与儿童期创伤及父母养育方式关系研究

孙雨蒙 卢建平*

深圳市康宁医院

目的 本研究旨在探讨青少年抑郁发作患者人格特征的影响因素，并分析儿童期创伤在父母养育方式与青少年抑郁发作患者人格特征之间的中介作用，从心理机制的角度为青少年抑郁发作的防治提供针对性的指导。

方法 以2020年8月-2021年12月深圳市康宁医院儿少精神科收治的187例抑郁发作患者为被试，采用艾森克人格问卷、儿童期创伤问卷和父母养育方式评价量表评估患者的心理状况，采用Pearson相关分析方法分析各人格维度与儿童期创伤总分、父母养育方式各因子之间的关联，采用多元逐步线性回归预测各人格维度的影响因素，采用SPSS软件Process插件通过Bootstrap法对儿童期创伤在父母养育方式与青少年抑郁发作患者人格特征之间的中介效应进行验证。检验水准 $\alpha=0.05$ 。

结果 (1) 母亲拒绝、否认的养育方式和儿童期创伤正向预测神经质维度(β 值分别为0.36和0.18, P 值均 <0.05)；父亲偏爱被试的养育方式正向预测内外向维度、负向预测神经质维度(β 值分别为0.90和-0.78, P 值均 <0.05)；父亲拒绝、否认的养育方式正向预测神经质维度(β 值=0.66, P 值 <0.05)。

(2) 儿童期创伤在母亲拒绝、否认的养育方式与青少年抑郁发作患者的神经质维度之间起到了中介作用(效应值为0.14, 95%CI: 0.03~0.26)；儿童期创伤在父亲偏爱被试的养育方式与青少年抑郁发作患者的神经质维度之间起到了中介作用(效应值为-0.14, 95%CI: -0.25~-0.05)；儿童期创伤在父亲拒绝、否认的养育方式与青少年抑郁发作患者的神经质维度之间起到了中介作用(效应值为0.16, 95%CI: 0.03~0.30)。

结论 父母养育方式影响青少年抑郁发作患者人格特征，其关系受到儿童期创伤的影响。

关键词 青少年,抑郁发作,人格特征,儿童期创伤,父母养育方式

Relationship of Depression Levels To Internet Addiction and Inflammatory Factors in Adolescents with Depressive Disorder Exposed To Secondhand Smoke

Xin Zhao², Xin Zhao¹, Mingru Hao¹, Mingru Hao², Haojie Fan², Haojie Fan¹, Lewei Liu¹, Lewei Liu², Cheng Yang^{1,2}, Huanzhong Liu^{1,2}

1.Department of Psychiatry,Chaohu Hospital of Anhui Medical University

2.Department of Psychiatry, School of Mental Health and Psychological Sciences, Anhui Medical University,

目的 抑郁水平通常与网络成瘾(IA)和炎症生物标志物的水平有关。然而，在暴露于二手烟的抑郁症青少年中，这种关联尚未得到充分探索。本研究旨在探讨暴露于二手烟环境的抑郁症青少年中IA抑郁程度与炎症细胞因子之间的关联。

方法 从2023年1月到12月，这项研究包括136名患有抑郁症的青少年和83名健康对照(HC)。使用24项汉密尔顿抑郁量表(HAMD-24)和网络成瘾测试量表(IAT)来评估抑郁和网络成瘾症状。此外，还测量了白细胞介素(IL)-1 β 、IL-6、IL-8、IL-10、IL-17A和肿瘤坏死因子- α (TNF- α)的血浆水平。

结果 青少年抑郁症的二手烟暴露率为77.2%。患者的IA评分和二手烟暴露高于HC(均 $P>0.05$)。二手烟暴露组的24项汉密尔顿抑郁量表评分与IA总分和IL-1 β 、IL-6、IL-10、IL-17A和TNF- α 水平呈正相关，但与性别呈负相关。相比之下，在非二手烟暴露组中，24项汉密尔顿抑郁总分与TNF- α 水平和性别呈负相关。进一步的多因素逐步线性回归分析显示，在二手烟暴露组中，HAMD-24评分与IA评分($\beta=0.350$, $t=4.024$, $P<0.001$)、性别($\beta=-0.249$, $t=-2.846$, $P=0.005$)和IL-6水平($\beta=0.216$, $t=2.466$, $P=0.015$)独立相关。相比之下，在非二手烟暴露组中，HAMD-24总分与性别($\beta=-0.374$, $t=-22.347$, $P=0.026$)和TNF- α ($\beta=-0.356$, $t=-2.234$, $P=0.034$)独立相关。

结论 二手烟暴露在患有抑郁症的青少年中很常见，在二手烟暴露的情况下，抑郁程度与IA和炎

性细胞因子水平升高有关。研究结果表明, IA 和炎症性细胞因子可能与青少年抑郁症患者抑郁水平升高有关, 但需要进一步的纵向研究来探索抑郁症青少年患者的抑郁水平与网络成瘾和炎症细胞因子之间的因果关系。

目的 探讨童年性虐待对青少年抑郁症患者自杀未遂的影响, 及反刍思维与抑郁症状是否在童年性虐待和自杀未遂关系中起到链式中介作用。

方法 采用儿童期创伤问卷(Childhood Trauma Questionnaire-short Form, CTQ-SF), 患者健康问卷抑郁量表(patient health questionnaire-9, PHQ-9)、反刍思维量表-10 简表(ruminative responses scale, RRS-10), MINI 5.0 中文版自杀模块对 796 名符合研究纳入标准的 11-18 岁单相抑郁青少年进行临床评估。应用 SPSS23.0 对数据进行描述统计、差异分析、相关和回归分析;应用 SPSS PROCESS V3.4 插件进行 Bootstrap 中介效应检验。

结果 ① 单相抑郁青少年自杀未遂发生率为 55.78%, 其中女性是男性的 1.6 倍 (OR=1.605, 95% CI: 1.169-2.204)。② 与无自杀未遂组相比, 自杀未遂组年龄更小(16 [14,17]分与 15 [14,16]分, $p < 0.001$); PHQ-9 (14 [9,19]分与 18 [12,23]分, $p < 0.001$); 反刍思维(22 [18,27]分与 24 [21,29]分, $p < 0.001$); 性虐待 (5 [5,6]分与 5 [5,7]分, $p = 0.001$) 分数均显著更高, 差异具有统计学意义。③ 回归分析显示童年性虐待 (OR=1.086, 95% CI: 1.035-1.143)、反刍思维 (OR=1.031, 95% CI: 1.005-1.057), 抑郁症状 (OR=1.041, 95% CI: 1.017-1.065)、年龄 (OR=0.852, 95% CI: 0.782-0.927) 是自杀未遂的风险因素。④ 中介效应分析结果表明, 童年性虐待既可直接影响抑郁症青少年自杀未遂行为 ($\beta = 0.083$, 95% CI: 0.033-0.132, $p = 0.001$), 又可通过反刍思维的简单中介 ($\beta = 0.007$,

95% CI: 0.001-0.017) 及反刍思维与抑郁症状的链式中介 ($\beta = 0.005$, 95% CI: 0.002-0.010) 影响自杀未遂, 总间接效应占总效应的 14.43%。

结论 童年性虐待是青少年抑郁症患者自杀未遂的重要风险因素, 童年性虐待不仅可直接增加自杀未遂的风险, 还可通过反刍思维和抑郁症状间接增加自杀未遂行为, 临床中应加强对童年性虐待和反刍思维的有效评估和干预, 降低自杀风险。

Prevalence and Clinical Features of The Adolescent Patients with Major Depressive Disorder Co-occurring Insomnia and Excessive Daytime Sleepiness Symptoms

Mingru Hao¹, Mingru Hao², Huanzhong Liu², Huanzhong Liu¹

1. Chaohu Hospital of Anhui Medical University

2. Department of Psychiatry, School of Mental Health and Psychological Sciences, Anhui Medical University

Objective This study aimed to examine the prevalence and clinical features of the adolescent patients with major depressive disorder (MDD) co-occurring insomnia and excessive daytime sleepiness (EDS) symptoms

Methods This was a cross-sectional study, which enrolled a total of 491 adolescent inpatients and outpatients who meet the criteria of MDD based on the Diagnostic and Statistical Manual of Mental Disorders, fifth edition (DSM-V). The Insomnia Severity Index (ISI) and The Epworth Sleepiness Scale (ESS) was used to evaluate whether the participants co-occurring insomnia and EDS symptoms. The socio-demographic characteristics and clinical features were compared among the following four groups: co-occurring excessive daytime sleepiness and insomnia symptoms (INS-EDS), insomnia symptom only (INS-Only), excessive daytime sleepiness symptom only (EDS-Only) and no sleep disturbance (NS)

Results Of the 491 adolescent patients with

MDD, 61.1% had sleep disorders, among which 21.2% had INS-only, 25.1% had EDS-only, and 14.9% had INS-EDS. Trazodone use was more frequent in patients with INS-Only group compared to the EDS-Only group, while the use of other medication did not differ among the four groups. Similar to the INS-Only group, patients with both sleep disturbances had higher suicidal ideation, more severe depressive symptom and lower quality of life. Compared to the NS group, patients with co-occurring sleep disturbances were more likely to be addicted to the internet, suffer from cyber bullying and experience abnormal parental marital status

Conclusion The joint presentation of insomnia and EDS in depression were associated with more severe clinical features than depressed adolescent patients without sleep disorders. But we did not find the difference of clinical manifestations between the INS-EDS group and the INS-Only group. Further research is warranted to more fully understand the joint presentation of insomnia and EDS in depressed adolescent

青少年抑郁障碍患者肥胖与炎症细胞因子的关联性研究

郝明茹^{1,2} 刘震忠^{1,2}

1.安徽医科大学附属巢湖医院

2.安徽医科大学精神卫生与心理科学学院

目的 探讨青少年抑郁障碍患者肥胖的患病特点及其与炎症细胞因子的关系。

方法 入组符合《精神疾病诊断与统计手册》第五版(DSM-5)抑郁障碍诊断标准的患者147例,根据我国青少年体质指数(BMI)分类标准,将患者分为消瘦组、正常组、超重组及肥胖组。采用流调用抑郁自评量表(CES-D)评估患者抑郁水平,以及超敏电化学发光技术(MSD)测定血浆炎症细胞因子IL-10、IL-17A、IL-1 β 、IL-6、IL-8及TNF- α 的水平。使用SPSS23.0进行统计分析,组间比较分别采用单因素方差分析或Kruskal-Wallis H检验,及 χ^2 检验。采用Spearman相关分析BMI与炎症细胞因子之间

的关系,以及多元线性回归分析青少年抑郁障碍患者伴发肥胖的影响因素。

结果 147例青少年抑郁障碍患者中,体型异常率为38.78%(57/147),其中消瘦、超重及肥胖率分别为12.24%(18/147)、16.33%(24/147)、10.20%(15/147)。四组患者在性别($\chi^2=8.582$, $P=0.032$)及炎症细胞因子IL-6($H=10.113$, $P=0.018$)和IL-8($H=9.443$, $P=0.024$)上的差异有统计学意义。多重比较结果显示:与消瘦组相比,肥胖组血浆IL-6($Z=-2.717$, $P=0.007$)和IL-8水平($Z=-2.698$, $P=0.007$)水平更高;与正常组相比,男性肥胖率高于女性($\chi^2=7.386$, $P=0.007$),肥胖组IL-6水平($Z=-2.787$, $P=0.005$)更高。Spearman相关分析结果显示: BMI与IL-6($r_s=0.256$, $P=0.002$)及IL-8($r_s=0.185$, $P=0.025$)呈正相关。多元线性回归分析显示,血浆IL-6($\beta=0.722$, $P<0.001$)及性别($\beta=2.566$, $P=0.001$)是青少年抑郁障碍患者伴发肥胖的独立影响因素。

结论 青少年抑郁障碍患者的肥胖率存在性别差异,肥胖与抑郁障碍并存会放大炎症状态。

工作记忆训练联合盐酸托莫西汀治疗学龄期ADHD效果的研究

李纪迎 张艳*

山东省精神卫生中心

目的 分析工作记忆训练联合药物盐酸托莫西汀治疗学龄期ADHD患儿的效果。

方法 选取100例学龄期ADHD患儿,使用《注意缺陷多动障碍评定量表》评估其临床症状严重程度及临床亚型,使用《Conners父母评定问卷》评估其行为问题,利用数字广度、视空间记忆、Stroop色词干扰任务及N-back范式等评估其工作记忆特征。将100例患儿区组随机法分为试验组(50例,工作记忆训练联合盐酸托莫西汀治疗)和对照组(50例,盐酸托莫西汀治疗)2组。两组ADHD患儿分别进行为期8周的治疗。评估比较两组患儿临床症状及工作记忆功能改善情况。

结果 1.人口学资料的对比: 两组的性别、年龄比较无差异($P>0.05$); 2.Conners父母症状问卷结

果中两组在多动指数、多动冲动、学习问题、品行问题四个因子得分无显著差异 ($P > 0.05$); 3.在数字广度、视空间记忆、1-back 任务的正确率、Stroop 色词干扰任务等测试结果中两组未发现显著差异 ($P > 0.05$); 4.注意力缺陷、多动冲动因子分数与 N-back 正确率、Stroop 阅读总数等记忆功能因子呈负向关系。5.经过 8 周治疗, 两组患儿的《注意缺陷多动障碍评定量表》得分及数字广度、视空间记忆、1-back 任务的正确率、Stroop 色词干扰任务等得分均有显著改善 ($P < 0.01$); 且实验组工作记忆分子得分显著高于对照组 ($P < 0.05$)。

结论 1.ADHD 患儿临床核心症状严重程度与其工作记忆功能呈负相关。2.工作记忆训练联合药物盐酸托莫西汀治疗 ADHD 患儿在有效减轻临床核心症状的同时, 还能明显改善患儿的工作记忆功能。

初中阶段注意缺陷多动障碍组织技能训练效果分析

江文庆¹ 李焱¹ 林裕雄¹ 朱红⁵ 凌晓霞⁴ 孙智信¹ 程永琛³ 周丹妮²

1.上海市精神卫生中心

2.上海市罗山中学

3.上海市浦东教育发展研究院

4.上海市杨园中学

5.上海市洋泾中学

目的 注意缺陷多动障碍(ADHD)初中阶段患儿存在众多的功能损害, 其功能改善的需求容易受到忽视。组织技能功能损害是指个体无法做出时间安排、计划和管理自己生活的能力。ADHD 患儿的组织技能特征如何? 组织技能表现与患儿的症状、自尊水平是否存在相关性? 通过组织技能训练(下称“OST”)能否改善患儿的症状, 甚至改善个体的自尊水平? 组织技能的训练是否在初中阶段 ADHD 患儿中可行? 是一系列值得探索的问题。

方法 由上海市精神卫生中心儿少科组织, 以上海市浦东新区青少年发展中心(下称“区中心”)的主要合作方, 在 2021 年 2 月到 2023 年 12 月期间, 由区中心通过学校心理系统向区内初中阶段在校学

生公开招募未服药的 ADHD 患儿。由家长及学生知情同意后, 由医生确认 ADHD 的诊断。对符合入组标准的患儿开展组织技能训练, 每周一次, 每次 1 个小时, 分为家长组和青少年组, 由医生及心理老师为治疗师, 两组同时进行, 共 10 次, 干预内容参考《注意缺陷多动障碍儿童组织技能训练》, 并加以初中阶段的改编。在干预前、后分别采用注意缺陷多动障碍诊断量表、自我意识量表和执行功能评定量表(BRIEF)进行评定, 并进行自身前后 t 检验。

结果 共 21 名青少年 ADHD 患儿入组, 其中 18 人完整完成 OST 训练, 其中, 男生 17 人, 女生 4 人, 平均年龄为 11.87 ± 0.74 岁。注意缺陷症状与组织材料($r=0.769, P=0.006$)、监督($r=0.742, P=0.009$)相关, 多动与监督($r=0.627, P=0.039$)。ADHD 青少年在干预前后的 ADHD-DS 得分、BRIEF 得分均有所下降, 其中, Brief 量表的组织材料得分有下降趋势($t=2.039, P=0.088$); 自我意识的焦虑水平($t=3.530, P=0.005$)、合群性($t=2.264, P=0.045$)和幸福满足感($t=2.755, P=0.019$)显著改善。

结论 针对低年龄初中阶段注意缺陷多动障碍患儿仍有进行组织技能训练的需要, 组织技能训练能部分改善功能表现, 提高自尊水平。

Prediction of Early Treatment Response To Depressive Symptoms in Adolescents with Mood Disorders: The Role of Heart Rate Variability and Amygdala Functional Connectivity

Zexin Lin Fei Wang*

Early Intervention Unit, Department of Psychiatry, The Affiliated Brain Hospital of Nanjing Medical University

Objective Heart rate variability (HRV) is considered a transdiagnostic biomarker for mental disorders and can predict the response of mood disorder patients to antidepressant medication, psychotherapy, and physical therapy. The amygdala is a key region strongly associated with HRV functional connectivity and is closely linked to the pathophysiology and clinical

symptoms of mood disorders. This study explores amygdala functional connectivity (FC) as an early marker for identifying treatment response and elucidates the imaging mechanism by which HRV predicts antidepressant efficacy

Methods The study recruited 66 adolescents with mood disorders experiencing major depressive episodes. All participants underwent baseline treatment and resting-state MRI scans. The Hamilton Depression Rating Scale (HAMD) was used to assess the severity of mood symptoms and early treatment response at baseline and after two weeks. Patients were divided into treatment response (HAMD remission rate $\geq 50\%$, $n=33$) and non-response subgroups ($n=33$). Baseline differences in amygdala FC between subgroups were compared, and the correlation between resting-state HRV and early treatment response was analyzed

Results At baseline, the non-response group exhibited higher FC between the right amygdala and right postcentral gyrus compared to the response group. FC values were significantly negatively correlated with HAMD remission rates ($r=-0.499$, $P<0.001$), indicating that higher right amygdala and postcentral gyrus FC predicted poorer treatment response. Additionally, FC was correlated with HRV high-frequency component (HF-HRV) ($r=0.332$, $P=0.006$), and HF-HRV was correlated with HAMD remission rates ($r=-0.387$, $P=0.001$)

Conclusion The FC values between the right amygdala and postcentral gyrus are related to treatment outcomes and resting HRV (HF-HRV), potentially explaining the mechanism by which HRV serves as a biomarker for predicting treatment efficacy. Limitations include a relatively small sample size, which may restrict the generalizability of the results, and the lack of healthy controls. Our study suggests that FC between the amygdala and cortex is related not only to HRV but also to treatment response, positioning HRV as a biomarker for predicting individual variability in treatment response

Association of Pain Intensity and Sensitivity with Childhood Trauma in Adolescents with Depressive Disorder

Qingqing Shen Qing Zhang Jingwen Shang Yingao Cui Yunxiao Liu Huanzhong Liu*
Chaohu Hospital of Anhui Medical University

Objective This study aims to further investigate the association of pain intensity and sensitivity with childhood trauma in adolescents with depressive disorder by exploring the differences in pain intensity and sensitivity between adolescents with depressive disorder with and without childhood trauma

Methods A consecutive enrolment method was used to select 200 adolescent patients with depressive disorders from three hospitals in Anhui Province as subjects, and the subjects were assessed for suicidal ideation using the Childhood Trauma Questionnaire (CTQ). The intensity of somatic pain was assessed using the Numerical Rating Scale-11 (NRS-11). Subjects were assessed for forearm and tibial pain sensitivity using a hand-held pressure pain instrument, and experimental pain sensitivity measures included pressure pain threshold (PPT) and pressure pain tolerance (PTO). Differences in pain intensity and pain sensitivity were compared between adolescents with depressive disorders with and without childhood trauma, and the relationship between pain intensity and sensitivity and childhood trauma was analysed

Results It was found that pain intensity was significantly higher in patients with childhood trauma (4.15 ± 2.42) than in those without childhood trauma (3.15 ± 2.26) ($p=0.032$). Subjects with high CTQ total scores, emotional abuse (EA) scores, physical abuse (PA) scores, emotional neglect (EN) scores, and physical neglect (PN) scores had a higher pain intensity grading. Patients with sexual abuse (SA) and emotional neglect had higher pain tolerance, i.e., subjects with childhood trauma had lower pain sensitivity. Spearman's correlation analysis and generalised linear regression analyses showed that patients who suffered more severe sexual abuse and those with emotional neglect had greater

pain tolerance; patients who suffered more severe childhood trauma had greater pain intensity; HAM-D total score was strongly associated with pain intensity and The HAM-D total score was closely related to pain intensity and sensitivity, with the more severe the depressive symptoms, the higher the pain intensity and the lower the pain sensitivity. Ordered multiclassification logistic regression analysis showed that the HAMD total score and childhood trauma total score had a statistically significant positive impact on pain intensity

Conclusion Pain intensity was higher in patients with childhood trauma than in patients without childhood trauma. Childhood trauma and severity of depressive symptoms were closely associated with decreased pain sensitivity and increased pain intensity, respectively, in patients with adolescent depressive disorders. In clinical practice, psychiatrists should pay attention to the childhood trauma and pain status of patients with adolescent depressive disorders, and early screening of pain symptoms in patients with adolescent depressive disorders is of clinical significance

ADHD 儿童跨期选择中的决策行为特征及其与核心症状的关系

洪海恒 钱秋谨* 陈彩丽 余梓炎 张诗雨 王文辰
李海梅 王玉凤 刘璐
北京大学第六医院

目的 跨期选择是个体在价值小但更快获得的奖励和价值大但更慢获得的奖励间进行选择。跨期选择偏好与远期生活质量有关,探究 ADHD 儿童跨期选择中的决策行为特征有助于理解 ADHD 儿童的决策能力,提供新的临床干预视角以促进患者的个人发展。本研究旨在研究 ADHD 儿童跨期选择中的决策行为特征及跨期选择与 ADHD 核心症状的关系。

方法 研究共纳入 145 名被试,包括 73 名 ADHD 儿童和 72 名年龄、智商匹配的正常对照(TD)儿童。使用 ADHD 症状评定量表评估 ADHD 核心症状得分(包括注意缺陷得分、多动冲动得分、核心

症状总分),使用两种选择冲动范式(Two Choice Impulsivity Paradigm, TCIP)评估跨期选择行为。比较 TCIP 中两组间方形选择数、反应时间的差异;采用线性回归模型分析 TCIP 中两组内的方形选择数比例与选择轮次的关系;采用分层漂移扩散模型比较 TCIP 中两组间漂移率、决策阈值及非决策时间的差异;最后分析方形选择数与 ADHD 核心症状得分的相关性。

结果 ADHD 组的方形选择数小于 TD 组[方形选择数中位数(Q1, Q3): 26.0(9.0, 44.5) vs. 39.0(29.0, 48.0), $P < 0.001$];两组内的方形选择数比例随选择轮次的增加而减少[ADHD 组斜率(95%置信区间): -0.0044(-0.0051, -0.0036), TD 组斜率(95%置信区间): -0.0016(-0.0027, -0.0004)];两组间的反应时间无显著性差异($Z = -1.064$, $P = 0.287$)。ADHD 组的漂移率[(0.07±0.02) vs. (0.42±0.02), $P < 0.001$]和决策阈值[(2.77±0.03) vs. (3.00±0.03), $P < 0.001$]小于 TD 组、非决策时间[(0.73±0.01) vs. (0.69±0.01), $P = 0.031$]大于 TD 组。方形选择数与 ADHD 注意缺陷得分($r = -0.22$, $P = 0.008$)及核心症状总分($r = -0.20$, $P = 0.017$)呈负相关。

结论 ADHD 儿童在跨期选择中偏好于更快获得小额奖励,即时选择偏好可能与厌恶等待有关。ADHD 儿童在跨期选择的决策中表现出更慢的决策证据积累速度、更冲动的决策风格及更长的非决策时间。TCIP 任务中的即时偏好可能与注意缺陷症状有关。

系统式执行技能训练对 ADHD 儿童情绪问题的疗效研究

杜琳 彭莘越 王丽丽 董涵宇 贾飞勇*
吉林大学第一医院

目的 探究系统式执行技能训练对 ADHD 儿童情绪问题的疗效。

方法 本研究是一项对照研究,选取 2021 年至 2023 年就诊于吉林大学第一医院发育行为儿科的 6-12 岁的 ADHD 儿童为研究对象。符合入组标准的儿童家长均接受 ADHD 家长宣教。在对系统式执行技

能训练详细说明后,儿童家长按照自愿原则,选择是否同时接受系统式执行技能训练。根据自愿原则分为试验组和对照组。试验组参加家长宣教和系统式执行技能训练(包含儿童团体训练和家长培训)。对照组仅参加家长宣教,自然发育12周。家长宣教为线下单次3h集中宣教。系统式执行技能训练的儿童团体训练共8次课程,每次课程90分钟,每周一次;系统式执行技能训练的家长培训共6次课程,每次课程3.5小时,每周一次。两组儿童均在基线和3个月后进行评估。采用Achenbach儿童行为量表(Achenbach Child Behavior Checklist, CBCL)、长处和困难问卷(Strengths and Difficulties Questionnaire, SDQ)父母版及教师版评估两组ADHD儿童的情绪问题。采用SPSS 23.0进行数据分析。两组基线特征比较采用两独立样本t检验、非参数秩和检验和卡方检验。干预前后组内及干预前后差值比较采用两配对样本秩和检验和非参数秩和检验。

结果 CBCL量表中分裂焦虑和抑郁因子和SDQ父母版和教师版的情绪问题因子在治疗3个月后,试验组比对照组有更为显著的改善($P<0.05$)。

结论 系统式执行技能训练能有效改善ADHD儿童焦虑、抑郁等情绪问题。

静息态功能磁共振全脑低频振荡振幅预测青少年抑郁症的机器学习分析

张琪 况利*

重庆医科大学附属第一医院

目的 基于静息态功能磁共振全脑低频振荡振幅(amplitude of flow-frequency fluctuation, ALFF)使用机器学习分析技术预测青少年抑郁症研究。

方法 收集符合DSM-IV抑郁症诊断标准的76名青少年患者作为病例组,同时收集年龄、性别相匹配的44名健康被试作为对照组,两组被试均接受3.0T磁共振仪扫描,应用软件DPABI对获取到的大脑结构像与血氧水平依赖成像的静息态功能像数据进行处理,分析两组被试大脑静息态低频段(0.01-0.1Hz)的功能活动情况,采用置换检验(permuta-

tion test)与无阈值簇群增强(threshold-free cluster enhancement, TFCE)校正方法进行统计分析。应用软件PRoNTo以全脑zALFF作为机器学习样本对青少年抑郁症患者与健康被试进行分类预测。

结果 与健康组相比,抑郁组大脑右侧颞上回、右侧颞极颞上回、右侧枕中回等zALFF增高;双侧岛叶、右侧中央沟盖等zALFF降低;分类样本预测结果显示,全脑zALFF预测青少年抑郁症准确率68.42%,灵敏度86.84%,特异度50.00%。

结论 青少年抑郁症患者相比于健康被试大脑功能活动有明显异常,并且全脑zALFF在预测青少年抑郁症中具有一定价值。

ADHD儿童视觉感知功能缺陷的事件相关电位评估

钟少根^{1,2,3,4} 吴桂森^{1,2,3,4} 祝雨^{1,2,3,4} 党宸^{1,2,3,4} 冯源^{1,2,3,4} 王长明⁵ 孙黎^{1,2,3,4}

1.北京大学第六医院

2.北京大学精神卫生研究所

3.国家卫生健康委员会精神卫生学重点实验室(北京大学)

4.国家精神心理疾病临床医学研究中心(北京大学第六医院)

5.首都医科大学宣武医院

目的 视觉感知功能缺陷在注意缺陷多动障碍(attention deficit hyperactivity disorder, ADHD)中经常出现,如ADHD在阅读上常表现出漏字、串行,在书写上常出现左右颠倒的现象。已有研究对精神分裂症和孤独症谱系障碍的视觉感知功能缺陷的神经机制进行探索,但目前尚缺少对于ADHD视觉感知功能缺陷的神经机制的研究。因此,本研究的目的是初步探索ADHD儿童视觉感知过程的异常神经电生理特点。

方法 本研究分别纳入性别、年龄和总智商相匹配的29名ADHD儿童(年龄范围:90~166月)和25名健康对照儿童(年龄范围:76~151月)进行分析。采用128导的EGI脑电设备收集所有被试完成轮廓整合任务的脑电数据。被试在任务过程中,

需要对由 Gabor 要素构成的似“鸡蛋形”轮廓的尖端朝向做出判断。

结果 与健康对照儿童相比, ADHD 儿童在正确率、反应时方面没有显著差异, 但反应时较长。脑电的分析结果显示, 在中等难度轮廓整合任务时, ADHD 儿童在右侧枕顶区的 P1 和 Nc1 的振幅显著小于健康对照儿童。在高难度轮廓整合任务时, ADHD 儿童在右侧枕顶区的 P1 的振幅显著小于健康对照儿童。

结论 本研究发现 ADHD 儿童 P1 和 Nc1 的振幅较低, 而 P1 和 Nc1 分别是与感觉和知觉组织有关的脑电生理成分。这些结果表明 ADHD 儿童的视觉感知功能缺陷在加工早期和晚期均可能存在, 为我们理解其视觉感知过程提供更深的见解。

关于青少年非自杀性自伤行为表露动机的质性研究

吴开蓉 胡兰* 何宗岭 何江军 郭虹蔓 李剑啸 何秀秀
成都市第四人民医院

目的 深入了解青少年是否主动向他人表露非自杀性自伤行为 (Non-suicidal self-injury behavior, NSSI) 及其动机, 为临床心理工作者制定针对性心理干预措施提供指导。

方法 采用目的抽样法, 于 2023 年 11 月至 2024 年 3 月收集 21 例伴有 NSSI 的青少年并进行半结构化深入访谈, 访谈提纲主要包括基本信息、是否主动向他人表露 NSSI 及其动机等, 采用诠释现象学分析法分析转录资料, 采用 Colaizzi 7 步分析法归纳并提炼主题。

结果 1. 其中 8 人主动向他人表露 NSSI, 13 人不主动向他人表露 NSSI。2. 进一步关于 NSSI 行为表露动机的质性分析发现, 青少年是否主动向他人表露 NSSI 的动机主要源于两方面, 即社会人际动机和个体认知动机。首先, 不主动向他人表露 NSSI 的社会人际动机主要有被污名化、人际关系的消极影响和消极反馈, 个体认知动机主要有羞耻感和对 NSSI 的态度。其次, 主动向他人表露 NSSI 的社会

人际动机主要有积极反馈和群体认同, 个体认知动机主要有寻求帮助和情感支持、宣泄压力和抑制 NSSI 冲动。

结论 青少年主动向他人表露或不表露 NSSI 的动机主要包括社会人际和个体认知两方面, 理解青少年 NSSI 行为的相关表露动机有助于临床心理工作者制定和优化心理干预策略。未来的研究可以进一步探索 NSSI 行为动机表露与 NSSI 行为严重性、心理干预效果、总体预后等方面的关联, 以此指导临床实践。

Dynamic Functional Connectivity Patterns Predict Early Pharmacological Treatment Response in Drug-naïve, First-Episode Adolescent MDD

Maojia Ran Hang Zhang Meijiang Jin Yuanmei Tao Shoukang Zou Hanmei Xu Zhujun Wang Fang Deng Lijuan Huang Hong Zhang Xiaowei Tang Yanping Wang Xia Fu Li Yin*

Department of Psychiatry, West China Hospital of Sichuan University, Chengdu, Sichuan 610041, China

Objective We have found adolescents with major depressive disorder (MDD) have abnormal brain dynamic functional connectivity (dFC) patterns. The aim of this study is to investigate whether dFC patterns will be changed by antidepressant treatment, as well as whether baseline dFC pattern could predict treatment response in MDD adolescents

Methods We included 35 drug-naïve, first-episode MDD adolescents (age 14.40 ± 1.24) and 24 healthy controls (age 14.21 ± 1.41). All MDD adolescents received 6 weeks of pharmacotherapy (agomelatine, sertraline, escitalopram or venlafaxine, with or without antipsychotics, sedative-hypnotics or anxiolytics). Independent component analysis was used to compare dFC

pattern between MDD adolescents and HC at baseline, as well as between pre- and post- treatment in MDD adolescents. Finally, Pearson's correlation and logistic regression were used to explore the associations between average dynamic functional connectivity values and treatment response

Results Inhibitory control network, sensory-motor network and frontoparietal network were found to exist different dFC pattern between pre- and post- treatment. Mean dFC values between inferior frontal gyrus and bilateral insular cortex were found to be related with treatment response and could serve as predictors

Conclusion These findings demonstrate that brain dFC patterns maybe a prospective factor to predict antidepressant treatment response

关键词: adolescent MDD, dynamic functional connectivity, pharmacotherapy, treatment response, MRI

Interaction of ABC Family Gene Polymorphisms with Slower Processing Speed Contributes To Greater Depression Severity.

Meijiang Jin Maojia Ran Zhujun Wang Hang Zhang Yuanmei Tao Hanmei Xu Shoukang Zou Li Yin*
Sichuan University

Objective The ABC family genes, which encode ATP-binding cassette proteins, which is involved in the transport of various substances, is associated with major depression disorder (MDD); but its clinical relevance in MDD remains unknown. Therefore, the aim of this study was to investigate whether ABC family genes are associated with cognitive functions in patients with MDD, and the combined effects of genes and cognitive functions on the severity of depression

Methods We investigated the association of variants of ABC family genes with clinical symptoms and cognitive function in Chinese patients with MDD (n = 805, 12-65 years) and age-matched healthy control subjects (n = 1493) using linear models or logistic re-

gression models. Seven single nucleotide polymorphisms (SNP) (rs28401781, rs4148739, rs3747802, rs1109866, rs1109867, rs3731885 and rs3755047) of ABCB1 and ABCB6 were selected. The participants' cognitive functions were assessed using the Wisconsin Card Sorting Test, the Tower of Hanoi test, the Trail Making Test and the Verbal Fluency Test, and the severity of depression was assessed by the Hamilton Depression Rating Scale (HAMD)

Results The allele frequencies and genotype frequencies of rs1109866 and rs1109867 were significantly different between MDD patients and healthy controls ($p < 0.05$). In MDD patients, rs28401781 ($t = 2.781$, $p = 0.006$, $p_{adj} = 0.042$) and rs4148739 ($t = 3.067$, $p = 0.003$, $p_{adj} = 0.021$) were significantly associated with executive function. And we found that both rs1109866 and rs1109867 interacted with poorer processing speed to cause greater depression severity

Conclusion These results suggested that ABC family genes affected the severity of depression through cognitive functions. This provides possible evidence for the different clinical manifestations of MDD patients

Efficacy of TDCS in The Cognitive Function Treatment for Patients with Major Depressive Disorder: A Systematic Review and Meta-analysis

Hong Li Zhifen Liu*
Department of Psychiatry, The First Hospital of Shanxi Medical University, Taiyuan, China.

Objective Transcranial direct current stimulation (tDCS) has demonstrated as a promising treatment for depression. However, it remains to be determined whether a tDCS treatment course may also enhance cognitive function in depressed patients. We aimed to examine the most updated evidence on the efficacy of tDCS in anti-depressive treatment and its impact on cognitive function (INPLASY registration number:

INPLASY202360008).

Methods A systematic review was performed from the first date available in PubMed, EMBASE, Cochrane Library, and additional sources published in English from 1 January 2001 to 31 May 2023. We examined cognitive outcomes from randomised, sham-controlled trials of tDCS treatment for major depression. The evaluation process strictly followed the Cochrane bias risk assessment tool into the literature, and meta-analysis was performed according to the Cochrane System Reviewer's Manual

Results We included a total of 371 patients from 12 studies in this quantitative synthesis. Results showed significant benefits after active tDCS compared to sham for the antidepressant effect (MD -2.18 [-3.65, -0.72]). Active relative to sham tDCS treatment was associated with increased performance gains on a measure of verbal memory (MD 3.55 [-0.08, 7.18]). Results showed no cognitive enhancement after active tDCS compared to sham for the global cognitive function as well as dimension-specific cognitive measures

Conclusion Our study provides an important evidence-based medical support for tDCS in antidepressant and dimension-specific cognitive benefits. Further well-designed, large-scale randomized sham-controlled trials are warranted

关键词: Transcranial direct current stimulation, treatment, depression, cognition

伴非自杀性自伤行为青少年抑郁障碍自尊及父母教养方式的对照研究

朱峰* 刘璐璐 胡金涛 王丹 曹阳 成宁
苏州市广济医院

目的 比较伴或不伴非自杀性自伤 (NSSI) 行为的抑郁障碍青少年自尊水平及父母教养方式的差异, 为进一步探索此类青少年心理机制和干预导向提供临床参考。

方法 将我院儿少精神科住院的首发青少年抑郁障碍患者作为研究对象, 共纳入 117 例, 根据有无 NSSI 分为研究组 (伴 NSSI) 51 例和对照组 (不

伴 NSSI) 66 例, 两组治疗前均进行汉密尔顿抑郁量表 (HAMD-17)、抑郁自评量表 (SDS), 临床疗效总评量表病情严重程度 (CGI-SI)、自尊量表 (SES)、父母教养方式问卷中文版 (PBI) 的评定, 比较两组间的差异。同时对研究组内自尊量表及父母教养方式问卷进行相关性分析。

结果 两组在 HAMD-17、SDS、CGI-SI 评分差异无统计学显著性 ($P > 0.05$)。研究组 SES 评分低于对照组 ($P < 0.05$), 研究组在父亲教养方式总分、父亲关爱因子分、父亲控制因子分均高于对照组 ($P < 0.05$), 研究组内母亲关爱因子分与 SES 呈正相关 ($P < 0.05$), SES 会随着母亲关爱因子分的升高而升高。

结论 伴 NSSI 的抑郁障碍青少年可能具有低自尊的特点, 其父亲教养方式特点为高关爱、高控制, 其自尊水平会随着母亲的关爱程度而提高。改善父母教养方式可能会有效地预防和减少抑郁障碍青少年中 NSSI 的发生。

Clarifying ADHD and Sluggish Cognitive Tempo Item Relations: A Network Analysis of ADHD and SCT Items Across Different Demographic Groups Among Chinese Children

Jie Luo Yi Zheng*

Beijing An Ding Hospital, Capital Medical University

Objective This study aims to elucidate the network structure of Attention Deficit Hyperactivity Disorder (ADHD) and Sluggish Cognitive Tempo (SCT) symptoms among Chinese children aged 6 to 16. Additionally, it seeks to explore differences in ADHD and SCT networks across gender and age groups, and to compare the ADHD syndrome networks between participants with ADHD and those with SCT

Methods This study analysed secondary data from a large national survey of 72,107 Chinese children aged 6 to 16, whereby ADHD and SCT symptoms were assessed using the Child Behavior Checklist (CBCL).

Network analysis was performed to examine the relationships among ADHD and SCT items. Network communities were identified using Exploratory Graphical Analysis and network comparison tests were conducted to identify differences across gender and age groups, as well as between ADHD and SCT cohorts

Results The analysis identified distinct yet overlapping networks for ADHD and SCT symptoms. Three primary dimensions emerged: attention/task completion, hyperactivity/impulsivity, and SCT-specific symptoms. Gender differences were marginal, with males exhibiting slightly higher network connectivity. Significant age-related variations were found, with younger children showing more interconnected networks. Moreover, the ADHD syndrome network in SCT participants exhibited higher density and connectivity compared to ADHD patients, with differences in centrality measures indicating distinct focal symptoms in each group

Conclusion The findings supported the conceptual distinction between ADHD and SCT while acknowledging their overlapping symptoms. Furthermore, network structure of ADHD and SCT were different across gender and age groups, underscoring the need for tailored diagnostic and intervention strategies. Finally, the distinct network patterns in ADHD network of ADHD and SCT cohorts advocated for a nuanced approach in clinical practice. The current study provided insights for researchers and clinicians on the assessment and intervention for ADHD and SCT, and called for more longitudinal studies with clinical population sample to elucidate the network structure of ADHD and SCT across different demographics

关键词: Attention Deficit Hyperactivity Disorder (ADHD); Sluggish Cognitive Tempo (SCT); Network Analysis; different demographics; Chinese Children

伴非自杀性自伤行为青少年抑郁障碍的行为问题和自我意识特点

朱峰* 王丹 曹阳 胡金涛 刘璐璐 成宁 杨绪娜
苏州市广济医院

目的 探讨伴非自杀性自伤行为 (NSSI) 的青少年抑郁障碍患者的行为问题和自我意识水平的特点。

方法 参照 DSM-5 的诊断标准, 选取 2023 年 9 月到 2024 年 3 月苏州市广济医院门诊和住院的诊断抑郁障碍的青少年 (12-17 岁) 作为研究对象, 共入组 218 例患者, 根据是否伴有非自杀性自伤行为分为观察组 (伴 NSSI) 97 例和对照组 (不伴 NSSI) 121 例。所有入组患者由家长或直接监护人填写儿童行为量表 (Achenbach Child Behavior Checklist, CBCL), 患者自己填写儿童自我意识量表 (children's self-concept scale, CSCS)。

结果 伴有 NSSI 的行为问题评分显著大于对照组, 如行为问题总分 (31.44 ± 23.15) vs. (19.97 ± 15.56), $P < 0.01$, 而儿童自我意识量表评分显著小于对照组, 如总分 (48.89 ± 9.76) vs. (58.22 ± 10.20), $P < 0.05$ 。

结论 伴非自杀性自伤行为与不伴有非自杀性自伤行为的青少年抑郁障碍患者相比, 其行为问题更多, 且自我意识差。这可能为非自杀性自伤行为的干预研究找到更多的突破, 对于同样患有抑郁障碍的青少年, 较低自我意识和较高的行为问题, 可能成为其非自杀性自伤行为频繁发生的重要影响因素, 因此对于此类患者的治疗干预中, 通过积极地改善行为问题, 提高自我意识水平, 可能会有效地减轻或减少非自杀性自伤行为的发生。

关键词: 青少年抑郁障碍, 非自杀性自伤行为, 行为问题, 自我意识

基于 Minecraft 游戏的 ADHD 儿童识别方法研究

张丽雯 赵文涛 曹晓华*
山西医科大学第一医院

目的 本研究旨在利用 Minecraft (《我的世界》) 游戏, 通过游戏任务探讨注意力缺陷多动障碍 (ADHD) 儿童和正常儿童在认知和行为方面的差异, 为早期诊断和干预提供参考。

方法 招募 30 名 ADHD 儿童和 30 名正常儿童作为对照组, 设计自由探索和构建任务, 要求参与者在游戏中进行不限时自由探索, 待熟悉后, 完成

一个建造房屋的任务。包括获取材料、设计房屋结构、放置家具等步骤。使用 Epilog 等游戏插件收集参与者在游戏中的可视化移动数据, 通过后台日志记录其他游戏行为数据, 如材料种类和数量、建造速度、完成度等。同时, 通过屏幕录制记录其他行为信息, 如儿童往返找材料的频次、建造房屋的顺序、复杂程度等。在游戏结束后, 对参与者进行心理评估, 包括社交互动、注意力集中等方面。

结果 ADHD 儿童倾向于按照固定顺序建造房屋, 而正常儿童更加灵活。ADHD 儿童的建筑物可能更加模式化和简单, 而正常儿童的建筑物可能更具创意和复杂性。ADHD 儿童在游戏中使用的工具更加单一, 而正常儿童更多样化。

结论 通过 Minecraft 游戏设计的任务, 我们发现 ADHD 儿童在游戏中的行为和认知表现存在一些特征, 例如固定化的行为模式、建造物的简单性等。这些特征可作为识别 ADHD 儿童的线索之一。为利用虚拟环境进行 ADHD 儿童研究和早期干预, 维护身心健康提供了新的思路和方法。

早发精神分裂症的血清学指标与临床症状的相关性研究

周敏思 卢建平*

康宁医院

目的 早发精神分裂症是一种罕见的、严重的慢性精神病。近期研究显示代谢紊乱与精神分裂症的发病密切相关, 本研究将通过临床常规血清学指标, 分析早发精神分裂症患者机体代谢状态和变化与临床症状的相关性。

方法 在深圳康宁医院儿少精神科住院部招募符合精神障碍诊断与统计手册(第五版)精神分裂症谱系和其他精神病性障碍的早发精神分裂症患者共 84 例, 收集一般资料, 使用学龄儿童情感障碍和精神分裂症问卷、阳性和阴性症状量表、个人和社会功能量表评估早发精神分裂症患者的共病情况、临床症状及社会功能。入院第 2 日清晨完成糖脂代谢、炎症因子、神经损伤相关指标的检测, 包括空腹血糖、血脂、甲状腺激素、超敏 C 反应蛋白、神经烯醇化酶等。分析患者临床症状、社会功能与血

清学指标的相关性。

结果 阳性和阴性症状量表总分与空腹血糖($r=0.297, P<0.01$)、游离甲状腺素正相关($r=0.237, P<0.05$), 与神经烯醇化酶负相关($r=-0.237, P<0.05$); 阴性症状因子分与神经烯醇化酶负相关($r=-0.260, P<0.05$); 认知损害因子分与空腹血糖正相关($r=0.286, P<0.05$); 阳性症状因子分与超敏 C 反应蛋白正相关($r=0.256, P<0.05$); 兴奋敌对因子分与甘油三酯负相关($r=-0.257, P<0.05$); 抑郁焦虑因子分与 S-100 b 蛋白负相关($r=-0.241, P<0.05$)。个人与社会功能量表评分与空腹血糖负相关($r=-0.254, P<0.05$), 与神经烯醇化酶正相关($r=0.378, P<0.05$)。

结论 早发精神分裂症患者的空腹血糖、甘油三酯、超敏 C 反应蛋白、神经烯醇化酶及 S-100 b 蛋白与临床症状严重程度及社会功能受损相关。初步表明糖脂代谢、神经损伤可能参与早发精神分裂症的发病机制。

217 例儿童青少年抑郁障碍患者住院资料调查分析

胡金涛 朱峰* 刘璐璐 曹阳 王丹

苏州市广济医院

目的 调查苏州市广济医院儿少精神科住院部儿童青少年抑郁障碍患者临床特征、症状分布以及治疗方案中的药物选择。

方法 1.对象: 对 2021 年 1 月-2022 年 12 月在苏州市广济医院住院部住院治疗, 诊断为抑郁障碍的儿童青少年患者一般情况及出院时的诊断分类、药物使用情况进行回顾性分析。

结果 ①共纳入 217 例患者, 其中男性患者 51 例(23.5%), 女性患者 166 例(76.5%), 起病年龄的高峰期在 14 岁(25.81%), 其中首发 167 例, 复发 50 例。②出现频率居前 3 位的临床症状依次是情绪低落(90.78%)、兴趣、乐趣减退(76.96%), 悲观消极(62.21), 60.37%的儿童青少年抑郁障碍患者曾经出现自伤行为, 自伤方式多为划伤皮肤(90.84%), 23.5%的儿童青少年抑郁障碍患者曾经出现自杀行为。③217 例患者中抗抑郁药物使用排

名前3位依次为舍曲林 88 例 (40.55%), 氟西汀 64 例 (29.49%), 草酸艾司西酞普兰 26 例 (11.98%); 抗精神病药物使用排名前 3 位依次为奥氮平 77 例 (35.48%), 奎硫平 72 例 (33.18%), 阿立哌唑 65 例 (29.95%); 情感稳定剂使用情况, 未使用 131 例 (60.37%), 碳酸锂缓释片 31 例 (14.29%), 丙戊酸镁缓释片 31 例 (14.29%); 无抽搐电休克治疗情况, 共有 39 例 (17.97%) 联合 MECT 治疗。

结论 儿童青少年抑郁障碍伴随着高自杀率、高自伤率等特征, 应受到重视, 做到早发现早治疗。新型非典型抗精神病药和抗抑郁药为儿童青少年抑郁障碍的主要治疗药物, 治疗方案以联合药物治疗为主。

儿童青少年强迫障碍 100 例病历的临床分析

胡金涛 朱峰* 刘璐璐 曹阳 王丹 成宁
苏州市广济医院

目的 强迫性障碍 (Obsessive-Compulsive Disorder, OCD) 是一种常见的慢性精神障碍, 影响着儿童和青少年的日常生活和心理健康。早期识别和干预对改善预后至关重要。本研究旨在探讨儿童青少年强迫性障碍的临床特征、诊断难点以及治疗响应, 以期为临床实践提供指导。

方法 采用横断面研究设计, 选取了 100 名年龄在 8 至 18 岁之间的 OCD 患者。通过临床访谈、心理评估量表和行为观察, 收集了患者的基本信息、症状严重程度、治疗历史等数据。利用耶鲁布朗症状清单 (Y-BOCS CL) 收集患者临床症状并利用耶鲁布朗强迫量表 (Y-BOCS) 进行症状严重程度评定; t 检验、卡方检验及 Wilcoxon 秩和检验对数据进行统计分析。

结果 儿童青少年 OCD 患者的主要症状包括强迫思维和行为。本组男性儿童青少年患者发病年龄 ((12.1±3.7) 岁) 小于女性儿童青少年患者 ((15.1±2.4) 岁) ($P<0.05$); 强迫症状女性以强迫回忆和强迫洗涤多见 ($P<0.05$); Y-BOCS 强迫思维分量表中强迫思维所致影响项目的得分男性 (2.6±1.2) 大于女性 (1.8±1.3) ($P<0.05$)。大多数患者对认知行为治疗

(CBT) 有良好的响应, 但治疗依从性存在问题。

结论 本研究揭示了儿童青少年 OCD 的临床特点, 在发病年龄, 强迫症状以及症状表现形式存在性别差异。认知行为治疗是有效的治疗手段, 但需要解决治疗依从性问题。

青少年抑郁障碍患者非自杀性自伤行为与压力感知及应对方式的相关性研究

曹阳 朱峰* 刘璐璐 王丹 胡金涛
苏州市广济医院

目的 分析青少年抑郁障碍患者非自杀性自伤 (NSSI) 行为的发生与其压力感知及应对方式的相关性。

方法 研究纳入 2021 年 10 月至 2023 年 5 月住院的 275 例抑郁障碍患儿, 根据是否有 NSSI 行为分为研究组 (伴 NSSI 行为, 219 例) 及对照组 (不伴 NSSI 行为, 56 例)。采用压力觉知量表 (PSS) 和中学生应对方式量表 (CSSMSS) 评估患者的觉知压力和应对方式; 采用独立样本 t 检验比较两组评分的差异, Spearman 相关性分析研究 NSSI 行为与青少年压力感知及应对方式的相关性。

结果 研究组 PSS 评分 (31.47±4.92) 与对照组 PSS 评分 (29.32±4.79) 差异具有统计学意义 ($t=2.93$, $P<0.01$); 研究组 CSSMSS 评分问题解决维度 (15.82±4.63)、寻求社会支持维度 (15.92±4.46)、积极合理化解解释维度 (10.36±3.17) 评分显著低于对照组 (18.5±5.42)、(17.37±4.42)、(12.61±3.55), 差异具有统计学意义 ($t=-3.31\sim-2.17$, $P<0.01$); 逃避 (10.38±2.48)、幻想否认 (13.60±3.69) 评分显著高于对照组 (9.36±2.94)、(12.30±3.72), 差异均有显著意义 ($t=2.34\sim2.65$, $P<0.05$)。研究组忍耐维度 (11.11±2.45)、发泄情绪维度 (10.45±2.95) 评分与对照组 (11.00±2.75)、(9.96±3.24) 差异无统计学意义 ($P>0.05$)。相关性分析结果显示, NSSI 行为的发生与 PSS 评分 ($r=0.17$, $P<0.01$) 呈正相关, 与逃避 ($r=0.14$, $P=0.03$)、幻想否认 ($r=0.13$, $P=0.03$) 呈正相关, 与解决问题 ($r=-0.20$, $P<0.01$)、寻求社会支持 ($r=-0.12$, $P=0.04$)、合理化解解释评分 ($r=0.25$,

$P < 0.01$) 呈负相关。PSS 总分与 CSSMSS 量表积极合理化解释 ($r = -0.15, P = 0.02$) 呈负相关, 与忍耐 ($r = 0.39, P < 0.01$)、逃避 ($r = 0.38, P < 0.01$)、发泄情绪 ($r = 0.43, P < 0.01$)、幻想否认 ($r = 0.45, P < 0.01$) 呈正相关。

结论 青少年抑郁障碍 NSSI 行为的发生与患者高压力觉知及消极应对方式相关, 且高压力觉知也与消极应对方式呈正相关, 与积极应对方式呈负相关。

关键词: 非自杀性自伤, 青少年抑郁障碍, 压力觉知, 应对方式

精神分裂症患者及其一级亲属注意维持功能受损的相关研究

王丹 朱峰*
苏州市广济医院

目的 通过比较精神分裂症患者组 (研究组)、精神分裂症患者一级亲属 (亲属组) 和健康对照组 (对照组) 事件相关电位 (ERP) 关联性负变 (CNV) 脑电行为学数据、认知功能测验相关评分的不同, 探讨精神分裂症患者及其一级亲属注意维持能力损害程度。

方法 纳入满足 ERP 实验入组标准的精神分裂症患者 31 名作为研究组, 纳入 31 名患者中无精神疾病的一级亲属 15 名作为亲属组, 同时收集与研究组年龄、受教育年限等一般资料相符的健康志愿者 30 名作为对照组。对研究组、亲属组和对照组进行基于点阵图预期 (DPX) 任务诱发 CNV 波, 记录此时行为学数据 (DPX 任务错误率) 结果; 采用 MATRICS 公认认知成套测验 (MCCB) 中反应认知功能的持续操作测验 (CPT-IP) 评估注意维持功能; 将所得数据录入最终数据库, 并采用 SPSS23.0 进行统计学处理和分析。

结果 1. 三组 DPX 任务错误率比较, 三组之间 EAX、EAY、EBX 之间有差异, $P < 0.05$ 。研究组 EAX、EAY、EBX 得分均高于对照组, 差异有统计学意义, $P < 0.05$ 。亲属组 EAX、EAY、EBX 得分均高于对照组, 差异有统计学意义, $P < 0.05$, 亲属组和研究者之间各项得分无差异。2. 三组之间持续操作测验 2D、3D、4D、持续均数之间有差异, $P < 0.05$ 。

研究组持续操作测验 2D、3D、4D、持续均数低于对照组, 差异有统计学意义, $P < 0.05$ 。亲属组持续操作测验 2D、3D、4D、持续均数低于对照组, 差异有统计学意义, $P < 0.05$ 。研究组和亲属组之间持续操作测验 2D、3D、4D、持续均数低于对照组, 但差异无统计学意义, $P > 0.05$ 。

结论 相对于健康对照, 精神分裂症患者及其一级亲属均存在不同程度的注意维持功能受损, 精神分裂症患者及其一级亲属之间注意维持功能受损程度无明显差异。

关键词: 精神分裂症、注意维持功能、事件相关电位、点阵图预期任务

精神分裂症认知功能受损影响因素研究

王丹 朱峰*
苏州市广济医院

目的 探讨影响精神分裂症认知功能受损的相关因素。并对认知功能受损程度与病程、发病年龄、受教育年限、智商、PANSS 量表分数之间的关联度进行分析。方法 选择精神分裂症首发患者 30 名、慢性精神分裂症患者 30 名、健康对照 30 名。认知功能评估采用 MATRICS 公认认知成套测验 (MCCB)。所得数据采用 SPSS 23.0 进行统计学处理和分析。

方法 选择精神分裂症首发患者 30 名、慢性精神分裂症患者 30 名、健康对照 30 名。认知功能评估采用 MATRICS 公认认知成套测验 (MCCB)。所得数据采用 SPSS 23.0 进行统计学处理和分析。

结果 与对照组比较, 首发精神分裂症患者及慢性精神分裂症患者在 7 个心理维度的认知测评得分均显著下降 [$F = 8.23, 36.31, 34.10, 7.62, 22.58, 22.96, 33.30, 17.00, 6.38; P < 0.05$)]。首发组的各项认知测验得分与慢性组均无明显差异 ($P > 0.05$)。相关分析结果表明, 精神分裂症患者各项认知测验结果与病程长短和 PANSS 量表阳性症状评分得分、PANSS 量表总分无相关性 ($P > 0.05$); 而认知功能测验中连线测验评分与 PANSS 量表阴性症状评分呈正相关 ($r = 0.266, P < 0.05$); 认知功能测验中符号编码得分、霍普金斯总分、空间广度得分、迷宫测验得分、简易视觉总分、语义流畅性得分、持续操作总分、情绪管理总分与智商水平呈正相关 ($P < 0.05$);

认知功能测验中符号编码得分、霍普金斯总分、空间广度得分、迷宫测验得分、简易视觉总分、语义流畅性得分、持续操作总分与受教育年限呈正相关($P < 0.05$)。

结论 精神分裂症普遍存在认知功能受损。其认知功能受损程度与病程、发病年龄无明显相关性,与阴性症状呈弱相关,与智商水平、受教育年限呈明显负相关。

关键词: 精神分裂症 认知功能 病程 精神分裂症认知功能成套测验

自我接纳在伴有非自杀性自伤青少年抑郁障碍患者社会支持与应对

刘璐璐 朱峰*
苏州市广济医院

目的 分析伴有非自杀性自伤青少年抑郁障碍患者自我接纳与社会支持及应对方式之间的关系,探讨自我接纳在社会支持与应对方式间的中介效应。

方法 选取 2022 年 1 月至 2023 年 5 月于苏州市广济医院住院治疗的 130 例伴有非自伤性自杀的青少年抑郁障碍患者为研究对象,采用一般资料调查问卷、自尊量表(self-esteem scale, SES)、儿童青少年社会支持量表(Child and Adolescent Social Support Scale, CASSS)、中学生应对方式量表(Coping Style Scale for Middle School Students, CSSMSS)对患者进行调查。分析自我接纳与社会支持及应对方式之间的关系,探讨自我接纳在社会支持及应对方式间的中介效应。

结果 伴有非自杀性自伤青少年抑郁障碍患者自我接纳与社会支持呈正相关($P < 0.05$),自我接纳与问题解决、求助、忍耐呈正相关($P < 0.05$),与回避、发泄、幻想呈负相关($P < 0.05$)。社会支持与问题解决、求助呈正相关($P < 0.05$),与回避、幻想呈负相关($P < 0.05$)。自我接纳在伴有非自杀性自伤青少年抑郁障碍患者社会支持与应对方式间起部分中介作用,中介效应占总效应的 2.61%。

结论 自我接纳为伴有非自杀性自伤青少年抑郁障碍患者社会支持与应对方式的中介变量。因此,提高伴有非自杀性自伤青少年抑郁障碍患者的自我接纳,加强患者家属对疾病的认知改善其对着患者

的接纳认识,提高患者的社会支持性,从而改善患者的应对方式。

关键词: 非自杀性自伤;自我接纳;社会支持;应对方式

伴有非自杀性自伤青少年抑郁障碍患者社会支持利用度与应对方式的相关性

刘璐璐 朱峰*
苏州市广济医院

目的 分析伴有非自杀性自伤青少年抑郁障碍患者社会支持利用度与应对方式之间的关系,探讨社会支持利用度与应对方式间的相关性。

方法 选取 2022 年 1 月至 2023 年 5 月于苏州市广济医院住院治疗的 130 例伴有非自伤性自杀的青少年抑郁障碍患者及 104 名不伴有非自杀性自伤的青少年抑郁障碍患者为研究对象,采用一般资料调查问卷、儿童青少年社会支持量表(Child and Adolescent Social Support Scale, CASSS)、中学生应对方式量表(Coping Style Scale for Middle School Students, CSSMSS)对患者进行调查。分析社会支持利用度与应对方式之间的关系,探讨社会支持利用度与应对方式间的相关性。

结果 两组患者在 CASSS 量表的社会利用度分量表、CSSMSS 量表的求助、退避、幻想、忍耐分量表均有显著性差异($P < 0.05$),在 CSSMSS 量表的问题解决、发泄分量表无显著性差异($P > 0.05$)。伴非自杀性自伤青少年抑郁障碍患者组 CASSS 量表的社会利用度分量表与 CSSMSS 量表问题解决、求助、幻想分量表呈正相关($P < 0.05$),与发泄呈负相关($P < 0.05$)。

结论 伴非自杀性自伤青少年抑郁障碍患者的社会支持利用度与其应对方式存在相关性。因此适当加强伴非自杀性自伤青少年抑郁障碍患者的社交技能训练,提高其社会支持利用度,可以改善患者的应对方式,以更好地适应社会生活。

关键词: 非自杀性自伤;青少年抑郁障碍患者;社会支持利用度;应对方式

小剂量阿立哌唑、利培酮治疗阿斯伯格共病 ADHD 的临床分析

蒋红梅 王敏建*

重庆市精神卫生中心

目的 探讨小剂量阿立哌唑、利培酮增效治疗阿斯伯格共病 ADHD 的患者的临床疗效和安全性。

方法 选取重庆市精神卫生中心 2023 年 1 月-2024 年 1 月收治的阿斯伯格共病 ADHD 患者 60 例, 采取随机数字表法分为 A 组、B 组、C 组, 每组各 20 例, A 组单用专注达治疗, B 组、C 组分别在 A 组治疗基础上联合阿立哌唑和利培酮治疗。采用 SNAP-IV 量表(父母版)、Conners 父母症状问卷(PSQ) 对 ADHD 患者的核心症状、行为和情绪进行疗效评估, 副反应量表(TESS)评定安全性, 通过各组自身治疗前后对照和组间对照,对结果进行统计分析。

结果 A 组、B 组、C 组总效率 76.31%、85.25%、86.33%;B 组、C 组总有效率均高于 A 组, 差异有统计学意义($P<0.05$)。治疗前三组患者 SNAP-IV 量表(父母版)、Conners 父母症状问卷(PSQ) 评分比较, 差异无统计学意义($P>0.05$);治疗 4、8、12 周末 SNAP-IV 量表(父母版)、Conners 父母症状问卷(PSQ) 评分较治疗前均显著下降, 差异有统计学意义($P<0.05$);B 组、C 组在治疗第 4 周末开始, SNAP-IV 量表(父母版)、Conners 父母症状问卷(PSQ) 下降程度均显著高于 A 组, 差异有统计学意义($P<0.05$)。A 组(33.33%)、B 组(34.67%)、C 组(35.00%)不良发生率比较, 差异无统计学意义($P>0.05$)。

结论 小剂量阿立哌唑、利培酮增效治疗阿斯伯格共病 ADHD 的患者疗效显著, 可快速控制 ADHD 症状, 且安全性高, 值得临床应用推广。

Childhood Maltreatment Associated Suicidal Risk in Chinese Children and Adolescents: A Mediation of Resilience

Junwei Peng¹, Jin Lu², Yuanyuan Xiao¹

1.School of Public Health, Kunming Medical University

2.The First Affiliated Hospital, Kunming Medical University

Objective We aim to investigate the mediating role of resilience in the associations between childhood maltreatment (CM) and the three suicidal risk indicators (suicidal ideation, SI; suicidal plan, SP; suicidal attempt, SA) among a large sample of Chinese children and adolescents

Methods A population-based cross-sectional survey was conducted in southwestern China Yunnan province. Totally 9969 children and adolescents were randomly chosen by using a multi-stage stratified cluster sampling design. Univariate and multivariate logistic regression models were fitted to explore the associations between CM, resilience, and the three suicidal risk indicators, with dose-response trends further elucidated by using the restricted cubic splines. Path models were used to estimate the mediation of resilience

Results The estimated prevalence rates for one-year SI, SP, and SA were 32.86% (95% CI: 31.93-33.80%), 19.36% (95% CI: 18.57-20.16%), and 9.07% (95% CI: 8.51-9.66%). After adjustment, CM experiences significantly associated with all 3 suicidal risk indicators, and the odds ratios (ORs) were 2.13 (95% CI: 1.91-2.37), 2.45 (95% CI: 2.13-2.81), and 3.61 (95% CI: 2.90-4.52) for one-year SI, SP, and SA, respectively. Path models revealed that resilience significantly mediated the associations between CM and the three suicidal risk indicators, and among all dimensions of resilience, family support presented consistent and strongest mediation

Conclusion Our study results suggest that intervention measures which focusing on improving psychological resilience might be effective in reducing suicidal risk for children and adolescents who had experienced maltreatment. Prospective studies should be done to corroborate our findings

关键词: Childhood maltreatment, Resilience, Suicide, Children and adolescents, Mediation

儿童青少年精神科住院患者非自杀性自伤行

为的发生率及影响因素分析

张培 马筠*

武汉市精神卫生中心

目的 探讨儿童青少年精神科住院患者非自杀性自伤(non-suicidal self-injurious, NSSI)行为的发生率及影响因素。

方法 采取连续入组方式,将2021年10月至2022年12月在武汉市精神卫生中心儿少病区住院就诊的674例儿童青少年患者纳入研究,根据是否存在NSSI行为,将入组患者分为NSSI组(n=320)和非NSSI组(n=354)。采集研究对象的一般人口学资料,并采用PHQ-9抑郁量表、GAD-7焦虑量表、CTQ-SF儿童期创伤问卷、PDD病耻感问卷、PSQI匹兹堡睡眠质量问卷、ASLEC青少年生活事件量表、自杀态度问卷对入组患者的精神症状及心理维度进行评估。统计学方法采用卡方检验、t检验和多因素Logistic回归分析。

结果 1)儿童青少年精神科住院患者的NSSI行为发生率为47.5%(320/674);2)单因素分析结果显示,NSSI组患者在抑郁、失眠、情感虐待、情感忽视、人际压力、学习压力、对自杀行为的态度等维度的得分均高于非NSSI组,差异均有统计学意义(P值均<0.05);3)多因素Logistic回归分析结果显示,年龄(OR=1.491,95%CI:0.706~3.147,P=0.028)、性别(OR=1.647,95%CI:1.022~3.838,P=0.019)、抑郁程度(OR=2.647,95%CI:1.899~4.629,P=0.001)、情感忽视(OR=3.465,95%CI:1.038~11.565,P=0.043)、人际压力(OR=2.906,95%CI:1.126~7.502,P=0.027)是儿童青少年精神科住院患者发生NSSI行为的危险因素。

结论 儿童青少年精神科住院患者伴有较高的NSSI发生率,年龄较小、女性、抑郁程度高、情感忽视严重、人际压力大的精神科住院儿童青少年更容易发生NSSI行为。

关键词: 儿童青少年,住院患者,非自杀性自伤,影响因素

青少年抑郁症发生非自杀性自伤行为的影响因素及运动调节措施的应用研究

邓红冬*

赣州市第三人民医院

目的 总结青少年抑郁症发生非自杀性自伤行为的影响因素,分析运动调节措施对其的作用。

方法 采用回顾性分析,将本院诊治的门诊及住院的162例青少年抑郁症患者作为研究对象,病例收集年限为2023年1月-2024年4月,按照是否发生非自杀性自伤行为进行分组,即未发生非自杀性自伤行为的有121例,将其设为对照组;发生非自杀性自伤行为的有41例,将其设为观察组,筛查发生非自杀性自伤行为的有关因素;同时对观察组患者采取运动调节措施,要求每周最少运动五次,每次的时间不少于30分钟,最好采取跑步的形式,运动时间长度慢慢加长,设定时常为八周。八周后再分析干预前后患者病情的改善情况。

结果 青少年抑郁症发生非自杀性自伤行为的影响因素包括重度抑郁、有童年创伤、家庭环境不良、学习压力较大、受过校园霸凌(P<0.05);在八周运动调节措施的干预下,患者的抑郁症状、非自杀性自伤行为评分均相比干预前较低(P<0.05)。

结论 青少年抑郁症发生非自杀性自伤行为的影响因素复杂多样,需重点关注青少年的身心健康、情绪调节方法,应对压力的措施。采取运动调节措施进行干预,有益于缓解患者的抑郁症状,减少非自杀性自伤行为的发生。

关键词: 青少年抑郁症;非自杀性自伤行为;影响因素;运动调节措施

对比低电量与正常电量无抽搐电休克治疗青少年抑郁症疗效及预后影响

常少华*

宁夏回族自治区宁安医院(宁夏精神卫生中心)

目的 研究对比低电量与正常电量无抽搐电休克(MECT)治疗青少年抑郁症患者的临床治疗效果及预后影响

方法 选取2021年6月至2023年5月宁夏回族自治区宁安医院治疗的青少年抑郁症患者40例,以随机数字表法分为对照组、观察组,20例/组,两组均服用抗抑郁药物。其中对照组实施正常电量无

抽搐电休克治疗 (MECT)、观察组实施低电量无抽搐电休克治疗 (阈下 MNET 或 NET)。研究分析不同电量治疗的临床效果。

结果 观察组治疗后汉密尔顿抑郁量表 (HAMD) 评分 [$(5.26 \pm 1.14$ Vs $9.22 \pm 2.14)$ 分]、自杀意念自评量表 (SIOSS) 评分 [$(5.12 \pm 1.95$ Vs $10.44 \pm 1.89)$ 分]、不良反应发生率 (5.00% Vs 30.00%) 均低于对照组, 差异有统计学意义 ($P < 0.05$); 观察组治疗后简明智力状态检查量表 (MMSE) 评分 [$(28.15 \pm 1.27$ Vs $23.82 \pm 4.34)$ 分]、临床记忆量表 (CMS) 评分 [$(86.47 \pm 4.39$ Vs $79.28 \pm 2.31)$ 分] 均高于对照组, 差异有统计学意义 ($P < 0.05$)。

结论 NET 治疗青少年抑郁症患者疗效显著, 可改善其认知功能、记忆功能, 降低不良反应发生率, 预后效果较佳。

认知行为疗法联合舍曲林对青少年非自杀性自伤患者的应用价值: 一项回顾性研究

韩友松*

安庆市第六人民医院

目的 研究认知行为疗法联合舍曲林对青少年非自杀性自伤 (NSSI) 患者的应用价值。

方法 临床选取 2023 年 1 月至 2024 年 1 月在本院接受治疗的青少年 NSSI 患者 83 例, 依据病历系统记录的不同管理方案分为对照组 ($n=41$, 舍曲林)、观察组 ($n=42$, 舍曲林+认知行为疗法), 观察对比两组患者状态-特质焦虑问卷 (STAI)、渥太华自伤量表 (OSI)、简易应对方式 (SCSQ)、认知情绪调节问卷 (CERQ) 及生活质量综合评估问卷 (GQOLI-74) 评分。

结果 管理前两组患者 STAI、OSI、SCSQ、CERQ 及 GQOLI-7 评分对比无统计学意义 ($P > 0.05$), 管理后观察组 STAI、消极应对、OSI、缺乏适应性调节策略评分低于对照组, 但观察组积极应对、适应性调节策略及 GQOLI-7 评分高于对照组 ($P < 0.05$)。

结论 非自杀性自伤 (NSSI) 指在没有自杀意图情况下, 对自身身体组织进行故意且直接的伤害,

个体虽其本意上没有自杀的意图, 但长期影响下使得自伤行为愈发严重, 最终导致个体死亡[1,2]。相关资料显示, 研究发现 NSSI 者在第一年的自杀风险为 0.7%, 大约是普通人的 66 倍, 而青少年生理及心理由于处于生长发育期, 其 NSSI 患病率显著较高[3]。随着医学护理领域的发展, 并且由于青少年群体身心健康发展意义重大, 因此青少年 NSSI 行为引起临床的广泛关注[4]。临床通常使用舍曲林进行治疗, 能够在一定程度上有效缓解患者临床症状, 但由于患者年龄较小, 认知水平低, 在接受治疗时用药依从性低, 需要采取相应措施提高疗效[5]。认知行为疗法是一种新型心理治疗方式, 具有结构性、疗程短、认知取向性特征, 通过改变患者自身看法及态度破坏其负性思维及情绪的恶性循环[6]。参考相关资料发现, 认知行为疗法在临床其他心理障碍疾病中运用, 并取得较高临床疗效, 但长期单一使用其治疗方式具有一定的局限性[7]。因此, 对青少年 NSSI 患者进行科学有效的管理策略显得极为迫切。然而, 针对认知行为疗法联合舍曲林管理策略及其对患者实际效果的研究较为有限。基于此, 本研究旨在通过回顾性研究, 分析认知行为疗法联合舍曲林与患者应对方式、生活质量等之间的关联性, 进而深入了解认知行为疗法联合舍曲林管理对患者潜在影响因素, 有望为临床实践提供指导。

综上所述, 针对青少年 NSSI 患者实施认知行为疗法联合舍曲林一方面能够一定程度上改善患者负性情绪、自伤行为、应对方式; 另一方面有利于提高患者认知情绪调节能力及生活质量。

“结构化”团体治疗联合药物治疗对青少年抑郁症的疗效及社会功能康复的研究

王彬* 余鑫铭 吴凡 郭建 李世康

滁州市第二人民医院

目的 探究以人本主义理论及认知行为治疗为基础的“结构化”团体治疗联合药物治疗相较于单纯的药物治疗对青少年抑郁症患者的治疗效果以及在恢复其社会功能方面疗效的价值, 为探索青少年抑郁症患者多元化治疗提供支持。

方法 选择2022年5月至2024年6月期间在滁州市第二人民医院儿童青少年科住院的年龄在12-18岁之间的患者64例,随机分为药物治疗组(对照组)和结构化团体治疗联合药物治疗组(观察组)各32例,对照组给与常规药物治疗,观察组在常规药物治疗的基础上给予一周一次,共八次的结构化的团体心理治疗。两组治疗前后分别给予汉密尔顿抑郁量表17项指标(HAMD-17)、个人和社会功能量表(PSP)及儿童社交焦虑量表(SASC),在干预前和干预后对研究的对象进行测查采集数据;重点观察两组治疗后组间的结果差异。采用SPSS统计软件处理数据,计量资料以 $\bar{x} \pm s$ 表示,组间比较采用t检验,多组资料之间对比采用F检验,应用Pearson分析法分析焦虑、抑郁与疾病康复的关系,以 $P < 0.05$ 为差异有统计学意义。

结果 在相同的实验周期内两组治疗均有效,观察组治疗总有效率、社会功能恢复相较于对照组更高($P < 0.05$),两组汉密尔顿抑郁量表(HAMD)评分及儿童社交焦虑量表(SASC)分值均低于治疗前,且观察组低于对照组($P < 0.05$)。治疗后,两组社会功能量表(PSP)均高于治疗前,且观察组显著高于对照组($P < 0.01$)。

结论 青少年抑郁症患者应用结构化团体心理治疗效果确切,可有效减轻患者抑郁症状,提高患者社会功能及人际交往能力效果显著。

Association of Pain Intensity and Sensitivity with Negative Emotions in Adolescents with Depressive Disorder

Jingwen Shang Qingqing Shen Qing Zhang Huanzhong Liu*
Chaohu Hospital of Anhui Medical University

Objective The purpose of this study was to further explore the association of pain intensity and sensitivity with negative emotions in adolescent patients with depressive disorders by exploring the differences in pain intensity and sensitivity in adolescent patients with de-

pressive disorders with different levels of negative emotions

Methods A consecutive enrollment method was used to select 193 adolescent patients with depressive disorders from three hospitals in Anhui Province as subjects. The Beck Hopelessness Scale (BHS) was used to assess the subjects' negative emotions, and the intensity of somatic pain was assessed using the Numerical Rating Scale-11 (NRS-11). Subjects were assessed for forearm and tibial pain sensitivity using a hand-held pressure pain instrument, and experimental pain sensitivity measures included pressure pain threshold (PPT) and pressure pain tolerance (PTO). To compare the differences in pain intensity and pain sensitivity among adolescent patients with depressive disorders with different levels of hopelessness, and to analyze the relationship between pain intensity and sensitivity and negative mood

Results It was found that pain intensity was significantly higher in patients with high levels of despair than in those without childhood trauma ($p < 0.05$). Subjects with a high degree of despair had a higher pain intensity rating. Spearman's correlation and generalized linear regression analyses showed that patients with a high degree of despair had greater pain intensity and higher pain tolerance, i.e., lower pain sensitivity; the HAM-D total score was statistically strongly associated with pain intensity and sensitivity, with the more severe the level of depression, the greater the pain intensity, and the lower the pain sensitivity

Conclusion Pain intensity was higher in patients with severe negative mood than in those with less negative mood. Negative mood and depression severity were strongly associated with decreased pain sensitivity and increased pain intensity, respectively, in patients with adolescent depressive disorders. In clinical practice, attention to monitoring negative mood in patients with adolescent depressive disorders can help early detection of pain symptoms and intervention to improve patients' somatic symptoms

抑郁障碍青少年非自杀性自伤行为与注意缺陷多动障碍症状相关性研究

徐德峰 王晶晶 王明真 李世娜 乔冬冬*
山东省精神卫生中心

目的 抑郁障碍、注意缺陷多动障碍(ADHD)都是非自杀性自伤(NSSI)最可能的因果风险因素之一。本研究旨在探讨抑郁障碍青少年 NSSI 行为与 ADHD 症状之间的关系,并进一步探讨执行功能和情绪调节在其中发挥的作用。

方法 本研究纳入山东省精神卫生中心就诊的抑郁障碍青少年患者 147 例(平均年龄 14.83 ± 1.85 岁;男 37 例,女 110 例),根据 DSM-5 诊断标准,将患者分为伴 NSSI 组和不伴 NSSI 组,采用 SNAP-IV 量表评估 ADHD 症状,渥太华自伤量表(OSI)评估自伤情况,儿童抑郁量表(CDI)评估抑郁症状、情绪调节量表(ERQ)评估情绪调节、执行功能行为评定量表(BRIEF)评估执行功能。应用 SPSS24.0 软件和 Mplus8.0 进行数据整理和数据分析。 $P < 0.05$ 为差异具有统计学意义。

结果 本研究中抑郁障碍青少年 NSSI 行为检出率为 67.3%,常见自伤部位为手部、下臂或腕部、上臂或肘部等,常见自伤方法为切割、搔抓、啃咬等。伴 NSSI 行为组在 ADHD 症状得分、CDI 得分、执行功能缺陷程度方面均高于不伴 NSSI 行为组,差异具有统计学意义($P < 0.05$)。抑郁障碍青少年 ADHD 症状、认知重评策略、执行功能均与 NSSI 行为相关($r = -0.554 \sim -0.514$, $P < 0.05$)。链式中介分析发现执行功能和认知重评策略在 ADHD 症状和 NSSI 行为关系中的链式中介效应有统计学意义,间接效应值为 0.137 (95%CI=0.070~0.225),占总效应值 52.69%,其中 ADHD 症状通过执行功能和认知重评策略共同影响 NSSI 行为发生这一路径的间接

效应为 0.032 (95%CI: 0.011~0.069),占总效应值的 12.31%,ADHD 症状通过执行功能受损影响 NSSI 行为发生这一路径的间接效应 0.062 (95%CI=0.022~0.138),占总效应值的 23.85%,ADHD 症状通过认知重评策略影响 NSSI 行为发生这一路径的间接效应 0.043 (95%CI=0.012~0.090),占总效应值的 16.54%。

结论 青少年抑郁障碍患者 NSSI 行为与 ADHD 症状严重程度、情绪失调及执行功能缺陷相关,其中执行功能、情绪调节在 ADHD 症状和 NSSI 行为之间存在链式中介作用。

基于 PERMA 模式的家庭抗逆力提升干预对抑郁症青少年的疗效分析

赵雯 冉曼利*
重庆市精神卫生中心

目的 青少年群体是心理问题、精神问题的重灾区,而抑郁症或抑郁倾向近年来尤为凸显,青少年患抑郁症会影响整个家庭的稳定性。

探究基于 PERMA 模式的家庭抗逆力提升干预对抑郁症青少年的临床疗效,及其对患者家庭抗逆力、创伤后成长水平和幸福感指数的影响

方法 本研究选取 2023.1-2024.1 在我院收治的 30 例抑郁症青少年家庭为研究对象,设为观察组,予以氟西汀胶囊联合采用“基于 PERMA 模式的家庭抗逆力提升干预方案”,常规护理健康知识宣教治疗 4 周;选取同期住院的 30 例抑郁症青少年家庭为对照组,氟西汀胶囊联合常规护理健康知识宣教治疗 4 周。分别在干预前和干预后 4 周对两组患者家庭进行评估,比较两组包括中文版家庭抗逆力评定量

表(C-FRAS)、创伤后成长量表(PTGI)和幸福感知数量表(IWB)的评分差异。

结果 干预4周后观察组中文版家庭抗逆力评定量表(C-FRAS)、创伤后成长量表(PTGI)和幸福感知数量表(IWB)评分均优于对照组,差异有统计学意义($P<0.05$)。

结论 基于PERMA模式的抗逆力提升干预方案对青少年抑郁患者家庭抗逆力水平、创伤后成长水平和幸福感知指数具有明显的提高作用。且具有操作性强,患者接受度高的优势,值得临床应用实践。

关键词: PERMA模式 家庭抗逆力 青少年 抑郁症

青少年抑郁患者树木画特征研究

陆奕彬¹ 陈旭彤²

1.东莞市第七人民医院

2.东莞市清溪医院

目的 探究树木画投射测验用于评估青少年抑郁的可能性。

方法 采用Koch画树投射测验(TDT),旨在通过要求被测者画一棵树,从而了解其个人特质、情感状态和心理特征;以及用青少年抑郁自评量表(SDS)对48名青少年抑郁障碍患者和32名正常青少年进行群体调查。树木绘画投射测验:统一提供给每位实验对象A4纸一张、铅笔一支、橡皮一只。要求被试在指导语下进行绘画。完成绘画后,笔者对每一幅画进行检查,对画中特征不清的部分,向绘画者进行询问。评分者将对每一幅树木画绘画作品在树木画投射测验编码表及评分表中进行评分并录入。并采用Logistic回归分析建立画树投射测验对青少年抑郁障碍的诊断方程。

结果 ①抑郁组和正常组之间有18个绘画特征具有显著性差异($t=5.526\sim 35.208$, $P<0.05$);②将绘画特征的其中5项作为自变量,以是否患抑郁障碍为因变量,进行二元Logistic回归分析。得到树有涂黑或阴影($OR=4.155$, $P=0.045$)、树被细致刻画($OR=7.094$, $P=0.007$)和树冠内线条凌乱($OR=7.828$, $P=0.003$)。

结论 (1) 在绘画特征上,抑郁组和非抑郁

组在树有涂黑或阴影、树线条颤抖、枯树或落叶树、树被细致刻画、树木矮小、树位于画面中部、树位于画面下部、树干线条为双曲线、树干上有疤痕或污点、管状树枝、树枝向上、刀状尖锐树枝、树冠内线条凌乱、树冠左侧树枝不规则、树冠右侧树枝不规则、果实、竖向纸张、横向纸张这18项树木画特征具有显著性差异。

(2) 树有涂黑或阴影、树被细致刻画、树冠内线条凌乱、树有刀状尖锐树枝和树

有果实这5项树木画特征进入了Logistic回归方程。

(3) “树有涂黑或阴影”、“树被细致刻画”和“树冠内线条凌乱”这3项树木

画特征通过了显著水平为5%的显著性检验呈现出显著性。树有涂黑或阴影、树被细致刻画和树冠内线条凌乱3个绘画特征对青少年抑郁障碍具有预测作用。

关键词: 青少年;抑郁症;树木画投射测验;绘画特征

首发儿童精神分裂症患者脑功能与幻听关系的研究

杜洁^{2,3} 杜洁¹ 邵明龙¹ 邵明龙^{2,3} 李亚霖^{1,2,3} 李想^{1,2,3} 周之禄^{1,2,3} 生龙雨^{1,2,3} 郭素芹^{1,2,3}

1.新乡医学院第二附属医院

2.河南省精神病医院

3.河南省生物精神病重点实验室

目的 旨在通过分析首发儿童精神分裂症患者脑功能特征,比较幻听与无幻听首发儿童精神分裂症患者脑功能差异,以深入探究儿童精神分裂症患者幻听发生的机制。

方法 研究纳入了55名首发儿童精神分裂症患者和28名健康对照者,采集rfMRI数据。根据SAPS量表中的“听幻觉”条目得分将患者分为无幻听组和幻听组。使用DPARSF软件对磁共振原始数据进行预处理,计算出整个大脑的ALFF平均值,利用REST软件进行GRF校正,利用协方差分析、双样本t检验获得组间差异脑区,以 $P<0.05$ 为结果显著,检验水准均设定为 $\alpha=0.05$,双侧检验。

结果 三组之间ALFF值差异脑区分布在左侧

三角部额下回, fALFF 值差异性脑区分布在左侧颞上回、左侧岛叶、左侧中央后回和左侧颞极颞上回。进一步的两两比较显示, 与对照组相比, 幻听组 ALFF 值降低发生在左侧岛叶、左侧三角部额下回与左侧岛盖部额下回, fALFF 值降低发生在右侧尾状核; 无幻听组 ALFF 值升高发生在双侧小脑, fALFF 值升高发生在中央后回、中央前回、左侧脑岛、左侧颞上回、左侧颞极颞上回; 此外, 幻听组较无幻听组 fALFF 值降低发生在右侧颞上回。

结论 首发儿童精神分裂症患者存在脑功能差异, 且幻听与无幻听首发儿童精神分裂症患者之间脑功能存在差异, 为研究儿童精神分裂症的发病机制提供了重要线索。

关键词: 脑功能; 幻听; 儿童; 首发精神分裂症

青少年抑郁症患者抑郁严重程度与认知功能的关系研究

王雪杰 李秀丽*

潍坊市益都中心医院

目的 比较客观认知功能在不同抑郁症严重程度下的差异。

方法 选取前往山东某三甲医院就诊, 并经精神科医师评估符合 ICD-10 诊断标准的 110 名抑郁症患者, 采用中国科学院心理所研发设计的基本认知能力测验系统测评青少年抑郁症患者客观认知功能。并采用抑郁症状自评量表评估其病情严重程度。共采集重度抑郁症组 70 人、中度抑郁症组 22 人、轻度抑郁症组 18 人。采用 SPSS17.0 系统软件进行分析。

结果 (1) 三组被试在空间知觉、言语理解、情景记忆任务上差异具有统计学意义 ($P < 0.05$)。事后检验显示中度抑郁症组与重度抑郁症组在空间知觉任务中差异显著 ($P < 0.05$), 中度抑郁症组在空间知觉任务中表现比重度抑郁症组更好; 三组被试在言语理解任务中差异均显著 ($P < 0.05$), 重度抑郁症组在言语理解任务中得分最低; 轻度抑郁症组与中度抑郁症组、中度抑郁症组与重度抑郁症组在情景记忆任务中差异具有统计学意义 ($P < 0.05$), 重度抑郁症组在情景记忆任务中得分最低。(2) 空间知觉 ($r = -0.224, P = 0.019$)、情景记忆 2 ($r =$

$0.266, P = 0.005$)、言语理解 ($r = -0.284, P = 0.003$) 与抑郁症状表现严重程度呈负相关。(3) 抑郁症状严重程度能显著预测空间知觉 ($R^2 = 0.046, P = 0.025$)、情景记忆 ($R^2 = 0.064, P = 0.008$)、言语理解 ($R^2 = 0.068, P = 0.006$) 能力。

结论 青少年抑郁症认知功能障碍与抑郁症状严重程度相关, 抑郁症状严重程度可预测其认知功能水平。

关键词: 青少年抑郁, 认知

移空技术对大学生焦虑抑郁情绪干预效果研究

曹娟*

芜湖市第四人民医院

目的 探索短程移空技术对改善大学生焦虑抑郁情绪的影响。

方法 使用 PHQ-9、GAD-7 对来访大学生的抑郁、焦虑状况进行评估, 对于达到临界点大学生 (PHQ-9、GAD-7 ≥ 5 分) 进行随机化分组。61 名入组被试分别进入观察组和对照组 (观察组 31 人, 对照组 30 例)。观察组由接受移空技术培训的心理咨询 (治疗) 师完成, 咨询 (治疗) 师按照操作流程进行结构化治疗, 共干预 3 周 3 次, 每周 1 次, 每次约 50 分钟。对照组由心理咨询 (治疗) 师完成, 采用支持性心理咨询干预, 共干预 3 周 3 次, 每周 1 次, 每次约 50 分钟。对两组被试进行开始前、结束时及结束后 1 周施测抑郁-焦虑-压力量表 (DASS-21)、简易应对方式问卷和自我效能感量表。

结果 1、观察组被试有 23 人完成所有测试, 对照组被试有 26 人完成所有测试; 2、观察组在所有量表得分均值上即时后测、1 周后测均低于前测得分 (P 均小于 0.05); 3、对照组在所有量表得分均值上即时后测、1 周后测与前测得分均值的差异均未达到统计显著 (P 均大于 0.05)。

结论 移空技术对大学生情绪困扰、心身症状的缓解具有明显的干预效果。

REWARD RELATED NEURAL CIRCUITS OF ANXIETY DISORDER COMORBID WITH NSSI IN ADOLESCENTS

Wenjing Liu Wenhong Cheng* Fang Zhang Yanhuan Huang Zhen Liu Wenqing Jiang Xiaochen Zhang Changminghao Ma Makelun Yao
shanghai mental health center

Objectives The neurobiological foundations of NSSI are multifaceted and intricate, with the reward-related neural circuits playing a pivotal role. Despite this, the specific functions of these circuits in the context of NSSI among children and adolescents, especially those diagnosed with comorbid anxiety disorders, remain largely unexplored.

Methods Our analytical process commenced with the calculation of the Functional Connectivity Strength (FCS) across eight striatal regions. This involved quantifying the mean functional connectivity between each striatal structure and the cerebral cortex. Subsequently, we employed a Multivariate Distance Matrix Regression (MDMR) model to discern any disparities in the overall striatal FCS pattern between the groups diagnosed with anxiety disorders, with and without NSSI. Finally, we explored the correlation between striatal FCS patterns and SCARED, IPPA, and CTQ respectively.

Results The investigation unveiled a significant discrepancy in the overall striatal FCS patterns between the NSSI and non-NSSI groups. Subsequent post-hoc analyses indicated a reduction in FCS across almost all striatal structures within the NSSI group, with the left caudate demonstrating the most pronounced effect size. Furthermore, significant correlations were identified between the striatal FCS pattern and the principal component scores representing parental and peer relationships, alongside trauma. Post-hoc analyses elucidated that diminished FCS was linked to inferior parental and peer relationships, as well as to heightened levels of trauma across all assessed striatal structures, once again with the left caudate showing the largest effect size.

Conclusions Adolescents diagnosed with anxiety disorders and comorbid NSSI exhibited lower functional connectivity between the striatum and cortex, relative to their non-NSSI counterparts.

ety disorders and comorbid NSSI exhibited lower functional connectivity between the striatum and cortex, relative to their non-NSSI counterparts.

关键词: Anxiety disorder; self-harm; functional connectivity

非自杀性自伤未成年人住院患者吸烟状况及影响因素

牛红利¹ 韩勇² 朱建立¹ 彭志珍¹ 章杰¹ 任衍镇¹ 胡静¹

1. 中山市第三人民医院

2. 河南省精神卫生中心

目的 吸烟是严重危害人类身心健康的行为,尤其是对未成年人。非自杀性自伤(Non-Suicidal Self-Injury, NSSI)被认为是全球性重要公共卫生问题之一,未成年人在数量上占据主体。本研究旨在了解 NSSI 未成年人住院患者吸烟状况及影响因素,为公共卫生政策的制定及干预提供参考。

方法 以 2023 年 6 月至 2024 年 5 月于中山市第三人民医院住院的 206 例 NSSI 未成年人住院患者为研究对象,使用自编一般人口问卷收集其年龄、教育程度、户籍地、有无医保、学业状态、职业状态、疾病诊断、抚养方式、亲子关系、病程、是否吸烟饮酒。并对吸烟原因进行调查。以是否吸烟分为 2 组,进行单因素组间比较。进一步对组间具有统计学差异的指标纳入 logistics 回归模型,进行多因素分析。

结果 (1) 本研究共筛出 25 名 NSSI 未成年人住院患者存在吸烟行为,吸烟检出率为 12.14%; (2) NSSI 未成年人住院患者吸烟的主要原因依次是缓解负性情绪、同伴影响及父母影响; (3) 性别 ($P=0.001$)、学业状态 ($P<0.001$)、职业状态 ($P<0.001$)、病程 ($P=0.004$)、亲子关系 ($P<0.001$) 及是否饮酒 ($P<0.001$) 在组间具有统计学差异; (3) 多因素分析结果显示,待业或辍学的人群 ($OR=3.952, P=0.012$) 以及亲子关系较差的人群 ($OR=9.508, P<0.001$) 吸烟风险显著增加。

结论 应加强对女性、辍学、无业、激烈的亲子冲突及饮酒特征的 NSSI 未成年人关注及干预,防止吸烟导致的健康受损加重。

抑郁障碍青少年抑郁程度与网络成瘾的关系: 社交回避与学业挫败感的链式中介作用

赵心睿^{1,2} 杨楹¹ 韦雨欢^{1,3} 陈佳佳^{1,2} 王诗健^{1,3} 李静雅¹

1.山东省精神卫生中心
2.滨州医学院
3.济宁医学院

目的 本研究旨在探究抑郁障碍青少年抑郁程度与网络成瘾之间的关系, 以及社交回避和学业挫败感在两者间的作用, 为抑郁障碍青少年网络成瘾行为的预防提供科学参考。

方法 被试为2021年5月至2022年10月在中国山东省精神卫生中心门诊就诊和住院治疗的463名青少年抑郁障碍患者。采用儿童抑郁量表、挫败感量表、社交回避和苦恼量表以及青少年网络成瘾量表进行评估。

结果 在性别方面, 与男孩相比, 女孩在抑郁、社交回避、挫败量表上的得分更高; 在年龄方面, 随着年龄的增长, 青少年的抑郁、社交回避水平均呈下降趋势; 在受教育程度方面, 初中生和高中生的抑郁、社交回避水平均比小学生和大学生严重; 在精神疾病家族史方面, 存在家族史的青少年抑郁水平较高; 在家庭收入水平方面, 随着家庭收入的升高, 青少年的网络使用程度呈降低趋势。

抑郁障碍青少年网络成瘾的检出率为10.8%。网络成瘾与抑郁程度、社交回避、学业挫败感均呈显著正相关($r=0.414, 0.411, 0.352, P<0.001$)。链式中介效应检验表明, 社交回避和学业挫败感在抑郁程度和网络成瘾之间的中介效应显著, 中介效应量分别为0.084(95%CI: 0.018–0.155)、0.148(95%CI: 0.040–0.258); 且社交焦虑-抑郁的链式中介效应也显著, 中介效应量为0.014(95%CI: 0.003–0.034)。

结论 抑郁障碍青少年抑郁程度不仅直接影响网络成瘾, 而且还通过社交回避和学业挫败感的链式中介效应间接影响网络成瘾。

关键词: 儿童青少年, 抑郁障碍, 社交回避, 学业挫败感, 网络成瘾

母亲童年期创伤对青少年抑郁障碍的代际影响: 教养方式和子代童年期创伤的链式中介作用

陈佳佳^{1,2} 赵心睿¹ 赵心睿² 韦雨欢³ 韦雨欢¹ 王诗健^{1,3} 李静雅¹ 杨楹^{1,2,3}

2.滨州医学院
3.济宁医学院

目的 《国民抑郁症蓝皮书 2022-2023 年》显示, 18岁以下的抑郁障碍患者占总人数的30%, 抑郁障碍发病群体呈年轻化趋势。从发展精神病理学的视角, 父母童年期创伤经历对青少年抑郁障碍的代际影响是当前抑郁障碍领域的热点研究问题。童年期创伤是指个体18岁之前所遭受到的包括各种形式的童年虐待、忽视以及家庭功能不全的成长经历, 其后果持久且深远。当前诸多证据表明, 母亲童年期创伤经历会增加其子女患严重精神性疾病的风险, 但其内部机制还有待深入探讨, 尤其是基于中国文化背景下临床群体的研究是有待补充的。

方法 采用量化研究, 以263对抑郁障碍青少年及其母亲为对象(子代 Mage=15.07, SD=2.59, 女孩占比65.2%; 母亲 Mage=43.26, SD=4.76), 构建结构方程模型, 考察教养方式及子代童年期创伤在母亲童年期创伤对青少年抑郁障碍代际影响中的链式中介作用。本研究采用童年创伤问卷对青少年母亲进行测量; 采用童年创伤问卷、教养方式量表以及儿童抑郁量表对青少年抑郁障碍患者进行测量。

结果 (1) 相关分析显示, 母亲童年期创伤与控制型教养方式、子代童年期创伤及青少年抑郁障碍严重程度之间呈显著正相关; 母亲童年期创伤与鼓励自主型、关怀型教养方式分别呈显著负相关。

(2) 结构方程模型显示, 母亲童年期创伤会对青少年抑郁障碍严重程度产生代际影响, 且通过教养方式和子代童年期创伤的链式中介作用产生间接效应。

结论 教养方式与子代童年期创伤在母亲童年期创伤对青少年抑郁障碍的代际影响中起中介作用。这拓展了对中国文化背景下临床群体中的童年创伤代际影响发生机制的认识, 并为母亲童年期创伤对青少年抑郁障碍产生影响提供了新的证据, 为后续

提早阻断其恶性代际影响,及早干预提供思路和借鉴,促进青少年身心健康发展。

内蒙古自治区儿童青少年抑郁症状及其影响因素分析

陈贵伟 白银霞*

内蒙古自治区精神卫生中心

目的 本调查旨在了解内蒙古自治区儿童青少年抑郁症状的检出率,并探讨分析影响抑郁症状的相关因素,从而为专业人员加大对疾病的健康知识的宣讲以及促进学生的心理健康提供依据,同时,关注抑郁症状高风险人群,提前进行干预,以防止症状进一步发展为抑郁症。

方法 本调查采用整群分层随机抽样的方法,抽取内蒙古自治区 12 个盟市的儿童青少年,使抑郁自评量表(Self-rating Depression Scale,SDS)及自编一般情况问卷,使用 Epidata 4.6 软件录入数据,用 Excel 软件对 Epidata 导出数据进行初步整理,分类变量使用构成比表示,单因素分析用卡方检验,多因素分析采用多因素 Logistic 回归分析,以探讨儿童青少年抑郁症状的检出率及其影响因素。

结果 (1)本次调查共完成 6281 份问卷,有效问卷 6058 份,有效率 96.4%。儿童青少年抑郁症状的检出率为 45.03%。(2)对儿童青少年抑郁症状的影响进行单因素分析表明,性别、年龄、是否独生子女、家庭类型、家庭月收入以及父母的文化程度和母亲的工作状况有统计意义($P<0.05$)。(3)影响儿童青少年抑郁症状的多因素分析:与男生相比,女生的抑郁症状检出率更高;与 6~岁年龄组相比,12~岁年龄组的抑郁症状检出率更高;与 6~岁年龄组相比,16~岁年龄组的抑郁症状检出率更高;与独生子女相比,非独生子女的抑郁症状检出率更高;与大家庭(三代及以上)相比,重组家庭的抑郁症状检出率更高;与家庭月收入 5000 元以上相比,家庭月收入 4000-5000 元、3000-4000 元、2000-3000 元、1000-2000 元、1000 元以下的抑郁症状检出率更高;与父亲研究生及以上学历相比,父亲初中学历的抑郁症状检出率更高;与父

亲研究生及以上学历相比,父亲小学及以下学历的抑郁症状检出率更高;与母亲研究生及以上学历相比,母亲小学及以下学历的抑郁症状检出率更高。

结论 (1)内蒙古自治区儿童青少年的抑郁症状检出率为 45.02%。(2)性别、年龄、家庭类型、家庭月收入以及父亲文化程度是本调查中导致儿童青少年抑郁症状出现的影响因素。

行为矫正治疗技术对青少年非自杀性自伤的应用研究

周英*

成都市第四人民医院

目的 青少年非自杀性自伤的行为矫正技术是将辩证行为疗法与行为矫正技术的理念和实操相结合而产生的一种临床新技术、新方法、新理念。帮助患者掌握正念放松相关训练技能,帮助其适应压力性事件,指导患者正视情绪及调节不良情绪的方法,患者再训练后弱化情绪敏感性,采用积极、正确的方法泄情绪;同时强化患者正确缓解情绪的方法,替代、消退、摆脱反复的 NSSI 的行为模式,塑造积极的应对方式和重建规则感与边界意识。

方法 对 2023 年 11 月-2024 年 4 月住院期间发生非自杀性自伤(NSSI)的 48 名青少年患者随机分为实验组(24 名患者)和对照组(24 名患者)。对照组常规进行药物治疗、物理治疗、心理治疗;实验组除常规的药物治疗、物理治疗、心理治疗外,运用该技术进行干预,通过为期 3-7 天的行为矫正治疗,包括签订行为契约、行为矫正技术的启动、行为矫正第一日之非自杀性自伤行为的消退与重塑、行为矫正第二日之情绪调节练习、行为矫正第三日之积极应对技巧、行为矫正治疗结束等几个部分实施治疗。

结果 通过对比观察发现:实验组通过行为矫正治疗技术的干预后,患者在院期间再次发生 NSSI 的患者人数为 2 例,对照组为 18 例;实验组患者自愿参加团体心理治疗的次数平均为 4.5 次/周,对照组为 2.8 次/周。

结论 行为矫正治疗技术能减少青少年非自杀

自伤的频率, 通过治疗干预能学习正念放松相关训练技能, 学会采用积极、正确的方法缓解情绪, 获得应对危机的能力, 从而替代、消退、摆脱掉反复的NSSI的行为模式。能一定程度的提升住院患者的治疗积极性。

关键词: 行为矫正治疗技术; 青少年非自杀性自伤; 治疗积极性

孤独症儿童父母心理资本、社会支持和社会疏离的关系: 基于主客体互倚模型

韦瑶 张利峰*
中山大学护理学院

目的 探讨孤独症儿童父母的心理资本对社会疏离的影响以及社会支持的中介作用, 为临床干预提供理论依据。

方法 采用便利抽样法, 选择 202 对孤独症儿童的父母为研究对象, 采用一般资料问卷、积极心理资本问卷 (PPQ)、孤独症儿童家庭社会支持量表和一般疏离感量表 (GAS) 进行调查, 基于主客体互倚模型探讨孤独症儿童父母心理资本与社会疏离之间的关系, 以及社会支持在两者间的中介作用。

结果 ①本组孤独症儿童母亲的心理资本显著负向预测自身的社会疏离 (效应值: -0.091 , $p < 0.05$), 父亲的心理资本显著负向预测自身的社会疏离 (效应值: -0.127 , $p < 0.05$), 主体效应显著; 母亲与父亲的心理资本均不能显著预测对方的社会疏离, 客体效应不显著; ②母亲的社会支持在自身心理资本对社会疏离的主体效应中起到部分中介作用 (效应值: -0.017 , 占总效应值的 18.68% , $p < 0.05$), 父亲的社会支持在自身心理资本对社会疏离的主体效应中起到部分中介作用 (效应值: -0.469 , 占总效应值的 14.25% , $p < 0.05$); ③父亲的社会支持在母亲心理资本对父亲社会疏离的客体效应中起完全中介作用 (效应值: -0.007 , $p < 0.05$)。

结论 孤独症儿童父母的心理资本可以通过社会支持对自身社会疏离产生影响, 母亲的心理资本通过父亲的社会支持影响父亲社会疏离, 有利于从二元视角理解父母心理资本如何影响社会疏离水平, 提示医护人员应积极探索以家庭为单位的干预方案, 实际干预中可通过提高社会支持水平来改善孤独症

儿童父母的社会疏离状况, 帮助父母与社会良好互动, 最终实现孤独症家庭社会融合。

学龄期儿童孤独感的潜在类别及相关影响因素分析

黄燕虹^{1,2} 梁芷雅^{1,2,3} 吴库生³ 张绚智^{1,2} 余心乐^{1,2}
顾倩菲^{1,2}

1. 汕头大学精神卫生中心

2. 汕头大学医学院—曼尼托巴大学医学院生物精神病学联合实验室

3. 汕头大学医学院预防医学系

目的 孤独感作为一种常见的消极情绪状态, 已日益成为一种普遍的公共卫生问题, 不仅阻碍儿童的正常社交功能, 还会为其未来的身心健康带来危害。本研究旨在根据学龄期儿童表现出的孤独感症状, 识别其潜在类别, 并对其相关影响因素作进一步探讨。

方法 采用随机整群抽样法, 于 2023 年 3-6 月使用人口学特征问卷、Conners 简明症状问卷、儿童孤独量表 (CLS)、领悟社会支持量表 (PSSS) 和儿童希望量表 (CHS), 以汕头市公立小学 2-5 年级的小学生为对象进行问卷调查。利用 Mplus 8.3 进行潜在类别分析建立亚组模型, 通过卡方检验、方差分析、LASSO 回归、多分类 logistic 回归分析探究不同类别儿童孤独感的特征及相关影响因素。

结果 本研究最终回收有效问卷共 2514 份, 有效率为 92.8% 。2514 名学龄期儿童孤独感状况可分为 4 种不同的潜在类别: 低孤独感组 (37.0%)、边缘孤独感组 (40.4%)、中度孤独感组 (10.3%) 和高度孤独感组 (12.3%)。多分类 Logistic 回归分析结果显示, 低孤独感组的 PSSS 和 CHS 得分显著高于其余三组 ($P < 0.01$); 以二年级为对照, 随着年级的升高, 儿童属于边缘孤独感组、中孤独感组和高孤独感组的可能性显著降低 ($P < 0.05$); 在边缘孤独感组中, 与低孤独感组相比, 学习成绩优秀 ($OR = 0.47$) 及良好 ($OR = 0.64$) 的儿童占比较低, 同时作为独生子女 ($OR = 0.64$) 的儿童在该组中的可能性也更低 ($P < 0.05$); 在中孤独感组中, 与低孤独感组相比,

儿童学习成绩优秀(OR=0.33)及良好(OR=0.55)和感受到父母尊重(OR=0.47)的可能性更低,中孤独感组儿童父亲为小学及以下文化程度(OR=2.08)、曾受过欺凌(OR=1.49)、曾受到过身体攻击(OR=1.64)的可能性更高($P<0.05$);而在高孤独感组中,与低孤独感组相比,儿童有4个及以上朋友(OR=0.20)、与朋友关系好(OR=0.32)、感受到父母尊重(OR=0.59)的可能性更低,曾受过欺凌(OR=1.46)和经常接受父母作业辅导(OR=1.54)的儿童更有可能属于高孤独感组($P<0.05$)。

结论 学龄期儿童的孤独感存在明显不同的分类特征,年级、学习成绩、父亲文化程度、被欺负经历、被身体攻击经历、父母家庭作业辅导、是否独生子女、朋友数量、与朋友的关系、父母尊重感、领悟社会支持和希望是其孤独感潜在类别的影响因素,学校及家长应积极识别不同类别儿童孤独感特征并及时采取有效的干预措施,以维护学龄期儿童的心理

青少年家庭功能与心理健康的关系探索 —— 自尊、情绪及应激的平行中介作用

陈祥展^{2,3} 陈祥展¹

- 1.长江大学精神卫生中心
- 2.荆州市精神卫生中心
- 3.长江大学精神卫生研究所

目的 探索青少年家庭功能与心理健康的作用机制,研究自尊及情绪因素在其中的作用。

方法 采用家庭功能量表、青少年自尊评定问卷、青少年情绪弹性问卷、中学生应激源调查问卷及青少年心理健康素养评定问卷,以方便取样法于2023年在荆州市使用问卷星网络在线收集工具及线下问卷进行数据收集。采用SPSS 23.0及Process插件分别对数据进行描述性统计和中介效应分析。

结果 (1)研究回收问卷28941份,排除作答时间较短、不愿作答等无效问卷后,有效问卷26284份,有效率91%;其中男性13090人(49.8%),女性12028人(45.8%),缺失1166(4.4%),年龄 13.02 ± 1.87 。(2)在本研究的样本($N=26284$)中,

符合心理健康素养问卷有效率标准的5989人(22.8%)。(3)家庭功能量表得分 22.72 ± 7.62 ,青少年自尊评定问卷得分 63.06 ± 20.52 ,青少年情绪弹性问卷得分 40.93 ± 13.09 ,中学生应激源调查问卷得分 17.09 ± 22.10 ,青少年心理健康素养评定问卷得分 77.09 ± 21.25 。(4)对家庭功能、自尊、情绪、应激及心理健康素养进行相关分析,结果显示被试群体心理健康素养与家庭功能总分、自尊、情绪及应激都显著正相关($p<0.001$)。(5)结构方程模型拟合指数优良,在具体模型中,直接路径“家庭功能-心理健康素养”($\beta=0.4698, p<0.001$)和间接路径“家庭功能-自尊-心理健康素养”($\beta=0.2316, p<0.001$)、“家庭功能-情绪-心理健康素养”($\beta=0.1476, p<0.001$)及“家庭功能-应激-心理健康素养”($\beta=0.1009, p<0.001$)均显著。直接预测与间接预测解释率分别为49.5%与50.5%。

结论 家庭功能得分能够直接预测心理健康素养,也能够通过自尊、情绪及应激等特质间接预测心理健康素养,自尊、情绪及应激起部分中介作用。家庭功能影响心理健康素养的因素较多,从生理、社会抑或综合因素深入分析,有助于未来更多对青少年心理健康素养的干预。

关键词:家庭功能;心理健康素养;自尊;情绪;应激

家庭功能对青少年心理健康影响研究进展

耿坤 杨林*

大理大学第一附属医院

摘要:目前青少年心理健康受到国内外学者广泛关注。家庭是青少年生活的主要场所,其中家庭功能是对青少年心理健康影响因素之一。本文从家庭功能动态轨迹发展及家庭环境对青少年心理健康影响进行总结(1)家庭功能的动态轨迹发展大致可以分为4个亚类别:“低—升高组”、“低—下降组”、“高—升高组”、“高—下降组”四个亚类别。家庭功能紊乱的发展轨迹可以分为“家庭功能紊乱—低持续组”、“家庭功能紊乱—中持续组”、“家庭功能紊乱—高持续组”以及“家庭功能紊乱—升高组”四种不同类别。与“家庭功能紊乱—低持续组”的学生相比,其他组学生心理韧性得分均较低,

其中,“家庭功能紊乱—高持续组”对随后心理韧性的负面影响最大,“家庭功能紊乱—升高组”和“家庭功能紊乱—中持续组”次之。家庭功能和心理韧性呈正相关,而家庭功能和心理健康呈负相关。相对于高水平家庭功能持续组,其他家庭功能发展轨迹亚组可以通过降低青少年的心理韧性,增加其心理健康问题的风险。(2)家庭环境包括学生自觉父母间关系、自觉家庭经济条件、父母是否离异、留守情况(父、母在外地工作)等内容。女生的心理亚健康状态、情绪问题维度和品行问题维度的检出率均高于男生。自觉父母间关系不好/很差的青少年的心理亚健康状态、情绪问题维度、品行问题维度和社会适应困难维度的检出率均高于自觉父母间关系很好的青少年。自觉家庭经济条件不好/很差的青少年的品行问题维度的检出率高于自觉家庭经济条件很好/比较好的青少年。母亲在本地工作的青少年的心理亚健康状态和情绪问题维度的检出率低于母亲在外地工作的青少年。

关键词: 家庭功能,家庭环境,心理健康,青少年

Early-Life Adverse Experiences As Mediators Between Polygenic Risk Scores for Schizophrenia and Psychotic-Like Experiences Trajectories in Adolescents

Min Xie Jia Cai Zhengyang Zhao Qiuyue Lv Shiwang
Tao Jiashuo Zhang Chunxia Qiao Qiang Wang*
Sichuan University, West China Hospital

Objective Adolescent psychotic-like experiences (PLEs) exhibit diverse symptom trajectories over time and are heavily influenced by genetics. Research has shown associations between adverse childhood experiences (ACEs), polygenic risk scores (PRS), and PLEs or other psychiatric conditions. Investigating the impact of ACEs and the genetic underpinnings of heterogeneous PLEs trajectories is crucial for understanding disease etiology, prediction, and early intervention. This study aimed to explore associations between schizophrenia genetic risk, adolescent PLEs trajectories, and the potential mediating role of ACEs.

Methods This cohort study employed the Adolescent Brain and Cognitive Development (ABCD) study (N = 11,876). Included were adolescents with genetic information, ACEs assessed at baseline, and PLEs measured at up to four occasions. Trajectories were derived via growth mixture modeling of longitudinal PLEs. PRS for schizophrenia (PRS_{scz}) were computed in individuals of European ancestry. Logistic regression analysis was used to examine the association between PRS_{scz} and PLEs trajectories. Spearman correlation analysis assessed associations between PRS_{scz}, ACEs, and PLEs trajectories. Mediation analysis explored the mediating effects of ACEs on the relationship between PRS_{scz} and PLEs trajectories

Results The study included 11,876 adolescents (mean [SD] age at baseline, 118.98 [7.50] months; 6,187 males [52.43%]) from the ABCD cohort. Distinct PLEs trajectories were identified: 1) stable low (10,660, 89.83%), 2) decreasing (768, 6.47%), and 3) increasing (439, 3.70%). Logistic regression analysis indicated that PRS_{scz} and ACEs were associated with an increased risk of PLEs (OR = 1.422, 95% CI = 1.327-1.523, $p < 0.001$; OR = 1.307, 95% CI = 1.244-1.374, $p < 0.001$, respectively). Furthermore, ACEs partially mediated the association between PRS_{scz} and PLEs trajectories (proportion mediated: 11.32%)

Conclusion This cohort study revealed that PRS for schizophrenia and ACEs are both risk factors for decreasing and increasing PLEs symptom trajectories. ACEs potentially mediate the pathway from PRS_{scz} to PLEs trajectories

关键词: psychotic-like experiences, polygenic risk scores, adverse childhood experiences

“双减”前后精神科 6~16 岁患儿患病类型及病前生活事件分析

陈彦超¹ 任瑞¹ 孙雅¹ 景兰¹ 阙建宇² 陈丽霞¹
1.内蒙古自治区精神卫生中心(内蒙古自治区第三医院、内蒙古自治区脑科医院)
2.厦门市仙岳医院,厦门医学院附属仙岳医院,福建省精神医学中心,福建省精神疾病临床医学研究中

心

目的 探索“双减”政策前后内蒙古自治区某精神专科医院门诊 6~16 岁首诊患儿的患病类型及病前生活事件的变化。

方法 回顾 2018 年 9 月 1 日~2022 年 8 月 31 日首次就诊于内蒙古某精神专科医院门诊的 6~16 岁患儿的诊断及病前生活事件,采用 Pearson χ^2 检验进行组间比较,采用 Bonferroni 检验进行事后检验,分析在“双减”政策实施前的 3 年和实施后的 1 年,就诊患儿的患病类型和生活事件的变化。

结果 共计 4910 例患儿纳入分析,其中 2018~2019 学年 897 例,2019~2020 学年 1262 例,2020~2021 学年 1762 例,2021~2022 学年 989 例。不同学年首次就诊的患儿诊断为非神经发育障碍的比例依次为:2018~2019 学年:69.23%,2019~2020 学年:80.90%,2020~2021 学年:80.99%,2021~2022 学年:77.35%,组内差异具有统计学意义($\chi^2=55.94$, $P<0.001$);2018~2019 学年在门诊首次就诊的非神经发育障碍患儿的比例低于其他 3 个学年($P<0.05$)。病前生活事件中只有受惩罚、丧失、学习压力事件的患儿比例在不同学年之间不完全相同,差异有统计学意义($P<0.05$)。其中 2018~2019 学年首次就诊的患儿中有学习压力的比例(14.27%)低于其后的 3 个学年(依次为 20.05%、20.43%、21.13%)($P<0.05$),而其后的 3 年之间无统计学差异。而首诊的非神经发育障碍患儿的病前生活事件中有人际压力、学习压力、适应事件的比例在不同学年之间无统计学差异($P>0.05$)。2021~2022 学年首次就诊的有受惩罚事件的患儿比例(8.24%)低于 2018~2019 学年(13.85%)和 2020~2021 学年(12.75%)($P<0.05$)。

结论 在精神科就诊的儿童青少年人数在“双减”政策实施后 1 年较前 2 年明显减少;自“双减”政策实施前 2 年起,就诊患儿中诊断为非神经发育障碍的比例开始增加,病前有学习压力事件的发生率也同时升高;而“双减”政策实施后 1 年和之前的 3 年相比,非神经发育障碍患儿中病前有学习压力事件的发生率并无差异,但受惩罚事件的发生率降低。

关键词: 儿童青少年,精神障碍,生活事件,“双减”政策

Analysis of The Diagnostic and Predictive Value of Inflammatory Factors in The Occurrence of Depression

Jierui Cai Jun Yang Lin Yang*

First Affiliated Hospital of Dali University

Objective With the development of social modernization and the increase of life pressure, the incidence rate of depression in China is rising rapidly. However, some patients have limited disease control with existing treatment options, and lack laboratory testing indicators for disease diagnosis and efficacy monitoring. Numerous studies have shown that NLRP1, NLRP3, NLRP6, NLRP12, AIM2, and NLRC4 collectively constitute the inflammasome family. Among them, NLRP3 inflammasome is widely involved in the occurrence and development of various diseases, while NLRP1 inflammasome is the earliest known inflammasome, and its regulation and role in diseases are still unclear. In recent years, studies have shown that NLRP1 inflammasomes are also expressed in glial cells and neurons. Studies have suggested that in a mouse depression model induced by long-term exposure to glucocorticoids, inflammatory complexes such as NLRP1, ASC, and Caspase-1 are expressed at higher levels in their brains. This study aims to analyze the expression of inflammatory factors in the serum of depressed patients, clarify the diagnostic and predictive value of inflammatory factors in the occurrence of depression, and explore new diagnostic methods and treatment targets for depressed patients

Methods From January 2023 to January 2024, depression patients and 40 healthy individuals who underwent physical examinations during the same period were recruited from the First Affiliated Hospital of Dali University for the study. Treat patients with depression as the diseased group and those undergoing health examinations as the healthy group. Collect general clinical data of all enrolled patients and PHQ-9 scores of patients in the diseased group before and after treatment; Simultaneously collect the serum of all enrolled patients upon admission and test the levels of immune inflammatory factors, including IL-1 β , IL-18, TNF - α , IL-10,

NLRP1, Caspase-1, ASC, etc

Results There was a statistically significant difference in IL-1 β , IL-18, TNF - α , IL-10, NLRP1, and ASC levels between the diseased group and the healthy group ($P < 0.05$), while there was no statistically significant difference in Caspase-1 levels ($P < 0.05$); Multivariate binary logistic regression found that NLRP1 and ASC levels were considered independent risk factors for depression ($P < 0.05$); ROC curve analysis shows that NLRP1 and ASC levels have good clinical predictive value for the occurrence of depression

Conclusion The levels of NLRP1 and ASC are independent risk factors for depression and have certain predictive value for the occurrence of depression

关键词: Depression; NLRP1 inflammasome; ASC.

Clinical Symptomatology As Predictors of Early Treatment Response in Adolescents and Young Adults with Major Depressive Episode

Lifei Wang Jia Duan Fei Wang*

Early Intervention Unit, Department of Psychiatry, The Affiliated Brain Hospital of Nanjing Medical University

Objective The objective of this study was to predict early-stage treatment response in adolescents and young adults with Major Depressive Episodes (MDE) undergoing inpatient treatment, focusing on identifying baseline clinical predictors

Methods This study included 218 patients aged 13-25, diagnosed with major depressive disorder (MDD) or bipolar disorder (BD), and experiencing MDE. They were recruited from Nanjing Medical University Affiliated Brain Hospital's inpatient services. Standardized clinical interviews and symptom severity scales were used for diagnosis and assessment. Participants underwent a two-week treatment regimen with medications such as lithium and quetiapine, standardized to real-world clinical practice. Treatment response was primarily evaluated by the change in the Hamilton Depression Rating Scale (HAMD) from baseline

Results Baseline assessments showed that early-

stage treatment responders had higher depressive symptom severity but lower psychiatric symptom severity compared to non-responders. Post-treatment, both groups exhibited symptom improvement, with responders showing significantly greater reduction. Logistic regression analysis revealed that high baseline HAMD scores and low thought disorder scores from the Brief Psychiatric Rating Scale (BPRS) were significant predictors of positive treatment response

Conclusion The study identified significant baseline predictors of treatment response in young patients with MDE, highlighting the potential of using clinical symptomatology to guide early intervention strategies. These findings suggest a basis for enhancing treatment protocols in clinical settings to improve outcomes for adolescents and young adults experiencing MDE. Further research is needed to validate these predictors across larger and more diverse populations

Lipid Metabolic Characteristics in Adolescents with Major Depressive Disorder: An Integrated Metabolomic Approach

Yao Gao Zhifen Liu*

First Hospital of Shanxi Medical University

Objective The objective of this study is to investigate the role of lipid metabolism in the pathophysiology of adolescents with major depressive disorder (MDD). The study aims to identify alterations in plasma lipid profiles and explore tissue-specific lipid metabolic changes, which could potentially inform the development of new therapeutic approaches for MDD

Methods An integrated metabolomic analysis was conducted, beginning with a non-targeted approach to identify changes in plasma lipid profiles of adolescents with MDD. This was followed by a targeted lipid metabolomic study to confirm specific lipid species and affected pathways. Additionally, an animal model was

utilized to further investigate tissue-specific lipid metabolic changes associated with MDD

Results The non-targeted metabolomic analysis revealed alterations in plasma lipid profiles in adolescents with MDD. The subsequent targeted study confirmed these findings and identified specific lipid species and pathways that are affected. The use of an animal model provided further evidence of tissue-specific metabolic disturbances related to lipid metabolism in the context of MDD

Conclusion This study's findings provide valuable insights into the complex metabolic underpinnings of MDD in adolescents, particularly highlighting the significance of lipid metabolism. Understanding these metabolic disturbances may contribute to the development of novel therapeutic strategies for adolescents suffering from MDD

关键词: Adolescent with Major Depressive Disorder, Lipid Metabolism, Metabolomics, Non-Targeted Metabolomics, Targeted Metabolomics

青少年精神障碍患者家庭照顾困境的质性研究

张小梅 卢白莉 韩利*
武汉市精神卫生中心

目的 探讨青少年精神障碍患者家庭照顾困境及需求,为制订针对性服务对策提供参考。

方法 采用目的抽样法选取青少年精神障碍患者家庭照顾者 20 例,进行半结构式深度访谈,采用 Colaizzi 7 步分析法分析、归纳、提炼主题。

结果 提炼出 5 个核心主题及 12 个亚主题:一是照顾者心身及家庭压力大,包括巨大的心理压力,如对孩子病情的担忧及自责,病耻感,照顾过程中精力不足;此外是巨大的家庭经济压力,来源于患者就医导致的医疗支出以及由于照顾误工影响家庭收入。二是照顾知识技能储备不足,疾病知识缺乏,对儿童青少年身心发展规律不了解,不能应对日常康复过程中各种状况,亲子沟通技巧不足,难以建立良好的亲子关系,日常亲子冲突多且应对困难。三是精神科药物副作用多,照顾者担心药物对孩子

身体造成伤害,部分患者不愿意吃药,照顾者不知如何应对。四是患者康复期间存在诸多社会适应问题,如作息紊乱、复学困难、手机及游戏成瘾、社交困难等,给照顾者造成较大心理负担。五是照顾者对专业服务的需求大,他们希望能得到可及的心理咨询及健康指导服务及面向家庭的学习培训项目。

结论 需重视照顾者心理困境,提高照顾者对青少年精神障碍的认知及应对能力,提供多样化常态化心理健康支持及亲子教育服务,以提高家庭照顾者照顾能力及心理健康水平。

艾司西酞普兰联合焦点解决短程治疗对青少年抑郁患者负性情绪、认知功能的影响

李梅 巫江丽*
杭州市第七人民医院

目的 分析艾司西酞普兰联合焦点解决短程治疗对青少年抑郁患者负性情绪、认知功能的影响。

方法 选取 2021 年 12 月至 2023 年 6 月在杭州市第七人民医院就诊的 60 例抑郁症青少年患者,根据随机数字表法分为观察组(30 例)和对照组(30 例)。对照组使用艾司西酞普兰(规格:5 mg,国药准字:J20100165,丹麦灵北药厂),起始剂量 10 mg/d,1 周后根据患者的个体反应,可以增至 20 mg/d,早晨或晚上口服。服药 1 个月。观察组在对照组治疗的基础上联合焦点解决短程治疗。对比两组患者的临床疗效、负性情绪、认知功能、不良反应。

结果 治疗后 2~6 周两组患者健康问卷(PHQ-9)评分均降低,观察组较对照组更优(均 $P < 0.05$);两组的汉密尔顿抑郁量表(HAMD)评分、广泛性焦虑自评量表(GAD-7)评分均降低,观察组较对照组更低(均 $P < 0.05$);两组的精神状态评定量表(MMSE)评分均上升,观察组较对照组的认知功能更优(均 $P < 0.05$)。与对照组相比,观察组的不良反应总发生率更低($P < 0.05$)。

结论 艾司西酞普兰联合焦点解决短程治疗不仅可缓解青少年抑郁患者的焦虑和负面情绪,还能提高患者的认知功能,降低不良反应发生率,值得在临床推广应用。

关键词:艾司西酞普兰;焦点解决短程治疗;抑郁;负性情绪;认知功能

神经调控技术联合认知治疗快速抑制青少年非自杀性自伤

韩笑宇 栾燕* 谢丽娜 李璞鸥 苏荣坤 王晓坤 张凡 高柏慧 王冠文 王怡萱 王鹤凝 朱睿明 姚明洋
沈阳市精神卫生中心

目的 现阶段青少年因学习问题、家庭问题、社会支持问题等多种因素导致焦虑抑郁,进而产生非自杀性自伤行为的情况逐年递增,而父母多数不愿意接受药物治疗,考虑到神经生物学影响,在常规认知治疗干预的基础上利用磁脉冲、微电流作用于颅脑中枢或外周神经系统,调节神经系统兴奋或抑制活动,对来访者进行联合干预,用以在短时间内快速抑制不良行为及情绪。

方法 实验法、问卷调查法。在门诊患者中选取存在非自杀性自伤行为并同时存在抑郁、焦虑情绪的且不愿意使用药物治疗的青少年患者。选取实验组 25 人,对其进行经颅磁刺激治疗辅助认知治疗,另外选取 25 人为对照组,仅做相应次数的认知治疗。选用焦虑自评量表(SAS)、抑郁自评量表(SDS)、青少年自杀意念量表(PANSI)、自杀态度测评量表(QSA)四个测评量表,对干预未实施、联合干预实施一周后、联合干预实施三周后分别进行问卷评估。

结果 在未做联合干预前,实验组与对照组在测评问卷的分值上,差异均无统计学意义($P>0.05$);干预后,观察组患者的 SAS、SDS 评分显著低于对照组;自杀态度和意念评分显著低于对照组,差异均有统计学意义($P<0.05$)。表明联合干预方式可以在时间进程上更快速的起到有效的行为控制作用。

结论 神经调控技术联合认知治疗对青少年非自杀性自伤行为可以起到良好的控制和改善作用,且经实证研究表明,联合干预法可以有效抑制青少年的自杀想法,也可以起到很好的情绪调节作用。

关键词:焦虑,抑郁,非自杀性自伤,青少年,经颅磁刺激治疗

生活习惯的改变对初中生自伤行为的影响:一项纵向研究

张梨^{1,2,3} 邓小鹏^{1,2} 张新风^{1,2} 刘波^{1,2,3}

- 1.荆州市精神卫生中心
- 2.长江大学精神卫生研究所
- 3.长江大学精神卫生中心

目的 本研究旨在探讨生活习惯的变化对青少年自伤行为的影响,为家庭和学校提供促进青少年心理健康发展的理论依据,并据此制定更为有效的预防与干预措施。

方法 研究采用问卷调查法,对荆州区两所学校在 2021 年是初一的学生和 2023 年是初三的学生的心理健康状况进行了追踪调查,内容包括一般人口学资料问卷及一些标准化问卷。通过姓名、学号等个人信息精确匹配两份问卷数据,以 $P<0.05$ 为统计学差异的显著性标准。

结果 (1)共匹配 666 份调查问卷,有效问卷 585 份,有效率 87.84%。男生 292 人(49.91%),女生 293 人(50.09%);2021 年初一学生平均年龄 12.2 ± 0.43 岁,2023 年初三学生平均年龄 14.2 ± 0.48 岁。(2)2021 年有 129 名学生发生自伤行为,检出率为 22.05%。男生检出自伤 43 人(14.73%)、女生检出 86 人(29.35%);2023 年 50 名学生发生自伤行为,检出率为 8.55%。男女生分别检出自伤 17 人(5.82%)、33 人(11.26%),两次调查的男女生自伤检出率均有统计学差异($\chi^2=18.577, 5.658$);(3)两年内自伤行为消失 105 人(81.40%)、新增自伤行为 26 人(5.70%)、持续自伤 24 人(18.60%)、一直无自伤行为 430 人(73.50%)。(4)单因素分析:运动习惯的改变($\chi^2=9.353$)、网络依赖行为的改变($\chi^2=20.378$)、网络依赖行为程度的改变($\chi^2=16.837$)、失眠程度的改变($\chi^2=42.320$),对初中生发生自伤行为的影响有统计学差异(P 均 <0.05);(5)二元 logistic 回归分析:①从不运动变为运动($OR=0.19, 95\% CI=0.06-0.61$)、运动者的运动频率不变($OR=0.10, 95\% CI=0.02-0.54$)和运动频率增加($OR=0.17, 95\% CI=0.04-0.73$)与自伤检出率下降有关, P 值均有统计学差异。②无网络依赖行为变为有网络依赖行为($OR=2.97, 95\% CI=1.10, 8.02$)、长期网络依赖($OR=2.66, 95\% CI=0.94, 7.57$)、长期失眠($OR=11.74, 95\% CI=2.67, 51.59$)、心理压力增加($OR=3.47, 95\% CI=1.34, 8.96$)与初中生的自伤检出率

增加有关, P 值均有统计学差异。

结论 本研究发现, 青少年保持运动习惯、运动频率增加与自伤检出率下降有关; 而网络依赖行为、失眠及心理压力的增加与自伤检出率增加有关。这些发现强调了培养健康生活习惯在预防青少年自伤行为中的重要性。

Clinical Features and Influencing Factors of Depressive Adolescents with Non-Suicidal Self-Injury Behaviors

Xi liu*

Shandong Mental Health Center

Objective Non-suicidal self-injury (NSSI) behaviors refer to individuals' intentional behaviors to destroy their bodies, which are still not recognized by society even without suicidal intent. Depending on the definition of NSSI and adopted evaluation tools, the lifetime prevalence of self-reported NSSI among adolescents varies from 7% to 66%, they are becoming a serious global public health problem. This study investigates the clinical features and influencing factors of depressive adolescents with non-suicidal self-injury (NSSI) behaviors

Methods 203 hospitalized depressive adolescents were grouped according to with or without NSSI behaviors. Their clinical features were compared through a self-made questionnaire of clinical data. The risk factors of NSSI behaviors were determined by a multivariate logistic regression model

Results The proportions of females in the NSSI group, unemployed mothers, and those distrusting their mothers were higher than the other group. Introverted irritability (OR=1.467, 95% CI 1.254-1.716), obsessive symptoms (OR=2.290, 95% CI 1.537-3.413), and overt aggressive behavior (OR=1.180, 95% CI 1.093-1.274) are the risk factors of NSSI behaviors. The mother having a job (OR=0.087, 95% CI 0.019-0.389) is a protective factor

Conclusion There are gender differences in depressive adolescents with NSSI behaviors, which are also related to mother's occupation, introverted irritability, obsessive symptoms, and overt aggressive behavior

关键词: Non-suicidal self-injury; Depression disorder; Adolescent; Influencing factors

伴与不伴非自杀性自伤的青少年抑郁障碍患者临床特征及应对方式比较

刘茜*

山东省精神卫生中心

目的 非自杀性自伤是指个体直接、反复对机体某个组织产生伤害行为, 此类行为虽然无法直接让人死亡, 但是也不被大众所接受。目前为止, 由于自伤行为界定的时间、构成样本及调查方法等不同, 所得出的结果也不同, 因此不能得出一个明确的自伤行为发生率, 相关研究表明, 中国青少年中发生 NSSI 者大约占比 5.4%-23.2%, 而在青少年抑郁障碍患者的发生率更高, 大约为 44%-61.2%。本研究旨在通过现状调查, 探讨青少年抑郁障碍患者 NSSI 的检出率、实施方式、发生原因、目的、外部刺激事件等及伴与不伴 NSSI 的青少年抑郁障碍患者临床特征、应对方式、心理防御方式的差异性, 为实施针对性的干预措施、减少青少年抑郁障碍患者发生 NSSI 提供理论依据。

方法 纳入 193 例 2020 年 12 月至 2022 年 5 月在山东省精神卫生中心就诊的青少年抑郁障碍患者, 根据是否伴有 NSSI 行为进行分组, 使用汉密尔顿焦虑量表 (HAMA)、汉密尔顿抑郁量表 (HAMD)、症状自评量表 (SCL-90)、心理防御方式量表 (DSQ)、应对方式量表 (CSQ)、激惹、抑郁和焦虑自评量表 (IDA) 及自制一般情况调查表以收集临床相关资料。比较两组患者各项资料, 从而发现伴 NSSI 组患者自伤方式及频率、抑郁焦虑程度及其应对防御方式等的特点。

结果 NSSI 组女性比率、对母亲不信任比率较高, 且抑郁、焦虑、激惹程度更重, 更多使用不成熟应对方式 ($P<0.05$); 不成熟防御机制因子、退避因子对患者实施 NSSI 有正向预测作用 ($P<0.05$)。

结论 青少年抑郁障碍患者伴 NSSI 行为存在

性别差异, 且与不成熟型心理防御机制及退避的应对方式相关。

关键词: 青少年; 抑郁障碍; 非自杀性自伤; 临床特征; 应对方式

Non-suicidal Self-injury in Adolescent Depression Patients

Xi liu*

Shandong Mental Health Center

Objective This review aims to explore the pathological mechanism, related influencing factors and treatments of non-suicide self-injury (NSSI) in adolescent depression patients

Methods 1 Data Source

The experimental data were obtained from database retrievals (CNKI, VIP, Wanfang, et al). The retrievals range from the establishment of the databases to April 2023.

2 Retrieval Strategy

Search formula: non-suicide self inquiry * [Tianb] AND Depressive Disorder * [Tianb] AND adult [Tianb].

3 Inclusion Criteria

The literature is cross-sectional or prevalence study; The study subjects are adolescents 12-18 years old. Their depressive disorders meet the diagnostic criteria in the Diagnostic and Statistical Manual of Mental Disorders (5th edition) (DSM-5) or the International Classification of Diseases (10th edition) (ICD-10), and their NSSIs meet the diagnostic criteria in the Diagnostic and Statistical Manual of Mental Disorders (5th edition) (DSM-5).

4 Exclusion Criteria

Literature with incomplete data or information; Repeated publications by the same author; Research subjects accompanied by other mental disorders or severe physical diseases.

Results 52 articles that meet the standards were selected

Conclusion Adolescent NSSI has become one of the most concerned public health problems around the

world. However, because the pathogenesis is complex, further research is essential. Moreover, current research on NSSI is mainly cross-sectional, and further longitudinal studies are necessary to probe into the outcomes of NSSI adolescent patients

关键词: non-suicidal self-injury; adolescent depression; influencing factors; pathological mechanism

团体绘画治疗在青少年抑郁症患者情绪与睡眠中的应用

关春兰* 许春花 樊红

首都医科大学附属北京安定医院芜湖医院 (芜湖市第四人民医院)

目的 探讨团体绘画治疗在青少年抑郁症患者不良情绪和睡眠中的应用效果。

方法 2021年11月-2023年6月选择100例青少年抑郁障碍患者, 随机分为常规组和观察组, 各50例。常规组进行精神科常规护理干预, 包括为患者提供有关抑郁症的知识, 使患者自身认知度提高; 主动与患者相互沟通, 为患者提供心理安抚方法等; 加强与陪护家属的沟通交流, 为患者提供更多的家庭支持; 对患者及家属进行药物相关知识的宣教, 并告知患者按时服药的重要性。观察组在常规组的基础上增加8次团体绘画治疗, 绘画主题包括: 水粉自由画、曼陀罗静心画、雨中人、树木画、主题画-勇敢的我、多重接龙形式的随意画、生命线和理想摩天轮。每次绘画结束后, 鼓励小组成员进行作品回顾, 对作品内容讲解, 护理人员再根据内容帮助患者分析问题, 共同探讨解决方式。干预前和干预4周后分别使用汉密尔抑郁量表 (HAMD 量表)、汉密尔顿焦虑量表 (HAMA 量表) 对患者的抑郁、焦虑情绪进行评估, 匹兹堡睡眠质量指数量表 (PSQI 量表) 评估患者的睡眠状况。使用 SPSS 25.0 软件进行数据分析, 计量资料以 ($\bar{x} \pm s$) 描述, 组间比较采用独立样本 t 检验, 以 $P < 0.05$ 表示差异有统计学意义。

结果 干预前, 常规组与观察组患者 HAMD 量表、HAMA 量表和 PSQI 量表得分差异不具有统计学意义 ($P > 0.05$)。干预后, 常规组 HAMD 量表得分为 (9.23 ± 0.94) 分高于观察组 (5.67 ± 0.67) 分, 差

异具有统计学意义 ($P < 0.05$)；常规组 HAMA 量表得分为 (10.34 ± 0.95) 分高于观察组 (6.02 ± 0.94) 分，差异具有统计学意义 ($P < 0.05$)；常规组 PSQI 量表得分为 (13.66 ± 3.26) 分高于观察组 (5.32 ± 1.22) 分，差异具有统计学意义 ($P < 0.05$)。

结论 绘画治疗以笔和画纸为媒介，帮助患者将内心无法言说的焦虑、抑郁情绪，通过绘画作品表达出来，既能帮助患者表达不良情绪，又能帮助患者发泄情绪。

关键词：绘画治疗；护理干预；青少年；抑郁症

奥尔夫音乐治疗对改善儿童孤独症谱系障碍症状的临床研究

李正 王念蓉* 李晓霞 王永军 古吉燕 赵妍
重庆医科大学附属妇女儿童医院/重庆市妇幼保健院

目的 探讨奥尔夫音乐治疗对儿童孤独症谱系障碍 (autism spectrum disorder, ASD) 发育情况和临床症状的改善效果。

方法 在 2023 年 4 月至 2023 年 9 月开展随机、单盲、对照试验，招募了 68 名 2 至 6 岁的 ASD 儿童，随机分配到研究组和对照组，每组 34 例。研究组在维持原有常规康复治疗 (行为疗法-结构化教学-社交发展) 基础上增加奥尔夫音乐治疗，对照组仅接受常规康复治疗，干预 8 周。研究组接受每周 5 次的奥尔夫音乐治疗，每次治疗持续 40 分钟，由专业音乐治疗师进行指导，包括唱歌、乐器演奏和音乐聆听等。在基线和干预后，使用 Gesell 发育诊断量表 (GDS)、儿童孤独症评定量表 (CARS) 和孤独症儿童行为量表 (ABC) 评估 ASD 儿童的发育情况和临床症状。

结果 在治疗前，两组 GDS、CARS、ABC 得分对比未见统计学差异 (均 $P > 0.05$)。治疗后，治疗后两组儿童 GDS 量表适应性行为、粗大、精细、语言及个人-社会等 5 大能区评分均较治疗前提升，且研究组在个人-社会能区评分明显优于对照组 ($P < 0.05$)；两组在 ABC 评分总分均较治疗前降低，且研究组中交往、语言因子评分效果优于对照组 ($P < 0.05$)。

结论 奥尔夫音乐治疗联合常规康复治疗能改

善孤独症儿童的发育水平，提高社会生活能力，有利于孤独症儿童的预后。

关键词：孤独症谱系障碍，奥尔夫音乐，干预

感知社会支持对青少年抑郁障碍患者智能手机成瘾的不同影响：孤独感和表达抑制的作用

周勇杰¹ 梁淑珩² 霍丽娟²

1. 深圳市康宁医院

2. 华南师范大学

目的 青少年智能手机成瘾 (smartphone addiction, SA) 日益严重，尤其是在患有抑郁症的青少年中。本研究旨在探讨青少年抑郁障碍患者感知社会支持与 SA 的关系，并区分家庭支持与朋友/重要他人支持对 SA 的不同影响。同时，本研究还将探讨孤独感及表达抑制在感知社会支持与 SA 关系中的作用。

方法 本研究选取 2341 名 12-18 岁的青少年抑郁障碍患者作为研究对象。通过多维感知社会支持量表 (MSPSS)、孤独感量表 (UCLA)、手机成瘾指数 (MPAI) 和情绪调节问卷 (ERQ) 等量表，测量研究对象的感知社会支持、孤独感、手机成瘾和表达抑制水平。采用结构方程模型探讨感知社会支持对 SA 的预测作用；还将探讨在不同来源社会支持与孤独感关系中，孤独感的中介作用和表达抑制的调节作用。

结果 1. 感知社会支持总分对 SA 具有显著的正向预测作用；2. 孤独感在感知社会支持与 SA 的关系中起完全中介作用，其中家庭支持对 SA 有显著负向预测作用，朋友/重要他人支持对 SA 有显著正向预测作用；3. 表达抑制在朋友/重要他人支持与孤独感之间的关系中表现出显著的调节作用。

结论 本研究提示家庭支持和朋友/重要他人支持对抑郁青少年 SA 的影响机制不同，研究结果有助于理解抑郁青少年 SA 的影响因素，并为开发针对性的干预措施提供理论依据。具体来说，针对来自家庭的支持不足，可以通过加强家庭支持来降低青少年的孤独感，从而减少 SA。而对于来自朋友/重要他人的社会支持不足，则需要关注表达抑制的作用，可以通过教授情绪表达技巧，鼓励青少年积

极表达情绪,从而降低孤独感,减少对智能手机的依赖。

关键词:抑郁症青少年,智能手机成瘾,感知社会支持,孤独感,表达抑制

青少年抑郁症的心理社会因素

龚云*

杭州市第一人民医院

目的 探索青少年抑郁症患儿心理社会相关因素。

方法 比较 108 例青少年抑郁症和 280 例健康对照结果。采用儿童抑郁量表(CDI) 评定抑郁严重程度、多伦多述情障碍 20 条目量表中文版(TAS-20)、中文版儿童用家庭功能评估量表(FFAS-C)、青少年生活事件量表(ASLEC)、应付方式问卷(CSQ)和领悟社会支持量表(PSSS)对两组被试进行评定。

结果 (1)青少年抑郁症组 CDI 总分及各因子分、TAS-20 总分及因子分、FFAS-C 总分和各因子分均显著高于正常对照组 ($P<0.001$); 抑郁症组 PSSS 总分及因子分均显著低于对照组 ($P<0.001$)。抑郁症组 CSQ 量表自责、退避因子分高于对照组 ($P<0.001$), 求助、合理化因子分低于对照组 ($P<0.01$); 青少年抑郁症组 ASLEC 量表学习压力、人际关系、健康适应因子分均高于对照组 ($P<0.005$), 受惩罚、丧失和其他因子低于对照组 ($P<0.01$), ASLEC 总分两组无差异 ($P=0.419$)。 (2) 抑郁症组 TAS-20 总分高于 60 的百分显著高于对照组 (88.2% vs 26.1%, $\chi^2=146.37, P=0.000$); 抑郁症组 FFAS-C 总分异常比例 48.3%, 明显高于对照组的 13.3% ($\chi^2=68.204, P<0.05$)。 (3) 相关分析显示: 青少年抑郁患儿 CDI 总分和 TAS-20 难以识别情感、难以描述情感及 TAS-20 总分均正相关 ($P<0.01$)。青少年抑郁 CDI 总分和 FFAS-C 量表家庭优势、家庭困难、家庭沟通因子分和 FFAS-C 总分均正相关 ($P<0.05$)。青少年抑郁 CDI 总分和 PSSS 量表总分及各因子分均负相关 ($P<0.05$)。青少年抑郁 CDI 总分和 ASLEC 量表的人际关系、学习压力健康适应因子均正相关 ($P<0.01$)。

结论 青少年抑郁症存在述情障碍问题和家庭功能问题、学习压力和人际关系压力以及健康适应

压力高及社会支持少。青少年抑郁症症状严重程度和述情障碍及家庭功能、负性生活事件正相关、和社会支持负相关。

关键词: 青少年; 抑郁症; 心理社会因素

核磁共振正电子发射断层扫描在孤独症谱系障碍中的应用: 研究进展和未来方向

颜柳娇*

中山大学附属第八医院(深圳福田)

目的 孤独症谱系障碍(ASD)是一种严重的发育障碍类疾病,其特征是社交缺陷,狭窄的兴趣和重复刻板的行为,目前对于 ASD 的病因学分析已经进入了新的阶段,如核磁共振正电子发射断层扫描(MR-PET)等技术有助我们更好地理解 ASD 的病理生理机制,为疾病的诊断和治疗带来了新的希望。

方法 我们检索了来自 PUBMED 和 GOOGLESCHOLAR 的文章,检索表达式: (“mr”or“magnetic resonance”or“mri”or“magnetic resonance imaging”and (“pet”or“Positron emission tomography”) and (“asd”or“Autism spectrum disorder”or“child autism”or“infantile autism”))

结论 目前关于孤独症谱系障碍的 MR-PET 的研究尚处于起步阶段,既往的研究一经发现 ASD 患者在脑葡萄糖代谢、脑血流灌注、神经递质系统异常、中枢神经系统炎症的病理生理变化具有重要意义,新的技术如机器学习的应用能产生更精确地 MR-PET 图像,未来进一步引入人工智能、机器学习等方法,引入更多的放射性配体和靶标将有助于我们加深对于疾病的理解,对未来的诊断和治疗发挥作用。

关键词: ASD, MR-PET, 机器学习

探讨童年创伤经历和抑郁青少年非自杀性自伤行为的因果关联 ——基于双重机器学习的异质性分析

周勇杰¹ 杨菁菁² 徐浩力² 刘丹² 邹新文³ 王旻²

- 1.深圳市精神卫生中心/深圳市康宁医院
- 2.深圳大学管理学院
- 3.德国曼海姆大学商业信息与数学学院

目的 非自杀性自伤 (non-suicidal self-injury, NSSI) 是指在缺乏明确自杀意图的情况下, 个体故意、反复伤害自己身体的行为。现有理论与实证研究均指出, 童年时期的创伤经历对于青少年 NSSI 行为的形成与发展具有深远影响。然而, 目前针对这一主题的异质性研究尚显不足。本研究旨在深入剖析童年创伤经历与 NSSI 之间的因果关系, 并探讨不同群体间的异质性特征。

方法 本研究采用覆盖全国的多中心抑郁青少年数据集, 包含了 2500 名 12-18 岁的青少年截面数据。使用双重机器学习模型估计不同类型童年创伤对抑郁青少年 NSSI 行为的因果效应。借助 SHapley Additive exPlanations 模型量化每个特征对于预测结果的贡献。通过 Policy Tree 模型得到异质性结果。

结果 双重机器学习模型表现出良好的泛化性能, 儿童期遭受的躯体忽视与抑郁青少年 NSSI 行为之间存在显著的负向因果效应: 在训练集上得到的平均干预效应 (ATE) 为 -0.089 (置信区间 [-0.134, -0.043], $P=0.0$), 在测试集上的 ATE 为 -0.088 (置信区间 [-0.136, -0.040], $P=0.0$)。而躯体虐待、情感忽视、情感虐待及性虐待与抑郁青少年 NSSI 行为之间不存在显著因果效应。教师评价重视程度、是否留守和自我感觉家庭年收入为对结果贡献最重要的特征。异质性分析显示, 非留守儿童, 或对老师评价较为重视的留守儿童中, 经历童年躯体忽视的抑郁青少年 NSSI 行为有所减少。

结论 本研究突显了早期环境因素在心理健康发展中的重要性, 并为针对特定群体的干预策略提供了依据, 展现了因果机器学习方法在精神医学研究领域的应用前景。

青少年非自杀性自伤患者家庭互助支持模式干预方案的构建研究

秦瑗 杨波*

重庆市精神卫生中心

目的 构建科学、系统的青少年非自杀性自伤患者家庭互助支持模式干预方案, 为青少年非自杀性自伤患者的家庭管理提供实践指导。

方法 采用描述性现象学研究方法, 通过目的抽样法对 18 名青少年非自杀性自伤患者家庭照顾者进行半结构式访谈, 了解其参与家庭互助支持项目的行为意向及需求, 明确其参与该项目的促进和阻碍因素。采用文献分析法, 检索国内外数据库关于家庭互助支持模式的干预性文献, 为青少年非自杀性自伤患者家庭互助支持模式的干预方案初稿提供指导; 运用德尔菲法对方案初稿进行两轮函询, 汇总专家意见后对原条目进行修改, 形成青少年非自杀性自伤患者家庭互助支持模式的干预方案终稿。

结果 根据 18 名青少年非自杀性自伤患者家庭照顾者的质性访谈, 提炼出 3 个主题和 11 个副主题, 主题包括: 照顾者的需求、参与家庭互助支持活动的促进因素、参与家庭互助支持活动的阻碍因素。文献检索最终纳入 12 篇文献, 全部为英文文献。德尔菲函询问卷有效回收率为 92.31%、100%, 专家权威系数为 0.867、0.873。两轮函询的肯德尔和谐系数 (W) 检验均具有统计学意义 ($P<0.001$), 第一轮函询肯德尔和谐系数值为 0.188~0.250, 第二轮函询肯德尔和谐系数值为 0.301~0.410, 最终形成青少年非自杀性自伤患者家庭互助支持模式的干预方案, 包括青少年非自杀性自伤患者家庭照顾者志愿者遴选、培训、考核与维持以及志愿者开展家庭互助支持活动的整体方案。

结论 大多数青少年非自杀性自伤患者家庭照顾者缺乏青少年非自杀性自伤行为的信息知识与照护技能, 对专业知识、照顾技能、情感支持等存在诸多需求, 对参与家庭互助支持项目持肯定态度, 但也存在部分阻碍因素。本研究根据质性访谈结果, 结合文献分析初步拟定青少年非自杀性自伤患者家庭互助支持模式的干预方案初稿, 运用德尔菲法形成干预方案终稿。该方案具有科学性与可行性, 可用于指导青少年非自杀性自伤患者家庭间互助支持的临床实践。

伴与不伴对立违抗的 ADHD 患儿的症状严重

程度及其父母对家庭的不满程度的研究

郑其咏^{1,2} 钟慧¹

1.合肥市第四人民医院

2.安徽医科大学精神卫生与心理科学学院

目的 探讨伴有对立违抗障碍的ADHD患儿相较于不伴有对立违抗障碍的ADHD患儿其多动症状以及其父母对于家庭亲密度与适应性的差异。

方法 我们收取2021年-2023年于安徽省精神卫生中心儿童青少年科门诊就诊的首诊ADHD患儿88例,根据范德比尔特量表将ADHD分为对立违抗组(24例)和不伴对立违抗组(64例)的两组,并且用SNAP-IV问卷调查的总分作为其ADHD患儿多动症状严重程度以及对他们的损害的评判标准,将患儿家庭亲密度和适应性量表(FACESII-CV)中的理想与现实亲密度与适应性差值用以评判患儿父母对家庭的不满程度,将分组后的数据导入SPSS26程序进行分析,采用独立样本t检验的方式,分析伴或不伴有对立违抗症状的ADHD患儿其多动症状严重程度以及他们父母对家庭的亲密度与适应性的不满程度是否有无显著性的统计学差异。

结果 伴有对立违抗组的SNAP-IV分值显著高于不伴有对立违抗症状组($p < 0.01$),并且对立违抗组父母对其家庭亲密度不满程度显著高于不伴对立违抗组($p < 0.05$),但在对家庭适应性的不满程度上两组无统计学差异($p > 0.05$)。

结论 伴有对立违抗障碍症状的ADHD患儿其表现出的多动症状严重程度以及对他们所造成的损害相较于不伴有对立违抗症状的ADHD患儿更加严重,同时伴有对立违抗的患儿的父母对家庭亲密度的不满相较于不伴有对立违抗的父母更加强烈。

关键词: ADHD、对立违抗、SNAP-IV、家庭亲密度、家庭顺应性

自伤青少年压力情境下内隐自我认知探究

曾灿*

韶关学院

目的 本实验旨在通过内隐联想测验(IAT)实验范式探究自伤青少年在经历高、低压力的社会情

境后,内在不良自我认知图式的改变。

方法 正式实验开始前,先采用《青少年自我伤害行为问卷》在学校进行大规模被试筛查,然后基于自愿原则对符合条件的被试进行招募,对报名的被试进行一对一结构化访谈,再次确认其是否符合条件。最终招募有自伤行为的青少年93人、无自伤行为的青少年97人,共190名被试。

实验采用2(被试类型:自伤/非自伤)×2(情境类型:高压/低压)×4(评价维度:消极/我、积极/他、积极/我、消极/他)的三因素混合设计。首先,本研究采用改编过的蒙特利尔社会应激测试,给被试制造高/低不同的压力情境,自伤/非自伤被试被随机分配到两种不同的压力条件下,待被试经历压力情境后,需填写情绪感受量表,以评估其情绪状态。最后,被试还需完成内隐联想测试(IAT)。本IAT测验中,将“我”与积极词、“他”与消极词的联结设定为相容任务,而“我”与消极词、“他”与积极词的联结设定为不相容任务。每位被试均需完成高或低压力情境,及IAT测试。

因变量包括:(1)被试执行相容任务与不相容任务的反应时均值;(2)被试完成IAT任务的效应指标——D值,D值大于0说明被试对“我”持积极的内隐自我认知评价,D值小于0说明被试对“我”持消极的内隐认知评价。(3)4组被试在4类不同评价维度上的平均反应时。

结果 结果显示:(1)所有组别中,相容任务的反应时显著小于不相容任务,被试对“我”与积极词、“他”与消极词的联结设定反应时间更短。(2)被试类型主效应显著,自伤被试对“我”-消极词任务反应时显著低于非自伤被试,情境类型的主效应不显著,但情境类型与被试类型的交互效应显著,即在低压力社会情境下,自伤与非自伤组在评价维度上的反应时无明显差异;但在高压情境下,自伤被试对“我”-消极词任务的反应时显著低于非自伤被试。

结论 结果表明:(1)被试在内隐认知中普遍倾向于认为自我是积极的,而他人是负面的。(2)但在高压情境下,自伤青少年迅速转变对自我的认知,产生更高的自我消极认知,以及更高的负面情绪体验,不良的自我认知及负面情绪或在压力事件与青少年自伤行为中起重要介导作用。

The Diagnosis Utility of Central Symptoms for Major Depressive Disorder in Adults with Attention-deficit/hyperactivity Disorder : a Network Analysis

Yuan Gao Lu Liu*

PEKING UNIVERSITY SIXTH HOSPITAL

Objective The screening and diagnosis of Major Depressive Disorder (MDD) in adults with Attention-deficit/hyperactivity disorder (aADHD) is important for both clinical intervention and the exploration of the underlying pathogenesis. Instead of the use of routine scales containing all related items, we try to use network analyses to identify the central symptoms which could present the MDD features and support the clinical MDD diagnosis in aADHD effectively, and whether the central symptom related imaging feature could reflect the MDD-related neurobiological alteration successfully

Methods We constructed a network of ADHD and MDD symptoms assessed via the ADHD Rating Scale (ADHD-RS) and Self-rating Depression Scale (SDS) in 433 adults with ADHD (aADHD). Central depressive symptoms were sequenced based on their Expected Influence (EI) and were used to built the diagnostic model. Receiver operating characteristic curves (ROCs) were built to compare their diagnostic utilities. Then, we calculated the cutoff of central symptoms in the optimal model and compare brain functions between two groups defined using this cutoff

Results Five items were defined as the central symptoms, including “I feel down-hearted and blue” (EI=1.684), “I feel more irritable than usual” (EI=1.641), “I still enjoy the things I used to”(trans-item, EI=1.045), “My mind is as clear as it used to be”(trans-item, EI=0.832) and “I feel that others would be better off if I were dead” (EI=0.820). ROCs analyses supported that these five central symptoms should be included in the diagnostic model. Under the cutoff of 14, the diagnostic utility of this 5-item model was no worse than the 20-item model ($z = -0.453, p = 0.650$), even showing higher specificity. Based on this cutoff, aADHD+MDD patients (5-items score ≥ 14) showed increased ALFF and

ReHo in the left anterior cingulate compared to aADHD-MDD patients. Correlation analysis showed a significant positive correlation between the ALFF and ReHo value of left anterior cingulate and the 20-items SDS score, as well as 5-items central symptom score

Conclusion Central depressive items identified using network analyses could predict the MDD diagnosis in aADHD effectively. In addition, these central items could be used to detect MDD-related brain functional alteration. For future study and clinical evaluation, these five symptoms may be used as prior diagnostic indicators for MDD in aADHD and greatly promote the efficiency of screening MDD in aADHD

儿童青少年精神障碍患者家长自杀倾向及危险因素分析

夏磊^{1,2} 王芸^{1,2} 刘寰忠^{1,2}

1.安徽医科大学附属巢湖医院

2.安徽省精神医学中心

目的 儿童青少年日益增长的心理行为问题,已成为关系国家和民族未来的重要公共卫生的一大挑战,给个人和家庭带来严重的负面影响。临床医务工作者在对儿童青少年精神障碍患者的诊疗时,极易忽视患儿的家长的心理健康状况。极少有研究对儿童青少年精神障碍家长的心理健康问题及自杀风险进行调查。本研究拟调查儿童青少年精神障碍家长自杀倾向,探讨其危险因素,并构建预测模型。

方法 采用横断面调查的方法,收集2022年8月至2023年7月就诊于安徽省内两所医院(安徽医科大学附属巢湖医院和宿州市第二人民医院)共299名儿童青少年精神障碍家长的社会人口学资料,并采用自杀相关的标准化问题、患者健康问卷-9(PHQ-9)以及多伦多述情障碍量表(TAS-20)分别评估调查对象自杀倾向、抑郁症状及述情障碍的程度。

结果 自杀倾向的总体检出率为15.4%,其中自杀意念、自杀计划和自杀未遂检出率分别为11.0%、3.3%和8.0%。Logistic回归分析结果显示,躯体疾

病史、抑郁症状、述情障碍以及情感辨别不能因子与较高的自杀倾向风险有关(均 $P < 0.05$)。基于回归分析结果,构建预测患儿家长自杀倾向风险预测模型,并绘制受试者工作特征(ROC)曲线下面积(AUC)。结果显示,抑郁症状和述情障碍两项联合 AUC 为 0.79 (95% CI: 0.70-0.87); 抑郁症状和情感辨别不能因子两项联合 AUC 为 0.80 (95% CI: 0.72-0.87)。相比于抑郁症状、述情障碍和情感辨别不能因子单独应用,两项联合的曲线下面积更大,对自杀倾向有更好的识别预测能力。

结论 儿童青少年精神障碍患者家长自杀倾向检出率较高,提示临床上在注重青少年精神障碍患者的同时,亦不能忽视患儿家长的心理健康,应加强对患儿和家长的护理,必要时提供个体化的综合干预措施。

精神障碍患儿家长病耻感水平与心理健康状况、自杀倾向的相关性研究

夏磊^{1,2} 田英汉^{1,2} 刘寰忠^{1,2}

- 1.安徽医科大学附属巢湖医院
- 2.安徽省精神医学中心

目的 全球有近 10 亿人口存在精神健康问题,尤其儿童青少年人群受到尤为关注。污名化和歧视往往造成的患病个体被社会排斥以及个人基本权利被剥夺等严重负面影响。既往研究多集中在评估患者本身的病耻感,本研究旨在调查精神障碍患儿家长的病耻感、心理健康状况以及自杀倾向,并其之间的关系。

方法 调查对象为 2022 年 8 月至 2023 年 7 月就诊于安徽省内两所医院共 299 名儿童青少年精神障碍家长。收集其社会人口学资料,并采用贬低-歧视感知量表(PDD)、患者健康问卷-9(PHQ-9)、广泛性焦虑障碍量表(GAD-7)、中文版失眠严重程度指数(ISI)以及自杀相关的标准化问题分别评估调查对象的病耻感水平、抑郁、焦虑、失眠和自杀倾

向。以 PHQ-9 ≥ 10 、GAD-7 ≥ 10 以及 ISI ≥ 15 定义临床抑郁、焦虑以及失眠,将 PDD 的平均得分以量表中间点分 2.50 划分为存在高水平或低水平病耻感进行组间比较。

结果 共有 82 名(27.4%)家长划为病耻感高水平组。(1)组间比较一般资料显示:病耻感高水平组的月收入 < 2000 元的比例较低水平组高(45.1% vs 33.6%, $P = 0.029$),存在躯体疾病史的比例较高(18.3% vs 4.6%, $P < 0.001$),其余变量如患儿疾病类型、年龄分段、性别、受教育程度与精神疾病史无差异;(2)组间比较心理健康状况显示:病耻感高水平组抑郁(24.4% vs 9.2%)、焦虑(18.3% vs 6.9%)以及失眠的检出率(14.6% vs 3.7%)显著高于低水平组(均 $P < 0.01$);(3)组间比较自杀倾向显示:尽管病耻感高水平组自杀意念(15.9% vs 9.2%)、自杀计划(6.1% vs 2.3%)以及自杀未遂的检出率(9.8% vs 7.4%)数值上高于低水平组,但差异无统计学意义(均 $P > 0.05$)。控制月收入和躯体疾病史混杂因素,病耻感高水平组患儿家长的抑郁(OR=2.289, 95%CI: 1.100-4.764, $P = 0.027$)和失眠风险(OR=2.879, 95%CI: 1.050-7.892, $P = 0.040$)仍高于病耻感低水平组患儿家长,焦虑差异不再具有统计学意义(OR=2.076, 95%CI: 0.909-4.738, $P = 0.083$)。

结论 精神障碍患儿家长病耻感水平较高,与一系列不良心理健康问题密切相关。政策制定者、医疗服务机构以及社会组织应立即采取行动,共同努力消除对精神健康问题的污名化和歧视。

伴自杀未遂的青少年抑郁患者心理理论损害与脑影像的相关性研究

李梦婷^{1,2} 钟慧¹

- 1.合肥第四人民医院
- 2.安徽医科大学精神卫生与心理科学学院

目的 探讨伴与不伴自杀未遂青少年抑郁障碍患者心理理论的损害及其与静息状态功能磁共振成

像的低频波动振幅差异的相关性。

方法 本研究包括 45 例伴自杀未遂的青少年抑郁障碍患者(SU 组)、45 例不伴自杀未遂的抑郁障碍患者(NSU 组)和 20 例健康对照组(HC 组)。采用 17 项汉密尔顿抑郁量表(17-item Hamilton depression scale,HAMD-17)、国际神经精神科简式访谈问卷版本 6.0.0 中文版(mini-international neuropsychiatric interview,M. I. N. I.)对所有被试进行抑郁严重程度和自杀特质相关临床心理量表评定。采用静息状态功能磁共振成像(rs-fMRI)计算 zALFF 值(低频波动振幅),并比较各组间的差异。心理理论故事图片任务(theory of mind-picture sequencing task,ToM-PST)包括初级信念、初级错误信念、次级信念、次级错误信念、三级错误信念、现实感、理解互惠、理解欺骗和欺骗侦测、图片排序总分、心理理论总分指标,用于测试三组被试的心理理论水平。采用 SPSS 25.0 对数据进行统计分析,单因素方差分析比较 3 组被试心理理论水平的差异,采用 Pearson 相关分析探讨特定脑区 zALFF 值与心理理论损害的相关性。

结果 三组患者左侧背外侧额上回的 zALFF 值有显著差异(GRF 校正),与健康对照组相比,自杀未遂组和非自杀未遂组 zALFF 值均有所增加。

青少年自杀未遂组在理解初级错误信念、图片排序总分显著低于健康对照组,在理解现实感分、欺骗、欺骗侦测、心理理论总分显著高于非自杀未遂组,非自杀未遂组在理解初级错误信念、现实感、欺骗、欺骗侦测、图片排序总分、心理理论总分显著低于健康对照组(均 $P < 0.05$)。三组被试者理解初级信念、次级信念、次级错误信念、三级错误信念、互惠均差异无统计学意义(均 $P > 0.05$)。

Pearson 相关分析显示,青少年自杀未遂组的左侧背外侧额上回的 zALFF 值与图片排序总分呈显著负相关($r = -0.417, P < 0.05$),青少年自杀未遂组的初级信念、初级错误信念、次级信念、次级错误信念、三级错误信念、现实感、互惠、欺骗、欺骗侦测、心理理论总分无显著相关性(均 $P > 0.05$)。

结论 伴与不伴自杀未遂的青少年抑郁障碍患者理解图片排序的能力与静息状态功能磁共振成像的低频波动振幅值在左侧背外侧额上回存在显著的负性相关性。

关键词: 自杀未遂;抑郁障碍;青少年;低频波动振幅;心理理论;

基于网络的普遍预防性心理干预对青少年抑郁症状的改善效果: Meta 分析和系统评价

刘沛 黄颐*

四川大学华西医院

目的 本研究评估基于网络的普遍预防性心理干预对青少年抑郁症状的改善效果,并探索改善效果的影响因素。

方法 在 CNKI、PubMed、Embase、Web of Science、Cochrane Library、Scopus、ProQuest 以及 PsycINFO 的 8 个中英文数据库中,检索截止至 2024 年 5 月 20 日发表的符合纳入标准的随机对照试验研究报告。纳入文献的研究对象为平均年龄 12~18 岁未作抑郁症状或抑郁症诊断筛查的普通青少年人群,实验组措施为包含自助式网站、移动设备应用程序等的任何基于网络的预防性心理干预,对照组措施包含无任何处理、等候控制、注意控制、安慰剂控制等,主要结局指标为各组后测时间点的抑郁症状严重程度。对纳入 Meta 分析的文献进行质量偏倚风险评价,提取文献中有关受试对象、干预内容、统计学方法等特征,提取抑郁症状的测量数据并采用均数差或标准化均数差计算干预措施的效应,针对异质性进行敏感性分析和亚组分析。本研究通过 PROSPERO 注册,注册号为 CRD42024557571。

结果 文献检索的初步结果为 2023 篇,通过排除重复文献、非随机对照试验、研究对象和方法不符合纳入标准、无法提取想要数据的文献,最终纳入 18 篇文献进行 Meta 分析,基线时间点样本量为实验组 6756 例、对照组 6323 例,总计 13079 例。文献质量评价结果显示,6 篇研究(33.3%)被评为“低偏倚风险”,5 篇(27.8%)为“未知偏倚风险”,7 篇(38.9%)为“高偏倚风险”。对于平均年龄 12~18 岁的普通青少年,网络预防性心理干预组相比于对照组在后测时间点的抑郁症状分数显著更低,标准化均数差(SMD)较小而具有统计学意义,异质性较低: $SMD = -0.07, 95\%CI (-0.11, -0.03), p = 0.001, I^2 = 41\%$ 。亚组分析结果发现,干预的内容特征、干预持续周数、心理治疗师或教师指导方式以及干预实施形式影响干预效果。主要结果无显著的发表偏倚。

结论 基于网络的普遍预防性心理干预可在短

期内有效改善平均年龄 12~18 岁普通青少年的抑郁症状。亚组分析结果发现,干预的内容特征、干预持续周数、心理治疗师或教师指导方式以及干预实施形式影响了干预效果,包含认知或情绪训练模块、干预持续时长在 5 周以内、心理治疗师或教师仅提供程序技术指导、在学校集中实施的网络化预防性心理干预对青少年抑郁症状的改善效果可能更优。

父母患有精神疾病儿童的心理状态研究综述

李璞鸥 栾燕* 谢丽娜 韩笑宇 张凡 王晓坤 苏荣坤 高柏慧 王怡萱 王冠文 姚明洋
沈阳市精神卫生中心

目的 父母患有精神疾病的儿童(COPMI)发生心理问题和其他不良健康结果的风险更大,在世界范围内,数以百万计的儿童在父母一方或双方患有精神障碍的家庭中长大。例如,12.1%-15.6%的加拿大儿童、16%的荷兰儿童和 21%-23%的澳大利亚儿童暴露于父母的精神疾病。对 COPMI 精神障碍的遗传估计值通常在 50%以上,直系亲属患有精神疾病是已知精神障碍的最大危险因素。COPMI 的经历可以被认为是一种特定类型的不良童年经历(ACE)。在患有精神疾病的家庭中长大的儿童,身体和情感虐待、忽视和其他不良情况可能较普遍。此外,COPMI 经常经历额外的社会心理挑战,如经济问题、父母离婚、入学率低和父母预期寿命缩短等,这些也被认为是 ACE。与患有精神疾病的父母一起长大的遗传和环境因素可能会增加患多种心理和身体疾病的风险。

方法 父母的精神疾病会对儿童产生强烈影响。与同龄同龄人相比,他们发生行为、发育和情绪困难的风险更高。具体结局包括:辍学率增加、被寄养或亲属照料的可能性增,以及可能发生药物滥用障碍。儿童表述他们对父母的“好日子”和“坏日子”很敏感,儿童将好日子定义为互动、沟通、父母工作和家务完成时间的增加。坏日子被描述为父母不那么专心、脾气暴躁或有可能大喊大叫。

父母患有精神疾病的子女通常得不到足够的父母心理健康信息。他们只能“猜测”或“弄清楚”父母

发生了什么。儿童可能会对精神疾病产生误解,例如将父母的疾病归咎于自己,或者认为精神疾病可以像感冒一样感染并传染给朋友。对儿童保守秘密会导致他们感到困惑,与疾病相关的话题可能是儿童讨论的“禁区”,因此关于精神疾病的亲子交流有限或者没有。此外,儿童可能难以理解或担心父母的行为,由于无法获得准确、非污名化的心理健康信息,许多儿童似乎在寻找自己对父母行为的理解,这往往导致困惑和痛苦。父母可能认为儿童没有意识到这种疾病,儿童倾向于通过观察父母的行为来描述心理健康障碍。只有部分儿童能够理解精神疾病诊断,或被明确告知父母的精神疾病。

结果 有证据表明,具有 COPMI 背景的个体在 18 岁之前发生精神障碍的风险要高出 2-4 倍。18 岁以后,这一风险比父母无精神疾病的成年子女高 13 倍。据估计,约三分之二的 COPMI 在成年后出现社会心理和/或精神障碍。COPMI 背景的长期后果包括焦虑障碍、重度抑郁和物质使用障碍。

结论 鉴于这些儿童的患病率和风险,为他们提供适当和可获得的支持和干预措施非常重要。这些干预措施中旨在向儿童提供心理健康教育和有关父母疾病的知识。通过改善应对、提高自尊和无害暴露于可容忍的风险水平来提高儿童的心理弹性,帮助儿童应对未来的挑战和逆境。

Testing The Efficacy of Computer-assisted Executive Function Training in Adolescents with Major Depressive Disorder: Study Protocol for A Randomized Clinical Trial

Xiyan Zhang¹, Li Yan², Chen Fazhan¹, Ji Weidong¹, Jiang Wenqing²

1.Shanghai Pudong New Area Mental Health Center, School of Medicine, Tongji University

2.Shanghai Mental Health Center, Shanghai Jiao Tong University School of Medicine

Objective Given the limitations of medication in improving executive function impairment in patients with major depressive disorder, computerized executive

function training has been proposed as a possible intervention option, but there is a lack of research results in the adolescent population. This study investigated the efficacy of computer-assisted executive function training in adolescents with major depressive disorder, including in terms of clinical symptoms and executive function impairment

Methods A single-blind randomized controlled clinical trial in 58 adolescents with major depressive disorder. Participants were randomly assigned to a control group and a study group. The control group was given only drug treatment. The study group received 8 weeks of computer-assisted executive function training on the basis of drug therapy. Changes in depressive symptoms and executive function were assessed using the Childhood Depression Scale(CDI) and neuropsychological tests before and after the intervention

Results The total effective rate was 89.2% in the study group and 66.7% in the control group ($\chi^2=0.421$, $p=0.039$). CDI scores, total interval errors of spatial working memory and persistent errors in Wisconsin card sorting test (WCST) decreased, and the digit span backward score and the WCST conceptualization level increased in both groups after treatment. At the end of the 8th week of treatment, the CDI scores ($t=3.213$, $p=0.002$), the total interval errors of spatial working memory ($t=2.741$, $p=0.008$) and the persistent errors in WCST ($t=2.552$, $p=0.013$) of the study group were significantly lower than those of the control group, and the digit span backward score ($t=-0.3895$, $p < 0.001$) and the WCST conceptualization level ($t=-2.734$, $p=0.008$) of the study group were significantly higher than those of the control group

Conclusion Computer-assisted executive function training is effective for adolescents with depression, which can not only reduce depressive symptoms, but also improve impaired executive function. If the findings are conclusive, computer-assisted executive function training could be added to the therapeutic arsenal for depression in adolescents

关键词: adolescent, major depressive disorder, computer training, executive function, efficacy

医疗失效模式与效应分析联合根因分析法在精神科用药安全中的运用

乔芬 刘川*

重庆医科大学附属大学城医院

目的 医疗失效模式与效应分析联合根本原因分析法探索精神科住院患者用药潜在风险及其用药错误发生的原因, 针对原因制定相应的控制方案, 保障患者用药安全, 提升医疗治疗。

方法 应用前瞻性质量改进工具医疗失效模式及效应分析(HFMEA) 联合根因分析法(RCA)。对精神科住院患者用药流程中潜在的风险因子进行评估分析, 运用决策树分析整改价值, 进一步进行根因分析, 结合科室的实际情况从制度、培训、医嘱、药品管理、用药过程、人员管理六个方面制定控制方案, 比较实施前后口服用药流程风险值(RPN)、用药错误不良事件发生率、医嘱错误率、医护人员发现隐患的能力及患者满意度。

结果 实施医疗失效模式及效应分析(HFMEA) 后用药流程的潜在失效风险 RPN 值及用药相关不良事件发生率显著低于实施前, 医嘱错误率下降, 医护人员发现隐患的能力及患者满意度明显提升。

结论 医疗失效模式及效应分析(HFMEA) 联合根因分析法(RCA) 找到威胁用药安全的主要危险因素及不良事件的特征分布, 科室结合用药错误中主要危险因素及其特点采用针对性的预防措施, 降低用药错误不良事件发生率, 提升医护人员综合能力, 提高医疗质量, 保障患者安全。

Causal Associations between Attention Deficit Hyperactivity Disorder and Obstructive Pulmonary Diseases: A Two-sample Mendelian Randomization Study

Shujuan Yin Yingjun Zheng Sizhi Ai*

The Affiliated Brain Hospital of Guangzhou Medical University

Objective Previous observational studies have

suggested an increased risk of respiratory system diseases in individuals with attention deficit hyperactivity disorder (ADHD). However, whether the genetic associations between ADHD and obstructive pulmonary disease (OPD), including chronic obstructive pulmonary disease (COPD), asthma, and chronic bronchitis is unclear. This study aims to investigate the causal relationship between ADHD and OPD, along with the association with pulmonary function test (PFT) parameters

Methods Our study used Genome-wide association study (GWAS) summary data of European individuals, including the following: ADHD (20,183 cases and 35,191 controls); summary statistics for COPD, including UK Biobank participants, resulting in 3,871 cases and 459,139 controls; asthma (56,157 cases and 352,255 controls); chronic bronchitis (10,159 cases and 440,263 controls); Three PFTs parameters included forced expiratory volume in 1 second (FEV1) (sample sizes of 421,986); forced vital capacity (FVC) (sample sizes of 307,638); and FEV1/FVC<0.7 (55,907 cases and 297,408 controls.). In this study, 2-sample mendelian randomization (MR) tested potential causal associations between genetic variants of ADHD and OPD and PFT parameters. The inverse-variance weighted (IVW) method was used as the primary analysis. The study dates were November 2023 to February 2024

Results Significant causal associations were observed between ADHD and COPD (OR=1.003, 95%CI: 1.002,1.005, P<0.001), asthma (OR=1.069, 95%CI: 1.017,1.124, P=0.046) and chronic bronchitis (OR=1.270, 95%CI: 1.124,1.435, P<0.001). Additionally, ADHD was significantly linked to both FEV1 (β = -0.034, 95%CI: -0.056,-0.012, P=0.005) and FEV1/FVC<0.7 (OR=1.013, 95%CI: 1.005,1.020, P=0.004), yet the correlation between ADHD and FVC did not remain significant after FDR correction

Conclusion This study reported a significant causal association between ADHD and OPD. Individuals with ADHD were at an increased risk of developing OPD, accompanied by unfavorable PFT parameters. These findings offered valuable insights for early intervention strategies targeting ADHD, potentially reducing the incidence of chronic diseases later in life

抚慰孩子的心灵~青少年抑郁症

孙湃湃*

阜新市第四人民医院

目的 提高心理健康意识, 用科学的方法缓解压力, 预防心理问题。中国古代学者蒲辅周曾提出“无病善防、提高体质; 有病驱邪, 慎毋伤正”的理论, 更强调了预防的重要性。

中国科学院心理研究所曾经发布的调研显示, 约 14.8%的青少年存在不同程度的抑郁风险, 其中 4.0%的青少年属于重度抑郁风险群体。其实相比成人, 情感发育尚未成熟的青少年更容易出现情绪问题乃至抑郁障碍。这是因为, 大脑中负责感知情感的杏仁核在 15 岁时就发育成熟, 而负责控制情感的前额皮质要到 25 岁左右才会成熟, 成熟状态不一致的生理结构, 使发育中的青少年可以像成人一样感知情绪, 却无法控制情绪和行为, 而青春期受激素影响, 更增加了青少年抑郁障碍的风险。

另外, 慢性压力也是抑郁障碍的诱因, 慢性压力会让感知情绪的杏仁核变得更大、更敏感, 导致青少年持续感到抑郁。比如生活环境的变化, 家庭关系紧张、父母不和睦, 学校中人际交往不畅等情况, 使得缺少父母关心、照顾与陪伴的青少年更容易产生抑郁、孤独、手机成瘾等问题, 心理健康风险更高。

方法 青少年抑郁障碍的常见表现有: 大部分时间不开心、感到无聊、什么都不愿做, 容易发火, 有时有身体不适, 经过很多检查却无器质性问题的头疼、肚子疼, 睡眠、饮食不规律, 以及常被人误以为是身体疾病导致的二便问题。肠道堪称“第二个大脑”, 非常容易受情绪影响, 很多青少年在情绪紧张时腹泻, 考虑可能为肠易激综合征, 也有在情绪问题时出现便秘的情况。

第一, 多关注孩子的情绪, 倾听他们行为背后的动机、情绪, 而不只是关注孩子的学习, 让孩子多维度发展。

第二, 适当与孩子沟通交流, 通过谦虚真诚的心态, 站在孩子的角度理解、倾听他们的感受。可以

使用心理学常用的“空椅子技术”，帮助父母更加理解孩子。

第三，要更加关注青少年睡眠、运动与心理健康之间的相互影响，更充足的睡眠和运动有助于降低青少年的抑郁、孤独和手机成瘾。

结果 在兴趣爱好、人际交往、团队协作等方面的才能也尤为重要。

充足的睡眠会消除疲劳，保护大脑，促进生长发育，增强免疫力，减轻压力；适当的运动，不仅增强孩子们的身体素质，更加强了孩子们人际交往能力，提升团队意识，实现真正意义上的身心健康。

互相理解、平等尊重的家庭和学校氛围可以满足青少年的心理需求，真正促进孩子心智和情绪的健康成长。

结论 作为医疗机构的工作人员，如何针对青少年群体的心理健康状况更好服务，我有以下四点建议：一是建立医校共联体，进一步完善青少年心理健康筛查和检测机制；二是加强宣讲活动，着力青少年的心理健康工作；三是倡导青少年健康使用手机，减少手机成瘾风险；四是加强对高风险群体心理健康的精准预防和干预工作。

ALFF-Based Functional Connectivity Changes of Cognitive Improvement with Mood Disorder in Adolescents and Young Adults

saidahemaiti Mukadaisi Fei Wang*

Nanjing Medical University

Objective Patients with mood disorders, whether adolescents or adults, frequently exhibit varying degrees of cognitive impairment. However, Little is known about the neural basis of cognitive improvement following treatment. Therefore, the aim of this study was to investigate the relationship between cognitive function and ALLF-Based FC in adolescents and young adults with mood disorder

Methods A total of 197 patients with mood disorder, aged 12-25 years, underwent rs-fMRI scans at

baseline and after hospitalization. Brain regions showing significant differences between the two scans were identified as regions of interest (ROI), and whole-brain functional connectivity (FC) was subsequently calculated. The Cognitive function was assessed by the Repeatable Battery for the Assessment of Neuropsychological Status (RBANS). Finally, the correlation between ALFF-based FC values of these abnormal brain regions and cognitive function scales was analyzed

Results The ALFF value of the left precentral gyrus after treatment was lower than baseline. The seed-based functional connectivity showed that the FC value between the left precentral gyrus and the right lingual gyrus increased ($P < 0.05$), and the FC value between the left precentral gyrus and the left superior temporal gyrus, left middle frontal gyrus decreased compared with baseline ($P < 0.05$). In addition, the FC value changes associated with RBANS - speech function total score. In baseline, The FC value between the seed area and the right lingual gyrus shows a positive correlation with the changes in RBANS-speech total score, while the change in FC value after treatment exhibits a negative correlation. The FC value between the seed area and the left superior temporal gyrus is negatively correlated with changes in the RBANS speech total score, while the change in FC value after treatment exhibits a positive correlation. The FC value between the seed area and the left middle frontal gyrus shows a negative correlation with changes in the RBANS speech total score. After treatment, changes in the FC value exhibit a positive correlation with changes in RBANS speech total score. When using the FC values of various brain regions at baseline as independent variables and the changes in the RBANS speech total scores before and after treatment as the dependent variable in a regression model, the R value was found to be 0.275, and the R^2 was 0.076. This indicates that the independent variables explain 7.6% of the variance in the dependent variable. Following this, the FC changes were used as independent variables, and the changes in total RBANS-speech scores before and after treatment were used as dependent variables for linear regression analysis. It was found that the FC changes between the seed area and the lingual gyrus were neg-

atively correlated with changes in RBANS-speech function after treatment

Conclusion The negative correlation between FC changes between the left precentral gyrus and the right lingual gyrus and changes in RBANS-speech scores suggests that alterations in functional connectivity between the left precentral gyrus and the right lingual gyrus may represent a potential mechanism underlying improvements in speech function

Resolving Heterogeneity of Depression Through Individual Differential Structural Covariance Network Analysis

Zhanjie Luo Yanling Zhou Yuping Ning*
Zhanjie Luo

Objective Major depressive disorder (MDD) is characterized by its significant heterogeneity, hindering progress in MDD research. Traditional case-control studies, like group-level structural covariance network, struggle to capture individual heterogeneity among MDD patients

Methods In this study, T1-weighted structural images were obtained from 350 participants, including an adolescent original dataset (103 early-onset MDD patients, 82 healthy controls (HCs)) and an adult validation dataset (108 adult-onset MDD patients, 57 HCs). A subject-level individual differential structural covariance network (IDSCN) were constructed for each patient based on the concept of normative modeling

Results Our study identified two neuroanatomical subtypes. The identified IDSCN subtypes were distinguished more by specific features of individual symptoms rather than overall severity of depression and anxiety. The low-covariance subtype is characterized by significant neural maturation gaps across the whole brain and more pronounced anxiety somatization symp-

toms. Conversely, the high-covariance subtype demonstrates simultaneous mature of brain structures

Conclusion Our findings provide valuable insights into the neuroanatomical heterogeneity of MDD patients, highlighting the importance of considering individual symptom profiles in subtype classification. These findings have substantial clinical implications for personalized treatment and precision medicine, offering more effective treatment choices and accurate diagnoses

关键词: Depression, Heterogeneity, Individual differential structural covariance network, Neuroanatomical subtypes

青少年重性抑郁疗效的早期预测研究

刘结 王菲* 王洋
南京医科大学附属脑科医院

目的 青少年抑郁具有症状不典型, 治疗难等特点, 越早的识别患者对抗抑郁的反应, 找出与疗效相关的早期标记物有助于青少年抑郁治疗方案的选择和修正。

方法 本研究为单中心真实世界研究, 在南京医科大附属脑科医院早期干预科病房纳入 95 个年龄在 13-18 之间的青少年患者, 符合精神疾病诊断和统计手册第四版 (DSM-IV) 的情感障碍 (BD 或 MDD) 诊断标准。使用 17 项的汉密尔顿抑郁评分量表(HAMD-17)、汉密尔顿焦虑症评分量表(HAMA)来测量患者抑郁及焦虑的严重程度。纳入标准为 HAMD 评分 ≥ 17 分。分别在治疗前 (基线)、治疗 1 周 (极早期)、出院前通过量表对临床症状进行评估。采用相关性分析进行治疗前、治疗 1 周后症状变化与出院时 HAMD 减分率间的关系分析。使用线性回归分析与治疗效果相关的临床症状。

结果 基线时 HAMD 得分与出院时 HAMD 减分率呈正相关($r=0.211, p=0.04$), 治疗 1 周后 HAMD 减分率与出院时 HAMD 减分率呈正相关($r=0.342, p=0.001$), 治疗 1 周后 HAMA 减分率与出院时 HAMD 减分率呈正相关 ($r=0.385, p<0.001$)。把基线时 HAMD 得、治疗 1 周后 HAMD 减分率、HAMA 减分率当作自变量, 出院时 HAMD 减分率作为因变量, 纳入多元线性回归, 结果提示模型成立

($R^2=0.134$, $F=4.69$, $p=0.04$)。

结论 基线时抑郁症状越重, 治疗后症状改善越好, 治疗 1 周后焦虑、抑郁症状改善越多, 出院时效果越好。

Electroencephalogram Microstate and Spectral Power Analysis for Attention Deficit Hyperactivity Disorder in Children and Adolescents

Yexian Zeng Yanling Zhou*

广州医科大学附属脑科医院

Objective Attention-Deficit/Hyperactivity Disorder (ADHD) is a widely recognized neurodevelopmental disorder characterized by inattention, hyperactivity, and impulsivity. Behavioral assessment, the current gold standard for diagnosis, is subject to inaccuracies due to its subjective nature and is limited to post-symptom onset evaluations. Early diagnosis is pivotal for enhancing the quality of life in ADHD patients

Methods This study introduces a novel machine learning (ML) approach for the objective diagnosis of ADHD in medicated and unmedicated individuals, leveraging electroencephalogram (EEG) data features. We also investigated the utility of resting-state EEG microstates in discerning ADHD patients from healthy controls and in predicting symptom severity

Results Our analysis revealed that resting-state EEG microstates effectively differentiated ADHD patients from controls. The 8-feature Linear Discriminant Analysis model emerged as the most predictive ML model for ADHD, achieving an AUC of 0.967 in the training set, with sensitivity = 0.914, specificity = 0.927, and accuracy = 0.921. In the validation set, the model's performance remained robust with an AUC of 0.747, sensitivity = 0.695, specificity = 0.716, and accuracy = 0.706. Additionally, these EEG features accurately forecasted the severity of ADHD symptoms

Conclusion The development of an ML model

utilizing EEG data features presents a promising diagnostic tool for early and objective identification of ADHD. This advancement may facilitate earlier clinical intervention and contribute to the improvement of ADHD patients' quality of life through targeted therapeutic strategies

关键词: ADHD, EEG, children and adolescents, Diagnostic markers

基于临床症状-人格特征-童年创伤的青少年抑郁自杀预测模型

陶婉卿 王我* 冉柳毅

重庆医科大学附属大学城医院

Background Major depressive disorder (MDD) is the most common psychiatric disorder among adolescents who die by suicide. Childhood maltreatment and personality features act as risk factors. Therefore, it is necessary to construct and validate a predictive model of suicide in adolescents with MDD.

Methods Participants were assigned to suicide attempt (SA) group and non-suicide attempt (NSA). Univariate logistic, random forest, and lasso regression model were used to identify potential suicide predictors to establish a nomogram

Results The 6 optimal predictors of SA were screened out. These were HAMD, PHQ-15, BSSI, extroversion, emotional neglect, physical neglect. The AUC of the nomogram constructed from these predictors was 0.803. The specificity and sensitivity were 0.875 and 0.579. Results of DCA curve showed model yields net benefit to a wide range of approximately 9% to 94%

Conclusion We have developed a simple and effective prediction tool for suicide attempt risk among adolescent with MDD. It enables the easy and exact prediction of suicide risk in adolescents with MDD.

男性青少年抑郁症患者的免疫与性激素变化研究

陈新英*

天津市安定医院

目的 本研究主要通过探究男性青少年抑郁症患者的 IgA、IgM 及性激素的变化规律,进一步揭示抑郁症的病理机制。

方法 (1)对 175 名男性青少年抑郁症患者的 IgA、IgM 检测并分析。(2)对 175 名青少年抑郁症患者和对照组 175 名青少年的性激素(雌二醇,泌乳素,孕酮,卵泡激素,促黄体生成素)检测并分析。

结果 (1)175 名被试的 IgA、IgM 值分别为 $1.95\pm 0.78\text{g/L}$ 和 $1.02\pm 0.33\text{g/L}$,值均在正常值范围内。

(2)研究组雌二醇水平 ($97.41\pm 42.59\text{pmol/L}$) 显著低于对照组 ($113.39\pm 21.21\text{pmol/L}$; $t=-4.420, p=0.000$),研究组中有 18 人 (10.29%) 低于正常值。研究组泌乳素水平 ($24.33\pm 12.38\text{ng/ml}$) 显著高于对照组 ($9.86\pm 2.56\text{ng/ml}$; $t=15.141, p=0.000$),研究组中有 138 人 (78.86%) 高于正常值。研究组孕酮水平 ($0.98\pm 0.55\text{nmol/L}$) 显著高于对照组 ($0.32\pm 0.10\text{nmol/L}$; $t=15.505, p=0.000$),研究组中有 140 人 (80.00%) 高于正常值。研究组睾酮水平 ($15.58\pm 5.73\text{nmol/L}$) 与对照组 ($16.32\pm 4.50\text{nmol/L}$) 不存在显著差异 ($t=-1.337, p=0.182$),但研究组中有 20 人 (11.42%) 低于正常值。研究组卵泡激素、促黄体生成素水平 ($4.46\pm 1.95\text{mIU/ml}$, $5.11\pm 1.69\text{mIU/ml}$) 与对照组 ($4.43\pm 2.06\text{mIU/ml}$, $5.02\pm 1.65\text{mIU/ml}$) 不存在显著差异 ($t=0.177, p=0.860$; $t=0.487, p=0.620$)。

结论 (1)男性青少年抑郁症患者不存在 IgA、IgM 异常。(2)低水平的雌激素及高水平的泌乳素和孕酮与抑郁有密切关系,同时低水平的睾酮可作为抑郁的参考值。

Chunxia Qiao Min Xie Qiang Wang*
West China Hospital, Sichuan University

Background Early life chronic stress, such as adverse childhood experiences (ACEs), has been regarded as high-risk factor for developing psychiatric disorders later in life. ACEs during preadolescence may underline deviations of brain morphology. In this study, we aim to investigate the association between ACEs and structural brain networks.

Methods Subjects aged between 107 to 133 months in the Adolescent Brain Cognitive Development (ABCD) Study were included in our research. Self-reported ACEs includes physical abuse, sexual abuse, emotional abuse, parent substance use, parent incarceration, household mental illness, physical neglect, emotional neglect, marry status, and exposure to domestic violence. After being preprocessed by Freesurfer, cortical measures and image intensity measures were extracted with Destrieux Atlas parcellation, including cortical area, sulcal depth, cortical thickness, cortical volume, T1w, T2w, T1 cortical contrast, and T2 cortical contrast. We constructed the morphometric similarity network (MSN) of the whole brain with the measures above. Graph-based global network metrics were calculated based on MSN through GREYNET, including small-world parameters of the clustering coefficient (C_p), the shortest path length (L_p), and the Sigma (Σ), local efficiency (E_{loc}) and global efficiency (E_g). We investigated the relations between network metrics and total and subscale ACEs scores with controlling age, sex, handedness, and education level.

Results We have discovered a significant relationship between ACEs and the structural brain network. Total score of ACEs was negatively associated with E_{loc} ($r = -0.027, P = 0.01$), E_g ($r = -0.044, P < 0.001$), and Sigma ($r = -0.026, P = 0.013$), and positively associated with L_p ($r = 0.04, P < 0.001$). The higher the ACEs total score, the worse the local efficiency, global efficiency, and Sigma of network, and the longer of the shortest path length of the network. In addition, subscales of ACEs, such as criminal status, mental illness, and substance abuse in the household also have the same

The ABCD Study: Association Between Adverse Childhood Experiences and Structural Brain Network Efficiency

trends with total score of ACEs.

Conclusion Structural brain network connectivity is associated with ACEs. Adolescents who experienced more adversities have brains that worked less efficiently. Specific causal relationships hope to be explored soon.

关键词: adverse childhood experiences, morphometric similarity network, global network metrics, structural brain networks

M115 单倍体不足导致小鼠肠道菌群及代谢物异常

韩蕾 魏雅槟*

北京大学医学部中国药物依赖研究所

目的 孤独症谱系障碍(Autism spectrum disorder, ASD) 是一种以社会交往障碍、交流障碍、兴趣狭窄及刻板重复行为为基本特征的神经发育障碍性疾病。近年来 ASD 的患病率逐年升高, 美国疾病预防控制中心的调查显示到 2016 年已经升至 2.76%。ASD 是居于儿童精神致残首位的神经发育障碍性疾病, 给家庭和社会造成沉重的疾病负担。研究发现与健康儿童相比, ASD 儿童的粪便细菌谱显示致病细菌和有益细菌丰度平衡变化, 同时通过肠道菌群干预可以改善 ASD 样行为。研究发现, 肠道共生菌群可以影响小鼠大脑发育和功能调节, 并参与许多神经精神疾病(如焦虑和抑郁)的病理过程, 影响多种复杂行为, 包括社交行为和焦虑样行为。这些研究表明, 肠道菌群可能对 ASD 的发展有重大影响。M115 作为一种 ASD 风险基因, 参与肠道菌群稳态调节以及介导 ASD 样行为的具体机制尚不清楚。本研究旨在探讨 M115 单倍体不足小鼠肠道菌群结构变化对其 ASD 样行为的影响及具体作用机制。

方法 通过超声发声实验等行为学实验检测 M115 单倍体不足小鼠 ASD 样行为; 通过 16sRNA 测序检测 M115 单倍体不足小鼠肠道菌群结构; 通过血清中的异硫氰酸荧光素强度以及 qPCR 检测 M115 单倍体不足小鼠肠道通透性; 通过代谢组测序检测 M115 单倍体不足小鼠血清和海马代谢物变化; 通过免疫荧光实验、分子实验实验检测 M115 单倍体不足小鼠海马小胶质细胞的状态以及吞噬功能。

结果 初期研究成果表明: M115 单倍体不足小鼠出现 ASD 样行为; 16sRNA 测序结果显示 M115 单倍体不足小鼠肠道中毛螺菌科、拟杆菌属、丁酸弧菌属、副拟杆菌属等菌群出现差异变化。血清及海马代谢组学测序显示 M115 单倍体不足小鼠显示和 ASD 相关血清代谢物 SIP 等显著上升并出现新的潜在的 ASD 血清变化标志物。

结论 本研究发现 M115 单倍体不足小鼠肠道菌群结构及其代谢物紊乱并介导 ASD 样行为。

ADHD 儿童静息态脑电中的非周期性特征与非周期性校正后的 α 振荡特征研究

陈然¹ 王久菊²

1.重庆医科大学附属大学城医院

2.北京大学第六医院

目的 本研究旨在探索 ADHD 儿童静息态脑电活动中的非周期性特征和非周期性校正后 α 波段的振荡特征, 重点关注不同头皮区域和偏侧化对这些神经相关性的影响。

方法 共有 62 名患有 ADHD 的儿童和 52 名典型发育儿童(年龄在 6 至 12 岁之间)参与了研究。在闭眼情况下记录至少进行 6 分钟的脑电图(EEG)。使用 Python 包‘FOOOF’计算非周期性参数(指数和截距), 以及非周期性校正后的 α 波段振荡特征, 主要包括中心频率(CF)、校正后的功率(AP)和带宽(BW)。我们进行了包含两个被试间水平(ADHD 组和对照组)和两个被试内因素(偏侧化和头皮区域)的混合设计 ANOVA 分析, 以及考虑性别和年龄后的 ANCOVA 分析。

结果 结果表明 ADHD 组显示出显著低于对照组的非周期性指数, 这一差异不受偏侧化、头皮区域或性别等因素的显著影响。其他测量指标在组间没有显著区别。我们注意到 α 波段的 CF 随年龄增加而增加, 而只有额区的 AP 与年龄呈显著正相关。性别和偏侧化在截距这个指标上存在显著主效应, 同时性别和偏侧化在 CF 上存在显著交互效应。

结论 我们的研究结果表明, 年龄在 6 至 12 岁 ADHD 儿童的非周期性指数显著较低, 提示这一测

量指标可能作为 ADHD 的生物标记物。未来的研究应在探索非周期性和非周期性校正后的周期特征时考虑年龄、性别、偏侧化和头皮区域等因素。

青少年抑郁障碍患者急性期治疗有效后 2 年内再住院的影响因素分析

袁晓菲 陈旭*

首都医科大学附属北京安定医院

目的 探讨青少年抑郁障碍患者急性期治疗有效后 2 年内的再住院的影响因素。

方法 入组 2018 年 1 月 1 日至 2018 年 12 月 31 日在首都医科大学附属北京安定医院经急性期治疗有效的青少年抑郁障碍患者 (n=304 例), 根据 2 年内是否再住院, 分为再住院组 (n=31) 和未住院组 (n=273), 收集一般人口学资料、病史、临床特征、药物治疗等资料, 分析再住院情况, 采用单因素和二元 Logistic 回归对再住院的相关因素进行分析。

结果 单因素分析显示, 两组患者在性别、年龄、是否有家族史、是否自杀未遂、是否转躁、是否门诊治疗、2 年内是否急诊就诊、连续门诊治疗时间这 8 个因素间存在统计学差异 ($p<0.05$), 二元 Logistic 回归结果显示, 阳性家族史 (OR =3.901, 95%CI: 1.425~10.678, $P=0.008$), 转躁 (OR =6.282, 95%CI: 2.178~18.125, $P=0.001$)、2 年内急诊就诊 (OR =10.756, 95%CI: 3.499~33.060, $P<0.001$) 是患者 2 年内再住院的重要影响因素。

结论 青少年抑郁障碍患者有阳性家族史, 在 2 年内转躁, 在急诊就过诊, 再住院的风险增高。

关键词: 青少年抑郁障碍, 再住院, 影响因素

The Efficacy of CATCH-IT in Adolescents with Moderate To Severe Depression

Xiaofei Yuan Xu Chen*

Beijing Anding Hospital, Capital Medical University, Beijing, China

Objective The incidence of adolescent depression is increasing year by year, which has caused serious social burden. For moderate to severe depressive disorder, the guidelines recommend drug therapy combined with psychotherapy. However, face-to-face psychotherapy has problems such as high cost and low accessibility. The emergence of digital psychotherapy can improve the accessibility, timeliness and diversity of medical services. In this study, we aim to assess the feasibility and effectiveness of the Chinese adaptation of the program Competent Adulthood Transition with Cognitive-behavioral Humanistic and Interpersonal Training (CATCH-IT) in addressing depression and anxiety symptoms among adolescents diagnosed with moderate to severe depression

Methods Using a purposive sampling method, consecutive enrollment, and concurrent control approach, we designed an exploratory, single-center, randomized study to recruit a total of 89 adolescents with moderate to severe depression who met the inclusion criteria. The recruitment took place from January 2022 to October 2022 at the child psychiatric ward of Beijing An Ding Hospital. These participants were then randomly assigned to either the intervention group or the control group, with 44 adolescents in the intervention group and 45 adolescents in the control group. The intervention group received a combination of conventional treatment and CATCH-IT treatment, while the control group received conventional treatment and standardized health education. Both the CATCH-IT treatment and standardized health education interventions lasted for a duration of 2 weeks, consisting of a total of 14 units. To assess the outcomes, we employed various assessment tools, including the Hamilton Depression Inventory (HAMD-17), Patient Health Questionnaire Depression Scale (PHQ-9), Generalized Anxiety Disorder Scale (GAD-7) and Acceptability Self-administered Questionnaire. Data was collected at multiple time points: before the intervention (T0), at the end of the second week after the intervention (T1), at the end of the fourth week after the intervention (T2), and at the end of the eighth week after the intervention (T3). We analyzed whether there were significant differences in depression and anxiety symptoms between the two

groups at each time point

Results (1) During the recruitment period, a total of 93 patients met the inclusion criteria, out of which 89 patients agreed to participate in the study, resulting in a recruitment rate of 96.8%. Among them, 31 patients in the intervention group and 30 patients in the control group completed the intervention and follow-up assessments. The retention rates were 70.5% in the intervention group and 66.7% in the control group, with no significant difference observed between the two groups ($p>0.05$)

(2) The baseline characteristics and demographic data of the two groups were comparable, with no significant differences observed ($p>0.05$). At the end of the eighth week (T3) after the intervention, there were no statistically significant differences in depression and anxiety scores between the two groups ($p>0.05$). However, in the subgroup analysis of patients with severe anxiety at baseline, a significant difference in HAMD scores was found between the two groups at the end of the second week (T1) ($d = -1.25$, 95% CI: $-2.35 \sim -0.15$, $p=0.03$). The intervention group demonstrated a greater reduction in HAMD scores compared to the control group, indicating a larger treatment effect ($d=0.26$, 95% CI: $-0.70-0.18$, $p=0.25$), although the difference was not statistically significant.

Conclusion (1) The feasibility of CATCH-IT treatment for adolescent patients with moderate to severe depression is acknowledged and accepted to some extent, although there is potential for further improvement and optimization.

(2) No significant disparity was observed between CATCH-IT treatment and standardized health education in terms of improving depressive and anxiety symptoms among adolescents with depression in both groups. However, CATCH-IT treatment demonstrated a rapid alleviation of persistent depressive symptoms, particularly in individuals with severe co-occurring anxiety. Future clinical randomized controlled trials could consider conducting long-term multi-experimental studies in this specific co-occurring group.

关键词: adolescent; depression; CATCH-IT; health education

基于积极心理品质课程的青少年情绪问题干预

沈晴¹ 蔡瑞文¹ 熊源露² 王静函² 徐家华² 袁纯钰² 谭淑平²

1. 华北理工大学

2. 北京回龙观医院, 北京大学回龙观临床医学院

目的 青少年是学业发展的黄金时期, 也是压力引起的情绪问题的关键期。如何促进个人心理健康成长成为家长、学校甚至全社会关注的问题。与以往干预手段不同的是, 积极心理学倡导重视激发人的潜能, 培养人的积极情绪, 引导人们追求幸福和成功, 从而促进抑郁和焦虑等情绪问题的发生。本研究采用积极心理品质课程, 对青少年群体进行干预, 并采用纵向追踪手段, 提升初一学生的主观幸福感, 改善其抑郁焦虑的情绪。

方法 采用问卷法对总计 387 名初一学生进行基线和干预后评估。所有学生按班级随机分为实验组 ($n=240$) 和对照组 ($n=147$), 实验组进行长达两个月的积极心理品质课程干预, 对照组继续维持原有的心理课程, 于干预前、基线和干预后分别测量抑郁 (PHQ-9)、焦虑 (GAD-7)、幸福感 (EPOCH) 以及积极心理品质 (PP)。并通过重复测量方差分析和 t 检验, 揭示积极心理品质课程的干预效果。

结果 在对照组中, 抑郁、焦虑、主观幸福感、积极心理品质均在观察结束后 (期末考试前) 有所升高 ($P_s < 0.05$); 但实验组中, 抑郁、焦虑均在干预结束后有所下降 ($P_s < 0.05$); 我们进一步发现, 其中主观幸福感、积极心理品质反而表现出升高 ($P_s < 0.05$)。在组间检验中发现, 所有变量均在前测无显著差异, 在经过积极心理品质课程干预后, 在实验组中, 以上变量均具有显著差异 ($P_s < 0.05$)。在组内检验中发现, 在对照组中, 除了主观幸福感外所有变量均具有显著的组内差异 ($P_s < 0.05$); 在实验组中, 除了抑郁、焦虑外所有变量均具有显著的组内差异 ($P_s < 0.05$);

通过重复测量分析发现, 在抑郁和焦虑中, 组间均存在差异 ($P < 0.05$), 交互作用显著 ($P < 0.05$), 但主效应不显著 ($P > 0.05$); 在主观幸福感和积极心理品质上, 交互作用和主效应均显著 ($P < 0.05$); 组间差异不显著 ($P > 0.05$);

进一步,我们探索了主观幸福感的变化是否能够中介抑郁分数的改善。在不分组的情况下,我们揭示了主观幸福感提升部分中介了初一学生在抑郁水平上的获益(总效应 $\beta=0.57$, BoostSE=0.04, 95% Booststrap CI=[0.487, 0.662]; 直接效应 $\beta=0.681$, BoostSE=0.04, 95% Booststrap CI=[0.599, 0.763]; 间接效应 $\beta=-0.10$, BoostSE=0.03, 95% Booststrap CI=[-0.171, -0.009])。

结论 积极心理品质课程作为一种干预手段,在初一学生的心理干预中的作用具体体现在对正性情绪起到了促进作用,对负性情绪起到了一定的缓解作用。

关键词:青少年、积极心理品质、幸福感、抑郁、焦虑

注意缺陷多动障碍儿童执行功能和核心症状的行为表现研究

李果 刘子奇 陶梦娇 王昕 张建昭 杨健*
首都儿科研究所附属儿童医院神经内科

目的 比较注意缺陷多动障碍(ADHD)儿童执行功能和核心症状的行为表现,探讨 SNAP-IV 量表维度总分数与 BRIEF 各维度总分数以及 SNAP-IV 量表各核心症状分数与 BRIEF 各维度总分数反映的行为表现问题的相关性。

方法 选取 2022 年 7 月至 2023 年 5 月于首都儿科研究所附属儿童医院神经内科门诊和多动症门诊就诊的 ADHD 儿童共 89 例,进行 SNAP-IV 量表评估、BRIEF 量表评估。通过 SPSS23.0 软件包,采用 Spearman 和 Pearson 相关系数分析,分别比较 SNAP-IV 量表维度总分数与 BRIEF 各维度总分数相关性、SNAP-IV 量表注意力不集中各维度分数与 BRIEF 各维度总分数相关性和 SNAP-IV 量表多动-冲动各维度分数与 BRIEF 各维度总分数相关性。

结果 SNAP-IV 量表多动-冲动维度总分数与 BRIEF 抑制维度总分数呈中度的正相关($r=0.557$, $P<0.01$); SNAP-IV 量表注意力不集中维度总分数与 BRIEF 工作记忆、计划、元认知维度总分数呈中度正相关($r=0.462-0.523$, $P<0.01$)。

其中 SNAP-IV 量表注意力不集中维度反映的行动力不足行为分数与 BRIEF 抑制维度总分数、畏

难行为分数与 BRIEF 工作记忆和元认知维度总分数、遗失行为与 BRIEF 组织维度总分数呈中度的正相关($r=0.417-0.465$, $P<0.01$); BRIEF 抑制维度总分数与 SNAP-IV 量表多动-冲动维度反映的自制力缺乏行为分数、行为管理指数维度总分数与抢答行为分数呈中度的正相关($r=0.414-0.570$, $P<0.01$)。

结论 ADHD 儿童的部分核心症状和执行功能在行为学上的表现有相关性,注意力不集中、多动-冲动维度的部分症状与执行功能的一些维度呈现出相关性。可以进一步对 ADHD 儿童的神经心理内表型进行研究和探讨。

关键词:ADHD,儿童,执行功能,行为表现

青少年不良同伴关系和网络成瘾:自伤成癮的中介作用

徐高阳 刘梦琪 郑毅*

首都医科大学附属北京安定医院

目的 网络成瘾是危害青少年身心健康的重要因素,不仅影响青少年的学业表现,还和焦虑、抑郁、非自杀性自伤(Non-Suicidal Self-Injury, NSSI)等精神心理疾病有关,但其内在动机有待进一步探究。本研究旨在探讨自伤成癮是否可以作为同伴关系和网络成瘾之间的中介变量,进一步揭示三者之间的深层次关系。

方法 选取于北京安定医院住院的 107 名 NSSI 青少年为研究对象,使用学生同伴关系量表、网络成瘾量表、渥太华自伤量表进行评估,并采用 SPSS26.0 以及 Process 插件进行数据分析。

结果 共纳入 NSSI 青少年男性 11 人,女性 96 人;独生子女 50 人,非独生子女 57 人;农村户籍 31 人,城市户籍 76 人。相关性分析结果显示,同伴关系和 NSSI 成癮呈显著负相关($r=-0.268$, $P<0.01$);同伴关系和网络成瘾呈显著负相关($r=-0.358$, $P<0.01$);NSSI 成癮和网络成瘾呈显著正相关($r=0.305$, $P<0.01$)。中介效应检验发现自伤成癮在同伴关系和网络成瘾之间起部分中介作用($\beta=-0.06$, 95% CI: -0.145 ~ -0.007, $P<0.05$, 中介效应占总效应的 17%)。

结论 青少年不良同伴关系既可以直接作用于也可通过 NSSI 成癮间接作用于网络成瘾;NSSI 成

瘾在不良同伴关系和网络成瘾之间起部分中介作用。

孤独症谱系障碍患儿血清维生素 B12、叶酸及氨基酸水平分析

李慧慧*

郑州大学第三附属医院

目的 探讨孤独症谱系障碍(autism spectrum disorder, ASD) 患儿是否存在血清维生素 B12、叶酸及氨基酸水平异常, 为建立 ASD 的早期预警信号和开展 ASD 儿童的靶向营养干预提供依据。

方法 收集 2020 年 7 月—2023 年 12 月期间在郑州大学第三附属医院儿童发育行为科就诊和接受康复训练的典型 ASD 患儿 40 名作为病例组, 另选取 35 名性别、年龄匹配的正常儿童作为对照组。采用化学发光免疫分析法测定血清维生素 B12、叶酸水平, 采用循环法测定血同型半胱氨酸水平, 采用串联质谱法检测苯丙氨酸、色氨酸、酪氨酸、丙氨酸、瓜氨酸等血清氨基酸水平, 并进行统计学分析。

结果 ASD 组血清维生素 B12 和叶酸的水平低于对照组, 血清同型半胱氨酸、苯丙氨酸、色氨酸的水平高于对照组, 酪氨酸水平低于对照组, 差异均具有统计学意义(t 值分别为 6.21, -2.34, -7.36, 5.71, 3.75, -4.98, P 值均 <0.05);

结论 ASD 患者血清维生素 B12、叶酸、同型半胱氨酸、苯丙氨酸、色氨酸及酪氨酸水平存在异常, 这些异常指标有可能成为 ASD 的预警信号, 应及时开展靶向营养干预。

关键词: 孤独症谱系障碍, 维生素 B12, 叶酸, 氨基酸水平

学龄前 ADHD 执行功能与情绪失调的关系研究

李瑜¹ 朱大倩¹ 杨涵钰^{1,2} 杨依静¹

1. 复旦大学附属儿科医院

2. 复旦大学

目的 情绪失调是学龄前注意缺陷与多动障碍(ADHD) 儿童常见的伴随症状, 既往研究表明 ADHD 儿童至少会在一个情绪失调环节中出现问题。作为 ADHD 的核心缺陷, 执行功能与情绪失调有着密切联系。本研究拟使用多种研究工具, 探讨学龄前 ADHD 儿童执行功能与情绪失调的关系, 以更好地了解学龄前 ADHD 情绪失调的发生机制, 并为干预学龄前 ADHD 儿童的情绪失调问题提供理论基础。

方法 于复旦大学附属儿科医院精神心理科门诊、合作幼儿园初筛招募有注意缺陷多动障碍倾向的学龄前儿童 44 名, 经过排除边缘情况, 最终纳入 38 名确诊为学龄前 ADHD 儿童, 并采用被试内实验设计进行研究。采用标准化剑桥神经心理成套测试(CANTAB)和家長版学龄前儿童执行功能行为评定量表(BRIEF-P), 对学龄前 ADHD 儿童的执行功能进行全面评估; 采用情绪理解测验(TEC)和情绪调节检核表(ERC)分别对学龄前 ADHD 儿童情绪失调中的情绪理解能力、情绪调节能力及情绪不稳定性进行评估。

结果 根据儿童的测验结果显示, 学龄前 ADHD 儿童在停止信号任务(SST)中的反应时间与情绪理解显著正相关($r=0.368$, $p<0.05$), 在空间工作记忆任务(SWM)中的总错误数与情绪理解显著负相关($r=-.344$, $p<0.05$)。家長报告的量表结果显示, 学龄前 ADHD 儿童的总体执行功能受损与情绪调节显著负相关($r=-.396$, $p<0.05$), 抑制自我调控、认知灵活性和元认知各分指数与情绪调节均呈显著负相关(均 $p<0.05$); 此外, 学龄前 ADHD 儿童的执行功能受损总分与情绪不稳定性显著正相关($r=0.753$, $p<0.01$), 各分指数也均呈显著正相关(均 $p<0.01$)。

结论 执行功能在学龄前 ADHD 儿童情绪失调中发挥这重要作用, 未来的干预方案需重点关注对学龄前 ADHD 儿童的执行功能的训练和干预, 以减少学龄前 ADHD 儿童的情绪失调症状, 促进其身心健康和发展。

关键词: 学龄前 ADHD; 执行功能; 情绪失调

分析青少年非自杀性自伤患者的心理护理效果评价

陈思岚*

西安交通大学第一附属医院

目的 通过对非自杀性自伤的青少年患者进行心理护理,分析心理护理对抑郁患者自伤情况和心理症状的影响,研究心理护理在治疗 NSSI 方面的潜力。

方法 纳入 2021 年 3 月-2022 年 12 月至我院就诊的非自杀性自伤患者 80 例,将研究对象随机等比例分入研究组(心理护理)或对照组(常规护理)。给予所有研究对象常规非自杀性自伤药物和物理治疗,对照组给予患者常规护理,包括评估自杀和自我伤害风险、减压正念练习、及时阻止患者的自伤行为、叮嘱患者按时服药等;研究组在此基础上,给予患者心理护理(包括建立心理护理团队、建立良好的护患关系、专业心理治疗、增强自我效能感、团体心理治疗)。为了分析比较两组患者的自伤情况,使用青少年自伤量表评估非自杀性自伤患者近 1 个月的自伤频率和严重程度;为了分析比较两组患者的心理症状,使用蒙哥马利-阿斯伯格抑郁量表(MADRS)衡量抑郁发作的严重程度。实验数据采用 SPSS 26.0 进行分析,计量数据以平均值±标准差表示,组间比较使用独立 t 检验,若为分类资料则用个数和百分数表示,组间比较使用卡方检验, $P < 0.05$ 被认为具有显著性差异。

结果 针对 NSSI 患者焦虑、抑郁的易感因素及相关因素,对研究组进行系统的心理护理。通过 2 周的干预后,研究组患者的自伤频率及自伤程度随着干预时间的增长而逐渐减小,干预效果更好,表明研究组患者的自伤情况明显优于对照组,两组间差异有统计学意义($P < 0.05$);干预前,两组患者的抑郁程度大致相同,干预后,研究组患者的抑郁程度明显下降,表明研究组患者的心理症状明显轻于对照组,两组间差异有统计学意义($P < 0.05$)。

结论 通过专业的心理干预,可以在一定程度上降低患者的焦虑和抑郁水平,并通过护患有针对性的沟通,使患者得到缓解。同时,集体心理治疗使兴趣爱好不多的非自杀性自伤患者在同伴的影响下重新找到了自己的兴趣爱好,也在一定程度上缓解了患者的焦虑和抑郁情绪。结果表明,给予青少年非自杀自伤患者心理护理,可有效降低患者焦虑和抑郁的负面情绪,减少自伤频率和程度,值得临床推广。

关键词:青少年;非自杀性自伤;心理护理;自残;负面情绪

校园欺凌对寄宿初中生心理健康问题的影响:学校归属感与心理韧性的中介效应

张菱 刘晓阳 戴振威 苏小游*

中国医学科学院北京协和医学院群医学及公共卫生学院

目的 近年来,校园欺凌已成为全球范围内的重要教育和公共卫生问题。校园欺凌对学生的心理健康具有显著的负面影响,而寄宿学生长期处于封闭的校园环境,远离家庭支持系统,更有可能成为校园欺凌的卷入者,面临更大的心理健康风险。本研究旨在探讨校园欺凌对寄宿初中生心理健康的影响,并分析学校归属感和心理韧性的中介效应。

方法 采用分层随机整群抽样的方法对河北省几所寄宿中学初中三个年级的学生进行问卷调查。使用特拉华欺负受害量表、中学生心理健康量表(MSSMHS)、学校归属感量表、中文版心理韧性量表(CD-RISC-10)调查寄宿初中生的校园欺凌、心理健康问题、学校归属感、心理韧性的情况。运用 SPSS 26.0 软件对研究收集的数据进行分析与处理,采用 t 检验、方差分析等对性别、年级等人口学变量以及校园欺凌、心理健康问题等相关因素得分进行差异性检验。运用 Amos 28.0 构建结构方程模型并用 Bootstrap 方法进行中介效应检验,用 Bollen-Stine Bootstrap 估计拟合指数。检验水准 $\alpha = 0.05$ 。

结果 本研究共收集问卷 949 份,剔除不合格问卷后(前后有明显逻辑错误、重要的人口学变量缺失或存在异常值等)有效问卷 851 份,问卷有效率为 89.7%。其中男生 424 名(49.8%),女生 427 名(50.2%);初一学生 245 名(28.8%),初二学生 256 名(30.1%),初三学生 350 名(41.1%)。校园欺凌得分为 5.0 ± 8.1 ,心理健康问题得分为 1.6 ± 0.8 ,学校归属感得分为 4.5 ± 0.8 ,心理韧性得分为 24.7 ± 9.9 。校园欺凌对心理健康问题的直接效应显著,效应值为 0.035 (0.024-0.046),而学校归属感、心理韧性在校园欺凌与心理健康问题之间均起到部分中介作用,其中学校归属感的中介效应占总效应的 31.2%,心理韧性占总效应的 3.3%,中介效应值分别为 0.017

(0.012-0.022)、0.002 (0.001-0.004)。模型拟合度良好, $c^2/df=1.59$, $RMSEA=0.03$, $AGFI=0.99$, $CFI=0.99$ 。

结论 校园欺凌不仅能直接影响寄宿初中生的心理健康问题的发生, 也会通过降低学校归属感和心理韧性, 显著增加心理健康问题风险。因此, 提高学生的学校归属感、增强学生的心理韧性可能是缓解校园欺凌负面影响的有效策略, 例如建立积极的校园文化、提供心理支持和辅导、开展心理健康教育等。本研究为进一步研究校园欺凌对青少年心理健康的影响提供了重要的实证依据, 并为制定有效的干预策略提供了理论依据。

本研究由国家心理健康和精神卫生防治中心资助。

计算机认知行为治疗中失眠对童年创伤和抑郁的中介作用研究

Xinyu Shang Ping Zuo Yang Wang Hantong Shen Fei Wang* Rongxin Zhu
南京脑科医院

与传统的面对面治疗相比, 基于计算机的认知行为疗法在几个方面具有优势。然而, 它仍然有几个局限性, 其中缺乏个性化是最常关注的问题之一。本研究旨在探讨如何通过 ICBT 干预减轻经历过童年创伤事件的患者的抑郁症状, 以探讨是否应该更有针对性地提供治疗。根据先前的研究结果, 失眠被确定为一个潜在的目标。筛选出 150 名处于抑郁状态 PHQ-9 总分 25 分且无严重自杀意念、无其他精神障碍的参与者, 使用《失眠严重程指数》(IS)和《儿童创伤问卷-28 项简式》获得干预前数据。随后参与者被随机分配为立即接受干预或 4 周后接受干预作为对照条件, 干预后再测抑郁严重程度和失眠严重程度。以童年创伤为自变量, 以抑郁严重程度的变化为因变量, 以失眠的变化为中介变量, 以性别和年龄为控制变量, 进行中介效应分析, 建立中介模型, 检验模型的拟合度和每条途径的显著性。中介分析表明, 失眠部分中介了童年创伤和抑郁之间的关系, 具体而言, 失眠在儿童期情绪虐待与抑郁之间的关系中起部分中介作用, 在情绪忽视、性

虐待、身体虐待和身体忽视与抑郁之间分别起完全中介作用。失眠的变化部分中介了抑郁的改善和童年创伤中的情绪忽视的关系。

研究表明, 针对抑郁症状的患者, 治疗师可以通过是否失眠、是否有童年创伤进行更个性化、更有针对性的干预, 以最大限度的提高治疗效果。

孤独症谱系障碍早期成人社交与非社交认知灵活性的行为学研究

关霖¹ 常天怡¹ 赵佳¹ 孟凡超¹ 金悦宁² 周媛^{1,2}
陈旭¹ 王刚¹

1.首都医科大学附属北京安定医院

2.中国科学院心理研究所行为科学重点实验室

目的 孤独症谱系障碍 (autism spectrum disorder, ASD) 是一种以社交困难以及刻板重复行为为核心特征的神经发育障碍。其发生率近年来不断攀升, 成为全球性的公共卫生议题。既往研究发现 ASD 个体的认知灵活性存在不同程度受损, 导致日常生活受到影响, 但目前对于 ASD 个体在社交与非社交两种不同情景下认知灵活性表现的研究较少, 有待进一步探索。

方法 本研究纳入 30 例 ASD 早期成人 (年龄范围: 18-33 岁, 男:女=13:17) 及 29 例年龄、性别及智力发育水平可比的典型发育 (typical development, TD) 对照 (年龄范围: 19-31 岁, 男:女=15:14), 采用概率反转学习 (probabilistic reversal learning, PRL) 任务, 设计了社交与非社交两种不同情景, 通过 2x2 方差分析, 考察诊断 (ASD vs. TD) 与情景 (社交 vs. 非社交) 及其交互效应对受试者在 PRL 任务中行为学指标的影响。

结果 方差分析结果显示在任务的习得阶段, 诊断x情景存在显著的交互效应 ($F=6.338$, $P=0.015$), 在社交情景中, ASD 组无效失败转换的比例显著低于 TD 组, 在非社交情景中, ASD 组则显著高于 TD 组。在反转阶段, 对于无效失败转换比例, 情景存在显著的主效应 ($F=5.766$, $P=0.020$), 无论何组被试, 非社交情景的无效失败转换比例都显著高于社交情景; 对于有效失败转换比例, 诊断 ($F=4.992$, $P=0.030$)

存在显著的主效应, 诊断×情景存在显著的交互效应 ($F=6.023, P=0.018$), 提示在社交情景中 ASD 组的有效失败转换比例显著高于 TD 组; 对于有效成功转换, 情景 ($F=5.667, P=0.021$) 存在显著的主效应, 提示在无论何组被试, 非社交情景的有效成功转换比例都显著高于社交情景。隐马可夫模型参数显示, ASD 组在两个情景中都体现出高于 TD 组的趋势; 在非社交情景中, ASD 组对积极反馈的敏感性低于 TD 组 (89% HDI: [-0.11, 0.00]), ASD 组对消极反馈的敏感性也显著低于 TD 组 (89% HDI: [-0.13, -0.01])。

结论 在 PRL 任务总体表现中, TD 在认知灵活性方面优于 ASD 个体, 但两组受试者 PRL 任务相关行为学指标的差异也可能揭示 ASD 受试者存在不同的策略, 尤其是在社交情境中。另外, ASD 组在两种情境下都倾向于高估任务环境的不确定性, 对积极和消极反馈的敏感性也低于 TD 组, 提示 ASD 个体对情境的反馈和环境变化有不同的感知和反应模式, 从而影响其不同情景下认知灵活性的表现。

青少年抑郁非药物干预研究进展

祖孟兰¹ 徐珊¹ 许皓² 谭淑平² 朱小林²

1. 承德医学院

2. 北京回龙观医院

目的 以往在青少年和成人的研究中发现自尊、非适应性完美主义、反刍思维与其抑郁情绪的发生密切相关, 但较少有研究探索非适应性完美主义、反刍倾向在自尊对抑郁影响中的作用, 因此本研究旨在进一步探讨自尊、非适应性完美主义、反刍倾向与抑郁的链式中介关系。

方法 采用方便抽样的方法对在校中学生进行问卷调查, 调查内容包括学生的基本信息 (性别、年级、是否为独生子女、是否有留守经历)、病人健康问卷 (PHQ-9)、自尊量表 (SES)、青少年反刍倾向-风格量表 (RTSS)、完美主义问卷 (FMPS)。通过问卷星线上发放问卷, 共收回有效问卷 1111 份。学生的平均年龄为 14.96 岁, 男生的平均年龄为 14.96 岁, 男生 633 人 (57.0%), 女生 478 人 (43.0%); 初中

597 人 (53.7%), 高中 514 人 (46.3%); 其中独生子女 176 人 (15.5%), 非独生子女 939 人 (84.5%); 有留守经历 338 人 (30.4%), 无留守经历 773 人 (69.6%)。使用 SPSS26.0 和 PROCESS 插件, 对数据进行统计分析。

结果 相关分析发现人口学变量中, 性别、独生子女与自尊负相关 (均 $P < 0.05$); 性别、年级、独生子女、有无留守经历均与反刍倾向相关 (均 $P < 0.05$), 性别、年级、有无留守经历与抑郁相关 (均 $P < 0.05$); 非适应性完美主义、反刍倾向、抑郁均与自尊呈显著负相关 (均 $P < 0.05$); 反刍倾向、抑郁均与非适应性完美主义呈显著正相关 (均 $P < 0.05$); 抑郁与反刍倾向呈显著正相关 ($P < 0.05$)。中介效应分析发现, 自尊能够直接负向预测青少年抑郁, 直接效应量为 -0.388, 直接效应占比为 70.29%; 非适应性完美主义在自尊与抑郁之间起中介作用, 中介效应量为 -0.027, 中介效应占比为 4.89%; 反刍倾向在自尊与抑郁之间起中介作用, 中介效应量为 15.94%; 且非适应性完美主义-反刍倾向的链式中介作用也显著, 中介效应量为 -0.050, 中介效应占比为 9.06%。

结论 研究发现青少年自尊水平越高, 抑郁程度可能越低。自尊可以直接影响青少年抑郁, 还可以通过非适应性完美主义和反刍倾向的独立中介, 以及非适应性完美主义-反刍倾向的链式中介间接作用于抑郁。

关键词: 自尊; 非适应性完美主义; 反刍倾向; 抑郁

学龄前注意缺陷多动障碍儿童事件相关电位 P300 研究

陶梦娇 任永颖 刘子奇 孙静 张建昭 王昕 杨健*
首都儿科研究所

目的 通过对 3-5 岁学龄前 ADHD 儿童进行事件相关电位 P300 的检测, 比较分析学龄前 ADHD 患儿与正常儿童 P300 的特点, 以期对学龄前 ADHD 患儿认知功能的研究提供新的参考。

方法 选取 2021 年 3 月至 2024 年 3 月于首都儿科研究所附属儿童医院神经内科及保健科门诊就诊的 3-5 岁学龄前儿童共 69 例, 分为 ADHD 组 (41

例)、正常儿童组(28例),对所有儿童进行事件相关电位 P300 的检测,记录 P300 的潜伏期和波幅。按照 10-20 系统记录中线(Fz、Cz、Pz 和 Oz)和双侧中央顶叶电极(C3 和 C4)的脑电活动。利用 SPSS 26.0 软件包对两组儿童的 P300 波幅和潜伏期进行分析。计量资料符合正态分布,两组间比较采用两独立样本 t 检验;不符合正态分布,两组间比较采用 Mann-Whitney U 检验。 $P < 0.05$ 则认为差异有统计学意义。

结果 ADHD 组患儿在各个电极点(Fz, Cz, Pz, Oz, C3, C4)P300 的潜伏期均长于健康对照组,差异具有统计学意义($P < 0.05$)。ADHD 组 Pz 点和 Oz 点 P300 的波幅均高于正常对照组,差异具有统计学意义($P < 0.05$)。

结论 学龄前 ADHD 患儿 P300 显示中央线及双侧中央区潜伏期延长,顶叶、枕叶波幅增高,提示学龄前 ADHD 患儿已存在注意认知功能受损。

关键词: 注意力缺陷多动障碍;学龄前;事件相关电位;P300

数据驱动下的抽动障碍的亚型分析的相关研究进展

杨凯 杨卿灏 胡淑锦 全进铨 雷天缘 崔永华*
首都医科大学附属北京儿童医院

目的 抽动障碍(tic disorder, TD)是儿童常见的神经发育障碍,在 DSM-5 诊断标准下可分为暂时性抽动障碍(provisional tic disorder, PTD)、慢性运动或发声抽动障碍(chronic motor or vocal TD, CMT 或 CVT)和抽动秽语综合征(Tourette syndrome, TS)。目前在这些亚型中的早期诊断分类是比较困难的,目前基础上的新发病抽搐症状较难以鉴别。机器学习工具已广泛用于精神疾病的早期诊断分类。然而,目前很少有机器学习模型被建立用于 TD 患者的诊断分类。在这篇综述中,我们描述了抽动障碍在不同维度下的数据驱动分类。我们讨论了这些发现的潜在机制和治疗意义,描述了有待开发的领域,并为未来的研究提供了可测试的假设。

方法 通过 PubMed, Web of Science 检索文献,采用年份过滤范围 2000 年至 2024 年,对研究方法不进行限制,包括临床特征、社会特征、影像学、免

疫系统、遗传基因等分类特征。

结果 研究结果显示,从数据驱动的角度对抽动障碍进行亚型分析是完全可行并且是有显著临床意义的。临床特征和社会行为特征分析表明,通过 HAC、EFA 和 LCA 等方法,抽动症患者可分为多个簇和因子,每个簇与不同的行为和共病症状相关,如强迫障碍(obsessive-compulsive disorder, OCD)、注意缺陷多动障碍(attention deficit hyperactivity disorder, ADHD)和自闭症等复杂关联。此外,一些高遗传性的表型(如高社会去抑制率)比传统诊断更能准确反映 TS 的生物网络,对称/精确、攻击性冲动、对伤害的恐惧和囤积等特征与 TS、OCD 和 ADHD 存在复杂的遗传联系,可能代表这些疾病共同的认知控制脆弱性。这些研究强调图雷特综合征不是一种单一的疾病,而是一种异质性综合征,根据不同的亚型分类方法,有不少于两个主要的集群定义了从简单图雷特综合征到复杂图雷特综合征的严重程度/复杂性梯度。

结论 目前抽动障碍的临床特征和相关危险因素对有效识别高危人群是非常重要的。识别和定义“抽动障碍谱系”中的各种表型对早期干预和预防工作具有重要的临床意义。通过综合观察各种临床特征,我们可以了解更多导致抽动障碍的原因,这表明需要更好地了解抽动障碍内部的差异。目前的研究可能为 TD 的神经生物学机制提供更深入的了解,并具有推进 TD 精准治疗方法和个性化预后预测的研究和实践的重大潜力。

青少年抑郁症患者家庭照顾者照护能力要素的质性研究

周国岭 王晓蕾*
杭州市第七人民医院

目的 探索我国青少年抑郁症患者家庭照顾者照护能力内涵,为开展针对性的照护能力干预提供借鉴和参考。

方法 采用目的抽样方法,于 2021 年 12 月—2022 年 1 月在杭州市两所三甲医院儿童心理门诊选取 17 名抑郁症青少年家庭照顾者进行半结构化访谈,采用主题分析法确定主题。

结果 共提炼出五大主题,即疾病知识,包括知识获取途径,疾病相关知识等;照护技能,包括疾病管理,情感支持,生活照护等;照护态度,包括缓解病耻感,接受理解,降低要求等;个人应对,包括照护问题应对,情绪应对等;寻求支持中包括非专业支持,专业支持等。

结论 照护能力内涵丰富,抑郁症照顾者照护能力有待提升。医务人员应提供专业化的健康教育,以期提升照顾者照护能力,维护并促进其身心健康。本研究从照顾者照护情况和实际需求出发,初步探讨了青少年抑郁症患者家庭照顾者照护能力要素。研究结果反映,照顾者在照护方面具有一定的局限和困难,建议增加照顾者专业照护知识和照护技能的培训,提供多途径的支持以提升照顾者个人应对能力,健全照顾者支持系统,以期为青少年抑郁症患者提供优质的照护。但由于本研究访谈对象均来自杭州两家三甲医院,可能导致研究结论的局限性。后期研究者将扩大研究区域进行更深入的探究。

注意缺陷多动障碍的视听注意反应与 P300 的相关性研究

刘若楠* 徐定定

新疆维吾尔自治区人民医院

目的 探讨视听整合持续操作测验 (IVA-CPT) 和事件相关电位 P300 在注意缺陷多动障碍 (ADHD) 患者中的相关性及其临床诊断中的应用价值。

方法 将符合 DSM-V 中 ADHD 诊断标准的 30 例患儿和 30 例健康儿童进行 IVA-CPT 检测和注意缺陷多动障碍筛查量表中文版 (SNAP-IV) 评估。同时运用视觉 oddball 范式,记录 P300 脑电信息参数。

结果 在 IVA-CPT 测试中,ADHD 患者的综合注意力商数、综合控制力商数、听觉/视觉控制力商数和听觉/视觉注意力商数均显著降低 (均 $P < 0.01$)。ADHD 患者及三个亚型与对照组相比,P300 的潜伏期延长、波幅降低 ($P < 0.05$ 或 0.01),尤在 Cz 更显著;但是波幅下面积各组间无统计学差异。另外,ADHD 患者 IVA-CPT 的视觉注意力

商数和视觉控制力商数与 P300 波幅呈正相关 ($P < 0.05$ 或 0.01);而与 P300 潜伏期呈负相关 ($P < 0.01$)。

结论 ADHD 患者的 P300 有显著改变,主要表现为 P300 潜伏期延长和波幅降低,可能与注意反应延缓和抑制控制损害有关。提示 ADHD 患者存在神经认知功能异常。

中高考学生轻度抑郁的早期干预研究

黄众¹ 况利^{1,2}

1.重庆医科大学附属大学城医院

2.重庆医科大学附属第一医院精神卫生中心

目的 本综述旨在探讨中高考学生因学业压力导致的轻度抑郁产生原因,并提出有效的早期干预建议,以期通过学校、家庭和社会的多方支持,帮助中高考学生在心理教育、家庭支持和自我调节等方面得到全面帮助,降低抑郁风险,促进心理健康。

方法 本文通过系统回顾和分析现有文献,综合各类研究成果,探讨中高考学生轻度抑郁的成因。首先,本文通过检索 PubMed、PsycINFO、Web of Science 等数据库中 2000 年至 2023 年间发表的相关研究,筛选出与中高考压力和青少年抑郁相关的文献。其次,对这些文献进行分类整理,重点关注学业压力、家庭环境、社会支持等因素对抑郁症的影响。本文结合心理学、教育学和社会学的理论与实践,提出具体的干预策略和建议。

结果 通过对 130 篇相关文献的分析,发现中高考学生因学业压力大,抑郁症发病率显著高于其他青少年群体。数据显示,约有 30% 的中高考学生报告经历过不同程度的抑郁症状,而这一比例在普通青少年中约为 20%。学业压力、父母期望、高强度的学习时间和缺乏休息是主要的压力源。研究表明,心理健康教育的普及、优化家庭支持环境以及培养学生自我管理和情绪调节技能是有效的干预措施。

心理健康教育: 通过在学校中开展心理健康课程和讲座,帮助学生识别和管理压力与情绪。例如,

一项研究表明,经过 8 周的心理健康课程后,学生的抑郁症状显著减少 ($p < 0.05$)。

家庭支持: 优化家庭环境,增强父母对孩子学业压力的理解和支持。研究显示,父母参与的心理教育项目能够显著降低学生的抑郁水平 ($d=0.4$)。

自我调节技能: 通过训练学生的自我管理和情绪调节技能,如正念冥想和认知行为疗法 (CBT),可以有效缓解抑郁症状。一项包含 200 名学生的研究发现,经过 12 周的正念冥想训练,学生的抑郁评分下降了 15% ($p < 0.01$)。

结论 通过系统化的早期干预策略,可以有效帮助中高考学生应对学业压力,降低抑郁症发病率,促进心理健康。本文为教育工作者、心理学家和政策制定者提供了有价值的参考,提出了通过心理健康教育、家庭支持和自我调节技能训练来构建支持性环境的具体方法。这些干预措施不仅有助于改善中高考学生的心理健康状态,还为未来的研究和实践提供了科学依据和实践指导。

学龄期注意缺陷多动障碍伴情绪失调与其执行功能及静息态功能连接异常的相互作用关系

李思迅 黄颐*

四川大学华西医院

目的 情绪失调在注意缺陷多动障碍 (Attention-Deficit/Hyperactivity Disorder, ADHD) 儿童中非常普遍,显著影响其功能损害和不良预后。本研究旨在探索 ADHD 伴情绪失调儿童的执行功能及以“眶额叶皮层”为种子点的功能连接特征,同时在 ADHD 儿童中探索三者间的相互作用关系。

方法 共纳入 ADHD 儿童 160 名,健康对照 80 名参与研究。使用 CBCL 量表 (Anxiety/depression, Attention, Aggressive, AAA) 条目将 ADHD 儿童分为伴有与不伴有情绪失调的两个亚组。参与者完成剑桥神经心理自动化成套测试软件 (Cambridge NeuroPsychological Tests Automated Battery, CANTAB) 及行静息态功能磁共振扫描。经过数据质量检查后,最终纳入 ADHD 伴情绪失调组 66 例、ADHD 不伴情绪失调组 40 例和 TDC 组 52

例进行统计分析。使用协方差分析及事后检验比较三组间执行功能及以“眶额叶皮层”为种子点的静息态功能连接特征。同时,以异常功能连接为自变量,以异常执行功能为中介变量,以情绪失调为因变量,在 ADHD 儿童中建议中介模型。

结果 以“性别、年龄、智力”为协变量的协方差分析及事后检验发现,与不伴情绪失调的 ADHD 儿童相比,伴有情绪失调的 ADHD 儿童抑制控制功能 (IED) 更差 ($P=0.01^{**}$)。以“性别、年龄、智力、核心症状严重程度、平均头动参数”为协变量的协方差分析及事后检验的结果发现,与不伴情绪失调的 ADHD 儿童相比,伴有情绪失调的 ADHD 儿童存在“眶额叶皮层-内侧额上回”功能连接异常 (左侧眶部额中回—右侧内部额上回: $P=0.04^*$; 右侧眶部额中回—左侧内部额上回: $P=0.01^*$; 右侧眶部额中回—右侧内部额上回: $P=0.01^*$)。IED 在 ADHD 儿童“右侧眶部额中回-左侧内部额上回”功能连接对其情绪失调的影响中起部分中介作用,总效应值为 0.27 ($P=0.01^*$),直接效应值为 0.21 ($P=0.04^*$),间接效应值为 0.06 ($P=0.001^{**}$),中介效应值占总效应值的 22%。

结论 伴有情绪失调的 ADHD 儿童存在执行功能受损及以“眶额叶皮层”为种子点的功能连接异常。ADHD 儿童情绪失调、执行功能及功能连接之间存在相互作用关系。

小儿脑瘫合并孤独症谱系障碍康复观察——杜春红

杜春红*

台州市第二人民医院

目的 探索孤独症谱系障碍合并脑瘫患儿的康复治疗方法

方法 患儿为三级精神专科医院康复医学科在训儿童,均经儿童精神科确诊为 CP 合并 ASD。患儿 A,女,5 岁 3 个月就诊,四肢运动障碍,肌张力无增高,躯干控制差,坐位平衡 2 级,站位平衡 0 级,追视差,呼名反应差,有刻板行为,无法正常交流,并发癫痫。患儿 B,男 6 岁 1 个月,右侧肢体

运动障碍,右侧腓肠肌肌张力增高,坐位平衡3级,站位平衡2级,可追视,呼名反应尚可,有刻板行为,无法正常交流。患儿C,女,3岁10个月,右侧肢体运动障碍,肌张力无明显增高,追视差,呼名反应差,有刻板行为,无法正常交流,并发癫痫。观察3例孤独症谱系障碍合并脑瘫患儿,分别进行运动疗法、感觉统合治疗、认知知觉功能障碍训练、言语训练等康复治疗6个月,并于治疗前后进行肌力评定、Ashworth肌张力评定、孤独症儿童发展评估表评估。观察患儿各项功能改善情况。

结果 患儿认知能力、追视能力、粗大运动提高明显。

结论 CP与ASD共患病,兼具两种疾病特点,同时治疗难度远远大于单病种。临床中多种治疗方式相结合,兼顾运动、感觉、言语、认知、社交等领域,并加强照顾者教育实现共同干预,对患儿康复更有意义。若患儿合并癫痫等其他疾病,治疗难度更大。

关键词:脑瘫 孤独症谱系障碍 康复治疗

223 例青少年非自杀性自伤行为影响因素分析

钱成*

嘉兴市康慈医院

目的 探讨青少年非自杀性自伤(NSSI)的影响因素,为早期发现与预防提供。

方法 选取2020年9月~2022年9月桐乡市4所初中及4所高中学生,随机抽取每年级2个班级共690例,采用青少年自伤行为问卷(ASIS)筛选NSSI。应用一般情况调查问卷收集患者的个人一般情况,采用单因素分析筛选影响NSSI患者一般资料;对比NSSI与非NSSI者的症状自评量表(SCL-90);对比初中组及高中组青少年的ANSAQ评分;采用多因素分析筛选出影响青少年出现NSSI的危险因素。

结果 符合NSSI者223人,非NSSI者467人,其中初中组127人,高中组96人。NSSI组在性别、母亲文化程度、是否独生子女、是否有留守经历、是否寄宿、学习成绩以及是否有抑郁病史与无NSSI组比较差异有统计学意义($P<0.05$);NSSI组较无NSSI

组比较SCL-90得分明显升高,且平均值高于160分的临界值($P<0.05$);高中NSSI组在自伤频率、初发年龄、疼痛体验次数均高于初中NSSI组($P<0.05$);初中NSSI组在他人在场次数及抵制自伤行为方法高于高中NSSI组($P<0.05$);留守经历、学习成绩及抑郁病史是出现NSSI的潜在危险因素。

结论 NSSI影响因素较多,负性生活刺激、女性和抑郁病史是导致NSSI发生的主要因素。

关键词:青少年;非自杀性自伤;影响因素

147例青少年非自杀性自伤患者的临床和人格特征

李亚玲*

嘉兴市康慈医院

目的 探讨青少年非自杀性自伤患者的临床和人格特征。

方法 对2020年09月—2022年08月嘉兴市康慈医院门诊就诊的147例伴有非自杀性自伤的青少年作为研究对象,对其自伤方式、心理特征(SCL-90)、人格特征(EPQ)进行研究。

结果 发现147例青少年患者有10种NSSI行为方式,割伤113例(占76.9%)、击打自己40例(占27.2%)、撞头或拳击37例(占25.2%)、咬23例(占15.6%)、服药过量18例(占12.2%)、用针、笔扎13例(占8.84%)、干扰伤口愈合11例(占7.48%)、烧灼9例(占6.12%)、用力抓6例(4.1%)、拽头发2例(占1.36%)等。其中:一种自伤方式81例(占55.1%);两种自伤方式40例(占27.2%);三种自伤方式22例(占15.0%);3种以上自伤方式的4例(占2.7%)。艾森克人格问卷提示青少年非自杀性自伤患者的神经质得分高于无自伤自杀行为组,内外向、精神质、掩饰性得分显著低于无自伤自杀行为组。SCL-90提示人际关系敏感、抑郁、焦虑、强迫等4个因子分高于全国青年组常模,且中度异常。

结论 青少年非自杀性自伤的方式具有多样性、反复性,多有特定的心理和人格特征。

关键词:青少年;非自杀性自伤;艾森克人格问卷;临床特征;SCL-90;人格特征

创伤经历对青少年抑郁障碍患者事件性前瞻记忆的影响

解艳霞 党云皓*

西安市精神卫生中心

目的 前瞻记忆是指记忆将要执行的预期动作的能力,即对在未来特定情境或事件没有世界的外部提示的情况下,从事先前计划好的活动的记忆。在青少年儿童的学业成就和人际关系中起着至关重要的作用。本研究旨在探讨有创伤经历的青少年抑郁障碍患者,事件性前瞻记忆的特点。

方法 纳入 60 名青少年抑郁障碍患者和 60 名健康对照青少年,采用儿童抑郁量表(CDI)、流调用抑郁自评量表(CES-D)、童年期创伤量表(CTQSF)对青少年抑郁障碍患者进行调查,所有被试进行意图记忆测验(MIST; Raskin, Buckheit, & Sherrod, 2010),这是一种标准化和有效的 PM 测量工具。采用双重任务研究范式,选取由三角形和多边形并列组成的 380 张图片,作为实验材料,分析非靶线索反应时和控制条件的反应时;通过采集 N110、P170,分析不同条件下波幅及潜伏期的差异,探究童年创伤个体事件性前瞻记忆的特点。

结果 对于有创伤经历的青少年抑郁障碍患者,非靶线索的反应时长于控制条件的反应时;控制条件下,可观察到 N110 的潜伏期和波幅均大于健康对照组。

结论 创伤经历是影响前瞻性记忆的重要因素。有创伤经历的青少年抑郁障碍患者在靶线索未出现时,事件性前瞻记忆存在缺陷。

关键词: 创伤,青少年,抑郁,前瞻性记忆

每日症状指数减少预测抑郁儿童青少年重复经颅磁刺激疗效

蒲犇*

宁波市精神病院

目的 重复经颅磁刺激(Repetitive transcranial magnetic stimulation, rTMS)已成为治疗儿童和青少

年抑郁症的新兴疗法,但如何早期预测疗效仍是一大挑战。本研究旨在探讨 rTMS 治疗过程中预测远期疗效的潜在因子。

方法 本研究采用回顾性队列研究设计,纳入 2014-2020 年间在某精神专科医院接受 ≥ 20 次 rTMS 治疗的 234 名抑郁症患儿。采用每日症状指数(DI-5)和儿童抑郁量表(CDI)评估抑郁症状。定义 DI-5 减分 $\geq 50\%$ 为治疗有效。使用 t 检验、卡方检验比较组间差异,重复测量方差分析探讨 DI-5 的变化趋势, Pearson 相关分析 DI-5 与 CDI 的关系。

结果 在基线和治疗后, DI-5 与 CDI 均呈显著正相关(基线 $r=0.73$, 治疗后 $r=0.75$, 均 $P<0.001$)。105 名(45%)患儿治疗有效。两组患儿在第 11 次治疗时 DI-5 差异显著(中位数差 2 分, $P=0.010$)。第 11 次治疗时 DI-5 减分 < 2 分的患儿,第 20 次治疗无效的概率为 97.4%;减分 ≥ 2 分者有效概率为 85%。

结论 第 11 次 rTMS 治疗时 DI-5 减分 ≥ 2 分可能是预测儿童青少年抑郁症 rTMS 疗效的早期预测因子。该发现有助于优化个性化治疗,提高临床获益。但本研究为回顾性设计,尚需前瞻性研究加以验证。

亚历山大病的类脑模型建立与致病机制研究

仇念壮¹ 高书敏¹ 冯振东¹ 韩蕾¹ 刘佳佳² 魏雅槟¹

1. 北京大学中国药物依赖性研究所

2. 北京大学护理学院

目的 亚历山大病(AxD)是一种原发性星形胶质细胞疾病,由 17 号染色体上的 GFAP 基因功能获得性突变引起,导致髓磷脂生成障碍和脑白质损伤。AxD 死亡率高,尚缺乏有效治疗手段,迫切需要研究其发病机制并开发治疗药物。然而,关于 AxD 的研究多局限于啮齿类动物模型,难以呈现人类大脑的结构和功能多样性,限制了相关的研究进展。类器官模型是一种新型的体外三维培养技术,能够模拟人体器官的复杂结构和功能,相较于细胞模型及啮齿类动物模型具有独特优势,运用类器官模型能

够更全面的研究 AxD 的相关机制。

方法 本研究通过重编程 AxD 新生突变患者外周血细胞为多能干细胞，并进一步诱导分化为富含星形胶质细胞的大脑类器官，通过免疫荧光等分子实验及电生理等技术验证发育过程中的表征变化。通过单细胞测序、转录组检测技术，探究 AxD 发生的分子机制，确定潜在的生物标记物和治疗靶点，并通过计算设计和筛选药物技术辅助抗 AxD 先导化合物的发现。

结果 初期研究已收集 3 例 AxD 新生突变家系病例，其突变类型分别为：c.715 (exon4) C>T, c.716 (exon4) G>A 和 c.262 (exon1) C>T，且均已成功转为 LCL 细胞。

结论 本研究拟通过构建三维类脑模型研究 AxD 的发病机制，辅以计算机辅助药物设计技术，发现新型的抗 AxD 先导化合物，为 AxD 的治疗提供新方法。

儿童青少年阿立哌唑和脱氢阿立哌唑血浆浓度与催乳素水平的关系研究

安会梅* 马波涛 齐思远
北京回龙观医院

目的 阿立哌唑是目前儿童、青少年精神疾病患者使用最广泛的非典型抗精神病药物之一，其主要优势是不良反应发生率低，安全性好。由于阿立哌唑是一种部分多巴胺受体激动剂，因此可降低催乳素分泌水平。降低的催乳素水平可能与免疫功能障碍和其它健康问题相关。本研究的目的是在接受阿立哌唑治疗的儿童和青少年精神疾病患者中，探索血浆中阿立哌唑及其代谢产物脱氢阿立哌唑浓度与催乳素水平之间的关系。

方法 本研究为横断面研究，研究对象为 52 名（其中男 17 名，女 35 名），年龄为 13-18 岁，接受阿立哌唑治疗的儿童和青少年精神疾病住院患者。采用高效液相色谱-串联质谱法检测血浆阿立哌唑和脱氢阿立哌唑的浓度，采用化学发光免疫分析方法测定血清催乳素水平。

结果 在接受阿立哌唑治疗的儿童和青少年住

院患者中，约有 15% 患者表现出血清催乳素水平低于正常参考范围。在女性儿童和青少年中，阿立哌唑和脱氢阿立哌唑的血浆浓度与血清催乳素水平呈负相关。

结论 该研究结果提示，在临床实践中，除了定期监测血清催乳素水平外，对阿立哌唑及其主要代谢物脱氢阿立哌唑进行治疗药物监测有助于减轻催乳素降低带来的不良后果。因此，临床医生在为儿童和青少年患者（尤其是女性患者）开阿立哌唑处方时，应考虑阿立哌唑引起的催乳素水平下降。

关键词：阿立哌唑、脱氢阿立哌唑、催乳素、儿童和青少年

人文护理模式在精神科护理中的应用

杨万荣 刘川*
重庆医科大学附属大学城医院

目的 本文主要针对人文护理模式在精神科护理中的应用进行分析研究。方法：随机选取 2022 年 1 月至 2023 年 1 月我院收治的 50 例精神疾病患者，将其按照随机数字表法均分为对照组和观察组，对照组应用常规护理，观察组应用人文护理模式，两组护理前后焦虑(SAS)、抑郁(SDS)评分对比。结果：两组护理前 SAS、SDS 评分对比无统计学意义， $P > 0.05$ ，护理后观察组 SAS、SDS 评分均低于对照组，具有统计学意义， $P < 0.05$ 。结论：在精神科护理中应用人文护理模式可以有效缓解患者焦虑，抑郁的不良情绪，值得推广应用。

方法 对照组使用常规护理，包括基础病情护理、用药护理、饮食护理、日常生活护理等。观察组使用人文关怀护理：（1）营造人文关怀氛围。对科室护理人员进行人文关怀护理系统培训，灌输人文关怀的价值观和信念，形成人文关怀护理文化。（2）人身安全检查。患者入院时护理人员查看危险物品，将这些物品专柜放置，并向患者承诺，如确实需要，护理人员会提供给患者。（3）营造舒适宽松病房环境。将人文理念融入病房每个细节满含温馨，营造宽松、舒适、自由的环境，营造病房温馨氛围。（4）加强心理沟通。了解患者内心的痛苦和真实需求，用亲切慰问、关心关怀、引导患者宣泄不良情绪。（5）重视生活人文关怀。遵循人人平等的原则，做

好解释及防护工作,取得患者理解和配合;(6)精神科护理人员需培养自身无私奉献及爱岗敬业的职业道德素质。从满足精神障碍患者的身心两方面需求出发,为他们创造舒适安全、充满关怀、充满爱心的治疗环境。(7)精神科护理人员要加强护患间的有效沟通。在面对患者及其家属的疑问时,能以专业认真的态度进行详细解答,提高他们的信任度,促使患者配合治疗。(8)精神科护理人员要有专业熟练的护理技能。对精神科急救方法要熟练掌握,才能在护理过程中高效保障患者的生命安全,促进患者的病情恢复。

结果 两组护理前 SAS、SDS 评分对比无统计学意义, $P>0.05$, 护理后观察组 SAS、SDS 评分均低于对照组,具有统计学意义, $P<0.05$ 。

结论 本次研究数据提示,采取人文关怀的研究组患者家属护理满意度及疾病临床治疗总有效率均优于对照组,提示人文关怀在精神科应用价值突出。人文关怀护理属于以人为本的护理干预模式,将常规的变被动护理转变为主动护理,护理人员的服务态度及护理质量均可得到显著提高,可了解患者存在的心理问题,给予有效的心理支持。人文关怀护理模式下,可帮助患者逐步建立自信心。

综上所述,人文关怀在精神科护理中的实施及效果确切,提升了康复效果,提高了患者生活和社会能力,值得在临床推广使用。

催产素对成人孤独症治疗现状综述

赵佳 孟凡超 田音 陈旭 郑毅*

首都医科大学附属北京安定医院

目的 孤独症谱系障碍(Autism Spectrum Disorder, ASD)是一种严重的神经发育性疾病,相比于儿童期,成年 ASD 患者面临更大的生存需求及挑战。目前其致病机制尚不明确,有关的药物治疗研究非常有限,至今为止没有特效药物,同时也缺乏有效的治疗方法。近年来,ASD 发病率呈现迅速上升趋势,引起研究者的广泛关注。有大量研究显示,催产素(Oxytocin, OT)在缓解 ASD 患者核心症状方面发挥着重要作用,是 ASD 治疗的研究热点,但目前大部分研究针对于儿童及青少年,而对于成年 ASD

的治疗效果尚无明确定论。本文对 OT 在成人 ASD 治疗中的现状进行总结,包括其作用机制及研究进展,为成人 ASD 的治疗提供参考。

方法 研究使用文献检索法,检索时限为建库至 2023 年 12 月 31 日之前发表的相关实证研究。进行文献检索时,以“成人孤独症/自闭症”与“催产素”为组合,在中国知网、万方数据库进行中文文献检索;以“Autism”、“ASD”、“Adult”与“Oxytocin/OT”为组合,在 PubMed 以及 Web of science 核心数据库进行外文文献检索,排除重复、无关文献,最终获取有效实证研究英文文献 16 篇,中文 10 篇,共计 26 篇。

结果 现有研究结果提示单剂量 OT 可以改善成人 ASD 患者的社交障碍、减少重复刻板行为,连续使用 OT 对成人 ASD 患者的治疗结果存在较大的争议。ASD 患者的年龄、性别、智商、症状的严重程度,OT 的给药方式、剂量、给药频率以及治疗时间等因素都可能对药物的疗效产生影响。

结论 目前的研究结果尚未明确 OT 对成人 ASD 患者治疗的最佳剂量、给药频率、持续给药时间。因此,未来需要大量研究进一步探索并验证 OT 对成人 ASD 患者核心症状的作用及治疗机制。

结构化健康教育对青少年情绪障碍患者照顾者压力的影响研究

蒋伶俐 魏作霖 夏博呈 黄明金*

四川省精神卫生中心

目的 本研究拟在青少年情绪障碍的照顾者中,对比分析结构化健康教育相较于常规健康教育对照顾者压力的改善效果。

方法 选取 2020 年 6 月—2022 年 7 月绵阳市某三甲综合医院儿童心理卫生病区收治住院的青少年情绪障碍患者及其照顾者作为研究对象,应用随机数字表法将其分对照组和研究组。对照组采取常规日常护理及教育方案,研究组在对照组基础上采取结构化健康教育模式,共分为 4 个板块(疾病相关知识、药物作用与副反应、家庭压力的管理,日常生活指导)。分别于入院当天、出院当天、出院后 1、3、6 月对两组患者进行问卷调查,采用自行设计的

一般资料调查表采集基本信息,采用照顾者压力指数(The Caregiver Strain Index, CSI)评估干预效果。

结果 本研究共纳入 169 名照顾者,其中研究组 85 人,对照组 84 人,一般人口学资料均未见显著差异。两组患者经过干预后压力值均显著下降,研究组压力下降值较对照组明显($z = -4.011, P < 0.05$),广义估计方程(Generalized Estimating Equation, GEE)分析结果显示,两组间不存在统计学差异($P > 0.05$),但两组的 CSI 得分随时间存在下降趋势(Wald $\chi^2 = 790.347, P < 0.05$),且时间与干预之间存在显著交互效应(Wald $\chi^2 = 10.047, P < 0.05$)。

结论 结构化健康教育相较于常规健康教育方式能更好的改善青少年情绪障碍患者照顾者的压力。

关键词: 健康教育;青少年情绪障碍;照顾者

抑郁严重程度与血浆促甲状腺激素、BDNF 水平对青少年抑郁障碍患者的激越症状预测价值

赵鑫^{1,2} 郝明茹^{1,2} 刘寰忠¹

1.安徽医科大学附属巢湖医院

2.安徽医科大学精神卫生与心理科学学院

目的 探索抑郁严重程度和血浆促甲状腺激素、BDNF 水平对青少年抑郁障碍(MDD)患者的激越症状预测价值。

方法 2022 年 9 月至 2023 年 3 月入组符合《精神疾病诊断与统计手册》第 5 版(DSM-5)抑郁障碍诊断标准的患者 91 例,根据外显攻击行为量表修订版(Modified Overt Aggression Scale, MOAS)评估激越程度;24 汉密尔顿抑郁量表(HAMD24)测定抑郁严重程度;采用化学发光免疫分析(CLIA)测定血浆促甲状腺激素(TSH)水平;采用电化学发光免疫分析测定血浆脑源性神经营养因子(BDNF)。采用 SPSS 26.0 对数据进行统计分析,采用 Spearman 相关分析抑郁严重程度和血浆 TSH、BDNF 水平与激越程度的关系,多元线性回归分析青少年 MDD 患者激越程度的影响因素,二元 Logistic 回归分析青少年 MDD 患者伴发激越的危险因素,并通过受试者工作特征曲线(ROC)评估各项独立危险因素对伴发激越的预测价值。

结果 青少年 MDD 患者血浆 TSH、BDNF 水

平显著低于健康对照组($Z = -2.757, -4.019$, 均 $P < 0.05$);激越组与非激越组比较显示,激越组 HAMD24 总分($t = -4.972, P < 0.001$)显著高于非激越组,血浆 TSH 水平($Z = -3.631, P < 0.001$)、血浆 BDNF 水平($Z = -3.308, P = 0.001$)。Spearman 相关性分析显示,青少年 MDD 患者激越程度与 HAMD24 总分呈正相关($r = 0.483, P < 0.001$);与血浆 TSH、BDNF 水平呈负相关($r = -0.286, -0.293$, 均 $P < 0.05$)。多元线性回归分析显示,HAMD24 总分和血浆 BDNF 水平均是激越程度的危险因素($\beta = 0.261, -0.255$, $95\%CI = 0.037 \sim 0.390, -6.138 \sim -1.048$, 均 $P < 0.05$)。二元 Logistic 逐步回归分析显示,HAMD24 总分、血浆 TSH、BDNF 水平均是青少年 MDD 患者伴发激越症状的危险因素。ROC 曲线分析显示 HAMD24 总分(AUC=0.771, $P < 0.001$),血浆 TSH 水平(AUC=0.733, $P < 0.001$),血浆 BDNF 水平(AUC=0.712, $P = 0.001$),三项联合(AUC=0.889, $95\%CI: 0.822 \sim 0.956, P < 0.001$)的曲线下面积更大,对伴发激越症状有更好的识别预测价值。

结论 青少年 MDD 患者伴发激越症状与 HAMD24 总分和血浆 TSH、BDNF 水平紧密联系,且三项联合具有较好的预测能力。

关键词: 抑郁障碍;激越;BDNF;促甲状腺激素;青少年

儿童青少年抑郁症患者校园欺凌、心理韧性 与自杀未遂的关系

晏克文 卢瑾*

昆明医科大学第一附属医院

目的 探究儿童青少年抑郁症患者校园欺凌、心理韧性与自杀未遂的关系。

方法 从昆明医科大学第一附属医院门诊及病房招募 10-18 岁符合 DSM-5 诊断标准的抑郁症患者。通过 Beck 自杀意念量表中文版评估有无自杀未遂;中文版 Olweus 儿童欺凌问卷中受欺凌维度评估言语欺凌、间接欺凌和身体欺凌情况;青少年心理韧性量表评估心理韧性水平,并采集社会人口学信息。采用卡方检验和秩和检验对有和无自杀未遂患者进行差异性分析,并进行单因素及多因素逐步 logistics 回归分析。

结果 (1)共招募 784 名抑郁症患者,男性 224 (28.6%)人,女性 560(71.4%)人,其中 342(43.6%)人有自杀未遂,354 (45.2%)人遭受过欺凌,心理韧性总分的中位数为 81 分。(2)有和无自杀未遂患者在年龄、性别、居住地、独生子女、父母婚姻状态、受欺凌、言语欺凌、间接欺凌、身体欺凌、心理韧性总分、目标专注、积极认知及家庭支持得分方面有统计学差异(P 均 <0.05)。(3)将有统计学差异的 5 个人口学因素作为协变量,自杀未遂作为因变量,行单因素回归分析,发现自杀未遂与受欺凌和每种类型欺凌均呈正相关(OR: 1.733-2.392, P 均 <0.05),与心理韧性总分及目标专注、积极认知和家庭支持维度得分均呈负相关(OR: 0.864-0.972, P 均 <0.01)。(4)纳入有统计学差异的 5 个人口学因素及研究变量作为自变量,自杀未遂作为因变量,进一步构建 4 个逐步回归模型。模型 1 纳入三种类型欺凌,发现间接及身体欺凌和自杀未遂呈正相关(OR: 1.585-1.970, P 均=0.005);模型 2 纳入心理韧性的五个维度,发现目标专注、积极认知及家庭支持得分与自杀未遂正向关联(OR: 0.890-0.956, P 均 <0.05);模型 3 纳入受欺凌及心理韧性总分,发现自杀未遂与受欺凌存在正相关性(OR: 1.631, 95%CI: 1.028-2.201),与心理韧性总分呈负相关(OR: 1.631, 95%CI: 1.028-2.201);模型 4 纳入三种类型受欺凌及心理韧性的五个维度,发现自杀未遂与身体欺凌(OR: 2.061, 95%CI: 1.294-3.281)正向关联,与目标专注(OR: 0.896, 95%CI: 0.855-0.939)、积极认知(OR: 0.942, 95%CI: 0.893-0.995)及家庭支持(OR: 0.955, 95%CI=0.915-0.996)得分呈负相关。

结论 校园欺凌,特别是身体欺凌可能是儿童青少年抑郁患者自杀未遂的风险因素,而心理韧性,尤其是目标专注、积极认知、家庭支持方面可能是其保护因素。

关键词: 抑郁症 自杀未遂 校园欺凌 心理韧性 儿童青少年

青少年欺凌受害、抑郁症状与领悟社会支持之间的相关研究

雷昊 陶梦阳 宋景贵*
新乡医学院第二附属医院

目的 了解新乡市初中生校园欺凌的现状;探讨青少年欺凌受害、领悟社会支持、抑郁之间的关系,分析领悟社会支持在青少年欺凌受害与抑郁之间的中介作用。

方法 采用整群随机抽样的方法,在新乡市 12 所中学随机抽取 25 个班级,在取得学生及家长知情同意后,以班级为单位进行了施测。共 1400 名学生完成问卷调查,剔除无效问卷,回收有效问卷 1365 份,回收率 97.5%。被试统一填写一般情况调查问卷、青少年欺凌与网络欺凌量表中文版、领悟社会支持量表、病人健康问卷抑郁量表。使用 SPSS 25.0 对数据进行统计分析,并使用 PROCESS 插件 3.3 进行中介效应检验。

结果 在 1365 名被试中,遭受欺凌的青少年共 224 人,检出率为 16.4%,遭受身体欺凌检出率为 8.0%,言语欺凌 13.3%,关系欺凌 5.5%,网络欺凌 4.5%。不同年级的学生在欺凌受害总分、身体欺凌、关系欺凌维度上存在差异($H=14.380$, $P<0.001$; $H=8.418$, $P=0.015$; $H=10.019$, $P=0.007$)。男生在欺凌受害总分、身体欺凌、言语欺凌、关系欺凌、网络欺凌四个维度得分高于女生($Z=-2.909$, $P<0.001$; $Z=-6.825$, $P<0.001$; $Z=-4.115$, $P<0.001$; $Z=-2.193$, $P=0.004$; $Z=-2.909$, $P<0.001$)。不同主要生长地的学生在网络欺凌上存在差异($H=13.718$, $P<0.001$)。青少年欺凌受害总分及四个维度在学生是否在学校寄宿上不存在显著差异。不同成绩的学生在欺凌受害总分与身体欺凌上存在差异($H=9.903$, $P=0.007$; $H=12.152$, $P=0.019$)。青少年欺凌受害及四个维度与领悟社会支持均呈显著负相关($P<0.01$),与抑郁呈显著正相关($P<0.01$);领悟社会支持与抑郁呈显著负相关($P<0.01$)。领悟社会支持在青少年欺凌受害与抑郁之间起部分中介作用,中介效应占比为 15.25%。

结论 在 1365 名被试中,青少年欺凌受害总检出率为 16.4%,遭受身体欺凌检出率为 8.0%,言语欺凌 13.3%,关系欺凌 5.5%,网络欺凌 4.5%。年级、性别、主要生长地、成绩对青少年欺凌受害均有着显著影响。领悟社会支持在青少年欺凌受害与抑郁之间起部分中介作用,青少年欺凌受害不仅可以直接预测抑郁,还可以通过领悟社会支持间接预测抑郁。

关键词: 青少年欺凌受害;抑郁症状;领悟社会支持;中介效应

非自杀性自伤和自杀意念对抑郁障碍青少年脑白质纤维的影响研究

徐飞宇 杨楹*
山东省精神卫生中心

目的 非自杀性自伤(non-suicidal self-injury, NSSI)和自杀意念(suicidal ideation, SI)是导致青少年自杀死亡的危险因素。阐明青少年 NSSI 和 SI 的脑白质纤维束完整性改变的神经生物学特征是很有必要的,以便为今后干预并制定基于大脑的治疗方案提供信息。

方法 对 86 名抑郁障碍青少年患者和 77 名健康对照者进行临床评估来明确 NSSI 和 SI 的病史。44 名抑郁障碍青少年诊断为 NSSI 纳入 NSSI 组,40 名评估后纳入 SI 组(26 名患者重叠)。所有参与者都进行颅脑磁共振扫描,获取 DTI 数据。采用纤维束自动定量法,在三组中比较纤维束 100 个节点弥散指标的组间差异,并将节点弥散参数与临床变量进行偏相关分析。

结果 与健康对照组相比伴有 NSSI 或 SI 的抑郁障碍青少年在 38.89%(7/18)的纤维束出现了广泛的弥散指标改变。在 NSSI 组中,有 16.67%(3/18)的纤维束各弥散指标与渥太华自伤量表(Ottawa self-injury inventory, OSI)中的成瘾量表存在显著偏相关(所有 $P < 0.05$)。在 SI 组中,有 33.33%(6/18)的纤维束与贝克自杀意念(Beck suicidal ideation, BSI)量表存在显著偏相关(所有 $P < 0.05$)。

结论 伴有非自杀性自伤和自杀意念的抑郁障碍青少年脑白质纤维存在广泛的异常改变,且与更高的自伤成瘾性和自杀意念相关。

关键词: 抑郁障碍青少年;非自杀性自伤;自杀意念;弥散张量成像;纤维束自动定量

贵阳市中职学生手机成瘾现状及其影响因素分析

黄乾坤¹ 舒燕萍²
1.宜昌市精神卫生中心

2.贵州省第二人民医院

目的 了解贵阳市中职学生手机成瘾现状,分析其影响因素,为中职学生心理健康干预及手机有效管理提供科学依据。

方法 采用分层整群随机抽样的方法,于 2019 年 09 月对贵阳市两所中等职业技术学校在校 2408 名学生进行问卷调查,采用宗氏焦虑自评量表(SAS)、宗氏抑郁自评量表(SDS)、青少年心理弹性量表(RSCA)、青少年自杀意念量表(PANSI)、自我控制量表(SCS)、同伴压力量表、家庭关怀度指数问卷(APGAR)、手机依赖指数量表(MPAI)进行问卷调查。采用多因素 Logistic 回归分析手机成瘾的影响因素。

结果 贵阳市中职学生手机成瘾检出率为 19.31%,成瘾组与非成瘾组中职学生在年龄、民族、每周运动次数、SDS 评分、SAS 评分、RSCA 评分、SCS 评分、APGAR 评分、PANSI 评分、同伴压力评分差异有统计学意义($P < 0.05$)。多因素 Logistic 回归分析显示,年龄($OR = 1.097, 95\%CI: 1.026 \sim 1.172$)、SAS 评分($OR = 1.039, 95\%CI: 1.018 \sim 1.060$)、同伴压力评分($OR = 1.069, 95\%CI: 1.037 \sim 1.101$)是中职学生手机成瘾的危险因素;RSCA 评分($OR = 0.976, 95\%CI: 0.964 \sim 0.988$)、SCS 评分($OR = 0.919, 95\%CI: 0.904 \sim 0.934$)是中职学生手机成瘾的保护因素。

结论 贵阳市中职学生成瘾检出率较高,年龄、焦虑情绪、同伴压力、心理弹性、自控能力与中职学生手机成瘾相关,有必要采取更有针对性的措施以减少手机成瘾的发生,促进中职学生健康成长。

艾司西酞普兰联合短程创伤稳定化技术治疗青少年抑郁症疗效初探

汤义平* 徐佳婷 吴佳佳 汪晓静
台州市第二人民医院

目的 探索使用艾司西酞普兰联合短程创伤稳定化技术治疗青少年抑郁症患者的有效性。

方法 选取 80 例在我院心身科住院的青少年抑郁症患者,随机分为艾司西酞普兰联合短程创伤

稳定化技术组(研究组)和艾司西酞普兰联合心理健康宣讲组(对照组)。分别于入院时评定患者的青少年生活事件量表(Adolescent Self-rating Life Events Check-list, ASLEC)、事件影响量表-修订版(IES-R)、汉密顿抑郁量表(Hamilton Depression Scale-17, HAMD-17-17)、汉密顿焦虑量表(Hamilton Anxiety Scale, HAMA),治疗2周及4周时评定患者的IES-R、HAMD-17-17、HAMA。

结果 入组时两组ASLEC、IES-R、HAMD-17和HAMA评分无显著意义($P>0.05$)。研究组IES-R评分在治疗第2周较常规组有所改善($P<0.05$);在治疗第4周,研究组IES-R评分较对照组有明显改善,差异有极显著性意义($P<0.01$)、HAMD-17和HAMA评分较常规组均有所改善($P<0.05$)。

结论 艾司西酞普兰联合短程创伤稳定化技术对青少年抑郁症患者的治疗更为有效,值得进一步探索。

关键词: 创伤稳定化技术;艾司西酞普兰;青少年;抑郁症

辩证行为疗法在表现出自杀意念和自伤行为儿童中的应用研究

闫凤武*

丽水市第二人民医院

目的 探索辩证行为疗法干预表现出自杀意念和自伤行为的儿童有效性可行性和有效性。当前,对于患有情感和行为失调的儿童,尤其是表现出自杀意念和自伤行为的儿童,尚无有效的干预措施。本研究评估DBT在这一年龄段的适用性,并探讨其对儿童情绪和行为困难的影响。

方法 通过本地学校招募11名来自常规教育班级的通过学校心理筛查表现出自杀意念和自伤行为的儿童,年龄范围为8至11岁。参与者接受为期6周的DBT技能训练,每周一次,每次进行技能训练和作业回顾。训练内容包括正念、压力耐受、情绪调节和人际交往等技能的教学和实践。DBT技能训练包括使用卡通、简化的文本和活动来吸引儿童注意力,促进技能的学习。每节技能训练后,儿童会收到手册并分配家庭作业,家庭作业在下一课程中回顾。参与者的情绪和行为困难通过自我报告问卷

(包括儿童抑郁自评量表、自杀意念问卷、适应性应对策略问卷、儿童自我控制评级量表)在干预前后进行评估。

结果 技能理解和接受度:大多数儿童表示他们理解并能使用所学技能。家长也认为这些技能对儿童有帮助,且适合儿童学习。干预结束后,儿童报告适应性应对技能显著增加,抑郁症状和自杀意念显著减少,问题行为显著减少。抑郁症状:从干预前的平均13.2($SD=9.58$)减少到干预后的5.76($SD=5.03$), $t=3.91$, $p<0.05$ 。自杀意念:从干预前的平均0.87($SD=1.05$)减少到干预后的0.12($SD=0.32$), $t=2.13$, $p<0.05$ 。适应性应对技能:从干预前的平均106.55($SD=14.81$)增加到干预后的123.32($SD=20.51$), $t=2.03$, $p<0.05$ 。问题行为:从干预前的平均7.87($SD=2.81$)减少到干预后的6.86($SD=2.36$), $t=2.26$, $p<0.05$ 。

结论 本研究初步表明,适应于儿童的DBT技能训练具有可行性和接受性,且在减少儿童抑郁症状、自杀意念和问题行为方面有显著效果。然而,研究存在样本量小、无对照组和干预时间短的局限性,需要通过更大规模和长期的随机对照试验进一步验证其有效性。

一项双相情感障碍青少年患者出院后病情稳定影响因素分析

田音 袁晓菲 孟凡超 陈旭*

首都医科大学附属北京安定医院

目的 本研究旨在分析2018年1-12月份出院诊断为双相情感障碍青少年患者,出院后病情是否稳定及其影响因素,为临床治疗提供参考。

方法 本研究为单中心,利用本院电子病历系统数据,采用回顾性研究设计。例数不进行估算,拟纳入自2018年1月至2018年12月期间在北京安定医院住院并在出院时年龄 ≤ 18 岁,诊断为双相情感障碍的患者。收集这些患者性别、首发年龄、住院前发作次数、首次发病到首次诊断BPD时间、疾病发作形式、是否伴有精神病性症状、住院治疗情况、出院后1年是否病情稳定,2年内是否再住院等信息。

由两名主治医师及以上医师查阅每次就诊病历,采用 CGI-S 评分判定患者出院后 1 年病情是否稳定,定义出院后 1 年连续每次就诊情绪状态 CGI-S 评分平均分为 1 或 2 为病情稳定。使用 SPSS 26.0 统计分析软件,采用单因素分析比较组间差异;以 1 年后病情是否稳定作为结局,纳入性别、首发年龄、住院前发作次数、首次发病到首次诊断 BPD 时间、疾病发作形式、是否伴有精神病性症状、住院服用药物类型等作为自变量,使用 logistic 回归探索影响病情稳定影响因素。

结果 1)本研究共纳入共 210 人双相情感障碍青少年患者(年龄 11-18 岁, 16.3 ± 1.66);约 90%共 189 名患者在出院后进入门诊治疗流程。约 47.6%共 100 人出院后 1 年病情稳定,约 52.4%共 110 人出院后 1 年病情不稳定。约 95.2%共 200 人 2 年内未再住院,约 0.48%共 10 人 2 年内再住院。2)对出院后 1 年病情不稳定和稳定组卡方检验分析结果显示:两组在是否有自杀风险、住院是否服用抗抑郁药物、疾病发作形式方面差异有统计学意义($P < 0.05$)。有自杀意念/想法/企图 47.3% (不稳定组) VS 28% (稳定组)、无自杀意念/想法/企图 52.7% (不稳定组) VS 72% (稳定组)。服用抗抑郁药 34.5% (不稳定组) VS 16% (稳定组)、未服用抗抑郁药 65.5% (不稳定组) VS 84% (稳定组);抑郁发作 24.5% (不稳定组) VS 12% (稳定组)、躁狂发作 20.9% (不稳定组) VS 31% (稳定组)、混合发作 54.5% (不稳定组) VS 57% (稳定组)。3)进一步二元 logistic 回归分析表明,有自杀意念/想法/企图 ($P=0.013$, $OR=2.142$)、住院期间服用抗抑郁药物 ($P=0.016$, $OR=2.416$) 是出院后 1 年内患者病情不稳定的危险因素。

结论 有自杀意念/想法/企图、住院期间服用抗抑郁药物可能增加双相情感障碍青少年患者出院后 1 年内病情波动的风险。

未用药注意缺陷多动障碍儿童和青少年的功能连接异常:诊断分类和症状理解

胡樱子¹ 曾焯娴² 殷炜珍¹ 杨婵娟^{1,2} 周燕玲^{1,2}

1.广州医科大学附属脑科医院

2.广州医科大学

目的 注意缺陷多动障碍(ADHD)患病率高,鉴于其症状表现的多样性及非特异性,客观可靠的生物标志物仍需继续寻找。本研究拟探索未用药的 ADHD 儿童青少年的脑电异常,求证其在诊断分类和症状解释两方面的价值,并核验其是否能作为解释注意缺陷症状和多动/冲动症状间关联的神经电生理证据。

方法 研究纳入了 33 例未服药的 ADHD 患者及 41 例典型发育对照,采集了所有被试的静息态脑电、基本信息、SNAP-IV 量表及韦氏智力测验。选用和计算对容积传导不敏感的 iCOH 为功能连接指标。使用广义线性模型(GLM),在将年龄和智力作为协变量后比较两组差异,并通过 FDR 校正。随后使用带有递归特征消除算法的随机森林(RF-RFE)和单变量特征选择法(SelectKBest)进行特征选择,取二者交集为输入特征用以构建分类模型。使用支持向量机(SVM)构建分类模型,使用重复十折交叉验证模型性能。然后对所有被试的注意缺陷程度和多动/冲动程度分别进行线性回归,以确证分类特征在症状解释层面的价值。最后使用 PROCESS 和 Bootstrap 法检验特定特征在两大症状间的中介效应。

结果 (1) ADHD 组在 beta 频段上 Fp1-Cz、F7-Cz 及 Fp2-F4 的功能连接显著更弱,在 theta 频段上 P3-Cz、P3-C4、O1-O2、P3-P7、C3-P7、C3-P3、F3-C3 的功能连接显著更强;(2)特征选择发现 theta 频段 P3-Cz、C3-P7 以及 beta 频段 Fp1-Cz 的功能连接是重要特征,三者建模可达到 $AUC=0.89$ 的分类效能;(3) theta 频段 P3-Cz ($\beta=0.41$, 95%CI: 20.56~59.03)和 C3-P7 ($\beta=0.21$, 95%CI: 0.16~36.27)的功能连接与注意缺陷的程度有关,theta 频段 C3-P7 ($\beta=0.30$, 95%CI: 6.62~38.83)的功能连接与多动/冲动的程度有关;(4) theta 频段 C3-P7 在注意缺陷和多动/冲动间的中介效应成立(间接效应 95%CI: 0.01~0.12;直接效应 95%CI: 0.24~0.59),占比 9.71%。

结论 ADHD 在 beta 频段上额叶的功能连接较弱,而在 theta 频段的连接过强且集中在顶叶,并呈现出左侧化的倾向。theta 频段上左侧顶叶的过度连接对 ADHD 的分类和解释一致地发挥着重要作用。这提示 ADHD 可能不仅是额叶自上而下进行抑制控制的功能不良,顶叶自下而上调节环路的异常可能有着更大的价值。此外,这种过度连接还可作为 ADHD 两大症状群间的桥梁,为注意缺陷症状是前

驱、多动/冲动症状是适应和补偿这一观点提供支持。

A Multimodal Neuroimaging Meta-analysis of Functional and Structural Brain Abnormalities in Attention-deficit/hyperactivity Disorder

Chen Chao Wang Ying*

The First Affiliated Hospital of Jinan University

Objective Numerous neuroimaging studies utilizing resting-state functional imaging and voxel-based morphometry (VBM) have identified variations in distinct brain regions among individuals with attention-deficit/hyperactivity disorder (ADHD). However, the results have been inconsistent

Methods A comprehensive voxel-wise meta-analysis was performed on studies employing resting-state functional imaging and grey matter volume (GMV), examining discrepancies between individuals with ADHD and non-ADHD controls. The analysis utilized the Seed-based d Mapping with Permutation of Subject Images software

Results A systematic review of the literature identified 21 functional imaging studies (595 ADHD and 564 controls) and 50 GMV studies (1907 ADHD and 1611 controls). In general, individuals with ADHD exhibited increased resting-state functional activity in the right parahippocampal gyrus and bilateral orbito-frontal cortex (OFC), as well as decreased resting-state functional activity in the bilateral cingulate cortex (including the posterior cingulate cortex [PCC], median cingulate cortex [MCC], and anterior cingulate cortex [ACC]). The VBM meta-analysis revealed decreased GMV in the bilateral OFC, right putamen (extending to right superior temporal gyrus [STG]), left inferior frontal gyrus (IFG), right superior frontal gyrus (SFG), ACC, and precentral gyrus among individuals with ADHD

Conclusion The multimodal meta-analyses indicated that individuals with ADHD exhibit abnormalities in both function and structure in the bilateral OFC. In addition, a few regions exhibited only functional or only structural abnormalities in ADHD, such as in the limbic, prefrontal, primary sensorimotor regions

关键词：attention deficit hyperactivity disorder; meta-analysis; multimodal; voxel-based morphometry; resting-state functional imaging

Association between Gut Microbiota and Autism Spectrum Disorder: A Two-sample Mendelian Randomization Study

Yating Yang^{1,2}, Huanzhong Liu¹

1.Chaohu Hospital of Anhui Medical University

2.Huizhou Second People's Hospital

Background It is well known that there has been a focus of research on the relationship between gut microbes and autism spectrum disorders, but the relationship between gut flora and autism spectrum disorders is unclear, and this study used Mendelian randomization analysis to clarify the relationship between the two

The exposure group data are the most comprehensive and sample-sized pooled data on gut microbes in a meta-analysis of genome-wide association studies to date.

The exposure group data is the most comprehensive and extensive sample size of gut microbial data to date, and it is pooled from meta-analyses of genome-wide association studies.

Methods The exposure group data is the most comprehensive and largest sample size of gut microbial data published to date, and it is pooled from meta-analyses of genome-wide association studies. Autism spectrum disorder data from the iPSYCH-PGC consortium release, which included 18,382 people with autism spectrum disorder (ASD) and 27,969 controls. We explored the causal relationship between gut microbiota and autism spectrum disorders using various methods such as inverse variance weighting (IVW), simple

model, MR-Egger regression, weighted median, weighted model, and MRPRESSO

Results Dorea, Ruminiclostridium5, RuminococcaceaeUCG005, Ruminococcus1, Sutterella, Turicibacter. IVW results showed that Dorea (OR=0.810, 95%CI=0.685-0.958, P=0.014), Ruminiclostridium5 (OR=0.812, 95%CI=0.687-0.960, P=0.015), RuminococcaceaeUCG005 (OR=0.775, 95%CI=0.669-0.898, P=0.0006), Ruminococcus1 (OR=0.831, 95%CI=0.704-0.980, P=0.014), Sutterella (OR=0.821, 95%CI=0.684-0.987, P=0.036) were protective factors for ASD, but Turicibacter (OR=1.140, 95%CI=1.008-1.290, P=0.037) was a hazardous factor for ASD

Conclusion This study suggests a causal relationship between gut flora and autism spectrum disorders. Several gut bacteria were found to block the development of autism spectrum disorders, which lays the foundation for improving autism spectrum disorders by modulating the gut microbiota.

基于辩证行为治疗干预研究父母在儿童青少年情绪行为问题的作用

黄安琪¹ 干凯滢² 叶雨培² 钱雨欣² 李倩² 李锦卉¹ 柯晓燕^{1,2}

1. 南京大学医学院教学医院南京脑科医院儿童心理卫生研究中心

2. 南京医科大学附属脑科医院儿童心理卫生研究中心

目的 儿童和青少年的情绪和行为问题 (Emotional and behavioral problems, EBP) 是家长和社会普遍共同关注的问题, 常见表现是注意力不集中、自我伤害、情绪波动等, 严重者有自杀、自残等, 对学习、生活影响非常严重。并且 EBP 对父母来说可能是一种痛苦和创伤的经历, 并对其他家庭成员产生“连锁反应”, 普遍存在幸福感低, 社会支持低, 家庭沟通差问题。辩证行为疗法 (Dialectical behaviour therapy, DBT) 辩证行为疗法是一种多成

分的认知行为疗法, 其目标是参与治疗, 减少自伤和自杀, 并侧重于教授增强情绪调节、痛苦容忍和建立有价值生活的技能, 其第五个模块是家长教练, 即依据 DBT 的理念, 通过教授家长认可、问题解决和自身情绪管理技能。既往研究证明 DBT 在治疗严重情绪失调、减少自杀企图和自伤方面的有效性, 然而尚未有研究 ERP 父母在 DBT 干预后作用和好处。

方法 本研究采取方便抽样法, 选取 57 名 2023 年 7 月-2024 年 3 月在南京脑科医院儿童心理卫生中心就诊的儿童青少年情绪行为的父亲或母亲, 参加 DBT 方案的家长教练部分, 分两次, 通过线上方式, 持续干预 10 周, 每周 90min。干预前后分别采用抑郁-焦虑-压力自评量表、家庭功能评估量表及儿童行为检查表等进行评估, 并在干预后获得定性书面反馈。对干预前数据采用相关分析、Process 中介效应检验, 干预前后数据进行 t 检验等统计分析。

结果 根据干预前 57 名父母基本情况, 发现父母负性情绪、家庭功能、儿童行为均相关 ($r=0.26\sim 0.49$, $P<0.05$), 家庭功能在父母负性情绪与儿童异常行为之间存在部分中介作用 (间接效应值为-0.40, 占总效应的 32.35%)。共 42 名参与者 (73.81%为母亲, 26.19%为父亲) 参加了这项研究。DBT 家长教练干预后与干预前比较, 家长负性情绪总体显著降低 ($t=2.75$, $P<0.01$), 焦虑、抑郁、压力均显著下降 ($P<0.05$), 家庭功能明显改善 ($t=2.55$, $P=0.02$)。并均报告且 DBT-家长教练有帮助, 并且对他们自己和他们孩子的需要是有用的。

结论 父母情绪可直接影响儿童青少年问题, 也可通过家庭功能的中介作用影响儿童青少年问题。通过 DBT 家长教练干预后父母情绪及家庭功能得到明显改善, 展示对儿童青少年及父母的帮助, 具有较高的临床价值和社会意义。

青少年非自杀性自伤的家庭相关因素及干预策略

刘竞*

首都医科大学附属北京安定医院

目的 分析目前已发表的非自杀性自伤家庭因素及家庭治疗相关研究, 评估家庭治疗对非自杀性自伤的临床疗效。

方法 在知网、万方和维普数据库中检索非自杀性自伤相关中文文献, 在 Web of Science 集中检索相关英文文献, 进行文献回顾与综述。

结果 非自杀性自伤是多种因素相互作用的结果, 主要包括个体因素、环境因素和神经生物学因素三个方面。家庭在青少年身心发展中起着至关重要的作用, 父母养育行为本身就包含了情绪调节的社会化过程, 家庭因素对青少年的认知行为、情感表达和情绪调节等有着长期而深远的影响。

家庭因素(亲子互动、感知支持、情绪表达、虐待经历、父母冲突和父母心理健康)是与儿童和青少年自伤相关的重要危险因素。有研究表明, 家庭环境因素在诸多危险因素与青少年非自杀性自伤之间起到重要中介作用, 可通过多方面影响自伤行为的发生与发展。家庭教养方式可有效预测子女的自伤行为。父母教养方式中忽视与否定、身心虐待、过度保护、过分干涉、冷漠拒绝、严厉惩罚等, 会引起孩子强烈的负性情绪和情绪失调, 与非自杀性自伤行为呈正相关。也有研究显示, 家庭成员之间的亲密度是非自杀性自伤的保护因素, 与认知重评和表达抑制分别呈正相关和负相关。健康的家庭动力与自伤行为呈负相关。

家庭治疗是指任何明确关注和改变家庭成员之间的互动, 并寻求改善家庭功能的治疗方式。目前针对非自杀性自伤的家庭干预, 包括基于依恋的家庭治疗, 以家庭为中心的认知行为治疗, 心智化的家庭治疗和多系统家庭治疗。但目前针对非自杀性自伤的家庭干预的临床研究很少, 有效证据并不充分。

结论 家庭治疗旨在利用和调动儿童和家庭的现有优势和资源, 可能成为未来早期干预工作的重要途径。目前针对非自杀性自伤的家庭干预证据并不充分, 需要进一步开展高质量的临床研究评估其有效性。

Preadolescent Non-suicidal Self-injurious Behaviour and Its Association with Emotional

and Behavioural Problems: A Cross-sectional Study in China

Tengfen Yang Guangming Xu* Qinggang Chen Jie Li
天津市安定医院

Objective Nonsuicidal self-injury behaviour in preadolescent children implies a higher risk of suicide and a more severe clinical presentation, however, research on NSSI in this group is extremely limited. The aims of this study were to examine the prevalence of NSSI in preadolescent children and the impact of emotional and behavioural problems on NSSI

Methods The study, comprising 2006 children, was based on a survey of eight primary schools in Tianjin, China. NSSI behaviours, emotional and behavioural problems were evaluated by self-reports and parent reports. Logistic regression was used to test the effect of emotional and behavioural problems on NSSI

Results 506 (25.2%) participants reported having experienced at least once NSSI in the last 6 months. The NSSI group scored significantly higher than the non-NSSI group on emotional symptoms, conduct problems, hyperactivity, and peer relationship problems. Multivariate analysis showed a significant positive correlation between emotional and behavioural problems and NSSI in preadolescent children. Multivariate analysis showed that parents reported emotional symptoms (OR=1.164, 95%CI 1.087-1.247, $P<0.001$), conduct problems (OR=1.151, 95%CI 1.044-1.269, $P=0.005$), hyperactivity problems (OR=1.097, 95%CI 1.036-1.157, $P<0.001$) were risk factors for NSSI, student self-reported emotional symptoms (OR=1.337, 95%CI 1.252-1.428, $P<0.001$), hyperactivity problems (OR=1.174, 95%CI 1.101-1.252, $P<0.001$), peer communication problems (OR=1.145, 95%CI 1.066-1.231, $P<0.001$) were risk factors for NSSI

Conclusion This study suggests that NSSI is not uncommon in preadolescent children. Emotional and behavioural problems may enhance susceptibility to NSSI in preadolescent children

关键词: nonsuicidal self-injury, preadolescent children, emotional and behavioural problems, cross-sectional.

抑郁症青少年与健康青少年肠道菌群结构及多样性差异分析

蔡丽飞 贾福军*
广东省人民医院

目的 通过深入分析抑郁症青少年与健康志愿者肠道菌群结构与多样性的差异,揭示抑郁症青少年特有的肠道微生物特征。旨在为青少年抑郁症的预防与干预提供基于肠道微生态调控的潜在理论依据,以期在心理健康领域开辟新的治疗视角。

方法 在中国广东省招募了共计 48 名受试者,分为两组: NOR2 组包含 24 名抑郁症青少年, NOR1 组则为 24 名健康青少年。收集所有受试者的一般临床数据以及粪便样本,使用 24 项汉密尔顿抑郁量表和简明国际神经精神访问卷(MINI)进行心理测评。采用了 16S rDNA 基因测序进行微生物学分析,用组间 α 多样性指数差异描绘肠道菌群分类构成,用 LEfSe 软件对菌群相对丰度进行分析,并借助线性判别分析(LDA)方法筛选出组间差异显著的物种,采用测量统计软件分析类群间不同分类信息的丰度差异。

结果 抑郁症青少年组与健康青少年组间一般临床资料、OTU 数及 2D、3D PCA(主成分)分析差异不显著,在肠道菌群 Alpha 盒形图分析及多样性指数(包括 observed species、chao、ace、shannon 和 simpson 指数)上亦无统计学差异($P>0.05$)。通过 LEfSe 分析,抑郁症组在 β -变形菌纲、厌氧菌属、多形杆状菌_脆弱类杆菌种及拟杆菌属及其相关分类等特定菌群的相对丰度显著高于健康组,而在瘤胃球菌属、结肠杆菌科、维尔塞尔科等菌群上则显著较低($P<0.05$),其中,拟杆菌科在抑郁症组的粪便微生物群落中占据显著优势。Metastat 分析显示,两组在类、目、科、属、种等分类水平上存在差异,尤其在抑郁症组中放线菌和柔膜体纲、双歧杆菌等菌群的相对丰度较健康组显著降低($P<0.05$),而厌氧孢子杆菌、多形杆状菌等菌群的相对丰度则显著升高($P<0.05$)。

结论 抑郁症青少年与健康青少年在肠道菌群结构上存在显著差异,特别是 β -变形菌纲、厌氧菌属等有害菌群的丰度较高,而瘤胃球菌属、结肠杆

菌科等益生菌的丰度较低。本研究为青少年抑郁症的预防与干预提供了新的理论依据,更为后续开发基于益生菌的抑郁症辅助治疗策略提供了强有力的科学依据。

人工智能在孤独谱系障碍早期筛查与诊断中的研究进展

常佳 陈旭*
北京安定医院

孤独症谱系障碍(Autism Spectrum Disorder, ASD)被定义为一种由神经系统发育问题导致的广泛性的发育障碍性疾病,通常起病于婴幼儿期。其核心特征为社交交流和社会互动方面存在持续性的缺陷及受限的、重复的行为模式、兴趣或活动。在西方的流行病学研究报道中显示,ASD 的患病率逐年增加,从 2012 年的 1/69 到 2020 年的 1/36(数据均来自美国疾病控制与预防中心自闭症和发育障碍监测网络的 11 个社区,儿童年龄均为 8 岁)。而在 2014-2016 年间我国进行的第一个全国性儿童孤独谱系障碍流行病学研究中,发现我国估计的 ASD 患病率为 0.70%,相当于 143 名儿童中可能会出现 1 名 ASD 儿童。在如此巨大的疾病隐患面前,ASD 却缺乏治疗核心症状的药物,多以康复训练为主;且越早进行康复,干预效果越好。这提示了疾病早期筛查及诊断的重要性。但是家庭照顾者往往在儿童 2-3 岁才能发现较为明显的发育与行为异常并带其主动就医。此外,ASD 诊断主要依据医生及专业人员的经验,目前使用的评估方法也较为主观:耗时长、培训成本高等缺点造成了 ASD 儿童筛查诊断不及时而影响儿童其预后。截止目前,行业仍缺乏更为高效和客观的辅助筛查手段。因此,为提高 ASD 康复效果和减轻疾病负担,现亟待使大规模低龄儿童 ASD 筛查诊断成为可能。人工智能(AI)指用计算机以最少的人为干预来模拟智能行为。近年,计算机视觉技术、智能传感、语音识别、大数据分析技术已被广泛运用于医学诊断领域的研究中,并显示其特有的优势。本文对近年基于不同表征的智能化 AS 早期筛查诊断的文献进行整理归纳,并剖析现有的不足,同时希望为我国 ASD 筛查与诊断提供新思路。

青少年抑郁症患者非自杀性自伤行为及影响因素研究

郑秀秀*

丽水市第二人民医院

目的 探讨青少年抑郁症患者非自杀性自伤(NSSI)行为及影响因素。

方法 选择在丽水市第二人民医院诊治的 140 例青少年抑郁症患者为研究对象,根据患者是否存在 NSSI 行为分为 NSSI 组和对照组。采用一般情况调查表、NSSI 行为调查表、认知情绪调节量表、青少年生活事件量表及家庭亲密度和适应性量表(中文版)对青少年抑郁症患者进行调查,比较 NSSI 组和对照组患者的差异,并采用多因素 logistic 回归分析影响青少年抑郁症患者 NSSI 行为的主要因素。

结果 有 62 例(44.29%)患者出现 NSSI 行为,其中出现 1 种 NSSI 行为者 2 例(3.22%),2 种者 10 例(16.13%),3 种者 15 例(24.19%),4 种者 11 例(17.74%),5 种者 9 例(14.52%),≥6 种者 15 例(24.19%)。2 组患者的抑郁症严重程度、合并睡眠障碍差异有统计学意义(均 $P < 0.05$);多因素 logistic 回归分析结果显示,责难自己、责难他人、沉思、人际关系、受惩罚是影响青少年抑郁症患者 NSSI 行为的促发因素(均 $P < 0.05$);积极重新关注、积极重新评价、家庭亲密密度、家庭适应性则是影响青少年抑郁症患者 NSSI 行为的保护因素(均 $P < 0.05$)。

结论 青少年抑郁症患者容易发生 NSSI 行为,与认知情绪、社会关系、家庭环境等因素密切相关。

关键词: 青少年,抑郁症,非自杀性自伤行为

不同社交亚型孤独症儿童的注视模式研究

常天怡 郑毅*

首都医科大学附属北京安定医院

目的 孤独症谱系障碍 (Autism Spectrum Disorder, ASD) 是一种神经发育障碍,从生命早期起病,延续终生。全球范围内 ASD 的发病率逐年上升,已经成为亟待重视的公共卫生问题。ASD 人群往往对各种视觉刺激表现出非典型的视觉注意,已有多项眼动追踪研究发现 ASD 人群与健康人群之间存在显著的视觉注意差异,但 ASD 人群内部也存在注视模式的异质性。因此,本研究旨在使用眼动追踪技术探索不同 ASD 社交亚型的视觉注意特征。

方法 对 24-60 月龄的 ASD 和典型发育 (typical development, TD) 儿童进行眼球追踪测试。使用北京孤独症分型问卷 (Beijing Autism Subtyping Questionnaire, BASQ) 将 ASD 儿童分为主动但怪异组、被动组、冷漠组。主要观察指标为各个感兴趣区的注视时间,使用 SPSSAU 完成统计分析,首先比较四组儿童之间差异,随后比较组内不同感兴趣区的注视差异,将显著差异的眼动数据与行为学评估数据进行相关分析。

结果 研究最终纳入 TD 组 29 例;主动但怪异组 18 例,被动组 46 例,冷漠组 60 例。社交互动范式中眼睛区域的注视时间在四组间存在显著差异 ($H=16.863, p=0.001$),嘴巴区域的注视时间在四组间存在显著差异 ($H=33.606, p=0.000$)。人造面孔偏好范式中四组儿童注视人物头部的时间存在显著差异 ($H=51.237, p=0.000$),两组间比较显示三个 ASD 组注视时间都显著低于 TD 组 ($p_{\text{主动}}=0.023, p_{\text{被动}}=0.000, p_{\text{冷漠}}=0.000$); TD 组儿童注视人物图像的时间显著多于卡通图像 ($z_{\text{TD}}=-3.242, p_{\text{TD}}=0.001$),而被动组和冷漠组儿童注视人物图像的时间显著少于卡通图像 ($z_{\text{被动}}=-2.760, p_{\text{被动}}=0.006; z_{\text{冷漠}}=-3.139, p_{\text{冷漠}}=0.002$)。局限兴趣偏好范式中人物区域的注视时间在四组间差异显著 ($H=57.236, p=0.000$),两组间比较显示三个 ASD 组注视时间都显著低于 TD 组 ($p_{\text{主动}}=0.000, p_{\text{被动}}=0.000, p_{\text{冷漠}}=0.000$); TD 组儿童注视人物区域的时间显著高于物体区域 ($z=4.617, p=0.000$),而冷漠组儿童注视人物区域的时间显著低于物体区域 ($z=3.408, p=0.001$)。

结论 本研究使用眼动追踪技术,验证了不同社交亚型 ASD 儿童之间的视觉注意特点有显著差异,其中主动但怪异型儿童的眼动特征虽然最接近正常发育儿童,但仍然存在差距;而冷漠型 ASD 儿童的注视倾向与正常发育儿童差距最大。

阿斯伯格综合征诊疗现状和展望

王高华*

武汉大学人民医院

目的 本文旨在综述 AS 的诊疗现状和最新进展, 包括诊断标准、干预治疗方法和研究领域的突破。

方法 检索知网、万方、维普、Embase、MEDLINE 等数据库查阅文献, 对过往相关文献进行梳理和总结, 并对未来诊疗方向进行展望。

结果 共引用 32 篇中外文献, 对 AS 的诊疗现状进行总结, 作出展望。

结论 目前, 孤独症是导致我国儿童精神残疾的最大病种。而 AS 作为其一种不伴有智力损害和语言损害的特殊类型, 在临床上识别较为困难, 诊断标准不一, 在国内精神病学教科书中甚至都没有 Asperger 综合征的症状内容。早期诊断和治疗对 AS 儿童及成人的生活改善意义重大, 因此对其进行规范的诊疗是必要的。AS 是一种与 ASD 相关的神经发育障碍疾病, 然而, 它更侧重于协调性差和社交技能的缺陷, 而非语言和智力发展的迟缓。一些诊断问卷、测试等有助于 AS 的诊断和评估; 药物治疗对于共病的症状改善显著, 但对核心症状影响甚微, 甚至至今医护人员和治疗师们对其听觉触觉和视觉方面的脱敏工作几乎无能为力。我们仍需要更多关于 AS 的研究 (在查阅文献的过程中发现国内相关文献较少), 也希望未来人们会以更积极和鼓励的态度去对待 AS 人士, 帮助他们提高自信心。

注意缺陷与多动障碍系统式正念家庭养育云课堂医护合作的实践研究

张树林 刘川 陈然*

重庆医科大学附属大学城医院

目的 随着现代社会生活节奏的加快, ADHD

在儿童中的发病率逐渐上升, 给患儿及其家庭带来了极大的困扰, ADHD 的发生发展结局受家庭环境的显著影响。ADHD 不仅影响儿童的学习成绩和社交能力, 还可能导致家庭关系的紧张和冲突。因此, 探索有效的 ADHD 干预方法, 提高儿童的行为自我管理能力和行为自我管理能力, 减轻家庭压力, 具有重要的现实意义。

方法 系统式正念家庭养育云课堂致力于整合医护资源, 提供个性化服务, 以正念为基础, 结合家庭环境, 为 ADHD 患者及家庭提供全方位的支持。正念家庭养育强调家长在育儿过程中保持积极的心态和正确的育儿观念, 通过关注孩子的内心需求和情感变化, 建立亲密的亲子关系, 促进孩子的健康成长。家长参与度是影响 ADHD 患者恢复情况的关键因素。家长应积极参与云课堂, 学习如何有效地支持孩子的成长。同时, 医护团队也应积极引导家长参与, 提供专业的指导和支持, 确保干预措施的有效性和可持续性。从而提高儿童的注意力集中度和行为自我管理能力, 并减轻家庭压力。

首先, 通过筛选和评估确定符合条件的 ADHD 儿童及其家庭作为研究对象。然后, 为这些家庭提供系统式正念家庭养育干预, 通过云课堂的形式进行训练, 包括家长执行功能训练、儿童注意力训练, 亲子互动训练、情绪管理及行为矫正等方面。同时, 医护合作参与指导与支持工作, 确保干预措施的专业性和有效性。

结果 通过对干预前后数据的分析, 本研究发现系统式正念家庭养育与医护合作能够显著提高 ADHD 儿童的注意力集中度和行为自我管理能力。具体而言, 儿童在云课堂上的注意力集中时间明显延长, 课堂行为问题减少; 在家庭生活中, 儿童的行为更加规范, 亲子关系得到明显改善。同时, 家长的育儿压力也有所减轻, 家庭生活质量得到提高。

结论 系统式正念家庭养育云课堂结合医护合作, 为 ADHD 患者提供了更有效、全面且持续性的治疗支持。通过整合医护资源、提供个性化服务, 云课堂帮助 ADHD 患者在注意力、行为能力和情绪调节方面取得显著进步。

腺样体切除术对学龄期腺样体肥大患儿心理行为状况的效果分析

张作庆 田博*
青岛市精神卫生中心

目的 探讨腺样体切除术对腺样体肥大患儿心理行为状况的改善程度。

方法 纳入 103 例符合腺样体肥大临床诊断的学龄期儿童,其中接受腺样体切除术的 72 例儿童为研究组,接受药物保守治疗的 31 例儿童为对照组,在两种干预方法实施前 3 天内及干预后 4 周、8 周、16 周时,通过 Conner 父母症状问卷(PSQ)、儿童社交焦虑量表(SASC)、注意缺陷多动障碍评定量表(SNAP-IV)等测量工具对两组腺样体肥大患儿的心理行为状况进行分析,采用重复测量方差分析、独立样本 t 检验等统计学方法

结果 重复测量方差分析结果显示:两组 PSQ ($F=595.141, P<0.01$)、SASC ($F=595.141, P<0.01$)、SNAP-IV ($F=595.141, P<0.01$) 得分主效应差异有统计学意义;且 PSQ ($F=388.944, P<0.01$)、SASC ($F=3.986, P<0.05$)、SNAP-IV ($F=94.808, P<0.01$) 得分在测量时间*组别之间存在交互作用;对不同时点两组各量表得分差异比较显示:在进行干预后 16 周研究组 PSQ、SNAP-IV 得分较对照组明显降低,差异有统计学意义 ($P<0.01$);不同测量时间点成对比较显示:研究组 PSQ、SASC、SNAP-IV 得分在干预后 4 周、8 周、16 周与干预前比较差异均有统计学意义 ($P<0.01$);对照组 PSQ、SASC、SNAP-IV 得分在干预后 8 周、16 周与干预前比较差异均有统计学意义 ($P<0.05$)。

结论 腺样体切除术可以显著改善学龄期儿童心理行为状况;相比药物保守治疗,腺样体切除术能较短的时间内更大幅度改善学龄期儿童心理行为状况。

关键词: 心理行为状况;腺样体切除术;学龄期儿童

The Influence of Parenting Styles and Coping Strategies on Anxiety Symptoms in Adolescents: A Comparative Study of Groups with and without Non-Suicidal Self-Injury Behavior

Fang Cheng Changzhou Hu Beini Wang Lingjiang Liu*
Affiliated Kangning Hospital of Ningbo University

Objective Furthermore, parenting styles and the coping strategies of adolescents are directly or indirectly related to an individual's level of anxiety and the occurrence of NSSI. Examining these multivariate interactions is essential to understanding and intervening in NSSI behaviors

Methods This cross-sectional survey collected data from both NSSI-diagnosed patients at Ningbo Kangning Hospital and healthy adolescents in urban schools, including background information, parenting styles, coping strategies, and levels of anxiety. The data were analyzed using independent sample t-tests, multivariate analysis of variance (MANOVA), and regression analysis including main effects and interactions with NSSI

Results The results of the single-factor analysis showed that the NSSI group of adolescents scored significantly higher than the non-NSSI group ($p < 0.001$) on measures of generalized anxiety, somatization/panic, social phobia, and school phobia. The NSSI group of adolescents perceived less emotional warmth and understanding from their fathers and experienced more punishment and interference ($p < 0.001$). They were more inclined to use emotion-oriented coping strategies, while the non-NSSI group tended to use problem-oriented strategies ($p < 0.001$). Further multivariate analysis of variance (MANOVA) and regression analysis showed significant impacts of NSSI behavior, parenting style, and adolescent coping strategies on anxiety levels

Conclusion This study found that the anxiety levels of NSSI adolescents were significantly higher than those of non-NSSI adolescents, which was closely related to less emotional warmth from parents, more punishment and interference, and emotion-focused coping strategies. The results demonstrate that family environment and coping strategies play a critical role in NSSI behavior and anxiety levels, highlighting the importance of emphasizing emotional support and positive coping strategies in the prevention and intervention of NSSI behavior

青少年抑郁障碍与社会支持及童年心理创伤的相关性

王清泉¹ 王飞燕² 杨洪艳¹ 吴家静¹

1.遵义医科大学护理学院

2.成都市第四人民医院情绪障碍中心

目的 抑郁障碍 (Major depressive disorder, MDD) 是一种常见精神障碍, 其主要临床表现为显著和持续的情绪低落, 兴趣丧失和精力减退。社会支持会影响个体对负性事件的应对方式, 尤其是青少年抑郁障碍患者往往缺乏有效的社会支持, 同时, 童年期创伤是预测青少年是否具有良好的社会支持的重要因素。因此, 本研究旨在探讨青少年抑郁障碍与社会支持及童年心理创伤的相关性, 为促进青少年心理健康发展提供一定的理论依据。

方法 本研究采用便利抽样法, 选取于 2024 年 1-3 月首次在成都市第四人民医院就诊的 33 例青少年抑郁症患者作为研究对象, 采用一般情况调查表、宗氏抑郁自评量表 (Self-rating Depression Scale, SDS)、童年创伤问卷 (Childhood Trauma Questionnaire, CTQ)、社会支持评定量表 (Social Support Rate Scale, SSRS) 进行问卷调查。采用 SPSS 27.0 统计软件进行数据处理, 采用单因素分析、相关分析和回归分析等方法进行分析。以上所有分析均采用双尾检验, 显著性水平 $P < 0.05$, 则认为结果有统计学意义。

结果 (1) 在青少年抑郁障碍患者中, 情感虐待的发生率为 63.6%, 躯体虐待为 42.4%, 性虐待为 12.1%, 情感忽视为 33.3%, 躯体忽视为 63.6%。

(2) 抑郁与童年创伤呈正相关 ($r=0.358, P < 0.05$); 社会支持与抑郁、童年创伤呈负相关 (r 值分别为 -1.191、-2.231, 均 $P < 0.05$); 童年创伤与社会支持呈负相关 ($r=-2.31, P < 0.05$)。

(3) Logistic 回归分析结果显示, 有童年期创伤性经历, 尤其是经历过较严重的情感虐待和躯体忽视 ($P < 0.05$), 是青少年抑郁患者抑郁发作的危险因素。

结论 (1) 童年创伤经历作为早期应激, 是导

致青少年抑郁障碍发生的重要危险因素。童年期创伤经历总分及躯体虐待、躯体忽视、情感虐待、情感忽视四个创伤因子对青少年抑郁症的主效应显著, 可显著正向预测青少年抑郁症的发生风险。性虐待创伤因子对青少年抑郁症的主效应不显著。

(2) 青少年抑郁障碍患者往往伴有童年创伤经历, 不愉快的童年生活事件可能是青少年抑郁发作的一个危险因素。社会支持与抑郁、童年创伤呈负相关, 有效的社会支持系统有助于降低青少年抑郁障碍的发病率, 减少童年时期不愉快的事件发生率。

(3) 经历过严重的情感虐待和躯体忽视的中重度童年创伤者比无童年创伤经历者, SDS 评分更高, 抑郁程度更重。这表明, 情感虐待和躯体忽视可能是青少年抑郁障碍发病的危险因素。

关键词: 抑郁障碍; 青少年; 社会支持; 童年创伤

注意缺陷多动障碍患儿临床表现及智能水平的相关性

林裕雄 江文庆* 李焱 闫文洁 翟天好
上海市精神卫生中心

目的 通过 SNAP-IV 量表、Conners 量表及韦氏儿童智力测验第四版 (WISC-IV), 探索注意缺陷多动障碍 (ADHD) 患儿的临床表现及其智能水平的相关性。

方法 1. 对符合 DSM-5 中 ADHD 诊断标准的 6-16 岁患儿 ($n=305$) 采集性别、年龄、生长发育情况等一般人口学资料, 使用 SNAP-IV 量表、PSQ 量表采集患儿的行为学数据, 生成症状 (注意缺陷、多动冲动、对立违抗 3 个维度) 和社会功能 (品行问题、学习问题、心身障碍、多动-冲动、焦虑、多动指数 6 个维度) 分数。

2. 对所有 ADHD 使用韦氏儿童智力量表-第四版 (WISC-IV) 进行智力测验评估其认知水平, 生成总智商和言语理解、知觉推理、工作记忆、加工速度、一般能力、认知效率 6 个指数。

3. 对 ADHD 患儿的症状、社会功能及智力水平进行相关性分析。

结果 1. ADHD 患儿症状与智力水平的相关性 ADHD 患儿的注意缺陷症状与言语理解 ($P <$

0.001)、知觉推理($P=0.006$)、工作记忆($P<0.001$)、一般能力($P<0.001$)、认知效率($P=0.010$)、总智商($P<0.001$)呈负相关;多动冲动症状与知觉推理($P=0.036$)呈正相关。

2. ADHD 患儿社会功能与智力水平的相关性

ADHD 患儿的品行问题与加工速度($P=0.045$)呈正相关;学习问题与言语理解($P<0.001$)、知觉推理($P=0.001$)、工作记忆($P<0.001$)、一般能力($P<0.001$)、认知效率($P<0.001$)、总智商($P<0.001$)呈负相关;焦虑与言语理解($P=0.036$)、一般能力($P=0.033$)呈负相关;多动指数与工作记忆($P=0.030$)呈负相关。

结论 1. ADHD 患儿的症状与智力水平存在相关性,具体而言,总智商及智力的各维度(除加工速度外)指数越低,注意缺陷症状越严重;知觉推理能力越高,多动冲动症状越严重。

2. ADHD 患儿的社会功能与智力水平存在相关性,具体而言,总智商及智力的各维度(除加工速度外)指数越低,学习问题越严重;言语理解及一般能力越低,焦虑水平越高;工作记忆能力越低,多动水平越高;加工速度指数越高,品行问题越严重

关键词:注意缺陷多动障碍,临床表现,智能水平

幼儿儿童人格发展评定相关研究进展

闫秀萍 何凡 郑毅*

首都医科大学附属北京安定医院

人格特征被视为心理个性的基石和基本单位。性格特征指的是广泛的人格内部维度,被认为可以解释在不同情况下观察到的行为、思想和感觉的总体一致性。从性格的因素分析研究中反复得出的五大因素被视为它的五大特征:外向性、神经质、开放性、宜人性和尽责性。

气质是人格特质发展的“早期生活框架”。然而,追踪这种发展是当今人格科学面临的巨大挑战之一。越来越多的研究人员和理论家试图将最完善的气质维度排列起来,主要基于母亲的评分和实验室观察,并将自我报告的成人人格特征纳入五大人格特征和相关分类(Hampson et al 2007, Shiner 2006)。

在人格特征的发展过程中,基因与环境在多个层面上以复杂的方式相互作用。研究表明后天环境

和养育方式对性格的发展产生了重大影响。因此在幼儿或儿童早期气质人格的评估和测评具有重要意义,可以帮助父母在养育过程中及时发现问题,调整养育方式,以帮助儿童在人格发展过程中给与合理的引导和积极的支持。

儿童的个性特征(通常被视为气质的各个方面)通常通过父母报告或实验室观察来评估。John、Caspi、Robins、Moffitt(1994)在青少年中发现了一个与成人大五人格(即“小五人格”)相对应的五因素结构。研究表明人格的五因素模型可以用于儿童和成人的评估。对于幼儿及学龄前的儿童 Putnam(2006)有两个幼儿量表对应不同年龄 9-12 个月及 20-24 个月。

关于儿童气质类评定量表目前有: Carey 儿童气质的系列评估问卷,20 世纪七八十年代由 Carey 和 McDevitt 等依据 Thomas 和 Chess 的儿童气质理论陆续发展起来,根据年龄段分别形成了小婴儿、婴儿、幼儿、学龄前、学龄儿 5 个不同年龄阶段的量表。1996 年西安交大姚凯南教授将其引入中国,形成了中国儿童气质量表,根据年龄段分别形成了婴儿、幼儿、学龄前、学龄儿 4 个不同年龄阶段的量表。

关于儿童青少年个性类评定量表目前主要有:中国儿童创造性人格倾向量表(2018 年程淮、程南华等编制)、幼儿人格发展趋向评定量表(2002 年由陈学诗、郑毅等编制)及艾森克个性问卷(于 1985 年引入中国)。

因此,近 20 年国内关于幼儿儿童气质性格类的评定方法相关研究较少,尚待进一步研究开发。本文将针对以上既往的测评方法做深入的综述和分析,为以后的研究发现新的方向。

The Relationship between Pain Perception, Emotional Status and Empathy in Non-suicidal Self-harm Adolescents

Siyu Tong¹, Ke Zhao^{1,2}, Lijun Wang²

1.丽水市第二人民医院

2.温州医科大学

Objective The impact of emotional distress and physical pain perception on non-suicidal NSSI patients

is crucial in understanding their behavior. Empathy can activate the individual's perception of emotions and pain. This suggests that understanding the relationship between emotion and somatic perception, and the two through empathy, may be an entry point to help us explore the relationship between empathy and tactile perception in non-suicidal NSSI patients. Hence, this research will explore the connection among empathy, emotions, and pain perception, as well as examining their commonalities and distinctions

Methods This study recruited 66 non-suicidal NSSI adolescents aged 12-19 years in Zhejiang province between May and November 2023, China, to participate in tactile pain assessment, pain/emotional empathy experiment, and psychological questionnaires to assess tactile pain perception, pain/emotional empathy ability, and emotional characteristics

Results Depression, anxiety, alexithymia, and pain empathy of NSSI adolescents were mostly reflected in the speed of empathy response. In terms of the degree of empathy and response speed of NSSI adolescents, pain perception was significantly associated with pain empathy. Touch perception was more significantly correlated with emotional empathy. Touch threshold and depression, anxiety, and alexithymia were significantly related. However, pain perception was not significantly associated with depression, anxiety, and alexithymia

Conclusion This study discusses the relationship between empathy and emotion, pain perception and unique patterns in non-suicidal NSSI patients

关键词: Non-suicidal self-injury, Emotional Empathy, Pain Empathy, Pain Sensitivity, Emotional Status

注意缺陷多动障碍儿童父母情绪调节和儿童情绪调节的相关性

刘若楠*

新疆维吾尔自治区人民医院

目的 探讨注意缺陷多动障碍 (ADHD) 儿童父母的情绪调节特点及其对 ADHD 儿童情绪调节的影响。

方法 纳入 140 例符合美国精神障碍诊断与统计手册第四版 (DSM-IV) ADHD 诊断标准的儿童及其父母之一, 68 例正常儿童及其父母之一。采用情绪调节困难量表 (DERS)、情绪调节问卷 (ERQ) 和儿童情绪调节量表 (ERC) 对父母和儿童情绪调节分别进行评估。

结果 ADHD 儿童父母 DERS 的策略使用、冲动控制和目标行为得分较正常对照组高 (均 $P < 0.05$)。ADHD 儿童 ERC 情绪不稳得分与父母的策略使用和冲动控制得分正相关, ERC 儿童情绪调节得分与父母的策略使用、冲动控制和目标行为得分负相关 (均 $P < 0.01$)。ERC 儿童情绪调节得分在父母策略使用、冲动控制得分与儿童情绪不稳得分之间存在部分中介效应。

结论 本研究是对 ADHD 儿童父母情绪调节特征及其与 ADHD 儿童情绪调节关系的首次探索, 研究发现 ADHD 儿童父母在策略使用、冲动控制、目标行为等方面存在调节困难, 且影响 ADHD 儿童的情绪调节和情绪不稳。研究结果有望为未来 ADHD 儿童情绪的干预策略提供一定的方向, 即可以针对父母存在缺陷的情绪调节维度进行干预, 进而提高 ADHD 儿童的情绪调节技能及相关表现。本研究存在一定的不足: 除了当前采用的情绪调节困难量表, 未来可以尝试纳入不同的评估工具对父母情绪调节能力进行更为全面的评估, 例如情绪社会化量表等; 对父母精神疾病的评估采用自我报告的方式, 缺少严格的诊断评估, 在一定程度上无法完全排除父母自身精神疾病的影响, 未来可以通过对父母进行临床诊断访谈及症状评估以进一步验证本研究的结论; 对于儿童情绪评估为他评量表, 未来可以尝试纳入儿童情绪自评量表进一步评定儿童情绪, 多角度刻画儿童情绪调节的 ADHD 儿童父母存在多个维度的情绪调节缺陷, 可对 ADHD 儿童情绪调节产生影响而加重情绪不稳表现。

儿童青少年甲状腺结节与情绪障碍的研究进展

梁鑫浩*

山东省精神卫生中心

Peking University Sixth Hospital

目的 本文回顾甲状腺结节与儿童青少年情绪障碍之间的关系。文章还将回顾可能影响这种关系的相关因素因素。

方法 综述相关文献。

结果 甲状腺结节 (thyroid nodule) 是甲状腺细胞在局部异常生长所引起的散在病变, 是内分泌系统多发病和常见病。一般人群中通过触诊的检出率为 3%~7%。高分辨率超声检查获得的甲状腺结节患病率为 20%~76%, 儿童甲状腺实性结节的患病率为 1%~1.7%, 20%~57% 的儿童因各种适应症而接受颈部超声检查时会出现甲状腺异常, 包括结节或囊性病变。下丘脑-垂体-甲状腺轴已确立为应激反应神经内分泌系统之一, 焦虑和抑郁等持续不良情绪可能导致躯体疾病。有研究表明, 甲状腺结节与负性情绪存在共病概率, 二者互相影响。近年来有学者提出负面情绪可能是甲状腺结节发生的危险因素之一。也有学者将负性情绪作为甲状腺癌发生的独立危险因素, 认为压力和应激引起大脑皮质和下丘脑发生变化, 直接或间接削弱免疫系统, 导致恶性结节发生率增高。早期的研究表明, 年龄和性别是引发甲状腺结节的最主要危险因素, 女性本身具有感情细腻, 情绪不稳定等特点, 以及青少年青春期激素水平不稳定, 导致内分泌更易发生紊乱。同时也有研究认为, 现代社会竞争压力大, 儿童青少年承受着高学业压力和高敏感人际关系, 易引发精神焦虑等不良情绪, 而精神刺激会影响机体免疫反应异常, 诱导甲状腺细胞增生。儿童青少年甲状腺结节与其情绪问题的评估和治疗需要多学科团队方法和具有该领域经验的专家的参与。

结论 本综述仅针对甲状腺结节与儿童青少年情绪问题之间相关因素进行综述, 为将来甲状腺结节与儿童青少年情绪问题的研究提供新思路。

Working Memory and Its Brain Imaging Mechanism in Adults ADHD Co-morbid with Major Depressive Disorder

Qingjuan Lai Qiuqin Qian*

Objective Attention-Deficit/Hyperactivity Disorder (ADHD) and Major Depressive Disorder (MDD) both exhibit working memory (WM) impairments and frequently co-occur. However, the impact of comorbid MDD on WM in ADHD patients and the underlying mechanisms remains unclear and needs further investigation. Therefore, this study aims to explore the characteristics of WM and the underlying neuroimaging mechanisms in adults with ADHD comorbid with MDD.

Methods The study included 412 adult participants, comprising 125 ADHD patients with co-morbid MDD (ADHD+MDD), 148 ADHD patients without comorbid MDD (ADHD-MDD), and 139 healthy controls (HC). Among them, 63 ADHD+MDD, 83 ADHD-MDD, and 120 HC completed resting-state fMRI scans

ANCOVA explored differences in the Working Memory (WM) subscale of the Behavior Rating Inventory of Executive Function-Adult Version, and the Self-Rating Depression Scale (SDS) scores among the three groups. Partial correlation analyses examined relationship between WM and SDS scores in ADHD patients, and hierarchical regression analysis was performed on WM.

Functional connectivity (FC) analysis using the left/right dorsolateral prefrontal cortex (DLPFC) as the region of interest (ROI) was conducted. First, the correlation between FC and WM in ADHD and HC groups was analyzed separately (Gaussian Random Field (GRF) correction: voxel-level $P < 0.001$, cluster-level $P < 0.05$, two-sided test). Then, partial correlation analysis explored the relationship between WM-related FC and SDS/co-morbid MDD. Finally, a mediation analysis tested a potential 'SDS/co-morbid MDD→FC→WM' relationship.

Results For WM impairment, the ADHD+MDD group was significantly more severe than ADHD-MDD ($P = 0.027$), and the ADHD-MDD group was significantly more severe than HC ($P < 0.001$). SDS scores were positively correlated with the WM subscale scores ($r = 0.649$, $P < 0.001$), and explained 10.2% of the variance in WM ($P < 0.001$)

In ADHD patients, WM-related FC was identified

between the left DLPFC and the right supramarginal gyrus (FC[DLPFC/L - SMG/R]), which was significantly associated with co-morbid MDD ($r=-0.174$, $P=0.037$), but not with SDS scores ($r=0.126$, $P=0.134$). Mediation analysis showed FC[DLPFC/L - SMG/R] partially mediated the relationship between co-morbid MDD and WM. In HC, WM-related FC was found between the left DLPFC and the left superior frontal gyrus (FC[DLPFC/L - SFG/L]), but this FC was not significantly associated with SDS scores ($r=0.05$, $P=0.594$).

Conclusion MDD in adult ADHD patients aggravated WM impairment, which may be related to FC[DLPFC/L - SMG/R]. This study revealed the role of DLPFC in ADHD comorbidity with MDD, providing a scientific basis for a deeper understanding of the pathogenesis and brain biomarkers of ADHD comorbidity with MDD

Associations between Suicidal Ideation and Clinical Features As Well As Inflammatory Cytokines in Adolescents with Major Depressive Disorder

Lewei Liu Xin Zhao Xi Zhang Yinghan Tian Cheng Yang Mingru Hao Haojie Fan Lei Xia Huanzhong Liu*
Chaohu Hospital of Anhui Medical University

Objective Suicidal ideation is often associated with increased levels of inflammatory biomarkers. However, such associations have not been adequately explored in adolescents with major depressive disorder (MDD). This study aimed to examine the associations between suicidal ideation with clinical features as well as inflammatory cytokines in adolescents with MDD

Methods From January to December 2021, this study included 156 adolescents with MDD. The Positive and Negative Suicidal Ideation Scale (PANSI), the Center for Epidemiological Studies Depression Scale (CES-D), the Childhood Trauma Questionnaire (CTQ) and the Insomnia Severity Index Scale (ISI) were used to assess

suicidal ideation, depressive, childhood trauma and insomnia symptoms, respectively. Also, plasma levels of interleukin (IL)-1 β , IL-6, IL-10, IL-17A and tumor necrosis factor- α (TNF- α) were measured

Results Correlation analyses showed that PANSI score was negatively correlated with age and age at onset, and positively correlated with duration of illness, CES-D score, CTQ score, ISI score as well as levels of IL-1 β , IL-6 and TNF- α in adolescents with MDD (all $p < 0.05$). A further multivariate stepwise linear regression analysis showed that PANSI score was independently associated with age at onset ($\beta = -0.118$, $t = -2.496$, $p = 0.014$), CES-D score ($\beta = 0.614$, $t = 11.627$, $p < 0.001$), CTQ score ($\beta = 0.238$, $t = 4.539$, $p < 0.001$) and IL-1 β levels ($\beta = 0.143$, $t = 3.111$, $p = 0.002$)

Conclusion Suicidal ideation is associated with depressive, childhood trauma and insomnia symptoms as well as elevated levels of inflammatory cytokines in adolescents with MDD. The findings suggest that inflammatory cytokines may relate to the pathogenesis of suicidal ideation in adolescents with MDD, but further longitudinal studies are needed to explore the causal association between suicidal ideation and inflammatory cytokines in MDD

抑郁青少年非自杀性自伤行为的相关因素中介分析

周琳琦¹ 谢健²

1. 杭州市临平区第一人民医院

2. 杭州市第一人民医院

目的 既往研究表明, 近期压力生活事件与青少年非自杀性自伤(Non-suicidal self-injury, NSSI)之间存在强烈的关联。内化症状和情绪调节困难(Difficulty in emotion regulation, DER)可能介导近期压力生活事件与NSSI行为之间的关联。因此, 本研究旨在评估近期压力生活事件与青少年NSSI严重程度之间的关系, 以及内化症状和DER在两者之

间的潜在中介作用。

方法 共有 224 名重度抑郁障碍 (major depressive disorder, MDD) 青少年住院患者 (78.60% 为女性) 参与了这项研究, 年龄范围为 12-18 岁 ($M=15.30$, $SD=1.83$)。采用临床医生评定问卷收集了青少年近期压力生活事件、内化症状、DER 和 NSSI 行为的相关数据。构建结构方程模型对假设的模型进行了检验。

结果 在过去的 12 个月内, MDD 青少年 NSSI 报告率为 65.20%。近期压力生活事件被发现与 NSSI 严重程度直接相关 ($\beta=0.128$, $P=0.023$), 而内化症状在两者之间起显著的中介作用 ($\beta=0.076$, $P=0.023$)。同时, 还证实了近期压力生活事件和 NSSI 之间存在链式中介效应 ($\beta=0.034$, $P=0.023$), DER 和内化症状发挥链式中介作用, DER 通过内化症状与 NSSI 有显著的间接联系。这些发现为近期压力生活事件与 MDD 青少年 NSSI 行为之间的联系提供了更深一步的理解。我们讨论了针对近期压力生活事件、DER 和内化症状的干预措施对防治青少年 NSSI 行为的影响。

结论 近期压力生活事件似乎在青少年 NSSI 行为的病因中发挥了作用, 特别是受惩罚和人际关系事件值得被特别关注。DER 和内化症状在近期压力生活事件与 NSSI 之间起链式中介作用。青少年 NSSI 的干预应侧重于个人素质与压力来源两个方面。减少近期压力生活事件、筛查内化症状、提高情绪调节能力可能会降低青少年的 NSSI 行为。

儿童注意缺陷多动障碍及其不同亚型与情绪失调的关系

殷炜珍¹ 余萌² 漆姗姗¹ 洪丹萍¹ 杨婵娟¹

1. 广州医科大学附属脑科医院

2. 南方医科大学

目的 探究情绪失调与儿童注意缺陷/多动障碍 (ADHD) 及其不同亚型的特异性关系。

方法 纳入 47 名确诊且无共病的 6-12 岁 ADHD 儿童和 50 名典型发育 (TD) 儿童。采用自编问卷收集人口学信息、中文版 ADHD 斯诺佩评

估量表第 4 版 (SNAP-IV) 父母版进行评定 ADHD 亚型、情绪调节核量表 (ERC) 测量情绪消极/易变性维度, 情绪调节量表 (ERQ) 测量认知重评维度, 人际反应量表 (IRI) 测量认知同理心维度和单一面孔识别实验测量情绪识别能力。运用独立样本 t 检验, 多因素协方差和逻辑回归分析进行统计学分析。

结果 ① ADHD 组的情绪识别能力得分、EDQ 的认知重评维度得分和 IRI 的认知同理心维度得分均显著低于 TD 组 ($t=-2.849$ 、 -3.779 、 -5.244 , p 均 <0.01), 而 ERC 的情绪消极/易变性维度得分则显著高于 TD 组 ($t=4.928$, $p<0.001$)。② 在控制智商、年龄和性别情况下, ADHD 注意缺陷型组、ADHD 混合型组和 TD 之间在情绪识别能力 ($F(2, 82)=3.4$, $p<0.001$)、EDQ 的认知重评维度得分 ($F(2, 82)=7.37$, $p<0.001$)、IRI 的认知同理心维度得分 ($F(2, 82)=16.73$, $p<0.001$) 和 ERC 的情绪消极/易变性维度得分 ($F(2, 82)=19.56$, $p<0.001$) 上均存在显著差异。③ 逻辑回归分析结果进一步显示, 在控制智商、年龄和性别情况下, ERC 的情绪消极/易变性维度对 ADHD 混合型组的影响具有统计学意义 ($OR=5.68$, $CI=1.73-281.79$, $p<0.05$), 但对 ADHD 注意缺陷型组的影响不具有统计学意义 ($OR=4.6$, $CI=0.52-40.50$, $p>0.05$)。

结论 ADHD 儿童存在明显的情绪失调特征, 其中, 情绪消极/易变性是最突出的情绪失调问题, 且与 ADHD 混合型的关系较为密切。这提示, 在对 ADHD 儿童的临床评估和干预中, 应重视情绪失调, 重点为混合型的 ADHD 儿童提供情绪调节训练。

Network Analysis of Tourette Syndrome and Attention-deficit/hyperactivity Disorder Symptoms in Children and Adolescents

张文炎 崔永华*

首都医科大学附属北京儿童医院

Objective While Tourette syndrome (TS) and attention-deficit/hyperactivity disorder (ADHD) often co-occur, the nature of the relationship between their symp-

toms is not well understood. Network analysis of psychopathology allow for detailed examinations of symptom interactions, providing an effective approach to explore the patterns of comorbidity between TS and ADHD symptoms.

Methods This study included 3,958 participants (male/female = 3,004/954, age mean \pm SD = 8.60 \pm 2.25 years). We collected data on TS symptoms using the Motor Tic, Obsessions and Compulsions, Vocal Tic Evaluation Survey (MOVES), and ADHD symptoms using the Swanson, Nolan, and Pelham Rating Scale-IV (SNAP-IV). Network analysis was employed to construct a combined network of TS and ADHD symptoms at the symptom level. We utilized the expected influence (EI) and bridge EI metrics to explore the core and bridge symptoms within the network.

Results The network structure demonstrated a moderate number of non-zero connections between TS and ADHD symptoms, constituting 23.06% of all potential connections. Core symptoms in the comorbidity network included "Often has difficulty sustaining attention in tasks or play activities," "Certain bad words or thoughts keep going through my mind," and "Words come out that I can't stop or control." Bridging symptoms identified were "Words come out that I can't stop or control," "I do certain things like jumping or clapping over and over," "I can't control all my movements," and "Often talks excessively."

Conclusion The core and bridging symptoms identified in this study serve as potential therapeutic targets for the treatment of TS and ADHD comorbidity in clinical children and adolescents

青少年抑郁障碍患者自杀意念与童年创伤的关系: 抑郁症状和维生素 D 的双中介作用

赵丽丽¹ 刘乐伟² 耿峰³ 莫大明⁴ 刘宸忠²

1.安徽医科大学精神卫生与心理科学学院

2.安徽医科大学附属巢湖医院精神科

3.安徽医科大学第二附属医院心理与睡眠医学科

4.安徽省合肥市第四人民医院儿少心理科

目的 探讨青少年抑郁障碍患者自杀意念与童年创伤、抑郁症状及维生素 D 的关系, 并分析潜在的中介作用。

方法 2021 年 1 月至 12 月, 纳入 168 例青少年抑郁障碍患者和 89 例健康青少年。采用儿童期虐待问卷 (CTQ)、流调抑郁量表 (CES-D)、自杀意念量表 (PANSI) 评估童年创伤、抑郁症状和自杀意念, 同时检测血浆 25-羟维生素 D [25 (OH) D] 水平。采用 SPSS 23.0 进行统计分析, 使用 Pearson 或 Spearman 相关分析检验 PANSI 总分与其他因素的相关性, 并通过 PROCESS 宏程序分析抑郁和 25 (OH) D 在童年创伤与自杀意念之间的中介作用。

结果 与健康对照相比, 青少年抑郁障碍患者的自杀意念和各类型童年创伤水平均更高 (均 $P < 0.001$), 而血浆 25 (OH) D 水平更低 ($P < 0.001$)。相关分析显示, 青少年抑郁障碍患者自杀意念与童年创伤、抑郁以及 25 (OH) D 水平均存在显著相关性 (均 $P < 0.05$)。此外, 中介分析显示, 抑郁症状和维生素 D 在 CTQ 总分及情感虐待和情感忽视与自杀意念之间发挥部分中介效应, 间接效应值分别为 0.280 (95% CI [0.161~0.407]) 和 0.024 (95% CI [0.003~0.054]); 0.634 (95% CI [0.295~0.987]) 和 0.070 (95% CI [0.008~0.151]); (95% CI [0.306~0.941]) 和 0.051 (95% CI [0.003~0.120])。同时, 抑郁症状和维生素 D 在躯体忽视与自杀意念之间发挥完全中介效应, 间接效应值分别为 1.034 (95% CI [0.629~1.496]) 和 0.087 (95% CI [0.012~0.203])。

结论 青少年抑郁障碍患者的抑郁症状和维生素 D 水平是童年创伤导致自杀意念的潜在机制。临床中应对合并童年创伤的青少年抑郁障碍患者积极开展心理健康教育或提高其维生素 D 水平, 以减少自杀意念的发生, 提高临床预后。

心理治疗联合药物治疗对青少年抑郁患者抑郁情绪、睡眠障碍、认知功能的治疗效果研究

陈波* 苏娟

日照市精神卫生中心

目的 本文通过研究心理治疗联合药物治疗对青少年抑郁患者抑郁情绪、睡眠障碍、认知功能的治疗效果,探讨抑郁情绪、睡眠障碍、认知功能的相关性。为该疾病的临床治疗提供参考依据。

方法 本次研究选取我院从2019年9月至2023年9月期间收治的12-18岁青少年抑郁症患者150例为研究对象,将其随机分成研究组和对照组各75例,对照组患者采用药物治疗方式进行临床治疗,观察组则在对照组基础上联合心理治疗进行。通过研究观察患者在治疗前后的焦虑自评量表(SAS)、抑郁自评量表(SDS)、汉密尔顿抑郁量表(HAMD-17)、汉密尔顿焦虑量表(HAMA)、睡眠状况自评量表(SRSS)、匹兹堡睡眠质量指数(PSQI)以及中文精神分裂症认知功能成套测验(MCCB)中7个认知领域的认知功能,并比较7个认知领域得分和总得分。

结果 (1)两组患者在治疗前的SAS、SDS、HAMD-1、HAMA、SRSS、PSQI评分比较无显著差异($P>0.05$),经过相应的治疗后均较治疗前有显著的改善,且观察组患者治疗后的SAS、SDS评分由于对照组($P<0.05$)。(2)两组患者经过治疗在信息处理速度、注意/警觉性、工作记忆、词语学习、推理和问题解决能力、社会认知、视觉学习、总分等方面均具有显著差异($P<0.05$)。

结论 心理治疗联合药物治疗可以显著改善青少年抑郁患者抑郁情绪、睡眠障碍、认知功能,探讨抑郁情绪、睡眠障碍、认知功能。值得临床推广使用。

正念疗法干预在青少年创伤后应激障碍的临床护理价值分析

黄丹*

赣州市第三人民医院

目的 分析正念疗法干预对青少年创伤后应激障碍效果方法

方法 纳入2020年10月-2023年10月70例

青少年创伤后应激障碍患者。常规护理干预组(35例):普通护理。正念疗法干预组(35例):正念疗法干预。比较遵医嘱依从性优良率、焦虑(HAMA)、抑郁(HAMD)、斯坦福急性应激反应问卷(HAMARQ)评分、不良事件发生率、临床护理满意率。

结果 正念疗法干预组的遵医嘱依从性优良率更高, $p<0.05$ 。护理4周后,正念疗法干预组的HAMA、HAMD评分、HAMARQ评分、不良事件发生率,均低于常规护理干预组, $p<0.05$ 。护理4周后,正念疗法干预组的临床护理满意率,均更高, $p<0.05$

结论 正念疗法干预青少年创伤后应激障碍患者,更具有优势。这是因为,实施正念疗法干预模式下,成立小组,根据患者的具体情况,方便制定符合患者实际的正念疗法干预对策,同时以小组化模式开展,利于定期评估和监管患者病情。实施成立微信群策略,利用现代互联网技术,帮助患者有效掌握正念疗法干预的相关知识,获取帮助,并能够规范化实施正念疗法干预。实施正念疗法干预护理,正念减压疗法的作用机制主要是提供足够的训练刺激,改变患者的认知偏差,增强正念状态及元认知能力,消除或减少其对负性情绪的关注[14],提高遵医嘱依从性,改善病情,调整情绪,改善应激反应症状,从而避免不良反应发生。并且能够弥补单纯常规干预的不足,更有效改善病情,提高生活质量,让患者更满意[1]

关键词: 正念疗法;青少年创伤后应激障碍;焦虑;抑郁

非自杀性自伤对青少年抑郁症患者纹状体结构协变的调节作用

陈依莹 罗展杰 周燕玲* 宁玉萍*

广州医科大学附属脑科医院

目的 青少年重度抑郁症(AO-MDD)是一种严重威胁青少年成长和健康的疾病,约有三分之一的MDD患者曾有非自杀性自我伤害(NSSI)的经历,而这部分患者往往面临着更高的自杀风险。越来越多的研究发现,纹状体的异常与抑郁症密切相关,尤其是皮质-纹状体回路的改变。此外,纹状体作为奖赏系统的核心,其与系统内其他脑区之间的

异常连接, 已被发现与青少年重复性 NSSI 行为相关。与功能性磁共振成像相比, 结构协变分析技术能够在更长的时间尺度上评估大脑连通性, 且不易受伪影影响, 是一种分析大脑区域间解剖关联的有效方法。

方法 本研究运用结构协变分析技术, 旨在探讨 AO-MDD 患者是否显示出纹状体结构协变量的异常变化, 以及 NSSI 如何调节这些变化。通过收集 92 名 AO-MDD 患者和 81 名健康对照组 (HCs) 的 T1 加权解剖图像, 并采用基于体素的形态学分析评估每位参与者的灰质体积, 我们分析了纹状体的异常结构协方差及其受 NSSI 各维度调节的情况

结果 我们发现, 相比 HCs, AO-MDD 患者在皮质-纹状体回路的关键脑区显示出结构协变值的增加, 这反映了疾病早期发展或是一种代偿现象。此外, NSSI 调节了纹状体与奖赏系统 (内侧眶额叶皮质、额上回、扣带皮质和丘脑) 中关键脑区的异常。具体来说, 尾状核与奖赏系统显示出结构协方差增加, 这可能导致脑区过度同步发育, 引起多巴胺的释放异常增加, 破坏正常奖赏机制, 使个体对 NSSI 行为成瘾依赖, 同时, 我们还发现苍白球和壳核与奖赏系统间的结构协方差值降低, 反映出这些脑区间的神经发育不同步, 这种不协调可能导致认知和执行控制能力下降, 进而促发重复性 NSSI 行为。

结论 综上所述, 我们的研究突显了皮质-纹状体回路在 AO-MDD 患者早期发展中的关键作用, 并明确了 NSSI 在 AO-MDD 神经生理学改变中的重要生理意义。

人际创伤与青少年抑郁障碍患者症状间的关系: 一项网络分析研究

李静雅¹ 马逸凡^{1,2} 徐德锋¹ 杨楹^{1,2} 韦雨欢^{1,3}

1. 山东省精神卫生中心

2. 山东大学

3. 济宁医学院

目的 不同类型的人际创伤往往是共同存在的, 但对个体发展的影响可能不同, 其中某一类型的人

际创伤可能对儿童青少年精神病理症状有特别突出的影响, 既往研究多仅考虑单一类型人际创伤, 这可能会高估该风险因素影响, 忽视关键因素的作用。此外, 抑郁症状是一组高度异质性的多维度症状群, 不同维度的抑郁症状可能有着不同的病理发展机制。基于儿童青少年抑郁人际理论, 人际创伤与儿童青少年存在密切关系, 但对于不同类型人际创伤与不同维度抑郁症状间的关联缺乏深入研究。基于此, 本研究拟构建人际创伤与青少年抑郁障碍患者症状间的网络分析模型, 识别不同类型人际创伤与青少年抑郁障碍患者不同维度症状间的中心变量和差异关联, 找到优先干预的核心症状。

方法 本研究为横断面调查研究, 选取 2021 年 6 月至 2022 年 2 月在山东省精神卫生中心门诊就诊及住院的青少年抑郁障碍患者 413 人。被试完成了一般人口学调查表、童年创伤问卷 (CTQ)、社会同伴排斥量表 (SPR)、儿童抑郁问卷 (CDI) 等量表调查。采用 R 3.4.3 软件进行数据的整理和分析, 构建网络分析模型。

结果 相关分析结果显示, 除性虐待经历外, 不同类型人际创伤 (家庭方面: 情感虐待、躯体虐待、情感忽视、躯体忽视, 同伴方面: 同伴忽视、同伴侮辱、同伴躯体攻击、同伴谴责) 与青少年各维度抑郁症状 (负性情绪、人际问题、低效能、快感缺乏、低自尊) 均呈显著正相关 ($r=0.30-0.64, ps<0.01$); 网络分析结果显示, 人际创伤中的情感虐待是中心性最高的症状节点, 其次是抑郁症状中的低自尊和快感缺乏。与不同维度抑郁症状最强相关的人际创伤分别是, 1) 与低自尊相关性最强的情感忽视 (权重=0.23), 2) 与人际问题相关性最强的躯体忽视 (权重=0.18), 3) 与快感缺乏相关性最强的忽视 (权重=0.08), 4) 与效能低下相关性最强的情感虐待 (权重=0.08), 5) 与负性情绪相关性最强的情感虐待 (权重=0.07)。

结论 在抑郁障碍的青少年中, 童年期的虐待经历与同伴排斥均为抑郁症状的风险因素, 较同伴排斥而言, 童年期的虐待经历对抑郁症状的影响更大, 其中情感虐待是网络中最重要核心症状, 是青少年抑郁障碍患者症状干预和治疗的重要靶点。

青少年非自杀性自伤与家庭亲密度、人际关系及心理弹性的分析

李安妮 童永号 孙科 谢俊 李轶琛 马筠*
武汉市精神卫生中心

目的 非自杀性自伤 (NSSI) 指个体在无自杀意图时故意地、直接地对自身躯体进行伤害的行为。美国精神障碍诊断与统计手册第 5 版中指出, NSSI 最早发生年龄多为 10 岁且持续多年, 采取 NSSI 行为的个体多将其视作减压发泄的方法, 以此解决其创伤性体验所带来的影响。全球范围内, 青少年 NSSI 终生和 12 个月患病率分别为 22.1% 和 19.5%, 中国约 1/5 的中学生都存在自伤行为。有研究显示, 发生 NSSI 行为的青少年中有 33%~70% 有过至少一次的自杀企图。NSSI 的发生是家庭因素、社会环境及个人因素的相互影响的结果。本研究通过对青少年 NSSI 行为与家庭亲密度、人际关系及心理弹性的关系进行分析, 探寻影响 NSSI 发生的危险因素。

方法 于 2021 年 1 月至 2023 年 12 月期间对住院患者问卷调查共获得 2139 份有效问卷, 根据是否伴有 NSSI 行为分为 NSSI 组 235 例和非 NSSI 组 1904 例, 问卷包括一般资料、家庭亲密度、人际关系及心理弹性的调查。使用 Spearman 相关性分析青少年 NSSI 行为与家庭亲密度、人际关系及心理弹性的相关性; Logistic 回归分析影响青少年 NSSI 行为的因素。

结果 NSSI 组青少年有 48.09% 处于极端型家庭, 非 NSSI 组青少年有 40.55% 处于极端型家庭, 两组在家庭分型中差异显著 ($P < 0.05$); NSSI 组青少年同伴关系得分显著高于非 NSSI 组 ($P < 0.05$); 两组师生关系分型差异显著 ($P < 0.05$); NSSI 组心理弹性量表得分显著低于非 NSSI 组 ($P < 0.05$); Spearman 相关性分析结果显示家庭分型、师生关系分型以及坚韧性、力量性和乐观性得分与 NSSI 的发生之间呈负相关关系 ($r = -0.730, P < 0.05$; $r = -0.406, P < 0.05$; $r = -0.736, P < 0.05$; $r = -0.614, P < 0.05$; $r = -0.649, P < 0.05$), 与同伴关系得分呈正相关关系 ($r = 0.830, P < 0.05$); Logistics 回归分析结果显示极端型家庭倾向、较差的同伴关系以及较弱的坚韧性、力量性和乐观性为影响青少年 NSSI 发生的因素 ($P < 0.05$), OR 值分别为 1.829、0.317、0.405 **结论** 青少年非自杀性自伤行为的发生与家庭亲密度、人际关系状况及心理弹性有显著相关性。临床上, 对家庭功能差、人际交往

技能缺乏及心理弹性不足的青少年需多加关注。

Functional Connectivity of The Posterior Cingulate Cortex Moderates The Relationship between Tic Symptoms and Premonitory Urge in Tourette Syndrome

Xianbin Wang¹, Tianyuan Lei¹, Weiwei Men², Wenyan Zhang¹, Zhongliang Jiang¹, Kai Yang¹, Qinghao Yang¹, Yonghua Cui¹

1. Beijing Children's Hospital, Capital Medical University

2. Center for MRI Research, Academy for Advanced Interdisciplinary Studies, Peking University

Objective The neural mechanisms underlying the relationship between PU and tics remain unclear. This study investigates the potential role of the posterior cingulate cortex (PCC) in moderating the relationship between premonitory urge (PU) and tic severity in patients with Tourette syndrome (TS)

Methods We recruited 58 children and adolescents (47 males) with TS. Tic and PU severity were assessed using the Yale Global Tic Severity Scale (YGTSS) and the Premonitory Urge for Tics Scale (PUTS). Resting-state functional MRI was used to evaluate the functional connectivity of PCC regions, and degree centrality analysis was performed

Results A significant positive correlation was found between PUTS and YGTSS scores ($r = 0.541, p < 0.001$). The degree centrality (DC) of the right dorsal PCC showed significant negative correlations with both YGTSS ($r = -0.347, p = 0.011$) and PUTS scores ($r = -0.425, p = 0.002$). Moderation analysis indicated that the DC of the right dorsal PCC moderated the relationship between PU and tics. The higher the DC of the right dorsal PCC, the smaller the effect of PU on the tic; and vice versa. The above modulatory effects were also true before PU and vocal tics, but neither motor tics.

Conclusion The PCC plays a crucial role in

modulating tic symptoms and PU in TS. Enhancing PCC connectivity could be a promising therapeutic strategy for managing TS symptoms. Further research is needed to explore the PCC's potential as a treatment target in TS

关键词: Tourette syndrome, Posterior cingulate cortex, Tic symptoms, Premonitory urge, Functional connectivity

3.Bamford Centre for Mental Health & Wellbeing, Ulster University, Coleraine, Northern Ireland

Objective To examine the prevalence of attention deficit hyperactivity disorder in a community sample of children aged 6-13 years, and the extent to which it impacts parental mental health.

Methods Cross-sectional study of primary school pupils (number=2497) in Deyang, Sichuan Province, South-West China. We used standardized instruments to identify children with ADHD symptoms and parent depression.

Results The prevalence of ADHD was 9.8%. Factors associated with the likelihood of ADHD, included family environment($P=0.003$), time spent with children($P=0.01$), parenting style($P=0.01$), and parental relationship, pupils self-harm and lower academic ability ($P=0.001$). After controlling for other factors, having a child with ADHD increased the likelihood of parents' depression ($OR=4.35$, $CI=2.68\sim 7.07$), additional factors included parent relationship.

Conclusion ADHD may be a common disorder among Chinese children, the symptoms of which may increase the likelihood of parent depression. There is a need for greater detection of ADHD in schools,

acknowledgement of the challenges the disorder creates for academic success and family wellbeing, and psychoeducational tools for supporting parents of children with ADHD

Longitudinal Associations between Perceived Discrimination and Suicide Behaviors in 9-10 Years Old Children: The Mediating Roles of Victimization and Perpetration

蔡佳 吕秋玥 王强*

四川大学华西医院

Objective Although multiple studies have found that colored people commonly experience racial discrimination, available studies have yet to examine how perceived racism might be related to suicide vulnerability in youth. The purpose of this study was to examine how perceived racial discrimination contributes to subsequent suicidality and non-suicidal self-injury (NSSI), as well as the mediating roles of victimization and perpetration.

Methods In a large longitudinal sample from the ABCD cohort study, we used mediation analyses to study whether bullying assessed at 1-year follow-up may mediate the effects of perceived discrimination assessed at baseline on later outcomes of suicidality and NSSI assessed at 2-year follow-up.

Results Correlation analysis showed that perceived discrimination, bullying and suicidality and NSSI were positively correlated with each other. In addition, victimization partially mediated the relationship between perceived discrimination and suicidality and NSSI.

Conclusion Screening for discrimination, bullying may help identify individuals and groups of racial/ethnic minorities at risk for suicidality and NSSI. Reducing school bullying is of great significance for reducing suicide related behaviors of teenagers

团体绘画疗法在儿少病房对青少年情绪障碍应用效果分析

周英 鲁平* 凌琪
安庆市精神病医院

目的 探讨用团体绘画疗法在儿少病房对青少年情绪障碍应用的效果。

方法 将 2023 年 10 月—2024 年 4 月住院 80 例青少年情绪障碍患者作为研究对象,采用随机分组为观察组 (n=40) 和对照组 (n=40)。两组患者均进行常规的药物及一般心理治疗,在此基础上对对照组进行绘画疗法,疗程 8 周,比较两组患者的焦虑自评量表 (SAS)、抑郁自评量表 (SDS),采用护士住院患者观察量表 (NOSIE) 评估患者的精神与社会功能,护理满意度调查问卷进行评分。

结果 治疗前两组患者 (SAS、SDS) 评分比较,差异无统计学意义 ($P>0.05$) 治疗后两组患者 (SAS、SDS) 评分比较有所降低,差异有统计学意义 ($P<0.05$),住院患者观察量表 (NOSIE) 评估患者的精神与社会功能,护理满意度调查问卷进行评分,治疗后患者满意度明显高于治疗前。

结论 团体绘画疗法治疗青少年情绪障碍患者效果显著,可降低患者 (SAS、SDS) 评分,促进青少年精神和社会功能的恢复。

不足之处 本研究对青少年情绪障碍患者实施绘画疗法,能有效降低患者的不良情绪,认识能力及控制能力,但只评估了绘画干预对患者影响,未来的研究应该长期随访时间,关注绘画疗法对青少年情绪障碍患者的长期影响及改善功能随访,同时也要求家庭成员的参与及关注。

首发未用药的儿童青少年精神分裂症患者脑功能网络拓扑属性与幻听严重程度的相关性

研究

周之禄^{1,2} 李想^{1,2} 杜洁^{1,2} 李亚霖^{1,2} 杨莹^{1,2} 李文强^{1,2} 郭素芹¹ 韩勇^{1,2}

1. 新乡医学院第二附属医院
2. 河南省生物精神病学重点实验室

目的 儿童青少年精神分裂症是精神分裂症中较罕见且严重的亚型,也被称作早发精神分裂症 (early-onset schizophrenia, EOS),且幻听是精神分裂症患者的典型症状。本研究利用图论分析法探讨首发未用药的 EOS 患者脑功能网络的拓扑属性变化以及与幻听严重程度的相关性。

方法 纳入 EOS 患者 83 例,采用 SAPS 量表中的幻听条目评估患者幻听的严重程度,并将其分为无幻听组 (20 例)、轻度幻听组 (30 例)、重度幻听组 (31 例),同时匹配 32 名健康对照。对所有受试者采集头部静息态磁共振成像数据,利用 Brainnetome Atlas 脑图谱将大脑划分为 246 个脑区,构建脑功能网络,计算网络的节点和全局拓扑参数。以拓扑属性在组间有显著差异的节点为感兴趣区域计算全脑的功能连接,寻找功能连接异常的脑区,采用 Pearson 相关性分析观察有显著差异脑区的功能连接值与幻听评分之间的相关性。

结果 1. 所有被试在整个稀疏度阈值范围内 (0.1~0.34) 均满足小世界网络属性,即 $\gamma>1$, $\lambda\approx 1$ 。四组样本之间脑功能网络的全局拓扑属性 (聚类系数、特征路径长度、局部效率、全局效率) 均未发现明显差异。2. 在节点属性方面,度中心性 (DC) 及节点效率 (NE) 均发现有显著差异的大脑区域为左侧颞上回 ($P<0.05$, FDR 校正),事后多重比较发现,随着幻听严重程度的增加,DC 和 NE 均增强。3. 以左侧颞上回为种子点的脑功能连接发现,左侧颞上回与左侧扣带回之间的功能连接在四组间存在显著性差异;将左侧颞上回与左侧扣带回之间的功能连接值与幻听评分进行相关性分析后发现,随着幻听严重程度的增加,功能连接增强。

结论 首发未用药的儿童及青少年精神分裂症患者静息态脑功能网络具有小世界网络属性,随着幻听严重程度的增加,左侧颞上回在脑功能网络中的信息传递能力增强,且左侧颞上回与左侧扣带回之间的功能连通性增加,这些改变有可能是精神分裂症患者出现幻听症状的潜在神经生理学机制,并有可能成为早发精神分裂症准确诊断的潜在生物标

志物。

目的 The pathological mechanism of how modified electroconvulsive therapy (MECT) regulates frontoparietal network (PFN) is unknown, and there is a lack of predictive factors for predicting the efficacy of MDD.

方法 The samples included 30 first-episode, drug-naive adolescent patients with MDD and 34 healthy controls (HCs) from Sample 1 and 28 first-episode, drug-naive adolescent patients with MDD and 43 HCs from Sample 2. The patients received MECT and underwent scanning at two time points (baseline and posttreatment). Network homogeneity (NH) and support vector regression (SVR) analyses were employed to analyze the imaging data.

结果 Compared with HCs, patients at pretreatment exhibited decreased NH values in the right MSFG and left IPL. At posttreatment, patients exhibited increased NH values in the right AG. Additionally, SVM and receiver operatin

结论 This study provides evidence that MECT modulates PFN in adolescent MDD

Objective Tic disorder (TD) is a diverse neurodevelopmental disorder with various symptoms and comorbidities. Traditional classifications based on age onset and duration fail to adequately characterize the full clinical features of TD. This study aims to redefine TD subtypes by a comprehensive analysis of clinical features and comorbidities.

Methods We assessed 139 children and adolescents aged 6-18 years using 14 scales covering 43 dimensions. The k-means clustering algorithm was used to identify distinct TD subtypes. Differences between these subtypes were analyzed using t-tests and network analysis, with high expected influence (EI) metric representing key symptoms within each subtype.

Results We identified two distinct subtypes of TD, with 21.6% of participants classified as subtype1 and 78.4% as subtype2. Subtype1 exhibited more severe symptoms across TD, obsessive-compulsive spectrum disorders, and attention deficit hyperactivity disorder assessments compared to subtype2, with significant differences observed in 81.4% of the scale features. Network analysis revealed differences in core symptoms between the two subtypes; subtype1 primarily involved hyperactivity and vital activities, whereas subtype2 primarily involved attention deficit, hyperactivity and conduct. Furthermore, comparisons with DSM-5 classifications revealed distinct patterns, indicating the novel nature of the identified subtypes.

Conclusion Our study uncovered two novel subtypes of TD in children and adolescents, highlighting the internal heterogeneity within this disorder. Through detailed analysis of the clinical features of these subtypes, we deepen our understanding of TD, potentially enhancing diagnostic and treatment strategies

ADHD 儿童孤独症特质及其与 ADHD 核心症状、生态执行功能关系的网络分析研究

刘娟¹ 高媛² 吴赵敏¹ 操小兰¹ 陈俏如¹ 王媛¹ 董超¹ 陈晶¹ 张琳琳¹ 李颖¹ 杨斌让¹ 刘璐²

1.深圳市儿童医院

2.北京大学第六医院

目的 注意缺陷多动障碍(ADHD)儿童存在孤独症特质(ATs),但 ATs 及 ADHD 核心症状关系尚不清楚。心理病理学网络理论强调症状间的相互激活驱动精神障碍的发生与维持,本文采用网络分析方法,探索 ADHD 儿童 ATs 症状网络特征及其与核心症状、生态执行功能因子间的关联。

方法 共招募 264 例 ADHD 儿童。采用注意缺陷多动障碍筛查量表(SNAP-IV)、孤独症谱系障碍筛查问卷(ASSQ)、执行功能行为评定量表父母版(BRIEF)分别进行 ADHD 核心症状、ATs 及生态执行功能评定,基于 R4.3.2 构建偏相关网络模型和贝叶斯网络模型,获取强度、接近、中介、预期影响(EI)中心性,可预测性等网络指标。

结果 1. 构建 ASSQ 症状网络 整体网络中最强关联主要出现在社会互动问题与重复刻板行为(RRBs)和社交交流问题间,包括:“陈腐或早熟的”与“古怪教授”,“异常的面部表情”与“异常的姿势”,“缺少好朋友(S6)”与“仅以自己的方式表现社交性(R5)”,“缺乏同理心”与“字面意义上的理解”。其中, S6、R5、“语言不适合社交”的 EI 值最高,是网络中重要核心症状。DAG 分析显示,社会互动问题主要位于上方,对下方的其它症状存在可能的驱动作用。 2. 构建 SNAP-IV 和 ASSQ 因子网络 两组症候群因子中“注意缺陷”与“社会互动问题”存在关联。“社会互动问题”、“多动”的 EI 值最高,在整体网络中发挥更为重要的作用。 3. 构建 SNAP-IV、ASSQ、BRIEF 因子网络 ADHD 与 ATs 间的直接关联较少,但均与 BRIEF 因子存在较为明显的关联,如:注意缺陷与工作记忆、计划,多动与抑制;社会互动问题与抑制、启动,社交交流问题与工作记忆,RRBs 与转换。执行功能中的计划、监控、工作记忆及 ADHD 症状中的多动是整体网络中比较重要的核心因子(EI 值最高)。抑制因子是网络中最重要桥梁症状(桥梁最强)。DAG 显示,计划和工作记忆位

于顶部,对下部其他症状存在驱动作用。ADHD 和 ATs 主要通过执行功能连接,ATs 的社会互动问题、ADHD 的多动由抑制功能缺陷驱动,ATs 的社交交流问题和 ADHD 注意缺陷由执行功能中的工作记忆缺陷驱动。

结论 社会互动问题是 ADHD 儿童孤独症特质的核心症状;孤独症特质与 ADHD 核心症状间的关联主要通过执行功能的缺陷驱动连接。

7.浙江大学医学院第二附属医院

Objective The objective was to detect abnormal functional connectivity (FC) between Wernicke's area and other language-related functional regions, and identify frequency-specific altered FC using Wernicke's area as the seed region in ASC.

Methods The current study carried out a mega-analysis to attain a comprehensive understanding of the neural mechanisms underpinning ASC, particularly in the context of language processing. The study employed the Autism Brain Image Data Exchange (ABIDE) dataset, which encompasses data from 443 typically developing (TD) individuals and 362 individuals with ASC.

Results The findings revealed that increased FC

in individuals with ASC has frequency-specific characteristics. Further, in the conventional frequency band (0.01-0.08 Hz), individuals with ASC exhibited increased FC between Wernicke's area and the right thalamus compared with TD individuals. In the slow-5 frequency band (0.01-0.027 Hz), increased FC values were observed in the left cerebellum Crus II and the right lenticular nucleus, pallidum.

Conclusion These results provide novel insights into the potential neural mechanisms underlying communication deficits in ASC from the perspective of language impairments

儿童青少年精神障碍患者家长病耻感的危险因素分析及预测模型构建

赵鑫^{1,2,3} 郝明茹^{1,2,3} 凡豪杰^{1,2,3} 夏磊^{1,2,3} 刘宸忠^{2,3,4}

- 1.安徽医科大学精神卫生与心理科学学院
- 2.安徽医科大学附属巢湖医院
- 3.安徽省精神医学中心
- 4.脑库构建及资源利用安徽省重点实验室

目的 探讨儿童青少年精神障碍患者家长病耻感及其危险因素, 并构建病耻感的预测模型。

方法 采取横断面调查, 收集 2022 年 8 月至 2023 年 7 月就诊于安徽医科大学附属巢湖医院及安徽省宿州市第二人民医院精神科的 283 名儿童青少年精神障碍家长的社会人口学资料, 并采取精神疾病病耻感量表、患者健康问卷-9 (PHQ-9)、广泛性焦虑障碍量表 (GAD-7)、失眠严重指数量表 (ISI) 以及数字评价量表 (NRS) 评估患者家长的病耻感状况、抑郁症状、焦虑症状、失眠症状及疲劳程度。

结果 病耻感的总体检出率约为 43.4%。患者住院治疗且收入低的家长更易产生病耻感 (均 $P < 0.05$)。并且较无病耻感患者家长, 产生病耻感的患者家长 PHQ-9 总分更高 ($P = 0.016$)、失眠程度更重 ($P = 0.001$) 以及疲劳程度更加严重 ($P = 0.009$)。

对具有统计学意义的指标进行二元 Logistic 回归分析, 结果显示患者治疗方式及家长失眠程度与是否产生病耻感有关联 (均 $P < 0.001$)。基于回归分析结果, 构建预测患者家长产生病耻感的风险预测模型, 并绘制受试者工作特征 (ROC) 曲线下面积 (AUC) 为 0.667 (95% CI: 0.614-0.741, $P < 0.001$)。

结论 儿童青少年精神障碍患者家长病耻感检出率较高, 提示在注重儿童青少年精神障碍患者的同时, 亦应该关注患者家长的心理健康, 应该加强对患者家长的关注, 必要时提供适当的个人化干预措施。

A Study of The Interactive Mediating Effect of ADHD and NSSI Caused by Co-disease Mechanisms in Males and Females

程芳¹ 汪贝妮¹ 胡长舟¹ 张文武¹ 胡珍玉¹ 禹海航¹ 王艺明²

- 1.宁波大学附属康宁医院
- 2.贵州医科大学附属医院

Objective Non-suicidal self-injury (NSSI), of which the predisposing factors are complex and diverse, profoundly affects the physical and mental health of young people. Therefore, this work established an NSSI intermediary network model considering the interaction of multiple factors. A mediating effect between attention deficit/hyperactivity disorder (ADHD) and NSSI, considering the influence of comorbidities, such as depression, anxiety, and impulsive personality, was proposed based on sex differences.

Methods A total of 2,689 middle school students in Ningbo City, Zhejiang Province, China, were randomly sampled and participated in this study. Data regarding their demographic characteristics, attention deficit, hyperactivity/impulsivity, NSSI, anxiety, depression, internet addiction, and other comorbid symptoms were collected and analyzed. After initially screening the data, variables were assessed for significance using a single-factor inter-group difference analytic method,

and a binary logistic regression analysis was performed. The intermediary effect of factors influencing NSSI in males and females was also analyzed.

Results The overall NSSI rate was 15.16%. The results showed that the impact of individual impulsivity characteristics (impulsiveness, the ADHD with hyperactivity/impulsivity subtype) on NSSI behavior was not significant (regression results, $P > 0.05$). The degree of association between ADHD with attention deficit and ADHD with comprehension deficit subtypes, and other comorbid symptoms (depression, anxiety, and internet addiction disorder) and NSSI, with odds ratios (ORs) of 7.6/6.42/436.68/3.82/1.86, and 95% bootstrap confidence intervals (CIs) of 4.64, 12.87/3.46, 12.67/137.42, 2659.13/2.32, 6.37/1.31, 2.82, respectively. The results also showed significant effects of ADHD subtypes on comorbid symptoms and the path effects of NSSI ($P < 0.01$). Among them, the mediating effect was the strongest when anxiety was the mediating variable, and the mediating effect of girls was higher than that of boys.

Conclusion The results of this work demonstrated the influence of ADHD symptoms on NSSI behavior. Among patients with ADHD, patients with subtypes with obvious attention deficit characteristics were more likely to exhibit NSSI behavior, whereas the hyperactive impulse subtype had no direct impact on NSSI. We conclude that adolescent impulsivity may not be directly related to NSSI behavior and that impulsive characteristics jointly affect NSSI behavior through a series of NSSI comorbid symptoms. Notably, the probability of symptom onset and the degree of comorbidity was significantly higher in girls than in boys of the same age, and girls were more prone to NSSI behavior. These findings provide effective theoretical support for the prevention and treatment of adolescent NSSI behavior

关键词: NSSI, ADHD, Mediation effect, Comorbidity mechanism, Multi-parameter interactive effect

Parenting Styles and Adolescent Coping Methods: A Comparative Study of Non-Suicidal Self-Injury and Non-Non-Suicidal Self-Injury Groups

Fang Cheng* Changzhou Hu Beini Wang Lei Chen Zhenyu Hu Haihang Yu

Affiliated Kangning Hospital of Ningbo University

Objective This study aims to explore in depth how parental parenting styles affect coping strategies among adolescents, with a particular focus on the differences in this influence between the NSSI and non-NSSI adolescent populations.

Methods A cross-sectional survey was conducted on NSSI patients diagnosed at Kangning Hospital in Ningbo, China, as well as healthy adolescents in urban schools. Data including family background, parenting styles, and adolescent coping strategies were collected. Descriptive statistics, chi-square test, independent samples t-test, correlation analysis, and stepwise regression analysis were used to analyse the data.

Results Significant correlations were found among family disharmony, parental education level, and adolescent NSSI behaviour. In non-NSSI groups, excessive maternal preference was negatively correlated with adolescent problem-solving abilities, while in NSSI groups, negative parenting styles of parents were positively correlated with negative coping strategies.

Conclusion This study reveals a close relationship between parental parenting styles and adolescent coping strategies, with significant differences between NSSI and non-NSSI populations. The research findings emphasize the importance of considering family environment and parenting styles when preventing and intervening in adolescent NSSI behaviour. Future psychological interventions should focus on cultivating positive parenting styles, especially in promoting emotional support and understanding from parents, to help adolescents develop healthier coping mechanisms

关键词: Non-Suicidal Self-Injury (NSSI); Adolescent Coping Strategies; Parenting Styles; Youth Mental Health; Family Influence

综合医院精神心理研究协作组

以精神异常为首发的大面积颅脑占位性病变 1 例

谢霜 张耀木* 阳睿 邹瞻同 蒙高淋

中国人民解放军联勤保障部队第九二三医院

目的 帮助精神科医师、规培医生增强对躯体疾病引发精神异常的认识,避免误诊、漏诊,保障医疗安全。同时,我们希望通过本案例,促进临床医师对此类问题的识别与处理,为临床诊疗提供借鉴意义。

方法 本文分析归纳 1 例以典型精神病性症状(自言自语、行为怪异、易激惹、不饮不食、夜间不眠,情感反应不协调、治疗不合作)为主要表现的左顶枕叶大面积占位性病变患者的诊治过程作回顾性分析。患者女,73 岁,因“胡言乱语伴脾气大 1 个月”于 2024 年 5 月 27 日入住我院治疗。入科情况:右侧肢体肌力 IV 级,左侧 V 级,四肢肌张力正常,生理反射存在,病理反射未引出。精神状况检查:神清,对时间、人物及地点部分定向不准,接触交谈被动,不合作。可疑被害妄想、幻听、幻视。记忆粗测下降、智能粗测正常。情绪不稳定,易激惹,情感反应不协调。意志活动尚可,有自言自语怪异行为,否认自伤自杀观念及行为,自知力缺乏。既往存在多次可疑摔倒史。诊疗经过:入院即刻完善相关检验及检查:血常规未见明显异常。血生化:总胆红素 25.6 $\mu\text{mol/L}$ ↑,直接胆红素 7.5 $\mu\text{mol/L}$ ↑,间接胆红 18.10 $\mu\text{mol/L}$ ↑, α -羟丁酸脱氢酶 196U/L↑,肌红蛋白 107 $\mu\text{g/L}$ ↑,肌酸激酶 94U/L,肌钙蛋白 10.64 $\mu\text{g/L}$ 。凝血功能:纤维蛋白原 4.34 g/L ↑,D-二聚体 5460 $\mu\text{g/LFEU}$ ↑。急诊床旁心电图:1.窦性心律 2.S-T 段抬高(请结合临床,建议急查心酶)3.V1R/S>14.异常 q 波备注:QTc437ms。5 月 28 日头颅 CT 结果示:1.左侧顶枕叶占位性病变(左侧顶枕叶见不规则稍高、低混杂密度影,边界模糊不清,大小约 5.0 cm ×7.4 cm ,周围见片带状稍低密度影,相连脑沟、脑池变窄模糊,胼胝体压部受累);2.双侧基底节区腔隙性脑梗死;3.脑萎缩。入院诊断:精神障碍查因(器质性精神障碍?),涉及多学科间联合诊治。

结果 经急会诊后立即转至神经外科继续治疗。

结论 本文对患者临床资料进行回顾并进行相关文献的复习,分析颅脑占位性病变的特点,提示

诊治精神疾病中要细致查体、问诊的重要性,以及及时进行系统全面的体检和相关的检查,以明确诊断、及时治疗,旨在帮助提高精神科临床医师的甄别能力,为后续临床工作提供经验指导。

关键词: 颅脑大面积占位性病变,精神异常,影像学检查

精神科护理观察量表在伴有精神病性症状的重度抑郁发作患者的应用分析

韦秋媛 陆永艺* 谢霜 岑俊翰

中国人民解放军联勤保障部队第九二三医院

目的 探讨精神科护理观察量表在伴有精神病性症状的重度抑郁发作患者的应用价值。

方法 选取 2022 年 1 月至 2023 年 1 月来我科就诊住院,采用 ICD-10 诊断标准为伴有精神病性症状的重度抑郁发作患者 54 例作为研究对象,入院后使用精神科护理观察量表进行纵向的观察与评价。评定员由经过量表评定训练的病区责任护士担任。评定时间为患者住院期间,每天评定一次。根据量表结果,通过纵向比较分析病人的行为障碍、病情的演变及治疗效果进行客观评定,为临床治疗、护理提供科学依据。

结果 通过量表分值变化情况,比较分析伴有精神病性症状的重度抑郁发作患者在治疗前后的效果,可以发现使用精神科护理观察量表的评价结果与临床表现以及预后比较符合。同时使临床护理工作重点难点一目了然,护理工作开展有章可循。

结论 在精神科临床护理工作中通过精神科护理观察量表可以观察到伴有精神病性症状的重度抑郁发作患者的治疗效果、疾病进展等情况,是评价病程变化的合理工具。根据评价结果进行有针对性地制定合理的“人性化”护理方案,实施合理有效的临床护理措施,有效促进患者的康复,有利于患者缩短住院时间,早日回归社会。同时对护理质量提高也起到了积极的促进作用。

雷公藤多苷及其有效单体通过脑肠轴交流快速改善脓毒血症相关脑病诱发的情绪认知障碍

陈碧清* 胡中晓 黎陈铨
江苏省中医院

目的 雷公藤多苷是中药雷公藤的醇提物,已广泛用于治疗多种炎性疾病。雷公藤内酯醇是雷公藤多苷的主要活性成分之一,可以下调脂多糖(LPS)诱导的系统性炎症小鼠模型的腹腔巨噬细胞中的炎症细胞因子。

方法 通过一次性腹腔注射大剂量(15mg/ml) LPS和盲肠结扎手术(CLP)构造模拟脓毒血症的急性炎症小鼠模型,给予人体等效剂量的雷公藤多苷灌胃或雷公藤内酯醇腹腔注射治疗3天。之后通过旷场、悬尾、强迫游泳、Y迷宫等行为学实验测试各组小鼠的抑郁焦虑相关情绪表现。通过流式微球技术和荧光定量PCR技术检测外周血和脑中细胞因子表达水平。通过尼氏染色检测大脑神经细胞损伤程度。通过16s rDNA测序检测各组个体的盲肠内容物、腹腔灌洗液的菌群多样性。

结果 两种脓毒血症小鼠模型的体重均出现显著下降,外周血和脑内细胞因子水平显著升高,出现类似脓毒血症的急性系统性炎症表现。模型组小鼠在强迫游泳实验中不动时间增加、进入不动状态的潜伏期缩短,在悬尾试验中进入不动状态的潜伏期缩短,在旷场实验中静止时间显著增加,表现出明显的抑郁样行为;在旷场实验中进入中央次数显著增加、进入中央潜伏期明显变长、待在四角持续时间增加,表现出明显的焦虑样行为;Y迷宫中工作记忆行为受损。免疫组化结果显示,模型组小鼠脑内神经元损伤,显示出脓毒血症相关脑病的部分表现。而无论是雷公藤多苷灌胃,还是雷公藤内酯醇腹腔注射,均可以回升小鼠体重,显著降低外周血和脑内细胞因子水平,修复脑内神经元损伤,并且在行为实验中改善焦虑样行为和抑郁样行为,其中,雷公藤内酯醇对抑郁样行为的改善效果更突出。菌群测序发现脓毒血症模型小鼠腹腔菌群和肠道菌群组成高度相似,而雷公藤多苷治疗后,腹腔和肠道的菌群关联度下降,提示雷公藤多苷有助于脓毒血症中受损的肠屏障重新建立。

结论 雷公藤多苷已被中国药监局批准用于治疗克罗恩病、类风湿性关节炎等长期炎症性疾病。

本研究虽然仅是初步在动物模型上探索,但其研究结果提示,对于脓毒血症这种急性重症型炎症疾病,短期服用低剂量雷公藤多苷或可成为有效治疗脓毒血症及其脑病相关的情绪认知障碍症状的补充方案。

关键词: 脓毒血症相关脑病,雷公藤多苷,情绪认知,炎症风暴

个案报道:一例门诊精神分裂症患者持刀看诊行为干预措施

赵静 岑俊翰*

中国人民解放军联勤保障部队第九二三医院

目的 报道一例门诊精神分裂症患者身着红色印迹白大褂并持刀到精神科门诊看诊,门诊医务工作者知晓该患者病情,采用积极接纳、正面劝导等方法安抚患者,予以干预患者持刀可能出现任何的不良后果。探讨门诊精神分裂症患者持刀看诊行为干预措施,为探索门诊医务工作者处置类似患者制定规范的干预方案提供参考。

方法 回顾我科门诊医务工作者干预的一例门诊精神分裂症患者持刀看诊行为,包括病例资料、看诊经过、干预措施。该患者为青年男性,多次在我科住院治疗,诊断“精神分裂症”,治疗效果欠佳。出院后不规律服药,病情反复,家属难以管理,患者不定时会自行到我科门诊看诊。在某一次到门诊看诊时,患者身着红色印迹白大褂并一手持刀,情绪平稳,导诊护士热情接待患者后,立即实施干预措施:

- 1、协调处置:及时拨打医院保安班电话,请求保安人员第一时间到现场协助保障门诊所用人员的人身安全;
- 2、请示报告:及时向门诊医生、科室主任、科室护士长进行报告,请求科内专科人员共同协助干预;
- 3、积极干预:掌握心理知识,积极接纳患者,与患者快速建立良好的医患或护患关系,以对患者进行正面劝导和安抚;
- 4、联系家属:通过患者既往的住院信息中查找家属的联系电话并进行联系,告知家属患者此次看诊的异常行为表现及可能会出现的不良后果,建议要加强对患者的家庭支持及管理;
- 5、事件记录:以备总结和查验。

结果 该门诊精神分裂症患者顺利看诊后离开医院,并将白大褂脱下、刀具交由医院保安人员处置。

结论 采用规范的干预措施,有助于帮助和指导门诊医务工作者对门诊患者持刀看诊行为进行干预,提高医务人员能力建设和职业成就感,会成为阻止门诊精神分裂症患者看诊时持刀伤人的有效方式。

关键词:精神分裂症,门诊持刀看诊,干预措施,正面劝导

Analysis of Functional Connectivity Changes in Attention Networks and Default Mode Networks in Patients with Depression and Insomnia

Yongxue Hu^{1,2}, Yiming Wang^{1,2}

1. Guizhou Medical University

2. The Affiliated Hospital of Guizhou Medical University

Objective Multiple past studies have indicated widespread neural network dysfunction in patients with depression and insomnia. However, it remains unclear whether there's a specific correlation in the neural networks of patients experiencing both depression and insomnia. This study aims to analyse the functional connectivity changes in attention networks and default mode networks in patients with depression and insomnia

Methods The resting-state functional magnetic resonance imaging (fMRI) was used to compare alterations in the seed-based whole-brain voxel-wise functional connectivity within attention networks and default mode networks in patients with major depressive disorder (MDD, n=38), insomnia disorder (ID, n=37), comorbid depression with insomnia (n=49), and a healthy controls (n=50). Specific brain regions including bilateral dorsolateral prefrontal cortex, bilateral orbitofrontal cortex, bilateral anterior and posterior cingulate gyrus, bilateral hippocampus, bilateral precuneus, and bilateral thalamus were selected as regions of interest. Functional connectivity at the voxel level across the entire brain was established from these regions. Moreover, statistically significant differences in brain regions

were correlated with scores from HAMD-17, PSQI, and ISI using Pearson correlation analysis

Results Functional connectivity in the left orbitofrontal cortex, left precuneus, and left thalamus was altered in the four patient groups. Patients with depression and insomnia exhibit functional changes across multiple networks

Conclusion Anomalies in the attention network's functional connectivity might represent a latent pathophysiological mechanism underlying both depression and insomnia, potentially contributing to attentional dysfunction. Similarly, abnormal functional connectivity in the default mode network might contribute to increased emotional sensitivity and selective attention biases observed in patients

关键词: Major Depression Disorder, Insomnia Disorder, Functional Connectivity, Attention Networks, Default Mode Network

非自杀性自伤青少年父母照护能力提升需求的混合性研究

刘小玉*

广东省人民医院

目的 目的 描述和分析非自杀性自伤 (Non-Suicidal Self Injury, NSSI) 青少年父母照护能力提升需求, 以期为 NSSI 青少年父母提供更为有效的支持, 促进青少年健康成长。

方法 方法 采用质性与量化相结合的研究方法, 对广州市某三级甲等医院就诊的 19 名 NSSI 青少年父母采用面对面半结构式访谈, 并对 242 例 NSSI 青少年父母培训需求进行横断面调查。

结果 结果 NSSI 青少年父母照护能力提升需求分析出二大主题: 一、NSSI 青少年父母目前存在的困境: 1. 精神、经济负担沉重 2. 沟通障碍、无效应对。二、NSSI 青少年父母照护能力提升需求: 1. 获取专业知识; 2. 提升沟通能力; 3. 增强应对能力。 There are two main themes in the analysis of NSSI adolescent parents' needs for improving their care ability: 1. Current difficulties of NSSI adolescent parents: ①.

Heavy mental and economic burden ②. Communication barriers and ineffective responses. 2.NSSI adolescent parents need to improve their care ability: ①. Access to professional knowledge; ②. Improve communication skills;③. Improve your coping skills.

结论 NSSI 青少年父母承受着沉重的负担且缺乏有效的应对策略,亟需在专业知识、沟通能力、应对方法方面得到提升,需关注其需求,提高父母的沟通能力以及应对 NSSI 的策略,以提升 NSSI 青少年的家庭支持能力。

关键词: NSSI; 青少年; 父母; 照护需求; 混合研究;

青少年非自杀性自伤行为的护理现状

陈红梅 王雅琴*

中国人民解放军联勤保障部队第九二三医院

目的 近年来,青少年非自杀性自伤行为的发生率呈上升趋势,其行为的严重程度及危害性已引起广泛关注。为提高对青少年非自杀性自伤行为护理现状的认识,本文对青少年非自杀性自伤行为的护理现状进行综述,以期为今后进一步开展相关研究提供参考依据。

方法 1、心理支持和家庭支持

非自杀性自伤行为是青少年中最常见的心理健康问题之一,护理人员应根据非自杀性自伤行为的特点,从生理、心理和社会层面评估青少年非自杀性自伤行为的发生风险,制定相应的护理措施。护士应给予患者更多的情感支持,在帮助其疏导不良情绪的同时,鼓励其进行社交活动,帮助他们建立良好的人际关系。另外,护士应在患者治疗期间给予心理支持和心理辅导,以改善其不良情绪并降低再次出现自伤行为的可能性[2]。

对非自杀性自伤行为的青少年来说,家庭成员也是一个重要的支持系统。护士应为此类患者提供更多的有效情感支持和心理疏导,最大程度的帮助患者减轻其不良情绪。父母和家庭成员应该了解非自杀性自伤行为并给予关爱和鼓励,共同关注非自杀性自伤行为患者。

2、构建良好的护患关系

良好的护患关系是护理工作中的重要环节,护

士要认真倾听患者诉说,正确理解患者的情感体验。对患者所诉的问题,要耐心倾听,不要打断患者的诉说,使其感到自己被人尊重。鼓励和帮助他们参加有意义的活动,增加人际交往机会,建立良好人际关系。要仔细观察病情变化,如发现有自伤行为时应及时报告医生并协助其处理。

3、护理专业技术在青少年非自杀性自伤行为心理宣教中的应用

团体心理辅导是在团体的情境下进行的一种心理辅导形式,通过团体内人际交互作用,促使个体在交往中观察、学习、体验,认识自我,探索自我等,学习新的态度与行为方式,以促进良好的适应与发展的助人过程。青少年自伤行为的发生,通常有个体或群体干预,可以有效地控制个体或群体的行为。

结果 通过促进家庭成员之间的沟通和合作,帮助青少年建立良好的人际关系,使其积极配合治疗和护理工作。同时团体心理干预可让受助者在团体中感受到安全和支持,进而产生一种归属感和归属感。

结论 综上所述,青少年非自杀性自伤行为是一个亟待关注和解决的问题。通过加强研究、制定有效干预措施并改善护理现状,有望为青少年提供更好的支持和帮助,促进其身心健康发展。

某军队综合医院护士情绪衰竭现状及影响因素研究

史艳茹 李琦 曹效亲 孙莎莎 李瑶 乔昱婷*

中国人民解放军空军军医大学第一附属医院(西京医院)

目的 情绪衰竭是指个体由于情感资源被过度消耗儿感到疲惫不堪、工作无助的负面心理状态。护士的情绪衰竭会降低护士的身心健康和工作质量。

工作场所压力如工作负荷是引发员工情绪衰竭的主要因素。依据内在动机理论,当人们从事自己选择的活动时,通常会产生更高的幸福感和满足感。本研究旨在探究军队医院护士情绪衰竭现状水平,不同特征护士情绪衰竭水平的差异,以及探索角色过载这一主观工作负担和职业妥协对其的影响,为护理管理工作提供参考依据。

方法 采用方便抽样法,于2024年5-6月以某军队综合医院507名护士为研究对象,采用一般资料调查表、情绪衰竭量表、职业妥协量表表和角色过载量表进行横断面调查。

结果 军队医院护士情绪衰竭得分(11.98 ± 7.95)分,其中180人得分高于临界值(15分),结果显示:不同性别、年龄、工作年限、职称、岗位、夜班数、工作后学历提升及个人职业规划情况的护士的情绪衰竭总分差异有统计学意义($P<0.05$)。军队医院护士职业妥协得分(31.48 ± 10.47)分,角色过载得分(16.03 ± 4.65)分;护士职业妥协、角色过载与情绪衰竭均呈正相关($r=0.499\sim 0.679, P<0.001$);多元线性回归分析结果显示:年龄、个人是否有明确职业规划、职业妥协和角色过载进入回归方程($P<0.001$),共解释总变异量的51.1%。

结论 本组研究对象中三分之一护士存在情绪衰竭,军队医院护士情绪衰竭水平与地方医院相当,均处于中等低下水平。随着年龄增长护士情绪衰竭水平逐渐降低,个人有明确职业规划的护士情绪衰竭程度较无规划护士低,护士主观感受到的工作负荷和职业妥协感对护士的情绪衰竭程度产生影响。护理管理者应更加关注年轻护士,做好护士职业规划的引导,多举措降低护士职业妥协水平和主观工作负担,以期持续降低护士情绪衰竭水平。

关键词:情绪衰竭;职业妥协;角色过载

1 例精神疾病患者住院期间外出检查外走行为分析与处置

彭春丽*

联勤保障部队第九二三医院

目的 分析精神疾病患者住院期间外出检查外走行为,并制定针对性地处置对策,提高精神科工作人员对精神疾病患者住院期间外出检查外走行为

的防范能力和规范处置。最大限度地降低或避免患者外走行为的发生。

方法 在临床中,发现1例酒精所致精神障碍患者外出检查时外走的病例。

患者男,46岁,因“饮酒20余年,多疑伴记忆力下降5月余”第1次入院,患者于20年前开始饮酒,喝醉后行为冲动,脾气暴躁,骂老婆孩子、动手打人,砸家里的东西,夜间睡眠差,入睡困难。现为了进一步治疗,遂于今日至我科门诊就诊,门诊拟诊“记忆下降查因:器质性精神障碍?”收入我科。

精神状况检查:神清,定向准,查及可疑幻听,有牵连观念,情绪不稳,焦虑紧张,醉酒后脾气暴躁,情感反应尚协调,有冲动伤人毁物行为。自知力不全。

事件经过及处置流程:2023-12-11,16时患者在护工人员陪护下外出检查时趁护工人员不注意擅自外走,根据查医院监控录像发现,患者独自乘坐门诊大厅入目的出租车离开医院,车牌号为桂Axxxx。已第一时间报告科室及医院卫勤医疗总值班室,到中山派出所报警、联系家属告知患者外走情况。通过公安协助及出租车司机提供信息,明确买者从医院打车到琅东客运站,得知患者有可能前往藏庙方向、后接患者家属电话告知患者已回家,在工作人员协同下去到患者家中,经与患者及家属积极沟通,患者及家属愿意回医院积极配合治疗,并将患者及家属一起接回医院。

结果 通过规范处置,患者及时找回,并形成住院期间外出检查规范流程。

结论 在分析精神疾病患者住院期间外出检查外走行为的基础上制定有针对性的防范摄施和处置规范,能有效降低患者外出检查期间外走不良事件发生率及处置的有效性减少住院患者因外走行为而引起的医疗纠纷,确保患者安全。

精神科病房如何做好危险品管理与防范分享

岑俊翰*

中国解放军联勤保障部队第九二三医院

目的 精神科护理质量管理中的重要组成部分,而病房安全管理主要内容是危险品的管理,下面分

享如何做好危险品管理与防范,从而提高精神科临床护士的工作质量,保证患者安全。

方法 从以下案例分享:某天凌晨,患者小李坐在床边,迟迟不睡觉,护士李某(工作2年)问她,你怎么不睡啊。她说等一会,李某护士说那你坐一会休息。患者小李点了下头,护士就巡视病房去了,巡视回来看见小李的左手腕处有划痕,及时通知医生处理。病史回顾:小李,男,12岁,入院时,情绪低落,交流无障碍,曾有自伤行为,自伤自杀量表评分10分,已作为重点看护。目前入院10天,配合治疗,睡眠改善,交流顺畅,没有发现异常情况,说有人控制自己大脑让自己自伤,于是摔坏了塑料喝水杯,拿塑料碎片划破左手腕部。原因分析:1.对小李的自伤自杀风险缺乏预见性。2.护士李某对小李的情绪变化没有及时疏导。3.夜班值班人员少,没有和同伴沟通患者的情况。4.护士李某工作经验不足,对患者的心理变化不能及时发现。精神疾病的特殊性,患者的行为控制能力较低,发生不良事件的比率高于普通病房,危险物品的管理不到位,导致不良事件时有发生。为保证患者的住院安全,危险物品的管理尤其重要。精神科危险物品汇总 1.易碎品:2.利器类:3.绳索类:4.药物类:5.易燃易爆类:6.金属类:7.饮品类。针对以上7类危险物品,精神科对危险物品进行管理和防范必须做到以下①各类危险品,严格管理。②建立台账,定点放置,做好记录。③医疗器械,要注意保护,防止丢失,用后清点数目放回原处。④患者入院时,仔细检查危险品,发现危险品,立即交给家属带回或登记保管。⑤住院期间,患者外出检查或会客后回病区时,注意检查危险物品,防止流入病房。⑦病房应每月进行安全检查,杜绝安全隐患。使用危险物品务慎重,在护理人员监管下使用。⑧外人来访,入病房后,要有护理人员陪同,任务完成后进行安全检查,确保安全。⑨患者活动范围,不能随意进入工作区域。⑩工作人员养成自觉关门的习惯,严格做到随走随关门。⑪座谈会时对患者进行危险物品的健康宣教,使患者知晓危险物品的危害性。

结果 精神科危险物品未进入病区,患者未发生自残自杀现象,患者住院安全得到提高。

结论 做好精神科安全管理,就能对患者安全得以保障。精神科的安全工作是事无巨细,管理上不放过任何一个细小的环节,就能杜绝或减少各种不安全因素的发生。

关键词:精神科;危险物品;管理与防范

如何改善精神科护士的职业压力分享

岑俊翰*

中国解放军联勤保障部队第九二三医院

目的 精神病患者易出现自伤自杀、冲动毁物现象,对各种治疗与护理极不配合。精神科护理人员大多时间直接与患者接触,容易受到患者言语及肢体的伤害。精神科护理人员在工作中,面对这种特殊的患者,要遭受暴力行为的攻击,还需时刻提高警惕,防止患者意外事件的发生,精神高度紧张。在多重因素的影响下,精神科护士严重不足,精神科护士的执业倦怠感也很明显,通过以下分享,精神科护士如何改善临床护士的心理压力。

方法 通过心理干预对策,看看如何改善护士的心理压力。1.改善工作环境,提高工资待遇,精神科采用封闭式管理模式,精神科本身起步较晚,在药物配置、发放及物资下收下送等方面也落后于其他机构及科室,无形增加护士人力成本。管理部门改善医院工作环境,完善配套的后勤管理系统,减轻护士工作量,还护士于患者。2.加强人性化管理,护士长对护理人员的管理与支持可以减轻他们的工作压力。因此,护士长要善于学习管理理论知识及技巧,护理部可以安排护士长参加各种培训,定期组织护士长经验交流会,鼓励护士长加强交流,分享个人经验。重点关注特殊人群、特殊时期护理人员的思想动态,尽可能提供帮助。医院可以设置“减压坊”或者采取小组心理减压的方式,缓解临床护理人员的心理压力。护理部每年可以选派一些优秀护理人员到外院进行参观学习,提升护理人员工作积极性。3.鼓励护理人员提高心理素质(1)医院层面:院内成立心理辅导专家团队,定期了解护理心理状态,进行心理培训和辅导,在护理人员受到各种伤害或遇到意外时间后,心理辅导专家第一时间对护理人员进行心理援助,必要时采取巴林特减压模式。(2)个人层面:护理人员学习心理学知识与技能,培养护理人员健全的人格,保持稳定的情绪及乐观的精神,必要时采取正念减压法,环节心理压力。4.建立良好的社会与家庭支持系统(1)医院层面:精神卫生知识的宣传,让更多的人了解并关注精神卫生工作。(2)家庭层面:鼓励精神科护理人员的家

人,为他们营造和谐的家庭氛围。特别是单独家庭,管理部门应督促家长与子女做好沟通,帮助他们解决生活和工作中的困惑。(3)同事层面:工作中大家要形成互助友爱的工作氛围,齐心协力处理好各项日常工作。

结果 通过以上干预对策,精神科护士心理压力有所改善。

结论 通过系统的干预,有助于精神科护士对职业的认同感,改善护士的职业倦怠,提升职业成就感。

关键词:如何改善;精神科护士;职业压力

甲状腺功能与青少年非自杀性自伤相关性的研究进展

刘佳琪¹ 冯坤²

1.北京中医药大学东直门医院

2.清华大学玉泉医院(清华大学中西医结合医院)精神卫生科

目的 非自杀性自伤(NSSI)是指个体故意伤害自己身体但无自杀意图的行为,这一行为在青少年中尤为常见,严重影响了青少年的身心健康和社交活动。近年来,甲状腺功能异常与NSSI之间的关系逐渐受到关注。本研究旨在归纳总结甲状腺功能与青少年NSSI行为之间相关性的研究进展。

方法 本文通过文献回顾的研究方法,整理分析了近年来关于甲状腺功能与青少年NSSI行为之间关系的相关临床或试验研究,并按甲状腺功能的指标分类进行文献汇总归纳,总结各项甲状腺功能指标与青少年NSSI行为之间相关性的研究进展。

结果 文献回顾显示,甲状腺功能异常与NSSI行为有显著的相关性。其中多数研究发现T₄、FT₄与青少年NSSI行为具有正相关性,T₃、FT₃以及FT₃/FT₄的比值水平与青少年NSSI行为具有负相关性,这可能与NSSI患者T₄到T₃的异常转换有关。而各项研究中TSH水平与青少年NSSI的关系结果不一,高TSH水平与低TSH水平均可见于青少年NSSI患者。甲状腺功能异常可能导致情绪调节障碍、认知功能及应激反应出现异常等,这些因素可能共同促进了NSSI行为的发生。此外,甲状腺激

素对青少年神经发育和成熟以及心理健康都具有重要作用,青少年处在青春期的特殊阶段,其甲状腺激素水平的变化可能与NSSI行为的出现有关。

结论 本研究结果提示,甲状腺功能异常可能是青少年NSSI行为的一个潜在风险因素。未来的研究需要进一步探索甲状腺功能与NSSI行为尤其是青少年NSSI行为之间的因果关系,并评估甲状腺功能相关指标水平作为青少年NSSI风险评估和干预的潜在生物标志物的可行性、敏感性及特异性。甲状腺功能的评估和管理对预防和治疗青少年NSSI行为具有重要意义,未来的研究应持续关注甲状腺功能对NSSI行为的影响,并开发针对青少年NSSI群体甲状腺功能异常的相关预警及干预治疗措施。

关键词:甲状腺功能;青少年;非自杀性自伤;研究进展

青少年自尊与非自杀性自伤的关系-疏离感的中介作用

许春杏 张雨晴 蒙永彩* 马宏丽 李萌 张耀木
中国人民解放军联勤保障部队第九二三医院

目的 探讨青少年疏离感在自尊和非自杀性自伤之间的中介作用,以期为青少年非自杀性自伤的防治提供理论基础和参考依据。

方法 选取南宁市某医院精神心理科门诊就诊的60例伴有非自杀性自伤行为的青少年为研究组,社会上招募与其性别、年龄、受教育年限与之相匹配的60例不伴有非自杀性自伤行为的青少年作为对照组,分别用青少年自我伤害问卷(adolescents self-harm scale)、自尊问卷(Self-esteem Scale)、青少年学生疏离感问卷(adolescent students'alienation scale, ASAS)进行测评。使用SPSS 22.0软件对数据进行Spearman相关分析。采用Process v3.5程序对疏离感在自尊与非自杀性自伤之间的中介效应进行分析,设置模型序号为4,采用偏差校正的非参数百分位Bootstrap法对中介效应进行检验。

结果 自尊和青少年非自杀性自伤呈显著负相关($r=-0.467, p<0.01$)、疏离感和青少年非自杀性自伤呈显著正相关($r=0.615, p<0.01$),自尊和疏离感呈显著负相关($r=-0.489, p<0.01$);疏离感在青少年自尊和非自杀性自伤之间起到完全中介作用($\beta=-$

1.6781, 95% CI: -3.1031~-0.7664)。

结论 疏离感在青少年自尊和非自杀性自伤之间起完全中介作用,自尊影响青少年非自杀性自伤,主要通过疏离感间接影响青少年非自杀性自伤。

关键词:非自杀性自伤;青少年;自尊;疏离感;中介效应

人工智能赋能通识课《医学心理学与健康生活心理学》的设计与思考——以“梦的解析”为例

滕羽鸥 冯坤*

清华大学玉泉医院

人工智能作为 21 世纪的新兴技术,为教育领域带来了深远影响。本文以通识课《医学心理学与健康生活》“梦的解析”为例,分析传统课堂中“梦的解析”教学设计和优劣,进而设计人工智能赋能对教学环节的优化过程,并对其展开了思考和讨论。

传统课堂中的“梦的解析”教学设计是基于弗洛伊德的理论,旨在揭示学生梦境背后的潜意识愿望和冲突,以达到心理治疗的效果。该设计将“梦的解析”作为课程的一部分,通过课堂引导和作业,促进学生对自己内心世界的理解和认知。然而,传统教学存在一些优劣势。优势方面,该设计有助于学生深入思考并理解自己的内心世界,提升他们对梦境和心理冲突的认知水平。通过授课教师的指导和评价,学生可以获得专业的心理建议,有助于缓解心理压力,提升心理健康水平。劣势方面,学生作业的批改需要大量时间和精力,教师的评价标准可能存在主观性,影响了评分的公正性和客观性。

人工智能可以优化教学设计。以“梦的解析”为例,在教学环节上,AI 不仅可以提升教学效率,还能实现个性化教学和学生作业的深度评价。AI 辅助教学可以提取学生作业的主要内容,并与学生进行互动。在这一过程中,AI 提供的内容评价可作为独立的体验模考,为对自我梦境感兴趣的人群提供专业的参考建议。在辅助功能上,AI 可实现的功能有通用功能、专用功能和拓展功能。通用功能包括对学生提交的作业进行批改评价,学生和教师之间进行信息传递和交流等;专用功能包括对教学内容和任务进行具体分析和评价并提供相关专业建议;拓

展功能则包括根据学生提交的作业和表现,对学生的学习和成长进行个性化引导和建议,帮助学生理解自己的梦境,认识自己的内心冲突和矛盾,以及处理心理压力的方法等。

心理学课程具有独特的社会学和医学双重背景,AI 赋能课程的设计需要考虑到具体时间、伦理问题和心理健康促进的挑战,以避免让学生产生过度依赖和心理负担。同时,AI 技术本身也需要不断完善和更新,以适应教学实践的需求。个体化的学习过程和心理健康促进也需要更加细致的考量和设计。因此,在 AI 赋能课程的实践过程中,需要综合考虑教学、伦理和心理健康的多重因素,更好地运用人工智能技术来促进心理学教育实践和学生心理健康的发展。

关键词:人工智能,高等教育,通识课,心理学

抑郁障碍青少年复学困难的思考

滕羽鸥 冯坤*

清华大学玉泉医院

目的 抑郁障碍青少年在症状控制后复学阶段,可能出现复学失败、抑郁复发等情况。本文深入讨论了这一阶段可能存在的困难并提出了相应建议。

结果 复学困难的社会因素包括学习压力、社交压力和环境压力。抑郁障碍青少年在学习过程中可能出现注意力不集中、学习能力下降等问题,导致学习压力增加,进而影响复学的难度。学校教师 and 同学对抑郁障碍的认知不足,可能导致对患者的不理解和不接受,影响其社交能力和交友动力以及复学过程中的心理状态和情绪波动。

复学困难的深层原因包括获得感、幸福感和安全感的缺失。抑郁障碍青少年更需要获得感作为学习的动力,但是反复出错、被批评等负面体验可能导致获得感下降,进而复学失败;其次,青少年处于成长阶段,需要得到他人和社会的认同和支持,但是成绩下降和社交问题可能导致幸福感的减少,进而影响学习和生活的体面和尊严;最后,抑郁障碍青少年可能在复学后面临转型问题,家庭和患者对于职业选择和发展的了解不足,可能导致安全感的缺失,进而影响学业的顺利进行。

因此,对于抑郁障碍青少年而言,应该家庭、学

校、医疗、社会等多方支持,重视他们的获得感、幸福感和安全感,提供支持和指导,帮助他们建立积极的学习态度和规划未来,顺利复学。为了提升获得感,各方应注重抑郁障碍青少年在复学前的准备工作。家庭应接纳患者的厌学、拒学情绪和行为,给予支持和缓冲空间。学校应评估患者学习能力和注意力,并逐渐适应学校作息。为了提升幸福感,各方应帮助患者增加自我认同。学校和社会应正视抑郁障碍青少年群体,建立对疾病的正确认识,并加强社会认同带来的幸福感。为了提升安全感,各方应加强对患者的学业规划和职业规划的支持,让患者和家庭清晰了解未来的职业和所需的学业储备。家庭应意识到休学是治疗的需要,支持患者进行职业探索。学校可以提供线上教学支持,帮助患者维持学业。

结论 通过以上建议,可以为抑郁障碍青少年复学困难问题提供一定的解决方案和帮助,促进他们顺利完成复学过程,减轻其复学困难,有助于改善社会对抑郁障碍的认识和理解,促进社会心理健康事业的发展。

肿瘤相关性抑郁的研究进展

陈嘉悦¹ 冯坤² 滕羽鸥²

1.浙江大学附属金华医院

2.清华大学玉泉医院(清华大学中西医结合医院)

肿瘤相关性抑郁是指肿瘤诊断、治疗过程中出现情绪化,体验快乐的能力下降,失眠,精神运动迟钝,疲劳,无价值或内疚感,难以集中注意力,以及重复的自杀或死亡想法的疾病。现阶段恶性肿瘤已成为威胁人类健康的重要疾病,而肿瘤相关性抑郁在肿瘤患者中普遍存在,其中女性以及晚期癌症患者比例更高,病种上以乳腺癌占比最高。肿瘤相关性抑郁的发生在一定程度上影响着肿瘤患者的生存率。而且研究发现癌症患者照料者出现肿瘤以及抑郁的概率更高,以癌症患者的伴侣最易发生。目前肿瘤相关性抑郁的机制研究较少,主要围绕炎症-神经机制以及神经-免疫机制展开,诱发肿瘤相关性抑郁的原因则有诊断肿瘤时的心理应激以及缺乏社会支持等社会-心理因素以及肿瘤治疗产生的病理性质

因素等。临床上,肿瘤相关性抑郁的筛查与评估尚不完善,筛查以 PHQ-2 问卷推荐较多,评估主要以筛查出程度较重的抑郁为主,如情绪不良(情绪低落、悲伤或焦虑)、快感缺乏(丧失兴趣或快乐)、无价值感或过度内疚、专注力和决策能力受损、自杀意念和行为 5 个方面中出现 3 个或者患者出现自杀意念,可能提示肿瘤患者存在重度的肿瘤相关性抑郁,需转专科干预治疗。此外,肿瘤相关性抑郁的治疗推荐使用阶梯式、渐进式的管理模式,即先评估严重程度并予以相同等级的干预治疗措施,并提出在药物治疗前,非药物治疗手段应首先加以考虑。非药物治疗有健康教育、正念疗法、认知行为疗法、接纳和承诺治疗等方法,推荐程度较高的为正念疗法和认知行为疗法,但有研究表明接纳和承诺治疗可能更适合肿瘤相关性抑郁患者。药物治疗以传统抗焦虑、抑郁治疗为主,如 5-羟色胺类/去甲肾上腺素类抗抑郁药、苯二氮卓类、三环类和杂环类药物以及单胺氧化酶抑制剂等药物的应用,但需注意考虑与抗肿瘤药物之间的相互作用,避免出现不良反应,保证用药的安全性。此外,近几年传统医学在治疗肿瘤相关性抑郁方面也取得一定疗效。当前针对肿瘤相关性抑郁的研究越来越多,但现阶段仍存在临床样本量少、质量参差不齐等问题,肿瘤相关性抑郁仍有待进一步研究。

The Analysis of The Risk Factors and Prevention Measures of Nosocomial Infection in Psychiatric Patients under Different Management Mode

Yufang Zhou* Shuili Chen Tianyang Miao Cuixia Liu Xing Zheng Youtian Wang Shengwei Wu Xiaodong Chen Aixiang Xiao Junrong Ye Huaijie Li Jianxiong Guo

The Affiliated Brain Hospital of Guangzhou Medical University

Objective To study the difference in risk factors of nosocomial infection in psychiatric patients under the mode of containment management and non-containment management, and to develop targeted prevention

Methods The patients with nosocomial infection were selected in the Affiliated Brain Hospital of Guangzhou Medical University during the period of non-containment management from January 2016 to December 2018 and the period of containment management from January 2020 to November 2022. The data pertaining to patients with infection was retrospectively analyzed in our study, and the influencing factors of nosocomial infection were analyzed by univariate and multivariate Logistic regression models

Results Hospitalized patients who developed nosocomial infections during containment and non-containment management differed in terms of gender, psychiatric diagnosis, infection diagnosis, seasonality, fever occurrence, duration of antibiotic use, and the admission to ICU. Multivariate Logistic regression model showed that among patients with schizophrenia, depression and bipolar affective disorder who developed nosocomial infection, there was a binary logistic regression relationship between the occurrence of fever and whether to take containment management, the cause of infection, the number of days of antibiotic use, and the admission to ICU

Conclusion In psychiatric wards, there are obvious differences in the factors affecting nosocomial infection under the mode of containment management and non-containment management. Under the mode of containment management, Patients with nosocomial infections in psychiatric wards are primarily affected by the disease itself. Patients with depression and bipolar disorder are more susceptible to both the mode of containment management and nosocomial infection. Conversely, patients in psychiatric wards under non-containment management are more likely to be affected by seasonal and environmental factors. In order to prevent nosocomial infections and promote the physical and mental recovery of patients, targeted preventive measures should be implemented in psychiatric wards based on the hospital management mode and the type of mental illness

A 簇人格障碍患者的催眠暗示性与人格障碍功能风格之间的关联

张冰人¹ 潘冰² 王俊杰¹ 朱振宇¹ 陈旭裕¹, Timo Juhani Lajunen³, Wei Wang³

1.杭州师范大学

2.浙江大学附属第二医院

3.挪威科技大学

目的 人际关系高度敏感和不信任是 A 簇人格障碍(偏执型、分裂样、分裂型人格障碍)患者的主要特征,这可能是与他们极易受到来自环境的负面暗示有关。然而,催眠暗示性与这类患者人格障碍功能风格之间的确切关联还有待阐明。

方法 我们分别在杭州一家三甲医院和一所综合性高校中随机邀请了 36 名 A 簇人格障碍患者(患者组,男性 19 人,女性 17 人)和 115 名健康志愿者(对照组,男性 52 人,女性 63 人),完成 Parker 人格问卷(Parker Personality Measure)和斯坦福催眠暗示性量表 C 式(Stanford Hypnotic Susceptibility Scale: Form C)测试。分析方法如下:(1)分别采用 t 检验和 Mann-Whitney U 检验比较两组的人口学变量、Parker 人格问卷因子分、斯坦福催眠暗示性量表 C 式总分和各项目通过率;(2)采用多元方差分析和事后 Bonferroni 检验分析分组(患者组/对照组)和催眠水平(低/中/高)对人格障碍功能风格的主效应和交互作用;(3)分别采用皮尔逊相关和多元线性回归分析检验患者组中催眠项目通过率与 Parker 人格问卷因子分之间的相关关系和预测作用。

结果 (1)两组年龄、性别、受教育程度、既往催眠经历无显著差异。

(2)与对照组相比,患者组在 Parker 人格问卷的偏执型、分裂样、分裂型、边缘型、回避型和依赖型人格障碍功能风格上得分更高;在催眠暗示性总分和其中的挑战暗示、手下垂暗示、手臂僵硬暗示、梦境暗示和手臂固定暗示项目上通过率更高。

(3)在患者组中,梦境暗示负向预测了分裂样人格风格,幻听暗示负向预测了分裂型人格风格,蚊子幻觉正向预测了表演型和依赖型人格风格,手臂固定暗示负向预测了回避型人格风格。

结论 对他人感知方面暗示的不敏感性和对身体的高度控制加剧了 A 簇人格障碍患者的偏执态度

和人际回避倾向。这一发现有助于了解 A 簇人格障碍患者人际关系问题的原因，以进行针对性的暗示治疗。

关键词：A 簇人格障碍，催眠暗示性，偏执型，分裂样，分裂型

Practical Implications of ICD-11 Personality Disorder Classifications

Bing Pan¹, Bingren Zhang², Wei Wang³

1.Second Affiliated Hospital, Zhejiang University School of Medicine, Zhejiang University

2.Hangzhou Normal University,

3.Norwegian University of Science and Technology

Abstract Personality disorders (PDs) are associated with an inferior quality of life, poor health, and premature mortality, leading to heavy clinical, familial, and societal burdens. The International Classification of Diseases-11 (ICD-11) makes a thorough, dramatic paradigm shift from the categorical to dimensional diagnosis of PD and expands the application into adolescence. We have reviewed the recent literature on practical implications, and severity and trait measures of ICD-11 defined PDs, by comparing with the alternative model of personality disorders in the fifth edition of the Diagnostic and Statistical Manual of Mental Disorders (DSM-5), by mentioning the relevance in forensic and social concerns, and by referencing the developmental implication of life span, especially in adolescence. Study results strongly support the dimensional utility of ICD-11 PD diagnosis and application in adolescence which warrants early detection and intervention. ICD-11 permits the diagnosis of PDs at any age if a special trait persists over two years. By incorporating a continuum of severity, ranging from none to difficulty and from mild to severe, ICD-11 moves away from specific disorders, which may contribute to a reduction of stigma associated with PDs. More evidence-based research is needed along the ICD-11 PD application, such as its social relevance, measurement simplification, and longitudinal design of lifespan observation and treatment.

团体沙盘游戏在精神心理科住院患者中减压的应用

李家珍 李雪一* 陈海变 蔡晓丽

中山大学附属第五医院

目的 团体沙盘游戏是一种多人共用一个沙盘进行的团体心理干预方式，本研究探讨其对精神心理科住院患者的减压作用。

方法 选取 2022 年 2 月份-6 月份的精神心理科住院患者，在团体沙盘游戏前进行广泛性焦虑自评量表 (GAD-7) 评估，在团体沙盘游戏前、后使用量表询问评估患者的压力分值 (0~10 赋值法，压力越大则分数越高)。团体沙盘游戏治疗干预 90 分钟，包括 4 个环节：(1) 治疗前交谈和成员间熟悉 (15 分钟)；2、创作沙盘和分享 (45 分钟)；3、治疗性对话与讨论 (20 分钟)；4 拍照留念，记录及整理 (10 分钟)。

结果 共纳入住院患者 59 例，GAD-7 结果显示轻度焦虑 16 例，中度焦虑 19 例，重度焦虑 12 例。82.5% 的患者在团体沙盘游戏后的压力分值下降，团体沙盘游戏后压力分值 (2.68±2.60) 显著低于团体沙盘游戏前 (4.71±3.06) (P<0.05)。其中 69% (11/16) 轻度焦虑者，79% (15/19) 中度焦虑者和 50% (6/12) 重度焦虑患者在团体沙盘游戏后得到改善。

结论 团体沙盘游戏可有效缓解精神心理专科住院患者的压力情绪，尤其伴有轻度和中度焦虑者，值得推广。

伴寄生虫病妄想的躯体形式障碍 1 例

孙燕茹 高存友*

上海交通大学医学院附属同仁医院

患者女, 55岁, 因“右上腹隐痛、口干、乏力10余天”入感染科住院, 诊断为肝功能不全, 因身上虫爬眠感、眠差请精神科会诊。

【病史补充】患者20年前无明显诱因出现多种躯体不适, 感觉血管里有虫爬感, 但不能说出其的形状和大小, 无法确定其来源, 称其可能是坐月子期间妇科炎症打青霉素的时候进入体内的, 在血管里单路线钻动, 钻到哪里就哪里不舒服, 有时钻到背部血管, 就会背痛, 钻到心脏就会出现胸闷心慌, 爬到肺部就会得肺炎, 爬到肚子就会出现腹痛, 爬到头部就会头晕头痛, 无皮肤瘙痒感。称虫子在身上就会“免疫力差, 容易感冒”, 全身乏力, 上述症状时好时坏, 感冒时加重, 影响情绪和工作。10年前开始出现失眠, 超过半小时才能入睡, 曾在当地医院及我院其他科室就诊, 诊断为“焦虑状态”、“植物神经功能紊乱”、“失眠”, 患者认为病情严重, 反复要求检查, 要求做冠脉介入手术取出虫子, 接受过中药、“芬必得”、“黛力新”、“天舒胶囊”治疗, 虫爬感可通过转移注意力及中药调理减轻, 其他疗法无明显疗效。

患者自幼体健, 产后容易感冒。性格中间性格, 文盲, 已婚, 育有1子, 家庭关系和睦, 目前为家庭主妇, 曾做过保洁工作, 家族中无精神疾病患者。

【体检】入院时右上腹轻微压痛、反跳痛, 住院后腹痛减轻, 余未见明显阳性体征, 全身皮肤无黄染, 皮肤无明显搔抓痕迹。

【精神检查】意识清, 定向全, 接触好, 问答切题, 存在寄生虫病妄想及多种体感不适, 存在抑郁及焦虑情绪, 反复就医, 入睡困难, 既往无持续性情感高涨体验, 无消极言行, 有部分自知力。

【其他检查】丙氨酸氨基转移酶558U/L, 肺炎支原体抗体弱阳性(+/-), 呼吸道合胞病毒抗体弱阳性(+/-)。甲状腺及颈部淋巴结超声: 双侧甲状腺结节性病灶: TI-RADS3类, 随访; 左侧颈部IV区可疑淋巴结。冠脉CTA: 左前降支少许肺钙化斑块伴轻微狭窄, CAD-RDS 1, 上腹部CT平扫、乙肝检测、甲胎蛋白、血尿粪常规等检查未见明显异常。汉密尔顿焦虑量表: 有较明显焦虑症状(22分)。汉密尔顿抑郁量表: 目前有些抑郁症状(23分)。

【诊断】躯体形式障碍、寄生虫病妄想

【治疗】予护肝、护胃、抗感染治疗以及艾司唑

仑、度洛西汀联合阿立哌唑治疗, 患者腹部不适、口干等躯体症状好转出院, 但仍有虫爬感, 建议患者出院后到我院精神科门诊就诊。

关键词: 躯体形式障碍, 内脏幻觉, 寄生虫病妄想

探讨慢性心力衰竭患者的认知功能损伤情况及其相关影响因素分析

陈啸* 李佟

无锡市荣军医院

目的 探讨有氧运动及其联合认知行为治疗(CBT)对慢性心力衰竭(CHF)患者认知功能损伤的改善作用。

方法 使用蒙特利尔认知评估量表(MoCA)对江苏省荣军医院住院治疗及无锡市山北街道社区康复的CHF患者进行评估, 选取认知功能损伤的CHF患者90例, 根据各自需要完善强心、利尿、扩血管等常规临床抗心衰治疗, 随机分成有氧运动干预组、有氧运动联合CBT干预组及对照组, 每组30例。采用MoCA、汉密顿焦虑量表(HAMA)、汉密顿抑郁量表(HAMD)评价3组患者在有氧运动干预及其联合CBT干预3个月前后得分并进行比较, 同时比较3组患者左心室射血分数(LVEF)的变化。

结果 干预前, 有氧运动干预组和对照组、有氧运动联合CBT干预组和对照组、有氧运动干预组和有氧运动联合CBT干预组分别进行MoCA评分、HAMA评分、HAMD评分及LVEF比较, 差异均无统计学意义($P > 0.05$); 干预后有氧运动干预组及有氧运动联合CBT干预组MoCA评分、HAMA评分、HAMD评分及LVEF均优于对照组, 存在统计学差异($P < 0.05$), 有氧运动联合CBT干预组MoCA评分、HAMA评分、HAMD评分均优于有氧运动干预组, 有统计学差异($P < 0.05$)。

结论 有氧运动对CHF患者认知功能损伤具有明显的改善作用, 在其基础上联合CBT能够进一步促进认知功能的恢复, 全面提高患者生活质量。

关键词: 慢性心力衰竭; 认知功能损伤; 影响因素

血管紧张素转换酶抑制剂对慢性心力衰竭患者认知功能障碍的改善作用

陈啸* 李佟 张嘉玮
无锡市荣军医院

目的 探讨血管紧张素转换酶抑制剂(ACEI)对慢性心力衰竭(CHF)伴认知功能障碍患者认知功能的改善作用。

方法 选取江苏省荣军医院住院治疗及无锡市山北街道合并认知功能障碍的CHF患者60例,采用随机数表法将患者分为治疗组和对照组,各30例。对照组患者的治疗包括病因治疗、去除诱因、改善心力衰竭等传统疗法,治疗组在对照组基础上给予ACEI治疗。分别采用蒙特利尔认知评估量表(MoCA)、汉密顿焦虑量表(HAMA)和汉密顿抑郁量表(HAMD)分别评估患者的认知功能、焦虑和抑郁状况。采用SPSS 21.0统计软件分析数据。

结果 干预前,2组患者MoCA各项评分及总分比较,差异均无统计学意义($P > 0.05$)。干预后,与对照组相比,治疗组患者MoCA各项评分均有所增加,其中视空间及执行能力 $[(4.27 \pm 0.52) \text{ vs } (2.70 \pm 0.54) \text{ 分}]$ 和总分值 $[(24.70 \pm 1.09) \text{ vs } (22.23 \pm 1.43) \text{ 分}]$ 差异有统计学意义($P < 0.01$)。与干预前比较,治疗组干预后各项MoCA评分均增加,其中总分 $[(24.70 \pm 1.09) \text{ vs } (22.60 \pm 1.54) \text{ 分}]$ 和视空间及执行能力 $[(4.27 \pm 0.52) \text{ vs } (2.77 \pm 0.68) \text{ 分}]$ 差异有统计学意义($P < 0.05$)。干预前及干预后,2组患者间心功能、左室射血分数、焦虑、抑郁评分比较差异均无统计学意义($P > 0.05$);各组干预前后上述指标比较差异亦无统计学意义($P > 0.05$)。治疗期间2组患者心功能始终处于稳定状态,均未诱发急性心功能衰竭,药物治疗种类及方案也未调整。2组患者均未出现严重不良反应,亦未出现新的合并症。

结论 ACEI类药物能够改善CHF患者的认知功能,提高患者的执行能力。

关键词: 血管紧张素转换酶抑制剂;慢性心力衰竭;认知功能障碍

单相和双相抑郁障碍之间临床特征差异的Meta分析

付佳佳 孙志刚*
石家庄市第八医院

目的 综合评价单相抑郁症(Unipolar Depression, UD)和双相情感障碍抑郁发作(Bipolar depressive episode, BDE)之间的临床特征差异,为临床精准诊断提供依据。

结果 最终纳入15篇文献,其中中文文献10篇,英文文献5篇,UD患者3110例,BDE患者2043例为研究对象。Meta分析结果显示:两组之间具有统计学差异($P < 0.05$)的各临床特点以及OR值(95%CI)分别为:首次发病年龄6.41(2.60, 10.21),发病年龄 < 25 岁0.56(0.45, 0.71),性别(男)0.53(0.31, 0.92),发作无诱因4.24(2.80, 6.43)、每次抑郁发作间隔 < 3 个月0.57(0.45, 0.73),抑郁发作次数 > 3 次0.58(0.40, 0.84)、心境不稳定0.67(0.53, 0.85),精神病性症状0.43(0.29, 0.63),精神运动性迟滞0.59(0.46, 0.76),睡眠过多0.58(0.50, 0.68),食欲下降0.81(0.66, 0.99)。

结论 BDE多表现为首发年龄更年轻,多 < 25 岁,男性比例更高、抑郁发作更频繁,且多无发作诱因,临床特征为心境不稳定,多伴有精神病性症状、精神运动性迟滞,以及更多的非典型抑郁特征(如睡眠过多、食欲下降等);而UD患者发病多有诱因刺激,女性比例更高,且存在明显的生物节律紊乱。上述临床特征有助于早期识别单相和双抑郁障碍,继而降低误诊率,为临床提供有效服务。

关键词: 单相抑郁;双相抑郁发作;临床特征;荟萃分析

中国道家认知治疗的临床实践——有与无

俞少华*
浙江大学医学院附属第二医院

目的 优秀传统哲学思想可在心理治疗中应用,道家即为其中之一。道家倡导天人合一的思维方式、顺应自然的行为原则、返朴归真的价值取向、崇俭抑奢的生活信条、柔弱不争的处世之道。中国道家

认知治疗是在西方认知治疗的框架上,结合中国人的性格特征,把道家处世养生哲学用于调整焦虑抑郁强迫障碍等心理治疗。作者以个案实践来探讨该法疗效及相关的有无思考。

方法 用道家认知疗法进行 3-6 个月的干预。按照中国道家认知治疗的 ABCDE 技术,依次进行。A 为评估精神压力;B 为调查信念或价值系统;C 为分析心理冲突和应付方式;D 为道家哲学思想的导入;E 为评估和强化。其中 D 为关键步骤,让患者了解、认同、牢记并遵循 32 字保健诀即:利而不害,为而不争;少私寡欲,知足知止;知和居下,以柔胜刚;清静无为,顺其自然。每次治疗 50 分钟,每 1-2 周一次。单纯心理治疗或合并药物治疗。个案治疗前后进行 SCL-90, EPQ 等相关心理测评,并描述患者感悟体验。

结果 心理测评显示个案心理症状减轻,个人体验则人际和谐度增加。来访对“知足知止”“止境”“有无相生”等各有体悟。A.感觉“顺其自然”最有效,“不要太强求身体”,以前晚上钻研产品,效率不高,现作息也更规律,更符合自然。变化:不发不刷朋友圈、抖音,不看小红书,不打游戏。症状消除之后的空白,“无之以为用”再次的领悟。B. 利而不害:可以赚钱获益,共赢,不伤害他人。C. 有无相生:有为、无为相生,不刻意做什么,也不刻意不做什么;D. 止境:同辈竞争,自愿加班,甚至周末,文件反复修改,耗费太多,最后不愿再看,家庭关系受损,身心疲惫,于是止境,文件的时间,每天的工作时间。

结论 按照道家认知治疗的理论和技术,在心理治疗过程中找出影响患者行为和情绪背后的价值观,了解其生活事件与应对方式,根据道家处世养生原则调整认知方式,促成行动的改变,能够起到较好的治疗效果。有助于缓解症,平衡人生。特别是有无、有为无为对症状的理解,或达跳出的领悟

关键词: 中国道家认知治疗,强迫症,社交焦虑症,有无

The Chinese Version of The Self-Injurious Thoughts and Behaviors Interview-Revised (C-SITBI-R): Assessing NSSI and Suicidal Behaviors Among Adolescents in Clinical Settings

Yihui Liu^{1,2}, Jiarong Liang^{1,2}, Cailan Hou^{1,2}

1.Southern Medical University

2.Guangdong Provincial People's Hospital

Objective Self-injurious thoughts and behaviors (SITBs) are rising among youth, with significant prevalence in China post-COVID-19. Existing assessment tools often lack comprehensiveness. The revised Self-Injurious Thoughts and Behaviors Interview (SITBI-R) addresses these gaps but hasn't been adapted for Chinese adolescents. This study translated and validated the SITBI-R for use among Chinese adolescents in clinical settings to improve diagnosis and risk evaluation of non-suicidal self-injury (NSSI) and suicidal behaviors

Methods A total of 170 adolescents were recruited from two hospitals. The Chinese version of SITBI-R (C-SITBI-R), the MINI-International Neuropsychiatric Interview, the Revised Version of Adolescents Self-Harm Scale, the Chinese Version of Functional Assessment of Self-Mutilation, the Beck Scale for Suicide Ideation-Chinese Version, and NSSI and suicidal behavior disorder (SBD) diagnoses criteria from the DSM-5 were utilized. Data analysis included the Item-Content Validity Index, Universal Agreement Scale-Content Validity Index, Spearman's rank coefficient of correlation, Intraclass Correlation Coefficients, Cohen's Kappa and Fleiss' Kappa

Results The C-SITBI-R demonstrated perfect content validity (I-CVI=1.00, S-CVI/UA=1.00). The construct validity shows significant correlations to other validity measurement tools in terms of total scores compare and independent items. Test-retest reliability and interrater reliability were excellent. The C-SITBI-R showed high consistency with DSM-5 criteria for NSSI ($\kappa=1.00$) and SBD ($\kappa=0.86$), and for the current suicide risk in M.I.N.I. ($\kappa=0.94$)

Conclusion Overall, the C-SITBI-R exhibited excellent psychometric properties comparable to the original version. This study provides evidence supporting the reliable use of the C-SITBI-R in clinical settings

关键词: Self-injurious thoughts and behaviors, non-suicidal self-injury, suicidal behavior disorder, DSM-5 diagnoses criteria, Chinese adolescents, clinical

Network Connectivity between Internet Addiction, Depression, and Insomnia in College Students

Yongyi He Yuan Yang Cailan Hou*

Guangdong Mental Health Center, Guangdong Provincial People's Hospital (Guangdong Academy of Medical Sciences), Southern Medical University

Objective The COVID-19 pandemic has increased the prevalence of Internet addiction, insomnia, and depression, particularly among college student. This study aimed to investigate the complex inter-relationships among symptoms of Internet addiction, insomnia and depression in college students through network analysis

Methods This study was conducted in Guangzhou, China, from Jan 2023 to Mar 2024. Participants were recruited through consecutive sampling from Guangdong Mental Health Center and Guangdong Peizheng College. All participants completed the Internet Addiction Test (IAT), Insomnia Severity Index (ISI), and Patient Health Questionnaire (PHQ-9). Network analysis was employed to investigate the network structure, central symptoms, bridge symptoms, and network stability of these disturbances. All participants completed the Internet Addiction Test (IAT), Insomnia Severity Index (ISI), and Patient Health Questionnaire (PHQ-9). Network analysis was employed to explore the network structure, central symptoms, bridge symptoms, and network stability of these disturbances

Results A total of 1235 college students participated in this study. Depressive and insomnia symptoms were more central in the model compared to IAT symptoms. The most central nodes within the network were 'motor' (#PHQ8, strength = 1.418) and 'Do you feel depressed, moody, or nervous when you are offline, which goes away once you are back online?' (#IAT20, strength = 1.350). The least central node was 'Problems waking

up too early' (#ISI3, strength = 0.615). Several depressive symptoms (e.g., 'suicide', 'sleep', and 'guilty') acted as important bridging symptoms connecting internet addiction, depression and insomnia communities. The network stability of this model was high (CS=0.597)

Conclusion Depressive symptoms, particularly 'suicide', acted as important trans-diagnostic symptoms that connect different communities. These findings suggest that interventions targeting suicide and sleep issues may be effective in preventing or reducing symptoms of Internet addiction, depression, and insomnia

关键词: college student, depression, internet addiction, insomnia, network analysis

锌指蛋白 A20 在精神疾病中的研究进展

李莹 刘志芬*

山西医科大学第一医院

目的 精神疾病是一组具有高发病率和高复发率的复杂疾病。随着研究的深入,其神经免疫机制逐渐成为研究的热点。锌指蛋白 A20 是一种多功能的胞质蛋白,在多种炎症疾病的发展中扮演重要的角色。近期研究发现, A20 通过神经免疫机制作用于精神疾病,调节脑部神经炎症,缓解精神症状。因此,本文将详细讨论 A20 的结构特征、生物学功能,以及其在精神疾病中的研究进展,旨在为精神疾病的发病机制提供新的视角,并为未来的治疗策略提供可能的靶点。

方法 本文通过 Pubmed、中国知网、万方数据知识服务平台、维普中文期刊服务平台和中国生物医学文献数据库查阅 A20 和精神疾病相关文献,时间不限,对搜索结果整理和归纳。

结果 A20 在抑郁症、双相情感障碍和精神分裂症等疾病中具有重要作用,可通过多种信号通路调控炎症反应,促进胶质细胞向炎症表型转变,同时在多种药物中发挥抗炎作用,增强机体免疫,改善精神症状。

结论 A20 具有抗神经炎症和神经保护作用。它作为抗炎蛋白,可多靶点抑制 NF- κ B 通路激活,保护细胞免受促炎因子诱导的细胞凋亡和炎症反应。在精神疾病中, A20 表达水平降低,与疾病严

重程度负相关。研究发现, A20 可调控精神疾病的炎症反应, 发挥神经保护作用。多种药物、中药成分和活性化合物可上调 A20 的表达, 在精神疾病中具有重要作用。

关键词: 锌指蛋白 A20, 精神疾病, NF- κ B, 神经免疫

护士心灵成长工作坊的初步构建与实践

廖巧玲 李作为* 薛莲

绵阳市第三人民医院(四川省精神卫生中心)

目的 探索护士心灵成长工作坊的建设、管理规范及运行模式, 并评价其实践效果。

方法 依托医院心理护士队伍, 以护理部、工会、基层党组织建设及身心融合模式的开展为助力, 成立护士心灵成长工作坊, 建立完善相应规章、制度、流程及保障机制, 围绕临床各层级护理人员开展心理评估、筛查、干预及心理科普系列服务。

结果 护士心灵成长工作坊成立于 2022 年 5 月, 2022 年 6 月—2023 年 6 月, 面向临床护理人员开展线上+线下心理评估与筛查 1609 人次, 个体心理治疗 23 人次, 团体心理治疗 38 次, 开展心理科普讲座 4 次, 心理护士咨询门诊坐诊人员由 2 人增加至 6 人, 培养家庭心理治疗师 5 人。全院护士季度满意度调查显示总体满意率由 91.3% 上升至 93.6%, 心理护理人才队伍专科化水平稳步提升, 课题论文等科研产出持续增加。工作坊成立后, 心理护士职业认同感各维度和总评分均高于成立前 ($P < 0.05$), 职业倦怠中情感衰竭评分低于成立前, 个人成就感维度评分高于成立前 ($P < 0.05$), 护理队伍焦虑、抑郁情绪检出率低于成立前 ($P < 0.05$), 但仍高于国家常模。

结论 护士心灵成长工作坊的建立, 有助于缓解临床护士焦虑抑郁情绪, 满足临床护士心理需求, 提升心理护士的职业认同感, 降低职业倦怠的发生, 为专科护理人才的培训与运用提供了更多思路。

关键词: 护士; 心灵成长工作坊; 构建与实践

综合医院精神科住院患者跌倒预防流程的优化和应用

刘晓梅*

山西医科大学第一医院

目的 综合医院精神科住院患者跌倒预防流程的优化和应用

方法 依托医院护理不良事件上报系统, 将 2022 年 1 月 1 日~12 月 30 日实施综合医院常规跌倒预防措施的精神卫生科住院患者作为对照组, 其总床日数为 11156 例; 2023 年 1 月 1 日~2023 年 12 月 31 日常规跌倒预防措施基础上精神卫生科住院患者跌倒预防方案的患者作为实验组, 其总床日数为 11024 例。实验组成立精神科跌倒预防管理小组, 回顾分析 2022 年我科住院患者跌倒不良事件, 结果显示: 跌倒多发生于 60 岁以上老年人, 并多发生在清晨和夜间, 患者如厕、上下床、走廊行走时。下肢功能障碍、精神障碍患者更容易发生跌倒。60% 的患者在有陪护情况下发生跌倒, 38% 跌倒风险评估非高危的患者发生跌倒。52% 跌倒患者受到不同程度的伤害。使用鱼骨图对跌倒原因进行分析, 根据二八定律, 得出改善重点是: 患者及家属依从性差、患者风险意识不足、护士风险评估不全面、患者高估自我能力。通过优化环境管理, 组织多部门联合行动; 针对精神科患者进行个性化的跌倒预防; 开展《跌倒风险评估》专项活动, 对跌倒高风险患者进行动态评估; 丰富宣教形式, 鼓励患者及家属主动参与式健康宣教方式等举措进行跌倒预防。比较两组患者住院期间跌倒发生率、跌倒伤害占比。

结果 对照组跌倒发生率 0.06/1000, 实验组跌倒发生率下降至 0.02/1000; 跌倒伤害占比下降至 18%。

结论 优化后的精神卫生科跌倒预防方案, 可有效降低精神科住院患者跌倒及跌倒伤害发生率, 使跌倒管理更为全面有效, 值得借鉴及推广。

聚焦安全感的存在团体心理治疗的疗效观察

肖国强 周伯荣*

Third Affiliated Hospital of Guangzhou Medical University

目的 存在主义团体治疗(EGP)是一种起源于西方文明的心理治疗方法,旨在通过“死亡、自由、孤独、无意义”等主题找寻人生的意义,然而其对来访者的安全感提升作用仍未得到明确。该研究主要探究存在主义团体治疗对来访者安全感的疗效。

方法 共有 20 名质性心理障碍来访者被随机选取参与团体治疗,每周以小组形式提供治疗,持续 10 周。并在治疗前后通过量表对来访者的安全感进行检测,其他感兴趣的变量主要包括焦虑抑郁、失眠、简易应对方式、社会支持、死亡焦虑等方面。同时还通过对门诊对来访者半年及一年的心理状况及使用药物情况进行了随访。

结果 通过量化研究与质式研究相结合的方式,可以发现经过团体治疗后,来访者人际安全感($p<0.05$)有着显著的改善。焦虑抑郁、失眠、积极应对方式均($p<0.05$)有着明显改变。但是也可以发现来访者在死亡焦虑($p<0.05$)有所提升,社会支持、死亡态度等方面($p>0.05$)无明显改善。在 1 年的门诊随访中,有 11 名来访者(55%)在相继停药,余患者也均有不同程度降低药物使用量。质式研究则发现以团体凝聚力、希望重塑及利他主义等治疗因子在团体治疗中具有关键作用。

结论 EGP 能够显著提升来访者安全感,并改善心理健康水平。

关键词: 安全感,存在主义团体治疗,疗效,心理健康水平

焦点解决护理对中青年腹膜透析患者心理状态及生存质量的影响

余卫卫*

东南大学附属中大医院

目的 研究焦点解决护理对中青年腹膜透析患者心理状态及生存质量的影响。

方法 将 2022 年 03 月~2023 年 03 月在我院肾内科住院的中青年腹膜透析患者 88 例作为研究对象,采用随机数字法分为对照组和观察组,两组各 44 例。对照组患者给予常规护理,观察组患者在常规基础上实施焦点解决模式护理。比较两组患者的肾脏病和透析相关生存质量(KDTA)、汉密尔顿焦

虑量表(HAMA)、汉密尔顿抑郁量表(HAMD)及实验室生化指标。

结果 实施焦点解决护理模式干预后,观察组患者 KDTA 总分、疾病负担、认知功能、社交质量、睡眠、社会支持、医护鼓励及患者满意度 8 个项目中评分均高于对照组,具有统计学意义($P<0.05$);HAMA、HAMD 评分显著低于对照组($P<0.05$);白蛋白及血红蛋白指标均较对照组升高,差异具有统计学意义($P<0.05$);Ca、P、Scr、BUN 指标较对照组均降低,差异具有统计学意义($P<0.05$);观察组患者 Kt/V 指数更加优于对照组,差异具有统计学意义($P<0.05$)。

结论 在中青年腹膜透析患者中应用焦点解决护理模式,通过积极引导,发挥患者自身潜能,有效应对疾病状态,缓解患者负性情绪,使患者透析依从性更好,从而提升生存质量。

关键词: 中青年;腹膜透析;焦点解决护理;焦虑抑郁;生存质量

反刍思维与青少年拒学行为的关系

翟佩云 刘志芬*

山西医科大学第一医院

目的 全世界近五分之一的青少年存在拒学行为,对青少年心理健康及其家庭、社会发展造成持续不良影响,应该对拒学行为及其影响因素进行早期识别与干预。本研究探讨反刍思维与拒学行为的关系,为拒学行为的干预提供参考。

方法 选取 2023 年 11 月至 2024 年 3 月在山西医科大学第一医院精神卫生科就诊的、符合拒学行为标准的 25 例青少年为研究对象,年龄 12-18 岁($M=15.2$; $SD=1.78$)。使用反刍反应量表(RRS)、修订版拒学评估量表(SRAS-R)、儿童拒绝上学行为问卷(CSRBQ)、贝克抑郁量表(BDI-II)和儿童焦虑相关情绪障碍筛查(SCARED)对青少年的反刍思维、拒学情况和焦虑抑郁情绪进行评定。

结果 结果表明,拒学青少年的 RRS 评分与拒学程度(CSRBQ 评分)呈正相关($r=0.426$, $p<0.05$),与拒学行为功能(SRAS-R)中的回避消极负面情绪和引起重要他人关注呈正相关($r=0.454$, 0.452 , $p<0.05$);RRS 评分与青少年焦虑(SCARED)、抑郁

(BDI-II) 情绪评分呈正相关 ($r=0.637$ 、 0.657 , p 均 <0.01); 拒学程度与焦虑、抑郁情绪的相关关系未达到统计学意义。

结论 反刍思维与青少年拒学行为相关, 可能是诱发拒学行为主要的认知原因。

关键词: 青少年拒学行为; 反刍思维; 焦虑; 抑郁

浅谈心身科门诊人文关怀在医院高质量发展中的应用

范静怡* 王云琼 古怡仙

四川省医学科学院·四川省人民医院

目的 门诊是患者就诊的第一站, 门诊医疗和护理服务质量直接影响医院的社会形象和经济效益。心身医学科门诊患者多数自知力不完整而拒绝治疗、情绪低落、易激惹、冲动行为、伤人等特点。因此, 推行改善医疗服务, 建立以患者需求为导向的心身医学科门诊服务模式将有效提高患者的诊疗效率, 提升患者就医体验尤为重要。探讨心身医学科门诊人文关怀在医院高质量发展中的应用, 以及其研究进展, 为针对性改善患者就诊体验工作提供依据。

方法 ①研究对象: 心身医学科门诊就诊患者, 其具体定义为: 在心身医学科医院挂号就诊且诊断为精神类疾病的患者。②研究内容: a. 人文关怀在心身医学科门诊护理服务中的实践。b. 人文关怀在心身医学科门诊对于医院高质量发展做出的贡献。③研究方法: 通过文献评阅法对国内外研究进行文献检索和再次分析。

结果 ①就诊患者就医体验良好, 满意度显著上升。②医务人员通过人文关怀更加有归属感。③医疗服务中实施人文关怀能显著提高就医人员健康水平。

结论 对心身医学科门诊患者实施基于人文关怀理念, 能够减轻患者其内心焦虑、抑郁情绪, 提高患者满意度持续落实改善医疗服务工作要求, 通过优化门诊候诊时间的服务流程、加强一站式门诊服务建设、提升门诊质量服务能力等系列工作, 推进门诊服务模式优化创新, 探索构建公立医院高质量发展门诊管理新体系, 为建立健全现代医院门诊管理制度提供实践经验。

关键词: 人文关怀; 心身医学科门诊; 满意度; 医院高质量发展

老年肺结节合并焦虑患者肺功能变化特征

赵鹏¹ 王强¹ 由丽²

1. 南京大学医学院附属鼓楼医院

2. 南京医科大学附属脑科医院

目的 探究老年肺结节合并焦虑患者肺功能变化特征

方法 收集 2022 年 1 月至 2024 年 4 月在南京医科大学附属脑科医院 (胸科院区) 住院拟手术治疗的符合肺部结节诊治中国专家共识中肺结节诊断标准的老年肺结节患者 524 例。抑郁自评量表 (SDS) 评估患者抑郁严重程度, 焦虑自评量表 (SAS) 评估患者焦虑严重程度, 其中 SAS 标准分 ≥ 50 分的为焦虑组, 共 319 例; SAS 标准分 < 50 分的为非焦虑组, 共 205 例。受试患者完成 SAS 量表的当天进行肺功能检测, 比较两组的肺功能指标, 用力呼气容积 (FVC)、第一秒用力呼气容积 (FEV1)、第一秒用力呼气容积/用力呼气容积 (FEV1/FVC)。

结果 两组患者的性别、年龄、肺结节部位、肺结节大小、肺结节个数及发现病程无统计学差异 ($p > 0.05$)。焦虑组的 SDS 标准分显著高于非焦虑组 (50.52 ± 3.65 : 32.74 ± 8.22 ; $p < 0.01$); 焦虑组 FVC 百分比值显著低于非焦虑组 (88.73 ± 18.21 : 95.06 ± 24.27 ; $p < 0.01$); 焦虑组与非焦虑组 FEV1 百分比值及 FEV1/FVC 值无统计学差异 ($p > 0.05$)。

结论 老年肺结节合并焦虑患者 FVC 下降。

关键词: 肺结节, 肺功能, 焦虑, 用力呼气容积

轻度认知障碍 APOE E4 等位基因携带者记忆损害特征的 Meta 分析

吴家静¹ 景良洪¹ 杨洪艳² 冯乾森² 汪子琪² 王飞燕²

1. 重庆市人民医院

2. 成都市第四人民医院

目的 探讨轻度认知障碍 (Mild cognitive impairment, MCI) 患者载脂蛋白 E (Apolipoprotein E, APOE) ϵ 4 等位基因携带者与非携带者记忆损害的特征。

方法 检索了 Pubmed、Embase、Cochrane Library、中国知网、重庆维普、万方数据库、中国生物医学文献服务系统, 收集从建库至 2023 年 6 月公开发表的关于 MCI 患者 APOE ϵ 4 等位基因与认知行为的研究, 并由 2 名研究员独立筛选文献、提取资料并评价纳入研究的偏倚风险后, 采用 RevMan 5.3 软件对记忆认知损害特征进行 Meta 分析来评价不同分类变量的结果概况。

结果 共纳入 14 篇符合条件的文献纳入 Meta 分析。Meta 分析结果显示, APOE ϵ 4 等位基因携带者记忆损害更严重 (SMD=-0.33, 95%CI:-0.49~-0.18, $P<0.01$), 亚组分析结果显示, 长延迟回忆 (SMD=-0.42, 95%CI:-0.7~-0.15, $P<0.01$); 瞬时记忆 (SMD=-0.39, 95%CI:-0.77~-0.02, $P=0.04$); 视觉学习与记忆 (SMD=-0.31, 95%CI:-0.55~-0.07, $P=0.01$); 工作记忆 (SMD=-0.04, 95%CI:-0.32~0.24, $P=0.8$)。

结论 轻度认知障碍患者 APOE ϵ 4 等位基因携带者的认知功能比非携带者存在更大的损害, 未来针对 APOE4 出发的针对性干预可能是有效防止认知进行损害的靶点之一。

关键词: 轻度认知障碍; APOE ϵ 4 等位基因; 记忆损害; Meta 分析

青少年抑郁共病网络成瘾的现状与机制的研究进展

齐艺闰 李改智 温宇娇 乔丹 刘志芬*
山西医科大学第一医院

目的 网络成瘾和抑郁症这两种心理健康问题在青少年群体中均有较高的患病率, 且两者的共病现象也比较常见。本文旨在描述青少年网络成瘾与抑郁症的共病的情况, 归纳共病的核心心理机制与神经生理机制。

方法 采用文献综合分析方法, 通过在 PubMed 数据库、Web of Science、CNKI 等数据库中以 “Internet Addiction”、“Problematic Internet Use”、“Pathological Internet Use”、“adolescent”、“depressive

disorder”、“网络成瘾”、“青少年抑郁症”等关键词进行检索, 梳理和整合已有文献的研究成果并进行归纳总结。

结果 在网络成瘾的青少年群体中抑郁症的累计患病率为 32%; 青少年抑郁症样本中, 网络成瘾的患病率为 27.2%, 抑郁症是网络成瘾的诱发因素, 网络成瘾者也更容易罹患抑郁症。

究其原因, 共病的心理机制可以用社交迁移理论、补偿理论、自我疗愈理论与共同因素理论解释。在神经生理方面, 奖赏功能紊乱和执行功能损伤被认为是共病的核心病理机制。

结论 在青少年群体中, 网络成瘾与抑郁症之间存在复杂的双向关系, 现有的研究结果并不能得出一个统一的结论。通过对共病原因的归纳总结, 本综述指出未来研究应更深入地探索共病群体相较于单独一种疾病群体的特点, 以提供更有针对性的干预措施。

关键词: 青少年; 网络成瘾; 抑郁症; 心理机制; 奖赏功能; 抑制控制

聚焦解决模式在临床护理中的研究进展

陈慧仙¹ 康凤英² 李素萍³

1.山西医科大学护理学院

2.山西医科大学第一医院

3.山西医科大学第一医院精神卫生科

摘要 本文通过介绍聚焦解决模式 (solution-focused brief therapy, SFBT) 的概念、起源和发展以及理论基础、评估工具、干预实践的步骤、原则和使用技术等, 概括聚焦解决模式在国内外精神病患者、癌症患者以及慢性疾病患者中的干预现状和效果。聚焦解决模式是在积极心理学发展起来的一种新型干预模式, 是一种充分尊重和相信个体潜能的临床心理干预模式, 于 20 世纪 70 年代末提出, 最初是在以家庭治疗为中心的基础上逐渐发展起来的, 主要应用于治疗心理学和临床心理咨询中, 与 Bowen 的家庭系统理论及 A.T.Beck 的认知行为疗法共称为北美家庭治疗师最常引用的 3 种方法之一。该模式由 McAllister 引入护理领域, 于 2007 年被引入中国。随着其干预体系和内容的丰富以及充分尊重患者并激发患者主动参与自我管理的优势而受到

临床护理工作者的广泛认可及应用。近年来已在国际临床护理领域受到越来越多的关注。该模式下的干预将重点放在更关注个体的优势资源,更关注系统的综合作用,干预的方法较易学习和掌握。尤其是在各种慢性疾病患者的干预中。本文为研究者基于我国基本卫生服务实际情况,贴合我国社会文化环境,开发构建适合我国护理领域的聚焦解决模式的临床护理干预方案,为医护人员实施临床护理心理干预提供参考。

Bedtime Music Therapy for College Students with Insomnia: A Randomized Assessor-blinded Controlled Trial

Jianli Yang* Danni Yan Yufei Wu Ruihan Luo
Tianjin Medical University General Hospital

Objective Insomnia, a prevalent sleep disorder in contemporary society, frequently coexists with other mental health conditions such as depression, schizophrenia, and obsessive-compulsive disorder. Sleep disorders can compromise daytime functioning and overall quality of life. While music has been explored as an adjunct therapy for insomnia, its efficacy in improving insomnia among students remains unclear

Methods Seventy-five students, aged between 18 and 30 years with an average age of 20.97 years (SD: 1.92), presenting sleep issues were randomly allocated to one of three groups: the classical music group, the jazz music group, and the control group, each with 25 participants. Participants in the classical and jazz music group were instructed to listen to classical or jazz music for a minimum of 30 minutes preceding bedtime. This was paired with deep breathing and relaxation techniques, practiced two consecutive nights per week from 23:00 to 01:00 over a five-week intervention period. Conversely, participants in the control group were only directed to follow the deep breathing and relaxation techniques before sleep on two consecutive nights weekly. Insomnia severity with the Insomnia Severity

Index (ISI), sleep quality was assessed using the Pittsburgh Sleep Quality Index (PSQI), depressive symptoms with the Beck Depression Inventory-II (BDI-II), and anxiety symptoms with the Self-rating Anxiety Scale (SAS). Measurements were taken at baseline, after the second week of intervention, at the intervention's conclusion (five weeks), and two months post-intervention (follow-up)

Results 1. The music groups showed a significant difference in insomnia severity compared with the control group after five weeks of intervention ($p < 0.001$). 2. Music groups exhibited significant enhancements in sleep quality relative to the control group after a five-week intervention ($p < 0.001$). 3. Regarding mood enhancement, music groups showed significant improvements in depression and anxiety symptoms compared to the baseline after the five-week intervention ($p < 0.05$). Notably, the control group also displayed improvements in these symptoms post-intervention

Conclusion 1. Integrating music into a consistent bedtime routine ameliorates sleep quality and insomnia severity. However, no specific genre of music emerged as the superior choice for pre-sleep listening. 2. While music can considerably enhance mood indicators like depression and anxiety, techniques such as deep breathing and mindfulness also contribute positively

关键词: Bedtime music therapy, college students, insomnia

经颅磁刺激治疗抑郁症不同症状群的研究进展

张晓雨 刘志芬*
山西医科大学第一医院

目的 抑郁症是常见精神疾病之一,严重影响患者的日常工作及生活。近年来,经颅磁刺激技术(transcranial magnetic stimulation, TMS)在抑郁症的临床应用中显示出了一定的疗效。本文以不同症状为切入点,系统回顾了TMS治疗抑郁症不同症状群的临床研究,以期TMS技术对抑郁症的个体化治疗提供科学借鉴意义。

方法 采用文献综合分析方法,通过在 PubMed 数据库、Web of Science、CNKI 等数据库中以“Transcranial Magnetic Stimulation”、“depressive disorder”等关键词进行检索,梳理和整合已有文献的研究成果并进行归纳总结。

结果 各种 TMS 方案已在 MDD 中进行了大量临床实验,其中,高频 rTMS 应用于 DLPFC 区对 MDD 患者的抑郁症状具有明显的抗抑郁疗效,视觉 V1 区及眶额叶等区域可能同样为治疗 MDD 的潜在靶点。TBS 及 dTMS 作为 rTMS 衍生而来的技术,近年来,越来越多的研究也已经肯定了其抗抑郁疗效,加速 TBS 刺激方案更是为短程抗抑郁治疗提供了可能,dTMS 的其他线圈可能同样是干预抑郁症的潜在方案。TMS 对 DLPFC 的刺激不仅能改善 MDD 患者的抑郁症状,还能缓解伴随的焦虑症状。在认知功能方面,rTMS 显示出改善 MDD 患者执行功能、注意力和记忆力等受损维度的潜力。TBS 和 dTMS 对 MDD 患者的认知功能也显示出初步的改善效果,而 TBS 是否作为一种更优的认知功能增强技术,仍需进一步的研究来验证。综合来看,针对 MDD 患者的躯体症状,rTMS 无论是单独使用还是与其他治疗方式联合,均被认为是一种有效的治疗方法。rTMS 已经被证明可以减少 MDD 患者的自杀意念和行为,但其起效较慢,可能需要数周甚至数月才能显著见效。相比之下,iTBS 及其加速形式 aiTBS 在抗自杀方面表现出更为突出的效果,并且起效速度更快。

结论 TMS 技术在干预 MDD 不同症状群中展现出了潜力,通过利用 TMS 技术来调节不同症状群相关脑环路的皮质兴奋性与神经可塑性,可以开发出更多有效的个体化干预策略,与其他治疗模式的联合也可能导致更为全面和有效的治疗方案。

关键词: 经颅磁刺激,抑郁症,情感症状,认知功能,躯体症状,行为症状

舍曲林致凝血障碍(消化道出血、尿路出血)一例【罕见病例】

王舒婷*

渠县人民医院

目的 探讨舍曲林在抑郁障碍治疗中对凝血功

能的影响

方法 案例报告 一例 77 岁老年女性,因抑郁障碍服用舍曲林 50mg qd,4 天后加至 50mg bid,入院时血常规、尿常规、凝血未见异常,7 天后出现血便量约 100ml,血尿;立即复查凝血:凝血酶原时间测定 $\geq 120S$,国际标准化比值 ≥ 5 ;尿常规:尿潜血+3,红细胞(RBC-J)4016;粪便隐血试验(OB)阳性,泌尿系超声、胃镜、肠镜未见明显异常。立即停用舍曲林,予以输注血浆纠正凝血、补充维生素 K1,2 天后未再有血便、血尿,复查凝血 凝血酶原时间测定 15.30S,国际标准化比值 1.240。1 月后、2 月后、3 月后的随访未再出现血便和血尿、凝血正常。

结果 本例患者因抑郁障碍单药服用舍曲林,服药前辅助检查未见明显异常,口服舍曲林后抑郁症状好转,但同时出现凝血功能障碍,血便、血尿,排除相关因素及停用舍曲林后,凝血功能逐渐恢复正常,血便、血尿停止,可能这与舍曲林能将华法林从血浆蛋白中置换出来,增加凝血酶原时间这一因素有关。因此其凝血障碍(消化道出血、尿路出血)与舍曲林可能存在因果关系。

结论 舍曲林作为一种常见抗抑郁药物,其不良反应发生率低,凝血障碍发生率更少见,甚至罕见,但仍会发生。因此我们精神科医生要充分了解舍曲林的点,适时监测,减少罕见的不良反应的发生。

关键词: 舍曲林 凝血障碍 出血

Experience and Attitude of Psychiatric Nurses in Caring for Patients with Repeated Non-suicidal Self-injury in China: A Qualitative Study

leiyu yue*

Mental Health Center of West China Hospital, Sichuan University

Background The incidence of non-suicidal self-injury (NSSI) is high and often occurs repeatedly. Psychiatric nurses play a vital role in the care and treatment of NSSI patients, as they have the most frequent contact with patients. The attitude of nurses has a direct affect on the quality of care they provide to patients. Negative

care experiences and attitudes of patient aversion on behalf of nurses may delay the observation and treatment of changes in the patient's condition, leading to irreversible risks. Although cross-sectional studies have investigated the attitudes of medical staff toward NSSI patients, quantitative research results cannot comprehensively reflect the emotional experiences and complex psychological changes of the study subjects. A few studies have focused on the psychiatric nurses' care experiences and attitude toward patients with repeated NSSI

Objective This study aimed to explore psychiatric nurses' care experiences and attitudes toward patients during repeated NSSI

Methods A qualitative descriptive design using individual, semi-structured interviews. Using purposive sampling, 18 psychiatric nurses were recruited from a mental health center in Chengdu, China. Semi-structured interviews were conducted and audio-recorded. Audio-recordings were transcribed verbatim and analyzed using thematic analysis

Results Four themes emerged from the analysis: psychiatric nurses' care experience, perceptions, care attitude and coping style toward repeated NSSI patients. Psychiatric nurses have experienced negative care experiences and severe career burnout during the patient's repeated NSSI. Nurses' attitudes toward NSSI patients changed during repeated NSSI, from understanding to indifference to anger and resentment. At the same time, it was found that nurses' coping style with NSSI patients could be divided into three stages, namely, active coping, neglect and perfunctory, and criticism and punishment

Conclusion The findings have implications for health care systems regarding interventions to improve nurses' care experience and attitude toward repeated NSSI patients. These findings suggest that enhancing nurses' understanding of NSSI, establishing standardized emergency response and intervention programs, guiding positive professional values and responsibility, and improving nurses' caring attitudes can promote the early detection and timely intervention of NSSI.

关键词: Non-suicidal self-injury, repeated NSSI, psychiatric nurses, care experience, care attitude, qualitative study

青少年精神障碍患者服药感受调查分析

王雅琴 向敏*

中国人民解放军联勤保障部队第九二三医院

目的 改善青少年精神障碍患者服药主观感受不良体验,从而提高服药依存性及用药治疗效果。

方法 使用用药满意度问卷(MSQ)评估37名青少年精神障碍患者对服用抗精神病药物的感受。量表得分使用SPSS 25.0统计软件进行分析。本文采用描述统计分析。

结果 评估对象的服药感受,其中,服药感觉满意例数共21人(56.8%);服药感觉既无不满意也不觉满意共11人(29.7%);服药感觉不满意共5人(13.5%)。

结论 青少年精神障碍是指某种不正常、不合理的行为引发的功能障碍综合征,对青少年的正常生活与学习、社会功能造成严重影响。有研究显示,目前临床使用的抗精神病药、抗抑郁药、抗焦虑药及催眠药等多都缺少药品说明书的应用许可,其表述多为“目前缺少足够临床经验”或“儿童和青少年的安全性和有效性尚未进行评价”,因此临床对于儿童精神疾病的药物治疗一定程度上缺少法律上的支持。本文作者调查中,服药感觉既无不满意也不觉满意共11人(29.7%);服药感觉不满意共5人(13.5%)。可见,有约50%青少年精神障碍患者对服药治疗感受不佳。因此,改善青少年精神障碍患者服药主观感受不良体验,从而提高服药依存性及用药治疗效果,也是目前治疗青少年精神障碍领域亟待解决的问题。

关键词: 青少年,精神障碍,服药,主观感受

Biochemical Metabolism in Youth Major Depressive Disorder Patients with Or without Cognitive Impairments

Shijie Luo Yanbin Jia*

Department of Psychiatry, First Affiliated Hospital, Jinan University

Background Major depressive disorder (MDD) and insomnia have been linked to deficiencies in cognitive performance. However, the underlying mechanism of cognitive impairment in MDD patients with cognitive impairment (CI) remains unclear. This study aimed to explore the effects of IS in patients with MDD by comparing cognitive function indices among those with IS, those without Cognitive impairment (CI), and healthy controls (HCs). In addition, we assessed whether the dysfunction of central nervous system (CNS) is one of the important pathophysiologic mechanisms of CI in patients with MDD by comparing the biochemical metabolism ratios in the anterior cingulate cortex (ACC) and putamen

Method 39 MDD with CI, 66 MDD without CI, and 68 demographically matched HCs underwent the MATRICS Consensus Cognitive Battery (MCCB) assessment and proton magnetic resonance spectroscopy (1H-MRS). MCCB cognitive scores and biochemical metabolism in ACC and putamen were assessed and compared between groups

Results Compared to the HCs group, CI and NCI groups scored significantly lower in seven MCCB cognitive domains (speed of processing, attention/vigilance, working memory, verbal learning, visual learning, reasoning problem solving and social cognition). CI group also showed significantly lower score in seven MCCB cognitive domains than NCI group. And CI group showed higher Cho/Cr ratio in the right ACC vs. NCI group and HCs. CI group and NCI group both showed higher Cho/Cr ratio in the left putamen vs. HCs

Conclusion Patients with comorbidity of MDD with CI may exhibit more serious MCCB cognitive impairments than those without CI in all seven MCCB cognitive domains. Also, dysfunction of ACC may underlie the neural substrate of cognitive impairment in MDD with CI. Dysfunction of putamen may underlie the common neural substrate of MDD with or without cognitive impairment

关键词: Anterior cingulate cortex; Putamen; Cognitive impairment; Major depressive disorder; Proton magnetic resonance spectroscopy.

精神障碍患者静脉血栓栓塞的风险因素研究进展

孔兰兰 冀二妮*
深圳市康宁医院

目的 静脉血栓栓塞(venous thromboembolism, VTE)是一种静脉回流障碍疾病,主要包括深静脉血栓(deep venous thrombosis, DVT)和肺血栓栓塞(pulmonary embolism, PE)。VTE具有高发病率、高漏诊误诊率、高死亡率和疾病负担重等特点。研究显示精神障碍患者有较高的VTE风险,住院的精神障碍患者中VTE的发生率约为43/10000人年,是普通人群VTE发病率的1.5至6倍,约4%的精神障碍患者意外猝死与PE相关。VTE的临床表现多不典型,精神症状影响医生对患者躯体状况的判断,不配合的精神障碍患者不能充分描述其躯体不适等,这些因素使得VTE在精神专科医院易被漏诊。早期识别VTE可以提高精神科临床诊疗的安全性。

方法 本文主要就VTE在精神障碍患者中常见的风险因素进行综述,为精神科医师早期识别VTE提供一定的线索指导。

结果 精神障碍患者疾病本身的特点、共病、不同精神类药物、物理治疗、身体约束等因素都会增加精神障碍患者VTE的风险。

结论 VTE临床症状不典型,导致诊疗延迟,增加猝死风险。当精神障碍患者存在多种VTE的风险因素时,医务人员应尽早安排患者完善静脉血管彩超和/或肺动脉CT血管造影(CT pulmonary angiography, CTPA),早期识别VTE,减少漏诊率,以确保临床诊疗安全。

早期识别与分析大学生中精神病风险综合征的临床特征

姜振东 金粉淑* 罗晓玉 张立国
武汉市武昌医院

目的 预防精神分裂症发生过程中,应早期识

别以及干预前驱期,可将疾病转化率下降,可将临床结局改善。本研究旨在早期识别大学生中的精神病风险综合征,并对其临床特征进行深入分析。

方法 本研究分为两个阶段进行。在第一阶段,我们使用包含 16 条目的前驱期问卷对 600 名大学生进行筛查。第二阶段则采用精神病风险综合征结构化访谈(使用诊断测评工具 SIPS)进行进一步评估。为此,我们随机选择了 90 名前驱期问卷结果为阴性的大学生和 90 名结果为阳性的大学生。对于符合精神病风险综合征(根据 SIPS)诊断标准的个体,我们还使用了简明国际神经精神访谈来评估其可能存在的共病情况。

结果 在我们的样本中,精神病风险综合征的检出率为 15.00%。与其他症状相比,轻微阳性症状更为普遍,尤其是知觉异常/幻觉和异常思维内容。在诊断为精神病风险综合征的学生中,有 63.33% (57/90)的学生目前或既往共病至少 1 种精神障碍,其中最为常见的是特定恐惧症和抑郁障碍。

结论 临床应对大学生中精神病风险综合征演变过程、特征等情况进行纵向分析,可以针对大学生进行符合伦理规范早期干预,将预防模式探索,这一措施意义重大。此外,这类学生中,共病抑郁障碍和焦虑障碍的现象相当常见,这为我们提供了关于预防和早期干预策略的重要线索。

双相障碍缓解期患者内观认知疗法干预研究

毛富强* 闫耀征
天津医科大学

目的 双相障碍(Bipolar Disorder, BD)患者即使在缓解期,仍存在社会功能缺陷和认知功能障碍,并且由于其服药依从性较差,使其有较高的复发率和再住院率,这些因素导致了 BD 患者治疗成本的增加和生活质量的降低。因此,本研究旨在探究内观认知疗法(Naikan Cognitive Therapy, NCT)对 BD 缓解期患者服药依从性、社会功能以及认知功能的干预效果,为 NCT 作为辅助治疗应用到 BD 缓解期患者上提供数据支持和临床依据。

方法 将 2023 年 1 月至 2024 年 1 月于天津市

安定医院住院的 BD 患者当中,符合入排标准的 70 名患者纳入本研究,并采用随机方法分成 NCT 组和对照组,两组各 35 名;NCT 组和对照组分给予持续 4 周的 NCT 干预和健康教育。两组在干预前后采用药物依从性量表(Medication Adherence Rating Scale, MARS)、社会功能缺陷量表(Social Disability Screening Schedule, SDSS)、重复性成套神经心理状态测验(Repeatable Battery For the Assessment of Neuropsychological Status, Rbans)、stroops 色词测验等进行相关指标的评估和测量。通过比较干预前后 NCT 组和对照组各指标的得分,探究 NCT 对 BD 的干预效果。

结果 (1)NCT 组和对照组在一般人口学资料和疾病相关信息方面无显著差异($P>0.05$)。(2)两组在干预后,SDSS 得分均较干预前有所降低($P<0.05$),但 NCT 组的减分更加明显,两组差异具有统计学意义($P<0.05$)。(3)NCT 组和对照组的 MARS 总分和各因子评分,在干预前差异不显著,干预结束后,均显著高于对照组($P<0.05$)。(4)通过对 NCT 组和对照组在干预前后 Rbans 各领域和 stroops 色词测验测评结果比较显示,NCT 组和对照组在即时记忆、延迟记忆、视觉空间能力等方面前后得分没有差异($P>0.05$),而 NCT 组干预后在语言功能、执行功能、注意力方面得分的提高显著高于对照组($P<0.05$)。

结论 内观认知疗法能够提高双相障碍缓解期患者服药依从性,减少其社会功能缺陷,改善其社会功能,并且还可以改善语言功能、执行功能、注意力等方面认知功能缺陷,因此在临床中,可以应用作为双相障碍患者的辅助治疗。

双相障碍躁狂发作期认知功能研究进展

薛曼 孙志刚*
石家庄市第八医院

双相障碍(bipolar disorder, BD)是一类既有躁狂发作或轻躁狂发作,又有抑郁发作的常见精神障碍,其复发率和致残率高,病程迁延。认知功能损伤是双相情感障碍的核心症状之一,认知功能损伤会导

致患者的日常生活能力受损和生活质量下降。因此, 认知功能恢复已成为当前临床治疗的新靶点和新目标。既往多项研究表明双相障碍患者在躁狂发作期、抑郁发作期和缓解期都存在不同程度的认知功能损伤。因此, 更好的理解双相障碍患者不同情绪状态下的认知功能尤为重要。本文综述了双相障碍患者躁狂作期认知功能损伤的特点、认知功能的影响因素以及治疗对认知功能的影响。双相情感障碍躁狂发作患者的神经认知功能和社会认知功能均存在显著的缺陷。神经认知功能损伤主要体现为持续性思维和持续注意受损、冲动应答、决策制定受损、计算概率判断力差、难以控制的冒险行为、语言记忆损害、视觉记忆损害、工作记忆损害。社会认知障碍主要体现在心理理论和情绪认知方面, 社会认知障碍会导致深刻而持久的人际、社交和工作能力受损。既往躁狂发作的次数、病程、发病年龄、住院次数和治疗方案都会对认知功能产生影响。本文对上述内容进行综述, 以期深入了解双相障碍躁狂发作患者的认知功能, 将认知评估贯穿于治疗始终, 为其制定更有效的预防及治疗方案, 为帮助其进一步提高生活质量和社会功能提供理论基础。

关键词: 双相障碍,躁狂发作,认知功能

首发青少年抑郁症患者自杀意念的静息态脑电研究

何晓庆 王我*
重庆医科大学

目的 本研究旨在探讨静息态脑电相关指标与青少年抑郁症患者自杀意念的关系, 探究其作为青少年抑郁症自杀风险预警的生物标志物的可能性。

方法 本研究共纳入 99 名 12-17 岁的青少年研究对象, 包括 47 例伴自杀意念的青少年抑郁症患者 (SI 组)、26 名不伴自杀意念的青少年抑郁症患者 (noSI 组) 及 26 名青少年健康对照 (HC 组)。收集所有研究对象的社会人口学资料, 并在入组时使用汉密尔顿抑郁量表 (HAMD-17)、9 项患者健康问卷抑郁量表 (PHQ-9) 评估研究对象的抑郁症状, 使用哥伦比亚自杀严重度评估量表 (C-SSRS) 来评估患者过去一个月的自杀意念。对所有患者采集 64 导的静息态脑电, 并将脑电结果进行微状态和功率谱密

度的分析。

结果 本课题通过脑电微状态分析方法, 发现伴自杀意念的青少年抑郁症组相比于不伴自杀意念的病例组微状态 B 发生频率和覆盖范围更低, 也更难从微状态 D 转换至 B。同时, 与健康对照组相比, 伴自杀意念的青少年抑郁症组微状态 A 的发生频率更低。不同微状态间的转换概率是非随机的, 伴或不伴自杀意念的青少年抑郁组与微状态 C 有关的转换概率与健康对照组相比具有更明显的差异。通过功率谱密度分析方法发现伴自杀意念的青少年抑郁组相比健康对照在 δ 频段的右侧颞叶、枕叶; θ 频段的额区、中央区、顶区、枕区; β 频段的额区、枕区的脑电活动强度减弱。

结论 伴自杀意念的抑郁症青少年有独特的神经电生理特征, 脑电微状态和脑电功率谱密度分析方法可作为潜在的青少年抑郁症自杀风险监测的重要工具。

天麻多糖在精神疾病中的神经调节作用及应用前景

任中玉 王高华*
武汉市精神卫生中心

目的 精神疾病是一类在各种环境因素影响下, 大脑神经功能失调, 导致认知、情感、意志和行为等精神活动异常且病因未明的疾病。随着疾病发病率的不断上升, 又无明显减缓疾病进展的有效药物, 这严重影响了患者的心身健康和生活质量。天麻多糖是天麻主要有效成分之一, 随着植物多糖的深入研究, 天麻多糖的活性及药理作用逐渐被发掘出来, 并且在抑郁症的神经调节中发挥着显著作用。本文对天麻多糖的生物活性, 及其在抑郁症中的神经调节作用机制和潜在应用价值进行综述, 为抑郁症的机制研究提供新方向, 为天麻多糖在抑郁症的预防和治疗中的活性研究提供参考。

方法 本文从天麻多糖的结构和分类、天麻多糖的生物活性 (包括抗炎、抗氧化应激、抗凋亡) 及神经调节作用机制出发, 对天麻多糖对精神疾病的保护作用进行综述, 为寻找精神疾病的新药开发和治疗方式提供思路。

结果 天麻多糖作为天麻中重要的活性成分,在中枢神经系统中具有广泛的神经调节作用,比如免疫修饰、延缓衰老、抗炎、抗氧化等。目前已有研究表面天麻乙醇提取物、天麻水提取物、天麻素、等均具有抗抑郁作用,可通过特有的神经调节功能发挥神经保护活性进而改善神经元损伤和认知障碍,在神经精神疾病的研究中表现出明显的活性作用。

结论 天麻多糖的神经调节作用并不是某个单独的生物活性在起作用,而是表现出所有活性相互促进共同作用的结果。对天麻多糖有效的结构成分以及神经精神疾病方面的活性潜力进行深入的药理学研究,能为精神疾病的药理作用机制研究提供新方向。

凯斯勒心理疾患量表(K10)在中国医务人员中的信效度研究

王焯¹ 王婉轩² 马菁¹ 叶嘉璐¹ 李佳峰¹ 倪士光³ 邓秀良⁴ 张岚¹

- 1.四川大学华西医院心理卫生中心
- 2.国家心理健康和精神卫生防治中心
- 3.清华大学深圳国际研究生院
- 4.深圳市龙华区人民医院临床心理科

目的 对中国医务人员样本中凯斯勒心理疾患量表(Kessler 10 Psychological Distress Scale, K10)的因素结构进行探索性与验证性分析,并对其信效度进行检验。

方法 通过方便抽样的方法在线收集中国医务人员的K10数据(N=8602),总样本用于K10的内部一致性信度检验,将总样本分为两份,样本1(n=4301)用于探索性因素分析,样本2(n=4301)用于验证性因素分析和量表的内部一致性信度检验。

结果 通过探索性因素分析和碎石图,提取出抑郁、焦虑2个因素,可累计解释总方差的75.91%;通过验证性因素分析,支持K10的2因素结构,具有良好的结构效度($\chi^2=1495.921$, $df=34$, $\chi^2/df=43.998$, $GFI=0.939$)且优于单因素结构($\chi^2=2100.157$, $df=35$, $\chi^2/df=60.004$, $GFI=0.908$),量表的内部一致性信度 α 系数为0.952。

结论 本研究探索并验证了K10在中国医务人员

的样本中具有抑郁、焦虑的2个因素,且有良好的内部一致性信度和结构效度,可以用于测量中国医务人员的心理疾患风险状况、抑郁症状、焦虑症状。

(基金资助:本研究由国家心理健康和精神卫生防治中心“医务人员心理健康管理模式研究”项目资助)

一线医护人员工作场所的支持与感知压力和职业倦怠的关系研究 ——基于有调节的中介模型

魏作霖^{1,2} 蒋伶俐^{1,2} 夏博呈^{1,2} 祝怀义^{1,2} 李凌燕^{1,2} 王琳^{1,2} 赵峻^{1,2} 范箬馨^{1,2} 王鹏^{1,2} 黄明金^{1,2}

- 1.四川省精神卫生中心·绵阳市第三人民医院
- 2.川北医学院

目的 探讨重大公共卫生事件结束后一线医护人员工作场所的支持与感知压力和职业倦怠的关系,以及自我同情和复原力在其中的作用,为制定相应干预措施提供理论依据。

方法 2024年1月2日至2024年1月10日对中国西部某市的484名医护人员进行线上问卷调查。采用Harman单因素分析检验有无共同方法偏差。SPSS PROCESS插件分析复原力的中介作用和自我同情的调节作用。

结果 共同方法偏差影响本研究结果的可能性低。男性参与者的复原力水平较女性更高;工作年限3-6年以及精神科的参与者相较于其他组别感知压力水平较低;年龄 ≤ 35 岁、工作性质为医生以及非精神科的医护人员职业倦怠水平较高。高水平的工作场所的支持与较低水平的感知压力和职业倦怠相关,复原力显著介导了这一联系。自我同情调节了工作场所的支持对感知压力和职业倦怠间接影响的前半部分。自我同情水平过低可能会让工作场所的支持对复原力的正向效应消失,与中等水平自我同情的医护人员相比,高水平自我同情的医护人员其工作场所的支持对复原力的正向影响更强。

结论 在重大公共卫生事件后,一线医护人员高水平的复原力和自我同情可能会让他们更好的利

用工作场所的支持来减轻感知压力和职业倦怠的影响。

关键词：医护人员,工作场所的支持,感知压力,职业倦怠,自我同情,复原力

综合医院精神科开放式病区患者管理策略思考

滕羽鸥 冯坤*

清华大学玉泉医院

目的 在精神科治疗领域,综合医院的开放式病房管理一直是一个具有挑战性的话题。开放式病房在增加患者自由度的同时,也带来了更多的管理难题。本文旨在通过住院患者、陪护者和探视者的管理探讨综合医院精神科开放式病房管理策略。

结论 住院患者的管理需要考虑开放式病房的特点和住院患者的特点。相比于专科医院和精神科封闭病房,综合医院的精神科开放式病房给患者更多的自主空间,这让一些有病耻感的患者更容易接受住院治疗。开放式病房的住院患者病情相对较轻,部分患者在药物和心理治疗的帮助下,病情相对稳定,已经进入到了在监护人陪同下的适应社会的治疗阶段。然而,不可忽视的是,一些患者在刚入院时存在自伤自杀、藏药外跑等风险,因此应注意动态评估患者病情和其处于开放式病房的安全性。开放式病房旨在让患者更好地适应并回归社会,在执行过程中,应向患者宣教规定的细则,如请假制度、外出时间要求、外出地点限制等,强调虽然开放式病房允许外出,但首先是住院治疗,应遵从规定,对不能遵从者予以限制外出,以确保安全和疗效。

陪护者的管理需要明确陪护的目的和职责,确保病区和外出陪护的有效实施。陪护者可以是患者的家属或护工,主要目的是协助患者在病房的生活,并起到一定的监督责任,如及时制止患者的藏药行为并告知医务人员,帮助记录和反馈患者的症状等。陪护是为了保证患者安全,帮助患者配合治疗,从而尽快控制病情,好转出院。通常要求陪护者不离开患者,即尽量避免患者在病房而陪护者在楼道等其他地方的情况,以防止患者脱离陪护者视线。外出陪护时,陪护者应服从病房的管理安排,尤其是在开放式病房陪同患者外出时,完成监护职责,确

保患者安全,并及时反馈患者在外出社会适应阶段的表现,便于整体规划治疗方案。

探视者的管理需要明确探视的目的、探视人员的选择和病区探视的规范。探视主要指非陪同人员对患者的探望,包括护工陪护时的家属探视和家属陪护时的其他家属探视。其主要目的是从家庭的角度,与医务人员联动,共同帮助患者改善病情,尽早达到出院目的。探视人员以患者家属为主,经主管医师同意可放宽至关系密切、交流有助于病情恢复的非亲属。探视人员的进入应征求患者的意见,如患者对某位家属有被害妄想或害怕情绪,应经医务人员评估后决定是否适合探视。探视人员即使有医学或心理学背景,也不应在病区内为患者提供“治疗”,以避免对患者造成伤害。病区探视应对时间做出严格限定,确保病区的治疗优先完成,且不能打扰到其他患者。探视者应遵从病区的规定,接受物品检查,不协助患者携带违禁品进入病区。如酒等成瘾性物质应严格禁止,常用药品应与主管医师沟通,尽量由医务人员保存发放,而非交给患者本人。

儿童青少年前额叶任务态脑功能成像特征的回顾性队列研究:公共卫生事件对心理健康的影响

冯坤¹ 于晨超² 戎戈² 徐洲阳²

1.清华大学玉泉医院(清华大学中西医结合医院)

2.北京柚果科技有限公司

目的 本研究旨在探索公共卫生事件对儿童青少年前额叶血氧动力反应的影响及其心理健康相关性,为相关心理健康领域的干预策略效果提供评价依据。

方法 采用回顾性队列研究方法,以横跨新型冠状病毒肺炎(COVID-19)疫情前后,自2019-2023年5年间在北京清华大学玉泉医院8-17岁青少年的脑功能检查队列数据为对象,结合疫情后的约85%的有效跟踪随访和心理评测结果及2020-2022年公共卫生数据,评估儿童青少年在疫情前、期间和疫情后前额叶血氧动力反应的群体特征。该特征通过临床上使用的近红外脑功能成像系统(fNIRS)

进行采集,采集区域为前额叶的45通道。所采用的任务范式为言语流畅任务范式(VFT),其中包含4段类别举例(蔬菜、水果、四条腿动物和家用电器),任务总时长共240秒。本研究重点观察4段子任务所有通道的加权平均脑功能活化水平暨含氧血红蛋白激活水平,并对不同年龄(8-12岁/13-17岁),不同临床症状(有无情绪障碍)分组进行亚组分析。

结果 最终共纳入283例儿童青少年个体,研究发现13-17岁年龄组的含氧血红蛋白激活水平疫情后较之前有明显下降(2019:0.183,2020:-0.079,单位mmol/mmHg·mm·s),其中可观察到前额叶背外侧右侧,额中回存在激活损伤,该损伤在疫情进入第3年后逐渐恢复正常(-0.005)。

结论 研究表明青少年在重大公共卫生事件下存在着前额叶血氧动力激活程度下降,尤以负责情感及语言的部分激活显著降低,需要长时间的恢复。结合心理评测结果,间接证明公共卫生事件对青少年情绪及认知功能的负面影响是持续的。

综合医院精神科开放式病房青少年活动设置的思考

吴春媛¹ 滕羽鸥² 冯坤²

1.北京中医药大学

2.清华大学玉泉医院

目的 在综合医院的精神科开放式病房中,青少年的活动设置对其精神康复和心理健康有重要影响。本文将探讨如何通过科学合理的活动设置,有效支持青少年的心理健康和社会适应。

结论 青少年处于生长发育的快速阶段,逐渐开始独立思考。其长大成人、拥有独立性的强烈渴望与其阅历潜、经历少、敏感脆弱、经济依赖直接产生矛盾,导致其希望家庭满足其欲望但不要过多干涉其行为的现实问题。同时,青少年的可塑性大,情绪不稳定。青少年正处于教育阶段,社会背景单一。情绪障碍常对完成学业产生负面影响,尤其是当出现缺勤甚至休学时,会给青少年恢复社会功能带来严重压力,出现厌学、拒学、恐学等心理特点。促进青少年心理健康的方法主要包括发展良好的自我意

识,心理健康教育,客观评价自己,保持稳定情绪,增强抗逆力,提高自我价值感,学会自我负责。掌握人际沟通技巧,与家庭改善隔阂、增强理解和互动。

在青少年治疗活动的设置上,研究表明,重复经颅磁刺激、光照治疗、生物反馈治疗等物理治疗方法适用于青少年患者群体。实践过程中发现,在最初的治疗阶段,青少年对治疗的实施过程充满了好奇,也有对新事物的些许恐惧。在实施治疗前,应向青少年讲解操作的具体过程和可能出现的感受,在满足好奇的同时,消除恐惧,增加治疗的依从性。另外,常规团体心理治疗应固定、有计划的开展,以满足其对于稳定的需求,内容上开展灵活多样的、有竞争性或游戏特征的治疗,例如舞动治疗、游戏治疗、音乐治疗、绘画治疗、诗歌治疗、戏剧治疗等丰富的治疗主题。还可以设计人际团体治疗,以提高患者的人际交往能力。当然,家庭治疗是非常有必要的,不仅帮助家庭更好的协助青少年治疗疾病,也帮助家庭重新审视家庭的困境和难题,以及解决问题的方法和策略。

在青少年娱乐活动的设置方面,青少年具有不喜欢老师或家长约束,喜欢同龄人集群的特点,治疗之余,应鼓励青少年间的游戏与交流,为其提供适当的娱乐设施。共同参与游戏、完成任务,建立新的社群友谊。鼓励患者父母参与患者的治疗,共同学习,调节与子女的关系,增加家庭成员之间有效理解。建立24小时陪住制度,帮助青少年与其父母建立亲近且具有陪伴性质的新的关系。治疗的最终目的是回归社会,青少年应更多地接触自然,体验自然。应鼓励监护人在外出时间带领青少年进行室外活动,让阳光与爱共同治愈。

关键词: 青少年心理健康;物理治疗;团体心理治疗;家庭治疗;娱乐活动设置

青少年非自杀性自伤行为的研究现状

谭洁颖^{1,2} 张璐璐¹

1.广州市第一人民医院

2.广东医院大学附属广州市第一人民医院

目的 非自杀性自伤行为是指个体在没有自杀意图的情况下,故意对自己身体进行的一系列伤害行为。非自杀性自伤行为是一种复杂的行为,其与

自杀未遂、自杀行为不同,大部分的目的是在发泄缓解情绪或惩罚自己。近些年来,自伤行为在全球范围内整体呈上升趋势,特别是在青少年群体中越来越普遍,这可能与青少年正经历生理和心理的发展与过度阶段有关。有研究表明,非自杀性自伤行为是自杀行为的独立危险因素,不仅给青少年个体带来严重的身心健康问题,而且也给家庭和社会带来了巨大的负担。本文旨在研究青少年非自杀性自伤行为,以阐述其流行病现状及潜在影响因素之间的关系。

方法 使用中国知网和 PubMed 等国内外数据库进行系统检索,并使用了以下术语“青少年、非自杀性自伤、流行率、影响因素”。对符合条件的文献整理分类,并对相关研究进行归纳总结。

结果 青少年非自杀性自伤行为的总体患病率正逐步增长,主要集中在中学这一阶段,而在不同国家及地区之间也存在相应的差异。其潜在影响因素如人口学因素、个人因素、精神障碍、负性环境因素等与非自杀性自伤行为存在一定相关性。

结论 非自杀性自伤行为正逐步成为一个严重的公共卫生问题,引起了各界的广泛关注与担忧。一些研究发现,人口学因素、个人因素、精神障碍、负性环境因素等可以影响青少年非自杀性自伤行为的发生,或是更严重的自杀行为。应针对青少年不同的潜在影响因素制定个体化的治疗与干预策略。

关键词:非自杀性自伤,青少年,影响因素,现状

日间病房模式下 DBT 对青少年 NSSI 的疗效研究

陈芳 王我*

重庆医科大学心理卫生中心

目的 非自杀性自伤(NSSI)行为目前已成为世界范围内重要的精神卫生问题,除了药物治疗外,国际上主要以心理治疗为主,辩证行为治疗(DBT)具有最多的支持证据。日间病房的治疗模式因其时间灵活性和经济性,在国外已经发展较成熟。本文通过引进日间病房模式,探讨了在该模式下 DBT 技能培训作为青少年 NSSI 患者高自杀风险的辅助干预的临床有效性。旨在提出治疗青少年 NSSI 的新治疗模式,为发展我国本土化的 DBT 日间病房提供参考。

方法 在重庆医科大学附属大学城医院心理卫生中心招募 50 名青少年 NSSI 患者被分配到 2 周的 DBT 组 ($n=25$),和单纯药物组 ($n=25$)。对照组给予常规精神科 SSRI 药物治疗 2 周;实验组在此基础上实施 DBT 方案干预 2 周。主要结局指标是非自杀性自伤(non-suicidal self-injury, NSSI)发作的严重程度。在第 0 周和第 2 周(即干预组的前、后测)运用于丽霞(2013)修订的青少年自我伤害行为问卷进行评估。采用 t 检验进行统计学分析。

结果 两组治疗前自我伤害严重程度评分差异均无统计学意义 ($p>0.05$)。治疗后, DBT 组 (18.16 ± 3.06)的自伤程度评分显著降低 ($t=5.928, p<0.001$)。单纯药物组 (2.00 ± 1.12)的自伤评分无显著差异 ($p>0.05$)。

结论 日间病房模式下的 DBT 有助于改善青少年 NSSI 患者自伤情况。这种简化干预是一种可行的选择,可能是治疗与 NSSI 急性期相关的高危行为的有用辅助干预。

精神心理科护理中团体治疗的效果评价与探索

陈思岚*

西安交通大学第一附属医院

目的 本研究主要目的在于评估和探索团体治疗在精神心理科护理中的效果,比较传统护理模式与团体治疗模式在患者治疗响应和心理健康恢复方面的差异,提供更加有效的护理策略以促进精神患者的康复过程。

方法 本研究采用随机对照试验设计,分为对照组和观察组两部分。对照组患者接受传统护理模式,包括基本生理和心理需求的照顾、定期的药物管理、个体化的心理咨询以及日常健康和病情监测。观察组患者则接受团体治疗与护理模式,包括团体心理治疗、社交技能训练、支持性团体会议以及定期的团体动力学评估。

结果 研究结果显示,在观察组中,团体治疗显著提高了患者的社交技能和心理适应能力。借助团体互动,患者在社交参与和情绪管理方面表现出

更好的进步,相比之下,对照组患者在此类方面的提升较为有限。此外,观察组患者在治疗后的心理健康总评分上也有更为显著的提高。

结论 团体治疗在精神心理科护理中具有显著的优势,特别是在提升患者的社交能力和心理健康方面。借助团体互动,患者可以在安全和支持的环境中学习和练习新的社交技能,这对于患者的长期康复和社会功能恢复至关重要。鉴于此,团体治疗应被视为精神健康护理中的一个重要组成部分,对于提高治疗效果和患者满意度具有重要意义。

应用沟通技巧促进患者治疗依从性的精神心理科护理研究

陈思岚*

西安交通大学第一附属医院

目的 本研究主要目的在于探讨应用沟通技巧在精神心理科护理中促进患者治疗依从性的有效性。借助比较传统护理模式和沟通技巧应用护理模式,本研究分析了沟通技巧在提高患者治疗依从性方面的具体效果。

方法 本研究采用随机对照试验的方法,共纳入精神心理科的患者 200 名,随机分为对照组和观察组,每组 100 人。对照组:接受传统护理模式,基础生理和心理需求的照顾;定期的药物管理;个体化的心理咨询;日常健康和病情监测。观察组:接受沟通技巧应用与护理模式,应用动机访谈技术、情感倾听和反馈技巧;沟通技巧训练包括非语言沟通和开放式问题的使用;定期评估患者对治疗计划的理解和接受程度。

结果 研究显示,观察组患者在治疗依从性方面表现明显优于对照组。观察组中,患者对治疗计划的接受度提高,药物依从性增加,定期随访中表现出更高的积极性和满意度。数据表明,观察组的治疗依从性提高了 30%,与对照组相比有统计学上的显著差异 ($P<0.05$)。

结论 应用沟通技巧在精神心理科护理中显著提高了患者的治疗依从性。有效的沟通不仅增强了患者对治疗计划的理解和接受,还增强了患者的自

主管理能力和对护理过程的积极参与。研究结果强调了在精神心理科护理实践中加强沟通技巧培训的重要性,为提高患者治疗效果提供了有力的策略和证据。

关键词:沟通技巧;治疗依从性;精神心理科;护理

从中医“伏邪致病”理论探讨阿尔茨海默病的发病与治疗

马澜¹ 冯坤²

1.温州市中医院

2.清华大学玉泉医院

目的 阿尔茨海默病(AD)是一种隐匿发病的慢性中枢神经变性疾病,主要表现为记忆力进行性减退,对外界和自我的认知能力严重不足,最终导致认知、语言、执行功能障碍,以及人格和行为的改变、自理能力丧失等。西医认为 AD 是由神经系统病变、血管硬化、遗传等多种因素造成的,但治疗方法有限。中医作为补充替代医学,对 AD 的治疗有极大的辅助作用,具有毒副作用小、多靶点、多通路等优势。本文结合 AD 隐匿起病的特点,从“伏邪”致病探讨 AD 的发病与治疗,以期加深对 AD 的认识,为中医临床防治 AD 提供参考。

结果 中医对 AD 的认识历史悠久,早在《黄帝内经》中就有“善忘”症状的表述,这为中医认识呆病奠定了基础。中医将 AD 归属于“呆病”、“健忘”、“善忘”、“不慧”、“癡证”、“郁证”等范畴。目前,中医主流思想认为 AD 与心脾两虚、肾精亏虚导致的气血不足、痰浊毒瘀阻于脑窍有很大关系,与“伏邪”有着紧密联系。伏邪理论起源于《素问·生气通天论篇》中的“冬伤于寒,春必温病”。吴又可在《瘟疫论》中进一步提出“邪伏膜原”病机。伏邪指的是藏伏于体内而不立即发病的病邪,具有藏匿日久、反复发作、迁延难愈、耗散正气的特点,分为潜伏期和发作期。

伏邪与 AD 的发病体现在以下方面。一为肾精亏虚为伏邪藏匿之机,脑髓由肾精所化生,肾精亏虚可导致脑髓机能下降,进而引发 AD。二为藏而后发为伏邪致病之象。AD 发病前表现较为隐匿,存在轻度认知损害(MCI)阶段。MCI 患者的症状类似

于伏邪之伏而未发阶段。AD 的发生发展与伏邪侵袭后藏于机体，与正气抗衡，逐渐击退正气的过程相类似，符合伏邪的致病特点。

基于伏邪治疗 AD 有以下三个方面。一以调和阴阳为指导原则。AD 是在肾之阴阳亏虚、机体阴阳失衡状态下发病的，恢复机体阴阳平衡是治疗 AD 的重要原则。二以分期论治为基本治法。根据伏邪的致病特点，AD 的不同阶段采用不同的治疗方法。平台期以补虚为主，波动期以祛邪为主，兼顾扶正；下滑期以祛邪为主，兼顾扶正。三以补肾扶正贯穿始终。肾虚是 AD 发病之本，补肾法应贯穿 AD 的整个治疗过程。补肾法可以改善 AD 患者的认知功能，提高患者的日常生活能力。

结论 AD 的发病与伏邪致病相类似，具有因虚而发、藏匿日久、迁延难愈的特点。正虚，尤其是肾虚，是 AD 致病的根本；痰浊、瘀血等伏邪因虚而生、累积日久而阻于脑络，是 AD 致病的标志。根据伏邪致病的特点，对 AD 进行早期干预、分期论治，并以补肾法贯穿始终，能够充分发挥中医药的优势，延缓病程，提高患者的生活质量。

持久性公共卫生事件对青少年心理健康状况的影响：情绪控制与人际协助的中介效应研究

冯坤¹ 李子¹ 戎戈²

1.清华大学玉泉医院（清华大学中西医结合医院）

2.北京柚果科技有限公司

目的 评估持久性公共卫生事件对青少年心理健康状况影响，特别关注情绪控制与人际协助因子在其中的中介效应。通过分析，可以更准确地预测和识别未来类似公共卫生事件中青少年可能出现的心理问题，并有助于制定有效的预防和干预措施，减少心理问题的发生。

方法 本研究采用问卷调查法，并对问卷进行电子设计和收集统计，结合文献综述和数据分析方法，深入探讨了情绪控制与人际协助因子在青少年心理健康中的中介效应。

将初、高中组 3 个时间段观察到的焦虑和抑郁的结果作为自变量，以心理韧性、创伤后改变内各

因子作为单层中介变量，当期学习倦怠和网络依赖、新冠恐惧结果作为因变量，不考虑人口学（性别及年龄）等协变量，对“情绪-学习”因果链路进行独立中介分析，通过对重叠相关因子进行考察。

结果 经过 40 个独立的中介效应的中介效应分析结果综合，得到 4 个显著的中介效应路径。其中，在由焦虑导致的学习倦怠中，情绪控制能力是一个中介特质。特别值得注意的是，抑郁情绪可能导致的网路沉迷现象也是显著地由情绪控制能力影响着。创伤后改变的各项结果、体育时间、A、E、F、G、H、M、Q1、Q2 人格特质在两个标签上均没有特别突出的线性相关，但在考察中介效应的时发现，人际协助成为了一个特出的中介因子，可以显著改善（或恶化）因为抑郁导致的学习倦怠的结果。

结论 为了应对青少年可能出现的心理问题，提前制定预防和干预措施，减少心理问题的发生、注重人际协助的中介作用。(1)可以通过青少年的人际交往能力训练和社会支持网络，来提升他们面临不良处境时的调节能力。提升他们的心理韧性，使他们更好地应对压力和挑战；(2)研究的结果可以为政策制定者提供科学依据，如何更有效地分配心理健康资源。在未来的极端化事件中，需要医学、心理学、社会学等多个领域的专家共同合作，为青少年提供更综合的心理健康服务。因此，研究如何通过情绪控制和人际协助来减轻其负面影响，具有重要的现实意义和理论价值。

乳酸片球菌 CCFM6432 改善抑郁障碍患者快感缺失症状的临床及事件相关电位研究

黎杜星¹ 胡启明² 孙逸凡² 王军¹ 王军²

1.江南大学附属精神卫生中心

2.南京医科大学附属无锡精神卫生中心

目的 快感缺失是抑郁障碍的核心症状之一，与预后不良有关且对常规抗抑郁药物的反应不佳。前期研究发现乳酸片球菌 CCFM6432 能够改善焦虑或抑郁障碍患者的整体疗效且可能具有改善快感缺失症状的潜力，本研究拟系统论证乳酸片球菌 CCFM6432 辅助改善抑郁障碍患者快感缺失症状的

效果,并利用事件相关电位技术探索其潜在的神经相关性。

方法 自2023年2月至2024年6月在无锡市精神卫生中心招募符合入组条件的成年抑郁障碍患者为对象,随机分为研究组和对照组,其中研究组在常规治疗的基础上联合乳酸片球菌 CCFM6432 连续治疗30天,对照组在常规治疗的基础上联用无生物学活性的乳酸片球菌 CCFM6432 模拟剂(主要成分为麦芽糊精),两组均在基线水平和治疗30天后接受汉密尔顿焦虑量表(HAMA)、汉密尔顿抑郁量表(HAMD,17项版本)、愉快情绪体验量表(TEPS)评估,并在完成猜门任务的同时接受同步脑电检测。HAMA和HAMD总分分别反映患者焦虑和抑郁症状的严重程度,TEPS因子分TEPS-A和TEPS-C分别反映期待性快感和消费性快感主观体验程度高低,刺激前负波(SPN)和反馈相关负波(FRN)波幅分别反映与奖赏期待和奖赏反馈相关的神经加工活动强弱。分析比较各项指标在两组治疗前后的变化情况及组间差异。

结果 在剔除失访或脑电数据质量低下的被试后,研究组和对照组最终分别有27例和28例被试数据纳入分析,两组在平均年龄、性别构成比、体质指数、利手性、受教育年限等一般人口学资料上的差异均无统计学意义,且两组在抗抑郁药物种类及折合剂量、基线水平的HAMA、HAMD评分、TEPS总分与因子分上的差异亦无统计学意义。经过治疗后,两组HAMA、HAMD评分均显著降低,研究组的减分率显著高于对照组(皆 $p<0.05$),提示该组焦虑和抑郁症状改善幅度更明显;对照组的TEPS总分及因子分在治疗后无明显变化,而研究组TEPS总分及TEPS-A因子分在干预后明显升高($p=0.015$),提示该组被试的期待性快感主观体验显著改善。混合设计方差分析结果显示,SPN波幅的组别*干预前后交互作用显著($p=0.031$, $\eta^2=0.085$),简单效应分析显示研究组治疗后SPN波幅显著增大,且大于对照组,提示该组患者在干预后与奖赏期待相关的神经活动增强。FRN波幅的交互作用及组间或组内主效应均不显著,提示两组在干预前后与奖赏反馈相关的神经加工活动无明显变化。

结论 本研究结果表明乳酸片球菌 CCFM6432 对常规抗抑郁治疗具有增效作用,并且有效改善抑郁障碍患者的期待性快感缺失症状,增强与奖赏期待相关的神经加工活动。

基于 CiteSpace 可视化探析非药物治疗治疗阿尔茨海默病的现状与热点

马澜¹ 冯坤²

1.温州市中医院

2.清华大学玉泉医院

目的 阿尔茨海默病(Alzheimer's disease, AD)是一种以隐匿起病和进行性认知损害为特征的神经变性疾病,占有痴呆原因的60%-70%。目前全球约有5000万AD患者,预计到2050年将增至1.52亿。AD的典型病理特征包括 β -淀粉样蛋白(A β)沉积形成的老年斑和Tau蛋白过度磷酸化导致的神经纤维缠结(NFTs)。AD的病因尚不明确,且尚无特效治疗方法。研究发现,针刺、运动、经颅磁刺激(TMS)、芳香疗法、认知干预及心理、音乐等非药物治疗在防治AD方面具有一定效果。CiteSpace软件可通过绘制科学图谱分析该领域的研究热点和趋势,探索研究前沿和预测未来发展方向。本研究采用CiteSpace软件对非药物治疗治疗AD的相关研究进行可视化分析,旨在为后续研究提供思路。

方法 检索Web of Science核心合集数据库自2004年1月至2023年6月收录的关于非药物治疗治疗AD的相关文献,采用数据库自带分析功能、表格统计功能及CiteSpace软件对发文趋势、机构、期刊、作者、关键词进行分析。

结果 共纳入1128篇文献。年发文量分析上,2004-2007年,发文量较低。2008-2018年,发文量逐年增加,2018年达到76篇。2018-2023年,发文量迅速增加,2022年达到最高峰132篇。说明非药物治疗干预AD仍是研究热点。发文机构上,395个机构形成的网络图谱显示,哈佛大学和哈佛大学医学院发文量最多。中国的广州中医药大学、北京中医药大学等形成了研究团队,但缺乏与国际间的交流合作。作者合作分析上共有657个作者参与研究,Koch, Giacomo 发文最多。形成以美国和中国为首的研究团队,但国际间的合作仍不足。文献共被引分析上,被引频次最高的文献主要涉及TMS治疗AD的随机对照试验和系统回顾,针灸的有效性和安全性也得到了证实。关键词分析上,关键词主要集中在

于 TMS、针刺、认知疗法、抑郁症和认知损伤等,表明这些是当前研究的热点。

结论 随着人口老龄化,AD 已成为重大课题。现有的药物治疗手段有限,非药物治疗因其有效性和较少的副作用受到了越来越多的关注。本文分析显示,该领域的研究机构主要集中在美国,中国的研究机构需要加强与国际间的合作。研究热点集中在 TMS、针灸和认知疗法,未来应进一步挖掘中医非药物疗法如艾灸、拔罐等在 AD 治疗中的作用,并探索其具体机制,以期为 AD 患者提供更有效的治疗手段。

关键词: 阿尔茨海默病,认知疗法,针灸,经颅磁刺激,CiteSpace,文献计量学

基于 R 语言探析化痰祛瘀法治疗阿尔茨海默病的用药规律

马澜¹ 冯坤²

1.温州市中医院

2.清华大学玉泉医院

目的 AD 在中医学中被归类为“呆病”。清代陈士铎在《辨证录》中认为老年健忘是肾水之竭,应以滋肾填精为主,心肾兼补治之。目前的共识认为,AD 的病机“启动于肾虚,进展于痰瘀火,恶化于虚极毒盛”。根据病机,早期以补肾为主;中期化痰、祛瘀、泻火交替或并行;晚期因痰、瘀、火日久而化生毒浊,需补肾固元,解毒化浊。许多医者在临床中以化痰、祛瘀为治疗大法,取得了显著疗效。然而,目前缺乏针对痰、瘀等邪实为主的 AD 用药规律的系统研究。本研究通过检索现代文献,收集以化痰祛瘀法治疗 AD 的中药处方信息,并使用 R 语言进行数据挖掘,以探索化痰祛瘀法治疗 AD 的用药规律,为临床提供参考。

方法 通过计算机检索中国知网、万方、维普三大中文数据库,收集中药或中成药治疗 AD 的文献。运用 EndNote 软件对文献进行管理,运用 Microsoft Excel 软件,以方名、药物组成、功效分类、药物四气、五味、归经为关键词构建方剂数据库。采用 R 语言对中药使用频次、功效、性味归经、关联规则、相关性进行数据分析。

结果 共检索到 1158 篇文献,经过筛选,最终

纳入文献 68 篇,提取得到经验方药共 72 首,共包含 130 味中药。对 72 首经验方进行中药频次分析,使用频次最高的中药依次为石菖蒲、川芎、丹参、黄芪、远志、熟地黄、陈皮、茯苓、当归、桃仁、赤芍、半夏。中药的功效主要为补虚、活血、化痰,药物的四气以温为主,五味以甘、苦、辛为主,归经以肝经为主。设置最小支持度和置信度,得到 16 条有效关联规则,石菖蒲、川芎、郁金、桃仁、赤芍、红花为核心组方。相关性系数较高的药物组合主要为化痰药物如陈皮、半夏、茯苓、白术、石菖蒲、郁金等,以及祛瘀药物如桃仁、红花、赤芍等。

结论 痰瘀为 AD 患者的重要致病因素与病理产物。且化痰祛瘀法治疗 AD 的用药中包含大量补虚药物,体现了对于 AD 攻补兼施、标本兼治的治疗原则,也是中医整体观和辨证论治的具体体现。中医治疗 AD 具有巨大的优势,探索 AD 的用药规律,可以为临床提供一定的参考。

关键词: 阿尔茨海默病,数据挖掘,R 语言,中药

基于网络药理学和分子对接技术探讨桂枝茯苓丸治疗阿尔茨海默病的作用机制

马澜¹ 冯坤²

1.温州市中医院

2.清华大学玉泉医院

目的 阿尔茨海默病(AD)是一种严重的神经退行性疾病,表现为逐渐的认知损伤和神经病理学标志,包括 β 淀粉样蛋白斑块的沉积和 Tau 蛋白的神经原纤维缠结。尽管大多数治疗策略集中在单一靶点上,但疗效有限且伴有不良反应。因此,多靶点药物成为新的研究方向。中医药在治疗 AD 方面展示出多靶点作用和较少的不良反应,其中桂枝茯苓丸尤为显著。该方出自《金匮要略》,由桂枝、茯苓、桃仁、赤芍、牡丹皮五味中药组成,具有活血化瘀的功效。现代药理研究表明,桂枝茯苓丸中的活性成分通过减轻炎症反应和抑制氧化应激来保护神经细胞。

方法 本研究采用网络药理学方法,筛选桂枝茯苓丸的有效成分,并对其作用靶点和通路进行分析。

结果 通过 TCMS 数据库获取桂枝茯苓丸的

76种活性成分,筛选出223个潜在靶点。通过多种数据库筛选得到1414个AD相关靶点,并与药物靶点取交集,得到84个桂枝茯苓丸防治AD的潜在靶点。利用Cytoscape软件构建成分-靶点网络,发现槲皮素、 β -谷甾醇、山奈酚等成分为关键作用成分。进一步的PPI网络分析和基因本体(GO)及KEGG通路富集分析显示,桂枝茯苓丸的关键靶点包括AKT1、IL-6、TNF等,涉及PI3K/AKT、炎症反应等重要通路。

分子对接结果表明,桂枝茯苓丸的关键成分与靶点具有良好的结合能力,尤其是槲皮素、山奈酚、常春藤素等。槲皮素通过下调促炎细胞因子,减轻神经炎症,山奈酚通过激活PI3K/AKT信号通路抑制细胞凋亡,常春藤素通过降低炎症因子水平缓解神经炎症。研究表明,PI3K/AKT信号通路在中枢神经系统中发挥重要作用,通过调节细胞存活、自噬、神经炎症等过程,可能是桂枝茯苓丸治疗AD的重要机制。

结论 综上所述,本研究揭示了桂枝茯苓丸通过多种活性成分和多靶点、多通路减轻AD病理过程的可能机制,尤其是通过PI3K/AKT通路及其介导的炎症反应。这为桂枝茯苓丸在临床上治疗AD提供了理论依据。下一步研究将验证其在AD动物模型中的疗效,为中医药治疗AD提供更多支持。

关键词: 桂枝茯苓丸,阿尔茨海默病,网络药理学,分子对接,PI3K/AKT信号通路

基于五脏相关理论论治阿尔茨海默病

马澜¹ 冯坤²

1.温州市中医院

2.清华大学玉泉医院

阿尔茨海默病(AD)是一种以隐匿起病和进行性认知损害为特征的神经退行性疾病,目前全世界有5000万患者,预计到2050年将增至1.52亿。AD不仅极大地影响了年老者的生活质量,还对患者家庭和社会公共卫生系统造成重大负担。虽然市面上已有的药物能缓解部分症状,但无法治愈AD,因此,寻找有效的防治方法成为亟待解决的问题。

中医学的整体观和“五脏一体”理论认为,五脏(肝、心、脾、肺、肾)通过经络系统和精、气、血、

津液的联络共同维持生命活动。脑的功能变化与脏腑功能异常密切相关,AD患者的脑病变与五脏功能异常存在联系。本文从五脏理论出发,探讨其与AD的关系及治疗方法。

首先,肝和心与情志密切相关。肝主疏泄,调畅气机,舒畅情志;心主神,影响记忆、思想和认知。AD患者常表现出情志异常,肝气不舒、心神失调是其病因之一。疏肝解郁、平肝清心是治疗AD的重要方法。其次,脾和肾为后天和先天之本,主导精、气、血、津液的代谢和相互转化。脾主运化,提供气血补充;肾藏精生髓,滋养脑髓。脾肾功能异常导致脑髓失养,引发AD。温补脾肾、补益精血是治疗的关键。第三,肺、脾、肾共同主司水液代谢,避免痰毒留滞。肺主治节,调节全身水道;脾主运化,转化水液为津液;肾主水,气化津液。三脏功能失调导致水液停滞、痰浊壅塞,阻碍脑络,引发AD。调理肺脾肾,消除痰瘀是治疗的重要途径。在病理方面,肝气不舒、心肝火旺、肺脾肾不足是AD的主要病因。肝气郁结、气机郁滞导致痰浊、瘀血阻脑;心肝火旺、神乱致呆,引发精神行为症状;肺脾肾功能失调,水液代谢紊乱,形成痰浊、瘀血。温补脾肾、调理气血、清心安神、疏肝解郁是治疗AD的有效方法。

综上所述,从五脏整体观出发,调理五脏功能、平肝清心、温补脾肾、调理气血,五脏同调,能够更全面地改善AD的临床症状,提高疗效。五脏理论为AD的中医治疗提供了新的视角和方法,有望在未来研究和临床实践中取得更好的应用和效果。

与精神科患者及家属交流的思考与注意

滕羽鸥 冯坤*

清华大学玉泉医院

精神科患者通常面临多种复杂的心理问题,这不仅影响患者的生活质量,也对家庭成员带来巨大压力和挑战。本文将探讨患者及其家庭在精神科治疗中的角色和重要性,分析交流原则及其在治疗过程中的实际应用,旨在为医务人员提供有效的指导和支持,促进患者的康复和家庭的稳定。

精神科患者通常面临复杂的心理问题,包括情

绪障碍、认知障碍和行为障碍。患者的症状可能随时间波动，生活充满不确定性，需要长期治疗和支持。医务人员在交流时应避免刺激性语言，以尊重和理解为基础，提供积极反馈以缓解患者焦虑。

家庭在患者康复中起重要作用。支持性的家庭环境能减轻患者压力，提升治疗效果，而家庭冲突则可能加重患者病情。积极的家庭互动有助于缓解症状。家庭的稳定和支持是精神科患者康复的重要保障，医务人员应重视家庭作用，提供相应指导和支持。

在与精神科患者及其家属交流时，保持公平公正、始终安慰帮助以及慎独是至关重要的原则。首先，公平公正意味着医务人员应客观对待每位家庭成员的意见和感受，避免偏袒，促进家庭内部和谐。其次，医务人员应始终给予患者和家属安慰和支持，包括情感上的倾听和理解，以及提供实质性帮助，如疾病信息和应对策略。此外，通过建立支持小组和联系社区资源，可以进一步增强患者和家属的应对能力和心理韧性。最后，慎独要求医务人员在交流时避免将个人观点强加于人，尊重患者和家属的看法和决定，特别是对文化差异的尊重。这些原则的遵循，有助于建立信任关系，减少冲突，提高治疗效果和患者的康复质量。

在与精神科患者及其家属交流时，倾听、澄清事实和商量建议是关键技巧。首先，耐心倾听患者和家属的观点和感受，即使这些观点与医务人员的认知不一致，通过倾听可以更全面地了解他们的需求和困惑。其次，澄清事实是必不可少的，因为精神科疾病的复杂性容易导致误解。医务人员应解释病情和治疗方案，帮助家属理解患者的行为和情绪，从而减少冲突和误会。最后，商量建议时，应以委婉且具有商量性质的方式提出。通过这些交流方式，医务人员可以为患者和家属提供更有针对性的帮助，增强治疗的有效性。

与精神科患者及家属的交流是一个需要高度专业性和敏感度的过程。通过遵循公平公正的原则，始终给予安慰和帮助，以及慎重对待自己的经验和观点，医务人员可以有效地支持患者及其家属。在具体的交流方式上，通过倾听、澄清和商量，可以建立更深的理解和信任，从而为患者的康复创造更好的条件。

标准化病人在精神科教学中的思考

滕羽鸥 冯坤*

清华大学玉泉医院

在精神科教学中，使用真实病人案例虽然能提供丰富的实践经验，但也存在一些不可忽视的问题。为了解决这些问题，标准化病人案例的使用成为一种有效的替代方法。

真实病人案例用于教学存在一些问题。首先是精神科病人情绪不稳定，甚至有打人毁物等疾病导致的行为。在教学中，难以保证病人的配合程度，和学生的人身安全。与躯体疾病不同，精神科病人的病史中提及的心理问题在重复叙述时可能给病人再次带来创伤，尤其是在教学环境下，面对多为经验极为有限的实习医生的提问，可能增加这种创伤程度。而病区首先保证患者的诊治，精神科疾病的住院病人很难在短期达到出院标准，普遍住院时间较长。然而教学则希望在短期内见到尽可能多的不太疾病的典型病人，难以实现。

标准化病人案例用于教学的优劣分析包括以下几个方面。首先，标准化病人案例的准备建议由精神科医护人员进行演示和录制，以确保基于专科医护人员丰富的临床经验，尽可能真实地显示出病人的特点。其次，标准化病人案例的优势分析显示，标准化病人解决了真实病人用于教学存在的问题，如病人难以配合、反复叙述病史对病人产生创伤和病区病人难以保证充分典型等。此外，录制后的标准化病人案例可以随时暂停、反复观看，便于教学中对特征性的精神科症状、综合征、诊断等的讲解和学生对重难点的理解。然而，标准化病人案例也有不足之处，部分精神科疾病有独特的面容、行为等，如抑郁症患者淡漠的表情，锥体外系反应的震颤等，这些都是标准化病人演示者难以模拟出的，因此需要通过适当的真实照片和视频进行补充。

标准化病人案例在教学中的应用和注意包括以下几个方面。首先，在教学适用范围方面，针对不同层次的医学学生和心理学学生，应准备不同的标准化病人案例，显示不同的侧重点。例如，心理学学生重点在于识别什么程度的病人需要转至精神科就诊，而不同程度的精神专科学学生则在问诊与专科检查、诊断与鉴别诊断、治疗与调护等方面各有侧重。其

次, 在应用注意方面, 标准化病人是对临床实习的有效补充, 应注意其典型性, 在一个案例中尽可能多地显示出病人可能共同出现的症状, 同时注意这些症状与疾病严重程度关系, 避免出现单纯的症状堆叠而不符合临床实际的情况。最后, 在教学反馈方面, 教学过程中和教学结束后均应注意与学生的互动, 邀请学生反馈学习体验, 提出改进建议, 也可邀请学生参与新案例的录制, 以加深对疾病的理解。

综合医院精神科开放式病房助力大专院校学生心理健康的思考

滕羽鸥 冯坤*
清华大学玉泉医院

在现代社会, 大学生的心理健康问题日益引起关注。综合医院精神科开放式病房在助力大专院校学生健康管理中扮演着重要角色。与封闭式病房相比, 开放式病房更容易被学生及其家庭接受, 有助于学生在较为宽松的环境中进行治疗和康复。本文将探讨综合医院精神科开放式病房如何通过建立绿色通道, 与大专院校和家庭紧密合作, 提供及时、专业的心理健康服务, 帮助学生有效应对心理问题, 促进他们的全面发展和健康成长。

大专院校的学生来自五湖四海, 入学后面临着生活习惯差异的适应。有别于高中应试教育的强目的性, 大专院校教育拥有更多的选择, 需要学生进行自主规划, 完成自己的学业和就业设计。大专院校的学生面临着学习和经济的压力, 需要学会自主学业规划, 平衡学习生活, 学会步入社会, 独自面对压力。大专院校学生在面对难以疏解的压力时, 可能需要心理辅导和帮助。除常规的学业和生活压力导致的心理问题, 家庭变故、突发疾病、重大学习生活事件通常是心理需求的主要诱因。

大专院校学生的健康管理模式包括以下几个方面: 本科生通常以班级为单位, 由院校选派班主任作为管理者和联络人, 学生遇到问题首先通过班主任协调解决, 因此班主任成为了学工系统下学生心理健康的首要管理者。研究生通常以师门为单位, 导师既是学习的引领者, 也是学生的管理者, 学

生遇到问题首先通过导师协调解决, 因此导师成为了学工系统的学生心理健康的首要管理者。心理筛查是新生入学和每学期开学的必要筛查项目, 对于可能存在心理问题的学生或正在接受心理治疗的学生, 通常由心理中心统筹管理, 由院系负责具体联络。

大专院校学生人数众多, 专职或兼职心理咨询师有限, 辅导员虽然经过心理培训, 但更多是辅助预警和管理, 对存在心理问题的学生难以提供专业帮助。大专院校缺乏专业的精神科医师, 当学生出现严重心理问题时, 通常采用家校联动的送诊方式, 但由于与专科医院的联系有限, 学生及时就诊和报销等问题不可避免。相比于封闭式病房, 开放式病房更容易被学生和家庭接受, 精神科应在力所能及的范围内, 与大专院校建立绿色通道, 帮助学生快速就诊。应当建立医院-学校-家庭联动的学生心理健康管理模式, 以应对学生不同的心理健康促进需求, 包括医院的专业诊疗, 学院的综合管理和家庭的长期支持。

关键词: 大学生心理健康, 综合医院精神科, 开放式病房, 学校-家庭-医院联动, 绿色通道

综合医院精神科开放式病房中年活动设置的思考

滕羽鸥 冯坤*
清华大学玉泉医院

在综合医院的精神科开放式病房中, 中年患者的活动设置是一个关键因素, 对他们的康复和心理健康有着重要影响。本文将探讨在综合医院精神科开放式病房中, 如何通过科学合理的活动设置, 有效地支持中年患者的心理健康和社会适应。

中年是从逐渐成熟到开始衰退的阶段, 其智力不断增长并达到顶峰。积累的理论知识和实践经验能帮助中年人做出分析, 解决实际问题。中年人多年形成的认知行为模式已经成为定式, 一旦出现不能自洽的扰动, 其认知行为很难改变, 从而引发问题。中年人面对着来自家庭和社会的压力, 赡养父母、养育孩子、夫妻共处的家庭压力和熬夜加班、工作不顺等工作压力让中年人缺少释放压力的时间和空间。促进中年心理健康的方法主要包括合理安排

时间,平衡工作与家庭,平衡脑力与体力活动。保持和平心态,量力而行,学会取舍。学会缓解压力,找到适合自己的宣泄情绪的方式,给负面情绪一个缺口。

对于中年治疗活动的设置,研究表明,重复经颅磁刺激、光照治疗、生物反馈治疗等物理治疗方法适用于中年患者群体。实践过程中发现,中年患者对治疗的疗效更为关注,希望得到专业的讲解。治疗前应向患者讲解治疗的方式、疗程和预期效果,消除其对治疗的疑惑和顾虑,增加治疗的依从性。应尝试认知行为疗法等适青年的方式,以缓解焦虑、改善睡眠、增加动力等为主题,帮助中年患者改善症状,面对社会。

在中年娱乐活动的设置上,中年人逐渐成熟,也更加独立,使得这一群体更多的是与同龄人有限程度的相处和独自承担压力。促进中年患者间的团体活动和充分交流,鼓励经验分享,让朋辈互助助力改善疾病。共同参与活动、完成任务,是调节与家庭成员的关系,增加家庭成员之间理解的有效方法。病区内的家庭任务设置,应侧重帮助家庭成员理解患者,增加交流,促进情感。治疗的最终目的是回归社会,中年应更多的接触社会,适应社会,最终回归社会。应鼓励监护人在外出时间带领中年患者进行室外活动,适当的参与社会工作,逐渐适应。

综合医院精神科开放式病房老年活动设置的思考

吴春媛¹ 滕羽鸥² 冯坤²

1.北京中医药大学

2.清华大学玉泉医院

在综合医院的精神科开放式病房中,老年患者的活动设置是一个关键因素,对他们的康复和心理健康有着重要影响。本文将探讨在综合医院精神科开放式病房中,如何通过科学合理的活动设置,有效地支持老年患者的心理健康和社会适应。

老年人在生理功能逐渐衰退的同时,感知觉功能下降,记忆减退,情绪趋于不稳定,表现为易兴奋、激惹、爱唠叨等。其人格也可能逐渐改变,出现

猜疑、偏执等情况。老年人退休后可能因为工作强度突然下降而出现空余,觉得自己缺乏社会价值等负面的情感体验。一些老年人开始与邻里一同活动,找到新的生活规律。另一些老年人则可能进去病态。促进老年心理健康的内容主要包括适应退休生活,把退休当成成功生活经历的一部分,通过参加老年大学、参加团体活动等方式,寻找和培养兴趣,保持适当的人际交往,以促进身心健康。

在老年诊疗活动的设置上,研究表明,重复经颅磁刺激、光照治疗、生物反馈治疗等物理治疗方法适用于老年患者群体。实践过程中发现,老年人可能存在感觉减退的情况,对于触觉、压力觉、痛觉、温度觉等都没有年轻人敏感,在设备调试的过程中,操作者应确保安全性,避免患者受伤,增加患者的依从性。应尝试正念治疗等动作舒缓的适宜老年人的方式,以改善睡眠、调节情绪等为主题,帮助老年患者改善症状,通过团体交流的方式,帮助老年患者寻找社会价值。老年在治疗后终究要回归家庭,调节老年与儿女的关系至关重要。应通过促进老年与儿女的交流,减少老年通过过度的症状描述和表现,从而引发儿女关注的行为,让交流回归正规。

老年娱乐活动的设置上,老年人退休后空余时间逐渐增多,开始回归集群活动。病区应适当为老年患者提供活动空间和设备,估计老年人进行棋牌、书画等益智活动。指导儿女体验老年人的感官世界,帮助儿女理解老年人的生活状态,是调节与儿女的关系,增加家庭成员之间理解的有效方法。病区内的家庭活动设置,使得儿女必须在一定时间内放下工作,陪伴父母,增加交流,促进情感。治疗的最终目的是回归社会,老年应更多的接触自然。应鼓励监护人在外出时间带领中年患者进行室外活动,增加运动,维持机体功能和身体健康。

不同的院内感染防控背景下中国某精神专科医院院内感染诊断与精神疾病诊断相关性的回顾性研究

周玉芳^{1,2} 缪天养^{1,2} 郑兴^{1,2} 陈水丽^{1,2} 王又天^{1,2}
吴升伟^{1,2} 施海珊^{1,2} 陈晓东^{1,2} 肖爱祥^{1,2} 叶君荣^{1,2}
李怀杰^{1,2} 郭建雄^{1,2} 邹月^{1,2}

1. 广州医科大学附属脑科医院
2. 广东省神经科学疾病研究重点实验室、神经致病基因与离子通道病省部共建重点实验室

目的 探讨精神病院医院感染(nosocomial infection, NI)不同防治措施与精神疾病患者之间的关系,了解精神病院医院感染的特点,为精神专科的院感防控提供参考依据。

方法 选取中国东南部某精神病院 NI 监测系统记录的资料,其中 2016 年 1 月 1 日至 2019 年 11 月 30 日住院的精神疾病 NI 患者归为非 COVID-19 疫情防控组(NC19C, n=898),2020 年 1 月 25 日至 2022 年 11 月 30 日住院的精神疾病 NI 患者归为 COVID-19 疫情防控组(C19C, n=840)。数据采用 SPSS 22.0 版本进行分析,独立样本 t 检验、卡方检验、多元逻辑回归分析被用于分析数据。经过 Bonferroni corrected 检验, $P < 0.0024$ 被认为具有统计学意义。

结果 在罹患院内感染的精神分裂症患者中,C19C 期发生医院获得性肺炎的概率是 NC19C 期的 3.103 倍($OR=3.103, 95\%CI=2.204\sim 4.370, P=0.000$),C19C 期发生医院获得性泌尿道感染的概率是 NC19C 期的 3.081 倍($OR=3.081, 95\%CI=1.719\sim 5.519, P=0.000$)。在罹患院内感染的抑郁症患者中,由于 P 值均大于 0.0024,此类患者的院内感染诊断在 C19C 期和 NC19C 期不存在统计学差异。在罹患院内感染的双相情感障碍患者中,C19C 期发生医院获得性肺炎的概率是 NC19C 期的 7.484 倍($OR=7.484, 95\%CI=5.020\sim 11.157, P=0.000$),C19C 期发生医院获得性泌尿道感染的概率是 NC19C 期的 3.411 倍($OR=3.411, 95\%CI=2.119\sim 5.491, P=0.000$)。

结论 在不同院感措施前提下,精神专科的院感特点不同。在加强院感防控的背景下,精神专科的院感诊断可能和精神疾病的诊断有关系。

关键词: 精神疾病,医院院内感染,院内感染诊断,不同的院感防控背景

针灸治疗椎体外系症状的 Meta 分级及理论探讨

吴春媛¹ 滕羽鸥² 冯坤²

1. 北京中医药大学
2. 清华大学玉泉医院

目的 系统评价针灸疗法治疗椎体外系症状的临床疗效。

方法 计算机检索中国知网期刊全文数据库(CNKI)、万方学术期全文数据库(Wanfang)、维普中文科技期刊数据库(VIP)、中国生物医学网、Web of Science、美国医学在线(PubMed)、荷兰医学文献数据库(Embase)及国际循证医学图书馆(Cochrane Library)等各大数据库。检索语言为中文和英文;检索时间从 2010 年 1 月 1 日至 2024 年 4 月 1 日;检索关于针灸治疗椎体外系症状的随机对照临床试验。由 2 名研究者独立筛选文献、提取资料并评价纳入研究的偏倚风险后,采用 Stata 17 软件进行 Meta 分析。

结果 共纳入 20 项高质量临床研究,纳入研究总受试者 1603 例。Meta 分析针灸结合其他疗法较单纯其他疗法改善情况结果显示:(1)UPDRS-III 示[$MD=-3.43, 95\%CI=(-4.53, -2.32), Z=-6.086, P=0.00 < 0.1$]。(2)UPDRS-III 肌强直部分示[$MD=-1.21, 95\%CI=(-2.31, -0.12), Z=-2.172, P=0.03 < 0.1$]。(3)UPDRS-III 震颤部分示[$MD=-0.38, 95\%CI=(-0.72, -0.03), Z=-2.161, P=0.031 < 0.1$]。

结论 本研究结果表明,针灸疗法对椎体外系症状均有改善,针灸联合其他疗法的效果优于单纯其他疗法,说明针灸可以作为一种辅助疗法以提高椎体外系症状的临床疗效。

椎体外系症状归属于中医学“颤证”、“挛证”、“颤振”等范畴,主要病机肝肾阴虚,兼有肝风、阳亢、血瘀等次证。肾主骨生髓,肾虚无以化精生髓,脉络空虚,四肢百骸缺少濡养,则不能主司肢体的正常运动功能;肝阴不足,筋失所养,可致手足颤动、屈伸不利等症状。临床选穴用太冲、太溪、肝俞、肾俞穴以滋补肝肾;丰隆穴作为胃经之络穴,补益脾胃,祛痰利水;足三里穴等以补养为主的腧穴,能够调整脏腑虚实,补益气血,充养筋脉,濡养脑髓。穴位所在经脉主要集中在督脉、大肠经、胃经等。督脉统摄全身阳经,在治疗中起着重要的作用,尤其是百会穴,作为诸阳之会,能够统摄和调控一身阳气。“颅底七穴”中哑门属督脉,也是督脉与阳维脉的交会穴,督脉总督人体一身之阳;阳维脉维系一身之阳经,哑门穴可看作一身之阳的聚结点。阳明乃后天之本,生化之源,故气血皆多,为气血亏虚者提供

了良好的支持。

关键词：针灸,椎体外系症状,Meta 分析,系统评价

Use of A Holistic Music Therapy Approach in The Treatment of Premature Infants and Caregivers in The Neonatal Intensive Care Unit (NICU): A Case Study

Yulin Wang Yanqing Xu*

Children's Hospital of Fudan University

Objective Literature has shown that premature infants represent a unique patient population characterized by extreme physical and emotional vulnerability, rendering them incapable of independent survival. Following premature birth, premature infants are immediately placed in the highly mechanized environment of the Neonatal Intensive Care Unit (NICU), where they face significant challenges, including stress, deprivation, overstimulation, and the abrupt transition from the predictable and safe environment of the womb. The experience of having a premature baby can be profoundly traumatic for parents, primarily due to the uncertainty surrounding their child's survival and the potential developmental impacts of premature birth. Additionally, witnessing the invasive medical care required for their child can be extremely distressing for parents. This case study aims to explore how the use of a holistic music therapy approach helps a 27-week-and-4-day gestational age very low birth weight infant (VLBW) and his family deal with physical, emotional, developmental, neurobehavioral, social, cognitive, and environmental challenges during the hospitalization at NICU.

Methods This case provides a holistic perspective on the treatment of a premature infant and his family from referral, assessment, treatment planning, implementation, family education, and termination. After surviving 72 days alone in the incubator, the infant was finally able to reunite with his parents in the daytime family care ward. The premature infant was initially referred by the neonatologist to enhance parent-infant

bonding. A pediatric psychiatrist and a music therapist conducted an assessment to evaluate the baby's vitals, psychosocial needs, comfort sounds, feeding and weight gain, environmental stimulation, pain, and as well as the parents' needs. The treatment planning, including identifying the appropriate goals, approach, setting, and frequency, was discussed by the team made up of neonatologists, psychiatrists, music therapists, and nursing staff. The music therapy sessions were administered three times per week, each lasting 20 minutes, by a U.S.-trained, board-certified music therapist (MT-BC). These sessions addressed concerns across various domains, including physical, emotional, developmental, social, cognitive, and environmental aspects. Specific goals included stabilizing vital signs, enhancing parent-infant bonding, improving self-regulation, organizing and tolerating stimuli, facilitating feeding and weight gain, promoting neurodevelopment, and improving sleep quality. Various music therapy interventions including individually provided sustained music, music and multimodal neurologic enhancement stimulation, music-reinforced nonnutritive sucking, breathing entrainment, singing as entrainment, environmental music therapy, contingent singing, infant-directed singing, auditory stimulation with the mother's voice. were implemented. The use of "Song of Kin" and lullabies was also introduced in the treatment, particularly in terms of offering support to the parents. Family education, including disease education, the importance of using live music, appropriate ways of using music to interact with the infant, and music choice, was introduced by the music therapist as well. A total of 27 sessions were implemented before the infant was discharged. A series of follow-up sessions were provided every two weeks at the outpatient program. Standardized instruments were used as pre- and post-treatment evaluation tools for the infant's levels of developmental as well as parents' moods and quality of life. Qualitative interview with the parents about their experiences and perceptions of receiving music therapy during their NICU stay was also conducted during the termination.

Results During the hospitalization period, while receiving music therapy, the infant was able to self-regulate and maintain stable oxygen saturation and heart

rate, gradually wean off the ventilator, tolerate feeding well, achieve consistent weight gain, and exhibit age-appropriate interactive and social behaviors. Additionally, parents reported better scores on quality of life at the end of the treatment.

Conclusion The findings suggest that integrating music therapy into the care plan for premature infants in the NICU can enhance not only the infants' developmental outcomes but also provide substantial emotional and psychological support to their families. This holistic approach underscores the importance of addressing both the medical and psychosocial needs of this vulnerable population, highlighting the potential benefits of music therapy as a standard component of NICU care.

高校科研人员失眠严重程度和焦虑抑郁现状及其影响因素分析

韩琳 陈旭东*

中南大学湘雅二医院

目的 随着科技创新的重要性日益凸显,高校科研人员作为创新型国家建设的中坚力量,其心理健康问题却鲜有得到应有的关注和研究。高校科研人员失眠、焦虑、抑郁的发生率、严重程度及其对日常生活和工作的影响不得而知。同时工作压力、工作环境质量以及个人心理弹性等可量化因素如何影响心理健康的深入研究。本研究旨在填补这一研究空白,通过深入分析高校科研人员的心理健康状态,识别影响其身心健康的关键因素,为改善他们的心理健康状况提供理论依据和实践指导。

方法 采用线上问卷调查高校科研人员。问卷包括自编题目和失眠严重程度指数量表、广泛性焦虑量表、9项患者健康量表、心理弹性量表和家庭功能量表,以收集高校科研人员人口学信息、科研环境信息和评估科研人员心理健康状态。采用SPSS软件进行数据分析,使用卡方检验、秩和检验、单因素分析和多因素logistic回归分析方法, α 均取值0.05。

结果 回收问卷样本涉及全国19个省份共821

份问卷,其中经过质控后纳入654份有效样本进行分析。645名科研人员中,中重度失眠有271位(42%),中重度焦虑有283位(43.8%),中重度抑郁有273位(42.4%)。logistic回归分析结果显示:非常投入科学研究、中等心理弹性水平是失眠的危险因素,单位举办/参加学术会议的机会比较多、家庭功能优秀是失眠的保护因素。工作年限大于10年、中等评分心理弹性是焦虑的危险因素,单位举办/参加学术会议的机会比较多、家庭功能优秀是焦虑的保护因素。工作年限6-10年、成果指数35-45是抑郁的危险因素,单位举办/参加学术会议的机会比较多、高心理弹性水平、家庭功能优秀是抑郁的保护因素。

结论 本研究揭示了高校科研人员中普遍存在的心理健康问题,其中失眠、焦虑和抑郁的发生率较高。科研人员参与学术会议的机会、心理弹性水平以及家庭功能是影响其心理健康的关键因素,更多的学术交流机会和良好的家庭支持环境有助于高校科研人员的心理健康。基于这些发现,我们建议制定针对性的心理健康干预计划,以提高科研人员的心理弹性,并优化其家庭和工作环境,从而改善他们的整体心理健康状态。

抑郁障碍患者情感灵活性异常的神经相关性: 一项事件相关电位研究

胡启明¹ 黎杜星² 孙逸凡¹ 王军^{1,2}

1.南京医科大学附属无锡精神卫生中心

2.江南大学附属精神卫生中心

目的 既往研究表明抑郁障碍患者存在情感灵活性异常,这可能是疾病发生发展的重要影响因素,但相关神经生理机制尚不明确。本研究旨在行为学研究的基础上,结合事件相关电位(ERP)技术,探索与抑郁障碍患者情感灵活性异常相关的神经电生理特征。

方法 自2022年3月至2023年3月,在无锡市精神卫生中心招募符合DSM-5中抑郁障碍诊断标准的患者及在周边社区招募健康志愿者作为研究对象,在完成情感转换任务范式(AST)时同步记录

脑电活动进行 ERP 分析。基于平均反应时计算出不同类型的情感转换成本（例如，正性情感转换成本=从判断正性图片人物数量转换至判断情绪图片效价时的反应时-重复判断正性图片情绪效价时的反应时）；ERP 成分晚期正电位（LPP）主要反映的是大脑对情绪刺激的加工强度或注意力资源分配多少，类似于情感转换成本，计算不同类型的情感转换时的 LPP 波幅差（例如，负性情感转换 LPP 波幅差=从判断负性图片人物数量转换至判断情绪图片效价时的 LPP 波幅-重复判断负性图片情绪效价时的 LPP 波幅）。以组别（患者组 vs. 对照组）为组间因素，以情绪图片效价（正性 vs. 负性）和任务类型（判断情绪效价 vs. 判断人物数量）为组内因素，采用混合设计方差分析比较两组被试不同类型情感转换成本及 LPP 波幅的差异，采用 Bonferroni 法进行多重比较校正；使用 Pearson 相关分析探索各指标之间的相关性。

结果 最终患者组和对照组各有 29 例被试数据纳入分析，两组在平均年龄、性别构成比、体质指数、利手性、受教育年限等一般人口学资料上的差异均无统计学意义。混合设计方差分析结果显示，情感转换成本存在效价×任务类型交互作用 ($p < 0.001, \eta^2 p = 0.244$)、组别主效应 ($p = 0.043, \eta^2 p = 0.071$) 和任务类型主效应 ($p < 0.001, \eta^2 p = 0.432$)，简单效应分析显示患者组的正性情感转换成本高于对照组 ($p = 0.028$)；情感转换 LPP 波幅差的组别×效价×任务类型交互作用显著 ($p = 0.015, \eta^2 p = 0.101$)，简单效应分析显示患者组的负性情感转换 LPP 波幅差显著小于对照组 ($p = 0.023$)。Pearson 相关分析显示，汉密尔顿抑郁量表 (HAMD) 总分与抑郁障碍患者的正性情感转换成本 ($r = 0.538, p = 0.008$) 及负性非情感转换 LPP 波幅差 ($r = 0.463, p = 0.026$) 均显著正相关。

结论 本研究结果表明，抑郁障碍患者转入正性情感判断时的耗时更长，转入负性情感判断任务时所需的神经加工与注意资源分配更少，而且患者转入正性情感判断的难度和转出负性情感所需的脑资源消耗都随着抑郁症状的加重而增加。

关键词：抑郁障碍,情感灵活性,情感转换任务,事件相关电位,晚期正电位

伴发精神病性症状的病毒性脑炎后脑脊液 TBA 阳性（未知抗体）自身免疫性脑炎：双

峰脑炎

律东* 梁晓欣 姚多财 熊素素
广东医科大学附属医院

目的 报告 1 例伴发精神症状的病毒性脑炎继发脑脊液 TBA 阳性的自身免疫性脑炎 (AE) 的患者的临床表现及诊治经过，提高临床医生对该类疾病的认识。

方法 收集 1 例伴发精神症状的病毒性脑炎继发 AE 的患者的临床资料，对其诊断和治疗过程结合文献进行分析总结。

结果 男性，38 岁，以高热、头痛、抽搐、意识障碍急性起病，外院经抗感染、抗病毒等对症治疗后神志清楚，病情好转后出院，半个月后患者出现精神病性症状：冲动、易激惹、失眠、被害感，记忆力下降，入住我科后完善头部磁共振示：左侧丘脑及双侧海马区异常信号影，相关检测提示脑脊液白细胞升高、IgG 指数及 IgG24 小时鞘内合成率升高、寡克隆区带 II 型，脑脊液病原微生物宏基因检测 (NGS) 发现 EBV、脑脊液神经抗体 TBA 法阳性（考虑为未知抗体），后经过神经元染色确定为细胞膜表面抗体，考虑为致病性抗体，患者血液、脑脊液经 CBA 法检测自身免疫性脑炎抗体、副瘤综合征抗体、小脑共济失调抗体等筛查均为阴性，后续拟经过免疫共沉淀、质谱分析、CBA 验证等检测来进一步明确新抗体。经多学科联合会诊诊断为病毒性脑炎继发 AE，给予激素、免疫球蛋白冲击、抗精神病药物治疗后患者精神病症状消失，病情明显好转出院，后续予以吗替麦考芬脂、激素治疗，随访 9 个月，又经过 3 次腰穿术检测脑脊液，白细胞均正常，IgG 指数及 IgG24 小时鞘内合成率逐渐下降至正常，TBA 法检测抗体滴度逐渐变弱至阴性，头部磁共振丘脑异常信号消失，海马信号变弱，遗留记忆力稍下降，可正常生活。

结论 病毒性脑炎经抗病毒等治疗有效的患者，在恢复期再次出现临床症状，尤其是边缘系统症状，应高度怀疑继发 AE 可能，此时应完善神经抗体检测 (CBA+TBA) 等，以早期诊断、早期治疗、改善预后。

关键词：自身免疫性脑炎；病毒性脑炎；精神病性症状；神经免疫抗体；TBA

以精神病性症状起病的多重抗体阳性副肿瘤性神经系统综合征 1 例

律东* 姚多财 梁晓欣 熊素素
广东医科大学附属医院

目的 探讨副肿瘤性神经系统综合征 (Paraneoplastic neurological syndromes, PNS) 的临床表现和诊治特点, 提高精神科医师及神经内科医师对 PNS 的认识。

方法 回顾收集 1 例以精神病性症状起病的副肿瘤性神经系统综合征患者的临床表现, 影像学资料、实验室检测数据等, 并结合文献进行分析。

结果 该患者为中年男性, 以睡眠障碍及幻觉起病, 随后 2 年内症状逐渐加重, 并出现共济失调、行为异常、肌无力、肌肉疼痛、自主神经功能障碍等症状。检查发现 AchRAb、抗 CASPR2 抗体、AQP4 抗体、SP100 抗体、抗 CV2/ CRMP5 抗体均阳性, 头部 MR 可见右侧桥脑、左侧尾状核及右侧丘脑病灶, PET-CT 考虑胸腺瘤, 术后病理为(纵隔)胸腺瘤, 符合 B3 型, 最终, 诊断为胸腺瘤合并副肿瘤性神经系统综合征、抗 CASPR2 抗体阳性相关脑炎及重症肌无力 (MG), 经过多学科 (精神科、神经内科、胸外科及影像科等) 讨论, 予以激素、丙球、溴比斯的明等对症及外科手术治疗, 患者达到临床痊愈, 头部磁共振右侧桥脑病灶消失, 左侧尾状核头、右侧丘脑病灶信号明显变弱, 随访患者可以正常生活和工作, 无复发。

结论 副肿瘤性神经系统综合征、自身免疫性脑炎属于罕见病, 预后不佳, 需要早期完善神经抗体检测及排查相关肿瘤, 多学科联合诊疗, 早期明确诊断和有效治疗可以给患者带来显著的效果。

关键词: 副肿瘤性神经系统综合征; 精神病性症状; 神经免疫抗体; 胸腺瘤

以抑郁症状起病的母系遗传性糖尿病伴耳聋 1 例

律东* 姚多财 梁晓欣 熊素素
广东医科大学附属医院

目的 探讨母系遗传性糖尿病伴耳聋 (maternally inherited diabetes mellitus with deafness, MIDD) 的临床表现和诊治特点, 提高临床医生对 MIDD 的认识。

方法 回顾收集 1 例以抑郁症状起病的母系遗传性糖尿病伴耳聋患者的临床表现, 影像学资料、实验室检测数据等, 并结合文献进行分析。

结果 该患者为中年男性, 以抑郁症状及认知障碍起病, 伴有糖尿病及耳聋, 10 余年来多次被误诊为抑郁障碍及 2 型糖尿病。检查发现头部 CT 显示双侧基底节区、小脑半球、丘脑多发斑片状钙化灶; 头部 MRI 显示: 双侧尾状核头、双侧豆状核、丘脑内见对称异常信号影; 听力检测为神经性耳聋, 经过多学科 (精神科、内分泌科、神经内科、耳鼻喉科及影像科) 讨论, 考虑可能为 MIDD, 经查患者和其父母基因, DNA 基因突变 (MT-TL1 基因的 3243 位点上, m.3243A > G 基因突变), 诊断为母系遗传性糖尿病伴耳聋, 予以抗抑郁、控制血糖等对症支持治疗, 患者抑郁症状及认知功能有所好转。遗憾的是由于发病时间长, 患者双耳听力不可逆下降, 但目前可以正常生活, 现无明显抑郁症状, 无复发。

结论 母系遗传性糖尿病伴耳聋属于罕见病, 极少见有病人以抑郁症状及认知障碍为首表现, 这可能扩大了母系遗传性糖尿病伴耳聋的临床表型。

关键词: 母系遗传性糖尿病伴耳聋、抑郁障碍、认知障碍、基因

The Pathogenic Mechanism of Intestinal Microbial Metabolites in The Comorbidity of Depression and Cardiovascular Diseases

MoJun Jin¹, Liemin Ruan²

1.Ningbo University

2.The First Affiliated Hospital of Ningbo University

In recent years, the comorbidity rate of depression and cardiovascular diseases has been continuously increasing, posing challenges to clinical diagnosis and treatment. Currently, it is believed that the comorbidity of depression and cardiovascular diseases involves a complex network of pathogenic mechanisms, including

inflammatory responses, platelet aggregation, and abnormalities in the hypothalamic-pituitary-adrenal (HPA) axis function. Further research in fields such as "gut-brain axis" and "gut-heart axis" has revealed that intestinal microbiota and their metabolites directly or indirectly participate in the regulation of emotions and cardiovascular system health, forming complex networks of metabolism, inflammation, and neuron that link gut, heart, and brain. Intestinal microbiota products including short-chain fatty acids (SCFAs), trimethylamine N-oxide (TMAO), secondary bile acids (SBAs), and others. These factors influence emotional and cardiovascular health by altering intestinal barrier integrity, immune activity, and vagus nerve stimulation. Intestinal microbiota also generates essential neurotransmitters such as gamma-aminobutyric acid (GABA), serotonin (5-HT), dopamine, and norepinephrine, which play crucial roles in regulating gastrointestinal immune function, endocrine activity, and neural circuits related to human emotions. Interventions targeting intestinal microbiota have emerged as novel therapeutic strategies for depression and cardiovascular diseases. This article summarizes the pathogenic mechanisms of intestinal microbiota and their metabolites in the common pathogenic factors of depression and cardiovascular diseases, as well as related treatment strategies.

关键词: Depression, cardiovascular diseases, intestinal microbiota metabolites, inflammation; probiotics

学龄期孤独症谱系障碍患儿合并紧张症的相关因素

李雷俊 邹小兵 李咏梅 邢艺沛 陶炯*
中山大学附属第三医院

目的 探讨学龄期(6-17岁)孤独症谱系障碍患儿合并紧张症的相关因素。

方法 通过对中山大学附属第三医院儿童行为发育中心和精神心理科门诊就诊和住院患者以及社会性广告招募的形式,共纳入学龄期(6-17岁)孤独症谱系障碍患儿共222人,依据《精神障碍诊断

与统计手册(第五版)》(DSM-5)紧张症的诊断标准将患儿分为孤独症谱系障碍合并紧张症组(n=45)和孤独症谱系障碍组(n=177),采用中文版的减弱行为量表(ABQ)、中文版儿童简化情绪量表、斯宾思儿童焦虑量表、汉密失能量表、重复行为量表修订版(RBS-R)进行心理因素的量表评估。对两组间的一般情况与临床特征进行比较,并采用 Logistic 回归方法对孤独症谱系障碍合并紧张症的相关因素进行分析。

结果 孤独症谱系障碍合并紧张症组和孤独症谱系障碍组在社会功能损害($z=4.91, p<0.001$)、抑郁($\chi^2=12.54, p<0.001$)、重复刻板行为($z=5.02, p<0.001$)、强迫症($\chi^2=7.49, p=0.006$)方面有统计学差异。多因素二元 Logistic 回归分析结果显示,重复刻板行为增加了孤独症谱系障碍合并紧张症的风险,具有统计学意义[OR=1.045, 95%CI (1.02-1.07), $P<0.001$]。

结论 紧张症导致了孤独症谱系障碍患儿社会功能的进一步损害;重复刻板行为、抑郁、强迫与孤独症谱系障碍患儿合并紧张症有关,其中重复刻板行为是孤独症谱系障碍患儿合并紧张症的独立风险因素,重复刻板行为越突出,合并紧张症的风险越高。

关键词:紧张症,孤独症谱系障碍,重复刻板行为

综合医院精神科联络会诊特点分析

尚兰 孙仕友*
北京回龙观医院

目的 了解综合医院住院患者精神科会诊的状况和特点。

方法 收集北京某精神科专科医院近4年(2016-2019)会诊病例214例患者,对患者的人口统计学、科室分布、诊断和治疗方案进行分析。

结果 患者年龄10岁-95岁(平均年龄 60.85 ± 20.82),男性:113例(占52.8%),女性101例(占47.2%)。二级以上综合医院30家,其中三级以上医院16家,会诊人数128例(占总数59.8%)。请求会诊的科室26个,排名前五位的分别为康复科:26例(占12.1%),血液科:25例(占11.7%),神

经内科: 21 例(占 9.8%), 急诊科: 17 例(占 7.9%), 脑病科 16 例(占 7.5%)。精神科会诊的诊断主要为, 谵妄: 53 例, 占 21%, 抑郁状态: 45 例, 占 21%, 痴呆: 21 例, 占 9.8%, 脑器质性精神障碍: 15 例, 占 7.6%, 焦虑状态, 13 例, 占 6.1%, 幻觉妄想状态: 11 例, 占 5.1%, 精神分裂症 12 例, 占 5.6%。会诊后的治疗方案: 非药物治疗: 22 例, 占 10.3%, 药物治疗: 192 例, 占 89.7%。其中精神病药: 116 例, 占 54.21%, 抗抑郁剂: 87 例, 占 40.65%, 非苯二氮卓类催眠药: 55 例, 占 25.70%, 苯二氮卓类抗焦虑药: 44 例, 占 20.56%, 心境稳定剂: 13 例, 占 6.07%。

结论 综合医院有必要加强精神科会诊服务, 特别对老年合并神经精神科疾病患者, 需进一步提高非精神科医师对精神疾病的识别和处理。

关键词: 综合医院; 会诊联络精神病学; 回顾分析

智慧型幸福量表在临床护士中的测量及对职业妥协的影响

李琦 史艳茹*

空军军医大学第一附属医院

目的 检验智慧型幸福量表在临床护士群体中的信效度, 并探讨智慧型幸福对护士职业妥协的影响。职业妥协通常指个体在职业发展过程中因外部因素而做出的非自愿性调整或牺牲。智慧型幸福则是指个体在面对生活挑战时展现出的积极心理状态, 包括自我接纳、生活目标明确和对环境的适应能力等。

方法 研究采用横断面问卷调查法, 对西安市三所三甲医院的护士进行调查。共收集问卷 580 份, 有效回收率为 96.89%。统计分析采用 SPSS 26.0 软件。测量智慧型幸福对护士职业妥协的影响采用多元阶层回归, 同时, 为了剔除常见的人口统计学变量混杂干扰, 我们将样本的年龄、性别、婚姻状况、学历和职称作为控制变量纳入回归模型。

结果 探索性因子分析共提取 1 个公因子, 累计方差贡献率为 74.933%, 总量表的 Cronbach's α 系数为 0.941, 折半系数为 0.903, KMO 值为 0.929, Bartlett's 球形检验的 χ^2 值 $P < 0.05$ 。智慧型幸福量表

每个测量条目的均值在 3.65~4.06 分之间, 处于中等水平; 智慧型幸福可以显著降低护理人员的职业妥协 ($\beta = -0.265$, $P < 0.01$)。

结论 本研究证实智慧型幸福量表在临床护士中的信效度。同时, 提升护士的智慧型幸福水平可能是减少职业妥协的有效途径。建议护理管理者和人力资源部门重视护士的心理健康和幸福感, 通过提供心理支持、职业发展机会和积极的工作环境等措施, 促进护士的智慧型幸福水平。

关键词: 护士, 智慧型幸福量表, 职业妥协

心理脱离对职业妥协的影响分析: 智慧型幸福的中介作用

李琦 史艳茹*

空军军医大学第一附属医院

目的 本研究聚焦于心理脱离对护士职业妥协的影响, 并探讨了智慧型幸福在这一过程中的中介作用。研究的目的在于为护士的职业发展和心理健康提供科学的干预策略, 以期改善护士的工作状态和生活质量。

方法 采用了便利抽样法, 选取了 2024 年 5 月至 2024 年 6 月期间, 陕西省西安市三所三甲医院的 580 名护士作为研究对象。通过职业妥协量表、心理脱离量表和智慧型幸福量表, 进行了为期两个月的横断面调查。研究采用 SPSS 26.0 进行统计分析, process 插件进行中介分析。

结果 护士职业妥协、心理脱离、智慧型幸福得分分别为 (31.60 ± 10.30) 分、 (10.71 ± 4.18) 分及 (27.29 ± 4.98) 分。职业妥协与心理脱离呈正相关 ($r = 0.247$); 心理脱离与智慧型幸福呈正相关 ($r = 0.145$); 职业妥协与智慧型幸福呈负相关 ($r = -0.271$), 均 $P < 0.01$ 。智慧型幸福在职业妥协与心理脱离之间起到显著的中介作用, 中介效应占 11.21%。

结论 心理脱离不仅直接对护士职业妥协产生显著的正向影响, 而且可以通过提升护士智慧型幸福水平, 间接减少职业妥协。护理管理者和教育者应重视提升护士的心理脱离能力和智慧型幸福水平, 以减少职业妥协, 促进护士的心理健康和职业发展。

关键词: 心理脱离, 智慧型幸福, 职业妥协, 护士

精神病专科医院患者伴躯体疾病 及抗精神药物应用情况调查

童孝江*

泾县医院

目的 调查精神病专科医院住院患者伴发躯体疾病, 以及临床应用精神病药物的现状。

方法 2023年10月芜湖安定精神病医院(二级)住院的461例精神疾病患者, 采用自编的患者情况调查表进行登记, 调查患者一般人口资料、所患躯体疾病, 以及临床所使用的精神药物情况。

结果 ①一般人口学资料: 年龄: 47.09 ± 12.78 岁。性别: 男性333例(72.1%), 女性128例(27.7%)。精神疾病诊断: 精神分裂症296例(64.2%), 双相情感障碍45例(9.8%), 器质性精神障碍10例(2.2%), 精神发育迟滞88例(19.1%), 使用酒精引起的精神和行为障碍6例(1.3%), 其他6例(1.3%)。②躯体疾病情况: 心脏疾病91例(19.7%), 高血压病55例(11.9%), 糖尿病56例(12.1%), 血液系统病16例(3.5%), 呼吸系统病8例(1.7%), 低血钾21例(4.5%), 其他疾病13例(2.8)。③精神药物使用: 一种抗精神病药物364例(79.0%), 二种抗精神病药物联用87例(18.9%), 三种抗精神病药物联用1例(0.2%), 未用抗精神病药物9例(2.0%)。奥氮平等效剂量: 平均 7.10 ± 4.65 mg/d, 最小剂量0.33mg/d, 最大剂量35.0mg/d。④奥氮平等效剂量伴躯体疾病患者(6.53 ± 4.17 mg)较不伴躯体疾病患者(7.52 ± 4.94 mg)低, 差异具有统计学意义($Z=2.006$, $P=0.045$)。

结论 精神病专科医院住院患者年龄较大, 患者伴躯体疾病较多, 抗精神病药物联合应用比率偏高, 提示临床应着重注意年龄大和伴躯体疾病患者的医疗风险管理。

关键词: 躯体疾病 抗精神药物应用

DIP 付费下抑郁症患者住院费用的灰色关联及结构变动分析 ——以江苏省扬州市某综合性医院为例

高霞¹ 朱瑞轩² 蔡滨¹ 石元洪¹ 史力群¹ 杨扬¹ 董丽平¹ 童萍¹ 钱少敏¹

1.江苏省苏北人民医院

2.大连医科大学

目的 分析综合性医院心理科按病种分值付费(DIP)改革前后抑郁症患者住院费用的变化情况, 为完善医保支付方式改革提供实证数据支持。

方法 根据我院DIP实际执行时间收集抑郁症住院患者相关信息, 分为改革前和改革后两组, 比较两组患者基本情况、住院天数、费用情况等。符合正态分布的计量资料用均数标准差表示, 组间比较采用t检验;计数资料组间比较用卡方检验。采用结构变动度分析研究各单项费用对次均住院总费用的结构变动值、结构变动度及结构变动贡献率。采用灰色关联分析法比较各单项费用与次均住院总费用之间的关联系数、关联度及关联序。

结果 DIP改革前后, 患者年龄、性别差异无统计学意义($P>0.05$);住院天数缩短($P<0.05$);DIP改革前人均次住院总费用8275.10(± 1950.38)元, 改革后7401.87(± 1707.73)元, 统计学差异有显著意义($P<0.01$)。灰色关联分析显示患者次均住院费用中治疗费与总费用的关联度最高, 关联系数为0.930, 医技诊断项目费0.906、综合医疗服务费0.755、药品费0.737、护理费0.727依次递减;材料费的关联度最低为0.702;结构变动分析显示2021-2023年抑郁症患者次均住院费用结构变动度(DSV)为33.08%, 变动较大;单项次均住院费用结构变动贡献率(CSV)排名前三的依次为治疗费、医技诊断项目和药品费, 是导致抑郁症患者住院费用变动的最大影响因素。

结论 DIP改革可通过改进住院流程, 缩短平均住院日, 优化费用结构, 降低住院费用。住院医疗费用受主客观因素影响, 药品费、材料费下降已成必然趋势, 体现医务人员劳动价值的心理治疗费用有所增加。付费方式改革对提高医务人员合理控费有促进意义, 但仍有进一步提升的空间。

前额工作记忆神经网络——基于多项认知任

务的近红外脑功能成像

任雨菲¹ 张小芊² 冯坤² 刘破资^{2,3}

1.清华大学外国语言文学系

2.清华大学玉泉医院

3.清华大学临床医学院

目的 在中国，精神障碍已经成为显著的公共卫生挑战。目前，诊断和治疗策略主要依据患者的病史、精神状态评估和心理评估量表，结合临床经验和诊断准则来制定，缺乏科学量化依据。近年来，尽管近红外光谱脑功能成像技术在精神卫生领域已被广泛探索，但认知任务范式的多样性和功能成像图谱理论解析的不足，限制了 NIRS 在精神疾病领域的广泛应用。制定一套适用于中国人群的标准化近红外任务，并建立对图像的理論解析，将促进 NIRS 在国内精神科的辅助诊断和推广。

方法 我们的研究团队将利用近红外脑功能成像仪，探索所创建的“多项认知任务近红外脑成像图谱采集及分析系统”这一套近红外测试标准，并进行相关的图谱数据分析。多项认知任务有四个认知任务组成，依次是情绪图片任务、言语流畅任务、对指运动任务以及症状刺激任务，以充分发挥近红外脑功能成像的时间依赖特性和对精神状态的检测潜力。

结果 通过静息态与任务态交替的刺激模式，发现了六种典型的与症状相关的脑功能成像波形，并初步宏观的归纳出前额工作记忆网络的三种网络联合工作模式的表征，即注意工作记忆主协调网络、感知觉内容工作记忆次级网络和情绪行为工作记忆决策执行网络。

结论 这是首次尝试用功能成像的方式表征前额工作记忆网络在认知、情绪和行为调节功能，将可能促进近红外脑功能成像在临床研究中的应用。我们以临床诊断以及六种波形为依据，对工作记忆这一认知和心理机制进一步划分，从认知角度对患者注意、感知觉内容、情绪行为执行功能的考察将促进相关神经机制研究，对于认知科学以及医学内表型标志物的发展具有重要意义。

关键词：近红外脑功能成像，言语认知任务，前额，工作记忆网络，精神障碍

奥氮平致多形性红斑药疹 1 例

崔隽*

锡林郭勒盟安神医院

目的 本文报告一例奥氮平所致多形性红斑药疹的临床病例。多形性红斑典型表现为多在肢端呈对称分布的靶形或虹膜状红斑，是一种急性炎症性皮肤病。该病多见于病毒或细菌感染，亦见于抗生素等药物不良反应。

方法 奥氮平所致多形性红斑药疹的不良反临床罕见，本病例回顾奥氮平所致多形性红斑的临床表现、治疗方案，帮助临床医师更容易识别奥氮平所致不良反应，及时应对处理。

结果 奥氮平出现多形性红斑性药疹的治疗目前没有统一的规范，一般认为出现多形性红斑等严重不良反应后应立即停用奥氮平，并使用抗过敏药物。但临床实际工作中，突然停用奥氮平可能会引发恶性综合征等严重撤药反应，给患者带来更大的损害。本例患者在出现多形性红斑后，临床处理为将奥氮平逐渐减量并维持小剂量继续治疗，同时予以抗过敏药物治疗。最终患者的红斑得到了有效的治疗，也未发现给患者带来临床损害。

结论 熟悉奥氮平可能出现的不良反临床医师尤为重要，监测常见和罕见的不良反应可以显著降低与奥氮平治疗相关的致残率和死亡率。此外，如果患者充分了解其不良反应的性质和风险，并且临床医生认识到并试图治疗这些不良反应，则可以显著提高对奥氮平治疗的依从性。对其他奥氮平不良反应的适当管理有助于最大限度地提高奥氮平治疗的益处，所以奥氮平等抗精神病药物罕见的不良反应需要更多的被报道出来。

Fronto-limbic Network Homogeneity As An Imaging Biomarker for Bipolar Disorder and Early Treatment R

高玉军^{1,2,3} 王高华¹ 陆林²

1.武汉大学人民医院

2.北京大学第六医院

3. 武昌医院

目的 The fronto-limbic network is implicated in the neurobiology of bipolar disorder (BD). However, no studies are designed to assess directly the abnormalities network homogeneity (NH) of the fronto-limbic network in BD.

方法 This study included 117 patients with BD [42 depression in BD (BipD), 38 BipM, and 37 remitted BD (rBD)] and 83 healthy controls (HCs). All participants underwent resting-state functional magnetic resonance imaging (rs-fMRI) and scale tests. NH, support vector machine (SVM) and support vector regression (SVR) were employed to analyze the data

结果 The NH values were significantly different in the frontal lobe, temporal lobe, and left precuneus among the four groups. SVM and receiver operating characteristic curves indicated that the NH values of the abnormal brain could be used to differentiate BD and HCs.

结论 NH changes may offer value as a neuroimaging biomarker capable of differentiating BD and predicting early treatment response in patients with B

骑电动车摔倒无明显脑外伤而急起精神障碍一例

王雅琴 许春杏 陈红梅* 曹绚

中国人民解放军联勤保障部队第九二三医院

目的 以期精神科医疗护理人员增强对摔倒无明显脑外伤而急起精神病性症状的认识。同时, 摔倒无明显脑外伤而急起神病性症状案例为研究精神障碍的病程发展机制提供了一个特别的研究机会。希望通过本案例, 促进精神科临床医务人员对此类问题的识别与处理, 为临床治疗及护理提供鉴别意义。

方法 患者, 男, 17 岁。因“反复行为异常、敏

感多疑 1 周”于 2024 年 2 月 20 号入院治疗。病例资料: 2024 年 2 月 13 号患者骑电动车摔倒, 没有明显脑外伤, 出现怪异行为, 夜间不睡觉, 在床上撒饼干、方便面后并踩碎, 咬充电线等。因为摔倒时脚外踝受伤, 一直不配合换药, 自语自笑, 敏感多疑。家属无法管理患者, 保证患者安全。既往史、个人史、家族史均无特殊。精神专科检查, 患者意识清晰, 时间、地点、人物及自我定向差, 接触交谈欠合作。自知力缺乏。思维逻辑性差, 查及可疑的关系妄想、被害妄想, 记忆力、计算力明显下降。情感焦虑, 伴有轻微的抑郁情绪。意志无明显增强或减退。辅助检查: X 线: 左外踝骨折, 左外踝周围软组织肿胀。磁共振头部 MR: 考虑病理性脑萎缩: 1、脑实质欠饱满。2、脑室形态扩张、脑沟及脑裂增宽, 透明隔间腔增宽。患者有明确的脑部器质性病变, 主要以精神症状、认知功能下降等表现为主, 考虑精神症状和脑部病变相关。入院诊断 1. 器质性精神障碍 2. 左外踝骨折 3. 脑萎缩。

结果 予以酮可可碱注射液改善脑循环, 遵神经内科会诊意见加用吡拉西坦分散片营养脑神经, 予盐酸哌罗匹隆片抗精神病治疗、奥沙西洋片改善睡眠等对症处理。患者共住院治疗 14 天, 期间: 患者情绪、认知功能逐渐改善, 未再有怪异行为及敏感多疑, 睡眠改善。出院精神状况检查: 意识清晰, 定向准确。接触主动、合作, 问话能答, 基本切题。否认幻觉、妄想, 思维贫乏改善, 认知功能改善, 情感反应较前协调。自知力部分恢复。

结论 器质性精神障碍是指由严重创伤、脑血管疾病、感染、脑部肿瘤引起的精神障碍, 所以又称脑器质性精神病。器质性精神障碍既有器质性疾病的临床症状, 又有精神障碍性疾病的临床症状, 严重威胁患者的健康。对于该患者, 骑电动车摔倒无明显脑外伤史, 磁共振头部 MR 显示 1、脑实质欠饱满。2、脑室形态扩张、脑沟及脑裂增宽, 透明隔间腔增宽。患者有明确的脑部器质性病变, 主要以精神症状、认知功能下降等表现为主, 考虑精神症状和脑部病变相关。

器质性抑郁障碍急起尿潴留一例

陈红梅 阳睿 王雅琴*

中国人民解放军联勤保障部队第九二三医院

目的 以期精神科医务人员增强对器质性抑郁障碍的认识。同时，器质性抑郁障碍引起急性尿潴留病例为此提供一个学习研究机会。我们希望通过本病例，促进精神科临床医务人员对此类问题的识别与处理，为临床治疗提供借鉴意义。

方法 患者男，73岁。因“心情差1月”于2024年4月26日入住我院治疗。2024年4月28日，患者夜间下腹部胀痛，诉一日未排尿，予留置尿管导尿。既往史、个人史、家族史：无特殊。精神检查：神清，定向准，接触交谈被动合作。否认幻觉、妄想。情绪低落、愉悦感丧失、精力下降、动力下降，情感反应尚协调。记忆、智能粗测下降。意志减退。曾有自杀行为，自知力部分存在。入院检查：头颅MRI：左侧基底节及右放射冠区腔隙灶。2、脑白质高信号（Fazekas2级）3、脑萎缩4、椎基底动脉扩张延长症；其余无特殊。入院诊断：器质性抑郁障碍。

结果 入院后给予盐酸米那普仑片 50mg/d，1周内缓慢加量至 100mg/d，在此过程中，患者急性尿潴留症状逐渐减轻，直至2024年5月4日拔除尿管，我们观察到，患者后续在住院期间，未再次发生急性尿潴留的情况。

结论 通过相关文献学习，我们总结器质性抑郁障碍的几点假设机制，其中一些较为公认的假设包括脑结构的变化、生理功能的退化、炎症[1]。对于该患者来说，整个急性尿潴留过程中未出现脑结构的负性变化，也从未使用改善脑血管疾病等药物治疗。因此脑白质病变引起脑神经功能紊乱使患者出现抑郁障碍的同时，也导致神经递质功能出现失调，使得支配排尿的神经功能出现问题，继而引发急性尿潴留症状。参考文献：[1]张孝玲,肖谦.老年期抑郁障碍危险因素的研究进展[J].现代医药卫生,2023,39(05):869-873.

精神分裂症研究协作组

探讨住院精神分裂症患者用药管理安全性的调查

陈雪凝 刘辉*

海南省平山医院

目的 调查住院精神分裂症患者的用药管理的安全性，为临床用药的合理性提供帮助；

方法 选择2018年3月至2019年7月入住该院住院部的精神分裂症患者128例，采用完全随机方法将患者分为观察组（64例）及对照组（64例），观察组采用阿立哌唑治疗，对照组采用利培酮治疗，对比治疗前后两组患者的药物副作用（TESS量表）及患者的严重程度（PANSS量表）评分情况；

结果 采用阿立哌唑的观察组患者在用药1疗程时与对照组比较TESS评分显著减少（ $P < 0.05$ ），且与本组用药7d相比显著下降（ $P < 0.05$ ）；对照组患者用药1疗程及用药7d比较无显著差异（ $P > 0.05$ ）；同时发现其与对照组相比，治疗后阴性症状评分显著低于对照组阴性症状评分（ $P < 0.05$ ），但总分比较无显著差异（ $P > 0.05$ ）；

结论 1. 精神分裂症绝大多数患者治疗以口服抗精神病药物治疗为主，阿立哌唑作为D1和5-HT1A受体，而利培酮主要作用于5-HT2A受体，对于患者的阴性症状来说，采用阿立哌唑起效更快。

本研究结果显示，采用阿立哌唑的患者在用药1疗程时TESS评分更低，服用阿立哌唑1疗程的患者副作用更低，阿立哌唑治疗后阴性症状评分显著低于对照组阴性症状评分，可见，在临床针对阴性症状为主的精神分裂症患者，建议选用阿立哌唑进行治疗，起效更快，副作用更低，安全性好。

总之，住院精神分裂症患者采用阿立哌唑及利培酮均能够获得较好的疗效，患者副反应小，阿立哌唑的耐受度更高，对患者的阴性症状缓解更快，可以依据患者个体情况进行针对性选择用药。

免疫衰老与精神分裂症认知障碍的关系研究

李娜 谭云龙*
北京回龙观医院

目的 精神分裂症 (Schizophrenia, SCZ) 患者较普通人群寿命减少约 15-20 年, 研究表明, 过早或加速衰老、免疫系统功能障碍在 SCZ 的病理机制中发挥重要作用。认知障碍是 SCZ 的核心特征, 是导致 SCZ 患者临床疗效差和预后不佳等的主要原因之一。有证据显示, T 细胞衰老与神经退行性疾病相关的认知受损有关, 但其与 SCZ 患者中认知障碍的关系目前尚不明确。基于上述内容, 本研究旨在探索免疫衰老相关 T 细胞表型与 SCZ 患者认知障碍之间的关联。

方法 从 2021-2022 年共纳入符合入组标准的慢性 SCZ 患者 65 例和健康对照 (healthy control, HC) 58 例。使用流式细胞术检测免疫衰老标志物, 包括 CD4⁺ 和 CD8⁺ 幼稚 (CD45RA⁺) 和记忆 (CD45RO⁺、CD95⁺) T 细胞的百分比; 并检测 CD8⁺CD45RA⁺/CD45RO⁺CD95⁺ 细胞亚群中细胞因子 (IFN- γ 、IL-1 β 、IL-6 和 TNF- α) 的水平, 以反映幼稚及记忆 T 细胞的功能。采用 T1 加权成像和弥散张量成像获取皮层下体积、皮层厚度和白质纤维束的分数各项异性 (fractional anisotropy, FA)。分别采用中文版 MATRICS 共识认知能力测验 (MCCB) 和阳性与阴性症状量表 (PANSS) 评估被试的认知功能或精神病理症状。

结果 (1) 与 HC 组相比, 慢性 SCZ 组中幼稚 T 细胞亚群的数量较低, 而记忆性 T 细胞亚群的数量较高。(2) 在有调节的中介模型中, 右侧顶下小叶厚度在 CD8⁺CD45RA⁺CD95⁺ 幼稚 T 细胞来源的 IL-1 β 水平对工作记忆维度得分的影响中起中介作用, 且右侧扣带束的 FA 值在 IL-1 β 水平与右侧顶下小叶厚度之间的间接路径中起调节作用。

结论 本研究从免疫衰老的角度揭示了生理性加速衰老在慢性 SCZ 患者认知缺陷中的潜在作用。能够为将来针对免疫衰老的治疗手段在临床实践中的应用与推广提供初步理论依据。

Trans-scale Study of Blood-based Gene Expression, Neuroimaging Brain Phenotypes and Cognitive Performance in Schizophrenia

and Healthy Individuals

Longbiao Cui¹, Huaning Wang²

1. Department of Psychiatry, Xijing 986 Hospital, Fourth Military Medical University

2. Department of Psychiatry, Xijing Hospital, Fourth Military Medical University

Objective Cognitive impairments are prominent features of schizophrenia, yet the underlying biological mechanisms remain poorly understood. We aimed to explore the connections between gene expression, brain imaging characteristics, and cognitive abilities in patients with schizophrenia and healthy individuals

Methods To address this gap, we conducted a comprehensive study involving 43 individuals with schizophrenia and 60 healthy controls. Our trans-scale dataset included mRNA sequencing, brain imaging, and cognitive assessments. Multivariate correlation analysis was used to examine associations across cognitive assessments, brain volume and connectivity, and gene expression.

Results We discovered significant cognitive deficits in individuals with schizophrenia compared to controls, along with reduced grey matter volume in the hippocampal/parahippocampal (HIP/PHG) region. Additionally, we observed altered connectivity patterns between the superior temporal gyrus and the right HIP/PHG, as well as differential gene expression associated with these regions. Intriguingly, only healthy individuals exhibited significant relationships between gene expression, brain characteristics, and cognitive performance, indicating disrupted or heterogeneous relationships in schizophrenia. Moreover, we developed a diagnostic test that successfully differentiated individuals with schizophrenia from healthy controls, achieving high accuracy with AUC values exceeding 90% in independent replication and test sets

Conclusion Our study provides valuable insights into the intricate relationships between genes, brain structure/function, and cognition in schizophrenia

不同分型精神分裂症患者事件相关电位差异性研究

王伟* 梁博

乌鲁木齐市精神病福利院

目的 了解不同分型慢性康复期精神分裂症患者事件相关电位(ERP)检查结果的差异。

方法 将 2019 年 3 月至 2020 年 3 月期间住院治疗的 206 例缓解期精神分裂症患者去除合并脑血管疾病及高血压、糖尿病、冠心病等慢性全身性疾病患者,保留偏执型及单纯型精神分裂症患者共 105 例为研究对象,其中偏执型 63 名为观察 1 组,单纯型 42 名为观察 2 组。对两组患者分别进行事件相关电位检查,比较两组患者 MMN、P300 相关靶点检测指标。

结果 两组患者事件相关电位(ERP)检查结果中的 Fz、Cz、Pz 三个电极 MMN、P300 的潜伏期均显示延迟,波幅降低。两组患者事件相关电位(ERP)检查结果中的 P300 的潜伏期值以及波幅值有明显差异,有统计学意义。两组患者事件相关电位(ERP)检查结果中的 MMN-Fz 及 MMN-Cz 潜伏期值及波幅值有明显差异,有统计学意义。两组患者事件相关电位(ERP)检查结果中的 Cz 电极 P50 门控/抑制的比值两组间比较无明显差异。

结论 比较两组患者的事件相关电位(ERP)发现单纯型精神分裂症患者 MMN 及 P300 的认知电位潜伏期延迟较偏执型患者显著。单纯型精神分裂症患者的认知功能受损与偏执型精神分裂症患者相比可能较重。

桃红四物汤对精神分裂症患者性激素指标的影响及临床疗效的观察

全瑞国¹ 冯伟薇²

1.内蒙古科技大学包头医学院

2.包头市第六医院

目的 探讨桃红四物汤治疗慢性精神分裂症患

者的性激素指标的影响及临床疗效的观察。对象 选取包头市第六医院 2023 年 1 月-12 月住院女患者 50 例,患者年龄为 18-50 岁,平均年龄为(36.25±5.21) 岁。

方法 将被试随机分为观察组和对照组,各 25 例,观察组在因服用抗精神病药而停经的基础上服用桃红四物汤,每日一剂,用量为 400ml / 日,早晚服用各 200 ml,7 天为一个疗程,停药 2 天后再继续服用直到来潮,连续服用 2 个月经周期,对照组单独服用抗精神病药。在治疗前、后通过静脉采血做性激素六项检查,比较两组性激素(卵泡生成激素(FSH)、黄体生成激素(LH)、雌二醇(E2)、孕酮(P)、睾酮(T)、催乳激素(PRL)指标的变化以及精神分裂症临床疗效的评定。

结果 ① 治疗后,观察组催乳激素(PRL)指标有所降低,($P < 0.05$),而对照组没有明显变化;其他 5 项激素治疗前后均无显著变化,无统计学意义,② 治疗前后,观察组和对照组 PANSS 总分、阳性症状、阴性症状、精神病理症状各项得分都显著降低,有显著差异($P < 0.01$)。

结论 桃红四物汤辅助治疗慢性精神分裂症,降低抗精神病药物引起的催乳素升高的副反应,减少女性患者闭经的发生,调节月经不调,降低药物引起的副反应,提高了临床治疗效果,值得临床上推广和应用。

精神科护理带教中标准化患者微课教学的应用分析

徐艳*

成都市第四人民医院

目的 探究精神科护理带教中基于标准化患者采用微课教学的效果。

方法 选择 2022 年在精神科实习的 17 名护生作为对照组,选择 2023 年在精神科实习的 18 名护生作为研究组。对照组中男性护生 1 名,其余均为女性护生;年龄 21-24 岁,平均年龄(21.12±1.11) 岁。研究组中男性护生 2 名,其余均为女性护生;年龄 21-24 岁,平均年龄(21.39±1.07) 岁。两组护

生在性别、年龄等一般资料上比较,差异无统计学意义 ($P>0.05$),具有可比性。纳入标准:(1)所有护生都为应届护理学本科学生。(2)护生在精神科进行 2 周的实习。排除标准:(1)护生缺勤率高。

(2)护生不能配合完成考核。

结果 研究组实习护生理论、操作考核成绩明显更高,对带教满意度评分更高 ($P<0.05$)。

结论 精神科护理带教过程中基于标准化患者采用微课教学方式,能够有效提高实习护生的理论水平、操作技能以及对带教的满意度。

精神科护理带教是培养合格精神科护理人员的重要环节[1]。随着医学教育的不断发展和创新,越来越多的教学方法被引入到精神科护理带教中。微课教学作为一种新兴的教学方式,已经在多个学科领域得到了广泛应用。本研究旨在探究精神科护理带教中基于标准化患者采用微课教学的效果。

关键词:精神科护理带教;标准化;微课

Insights Into Causal Associations between Type 2 Diabetes and Common Human Diseases: A Phenotype-wide Bi-directional Mendelian Randomization Analysis

Wenxi Sun¹, Dongming Liu², Ancha Baranova^{3,4}, Hongbao Cao³, Xiaobin Zhang¹, Fuquan Zhang⁵

1.Suzhou Guangji Hospital

2.Nanjing Drum Tower Hospital, Affiliated Hospital of Medical School

3.George Mason University, Manassas, Virginia, USA

4.Research Centre for Medical Genetics, Moscow, Russia.

5.Institute of Neuropsychiatry, The Affiliated Brain Hospital of Nanjing Medical University

Objective There is substantial evidence showing the significant comorbidity between Type 2 Diabetes (T2D) and various diseases. However, there is still a need to develop a detailed understanding of the pairwise causal associations within the comorbidity networks of T2D

Methods The phenome-wide Mendelian ran-

domization (MR) analyses were conducted to investigate the bidirectional causal relationship between type 2 diabetes (T2D, with 180,834 cases) and 892 common diseases in the FinnGen datasets (with 377,277 cases). Inverse variance weighting was the primary method used, supplemented by weighted median and MR-Egger approaches for sensitivity analyses

Results In the MR analysis, a total of 41 diseases were causally associated with T2D risk (average b: 0.124). This included 9 neurological diseases (average b: 0.178), 8 psychiatric and behavioral diseases (average b: 0.003), 7 circulatory diseases (average b: 0.120), and 5 digestive system diseases (average b: -0.002). Our reverse MR analysis showed that T2D was causally linked to the risk of 120 disease phenotypes (average b: 0.103). This included 35 circulatory diseases (average b: 0.118), 24 genitourinary system diseases (average b: 0.132), 15 skin, muscle, bone, and connective tissue diseases (average b: 0.067), 11 endocrine system diseases (average b: 0.114), 10 digestive system diseases (average b: 0.109), among others. Bidirectional causality was observed between T2D and 16 diseases. Most MR analyses showed little evidence of heterogeneity and pleiotropy

Conclusion Our findings highlight the broad yet limited causal effect that T2D exerts on other human diseases. Conversely, analyses investigating the impact of other diseases on T2D show a more confined scope but a greater magnitude of effect

The Expression of Immune Related Genes and Potential Regulatory Mechanisms in Schizophrenia

Haohao Zhu*

Wuxi Mental Health Center

Objective This study aimed to investigate the role of immune dysfunction in the pathogenesis of schizophrenia through single-cell transcriptome and

bulk RNA data analyses

Methods The single-cell RNA sequencing (scRNA-seq) was selected to assess the cellular composition and gene expression profiles of the brain tissue. Further, bulk RNA sequencing data was utilized to corroborate findings from the single-cell analyses and provide additional insights into the molecular changes associated with the disease. Gene-drug interaction data was also included to identify potential therapeutic drugs targeting these dysregulated immune-related genes in schizophrenia

Results We discovered significant differences in cellular composition within schizophrenia tissue, including increased infiltration of fibroblasts, horizontal basal cells, monocytes, mesenchymal cells, and smooth muscle cells. The investigation of immune-related genes revealed significantly different expression of genes such as S100A2, CCL14, IGHA1, BPIFA1, GDF15, IL32, BPIFB2, HLA-DRA, S100A8, PTX3, TPM2, TNFRSF12A, GREM1 and others. These genes possibly contribute to the progression of schizophrenia through various pathways such as humoral immune response, IL-17 signaling pathway, adaptive immune response, antigen processing and presentation, and gut IgA production. Our findings also suggest possible transcriptional regulation in schizophrenia's immune dysfunction by transcription factors in monocytes, neutrophils, endothelial cells, and epithelial cells. Lastly, potential therapeutic drugs were identified through gene-drug interaction data, such as those targeting HLA-A and HLA-B

Conclusion The cellular heterogeneity and immune-related gene dysregulation play important roles in schizophrenia, which provides a foundation for understanding the pathogenesis and developing new treatment methods

关键词: Schizophrenia, scRNA, bulk RNA, immunity related genes, mechanism

首发和复发未用药精神分裂症患者的新型炎症指标水平与攻击性的相关分析

崔迎奥 刘寰忠*

安徽医科大学附属巢湖医院

目的 探讨新型炎症指标水平与首发和复发未用药精神分裂症患者攻击行为发生的相关性, 以期减少精神分裂症患者攻击行为的发生提供参考。

方法 前瞻性选取 2022 年 10 月-2024 年 4 月期间在安徽医科大学附属巢湖医院新入院的、符合《诊断与统计手册: 精神障碍(第 5 版)》(DSM-V) 精神分裂症诊断标准的 168 例从未服药或至少两周未服药精神分裂症患者为研究对象, 根据是否首次发病分为首发组 58 例与复发组 110 例, 使用改良版外显攻击行为量表(Modified Overt Aggression Scales, MOAS) 分别对两组患者进行攻击性评估。使用自制问卷收集患者的一般人口学资料和临床资料, 采集入院第二天的血液学数据(中性粒细胞、单核细胞、淋巴细胞和血小板计数以及高密度脂蛋白)。同期招募年龄和性别相匹配的 110 例健康对照人群(健康对照组)。采用 Spearman 相关性分析精神分裂症患者的炎症指标水平与 MOAS 总分的关系, 采用二元 logistic 回归分析精神分裂症患者攻击性评分的影响因素。

结果 与健康对照组相比, 首发组和复发组的 NLR、MLR、PHR、MHR 显著升高, NHR 显著降低, 首发组的 PLR 显著升高。Spearman 相关性分析显示, 首发组中 MOAS 总分未发现与任何炎症指标存在相关性; 复发组中 MOAS 总分与 NLR、MLR、PLR 呈正相关($r=0.234, 0.192, 0.234$, 均 $P<0.05$)。复发组有攻击性患者 NLR、PLR、MLR[分别 2.69(1.83,3.78) 比 2.11(1.50,2.50)、129.91(94.85,166.03) 比 100.00(81.44,122.49)、0.24(0.18,0.32)比 0.19(0.14,0.26)]显著高于无攻击性患者, LHR[1.64(1.23,2.17)比 1.87(1.62,2.26)]显著低于无攻击性患者。二元 Logistic 回归分析发现 NLR 是复发精神分裂症患者攻击行为发生的影响因素。

结论 NLR 与复发精神分裂症患者攻击行为的发生存在相关性, 对减少精神分裂症患者攻击行为的发生具有参考价值。

关键词: 精神分裂症; 首发; 复发; 炎症指标; 攻击性

精神分裂症快感缺失及社会认知加工缺陷的

P300 证据

赵丁 张杨骏 纪家武*

福州市第二总医院神经精神病防治院

目的 快感缺失(Anhedonia) 作为精神分裂症的核心症状之一, 患者通常难以识别愉快情绪, 对快乐情绪的感受力下降。本研究旨在利用事件相关电位中 P300 成分检测精神分裂症患者快感缺失与社会认知加工缺陷的相关关系, 为临床精神分裂症患者的预后好坏及社会认知功能评估指标提供理论依据。

方法 本研究经过医院伦理委员会批准, 随机招募近 3 年来符合 DSM 5 精神分裂症诊断标准的住院患者 30 例, 及自愿参与研究的正常对照组 31 例, 通过观看愉快面孔情绪图片诱发其愉快情绪(快感体验)及中性面孔情绪图片任务(作为对比刺激), 情绪图片均来源于中国化面孔情绪图片系统(Chinese Facial Affective Picture System, CFAPS)。本实验采用经典的 Oddball 范式, 在实验室条件下, 模拟真实的人际交往互动, 设置愉快情绪面孔为快乐情绪的诱发条件(快感唤起)。利用 ERP 技术同步记录大脑在快感体验的认知加工过程, 通过对比精神分裂症组及健康组的 P300 成分的波幅及潜伏期。

结果 P300 波幅反映面孔识别加工过程, 与情绪表情的辨认和识别有关, 反映了对刺激物注意力的资源分配, 当模拟人际交往的快感唤起时, 与健康人群相比, P300 成分在精神分裂症患者中的波幅降低($2.839 \pm 0.453 \mu\text{V}$, $P < 0.05$), 这说明精神分裂症的愉快情绪无法被等价唤起。P300 潜伏期反映大脑对情绪诱发事件进行识别、加工的所需时间, 精神分裂症在快感唤起时, 与健康组相比 P300 成分潜伏期延长($321.613 \pm 31.754 \text{ms}$, $P < 0.05$), 这说明精神分裂症患者在快感唤起时需要更多的加工时间。

结论 精神分裂症患者存在快感缺失, 在识别及加工愉快情绪面孔的能力受损, 识别加工的时间更长。精神分裂症患者在识别及加工愉快情绪面孔的能力受损, 在人际交往中, 无法准确识别及提取愉快信息。该研究在脑加工水平揭示关于精神分裂症患者快感缺失与认知加工缺陷研究的临床证据。

鲁拉西酮与利培酮对女性精神分裂症患者疗效比较

唐旭*

台州市第二人民医院

目的 分析女性精神分裂症患者选择利培酮、鲁拉西酮治疗的效果。

方法 选择 2021 年 3 月-2023 年 3 月期间我院接收的女性精神分裂症患者, 共计 80 例展开研究, 以随机数表的方式实施分组, 给予对照组患者实施利培酮药物治疗, 研究组选择鲁拉西酮药物治疗。通过 PANSS 减分率, 对患者临床疗效进行评估, 当减分率在 25%—49% 代表有效; 在 50%—74%, 代表显效; $\geq 75\%$ 代表痊愈; $< 25\%$ 代表无效。PANSS 阴性和阳性量表进行评分, 分值越高, 表明患者的症状越严重, 血清催乳素比较, 副反应量表比较不良反应发生情况。

结果 研究组的临床疗效 92.5% 与对照组 87.5% 之间数据差异不明显, 不存在统计学价值 ($P > 0.05$); 对照组、研究组的 PANSS 评分差异, 没有统计学价值 ($p > 0.05$); 治疗 6 周、12 周、24 周后, 对照组血清催乳素水平明显高于研究组, 差异没有统计学价值 ($P < 0.05$); 对照组与研究组都没有发生严重不良事件, 两组不良反应发生率不存在统计学差异 ($P > 0.05$)。

结论 比较利培酮与鲁拉西酮药物治疗女性精神分裂症患者的效果可知, 两种药物都能用于治疗女性精神分裂症患者, 且不良反应较少, 可在临床中防范应用。

关键词: 女性精神分裂症患者, 利培酮, 鲁拉西酮

Analyses of Single-cell and Bulk RNA Sequencing Combined with Machine Learning Reveal The Expression Patterns of Disrupted Mitophagy in Schizophrenia

Kun Lian^{1,2}, Xiufeng Xu²

1. The Second Affiliated Hospital of Kunming Medical

University

2.The First Affiliated Hospital of Kunming Medical University

Objective Mitochondrial dysfunction is an important factor in the pathogenesis of schizophrenia. However, the relationship between mitophagy and schizophrenia remains to be elucidated

Methods Single-cell RNA sequencing datasets of peripheral blood and brain organoids from SCZ patients and healthy controls were retrieved. Mitophagy-related genes that were differentially expressed between the two groups were screened. The diagnostic model based on these genes was constructed using two machine learning methods, and the relationship between mitophagy and immune cells was analyzed. Single-cell RNA sequencing data of brain organoids was used to calculate the mitophagy score (Mitoscore)

Results We identified seven mitophagy genes that were differentially expressed in schizophrenia patients, and this gene signature was an independent risk factor for schizophrenia. The mitophagy genes were related to the infiltration of neutrophils, activated dendritic cells, resting NK cells, regulatory T cells, resting memory T cells, and CD8 T cells. In addition, we identified 12 cell clusters based on the Mitoscore, and the most abundant neurons were further divided into three subgroups. Results at the single-cell level showed that Mitohigh_Neuron established a novel interaction with endothelial cells via SPP1 signaling pathway, suggesting their distinct roles in SCZ pathogenesis

Conclusion We identified a mitophagy signature for schizophrenia that provides new insights into disease pathogenesis and new possibilities for its diagnosis and treatment

母体免疫激活雄性子代大鼠行为学异常表达与年龄变化的相关研究

史佩灵 陈腾飞 李文强*

河南省重点实验室

目的 分析母体免疫激活大鼠模型雄性行为学的异常表现与年龄之间的关系。

方法 在 SD 大鼠孕 9 天尾静脉注射 10 mg/kg 的 Poly I:C (n=14) 或等体积生理盐水 (n=14), 3 小时后尾静脉采血做孕鼠血浆的炎症因子水平, 判断母体免疫激活成功; 挑选出生后的雄性后代, 随机分为 Poly I:C 组和 Saline 组, 在子代大鼠出生 40 天、60 天 (postnatal day 40, P40, postnatal day 60, P60) 进行行为学检测。

结果 1. 孕鼠血浆结果显示: Poly I:C 组 IL-6 ($P < 0.001$)、IL-1 β ($P < 0.001$) 和 TNF- α ($P < 0.001$) 炎症因子水平均显著高于 Saline 组。

2. 行为学检测结果 开放旷场实验中 P60 两组大鼠运动总距离无显著统计学差异, 中心区域活动距离明显减少 ($P < 0.001$); 在黑白箱实验中 P60 的 Poly I:C 在白箱中逗留的时间显著减少 ($P < 0.001$), 在 P40 中两组未有差异; 在高架十字迷宫中 P60 的 Poly I:C 组入开放臂的时间显著减少 ($P < 0.001$), 进入开放臂的次数无显著统计学差异; 在 PPI 实验中 P60 的 Poly I:C 组在 75dB ($P < 0.05$)、80dB ($P < 0.01$) 及 85dB ($P < 0.001$) 抑制率均显著降低, P40 的两组间未见差异。

结论 母体免疫激活可导致后代的发育特异性行为障碍。

关键词: Poly I:C; 母体免疫激活; 行为学; 大鼠

棕榈酸帕利哌酮注射液治疗稳定期精神分裂症患者依从性的影响因素分析

王贤 施征宇*

上海市虹口区精神卫生中心

目的 研究棕榈酸帕利哌酮注射液治疗稳定期精神分裂症患者依从性的影响因素。

方法 纳入 2020 年 8 月-2022 年 12 月在上海市虹口区精神卫生中心门诊就诊并使用棕榈酸帕利哌酮注射液治疗的稳定期精神分裂症患者 122 例。收集患者基本信息、疾病特征及治疗情况、康复支持等资料, 进行随访 1 年, 观察患者使用棕榈酸帕

利哌酮注射液治疗的依从性,采用多因素 Logistic 回归分析法分析棕榈酸帕利哌酮注射液治疗稳定期精神分裂症患者依从性的独立影响因素。

结果 1 年随访期内, 1 例失访(死亡), 有效随访 121 例, 其中 36 例中断治疗, 85 例患者仍在接受棕榈酸帕利哌酮注射液治疗, 依从率为 70.25%。单因素分析显示工作情况、病程、副反应、监护人年龄、监护人文化程度、家庭人均月收入、患者参加个案管理是影响治疗依从性的相关因素。多因素 Logistic 回归分析显示, 病程(OR=5.214,95%CI=1.777-15.297,P=0.003)、副反应(OR=6.065,95%CI=2.310-15.921,P<0.001)、监护人文化程度(OR=0.260,95%CI=0.097-0.701,P=0.008)、患者参加个案管理(OR=0.186,95%CI=0.055-0.635,P=0.007)是棕榈酸帕利哌酮注射液治疗稳定期精神分裂症患者依从性的独立影响因素。

结论 长病程、出现副反应可能是稳定期精神分裂症患者棕榈酸帕利哌酮注射液治疗依从的危险因素, 监护人文化程度高及患者参加个案管理是保护因素, 选择合适的患者、加强患者家属对疾病的认知、减少治疗副反应及针对患者开展个案管理是提升依从性的举措。

鲁拉西酮联合舍曲林治疗精神分裂症伴强迫症状 1 例

丛伟东* 毛高伟

福建医科大学附属福州神经精神病医院

目的 本文报道了 1 例鲁拉西酮联合舍曲林治疗精神分裂症伴强迫症状的案例, 旨在提高对本病的识别能力, 提高治疗的有效率。

方法 病史摘要 患者, 男性, 20 岁, 未婚, 无业, 汉族。患者缘于 2021 年 1 月无明显诱因出现凭空闻声, 听到别人说他坏话, 感到被监控, 疑人害, 常对空谩骂, 无法工作。曾就诊本院诊断为“偏执型精神分裂症”, 予“奥氮平、利培酮”等治疗, 病情好转后出院。在门诊规律随诊, 后反复出现双眼上翻, 持续 5-30 分钟, 每周 2-7 次, 出现此症状前一般提

前会有预感, 多在情绪紧张、凭空闻声后出现, 并不感到痛苦, 后反复在我院门诊就诊, 考虑为“1.精神分裂症 2.锥体外系反应”, 先后予“奥氮平、利培酮、氨磺必利、氯氮平、齐拉西酮、丙戊酸钠、苯海索”等足量足疗程治疗, 妄闻多疑好转, 双眼上翻并未缓解。于 2023 年 4 月再次入住本院精神科。症状体征 凭空闻声、疑人害、双眼上翻。身高 179 cm, 体重 75kg, T 36.6°C, P 89 次/分, R 19 次/分, BP 137/82mmHg。

入院检查: 血常规、心电图、颅脑 MRI 等相关检查未见明显异常; 入院量表评估: PANSS87 分, BPRS 45 分, Y-BOCS18 分, HAMA 17 分, HAMD 8 分, YMRS 9 分, RESESE 4 分, ADL 17 分, GAS 40 分。**精神检查:** 感知觉及思维: 可引出假性幻听, 语量、语速适中, 思维逻辑欠条理, 引出关系妄想、被害妄想。存在反复双眼上翻的强迫行为, 出现此行为前自身会提前感知, 多继发于情绪紧张及幻听, 东莨菪碱、苯海索治疗后无效。部分自知力, 余精神检查无特殊。

诊断 根据 ICD10 诊断标准, 诊断: 精神分裂症。

治疗方法 治疗逐渐滴定鲁拉西酮及舍曲林, 予鲁拉西酮 80mg qn 联合舍曲林 150mg qd 系统治疗, 结合认知行为治疗, 治疗 2 周后, 患者双眼上翻症状明显减轻, 发作频率及持续时间明显减少。治疗 1 个月后, 患者凭空闻声、多疑明显减轻, 双眼上翻症状基本消失, 情绪平稳。经药物联合认知行为治疗, 患者好转出院。

出院时 PANSS 51 分, BPRS 17 分, Y-BOCS 3 分, RESESE 2 分, HAMA 6 分, HAMD 4 分, YMRS 5 分, ADL 15 分, GAS 75 分。在出院后第 2 周、第 1 个月、第 2 个月、第 3 个月、1 年随访中, 除了随访第 1 个月时患者出现了 1 次双眼上翻, 持续约 1 分钟, 其他时间未再出现双眼上翻症状。

结果 临床转归 患者强迫症状基本消失, 凭空闻声、多疑明显减轻, 在出院后 1 年内的随访中, 病情稳定, 可正常工作、生活。

结论 鲁拉西酮联合舍曲林可治疗精神分裂症伴强迫症状。

关键词: 鲁拉西酮; 舍曲林; 精神分裂症; 锥体外系副反应; 强迫症状

精神分裂症合并周期性血小板减少性紫癜的认识

岑俊翰 赵静*

中国人民解放军联勤保障部队第九二三医院

目的 帮助精神科护士对精神分裂症合并血小板减少性紫癜的认识,同时为血小板减少患者护理提供一个独特研究机会。我们希望通过本案例,促进临床精神科护士对此类问题的识别与处理,为临床护理提供借鉴意义。

方法 在临床中我们发现一例精神分裂症合并血小板减少性紫癜的病例。通过症状检查及检验:白细胞计数 $17.02 \times 10^9/L \uparrow$, 血红蛋白浓度 $89g/L$, 血小板计数 $197 \times 10^9/L$, 网织红细胞计数 $20.11\% \uparrow$, 网织红细胞绝对值 $556.2010^6/g/L \uparrow$, D-二聚体 $1500\mu g/L$ FEU t, 红细胞碎片手工计数 15.0% , 直接抗球蛋白试验(抗 C3)弱阳性(士)。入院后患者出现乱语、自语自笑自哭等行为,失眠,思维较散漫,否认幻觉等精神病性症状,注意力欠集中,情绪易激,协调精神运动性兴奋,自知力缺乏。

结果 周期性血小板减少性紫癜(CTP)临床特征为周期性血小板减少与血小板增多,血小板数在一定范围内波动,谷值与峰值间隔有一相对的规律性,可出现不同程度的出血倾向。由于 CTP 有一些临床特征与 ITP 相似,CTP 常误诊为原发免疫性血小板减少症(primary immunologic thrombocytopenic purpura, ITP),不少患者被误诊为 ITP 并接受包括皮质类固醇、血小板生成素受体激动剂、利妥昔单抗和脾切除术的治疗,随后血小板计数短暂增加,不久后再次出现血小板减少,这被错误地归因于不可避免的“复发”而再次治疗,造成疾病负担和痛苦,当诊断 CTP 时需注意与 ITP 相鉴别。CTP 可以通过频繁的血小板计数监测来诊断,揭示周期性血小板循环的典型模式。CTP 的出血表型通常是轻微的,包括血小板计数处于最低点时的皮肤黏膜出血,其他部位可能发生严重出血,但少见。CTP 可能与血液恶性肿瘤或甲状腺疾病有,目前主要认为与周期性的血小板生成和/或破坏的变化有关,包括可能的病因及发病机制:①巨核细胞数的周期性变化。②血清 TPO 水平变化。③巨核细胞在对 TPO 新陈代谢的调控中的重要的作用。④与自身免疫有关。⑤大颗粒淋巴细胞疾病导致周期性血小板减少。⑥随月经周期变化。本例患者为女性精神分裂症患者,存

在月经周期性失血等因素造成的血小板改变。

结论 结合病史及检测结果,诊断血小板减少性紫癜明确,该病是由于血管性血友病因子裂解酶(ADAMTS13)活性缺乏引起广泛微血管血栓形成,导致微血管内容血、消耗性血小板减少。血浆置换是主要治疗手段,现患者临床症状缓解、血小板计数恢复正常,可考虑降低血浆置换频次,必要时复查 ADAMTS13 活性。

精神科椎体外系反应识别和护理

岑俊翰*

中国解放军联勤保障部队第九二三医院

目的 帮助精神科护士对抗精神病药物所致锥体外系反应(Extrapyramidal symptoms, EPS)的识别与护理,保证患者安全,提升护理质量,通过本案例,促进临床精神科护士对类似问题的识别与处理,为临床提供经验。

方法 临床护士牢记以下症状:急性肌张力障碍,出现最早,儿童和青少年较多见。可引起扭转、重复运动以及异常姿势,其好发于舌头、脸和脖子,如咀嚼肌受累--下颌不能闭合。面,颈和舌肌受累--口眼歪斜,眼球向上凝视(动眼危象),斜颈,伸舌卷舌,张口,扮相。喉肌受累--言语、吞咽困难。四肢、躯干肌受累--角弓反张,扭转痉挛,步态不稳。静坐不能,治疗 1-2 周后最常见,表现为不可控制的激越不安、不能静坐,来回走动或原地踏步。重者可出现焦虑,易激惹。类帕金森综合征,一般于治疗 1-2 月发生,发生率可高达 56%。特征:运动不能;肌肉强直;震颤;植物神经功能混乱。临床表现:动作笨拙,迟缓,少动,肌肉僵硬,面具脸,慌张步态,静止性震颤和流涎,多汗及皮脂溢出。迟发性运动障碍(TD),多见于持续用药几年后。服药,减药或停药时均可出现,老人和有躯体病者为高危人群。临床表现:不由自主,有节律的刻板式运动为特征。颊-舌-咀嚼综合征,表现为吸吮、舔舌,鼓腮,躯干或四肢舞蹈或指划样运动。

结果 通过牢记症状,护理人员熟悉精神药物的基本知识及其副作用的护理。常见原因:①病人

个体差异对药物的耐受性不同、产生副作用也各异。
 ②不同种类的药物及给药途径。③疾病的不同时期。
 ④药物的蓄积作用。必要的处理：医护沟通，分析患者发生的锥体外系反应症状，对严重的副反应，应及时更改药物的种类及给药途径。吞咽的处理：轻者进食水发生呛咳，重者可发生窒息死亡。故对一般困难者，给半流或流质饮食，要小心喂食；严重者停止口腔进食，可鼻饲饮食或静脉输液，保证摄入量。便秘的处理：属一般副作用，不影响治疗，但病人极为痛苦。应鼓励病人多运动，适量多饮水，多吃蔬菜。如三日无大便应予灌肠或给予导泻药物处理。心理护理：护理人员以心理学理论为指导通过语言、表情、态度、姿势、行为、文字和周围环境的合理安排，对病人进行科学的启发、教育或暗示，改变患者的感受、认识、情绪和行为等，从而达到改善其心态、行为方式，促其病情好转或康复的一种重要的护理形式。

结论 采取牢记主要的症状，可以为临床护士简单的掌握患者发生的锥体外系反应，提升临床护理质量，保证患者的治疗及安全。

1 例精神分裂症伴股骨粗隆间骨折精细化护理

周节 付慧*

联勤保障部队第九二三医院

目的 精神分裂症是一种以个性改变，思维、情感和行为分裂、精神活动与环境不协调为主要特征的精神疾患，当患者行为紊乱又合并股骨骨折时会大大增加护理工作的难度和治疗的复杂性，影响愈后及增加并发症的机会，现报道 1 例青年精神分裂症伴股骨粗隆间骨折的住院患者，探讨精神分裂症伴股骨粗隆间骨折患者的精细化管理。

方法 病例介绍：患者男，20 岁，6 年前诊断为精神分裂症，因骑电动车不慎摔倒，右髌部着地后疼痛、活动受限就诊，急诊 X 光检查提示右侧股骨粗隆间骨折，于全身麻醉下行右股骨粗隆间骨折切开复位钢板、螺丝钉、空心钉内固定术。术后五天患者出现言语混乱、精神狂躁，易激惹，不配合卧床休息和康复，自行下床随意移动术肢，转入我科治

疗。

精细化护理措施：1.心理护理：建立良好信任的护患关系，给予更多的关心和爱护，精神分裂症患者多缺乏自知力而精神科住院环境封闭特殊，肢体约束，患者会缺乏安全感，不安心住院者居多，护理操作尽量集中进行，建立良好的护患关系，承诺配合治疗能减轻术肢疼痛和早日出院，以取得患者信任与配合。2.治疗护理原发病：控制精神症状是减少行为紊乱的关键。3.安全管理：评估并制定合理化的安全防护措施，床头挂“防跌倒坠床”“禁止下床”标识，给予床栏，做好健康教育，加强巡视和床头交接，注意晚夜班管理。4.病情观察：注意观察精神症状和术肢情况，防止移位、感染，行为紊乱必要时给予保护性约束和使用镇静药或安眠药。5.鼓励感兴趣的事情转移患者注意力。5.满足患者的日常需求：将常用物品及食物放在伸手可取的位置，减少患者因取物而自行下床。6.预防压疮：卧床期间注意翻身，髌部放置软垫。7.饮食护理：进食高蛋白、高维生素、高钙、高纤维易消化的食物以加快切口及骨折的愈合，防止便秘。8.功能锻炼：向患者及家属交待术后注意事项及功能锻炼的必要性，早期积极活动，指导帮助进行踝关节背伸屈活动，根据病情协助床上坐起，给与及时的表扬与肯定，可使用零食等东西适当奖励，提供患者积极性和治愈信心。

结果 患者精神状态好转，无术肢畸形脱位，可依靠拐杖下床活动，解除保护性约束能控制，顺利出院。

结论 以往报道的精神分裂的股骨骨折患者多为老年，体力及行为紊乱程度容易在可控范围，当年轻力壮的中青年患者，股骨骨折需严格卧床与行为紊乱不配合卧床的矛盾冲突时大大的增加了治疗护理难度，建立良好信任的护患关系，根据患者的生理及心理特点来加强精神专科治疗和术后护理，有针对性的预防和控制并发症可大大提高患者治疗依从性及减少并发症的发生。

TDCS Combined with RTMS for The Treatment of Negative Symptoms in Patients with Schizophrenia: Study Protocol for A Randomized Controlled Trial

Shiwang Chen¹, Shen Li¹, Meijuan Li¹, Yuying Qiu¹,
Xiangyang Zhang², Jie Li¹

1. Tianjin Anding Hospital

2. Chinese Academy of Sciences

Objective Despite the significant advancements in the field of psychopharmacology, the majority of patients with schizophrenia retain disabling symptoms, most commonly a variety of negative symptoms. Physiotherapy techniques, due to their high compliance and safety, are increasingly being used in the treatment of schizophrenia. Neuroimaging and neurophysiological studies have shown that negative symptoms are associated with abnormal brain activity in the combined right and left dorsolateral prefrontal and temporoparietal joint regions, and that physical therapy techniques can modulate cortical activity. Therefore, we aimed to investigate the efficacy of combining transcranial direct current stimulation (tDCS) with repetitive transcranial magnetic stimulation (rTMS) on negative symptoms in patients with schizophrenia and explore the possible mechanisms

Methods This is a double-blind, randomized, placebo-controlled study investigating the efficacy of tDCS combined with rTMS over a 4-week treatment period, and with a 2-week follow-up period in patients with predominantly negative symptoms of schizophrenia. There are 4 intervention modalities, including active tDCS stimulation combined with active rTMS stimulation, active rTMS stimulation combined with sham tDCS stimulation, active tDCS stimulation combined with sham rTMS stimulation, and sham tDCS stimulation combined with sham rTMS stimulation. The primary outcome measure will be changes in the Negative Symptom Assessment Scale (SANS), with secondary outcomes including changes in Positive and Negative symptom scale (PANSS) total and negative total scores, changes in the MATRICS Consensus Cognitive Battery (MCCB), changes in local brain activity (functional magnetic resonance imaging, fMRI) and white matter integrity (diffusion tensor imaging, DTI), changes in laboratory examination indices and changes in psycho-behavioral and EEG indices

Results This is the first clinical trial combining tDCS with rTMS for the treatment of schizophrenia patients with predominantly negative symptoms. This study will provide robust evidence for the efficacy of combining tDCS with rTMS for the treatment of negative symptoms in schizophrenia. In addition, our study will help to further explore the mechanisms of tDCS combined with rTMS for the treatment of negative symptoms in schizophrenia in terms of imaging and behavior

Conclusion 关键词: tDCS; rTMS; negative symptoms; schizophrenia

精神分裂症患者左侧中央后回核磁功能异常

刘须振 刘松 陈安冉 李文强 吕路线 杨勇锋*
新乡医学院第二附属医院

目的 来自核磁共振的结构和功能研究表明,精神分裂症(SZ)患者存在异常的大脑结构及功能。大部分研究中是横断面的观察性研究,纵向队列研究较少,而且目前研究结果异质性大,结论不一致。

方法 我们招募 110 名 SZ 患者,在抗精神病药物治疗的基线和第 8 周进行大脑结构和静息状态功能成像扫描,同时对 100 名健康对照(HC)进行基线扫描以进行比较。计算个体基于体素的大脑灰质体积(GMV)、区域一致性(ReHo)、低频振幅(ALFF)、度中心性(DC)和功能连接(FC)。应用 PANSS 和 MCCB 评估 SZ 患者的精神病性症状和认知功能。

结果 与基线 HC 相比, SZ 患者大脑 GMV 减少,右侧尾状核 ALFF 和 ReHo 值较高,双侧中央后回 ALFF 和 ReHo 值较低。治疗 8 周后,右侧小脑下部、左内侧额上回、右背外侧额上回、右侧额中回 ALFF 和 ReHo 值增高,左侧枕中回、左侧中央后回 ALFF 和 ReHo 值降低。左侧中央沟盖 DC 和 ReHo 值降低。在 PANSS 五因子、三因子模型中,发现多个治疗前后差异脑区与 PANSS 评分变化具有相关性。以差异脑区为 ROI 进行 FC 计算得出,8 周治疗后左侧中央后回与右侧眶部额上回、左侧眶部额中回、右侧枕下回、左侧眶部额上回、左内侧额上回、左侧中央后回连接减弱。

结论 这些发现为 SZ 结构和功能活动异常假

说提供了新的证据,提示多个异常脑区的功能变化与疗效反应相关,特别是SZ患者左侧中央后回存在功能的缺陷,其功能指标的变化与抑郁症状、认知症状相关。

关键词:精神分裂症,核磁共振,左侧中央后回,ALFF,ReHo,FC

药物基因组学检测在难治性精神分裂症患者中的临床效能研究

兰吴沅*

衢州市第三医院

目的 为提升难治性精神分裂症患者用药有效性、安全性,本文重点探讨药物基因组学检测在难治性精神分裂症患者中的应用效果。

方法 选择2021年11月—2022年9月间在衢州市第三医院诊治的难治性精神分裂症男性患者100例纳入研究,依据随机数表法将患者分为对照组(基于医生经验用药)和观察组(基于药物基因检测用药),每组50例。比较2组治疗依从性、临床疗效、自知力、生活质量、出院1个月及1年的社会适应状况、复发率、不良反应发生率。

结果 治疗1个月后,观察组患者阳性症状、阴性症状、一般精神病理症状评分均低于对照组[(20.11±2.67)分 vs. (23.89±3.10)分, (15.02±1.88)分 vs. (18.27±2.33)分, (30.35±2.93)分 vs. (35.24±3.80)分,均 $P<0.001$];观察组自知力评定量表(SAI)与简明健康状况调查问卷(SF-36)评分均明显高于对照组[(10.27±1.71)分 vs. (7.24±1.62)分, (88.06±18.37)分 vs. (73.41±16.82)分,均 $P<0.001$]。出院1个月及1年后,观察组个人和社会功能量表(PSP)评分均明显高于对照组[(68.30±6.10)分 vs. (59.24±5.68)分, (81.32±7.30)分 vs. (75.49±6.29)分,均 $P<0.001$];观察组药物相关不良反应发生率明显低于对照组($P<0.05$)。出院1年后,观察组复发率明显低于对照组($P<0.001$)。

结论 依据药物基因组检测结果指导难治性精神分裂症临床用药优势明显,患者依从性高,缓解症状快,改善患者生活质量、社会适应性,复发率及不良反应率低,值得临床推广应用。

养心疏肝汤加减联合阿立哌唑治疗精神分裂症患者的影响

李阳*

丽水市第二人民医院

目的 观察养心疏肝汤加减联合阿立哌唑治疗精神分裂症患者的效果。

方法 对照组采用西药治疗:阿立哌唑片(江苏恩华药业股份有限公司,国药准字H20140121,规格10mg,批号201611022)10mg/次,1次/d,2周后可酌情加量,最高不超过30mg/d。观察组采用中西医结合治疗:阿立哌唑片的用量用法与对照组相同,中药养心疏肝汤组成为茯神15g,黄芪15g,柴胡15g,龙眼肉12g,柏子仁12g,郁金12g,半夏9g,生地15g,川芎12g,远志12g,牡丹皮9g,石菖蒲9g,酸枣仁15g,炙甘草9g,肾虚甚者加牡蛎9g、龙骨9g,瘀血内停加桃仁9g,痰瘀甚者加茯苓12g、苍术9g,水煎取汁400ml,分成200ml/次,于早9:00和晚9:00服用。4周为1个疗程,两组治疗2个疗程。

结果 观察组总有效率为88.10%高于对照组的69.05%($P<0.05$);观察组PANSS各量表评分与CGI-SI评分均低于对照组($P<0.05$);观察组不良反应发生率为7.14%低于对照组的28.57%($P<0.05$)。

结论 采用养心疏肝汤联合阿立哌唑治疗精神分裂症,患者病情得到明显控制,疗效优于单用阿立哌唑,并能减少不良反应发生,值得推荐。

关键词:精神分裂症;养心疏肝汤;阿立哌唑;不良反应

轻微精神病综合征患者认知功能障碍研究进展

李月^{1,2} 赵文涛^{1,2} 王骁^{1,2} 刘志芬^{1,2} 徐勇³ 刘莎^{1,2}

1.山西医科大学第一临床医学院精神卫生科

2.精神障碍人工智能辅助诊疗山西省重点实验室

3.中山大学附属第八医院临床心理科

目的 轻微精神病综合征 (attenuated psychosis syndrome, APS) 是指具有高度精神病风险的临床障碍, 梳理 APS 患者的认知功能特征及干预进展, 为 APS 患者早期识别和有效干预提供有价值的参考。

方法 课题组以“attenuated psychosis syndrome”、“ultra high risk psychosis syndrome”、“cognitive impairment”、“brain mechanism”、“cognitive intervention”为关键词, 系统检索 PubMed、EMBASE、Scopus、中国知网、万方数据知识服务平台、维普网数据库等数据库。检索时间为从建库至 2024 年 3 月 1 日, 限定语种为英文或中文。按照纳入、排除标准严格筛选后对文献进行综述。

结果 APS 患者通常表现出明显的多维度认知功能受损, 尤其是注意力和记忆力。APS 患者认知功能障碍与额叶、颞叶及皮层下脑区的功能和结构异常有关。针对 APS 患者的认知功能干预, 国际指南推荐认知行为治疗 (cognitive behavioral therapy, CBT) 作为一线治疗。如果心理治疗无效, 可为成年患者短暂使用低剂量的第二代抗精神病药物。此外, 营养治疗、计算机认知训练也显示出一定的疗效, 这为临床认知功能干预提供了重要的补充。

结论 APS 患者的认知功能对疾病转归及预后至关重要。已有认知功能干预方法对 APS 患者具有一定的疗效, 然而干预方法相对传统, 未来可利用计算机、虚拟现实、人工智能等技术, 开发新型认知功能干预程序。同时, 结合脑影像、电生理等客观生理学指标探究 APS 认知功能干预脑机制, 为深入认识 APS 认知功能障碍神经病理机制, 探寻更优的认知功能干预方式提供重要方向。

关键词: 轻微精神病综合征, 认知功能障碍, 脑机制, 干预

患者死亡的一个重要原因, 自杀相关的高发生率给社会和家庭带来了沉重的负担。因此, 精神分裂症患者自杀风险相关因素的早期识别, 并且制定相应的干预治疗措施, 对减少自杀导致的不良后果具有重要意义。本文将从精神分裂症患者产生的自杀行为为相关影响因素、干预措施等方面进行综述。以期早期发现精神分裂症患者的自杀行为, 从而为更好的选择干预措施提供参考依据, 旨在为精神分裂症患者自我伤害预防工作提供思路和科学根据。

方法 我们采用关键词检索的方式, 以“自伤 (self-injury)、自残 (self-harm)、自杀 (suicide)、精神分裂症 (schizophrenia)”等作为关键词组合检索在 2014 年 04 月至 2024 年 04 月发表在中国知网、万方数据知识服务平台、维普数据库、中国生物医学文献数据库、PubMed、Web of Science、Cochrane 数据库等数据库中的中英文文献。

结果 精神分裂症患者发生自杀未遂的终生风险达到 25%~50%, 我国精神分裂症患者存在自杀观念的比例达 25.8%, 其中自杀死亡的患者为 5%。目前的研究显示精神分裂症患者发生自杀的影响因素包括年龄、性别、家庭、智商、抑郁症状、物质依赖性、躯体疾病、精神症状的严重程度和入院次数等。对这一部分人的干预措施包括风险的评估、药物干预、物理治疗、心理、社区及家庭的干预。

结论 精神分裂症患者出现自杀因其发病率高、病残率高、危害性大已经成为影响患者生命最主要的原因, 危险因素较多并且复杂。不同的危险因素对不同精神分裂症患者的自杀风险影响程度也不尽相同。因此, 提高对自杀风险因素的认识, 实施有效的预防措施, 可以降低精神分裂者患者的自杀率, 改善他们的生活质量和预后。

关键词: 精神分裂症, 自杀, 影响因素

精神分裂症患者自杀相关因素的研究进展

王申 成亚丽 顾镭 武建胤 李华君 杜志国*
聊城市第四人民医院

目的 精神分裂症是精神科常见精神障碍, 其发病机制复杂, 临床症状丰富多样, 具有高致残率、致死率的特点。有研究显示, 精神分裂症患者的预期寿命缩短 15~20 年, 其中自杀是导致精神分裂症

3 种干预方法对抗精神病药物致高催乳素血症的影响

宋礼彬 张英姿 江益娟* 兰智勇
衢州市第三医院

目的 探究 3 种干预方法对抗精神病药致高催乳素血症的疗效影响。

方法 招募 2019 年 1 月至 2020 年 12 月因服用

抗精神病药致高催乳素血症而住院治疗的 90 例患者为研究对象,采用随机数字表法分为阿立哌唑组、逍遥丸组、维生素 B6 组,各 30 例,疗程 8 周。治疗前、治疗 4 周及 8 周比较血清催乳素水平、阳性和阴性精神症状评定量表(PANSS)、治疗伴发症状量表(TESS)及不良反应发生情况。

结果 治疗后 3 组血清催乳素水平降低,阿立哌唑组、逍遥丸组低于维生素 B6 组,差异有统计学意义($P<0.05$);3 组 PANSS 评分均有所降低,但差异无统计学意义($P>0.05$);治疗后 TESS 评分及不良反应发生率,阿立哌唑组 $>$ 逍遥丸组 $=$ 维生素 B6 组,差异具有统计学意义($P<0.05$)。

结论 3 种干预方法对抗精神病药致高催乳素血症都有显著疗效,阿立哌唑和逍遥丸的疗效优于维生素 B6,逍遥丸和维生素 B6 安全性高于阿立哌唑。

抗精神病药物在治疗精神分裂症、双相情感障碍和抑郁症等精神疾病中发挥着关键作用。由于精神病的治疗过程较为漫长,长期服药可能会导致高催乳素血症(hyperprolactinemia, HPRL),进而依从性差及病情恶化[1]。抗精神病药物诱导的 HPRL 已被估计发生在高达 70%的精神分裂症患者中[2]。研究表明,HPRL 可能引起不孕、性欲降低、勃起功能障碍、乳汁分泌过多、男性乳房女性化、月经失调、闭经、骨质疏松和乳腺癌等[3]。已有研究表明,阿立哌唑能有效改善抗精神病药物所致的 HPRL[4],逍遥丸治疗抗精神病药致 HPRL 疗效显著、不良反应少[5],大剂量的维生素 B6 能持续改善精神分裂症患者的 HPRL[6]。本研究通过比较阿立哌唑、逍遥丸以及维生素 B6 对抗精神病药所致 HPRL 的疗效及安全性,为临床治疗提供依据。

关键词: 阿立哌唑;逍遥丸;维生素 B6;抗精神病药;高催乳素血症

稳定期精神分裂症述情障碍与面部情绪识别和社会功能的关联性研究

丁宝玲 施剑飞*
杭州市第七人民医院

目的 探讨稳定期精神分裂症述情障碍与面部情绪识别和社会功能的关系。

方法 选取在本院门诊就诊的 60 例稳定期精神分裂症患者,选用阳性与阴性症状量表(Positive and Negative Syndrome Scale, PANSS)评估稳定期精神分裂症患者的精神症状;多伦多述情障碍量表(Toronto Alexithymia Scale-20, TAS-20)评估患者的述情障碍水平;面部情绪识别测验评估患者面部情绪识别能力;社会功能缺陷量表(Social Disability Screening Schedule, SDSS),评估患者社会功能。

结果 TAS-20 总分与面部情绪识别总分呈负相关($r=-0.495$, $P<0.01$),与 SDSS 评分呈正相关($r=0.528$, $P<0.01$),面部情绪识别得分与 SDSS 总分呈负相关($r=-0.620$, $P<0.01$),面部情绪识别能力在述情障碍和社会功能之间有一定的中介作用($\beta=-0.410$, $t=-4.006$, $P<0.01$)。

结论 稳定期精神分裂症患者的社会功能损害与述情障碍及面部情绪识别能力密切相关。面部情绪识别在患者述情障碍与社会功能间存在中介作用。

关键词: 面部情绪识别;述情障碍;社会功能;精神分裂症

精神分裂症代谢指标与工作记忆相关性研究

李君伟 宋传福*
芜湖市第四人民医院

目的 探索精神分裂症患者代谢指标与工作记忆间的相关性

方法 测量 47 例入院一周内使用利培酮治疗的精神分裂症患者体重(weight,WT)、空腹血糖(glucose,GLU)、甘油三酯(triglycerides,TG)、高密度脂蛋白(high density lipoprotein,HDL)、腹壁脂肪厚度,使用阳性和阴性症状量表(positive and negative syndrome scale,PANSS)评定精神症状,运用 N-back 工作记忆测验精神分裂症患者工作记忆。治疗 6 个月后再次测量 WT、GLU、TG、HDL、腹壁脂肪厚度、评定精神症状、测验工作记忆,进行前后对照,并结合一般资料问卷所得结果进行分析

结果 治疗后 WT、TG、腹壁脂肪厚度、药物剂量明显高于治疗前,HDL、PANSS 明显低于治疗前,差异有统计学意义($P<0.05$);1-back.RT(反应时)、2-back.RT 明显高于治疗前,差异有统计学意义($P<0.05$);甘油三酯差值与 1-back.RT 差值呈正相

关 ($r=0.353$, $P<0.05$), 腹壁脂肪厚度差值与 1-back.RT 差值呈正相关 ($r=0.322$, $P<0.05$)

结论 精神分裂症患者甘油三酯、腹壁脂肪厚度与工作记忆存在一定相关性, 通过控制甘油三酯水平及腹壁脂肪厚度, 可能会改善患者工作记忆

关键词: 精神分裂症; 代谢指标; 工作记忆

磁休克治疗对精神分裂症患者皮层厚度的影响

李金*

苏州市广济医院

目的 精神分裂症是一种严重的精神疾病, 具有广泛的症状谱, 包括行为、情绪和认知障碍, 几乎每个患者都检测到某种程度的残疾。许多抗精神病药物可用于治疗, 但 40% 的患者仅获得部分反应, 而 10% 的患者几乎没有反应。对于对药物反应有限的患者, 电休克疗法 (ECT) 是一种潜在的选择, 因为 ECT 可以提供快速的整体症状改善。然而, 认知不良反应很常见, 如健忘症和发作后迷失方向。作为替代方案, 磁力发作疗法 (MST) 在减轻症状方面的效果与 ECT 相当, 但认知障碍较轻。然而, 目前尚不清楚磁休克治疗 (MST) 对精神分裂症患者皮层厚度的影响。

方法 51 名精神分裂症患者, 其中接受电休克 (ECT) 治疗 33 例, 接受 MST 治疗 18 例。通过阳性与阴性症状量表 (PANSS) 和重复性成套神经心理状态测验 (RBANS) 测定临床症状和认知功能。FreeSurfer 6.0 软件对患者皮层厚度进行分析。

结论 使用 FreeSurfer 的标准自动重建算法计算皮层厚度, 以重建皮层表面。所有重建的图像都由训练有素的研究人员仔细检查。将每个样本投影到 fsaverage 上, 并使用 30mm 高斯核进行平滑。但是无论在 ECT 组或是 MST 组我们均没有发现治疗前后皮层厚度的显著改变。磁休克对精神分裂症患者皮层厚度影响较弱, 可能与其认知保留机制有关。

关键词: 电休克; 磁休克; 精神分裂症; 皮层厚度

伴有代谢综合征的精神分裂症患者认知功能损害 及其危险因素的研究

徐学兵*

宁夏回族自治区宁安医院

目的 通过对 58 例明确诊断为伴有代谢综合征的精神分裂症患者认知功能损害的研究, 探讨代谢综合征与精神分裂症认知功能损害之间的关联, 分析其发生的危险因素, 提出干预措施, 为科学、有效的降低伴有代谢综合征的精神分裂症患者认知功能损害提供临床思维。

方法 以 2023 年 1—12 月入住宁夏宁安医院的 362 例精神分裂症患者为研究对象, 将其分为二组, 一组为代谢综合征(non-MetS)组: 即被明确诊断为伴有代谢综合征的 58 例 (发生率为 16.05%); 一组为非代谢综合征组 ($n=304$)。采用阳性和阴性症状量表 (PANSS) 评估患者精神病性症状, 使用蒙特利尔认知评估量表 (MOCA)、语言流畅性测试 (VFT) 评估认知功能。采用全自动生化分析仪测定甘油三酯、高密度脂蛋白、低密度脂蛋白、空腹血糖等血清生化指标。采用描述统计、单因素分析及多因素回归分析方法对代谢综合征发生率及影响因素进行分析。所有数据采用 SPSS 22.0 进行统计分析。

结果 二组受试者在年龄、性别、教育、职业、居住方式、饮食等一般背景资料上无显著差异 ($P>0.05$), 患者组在用药情况和精神症状方面无显著差异。单因素方差分析发现, 非代谢综合征组和代谢综合征组在定向力和语言流畅度“自”开头一字的障碍方面存在显著差异 ($F=9.63$, $P<0.001$; $F=8.47$, $P<0.001$)。多因素回归分析显示, 精神病理症状、高腰围和高甘油三酯是定向力和语言流畅性的预测因子 ($\beta=-0.247$, $t=-3.105$, $P=0.0029$; $\beta=0.198$, $t=2.213$, $P=0.038$)。预测分析结果显示, 甘油三酯、腰围、PANSS 总分、PANSS 精神病理评分、PANSS 阴性症状评分在预测代谢综合征组认知功能损害方面具有较高的可靠性。

结论 代谢综合征可加重精神分裂症患者认知障碍损害程度。应加强精神分裂症患者代谢综合征指标的监测, 并将引起代谢综合征的风险纳入制定治疗方案的评估范围, 尽可能降低精神分裂症发生代谢综合征的可能性。

关键词: 精神分裂症; 代谢综合征; 认知功能损害

一例发热后引起的精神障碍的诊疗

陆永艺 谢霜* 韦秋媛 周小念

中国人民解放军联勤保障部队第 923 医院

目的 坚持服药在治疗精神疾病的意义

方法 我院于 2022 年 12 月 30 日收治的一例发热及四肢抽搐后引起的精神障碍。患者男性,于 2022 年 11 月 27 日出现一次发热及四肢抽搐,后出现行为异常,表现为自笑,不主动进食,上厕所须他人督促,动作、反应迟钝,问话不答,外院治疗未见改善后于 12 月 30 日送至我科住院治疗,诊断“精神分裂症”、“慢性乙型病毒性肝炎”,予阿立哌唑片抗精神病症状,奥沙西洋片改善睡眠及护肝治疗,治疗一周好转后出院。出院后患者外出玩耍暂停服药一天后,患者症状再发,表现情绪不稳,乱砸东西,攻击家人,自笑及自言自语,答非所问,自知力缺乏,家属于 2023 年 3 月再次送入我科住院治疗,入院后予肌注盐酸氯丙嗪注射液+盐酸异丙嗪注射液治疗控制精神症状效果不佳,患者仍表现兴奋躁动,攻击性强,自语自笑,夜间难以入睡,后予利培酮联合无抽搐电休克治疗,及肌注盐酸氯丙嗪+盐酸异丙嗪后症状缓解,停止无抽搐电休克治疗及停止肌注盐酸氯丙嗪注射液+盐酸异丙嗪注射液,药物治疗观察恢复效果较佳后出院。

结果 患者出院后坚持服药,目前仍持续门诊治疗,现能正常工作及生活。

结论 坚持服药积极治疗是能够有效控制精神症状,帮助患者回归正常工作生活。

关键词: 坚持服药,精神分裂症,无抽搐电休克治疗精神疾病

音乐治疗对精神分裂症患者反刍思维及攻击行为的影响

苏焕*

山西医科大学

目的 精神分裂症(Schizophrenia, SCH)是一

类以思维,情感和和行为障碍为主要表现的精神科常见疾病。有研究表明 SCH 患者有更多的攻击行为和一定程度认知功能的损害。反刍作为一种表达痛苦的自我生成思维的特定形式,是一种自我集中,面向过去的消极的思维形式。反刍思维促进负面情绪的产生,加重病情严重程度。过去精神分裂症的治疗主要以抗精神病药物为主,而随着医学由单纯生物模式向生物-社会-心理综合模式的发展,音乐治疗逐渐成为调节精神心理状态的最佳手段之一。本研究旨在探讨音乐治疗对精神分裂症患者反刍思维及攻击行为的影响。通过汉密顿抑郁量表(HAMD)、反刍反应量表(RRS)和攻击行为问卷(AQ),证实音乐治疗对减轻精神分裂症患者反刍思维的有效性,同时可以改善精神分裂症患者的抑郁情绪及攻击行为。

方法 本研究选自在山西医科大学精神卫生中心精神科接受治疗且符合纳排标准的 40 例精神分裂症患者,收集病例时间为 2024 年 6 月~2024 年 9 月。受试者分别按照就诊的先后顺序分为音乐组和对照组各 20 例。对照组进行常规药物治疗,音乐组在常规药物治疗基础上进行音乐治疗。规范干预 14 天后,应用汉密顿抑郁量表(HAMD)、反刍反应量表(RRS)和攻击行为问卷(AQ)评定精神分裂症患者反刍思维、攻击行为及抑郁情绪的改善情况。

结果 1.基线标准

干预前,对两组患者基线资料(年龄、性别、文化程度、婚姻状况、音乐受训年限)和精神分裂症发病相关因素(病史、病程、病变性质)进行组间比较,均无明显差异($p>0.05$),两组患者基线基本一致。

2.反刍思维与攻击行为严重程度分级

(1) 干预 14 天后,对照组和音乐组患者 RRS 和 AQ 分数均有不同程度的下降,经统计学分析 $p<0.05$,差异具有统计学意义。

(2) RRS 和 AQ 分数,音乐组与对照组相比下降明显,差异具有统计学意义($p<0.05$)。

3.抑郁状态评分

(1) 干预 14 天后,音乐组和对照组 HAMD 评分均较干预前降低,差异具有显著统计学意义($p<0.01$)。

(2) 音乐组较对照组抑郁状态评分,与对照组相比音乐组的总分降幅更大,差异具有统计学意义($p<0.05$)。

结论 1.本次研究中利用音乐治疗进行训练,可以明显降低精神分裂症患者反刍思维及攻击行为。

在本次研究中选择的音乐为4/4拍慢速,节奏舒缓、音量适合,有利于缓解精神分裂症患者的负性情绪,改善其攻击行为。

2.音乐治疗可有效缓解精神分裂症患者的抑郁症状。听喜欢的音乐可募集与积极情绪状态相关的大脑区域,从而调动积极情绪相关脑区的活跃度,进而增加患者的训练积极性,提高患者依从性,积极促进其身体各项功能的康复。

关键词:精神分裂症;音乐治疗;反刍思维;攻击行为

双相抑郁患者 ADCY-2 基因多态性与认知功能及 MECT 疗效关系

于名超*

淮安第三人民医院

目的 探讨双相抑郁患者腺苷酸环化酶-2 (ADCY-2)基因多态性与认知功能及改良电休克治疗(MECT)疗效关系

方法 选取1年内在我院诊治的双相抑郁患者80例作为研究对象,采用TaqMan基因分型技术检测ADCY-2基因rs2892609、rs1864071单核苷酸多态性的分布,采用事件相关电位检测(P300)和威斯康辛卡片分类测验(WSCT)评估双相障碍患者的认知功能,对患者进行8次MECT治疗,以汉密尔顿抑郁量表(HAMD)总分评估MECT疗效,分析ADCY-2基因多态性与认知功能及MECT疗效关系

结果 ADCY-2基因rs2892609位点GG型的CC评分明显高于GT型、TT型,RE、潜伏期评分明显低于GT型、TT型,rs1864071位点AA型的PE评分明显低于AG型、GG型,波幅评分明显高于AG型、GG型,差异显著($P < 0.05$)。ADCY-2基因rs2892609位点GG型与GT型、rs1864071位点AA型与AG型治疗前、第8次治疗HAMD评分比较,差异无显著性($P > 0.05$);rs2892609位点GG型第2、4、6次治疗HAMD评分明显高于GT型,rs1864071位点AA型第2、4、6次治疗HAMD评分明显高于AG型($P < 0.05$)

结论 双相抑郁患者ADCY-2基因rs2892609、rs1864071位点的基因多态性与认识功能障碍有关,

rs2892609位点的GT基因型、rs1864071位点的AG基因型患者接受MECT治疗时起效更快,效果更好

关键词:双相抑郁;腺苷酸环化酶-2;基因多态性;认知功能;改良电休克治疗

经颅交流电刺激对精神分裂症患者认知功能的影响

刘雪松 宋传福*

芜湖市第四人民医院

目的 探讨经颅交流电刺激(transcranial alternating current stimulation, tACS)对精神分裂症患者认知功能的影响,为精神分裂症伴认知功能损害患者的治疗提供参考。

方法 选取23例在芜湖市第四人民医院处于维持期治疗的精神分裂症住院患者为研究对象,随机分为干预组($n=12$)和对照组($n=11$),两组均维持原有的药物治疗方案不变。干预组采用tACS真刺激,对照组采用tACS伪刺激。干预组使用非侵入式tACS刺激设备,刺激频率40Hz,电流强度1-2mA,每次刺激时间持续20分钟。选择左侧背外侧前额叶和右侧顶叶作为刺激位点,即国际10-20脑电系统的F3与P4两个位点。对照组采用同样的电流强度,但仅持续30秒,随后患者继续佩戴电极,持续20分钟。采用重复测量方差分析比较两组在干预前(基线)、干预后即刻(2周末)、随访时(6周末)的MATRICS公认认知成套测验(MATRICS Consensus Cognitive Battery, MCCB)、同步听觉连续加法测试(Paced Auditory Serial Addition Test, PASAT)评分的差异。

结果 两组在MCCB各测验比较显示,连线测验($p < 0.05$)、持续操作测验($p < 0.05$)的组间效应显著;时间和组别对迷宫测验($p < 0.05$)、持续操作测验($p < 0.05$)的交互效应显著。在MCCB中的持续操作测验任务表现上,tACS干预组在干预后即刻、随访时的评分均较对照组有显著提升;在MCCB的连线测验评分中,干预组在随访时较对照组有显著提升。两组均无明显不良事件发生。

结论 tACS可以改善精神分裂症患者的注意力和信息处理速度,且安全性高,可以作为精神分

裂症患者认知功能缺陷的潜在治疗方法。

关键词：经颅交流电刺激,精神分裂症,认知功能

CNS Drugs-induced Akathisia: A Disproportionality Analysis of The FAERS Database

Yutong Li Haiyun Xu*

Zhejiang Provincial Clinical Research Center for Mental Disorder, School of Mental Health, Wenzhou Medical University, Wenzhou, China

Purpose This study aims to evaluate the occurrence of drug-induced akathisia using real-world data from the FDA Adverse Event Reporting System (FAERS), describe its clinical characteristics, and identify drugs most closely associated with drug-induced akathisia

Methods We retrieved relevant reports of drug-induced akathisia from the FAERS database and analyzed their clinical characteristics, including incidence rates, gender distribution, age distribution, and reporting sources. Through statistical methods, we determined drugs most strongly associated with drug-induced akathisia and compared them with their drug labels

Results We found that various drugs can lead to drug-induced akathisia, including antiemetics, antipsychotics, and antidepressants. Consumers constituted the main reporting source, with the United States being the country with the highest number of reports. Among the drugs, antipsychotics accounted for half of the top 30 drugs. Additionally, some drugs did not have a clear mention of akathisia risk on their labels

Conclusion This study underscores the importance of drug-induced akathisia in clinical practice, especially concerning psychiatric medications. While the FAERS database provides valuable real-world data, caution is warranted in interpreting the results due to the spontaneous nature of reporting, which may introduce biases. Further epidemiological investigations are needed to delve deeper into the relationship between drugs and akathisia to guide clinical practice

关键词：Disproportionality analysis' Drug-induced akathisia' FAERS database' Pharmacovigilance' Real-world data

阶段相宜护理在精神分裂症患者的应用效果

周小念 韦新燕* 付慧 张兵

中国人民解放军联勤保障部队第九二三医院

目的 探讨阶段相宜护理用于精神分裂症的临床效果。

方法 研究对象 100 例精神分裂症患者均选自我院收治,按照计算机随机分配法,分成对照组和观察组,各 50 例。对照组接受常规护理,即:遵医嘱指导患者用药,加强体表体征监测,给予心理支持等。观察组接受阶段相宜护理干预,即:1.培训与质控:成立护理小组,负责评估病情、制定计划、告知方案等,全程指导和监督护理计划执行情况。根据疗效,优化计划,每日总结照护,每周集体讨论。以文字交接特殊护理情况,保证护理动态、连续。护士长定期或不定期抽查,惩劣奖优,持续改进。2.具体方案:(1)入院阶段:行精神科专科风险评估,并于患者入院 24h 内,拟定个体化护理方案,提交给护理小组,组员知晓后并执行落实。开展疾病宣教,加强症状体征、用药、饮食等情况,动态化呈报给小组,以便及时调整方案,并落实方案。(2)疾病急性发作阶段:安置于一级护理病房,2h 内完成评估检查,掌握患者用药、睡眠及饮食情况。根据患者具体情况及病情进展,制定适宜健康教育,纠正患者不良生活习惯,嘱咐患者按时按量用药、规范进食、保持睡眠充足,行自我生活料理活动。及时掌握患者精神异常症状,如:妄想、幻觉等,鼓励患者参加工娱活动,分散注意力。(3)疾病康复阶段:联合专业心理工作者,于适当时机,行护患沟通,掌握患者状态及特点,用心理学技巧疏导患者情绪,给予心理康复建议,提高安全感和信赖感。鼓励患者参加人际交往、文娱及日常生活活动,促进患者精神障碍症状改善,促进患者正常生活能力恢复。(4)患者出院后,连续随访,督导、鼓励行疾病控制康复行为。

结果 1.两组患者护理依从性、住院时间和住院费用的比较,观察组护理依从性高于对照组,住院时间短于对照组,住院费用少于对照组($P<0.05$)。

2.两组患者 SSPI 因子评分的比较, 观察组 SSPI 各因子评分高于对照组 ($P<0.05$)。

结论 本研究显示, 实施阶段相宜护理模式, 能给予患者高效、及时的康复护理支持, 确保患者入院后, 得到严密、周全的护理措施, 从而在急性发作期取得较好的症状控制效果, 在疾病康复期实施及时日常生活、社会交往引导, 最终实现康复效果的优化。

计算机化认知行为治疗与舍曲林联合应用在精神分裂症后抑郁中的疗效评估

黄仁春*

福州市第二总医院神经精神病防治院

目的 精神分裂症后抑郁 (PPD) 是一种常见且严重的临床现象, 影响患者的生活质量和社会功能。本研究旨在评估计算机化认知行为治疗 (CCBT) 联合舍曲林对 PPD 患者的疗效及其对生活质量的影

方法 本研究纳入 68 例符合 PPD 诊断标准的患者, 随机分为两组: 对照组 (34 例) 接受舍曲林治疗, 实验组 (34 例) 在舍曲林治疗基础上接受 CCBT 干预。治疗为期 12 周, 每周进行 2 次 CCBT, 每次 45-60 分钟。研究在第 2、4、8、12 周时, 使用卡尔加里精神分裂症抑郁量表 (CDSS)、蒙哥马利抑郁量表 (MADRS)、日常生活自理能力评定表 (ADL)、认知领域评分 (MCCB)、生活质量评分 (SF-36) 评估两组患者的抑郁、焦虑、认知功能、生活质量及不良反应率。

结果 实验组在 CDSS、MADRS、ADL、MCCB 和 SF-36 评分上均显著优于对照组 ($p<0.05$), 显示 CCBT 联合舍曲林在改善抑郁症状、提高生活质量、增强日常生活自理能力和认知功能方面具有显著优势。不良反应率两组无显著差异 ($p>0.05$)。

结论 CCBT 联合舍曲林治疗 PPD 患者效果显著, 能够有效改善抑郁情绪和生活质量, 促进社会功能的恢复。该方法具有良好的临床应用前景, 建议推广应用。

塞来昔布辅助治疗精神分裂症的有效性、安全性及机制研究

李金铭 苏玺*

新乡医学院第二附属医院, 河南省精神病医院, 河南省生物精神病学重点实验室

目的 本研究旨在探究塞来昔布辅助治疗精神分裂症的有效性、安全性及可能机制。

方法 1. 前瞻性收集 2019 年 4 月至 2020 年 10 月在新乡医学院第二附属医院住院的 90 例精神分裂症患者的资料, 采用随机数字表法将患者分为安慰剂组和塞来昔布辅助治疗组。安慰剂组有 46 例完成 6 周随访, 其中男 29 例, 女 17 例, 年龄 21~34 (27.46 ± 6.50) 岁; 塞来昔布组有 44 例完成 6 周随访, 其中男 32 例, 女 12 例, 年龄 21~39 (30.52 ± 8.69) 岁。

2. 采用阳性与阴性症状量表 (Positive and Negative Syndrome Scale, PANSS) 评估 2 组患者的精神病症状, 对比分析治疗后 PANSS 评分变化量以评估塞来昔布辅助治疗的有效性。采集体重、糖脂等代谢相关指标, 血压、心电、血常规等心血管相关指标, 利用不良反应量表评估不良反应, 进而分析塞来昔布辅助治疗的安全性。使用酶联免疫吸附试验检测患者血清肿瘤坏死因子 α (tumor necrosis factor- α , TNF- α)、白细胞介素 (interleukin, IL)-4、干扰素 γ (interferon- γ , IFN- γ) 水平, 采用 Pearson 相关分析 2 组患者细胞因子水平与 PANSS 评分、PANSS 减分率 [(治疗前评分-治疗后评分)/治疗前评分 $\times 100\%$] 及糖脂代谢指标的关系, 分析炎症在塞来昔布辅助治疗中的作用。

结果 塞来昔布辅助治疗组 6 周 PANSS 阳性评分变化量显著高于安慰剂组 [(-8.00 ± 6.12) 分比 (-4.78 ± 5.19) 分, $H=-0.55$, $P=0.008$]。塞来昔布辅助治疗组 6 周体重、体重指数、总胆固醇、甘油三酯的变化量均显著低于安慰剂组 ($F=-7.37$ 、 -7.30 、 2.56 、 -2.54 , 均 $P<0.05$); 塞来昔布辅助治疗未发现严重不良反应。基线期 TNF- α 与基线期阴性症状、6 周 PANSS 减分率呈正相关 ($r=0.260$ 、 0.330 ; 均

$P < 0.05$), 与 6 周体重呈负相关 ($r = -0.311$; $P < 0.05$); 基线期 IL-4 水平与 6 周 PANSS 总分、6 周 PANSS 阴性症状评分呈正相关 ($r = 0.320, 0.397$; 均 $P < 0.05$), 与 PANSS 减分率、6 周血糖 ($r = -0.316, -0.331$; 均 $P < 0.05$) 呈负相关; 6 周 IFN- γ 水平与低密度脂蛋白水平负相关 ($r = -0.306$; $P < 0.05$); 塞来昔布辅助治疗组无该相关性。

结论 塞来昔布辅助治疗可改善精神分裂症阳性症状, 未见不良反应。炎症状态与精神分裂症症状、疗效以及代谢不良反应相关。

饮酒与精神分裂症的因果关系: 一项双向孟德尔随机研究

陈安冉 杨勇锋*

新乡医学院第二附属医院

目的 观察性研究显示饮酒与精神分裂症(SZ)存在关联, 被认为是 SZ 的危险因素。然而, 由于观察性研究的限制, 确定两者之间的因果关系是困难的。因此, 本研究旨在利用双向孟德尔随机化(MR)研究方法明确每周饮酒量(DPW)与 SZ 之间的因果关系。

方法 本研究使用欧洲个体全基因组关联研究(GWAS)的汇总统计数据进行了双向 MR 分析。在评估因果关系时, 主要采用了反方差加权法(IVW)作为主要分析方法。此外, 为了补充 IVW 的结果, 还使用另外两种 MR 方法, 即 MR-Egger 和加权中位数法。研究运用 MR-Egger 截距来检测水平多效性, 并进行留一敏感性分析, 评估结果的稳健性。

结果 IVW 方法的 MR 结果表明, DPW 不会增 SZ 的风险。然而, 反向 MR 分析显示, SZ 与 DPW 呈显著正相关 (优势比 (OR) = 1.01, 95% 置信区间 (CI) 1.00-1.02, $P = 0.01$)。MR-Egger 回归检验显示, 定向多效性不会对 MR 结果产生偏倚 (截距 = 9.70×10^{-4} , $P = 0.52$)。MR-Egger 分析显示 SZ 与 DPW 之间没有因果关系 (OR = 1.00, 95% CI: 0.95-1.04, $P = 0.92$)。然而, 加权中位数方法显示 SZ 与 DPW 之间存在因果关系 (OR = 1.01, 95% CI: 1.00-1.02, $P = 8.78 \times 10^{-3}$)。留一敏感性分析的结果显示, 每个 SNP 均不影响 IVW 估计值, 漏斗图表明

没有异质性的证据。

结论 本项 MR 研究明确了 SZ 与 DPE 之间存在的因果关系, 及时干预 SZ 患者与饮酒相关的不良生活习惯, 如: 减少或戒除饮酒, 将有效预防与饮酒相关的疾病在 SZ 患者中的发生。

BDNF 与氧化应激交互作用在双相情感障碍患者中的性别差异

张沛云 严琦*

南通四院

目的 探讨双相情感障碍患者脑源性神经营养因子(BDNF)、氧化应激(OxS)及两者交互作用与临床症状之间的关系是否存在性别差异。

方法 本研究共招募了 86 名双相情感障碍患者和 90 名健康对照, 测定血浆 BDNF、超氧化物歧化酶(SOD)、谷胱甘肽过氧化物酶(GSH-Px)、过氧化氢酶(CAT)和丙二醛(MDA)水平。应用 HAMD-17、HAMA、YMRS 及斯奈思-汉密尔顿快感量表(SHAPS)来评估抑郁、焦虑、躁狂及快感缺失症状。采用双因素方差分析、偏相关分析和多元回归分析等方法进行统计。

结果 1、将受教育年限和 BMI 作为协变量进行双因素方差分析显示, 诊断对 MDA 有主效应($F = 10.061, p = 0.002$), 表明患者与对照组 MDA 水平存在差异。性别对 CAT 水平有主效应($F = 62.243, p < 0.001$), 诊断及性别交互作用对 CAT 水平有显著影响($F = 5.45, p = 0.021$), 表明 CAT 水平存在性别差异并且在患者和对照组不同。ANCOVA 显示, 男性患者和男性对照组的 MDA 水平分别高于女性患者和女性对照组($F = 34.627; F = 27.273, p < 0.001$)。

2、将年龄、BMI、教育程度、吸烟和发病年龄作为协变量, 偏相关分析显示女性患者 MDA 和 CAT 水平分别与 HAMA 和 SHAPS 评分负相关 ($r = -0.29, P_{Bonferroni} = 0.03$; $r = -0.303, P_{Bonferroni} = 0.023$), 但在男性患者中未发现相关性 ($r = -0.033, P_{Bonferroni} = 0.864$; $r = -0.21, P_{Bonferroni} = 0.266$)。男性患者 CAT 水平与 HAMA 评分负相关 ($r = -0.403, P_{Bonferroni} = 0.027$)。

3、将年龄、BMI、教育程度、吸烟和发病年龄作为协变量，多元回归分析显示，在女性患者中BDNF×CAT、BDNF×GSH-Px均与SHAPS评分相关（ $B = -0.124$ ， $t = -2.055$ ， $P_{Bonferroni} = 0.045$ ； $B = -0.336$ ， $t = -2.041$ ， $P_{Bonferroni} = 0.047$ ），但在男性患者中均无相关关系（ $B = -0.206$ ， $t = -0.301$ ， $P_{Bonferroni} = 0.766$ ； $B = 0.274$ ， $t = 0.173$ ， $P_{Bonferroni} = 0.864$ ）。

结论 本研究结果表明，双相情感障碍患者血浆CAT、MDA水平及BDNF与CAT、BDNF与GSH-Px交互作用与其焦虑、快感缺失症状之间的相关性均存在性别差异。

MECT对精神分裂症患者脑功能的影响--基于fNIRS的研究

孙伟东* 康璐 孙丹鹤

齐齐哈尔医学院附属第四医院

目的 探讨精神分裂症患者脑功能的异常，及MECT治疗前后患者脑功能的变化与临床症状改善情况。

方法 依据纳入与排除标准，选取2024年1月-2024年12月于齐齐哈尔医学院附属第四医院住院，需要行MECT的精神分裂症患者30例。由主治医师及以上的精神科医师对其脑功能和临床症状进行评估，同时入组30名正常被试，比较精神分裂症患者与正常被试之间脑功能异常。而后，精神分裂组患者采用MECTA 5000Q电休克治疗仪进行为期4周的MECT治疗。采用fNIRS技术和PANSS量表评估患者治疗前后脑功能和临床症状的变化及治疗前后患者脑功能的变化与临床症状改善之间的关系。

结果 入组时，与正常组人群相比，患者组9个前额叶区域均未激活（ $P > 0.05$ ），对照组均激活（ $P < 0.05$ ），患者组9个前额叶区域的oxy-Hb变化值均低于对照组（ $P < 0.05$ ）。4周后患者组PANSS总分均较入组时下降（ $P < 0.05$ ），有6个前额叶区域激活（ $P < 0.05$ ，其中左腹外侧前额叶及左侧颞上皮质的oxy-Hb变化值较入组时提高（ $P < 0.05$ ）。未发现PANSS评分与oxy-Hb变化值间存在统计学相关性

（ $P > 0.05$ ）。

结论 MECT可明显改善精神分裂症患者脑功能异常，另外，fNIRS可以评估特定状态下脑组织中氧合血红蛋白、脱氧血红蛋白以及总血红蛋白的浓度变化，值得今后在临床推广应用。

作业疗法对慢性精神分裂症患者认知功能的影响分析

李巍* 王大海 陆奕庭 杨佳华

沈阳市精神卫生中心

目的 探讨作业疗法对慢性精神障碍患者认知功能的影响。

方法 入组2023年1月在沈阳市精神卫生中心住院的慢性精神分裂症患者120名，采集基本信息，将患者随机分为2组，一组为干预组入组患者65人，每日给予作业疗法，共持续3个月。作业疗法需提前拟定训练计划，内容包括破冰游戏，诗朗诵，唱歌，手工制作，操作电脑，家务活动等。另一组为观察组，入组患者55人。采用蒙特利尔认知评估（MoCA），评估2组基线认知功能，此后3个月每个月进行一次认知功能评估。两组年龄，教育年限，MoCA对比采用独立样本T检验，性别比较采用卡方检验。

结果 1.2组性别，年龄，病程，教育程度以及基线MoCA得分均无显著差异（ $p > 0.05$ ）。2.2组对比第一个月MoCA无显著差异（ $p > 0.05$ ），各分项得分无显著差异。3.2组对比第二个月干预组MoCA总分显著高于观察组（ $p < 0.05$ ），分项分中语言功能显著高于观察组（ $p < 0.05$ ），第三个月干预组MoCA显著高于观察组（ $p < 0.01$ ），其中语言功能显著高于对照组（ $p < 0.01$ ），视空间与执行功能显著高于观察组（ $p < 0.05$ ），抽象能力显著高于观察组（ $P < 0.01$ ）。

结论 1、1个月以内短期的作业疗法对认知功能无显著影响。2、2个月以上的作业疗法对慢性精神分裂症患者认知功能有显著改善。其中语言功能改善显著。3、3个月的作业疗法对慢性精神分裂症患者认知功能改善的效果最佳，其中语言功能，视

空间与执行功能，抽象能力均明显改善。

非典型抗精神病药物与精神分裂症患者糖脂代谢异常关系的研究进展

卢冰清*

金华市第二医院

精神分裂症是常见的一种精神系统疾病，临床多表现为情感、意志行为、感知及思维等多方面障碍，且病程较长、病情反复发作，随着病情发展，可给患者认知功能造成不可逆损伤，严重影响日常生活。本文综述了精神分裂症患者使用非典型抗精神病药物引发的糖脂代谢异常及干预策略，旨在为长期用药患者提高生活质量和疾病预后提供依据。精神分裂症治疗通常需要长期依赖抗精神病药物，典型抗精神病药物氯丙嗪问世以来，显著改变了精神科治疗，使许多重症患者重返社会。而氯氮平的引入带来非典型抗精神病药物概念，其后陆续有利培酮、奥氮平、喹硫平、齐拉西酮、阿立哌唑等问世。非典型抗精神病药物较典型药物更显著地阻断 5-羟色胺 2 (5-HT₂) 受体，副作用较少，在精神分裂症治疗中得以广泛应用。然而，长期使用非典型抗精神病药物可能引发不良代谢效应，如葡萄糖耐量下降、血糖升高和血脂异常，增加心血管疾病和 2 型糖尿病风险。非典型抗精神病药物与精神分裂症患者糖脂代谢异常关系复杂。药物可能通过多种途径导致糖脂代谢异常，包括血糖升高、胆固醇和甘油三酯水平异常，从而增加心血管风险。在应对这种情况时，可以采取多种干预对策，包括谨慎选择药物、药物干预、生活方式改变以及个体化治疗计划。通过综合管理，可以有效降低患者可能面临的代谢异常风险，提高其整体健康水平。然而，未来仍需要深入研究药物对糖脂代谢的具体影响机制，以及更精准的治疗策略，以促进精神分裂症患者的综合康复。

Alterations of Eye Tracking Measure in First-episode Schizophrenia Are Mediated by COVID-19 Impact

Hao Hu Dan Zhang Qian Guo Guanjun Li Jijun Wang*
Shanghai Mental Health Center

Objective This study aims to assess the effects of coronavirus disease-19 (COVID-19) on clinical symptoms and eye movement alterations of patients with first-episode schizophrenia (FES).

Methods Psychological distress in 37 patients and 50 healthy controls were evaluated. Eye-tracking performances were also collected. Participants were divided into high-impact and low-impact subgroups, according to the median score of CIS. The effects of group × coronavirus impact level on eye movement characteristics were investigated.

Results The depression, anxiety, perceived stress scores, and coronavirus impact scores of patients were significantly higher than healthy controls. The average saccade amplitude of the free-viewing task, and the average saccade velocity of anti-saccade of FES were lower than those of healthy controls. There were significant interactive effects between the group and the coronavirus impact level on average fixation duration in the free-viewing test, and reaction time in the anti-saccade test. The anxiety and depression scores of patients were positively correlated with the coronavirus impact score

Conclusion FES patients who were more affected by the coronavirus showed more severe eye movement abnormalities. This study provides valuable information for exploring the neuropsychological mechanism of COVID-19 in patients and provides evidence for formulating psychological intervention measures

小檗碱治疗奥氮平致精神分裂症患者胰岛素

抵抗的疗效及对炎症因子相关蛋白的影响

穆晞园*

金华市第二医院

目的 探讨奥氮平所致精神分裂症胰岛素抵抗患者使用小檗碱治疗的疗效, 及对炎症因子肿瘤坏死因子- α (TNF- α)、白细胞介素- 1β (IL- 1β)、白细胞介素-6 (IL-6) 和相关蛋白表达水平的影响。

方法 选取 2018 年 6 月至 2020 年 8 月金华市第二医院收治的 60 例首发精神分裂症患者为研究对象, 随机分为 3 组, 各 20 例。对照组给予奥氮平及小檗碱模拟剂治疗, 低剂量组在对照组治疗的基础上给予低剂量小檗碱 (300 mg/d) 干预治疗, 高剂量组在对照组治疗的基础上给予高剂量小檗碱 (900 mg/d) 干预预防治疗, 均连续治疗 12 周。观察患者治疗前后患者炎症因子 TNF- α 、IL- 1β 、IL-6 水平、血浆核因子- κ B (NF- κ B) 水平、糖脂代谢相关指标空腹血糖 (FBG)、总胆固醇 (TC)、三酰甘油 (TG) 水平及胰岛素抵抗指数 (HOMA-IR) 水平。

结果 治疗后, 高剂量组和低剂量组 TNF- α 、IL- 1β 、IL-6、NF- κ B、FBG、TC、TG、HOMA-IR 水平均低于对照组 (均 $P < 0.05$), 且高剂量组均低于低剂量组 (均 $P < 0.05$)。

结论 小檗碱治疗奥氮平所致精神分裂症胰岛素抵抗, 可显著降低患者炎症因子 TNF- α 、IL- 1β 、IL-6 水平、血浆 NF- κ B 和糖脂代谢相关指标 FBG、TC、TG 及 HOMA-IR, 提高临床疗效, 具有临床应用价值

Association Between Altered Hormones and Network Structure of Brief Psychiatric Rating Scale in Drug-naïve, First Episode Schizophrenia

Xiuxia Yuan Xueqin Song* Xue Li Gangrui He
the First Affiliated Hospital of Zhengzhou University

Objective We aimed to explore alteration of thyroid and sex hormones in patients with SCZ. This study

also performed a network analysis of Brief Psychiatric Rating Scale (BPRS) to identify central symptoms and its association with hormone levels

Methods Thyroid and sex hormones level and were measured using radioimmunoassay methods. This study uses BPRS to evaluate mental symptoms severity in patients with SCZ. BPRS five domains were anxiety/depression, activation, thought disturbance, anergia, hostility. We estimated a network structure for both BPRS five domains (symptom-dimensions) and 18-items (symptom-items)
